relations between adjoining regions can be easily discerned. On the other hand, only very small samples can be examined in any given film. This means that the technique is not good for measuring defects larger than the film thickness or those whose number per unit volume is low. A scanning electron microscope (SEM) uses a narrow beam of electrons (often of about 40 kiloelectron Volts) that scans the surface of a sample and forms a corresponding image from the backscattered electrons or secondary electrons. No special surface preparation is necessary, and, since the depth of focus in an SEM is much greater than in an optical microscope, quite irregular surfaces, such as fractures, can be studied successfully. The strikingly detailed pictures of insects seen in publications are also taken with an SEM. Useful magnifications range from 100 to 20 000x. The electron beam used in an SEM causes each atom near the surface to emit an X ray that is characteristic of that element. By constructing an image based on the distribution of the intensity of the characteristic X ray of a given element, it is possible to show that element's distribution among the phases in the surface. If the electron beam is not swept but held in one spot, a chemical analysis can be made of the various elements in the region under the electron beam by measuring the intensity of the X rays emitted by each element. Testing Mechanical Properties:- the most common mechanical properties are yield stress, elongation, hardness, and toughness. The first two are measured in a tensile test, where a sample is loaded until it begins to undergo plastic strain (i.e. strain that is not recovered when the sample is unloaded). This stress is called the Yield Stress. It is a property that is the same for various samples of the same alloy, and it is useful in designing structures since it predicts the loads beyond which a structure will be permanently bent out of shape. If the tensile test is continued past yielding, the load reaches a maximum as the strain localizes and a neck develops in the sample. The maximum load, divided by the initial cross-sectional area of the sample, is called the Ultimate Tensile Stress (UTS). The final length minus the initial length, divided by the initial length, is called the Elongation. Yield stress, UTS, and elongation are the most commonly tabulated mechanical properties of metals. The hardness of a metal can be measured in several ways. If a hard indenter (a sphere, cone, or pyramid) is pushed a short distance into a metal with a defined load, the load divided by the contact area becomes the measure of hardness. For testing steel, one of the oldest of such tests, the Brinell hardness test, uses a 10-millimeter-diameter ball and a 3 000-kilogram load. Brinell hardness values correlate well with UTS. Much smaller loads and diamond microindenters also can be used in conjunction with a microscope to measure the hardness of quite small regions (down to a few micrometers, or millionths of a meter, across). A different type of testing machine, which indicates hardness directly, bears the name Rockwell. Here, instead of measuring the width of the indentation after the indenter has been removed, a sensitive gauge indicates the depth to which the indenter sinks into the surface under a given load. Various sizes of indenters and loads allow a wide range of hardness to be measured. These hardness numbers are useful for quality control in manufacturing, especially in assuring consistency from batch to batch. Of particular concern in engineering structures is the prevention of sudden, complete failure, as in the fracture of a brittle material. Much to be preferred is a structure that will deform under an overload but not fail. Sudden failure begins at a notch or crack that locally concentrates the stress, and the energy required to extend such a crack in a solid is a measure of the solid's toughness. In a hard, brittle material, toughness is low, while in a strong, ductile metal it is high. A common test of toughness is the Charpy test, which employs a small bar of a metal with a V-shaped groove cut on one side. A large hammer is swung so as to strike the bar on the side opposite the groove. The energy absorbed in driving the hammer through the bar is the toughness. A test requiring more instrumentation, but measuring material properties that are more useful for analysis, is the pulling apart of two sides of a sample containing a crack that is initially cut about one-third of the way through the sample. The use and analysis of such a test is called Fracture Mechanics, and the information acquired is used to demonstrate the integrity of structures made of strong materials that contain small flaws – for example, rocket casings, airplanes, and nuclear reactor pressure vessels. If a part is loaded once to a stress near the yield stress, it will not break. However, if it is loaded repeatedly to this level, it will eventually break. This failure is called Fatigue, and avoiding fatigue is an important goal in the design of moving machinery. The more cycles a part will undergo, the lower the allowable stress it must be assigned in order to avoid failure by fatigue. Another type of failure observable at loads below the yield stress is called Creep. If a load is applied and left on the sample for months or years, the sample will slowly extend. In metals with high melting temperatures, creep becomes a problem at higher temperatures. It becomes a limiting consideration in gas turbines that operate at the highest temperature the metal parts can take. / Вильэм . Метод изобрёл в 1900 Шведский инженер, металлург Юхан Аугусти Бринэль (Johan Augusti Brinell; родился 21 Июня 1849 в Бриньгэтуфта (Bringetofta) – умер 17 Ноября 1925 в Стокгольме); данный метод стал первым широко используемым и стандартизированным методом определения твёрдости в материаловедении. тест по Шарпи (Charpy test). Тест по Шарпи ИСО 179 (АОИМ Ди.256 (ASTM D256)):- основным отличием методов Шарпи и Изода является способ установки испытуемого образца. При испытании по методу Шарпи образец не зажимают, а свободно устанавливают на опору в горизонтальном положении.

METALLURGY = МЕТАЛЛУРГИЯ – Metallurgy is the production of metals from raw materials such as ore concentrates, residues and recycling materials. Metallurgy is the art and science of extracting metals from their ores and modifying the metals for use. Metallurgy customarily refers to commercial as opposed to laboratory methods. It also concerns the chemical, physical, and atomic properties and structures of metals and the principles whereby metals are combined to form alloys. The present-day use of metals is the culmination of a long path of development extending over approximately 6 500 years. It is generally agreed that the first known metals were gold, silver, and copper, which occurred in the native or metallic state, of which the earliest were in all probability nuggets of gold found in the sands and gravels of riverbeds. Such native metals became known and were appreciated for their ornamental and utilitarian values during the latter part of the Stone Age. Gold can be agglomerated into larger pieces by cold hammering, but native copper cannot, and an essential step toward the Metal Age was the discovery that metals such as copper could be fashioned into shapes by melting and casting in molds; among the earliest known products of this type are copper axes cast in the Balkans in the 4th millennium BC. Another step was the discovery that metals could be recovered from metal-bearing minerals. These had been collected and could be distinguished on the basis of color, texture, weight, and flame color and smell when heated. The notably greater yield obtained by heating native copper with associated oxide minerals may have led to the smelting process, since these oxides are easily reduced to metal in a charcoal bed at temperatures in excess of 700 °C (1 300 °F), as the reductant, carbon monoxide, becomes increasingly stable. In order to effect the agglomeration and separation of melted or smelted copper from its associated minerals, it was necessary to introduce iron oxide as a flux. This further step forward can be attributed to the presence of iron oxide gossan minerals in the weathered upper zones of copper sulfide deposits. Bronze:- In many regions, copper-arsenic alloys, of superior properties to copper in both cast and wrought form, were produced in the next period. This may have been accidental at first, owing to the similarity in color and flame color between the bright green copper carbonate mineral malachite and the weathered products of such copper-arsenic sulfide minerals as enargite, and it may have been followed later by the purposeful selection of arsenic compounds based on their garlic odor when heated. Arsenic contents varied from 1 to 7 percent, with up to 3 percent tin. Essentially arsenic-free copper alloys with higher tin content – in other words, true bronze – seem to have appeared between 3000 and 2500 BC, beginning in the Tigris-Euphrates delta. The discovery of the value of tin may have occurred through the use of stannite, a mixed sulfide of copper, iron, and tin, although this mineral is not as widely available as the principal tin mineral, cassiterite, which must have been the eventual source of

the metal. Cassiterite is strikingly dense and occurs as pebbles in alluvial deposits together with arsenopyrite and gold; it also occurs to a degree in the iron oxide gossans mentioned above. While there may have been some independent development of bronze in varying localities, it is most likely that the bronze culture spread through trade and the migration of peoples from the Middle East to Egypt, Europe, and possibly China. In many civilizations the production of copper, arsenical copper, and tin bronze continued together for some time. The eventual disappearance of copper-arsenic alloys is difficult to explain. Production may have been based on minerals that were not widely available and became scarce, but the relative scarcity of tin minerals did not prevent a substantial trade in that metal over considerable distances. It may be that tin bronzes were eventually preferred owing to the chance of contracting arsenic poisoning from fumes produced by the oxidation of arsenic-containing minerals. As the weathered copper ores in given localities were worked out, the harder sulfide ores beneath were mined and smelted. The minerals involved, such as chalcopyrite, a copper-iron sulfide, needed an oxidizing roast to remove sulfur as sulfur dioxide and yield copper oxide. This not only required greater metallurgical skill but also oxidized the intimately associated iron, which, combined with the use of iron oxide fluxes and the stronger reducing conditions produced by improved smelting furnaces, led to higher iron contents in the bronze. Iron:- It is not possible to mark a sharp division between the Bronze Age and the Iron Age. Small pieces of iron would have been produced in copper smelting furnaces as iron oxide fluxes and iron-bearing copper sulfide ores were used. In addition, higher furnace temperatures would have created more strongly reducing conditions (that is to say, a higher carbon monoxide content in the furnace gases). An early piece of iron from a trackway in the province of Drenthe, Neth., has been dated from 1350 BC, a date normally taken as the Middle Bronze Age for this area. In Anatolia, on the other hand, iron was in use as early as 2000 BC. There are also occasional references to iron in even earlier periods, but this material was of meteoric origin. Once a relationship had been established between the new metal found in copper smelts and the ore added as flux, the operation of furnaces for the production of iron alone naturally followed. Certainly by 1400 BC in Anatolia, iron was assuming considerable importance, and by 1200–1000 BC it was being fashioned on quite a large scale into weapons, initially dagger blades. For this reason, 1200 BC has been taken as the beginning of the Iron Age. Evidence from excavations indicates that the art of iron making originated in the mountainous country to the south of the Black Sea, an area dominated by the Hittites. Later the art apparently spread to the Palestinians, for crude furnaces dating from 1200 BC have been unearthed at Gerar, together with a number of iron objects. Smelting of iron oxide with charcoal demanded a high temperature, and, since the melting temperature of iron at 1 540 °C (2 800 °F) was not attainable then, the product was merely a spongy mass of pasty globules of metal intermingled with a semiliquid slag. This product, later known as Bloom, was hardly usable as it stood, but repeated reheating and hot hammering eliminated much of the slag, creating wrought iron, a much better product. The properties of iron are much affected by the presence of small amounts of carbon, with large increases in strength associated with contents of less than 0.5 percent. At the temperatures then attainable – about 1 200 °C (2 200 °F) – reduction by charcoal produced an almost pure iron, which was soft and of limited use for weapons and tools, but when the ratio of fuel to ore was increased and furnace drafting improved with the invention of better bellows, more carbon was absorbed by the iron. This resulted in blooms and iron products with a range of carbon contents, making it difficult to determine the period in which iron may have been purposely strengthened by carburizing, or reheating the metal in contact with excess charcoal. Carbon-containing iron had the further great advantage that, unlike bronze and carbon-free iron, it could be made still harder by quenching, i.e. rapid cooling by immersion in water. There is no evidence for the use of this hardening process during the early Iron Age, so that it must have been either unknown then or not considered advantageous, in that quenching renders iron very brittle and has to be followed by tempering, or reheating at a lower temperature, to restore toughness. What seems to have been established early on was a practice of repeated cold forging and annealing at 600–700 °C (1 100–1 300 °F), a temperature naturally achieved in a simple fire. This practice is common in parts of Africa even today. By 1000 BC iron was beginning to be known in central Europe. Its use spread slowly westward; iron making was fairly widespread in Great Britain at the time of the Roman invasion in 55 BC. In Asia iron was also known in ancient times, in China by about 700 BC. Brass:- While some zinc appears in bronzes dating from the Bronze Age, this was almost certainly an accidental inclusion, although it may foreshadow the complex ternary alloys of the early Iron Age, in which substantial amounts of zinc as well as tin may be found. Brass, as an alloy of copper and zinc without tin, did not appear in Egypt until about 30 BC, but after this it was rapidly adopted throughout the Roman world, for example, for currency. It was made by the calamine process, in which zinc carbonate or zinc oxide were added to copper and melted under a charcoal cover in order to produce reducing conditions. The general establishment of a brass industry was one of the important metallurgical contributions made by the Romans. Precious Metals:- Bronze, iron, and brass were, then, the metallic materials on which successive peoples built their civilizations and of which they made their implements for both war and peace. In addition, by 500 BC, rich lead-bearing silver mines had opened in Greece. Reaching depths of several hundred meters, these mines were vented by drafts provided by fires lit at the bottom of the shafts. Ores were hand-sorted, crushed, and washed with streams of water to separate valuable minerals from the barren, lighter materials. Because these minerals were principally sulfides, they were roasted to form oxides and were then smelted to recover a lead-silver alloy. Lead was removed from the silver by cupellation, a process of great antiquity in which the alloy was melted in a shallow porous clay or bone-ash receptacle called a Cupel. A stream of air over the molten mass preferentially oxidized the lead. Its oxide was removed partially by skimming the molten surface; the remainder was absorbed into the porous cupel. Silver metal and any gold were retained on the cupel. The lead from the skimmings and discarded cupels was recovered as metal upon heating with charcoal. Native gold itself often contained quite considerable quantities of silver. These silver-gold alloys, known as Electrum, may be separated in a number of ways, but presumably the earliest was by heating in a crucible with common salt. In time and with repetitive treatments, the silver was converted into silver chloride, which passed into the molten slag, leaving a purified gold. Cupellation was also employed to remove from the gold such contaminates as copper, tin, and lead. Gold, silver, and lead were used for artistic and religious purposes, personal adornment, household utensils, and equipment for the chase. In the thousand years between 500 BC and AD 500, a vast number of discoveries of significance to the growth of metallurgy were made. The Greek mathematician and inventor Archimedes, for example, demonstrated that the purity of gold could be measured by determining its weight and the quantity of water displaced upon immersion – that is, by determining its density. In the pre-Christian portion of the period, the first important steel production was started in India, using a process already known to ancient Egyptians. Wootz steel, as it was called, was prepared as sponge (porous) iron in a unit not unlike a bloomery. The product was hammered while hot to expel slag, broken up, then sealed with wood chips in clay containers and heated until the pieces of iron absorbed carbon and melted, converting it to steel of homogeneous composition containing 1 to 1.6 percent carbon. The steel pieces could then be heated and forged to bars for later use in fashioning articles, such as the famous Damascus swords made by medieval Arab armourers. Arsenic, zinc, antimony, and nickel may well have been known from an early date but only in the alloy state. By 100 BC mercury was known and was produced by heating the sulfide mineral cinnabar and condensing the vapours. Its property of amalgamating (mixing or alloying) with various metals was employed for their recovery and refining. Lead was beaten into sheets and pipes, the pipes being used in early water systems. The metal tin was available and Romans had learned to use it to line food containers. Although the Romans made no extraordinary metallurgical discoveries, they were responsible for, in addition to the establishment of the brass industry, contributing toward improved organization and efficient administration in mining. Beginning about the VI century, and for the next thousand years, the most meaningful developments in metallurgy centred on iron making. Great Britain, where iron ore was plentiful, was an important iron-making region. Iron weapons, agricultural implements, domestic articles, and even personal adornments were made. Fine-quality

cutlery was made near Sheffield. Monasteries were often centres of learning of the arts of metalworking. Monks became well known for their iron making and bell founding, the products made either being utilized in the monasteries, disposed of locally, or sold to merchants for shipment to more distant markets. In 1408 the bishop of Durham established the first water-powered bloomery in Britain, with the power apparently operating the bellows. Once power of this sort became available, it could be applied to a range of operations and enable the hammering of larger blooms. In Spain, another iron-making region, the Catalan forge had been invented, and its use later spread to other areas. A hearth type of furnace, it was built of stone and was charged with iron ore, flux, and charcoal. The charcoal was kept ignited with air from a bellows blown through a bottom nozzle, or tuyere. The bloom that slowly collected at the bottom was removed and upon frequent reheating and forging was hammered into useful shapes. By the XIV century the furnace was greatly enlarged in height and capacity. If the fuel-to-ore ratio in such a furnace was kept high, and if the furnace reached temperatures sufficiently hot for substantial amounts of carbon to be absorbed into the iron, then the melting point of the metal would be lowered and the bloom would melt. This would dissolve even more carbon, producing a liquid cast iron of up to 4 percent carbon and with a relatively low melting temperature of 1 150 °C (2 100 °F). The cast iron would collect in the base of the furnace, which technically would be a blast furnace rather than a bloomery in that the iron would be withdrawn as a liquid rather than a solid lump. While the Iron Age peoples of Anatolia and Europe on occasion may have accidently made cast iron, which is chemically the same as blast-furnace iron, the Chinese were the first to realize its advantages. Although brittle and lacking the strength, toughness, and workability of steel, it was useful for making cast bowls and other vessels. In fact, the Chinese, whose Iron Age began about 500 BC, appear to have learned to oxidize the carbon from cast iron in order to produce steel or wrought iron indirectly, rather than through the direct method of starting from low-carbon iron. During the XVI century, metallurgical knowledge was recorded and made available. Two books were especially influential. One, by the Italian Vannoccio Biringuccio, was entitled De la pirotechnia (Eng. trans., The Pirotechnia of Vannoccio Biringuccio, 1943). The other, by the German Georgius Agricola, was entitled De re metallica. Biringuccio was essentially a metalworker, and his book dealt with smelting, refining, and assay methods (methods for determining the metal content of ores) and covered metal casting, molding, core making, and the production of such commodities as cannons and cast-iron cannonballs. His was the first methodical description of foundry practice. Agricola, on the other hand, was a miner and an extractive metallurgist; his book considered prospecting and surveying in addition to smelting, refining, and assay methods. He also described the processes used for crushing and concentrating the ore and then, in some detail, the methods of assaying to determine whether ores were worth mining and extracting. Some of the metallurgical practices he described are retained in principle today. / Итальянец Ванночио Биринуччио (Vannoccio Biringuccio). Под Металлургией, от Греческого слова Metallurgéō, означающее Добываю Руду или Обрабатываю Металлы, понимается область науки и техники и отрасль промышленности, охватывающие процессы получения металлов из руд и других материалов, а также процессы, сообщающие металлическим сплавам путём изменения их химического состава и строения (структуры) свойства, соответствующие назначению. К металлургии относятся:- процессы обработки руд с целью их подготовки к извлечению металлов (дробление, обогащение, окускование и прочее); процессы извлечения металлов из руд и других материалов; очистка металлов от нежелательных примесей (рафинирование); производство металлов и сплавов; термическая, химико-термическая и термомеханическая обработка металлов; обработка металлов давлением и литьём; покрытие в декоративных или защитных целях поверхности изделий из металла слоями другого металла и диффузионное внедрение в поверхностные слои металлических изделий других металлов и неметаллов. Металлургические процессы применяются также для производства неметаллических материалов, в том числе полупроводников. Металлургия включает также металловедение. Металлургия – одна из важнейших отраслей современной промышленности. Масштабы производства металлов (в первую очередь стали) характеризуют технико-экономический уровень развития страны. Различают пирометаллургию и гидрометаллургию.

METAL OXIDES = ОКСИДЫ МЕТАЛЛОВ (или ОКИСЛЫ МЕТАЛЛОВ) – Metal Oxides:- oxidized ferrous particles which are very old or have been recently produced by conditions of inadequate lubrication. Trend is important. / Окислы или Оксиды .

METALWORKING = ОБРАБОТКА МЕТАЛЛА – Metalworking:- Processes:- metals are important largely because they can be easily deformed into useful shapes. Literally hundreds of metalworking processes have been developed for specific applications, but these can be divided into five broad groups:- rolling, extrusion, drawing, forging, and sheet-metal forming. The first four processes subject a metal to large amounts of strain. However, if deformation occurs at a sufficiently high temperature, the metal will recrystallize – that is, its deformed grains will be consumed by the growth of a set of new, strain-free grains. For this reason, a metal is usually rolled, extruded, drawn, of forged above its recrystallization temperature. This is called Hot Working, and under these conditions there is virtually no limit to the compressive plastic strain to which the metal can be subjected. Other processes are performed below the recrystallization temperature. These are called Cold Working. Cold working hardens metal and makes the part stronger. However, there is a definite limit to the strain that can be put into a cold part before it cracks. (i) Rolling:- rolling is the most common metalworking process. More than 90 percent of the aluminum, steel, and copper produced is rolled at least once in the course of production – usually to take the metal from a cast ingot down to a sheet or bar. The most common rolled product is sheet. With high-speed computer control, it is common for several stands of rolls to be combined in series, with thick sheet entering the first stand and thin sheet being coiled from the last stand at linear speeds of more than 100 kilometers (60 miles) per hour. Similar multistand mills are used to form coils of wire rod from bars. Other rolling mills can press large bars from several sides to form I-beams or railroad rails. Rolling can be done either hot or cold. If the rolling is finished cold, the surface will be smoother and the product stronger. (ii) Extrusion:- extrusion converts a billet of metal into a length of uniform cross section by forcing the billet to flow through the orifice of a die. In forward extrusion the ram and the die are on opposite sides of the workpiece. Products may have either a simple or a complex cross section; examples of complex extrusions can be found in aluminum window frames. Tubes or other hollow parts can also be extruded. The initial piece is a thick-walled tube, and the extruded part is shaped between a die on the outside of the tube and a mandrel held on the inside. In impact extrusion (also called Back-Extrusion), the workpiece is placed in the bottom of a hole (the die), and a loosely fitting ram is pushed against it. The ram forces the metal to flow back around it, with the gap between the ram and the die determining the wall thickness. When toothpaste tubes were made of a lead alloy, they were formed by this process. (iii) Drawing:- drawing consists of pulling metal through a die. One type is wire drawing. The diameter reduction that can be achieved in such a die is limited, but several dies in series can be used to obtain the desired reduction. Deep drawing starts with a disk of metal and ends up with a cup by pushing the metal through a hole (die). Several drawing operations in sequence may be used for one part. Deep drawing is employed in making aluminum beverage cans and brass rifle cartridges from sheet. (iv) Sheet Metal Forming:- in stretch forming, the sheet is formed over a block while the workpiece is under tension. The metal is stretched just beyond its yield point (2 to 4 percent strain) in order to retain the new shape. Bending can be done by pressing between two dies. (Often a part can be made equally well by either stretch forming or bending; the choice then is made on the basis of cost.) Shearing is a cutting operation similar to that used for cloth. In these methods the thickness of the sheet changes little in processing. Each of these processes may be used alone, but often all three are used on one

part. For example, to make the roof of an automobile from a flat sheet, the edges are gripped and the piece pulled in tension over a lower die. Next a mating die is pressed over the top, finishing the forming operation, and finally the edges are sheared off to give the final dimensions. (v) Forging:- forging is the shaping of a piece of metal by pushing with open or closed dies. It is usually done hot in order to reduce the required force and increase the metal's plasticity. Open-die forging is usually done by hammering a part between two flat faces. It is used to make parts that are too big to be formed in a closed die or in cases where only a few parts are to be made and the cost of a die is therefore unjustified. The earliest forging machines lifted a large hammer that was then dropped on the work, but now air- or steam-driven hammers are used, since these allow greater control over the force and the rate of forming. The part is shaped by moving or turning it between blows. A forged ring can be formed by placing a mandrel through the ring and deforming the metal between the hammer and the mandrel. Rings also can be forged by rolling with one roll inside the ring and the other outside. Closed-die forging is the shaping of hot metal within the walls of two dies that come together to enclose the workpiece on all sides. The process starts with a rod or bar cut to the length needed to fill the die. Since large, complex shapes and large strains are involved, several dies may be used to go from the initial bar to the final shape. With closed dies, parts can be made to close tolerances so that little finish machining is required. Two closed-die forging operations given special names are upsetting and coining. Coining takes its name from the final stage of forming metal coins, where the desired imprint is formed on a smooth metal disk that is pressed in a closed die. Coining involves small strains and is done cold to enhance surface definition and smoothness. Upsetting involves a flow of the metal back upon itself. An example of this process is the pushing of a short length of a rod through a hole, clamping the rod, and then hitting the exposed length with a die to form the head of a nail or bolt. Metallurgy:- an important benefit of hot working is that it provides control over and improvement of mechanical properties. Hot-rolling or hot-forging eliminate much of the porosity, directionality, and segregation that may be present in cast shapes. The resulting 'wrought' product therefore has better ductility and toughness than the unworked casting. During the forging of a bar, the grains of the metal become greatly elongated in the direction of flow. As a result, the toughness of the metal is substantially improved in this direction and somewhat weakened in directions transverse to the flow. Part of the design of a good forging is to assure that the flow lines in the finished part are oriented so as to lie in the direction of maximum stress when the part is placed in service. The ability of a metal to resist thinning and fracture during cold-working operations plays an important role in alloy selection and process design. In operations that involve stretching, the best alloys are those which grow stronger with strain (strain harden) – for example, the copper-zinc alloy, brass, used for cartridges and the aluminum-magnesium alloys in beverage cans, which exhibit greater strain hardening than do pure copper or aluminum, respectively. Another useful property that can be controlled by processing and composition is the plastic anisotropy ratio. When a segment of sheet is strained (i.e. elongated) in one direction, the thickness and width of the segment must shrink, since the volume remains constant. In an isotropic sheet the thickness and width show equal strain, but, if the grains of the sheet are oriented properly, the thickness will shrink only about half as much as the width. Since it is thinning that leads to early fracture, this plastic anisotropy imparts better deep-drawing properties to sheet material with the optimum grain orientation. Fracture of the workpiece during forming can result from flaws in the metal; these often consist of nonmetallic inclusions such as oxides or sulfides that are trapped in the metal during refining. Such inclusions can be avoided by proper manufacturing procedures. Laps are another type of flaw in which part of a metal piece is inadvertently folded over on itself but the two sides of the fold are not completely welded together. If a force tending to open this fold is applied during the forming operation, the metal will fail at the lap. The ability of different metals to undergo strain varies appreciably. The shape change that can be made in one forming operation is often limited by the tensile ductility of the metal. Metals with the face-centred cubic crystal structure, such as copper and aluminum, are inherently more ductile in such operations than metals with the body-centred cubic structure. To avoid early fracture in the latter type of metals, processes are used that apply primarily compressive stresses rather than tensile stresses. / прокатка (rolling). METALWORKING LUBRICANT = СМАЗКА ДЛЯ (или ПРИ) ОБРАБОТКИ МЕТАЛЛОВ – Metalworking Lubricant is any lubricant, usually petroleum-based, that facilitates the cutting or shaping of metal. Basic types of metalworking lubricants are:- cutting and tapping fluids, drawing compounds, etc. See also Lubricant.

METAMERIC = МЕТАМЕРНОЕ – Metameric:- (1) pertaining to spectrally different objects or color stimuli that have the same tristimulus values. (2) Pertaining to objects, having different spectrophotometric curves that match when illuminated by at least one specific illuminant (viewing condition) and observed by a specific observer.

METAMERIC COLOR MATCH = МЕТАМЕРНАЯ ПОДГОНКА ЦВЕТА (или МЕТАМЕРНЫЙ ПОДБОР ЦВЕТА, или МЕТАМЕРНЫЙ ПОДБОР ОТТЕНКОВ) – Metameric Color Match is a color match between two materials in which the colors are identical under some lighting conditions but not under others. Metameric color matches are common when different pigments or dyestuffs are used to color the two materials.

METAMERISM = МЕТАМЕРИЗМ (или МЕТАМЕРИЯ) – Metamerism is a property of two specimens that match under a specified illuminator (illuminant) and to a specified observer and whose spectral reflectances or transmittances differ in the visible wavelengths and may appear to be a miss match under a second specified illuminant to the same specified observer. A Metamerism occurs when the color standard and the submit do not match under all lighting conditions. This means that a solid color fabric when viewed under two different lights in a commercial light box, will appear to cast two different colors. The correct technical definition for metamerism is a conditional match that is, two or more samples match for one observer under one light source, but not under a different light source for that same observer. / Под Метамерией, от Греческих слов Metá, означающее Между или После или Через, и Méros, означающее Доля или Часть, понимается расчленение тела у некоторых групп организмов на ряд последовательно расположенных участков – метамеров, в которых в той или иной степени повторяются системы органов. У животных наиболее полная метамерия, затрагивающая целом, называется сегментацией. Метамерия (в биологии), сегментация, расчленение тела многих двусторонне-симметричных животных на повторяющиеся более или менее сходные части – метамеры (сегменты), расположенные последовательно вдоль продольной оси тела. Для паразитических Ленточных Червей характерна метамерия в форме стробиляции – тело лентеца состоит из одинаковых по строению члеников – проглоттид, почкующихся в головном конце (в области шейки) паразита и образующих цепочку – стробилу. Метамерия может быть только наружной (псевдометамерия) или затрагивать и внутренние органы (истинная метамерия). Истинная метамерия бывает полной, когда она охватывает весь организм, и неполной, когда она распространяется лишь на некоторые системы его органов, например, дерматомеры (кожные метамеры), миомеры (мышечные), склеромеры (скелетные), нейромеры (нервные метамеры). Различают (i) гомономную метамерию, когда все метамеры тела сходны по строению, выполняют одинаковые функции и несут одинаковые конечности, и (ii) гетерономную метамерию, когда метамеры, сохраняющие в основном общий план строения, в разных направлениях дифференцируются и внешне становятся несходными, несут разные конечности или частично теряют

их. Полная метамерия свойственна Кольчатым Червям и Членистоногим (у последних метамеры, сливаясь в комплексы, образуют голову, грудь, брюшко). У Хордовых Животных метамерия проявляется в строении скелета, а также мускулатуры, нервной системы, кожных образований, кровеносной системы, органов выделения и так далее. У большинства Позвоночных Животных и у Человека метамерия отчётливо выражена на ранних стадиях зародышевого развития. У взрослого человека черты метамерии сохранились в скелете позвоночника, в спинномозговых рефлекторных центрах и корешках спинномозговых нервов, а также в правильном чередовании рёбер, межрёберных мышц и нервов. Метамерия (в химии), частный случай изомерии, связанный с положением гетероатома в цепи алифатических соединений. Метамерны, например, метилпропиловый эфир $CH_3OCH_2CH_2CH_3$ и диэтиловый эфир $CH_3CH_2OCH_2CH_3$. Термин Метамерия был предложен Шведским химиком и минералогом Бароном Йонсом Якобом Бэшэлиосом (или Берцелиусом; Baron Jöns Jacob Berzelius; 1779–1848) в 1830 и в настоящее время практически не применяется.

METAP WEAVE–KNIT PROCESS = ХХ ПРОЦЕСС ТКАЧЕСТВА–ВЯЗКИ – Metap Weave-Knit Process is a technique combining weaving and knitting in one operation with two independent yarn systems wound on warp beams. In the fabrics produced, woven strips are linked together with wales of stitches. Generally, the fabrics have 75–85% woven and 25–15% knitted structure.

METER = МЕТР – Meter, also spelled Metre (in the European Union) in measurement, fundamental unit of length in the Metric System and in the International System of Units (SI). It is equal to approximately 39.37 inches in the British Imperial and United States Customary systems. The metre was historically defined by the French Academy of Sciences in 1791 as 1/10 000 000 of the quadrant of the Earth's circumference running from the North Pole through Paris to the equator. The International Bureau of Weights and Measures in 1889 established the international prototype metre as the distance between two lines on a standard bar of 90 percent platinum and 10 percent iridium. By 1960 advances in the techniques of measuring light waves had made it possible to establish an accurate and easily reproducible standard independent of any physical artifact. In 1960 the metre was thus defined in the SI system as equal to 1 650 763.73 wavelengths of the orange-red line in the spectrum of the krypton-86 atom in a vacuum. By the 1980s, advances in laser measurement techniques had yielded values for the speed of light in a vacuum of an unprecedented accuracy, and it was decided in 1983 by the General Conference on Weights and Measures that the accepted value for this constant would be exactly 299 792 458 metres per second. The metre is now thus defined as the distance traveled by light in a vacuum in 1/299 792 458 of a second. The Metre is the length of the path travelled by light in vacuum during a time interval of 1/299 792 458 of a second. Meter or Metre is the metric and SI base unit of distance. Originally, the meter was designed to be one ten-millionth of a quadrant, the distance between the Equator and the North Pole. The Earth is difficult to measure, and a small error was made in correcting for the flattening caused by the Earth's rotation. As a result, the meter is too short by about 0.013%. That's not bad for a measurement made in the 1790's. For a long time, the meter was precisely defined as the length of an actual object, a bar kept at the International Bureau of Weights and Measures in Paris. In recent years, however, the SI base units (with one exception) have been redefined in abstract terms so they can be reproduced to any desired level of accuracy in a well-equipped laboratory. The 17th General Conference on Weights and Measures in 1983 defined the meter as that distance that makes the speed of light in a vacuum equal to exactly 299 792 458 meters per second. The speed of light in a vacuum, c, is one of the fundamental constants of nature. Since c defines the meter now, experiments made to measure the speed of light are now interpreted as measurements of the meter instead. The meter is equal to approximately 1.093 613 3 yards, 3.280 840 feet, or 39.370 079 inches. Its name comes from the Latin metrum and the Greek metron, both meaning measure. The unit is spelled Meter in the United States and Metre in Britain; there are many other spellings in various languages. / Обычной Системе Мер США. Под Метром, от Французского слова Mètre и от Греческого слова Métron, означающее Мера, понимается основная единица длины в Международной Системе Единиц СИ. Обозначение:- м. Эта мера длины воспроизводит единицу длины – метр. Согласно определению, принятому 17-й Генеральной Конференцией по Мерам и Весам в 1983, метр – длина пути, проходимого светом в вакууме за 1/299 792 458 долю секунды. С 1960 по 1983 метр определяли как длину, равную 1 650 763.73 длины волны в вакууме излучения, соответствующего переходу между уровнями $2p_{10}$ и $5d_5$ атома ^{86}Kr. До 1960 международным прототипом метра служил эталон в виде штриховой меры длины – бруса Х-образного сечения из сплава Pt-Ir (Платины (90%) и Иридия (10%)) с нанесёнными на одной из его плоскостей штрихами. Этот брус хранится в Международном Бюро Мер и Весов в Севре близ Парижа, Франция. Первоначально, во Франции в 1791, метр был определён как $1 \cdot 10^{-7}$ часть 1/4 длины земного меридиана.

METERING DEVICE = ДОЗАТОР (или ОТМЕРИВАЮЩЕЕ УСТРОЙСТВО, или ДОЗИРУЮЩЕЕ УСТРОЙСТВО) – Metering Device (seed) is the part of a seeder or planter that controls the amount (volume or number) of seeds to be deposited along the row or in a hill. / часть сеялки (seeder) или сеялки точного высева (planter). Под Дозатором, понимается устройство для автоматического отмеривания (дозирование) заданных массы или объёма жидких или сыпучих материалов. Различают дозаторы объёмные, весовые; периодического и непрерывного действия.

METERING PUMP = ДОЗИРУЮЩИЙ НАСОС (или ПРЯДИЛЬНЫЙ НАСОСИК) – Metering Pump is a positive displacement device that pumps a measured amount of polymer solution to the spinnerets. / Прядильный Насосик прядильной машины для искусственного волокна.

METHANE = МЕТАН – Methane, also called Marsh Gas, is a colorless, odorless gas that occurs abundantly in nature as the chief constituent of natural gas, as a component of firedamp in coal mines, and as a product of the anaerobic bacterial decomposition of vegetable matter under water (hence its alternate name, marsh gas). Methane also is produced industrially by the destructive distillation of bituminous coal in the manufacture of coal gas and coke-oven gas. The decomposition of sludge by anaerobic bacteria in sewage-treatment processes also produces a gas rich in methane. Methane is the simplest member of the paraffin series of hydrocarbons. Its chemical formula is CH_4. It is lighter than air, having a specific gravity of 0.554. It is only slightly soluble in water. It burns readily in air, forming carbon dioxide and water vapor; the flame is pale, slightly luminous, and very hot. The boiling point of methane is –162.0 °C (–259.6 °F) and the melting point is –182.5 °C (–296.5 °F). Methane in general is very stable, but mixtures of methane and air, with the methane content between 5 and 14 percent by volume, are explosive. Explosions of such mixtures have been frequent in coal mines and collieries and have been the cause of many mine disasters. The chief source of methane is natural gas, which contains from 50 to 90 percent methane, depending on the source. Methane produced by the destructive distillation of bituminous coal and by coal carbonization is important in locations where natural gas is not plentiful. Since commercial natural gas is composed largely of methane, their uses may for all practical purposes be considered identical. Because of its abundance, low cost, ease of handling, and cleanliness, such gas is widely used as a fuel in homes, commercial establishments, and factories. Methane is an important source of hydrogen and some organic chemicals. Methane reacts with steam at high temperatures to yield carbon monoxide and hydrogen; the latter is used in the manufacture of ammonia for fertilizers and explosives. Other valuable chemicals derived from methane include methanol, chloroform, carbon tetrachloride, and nitromethane. The incomplete combustion of methane yields carbon black, which is widely used as a reinforcing agent in rubber used for automobile tires. / Метан (от метил и –ан – суффикс, употребляемый для образования названий насыщенных углеводородов), CH_4, бесцветный газ, $t_{кип}$ 161.6 (164.5) °C. Метан является основным компонентом природных (77–99%), попутных нефтяных (31–90%), рудничного и болотного газов.

Метан содержится в газах нефтепереработки, образуется при газификации твёрдых топлив. Он горит бесцветным пламенем, образует взрывоопасные смеси с воздухом. Метан является сырьём для получения многих ценных продуктов химической промышленности – ацетилена, сажи, сероуглерода, синильной кислоты, технического углерода, формальдегида, хлороформа и других веществ. Метан применяется как топливо. Известен также как Болотный Газ.

METHENAMINE PILL TEST = ТЕСТ НА ТАБЛЕТКУ МЕТЕНАМИНА (или УРОТРОПИНА) – Methenamine Pill Test:- since 1971, the Flammability Fabrics Act has and continues to require that all machine made carpet made of synthetic or natural fibers pass the Methenamine Pill Test, ASTM D 2859-96, Standard for Surface Flammability of Carpets and Rugs of the Consumer Product Safety Commission. FF 1-70 requirements pertain to carpet larger than 24 square feet in size. FF 2-70 pertains to carpet and rug less than 24 square feet in size. The test method and acceptance criteria for both carpets and rugs, machine-made, which are substantially alike in all other aspects of construction and constructional units, including gauge, stitch rate, pile thickness, yarn twist, pile height, primary and secondary back materials, back coat and laminate are the same. The Pill Test was selected as the flammability test standard because it demonstrates that a carpet will self-extinguish when exposed to a small incendiary source of fire, such as a lighted cigarette, match, or a burning ember from a fireplace. Small sources of fires have shown to be the leading cause of most fires. Studies of fires have also shown that carpet will not likely become involved in a fire until a room reaches flashover (the point in which a room becomes fully involved in a fire). In addition to this, fire experts agree that minimizing a threat from a fire requires that the fire be suppressed while it is still small. The Pill Test relies on the use of a solid white organic compound Hexamine (known also as Hexamethylentramine and Methenamine) tablet (i.e. 'pill') approximately the same size as a typical aspirin that is used to replicate the source of a fire the size of a lighted cigarette, a match or a fireplace ember. The carpet test specimen (the sample) is first placed in an oven to remove any moisture that may be present. Next, the sample is cut to a 9" x 9" size, and the pill is placed in the center of the sample. The pill is then ignited by a match and allowed to burn for two minutes. If the charred area of the sample extends beyond 3 inches the sample fails. If more than one out of the required eight tested samples fails in this same manner, that carpet cannot be sold in the United States. Effective November 12, 2008, all carpet manufacturers in the US are now required to comply with The Consumer Product Safety Improvement (CPSI) Act of 2008. According to this Act, carpet manufacturers are now required to provide a CPSI Certification of Compliance to their dealers with each carpet shipment, and to make Pill Test documents readily available to the Consumer Product Safety Commission upon their request. See also Flammability Tests. Methenamine Pill Test simulates a carpet exposed to a limited source of ignition – a glowing ember, burning match, or cigarette. If the carpet does not support or propagate the flarne, the fire would likely be a Stage 1 fire. Methenamine Pill Test is a test for the flame resistance of carpets or rugs in which a methenamine tablet is ignited on a test sample under controlled conditions and the size of the burn hole is measured. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Смотрите также Тесты На Воспламеняемость (Flammability Tests).

METHYLATION = МЕТИЛЯЦИЯ – Methylation is the enzymatic addition of methyl (CH_3) group to DNA which causes inactivation of that region. Usually CpG nucleotide pairs are target for this addition.

METHYL TERTIARY BUTYL ETHER = ТРИМЕТИЛ БУТИЛОВЫЙ ЭФИР (или ЭФИР ТРИМЕТИЛКАРБИНОЛА) – Methyl Tertiary Butyl Ether (MTBE) is a chemical gasoline additive that can be used to boost the octane number and oxygen content of the fuel, but can render contaminated water undrinkable. $(CH_3)_3COCH_3$ – an ether-based used for gasoline blending (high octane), in particular in the United States, where a minimum oxygen content has been mandated for reformulated and oxygenated gasoline. Methyl Tertiary Butyl Ether (MTBE) is a chemical compound that is manufactured by the chemical reaction of methanol and isobutylene. MTBE is produced in very large quantities (over 200 000 barrels per day in the United States in 1999) and is almost exclusively used as a fuel additive in motor gasoline. It is one of a group of chemicals commonly known as Oxygenates because they raise the oxygen content of gasoline. At room temperature, MTBE is a volatile, flammable and colorless liquid that dissolves rather easily in water. Gasoline with MTBE is being removed in the United States in favor of ethanol after MTBE was found to contaminate water. Ethanol can't be mixed into the fuel during refining. Adding the ethanol at distribution centers before it is sent to service stations can create some supply bottlenecks. Refiners are phasing out MBTE before provisions of the Energy Policy Act of 2005 take effect in May 2006.

MÉTIER = СТАНОК (или МЕТИЕ) – Métier is a spinning machine for producing manufactured fibers. The bank of cells or compartments and associated equipment used in the dry spinning of fibers, such as cellulose acetate and cellulose triacetate. / ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate). в переводе с Французского языка – Станок.

MÉTIER TWIST = СТАНОЧНАЯ КРУТКА – Métier Twist is the amount of twist present in yarn wound at the métier.

MET LIMITED = МЭТ ЛИМИТИД – MeT Limited is a company founded to establish a framework for secure mobile transactions, ensuring a consistent user experience independent of device, service and network. Mobile electronic Transactions Limited (MeT Limited or MeT Ltd) is a company founded to establish a framework for secure mobile transactions, ensuring a consistent user experience independent of device, service and network. MeT Ltd is to further strengthen the framework for secure mobile transactions – the ability to buy goods and services using a mobile device. MeT Limited sponsors are Ericsson, NEC, Nokia, Panasonic, Siemens and Sony Ericsson and currently there are about 50 Associate members. Headquartered in London, The United Kingdom.

METRIC COTTON COUNT = МЕТРИЧЕСКИЙ НОМЕР ХЛОПКОВОЙ ПРЯЖИ – Metric Cotton Count is an indirect system measuring length per unit of mass, i.e. the number of kilometers per 1/2 kilogram. / Косвенная система, измеряющая соотношение длины с единицей массы, то есть количество километров на пол килограмма.

METRIC COUNT = МЕТРИЧЕСКИЙ НОМЕР – Metric Cotton Count is the number of kilometers per kilogram of yarn. / Метрический Номер пряжи отражает число километровых мотков в одном килограмме.

METRIC SYSTEM = МЕТРИЧЕСКАЯ СИСТЕМА – Metric Sytem is international decimal system of weights and measures, based on the metre (meter) for length and the kilogram for mass, that was adopted in France in 1795 and is now used officially in almost all countries. The French Revolution of 1789 provided an opportunity to pursue the frequently discussed idea of replacing the confusing welter of thousands of traditional units of measure with a rational system based on multiples of 10. In 1791 the French National Assembly directed the French Academy of Sciences to address the chaotic state of French weights and measures. It was decided that the new system would be based on a natural physical unit to ensure immutability. The academy settled on the length of 1/10 000 000 of a quadrant of a great circle of the Earth, measured around the poles of the meridian passing through Paris. An arduous six-year survey led by such luminaries as Jean Delambre, Jacques-Dominique Cassini, Pierre Mechain, Adrien-Marie Legendre, and others to determine the arc of the meridian from Barcelona, Spain, to Dunkirk, France, eventually yielded a value of 39.370 08 inches for the new unit to be called the Metre, from Greek Metron, meaning 'Measure'. By 1795 all metric units were derived from the metre, including the gram for weight (one cubic centimetre of water at its maximum density) and the liter for capacity (1/1 000 of a cubic meter). Greek prefixes were established for multiples of 10, myria (10 000), kilo (1 000), hecto (100), and deca (10), while Latin prefixes were selected for the submultiples, milli (0.001), centi (0.01), and deci (0.1). Thus, a kilogram equals 1 000 grams, a millimetre 1/1 000 of a metre. In

1799 the Metre and Kilogram of the Archives, platinum embodiments of the new units, were declared the legal standards for all measurements in France, and the motto of the metric system expressed the hope that the new units would be 'for all people, for all time'. Not until 1875 did an international conference meet in Paris to establish an International Bureau of Weights and Measures. The Treaty of the Metre signed there provided for a permanent laboratory in Sèvres, near Paris, France, where international standards are kept, national standard copies inspected, and metrological research conducted. The General Conference of Weights and Measures, with diplomatic representatives of some 40 countries, meets every six years to consider reform. The conference selects 18 scientists who form the International Committee of Weights and Measures that governs the bureau. For a time, the international prototype metre and kilogram were based, for convenience, on the archive standards rather than directly on actual measurement of the Earth. Definition by natural constants was readopted in 1960, when the metre was redefined as 1 650 763.73 wavelengths of the orange-red line in the krypton-86 spectrum, and again in 1983, when it was redefined as the distance traveled by light in a vacuum in 1/299 792 458 second. The kilogram is still defined as the mass of the international prototype at Sèvres. In the XX century the metric system generated derived systems needed in science and technology to express physical properties more complicated than simple length, weight, and volume. The centimetre-gram-second (CGS) and the metre-kilogram-second (MKS) systems were the chief systems so used until the establishment of the International System of Units. Metric System (of measurement):- in general terms, a system that is internationally consistent, and is based on units that are related to others by powers of ten (for example, a milliliter is 1/1000 of a liter). The international consistency of this system and the general ease of calculations makes it vastly superior to systems with pounds and quarts and feet, etc, which define different quantities in different countries. Also see SI. / такие светила как, Жан Дэлямбр (Jean Delambre), Жак-Доминик Кассини (Jacques-Dominique Cassini), Пьер Мёшэн (Pierre Mechain), Адриан-Мари Лежандр (Adrien-Marie Legendre), и другие. Международная Метрическая Конвенция была подписана в Париже, Франция 20 Мая 1875 17-ю государствами, в том числе Россией. Конвенция преследовала обеспечение международного единства измерений и усовершенствования метрической системы мер. Метрическая Система Мер (МСМ) – система мер, основанная на двух единицах:- метре (м) – единице длины и килограмме (кг) – единице массы. МСМ возникла во Франции в конце XIX века, в период Великой Французской революции. В 1875 в Париже 17 государствами, в том числе и Россией, была подписана Метрическая Конвенция для обеспечения международного единства и усовершенствования МСМ и создана международная организация мер и весов (один из её органов – Генеральная Конференция по Мерам и Весам). МСМ, исходя из потребностей практики, включала лишь единицы длины (метр, равный десятимиллионной части 1/4 длины Парижского географического меридиана), площади (ар, равный площади квадрата со стороной 10 м), объёма (стер, равный объёму куба с ребром 1 м), вместимости для жидких и сыпучих тел (литр, равный объёму куба с ребром 0.1 м), массы (грамм – масса воды, заполняющей при 0 °С куб с ребром, равным 0.01 м). Десятичные приставки к этим единицам – мира (10^4 – давно не применяется), кило, гекто, дека, деци, санти и мили – обеспечили образование десятичных кратных и дольных единиц. МСМ действует в большинстве государств мира. Развитие науки и техники вызвало необходимость установления единиц для ряда других физических величин, в первую очередь для электрических и магнитных. В процессе развития МСМ были созданы охватывающие широкие области науки и техники отраслевые метрические системы единиц для механических величин (МКС, СГС, МТС, МКГСС), для электрических и магнитных величин (МКСА, СГС и другие), для тепловых величин (МКСГ), для акустических величин (МКС, СГС) и световых величин (МСС) и введены в употребление не связанные между собой внесистемные единицы. На базе отраслевых систем МКС, МКСА, МКСГ и МСС разработана универсальная для всех отраслей науки и техники Международная Система Единиц (СИ), утверждённая XI Генеральной Конференцией по Мерам и Весам в Париже, Франция в Октябре 1960. Метрическая Система Мер (десятичная система мер) является системой единиц физических величин, в основу которой положена единица длины метр. Кратные и дольные единицы Метрической Системы Мер находятся в десятичных соотношениях. На основе этой системы была создана Международная Система Единиц, охватывающая все области измерений.

METRIC TON = МЕТРИЧЕСКАЯ ТОННА – Metric Ton or Metric Tonne is an alternate name for the tonne. In the United States, the Department of Commerce recommends that the tonne be called the Metric Ton to distinguish it clearly from the traditional American ton. The proper symbol for the unit is simply T. Metric Ton (equivalent to 2 204.623 pounds (lb) or 35.314 cft). or 1 000 kilograms. A metric unit of mass, equal to 1 000 kilograms, or approximately 2 204.623 pounds avoirdupois. This metric ton is a bit smaller than the British Long Ton. The metric ton is now known officially as the Tonne. Unit of weight measurement:- 1 000 kilograms (metric ton) or 2 240 lb (long ton). See also Long Ton, Short Ton, Ton, and Tonne. International System of Units (Le Système International d'Unités (SI)). A Metric Tonne or ton is a unit of mass equal to 1 000 kg or approximately the mass of one cubic meter of water at four degrees Celsius. 1 Metric ton = 1 000 kg = 2 204.623 lb. / Лё Систэм Этэрнасьёналь д'Юните (Эс.И. или, как её уже устоялось называть в России, СИ).

METROPOLITAN AREA = МЭТРОПОЛИТЭННЫЙ АРЕАЛ – In the United States, the general concept of a Metropolitan Area (MA) is one of a large population nucleus, together with adjacent communities that have a high degree of economic and social integration with that nucleus. Some MAs are defined around two or more nuclei. The MAs and the central cities within an MA are designated and defined by the federal Office of Management and Budget, following a set of official standards that are published in a Federal Register Notice. These standards were developed by the interagency Federal Executive Committee on Metropolitan Areas, with the aim of producing definitions that are as consistent as possible for all MAs nationwide. Each MA must contain either a place with a minimum population of 50 000 or a US Census Bureau-defined urbanized area and a total MA population of at least 100 000 (75 000 in New England). An MA contains one or more central counties. An MA also may include one or more outlying counties that have close economic and social relationships with the central county. An outlying county must have a specified level of commuting to the central counties and also must meet certain standards regarding metropolitan character, such as population density, urban population, and population growth. In New England, MAs consist of groupings of cities and county subdivisions (mostly towns) rather than whole counties. The territory, population, and housing units in MAs are referred to as 'Metropolitan'. The metropolitan category is subdivided into 'inside central city' and 'outside central city'. The territory, population, and housing units located outside territory designated 'Metropolitan' are referred to as 'Nonmetropolitan'. The metropolitan and nonmetropolitan classification cuts across the other hierarchies; for example, generally there are both urban and rural territory within both metropolitan and nonmetropolitan areas. To meet the needs of various users, the standards provide for a flexible structure of metropolitan definitions that classify each MA either as a metropolitan statistical area (MSA) or as a consolidated metropolitan statistical area divided into primary metropolitan statistical areas. In New England, there also is an alternative county-based definition of MSAs known as the New England County Metropolitan Areas. Documentation of the MA standards and how they are applied is available from the Population Distribution Branch, Population Division, US Census Bureau, Washington, DC 20233-8800, telephone +1-301-4572419. / Мэтрополитэнский Ареал – территориальная единица, выделяемая в США для обозначения крупного города, взятого вместе с пригородным окружением. Наиболее близкий к термин в России – городская агломерация. Главный критерий выделения – наличие центрального города с населением не менее 50 000 человек или урбанизированного ареала с таким же населением, но при общей людности не менее 100 000 человек.

MEZZANINE CAPITAL = МЕЗОНИННЫЙ КАПИТАЛ – Mezzanine Capital is a heading for a variety of hybrid financing instruments that are between pure equity capital and pure debt capital. Mezzanine capital financings have a great deal of flexibility regarding their features and can therefore be adjusted to the individual requirements of those seeking capital. This means that mezzanine capital financing instruments can be constructed as both equity and debt mezzanine capital. Equity mezzanine capital includes mezzanine financings that place the provider of capital in a position similar to that of a shareholder, primarily through dormant participations or participatory rights. Debt mezzanine capital comprises corresponding financings that place the provider of capital in a position similar to that of a lender, primarily through subordinated loans. / От Итальянского слова Mezzanino, означающее Надстройка, .

MFA = MULTI–FIBRE ARRANGEMENT

MFI = MONETARY FINANCIAL INSTITUTION

MFI = MONEY FLOW INDEX

MFN = MOST FAVORED NATION

MG = MADAGASCAR

MGE = MGEX

MGEX = THE MINNEAPOLIS GRAIN EXCHANGE, INC.

MGF = MALAGASY FRANC

MGM = MILLIGRAM

MGR = MAGNOPORTHE GRISSA REPEAT

MH = MAJOR PEDOLOGICAL HORIZON

MH = MARSHALL ISLANDS

MH = MERCHANT HAULAGE

MHA = MILLION HECTARES

MHA = MOBILE HUMID ACID

MHE = MINISTRY OF HIGHER EDUCATION

MHR = MEMBER OF THE UNITED STATES HOUSE OF REPRESENTATIVES

MHS = MANUFACTURED HOUSING SECURITIES

MIA = MARINE INSURANCE ACT

MIB = MARINE INDEX BUREAU

MIBANT = MORGAN IMPACT BEND ANGLE NAIL TESTER

MIBANT ANGLE = УГОЛ XX – MIBANT Angle is the bend angle in a fastener shank when subjected to a MIBANT (Morgan Impact Bend Angle Nail Tester) test. / Моргэн .

MIBANT TEST = ИСПЫТАНИЕ XX – MIBANT Test (Morgan Impact Bend Angle Nail Tester):- standard impact nail tester used in the pallet and lumber industry as an indication of impact bend resistance of nails or staples. / Моргэн.

MICR = MAGNETIC INK CHARACTER RECOGNITION

MICRO = МИКРО – Micro:- millionth. / Под Микро... или Микр..., от Греческого слова Mikrósб означающее Маленький или Малый, понимается:- (1) составная часть сложных слов, указывающая (в противоположность макро...) на малые размеры или малую величину чего-либо (например, микроклимат, микролит, микроорганизмы); или (2) приставка для образования наименований дольных единиц, по размеру равных одной миллионной доле исходных единиц. Обозначения:- Русское мк, международное m. Пример:- 1 мксек (микросекунда) = 10^{-6} сек.

MICROBE = МИКРОБ – Microbe is synonymous with microorganism. Very small living organism. / Под Микроорганизмами или Микробами понимаются мельчайшие, преимущественно одноклеточные организмы, видимые только в микроскоп:- Бактерии, микроскопические Грибы и Водоросли, Простейшие (Protozoan). Иногда к микроорганизмам относят Вирусы. Характеризуются огромным разнообразием видов, способных существовать в различных условиях (горячие источники, дно океана, снега гор и так далее). Играют большую роль в кругообороте веществ в природе. Используются в пищевой и микробиологической промышленности (виноделие, хлебопечение, производство антибиотиков, витаминов, аминокислот, белка и другого), генной инженерии. Патогенные микроорганизмы вызывают болезни растений, животных и человека.

MICROBIAL ACTIVITY = МИКРОБНАЯ АКТИВНОСТЬ (или МИКРОБНАЯ ДЕЯТЕЛЬНОСТЬ) – Microbial Activity is the action of soil microbes in degrading herbicides.

MICROBIOTA = МИКРОБИОТА – Microbiota:- microflora and microfauna. / Под Микробиотой понимается Род Растений Семейства Кипарисовых. Один реликтовый Вид, в бывшем Союзе Советских Социалистических Республик (СССР). Вечнозелёный Кустарник. Растёт в поясе высокогорных хвойных лесов, реже на гольцах Сихотэ-Алиня. Был занесён в Красную Книгу бывшего СССР.

MICRO–BRIDGE = МИКРО–МОСТ (или МАЛЫЙ ПУТЬ, или МАЛЫЙ УЧАСТОК, или МАЛЕНЬКИЙ ОТРЕЗОК) – Microbridge is a system of through rates and service offered by a carrier for cargo shipments from any inland US location to a port by sea, to a foreign port, and finally overland to foreign inland destination. Cargo moving on one bill of lading from a foreign port to an inland destination. Micro-Bridge:- a cargo movement in which the water carrier provides a through service between an inland point and the port of load/discharge. The carrier is responsible for cargo and costs from origin on to destination. Also known as IPI, or Through Service. Cargo moves via land from/to inland point; another term for Inland Points Intermodal (IPI). / и портом погрузки/разгрузки.

MICROCAP STOCK = ДОЛЯ (или АКЦИЯ) МИКРОКАП – Microcap Stock is a stock with a relatively small market capitalization. In the USA, this can mean companies with market caps of less than USD100 million. In Canada, the cut-off is lower and generally means companies valued well under CAD50 million.

MICROCARPA = МЕЛКОПЛОДНОЕ – Microcarpa:- with small fruits. / , от Греческого слова Mikrós, означающее Малый, .

MICROCLIMATE = МИКРОКЛИМАТ – (1) Microclimate is a climatic condition in a relatively small area, within a few feet above and below the Earth's surface and within canopies of vegetation. Microclimates are affected by such factors as temperature, humidity, wind and turbulence, dew, frost, heat balance, evaporation, the nature of the soil and vegetation, the local topography, latitude, elevation, and season. Weather and climate are sometimes influenced by microclimatic conditions, especially by variations in surface characteristics. Microclimate is the climatic condition of a small area, such as a ricefield, resulting from the modification of the general climatic conditions by local differences in elevation or exposure. Also the environmental conditions below the crop canopy. / Микроклимат – совокупность физических параметров воздушной среды (температуры, относительной влажности, скорости и направления ветра, условий инсоляции и так далее) на небольших открытых или закрытых пространствах (до десятков и сотен метров в поперечнике). Микроклимат Помещений зависит от солнечной радиации, ограждающих конструкций, кондиционирования воздуха, отопления и вентиляции, озеленения прилегающей территории и тому подобного. Оптимальные параметры микроклимата обеспечивают наиболее эффективные условия труда и отдыха людей. Микроклимат Населённых Мест складывается в результате изменений климатических условий, происходящих под влиянием застройки территории, её благоустройства, озеленения и тому подобного. Климат приземного слоя воздуха небольшой территории (опушки леса, поля, площади города и тому подобного).

(2) Microclimate is the climate of a small, specific place within an area as contrasted with the climate of the entire area. / Микроклимат:- искусственно создаваемые климатические условия в закрытых помещениях, например, в жилище, для защиты от неблагоприятных внешних воздействий и создания зоны комфорта.

(3) Microclimate is the temperature and humidity of the space between your skin and the base layer of clothing.

MICRODENIER = МИКРОДЕНЬЕ – Microdeniers:- one of the most important developments in spinning man- made fibers is the technology of microdeniers where continuous filament fibers emerge from a spinnerette less than one denier per filament in weight. This makes polyester, nylon, acrylic, or rayon, thinner than a silk-worm's web, which is one denier per filament. by comparison, a human hair is generally 2 to 4 deniers per filament. These superfine fibers have made a striking impact on fashion around the world in dress, sportswear, intimate apparel and activewear fabrics. A term Microdenier refers to fibers having less than 1 denier per filament or 0.1 tex per filament. / Найлан^{T3} (Nylon^{TM}).

MICROECONOMICS = МИКРОЭКОНОМИКА – Microeconomics:- the subdivision of the discipline of economics that studies the behavior of individual households and firms interacting through markets, how prices and levels of output of individual products are determined in these markets, the interconnections by which different markets affect each other, and how the price mechanism allocates resources and distributes income. Microeconomics is the study of economics in terms of individual areas of activity (as a firm, household or prices). Study of the individual components of an economy in isolation. Microeconomics examines the choices open to specific people, companies and industries and has been developed to enable the study of subjects such as utility, price mechanisms, competition and margins. Microeconomics is the study of the allocation of resources and distribution of income and how they are affected by government policies. It refers to the behavior and decision-making of individuals and firms as opposed to that of countries or governments. Analysis of the economic behavior of individual units, such as consumers, sectors, firms or products. Production, consumption, investment, savings, etc are analyzed as a function of certain laws that govern the economic activity of the unit in isolation. See also Macroeconomics. / Микроэкономическими Моделями являются экономические математические модели, отражающие развитие экономики в целом или отдельных её частей и имеющие в качестве исходных параметров и переменных микроэкономической характеристики, например, затраты ресурсов, выпуск отдельных видов продуктов. Микроэкономика – изучение поведения основных экономических субъектов, таких, как компании, отрасли промышленности или семьи. Например, исследование компаний, действующих в области воздушных перевозок, было бы микроэкономическим вопросом. Смотрите также Макроэкономика (Macroeconomics).

MICROELEMENT, MICRONUTRIENT = МИКРОЭЛЕМЕНТ, МИКРОПИТАТЕЛЬНОЕ ВЕЩЕСТВО – Microelement, Micronutrient is a nutrient element needed by the plant in very small amounts. Considered as microelements are iron, manganese, boron, molybdenum, copper, zinc, and chlorine. / В биологии под Микроэлементами понимаются химические элементы:- Алюминий (Al), Бор (B), Железо (Fe), Иод (I), Кобальт (Co), Марганец (Mn), Медь (Cu), Молибден (Mo), Цинк (Zn) и другие, содержащиеся в организмах в низких концентрациях (обычно тысячные доли процента и ниже) и необходимые для их нормальной жизнедеятельности. В организм растений поступают из почвы, в организм Животных и Человека – с пищей. Входят в состав ряда ферментов, витаминов, гормонов, дыхательных пигментов. Влияют на рост (I, Mn, Zn – у Животных), размножение (Mn, Zn – у Животных, B, Cu, Mn, Mo – у Растений), кроветворение (Co, Cu, Fe) и так далее. Недостаток или избыток микроэлементов приводит к нарушению обмена веществ. Микроэлементы используют для повышения урожайности сельскохозяйственных культур (микроудобрения) и продуктивности сельскохозяйственных животных (добавки микроэлементов к кормам).

MICROENCAPSULATION = МИКРОИНКАПСУЛЯЦИЯ (или МИКРОКАПСУЛИРОВАНИЕ) – Microencapsulation is an enclosing materials in capsules of less than one micron to over 2 000 microns in diameter. These can contain polymer additives that can then be released under certain conditions of use or processing. Micro-Encapsulation is a method of enclosing polymer additive materials in microscopic capsules, which can then be released under certain conditions to enhance performance properties. / Микрокапсулирование – коацервация различных веществ в полимерную оболочку. Под Микроинкапсуляцией, от Греческих слов Mikros, означающее Маленький или Малый, и En, означающее В, и Латинского слова Capsula, означающее Коробочка, понимается процесс включения какой-либо субстанции (вещества) в маленькие капсулки, из которых эти субстанции могут освобождаться в дальнейшем с помощью повышения температуры, растворения или под действием других факторов.

MICROFAUNA = МИКРОФАУНА – Microfauna:- protozoan and smaller nematodes. / Микрофауна:- протозойный (простейшие) и мелкие нематоды. Под Микрофауной, от Греческого слова Mikrós, означающее Малый, и Латинского слова Fauna, означающее Богиня Лесов И Полей (покровительница животных в Римской мифологии), понимается .

MICROFIBER = МИКРОВОЛОКНО – Microfiber is a type of material that is primarily used as an upholstery fabric because of it strong and durable nature, but it can also be found in other household products such as drapes, linens, and cleaning tools like mops. The material is less commonly used for clothing, because it is flammable, but it is often used for athletic attire because of its ability to wick moisture away from the body. Made primarily of petroleum waste products, the material makes use of waste that would otherwise fill up landfills. Development:- during the middle of the XX century, the manufacturing of synthetic fibers began to expand into new areas. One of the breakthroughs was to take the sludge that was left over after oil had been refined and turn it into a synthetic fiber that could be used in upholstery; the process of refining this waste product yielded a substance known as Polypropylene, which could in turn be processed into a thin olefin fiber. Olefin fibers were ideal to use in the production of car upholstery, home and office carpeting, and

even some draperies. Olefin fibers caught on in a big way during the 1970s with one company in particular, Hercules, Inc., producing their own branded form of olefin fiber, which was dubbed Herculon®. Continued experimentation allowed for the use of polypropylene to develop an extremely fine fiber, today referred to as Microfiber. This extremely thin, but surprisingly resilient, fiber could be used for a number of textile applications that the broader weaves of olefin fibers were simply not suited for because of their density. Today it is possible to transform what would have been waste into a highly-valued material. Moisture-wicking:- microfiber has the excellent wicking properties, meaning it will absorb moisture and oils rather than allow them to set on the surface of the material. This makes it an ideal material for such things as footballs and basketballs, as the sweat from the players' hands will not make the ball slippery and harder to hold. The moisture-wicking characteristic also makes the material a popular choice for furniture, particularly couches, as most food and liquids can be easily wiped off before the furniture is stained. Household Supplies:- Microfibers are also used for various types of cloth where absorption of water is desirable; for instance, cleaning cloths used for dusting, cleaning glass, mopping, or detailing cars are often made of microfiber material. Most cloths made of this material do not leave behind residue of lint or dust, which makes them ideal for waxing a car; however, it is important to note that microfiber material will absorb dust and lint. A good ideal is to wash the cloth after each use, to avoid any leftover residue that may be deposited the next time the cloth is used. Linens:- microfiber is often used in other textile applications such as tablecloths, sheer draperies, and curtains. The stain-repelling ability of the microfiber blend in these types of products makes them very attractive to many homeowners, restaurant owners, and other types of business owners who prefer to use materials that are both good-looking and serviceable. Bath towels and hand towels are also popular when made in this material, as it is known to easily remove water and moisture. Clothing:- while the use of microfiber for clothing has been around for some years now, it is most often found in sports apparel due to its ability to wick away sweat. The material can also be found in medical compression socks, which are used to help patients increase blood flow. There are those that object to using the material for clothing because it is not a natural material and because it is flammable. Also, some people may feel that a garment made from microfiber material is not as comfortable as other fabric options. Microfibers:- a lightweight, synthetic fiber (usually of acrylic, nylon, polyester or rayon) that be can woven into fabrics with a soft, suede-like finish. It is water-repellant, wrinkle-resistant and easy to care for. It is machine-washable. Microfiber can be found everywhere, from cleaning products, furniture, active wear and in filtration, but what is it exactly? The term microfiber, refers to a synthetic fiber that less than one denier in diameter, but larger than 0.3 denier. To be certain that is a very small fiber, as it is thinner than silk and approximately one-fifth the diameter of a human hair. By definition though, that is where the clarity seems to end. Microfiber has many desirable properties, which make it useful for a broad range of products. Many of these items are marketed as simply microfiber, making it complicated to determine what the difference is between one product and the next. The most common microfiber is one that is constructed of polyester and polyamides. During the manufacturing process, the fibers are split, which makes them incredibly effective at picking up and trapping dirt or wicking moister. Most specifications have tolerance limits, which are clearly identifiable and are either materially prescriptive or performance based. To develop a standard definition of microfiber insitu is problematic. Over time the term Microfiber has grown to describe a technology across a platform of product verticals, much in the same way the term Plastic has become more of a descriptor for a wide range of materials than a 'thing' in and of itself. One example of this is a microfiber towel that is marketed for cleaning. Today there is no specification that determines either performance or material construction of this category. A product can be called a Microfiber Towel, but there are no specifications to describe the minimum content of fibers or the performance of the product. The technology term microfiber is used to market products with no boundaries, so buyer beware. Addressing a microfiber standard definition will need to be application specific. There is no current specification method for comparing a woven microfiber cloth to a nonwoven microfiber cloth. There are some attributes each share, like weight and size and potentially even fiber chemistry, but that is where it ends. Nonwoven technology produces many analogs to traditional woven and knit products to fill a need. As these technologies evolve, it becomes increasingly difficult to compare and contrast. INDA® (short for The Association of the Nonwoven Fabrics Industry; headquartered in Cary, State of North Carolina, the United States of America), and its European counterpart, EDANA (short for the European Disposables and Nonwovens Association; headquartered in Bruxelles, Belgium), are considering developing a standard around microfiber wipes to help the industry better understand the performance of nonwovens compared to traditional woven technical products. Nonwoven microfiber wipes have the capability to be laundered and/or applied as a single-use material in applications where cleaning is critical, but cross contamination is a concern. Parting Thoughts:- Critical cleaning is essential to health and hygiene, as well as in cleanroom environments. The demands of these applications require a highly engineered material. On face value, engineered materials may not seem as eco-friendly as natural fabrics, but it's worth noting that during the production process of polyester microfibers no pesticides are used and the dyeing methods do not require any water. Comparatively, a huge amount of water is needed in the dyeing process of non-synthetic materials. Nonwoven microfiber materials are also produced at rate that is an order of magnitude faster and at lower weights for equivalent performance than traditional woven products. In essence, specifications are about data communication and the exchange of that information. It is critical that all interested parties have a means to collaborate around that complex information. Micro-Fibers:- extremely fine synthetic fibers – the finest of all man-made fibers, at least 60 times finer than a human hair. Today micro-fibers are used in polyester, nylon and acrylic. / Хокьюлыз, Инк. (Hercules, Inc.). Хокьюлан® (Herculon®). Найлан^{T3} (Nylon^{TM}).

MICROFIBERS/MICRODENIERS = МИКРОВОЛОКНА/МИКРОДЕНЬЕ – Microfibers/Microdeniers:- the name given to ultra-fine manufactured fibers and the name given to the technology of developing these fibers. Fibers made using microfiber technology, produce fibers which weigh less than 1.0 denier. The fabrics made from these extra-fine fibers provide a superior hand, a gentle drape, and incredible softness. Comparatively, microfibers are two times finer than silk, three times finer than cotton, eight times finer than wool, and one hundred times finer than a human hair. Currently, there are four types of microfibers being produced. These include acrylic microfibers, nylon microfibers, polyester microfibers, and rayon microfibers. / Найлан^{T3} (Nylon^{TM}).

MICRO FINE DUCK DOWN LIKE FIBER = МИКРО ТОНКОЕ ВОЛОКНО ТИПА ЛЕБЯЖЬЕГО ПУХА – Micro Fine Duck Down Like Fiber is micro denier polyester staple fiber developed through direct spinning technology, and its thickness is 1/100 of one human-hair. Thus it has fantastic soft touch that can be applied to deluxe textiles or stuffs as substitute for duck down feather. Micro fine down like fiber is used in bedding products such as pillows, comforters and mattress pads, offering down-like luxury. From tiny spiral fibers that cradle your head and neck to silky soft microfibers, bedding products made from micro fine down like fiber have a variety of comfort levels to help you wake up feeling refreshed. Advantages:- (i) Soft Touch; (ii) the ultra fine denier of micro fine down like fiber give it the feel of duck down; (iii) Easy Care; (iv) Machine washable and fast drying, micro fine down like fiber offers great ease of care; (v) Preservation of Warmness; and (vi) Dimentional interlocking between microfibers builds heat-retaining layers on non-woven. Usage:- (i) Garment:- Coat, Jacket, Shirt, instead of luxurious duck or goose down feather; (ii) Non-woven:- filling material mixed with duck down, Advanced Padding, Various Non-woven; (iii) Siliconized type is used for deluxe padding, duck down-like pillow and quilts, non-wovens, and this type can be specialized with anti-bacterial treatment; and (iv) Non-siliconized type is used for fabrics as well as padding, non-woven. Specification:- (i) Denier:- 0.7/0.8/ 1.2/ 1.5/ 3D; and (ii) Length:- 17 / 22 / 32 / 38 / 51 /64 mm.

MICROFLEECE = МИКРОФЛИС – Microfleece is a soft, luxorous fabric with a velvety feel.

MICROFLORA = МИКРОФЛОРА (или МИКРОБНАЯ ФЛОРА) – Microflora is a bacteria, including actinomycetes; viruses, and fungi. / Под Микрофлорой или Микробной Флорой, от Греческого слова Mikrós, означающее Малый, и Латинского слова Flora, по имени Богини Флоры, от Латинского слова Flos, родительный падеж Floris, означающее Цветок, понимается совокупность микроорганизмов, обитающих в определённой среде – почве, воде, воздухе, пищевых продуктах, в организмах человека, животных и растений. В 1 миллилитре (мл) воды может содержаться от 5 до 100 тысяч клеток, в 1 грамме (г) почвы – 2–3 миллиарда. Кожа, слизистые оболочки, кишечник животных и человека имеют постоянную так называемую нормальную микрофлору.

MICROMERIS = МИКРОМЭРИС (или МАЛОМЕРНОЕ) – Micromeris:- with small parts or divisions. / , от Греческого слова Mikrós, означающее Малый, .

MICROMETRE = МИКРОМЕТР – Micrometre or Micrometer:- one millionth of a meter. Also known as Micron. See also Micron. Micrometer (µm) is a common metric unit of distance equal to 0.001 millimeter or about 0.039 370 mil. The name Micron is also used for this unit. / .

MICROMINI = МИКРОМИНИ – Micromini is a very short miniskirt.

MICRON = МИКРОН – (1) Micron is a unit of length. One Micron = 39 millionths of an inch (.000 039”). Contaminant size is usually described in microns. Relatively speaking, a grain of salt is about 60 microns and the eye can see particles to about 40 microns. Many hydraulic filters are required to be efficient in capturing a substantial percentage of contaminant particles as small as 5 microns. A micron is also known as a Micrometre, and exhibited as µ. See also Micrometre. A Micron is 1/25,400 of an inch. The most accurate way of determining wool grades. Micron (µ) is a metric unit of distance equal to one millionth of a meter. Micron is simply a shorter name for the micrometer. In 1968 the Conférence Générale des Poids et Mesures (CGPM) decided to drop the micron as an approved unit and recommend that micrometers be used instead. Microns, however, are still in common use. One millionth of a meter. Also known as Micrometer. Micron is the unit of measure that describes the average staple fiber diameter in a lot of wool. Over the past 30 years, the Micron measurement has evolved to become the predominant term used commercially to describe the fineness of a wool fiber. A Micron is determined by the actual measurement when the wool lots are tested for sale during wool processing. Most wool fibers range in the area of 18–40 micron. Merino wool falls into the 18–24 micron range. The 25–32 micron, medium range wool, is usually defined by the word ‘Shetland’, and is used in such applications as blankets and knitwear apparel. The 33–40 range Micron usually describes the wool most often used in the carpet industry. / Шетлэнд (Shetland). Одна миллионная метра. Известен также как Микрометр (Micrometer). Под Микроном, от Греческого слова Mikrón, означающее Малое, понимается устаревшее наименование дольной единицы длины – микрометра. Не подлежат применению и дольные единицы от микрона – миллимикрон (ммк) и микромикрон (мкмк), заменённые нанометром (нм) и пикометром (пм). Бывшее обозначение микрона:- мк и µ. Микрометр является дольной единицей длины Международной Системы Единиц СИ. Он равен 10^{-6} метра. Обозначение:- мкм. Под Микроном, от Греческого слова Mikrón, означающее Малое, понимается дольная единица длины, равная 10^{-6} метра (м), или 10^{-3} миллиметра (мм). Обозначения:- мк, m. Наименование Микрон отменено решением 13-й Генеральной Конференции По Мерам И Весам (1967), и эта единица, согласно Российскому ГОСТ 7663-55 и правилу образования наименований дольных единиц, должна именоваться микрометром (мкм).

(2) Micron (µ) is an informal unit of pressure widely used in vacuum technology. In this use, a micron is a micron of mercury, that is, 0.001 mm Hg or approximately 1.333 microbars (µbar or µb) or 133.3 milliPascals (mPa). For all practical purposes, 1 micron is identical to 1 milliTorr (mTorr). Torr is the unit named for Evangelista Torricelli (1608–1647), the Italian scientist who invented the barometer. / Эвандьжэлиста Торричэлли (Evangelista Torricelli; 1608–1647).

MICRONAIRE = МАЙКРОНЭЙР – Micronaire (Mic.) – fineness is a measure of mass per unit length expressed in micrograms per inch for cotton. A fiber sample of constant weight is measured by passing air through the fibers and measuring the drop in pressure. The micronaire scale has been established empirically with a standard set of Cottons and is not linear. Other factors such as fineness and maturity have an influence on micronaire results. Micronaire – Description:- (i) less than 3.0 – very fine; (ii) 3.0 to 3.6 – fine; (iii) 3.7 to 4.7 – medium; (iv) 4.8 to 5.4 – coarse; and (v) 5.5 and higher – very coarse. Micronaire is an airflow measurement that is performed on a 2.34 grams test specimen which is compressed to a specific volume in a porous chamber. Air is forced through the specimen and the resistance to the airflow is proportional to the linear density of the fibers (expressed in micrograms per inch). The micronaire range for upland Cotton is 2.0 to 6.5. Since denier is equal to micronaire divided by 2.82, upland Cottons ordinarily range from 0.7 to 2.3 denier. Micronaire is a measure of fiber fineness and maturity. An airflow instrument is used to measure the air permeability of a constant mass of Cotton fibers compressed to a fixed volume. Micronaire measurements can be influenced during the growing period by environmental conditions such as moisture, temperature, sunlight, plant nutrients, and extremes in plant or boll population. Fiber fineness affects processing performance and the quality of the end product in several ways. In the opening, cleaning, and carding processes, low-micronaire, or fine-fiber, cottons require slower processing speeds to prevent damage to the fibers. Yarns made from finer fiber result in more fibers per cross-section, which in turn produces stronger yarns. Dye absorbency and retention varies with the maturity of the fibers. The greater the maturity, the better the absorbency and retention. The chart below can be used as a guide in interpreting micronaire measurements. Micronaire:- A measurement of airflow resistance through a standard weight of cotton compressed to a specific volume. The higher the value, the larger the diameter of the fibers. Micronaire range is normally 2- 5, although there are some fiber types that produce fibers with micronaire as high 8. In Cotton industry, a Micronaire or Fiber Fineness is the measurement by an air flow instrument which evaluates for the merchant and mill operator the spin ability of the Cotton. The measurement determines the fiber fineness and maturity in combination. The instrument subject a Cotton sample to standard air pressure and the amount of flow is indicated on the machine as a Micronaire or Mike reading. A fine fibered, immature Cotton causes more resistance to the air flow giving a low reading; while a coarse and mature Cotton causes less resistance, resulting in a higher Micronaire reading. Deliverable reading are not less than 3.5 nor more than 4.9.

Relationship of Micronaire Readings to Market Value / Соотношение Показателей Майкронэйр с Рыночной Стоимостью				
Discount Range / Уровень Скидки	**Base Range** / Базовый Уровень	**Premium Range** / Уровень Надбавки	**Base Range** / Базовый Уровень	**Discount Range** / Уровень Скидки
34 & below	35 – 36	37 – 42	43 – 49	50 & above

MICRONAIRE FINENESS = ТОНИНА ПО МАЙКРОНЭЙР – Micronaire Fineness is the weight in micrograms of one inch of fiber.

MICRONAIRE METHOD = МЕТОД МАЙКРОНЭЙР – Micronaire Method is a means of measuring fiber fineness by determining the resistance of a sample to a flow of air forced through it.

MICRONAIR READING = ПОКАЗАТЕЛЬ МАЙКРОНЭЙР – Micronair Reading or Mike:- the results of an airflow instrument used to measure cotton fiber fineness and maturity. / Результаты прибора, измеряющего движение потока воздуха, используемые для определения тонины и зрелости хлопкового волокна.

MICRONAIRE VALUE = ЗНАЧЕНИЕ МАЙКРОНЭЙР – Micronaire Value is a measurement of cotton fiber quality. The Micronaire Value is a function of fiber fineness and maturity. Low values indicate fine and/or immature fibers, whereas high values indicate coarse and/or mature fibers. The micronaire value is determined in practice by measuring the resistance to air flow of a specified mass of fibers (in the form of a 'plug') confined in a chamber of a specified volume. / Мера качества хлопкового волокна. Значение майкронэйр является функцией от тонины волокна и его зрелости. Низкие значения указывают на тонкие и/или недозрелые волокна, в то время как высокие значения указывают на толстые и/или зрелые волокна. На практике значение майкронэйр определяется измерением сопротивления потоку воздуха, прогоняемого через определённую массу волокон (в форме 'затычки' или 'пробки'), заключённую в камеру определённого объёма.

MICROORGANISM = МИКРООРГАНИЗМ – Microorganism is a protozoan, fungus, bacterium, virus or other microscopic self-replicating biotic entity. Microorganism is a living entity which is visible only with the aid of a microscope. / Под Микроорганизмами или Микробами понимаются мельчайшие, преимущественно одноклеточные организмы, видимые только в микроскоп:- Бактерии, микроскопические Грибы и Водоросли, Простейшие (Protozoan). Иногда к микроорганизмам относят Вирусы. Характеризуются огромным разнообразием Видов, способных существовать в различных условиях (горячие источники, дно океана, снега гор и так далее). Играют большую роль в кругообороте веществ в природе. Используются в пищевой и микробиологической промышленности (виноделие, хлебопечение, производство антибиотиков, витаминов, аминокислот, белка и другого), генной инженерии. Патогенные микроорганизмы вызывают болезни растений, животных и человека.

MICRO PAYMENTS = МИКРОПЛАТЕЖИ (или ПЛАТЕЖИ МАЛЫХ СУММ) – Micro Payments:- transaction in small amounts, costing a few cents to usually less than five Dollars, typically involving sale of information on Internet. In the European Union, encompasses the lowest payment values, typically under €2.00 (EUR2.00). Online payment of small and smalles amounts (usually cents). See also Macro Payment, and Medium Payment.

MICROPLANTLET = МИКРОРОСТОК (или МИКРОПРОРОСТОК, или МИКРОСЕЯНЕЦ) – Microplantlet is a plantlet produced in vitro on a defined medium. / в лабораторных условиях в среде определённого состава. В переводе с Латинского In Vitro, означает В Лабораторных Условиях или В Пробирке.

MICROPLOT = МИКРОДЕЛЯНКА (или МАЛАЯ ДЕЛЯНКА) – Microplot is a small plot 1–2 m^2 covered with a cage, used to simulate large field plot conditions. / .

MICROPOROUS = МИКРОПОРИСТОЕ – Microporous:- a coating on a fabric that breathes through microscopic pores.

MICROPYLE = МИКРОПИЛЕ (или СЕМЯВХОД, или ПЫЛЬЦЕВХОД) – Micropyle is a small pore in a seed that allows water absorption. A minute opening in the wall of an ovule through which the pollen tube enters. / Под Микропиле, от Греческих слов Mikrós, означающее Малый, и Pýlē, означающее Отверстие, понимается:- (i) одно или несколько отверстий в оболочке яйца Насекомых, Паукообразных, некоторых Моллюсков, Рыб и некоторых других Животных, через которые сперматозоид проникает в яйцо; и (ii) отверстие в покровах семезачатка у Растений, через которое после опыления пыльцевая трубка проникает в нуцеллус. Семявход или Микропиле или Пыльцевход – канал в интегументе (или интегументах), через который у Голосеменных Растений проникают в семяпочку пыльцевые зёрна, а у Покрытосеменных – пыльцевые трубки. На поверхности зрелого семени наружное отверстие семявхода может быть заметно в виде тёмной точки.

MICROSCLEROTIA = МИКРОСКЛЕРОЦИЯ – Microsclerotia (singular:- microsclerotium) is a very small sclerotia, such as those produced by the Verticillium wilt fungus. See also Sclerotia. / Смотрите также Склероция (Sclerotia).

MICROSCOPE METHOD = МИКРОСКОПНЫЙ МЕТОД – Microscope Method is a method of particle counting which measures or sizes particles using an optical microscope.

MICROSPERMA = МИКРОСПЭРМА (или МЕЛКОСЕМЯННОЕ) – Microsperma:- with small seeds. / Под Микроспэрмой, от Греческого слова Mikrós, означающее Малый, .

MICROSPORANGIA = МИКРОСПОРАНГИЙ – Microsporangia or Microsporangium is the receptacle in which microspores (male spores) are developed. / Под Микроспорангием понимается цветоложе, в котором развиваются микроспоры (мужские споры).

MICROSPORE = МИКРОСПОРА – Microspore in seed plants, it gives rise to the pollen grain, the male gametophyte. / Под Микроспорой понимается мелкая спора высших разноспоровых растений, из которой развивается мужской гаметофит; у высших споровых растений (водных папоротников, селагинелл) из микроспоры развивается мужской заросток. У семенных растений микроспоре гомологично пыльцевое зерно (пылинка).

MICROTUBER = МИКРОКЛУБЕНЬ – Microtuber is a tuber produced in vitro.

MIDAM = MIDAMERICA COMMODITY EXCHANGE

MIDAMERICA COMMODITY EXCHANGE = СРЕДНЕАМЕРИКАНСКАЯ БИРЖА СЫРЬЯ (или СРЕДНЕАМЕРИКАНСКАЯ СЫРЕВАЯ БИРЖА) – The MidAmerica Commodity Exchange (Midam) was a Chicago-based futures exchange, offering a range of mini-size contracts. The exchange was shut down in 2004 and all of its contracts moved to the Chicago Board of Trade. The exchange traces its roots back to 1868, and was incorporated as the Chicago Open Board of Trade in 1880, assuming the MidAmerica name in 1972. The Midam was founded in 1868 as Pudd's Exchange. In the 1880s, it registered and changed its name to something similar to the Chicago Board of Trade, i.e. the Chicago Open Board of Trade. Trading on the Pudds Exchange originated in the open air on the corner of Washington and LaSalle. Midam affiliated with the Chicago Board of Trade in 1986, but remained a separate legal entity and exchange. It merged with the Chicago Rice and Cotton Exchange in 1991. The mini contracts were one-fifth the size of those on other exchanges, and included wheat, corn, oats, soybeans, live cattle, live hogs, silver, gold, platinum, soybean meal futures, options on gold, foreign currencies and other derivatives. Volumes reached 2.4M contracts in 2000, ranking 37th among global exchanges. Midam, with lower membership prices than its bigger neighbors, the CBOT and CME, attracted newcomers to its trading floor, a number of whom became very successful (e.g., Richard Dennis and others) and went on to trade at other exchanges. The MidAmerica Commodity Exchange (MidAm) was founded as the Chicago Open Board of Trade, probably in the late 1870s. From the beginning, it specialized in smaller contract size versions of Chicago Board of Trade (CBOT) contracts. It was originally designated in 1922 following passage of the Grain Futures Act which required grain exchanges to be designated as contract markets. It became the MidAmerica Commodity Exchange in 1972. MidAm became a subsidiary of the CBOT in 1986. Trading on the MidAm ceased in April 2003, and it was dissolved as a legal entity on July 03, 2003. In January 2004, the CBOT requested that the CFTC vacate the MidAm's contract

market designation. The MidAmerica Commodity Exchange (MACE, MidAm) was founded as 'Pudd's Exchange' in a field on the corner of LaSalle and Washington streets in 1868. In 1880, it was incorporated as the Chicago Open Board of Trade. The exchange became known as the MidAmerica Commodity Exchange in 1973, and kept the name after it became affiliated with the Chicago Board of Trade in 1986. The exchange offered smaller versions of contracts offered by the Chicago Board of Trade, thus allowing individuals with smaller assets to trade and gain experience before trading larger amounts. Contracts ranged from 1/2 to 1/5 of the regular CBOT contracts and consisted of many of the same futures and options contracts:- grains, livestock, metals, foreign currencies, etc. Though MACE was smaller than the prominent Chicago commodity exchanges, it was the first to institute many policies and contracts that were emulated by the larger exchanges. It was the first exchange to introduce a third party clearing house and customer margin requirements. In 1977, the Commodity Futures Trading Commission forced a restructuring of the exchange, including the implementation of an effective rule enforcement program, and a USD50 000 penalty. MidAm acquired the Chicago Rice and Cotton Exchange (CRCE) in December 1985. Previously CRCE had been the New Orleans Cotton Exchange (NOCE), which was established in 1981 and moved to Chicago in 1983. The CRCE was dissolved in 1991. The exchange continued to function after affiliating with CBOT, with members retaining access to MidAm original contracts, or contracts that originated from a MidAm contract. The CBOT administration took over the day-to-day operations of the exchange and a MidAm Advisory Committee was elected from the MACE membership. The MidAmerica Commodity Exchange was ultimately dissolved in 2003. The MidAmerica Commodity Exchange collection ranges from 1880–2003 and includes pamphlets, reports, legal files, rulebooks, annual reports, meeting minutes, contract applications, correspondence, press releases, ledgers, newsletters, notices, and multimedia. Records from the Chicago Open Board of Trade and the Chicago Rice and Cotton Exchange/New Orleans Cotton Exchange are also present. / угол Вошингтэн (Washington) и ЛэСал (LaSalle). Ричод Дэнис (Richard Dennis). СИБАТ® (CBOT®).

MID CAP = СО СРЕДНЕЙ КАПИТАЛИЗАЦИЕЙ – In the United States, Mid Cap is a company with a market capitalization between USD2 and USD10 billion, which is calculated by multiplying the number of a company's shares outstanding by its stock price. Mid cap is an abbreviation for the term 'Middle Capitalization'. As the name implies, a mid cap company is in the middle of the pack between large cap and small cap companies. Keep in mind that classifications such as large cap, mid cap and small cap are only approximations that change over time. Also, the exact definition of these terms can vary among the various participants in the investment business. Mid = Middle, Cap = Capitalization. Medium-sized company, which ranks between a large cap and a small cap in terms of market capitalization and trading volumes.

MIDDLE DISTILLATE = СРЕДНИЙ ДИСТИЛЛЯТ (или СРЕДНИЙ ПОГОН) – Middle Distillate:- hydrocarbons that are in the so-called 'Middle Boiling Range' of refinery distillation. Examples are heating oil, diesel fuels, and kerosene. / Смесь углеводородов, выкипающих в так называемом 'среднем интервале кипения' при дистилляции на нефтеперегонном заводе. Примерами являются печное бытовое топливо, дизельное топливо, и керосин. Под Нефтяными Погонами или Нефтяными Дистиллятами понимаются фракции, отбираемые при перегонке нефти, например, бензиновая или керосиновая. С повышением температуры кипения фракции повышается плотность, изменяются свойства и углеводородный состав нефтяных дистиллятов. Аналогичные по температурам кипения фракции разных нефтей могут различаться между собой.

MIDDLE PRICE = СРЕДНЯЯ ЦЕНА – Middle Price is a price between the buying and selling price, usually shown in indices. Also known as Middle-Market Price, and Middle Rate. / Известна также как Средне-Рыночная Цена (Middle-Market Price) и Средняя Ставка (Middle Rate).

MIDDLE RATE = СРЕДНЯЯ СТАВКА – Middle Rate is the arithmetic mean between several rates, for example between the bid and asked rates. Also known as Average Rate, and Middle Price. / Среднеарифметическое значение между несколькими ставками, например между ставками предложения и спроса. Известна также как Средняя Ставка (Average Rate) и Средняя Цена (Middle Price).

MIDDLE WEIGHT = СРЕДНИЙ ВЕС – Middle Weight:- a weave that is tighter than lightweight, which combines warmth and wickability.

MIDDLING = СЕРЕДНЯК – Middlings (plural). Of medium size, position, or quality. Not exceptional in any way especially in quality or ability or size or degree; 'ordinary everyday objects'; 'ordinary decency'; 'an ordinary day'; 'an ordinary wine'. Mediocre in quality, size, etc; neither good nor bad. Middling:- any commodity of intermediate quality or size, especially when coarse particles of ground Wheat are mixed with bran. / Термин может быть использован в качестве жаргона для обозначения средних компаний, товаров среднего качества и тому подобного.

MIDDLING = СРЕДНИЙ – In the Cotton industry, Middling is the designation of a specific grade of Cotton. Grades are determined by the amount of leaf, color, and the ginning preparation of Cotton, based on samples from each bale of Cotton. Middling is a high-quality white Cotton. / В хлопковой отрасли под термином Средний понимается конкретный сорт хлопкового волокна. В целом же сорта определяются количеством сора, цветом и качеством приготовления хлопкового волокна в процессе джинирования, основываясь на образцах, взятых из каждой кипы хлопкового волокна. Средний сорт относится к высококачественному белому хлопковому волокну, если дополнительно не указывается иной цвет волокна.

MIDDLINGS = КРУПКИ (или ОТРУБИ, или ПРОДЕЛЫ) – Middlings:- a by-product of flour milling comprising several grades of granular particles containing different proportions of endosperm, bran, and germ. / Крупка, промежуточный продукт измельчения зерна Пшеницы при переработке её в сортовую (белую) муку. Отруби, побочный продукт мукомольного производства. Состоит из оболочек зерна и остатков неотсортированной муки. В зависимости от вида перерабатываемого зерна отруби бывают:- пшеничные, ржаные, ячменные, рисовые, гречишные и другие. По степени измельчения могут быть грубые (крупные) и тонкие (мелкие). Отруби (в основном пшеничные и ржаные) – ценный корм для всех видов сельскохозяйственных животных. Питательность отрубей зависит от содержания мучнистых частиц (чем меньше муки и больше оболочек, тем ниже питательность). Химический состав пшеничных отрубей в среднем (%):- воды 14.8; белков 15.5; жиров 3.2; клетчатки 8.4; безазотистых экстрактивных веществ 53.2; золы 4.9. В 100 кг отрубей – 71–78 кормовых единиц и 12.5–13 кг переваримого протеина. Значительное количество отрубей в хлебе снижает его усваиваемость, небольшая примесь – улучшает вкус, повышает перистальтику кишок. Льняные отруби применяют для припарок, горчичные – для горчичников, миндальные – для смягчения кожи лица и рук.

MIDDY = МАТРОСКА (или ХХ) – Middy is a loosely fitting blouse with a sailor collar worn by women and children. / одеваемая женщинами и детьми.

MIDDY TWILL = САРЖА МИДИ (или ГАРДЕМАРИНСКАЯ САРЖА, или МИЧМАНСКАЯ САРЖА) – The term Middy Twill is used for many fabrics that are sturdy and have a twill weave. Traditionally made of cotton, middy twill today is likely to include at least some man-made fibers in its construction. When middy blouses are in fashion (a loasefitting, hip-length overblouse with a sailor collar) the

most popular color for this twill is navy blue. It is used also for school uniforms. / Отбельная хлопчатобумажная плотнотканая ткань с основонастилочным трёхнитным саржевым переплетением.

MIDGE DAMAGE = ПОВРЕЖДЕНИЕ ГАЛЛИЦАМИ – Midge Damage is found mostly in Wheat, although it has been detected in barley, rye, and some grasses. The only part of the plant damaged is the developing seed. When a kernel of grain is attacked either it will not develop or it will develop as a shrivelled, deformed kernel. Infestations of the Wheat midge can significantly reduce yield. They are most severe when rainfall is high during the spring or summer. / Повреждение Галлицами наблюдается главным образом в Пшенице, хотя оно может быть найдено и в Ржи, Ячмене и у некоторых Трав. . как ссохнущееся (или съёжившившееся) деформированное ядро. . Они бывают самыми тяжкими при повышенных дождевых осадках в течение весны или лета. Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется. Под Галлицами понимается Семейство Насекомых Отряда Двукрылых. Длиной 1–5 миллиметров. Около 4 000 Видов, в бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось около 500. Личинки ряда Видов, развиваются в тканях растений, вызывая образование галлов (отсюда название). Некоторые, например, Гессенская Муха вредят культурным растениям и лесу.

MIDI = МИДИ (или XX) – Midi is a dress, skirt, or coat that usually extends to the mid-calf.

MIDIS = MARKET INFORMATION DATA INQUIRY SYSTEM

MID–MONTH = СЕРЕДИНА МЕСЯЦА – Mid-Month:- 15th day of the month. Date on which forward transactions are settled (squared) on the some exchanges, especially in Belgium and the United Kingdom. / 15-й день месяца является датой, на которую некоторые биржи, особенно в Бельгии и Соединённом Королевстве, производят расчёт (сведение) по форвардным операциям.

MIDNIGHT BLUE = XX (или ПОЛУНОЧНАЯ СИНЕВА) – Midnight Blue:- a deep blackish blue.

MIDPOINT = СРЕДНЕЕ ЗНАЧЕНИЕ (или ЦЕНТР ТЯЖЕСТИ) – In technical analysis, the Midpoint of a bar or candle can be used in the evaluation of technical analysis studies. The midpoint is the (High + Low) / 2. / В техническом анализе биржевых рынков, среднее значение штриха или свечи может быть использовано при расчёте индикаторов технического анализа. Среднее значение определяется по формуле:- (Максимум + Минимум) / 2.

MIDRIB = СРЕДНЯЯ ЖИЛКА (или СРЕДНИЙ ПУЧОК) – Midrib is the prominent ridge in the middle of the underside of the leaf blade. Central vein of the leaf. Midrib is the main or central rib of a leaf. / Центральная жилка листа. Средняя Жилка – это главный или центральный пучок (жилка) листа.

MIDRIFF = ОТКРЫТЫЙ КУПАЛЬНИК (или ТОПИК) – Midriff is a woman's garment that exposes the midriff. / Купальный костюм, закрывающий лишь грудь и бёдра.

MIDSTREAM = ПРОМЕЖУТОЧНОЕ ЗВЕНО – Midstream:- the processing, storage and transportation sector of the petroleum industry. See also Downstream, and Upstream Oil And Gas Industry. / Сектор переработки, хранения и транспортировки в нефтегазовой отрасли. Смотрите также Конечное Звено (Downstream), и Начальное Звено Нефтегазовой Отрасли (Upstream Oil And Gas Industry).

MIF = MERCATO ITALIANO FUTURES

MIF = MULTILATERAL INVESTMENT FUND

MIFS = MYANMAR–IRRI FARMING SYSTEMS

MIG–1 = MOODY'S INVESTMENT GRADE 1

MIGA = MULTILATERAL INVESTMENT GUARANTEE AGENCY

MIGRATION = МИГРАЦИЯ – (1) Migration is a moving from one country, place, or locality to another. / Под Миграцией, от Латинского слова Migratio, от Migro, означающее Переселяюсь или Перехожу, понимается:- (1) перемещение, переселение. (2) Миграция населения – перемещения людей, связанные, как правило, со сменой места жительства. Подразделяется на безвозвратную (с окончательной сменой постоянного жительства), временную (переселение на достаточно длительный, но ограниченный срок), сезонную (перемещение в определённые периоды года). Различают внешнюю (за пределы страны) и внутреннюю миграцию; к внешней относятся эмиграция (выезд из своей страны; от Латинского слова Emigrare, означающего Переселяться), иммиграция (въезд в чужую страну); к внутренней – движение из села в город, межрайонные переселения и другие. Иногда к миграции относят так называемые маятниковые миграции (регулярные поездки к месту работы или учёбы за пределы своего населённого пункта). (3) Миграция животных – передвижения животных, вызываемые изменением условий существования в местах их обитания или связанные с циклом их развития. Первые могут быть регулярными (сезонными, суточными) или нерегулярными (при засухах, пожарах и так далее). Вторые обеспечивают расселение Вида (у Сидячих Животных, например, Губок, Кораллов, – на стадии личинки). Регулярные миграции совершаются по более или менее определённым путям. Миграцию птиц называют перелётами.

(2) In chemistry, Migration refers to the movement of molecules on the surface of plastics or in surrounding materials. Plastics with low migration values hinder or prevent the migration of, for example, additives, which makes them especially suitable for applications that come into contact with food or drinking water.

(3) In textile, Migration is a movement of dye from one area of dyed fabric to another. Includes movement of color from the dyed area to the undyed area of cloth.

(4) In textile, Migration is a movement of fibers which go from the center to the outside surface of yarn and back again periodically. / В текстиле, под Миграцией понимается перемещение волокон, которые периодически выходят из центра на внешнюю поверхность пряжи и обратно.

MIGRATORY = МИГРАНТ (или МИГРИРУЮЩЕЕ, или ПЕРЕЛЁТНОЕ) – Migratory is a term applied to an Insect Species that undergoes long-range movement, sometimes hundreds of miles, e.g., fall armyworms do not overwinter in the Carolinas but rely instead on annual, long-range, northward movement by consecutive generations 'hopscotching' from the Southern United States. It can also refer to shorter, more localized flights or transport, e.g., the migration of thrips from alternative hosts to Cotton. / Под Мигрантами, от Латинского слова Migrans, родительный падеж Migrantis, означающее Переселяющийся, в широком смысле слова понимаются все мигрирующие животные (смотрите Миграции Животных). В узком смысле – то же, что Аллохтоны. Аллохтоны, организмы, населяющие какую-либо местность, но в отличие от автохтонов, возникшие в процессе эволюции где-либо в

другом месте. В населяемые в данное время области они попали путём расселения из своего первоначального центра распространения (смотрите Миграции Животных). Так, Аллохтоны Северной Америки являются Опоссум (Сумчатая Крыса) и несколько Видов Колибри, проникшие сюда из Южной Америки.

MIKE = МАЙК – Mike (pronunciation:- MIKE) or M is international nautical signal flag meaning:- My vessel is stopped; making no way. Mark Missing (Sailing Regatta). Meaning:- I have a doctor on board. Inport:- Medical guard duty. Underway:- My vessel is stopped; making no way. International Meaning:- My vessel is stopped; making no way.

MIL = MANDATORY INTERRUPTIBLE LOAD

MIL = MILITARY

MIL = МИЛ – (1) Mil is the unit of length equal to one thousandth (10^{-3}) of an inch (0.025 4 millimeter), used, for example, to specify the diameter of wire or the thickness of materials sold in sheets. Mil is the unit of length, 0.001 inch, commonly used for measuring the diameter of wires and textile monofilaments. Mil is the unit of distance equal to 0.001 inch:- a 'milli-inch', in other words. Mils are used, primarily in the United States (US), to express small distances and tolerances in engineering work. One mil is exactly 25.4 microns, just as one inch is exactly 25.4 millimeters. This unit is also called the Thou. With the increasing use of metric units in the US, many machinists now avoid the use of 'mil' because that term is also a handy slang for the millimeter. / мононить (monofilament). Под Милом понимается единица длины в системе Английских мер. 1 мил = 1/1 000 дюйма = 25.4 мкм = $2.54 \cdot 10^{-5}$.

(2) Mil is the unit of angle measure, used in the military for artillery settings. At one time the US Army used a mil equal to 1/1 000 of a right angle, 0.1 grad, 0.09°, or 5.4 arcminutes (often written 5.4 moa). Later this was changed to 1/1 600 right angle, or 0.056 25° (3.375 moa). In target shooting, the mil is often understood to mean 0.001 radian or 1 milliradian, which is about 0.057 3° or 3.437 75 moa. In Britain, the term angular mil generally refers to the milliradian. 1 milliradian corresponds to a target size of 10 millimeters at a range of 10 meters, or 3.6 inches at 100 yards. / Круговой Мил (Circular Mil). 2π/6400 рад.

(3) Mil is a common slang name for the milliliter (mL) or the millimeter (mm).

(4) In Scandinavia, the Mil, pronounced like 'meal' in English, is a traditional distance unit considerably longer than Roman or English miles. In Denmark, the traditional mil was 24 000 Danish feet, which is 4.680 5 miles or 7.532 5 kilometers (this is the same as the north German meile). The Danish mil has sometimes been interpreted as exactly 7.5 kilometers (4.660 3 miles). In Sweden, the traditional mil was 36 000 Swedish feet, which is 6.641 miles or 10.687 kilometers. In Sweden and Norway the mil is now interpreted as a metric unit equal to exactly 10 kilometers (6.213 7 miles).

MILANESE KNITTING = МИЛАНСКИЙ ТРИКОТАЖ (или МИЛАНСКОЕ ВЯЗАНИЕ, или ПЕРЧАТОЧНОЕ ТРИКОТАЖНОЕ ПОЛОТНО) – Milanese Knitting:- Milanese is made with two sets of warp, one moving downward to the left and the other downward to the right, with the diagonal crossing of the yarns producing a diamond effect on the back, and a fine rib showing on the surface. See also Knitting. Milanese Knitting is a type of run-resistant warp knitting with a diagonal rib effect using several sets of yarns. Milanese is a kind of warp knitting with several sets of yarns. Characteristie is its diagonal argyle-type pattern. / Milanese = Миланез (трикотажная машина); Оплетённая; Миланское.

MILAN STRAW = МИЛАНСКАЯ СОЛОМКА (или МИЛАНСКАЯ СОЛОМА) – Milan Straw is a type of straw.

MILC = MILK INCOME LOSS CONTRACT

MILDEW = ЛОЖНАЯ МУЧНИСТАЯ РОСА (или ПЕРОНОСПОРОЗ, или МИЛДЬЮ) – Mildew is a fungal condition that affects Wheat, Barley and a number of other Grains. It develops in unthreshed kernels of grain, usually under conditions of excessive moisture. It should not be confused with the disease powdery mildew, which attacks the leaves, reducing yield. Downy mildew, caused by Peronospora Manshurica, can sometimes form a white coating on Soybeans. These are spores of the Fungus. They do not affect the processing or safety of the seed, but can affect the appearance. Mildew is a whitish growth caused by spore-forming Fungi that grow in a warm, moist, confined atmosphere. The formation of mildew may cause discoloration, tendering, or variation in dyeing properties in cellulosic fiber. / Ложная Мучнистая Роса, вызываемая Грибом Пэроноспора Маншурика (Peronospora Manshurica), иногда может вызвать белый налёт на Соевых Бобах. В данном случае это споры Грибов. Они не оказывают влияния на . Милдью или Мильдью (от Английского слова Mildew), поражение растений болезнями типа ложной мучнистой росы, вызываемой Пероноспоровыми Грибами. В Советской литературе милдью обычно было принято называть только ложную мучнистую росу Винограда. Ложная Мучнистая Роса или Пероноспороз является болезнью растений. Она вызывается паразитическими Ложномучнисторосяными Грибами. Поражает Виноград, Капусту, Огурец, Свёклу и другие. На листьях пятна с беловатым, сероватым или фиолетовым налётом. Ложная Мучнистая Роса или Пероноспороз, болезнь растений, вызываемая Грибами Класса Фикомицетов Семейства Пероноспоровых. Поражает зелёные части растения, преимущественно листья, на которых образуются пятна, покрытые с нижней стороны сероватым или фиолетовым налётом – спороношения Гриба (зооспорангии со спорангиеносцами). Зооспорангии возникают многократно в течение вегетационного периода; распространяясь воздушным путём, они служат основным источником инфекции. Развитию болезни благоприятствует высокая влажность воздуха и почвы. Наиболее вредоносны ложная мучнистая роса Винограда (милдью), Картофеля, Лука, Огурца, Подсолнечника, Свёклы, Табака, Томата и некоторых других. Меры борьбы:- применение фунгицидов в период вегетации (первая обработка – при появлении признаков болезни). Пероноспороз, опасная болезнь растений, вызываемая паразитическими Пероноспоровыми Грибами; то же, что Ложная Мучнистая Роса.

MILDEW RESISTANCE = СОПРОТИВЛЕНИЕ ЛОЖНОЙ МУЧНИСТОЙ РОСЕ (или СОПРОТИВЛЕНИЕ МИЛДЬЮ, или СТОЙКОСТЬ К ПЕРОНОСПОРОЗУ, или СОПРОТИВЛЕНИЕ ОБРАЗОВАНИЮ ПЛЕСЕНИ) – Mildew Resistance is the degree to which fabrics are unaffected by certain fungi that cause odor and discoloration. Mildew Resistant:- among the many properties that can be given to fabrics in the finishing is resistance to traditional enemies. Waterproofed fabrics and fabrics treated with metallic compounds and certain organic compounds will resist mildew. Fabrics such as canvas, that are exposed to the damp conditions that encourage the growth of mildew Fungus, can be treated with finishes to resist this fungus, making them mildew resistant. See also Finishing.

MILE = МИЛЯ – Mile is a traditional unit of distance. The word comes from the Latin word for 1 000, mille, because originally a mile was the distance a Roman legion could march in 1 000 paces (or 2 000 steps, a pace being the distance between successive falls of the same foot). There is some uncertainty about the length of the Roman mile. Based on the Roman foot of 29.6 centimeters and assuming a standard pace of 5 Roman feet, the Roman mile would have been 1 480 meters (4 856 feet); however, the measured distance between surviving milestones of Roman roads is often closer to 1 520 meters or 5 000 feet. In any case, miles of similar lengths were used throughout Western Europe. In medieval Britain, several mile units were used, including a mile of 5 000 feet (1 524 meters), the modern mile defined as 8 furlongs (1 609 meters), and a longer mile similar to the French mille (1 949 meters), plus the

Scottish mile (1 814 meters) and the Irish mile (2 048 meters). In 1592, Parliament settled the question in England by defining the statute mile to be 8 furlongs, 80 chains, 320 rods, 1 760 yards or 5 280 feet. The statute mile is exactly 1 609.344 meters. In athletics, races of 1 500 or 1 600 meters are often called Metric Miles. See also Nautical Mile. / 8 фурлонгам (фарлонгам (furlongs)), 80 чейнам (chains), 320 родам (rods), 1 760 ярдам или 5 280 футам. Законная миля составляет ровно 1 609.344 метров. Под Милей, от Английского слова Mile, от Латинского слова Milia (Passuum), означающее Тысяча (Шагов), понимается единица длины, имевшая распространение в национальных неметрических системах единиц применяющаяся ныне главным образом в морском деле. Морская Миля равна длине дуги меридиана в 1' (её значение – переменное и зависит от географической широты местности). Обозначение:- м. миля. Международная Морская Миля, равная 1.852 километра или средней длине дуги меридиана в 1'. В Великобритании 1 морская миля равна 1.853 километра. 1 сухопутная (уставная) миля равна 1.609 344 километра, применяется в США. В России до введения Метрической Системы Мер в качестве единицы длины также применялась миля, равнявшаяся 7 вёрстам или 7.468 километрам. Миля – Британская единица длины, равная 1 760 ярдам или 5 280 футам или, приблизительно, 1 609.344 метрам. Под Милей, от Латинского слова Milia (Passuum), означающее Тысяча (Шагов), понимается:- (i) Британская единица длины, равная 1 760 ярдам = 5 280 футам ≈ 1 609.344 метрам (м). (ii) Морская Миля, равная длине дуги меридиана в 1'; её значение – переменное, зависит от географической широты местности. Обозначение:- м. миля. (iii) Международная Морская Миля, равная средней длине дуги меридиана в 1'. 1 международная морская миля равна 1 852 метрам. (iv) Русская единица длины, применявшаяся до введения Метрической Системы Мер и равная 7 вёрстам, или 7.468 километрам (км). Под Милей, от Английского слова Mile, от Латинского словосочетания Milia Passuum, означающее Тысяча Двойных Римских Шагов, понимается единица длины, имевшая распространение в национальных неметрических системах единиц и применяемая теперь главным образом в морском деле. В бывшем Союзе Советских Социалистических Республик (СССР) и большинстве стран применяется морская миля, равная, согласно решению Международной Гидрографической Конференции (1929), 1.852 километра (км) – средней длине 1" дуги меридиана. 1 морская миля = 10 кабельтов. В Великобритании 1 морская миля = 1.853 184 км, 1 сухопутная уставная миля = 1.609 344 км (она применяется и в Соединённых Штатах Америки (США)). Географическая миля (Немецкая) – 1/15° экватора = 7.420 4 км. Старая Русская миля = 7.467 6 км, старая Римская миля = 1.481 км.

MILEAGE ALLOWANCE = УСТУПКА ЗА МИЛЬАЖ (или УСТУПКА ЗА РАССТОЯНИЕ В МИЛЯХ) – Mileage Allowance is an allowance, based upon distance, that railroads give to shippers using private railcars.

MILEAGE PRORATION = ТАКСАЦИЯ ПРОПОРЦИОНАЛЬНО МИЛЬАЖУ (или ТАКСАЦИЯ ПРОПОРЦИОНАЛЬНО РАССТОЯНИЮ В МИЛЯХ, или ПРОПОРЦИЯ В ОТНОШЕНИИ РАССТОЯНИЯ В МИЛЯХ) – Mileage Proration is a proration on the basis of the applicable local mileage (aircargo). / В перевозках авиационных грузов . Под Таксацией, от Латинского слова Taxatio, означающее Оценка, понимается учёт .

MILEAGE RATE = СТАВКА ЗА МИЛЬАЖ (или СТАВКА ЗА РАССТОЯНИЕ В МИЛЯХ) – Mileage Rate is a rate based upon the number of miles the commodity is shipped. / Ставка, основанная на количестве милей при перевозке сырья.

MILITARY BILL OF LADING = ВОЙСКОВОЙ КОНОСАМЕНТ (или АРМЕЙСКИЙ КОНОСАМЕНТ) – Military Bill Of Lading is a bill issued by the US military. Also known as Form DD1252, or Government Bill of Lading (GBL). / Коносамент, выдаваемый вооружёнными силами США. Известен также как Форма Ди.Ди.1252 (Form DD1252), или Правительственный Коносамент (ПК; Government Bill of Lading (GBL)).

MILITARY BRAID = ВОЕННЫЙ ГАЛУН – Military Braid is a flat and ribbed braid. It is usually used for decorating uniforms.

MILITARY SEALIFT COMMAND = КОМАНДОВАНИЕ ВОЕННЫХ МОРСКИХ ПЕРЕВОЗОК – Military Sealift Command (MSC) is the US Department of the Navy.

MILITARY TRAFFIC MANAGEMENT COMMAND = КОМАНДОВАНИЕ УПРАВЛЕНИЯ ВОЕННЫМ ДВИЖЕНИЕМ – Military Traffic Management Command (MTMC) is the US Department of the Army.

MILK = МОЛОКО (или МОЛОЧНОЕ) – Milk:- Milk Yarn is made from milk protein fibers. To make it, all the water content is taken out from the milk and then it is skimmed. A new bio-engineering technique is then applied to make a protein spinning fluid. This fluid is suitable for wet spinning process through which the final high-grade textile fiber is made. While spinning, a solvent is used by most of the manufacturers and micro-zinc ion is embedded in the fiber which gives it the characteristics of being bacteriostatic and durable. It combines the advantages of both, natural as well as synthetic fibers. It is glossy and luxurious in appearance, feel and comfortability, just like silk. It blends well with other fibers such as cotton, modal, tencel and bamboo. The fabrics made from milk yarn are primarily used in manufacturing kidswear, top-grade underwear, shirts, T shirts, loungewear.

MILK GRAIN STAGE = СТАДИЯ МОЛОЧНОЙ СПЕЛОСТИ ЗЕРНА (или СТАДИЯ МОЛОЧНОГО СОСТОЯНИЯ ЗЕРНА) – Milk Grain Stage is a stage in the ripening phase of Rice growth and development when the contents of the caryopsis (starch portion of the grain) is at first watery, but later turns milky in consistency.

MILK QUOTA SCHEME = СХЕМА КВОТ НА МОЛОКО – Milk Quota Scheme is a supply control measure to limit the volume of milk produced or supplied. Quantities up to a specified quota amount benefit from full market price support. Over-quota volumes may be penalized by a levy (as in the European Union, where the 'super levy' is 115% of the target price) or may receive a lower price. Allocations are usually fixed at individual producer level. Other features, including arrangements for quota reallocation, differ according to scheme.

MILKY = МОЛОЧНОЕ (или МЛЕЧНОЕ) – Milky:- resembling milk in color.

MILL = ЗАВОД – Mill (in textile industry) is a business concern or factory that manufactures textile products by spinning, weaving, or knitting.

MILL CONSUMPTION = ПОТРЕБЛЕНИЕ КОМБИНАТАМИ – In the Cotton industry, Mill Consumption is a quantity of a fiber processed in manufacturing establishments. / В хлопковой отрасли, количество волокна, перерабатываемого производственными структурами.

MILLED RICE = ОБРУШЕННЫЙ РИС – Milled Rice has had the hulls and bran removed. It is also called White Rice or Polished Rice. Most milled Rice sold into the domestic market has been milled very hard and has had the broken content removed to below 4%. Less expensive Rice sold to export markets may be milled to a lessor degree and may have higher percentages of broken kernels. State laws require that milled Rice sold to US consumers be enriched with vitamins to make its nutritional value similar to brown Rice. For this reason, cooking directions mention that the Rice should not be washed. The enrichment is usually a powder and is easily removed with water. Most ethnic consumers who eat a lot of Rice wash the Rice to improve taste and texture. Much of the Japonica Rice packaged in California is not enriched and is labeled as coated with glucose (allowed by law) for these consumers who do not like the

taste of enrichment and who were going to wash it away anyway. Almost all Rice is consumed in the milled form, and most Rice exported from the United States is exported in the milled form. Milled Rice is Rice after it is processed to remove the husk and to, sometimes, polish the kernel. Milled Rice is a Rice from which the hull and bran have been removed. / зерновка (ядро). Зёрна Риса, прежде чем попасть в магазин, проходят обработку. Сначала их 'раздевают' от семенных оболочек и цветковой плёнки. Процесс удаления этой шелухи называют обрушиванием. После этого на зерне остаются приросшие к нему плодовые оболочки (отруби) и зародыш. Эти полезнейшие части рисового зёрнышка, содержащие белок, витамины, клетчатку и минералы, удаляют в процессе шлифовки. В результате остаётся эндосперм. Так называют основную часть зерна, представляющую собой запасы крахмала, необходимые для развития зародыша. Других полезных веществ в ней почти нет. К сожалению, такая же судьба уготована почти всем зерновым продуктам, которые мы употребляем. Зачем производители так делают? Они объясняют это исключительно заботой о нас, потребителях:- считается, что мы любим всё белое и чистое, а всё тёмное и с отрубями оскорбляет наши эстетические и вкусовые чувства. Но справедливости ради отметим, что в последние годы начали продавать и более полезные Виды Риса – бурый или коричневый. Они проходят менее жёсткую обработку, а порой даже не шлифуются вовсе. А значит, эти зёрнышки по большей части сохранили плодовые оболочки и зародыш. Значит, этот рис и есть самый полезный.

MILLED WHITE RICE = ОБРУШЕННЫЙ БЕЛЫЙ РИС – Milled White Rice:- with the volatile, nutritious bran layers and germ removed, the starchy center of the grain has a longer storage life and quicker cooking period. This is the most common form of Rice for human consumption around the world.

MILL END = ЛОСКУТ (или ЗАВОДСКОЙ МЕРНЫЙ ЛОСКУТ) – Mill End is a remnant or short length of finished fabric. / Лоскут, получаемый при формировании готовых тканей в торговые куски.

MILLI = МИЛЛИ – Milli:- thousandth. / Под Милли..., от Латинского слова Mille, означающее Тысяча, понимается приставка для образования наименований дольных единиц, по размеру равных 1/1000 исходных единиц. Обозначения:- Русское м, международное m. Пример:- 1 мА (миллиАмпер) = 10^{-3} А.

MILLIAMPERE = МИЛЛИАМПЕР – MilliAmpere (mA) is a common unit of electric current equal to 0.001 Ampere.

MILLIAMPERE HOUR = МИЛЛИАМПЕР ЧАС – MilliAmpere Hour (mA·h) is a common unit of electric charge, used (for example) in stating the capacity of batteries for cell phones and other electronic equipment. One milliAmpere hour is the charge accumulated by a current of 1 milliAmpere in 1 hour; this is equal to exactly 3.6 Coulombs (C). / 3.6 Кулона ().

MILLIARD = МИЛЛИАРД – Milliard is the European term for 1 000 million. Also known as Billion in the United States. / Европейский термин для 1 000 миллионов. Известен также как Биллион или Миллиард (Billion) в Соединённых Штатах Америки. Миллиард, от Французского слова Milliard, означающее Тысячу Миллионов, является числом, изображаемым в десятичной записи единицей с девятью нулями (1 000 000 000) или 10^9.

MILLIMETERS OF WATER = МИЛЛИМЕТРОВ ВОДЫ – Millimeters Of Water or mm H_2O:- unit for small differences in pressure, measured as the difference in height in mm between the two surfaces of a water column in a siphon. 1 mm H_2O = 9.81 Pa.

MILLINERY = ШЛЯПКИ (или МИЛИНЭРИ) – Millinery is a women's apparel for the head.

MILLING = ВАЛЯНИЕ (или ВАЛКА) – Milling is the operation of shrinking and felting a woolen fabric to make it thicker and denser. Also call Fulling. Milling is:- (1) the process of treating fabric in a fulling mill, i.e. fulling. (2) In silk manufacturing the twisting of the filaments into yarn. (3) A grinding process, i.e. ball-milling of dyes and pigments. / Валяние или Валка (Fulling).

MILLING = ИЗМЕЛЬЧЕНИЕ (или РАЗМОЛ) – Milling is the first stage of mineral processing. Ore pieces from the mine are further mechanically reduced in size to maximize efficiency of the concentration process. / Под Измельчением понимается дробление (до частиц менее 5 миллиметров (мм)) какого-либо твёрдого материала. Производится в основном мельницами.

MILLING = ПОМОЛ (или РУШЕНИЕ, или МОЛОТЬБА, или ОБМОЛОТ, или РАЗМОЛ, или ШЕЛУШЕНИЕ) – Ground grain was one of civilized man's first foods. Ancient methods of grinding can be traced to the Far East, Egypt and Rome. As early as 6700 BC (short for Before Christ), man ground grains with rocks. Water mills did not appear until 85 BC in Asia Minor. Windmills appeared between 1180 and 1190 AD (short for Anno Domini) in Syria, France and England. Wheat milling is the science of analyzing, blending, grinding, sifting, and blending again, a variety of Wheat. The miller analyzes the Wheat, then blends it to meet the requirements of the end use. For example, hard Wheat flours provide for a variety of bread products; durum semolina and flour are used in pasta. A blend of soft and hard Wheats produces Asian noodles. Soft Wheats produce an array of crackers, cookies, cereals, cakes, pancakes, breading and pastries. Pets, fish, shrimp and livestock are equally lucky to be guaranteed quality feeds. Beyond human and animal nutrition, millers provide the 'glue' that keeps our walls papered and other building products affordable and available. Milling is the process by which Wheat is ground into flour, through which the Wheat grain is separated into its constituent parts:- bran, germ and white flour. The aim of Rice Milling is to attain the highest yield of white Rice of the best quality. This means removing the least amount of hull and bran to give well-milled Rice, which contains a minimum of broken kernels and foreign matter. As the level of sophistication within the rice mill increases, so does the milling yield and the financial value of the Rice crop. In many remote and poorer areas, pestles and mortars or small single pass Rice mills are still the most popular. In other countries, all of the Rice is milled in larger sophisticated commercial mills which incorporate the equipment seen in this presentation. The quality of milled white Rice will be dependant on the quality of the paddy or rough Rice coming into the mill as well as the milling process. Good Paddy into the mill means quality milled Rice output. Milling is the process of separating the hull or husk and bran from the Paddy or rough Rice into milled Rice and bran-and-chaff. / шлифование (grinding). Под Молотьбой понимается выделение семян или плодов из бобов, колосьев, корзинок, метёлок, початков растений. Проводят комбайнами и молотилками в поле и на току, обычно совмещая с очисткой и сортированием. Под Помолом понимается измельчение материала (извести, угля и другого) механическим способом. Качество измельчения какого-либо материала – грубый или тонкий помолы. Совокупность технологических процессов переработки зерна в муку.

MILLING DEFECTS = ПОРОКИ ВАЛЯНИЯ (или ДЕФЕКТЫ ВАЛКИ) – Milling Defects:- the defects which are caused during the process of milling of woolen fabrics. They are as follows:- Mill Rigs, and Uneven Milling.

MILLING DEGREE = СТЕПЕНЬ РУШЕНИЯ – Milling Degree means the degree to which the rice is milled. / Степенью рушения является степень, с которой рис был обрушен.

MILLING DYE = КРАСИТЕЛЬ ДЛЯ ВАЛКИ – Milling Dye is a class of acid dye. There is no clear distinction between milling acid dyes and supermilling acid dyes. They come in a range of colors, including some bright shades and a large choice of 'pure' (as opposed to mixtures) colors. Washfastness is generally quite good. Lightfastness varies from poor to very good. Retarders are usually used to help

achieve level results. Application temperature is typically at or near the boil. These dyes are used on wool and polyamide (nylon). The term 'Milling' is said to refer to a process of making wool felt; milling dyes don't wash out badly in the process. / Найлан^{T3} (Nylon^{TM}).

MILLING OF RICE = РУШЕНИЕ РИСА – Milling Of Rice consists of two steps:- step one – removal of hard protective husk – the Rice husk is the protective layer surrounding the grain. Once removed, the Rice grain is packaged as brown Rice. Brown Rice is 'healthy' because it still contains the Rice germ and outer bran layers – important for healthy body functions. Step two – removal of the germ and brown layers – gentle milling removes the germ and bran layers from the grain to expose a white starch center. The polished white starch center is what we know as white Rice. There are seven classes of milled Rice. The following four classes shall be based on the percentage of whole kernels, and types of Rice:- (i) Long Grain Milled Rice; (ii) Medium Grain Milled Rice; (iii) Short Grain Milled Rice; and (iv) Mixed Milled Rice. The following three classes shall be based on the percentage of whole kernels and of broken kernels of different size:- (v) Second Head Milled Rice; (vi) Screenings Milled Rice; and (vii) Brewers Milled Rice. / Рушение Риса осуществляется в два этапа:- этап первый – удаление . на процентном содержании целиковой зерновки (целых ядер), и типах Риса:- . (vi) Высевки (Screenings). Под Молотьбой или Обмолотом понимается выделение семян (или плодов) из бобов, колосьев, корзинок, метёлок, початков растений. Молотьбу проводят комбайнами и молотилками в поле и на току, обычно совмещая с очисткой и сортированием.

MILLING RECOVERY RATE = СТАВКА ВЫДЕЛЕНИЯ ПРИ РУШЕНИИ – Milling Recovery Rate is the total milled Rice yield as a percentage of rough Rice yield.

MILLING WHEAT = ПОМОЛЬНАЯ ПШЕНИЦА (или МУКОМОЛЬНАЯ ПШЕНИЦА) – Wheat Cleaning and Milling:- Wheat is harvested by combines that cut the stalk remove and collect the seed, and either return the straw to the soil, to be plowed under with the stubble and thus provide hummus or compress and bale it for future use as litter, ensilage and so on. Wheat may be bagged in jute sack and stored in warehouses or it may be stored in bulk in elevators. The latter method provides the best protection against rodent and insect infestation. The moisture content of bulk stored Wheat should not be higher than 14.5% and that of sack stored Wheat not higher than 16%. Otherwise, microorganism may grow and cause heating and spoilage. When it is necessary to lower the moisture content of Wheat it may be dried in bins by blowing hot air (not higher in temperature than 175 degree F) across the bins. In preparing Wheat for milling, it is blown into hopper scales that record the quantity of uncleaned Wheat. Some of the coarser impurities are removed by this process. The grain then passes over a series of coarse and fine sleeves that further remove contaminating materials, including chaff and straw. Still in dry states stones may be removed by passing Wheat over short openings that allow the heavier stones to fall out of mass and be trapped. The Wheat is next passed over discs or cylinders containing indented surface that remove seeds short or longer than Wheat following a pass through a magnetic separator to remove any metals present. The next cleaning process is dry scouring to remove adhering dirt. The Wheat is then washed in water, a process that both removes dirt and adds 2–3% water to the grain. The added water is necessary to provide desirable conditions for milling. A stone trap is including in the washer. Excess water is removed by centrifugation. A second wet cleaning with a light brushing action is ordinarily used, followed by aspiration (blowing air through the grain), which is the final cleaning operation. The grain is then carried into a bin from which it is fed to the milling operation. This bin is located on the top floor of the flour mill, the grain having been elevate do this position during the various cleaning operation. In milling, grain is fed automatically though scale hoppers that regulate the flow of the seeds at rates corresponding to those of the following operations:- Milling may be carried out by passing the grain through a series of corrugated rolls rotating toward each other, which remove chunks of the endosperm from the bran. After each passage through the break rolls, the material is sifted through cloth, or wire sieve and separated according to particle size. The various streams of different sized flour particles are finally blended to provide the different grades of flour. The more finely ground flour is nearer to white but less nutritious than the coarser ground flour. This results from the more effective removal of bran and germ from finely ground flour. Impact milling is now used in some operations. With this method, the seed is broken open by impact in a machine. Flour particles of different sizes are separated by air classification or by centrifugation. While almost any Wheat can be milled, millers produce a wide range of flours with specifications tightly defined by bakers for each product. Millers analyze and then segregate each batch of wheat to meet the quality their customers require for each grist or blend. Milling quality Wheat is milled by first removing germ and outer bran layers amounting to approximately 8–10% of the weight of the Wheat in a pearling process. The pearled Wheat is then milled in a conventional roller mill to produce flour or semolina. Unexpectedly high yields have been observed, and the process yields a milled product which is unusually high in aleurone cell wall fragments for a given ash content.

MILLING YIELD = ВЫХОД ПРИ РУШЕНИИ – Milling Yield is an estimate of the quantity of whole kernels and total milled rice (whole and broken kernels combined) that are produced in the milling of rough rice to a well-milled degree. / количества целиковой зерновки (целых ядер) и .

MILLING YIELD/RECOVERY = ВЫХОД/ВЫДЕЛЕНИЕ ПРИ РУШЕНИИ – Milling Yield/Recovery is the estimate of the quantity of head rice (whole rice or nearly whole kernels) and of total milled rice that can be produced from a unit of rough rice. It is generally expressed as a percentage.

MILLION BRITISH THERMAL UNIT = МИЛЛИОН БРИТАНСКИХ ЕДИНИЦ ТЕПЛОТЫ – Million British Thermal Unit (MMBTU):- 1 MMBtu is equal to 1 million BTU (British Thermal Unit). Natural gas is measured in MMBtu's. 1 MMBtu = 28.263 682 m^3 of natural gas at defined temperature and pressure. 1 standard cubic foot of natural gas yields ≈1 030 BTU (between 1 010 BTU and 1 070 BTU, depending on quality, when burned). One million British thermal units (MMBtu), one dekatherm. Approximately equal to a thousand cubic feet (MCF) of natural gas. / Один миллион Британских единиц теплоты (МБет, в Англоязычном исполнении – MMBtu), одна декатермия. Приблизительно равен тысяче кубических футов (ТКФ, в Англоязычном исполнении – MCF) природного газа.

MILLITRON® PROCESS = МИЛЛИТРОНОВСКИЙ® ПРОЦЕСС – Millitron® Process is a computer-controlled, non-contact spray printing process that allows the production of intricate multicolored designs. Although this process was developed for carpets by Milliken & Co., it can also be used for upholstery, pile fabrics, and other textiles. / Милыкэн Энд Ко. (Milliken & Co.).

MILLIVOLT = МИЛЛИВОЛЬТ – MilliVolt (mV) is a common unit of electric potential equal to 0.001 Volt.

MILLIWATT = МИЛЛИВАТТ – MilliWatt (mW) is a common unit of power equal to 0.001 Watt.

MILLIWATT HOUR = МИЛЛИВАТТ ЧАС – MilliWatt hour (mW·h) is a common metric unit of work or energy, representing the energy delivered at a rate of one milliWatt for a period of one hour. This is equivalent to exactly 3.6 Joules (J) of energy, or about 0.003 412 Btu, 0.859 846 (small) calories, or about 2.655 foot pounds.

MILL PRICE = ЗАВОДСКАЯ ЦЕНА (или ФАБРИЧНАЯ ЦЕНА) – In the Cotton industry of the United States, Mill Price is the price for Cotton delivered to mills in Western North Carolina and South Carolina is commonly referred to as Group B Mill Price. These prices, including landing and brokerage costs, are quoted for Cotton of given grades and staples from given regions. The SLM 1-1/16-inch price is often compared with polyester staple and rayon staple prices to indicate cotton's competitive position in the raw fiber market.

MILL RIGS = XX – Mill Rigs:- the creases produced in the milling are known as mill rigs. Milling Defect. / Порок или дефект валяния (или валки).

MILL RUN = НЕСОРТНАЯ ПРОДУКЦИЯ (или ЗАВОДСКАЯ ВЫРАБОТКА) – Mill Run is the yarn, fabric, or other textile product that has not been inspected or that does not come up to the standard quality.

MILL SPLICES = ФАБРИЧНЫЕ СОЕДИНЕНИЯ ВНАКРОЙ – Mill Splices:- butted seams or splices which have been overlooked in the converting operation. Interlining defects. / Порок или дефект.

MILLWORK = СТОЛЯРНЫЕ ЗАГОТОВКИ (или СТОЛЯРНЫЕ ИЗДЕЛИЯ) – Millwork:- planed and patterned lumber for finish work in buildings, including items such as sash, doors, cornices, panelwork, and other items of interior or exterior trim, but not flooring or siding. / Строганый и профилированный пиломатериал для залючительных работ в зданиях, включая изделия, такие как оконные рамы, двери, карнизы, , и прочие изделия для внутреннего или внешнего выравнивания но не для полового покрытия или наружной обшивки.

MILL WRINKLE = ЗАВОДСКАЯ ЗАСЕЧКА (или ФАБРИЧНАЯ ЗАСЕЧКА) – Mill Wrinkle:- xxxxx. See also Crease. Fabrics defect. / Засечка – порок ткани. Засечки:- представляют собой полосы, окрашенные менее интенсивно, чем вся ткань, образуются при крашении в расправленном состоянии вследствие образования складок, часто из-за плохого оформления шва между кусками.

MIMC = MEMBER OF THE INSTITUTE OF MANAGEMENT CONSULTANTS

MIN = MINIMUM

MINAUDIÈRE® = МИНОДЬЕР® (или КОКЕТКА) – Minaudière® is a small evening bag made from precious metals and offen studded with precious or semiprecious gems. Minaudière®:- with its combination of grace and ingenuity, the Minaudière® precious case pays homage to the essence of femininity. In the Roaring Twenties, ladies began carrying their beauty accessories with them in a vanity case. While visiting his socialite friend Florence Jay Gould, Charles Arpels was surprised to see her tossing her lipstick, powder case, cigarettes, and lighter into a Lucky Strike cigarette tin. From this encounter, the idea for the Minaudière® precious case was born. This piece owes its name to Estelle, the wife of Alfred Van Cleef, whose mannerisms – or 'minauderies' – enchanted her entourage. The Minaudière® precious case provided compartments for an elegant lady's various items – make-up, comb, mirror, dance card, cigarette holder, and even a retractable watch – all enclosed within a luxurious case. The Minaudière® case has become one of the Maison's emblematic pieces. Examples range from the Volutes model with its sleek black lacquer surface and diamond clasp (1935) to the exquisite Haliades motif in white gold, diamonds, emeralds, and sapphires (2007). A timeless beauty, the Minaudière® evokes the spirit of Van Cleef & Arpels. / Minaudière = Жеманство или Жеманник или Жеманные или Манерничанье или Ломанье или Кривлянье или Кривляка. Шарль Арпэль (Charles Arpels). Минодьер® (от Французского слова Minaudière®, означающее Кокетничать) – это маленькая сумочка, имеющая жёсткую основу и оригинальную форму. Как правило, минодьер® – это вечерняя сумочка, поскольку отличается богатым декором и обильной отделкой. Дизайнеры щедро украшают клатчи-минодьеры® драгоценными камнями, золотом, кристаллами, бисером, стразами. Кроме того, минодьер® отличает яркий и оригинальный дизайн, например, сумочка может быть в форме десерта, животного и так далее. История Минодьера®:- самый первый минодьер® появился в 1920-е. Большую роль в возникновении этого миниатюрного аксессуара сыграла случайность. Известный в светских кругах сын продавца драгоценных камней, Шарль Арпэль (Charles Arpels), как-то заметил, что популярная светская львица того времени Флоренс Дьжей Гульд (Florence Jay Gould) складывала свои дамские мелочи в обычную металлическую коробочку. Шарль посчитал дурным тоном использование такого своеобразного футляра для женщины, имеющей столь весомое место в обществе. Так он создал маленькую сумочку с жёстким каркасом, в которую женщина могла положить свои дамские мелочи вроде зеркальца и губной помады. Тогда такая сумочка называлась Несессером. Первый несессер как произведение ювелирного искусства Шарль Арпэль создал, вдохновившись образом своей сестры Эстэль (Estelle). По мнению брата, Эстэль была 'та ещё кокетка'. Именно поэтому сумочка, украшенная драгоценными камнями, получила название Минодьер®. В 1890-х Эстэль Арпэль познакомилась с сыном ювелира и гранильщика Альфредом Ван Клифом (Alfred Van Cleef). Супружеский союз между молодыми людьми, начавшийся в 1895, положил начало не только великой любви, но и истории выдающего ювелирного дома Ван Клиф Энд Арпэльс (Van Cleef & Arpels). Именно ювелирный дом, основателями которого стали братья Арпэль и молодожёны Ван Клиф, запатентовал минодьер® как собственное изобретение. Вторым ярким именем в мире моды, популяризировавшим минодьеры®, стал брэнд Юдифь Лебэр (Judith Leiber). Основательница марки Юдифь Лебэр начинала с домашнего производства сумочек, которое потом переместилось на маленький заводик её друга. В 1963 году Юдифь создала собственную фирму имени себя, которая стала по-настоящему популярной только спустя 40 лет. И снова появлению её незабываемых сумочек-минодьеров® поспособствовал случай! Однажды Юдифь Лебэр заказала по почте подарок для своего друга, но получила в руки поцарапанную металлическую коробочку. Чтобы как-то спрятать эту царапину, Юдифь обклеила коробочку кристаллами. Почти через полвека, когда цена за усыпанную кристаллами сумочку достигла 5 тысяч Долларов США, к Юдифь Лебэр пришёл настоящий успех. Её сумочки носили несколько жен президентов США, а прочие состоятельные дамы и звёздные модницы устраивали за минодьерами® этого брэнда настоящую охоту. И немудрено! Ведь минодьер® от Юдифь Лебэр трудно назвать просто вечерней сумочкой. Он был и остаётся самым настоящим произведением искусства! Сумочки от Юдифь Лебэр имели самую необыкновенную форму. В коллекциях разных лет встречались сумочки в форме цветов, животных, фруктов, десертов, морских раковин, птиц. До сих пор минодьеры® от Юдифь Лебэр имеют огромную популярность. Миниатюрный минодьер® в виде глобуса на шнурке был представлен модным домом Шанэль (Chanel) в сезонной коллекции ready-to-wear. В такую сумочку вряд ли поместится даже губная помада, однако от этого она не станет менее желанной. Такой минодьер® гармонично завершит слегка небрежный рафинированный образ и охарактеризует свою хозяйку как внимательную к деталям. Дизайнеры марки Виктор Эн Ролф (Victor & Rolf) решили повторить форму флакона своего парфюма. Получился слегка футуристичный минодьер® с чёрными глянцевыми гранями в золотой оправе, который можно носить, держа за кожаный ремешок, или просто в руках. Как драгоценная шкатулка выглядит маленькая сумочка Ботэга Вэнета (Bottega Veneta). Декор, напоминающий фрагмент старинной лепнины, буквально переносит в богатые дворцы эпохи Возрождения. С таким аксессуаром каждая почувствует себя королевой! Поистине царский минодьер® предлагает и Дольчэ Э Габбана (Dolce & Gabbana). Минодьер®, выполненный в форме миниатюрного ридикюля, сплошь состоит из золотых металлических завитков, в которые словно вплетены разноцветные камни и эмаль. Чем не шкатулка с секретами Византийской принцессы! Марка Kotur предлагает соригинальничать и создать минодьер® с собственным неповторимым дизайном. К атласной прямоугольной сумочке с закруглёнными углами прилагается набор самоклеящихся стразов и набор разноцветных глиттеров. Помимо традиционных роскошных вариантов, модный сезон предлагает и более доступные по цене минодьеры®, которые нисколько не уступают люксовым 'собратьям'. Кроме того, модные минодьеры® от демократичных марок – это лишь подтверждение того, что модный аксессуар может быть не только роскошным или вычурным, но и оригинальным и стильным. Об этом говорят и искусно расшитые камнями минодьеры® от Эксэсорайз (Accessorize), металлическая коробочка от Сара (Zara) и неповторимый дизайн минодьеров® от To Be Queen.

MINERAL FIBERS = МИНЕРАЛЬНЫЕ ВОЛОКНА (или ВОЛОКНА МИНЕРАЛЬНОГО ПРОИСХОЖДЕНИЯ) – Mineral Fibers is a generic term for all non-metallic, inorganic fibers, which may be natural, such as asbestos, or manufactured from such sources as rock, ore, alloys, slag, or glass. See also Natural Fibers. Mineral Fibers:- textile raw material obtained from minerals in the earth, such as asbestos, silver, gold, copper, and the like.

MINERAL IMPURITIES = МИНЕРАЛЬНЫЕ ПРИМЕСИ – For dried edible fungi, Mineral Impurities means those substances which, after ashing, remain as insoluble residues in hydrochloric acid. Organic impurities of vegetable origin means admixtures of other edible fungi, parts of plants such as leaves, pine needles, etc. Also known as Dirt. / Примеси естественного неорганического происхождения такие, как земля, песок и пыль.

MINERALIZATION = МИНЕРАЛИЗАЦИЯ – Mineralization is the conversion of an element from an organic form to an inorganic state as a result of microbial decomposition.

MINERAL MATTER = МИНЕРАЛЬНЫЕ ПРИМЕСИ – Mineral Matter refers to stones, earth pellets, and fertilizer pellets that may be found in samples of grain. / К Минеральным Примесям относятся камни, комочки земли и комочки удобрений, которые могут находиться в пробах зерна.

MINERAL OIL = МИНЕРАЛЬНОЕ МАСЛО – Mineral Oil is an oil derived from a mineral source, such as petroleum, as opposed to oils derived from plants and animals.

MINERALS = МИНЕРАЛЫ – Minerals are solid particles other than organic matter which act as major components of soils and sources of nutrient elements. / Под Минералом, от позднелатинского слова Minera, означающее Руда, понимается природное тело, приблизительно однородное по химическому составу и физическим свойствам, образующееся в результате физико-химических процессов в глубинах и на поверхности Земли. Известно около 3 000 минеральных видов; наиболее распространены:- силикаты (около 25% от общего числа минералов); окислы и гидроокислы (около 12%); сульфиды и их аналоги (около 13%); фосфаты, арсенаты, ванадаты (около 18%). Физические и химические свойства минералов обусловлены их кристаллической структурой и химическим составом. В основу классификации минералов положены различия в типах химических соединений, кристаллических структур и их пространственных мотивов (островные, цепочечные, слоистые и другие). Диагностическими признаками минералов являются:- форма выделений, цвет, плотность, твёрдость механические, оптические, магнитные, электрические и другие свойства. Минералы входят также в состав метеоритов; обнаружены на Луне и Марсе. Под Минералом, от Французского слова Minéral, от позднелатинского слова Minera, означающее Руда, понимается природное тело, приблизительно однородное по химическому составу и физическим свойствам, образующееся в результате физико-химических процессов на поверхности или в глубинах Земли (и других космических тел), главным образом как составная часть горных пород, руд, метеоритов. Минералы в подавляющем большинстве – твёрдые тела, подчиняющиеся всем законам физики твёрдого тела; реже встречаются жидкие минералы (например, ртуть самородная). Отнесение воды к минералам – вопрос дискуссионный, но лёд общепринято считать минералом. Различают минералы кристаллические, аморфные – метаколлоиды (например, опалы, лешательерит, лимонит и другие) и метамиктные минералы, имеющие внешнюю форму кристаллов, но находящиеся в аморфном, стеклоподобном состоянии. Каждый минерал (минеральный вид) представляет собой природное соединение определённого состава с присущей ему кристаллической структурой. Модификации минералов одинакового состава (например, алмаз – графит, кальцит – арагонит), но имеющие различную кристаллическую структуру, относятся к различным минеральным видам; наоборот, изоморфные ряды минералов (например, оливины, вольфрамиты, колумбиты) с изменяющимся в определённых пределах составом, но с постоянной структурой, относят к одному минеральному виду. Минералы, у которых небольшие изменения в химическом составе, некоторых свойствах (например, окраске) или морфологических особенностях не приводят к резким различиям в структуре (например, в разновидностях кварца – горном хрустале, аметисте, цитрине, халцедоне), называются Минеральными Разновидностями. Единичные кристаллы, зёрна и другие минеральные тела, отделённые друг от друга физическими поверхностями раздела, относятся к минеральным индивидам. Сростки минеральных индивидов образуют минеральный агрегат. В природе найдено и изучено около 2 500 минеральных видов и примерно столько же разновидностей. Ежегодно открывается около 30 новых минеральных видов. Большинство минералов представлено ионными структурами (смотрите Кристаллохимия). Менее распространены ковалентные и интерметаллические структуры. Молекулярные решётки в природе весьма редки (например, реальгар AsS, сера самородная, битумы и смолы). Реальные структуры минералов характеризуются наличием дефектов в кристаллах (вакансий, примесных и межузельных атомов или ионов) и дислокаций. Нередко в минералах возникают так называемые неупорядоченные структуры, характеризующиеся нарушением правильного порядка расположения ионов в решётке и тенденцией к их последующему перераспределению, направленному к повышению степени упорядоченности (например, в полевых шпатах). Отдельные структурные элементы кристаллической решётки минералов (слои, пакеты, цепочки и тому подобные) могут быть несколько смещены относительно друг друга при полном сохранении структуры внутри этих элементов. В результате возникают политипные модификации (политипы), характеризующиеся одинаковыми параметрами элементарной ячейки в двух направлениях и третьим – переменным. Политипы особенно часто появляются у слоистых минералов (например:- слюд, графита, молибденита, глинистых минералов). В отличие от образования полиморфных модификаций (смотрите Полиморфизм), переход одного политипа в другой происходит не скачкообразно, а постепенно и не сопровождается резким тепловым эффектом, что объясняет существование в природе при одинаковых термодинамических условиях нескольких политипных модификаций минералов. Если явление полиморфизма связано с изменениями температуры и давления, то политипия минералов, по-видимому, зависит в первую очередь от условий роста кристаллов. Изучение явлений упорядочения, структурных дефектов, политипии и других отклонений в строении реальных минералов от идеальных структур помогает расшифровать термодинамические условия образования минералов. Химический Состав, Формулы И Классификация:- Роль химических элементов в структуре минералов различна:- одни являются главными и определяют основной состав минералов; другие, будучи по свойствам и строению атомов (ионов) близки к главным, присутствуют в минералах преимущественно в виде изоморфных (смотрите Изоморфизм) примесей (например, Pd, Ge, In, Cd, Ga, Tl, Se, I, Br, Re, Rb, многие редкоземельные). Для химии минералов характерно резкое преобладание соединений переменного состава, представляющих однородные смешанные кристаллы (твёрдые растворы) – изоморфные ряды минералов. Этим, а также различной степенью упорядоченности структуры, определяются колебания физических и химических свойств внутри одного минерального вида:- например, плотности, твёрдости, цвета, показателя преломления, магнитной восприимчивости, температуры плавления и других. Сложность и недостаточное постоянство состава минералов определяются явлениями изоморфизма, наличием субмикроскопических включений, а также явлениями сорбции, которые имеют место при образовании минералов из коллоидных систем (например, урансодержащие опалы, лимониты, монтмориллониты и другие). Субмикроскопические включения в минералах могут возникать:- (а) вследствие захвата дисперсных примесей в процессе кристаллизации из расплава, раствора и других сред (например, газово-жидкие включения в кварце, включения гематита в полевом шпате); (б) при распаде твёрдых растворов вследствие изменения температурных

условий (образование пертитов у полевых шпатов, распад сложных сульфидов и сложных окислов); (в) при метамиктных превращениях; (г) явлениях замещения одного минерала другим или вторичных изменениях. Многие минералы (например, магнетит) постоянно содержат различные микровключения. В природе наиболее распространены минералы класса силикатов – около 25% от общего числа минералов; окислы и гидроокислы – около 12%; сульфиды и их аналоги составляют около 13%; фосфаты, арсенаты (ванадаты) – около 18%; прочие природные химические соединения – 32%. Земная кора на 92% сложена силикатами, окислами и гидроокислами. По типу химических соединений минералы подразделяются на простые тела (самородные элементы) и составные (бинарные и прочие). Помимо простых анионов S^{2-}, O^{2-}, OH^{-}, Cl^{-} и другие, в структурах часты комплексные солеобразующие анионные радикалы $(CO_3)^{2-}$, $(SiO_4)^{4-}$, $(PO_4)^{3-}$ и другие. В зависимости от состава простого или комплексного аниона среди минералов выделяют сульфиды и их аналоги, окислы, галогениды, соли кислородных кислот. В основу современной классификации минералов положены различия в типах химических соединений и кристаллических решёток. Состав минералов определённого структурного типа, а также закономерные его изменения при изоморфизме определяются строением и кристаллохимическими характеристиками слагающих атомов (ионов), их радиусами, координационными числами и типом химической связи. Конституция (состав и структура) минералов выражается кристаллохимическими формулами, в которых указываются:- (а) валентность иона (если присутствуют элементы в различной степени валентности); (б) комплексные анионы (в квадратных скобках), например, $(SiO_4)^{4-}$, $(AlO_4)^{5-}$; (в) изоморфные группы элементов, заключающиеся в круглые скобки и отделяющиеся друг от друга запятыми; при этом элементы, находящиеся в большем количестве, пишутся на первом месте; (г) дополнительные анионы OH^{-}, F^{-}, Cl^{-}, O^{2-} и другие, помещающиеся после анионного радикала; (д) молекулы воды в кристаллогидратах (в конце формулы, соединяются с ней через точку); (е) цеолитная или адсорбционная вода показывается также в конце формулы, пишется через точку и обозначается nH_2O; (ж) недостаток атомов в дефектных структурах отмечается буквой x; (з) если катионы в структуре минералов занимают различное положение, то в формуле они показываются раздельно, при этом координационное число их обозначается Римскими цифрами в показателе и справа от символа элемента. Примеры развёрнутого кристаллохимического написания формул минералов:- магнетит $Fe^{2+}\ Fe_2^{3+}\ O_4$; андалузит $Al^{VI}\ Al^{V}(SiO_4)O$; гипс $Ca(SO_4)x2H_2O$; пирротин $Fe_{1-x}\ S$, флогопит $K(Mg,\ Fe)_3\ (AlSi_3O_{10})\ (OH,F)_2$; опал SiO_2xnH_2O. Морфология Минералов определяется их внутренней структурой и условиями образования. Размер отдельных минеральных индивидов широко варьирует:- от 1–100 нм (коллоидные минералы) до 10 м (например, кристаллы сподумена в пегматитах). В зависимости от кристаллической структуры и условий роста возникают кристаллы минералов различного облика (габитуса) – изометрического (например, галит, галенит, сфалерит, оливин и другие), листоватого и чешуйчатого (например, молибденит, слюды, тальк), дощатого (например, барит), столбчатого и игольчатого (рутил, актинолит, турмалин). На некоторых кристаллах минералов наблюдается характерная штриховка, а также формы роста и растворения. Детально изучая морфологию минералов и скульптуру граней, то есть проводя кристалломорфологические исследования, можно воссоздать историю образования минеральных индивидов. Наряду с отдельными кристаллами минералов в природе образуются также сростки минералов, как закономерно ориентированные по отношению друг к другу (двойники, параллельные и эпитаксические сростки), так и без взаимной ориентации (минеральные агрегаты). По морфологии агрегатов выделяются друзы (щётки), дендриты, зернистые, плотные и землистые массы, оолиты и сферолиты, секреции и конкреции, различные натёчные агрегаты минералов, особенно характерные для минералов экзогенного происхождения. Изучение морфологии минеральных агрегатов составляет содержание особого раздела минералогии – онтогенического анализа минералов. Знание морфологических особенностей минералов помогает быстро их определять. Физические Свойства Минералов обусловлены кристаллической структурой и химическим составом. Вследствие изоморфизма, микронеоднородности, разупорядоченности, наличия дефектов и других особенностей в природных кристаллах минералов, свойства их обычно не являются строго постоянными. Физические свойства минералов подразделяют на скалярные (например, плотность) и векторные, имеющие различную величину в зависимости от кристаллографических направления (например, твёрдость, кристаллооптические свойства и другие). К физическим свойствам минералов, которые наряду с формами выделений служат основой их диагностики, относятся плотность, механические, оптические, люминесцентные, магнитные, электрические, термические свойства, радиоактивность. По плотности минералы подразделяются на:- лёгкие (до 2 500 килограммов на кубический метр (кг/м^3)), средние (от 2 500 до 4 000 кг/м^3) – преобладающая масса минералов, тяжёлые (от 4 000 до 8 000 кг/м^3) и весьма тяжёлые (более 8 000 кг/м^3). Плотность минералов зависит от массы атомов или ионов, входящих в кристаллическую структуру, и характера их упаковки, а также от присутствия в минералах добавочных анионов (OH^{-}, F^{-} и других) и воды. Механические свойства включают твёрдость (смотрите Твёрдость Минералов), хрупкость, ковкость, спайность (смотрите Спайность Минералов), отдельность (смотрите Отдельность Минералов), излом, гибкость, упругость. При диагностике обычно определяется относительная твёрдость минералов в соответствии со Шкалой Мооса (или Шкалой Моса (The Mohs Scale); предложена Немецким учёным Карлем Фридрихем Кристианом Мосом (Carl Friedrich Christian Mohs; 1773–1839) в 1811). Спайность – весьма совершенная, совершенная, средняя (ясная), несовершенная (неясная) и весьма несовершенная – выражается в способности минерала раскалываться по определённым направлениям (параллельным сеткам кристаллической решётки с наибольшей ретикулярной плотностью атомов и наименьшей силой сцепления между ними). Излом (ровный ступенчатый, неровный, занозистый, раковистый и другие) характеризуют поверхности раскола минерала, произошедшего не по спайности. Оптические свойства (смотрите Кристаллооптика) – цвет минералов, блеск, степень прозрачности, светопреломление, светоотражение, плеохроизм – могут быть изучены на отдельных участках зёрен минерала с помощью оптической микроскопии в видимой, ультрафиолетовой и инфракрасной областях спектра. Блеск минералов (металлический, полуметаллический и неметаллический – алмазный, стеклянный, жирный, восковой, шелковистый, перламутровый и другие) обусловлен количеством отражаемого от поверхности минерала света и зависит от его показателя преломления. По прозрачности минералы разделяются на прозрачные, полупрозрачные, просвечивающие в тонких осколках и непрозрачные. Количественное определение светопреломления и светоотражения минералов возможно только под микроскопом, равно как и определение плеохроизма. Большинство других физических свойств минералов (люминесцентные, магнитные, электрические, радиоактивные и другие) рассматривается в специальных статьях (смотрите Люминесценция, Магнетизм, Пьезоэлектричество, Радиоактивные Минералы). В современной минералогии возникло и успешно развивается особое направление – физика минералов. Диагностика Минералов производится предварительно в полевых условиях главным образом по внешним физическим признакам – форме выделения и их окраске, облику и характеру симметрии кристаллов, цвету черты, блеску, спайности, излому и относительной твёрдости. С помощью магнитной стрелки компаса определяются ферромагнитные минералы (магнетит, пирротин). Карбонаты легко диагностируются по ‘вскипанию’ с HCl. Иногда используются качественные химические реакции. Существуют специальные определители, позволяющие по этим данным относить обнаруженный минерал к определённому минеральному виду. Многие минералы (например, глинистые) в полевых условиях диагностировать нельзя. В лабораторных условиях элементный состав минерала определяют методами классического химического анализа, а также эмиссионного или атомно-адсорбционного спектрохимического анализа. Прозрачные и просвечивающие минералы исследуют в проходящем свете с помощью поляризационного микроскопа, непрозрачные минералы изучают в отражённом свете на специальных микроскопах. Точная диагностика ряда минералов

производится с помощью Рентгенограмм. Тонкодисперсные минералы, которые показывают нечёткие линии на Рентгеновских порошкограммах (дебаеграммах или дифрактограммах), исследуют электронографическим методом под электронным микроскопом. Для быстрой диагностики некоторых люминесцирующих минералов (например, шеелита) применяют специальные приборы – люминоскопы. Для решения вопроса о форме вхождения воды в состав минерала используют термический анализ (дифференциальные кривые нагревания, кривые потери веса), инфракрасную спектроскопию, ядерный магнитный резонанс, а для определения формы вхождения элемента-примеси в состав минерала – Рентгеновский микроанализатор с электронным зондом, электронный парамагнитный резонанс; в некоторых случаях применяются люминесцентные и радиографический (для U и Th) методы. Явления структурного упорядочения минералов и политипии изучаются методами Рентгеновской дифрактометрии и электронографии. Условия Нахождения И Образования:- По распространённости в природе все минералы разделяют на породообразующие и рудообразующие (принимающие существенное участие в составе горных пород или руд), второстепенные, или акцессорные (при содержании не более 1%), редко встречающиеся и весьма редкие, обнаруженные только в единичных случаях. Такое разделение условно, поскольку минералы, чрезвычайно редко образующиеся в одних природных процессах, оказываются широко распространёнными в других геологических условиях. Каждый минерал имеет свою историю развития, возникая в конкретных геологических и физико-химических условиях вследствие определённых природных геохимических процессов. В своём развитии минерал проходит стадию зарождения, роста и изменения. Эволюция минеральных индивидов и агрегатов во времени, охватывающая все указанные стадии, объединена Советским учёным Дмитрием Павловичем Григорьевым (1909–2003) в 1961 под названием Онтогения Минералов. Зарождение минерала может происходить из различных по фазовому состоянию сред (расплава, раствора, газа) во взвешенном состоянии или на каком-нибудь субстрате. В процессе роста минерал изоморфно или механически захватывает примеси, находящиеся в минералообразующей среде (вследствие чего возникает зональное строение минерала), и жидкие, газово-жидкие и газовые включения самой среды. При изменении физико-химической обстановки (например, падение температуры, увеличение давления, приток новых растворов и так далее) могут происходить следующие явления:- (а) деформации, приводящие к механическому двойникованию, появлению дислокаций, мозаичного и блочного строения; (б) растворение минерала, о котором свидетельствуют специфические фигуры на гранях; (в) полиморфные превращения; (г) распад твёрдых растворов; (д) перекристаллизация; (е) процессы химического изменения, приводящие к замещению одних минералов другими. Если при этих замещениях сохраняется внешняя форма ранее существовавшего минерала, возникают псевдоморфозы (например, лимонита по пириту). Псевдоморфозы, у которых первичный и образующийся по нему вторичный минералы представлены полиморфными модификациями одного состава, называют параморфозами (например, сфалерита по вюртциту, графита по алмазу). Возникая вследствие различных реакций, любой минерал не встречается изолированно, а всегда сопровождается другими минералами. Эти минеральные ассоциации, закономерно образующиеся в ходе единого процесса, ограниченного в пространстве и во времени и протекающего в определенных физико-химических условиях, называются Парагенезисом Минералов или Парагенетическими Ассоциациями. Количество возможных устойчивых минералов в парагенетической ассоциации определяется минералогическим правилом фаз. Поскольку природные процессы протекают в условиях меняющихся температуры, давления и концентрации компонентов, то в ходе их развития одни парагенетические ассоциации минералов закономерно сменяются другими. Исследование возникающих ассоциаций минералов с помощью физико-химических диаграмм (состав – парагенезис) является основой парагенетического анализа, разработанного Советским учёным Дмитрием Сергеевичем Коржинским (1899–1985). Этот метод позволяет предсказывать нахождение минерала в той или иной ассоциации, а также выделять различные стадии процесса минералообразования. Минерал может встречаться на одном месторождении в разных парагенетических ассоциациях, то есть выделяться на разных стадиях. Такие разновременные выделения одного и того же минерала называются Генерациями. Являясь продуктом природных реакций, минерал причинно связан с образующей его средой, её фазовым состоянием и физико-химическими параметрами. Всё это отражается на составе и свойствах минерала, который приобретает на каждой стадии развития процесса минералообразования свои специфические типоморфные черты. Под типоморфизмом понимают сумму химических, структурных и физических признаков минерала, связанных причинно-следственными отношениями со средой, в которой минерал образовался. Типоморфными могут быть как сами минералы или их парагенезисы, так и отдельные их признаки. Типоморфные особенности минералов можно использовать для установления генезиса минералов, а также как поисковые признаки при геологоразведочных работах. Минералы возникают при эндогенных, экзогенных и метаморфогенных процессах. Современное понятие ‘Генезис Минералов’ включает характеристику ряда явлений, обусловливающих возникновение минералов, в том числе:- (а) химизм процесса минералообразования; (б) фазовое состояние среды минералообразования; (в) физико-химичские параметры системы, при которых происходило возникновение минералов (температура, давление, активность компонентов, кислородный потенциал, режим основности – кислотности); (г) механизм зарождения, роста и развития минерала, в частности способ его образования (свободная кристаллизация, метасоматическое развитие, перекристаллизация, раскристаллизация гелей и другие); (д) процессы последующего изменения минералов и явления метаморфизма; (е) источник вещества. Главнейшими путями определения генезиса минералов являются:- (а) наблюдения геологических условий нахождения минералов; (б) выявление типоморфных особенностей минералов; (в) парагенетический анализ; (г) онтогенические исследования; (д) изучение газово-жидких включений в минералах; (е) расчёты термодинамических характеристик природных реакций; (ж) определение термодинамических параметров по различным геотермометрам и геобарометрам; (з) изучение физико-химических систем; (и) экспериментальное моделирование возможных природных процессов образования минералов; (к) изучение изотопного состава минералов. Получение объективных количественных данных, характеризующих генезис минералов, позволяет восстанавливать геологические процессы и историю формирования месторождений полезных ископаемых и тем самым создать научную основу для их поисков, разведки и промышленной оценки. Применение:- Свойства минералов определяют области их применения в технике. Так, например, весьма твёрдые минералы (алмаз, корунд, гранаты и другие) применяются как абразивы; минералы с пьезоэлектрическими свойствами используются в радиоэлектронике и так далее. На различиях физических свойств минералов (главным образом плотности, упругих, магнитных, электрических, поверхностных, радиоактивных и других) основаны методы обогащения руд, а также геофизические методы разведки месторождений полезных ископаемых. В этой связи особо важное значение приобретает всестороннее изучение свойств и особенностей минералов. Большие перспективы открывает возможность направленного изменения свойств минералов путём ‘генерирования’ или ‘залечивания’ дефектов кристаллической решётки, что может быть осуществлено разными путями – механическим, акустическим (ультразвуковая обработка), термическим (нагреванием и последующим быстрым или медленным охлаждением), химическим (протравливанием, обработкой реагентами, способными ‘легировать’ поверхность минералов примесными ионами), радиационным (облучением Рентгеновскими и Гамма-лучами, потоками быстрых частиц и тому подобным). На современном этапе развития (1980-е) промышленность использует не более 15% всех известных минералов. Детальное изучение распространённости, состава и свойств минералов позволяет вовлекать в сферу практического применения всё новые минеральные виды, используя при этом почти все элементы Таблицы Менделеева,

заключённые в различных минералах в форме основных компонентов (руды чёрных, цветных, частично редких металлов) или элементов-примесей (рассеянные элементы). Широкое применение в оптике, радиоэлектронной технике, в электроэнергетике приобрели монокристаллы минералов и их синтетические аналоги. Некоторые минералы являются драгоценными и поделочными камнями. В число объектов изучения минералогов все шире вовлекаются минералы Луны, космических тел и минералы мантии Земли.

MINERAL SEAL OIL = МИНЕРАЛЬНОЕ ТЮЛЕНЬЕ МАСЛО (или МИНЕРАЛЬНЫЙ ЗАМЕНИТЕЛЬ ТЮЛЕНЬЕГО ЖИРА) – Mineral Seal Oil is a distillation fraction between kerosene and gas oil, widely used as a solvent oil in gas adsorption processes, as a lubricant for the rolling of metal foil, and as a base oil in many specialty formulations. Mineral seal oil takes its name – not from any sealing function – but from the fact that it originally replaced oil derived from seal blubber for use as an illuminant for signal lamps and lighthouses. / получаемое из жира морских тюленей для использования в качестве осветительного средства сигнальных ламп и маяков.

MINERAL SPIRITS = МИНЕРАЛЬНЫЕ СПИРТЫ (или ЛИГРОИНЫ) – Mineral Spirits:- a petroleum derived solvent similar to gasoline, used primarily for thinning alkyd and other oil based coatings such as paint, stain, and varnish. / такие как краска, морилка, и лак. Под Лигроином понимается смесь углеводородов, фракция нефти, выкипающая в интервале температур 120–240 °C. Наполнитель жидкостных приборов, растворитель, топливо для тракторов. Посредством риформинга лигроин перерабатывают в высокооктановый бензин. Лигроин применяется как растворитель в лакокрасочной промышленности и наполнитель в жидкостных приборах. Тяжёлые лигроиновые фракции используются также как сырьё для получения высокооктановых бензинов риформингом и другими способами. Ранее лигроин употреблялся в качестве моторного топлива для тракторов.

MINER'S HEAD = ВТУЛКА–ГОЛОВКА МАЙНЁРА – Miner's Head is an accelerating head used on walking (or great) wheels. Miner's Head is an accelerating head with an additional pulley to increase the ratio. Wheel-heads made in Chesterfield were manufactured according to patents 1803 and 1810 owned by Amos Miner from upstate New York. Miner's 1810 patent gave him exclusive right to manufacture, or license the manufacture of, his wheels until 1824. After the expiration of the patent Chesterfield became the center of manufacturing wheel-heads in New England. / Эймэс Майнё (Amos Miner).

MIN GEN = XX – Min Gen (in electricity):- an emergency declaration for periods of light load.

MINGLED PILE = СМЕШАННЫЙ ВОРС – Mingled Pile:- terry loops of contrasting color appearing on the wrong side of the fabric. Note:- this defect is commonly caused by interference with the formation of individual pile loops, as the result of incorrect shedding, drawing-in, etc. / Смешанный Ворс (Mingled Pile):- порок ткани; махровые петли контрастного цвета, появляющиеся на изнанке ткани. Примечание:- этот порок обычно вызывается неправильной проборкой нитей основы.

MINI = МИНИ (или МАЛЫЙ) – In the futures trading, a term Mini refers to a futures contract that has a smaller contract size than an otherwise identical futures contract. / В торговле фьючерсами, относится к фьючерсному контракту, который имеет более меньший размер контракта, нежели тождественный фьючерсный контракт.

MINI–BRIDGE = МИНИМОСТ (или МАЛЫЙ ОТРЕЗОК) – Mini-Bridge:- cargo moving on one bill of lading from a foreign port through two US ports and to an inland destination. A joint rail/ocean movement between a US port and a foreign country.

MINIKIT TRIAL = ОПЫТ С МИНИНАБОРОМ (или ИСПЫТАНИЕ С МИНИНАБОРОМ) – Minikit Trial is an extremely small trial with a small number of varieties tested in farmers' fields.

MINI LAND BRIDGE = С МАЛЫМ НАЗЕМНЫМ ОТРЕЗКОМ – An abbreviation for Mini Land Bridge (MLB) containers moving from a foreign country by vessel, and then sent to an inland point in the United States or elsewhere by land transportation (rail or truck). See also Land Bridge. An intermodal system for transporting containers by ocean and then by rail or motor to a port previously served as an all-water move, e.g., Hong Kong to New York over Seattle. Miniland Bridge is the process of taking inland cargo bound for export to the coast by rail and loading it directly to the ship. Cargo moves port to port via land; port to port via rail; port destination served overland by rail. / Обозначение . , например, .

MINIMUM ABSORBED DOSE = МИНИМАЛЬНАЯ ПОГЛОЩЁННАЯ ДОЗА – Minimum Absorbed Dose (Dmin) is the localized minimum absorbed dose within the process load. See also Absorbed Dose. / Смотрите также Поглощённая Доза (Absorbed Dose).

MINIMUM BID RATE = МИНИМАЛЬНАЯ СТАВКА ПРЕДЛОЖЕНИЯ – The Minimum Bid Rate is a minimum rate in the main refinancing operations. It is determined by the Governing Council, normally at the first meeting of each month. Minimum Bid Rate is the lower limit to the interest rates at which counterparties may submit bids in the variable rate tenders of the main refinancing operations. This is one of the Key ECB Interest Rates reflecting the stance of monetary policy. See also Key ECB Interest Rates. / Смотрите также Ключевые Процентные Ставки ЕЦБ (Key ECB Interest Rates).

MINIMUM BILL OF LADING = МАЛЫЙ КОНОСАМЕНТ (или МИНИМАЛЬНЫЙ КОНОСАМЕНТ) – Minimum Bill Of Lading:- a clause in a Bill of lading which specifies the least charge that the carrier will make for issuing a lading. The charge may be a definite sum or the current charge per ton for any specified quantity. The least amount you can charge per individual Bill of Lading.

MINIMUM CARE = МИНИМАЛЬНЫЙ УХОД – Minimum Care is a term describing home laundering methods. Minimum care fabrics, garments, and household textile articles can be washed satisfactorily by normal home laundering methods and can be used or worn after light ironing. Light ironing denotes ironing without starching or dampening and with a relatively small expenditure of physical effort. / Стойкость ткани к стирке, к моли, плесени и так далее.

MINIMUM CHARGE = МИНИМАЛЬНЫЙ СБОР – Minimum Charge is the lowest charge that can be assessed to transport a shipment. The lowest amount which applies to the transport of a consignment, irrespective of weight or volume.

MINIMUM CIRCUIT AMPERES = АМПЕР ПРИ МИНИМАЛЬНОМ ТОКЕ – Minimum Circuit Amperes (MCA) is the minimum current rating allowed for the wiring and circuit breaker or fuse protection for the equipment. It is used by the installer and electrician to size the branch circuit to feed the equipment.

MINIMUM PREMIUM = МИНИМАЛЬНАЯ ПРЕМИЯ – In insurance, Minimum Premium is the minimum amount that is payable to an insurer or reinsurer as a premium in respect of a insurance or, more commonly, reinsurance contract which provides for a deposit premium. The minimum premium may be the same as the deposit premium or a different figure. The smallest premium which an insurance company will accept for writing a particular policy or bond for a designated period.

MINIMUM PRICE CONTRACT = КОНТРАКТ С МИНИМАЛЬНОЙ ЦЕНОЙ – Minimum Price Contract:- a hybrid commercial forward contract for agricultural products that includes a provision guaranteeing the person making delivery a minimum price for the product.

For agricultural commodities, these contracts became much more common with the introduction of exchange-traded options on futures contracts, which permit buyers to hedge the price risks associated with such contracts. Minimum Price Contract is a contract that establishes a minimum (floor) sale price while allowing the seller to capture a higher price if prices rise. Minimum Price Contract is an agreement in which a minimum sale price is established. During the contract period the producer is guaranteed either the current cash price or the minimum sale price previously established whichever is greater. In exchange for the minimum price guarantee the producer must pay a fee similar in size to an option premium. See also Basis Contract; Delayed Payment Contract; Elevator Cash Contract; Forward Contract; Hedge-To-Arrive Contract; Offer Contract; and Price-Later (Delayed Price) Contract.

MINIMUM PRICE FLUCTUATION = МИНИМАЛЬНАЯ ФЛУКТУАЦИЯ ЦЕНЫ (или МИНИМАЛЬНОЕ КОЛЕБАНИЕ ЦЕНЫ) – Minimum Price Fluctuation is the minimum unit by which the price of an asset or an options premium can fluctuate per trade. Minimum Price Fluctuation is the smallest allowable increment of price movement possible in trading a given futures or option contract. Also known as Tick, or Tick Size. See also Point. / Наименьший возможный в торговле шаг в движении цены данного фьючерсного или опционного контракта. Известно также как Шаг (Tick) или Размер Шага (Tick Size). Смотрите также Пункт (Point).

MINIMUM RESERVE RATES = СТАВКИ МИНИМАЛЬНОГО РЕЗЕРВА – Minimum Reserve Rates:- the minimum reserve is an interest-free minimum deposit that commercial banks are obliged to maintain with the central bank. The minium reserve is a monetary policy instrument that central banks have to control the commercial banks' demand for central bank money. It is specified as a percentage of the customers' deposits at the respective commercial bank. The money deposited with the central bank within the framework of the minimum reserve rate cannot be lent. / В настоящее время Минимальные Резервы – это часть банковских активов, которые любой коммерческий банк обязан хранить на счетах центрального банка. Минимальные резервы выполняют две основные функции. Во-первых, они как ликвидные резервы служат обеспечением обязательств коммерческих банков по депозитам их клиентов. Периодическим изменением нормы обязательных резервов центральный банк поддерживает степень ликвидности коммерческих банков на минимально допустимом уровне в зависимости от экономической ситуации. Во-вторых, минимальные резервы являются инструментом, используемым центральным банком для регулирования объёма денежной массы в стране.

MINIMUM RESERVE REQUIREMENT = ТРЕБОВАНИЕ К МИНИМАЛЬНОМУ РЕЗЕРВУ (или ТРЕБОВАНИЕ К МИНИМУМУ РЕЗЕРВОВ) – Minimum Reserve Requirement is the obligation for credit institutions to keep a deposit with the central bank. The minimum reserve requirement for an individual institution is calculated as a percentage of the money deposited by the (nonbank) customers of this institution. The Eurosystem requires credit institutions to hold minimum reserves in accounts with the national central banks. Each credit institution must keep a certain percentage of some of its own customer deposits (as well as of some other bank liabilities) in a deposit account with the relevant national central bank on average over a reserve maintenance period of around one month. The Eurosystem pays a short-term interest rate on these accounts. The purpose of the minimum reserve system is to stabilize money market interest rates and create (or enlarge) a structural liquidity deficit in the banking system.

MINIMUM RESERVES = МИНИМАЛЬНЫЕ РЕЗЕРВЫ – Minimum Reserves:- the European Central Bank (ECB) requires credit institutions to hold compulsory deposits on accounts with the national central banks (NCBs):- these are called 'Minimum' or 'Required' Reserves. The amount of required reserves to be held by each institution is determined by its reserve base. In order to determine an institution's reserve requirement, the reserve base is multiplied by the reserve ratio. The ECB applies a uniform positive reserve ratio to most of the balance sheet items included in the reserve base. This reserve ratio was set at 2% at the start of Stage Three of European Economic and Monetary Union (EMU) and is lowered to 1% from 18 January 2012. As noted above, the reserve requirement for each individual institution is calculated by applying the reserve ratio to the reserve base. Institutions have to deduct a uniform lump-sum allowance of EUR100 000 (€) from their reserve requirement. This allowance is designed to reduce the administrative costs arising from managing very small reserve requirements. In order to meet their reserve requirements, credit institutions have to hold balances on their current accounts with the NCBs. This means that compliance with minimum reserve requirements is determined on the basis of the average daily balances on the counterparties' reserve accounts over one reserve maintenance period. The Eurosystem aims to ensure that the minimum reserve system neither puts a burden on the banking system in the euro area nor hinders the efficient allocation of resources. For this reason, credit institutions' holdings of required reserves are remunerated. The remuneration corresponds to the marginal rate (weighted according to the number of calendar days) of the main refinancing operations during the reserve maintenance period. This rate is therefore very close to the short-term money market rates. The key functions of the minimum reserve system are to stabilise money market interest rates and to enlarge the structural liquidity shortage of the banking system (Source:- The Monetary Policy of the ECB. European Central Bank, Frankfurt 2004). Data on the amount of required minimum reserves and their fulfilment are published on page *42 of the statistical section of the Monthly Report of the Deutsche Bundesbank. Minimum Reserves:- minimum amount of funds which by law must be deposited by the banks with the note-issuing bank. Usually non-interest-bearing. The amount which must be deposited is, as a rule, calculated as a percentage of stipulated liability items. Minimum reserves restrict the credit-granting leeway of the banks and influence the money supply. Also known as Minimum Balances. See also Central Bank Powers. / В настоящее время Минимальные Резервы – это часть банковских активов, которые любой коммерческий банк обязан хранить на счетах центрального банка. Минимальные резервы выполняют две основные функции. Во-первых, они как ликвидные резервы служат обеспечением обязательств коммерческих банков по депозитам их клиентов. Периодическим изменением нормы обязательных резервов центральный банк поддерживает степень ликвидности коммерческих банков на минимально допустимом уровне в зависимости от экономической ситуации. Во-вторых, минимальные резервы являются инструментом, используемым центральным банком для регулирования объёма денежной массы в стране.

MINIMUM SAMPLE PORTION = МИНИМАЛЬНАЯ МАССА ПРОБЫ – The Minimum Sample Portions allow inspectors to exercise judgment regarding sample sizes to be analyzed. This would be appropriate when reporting concentrations of factors that would not determine grade. However, minimum sample portions may also be used when the factor present has determined the grade, if the concentration is well within tolerance levels for that grade. Minimum portions may be used when the grade would not be altered by analysis of a larger sample.

MINIMUM STOCKING ORDER = МИНИМАЛЬНЫЙ ЗАКАЗ ТОВАРНОЙ ПРОДУКЦИИ – Minimum Stocking Order:- the smallest number of units that must be bought by a foreign entity to qualify as an export sales representative. Can also refer to the Dollar value of the purchase.

MINIMUM TICK = МИНИМАЛЬНЫЙ ШАГ – Minimum Tick is the smallest possible change in price to a security. Various regulations exist regarding what the minimum tick is for different securities, and which trades may occur on a tick. For example, until 2007, a short sale could not occur at the same price as the security's previous trade, when that price was itself a downtick from the trade before that. A minimum tick is also called a Trading Variation. See also Minimum Price Fluctuation, and Tick. Minimum Tick is smallest possible price movement of a security or contract. For example, equity options with premiums of 3 points and greater are traded in eighths of a point, while equity options with premiums less than 3 points may be quoted at sixteenth-of-a-point intervals. / Минимальное

изменение цены. Смотрите также Минимальная Флуктуация Цены или Минимальное Колебание Цены (Minimum Price Fluctuation).

MINIMUM TILLAGE = МИНИМАЛЬНАЯ ВСПАШКА (или МИНИМАЛЬНАЯ ОБРАБОТКА ПОЧВЫ) – Minimum Tillage is the least amount possible of cultivation or soil disturbance done to prepare a suitable seedbed. The main purposes of minimum tillage are to reduce tillage energy consumption, to conserve moisture, and to retain plant cover to minimize erosion. / Под Вспашкой понимается одновременное оборачивание, крошение и перемешивание почвы отвальными плугами, основной приём её обработки. Поддерживает рыхлость пахотного слоя, уничтожает сорняки, вредителей и возбудителей болезней. В районах с ветровой эрозией применяют также плоскорезную обработку почвы. Под Минимальной Обработкой Почвы понимается система обработки почвы, позволяющая сократить число проходов тракторов и сельскохозяйственных машин по полю и тем самым снизить энергетические затраты, уменьшить уплотнение и распыление пахотного слоя. Применяется на хорошо окультуренных почвах. Под Боронованием (Harrowing) понимается рыхление поверхностного слоя почвы боронами и вращающимися мотыгами. Предохраняет почву от высыхания, выравнивает её поверхность, разрушает почвенную корку, уничтожает сорняки.

MINIMUM WAGE = МИНИМАЛЬНАЯ ЗАРАБОТНАЯ ПЛАТА (или МИНИМУМ ЗАРАБОТНОЙ ПЛАТЫ) – Minimum Wage is the lowest wage established by law that can be paid by an employer to a worker. / Минимальная Заработная Плата, устанавливаемая законом, которая может быть выплачена работодателем рабочему. Под Минимумом Заработной Платы понимается уровень заработной платы работника простого (неквалифицированного) труда. Он устанавливается государством в законодательном порядке, а также на основе соглашений между предпринимателями (работодателями) и профсоюзами.

MINIMUM WEIGHT = МИНИМАЛЬНЫЙ ВЕС – Shippers transport a specified Minimum Quantity (Minimum Weight) or more commonly publish volume rates on carload (rail) and truckload (motor carrier) quantities, Therefore, in inventory situations, the decision maker responsible for transporting goods should consider how the lower-volume rate affects total cost. In other words, in addition to considering storage (holding) cost and order or setup cost, the decision maker should consider how lower transportation costs affect total cost. Cost Relationships:- Sometimes the economic order quantity (EOQ) suggested by the basic model may be less than the quantity necessary for volume rate. We can adjust the model to consider the following cost relationships associated with shipping a volume larger than the one determined by the basic EOQ approach. (i) Increased inventory carrying cost for inventory in the warehouse:- the larger quantity required for the volume rate means a larger average inventory (1/2Q) and consequently and increased inventory carrying cost. (ii) Decreased order or setup costs:- the larger quantity will reduce the number of orders placed and the ordinary costs of order placement and/or order setup. (iii) Decreased transportation costs:- the larger quantity will reduce the cost per hundredweight of transpoting the goods, consequently lowering transportation costs. (iv) Decreased in-transit inventory carrying cost:- carload (CL) and truckload (TL) shipments usually have shorter transit times than less-then-carload (LCL) or less-then-truckload (LTL) shipments, and the faster time generally means a lower cost for inventory in transit. See also Mixed Shipments. Truckload is (TL) a quantity of freight weighing 20 000 pounds or more, or occupies one pup or more, or whose TL rate or rating is subject to a minimum weight of 20 000 pounds or more. Truckload (TL):- a shipment weighing the minimum weight or more. Carriers give a rate reduction for shipping a TL-size shipment. TL Class Rates – means Class rates with a stated minimum weight of 20 000 pounds or greater. Carload (CL):- rail service requiring shipper to meet minimum weight. The shipment weight the carrier's tariff specifies as the minimum weight required to use the TL or CL rate; the rate discount volume.

MINING = ДОБЫЧА (или РАЗРАБОТКА, или ГОРНОЕ ДЕЛО) – Mining is the extraction of economically important minerals and ores from the earth. US Mining is one of the most heavily-regulated industries in the world. The Mining Law of 1872 – which governs prospecting and mining for minerals like gold, copper, silver and lithium – led the United States to become a global leader in minerals mining, and helped advance innovations in energy, healthcare, manufacturing and defense technology. It is complemented by exhaustive modern federal and state environmental, ecological and reclamation laws and regulations to ensure that operations fully protect public health and safety, the environment, and wildlife. More than three dozen federal environmental laws and regulations govern the US mining industry – in addition to laws at the state and local level. Dozens of environmental and regulatory requirements ensure mining operations maintain the highest possible standards for safety and the environment. Given the applicability of the National Environmental Protection Act, Endangered Species Act, Clean Water Act, Clean Air Act, National Historic Preservation Act and other laws, including environmental standards in the text of the General Mining Law would create inconsistencies and uncertainty, while providing no additional environmental benefit. The National Academy of Sciences has concluded that the existing set of state and federal regulations are comprehensive and effective. Mining's contributions to the US economy are substantial. Unnecessary changes to the Mining Law of 1872 will impair US global competitiveness, depress employment, and reduce tax revenues at the federal and state level. The US mining industry directly and indirectly employs more than 1.5 million individuals paying in excess of USD95 billion in labor income. In 2017, domestic mining activity generated an estimated USD17 billion in federal, state and local taxes that supported direct, indirect and induced taxes of USD42 billion. The US mining industry pays between 40 to 50 percent of earnings in federal, state and local royalties, taxes and other fees to benefit the communities in which it works and the US federal government. US economy and national defense depend on a strong domestic mining industry, utilizing our nation's vast minerals reserves. Duplicative regulations and restrictions put critical US supply chains for the manufacturing, infrastructure and defense industrial sectors at risk. According to the US Geological Survey, the US is 100 percent import reliant for 18 minerals – 14 of which have been deemed 'critical' by the Secretaries of Defense and the Interior – and more than 50 percent import reliant for another 30 minerals. New mining operations are already either restricted or banned on more than half of all federally-owned public lands, and mining is not permitted in national parks, wilderness areas, wildlife refuges, recreation areas and more. This means a significant percentage of our nation's mineral resources that reside on federal lands are already off limits. The current extensive environmental laws thoroughly protect land that remains open to mining. / Под Разработкой месторождений полезных ископаемых понимается система организационно-технических мероприятий по добыванию полезных ископаемых из недр. Осуществляют открытым способом (на земной поверхности или дне водоёма) и подземным (с помощью горных выработок или буровых скважин). Разработка месторождений полезных ископаемых, система организационно-технических мероприятий по добыванию полезного ископаемого из недр Земли. Различают разработку месторождений полезных ископаемых открытым и подземным способами. Открытыми горными работами извлекают твёрдые полезные ископаемые (смотрите Открытая Разработка Месторождений полезных ископаемых); по применяемой технике и методам ведения работ в особую группу выделяется разработка месторождений торфа. При подземной разработке месторождений добычные работы либо ведутся из подземных горных выработок (смотрите Подземная Разработка Полезных Ископаемых), либо извлечение полезных ископаемых осуществляется через скважины; последний способ применяется для добычи всех жидких и газообразных полезных ископаемых (смотрите Нефть и Природные Горючие Газы), а также твёрдых полезных ископаемых при воздействии на залежь одним из физико-химических методов (например, подземное растворение, подземное выщелачивание, скважинная гидродобыча, подземная газификация углей). Развивается направление, связанное с использованием микроорганизмов для добычи полезных ископаемых (смотрите Бактериальное Выщелачивание). Особое

место занимает разработка месторождений Мирового океана и извлечение полезных ископаемых из морской воды (смотрите Подводная Добыча полезных ископаемых). В начале 1970-х в мире ежегодно добывалось свыше 11 миллиардов тонн (т) твёрдых полезных ископаемых, около 3 миллиардов т нефти и около 1 000 миллиардов кубических метров ($м^3$) природного газа. Прирост мировой горной промышленности составляет не менее 4–5% в год; примерно каждые 15–18 лет объём добычи полезных ископаемых удваивается. В стоимостном выражении на разработку энергетического сырья приходится 72%, руд – 21%, нерудных ископаемых – 7%. Открытым способом в мире добывается около 60% металлических руд, 85% неметаллических руд, 100% нерудных полезных ископаемых и около 35% угля. Подземный способ разработки применяется для полезных ископаемых, залегающих на больших глубинах. Характерные особенности разработки твёрдых полезных ископаемых:- строительство высокопроизводительных горных предприятий (карьеры годовой мощностью десятки миллионов т полезного ископаемого, шахты и рудники – несколько миллионов т); отработка месторождений с низким содержанием полезного компонента; комплексное использование полезных ископаемых при разработке месторождения (например, использование вскрышных пород для строительной индустрии); переход на большие глубины (для карьеров – сотни метров (м), для рудников – несколько километров (км)); внедрение (на базе комплексной механизации и автоматизации) циклично-поточных и поточных схем ведения работ; улучшение производственных условий и техники безопасности; рекультивация земель и недр, нарушенных горными работами. При разработке нефтяных и газовых месторождений внедряются новые способы воздействия на продуктивные пласты с целью более полного извлечения полезного ископаемого из недр, автоматизированные системы добычи. О мировых минеральных ресурсах смотрите в статье Полезные Ископаемые. Под Горным Делом понимаются отрасли науки и техники, охватывающие комплекс процессов по извлечению (добыче) из недр Земли полезных ископаемых и их первичной переработке. Горное Дело, отрасли науки и техники, охватывающие процессы извлечения (добычи) из недр Земли полезных ископаемых (смотрите также Горная Наука и Горная Промышленность). На протяжении тысячелетий горное дело включало добычу только твёрдых полезных ископаемых (нерудные строительные материалы, руда и другие). Во 2-й половине XIX века начинает развиваться добыча нефти, в начале XX века – природного газа. Добыче полезных ископаемых предшествует их разведка (смотрите Разведка Месторождений полезных ископаемых), необходимая для определения запасов, качества руд и экономической целесообразности эксплуатации данного месторождения, производственной мощности горного предприятия, способов разработки месторождения. Всё более широкое применение получают геофизические методы разведки, развиваются геохимические поиски и микробиологическая разведка. Данные разведочных работ и пространственно-геометрических измерений изображаются на картах, планах, разрезах и графиках методами маркшейдерии и горной геометрии. (Примечание:- Маркшейдерия, от Немецких слов Markscheider (Маркшейдер), от Mark, означающее Граница, и Scheiden, означающее Разделять, отрасль горной науки и техники, предметом которой является изучение на основе натурных измерений и последующих геометрических построений структуры месторождения, формы и размеров тел полезного ископаемого в недрах, размещения в них полезных и вредных (для технологии переработки) компонентов, свойств вмещающих пород, пространственного расположения выработок, процессов деформации пород и земной поверхности в связи с горными работами, а также отражение динамики производственного процесса горного предприятия. Работы выполняются с помощью маркшейдерских приборов.) Когда выявлены достаточные запасы полезного ископаемого, а также техническая и экономическая целесообразность его использования, приступают на основе предварительно составленного проекта к разработке месторождения. Для этого проводится по определённому плану сеть подземных или открытых горных выработок или бурятся скважины; для вскрытия месторождения строятся необходимые надземные и подземные сооружения. Правила технической эксплуатации шахт требуют, чтобы из подземных выработок было не менее двух выходов на земную поверхность:- по одному из них поступает свежий воздух, по другому выходит отработанный. Такими выходами обычно являются вскрывающие месторождение и соединённые между собой выработки:- вертикальные или наклонные шахтные стволы, штольни. Глубина вертикальных стволов превышает в некоторых случаях 2 000 метров (м). Способы проходки стволов, как и других горных выработок, зависят от характера и обводнённости пересекаемых ими пород. По мере выемки породы стенки горных выработок крепятся для предотвращения их обрушения (смотрите Крепление Горных Выработок). После того как месторождение вскрыто, проводят выработки по полезному ископаемому, назначение которых – подготовить месторождение к очистным работам (так называемые Подготовительные Работы). После проведения подготовительных выработок приступают к очистным работам для извлечения полезного ископаемого. Забои для производства очистных работ носят название Очистных Забоев, а выработки, образующиеся при этом, – Очистных Выработок. Установленный для данных естественно-геологических и технико-экономических условий порядок проведения во времени и пространстве подготовительных и очистных работ называется Системой Разработки Месторождения. Проходка подготовительных выработок и очистные работы по добыче полезных ископаемых производятся, как правило, машинами:- буровыми, породопогрузочными, комбайнами и другими. Добытое полезное ископаемое доставляется от очистного забоя к земной поверхности рудничным транспортом:- транспортировка грузов и людей по шахтному стволу осуществляется шахтным подъёмом. Все подземные горные выработки снабжаются свежим воздухом (смотрите Проветривание Шахты, Рудничная Атмосфера). В подземных выработках устанавливается стационарное электрическое освещение, а рабочим выдаются переносные рудничные лампы. Скопляющаяся в подземных выработках вода постоянно удаляется системой рудничного водоотлива. Специальные службы следят за правильностью и безопасностью подземных работ (смотрите Государственный Горнотехнический Надзор), принимают меры для предотвращения и ликвидации пожаров, аварий, катастроф и их последствий (смотрите Горноспасательное Дело). Начало горного дела относится к ранней стадии развития человеческого общества. В период родового строя для подземной добычи кремния проводились горные выработки, иногда с деревянным креплением. Для горных работ применялись каменные орудия и кайлы из Оленьего рога. В рабовладельческом обществе начинается систематическая разработка медных и оловянных руд, добыча золота и серебра (смотрите Благородные Металлы). На территории бывшего Союза Советских Социалистических Республик (СССР) обнаружены следы древних рудников периода бронзового века. В Центральной Европе от этого периода остались выработки со следами крепления, лестниц и тому подобного. Задолго до Нашей Эры горное дело существовало в Китае, Японии, странах Американского континента. Главным фактором развития производительных сил в античном обществе стало освоение производства железа. На горных работах использовался труд огромного числа рабов и осуждённых преступников. Крупную экономическую роль играло горное дело в Древнем Риме конца республики и эпохи империй (I век до Нашей Эры – III век Нашей Эры). С развитием феодальных отношений в горном деле происходят значительные сдвиги. В XI–XIII веках начинается широкое развитие горного дела в Центральной Европе, возникает пока ещё ручное бурение горных пород. Важные усовершенствования в горном деле были сделаны в Европе в XV–XVI веках. Применение Конного привода и водяного колеса для рудничного подъёма, а также для водоотливных устройств позволило вести горные работы на глубине до 150 метров (м). Появляются взрывные работы, которые начинают вытеснять огневой способ разрушения. Вводится мокрое обогащение, что позволяет вести разработку сравнительно бедных руд. В 1512 в Саксонии была выдана привилегия на мокрую толчею. В это время в рудниках начинают устраивать деревянные настилы для перемещения по ним тележек с полезным ископаемым. Появляются первые горные училища и руководства по горному делу (‘О Горном Деле и Металлургии...’ Немецкого учёного,

одного из основоположников минералогии Георгия Агриколы (Georgius Agricola; настоящее имя Геок Бауа (Georg Bauer); 1494–1955) в 1556). В горном деле раньше, чем в других отраслях промышленности, нашли применение паровые машины, первоначально для откачивания воды – атмосферный двигатель (atmospheric engine) (Английский изобретатель Томэс Ньюкэмэн (Thomas Newcomen; 1664–1729) в 1712), затем и для рудничного подъёма. С эпохи промышленного переворота (конец XVIII – начало XIX веков) осуществляется переход к широкому применению в горном деле машин. В 1815 Англичанин Сэр Хампфри Дэйви (Sir Humphry Davy; 1778–1829) изобретает безопасную рудничную лампу – Лампу Дэйви (The Davy Lamp). Совершенствуется техника бурения, всё шире применяются взрывчатые вещества, вводится рельсовая откатка с конной тягой. В 1830-х начинают применять стальные канаты для рудничного подъёма и откатки. В середине 1850-х появляются первые работоспособные врубовые машины. Условия развития горного дела вновь изменяются в конце XIX – начале XX веков в связи с огромным увеличением спроса на полезные ископаемые. Интенсивно развивается техника проходки стволов шахт (смотрите Стволопроходческий Агрегат). Усовершенствованные методы проходки, вентиляции и водоотлива позволяют увеличить глубину разработок до 1 000 м, иногда – до 2 000 м. Создаются высокопроизводительные системы разработки угольных и рудных месторождений (смотрите Подземная Разработка). Вводится электрический привод для подъёмных машин, насосов, вентиляторов, электрифицируется рудничный транспорт, осуществляется механизация зарубки с помощью врубовых машин, широко применяются отбойные молотки, работающие сжатым воздухом. Возникают самостоятельные научно-технические дисциплины, занимающиеся вопросами добычи отдельных видов полезных ископаемых:- угля, руд, нефти, торфа и так далее. Важнейшими задачами, стоявшими перед горным делом в бывшем СССР, являлись рациональное использование недр, значительное повышение экономической эффективности и улучшение условий труда в этой самой тяжёлой и опасной области его массового применения. Велись интенсивные поиски новых систем разработки месторождений, более мощных средств механизации, применения автоматизации и построения технологии добычи по принципу поточного производства. В угольных шахтах всё больше механизируются отбойка и погрузка угля; погрузку угля и породы в подготовительных выработках производят горными комбайнами и погрузочными машинами. Механизируются отбойка и погрузка также при добыче руд. Постепенно расширяется применение автоматизации и дистанционного управления машинами и механизмами. Внедряются в промышленную практику металлическая крепь (взамен деревянной) и передвижная механизированная крепь (смотрите Горная Крепь). Наблюдается стремление всемерно сокращать разбросанность горных работ и форсировать выемку в относительно ограниченном числе забоев. В связи с этим вводятся в строй шахты большой производительности и сверхмощные. Повышение эффективности горного дела осуществляется преимущественно за счёт более широкого внедрения способов открытой разработки месторождений. При открытом способе разработки производительность труда выше, чем на шахтах, в 7–10 раз и более, себестоимость добычи значительно ниже. Во 2-й половине 1950-х в угольной промышленности добыча открытым способом резко увеличивается. За период с 1913 по 1968 относительный удельный вес добычи угля в карьерах возрос в общем мировом балансе с 6 до 30%. В бывшем СССР в 1968 в карьерах было добыто 25% угля (об открытых горных работах смотрите также Гидромеханизация, Дражная Разработка, и Торфодобыча). В бывшем Союзе Советских Социалистических Республик (СССР) доля открытого способа добычи составляла (в 1969):- по железной руде 77%, рудам цветных металлов 64%, марганцевым 56.4%, горнохимическим 46.6%, неметаллическим ископаемым и строительным материалам 100%. Большие успехи достигнуты в изучении физических свойств горных пород, позволяющие находить оптимальные решения в конструировании породоразрушающих машин и инструментов, а также в методах переработки полезных ископаемых (смотрите Обогащение Полезных Ископаемых). Продолжаются теоретические и опытные работы в областях горного дела, открывающих перспективу добычи ископаемых без работы людей под землёй, методами геотехнологии, а также добычи полезных ископаемых с морского дна (смотрите Подводная Добыча полезных ископаемых). Неизмеримо возросли, особенно за десятилетие 1960–70, способы добычи жидких и газообразных полезных ископаемых, занимавших (в 1969) около 60% в топливном балансе бывшего СССР. Развитие добычи этих полезных ископаемых было тесно связано с развитием техники бурения скважин (смотрите Бурение). В связи с большой спецификой разработки месторождений нефти и природного газа эти вопросы освещены в статьях Нефть и Природные Горючие Газы. Разработка нефтяных месторождений ведётся на больших глубинах с искусственным воздействием на пласт (например, заводнением), в акваториях морей. В газовой промышленности бывшего СССР создавались мощные газовые промыслы с ежегодной добычей 75–100 миллиардов кубических метров ($м^3$) и строительство магистральных газопроводов больших диаметров (смотрите Газопровод).

MINING FEASIBILITY STUDY = ИЗУЧЕНИЕ ОСУЩЕСТВИМОСТИ (или ВЫПОЛНЕНИЯ) ДОБЫЧИ (или РАЗРАБОТКИ) – Mining Feasibility Study:- an assessment of the economic viability of a potential mining project.

MINISKIRT = МИНИЮБКА – Miniskirt is a woman's short skirt with the hemline several inches above the knee.

MINI–TENDERS = МАЛЫЕ КОНКУРСЫ (или МИНИ–КОНКУРСЫ) – Mini-Tender is a tender offers for less than 5 percent of a company's stock. Mini-tender offers typically do not provide the same disclosure and procedural protection that larger, traditional tender offers provide.

MINITUBER = МИНИКЛУБЕНЬ – Minituber is a small tuber produced under greenhouse conditions on a small potato plant generated by micropropagation. Minituber is a tuber produced in a protected environment from pathogen-free parent material. / разведение или распространение (propagation).

MINIVER = XX (или ГОРНОСТАЕВЫЙ МЕХ, или БЕЛИЧИЙ МЕХ) – Miniver is a white fur worn originally by medieval nobles and used chiefly for robes of state.

MIN/MAX = МИН/МАКС – Min/Max:- a zero cost collar-style hedging strategy whereby a client sells one option in exchange for another. In bullion markets, primarily used by producers who grant call options in exchange for put options – in this case, the structure guarantees that the client will receive a minimum pre-determined price in exchange for a possible opportunity loss if the actual price at maturity is above a maximum level, as determined by the strike price of the call option granted.

THE MINNEAPOLIS GRAIN EXCHANGE, INC. = МИННЕАПОЛИСКАЯ БИРЖА ЗЕРНА, ИНК. – The Minneapolis Grain Exchange, Inc. (MGEX) is a commodity exchange located in Minneapolis, State of Minnesota (MN), the United States of America. It is the world's largest market for Hard Red Spring Wheat futures and options trading. It was established as the Minneapolis Chamber of Commerce in 1881 as an organization designed to promote trade in grains and to prevent abuses. In 1947, it became the MGEX; originally named the Minneapolis Chamber of Commerce, the Minneapolis Grain Exchange Buildings were renamed in 1947. Since its inception in 1881, MGEX has been the principal market for Hard Red Spring Wheat (HRSW) – first as a cash market, then futures and options. Millers, exporters, elevators, farmers and speculators look to MGEX when they trade HRSW wheat – and with good reason. Known for its stable and reliable trading environment, MGEX has a reputation as a good place to do business. It offers the liquidity, the product line and the oversight to ensure fair and accurate trading for all its participants. In addition to our flagship HRSW contract, MGEX also offers the Apple Juice Concentrate (AJC) contract as well as index-based contracts. Index futures and options contracts are offered on

hard red spring wheat (HRSI), hard red winter wheat (HRWI), soft red winter wheat (SRWI), corn (NCI) and soybeans (NSI). These indexes are calculated daily by DTN, an Omaha-based electronic commerce and information services company.

MINOR = НЕСОВЕРШЕННОЛЕТНИЙ – Minor is a person who is under the age of legal competence; a person under the age of majority. / Несовершеннолетние, лица, не достигшие возраста, с которым закон связывает наступление дееспособности. В бывшем Союзе Советских Социалистических Республик (СССР) несовершеннолетними считались лица, не достигшие 18 лет. Законные интересы несовершеннолетних полностью или частично осуществляют их родители, иные законные представители, опекуны, попечители. В уголовном процессе установлен особый порядок рассмотрения дел о несовершеннолетних, обеспечивающий наиболее тщательное их расследование.

MINOR CERVICAL TRAUMA = НЕЗНАЧИТЕЛЬНАЯ ШЕЙНАЯ ТРАВМА – Minor Cervical Traume:- a rise in cervical injury claims was first noted in 1999. Some countries reported many problems whereas others had no difficulties. Faced with this imbalance and in the absence of objective conclusions in this field, the Comité Européen des Assurances (CEA) and the Association for the Study and Compensation of Bodily Injury (Association pour l'Étude de la Réparation du Dommage Corporel (AREDOC) in France) jointly began a comparative study on claims involving cervical spinal injuries. In order to analyse the possible after-effects of phenomena with no initial detectable injury, a minor or benign cervical trauma may be defined as a lesion of the cervical spine, caused by acceleration-deceleration mechanisms (due for example to pronounced extension and/or flexion more or less accompanied by torsion), without neurological complications and without affecting the osseous, nervous or ligamentary-disc structures, which may lead to painful symptoms when at rest or during movement and be accompanied by reduced mobility of the cervical spine. / Комите Эропеэнн дэ Ассюранс (Сэ.Ё.А.; Comité Européen des Assurances (CEA)) и Асосьясьё пур л'Этюд дё ля Репарасьё дю Домаж Корпорэль (АРЭДОК; Association pour l'Étude de la Réparation du Dommage Corporel (AREDOC)). скучиванием (torsion).

MINOR GENES = МАЛЫЕ ГЕНЫ (или НЕЗНАЧИТЕЛЬНЫЕ ГЕНЫ) – Minor Genes are genes which individually produce very little effect, but may produce marked effect in combination.

MINORITY INTEREST = МИНОРИТАРНЫЙ ПРОЦЕНТ (или МИНОРИТАРНЫЙ ПАКЕТ) – Minority Interest:- shareholding that does not give the holder control of a company, i.e. a holding of less than 50%. See also Controlling Interest, and Majority Interest. / Миноритарный Процент – 'подчинённый интерес'; пакет акций, не являющийся контрольным. Долевое участие акционеров, которые все вместе владеют менее чем половиной акций компании. В консолидированном бухгалтерском балансе компании так обозначаются филиалы, которые не находятся в её полной собственности; пакет акций, не являющийся контрольным, отражается как отдельный счёт капитала или как обязательства с неограниченным сроком. Доходы по пакету акций, не являющемуся контрольным, вычитаются в отчёте о доходах при подсчёте чистого консолидированного дохода.

MINOR METALS = ВТОРОСТЕПЕННЫЕ МЕТАЛЛЫ – Minor Metals can be defined as metals that are by-products of other metals according to the London Metal Exchange (LME). Additional criteria has been formulated to define minor metals. Minor metals are used in many end-use applications:- rechargeable batteries, lasers, high temperature alloys, electronics, optics, etc. Minor metals include cobalt (cathodes for rechargeable batteries), molybdenum (heating), lithium (batteries), magnesium, manganese, silicon (photovoltaic solar cells), titanium, tungsten, zirconium, and rare earth elements, among others. A complete list of minor metals can be found here. Cobalt (99.3% cobalt and higher) and molybdenum (60% molybdenum +/–5% in molybdenum contained in roasted molybdenum concentrates, RMC) are currently traded at the LME.

MINORS = МЕЛЬЧАК (или МЕЛЮЗГА, или ВТОРОСТЕПЕННЫЕ, или МИНОРИТАРИИ) – (1) Minors:- lesser or smaller in amount, extent, or size.

(2) Lesser in importance, rank, or stature:- a minor politician. / Термин может быть использован в качестве жаргона для обозначения мелких компаний, второстепенных валют и тому подобного.

MINT = МОНЕТНЫЙ ДВОР – The Mint is a place where coins of a country are manufactured under government authority. Today, United States Mint facilities in Philadelphia and Denver produce all US circulating coins. See also Coin. The Mint is the place where money is coined by the public authority. / Смотрите также Монета (Coin). Монетный Двор это то место, где государственные власти чеканят деньги. Под Монетным Двором понимается предприятие по чеканке монет, изготовлению медалей, орденов и других государственных металлических знаков отличия. Монетный Двор – государственное предприятие, занимающееся чеканкой монет и изготовлением орденов, медалей и других государственных металлических знаков отличия, а также различных чеканочных и штамповочных изделий из металла с применением золочения, серебрения и ювелирных эмалей. Монетные дворы возникают с образованием национальных государств, когда чеканка монет становится государственной монополией. В России первый Казённый Монетный Двор возник в 1534 в Москве. В 1724 был основан Монетный Двор в Петербурге; с 1876 он стал единственным в стране. В Англии в конце XII века был создан Монетный Двор в Лондоне, в США – в 1792 Монетный Двор в Филадельфии. В первые годы после Великой Октябрьской Социалистической Революции чеканка монет не производилась. На Монетном Дворе в Ленинграде (бывшем Петрограде) до 1921 изготовлялись ордена и юбилейные медали. С Августа 1921 началась чеканка серебряной, с 1924 медной, а затем бронзовой и никелевой, с 1961 латунной и нейзильберовой монет. Ленинградский Монетный Двор чеканил разменную монету образца 1961. Организованный в 1942 Монетный Двор в Москве изготовливал ордена и медали СССР, знаки отличия и другие изделия из драгоценных металлов.

MINTED COINS = ОТЧЕКАНЕННЫЕ МОНЕТЫ – Minted Coins are pieces of metal that are minted at the instruction of the state and that serve or have served as legal tender.

MINUTES = ПРОТОКОЛЫ (СОБРАНИЙ УЧРЕДИТЕЛЕЙ) – In the United States, the Minutes or the Corporate Minutes are the written record of transactions taken or authorized by the board of directors or shareholders. These are usually kept in the corporate minute book in diary fashion.

MIP = MONTHLY INCOME PREFERRED SECURITY

MIRAID = MARITIME INSTITUTE FOR RESEARCH AND INDUSTRIAL DEVELOPMENT

MIRROR VELVET = ЗЕРКАЛЬНЫЙ БАРХАТ – Mirror Velvet is a velvet with the pile pressed flat to impart a shimmering appearance. / Зеркальный Бархат – бархат с прессованным ворсом.

MIS = MANAGEMENT INFORMATION SYSTEM

MISALIGNED CLOSURE = НЕВЫРОВНЕННАЯ В ЛИНИЮ ЗАСТЁЖКА – Misaligned Closure:- closure components do not line up. Sewing Room Defects. / Порок или дефект швейного производства.

MISALIGNED SEAM = НЕВЫРОВНЕННЫЙ В ЛИНИЮ ШОВ – Misaligned Seam:- where seams do not line up or cross specified point. Sewing Room Defects. / Порок или дефект швейного производства.

MISC = MISCELLANEOUS

MISCELLANEOUS PETROLEUM PRODUCTS = ПРОЧИЕ НЕФТЕПРОДУКТЫ – Miscellaneous Petroleum Products are all finished petroleum products not classified elsewhere, for example, petrolatum, lube refining byproducts (aromatic extracts and tars), absorption oils, ram-jet fuel, petroleum rocket fuels, synthetic natural gas feedstocks, and specialty oils. / Все конечные нефтепродукты, неклассифицированные где-либо ещё, например, петролатум (petrolatum), побочная продукция очистки, идущая на смазывание (ароматические экстракты (aromatic extracts) и смолы (tars)), абсорбционные масла (absorption oils), топливо для прямоточных воздушно-реативных двигателей (ram-jet fuel), нефтяные ракетные топлива (petroleum rocket fuels), различные запасы сырья для производства синтетического газа (synthetic natural gas feedstocks), и особые масла (specialty oils).

MISCELLANEOUS CHARGE ORDER = ОРДЕР РАЗНЫХ СБОРОВ (или КВИТАНЦИЯ РАЗНЫХ СБОРОВ) – Miscellaneous Charge Order is a document issued by a carrier or his agent requesting the issue of an appropriate passenger ticket and baggage check or revision of services to the person named in such document. / пассажирского билета и багажной квитанции .

MISCIBLE = СМЕШИВАЮЩЕЕСЯ (или СОВМЕСТИМОЕ) – Miscible:- capable of being mixed in any concentration without separation of phases, e.g., water and ethyl alcohol are miscible.

MISCLIP = ПРОПУЩЕННЫЙ КЛУП (или ПРОПУЩЕННАЯ ПОДРЕЗКА) – Misclip:- xxxxx. Fabrics Defect. See also Scalloped Selvage.

MISDIRECTED NAPPING = ВОРСОВАНИЕ (или РАТИНИРОВАНИЕ) НЕ В ДОЛЖНОМ НАПРАВЛЕНИИ – (1) Misdirected Napping:- patterns not marked in same direction on napped fabrics. Cutting Room Defects, and namely – Marking Defects. / в том же направлении на начёсных тканях (тканях с начёсом). Порок или дефект раскроя.

(2) Misdirected Napping:- air pockets not removed. Napped material reversed in spreading. Cutting Room Defects, and namely – Spreading Defects. / Порок или дефект раскроя.

MISDRAW = XX (или ПОМЕХА) – Misdraw or Wrong Draft or Wrong Draw:- warp yarns that do not conform to the required draft plan. Note:- this defect is caused by yarns being drawn into the heald wires in the wrong sequence. See also Wrong Draw. Defect Name:- Misdraw (Color). Defect Type:- warp lines, vertical lines. Fabric Type:- Warp Knit Fabrics. Description:- Misdraw (Color):- This is usually the result of an end being threaded or drawn into the wrong guide bar. It may also result from mixing yarn. In some instances, it can be traced to a creeling error in warping, causing an end to appear out of position on the warp beam. Severity:- Major. Fabrics defect. Misdraw (Color):- in woven fabrics the drawing of colored yarns through the loom harness contrary to the color pattern and/or design weave is termed as misdraw. In case of warp knits misdraw is the drawing of colored yarns through the guide bars contrary to the pattern design. / Помеха – ошибка проборщика или ткача при проборке. Неверная Проборка; Неправильная Проборка; Неправильно Пробранные В Ремизы Нити Основы (Misdraw; Wrong Draft; Wrong Draw):- порок основы; нити основы, которые пробраны в ремиз не в соответствии с рисунком проборки. Примечание:- этот порок вызван неправильной проборкой основных нитей.

MISLOCATED REINFORCEMENT = ОШИБОЧНО РАЗМЕЩЁННОЕ УСИЛЕНИЕ – Mislocated Reinforcement:- where bartack or brad not in proper location. Sewing Room Defects. / Порок или дефект швейного производства.

MISMATCHED BAND ENDS = ОШИБОЧНО СПАРЕННЫЕ КОНЦЫ ЛЕНТ – Mismatched Band Ends:- usually caused by the use of two different sizes or shades of bands. Interlining defects. / Порок или дефект.

MISMATCHED PLAIDS = XX ПЛЕДЫ – Mismatched Plaids:- marker did not block component parts to match; Cutting Room Defects, and namely – Marking Defects. / Порок или дефект раскроя.

MISMATCHING = ОШИБОЧНОЕ СПАРИВАНИЕ – Mismatching is an error during annealing of primer to template or probe to target, caused by low stringency.

MISMATCHING PLAIDS = НЕВЕРНО ПОДОГНАННЫЕ ЭЛЕМЕНТЫ ШОТЛАНДКИ – Mismatching Plaids:- material spread too loose or too tight, causing plaid lines to run diagonally or bow. Cutting Room Defects, and namely – Spreading Defects. / Порок или дефект раскроя. Шотландка – клетчатая ткань.

MISMESHED AND UNMESHED COIL = ОШИБОЧНО РАЗМЕЩЁННЫЙ И НЕЗАЦЕПЛЁННЫЙ ВИТОК – Mismeshed and Unmeshed Coil:- unmeshed chain below the slider, except when caused by inadvertent coil damage, can be re-engaged by operation of the slider over the disengaged portion. Closure defects, and namely – Nylon Spiral Zipper:- Coil Defects. / Порок или дефект застёжки. Найлан^{T3} (Nylon^{TM}).

MISMESHED AND UNMESHED TEETH = ОШИБОЧНО РАЗМЕЩЁННЫЙ И НЕЗАЦЕПЛЁННЫЙ ЗУБ – Mismeshed and Unmeshed Teeth:- readily visible, particularly in large sizes. Usually results in inoperable zipper. Closure defects, and namely – Zippers:- Chain or Teeth Defects. / Порок или дефект застёжки.

MISPICK = ПРОЛЁТ (или ПРОМЁТКА, или НЕДОБРОКАЧЕСТВЕННАЯ ПОПЕРЕЧНАЯ НИТЬ, или ПОДНЫРКА) – Mispicks:- missing filling picks in the material which have not been cast all the way through the shed of the loom or have become broken in the loom shed; failing to interlace in the proper manner with warp because of some mechanical defect in weaving. One of the commonest defects encountered in weaving. Mispick is a flaw in the texture of the cloth, consisting of irregular crossings of the warp and filling; caused by the imperfect shed in the loom. Mispick:- incorrect weft insertion. Woven fabric defect. Mispick is a weaving defect in which a pick is improperly interlaced, resulting in a break in the weave pattern. Mispicks can result from starting the loom on the incorrect pick after a pick-out. Mispick:- a pick not properly interlaced. Mispick:- in woven fabrics, a pick not properly interlaced which causes a break in the weave pattern. Synonym:- Wrong Pick. See also Double Pick. Mispick:- a defect in woven fabric caused by a missing or out-ofsequence yarn. (1) Defect Name:- Mispick. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Twill Derivatives; and Bottomweights – Plain Weave Derivatives. Description:- Mispick:- This is the result of one pick missing from the fabric. This mispick looks identical to a coarse pick. This is because in a plain weave when one pick is missing, the picks on either side come together in the same shed. Close examination of a spun-yarn fabric will show the two separate yarns; however, in a filament fabric, the two merge and appear as one coarse yarn. Severity:- Major. (2) Defect Name:- Mispick. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Plain Weave Derivatives; Denim Bottomweights – Indigo Dyed; and Bottomweights – Twill Derivatives. Description:- Mispick:- This defect is the result of one pick of filling missing from the fabric. The appearance of this defect is affected by the weave. Severity:- Major. / :- уточные поперечные нити в материале, . неправильная прокладка утка. Порок или дефект ткачества. Пролёты в одну уточную прокидку. Размер порока – за каждое место. Подныркы не более 5 сантиметров (см). Размер порока – до 1 см. Под Поднырками понимается дефект суровой ткани, когда уточные нити на коротких участках не переплетаются с основными, а выступают в виде скобочек или петель сверху или снизу полотна; причины – нечистый зев,

несвоевременный ввод уточной нити в зев, провисание нитей основы, излишне высокое или низкое расположение шпаруток и другое. Подныpка (Mispick):- дефект, в виде одной или нескольких нитей утка, неправильно перекрывающих нити основы. Примечание:- этот дефект вызван неправильной последовательностью прокладки уточной нити. Подныpка (mispick):- порок утка в виде одной или нескольких нитей утка, неправильно перекрывающих нити основы. Примечание:- этот порок вызван неправильной последовательностью прокладки уточной нити.

MISPLACED = НЕПРАВИЛЬНО РАЗМЕЩЁННОЕ (или СМЕЩЁННОЕ) – Misplaced:- this may be due to operator error or lack of proper positioning gauges. Closure defects, and namely – Metal Buttons, Snap Fasteners, Rivets and Burrs. / Порок или дефект застёжки.

MISPLACED COMPONENT = НЕПРАВИЛЬНО РАЗМЕЩЁННЫЙ (или СМЕЩЁННЫЙ) КОМПОНЕНТ – Misplaced Component:- where part not positioned according to specifications. Sewing Room Defects. / Порок или дефект швейного производства.

MISPLACED PIECE RATE TICKETS OR BUNDLE MEMBERS = НЕПРАВИЛЬНО РАСПОЛОЖЕННЫЕ ПОШТУЧНЫЕ (или СДЕЛЬНЫЕ) ЯРЛЫКИ (или КАРТОЧКИ) ИЛИ НАБОРНЫЕ (или ПАКЕТНЫЕ, или ГРУППОВЫЕ) ЭЛЕМЕНТЫ (или ЗВЕНЬЯ) – Misplaced Piece Rate Tickets or Bundle Members:- attached to, or marked on, wrong bundles, causing mixed sizes or/and shades. Cutting Room Defects, and namely – Cutting Defects. / Ticket = Ярлык на пачке кроя. Порок или дефект раскроя.

MISPLACED TEETH = НЕПРАВИЛЬНО РАЗМЕЩЁННЫЕ (или СМЕЩЁННЫЕ) ЗУБЬЯ – Misplaced Teeth:- this refers to a tooth being out of position, and occasionally may involve two or three teeth. Seriousness ranges from trifling to almost as serious as a missing tooth, depending upon degree of misplacement and general design of zipper. By the latter, we refer, as an example, to a tooth that is symmetrical, being less prone to damage in this type of defect than is a nonsymmetrical tooth. Closure defects, and namely – Zippers:- Chain or Teeth Defects. / Порок или дефект застёжки.

MISPRINT = СБИТЫЙ РИСУНОК (или РАСТРАФ РИСУНКА, или ЩЕЛЧОК) – Misprint:- in printed fabric, colors or patterns, or both, either missed, or partially missed, or incorrectly positioned relative to each other. Fabrics defect. Misprint:- in printed fabrics, either missed, or partially missed, or incorrectly positioned relative to each other. / Под Сбитым Рисунком понимается местный порок в виде нарушения структуры рисунка или цвета нитей. Сбитый Рисунок не более 5 см. Размер порока – до 1 см. Под Сбитым Рисунком или Разом (Раз) понимается дефект суровой ткани, когда по всей ширине ткани нарушен рисунок переплетения, появляется при разладках каретки или при пуске станка без предварительного отыскания раза. Растраф Рисунка:- местный порок ткани, заключающийся в смещении отдельных деталей рисунка на ткани. Растраф Рисунка. Размер порока – по всему куску. Во II группе порок оценивается для гладкокрашеных и набивных тканей, предназначенных для корсетных изделий, женского и постельного белья и махровых тканей. Щелчок от печати, не более 2 см. Размер порока – до 0.5 см. Размер порока определяют по наибольшей протяжённости. Щелчок – небольшой окрашенный участок набивной ткани различной формы. Под Непропечатанным Рисунком понимается распространённый порок, выраженный в виде отсутствия в некоторых местах изображения деталей рисунка или нечётком изображении рисунка.

MISREGISTER = СБИТЫЙ РИСУНОК (или РАСТРАФ РИСУНКА, или ЩЕЛЧОК) – Misregister:- in printed fabric, colors or patterns not correctly positioned. Compare Misprint. Fabrics defect. Misregister, out of register:- in a printed fabric, colors not correctly positioned with respect to each other. Note:- this defect is often caused by printing rollers or screens not being synchronized. / Местный порок ткани, представляющий собой Сбитый Рисунок на ткани из-за неточного изготовления рисунка на шаблонах или неправильной установки шаблона на печатной машине. Под Сбитым Рисунком понимается местный порок в виде нарушения структуры рисунка или цвета нитей. Сбитый Рисунок не более 5 см. Размер порока – до 1 см. Под Сбитым Рисунком или Разом (Раз) понимается дефект суровой ткани, когда по всей ширине ткани нарушен рисунок переплетения, появляется при разладках каретки или при пуске станка без предварительного отыскания раза. Растраф Рисунка:- местный порок ткани, заключающийся в смещении отдельных деталей рисунка на ткани. Растраф Рисунка. Размер порока – по всему куску. Во II группе порок оценивается для гладкокрашеных и набивных тканей, предназначенных для корсетных изделий, женского и постельного белья и махровых тканей. Щелчок от печати, не более 2 см. Размер порока – до 0.5 см. Размер порока определяют по наибольшей протяжённости. Щелчок – небольшой окрашенный участок набивной ткани различной формы. Сбитый Рисунок (Misregister):- порок заключительной отделки в виде нарушения структуры рисунка или цвета нитей. Примечание:- этот порок часто вызывается несинхронизируемой ротационной набивкой или трафаретным шаблоном.

MISREPRESENTATION = ЗАБЛУЖДЕНИЕ – (1) Misrepresentation:- any false statement that encourages a person or company to enter into a contract. Misrepresentation may be either fraudulent, i.e. a deliberate intention to deceive, or innocent, i.e. the result of a genuine mistake. In the United Kingdom, under law the injured party may have the contract dissolved and claim suitable damages. See also Mistake.

(2) An incorrect statement made about a material fact that, if made deliberately and with intent to deceive, could cause the insurance contract to become null and void. Misrepresentation:- a misstatement of fact that is made by the insured or his broker to an underwriter during the negotiation of the placement, amendment or renewal of cover which causes the underwriter to grant, amend or renew cover on an incorrect basis of fact. If the misrepresentation is material the underwriter may avoid the contract on the basis that the insured has breached his duty of utmost good faith.

MISSED SECTIONAL BREAKS = ПРОПУЩЕННЫЕ СЕКЦИОННЫЕ ПОЛОМКИ – Missed Sectional Breaks:- sectional marker breaks too long or too short. Parts in lay will be short or material wasted. Cutting Room Defects, and namely – Spreading Defects. / Порок или дефект раскроя.

MISSED STITCH = ПРОПУЩЕННЫЙ СТЕЖОК (или ПРОПУЩЕННАЯ ПЕТЛЯ) – A Missed Stitch appears in the form of a lifted loop. Possible Cause:- this happens when the stitching needle is unable to penetrate through the fabric. This is a minor defect and doesn't affect the appearance of the fabric to a great extent. Stitching defect.

MISSING END = ОТСУТСТВУЮЩАЯ ПРОДОЛЬНАЯ НИТЬ (или ЗАХЛЕСТНУВШАЯСЯ ПРОДОЛЬНАЯ НИТЬ, или НАСКОЧИВШАЯ ПРОДОЛЬНАЯ НИТЬ, или ПРОПУЩЕННАЯ ПРОДОЛЬНАЯ НИТЬ, или НЕДОСТАЮЩАЯ ПРОДОЛЬНАЯ НИТЬ) – Missing End is a defect where one or more warp ends are missing in the fabric is called a Chira. This is the most frequently occurring defect in Indian fabrics and constitutes 40–50% of the total defects. Most chiras are caused by broken that are not mended immediately. It can be prevented by minimizing missing ends in the beam and efficient manintenace of the warp stop motion. Effective supervision to ensure that a broken end is not left unmended for long can also minimize the occurrence of chira. One warp end is missing in the fabric. The most common defect characterized by a gap of one or more warp threads in a fabric caused due to unmended broken ends, missing ends and high incidence of warp breakages. Missing End:- one warp end is missing in the fabric. Weaving defect. See also End Out. Missing Ends:- the fabric is characterized by a gap, parallel to the warp. The number of ends missing may be one or more. Causes:- (i) loom not equipped with warp stop motion; (ii) dirty drop wires or accumulation of lint may

prevent their dropping; and (iii) in electric warp stop motion, the electric bars are dirty or corroded. Mending:- when there are only two adjacent ends missing, the fault can be rectified by combing in both directions using a metallic comb. This may fill the bare patch formed due to missing ends. Missing Ends:- the fabric is characterized by a gap parallel to the warp. The no of ends missing may be one or more. Weaving Defect. Missing End:- absence of warp end at its proper place in a fabric is termed as a missing end. This defect appears in a fabric as a fine warp way crack till it is rectified by the weaver. This is most frequently occurring defect in Indian fabrics and constitutes 40 to 50 percent of the total defects in loom shed cloth. Number of missing ends may be more than one. Negligence of the weaver to draw the broken ends in place or improper functioning of the warp stop motion are the causes for this defect. Minor Defect Classification:- 1-3 non adjacent ends missing at a place. Major Defect Classification:- 2-6, 4-8 nonadjacent ends missing at a place. / Порок или дефект ткачества.

MISSING HILL = ПРОПУЩЕННАЯ ЛУНКА (или ПРОПУЩЕННОЕ ГНЕЗДО, или ПОТЕРЯННОЕ ГНЕЗДО) – Missing Hill is the place where transplanted seedlings were damaged, are non-existing, or died before maturing.

MISSING INTERLACEMENT OF WEFT AT SELVEDGES = ПРОПУЩЕННОЕ (или НЕДОСТАЮЩЕЕ) СВЯЗЫВАНИЕ (или ПЕРЕПЛЕТЕНИЕ) УТКА В КРОМКАХ – Missing Interlacement Of Weft At Selvedges:- in this defect, a group of extreme warp ends in the selvedges do not interlace with the weft over a fabric length of 1 to 4 cm. The main cause of this defect is excessive tension in the weft yarn. / Порок или дефект. Нарушение Кромки:- (1) Оторванная Кромка; размер порока свыше 0.5 до 5 м. (2) Стянутая Кромка:- (a) размер порока более 1 до 2.5 см; и (b) более 2.5 до 4 см. Порок Стянутая Кромка определяют как разность между длиной по фону (на расстоянии 5 см от кромки) и по кромке на трёхметровой длине ткани. Оценка порока относится ко всему куску. Нарушение кромки оценивается для тканей, поставляемых швейным предприятиям, для розничной торговли – не допускается. Для бархата, предназначенного для промышленной переработки, порок не учитывается.

MISSING LOOPS AND BUTTON = ПРОПУЩЕННЫЕ (или НЕДОСТАЮЩИЕ) ПЕТЕЛЬКИ И ПУГОВИЦА – Missing Loops And Button on denim trouser. Possible Cause:- carelessness and no check for defect along the chain This is a minor defect as the article can be fixed and brought in perfect wearing condition by stitching the missing parts. Stitching defect.

MISSING PATCHES OF COLOR FROM TOP LEFT AND BOTTOM RIGHT CORNERS OF THE 'X' = ПРОПУЩЕННЫЕ (или НЕДОСТАЮЩИЕ) ЛЯПКИ (или ПЯТНА, или УЧАСТКИ) КРАСКИ УГЛОВ СВЕРХУ СЛЕВА И ВНИЗУ СПРАВА БУКВЫ 'X' – Missing Patches Of Color From Top Left And Bottom Right Corners Of The 'X':- Possible Cause:- incomplete transfer of design from paper to fabric on transfer printing due to removal of transfer of paper while the fabric was still hot. The defect is minor as only a very slight portion of the design is missing. Printing defect.

MISSING PICK = ОТСУТСТВУЮЩАЯ ПОПЕРЕЧНАЯ НИТЬ (или ПРОПУЩЕННАЯ ПОПЕРЕЧНАЯ НИТЬ, или НЕДОСТАЮЩАЯ ПОПЕРЕЧНАЯ НИТЬ, или ПРОСКОЧИВШАЯ ПОПЕРЕЧНАЯ НИТЬ) – After weft break, if weaver starts the machine without reversing the machine by one pick, defect observed as Missing Pick. Missing Picks:- a narrow streak running parallel with weft threads caused due to absence of weft. Causes:- (i) faulty let-off and take-up motion; (ii) faulty weft-stop motion; and (iii) fell of the cloth not adjusted after loom stoppage for mending. Mending:- when there are only two adjacent picks missing, the fault can be rectified by combing in both directions using a metallic comb. This may fill the bare patch formed due to missing ends. Missing Pick:- worker negligence, weft end to end knotting if not proper, weft detector if not works, pick finding mechanism if not work proper. Missing Pick:- after weft break, if weaver starts the machine without reversing the machine by one pick, defect observed as missing pick. Weaving defect. See also Broken Pick. / Порок или дефект ткачества. Проскочившая Поперечная Нить (Missing Pick):- дефект, при котором наблюдается полосатость поперек ткани, где отсутствует прокладка уточной нити. Примечание:- этот дефект часто вызывается прерыванием подачи утка, неисправным уточным нитенаблюдателем. Проскочившая Уточная Нить (missing pick; missing weft yarns):- порок утка, при котором наблюдается полосатость поперёк ткани, где отсутствует прокладка уточной нити. Примечание:- этот порок часто вызывается прерыванием подачи утка, неисправным уточным нитенаблюдателем.

MISSING PLUSH LOOP = ПРОПУЩЕННАЯ (или НЕДОСТАЮЩАЯ) ПЛЮШЕВАЯ ПЕТЛЯ – Missing Plush Loop:- mulfunctioning of loop. Knitted fabric defect. Missing Plush Loops:- an area in a plush fabric that is devoid of plush loops. Note:- this defect is caused by the malfunctioning of the loop-forming elements. / Порок или дефект .

MISSING SHIP = БЕЗ ВЕСТИ ПРОПАВШЕЕ СУДНО – Missing Ship:- a ship is deemed to be 'missing' when, following extensive inquiries, she is officially posted as 'missing' at Lloyd's. She is then considered to be an 'actual total loss' and policy claims for both hull and cargo are settled on that basis. / Лойдз (Lloyd's).

MISSING SLEEVE = ПРОПУЩЕННЫЙ (или НЕДОСТАЮЩИЙ) РУКАВ – Missing Sleeve:- Possible Cause:- carelessness and no check after the process chain stage and packing stage. Major defect. The product has lost purpose for its intended use because of the missing sleeve. Stitching defect.

MISSING SUPPLEMENTARY WARPS = ЗАХЛЕСТНУВШИЕСЯ ДОПОЛНИТЕЛЬНЫЕ ОСНОВЫ (или НАСКОЧИВШИЕ ДОПОЛНИТЕЛЬНЫЕ ОСНОВЫ, или ПРОПУЩЕННЫЕ ДОПОЛНИТЕЛЬНЫЕ ОСНОВЫ, или НЕДОСТАЮЩИЕ ДОПОЛНИТЕЛЬНЫЕ ОСНОВЫ) – Missing Supplementary Warps:- Possible Cause:- the motif has lost its intended design because of missing warps. Supplementary warps should be stitched to back of fabric. Otherwise they can easily be plucked out from the fabric due to entanglement during processing or subsequent use. This is a major defect as it foils the motif. If the warps are not stitched the frequency of occurrence is normally high. Weaving defect.

MISSING TEETH = НЕДОСТАЮЩИЕ ЗУБЬЯ – Missing Teeth:- readily visible, particularly in large sizes. Will result in early failure of the zipper. Closure defects, and namely – Zippers:- Chain or Teeth Defects. / Порок или дефект застёжки.

MISSING TOP OR BOTTOM STOP = ОТСУТСТВУЮЩИЙ ВЕРХНИЙ ИЛИ НИЖНИЙ СТОПОР – (1) Missing Top or Bottom Stop:- readily apparent and will result in zipper failure. If facilities for attaching a top or bottom stop are not available, then the entire zipper should be replaced. In some instances, bottom stops are attached at garment plant. An improperly or poorly attached bottom stop may be result of carlessness on part of the operator or of improper functioning of the bottom stop machine. Closure defects, and namely – Zippers:- Top or Bottom Stop Defects. (2) Missing Top Or Bottom Stop:- readily apparent and will result in zipper failure. Closure defects, and namely – Nylon Spiral Zipper:- Top or Bottom Stop Defects. / Порок или дефект застёжки. Найлан^{T3} (Nylon^{TM}).

MISSING WARP = ОТСУТСТВУЮЩАЯ ОСНОВА (или ЗАХЛЕСТНУВШАЯСЯ ОСНОВА, или НАСКОЧИВШАЯ ОСНОВА, или ПРОПУЩЕННАЯ ОСНОВА, или НЕДОСТАЮЩАЯ ОСНОВА) – Missing Warp:- warp float on back side. Possible Cause:- when a frame gets stuck and leaves a particular warp down for successive picks. A minor defect in this case as it is barely visible. However, depending on frequency and size, hence visibility it can become major. Weaving defect.

MISSING YARN = ОТСУТСТВУЮЩАЯ ПРЯЖА (или ОТСУТСТВУЮЩАЯ НИТЬ, или НЕДОСТАЮЩАЯ ПРЯЖА) – Missing Yarn occurs in circular knit. Caused by one end of yarn missing from feed and machine continuing to run. Knitted fabric defect. Missing

Yarn:- occurs in warp knit. Results from wrong fiber yarn (or wrong size yarn) placed on warp. Fabric could appear as thick end or different color if fibers have different affinity for dye. Missing Yarn is the yarn absent from a pattern. Note:- this defect is the result of a machine continuing to run with one feed of yarn missing. (1) Defect Name:- Missing Yarn. Defect Type:- weft lines, horizontal lines. Fabric Type:- Single Knit Fabrics. Description:- Missing Yarn:- This is the result of a machine continuing to run with one yarn broken and/or missing. The result is barré. Severity:- Major. (2) Defect Name:- Missing Yarn. Defect Type:- weft lines, horizontal lines. Fabric Type:- Single Knit Fabrics. Description:- Missing Yarn:- This is the result of a machine continuing to run with one yarn broken and/or missing. The result is barré. Severity:- Major. (3) Defect Name:- Missing Yarn. Defect Type:- weft lines, horizontal lines. Fabric Type:- Double Knit Fabrics. Description:- Missing Yarn:- This is the result of a machine continuing to run with one yarn broken and/or missing. The result is barré. Severity:- Major. (4) Defect Name:- Missing Yarn. Defect Type:- weft lines, horizontal lines. Fabric Type:- Double Knit Fabrics. Description:- Missing Yarn:- This is the result of a machine continuing to run with one feed of yarn missing. Severity:- Major. / Порок или дефект . Под Отсутствующей Нитью понимается местный порок в виде отсутствия одной или нескольких нитей.

MISS–KNIT = XX – Miss-Knit:- in knitted fabrics, a deviation from the designated knitting pattern. Fabrics defect.

MISS–SELECTION = XX – Defect Name:- Miss-Selection. Defect Type:- Pattern Defects. Fabric Type:- Double Knit Fabrics. Description:- Miss-Selection:- This is where the pattern design has been corrupted by the random dropping of stitches. It could be the result of sticking jacks or erratic behavior of the yarn feed. Severity:- Major.

MISS–STITCH = ПРОПУЩЕННАЯ ПЕТЛЯ – Miss-Stitch is a knitting construction formed when the needle holds the old loop and does not receive new yarn. It connects two loops of the same course that are not in adjacent wales. Also known as Float-Stitch. / Известна также как Петля Глади или Петля Гладкого Переплетения (Float-Stitch).

MIS–STOW = НЕОТШТИВЛЕННЫЙ – Mis-Stow:- a container which is stowed in an improper position on a vessel or a container on a vessel which does not belong on that vessel.

MISTAKE = ОШИБКА – In legal parlance, Mistake is any error, short of misrepresentation, that induces a person or company to enter into a contract. Mistakes may be mutual, i.e. common to both parties, or unilateral. Mutual mistakes include the innocent purchase or exchange of goods that are not in fact for sale:- unilateral mistakes include more deliberate deceptions. Both mutual and unilateral mistakes may invalidate a contract, but they do not necessarily do so. See also Misrepresentation.

MIST CHAMBER = ТУМАННАЯ КАМЕРА (или КАМЕРА ТУМАНА) – Mist Chamber is an enclosure containing a device that produces a fine mist of water on plants, facilitating the hatching of gall midge eggs and the movement of first-instar larvae.

MIT = MARKET–IF–TOUCHED

MIT = MUNICIPAL INVESTMENT TRUST

MITEAS = MADRID INTERNATIONAL TRADEMARK ELECTRONIC APPLICATION SUBMISSION

MITER = МИТРА (или XX) – Miter is a liturgical headdress worn by bishops and abbots. Also Mitre.

MITERFOLDS = XX – Miterfolds (Label) are normally used in Jerseys, bathrobes and outerwear and add functionality to the label by allowing it to be used as a hanger for the garment.

MITES = КЛЕЩИ – Mites is a group of small, active, non-insect arthropods, some of which are predators of other mites and small insects, e.g., thrips; most Species are plant feeding. The two-spotted Spider Mite (Tetranychus Urticae) is the predominant Mite on Cotton in the Southeast, typically more of a problem under hot, dry conditions, and damages Cotton plants by rasping mostly lower leaf cells; populations are often reduced by naturally occurring fungi, particularly under humid conditions. Mite infestation can cause circular patches of defoliating plants, usually more common at the end of the growing season. Leaves initially develop yellow patches on the upper surface, occasionally with small areas of dead tissue. Leaves turn red before defoliation. Mites and their webs can be observed on the under surface of the leaves. Mite activity results in a circular, defoliating patch of plants with reddened leaves that may vary in size from only one or two plants up to a patch many meters across. The mites and their webs may be observed on the under surface of the leaves and in the growing point of the plant. Affected parts of the plant (including bolls) may develop a ‘sandpaper’ brown appearance and texture. These mite ‘hot-spots’ are usually more common towards the end of the growing season. Mite is the small arachnid of the order Acarina. / Виды (Species). и в точке роста растения. Клещи относятся к группе членистоногих Класса Паукообразных. Обычно выделяют три Отряда Клещей:- Акариформные, Паразитиформные и Клещи-Сенокосцы. Длина Клеща колеблется в диапазоне 0.05 мм – 3 см. Насчитывается около 20 000 Видов Клещей, большинство из которых обитает на суше, но имеются и водные Клещи. Клещи являются Вредителями Растений и сельскохозяйственных продуктов, паразитами животных и человека, переносчиками возбудителей инфекционных заболеваний (лихорадок, тифов, туляремии, чумы, энцефалитов). Клещ (на Латинском Acarina):- Растительноядные (Галловые, Паутинные Клещи); Акароидные (остатками растительного и животного происхождения). В сборную группу Клещей входят 3 Отряда:- (1) Саркоптоидные (Настоящие; Акариформные (Acariformes)); (2) Паразитиформные (Parasitiformes); и (3) Сенокосцы (Opilioacarina). Волосатые Клещи (Glycyphagidae). Клещи (Acarina), мелкие (от 0.1 до 30 миллиметров (мм)) членистоногие животные Класса Паукообразных Подтипа Хелицеровых. По мнению одних зоологов, Клещи – единый Отряд, включающий 3 Подотряда:- Клещи-Сенокосцы (Opilioacarina), Акариформные Клещи (Acariformes) и Паразитиформные Клещи (Parasitiformes). Другие зоологи считают эти группы неродственными друг другу отрядами. Для Клещей характерны шестиногая личинка (у Нимф и взрослых Клещей – 8 ног) и особый передний участок тела – ‘головка’ (гнатосома), часто подвижно сочленённая с телом и несущая 2 передние пары конечностей (хелицеры и педипальпы). У немногих примитивных Клещей, в том числе у Клещей-Сенокосцев, сохраняется сегментация. Тело Клещей состоит из крупных отделов. Для большинства Акариформных Клещей характерно деление на головной отдел (протеросому), несущий 4 пары конечностей, и задний отдел (гистеросому) с 2 задними парами ног. У Паразитиформных Клещей имеются головогрудь (просома), несущая все 6 пар конечностей, и безногое брюшко (опистосома). У высших представителей обоих Подотрядов отделы тела обычно сливаются. Покровы тела тонкие, кожистые или с плотными щитами, более или менее сливающимися. Окраска разнообразная, одноцветная или пёстрая. Строение конечностей варьирует в зависимости от способа питания и образа жизни. Хелицеры с клешнёй на конце, когтеобразные или иглообразные; служат для захвата пищи, размельчения её или для прокола кожи животного-хозяина и закрепления на нём; у самцов некоторых Клещей хелицеры приспособлены для спаривания. Педипальпы простые, ногообразные; их основные членики формируют предротовую полость, остальные образуют щупальце. Ноги с коготками и присосками, у некоторых Клещей без них. Кожные органы чувств – щетинки и лировидные органы – рассеяны на теле и конечностях. Глаз 1–2 пары (иногда есть 1 непарный срединный), у многих глаза отсутствуют. Дыхание кожное или трахейное; трахеи открываются 1–4 парами дыхалец (или стигм) у переднего края тела или на его боках. Клещи раздельнополы; у многих выражен половой диморфизм. Положение полового отверстия сильно варьирует; у самок иногда имеются парные совокупительные отверстия,

помимо непарного яйцевыводного. Оплодотворение сперматофорное (самец прикрепляет сперматофор к половому отверстию самки или оставляет его на субстрате, а самка захватывает его) или внутренее, сопровождающееся спариванием. Известно девственное размножение (партеногенез). Большинство Клещей откладывает яйца, некоторые живородящи. Цикл развития включает фазы яйца, предличинки, личинки, прото-, дейто-, тритонимфы и взрослых Клещей; у многих Клещей отдельные фазы развития выпадают; иногда (у Аргасовых Клещей) Нимфы линяют несколько раз и число нимфальных стадий непостоянно. Известно свыше 10 000 Видов Клещей. Наиболее распространённые представители некоторых групп Клещей:- Акариформные Клещи (Acariformes):- Амбарный Клещ Калоглифус (Caloglyphus Rodionovi); Пузатый Клещ (Pediculoides Ventricosus); Железница (Demodex Cati); Водяной Клещ Аррenурус (Arrenurus Globator). Паразитоформные Клещи:- Пастбищный Клещ Дермацентор (Dermacentor Marginatus). К Акариформным Клещам относятся Саркоптиформные (Панцирные Клещи, Амбарные, Волосяные, Перьевые, Чесоточные и другие) и Тромбидиформные Клещи (Паутинные Клещи, Водяные Клещи, Краснотелки, Железницы, Галловые Клещи и другие). К Паразитиформным Клещам принадлежат Гамазовые Клещи, Аргасовые Клещи, Иксодовые Клещи и другие. Распространены Клещи повсеместно. Большинство обитает на суше, некоторые в морях и пресных водах. Особенно многочисленны Клещи в умеренных и тропических странах. Хищные и растительноядные Клещи живут свободно в почве, лесной подстилке, на растениях, в разлагающихся органических остатках, в норах и гнёздах животных; многие паразитируют на растениях, животных и на человеке; есть и полостные паразиты. Некоторые Клещи полезны:- участвуют в образовании почв, перерабатывают растительные остатки, истребляют некоторых вредителей растений. Многие Клещи причиняют большой вред. Иксодовые, Аргасовые и некоторые Гамазовые Клещи сильно вредят человеку и животным как эктопаразиты и переносчики возбудителей трансмиссивных болезней:- энцефалитов, геморрагических и других лихорадок и прочее; они переносят Вирусы, Бактерии, Спирохеты, Анаплазмы, Пироплазмы, Тейлерии, Микрофилярии. Некоторые Панцирные Клещи – промежуточные хозяева Ленточных Червей – паразитов домашних животных. Амбарные Клещи повреждают запасы зерна и других продуктов; Галловые Клещи, Паутинные Клещи и некоторые Гамазовые Клещи вредят растениям; Чесоточные Клещи паразитируют в коже человека и животных, вызывая чесотку. Клещ Акарапис вызывает болезнь Пчёл – акарапидоз. Личинки Клещей-Краснотелок, нападая на человека, вызывают укусами дерматиты, передают Японскую лихорадку – тсутсугамуши. Против Клещей применяются акарициды (или митициды) и биологические методы борьбы. Изучением Клещей занимается акарология. Клещи-Сенокосцы (Opilioacarina), Отряд Примитивных Клещей. Тело овальное, длина 1–2 миллиметра (мм), слабо склеротизовано. Ноги длинные и тонкие. Известно 10 Видов. Встречаются Клещи-Сенокосцы очень редко. Обитают в растительных остатках. В бывшем Союзе Советских Социалистических Республик (СССР) в Средней Азии были обнаружены 2 Вида:- Paracarus Hexophthalmus и Opilioacarus Italicus. Некоторые зоологи считают Клещей-Сенокосцнев Подотрядом Отряда Клещей. Клещи-Краснотелки (Trombea), Надсемейство из Подотряда Тромбидиформных Клещей. Длина до 2–3 миллиметров (мм); окраска от беловато-розоватой до красной. 2 Семейства:- Trombiculidae и Leeuwenhoekiidae, объединяющие 1 600 Видов. Распространены всесветно, от тундры до субтропиков и тропиков. В бывшем Союзе Советских Социалистических Республик (СССР) – 150 Видов. Взрослые и Нимфы живут в почве; хищники, питаются низшими насекомыми и их яйцами. Паразитирует только одна фаза жизненного цикла Клещей-Краснотелок – личинка; животные-хозяева – млекопитающие, птицы, пресмыкающиеся и земноводные, Некоторые виды нападают на человека. Укусы Клеща-Краснотелки вызывают у человека и животных дерматиты. В Юго-Восточной Азии Клещи-Краснотелки могут служить переносчиками возбудителя тяжёлого риккетсиозного заболевания – лихорадки тсутсугамуши.

MITICIDE = МИТИЦИД – Miticide is any chemical substance used to control mites or ticks (especially species that damage ornamental or food plants), which are not susceptible to commonly used insecticides. Azobenzene, Dicofol, Ovex, and Tetradifon are commonly used miticides. Many miticides kill eggs and larval stages as well as adult animals. Some are also toxic to honeybees and other beneficial insects. Also called Acaricide. Miticide is a material that kills mites. / Под Митицидом, от сочетания Английского слова Mite, означающее Клещ, и Латинского слова Caedo, означающее Убиваю, понимается .

MITIGATE = УМЕНЬШАТЬ (или СМЯГЧАТЬ, или СНИЖАТЬ, или МИНИМИЗИРОВАТЬ) – Mitigate:- to make less severe; steps to eliminate further damage after a loss occurs.

MITKAL = МИТКАЛЬ – Mitkal is the narrow cheesecloth or cotton sheeting, gray or bleached, made in Russia. / Миткаль, от Персидского слова Меткал, суровая тонкая хлопчатобумажная ткань. Полуфабрикат в производстве клеёнки, дерматина и тому подобного. Из миткаля в результате красильно-отделочных операций получают ситец и бельевые ткани – мадаполам, муслин. Отбеливанием миткаля получают глянцевитую жёсткую хлопчатобумажную бельевую ткань – мадаполам, от Мадаполлам – название бывшего пригорода Индийского города Нарсапур. Миткаль – суровая тонкая хлопчатобумажная ткань полотняного переплетения из довольно толстых нитей неотбеленной пряжи, как правило, сероватого оттенка. Миткаль используется как полуфабрикат в производстве клеёнки, дерматина и другого. В результате соответствующей отделки из миткаля получают ситец и бельевые ткани – мадаполам, муслин другие. При дальнейшей обработке из миткаля получали другие ткани:- при отбеливании – коленкор и мадаполам, при крашении – кумач, при нанесении орнамента – ситец и так далее. Самым лучшим миткалем в XIX веке считался Английский.

MITOCHONDRIA = МИТОХОНДРИЯ – Mitochondria is a functional organelle in the cell cytoplasm, of both plants and animals, containing highly ordered membrane-bound arrays of enzymes and proteins involved in respiration and energy metabolism. Mitochondria contain a small circular piece of DNA, which carries genes for a small number of mitochondrial proteins. Mitochondria are inherited almost exclusively from the female parent, and DNA sequences encoding mitochondrial genes are analysed to determine inter-specific relationships and the slow rates of mutation in mitochondrial DNA sequences are used as one form of ‘molecular clock’. / Под Митохондриями, от Греческих слов Mitos, означающее Нить, и Chondrion, означающее Зёрнышко или Крупинка, понимаются органоиды животных и растительных клеток. В митохондриях протекают окислительно-восстановительные реакции, обеспечивающие клетки энергией. Число митохондрий в одной клетке от единиц до нескольких тысяч. У прокариот отсутствуют (их функцию выполняет клеточная мембрана).

MITOCHONDRION = МИТОХОНДРИОН – Mitochondrion is an organelle found in all eukaryotes. Site of respiration (ATP synthesis). Contains its own DNA. / Под Митохондриями, от Греческих слов Mitos, означающее Нить, и Chondrion, означающее Зёрнышко или Крупинка, понимаются органоиды животных и растительных клеток. В митохондриях протекают окислительно-восстановительные реакции, обеспечивающие клетки энергией. Число митохондрий в одной клетке от единиц до нескольких тысяч. У прокариот отсутствуют (их функцию выполняет клеточная мембрана).

MIT ORDER = MARKET IF TOUCHED ORDER

MITOSIS = МИТОЗ – Mitosis is a process of somatic cell division which produces daughter nuclei which are identical genetically to one another and to the parent nucleus. They contain the same number of chromosomes. Mitosis produces genetically equivalent cells in the growing somatic region of organisms. It is a process by which the diploid stage of a cell is maintained, i.e. there is no reduction in

chromosome number. The five main stages are prophase, prometaphase, metaphase, anaphase, and telophase. Mitosis is the normal process of cell division when the diploid or other normal chromosome number is conserved to produce two daughter cells with identical numbers of chromosomes to the parent cell. Compare with Meiosis. / Митоз – непрямое деление ядра. Под Митозом, от Греческого слова Mitos, означающее Нить, понимается способ деления клеток, обеспечивающий тождественное распределение генетического материала между дочерними клетками и преемственность хромосом в ряду клеточных поколений. Обычно подразделяют на несколько стадий. Схема митоза:- профаза, прометафаза, метафаза, анафаза и ранняя и поздняя телофаза. Сравните с Мейозом (Meiosis).

MITS = MULTICROP INVERTED–T SEEDER

MITT = РУКАВИЧКА (или МИТЕНКА) – Mitt is a woman's glove that leaves the fingers uncovered; mitten.

MITTEN = ВАРЕЖКА – Mitten is a covering for the hand and wrist having a separate section for the thumb only.

MITTER PRINTING MACHINE = МИТТАВСКАЯ ПЕЧАТНАЯ МАШИНА – Mitter Printing Machine is a rotary carpet printing machine with up to eight stainless-steel mesh screens, and with cylindrical squeegees of moderately large diameter in each rotary screen. The unit has a streaming zone for dye fixation. Mitter GmbH & Co. Maschinenbau; Schloss Holte-Stukenbrock, Germany. / Мита Ге.эм.бе.Ха. Унд Ко. Машиненбау (Mitter GmbH & Co. Maschinenbau; Шлосс Хольтэ-Штукэнброк (Schloss Holte-Stukenbrock), Германия).

MIXED BROWN RICE FOR PROCESSING = СМЕСЬ БУРОГО РИСА ДЛЯ ПЕРЕРАБОТКИ – In the Rice industry of the United States, Mixed Brown Rice For Processing shall be brown Rice for processing which contains more than 25.0 percent of whole kernels of brown Rice and more than 10.0 percent of 'other types'. / В рисовой индустрии Соединённых Штатов Америки к Смеси Бурого Риса для Переработки относится бурый Рис для переработки, который содержит более 25.0 процентов целиковой зерновки (целых ядер) бурого Риса и более 10.0 процентов 'прочих типов'.

MIXED BUYING = СМЕШАННАЯ ПОКУПКА – Mixed Buying:- this is a general phrase that likely implies that the buying of the asset was by a couple different segments of the market. Mixed buying might be buying by commercial interests such as textile mills and cotton merchant or noncommercial interests like commodity funds and speculators. See also Mixed Selling.

MIXED CONSIGNMENT = СБОРНАЯ КОНСИГНАЦИЯ (или СБОРНАЯ ОТГРУЗКА) – Mixed Consignment is a consignment of different commodities, articles or goods, packed or tied together or contained in separate packages (aircargo). / В перевозках авиационных грузов .

MIXED CONTAINER LOAD = СМЕШАННАЯ ЗАГРУЗКА КОНТЕЙНЕРА (или КОНТЕЙНЕР СО СБОРНЫМ ГРУЗОМ) – Mixed Container Load is a container load of different articles in a single consignment. / Загрузка контейнера различной продукцией для одновременной перевозки. Под пакетно-контейнерными перевозками понимается наиболее экономичный вид транспортировки в контейнерах, сформированных в группы (пакет) грузов, в том числе тарно-штучных, без расформировки пакетов от грузоотправителя до получателя, что позволяет рационально использовать механизацию, сокращать затраты ручного труда, простои транспорта, обеспечивает максимальную сохранность грузов.

MIXED CREDIT = СМЕШАННЫЙ КРЕДИТ – Mixed Credit is a credit that contains an aid element, so as to provide concessional credit terms – such as a lower rate of interest or a longer credit period. Mixed Credit refers to the practice of combining concessional and market-rate export credit as an export promotion mechanism. / вывозной (или экспортный) кредит (export credit). Смешанный Кредит – метод кредитования, который включает в себя льготные долгосрочные государственные кредиты и вывозные (или экспортные) кредиты на обычных коммерческих условиях. Смешанные кредиты применяются в условиях острой межгосударственной конкуренции. Смешанный Кредит – кредит на финансирование вывоза (или экспорта), предоставленный совместно коммерческим банком и государственным финансово-кредитным учреждением.

MIXED CROPPING = СМЕШАННОЕ ВОЗДЕЛЫВАНИЕ КУЛЬТУР (или ВЫРАЩИВАНИЕ СМЕШАННЫХ КУЛЬТУР) – Mixed Cropping is a cropping system that uses more than one type of crop, growing simultaneously, on the same piece of land at the same time. / Под Смешанными Посевами понимается совместное выращивание на одной площади двух и более одновременно посеянных растений (Клевера с Тимофеевкой, Вики с Овсом и другие).

MIXED END = СМЕШАННАЯ (или СМЕСОВАЯ) ПРОДОЛЬНАЯ НИТЬ, (или РАЗНАЯ ПРОДОЛЬНАЯ НИТЬ) – Mixed End:- in woven fabrics, a warp yarn differing from that normally being used in the fabric. Fabrics defect. Mixed End (yarn):- the yarn of a different fiber blend used on the warp frame, resulting in a streak in the fabric.

MIXED END OR FILLING = СМЕШАННАЯ ПРОДОЛЬНАЯ НИТЬ ИЛИ УТОЧИНА – Mixed End or Filling:- warp or filling yarn differing from that normally used in the fabric, e.g., yarn with the incorrect twist or number of plies, yarn of the wrong color, or yarn from the wrong lot. Fabrics defect. / Разный Уток – порок ткани от наработки в одном куске мест различными номерами утка.

MIXED ENDS = СМЕШАННЫЕ ПРОДОЛЬНЫЕ НИТИ (или ЗАМИКСОВАННЫЕ ПРОДОЛЬНЫЕ НИТИ) – Mixed Ends (Yarn):- yarn of a different fiber blend used on the warp frame, resulting in a streak in the fabric. Woven fabric defect. / Порок или дефект ткачества.

MIXED FARMING = СМЕШАННОЕ ХОЗЯЙСТВО (или КОМПЛЕКСНОЕ ХОЗЯЙСТВО) – Mixed Farming is a raising of crops, animals (livestock), and/or trees simultaneously in the same piece of land. / Комплексное Хозяйство – сочетание земледелия с животноводством.

MIXED FERTILIZERS = СМЕШАННЫЕ УДОБРЕНИЯ (или ТУКОСМЕСИ) – Mixed Fertilizers are fertilizers containing two or more of the major fertilizer elements.

MIXED FILLING = СМЕШАННАЯ УТОЧИНА (или РАЗНАЯ УТОЧИНА) – Mixed Filling:- caused by bobbin of lightweight yarn or different fiber blend used in filling. Will appear as a distinct shade change. Woven fabric defect. Mixed Filling:- in woven fabrics, a filling yarn differing from that normally being used in the fabric. See also Filling Band. Compare Barré. See also Mixed End Or Filling. (1) Defect Name:- Mixed Filling. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Oxford or Basket. Description:- Mixed Filling:- The nubby effect, which is a desired characteristic of this fabric, is lost or greatly reduced by the difference in the filling at the top of the photograph. This constitutes a defect. Severity:- Major. (2) Defect Name:- Mixed Filling. Defect Type:- weft lines, horizontal lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Mixed Filling (also Filling Band):- This defect is the result of a bobbin of lightweight filing; the twill line is subdued and the shade is affected. Since it is a mixed filling problem on this 3/1 left hand twill, the defect is more noticeable from the back. Severity:- Major. / Порок или дефект ткачества. Разный Уток – порок ткани от наработки в одном куске мест различными номерами утка. Разный Номер Утка (mixed filling; mixed weft):- порок утка;

нити утка с разной толщиной, ошибочно заработанные в полотно. Примечание:- этот порок часто вызывается смешиванием партий пряжи или при отсутствии контроля при использовании различных типов пряжи.

MIXED FILM = СМЕШАННАЯ ПЛЁНКА – Mixed Film is a type of lubrication that features a combination of full-film and thin-film elements.

MIXED INCOME = СМЕШАННЫЙ ДОХОД – Mixed Income:- the balancing item on the generation of income account for unincorporated businesses owned by households. The owner or members of the same household often provide unpaid labor inputs to the business. The surplus is therefore a mixture of remuneration for such labor and return to the owner as entrepreneur. / строка баланса (item).

MIXED INTERCROPPING = СМЕШАННОЕ ВОЗДЕЛЫВАНИЕ ПРОМЕЖУТОЧНЫХ КУЛЬТУР – Mixed Intercropping is the simultaneously growing two or more crops intermingled in the same plot, with no distinct row arrangement. / Под Смешанными Посевами понимается совместное выращивание на одной площади двух и более одновременно посеянных растений (Клевера с Тимофеевкой, Вики с Овсом и другие).

MIXED INVESTMENT FUND = ФОНД СМЕШАННЫХ КАПИТАЛОВЛОЖЕНИЙ (или СМЕШАННЫЙ ИНВЕСТИЦИОННЫЙ ФОНД) – Many first time investors may find they are steered towards Mixed Investment Funds (formerly called 'Managed' Funds). They are a type of fund that invests in a range of assets, typically shares, bonds and cash, with the allocation between the different types of assets left to the discretion of the fund manager. Being exposed to a single type of asset, such as shares, can be more volatile than spreading your risk across several types of assets. Mixed investment funds include many of the components of a 'model' investment portfolio within a single fund. Principally, the funds offer asset diversification within the fund. For those with smaller amounts of money to invest, or who do not have the time or expertise to structure their own portfolio, mixed investment funds may be an attractive option. Mixed investment funds may typically be offered through an Individual Savings Account (ISA; a tax-efficient way of saving in cash or investing in shares, bonds and other investment products) or as a default choice in a pension. Mixed Investment Fund is the investment fund investing its assets in various securities, money market instruments or real estate property.

MIXED LOAN = СМЕШАННЫЙ ЗАЁМ – Mixed Loan is a type of credit granted to economically weak countries to reduce export prices and ease transactions. The loan consists of a tranche at preferential terms (government tranche) and a tranche at market conditions (bank tranche).

MIXED MILLED RICE = СМЕШАННЫЙ ОБРУШЕННЫЙ РИС – In the Rice industry of the United States, Mixed Milled Rice shall consist of milled Rice which contains more than 25.0 percent of whole kernels of milled Rice and more than 10.0 percent of 'other types' as defined in paragraph (i) of this section. US No. 5 and US No. 6 mixed milled Rice shall contain more than 10.0 percent of whole kernels of 'other types' (broken kernels do not apply). / который содержит более 25.0 процентов целиковой зерновки (целых ядер) обрушенного риса и .

MIXED PLYS = СМЕШАННЫЙ XX – Mixed Plys:- results in mixed shades. Cutting Room Defects, and namely – Shade Marking Defects. / Порок или дефект раскроя.

MIXED ROUGH RICE = СМЕШАННЫЙ РИС–СЫРЕЦ – Mixed Rough Rice shall consist of rough Rice which contains more than 25 percent of whole kernels and which, after milling to a well-milled degree, contains more than 10 percent of 'other types'. / который содержит более 25.0 процентов целиковой зерновки (целых ядер).

MIXED–ROW CROPPING = СМЕШАННОЕ ВОЗДЕЛЫВАНИЕ ПРОПАШНЫХ КУЛЬТУР (или СМЕШАННОЕ ВОЗДЕЛЫВАНИЕ СПОСОБОМ РЯДОВОГО ПОСЕВА) – Mixed-Row Cropping is a growing two or more crops simultaneously intermingled within a distinct row arrangement. / Под Смешанными Посевами понимается совместное выращивание на одной площади двух и более одновременно посеянных растений (Клевера с Тимофеевкой, Вики с Овсом и другие).

MIXED SELLING = СМЕШАННАЯ ПРОДАЖА – Mixing Selling:- this is a general phrase that likely implies that the selling of the asset was by a couple different segments of the market. Mixed selling might be selling by commercial interests such as textile mills and cotton merchant or noncommercial interests like commodity funds and speculators. See also Mixed Buying.

MIXED SHIPMENT = СБОРНАЯ ОТГРУЗКА – Mixed Shipment:- when a number of differently described articles are shipped as a mixed shipment, the charges on the shipment will be determined as follows:- (i) The rate to apply on each article will be the rate which would apply on that article if such article were tendered as a straight shipment, weighing the same as the aggregate weight of the mixed shipment. (ii) The minimum weight for the entire shipment will be the highest minimum weight applicable in connection with any article in the shipment. Any deficit weight will be charged for at the same rate as that applying to the lowest rated article in the shipment. (iii) When the total charge on the shipment is lower by considering the articles as if they were divided into two or more separate TL (short for Truckload) or volume shipments, the shipment will be rated accordingly. (iv) When the total charge on the shipment is lower by applying the TL or volume rate and minimum weight, or actual weight, if greater, for one or more articles and the LTL (short for Less Than Truckload) rate and actual weight for the remainder, such charges will apply, subject to the following:- the LTL rates to be assessed are those which would apply if the LTL portions were considered as a separate shipment. (v) The weight of the portion assessed LTL rates may not be applied toward the TL or volume minimum weight. Apply the straight TL or volume packing requirements. Where different TL or volume rates and minimum weights are provided on the same articles included in a mixed TL or mixed volume shipment, the lowest charges that can be computed by the use of any such rate and its accompanying minimum weight for that article will be used to determine the charges for the entire shipment. Note:- the provisions of this item do not apply on the following articles:- (a) Explosives, consisting of ammunition, explosive or incendiary, or gas or smoke or tear producing; Explosives, NOI (short for the Not Otherwise Indexed; the abbreviation NOI or NOIBN (short for the Not Otherwise Indexed by Name) may be used interchangeably with NOS (short for the Not Otherwise Specified)); propellants, explosive; or fireworks:- Class A or B (Item 64300 of NMF 100). (b) Mixed shipments of articles where the weight of the shipment does not meet, or is not charged for, the minimum weight requirements set forth in Paragraph ii of this item. A shipment consisting of more than one commodity, articles described under more than one class or commodity rate item in a tariff. Mixed Shipment is a shipment consisting of items described in and rated under two or more rate items within a tariff. See also Minimum Weight.

MIXED WHEAT = СМЕШАННАЯ ПШЕНИЦА – Mixed Wheat is any mixture of Wheat that consists of less than 90 percent of one class and more than 10 percent of one other class, or a combination of classes that meet the definition of Wheat. In the United States, mixed Wheat is graded according to the US numerical and US Sample grade requirements of the class of Wheat that predominates in the mixture, except that the factor Wheat of other classes is disregarded.

MIXED YARN = СМЕШАННАЯ ПРЯЖА – (1) Mixed Yarn:- when the individual plies are of different yarn count. Thread defects, and namely – Spinning. Defect Name:- Mixed Yarn. Defect Type:- warp lines, vertical lines. Fabric Type:- Shirting and Dress Goods –

Chambray. Description:- Mixed Yarn:- This is one warp end of an all-cotton yarn running in a 50/50 cotton/polyester blend. In this fabric, only the cotton is dyed so that the all-cotton yarn shows dark. Severity:- Major. / Порок или дефект нитей.

(2) Mixed Yarn occurs in warp knit. Results from wrong fiber yarn (or wrong size yarn) placed on warp. Fabric could appear as thick end or different color if fibers have different affinity for dye. Knitted fabric defect. Defect Name:- Mixed Yarn. Defect Type:- warp lines, vertical lines. Fabric Type:- Warp Knit Fabrics. Description:- Mixed Yarn:- This is the result of a yarn with different dye affinity having been mixed during creeling of the warp. Severity:- Major. / Порок или дефект. Сродство (Affinity).

MIXTURE = СМЕСЬ (или СМЕСКА, или СМЕСОВКА, или СМЕСОВАЯ) – Although the word Mixture is often ignored in favor of the word Blend, it should be used to describe fabrics made from a combination of two or more fibers in which one of the fibers is used for the filling thread. See also Biconstituent Fiber, and Blend. Mixture is a fabric woven of variously colored threads. / для уточной нити.

MK = MACEDONIA = THE FORMER YUGOSLAV REPUBLIC OF MACEDONIA

MKD = MACEDONIAN DENAR

ML = MALI

MLB = MINI LAND BRIDGE

MLP = MASTER LIMITED PARTNERSHIP

MLR = MINIMUM LENDING RATE

MM = MATERIALS MANAGEMENT

MM = MYANMAR

MM&P = MASTER, MATES AND PILOTS UNION

MMBBL = MILLION BARRELS

MMBOE = MILLION BARRELS–OF–OIL EQUIVALENT

MMBTU = MILLION BRITISH THERMAL UNIT

MMCF = MILLION CUBIC FEET

MMCM = MILLION CUBIC METERS

MMDA = MONEY MARKET DEMAND ACCOUNT

MMDA = MONEY MARKET DEPOSIT ACCOUNT

MMK = MYANMAR KYAT

MMME = MIDDLE MARKET MANUFACTURING EXPORTER

MMPU = MULTIMODE POWER UNIT

MMSU = MARIANO MARCOS STATE UNIVERSITY

MMTPA = MILLION TONS PER ANNUM

Mn = MILLION

MN = MONGOLIA

MNC = MULTINATIONAL CORPORATION

M–NITROBENZENE SULFONIC ACID, SODIUM SALT = М–НИТРО БЕНЗОЛСУЛЬФОНОВАЯ КИСЛОТА, СОЛЬ НАТРИЯ – M-Nitrobenzene Sulfonic Acid, Sodium Salt or Meta-Nitro Benzene Sulfonic Acid Sodium Salt or Sodium Salt Of M-Nitrobenzene Sulphonic Acid:- is a resist salt. Molecular Formula:- $C_6H_4NO_5S$. Synonyms:- Sodium 3-Nitrobenzenesulphonate; 3-Nitrobenzenesulfonic Acid; Sodium 3-Nitrobenzenesulfonate; and 3-Nitrobenzenesulfonate. See also M-Nitrobenzene Sulfonate. / Соль Натрия Мета-Нитро Бензолсульфоновой Кислоты (Sodium Salt Of M-Nitrobenzene Sulphonic Acid).

MNT = MONGOLIAN TUGRIK

MO = MACAU

MO = MONEY ORDER

MOA = MINISTRY OF AGRICULTURE

MOBCAP = ДОМАШНИЙ ЧЕПЕЦ – Mobcap is a woman's fancy indoor cap made with a high full crown and often tied under the chin.

MOBEY FORUM = ФОРУМ МОУБИ (или МОБИЛЬНЫЙ ФОРУМ) – Mobey Forum is the financial industry-driven forum, whose mission is to encourage the use of mobile technology in financial services.

MOBILE BANKING = МОБИЛЬНОЕ БАНКОВСКОЕ ОБСЛУЖИВАНИЕ – Mobile Banking is a range of traditional banking services, including push payments, where a customer gives the order to the bank to execute a transfer of funds, conducted via a mobile trusted device. / С разработкой и внедрением в жизнь полупроводников, а также развитием средств связи и Интернета практически все крупные банки стали предлагать своим клиентам услугу Мобильное Банковское Обслуживание, которую в России называют Мобильный Банк. В её основе лежит использование мобильного телефона для контроля и управления банковским счётом, например, карточным счётом. Услуга Мобильный Банк предлагает клиентам банка несколько или все (в зависимости от банка) приводимые ниже операции по счёту, а именно:- (i) получение информации о лимите доступных средств по банковской карте; (ii) получение информации о последних, к примеру, пяти операциях по банковской карте; (iii) справка о банковских картах, подключённых к услуге Мобильный Банк; (iv) перечисление платежей в пользу третьих лиц; (v) приостановка действия (блокировка) банковской карты; (vi) блокировка/разблокировка услуг Мобильного Банка; (vii) установка Java-приложений (для телефонов стандарта GSM), упрощающих работу с Мобильным Банком за счёт автоматического формирования запросов в банк; (viii) перечисление денежных средств на счета карт; и (ix) оформление поручения на

перечисление денежных средств. В отношении мобильных телефонов пользование данной услугой предполагает отсылку запросов или получение ответов и уведомлений банка в виде SMS-сообщений.

MOBILE COMMERCE = МОБИЛЬНАЯ КОММЕРЦИЯ – Mobile Commerce is the electronic commerce using mobile devices as the customer device, e.g., mobile phones. M-Commerce (Mobile Commerce) is the buying and selling of goods and services through wireless technology, i.e. handheld devices such as cellular telephones and personal digital assistants (PDAs). Japan is seen as a global leader in m-commerce. As content delivery over wireless devices becomes faster, more secure, and scalable, some believe that m-commerce will surpass wireline e-commerce as the method of choice for digital commerce transactions. This may well be true for the Asia-Pacific where there are more mobile phone users than there are Internet users. Industries affected by m-commerce include:- (i) Financial services, including mobile banking (when customers use their handheld devices to access their accounts and pay their bills), as well as brokerage services (in which stock quotes can be displayed and trading conducted from the same handheld device); (ii) Telecommunications, in which service changes, bill payment and account reviews can all be conducted from the same handheld device; (iii) Service/retail, as consumers are given the ability to place and pay for orders on-the-fly; and (iv) Information services, which include the delivery of entertainment, financial news, sports figures and traffic updates to a single mobile device. Forrester Research predicts USD3.4 billion sales closed using PDA and cell phones by 2005.

MOBILE DEVICE = МОБИЛЬНОЕ УСТРОЙСТВО – Mobile Device is a set of seamlessly compatible hardware and software used interactively by a customer for making transactions wirelessly to other receiving parties which can be remote (e.g., server located on some communication network including the Internet) or face-to-face (e.g., electronic terminals like point of sale (POS), vending machines, parking meters). Examples of mobile devices are mobile phones, personal digital assistants (PDAs) and interactive laptops. See also Mobile Trusted Device and Personalised Mobile Trusted Device. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

MOBILE ELECTRONIC TRANSACTIONS = МОБИЛЬНЫЕ ЭЛЕКТРОННЫЕ ТРАНЗАКЦИИ (или МОБИЛЬНЫЕ ЭЛЕКТРОННЫЕ ОПЕРАЦИИ) – Mobile Electronic Transactions or MeT are the technical framework and application guidelines for secure transactions with mobile trusted devices.

MOBILE PAYMENT = МОБИЛЬНЫЙ ПЛАТЁЖ – A Mobile Payment or m-Payment is not by itself a new payment instrument but an access method to activate an existing means of payment for financial transactions processed by banks between bank customers. An m-payment involves a wireless device that is used and trusted by the customer. M-payments may be card based or non-card based, in both the real and virtual world.

MOBILE PAYMENT FORUM = ФОРУМ МОБИЛЬНЫХ ПЛАТЕЖЕЙ – Mobile Payment Forum (MPF) was established by American Express, JCB, MasterCard and Visa end 2001, MPF is the successor to the Global Mobile Commerce Interoperability Group (GMCIG). See also Global Mobile Commerce Interoperability Group. The Mobile Payment Forum (MPF) is a global, cross-industry alliance of leading organizations from the mobile and financial industries dedicated to realizing the full potential of mobile commerce. Launched in November 2001, the Forum creates a framework for the deployment of simple, secure and interoperable m-payments. The Forum provides an open, flexible and trusted environment in which member organizations can clarify the opportunities and address the complex challenges facing the industry. Membership in the Forum includes organizations involved in facilitating mobile payments:- key financial institutions, payment card companies, telecommunications operators, wireless-device manufacturers, merchants, content providers and software and hardware developers and vendors. Our mission is to leverage the expertise of key participants in the mobile communications and financial industries to create a foundation for standardized technology and functionality for mobile payments, and address consumer and merchant needs for simple, secure, and interoperable m-payment choices. In accomplishing this, the Mobile Payment Forum aims to:- (i) accelerate the global market for m-payments; (ii) simplify the consumer payment experience; and (iii) collaborate on future directions for mobile commerce. Although the mobile commerce market is still growing, analysts, the financial community and consumers are all excited by this emerging payment channel. Key to the industry's long term success is cross industry cooperation to establish consistency in payment solutions and consensus on technology standards. The Mobile Payment Forum was launched in November 2001 when American Express, JCB Co, Ltd, MasterCard International and Visa International, joined forces to invite Financial institutions, telecommunication operators, handset manufacturers and vendors to collaborate in the development of an interoperable global m-payment market. Today, the combined experience and expertise of these key industry players allows the Forum to address the critical issues for mobile payments, develop trusted relationships, identify requirements and build a framework that will make global, interoperable mobile payments a viable reality. The Mobile Payment Forum is the only global, cross-industry alliance of leading organizations from the wireless and financial industries dedicated to realizing the full potential for mobile (m) payments. The Forum was incorporated in March, 2001 and launched in November, 2001. With members representing key industry segments around the world, the Mobile Payment Forum is well positioned to carry out its mission to create a foundation for standardized technology and functionality for mobile payments, and address consumer and merchant needs for simple, secure, and interoperable m-payment choices. The Mobile Payment Forum brings together the wireless and financial industries to accelerate the development of the mobile payment market by providing an open and trusted environment in which member organizations address complex challenges facing the industry. The Mobile Payment Forum influences the development of wireless and financial standards by delivering the necessary tools to aid the industry in creating standards for safe, interoperable m-payments. These tools include requirements documents, best practices, detailed use cases, white papers and, as appropriate, specifications. The group was established by American Express, JCB Co. Ltd, MasterCard International and Visa International, who bring their extensive experience in creating interoperable global standards and specifications and their knowledge of payments via emerging channels. The Forum's board of directors reflects its global, cross-industry make-up. In addition to the founders, it includes:- 3 (formerly Hutchison3G), Nokia, NTT DoCoMo, Oracle, Orange, Telecom Italia Mobile, T-Mobile and Vodafone. Member participants in the Forum are working together to find common ground, with the ultimate goal of delivering a practical framework that allows for a choice of protocols and payment solutions – thereby meeting consumer and merchant needs for selection, convenience, and simplicity. The Mobile Payment Forum is led by its board of directors, who oversee the Steering Group. The Steering Group is responsible for the strategic planning, review and approval of all technical activities of the Mobile Payment Forum. In addition to its strategic planning role, the work of the Steering Group includes such activities as evaluating activity proposals and assigning the work to appropriate Working Groups; providing reports on the progress of technical work; and initiating contact with other industry groups and establishing liaisons as necessary. The Mobile Payment Forum has three technical working groups, organized along the functional lines associated with the mobile payment process. All current and future activities are assigned to one of the following working groups:- (i) Mobile Payment Configuration and Maintenance; (ii) Mobile Payment Processes Working Group; and (iii) Mobile Payment Authentication Working Group. The Mobile Payment Forum favors open standards and choice and is technology-neutral. Our goal is to create a framework that will allow a choice of protocols and payment solutions to be used. The Mobile Payment Forum is focused on developing a framework for technical specifications that address specific areas of mobile payments such as cardholder authentication, passwords, and encryption. We would prefer to build on current technologies and take advantage of existing infrastructure rather than redesign them;

for example, the Forum may produce use cases and business requirements documents for the personalization of multi-application devices but then share them with relevant organizations created for the purposes of developing standards. In this way we would complement, rather than duplicate efforts. However, if we find that no other organization is taking the lead on necessary specifications, the Forum will, as a last resort, take on such an initiative. The Mobile Payment Forum has a very specific focus – to develop methods for standardized, secure and authenticated mobile payments. An organization with an international membership base serving a global market, ours is the only consortium to bridge the efforts of the entire mobile and financial communities for m-commerce. We intend to make it possible to choose from a number of protocols and payment solutions for mobile payments. Cross-industry co-operation is the single most efficient and rapid method of developing acceptable approaches, standards and specifications. Acting as a bridge between the mobile and financial industries, the Mobile Payment Forum aims to accelerate the development of the m-commerce market by allowing consumers to make secure, convenient mobile payments. Our approach will expand the overall market. In the process, it will increase market opportunities for handset and chip manufacturers, telcos, programmers, wireless application service providers (WASPs) and many more organizations. Ultimately, our efforts should simplify the payment process and reduce the cost of deployment, allowing merchants to provide affordable, interoperable m-payment options and consumers around the world to purchase simply and securely. Merchants and consumers will be able to do this anywhere in the world, in ways that take into account any specific regional preferences or circumstances. We actively seek to engage all organizations involved in m-commerce, including telecommunications providers, handset manufacturers, payment card companies, financial institutions, merchants and merchant acquirers, wireless application service providers (WASPs), and programmers for the mobile market – such as browser developers, encryption service developers, systems integrators and chip manufacturers. Organizations that want to play a leading role in the forum can become Principal members at a cost of USD12 500.00 a year. Principal members have voting rights, may run for a seat on the board of directors, are automatically eligible to participate in Steering Committee (through which all technical matters are passed), and may have unlimited participation in all committees and working groups. Associate membership costs USD4 000.00 a year. Associate members do not have voting rights but may participate in working groups, provide input on deliverables, have access to all research and attend all general meetings. For additional information, please visit http://www.mobilepaymentforum.org. Headquartered in Wakefield, MA, the United States. / операторы дальней связи. MOBILE TRUSTED DEVICE = МОБИЛЬНОЕ ДОВЕРИТЕЛЬНОЕ УСТРОЙСТВО – A Mobile Trusted Device (MTD) is a device used by the customer to perform a transaction, which meets the standards for the schemes in which it will be used. This system may be owned by the customer or by a service provider or bank, e.g., PC, mobile phone, card reader provided by one's bank, etc. See also Mobile Device and Personalised Mobile Trusted Device.

MOC = MARKET ON CLOSE

MOCATTA® = МОКАТА® – Mocatta & Goldsmid:- the London Gold Fix has been a regular feature of the international gold market since Friday, September 12, 1919, when the five gold pool members met for the first time, at the premises of the London merchant bank N.M. Rothschild, and with Rothschild as the chairman. Brief History of Mocatta & Goldsmid as London Bullion Market Member:- 1671 – founded in Camomile Street by Moses Mocatta; 1677 – moved to Mansell Street; 1710 – Abraham Mocatta admitted as a broker on the Royal Exchange; 1767 – known as Mocatta & Keyser with offices in Grigsby's coffee house; 1783 – admission of Asher Goldsmid to the firm led to its being renamed Mocatta & Goldsmid. Offices in the Bank of England. 9 generations presided over the firm. Since 1976 only, when Edward 'Jock' Mocatta died, no member of the family has been actively involved in the company. 1970s – known as the Mocatta Group. Becomes subsidiary of Standard Chartered Bank. 1992 – becomes full division of Standard Chartered. 1997 – acquisition by Bank of Nova Scotia of Mocatta Bullion from Standard Charted, forming a global bullion division, Scotia Mocatta. The Mocatta® name has been synonymous with bullion for over three centuries. Mocatta & Goldsmid is the oldest and one of the largest bullion banks in the world, Mocatta & Goldsmid traces its history back to 1671. Throughout history the company acted as an exclusive broker to the Bank of England and the East India Company. In 1897, Mocatta chaired the first London Silver Fixing. ScotiaMocatta, as it became following acquisition by The Bank of Nova Scotia in December 1997, continues to chair the Fixing today. As of May 2004, ScotiaMocatta has been appointed the new Chairman of the London Gold Fixing. ScotiaMocatta, part of Scotiabank Global Banking and Markets, is a global leader in precious and base metals trading, finance and physical metal distribution, with roots dating back to 1671. ScotiaMocatta, a division of The Bank of Nova Scotia, is a global leader in precious and base metals innovation. The Mocatta® name has been synonymous with bullion for over three centuries. As one of the world's top bullion dealers, ScotiaMocatta is a global full-service organization that provides hedging, financing, and physical products and services. Our staff is second to none in its industry. With more than 160 professionals and 12 offices around the world, the ScotiaMocatta global precious and base metals team has an extraordinary breadth of industry and geographical specialization. Drawing on the combined expertise of Scotiabank in investment banking and corporate banking, including research, derivatives, foreign exchange, and mining and project finance, ScotiaMocatta is able to provide clients with truly integrated solutions. The ScotiaMocatta global metals team provides 24-hour global coverage, in-depth local expertise and innovative solutions. Scotiabank is one of North America's leading financial institutions and the most international of Canada's major banks, with operations in more than 50 countries. Scotiabank's global corporate and investment banking and capital markets operations provide specialized solutions for corporate, institutional and government bodies and, through ScotiaMocatta, to the precious and base metals industries. ScotiaMocatta's global reach is complemented by access to the network of Scotiabank's resources and professionals. Scotiabank provides significant credit strength, industry presence, while helping clients seize opportunities, unlock value and achieve results. Our History:- through the centuries Mocatta has been at the forefront of world markets with innovative new products and solutions that have become industry standards. ScotiaMocatta's evolution of expertise and innovation makes us one of the world's top precious and base metals dealers. 1671:- Mocatta Established. 1774:- Handled 3/4 of world gold production. 1897:- Made Permanent Chair of the London Silver Fixing. 1997:- Scotiabank acquired Mocatta and forms ScotiaMocatta. 2004:- First non-British bank to chair the London Gold Fixing. Recent:- (i) Membership received into the Shanghai Gold Exchange; and (ii) Expanded team to include global Base Metals capabilities. Mocatta® was founded in 1671 by Moses Mocatta, first sent gold to India in 1676, and became broker to the Bank of England and the East India Company in the XVIII century. The firm became Mocatta Goldsmid in 1779 and was always run by a Mocatta or a Goldsmid until 1957 when the family firm was acquired by Hambros Bank. In 1973 Standard Chartered Bank took over the controlling interest, which was sold to Bank of Nova Scotia in 1997. Scotia-Mocatta is the global bullion banking division of the Bank of Nova Scotia, formed in 1997 by the bank's acquisition of Mocatta Bullion from Standard Chartered Bank in London. Mocatta itself dates back to 1671 as the oldest member of the London market. Scotia-Mocatta is a London fixing member. / Нэйсэн Мэйо Росчайлд (или Натан Майа Ротшильд; Nathan Mayer Rothschild). Моката Энд Кайза (Mocatta & Keyser) с конторами в (Grigsby). Моката Энд Голдзмид (Mocatta & Goldsmid). Только с 1976у, когда Эдвод 'Дьжок' Моката (Edward 'Jock' Mocatta). СкошаМоката (ScotiaMocatta). Голдзмид (Goldsmid).

MOCCASIN = МОКАСИН – Moccasin:- a soft leather heelless shoe or boot with the sole brought up the sides of the foot and over the toes where it is joined with a puckered seam to a U-shaped piece lying on top of the foot; a regular shoe having a seam on the forepart of the vamp imitating the seam of a moccasin. / heel = каблук или пятка. Мокасин – мягкая кожаная обувь без каблука, часто украшенная узорами или рисунками. Под Мокасинами, от Английкого слова Moccasin, заимствование из языка Индейцев-Алгонкинов), мягкая замшевая обувь Северо-Американских Индейцев. Мокасины распространены у всех племён, за исключением Индейцев Тихоокеанского Побережья и Калифорнии. Существует 2 типа мокасинов – чулкообразные, выкроенные из одного или трёх кусков замши, и мокасины с отдельно выкроенной твёрдой подошвой из сыромятной кожи и мягким замшевым верхом. Мокасины обычно украшены иглами дикобраза, бисером.

MOCHA = МОКА (или XX) – Mocha:- a dark chocolate-brown color.

MOCK CRÊPE = МОК КРЭП (или ЛОЖНЫЙ КРЭП, или ИМИТАЦИЯ КРЭПА) – Mock Crêpe is a term for fabrics that have the appearance of crêpe, but are not made from crêpe yarns. See also Crêpe. / Mock = Имитация или Подражание или Подделка или Обманка. Ложный Крэп – ткань, сработанная крэповым переплетением из пряжи пологой крутки.

MOCK DYEING = ЛОЖНОЕ КРАШЕНИЕ (или МНИМОЕ КРАШЕНИЕ, или ПРИТВОРНОЕ КРАШЕНИЕ) – Mock Dyeing is a heat stabilization process for yarns. The yarns are wound onto packages and subjected to package dyeing conditions (water, pressure, temperature) but without dye an chemicals in the bath.

MOCK LENO = ЛОЖНОЕ ПЕРЕВИВОЧНОЕ – Mock Leno:- a combination of weaves having interlacings that tend to form the warp ends into groups (with empty spaces intervening) in the cloth, thereby giving an imitation of the open structure that is characteristic of leno fabrics. Mock leno fabrics are used for summer shirts, dresses, and other apparel, and as a shading medium in Jacquard designs. / Жакяр (Jacquard). переплетение .

MOD = MINISTRY OF OVERSEAS DEVELOPMENT

MODACRYLIC FIBER = МОДАКРИЛОВОЕ ВОЛОКНО – Modacrylic is a synthetic fiber composed of linear macromolecules having in the chain at least 50% and less than 85% by mass of acrylonitrile. Alphabetic code – MAC; and relevant commercial allowance – 2.00 (refers to European Union Directives on Textile Labelling). Modacrylic Fiber is a manufactured fiber similar to acrylic in characteristics and end-uses. Modacrylics have a higher resistance to chemicals and combustion than acrylic, but also have a lower safe ironing temperature and a higher specific gravity than acrylic. Modacrylic Fiber is a manufactured fiber in which the fiberforming substance is any long chain synthetic polymer composed of less that 85% but at least 35% by weight of acrylonitrile units. Both wet and dry spinning are used. Characteristics:- although modacrylics are similar to acrylics in properties and application, certain important differences exist. Modacrylics have superior resistance to chemicals and combustion, but they are more heat sensitive (lower safe ironing temperature) and have a higher specific gravity (less cover). End Uses:- the principal applications of modacrylic fibers are in pile fabrics, flame-retardant garments, draperies, and carpets. Modacrylic is a generic name for modified acrylic fibers derived from thirty-five to eighty-five percent of acrylonitrile units. It differs from acrylic in its chemical structure. Modacrylic is used Most commonly to make fake furs and wigs. Modacrylic fibers are naturally flame-retardant (slow-burning). See also Acrylic. Modacrylic Fiber is a manufactured fiber in which the fiberforming substance is any long chain synthetic polymer composed of less than 84% but at least 50% by weight of acrylonitrile units. $(–CH_2CH[CN]–)_x$. Modacrylic fibers are made from resins that are copolymers (combinations) of acrylonitrile and other materials, such as vinyl chloride, vinylidene chloride or vinyl bromide. Modacrylic fibers are either dry spun or wet spun. Modacrylic Fiber have characteristics of soft, resilien, easy to dye to bright shades, abrasion resistant, flame resistant, quick drying, resistant to acids and alkalies, shape retentive. It can be made to fabrics like fleece, knit-pile backing or nonwoven fabrics. It is suitable for making garment like deep-pile coats, trims and linings, simulated fur, wigs and hair pieces, children's sleepwear, career apparel. Fake Furs are often made out of this fiber. / Термин Модакриловое Волокно употребляют по отношению к сополимерам с винилхлоридом или винилиденхлоридом, содержащим ниже 85% акрилонитрила. Они окрашиваются основными красителями в присутствии переносчиков. Модакриловые волокна употребляют всё больше и больше в качестве обивочного материала для покрытия сидений в автомобилях, в смесях с другими волокнами для производства верхней одежды и тканей с ворсом типа штапеля, а также для изготовления париков. К недостаткам модакриловых волокон по сравнению с поли-акрилонитрильными следует отнести повышенную термостойкость и светостойкость. Устойчивость к дымовым газам не является проблемой в случае антрахиноновых красителей для акриловых и модакриловых волокон, поскольку эти волокна труднопроницаемы для окислов азота. Однако те же самые красители на кислотно-модифицированных полиамидных волокнах могут быть серьёзно повреждены окислами азота или озоном. На основе сополимеров акрилонитрила, содержащих от 40 до 60% второю мономера, получают модакриловые волокна. На основе сополимеров акрилонитрила, содержащих от 40 до 60% второго мономера, получают модакриловые волокна. Волокна на основе сополимеров акрилонитрила можно подразделить на две группы:- (1) полиакрилонитрильные волокна, получаемые из сополимеров, содержащих не менее 85% акрилонитрила; и (2) модакриловые волокна, получаемые из сополимеров, содержащих менее 85% (обычно – 10–60%) акрилонитрила. Эти сополимерные волокна, которые согласно приведённому выше определению содержат 35–85% звеньев акрилонитрила, были первоначально разработаны с целью улучшения свойств поливинилхлоридных волокон (в частности, для повышения температуры размягчения) и облегчения их формования из растворов в обычных растворителях. В настоящее время модакриловые волокна – сами по себе или в смеси с другими волокнами – применяются в качестве огнестойких волокон. Они представляют собой статистические сополимеры акрилонитрила с винилхлоридом или винилиденхлоридом, полученные путём обычной радикальной сополимеризации. Примерами модакриловых волокон этого типа могут служить Дайнел, Теклан, Верел и Канекалон. Все они формуются из раствора. Из-за нерегулярного строения макромолекул и низкого содержания звеньев акрилонитрила межцепные взаимодействия в модакриловых волокнах выражены слабее, чем в полиакрилонитрильных. Поэтому модакриловые волокна менее прочны, растворимы в менее полярных растворителях и размягчаются при более низких температурах. Однако они сохраняют высокую хемо- и светостойкость, присущую полиакрилонитрильным волокнам. Однако перечисленные соединения являются дорогостоящими и по этой причине не нашли применения в промышленном масштабе.

MODAL® = МОДАЛЬ® – Modal® is a cellulose fiber made by spinning reconstituted cellulose from Beech trees. It is about 50% more hygroscopic (water-absorbent) per unit volume than cotton. It takes dye like cotton, and is color-fast when washed in warm water. Modal® is essentially a variety of rayon. Textiles made from Modal® are resistant to shrinkage and fading, but prone to stretching and pilling. They are smooth and soft, more so than mercerized cotton, to the point where mineral deposits from hard water do not stick to the fabric surface. Modal® fabrics should be washed at lower temperatures, and ironed after washing. Lenzing Modal® is a registered trademark of Lenzing AG (headquartered in Lenzing, Austria), an Austrian company specializing in textiles and fibers, particularly natural fibers made from cellulose. Modal® has been used alone or with other fibers in household linens such as towels, bathrobes, and bedsheets, and the fabric has increased in popularity in the early XXI century. Many textile companies use Modal® mixed with other fibers such as spandex. Modal® has gained ground in India; Indian textile companies were expected to produce around 4 000 tons in

2005. Modal® is a cellulose fiber having a high breaking force (BF) and a high wet modulus B_w. The breaking force BF_c in the conditioned state and the wet modulus F_w required to produce an elongation of 5%. In its wet state are:- $BF_c \geq 1.3\sqrt{LD} + 2LD$, and $F_w \geq 0.5\sqrt{LD}$, where LD is the mean linear density (mass per unit length) in decitex. BF_c and F_w are expressed in centiNewtons. Alphabetic code – CMD; and relevant commercial allowance – 13.00. Modal® fibers may be produced using the same principle as viscose, yet it is under changed reaction specifications so that the fiber is different to viscose in tenacity and swellability. The higher tensile strength and absorbency of the Modal® fibers is comparable to that of cotton fibers, however the negative effects such as accumulation of lime scale or graying, which appear during the washing of 100% cotton textiles, are removed. The quality of modal fibers is recognizable through softness and color brilliance. Increasingly, apparel is being offered for sale which is designated as 'modal' in the labeling, but which are viscose fibers and not modal fibers. This is a violation of the textile labeling act. Modal is a strong fiber and only loses 20% of its strength when it's wet, not distorting and tearing easily like wet viscose rayon. It can absorb up to 15% of its weight in moisture before feeling wet, and will dry more quickly than viscose rayon. Modal® is a cellulose fiber made by spinning reconstituted cellulose from Beech trees. It is about 50% more hygroscopic, or water-absorbent, per unit volume than cotton is. It is designed to dye just like cotton, and is color-fast when washed in warm water. Modal® is essentially a variety of rayon. Textiles made from Modal® are resistant to shrinkage and fading. They are smooth and soft, more so than even mercerized cotton, to the point where mineral deposits from hard water, such as lime, do not stick to the fabric surface. Like pure cotton, Modal® should ideally be ironed after washing. Pure Modal® has been used in household linens such as towels, bathrobes, and bedsheets. Many textile companies use Modal® mixed with other fibers like spandex. Modal® is a type of viscose. Modal® fabric has softness, good drape and is comfortable for wearing. Modal® fabric has good moisture regain and air permeability which is often considered better than cotton fabric, it is a good material for exercise clothing and health suit, which can serve to benefit physiology circulation and health of the body. Modal® fabric has level up surface, fine and smooth and velvet, which have the effect of natural silk. The yarn has the character of high strength. The fabric has good softness and brilliant luster. The effect of the finished Modal® garment is very good, and the form is steady. The garment maintains anti-crease properties and has relatively easy care. / Ленцинь А.Ге. (Lenzing AG). Очень часто в начале 2000-х Китайские изготовители текстильной продукции и особенно из махровых тканей стали обманывать своих потребителей, указывая на состав волокон. В частности они выдавали за бамбуковое волокно модальное.

MODE = РЕЖИМ (или ОБРАЗ, или СПОСОБ) – Mode:- the most frequent values considered from observation or data. / Под Режимом, от Французского слова Regime, от Латинского слова Regimen, означающее Управление, понимается совокупность правил, мероприятий, норм для достижения какой-либо цели, например, режим экономии.

MODE OF ACTION = СПОСОБ ВОЗДЕЙСТВИЯ – Mode Of Action is a method or process by which a herbicide can have an impact upon a plant, or a plant process or pathway.

MODEL = МОДЕЛЬ – Model is a framework for analysis that provides a reasonable basis for the valuation of the financial effects of future events consistent with the purpose intended, adjusted where necessary or appropriate to recognize the inherent uncertainty associated with projections involving future events. The term Model, as used by actuaries, typically refers to mathematical forms, terms, or computational procedures designed to be consistent with recognized actuarial practice and may also refer to methods, techniques, procedures, or approaches used by actuaries. Model is the mathematical use of data to project experimental results. A small imitation of the real thing; a system of postulates, data, and inferences presented as a mathematical description of an entity or state of affairs. / Под Моделью, от Французского слова Modèle от Латинского слова Modulus, означающее Мера или Норма или Образец, понимается .

MODERATE RESISTANCE = УМЕРЕННАЯ РЕЗИСТЕНТНОСТЬ (или УМЕРЕННАЯ СОПРОТИВЛЯЕМОСТЬ, или УМЕРЕННАЯ УСТОЙЧИВОСТЬ) – Moderate Resistance:- intermediate levels of resistance, between resistant and susceptible.

MODERN BIOTECHNOLOGY = СОВРЕМЕННАЯ БИОТЕХНОЛОГИЯ – Modern Biotechnology is the application of:- (a) in vitro nucleic acid techniques, including recombinant deoxyribonucleic acid (DNA) and direct injection of nucleic acid into cells or organelles; or (b) fusion of cells beyond the taxonomic family, that overcome natural physiological reproductive or recombination barriers and that are not techniques used in traditional breeding and selection.

MODERN PORTFOLIO THEORY = СОВРЕМЕННАЯ ТЕОРИЯ (ИНВЕСТИЦИОННОГО) ПОРТФЕЛЯ – Modern Portfolio Theory is a model developed by Harry M. Markowitz (USA) designed to optimize the performance of a securities portfolio through diversification. The objective is to achieve the highest possible yield at a given degree of risk. The research that earned Markowitz the Nobel Prize involved his 'Portfolio Theory', which sought to prove that a diversified, or 'optimal', portfolio – that is, one that mixes assets so as to maximize return and minimize risk – could be practical. His techniques for measuring risk associated with various assets and his techniques for mixing assets became routine investment methods. He also developed a computer language called Simscript, used to write economic-analysis programs. / Хэри Эм. Марковиц (Harry M. Markowitz).

MODERN VARIETIES = СОВРЕМЕННЫЕ РАЗНОВИДНОСТИ – Modern Varieties (cultivars) are dwarf, semidwarf, stiff-stemmed, high-tillering, nitrogen-responsive, photoperiod-insensitive, high-yielding varieties. Their characteristics are different from those of traditional varieties. / карликовые, полукарликовые, .

MODIFICATION = МОДИФИКАЦИЯ – Modification is a change or alteration to the terms of an agreement. See also Amendment. / Замена или изменение положений соглашения. Смотрите также Поправка (Amendment). Под Модификацией, от позднелатинского слова Modificatio, означающее Изменение, понимается видоизменение.

MODIFICATION DETECTION CODE = КОД ОБНАРУЖЕНИЯ МОДИФИКАЦИЙ – Modification Detection Code:- an unkeyed hash function whose specific purpose is message integrity.

MODIFIED ACETATE FIBERS = МОДИФИЦИРОВАННЫЕ АЦЕТАТНЫЕ ВОЛОКНА – Modified Acetate Fibers are the fibers that are stretched and then treated with alkali.

MODIFIED ATMOSPHERE = МОДИФИЦИРОВАННАЯ АТМОСФЕРА – Modified Atmosphere is a blend of gases tailored to replace the normal atmosphere within a container. / Смесь газов, подобранная для замены обыкновенной атмосферы внутри контейнера.

MODIFIED CELLULOSE FIBERS = МОДИФИЦИРОВАННЫЕ ЦЕЛЛЮЛОЗНЫЕ ВОЛОКНА – Modified Cellulose Fibers are the cotton fibers treated with caustic soda to give strength, increased luster, and improved affinity for dye. Modification of a fiber changes its physical and chemical properties within the limits of a generic family.

MODIFIED CONSTRUCTION PLYWOOD = МОДИФИЦИРУЕМАЯ КОНСТРУКЦИОННАЯ ФАНЕРА – Modified Construction Plywood:- panels which are not standard thickness or which have an even number of plies. See also Plywood, and Standard Construction Plywood. / .

MODIFIED FIBERS = МОДИФИЦИРОВАННЫЕ ВОЛОКНА – Modified Fibers are the fibers that are treated to eliminate charactetistics considered undesirable and to add characteristics considered desirable. Some treatments improve a fiber's ability to take dye, whereas others give a fiber stretch it does not naturally have. / Модифицированное Волокно – текстильное волокно с заданными специфическими свойствами, полученное путём дополнительной химической или физической модификации.

MODIFIED RAYON FIBERS = МОДИФИЦИРОВАННЫЕ ВОЛОКНА РЭЙОН (или МОДИФИЦИРОВАННЫЕ ГИДРАТЦЕЛЛЮЛОЗНЫЕ ВОЛОКНА) – Modified Rayon Fibers:- chemical treatment while fibers are in the plastic state to give them high tenacity (high strength). Changes in the molecular structure of the fiber have been made.

MODIFIED STRETCH YARN = МОДИФИЦИРОВАННАЯ РАСТЯЖИМАЯ ПРЯЖА – Modified Stretch Yarn is the stretch yarn that develops more bulk than usual but less bulk than a bulked yarn in the finished fabric.

MODIFIED YARN = МОДИФИЦИРОВАННАЯ ПРЯЖА – Modified Yarn:- xxxxx. See also Modified Fibers. / Модифицированная Нить – текстильная нить с заданными специфическими свойствами, полученная путём дополнительной химической или физической модификации.

MODIFYING GENE = МОДИФИЦИРУЮЩИЙ ГЕН – Modifying Gene is a gene that alters the expression of another gene which is non-allelic. The effect of the modifying gene (modifier) is relatively small compared to that of the non-allelic gene being affected.

MODU = MOBILE OFFSHORE DRILLING UNIT

MODULAR UNIT LOAD DIMENSIONS = XX – Modular Unit Load Dimensions are the packages or unit loads are suitable for modular container stuffing if their dimensions or multiples of their dimensions are equal to the internal dimensions of the container. By using appropriately dimensioned load units it is possible to tightly pack the container making good use of the 'natural' securing elements of the container, namely the side and end walls. If the cargo modular unit load dimensions and the overall load is of appropriate dimensions, there may be no need for additional load securing measures to be implemented.

MODULAR UNIT LOAD PACKAGING = XX – Modular Unit Load Packaging is a packaging whose dimensions permit the items in a consignment to be grouped together to form modules. Modules are predefined basic sizes defined for cargo units which enable them to fit together, to be combined and to be transported with different means of transport.

MODULATED LAMP SYSTEM = МОДУЛИРОВАННАЯ СИСТЕМА ЛАМП – Modulated Lamp System is a system that provides a realistic simulation of anticipated ozone depletion. It modulates lamp output in accordance with actual levels of incoming solar UV radiation.

MODULE = МОДУЛЬ – In the United States, once cotton is harvested, it is stored in modules – which hold 13 to 15 bales – for protection against the weather. Modules are stored in the field or on the gin yard until the cotton is ginned. The Module is the primary unit of temporary seed cotton storage after seed cotton is removed from the field by a harvester and prior to ginning. As seed cotton is moved from the field to the gin, the harvesting process continues – raw agricultural products (cotton lint/fiber, cottonseed and motes) are produced by the ginning process that are transported away from the gin to be used in industrial operations. To facilitate the continuation of the harvesting process, module feeders meter seed cotton into the gin at a uniform rate in a uniform stream. Both cotton field harvesters and gin plants rely on pneumatic fans to move cotton through their systems. As the module is broken apart and fed into the ginning system, centrifugal force separates green bolls as well as potentially hazardous materials such as stones and metallic objects from the seed cotton. Strategically placed rock traps and magnets in the air ducts and machinery remove rocks and capture ferrous objects before they can get into the ginning stream. After cotton is harvested, it is dumped into a Module Builder. This machine compresses the cotton into a large block. After a module is built, the module builder moves on to build more modules. The block, or module, is left in the field until it is delivered to the gin. Module is the unit of volume for raw cotton in the United States. When cotton is harvested, machinery is used to compact it into bundles called modules for transportation to the gin. A cotton module is 8 ft by 8 ft by 20 ft, or 1 280 cubic feet (about 36.25 cubic meters). This unit is essentially the same as the TEU (short for the Twenty-foot Equivalent Unit; a measure used for capacity in container transportation), the volume of a standard 20 ft container In the United States, storage units of harvested cotton composed of 13–15 unprocessed bales of cotton. See also Cotton Module Builder. The modular system of seed cotton storage and handling has been rapidly adopted. This system stores seed cotton in the field after harvesting until the gin is ready to process it. Modules can also be transported longer distances, allowing gins to increase productivity. In 1994, 78 percent of the US crop was handled in modules. Module trucks and trailers transport cotton from the field to the gin. A pneumatic system removes the cotton from the trailers, and either a pneumatic system or a module feeder removes the cotton from modules. Module is a stack of seed cotton normally containing 12–14 bales of picked cotton or 8–10 bales of stripped cotton. Modules are an aspect that some growers pay a lot of attention to and others very little. Even, well compacted, consistent modules, dome shaped on top to shed water, should be the objective. Properly built modules are easier to move, shed water, don't break apart, contain more bales and are thus cheaper to transport per unit. Modules should always be built in flood free areas, free of rocks, with easy truck access and never built under or adjacent to powerlines. Ideally they should be on mounded compacted pads with all weather access a further advantage. At no time should an operator work on or in a module builder when the harvester is unloading. Avoid contamination of any kind. Regularly check hydraulic fittings. Blown hoses can spray oil over the module, contaminating the cotton causing severe downgrading. Other contaminants, particularly plastic in the module will also cause severe downgrading. Module tarp covers are an item commonly overlooked by growers. In some cases, this can be an expensive oversight conservatively costing the grower between AUD50.00 and AUD60.00 per bale due to downgrading of cotton during a wet harvest. Tarps are designed to protect modules in the field. Modules can be valued at anything from AUD8 000.00–10 000.00 and up to AUD15 000.00 depending on the price of cotton. Skimping on module covers can easily cost far more than the value of the tarps in downgrading during a wet harvest. Tarps should be checked annually for holes and either repaired or replaced. Old tarps should also be inspected to ensure that they are not worn out and that the weave is still in good condition and not starting to let go. Poorly built modules tend to be flat on top encouraging water to pool during a wet harvest. If tarps are holed, or old or worn out, water seeps into the cotton resulting in losses through rotting, heavy spotting and contamination resulting in severe downgrading. Care should also be taken with the way tarps are tied down. Ropes tend to channel water into the module. It is best if ropes are covered by flaps to prevent this problem. Modules should be sited away from floodways and areas of poor access after rain. Module handling is a relatively expensive operation which is organised by contractors. Costs are made up of the module lift plus one way distance of travel to the gin. Chain beds are used for short hauls. Flat beds and in-field loaders are more economic for longer hauls. / Под Модулем, от Латинского слова Modulus, означающее Мера или Норма или Образец, понимается унифицированное . В хлопкопроизводящих странах бывшего Советского Союза на хлопкоочистительных предприятиях хлопок-сырец перед джинированием хранится в Бунтах (Stacks) на открытых специализированных площадках, в складах и под навесами. Каждый бунт формируется из хлопка-сырца одного селекционного типа, одного промышленного сорта и одного класса засорённости. В разных странах бунты накрывают разными материалами, сделанными на основе брезента.

MODULED SEED COTTON = ХЛОПОК–СЫРЕЦ В МОДУЛЕ – Moduled Seed Cotton:- a mechanical module builder compresses cotton into large modules in the field after harvest so that cotton may be temporarily held on the farm or at the gin while awaiting ginning. About 75 percent of US cotton is moduled. This practice is especially important in the Southwest and West.

MODULUS = МОДУЛЬ – Modulus is the ratio of change in stress to change in strain following the removal of crimp from the material being tested; i.e. the ratio of the stress expressed in either force per unit linear density or force per unit area of the original specimen, and the strain expressed as either a fraction of the original length or percentage elongation. See also Young's Modulus. Modulus is the property of a material representative of its resistance to deformation. In tensile testing the modulus is expressed as the ratio of tenacity to strain. See also Chord Modulus, Secant Modulus, Tangent Modulus, and Wet Modulus. / В архитектуре и строительстве под Модулем, от Латинского слова Modulus, означающее Мера, понимается исходная мера, принятая для выражения кратных соотношений размеров комплексов, сооружений и их частей. В качестве модуля принимают меру длины (метр или фут), размер одного из элементов здания или размер строительного изделия. Применение модуля придаёт комплексам, сооружениям и их частям соизмеримость, облегчает унификацию и стандартизацию строительства.

MOFF = MULTIPLE OPTION FINANCING FACILITY

MOGADORE = XX – Mogadore is a corded silk or rayon fabric with wide ridges and often with wide stripes used for ties. Mogadore is a village in Portage and Summit counties in the US state of Ohio.

MOGAS = MOTOR GASOLINE

MOHAIR = МОХЕР – Mohair is a long, lustrous, silky white hair of the Angora goat is stronger and more resilient than wool. It dyes more easily than any other specialty hair fiber and often comes in brilliant colors. It is blended with wool to add sheen and fluffiness to the wool or used alone to make soft, fuzzy sweaters, lofty novelty coatings and smooth worsted suitings with a somewhat wiry hand. See also Angora. Mohair:- hair fibers from the Angora goat. End-uses include sweaters, coats, suits, and scarves. Mohair is a silky textile produced from the hair of the Angora goat. It is most often spun into a thread that can be woven, knitted, or crocheted depending upon the application. Mohair is durable, warm, insulating, and light. It also has moisture wicking properties that carry moisture away from the skin of the wearer. The hair of the Angora goat has been used to produce textiles for centuries, and the term mohair entered English usage from the Arabic mukhayyar, referring to a type of woven head cloth. Despite being very soft, mohair can be irritating to the skin, like many animal products. As a result, many mohair garments are lined with silk or cotton, and mohair is frequently mixed with other fibers for comfort. The fiber has been used in the West since the XVI century, when Charles V first brought Angora goats to Europe, although the delicacy of the species made mohair difficult to obtain and prohibitively expensive for many. During the Second World War, the United States became concerned about wool production, as military uniforms were made from wool. The decision was made to blend wool and mohair, and the government began to heavily subsidize wool and mohair farmers in 1954 for their products in an attempt to keep the supply lines open. As late as 2005, mohair and wool producers could still receive financial assistance from the United States government. Angora Goats originate from Turkey, in the region now called Ankara. Bred for their special wool and milk products, the Goats were used extensively throughout the Middle East for centuries before being introduced to the West. Angora goats are very delicate and highly susceptible to infestations of external parasites due to their shaggy coats. Angora goats also have high and very specific nutritional requirements, and they will begin to suffer from health problems if these are not met. Goats are sheared for their mohair one or two times a year, depending upon production requirements, the health of the goats, and other factors. They also need to be combed regularly, to prevent clumping and the collection of debris. One Angora goat can produce 11 to 17 pounds (5 to 8 kilograms) of mohair in one year. Mohair takes and holds dye well, making it a common choice for novelty knitted products. Mohair is a silk-like fabric or yarn made from the hair of the Angora Goat. It is notable for its durability, resiliency and high luster. Mohair:- from the Angora Goat. Some has Cotton warp and Mohair filling (sometimes called Brilliantine). Imitation Mohair made from wool or a blend. Plain or twill or knitted. Angora Goat is one of the oldest animals known to man. It is 2 1/2 times as strong as wool. Goats are raised in South Africa, Western Asia, Turkey, and neighboring countries. Some are in the USA. Fabric is smooth, glossy, and wiry. Has long wavy hair. Also made in a pile fabric of cut and uncut loops similar to frieze with a Cotton and wool back and Mohair pattern. Similar to Alpaca. Mohair is the long, lustrous hair of the Angora goat. It is used, mixed with other fibers, to make mohair fabrics. Mohair:- The Animal:- A word 'Mohair' is derived from Arabic (Mukhayyar, a Goat's Hair Cloth). The Goat in question, the Angora (Capra Hircus) is thought to have originated in Tibet. Turkey was the center of Mohair textile production before the Goat was introduced, during the XIX century, to Southern Africa and the USA. Angora Goats are shorn twice a year and yield from 3 to 5 kg of Mohair. The Fiber:- Mohair's diameter ranges from 23 microns at first shearing to 38 microns in older animals. Light and insulating, its tensile strength is significantly higher than that of merino wool. Like wool, Mohair has surface scales, but they are thinner, making it smooth to the touch. Light reflected from the surface gives Mohair a characteristic lustre. Mohair:- Thin surface scales make Mohair smooth to touch, while light reflected from its surface gives it a characteristic lustre. Uses Of Mohair:- Mohair dyes exceptionally well and is moisture-absorbing, resilient, and flame- and crease-resistant. It is used mainly in yarn for knitting and crocheting, and in fabric for stoles, scarves and durable upholstery. Fine hair from younger animals is used in clothing, while thicker hair from older animals goes into rugs and carpets and heavy fabrics for jackets and coats. Mohair is often blended with wool to make top quality blankets. Weavers in Italy and Japan use Mohair in blends as low as 20% to add crease resistance and lustre to luxury garments. Producers:- Although Angora Goats are raised for Mohair around the globe, the major producer is South Africa. Production is concentrated in the country's Eastern Cape region, where the Angora Goat population is estimated at 850 000. Another major producer is the US state of Texas, with a herd of 200 000 Goats. Production And Trade:- Current world output of Mohair is estimated at around 5 000 tons a year, down from a high of 25 000 tons in the 1990s, when the fiber ranked second only to wool. South Africa accounts for 60% of total production. Almost all South African Mohair is exported raw or semi-processed to textile makers in Europe, the UK and the Far East. Tajikistan's 'Mohair Magic':- A project trained female spinners and knitters to produce high quality Mohair yarn and knitwear for Western markets. Tajikistan is one of the world's poorest countries, with per capita annual income of USD1 300. Most of the population relies on subsistence farming and livestock production and on remittances from family members working in neighbouring Russia. In the dry and mountainous Asht region, in northern Tajikistan, many rural families earn income from Angora goats. There are around 250 000 Angora Goats in Northern Tajikistan, and the Asht region is one of the centers of their production. Goats are raised primarily for their luxury fiber, Mohair. Most Mohair produced in Tajikistan is exported as raw fiber to the Russian Federation. In Asht region, about 20% of Mohair produced is processed by women into cheap yarn and knitted products, such as socks and mittens, also destined for Russian markets. An estimated 30 to 40% of women in Asht are involved in producing and selling Mohair yarn and knitwear. In 2006, the International Fund for Agricultural Development (IFAD) and the International Center for Agricultural Research in the Dry Areas (ICARDA) launched a project to improve the region's Mohair production and processing. Research indicated that by producing luxury Mohair yarn and knitwear for Western markets, a proficient Mohair spinner could earn about USD240 per month (or nearly USD3 000 a year). At the same time, increased demand for top quality raw fiber for spinning would help boost the incomes of local Angora Goat farmers who invest in improving Angora Goat production. Two key objectives, therefore, were developing production of a 'fair trade' luxury yarn that could sell for USD140 per kg on the US market, and setting up a breeding programme that would lead to long-term improvements in

Angora Goat production and fiber quality. Strongly Competitive:- Activities include training Tajikistani spinners and knitters to produce high quality yarn and products. The project team worked with four groups of spinners – each composed of 15 women – to produce from local fiber a Mohair yarn that competes strongly with Australian and Italian luxury kid Mohair yarns sold in North America. The yarn sells for a wholesale price of USD140 a kg (the same price as world quality Australian luxury Mohair yarn). Women are able to spin and knit in their own homes, whenever they have free time. That way, they earn income without compromising their traditional household and family obligations, and avoid potential conflicts with husbands and other family members. Sales of yarn and products not only provide much needed income for the women and their families, but increase women's status within their households and communities. Meanwhile, project scientists are working with farmers in the Asht region to create four breeding nuclei to improve Goat selection and breeding. The nuclei will produce superior breeding animals that can be used by farmers in the community to improve fiber quality and the overall performance of their flocks. Selection will focus on producing high quality, fine, kemp-free fiber for the women spinning groups. Samples of luxury yarns produced in Asht were test-marketed in a US yarn store in February and September 2009. The samples were marketed under the trademark 'Mohair Magic', developed by the project and successfully sold for their established price of USD140/kg. In December 2009, samples of yarn and Mohair shawls from Asht were testmarketed at a fair trade show in Wisconsin, USA, with excellent results. The project also helped develop linkages between women's producer groups in the Asht region and knitters and yarn stores in the USA to facilitate orders for yarns and help them ship the orders. This initial experiment will help the project develop 'Magic Mohair Hubs' at the national and international level in collaboration with the Central Asian Crafts Support Association (CACSA, an Non-Governmental Organization based in Kyrgyzstan) and other partners. Hubs will serve to collect yarns from spinners, conduct quality control and export the yarns and products to buyers in the USA and Europe. The project's approach is being up-scaled through the IFAD/ICARDA grant of USD1.5 million, approved in April 2009, aimed at improving the livelihoods of small farmers and rural women through value-added processing and export of cashmere, wool and mohair in Tajikistan, the Islamic Republic of Iran, and Kyrgyzstan. Markets Grow For Luxury Yarns:- Surveys indicate that in the USA, 36% of the adult female population – that's 53 million women – know how to knit or crochet, an increase of 50% over the last 10 years. In addition, many women aged between 25 and 34 are starting to knit. Result:- strong growth in imports of knitting yarns into the USA. Yarns like those produced by Tajikistan's spinners – made from natural fibers, and to 'fair trade' standards – are in particularly high demand. / Хлопковая основа и Мохеровая уточина . Имитационный Мохер. Крошэ, от Французского слова Crochet, означающее Крючок, . Мохер, как известно, родом из Турции. Именно там, в провинции Ангора, много веков обитали Козы, шерсть которых такая нежная, мягкая и тёплая, что считается самым роскошным видом натуральной шерсти. Ангорская козочка 'одета' в шикарный наряд из длинной, до 25 см, очень тонкой и блестящей шерсти. Долгое время Турецкие власти удерживали исключительно за своей страной право на разведение Ангорских Коз или их продажу, однако в начале XIX века Европейские завоеватели начали вывозить (или экспортировать) Коз и их шерсть по всему свету. Сегодня Ангорских Коз разводят не только в Турции, но в других странах – на юге США, в Южной Америке – где имеется сходный климат. Мохер подразделяется на три вида в зависимости от возраста животных, от которых он получен:- (i) Kid Mohair – мохер из шерсти козлёнка, с его первой стрижки, то есть до того как животному исполнится полгода. Волокно это невероятно нежное и мягкое на ощупь, толщина волосков – до 27 микрон. (ii) Goatling – мохер со второй стрижки животного, её не достигшего 2 лет. Это тоже исключительно приятная на ощупь и полезная для здоровья шерсть. (iii) Adult Mohair – мохер из шерсти взрослой козы. Её шерсть чуть более толстая. Впрочем, толщина её волоса составляет всего 30 микрон. Мохер гипоаллергенен, и не раздражает даже очень чувствительную кожу, это блестящее, прочное волокно, отлично поддающееся окрашиванию. Впрочем, одежда из мохера вовсе не обязательно должна окрашиваться, ведь природные оттенки этой шерсти исключительно приятны на вид. Они могут быть белыми или многих оттенков серо-коричневого цвета. Изделие из мохера обеспечит теплоизоляцию даже при намокании. Если удалось купить изделие из мохера, то можно быть уверенным в том, что оно не растянется и легко вернётся к изначальной форме даже при растягивании его на 30%. Волокна у мохера исключительно прочные, поэтому при стирке любимый свитер можно выворачивать как угодно, не повреждая его. Мохер очень легко впитывает влагу, поэтому в нём нельзя переохладиться от выделений пота – всё впитается. В одежде из мохера можно комфортно чувствовать себя как в холод, так и в жару. Более того, сейчас очень популярны остужающие изделия из мохера. Это очень тонкая одежда, в которой, благодаря гладкости волокон, можно не перегреться в жару. Кстати, гладкость и блеск волокон лежат в основе ещё одного полезного свойства мохера – они не дают ему сваляться и не позволяют грязи приставать, поэтому шерстяная одежда долго сохраняет презентабельный вид. Мохер при носке на голое тело практически не 'кусается', поэтому очень популярны детские изделия из этой шерсти. Мохер – 100% шерсть Ангорской козы. Мохер – роскошное естественное волокно. Эта шерсть более блестящая, чем овечья шерсть, поэтому придаёт поверхности валяного изделия особую лёгкость шелковистость. Это один из самых тёплых и прочных натуральных материалов. Использование мохера в технике валяния позволяет добиться невероятных декоративных эффектов. Мохер – вошел в моду с конца 1950-х. Мохером называют шерсть Ангорской козы, а также пряжу и ткани из этой шерсти или с этой шерстью (процент мохера может быть и небольшим).

MOHAIR RUG = МОХЕРОВЫЙ КОВРИК (или КОВРИК ИЗ МОХЕРА) – Mohair Rug is a floor covering with mohair pile and jute back.

MOIRÉ = МУАРЕ (или МУАР, или МУАРОВАЯ) – Moiré:- a wavy, rippling pattern similar to a watermark produced in the finishing of certain fabrics by calendering, usually on a ribbed tex tile fabric. On acetate, moiré made this way is permanent. Moiré:- when the surface of the fabric looks lighter and darker in circle form is moiré. Moiré is a wavy or watered effect on a textile fabric, especially a corded fabric of silk, rayon, or one of the manufactured fibers. Moiré is produced by passing the fabric between engraved cylinders which press the design into the material, causing the crushed and uncrushed parts to reflect light differently. Dyeing defect. Moiré is a well-known phenomenon in textile printing. It describes the interference between the overlaying structures. If a line halftone is used to present halftones, moiré can form between halftone and screen or between halftone and substrate structure. The effect occurs when the engraved halftone dots fall precisely on the screen holes with regular repetition and are slightly displaced in the gaps in between. This effect occurs above all in the light halftone area, where the engraved halftone dots are smaller. It then produces a light/dark effect that appears in the form of waves or lines. Moiré is a fabric having a wavy watered appearance. Fairly stiff with body in most cases. It is produced by passing the fabric between engraved cylinders which press the design into the material, causing the crushed and uncrushed parts to reflect the light differently. The pattern is not permanent, except on acetate rayon. / Порок или дефект крашения. Под Муаре или Муаровым, от Французского слова Moiré, означающее Муар или Муаровая или Переливчатая, понимается . Под Муаром понимается распространённый порок в виде нежелательного мраморного внешнего вида поверхности.

MOIREING = КОЛОЧЕНИЕ (или МУАРИРОВАНИЕ) – Moireing is a finishing process by engraved rollers that produces a waved or watered effect on a textile fabric. Design is permanent when heat-set. / Колочение или Муарирование – операция отделки для получения муара.

MOIRÉ TAFFETA = МУАРОВАЯ ТАФТА – Moiré Taffeta is the most common moiré fabric. A moire is a watermark design produced by passing fabric through heated rollers engraved with the designs.

MOIRÉ/WATERMARKED = МУАРЕ (или МУАРОВАЯ)/ПЕРЕЛИВЧАТАЯ – Moiré/Watermarked:- while you may not have known it, chances are that you have worn moiré fabric at some point in the past. As a material that finds its way into a number of different types of apparel as well as other uses, moiré fabric has a look that is often associated with quality, style and glamor. Here are a few things you should know about moiré fabric and how this beautiful material finds its way into many different settings. Moiré fabric is created by the application of a finishing technique to a woven fabric section. Often created with the use of silk fabric as the foundation, moiré fabric finishing can result in a deep luster to the material, or dull the finish by essentially regulating the degree of crushing that is done to the fibers. The resulting effect is to create a rippled or wavy pattern to the fabric that allows for a shimmering quality as the fibers are brushed one way or the other. One popular method of preparing moiré fabric involves using rollers that have been engraved with a design. The material is run between the engraved rollers with some sections of the fabric crushed to reveal the finished design that has a fluid or watery look. This type of application is often used to create material styles are ideal for evening gowns, formal capes, clutch handbags, and other types of formal apparel and accessories for women. Another approach to achieving a moiré fabric style is by using several different colors in printing fabrics, allowing the colors to overlap. The design achieves a sense of depth that varies as the eye travels across the pattern of the fabric. Because of the crushing of the fabric during the process, the color variation as the nap is brushed one way or the other will create a stunning effect. When used as fabric for household textiles, moiré fabric provides a nice touch of elegance to the space. The corded fabric is perfect for creating formal window treatments with corded silk panels as part of the overall treatment. The material also makes a statement as covering material for chair seats, screen panels, and fabric wall treatments. For many years, the use of moiré fabric for bedspreads was an easy way to add a sense of style to just about any style of bedroom furniture without spending a lot of money. Other uses for moiré fabric pop up from time to time. The material can be used as the liner fabric in jewelry boxes and cigarette cases. Along with the uses around the house, moiré fabric can also be used in what may be referred to as a Final Application, as the lining material of choice in coffins. Durable and attractive, moiré fabric is a great way to add some zing to the home or the wardrobe. Available in a full range of colors, the material is relatively inexpensive and holds up well with a minimum amount of care. Moiré/Watermarked:- a corded fabric, usually made from silk or one of the manufactured fibers, which has a distinctive water-marked wavy pattern on the face of the fabric. Moiré is a fabric finish with a wavy, watered appearance, caused by varying the tension in the warp and weft of the weave. It is often used in dress and decorative fabrics. The finish can be applied to acetate, rayon, cotton and other types of fabric; it should only be dry-cleaned. / Под Муаре или Муаровым, от Французского слова Moiré, означающее Муар или Муаровая или Переливчатая, понимается . Муар – шёлковая ткань полотняного переплетения с волнообразным отливом, полученным за счёт обработки специальными валиками-каландрами, однотонная, переливающаяся. Использовалась для пошива женского платья, отделки мужской одежды, орденских лент. Лучший муар в Росси XIX века выпускала фабрика Н. Серебряникова в Петербурге. Муар из шёлка высшего качества назывался гро-муар, муар с крупными волнами – муар-антик.

MOIST = СЫРАЯ – Moist:- a sample of grain is identified as moist if the moisture content exceeds the damp range established for that class of grain. With increasing moisture content, grain is graded straight, tough, damp, moist, and wet. / Проба зерна идентифицируется как Сырая, если содержание влаги в нём превосходит уровень влаги для влажного зерна, установленный для такого класса зерна. В случае увеличения содержания влаги зерно будет последовательно отсортировано как сухое или твёрдое (straight), средней сухости или мягкое (tough), влажное или вязкое (damp), сырое (moist) и мокрое (wet).

MOISTURE = ВЛАЖНОСТЬ – (1) In the Cotton industry, adding moisture before fiber/seed separation and lint cleaning helps maintain fiber length and reduces the number of fibers broken in gin stands and lint cleaners. For example, if moisture is restored to raise fiber moisture from 4 percent up to 6 percent, staple length increases by 1/32 inch, and short fiber content (SFC) decreases by 2 percent. However, adding moisture to lint that has already been ginned will not increase fiber length. Other benefits resulting from moisture restoration include reducing cotton's static electricity level, reducing the volume of cotton required to achieve a given bale size and reducing the force required to press bales. The resilient forces exerted on restraining bale ties are also lower for higher moisture cotton. Cotton with fiber moisture of 9 percent or more may be rough in appearance and will not smooth out properly when processed through the lint cleaners. Thus, the recommended fiber moisture level of 6 to 7 percent is based on production, as well as quality aspects. Lint moisture in the bale must be uniform and not exceed 9 percent to avoid fiber discoloration and weight loss during storage. This is found by definite prescribed methods and is stated as a percentage of the weight of the sample, either in the original, or in the oven-dry weight as found in a conditioning oven used for the purpose. / Содержание влаги в хлопке-сырце или хлопковой продукции, выраженное в процентах. с тем, чтобы избежать изменения цвета волокна и потерю веса в процессе хранения.

(2) In the Rice industry, at harvest, Paddy Rice has moisture content of generally between 20 and 28 percent. Most of paddy varies with maturity, whether it is rainy or dry season, and atmospheric humidity. The moisture content of paddy can vary and is understandably higher in the wet season than in the dry season. Paddy Rice should be dried to a moisture content of less than 20 percent within 48 hours of harvest to reduce the chances of damage. To facilitate good storage, it is best that the paddy Rice is dried in the sun or with modern drying techniques and/or machinery to a moisture content of 14 percent or less. Rice kernels should have a moisture content of between 13 and 14 percent to ensure good storage. When the moisture level exceeds 14 percent, the Rice takes on a yellowish hue that can lead to mold, lumping and decay and can result in damage affecting both the quality and quantity of the Rice. The damaged Rice can affect undamaged Rice in close proximity but not necessarily in direct contact particularly when bagged and awaiting shipment. Therefore, it is prudent to check for this type of damage prior to the cargo leaving the warehouse storage facility. In order to do so, the carrier and their appointed surveyors require the full cooperation of shippers to identifying where the Rice is being stored prior to shipment. Rice processing is the most essential stage of the post harvest activity where husks and bran particles are removed from the paddy grain. Milled Rice maintains a higher temperature than that prior to processing. Generally, at this stage the moisture content is higher than 14 percent and particles of bran adhere to the surface of the kernel. Since the Rice has generally been whitened, it soon takes on an ivory or yellow coloration. / Рисовая зерновка должна иметь содержание влаги в диапазоне 13 и 14 процентов для обеспечения надлежащего хранения. и гниение могут привести к повреждению, воздействующему как на качество, так и на количество Риса.

MOISTURE CONTENT = СОДЕРЖАНИЕ ВЛАГИ (или ВЛАГОСОДЕРЖАНИЕ) – (1) Moisture Content is a measure of the water content of grain. Grain that is within acceptable limits of moisture is referred to as a Straight Grade. With increasing moisture content, grain may be referred to as Tough, Damp, Moist and Wet. Wheat quality is threatened when the moisture content of stored grain exceeds 15%. There is a risk of infestation and mould as well as mycotoxin formation, all of which can lead to rejection. Moisture Content has a marked influence on all aspects of paddy and Rice quality and it is essential that paddy be milled at the proper moisture content to obtain the highest head Rice yield. Paddy is at its optimum milling potential at moisture content of 14% wet weight basis. Grains with high moisture content are too soft to withstand hulling pressure which results in grain breakage and possibly pulverization of the grain. Grain that is too dry becomes brittle and has greater breakage. Moisture content and temperature during the drying process is also critical as it determines whether small fissures and/or full cracks are introduced into the grain structure. Moisture Content is the amount of water measured in the soil or plant. Expressed as percentage moisture based on total fresh weight of the

substance. Moisture Content is the amount of water contained in a material, expressed as a percentage of its total mass (including moisture and any extractables). / Содержание Влаги это мера для определения содержания воды в зерне. Зерно, содержание влаги у которого находится в пределах допустимого значения, относится к сухому или твёрдому сорту. В случае увеличения содержания влаги зерно будет последовательно отсортировано как сухое или твёрдое (straight), средней сухости или мягкое (tough), влажное или вязкое (damp), сырое (moist) и мокрое (wet).

(2) Wood is a semi-porous material. It absorbs moisture and swells when conditions are wet or humid and releases moisture during dry periods. The amount of water that the wood contains at any time is called Moisture Content (MC). This value is expressed as a ratio of the weight of water in the wood to the weight of the oven-dry wood. For example, if a board has 25% MC, one fifth of the board's weight is water. When wood reaches a balance with the surrounding atmosphere and does not absorb or release moisture, it is said to have reached its Equilibrium Moisture Content. Wood changes dimensionally with changes in moisture content. Lumber shrinkage is much larger across the grain (radial or tangential shrinkage), and is negligible parallel (longitudinal) to the grain. The moisture content of freshly sawn lumber is much higher than the equilibrium moisture content wood will reach under normal service conditions. This is why lumber is generally dried before being shipped to users. Drying lumber increases its structural performance, greatly reduces the chances of fungal growth such as mold, stain, or decay, and reduces swelling and shrinkage, which could lead to warping or other problems. The 'S-Dry' label on a North American grade-stamp for construction lumber indicates that the lumber was surfaced at a moisture content of 19% or less. Panel products such as plywood or OSB (Oriented Strand Board) are at a low moisture content at the time of manufacturing. Engineered wood products such as I-joists also tend to have moisture content lower than S-Dry lumber, which keeps them very dimensionally stable as long as they are dry. Typical Moisture Content of Wood Products at Time of Manufacture (Product – Moisture Content):- (i) Lumber – S-Dry – 19% or less; (II) Lumber – S-Green – usually over 19%; (iii) Panel products (OSB, plywood) – 4–8%; and (iv) I-Joists – 4–16%. Wood that is Not Kept Dry:- Wood that is in contact with water over a long period of time can become discolored for various reasons and may grow fungi, including stains, molds and decay. Discoloration – Is it due to Moisture? If wood stays wet, it can take on a darker appearance due to the water. This dark appearance will disappear when the wood dries again, but if it stays wet too long, it may become permanently discolored. Discoloration of the wood may be due to moisture issues or other causes. Potential causes of discoloration in wood include:- (i) Staining Fungi (usually 'bluestain' that goes deep into the wood); (ii) Weathering (gives wood a grey colour); (iii) Decay Fungi (the wood may be weaker); (iv) Mold (may appear in various colours – grey, red, brown, black, white yellow); (v) Dirt (will rub off when dry); (vi) Iron stain (caused by steel straps, machinery from transportation or manufacturing); (vii) Yeasts (black and slimy to the touch); and (viii) Miscellaneous chemical stains (caused by naturally occurring wood chemicals). Of these, only decay will affect the structural performance of the wood; other forms of discoloration will not weaken the wood. In the case of staining fungi, the staining may have occurred in the tree before the wood was sawn into lumber, although storing wet lumber over a long period of time may also cause staining of the wood. Decay fungi are different from molds and staining Fungi. Molds and stains feed off the free water and the sugars stored inside the wood but don't affect the wood strength. On the other hand, decay fungi will gradually eat the wood if it remains wet for too long. Although conditions for mold and stain growth are also favorable to decay, the presence of mold or stain does not indicate that there is decay. Still, excess water, as well as moderate to warm temperatures that sustain mold growth, could ultimately lead to decay, if the wood is not quickly dried. Molds are everywhere; therefore, they have the potential to thrive where there is moisture. They have received much public attention after having been identified as a contributor to poor indoor air quality, along with dust, mites and other factors. Molds can grow on many surfaces, including wallboard, paint, shower curtains, ceramic tile and grout, as well as wood. Although there are still many unknown factors regarding molds and their effects on health, one thing is for sure: molds indicate a problem with moisture management in the building. Water can come from various sources and the way to solve the problem is to remove these sources. Ensuring that materials are dry during construction is a good practice to reduce the chances of problems down the road. Potential causes of water entry in the building include:- (i) Plumbing failure; (ii) Poor thermal performance; (iii) Poor detailing of the envelope (leaks); and (iv) Poor ventilation. Wall construction practices have evolved. Air tightness is emphasized and many new materials are available for wall construction. Though there are typically provisions included in the wall design for the building envelope to dry, it is good practice to ensure that building materials are dry (i.e. 19% MC or less) at the time of enclosing the wall. Refer to the Canadian Mortgage and Housing Corporation Best Practice Guides for a discussion on the proper designing of wood frame envelopes. Most building codes require that wood be dried to 19% MC or less. This moisture content is sufficiently low to virtually eliminate the chances of mold growth on wood products as well as minimize dimensional changes in the members. Moisture and Construction:- Wood Used In Buildings:- in normal applications, wood will undergo changes in moisture content throughout its life in relation to seasonal changes in relative humidity and temperature. For example, in more humid regions, wood will have an average moisture content value that is higher than in drier regions. In fact, wood is a good moisture sink and will help equilibrate the humidity fluctuations in the building. Figure 4 illustrates how wood comes into equilibrium with relative humidity and temperature in a building envelope. The Figure also indicates that:- (i) The risk of mold increases with higher moisture content and relative humidity, particularly when these conditions are sustained for longer time periods; (ii) Mold can start growing where humidity levels exceed 80%; although growth is slow, it can speed up when humidity is higher. Furthermore, it is worth noting that:- (a) Wood moisture content level typically has to be high (30% and above) for an extended period, in order for wood to decay; and (b) Most fungi grow fastest in the 60–80 °F (15–25 °C) range; around freezing, they grow very slowly or not at all. The following Table lists some examples of expected long term average MC values for lumber inside the building envelope in various North American regions. Average Yearly MC for Wood in Various North American Regions (Region – Average MC Range of Wood):- (i) Coastal – 8–12%; (ii) Inland – 6–10%; and (iii) Drier climates – 5–9%. All these values are below 19% moisture content, which means that wood will slowly keep drying in service. The time for wood to reach equilibrium with the surroundings is not critical in such cases, as the moisture content levels are below those that will support fungal growth. However, changes in moisture content result in dimensional changes that could lead to serviceability problems if not considered during design and construction. Simple construction details, such as ensuring that materials are compatible and leaving gaps between sheathing, will accommodate shrinkage and swelling. Engineered wood products are manufactured using dried wood in a controlled environment. As a result, these products are dimensionally stable. Severe wetting could compromise quality and dimensional stability. Panel products and engineered structural wood products should be protected from moisture. Wood Outside Buildings:- Some outdoor applications such as decks and porches are more conducive to decay. In such cases, the wood should be protected by treatment (preservative treated wood). Otherwise, a naturally durable species, such as cedar, should be considered. Regardless of the protection provided, it is good practice to keep wood away from potential water sources. Should that not be possible, the structure should be detailed to ensure that moisture does not accumulate and that wood will re-dry after wetting. Site Considerations:- most wood construction products, even those intended for protected interior use, are often left outside for a length of time, where they are subject to picking up moisture from rain, snow, or the ground. Outdoor storage on the building site should be minimized to limit potential damage caused by exposure to moisture. This can often be achieved by careful planning. Upon Delivery (Do – Don't):- (i) Prepare the material storage area; the site should be clean, and well-drained. – Let water infiltrate through torn wrapper. (ii) Examine the state of the wrapper upon delivery. – Drop the bundles in puddles or allow them to be dumped on the ground. (iii) Leave intact specialty wrapping on the bundles. – Store wood products in basements. (iv) Fix or replace damaged wrapper with a good quality tarp. – Lift I-joists in ways they are not designed for; lift with the

web in the vertical position, how they are designed to take structural loads. (v) Store materials off the ground. – Leave the materials in an area that incites theft. (vi) Have the material delivered as close to the installation date as possible. – Let the materials sit too long. Materials left exposed risk water absorption and deterioration, as well as theft. (vii) Protect the materials after they have been installed by closing the structure quickly (walls/roof). – Hurry to 'close-in' the walls, especially if the wood is green and/or has been wetted. (viii) Provide enough time and ventilation for the materials inside the wall cavities to dry to an acceptable level before installing the vapour barrier, when elevated moisture levels have been detected. – . Storage and Handling Techniques:- Storage Area:- (i) Ensure storage area is well-drained and clear of obstacles, debris, and vegetation (Vegetation can harbour insects, prevent good ventilation and keep the air moist); and (ii) If the soil is wet or poorly drained, place a polyethylene tarp or a temporary gravel pad on the ground below the supports for the materials. Storage Off Ground:- (i) Keep packages of lumber, trusses, I-Joists and panels 6 to 8 inches off the ground (dry wood in contact with the ground will quickly take up water); and (ii) Store bundles as level as possible. Wrapping:- (i) Keep wrappers on the bundles until they are ready to be used; (ii) Re-cover using a waterproof tarp if the wrapping is damaged. Warning:- Tarps develop holes easily on lumber corners or other points of stress; (iii) The tarp should not be tucked under the pile or wrapped tightly; and (iv) Make sure the tarp covering extends beyond the bundles. Beware of polyethylene tarps; though they are efficient at protecting the wood from soil moisture, their use as a wrapping material may keep the moisture trapped inside the pile. If Wood is Re-Wetted:- kiln dried lumber and panels have some innate degree of water repellence and are not easily wetted by a small amount of rain. Wood gets wet and dries from the outside in. In cases of wetness, the wood will dry quickly on the surface and limit mold growth. Wood products are most commonly stored in solid piles. With tidy piles of panel products, the top panel can retain the moisture but most of the water runs off and does not readily penetrate into the pile. Piled lumber can be more vulnerable as rainwater or snowmelt percolates in between the lumber pieces and may wet several layers. Such water is held between the boards as a film that wets the surfaces. Wood in this situation could remain wet long enough to develop surface mold or wood-staining fungi. For longer term storage, lumber should be stickered. Handling Green Lumber:- A water-based formulation containing a low level of an antimicrobial chemical is sometimes applied to lumber that will be sold green. This is to prevent the growth of staining fungi or molds on the lumber before it is used. The products used to treat the wood are registered for commercial use by the Pest Management Regulatory Agency in Canada or by the Environment Protection Agency in the USA. Prior to their use, risk assessments determine that the products are safe for use under the conditions given on the pesticide label. The chemicals used for treatment are mild, such as detergent type chemicals or fungicides used on agricultural food products. Their protection time on green lumber is therefore limited. The treatment is meant to give a few months protection against fungi to cover the time between manufacturing to receiving the wood at the building site. It is not intended to replace preservative-treated wood. Often, by the time green lumber has been shipped from the sawmill, it is partially airdried. Manufacturers rarely wrap packages of green lumber. Upon arrival at the building site, green lumber is best stored indoors. High Moisture Content Before Installation:- in the event that a user would like to dry lumber before installation, rather than install it green and let it dry in place, the proper procedure involves stacking the lumber with stickers (small sticks of dry wood about 3/4 inch thick by 1/2 inch wide) to provide sufficient air-flow between the layers of boards. (i) Place stickers across the pile, no farther than 2 feet apart; (ii) Align stickers vertically with the ones of the row below so that the weight is transferred directly to the pile below; and (iii) Place first and last stickers as close to the end of the pile as possible to prevent checking in the lumber. A makeshift roof made up of longer pieces of wood could be placed on the wood pile to help reduce wetting and to protect the pieces from the hot sun, which could cause checking in the uppermost boards. Otherwise, a sheet of plywood over the pile or a tarp under the top layer will help shed water and prevent the lower tiers from getting wet. Weight should also be placed on top of the pile to prevent the upper pieces of wood from warping as the wood dries. Wetting After Installation:- for surface-wetted material used in framing, getting the roof sheathing and roof membrane on quickly and allowing the wood to air dry in place is a common strategy that works. The lumber will dry out naturally so long as it is well ventilated and the humidity level of the air is not high. The latter, of course, depends on the local weather during the time of construction. In cold weather, space heaters should be used to help with drying. The site manager should make sure the framing is dry when the whole building is closed and sealed, otherwise moisture trapped in the structure may cause problems, given the tight construction methods in use today. A Few Points to Remember:- the versatility and long-term performance of wood products has ensured that traditional and innovative wood materials will continue to be important to the North American construction industry. The trends towards using engineered wood products and the advances in wall construction places a greater emphasis on managing moisture in wood. As a final reminder, here are a few points to remember when handling wood products to ensure that they remain dry and mold free:- (i) Examine the wrapper on delivery to make sure that it is fully protecting the wood; (ii) Minimize outdoor on-site storage; (iii) Store wood products in a dry, well drained area; (iv) Keep an intact protective cover on the products until ready to use; (v) Allow sufficient time for the materials to dry if they have been wetted; and (vi) Avoid closing in walls that have wet building materials. Clean Up Material Affected by Mold:- Recommendations on remedial procedures for materials damaged by water and mold growth are identified in various publications and articles such as 'Remedial Procedures for Water Damage in Buildings' by Public Works and Government Services Canada (T. Nathanson, 2002), or New York City's Dept, of Health and Mental Hygiene's 'Guidelines on Assessment and Remediation of Fungi in Indoor Environments'. In all cases, the first recommendation is that the source of moisture and the conditions suitable for mold growth should be eliminated before surface mold is cleaned. Clean-up measures depend on the extent of material affected by water and/or fungal attack. In cases involving small amounts of mold, it is generally recommended that molds be removed from solid or semi-porous materials (such as wood) by cleaning with a water/detergent solution or wet vacuuming with a HEPA equipped vacuum cleaner, after which the materials should then be thoroughly dried. Disinfectants or biocides are generally not recommended, since they may contain respiratory irritants and are not always completely effective in destroying mold organisms. Good practice also considers the health of workers in cleaning up affected areas. In order to minimize risk, it is recommended to wear protective equipment such as a N95 particulate half facemask, rubber gloves and eye protection. Larger areas, however, may need professional clean up. On-site professional advice is available should there be doubt on the appropriate course of action. Moisture Content is the amount of water contained in the wood, expressed as a percentage of the weight of the oven-dry wood. Moisture Content is the proportion of water in a sample of biomass, defined as the weight of water as a percentage of the weight of biomass. This can be defined on either a wet basis, as a percentage of the total (wet) weight of the sample, or a dry basis, as a percentage of the oven dry weight of biomass. Wet basis is usually used for fuel purposes. / Количество воды, содержащейся в древесине, и выраженное как процент от веса древесины после печной сушки.

MOISTURE COTTON = ВЛАЖНЫЙ ХЛОПОК – Moisture Cotton:- according to the Manchester Method, the standard is fixed at 7.834 pounds. On exposure to air, 100 pounds of bone-dry cotton will take on 8-1/2 pounds of moisture, a total of 108-1/2 pounds; thus, 108-1/2 pounds will contain 8-1/2 pounds of moisture; 100 pounds of cotton will contain 7.834 pounds of moisture.

MOISTURE–FREE WEIGHT = СВОБОДНЫЙ ОТ ВЛАГИ ВЕС (или СУХОЙ ВЕС) – Moisture-Free Weight is:- (1) the constant weight of a specimen obtained by drying at a temperature of 105 °C in a current of desiccated air. (2) The weight of a dry substance calculated from an independent determination of moisture content, e.g., by distillation with an immiscible solvent or by titration with Fischer reagent.

MOISTURE PROPERTIES = ВЛАЖНОСТНЫЕ СВОЙСТВА – Moisture Properties:- all fibers when exposed to the atmosphere pick up some moisture; the quantity varies with the fiber type, temperature, and relative humidity. Measurements are generally made at standard conditions, which are fixed at 65% RH and 70 °F. Moisture content of a fiber or yarn is usually expressed in terms of percentage regain after partial drying.

MOISTURE REGAIN = УВЛАЖНЕНИЕ (или ВЛАГОПОГЛОЩАТЕЛЬНАЯ СПОСОБНОСТЬ, или КОНДИЦИОННАЯ ВЛАЖНОСТЬ) – Moisture Regain is the amount of water a completely dry fiber will absorb from the air at a standard condition of 70 degrees F and a relative humidity of 65%. Expressed as a % of the dry fiber weight. Moisture Regain is the amount of water contained in the material expressed as a percentage of its oven-dry mass. Moisture Regain is the percentage of moisture in a textile material brought into equilibrium with a standard atmosphere after partial drying, calculated as a percentage of the moisture-free weight. See also Standard Moisture Regain. Moisture Regain is the moisture in a material determined under prescribed conditions and expressed as a percentage of the weight of the moisture-free specimen. Moisture Content and Moisture Regain:- What is Humidity? Humidity is a term used to describe the amount of moisture present in the atmosphere. This can be described in terms of Absolute Humidity or Relative Humidity. Absolute Humidity:- it is the weight of water present in a unit volume of moist air. It can be expressed interns of gram per cubic meter. Relative Humidity:- it is the ratio of the actual vaper pressure to the saturated vapour pressure at the same temperature. Formulas:- RH% = Actual Vapour Pressure / Saturated Vapour Pressure x 100. Moisture Content (M) = Weight of Water / Total Weight of Material x 100. Moisture Regain (R):- it is defined as the weight of water in a material expressed a percentage of the oven dry weight of the material. Formula:- Moisture Regain (R) = Weight of Water / Oven dry weight of the material x 100. The temperature of the oven dryer should be 105 °C ± 3 °C. The water partile should be removed and time is 2 hours. For Example:- (i) Initial weight of sample = 10 g. (ii) Over dry weight of sample = 7 g. (iii) Weight of water = 3 g. (iv) Moisture content % = 3/10 x 100. (v) Moisture Regain % = 3/7 x 100. What is standard testing atmosphere? It is an atmosphere with a relative humidity of 65 ± 2% and at temperature of 20 °C ± 2 °C (68 °F ± 4 °F). But in India, temperature of 20 °C is difficult to obtain, and so a higher standard temperature of 27 °C ± 2 °C (81 °F ± 4 °F) is used. Standard Regain:- for example, raw cotton – 8.5%, cotton yarn – 7.0–7.5%, silk – 11%, wool – 17%, viscous – 13%, Nylon – 4%, and polyester – 0.4%. It is the one which is adopted for business purpose and it is generally very close to the standard regain. Moisture Regain is a measure of the increase in weight due to the adsorption of water by a fiber vs. its initial dry weight. Usually expressed as %. / Найлан^{T3} (Nylon^{TM}). Стандартная или Нормальная Влажность в процентах от веса абсолютно сухого материала.

MOISTURE SENSITIVITY = ЧУВСТВИТЕЛЬНОСТЬ К ВЛАГЕ – Moisture Sensitivity is a degree to which the quality of a product is impacted even by minimal uptake of water vapor.

MOISTURE STRESS = НЕДОСТАТОК ВЛАГИ – Moisture Stress occurs when the plant suffers from a lack of water to support good growth and development.

MOISTURE TESTER = ВЛАГОМЕР – Moisture Tester is the experimental equipment and instruments used to test the moisture (water) content of the soil, plant or seeds. / Под Влагомером понимается прибор для измерения влажности газов, жидкостей и твёрдых (в том числе сыпучих) тел. Различают влагомеры:- гигроскопические, электрохимические (для газов и жидкостей), гигрометрические и психрометрические (для газов), ёмкостные и кондуктометрические (для жидкостей и твёрдых тел), а также влагомеры, основанные на явлении ядерного магнитного резонанса.

MOISTURE TRANSPORT = ПРОХОЖДЕНИЕ ВЛАГИ – Moisture Transport is the movement of water from one side of a fabric to the other, caused by capillary action, wicking, chemical or electrostatic action.

MOISTURE VERSUS REGAIN = ВЛАЖНОСТЬ ПРОТИВ КОНДИЦИОННОЙ (или ОСТАТОЧНОЙ) ВЛАЖНОСТИ – Moisture versus Regain:- as applied to textiles, ‘moisture’ is the total weight of water present in a material, calculated on the weight of the conditioned sample. ‘Regain’ is the total weight of water present, calculated on a moisture-free or dry basis.

MOITY WOOL = СОРНОРЕПЕЙНАЯ ШЕРСТЬ – Moity Wool is a wool that contains straw or other, non-seed-or-burr vegetable matter.

MOKKA COFFEE BEANS = ЗЁРНА КОФЕ МОККО – Maui Mokka Coffee Beans are said to be one of the most exclusive Coffee beans grown in Hawaii. These incredibly small beans produce a delightful cup of orange sweetness with a citrusy scent. Since the Coffee beans are left to dry while still inside the fruit, this produces an exotic character to each bean, giving it a winy and slight, fruity-orange flavor. When brewed, it has also been noted to have hints of chocolate undertones. This gourmet Coffee is lightly acidic and finishes with a crisp smoothness. It wasn’t until just a few years ago that this rare Coffee was revived on the Ka’anapali Plantation on the island of Maui. The Ka’anapali Estate is now comprised of 300 acres, in which 140 of those acres are dedicated to the growth of the exotic Maui Mokka. This plot of land is one of the few places in the world where Mokka Coffee beans are grown. Mokka plants date back to at least 1 000 years ago and are said to have originated from both Ethiopia, the ‘birthplace’ of coffee, and Yemen. This particular Mokka plant is a cultivar of the same variety found in Yemen. The Mokka Coffee plants produce light yields because some of the plants have alternate bearings, meaning one year they may produce heavy quantities and the next year may yield small or smaller quantities. The low yield is also accommodated by the fact that the Coffee beans are extremely difficult to harvest with machinery. Since cultivation with specialized equipment proved unsuccessful, almost all of the beans are hand selected. Being harvested through manual labor provides the beans with extra care and more specialized treatment. After harvesting, the beans are dry-processed, meaning the Coffee cherries are picked and immediately dried in the sun, enclosing each bean with a burst of citrusy flavor. Each bean is then carefully chosen and sorted depending upon quality. With all of these factors, Maui Mokka is very uncommon, but proves to be an extraordinary, specialty Coffee. Ordering the 5 lb wholesale option for Maui Mokka will ultimately save you money, while also saving the time it takes to reorder and receive shipment. Choose the bulk option at check-out to secure your supply. Delivered directly to you in a heat-sealed valve bag, your Maui Mokka is guaranteed fresh in flavor and aroma. One of the northernmost Coffee estates in the world, estate grown on the island of Maui in Hawaii, this is the only Coffee farm on the island. But, even more special, it is the only Coffee farm in the world commercially growing the Mokka Coffee bean Variety. Characterised by its very small and rounded size, it makes a strong case against the belief that large beans mean a better cup. Maui’s unique tiny Mokka beans give this Coffee an intensely sweet and citrus acidity with a light body and flowery and light aroma. The Hawaiian islands conjure up visions of paradise. But that is not all. The Coffee lover also knows that Coffee from Hawaii is known for it’s high praise, accompanied by an equally high price. Hawaiian Coffees are the only Coffees grown in the United States (sorry, Puerto Rico is a territory). Although many think of Hawaiian Kona Coffee, Royal Kona Coffee, or Hawaiian Gold Kona Coffee as being the best, or even the only Coffee Hawaii has to offer, many do not realize that the islands of Hawaii have a lot more to offer than just pure Kona Coffee. We will go into a brief history on how Coffee got to the Hawaiian isles, as well as geographic layout of the islands, and the varieties grown on each. As we get into the different flavors they bring to the cup, you will see that Hawaiian Coffee beans are as varied as the islands and peoples themselves. In this article, we will talk about Maui Coffee, Kauai Coffee, Molokai Coffee, and Oahu Coffee. The term Kona Coffee encompasses so much, we will dedicate an entire article just to Kona Coffee Beans and The Big Island of Hawaii at a later date. Coffee

Trees arrived in Hawaii in the early 1800's through various means. One way was in 1825. The British ship HMS Blonde brought Coffee trees from Brazil. These trees were planted in Oahu, and then spread to other islands. The first actual Coffee plantation was on the North Shore of Kauai. As the flourishing Coffee plantations of the XIX century in Hawaii gave way to the XX century, the future of Coffee on Hawaii was uncertain. Sugar tariffs were lifted to the mainland in 1900. Quickly Coffee plantations were replaced with sugar cane fields. But in the 1960's and 1970's, Coffee once again became a delicacy, and people were willing to pay more for unique Coffees. As a result, the Coffee plantations saw their second wind. After 100 years, the life of Coffee in Hawaii has come full circle. There are now upwards of 7 000 acres producing about 7 million pounds of green Coffee each year. Hawaiian isle Coffee is still one of the most expensive, relatively high-volume Coffees consumed in the world, along with the likes of Jamaican Blue Mountain Coffee (JMB). First a quick primer on the different islands of Hawaii. There are 8 islands – Hawaii (called The Big Island), Kahoolawe, Lanai, Maui, Molokai, Oahu, Kauai, and Niihau. Of these, Coffee (always Arabica) is really only grown on 5 of the 8 islands. Here is a map as well as a breakdown of the islands, regions, varieties, and some notes on each:- Maui:- Growing Area(s):- Kaanapali, Haleakala, Hana. Varieties:- Mokka, Yellow Caturra, Red Catuai and Typica. Price Range for Roasted:- USD14–24/lb. Price Range for Green:- USD13–23/lb. The Mokka has hints of nuts and chocolate, medium acidity, medium body, and a long finish. The Yellow Caturra hits you with spice, cinnamon, licorice, and allspice. It is low acid, yet full bodied, with a dry finish. The Red Catuai has hints of spice, medium acidity, full body, and a wine-like finish. The Typica is nutty, much like a Kona, and has medium to high acidity, medium body, and a lingering finish.

MOLD = ЛИТЕЙНАЯ ФОРМА (или ФОРМОЧКА, или КОКИЛЬ) – Mold is the cavity or matrix into or on which the plastic composition is placed and from which it takes form. Mold is a cavity where a molten metal is shaped, as in casting. / литьё или отливка (casting). Под литейной Формой, от Латинского слова Forma, понимается приспособление в литейном производстве для получения отливок. Изготовляются из формовочных материалов (разовые), огнеупорной керамики (полупостоянные – выдерживают сотни отливок) или металла (постоянные – десятки тысяч отливок).

MOLD = ПЛЕСЕНЬ – Mold is:- a downy or furry growth on the damp surface of organic matter, generally caused by saprophytic fungi with conspicuous mycelia or spore masses. / или массы спор. Под Плесенями понимаются налёты на продуктах питания, растительных остатках и других органических субстратах, образованные так называемыми плесневыми грибами из класса Оомицетов, Сумчатых и несовершенных грибов. Некоторые плесневые грибы вызывают болезни растений, животных и человека; другие – используют в сыроварении и фармацевтической промышленности (из родов Аспергилл, Пенициллиум и других). Плесень (Mold или Mould; Molding – Плесневение) на древесине:- грибница и плодоношения Плесневых Грибов на поверхности древесины, в виде отдельных пятен или сплошного налёта. Чаще всего появляется на сырой заболони при хранении лесоматериалов и вызывают поверхностное окрашивание древесины в сине-зелёный, голубой, зелёный, чёрный, розовый и другие цвета, в зависимости от окраски спор и грибницы, а также от выделяемого пигмента.

MOLDBOARD = ОТВАЛ – Moldboard is the curved part of a plow which lifts the soil, turns it to the side. / Отвал плуга.

MOLDED EDGE = ОПРЕСОВАННЫЙ (или ЛИТОЙ) КРАЙ – Molded Edge is an edge that is not physically altered after molding for use in final form, and particularly one that does not have fiber ends along its length.

MOLDED NET = ОПРЕСОВАННОЕ (или ЛИТОЕ) ХХ – Molded Net:- description of a molded part that requires no additional processing to meet dimensional requirements.

MOLD GROWTH THRESHOLD = ПОРОГ РОСТА ПЛЕСЕНИ – Mold Growth Threshold:- relative humidity in excess of 75% promotes rapid multiplication of the majority of mold species.

MOLDING = ОТЛИВКА (или ФОРМОВАНИЕ) – Molding is the thermoplastic nature of most of the man-made fibers means that they change their shape under heat, thereby enabling the molding of items instead of knitting them or cutting and sewing them to the desired shape. Although this method of manufacture has great promise, so far it has been successful primarily in brassieres (most seamless brassieres have molded cups) and in upholstery applications.

MOLD (RELEASE) LUBRICANT = СМАЗКА ДЛЯ (ВЫСВОБОЖДЕНИЯ) ФОРМ – Mold (Release) Lubricant is a compound, often of petroleum origin, for coating the interiors of molds for glass and ceramic products. The mold lubricant facilitates removal of the molded object from the mold, protects the surface of the mold, and reduces or eliminates the need for cleaning it. See also Lubricant. / для литейных стекольных форм .

MOLD SHRINKAGE = УСАДКА ПРИ ЛИТЬЕ – Mold Shrinkage is the rapid thermal shrinkage that a molded part experiences upon removal from a mold and cooled at room temperature.

MOLD SURFACE = ОПРЕССОВАННАЯ (или ЛИТАЯ) ПОВЕРХНОСТЬ – Mold Surface is the side of a laminate that faced the mold (tool) during cure in an autoclave or hydroclave.

MOLE = МОЛ (или БРЕКВАТЕР) – A Mole or Breakwater is a massive port structure made of masonry or large stone blocks laid in the sea to protect the harbour from waves and current. Sometimes the terms Jetty and Pier are used to mean the same. Mole (maritime term):- a breakwater used as a landing pier.

MOLE = МОЛЬ – Mole:- essentially, an amount of a chemical equal to its molecular mass, but measured in grams, rather than atomic mass units; (more formally, amount of a substance containing approximately $6.022 \cdot 10^{23}$ molecules or formula units). For example, sodium chloride has an molecular weight of approximately 28. Twenty eight grams of sodium chloride would be one mole. If this was dissolved enough water to make one liter of solution, the solution would be said to be 1 molar sodium chloride. / Под Молем понимается единица количества вещества СИ. Обозначение:- моль. В одном моле содержится столько молекул (атомов, ионов или каких-либо других структурных элементов вещества), сколько атомов содержится в 0.012 кг ^{12}C (углерода атомной массой 12), то есть $6.022 \cdot 10^{23}$. Моль:- поштучно пересчитать молекулы в химической практике невозможно, зато вещество можно взвесить, то есть определить его массу. Следовательно, за единицу измерений количества вещества следует принять порцию из определённого и всегда одинакового числа частиц, достаточно большую, чтобы её легко можно было взвесить на обычных весах. Такая единица измерений получила название Моль, а величина, показывающая массу одного моля вещества – Молярная Масса. Молярная масса вещества Б обозначается $M_Б$, или М(Б). Таким образом, единица измерений количества вещества [n] = 1 моль, а единица измерений молярной массы [МБ] = 1 г/моль. Применяются кратные и дольные единицы, производные от моля:- 1 кмоль = 1 000 моль, 1 ммоль = 0.001 моль и так далее. Слово 'Моль' как обозначение единицы измерений не склоняется (5 моль; 0.25 моль), а в качестве названия единицы измерений (в тексте и устной речи) склоняется как существительное мужского рода (четверть моля, пятью молями, двух молей и тому подобное).

MOLECULAR MARKER = МОЛЕКУЛЯРНЫЙ МАРКЁР – Molecular Marker is a molecular signpost used in eukaryotic gene isolation. Usually a restriction fragment length polymorphism (RFLP) probe or a primer site for DNA amplification. / амплификация ДНК.

MOLECULAR ORIENTATION = МОЛЕКУЛЯРНАЯ ОРИЕНТАЦИЯ – Molecular Orientation is the degree to which fiber molecules are parallel to each other and to the longitudinal axis of the fiber.

MOLECULAR WEIGHT = МОЛЕКУЛЯРНЫЙ ВЕС – Molecular Weight is the weight of a molecule; the sum of all atomic weights of all the atoms in the molecule; expressed in atomic mass units (defined as exactly one twelfth the mass of a carbon-12 atom); this term is obsolete an should be replaced with molecular mass or relative molecular mass (r.m.m.). Water, for example, has a molecular weight of about 16 (for the oxygen) plus 2 (for the two hydrogens), or 18. The molecular weight of cellulose is in the millions. The concepts of molecular weight and moles are useful in understanding, among other things, pH and variations in effectiveness of different hydration states of a compound. Molecular Weight is the sum of the atomic weights of a molecule's constituent atoms. / Под Молекулярным Весом или Молекулярной Массой понимается масса молекулы, выраженная в единицах атомной массы. Равна сумме масс всех атомов, из которых состоит молекула. Величины молекулярной массы используются в химических, физических и химико-технических расчётах.

MOLESKIN = МОЛЕСКИН – Moleskin is a woven twill fabric that is extremely soft on one side with a short raised surface. The name simply refers to the similarity between the softness of mole fur and the softness of this cotton fabric, which has a velvety nap that feels similar to suede. It is not made from the actual fur or hide of a mole. This fabric is very densely woven, making it quite durable and easy to clean. Lighter blends of moleskin sometimes are used for work clothes, especially those made by British manufacturers. Lighter moleskin also has been used for military wear, such as for the West German Army uniforms from the 1960s to the 1990s. Heavier moleskin commonly is found lining winter coats for extra protection from the wind and cold. Several shoe designers use this fabric for the upper part of their shoes for added durability. Moleskin can be dry cleaned or washed on a gentle cycle and should be turned inside out before washing. Washing will help maintain the tightness of the weave of the fabric, which does not wrinkle or lose its shape from stretching. This fabric typically costs about 5 US Dollars (USD) to 9 USD per yard. The relief and prevention of blisters is another use for moleskin. One side of a bandage for this purpose is the soft moleskin, and the other side is adhesive. A hole is cut in the bandage where the blister is, and then the adhesive side is placed over the blister, sticking to the skin surrounding it. This makes the blister and the fabric the same level and reduces the friction and pressure caused by whatever external object – usually a shoe – is rubbing against the skin to cause the blister. A different type of moleskin is used in the movie industry. A piece of flesh-toned fabric called a Moleskin is attached to adhesive, which is then adhered to genitalia to cover it for filming. This can give the appearance of nudity while giving the actor or actress some semblance of privacy. There also are notebooks take their name from moleskin fabric, which was used to cover traveling notebooks or journals because of its durability. The use of these notebooks became so widespread, especially among noted authors, that the small traveling notebooks themselves became known as Moleskins. Famous people known to use moleskins include Oscar Wilde, Vincent Van Gogh and Ernest Hemingway. Moleskin is a heavy sateen-weave fabric made with heavy, soft-spun filling yarns. The fabric is sheared and napped to produce a suede effect. Moleskin is a heavy cotton fabric that is woven and then sheared to create a short, soft pile on one side. Moleskin clothing is notable for its softness and durability. Some variants of the cloth are so densely woven that they are windproof. Moleskin is a heavy durable cotton fabric with a short thick velvety nap on one side. A garment of moleskin, namely a durable cotton with a velvety nap on one side. Usually used in plural. / уточные пряжи. протирание или притирка (rubbing). Молескин – восьминитный уточный сатин. Под Молескином понимается плотная прочная хлопчатобумажная ткань, обычно окрашенная в тёмные тона. Из молескина шьют спецодежду, рабочие и спортивные костюмы, обувь и тому подобное. Молескин, от Английского слова Moleskin, от Mole, означающее Крот, и Skin, означающее Кожа, плотная, прочная хлопчатобумажная ткань, вырабатываемая усиленным сатиновым переплетением. Молескин имеет на лицевой стороне плотный гладкий уточный застил, который создаётся своеобразным переплетением, а также большей плотностью нитей по утку, чем по основе. Молескин выпускается обычно гладкокрашеным в тёмные тона. Некоторые сорта молескина подвергаются ворсованию и называются молескин-сукно. Молескин употребляется для изготовления рабочей, спортивной и специальной форменной одежды, верха обуви, переплётов и прочего. Наиболее плотные сорта молескина иногда называют 'Чёртовой Кожей'.

MOLESKIN FINISH = МОЛЕСКИНОВАЯ ЗАКЛЮЧИТЕЛЬНАЯ ОТДЕЛКА – Moleskin Finish:- a cotton fleece lined with close, soft, thick nap that is used in underwear for cold climates.

MOLLIC EPIPEDON = МОЛЛЕВЫЙ ЭПИПЕДОН – Mollic Epipedon:- thick, dark surface soil horizon, highly saturated by bivalent cations (Ca++ and Mg++). / поверхностный горизонт, .

MOLLUSCICIDE = МОЛЛЮСКИЦИД – Molluscicide is a pesticide that kills molluscs (such as snails). / Под Моллюскицидом, от Латинских слов Molluscus, означающее Мягкий, и Caedo, означающее Убиваю, понимается .

MOLT = ЛИНЯТЬ (или ЛИНЬКА) – Molt:- to shed or cast off hair, feathers, shell, horns, or an outer layer of skin (insects or snakes) in a process of growth or periodic renewal. The cast-off parts are replaced by new growth. / Под Линькой понимается периодическая смена наружных покровов (хитинового, шёрстного, а также оперения) у животных. Регуляция линьки происходит с участием гормонов.

MOLY = МОЛИ – Moly:- molybdenum disulfide, a solid lubricant and friction reducer, colloidally dispersed in some oils and greases.

MOLYBDENUM DISULFIDE = ДИСУЛЬФИД МОЛИБДЕНА – Molybdenum Disulfide is a black, lustrous powder (MoS_2) that serves as a dry-film lubricant in certain high-temperature and high-vacuum applications. It is also used in the form of pastes to prevent scoring when assembling press-fit parts, and as an additive to impart residual lubrication properties to oils and greases. Molybdenum disulfide is often called Moly or Molysulfide.

MOMENTUM = МОМЭНТУМ (или МОМЕНТ) – Momentum is a leading indicator measuring a security's rate of change. The ongoing plot forms an oscillator that moves above and below 100. Bullish and bearish interpretations are found by looking for divergences, centerline crossovers and extreme readings. The indicator is calculated with the following formula:- Momentum = (Price / $Price_{(n\ periods\ ago)}$) x 100. Momentum can also refer to a particular investing or trading style. The rational is that the hot get hotter and cold get colder. Bullish momentum players buy securities that are popular or that they believe will become popular. As the word spreads and popularity grows, the advance will accelerate. Price acceleration is the same a an increase in momentum. In technical analysis, the relative change in price over a specific time interval. Often equated with speed or velocity and considered in terms of relative strength. Momentum is an indicator which represents the change in price compared to a fixed past period of time. It is the underlying thrust or power behind an upward or downward price movement. A mathematical representation generally depicted in graphical form of the rate of change that a price or an indicator has just been through. This is thought to be one of the few leading technical indicators when watching for divergence. Momentum measures trend strength and identifies likely reversal points. A simple but effective measure of rate of change of prices. / Под Моментом, от Латинского слова Momentum, означающее Движущая Сила или Толчок, понимается характеристика распределения значений случайной величины. В техническом анализе биржевых рынков момент измеряет

силу тенденции и по всей вероятности идентифицирует разворотные точки. Момент является простой, но эффективной мерой скорости изменения цен.

MOMIE CLOTH = ПОЛОТНО МОМИ – Momie Cloth is a fabric made with a weave that produces a pebbled effect, similar to crêpe. See also Crêpe. / Полотно Моми – ткань, сделанная с помощью переплетения, которое производит эффект гальки, аналогичный крэпу. Смотрите также Крэп (Crêpe).

MOMME = МОММЕ (или МОМИ) – (1) Momme is a traditional Japanese weight unit corresponding to the Chinese mace. Jewelers continue to use the momme to measure the weight of cultured pearls; for this purpose it equals exactly 3.75 grams (about 0.132 ounce) or 18.75 carats. The unit is commonly pronounced 'Mommy' in English. / Момме – традиционная Японская единица веса, связанная с Китайской Мэйс (Mace). Ювелиры продолжают использовать момме для измерения веса культурных жемчужин (cultured pearls); для этой цели она равна точно 3.75 граммам (около 0.132 унции) или 18.75 каратов. В Английском языке данная единица обычно произносится как Моми (Mommy).

(2) Momme is a traditional unit used to measure the 'weight' (density per unit area) of silk. The measure is the weight in momme (1) of a standard strip of silk 25 yards long by 1.49 inches wide, an area of 1 341 square inches or about 0.865 2 square meter. This makes the silk momme equal to about 3.62 grams per square yard or 4.33 grams per square meter. Momme is the Japanese unit of weight used for weighing silk. A momme is slightly less than 4 grams (about .034 ounces). / Момме – Японская единица веса (2/15 унции или 58 гран или 3.758 4 г); служит для характеристики лёгких шёлковых тканей.

MONAGUM = МОНЭГАМ – Monagum is a modified starch gum. The only thickener for discharge printing with hypochlorite bleach that stays thick. Monagum is a modified starch gum used to mixed with household bleach, It is used as a thickener for discharge color printing with bleach. PRO Chemical & Dye (Fall River, State of Massachusetts (MA), the United States) sells a product for this purpose under the name Monagum, while Dharma Trading Company (Petaluma, State of California (CA), the United States) sells something called Bleach Thickner. Monagum is a trade name for carboxymethyl starch, a starch ether. / торговое название карбоксиметильного крахмала (carboxymethyl starch), . Пи.Ар.Оу. Кэмикэл Энд Дай (PRO Chemical & Dye). Дарма Трэйдинь Кампэни (Dharma Trading Company).

MONARCHY = МОНАРХИЯ – Monarchy is a form of rule in which there is a single head of state, a monarch, with the title of King (or Queen) or its equivalent; in which the monarch holds his or her office for life; in which the position of monarch normally descends by rules of heredity only to members of a specific royal family; and where the monarch is popularly believed to be possessed of a religious or similar symbolic significance for the state and its institutions that legitimate his or her privileges. When the monarch rules with full or nearly full executive, legislative and judicial powers practically unlimited by constitutional or legal restrictions, the system is often referred to as an 'Absolute Monarchy'. When the powers of the monarch are effectively limited and restricted by law (at least to insure respect for the subjects' recognized rights to personal freedom and property and often also to limit the monarch's powers of legislation and taxation), the system is normally referred to as 'Constitutional Monarchy'. / Под Монархией понимается государство, главой которого является монарх. Различают:- (i) неограниченную (абсолютную) монархию, характерную для рабовладельческого и феодального строя; и (ii) ограниченную, так называемую конституционную, монархию, при которой власть монарха ограничена парламентом. В современную эпоху существуют государства с конституционной монархией, например, Великобритания, Дания, Норвегия и Швеция. В некоторых странах Азии имеется ещё теократическая монархия, глава государства в которой является одновременно и религиозной главой.

MONEP = MARCHE DES OPTIONS NEGOCIABLES DE PARIS

MONETARY = МОНЕТАРНОЕ (или ВАЛЮТНОЕ, или ДЕНЕЖНОЕ) – Monetary:- of or pertaining to money or its means to circulation.

MONETARY AGGREGATE = МОНЕТАРНЫЙ АГРЕГАТ (или ДЕНЕЖНЫЙ АГРЕГАТ) – In the United States, aggregate measures through which the Federal Reserve monitors the nation's monetary assets:- M1, M2, and M3. Monetary Aggregates in the European Union:- given that many different financial assets are close substitutes, and that the nature and characteristics of financial assets, transactions and means of payment are changing over time, it is not always clear how money should be defined and which financial assets belong to which definition of money. Central banks usually define and monitor several monetary aggregates. The ECB's definitions of Euro area monetary aggregates are based on harmonised definitions of the money-issuing sector and the money-holding sector, as well as of categories of monetary financial institution (MFI) liabilities. The money-issuing sector comprises MFIs resident in the Euro area. The money-holding sector includes all non-MFIs resident in the Euro area, excluding the central government sector. Based on conceptual considerations and empirical studies, and in line with international practice, the Eurosystem has defined a narrow (M1), an intermediate (M2) and a broad monetary aggregate (M3). These aggregates differ with regard to the degree of liquidity of the assets they include. M1 includes currency, i.e. banknotes and coins, as well as balances that can immediately be converted into currency or used for cashless payments, such as overnight deposits. M2 comprises M1 and, in addition, deposits with an agreed maturity of up to two years or redeemable at a period of notice of up to three months. These deposits can be converted into components of narrow money, but some restrictions may apply, such as the need for advance notification, penalties and fees. M3 comprises M2 and certain marketable instruments issued by the resident MFI sector. These marketable instruments are repurchase agreements, money market fund shares/units and debt securities with a maturity of up to two years (including money market paper). A high degree of liquidity and price certainty make these instruments close substitutes for deposits. As a result of their inclusion, broad money is less affected by substitution between various liquid asset categories than narrower definitions of money, and is more stable. Holdings by Euro area residents of liquid assets denominated in foreign currencies can be close substitutes for Eurodenominated assets. Therefore, the monetary aggregates include such assets if they are held with MFIs located in the Euro area. See also M1, M2, and M3. Monetary Aggregate, e.g., M1, M2, M3, is banknotes and coins plus certain liabilities of financial institutions (deposits and short-term securities) that have a high degree of liquidity and are held by non-banks resident in the Euro area. M1 is a subset of M2 which is a subset of M3. Monetary Aggregates have at times been advocated as guides to monetary policy on the grounds that they may have a fairly stable relationship with the economy and can be controlled to a reasonable extent by the central bank, either through control over the supply of balances at the Federal Reserve or the federal funds rate. An increase in the federal funds rate (and other short-term interest rates), for example, will reduce the attractiveness of holding money balances relative to now higher-yielding money market instruments and thereby reduce the amount of money demanded and slow growth of the money stock. There are a few measures of the money stock – ranging from the transactions-dominated M1 to the broader M2 and M3 measures, which include other liquid balances – and these aggregates have different behaviors. Ordinarily, the rate of money growth sought over time would be equal to the rate of nominal GDP growth implied by the objective for inf lation and the objective for growth in real GDP. For example, if the objective for inf lation is 1 percent in a given year and the rate of growth in real GDP associated with achieving maximum employment is 3 percent, then the guideline for growth in the money stock would be 4 percent. However, the relation between the growth in money and the growth in nominal GDP, known as 'Velocity', can vary, often unpredictably, and this uncertainty can add to difficulties in using

monetary aggregates as a guide to policy. Indeed, in the United States and many other countries with advanced financial systems over recent decades, considerable slippage and greater complexity in the relationship between money and GDP have made it more difficult to use monetary aggregates as guides to policy. In addition, the narrow and broader aggregates often give very different signals about the need to adjust policy. Accordingly, monetary aggregates have taken on less importance in policy making over time. The Federal Reserve publishes data on three monetary aggregates:- M1, M2, and M3. The aggregates have had different roles in monetary policy as their reliability as guides has changed. See also M0, M1, M2, and M3.

MONETARY BASE = МОНЕТАРНАЯ БАЗА (или ВАЛЮТНАЯ БАЗА, или ДЕНЕЖНАЯ БАЗА) – Monetary Base:- in the Euro area, it consists of currency (banknotes and coins) in circulation, the reserves held by counterparties with the Eurosystem and the funds deposited with the Eurosystem's deposit facility. These items are liabilities on the Eurosystem's balance sheet. Reser ves can be broken down further into required and excess reserves. In the Eurosystem's minimum reserve system counterparties are obliged to hold required reserves with the national central banks (NCBs). In addition to these required reserves, credit institutions usually hold only a small amount of voluntary excess reserves with the Eurosystem. Monetary Base:- bank notes and coins circulating in the private sector of the economy as well as giro (clearing) balances maintained with the central bank by commerce, industry and the banks. Also known as Central Bank Money. See also Money Supply. / Монетарная База:- банкноты и монеты, циркулирующие в частном секторе экономики, а также остатки по безналичным платежам (взаиморасчётам), поддерживаемые в центральном банке коммерческими и промышленными структурами и банками. Известна также как Деньги Центрального Банка (Central Bank Money). Смотрите также Денежная Масса В Обращении (Money Supply).

MONETARY CAPITAL = МОНЕТАРНЫЙ КАПИТАЛ (или ВАЛЮТНЫЙ КАПИТАЛ) – Monetary Capital:- monetary value of the components of capital assets. Also the stock of funds available in monetary form (usually called Capital). In theory, monetary capital should equal the book value of the corresponding assets in a business. In fact, there may be a difference, owing to a loss in monetary value or a difference in depreciation for accounting purposes and a real decline in the value of capital assets. Assets are sometimes revalued, or restated, to eliminate these differences.

MONETARY COMMITTEE = МОНЕТАРНЫЙ КОМИТЕТ (или ВАЛЮТНЫЙ КОМИТЕТ) – Monetary Committee is a committee established by Article 105(2) of the EEC Treaty; it was superseded by the Economic and Financial Committee (EFC) at the beginning of Stage Three of Economic and Monetary Union (EMU).

MONETARY CONTROL ACT OF 1980 = АКТ О МОНЕТАРНОМ КОНТРОЛЕ ОТ 1980 (или АКТ О ВАЛЮТНОМ КОНТРОЛЕ ОТ 1980) – In the United States, Monetary Control Act of 1980 (MCA) is the act which requires that all banks and all institutions that accept deposits from the public make periodic reports to the Federal Reserve System. Starting in September 1981, the Fed charged banks for a range of services that it had provided free in the past, including check clearing, wire transfer of funds and the use of automated clearinghouse facilities.

MONETARY EQUILIBRIUM = МОНЕТАРНОЕ РАВНОВЕСИЕ (или ВАЛЮТНЫЙ ПАРИТЕТ) – Monetary Equilibrium:- when the quantity of money supplied is equal to the quantity demanded. / Ситуация, когда количество предлагаемых денег равняется количеству требуемых денег.

MONETARY FINANCIAL INSTITUTIONS = МОНЕТАРНЫЕ ФИНАНСОВЫЕ ИНСТИТУТЫ (или ВАЛЮТНЫЕ ФИНАНСОВЫЕ УЧРЕЖДЕНИЯ, или МОНЕТАРНЫЕ ФИНАНСОВЫЕ УЧРЕЖДЕНИЯ) – Monetary Financial Institutions (MFIs) are the financial institutions forming the money-issuing sector of the Euro area. They include the European Central Bank (ECB), the national central banks (NCBs) of the Euro area countries, and credit institutions and money market funds located in the Euro area.

MONETARY INCOME = МОНЕТАРНЫЙ ДОХОД (или ВАЛЮТНЫЙ ДОХОД) – Monetary Income is the income accruing to the national central banks (NCBs) in the performance of the Eurosystem's monetary policy function, derived from assets earmarked in accordance with guidelines established by the Governing Council and held against banknotes in circulation and deposit liabilities to credit institutions.

MONETARY POLICY = ВАЛЮТНАЯ ПОЛИТИКА (или МОНЕТАРНАЯ ПОЛИТИКА, или ДЕНЕЖНО–КРЕДИТНАЯ ПОЛИТИКА) – Monetary Policy is that part of the government's economic policy which tries to control the size of the total stock of money (and other highly liquid financial assets that are close substitutes for money) available in the national economy in order to achieve policy objectives that are often partly contradictory:- controlling the rate of increase in the general price level (inflation), speeding up or slowing the overall rate of economic growth (mainly by affecting the interest rates that constitute such a large share of suppliers' costs for new investment but partly by influencing consumer demand through the availability of consumer credit and mortgage money), managing the level of unemployment (stimulating or retarding total demand for goods and services by manipulating the amount of money in the hands of consumers and investors), or influencing the exchange rates at which the national currency trades for other foreign currencies (mainly by pushing domestic interest rates above or below foreign interest rates in order to attract or discourage foreign savings from entering or leaving domestic financial markets). Monetary policy is said to be 'easy', 'loose', or 'expansionary' when the quantity of money in circulation is being rapidly increased and short-term interest rates are thus being pushed down. Monetary policy is said to be 'tight' or 'contractionary' when the quantity of money available is being reduced (or else allowed to grow only at a slower rate than in the recent past) and short-term interest rates are thus being pushed to higher levels. The government's ability to control the size of the money stock and the levels of interest rates is only partial, not absolute. This is because monetary policy makers must rely mainly on influencing the privately-owned banking system's supply schedule for loaned funds. Monetary policy makers are much less able to affect the private sector's demand schedule for such funds, yet both supply and demand for money interact to determine the quantity of money created and its price, the interest rate. Even in trying to control the supply side of the loan market, it is easier for the Fed to force the banks to tighten credit and make fewer new loans (by raising the legal reserve requirements, for example) than it is to convince them to extend a larger volume of loans when bankers have become worried about their prospects for being repaid (or fear rapid inflation will cause their repayments to be worth less than the original value of the their loans). Government monetary policy-makers are generally much more successful in manipulating short-term interest rates (rates on loans for periods of less than a year) than they are in manipulating medium-term interest rates (1 to 5 years) and long-term interest rates (more than five years). This is because demand and supply for medium-term and long-term loans tend to be both much more elastic and much more affected by the public's expectations about future rates of inflation than the supply and demand for short-term loans are. A very expansionary monetary policy may well lower short-term interest rates by flooding the banks and financial markets with loanable funds and yet at the same time may actually raise longer-term interest rates by prompting fears among lenders that inflation will soon be accelerating. Unfortunately, medium and long-term interest rates have much more influence on the rate of growth of the economy and on levels of unemployment than short-term interest rates do, because major new investment spending like research and development for new products or the construction of whole new factories are long-term projects that require long-term financing, and they are much less likely to be undertaken if long-term interest costs are high than if they are low. Monetary Policy is a central bank's actions to influence the availability and cost of money and credit, as a means of helping to promote national economic goals. Tools of

monetary policy include open market operations, discount policy, and reserve requirements. How can Monetary Policy influence the price level? This question touches upon what economists generally describe as the so-called 'Transmission Process', i.e. the process through which actions of the central bank are transmitted through the economy and, ultimately, to prices. While this process is in essence extremely complex – one that changes over time and is different in various economies, so much so that, even today, not all the details behind it are fully known – its basic features are well understood. The way in which monetary policy exerts its influence on the economy can be explained as follows:- the central bank is the sole issuer of banknotes and bank reserves, i.e. it is the monopolistic supplier of the so-called 'Monetary Base'. By virtue of this monopoly, the central bank is able to influence money market conditions and steer short-term interest rates. In the short run, the central bank can influence real economic developments. In the short run, a change in money market (i.e. short-term) interest rates induced by the central bank sets a number of mechanisms in motion, mainly because this change has an impact on the spending and saving decisions taken by households and firms. For example, higher interest rates will, all things being equal, make it less attractive for households and firms to take out loans in order to finance their consumption or investment.They also make it more attractive for households to save their current income rather than spend it. Finally, changes in official interest rates may also affect the supply of credit. These developments, in turn, and with some delay, influence developments in real economic variables such as output. In the long run, changes in the money supply will affect the general price level … The dynamic processes outlined above involve a number of different mechanisms and actions taken by various economic agents at different stages of the process. Furthermore, the size and strength of the various effects can vary according to the state of the economy. As a result, monetary policy usually takes a considerable amount of time to affect price developments. However, in the economics profession, it is widely accepted that, in the long run, i.e. after all adjustments in the economy have worked through, a change in the quantity of money supplied by the central bank (all things being equal) will only be reflected in a change in the general level of prices and will not cause permanent changes in real variables such as real output or unemployment.A change in the quantity of money in circulation brought about by the central bank is ultimately equivalent to a change in the unit of account (and thereby in the general price level), which leaves all other variables stable, in much the same way as changing the standard unit used to measure distance (e.g., switching from kilometers to miles) would not alter the actual distance between two locations. … but not the level of real income or employment:- this general principle, referred to as the 'Long-Run Neutrality' Of Money, under lies all standard macroeconomic thinking and theoretical frameworks. As mentioned above, a monetary policy which credibly maintains price stability has a significant positive impact on welfare and real activity. Beyond this positive impact of price stability, real income or the level of employment in the economy are, in the long run, essentially determined by real (supply-side) factors, and cannot be enhanced by expansionary monetary policy. (Supply-side factors are factors driving the supply of goods and services in an economy, in particular the amount and quality of capital and labour, as well as technological progress and the design of structural policies.) These main determinants of long-run employment and real income are technology, population growth and all aspects of the institutional framework of the economy (notably property rights, tax policy, welfare policies and other regulations determining the flexibility of markets and incentives to supply labour and capital and to invest in human resources). Inflation is ultimately a monetary phenomenon:- as confirmed by a number of empirical studies, prolonged periods of high inflation are typically associated with high monetary growth. While other factors (such as variations in aggregate demand, technological changes or commodity price shocks) can influence price developments over shorter horizons, over time their effects can be offset by some degree of adjustment of monetary policy. In this sense, the longer-term trends of prices or inflation can be controlled by central banks. The term 'Monetary Policy' refers to what the nation's central bank, does to influence the amount of money and credit in the economy. What happens to money and credit affects interest rates (the cost of credit) and the performance of the economy. The goals of monetary policy include the promotion of sustainable economic growth, full employment, and stable prices. Through monetary policy, the nation's central bank is most able to maintain stable prices, thereby promoting economic growth and maximum employment. Three instruments of monetary policy are:- (i) open market operations, (ii) the discount rate and (iii) reserve requirements. 'Open Market Operations' involve the buying and selling of US government securities (federal agency and mortgage-backed). The term 'Open Market' means that the Fed doesnt decide on its own which securities dealers it will do business with on a particular day. Rather, the choice emerges from an 'open market' in which the various securities dealers that the Fed does business with – the primary dealers – compete on the basis of price. Open market operations are flexible and thus, the most frequently used tool of monetary policy. The 'Discount Rate' is the interest rate charged by Federal Reserve Banks to depository institutions on short-term loans. 'Reserve Requirements' are the portions of deposits that banks must maintain either in their vaults or on deposit at a Federal Reserve Bank. / Фэд (Fed). Монетарная Политика:- решения Совета Управляющих Федеральной Резервной системы (Federal Reserve Board), относящиеся к денежной массе (money supply). Чтобы ускорить экономический рост, ФРС может стимулировать предложение кредитных ресурсов со стороны сферы банковской деятельности путём проведения операций на открытом рынке (open market operations) либо может снизить долю отчислений в обязательные резервы для банков – членов ФРС или свою учётную ставку (discount rate), по которой банки заимствуют средства у ФРС из фонда избыточных резервов. Если же экономический рост происходит слишком быстрыми темпами и возникает проблема ускорения роста инфляции, то ФРС может изъять деньги из банковской системы, повысив уровень отчислений в обязательные резервы или повысив учётную ставку, и, таким образом, способствовать сокращению темпов экономического роста. Другие инструменты монетарной политики варьируют от избирательного контроля за предложением кредита до простого, но очень эффективного 'воздействия убеждением' (moral suasion). Кредитно-денежная политика отличается от налогово-бюджетной политики (fiscalpolicy), которая проводится путём контроля за уровнем государственных расходов и налогообложения. Обе политики нацелены на контроль уровня экономической активности; об их успешности должны свидетельствовать такие факторы, как объём промышленного производства, уровень занятости и уровень цен. Валютная Политика, совокупность мероприятий, проводимых государствами и центральными банками в сфере денежного обращения и валютных отношений с целью воздействия на покупательную силу денег, валютные курсы и на экономику страны в целом. Валютная политика определяется экономическим строем общества и классовой природой государства, непосредственно связана с внешней торговлей и внешнеторговой политикой, а также с денежным обращением в данной стране. В капиталистических странах валютная политика в основном направлена на поддержание покупательной силы денег и укрепление валютных курсов, что, однако, далеко не всегда достижимо в связи с господствующей там инфляцией. В условиях общего кризиса капитализма, в особенности в отдельные периоды (в частности, в 1930-е), валютная политика направляется на снижение покупательной силы денег и понижение валютных курсов для проведения валютного демпинга на мировом капиталистическом рынке. Валютная политика капиталистических государств часто принимает формы прямого вмешательства государства в операции с иностранной валютой при одновременном введении ограничений в области валютных операций, что способствует внешнеэкономической экспансии монополий, облегчает их борьбу за рынки сбыта и новые сферы приложения капитала. Валютная политика осуществляется главным образом в двух формах:- учётной (дисконтной) и девизной (смотрите также Кредитная Политика). Учётная политика в сфере международных валютных отношений направлена на регулирование валютного курса изменением процентных ставок за кредит. Повышение процентных ставок привлекает капиталы из стран, где существуют более низкие процентные ставки, что улучшает состояние платёжного баланса данной страны и повышает курс её валюты. Напротив, понижение процентной ставки приводит к отливу капитала в другие страны и понижению курса валюты данной страны. Девизная политика направлена на

регулирование валютного курса покупкой и продажей иностранной валюты. При падении курса национальной валюты центральный банк страны обычно продаёт на валютном рынке крупные суммы иностранной валюты, что приводит к повышению курса национальной валюты в отношении иностранных валют и, наоборот, скупка иностранной валюты влечёт за собой падение курса национальной валюты. В современных условиях особое значение приобретает прямое вмешательство государства в область международного валютного оборота, в частности путём введения валютных ограничений. Буржуазные экономисты приписывают валютной политике капиталистических государств способность определять покупательную силу денег и курс своей валюты, движение товарных цен и экономическую конъюнктуру в целом и даже усматривают в валютной политике одно из орудий 'бескризисного' развития капитализма. В действительности же валютная политика, оказывая известное и довольно ограниченное влияние на валютно-экономическое положение страны, не в состоянии противостоять разрушительному стихийному действию экономических законов капитализма в валютной сфере (смотрите Валютный Кризис). В развивающихся странах валютная политика – важный экономический инструмент, способствующий развитию внешней торговли, улучшению платёжного и торгового баланса страны. Для валютной политики развивающихся стран характерно широкое применение валютных ограничений:- запрещение продажи валюты на открытом рынке, ограничение переводов валюты за границу, обложение налогом переводных операций, обязанность граждан страны сдавать казначейству имеющуюся у них иностранную валюту в обмен на национальную валюту. Будучи направленными на развитие национальной экономики, эти ограничения позволяют укрепить позиции государства в расчётах с другими странами, пополнить запасы иностранной валюты, а также ограничить деятельность иностранных компаний, перевод их прибылей за границу. Валютная политика социалистических стран осуществляется на базе государственной валютной монополии. Задачи валютной политики социалистических стран:- планомерная организация международных расчётов каждой страны с тем, чтобы обеспечить сосредоточение поступающих в страну валютных средств в руках государства и наиболее целесообразно использовать их в интересах укрепления социалистической экономики и расширения международных экономических связей. Валютная политика преследует цель защитить независимость социалистической экономики, оградить её от влияния стихийного капиталистического рынка, от валютной спекуляции, а также от всякого рода попыток капиталистических стран нанести ущерб внешней торговле социалистических стран проведением различных валютных махинаций.

MONETARY POLICY INSTRUMENTS = ИНСТРУМЕНТЫ МОНЕТАРНОЙ ПОЛИТИКИ (или ИНСТРУМЕНТЫ ВАЛЮТНОЙ ПОЛИТИКИ, или ИНСТРУМЕНТЫ ДЕНЕЖНО–КРЕДИТНОЙ ПОЛИТИКИ) – Monetary Policy Instruments:- the transmission mechanism of monetary policy starts with the central bank's management of liquidity and steering of short-term interest rates. The money market, as part of the financial market, plays a crucial role in the transmission of monetary policy decisions, since it is the first market to be affected by changes in monetary policy. A deep and integrated money market is essential for an efficient monetary policy, since it ensures an even distribution of central bank liquidity and a homogeneous level of short-term interest rates throughout the single currency area. This precondition was met almost immediately from the start of Stage Three of EMU when the national money markets were successfully integrated into an efficient Euro area money market. To steer short-term interest rates, the Eurosystem has at its disposal a set of monetary policy instruments, namely open market operations, standing facilities and reserve requirements. Monetary Policy Instruments of the ECB:- the ECB has a number of monetary policy tools at its disposal designed to help reach its primary objective of price level stability. These include, above all, open market operations and standing facilities.

MONETARY POLICY OPERATIONS = ОПЕРАЦИИ МОНЕТАРНОЙ ПОЛИТИКИ (или ОПЕРАЦИИ ВАЛЮТНОЙ ПОЛИТИКИ, или ОПЕРАЦИИ ДЕНЕЖНО–КРЕДИТНОЙ ПОЛИТИКИ) – Monetary Policy Operations:- either liquidity-providing or liquidity-absorbing operations, executed by national central banks with the banking system, with a view to achieving the objective of price stability.

MONETARY POLICY STRATEGY = СТРАТЕГИЯ МОНЕТАРНОЙ ПОЛИТИКИ (или СТРАТЕГИЯ ВАЛЮТНОЙ ПОЛИТИКИ, или СТРАТЕГИЯ ДЕНЕЖНО–КРЕДИТНОЙ ПОЛИТИКИ) – Monetary Policy Strategy:- the general approach to the conduct of monetary policy. The key features of the monetary policy strategy of the ECB are a quantitative definition of the primary objective of price stability and an analytical framework based on two pillars – economic analysis and monetary analysis. Moreover, the strategy includes general principles for the conduct of monetary policy, such as the medium-term orientation. The strategy forms the basis of the Governing Council's overall assessment of the risks to price stability and its monetary policy decisions. It also provides the framework for explaining monetary policy decisions to the public.

MONETARY POLICY TRANSMISSION MECHANISM = МЕХАНИЗМ ТРАНСМИССИИ МОНЕТАРНОЙ ПОЛИТИКИ (или МЕХАНИЗМ ТРАНСМИССИИ ДЕНЕЖНО–КРЕДИТНОЙ ПОЛИТИКИ) – Monetary Policy Transmission Mechanism:- the proces s through which monetary policy decisions affect the economy in general and the price level in particular.

MONETARY RESERVES = ВАЛЮТНЫЕ РЕЗЕРВЫ (или МОНЕТАРНЫЕ РЕЗЕРВЫ, или ЗОЛОТО–ВАЛЮТНЫЕ РЕЗЕРВЫ) – Monetary Reserves:- a government's stockpile of foreign currency and precious metals. Monetary reserves are useful both for settling transactions involving foreign counterparties and for undertaking trading in foreign exchange and commodity markets. In general, the larger the monetary reserve, the better the country is able to engage in transactions with foreign countries. / Валютные Резервы, запасы иностранной валюты и золота, которыми располагают правительственные органы или центральные банки той или иной страны для платежей по международным расчётам, связанным с внешней торговлей, инвестициями и другими операциями. Золото, как мировые деньги, играет роль основных валютных резервов, поскольку оно свободно может быть превращено в любую иностранную валюту, в которой должны быть произведены платежи. Однако прямые платежи золотом, как правило, не производятся, так как расчёты между контрагентами по международным сделкам обычно предусматриваются в какой-либо национальной валюте. Иностранная валюта, включаемая в состав официальных валютных резервов страны, представляет собой в основном принадлежащие центральному банку, казначейству и другим государственным органам свободные остатки на счетах в иностранных банках и в небольшой части иностранные банкноты и монеты. К общим валютным резервам страны причисляются, кроме того, средства в иностранных валютах, принадлежащие коммерческим банкам, осуществляющим международные расчёты. Международный Валютный Фонд (МВФ), публикующий статистические данные о валютных резервах стран-членов фонда, включает в состав официальных валютных резервов также суммы, внесённые в капитал фонда в золоте, поскольку в пределах свободного остатка этих сумм каждая страна имеет право автоматически требовать необходимую ей иностранную валюту. С начала 1970 МВФ включает в состав официальных резервов специальные права заимствования (СДР). Валютные резервы создаются в каждой стране для покрытия временных превышений платежей над поступлениями по международным расчётам. Размеры необходимых стране валютных резервов зависят от размеров и частоты разрывов между расходом и приходом иностранной валюты. Наличие валютных резервов определяет так называемую международную ликвидность страны, то есть её способность бесперебойно производить платежи по внешним расчётам. Условно её определяют по соотношению валютных резервов с суммой импорта страны как главные статьи в международном платёжном обороте:- снижение этого соотношения свидетельствует об ухудшении ликвидности и наоборот. Сопоставление общих валютных резервов всех капиталистических стран с суммой мирового импорта показывает, что с

середины 1950-х общая международная ликвидность снижается, поскольку темп роста валютных резервов значительно отстаёт от роста мировой торговли. Однако при этом ликвидность одних стран улучшается, а других – ухудшается, в связи с чем возникла проблема международной ликвидности. Резкие колебания в распределении валютных резервов между капиталистическими странами отражают действие закона неравномерного развития капитализма. После 2-й Мировой Войны 1939–45 валютные резервы капиталистических стран увеличились с 53.1 в 1948 до 76.6 миллиардов Долларов США в 1968, то есть на 43%, а обороты по внешней торговле выросли за тот же период со 114.1 до 437.6 миллиардов Долларов США, то есть почти в 4 раза. Валютные резервы США, составлявшие в 1948 24.4 миллиардов Долларов США (в золоте), снизились на конец 1969 до 16.9 миллиардов Долларов США (в том числе 11.8 миллиардов Долларов США в золоте). За тот же период валютные резервы капиталистических стран континентальной Европы увеличились с 6.1 до 35.4 миллиардов Долларов США. Сокращение валютных резервов США обусловлено дефицитностью их платёжного баланса, оно резко ухудшает международные валютные позиции США и ставит Доллар США под угрозу девальвации. В социалистических странах валютные резервы используются для планомерного регулирования внешнеэкономических связей и денежных расчётов с капиталистическими странами. Для взаимных расчётов валютных резервов этим странам, как правило, не требуются, поскольку получаемые каждой социалистической страной от других социалистических стран товары и услуги оплачиваются ею поставками товаров и услуг. Однако в отдельных случаях валютные резервы используются социалистическими странами для предоставления кредитов другим социалистическим странам в золоте или иностранной обратимой валюте.

MONETARY RISK INFLATION = РАЗДУВАНИЕ МОНЕТАРНОГО РИСКА (или ИНФЛЯЦИЯ ВАЛЮТНОГО РИСКА) – Monetary Risk Inflation can reduce the value of an investment. The purchasing power of the invested capital declines if the rate of inflation is higher than the return generated by the securities. / Раздувание монетарного риска может снизить объём инвестиций. Приобретательская способность инвестированного капитала падает, если уровень инфляции выше получаемой отдачи от инвестиций в ценные бумаги.

MONETARY STABILITY = МОНЕТАРНАЯ СТАБИЛЬНОСТЬ (или ВАЛЮТНАЯ СТАБИЛЬНОСТЬ) – Monetary Stability means keeping the purchasing power of money as constant as possible, i.e. price stability, adjusted for external influences.

MONETIZE = МОНЕТИЗИРОВАТЬ – Monetize:- action in which a central bank purchases an object that is not money (for example, gold) and pays for it by creating balances at the central bank. The action permits an increase in the money stock. / Действие, при котором центральный банк приобретает объект, не являющийся деньгами (например, золото) и платит за него, создавая балансы в центральном банке. Это действие разрешает увеличение в денежном эквиваленте уставного капитала.

MONEY = ДЕНЬГИ – Money:- a term originally referring to metal coins used as a medium of exchange and later referring to a standard unit of exchange. By extension:- anything that functions as a generally accepted means of exchange. As a means of payment, money has three main characteristics:- its liquidity – money can be used directly as payment for any debt simply by physical transfer; money is a fungible good; and money is universally accepted within a given society. Money has four main functions:- money is a medium of exchange; money is a unit of account; money is a store of value; and money is a standard of deferred payment. Money:- a commodity accepted by general consent as a medium of economic exchange. It is the medium in which prices and values are expressed, it circulates from person to person and country to country, thus facilitating trade, and it is the principal measure of wealth. The subject of money has fascinated wise men from the time of Aristotle to the present day because it is so full of mystery and paradox. The piece of paper labelled one Dollar or 100 Francs or 10 Kroner or 1 000 Yen is little different, as paper, from a piece of the same size torn from a newspaper or magazine, yet it will enable its bearer to command some measure of food, drink, clothing, and the remaining goods of life while the other is fit only to light the fire. Whence the difference? The easy answer, and the right one, is that people accept money as such because they know that others will. The pieces of paper are valuable because everyone thinks they are, and everyone thinks they are because in his experience they always have been. At bottom money is, then, a social convention, but a convention of uncommon strength that people will abide by even under extreme provocation. The strength of the convention is, of course, what enables governments to profit by inflating the currency. But it is not indestructible. When great variations occur in the quantity of these pieces of paper – as they have during and after wars – they may be seen to be, after all, no more than pieces of paper. People will then seek substitutes – like the cigarettes and cognac that for a time became the medium of exchange in Germany after World War II. As John Stuart Mill wrote:- ‘There cannot, in short, be intrinsically a more insignificant thing, in the economy of society, than money; except in the character of a contrivance for sparing time and labour. It is a machinery for doing quickly and commodiously, what would be done, though less quickly and commodiously, without it: and like many other kinds of machinery, it only exerts a distinct and independent influence of its own when it gets out of order’. (Principles of Political Economy, W.J. Ashley [ed.], 1909, p. 488.) Mill was perfectly correct, although one must add that there is hardly a contrivance man possesses that can do more damage to a society when it goes wrong. Functions of Money:- the basic function of money is to enable buying to be separated from selling, thus permitting trade to take place without the so-called Double Coincidence Of Barter. If a person has something to sell and wants something else in return, it is not necessary to search for someone able and willing to make the desired exchange of items. The person can sell the surplus item for general purchasing power – that is, ‘money’ – to anyone who wants to buy it and then use the proceeds to buy the desired item from anyone who wants to sell it. The importance of this function of money is dramatically illustrated by the experience of Germany just after World War II, when paper money was rendered largely useless because, despite inflationary conditions, price controls were effectively enforced by the American, French, and British armies of occupation. People had to resort to barter or to inefficient money substitutes. The result was to cut total output of the economy in half. The German ‘economic miracle’ just after 1948 reflected partly a currency reform by the occupation authorities, but some economists hold that it stemmed primarily from the German government’s elimination of all price controls, thereby permitting a money economy to replace a barter economy. Separation of the act of sale from the act of purchase requires the existence of something that will be generally accepted in payment – this is the ‘medium of exchange’ function of money. But there must also be something that can serve as a temporary abode of purchasing power, in which the seller holds the proceeds in the interim between the first sale and the subsequent purchase, or from which the buyer can extract the general purchasing power with which to pay for what is bought. This is the ‘asset’ function of money. Varieties of Money:- anything can serve as money that habit or social convention and successful experience endow with the quality of general acceptability, and a variety of items have so served – from the wampum (beads made from shells) of American Indians to cowries (brightly coloured shells) in India, to whales’ teeth among the Fijians, to tobacco among early colonists in North America, to large stone disks on the Pacific island of Yap, to cigarettes and liquor in post-World War II Germany. The wide use of cattle as money in primitive times survives in the word pecuniary, which comes from the Latin pecus, meaning cattle. Metallic Money:- the use of metals as money has occurred throughout history. As Aristotle observed:- The various necessities of life are not easily carried about, and hence man agreed to employ in their dealings with each other something which was intrinsically useful and easily applicable to the purposes of life, for example, iron, silver, and the like. Of this the value was at first measured by size and weight, but in process of time they put a stamp upon it, to save the trouble of weighing and to mark the value. The use of metal for money can be traced back to more than 2 000 years before the birth of Christ. But standardization and certification in the form of coinage, as referred to by Aristotle, did not occur except perhaps in

isolated instances until the VII century BC. Historians generally assign to Lydia, a state in Anatolia, priority in using coined money. The first coins were made of electrum, a natural mixture of gold and silver, and were crude, bean-shaped ingots bearing a primitive punchmark certifying to either weight or fineness, or both. The use of coins enabled payment to be by 'tale', or count, rather than weight, greatly facilitating commerce. But this in turn encouraged clipping (shaving off tiny slivers from the sides or edges of coins) and sweating (shaking a bunch of coins together in a leather bag and collecting the dust that was thereby knocked off) in the hope of passing on the lighter coin at its face value. Gresham's law (that 'bad money drives out good' when there is a fixed rate of exchange between them) came into operation, and heavy, good coins were held for their metallic value, while light coins were passed on. The coins became lighter and lighter, and prices higher and higher. Then payment by weight would be resumed for large transactions, and there would be pressure for recoinage. These particular defects were largely ended by the 'milling' of coins (making serrations around the circumference of a coin), which began in the late XVII century. A more serious matter was the attempt by the sovereign to benefit from the monopoly of coinage. In this respect, Greek and Roman experience offers an interesting contrast. Though Solon, on taking office in Athens in 594 BC, did institute a partial debasement of the currency, for the next four centuries, until the absorption of Greece into the Roman Empire, the Athenian Drachma had an almost constant silver content (67 grains of fine silver until Alexander, 65 grains thereafter) and became the standard coin of trade in Greece and in much of Asia and Europe as well. Even after the Roman conquest, the Drachma continued to be minted and widely used. The Roman experience was very different. Not long after the silver Denarius, patterned after the Greek Drachma, was introduced in about 212 BC, the prior copper coinage (aes, or libra) began to be debased until, by the time the empire began, its weight had been reduced from one pound to half an ounce. The silver denarius and the gold aureus (introduced about 87 BC) suffered only minor debasement until the time of Nero (AD 54), when almost continuous tampering with the coinage began. The metal content of the gold and silver coins was reduced, and the proportion of alloy was increased to three-fourths or more of its weight. Debasement in Rome (as ever since) was a reflection of the state's inability or unwillingness to finance its expenditures through explicit taxes. But the debasement in turn worsened Rome's economic situation and undoubtedly contributed to the collapse of the empire. Paper Money:- in the late XVIII and early XIX centuries, paper money and bank notes spread widely. The bulk of the money in use came to consist not of actual gold or silver but of fiduciary money – promises to pay specified amounts of gold and silver. These promises were initially issued by individuals or companies as bank notes or as the transferrable book entries that came to be called Deposits. But gradually the state assumed a role. From fiduciary paper money promising to pay gold or silver, it is a short step to fiat paper money – that is, notes that are issued on the 'fiat' of the sovereign, are specified to be so many dollars or francs or yen, and are legal tender but are not promises to pay something else. The first large-scale issue in a Western country occurred in France in the early XVIII century (though there are reports of paper money in China many centuries earlier). Later, the French revolutionary government issued paper money in the form of assignats from 1789 to 1796. The American colonies and later the Continental Congress issued bills of credit that could be used in making payments. These early experiments gave fiat money a deservedly bad name. The money was overissued, and prices rose drastically until the money became worthless or was redeemed in metallic money (or promises to pay metallic money) at a small fraction of its initial value. Subsequent issues of fiat money in the major countries during the XIX century were temporary departures from a metallic standard. In Great Britain, for example, payment of gold for the outstanding bank notes was 'suspended' during the Napoleonic Wars (1797–1815). As a result, gold coin and bullion became more expensive in terms of paper. Similarly, in the United States during the Civil War, convertibility of Union currency (greenbacks) into specie was suspended, and resumption did not occur until 1879. At its peak, in 1864, the greenback price of gold, nominally equivalent to USD100, reached more than USD250. Standards of Value:- in the Middle Ages, when money consisted primarily of coins, silver and gold coins circulated simultaneously. As governments came increasingly to take over the coinage, and especially as fiduciary money was introduced, they tended to specify their nominal monetary units in terms of fixed weights of both silver and gold – to adopt a national bimetallic standard. Gresham's law, however, usually assured that the bimetallic standard degenerated into a monometallic standard: if the quantity of silver designated as the monetary equivalent of one ounce of gold was less than the quantity that could be purchased in the market for one ounce of gold (i.e. if the mint overvalued silver), no one would bring gold to be coined. If one had gold, it was better to buy silver and bring it to be coined. Silver, the cheaper metal, 'drove out' gold and became the standard. This happened in most of the countries of Europe, so that by the early XIX century all were effectively on a silver standard. In Britain, on the other hand, the ratio established in the XVIII century at the advice of Sir Isaac Newton, then serving as master of the mint, overvalued gold and therefore led to an effective gold standard. In the United States a ratio of 15 ounces of silver to one ounce of gold was set in 1792. This ratio overvalued silver, so silver became the standard. In 1834 the ratio was altered to 16 to one, which overvalued gold, so gold became the standard. The Gold Standard:- the great gold discoveries in California and Australia in the 1840s and '50s produced a temporary decline in the value of gold in terms of silver. This price change, plus the dominance of Britain in international finance, led to a widespread shift from a silver standard to a gold standard. Germany adopted gold in 1871–73, the Latin Monetary Union (France, Italy, Belgium, Switzerland) in 1873–74, the Scandinavian Union (Denmark, Norway, and Sweden) and The Netherlands in 1875–76. By the final decades of the century, silver remained dominant only in the Far East (China, in particular). Elsewhere the gold standard reigned. The early XX century was the great era of the international gold standard. Gold coins circulated in most of the world; paper money, whether issued by private banks or by government, was convertible on demand into gold coins or gold bullion at an official price (with perhaps the addition of a small fee); and bank deposits were convertible into either gold coin or paper currency that was itself convertible into gold. In a few countries, a minor variant prevailed – the so-called Gold-Exchange Standard, under which the currency was converted at a fixed price into the currency of another country (usually the British pound sterling) that was itself convertible into gold. There was, in effect, a single world money called by different names in different countries. A US Dollar, for example, was defined as 23.22 grains of pure gold (25.8 grains of gold 0.9000 fineness). A British Pound Sterling was defined as 113.00 grains of pure gold (123.274 grains of gold $11/12^{th}$ fine). Accordingly, one British pound equalled 4.8665 US Dollars (113.00/23.22) at the official parity. The actual exchange rate could deviate from this only by an amount that corresponded to the cost of shipping gold. If the price of the pound sterling in terms of Dollars rose to a considerably higher value than this in the foreign exchange market, someone in New York City who had a debt to pay in London might find that, rather than buy the needed pounds on the market, it was cheaper to get gold for Dollars at a bank or at the US subtreasury, ship the gold to London, and get pounds for the gold from the Bank of England. This set an upper limit to the exchange rate. Similarly, the cost of shipping gold from Britain to the United States set a lower limit. These limits were known as the Gold Points. Under such an international gold standard, the quantity of money in each country was determined by the specie-flow adjustment mechanism analyzed by XIX-century economists. If, for whatever reason, the quantity of money in a country rose unduly, this would tend to raise prices in that country relative to prices in other countries; the rise in prices would have the effect of discouraging exports and encouraging imports. The decreased supply of foreign currency from the sale of exports plus the increased demand for foreign currency to pay for imports would tend to raise the price of foreign currency in terms of domestic currency. As soon as this price hit the upper gold point, gold would be shipped out of the country to other countries. The decline in the amount of gold would produce in turn a reduction in the total amount of money – because banks and government institutions, seeing their gold reserves decline, would want to protect themselves against further demands by reducing the claims against gold that were outstanding. This would tend to lower prices at home. The influx of gold abroad would have the opposite effect, increasing the quantity of money there and raising prices. These adjustments would continue until the gold flow

ceased or was reversed. This is precisely the mechanism that operates within a unified currency area, the mechanism that determines how much money there is in Illinois compared to how much there is in other states or how much there is in Wales compared to how much there is in other parts of the United Kingdom. In the early XX century, most of the world was a unified currency area, so the gold standard functioned throughout the world. Its great advantage was that – if permitted to operate – it would greatly limit the power of any national government to engage in irresponsible monetary expansion. This was also its great disadvantage. In an era of big government and of full-employment policies, a real gold standard would tie the hands of governments in one of the most important areas of policy. The Decline Of Gold:- World War I ended the real international gold standard. Most belligerents suspended the free convertibility of gold. The United States, even after its entry into the war, maintained convertibility but embargoed gold exports. For a few years after the end of the war, most nations had inconvertible national paper standards – inconvertible in that paper money was not convertible into gold or silver. The exchange rate between any two currencies was a market rate that fluctuated from time to time. During this period this was regarded as a temporary phenomenon, like the British suspension of gold payments during the Napoleonic era, and the US suspension during the Civil War greenback period. The great aim was a restoration of the prewar gold standard. This aim dominated monetary developments during the 1920s. Britain, still a major financial power, returned to gold in 1925. Winston Churchill, then chancellor of the Exchequer, decided to follow prevailing financial opinion and adopt the prewar parity (i.e. to define a pound sterling once again as equal to 123.274 grains of gold $11/12^{th}$ fine). This produced exchange rates that, at the existing prices in sterling, overvalued the pound and so tended to produce gold outflows, especially after France returned to gold in 1928 at a parity that undervalued the franc. By 1929 the important currencies of the world, and most of the less important ones, were again linked to gold. The gold standard that was restored, however, was a far cry from the prewar gold standard. The establishment of the Federal Reserve System in the United States introduced an additional link in the international specie-flow mechanism. That mechanism no longer operated automatically. It operated only if the Federal Reserve chose to let it do so, and the Federal Reserve did not so choose; it took certain measures that prevented gold inflows from producing a corresponding expansion in the money supply. The United Kingdom had recurring difficulties in retaining its gold. It followed a restrictive monetary policy, but, because of rigidities in prices and particularly in wages, the result was unemployment rather than a lowering of prices. Unemployment reduced imports and stimulated exports, thus preventing gold losses. But this was not a tenable long-term position, as a lower price level might have been. Most other countries adopted a gold-exchange standard. Everywhere, central banks took scattered measures to loosen the connection between changes in the money supply and inflows or outflows of gold. If the Great Depression had not occurred, this system might have grown and matured and improved. But the Depression brought the managed gold standards to a quick end. It originated in the United States, spread to all the countries linked by the gold exchange standard, and then reverberated back to the United States. Britain was the first major country to cut the link, leaving the gold standard in 1931. The United States followed in March 1933, restoring a fixed – but higher – Dollar price for gold in January 1934, at USD35 an ounce. The Dollar Standard:- the world's monetary system operated on a Dollar standard from the end of World War II until 1971, when, in an attempt to control inflation, the United States unilaterally severed the connection between the Dollar and gold. Under the Dollar standard, the dollar was widely used in international trade, even in trade between countries other than the United States. It was the unit in terms of which the exchange rates of other currencies were expressed. Other countries maintained their 'official' exchange rates by buying and selling US Dollars and held Dollars as their primary reserve currency for that purpose. The existence of a dollar standard did not mean that other countries could not change their exchange rates – as Germany and France did in 1969 – just as the gold standard did not mean that they could not 'devalue' or 'appreciate' in terms of gold. What it did mean was that the United States could not determine its own exchange rate or its balance of payments position. It also meant that US monetary policy had a major effect on the world economy. Since 1971 the world's monetary system has consisted of a collection of national fiat currencies linked by 'floating' exchange rates set in the market. Frequent government interventions to affect exchange rates have been effective at most only temporarily. None of the numerous proposals to reform the system has come close to acceptance. Modern Monetary Systems:- monetary systems are today very much alike in all the major countries of the world. They consist of three levels:- (1) the Holders of Money (the 'public') – individuals, businesses, governmental units; (2) Commercial Banks (privately or governmentally owned), which borrow from the public and make loans to individuals, firms, or governments; and (3) Central Banks, which have a monopoly on the issue of certain types of money, serve as the bankers for the central government and the commercial banks, and have the power to determine the quantity of money. Public Money Holdings:- the public holds its money as:- (1) currency (including coin) and (2) bank deposits. Currency:- in most countries the bulk of the currency consists of notes issued by the central bank. In the United Kingdom these are Bank of England Notes; in the United States, Federal Reserve Notes; and so on. It is hard to say precisely what 'issued by the central bank' means. In the United States, for example, the currency bears the words 'Federal Reserve Note', but these notes are not obligations of the Federal Reserve Banks in any meaningful sense. The holder who presents them to a Federal Reserve Bank has no right to anything except other pieces of paper adding up to the same face value. The situation is much the same in most other countries. The other major item of currency held by the public is coin. In almost all countries this is token coin, worth as metal much less than its face value. Bank Deposits:- bank deposits are counted also as part of the money holdings of the public. In the XIX century most economists regarded only currency and coin as 'money', treating deposits only as claims to money. As deposits became more and more widely held, and as a larger fraction of transactions came to be effected by check, economists started to include not the checks, but the deposits they transferred, as money on a par with currency and coin. The definition of money has been the subject of much dispute. The chief point at issue is which categories of bank deposits to call money and which to regard as near money. Many economists include as money only deposits transferable by check (demand deposits). Others include nonchecking deposits, such as 'time deposits' or 'current deposits' in commercial banks. Still others include deposits in other financial institutions, such as savings banks, savings and loan associations, and so on. The term Deposits is highly misleading. It connotes something deposited for safekeeping, like currency in a safe-deposit box. Bank deposits are not like that. When one brings currency to a bank for 'deposit', the bank does not put the currency in a vault and keep it there. It may put a small fraction of the currency in the vault as 'reserves', but it will lend most of it to someone else or buy an investment – that is, a bond or some other security. As part of the inducement to depositors to lend it money, it provides facilities for transferring demand deposits from one person to another by check. The deposits of commercial banks are assets of their holders but liabilities of the banks. The assets of the banks consist of 'reserves' – currency plus deposits at other banks – and 'earning assets' – loans plus investments in the form of bonds and other securities. The reserves are only a small fraction of the aggregate deposits. Initially, in the history of banking, the amount of reserves held was determined by each bank separately in terms of its judgment of the likely demands on it. The growth of deposits enabled the total quantity of money (including deposits) to be larger than the total sum available to be held as reserves. A bank that received, say, USD100 in gold might add USD25 to its reserves and lend out USD75. But the recipient of the USD75 loan would spend it. Some of those who received gold this way would hold it as gold, but others would deposit it in this or in other banks. If, for example, two-thirds was redeposited, some bank or banks would find USD50 added to deposits and to reserves and would repeat the process, adding USD12 ½ to its reserves and lending out USD37 ½. When this process worked itself out fully, total deposits would have increased by USD200, bank reserves would have increased by USD50, and USD50 of the initial USD100 deposited would have been retained as 'currency outside banks'. There would be USD150 more money in total than before (deposits up by USD200, currency outside banks down by USD50). Although no individual bank created money, the system as a whole did. This multiple expansion

process lies at the heart of the modern monetary system. Central Banking:- an important part of the monetary system is the central bank. The Bank of England was the first modern central bank, serving as the model for many others. It was established as a private bank in 1694 but quickly came to be largely an agency of the government. The Bank of France was established as a governmental institution by Napoleon in 1800. In the United States, the 12 Federal Reserve Banks, which, together with the Board of Governors in Washington, DC, constitute the Federal Reserve System, are technically owned by their member commercial banks, but this is a pure formality. Member banks get only a fixed annual percentage dividend on their stock and have essentially no real power. To all intents and purposes, the system is a governmental agency. The notes issued by a central bank (or other governmental agency) plus deposits at the central bank are often called High-Powered Money, because when held as bank reserves each Dollar or Pound or Franc may correspond to several Dollars or Pounds or Francs of commercial bank deposits. Generally speaking, there is now no formal limit to the amount of notes and deposits that a central bank may have as liabilities. The way in which a central bank increases or decreases the total amount of high-powered money is, typically, by making loans (discounting) or by buying and selling government securities (open-market operations). If, for example, the Federal Reserve System purchases USD1 000 000 of government securities, it will pay for these securities by a check on itself, adding USD1 000 000 to its assets and USD1 000 000 to its liabilities. The seller can take the check to a Federal Reserve Bank, which will exchange for it USD1 000 000 in Federal Reserve Notes. Or the seller may deposit the check at a commercial bank, and the bank will in turn present it to a Federal Reserve Bank, which will 'pay' the check by making a book entry increasing that bank's deposits with it by USD1 000 000. The bank may, in turn, transfer this sum to a borrower, who again will convert it into Federal Reserve Notes or deposit it. The important point is that these bookkeeping operations simply record a process whereby the central bank has created, out of thin air as it were, additional high-powered money – the direct counterpart of printing Federal Reserve Notes. Similarly, if the central bank sells government securities, it destroys high-powered money. (See also Monetary Policy.) In addition to the high-powered money of the central bank, the total quantity of money at any given time depends on the preferences of the public as to the relative amounts of money it wishes to hold as currency and as deposits and on the preferences of the banks as to the ratio they wish to maintain between their reserves and their deposits. (The reserve ratio is, of course, dominated by legal reserve requirements, where they exist, but may vary somewhat as banks think it prudent to keep a larger or smaller cushion in excess of required reserves.) It follows that, by controlling the amount of high-powered money and by other, less important means, a central bank can vary the total quantity of money as it wishes within broad limits. The major problem of modern monetary policy is how the central bank should use this power. Monetary Theories:- the relation between money and what it will buy has always been a central issue of monetary theory. Economists have generally held that the level of prices is determined by the quantity of money. But precisely how the quantity of money affects the level of prices, and what the effects are of changes in the quantity of money, have been conceptualized in different ways at different times. For an interval of two or three decades, from the mid-1930s to the mid-1960s, there was a widespread rejection of the quantity theory by professional economists. More recently, there has been something of a counterrevolution involving a partial return to and modification of earlier views. The following discussion of monetary theory will therefore deal first with the quantity theory of money, as it developed before the 1930s, then with the Keynesian revolution, and finally with the recent counterrevolution. The Quantity Theory Of Money:- in whatever way it has been formulated, the quantity theory of money has involved a distinction between the nominal quantity of money and the real quantity of money. The nominal quantity is that expressed in whatever units are used to designate money – talents, shekels, pounds, francs, lire, drachmas, dollars, yen, and so on. The real quantity is that expressed in terms of the volume of goods and services that the money will purchase. The quantity theory assumes that what ultimately matters to holders of money is the real rather than the nominal quantity. If this is so, then – whatever factors may determine the nominal quantity of money – it is the holders of money who determine the real quantity and, in the process, the price level. The following may be considered a hypothetical example. In a certain community the quantity of money in existence is USD1 000 000, and the total income of the community is USD10 000 000 a year. On the average, each member of the community holds an amount of money equal in value to one-tenth of a year's income, or to 5.2 weeks' income. Put differently, the income velocity of circulation is equal to 10 per year; that is, each USD1 on the average is paid out 10 times a year. For the sake of simplicity there are no business enterprises; the members of the community buy and sell services from and to one another. The quantity of money is somehow then doubled, but in such a way that no one expects the quantity to change again. Each member of the community will regard himself as better off. Each now has 10.4 weeks' income in the form of cash instead of the previous 5.2 weeks'. If everyone were to hold onto the extra cash, nothing further would happen. But people will try to spend it. One person's spending, however, is another's receipts. All the people together cannot spend more than all the people receive. The attempt of each to do so is bound to be frustrated. In the attempt to spend more than they receive, people will simultaneously try to buy more of various services from each other and to sell less. To induce others to sell, they will offer higher prices; to induce others not to buy, they will ask higher prices. Whether the quantity sold goes up or down depends on whether the attempt to buy more is stronger or weaker than the attempt to sell less. But in either case total spending is sure to go up and so are total income and prices paid. When income has doubled, to USD20 000 000, the amount of money in existence will again be equal in value to 5.2 weeks' income. The community will have succeeded in reducing its real cash balances to their former level, not by reducing nominal balances but by raising incomes and prices. The process of adjustment may not be smooth; spending may go too far and leave people with real balances that are too small, requiring a subsequent fall in the price level; but the final position will tend toward a doubling of prices, and the previous real flows of services will be resumed with no one any better off than before the new money was distributed. This simple example embodies most of the basic principles of monetary theory:- (1) the central distinction between the nominal and the real quantity of money; (2) the equally crucial contrast between the alternatives open to the individual and to the community as a whole. To each individual separately (in the hypothetical example and in the real world) it looks as if income is outside personal control, but each individual can determine how much cash to hold. To the community as a whole, the total amount of cash is fixed, but it is able to determine the size of its income in dollars; (3) the importance of attempts. The attempt of people as a whole to spend more than they receive, even though doomed to frustration, has the effect of raising total nominal expenditures and receipts. Quantity Equations:- a useful device for clarifying the variables stressed in the quantity theory is the so-called Quantity Equation. The quantity equation has taken different forms according as quantity theorists have stressed different variables. The most famous is the so-called transactions version:- MV = PT. (1). This version starts with the identity that any transaction has two sides:- an amount of money paid and a corresponding quantity transferred at a certain price – for example, USD20 paid for two books at USD10 each. The left side of the equation sums up the amount of money paid out; the right side, the value of the transaction. Generalized to the whole economy, the left side of the equation becomes the amount of money in existence (M) multiplied by the average number of times per year (or other unit of time) that each dollar is used in effecting a transaction – the transaction velocity of circulation (V). The right side of the equation then becomes the product of an average price (P) times an aggregate quantity of goods (T). In this version, all transactions of whatever kind are included – purchases of securities along with purchases of restaurant meals, purchases of the food ingredients by the restaurant as well as of the final meals. The inclusion of capital as well as current transactions, and of intermediate as well as final goods, makes the concepts of total transactions (T) and the 'general price level' (P) highly ambiguous and difficult to handle statistically. The emergence of national income accounting in recent decades has led to the substitution of an income version of the quantity equation:- MV = Py. (2). In this equation y represents national income in constant prices (the total value at fixed prices of all final goods and services, including additions to the stock of capital), P is a price

index, and V is the average number of times that the money stock is used for making income transactions (that is, payments for final goods and services, or alternately, for final productive services – services of labour, land, and so forth). In both these equations the two sides are, by definition, precisely equal to one another – that is, each equation is an identity (like the equality of total assets and total liabilities on a double-entry balance sheet). In practice, the data on transactions or on income – the right sides of the equations – come from different statistical sources than do the data on the quantity of money, and only indirect data exist for velocity. As a consequence, when these equations are used to describe the real world, V is usually computed in such a way as to make the two sides equal, thus embodying all the statistical errors of the other terms. These versions of the quantity equation emphasize the function of money as a medium of exchange – its use in making payments. But money also serves as a store of purchasing power in the interim between sale and purchase. This aspect is emphasized in the cash balance approach. It has generally been supposed that the amount of money people will want to hold for this purpose bears some relation to their income. This leads to the equation:- M = kPy, (3); in which M, P, and y are defined as in equation (2), and k is the ratio of money stock to income. Although equation (3) is simply a mathematical transformation of equation (2) – k being numerically equal to the reciprocal of V – it brings out the difference between the aspects of money stressed by the transactions approach and those stressed by the cash-balances approach. In particular, the cash-balances approach fits in better with general economic analysis than does the transactions approach. Equation (3) can be regarded as describing the demand for money, with P and y being two of the variables on which the demand for money depends and with k symbolizing all the other variables. For completeness, the analysis requires another equation showing how the supply of money is determined. This approach provides a better bridge to the later Keynesian and more recent monetarist developments than does the transactions approach. Uses Of The Equations:- the purpose of the quantity equations is mainly to provide an analytical filing system to help sort out the forces at work. Their usefulness derives from the empirical hypothesis that each of the four main labels (M, V, P, and y for the income version) refers to a fairly distinct set of forces subject to influences that are different from those classified under another label. In its simplest form, the quantity theory regards output (y) as being determined by the productive opportunities of the community and its tastes and preferences; it regards the quantity of money (M) as being determined by the conditions of production of the monetary metal plus the characteristics of the financial and banking structure (for a commodity standard) or the decisions of the monetary authorities and the financial structure (for a fiat standard); it regards velocity (V) as being determined by payments practices, the financial and economic arrangements for effecting transactions, and the costs of and returns from holding money instead of other assets; and, finally, it regards the price level (P) as the variable that adjusts to reconcile the conditions of production determining y with the financial conditions determining M and V. In the most rigid form of the quantity theory, velocity is seen as very stable. This view regards the level of prices as determined directly by changes in the quantity of money and as moving in strict proportion to the quantity of money. But the more sophisticated theorists never took this simplistic view. They all recognized that prices could not adjust instantaneously and fully and that, during so-called Transition Periods, changes in the quantity of money would affect output as well as prices. They also recognized that V was not a constant but itself a function of other variables, such as interest rates, and that it was subject to substantial random perturbations. As a result, they recognized that changes in output and prices could be produced in principle by independent changes in either V (the demand for money) or M (the supply of money). On an analytical level the quantity theory of money is not the tautology of the equation; it is, rather, an analysis of the factors determining the quantity of money that the community wishes to hold. On an empirical level, it does not assume that V is constant; it holds that changes in the demand for money tend to proceed slowly and gradually or to be the result of events set in train by prior changes in supply, whereas, in contrast, substantial changes in the supply of nominal balances can and frequently do occur independently of any changes in demand. The conclusion is that substantial changes in prices or nominal income are almost invariably the result of changes in the nominal supply of money rather than of V. An implication of the foregoing is that monetary policy – policy as to changes in the quantity of money – is the appropriate means for preventing inflation or deflation and for avoiding wide cyclical fluctuations. The Keynesian Critique:- the groundwork for the Keynesian attack on the quantity theory was laid by two historical experiences. One was the British experience after the return to gold in 1925. In order to maintain the parity set for the pound in terms of gold, the Bank of England followed a consistently tight monetary policy. But prices did not move downward sufficiently, and there was persistent unemployment. This raised doubts about the allegedly classical postulate that money was only a veil, that total output was determined by real conditions, and that full employment was the ‘equilibrium’, or normal, position. The second and even more dramatic experience was the Great Depression. Later study has shown that the severity of the Depression, certainly in the United States, can be attributed to bad monetary policy – a policy that permitted or forced the quantity of money to decline by one-third from 1929 to 1933. This was not known or understood at the time; on the contrary, the Federal Reserve authorities insisted that they were doing everything they could to offset the forces making for depression. This stimulated the British economist John Maynard Keynes – who had been a highly sophisticated quantity theorist on strictly classical lines – to develop an alternative interpretation of the debacle after 1929 and an alternative prescription for policy. It also produced a sympathetic climate for his new theory, so that the Keynesian revolution swept the economics profession in a remarkably short time. Keynes’s Interpretation:- Keynes did not, of course, deny the validity of the quantity equation. What he maintained was very different: that the right-hand side – Py, or prices times output – was determined by forces largely independent of the left-hand side. P, he argued, was largely an institutional datum, linked to customary nominal rates of wages that were very resistant to change, or at least to decline. Real income or output, y, he argued, was determined by aggregate demand, which depended primarily on the amount of ‘autonomous spending’ – that is, spending that was not linked directly to current income and that consisted mostly of investment expenditures by enterprises and spending by government. The rest of aggregate demand consisted mostly of consumption, which was linked closely to current income. On this view, the key factor determining the level of real income and output, and thereby the level of nominal income, was the strength of investment and of government spending. How then could the quantity equation hold? Keynes’s answer was that V was so pliable that it would adjust to keep the two sides equal. Let autonomous spending increase without a change in the quantity of money, and V would simply increase in response; let the quantity of money increase without an increase in autonomous spending, and V would decline to offset the increase in M. In the extreme form of this approach – as much a caricature of Keynes’s thinking as the attribution of a constant V is of his predecessors’ – the quantity of money simply did not matter at all for the course of prices or real output but only for the movement of V. How did Keynes explain the plasticity of V? He did so by means of a very special explanation of the demand for money, to which he applied the phrase ‘liquidity preference’. He regarded the quantity of money demanded as divided into two parts, one part, M_1, ‘held to satisfy the transactions and precautionary-motives’, the other, M_2, ‘held to satisfy the speculative-motive’. He regarded M_1 as a roughly constant fraction of income, and with respect to this part he accepted a rather rigid form of the quantity theory. He regarded M_2, however, as largely independent of income and as highly sensitive to current interest rates and to the expectations of future interest rates. This explained the plasticity of V. According to Keynes, if current interest rates are above the level many holders of money expect to prevail in the future, people will prefer to hold their speculative balances in bonds instead of money – because they expect a fall in interest rates, which means a rise in bond prices. Conversely, if current interest rates are below the level expected to prevail in the future, they will prefer to hold money. Over short periods, he argued, these expectations are widely and strongly held at about the same level. In the extreme, with everyone holding the same expectations and everyone sensitive, liquidity preference will become, as he termed it, absolute. Under such circumstances, let the monetary authorities try to increase the amount of money by buying bonds. This will tend to raise bond prices and lower interest

rates, but even the slightest lowering will lead speculators to absorb the additional money and sell bonds. The result will be a lower V or a higher k for the community as a whole. The converse will hold if the authorities try to reduce the amount of money. Alternatively, if nominal income rises, for whatever reason, without a change in the quantity of money, that will require an increase in M_1, but it can and will come out of M_2 without any further effects. The conclusion is that under circumstances of absolute liquidity preference income can change without a change in M or in interest rates, and M can change without a change in income or in interest rates. The holders of money are in metastable equilibrium, like a tumbler on its side on a flat surface; they will be satisfied with whatever the amount of money happens to be. For the long run, Keynes regarded the size of M_2 as depending on the level of interest rates for a different reason. The interest rate measures the cost of holding money instead of bonds – it is the price, as Keynes put it, that the holder of money pays for retaining liquidity. If the interest rate is low, the cost of liquidity is low; hence people will hold a large fraction of their wealth in the form of money, and the fraction will be sensitive to small changes in the interest rate – liquidity preference being absolute in the long run as well as in the short run. If interest rates were high, and M_2 low – a condition that Keynes expected to hold only at times of full employment – then the quantity theory would 'come into its own', in the double sense that velocity would be constant and that prices rather than output would respond to changes in the quantity of money. Keynes himself regarded absolute liquidity preference as a strictly 'limiting case'; while it 'might become practically important in future', he knew 'of no example ... hitherto'. In practice, however, he treated velocity as if its behaviour frequently approximated this limiting case, and his disciples went much further than he did. If liquidity preference was not absolute, then in the Keynesian view a change in the quantity of money would first affect interest rates in order to induce the community to hold the changed quantity of money. This change in interest rates might in turn affect autonomous spending – a decline encouraging investment and a rise discouraging investment – and in this way aggregate demand, income, and employment. The more sensitive is the quantity of money demanded to interest rates, and the less sensitive is investment to interest rates, the smaller will be the final effect of changes in the quantity of money, and conversely. Changing Views:- the Keynesian revolution swept the economics profession in the late 1930s and early 1940s; by the 1960s Keynesian ideas had become deeply embedded in the thinking of informed intellectuals. The course of events, however, did not follow the pattern that many had expected. Their analysis had predicted a great postwar depression if war spending was not replaced by other government spending. But government spending fell precipitously in the United States and elsewhere without ill effect. The analysis of the Keynesians had called for 'Cheap Money' policies – that is, low interest rates – with a view to stimulating investment and thereby avoiding mass unemployment. Those policies proved in the main to be unnecessary; where they were adopted they were consistently followed by inflation that could be restrained only by abandoning the cheap-money policies. A reexamination of the Great Depression of the 1930s demonstrated that, contrary to general belief, it had been a tragic testament to the great power of monetary policy, not to its impotence. The US Federal Reserve System could have prevented the decline of one-third in the quantity of money that occurred from 1929 to 1933. Had it done so, the evidence indicates, the Depression would have been far milder and briefer. Most important of all, extensive empirical research demonstrated that the velocity of circulation of money, far from moving to offset changes in the quantity of money, has generally moved in the same direction and reinforced the effect of these changes. The Monetarist View:- the result has been a major change in the views of today's followers of Keynes. They attribute far more importance to the quantity of money than they earlier did, regarding the quantity of money demanded as less elastic with respect to interest rates, and investment as more elastic, than they did in the first flush of enthusiasm. Some economists have been waging a counterrevolution in the name of monetary policy, to which the name monetarism has become attached. This doctrine, although still probably a minority view among professional economists, has made significant gains and has influenced considerably the views even of those who still regard themselves as Keynesians. No counterrevolution ever produces a return to the status quo. The monetarist doctrine has much in common with the quantity theory, but it has not expunged the Keynesian revolution. The Keynesian emphasis on the plasticity of velocity, for example, has led to extensive work on the stability of the demand for money, and in particular on the exploration of time lags between monetary changes and economic changes and on the separate effects of monetary changes on prices, output, and interest rates. Key Propositions:- for the long run, monetarism accepts almost wholly the earlier quantity theory. Its main contribution to that theory is a much more detailed and sophisticated analysis of short-run effects and a more detailed set of empirical generalizations about these effects. The key propositions of monetarism are as follows:- (i) The rate of growth of the quantity of money is consistently, though not precisely, related to the rate of growth of nominal income. That is, if the quantity of money grows rapidly, so will nominal income, and conversely. The velocity of circulation, though not constant, is fairly predictable. (ii) This relation is not obvious, mainly because it takes time for changes in monetary growth to affect income. (iii) On the average, a change in the rate of monetary growth produces a change in the rate of growth of nominal income six to nine months later. But this is an average. (iv) If the rate of monetary growth is reduced, then about six to nine months later the rate of growth of nominal income and also of physical output will decline, but the rate of price rise will be affected very little. There will be downward pressure on prices only as a gap emerges between actual and potential output. (v) The effect on prices comes on the average about a year after the effect on nominal income and output, so that the total delay between a change in monetary growth and a change in the rate of inflation averages roughly two years. (vi) The above relationships are not invariable. There is many a slip between the monetary change and the income change. (vii) Monetary changes affect output only in the short run – though 'short run' may mean five to 10 years. Over the longer run the earlier quantity theory seems to hold, and the rate of monetary growth affects only prices. What happens to output in the long run depends on such 'real' factors as the enterprise, ingenuity, and industry of the people; the extent of thrift; the structure of industry and government; the relations among nations; and so on. (viii) It follows that inflation is always and everywhere a monetary phenomenon, in the sense that it cannot occur without a more rapid increase in the quantity of money than in output. There are, of course, many possible reasons for monetary growth – gold discoveries, the manner in which government spending is financed, and even the manner in which private spending is financed. (ix) Government spending may or may not be inflationary. It will be inflationary if it is financed by creating money – that is, by printing currency or creating bank deposits – and if the resultant rate of monetary growth exceeds the rate of growth of output. If it is financed by taxes or by borrowing from the public, the main effect is that the government spends the funds instead of someone else. (x) One of the most difficult things to explain is the way in which a change in the quantity of money affects income. Generally, the initial effect is not on income at all but on the prices of existing assets (bonds, equities, houses, and other physical capital). This is the liquidity effect stressed by Keynes; it occurs on the balance sheet, not on the income account. An increased rate of monetary growth raises the amount of cash people (or businesses) have relative to other assets. The holders of the excess cash will try to correct this imbalance by buying other assets. But one person's spending is another's receipts. All the people together cannot change the amount of cash all hold – only the monetary authorities can do that. Their attempts will tend, however, to raise the prices of assets and to reduce interest rates. These changes will in turn encourage spending to produce new assets. Thus the initial effect on balance sheets is translated into an effect on income and spending. In this connection the monetarists stress a far wider range of assets and interest rates than do the Keynesians; they emphasize such assets as durable consumer goods and other real property, and they regard market interest rates as only a small part of the whole complex of relevant rates. (xi) One important feature of this mechanism is that a change in monetary growth affects interest rates in one direction at the outset and in the opposite direction later on. More rapid monetary growth at first tends to lower interest rates. But later on, as it raises spending and stimulates price inflation, it also produces a rise in the demand for loans that will tend to raise interest rates. Taking the opposite case, a slower rate of monetary growth at first raises interest rates, but

later on, as it reduces spending and price inflation, it lowers interest rates. This inconsistent relation between the quantity of money and interest rates explains why monetarists insist that interest rates are not a good guide to monetary policy. (xii) These propositions clearly imply that monetary policy is important and that what is important about monetary policy is its effect on the quantity of money, not on bank credit or total credit or interest rates. Wide swings in the rate of change of the quantity of money are evidently destabilizing and should be avoided. Beyond this, different monetarists draw different conclusions. Some conclude that the monetary authorities should make deliberate changes in the rate of monetary growth in order to offset other forces making for instability; these changes should be gradual and small and make allowance for the lags involved. Others maintain that not enough is known about the relations between changes in the quantity of money and in prices and output to assure that a discretionary monetary policy will do good rather than harm. They believe that a wiser policy would be simply to have the quantity of money grow at a steady rate over time. Conclusion:- no other subject in economics has been studied longer or more intensively than the subject of money. The result is a vast amount of documented experience and a well-developed body of theoretical analysis. The extent to which the students of monetary problems agree in their basic conclusions is concealed by the tendency of laymen to exaggerate their differences. But even among professional economists there remain important disagreements, centring mainly on empirical judgments about the stability and form of some of the relations between money and other economic magnitudes. Money is anything that serves as a generally accepted medium of exchange, a standard of value and a means to save or store purchasing power. In the United States, currency (the bulk of which is Federal Reserve notes), coin and funds in checking and similar accounts at depository institutions are examples of money. Money is any generally accepted medium of exchange – that is, anything which is generally acceptable in a particular society as a means of payment or of settling debts arising out of exchanges on credit. Put slightly differently, money is a very special sort of good for which a very large proportion of the demand (at the extreme, all of the demand) is derived from people's (realistic) expectations that it can be quickly and easily re-exchanged for some other more immediately desired good or service (rather than the demand arising from a desire to personally consume the money-good itself). The earliest forms of money arose spontaneously in barter economies when experienced traders identified certain commodities that were so widely desired for actual use in the society that they could reasonably count on their acceptability as payment in almost any trade. Monetary demand for such commodities was further enhanced if they also had other physical properties making them especially convenient to use for trade – such as durability, portability, ease of storage, uniformity of quality, easy divisibility, and so on. That is, demand for these goods derived from their desireability as a medium of exchange was gradually 'added on' to the pre-existing demand for them as objects of direct utility. Historical monetary systems have flourished on the basis not only of useful metals such as gold, silver, copper, bronze and iron but also on the basis of salt, tobacco, cattle and other livestock, furs and other animal hides, grain, gourds, beads, sea shells, feathers, and even transferable titles to particular coconut trees. In present day industrialized economies, money normally consists mostly of abstract claims on government or on heavily government-regulated banks ('fiat money') – claims such as token coins and paper currency or central bank notes or even magnetic tape entries representing one's checking account balance at a government insured bank that theoretically entitles one to withdraw cash on demand. Historically such government sponsored currency usually originated as 'IOU's' in which the government (or its central bank) promised to redeem the tokens on demand (perhaps only after some future deadline) with 'real money' – i.e. fixed quantities of gold, silver or what have you. However, government promises of redemption have by the XX century largely been withdrawn or downwardly adjusted, and these tokens have very little (or no) intrinsic or use value. Nevertheless, in relatively 'stable' countries (like the United States, Great Britain, Switzerland, Japan or Germany) fiat currencies remain generally acceptable as a means of payment because people think that they 'know for sure' the currency can be used to satisfy their tax bills, because legal tender laws usually require private creditors to accept them to discharge contractual debts, and because people generally have come to believe through favorable past experience that the official government money will continue to be widely acceptable in exchange for an at least moderately predictable quantity of goods and services in the private markets in the foreseeable future. Unfortunately, the confidence with which people hold their expectations about the future value of any given variety of fiat money is extremely fragile. Confidence in the value of fiat money is easily and quickly undermined under conditions of political or economic instability, especially when the government has already been observed reneging on some of its many other solemn promises and obligations and when the money stock is clearly being expanded at an extremely rapid rate – with the result that a number of such national currencies have become worthless virtually overnight in the course of the XX century's all too numerous war- and revolution-related hyperinflations. Money is a generally accepted payment medium which all market participants use to buy goods and services. State governments declare a certain currency to be the official means of payment, i.e. all nationals are obliged to accept it as payment for goods or services. In its capacity as a unit of account or measure of value, money enables consumers to compare products on the basis of their price, expressed in terms of monetary units. In other words, for something to be money, it must serve as:- (i) unit of account, measure of value and store of value as well as (ii) medium of exchange and legal currency. Money is an indispensable part of modern life. This chapter attempts to deal with questions such as what money is, why we need money, why money is accepted and for how long money has existed. History Of The Word 'Money':- money plays a key role in today's economies. It is certainly no exaggeration to say that 'money makes the world go round' and that modern economies could not function without money. The English word 'Money' is of Roman origin. In ancient Rome, however, the word 'Monetor' or 'Moneta' meant advisor, i.e. a person who warns or who makes people remember.According to some historians, the meaning of the word goes back to a key event in Roman history. A flock of geese in a sanctuary of the Goddess Juno on Capitoline Hill squawked an alarm to alert the Roman defenders during an invasion of the Gauls in 390 BC and thus saved them from defeat. In return, the Romans built a shrine to Moneta, the goddess who warns or who gives advice. In 289 BC the first Roman mint was built in or near this temple, initially producing bronze and later silver coins. Many of these coins were cast with the head of Juno Moneta on their face. Hence the words 'money' and 'mint' are derived from her name. Functions Of Money:- What is money? If we have to define money today, we first think of banknotes and coins. These assets are regarded as money since they are liquid. This means that they are accepted and are available to be used for payment purposes at any time.While it is uncontested that banknotes and coins fulfil this purpose, nowadays a number of other forms of assets exist which are very liquid and can be easily converted into cash or used to make a payment at very low cost.This applies, for instance, to overnight deposits and some other forms of deposits held with banks. (Overnight Deposits are funds which are immediately available for transaction purposes. It should be mentioned that electronic money on prepaid cards is included in overnight deposits.) Consequently, these instruments are included in those definitions of money often referred to as 'Broad Money'. The various forms of money have changed substantially over time. Paper money and bank deposits did not always exist. It would therefore be useful to define money in more general terms. Money can be thought of as a very special good that fulfils some basic functions. In particular, it should serve as a medium of exchange, a store of value and a unit of account. Therefore, it is often stated that money is what money does. In order to better illustrate these functions, consider how people had to conduct their transactions before the existence of money. Without money, people were forced to exchange goods or services directly for other goods or ser vices through bartering.Although such a 'barter economy' allows for some division of labor, there are practical limitations and any exchange of goods implies substantial so-called 'Transaction Costs'. The most apparent problem with a barter economy is that people have to find a counterpart who wants exactly the same good or service that they are offering and who is offering what they want in return. In other words:- a successful barter transaction requires a mutual coincidence of wants to exist. A baker who, for instance, wanted a haircut in exchange for some loaves of bread would have to find a hairdresser

willing to accept those loaves of bread in exchange for a haircut. However, if the hairdresser needed a pair of shoes instead, he would have to wait until a shoe-shop owner wanted to get a haircut in exchange. Such a barter economy would therefore imply substantial costs related to searching for the appropriate counterpart and waiting and stockpiling. Money As A Medium Of Exchange:- to avoid the inconveniences associated with a barter economy, one of the goods can be used as a medium of exchange. This crude form of money used for exchange is then called Commodity Money. Bartering one good against money and then money against another good might at first glance further complicate transactions. At second glance, however, it becomes clear that the use of one good as a medium of exchange facilitates the whole process to a considerable extent, as the mutual coincidence of wants is no longer required for an exchange of goods and services to take place. It is obvious that one precondition for this particular good to fulfil the function of money is that it is accepted throughout the economy as a medium of exchange, be it because of tradition, informal convention or law. At the same time, it is obvious that goods serving as a medium of exchange should have some specific technical properties. In particular, goods serving as commodity money should be easy to carry, durable, divisible and their quality should be easy to verify. In a more economic sense, of course, money should be a rare good, as only rare goods have a positive value. Money As A Store Of Value:- if the good used as money maintains its value over time, it can be held for longer periods. This is particularly useful because it allows the act of sale to be separated from the act of purchase. In this case, money fulfils the important function of a store of value. It is for these reasons that commodities that also serve as a store of value are preferable to commodities that only ser ve as a medium of exchange. Goods such as flowers or tomatoes, for instance, might in principle serve as a medium of exchange. However, they would not be useful as a store of value and would therefore probably not have been used as money. So if this function of money does not work properly (for instance if the good serving as money loses its value over time), people will make use of the value-storing function of other goods or assets or – in extreme cases – even go back to bartering. Money As A Unit Of Account:- of equal importance is the function of money as a unit of account.This can be illustrated by going back to our previous example. Even if the difficulty of the mutual coincidence of wants is overcome, people would still have to find the exact exchange ratio between bread and haircuts or between haircuts and shoes, for example. Such ‘exchange ratios’ – the number of loaves of bread worth one haircut, for instance – are known as Relative Prices or Terms Of Trade. In the market place, the relative price would have to be determined for each pair of goods and services and, of course, everybody involved in the exchange of goods would need all the information about the terms of trade between all goods. It is easy to show that, for two goods, there is only one relative price, while for three goods there are just three relative prices (namely bread against haircuts, haircuts against shoes and bread against shoes). In the case of ten goods, however, there are already 45 relative prices, and with 100 goods the number of relative prices amounts to 4 950. (More generally, for n goods, there are ((n x (n – 1)) / 2) relative prices.) Therefore, the greater the number of goods being exchanged, the more difficult it becomes to gather information on all possible ‘exchange rates’. Consequently, collecting and remembering information on the terms of trade creates high costs for the participants in a barter economy, increasing disproportionately with the number of goods exchanged. These resources can be used more efficiently in other ways if one of the existing goods is used as a unit of account (a so-called ‘Numeraire’). In this case, the value of all goods can be expressed in terms of this ‘numeraire’ and the number of prices which consumers have to identify and remember can be reduced significantly. Therefore, if all prices were labelled in money terms, transactions would be much easier. More generally speaking, not only can the prices of goods be expressed in money terms, but so too can the price of any asset. All economic agents in a currency area would then calculate things such as costs, prices, wages, income, etc in the same units of money. As in the above-mentioned functions of money, the less stable and reliable the value of money, the more difficult it is for money to fulfil this important function. A commonly accepted reliable unit of account thus forms a sound basis for price and cost calculations, thereby improving transparency and reliability. Forms Of Money:- over time, the nature of goods serving as money has changed. It is widely agreed that what at times became the prime function of these goods was often not the same as their original purpose. It seems that goods were chosen as money because they could be stored conveniently and easily, had a high value but a comparably low weight, and were easily portable and durable. These widely desired goods were easy to exchange and therefore came to be accepted as money. So the evolution of money depends on a number of factors, such as the relative importance of trade and the state of development of the economy. Commodity Money:- a variety of items have served as commodity money, including the wampum (beads made from shells) of the American Indians, cowries (brightly colored shells) in India, whales’ teeth in Fiji, Tobacco in the early colonies in North America, large stone discs on the Pacific Island of Yap and cigarettes and liquor in post-World War II Germany. Metallic Money:- the introduction of metallic money was a way by which ancient societies tried to overcome the problems associated with using decaying commodities as money. It is not known exactly when and where metallic money was used for the first time. What is known, however, is that metallic money was in use in around 2000 BC in Asia, although in those times its weight does not seem to have been standardised nor its value certified by the rulers. Chunks or bars of gold and silver were used as commodity money since they were easy to transport, did not decay and were more or less easily divisible. Moreover, it was possible to melt them in order to produce jewellery. Metallic Coins:- Europeans were among the first to develop standardized and certified metallic coins. The Greeks introduced silver coins around 700 BC; Aegina (595 BC), Athens (575 BC), and Corinth (570 BC) were the first Greek city-states to mint their own coins. The silver content of the Athenian drachma, famous for depicting the legendary owl, remained stable for nearly 400 years. Greek coins were therefore widely used (their use was further spread by Alexander the Great), and have been found by archaeologists in a geographical area ranging from Spain to modern India. The Romans, who had previously used cumbersome bronze bars called aes signatum as money, adopted the Greek innovation of using official coins and were the first to introduce a bi-metal scheme using both the silver denarius and the gold aureus. Under the Emperor Nero in the I century AD, the precious metal content of the coins started to diminish as the imperial mints increasingly substituted gold and silver for alloy in order to finance the Empire’s gigantic deficit. With the intrinsic value of the coins declining, the prices of goods and services began to rise.This was followed by a general rise in prices that may have contributed to the downfall of the Western Roman Empire. The more stable Eastern Roman solidus, introduced by Constantine the Great in the IV century AD, was maintained at its original weight and precious metal content until the middle of the XI century, thus gaining a reputation that made it the most important coinage for international trade for over five centuries. Byzantine Greek coins were used as international money and were found by archaeologists as far away as Altai in Mongolia. In the mid-XI century, however, the Byzantine monetary economy collapsed and was replaced by a new system which lasted throughout the XII century, until the Crusader conquest of Constantinople in 1204 eventually ended the history of Graeco-Roman coinage. The Greeks and Romans had spread the custom of using coins and the technical knowledge of how to strike them over a vast geographical area. For most of the Middle Ages locally minted gold and silver coins were the dominant means of payment, although copper coins were increasingly being used. In 793 AD Charlemagne reformed and standardized the Frankish monetary system, introducing a monetary standard according to which one Frankish silver pound (408 g) equaled 20 shillings or 240 pence – this standard remained valid in the United Kingdom and Ireland until 1971. After the fall of Constantinople, the Italian merchant city-states of Genoa and Florence introduced gold coinage in 1252 with the genoin of Genoa and the fiorina (or florin) of Florence. In the XV century their place was taken by the ducato of Venice. Paper Money:- the Chinese began using paper money around 800 AD under Emperor Hien Tsung and continued to do so for several hundred years.This paper money had no commodity value and was money only by imperial decree, or so-called Fiat Money (i.e. money without intrinsic value). Paper money was most widespread in China around 1000 AD, but it was abandoned around 1500 when Chinese society went into decline following the Mongol Conquest. Obligations:- it was, however, difficult to conduct long-distance trade as long

as value could only be stored in the form of commodities and coins. The Italian citystates were therefore the first to introduce certificates of indebtedness (‘obligations’ or ‘bills of exchange’) as a means of payment. To reduce the risk of being robbed on their journeys, merchants took these obligations with them. Debtor and lender were mentioned in the certificates, a payment date was fixed, and the amount of gold or silver noted. Soon, merchant bankers began to trade these obligations. The first evidence of such a contract dates back to 1156. Obligations continued to be used mostly by Italian merchants, and the bi-metal scheme remained dominant until the Thirty Years’ War. Due to the economic turmoil caused by the war, rulers such as the Swedish kings started to prefer paper money. This was subsequently introduced by the Bank of England in 1694 and the Banque Générale in France in 1716. The advent of paper fiat money in Europe marked the beginning of a new phase in the evolution of money. The responsibility for establishing and regulating the system of fiat money in a country remained with the governments, but other public or private institutions such as central banks and the financial system played an increasingly crucial role in the success of the national currency. Gold Standard:- since the adoption of fiat money approximately two centuries ago, the monetary system has undergone great change. Paper money was – and still is – legal tender only by an act of the competent authority. It was issued in fixed units of national currency and had a clearly defined nominal value. For a long time, the nation states held gold reserves in their central banks to ensure the credibility of their currency – a system known as the Gold Standard. Currencies in the form of coins and fiduciary paper notes were convertible into gold at a fixed parity. The United Kingdom was effectively the first country to set up a gold standard in 1816, the exchange rate of pounds into gold having been determined in 1717 at 3.811 Pounds Sterling per ounce by Sir Isaac Newton himself. With the start of World War I, many countries began printing more and more money in order to finance the cost of the war. In Germany, for instance, the number of banknotes issued by the Reichsbank grew from 2 593 million in 1913 to a total of 92 844 720.7 billion banknotes in circulation on 18 November 1923. This ultimately led to hyperinflation. With more money circulating, most countries suspended the convertibility of their currencies into gold, as its increased quantity was no longer balanced by the national gold reserves. Gold Exchange Standard:- the British gold standard finally collapsed in 1931, but the system was revived at the 1944 international conference held in Bretton Woods, New Hampshire. Here, a revised gold standard was agreed upon:- the exchange rates of the national currencies of the major economic powers were pegged to the Dollar and the Dollar was convertible into gold at a fixed price of USD35 per ounce. The Bretton Woods monetary system is therefore sometimes called the Gold Exchange Standard. Central banks stood ready to provide dollars in exchange for their national currency and vice versa. The Bretton Woods monetary system collapsed in 1971 and since then the currencies of the major economies have remained pure fiat money. In addition, most countries have allowed the exchange rates of their currencies to float. The evolution of money has not stopped. These days, various forms of intangible money have emerged, among them so-called ‘Electronic Money’ (‘E-Money’), or Electronic Means Of Payment, which first appeared in the 1990s. This kind of money can be used to pay for goods and services on the internet or using other electronic media. Upon receiving authorisation from the buyer for the payment to take place, the vendor contacts the issuing bank and is transferred the funds. At present there are various card-based electronic money schemes in Europe, generally operated by financial institutions. / Дьжон Стюат Мил (John Stuart Mill). ДаблЮ.Дьжей. Эшли (W.J. Ashley). Алыгзэндё (Alexander the Great). Винстэн Чёчил (Winston Churchill). Британский экономист Дьжон Мэйнад Кейнз (John Maynard Keynes). Император (Hien Tsung). Банкь Жэнераль (Banque Générale). Сэр Айзэк Ньютчэн (Sir Isaac Newton). Райхсбанк (Reichsbank). Брэтчэн Вудз (Bretton Woods). гранулы или бисеринки или бусинки или шарики (beads). Деньги, особый товар, выполняющий роль всеобщего эквивалента. Стихийно выделились на определённом историческом этапе. В докапиталистических формациях роль денег выполняли различные товары (шкуры зверей, зерно, скот), постепенно она перешла к благородным металлам (золоту, серебру), наилучшим образом отвечающим требованиям денежного товара. Функции денег:- мера стоимости; средство обращения; сокровище; средство платежа; всемирные деньги. Функцию меры стоимости деньги выполняют как идеальные, счётные деньги, с ней связаны цена и масштаб цен; функцию средства обращения – полноценные деньги (золотые и серебряные монеты) и их заменители – неполноценные монеты и бумажные деньги; средства сокровища – только полноценные деньги; средства платежа – полноценные деньги и их заменители – кредитные деньги (векселя, банковские билеты); всемирные деньги – слитки золота, кредитные деньги в национальных валютах и международные кредитные средства (например, специальные права заимствования). Деньги – официальное средство платежа, признанное правительством и состоящее из банкнот и монет. В более общем смысле деньги – это синоним наличных средств (cash), в которые входят и свободно обращающиеся инструменты, такие, как чеки на средства в пределах остатков на банковских счетах. Золотые Цены – цены товаров, выраженные в золоте. В условиях золотого обращения при свободном обращении золотых монет и разменных на золото банкнот цены, выраженные в национальных денежных единицах, соответствовали золотые цены. При золотослитковом и золотодевизном стандартах между ценами в национальной валюте и золотыми ценами не было существенного разрыва. Однако после ликвидации золотого стандарта и введения в капиталистических странах бумажноденежного обращения с номинальным золотым содержанием валют, участившимися их девальвациями и образованием свободного рынка золота цены товаров в национальных денежных единицах перестали соответствовать золотым ценам. Это объясняется различиями в колебаниях цен на товары и рыночных цен золота, что особенно проявляется при девальвациях и ревальвациях валют. Например, после девальвации Фунта Стерлингов в 1967 цены товаров в Великобритании стали медленно повышаться, а золотые цены сразу резко упали. В современных условиях золотые цены в любой стране могут быть определены, исходя из фактических товарных цен в национальной валюте и рыночной цены золота в данной валюте. Во внутреннем товарообороте золотые цены не имеют практического значения. В международной торговле имеют место случаи заключения контрактов с установлением цен товаров в золотых денежных единицах и платежом на базе фактической цены золота в национальной валюте (так называемая Золотая Оговорка).

MONEY FLOW INDEX = ИНДЕКС ПО ДЕНЕЖНЫМ ПОТОКАМ – The Money Flow Index (MFI) is a volume-weighted momentum indicator that measures the strength of money flowing in and out of a security. It compares ‘positive money flow’ to ‘negative money flow’ to create an indicator that can be compared to price in order to identify the strength or weakness of a trend. The Money Flow Index (MFI) is measured on a 0–100 scale and is often calculated using a 14 day period. Money Flow Index measures trend strength and warns of likely reversal points. / индикатор момента . Индекс по Денежным Потокам (ИДП; Money Flow Index (MFI)) по своей сути очень похож на Индекс Относительной Силы (RSI). Технология расчёта осциллятора:- (i) Определяют типичную цену (Typical Price (TP)) данного периода:- TP = (High + Low + Close) / 3. (ii) Рассчитывают величину денежного потока (Money Flow (MF)):- MF = TP x Volume. Если текущая типичная цена больше предыдущей, то денежный поток считается положительным. Если текущая типичная цена меньше предыдущей, денежный поток считается отрицательным. Положительный денежный поток (positive money flow) – это сумма значений положительных денежных потоков за выбранный период. Отрицательный денежный поток (negative money flow) – это сумма значений отрицательных денежных потоков за выбранный период. (iii) Определяется денежное соотношение (Money Ratio (MR)) путём деления положительного денежного потока на отрицательный:- MR = POSITIVE MONEY FLOW / NEGATIVE MONEY FLOW. (iv) С помощью денежного соотношения рассчитывается индекс по денежным потокам:- MFI = 100 – (100 / (1 + MR)); где:- HIGH – максимальная цена текущего штриха или свечки; LOW – минимальная цена текущего штриха или свечки; CLOSE – цена закрытия текущего штриха или свечки; и VOLUME – объём текущего штриха или свечки. Зона перекупленности:- 80–100; зона перепроданности:- 0–20.

MONEY FOR MONTHLY SETTLEMENT = ДЕНЬГИ ДЛЯ ЕЖЕМЕСЯЧНОГО РАСЧЁТА – Money For Monthly Settlement:- apart from overnight money and time deposits, a type of interbank money market trading. Term referring to short-term loans on the money market repayable at the end of the month without prior termination.

MONEY LAUNDERING = ОТМЫВАНИЕ ДЕНЕГ – Money Laundering:- processing 'dirty' money (i.e. obtained from crime) to make it appear legitimate. Generally, a distinction is made between three phases of laundering:- (i) feeding money of criminal origin into the financial system; (ii) masking the origin of funds by frequently transferring and converting; and (iii) reintegrating the funds into the legal economy. See also Money Laundering Law. Money-Laundering:- disguising illegally obtained funds so that they seem legal. The introduction of criminal proceeds into the financial and economic system to disguise their illegal origin. Pursuant to Section 261 of the German Penal Code, money laundering is a criminal offense. Accoding to the Money Laundering Act banks and their employees are obliged to establish the identity of customers when entering into a business relationship intended to operate on a lasting basis, establish whether there are any economic beneficiaries, such as third-party trust companies, to identify the parties involved in suspicious transactions and report such activities to the law enforcement authorities, and to take internal safeguards against money laundering. Records of all such investigations are to be kept. Data collected may be used solely in connection with the prosecution of money launderers. If criminal investigation proceedings are instituted, the fiscal authorities will be duly informed if this is deemed relevant in connection with taxation procedures or tax offences. / Перерабатывание 'грязных' денег (то есть полученных противоправным путём) с тем чтобы превратить их в законные или чистые. Большей частью отмыв денег происходит по одному из следующих путей:- (i) вливание денег криминального происхождения в финансовую систему; (ii) маскировка происхождения денежных средств посредством частых переводов и конверсии; и (iii) реинтегрирование денежных средств в законную экономику. Смотрите также Закон Об Отмывании Денег (Money Laundering Law). Отмывание Денег – маскировка незаконно полученных денежных средств таким образом, чтобы они выглядели вполне легальными.

MONEY LAUNDERING LAW = ЗАКОН ОБ ОТМЫВАНИИ ДЕНЕГ – Money Laundering Law is a law introduced in Switzerland in 1998 to supplement the pertinent provisions of the penal code and the Agreement on the Swiss banks' code of conduct with regard to the exercise of due diligence. Under the law, financial brokers and agents are required to identify their contracting partners, to establish the beneficial owner's identity, to clarify the background of any unusual looking transactions, and to keep a record of this data. If there are reasonable grounds to suspect that the funds in question are of criminal origin, this is to be reported immediately to the relevant authorities and the funds blocked.

MONEY LAUNDERING REGULATIONS = ПРЕДПИСАНИЯ В ОТНОШЕНИИ ОТМЫВАНИЯ ДЕНЕГ – Money Laundering Regulations are the regulations that describe the way that financial institutions should act to prevent money laundering. / Предписания, которые описывают подход финансовых учреждений, который они должны использовать для предотвращения отмывания денег.

MONEY MANAGEMENT = УПРАВЛЕНИЕ ДЕНЕЖНЫМИ СРЕДСТВАМИ – Money Management is the process of budgeting, saving, investing, spending or otherwise in overseeing the cash usage of an individual or group. The predominant use of the phrase in financial markets is that of an investment professional making investment decisions for large pools of funds, such as mutual funds or pension plans. Also referred to as Investment Management and/or Portfolio Management. While the term is usually used in reference to professional money managers, everyone practices some form of investment management with their personal finances. There are a wide range of money management services, from the operation of passively-managed mutual funds with low fees to in-depth estate planning and consulting. Money Management:- this is one of the key elements to good trading. Having an effective plan in place to know when to exit a position with a loss as well as with a gain is paramount to trader longevity. Also known as Risk Management. / Управление Денежными Средствами является одним из ключевых элементов хорошей торговли. Наличие эффективного плана, регулирующего моменты выхода из открытой позиции с убытком или с прибылью, позволит торговцу оставаться на рынке длительное время. Известно также как Управление Рисками (Risk Management). Управление Денежными Средствами:- в области финансового планирования – способность управлять денежно-кредитными ресурсами. Включает управление банковскими операциями, кредитными операциями, бюджетное и налоговое планирование, управление и планирование заимствованиями. Этот термин также является синонимом управления портфелем активов (portfolio management).

MONEY MARKET = ДЕНЕЖНЫЙ РЫНОК (или РЫНОК ДЕНЕГ) – Money Market is a segment of the financial market in which financial instruments with high liquidity and very short maturities are traded. The money market is used by participants as a means for borrowing and lending in the short term, from several days to just under a year. Money market securities consist of negotiable certificates of deposit (CDs), bankers acceptances, US Treasury bills, commercial paper, municipal notes, federal funds and repurchase agreements (repos). The money market is used by a wide array of participants, from a company raising money by selling commercial paper into the market to an investor purchasing CDs as a safe place to park money in the short term. The money market is typically seen as a safe place to put money due the highly liquid nature of the securities and short maturities, but there are risks in the market that any investor needs to be aware of including the risk of default on securities such as commercial paper. Money Market is a market operated by banks and other financial institutions to facilitate the short-term borrowing and lending of money. A wider money market includes also the markets in bullion and foreign exchange. The open market for lending or borrowing short-term funds (as a rule up to 12 months) and dealing in negotiable instruments. In addition to the national money markets, the Euromoney market has developed in recent years into an efficient international market place for dealing in short-dated loanable funds. Institutions and practices through which short-term funds are made available to borrowers and businesses. Money Market is the market in which short-term loans are made and short-term securities traded. 'Short term' usually applies to periods under one year but can be longer in some instances. The market for short-term debt instruments. Unlike the capital market, the money market is a marketplace for short-term borrowing and capital investment. Central bank funds are taken up and lent by banks, and money market instruments issued by central banks are sold to banks and repurchased. The money market helps banks manage their liquidity positions and enables the European Central Bank to coordinate its monetary policy targets. Figurative expression for the informal network of dealers and investors over which short-term debt securities are purchased and sold. Money market securities generally are highly liquid securities that mature in less than one year, often less than ninety days. Compare Capital Market. / Денежный Рынок – рынок краткосрочных долговых инструментов (short-term debt instruments) – свободно обращающихся депозитных сертификатов, депозитных сертификатов в Евродолларах, коммерческих ценных бумаг, банковских акцептов, краткосрочных казначейских векселей, а также дисконтных векселей Федерального Банка по Ссудам на Жильё (Federal Home Loan Bank), Федеральной Национальной Ассоциации по Закладным (Federal National Mortgage Association) и Федеральной Системы Кредитования Ферм (Federal Farm Credit System). Заимствование федеральных средств банками друг у друга, заимствование средств банками через дисконтное ('учётное') окно (window) Федерального Резервного Банка и различные формы соглашений о продаже с обратным выкупом также являются элементами денежного рынка. Общими чертами этих долговых инструментов являются безопасность и ликвидность. Операции на денежных рынках проводятся дилерами, банками, расположенными в крупных финансовых центрах (money center banks), а также через Отдел по Торговле на Открытом Рынке (Open Market Trading Desk) Нью Йоркского Федерального

Резервного Банка. Нью Йорк является крупнейшим денежным рынком, за ним идут Лондон и Токио. Дилеры, действующие на крупных денежных рынках, постоянно поддерживают связь друг с другом, а также с основными заёмщиками и инвесторами, чтобы пользоваться возможностями арбитража (arbitrage). Такая практика помогает сохранять единые цены во всем мире.

MONEY MARKET ACCOUNT = СЧЁТ ПО ДЕНЕЖНОМУ РЫНКУ – Money Market Account is a savings account that offers the competitive rate of interest (real rate) in exchange for larger-than-normal deposits. Also known by the acronym 'MMDA', which stands for 'money market demand account' or 'money market deposit account'. Many money market accounts place restrictions on the amount of transactions you can make in a month (such as five or less). Furthermore, you usually have to maintain a certain balance in the account to receive the higher rate of interest. Some banks require at least USD500, others require a much higher balance. Money Market Account is an account in which customer's money is reinvested in short-term securities by the bank or investment firm managing the account. / Счёт, на котором деньги заказчика реинвестируются в краткосрочные ценные бумаги банком или инвестиционной фирмой, управляющей данным счётом.

MONEY MARKET BOOK CLAIMS = ЗАРЕЗЕРВИРОВАННЫЕ ТРЕБОВАНИЯ ДЕНЕЖНОГО РЫНКА – Money Market Book Claims:- in Switzerland, short-term capital raised by first-class Swiss and foreign borrowers by tender at a fixed interest rate and maturity (up to 364 days). / В Швейцарии, краткосрочный капитал, заимствованный первоклассными Швейцарскими и иностранными заёмщиками посредством конкурса (тендера) с фиксированными процентной ставкой и погашением (до 364 дней).

MONEY MARKET FUND = ФОНД ДЕНЕЖНОГО РЫНКА – Money Market Fund is a mutual fund whose investments are in high-yield money market instruments such as federal securities, CDs and commercial paper. Its intent is to make such instruments, normally purchased in large denominations by institutions, available indirectly to individuals. See also Certificate of Deposit and Commercial Paper. Investment fund investing in short-dated money market paper. Money Market Fund is an open-end mutual fund which invests solely or primarily in money market instruments and liquid paper with very short maturities. Money market instruments include time deposits, borrower's note loans, bonds with short remaining maturities as well as commercial papers and deposits with banks (certificates of deposit). The main advantage over time deposits or savings deposits is that the funds are available at any time, not just at previously arranged intervals of 30, 60 or 90 days. / Фонд Денежного Рынка – фонд, специализирующийся на инвестициях. Он представляет собой открытый взаимный фонд (mutual fund), инвестирующий средства в коммерческие ценные бумаги, акцептованные банком переводные векселя, соглашения о продаже ценных бумаг с последующим выкупом, государственные ценные бумаги, депозитные сертификаты и другие высоколиквидные и безопасные ценные бумаги и выплачивающий ставку процента, сравнимую со ставкой на денежном рынке. Эти фонды, созданные в начале 1970-х, были особенно популярны в начале 1980-х, когда резко выросли процентные ставки и инфляция. Плата за управление средствами составляет менее 1% стоимости активов инвестора; проценты сверх этой суммы ежемесячно переводятся на счета акционеров. Чистая стоимость активов фонда постоянная – 1 Доллар на акцию, а процентные ставки могут расти или снижаться. Подобные фонды обычно предоставляют такую удобную возможность, как право выписывать чеки. Большинство фондов не имеет федерального страхования, но некоторые пользуются услугами частных страховых компаний. Отдельные фонды инвестируют средства только в обеспеченные государством ценные бумаги, что даёт акционерам дополнительные гарантии. Многие фонды входят в 'семью фондов'. Это означает, что инвесторы могут переводить средства из одного фонда в другой и обратно бесплатно. Средства, находящиеся на счёте управления активами (asset management account), обычно автоматически переводятся в фонд денежного рынка до тех пор, пока владелец счёта не примет решения о том, куда их далее инвестировать.

MONEY MARKET PAPER = БУМАГА ДЕНЕЖНОГО РЫНКА – Money Market Paper:- securities with a short maturity. Classical money market instruments in Switzerland are domestic (Swiss) bills of exchange, Treasury bills and Treasury notes issued by the Confederation and so-called Federal Rescriptions. Of particular importance for short-term investments abroad are US money market instruments or paper, usually with terms of 3 to 6 months (bankers' acceptances, certificates of deposits (issued in New York or London), commercial paper, finance paper, and Treasury bills.

MONEY MARKET SAVINGS ACCOUNT = СБЕРЕГАТЕЛЬНЫЙ СЧЁТ ПО ДЕНЕЖНОМУ РЫНКУ – Money Market Savings Account is a type of savings account offered by a financial institution. Money Market Account is a savings account that offers the competitive rate of interest (real rate) in exchange for larger-than-normal deposits. Also known by the acronym 'MMDA', which stands for 'money market demand account' or 'money market deposit account'. Many money market accounts place restrictions on the amount of transactions you can make in a month (such as five or less). Furthermore, you usually have to maintain a certain balance in the account to receive the higher rate of interest. Some banks require at least USD500, others require a much higher balance.

MONEY MARKET TRADING = ТОРГОВЛЯ НА ДЕНЕЖНОМ РЫНКЕ – Money Market Trading is a trading in overnight money and time deposits, conducted by telephone or electronically, between institutional investors (banks, insurance companies, mutual funds, major companies, as well as government institutions).

MONEY REMITTANCE = ПЕРЕЧИСЛЕНИЕ ДЕНЕЖНЫХ СРЕДСТВ – Money Remittance shall mean a payment service where funds are received from a payer, without any payment accounts being created in the name of the payer or the payee, for the sole purpose of transferring a corresponding amount to the payee or to another payment service provider acting on behalf of the payee, and/or where such funds are received on behalf of and made available to the payee.

MONEY STOCK = ДЕНЕЖНАЯ МАССА (или ДЕНЕЖНЫЙ ЗАПАС) – Money Stock:- also sometimes loosely referred to as the Money Supply, a term that, strictly speaking, should be reserved for the entire supply schedule of associated interest rates and the quantities of money that would be created at those rates. The money stock is the total amount of money available in a particular economy at a particular point in time. Since many different things may serve more or less well as money (or close money substitutes), and since several different sorts of things may be serving as money at the same time in any particular economy, precise definition and measurement of the money stock presents some serious practical problems for the policy maker who wishes to use manipulation of the growth (or contraction) of the money stock as a tool of economic policy. The narrowest definition of the money stock in common use by the advanced industrial countries today ('M1') includes only the paper currency and coinage in circulation among the public plus the total balances instantly available to depositors in privately held checking accounts ('demand deposits' or 'sight deposits') in the country's commercial banks and similar depository institutions (like savings and loans, credit unions, etc). A very large proportion of checking account money, of course, is simply created by the banks themselves as they extend loans to borrowers by simply crediting their borrowers' checking account balances with the amounts loaned. Travelers' checks are also included in M1 in some countries, including the United States. 'M2', the next broadest measure of the money stock, adds on to the totals included in M1 the total amount of deposits in short-term savings accounts and small certificates of deposit. There are a number of still broader definitions of the money stock ('M3', 'M4', 'L', etc) that go on to add in such only slightly less liquid money-like assets as checkable money market mutual funds, larger denomination bank certificates of deposit, credit card credit limits, pre-approved lines of credit, and so on. Total quantity of

money available for transactions and investment; measures of the US money stock include M1, M2, and M3. Also referred to as the Money Supply or, simply, Money.

MONEY SUPPLY = ДЕНЕЖНАЯ МАССА В ОБРАЩЕНИИ – The term Money Supply is sometimes used to refer to the overall money volume (cash in circulation), but may also refer to the central bank money supply. The European Central Bank (ECB) distinguishes three money supply categories:- M1 is a narrow monetary aggregate that comprises currency in circulation (without banks' cash deposits) and overnight deposits of domestic non-banks. M2 is a somewhat broader monetary aggregate that comprises M1 plus deposits with an agreed maturity of up to two years and deposits redeemable at notice of up to three months. M3 is a broad monetary aggregate that comprises M2 plus shares in money market funds, repurchase agreements, money market instruments as well as debt securities with a maturity of up to two years. Much like the Deutsche Bundesbank used to do, the European Central Bank bases its monetary policy decisions on M3. Total amount of money available at short notice in a given country. There are several categories of money supply:- M0, M1, M2 and M3. See also M0, M1, M2, and M3. The amount of money in the economy, consisting primarily of currency in circulation plus deposits in banks:- M1 – US money supply consisting of currency held by the public, traveler's checks, checking account funds, NOW and super-NOW accounts, automatic transfer service accounts, and balances in credit unions. M2 – US money supply consisting of M1 plus savings and small time deposits (less than ,000) at depository institutions, overnight repurchase agreements at commercial banks, and money market mutual fund accounts. M3 – US money supply consisting of M2 plus large time deposits (,000 or more) at depository institutions, repurchase agreements with maturities longer than one day at commercial banks, and institutional money market accounts. Money Supply is the total quantity of money available for transactions and investment; measure of the US stock include M1, M2 and M3. Also referred to as the Money Stock or simply Money. The stock of money that exists in an economy at a given time. Stabilizing prices by steering the money supply is an important economic policy target. In Switzerland, money supply policy measures focused for some years (until 1978) on M1 (circulation of coins and notes in the non-banking sector and domestic non-bank demand deposits at banks and in postal checking accounts). In 1980 the Swiss National Bank began setting a new money supply target based on the adjusted central bank money supply. Factoring in further monetary aggregates (time deposits, savings) gives M2 and M3. The latter has served as reference parameter for the Swiss National Bank since 1997. Total stock of a nation's money available for spending, consisting of currency and near-money, such as checking account deposits and certain liquid assets held by private firms and individuals. Modern economists consider that the money supply consists of three types of money:- (i) M1 – currency plus checking account deposits; (ii) M2 – M1 plus time deposits in commercial banks, other than large certificates of deposits; (iii) M3 – M2 plus deposits at nonblank thrift institutions, primarily savings banks and savings and loan associations. M2 and M3 are readily convertible into M1, and the central banking authorities have relatively little control over this conversion. / , однодневные расчётные соглашения об откупе в коммерческих банках, и . Денежная Масса в Обращении – общая сумма денег в экономике включает главным образом:- (i) деньги, находящиеся в обращении; и (ii) депозиты на сберегательных и чековых счетах. Слишком большой объём денежной массы по отношению к объёму производства продукции, как правило, приводит к снижению процентных ставок, росту цен и инфляции; слишком малый объём денежной массы, как правило, приводит к повышению процентных ставок, снижению цен и объёма производства, росту безработицы и замораживанию производственных мощностей. Значительный объём средств находится на депозитных счетах до востребования (demand deposits) в коммерческих банках, которые регулируются Советом Управляющих Федерального Резерва. Он управляет ростом денежной массы путём увеличения или уменьшения резервных требований к банкам и дисконтной ставки (discount rate), по которой они могут занимать средства в ФРС, а также с помощью проведения операций на открытом рынке (open market operations) – торговли государственными ценными бумагами с целью изъятия средств из ФРС или внесения в неё средств. Изменения в денежной системе, особенно после снятия ограничений в области банковской деятельности в 1980-х, привели к возникновению противоречий среди экономистов относительно того, из чего реально состоит денежная масса в данный момент времени. Для разрешения противоречий был проведён детальный анализ и разработана подробная классификация составляющих денежной массы. В общем, различные формы денег сегодня группируются в категории М-1, М-2, М-3 и представляют деньги и 'почти деньги' (near money); категория L представляет долгосрочные ликвидные фонды.

MONEY TRUST = ДЕНЕЖНЫЙ ТРЕСТ – In the United States, Money Trusts are small groups of powerful banking and financial interests located in the money centers of New York and Philadelphia during the 1800s and early 1900s. / В Соединённых Штатах Америки Денежными Трестами являлись небольшие группы крупных банковских и финансовых дельцов, а точнее их капиталов, располагавшиеся в денежных центрах Нью Йорка и Филадельфии в течение 1800-х и в начале 1900-х.

MONITORING = МОНИТОРИНГ (или НАБЛЮДЕНИЕ) – Monitoring:- observing and noting specific details, e.g., particular aspects of the growth of plant's in an experiment; the farmer's use of specific varieties or types of cultivation in specific areas. Monitoring is an official process to verify phytosanitary situations. See also Treatment. / Под Мониторингом, от Латинского слова Monitor, означающее Надзирающий или Напоминающий, понимается наблюдение, оценка и прогноз состояния окружающей среды в связи с хозяйственной деятельностью человека. Различают 3 главные ступени мониторинга:- глобальный биосферный мониторинг, региональный геосистемный, или природохозяйственный, мотниторинг и локальный биоэкологический, или санитарно-гигиенический, мониторинг. В бывшем СССР и других странах были созданы специализированные станции мониторинга; наблюдения ведутся также в биосферных заповедниках.

MONITORING & EVALUATION COST = ЗАТРАТА НА МОНИТОРИНГ И ОЦЕНКУ (или ЗАТРАТА НА НАБЛЮДЕНИЕ И ВЫЧИСЛЕНИЕ) – Monitoring & Evaluation Cost:- expenditures associated with the planning, collection, and analysis of data used to assess program operation and effects. It includes activities such as load metering, customer surveys, new technology testing, and program evaluations that are intended to establish or improve the ability to monitor and evaluate the impacts of Demand-Side Management (DSM) programs, collectively or individually.

MONITORING SURVEY = ОБСЛЕДОВАНИЕ ПО МОНИТОРИНГУ (или ИЗЫСКАНИЕ ПО НАБЛЮДЕНИЮ) – Monitoring Survey is ongoing survey to verify the characteristics of a pest population.

MONKEY FIST = ОБЕЗЬЯНИЙ КУЛАК – Monkey Fist (maritime term):- a knot worked into the end of a heaving line (for weight).

MONKEY ISLAND = ОБЕЗЬЯНИЙ ОСТРОВ (или ВЕРХНИЙ МОСТИК, или КОМПАСНАЯ ПЛОЩАДКА) – Monkey Island (maritime term):- a flying bridge on top of a pilothouse or chart house.

MONKEY JACKET = ОБЕЗЬЯНИЙ ЖАКЕТ – Monkey Jacket is a mess jacket.

MONK'S CLOTH = МОНАШЕСКОЕ ПОЛОТНО – Monk's Cloth is a heavy weight cotton fabric utilizing the basket weave variation of the plain weave. Used for draperies and slip covers, monk's cloth is an example of 4 x 4 basket weave. It has poor dimensional stability and tends to snag. Monk's Cloth is a rough, substantial, rather bulky fabric made of very coarse yarn in a 4– and –4 or similar basket-weave construction. Monk's Cloth is a coarse heavy fabric in 4 x 4 basket weave made originally of worsted and used for monk's habits, but now chiefly of cotton or linen and used for draperies. Quite heavy, due to construction. It is difficult to sew or manipulate as

the yarns have a tendency to slide, stretch and fray. May sag in time depending on the compactness of the weave. It can also be made in other basket weaves. Quite rough in texture. / Хлопчатобумажная ткань с переплетением рогожка.

MONOCARPIC = МОНОКАРПИЧЕСКОЕ – Monocarpic:- a plant that flowers only once in its life and then dies. Compare with Polycarpic. / Под Монокарпическими, от Греческих слов Mónos, означающее Единственный или Один, и Karpós, означающее Плод, растениями понимаются растения, цветущие один раз в жизни и после плодоношения отмирают. Все одно- и двулетние растения и некоторые многолетние, например, агава, бамбук. Сравните с Поликарпическим (Polycarpic).

MONOCHROMATIC SCHEME = МОНОХРОМАТИЧЕСКАЯ СХЕМА – Monochromatic Scheme:- the use of a combination of different shades of one color.

MONOCOT = МОНОКОТ – Monocot is abbreviated term for Monocotyledon. Monocot is a plant with one cotyledon or seed leaf, parallel leaf venation, and fibrous roots. Floral parts occur in groups of 3. / , и фиброзные или мочковатые корни.

MONOCOTYLEDON = ОДНОДОЛЬНОЕ (или МОНОКОТИЛЕДОН) – Monocotyledon is a large group of flowering plants with a single cotyledon that initially emerges from the seed. The Agavaceae and Liliaceae are monocotyledons. Monocotyledon is a member of Monocotyledonae; one of two classes of angiosperms, usually characterized by the following:- one seed leaf (cotyledon), leaves with parallel venation, root systems arising adventitiously and usually diffuse (fibrous). / с единственной семядолей, . , от Греческого слова Mónos, означающее Единственный или Один, . Представление об Однодольных Растениях было введено Английским биологом Дьжоном Рэем (John Ray). Под Однодольными Растениями (Monocotyledones) понимается класс Покрытосеменных (Цветковых) Растений. Отличаются от двудольных растений рядом признаков, в том числе одной семядолей у зародыша (отсюда название), проводящие пучки у них расположены беспорядочно; лишены образовательной ткани, и поэтому стебель и корень, как правило, в толщину не растут; листья обычно с параллельным или дугообразным жилкованием; цветок большей частью трёхчленного типа. К Однодольным относятся Злаки, Орхидные, Пальмы и другие. Травы, реже лианы, древовидные формы имеют вторичное происхождение. Класс объединяет 70 (по другим данным, до 90) Семейств (в том числе Мятликовые, Пальмы), около 65 000 Видов. Распространены на всех континентах мира, наиболее разнообразны в тропиках. Среди Однодольных Растений пищевые (Кукуруза, Пшеница, Рис, Рожь и другие), кормовые (Овёс, луговые Травы – Мятлик, Овсяница), декоративные (Касатик, Лилия, Тюльпан), технические (Агава, Бамбук, Камыш) и лекарственные (Ландыш, Чемерица) Растения.

MONOCOTYLEDONOUS = ОДНОДОЛЬНОЕ (или ОДНОСЕМЯДОЛЬНОЕ) – Monocotyledonous:- an embryo having a single cotyledon.

MONOCROPPING = ВОЗДЕЛЫВАНИЕ ОДНООБОРОТНОЙ КУЛЬТУРЫ (или ВЫРАЩИВАНИЕ БЕССМЕННОЙ КУЛЬТУРЫ) – Monocropping:- when only one type of crop is grown on the land.

MONOCULTURE = МОНОКУЛЬТУРА (или БЕССМЕННАЯ КУЛЬТУРА) – Monoculture:- growing the same crop on the same piece of land year after year. Monoculture:- growth of a single species in a particular area. / Виды (Species). Под Монокультурой, от Греческого слова Mónos, означающее Единственный или Один, и Латинского слова Cultura, означающее Возделывание или Развитие, понимается:- (i) единственная сельскохозяйственная культура, возделываемая в хозяйстве; и (ii) длительное, непрерывное выращивание растений одного вида на одном и том же участке без соблюдения севооборота.

MONOCYCLIC = МОНОЦИКЛИЧЕСКОЕ – Monocyclic:- having one cycle per season. / Под Моноциклическим, от Греческих слов Mónos, означающее Единственный или Один, и Kýklos, означающее Круг, понимается .

MONOECIOUS = ОДНОДОМНОЕ (или ОБОЕПОЛОЕ) – Monoecious:- having male and female flowers on the same plant of the same species. Monoecious:- with both male and female reproductive organs on the same plant. / Однодомное:- как с мужскими, так и с женскими репродуктивными органами на одном и том же растении. , от Греческого слова Mónos, означающее Единственный или Один, . Под Однодомными Растениями понимаются растения, у которых однополые женские (пестичные) и мужские (тычиночные) цветки или женские и мужские органы полового размножения (у нецветковых растений) находятся и развиваются на одной и той же особи. К однодомным растениям относится большинство семенных растений с разнополыми шишками и цветками, например, Берёза, Дуб, Кукуруза, Лещина, Ольха, Пихта, Сосна. Сравните с Двудомными Растениями (Dioecious) и Многодомными Растениями.

MONOFIL = МОНОНИТЬ (или МОНОФИЛ) – Monofil is a filament yarn consisting of a single filament. See also Monofilament. / филаментная (комплексная) пряжа (filament yarn). Смотрите также Мононить (Monofilament). Под Мононитью или Моноволокном понимается одиночное химическое волокно непрерывной длины и сравнительно большого диаметра (0.03–1.00 мм). Применяется в производстве канатов, конвейерных лент, обивочных материалов, рыболовных сетей, сеток для бумагоделательных машин, фильтров, хирургических нитей, щёток и другого.

MONOFILAMENT = МОНОНИТЬ (или ОДНОВОЛОКНИСТАЯ НИТЬ, или МОНОФИЛАМЕНТ) – Monofilament is a single filament of a manufactured fiber, usually made in a denier higher than 14. Monofilaments are usually spun singularly, rather than extruded as a group of filaments through a spinneret and spun into a yarn. End-uses include hosiery and sewing thread. Monofilament is any single filament, generally a coarser manufactured fiber. Monofilaments are generally spun individually, rather than being extruded through the spinneret in groups of filaments. Cross-sections may be of various shapes. Monofilament is any single filament of a manufactured fiber, usually of a denier higher than 14. Instead of a group of filaments being extruded through a spinneret to form a yarn, monofilaments generally are spun individually. Monofilaments can be used for textiles such as hosiery or sewing thread or for nontextile uses such as bristles, papermaker's felts, fishing lines, etc. Monofilament is a single, fine thread of continuous man-made fiber (as in nylon hosiery). See also Multifilament, Staple, and Tow. Monofilament:- any single filament of a manufactured fiber, usually of a denier higher than 14. Rather than a group of filaments being extruded through spinnerets to form a yarn, monofilaments generally are spun individually. Monofllament is a single fiber or filament of indefinite length, strong enough to function as a yarn in commercial textile operations. / Найлан[ТЗ] (Nylon[TM]). Под Мононитью или Моноволокном понимается одиночное химическое волокно непрерывной длины и сравнительно большого диаметра (0.03–1.00 мм). Применяется в производстве канатов, конвейерных лент, обивочных материалов, рыболовных сетей, сеток для бумагоделательных машин, фильтров, хирургических нитей, щёток и другого.

MONOFILAMENT YARN = МОНОФИЛАМЕНТНАЯ ПРЯЖА (или ПРЯЖА МОНОНИТЬ) – Monofilament Yarn or Monofil is the filament yarn consisting of a single filament. See also Multifilament Yarn. Monofilament Yarn is a petrochemical product. Monofilament Yarn is the yarn composed of one filament that runs the whole length of the yarn. Mono, meaning One, usualy made of an extruded plastic, either Polypropylene or Polyethylene. / филаментная (комплексная) пряжа (filament yarn). Текстильная Мононить или Монофиламентная Нить (Monofilament Yarn/Thread) – элементарная нить для непосредственного изготовления текстильных изделий.

MONOGENIC RESISTANCE = МОНОГЕННАЯ РЕЗИСТЕНТНОСТЬ (или СОПРОТИВЛЯЕМОСТЬ ПРОДУЦИРОВАНИЮ ПОТОМКОВ ОДНОГО ПОЛА, или УСТОЙЧИВОСТЬ ПРОДУЦИРОВАНИЮ ПОТОМКОВ ОДНОГО ПОЛА) – Monogenic Resistance is a resistance governed by one gene. Major gene resistance.

MONOGRAM = МОНОГРАММА – Monogram:- initials of a name combined in a single design and used on clothing, ornaments, stationery, and the like.

MONOHYBRID = МОНОГИБРИД – Monohybrid:- heterozygous for one pair of alleles. / Моногибрид – организм, гетерозиготный по одной паре аллелей. Под Моногибридом, от Греческого слова Mónos, означающее Единственный или Один, и Латинского слова Hibrida, означающее Помесь, понимается .

MONOHYBRID CROSS = МОНОГИБРИДНАЯ ПОМЕСЬ (или МОНОГИБРИДНОЕ СКРЕЩИВАНИЕ) – Monohybrid Cross is a cross between two parents differing in one gene.

MONOMER = МОНОМЕР – Monomer is the simple, unpolymerized form of a compound from which a polymer can be made. Monomer is a single unit or molecule from which polymers are formed.

MONOMODAL RAINFALL DISTRIBUTION = МОНОМОДАЛЬНОЕ РАСПРЕДЕЛЕНИЕ ОСАДКОВ – Monomodal Rainfall Distribution:- only one peak, compared with bimodal which has two peaks in the season.

MONOMORPHIC = МОНОМОРФНОЕ – Monomorphic:- with a single shape or form. / Под Мономорфным, от Греческого слова Mónos, означающее Единственный или Один, и Morphē, означающее Форма, понимается .

MONOPHAGIC = МОНОФАГИЙНОЕ (или ОДНОЯДНОЕ) – Monophagic:- (Greek:- monos – one; phagein – to eat) Associated with a particular food source.

MONOPHYLETIC = МОНОФИЛЕТИЧЕСКОЕ – Monophyletic:- of a group of organisms sharing and including a common ancestor, and including all the descendents of that common ancestor, therefore with similar characteristics. Otherwise known as a Clade. See also Paraphyletic, and Polyphyletic. / и включающая общего предка, и включающая всех потомков данного общего предка, . Под Монофилией, от Греческих слов Mónos, означающее Единственный или Один, и Phýlon, означающее Племя или Род, понимается происхождение группы организмов от единого общего предка (не от одной пары родителей, а от однородной группы особей). Наглядное выражение монофилии – изображение истории развития органической природы в виде родословного дерева.

MONOPLOID (HAPLOID) = МОНОПЛОИД (или ИСТИННЫЙ ГАПЛОИД) (ГАПЛОИД) – Monoploid (Haploid) is a plant or organism having only one set of chromosomes. / Под Гаплоидами, от Греческих слов Haplóos, означающее Одиночный, и Éidos, означающее Вид, понимается клетка или особь с одинарным (гаплоидным) набором непарных хромосом. Гаплоидны половые клетки, некоторые Грибы, Водоросли.

MONOPODIAL BRANCH (MONOPODIUM) = МОНОПОДИАЛЬНАЯ ВЕТВЬ (МОНОПОДИЙ) – Monopodial Branch (Monopodium) is a monopodium or vegetative branch in Cotton (as opposed to the fruiting branch or sympodium) is a continuous, non-segmented, vegetative branch typically arising from lower nodes of the main-stem axis. Monopodia do not directly bear fruit, but can give rise to sympodia that may bear fruit. A vegetative branch continues to produce leaves until some stress causes it to cease growth. The number of monopodia on a plant normally varies from zero to four depending on plant density, cultivar, planting date, and other factors. If the terminal of a main stem is damaged, particularly early, a lateral monopodium will assume the role of the main stem. Unless a large percentage of the crop suffers terminal abortion, these plants should be avoided in plant monitoring. See also Sympodial Branch. / Под Моноподием, от Греческих слов Mónos, означающее Единственный или Единый или Один, и Pús, родительный падеж Podos, означающее Нога, понимается тип ветвления Растений, при котором рост главной оси продолжается всю жизнь, а на ней развиваются таким же образом ветви 2-го, 3-го порядка и так далее (смотрите Ветвление). Рост главной оси может приостанавливаться лишь временно в неблагоприятных условиях, например, зимой. Моноподиальное ветвление характерно для многих Семенных Растений (например, для Ели, Дуба, Ландыша), а также для Зелёных Водорослей, Грибов, Лиственных Мхов.

MONOPOLY = МОНОПОЛИЯ – Monopoly is a situation in which a single company or group owns all or nearly all of the market for a given type of product or service. By definition, monopoly is characterized by an absence of competition, which often results in high prices and inferior products. According to a strict academic definition, a monopoly is a market containing a single firm. In such instances where a single firm holds monopoly power, the company will typically be forced to divest its assets. Antimonopoly regulation protects free markets from being dominated by a single entity. Monopoly is the extreme case in capitalism. Most believe that, with few exceptions, the system just doesn't work when there is only one provider of a good or service because there is no incentive to improve it to meet the demands of consumers. Governments attempt to prevent monopolies from arising through the use of antitrust laws. Of course, there are gray areas; take for example the granting of patents on new inventions. These give, in effect, a monopoly on a product for a set period of time. The reasoning behind patents is to give innovators some time to recoup what are often large research and development costs. In theory, they are a way of using monopolies to promote innovation. Another example are public monopolies set up by governments to provide essential services. Some believe that utilities should offer public goods and services such as water and electricity at a price that is affordable to everyone. Exclusive control over the supply of a particular product or service by one seller, or monopolist. A monopsony exists in a market where there is only one buyer. Monopoly, literally, 'single seller'. A situation in which a single firm or individual produces and sells the entire output of some good or service available within a given market. If there are no close substitutes for the good or service in question, the monopolist will be able to set both the level of output and the price at such a level as to maximize profits without worrying about being undercut by competitors (at least in the short run). If demand for the good or service being sold by the monopolist is highly inelastic, prices and the rate of profit in the industry will tend to be higher (and output lower) than under competitive conditions and prices may in fact be noticeably higher than the marginal costs of production for substantial periods of time. To keep new competitors from entering the industry and flooding the market with additional supply in response to the unusually high rate of profit, monopolists historically have typically had to rely in the long run upon some sort of legal barriers to entry erected by government – either an open grant of protected monopoly that legally forbids competitors to enter the market, or a regulatory regime that in practice makes it almost impossible for new competitors to meet required standards, or perhaps only such more transient barriers to entry as legally protected patent rights or copyrights for essential technology. However, see also entries under barriers to entry, cartel, natural monopoly and competition. See also Monopsony. Strictly, an industry with only one supplier. The term is also applied more widely to an industry controlled (monopolized) by one company, which produces a sufficient proportion of the total output of that industry to effectively control supply and therefore price. In the United Kingdom, monopolies, and mergers or take-overs that might lead to the creation of a monopoly, are subject to the scrutiny of the Monopolies and Mergers Commission. / выработка (output). Под Монополией, от Греческих слов Mónos, означающее Единственный или Единый или

Один, и Pōlēō, означающее Продаю, понимается исключительное (монопольное) право в какой-либо сфере деятельности государства (например, монополия внешней торговли), организации, предприятия, фирмы и так далее. Монополия – контроль за производством и реализацией товаров или услуг, осуществляемый одной фирмой или группой фирм, действующих по взаимной договорённости. В чистой форме монополия, которая характеризуется отсутствием конкуренции, ведёт к более высоким ценам и общему отсутствию реакции на потребности и желания клиентов. Хотя наиболее очевидные проявления монополий в США запрещены в силу антимонопольных законов (antitrust laws), принятых в конце XIX и начале XX веков, монополии в определённой степени сохраняются в результате действия таких факторов, как патенты, дефицит основных материалов, а также высокие первоначальные затраты и высокая стоимость производства, которые понижают в определённых отраслях стимулы к конкуренции. Общественные (публичные) монополии (public monopolies), управляемые государством, такие, как почтовая служба, или в значительной степени регулируемые государством, например предприятия, предоставляющие коммунальные услуги, обеспечивают важнейшие услуги по приемлемым ценам и, как правило, не имеют недостатков частных монополий (private monopoly). Монопсония (monopsony), то есть доминирование на рынке одного покупателя или группы действующих совместно покупателей, распространена меньше, чем монополия.

MONOPSONY = МОНОПСОНИЯ – In economics, a Monopsony (from Ancient Greek Mónos = Single + Opsōnía = Purchase) is a market form in which only one buyer faces many sellers. It is an example of imperfect competition, similar to a monopoly, in which only one seller faces many buyers. As the only purchaser of a good or service, the monopsonist may dictate terms to its suppliers in the same manner that a monopolist controls the market for its buyers. The term was first introduced by Joan Robinson in her influential book, The Economics of Imperfect Competition, published in 1933. Robinson credited classics scholar Bertrand Hallward at the University of Cambridge with coining the term. A single-payer universal health care system, in which the government is the only 'buyer' of health care services, is an example of a monopsony. During the Cold War, the defense industry in the United States had a monopsonistic element in respect to major defense projects; strategic considerations limited the sole buyer (the United States Department of Defense (DoD)) to procuring its needs from domestic suppliers, while there were virtually no other parties other than DoD with the interest or resources to purchase many of the suppliers' products. In the post-Cold War world, this has weakened, as more states have the need and ability to purchase sophisticated military equipment, and DoD is freer to purchase from foreign (particularly European) suppliers. An interesting example of a situation where both a monopoly and a monopsony exist (a bilateral monopoly) involves the market for nuclear-powered aircraft carriers: the monopsony being with only one purchaser (the United States Navy) and the monopoly being with only one producer (Huntington Ingalls Industries, as their Newport News Shipbuilding division is the only place with the capacity to manufacture, overhaul, and decommission them). It has also been argued that Wal-Mart, in the United States, functions as a monopsony in certain market segments, as its buying power for a given item may dwarf the remaining market. Another possible monopsony could develop in the exchange between the food industry and farmers. Texas is said to have almost total control over the K-12 textbooks in the US due to its market dominance. Unlike most other states, Texas operates as a single unified school district, with all students being taught the same curriculum from the same books statewide. Combined with Texas' large size, Texas' textbook purchases far outweigh those of other buyers. The term 'Monopsony Power', in a manner similar to 'monopoly power', is used by economists as a shorthand reference to buyers who face an upwardly sloping supply curve but that are not the only consumer; alternative terms are oligopsony or monopsonistic competition. Monopsony, literally, 'single buyer'. A situation in which a single firm or individual is the only buyer of a particular good or service within a given market. Monopsony:- a market similar to a monopoly except that a large buyer not seller controls a large proportion of the market and drives the prices down. Sometimes referred to as the Buyer's Monopoly. People have accused Ernest and Julio Gallo (the big wine makers) of being a monopsony. They had such power buying grapes from growers, that sellers had no choice but to agree to their terms. Industry in which there are many manufacturers but only one customer for the goods produced. By controlling demand the consumer can, in theory, set the price. Monopsonies generally evolve to serve nation states; the market for warships, for example, is a virtual monopsony in that the vessels produced are purchased only by the government of the nation concerned, or by other governments that have its approval. See also Monopoly. / Дьжоун Робинсэн (Joan Robinson). Бэртро Холвод (Bertrand Hallward). Хантиньгтэн Инголз Индэстриз (Huntington Ingalls Industries). Вол-Мат (Wal-Mart). Онэст энд Хулио Гайо (Ernest and Julio Gallo). Монопсония – ситуация, при которой на рынке доминирует единственный покупатель, что заставляет продавцов соглашаться на его условия. Например, фермеры – производители Табака могут не иметь выбора и продавать свою продукцию табачной компании, являющейся единственным покупателем на рынке. Таким образом, табачная компания полностью контролирует цены приобретения сырья. Противоположностью монопсонии является монополия (monopoly).

MONOSOMIC = МОНОСОМИЧЕСКИЙ (или МОНОСОМИК) – Monosomic is a plant that lacks one of a pair of homologous chromosomes. / Под Моносомическим, от Греческих слов Mónos, означающее Единственный или Один, и Sōma, означающее Тело, понимается . Моносомия, отсутствие в хромосомном наборе диплоидного организма одной хромосомы. Клетку или организм, у которых та или иная гомологичная хромосома представлена в единственном числе, называют Моносомиком. Моносомия – результат нарушений при расхождении гомологичных хромосом, что чаще происходит в половых клетках (при мейозе), но возможно и в клетках тела – соматических (при митозе). Например, больные синдромом Шерешевского-Тернера – моносомики по половой Х-хромосоме. Смотрите также Хромосомные Болезни, и Хромосомные Перестройки.

MONOSOMIC ALIEN ADDITION LINE = МОНОСОМИЧЕСКАЯ ЛИНИЯ С ПРИСОЕДИНЕНИЕМ ЧУЖАКА – Monosomic Alien Addition Line (MAAL) is an individual having one extra chromosome from the genome of another species. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

MONOTONOUS SWAMPS = МОНОТОННЫЕ ТОПИ (или МОНОТОННЫЕ ЛЕСНЫЕ БОЛОТА, или МОНОТОННЫЕ ТРЯСИНЫ) – Monotonous Swamps are freshwater swamps inland of and overlapping with the tidal swamps.

MONOTYPIC = МОНОТИПНЫЙ – Monotypic:- a Genus with a single representative Species. / Виды (Species). Под Монотипным, от Греческих слов Mónos, означающее Единственный или Один, и Týpos, означающее Отпечаток, понимается .

MONSOON = МУССОН (или СЕЗОН ДОЖДЕЙ) – Monsoon:- the cyclic surface winds blowing in tropical and subtropical latitudes for several months from the southwest, switching for several months from the northeast, and the rains that accompany them. / Под Муссонами, от Французского слова Mousson, от Арабского слова Маусим, означающее Сезон, понимаются устойчивые ветры, направление которых резко меняется на противоположное (или близкое к противоположному) 2 раза в год. Обусловлены главным образом сезонными различиями в нагревании материков. Зимние муссоны чаще направлены с суши на океан, летние – с океана на сушу. Основная особенность муссонного климата – обильное осадками лето и сухая зима. Муссоны хорошо выражены в тропических широтах, главным образом в бассейнах Индийского Океана. Бывают и внетропические муссоны (на Дальнем Востоке).

MONSTROSE = ПРОТИВОЕСТЕСТВЕННОЕ (или ЧУДОВИЩНОЕ, или УРОДЛИВОЕ, или УЖАСНОЕ, или БЕЗОБРАЗНОЕ, или СТРАННОЕ) – Monstrose or Monstrous:- an abnormal uncoordinated form of vegetative growth, often with random production of differentiated structures, resulting in loss of normal growth habit. / потере габитуса роста. Под Монстром, от Французского слова Monstre, означающее Урод или Чудовище, .

MONTANE = ГОРНОЕ (или ГОРИСТОЕ, или НАГОРНОЕ, или ЖИВУЩЕЕ В ГОРАХ) – Montane:- occurring in mountains.

MONTERO = МОНТЭРО – Montero is a round hunter's cap with ear flaps. / Охотничья шапка с наушниками.

MONTHLY CAPACITY CREDIT MARKETS = ПОМЕСЯЧНЫЕ РЫНКИ КРЕДИТА ЁМКОСТЕЙ (или XX) – Monthly Capacity Credit Markets (Monthly CCMs):- in electricity, the capacity credits cleared each month through the PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC) Monthly CCMs in the United States. / В Американской сфере электроснабжения кредиты ёмкостей расчитываются каждый месяц через корпорацию Пи.Дьжей.Эм. (Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC) или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

MONTHLY CHARTS = ПОМЕСЯЧНЫЕ ГРАФИКИ – The term Monthly Charts is used to describe charts that are constructed of monthly bars or candles. Each monthly bar or candle contains the Open, High, Low, and Close that occurred during each trading day. / В техническом анализе биржевой торговли термин Помесячные Графики применяется для описания графиков, которые выстраиваются на основе помесячных штрихов или свечей. Каждый помесячный штрих или свеча содержит цены Открытия, Максимума, Минимума и Закрытия, полученные в результате соответствующих цен, имевших место в течение каждого месяца.

MOODY'S (CORPORATION) = МУДИЗ (КОРПОРЭЙШЭН) (или (КОРПОРАЦИЯ) МУДИЗ) – Moody's is an essential component of the global capital markets, providing credit ratings, research, tools and analysis that contribute to transparent and integrated financial markets. Moody's Corporation (NYSE®:- MCO) is the parent company of Moody's Investors Service, Inc., which provides credit ratings and research covering debt instruments and securities, and Moody's Analytics, Inc, which offers leading-edge software, advisory services and research for credit analysis, economic research and financial risk management. The Corporation, which reported revenue of USD2 billion in 2010, employs approximately 4 500 people worldwide and maintains a presence in 26 countries. Moody's Investors Service, Inc., Moody's Analytics, Inc. headquartered in New York, State of New York (NY), the United States. Moody's Investors Service, Inc is a leading provider of credit ratings, research, and risk analysis. Moody's commitment and expertise contributes to transparent and integrated financial markets. The firm's ratings and analysis track debt covering more than 110 countries, 12 000 corporate issuers, 25 000 public finance issuers, and 106 000 structured finance obligations. Moody's Analytics, Inc helps capital markets and credit risk management professionals worldwide respond to an evolving marketplace with confidence. The company offers unique tools and best practices for measuring and managing risk through expertise and experience in credit analysis, economic research and financial risk management. By providing leading-edge software, advisory services, and research, including the proprietary analysis of Moody's Investors Service Ltd, Moody's Analytics integrates and customizes its offerings to address specific business challenges. Xxxxx. Moody's Corporation (NYSE®:- MCO) is the holding company for Moody's Analytics, Inc. and Moody's Investors Service, Inc., a credit rating agency which performs international financial research and analysis on commercial and government entities. The company also ranks the credit-worthiness of borrowers using a standardized ratings scale. The company has a 40% share in the world credit rating market, as does its main rival, Standard & Poor's; and it is one of the credit rating agencies (Standard & Poor's, Moody's Investor Service Ltd and Fitch Ratings Ltd). Moody's was founded in 1909 by John Moody. Top institutional owners of Moody's include Berkshire Hathaway and Davis Selected Advisers. Moody's was founded in 1909 by John Moody, beginning with Analyses of Railroad Investments, 'a book about railroad securities, using letter grades to assess their risk'. Moody's Investors Service was incorporated on 1914-July-01, and soon extended coverage to US municipal bonds. By 1924, Moody's ratings covered nearly 100 percent of the US bond market. In the 1970s, Moody's expanded into commercial debt, and also began the practice, along with other ratings agencies, of charging bond issuers for ratings as well as charging investors. The number of countries covered by Moody's has risen from 3 in 1975, to 33 in 1990, to over 100 by 2000. Announcements by Moody's of possible or actual downgrades of a country's bond rating can have a major political and economic impact, as for example in Canada in 1995. Credit rating agencies such as Moody's have been subject to criticism in the wake of large losses in the Asset backed security collateralized debt obligation (ABS CDO) market that occurred despite being assigned top ratings by the CRAs. For instance, losses on USD340.7 million worth of ABS collateralized debt obligations (CDO) issued by Credit Suisse Group AG added up to about USD125 million, despite being rated Aaa by Moody's. Moody's has been accused of 'blackmail'. In one example the German insurer Hannover Re was offered a 'free rating' by Moody's. The insurer refused. Moody's continued with the 'free ratings', but over time lowered its rating of the company. Still refusing Moody's services, Moody's lowered Hannover's debt to junk, and the company in a few hours lost USD175 million in market value. 'As the housing market collapsed in late 2007, Moody's Investors Service, whose investment ratings were widely trusted, responded by purging analysts and executives who warned of trouble and promoting those who helped Wall Street plunge the country into its worst financial crisis since the Great Depression. A McClatchy investigation has found that Moody's punished executives who questioned why the company was risking its reputation by putting its profits ahead of providing trustworthy ratings for investment offerings'. Moody's ratings:- (1) Long-term obligation ratings:- (i) Investment grade:- (a) Aaa:- Moody judges obligations rated Aaa to be the highest quality, with the 'smallest degree of risk'; (b) Aa (Aa1, Aa2, Aa3):- Moody judges obligations rated Aa to be high quality, with 'very low credit risk', but 'their susceptibility to long-term risks appears somewhat greater' (AA+, AA and AA- in S&P); (c) A (A1, A2, A3):- Moody judges obligations rated A as 'upper-medium grade', subject to 'low credit risk', but that have elements 'present that suggest a susceptibility to impairment over the long term' (A+, A and A- in S&P); (d) Baa1, Baa2, Baa3: Moody judges obligations rated Baa to be 'moderate credit risk'. They are considered medium-grade and as such 'protective elements may be lacking or may be characteristically unreliable'. (ii) Speculative grade (also known as 'High Yield' or 'Junk'):- (a) Ba1, Ba2, Ba3:- Moody judges obligations rated Ba to have 'questionable credit quality'; (b) B1, B2, B3:- Moody judges obligations rated B as speculative and 'subject to high credit risk', and have 'generally poor credit quality'; (c) Caa1, Caa2, Caa3:- Moody judges obligations rated Caa as of 'poor standing and are subject to very high credit risk', and have 'extremely poor credit quality. Such banks may be in default...'; (c) Ca:- Moody judges obligations rated Ca as 'highly speculative' and are 'usually in default on their deposit obligations'; (d) C:- Moody judges obligations rated C as 'the lowest rated class of bonds and are typically in default', and 'potential recovery values are low'. (iii) Special:- (a) WR:- Withdrawn Rating; (b) NR:- Not Rated; and (c) P:- Provisional. (2) Short-term taxable ratings:- (a) P-1:- Moody judges Prime-1 rated issuers as having 'a superior ability to repay short-term debt obligations'; (b) P-2:- Moody judges Prime-2 issuers as having 'a strong ability to repay short-term debt obligations'; (c) P-3:- Moody judges Prime-3 rated issuers as having 'an acceptable ability to repay short-term obligations'; and (d) NP:- Moody considers 'Not Prime' rated issuers as not falling 'within any of the Prime rating categories'. Moody notes that 'Canadian issuers rated P-1 or P-2 have their short-term ratings enhanced by the senior-most long-term rating of the issuer, its guarantor or support-provider'. (3) Short-term tax-exempt ratings:- unlike S&P, Moody's has separate categories for short term municipal bonds. The ratings categories largely overlap, though, and have the same implications for the ability to repay

short-term obligations. (4) Individual bank ratings:- Moody's also rates each bank's financial strength. These ratings differ from deposit ratings in that they measure how likely the bank is to need assistance from third parties:- (a) A:- 'superior intrinsic financial strength'; (b) B:- 'strong intrinsic financial strength'; (c) C:- 'adequate intrinsic financial strength'; (d) D:- 'modest intrinsic financial strength, potentially requiring some outside support at times'; and (e) E:- 'very modest intrinsic financial strength, with a higher likelihood of periodic outside support'. / Дьжон Муди (John Moody). Мудиз Корпорэйшэн (Moody's Corporation). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Мудиз, Энэлытикс, Инк. (Moody's Analytics, Inc.). Ханофа Ри (Hannover Re). Крэди Свиссэ Груп А.Ге. (Credit Suisse Group AG). МэКлатчи (McClatchy). Стэндод энд Поз (Standard & Poor's), Мудиз Инвэстоз Сёвис Эл.ти.ди. (Moody's Investor Service Ltd), Фитч Рэйтиньгз Лимитид (Fitch Ratings Ltd).

MOON MARKS = XX ОТМЕТИНЫ – Moon Marks:- Moon type shape on the fabric selvedge or fabric selvedge is not straight. Finishing defect. / Порок или дефект заключительной отделки.

MOORING = ШВАРТОВКА (или ШВАРТОВ, или БРИДЕЛЬ, или МЁРТВЫЙ ЯКОРЬ, или МЕСТО СТОЯНКИ СУДОВ, или ШВАРТОВНАЯ БОЧКА) – Mooring:- arrangement or location for securing ship to buoy or pier. Mooring (maritime term):- securing to a dock or to a buoy, or anchoring with two anchors. / к рейдовой бочке или причалу. Постановка на два якоря (на бочку, на бридель, на швартовы).

MOORING LINE = ШВАРТОВЫЙ КАНАТ (или ШВАРТОВ) – Mooring Line is a cable or line to tie up a ship. / Под Швартовным Устройством судна понимается совокупность приспособлений и механизмов (вьюшки, киповые планки, клюзы, кнехты, лебёдки, утки, швартовные клюзы, швартовные лебёдки или шпили, швартовы и прочие) для удержания судна во время стоянки у причала или у борта другого судна. Управление швартовными механизмами местное или дистанционное. Автоматическое потравливание или выбирание швартового троса при изменении его натяжения (например, при погрузке или разгрузке судна) позволяет избежать тяжёлой ручной работы. Швартов, от Голландского слова Zwaartouw, гибкий трос (стальной, синтетический или из растительного волокна), с помощью которого подтягивают и крепят судно к причалу или другому судну.

MOP = MACANESE PATACA

MOQUETTE = МОКЕТ – Moquette is an upholstery fabric having a velvety pile.

MORAL HAZARD = МОРАЛЬНАЯ ОПАСНОСТЬ (или ОПАСНОСТЬ НЕДОБРОСОВЕСТНОСТИ) – Moral Hazard is the risk that a party to a transaction has not entered into a contract in good faith, has provided misleading information about its assets, liabilities or credit capacity, or has an incentive to take unusual risks in a desperate attempt to earn a profit before the contract settles. Those personal characteristics of a prospective insured or its employees or associates that may increase the probability or size of an insurance loss. / Моральная, от Латинского слова Moralitas от Moralis, означающее Относящееся К Нраву, Характеру, Складу Души, Привычкам, . кредитоёмкость (credit capacity).

MORATORIUM = МОРАТОРИЙ – Moratorium is a temporary waiver of amortization on a loan to enable the borrower to cope with a cash shortage more easily. Interest payments may continue or be postponed. Frequently declared by Newly Industrializing Countries (NIC) sovereign borrowers. See also Debt Rescheduling, Paris Club, and Rescheduling Agreement. Legally invoked period of delay during which debtors are not required to meet obligations when they fall due. (1) For example, if a company is going through rough times it might have a moratorium on advertising spending. In other words, to cut costs, it won't spend any money on advertising. (2) Such action may be imposed by a government, or taken voluntarily by a private business, usually in times of economic crisis such as an earthquake or flood, in order to provide people with time to stabilize their finances before dealing with potential problems such as a mortgage default and foreclosure. / суверенные (самостоятельные) заёмщики. Под Мораторием, от Латинского слова Moratorius, означающее Замедляющий или Отсрочивающий, понимается отсрочка исполнения обязательств, устанавливаемая правительством на определённый срок или до окончания каких-либо чрезвычайных событий, например, войны, стихийного бедствия. Мораторий, отсрочка исполнения обязательств, устанавливаемая правительством на определённый срок или до окончания каких-либо чрезвычайных событий (например, войны, стихийных бедствий). Распространяется на все обязательства (Общий Мораторий) или только на некоторые их виды, или на отдельные категории должников. В бывшем Союзе Советских Социалистических Республик (СССР) мораторий мог быть установлен Постановлением Совета Министров СССР или Союзной республики. Советское гражданское право рассматривало мораторий в качестве основания приостановления срока исковой давности (ГК РСФСР, Ст. 85). В СССР общий мораторий никогда не объявлялся. Во время Великой Отечественной Войны 1941–45 был объявлен мораторий лишь по отдельным обязательствам. В буржуазных странах правительства прибегают к мораторию в период экономических кризисов; как правило, мораторий распространяют на операции банков по внешним займам. Особая форма моратория – Банковский Мораторий, при котором по распоряжению правительства закрываются на некоторое время кредитные учреждения. Характерен для современного валютно-финансового кризиса:- например, девальвация Американского Доллара в 1971–73 сопровождалась неоднократным закрытием главных валютных рынков Западной Европы в Японии.

(1) Moratorium is a period of time in which there is a suspension of a specific activity until future events warrant a removal of the suspension or issues regarding the activity have been resolved.

(2) In bankruptcy law, Moratorium is a legally binding halt of the right to collect debt.

MORDANT = ПРОТРАВА – Mordant is a chemical that aids attachment of a dyestuff to fibers by bonding to both the fiber and the dye. A mordant must have high affinity for both the dye and the fiber, acting to attach the dyestuff to the fiber. Mordants are necessary for dyes that have very low or no natural affinity for the fiber. They are often salts of metals such as chromium, copper, tin or iron. Mordants may be applied before, with or after the dye, depending on the nature of the dye, the fiber and the mordant. Some mordants, especially chromium compounds, are very serious health hazards. Mordant is a material used to fix a dye in or on a substance, by combining with a dye to form an insoluble compound. Commonly used mordants are chrome, iron, aluminum, and tin. Mordant is a substance that acts as a binder for the dye. A mordant has an affinity for both the dyestuff and the fabric. Mordant is a chemical used in some textile fibers to provide affinity for dyes. / Сродство (Affinity). Под Протравами понимаются вещества, содержащие ионы металлов (главным образом Cr^{3+}).

MORDANT DYE = ПРОТРАВНЫЙ КРАСИТЕЛЬ – Mordant Dyes is a class of dyes which are applied with the aid of a second substance (known as the Mordant) which is not a dye but which combines with the dye to form a more complex and less soluble molecule, often known as a Lake. Mordants are usually metal-containing oxides or hydroxides (e.g., chromium, copper, aluminum, and iron), and these form lakes with essentially acidic dyes. For basic dyes complex acids (e.g., tannic) are used as mordants, but basic dyes are not normally classified as mordant dyes. The majority of the natural coloring matters belong to this group. They may be regarded as true mordant dyes, since they have no affinity unless the mordant is first present on the fiber. This distinguishes them from

the modern synthetic mordant dyes which also behave as normal acid dyes, the purpose of the mordant (usually a compound of chromium) being principally to improve the fastness properties. Among important natural mordant dyes is alizarin, obtained from the root of the madder plant but now manufactured synthetically from anthraquinone. Its most important application was on an aluminum mordant to produce the famous Turkey red. On other metal mordants differently colored dyeings are obtained (e.g., tin-pink, iron-violet, chromium-puce). Logwood, obtained from campeachy wood, is the only natural mordant dye still used commercially. Applied on a suitable mordant, e.g., iron or copper, it produces dense black shades. Synthetic mordant dyes (chrome colors) are used for the production of fast dyeing on wool. The mordant (usually a dichromate or chromate) may be applied before, together with, or after the dye, which is itself applied in much the same way as an acid dye. Mordant Dye is a dyestuff that requires the use of a mordant. There are very few synthetic dyestuffs currently in use that require a separate mordant, except for some dyes for wool, where mordant dyes are still quite popular. Since chromium is almost exclusively used as the mordant on wool, chrome dye has become essentially synonymous with mordant dye. Many natural dyes (plant extracts, etc) require a mordant. The mordant used can significantly influence the hue produced with a particular dyestuff. The Mordant or Chrome Dyes are acidic in character. Sodium or potassium bichromate is used with them in the dyebath or after the process of dyeing is completed. This is done for getting the binding action of the chrome. They are mostly used for wool which gets a good color fastness after treatment with mordant dyes. They are also used for cotton, linen, silk, rayon and nylon but are less effective for them. / Найлан^{T3} (Nylon^{TM}). хромировочный краситель (chrome dye). Протравные Красители – органические красители (азокрасители, антрахиноновые и другие), которые образуют на волокне прочные комплексы при взаимодействии со вспомогательными веществами – протравами, содержащими ионы металлов (главным образом Cr^{3+}). Применяются для крашения шерсти, реже – натурального шёлка (окраски устойчивы к любым воздействиям).

MOREEN = МОРИН – Moreen fabric is a heavy, ribbed fabric. It was originally made from wool, but is now more commonly made from cotton or a blend of cotton and wool. Moreen is typically given a moiré finish, meaning that it has a rippled, ‘watermark’ appearance on the surface. This fabric was very popular between the XVII and XIX centuries, especially in women’s dresses and petticoats. It is also used in furnishing fabrics. Moreen fabric is sturdy, and can be made in various weights, and can be plain rather than patterned. The lighter weights are used for bathing dresses and the heavier qualities for curtains. Moreen is a strong fabric of wool, wool and cotton, or cotton with a plain glossy or moir finish. As nouns the difference between Fabric and moreen is that fabric is (archaic) structure, building while moreen is a thick woollen fabric, watered or with embossed figures, used in upholstery, for curtains, etc. Moreen is a heavy fabric of wool (or wool and cotton) used mostly in upholstery or for curtains. / хлопчатобумажная подкладочная ткань с продольным рубчиком с плотностью по утку большей, чем по основе.

MORESQUE = МАВРИТАНКА (или МАВРИТАНСКОГО СТИЛЯ) – Moresque is a multicolored yarn formed by twisting or plying single strands of different colors. / В переводе с Французского Мавританка.

MORIF = MAROS RESEARCH INSTITUTE FOR FOOD CROPS

MORION = МОРЬЁН (или МОРИОН) – Morion:- a high-crested helmet with no visor. / шлем XIV–XVII веков.

MORNING DOJI STAR = УТРЕННЯЯ ЗВЕЗДА ДОДЗИ – Morning Doji Star:- in technical analysis, a three day bullish reversal pattern that is very similar to the Morning Star. The first day is in a downtrend with a long black body. The next day opens lower with a Doji that has a small trading range. The last day closes above the midpoint of the first day. / В техническом анализе биржевых рынков, под Утренней Звездой Додзи понимается трёхдневная бычья модель разворота, очень похожая на Утреннюю Звезду. Первый день тенденции на понижение отображается длинным тёмным телом. Следующий день открывается ниже телом Додзи, имеющим маленький торговый диапазон. Последний день закрывается выше среднего значения цен первого дня.

MORNING STAR = УТРЕННЯЯ ЗВЕЗДА – Morning Star:- in technical analysis, a three day bullish reversal pattern consisting of three candlesticks – a long-bodied black candle extending the current downtrend, a short middle candle that gapped down on the open, and a long-bodied white candle that gapped up on the open and closed above the midpoint of the body of the first day. / В техническом анализе биржевых рынков, под Утренней Звездой понимается трёхдневная бычья модель разворота, состоящая из трёх свечей:- длинной темной свечи, продолжающей тенденцию на понижение, но с расширенным торговым диапазоном; небольшой свечи, образованной с отрывом вниз по открытии; и длинной светлой свечи, которая открывается с отрывом от предыдущей и закрывается выше среднего торгового диапазона первого дня.

MOROCCO = САФЬЯН (или САФЬЯНОВАЯ, или МАРОККАНКА) – Moroceo is a type of leather. See also Leather. Morocco, goatskin leather, dyed on the grain side and boarded by hand or machine to bring up the grain in a bird’s-eye effect. It probably originated with the Arabs in North Africa as an alum-tanned product typically dyed red. The process later spread to the Levant, to Turkey, and along the Mediterranean, where sumac was used for tanning. Today the term is also applied to chrome-tanned goat leather whether boarded or embossed to show the characteristic grain; it is often crushed and glazed. Hard, but pliable, it is valued especially for bookbindings and purses. Levant Morocco is larger grained; French Morocco is a sheepskin imitation.

MORPHOGENESIS = МОРФОГЕНЕЗ (или ФОРМООБРАЗОВАНИЕ) – Morphogenesis:- the combined processes of cell division, differentiation, organ initiation, and organ development. / Под Морфогенезом, от Греческих слов Morphē, означающее Форма, и Génesis, означающее Возникновение или Происхождение, понимается .

MORPHOLOGY = МОРФОЛОГИЯ – Morphology is a branch of biology that deals with the physical form and structure of plants and animals. A study of the forms, relations, metamorphoses, and phylogenetic development of organs apart from their functions. Morphology is the study of the fine structure of a fiber or other material. / В биологии под Морфологией, от Греческих слов Morphē, означающее Форма, и Lógos, означающее Слово или Учение, понимается наука о форме и строении организмов. Выделяют морфологию животных и человека, к которой относят анатомию, эмбриологию, гистологию и цитологию, и морфологию растений, которая изучает строение и формообразование, главным образом на организменном уровне, а также на эволюционно-видовом (в связи с эволюцией формы).

MORTAR AND PESTLE = СТУПКА И ПЕСТИК – Mortar And Pestle are a device for grinding, consisting of a vessel (mortar) in which substances are ground with a club-shaped implement (pestle). / Устройство для шлифования (grinding), состоящее или сосуда (ступки или ступы), в котором .

MORTAR BOARD = ХХ (или АКАДЕМИЧЕСКИЙ ГОЛОВНОЙ УБОР) – Mortar Board:- an academic cap consisting of a closely fitting headpiece with a broad flat projecting square top.

MORTGAGE = ЗАКЛАДНАЯ (или ИПОТЕКА) – Mortgage is a property and land put up as loan collateral, to which the creditor may resort in case of mortgagor’s failure to fulfil payment obligations. This entitlement is entered in the Land Register. It constitutes a lien on real estate to safeguard the creditors’ interests. A first mortgage signifies a first-ranking charge entered in the Land Registry, which is the most secure (vested) right as no other charge take priority. See also Hypothecation. Mortgage is legal instrument evidencing a security interest in assets, usually real estate. Mortgages serve as collateral for promissory notes. In the United States, ‘Mortgage’

refers to all forms of debt where the property is pledged as security for repayment of the debt, including deeds of trust; trust deeds; contracts to purchase; land contracts; junior mortgages; and home equity loans. A mortgage is considered a first mortgage if it has prior claim over any other mortgage or if it is the only mortgage on the property. All other mortgages, (second, third, etc) are considered junior mortgages. A home equity loan is generally a junior mortgage. If no first mortgage is reported, but a junior mortgage or home equity loan is reported, then the loan is considered a first mortgage. All mortgages other than first mortgages (for example, second, third, etc) are classified as 'junior' mortgages. A second mortgage is a junior mortgage that gives the lender a claim against the property that is second to the claim of the holder of the first mortgage. Any other junior mortgage(s) would be subordinate to the second mortgage. A home equity loan is a line of credit available to the borrower that is secured by real estate. It may be placed on a property that already has a first or second mortgage, or it may be placed on a property that is owned free and clear. Mortgage is a temporary and conditional pledge of property to a creditor as security for the repayment of a debt. Mortgage is a written conveyance of title to real estate property, but not its possession, to secure the payment of a debt or the performance of some obligation. Distinguished from a lien in that the creditor has actual title to the property and from a pledge in that the debtor retains possession. See also First Mortgage, Fixed-Rate Mortgage, Portfolio Mortgage, and Second Mortgage. A charge over property given by the owner (borrower/mortgagor) to a lender (mortgagee) to secure repayment of a loan or to ensure satisfaction of a debt. Transfer of the deeds to a property as security for the repayment of a debt, e.g., building societies that provide a loan for the purchase of a house take legal possession of the property until the loan and interest have been repaid. Also known as Legal Charge. Mortgage is a loan secured by an asset such as real estate. When you 'mortgage the farm', you are borrowing by using the farm as security and in the event that the loan is not repaid, the lender has the right to sell the property in order to recover the loan. / Смотрите также Закладывание (Hypothecation). В Соединённых Штатах Америки термин Закладная относится ко всем формам долгов, по которым имущество закладывается в качестве обеспечения гарантированной выплаты (repayment) долга. Включает в себя:- . Смотрите также Закладная С Фиксированной Ставкой (Fixed-Rate Mortgage). Документ о закладе или залоге имущества. Под Ипотекой, от Греческого слова Hypothēkē, означающее Залог, понимается залог недвижимости (земли, строений) с целью получения долгосрочной ссуды. Закладная – именная ценная бумага, удостоверяющая следующие права её законного владельца:- (i) право на получение исполнения по денежному обязательству, обеспеченному ипотекой имущества, указанного в договоре об ипотеке, без представления других доказательств существования этого обязательства; и (ii) право залога на указанное в договоре об ипотеке имущество. Закладная – долговое обязательство, с помощью которого заёмщик передаёт кредитору права на недвижимость в качестве обеспечения кредита. При этом заёмщик имеет право пользоваться собственностью; право собственности, переданное кредитору, ликвидируется, когда кредит полностью погашается. Ипотечный заём, как правило, связан с недвижимостью. Кредит под личную собственность, включая механизмы, оборудование или инструменты, называется ипотечным кредитом под движимое имущество (chattel mortgage).

MORTGAGE–BACKED SECURITIES = ЦЕННЫЕ БУМАГИ, ОБЕСПЕЧЕННЫЕ ЗАКЛАДНЫМИ – Mortgage-Backed Securities (MBS) are investment instruments that represent ownership of a group of mortgages. Usually, financial institutions treat MBS as a method to fund the capital pool brought by lending mortgages. Up to 2006, MBS market is one of the fastest growing, as well as one of the largest financial markets in the United States. There are now three major agencies in the US issuing MBS – Ginnie Mae (the Government National Mortgage Association, or GNMA), Fannie Mae (the Federal National Martgage Association, or FNMA), and Freddie Mac (the Federal Home Loan Mortgage Corporation, or FHLMC). These agencies support the secondary market by issuing an MBS in exchange for pools of mortgages from lenders. This ensures that lenders have funds to make additional loans. In general, MBS issued through these three government-supported agencies are considered to have no credit or negligible credit risk. The biggest uncertainty of mortgage-backed securities is the prepayment behavior. In the United States, mortgagors could prepay their loans at any time with no or only little penalty. The above earlier payments lead to unstable future cash flow, thus uncertainty of MBS fair price today. To some extent, mortgages can be treated as a callable bond and people could exercise their option any time they like. So before we begin to price MBS, what we want to know is at what time those borrowers will exercise the call option and what the value of that embedded option is. Roughly, there are three reasons causing the prepayment behaviours:- (i) Refinancing:- when interest rates decline, mortgagors originally signed the higher rate contract would like to refinance through entering a new mortgage contract, thus to take advantage of the prevailing low interest rates. (ii) House Turnover or House Sales:- many mortgage contracts specify the settlement of remaining loan before selling out the house. So people would like to prepay before mortgage maturity date if they want to sell the house. (iii) Involuntary Prepayment:- prepayment could occur unexpectedly. Such early termination events include marriage, divorce, death and other extraordinary events. Lots of studies then report that several factors affect those behaviours – interest rate as mentioned above, mortgage seasoning, borrowers' heteroscedasticity, overall economy, burnout effect, even geographic diversity and schooling time …. It seems to be a tough work if we want to construct a model with these multitudinous factors, but still, several models have been built through chasing one or several above variables. In the United States, a Mortgage-Backed Security (MBS) is an asset-backed security or debt obligation that represents a claim on the cash flows from pools of mortgage loans, most commonly onresidential property. Mortgage-Backed Securities (MBS) are pools of mortgages used as collateral for the issuance of securities in the secondary market. MBS are commonly referred to as 'Pass-Through' Certificates because the principal and interest of the underlying loans is 'passed through' to investors. The interest rate of the security is lower than the interest rate of the underlying loan to allow for payment of servicing and guarantee fees. The Ginnie Mae® MBS are fully modified pass-through securities guaranteed by the full faith and credit of the United States government. Regardless of whether the mortgage payment is made, investors in Ginnie Mae® MBS will receive full and timely payment of principal as well as interest. The Ginnie Mae® MBS are created when eligible mortgage loans (those insured or guaranteed by the Federal Housing Administration (FHA), the Department of Veterans Affairs (VA), the Department of Agriculture's Rural Housing Service (RHS) or the Department of Housing and Urban Development's Office of Public and Indian Housing (PIH)) are pooled by approved issuers and securitized. The Ginnie Mae® MBS investors receive a pro rata share of the resulting cash flows (again, net of servicing and guaranty fees). The Ginnie Mae® I MBS requires all mortgages in a pool to be the same type, e.g., single-family. Each mortgage must be, and must remain, insured or guaranteed by FHA, VA, RHS or PIH. In addition, the mortgage interest rates must all be the same and the mortgages must be issued by the same issuer. The minimum pool size is USD1 million; payments on Ginnie Mae® I MBS have a stated 14-day delay (payment is made on the 15th day of each month). The Ginnie Mae® II MBS allows multiple-issuer pools to be assembled, which in turn allows for larger and more geographically dispersed pools as well as the securitization of smaller portfolios. A wider range of coupons is permitted in a Ginnie Mae® II MBS pool, and issuers are permitted to take greater servicing fees – ranging from 25 to 75 basis points. The minimum pool size is USD250 000.00 for multi-lender pools and USD1 million for single-lender pools. The Ginnie Mae® II MBS have an additional five-day payment delay because issuer payments are consolidated by a central paying agent (payment is made on the 20th day of each month). See also Ginnie Mae® Platinum Securities, Government National Mortgage Association, and Real Estate Mortgage Investment Conduit. / , например, . (Дьжини Мэй® (Ginnie Mae®) или Дьжи.Эн.Эм.Эй. (GNMA)) и (Фэни Мэй (Fannie Mae) или Эф.Эн.Эм.Эй. (FNMA)). Фрэди Мэк (Freddie Mac) или Эф.Эйч.Эл.Эм.Си. (FHLMC).

MORTGAGE BANK = ИПОТЕЧНЫЙ БАНК (или БАНК ПО ЗАКЛАДНЫМ) – Mortgage Bank is joint-stock bank primarily engaged in mortgage and public-sector lending business. There are also public-sector mortgage banks whose main objective is the financing of residential construction and public investments. Capital is raised by the sale of mortgage bonds (Pfandbriefe) and public-sector debentures (Kommunalobligationen). Banks operating in this field of business are subject to the German Pfandbrief Act. A bank specialized in granting mortgage loans. Mortgage Banks focus on the long-term loans business and raise funds on the capital markets by issuing mortgage-backed securities. / Банк, специализирующийся в предоставлении долгосрочных ссуд с ипотечным покрытием (под залог недвижимости).

MORTGAGE BANKS ACT = АКТ ОБ ИПОТЕЧНЫХ БАНКАХ (или АКТ О БАНКАХ ПО ЗАКЛАДНЫМ) – In Germany, the Mortgage Banks Act (Hypothekenbankgesetz) governed the rights and obligations of mortgage banks in Germany. This Act, which was superseded on 2005-July-19 by the Pfandbrief Act, only remains valid in context with transitional provisions. It regulates the organization and business activities of private mortgage banks as well as their supervision by the state. It stipulates that mortgage banks must restrict their activities to the extension of mortgage loans, public-sector debentures (Kommunaldarlehen) and the issue of 'Pfandbriefe', all of which are subject to constant supervision by a government authority. Secondary business is permitted to a limited extent. / Фандбрифэ (Pfandbriefe).

MORTGAGE BOND = ОБЛИГАЦИЯ С ИПОТЕЧНЫМ ПОКРЫТИЕМ (или ОБЛИГАЦИЯ ПОД ЗАКЛАДНУЮ) – Certificate stating that a mortgage has been taken out and that a property is security against default. In Germany, a Mortgage Bond is a fixed-income security (debt instrument) placed by a private mortgage bank, a ship mortgage bank or a public sector bank to procure capital for the issuer. The capital is allocated in exchange for the assignment of mortgages as loans, in particular, for home financing. A trustee ensures that the mortgage bonds (Pfandbriefe) are always backed by mortgages of the same amount carrying at least the same interest rate. Mortgage bonds (Pfandbriefe) are traded on the exchanges. Use of the term 'Pfandbrief' is regulated by law. Mortgage bonds (Pfandbriefe) usually offer a somewhat higher return than government bonds, but in their ratings the issues are considered to be equivalently secure. Mortgage bonds (Pfandbriefe) are eligible as investments of ward money, as collateral for lombard loans and as premium reserve fund investments. Embody a money claim on the Central Mortgage Bond Institute of the Swiss Cantonal Banks or the Mortgage Bank of the Swiss Mortgage Institutions. Depending on the market situation, mortgage bonds offer a higher return than other forms of fixed-interest investment. Bond issue secured by a mortgage on the issuer's property, the lien on which is conveyed to the bondholders by a deed of trust. Also known as Mortgage-Backed Bond. Document by which the drawer of a draft gives instructions to the bearer to facilitate the transaction with the drawee. Mortgage Bond is a bond secured by a mortgage on a property. The value of the property may or may not equal the value of the bond issued against it. See also Bond, and Debenture. / Облигация, обеспеченная залогом имущества. Стоимость этого имущества может или не может быть эквивалентной стоимости облигации, выпущенной под него. Смотрите также Облигация (Bond) и Долговое Обязательство (Debenture). Облигация с Ипотечным Покрытием – облигация, исполнение обязательств по которой обеспечивается залогом ипотечного покрытия. Облигация, Обеспеченная Закладной (ипотекой):- выпуск облигаций, обеспеченных закладной на собственность выпустившей их стороны, право конфискации которой передаётся акционерам по доверенности. Ипотечная закладная может иметь такие обозначения, как 'старшая', 'основная', 'первая', 'приоритетная', 'исключительная', 'юниорская', 'вторая', 'третья' и так далее, в зависимости от приоритета права конфискации имущества. Большинство облигаций, выпущенных корпорациями, является облигациями с первичным ипотечным залогом, обеспеченными конкретной недвижимостью, и также представляют собой необеспеченные претензии на общие активы фирмы. Эти облигации пользуются привилегированной позицией по отношению к необеспеченным облигациям выпустившей их корпорации. Смотрите также Consolidated Mortgage Bond; и Mortgage.

MORTGAGE DEBENTURE = ДОЛГОВОЕ ОБЯЗАТЕЛЬСТВО С ИПОТЕЧНЫМ ПОКРЫТИЕМ (или ДОЛГОВОЕ ОБЯЗАТЕЛЬСТВО ПОД ЗАКЛАДНУЮ) – Mortgage Debenture is a long term corporate debt security normally secured by a fixed charge on specified properties and ranks ahead of ordinary debentures offering the highest degree of security among corporate bonds.

MORTGAGE LOAN = ССУДА С ИПОТЕЧНЫМ ПОКРЫТИЕМ (или ССУДА ПОД ЗАКЛАДНУЮ) – In Germany, Mortgage Loan is a loan secured by a mortgage entered in the Land Register. Mortgage Loan is a temporary and conditional pledge of property to a creditor as security for the repayment of debt. Mortgage Loan is a loan secured by a mortgage on real property. In granting these loans, the banks differentiate between mortgage investments, fixed advances and loans secured by a mortgage (indirect mortgage loan) and current account loans secured by a mortgage (construction loan). See also Appurtenance Lien. / выплата (repayment) . Ипотечное жилищное кредитование.

MORTGAGE MARKET = РЫНОК ЗАКЛАДНЫХ – Mortgage Market is a general name for supply and demand of borrowers seeking mortgage funds and lenders willing to invest in mortgages, This is the primary mortgage market. Existing mortgages are bought and sold on the secondary mortgage market. In the United States, the government has helped promote an orderly mortgage market through the Government National Mortgage Association (GNMA or Ginnie Mae®) and the Federal National Mortgage Association (FNMA or Fannie Mae). / (Дьжи.Эн.Эм.Эй. (GNMA) или Дьжини Мэй® (Ginnie Mae®)) и (Эф.Эн.Эм.Эй. (FNMA) или Фэни Мэй (Fannie Mae)).

MORTGAGE NOTE = БИЛЕТ С ИПОТЕЧНЫМ ПОКРЫТИЕМ (или НОТА ПОД ЗАКЛАДНУЮ) – Mortgage Note is a security which is vested by a personal claim and secured by a lien or mortgage on real estate property. It incorporates both the claim and its lien.

MORTGAGE RATES = СТАВКИ ПО ЗАКЛАДНЫМ – Mortgage Rates are the rates that banks charge for loans to homeowners with the home used as collateral for the loan. Fixed-rate mortgage rates are fixed over the term of the loan whereas adjustable-rate mortgages (ARMs) vary over the term of the loan.

MOSAIC = МОЗАИКА (или МОЗАИЧНОСТЬ, или МОЗАИЧНАЯ БОЛЕЗНЬ) – Mosaic is the mottled patchy pattern on leaves caused by a virus. The arrangement of leaves on the upper stem to avoid shading. / крапчатый бляшечный/бляшковый узор на листьях, вызванный Вирусом. Под Мозаичными Болезнями, от Французского слова Mosaique, Растений понимаются болезни, вызываемые Вирусами. Вредоносны мозаики Капусты, Огурца, Свёклы, Табака, Томата и других. На листьях и плодах зелёные пятна различной интенсивности, формы и величины. Мозаичные Болезни Растений, группа вирусных болезней Растений, характеризующихся мозаичной (пёстрой) расцветкой поражённых органов (главным образом листьев и плодов), чередованием пятен разнообразной величины и формы, окрашенных в зелёный цвет различной интенсивности. Мозаичные болезни Растений распространены повсеместно. Значительно снижают урожай, ухудшают качество продукции. При мозаичных болезнях меняется форма листовой пластинки растения, оно отстаёт в росте. Патологические изменения происходят главным образом в хлорофиллоносных тканях; поражается палисадная паренхима, идёт распад одних пластид, в других снижается содержание хлорофилла, в результате чего падает энергия фотосинтеза и в листьях уменьшается содержание углеводов; отдельные клетки и участки тканей отмирают. Мозаичные болезни растений легко передаются через семена, с соком больных Растений во время пикировки рассады, при пасынковании, соприкосновении больных и здоровых Растений и лёгком взаимном травмировании их, например, при ветре. Механические переносчики Вируса – Тли, Клопы, Клещи, почвенные Нематоды. Вирус проникает в Растение через повреждённые ткани; сохраняется в почве, растительных

остатках и семенах. Из мозаичных болезней Растений наиболее вредоносны:- мозаика Табака и Томата (возбудитель – Nicotina Virus), зелёная мозаика Огурцов и обыкновенная огуречная мозаика (возбудитель – Cummis Virus), крапчатая мозаика Картофеля и морщинистая мозаика Картофеля (возбудители соответственно – Solanum Virus 1 и Solanum Virus 2), мозаика Свёклы (возбудитель – Beta Virus 2), мозаика Капусты (возбудитель – Brassica Virus 3), а также мозаика Сои, Гороха, Фасоли, мозаичные болезни плодовых деревьев, Кустарников и декоративных Растений. О мерах борьбы смотрите в статье Вирусные Болезни Растений.

MOSQUITO NETTING = МОСКИТНОЕ СЕТНОЕ ПОЛОТНО – Mosquito Netting is a coarsely meshed, net fabric used to make mosquito nets to place over windows and beds to keep mosquitoes out. See also Net.

MOSS CRÊPE = ЗАФИЛЬЦОВАННЫЙ КРЭП (или МШИСТЫЙ КРЭП) – Officially, Moss Crêpe is made in a plain or dobby weave with rayon yarns that produce the moss-like effect. In practice, however, the term refers to any crêpe, including polyester, considered to have a moss-like surface. See also Weaving. Moss Crêpe:- Mossy Crêpe or Sand Crêpe (trade mark). Has a fine moss effect created by plain weave or small Dobby. Made with a spun-rayon warp and a filament rayon filling. The two-ply warp yarn is very coarse and bulkier than the filling. Mostly made in rayon and synthetics but some in silk. / Основная пряжа в два сложения , нежели уточина.

MOSS FRINGE = ЗАФИЛЬЦОВАННАЯ БАХРОМА (или МШИСТАЯ КАЙМА) – Moss Fringe is a short and thick fringe made of fluffy of woolen or acrylic yarns. / Бахрома по Кромке – порок ткани размером более 1.5 см с одной стороны и более 2 см с другой стороны.

MOSS GREEN = МХОВО–ЗЕЛЁНОЕ (или ХХ) – Moss Green:- a variable color averaging a mod yellow-green.

MOSSY COTTON = ЗАПУШЁННЫЙ ХЛОПОК – Mossy Cotton:- that which has considerable amounts of short and immature fiber content. / Хлопок, содержащий значительное количество короткого и незрелого волокна.

MOST FAVORED NATION = НАИБОЛЕЕ БЛАГОПРИЯТСТВУЕМАЯ НАЦИЯ – Most Favored Nation is a basic principle of the General Agreement on Tariffs and Trade (GATT) which requires countries to treat imports from one GATT member no less favorably than imports from another GATT member. / Наиболее Благоприятствуемая Нация относится к базовому принципу Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)), который требует от стран использовать режим ввоза из одной страны участницы ГСТТ не менее благоприятный, чем из другой страны участницы ГСТТ.

MOST FAVORED NATION TREATMENT = РЕЖИМ НАИБОЛЕЕ БЛАГОПРИЯТСТВУЕМОЙ НАЦИИ – Most Favored Nation (MFN) Treatment:- a commitment that a country will extend to another country the lowest tariff rates it applies to any other country. All contracting parties undertake to apply such treatment to one another under Article I of the General Agreement on Tariffs and Trade (GATT). When a country agrees to cut tariffs on a particular product imported from one country, the tariff reduction automatically applies to imports of this product from any other country eligible for most-favored nation treatment. This principle of nondiscriminatory treatment of imports appeared in numerous bilateral trade agreements prior to establishment of GATT. A country is under no obligation to extend most-favored nation (MFN) treatment to another country unless both are bilateral contracting parties of the GATT or MFN treatment is specified in a bilateral agreement. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) . В международном праве принцип наибольшего благоприятствования является одним из важнейших принципов регулирования экономических, в том числе торговых, отношений между государствами. Он означает, что каждое из договаривающихся государств обязуется предоставлять другому такие же права и льготы в той или иной области их взаимоотношений, которые оно уже предоставило или предоставит в будущем любому третьему государству.

MOTES = КОМОЧКИ – Mote is a small piece of seed or vegetable matter in cotton. Motes are removed by boiling the fiber or fabric in sodium hydroxide, then bleaching. When not removed, they can leave a dark spot in the fabric. Motes are the small black specks seen in cotton yarn or cloth. They were not removed by the cotton gin or the successive machines through which the cotton passed from raw stock to spun yarn or woven cloth. / пятно. Небольшие чёрные мушки (крапинки), встречающиеся в пряже или ткани из хлопка. Они не были удалены хлопковым джином или последующими машинами, через которые проходило хлопковое волокно с тем, чтобы превратиться в готовую пряжу или сотканную ткань.

MOTES = ОРЕШЕК (или (ВОЛОКНИСТЫЙ) УЛЮК, или ПАУЧКИ) – Motes are a small group of short fibers often attached to a portion of the seed or to an immature seed. In the United States, mote is immature seed with short, immature fiber attached. Motes are a small group of short fibers attached to a piece of the seed or to an immature seed. Motes may be cleaned and baled. Another by-product of the gin is Motes. Motes are small, immature seeds with attached fiber that are removed at a different stage of the gin stand than the mature seeds. The fiber can be removed from the motes using a delinting machine. This fiber is called gin mote fiber and is used in nonwoven products. Motes are the cotton waste material from cotton ginnig process, primarily resulting from the lint cleaning operation. Motes can be reclaimed and sold for use in padding and upholstery filling, nonwovens, and some open-end yarns. A Mote, which is the impurity found in cotton consisting of a seed fragment encompassed by cotton fibers. Gin Motes are the short fragments of unmanufactured cotton fiber removed from lint cleaners after ginning cotton Very small pieces of seed or small immature seeds found in almost any ginned cotton, a large quantity of which detracts from the value of the fiber. Motes can be either fuzzy (immature seeds on which fiber development ceased at an early stage) or bearded (a piece of seed coat with long fibers attached). Both are often termed seed coat neps. See also Gin Motes. Motes are the small particles of cotton seed or other parts of the cotton plant or hulls. Under the name of Motes, nearly all of the impurities following upon bad ginning have been grouped. Whole seeds, broken parts of seeds, seed ends and the fibers that become separated from the general mass to wind themselves about the heavier forms of trash, in fact all fibered masses detached from the smoother layer of the main body are to be designated Motes. These fibered masses may be cleared by the cleaning processes at the mills, but such separation involves the probable loss of other fibers or parts of fibers to be caught up in the severance. This latter probability leads us to presuppose the introduction of broken and shortened fibers into the cleared mass, by which it would be to some extent reduced in value. As to whole seeds and fatty seed ends I have just presented this phase of Motes in my discussion of Oil Stain. Motes are considered heavy impurities and because of their tenacity to the body of fibers about them, they have been classed to that extent. Inseparable. A small trace of Motes, an occasional immature seed, and the shell or split hull also, as incidentals, may be found in the higher grades. But Motes indicate bad ginning and when found in quantity are usually accompanied by gin cut. Therefore where Motes are found as a prominent impurity cotton is to be placed in the lower grades. / развод (или потёк (stain)). Паучки – неразвившиеся семена Хлопчатника различные по массе, покрытые незрелым волокном различной окраски. Незрелые волокна хлопка (паучки). Улюкосодержащие Отходы представляют собой массу, состоящую из неразвившихся и битых семян Хлопчатника с разной степенью опушенности, пороков хлопкового волокна, свободного волокна, кожицы семян без волокон и сорных примесей. Отходы улюкосодержащие получают в результате очистки на очистителе волокнистых материалов отходов переработки хлопка-сырца, выделившихся после джинов; после семеочистителей, установленных перед первым линтерованием; после комплекса технологического оборудования регенерации волокна (или от регенератора волокна) при извлечении прядомого волокна из отходов от волокноочистителей

всех марок и конденсоров волокна. Волокнистый Улюк:- к волокнистому улюку относят очищенные волокнистые отходы от джинов, волокноочистителей всех марок, семеочистителей до первого линтерования, регенераторов при переработке волокнистых отходов I и II сортов хлопка-сырца и конденсоров хлопкового волокна. Волокнистый улюк по внешнему виду представляет собой массу недоразвитых щуплых семян (улюка) Хлопчатника с различной степенью опушенности с примесью сцепившегося вместе с улюком волокна в свободном состоянии, волокнистых пороков и сора. Волокнистый улюк в зависимости от сорта хлопка-сырца, массовой доли чистой волокнистой части и цвета делят на два типа:- (i) 1-й – получаемый при переработке I и II сортов хлопка-сырца; и (ii) 2-й – получаемый при переработке III и IV сортов хлопка-сырца. Волкнистый улюк должен соответствовать следующим требованиям:- (1) Цвет Общей Массы:- для 1-го типа – от белого до бледно-желтоватого, для 2-го типа – от кремовато-жёлтого до светло-бурого; (2) Массовая Доля Чистой Волокнистой Части:- для 1-го типа – не менее 40%, для 2-го типа – не менее 30%; (3) Массовая Доля Сорных Примесей:- для 1-го типа – 14%, для 2-го типа – 20%; (4) Нормированная Влажность:- для 1-го типа – 10%, для 2-го типа – 14%; (5) Орешек (недоразвитые семена, покрытые подпушком, щуплые семена, дроблёные семена и кожица семян без волокон):- не нормируется. Примечания:- (1) Волокнистый Улюк 1-го типа массовой доли чистой волокнистой части менее 40% относят ко 2-му типу. (2) Массовая доля сорных примесей волкнистого улюка допускается до 25%. К массовой доле чистой волокнистой части относят:- недоразвитые семена, покрытые волокном (волокнистый улюк), волокнистые пороки (жгутики, комбинированные жгутики, блестящий пластик незрелого волокна, кожица с волокном и пухом, узелки), а также свободное волокно. К засорённости относят:- частицы листка, прицветника, стебля, ветвей и коробочек хлопчатника, целые семена, а также пыль, землю и песок. В волокнистом улюке не допускается наличие проволоки, камней и обрывков шпагата. Тип волокнистого улюка определяют по внешнему виду путём сравнения с образцами, утверждёнными в установленном порядке. Основные образцы волокнистого улюка изготавливали и хранили в бывшем СССР в Центральном Научно-Исследовательском Институте Хлопкоочистительной Промышленности (ЦНИИХпром). Срок действия образцов – 5 лет. Для хлопкозаводов и предприятий-потребителей ЦНИИХпром изготавливали дубликаты образцов.

MOTE TRASH = КОМОЧКОВЫЙ СОР – Mote Trash:- xxxxx. See also Trash. Fabrics defect.

MOTH = МОЛЬ (или МОТЫЛЁК) – Moth is an adult of the insect Order Lepidoptera, Suborder Heterocera. / Под Молями Настоящими понимается Семейство Бабочек. Крылья в размахе 6–60 миллиметров (мм). 2 000 видов. Распространены широко. В бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось около 200 Видов. Многие Настоящие Моли повреждают продовольственные товары, шерсть, мех, перо, мебель. Молями называют Бабочек и других Семейств. Моли Настоящие (Tineidae), Семейство Бабочек. Крылья в размахе от 6 (Meessia) до 60 миллиметров (мм) (Scardia). 2 000 Видов; распространены очень широко. В СССР около 200 Видов. Гусеницы в шёлковых ходах или чехликах; питаются растительными или животными остатками, грибами и лишайниками. Около 40 Видов – вредители; одни портят продовольственные запасы (особенно Зерновая Моль (Nemapogon Granellus)), другие – шерсть, мех, перо (Платяная Моль (Tineola Biselliella) и Мебельная Моль (Tineola Furciferella)). Молями называют также представителей других Семейств:- Выемчатокрылые Моли, Горностаевые Моли, Моли-Минеры и другие. Мотыльки, народное название некоторых Бабочек.

MOTHER CAREY'S CHICKENS = ЦЫПЛЯТА МАТУШКИ КЭРИ – Mother Carey's Chickens (maritime term):- small birds that foretell bad weather and bad luck.

MOTHER HUBBARD = МАТУШКА ХАБАД (или ФАРТУК) – Mother Hubbard:- a loose usually shapeless dress. / Матушка Хабад – персонаж детской песни. Длинное свободное платье у деревенских женщин. Фартук, одеваемый поверх другой одежды во время работы.

MOTHER–OF–ALL = МАТЬ ВСЕМУ – Mother-Of-All:- the whole stand that supports the maidens, bobbin, and flyer.

MOTHER VESSEL = МАТЕРИНСКОЕ СУДНО (или СУДНО МАТКА) – Mother Vessel is a main ocean vessel in a liner service designated to move containers from set origin points to set destination ports/points on a regular basis.

MOTH REPELLENCY = РЕПЕЛЛЕНТНОСТЬ К МОЛИ (или ОТТАЛКИВАНИЕ В ОТНОШЕНИИ МОЛИ) – Moth Repellency is an example of the desirable qualities that can be given to fabrics in the finishing process. Some fabrics are treated with colorless chemicals, similar to dyestuffs, added to the dye bath. Another method atomizes the fabric with mothproofing chemicals. Fabrics that attract moths, such as woolens, can be treated for repellency. The treatment also repels other insects, such as carpet beetles. Wool rugs are almost always treated for moth repellency today. See also Repellency.

MOTIF = МОТИВ – Motif is a design or color used alone or repeated on a fabric.

MOTLEY = МАТЛИ (или ПЁСТРАЯ, или РАЗНОЦВЕТНАЯ) – Motley is a woolen fabric of mixed colors made in England between the XIV and XVII centuries. A garment made of motley fabric, namely a woolen fabric of mixed colors made in England between the XIV and XVII centuries, especially the characteristic dress of the professional fool.

MOTOR = МОТОР (или ДВИГАТЕЛЬ) – Motor is a device which converts fluid power into mechanical force and motion. It usually provides rotary mechanical motion. / Под Двигателем (Engine) понимается энергосиловая машина, преобразующая какой-либо вид энергии в механическую работу. В зависимости от типа двигателя работа может быть получена от вращающегося ротора, возвратно-поступательно движущегося поршня или от реактивного аппарата. Двигатели приводят в действие рабочие машины, транспортные средства сухопутного, водного, воздушного и космического назначения, производственно-технологической установки, коммунальные и бытовые приборы и тому подобное. Двигатели, непосредственно преобразующие природные энергетические ресурсы (топливо, энергию ветра, воды и другие) в механическую энергию, называются Первичными Двигателями (паровые, ветряные, гидравлические и другие). Наибольшую группу среди первичных двигателей составляют тепловые двигатели, использующие химическую энергию топлива или атомную энергию. Двигатели, преобразующие энергию первичных двигателей в механическую работу, называются Вторичными Двигателями (электрические, пневматические, некоторые типы гидравлических и другие). Устройства, отдающие накопленную механическую энергию, также относят к двигателям (инерционные, пружинные, гиревые механизмы). По назначению двигатели разделяют на стационарные, то есть установленные неподвижно; передвижные, используемые на движущихся рабочих машинах; транспортные, применяемые на различных видах транспортных средств. Первым в истории человечества механическим двигателем было водяное колесо, применявшееся для оросительных систем в странах Древнего Востока, в Египте, Китае, Индии. В средние века водяные колёса получили распространение в странах Европы как энергетическая база мануфактурного производства. В этот же период широко применялись ветряные двигатели. Примерно с XIII века предпринимались попытки создания вечного двигателя. Переход к машинной технике, начавшийся с середины XVIII века, требовал создания двигателей, не зависящих от местных источников энергии (воды, ветра и тому подобных). Первым двигателем, использующим тепловую энергию топлива, была поршневая пароатмосферная машина прерывного действия, появившаяся в конце XVII – начале XVIII веков (проекты Французского физика Двигатель Папа (или Папена; Papin Engine;

Дони Папа (Denis Papin); 1647–1712) и Английского механика Томэса Сэйвэри (Thomas Savery; 1650–1715), усовершенствованные в дальнейшем Томэсом Ньюкомэном (Thomas Newcomen; 1663–1729; в 1712) в Англии и Мортэном Триэвальдом (Mårten Triewald; 1691–1747) в Швеции). Пароатмосферные Двигатели значительного распространения не получили. Проект универсального парового двигателя был предложен в 1763 Русским механиком Иваном Ивановичем Ползуновым (1728–1766), который сдвоил в своей машине цилиндры, получил двигатель непрерывного действия. Вполне развитую форму универсального теплового двигателя получил в 1784 в паровой машине Английский механик Дьжеймз Вот (или Ватт (James Watt); 1736–1819). Внедрение паровых машин обусловило независимость размещения промышленного производства от природных источников энергии и привело к быстрому развитию промышленности на новой энергитической основе. К 1880 мощность использовавшихся в мировом хозяйстве паровых машин превысила 26 миллионов кВт (35 миллионов лошадиных сил (лс)). Во второй половине XIX века в процессе дальнейшего совершенствования энергетической базы производства были созданы два новых типа тепловых двигателей:- паровая турбина и двигатель внутреннего сгорания (двс). В паровых турбинах, получивших распространение после 1884 (патенты Английского учёного Чарлза Алдьжёнона Пасэнза (Charles Algernon Parsons; 1854–1931), Шведского изобретателя Каля Гюстава Потрикя дэ Ляваля (Karl Gustaf Patrik de Laval; 1845–1913)), энергия пара преобразуется в энергию вращающегося вала без кривошипно-шатунного механизма. Паровые турбины открыли широкие возможности наращивания мощности единичного агрегата и стали основным двигателем крупных электрических станций. С начала XX века мощность паровых турбин непрерывно увеличивалась, достигнув в 1960-х 1 200 МВт в одном агрегате. Первый практически пригодный двс был сконструирован в 1859 Бельгийским инженером Жо Жозэфом Этьеном Лёнуаром (Jean Joseph Étienne Lenoir; 1822–1900). В 1876 Николяус Аугуст Ото (Nikolaus August Otto; 1832–1891) в Германии создал более совершенный 4-тактный газовый двигатель. По сравнению с паровой машиной двс, освобождённый от парокотельного агрегата, имел более высокий коэффициент полезного действия (кпд), был более простым и компактным двигателем. В 1897 Немецкий инженер Рудольф Кристиан Кал Дизэль (Rudolf Christian Karl Diesel; 1858–1913), работая над повышением эффективности двигателя, предложил двс с воспламенением от сжатия (смотрите Дизель). Дальнейшее усовершенствование этого двигателя позволило применить в качестве дешёвого топлива нефть, в результате чего двс становится экономичным стационарным двигателем. В то же время двс получает широкое распространение на транспорте. В 1960-е около 80% суммарной мощности всех существующих двигателей падает на долю транспортных (смотрите Автомобильный Двигатель, Судовой Двигатель). Например, общая мощность автомобильных двигателей во всех странах мира превысила 11 миллиардов кВт (15 миллиардов лс). Параллельно с развитием тепловых двигателей совершенствовалась конструкция первичных гидравлических двигателей, особенно гидротурбин (проекты Французского инженера Бенуа Фурнейро (Benoît Fourneyron; 1802–1867), Американского изобретателя Лэстёра Элэна Пэлтэна (Lester Allan Pelton; 1829–1908), Чешского инженера Австрийского происхождения Викто Капляна (Viktor Kaplan; 1876–1934) и других). Создание мощных гидротурбин позволило строить гидроэнергетические агрегаты большой мощности (до 600 МВт) и создавать крупные ГЭС в местностях, где имеются большие реки, водопады и тому подобное. Важнейшие сдвиги в развитии энергетической базы промышленного производства были связаны с изобретением и применением электрических двигателей. В 1831 Английский физик-экспериментатор и химик Майкэл Фэрэдэй (Michael Faraday; 1791–1867) открыл явление электромагнитной индукции, а в 1834 Русский физик и электротехник Борис Семёнович Якоби (или Морыц Хэрман фон Якоби (Moritz Hermann von Jacobi); 1801–1874) создал первый электрический двигатель постоянного тока, пригодный для практических целей. Однако только с 1870-х двигатели постоянного тока получают широкое применение благодаря созданию источников дешёвой электроэнергии (генераторов постоянного тока) и усовершенствованию конструкции двигателей электротехниками Антонио Пачинотти (Antonio Pacinotti; 1841–1912) в Италии и Зенобэм Теофилем Граммом (Zénobe Théophile Gramme; 1826–1901) в Бельгии. В 1888–89 Русский инженер электротехник Михаил Осипович Доливо-Добровольский (1861–1919) создал трёхфазную короткозамкнутую асинхронную электрическую машину (смотрите Асинхронный Электродвигатель). В последующие годы конструкция электрических машин совершенствовалась, были созданы электрические двигатели в широком диапазоне мощностей – от долей Вт до десятков МВт. Асинхронные электрические двигатели просты в изготовлении, надёжны в эксплуатации, что обусловило их широкое распространение в промышленности. Электропривод в XX веке стал основным фактором развития энергетики, обусловив постепенное её расчленение на две самостоятельные системы. Первичные двигатели (например, турбогенераторы, гидрогенераторы) концентрируются преимущественно на тепловых электростанциях и ГЭС, а электрические двигатели образуют параллельную систему конечных приёмников тока, установленных на предприятиях различных отраслей народного хозяйства. Электрические двигатели получают также широкое применение в бытовом обслуживании (швейные, стиральные, кухонные машины, холодильники, электробритвы и тому подобное). В первой половине XX века были созданы новые типы практически пригодных тепловых двигателей – газовая турбина, реактивный двигатель, ядерная силовая установка. Газовые турбины стали основой авиационного двигателестроения (смотрите Авиационный Двигатель), распространяются в локомотивостроении (газотурбовозы), на автомобилях и так далее. Реактивные двигатели позволяют реализовать огромные мощности в одном агрегате. Суммарная мощность двигателя ракеты, которая в 1961 вывела на орбиту первый космический корабль Восток, пилотируемый Юрием Алексеевичем Гагариным (1934–1968), составляла 14 миллионов кВт (около 20 миллионов лс), что примерно равно мощности всех электростанций бывшего СССР в 1948. Мощность двигателя ракеты-носителя Протон (1965–68) превышала 45 миллионов кВт (около 60 миллионов лс) (смотрите также Ракетный Двигатель). В промышленности бывшего СССР свыше 85% мощности было сосредоточено в электрических двигателях и установках. В сельском хозяйстве в 1968 на долю двс приходилось около 90% общей мощности двигателей (смотрите Тракторный Двигатель). Мощность двигателей в народном хозяйстве бывшего СССР непрерывно росла. В 1967 мощность выпущенных двигателей увеличилась по сравнению с 1960 в 1.8 раза и составила по паровым и гидравлическим турбинам 14.7 миллионов кВт, по дизелям (без автотракторных) 11 миллионов кВт. В том же 1967 было выпущено свыше 5 миллионов электрических двигателей суммарной мощностью около 30 миллионов кВт. Для обеспечения сложных по режиму условий работы применяется комбинирование двигатели различных типов, например, паровые турбины устанавливаются совместно с двс или газовыми турбинами, разрабатываются проекты комбинированных ракетных двигателей, в которых сочетаются реактивные и жидкостные ракетные двигатели (например, турборакетные или ракетно-прямоточные). Рост энергосистем, комплексная механизация и автоматизация производства, совершенствование транспорта, расширение космических исследований определяют пути дальнейшего развития двигателей. Непрерывно увеличивается мощность первичных двигателей электрических станций, совершенствуется их конструкция, ведутся работы по созданию установок термоядерного синтеза, двигателя внешнего сгорания, новых типов ракетных двигателей (ионных, плазменных, фотонных и других). Для транспортного двигателестроения важными являются работы по созданию экономичных роторных беспоршневых и роторно-поршневых двс (смотрите, например, Дигатель Ванкэля (Феликс Хайнрихь Ванкэль (Felix Heinrich Wankel); 1902–1988; в 1957 Немецким инженером-механиком и изобретателем)), электрических автомобильных и малогабаритных атомных двигателей. За рубежом (США) ведутся работы по использованию для автомобильного транспорта двигателей внешнего сгорания (смотрите Двигатель Стёлина (Шотландский министр Робэт Стёлин (Robert Stirling); 1790–1878; в 1816)) в комбинации с электрическим двигателем. Важнейшим направлением развития

энергетической техники во второй половине XX века является преобразование химической и тепловой энергии топлива при помощи топливных элементов и магнитогидродинамических генераторов непосредственно в электрический ток для питания двигателя. Развитие атомной энергетики, реактивной техники, безмашинных генераторов тока в соединении с двигателями большой мощности откроет новые перспективы в развитии производительных сил общества.

MOTOR BEARING = МОТОРНЫЙ ПОДШИПНИК – Motor Bearing is a bearing which supports the crankshaft in an internal-combustion engine. It is a support or guide by means of which a moving part is positioned with respect to the other parts of a mechanism. See also Bearing.

MOTOR BRIDGE = АВТОМОБИЛЬНЫЙ МОСТ (или МОТОРНЫЙ УЧАСТОК, или МОТОРНЫЙ ОТРЕЗОК) – Motor Bridge:- cargo that moves via truck overland to US West Coast. / Груз, перевозимый в грузовиках по суше к Западному Побережью США.

MOTOR CARRIER = АВТОМОБИЛЬНЫЙ ПЕРЕВОЗЧИК (или МОТОРНЫЙ ПЕРЕВОЗЧИК) – A Motor Carrier is defined as 'a person providing commercial motor vehicle (as defined in §31132) transportation for compensation'. 49 USC §13102(14); 49 USC is short for the United States Code:- Title 49. Refers to a trucking company. A term used to indicate a company which moves trailers via highway. / Относится к автоперевозочной компании. Термин, используемый для обозначения компании, которая перевозит прицепы по автомобильным дорогам.

MOTOR GASOLINE = МОТОРНЫЙ БЕНЗИН (или АВТОМОБИЛЬНЫЙ БЕНЗИН, или МОТОРНЫЙ ГАЗОВЫЙ БЕНЗИН, или МОТОРНЫЙ ГАЗОЛИН) – Motor Gasoline consists of a mixture of light hydrocarbons distilling between 35 °C and 215 °C. It is used as a fuel for land-based spark ignition engines. Motor gasoline may include additives, oxygenates – Methyl Tertiary Butyl Ether (MTBE) and octane enhancers. There are two kinds of motor gasoline:- (i) Leaded Motor Gasoline with tetraethyl lead and/or tetramethyl lead added to enhance octane rating; and (ii) Unleaded Motor Gasoline where compounds have not been added to enhance octane rating, and it may contain traces of organic lead. This category may include motor gasoline blending components (excluding additives/oxygenates), e.g., alkylates, isomerate, reformate and/or cracked gasoline destined for use as finished motor gasoline. A complex mixture of relatively volatile hydrocarbons, with or without small quantities of additives, which have been blended to form a fuel suitable for use in spark-ignition engines. See also Conventional Gasoline, Oxygenated Motor Gasoline, and Reformulated Motor Gasoline. Motor Gasoline is the principal fuel used in the transport/road sector and accounts for some 25% of total oil use in the world. In some countries, for example in the United States, motor gasoline consumption is almost half of total oil consumption. Motor gasoline is a complex mixture of relatively volatile hydrocarbons used for sparkignition internal combustion engines. Gasoline is produced in refineries as the result of primary distillation of crude oil and then further processing, including changing the molecular structure, until the required specifications are met. The characteristics of the gasoline produced depend on the type of crude oil that is used and the setup of the refinery at which it is produced. Motor gasoline may include some quantities of additives and blending components to improve fuel properties such as, e.g., octane number, stability and deposit formation in engines. Gasoline characteristics are also impacted by other ingredients that may be blended into it, such as ethanol. The performance of the gasoline must meet industry standards and environmental regulations that may depend on location. The Joint Oil Data Initiative (JODI) definition of gasoline also includes aviation gasoline which is used in aviation piston engines. Aviation gasoline is a mixture of many different hydrocarbon compounds. The specification requirements for aviation gasoline, especially anti-knock, volatility, fluidity, stability, corrosiveness, and cleanliness impose severe limitations on the compounds that can be used. / и добавки, увеличивающие октановое число. (а) Этилированный Автомобильный Бензин с тетраэтилсвинцом и/или тетраметилсвинцом; и (б) Неэтилированный Автомобильный Бензин, . например, алкилаты, изомерат, реформат и/или крекинг-бензин.

MOTOR GASOLINE BLENDING = КОМПАУНДИРОВАНИЕ МОТОРНОГО БЕНЗИНА (или КОМПАУНДИРОВАНИЕ АВТОМОБИЛЬНОГО БЕНЗИНА) – Mechanical mixing of motor gasoline blending components and oxygenates as required, to produce finished motor gasoline. Finished motor gasoline may be further mixed with other motor gasoline blending components or oxygenates, resulting in increased volumes of finished motor gasoline and/or changes in the formulation of finished motor gasoline, e.g., conventional motor gasoline mixed with Methyl Tertiary Butyl Ether (MTBE) to produce oxygenated motor gasoline. / или кислородосодержащие добавки (oxygenates). , например, .

MOTOR GASOLINE GRADES = СОРТА МОТОРНОГО БЕНЗИНА (или СОРТА АВТОМОБИЛЬНОГО БЕНЗИНА) – The classification of gasoline by octane ratings. Each type of gasoline (conventional, oxygenated, and reformulated) is classified by three grades:- regular, midgrade, and premium. In the United States, gasoline sales are reported by grade in accordance with their classification at the time of sale. In general, automotive octane requirements are lower at high altitudes. Therefore, in some areas of the United States, such as the Rocky Mountain States, the octane ratings for the gasoline grades may be 2 or more octane points lower. (i) Regular Gasoline:- Gasoline having an antiknock index, i.e. octane rating, greater than or equal to 85 and less than 88. (ii) Midgrade Gasoline:- Gasoline having an antiknock index, i.e. octane rating, greater than or equal to 88 and less than or equal to 90. (iii) Premium Gasoline:- Gasoline having an antiknock index, i.e. octane rating, greater than 90. Octane requirements may vary by altitude. In the United States, Regular – 87; Plus – 89; Supreme – 92/93; Supreme Plus – 94. / (а) Премиум или Высококачественный (или высшего качества, или высокооктановый). (б) Среднего Качества (или среднеоктановый). (в) Регуляр или Обычного Качества (или стандартный, или обычный, или нормальный, или низкооктановый). , то есть .

MOTOR INSURANCE = АВТОМОБИЛЬНОЕ СТРАХОВАНИЕ – Motor Insurance is a line of insurance which offers coverage for property, accident and liability losses involving motor vehicles. / Линия страхования, которая предлагает покрытие возможных убытков по имуществу, проишествию и ответственности, напрямую связанных с моторными транспортными средствами.

MOTORIZED PALLET TRUCK = МОТОРИЗОВАННЫЙ ГРУЗОВИК ДЛЯ ПОДДОНОВ – Motorized Pallet Truck:- there are two different types of motorized pallet trucks, the 'Walkie' and the 'Rider'. The 'Walkie' is built so that the operator can walk alongside it. The 'Rider' is built so that the operator can stand and ride on the truck. / Воки (Walkie) и Райдё (Rider).

MOTOR OIL = МОТОРНОЕ МАСЛО (или ДВИГАТЕЛЬНОЕ МАСЛО) – Motor Oil is an oil that is used to lubricate the moving components of an internal-combustion engine. Motor Oils are rated in terms of viscosity. The oils you cite are what are called Multi-Viscosity Oils. That is, their viscosity character changes in a non-linear way with temperature. Single viscosity oils thin as they get hotter, thicken as they get colder. A common oil some years ago ws 30 weight. In fact, simple power tools (lawnmowers) often still suggest such oils, they work well when air temperatures are stable such as in the summer. Multi-viscosity oils have the properties of the first number when cold (below 30 deg F) and the properties o the second number when hot (say above 100 deg F). These oils enable better winter operation, fuel economy and engine durability. So, a 10 weight oil is thicker than is a 5 weight oil. You need to read your owners manual carefully as the oil you use is very important. Generally, modern cars like 5W-30 year round. Older cars had larger bearing clearances and actually required the heavier 10W-30 or 10W-40 oils though, so check. Actually, the lower the number, the thinner the oil. 5W-30 means it is thin when cold, and the 30 means it is thicker when the engine is hot. You need thinner oil when starting to ensure adequate lubrication to the cylinders. Motor Oil, Engine Oil, or Engine Lubricant is any of various substances

(comprising oil enhanced with additives, for example, in many cases, extreme pressure additives) that are used for lubrication of internal combustion engines. The main function of motor oil is to reduce wear on moving parts; it also cleans, inhibits corrosion, improves sealing, and cools the engine by carrying heat away from moving parts. Motor oils are derived from petroleum-based and non-petroleum-synthesized chemical compounds. Motor oils today are mainly blended by using base oils composed of hydrocarbons, polyalphaolefins (PAO), and polyinternal olefins (PIO), thus organic compounds consisting entirely of carbon and hydrogen. The base oils of some high-performance motor oils contain up to 20% by weight of esters. Motor Oil is the refined lubricating oil, usually containing additives, used in internal combustion engines. Modern Engine Oil has been carefully developed by engineers and chemists to perform several important functions. The efficient operation of an engine depends on the oil to:- (i) Permit easy starting; (ii) Disperse soot; (iii) Lubricate engine parts and prevent wear; (iv) Reduce friction; (v) Protect against rust and corrosion; (vi) Help prevent sludge and varnish formation; (vii) Prevent combustion chamber deposits; (viii) Cool engine parts; (ix) Seal combustion pressures; (x) Resist foaming; and (xi) Provide fuel efficiency. Permit Easy Starting:- The ease of starting an engine depends not only on the condition of the battery, ignition and fuel quality, but also on the flow properties of the engine oil. If the oil is too viscous or heavy at starting temperatures, it will impose enough drag on the moving parts that the engine cannot be cranked fast enough to start promptly and keep running. Since cold temperatures thicken all oils, an oil for winter use must be thin enough to permit adequate cranking speeds at the lowest anticipated temperature. It must also be fluid enough to quickly flow to the bearings to prevent wear. In addition, the oil must be thick enough, when the engine reaches normal operating temperatures, to provide adequate protection. Viscosity is an important characteristic of an oil which is defined as the oil's resistance to flow. It can be measured in many ways, but a critical one for engine oil is referred to as the cold cranking temperature. It evaluates the ease with which the engine crankshaft can rotate at the specified temperature. This resistance, or fluid friction, keeps the oil from being squeezed out from between engine surfaces when they are moving under load or pressure. Resistance to motion or flow is a function of the molecular structure of the oil. Since it is this internal fluid friction that is responsible for most of the drag put on the starter during cranking, it is important to use an oil with viscosity characteristics that ensure ease of cranking, proper oil circulation, and high temperature protection. The effect of temperature on viscosity varies widely with different types of oil. For this reason, a calculation has been developed to quantify the amount of viscosity change with temperature, which is known as the Viscosity Index (VI). An oil with a high viscosity index is one that shows less change in viscosity with temperature variation. Today, through the use of enhanced refining methods and special chemical additives, many high viscosity index engine oils are light enough to enable easy cranking at low temperatures and yet will still be viscous enough to protect satisfactorily at high temperatures. These oils with high viscosity indexes are known as 'Multi-Grade' Oils. Often they are also called by names that imply all-season usage since they perform satisfactorily in both winter and summer. Multi-grade oils are most often recommended by vehicle manufacturers. Lubricate Engine Parts and Prevent Wear:- Once an engine is started, the oil must circulate promptly and lubricate all moving surfaces to prevent the metal-to-metal contact that would result in wear, scoring, or seizure of engine parts. Oil films on bearings and cylinder walls are sensitive to movement, pressure and oil supply. These films must be continually replenished by adequate flow and proper oil distribution. As mentioned earlier, the viscosity of an oil must be low enough at the starting temperature to permit rapid cranking and starting, and high enough at peak operating temperatures to ensure adequate separation of moving parts for guaranteed engine protection. Once the oil reaches the moving parts its function is to lubricate and prevent wear of the surfaces. Lubrication specialists describe several classes of lubrication. Full-film or elasto-hydrodynamic lubrication occurs when the moving surfaces are continuously separated by a film of oil. The determining factor in keeping these parts separated is the viscosity of the oil at its operating temperature. The viscosity must remain high enough to prevent metal-tometal contact. Since the metals do not make contact in full-film lubrication, wear is negligible unless the separated parts are scratched by particles larger or of equal size than the thickness of the oil film itself. Bearings on crankshafts, connecting rods, and camshafts normally operate with full-film lubrication. Under some conditions, it is impossible to maintain a continuous oil film between moving parts and there is intermittent metal-to-metal contact between the high spots (asperities) on sliding surfaces. Lubrication specialists call this mixed film lubrication. Under these circumstances, the load is only partially supported by the oil film. The oil film is ruptured resulting in significant metal-to-metal contact. When this occurs, the friction generated between the surfaces can produce enough heat to cause one or both of the metals in contact to melt and weld together. Unless counteracted by proper additive treatment, the result is either immediate seizure or the tearing apart and roughening of the surfaces. Boundary lubrication conditions exist during engine start-up and often during the operation of a new or rebuilt engine. Boundary lubrication is also found around the top piston ring where oil supply is limited, temperatures are high, and a reversal of piston motion occurs. Reduce Friction:- Under full-film lubrication conditions, a thick film of oil prevents metal-tometal contact between moving engine parts. Relative movement of these lubricated parts requires enough force to overcome the fluid friction of the lubricant. The viscosity of the oil should be high enough to maintain an unbroken film, but should not be higher than necessary, since this increases the amount of force required to overcome this fluid friction. Car manufacturers specify proper oil viscosity ranges according to expected ambient temperatures. This is to ensure that the lubricant will provide adequate, but not excessive, viscosity at normal operating conditions. When oil becomes contaminated, its viscosity changes. With soot, dirt, oxidation, or sludge, viscosity increases; with fuel dilution it decreases. Both directions of viscosity change are potentially harmful to the engine. For this reason, contaminant levels in engine oil must be kept low. This can be best accomplished by changing the oil and filter at proper intervals. If an engine oil does not disperse contaminants properly, the oil filter will plug and go into bypass allowing the contaminants to cause damage to the internal parts of the engine. The amount and type of chemical additives is important for reducing friction under the extreme pressure conditions of boundary lubrication. The proper balance of the total additive system in a modern engine oil is critical if all lubrication conditions of an engine are to be satisfied. The oil formulator can achieve this balance of motor oil compounding only through much research, with emphasis on proof-testing in actual engines, both in the laboratory and in field service. Protect Against Rust and Corrosion:- For each gallon of fuel burned in an engine, more than one gallon of water is formed. Although most of this water is in vapour form and goes out the exhaust, some condenses on the cylinder walls or escapes past the piston rings and is trapped, at least temporarily, in the crankcase. This occurs most frequently in cold weather before the engine has warmed up. In addition to water and the by-products from incomplete combustion of the fuel, other corrosive combustion gases also get past the rings and are condensed or dissolved in the engine oil. Add to this the acids formed by the normal oxidation of oil and the potential for rust and corrosive engine deposits becomes significant. The life of engine parts depends in part on the ability of the motor oil to neutralize these corrosive substances. Thanks to much research, effective oil-soluble chemical compounds have been developed. These are added to engine oils during manufacture to provide vital protection to engine parts. Help Prevent Sludge and Varnish:- In formulating today's high quality motor oils, a basic objective is not only to keep engine parts clean, but also to prevent sludge and varnish deposits from interfering with proper engine operation. Engine sludge formation is generally a problem of low engine temperature operation. Engine sludge deposits are formed by combinations of water from condensation, dirt and the products of oil deterioration and incomplete combustion. Sludge-forming materials are often so small initially that no oil filter can remove them. They are much smaller than the thickness of the oil film on engine parts and therefore cause no wear or damage so long as they remain small and well-dispersed. However, as their levels increase in the oil during use, they tend to join together to form larger masses and oil flow can be restricted. Sludge formation is aggravated by water vapour which condenses in the crankcase in cold engine operation. The rate at which sludge-forming materials accumulate in the crankcase oil is related to several factors of engine operation. Factors such as, rich air-fuel

mixtures which occur during starting or when a choke is sticking; operating with dirty air cleaners; or cases of ignition misfiring, increase the rate of sludge accumulation in the oil. Straight mineral oils have only a very limited ability to keep these contaminants from coagulating and forming masses of sludge within the engine. This is the job of the detergent/dispersant additives that are blended into modern engine oils. These additives keep vital engine parts clean and oil contaminants suspended in such a fine form that they can be removed by regular oil and filter changes. Detergent/dispersants are also very effective in preventing varnish deposits within an engine. Varnish-forming materials react chemically or combine with oxygen in the crankcase to form complex chemical compounds. These compounds continue to react with each other and with oxygen on the hotter parts of the engine, especially EGR valves and oxygen sensors and are baked by engine heat into a hard coating on the hotter parts of the engine. The hydraulic lifters, piston rings, and bearings are particularly sensitive to varnish deposits. If varnish-forming materials are allowed to accumulate in these areas, engine operation is impaired. Engines cannot tolerate excessive amounts of sludge and varnish on sensitive parts. Sludge deposits collect on oil pump screens, limiting the flow of oil to vital engine parts and resulting in rapid and destructive wear. Piston rings which are stuck or sluggish because of varnish accumulation prevent the engine from developing full power. Sludged or plugged oil-control rings prevent removal of excess lubricant from the cylinder walls and result in excessive oil consumption. Disperse Soot:- Soot is a by-product of diesel and some direct injection gasoline engine combustion. It is black carbonaceous particulate matter, which does not dissolve in lubricating oil, but can be suspended by the oil and removed during an oil change. If soot is not well dispersed it will cause the oil to thicken up from its original SAE viscosity grade. In addition, soot can agglomerate to form particles large enough to initiate abrasive wear and when the soot load of an oil gets too high, it settles out and forms sludge. Agglomerated soot and/or highly thickened oil can result in high pressure at the oil filter inlet. This can cause the filter by-pass to open and allow unfiltered oil into the engine. Engine oils formulated to fight soot are able to disperse large amounts of soot without thickening up. Good soot dispersal stops large particles agglomerating, reduces abrasive wear developing and inhibits the formation of sludge. For many years the US Environmental Protection Agency (EPA) has set stringent limits on nitrogen oxide (NOx) and particulate matter (PM) emissions from on-road trucks and buses. Through a combination of engine redesign, ultra-low-sulphur diesel (ULSD) fuel and new engine oil technology, these new vehicles cut harmful emissions by 98 percent. In addition, the regulation required a 97 percent reduction in the sulphur content of on-road diesel fuel – from 500 parts per million (ppm) to 15 ppm – so the fuel won't damage the new exhaust aftertreatment devices, specifically Diesel Particulate Filters (DPFs) that trap and further reduce soot emissions. Engine manufacturers have been developing engines that not only utilize DPFs but also run on pollution-reducing ULSD fuel and utilize cooled exhaust gas recirculation (EGR) devices to redirect some of the exhaust gases normally emitted by the vehicle back into the engine, thus lowering NOx production but creating more internal soot. Effective with the 2010 model year, limits for nitrogen oxide (NOx) emissions were further reduced. Most OEMs implemented the use of Selective Catalytic Reduction (SCR) devices in order to meet the 2010 emission levels. The 2010 implementation of lower emissions limits did not require any changes to the lubricants specifications. Reduce Combustion Chamber Deposits:- In performing its lubrication function, some oil must reach the area of the top piston ring in order to lubricate and seal the rings and the cylinder walls. This oil is then exposed to the heat and flame of burning fuel and part of it actually burns off. Modern refining techniques have produced oils that burn cleanly under these conditions, leaving little or no carbon residue. The detergent/dispersant additives in modern motor oils keep the piston rings free in their grooves, thereby maintaining compression pressures and minimizing the amount of oil reaching the combustion chamber. This not only reduces oil consumption, but more importantly, keeps combustion chamber deposits to a minimum. Excessive combustion chamber deposits adversely affect engine operation. Deposits that form on spark plugs may cause the plugs to foul. Excessive depositbuild-up causes pinging, knocking, or other combustion irregularities that reduce the efficiency and economy of the engine. Because these deposits act as heat barriers, pistons, rings, spark plugs, and valves are not properly cooled. This can result in damage or even failure of the parts necessitating premature replacement/overhaul. In preventing excessive combustion chamber deposits, it is important that a motor oil accomplish two things:- (i) The oil must keep the piston rings free so that they can minimize the amount of oil reaching the combustion chamber; and (ii) That portion of the oil reaching the combustion chamber should burn as cleanly as possible. Cool Engine Parts:- Many people assume that engine cooling is accomplished only through the action of the fluid in the cooling system. This in fact does only about 60 percent of the cooling job. It cools the upper part of the engine only – the cylinder heads, cylinder walls, and the valves. The crankshaft, the main and connecting rod bearings, the camshaft and its bearings, the timing gears, the pistons, and many other components in the lower part of the engine are directly dependent on the motor oil for necessary cooling. All these parts have defined operating temperature limits which must not be exceeded. Some can tolerate fairly high temperatures while others, such as the main and connecting rod bearings, must run relatively cool to avoid failure. Circulating oil picks up heat and carries it to the crankcase or oil cooler. Afterwards, cooler fluid or surrounding air removes the excess heat. To keep this cooling process working, large volumes of oil must be constantly circulated to the bearings and other engine parts before eventually returning to the oil pan to cool and be recirculated again. If the oil supply is interrupted, these parts heat up rapidly from increased friction and combustion temperatures. A bearing failure is often referred to as a 'burned-out bearing' because temperatures rose high enough to actually melt the bearing metal. While only a small quantity of oil is required at any one time and place to provide lubrication, the oil pump must circulate many litres/gallons of oil per minute. Chemical additives and the physical properties of the oil have little effect on its ability to provide adequate cooling. What is critical is the continuous circulation of large quantities of oil throughout the engine and over hot engine parts. This is made possible through the use of largecapacity oil pumps and oil passages adequate to handle the required volume of oil. These oil passages cannot do the job properly if they are allowed to become partially or completely clogged with deposits. When this happens, the oil cannot circulate or cool properly and early engine failure may result. This is another reason for changing the oil and filter before the contaminant level becomes too high. Proper cooling also requires that the oil level in the crankcase never be permitted to remain below the 'add oil' line on the dipstick. This to ensure sufficient retention time of the oil in the crankcase. Seal Combustion Pressures:- The surfaces of the piston rings, ring grooves, and cylinder walls are not completely smooth. If examined under a microscope, these surfaces would show minute hills and valleys. For this reason, the rings by themselves can never completely prevent high combustion and compression pressures from escaping into the low pressure area of the crankcase, as a consequence reduction in engine power and efficiency. Engine oil fills in these hills and valleys on ring surfaces and cylinder walls and helps to seal in compression and combustion pressures. Because the oil film at these points is rather thin – generally less than 0.025 mm thick – it cannot compensate for existing excessive wear of rings, ring grooves, or cylinder walls. Where such conditions already exist, oil consumption may be high. It may also be high in a new or rebuilt engine until the hills and valleys on these surfaces have smoothed out enough to allow the oil to form the right seal. Be Non-Foaming:- Because of the many rapidly moving parts in an engine, air in the crankcase is constantly being whipped into the oil. This produces foam, which is simply a lot of air bubbles which may or may not readily collapse. These air bubbles normally rise to the surface and break, but water and certain other contaminants slow down the rate at which this occurs, and the result is foam. Foam is not a good conductor of heat, so if the amount of foam is excessive, engine cooling will be impaired because the heat will not be dissipated. Foam also does not have much ability to carry a load and has an adverse effect on the operation of hydraulic valve lifters and bearings. This is because it contains air and air is easily compressible. On the other hand, oil which is free of air is virtually incompressible. Many engines have variable timing units, fuel injectors, valve control solenoids, and many other units that require high pressure oil to make them operate properly. Foam or air entrainment in the oil causes failure modes and shuts the engine down. Motor

Oil is a type of oil used to lubricate the engine and other internal parts of the engine of a motor such as a car or other road vehicle. / присадки для сверхвысокого давления). снижение износа . Используемое в двигателях внутреннего сгорания очищенное смазочное масло, обычно содержащее присадки (или добавки). Моторные Масла подразделяются в зависимости от показателей вязкости. Масла, которые вы упомянули, это те, которые называются Мульти-Вязкостными Маслами. С изменением температуры их показатель вязкости меняется нелинейным образом. . Фактически, чем ниже номер, тем более жидкое масло. Например, 5W-30 означает, что оно остаётся жидким даже в условиях холода, и 30 означает что масло более густое при работе двигателя в условиях жары. Вам нужно более жидкое масло для старта двигателя для обеспечения адекватной смазки цилиндрам. Моторное Масло – очищенное смазочное масло, обычно содержащее присадки, используемое в двигателях внутреннего сгорания. Моторное Масло – тип масла, используемого для смазки двигателя и прочих внутренних частей двигателя мотора автомобиля или иного транспортного средства. К Моторным Маслам относятся нефтяные и синтетические смазочные масла, используемые в двигателях внутреннего сгорания всех типов (газотурбинные, поршневые, роторные) для уменьшения износа, снижения трения скольжения, отвода тепла от трущихся деталей, уплотнения зазоров в паре цилиндр – поршень и другого. Моторные масла, как правило, содержат комплексы присадок, улучшающих их эксплуатационные свойства (антикоррозионные, вязкостные, моющие, противоизносные и так далее). Моторные масла подразделяются на масла для карбюраторных двигателей, дизельные и газотурбинные, которые в свою очередь делятся на несколько групп по вязкости и другим эксплуатационным свойствам. Под Моторными Маслами понимаются нефтяные и синтетические смазочные масла или их смеси, используемые для двигателей внутреннего сгорания (поршневых, роторных, газотурбинных). Все моторные масла содержат комплексы присадок, улучшающих их эксплуатационные свойства (моющие, противоизносные, антикоррозионные, вязкостные и так далее). Подразделяются на масла для карбюраторных двигателей, дизельные и газотурбинные, которые в свою очередь делятся на несколько групп по вязкости и другим эксплуатационным свойствам. Под Нефтяными Маслами (минеральными маслами) понимаются жидкие смеси высококипящих углеводородов ($t_{кип}$ 300–600 °С), молекулярной массы 250–1 000 и более, вязкостью от $2 \cdot 10^{-6}$ $м^2/с$ до $70 \cdot 10^{-6}$ $м^2/с$ при 100 °С. Используются главным образом как смазочные масла, гидравлические и смазочно-охлаждающие жидкости, теплоносители, компоненты пластичных смазок. Нефтяные масла по областям применения делят на смазочные, электроизоляционные и другие. Моторные Масла – группа масел, используемых для смазывания двигателей внутреннего сгорания (поршневых и реактивных); относятся к разряду смазочных масел (смотрите Масла Нефтяные). В бывшем Союзе Советских Социалистических Республик (СССР) практически все моторные масла являлись продуктами переработки нефти и только некоторые сорта авиационных масел – Синтетические Масла. Все моторные масла, за исключением некоторых авиационных, содержат моющие, противоизносные и антиокислительные присадки. Северные, зимние и всесезонные моторные масла, получаемые на маловязких основах, содержат также вязкостные загущающие присадки и депрессаторы, понижающие температуру застывания масел. В зависимости от назначения моторные масла подразделяются на:- (i) автомобильные (автолы, для карбюраторных двигателей), (ii) дизельные и (iii) авиационные. Первые два класса, включающие Автотракторные, Тепловозные и Судовые Масла, в свою очередь, подразделяются (ГОСТ 17479-72) на 11 групп по вязкости (при 100 °С) и на 9 групп по уровню эксплуатационных свойств. В зависимости от конструктивных особенностей двигателя, времени года и района эксплуатации (Север, Юг) выбирается необходимая вязкость масла (6, 8, 10, 12, 14, 16 или 20 сСт при 100 °С) и температура застывания (от –15 до –42 °С), а в зависимости от степени форсировки двигателя – группа масла по уровню качества (смотрите прилагаемую ниже таблицу). Повышение качества моторных масел групп от А до Е (условное обозначение) достигается в основном повышением концентрации присадок и в некоторых случаях – изменением качества базового масла. Физико-химические свойства масел соответствующих классов и групп должны удовлетворять техническим условиям; эксплуатационные качества определяют испытаниями на одноцилиндровых установках и развёрнутых двигателях. Авиационные моторные масла применяются для поршневых, турбореактивных и турбовинтовых двигателей. Всего существует около 20 сортов и марок авиационных масел, от самых лёгких дистиллятных (с вязкостью 3–4 сСт при 100 °С) до тяжёлых остаточных (с вязкостью 22 сСт при 100 °С). Требования к качеству авиационных масел особенно высокие. Практически все масла для реактивной авиации содержат комплексы присадок и имеют сравнительно узкий фракционный состав, низкую температуру застывания (от –55 до –60 °С), высокую стабильность, малую вспениваемость и хорошую прокачиваемость по циркуляционной системе двигателя. В связи с развитием сверхзвуковой авиации и повышением требований к термостойкости и низкотемпературным свойствам смазочных масел широкое применение получили синтетические масла. Их производство базируется на использовании сложных органических эфиров и спиртов, кремнийорганических и фторуглеродных соединений, глубокой химической переработке некоторых нефтяных фракций и других видов сырья. Применение таких масел позволяет расширить температурный диапазон их использования от –60 до +250 °С (для лучших сортов нефтяных масел этот интервал находится в пределах от –40 до +150 °С). Синтетические масла находят также применение в некоторых наземных газотурбинных и других двигателях. В бывшем СССР существовала разбивка на группы автомобильных и дизельных масел для двигателей разного типа (по ГОСТу 17479-72) (смотрите прилагаему ниже таблицу).

Группа Масел		**Тип Двигателей**
А		Нефорсированные Карбюраторные и Дизельные
Б	Б1	Малофорсированные Карбюраторные
	Б2	Малофорсированные Дизельные
В	В1	Среднефорсированные Карбюраторные
	В2	Среднефорсированные Дизельные
Г	Г1	Высокофорсированные Карбюраторные
	Г2	Высокофорсированные Дизельные
Д		Высокофорсированные Дизельные, Работающие В Тяжёлых Условиях
Е		Малооборотные Дизельные, Работающие На Тяжёлом Топливе С Содержанием Серы До 3.5%

MOTOR TRUCK CARGO LIABILITY INSURANCE = СТРАХОВАНИЕ ОТВЕТСТВЕННОСТИ ЗА АВТОМОБИЛЬНЫЙ ГРУЗ – Motor Truck Cargo (MTC) Liability Insurance is intended to provide legal liability coverage for truckers (common or contract carriers) while they are transporting property of others (cargo). Under this coverage the insured is the trucker and the covered property is the property of others that is being transported by the insured. The trucker is liable for cargo under the terms of a bill of lading (common carrier) or a contract with the shipper (contract carrier). A common carrier is one that offers its services to the general public. It may haul cargo intrastate or interstate, depending on its authorized operating scope. A contract carrier is one that hauls for a specific shipper under the terms of a negotiated contract. The service is not available to the general public. Carriers are now permitted to offer their services as both a common and a contract carrier. The legal liability imposed on these two types of motor carriers differs in extent. Generally, a common carrier is responsible for the safe delivery of the goods it is transporting and thus owes a very high degree of care. This level of legal liability can be referred to as ‘Strict Liability’ or Liability Without Fault. However, several defenses are available

to a common carrier. They are:- (i) act of God; (ii) public enemy; (iii) inherent vice; (iv) act or fault of the shipper; and (v) public authority. The act of God defense may become available to the motor carrier when the loss is caused by a storm or other natural event that could not be anticipated. If, for example, the driver has warning of flooding conditions in a particular area and, in his/her haste to deliver the goods, drives into the area anyway, it is unlikely the defense will be available. Public enemy refers to warlike actions or political strife against the nation. Inherent vice refers to loss emanating from within the cargo itself; for example, wine sours in transit without some external cause such as extreme heat or cold. Act or fault of the shipper is probably the most commonly used defense. Negligent or careless packaging by the shipper is an example. The public authority defense is rarely available. It could involve a drug bust by US Customs or other police authority in which they confiscate a truckload of goods or place it under quarantine because contaminated cargo is suspected. With respect to a contract carrier, the contract itself will usually provide details of the liability being assumed by the carrier. If the contract is silent on legal responsibility, the contract carrier is responsible only for loss that results from its own negligence, in contrast to the strict liability imposed on a common carrier. However, the contract often makes the trucker responsible for any loss to cargo, regardless of negligence. Exempt Zones:- certain types of carriage are exempted from the rules that apply to common carriers. Examples are agricultural products (enables farmers to transport their goods to market without traditional regulations), household goods, express carriage, and transportation incidental to air carriage, such as intermodal air-truck carriage. A carrier's exposure begins when property is delivered to and accepted by the carrier. It ends when the shipment is completed, that is, arrives at the final destination and is delivered to the consignee. At times, it is not totally clear whether cargo has been accepted by the carrier or actually delivered to the consignee. Delivery by the carrier to the consignee's premises is usually evidenced by a receipt that the carrier takes from the consignee at time of delivery. But what if the consignee's business is closed for the day when the delivery is actually made? Or what if an 'impostor' accepts the delivery from the carrier? In short, extenuating circumstances can make the facts unclear. The bill of lading may provide that after the carrier has delivered the property to a terminal in the consignee's locality and notified the consignee that the property is there, the carrier's liability then becomes that of a warehouse operator – after expiration of 'free time' (usually 48 to 72 hours). It is viewed as reasonable that the carrier's liability be reduced from strict liability after a reasonable period of time if the consignee neglects to pick up the cargo after being notified of its delivery. A warehouse operator is generally responsible only for loss that results from its negligence – that is, its failure to exercise the degree of care a reasonably prudent person would have exercised under the same circumstances. The US Code (49 USC 13906; 49 USC is short for the United States Code:- Title 49) requires motor carriers of cargo operating within federal jurisdiction to show evidence of cargo liability insurance with minimum limits of USD5 000.00 for loss or damage to the contents of any one vehicle, and USD10 000.00 for aggregate losses or damage at any one time and place. Self-insurance is permitted for carriers that have the appropriate level of financial stability. Although there are no filed policy forms for motor truck cargo liability insurance, most insurers that write this coverage maintain a standard form for issuing policies. This form can be modified by endorsement to fit the needs of a particular insured. Advisory non-filed forms for this class of business are available from the American Association of Insurance Services (AAIS) and the International Organization for Standardization (ISO). AAIS offers three MTC liability forms. Coverage can be on an 'open perils' or 'named perils' basis, but coverage applies only when the insured is legally liable. The three MTC forms are:- (i) Motor Truck Cargo Liability Coverage:- this MTC form is designed to cover all shipments of described cargo during the policy term (i.e. annual), while on any truck, trailer, or semi-trailer or at a scheduled terminal; (ii) Motor Truck Cargo Liability Coverage – Scheduled Vehicle Form:- this MTC form is designed to cover all shipments of described cargo during the policy term while on any scheduled truck, trailer, or semitrailer; and (iii) Motor Truck Cargo Liability Coverage – Named Perils Form:- this MTC form is designed to cover all shipments of described cargo for loss caused by a named peril during the policy term, while on any scheduled truck, trailer, or semitrailer. Freight charges due the trucker that become uncollectible because of a loss are also covered. It is often difficult, after a loss, for a trucker to go back to the shipper and ask for payment. Freight charge coverage will reimburse the trucker when it cannot collect these charges. AAIS also has an owners form that provides coverage for the trucker's property that it is transporting. Motor Truck Cargo (MTC) Liability Insurance is intended to provide legal liability coverage for truckers (common or contract carriers) while they are transporting property of others (cargo). Under this coverage the insured is the trucker and the covered property is the property of others that is being transported by the insured. The trucker is liable for cargo under the terms of a bill of lading (common carrier) or a contract with the shipper (contract carrier). The legal liability imposed on these two types of motor carriers differs in extent. Generally, a common carrier is responsible for the safe delivery of the goods it is transporting and thus owes a very high degree of care. This level of legal liability can be referred to as 'Strict Liability' or Liability. The US Code (49 USC 13906; 49 USC is short for the United States Code:- Title 49) requires motor carriers of cargo operating within federal jurisdiction to show evidence of cargo liability insurance with minimum limits of USD5 000.00 for loss or damage to the contents of any one vehicle, and USD10 000.00 for aggregate losses or damage at any one time and place. Self-insurance is permitted for carriers that have the appropriate level of financial stability. Although there are no filed policy forms for motor truck cargo liability insurance, most insurers that write this coverage maintain a standard form for issuing policies. This form can be modified by endorsement to fit the needs of a particular insured. Advisory non-filed forms for this class of business are available from the American Association of Insurance Services (AAIS) and the International Organization for Standardization (ISO). Motor Truck Cargo Legal Liability coverage forms insure common or contract carrier trucking concerns' liability for property of others, consisting of cargo the trucker hauls or transports. These forms clearly define the term Transit to clarify when shipments begin and end. Property shipments usually begin when the insured trucker takes possession of the property being shipped at a specific point of origin. Transit includes necessary stops incidental to the shipment, such as for meals and rest. Transit normally ends when the shipment arrives at the intended destination and the designated party, usually the consignee, accepts it. The American Association of Insurance Services (AAIS) provides two basic coverage forms. One is broader than the other and contains built-in reporting conditions. Both insure motor carriers and cover all shipments of described cargo by truck or other types of motor vehicle. Both forms cover property at scheduled terminals and each includes some built-in additional coverages. Each coverage form has a coverage section, unlike most other inland marine coverage forms. It states that coverage applies only on a legal liability basis, meaning only to the extent of the named insured's legal responsibility for the property shipped and for the amount of liability for a loss. In these coverage forms, the insured trucker transports property of others, its customers, for a charge or fee and is responsible for loss to that property while in its possession. The United States Code provides guidance and direction on the liability of trucking concerns and their responsibility for the property hauled. The bill of lading or other shipping document also addresses the amount of liability for a loss for which the trucker is responsible. Both the Code and the shipping document establish the legal framework to determine the liability of the insured for the property being hauled. If a cargo owner wants coverage for property on its own vehicle or on the vehicles of another party, the Transportation Coverage Form should be used. Supplemental Coverages:- each of these coverages provides additional limits of coverage or additional coverage. Required entries vary by type of coverage:- (i) Contract Penalty:- the limit is USD5 000.00 unless a different limit is indicated; (ii) Expediting Expenses:- the limit is USD5 000.00 unless a different limit is indicated; (iii) Freight Charges:- the limit is USD5 000.00 unless a different limit is indicated; (iv) Moving Equipment:- the limit is USD5 000.00 unless a different limit is indicated; (v) Newly Acquired Terminals:- the limit is USD100 000.00 unless a different limit is indicated; (vi) Off-Board Electronics:- the limit is USD5 000.00 unless a different limit is indicated; (vii) On-Board Electronics:- the limit is USD5 000.00 unless a different limit is indicated; (viii) On-Board Expendable Supplies:- the limit is USD5 000.00 unless a different limit is indicated; (ix) Pollutant Cleanup And Removal:- the

limit is USD10 000.00 unless a different limit is indicated; and (x) Rewards:- the limit is USD1 000.00 unless a different limit is indicated. Property Covered:- Property is covered under two different circumstances, unless it is excluded or otherwise subject to limitations:- (i) Property In Vehicles:- property of others is covered for direct physical loss or damage caused by or resulting from a covered peril during transit, loading and unloading. The property must be described on the schedule of property. Coverage in transit applies only when the property of others is in or on a vehicle. Coverage during loading and unloading applies only when the property of others is loaded or unloaded from an area adjacent to the vehicle. Note:- Coverage on this property ends 72 hours after it arrives at the intended destination or for the period of time for which the named insured is liable based on the terms of the shipping document, whichever is less. (ii) Property In Terminals:- property of others is covered for direct physical loss or damage caused by or resulting from a covered peril at a terminal location indicated on the schedule of coverages or within 100 feet of it. Property is covered at the terminal only if considered still in transit. Only the property described on the schedule of coverages is covered. Note:- Coverage ends 30 days after it arrives at the terminal or for the period of time for which the named insured is liable based on the terms of the shipping document, whichever is less. Property Not Covered:- ten types of property are specifically listed as not covered:- (i) Art of all kinds is excluded. This includes, but is not limited to, all objects of art, including paintings and statuary. (ii) Contraband is goods prohibited by law or treaty from being imported or exported. It also includes legal property in the course of illegal transportation or trade. (iii) Jewelry, Stones And Metals are excluded. Stones are both precious and semi-precious stones. Metals are gold, silver, platinum and other precious metals and alloys. (iv) Live Animals are not covered but coverage applies if death is caused by or necessitated by a specified peril. (v) Money And Securities means a number of different types of property. It includes accounts, bills, currency, food stamps, evidence of debt, and lottery tickets not held for sale, in addition to money, notes or securities. Note:- most of this property is more correctly insured under commercial crime coverage forms. Related Article:- Commercial Crime Coverage Analysis. (vi) Other Carriers means the insurance company does not cover property of others in the possession of any other carrier if the named insured waived its subrogation rights or otherwise made them unenforceable. (vii) Property That Has Been Delivered means property of others is not covered after 72 hours following its delivery to its intended destination. (viii) Property At A Terminal means property of others is not covered after 30 days following its delivery to a terminal. (ix) Storage means that coverage does not apply to property the named insured stores under warehouse receipts or other written storage contracts. (x) Trailer, Container Or Conveyance means there is no coverage for intermodal containers, trailers or other conveyance or for their equipment or supplies. Note:- This property is covered when it is property of others and meets the criteria as Covered Property on the schedule of coverages. Note:- An intermodal container is a reusable, transportable cargo container or enclosure of rigid construction and usually rectangular in shape. It is fitted with devices to secure it to a container chassis vehicle and other devices that facilitate its handling, particularly in its transfer from one mode of transportation to another. They are designed for easy filling and emptying and are intended to contain one or more articles of cargo or bulk commodities for transportation by rail, highway, water or air.

MOTOR TRUCK CARGO OWNER'S FORM = ФОРМА (ПОЛИСА ПО СТРАХОВАНИЮ ОТВЕТСТВЕННОСТИ) ВЛАДЕЛЬЦА АВТОТРАНСПОРТА (или ФОРМА ДЛЯ ВЛАДЕЛЬЦА В ОТНОШЕНИИ АВТОМОБИЛЬНОГО ГРУЗА) – Motor Truck Cargo Owner's Form:- this form insures the owner of a truck against loss to his own property while being transported. It pays for the loss or damage of cargo for the perils insured against, regardless of the legal liability. / Эта форма страхового полиса страхует владельца грузовика от убытков, наносимых его собственному имуществу во время транспортировки грузов. Она оплачивает убытки или повреждения груза от застрахованных угроз независимо от юридической ответственности.

MOTOR TRUCK CARGO TRUCKER'S FORM = ФОРМА (ПОЛИСА ПО СТРАХОВАНИЮ ОТВЕТСТВЕННОСТИ) ПЕРЕВОЗЧИКА (или ФОРМА ДЛЯ ВОДИТЕЛЯ ГРУЗОВИКА В ОТНОШЕНИИ ПЕРЕВОЗИМОГО АВТОМОБИЛЬНОГО ГРУЗА) – Motor Truck Cargo Trucker's Form:- this form indemnifies the policyholder, a trucker, for loss or damage resulting from his legal liability as a carrier while transporting the property of others. I does not insure against any loss for which he is not legally liable.

MOTTLE = КРАПЧАТОСТЬ (или ПЯТНИСТОСТЬ) – Mottle:- a pattern of light and dark areas across a leaf as seen in leaves of plants affected by Verticillium Wilt. / Рисунок из светлых и тёмных зон поперёк листа подобно рисунку, наблюдаемому у листьев растений, поражённых Вертициллиозным Вилтом (Verticillium Wilt).

MOTTLED = КРАПЧАТОЕ (или ПЯТНИСТОЕ, или ИСПЕЩРЁННОЕ, или КРАПЛЁНОЕ, или ПЁСТРОЕ) – Mottled:- color applied unevenly during printing. Defect Name:- Mottled. Defect Type:- Printing Defects. Fabric Type:- Print Goods. Description:- Mottled:- This term is used to describe a condition where color or dye is unevenly applied to or accepted by a fabric. Severity:- Major.

MOTTLED APPEARANCE = ИСПЕЩРЁННЫЙ (или В КРАПИНКУ) ВНЕШНИЙ ВИД – Mottled Appearance:- Fabric:- flannel dress goods; Construction:- (i) Count:- 80 x 76; (ii) Warp:- 20/1 80% 2-in. 1%-den. dull viscose rayon 20% 2-in. 3-den. dull acetate rayon; (iii) Filling:- 11/1, same blend as warp; Finish:- plain dyed dark blue. Defect:- over-all mottled appearance. Analysis:- examination under a pick glass showed that there was poor color match between the viscose and the acetate. It was found that by stripping and redyeing the viscose only, leaving the acetate white, the distribution of the acetate and viscose was not perfectly uniform. However, on redyeing in the laboratory to the original solid shade, but with more careful matching of the two fibers, the finished appearance was improved to such an extent that the two-tone mottled effect was completely eliminated. This defect was blamed on the dyer for carelessness in not obtaining a better match. A similar effect may be found in fabrics which contain continuous-filament viscose- and acetate-rayon yarns that are not carefully matched in shade. Mottled Appearance:- variation in color or surface effect, localized or general, which is not specifically orientated in the length or width directions. Note:- this defect is often causes by uneven application or penetration of dye or by surface distortion. Mottled Appearance:- Fabric:- novelty yarn-dyed pique; Construction:- (i) Count:- 108 x 96; (ii) Warp:- 35/1 cotton, one end dyed red alternating with one end of white; (iii) Filling:- 40/1 cotton; Finish:- bleached and preshrunk. Defect:- uneven mottled appearance. Analysis:- examination of a cutting showed that the red-dyed warp yarn had lost considerable color in some areas. There was no definite continuity or regularity to the shading of color. Laboratory scouring and bleaching tests indicated that the colored varus were dyed with a dyestuff that resisted all scouring and bleaching which would normally be employed in finishing fabrics of this type. The only way in which it was possible to duplicate the change in shade was by use of a sodium hydrosulphite stripping agent. Apparently these goods were given an abnormally severe bleaching treatment in finishing, which could not be duplicated in the laboratory. It is possible that the finisher noticed a slight bleeding of excessive surface color during boil-off and attempted to eliminate the danger of staining of the white yarn by using a sodium hydrosulphite stripping bath. / Уточина:- . Брызги (mottled appearance):- порок заключительной отделки ткани в виде брызг на полотне. Примечание:- этот порок часто вызывается неравным нанесением или проникновением краски.

MOU = MEMORANDUM OF UNDERSTANDING

MOULD = МУЛЬДА (или ЛИТЕЙНАЯ ФОРМА, или ИЗЛОЖНИЦА, или КОКИЛЬ, или ШАБЛОН) – Casting Moulds made of copper, graphite, cast iron or steel for casting metal ingots. / В технике под Мульдой, от Немецкого слова Mulde, означающее Корыто, понимается:- (1) в сталеплавильном производстве – стальная обычно литая коробка ёмкостью 0.25–3.3 кубических метров ($м^3$) для загрузки шихты в печь завалочной машиной. (2) В доменном производстве – форма (изложница) для отливки

чугунных чушек на разливочной машине. Под литейной Формой, от Латинского слова Forma, понимается приспособление в литейном производстве для получения отливок. Изготовляются из формовочных материалов (разовые), огнеупорной керамики (полупостоянные – выдерживают сотни отливок) или металла (постоянные – десятки тысяч отливок). Под Изложницей понимается металлическая форма для отливки металла в виде слитка. Подразделяются по конструкции на глуходонные и сквозные, по способу заливки металла – на заполняемые сверху или снизу (сифонная разливка). Под Кокилем, от Французского слова Coquille, понимается металлическая форма для отливки изделий (литьё в кокиль). Под Шаблоном, от Немецкого слова Schablone, означающее Модель или Образец, понимается:- (1) пластина с вырезами, очертания которых соответствуют контуру изделия и тому подобного. (2) Чертёж детали (архитектурный, строительный), выполненный в натуральную величину. (3) В переносном смысле – образец, штамп, которому слепо подражают.

MOULDING = НАКЛАДКА (или ПРОФИЛЬНЫЕ ПЛАНКИ, или ФОРМОВАННЫЕ ИЗДЕЛИЯ, или ОТДЕЛОЧНЫЕ МАТЕРИАЛЫ, или ОБЛИЦОВОЧНЫЕ МАТЕРИАЛЫ, или МОЛДИНГ, или КАЛЁВКА, или КАЛЕВАТЬ) – Moulding is a wood strip having a curved or projecting surface used for decorative purposes. / Деревянная жердь, имеющая искривлённую или выступающую поверхность, используемая в декоративных целях. В строительстве под Отделочными Материалами понимаются строительные материалы, применяемые в целях повышения эксплуатационных и декоративных качеств зданий и сооружений и защиты основного материала конструкции от воздействия внешней среды. В современном строительстве применяют отделочные материалы из природного камня, стекла, керамики, пластмасс, дерева, бетона, строительных растворов, асбестоцемента и другого. Особую группу отделочных материалов составляют краски и лаки. Различают отделочные материалы для наружной и внутренней отделки, конструктивно-отделочные и эксплуатационно-отделочные. Среди отделочных материалов выделяют облицовочные материалы, обладающие большой стойкостью и повышающие долговечность и архитектурно-художественные качества зданий (например, природный камень, керамика).

MOULDS, DAMAGED GRAIN AND ODOURS = ПЛЕСЕНИ, ПОВРЕЖДЁННОЕ ЗЕРНО И ЗАПАХИ – In Wheat industry, Moulds, Damaged Grain And Odors (or Odours):- visual examination assesses grain for moulds, Fusarium (pink grains) and particularly ergot. Checks are made for live insects and grain damaged by insects. Experienced staff also assess grain for unusual odors. 'Mustiness' or 'chemical' odors indicate storage problems. Individual companies set their own criteria for these assessments. / () и в частности . Особое внимание уделяется живым насекомым и зерну, повреждённому насекомыми. Опытный персонал также оценивает зерно на необычные запахи. Затхлый или химический запахи указывают на проблемы хранения. Частные компании устанавливают свои собственные критерии для этих оценок.

MOUSING = СТОПОРНОЕ ЗВЕНО (или КАБОЛКА, или ЗАКАБОЛИВАНИЕ) – Mousing (maritime term):- small stuff seized across a hook to prevent it from unshipping (once hooked, mousing keeps the hook on). / Стопорное Звено (Каболка) гака; Закаболивание гака.

MOUSQUETAIRE = МУСКЁТЭР (или МУШКЕТЁР, или МУШКЕТЁРСКОЕ) – Mousquetaire is a long glove, eight to sixteen buttons in lenght. It has a vertical opening with buttons near the wrist, so that the wearer can remove the finger section and tuck it into the arm section without having to remove the entire glove.

MOUSSELINE = МУСЛИН – Mousseline is the name for a broad category of fabrics, usually fairly sheer and lightweight and made in a variety of fibers, including man-mades, silk, cotton, and wool. Mousseline usually has a crisp hand. The word mousseline is offen used today for a fabric resembling de Soie. See also Muslin. Mousseline is a fine sheer fabric (as of rayon) that resembles muslin. / Дё Суа (De Soie), означающее Из Шёлка.

MOUSSELINE DE SOIE = МУСЛИН ДЁ СУА (или МУСЛИН ИЗ ШЁЛКА) – Mousseline De Soie:- literally, 'Muslin Of Silk'. The words 'de soie' mean 'of silk' which may explain why the fabric, similar to this made from man-made fibers is usually called Mousseline. Mousseline de Soie (silk organdy) is a lightweight, sheer, plainweave silk fabric similar to chiffon in its appearance and uses, but a little crisper. Mousseline De Soie is a silk muslin having a crisp finish. Sheer, open, and lightweight. It is something like chiffon but with a crisp finish produced by sizing. It does not wear well and it does not launder. / Муслин дё Суа (Mousseline de Soie) или Муслин Из Шёлка (Muslin Of Silk) – ткань, имеющая .

MOUSY = МЫШИНОЕ – Mousy:- grayish brown. / Мышиное:- серовато-бурое.

MOVEMENT CERTIFICATE = СВИДЕТЕЛЬСТВО О ПЕРЕМЕЩЕНИИ (ТОВАРА) (или СЕРТИФИКАТ О ПЕРЕМЕЩЕНИИ (ТОВАРА)) – Movement Certificate Eur 1 or EUR1 forms give preferential import entry (usually a zero duty rate) for EU-made goods when shipped to certain markets including Algeria, Bulgaria, Chile, Croatia, Eygpt, Iceland, Israel, Jordan, Lebanon, Mexico, Morocco, Norway, Romania, Serbia, South Africa, Switzerland, Syria and Saudia Arabia. It is equivalent to Certificate of Origin. The Movement Certificate (abbreviation:- EUR.1 Form) is used in preferential trade between XXXXX and YYYYY. Goods must be described in accordance with commercial practice and with sufficient detail to enable them to be identified. No spaces must be left between the items entered on the certificate and each item must be preceded by an item number. A horizontal line must be drawn immediately below the last item. Any unused space must be struck through in such a manner as to make any later additions impossible. Certificates must not contain erasures or words written over one another. Any alterations must be made by deleting the incorrect particulars and adding any necessary corrections. Any such alteration must be initialed by the person who completed the certificate and endorsed by the Customs authorities of the issuing country or territory. Movement Certificate (EUR.1 Form) is used for entitlement to preferential, usually zero, import duty rates, for exports between the United Kingdom to Turkey. EUR1 certification is required for most agricultural, and all coal and steel products. For all other industrial products, an ATR certificate is used. To qualify for EUR1 certificate:- (i) the goods must have a free circulation status in the European Union (EU); (ii) all EU duties and taxes paid; and (iii) accompanied by a correctly completed and endorsed form. The Customs Authority on written application of the exporter issues the Movement Certificate EUR.1. The exporter has to offer, at the request of the Customs Authorities, all the appropriate documents that are evidence of the origin of the goods. These documents may be verified for authenticity and accuracy of presented information by the customs authority of either party. Validity of proof of origin shall be for four months from the date of issue in the exporting country, and must be submitted within the said period to the customs authorities of the importing country. In case of theft or loss of the EUR.1 Certificate, the exporter may as the customs authorities that have issues the original certificate to issue a duplicate copy of it, and clearly including the word DUPLICATE on it as a remark. A EUR1 is a certificate entitling preferential import duty rates, usually zero, for exports to Turkey from the United Kingdom (UK) or a European Union (EU) country. The Turkish British Chamber of Commerce and Industry is now authorised to endorse and issue EUR1 Certificates. Documentation necessary in any business transaction:- originating products on importation to Jordan or the European Union (EU) shall benefit from the Agreement upon submission of either:- (i) a movement certificate EUR.1, or in other cases:- (ii) a declaration, given by the exporter on an invoice; and (iii) a delivery note or any other commercial document which describes the products concerned in sufficient detail to enable them to be identified (invoice declaration). Supporting documents:- documents used for providing evidence that products covered by a movement certificate EUR.1 or an invoice declaration can be considered as products originating in the EU or in Jordan, plus fulfil the other requirements of this Protocol may

consist of the following:- (i) direct evidence of the processes carried out by the exporter or supplier to obtain the goods concerned, contained for example in his accounts or internal book-keeping; (ii) documents proving the originating status of materials used, issued or made out in the EU or Jordan where these documents are used in accordance with domestic law; (iii) documents proving the working or processing of materials in the EU or Jordan, issued or made out in the EU or Jordan, where these documents are used in accordance with domestic law; and (iv) movement certificates EUR.1 or invoice declarations proving the originating status of materials used, issued or made out in the European Union or Jordan in accordance with this Protocol. The proof of originating status can be made by presentation of either a movement certificate EUR.1 or an invoice declaration. Proof of compliance with the necessary conditions for implementation of the provisions on the free circulation of goods between the Community and Turkey is provided by a Movement Certificate. Following Turkey's inclusion in the system of pan-European cumulation of the rules of origin on 1999-January-01, where products of Community or Turkish origin are exported to a country covered by that system (the EFTA, Central and Eastern European, EEA and Baltic countries) and, without being processed or having undergone only minimal operations, are then sent to Turkey or the Community, the above countries must issue the goods in question with a movement certificate EUR.1 or invoice declaration stating that they are of Community or Turkish origin, as appropriate. / привоз (importation). обозначение . Форма ЕВР.1.

MOVING AVERAGE = СКОЛЬЗЯЩАЯ СРЕДНЯЯ ВЕЛИЧИНА (или СКОЛЬЗЯЩЕЕ СРЕДНЕАРИФМЕТИЧЕСКОЕ) – (1) In statistics, a Moving Average is a method for smoothing time series by averaging (with or without weights) a fixed number of consecutive terms. The averaging 'moves' over time, in that each data point of the series is sequentially included in the averaging, while the oldest data point in the span of the average is removed. In general, the longer the span of the average, the smoother is the resulting series. Context:- Moving averages are used to smooth fluctuations in time series or to identify time series components, such as the trend, the cycle, the seasonal, etc. A moving average replaces each value of a time series by a (weighted) average of p preceding values, the given value, and f following values of a series. If p = f the moving average is said to be centred. The moving average is said to be symmetric if it is centred, and if for each k = 1, 2, ..., p = f, the weight of the k-th preceding value is equal to the weight of the k-th following one. The moving average is not defined for the first p and the last f time series values. In order to compute the moving average for those values, the series must be backcasted and forecasted.

(2) Moving Average is an arithmetic average (often using closing prices) over a given period of time (e.g., five days). The period is constantly moving forward in time so the average reflects only the most recent prices. In technical analysis, this is a key trend line that is plotted on a bar chart, reflecting the progress of prices over a given period of time. See also Moving Averages, and Weighted Moving Average. The Moving Average is one of the classic and most-reliable tools for technical analysis. A moving average simply shows the average value of a security's price over a defined period of time. The direction of the average reflects the general trend of the security. Although the moving average is one of the simplest technical indicators, there are variations in its calculation. For example, the moving average calculation can be based on a security's open, high, low, close, volume or even another indicator. In addition, it can be calculated over different time periods. The longer the time period, the smoother the average. The shorter the time period, the more reactive the average. There also are variations in the process used to calculate the average. Two of the most popular methods are the simple moving average (SMA) and the exponential moving average (EMA). The only significant difference between the EMA and SMA is the weight assigned to the most recent data. The SMA applies equal weight to all prices in the range; the EMA applies more weight to recent prices. 'Two averages' (above) shows a 20-day SMA in red and the equivalent of a 50-day EMA in blue applied to daily data of the Market Vectors Gold Miner (GDX) exchangetraded fund (ETF). An SMA is calculated by adding the security's price for the desired lookback period (say, five days) and dividing by the same number (in this case, five). Each day, we add the new day and drop the oldest. For example, assume these seven daily closing prices: 101, 102, 103, 104, 105, 106, 107. On the fifth day of this sequence, the average would be (101 + 102 + 103 + 104 + 105) / 5 = 103. On the second day of this sequence, the average would be (102 + 103 + 104 + 105 + 106) / 5 = 104. On the third day of this sequence, the average would be (103 + 104 + 105 + 106 + 107) / 5 = 105. Such an average is probably too sensitive to price changes because small changes in price quickly are reflected in changes in the average. This is where EMAs are helpful. Because EMAs emphasize more recent prices in their calculation, we can achieve a smoother average line with nearly the same level of reactivity. EMAs are based on the most recent value of the average, the most recent raw price and a weighting multiplier. The weighting multiplier can be changed to mimic a comparable length SMA. For the initial EMA calculation, an SMA of the target length is substituted for the previous-period EMA. First, we calculate the value of the multiplier. Multiplier = (2 / (Time periods + 1)) = (2 / (5 + 1)) = 0.33 Then, we insert the multiplier value into the following EMA formula:- EMA = [Close – EMA(previous day)] x multiplier + EMA(previous day) 'Average comparison' (right) shows the values of a five-day SMA and EMA for Apple. The exponential moving average starts with the simple moving average value of 449.61 in the first calculation. After the first calculation, the EMA formula takes over. The chart of the EMA is shown in 'Apple smoothie' (below right). Because the EMA gives more weight to recent price action, whipsaws are less frequent. As seen in the chart, Apple closing prices stay above the stock's five-period EMA throughout most of the uptrend that started in January 2012. Reading Averages:- the most popular method of interpreting a moving average is to compare the relationship between a moving average of the security's price with the security's price itself. A buy signal is generated when the security's price rises above its moving average and a sell signal is generated when the security's price falls below its moving average. While such basic trading rules may be appealing, moving averages may be better used in a less-rigid sense. For example, they can be used to find support and resistance and trend identification. 'Look at me, MA' (page 45) shows an example of the S&P 500 bouncing off its 50-day SMA. The green arrows identify points of bullish reaction. The red arrows identify periods when the average provided resistance. Trend identification generally is done with long-term averages. Perhaps the most popular application is the 200-day moving average. In general, the market is considered bullish when it is above the 200-day moving average, and bearish when it is below the 200-day moving average. As seen in 'Look at me, MA', Microsoft broke its 200-day moving average on September 29, 2012, at USD30. It corrected until it reached USD26, and then consolidated and started forming its base. On April 09, 2013, eight months later, Microsoft was able to close above its 200-day moving average at USD29.60, initiating a big rally that hit USD36 by June 05, a 20% rally in just two months. Crossovers:- two moving averages can be used together to generate crossover signals. Crossovers involve one relatively short moving average and one relatively long one. As with all moving averages, the general length of the lookback period determines the indicator's sensitivity. A system using a five-day EMA and a 20-day EMA would be deemed short-term. A system using a 50-day SMA and a 200-day SMA would be long-term. A bullish crossover occurs when the shorter moving average crosses above the longer moving average. A bearish crossover occurs when the shorter moving average crosses below the longer moving average. As seen in 'Look at me, MA', when the five-period EMA (red) of Caterpillar Inc. (CAT) crossed below the 20-period EMA (blue), the stock began a downtrend correction from USD95 to USD83. Moving average crossovers produce relatively late signals. After all, the strategy depends on two lagging indicators. The longer the moving average periods, the greater the lag in the signals. These signals work great when a good trend takes hold. However, a moving average crossover system will produce lots of false signals in the absence of a strong trend. As lagging indicators, all moving average-based strategies are not intended to get you in at the exact bottom nor out at the exact top. Rather, they keep you in line with the security's price trend by being on the right side of the bulk of the move. See also Exponential Moving Average. / Кэтёпилар Инк. (Caterpillar Inc.; Си.Эй.Ти. (CAT)). интервал сглаживания (smoothing) или временной интервал; средняя арифметическая взвешенная; смещающиеся точки. Скользящая Средняя

Величина – средний показатель котировок ценных бумаг или товарно-сырьевой продукции, подсчитанный за небольшой период времени в несколько дней или за длительный период времени в несколько лет и отражающий тенденции за последний временной интервал. Например, скользящая средняя величина за 30 дней включает вчерашние показатели; завтра та же средняя будет включать сегодняшние показатели и более не будет включать показатели за первый день вчерашней скользящей средней величины. Таким образом, каждый день в усреднённый показатель включаются данные за последний день и не включаются данные за текущий день.

MOVING AVERAGE CHARTS = ГРАФИКИ СКОЛЬЗЯЩИХ СРЕДНИХ ВЕЛИЧИН – Moving Average Charts:- in technical analysis a statistical price analysis method of recognizing different price trends. A moving average is calculated by adding the prices for a predetermined number of days and then dividing by the number of days. / В техническом анализе биржевых рынков, .

MOVING AVERAGE CONVERGENCE AND DIVERGENCE = СХОЖДЕНИЕ РАСХОЖДЕНИЕ СКОЛЬЗЯЩИХ СРЕДНИХ ВЕЛИЧИН (или СХОЖДЕНИЕ РАСХОЖДЕНИЕ СКОЛЬЗЯЩЕГО СРЕДНЕАРИФМЕТИЧЕСКОГО) – Moving Average Convergence And Divergence (MACD) is an indicator developed by Gerald Appel that is calculated by subtracting the 26-period exponential moving average of a given asset from its 12-period exponential moving average. By comparing moving averages, Moving Average Convergence And Divergence (MACD) displays trend following characteristics, and by plotting the difference of the moving averages as an oscillator, MACD displays momentum characteristics. Moving Average Convergence/Divergence (MACD):- a technical analysis tools that shows the relationship between two moving averages of prices. Moving Average Convergence/Divergence (MACD) is the crossing of two exponentially smoothed moving averages that are plotted above and below a zero line. / В техническом анализе биржевых рынков, . МЭКДИ (MACD) отражает характеристики момента.

MOVING AVERAGES = СКОЛЬЗЯЩИЕ СРЕДНИЕ ВЕЛИЧИНЫ (или СКОЛЬЗЯЩИЕ СРЕДНЕАРИФМЕТИЧЕСКИЕ) – Although Moving Averages are an imprecise technical tool, they are effective in their ability to help define the environment that you are trading in. In their most common form, moving averages are just a simple average of a market's closing prices for the last x number of periods. Those periods may be days, weeks, months or minutes. Their simplicity allows for considerable flexibility in their use and construction. To calculate a 9 day moving average you merely add up the closing prices for the last 9 days and divide by the number of days. In this case the divisor would be 9. At the close of business on the 10th day, you would recalculate the average by dropping of the first day and adding the tenth to your calculation. The moving average will always lag behind the market. As such, it makes for an excellent trend indicator. The market is in an uptrend when its last price is above the moving average and declining when the last price is below the moving average. You will lose some sensitivity if you use two moving average calculations such as a 9 and 18 day combination. Here, the uptrend is when the shorter, more sensitive moving average crosses over the longer average. The 9 and 18 day combination is the most common set of parameters for moving average analysis. The numbers are based on the assumption of 20 trading days in a month combined with the desire by traders to get a little advance warning ahead of everyone else. Hence, the 18 day value. The 9 day value is a harmonic of the larger 18 day value. You can use these trend indications as a trading signal and go long the market when an uptrend is indicated and reverse when a downtrend materializes as the averages again cross each other. With this methodology you are always in the market. Although, this system does an excellent job of catching developing trends, it can devastate your account as the market consolidates or reverses its trend. There are also several different ways of calculating a moving average. The simple moving average discussed above weights all past data equally. There is a school of thought that believes that the more distant the price action the less relevant it is to the current market situation. The Moving Average is one of the most useful and objective tools available to the technical analyst. Moving averages show the average value of a security's price over a certain number of time periods. The most commonly used moving averages are the 20, 30, 50, 100, and 200 day averages. Moving averages smooth a data series and make it easier to spot trends and smooth out price and volume fluctuations or noise that can confuse interpretation. It moves because for each calculation, the latest x number of time periods' data are used. Using the data from prior time periods, a moving average lags the market. An exponentially smoothed moving average (EMA) gives greater weight to the more recent data, in an attempt to reduce the lag. The shorter the time span, the more sensitive the moving average will be to price changes. The longer the time span, the less sensitive or the more smoothed the moving average will be. A technical analysis term meaning the average price of a security over a specified time period (the most common being 20, 30, 50, 100 and 200 days), used in order to spot pricing trends by flattening out large fluctuations. This is perhaps the most commonly used variable in technical analysis. Moving average data is used to create charts that show whether a stock's price is trending up or down. They can be used to track daily, weekly, or monthly patterns. Each new day's (or week's or month's) numbers are added to the average and the oldest numbers are dropped; thus, the average 'moves' over time. In general, the shorter the time frame used, the more volatile the prices will appear, so, for example, 20 day moving average lines tend to move up and down more than 200 day moving average lines. An average of a number of specified historical time periods from the point on the chart. Moving averages offer an indication of the clear direction and slope of the trend in the market. Since moving averages measure historical data, they are a lagging indicator; in other words, the information they reveal is not predictive, but rather can be used to gauge momentum in the marketplace. The Moving Average is probably the best known, and most versatile, indicator in the analysts tool chest. It can be used with the price of your choice (highs, closes or whatever) and can also be applied to other indicators, helping to smooth out volatility. As the name implies, the Moving Average is the average of a given amount of data. For example, a 14 day average of closing prices is calculated by adding the last 14 closes and dividing by 14. The result is noted on a chart. An average of data for a certain number of time periods. It 'moves' because for each calculation, we use the latest x number of time period's data. By definition, a moving average lags the market. An Exponentially Smoothed Moving Average (EMA) gives greater weight to the more recent data, in an attempt to reduce the lag. A Moving Average is the sum of a set of data points, usually days, which are divided by the number of data points. When a new data period is added, the oldest data period is deleted and the average is recalculated. A way of mathematically smoothing a price series by several different averaging methods. Normally plotted on the same price chart as the futures market. Moving Averages provide an objective measure of trend direction by smoothing price data. Normally calculated using closing prices, moving averages can also be used on median, typical, weighted closing, and high or lowprices as well as other indicators. Shorter length moving averages (MAs) are more sensitive and identify new trends earlier, but also give more false alarms. Longer moving averages are more reliable but are less responsive, only picking up the big trends. Use a moving average that is half the length of the cycle that you are tracking. If the peak-to-peak cycle length is roughly 30 days, then a 15 day moving average is appropriate. If 20 days, then a 10 day moving average is appropriate. Some traders, however, will use 14 and 9 day MAs for the above cycles in the hope of generating signals slightly ahead of the market. Others favor the Fibonacci numbersof 5, 8, 13 and 21. 100 to 200 Day (20 to 40 Week) moving averages are popular for longer cycles; 20 to 65 Day (4 to 13 Week) moving averages are useful for intermediate cycles; and 5 to 20 Days for short cycles. Moving Average:- the average price of a security over a specified time period (the most common being 20, 30, 50, 100 and 200 days), used to find pricing trends by flattening out large fluctuations. The Moving Average is a powerful measure of trend direction, achieved by smoothing price data. Moving Averages can also be used on median,typicaland weighted closing prices as well as other indicators. Selecting A Long-Term Moving Average:- when tracking the primary trend you are faced with a wide choice of moving averages. Single Moving Average is a simple moving average system, often combined with filters for greater effectiveness. Two Moving Averages are fast and slow moving averages provide a powerful measure

of trend strength and direction. Three Moving Averages is a more sophisticated system that uses a third moving average to identify ranging markets. Trading with Moving Averages:- fast and slow moving averages can provide potent market signals. / В техническом анализе биржевых рынков, . флуктуации (колебания) объёма . интервал сглаживания (smoothing) или временной интервал; средняя арифметическая взвешенная; смещающиеся точки. Скользящие Средние Величины являются очень простыми инструментами сглаживания несущественных колебаний котировок за выбранный промежуток времени, что делает любые тенденции более наглядными. Скользящая средняя величина определяется как среднеарифметическая цена закрытия за последние несколько дней, заканчивая текущим днём. Для хлопка, например, часто используются 9-, 18- и 40-дневные скользящие средние величины. Как правило, скользящие средние величины рассчитываются на основе цен закрытия. Тем не менее, можно рассчитывать скользящие средние величины цен открытия, максимумов, минимумов, а также средних значений суточных цен открытия, закрытия, максимума и минимума. Кроме того, их можно рассчитывать не только на посуточных графиках, но и на графиках, основанных на иных временных интервалах, в этом случае цена закрытия будет относиться к данному интервалу. Термин ‘скользящие’ означает, что серия усредняемых значений непрерывно движется во времени. На рынках, где чётко выраженная ценовая тенденция отсутствует, скользящая средняя величина, как правило, изменяется в некотором горизонтальном диапазоне, при этом она может подавать ложные сигналы для торговца. В качестве инструмента технического анализа используются Взвешенная Скользящая Средняя Величина (WMA – Weighted Moving Average), Простая Скользящая Средняя Величина (SMA – Simple Moving Average), Треугольная Скользящая Средняя Величина (TMA – Triangular Moving Average) и Экспоненциальная Скользящая Средняя Величина (EMA – Exponential Moving Average).

MOW = КОСИТЬ (или ЖАТЬ) – Mow:- to cut the standing grass or grain or similar produce with a scythe, sickle, or machine. To cut close to the ground short standing grass with a lawn mower. / газон (lawn).

MOYGASHEL® = МОЙГЯШЭЛ® – Moygashel® is a trade name representing excellent quality in imported Irish linen. Moygashel® is not a type of linen, it is a brand name. I’ve known vintage buyers and sellers to be confused because clothing made of Moygashel® linen often has a label identifying it as such, and it is easy to conclude that Moygashel® is the name of the garment maker. As the ad tells us, Moygashel® was considered to be the highest quality Irish linen. Not only did quality garment makers choose it, the fabric was available to home dressmakers, and the coveted Moygashel® label was included with a purchase. What makes Irish linen, and Moygashel® in particular, so so wonderful? Experts tell us it is the quality of the water in Ireland with which the fibers are processed, much in the same way that the water in Scotland is thought to play a role in the quality of their cashmere. There is still a linen industry in Ireland, though most of the raw material, flax, is grown in northern Europe and China and imported into the country. Moygashel® still exists as well, as a division of Ulster Weavers, specializing in home furnishing linens. / Мойгяшэл® – торговое название, относящееся к привозному Ирландскому льну превосходного качества, хотя многие не относят его к типу льна, а считают фирменным названием.

MOZZETTA = МОЦЭТТА – Mozzetta is a short cape with a small ornamental hood worn over the rochet by Roman Catholic prelates. / Римскими Католическими .

MP = MARKET PARTICIPANT

MSI PLESSEY CODE = КОД ЭМ.ЭС.АЙ. ПЛЭСИ – MSI Plessey Code:- this barcode is a variable length barcode that can encode up to 15 numeric digits. Checksum generation is dependent on the value of the checksum parameter. The following table indicates the value of the checksum property and the type of checksum created. Setting, Description, 0, one modulus 10 checksum, 1, two modulus 10 checksums, 2, one modulus 11 checksum/one modulus 10 checksum. MSI (also known as Modified Plessey) is a barcode symbology developed by the MSI Data Corporation (headquartered in Costa Mesa, State of California (CA), The United States of America), based on the original Plessey Code symbology. It is a continuous symbology that is not self-checking. MSI is used primarily for inventory control, marking storage containers and shelves in warehouse environments. The MSI Plessey Code is a pulse-width modulated non-self checking code. Each character is represented by 4 bars; a narrow bar represents a binary 0 and a wide bar represents a binary 1. The bars have the binary weights 8-4-2-1. It is possible to encode the digits 0 through 9 and the letters A through F, although this code is most often used just for numeric information. The start character is a single wide bar, and the stop character is two narrow bars. The Plessey code was originally developed in England and gave rise to several variations including the MSI, Anker, and Telxon codes. Of these, the MSI Plessey is still in use in the USA; it is used in libraries, and is often used for retail grocery shelf marking. / Код Плэси (Plessey) был первоначально разработан в Англии и . коды Эм.Эс.Ай. Дэйтча Корпорэйшэн (MSI Data Corporation), Энкё (Anker), и Тчэлзон (Telxon).

MUCCADDAM = МУКАДДАМ – In India and Pakistan, Muccaddam or Macadam or Muccadum is a representative appointed by the banks to control and monitor stocks of cotton pledged by the banks as and when they require. In Pakistan, a pledge is a contract whereby a good is deposited with the lender as security for repayment of the loan. Transferring the goods from owner's godowns may make the delivery of goods or keys of owner's godowns are handed over to the bank or his appointed Muccaddam. (Muccaddam is the organization providing the facility of agents on behalf of banks. The appointed Macadam must be on the list of approved Macadam's). / Мэкэдэм (Macadam). В Индии и Пакистане, представитель, назначенный банками контролировать и обследовать запасы хлопка, находящиеся в залоге у этих банков, как и когда им это потребуется.

MUCILAGE = СЛИЗЬ (или РАСТИТЕЛЬНЫЙ КЛЕЙ) – Mucilage is a water-soluble gelatinous slime, generally containing modified carbohydrates. / слизь (slime), модифицированные углеводы. Под Слизями понимаются природные вещества, образующие вязкие водные растворы. По химической природе – смеси гликопротеидов. У животных и человека покрывают так называемые слизистые оболочки, а у земноводных и кожные покровы; у растений способствуют поглощению воды, повышают засухоустойчивость; у ряда Бактерий связывают отдельные клетки в колонии. Применяются в медицине, пищевой, текстильной и других отраслях промышленности.

MUCK = ПЕРЕГНОЙ – Muck is a highly decomposed organic material in which the original plant parts are not recognizable. / Под Перегноем понимается:- (1) то же, что Гумус. (2) Перепревший навоз – органическое удобрение, используемое в основном в овощеводстве и цветоводстве для приготовления торфоперегнойных горшочков и мульчирования посевов.

MUCK SOIL = ПЕРЕГНОЙНАЯ ПОЧВА – Muck Soil is an organic soil in which the organic matter is well decomposed.

MUCRO = МУКРО (или ОСТРЫЙ КОНЕЦ, или ВЫЕМКА, или ОСТРИЁ) – Mucro is a short sharp point on the tip of a flower or leaf. See also Drip Tip. Mucro (syn. Glandular Process) is a small bulge on either side of the lemmal apiculus formed by the fusion of the two lateral nerves. / Выемка верхушки листа.

MUCRONATE = ЗАОСТРЁННОЕ (или ОСТРОКОНЕЧНОЕ, или ВЫЕМЧАТОЕ) – Mucronate:- ending with a triangular tip or a sharp point.

MUD = MUNICIPAL UTILITY DISTRICT

MUDBALL BEANS = БОБЫ В ВИДЕ ГРЯЗНЫХ КОМОЧКОВ (или ШАРИКОВ) – Mudball Beans are beans or soybeans completely covered with caked-on mud. / Бобы В Виде Грязных Комочков – это бобы или соебобы, полностью покрытые спёкшейся грязью.

MUDCRETE = ГИДРАВЛИЧЕСКИЙ БЕТОН (или ГРЯЗЕБЕТОН) – The first is Mudcrete a concept developed largely by Stephen Priestley of Beca and used on many projects in the Auckland Harbour. This is a very simple concept of mixing cement with marine muds to create a 'soft rock' suitable for use as a construction material. We have done much testing of this material since 1992. In Australia and New Zealand, a soil mixed with cement used to form a quick-drying, solid reclamation in a marine environment. Mudcrete is a mixture of marine sediment and cement that can be shaped to form a natural looking rock-life platform that would extend from the existing rowing shed around the base of the cliff for a distance of approximately 450 meters to a small point close to the College's southern boundary.

MUD SCOW = ГРУНТООТВОЗНАЯ ШАЛАНДА – Mud Scow (maritime term):- a large, flat: bottomed boat used to carry the mud from a dredge.

MUFF = МУФТА – Muff is a loose skein of textured yarn prepared for dyeing or bulking. In the bulking operation, the yarn contracts and the resulting skein resembles a muff. Muff is a warm tubular covering for the hands. Muff is a tube of fur, wool, or velvet covering used to warm the hands outdoors. It is occasionally supplied as a matching accessory with an outerwear costume.

MUFF DYEING = МУФТОВОЕ КРАШЕНИЕ (или КРАШЕНИЕ В МУФТАХ) – Muff Dyeing is a form of yarn dyeing in which the cone has been removed. See also Dyeing. / Муфта (muff).

MUFFLER = ШАРФ (или КАШНЕ, или ПОВЯЗКА, или ШЕЙНЫЙ ПЛАТОК) – Muffler is a long woven or knitted scarf worn around the neck for warmth. Muffler is a scarf worn around the neck.

MUG = MESSAGE USER GROUP

MUI = MARKET USER INTERFACE

MUKLUK = УНТЫ (или МАКЛАК) – Mukluk:- a sealskin or reindeer-skin boot worn by Eskimos; a boot often of duck with a soft leather sole and worn over several pairs of socks.

MULBERRY = БАГРОВОЕ (или ШЕЛКОВИЦА, или ТУТОВОЕ, или ХХ) – Mulberry:- a dark purple or purplish black.

MULCH = МУЛЬЧА – Mulch is the organic material that is used to protect the soil. Any material, such as straw, sawdust, leaves, plastic film, loose soil, etc, that is spread upon the surface of the soil to protect it and plant roots from the effects of raindrops, soil crusting, freezing, evaporation, etc. / Мульча; Мульчирующее Покрытие; Мульчировать. и корни растения от воздействия . Мульча:- защищающее почву покрытие. В этой книге к нему относят рыхлое покрытие из измельчённой коры, торфа (торфяного мха) или подобных материалов, используемых для укрытия луковиц в горшках и создания для них периода, готовящего их к раннему цветению. Под Мульчей понимают однородный материал или смесь веществ различного происхождения, которые по совокупности своих качественных характеристик пригодны для защиты грунта, используемого для выращивания культурных Растений. Под Мульчированием, от Английского слова Mulch, означающее Обкладывать Корни Растений Соломой, Навозом и тому подобным, понимается сплошное или междурядное покрытие почвы мульчей (мульчбумагой, торфяной крошкой, навозом-сыпцом, перегноем, компостами, опавшей листвой и другим). Применяется в сельском хозяйстве при выращивании овощных, плодовых, ягодных, декоративных и других культур. Мульчирование снижает затраты труда на междурядную обработку посевов и положительно влияет на условия роста Растений и почвенное плодородие:- ослабляет испарение влаги с поверхности почвы, уменьшает амплитуду колебания её температуры в течение суток, защищает поверхность поля от размывания, предупреждает образование почвенной корки, угнетает прорастание Сорняков и тому подобное. Как правило, мульчирование повышает урожай сельскохозяйственных культур, особенно в засушливых районах. На тяжёлых и избыточно увлажнённых почвах оно менее эффективно и может даже снизить урожай.

Роль мульчи выполняет также оставленная на зиму на полях стерня (жнивьё) зерновых культур, которая защищает почву от эрозии (смотрите Эрозия Почвы). Особенно большое значение этот приём имеет в условиях степных районов бывшего Союза Советских Социалистических Республик (СССР), где часты сильные ветры (Алтайский и Красноярский края, Новосибирская и Омская области, Северная часть Казахстана и другие).

MULCHING = МУЛЬЧИРОВАНИЕ – A term Mulching refers to cover the vacant space of the crop field or breakdown the topsoil surface with artificial or natural (soil) mulch to conserve soil moisture. Objectives Of Mulching:- (i) to protect the soil from erosion; (ii) to reduces compaction from the impact of heavy rains; (iii) to conserves moisture, reducing the need for frequent watering; (iv) to maintains a more even soil temperature; (v) to prevents weed growth; and (vi) to keeps fruits and vegetables clean. Mulch:- the materials used for mulching. Mulches are of two types:- (a) Organic Mulches:- water hyacinth, Rice straw, Rice husk, saw dust, leaf, etc; and (b) Inorganic Mulches:- paper, polythene, plastic, etc. Types Of Mulching:- (1) Natural Mulching:- it refers to the mulching operation done in the field to break down surface crust of the crop field. No artificial mulch materials are use in this case. (2) Artificial Mulching:- it refers to the operation done in the field to cover the gap space of the crop field with external or artificial mulching materials. Different mulching materials like opaque polythene, water hyacinth, saw dust, unfilled grain, paper etc are use in this case. / Под Мульчированием, от Английского слова Mulch, означающее Обкладывать Корни Растений соломой, навозом и тому подобным, понимается сплошное или междурядное покрытие почвы мульчей (мульчбумагой, торфяной крошкой, навозом-сыпцом, перегноем, компостами, опавшей листвой и другим). Применяется в сельском хозяйстве при выращивании овощных, плодовых, ягодных, декоративных и других культур. Мульчирование снижает затраты труда на междурядную обработку посевов и положительно влияет на условия роста растений и почвенное плодородие:- ослабляет испарение влаги с поверхности почвы, уменьшает амплитуду колебания её температуры в течение суток, защищает поверхность поля от размывания, предупреждает образование почвенной корки, угнетает прорастание сорняков и тому подобное. Как правило, мульчирование повышает урожай сельскохозяйственных культур, особенно в засушливых районах. На тяжёлых и избыточно увлажнённых почвах оно менее эффективно и может даже снизить урожай. Роль мульчи выполняет также оставленная на зиму на полях стерня (жнивьё) зерновых культур, которая защищает почву от эрозии (смотрите Эрозия Почвы). Особенно большое значение этот приём имел в условиях степных районов бывшего Союза Советских Социалистических Республик (СССР), где часты сильные ветры (Алтайский и Красноярский края, Новосибирская и Омская области, Северная часть Казахстана и другие). Мульчирование почвы – это путь к богатому урожаю. На агротехническом языке мульчирование означает простую и эффективную почвозащитную технологию, способствующую успешному выращиванию растений. Но сначала следует поточнее определиться с понятием ‘Мульча’:- под мульчей понимают однородный материал или смесь веществ различного происхождения, которые по совокупности своих качественных характеристик пригодны для защиты грунта, используемого для выращивания культурных Растений. Теперь можно, переходя к термину ‘мульчирование почвы’, лучше понять, что это такое. Не зная толком, что значит мульчировать почву или, если проще, что такое мульчировать, нельзя переходить к практическим действиям, поскольку есть опасность нанести уже растущим или только будущим растениям непоправимый вред. Какую пользу приносит мульчирование почвы на дачном участке? Если пренебречь тем, что порой мульчу используют в качестве декоративного украшения, то остальные её свойства сводятся в основном к защитным функциям:- (i) защита корневой системы растений за счёт поддержания в почве необходимого уровня влаги (замульчировать почву – это сохранить в ней влагу) и кислотности, температурного режима и питательной среды (в том числе для дождевых червей, которые разрыхляют грунт); (ii) защита выращиваемых растений от переохлаждения при низких температурах и от сорняков (за счёт препятствования их росту). Кроме того, покрытая мульчей земля не затвердевает в виде трудно пробиваемой корки, а вырастающий ягодный или овощной урожай предохраняется от загрязнения. Виды мульчирования почвы, какие материалы использовать для процедуры (органические и неорганические). Классической является классификация мульчи по её составу на органическую и неорганическую. Несмотря на то что компост также имеет органическое происхождение, его иногда выделяют в отдельную категорию мульчи. Будучи для растительности чрезвычайно питательным, компост ещё и способствует разрыхлению земли и не допускает превращения её поверхности в корку. Ряд специалистов не без основания считают, что мульчированием можно называть и задернение почвы. Для мульчирования можно использовать даже скорлупу грецких орехов и шелуху семечек Подсолнуха. В качестве основного варианта почти всегда рассматривается органическое мульчирование, поскольку его результатом является, в частности, повышение плодородности почвы. Примечание:- Перед мульчированием опилками, стружкой и корой землю нужно обработать навозом, фекалиями или мочевиной, чтобы избежать недостатка в ней азота. Несколько слов о задернении, под которым в данном контексте понимается обычный травяной газон. Обладая не меньшей полезностью, чем специально приготовленная мульча, газонные растения, сберегая питательные вещества, одновременно являются заслоном для почвенной эрозии. Далее о том, чем мульчировать почву, более подробно. Использование Опилок:- Опилки отлично защищают растения от атак вредителей-слизней, затрудняя им процесс передвижения. Из несомненных достоинств этого материала отметим его универсальность для использования на любых почвах, отличную аэропроницаемость, позволяющую почве свободно ‘дышать’, плотность покрытия, в результате которой интенсивно развивающиеся в верхнем слое грунта микроорганизмы постепенно превращают в плодородную земляную массу сами опилки. Помидорам и картошке, всегда страдающим от перегрева почвы, в засушливое лето без опилок вообще не обойтись. Примечание:- Выпревание растений при опилочном мульчировании почвы предотвращается контролем за тем, чтобы опилки не слеживались. Сено И Солома:- Не любят слизни и солому, которая в качестве мульчи очень хороша на огородных грядках. Первоначальная 15-сантиметровая толщина соломенной мульчи потом естественным образом сокращается на две трети. Солома является благодатным материалом и для мульчирования огородных междурядий, а также для укрытия грунта, где растут деревья. Для ведущих достаточно большое хозяйство нет особой проблемы в том, где взять солому или сено для мульчирования. Остальным придётся приобретать – благо, крупные сельскохозяйственные производства способны реализовать излишки. Можно использовать мульчирование сеном и зелёной массой в виде скошенной травы и выполотых сорняков (желательно избавленных от семян). Особенности мульчирования почвы вокруг деревьев предполагают, что защитный слой оставит открытым требующую сухости корневую шейку. В целом же глубоко ушедшим в землю древесным корням поверхностная микрофлора ущерба не нанесёт. В связи с этим здесь будут очень уместны покрывающие землю растения (мульчирование задернением), высаженные в виде газона и способные без труда переносить естественное затемнение, создаваемое кронами деревьев. Примечание:- Сделав мульчирование задернением с помощью Белого Клевера, можно одновременно избавиться от Сорняков и личинок Майского Жука. Применение Торфа При Мульчировании:- Основная функция торфа в качестве мульчирующего слоя – защита почвы от ветряной эрозии, от ухудшения её плодородных качеств через вымывание определяющих эти качества элементов, от неблагоприятной патогенной флоры. Торфяная мульча не требует искусственной уборки, переходя в грунт, она улучшает его состав. Оптимальным считается применение мульчи из торфа для хорошего развития малиновых кустарников, постоянно требующих влаги, которую так прекрасно задерживает торф. Примерно через полмесяца после укоренения в открытом грунте высаженной туда томатной рассады почву тоже мульчируют торфом. Наконец, используют декоративные качества однородной торфяной структуры, что даёт возможность делать очень привлекательную отсыпку. Технология Мульчирования

Сидератами И Скошенной Травой:- Огородная трава, включая специально выращенные сидераты, в силу своего расположения на прогретом Солнцем открытом воздухе быстро избавляется от большей части содержащейся в ней влаги. Это в значительной мере тормозит процесс разложения. Под натиском осенних дождей он интенсифицируется уже на опустевшем от собранного урожая огороде. В результате зимне-осеннего перегнивания хозяин участка к весне получает для грядок новое естественное органическое удобрение. Разобравшись, как несложно приготовить мульчу из травы в летне-осенний период, нужно сказать, что применяется и так называемая ранневесенняя (непосредственно после исчезновения снежного покрова) сидерация растениями, способными к очень быстрому росту. Мульчирование ещё до Майской посадки огурцов, кабачков или иных любящих тепло огородных культур в открытом грунте производится с помощью, к примеру, горчицы (или другого сидерата), успевающей набрать большой объём зелени, которая в скошенном виде и используется в качестве мульчи (можно добавлять и в компост). Оставив в почве корешки и дав возможность грунтовым микроорганизмам с ними ‘поработать’, через пару-тройку недель после скашивания сидератной зелёной массы можно приступать к высадке намеченной культуры. Мульчирование огурцов, поздней капусты и других овощей сидератами принесёт успех, если:- (i) земля для посадки семян будет влажной и рыхлой, а сами семена будут прикасаться к ней большей частью поверхности (нужно немного прикатать); (ii) удастся защитить высаженный семенной материал от пернатых (огородные пугала по-прежнему эффективны); (iii) скашивание будет произведено до того, как сидерат зацветёт и у него образуются плохо разлагающиеся жесткие стебли; и (iv) в процессе мульчирования не будет повреждена почва с полезной микрофлорой. Примечание:- Неиспользование сидератов из одного растительного семейства с основной культурой защитит последнюю от родственных болезней. Особенности Мульчирования Плёнкой И Текстилем:- Неорганическое мульчирование успешно справляется с защитными функциями, если они не связаны с подкормкой растений. Применяемую неорганику можно было бы условно классифицировать следующим образом:- (i) чёрная (порой цветная) плёнка и текстильные материалы, а также бумага и картон; (ii) камни (щебень, гравий, галька и другие); и (iii) керамзит. Последние два вида имеют декоративно-прикладное значение, поскольку способны отлично украсить садовую или ландшафтную композицию, но также способны мешать периодически необходимым земляным работам, связанным с обработкой почвы для выращивания садовых и огородных культур. Керамзит к тому же имеет слабую структуру и со временем подвержен распаду на всё более мелкие частички. Чёрная плёнка применяется часто из-за отсутствия процесса приготовления мульчи. Привлекает её способность отлично сохранять влагу и препятствовать развитию сорных растений. При этом нужно помнить, что она, по сути, является материалом одноразового использования, приходя под Солнечными лучами к непригодности всего за сезон. Принимая решение об использовании плёночного мульчирования, надо предусмотреть:- (i) схему, по которой будет производиться полив выращиваемой растительности (капельный или через отверстия в покрытии); (ii) меры по борьбе со слизнями, которые собираются под плёнкой; (iii) способность растений перенести неизбежно усиленный плёночной мульчей перегрев в особо жаркую погоду. Примечание:- Прикрыв плёнку от Солнца тонким соломенным слоем (или сеном), можно продлить её использование на несколько сезонов. Покрытой камнями, чтобы не искажать эстетическое восприятие, плёнкой ещё мульчируют почву в альпинариях, где она мешает развиваться сорнякам. Всё большую распространённость среди применяющих мульчирование землепользователей получают текстильные материалы, изготовленные на основе полипропиленового волокна. Из-за относительной дешевизны и отличного качества, в том числе такого, как поглощение Солнечных лучей, стал широко известен геотекстиль, не дающий ни одного шанса выжить сорнякам, попавшим под его покрытие. Мульчирование Корой И Щепой:- Щепа и кора, особенно с Берёзы или Дуба, имеют в применении для мульчирования определённые ограничения, связанные с их химическим составом. Передача ими в грунт дубильных веществ способна замедлить рост растений. Поэтому на огородных грядках нужны иные материалы, а вот хвойные посадки (Ель, Кипарисовик и другие), не страшащиеся дубильного влияния, заметно прибавляют в развитии за счёт подкисления корой почвы, на которой они произрастают. Для хвойных растений в интересах улучшения их питания вполне можно ежегодно производить мульчирование грунта компостом. Серьёзным аргументом в пользу мульчирования корой является сочетание в ней хорошей толщины в сравнении с почти невесомой лёгкостью и повышенным содержанием фитонцидов, очищающих окружающую среду от нежелательных микроорганизмов и насекомых. Мульча из коры делает естественным вид приствольного круга возле дерева. При выборе щепы нужно присмотреться к предлагаемым размерам. Как и опилки, деревянные отходы в виде щепы естественным путём переходят в состояние гумуса, до этого успешно справившись с функциями сохранения необходимой рыхлости и влажности грунта и стимулирования увеличения необходимой для растения микрофлоры. Мульчирование Листовым Перегноем:- Опавшая листва даже без дополнительной обработки может быть использована для защиты почвы. Но обязательным условием этого является отсутствие у деревьев, с которых она опала, болезней, спровоцированных Грибком, иначе спорами может быть поражён весь участок. Чтобы избежать такой возможности, листву предпочитают использовать как компонент компоста, тем более что её питательность не вызывает сомнений. Дополнительным предохранителем послужит противогрибковая обработка листьев непосредственно перед тем, как они будут заложены в компост. Листовой перегной, слабокислый и удобрением не являющийся, отлично кондиционирует почву, способствуя улучшению её структуры. Помимо созревшего листового перегноя для мульчирования используют и сухую, и наполовину перепревшую листву. Использование Хвои Для Мульчирования:- Цветочные клумбы хорошо защищаются сосновой хвоей. А вообще сосновую хвою как мульчу стремятся использовать для защиты культур, которые время от времени вредители атакуют массово (общеизвестным представителем таких растений является Чеснок). Бесплатность и натуральность сосновой хвои (вместе с ней в мульчу добавляются и шишки, и веточки, и кусочки коры), её способность делать землю насыщенной влагой, хорошо дышащей, в меру рыхлой привлекает к ней усиленное внимание. Это внимание должно сочетаться с некоторой осторожностью, поскольку такая мульча может привести и к агрономической беде, сверх всякой меры закислив почву в огороде или угнетающе подействовав на развитие некоторых культур. Прекрасные результаты получаются, когда мульчирование Клубники осуществляется таким укрывным материалом, как хвоя. В этом случае от закисления спасаются ежегодной подкормкой клубничного участка древесной золой. Кстати, во время плодоношения мульчирование Клубники делают с помощью чистой соломы, чтобы ягоды не соприкасались с грунтом. Производители очень заботятся о том, чтобы всегда было чем мульчировать Клубнику, поскольку она не только вкусна, но и повышение её урожайности ведёт к неплохому доходу. Особенности Мульчирования Почвы, Что Надо Знать Об Агротехнической Процедуре:- Агротехника мульчирования основывается на обязательности достаточной прогретости почвы. Искусственное покрывало над холодным грунтом (органическое либо неорганическое) приведёт к негативному результату – задержке в развитии растений. Это правило не распространяется на Картофель, мульчу над которым (только органическую) делают сразу после высадки в грунт. Для мульчирования почвы оптимальными считаются два сезона:- (1) основной целью весеннего мульчирования согретой почвы является защита растения от перегрева и пересыхания, то есть после завершения холодной поры нужно немного подождать; (2) в середине или в завершающей стадии осени мульчирование не успевшей переохладиться почвы делается, главным образом, чтобы избежать повреждения или гибели растения от зимних холодов. Созданию защитного покрытия должны предшествовать очистка грунта от Сорняков (многолетних и крупных) и обогащение его золой, костной мукой либо другими неторопливо разлагающимися удобрениями. Мульчирующий слой укладывается не навсегда – его замена производится по

мере исчерпания им выполняемых функций, что связано, в свою очередь, с характеристиками используемых материалов. Покрытая мульчей земля требует более значительного полива, направленного на то, чтобы полностью промокший защитный слой оказался на увлажнённом грунте. Из некоторых индивидуализированных особенностей мульчирования можно отметить, что:- (i) площадь покрытия мульчей земли под кустами и деревьями ограничена диаметром их кроны (не считая зазора между укрытием и стволом); (ii) огородные грядки с овощами и цветочные клумбы мульчируют целиком 10-сантиметровым (можно на 3 см меньше) слоем; (iii) овощная рассада высаживается в грунт, когда он уже покрыт плёнкой или текстилем. Примечание:- Применение мульчирования не ограничено открытым пространством – его применяют и в закрытых помещениях и даже для растений, выращиваемых в горшках. Выяснив, что такое мульча и где её взять, узнав на практике, как приготовить мульчу, осуществив весь процесс приготовления мульчи своими руками, потратив время на мульчирование почвы, землепользователь может значительно его сэкономить на поливах и прополке. А результат в виде хорошего урожая напомнит ему о не зря затраченных усилиях. Мульчирование – это укрытие поверхности земли вокруг Растений любыми материалами, регулирующими водный и воздушный режимы в верхних слоях почвы. Мульчирование Растений – агроприём не новый, и упоминания о нём часто встречаются в литературе.

MULE = КОМНАТНАЯ ТУФЛЯ БЕЗ ЗАДНИКА (или ШЛЁПАНЕЦ, или ХХ) – Mule:- a shoe or slipper without quarter or heel strap. Compare Scuff. / heel = каблук или пятка.

MULE SPINNING FRAME = ГИБРИДНЫЙ ПРЯДУЩИЙ СТАН (или ПРЯДИЛЬНАЯ РАМА МЬЮЛ, или ГИБРИДНАЯ ПРЯДИЛЬНАЯ РАМА) – Mule Spinning Frame is a spinning machine invented by Samuel Crompton in 1782 and termed 'Mule' because it was a combination of the machines invented by Arkwright and Hargreaves. It was once widely used for spinning wool and to a lesser extent for very fine counts of cotton yarn. Its action was intermittent and slower than that of the more current ring spinning frame. It drew out and twisted a length of yarn and then wound it in the form of a cop, or bobbin, then repeated the cycle. See also Spinning Frame. / прядильная машина, изобретённая в 1782 Самьюэлом Кромптчэном (Samuel Crompton; 1753–1827). Английское слово Мьюл (Mule), означающее Мул (гибрид Лошади (кобылы) и Осла (самца)), было использовано в её названии в связи с тем, что она явилась комбинацией машин, изобретённых ранее Ричадом Акрайтом (Richard Arkwright; 1732–92) и Дьжеймзом Хагрэйвзом (James Hargreaves; 1720–78). Прядильная машина периодического действия.

MULL = КИСЕЯ (или МАЛ, или МЮЛЛЬ, или МУЛЛЬ) – Mull is a soft fine sheer fabric of cotton, silk, or rayon. / лёгкая хлопчатобумажная отбельная ткань полотняного переплетения для Восточных рынков; сорт лёгкого муслина.

MULLEN BURSTING STRENGTH = ПРОЧНОСТЬ НА ПРОРЫВ ПО МАЛЭНУ – Mullen Bursting Strength:- an instrumental test method that measures the ability of a fabric to resist rupture by pressure exerted by an inflated diaphragm. Mullen Burst Tester was invented by John W. Mullen in 1887. / Дьжон ДаблЮ. Малэн (John W. Mullen). Прочность На Разрыв Под Действием Внутреннего Давления.

MULTICELLULAR = МНОГОКЛЕТОЧНОЕ – Multicellular:- composed of many cells attached to one another in a characteristic fashion that determines the gross external form of the organism. Multicellular:- of an organism composed of many cells. / Под Многоклеточными понимаются животные и растительные организмы, тело которых состоит из многих специализированных клеток, объединённых в ткани и органы. Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTICOLLINEARITY = МУЛЬТИКОЛЛИНЕАРНОСТЬ (или МНОЖЕСТВЕННАЯ ВСТРЕЧАЕМОСТЬ) – Multicollinearity is a statistical term for a problem that is common in technical analysis. That is, when one unknowingly uses the same type of information more than once. One needs to be careful and not utilize technical indicators that reveal the same type of information. / Мультиколлинеарность – это статистический термин для обозначения проблемы, которая является обыденной в техническом анализе. То есть, когда кто-то неосознанно использует один и тот же тип информации более одного раза. Этому пользователю необходимо соблюдать осторожность и не использовать технические индикаторы, которые показывают информацию одного и того же типа. Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTI COMMODITY EXCHANGE OF INDIA LIMITED = МУЛЬТИСЫРЬЕВАЯ БИРЖА ИНДИИ ЛИМИТИД – Multi Commodity Exchange of India Limited (MCX). Headquartered in Mumbai, India, MCX is a demutualised multi-commodity futures exchange. The exchange began operations in November 2003. Website:- http://www.mcxindia.com. Multi Commodity Exchange of India (MCX) which facilitates online trading, clearing and settlement operations for commodity futures markets across the country. Headquartered in Mumbai, Multi Commodity Exchange of India Ltd (MCX) is a state-of-the-art electronic commodity futures exchange. The demutualised Exchange has permanent recognition from the Government of India to facilitate online trading, and clearing and settlement operations for commodity futures across the country. Having started operations in November 2003, today, MCX holds a market share of over 85% (as on 2012-March-31 MCX had a market share of 86%) of the Indian commodity futures market. The Exchange has more than 2 170 registered members operating through over 3,46,000 including CTCL trading terminals spread over 1 577 cities and towns across India. MCX was the third largest commodity futures exchange in the world (data maintained by Forward Markets Commission (FMC), regulator of India's commodity market), in terms of the number of contracts traded in CY2011. MCX offers more than 40 commodities across various segments such as bullion, ferrous and non-ferrous metals, energy, and a number of agri-commodities on its platform. The Exchange introduces standardized commodity futures contracts on its platform. These contracts in futures exchanges provide an anonymous trading environment for ideal price discovery. The Exchange is the world's largest exchange in Silver and Gold, second largest in Natural Gas and the third largest in Crude Oil with respect to the number of futures contracts traded. MCX has been certified to three ISO standards including ISO 9001:2008 Quality Management System standard, ISO 14001:2004 Environmental Management System standard and ISO/IEC 27001:2005 Information Security Management System standard. The Exchange's platform enables anonymous trades, leading to efficient price discovery. Moreover, for globally-traded commodities, MCX's platform enables domestic participants to trade in Indian currency. The Exchange strives to be at the forefront of developments in the commodities futures industry. MCX was the first exchange in India to initiate evening sessions to synchronise with the trading hours of global exchanges in London, New York and other major international markets. It was the first exchange in India to offer futures trading in steel, crude oil, and almond. In June 2005, MCX launched MCXCOMDEX, India's first real time composite commodity futures index, which provides our members with valuable information regarding market movements in the key commodities, as determined by physical market size in India, which are actively traded on our Exchange. We have introduced several other indices, including MCXAgri (agricultural commodities index), MCXEnergy (energy commodities index) and MCXMetal (metal commodities index). We also have three rain indices, namely RAINDEXMUM (Mumbai), RAINDEXIDR (Indore), and RAINDEXJAI (Jaipur) which track the progress of monsoon rains in their respective geographic locations. In December 2009, we launched EFP transactions for the first time in India, which enables parties with futures positions to swap their positions in the physical markets and vice versa. MCX has forged strategic alliances with various national and international trade bodies/associations/organizations, which we believe enables us to grow our business and expand our market presence. Among international alliances, we have formed strategic alliances with a number of exchanges such as the London Metal Exchange, the New York Mercantile Exchange, the LIFFE Administration and Management (under renewal), the

Baltic Exchange Limited, Shanghai Futures Exchange and Taiwan Futures Exchange. Key Milestones:- 2002-May-28:- converted into a public limited company and name changed to Multi Commodity Exchange of India Limited. 2003-September-26:- received permanent recognition from the Ministry of Consumer Affairs, Food and Public Distribution, Government of India. 2003-November-10:- the first day of trading on our exchange platform. 2003-December-08:- pioneered online futures evening trading sessions synchronized with the trading hours of global exchanges. 2004-November-29:- memorandum of understanding (MoU) entered into between Financial Technologies (India) Ltd (FTIL) and National Agricultural Cooperative Marketing Federation of India Ltd (NAFED) to create a national level agricultural spot exchange. 2005-June-07:- launched of composite commodity futures index ('MCX-COMDEX'). 2005-June-14:- 'Commodity Suchana Kendra', a joint initiative between our Company, Maharashtra State Agricultural Marketing Board (MSAMB) and The National Spot Exchange for Agriculture Produce (NSEAP) to link up all Agriculture Produce Market Committee (APMC) markets, was launched at the Agriculture Produce Market Committee, Navi Mumbai. 2005-October-25:- entered into a license agreement with London Metal Exchange (LME) for the use of the LME's official prices as the basis for settlement of certain futures contracts. 2005-December-01:- entered into an MoU with the University of Mumbai for creating a chair in its Department of Economics. 2006-June-05:- signed a license agreement with NYMEX®. 2006-June-12:- teamed up with the Department of Posts, Government of India, to launch Gramin Suvidha Kendra in Jalgaon, Maharashtra, for information dissemination and query redressal on agricultural issues to farmers using the Indian postal network. 2006-July-24:- signed an agreement with Euronext.LIFFE. 2007-May-23:- certified to ISO/IEC 27001:2005. 2008-June-03:- received membership of the International Organisation of Securities Commissions (IOSCO). 2008-June-09:- launched futures in CER (Certified Emission Reduction) by our Company. 2008-July-18:- launched Gujarati and Hindi versions of our website:- http://www.mcxindia.com. 2009-October-14:- released Commodity Insights Yearbook, India's first Yearbook on Indian Commodity Ecosystem in collaboration with PricewaterhouseCoopers (PwC). 2009-November-30:- launched Exchange of Futures for Physicals (EFP) transactions. 2009-December-03:- became the world's 6th largest commodity futures exchange in terms of the number of contracts traded on the exchange for the period January to June 2009. 2010-June-07:- signed an MoU with Shanghai Futures Exchange. 2010-October-20:- obtained renewal of its ISO 9001:2008 certification from Bureau Veritas Certification (India). 2010-December-09:- released Commodity Insights Yearbook 2010 in collaboration with PwC. 2010-December-20:- entered into an MoU with Taiwan Futures Exchange (TAIFEX) to develop commodity futures market in India. 2011-February-18:- launched silver micro – 1 Kg silver futures contract. 2011-March-31:- filed Draft Red Herring Prospectus (DRHP) with The Securities and Exchange Board of India (SEBI). 2011-April-18:- launched Gold Petal – 1 gram gold futures contract. 2011-June:- Crisil assigned the proposed initial public offering (IPO) of MCX the highest Crisil IPO grade of '5/5'. 2011-September-23:- recorded its highest daily turnover since inception of Rs 1 116.66 billion. 2011-September:- became the world's 5th largest commodity exchange in terms of the number of futures contracts traded during the period January to June 2011, based on Futures Industry Association (FIA) volume survey and market data. 2011-October-03:- launched futures contract in Cotton. 2011-November-23:- launched Gold Petal New Delhi contracts. 2011-December-20:- launched Copper Mini and Nickel Mini contracts. 2012-January-09:- signed an MoU with The All India Glass Manufacture's Federation. 2012-February-27:- MCX's IPO was oversubscribed 54.13 times. 2012-March-09:- became India's first listed exchange. / Гуджяраты (Gujarati) и Хынди (Hindi) версии. Бьюроу Вэритас Сётификэйшэн (Bureau Veritas Certification). ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE).

MULTICOMPONENT FABRIC = МУЛЬТИКОМПОНЕНТНАЯ ТКАНЬ (или МНОГОКОМПОНЕНТНАЯ ТКАНЬ) – Multicomponent Fabric is a fabric in which at least two layers of material are sealed together by an adhesive.

MULTICOMPONENT FIBER = МУЛЬТИКОМПОНЕНТНОЕ ВОЛОКНО (или МНОГОКОМПОНЕНТНОЕ ВОЛОКНО) – Multicomponent Fiber is a fiber composed of two or more fiber forming polymer components, which are chemically or physically different or both. Components can have arrangements such as side-by-side coresheath or matrix. Where there are only two components, the fiber is said to be bicomponent.

MULTICROPPING = МУЛЬТИЗЕМЛЕДЕЛИЕ – Multicropping is the growing of more than one crop together in one field or sequentially. / выращивание вместе на одном поле или последовательно более одной сельскохозяйственной культуры.

MULTICURRENCY CREDIT LINE = МУЛЬТИВАЛЮТНАЯ КРЕДИТНАЯ ЛИНИЯ – Multicurrency Credit Line is a credit line which may be drawn on in one or more currencies stipulated in the credit agreement. / Кредитная линия, которая может предоставлена в одной или более валютах, оговорённых кредитным соглашением. Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTIDISCIPLINARY = МУЛЬТИДИСЦИПЛИНАРНОЕ (или МНОГОДИСЦИПЛИНАРНОЕ) – Multidisciplinary:- a combination of many disciplines in an assignment, not necessarily working in an integrated or coordinated manner.

MULTIDISCIPLINARY APPROACH = МУЛЬТИДИСЦИПЛИНАРНЫЙ ПОДХОД (или МНОГОДИСЦИПЛИНАРНЫЙ ПОДХОД) – Multidisciplinary Approach is an approach that uses many experts from different disciplines working together on a research program to solve a problem.

MULTI–FIBER ARRANGEMENT = МУЛЬТИВОЛОКОННАЯ ДОГОВОРЁННОСТЬ (или ДОГОВОРЁННОСТЬ ПО МУЛЬТИВОЛОКНАМ) – Managed Trade:- From the Kennedy Declaration to the MFA:- However, the intervening decades of 'managed trade' still had to be negotiated, and the trade policies of individual national governments recognised. Immediately prior to the International Federation's (ITMF) meeting in Osaka, President John F. Kennedy of the United States of America, on the 2nd May 1961, issued an unprecedented declaration, in which he announced a programme of assistance to the United States textile industry, designed to meet a wide range of the problems that it faced as a result of rapid technological change, shifts in consumer preference, and increasing international competition. Although the world of textiles was taken by surprise by President Kennedy's announcement, the Federation was quick to grasp its great significance and, still in Osaka, issued the following comments:- 'Note has been taken, with the greatest interest, of the declaration made by President John F. Kennedy, of the United States of America, on the 2nd May 1961, regarding the textile industry. It is noted with satisfaction that the existence of a special problem of the international textile trade is thereby officially recognised at the highest level, and that it is also officially admitted that special solutions must be found to this problem. (The International Federation (ITMF)) takes great interest in President Kennedy's statement, particularly his proposal to call an international conference of all the principal textile exporting and importing countries, for the purpose of seeking an international understanding which will provide a basis for trade that will avoid undue disruption of established industries. The Federation recommends that this proposal should be given the most serious consideration by all the governments concerned, in consultation with representative national textile industry associations, so that both traditional and new industries can look forward to a stable future'. Multilateral negotiations began immediately thereafter, and led first to the 'Short-Term Arrangement' (1961–62) and eventually to the 'GATT Long-Term Agreement on International Trade in Cotton Textiles' (1962–73). The ultimate fruit of these accords was the Multi-Fibre Agreement (1974–2004) which, in later revisions, timetabled the orderly, progressive elimination of quotas between 1995 and 2005, when rules on international textile trade will be fully integrated into those of the World Trade Organization set up under the Uruguay Round accord. The theme of the need for orderly market conditions prevailing while the global structural adjustment took

place was highlighted at the 1963 International Federation meeting in Athens. A statement was adopted in which the claims of the textile industries in both the developing and the highly industrialized countries were officially and collectively acknowledged. The Federation explicitly pointed out that 'to satisfy both claims, it will be necessary to complete the current structural adjustment in productive capacities of the world's textile industries. This can only be achieved if, during the transition period, orderly conditions prevail in the world's textile markets; moreover, dumping practices be avoided and prices be brought into a normal relationship to true costs. Efforts should be made by both developing and highly industrialized countries to ensure the successful implementation of the GATT Agreement on International Trade in Cotton Textiles. It should also be considered whether the present five-year term of the GATT Arrangement needs to be extended to permit the necessary structural adjustments to be carried out'. Forty years later, the adjustments are continuing and the restoration of 'normal' price/cost relationships remains contentious at the highest levels of international cooperation, across multiple industries. Certainly, the transition period has proved to be both longer and more radical than many of its planners could have imagined. By 1966, the International Federation had arrived at the conclusion which has governed its attitude to the intersection of its own activities with the conduct of international trade negotiations, declaring that 'the controversial nature of the subject makes it difficult for the Federation to make specific recommendations in this field'. It was rather agreed that its role should be to provide 'a useful forum for the managements of textile enterprises to air their views on international trade policy at industrial level'. This has indeed been the case, and occasion has been provided by the renewals of the MFA which took place in 1977, 1981, 1986, and 1991. However, as the international textile trading community became increasingly focused on the dawning of a post-quota world, it was recognised that the best service that the International Federation could provide was to help equip its members by means of pursuing practical projects of tangible value to the industry, and to continue widening the opportunities that participation offers for the establishment of international business relationships. The latter are, after all, at the heart of any company's transition to a successful, globalized industrial operation. In many ways, the conclusions of the Federation's 1967 New Delhi conference stood as an endorsement of the cooperative model of international trade, despite the fact that the Federation chose to concentrate on the industry's 'knitting' – its core challenges – rather than its politics. It was observed that 'international textile competition is likely to increase. Foreign trade in textiles should be carried out under orderly and equitable conditions. Importing countries should avoid unjustified demands for undue protection for their domestic markets; exporting countries should refrain from making excessive claims for increased shares in the world's export trade'. The meaning of the words Undue and Excessive clearly had to be left to the trade body responsible, whether at the national or supra-national level. By the early 1970s a consensus had emerged among members, that the Federation should direct its efforts principally towards the exploration of new ways and means of ensuring the future prosperity of the global textile industry. Outside the annual conference framework, this priority was best pursued through the working programmes of the specialist committees which carry out their projects with the full delegated authority of the Federation and report to the Committee of Management each year on their progress. The International Federation's (ITMF) scope to advise the world's textile industries as they wrestled, and continue to wrestle, with restructuring and relocation issues has therefore in recent times been concentrated on monitoring and reporting the productive capacities installed around the world, and the direction and quality of new investments. In addition to the statistical reports that are regularly compiled, these trends are described and interpreted in the Annual Conference setting. The Multi-Fibre Arrangement (MFA) is an international umbrella compact, authorized by the General Agreement on Tariffs and Trade (GATT), that allows contracting parties to negotiate bilaterally quantitative restrictions on textile imports (which normally would be considered contrary to GATT provisions) to the extent the importing country considers them necessary to prevent market disruption. The Multi-Fiber Arrangement (MFA) provides that such restrictions should not reduce imports to levels below those attained during the preceding year. Bilateral agreements usually allow for import growth tied to anticipated greater demand. The Multi-Fibre Arrangement (MFA) is an international agreement originally designed to expand trade in textile products, particularly exports from developing countries. It has developed into an arrangement sanctioning bilateral quotas and restrictions on textile imports.1961:- The Short-Term Arrangement Regarding International Trade in Cotton, the first of the forerunners to the MFA, is negotiated. It establishes the right of importing countries to negotiate restrictions on low-cost textile imports. 1962:- The second of the forerunners, the Long-Term Arrangement Regarding International Trade in Cotton, is negotiated. 1967:- Tariff cuts are agreed upon shortly after the Kennedy Round of talks under the General Agreement on Tariffs and Trade. In the United States, legislation is introduced to mandate quotas on textile and apparel products of all fibers. 1971:- The US Government concludes bilateral restraint agreements with its four largest textile and apparel suppliers:- Japan, Hong Kong, Taiwan and South Korea. The agreements cover trade in wool and man-made fiber textile and apparel products. 1972:- The GATT Working Party on textiles calls for a new international arrangement covering cotton, man-made fibers and wool textile and apparel products. 1974:- The Multi-Fibre Arrangement, signed by 42 countries, goes into effect. The US Congress establishes the Generalized System of Preferences, but excludes textile and apparel articles subject to a textile agreement from the system's duty-free treatment. 1977:- The MFA is extended (MFA II). 1978:- The Carter Administration prepares to make tariff concessions on textiles and apparel as part of the Tokyo Round of GATT talks. Congress enacts legislation that would have blocked implementation of the proposed concessions, threatening the status of the GATT negotiations. President Carter vetoes the bill, but agrees to provide relief for the domestic industry. 1981:- The MFA is extended once more (MFA III). The United States establishes 18 new quotas against five supplying countries. 1982:- The United States negotiates new bilateral agreements with its three largest suppliers – Hong Kong, South Korea and Taiwan. MFA III assumed growth would be limited to 6 percent only in 'exceptional circumstances'. However, Washington used this as a rule, limiting growth to between 0.5 percent and 1.5 percent a year on a wide range of products. 1985:- President Reagan vetoes legislation to restrict textile and apparel imports further. The president calls on the Office of the US Trade Representative to 'most aggressively renegotiate the Multi-Fibre Arrangement on terms no less favorable' than those already in force. 1986:- President Reagan announces agreement on extending the MFA another five years (MFA IV). Coverage is expanded to reach virtually all known and conceivable fibers that may be used to manufacture textile or apparel products. Multi-Fibre Arrangement is a special protocol agreed by members of GATT as derogation from normal GATT rules. The MFA, which ran from 1974 to 1994, permitted members to establish quotas restricting textile and clothing trade which applied to specific supplying countries. Normal GATT rules insist that all GATT parties are to be treated equally. On 1995-January-01, the MFA was superseded by the Agreement on Textiles and Clothing (ATC). The Multifiber Arrangement (MFA) was an international trade agreement dealing with textiles and clothing that was in place from 1974 till 2004. It imposed quotas on the amount of clothing and textile exports from developing countries to developed countries. Key Takeaways:- (i) The Multifiber Arrangement (MFA) governed international trade around garments and textiles from 1974 through 2004; (ii) The goal of the MFA was to establish quotas limiting textile imports into developing countries whose domestic industries were facing serious damage from rapidly increasing imports; and (iii) The system of import quotas that dominated the trade during this period have now been phased out. Understanding The Multifiber Arrangement:- Under the Multifiber (multifibre) Arrangement, the United States (US) and the European Union (EU) restricted imports from developing countries in an effort to protect their domestic textile industries. Under the agreement, each developing country signatory was assigned quotas (numerically limited quantities) of specified items that could be exported to the US and EU. (Note that at the start of the agreement the EU did not exist in its current form; the agreement included what was then the European Community (EC) and the European Free Trade Association (EFTA). History of the Multifiber Arrangement:- The agreement was first established under the auspices of the then-existing General Agreement on Tariffs and Trade (GATT). The origins acknowledged both (1) the threat to

developed markets from cheap clothing and textile imports in terms of market disruption and the impact on their own producers, and (2) the importance of these exports to developing countries in terms of their own economic development and as a means to diversify export earnings. At that stage, developing countries were often still heavily reliant on primary commodity exports. The agreement attempted to mitigate this potential conflict to ensure continued cooperation in international trade. In this context, the quotas were described as an orderly means in which to manage the global clothing and textiles trade in the shorter term to prevent market disruptions. The ultimate aim remained one of reduction of barriers and liberalization of trade, with developing countries expected to take an increasing role over time in this trade. The number of signatories to the agreement changed slightly over time but was generally in excess of 40, with the EC counting as one signatory. Trade between these countries dominated the global clothing and textile trade, accounting for as much as 80%. GATT has since been supplanted by the World Trade Organization (WTO), and at the Uruguay Round of GATT the decision was taken to transfer oversight of the global textile trade to the WTO. Also as a result of that round of negotiations, the dismantling of quotas on the global clothing and textile trade began. The process was completed on 01 January 2005, effectively marking the end of the MFA. The agreement had helped protect industries of the developed economies as it was designed to, but also helped spur textile production in certain countries where the quotas actually gave them access they had not previously had. Officially known as 'The Arrangement Regarding International Trade in Textiles', the Multifiber Arrangement (MFA) provides a framework for the negotiation of bilateral agreements between importing and producing countries, or for unilateral action by importing countries in the absence of an agreement. These bilateral agreements establish quantitative limits on imports of textiles and apparel, of cotton and other vegetable fibers, wool, man-made fibers and silk blends, in order to prevent market disruption in the importing countries-restrictions that would otherwise be a departure from GATT provisions. The United States has bilateral agreements with many supplying countries, including the four largest suppliers:- China, Hong Kong, the Republic of Korea, and Taiwan. The Multi Fibre Arrangement (MFA) governed the world trade in textiles and garments from 1974 through 1994, imposing quotas on the amount developing countries could export to developed countries. Its successor, the Agreement on Textiles and Clothing (ATC), expired on 01 January 2005. History:- Since the (re)emergence of developing countries as a source of cotton textile production, after the Textile manufacture during the Industrial Revolution, such as India, Bangladesh, and Pakistan's Khadi production in the Swadeshi movement initiated by Mahatma Gandhi, cotton production from these countries steadily increased after colonial independence. A number of treaties concerning Short-Term Arrangements regarding International Trade in Cotton Textiles (Geneva, 21 July 1961); Long-Term Arrangement regarding International Trade in Cotton Textiles (Geneva, 09 February 1962 and 15 June 1970), and Arrangement regarding International Trade in Textiles (Geneva, 20 December 1973) attempted to address the issue of what seemed a natural dominance of developing world in cotton textile production at the time. Eventually, the Multi Fibre Agreement was established in 1974. Impact:- The MFA was introduced in 1974 as a short-term measure intended to allow developed countries to adjust to imports from the developing world. Developing countries and countries without a welfare state have a comparative advantage in textile production because it is labor-intensive and their poor social insurance systems allow them low labor costs. According to The World Bank/International Monetary Fund (IMF) study, the system has cost the developing world 27 million jobs and USD40 billion a year in lost exports. Developing countries have resisted moves such as a social clause in tariff agreements, to link them to improvements in working conditions. The Arrangement was not negative for all developing countries. For example, the European Union (EU) imposed no restrictions or duties on imports from the emerging countries, such as Bangladesh, leading to a massive expansion of the industry. At the General Agreement on Tariffs and Trade (GATT) Uruguay Round, it was decided to bring the textile trade under the jurisdiction of the World Trade Organization (WTO). The Agreement on Textiles and Clothing provided for the gradual dismantling of the quotas that existed under the MFA. This process was completed on 01 January 2005. However, large tariffs remained in place on many textile products. Bangladesh was expected to suffer the most from the ending of the MFA, as it was expected to face more competition, particularly from China. However, this was not the case. It turns out that even in the face of other economic giants, Bangladesh's labor is 'cheaper than anywhere else in the world'. While some smaller factories were documented making pay cuts and layoffs, most downsizing was essentially speculative – the orders for goods kept coming even after the MFA expired. In fact, Bangladesh's exports increased in value by about USD500 million in 2006. However, poorer countries within the developed world, such as Greece and Portugal, are expected to lose out. During early 2005, textile and clothing exports from China to the West grew by 100% or more in many items, leading the US and EU to cite China's WTO accession agreement allowing them to restrict the rate of growth to 7.5% per year until 2008. In June, China agreed with the EU to limit the rate to 10% for 3 years. No such agreement was reached with the US, which imposed its own import growth quotas of 7.5% instead. When the EU announced their new quotas to replace the lapsed MFA, Chinese manufacturers accelerated their shipping of the goods intended for the European market. This used up a full year's quota almost immediately. As a result, 75 million items of imported Chinese garments were held in European ports in August 2005. A diplomatic resolution was reached at the beginning of September 2005 during Tony Blair's visit to China, putting an end to a situation the UK press had dubbed 'Bra Wars'. The Multi-Fiber Agreement (MFA), negotiated under the auspices of the General Agreement on Tariffs and Trade (GATT), provides a set of complex rules to which signatory nations agree to abide when negotiating bilateral agreements to control trade in cotton, wool, and manmade fiber textiles and apparel. In 1985, the United States had bilateral textile agreements with 36 exporting countries, most of which were negotiated under the rules of the MFA. / Официально известная как Договорённость, Касающаяся Международной Торговли Текстилём, Мультиволоконная Договорённость (МВД) обеспечивает рабочие рамки для переговоров по двухсторонним соглашениям между привозящими и производящими странами, или для односторонних действий ввозящих стран в отсутствии соглашения. Эти двухсторонние соглашения устанавливают количественные ограничения на привозы текстиля и одежды, хлопка и других растительных волокон, шерсти, искусственных волокон и шёлковых смесей с тем, чтобы предотвратить подрыв рынка по ограничениям ввозящих стран, что в противном случае расценивалось бы как отступление от положений Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)). Соединённые Штаты Америки имеют двухсторонние соглашения со многимим поставляющими странами, включая четыре крупнейших поставщика:- Китай, Гон Конг, Республика Корея и Тайвань. Мульти-Волоконная Договорённость (МВД) регулировала всемирную торговлю текстилем и швейными изделиями с 1974 по 1994, устанавливая квоты по количеству возможного вывоза развивающимися странами в развитые страны. Правопреемником этой договорённости стало Соглашение по Текстилю и Одежде (СТО) (Agreement on Textiles and Clothing (ATC)), истекшее 01 Января 2005. История:- . Мульти-Волоконная Договорённость (МВД), достигнутая под эгидой Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)), обеспечивает набор сложных правил, которые подписавшие нации согласны соблюдать при заключении двухсторонних соглашений по контролю за торговлей хлопком, шерстью, и текстилем и одеждой из искусственных волокон. В 1985 Соединённые Штаты Америки заключили двухсторонние текстильные соглашения с 36 экспортирующими странами, большинство из которых были заключены по правилам МВД. Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTIFILAMENT YARN = КОМПЛЕКСНАЯ ПРЯЖА (или МУЛЬТИФИЛАМЕНТНАЯ ПРЯЖА, или ПРЯЖА ИЗ МНОЖЕСТВА (ЭЛЕМЕНТАРНЫХ) НИТЕЙ) – Multifilament Yarn is the yarn consisting of many continuous filaments or strands, as opposed to monofilament which is one strand. Most textile filament yarns are multifilament. See also Monofilament Yarn. Multifilament Yarn or Multifil is the filament yarn consisting of two or more filaments. Multifilament Yarn is the yarn made of two or more filaments (long

threads) of man-made fibers (monofilaments) that are joined together, usually by twistingally by twisting. Multifllament Yarn:- a large number (500 to 2 000) of fine, continuous filaments (often 5 to 100 individual filaments) usually with some twist in the yarn to facilitate handling. / филаментная (комплексная) пряжа (filament yarn). мононить (monofilament). Комплексная Нить или Мультифиламент (Multifilament) – текстильная нить, состоящая из двух или более элементарных нитей.

MULTIGENIC, POLYGENIC = МУЛЬТИГЕННОЕ, ПОЛИГЕННОЕ – Multigenic, Polygenic:- characteristic controlled by many genes.

MULTIGENICULATA = МНОГОСУЧКОВАТОЕ (или МНОГОКОЛЕНЧАТОЕ, или РАЗНОКАЛИБЕРНОЕ, или РАЗНООБРАЗНОЕ) – Multigeniculata:- with many angled stems. / Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTIGRADE OIL = МУЛЬТИСОРТОВОЕ МАСЛО (или МНОГОЦЕЛЕВОЕ МАСЛО, или УНИВЕРСАЛЬНОЕ МАСЛО) – Multigrade Oil is an oil meeting the requirements of more than one the Society of Automotive Engineers (SAE) viscosity grade classification, and may therefore be suitable for use over a wider temperature range than a single-grade oil. Multigrade Oil is a motor or gear oil that meets the requirements of more than one SAE viscosity grade and thus it can be used in a wider temperature range. / моторное или передаточное масло, которое удовлетворяет требованиям более, чем к одному сорту вязкости по САИ и . Под Мульти..., от Латинского слова Multum, означающее Много, понимается составная часть сложных слов, указывающая на множественность, многократность, например, мультимиллионер, мультиплекс и другое.

MULTILATERAL AGREEMENT = МНОГОСТОРОННЕЕ СОГЛАШЕНИЕ (или МУЛЬТИЛАТЕРАЛЬНОЕ СОГЛАШЕНИЕ) – Multilateral Agreement is an international compact in which three or more parties participate. / Международный договор, в котором принимает участие от трёх и более сторон. Под Мультилатеральным, от Латинских слов Multum, означающее Много, и Lateral, от Laterus, от Latus, родительный падеж Lateris, означающее Сторона, понимается .

MULTILATERAL CLEARING ORGANIZATION = МНОГОСТОРОННЯЯ КЛИРИНГОВАЯ ОРГАНИЗАЦИЯ – In the United States, a Multilateral Clearing Organization (MCO) is a system utilized by more than two participants in which the bilateral credit exposures of participants arising from the transactions cleared are effectively eliminated and replaced by a system of guarantees, insurance, or mutualized risk of loss. Section 409 of the Federal Deposit Insurance Corporation Improvement Act, 12 USC § 4422 (12 USC is short for the United States Code:- Title 12), provides that an MCO for over-the-counter derivatives may operate in the United States if, among other alternatives, the MCO is supervised by a foreign financial regulator that the CFTC, or one of several other United States financial regulators, has determined satisfies appropriate standards. The term Multilateral Clearing Organization means a system utilized by more than 2 participants in which the bilateral credit exposures of participants arising from the transactions cleared are effectively eliminated and replaced by a system of guarantees, insurance, or mutualized risk of loss. See also Clearing Organization. / Термин Многосторонняя Клиринговая Организация означает систему, применяемую более, чем 2 участниками, в которой двухсторонние кредитные взаимоотношения между участниками, возникающие в результате расчётов по операциям, однозначно исключены и заменены системой гарантий, страховки, или взаимосогласованным риском убытков. Смотрите также Клиринговая Организация или Расчётная Организация (Clearing Organization). Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTILATERAL INVESTMENT FUND = ФОНД МНОГОСТОРОННИХ КАПИТАЛОВЛОЖЕНИЙ (или МНОГОСТОРОННИЙ ИНВЕСТИЦИОННЫЙ ФОНД) – The Multilateral Investment Fund (MIF) supports economic growth and poverty reduction in Latin America and the Caribbean through encouraging increased private investment and advancing private sector development. It works with the private sector to develop, finance, and execute innovative business models that benefit entrepreneurs and poor and low-income households; partners with a wide variety of institutions from the private, public and nonprofit sectors; evaluates results; and shares lessons learned. The MIF is a laboratory for testing pioneering, market-based approaches to development, and an agent of change that seeks to broaden the reach and deepen the impact of its most successful interventions. Our Mission:- the Multilateral Investment Fund, funded by 39 donors, supports private sector-led development benefitting low-income populations and the poor – their businesses, their farms, and their households. The aim is to give them the tools to boost their incomes:- access to markets and the skills to compete in those markets, access to finance, and access to basic services, including green technology. A core MIF mission is to act as a development laboratory – experimenting, pioneering, and taking risks in order to build and support successful micro and SME business models. To make effective use of MIF projects, the MIF is committed to:- (i) rigorous results measurement and impact evaluation, and (ii) active knowledge sharing so that the most promising solutions are widely known and can be taken to scale. The MIF works through technical assistance grants, equity investments, and lending as well as through combinations of these tools when both capacity building and risk sharing finance are needed for success. It is the largest international technical assistance provider to the private sector in Latin America and the Caribbean and always works with local, mostly private partners to help fund and execute projects – civil society organizations, industry associations, foundations, universities, cooperatives, companies, and financial institutions. The MIF finances about 100 projects per year, with a total finance volume of about USD100 million. Every Dollar approved by the MIF leveraged more than USD4 from partners in 2011. Of the MIF's 546 active projects, 80% were on track to meet their development objectives at the end of 2011. As of June 30, 2012, the MIF had an active portfolio of 51 funds – 44 operating and 7 pending first closing. These funds have provided capital for over 350 individual small businesses, generating over USD1 billion in revenues and creating more than 28 000 jobs. Headquartered in Washington, DC, the United States. Our History:- established in 1993 as part of the Inter-American Development Bank (IDB) Group, the MIF is the largest provider of technical assistance for private sector development in the Latin American and Caribbean region. In its 17-year history, the MIF has approved over 1 700 projects, committed over USD1.5 billion and mobilized a total of over USD2.7 billion in the LAC region, reaching over 4 million beneficiaries. The MIF plays a distinct role within the IDB Group, pursuing innovative ways to build economic opportunity and decrease poverty. It has successfully tested, experimented and searched for innovative solutions and approaches, and is an effective agent of change by achieving large-scale, sustainable change in the thinking or behavior of individuals, policy-makers, organizations or businesses. In recognition of these results, in 2005 the Donor countries decided to replenish the MIF's resources, extend its term and enhance its focus through new defining agreements (Agreement Establishing MIF II, signed on April 09 in Okinawa, Japan). The MIF´s resource replenishment and MIF II came into effect in March 2007. In developing MIF II, Donors sought to embody the lessons of experience and position the MIF to meet current and evolving needs of the Region, reinforcing proven success factors. Donors emphasized the importance of maximizing the MIF's development impact, by:- (i) focusing resources on areas where there is both a critical need for assistance, and where MIF interventions can make a measurable difference; (ii) testing and introducing new ideas and piloting concepts to stimulate and build support for larger scale changes; and (iii) continuously improving MIF's development effectiveness through an integrated focus on results, which calls for the clear identification of what is to be accomplished, effective measurement of the results attained, and widely sharing the knowledge gained from its experience. Multilateral Investment Fund (MIF):- under the Enterprise for the Americas Initiative, the fund complements the Inter-American Development Bank. The fund provides program and project grants to advance specific,

market-oriented investment policy initiatives and reforms and encourages domestic and foreign investment in Latin America and the Caribbean. / Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTILATERAL INVESTMENT GUARANTEE AGENCY = АГЕНТСТВО ГАРАНТИЙ МНОГОГРАННЫХ КАПИТАЛОВЛОЖЕНИЙ (или АГЕНТСТВО ГАРАНТИЙ МУЛЬТИЛАТЕРАЛЬНЫХ ИВЕСТИЦИЙ) – The Multilateral Investment Guarantee Agency (MIGA) is a member of the World Bank Group. Our mission is to promote foreign direct investment (FDI) into developing countries to help support economic growth, reduce poverty, and improve people's lives. Our Strategy:- MIGA's operational strategy plays to our foremost strength in the marketplace – attracting investors and private insurers into difficult operating environments. We focus on insuring investments in the areas where we can make the greatest difference:- (i) countries eligible for assistance from the International Development Association (the world's poorest countries); (ii) conflict-affected environments; (iii) complex deals in infrastructure and extractive industries, especially those involving project finance and environmental and social considerations; and (iv) South-South investments (from one developing country to another). MIGA offers comparative advantages in all of these areas – from our unique package of products and ability to restore the business community's confidence, to our ongoing collaboration with the public and private insurance market to increase the amount of insurance available to investors. As a multilateral development agency, MIGA only supports investments that are developmentally sound and meet high social and environmental standards. MIGA applies a comprehensive set of social and environmental performance standards to all projects and offers extensive expertise in working with investors to ensure compliance to these standards. Our Products:- we fulfill our mission by providing political risk insurance guarantees to private sector investors and lenders. MIGA's guarantees protect investments against-non-commercial risks and can help investors obtain access to funding sources with improved financial terms and conditions. Our unique strength is derived from our standing as a member of the World Bank Group and our structure as an international organization with our shareholders including most countries of the world. Since our inception in 1988, MIGA has issued more than USD24 billion in political risk insurance for projects in a wide variety of sectors, covering all regions of the world. We also conduct research and share knowledge as part of our mandate to support foreign direct investment into emerging markets. This underscores our position as a thought leader and source of pertinent information for the political risk insurance community. Our Team:- our people have extensive experience in political risk insurance, with backgrounds including banking and capital markets, environmental and social sustainability, project finance and sector specialties, and international law and dispute settlement. Meet our senior management. Our Shareholders:- a Council of Governors and a Board of Directors representing our member countries guide the programs and activities of MIGA. MIGA's corporate powers are vested in the Council of Governors, which delegates most of its powers to a Board of Directors. Voting power is weighted according to the share of capital each director represents. The directors meet regularly at the World Bank Group headquarters in Washington, DC, where they review and decide on investment projects and oversee general management policies. The Multilateral Investment Guarantee Agency (MIGA) was established in 1988 as a part of the World Bank Group. MIGA encourages equity investment and other direct investment flows to developing countries through the mitigation of noncommercial investment barriers. The agency offers investors guarantees against noncommercial risks; advises developing member governments on the design and implementation of policies, programs, and procedures related to foreign investments; and sponsors a dialogue between the international business community and host goverments on investment issues. The idea for a multilateral political risk insurance provider was floated long before MIGA's establishment – in fact as far back as 1948. But it was not until September 1985 that this idea started to become a reality. At that time the World Bank's Board of Governors began the process of creating a new investment insurance affiliate by endorsing the MIGA convention that defined its core mission:- 'to enhance the flow to developing countries of capital and technology for productive purposes under conditions consistent with their developmental needs, policies and objectives, on the basis of fair and stable standards to the treatment of foreign investment'. On April 12, 1988 an international convention established MIGA as the newest member of the World Bank Group. The agency opened for business as a legally separate and financially independent entity. Membership was open to all IBRD (short for the International Bank for Reconstruction and Development) members, and the agency began with capital stock of USD1 billion. MIGA's original 29 members were:- Bahrain, Bangladesh, Barbados, Canada, Chile, Cyprus, Denmark, Ecuador, Egypt, Germany, Grenada, Indonesia, Jamaica, Japan, Jordan, Korea, Kuwait, Lesotho, Malawi, Netherlands, Nigeria, Pakistan, Samoa, Saudi Arabia, Senegal, Sweden, Switzerland, United Kingdom, and United States. MIGA was created to complement public and private sources of investment insurance against non-commercial risks in developing countries. MIGA's multilateral character and joint sponsorship by developed and developing countries were seen as significantly enhancing confidence among cross-border investors. Today, MIGA's mission is straightforward:- to promote foreign direct investment into developing countries to support economic growth, reduce poverty and improve people's lives. / Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTILATERAL NETTING = МНОГОСТОРОННИЙ ВЗАИМОРАСЧЁТ (или МНОГОСТОРОННЕЕ СВЕДЕНИЕ, или МНОГОСТОРОННИЙ НЕТТИНГ) – Multilateral Netting is a netting on a multilateral basis is arithmetically achieved by summing each participant's bilateral net positions with the other participants to arrive at a multilateral net position. Such netting is conducted through a central counterparty (such as a clearing house) that is legally substituted as the buyer to every seller and the seller to every buyer. The multilateral net position represents the bilateral net position between each participant and the central counterparty. See also Netting. Netting among more than two parties. / Взаиморасчёт или Сведение между более, чем двумя сторонами. Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTILATERAL TRADE NEGOTIATIONS = МНОГОСТОРОННИЕ ТОРГОВЫЕ ПЕРЕГОВОРЫ – Multilateral Trade Negotiations is a term describing the eight multilateral rounds of negotiations held under the auspices of the General Agreement on Tariff and Trade since 1947. See also Rounds. / Термин, описывающий восемь многосторонних раундов переговоров, проводённых с 1947 под знамёнами Генерального Соглашения о Тарифах и Торговле (ГСТТ). Смотрите также Раунды (Rounds). Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTILINE = МУЛЬТИЛИНИЯ – Multiline:- mixing seeds of several resistant lines which differ only in the resistance genes they carry. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

MULTILINES = МУЛЬТИЛИНИИ – Multilines are breeding lines composed of a number of backcross derivatives of a recurrent parent, each carrying a different resistant gene. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

MULTILINE VARIETY = МУЛЬТИЛИНЕЙНАЯ РАЗНОВИДНОСТЬ – Multiline Variety is a variety composed by mixing several isogenic or near-isogenic lines. / Под биологической Разновидностью понимается таксономическая категория (ранг) ниже

Подвида в систематике Растений. Разновидность – группа особей, отличающихся от типичных для Вида особей какими-либо второстепенными признаками (характером роста, окраски).

MULTILOBAL = МНОГОЛЕПЕСТКОВОЕ (или МНОГОЛОПАСТНОЕ) – Multilobal is a fiber with a modified cross section exhibiting several lobes. / волокно с модифицированным поперечным сечением, проявляющим несколько лепестков.

MULTILOBAL CROSS SECTION = МНОГОЛЕПЕСТКОВОЕ ПОПЕРЕЧНОЕ СЕЧЕНИЕ (или МНОГОЛОПАСТНОЕ ПОПЕРЕЧНОЕ СЕЧЕНИЕ) – Multilobal Cross Section:- described is a synthetic fiber for use in carpets, having a multilobal cross section, each lobe of said multilobal cross section having a first end and a second end and one side and an opposite side, the first end of each of said lobes being connected to the first end of the other lobes, the second end of each of said lobes radiating outwardly, each lobe having a plurality of projections, alternating along a contour of each lobe, each projection of each lobe having no direct counterpart on the opposite side of said lobe, the fiber having a modification ratio of from about 2.5 to about 7. See also Cross Section. The patented Sedifilt® process begins with 100% pure polypropylene that is melt-spun (extruded) without the use of any chemicals. The extruded media consists of continuous filaments of multi-lobal cross-section with numerous micro voids between each individual filament. These chemical-free continuous filaments are then randomly oriented to each other, intermixed, looped and entwined into a non-round, highly stable, bulky yarn. The multi-lobal cross-section of filaments combined with the random yarn structure gives much improved void to solid ratio. This improved porosity gives a higher dirt holding capacity and reduced resistance to flow. Sedifilt® multi-lobal cross section of individual filaments has more micro-voids giving higher dirt holding capacity and lower resistance to flow. Multilobal polyester yarn:- draw-false-twist texturable polyester yarns are provided which have filaments having 6–10 essentially symmetric lobes of equal length equispaced around the central axis of the filament, a modification ratio of from 1.17 to 1.85 and a denier per filament between 3.8 R.sub.o and a maximum value which is a function of the modification ratio, the number of lobes and the factor R.sub.o which is a nominal draw ratio. Less than 12% of the draw-false-twist textured filaments have flattened cross-sectional peripheries greater than 10 microns in length. / объёмная пряжа (bulky yarn). пористость или рыхлость (porosity). Сэдифилт® (Sedifilt®).

MULTILOCATION TRIALS = ОПЫТЫ В МНОГОЧИСЛЕННЫХ МЕСТАХ – Multilocation Trials:- the same experiment is conducted in a number of different locations or sites across a geographic area.

MULTI–MIXER = МНОГОКАМЕРНАЯ СМЕШИВАЮЩАЯ МАШИНА – Rieter UNIMIX is a machine for perfect mixing of raw material. Mixing is found on different lodging and withdrawing of material. Lodging is at horizontal layers on the bottom conveyer and withdrawing at vertical direction by opening belt with spikes at the angle 80°. At the end of machine is placed clearing saw cylinder. Fit for all sorts of cottons and synthetic fibers up to length 65 mm. In spinning process, Multi-Mixer mixing system offers an optimal solution for any textile manufacturer, and for any mixing task in the field of one-component staple fiber mixes. / В прядильном производстве Риэта ЮНИМИКС (Rieter UNIMIX). Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTIMODAL BILL OF LADING = МУЛЬТИМОДАЛЬНЫЙ КОНОСАМЕНТ (или СМЕШАННЫЙ КОНОСАМЕНТ) – Multimodal Bill Of Lading (B/L) is a bill of lading covering shipment of goods by more than one means of transportation but including an ocean leg. The two major forms of multimodal bill of lading are the combined transport bill of lading and the through bill of lading. Under the former, the carrier signing the bill of lading (the contractual carrier) frequently subcontracts the various legs to other carriers (the actual carriers), but still takes responsibility for delivery of the goods to the place of delivery and for any damage that might occur during carriage. Under the latter, the carrier takes responsibility for the goods only up to a specified point (still called the Place Of Delivery) and then passes responsibility to a second carrier for on-carriage to the final destination. A Multimodal Bill of Lading or Intermodal Through Bill of Lading is one that obligates the carrier to transport the cargo from origin to des-tination by more than one mode of trans-portation on a single freight charge by use of a single bill of lading. If a shipper wants to avoid Carmack's limits on liability, the shipper can do so by using, for example, a multimodal ocean bill of lading to transport the inland portion of the delivery under that bill. The shipper, on the other hand, may likely not avoid Carmack with a multimodal bill if the motor carrier issues a second bill of lading. / избежать лимиты ответственности по Камэку (Carmack's). Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTIMODAL TRANSPORT = МУЛЬТИМОДАЛЬНАЯ ПЕРЕВОЗКА (или СМЕШАННАЯ ПЕРЕВОЗКА, или ПЕРЕВОЗКА В СМЕШАННОМ СООБЩЕНИИ) – Multimodal Transport is the carriage of cargo (containers) by means of at least two different modes of transport. Shipment of goods by more than one means of transportation but including an ocean leg. Multimodal is synonymous for all practical purposes with Intermodal. / Под Смешанной Перевозкой понимается перевозка пассажиров и грузов при помощи нескольких видов транспорта (железнодорожного, речного и так далее). В отличие от прямой перевозки одним видом транспорта. Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTIMODAL TRANSPORT CONTRACT = КОНТРАКТ НА МУЛЬТИМОДАЛЬНУЮ ПЕРЕВОЗКУ (или ДОГОВОР НА ТРАНСПОРТИРОВКУ В СМЕШАННОМ СООБЩЕНИИ) – A term Multimodal Transport Contract means a contract whereby a multi modal transport operator undertakes, against payment of freight, to perform or to procure the performance of international multimodal transport.

MULTIMODAL TRANSPORT DOCUMENT = ПЕРЕВОЗОЧНЫЙ ДОКУМЕНТ НА ТРАНСПОРТИРОВКУ В СМЕШАННОМ СООБЩЕНИИ (или ДОКУМЕНТ НА МУЛЬТИМОДАЛЬНУЮ ПЕРЕВОЗКУ) – Multimodal Transport Document:- the FIATA multimodal Bill of Lading is commonly used by shipping lines and multimodal transport providers where the voyage involves more than one mode of transport. In his new role as the Multimodal Transport Operator (MTO) the freight forwarder promises to either carry the cargo, or get the cargo carried as principal. (FIATA:- in French – Fédération Internationale des Associations de Transitaires et Assimilés, in English – International Federation of Freight Forwarders Associations.) Multimodal Transport Document is a document providing for a combined transport by at least two different modes of transport from a place at which the goods are taken to a place designated for delivery under the responsibility of the carrier. Also known as Combined Transport Document. A term Multimodal Transport Document means a document which evidences a multi modal transport contract, the taking in charge of the goods by the multimodal transport operator, and an undertaking by him to deliver the goods in accordance with the terms of that contract. / Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTIMODAL TRANSPORT OPERATOR = ОПЕРАТОР МУЛЬТИМОДАЛЬНОЙ ПЕРЕВОЗКИ – The Multimodal Transport Operator (MTO) means any person who on his own behalf or through another person acting on his behalf concludes a multimodal transport contract and who acts as a principal, not as an agent or on behalf of the consignor or of the carriers participating in the multimodal transport operations, and who assumes responsibility for the performance of the contract. / Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTIMONTHLY CAPACITY CREDIT MARKETS = XX – Multimonthly Capacity Credit Markets (Multimonthly CCMs):- in electricity, the capacity credits cleared through PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC)

Multimonthly CCMs in the United States. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

MULTINATIONAL BANK = МУЛЬТИНАЦИОНАЛЬНЫЙ БАНК (или МНОГОНАЦИОНАЛЬНЫЙ БАНК) – Multinational Bank is a bank that operates in many countries. Shareholder structure and management membership generally reflect the bank's multinationality. / Банк, который действует во многих странах. Структура акционеров и состав правления обычно отражают многонациональность данного банка. Под Мульти, от Латинского слова Multum, означающее Много, понимается .

MULTIPASS TEST = ИСПЫТАНИЕ НА МНОГОХОДНОСТЬ – Multipass Test:- filter performance tests in which the contaminated fluid is allowed to recirculate through the filter for the duration of the test. Contaminant is usually added to the test fluid during the test. The test is used to determine the Beta-Ratio (q.v.) of an element.

MULTIPEST THRESHOLD = МУЛЬТИВРЕДИТЕЛЬСКИЙ ПОРОГ – Multipest Threshold is the point at which the combined effects of subthreshold levels of two or more pests justify treatment.

MULTIPHASE LOOM = МНОГОФАЗНЫЙ ТКАЦКИЙ СТАНОК – Multiphase Loom:- the phase number of a loom is defined as the average number of shuttles or weft carriers inserting weft simultaneously. It is shown that existing multi-phase looms must have high phase numbers to compensate for their low shuttle velocity. The analysis suggests that looms with high-velocity flying shuttles would achieve equally high weft-insertion rates with moderate increases in the phase number. Such moderate increases in the phase number can be obtained by dividing the shedding and beat-up motions into a comparatively small number of sections. The suggested alternative would avoid many of the textile and engineering problems arising in existing multi-phase looms. Features of Multiphase Loom:- (1) A multi-phase loom with magnetic shuttle features that the spiral reed blade with shuttle path is used for beating-up. (2) The linear motor is used for wefting, the heald wheel or electromagnetically excited heald needle is used for opening, and the weft opening with off-line multi-path asynchronous weft replenishing is used. (3) Its advantages include high efficiency, high speed and low weaving cost. (4) The multiphase loom can form many different sheds at different places, thereby enabling insertion of number of filling yarns, one behind the other. Advantages of Multiphase Loom Over Conventional Loom:- (1) An analysis of the factors determining the weft-insertion rate of weaving machines shows that these factors are essentially the same on all looms in which shuttles or weft carriers are used, such as conventional shuttle looms, gripper-shuttle looms, and multi-phase looms. (2) Its advantages include high efficiency, high speed and low weaving cost. (3) The multiphase loom can form many different sheds at different places, thereby enabling insertion of number of filling yarns, one behind the other. Suggestions:- The multiphase loom is the modern invention of the new era. For the excellent loom speed and weaving speed it is now very popular to the many industrialists. But here in Bangladesh the multiphase loom are not available in every factory due to its higher cost. We think in Bangladesh if this machine being available then many weavers will get the real benefit of the multiphase machine. / уточные пряжи .

MULTIPHASE SAMPLING = МНОГОФАЗНЫЙ (или МНОГОФАЗОВЫЙ) ОТБОР ПРОБ – Multiphase Sampling is a collecting information from different categories and from different subsamples.

MULTIPLE ALLELES = МНОГОЧИСЛЕННЫЕ АЛЛЕЛИ – Multiple Alleles are a series of alleles (more than 2) that affect the development of a character. Multiple Alleles are a series of more than two mutational forms at a given locus. / свойства (character). Под Аллелями, от Греческого слова Allēlōn, означающее Друг Друга или Взаимно, или Аллеломорфами понимаются различные формы одного и того же гена, расположенные в одинаковых участках (локусах) гомологичных (парных) хромосом; определяют варианты развития одного и того же признака. В нормальной диплоидной клетке может присутствовать не более двух аллелей одновременно.

MULTIPLE ARBITRARY AMPLICON PROFILING = МНОГОЧИСЛЕННОЕ ПРОИЗВОЛЬНОЕ ПРОФИЛИРОВАНИЕ АМПЛИКОНА – Multiple Arbitrary Amplicon Profiling (MAAP) is a collective term used to describe the Random Amplified Polymorphic DNA (RAPD), Arbitrarily Primed Polymerase Chain Reaction (AP-PCR), and DNA amplification fingerprinting (DAF) reactions.

MULTIPLE CAR RATE = СТАВКА ДЛЯ БОЛЬШЕГО КОЛИЧЕСТВА ВАГОНОВ – Multiple Car Rate is a railroad rate that is lower for shipping more than one carload at a time.

MULTIPLE CONSIGNEE CONTAINER = КОНТЕЙНЕР ДЛЯ НЕСКОЛЬКИХ ГРУЗОПОЛУЧАТЕЛЕЙ – Multiple Consignee Container is a container with cargo for more than one consignee. / Контейнер с грузом, предназначенным более, чем для одного консигнатора (грузополучателя).

MULTIPLE CROPPING = ВЫРАЩИВАНИЕ ДВУХ И БОЛЕЕ УРОЖАЕВ В ГОД (НА ОДНОЙ И ТОЙ ЖЕ ПЛОЩАДИ) – Multiple Cropping is a growing more than one crop in the same plot in 1 year. / Земледелие.

MULTIPLE CROPPING INDEX = ИНДЕКС ПО ВЫРАЩИВАНИЮ ДВУХ И БОЛЕЕ УРОЖАЕВ В ГОД – Multiple Cropping Index (MCI) is the sum of the areas planted to different crops harvested during the year, divided by the total cultivated area. / Земледелие.

MULTIPLE CROSS = МНОЖЕСТВЕННАЯ ПОМЕСЬ (или МНОЖЕСТВЕННОЕ СКРЕЩИВАНИЕ) – Multiple Cross is a cross involving more than two parents. / Под Помесью или Метисом понимается животное, полученное от скрещивания особей разных пород. Благодаря неоднородной генетической структуре наследственности обычно отличается повышенной продуктивностью, жизнеспособностью. Служит хорошим материалом для отбора при выведении новых пород.

MULTIPLE DEPENDENT CLAIM = МНОГОЗАВИСИМАЯ ПРЕТЕНЗИЯ (или МНОГОЗАВИСИМЫЙ ПУНКТ ФОРМУЛЫ) – Multiple Dependent Claim is a dependent claim which further limits and refers back in the alternative to more than one preceding independent or dependent claim. Acceptable multiple dependent claims shall refer to preceding claims using the terms 'or, any one of, one of, any of, either'. A multiple dependent claim may not depend on another multiple dependent claim, either directly or indirectly.

MULTIPLE LIEN (ON PROPERTY) = МНОГОГРАННЫЕ (или МНОЖЕСТВЕННЫЕ, или МНОГОКРАТНЫЕ, или СОСТАВНЫЕ) ПРАВА УДЕРЖАНИЯ (СОБСТВЕННОСТИ) – Multiple Lien (On Property):- the pledging of several pieces of land as security for the repayment of the same claim, each property being encumbered with the full amount of the pledge. A multiple lien may be established only if the pieces of land belong to the same owner or are owned by debtors granting joint and several guarantee. / выплата (repayment) .

MULTIPLE OPTION FINANCING FACILITY = ОБЕСПЕЧЕНИЕ ФИНАНСИРОВАНИЯ С МУЛЬТИВАЛЮТНЫМ ОПЦИОНОМ (или ПОДДЕРЖКА ФИНАНСИРОВАНИЯ С МУЛЬТИВАЛЮТНЫМ ОПЦИОНОМ, или ВОЗМОЖНОСТЬ ФИНАНСИРОВАНИЯ С МУЛЬТИВАЛЮТНЫМ ОПЦИОНОМ) – Multiple Option Financing Facility is the money market facility allowing the borrower to choose among several currencies for the financing package.

MULTIPLE–RANGE TEST = МНОГОДИАПАЗОННЫЙ ТЕСТ (или КРИТЕРИЙ МУЛЬТИРАЗМАХА) – Multiple-Range Test is a sequential test used to make pairwise comparisons among several means which provide the least significant ranges.

MULTIPLE RESISTANCE = МНОЖЕСТВЕННАЯ РЕЗИСТЕНТНОСТЬ (или МНОЖЕСТВЕННАЯ СОПРОТИВЛЯЕМОСТЬ, или МНОЖЕСТВЕННАЯ УСТОЙЧИВОСТЬ) – Multiple Resistance is a resistance to several stresses such as insects, nematodes, diseases, drought, and nutritional deficiencies.

MULTIPLE WOUND YARN = ТРОЩЁНАЯ ПРЯЖА (или МНОГОНАМОТАННАЯ ПРЯЖА, или ВО МНОЖЕСТВЕ НАМОТАННАЯ ПРЯЖА) – Multiple Wound Yarn (synonym:- Assembled Yarn) is a yarn without twist composed of two or more singles, folded or cabled yarns. Multiple Wound Yarn:- two or more components; no twisting operation; similar or dissimilar components. / Трощёная Нить (Multiple Wound Yarn) – текстильная нить, состоящая из двух или более нитей, соединённых без скручивания.

MULTIPLICATION = РАЗМНОЖЕНИЕ (или МУЛЬТИПЛИКАЦИЯ) – Multiplication is the growing of seed for sale or wide distribution as a planting material in a given community or for specific research.

MULTIPURPOSE CARGO BERTHS = МНОГОЦЕЛЕВЫЕ ГРУЗОВЫЕ ПРИЧАЛЫ – Multipurpose Cargo Berths:- a wharf or berth that is not dedicated to any particular cargo, but is equipped to handle several types of cargo. / Пристань или причал, который не предназначен для какого-то конкретного груза, но оснащённый оборудованием для обработки (перевалки) нескольких типов груза. Под Пристанью понимается небольшой порт на внутренних водных путях, имеющий обычно 1–2 причала. Причал, комплекс сооружений и устройств, предназначенных для подхода, швартовки, стоянки, обработки и обслуживания судов, посадки и высадки пассажиров, грузовых операций и тому подобного. Различают грузовые, пассажирские, судоремонтные и другие причалы.

MULTIPURPOSE VESSEL = СУДНО МНОГОЦЕЛЕВОГО НАЗНАЧЕНИЯ (или УНИВЕРСАЛЬНОЕ СУДНО) – Multipurpose Vessel is any ship capable of carrying different types of cargo which require different methods of handling. There are several types of ships falling into this category, for example, ships which can carry roll on/roll off cargo together with containers. Vessel designed for the carriage of different types of cargo: general, bulk, heavy and/or containerised cargo. Also known as Multipurpose Ship.

MULTISOURCE FINANCING = ФИНАНСИРОВАНИЕ ИЗ МНОГОЧИСЛЕННЫХ ИСТОЧНИКОВ – Multisource Financing:- all-in financing provided by banks to cover deliveries of products manufactured in different countries, usually backed with export credit insurance taken out in the respective countries. This form of financing is growing increasingly popular as production becomes more international. / вывозной (или экспортный) кредит (export credit).

MULTITANK CONTAINER = КОНТЕЙНЕР С МНОГОЧИСЛЕННЫМИ ЦИСТЕРНАМИ (или МНОГОЦИСТЕРНОВЫЙ КОНТЕЙНЕР) – Multitank Container is a container frame fitted to accommodate two or more separate tanks for liquids. / Рама в форме типового контейнерного каркаса, сконструированная таким образом, чтобы в ней располагались две и более отдельные цистерны для жидкостей.

MUNGO = МУНГО – Mungo:- wool fibers recovered from old and new hard worsteds and woolens of firm structure. The fibers are less than .5 in. in length, and owing to their reduced spinning and felting qualities, they are largely used in cheaper woolen blends. Mungo fibers are usually shorter than shoddy fibers. / Мунго:- шерстяные волокна, полученные из старых и новых . В длину волокна не превышают и 0.5 дюйма (inch (in)), . Под Мунго (на Французском) понимается угарная шерсть; лоскут из сильно валяной шерсти (короткого штапеля).

MUNICIPAL BONDS = МУНИЦИПАЛЬНЫЕ ОБЛИГАЦИИ – Municipal Bond is a bond issued by a state, city, or local government. Municipalities issue bonds to raise capital for their day-to-day activities and for specific projects that they might be undertaking (usually pertaining to development of local infrastructure such as roads, sewerage, hospitals etc) interest on municipal bonds are generally exempt from federal tax. In the case that the bond is bought by a resident of the state that issued the bond, the interest payments are also exempt from state tax. Interest payments are further exempt from local tax if they are bought by residents of the locality that issued the bond. Capital gains however are taxable. Given the tax-savings they offer, municipal bonds are often bought by people who have large tax burdens. Yields on municipal bonds are often lower than corporate or Treasury bonds with comparable maturities, because of the important advantage of not being taxed at the federal level. In general, municipal bonds are considered safer than corporate bonds, since a municipality is far less likely to go bankrupt than a company. Some municipal bonds can also be insured by outside agencies. These companies will promise to pay the interest and principal if the issuer defaults. Both issuers and bondholders can carry this insurance, though a bondholder would need to have a large stake to get the coverage. There are two common types of municipal bonds:- general obligation and revenue. General Obligation (GO) bonds are unsecured municipal bonds that are simply backed by the full faith and credit of the municipality. Generally, these bonds have maturities of at least 10 years and are paid off with funds from taxes or other fees. Revenue bonds are used to fund projects that will eventually create revenue directly, such as a toll road or lease payments for a new building. The revenues from the projects are used to pay off the bonds. In some cases the issuer is not obligated to pay interest unless a certain amount of revenue is generated. Municipal bonds usually come in USD5 000.00 par values and usually require a minimum investment of USD25 000.00 in order to get the best price. Also known as Muni. In the United States, Municipal Bond is a bond issued by cities, counties, states and local governmental agencies to finance public projects, such as construction of bridges, schools and highways. Debt securities issued by state and local governments, and special districts and counties. Also known as Local Authority Bond. / Долговые ценные бумаги, выпускаемые регинальными правительствами, а также правительством штата, районов или округов. Известны также как Облигации Местных Властей (Local Authority Bonds). Муниципальные Облигации – это долгосрочные долговые обязательства властей штата или муниципалитетов, полученные от продажи облигаций, могут быть направлены на удовлетворение общих потребностей органов управления или на осуществление особых проектов. Выпуск должен быть одобрен референдумом или избирателями. До принятия Акта о Налоговой Реформе от 1986 (Tax Reform Act of 1986) термины ‘муниципальный’ и ‘освобождённый от налога’ (tax-exempt) были синонимами, поскольку практически все муниципальные обязательства не облагались федеральным подоходным налогом, а также большинством налогов штата и местным подоходным налогом, по крайней мере в штате их выпуска. Акт от 1986, однако, разделил муниципальные ценные бумаги на две широкие категории:- (i) облигации, выпускаемые для финансирования общественных целей (public purpose bonds), которые остаются исключением из налогообложения и могут выпускаться без ограничений; и (ii) облигации, выпускаемые для финансирования частных целей (private purpose bonds), которые облагаются налогом, если не являются специально оговорённым исключением. Различие в налогообложении между облигациями, выпускаемыми для финансирования общественных и частных целей, основано на выражаемой в процентном соотношении степени, в которой облигации приносят доход частным вкладчикам:- если являющиеся исключением из налогообложения облигации, выпускаемые для финансирования общественных целей, приносят более 10% дохода частным вкладчикам, то этот доход облагается налогом. Разрешённые облигации, выпускаемые для финансирования частных целей (permitted private purpose bonds), представляют собой специально оговорённые исключения из налогообложения; они обычно составляют предпочтительные с точки зрения налогообложения статьи (tax preference items) при расчёте альтернативного минимального налога (alternative minimum tax), но начиная с 15 Августа 1986 объём эмиссии облигаций, не облагаемых налогом, ограничен.

MUNICIPALITY = МУНИЦИПАЛИТЕТ – In reference to electricity, Municipality is a city, county, irrigation district, drainage district, or political subdivision or agency of a state component under the laws thereof to carry on the business of developing, transmitting, and/or distributing power. Typically, a municipality is not-for-profit; however, profits may be returned to customers or used internally. / По отношению к электричеству, город, округ, ирригационный район, район осушки или политическое подразделение или агентство территориальной единицы штата, по закону обязанное осуществлять развитие, передачу и/или сбыт электроэнергии. Обычно, муниципалитет является некоммерческой организацией; тем не менее, прибыли могут быть возвращены клиентам-потребителям либо использованы на внутренние цели.

MUNSELL COLOR SYSTEM = ЦВЕТОВАЯ СИСТЕМА МЮНСЭЛА – Munsell Color System is a system of specifying colors of surfaces illuminated by daylight and viewed by an observer adapted to daylight, in terms of three attributes:- hue, value, and chroma, using scales that are perceptually approximately uniform. Munsell Color System is the color identification of a specimen by its Munsell hue, value and chroma as visually estimated by comparison with the Munsell Book of Color. In colorimetry, the Munsell color system is a color space that specifies colors based on three color dimensions:- hue, value (lightness), and chroma (color purity). It was created by the American Professor Albert H. Munsell in the first decade of the XX century and adopted by the USDA as the official color system for soil research in the 1930s. Several earlier color order systems had placed colors into a three-dimensional color solid of one form or another, but Munsell was the first to separate hue, value, and chroma into perceptually uniform and independent dimensions, and was the first to systematically illustrate the colors in three-dimensional space. Munsell's system, particularly the later renotations, is based on rigorous measurements of human subjects' visual responses to color, putting it on a firm experimental scientific basis. Because of this basis in human visual perception, Munsell's system has outlasted its contemporary color models, and though it has been superseded for some uses by models such as CIELAB (L*a*b*) and CIECAM02, it is still in wide use today. Explanation:- the system consists of three independent dimensions which can be represented cylindrically in three dimensions as an irregular color solid:- hue, measured by degrees around horizontal circles; chroma, measured radially outward from the neutral (gray) vertical axis; and value, measured vertically from 0 (black) to 10 (white). Munsell determined the spacing of colors along these dimensions by taking measurements of human visual responses. In each dimension, Munsell colors are as close to perceptually uniform as he could make them, which makes the resulting shape quite irregular. As Munsell explains:- 'Desire to fit a chosen contour, such as the pyramid, cone, cylinder or cube, coupled with a lack of proper tests, has led to many distorted statements of color relations, and it becomes evident, when physical measurement of pigment values and chromas is studied, that no regular contour will serve' (Albert H. Munsell, 'A Pigment Color System and Notation'). History and Influence:- the idea of using a three-dimensional color solid to represent all colors was developed during the XVIII and XIX centuries. Several different shapes for such a solid were proposed, including:- a double triangular pyramid by Tobias Mayer in 1758, a single triangular pyramid by Johann Heinrich Lambert in 1772, a sphere by Philipp Otto Runge in 1810, a hemisphere by Michel Eugène Chevreul in 1839, a cone by Hermann von Helmholtz in 1860, a tilted cube by William Benson in 1868, and a slanted double cone by August Kirschmann (1860–1932) in 1895. These systems became progressively more sophisticated, with Kirschmann's even recognizing the difference in value between bright colors of different hues. But all of them remained either purely theoretical or encountered practical problems in accommodating all colors. Furthermore, none was based on any rigorous scientific measurement of human vision; before Munsell, the relationship between hue, value, and chroma was not understood. Albert Munsell, an artist and professor of art at the Massachusetts Normal Art School (now Massachusetts College of Art and Design, or MassArt), wanted to create a 'rational way to describe color' that would use decimal notation instead of color names (which he felt were 'foolish' and 'misleading'), which he could use to teach his students about color. He first started work on the system in 1898 and published it in full form in A Color Notation in 1905. The original embodiment of the system (the 1905 Atlas) had some deficiencies as a physical representation of the theoretical system. These were improved significantly in the 1929 Munsell Book of Color and through an extensive series of experiments carried out by the Optical Society of America in the 1940s resulting in the notations (sample definitions) for the modern Munsell Book of Color. Though several replacements for the Munsell system have been invented, building on Munsell's foundational ideas – including the Optical Society of America's Uniform Color Scales, and the International Commission on Illumination's CIELAB (L*a*b*) and CIECAM02 color models – the Munsell system is still widely used, by, among others, The American National Standards Institute (ANSI) to define skin and hair colors for forensic pathology, The United States Geological Survey (USGS; a scientific agency of the United States government) for matching soil colors, in Prosthodontics during the selection of shades for dental restorations, and breweries for matching beer colors. / Тобиас Майа (Tobias Mayer; 1723–1762) в 1758, Йохан Хайнрих Ламбэрт (Johann Heinrich Lambert; 1728–1777) в 1772, Филип Ото Рунэ (Philipp Otto Runge; 1777–1810) в 1810, Мишэль Ёжэн Шевроль (Michel Eugène Chevreul; 1786–1889) в 1839, Хэрман фон Хэльмхольц (Hermann von Helmholtz; 1821–1894) в 1860, Британец Вильэм Бэнсэн (William Benson) в 1868, и Аугуст Киршман (August Kirschmann; 1860–1932) в 1895. Американский Профессор Элбёт Хэнри Мюнсэл (Albert Henry Munsell; 1858–1918).

MUNSELL NOTATION = МЮНСЭЛСКАЯ НОТАЦИЯ (или МЮНСЭЛСКОЕ ОБОЗНАЧЕНИЕ) – Munsell Notation is:- (1) the Munsell hue, value, and chroma assigned to the color of a specimen by visually comparing the specimen to the chips in the Munsell Book of Color. (2) A notation in the Munsell color system, derived from luminous reflectance Y and chromaticity coordinates x and y in the 1931 CIE system for standard illuminant C, by the use of scales defined by the Optical Society of America Subcommittee on the Spacing of the Munsell Colors. Commission Internationale de l'Eclairage (CIE) is the French title of the International Commission on Illumination. / Под Нотацией, от Латинского слова Notatio, означающее Записывание или Обозначение. Комисьо Этэрнасьёналь дё л'Эклераж (Сэ.И.Е.; Commission Internationale de l'Eclairage (CIE)).

MUR = MAURITIAN RUPEE

MURATA® SPINNING = ПРЯДЕНИЕ МУРАТА® – Murata® Spinning:- air-jet spinning technology was first introduced by DuPont™ in 1963, but it has only been made commercially successful by Murata since 1980. DuPont™ used only one jet, which produced a low strength yarn. The Murata system has two opposing air jets (1999), which improves the yarn strength. (Air-jet spinning is used mainly for spinning from short staple fibers, especially cotton and polyester blends.) Staple fibers are drafted using a roller drafting system with three or four pairs of rollers. The fibers are then threaded through the twin-jet assembly. The second jet N2 has a higher twisting torque than the first jet N1. Immediately after leaving the front drafting rollers, the fibers in the core of the yarn are twisted in the twist direction of N2. The fibers on the edges of the drafted ribbon are twisted by the weaker N1 and wrap around the core fibers in the opposite direction. Because the jet system is located between the front drafting rollers and the yarn delivery rollers, neither of which rotate around the axis of the yarn, the twist inserted by the jets is not real twist and after the yarn passes through the jet system, the core fibers become twistless. The yarn strength is imparted by the wrapping of the edge fibers. Because of the small jet dimensions, very high rotational jet speeds are possible. Although twist efficiency is only 6–12% because of the twist resistance of the yarn, delivery speeds of up to 300 m/min are possible. In a further development by Murata the second jet is replaced with a pair of roller twisters. The principle of yarn formation is similar to the twin-jet system. The new machine, the roller-jet spinner, is capable of delivery speeds of up to 400 m/min. However, the yarn has a harsher handle. See also Air Jet Spinning. Murata Machinery Ltd (Muratec) is a Japanese leading manufacturing of machine and textile machinery. It was established in 1935 as the Nishijin Jacquard Manufacturing

partnership, and was primarily involved in the manufacturing of textile machinery. In 1961, it developed the turret lathe, sparking its expansion into the field of machine tools. Today, it is a major player in a number of areas, manufacturing and selling products in the fields of logistics and automation, machine tools, sheet metal machinery, textile machine, and communication equipment. Additionally, in 1979, the company's textile machine division developed the Mach Splicer, a groundbreaking device that made it possible to create knotless yarn using compressed air. This revolutionary technology redefined the textiles industry, enabling the manufacturing of apparel products without compromising yarn quality, the scale expansion of spinning machines, and the improvement of the speed and efficiency of weaving machines and knitting machines. Today, this technology is used in Muratec's automatic winders, which boast the world's largest share of the automatic winder market. Here we profile one of Muratec's leading products from its textile machinery division, the VORTEX 861 Spinning Machine. VORTEX 861 is a world-leading Muratec product that employs unique spinning technology to make roving, spinning, and winding possible in a single machine. It boasts the following features. (i) Unique Spinning Technology:- the VORTEX 861 uses unique spinning technology that causes long fibers to converge at the core while short fibers diverge to the outer layer. Yarn thus produced has various advantages, such as being less hairy in appearance, having greater resistance to pilling, and displaying a high moisture absorption capacity. Yarn produced by the VORTEX 861 is known as VORTEX® and has both high functionality and fashion applicability. (ii) World's Fastest Spinning Speed and Process Integration:- VORTEX 861 can spin yarn at speeds of up to 450 m/min, resulting in productivity rates that are twenty times higher than those of conventional spinning machines. (iii) Improved Quality Management:- VORTEX 861 is equipped with the very latest yarn defect detection function as well as a quality control system, allowing for more precise detection of yarn quality. By including a Visual On-demand System (VOS), it has become much easier for the operator to determine operating conditions and conduct quality management, operational management, and maintenance management in comparison to earlier models. (iv) Space-Saving and Power Saving:- VORTEX 861 integrates roving, spinning, and winding into a single unit, making it possible to reduce running costs for labor, power, and maintenance. Furthermore, a comparison of the processes, installation area, machines, operators, and maintenance workers required for the VORTEX 861 and conventional models shows that the VORTEX 861 achieves a space saving of around 30% overall. It is also around 20% more energy efficient than conventional models. VORTEX 861 is an efficient spinning machine that well meets the needs of the age. / Мурата Мэшинёри Лтд (Murata Machinery Ltd или Муратэк (Muratec)) является ведущей компанией из Японии, изготавливающей машины и текстильное оборудование. Она была образована в 1935 как Нищидзин Жакяр Мэнифактчоринь (Nishijin Jacquard Manufacturing). Мак Сплайсё (Mach Splicer). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). ВОТЭКС® (VORTEX®).

MURIATIC ACID = МУРИАТИЧЕСКАЯ КИСЛОТА (или СОЛЯНАЯ КИСЛОТА, или ХЛОРИСТОВОДОРОДНАЯ КИСЛОТА) – Muriatic Acid, HCl, is an antiquated but much-used term for hydrochloric acid. Most muriatic acid sold in hardware stores is as strong as commercial hydrochloric acid sold for laboratory purposes. Sometimes it is somewhat diluted, but still is dangerous and must be handled with great care.

MUSETTE = МЮЗЭТ (или РЮКЗАК, или ВЕЩЬ МЕШОК) – Musette is a small knapsack; also, a similar bag with one shoulder strap. Called also Musette Bag. / .

MUSHROOM ANCHOR = ГРИБОВИДНЫЙ ЯКОРЬ (или МЁРТВЫЙ ЯКОРЬ) – Mushroom Anchor (maritime term):- an anchor without stock and shaped like a mushroom.

MUSHROOM TEST = ГРИБНОЙ ТЕСТ – Mushroom Test or Mushroom Apparel Flammability Test:- this test method involves igniting a cylinder of fabric around a core containing heat sensors and measuring the rate of heat transfer from the burning material to the sensor. See also Flammability Tests. / Грибной Тест или Грибной Тест На Воспламеняемость Одежды:- этот метод испытаний заключается в поджигании цилиндра из ткани вокруг сердечника, содержащего датчики тепла и измерении темпа теплопередачи от горящего материала датчику. Смотрите также Тесты На Воспламеняемость (Flammability Tests).

MUSHY WOOL = МЯГКАЯ ШЕРСТЬ (или ПОРИСТАЯ ШЕРСТЬ) – Mushy Wool is a wool that is lacking in character, dry, and wasty in manufacturing.

MUSKEG = МАСКЕГ (или СФАГНОВОЕ БОЛОТО) – Muskeg is a bog of northern North America, commonly having sphagnum mosses, sedge, and sometimes stunted black spruce and tamarack trees. Muskeg:- large expanses of peatlands. Muskeg is an acidic soil type common in Arctic and boreal areas, although it is found in other northern climates as well. Muskeg is approximately synonymous with bogland, but 'muskeg' is the standard term in Western Canada and Alaska, while 'bog' is common elsewhere. The term became common in these areas because it is of Cree origin; Maskek meaning low-lying marsh. Large tracts of this soil existing in Siberia may be called Muskeg or Bogland interchangeably. Muskeg consists of dead plants in various states of decomposition (as peat), ranging from fairly intact sphagnum moss, to sedge peat, to highly decomposed humus. Pieces of wood can make up five to 15 percent of the peat soil. Muskeg tends to have a water table near the surface. The sphagnum moss forming it can hold 15 to 30 times its own weight in water, allowing the spongy wet muskeg to form on sloping ground. Muskeg patches are ideal habitats for beavers, pitcher plants, agaric mushrooms and a variety of other organisms. Muskeg forms because permafrost, clay or bedrock prevents water drainage. The water from rain and snow collects, forming permanently waterlogged vegetation and stagnant pools. Muskeg is wet, acidic, and relatively infertile, which prevents large trees from growing, although stunted shore pine, cottonwood, some Species of Willow, and black spruce are typically found in these habitats. It needs two conditions to develop:- abundant rain and cool summers. A dead plant that falls on dry soil is normally attacked by bacteria and fungi and quickly rots. If the same plant lands in water or on saturated soil, it decomposes differently. Less oxygen is available under water, so aerobic bacteria and fungi fail to colonize the submerged debris effectively. In addition, cool temperatures retard bacterial and fungal growth. This causes slow decomposition, and thus the plant debris gradually accumulates to form peat and eventually muskeg. Depending on the underlying topography of the land, muskeg can reach depths greater than 30 meters (100 ft). Although at first glance muskeg resembles a plain covered with short grasses, a closer look reveals a bizarre and almost unearthly landscape. Small stands of stunted and often dead trees, which vaguely resemble Bonsai trees, grow where land protrudes above the water table, with small pools of water stained dark red scattered about. Its grassland appearance invites the unwary to walk on it, but even the most solid muskeg is spongy and waterlogged. Traveling through muskeg is a strange and dangerous experience for the unaccustomed. Muskeg can grow atop bodies of water, especially small ponds and streams. Because of the water beneath, the muskeg surface sometimes ripples underfoot. Thinner patches allow large animals to fall through, becoming trapped under the muskeg and drowning. Moose are at a special disadvantage in muskeg due to their long legs, minimal hoof area, and great weight. Hunters and hikers may occasionally encounter young moose in muskeg-covered ponds submerged up to their torsos or necks, having been unaware of the unstable ground. Muskeg can be a significant impediment to transportation. During the 1870s, muskeg in Northern Ontario was reported to have swallowed a railroad engine whole when a track was laid on muskeg instead of clearing down to bedrock. Many other instances have been reported of heavy construction equipment vanishing into muskeg in the spring as the frozen muskeg beneath the vehicle thawed. Construction in muskeg-laden areas sometimes requires the complete removal of the soil and filling with gravel. If the muskeg is not completely cleared to bedrock, its high

water content will cause buckling and distortion from winter freezing, much like permafrost. One method of working atop muskeg is to place large logs on the ground, then cover those logs with a thick layer of clay or other stable material. This is commonly called a Corduroy Road. To increase the effectiveness of the corduroy, prevent erosion, and allow removal of material with less disturbance to the muskeg, a geotextile fabric is sometimes placed down before the logs. However, temporary winter access roads on muskeg (ice road), created by clearing the insulating snow and allowing the muskeg to freeze, are more commonly used as they are cheaper to construct and easier to decommission. Water is often sprayed on these roads to thicken the ice allowing heavy trucks and equipment to safely access remote sites in the winter. / крупные скопления торфяников.

MUSLIN = МУСЛИН (или КИСЕЯ, или МАЗЛИН) – Muslin is a finely woven cotton fabric that is most typically unbleached or white cloth, produced from corded cotton yarn. It is often used to make dresses or curtains, but may also be used to complement foam or bench padding. It is a very breathable fabric and is a good choice for hot-weather clothing. Muslin is a broad term describing a wide variety of plain-weave cotton or polyester/cotton fabrics ranging from lightweight sheers to heavier shirting and sheeting. Muslin is a loosely-woven cotton fabric which originated in Bengal in South Asia, which was introduced to Europe from the Middle East in the XVII century. It became very popular at the end of the XVIII century in France. Muslin is most typically an unbleached or white cloth, produced from carded cotton yarn. It is often used to make sewing patterns, such as for clothing, curtains, or upholstery. Because air moves easily through muslin, muslin clothing is suitable for hot, dry climates. Muslin clothes were traded by ancient Greeks from the Indian port town Machilipatnam, which was called Maisolos or Masalia in ancient times. Some believe that the name muslin originated from the name Maisolos. Marco Polo, the famous traveller, visited the Kakatiya Kingdom in which Machilipatnam was located and praised the muslins available there. In 1298, Marco Polo described the cloth in his book The Travels. He said that it was made in Mosul, Iraq. Although this view has the fabric named after the city where Europeans first encountered it (Mosul), the fabric is believed to have originated in Dhaka, which is now the capital of Bangladesh. In the IX century, an Arab merchant named Sulaiman makes note of the material's origin in Bengal (known as Ruhml in Arabic). The word muslin is also used colloquially. In the United Kingdom, many sheer cotton fabrics are called Muslin, while in the United States, muslin sometimes refers to a firm cloth for everyday use, which in the UK and Australia is known as Calico. In British slang, Muslin used to refer to women or femininity, while in nautical slang, Muslin can refer to a vessel's sails. When sewing clothing, a dressmaker may test the fit of a garment, using an inexpensive muslin fabric before cutting the intended expensive fabric, thereby avoiding potential costly mistakes. The muslin garment is often called a 'Muslin', and the process is called 'Making A Muslin'. With the availability of inexpensive synthetic fabrics, which closely resemble the hand (drape and feel) of expensive natural fabrics, a test or fitting garment made of synthetics may still be referred to as a Muslin, because the word has become the generic term for a test or fitting garment. Muslin is also often used as a backing or lining for quilts, and thus can often be found in wide widths in the quilting sections of fabric stores. Muslin is the name for a large group of plain-weave fabrics, originally made of cotton. Muslin is an inexpensive, medium weight, plain weave, low count (less than 160 threads per square inch) cotton sheeting fabric. In its unfinished form, it is commonly used in fashion design to make trial garments for preliminary fit. Muslin is a plain-woven sheer to coarse cotton fabric. Muslin means 'from Mossul', a city now in Iraq. A very fine plain, striped, checked or embroidered fabric. / Знаменитый путешественник Марко Поло (Marco Polo) посетил Королевство Какатия (Kakatiya Kingdom), в котором Мачилипатнам (Machilipatnam), известный также как Масулипатнам (Masulipatnam) и Бандар (Bandar) (город в Кришнаитском Районе (Krishna District) Индийского Штата Андхра Прадеш (State of Andhra Pradesh)). Калико (Calico). раскрой (cutting). Муслин – недорогая, среднего веса, полотняного переплетения, низкой нумерации (менее 160 нитей на квадратный дюйм) хлопковая ткань постельной группы. Под Муслином, от Французского слова Mousseline (восходит к названию города Мосул в Ираке), понимается тонкая мягкая шёлковая или хлопчатобумажная ткань. Из муслина шьют бельё, блузки, платья. Муслин – очень тонкая лёгкая шерстяная или хлопчатобумажная ткань полотняного переплетения, популярная до середины XIX века. Иногда при изготовлении муслина использовалась также льняная или шёлковая пряжа. Слово Муслин происходит от названия города Мосул (Mossul) в Ираке, где в древности находились знаменитые текстильные мануфактуры. Разновидностью муслина можно считать муслинделин – рыхлую тонкую шерстяную ткань, которая использовалась для пошива женского платья. Кисея – очень тонкая редко тканая полупрозрачная хлопчатобумажная ткань полотняного переплетения, цветная, узорчатая или с вышитым орнаментом. В первое десятилетие XIX века самой модной была белая кисея, как подражание античным традициям. По техническим и художественным качествам близка к муслину.

MUSLIN SHEETING = ПРОСТЫННОЕ ПОЛОТНО НА ОСНОВЕ МУСЛИНА (или МУСЛИНОВАЯ ПОСТЕЛЬНАЯ ТКАНЬ) – Muslin Sheeting is a carded muslin for bed sheets in white or colors made in types 140 (A grade), 128 (B grade), and 112 (C grade).

MUSSINESS = ПУТАНИЦА (или РАСТРЁПАННОСТЬ, или ПОМЯТОСТЬ, или ЗАПУТАННОСТЬ) – Mussiness is a fabric defect on the surface that is characterized by undesirable unevenness caused by many minor deformations. Mussiness is independent of the presence of soil. Mussiness is a surface distortion in a fabric characterized by objectionable uneveness due to many minor deformations.

MUSTARD = ГОРЧИЦА (или ГОРЧИЧНОЕ) – Mustard:- a dark to moderate yellow.

MUTAGEN = МУТАГЕН – Mutagen is a physical or chemical agent capable of producing a heritable change in the DNA sequence of an organism. / Под Мутагенами, от Латинского слова Mutatio, означающее Изменение или Перемена, и Греческого слова Génos, означающее Происхождение или Род, понимаются физические и химические факторы, вызывающие наследственные изменения – мутации:- ионизирующее и ультрафиолетовое излучения, различные химические соединения (например, иприт, азотистая кислота) и другие.

MUTAGENICITY = МУТАГЕННОСТЬ – Mutagenicity:- the chemical and structural complexity of the chromosomal DNA and associated proteins of mammalian cells, and the multiplicity of ways in which changes to the genetic material can be effected make it difficult to give precise, discrete definitions. Mutagenicity refers to the induction of permanent transmissible changes in the amount or structure of the genetic material of celles or organisms. These changes, 'mutations', may involve a single gene or gene segment, a block of genes, or whole chromosomes. Effects on whole chromosomes may be structural and/or numerical. See also Genotoxicity. / Химическое и структурное разнообразие хромосомной ДНК и взаимосвязанных протеинов клеток млекопитающих, и многочисленность способов, в которых изменения в отношении генетического материала могут привести к сложности в формировании точных, разборчивых определений. Мутагенность относится к индукции постоянных передающихся изменений в количестве или структуре генетического материала клеток или организмов. Эти изменения, 'мутации', могут вовлекать единый ген или генный сегмент, блок генов, или целые хромосомы. Эффекты по целым хромосомам могут быть структурными и/или численными. Смотрите также Генотоксичность (Genotoxicity).

MUTANT = МУТАНТ – Mutant is a variant from the normal or wild type that is inherited; the product of mutation. / Под Мутантами понимаются организмы, отличающиеся от исходного (дикого) типа каким-либо наследственным отклонением, возникающим в результате мутации.

MUTATION = МУТАЦИЯ – Mutation is a sudden heritable change in an organism other than that due to the incorporation of genetic material from other sources. Most mutations are within the limit of a single gene. / Под Мутациями, от Латинского слова Mutatio, означающее Изменение или Перемена, понимаются возникающие естественно или вызываемые искусственно изменения наследственных свойств организма в результате перестроек и нарушений в генетическом материале организма – хромосомах и генах. Мутации – основа наследственной изменчивости в живой природе.

MUTON = МУТОН – Muton is the smallest length of DNA capable of a mutational change. / Мутон – наименьшая часть гена, изменение которой приводит к мутации.

MUTUAL AUTHENTICATION = ВЗАИМНАЯ АУТЕНТИФИКАЦИЯ (или ВЗАИМНОЕ УДОСТОВЕРЕНИЕ ПОДЛИННОСТИ) – Mutual Authentication is the process, whereby, during a transaction (and for every step in an incremental Purchase Transaction) the European Electronic Purse (EEP) is authenticated by the terminal and the terminal is authenticated by the EEP.

MUTUAL FUND = ВЗАИМНЫЙ ФОНД (или ПАЕВОЙ ИНВЕСТИЦИОННЫЙ ФОНД) – Mutual Funds:- these are pooling together the savings of large number of investors for attractive yield and appreciation in value. A mutual fund is a diversified portfolio of investment, managed by fund manager, who has necessary expertise of investment. Investment is made in types of securities (equity or debt) according to the investment policies laid down in the prospectus/offering document. There are two types of mutual funds, which are:- (i) open-end mutual funds; and (ii) closed-end mutual funds. In the United States, Mutual Fund is a pool of money managed by an investment company. Mutual Fund is an investment vehicle that is made up of a pool of funds collected from many investors for the purpose of investing in securities such as stocks, bonds, money market instruments and similar assets. Mutual funds are operated by money managers, who invest the fund's capital and attempt to produce capital gains and income for the fund's investors. A mutual fund's portfolio is structured and maintained to match the investment objectives stated in its prospectus. One of the main advantages of mutual funds is that they give small investors access to professionally managed, diversified portfolios of equities, bonds and other securities, which would be quite difficult (if not impossible) to create with a small amount of capital. Each shareholder participates proportionally in the gain or loss of the fund. Mutual fund units, or shares, are issued and can typically be purchased or redeemed as needed at the fund's current net asset value (NAV) per share, which is sometimes expressed as NAVPS. A collection of stocks, bonds or other securities owned by a group of investors and managed by a professional. When investors put money into a fund, it is pooled with money from other investors to create much better buying power then they would have investing on their own. An open-end investment fund. Investment company or trust whose capitalization is not fixed at a given number of shares, which issues shares to meet customer demand as it arises. The price for a share of a mutual fund is determined by the trust's net asset value per share, i.e. the net value of all its securities divided by the number of shares outstanding. Also known as Investment Fund; and Unit Trust in the United Kingdom. Mutual Funds are investment funds offered to investors in the public on a broad scale. See also Investment Company. A Mutual Fund is a pool of money accumulated from thousands of investors. Investors receive a proportionate share in the pool through shares or units. A mutual fund manager will then take the pool of money and decide what securities to buy and sell within the mutual fund on behalf the individual investors. These decisions are made with the assistance of high quality investment research and are made by experienced investment professionals. What are the benefits of investing in a mutual fund? Mutual funds are an affordable and convenient way for investors to gain access to investments that would otherwise only be available to large institutions or wealthy individuals. Mutual fund investing offers:- (i) Professional Money Management:- mutual funds are managed by professional money managers who have access to detail company research, economic data, and an understanding about how world events will affect your investments. This feature has particular value for investing in foreign markets where information is not always readily available to a retail investor and local laws and accounting practices are different than those in Canada, and therefore difficult to interpret. (ii) Diversification:- 'Don't put all of your eggs in one basket'. By investing in only one security you take on a great deal of risk of that investment under performing. By spreading your portfolio over several different investments this risk is reduced, thus reducing the overall risk of your portfolio. Since many investors cannot afford to split their portfolios into several different securities without paying a fortune in commissions, mutual funds are the ideal solution. By pooling the resources of several retail investors mutual funds can get better pricing and much lower commissions than a retail investor can get. This provides the benefits of diversification as a much lower cost. (iii) Transferability:- since most mutual fund families offer more than one type of mutual fund, a mutual fund investor has the ability to move their investment from one sector to another, from one country to another easily and (usually) without cost. An investor who purchases their own stocks would have to sell their old stocks and buy their new stocks, paying commissions on both trades. (iv) Liquidity:- mutual fund units are bought from, and sold back to the mutual fund company at the next available closing Net Asset Value Per Share. Any investor who wants to buy or sell a mutual fund can do so without having to worry about whether a liquid market is available. For retail equity investors, their ability to execute a trade depends on the availability of someone else who is willing to take the other side of the market. (v) Fractional Units:- mutual funds offer the unique feature to investors of allowing for fixed dollar investments. For purchases of equities you cannot invest a fixed dollar amount, you can only purchase a fixed number of whole shares. This makes it uncertain as to the total cost of the trade and means that you may not be able to fully invest idle cash. If you want to purchase a set dollar amount of a mutual fund, you will be allowed to purchase fractional units to ensure that you remain fully invested. (vi) Compounding:- another unique feature of mutual funds is that any distributions that are paid by the fund can be automatically re-invested into additional units of the same fund at no cost. This will help to ensure that you are staying fully invested, thus maximizing your returns through compounding. (vii) Time:- the most important benefit of investing in mutual funds is that it saves you time! By having the mutual fund manager manage your investments you no longer have to spend your time analyzing and worrying about individual stocks. Why invest in mutual funds at TD Direct Investing (конкретный фонд)? By investing in mutual funds at TD Direct Investing you will have the flexibility of holding all of you investments in one account:- stocks, bonds, options, and mutual funds. If you need professional assistance in managing your mutual fund holdings we can provide this to you using the TD Managed Assets Program (MAP). If you still want to manage your own investments but require some advice and guidance in narrowing down your mutual fund choices our FundSmart Mutual Fund Specialists are available to assist you free of charge 08 am to 08 pm Monday to Friday by calling +1-800-461-FUND (3863). A term to describe Managed Investments in the United States and are similar to Unit Trusts in Australia. / Смотрите также Инвестиционная Компания (Investment Company). , то есть . Взаимный Фонд – фонд, управляемый инвестиционной компанией, которая привлекает средства акционеров и вкладывает их в акции, облигации, опционы, фьючерсы, валюту или ценные бумаги денежного рынка. Эти фонды предлагают инвесторам преимущества диверсификации и профессионального управления. За управление средствами взимается плата, как правило, в размере от 0.5 до 2% стоимости активов за год. Фонды взимают и другие комиссионные сборы, такие, как плата по формуле 12b-l (12b-lfees), операционные сборы (exchange fees) и другие административные платежи. Фонды, работающие через брокеров, называются фондами 'с нагрузкой' (с комиссией) (loadfunds), а работающие непосредственно с инвесторами – фондами 'без нагрузки' (no-loadfunds). Акции взаимных фондов могут быть выкуплены у акционеров по текущей стоимости чистых активов (net asset value). Стоимость всех акций, находящихся у акционеров, в равной степени зависит от доходов и убытков фонда. Взаимные фонды осуществляют разные стратегии инвестирования. Некоторые из них проводят агрессивную политику повышения стоимости капитала, другие, более консервативные, нацелены на увеличение доходов акционеров. Инвесторам

рекомендуется оценить степень своей толерантности к риску прежде чем они решат, какой фонд будет для них приемлем. Кроме того, время покупок и продаж зависит от общего состояния экономики, активности рынков акций и облигаций, уровня процентных ставок и других факторов. Взаимный Фонд представляет собой портфель акций, облигаций и/или наличных средств, которым инвестиционная компания управляет от имени и по поручению множества инвесторов. Покупая акции фонда, инвесторы приобретают долю в обширном инвестиционном портфеле, которым они владеют совместно с остальными акционерами фонда. Управляющий взаимного фонда инвестирует средства этого фонда в соответствии с инвестиционными целями, указанными в проспекте фонда.

MUTUAL FUND UNITS = ПАИ ВЗАИМНЫХ ФОНДОВ – Mutual Fund Units:- (bond, equity, money market, mixed securities, precious metal, commodities, real-estate funds) Embody a share in the assets of a mutual fund and therefore enable the holder to participate directly in the success of the fund. Mutual Fund Units, or Shares, are issued and can typically be purchased or redeemed as needed at the fund's current net asset value (NAV) per share, which is sometimes expressed as NAVPS. The value of a Mutual Fund Unit is described as the net asset value per share (NAVPS). Here is how you calculate the NAVPS:- (i) first, take the total value of the fund if everything were sold on that day, less any outstanding debts; and (ii) divide that total value by the total number of units that the fund has sold to investors. Example:- if a fund is worth USD10 million and has sold one million units, the NAVPS will be USD10. If you own 10 units, your investment is worth USD100. The process of selling your mutual fund units is called as Redemption.

MUTUAL SAVINGS BANK = ВЗАИМНЫЙ СБЕРЕГАТЕЛЬНЫЙ БАНК – Mutual Savings Bank (MSB) is a type of thrift institution, originally designed to serve low-income individuals, that historically invested in long-term, fixed-rate assets such as mortgages. Initiated in 1816, the first mutual savings banks (MSBs) were the Philadelphia Saving Society and Boston's Provident Institution for Saving. Most MSBs were located in the Mid-Atlantic and industrial Northeast regions of the United States. By 1910, there were 637 of these institutions. MSBs were generally very successful until the 1970s. During the 1980s, regulations governing what they could invest in and what rate of interest they could pay to customers combined with rising interest rates to cause massive losses for MSBs. Consequently, many MSBs failed in the 1980s; others merged, became commercial banks or converted to stock form. Mutual Savings Bank (MSB) is a savings bank owned by its depositors; contrasted with a stock savings bank, which issues common stock to the public. Mutual Savings Bank is a savings and loan association that has no stockholders and, as a result, reinvests all profits in itself. Most mutual savings banks are owned by their depositors and borrowers. Because there are no stockholders to please, mutual savings banks are often very conservative with how they invest deposits. As a result, they tend to survive periods of financial distress relatively well. This was especially true during the Great Depression. In the United States, most mutual savings banks are in the Northeast. Mutual Savings Bank is a state-chartered savings bank which is owned by its depositors and managed by a fiduciary board of trustees. Mutual Savings Bank (MSB) is a deposit-gathering thrift institution that chiefly makes mortgage loans. Mutual savings banks, typically located in the northeastern states, are organized much like savings and loan associations. MSBs are technically not depositor-owned, although all are state-chartered. Also called Savings Bank. / Сберегательный банк, принадлежащий его же вкладчикам; в контрасте с акционерным сберегательным банком, который выпускает обыкновенный уставный капитал для населения. Взаимный Сберегательный Банк (ВЗБ) – сберегательный банк, организованный в рамках законов штата, принадлежащий его вкладчикам и действующий в их интересах. Местные попечительские советы принимают основные решения в качестве опекунов, независимо от юридических владельцев. Традиционно доход распределяется между вкладчиками после вычета расходов и выделения резервов согласно действующим требованиям. Не так давно многие сберегательные банки начали выпускать акции и предлагать потребительские услуги, такие, как предоставление кредитных карточек и чековых книжек, а также коммерческие услуги, например ведение чековых счетов компаний и предоставление коммерческих ипотечных кредитов.

MX = MEXICO

MX DYE = КРАСИТЕЛЬ ЭМ.ЭКС. – MX Dye is a family of 'cold' reactive dyes, first developed by Imperial Chemical Industries of Britain, and designated 'Procion MX'; chemically MX dyes belong to the dichlorotriazene family. A number of companies now manufacture MX dyes. They are by far the most popular dyes for textile artists working with cellulose fibers. They can also be used for wool and nylon in processes where they behave as acid dyes. There are around a dozen 'pure' MX dyes in common use, and all can be used quite successful in mixtures with each other. There are magenta, yellow and cyan shades that are excellent 'subtractive primary' colors. MX dyes are less popular with industrial dyers than some other reactive dyes, partly because their very high reactivity makes the dye process harder to control, partly because they are fairly expensive, and partly because goods require extensive washing after dyeing to remove hydrolyzed and unfixed dye. Care should be taken to avoid breathing MX dye dust, since it is known to cause respiratory allergies. The use of 'Procion' alone to denote MX dyes is incorrect since there are other Procion dye families. / Найлан^{T3} (Nylon^{TM}).

MXN = MEXICAN PESO

MY = MALAYSIA

MY = MARKETING YEAR

MYCELIUM = МИЦЕЛИЙ (или ГРИБНИЦА) – Mycelium is the hypha or mass of hyphae that make up the body of the Fungus. / Под Мицелием, от Греческого слова Мýкēs, означающее Гриб, или Грибницей понимается вегетативное тело Грибов, состоящее из тончайших ветвящихся нитей – гиф. Частями мицелия осуществляется вегетативное размножение Грибов.

MYCOPLASMA = МИКОПЛАЗМА – Mycoplasma is a polymorphic microorganism that is nonmotile and that can be cultivated with difficulty on special media, and that lacks cell wall, being bound only by a unit membrane. The internal components of a mycoplasma are ribosome and DNA strands. / Плевропневмониеподобный микроорганизм. Под Микоплазмами, от Греческих слов Мýkēs, означающее Гриб, и Plásma, означающее Вылепленное или Оформленное, понимается Класс Бактерий, не имеющих клеточной стенки и ограниченных плазматической мембраной. Неподвижны. Сапрофиты или паразиты. Патогенные микоплазмы вызывают болезни Человека (например, пневмонию), Животных (например, повальное воспаление лёгких крупного рогатого скота) и Растений.

MYCORRHIZA = МИКОРИЗА (или ГРИБОКОРЕНЬ) – A Mycorrhiza is a partnership between plant roots and beneficial Fungi in the soil. These Fungi infect the roots and grow into the soil and transfer P and Zn to the plant. If inadequate numbers of mycorrhizal Fungi are present in the soil at sowing, then uptake of P and Zn and Cotton growth are reduced. Factors leading to poor mycorrhiza development and stunted growth include long bare fallows and cuts of more than 40 cm during field development. The problem is transient and plants recover later in the season. Symptoms of zinc deficiency may be present. Adequate numbers of mycorrhizal Fungi usually survive single-season fallows. A mutually beneficial association between a fungus and the roots of a plant. The Fungi that form a mycorrhiza grow throughout the cortex of the plant roots and out into the surrounding soil where they function as an extension of the plant's root system. The plant provides a source of carbohydrate for the fungus while the fungus assists plant uptake of the less mobile nutrients such as phosphorus. Most plant species require mycorrhizal associations for normal healthy growth. Also known as VAM. Mycorrhiza is a symbiotic relationship between certain Fungi and the roots of plants, including orchids and many types of tree. Mycorrhiza may be ectotrophic, where the fungal hyphae invades the host roots or endotrophic where the fungal hyphae are entirely within the root cells. The fungal hyphae can help the roots to absorb essential nutrients and in some species are essential to the normal growth of the plant. Mycorrhiza is the symbiotic association of the mycelium of a fungus with the roots of a seed plant. This symbiosis helps to extend the effective root surface area and promotes uptake of phosphorus. / кора (cortex). виды (species). гриба с корнями . Под Микоризой, от Греческих слов Мýkēs, означающее Гриб, и Rhíza, означающее Корень, понимается симбиоз мицелия (грибницы) Гриба с корнем высшего растения, например, Подберёзовика с Берёзой или Подосиновика с Осиной. При разведении леса почву 'заражают' Грибами, вступающими в симбиоз с соответствующей породой. Известна также как Грибокорень. Под Микоризой, от Греческих слов Мýkes, означающее Гриб, и Rhiza, означающее Корень, или Грибокорнем понимается взаимовыгодное сожительство (симбиоз) мицелия Гриба с корнем высшего Растения. Различают микоризу эктотрофную (наружную), при которой Гриб оплетает покровную ткань окончаний молодых корней и проникает в межклетники самых наружных слоёв коры, и микоризу эндотрофную (внутреннюю), которая характеризуется внедрением мицелия (гиф Гриба) внутрь клеток. Эктотрофная микориза характерна для многих Деревьев (Дуб, Ель, Сосна, Берёза), Кустарников (Ива), некоторых Кустарничков (Дриада) и Травянистых Растений (Гречиха Живородящая). Молодые корни этих Растений обычно ветвятся, окончания их утолщаются, растущая часть корней окутывается толстым плотным грибным чехлом, от которого в почву и по межклетникам в корень на глубину одного или нескольких слоёв коры отходят гифы Гриба, образуя так называемую Сеть Гартига; корневые волоски при этом отмирают (эуэктотрофный тип микоризы). У Кустарничка Арктоуса Арктического и Травянистого Растения Грушанки Крупноцветковой гифы Гриба проникают не только в межклетники, но и в клетки коры (эктоэндотрофный тип микоризы). Эктотрофные микоризы образуют чаще гименомицеты (Роды Boletus, Lactarius, Russula, Amanita и другие), реже – гастеромицеты. В образовании микоризы на корнях одного Растения может участвовать не один, а несколько Видов Грибов. Однако, как правило, в растительных сообществах встречаются лишь определённые рибы-микоризообразователи – симбионты данных Видов Растений. При развитии эндотрофной микоризы форма корней не меняется, корневые волоски обычно не отмирают, грибной чехол и 'Сеть Гартига' не образуются; гифы Гриба проникают внутрь клеток коровой паренхимы. У Растений Семейства Вересковых, Грушанковых, Брусничных и Шикшевых гифы Гриба в клетках образуют клубки, позднее перевариваемые растением (эрикоидный тип микоризы). В образовании микоризы такого типа участвуют фикомицеты (Роды Endogone, Pythium). У Растений Семейства Орхидных гифы Гриба из почвы проникают в семя, образуя клубки, перевариваемые затем клетками семени. Из Грибов такой тип микоризы свойствен несовершенным (Род Rhizoctonia) и реже – базидиальным (Род Armillaria и другие). Наиболее распространён в природе – у многих однолетних и многолетних Трав, Кустарников и Деревьев самых различных Семейств – фикомицетный тип микоризы, при котором гифы Гриба пронизывают насквозь клетки эпидермиса корня, локализуясь в межклетниках и клетках средних слоёв коровой паренхимы. Микориза оказывает на растение благоприятное воздействие:- за счёт развитого мицелия увеличивается поглощающая поверхность корня и усиливается поступление в растение воды и питательных веществ. Грибы-микоризообразователи, вероятно, способны разлагать некоторые недоступные растению органические соединения почвы, вырабатывают вещества типа витаминов и активаторы роста. Гриб же использует некоторые вещества (возможно, углеводы), извлекаемые им из корня растения. При разведении леса на почве, не содержащей Грибов-микоризообразователей, в неё вносят в небольших количествах лесную землю, например, при посеве жёлудей – землю из старой дубравы.

MYCOTOXINS = МИКОТОКСИНЫ – Mycotoxins are poisonous substances produced by some Species of Fungi. For example, several Fusarium Species can cause a disease called Fusarium Head Blight. One of the more important Species of Fusarium, Fusarium Graminearum, can produce several mycotoxins, most commonly, deoxynivalenol or vomitoxin, which, when present in feed grain, is distasteful and can reduce the rate of weight gain in some animals. In Corn, Fusarium Graminearum, also called Gibberella Zeae, causes the disease gibberella ear rot. Besides deoxynivalenol, another compound known as Zearalerone may be formed. This compound has estrogen-like effects, especially in pigs and cattle. Mycotoxins are poisonous metabolic products produced by mold. / Виды (Species). Под Микотоксинами, от Греческих слов Мýkēs, означающее Гриб, и Toxikón, означающее Яд, понимаются ядовитые соединения, производимые некоторыми Семействами Грибов и способные вызывать заболевание или гибель.

MYLAR® FILM = ПЛЁНКА МАЙЛАР® – Mylar® and Melinex® are two brand names that are used in the United States and Britain by variety of companies. These are used to represent polyester films and PET (Polyethylene terephthalate) films. So these are known as Mylar Film. These films are developed by DuPont™. These sheets were originally developed in 1950's. These sheets were first time used in Echo Satellites by the National Aeronautics and Space Administration (NASA). These were launched in 1960 and 1964 having diameter 100 feet and having thickness .005 inches. Mylar Film is a trade name for a stiff, plastic-like film used in making insect cages. Mylar® is the brand name for a special type of stretched polyester film. Melinex® and Hostaphan® are two other well known trade names for this plastic, which is more generally known as BoPET or biaxially-oriented polyethylene terephthalate. MYLAR® is a registered trade name of DuPont Teijin Films. Mylar® is the trade name given by DuPont™ of the USA to a polyester film. Mylar® is also sold under other trade names such as Melinex. The film is unaffected by moisture and most other common chemicals. It is also temperature stable unless heated to around 200 °C+ when it will shrink. The film can be attached as a covering and then shrunk to give a smooth and tight finish. The film is available in both clear and aluminized finishes. The aluminisation of the film makes it gas tight due to the size of the molecules of aluminium even helium cannot get through. Remember that the aluminisation process of the Mylar® reduces to some extent its ability to shrink under heat. The best Mylar® to use on all sizes of models is the thinnest, 5 micron. It is really only there to avoid the use of excessive amounts of dope to seal the tissue, and to give a degree of stability to the covering, using

thicker Mylar adds some rigidity, but I think this is better achieved by using a heavier grade of tissue, or using Silk. Thicker Mylar® is harder to work around curves, and appears to delaminate easier being less flexible. / Названия Майлар® (Mylar®) и Мелинэкс® (Melinex®) относятся к двум фирменным названиям, которые используются в Соединённых Штатах Америки и Великобритании . и Хостафан® (Hostaphan®). ДюПо Тэйджин (DuPont Teijin).

MYLAR® FILTER = ФИЛЬТР МАЙЛАР® – Mylar® Filter is a clear polyester film that absorbs almost all radiation below 320 nm. The solar filter can be based on BoPET or biaxially-oriented polyethylene terephthalate (trade name Mylar®).

MYR = MALAYSIAN RINGGIT

MYSTERIOUS DISAPPEARANCE = ТАИНСТВЕННОЕ ИСЧЕЗНОВЕНИЕ – Mysterious Disappearance:- this form indemnifies the policyholder, a trucker, for loss or damage resulting from his legal liability as a carrier while transporting the property of others. I does not insure against any loss for which he is not legally liable.

MZ = MOZAMBIQUE

MZM = MOZAMBICAN METICAL

- N -

N = ЭН. – N is fifth letter in a NASDAQ® stock symbol specifying that the issue is the company's third class of preferred shares. / НЭЗДЭК® (NASDAQ®) .

n = NANO = 10^{-9}

N = NEW ISSUE (FIRST OFFERED WITHIN THE PAST 52 WEEKS)

N = NITROGEN

N = NOVEMBER

N, 2N = ЭН., 2ЭН. (или XX) – N, 2n:- the notations for the genetic and zygotic (diploid) or somatic chromosome number of a plant, e.g., 2n = 24 in Rice.

NA = NOT AVAILABLE

NACC = NORTH ATLANTIC COOPERATION COUNCIL

NACE = NOMENCLATURE GENERALE DES ACTIVITES ECONOMIQUES DANS LES COMMUNAUTES EUROPEENNES, REVISION 1, EUROSTAT, LUXEMBOURG, 1996

NACRE VELVET = ПЕРЛАМУТРОВЫЙ БАРХАТ (или БАРХАТ С ОТЛИВОМ) – Nacre Velvet is a velvet with a changeable appearance created by using one color for the pile and another for the backing. Nacre Velvet:- the back is of one color and the pile of another, so that it gives a changeable, pearly appearance.

NAD = NAMIBIAN DOLLAR

NAFC = NATIONAL AGRICULTURE AND FOOR COUNCIL

NAFTA = NORTH AMERICAN FREE TRADE AGREEMENT

NAIC = NATIONAL ASSOCIATION OF INVESTMENT CLUBS

NAICS = NORTH AMERICAN INDUSTRY CLASSIFICATION SYSTEM

NAIL = ГВОЗДЬ – Nail is a fastener made from endless wire by cutting a point and forming a head at the shank end opposite the point. See also Pallet. Nail is a straight fastener, made from round or square stock, usually pointed and headed, designed to be impulse driven. / Гвоздь (Nail):- прямой стержень, изготовленный из металла круглого или квадратного сечения с остриём и головкой на тупом конце. Смотрите также Поддон (Pallet).

NAINSOOK = НАНСУК (или НЭЙНСУК) – Nainsook is a fine, lightweight cotton in a plain weave that is produced in the finishing processes from the same gray goods as used for batiste, cambric, lawn. Soft and has a slight luster in the better qualities (mercerization). It is slightly heavier than batiste. Like lawn but not as crisp. Soft, lacks body. Usually found in white but also comes in pastel colors and some printed. Often tucked or embroidered, in blouses, night wear, lingerie, and infant's wear. Nainsook is a lightweight plain weave cotton fabric, usually finished to create a luster and a soft hand. Common end-uses are infants' wear, blouses, and lingerie. Nainsooka (Nainsook) is a soft lightweight muslin. Produced in the finishing processes from the same greige goods as used for batiste, cambric, lawn. Fine and lightweight. Soft and has a slight luster in the better qualities (mercerization). Slightly heavier than batiste. Like lawn but not as crisp. Soft, lacks body. Usually found in white but also comes in pastel colors and some printed. A lightweight, plain weave cotton fabric. Used for lingerie, baby clothes. Nainsook is a fine, lightweight, plain-weave fabric, usually of combed cotton. The fabric is often mercerized to produce luster and is finished soft. Nainsook is chiefly used for infants' wear, lingerie, and blouses. Nainsook is a fine, soft muslin fabric, often to used to make babies clothing. / используются для батиста, кэмбрика, лона. Нансук – тонкая белёная хлопчатобумажная ткань полотняного переплетения бельевой группы. Под Нансуком, от Французского слова Nansouk, понимается хлопчатобумажная тонкая лёгкая ткань, из которой шьют нижнее и постельное бельё. Нансук – тонкая хлопчатобумажная ткань белого цвета полотняного переплетения. Использовалась в XIX веке для белья и мелких деталей женского туалета.

NAK = NEGATIVE ACKNOWLEDGEMENT

NAKED CALL = ОГОЛЁННЫЙ ОПЦИОН НА ПОКУПКУ (или НЕОБЕСПЕЧЕННЫЙ ОПЦИОН НА ПОКУПКУ) – Naked Call is an options strategy in which an investor writes (sells) call options on the open market without owning the underlying security. This stands

in contrast to a covered call strategy, where the investor owns the security shares that are eligible to be exercised under the options contract. This strategy is sometimes referred to as an 'Uncovered Call' or a 'Short Call'. A naked call strategy is inherently risky, as there is limited upside potential and (theoretically) unlimited downside potential should the stock rise above the exercise price of the options that have been sold. As a result of the risk involved, only experienced investors who strongly believe that the price of the underlying stock will fall or remain flat should undertake this advanced strategy. The margin requirements are often very high for this strategy as well due to the propensity for open-ended losses, and the investor may be forced to purchase shares on the open market prior to expiration if margin thresholds are breached. The upside to the strategy is that the investor could receive income in the form of premiums without putting up a lot of initial capital. See also Naked Put.

NAKED OPTION = ОГОЛЁННЫЙ ОПЦИОН (или НЕОБЕСПЕЧЕННЫЙ ОПЦИОН) – Naked Option is an option to buy shares in which the seller of the option (the option writer) does not already own the shares. In this instance, the option writer hopes to buy back the option before it is exercised and so avoid having to supply the shares. If the option is exercised and the market price of the shares has risen, then the option writer makes a loss. An option writer who sells naked options is known as a Naked Writer. The sale of a call or put option without holding an equal and opposite position in the underlying instrument. Naked Option is the sale of a call or put option without holding an offsetting position in the underlying futures contract on commodity. Liability that exists in the long or short term and is not covered by a corresponding short or long position. Naked Option is an option position that is not offset by an equal and opposite position in the underlying asset. Also known as Naked Call, Naked Put, Uncovered Option, and Unhedged Position. Naked Option is a trading position where the seller of an option contract does not own any, or enough, of the underlying security to act as protection against adverse price movements. If the price of the underlying security moves against the trader, who does not already own the underlying security, he or she would be required to purchase the shares regardless of how high the price is. The potential for losses, then, can be unlimited, and as a result, brokers typically have specific rules regarding naked trading. Inexperienced traders, for example, would not be allowed to place this type of order. Naked trading is considered very risky since losses can be significant. An options trader could sell, for example, call options with a strike price of USD10. If the stock's price rises to USD20 or USD30 on good news, and the option is naked (the seller does not own the underlying stock). He or she would be required to buy the specified number of shares at the current price, and sell them to the option buyer for the USD10, resulting in a significant loss. Naked Option:- the sale of an option by a party who does not hold the underlying asset to back it. See also Covered Option. / Оголённый или Необеспеченный Опцион – опцион, по которому ни у покупателя, ни у продавца нет обеспечения соответствующими ценными бумагами или активами. Продавец оголённого опциона на покупку (call option), следовательно, не занимает длинной позиции (long position) по акциям или активам, на которые был выписан опцион. Аналогичным образом, продавец оголённого опциона на продажу (put option) не занимает короткой позиции (short position) по акциям или активам, на которые был выписан опцион. Оголённые опционы являются очень рискованными, хотя потенциально могут принести большую прибыль. Если котировки ценных бумаг или активов, на которые выписан опцион, изменяются в направлении, ожидаемом инвестором, то прибыль может быть огромной, поскольку инвестору придётся внести небольшую сумму для получения значительных доходов. Если же котировки ценных бумаг или активов изменяются в противоположном направлении, то продавец оголённого опциона может понести огромные убытки. Например, если некто выписывает оголённый опцион на покупку акций компании Экс.Уай.Зэд. (XYZ) по цене в 60 Долларов за акцию, не имея в наличии этих акций, и если цена акций поднимается до 70 Долларов, то продавец опциона должен будет поставить покупателю акции компании XYZ по цене в 60 Долларов за акцию. Для того чтобы приобрести эти акции, ему придётся на открытом рынке купить их по 70 Долларов за акцию, понеся убытки по своей позиции в размере 10 Долларов на каждую акцию. Если же продавец опциона уже владеет акциями компании XYZ на момент продажи опциона, он может просто передать их покупателю опциона. Такая стратегия известна под названием 'выписка покрытого опциона на покупку' (covered call).

NAKED POSITION = ОГОЛЁННАЯ ПОЗИЦИЯ (или НЕОБЕСПЕЧЕННАЯ ПОЗИЦИЯ) – Naked Position is a position that is not hedged. That is, the holder of a naked position has taken no step to reduce the risk inherent to the position. For example, if one buys 100 shares of AT&T, one is exposed to the risk that AT&T will decline in price. If one takes no action to prevent this (by buying put options or short selling AT&T, for instance), one holds a naked position in AT&T. Avoiding naked positions and hedging as much risk as possible is a substantial concern for many institutional investors. Long or short position which is not hedged by a corresponding opposite position. Naked Position is a security position, either long or short, that is not hedged. For example, an investor short 500 shares of IBM with no other position in IBM stock (such as ownership of calls) has a naked position in that security. Because a naked position subjects the investor to large potential gains or losses, it is an aggressive investment position. Naked Position is unprotected long or short position in a cash or futures market. Naked Position is a securities position that is not hedged from market risk. Both the potential gain and the potential risk are greater when a position is naked instead of covered (a covered position is hedged from market risk). If an investor simply holds 500 shares of Ford, he or she has a naked position in Ford. If the investor wanted to cover this position, he or she could buy put option contracts, which would help protect against downward movements in the price of Ford shares. Whether to have a naked position is rarely a concern for most small investors, but it is a concern for large investment holders and institutions. Naked Position is a long or short market position taken without having an offsetting short or long position. A trader who executes one side of a spread is said to be 'naked' until he executes the other side. / Эй.Ти.ЭндТи. (AT&T). Ай.Би.Эм. (IBM). Незащищённая длинная или короткая позиция на рынке наличных товаров или фьючерсных контрактов. Оголённая Позиция – позиция по ценным бумагам или активам, которая не застрахована от рыночного риска, например позиция лица, выписывающего опцион на покупку (call) или опцион на продажу (put), не занимающего при этом длинной (long position) или короткой позиции (short position) по соответствующим ценным бумагам или активам. Потенциальные риск или прибыль от оголённой позиции являются большими, чем в случае покрытой позиции.

NAKED PUT = ОГОЛЁННЫЙ ОПЦИОН НА ПРОДАЖУ (или НЕОБЕСПЕЧЕННЫЙ ОПЦИОН НА ПРОДАЖУ) – Naked Put is a put option whose writer does not have a short position in the stock on which he or she has written the put. Sometimes referred to as an 'Uncovered Put'. Naked puts are very risky since the writer can lose big if the underlying asset moves opposite to the desired direction. But, profits are huge if the underlying asset moves in the right direction. See also Naked Call.

NAKED SHORT = ОГОЛЁННЫЙ ПРОДАВЕЦ (или НЕОБЕСПЕЧЕННЫЙ ПРОДАВЕЦ) – Naked Short is a seller of a contract who does not have commodity to back up his position. / Оголённый Продавец или Необеспеченный Продавец – продавец фьючерсного сырьевого контракта, не имеющий сырья в подкрепление своей позиции.

NAKED WARRANTS = ОГОЛЁННЫЕ ВАРРАНТЫ (или НЕОБЕСПЕЧЕННЫЕ ВАРРАНТЫ) – Naked Warrants are the warrants that are issued without the simultaneous issue of a warrant-linked bond. Unlike traditional warrants, naked warrants are not connected with the company's financing plans. They are primarily issued by banks and securities underwriters. In many cases, a cash settlement is provided for instead of the acceptance/delivery of the underlying. Naked warrants can be both call and put warrants. Covered warrants are a sub-category of naked warrants.

NAKED WRITING = ОГОЛЁННОЕ ВЫПИСЫВАНИЕ (или НЕОБЕСПЕЧЕННОЕ ВЫПИСЫВАНИЕ) – Naked Writing is a writing a call or a put option in which the writer has no opposite cash or futures market position. This is also known as Uncovered Writing.

NAL = NATIONAL AGRICULTURAL LIBRARY

NAM = NATIONAL ASSOCIATION OF MANUFACTURERS

NAME = ИМЯ (или НАЗВАНИЕ) – Name is a member of the Society who is an individual and who trades on an unlimited basis. Name is an underwriting member of Lloyd's. Name is an individual member underwriting with unlimited liability. Since 2003-March-06 no person has been admitted as a new member to underwrite on an unlimited liability basis. / Лойдз (Lloyd's).

NAMECO = ИМЕННЫЕ КОМПАНИИ – Nameco:- at the Corporation of Lloyd's, a company that is a corporate member whose members consist of a single individual or a group of connected individuals or their nominees. Many Namecos were formed by Names who wished to cease underwriting on an unlimited liability basis. / Корпорации Лойда (Corporation of Lloyd's).

NAMED INSURED = ПОИМЕНОВАННЫЙ СТРАХОВАТЕЛЬ – Named Insured is any person, firm, or corporation, or any member thereof, specifically designated by name as insured(s) in a policy as distinguished from the others who, though unnamed, are protected under some circumstances.

NAMED PERILS POLICY = ПОЛИС ПО ПОИМЕНОВАННЫМ УГРОЗАМ – Named Perils Policy is any marine policy limiting coverage to perils specifically listed in the policy; opposed to All Risks policy. Institute Clauses C is a Named Perils cover. See also All Risks.

NAME REGISTRATION = РЕГИСТРАЦИЯ НАИМЕНОВАНИЯ – In the United States, a Name Registration is the filing of a document in a foreign state to protect the corporate name, often in anticipation of qualification in the state.

NAME RESERVATION = РЕЗЕРВИРОВАНИЕ НАИМЕНОВАНИЯ – In the United States, a Name Reservation is a procedure that allows a corporation to obtain exclusive use of a corporate name for a specified period of time.

NANKEEN = НАНКА (или ХХ) – Nankeen is a durable brownish yellow cotton fabric originally loomed by hand in China. Trousers made of nankeen, namely a durable brownish yellow cotton cloth originally hand-loomed in China.

NANOCELLULOSE = НАНОЦЕЛЛЮЛОЗА – A term Nanocellulose refers to nano-structured cellulose. This may be either cellulose nanocrystal (CNC or NCC), cellulose nanofibers (CNF) also called nano-fibrillated cellulose (NFC), or bacterial nanocellulose, which refers to nano-structured cellulose produced by Bacteria.

NANO–FIBER = НАНОВОЛОКНО – A term Nanofiber refers to fibers that are typically manufactured through an electrospinning process, which spins fibers in diameters ranging from 10 nm (nanometers) to several hundred nanometers, but usually less than 1 000 nm. In scientific terms, nanofibers are generally considered as having a diameter of less than one micron. The name nanofiber comes from the nanometer, which is a scientific unit of measurement representing a billionth of a meter, or three to four atoms wide. Current uses for nanofiber technology is in the fields of medical products, consumer products, industrial products, and high-tech applications for aerospace, capacitors, transistors, drug delivery systems, battery separators, energy storage, filtration, fuel cells, and information technology. Nano-Fiber:- Nano refers to 1 billionth of a meter, or $1 \cdot 10^{-9}$ meter. 150 000 strands of a nano-fiber can fit across a human hair. / .

NANOMATERIALS = НАНОМАТЕРИАЛЫ – Nanomaterials:- a definition given by the International Council of Chemical Associations (ICCA). This states that Nanomaterials are solid, particulate substances which are intentionally manufactured and have a weight-based cutoff of either 10 weight% or more of nano-objects or 50 weight% or more of aggregates or agglomerates consisting of nano-objects.

NANOMETER = НАНОМЕТР – Nanometer:- this measurement used to describe a nanofiber refers to 1 billionth of a meter, or $1 \cdot 10^{-8}$ centimeter. 150 000 strands of a nanofiber can fit across a human hair. / Нанометр (нм).

NANOTECHNOLOGY = НАНОТЕХНОЛОГИЯ – Nanotechnology research and technology development at the atomic, molecular or macromolecular levels (in the 1–100 nanometer range) aimed at creating and using materials which have novel properties and functions. Nano-Technology is a complex technology that involves nano-size materials and combines science such as biology, chemistry and physics and engineering. / нанометр (1 нм = 10^{-9} м).

NANTUCKET SLEIGH RIDE = НЭНТАКЕТСКОЕ ПЛАВАНИЕ В УПРЯЖКЕ – Nantucket Sleigh Ride (maritime term):- a term for what frequently happened to Nantucket whalers when they left the whaling ship in a small boat to go after a whale. If they harpooned the whale without mortally wounding it, the animal took off with the whaleboat in tow. Nantucket Sleigh Ride:- an obsolete and dangerous method of whale hunting in which a small boat manned by rowers and a harpooner, or a series of small boats tied together, would be attached to a whale by means of a harpoon and would then be towed by the creature at high speed across the water's surface, until the whale eventually became exhausted. Use of this term is sometimes attributed to Herman Melville, author of Moby-Dick, but actually is not found in the text of his published works. A Nantucket Sleighride was a term used by Nantucket whalers to describe what occurs immediately following the harpooning of a whale. The whale, distressed – or, more likely, annoyed – by the harpoon, attempts to flee and thus drags the whalers' longboat along with it. The speed of the 'sleigh ride' would vary depending on the species of the whale, with certain species (e.g., humpbacks) giving faster rides. The sperm whale was the whale that caused the longest drag events, reaching speeds of 23 mph (37 km/h). The length of the drag for the sailors would last as long as the whale could swim before it became exhausted. Fin whales and sei whales (Balaenoptera borealis) were the most dangerous species, as they would dive scores of fathoms deep taking the longboat and its occupants beneath the surface if possible. Once the whale had exhausted its energy, the sailors (if still alive) would kill it and harvest its oil. The discovery of petroleum and natural gas in Pennsylvania in the mid-1800s began a slow end to the whale hunting by American whalers. Other nations followed as either they discovered petroleum reserves of their own, or the increase in the trade of natural gas and oil rendered whale hunting less worthy of the dangers inherent in its pursuit. Japan still persists in the practice to this day; Norway finally closed its last rendering station at Grytviken (South Georgia Island) about 1965. / Хёмэн Мэлвил (Herman Melville), автор Моби Дик (Moby Dick). Гритвикен (Grytviken).

NAP = ЖГУТИК – Naps are large tangled masses of cotton fibers that often result from ginning wet cotton. Naps are not as detrimental to quality as Neps. The term 'Nappy Cotton' describes lint that is rough, and lumpy, and the term nap is applied to large clumbs or matted masses of fibers that contribute to the rough appearance of ginned cotton. Their formation is influenced to a large extent by the condition of the seed cotton at the time of ginning. Cotton that is ginned wet tends to be nappy. Naps are relatively easy for the classer to detect but are not as detrimental to quality as neps. Also known as Twists. / Крупные спутанные массы волокон, часто возникающие из-за влажности хлопка при джинировании. Термин 'Зажгученный Хлопок' используется для описания шероховатости и комковатости волокна, а термин 'Жгутик' применяется к крупным пучкам или запутанным массам волокон, создающим шероховатый вид джинированному хлопку. Их появление в большей степени обусловливается состоянием

хлопка-сырца во время джинирования. Джинирование увлажненного хлопка обязательно приведёт к зажгученности волокна. Жгутики относительно легко обнаруживаются классёром, и они не так вредны в отношении качества готовой продукции, нежели Узелки (Neps). Известны также как Жгутики (Twists). Жгутики представляют собой достаточно плотно скрученные и спутанные пучки волокон, трудно растаскиваемые руками. Жгутики, легко растаскиваемые руками, пороком не считаются. Присутствие жгутиков в хлопковом волокне в большом количестве свидетельствует о ненормальном процессе джинирования. Они образуются из-за тупых игл, тугого сырцового валика, слишком влажного хлопка-сырца или большого содержания незрелых волокон. Пластики представляют собой ярко выраженные скопления незрелых ('мёртвых') волокон. В большинстве случаев пластики бывают блестящие, реже матовые, белые, светло-жёлтые и жёлтые.

NAP = НАЧЁС – Nap is a fuzzy, fur-like feel created when fiber ends extend from the basic fabric structure to the fabric surface. The fabric can be napped on either one or both sides. Nap is a soft, fuzzy surface produced on a fabric by brushing it to raise the fiber. Nap is a downy surface given to a cloth when part of the fiber is raised from the basic structure.

NAPA = NATIONAL ASSOCIATION OF PURCHASING AGENTS

NAPERY = СТОЛОВОЕ БЕЛЬЁ (или XX) – Napery:- household linen, especially table linen.

NAPFA = NATIONAL ASSOCIATION OF PERSONAL FINANCIAL ADVISORS

NAPHTHA = НАФТА (или ТЕХНОЛОГИЧЕСКИЙ БЕНЗИН) – Naphtha is petroleum that is produced during oil refining. Heavy naphtha is the starting point for gasoline production. Light naphtha is the most important feedstock for steam crackers. Naphtha is an inflammable oil obtained by the dry distillation of petroleum. Naphtha is a petroleum distillation fraction most commonly used as feedstock destined for the petrochemical industry, e.g., ethylene manufacture. Naphtha comprises hydrocarbons in the 30 °C and 210 °C distillation range or part of this range. Special Naphtha is another name for White Spirit. A volatile, colorless product of petroleum distillation. Used primarily as a paint solvent, cleaning fluid, and blendstock in gasoline production. Naphtha is a generic term applied to a petroleum fraction with an approximate boiling range between 122 and 400 degrees Fahrenheit. There are also special naphthas – all finished products within the naphtha boiling ranges that are used as paint thinner, cleaners or solvents. Those products are refined to a specific flash point. Special naphthas include all commercial hexane and cleaning solvents conforming to the US American Society for Testing and Materials (ASTM) Specifications D1836 and D484, respectively. Naphthas to be blended or marketed as motor gasoline or aviation gasoline, or that are to be used as petrochemical and synthetic natural gas (SNG) feedstocks, are excluded. Naphtha are straight-run gasoline, unstable gas naphta, secondary-process gasoline and hydrocarbon inputs for production of ethylene. / Американское Общество по Испытаниям и Материалам (АОИМ). Под Нафтой, от Греческого слова Náphtha, означающее Нефть, понимается . растворитель красок (paint solvent) . , например, . К Нафте или Технологическому Бензину (raw gasoline) относятся:- прямогонный бензин (straight-run gasoline), нестабильный газовый бензин (unstable gas naphta), бензин вторичных процессов (secondary-process gasoline) и углеводородное сырьё (hydrocarbon inputs) для производства этилена.

NAPHTHALENE = НАФТАЛИН – Naphthalene is a solid aromatic hydrocarbon ($C_{10}H_8$) derived from coal tar. Naphthalene is used as moth flakes and as the basis of certain dye components.

NAPHTHA–TYPE JET FUEL = РЕАКТИВНОЕ ТОПЛИВО НА ОСНОВЕ НАФТЫ (или РЕАКТИВНОЕ ТОПЛИВО НА ОСНОВЕ ТЕХНОЛОГИЧЕСКОГО БЕНЗИНА) – Naphtha-Type Jet Fuel is a fuel in the heavy naphtha boiling range. The US American Society for Testing and Materials (ASTM) Specification D1655 specifies for this fuel maximum distillation temperatures of 140 °C at the 20% recovery point and 240 °C at the 90% recovery point, meeting Military Specification MIL-T-5624L (Grade JP-4). Grade JP-4 is used for turbojet and turboprop aircraft engines, primarily by the military. Excludes Ram-Jet Fuel and Petroleum Rocket Fuel. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ).

NAPHTHENES = НАФТЕНЫ – Naphthenes:- one of the three basic hydrocarbon classifications found naturally in crude oil. Naphthenes are widely used as petrochemical feedstocks. / Одна из трёх базовых разновидностей углеводородов, встречаемых в природе в нефти. Нафтены широко используются в качестве сырья для нефтехимии. Под Нафтенами, от Греческого слова Náphtha, означающее Нефть, понимаются насыщенные ациклические углеводороды, содержащиеся главным образом в нефти. Важнейшими нафтенами являются циклогексан, циклопентан и их гомологи. Под Нафтенами, от Греческого слова Náphtha, означающее Нефть, понимаются алициклические насыщенные углеводороды, содержащиеся главным образом в нефтях (отсюда и название, введённое в органическую химию Русскими химиками Владимиром Васильевичем Марковниковым (1838–1904) и Владимиром Николаевичем Оглоблиным (1854–1917) в 1883). Важнейшие представители нафтенов – циклопентан, циклогексан и их алкилпроизводные. К нафтенам принадлежат также углеводороды, содержащие несколько пяти- и шестичленных циклов (в том числе и конденсированных, например, декалин и другие). Некоторые авторы не совсем правильно относят к нафтенам все циклопарафины (или циклоалканы (цикланы)). Смотрите также Алициклические Соединения. Только два циклоалкана – циклопентан C_5H_{10}, называемый пентаметиленом, и циклогексан C_6H_{12}, называемый гексаметиленом. Вместе с их алкилпроизводными они содержатся в нефтях, поэтому их нередко называют также Нафтенами.

NAPHTHENIC = НАФТЕНОВОЕ (или НАФТЕН) – Naphthenic is a type of petroleum fluid derived from naphthenic crude oil, containing a high proportion of closed-ring methylene groups. / Нафтеновое – относящееся к нафтеновому ряду углеводородов; с высоким содержанием нафтенов; полученное из нефти нафтенового основания. Под Нафтенами, от Греческого слова Náphtha, означающее Нефть, понимаются насыщенные ациклические углеводороды, содержащиеся главным образом в нефти. Важнейшими нафтенами являются циклогексан, циклопентан и их гомологи. Под Нафтенами, от Греческого слова Náphtha, означающее Нефть, понимаются алициклические насыщенные углеводороды, содержащиеся главным образом в нефтях (отсюда и название, введённое в органическую химию Русскими химиками Владимиром Васильевичем Марковниковым (1838–1904) и Владимиром Николаевичем Оглоблиным (1854–1917) в 1883). Важнейшие представители нафтенов – циклопентан, циклогексан и их алкилпроизводные. К нафтенам принадлежат также углеводороды, содержащие несколько пяти- и шестичленных циклов (в том числе и конденсированных, например, декалин и другие). Некоторые авторы не совсем правильно относят к нафтенам все циклопарафины (или циклоалканы (цикланы)). Смотрите также Алициклические Соединения. Только два циклоалкана – циклопентан C_5H_{10}, называемый пентаметиленом, и циклогексан C_6H_{12}, называемый гексаметиленом. Вместе с их алкилпроизводными они содержатся в нефтях, поэтому их нередко называют также Нафтенами.

NAPHTHOL DYES = НАФТОЛОВЫЕ КРАСИТЕЛИ (или ХОЛОДНЫЕ КРАСИТЕЛИ, или ЛЕДЯНЫЕ КРАСИТЕЛИ) – Naphthol Dyes are insoluble azo dyestuffs that are produced on the fiber by applying a Naphthol to the fiber and then combining it with a diazotized base or salt at a low temperature to produce an insoluble dye molecule within the fiber. Naphthol dyes are classified as fast dyes, usually slightly cheaper than Vat dyeings; the methods of application are complex and the range of colors limited. Azoic combinations are still the only class of dye that can produce very deep orange, red, scarlet and Bordeaux shades of excellent light and washing fastness.The pigments produced have bright colors, and include navies and blacks, but there are no greens or bright blues. Crocking fastness varies with shades but washing fastness is equal to Vat dyeings, generally with less light fastness than the Vats. See

also Dyes. Naphthol Dyes:- a type of azo compound formed on the fiber by first treating the fiber with a phenolic compound. The fiber is then immersed in a second solution containing a diazonuim salt that reacts with the phenilic compound to produce a colored azo compound. Since the phenolic compound is dissolved in caustic solution, these dyes are mainly used for cellulose fiber, although other fibers can be dyed by modifying the process. / Фенольное (Phenolic).

NAPIFORM = РЕПОВИДНОЕ (или РЕПООБРАЗНОЕ) – Napiform:- turnip shaped (root). / (корень).

NAPKIN = САЛФЕТКА – Napkin is a rectangular piece of fabric or paper used to wipe the mouth and hands in the course of eating. Napkins are often matched to the tablecloth or placemats. Napkin:- (dialectical British) handkerchief; (chiefly Scottish) kerchief. A napkin is also utilized to clean the messy food from your face after eating a marvelous meal. The employees of Apparel Search generally use our sleeves as napkins. / скатерть или подложки.

NAPM = NATIONAL ASSOCIATION OF PURCHASING MANAGERS

NAPOLEON = НАПОЛЕОН – The Napoleon is the colloquial term for a former French gold coin. The coins were minted (at various times) in denominations of 5, 10, 20, 40, 50 and 100 Francs. This article will focus on the 20 Franc coins issued during the reign of Napoleon, which are 21 mm in diameter, weigh 6.45 grams (gross weight) and, at 90% pure, contain 0.186 7 Troy ounces or 5.801 grams of pure gold. The coin was issued during the reign of Napoleon I and features his portrait on the obverse. The denomination (known as the Franc Germinal French Franc # French Empire and Restoration) continued in use through the XIX century and later French gold coins in the same denomination were generally referred to as 'Napoleons'. Earlier French gold coins are referred to as Louis (the name of eighteen French Kings) or Écu (an old French word for Shield). The Napoleon is the colloquial term for a former French gold coin. The coins were originally minted in two denominations, 20 and 40 Francs for Napoleon Bonaparte. The 20 Franc coins are 21 mm in diameter (about the size of a US five cent piece), weigh 6.45 grams (gross weight) and; at 90% pure, contain .1845 ounces or 5.801 grams of pure gold. The 40 Franc coins are 26 mm in diameter, weigh 12.90 grams (gross weight) and; are 90% pure gold. The coins were issued during the reign of Napoleon I and feature his portrait, sometimes bare headed and other times wearing a laurel wreath (the ancient Roman symbol of supreme authority) and, depending upon the political status of France, the words on the front:- either Bonaparte – Premier Consul (First Consul) or Napoléon Empereur (emperor). On the back:- the legends read either 'RÉPUBLIQUE FRANÇAISE' (the French Republic) or after 1809, 'EMPIRE FRANÇAIS' (the French Empire). There was even a 20 Lire Napoleon minted under the auspices of the Kingdom of Italy, a country annexed by Napoleon I of France in 1805 as a result of the defeat of Austria (the former holder of the territories) at the Battle of Austerlitz. The coin continued in use through the XIX century and later French gold coins in the same denomination were generally referred to as 'Napoleons'. In particular the coins of Napoleon I, were minted not only at the several French mints but also at the mints in the Italian territories:- Genoa, Turin (1803 to 1813), Rome (1812 to 1813) and; the Netherlands:- Utrecht (1812 to 1813), and; in the Swiss territories:- Geneva. During the French occupation of these places, although the mints came under French administration and minted French Empire coins, it was otherwise business as usual as the incumbent mint masters remained in their posts, for example:- Sarwaas in Utrecht, Paroletti in Turin and Mazzio in Rome. Napoleon is the French gold coin with a face value of 20 Francs, bearing a portrait of Napoleon I or Napoleon III. It had a fineness of 900 and a fine gold content of 0.186 7 Troy ounces. / В честь Французского Императора Наполеона Бонапарта (Наполеон I (Napoléon I); 1769–1821) или его племянника – Императора Луи Наполеона Бонапарта (Наполеона III (Napoléon III); 1808–73).

NAPPED = НАЧЁСАННАЯ – The term 'Napped' means fabrics with a fuzzy, fibrous surface produced by scratching or pricking the surface so that some of the fibers are raised from the body of the yarn. Napped fabrics are not to be confused with pile fabrics. Outing and canton flannel, moleskin, etc, are typical fabrics with a nap.

NAPPINESS = ЗАЖГУЧЕННОСТЬ – (1) Nappiness:- the quality of having a nap; abundance of nap, as on cloth. / Ситуация, когда в хлопковом волокне в большом количестве присутствуют жгутики волокна, может привести к появлению соответствующего дефекта на поверхности ткани.

(2) The quality of having a nap; abundance of nap, as on cloth.

NAPPING = ВОРСОВАНИЕ (или РАТИНИРОВАНИЕ, или НАЧЁСЫВАНИЕ) – Napping is a finishing process that raises the surface fibers of a fabric by means of passage over rapidly revolving cylinders covered with metal points or teasel burrs. Outing, flannel, and wool broadcloth derive their downy appearance from this finishing process. Napping is also used for certain knit goods, blankets, and other fabrics with a raised surface. Napping is a mechanical finishing process which raises the surface fibers on fabrics by subjecting them to a rotating cylinder covered with a fine wire or some other form of abrading surface. Napping is a process that may be applied to woollens, cottons, spun silks, and spun rayons, including both woven and knitted types, to raise a velvety, soft surface. The process involves passing the fabric over revolving cylinders covered with fine wires that lift the short, loose fibers, usually from the weft yarns, to the surface, forming a nap. / Ворсование – извлечение на поверхность ткани или трикотажа концов отдельных волокон с целью образования приподнятого (как у бобрика) или лежащего (как у байки) начёса – ворса. Ворсование выполняется на ворсовальных машинах. Рабочий орган машины – вращающийся цилиндрический барабан, на котором закреплены планки с набором ворсовальных шишек или валики, обтянутые игольчатой лентой. Ворсование повышает износоустойчивость и теплозащитные свойства тканей.

NAPPING = ЗАЖГУЧИВАНИЕ – Napping is the raising of fibers on the face of the goods by means of teasels or rollers covered with card clothing (steel wires) that are about one inch in height. Action by either method raises the protruding fibers and causes the finished fabric to provide greater warmth to the wearer, makes the cloth more compact, causes the fabric to become softer in hand or smoother in feel, increases durability and covers the minute areas between the interlacings or the warp and the filling. Napping is the process of raising fibers from the base structure of a fabric or felt. / или основа и уточина.

NAPPO = NORTH AMERICAN PLANT PROTECTION ORGANIZATION

NAPPY COTTON = ЗАЖГУЧЕННЫЙ ХЛОПОК – Nappy Cotton:- matted mass formation of cotton fibers in the bale.

NARC = NATIONAL AGRICULTURAL RESEARCH CENTER

NARC = NEPAL AGRICULTURAL RESEARCH COUNCIL

NARP = NATIONAL AGRICULTURAL RESEARCH PROJECT

NARRATIVE = КОММЕНТАРИЙ – Narrative:- in a SWIFT message, this field may contain any kind of instruction or information. / В сообщении СВМФЭ (Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication)), это поле может содержать любой вид распоряжения или информации. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

NARROW AISLE = УЗКИЙ ПРОЛЁТ – Narrow Aisle (NA):- specialized lift trucks designed to be used in narrow aisles of 8 to 10 feet.

NARROWBAND = УЗКОПОЛОСНОЕ – Narrowband:- frequency band for data transfer via the power cable. The frequency on narrowband is 55 kHz.

NARROW–BASED INDEX FUTURES = ФЬЮЧЕРС НА УСЕЧЁННЫЙ ИНДЕКС – Narrow-Based Index Futures are futures contracts on small groups of stocks that allow an investor to take a position in a concentrated area of the equities market. Each narrow-based index will typically include five to nine companies in a specific sector. Also called Industry-Sector Futures, and Exchange-Traded Baskets. Like a stock index future, except targeted to a specific group of stocks, such as the auto, airline or telecom industries. / или дальней связи.

NARROW–BASED SECURITY INDEX = УСЕЧЁННЫЙ ИНДЕКС ПО ЦЕННЫМ БУМАГАМ – In general, the US Commodity Exchange Act defines a Narrow-Based Security Index as an index of securities that meets one of the following four requirements (i) it has nine or fewer components; (ii) one component comprises more than 30 percent of the index weighting; (iii) the five highest weighted components comprise more than 60 percent of the index weighting, or (iv) the lowest weighted components comprising in the aggregate 25 percent of the index's weighting have an aggregate Dollar value of average daily volume over a six-month period of less than USD50 million (USD30 million if there are at least 15 component securities). However, the legal definition in Section 1a(25) of the Commodity Exchange Act contains several exceptions to this provision. See also Broad-Based Security Index, and Security Future.

NARROW BROWN LEAF SPOT = УЗКАЯ БУРАЯ ПЯТНИСТОСТЬ ЛИСТЬЕВ – Narrow Brown Leaf Spot is a disease of rice caused by the fungus Cercospora janseana and Sphaerulina oryzina, which produces short, linear, brown lesions, most commonly on the leaves.

NARROW CROSS = УЗКОЕ СКРЕЩИВАНИЕ – Narrow Cross is a cross between parents that have many genes in common and only differ in a few.

NARROW FABRIC = УЗКАЯ ТКАНЬ – Narrow Fabric is any nonelastic woven fabric, 12 inches or less in width, having a selvage on either side, except ribbon and seam binding. Narrow Fabric is a woven fabric generally not exceeding 45 cm (18 in) in width.

NARROW FILLING BANDS = УЗКИЕ ЛЕНТЫ ИЗ УТОЧИН – Narrow Filling Bands:- Fabric:- novelty taffeta dress goods; Construction:- (i) Count:- 90 x 68; (ii) Warp:- 100/60 dull viscose rayon, 100/26 black-dyed acetate rayon, 100/40 dull acetate rayon; (iii) Filling:- 150/90 dull viscose rayon; Finish:- cross-dyed blue (viscose) and white (acetate). Defect:- narrow filling bands at regular intervals of about every 25 inches throughout the piece. Analysis:- actual measurements showed a decided difference between the crimp of the warp yarns in the dark-banded sections as compared with those in the light sections. For example, where there appeared to be a dark band, the contraction of the black-dyed yarn was found to be approximately eight times as great as it was in the light sections. This additional black-dyed yarn covered more of the adjacent lighter dyed yarns and produced the illusion of filling bands. This fabric was woven with multiple warp beams, and the defect was apparently caused by a periodic variation in the loom let-off of one beam during weaving, resulting in more contraction in the black-dyed yarn. / Уточина:- .

NARROW MARKET = УЗКИЙ РЫНОК (или МАЛОАКТИВНЫЙ РЫНОК) – Narrow Market is a market is referred to as narrow if a security is traded irregularly or if only a few units of a particular issue are in circulation. Sizable buying or selling orders for such securities generally lead to sharp price fluctuations in a narrow market. Narrow Market is a a market in a share where very few shares are available for sale, and where the price can vary sharply. Narrow Market is a market with few bid and ask offers. Characterized by low liquidity, high spreads, and high volatility. Small changes in supply and/or demand can have a dramatic impact on market price. Also called Thin Market. Opposite of Liquid Market. / колебания цены. Малоактивный Рынок – ситуация на рынке, при которой держатся неизменные цены при малочисленности сделок. Узкий Рынок – ситуация на рынке, при которой:- или заключается небольшое число сделок при некоторой тенденции снижения цен; или сделки отсутствуют и цены снижаются. Узкий Рынок – рынок ценных бумаг или товарно-сырьевой продукции, характеризующийся невысоким объёмом торгов и более значительными колебаниями цен по отношению к объёму, чем это было бы в случае активного ведения торгов. Говорят, что рынок на некоторые ценные бумаги является узким, если цена падает более чем на один пункт между операциями с полными лотами (round lot) без каких-либо видимых причин, что говорит о возможном отсутствии интереса и слишком малом количестве распоряжений брокерам. Термины тонкий рынок (thin market) и неактивный рынок (inactive market) используются как синонимы термина узкий рынок.

NARROW MATERIAL = УЗКИЙ МАТЕРИАЛ – Narrow Material:- bolts or rolls of material too narrow to cover marker width. Cutting Room Defects, and namely – Spreading Defects. / Порок или дефект раскроя.

NARROW OR VARYING WIDTH = УЗКАЯ ИЛИ ВАРЬИРУЮЩАЯСЯ ШИРИНА – (1) Narrow Or Varying Width:- this presents a problem only at the sewing operation and generally when a double needle sewing operation is used. Narrow tape permits outer row of stitching to run off the edge and, although not serious, it doesn't provide maximum strength and mars the appearance. If tape is too wide beyond the outside row of stitching, it may mar the appearance and, in addition, may fold over and catch in the slider when the zipper is opened or closed. Closure defects, and namely – Metal Zippers and Nylon Spiral Zippers:- Tare and Cord Defects. / втачивание (stitching). / Порок или дефект застёжки. Найлан^{T3} (Nylon^{TM}).

(2) Same as for metal zippers. Narrow Or Varying Width:- this presents a problem only at the sewing operation and generally when a double needle sewing operation is used. Narrow tape permits outer row of stitching to run off the edge and, although not serious, it doesn't provide maximum strength and mars the appearance. If tape is too wide beyond the outside row of stitching, it may mar the appearance and, in addition, may fold over and catch in the slider when the zipper is opened or closed. Closure defects, and namely – Nylon Spiral Zipper:- Tape and Cord Detects. / втачивание (stitching). Порок или дефект застёжки. Найлан^{T3} (Nylon^{TM}).

NARROW RANGE = УЗКИЙ ДИАПАЗОН – Narrow Range (NR):- if a price bar's range is less than the previous bar's range it is said to have an NR. The opposite of NR is Wide Spread (WS). NR is technically NR2 when compared to NR4, NR5, and NR7. Wide Spread (WS):- if a price bar's range is wider than the previous bar's range it is said to have a WS. The opposite of WS is Narrow Range (NR). WS is technically WS2 when compared to WS4, WS5, and WS7. Narrow Range 4 (NR4):- if a price bar's range is less than the previous 3 bars' ranges (measured independently) it is said to have the narrowest range in 4 days or NR4. The opposite of NR4 is WS4. NR, NR5, and NR7 are also closely watched price patterns. Narrow Range 5 (NR5):- if a price bar's range is less than the previous 4 bars' ranges (measured independently) it is said to have the narrowest range in 5 days or NR5. The opposite of NR5 is WS5. NR, NR4, and NR7 are also closely watched price patterns. Narrow Range 7 (NR7):- if a price bar's range is less than the previous 6 bars' ranges (measured independently) it is said to have the narrowest range in 7 days or NR7. The opposite of NR7 is WS7. NR, NR4, and NR5 are also closely watched price patterns. Wide Spread 4 (WS4):- if a price bar's range is wider than the previous 3 bars' ranges (measured independently) it is said to have the widest range in 4 days or WS4. The opposite of WS4 is NR4. WS, WS5, and WS7 are also closely watched price patterns. Wide Spread 5 (WS5):- if a price bar's range is wider than the previous 4 bars' ranges (measured independently) it is said to have the widest range in 5 days or WS5. The opposite of WS5 is NR5. WS, WS4,

and WS7 are also closely watched price patterns. Wide Spread 7 (WS7):- if a price bar's range is wider than the previous 6 bars' ranges (measured independently) it is said to have the widest range in 7 days or WS7. The opposite of WS7 is NR7. WS, WS4, and WS5 are also closely watched price patterns. This is a Toby Crabel price pattern. / Это ценовая модель Тоби Крэбэла (Toby Crabel).

NARROW RANGE DAY = ДЕНЬ С УЗКИМ ДИАПАЗОНОМ – Narrow Range Day:- narrowest trading range of the past X days (I usually look at a four or seven day period). One indicator for breakout mode.

NARROW ROW PLANTING = УЗКОРЯДНАЯ ПОСАДКА – Narrow Row Planting is a method of planting in which the seed is planted in uncommonly narrow rows, closer than normal, for the given crop.

NASDA = THE NATIONAL ASSOCIATION OF STATE DEVELOPMENT AGENCIES

NASDAQ® = THE NATIONAL ASSOCIATION OF SECURITIES DEALERS AUTOMATED QUOTATIONS

THE NASDAQ® 100 INDEX = ИНДЕКС ПО 100 ОТ НЭЗДЭК® – The NASDAQ-100 Index includes 100 of the largest non-financial domestic companies listed on the NASDAQ Global Select Market or the NASDAQ Global Market tiers of The NASDAQ Stock Market. Launched in January 1985, each security in the Index is proportionately represented by its market capitalization in relation to the total market value of the Index. The Index reflects NASDAQ's largest growth companies across major industry groups. All index components have a minimum market capitalization of USD500 million, and an average daily trading volume of at least 100 000 shares. The number of securities in the NASDAQ-100 index makes it an effective vehicle for arbitrageurs and securities traders. In October 1993, the NASDAQ-100 Index began trading on the Chicago Board Options Exchange. On 1996-April-10 the Chicago Mercantile Exchange began trading futures and futures options on the NASDAQ-100 Index. The NASDAQ 100 Index tracks the 100 largest stocks listed by the NASDAQ® Composite Index. It is the most widely traded Exchange Traded Fund (ETF) in the world, with 91 million shares moving each day. The NASDAQ 100 is often treated as an index of 'tech stocks' simply because it's components are mostly new technology companies. The NASDAQ-100 Index includes 100 of the largest domestic and international non-financial securities listed on The Nasdaq® Stock Market based on market capitalization. The Index reflects companies across major industry groups including computer hardware and software, telecommunications, retail/wholesale trade and biotechnology. It does not contain securities of financial companies including investment companies. The results shown should not be considered as a representation of the performance of the Index in the future, nor should the results be considered as a representation of the performance of NASDAQ-100 Index Tracking Stock or the NASDAQ 100-Trust. Investment returns and principal value for NASDAQ-100 Index Tracking Stock will fluctuate so that an investor's shares, when redeemed, may be worth more or less than the original cost. Fees and expenses will reduce the performance of the NASDAQ-100 Index Tracking Stock as compared to the performance of the NASDAQ-100 Index. An investment in NASDAQ-100 Index Tracking Stock should be made with an understanding that the NASDAQ-100 Trust will not be able to replicate exactly the performance of the Index because the total return generated by the securities held in the Trust will be reduced by transaction costs incurred in adjusting the actual balance of the securities and other Trust expenses, whereas such transaction costs and expenses are not included in the calculation of the Index. It is also possible that for short periods of time, the Trust may not fully replicate the performance of the Index due to the temporary unavailability of certain Index securities in the secondary market or due to other extraordinary circumstances. Such events are unlikely to continue for an extended period of time because the trustee of the Trust is required to correct such imbalances by means of adjusting the composition of the Trust. It is also possible that the composition of the Trust may not exactly replicate the composition of the Index if the Trust has to adjust its portfolio holdings in order to continue to qualify as a 'regulated investment company' under the Internal Revenue Code. As a result, while the investment objective of the Trust is to provide investment results that generally correspond to the price and yield performance of the Index, there is no assurance that this investment objective can be fully achieved. Launched in January 1985, the NASDAQ-100 Index represents the largest non-financial domestic and international securities listed on The NASDAQ® Stock Market based on market capitalization. The NASDAQ-100 Index is calculated under a modified capitalization-weighted methodology. The methodology is expected to retain in general the economic attributes of capitalization-weighting while providing enhanced diversification. To accomplish this, NASDAQ® will review the composition of the NASDAQ-100 Index on a quarterly basis and adjust the weightings of Index components using a proprietary algorithm, if certain pre-established weight distribution requirements are not met. To be eligible for initial inclusion in the Index, a security must be listed on the Nasdaq® Stock Market and meet the following criteria:- (i) the security's US listing must be exclusively on the Nasdaq® National Market (unless the security was dually listed on another US market prior to 2004-January-01 and has continuously maintained such listing); (ii) the security must be of a non-financial company; (iii) the security may not be issued by an issuer currently in bankruptcy proceedings; (iv) the security must have average daily trading volume of at least 200 000 shares; (v) if the issuer of the security is organized under the laws of a jurisdiction outside the United States, then such security must have listed options on a recognized options market in the United States or be eligible for listed-options trading on a recognized options market in the United States; (vi) only one class of security per issuer is allowed; (vii) the issuer of the security may not have entered into a definitive agreement or other arrangement which would likely result in the security no longer being Index eligible; (viii) the issuer of the security may not have annual financial statements with an audit opinion that is currently withdrawn; (ix) the issuer of the security must have 'seasoned' on NASDAQ® or another recognized market (generally, a company is considered to be seasoned if it has been listed on a market for at least two years; in the case of spin-offs, the operating history of the spin-off will be considered); and (x) if the security would otherwise qualify to be in the top 25% of the securities included in the Index by market capitalization for the six prior consecutive month-ends, then a one-year 'seasoning' criterion would apply. For the purposes of Index eligibility criteria, if the security is a depositary receipt representing a security of a non-US issuer, then references to the 'issuer' are references to the issuer of the underlying security. To be eligible for continued inclusion in the Index, the following criteria apply:- (i) the security's US listing must be exclusively on the Nasdaq® National Market (unless the security was dually listed on another US market prior to 2004-January-01 and has continuously maintained such listing); (ii) the security must be of a non-financial company; (iii) the security may not be issued by an issuer currently in bankruptcy proceedings; (iv) the security must have average daily trading volume of at least 200 000 shares (measured annually during the ranking review process); (v) if the issuer of the security is organized under the laws of a jurisdiction outside the United States, then such security must have listed options on a recognized options market in the United States or be eligible for listed-options trading on a recognized options market in the United States (measured annually during the ranking review

process); (vi) the security must have an adjusted market capitalization equal to or exceeding 0.10% of the aggregate adjusted market capitalization of the Index at each month- end. In the event a company does not meet this criterion for two consecutive month-ends, it will be removed from the Index effective after the close of trading on the third Friday of the following month; and (vii) the issuer of the security may not have annual financial statements with an audit opinion that is currently withdrawn. In administering the Index, Nasdaq® will exercise reasonable discretion as it deems appropriate. Except under extraordinary circumstances that may result in an interim evaluation, Index composition is reviewed on an annual basis as follows (such evaluation is referred to herein as the 'Ranking Review'). Securities listed on The Nasdaq® Stock Market which meet the applicable eligibility criteria (above) are ranked by market value. Index-eligible securities which are already in the Index and which are ranked in the top 100 eligible securities (based on market value) are retained in the Index. A security that is ranked 101 to 125 is also retained, provided that such security was ranked in the top 100 eligible securities as of the previous Ranking Review. Securities not meeting such criteria are replaced. The replacement securities chosen are those Index-eligible securities not currently in the Index that have the largest market capitalization. The data used in the ranking includes end of October NASDAQ® market data and is updated for total shares outstanding submitted in a publicly filed SEC document via EDGAR through the end of November 2008. Generally, the list of annual additions and deletions is publicly announced via a press release in the early part of December. Replacements are made effective after the close of trading on the third Friday in December. Moreover, if at any time during the year an Index Security is determined by Nasdaq® to become ineligible for continued inclusion in the Index based on the Continued Eligibility Criteria (above), the security will be replaced with the largest market capitalization security not currently in the Index and meeting the Initial Index eligibility criteria listed above. In addition to the Ranking Review, the securities in the Index are monitored every day by Nasdaq® with respect to changes in total shares outstanding arising from secondary offerings, stock repurchases, conversions, or other corporate actions. Nasdaq® has adopted the following weight adjustment procedures with respect to such changes. Changes in total shares outstanding arising from stock splits, stock dividends, or spin-offs are generally made to the Index on the evening prior to the effective date of such corporate action. If the change in total shares outstanding arising from other corporate actions is greater than or equal to 5.0%, the change will be made as soon as practicable, normally within ten (10) days of such action. Otherwise, if the change in total shares outstanding is less than 5%, then all such changes are accumulated and made effective at one time on a quarterly basis after the close of trading on the third Friday in each of March, June, September, and December. In either case, the Index share weights for such Index Securities are adjusted by the same percentage amount by which the total shares outstanding have changed in such Index Securities. NASDAQ 100 Index is an index of 100 technology stocks that trade on the Nasdaq® Stock Exchange. / , средства дальней связи, . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Сводный Индекс от НЭЗДЭК®. экстраординарные обстоятельства. ЭДГАР (EDGAR) . НЭЗДЭК® (NASDAQ®).

NASDAQ® CAPITAL MARKET COMPANIES = КОМПАНИИ РЫНКА КАПИТАЛОВ НЭЗДЭК® – The NASDAQ® Capital Market consists of over 550 companies that have applied for listing, having met and continued to meet financial and liquidity listing requirements and agreed to meet specific corporate governance standards. This market, previously called The NASDAQ® SmallCap Market, was renamed in 2005 to reflect the core purpose of this market, which is capital raising. / НЭЗДЭК® (NASDAQ®) .

NASDAQ® CLOSE = ЗАКРЫТИЕ НЭЗДЭК® – NASDAQ® Close is the NASDAQ® Official Closing Price (NOCP) – the industry standard reference prices – based on the NASDAQ Closing Crosses and the NASDAQ IPO/Halt Crosses. NASDAQ® closes at 04 pm Eastern each business day. That is 03 pm Central, 02 pm Mountain, and 01 pm Pacific. It opens at 09:30 am Eastern. That is 08:30 Central, 07:30 Mountain, and 06:30 Pacific. / Известно также как Официальная Цена Закрытия НЭЗДЭК® (NASDAQ® Official Closing Price).

THE NASDAQ® COMPOSITE INDEX = СВОДНЫЙ ИНДЕКС ОТ НЭЗДЭК® – The NASDAQ® Composite Index measures all NASDAQ® domestic and non-US based common stocks listed on The NASDAQ® Stock Market. The Index is market-value weighted. This means that each company's security affects the Index in proportion to it's market value. The market value, the last sale price multiplied by total shares outstanding, is calculated throughout the trading day, and is related to the total value of the Index. Today (in 2009) the NASDAQ® Composite includes over 5 000 companies, more than most other stock market indexes. Because it is so broad-based, the Composite is one of the most widely followed and quoted major market indexes. The NASDAQ® Composite Index is a market capitalization-weighted index of over 5 000 stocks. Because it is weighted by market capitalization, large companies such as Dell Computer, Intel, Microsoft, Oracle, Sun Microsystems, and WorldCom dominate the index. With such large portion of the index dominated by technology stocks, the NASDAQ® Composite is more a barometer for the technology sector than the broader market. The name NASDAQ® is derived from the National Association Of Securities Dealers Automated Quotation (System). / НЭЗДЭК® (NASDAQ®) . Один из ведущих мировых индексов по 5 000 акций инновационных и быстро растущих компаний главным образом технологического сектора, рассчитываемый компанией The NASDAQ® Stock Market, Inc..

NASDAQ® GLOBAL MARKET℠ COMPANIES = КОМПАНИИ ГЛОБАЛЬНОГО РЫНКА НЭЗДЭК® – The NASDAQ® Global Market℠ consists of over 1 450 companies that have applied for listing, having met and continued to meet stringent financial and liquidity requirements and agreed to meet specific corporate governance standards. Formerly called The NASDAQ® National Market, this market was renamed in 2006 to reflect the global leadership and international reach of this market and the companies whose securities are listed here. / НЭЗДЭК® (NASDAQ®) .

NASDAQ® GLOBAL SELECT MARKET℠ COMPANIES = КОМПАНИИ ГЛОБАЛЬНЫХ ВЫБОРОЧНЫХ РЫНКОВ НЭЗДЭК® – The NASDAQ® Global Select Market℠ has the highest initial listing standards in the world. Approximately 1 200 companies are listed on the Global Select, having met these stringent financial and liquidity requirements for initial listing and continue to meet stringent financial, liquidity and corporate governance requirements. / НЭЗДЭК® (NASDAQ®) .

NASDAQ® INTERNATIONAL LTD = НЭЗДЭК® ИНТЁНЭШЭНЭЛ ЭЛ.ТИ.ДИ. – NASDAQ International Limited is a subsidiary of the NASD headquartered in London, The United Kingdom. Its mission is to support NASD members in London, serve as a liaison to international companies seeking to list securities on NASDAQ®, encourage foreign institutional participation in NASDAQ® stocks, and to heighten the international image of the NASD and its markets. Change of Name 1987-June-19:- from Burginhall 118 Limited to NASDAQ/UK Limited. Change of Name 1987-September-07:- from NASDAQ/UK Limited to NASDAQ International Limited. Private limited company organized under Great Britain's Companies Act of 1985 on 1987-January-29. It is a wholly owned subsidiary of the NASDAQ Stock Market, Inc.. NASDAQ International Limited was organized to provide consultancy, advisory, supervisory, administrative, financial, personnel, and legal services in relation to undertakings regarding the investment or securities industry. / НЭЗДЭК® (NASDAQ®) .

NASDAQ® INTERNATIONAL SERVICE = МЕЖДУНАРОДНАЯ СЛУЖБА НЭЗДЭК® – NASDAQ® International Service is an extension to The NASDAQ® Stock Market's trading systems that allows early morning trading from 03:30 to 09:00 am Eastern Standard Time on each US trading day. This NASDAQ® service enables participants to monitor trades during London market hours.

NASD members are eligible to participate in this session through their US trading facilities or through those of an approved UK affiliate. / НЭЗДЭК® (NASDAQ®) .

NASDAQ® OFFICIAL CLOSING PRICE = ОФИЦИАЛЬНАЯ ЦЕНА ЗАКРЫТИЯ НЭЗДЭК® – The NASDAQ® Official Closing Price (NOCP) is a process for identifying the NASDAQ® market-specific closing price for NASDAQ®-listed issues. The NOCP replaces the NASDAQ® market-specific closing price that was based solely on the last reported NASDAQ® trade. Subject to review by NASDAQ® MarketWatch, the NOCP will equal the normalized price of the last trade reported to NASDAQ's proprietary trade reporting system – Automated Confirmation Transaction Service℠ (ACT℠) – with a last sale eligible sale condition modifier as of 04:00:02 pm, US Eastern Time. 'Normalizing' the NOCP means it will be adjusted to the nearest prevailing inside quote whenever the last sale is reported away from the inside market. Market participants, data distributors and investors will be provided with the NOCP for all NASDAQ® Global Select Market℠, NASDAQ® Global Market℠ and NASDAQ® Capital Market℠ securities. Date of NOCP – This field refers to the date the NOCP was disseminated for a given stock. It is possible that the date will not be from the prior day; this indicates that the stock didn't trade on NASDAQ® on the prior day. The NOCP is updated only when the stock is traded on NASDAQ®. Also known as NASDAQ® Close. See also NASDAQ® Official Open Price. The NASDAQ® Official Closing Price (NOCP) – the industry standard reference prices – based on the NASDAQ® Closing Crosses and the NASDAQ IPO/Halt Crosses. / НЭЗДЭК® (NASDAQ®) .

NASDAQ® OFFICIAL OPEN PRICE = ОФИЦИАЛЬНАЯ ЦЕНА ОТКРЫТИЯ НЭЗДЭК® – NASDAQ® Official Opening Price is a process for identifying the NASDAQ®-specific opening prices for NASDAQ®-listed issues. Date of the NASDAQ® Official Open Price – This field refers to the date the NASDAQ® Official Open Price was disseminated for a given stock. It is possible that the date will not be from the current trading day; this indicates that the stock didn't trade on NASDAQ® during the current trading day. The NASDAQ® Official Open Price is updated only when the stock is traded on NASDAQ®. The NASDAQ® Official Opening Price (NOOP) – the industry standard reference prices – based on the NASDAQ® Opening Crosses and the NASDAQ IPO/Halt Crosses. / НЭЗДЭК® (NASDAQ®) .

NASTIC = НАСТИЧЕСКОЕ – Nastic:- of a movement made by a part of a fixed plant in response to a non-directional or diffuse stimulus. The direction of movement is always related to the nature of the plant part and not to the stimulus. / , от Греческого слова Nastós, означающее Уплотнённый, . Под Настиями понимаются ростовые движения листьев, лепестков и других дорсовентральных органов растений, не ориентированные по отношению к действию раздражителя (свет, температура и тому подобное). Различают никтинастии, сейсмонастии, термонастии, фотонастии, хемонастии.

NATION = НАЦИЯ – Nation is a large aggregation or agglomeration of people sharing a common and distinctive racial, linguistic, historical and/or cultural heritage that has led its members to think of themselves as belonging to a valued natural community sharing a common destiny that ought to be preserved forever. / Под Нацией, от Латинского слова Natio, означающее Народ или Племя, понимается историческая общность людей, складывающаяся в процессе формирования общности их территориальных, экономических связей, литературного языка, некоторых особенностей культуры и характера. Возникает в период преодоления феодальной раздробленности на основе капиталистических экономических связей, образования внутреннего рынка, складывается из различных племён и народностей. Под Нацией понимается исторически сложившаяся форма общности людей, которая приходит на смену народности. Нации свойственна прежде всего общность материальных условий жизни:- территории и экономической жизни; общность языка, известных черт национального характера, проявляющихся в национальном своеобразии её культуры. Нация – более широкая, чем народность, форма общности, складывающаяся с возникновением и формированием капиталистической формации. Экономической основой возникновения нации послужили ликвидация феодальной раздробленности, упрочение экономических связей между отдельными областями внутри страны, объединение местных рынков в общенациональный. Руководящей силой возникавших в этот период наций была буржуазия, что наложило определённый отпечаток на их социально-политический и духовный облик. Внутри них обострялись социальные противоречия. Буржуазия, стремясь заглушить классовые противоречия, нередко становилась на путь разжигания межнациональных антагонизмов, проповеди идеологии национализма и национального эгоизма. Пролетариат противопоставляет буржуазному национализму идеологию и политику интернационализма. Проходящие в современном обществе процессы существенно меняют облик нации. Ускоряется процесс интернационализации, который ломает национальные перегородки и уничтожает национальную обособленность. Создаются новые возможности для экономического и духовного прогресса нации, развития равноправных и взаимовыгодных отношений различных наций и народностей, хотя национальные раздоры остаются характерной чертой межнациональных отношений при капитализме. В бывшем СССР после Октябрьского государственного переворота (революции) в жизни нации и народностей произошли крупные преобразования, укрепилась дружба и интернациональные связи народов Советского Союза. Однако глубокие деформации и грубые нарушения в жизни советсткого общества, попрание демократических норм и принципов социализма в период культа личности Иосифа Сталина, идеология и психология застоя привели в накоплению деформаций, разного рода негативных явлений, в том числе в сфере национальных отношений. Горбачёвская перестройка и демократизация были призваны создать реальные предпосылки для возрождения национальной самобытности, углубления процесса интернационализации, взаимного влияния и обогащения нации.

NATIONAL ACCOUNTING = НАЦИОНАЛЬНЫЙ БЮДЖЕТНЫЙ ПРОЦЕСС (или НАЦИОНАЛЬНОЕ БЮДЖЕТИРОВАНИЕ) – National Accounting:- accounting system that provides a simplified quantitative representation of a nation's economy. Also known as National Income Accounting, and Social Accounting in the United Kingdom. / Под Национальными Счетами понимается система таблиц в форме бухгалтерских счетов, характеризующая процесс производства, распределения и конечного использования совокупного общественного продукта и национального дохода, как правило, за год. В большинстве стран применяется стандартная система национальных счетов, принятая ООН в 1968 и пересмотренная в 1993.

NATIONAL ASSOCIATION OF SECURITIES DEALERS, INC. = НАЦИОНАЛЬНАЯ АССОЦИАЦИЯ ДИЛЕРОВ ПО ЦЕННЫМ БУМАГАМ, ИНК. – The National Association of Securities Dealers, Inc. (NASD) is a self-regulatory organization with jurisdiction over certain broker-dealers. The NASD requires member brokers to register and conducts examinations for compliance with net capital requirements and other regulations. It also conducts market surveillance of the over-the-counter (OTC) securities market. National Association of Securities Dealers Automated Quotations (NASDAQ®) is a subsidiary of the NASD which facilitates the trading of approximately 5 000 most active OTC issues through an electronically connected network. Originally established in the USA in 1939 to regulate the over-the-counter market, the NASD is a consortium of brokers and dealers responsible for establishing the legal and ethical standards of its members. The National Association of Securities Dealers (NASD) is an association of brokers and dealers in the over-the-counter securities business. Nonprofit organization formed under the joint sponsorship of the investment bankers' conference and the US Securities and Exchange Commission (SEC) to comply with the Maloney Act, which provides for the regulation of the OTC market. National Association of Securities Dealers, Inc. (NASD) is the self-regulatory organization of the securities industry responsible for the regulation of The NASDAQ® Stock Market and the over-the-counter markets. The NASD operates under the

authority granted it by the 1938 Maloney Act Amendment to the Securities Exchange Act of 1934. The National Association of Securities Dealers, Inc. (NASD) became effectively registered on 1939-August-09 as a national securities association, and registered with the United States Securities and Exchange Commission (SEC) in response to the 1938 Maloney Act (Section 15A) amendments to the Securities Exchange Act of 1934 which allowed it to supervise the conduct of its members subject to the oversight of the SEC. In 1971, NASD launched a new computerized stock trading system called the National Association of Securities Dealers Automated Quotations (NASDAQ®) stock market. The NASDAQ® and AMEX® stock exchanges merged in 1998. Two years later, the NASDAQ® underwent a major recapitalization and became an independent entity from NASD. In July 2007, the SEC approved the formation of a new self-regulatory organization (SRO) to be a successor to NASD. The NASD and the member regulation, enforcement and arbitration functions of the New York Stock Exchange were then consolidated into the Financial Industry Regulatory Authority (FINRA). Merged with the NYSE Regulation, Inc. in 2007 to form the organization now known as the Financial Industry Regulatory Authority (FINRA). / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). НЭЗДЭК® (NASDAQ®) и АМЭКС® (AMEX®). Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении). Национальная Ассоциация Дилеров по Ценным Бумагам (НАДЦБ) – некоммерческая организация, созданная при совместном участии Конференции инвестиционных банкиров и Комиссии по Ценным Бумагам и Биржам (Securities Exchange Commission (SEC)) в соответствии с Актом Мэлоуни (Maloney Act). Среди членов НАДЦБ – практически все инвестиционные банковские дома и фирмы, ведущие операции с ценными бумагами на внеучётном рынке (over the counter market). НАДЦБ действует под надзором SEC, и её основными целями являются:- (i) стандартизация существующей практики в данной области; (ii) установление высоких моральных и этических стандартов в области торговых операций с ценными бумагами; (iii) создание репрезентативного органа для консультаций с правительством и инвесторами по вопросам, представляющим взаимный интерес; (iv) установление и введение в действие справедливых и общеобязательных правил ведения торговых операций с ценными бумагами; (v) создание дисциплинарного органа, способного ввести на практике вышеперечисленные положения. НАДЦБ также требует, чтобы её члены постоянно поддерживали определённый объём высоколиквидных активов сверх текущих обязательств. Для обеспечения высокого уровня платёжеспособности и финансовой стабильности членов ассоциации проводятся периодические контрольные и аудиторские проверки. Специальный отдел по делам инвестиционных компаний занимается всеми вопросами, связанными с инвестиционными компаниями, и несёт ответственность за проверку отчётности о продажах, осуществляемых компаниями.

THE NATIONAL ASSOCIATION OF SECURITIES DEALERS AUTOMATED QUOTATIONS = АВТОМАТИЗИРОВАННЫЕ КОТИРОВКИ НАЦИОНАЛЬНОЙ АССОЦИАЦИИ ДИЛЕРОВ ПО ЦЕННЫМ БУМАГАМ – National Association of Securities Dealers Automated Quotations (NASDAQ®) is a computerized system established by the NASD to facilitate trading by providing broker/dealers with current bid and ask price quotes on over-the-counter stocks and some listed stocks. The NASDAQ® Stock Market, Inc. headquartered in New York, USA. NASDAQ® is the largest US electronic stock market. With approximately 3 200 companies, it lists more companies and, on average, trades more shares per day than any other US market. It is home to companies that are leaders across all areas of business including technology, retail, communications, financial services, transportation, media and biotechnology. NASDAQ® is the primary market for trading NASDAQ-listed stocks. An automated information network that provides brokers and dealers with price quotations on securities traded over-the-counter. An electronic network which lets brokers trade from their offices all over the country. NASDAQ® caters to large, mid-sized, and small growth companies. It lists close to 5 000 companies in technology, telecommunications, banking, retail and other growth sectors. The US exchange mainly for the shares of small companies not listed on the New York Stock Exchange. On 2007-May-25, the boards of directors of The NASDAQ® Stock Market, Inc. and OMX AB (publ) jointly announced that they have entered into a Transaction Agreement to combine the two companies, creating the world's premier exchange and technology company. The new group, to be called The NASDAQ OMX Group, Inc. (the 'Combined Group'), brings together two companies with a common culture and vision of innovation, competitiveness and pioneering technological expertise. NASDAQ OMX Group, Inc combines two highly complementary businesses, uniting NASDAQ's leading global brand, highly efficient electronic trading platform and track record of customer focused innovation with OMX's global technology services platform and customer base, efficient Nordic Exchange, derivatives capabilities and track record of successful cross-border exchange integrations. The Combination will create the largest global network of exchanges and exchange customers linked by technology. The Combination will provide significant benefits for customers, shareholders and other stakeholders in both companies. Combination will be effected through a cash and stock tender offer by NASDAQ® for all outstanding shares in OMX. NASDAQ® and OMX will have approximately 4 000 listed companies from 39 countries with an aggregate market capitalization of approximately USD5.5 trillion. The Combined Group will have many of the world's largest companies listed on its marketplaces, with a leading market share of listings in the technology, software, telecommunication and pulp and paper industries worldwide. Issuers will be associated with an innovative, future-focused company with blue-chip peers in all industry sectors. Listed companies will have access to a broad base of investors and deep pools of liquidity. The combined liquidity pools, advanced speed of execution and integrated crossborder trading capabilities will provide issuers with increased visibility and access to global equity capital. OMX has been a pioneer in creating a truly integrated cross-border stock market. OMX also has created a world-renowned technology customer base of equity, debt and derivatives exchanges with 60 clients in 50 countries worldwide, including Hong Kong, Singapore, Australia, and the United States. NASDAQ® pioneered electronic trading, and has continued to innovate over the last thirty years and now has the fastest, most efficient trading platform in the United States. Together, NASDAQ® and OMX will provide the technology for the world's increasingly competitive and demanding capital markets. NASDAQ® and OMX believe their focus on technology leadership and the combination of their expertise and brands will generate growth opportunities and additional sales of technology and related services globally. The Combined Group will leverage the strength of each organization's distribution capabilities to broaden the customer base for NASDAQ's and OMX's existing data products and to provide enhanced data tailored with value-added services to market participants. The market data generated by the Combined Group will lever its product expertise and develop innovative data products and combined indices incorporating global complementary NASDAQ® and OMX stocks and derivatives. In summary, NASDAQ® and OMX believe the Combined Group will create the world's premier global exchange technology company. The Combined Group will be structured as a US holding company, named The NASDAQ OMX Group, Inc., the shares of which will be listed on NASDAQ® and on OMX Nordic Exchange. The Combined Group's headquarters will be located in New York, which will also be the center of operations for the group's US cash trading business. The Combined Group's technology business and Nordic trading business will continue to be managed as today. See also OMX (Group AB). The National Association of Securities Dealers Automated Quotations (NASDAQ®) is a New York-based computerized exchange on which especially growth-oriented and innovative securites are traded. The index of the NASDAQ® is the NASDAQ® Composite Index. National Association of Securities Dealers Automated Quotations (NASDAQ®) system is a major electronic stock exchange in the United States which has a large number of technology companies listed on it. The NASDAQ® market is highly regulated and there are very strict reporting and compliance regulations that companies must meet. Companies must meet certain financial standards in order to be able to join the Nasdaq® 'club'. If listed companies fail to meet these standards or fail to comply, they risk being de-listed, i.e. kicked out of the club. / НЭЗДЭК® (NASDAQ®) или, в Русскоязычном жаргоне, НАЖДАК. в секторах технологий, дальней связи, . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). THE NATIONAL ASSOCIATION OF STATE DEVELOPMENT AGENCIES = НАЦИОНАЛЬНАЯ АССОЦИАЦИЯ АГЕНТСТВ ПО РАЗВИТИЮ ШТАТА – In the Unted States, the National Association of State Development Agencies (NASDA), was formed in 1946 to provide a forum for directors of state economic development agencies to exchange information, compare programs, and deal with issues of mutual interest. NASDA's organization includes International Trade and Foreign Investment components. Trade activities include maintenance of a State Export Program Database. The National Association of State Development Agencies (NASDA) is a national, nonprofit, trade association that provides members with a wide variety of training services, workshops, technical assistance, and data analysis in the area of economic development. Members come from economic development agencies across the country as well as from public, private, and nonprofit enterprises. Headquartered in Woodbridge, State of Virginia, the United States.

NATIONAL BALANCING POINT = НАЦИОНАЛЬНЫЙ РАЗДАТОЧНЫЙ ПУНКТ – National Balancing Point (NBP) is a notional point on UK Transco's national transmission system where load is assumed to be balanced. In the United Kingdom, the National Balancing Point, commonly referred to as the NBP, is a virtual trading location for the sale and purchase of natural gas in the United Kingdom. It was the pricing and delivery point for the natural gas futures contracts traded on the International Petroleum Exchange (IPE), located in London, The United Kingdom. It is the most liquid gas trading point in Europe and is a major influence on the price that domestic consumers pay for their gas at home. Gas at the NBP trades in pence per therm. It is similar in concept to the Henry Hub (Erath, State of Louisiana, the United States), but differs in that it is not an actual physical location. See also Henry Hub, and Title Transfer Facility. / Хэнри Хаб (Henry Hub).

NATIONAL BANK = НАЦИОНАЛЬНЫЙ БАНК – In banking, the term National Bank carries several meanings:- (i) especially in developing countries, a bank owned by the state; (ii) an ordinary private bank which operates nationally (as opposed to regionally or locally or even internationally); and (iii) in the United States, an ordinary private bank operating within a specific regulatory structure, which may or may not operate nationally, under the supervision of the Office of the Comptroller of the Currency. In the past, the term 'National Bank' has been used synonymously with 'Central Bank', but it is no longer used in this sense today. Some central banks may have the words 'National Bank' in their name; conversely if a bank is named in this way, it is not automatically considered a central bank. For example, National-Bank AG in Essen, Germany is a privately owned commercial bank, just like National Bank of Canada of Montreal, Canada. On the other side, National Bank of Ethiopia is the central bank of Ethiopia and National Bank of Cambodia is the central bank of Cambodia. In the United States, National Bank is a commercial bank that is chartered by the Office of the Comptroller of the Currency, which is a bureau of the US Department of the Treasury. By law, national banks are members of the Federal Reserve System. / Националь-Банк А.Ге. (National-Bank AG). В США под Национальными Банками понимаются частные коммерческие банки, деятельность которых регулируется федеральным законодательством. Были учреждены в 1863. Национальный Банк в США – это коммерческий банк, устав которого был одобрен Контролёром Денежного Обращения США (Comptroller of the Currency), а не департаментом штата по делам банков. Национальные банки обязаны быть членами Федеральной Резервной Системы (Federal Reserve System (FRS)) и должны приобретать акции своего регионального Федерального Резервного Банка (Federal Reserve Bank (FRB)). Они также должны входить в Федеральную Корпорацию Страхования Депозитов (Federal Deposit Insurance Corporation (FDIC)).

NATIONAL CARGO BUREAU = НАЦИОНАЛЬНОЕ ГРУЗОВОЕ БЮРО – National Cargo Bureau is a private organization having representatives throughout the main harbors in the United States. It is empowered to inspect cargoes of a hazardous nature and issue certificates which are automatically approved by the Coast Guard.

NATIONAL CENTRAL BANK = НАЦИОНАЛЬНЫЙ ЦЕНТРАЛЬНЫЙ БАНК – National Central Bank is a central bank of any country. / Национальный Центральный Банк – центральный банк любой страны.

NATIONAL COMMODITY AND DERIVATIVES EXCHANGE (LIMITED) = НАЦИОНАЛЬНАЯ БИРЖА СЫРЬЯ И ПРОИЗВОДНЫХ ИНСТРУМЕНТОВ (ЛИМИТИД) – National Commodity and Derivatives Exchange Limited (NCDEX) is an on-line multi-commodity exchange located in Mumbai, India, it began operations in December 2003. Website:- http://www.ncdex.com. National Commodity & Derivatives Exchange Limited (NCDEX) is located in Mumbai and is a professionally managed online multi commodity exchange. National Commodity & Derivatives Exchange Limited (NCDEX) is a professionally managed on-line multi commodity exchange. The shareholders of NCDEX comprises of large national level institutions, large public sector bank and companies. Promoter shareholders:- ICICI Bank Limited (ICICI; at the moment, ICICI is not a shareholder of NCDEX), Life Insurance Corporation of India (LIC), National Bank for Agriculture and Rural Development (NABARD) and National Stock Exchange of India Limited (NSE). Other shareholders:- Canara Bank, Punjab National Bank (PNB), CRISIL Limited, Indian Farmers Fertiliser Cooperative Limited (IFFCO), Goldman Sachs, Intercontinental Exchange (ICE), Shree Renuka Sugars Limited, Jaypee Capital Services Limited and Build India Capital Advisors LLP. NCDEX is the only commodity exchange in the country promoted by national level institutions. This unique parentage enables it to offer a bouquet of benefits, which are currently in short supply in the commodity markets. The institutional promoters and shareholders of NCDEX are prominent players in their respective fields and bring with them institutional building experience, trust, nationwide reach, technology and risk management skills. NCDEX is a public limited company incorporated on 2003-April-23 under the Companies Act, 1956. It obtained its Certificate for Commencement of Business on 2003-May-09. It commenced its operations on 2003-December-15. NCDEX is a nation-level, technology driven de-mutualised on-line commodity exchange with an independent Board of Directors and professional management – both not having any vested interest in commodity markets. It is committed to provide a world-class commodity exchange platform for market participants to trade in a wide spectrum of commodity derivatives driven by best global practices, professionalism and transparency. NCDEX is regulated by Forward Markets Commission. NCDEX is subjected to various laws of the land like the Forward Contracts (Regulation) Act, Companies Act, Stamp Act, Contract Act and various other legislations. NCDEX headquarters are located in Mumbai and offers facilities to its members from the centres located throughout India. The Exchange, as on 2012-February-09 offered contracts in 34 commodities – comprising 23 agricultural commodities, 6 precious metals, 2 energy, 1 polymer and 2 other metals. The top 5 commodities, in terms of volume traded at the Exchange, were Soya oil, Gaur Seed, Chana, RM seed and Guar gum. / Другие акционеры:- Бэньк (Canara Bank), Панджяб Нэшэнэл Бэньк (Пи.Эн.Би.; Punjab National Bank (PNB)), Крайсыл Лимитид (CRISIL Limited), Индиэн Фамёз Фётилайзё Кэопэрэтив Лимитид (Ай.Эф.Эф.Си.Оу.; Indian Farmers Fertiliser Cooperative Limited (IFFCO)), Голдмэн Сэкс (Goldman Sachs), Интчёконтинэнтэл Эксчэйндьж (Ай.Си.И.;

NATIONAL COTTON COUNCIL OF AMERICA = НАЦИОНАЛЬНЫЙ ХЛОПКОВЫЙ СОВЕТ АМЕРИКИ – The National Cotton Council of America's mission is to ensure the ability of all US Cotton industry segments to compete effectively and profitably in the raw cotton, oilseed and US-manufactured product markets at home and abroad. The Council serves as the central forum for consensus-building among producers, ginners, warehousers, merchants, cottonseed processors/dealers, cooperatives and textile manufacturers. The organization is the unifying force in working with the government to ensure that cotton's interests are considered. The Council's mission and objectives are carried out with the help of democratically-developed policy. Annual policymaking is initiated through recommendations generated by the Council's six program committees. Committee recommendations are refined and approved by the Council's 35-member board of directors, acting as a resolutions committee, but must be adopted by the Council's delegates voting at the annual meeting. The National Cotton Council of America (NCC) is the central organization representing all seven sectors, or interests, of the raw Cotton industry of the United States:- cooperatives, ginners, manufacturers (spinners), merchants, producers, seed crushers, warehouses. NCC is a voluntary private industry association established in 1939. NCC programs include technical services, foreign operations, communication services, economic services, and Government liaison. Headquartered in Memphis, TN, the United States. The National Cotton Council is a unifying force of the US Cotton industry, bringing together representatives from the seven industry segments in the 17 cotton-producing states of the Cotton Belt to work out common problems and develop programs of mutual benefit. The Council's delegates are elected by state, regional and national cotton interest organizations.They meet each year to adopt Council policies and set guidelines for activities over the next 12 months. Delegates also hold interest caucuses, with each of the seven sectors electing five of its group to serve on the Council board of directors. The 35-member board convenes between the annual meetings for progress reports on activities and to deal with issues that arise. The Board also elects officers, who include at least one representative from each of the Cotton industry's seven segments. Six program committees develop policy recommendations to the Council. The Farm Program and Economic Policy Committee establishes the Council's position on such issues as farm legislation and administration, federal tax laws, employment and water law. The Health, Safety and Environmental Quality Committee seeks to achieve reasonable and scientifically based government regulations for crop protection products, textile chemicals, worker safety and health and other matters. The International Trade Policy Committee directs the Council's stance on trade policy and negotiations. The Packaging and Distribution Committee works to enhance bale packaging, handling, storage and movement through use of improved materials and electronic technology. The Public Relations and International Market Development Committee guides an extensive program to expand US Cotton exports through far-reaching advertising and promotion campaigns, trade missions and other market development programs. Communications efforts are designed to build a greater understanding of the US Cotton industry, its products and its people through effective communication and information services. The Research and Education Committee seeks to attain comprehensive and more effective cotton research and education programs to reduce production and processing costs and to improve cotton fiber and oilseed products. The six program committees convene at the annual meeting to review Council programs and policies and make their recommendations for the coming year. Their recommendations go to the board of directors, which sits as a resolutions committee, and finally are put before the delegate body. Each recommendation must be approved by a majority of delegates from each of the seven segments, voting separately, before becoming official Council policy. Because of the democratic process involved in its policymaking procedure, the Council is able to move with the combined strength and support of all seven Cotton industry segments as it confronts issues affecting its members. The organizational meeting of the National Cotton Council of America (NCC) is held at the Peabody Hotel in Memphis, TN, on 1938-November-21, representing cotton producers, ginners, warehousers, merchants and cottonseed crushers. The first NCC Board was elected at the 1939 Annual Meeting in Dallas, and included 25 industry members. 1956:- The Agricultural Act of 1956 authorized the President to enter into agreements with foreign countries to limit their export to the United States. The NCC forms its export promotions division, Cotton Council International (CCI) and becomes the first cooperator with USDA's Foreign Agricultural Service. The National Cotton Council of America's is the central US organization whose membership represents the seven business segments of the national Cotton industry – producers who grow the fiber, ginners who separate the fiber from the seed, warehousemen who store the baled Cotton, merchants who market the fiber, crushers who process the seed, cooperatives who process, handle or market Cotton or cottonseed for their producer members and manufacturers who spin the fiber into yarn. National Cotton Council (NCC):- this is the central organization representing all seven sectors, or interests, of the US raw cotton industry:- producers (farmers or growers), ginners, warehousemen, merchants (shippers or exporters), seed crushers, cooperatives, and manufacturers (spinners). It is a voluntary private industry association established in 1939. NCC programs include technical services, foreign operations, public relations, economic and market research, and legislation. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

NATIONAL CREDIT UNION ADMINISTRATION = НАЦИОНАЛЬНАЯ АДМИНИСТРАЦИЯ КРЕДИТНЫХ СОЮЗОВ – The National Credit Union Administration (NCUA) is the independent federal agency that charters and supervises federal credit unions. NCUA, backed of the full faith and credit of the US government, operates the National Credit Union Share Insurance Fund (NCUSIF) insuring the savings of 80 million account holders in all federal credit unions and many state-chartered credit unions. In 1934, President Roosevelt signed the Federal Credit Union Act into law authorizing the formation of federally chartered credit unions in all states. The purpose of the federal law was to make credit available and promote thrift through a national system of nonprofit, cooperative credit unions. After the Federal Credit Union Act was signed into law, the new Bureau of Federal Credit Unions was first housed at the Farm Credit Administration. Regulatory responsibility shifted over the years as the agency moved from the Federal Deposit Insurance Corporation to the Federal Security Agency, and then the Department of Health, Education and Welfare. Meanwhile, in the 1940s and 1950s credit unions grew steadily and by 1960 credit union membership reached more than 6 million people at over 10 000 federal credit unions. In 1970, the Bureau became an independent federal agency when the National Credit Union Administration was formed to charter and supervise federal credit unions, and the National Credit Union Share Insurance Fund (NCUSIF) was also formed to insure credit union deposits. In the independent credit union spirit, the NCUSIF was created without tax Dollars and capitalized solely by credit unions. The 1970s brought major changes in the products offered by financial institutions and credit unions found they too needed to expand their services. In 1977, legislation expanded services available to credit union members, including share certificates and mortgage lending. In 1979, a three-member Board replaced the NCUA administrator. That same year Congress created the Central Liquidity Facility, the credit union lender of last resort. The 1970s were years of tremendous growth in credit unions. The number of credit union members more than doubled and assets in credit unions tripled to over USD65 billion. Deregulation, increased flexibility in merger and field of membership criteria, and expanded member services characterized the 1980s. High interest rates and unemployment in the early 1980s brought supervisory changes and insurance losses. With the Share Insurance Fund experiencing stress, the credit union community called on Congress to approve a plan to recapitalize the Fund. In 1985, federally insured credit unions recapitalized the NCUSIF by depositing 1 percent of their shares into the Share Insurance Fund. Backed by the 'full faith and credit of the United States Government', the fully-capitalized National Credit Union Share Insurance Fund has 'fail safe' features. Since recapitalization, the NCUA Board has only charged credit unions a premium when the Fund dropped to a 1.25 percent equity ratio.

During the 1990s and into the XXI century, credit unions have been healthy and growing. Credit union failures remain low and the Share Insurance Fund maintains a healthy equity level. The original intent of Congress was to create a system of not-for-profit cooperatives that promote thrift and thwart usury. In the United States, the National Credit Union Administration (NCUA) is the federal government agency that supervises, charters and insures federal credit unions. NCUA also insures state-chartered credit unions that apply and qualify for insurance. The NCUA also operates a credit facility for member credit unions. Headquartered in Alexandria, VA, the United States. / Президент США Фрэньклын Дэлано Роозвэлт (Franklin Delano Roosevelt; 1882–1945). Национальная Администрация Кредитных Союзов (НАКС) – независимое федеральное ведомство, расположенное в Вашингтоне, Округ Колумбия, учреждённое Конгрессом США для надзора за федеральной системой кредитных союзов. НАКС финансируется кредитными союзами и не получает средств от сбора налогов. Агентство курирует около 7 600 федеральных кредитных союзов и страхует на федеральном уровне счета участников приблизительно 4 600 зарегистрированных на уровне штатов кредитных союзов. Национальный Страховой Фонд Кредитных Союзов (National Credit Union Share Insurance Fund) является агентством, страхующим счета участников на сумму до 100 000 Долларов. Страхование обеспечено всеми доходами, возможными заимствованиями Американского правительства и регулируется Советом НАКС, который состоит из трёх членов, назначаемых президентом США.

NATIONAL DEBT = НАЦИОНАЛЬНЫЙ ДОЛГ – National Debt:- as usually defined, this denotes the total sum of the outstanding debt obligations of a country's central government. (But occasionally writers may use the term somewhat more broadly to refer to the total indebtedness of all levels of government, including regional and local governments, and sometimes also the indebtedness of government owned business entities such as local transit and communications systems or nationalized industries as well.) The national debt represents the accumulated total of all the government budget deficits of past years, less the accumulated total of all the government budget surpluses of past years. For most developed countries, such as the United States, the national debt consists almost entirely of interest-bearing 'IOU' instruments that are usually re-sellable on organized financial markets (such as, for example, US bonds, US Treasury notes, and US Treasury bills). These IOUs are originally purchased from the Treasury by private individuals, private corporations, insurance companies, pension funds and banks (both inside the United States and outside its borders), and the Treasury then uses the money thus raised to bridge its spending gap when its budget is in deficit. (The Treasury also sells IOUs to other Federal agencies that operate so-called Trust Funds – primarily the Social Security Administration and other Federal retirement programs – but since this is money that the government 'owes to itself', it is not counted as part of the national debt in any realistic system of accounting.) Money to pay the annual interest owed to the owners of the government's debt instruments has to be provided through appropriations in every year's Federal budget and, indeed, these interest payments on the national debt nowadays always constitute one of the two or three largest spending categories in the budget. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Национальный Долг – внутренний и внешний долги центрального правительства. Национальный долг включает такие кредитные обязательства, как краткосрочные Казначейские векселя, долгосрочные Казначейские векселя и Казначейские облигации. Конгресс США ограничивает размер национального долга, который увеличивается, если федеральные расходы поднимаются до установленного предела. В середине 1980-х национальный долг США составил примерно 5 триллионов Долларов. Проценты, уплачиваемые по национальному долгу, являются одной из основных статей расходов центрального правительства. Национальный долг, представляющий собой государственный долг, накопленный за много лет правительством страны, не следует путать с дефицитом федерального бюджета (federal budget deficit), который представляет собой превышение расходов над доходами за один финансовый год.

NATIONAL DIRECT DEBIT SCHEME = НАЦИОНАЛЬНАЯ СХЕМА ПРЯМОГО ДЕБЕТОВАНИЯ – National Direct Debit Scheme is a set of rules and operational procedures built by a national banking community in order to operate efficient and secure direct debiting in an individual country. According to local domestic needs there may exist one or more National Direct Debit Schemes in a country. / Свод правил и операционных процедур, созданных национальным банковским сообществом с тем, чтобы осуществлять эффективное и надёжное дебетование в отдельно взятой стране. В соответствии с локальными внутренними нуждами в стране может существовать одна или более Национальных Схем Прямого Дебетования.

NATIONAL ELECTRICAL CODE = НАЦИОНАЛЬНЫЙ ЭЛЕКТРИЧЕСКИЙ КОДЕКС – In the United States, the National Electrical Code is a code for the safeguarding of people and property from hazards related to the use of electricity. Compliance with this code along with proper maintenance will result in an installation essentially free from hazard. Abbreviated NEC. The NEC was first developed in 1897 as a result of the efforts of various insurance, electrical, architectural, and allied interests. It is sponsored and regularly updated by the National Fire Protection Association.

NATIONAL FLAG = НАЦИОНАЛЬНЫЙ ФЛАГ – National Flag is the flag carried by a ship to show her nationality. / Национальный Флаг – флаг морского судна, .

NATIONAL FUTURES ASSOCIATION® = НАЦИОНАЛЬНАЯ АССОЦИАЦИЯ ПО ФЬЮЧЕРСАМ® – The idea of a single, industrywide self-regulatory organization for the US futures markets may not seem controversial now, but the concept met with many questions and some resistance when it was introduced in the 1970s. Congress was in the process of passing the Commodity Futures Trading Commission Act in 1974, which established the CFTC as a government oversight agency for the futures industry. It was only the persistence of a few futures industry leaders, most notably Leo Melamed, that persuaded Congress to include language in the legislation to authorize the creation of 'registered futures associations'. Knowing that the success of such an association would require the cooperation of the entire industry, Mr. Melamed invited representatives from various industry segments and regions to assist himin the development of NFA. In 1976, this Organizing Committee began the task of developing the organizational framework thatwould become National FuturesAssociation. The Committee soon realized that if NFA were to be effective, every firmand individual handling public funds on any US futures exchangemust be obligated to follow the Association's rules and regulations.Congress agreed with that concept and amended the CFTC Act in 1978 to sanction NFA's proposed mandatory membership provision. NFA's application for registration was submitted to the CFTC on 1981-March-16 and was approved on September-22 of that year. A little more than one year later, NFA began operations on 1982-October-01. By the end of NFA's first year of operations, NFA's membership consisted of 334 Futures Commission Merchants (FCMs), 428 Commodity Pool Operators (CPOs) and 639 CommodityTradingAdvisors (CTAs). Additionally, 10 futures exchanges, 3 commercial banks and 2 commercial firms had joined on a voluntary basis. On 1983-August-01, the CFTC authorized NFA to begin registering a new category of futures professionals:- Introducing Brokers (IBs) – persons previously known as Agents Of FCMs. NFA also assumed responsibility for registering individuals associatedwith the firm, known as Associated Persons (APs) of IBs. Within two months, NFA had received applications for registration from approximately 650 IBs and 5 000 APs. In 1984, working closely with the CFTC, NFA developed a Temporary Licensing program which allowed qualified firms and individuals to begin conducting business while their registration forms were being processed. During the same year, NFA implemented a computerized database system known as the Membership Registration Receivables System (MRRS). Concurrently, NFA's Board of Directors adopted a bylaw requiring all new AP applicants to pass the National Commodity Futures Examination (Series 3), marking the first time any category of applicant had been required to take a competency examination as a condition for CFTC registration. NFA

expanded this testing requirement as it assumed registration responsibility for other categories of futures professionals:- FCMs, CPOs, CTAs and their APs. During its first four years, NFA sent all potential disqualification cases to the CFTC for final determination. However, in 1986 the CFTC granted NFA the authority to deny, revoke, suspend, restrict or condition registrations. In 1988, NFA initiated a Direct Entry Pilot Program, a three-phase program designed to allow direct computer access and entry of registration data by NFA Member firms.Thiswas followed in 2002 by the launch of NFA's Online Registration System (ORS), allowing almost all applicants and registrants to file their registration forms electronically. Before NFA began operations in 1982, the time required to process applicationswasmeasured inweeks, sometimes in months. In 2007, that process takes a matter of days, and inmost cases, temporary licenses are granted instantaneously. In 1974 Congress established the Commodity Futures Trading Commission (CFTC), a federal regulatory agency with jurisdiction over futures trading. The same legislation authorized the creation of 'registered futures associations', giving the futures industry the opportunity to create a nationwide self-regulatory organization. The CFTC provides government oversight for the entire industry. Each US futures exchange operates as a self-regulatory organization, governing its floor brokers, traders and member firms. NFA regulates every firm or individual who conducts futures trading business with public customers. Although the various regulatory organizations in the futures industry have their own specific areas of authority, together they form a regulatory partnership that oversees all industry participants. The National Futures Association® (NFA) is the industrywide, self-regulatory organization for the US futures industry. We strive every day to develop rules, programs and services that safeguard market integrity, protect investors and help our Members meet their regulatory responsibilities. Managing risk by trading futures and options on futures contracts is a vital component of the global economy. Every business day tens of millions of futures contracts are traded on an increasingly broad spectrum of products, including agricultural commodities, oil, precious metals, equities, treasury bonds, financial indexes and foreign currencies. Investor confidence is crucial to the success of the futures markets, and the best way to gain investor confidence is to ensure that the highest levels of integrity are demanded of all market participants and intermediaries. Membership in NFA is mandatory, assuring that everyone conducting business with the public on the US futures exchanges-more than 4 200 firms and 55 000 associates-must adhere to the same high standards of professional conduct. NFA is an independent regulatory organization with no ties to any specific marketplace. We operate at no cost to the taxpayer. We are financed exclusively from membership dues and from assessment fees paid by the users of the futures markets. Headquartered in Chicago, IL, the United States. The US National Futures Association® (NFA) has been authorized by US Congress in 1974 and designated by the Commodity Futures Trading Commission in 1982 as a registered futures association. NFA is the industrywide, industry-supported, self-regulatory organization of the futures industry. Its mission is to provide innovative regulatory programs and services that ensure futures industry integrity, protect market participants and help its members meet their regulatory responsibilities. The primary responsibilities of the NFA are to enforce ethical standards and customer protection rules, screen futures professional for membership, audit and monitor professionals for financial and general compliance rules, and provide for arbitration of futures-related disputes. A self-regulatory organization whose members include banks, commercial firms, commodity exchanges, Commodity Pool Operators (CPOs), Commodity Trading Advisors (CTAs), Futures Commission Merchants (FCMs), Introducing Brokers (IBs), that is responsible – under Commodity Futures Trading Commission oversight – for certain aspects of the regulation of CPOs, CTAs, FCMs, IBs, and their Associated Persons, focusing primarily on the qualifications and proficiency, financial condition, retail sales practices, and business conduct of these futures professionals. The National Futures Association also performs arbitration and dispute resolution functions for industry participants. / Лио Мэлэмэд (Leo Melamed). Национальная Фьючерсная Ассоциация (NFA) – это некоммерческая самоуправляемая организация фьючерсной индустрии США. NFA начала свою деятельность в 1982 с намерением охранять этичность фьючерсных рынков и защищать интересы инвесторов. Каждое частное лицо или фирма, занимающаяся бизнесом с общественностью на любой фьючерсной бирже США обязана быть зарегистрирована в КТСФ (CFTC) и быть членом NFA. На сегодняшний день, NFA насчитывает приблизительно 4 200 членов и 50 000 ассоциированных членов (представители фирм, являющимися членами NFA). Главной функцией NFA является установление тщательного контроля, в целях строгого подчинения членами NFA федеральных законов и правил, созданных КТСФ. NFA также имеет свои собственные правила, введённые для того, чтобы обеспечить этичное отношение к инвесторам и защитить их от обмана и манипуляции. Успех подхода NFA к регулированию может быть измерен многими способами. Например, два десятилетия после начала деятельности NFA, объём торгов на фьючерсных биржах США увеличился на 400 процентов. В это же время, количество жалоб от инвесторов снизилось на 72 процента. Способы NFA для Борьбы с Мошенничеством и Злоупотреблениями:- (i) Тщательный Надзор:- NFA применяет тщательные и строгие процедуры проверки для контроля всех фирм и частных лиц, желающих заниматься бизнесом с общественностью на любой фьючерсной бирже США. NFA имеет полномочия отказать, отнять, ограничить или приостановить действие членского статуса любой фирмы или частного лица. NFA проводит регулярные финансовые аудиты и ревизии документов и отчётности всех своих членов с целью обеспечения точного соблюдения законодательных требований КТСФ и правил, учреждённых NFA. (ii) Правила 'С Зубами':- NFA приняла ряд строгих правил, относящихся к рекламе, телефонным предложениям, оглашению риска, дискреционному трэйдингу, оглашению сборов, минимально требуемому капиталу, тестированию профессиональных знаний и так далее. NFA имеет полномочия применить дисциплинарные меры против любой фирмы или частного лица, нарушающего правила NFA. Дисциплинарные меры варьируются по строгости от 'предупредительного письма' за незначительные нарушения, до формальных исков. Наказание, связанное с иском может быть назначено в виде исключения или приостановления членства на установленный срок, запрет на какую-либо будущую связь с любым членом NFA, выговор, суровый выговор и штраф в размере до USD250 000 за каждое нарушение. NFA также сотрудничает с КТСФ, ФБР и другими правоохранительными органами в судебных преследованиях. (iii) Борьба С 'Брокерами-Мошенниками':- в 1993 NFA приняла правило 'О Телемаркетинге' с целью минимизировать вероятность обманных и манипуляционных методов предложения брокерских услуг. Новые процедуры требуют записи телефонных разговоров на магнитную ленту и хранения этих записей, а также удовлетворения увеличенных минимумов по капиталу и подачи всех рекламных материалов в NFA на одобрение. Внедрение этого правила значительно снизило число 'проблемных фирм' и 'брокеров-мошенников' во фьючерсной индустрии. Как NFA Информирует Инвесторов:- (1) онлайн-программа BASIC:- с момента своего создания NFA прилагала усилия для того, чтобы обеспечить инвесторов инструментами, необходимыми для принятия информированных финансовых решений. В 1998 NFA привела в действие систему под названием 'Background Affiliation Status Information Center' (BASIC). Система BASIC, доступная с помощью ссылки Broker/Firm Information (http://www.nfa.futures.org/basicnet/) на Интернет-сайте NFA, http://www.nfa.futures.org содержит текущую и прошлую регистрационную информацию обо всех настоящих и бывших членах КТСФ. Система также указывает сведения о дисциплинарных мерах, применённых NFA, КТСФ и какими-либо фьючерсными биржами США. (2) Библиотека Образовательной Информации для Инвесторов:- NFA опубликовала ряд образовательных брошюр с целью помочь инвесторам понять принципы действия фьючерсных рынков, а также рисков и возможностей, заключающихся в трэйдинге. NFA предоставляет эти материалы бесплатно. Их можно заказать с помощью электронной почты (information@nfa.futures.org) или через Информационный Центр NFA, по телефону +1-312-7811410. Эти брошюры также можно загрузить с сайта NFA:- http://www.nfa.futures.org/investor/publications.asp. Как NFA Решает Иски Инвесторов? Арбитраж:- NFA начала свою арбитражную программу в 1983, предложив удобный, эффективный и недорогой способ для разрешения споров

и устранения разногласий. С тех пор арбитраж NFA стал основной ареной для разрешения диспутов во всей фьючерсной индустрии. В Октябре 2001, NFA стала первой в финансовой индустрии регуляторной организацией, начавшей приём арбитражных заявлений через Интернет. Если необходимо официальное слушание, его можно назначить в удобное для обеих сторон время и место. Инвестор может воспользоваться услугами адвоката, но это не обязательно (таким образом, нет нужды платить за юридические услуги).

NATIONAL GRANGE = НАЦИОНАЛЬНАЯ УСАДЬБА – The National Grange is the nation's oldest national agricultural organization, with grassroots units established in 2 700 local communities in 40 states. Its 200 000 members provide service to agriculture and rural areas on a wide variety of issues, including economic development, education, family endeavors, and legislation designed to assure a strong and viable Rural America. It was formed in the years following the American Civil War to unite private citizens in improving the economic and social position of the nation's farm population. Over the past 143 years, it has evolved to include non-farm rural families and communities. The Grange is also a fraternal order known as the Order of Patrons of Husbandry, hence the 'P of H' on the organization's logo. Founding members determined that a fraternal organization would be best able to combine loyalty and democratic ideals to provide service to others. The National Grange was one of the first formal groups to admit women to membership on the basis of equality with men. It remains so today. Major objectives of the National Grange support stewardship of America's natural resources; promotion of world-wide free trade; a combination of local and federal support for rural education, medical, communications, and road systems; non-partisan political participation; assurance of safe and properly labeled food products; organization of cooperatives and other economic services to support rural Americans; and elimination of direct government farm programs so as to assure a competitive and efficient farm system. The National Grange supports the passage of progressive legislation that will benefit US agriculture, rural America, and the nation in general. After 143 years, it remains the nation's oldest and strongest sustained organizational force working for a better life for rural Americans everywhere. The National Grange of the Order of Patrons of Husbandry is the US organization created to educate and train farmers, to defend farmers' interests, and to promote its political and social ideology. Headquartered in Washington, DC, the United States. On 1867-December-04 in a small Washington, DC building that housed the office of William Saunders, Superintendent of Propagating Gardens in the Department of Agriculture, the Order of Patrons of Husbandry, more commonly known as the Grange, was born. Here, sitting around a plain wooden table, a group of seven earnest men, planned what was destined to become a vital force in preserving and expanding American democracy. They were all men of vision-they had faith in God, in their fellow man and the future. The Seven Founders of the Order of the Patrons of Husbandry were:- Oliver H. Kelley, William Saunders, Aaron B. Grosh, William M. Ireland, John R. Thompson, Francis McDowell and John Trimble (Assisted by Caroline Hall). Their names are inscribed on a Birthplace Marker located near the site of the original building on the south side of 4th Street SW, near Madison Street on the mall in Washington DC The marker was officially dedicated on 1951-September-09 and is the only private monument on the mall. Today's Grange provides an opportunity to serve by providing leadership for local community service projects is what the Grange does best. Examples of some projects include organizing a softball league, providing hearing testing, building a community center, sponsoring a community fair, staffing an after school child care program, conducting a candidate debate and organizing voter registration drives. The Grange believes in leadership development, and reaches out to all people in an effort to respond to real needs. It builds a better community by providing the services that people need to live better lives. In working together, the Grange is able to provide assistance when the government can't and individuals alone aren't strong enough. By working together the Grange builds community and people. The Grange provides each member with a legislative voice at the local, state and national level. Members are part of a grassroots constituency enabling them to effectively express their views and influence legislative policy at the highest levels of government. The Grange is nonpartisan, but it vigorously encourages member participation in the political process. The fellowship, recreation and social activities in the Grange are developed with the family in mind – children and senior citizens alike are very welcome in the Grange. Competitions in music, art, public speaking, crafts, and a whole variety of other activities are an important part of every Grange's agenda. The National Grange is the parent branch of the Order which speaks with authority and understanding for the major branches of agriculture and Rural America. All business sessions of the National Grange are open to any Subordinate Grange member in good standing. As spectators, they have no vote in the deliberations, but they do have ample opportunity to appear before committees and to testify. As the supreme legislative body of the Order, policies are developed through the channels of Subordinate, Pomona and State units, and consequently embody the seasoned judgment of the membership. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Оливё Эйч. Кели (Oliver H. Kelley), Вилъйэм Сондёз (William Saunders), Эрэн Би. Грощ (Aaron B. Grosh), Вилъйэм Эм. Айэлэнд (William M. Ireland), Дьжон Ар. Томпсэн (John R. Thompson), Фрэнсис МэкДавэл (Francis McDowell) и Дьжон Тчримбл (John Trimble (ассистируемый Кэрэлайн Хол (Caroline Hall)). Организация, сформированная в США с целью обучения и подготовки фермеров, защиты интересов фермеров и для продвижения её политической и социальной идеологии.

NATIONAL INCOME = НАЦИОНАЛЬНЫЙ ДОХОД – National Income:- total earnings from labor and property through the production of a country's goods and services during a given period, usually one year. National income consists of wages, salaries and other employee compensation; income of business proprietors, including business, professional, and farm income; rental income; corporate profits; and net interest. See also Gross National Disposable Income, and Real National Disposable Income. / Под Национальным Доходом понимается вновь созданная за год в сфере материального производства стоимость или соответствующая ей часть совокупного общественного продукта в натуральной форме, получаемая за вычетом все материальных затрат на его производство. В натурально-вещественном выражении состоит из средств производства и предметов потребления. Национальный доход – обобщающий показатель экономического развития страны. Статистика капиталистических стран в число производителей национального дохода включает отрасли непроизводственной сферы, что приводит к повторному счёту и искусственному завышению национального дохода примерно на 30%. Значительная часть национального дохода здесь идёт на потребление. В США и Великобритании, например, доля трудящихся в населении составляет 90%, а получают они только 40% национального дохода.

NATIONAL INCOME ACCOUNTING = БЮДЖЕТИРОВАНИЕ (или СИСТЕМА УЧЁТА) НАЦИОНАЛЬНОГО ДОХОДА – National Income Accounting is a term used in economics to refer to the bookkeeping system that a national government uses to measure the level of the country's economic activity in a given time period. National income accounting records the level of activity in accounts such as total revenues earned by domestic corporations, wages paid to foreign and domestic workers, and the amount spent on sales and income taxes by corporations and individuals residing in the country. National income accounting provides economists and statisticians with detailed information that can be used to track the health of an economy and to forecast future growth and development. Although national income accounting is not an exact science, it provides useful insight into how well an economy is functioning, and where monies are being generated and spent. Some of the metrics calculated by using national income accounting include Gross Domestic Product (GDP), Gross National Product (GNP) and Gross National Income (GNI). See also National Accounting. / Смотрите также Национальный Бюджетный Процесс (National Accounting).

NATIONAL INTRODUCING BROKERS ASSOCIATION = НАЦИОНАЛЬНАЯ АССОЦИАЦИЯ ПРЕДСТАВЛЯЮЩИХ БРОКЕРОВ – National Introducing Brokers Association (NIBA):- dedicated to assisting Introducing Brokers and Commodity Trading Advisors. NIBA was established as a not-for-profit association in 1991. Before NIBA existed, Introducing Brokers (IBs) and Commodity Trading Advisors (CTAs) had no central organization to ensure that they were represented within the industry. Now, through the efforts of dedicated members and volunteers, NIBA has continued to grow in both size and influence and is well respected throughout the markets. NIBA's goals and objectives rely on the unifying constant of communication. As the only official association representing IBs and CTAs it is our purpose to ensure open channels of communication among individual members and between IBs, CTAs, FCMs and industry regulators. Through these channels, our members learn, network, do business and find greater opportunities, both personally and professionally. Every year IBs and CTAs have the chance to do all this and more at NIBA Conferences and Seminars, held during the year. Here, IBs and CTAs from across the country connect with their peers to exchange ideas, discuss concerns and trade professional experiences from which other members can learn. In addition to our conferences and seminars, NIBA regularly schedules meetings with the NFA and the CFTC to discuss regulatory/policy issues, and with the Chicago, Kansas City, New York and other member exchanges to focus on relevant topics. The NIBA Journal an online newsletter dedicated to futures professionals and sent via email updates help members stay informed, current and connected. NIBA membership allows access to a variety of privileges, as a number of vendors, suppliers and resource providers to the industry grant discounts to NIBA members toward their products and services. NIBA has become a unified voice for IBs and CTAs nationwide, through our steadfast mission to enhance communications and maximize the spectrum of opportunities available to our members. It is a voice that commands respect throughout the industry and continues to grow in scope and strength, with the support of our members. We look forward to having you as a member. Headquartered in Chicago, IL, the United States. In the United States, the National Introducing Brokers Association (NIBA) is a non-profit organization for guaranteed and independent introducing brokers. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). В Соединённых Штатах Америки, Национальная Ассоциация Представляющих Брокеров является некоммерческой организацией для гарантированных и независимых представляющих брокеров.

NATIONALISM = НАЦИОНАЛИЗМ – Nationalism is an ideology, or rather a whole category of similar ideologies, based on the premise that each nation (or at least the ideologist's own nation) constitutes a natural political community whose members should all live together under the authority of 'their own' independent nation state. When the people of one nation live in large numbers in a multi-ethnic state or in states with government(s) dominated by political elites drawn from another nationality, nationalism often becomes an ideology justifying rebellion or secession in order to create or recreate a nation state for the heretofore subjugated nation. When substantial numbers of people seen as belonging to the nation live outside the borders of their own nation state, nationalism often becomes an ideology justifying an aggressive foreign policy striving to expand the state's borders to include them. Nationalist ideologies usually claim that their respective nation possess special national characteristics or virtues that make them morally and intellectually superior to all other nations and should qualify their nation state for a special or privileged role in the world at large. / Под Национализмом понимается идеология и политика, а также психология в национальном вопросе. Он противоположен интернационализму. Основа национализма – идеи национального превосходства и национальной исключительности, трактовка нации как высшей внеисторической и надклассовой формы общности. Используется с целью установления 'классового мира', раскола населения разных наций и стран. Под Национализмом понимается идеология и политика, заключающиеся в проповеди национальной обособленности и исключительности, недоверия к другим нациям и межнациональной вражды. Национализм возник в процессе образования наций и обусловлен спецификой развития буржуазного общества. Отражая характер взаимоотношений наций при капитализме, национализм выступает здесь в двух формах:- (i) великодержавного шовинизма господствующей нации, которому свойственно пренебрежительное отношение к другим нациям; и (ii) местного национализма угнетённой нации, отличающегося стремлением к национальной замкнутости и недоверием к другим нациям. Национализм в любой форме неприемлем для трудящихся, подлинные интересы которых отражает только интернационализм. Однако на определённом этапе национально-освободительного движения Марксисты считают исторически оправданной поддержку национализма угнетённой нации, который заключает в себе общедемократическое содержание (антиимпериалистическая направленность, стремление к политической и экономической независимости). В этой разновидности национализм есть, однако, и другая сторона, выражающая идеологию и интересы эксплуататорской верхушки, склонной к соглашательству с империализмом. Эту направленность национализма марксисты отвергают. Национализм как черта мировоззрения наиболее распространён и живуч в мелкобуржуазной среде, характерен для социальных слоёв и политических партий, которым свойственна мелкобуржуазная идеология. Социализм, открыв дорогу к установлению фактического равенства наций, создаёт предпосылки для ликвидации социальных корней национализма. Однако различного рода проявления и пережитки национализма, как показал исторический опыт бывшего СССР, других бывших социалистических стран, способны сохраняться достаточно длительное время и после того, как были подорваны породившие их социальные условия. Деформации общественного развития в бывшем Советском Союзе в период культа личности Иосифа Сталина и годы застоя пагубно отразились и на межнациональных отношениях, привели в консервации, а в конце 1980-х и к временному оживлению национализма. Сложившаяся административно-командная система, нуждавшаяся в предельно централизованных, единообразных структурах, игнорировала потребности национального развития; возобладал ведомственный, бюрократический подход к развитию экономики, социальной сферы и культуры, были серьёзно ущемлены права Союзных республик и других национально- территориальных образований. Питательной почвой сохранения и оживления национализма послужили также противоречия экстенсивного индустриально-экономического развития, игнорирование его социальных и экологических последствий. Немалый вред нанесли и грубые нарушения социалистической законности, в особенности переселение целых народов с мест их традиционного проживания, например, Чеченцев. Субъективными источниками национализма являются равнодушие к национальному своеобразию народов, их истории, культуре и языку, низкий уровень интернационального воспитания и другое. Сказывается и тяжкое наследие прошлой вражды и недоверия между нациями. Гармонизация межнациональных отношений на новой основе, определённой новыми принципами взаимоотношений национально-территориальных образований, открывает реальную перспективу преодоления конфликтов, националистических и сепаратистских тенденций, способствует развитию и укреплению дружбы народов.

NATIONALIZATION = НАЦИОНАЛИЗАЦИЯ – Nationalization is the involuntary transfer of ownership of a private business or other private property to a national government, either through uncompensated seizure (expropriation) or through forced sale at a government-determined price. / Под Национализацией понимается переход частных предприятий и отраслей экономики в собственность государства. В развитых капиталистических странах национализация проводится главным образом в отраслях, требующих больших капитальных вложений (военная, топливно-энергетическая промышленность, транспорт и другие отрасли инфраструктуры). Государство, как правило, выплачивает владельцам национализируемых предприятий значительную компенсацию. В развивающихся странах национализация направлена обычно против иностранного капитала. В результате создаётся государственный сектор – основа становления и развития национальной экономики. Национализация, переход из

частной собственности в собственность государства земли, промышленности, транспорта, связи, банков и так далее. Национализация имеет различное социально-экономическое и политическое содержание в зависимости от того, кем, в интересах какого класса и в какую историческую эпоху она проводится. В феодальную эпоху огосударствление служило централизации власти в борьбе с отдельными феодалами, укреплению монархии, сосредоточению в руках государства главного богатства – земли. В ходе буржуазных революций национализация земель способствовала ликвидации экономической базы феодализма и ускорению капиталистического развития. Во 2-й половине XIX века быстрое развитие капиталистических производительных сил привело к тому, что отдельные сферы и отрасли экономики по своим масштабам стали перерастать рамки частной собственности, что привело в ряде стран к национализации путей сообщения и средств связи в интересах развития экономики или в политических (военно-стратегических) и фискальных целях. По своему характеру национализация при капитализме может носить как прогрессивный, так и реакционный характер, на что указывал Фридрих Энгельс. Прогрессивна лишь та национализация, которая вызвана потребностями развития производительных сил, '... так как лишь в том случае, когда средства производства или сообщения действительно перерастут управление акционерных обществ, когда их огосударствление станет экономически неизбежным, только тогда – даже если его совершит современное государство – оно будет экономическим прогрессом, новым шагом по пути к тому, чтобы само общество взяло в свое владение все производительные силы' (Карл Маркс и Фридрих Энгельс, Соч., 2 Изд., Т. 20, С. 289, Прим.). Фридрих Энгельс подчёркивал, что национализация при капитализме не уничтожает капиталистического характера производительных сил и производственных отношений, ибо буржуазное государство '... есть по самой своей сути капиталистическая машина, государство капиталистов, идеальный совокупный капиталист' (там же, С. 290). Однако уже в тот период он показывал, что национализация крупных предприятий – свидетельство ненужности буржуазии для управления современными производительными силами. Переход от капитализма к социализму предусматривает ликвидацию частной капиталистической собственности и установление общественной собственности на средства производства. Обязательной предпосылкой для проведения социалистической национализации является победа социалистической революции и установление власти рабочего класса и трудового крестьянства. Теоретически необходимость социалистической национализации глубоко обоснована в трудах Карла Маркса, Фридриха Энгельса, Владимира Ильича Ленина, развита применительно к современной эпохе в программных документах Коммунистической Партии Советского Союза (КПСС), коммунистических и рабочих партий, подтверждена опытом социалистического строительства в Союзе Советских Социалистических Республик (СССР) и других социалистических странах. После победы социалистической революции, – писали Карл Маркс и Фридрих Энгельс в Манифесте Коммунистической Партии, – 'пролетариат использует свое политическое господство для того, чтобы вырвать у буржуазии шаг за шагом весь капитал, централизовать все орудия производства в руках государства, то есть пролетариата, организованного как господствующий класс, и возможно более быстро увеличить сумму производительных сил' (там же, Т. 4, С. 446). При ликвидации капиталистической собственности пролетарское государство допускает выплату компенсации владельцам национализированных средств производства. Карл Маркс и Фридрих Энгельс указывали, что при определённых условиях выкуп не только возможен, но и целесообразен. Закономерностью социалистической революции научный коммунизм считает сам факт перехода средств производства в общественную собственность, а формы и методы этого перехода зависят от конкретных условий. Это важное положение полностью разделял Владимир Ильич Ленин. Он считал, что преобразование буржуазной частной собственности в социалистическую общественную собственность может быть осуществлено мирным путём, без лишения буржуазии всех имущественных прав и с привлечением её на службу государства рабочих и крестьян. Владимир Ильич Ленин указывал, что в период революции сопротивление капиталистов можно сломить, национализировав собственность нескольких сот, самое большее одной-двух тысяч миллионеров. 'Даже и у этой горстки богачей не нужно отнимать 'все' их имущественные права, можно оставить им и собственность на многие предметы потребления, и собственность на известный, скромный доход' (Полное Собрание Соч., 5 Изд., Т. 32, С. 122). Марксизм-Ленинизм строго разграничивает крупную и мелкую частную собственность на средства производства. Если крупная капиталистическая собственность, имеющая нетрудовой характер, подлежит в ходе социально-экономических преобразований национализации, то мелкая собственность крестьян, кустарей и ремесленников не национализируется, а обобществляется в процессе кооперирования. Марксизм не только обосновал закономерность ликвидации капиталистической собственности на средства производства и замены её общественной собственностью, но и указал пути осуществления этого революционного переворота в социально-экономических отношениях. Карл Маркс и Фридрих Энгельс учитывали, что частную собственность нельзя уничтожить сразу, что экспроприация экспроприаторов – не единовременный акт. Владимир Ильич Ленин, разрабатывая в новых исторических условиях программные вопросы социалистической революции, определял основные пути и методы социалистического обобществления средств производства:- национализация собственности крупных и средних капиталистов и постепенное преобразование частной собственности мелкой буржуазии в общественную собственность. Национализация основных средств производства, проводимая пролетарским государством, – важнейшая революционная мера, приводящая производственные отношения в соответствие с уровнем и характером развития производительных сил. Она передаёт средства производства в руки подлинных хозяев – трудящихся и обеспечивает реальное освобождение их от эксплуатации. Используя национализацию, рабочий класс овладевает производственным аппаратом, завоёвывает командные высоты, лишает буржуазию и помещиков экономической базы их господства, осуществляет коренные преобразования социально-экономического строя общества. Пролетарское государство в первую очередь завоёвывает ключевые позиции в экономике путём национализации самых важных отраслей хозяйства. Важнейшую роль в создании социалистической собственности играет национализация банков, без которой невозможно лишить буржуазию её экономического могущества и организовать социалистическое производство и распределение продуктов по единому плану. Национализация внешней торговли и установление монополии внешней торговли позволяют социалистическому государству оградить себя от проникновения иностранного капитала и проведения им экономических диверсий, укрепить свою независимость и самостоятельность. Важное место занимает национализация земли, которая ликвидирует остатки феодальных и капиталистических отношений в сельском хозяйстве и создаёт большие возможности для развития социалистического сельского хозяйства на основе кооперирования крестьян. Национализация промышленности, транспорта и связи – необходимая мера, без которой невозможно создать материальную базу социалистической экономики. Национализация важнейших отраслей народного хозяйства закладывает основу экономической самостоятельности социалистического государства, ускоряет его социально-экономическое развитие. Национализация В Советской России:- После победы Октябрьской Революции 1917 рабочий класс приступил к осуществлению социалистических преобразований. Национализация земли и её недр, вод и лесов была провозглашена Декретом О Земле (26 Октября (08 Ноября) 1917). Частная собственность на землю была отменена. Земля объявлена государственной (общенародной) собственностью. В пользование крестьян бесплатно перешло 150 миллионов гектаров (га). Социалистическая национализация земли была проведена в интересах трудящихся и эксплуатируемых масс деревни. Она стала экономической основой кооперирования крестьянских хозяйств (смотрите Коллективизация Сельского Хозяйства). Социалистическая национализация земли '... обеспечила доведение до конца буржуазно-демократической революции ... кроме того ... дала наибольшие возможности пролетарскому государству переходить к социализму в земледелии' (Владимир

Ильич Ленин, Полное Собрание Соч., 5 Изд., Т. 37, С. 327). Она имела большое значение не только для периода строительства социализма, но и для дальнейшего развития Советского общества, для решения современных проблем сельского хозяйства. Важнейшим мероприятием стала национализация банков, которая началась с овладения Государственным Банком России и установления контроля над частными банками. Владимир Ильич Ленин видел в таком контроле лишь переходную форму к национализации, которая позволила бы трудящимся освоить управление финансами для социалистического строительства. Однако вследствие саботажа банкиров Советская власть была вынуждена ускорить национализацию банков. Декретом ВЦИК от 14 (27) Декабря 1917 частные коммерческие банки были национализированы. Установлена государственная монополия на банковское дело. Декретом СНК от 23 Января (05 Февраля) 1918 их капиталы полностью и безвозмездно передавались Государственному Банку. Слияние национализированных частных банков с Государственным Банком в единый Народный Банк Российской Советской Федеративной Социалистической Республики (РСФСР) было завершено к 1920. Такие звенья банковской системы царской России, как ипотечные банки, общества взаимного кредита и другие, были ликвидированы. Национализация банков облегчила Советскому государству борьбу с голодом и разрухой. В процессе национализации начала создаваться социалистическая банковская система (смотрите Банки). Национализация банков явилась важнейшим шагом на пути подготовки национализации промышленности. В руках государства оказался могучий рычаг воздействия на развитие промышленности, транспорта и других отраслей хозяйства. 14 (27) Ноября 1917 Всероссийский Центральный Исполнительный Комитет (ВЦИК) и Совет Народных Комиссаров (СНК) издали Положение О Рабочем Контроле, который являлся подготовительным мероприятием к национализации промышленности, прошедшей несколько этапов. Первый этап (Ноябрь 1917 – Февраль 1918) характеризовался быстрыми темпами, инициативой местных органов в проведении национализации. Первой была национализирована 17 (30) Ноября 1917 фабрика Товарищества Ликинской Мануфактуры А.В. Смирнова (Владимирская Губерния). Всего с Ноября 1917 до Марта 1918, по данным промышленной и профессиональной переписи 1918, национализировано 836 промышленных предприятий. В этот период, получивший название ‘Красногвардейской Атаки На Капитал’, темпы отчуждения фабрик и заводов обгоняли темпы налаживания управления национализированными предприятиями. На втором этапе национализация (Март–Июнь 1918) центр тяжести экономической и политической работы партии был перенесён с экспроприации буржуазии на закрепление завоёванных позиций, налаживание учёта и контроля, организацию управления национализированной промышленностью. Особенностью этого этапа национализации было обобществление целых отраслей промышленности и создание условий для национализации всей крупной промышленности. 02 Мая 1918 СНК принял Декрет О Национализации Сахарной Промышленности, 20 Июня – Нефтяной Промышленности. В Мае 1918 конференция представителей национализированных машиностроительных заводов, в работе которой участвовал Владимир Ильич Ленин, приняла решение о национализации заводов транспортного машиностроения. Всего за этот период национализировано 1 222 промышленных предприятия. Третий этап национализации продолжался с Июня 1918 (Декрет от 28 Июня) по Июнь 1919. Он характеризовался усилением организующей, руководящей роли Советского государства и его хозяйственных органов в проведении социалистической национализации. К осени 1918 в руках государства было сосредоточено 9 542 предприятия. Вся крупная капиталистическая собственность на средства производства была национализирована методом безвозмездной конфискации. С лета 1919 темпы национализации резко возросли. К государству перешли не только крупные, но и средние и большая часть мелких промышленных заведений. Форсирование процесса национализации было вызвано необходимостью мобилизовать все наличные производственные ресурсы в период Гражданской Войны 1918–20. На территориях, освобождённых от контрреволюционных сил и интервентов, восстанавливалось действие законов, связанных с национализацией. Национализация основных средств транспорта была осуществлена в короткие сроки 1917–18. Этому способствовали высокий уровень концентрации капитала и преобладание государственных (казённых) железных дорог. В Январе 1918 была завершена национализация морского и речного транспорта; осенью 1918 национализированы частные железные дороги. Национализация положила начало созданию социалистического уклада в экономике Советской страны, утверждению социалистических производственных отношений, содействовала становлению системы планомерного развития народного хозяйства. Наряду с монополией внешней торговли и аннулированием иностранных займов она заложила основу экономической независимости СССР. Национализация В Зарубежных Социалистических Странах:- имеет особенности, определяемые как международным положением этих стран, так и спецификой перехода к социализму, расстановкой классовых сил, историческими и экономическими особенностями. Национализация земли в этих странах (за исключением Монгольской Народной Республики (МНР)) в силу длительной традиции и глубокой привязанности крестьян к частной собственности на землю проведена лишь частично. Конфискованная в ходе аграрных реформ земля помещиков и крупных землевладельцев в основном была передана в собственность трудящихся крестьян (смотрите Конфискация Земли). Национализация банков осуществлялась с учётом опыта СССР. В большинстве стран она происходила в два этапа. На первом этапе, когда проводились демократические, антиимпериалистические и антифеодальные преобразования, были национализированы эмиссионные банки и крупные коммерческие банки, принадлежавшие буржуазии, связанной с иностранным капиталом. Все другие кредитные учреждения были взяты под контроль государственных эмиссионных банков. На втором этапе – этапе социалистических преобразований, была завершена национализация банков и установлена государственная монополия банковского дела. В Болгарии в 1946 были национализированы все иностранные и частные банки, принадлежавшие буржуазии, сотрудничавшей с фашистами, а в Декабре 1947 – все частные банки. В Венгрии в 1945 национализирован эмиссионный банк и введён контроль над частными банками, в 1948 их национализация была завершена. В Румынии в 1946 национализирован эмиссионный банк и введён контроль над более чем 450 частными банками и банкирскими конторами, которые в 1948 были национализированы. После образования Германской Демократической Республики (ГДР) частные банки продолжали деятельность под контролем народной власти. С переходом к строительству социализма за период 1952–53 они были национализированы. В Польше в период фашистской оккупации большинство банков прекратили свою деятельность. Декретом от 25 Октября 1948 все частные кредитные учреждения были ликвидированы и установлена государственная монополия на банковское дело. В Чехословакии национализация банков была осуществлена в 1945. В Югославии в 1944 были национализированы банки, принадлежавшие фашистским оккупантам и коллаборационистам, а в 1945 – все частные коммерческие банки. В Китайской Народной Республике (КНР) большая часть банков была национализирована сразу после установления народной власти, некоторые мелкие частные банки были преобразованы в смешанные государственно-частные, которые функционируют под контролем Народного Банка Китая. На Кубе все частные банки страны, включая и филиалы крупнейших Американских банков, были национализированы сразу после установления народной власти (1960). В Демократической Республике Вьетнам (ДРВ) государственная банковская система начала создаваться ещё в период антиимпериалистической революции, когда иностранные банки начали прекращать свою деятельность. Особенность национализации банков в ряде стран (в частности, в Чехословакии, Венгрии, Румынии) состояла в том, что владельцы банков, поддерживавшие мероприятия народной власти, получали частичную компенсацию в форме выкупа акций народным государством. В промышленности в большинстве стран в первую очередь национализированы предприятия, составлявшие собственность монополий Германии и её союзников, коллаборационистов. В результате

экономическая власть крупного капитала была в значительной мере подорвана, что облегчило подготовку и проведение дальнейшего обобществления средств производства. В результате национализации промышленности в законодательном порядке закреплялись экономические завоевания трудящихся, осуществлённые в 1944–45 в период освобождения. Крупная промышленная буржуазия лишилась средств производства. Темпы национализации промышленности в отдельных социалистических странах были различными. В отличие от СССР, где крупная и средняя промышленность была национализирована почти одновременно, в зарубежных социалистических странах национализация проводилась постепенно, как правило, по этапам, с более широким использованием рабочего контроля, государственного капитализма и других переходных форм. Законы о национализации в Европейских социалистических странах предусматривали выплату собственникам предприятий известного возмещения. Благодаря национализации был создан социалистический уклад, который стал господствующим в народном хозяйстве. Национализация В Развитых Капиталистических Странах:- одно из проявлений государственно-монополистического капитализма. Она вызвана рядом причин – концентрацией производства, давлением трудящихся масс и другим. Усиление государственного монополистического капитализма в связи с общим кризисом капитализма активизирует вмешательство буржуазного государства в процесс воспроизводства в интересах монополий, финансовой олигархии. Национализируются в первую очередь отрасли военной промышленности, важнейшие для народного хозяйства отрасли, а также отрасли, требующие огромных капитальных вложений на длительный срок (топливно-энергетическая, в том числе атомная энергетика, транспорт и другие отрасли инфраструктуры). Как правило, бывшим владельцам предприятий выплачивается значительная компенсация, иногда превышающая стоимость национализируемого имущества. Буржуазная национализация не изменяет существа капиталистического строя, так как не обращает национализированные средства производства в общественную собственность, следовательно, не обеспечивает планомерного развития народного хозяйства, не меняет характера распределения продукта. Часто она представляет собой способ переложения бремени финансирования капиталоёмких и малоэффективных отраслей и производств на плечи трудящихся масс. Коммунистические партии исходят из возможности использования при определённых условиях национализации для ограничения всевластия монополий и улучшения положения трудящихся, для осуществления демократического контроля над национализированными секторами производства и демократизации управления ими. В 1950–60-е коммунистические партии капиталистических стран разработали программы реформ, важной составной частью которых стало требование демократической национализации Последовательное осуществление этих программ путём классовой борьбы призвано подорвать власть капитала и создать предпосылки для социалистических преобразований. Теоретической основой национализации земли при капитализме явилось учение Карла Маркса о земельной ренте. При капитализме земельная частная собственность крупных землевладельцев препятствует рациональному ведению хозяйства, отвлекает от производства значительную часть общественного продукта, поступающую им в виде арендной платы, и понижает среднюю норму прибыли. Карл Маркс показал, что в условиях капитализма путём национализации к государству переходит лишь право собственности на землю, то есть право получать земельную ренту. Хотя от национализации земли при капитализме прежде всего и больше всего выигрывает буржуазия, пролетариат также заинтересован в ней, так как она уничтожает остатки феодализма, ускоряет развитие капитализма в земледелии со всеми присущими ему противоречиями. Национализация земли в условиях капитализма ставит задачу укрепления позиций буржуазии и имеет характер буржуазной реформы. Однако буржуазия ни в одной стране не решилась на осуществление национализации земли, поскольку она сама имеет в собственности значительную часть земли и боится всякого на неё покушения. Владимир Ильич Ленин установил, что национализация земли возможна лишь в молодом буржуазном государстве, поскольку с развитием капитализма и особенно в эпоху империализма происходят переплетение и сращивание интересов финансовой буржуазии и крупных землевладельцев. Развивая Марксистскую теорию аграрного вопроса, Владимир Ильич Ленин подчёркивал, что национализация земли в ходе буржуазной революции есть последовательная демократическая мера, окончательно уничтожающая остатки феодальных отношений и создающая широкие возможности для развития производительных сил в сельском хозяйстве. Однако в зависимости от степени развития капитализма в сельском хозяйстве, соотношения классовых сил и наличия определённых традиций частной собственности на землю сроки и формы национализации земли в различных странах могут существенно различаться. Как часть общего комплекса мероприятий по государственно-монополистическому регулированию экономики осуществляется национализация банков. Она носит частичный характер, не затрагивает основных принципов организации кредитных систем и не влечёт за собой существенных изменений в их политике, структуре, характере связей с другими кредитными учреждениями. В советах директоров и на руководящих постах остаются крупные акционеры, тесно связанные с финансовым капиталом. Национализируются, как правило, только эмиссионные банки; коммерческие банки, за редким исключением, остаются в частном секторе. Так, в Великобритании при национализации Английского Банка в 1946 коммерческие банки не были национализированы. Во Франции, которая имеет наиболее развитый государственный сектор в банковский системе, в 1945 наряду с Банком Франции были национализированы лишь 4 коммерческих банка из более чем 300. Национализация частных предприятий практиковалась многими государствами ещё в XIX веке. Огосударствление отдельных промышленных предприятий осуществлялось в Великобритании, Франции, Бельгии и других капиталистических государствах в 1920–30-х, проводилось без участия рабочего класса и сопровождалось выкупом государством у буржуазии средств производства. Такая национализация, естественно, не затрагивала капиталистических производственных отношений. Несколько иной характер первоначально носила национализация промышленности в ряде стран Западной Европы после окончания 2-й Мировой Войны 1939–45. В сложившейся тогда политической и экономической обстановке важнейшей движущей силой национализация стал рабочий класс. В 1944–46 национализация ряда отраслей производства была осуществлена во Франции. Коммунисты, входившие в состав правительства, стремились провести её в интересах трудящихся. В Декабре 1944 был сделан первый шаг по этому пути – национализированы шахты крупнейшего угольного бассейна департаментов Нор и Па-де-Кале. В Январе 1945 конфискованы автомобильные заводы Рено, владелец которых в годы оккупации активно сотрудничал с Гитлеровцами. В Марте 1945 проведена национализация авиамоторных заводов Гном И Рон. В 1946 во Франции были национализированы все крупные предприятия по производству электроэнергии и газа, завершена национализация угольной промышленности. Профсоюзы получили доступ в административные советы национализированных предприятий. Национализация сделала возможным улучшение условий труда, частичное повышение заработной платы. Острая борьба развернулась после войны вокруг национализации промышленности в Австрии. В результате разгрома фашистской Германии здесь происходил подъём рабочего движения. Австрийские рабочие в середине 1945 потребовали конфискации собственности военных преступников, национализации промышленности и банков. Проведённая в соответствии с законами от 26 Июня 1946 и 26 Марта 1947 национализация, хотя и создала довольно обширную государственно-капиталистическую собственность, однако не затронула многих ключевых позиций Австрийских монополий и иностранного капитала. Национализация в Великобритании, осуществлённая лейбористским правительством в 1945–51, охватила угольную, энергетическую и газовую промышленность, предприятия связи, транспорт (железнодорожный, почти весь воздушный, частично речной и автомобильный) и часть металлургических предприятий. Владельцы национализированных предприятий получили значительную компенсацию. В развитых капиталистических странах более всего

национализацией охвачены железнодорожный и воздушный, в небольшой степени – морской, речной и автомобильный транспорт. Национализация транспорта широко распространена в Западной Европе и в Японии, менее – в Северной Америке (Соединённые Штаты Америки (США), Канада). Магистральный железнодорожный транспорт везде, кроме США и Канады, принадлежит в основном национальным компаниям (государственным или смешанным). В США все железнодорожные компании – частные, в Канаде примерно половина магистральной сети принадлежит государственной национальной компании, объединяющей ряд железных дорог, построенных государством. В Японии и в некоторых странах Западной Европы в частной собственности находятся лишь железные дороги местного значения. Во всех развитых капиталистических странах (кроме США, где все авиакомпании – частные) большая часть воздушного транспорта сосредоточена в руках крупных национальных компаний (государственных, реже смешанных). Национализация слабо затронула морской и речной транспорт, однако внутренние водные пути, речные и морские порты, как правило, принадлежат государству или местным органам власти. Государственные предприятия (национальные компании) грузового автомобильного транспорта существуют в немногих странах развитого капитализма (Великобритания, Нидерланды). Но и там они охватывают лишь небольшую часть парка грузовых автомобилей и перевозок. Значительно шире национализирован автобусный транспорт. Основные автобусные компании в капиталистических странах, кроме США, принадлежат государству или муниципалитетам. Большая часть сети трубопроводов в развитых капиталистических странах принадлежит частным компаниям. В государственной собственности находятся в Западной Европе трубопроводы стратегического значения, обслуживающие базы Организации Северного Атлантического Трактата – так называемой НАТО. Национализация В Развивающихся Странах:- направлена, как правило, против иностранных монополий и политики неоколониализма. В результате национализации промышленных и других предприятий создаётся государственный сектор, который играет важную роль в становлении и развитии национальной экономики, в укреплении независимости. Национализация в этих странах проводится, как правило, с предоставлением компенсации прежним владельцам. Национализация банков даёт возможность молодым государствам создать национальную кредитную систему, освободиться от давления иностранного капитала. В большинстве этих стран после завоевания независимости созданы государственные эмиссионные банки, регулирующие денежное обращение и осуществляющие политику правительства в области кредита. По мере экономического развития в ряде стран национализируются не только иностранные, но и национальные частные банки и другие кредитные учреждения. Так, например, в Сирии национализация частных банков была проведена в 1961–63, в Бирме – в 1963, в Индии в 1969 национализированы 14 крупнейших коммерческих банков, а в 1971 – 42 крупные страховые компании. В ходе проведённых здесь аграрных реформ часть земли перешла в государственный сектор, однако, широкая национализация земли тормозится помещичьим землевладением. Национализация транспорта в развивающихся странах – важное средство борьбы против засилья иностранного капитала, которому в прошлом принадлежали основные сооружения и средства транспорта. В этих странах национализация транспорта способствует развитию государственного сектора, завоеванию экономической самостоятельности. Национализация земли, ликвидация частной собственности на землю и переход её в собственность государства. Буржуазная национализация земли была одним из условий перехода от феодальной к капиталистической форме земельной собственности. Впервые требование национализации земли как составной части социалистической революции выдвинуто Карлом Марксом и Фридрихом Энгельсом в Манифесте Коммунистической Партии, где среди переходных мер, осуществление которых в наиболее развитых странах облегчило бы переворот во всём способе производства, указывается экспроприация земельной собственности и обращение земельной ренты на покрытие государственных расходов. Развивая Марксистскую теорию аграрного вопроса в конкретных исторических условиях России, Владимир Ильич Ленин разработал вопрос о национализации земли, ставший важнейшей составной частью 1-й программы Российской Социал-Демократической Рабочей Партии (РСДРП) (смотрите Аграрная Программа Большевизма, Аграрная Программа Социал-Демократии В Первой Русской Революции 1905–1907 Годов). В СССР национализация всей земли была осуществлена в результате Великой Октябрьской Социалистической Революции. В других социалистических странах (за исключением Монгольской Народной Республики (МНР), где земля также национализирована полностью) государством была национализирована часть земли. Частичная национализация земли занимает важное место и в экономической политике некоторых развивающихся стран (Бирма, Алжир). Национализация:- перевод активов или производства частной компании в государственный сектор. Потери компании вследствие национализации активов могут компенсироваться или не компенсироваться. В развивающихся странах производство, как правило, национализируется, если правительство считает, что компания эксплуатирует страну, в которой находится, и вывозит (или экспортирует) слишком большую часть прибыли за рубеж. Национализируя компанию, правительство надеется сохранить прибыль внутри страны. В промышленно развитых странах промышленные отрасли часто национализируются, если для выживания им необходимы государственные субсидии. Например, правительство Франции национализировало сталелитейные и химические компании в середине 1980-х, чтобы сохранить рабочие места, которые были бы потеряны в случае сохранения частной собственности в этих отраслях. Однако в некоторых развитых странах национализация осуществляется в качестве национальной политики и не направлена на спасение испытывающих кризис отраслей промышленности.

NATIONAL LOANS FUND = НАЦИОНАЛЬНЫЙ ФОНД ЗАИМСТВОВАНИЙ – In order to separate government revenue and expenditure on the one hand and government borrowing and lending on the other, the National Loans Fund (NLF) was established on 01 April 1968 by the National Loans Act 1968 to account for government borrowing and lending, which were until then accounted for within the Consolidated Fund (CF). The accounts for the CF and NLF are now published separately. Both the CF and NLF are administered by the Treasury, with the bank accounts maintained at the Bank of England. The CF can therefore be regarded as central government's current account, whereas the NLF can be regarded as central government's main borrowing and lending account. By virtue of section 19(1) of the National Loans Act 1968, the net liabilities of the NLF are a liability of the CF. In the United Kingdom, an account of HM Government set up under the National Loans Fund Act (1968) which handles all government borrowing and most domestic lending transactions.

NATIONAL LUBRICATING GREASE INSTITUTE = НАЦИОНАЛЬНЫЙ ИНСТИТУТ СМАЗЫВАЮЩИХ ПЛАСТИЧНЫХ СМАЗОК – The National Lubricating Grease Institute (NLGI) is an international trade association that serves the grease and gear lubricant industry. It exists to promote research and development of lubrication technology. It also publishes industry standards for greases. History:- the NLGI was incorporated by a small number of US companies in 1933 to create a code for the National Recovery Act. The original name of the organization was the National Association of Lubricating Grease Manufacturers, Inc.. The name was changed in 1937 as the industry recognized the need for a joint development and standards association and membership grew. The NLGI is a not-for-profit corporation whose membership includes grease manufacturers and sales organizations, associated equipment manufacturers, industry suppliers, service organizations, research and educational groups. Membership is open to corporations and individuals. According to information posted by the NLGI in 2004, the institute has member organizations in 26 countries, while subscriptions to its journal, the NLGI Spokesman, represent 50 countries. Standards:- in cooperation with ASTM International and SAE International, the NLGI has developed the categorisation of lubricating greases specified in standard ASTM D4950 'Standard

Classification And Specification For Automotive Service Greases', reproduced in standard SAE J310 'Automotive Lubricating Greases'. The NLGI retains jurisdiction over the designation and definition of the categories, which it publishes in its 'Chassis And Wheel Bearing Service Classification System'. The NLGI has also created a symbol, the NLGI Certification Mark, which can be used on containers of greases to advertise their ASTM D4950 category. The measure of the consistency of a lubricating grease is commonly expressed by its NLGI consistency number, defined by the NLGI in the 'Standard Classification Of Lubricating Grease'. The NLGI consistency number is used in several standards:- ASTM D4950, SAE J310 and ISO 6743-9 'Lubricants, Industrial Oils And Related Products (Class L) – Classification – Part 9:- Family X (Greases)'. The NLGI also administers a professional certification program. Individuals passing an examination designed to test their knowledge in the field of lubricating grease obtain the Certified Lubricating Grease Specialist (CLGS) certification. National Lubricating Grease Institute (NLGI) is a trade association whose main interest is grease and grease technology. NLGI is best known for its system of rating greases by penetration. NLGI is a not-for-profit trade association, primarily composed of companies who manufacture and market all types of lubricating grease. Membership is by company rather than by individual. Associated with the manufacturers are companies who serve them with equipment, supplies, and services. Additionally, there are research and educational groups and member companies whose interests are primarily technical. Another category for membership – Consumer – is for organizations that are users of lubricating grease. The Institute thus works continuously to strengthen its association by rendering service to the end-user of grease as well as those on the manufacturing side. Mission And Purpose:- NLGI was incorporated in 1933 as the National Association of Lubricating Grease Manufacturers, Inc., for the purpose of writing a code concerning the NRA (National Recovery Act). In 1937, the name was changed to the National Lubricating Grease Institute. Its founders were J.R. Battenfeld, Battenfeld Grease & Oil Corporation; Guy Peters, Oil Craft Inc.; and W.H. Sauders, International Lubricant Corp.. Another name change was made to NLGI in 2001. The Institute's member organizations are located in 26 different countries worldwide. Of the 2 000 readers of our technical journal, the NLGI Spokesman, over 50 countries in every continent of the world are represented. This international representation is indicative of the universality of interest in lubricating grease. The NLGI is a not-for-profit trade association, primarily composed of companies who manufacture and market all types of lubricating grease. Membership is by company rather than by individual. Associated with the manufacturers are companies who serve them with equipment, supplies, and services. Additionally, there are research and educational groups and member companies whose interests are primarily technical. Another category for membership – Consumer – is for organizations that are users of lubricating grease. The Institute thus works continuously to strengthen its association by rendering service to the end-user of grease as well as those on the manufacturing side. The objectives of NLGI are to disseminate information that can lead to the development of better lubricating greases for the consumer and to provide better grease lubrication engineering service to the industry. NLGI endeavors to promote these objectives in a number of ways, including the encouragement of research in the field of lubricating greases, the promotion of improved laboratory and field tests and improvements in the technique of lubricating grease manufacture. Forums for technical discussions between consumers and producers are provided, and the dissemination of technical data relative to improved manufacturing techniques, new products, new uses and new methods of application is fostered. Today, NLGI continues to promote the technical advancement of grease lubrication, and contributes materially to greater production, increased machine life and a higher quality of machine performance through better lubrication. Headquartered in Lee's Summit, State of Missouri (MO), the United States of America. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Дьжей.Ар. Батэнфэльд, Батэнфэльд Грис Энд Оил Корпорэйшэн (J.R. Battenfeld, Battenfeld Grease & Oil Corporation); Гай Питёз, Оил Крэфт Инк. (Guy Peters, Oil Craft Inc.); и Дабл.Ю.Эйч. Садёз, Интёнэшэнл Любрикэнтч Корп. (W.H. Sauders, International Lubricant Corp.).

NATIONAL PETROCHEMICAL AND REFINERS ASSOCIATION = НАЦИОНАЛЬНАЯ АССОЦИАЦИЯ НЕФТЕХИМИКОВ И ПЕРЕГОНЩИКОВ – The National Petrochemical & Refiners Association (NPRA), is a national trade association based in Washington, DC representing more than 450 members, including virtually all US refiners and petrochemical manufacturers. Our members supply consumers with a wide variety of products used daily in their homes and businesses. These products include gasoline, diesel fuel, home heating oil, jet fuel, lubricants, and the chemicals that serve as 'building blocks' for everything from plastics to clothing to medicine to computers and many other products essential to maintaining and improving the nation's quality of life. The refining and petrochemical industries make a vital contribution to the health and welfare of this nation with their contributions to economic growth and national security while working diligently to operate their facilities safely and to protect human health and the environment. NPRA's Objectives:- (i) educate the public and policymakers about the vital role of the refining and petrochemical industries in the nation's economy and our contribution to improvements in the quality of life; (ii) serve as a strong advocacy voice for our members with government officials, the media and the public to promote policies that balance energy supply needs with environmental goals; (iii) facilitate technical advancement and continued progress in safety, environmental performance and security, in part through world-class meetings and conferences several of which are the foremost industry meetings in the world. Headquartered in Washington, DC, the United States. From its beginning as the National Petroleum Association (NPA), which was founded in 1902, the National Petrochemical & Refiners Association (NPRA) has successfully served an industry that has been changed dramatically by technology and the industrial developments of the XX century. NPA was founded by a group of primarily East Coast-based refining companies, such as Sun Oil, Pure Oil, Sinclair and Shell. It was joined in 1912 by the Western Petroleum Refiners Association or WPRA, which was founded as a sister organization representing mid-continent refiners. The two organizations worked together on many issues and jointly opened a Washington, DC office in 1918. NPRA is a national trade association representing nearly 500 members, including virtually all US refiners and petrochemical manufacturers. In 2009, NPRA celebrates a milestone of 107 years of service to the refining and petrochemical industries. From its beginning as the National Petroleum Association or NPA, which was founded in 1902, NPRA has successfully served an industry that has been changed dramatically by technology and the industrial developments of the XX century. NPA was founded by a group of primarily East Coast-based refining companies, such as Sun Oil, Pure Oil, Sinclair and Shell. It was joined in 1912 by the Western Petroleum Refiners Association or WPRA, which was founded as a sister organization representing mid-continent refiners. The two organizations worked together on many issues and jointly opened a Washington, DC office in 1918, realizing the need for the industry to interact with the federal government. Important issues to the Association's founders included fair business practices among members, rail tank car transportation, and revenue taxes on crude oil and petroleum products. Promoting new technology and other innovations has always been and continues to be a strong focus of NPRA. From its start, NPRA and its parent organizations, NPA and WPRA, were at the forefront in developing and distributing information on emerging manufacturing methods for the refining and, later, the petrochemical industries. By the 1960s, the issues facing the refining industry were national rather than regional. In response, on 1961-July-01, NPA and WPRA merged to create the present day NPRA, then known as the National Petroleum Refiners Association. The 1970s saw new realities emerging for the refining and petrochemical industries. In 1970, the Environmental Protection Agency was founded. This same year, The Clean Air Act of 1970 established air quality standards mandating new automobile engines and a new, unleaded formulation of gasoline to support the catalytic converters in those engines. This marked the first reformulation of petroleum products to meet growing consumer demands for cleaner products. Regulation by federal, state and local governments continues to challenge refiners to produce fuels and other products that are increasingly environmentally friendly. In this decade, refineries face unprecedented requirements for new investment to produce cleaner gasoline and diesel. NPRA's association with the petrochemical industry began early in the petrochemical industry's

development. The industry's technological roots were in the European coal chemicals industry largely developed in Germany in the late 1800s through World War II. Improvements in this technology, fueled by US companies with feedstocks from oil and natural gas, created the petrochemical industry as we know it today. Over the years, the petrochemical industry has faced many challenges. Feedstock and energy costs have been highly variable. Extensive environmental, health and safety laws were passed throughout the years. In the past decade, there has been increased competition for petrochemical sales worldwide. Also, globalization and information technology have significantly affected the organization of petrochemical businesses worldwide. To reflect the converging nature of the petrochemical and refining industries in its activities and membership, NPRA changed its name to the National Petrochemical & Refiners Association in 1998. Thus, through its first 100 years, NPRA has weathered dramatic changes in the oil industry and the world economy. The next 100 years will bring new technologies and unforeseen challenges to the industries. NPRA looks forward to continuing its century of service to industry during its second 100 years. / Щел (Shell).

NATIONAL PLANT PROTECTION ORGANIZATION = НАЦИОНАЛЬНАЯ ОРГАНИЗАЦИЯ ПО ЗАЩИТЕ РАСТЕНИЙ – National Plant Protection Organization (NPPO) is the official service established by a government to discharge the functions specified by the International Plant Protection Convention (IPPC). The Plant Protection and Quarantine (PPQ) serves as NPPO for the United States.

NATIONAL PRODUCT = НАЦИОНАЛЬНЫЙ ПРОДУКТ – National Product:- aggregate of goods and services produced by a nation's economy during a given period – usually, one year – excluding those produced by the national government and its agencies.

NATIONAL RATE OF UNEMPLOYMENT = НАЦИОНАЛЬНЫЙ УРОВЕНЬ БЕЗРАБОТИЦЫ – National Rate Of Unemployment is the rate of unemployment attainable without stimulating an increase in the inflation rate.

NATIONAL SECURITIES CLEARING CORPORATION = НАЦИОНАЛЬНАЯ КЛИРИНГОВАЯ КОРПОРАЦИЯ ПО ЦЕННЫМ БУМАГАМ – At first, the NYSE®, American Stock Exchange® (AMEX®) and NASD all had their own clearing corporations to settle trades that took place in their markets. In 1976 they were merged into a new organization:- National Securities Clearing Corporation. Over time, the regional exchanges eliminated their clearance and settlement organizations, and their functions were assumed by NSCC. The benefits were immediate. With netting, movements in a security were reduced to a minimum each day, and the changes in ownership could be sent to the Depository Trust Company (DTC). With net money settlement, only a single money transfer was required. And with net settlement, the Dollar amount of the financial obligations is now reduced by 95 percent. When two firms trade, they are considered 'contra-parties' to each other. In a multilateral netting environment, NSCC steps into the middle of a trade, becomes the contra-party to both firms and guarantees completion of the transaction. This guarantee assures all members that NSCC will complete trades on the original terms, even if the original contra-party fails between midnight of trade date+1 and settlement. To protect itself and its members, NSCC requires members to post collateral (usually cash and securities) to cover the risks associated with the trade. NSCC offers further protection from risk through a risk management system that monitors customers' financial health and trading patterns, as well as financial and operations requirements that applicants must meet in order to become NSCC members. In addition, NSCC ensures that it always has the capacity to process not only the average daily trading volume, but unexpected peak volumes, as well. This commitment has become increasingly important in light of the substantial volume growth in the 1990s. The US National Securities Clearing Corporation (NSCC) facilitates trade processing, clearance, delivery and settlement of equities, and corporate and municipal bond transactions. NSCC is owned equally by the New York and American stock exchanges and the National Association of Securities Dealers. Headquartered in New York, NY, the United States. Provides centralized clearance, settlement, and information services to broker-dealers, banks, and mutual funds. The NSCC was established in 1976 to handle clearance and settlement for its owners, the New York Stock Exchange (NYSE®), American Stock Exchange® (AMEX®), and the National Association of Securities Dealers, Inc.. The NSCC is a clearing agency registered with the Securities and Exchange Commission (SEC). The Depository Trust & Clearing Corportaion's (DTCC) subsidiary, National Securities Clearing Corporation (NSCC), established in 1976, provides clearing, settlement, risk management, central counterparty services and a guarantee of completion for certain transactions for virtually all broker-to-broker trades involving equities, corporate and municipal debt, American depositary receipts, exchange-traded funds, and unit investment trusts. NSCC also nets trades and payments among its participants, reducing the value of securities and payments that need to be exchanged by an average of 98% each day. NSCC generally clears and settles trades on a T+3 basis. National Securities Clearing Corporation (NSCC) is a systemically important system for clearing and settling virtually all broker-to-broker equity and corporate and municipal debt securities transactions in the United States. On an average trading day, NSCC receives trade data from over 50 trading venues (including all US securities exchanges and from automated trading systems) and from participants submitting transaction data directly, and it clears over 40 million securities transactions. (Based upon 2008 transaction data. With respect to fixed income securities (corporate and municipal bonds), virtually all transactions are effected in the over-the-counter markets and submitted to NSCC directly by Members on a bilateral basis. Average daily fixed income transaction volume is less than 1% of NSCC's daily volume.) Therefore, NSCC has assessed itself against the CCP (short for the central counterparties) Recommendations. Overall, NSCC either fully or broadly observes each of the CCP Recommendations as more fully described herein. The United States Congress requires clearing agencies, such as NSCC, to be registered with the US Securities and Exchange Commission (SEC) and subject to the SEC's comprehensive oversight. The standards that NSCC is required to adhere to as a registered clearing agency mirror a number of the CCP Recommendations. Specifically, NSCC's corporate governance structure is designed to fulfill the public interest requirements of the Securities Exchange Act of 1934 as amended (Exchange Act) and provides for fair representation of its participants. NSCC has a well-founded and transparent legal framework that is based upon the laws and regulations governing the settlement of securities transactions and the conduct of registered clearing agencies in the United States. NSCC's rules (the Rules) are clear and enable its members to understand the financial risks associated with participation. NSCC measures and manages credit and market risk exposure through its assessment of daily Clearing Fund (margin) requirements on its Members, ongoing monitoring of their financial condition and by taking other actions permitted under its rules. Finally, NSCC provides its members with safe and secure operations, while maintaining cost-effectiveness. NSCC was established in 1976 as a New York business corporation. Since 1999, it has been a wholly-owned subsidiary of The Depository Trust & Clearing Corporation. NSCC is registered with the SEC as a clearing agency. Core Services:- (i) Trade Capture:- NSCC's core services are trade capture, and clearance and settlement through its Continuous Net Settlement (CNS) System. Trade capture, the first step in the clearance and settlement process, involves the daily receipt of trade data from over 50 trading venues, including securities exchanges and automated trading facilities and from NSCC Members2 submitting transaction data directly. That data is then compared or recorded. Trade comparison consists of validating and matching the buy and sell sides of a securities transaction, and results in a compared trade that is reported to members. As straight through processing measures have been adopted by the marketplaces, today over 99% of trade data is submitted to NSCC on a 'locked-in' basis, meaning that it is already compared by the marketplace of execution. When submitted, locked-in trades are validated, recorded and reported to Members. The only trade comparison currently being done by NSCC is for some over-the-counter equity transactions and for fixed income (corporate and municipal) securities processing; (ii) Continuous Net Settlement (CNS):- Compared and recorded transactions in CNS-eligible securities are processed in the CNS system. To be CNS-eligible, a security must be eligible for book-entry transfer on the books of DTC and must be capable of being processed in

the CNS system; for example, securities may be ineligible for CNS processing due to certain transfer restrictions (e.g., 144A securities) or due to the pendency of certain corporate actions. (Securities and/or transactions that are not processed in the CNS system may be processed as Balance Orders (described below), or on a trade-for-trade basis, depending on the security, the transaction and the nature of the participants party to the transaction. For example, 144A securities settle on a trade-for-trade basis. Similarly, same day settling equity trades that are received by NSCC after the applicable cutoff time would settle on a trade-for-trade basis. NSCC does not guarantee trade-for-trade settlement.) Under the CNS system, all eligible compared and recorded transactions for a particular settlement date are netted by issue into one net long (buy) or net short (sell) position. As a continuous net system, those positions are further netted with positions of the same issue that remain open after their originally scheduled settlement date (usually T+3), so that trades scheduled to settle on any day are netted with fail positions to result in a single deliver or receive obligation for each Member for each issue in which it has activity. NSCC becomes the contra-party for settlement purposes, assuming the obligation of its Members that are receiving securities to receive and pay for those securities, and the obligation of Members that are delivering securities to make the delivery. CNS netting thus reduces the costs associated with securities transfers by reducing the number of securities movements required to settle transactions. In 2008, NSCC reduced the total value of obligations requiring financial settlement by 99% – from USD315.1 trillion to USD2.89 trillion. CNS relies on an interface with The Depository Trust Company (DTC) for the bookentry movement of securities to settle transactions. CNS short positions are compared against Members' DTC accounts to determine availability of securities for delivery. If securities are available, they are transferred from the Member's account at DTC to NSCC's account at DTC to cover the Member's short obligations to CNS. To control the automatic delivery of securities from their DTC accounts (for example, to prevent the automatic delivery of customer fully-paid securities), Members can use CNS exemption procedures. Partial settlements are permissible. The allocation of CNS long positions to receiving Members is processed in an order determined by an algorithm built into the system. Securities are automatically allocated to Members' long positions as the securities are received by NSCC. Members can request that they receive priority for some or all issues on a standing or override basis. Submission of buy-in notices and other specified activity will also affect the priority of a Member's long position. Daily money settlement for CNS activity is based on the value of all settled positions plus or minus mark-to-the-market amounts for all open CNS positions, and occurs through NSCC. The CNS deliveries made through DTC are made free of payment. When DTC and NSCC moved to same day funds settlement in 1996, certain crossguarantees and arrangements between NSCC and DTC were established to permit transactions to flow smoothly between DTC's system and the CNS system in a collateralized environment. Under this arrangement, DTC provides a guarantee to NSCC of all CNS long allocations (deliveries from CNS), and NSCC provides a guarantee to DTC for all CNS short covers (i.e. deliveries from the broker to CNS to satisfy a CNS delivery obligation) These guarantees ensure, among other things, that debits created in DTC's system continue to be collateralized when the securities serving as collateral are delivered into the CNS system as short covers and reduce risk at NSCC by ensuring that long allocations, or the approximate value of long allocations, will be made available to NSCC to cover certain exposures; (iii) Balance Order Processing:- for securities that are ineligible for processing in CNS, NSCC provides a Balance Order Accounting system that produces netted and allotted receive and deliver instructions for NSCC members. NSCC does not become a counterparty to balance order transactions, but does provide a trade guaranty to the receive and deliver parties which remains effective through the close of business on the scheduled settlement date. The settlement of balance order transactions generally occurs outside of NSCC. As a result, NSCC's guaranty is effectuated as follows:- In the event of the insolvency of a Member, Members are required to close-out the open guaranteed Balance Order transactions they had with the insolvent party and report gains or losses to NSCC. Any gains must be paid to NSCC, and NSCC will cover the losses on such closed-out transactions; (iv) Money Settlement:- participants are obligated to designate a settling bank to effectuate daily money settlement on their behalf and may designate a bank of their own choosing, provided the bank meets certain financial criteria, is a Federal Reserve member, and agrees to settle through use of the Federal Reserve's National Settlement Service (NSS). Money settlement at NSCC occurs at the end of the day and, from an operational perspective, is centralized with DTC's end-of-day money settlement so as to provide common participants with consolidated reporting and a single point of access for all settlement information. Throughout the day, debit and credit data generated by participant activities are recorded in the settlement system. At the end of the processing day, the data is summarized by NSCC product category (e.g., CNS, mutual funds, envelope services) and netted to produce an aggregate debit or credit for each participant. Similarly, DTC activity is also recorded and netted, separately. Following the determination of final net numbers for each participant for each clearing agency, these amounts are further netted to produce a consolidated net settlement obligation. (So, for example, a participant with a settlement debit at NSCC will have that debit netted against its settlement credit at DTC.) Settling banks, who may settle on behalf of multiple NSCC members and/or DTC participants, must separately acknowledge the respective settlement balances of their customer participants at each clearing agency. The consolidated net balances of their respective participant customers are then further netted to produce a single net-net settling bank consolidated debit or credit. Settlement of these net-net balances occurs through use of the NSS, whereby DTC, on its own behalf and as NSCC's settlement agent, submits instructions to have the Federal Reserve accounts of the settling banks charged for their net-net debit balances and credited with their net-net credit balances; and (v) Additional Services:- in addition to the core services described above, NSCC offers a number of other services, developed over the years in response to industry requests and initiatives; these include:- (a) Automated Customer Account Transfer Service (ACATS):- ACATS provides NSCC Members with the ability to transfer customer accounts and assets from one firm to another. To accomplish this in an automated fashion, the service interfaces with CNS for the delivery and settlement of CNS-eligible securities, with Fund/SERV to expedite the re-registration of mutual fund positions, and with Insurance Services to facilitate the reregistration of annuity positions; (b) Wealth Management and Insurance Services:- NSCC also provides a family of non-guaranteed services to support mutual funds, the growing interest in alternative investment products and the insurance industry. Mutual Fund Services is the industry standard for processing fund transactions, communicating account-related information, and linking fund companies with their network of distribution firms. Fund/SERV® automates purchases, registrations, redemptions and settlement of fund transactions. Other capabilities include coordinating account information between funds and firms; processing defined contribution transactions; settling commission payments; transferring accounts between firms, and assets in IRAs between fund companies; and, through the Mutual Fund Profile Service, providing a centralized repository for information contained in a fund's prospectus. Alternative investment products are primarily private vehicles that are purchased and redeemed periodically rather than being valued and processed on a daily basis. NSCC's services with respect to these products include the automated processing of new accounts, purchases and redemptions, tender offers and commission payments. NSCC's Insurance Services include processing of annuity applications and premiums, licensing and appointments, commission payments, reporting of positions and valuations, asset pricing, financial activity reporting and annuity customer account transfers. The aim of these services is to automate and provide seamless end-to-end communication between insurance carriers, distributors and their solution providers for the sale, processing and money settlement of insurance products nationwide; (c) Envelope Services:- Envelope Settlement Service (ESS) standardizes and controls Member-to-Member physical delivery of securities in the New York metropolitan area. Inter-city Envelope Settlement Service (IESS) standardizes and controls the physical delivery of securities among Members between NY and Toronto; and (d) Risk Management:- Risk management is the foundation for NSCC's ability to guarantee settlement, as well as the means by which it protects itself and its Members from the risks inherent in the settlement process. Procedures are in place to ensure that Members

comply with NSCC's rules. NSCC maintains strict membership standards, including minimum financial requirements, and Members are subject to ongoing review following admission. NSCC's Clearing Fund (which is its default fund) addresses potential exposure through a number of risk-based component charges calculated daily. In addition, NSCC maintains a committed liquidity facility. The Clearing Fund, together with NSCC's liquidity facility, ensures that NSCC has sufficient liquidity to complete end-of day money settlement. The Clearing Fund also provides the collateralization required to cover a Member's exposure. The Clearing Fund consists of deposits posted by Members in the form of cash and eligible securities. NSCC's rules also contain procedures for closing out the open positions of a defaulting Member and satisfying any resulting losses. If a Member becomes insolvent, NSCC first uses the defaulting Member's deposit to the Clearing Fund (and any funds available from any applicable collateral sharing arrangements with other clearing agencies) to cover any losses resulting from liquidation of the defaulting Member's open obligations. If those funds are insufficient to cover the liquidation of all such positions, NSCC would next look to apply at least 25% of its retained earnings to cover the loss and, if that remained insufficient, it would satisfy the deficiency through a loss allocation to non-defaulting participants (referred to in this Assessment as a 'participant loss allocation') – that is, by using the Clearing Fund and assessing participants in accordance with its Rules to make up the remaining deficiency. The Rules permit participants to cap their loss assessment liability by withdrawing from membership within certain time frames. To date, including through the recent well-publicized broker-dealer closeouts, NSCC has never invoked its participant loss allocation procedures. / взаиморасчёт или сведение (netting) . НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). АМЭКС® (AMEX®). Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении).

NATIONAL SECURITY CONTROLS = КОНТРОЛЬ ЗА НАЦИОНАЛЬНОЙ БЕЗОПАСНОСТЬЮ – In the United States, National Security Controls restrict exports of US goods and technology which would make a significant contribution to the military potential of another country and thus be detrimental to Western countries' national security.

NATIONAL SECURITY COUNCIL = СОВЕТ ПО НАЦИОНАЛЬНОЙ БЕЗОПАСНОСТИ – A National Security Council (NSC) is usually an executive branch governmental body responsible for coordinating policy on national security issues and advising chief executives on matters related to national security. An NSC is often headed by a national security advisor and staffed with senior-level officials from military, diplomatic, intelligence, law enforcement and other governmental bodies. The functions and responsibilities of an NSC at the strategic state level are different from those of the United Nations Security Council, which is more of a diplomatic forum. Occasionally a nation will be ruled by a similarly named body, such as 'the National Security Committee' or 'Council for National Security'. These bodies are often a result of the establishment or preservation of a military dictatorship (or some other national crisis), do not always have statutory approval, and are usually intended to have transitory or provisional powers. In the United States, the National Security Council was established by the National Security Act of 1947 to advise the President with respect to the integration of domestic, foreign and military policies relating to national security. National Security Council (NSC) is a governmental body specifically designed to assist the President in integrating all spheres of national security policy. The President, Vice President, Secretary of State, and Secretary of Defense are statutory members. The Chairman of the Joint Chiefs of Staff; Director, Central Intelligence Agency; and the Assistant to the President for National Security Affairs serve as advisers. In the United States, the National Security Council is a committee in the executive branch of government that advises the president on foreign and military and national security; supervises the Central Intelligence Agency. / В Соединённых Штатах Америки, Совет по Национальной Безопасности был создан на основании Акта о Национальной Безопасности от 1947 с целью извещения Президента страны об интеграции внутренней и внешней политики и военной доктрины в отношении национальной безопасности.

NATIONAL SECURITY OVERRIDE = ВТОРГАТЬСЯ В НАЦИОНАЛЬНУЮ БЕЗОПАСНОСТЬ – National Security Override:- in the United States, in some cases, despite a finding of foreign availability of a controlled commodity, control is maintained over exporting the commodity because it is deemed a national security sensitive item. The term National Security Override is used to describe this circumstance. The term has also been used in other contexts. For example, under a 1990 directive, the President tasked the interagency control groups to move as many dual use items from the State Department's International Munitions List to the Commerce Department's Commerce Control List. In some circumstances, a national security override is applied to prevent transfer of a particular item.

NATIONAL SECURITY TRADING SYSTEM = НАЦИОНАЛЬНАЯ СИСТЕМА ТОРГОВЛИ ЦЕННЫМИ БУМАГАМИ – The National Securities Trading System (NSTS) is an automated centralized quotation system used by the Cincinnati Stock Exchange that permits brokers to enter orders for certain securities and expose them to other brokers and dealers around the country. This experiment in developing a national market for securities differs from the Intermarket Trading System in that the Intermarket Trading System connects only specialists on exchanges. Operated by the Cincinnati Stock Exchange. The National Securities Trading System is an automated quotation system connecting brokers on the National Stock Exchange (Cincinnati Stock Exchange) to other brokers around the country, allowing them to make orders for certain securities without regard for the specific exchange on which they are traded. The system is exclusive to the National Stock Exchange, but contains a blueprint for what some envision as a future nation-wide exchange. / Система, эксплуатируемая Фондовой Биржей Цинциннати.

NATIONAL SETTLEMENT SERVICE = НАЦИОНАЛЬНАЯ РАСЧЁТНАЯ СЛУЖБА – In the United States, the National Settlement Service allows participants in private-sector clearing arrangements to do multilateral funds settlements on a net basis using balances in their Federal Reserve accounts. The service provides an automated mechanism for submitting settlement information to the Reserve Banks. It improves operational efficiency and controls for this process and reduces settlement risk to participants by granting settlement finality for movements of funds on settlement day. The service also enables the Federal Reserve to manage and limit the financial risk posed by these arrangements because it incorporates risk controls that are as stringent as those used in the Fedwire Funds Service. Approximately seventy arrangements use the National Settlement Service – primarily check clearinghouse associations, but also other types of arrangements. The National Settlement Service is a multilateral settlement service owned and operated by the Federal Reserve Banks. The service is offered to depository institutions that settle for participants in clearinghouses, financial exchanges and other clearing and settlement groups. Settlement agents, acting on behalf of those depository institutions in a settlement arrangement, electronically submit settlement files to the Federal Reserve Banks. Files are processed on receipt, and entries are automatically posted to the depository institutions' Federal Reserve Bank accounts.

NATIONAL STAGE APPLICATION = ЗАЯВКА ДЛЯ НАЦИОНАЛЬНОЙ СТАДИИ – National Stage Application is an application which has entered the national phase of the Patent Cooperation Treaty by the fulfillment of certain requirements in a national office (the United States Patent and Trademark Office (USPTO)), which is an authority entrusted with the granting of national or regional patents. Such an application is filed under 35 USC § 371 in the United States and is referred to as a '371 application'.

NATIONAL TREATMENT = НАЦИОНАЛЬНЫЙ РЕЖИМ (или РЕЖИМ РАВЕНСТВА) – National Treatment affords individuals and firms of foreign countries the same competitive opportunities, including market access, as are available to domestic parties. / Национальный Режим или Режим Равенства предусматривает предоставление частному лицу и фирме из иностранных

государств одни и те же возможности в плане конкурентоспособности, включая доступ на рынок, что и для своих собственных граждан и компаний. В международных отношениях под Национальным Режимом понимается правовое положение, устанавливаемое на основе международного договора или национального законодательства, согласно которому на иностранных физических и юридических лиц и товары распространяются все права и преимущества, которыми пользуются в данной стране местные физические и юридические лица и товары.

NATIONAL WEALTH = НАЦИОНАЛЬНОЕ БОГАТСТВО – In national accounting, National Wealth is a value of a nation's total resources or assets. / В национальном бюджетном процессе, стоимость всех национальных ресурсов и активов. Под Национальным Богатством понимается важнейший показатель экономического состояния страны, представляющей в денежном выражении совокупность потребительских стоимостей, созданных и накопленных обществом за всё время его производственной деятельности. Основной частью национального богатства являются материальные ценности. Национальное Богатство или Народное Богатство, один из наиболее важных показателей экономической мощи страны, который представляет в денежном выражении всю совокупность потребительных стоимостей, накопленных обществом за весь период его производственной деятельности (по состоянию на определённую дату). При капитализме 'выражение 'национальное богатство', – отмечал Фридрихь Энгельс, – появилось впервые благодаря стремлению либеральных экономистов к обобщениям. Пока существует частная собственность, выражение это не имеет смысла' (Карл Маркс и Фридрихь Энгельс, Сочинения, 2 Издание, Том 1, Страница 548). Поэтому буржуазной политической экономии свойствен ограниченный подход к национальному богатству. Она исследует лишь, каким образом создаётся богатство в рамках капиталистического строя и как оно должно распределяться для дальнейшего обогащения капиталистов. При этом буржуазная политическая экономия стремится завуалировать тот факт, что национальное богатство создаётся трудящимися, а присваивается эксплуататорами. В Марксистской политической экономии Национальное Богатство определяется как 'объективирование человеческого труда' (смотрите Карл Маркс, там же, Том 26, Часть 3, Страница 446). Важнейшая его часть – вещественное богатство, то есть совокупность накопленных материальных ценностей. Кроме того, имеются результаты труда, которые не зафиксированы в вещной форме, но, тем не менее, рассматриваются как богатство нации, например, степень искусности наличного населения, производственный опыт и другое. '... Если отбросить ограниченную буржуазную форму, – писал Карл Маркс, – чем же иным является богатство, как не универсальностью потребностей, способностей, средств потребления, производительных сил и так далее индивидов, созданной универсальным обменом? Чем иным является богатство, как не полным развитием господства человека над силами природы, то есть как над силами так называемой 'природы', так и над силами его собственной природы? Чем иным является богатство, как не абсолютным выявлением творческих дарований человека ...' (там же, Том 46, Часть 1, Страница 476). Впервые национальное богатство было исчислено Английским экономистом, родоначальником буржуазной классической политической экономии Сэром Вильэмом Пэти (William Petty; 1623–1687) в 1664, во Франции первая оценка национального богатства относится к 1789, в Соединённых Штатах Америки (США) – к 1805, в России – к 1864. С 1853 методологические проблемы измерения национального богатства становятся темой международных статистических конгрессов. В 1947 создана Международная Ассоциация Исследования Проблем Национального Дохода и Богатства, которая с 1966 выпускает журнал The Review of Income and Wealth. Наиболее значительные исследования национального богатства в XX веке за рубежом проведены Американским экономистом Рэймэндом Вилъйэмом Голдсмисом (Raymond William Goldsmith; 1904–1988), рассчитавшим величину национального богатства в США за 1898–1948, 1905–50, 1945–58, и Британцем Филипом Рэдфёном (Philip Redfern), который определил объём национального богатства Соединённого Королевства за 1938–53. В 1930-х Советский статистик, экономист математик Альберт Львович Вайнштейн (1892–1970) исчислил величину национального богатства России по состоянию на 01 Января 1914, показав его распределение по отраслям хозяйства и социальным группам. В Советской экономической литературе под Национальным Богатством обычно понимают запас материальных благ, созданных трудом и используемых для производства и потребления, а природные богатства и рабочая сила (труд) выступают в качестве источников и условий создания национального богатства. Некоторые Советские экономисты включают в состав национального богатства естественные ресурсы. Наконец, существует точка зрения, согласно которой понятие Национальное Богатство должно охватывать и нематериальные ценности – объём научных знаний, уровень культуры населения и тому подобное. Измерение величины национального богатства в капиталистических странах затруднено наличием 'коммерческой тайны' и других порождений частной собственности, что вынуждает применять косвенные методы определения его размеров. В бывшем Союзе Советских Социалистических Республик (СССР) статистика национального богатства использовала методы прямого счёта, опиравшиеся на данные инвентаризаций, бухгалтерскую и статистическую отчётность. В состав национального богатства Советского Союза включались следующие материальные блага:- основные и оборотные производственные фонды, состоящие из средств труда (машин, зданий производственного назначения и тому подобного) и предметов труда, подвергшихся обработке (сырья, материалов, топлива и тому подобного); непроизводственные фонды общества, к которым относятся жилой фонд и фонды культурно-бытового назначения, принадлежавшие государственным, кооперативным и общественным организациям; личное (потребительское) имущество населения; товарные запасы производственных предприятий и непроизводственных организаций; государственные резервы, в том числе страховые, золотой запас, запасы на нужды обороны и другое; природные ресурсы, вовлечённые в процесс производства, – сельскохозяйственные угодья, леса, месторождения полезных ископаемых, гидроэнергетические ресурсы и другое. Содержание составных частей национального богатства и их удельные веса не остаются неизменными. Особенно крупные сдвиги в составе национального богатства происходят в период научно-технической революции:- быстро увеличиваются и обновляются производственные фонды, в составе непроизводственных фондов всё большую долю занимает имущество научных, учебных, медицинских и других учреждений, непрерывно ускоряются темпы вовлечения природных богатств в хозяйственный оборот. По данным Центрального Статистического Управления (ЦСУ) СССР, национальное богатство Советского Союза (не считая земли и лесов) на конец 1973 составляло 1.7 триллиона Рублей. Из них 680 миллиардов Рублей – основные производственные фонды, 313 – оборотные фонды и запасы, 410 – основные непроизводственные фонды и около 300 миллиардов Рублей – личное имущество населения. Национальное богатство СССР больше национального богатства дореволюционной России в 20 раз и имеет принципиально иную социальную структуру:- в 1914 трудовому населению принадлежало 24.3% национального богатства (19.2% – сельскому и 5.1% – городскому населению), а частнокапиталистический сектор имел в своей собственности 55.3% национального богатства России; в Советском Союзе всё национальное богатство принадлежит трудящимся, оно учитывается и исчисляется по трём социальным формам народного хозяйства – государственное имущество, кооперативно-колхозное имущество, имущество населения. Темпы роста национального богатства в СССР примерно в 2.5 раза выше, чем в США. Национальное богатство при социализме выступает как совокупность общенародных, групповых и личных фондов. Его рост во многом определяется повышением эффективности общественного производства и особенно достижением наилучших сочетаний в динамике таких экономических показателей, как норма накопления в национальном доходе и фондоотдача. Постоянное накопление общественного богатства даёт возможность на каждом новом этапе развития решать задачи всё более крупные и масштабные.

NATIONAL WOODEN PALLET AND CONTAINER ASSOCIATION = НАЦИОНАЛЬНАЯ АССОЦИАЦИЯ ПО ДЕРЕВЯННЫМ ПОДДОНАМ И КОНТЕЙНЕРАМ – National Wooden Pallet And Container Association is a national association with the goal of promoting the design, manufacture, distribution, recycling, and sale of pallets, containers, and reels.

NATION STATE = ГОСУДАРСТВО–НАЦИЯ – Nation State is a form of state in which those who exercise power claim legitimacy for their rule partly or solely on the grounds that their power is exercised for the promotion of the distinctive interests, values and cultural heritage of a particular nation whose members ideally would constitute all, or most of, its subject population and all of whom would dwell within the borders.

NATIVE AMERICAN TRIBAL INSIGNIA = ЭМБЛЕМЫ ВЛАСТИ КОРЕННЫХ АМЕРИКАНСКИХ ТУЗЕМЦЕВ – Native American Tribal Insignia is an insignia that various federally and state recognized Native American tribes have identified as their official tribal insignia.

NATIVE LOAD CUSTOMERS = КОРЕННЫЕ ПОТРЕБИТЕЛИ НАГРУЗКИ – Native Load Customers:- the wholesale and retail customers on whose behalf the Transmission Provider, by statute, franchise, regulatory requirements, or contract, has undertaken an obligation to construct and operate the Transmission Provider's system to meet the reliable electric needs of such customers.

NATIVE REGALIA = КОРЕННЫЕ РЕГАЛИИ (или ТУЗЕМСКИЕ РЕГАЛИИ) – Native Regalia:- simply means Indian Dance, Potlatch, etc clothing apparel (costumes – in laymans terms) and is basically made from animal skins.

NATO = NORTH ATLANTIC TREATY ORGANIZATION

NATURAL = ЕСТЕСТВЕННОЕ (или НАТУРАЛЬНОЕ, или ПРИРОДНОЕ) – Natural:- of an off-white or beige color.

NATURAL–CATASTROPHE BONDS = ОБЛИГАЦИИ ПО ПРИРОДНЫМ КАТАСТРОФАМ – Natural-Catastrophe Bonds transfer some of the risk of unusual and devastating events from reinsurers to capital markets. Also known as Cat-Bonds. Catastrophe Bonds (also known as Cat Bonds) are risk-linked securities that transfer a specified set of risks from a sponsor to investors. They are often structured as floating rate bonds whose principal is lost if specified trigger conditions are met. If triggered the principal is paid to the sponsor. The triggers are linked to major natural catastrophes. Catastrophe Bonds are typically used by insurers as an alternative to traditional catastrophe reinsurance. For example, if an insurer has built up a portfolio of risks by insuring properties in Florida, then it might wish to pass some of this risk on so that it can remain solvent after a large hurricane. It could simply purchase traditional catastrophe reinsurance, which would pass the risk on to reinsurers. Or it could sponsor a cat bond, which would pass the risk on to investors. In consultation with an investment bank, it would create a special purpose entity that would issue the cat bond. Investors would buy the bond, which might pay them a coupon of LIBOR plus a spread, generally (but not always) between 3 and 20%. If no hurricane hit Florida, then the investors would make a healthy return on their investment. But if a hurricane were to hit Florida and trigger the cat bond, then the principal initially paid by the investors would be forgiven, and instead used by the sponsor to pay its claims to policyholders. Michael Moriarty, Deputy Superintendent of the New York State Insurance Department, has been at the forefront of state regulatory efforts to have US regulators encourage the development of insurance securitizations through cat bonds in the United States instead of off-shore, through encouraging two different methods – protected cells and special purpose reinsurance vehicles. The notion of securitizing catastrophe risks became prominent in the aftermath of Hurricane Andrew, notably in work published by Richard Sandor, Ken Froot, and a group of professors at the Wharton School who were seeking vehicles to bring more risk-bearing capacity to the catastrophe reinsurance market. The first experimental transactions were completed in the mid-1990s by AIG, Hannover Re, St. Paul Re, and USAA. The market grew to USD1–2 billion of issuance per year for the 1998–2001 period, and over USD2 billion per year following 9–11. Issuance doubled again to a run rate of approximately USD4 billion on an annual basis in 2006 following Hurricane Katrina, and was accompanied by the development of Reinsurance Sidecars. Issuance continued to increase through 2007 despite the passing of the post-Katrina 'hard market', as a number of insurers sought diversification of coverage through the market, including State Farm, Allstate, Liberty Mutual, Chubb, and Travelers, along with long-time issuer USAA. Total issuance exceeded USD4 billion in the second quarter of 2007 alone. It should be possible to adapt these instruments to other contexts. Professor Lawrence A. Cunningham of George Washington University suggests adapting cat bonds to the risks that large auditing firms face in cases asserting massive securities law damages. Other innovative uses of cat bond structures have been proposed as well. Investors choose to invest in catastrophe bonds because their return is largely uncorrelated with the return on other investments in fixed income or in equities, so cat bonds help investors achieve diversification. Investors also buy these securities because they generally pay higher interest rates (in terms of spreads over funding rates) than comparably rated corporate instruments, as long as they are not triggered. Key categories of investors who participate in this market include hedge funds, specialized catastrophe-oriented funds, and asset managers. Life insurers, reinsurers, banks, pension funds, and other investors have also participated in offerings. The financial changes beginning in 2007 accelerated what had been a gradual shift away from the fund of funds community toward more direct investment. A number of specialized catastrophe-oriented funds play a significant role in the sector, including Eskatos, Coriolis Capital Ltd, Credit Suisse Group AG, Nephila, AXA Investment Managers, Fermat Capital Management, Pentelia Capital Management, Anchor Risk Advisors, Solidum Partners, Clariden Leu, Securis Investment Partners, Goldman Sachs Asset Management, Secquaero Advisors, and others. Several mutual fund managers also invest in catastrophe bonds, among them OppenheimerFunds, Pioneer Investments, and PIMCO. Cat bonds are often rated by an agency such as Standard & Poor's, Moody's, or Fitch Ratings Ltd. A typical corporate bond is rated based on its probability of default due to the issuer going into bankruptcy. A catastrophe bond is rated based on its probability of default due to an earthquake or hurricane triggering loss of principal. This probability is determined with the use of catastrophe models. Most catastrophe bonds are rated below investment grade (BB and B category ratings), and the various rating agencies have recently moved toward a view that securities must require multiple events before occurrence of a loss in order to be rated investment grade. Most catastrophe bonds are issued by special purpose reinsurance companies domicilied in the Cayman Islands, Bermuda, or Ireland. These companies typically write one or more reinsurance policies to protect buyers (most commonly, insurers or reinsurers) called 'Cedants'. This contract may be structured as a derivative in cases in which it is 'triggered' by one or more indices or event parameters (see below), rather than losses of the cedant. Some bonds cover the risk that multiple losses will occur. The first second event bond (Atlas Re) was issued in 1999. The first third event bond (Atlas II) was issued in 2001. Subsequently, bonds triggered by fourth through ninth losses have been issued, including Avalon, Bay Haven, and Fremantle, each of which apply tranching technology to baskets of underlying events. The first actively managed pool of bonds and other contracts ('Catastrophe CDO') called Gamut was issued in 2007, with Nephila as the asset manager. Trigger types:- The sponsor and investment bank who structure the cat bond must choose how the principal impairment is triggered. Cat bonds can be categorized into four basic trigger types. The trigger types listed first are more correlated to the actual losses of the insurer sponsoring the cat bond. The trigger types listed farther down the list are not as highly correlated to the insurer's actual losses, so the cat bond has to be structured carefully and properly calibrated, but investors would not have to worry about the insurer's claims adjustment practices. (i) Indemnity:- triggered by the issuer's actual losses, so the sponsor is indemnified, as if they had purchased traditional catastrophe reinsurance. If the layer specified in the cat bond is USD100 million excess of USD500 million, and the total claims add up to more than USD500 million, then

the bond is triggered. (ii) Modeled loss:- instead of dealing with the company's actual claims, an exposure portfolio is constructed for use with catastrophe modeling software, and then when there is a large event, the event parameters are run against the exposure database in the cat model. If the modeled losses are above a specified threshold, the bond is triggered. (iii) Indexed to industry loss:- instead of adding up the insurer's claims, the cat bond is triggered when the insurance industry loss from a certain peril reaches a specified threshold, say USD30 billion. The cat bond will specify who determines the industry loss; typically it is a recognized agency like PCS. 'Modified index' linked securities customize the index to a company's own book of business by weighting the index results for various territories and lines of business. (iv) Parametric:- instead of being based on any claims (the insurer's actual claims, the modeled claims, or the industry's claims), the trigger is indexed to the natural hazard caused by nature. So the parameter would be the windspeed (for a hurricane bond), the ground acceleration (for an earthquake bond), or whatever is appropriate for the peril. Data for this parameter is collected at multiple reporting stations and then entered into specified formulae. For example, if a typhoon generates windspeeds greater than X meters per second at 50 of the 150 weather observation stations of the Japanese Meteorological Agency, the cat bond is triggered. (v) Parametric Index:- Many firms are uncomfortable with pure parametric bonds due to the lack of correlation with actual loss. For instance, a bond may pay out based on the wind speed at 50 of the 150 stations mentioned above, but the insurer loses very little money because a majority of their exposure is concentrated in other locations. Models can give an approximation of loss as a function of the speed at differing locations, which are then used to give a payout function for the bond. These function as hybrid Parametric/Modeled loss bonds, and have lowered basis risk as well as more transparency. Examples of cat bond sponsors include insurers, reinsurers, corporations, and government agencies. Over time, frequent issuers have included USAA, Hartford, Swiss Re, Munich Re, Liberty Mutual, SCOR, Hannover Re, Allianz, and Tokio Marine & Fire. To date, all direct catastrophe bond investors have been institutional investors, since all broadly distributed transactions have been distributed in that form. These have included specialized catastrophe bond funds, hedge funds, investment advisors (money managers), life insurers, reinsurers, pension funds, and others. Individual investors have generally purchased such securities through specialized funds. Examples of investment banks and other dealers that are active in the issuance of catastrophe bonds are Aon Benfield Securities, Inc., Swiss Re Capital Markets, Munich Re Capital Markets, Barclays Capital PLC, Deutsche Bank AG, BNP Paribas, Goldman Sachs, Merrill Lynch, GC Securities, JP Morgan, and Willis Capital Markets. Some of these groups also make secondary markets in these bonds. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)). Майкэл Мориати (Michael Moriarty). NATURAL COLOR SYSTEM = ЕСТЕСТВЕННАЯ ЦВЕТОВАЯ СИСТЕМА (или СИСТЕМА НАТУРАЛЬНЫХ ЦВЕТОВ, или ЕСТЕСТВЕННАЯ СИСТЕМА ЦВЕТА) – Natural Color System is a color order system based on resemblance's of colors to up to four of six 'elementary' colors red, yellow, green, blue, black, and white, in which the attributes of the colors are hue, chromaticness, and blackness. The Natural Color System (NCS) is a proprietary perceptual color model published by the Scandinavian Colour Institute (Skandinaviska Färginstitutet AB) of Stockholm, Sweden. It is based on the color opponency description of color vision, first proposed by German physiologist Ewald Hering. The system is usually used for matching colors (using printed reference cards), rather than mixing colors. The underlying physiological mechanisms involved in color opponency include the bipolar and ganglion cells in the retina, which process the signal originated by the retinal cones before it is sent to the brain. Models like RGB (an additive color model in which red, green, and blue light (RGB) is added together in various ways to reproduce a broad array of colors) are based on what happens at the lower, retinal cone level, and thus are fitted for presenting self-illuminated, dynamic images as done by TV sets and computer displays; see additive color. The NCS model, for its part, describes the organization of the color sensations as perceived at the upper, brain level, and thus is much better fitted than RGB to deal with how humans experience and describe their color sensations (hence the 'natural' part of its name); but it would be useless, for example, for describing the behavior of mixing lights and pigments. The NCS is based on the six elementary color percepts of human vision – the psychological primaries – as described by color opponency – white, black, red, yellow, green, and blue – which are difficult to define perceptually in terms of others. All the other perceptual colors are composite perceptions that can be defined in terms of those six (for example, turquoise looks like 'bluegreen', orange like 'a color that is both reddish and yellowish', and brown looks like 'a very dark orange', that is, like a mixture of red, yellow and black). This all means the appearance of a color can be readily predicted from its NCS notation, whereas its notation in systems such as RGB often looks unintuitive (for example, yellow does not look like 'a reddish-greenish color' at all, even though the yellow on an RGB monitor is obtained by mixing red and green lights). Note also that, under normal viewing circumstances, there is no hue that must be described as a mixture of opponent hues; that is, as a hue looking 'redgreen' or 'yellowblue' (see note in the color opponents article). Colors in the NCS are defined by three values, specifying the amount of blackness (darkness), chromaticity (saturation), and apercentage value between two of the colors red, yellow, green or blue (hue). The blackness and the chromaticity together add up to less than or equal to 100% – their remainder from 100%, if any, gives the amount of whiteness. The complete NCS color notations can also be tagged with a letter giving the version of the NCS color standard that was used to specify the color. Two examples of NCS color notation – the yellow and blue shades of the Swedish flag:- (i) Yellow – NCS 0580-Y10R (= 5% darkness, 80% saturation, 90% yellow + 10% red = very slightly darkish mostly saturated yellow with a slight orangish tinge), and (ii) Blue – NCS 4055-R95B (= 40% darkness, 55% saturation, 5% red + 95% blue = somewhat dark rather unsaturated blue with a very slight purplish tinge). The NCS is represented in 19 countries and is the reference norm for color designation in Sweden (since 1979), Norway (since 1984) and Spain (since 1994). It is also one of the standards used by the International Colour Authority, a leading publisher of color trend forecasts for the interior design and textile markets. Overview of the six base colors in Natural Color System with their equivalent in hex triplet, RGB and HSV coordinates systems (in the following format:- Color – Hex Triplet – RGB – HSV):- (i) White – #FFFFFF – (255,255,255) – (–º, 0%, 100%); (ii) Black – #000000 – (0,0,0) – (–º, –%, 0%); (iii) Green – #009F6B – (0,159,107) – (160º, 100%, 63%); (iv) Red – #C40233 – (196,2,51) – (50º, 100%, 100%); (v) Yellow – #FFD300 – (255,211,0) – (50º, 100%, 100%); and (vi) Blue – #0087BD – (0,135,189) – (197º, 100%, 74%). / Кандиновиск Фаръюинститьютэт А.Бе. (Skandinaviska Färginstitutet AB).

NATURAL CROSS POLLINATION = ЕСТЕСТВЕННОЕ ПЕРЕКРЁСТНОЕ ОПЫЛЕНИЕ – Natural Cross Pollination is a pollination of the Plant by Insects, wind, or floral parts without human intervention.

NATURAL DYE = ПРИРОДНЫЙ КРАСИТЕЛЬ (или НАТУРАЛЬНЫЙ КРАСИТЕЛЬ) – Natural Dyes have been used since ancient times. A garment that was discovered at Thebes, Egypt, and that dates from about 3000 BC, was dyed with indigo. By 2000 BC, linen and cloth dyeing had become a fairly common practice. The famous Tyrian purple, obtained from certain mollusks of the Mediterranean Sea, was manufactured by a secret process in the ancient Phoenician city of Tyre. The dye was so expensive that its use was reserved for royalty. A turning point in the history of dyes came in 1856. In that year an 18-year-old English chemist, named William Henry Perkin, was experimenting in his home laboratory, trying to synthesize the drug quinine. He did not succeed, but he noticed that some of the gummy mass at the bottom of a flask had a purplish glint. When he added alcohol, the mass turned a beautiful purple. Perkin had the substance tested as a dye, and when the tests proved satisfactory he founded a factory to produce the new dye. Perkin's new dye, named mauve, became very popular. It was the first of the synthetic dyes. Because it was made from aniline, which in turn was made from coal tar, mauve and many similar dyes synthesized thereafter were called Aniline Dyes or Coal-Tar Dyes. Coal-tar dyes are cheaper, more brilliant, and less likely to fade than any of the natural dyes. Furthermore, methods were found whereby even the natural dyes could be synthesized more cheaply than they could be obtained from nature. By the end of the XIX century synthetic dyes provided a vast number of colors. When Perkin's teacher, August Wilhelm von Hofmann, returned to his native Germany, he introduced synthetic dyes there. As the country most advanced in chemistry, Germany became, under Hofmann's leadership, the world center for dye manufacture. During World War I, America's supply of German dyes was cut off, and the American chemical industry was forced to manufacture dyes. As a result the United States became independent of any foreign supply About 80 000 tons of dyes are now manufactured each year in the United States, and more than 3 500 different dyes are used commercially. Natural Dyes are a class of colorants extracted from vegetative matter and animal residues. Natural Dye is a dye obtained from substances such as roots, bark, wood, berries, lichens, insects, shellfish and flowers. / Вильэм Хэнри Пёкин (William Henry Perkin). учитель Пёкина (Perkin), Аугуст Вильхэльм фон Хофман (August Wilhelm von Hofmann).

NATURAL ENEMY = ЕСТЕСТВЕННЫЙ ВРАГ – Natural Enemy is an organism which lives at the expense of another organism in its area of origin and which may help to limit the population of that organism. This includes parasitoids, parasites, predators, phytophagous organisms and pathogens.

NATURAL FABRICS = НАТУРАЛЬНЫЕ ТКАНИ – Natural Fabrics make use of animal's coats, the cocoons of silkworms, plants seeds, leaves and stems. It is breathable, does not cause rashes and are also soft and durable. Natural fabric is the best choice for everyone. It does not change color due to UV light and there is no warming effect to the user until the material looses its tensile strength. The various types of natural fabrics are cotton fabric, silk fabric, wool fabric, leather fabric, hemp fabric, coir fabric and linen fabric.

NATURAL FIBERS = НАТУРАЛЬНЫЕ ВОЛОКНА (или ПРИРОДНЫЕ ВОЛОКНА) – Natural Fiber is a fiber obtained from animal, vegetable or mineral sources, as opposed to those regenerated or synthesized from chemicals. See also Regenterated Fiber, and Synthetic Fiber. Natural Fibers are the fibers of animal (such as hair, silk, or wool), vegetable (such as Cotton, Flax, or Jute), or mineral origin (such as asbestos or glass). Natural Fiber is any hairlike raw material directly obtainable from an animal, vegetable, or mineral source and convertible into nonwoven fabrics such as felt or paper or, after spinning into yarns, into woven cloth. A natural fiber may be further defined as an agglomeration of cells in which the diameter is negligible in comparison with the length. Although nature abounds in fibrous materials, especially cellulosic types such as Cotton, wood, grains, and straw, only a small number can be used for textile products or other industrial purposes. Apart from economic considerations, the usefulness of a fiber for commercial purposes is determined by such properties as length, strength, pliability, elasticity, abrasion resistance, absorbency, and various surface properties. Most textile fibers are slender, flexible, and relatively strong. They are elastic in that they stretch when put under tension and then partially or completely return to their original length when the tension is removed. History:- The use of natural fibers for textile materials began before recorded history. The oldest indication of fiber use is probably the discovery of Flax and wool fabrics at excavation sites of the Swiss lake dwellers (VII and VI centuries BCE). Several vegetable fibers were also used by prehistoric peoples. Hemp, presumably the oldest cultivated fiber plant, originated in Southeast Asia, then spread to China, where reports of cultivation date to 4500 BCE. The art of weaving and spinning linen was already well developed in Egypt by 3400 BCE, indicating that flax was cultivated sometime before that date. Reports of the spinning of Cotton in India date back to 3000 BCE. The manufacture of silk and silk products originated in the highly developed Chinese culture; the invention and development of sericulture (cultivation of silkworms for raw-silk production) and of methods to spin silk date from 2640 BCE. With improved transportation and communication, highly localized skills and arts connected with textile manufacture spread to other countries and were adapted to local needs and capabilities. New fiber plants were also discovered and their use explored. In the XVIII and XIX centuries, the Industrial Revolution encouraged the further invention of machines for use in processing various natural fibers, resulting in a tremendous upsurge in fiber production. The introduction of regenerated cellulosic fibers (fibers formed of cellulose material that has been dissolved, purified, and extruded), such as rayon, followed by the invention of completely synthetic fibers, such as nylon, challenged the monopoly of natural fibers for textile and industrial use. A variety of synthetic fibers having specific desirable properties began to penetrate and dominate markets previously monopolized by natural fibers. Recognition of the competitive threat from synthetic fibers resulted in intensive research directed toward the breeding of new and better strains of natural-fiber sources with higher yields, improved production and processing methods, and modification of fiber yarn or fabric properties. The considerable improvements achieved have permitted increased total production, although natural fibers' actual share of the market has decreased with the influx of the cheaper, synthetic fibers requiring fewer man-hours for production. Classification And Properties:- Natural fibers can be classified according to their origin. The vegetable, or cellulose-base, class includes such important fibers as Cotton, Flax, and Jute. The animal, or protein-base, fibers include wool, mohair, and silk. An important fiber in the mineral class is asbestos. The vegetable fibers can be divided into smaller groups based on their origin within the plant. Cotton, Kapok, and Coir are examples of fibers originating as hairs borne on the seeds or inner walls of the fruit, where each fiber consists of a single, long, narrow cell. Flax, Hemp, Jute, and Ramie are bast fibers, occurring in the inner bast tissue of certain plant stems and made up of overlapping cells. Abaca, Henequen, and Sisal are fibers occurring as part of the fibrovascular system of the leaves. Chemically, all vegetable fibers consist mainly of cellulose, although they also contain varying amounts of such substances as hemicellulose, lignin, pectins, and waxes that must be removed or reduced by processing. The animal fibers consist exclusively of proteins and, with the exception of silk, constitute the fur or hair that serves as the protective epidermal covering of animals. Silk filaments are extruded by the larvae of moths and are used to spin their cocoons. With the exception of mineral fibers, all natural fibers have an affinity for water in both liquid and vapour form. This strong affinity produces swelling of the fibers connected with the uptake of water, which facilitates dyeing in watery solutions. Unlike most synthetic fibers, all natural fibers are nonthermoplastic; that is, they do not soften when heat is applied. At temperatures below the point at which they will decompose, they show little sensitivity to dry heat, and there is no shrinkage or high extensibility upon heating, nor do they become brittle if cooled to below freezing. Natural fibers tend to yellow upon exposure to sunlight and moisture, and extended exposure results in loss of strength.

All natural fibers are particularly susceptible to microbial decomposition, including mildew and rot. Cellulosic fibers are decomposed by aerobic Bacteria (those that live only in oxygen) and Fungi. Cellulose mildews and decomposes rapidly at high humidity and high temperatures, especially in the absence of light. Wool and silk are also subject to microbial decomposition by Bacteria and molds. Animal fibers are also subject to damage by moths and carpet Beetles. Termites and Silverfish attack cellulose fibers. Protection against both microbial damage and insect attacks can be obtained by chemical modification of the fiber substrate; modern developments allow treatment of natural fibers to make them essentially immune to such damage. Natural Fiber is a class name for various genera of fibers (including filaments) of:- (1) animal, e.g., silk and wool; (2) mineral, e.g., asbestos; or (3) vegetable origin, e.g., Cotton, Flax, Jute, and Ramie. / Найлан[Т3] (Nylon[TM]). Волокна животного (такие как волосы, шёлк или шерсть), растительного (такие как Джут, Лён, Пенька из конопли или Хлопок) или минерального происхождения (такие как асбест или стекло). Натуральное Волокно – текстильное волокно природного происхождения. Натуральные Волокна по исходному сырью подразделяются на две группы:- (1) волокна из органических природных высокомолекулярных веществ; и (2) волокна из неорганических высокомолекулярных веществ. К первой группе натуральных волокон из органических природных высокомолекулярных веществ относятся:- (i) Волокна Растительного Происхождения; и (ii) Волокна Животного Происхождения. К волокнам растительного происхождения относятся:- (a) Лиственные Волокна, такие как:- Абака, Сизаль, Формиум, Юкка и другие; (b) Плодовые Волокна, такие как:- Койр, Ласточник и другие; (c) Семенные Волокна, такие как:- Капок, Хлопок и другие; и (d) Стеблевые Волокна, такие как:- Джут, Кенаф, Лён, Пенька и другие. Иными словами – волокна волокнистых растений, дающих волокнистый или прядильный материал. К волокнам животного происхождения относятся:- (a) Волокна Волосяного Покрова, а именно Шерсть животных, таких как Верблюд, Коза, Овца и другие; и (b) Волокна, Выделяемые Железами:- к их числу относятся Шёлк Дубового, Тутового и других Шёлкопрядов. Ко второй группе натуральных волокон из неорганических высокомолекулярных веществ относятся Волокна Минерального Происхождения, образовавшиеся в горных породах и лаве; к их числу относятся Асбестовые и Базальтовые Волокна. К Природным или Натуральным Волокнам относятся текстильные волокна животного (такие как, волосы, натуральный шёлк или шерсть), минерального (такие как, асбест или стекло) и растительного (такие как, Джут, Лён, Пенька или Хлопок) происхождения, пригодные для изготовления пряжи. Под Текстильным Волокном понимается гибкое и прочное протяжённое тело ограниченной длины с малыми поперечными размерами. Применяется для изготовления пряжи и текстильных изделий. Основное сырьё текстильного производства. Различают:- (i) натуральные (природные) волокна растительного (Джут, Лён, Хлопок и другие), животного (шерсть, шёлк), минерального (асбест) происхождения; и (ii) химические волокна, подразделяемые соответственно на искусственные и синтетические. Природные Волокна (Натуральные Текстильные Волокна), образующиеся в природных условиях прочные и гибкие тела малых поперечных размеров и ограниченной длины, пригодные для изготовления пряжи или непосредственно текстильных изделий (например, нетканых). Одиночные волокна, не делящиеся в продольном направлении без разрушения, называются Элементарными (волокна большой длины – Элементарными Нитями); несколько волокон, продольно скреплённых (например, склеенных) между собой, называются Техническими. По происхождению, которое определяет и химический состав волокон, различают волокна растительного, животного и минерального происхождения. Волокна Растительного Происхождения формируются на поверхности семян (хлопок), в стеблях растений (тонкие Стеблевые Волокна – Лён, Рами; грубые – Джут, Пенька из Конопли, Кенаф и другие) и в листьях (жёсткие Листовые Волокна, например, Манильская Пенька (Абака), Сизаль). Общее название Стеблевых и Листовых Волокон – Лубяные. Растительные Волокна представляют собой одиночные клетки с каналом в центральной части. При их формировании образуется сначала наружный слой (первичная стенка), внутри которого постепенно откладываются несколько десятков слоёв синтезирующейся целлюлозы (вторичная стенка). Такая структура волокон определяет особенности их свойств – относительно высокую прочность, небольшое удлинение, значительную влагоёмкость, а также хорошую накрашиваемость, обусловленную большой пористостью (30% и более). Важнейшее Текстильное Волокно – Хлопок. Семена Хлопчатника, опушённые волокном, называются хлопком-сырцом. При его первичной обработке от семян последовательно отрывают хлопок-волокно (длина > 20 мм), более короткие волокна (пух, или линт) и подпушек (делинт, длина до 5 мм). Состав хлопка-волокна (% по массе):- целлюлоза до 96, пентозаны 1.5–2.0, жиры и воски 1.0, азотсодержащие и белковые вещества 0.3, зола 0.2–0.4. Пряжу из этого волокна применяют (иногда в смеси с другими природными или химическими волокнами) для выработки тканей бытового и технического назначения, трикотажа (преимущественно бельевого и чулочного), гардинно-тюлевых изделий, верёвок, канатов, швейных ниток и другого. Непосредственно из хлопка-волокна изготовляют нетканые и ватные изделия. Хлопок низших сортов, пух и подпушек применяют для получения эфиров целлюлозы. Основные хлопководческие страны (в 1980) – СССР (около 25% мирового сбора), КНР, США, Индия, Пакистан, Турция, и Египет. Лубяные Волокна выделяют из растений главным образом в виде Технических Волокон. Среди тонкостебельных волокон наиболее важен Лён (содержит около 80% целлюлозы, до 8% пентозанов, более 5% лигнина), среди грубостебельных волокон основное значение имеют Джут (около 70% целлюлозы, до 30% пентозанов и лигнина) и Пенька. Из льняной пряжи изготовляют бельевые, платьевые и другие ткани, парусину, брезент, пожарные рукава, шнуры, из так называемой Очёсковой Пряжи (получаемой из отходов первичной обработки льна) – мешочные ткани, холсты, низкокачественную парусину и брезент. Льняное Волокно часто применяют в смеси с химическими, например, полиэфирными, или хлопком. Льноводство развито в СССР (Северо-Западной области РСФСР, Западная часть УССР, БССР, республики Прибалтики), в ряде стран Средней и Северной Европы. Грубостебельные Волокна перерабатывают в толстую пряжу для мешочных и тарных тканей, а также для канатов, верёвок, шпагатов. Основные страны-производители джута – Индия, Бангладеш, Пакистан, Индонезия, КНР. Коноплеводство развито в СССР (Европейская часть РСФСР, УССР, республики Средней Азии), многих странах Западной Европы, Индии, Пакистане и других. Листовые Лубяные Волокна, используемые в канатном производстве, для плетения циновок и другого, выделяют из тропических растений, произрастающих в странах Африки, Центральной Америки, в Индонезии, на Филиппинах и других. Эти волокна с успехом заменяются синтетическими. К Волокнам Животного Происхождения относятся шерсть и шёлк. Шерсть – волокна волосяного покрова овец (почти 97% общего объёма производства шерсти), коз, верблюдов и других животных. В шерсти встречаются волокна следующих видов:- (1) пух – наиболее тонкое и упругое волокно с внутренним (‘корковым’) слоем, слагающимся из веретенообразных клеток, и наружным чешуйчатым слоем; (2) ость – более толстое волокно, имеющее также сердцевинный рыхлый слой, который состоит из редко расположенных пластин, перпендикулярных к оси волокна; (3) переходный волос, в котором сердцевинный слой расположен по длине волокна прерывисто (занимает по толщине промежуточное положение между пухом и остью); и (4) ‘мертвый’ волос – грубое, очень толстое, жёсткое и ломкое волокно с сильно развитым сердцевинным слоем. Овечью шерсть, состоящую из волокон первого или второго вида, называют однородной, состоящую из волокон всех видов – неоднородной. Шерстяное Волокно характеризуется невысокой прочностью, большой эластичностью и гигроскопичностью, малой теплопроводностью. Перерабатывают его (в чистом виде или в смеси с химическими волокнами) в пряжу, из которой изготовляют ткани, трикотаж, а также фильтры, прокладки и другое. Способность шерсти к свойлачиванию используют для выработки войлоков, валяной обуви, фетра. Основноые овцеводческие страны – Австралия, СССР (Северный Кавказ, Западная Сибирь, Поволжье, республики Средней Азии), Новая Зеландия, Аргентина, США, и ЮАР. Шёлк – продукт выделения шёлкоотделительных

желез насекомых, из которых основное промышленное значение имеет Тутовый Шелкопряд. Гусеница шелкопряда выпускает нить, состоящую из двух элементарных фиброиновых нитей толщиной около 15 мкм каждая, склеенных другим белковым веществом – серицином. Укладывая нить вокруг себя, гусеница формирует плотную многослойную оболочку (кокон). При размотке коконов соединяют обычно 5–10 элементарных нитей, получая Шёлк-Сырец. Образующиеся при этом отходы разрывают на короткие отрезки и перерабатывают в пряжу. Шёлк обладает высокой прочностью, эластичностью, большим влагопоглощением, приятным матовым блеском, лёгкой накрашиваемостью. Из шёлковых нитей вырабатывают платьевые (креповые и другие), декоративные и галстучные ткани, атласы, вышивальные нитки, из пряжи – разные полотна и другое. К Волокнам Минерального Происхождения относятся Асбесты (наиболее широко используют хризотил-асбест), расщепляя которые получают Технические Волокна. Перерабатывают их (обычно в смеси с 15–20% хлопка или химических волокон) в пряжу, из которой изготовляют огнезащитные и химически стойкие ткани, фильтры и др. Непрядомое короткое асбестовое волокно используют в производстве композитов (асбопластиков), картонов и другого. Объём мирового производства природных волокон в 1980 составил (миллионов тонн в год):- хлопок – 14.1, лён – 0.6, джут – 3.0, прочие грубостебельные и жёсткие – 1.0, шерсть (мытая) – 1.6, шёлк-сырец – 0.05.

NATURAL GAS = ПРИРОДНЫЙ ГАЗ – Natural Gas is petroleum that consists principally of light hydrocarbons. It can be divided into:- (i) lean gas (also called Sales Gas), primarily methane but often containing some ethane and smaller quantities of heavier hydrocarbons; and (ii) wet gas, primarily butan, ethane and propane as well as smaller amounts of heavier hydrocarbons, and partially liquid under atmospheric pressure. Gaseous petroleum consisting primarily of methane with lesser amounts of (in order of abundance) ethane, propane, butane and pentane, and heavier hydrocarbons as well as non-energy components such as nitrogen, carbon dioxide, hydrogen sulphide and water. A naturally occurring mixture of hydrocarbon and non-hydrocarbon gases found in porous rock formations. Its principal component is methane. A gaseous mixture of hydrocarbon compounds, primarily methane, used as a fuel for electricity generation and in a variety of ways in buildings, and as raw material input and fuel for industrial processes. Natural Gas is a gas composed mainly by methane. Before it can be used as fuel it must undergo a process of purification in which other elements such as ethane, propane, butane, pentanes, and higher molecular weight hydrocarbons, elemental sulfur, carbon dioxide, water vapor, and sometimes helium and nitrogen are removed. Natural gas is used in the generation of electricity generated by power plants; in homes for cooking and heating purposes; for transportation as an alternative to gasoline and diesel; in the production of ammonia for fertilizers; in the manufacture of plastics, paints, etc. Natural Gas futures are traded on the NYMEX® (New York, NY, USA) under ticker symbol NG in US Dollars and Cents per mmBtu. Natural Gas is a mixture of gaseous hydrocarbons, whose main component is methane. Natural gas is located in strata in a gaseous state, either as gas deposits or as a gas cap at oil and gas fields. Henry Hub Natural Gas (NG) Futures allow market participants significant hedging activity to manage risk in the highly volatile natural gas price, which is driven by weather-related demand. They also provide efficient transactions in and out of positions. Natural gas futures are:- (i) the third-largest physical commodity futures contract in the world by volume; (ii) widely used as a national benchmark price for natural gas, which continues to grow as a global and US energy source; and (iii) an independent, stand-alone commodity. Things to know about the contracts:- (i) natural gas futures prices are based on delivery at the Henry Hub in Louisiana; (ii) traded via open outcry, electronically on CME Globex and off-exchange for clearing only as an EFS, EFP or block trade through CME ClearPort; and (iii) options types include American, calendar spread, European and daily. Natural Gas is a naturally occurring mixture of hydrocarbon and nonhydrocarbon gases found in porous geological formations beneath the earth's surface, often in association with petroleum. The principal constituent is methane. Dynamic Trading Opportunities:- our (CME Group) Henry Hub Natural Gas Futures product slate offers opportunities for risk management of the highly volatile pricing of natural gas. Whether you are looking for physically or financially settled products, we have the liquidity to meet your needs, including:- (i) our benchmark Henry Hub Natural Gas Futures (NG) contract – the most liquid natural gas contract in the world; (ii) the Henry Hub Natural Gas Look-a Like Last Day Financial Futures (HH) contract-the same size as our NG contract and making it easy for you to trade out of NG into HH if you want to hold onto your position in the market; and (iii) our Henry Hub Natural Gas Last Day Financial Futures (NN) contract – allows you to hedge your basis risk and is highly correlated to our NG contract. Deeply Liquid:- (i) daily volume for NG is averaging over 390 000 contracts in 2013; (ii) robust open interest at record high levels reflects significant hedging activity; and (iii) HH/NN contracts experiencing strong volume and open interest growth in 2013 and offer up to 98% margin offsets with current NG positions. Improved Access:- (i) enjoy increased access to these markets through CME Direct; and (ii) trading incentives available on NN and HH throughout 2013. Henry Hub Natural Gas Futures (NG):- (1) Venue & Hours (All Times are New York Time/ET):- (i) CME Globex and CME ClearPort:- Sunday – Friday 06:00 pm – 05:15 pm New York time/ET (05:00 pm – 04:15 pm Chicago Time/CT) with a 45-minute break each day beginning at 05:15 pm (04:15 pm CT); (ii) Open Outcry Monday – Friday 09:00 am – 02:30 pm (08:00 am – 01:30 pm CT). (2) Contract Unit:- 10 000 million British thermal units (mmBtu). (3) Price Quotation:- US Dollars and cents per mmBtu. (4) Minimum Fluctuation:- USD0.001 (0.1¢) per mmBtu. (5) Termination of Trading:- trading of any delivery month shall cease three (3) business days prior to the first day of the delivery month. In the event that the official Exchange holiday schedule changes subsequent to the listing of a Natural Gas futures, the originally listed expiration date shall remain in effect. In the event that the originally listed expiration day is declared a holiday, expiration will move to the business day immediately prior. (6) Settlement Type:- physical. Listed Contracts:- the current year plus the next twelve years. A new calendar year will be added following the termination of trading in the December contract of the current year. On CME Globex:- the current year plus the next eight years. These contracts are listed with, and subject to, the rules and regulations of NYMEX®. / или Хэнри Хаб (Henry Hub). На Си.Эм.И. Глобэкс (CME Globex):- НАЙМЭКС® (NYMEX®). Под Природным Газом понимается смесь газообразных углеводородов, основным компонентом которой является метан. Природный газ в пластовых условиях находится в газовом состоянии в виде газовых залежей или в виде газовой шапки нефтегазовых месторождений. Смотрите также Газы Земной Коры, и Природные Горючие Газы.

NATURAL GAS LIQUIDS = ПРИРОДНЫЕ ГАЗОКОНДЕНСАТЫ (или ШИРОКАЯ ФРАКЦИЯ ЛЁГКИХ УГЛЕВОДОРОДОВ) – Natural Gas Liquids (NGL) are light hydrocarbons mainly consisting of butane, ethane and propane which are liquid under pressure at normal temperature. Liquids obtained during production of natural gas comprising ethane, propane and butane. Natural Gas Liquids (NGLs) are natural gas liquids and comprise Liquefied Petroleum Gases (LPGs, including butane, ethane, propane and their derivatives) and pentanes and pentanes-plus. Only NGL deriving directly from oil and gas field operations, or from natural-gas processing plants, are included in IEA Oil Market Report oil supply data. LPG production from oil refineries is therefore excluded. A general term for all liquid products separated from natural gas in a gas processing plant. Natural gas liquids include propane, butane, ethane, and natural gasoline. Can refer to pentanes and pentanes plus (sometimes referred to as Natural Gasoline or Plant Condensate), or to a broader classification running from ethane through to pentanes plus, and thus including Liquefied Petroleum Gases (LPG). See also Liquefied Petroleum Gases. Natural Gas Liquids (NGLs):- separated from natural gas, these include ethane, propane, butane and natural gasoline. / Под Газовым Конденсатом понимается смесь жидких углеводородов (C_5H_{12} + высшие), выделяющаяся из природных газов при эксплуатации газоконденсатных залежей в результате снижения пластовых давлений ниже давления начала конденсации и снижения температуры. Газовые конденсаты используются в качестве моторного топлива и являются ценным сырьём для химической промышленности. Под Газоконденсатом понимается природная смесь

легкокипящих нефтяных углеводородов, находящаяся в недрах в газообразном состоянии, а при охлаждении и снижении давления до атмосферного (в условиях дневной поверхности) распадающаяся на жидкую (конденсат) и газовую составляющие. Газоконденсатные залежи – важный промышленный тип месторождений высококачественного жидкого топлива.

NATURAL GAS MARKETED PRODUCTION = ТОВАРНАЯ ПРОДУКЦИЯ ПРИРОДНОГО ГАЗА – Natural Gas Marketed Production:- gross withdrawals of natural gas from production reservoirs, less gas used for reservoir repressuring; nonhydrocarbon gases removed in treating and processing operations; and quantities vented and flared.

NATURAL GASOLINE = ПРИРОДНЫЙ БЕНЗИН (или ПРОМЫСЛОВЫЙ БЕНЗИН) – Natural Gasoline is a mixture of hydrocarbons (mostly pentanes and heavier) extracted from natural gas that meets vapor pressure, end-point, and other specifications for natural gasoline set by the US Gas Processors Association. Includes isopentane, which is a saturated branch-chain hydrocarbon obtained by fractionation of natural gasoline or isomerization of normal pentane.

NATURAL GAS PLANT LIQUIDS = СЖИЖЕННЫЕ УГЛЕВОДОРОДЫ, ПОЛУЧАЕМЫЕ ИЗ ПРИРОДНОГО ГАЗА НА ГАЗОПЕРЕРАБАТЫВАЮЩЕМ ЗАВОДЕ – Natural Gas Plant Liquids recovered from natural gas in processing plants and, in some situations, from natural gas field facilities, as well as those extracted by fractionators. Natural gas plant liquids are defined according to the published specifications of the US Gas Processors Association and the American Society for Testing and Materials (ASTM) as follows:- ethane, isobutane, normal butane, pentanes plus, propane, and other products from natural gas processing plants, i.e. products meeting the standards for finished petroleum products produced at natural gas processing plants, such as finished motor gasoline, finished aviation gasoline, special naphthas, kerosene, distillate fuel oil, and miscellaneous products. / Американское Общество по Испытаниям и Материалам (АОИМ). , то есть .

NATURAL GAS PRODUCTION = ДОБЫЧА ПРИРОДНОГО ГАЗА (или ПРОИЗВОДСТВО ПРИРОДНОГО ГАЗА) – Natural Gas Production:- the volume of natural gas withdrawn from reservoirs less (1) the volume returned to such reservoirs in cycling, repressuring of oil reservoirs, and conservation operations; less (2) shrinkage resulting from the removal of lease condensate; and less (3) nonhydrocarbon gases where they occur in sufficient quantity to render the gas unmarketable. Volumes of gas withdrawn from gas storage reservoirs and native gas, which has been transferred to the storage category, are not considered production. Flared and vented gas is also considered production. This differs from 'Marketed Production' which excludes flared and vented gas. / сохранение (conservation).

NATURAL GAS SWAP = СВОП НА ПРИРОДНЫЙ ГАЗ – Natural Gas Swaps enable two parties to exchange, or 'swap', floating spot market prices for fixed gas prices over a predefined term, thereby allowing natural gas consumers to lock in a fixed price over the duration of the swap agreement. For example, an unhedged generator facing a variable-priced gas supply (e.g., Henry Hub spot prices) can eliminate price risk by entering into a swap with an over-the-counter market maker, whereby the market maker agrees to pay the generator's variable price liability (i.e. the Henry Hub spot price) in exchange for being paid a fixed price for the duration of the swap term. In perhaps the most common case, where the floating price is indexed to the Henry Hub spot price, the fixed price stream will be essentially equivalent to the levelized price of the NYMEX® futures strip (remember that NYMEX® futures are deliverable to Henry Hub) over the appropriate term. To apply real numbers to this concept, on 2001-November-06, Enron – the dominant market maker in natural gas swaps prior to its bankruptcy in late 2001 – was offering (indicatively) a 2-year natural gas swap indexed to Henry Hub at a price of USD3.317/mmBtu. Thus, a buyer of that swap would pay Enron USD3.317/mmBtu for the next two years, while Enron would pay the buyer the Henry Hub spot price (which the buyer could then use to purchase physical gas on the spot market at an effective price of USD3.317/mmBtu). As one would expect, levelizing the 24-month NYMEX® futures strip from Figure 1 (at a discount rate of 5%) yields a price of USD3.318/mmBtu – essentially the same as Enron's swap price. / Свопы На Природный Газ позволяют двум сторонам обменивать или менять плавающие спотовые рыночные цены на фиксированные цены на газ . или Хэнри Хаб (Henry Hub). НАЙМЭКС® (NYMEX®). Энрон (Enron).

NATURAL GAS WELLHEAD PRICE = ПРОМЫСЛОВАЯ ЦЕНА ПРИРОДНОГО ГАЗА (НА УСТЬЕ СКВАЖИНЫ) – Natural Gas Wellhead Price is the wellhead price of natural gas is calculated by dividing the total reported value at the wellhead by the total quantity produced as reported by the appropriate agencies of individual producing the US States and the US Minerals Management Service. The price includes all costs prior to shipment from the lease, including gathering and compression costs, in addition to State production, severance, and similar charges.

NATURALITES = НАТУРАЛЫ (или ХХ) – Naturalites is a class of fermentation products called Spinosads derived from an Ascomycetous Fungus, which is active against Lepidoptera and selected members of other Insect Families and some Mite Species. Naturalites is a marketing Segment made up of consumers who are primarily concerned about personal health and wellness. They are very concerned about dietary fat. Naturalites is a new customer segment in industrial countries that is focused on natural and organic consumer packaged goods. They are not politically committed to the environmental movement, nor are they driven to green and Eco-Friendly durable goods.

NATURAL LONGS = НАТУРАЛЬНЫЕ ПОКУПАТЕЛИ (или ПОКУПАТЕЛИ СЫРЬЕВИКИ, или ПОКУПАТЕЛИ ФИЗИЧЕСКОГО СЫРЬЯ) – A term Natural Longs refers to consumers of a commodity that must be a buyer in the market over time. Also known as Long Hedgers.

NATURALLY OCCURING = ЕСТЕСТВЕННО ПОЯВЛЯЮЩЕЕСЯ (или ВОЗНИКАЮЩЕЕ ЕСТЕСТВЕННЫМ ОБРАЗОМ) – Naturally Occurring is a component of an ecosystem or a selection from a wild population, not altered by artificial means.

NATURAL MONOPOLY = ЕСТЕСТВЕННАЯ МОНОПОЛИЯ – Natural Monopoly is a monopoly that does not arise from government intervention in the marketplace to protect a favored firm from competition but rather from special characteristics of the production process in the industry under the current state of technology. Theoretically, natural monopoly arises when there are very large 'economies of scale' relative to the existing demand for the industry's product, so that the larger the quantity of the good a single factory produces, the cheaper the average costs per unit get – right up to production at a level more than sufficient to supply the entire demand in the relevant market area. This might occur when production of the good requires extremely large initial capital investments to even enter the market in a modest way but then producing additional output requires only very modest additional outlays beyond the fixed initial investment. Under such circumstances, the firm that initially starts out with the largest share of the market is in a position to price its output at a level below its (higher cost) competitors' costs of production and still make a profit while driving them out of the business – and the larger its market share gets, the lower its unit costs become, until a monopoly position is finally obtained. (It is often argued that local telephone service, natural gas supply, and electrical power distribution fall into this category because of the heavy initial investments in networks of telephone lines, electrical lines and gas lines that are involved.) From the point of view of the rest of society, this single firm monopoly is potentially a blessing, since the one firm can in fact produce the amounts of the good they will demand at a lower total cost in resources than multiple competing firms could. However, once the firm has attained a monopoly

position, there is the likelihood that it will use its unusual dominance of this market to maximize profits by restricting output below the level which a competitive market would lead to and raising prices above competitive levels. This would lower overall social welfare below the maximum theoretically achievable because price would be set above marginal costs of production. It is therefore argued by some economists that such natural monopolies represent instances of 'market failure' and that this justifies government stepping in to regulate prices and output levels in such an industry so that price will more closely approximate marginal costs of production. (However, since the 'natural monopolist' by definition faces a situation where his marginal costs will be lower than his average per unit costs, forcing him to accept a price equal to his marginal cost will result in his always making a loss rather than a profit from his business. Consequently, the government regulators would either have to pay the monopolist a subsidy to allow him a 'fair return' on his investment or else fix the price of the product above its marginal costs of production anyway to accomplish the same end at greater social cost – which is the usual approach taken.) Critics of government regulatory practices point out that:- (i) Instances of true 'natural monopoly' situations seem upon close and systematic investigation to be extremely rare. The vast majority of actual real world monopolies are not 'necessitated' by economies of scale but instead have been politically conferred by government at the instigation of formerly dominant firms grown fearful of emerging competition. (ii) Where natural monopoly situations do exist, they tend to be of comparatively short duration, since advances in technology quite regularly seem to create opportunities for new competitors to undercut established giants of the industry. (iii) Even where natural monopoly situations exist for prolonged periods, high elasticity of demand due to the availability of substitute goods very often means that 'monopolistic' levels of price and output turn out to differ very little from the theoretical competitive optimum. (iv) Even where natural monopolies exist for prolonged periods and potentially would cause sizeable divergences from socially optimum levels of price and output, there is very little reason in theory or in historical experience to expect that real world regulatory agencies will in fact bring output and prices any closer to the theoretical optimum, because regulatory policies in practice are almost always much more responsive to arbitrary political pressures (especially from the regulated industry itself) than to any burning desire to have price equal marginal cost. (v) Moreover, financing the regulatory agency's large and highly paid staff (as well as the payroll for the regulated firms' expanded legal department and lobbying organization) is itself a sizable social cost imposed by the regulatory process that often outweighs any social benefits achieved.

NATURAL RESOURCE BASED PRODUCTS = ПРОДУКТЫ ИЗ НАТУРАЛЬНОГО СЫРЬЯ (или ПРОДУКТЫ НА ОСНОВЕ ЕСТЕСТВЕННЫХ РЕСУРСОВ, или ПРОДУКТЫ НА ОСНОВЕ ПРИРОДНЫХ РЕСУРСОВ) – This GATT (short for the General Agreement on Tariffs and Trade) Negotiating Group was formed as a direct result of pressure from resource-rich less developed countries to have an additional forum to deal with their special concerns, including the removal of barriers to trade in natural resource-based products. There are different interpretations among participants as to whether this group includes only three traditional product areas examined during the early 1980s GATT Work Program on Natural Resource Based Products:- non-ferrous metals and minerals; fish and fish products; and wood and wood products, or whether the Group may also discuss barriers in nontraditional product areas such as energy-based products. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) .

NATURAL RESIN = ПРИРОДНАЯ СМОЛА (или НАТУРАЛЬНАЯ СМОЛА) – Natural Resin:- inflammable, water-soluble, vegetable substances secreted by certain plants or trees, and characterizing the wood of many coniferous species. / виды (species). Под Природной Смолой или Натуральной Смолой понимаются продукты жизнедеятельности некоторых растений, выделяемые или на поверхность коры самопроизвольно или при ранении. Плавятся при нагревании, растворяются или набухают в органических растворителях, способны к плёнкообразованию. Наиболее важные природные смолы – канифоль, копалы, шеллак (природная смола животного происхождения, вырабатываемая насекомыми, так называемыми Лаковыми Червецами), янтарь. Раньше природную смолу широко применяли в производстве бумаги, граммофонных пластинок, клеёв, лаков. В современной промышленности успешно заменяются синтетическими смолами. Под Древесной Смолой понимается вязкая маслянистая жидкость от тёмно-бурого до чёрного цвета с резким запахом, получаемая при пиролизе древесины. Она является сложной смесью органических веществ. Применяется для получения понизителей вязкости глинистых растворов и литейных крепителей, в качестве консерванта древесины. Из древесной смолы получают также ингибиторы (вещества, тормозящие химические процессы) окисления топлив и масел, флотореагенты и другие.

NATURAL SELECTION = ЕСТЕСТВЕННЫЙ ОТБОР (или ЕСТЕСТВЕННАЯ СЕЛЕКЦИЯ) – Natural Selection is the driving force behind evolution, whereby organisms best adapted to their environment and most able to withstand environmental pressures are most likely to survive and reproduce, ensuring propagation and survival of their genes through the gene pool. Natural Selection is the growing and survival of the best adapted plants in a given location, with selection occurring naturally without human intervention. / разведение или распространение (propagation). Под Естественным Отбором понимается процесс выживания и воспроизведения организмов, наиболее приспособленных к условиям среды, и гибели в ходе эволюции неприспособленных. Естественный отбор – следствие борьбы за существование; обусловливает относительную целесообразность строения и функций организмов; творческая роль естественного отбора выражается в преобразовании популяций, приводящем к появлению новых видов. Естественный отбор как основной движущий фактор исторического развития живой природы открыт Английским естествоиспытателем Чарлзом Робертом Дарвином (Charles Robert Darwin; 12 February 1809 – 19 April 1882).

NATURAL SHORTS = ПРОДАВЦЫ СЫРЬЕВИКИ (или ПРОДАВЦЫ ФИЗИЧЕСКОГО СЫРЬЯ) – A term Natural Shorts refers to producers of a commodity that must be a seller in the market over time. Also known as Short Hedgers.

NATURAL STAIN = НАТУРАЛЬНАЯ ОКРАСКА (или ЕСТЕСТВЕННАЯ ПЯТНИСТОСТЬ) – Natural Stain:- a discoloration on or in lumber, other than its natural color. / развод (или потёк (stain)). Изменение цвета на или в пиломатериале, отличающееся от его природной окраски. Под Красителями понимаются органические соединения, применяемые для крашения текстильных материалов, кожи, меха, бумаги, пластмасс и другого. Красители получали главным образом из растений. В начале XX века природные красители почти полностью вытеснены синтетическими. Красители классифицируют как по химическому строению (азокрасители, индигоидные, нитрозокрасители, хининиминовые и другие), так и по областям и методам применения (дисперсные, кубовые, прямые, красители для меха и другие).

NAU = NANJING AGRICULTURAL UNIVERSITY

NAUTICAL MILE = МОРСКАЯ МИЛЯ – Nautical Mile is the unit of distance used primarily at sea and in aviation. The nautical mile is defined to be the average distance on the Earth's surface represented by one minute of latitude. This may seem odd to landlubbers, but it makes good sense at sea, where there are no mile markers but latitude can be measured. Because the Earth is not a perfect sphere, it is not easy to measure the length of the nautical mile in terms of the statute mile used on land. For many years the British set the nautical mile at 6 080 feet (1 853.18 meters), exactly 800 feet longer than a statute mile; this unit was called the Admiralty mile. Until 1954 the US nautical mile was equal to 6 080.20 feet (1 853.24 meters). In 1929 an international conference in Monaco redefined the nautical mile to be exactly 1 852 meters or 6 076.115 49 feet, a distance known as the International Nautical Mile. The international nautical mile equals about 1.150 8 statute miles. There are usually 3 nautical miles in a league. The unit is designed to equal 1/60 degree (2), although actual degrees of latitude vary from about 59.7 to 60.3 nautical miles. Distance of one minute of longitude at the

equator, approximately 6 076.115. The metric equivalent is 1 852 meters. The Nautical Mile is a special unit employed for marine and aerial navigation to express distance. The conventional value given here was adopted by the First International Extraordinary Hydrographic Conference, Monaco 1929, under the name 'International nautical mile'. As yet there is no internationally agreed symbol, but the symbols M, NM, Nm, and nmi are all used; in the table the symbol M is used. The unit was originally chosen, and continues to be used, because one nautical mile on the surface of the Earth subtends approximately one minute of angle at the center of the Earth, which is convenient when latitude and longitude are measured in degrees and minutes of angle. / Международная Морская Миля равна 6 076.115 49 футам. Обычно 3 морские мили или 5.556 километров составляют 1 морскую лигу. Под Милей, от Латинского слова Milia (Passuum), означающее Тысяча (Шагов), понимается:- (i) Британская единица длины, равная 1 760 ярдам = 5 280 футам ≈ 1 609.344 метрам (м). (ii) Морская Миля, равная длине дуги меридиана в 1'; её значение – переменное, зависит от географической широты местности. Обозначение:- м. миля. (iii) Международная Морская Миля, равная средней длине дуги меридиана в 1'. 1 международная морская миля равна 1 852 метрам. (iv) Русская единица длины, применявшаяся до введения Метрической Системы Мер и равная 7 вёрстам, или 7.468 километрам (км). Под Милей, от Английского слова Mile, от Латинского словосочетания Milia Passuum, означающее Тысяча Двойных Римских Шагов, понимается единица длины, имевшая распространение в национальных неметрических системах единиц и применяемая теперь главным образом в морском деле. В бывшем Союзе Советских Социалистических Республик (СССР) и большинстве стран применяется морская миля, равная, согласно решению Международной Гидрографической Конференции (1929), 1.852 километра (км) – средней длине 1" дуги меридиана. 1 морская миля = 10 кабельтов. В Великобритании 1 морская миля = 1.853 184 км, 1 сухопутная уставная миля = 1.609 344 км (она применяется и в Соединённых Штатах Америки (США)). Географическая миля (Немецкая) – 1/15° экватора = 7.420 4 км. Старая Русская миля = 7.467 6 км, старая Римская миля = 1.481 км. Морская Миля – единица длины, используемая в морской и воздушной навигации, основана на длине одной минуты дуги большого круга Земли, чаще всего используется как международная и Американская единица длины, равная 1 852 метрам (приблизительно 6 076 футов).

NAV = NET ASSET VALUE

NAVAJO PLY = НАВАХСКОЕ СЛОЖЕНИЕ – Navajo Ply makes a three-ply yarn from a single piece of yarn. This is done by making slip loops or finger crocheting the yarn and adding twist to it. Navajo Ply:- basically a hand-crocheted loop used to create a thee-ply yarn. / Крошэ, от Французского слова Crochet, означающее Крючок, .

NAVIGABLE AIRSPACE = ВОЗДУШНОЕ ПРОСТРАНСТВО ДЛЯ НАВИГАЦИИ – Navigable Airspace means airspace above the minimum altitudes of flight prescribed by regulations under this subpart and subpart III of this part, including airspace needed to ensure safety in the takeoff and landing of aircraft.

NAVIGATE AIRCRAFT AND NAVIGATION OF AIRCRAFT = ВЕСТИ ВОЗДУШНОЕ СУДНО И НАВИГАЦИЯ ВОЗДУШНОГО СУДНА – Navigate Aircraft and Navigation Of Aircraft include piloting aircraft.

NAVIGATION = НАВИГАЦИЯ – Navigation is the act of determining position, location and course to the destination of an aircraft or a vessel. / Действие по определению позиции, местоположения и курса к месту назначения воздушных или морских судов. Под Навигацией, от Латинского слова Navigatio от Navigo, означающее Плыву На Судне, понимается:- (i) мореплавание, судоходство; в более узком значении – раздел науки о способах выбора пути и методах вождения судов, летательных аппаратов (воздушная навигация, аэронавигация) и космических аппаратов (космическая навигация), задачами которой являются нахождение с помощью астрономического, радиотехнического и других методов оптимального маршрута (траектории), определение местоположения, направления и значения скорости и других параметров движения объекта с помощью навигационного оборудования, навигационных приборов, астрономических средств и радионавигационных систем; или (ii) период, когда по местным климатическим условиям возможно судоходство.

NAVIGATION SAFETY ADVISORY COUNCIL = СОВЕЩАТЕЛЬНЫЙ СОВЕТ БЕЗОПАСНОСТИ НАВИГАЦИИ – Navigation Safety Advisory Council (NAVSAC) is an industry advisory body to the US Coast Guard.

NAVSAC = NAVIGATION SAFETY ADVISORY COUNCIL

NAVY = ВОЕННО–МОРСКОЕ (или ТЁМНО–СИНИЙ) – Navy:- a variable color averaging a dark grayish purplish blue.

NAWF = NODES ABOVE WHITE FLOWER

NB = NOTA BENE

NBI = NATIONAL BUREAU OF INVESTIGATION

NBLS = NARROW BROWN LEAF SPOT

NBP = NATIONAL BALANCING POINT

NBPGR = NATIONAL BUREAU OF PLANT GENETIC RESOURCES

NBS = NARROW BROWN SPOT

NBS = NATIONAL BUREAU OF STANDARDS

NBS = NUTRIENT BASED SUBSIDY

NC = NEW CALEDONIA

NC = NO CHARGE

NC = NO–CHOICE

NC = NORDIC COUNCIL

NCA = NATIONAL COFFEE ASSOCIATION

NCAD = NET CASH AGAINST DOCUMENTS

NCAER = NATIONAL COUNCIL FOR APPLIED ECONOMIC RESEARCH

NCB = NATIONAL CENTRAL BANK

NCC = NATIONAL COTTON COUNCIL OF AMERICA

NCDEX = NATIONAL COMMODITY AND DERIVATIVES EXCHANGE (LIMITED)

NCL = NO CONTROL LIMIT

NCP = NONCAPSID PROTEIN

NCP = NUTRITION CENTER OF THE PHILIPPINES

NCPC = NATIONAL CROP PROTECTION CENTER

NCRE = NATIONAL CEREALS RESEARCH AND EXTENSION

NCRI = NATIONAL CEREALS RESEARCH INSTITUTE

NCRW = NATIONAL COMMISSION ON THE ROLE OF WOMEN

NCS = NOMINEE AND CUSTODY SERVICE

NCSE = NEW YORK COFFEE, SUGAR AND COCOA EXCHANGE

NCSO = NATIONAL CENSUS AND STATISTICS OFFICE

NCSU = NORTH CAROLINA STATE UNIVERSITY

NCTS = NEW COMPUTERISED TRANSIT SYSTEM

NCUA = NATIONAL CREDIT UNION ADMINISTRATION

NCV = NO COMMERCIAL VALUE

ND = NEXT DAY DELIVERY

NDE = NONDESTRUCTIVE EVALUATION

NDFA = NITROGEN DERIVED FROM THE ATMOSPHERE

NDF CONTRACT = NONDELIVERABLE FORWARD CONTRACT

NDI = NONDESTRUCTIVE INSPECTION

NDRF = NATIONAL DEFENSE RESERVE FLEET

NDT = NONDESTRUCTIVE TESTING

NDUAT = NARENDRA DEVA UNIVERSITY OF AGRICULTURE AND TECHNOLOGY

NE = NIGER

NEARBY = БЛИЖАЙШИЙ – Nearby:- the nearest listed trading or delivery month of a commodity futures market. See also Nearby Contracts, Nearby Delivery Month, and Nearby Futures. Nearby is the nearest listed trading month of a futures market. / Ближайший в списке торговли месяц или месяц поставки на рынке сырьевых фьючерсов. Смотрите также Ближайшие Контракты (Nearby Contracts).

NEARBY CONTRACTS = БЛИЖАЙШИЕ КОНТРАКТЫ – Nearby Contracts are the futures contracts closest to expiration. See also Nearby Delivery Month, and Nearby Futures. / Фьючерсные контракты с ближайшим сроком прекращения признания. Ближайшие Фьючерсы или Ближайшие Опционные Контракты – контракты с ближайшим по времени месяцем поставки (для фьючерсов) или с ближайшим по времени истечения срока действия (для опционов). Например, в Январе фьючерсные и опционные контракты с оплатой в Феврале или Марте будут считаться Ближайшими. В целом, Ближайшими контрактами гораздо более активно торгуют, нежели контрактами с более отдалёнными месяцами поставки, по которым ликвидность может быть просто никакой.

NEARBY DELIVERY MONTH = БЛИЖАЙШИЙ МЕСЯЦ ПОСТАВКИ – Nearby Delivery Month is the month of the futures contract closest to maturity. The New York Nearby refers to the US Cotton futures market. Most commodities are traded in futures markets and different commodities have different contract months, or months when delivery of the commodity represented by the contracts is due. There are five contract months (March, May, July, October, and December) in the New York futures market. Contract months reflect prices a market participant is willing to buy/sell today for cotton delivered in a specific month in the future, i.e. the March contract indicates a market participant's buy/sell price for cotton delivered in March. The term Nearby refers to the contract that is closest to expiration. To illustrate, in January, the nearby price refers to the March contract. In April, the nearby would refer to the May contract. The significance of the nearby price is that the cotton described by this price is scheduled to be delivered soon, which suggests that the nearby price approximates the market's valuation for fiber with immediate shipment. See also Nearby Contracts, and Nearby Futures. The nearest traded month, the Front Month. In plural form, one of the nearer trading months. The futures contract month closest to expiration. Also known as Front Month, and Spot Month. Nearby Delivery Month:- The futures contract month closest to maturity.

NEARBY FUTURES = БЛИЖАЙШИЕ ФЬЮЧЕРСЫ – Nearby Futures are the futures contracts that are closest to expiration or maturity. See also Nearby Delivery Month. / Ближайшие Фьючерсы – фьючерсные контракты, которые являются самыми близкими к своему прекращению признания или погашению. Смотрите также Ближайший Месяц Поставки (Nearby Delivery Month).

NEARBYS = NEARBY CONTRACTS = NEARBY FUTURES

NEARBY WEEKLY CHART = ПОНЕДЕЛЬНЫЙ ГРАФИК БЛИЖАЙШЕГО МЕСЯЦА ПОСТАВКИ – Nearby Weekly Chart is a chart where the unit of measure is a week's worth of trading for each bar. The nearby chart is constructed by adding each successive futures contract month (closest to expiration). This leaves chart gaps from contract month to contract month (roll-gap) where no trading was able to take place, but has the benefit of showing actual historical price levels for support and resistance.

NEAR TERM = БЛИЖНЕСРОЧНЫЙ – Near Term:- a loose combination of the short term and intermediate term for a market perspective.

NEAR–THE–MONEY OPTION = ОПЦИОН, БЛИЗКИЙ К БЕСПРИБЫЛЬНОМУ – Near-The-Money Option is an option with a strike price close to the current price of the underlying tradable.

NEC = NATIONAL ELECTRICAL CODE

NEC = NATIONAL EXECUTIVE COUNCIL

NECK BLAST = ЗАПАЛ УЗЛА МЕТЁЛКИ – Neck Blast is a form of blast disease where the Rice panicle base becomes dark thereby called 'Rotten Neck'; the panicles may fall over; the symptoms appear also on panicle branches. / 'запал узла' метёлки.

NECKERCHIEF = ШЕЙНЫЙ ПЛАТОК (или КОСЫНКА) – Neckerchief is a kerchief for the neck.

NECK GIRTH = ОБХВАТ ШЕИ – Neck Girth:- girths are circumference measures at standard anatomical sites around the body. Aim:- to measure the circumference of the neck, as one of the many measurements of body size. Equipment Required:- flexible metal tape measure and pen suitable for marking the skin. If a plastic or cloth tape is used, it should be checked regularly against a metal tape as they may stretch over time. Procedure:- the neck measurement is taken immediately above the thyroid cartilage (the Adam's Apple). The subject should keep their head up and looking straight ahead. When recording, you need to make sure the tape is not too tight or too loose, is lying flat on the skin. Reliability:- factors that may affect reliability include changes to the testing personnel, constant and even tension on the tape, and correct landmarking (finding the correct anatomical site for measurement). Advantages:- low costs involved in the testing procedure, and ease of self testing. Comments:- girth measurements combined with skinfold measurements can give a clearer picture of changes in tissue composition and distribution of muscle and fat. Mid Neck Girth:- circumference of the middle of the neck. Neck Base Girth:- circumference measurement of the base of the neck measured through the nape and the transition between the torso and the neck. / Обхват Шеи:- обхват в сантиметрах, измеренный на 2 сантиметра (см) ниже кадыка и на уровне 7-го шейного позвонка.

NECKING = СУЖЕНИЕ (или ШЕЙКА, или ГОРЛОВИНА, или ЦАПФА) – Necking is:- (1) the sudden reduction in the diameter of an undrawn manufactured filament when it is stretched. (2) Narrowing in width of a fabric or film when it is stretched.

NECKLEAF = ХХ (или ШЕЙКОВЫЙ ЛИСТ) – Neckleaf (nl):- the panicle is enclosed by a spathe-like leaf or leaf sheath arising at the panicle base. Occasionally, additional bracts may arise at the base of the panicle branches. A Neck Leaf (for Rice) is an extra leaf grown from the basal node of panicle. Usually most part of panicle is not covered by this neck leaf, but the panicle of NL1 (Gene Symbol of the Committee on Gene Symbolization, Nomenclature and Linkage (CGSNL)) mutant is covered by the neck leaf. If this is longer than a panicle, the spikelet does not appear from the leaf sheath when matured. / :- метёлка, или влагалище листа .

NECKLINE = ЛИНИЯ ШЕИ – In visual analysis, Neckline is a trendline drawn between the two shoulders on a head and shoulders formation. This location is the traditional breakout level for the new developing trend in the opposite direction. / В техническом анализе биржевых рынков, .

NECK NODE (PANICLE BASE) = ШЕЙНЫЙ УЗЕЛ (БАЗА МЕТЁЛКИ) – Neck Node (panicle base) is the nearly solid node between the uppermost internode of the culm and the panicle axis. / В ботанике под Метёлкой понимается ложное соцветие, многократно ветвящееся и несущее на концах ветвей простые соцветия – кисти (Сирень), колоски (у злаков), корзинки (у сложноцветных).

NECKTIE = ШЕЙНЫЙ ГАЛСТУК (или ГАЛСТУК) – Necktie is a narrow length of material worn about the neck and tied in front. / .

NECKWEAR = ШЕЙНАЯ ОДЕЖДА (или ОДЕЖДА ДЛЯ ШЕИ) – Neckwear:- articles of clothing, as ties and scarves, worn about the neck. / галстуки и шарфы, .

NECROSIS = НЕКРОЗ – Necrosis is sudden discoloration (yellow progressing to brown) of plant tissue, followed by die back of the epidermis, caused by many factors. / Под Некрозом, от Греческого слова Nékrōsis, означающее Омертвение, понимается омертвение ткани под влиянием нарушения кровообращения, химического или термического воздействия (ожог, отморожение), травмы и другого. Зона некроза окружается демаркацией, отторгается или подвергается гнойному расплавлению; на месте дефекта ткани образуется рубец.

NECROTIC MOSAIC = НЕКРОТИЧЕСКАЯ МОЗАЙКА (или НЕКРОТИЧЕСКАЯ МОЗАИЧНОСТЬ) – Necrotic Mosaic is a viral disease caused by the Rice necrotic mosaic Virus (RNMV). Polymyxa Graminis is considered to be the Vector of the RNMV. The disease occurs in Central and Southern Japan. Infected plants have elongate or spindle-shaped, yellow flecks and streaks on the basal portions of stems and sheaths. Plants may be moderately stunted with reduced tiller number and spreading growth habit. It can be transmitted by mechanical means and through the soil. There has been no evidence that Insects or Seeds transmit the disease.

NECROTROPHS = НЕКРОТРОФЫ – Necrotrophs are Parasitic Fungi that do not need a living host to be able to reproduce. / Под Некротрофами, от Греческих слов Nekrós, означающее Мёртвый, и Trophē, означающее Питание или Пища, понимаются .

NECTAR = НЕКТАР – Nectar is a sugary secretion produced by flowers and other vegetative parts. Nectar attracts pollinators to flowers. / (1) Под Нектаром, от Греческого слова Néktar, понимается сахаристый сок, выделяемый нектарниками растений и привлекающий к цветкам опылителей – насекомых, некоторых птиц. Важнейшая часть взятка пчёл.

(2) In Greek mythology, the gods and goddesses are often described as consuming nectar and ambrosia. Nectar is a sweet drink which gave immortality to any mortal who would be fortunate enough to drink it. Ambrosia is the heavenly food of the Greek gods and goddesses. Immortality is the concept of living forever. The gods and goddesses did not consume food that would be eaten by mortals. According to one Greek legend, each day doves flew to Mount Olympus carrying ambrosia to Zeus, King of the Greek gods and goddesses, which he dispersed to the other deities. Nectar was also used to anoint the bodies and hair of the Greek gods and goddesses. Only one mortal was ever permitted to consume the royal nectar and ambrosia. That mortal was Tantulus who invited the goddesses and gods of Greece to a banquet. Tantalus planned to steal ambrosia and nectar to take back to the mortals on earth. He had an evil plan which involved killing his own son, whom he then cooked by boiling and served to the royal guests. The goddesses and gods quickly discovered the crime and punished Tantulus for all eternity. He was forced to stand in a pool of water which disappeared each time he bent to get a drink. The tree branches above him had delicious fruit, but each time Tantulus tried to pluck the fruit the wind would blow the branches too far away to reach the figs, pomegranates, apples and pears. Scholars who study Greek mythology believe ambrosia and nectar were references to bee's honey. Honey can have healing properties and can also be used to make wine or mead (an alcohol based drink), Ambrosia would then refer to the honey comb or honey, while nectar was the wine or mead drink. Oil made from honey was used by the ancient Greeks to prevent corpses from decaying as quickly. Nectar is actually the liquid juice inside flowers that bees convert to honey. This seems to indicate that nectar and ambrosia were indeed honey based. In modern times, people can purchase mead or honey wine and eat honey or honeycombs to experience the food of the Greek gods and goddesses. Alternatively, people can find recipes for mead or honey wine and make it at home. There are also recipes for ambrosia recipes that include honey, coconut, oranges and other ingredients, which are often referred to as an Ambrosia Fruit Salad. Nectar is a beverage of the gods, which conferred immortality on any mortal lucky enough to partake of it. In this regard, nectar was like ambrosia, the divine food. The theft of either was a serious offense. Tantalus was condemned to an eternity of hunger and thirst, with water and fruit always just out of reach, for a crime which may well have involved stealing ambrosia from the gods. Tantalus:- there were two favorite treats of the gods, nectar and ambrosia. According to one version of his myth, Tantalus was condemned to eternal punishment in the afterlife for stealing ambrosia from the gods. / В Греческой мифологии под Нектаром, от Греческого слова Néktar,

понимался напиток олимпийских богов, вместе с амброзией (пищей богов) дававший им бессмертие и вечную юность. В переносном смысле – напиток превосходного вкуса и аромата.

NECTARY = НЕКТАРНИК – Nectary is a multicellular glandular structure secreting nectar. Found in flowers and on vegetative parts in some species. A gland on the Cotton Plant that secretes nectar, e.g., at base of flowers, on underside of leaves on the main vein. A Nectary is normally developed between stamens and ovary. It can be assumed that the flowers of Gesneriaceae are primarily nectar-flowers and that the (rather rare) lack of a nectary is a phylogenetically secondary condition. As floral ontogeny, floral anatomy, and the 'adnate' nectary of the Coronantheroid Gesneriaceae demonstrate, the nectary is an enation of the ovary base and not of receptacular origin or a transformed inner stamen whorl. There is a great Variety of nectary forms. In the complete form it is cylindrical, cup- or ring-shaped, occasionally with shallow lobes at the rim. In the paleotropical Gesneriaceae this is by far the prevailing form and other types are rare. In the Coronantheroid Gesneriaceae the nectary is also complete, but adnate to (or embedded in) the ovary base. In the neotropical Gesneriaceae only a dozen of the Genera have a ring-shaped nectary; in the others it is strongly modified. Two evolutionary lines can be observed:- (1) Beslerieae:- complete ring – dorsally thickened ring – semi-annular structure – dorsal gland. (2) Gloxinieae, Sinningieae and Episcieae:- ring – 5-lobed ring – 5 separate glands of equal size – 5 glands of unequal size (the two dorsal ones enlarged) – connation of the dorsal and step-wise reduction of the lateral and ventral glands – single dorsal gland. The nectary shape is of great importance in defining Genera (Wiehler 1983). Both in the paleo- and neotropical Gesneriaceae there are taxa in which the nectary is rudimentary (non-functional) or completely reduced (in pollen-flowers, deceptive pollen flowers and perfume-flowers, see Pollination). / Виды (Species). Желёзки Хлопчатника, выделяющие нектар, например, в основании цветков, на оборотной стороне листьев вдоль основной жилки листа. В цветках большинства Цветковых Растений имеются специальные экскреторные органы для производства нектара – Нектарники. Они возникли в самых разных ветвях эволюции цветковых растений и на самой разной морфологической основе, то есть на самых разных частях цветка. К Нектарникам относятся желёзки Растений, выделяющие нектар. Обычно они расположены в цветке, редко – на листьях и стеблях.

NEDA = NATIONAL ECONOMIC AND DEVELOPMENT AUTHORITY

NEDECO = NETHERLANDS DEVELOPMENT COMPANY

NEED = ПОТРЕБНОСТЬ (или НУЖДА) – Need is a lack of something wanted or deemed necessary by an individual or group. In economics, the lack applies to a good or service. The purpose of economic activity is to fulfill needs. The means whereby these needs are satisfied is one of the main determinants of an economic system. Economic doctrines differ in the means they advocate to reach these ends. / В экономике Потребность, нужда в чём-либо, объективно необходимом для поддержания жизнедеятельности и развития организма, человеческой личности, социальной группы, общества в целом; внутренний побудитель активности. Потребности делятся на биологические, свойственные животным и человеку, и социальные, которые носят исторический характер, зависят от уровня экономики и культуры. Потребности общества, и прежде всего экономические потребности как основа общественного производства, объективны. Осознанные обществом, классами и индивидами потребности, которые в классовом обществе различны, выступают как их интересы.

NEEDLE = ИГЛА (или ИГОЛКА) – Needle is:- (1) a thin, metal device, usually with an eye at one end for inserting the thread, used in sewing to transport the thread.

(2) Needle:- the portion of a knitting machine used for intermeshing the loops. Several types of knitting needles are available. See also Latch Needle, and Spring Needle. / Трикотажная Игла (Knitting Needle or Frame Needle) – основная деталь петлеобразующего механизма трикотажных машин, служащая для образования петель. Изготовляется из стальной проволоки или ленты; имеет длину 25–100 мм, толщину 0.3–1 мм. От толщины иглы зависит размер петли:- чем тоньше игла, тем меньше петля, которую можно на ней получить, и тем больше петель помещается на единицу ширины трикотажного полотна. Наиболее распространены трикотажные иглы Язычковые (Latch Needle), Крючковые (Bearded Needle), Пазовые (Compound Needle) и Трубчатые. Крючок язычковой иглы закрывается и открывается язычком, который поворачивается петлёй, скользящей по игле при петлеобразовании. Для перемещения иглы в пазу игольницы служат пяточки, число которых зависит от конструкции машины. Помимо одноголовочных, иглы бывают также двухголовочные, с двумя язычками и другие. Применяются почти во всех типах машин, выполняющих петлеобразование по вязальному способу. У крючковой иглы крючок имеет удлинённую форму. При петлеобразовании специальное устройство (пресс) нажимает на крючок, который погружается в чашу (углубление на стержне иглы), препятствуя попаданию петли под крючок. Иглы с помощью пяточек закрепляются в игольнице обычно неподвижно. Применяются в основовязальных машинах типа 'вертелка', а также мальезных, котонных и других, выполняющих петлеобразование по трикотажному способу. Пазовые иглы состоят из стержня с крючком и движка (замыкателя), перемещающегося для закрывания крючка в пазу вдоль стержня иглы. Закрепляются в игольнице неподвижно. Используются в основовязальных машинах типа вертелка, выполняющих петлеобразование по вязальному способу.

(3) In nonwovens manufacture, Needle is a barbed metal device used for punching the web's own fibers vertically through the web.

NEEDLE BAR = ФОНТУРА (или ИГОЛЬНИЦА, или ИГОЛЬНАЯ ПЛАНКА) – Needle Bar is a flat metal plate with slots (tricks) cut into it at regular intervals into which needles slide during the knitting process. / Под Фонтурой, от Французского слова Fonture, от Fondre, означающее Отливать или Плавить, понимается игольница, в которой размещаются трикотажные иглы*;* основной рабочий орган петлеобразующей системы трикотажной машины. В зависимости от формы различают плоские фонтуры (в виде пластин) и круглые (в виде цилиндра). Иглы в фонтуре закрепляются неподвижно либо перемещаются в пазах, которые имеются на внешней поверхности цилиндра или пластины. Расстояние между иглами в фонтуре определяет допустимую толщину нитей, из которых вырабатывается трикотаж. На машинах фонтуры в процессе петлеобразования обычно совершают поступательные (в плоских машинах) или вращательные (в круглых) движения.

NEEDLE BEARING = ИГОЛЬЧАТЫЙ ПОДШИПНИК – Needle Bearing is a rolling type of bearing containing rolling elements that are relatively long compared to their diameter. See also Bearing. / Игольчатый Подшипник:- роликоподшипник с игольчатыми роликами, использующийся для восприятия радиальной нагрузки. Относится к подшипникам качения, но при этом не имеющим сепаратора. Смотрите также Подшипник Качения.

NEEDLE BED = ИГОЛЬНАЯ ФОНТУРА – Needle Bed is a flat metal plate with slots at regular intervals in which the knitting needles slide on the knitting machine.

NEEDLE BURNS = ПРОЖОГИ ИГЛАМИ – Needle Burns:- scorched or fused thread or fabric caused by excessive friction. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или дефект от машинного оборудования. Под Следами От Игл понимается местный порок в виде мелких отверстий на поверхности текстильного полотна, в которых нити разрушены или оборваны.

NEEDLE CHEW = ЗАЖЁВАННОЕ ИГЛОЙ – Needle Chew:- caused by use of wrong or blunt needle or machine feeding difficulty. Sewing Room Defects. / Порок или дефект швейного производства.

NEEDLE CUTS = ИГОЛЬНЫЕ ПРОРУБКИ (или ПРОРУБКИ ИГЛАМИ) – Needle Cuts:- threads broken or material damaged by needles, caused by incorrect size, point or design of needle. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или дефект от машинного оборудования. Игольные Прорубки бывают двух видов:- явная (visible) и скрытая (invisible). Явная Прорубка трикотажного полотна – полное разрушение петель полотна при пошиве, выявляющиеся при просмотре его вдоль шва. Скрытая Прорубка трикотажного полотна – частичное разрушение петель полотна при пошиве, выявляющиеся после механического воздействия на полотно швов. Под Следами От Игл понимается местный порок в виде мелких отверстий на поверхности текстильного полотна, в которых нити разрушены или оборваны.

NEEDLED FABRICS = ИГЛОПРОБИВНЫЕ ТКАНИ – Needled Fabrics:- the product of the needle loom. Needled fabrics are used for rug pads, papermaker's felts, padding, linings, etc.

NEEDLE LEAF = ИГОЛЬЧАТЫЙ ЛИСТ (или ИГЛОВИДНЫЙ ЛИСТ) – Needle Leaf:- slender leaf of many conifers, e.g., Pinus sylvestris.

NEEDLE LINE = ЛИНИЯ ОТ ИГЛЫ – Needle Line:- caused by bent needle forming distorted stitches. Usually vertical line. Knitted fabric defect. Needle Lines or Vertical Lines are due to a wale that is either tighter or looser than the adjacent ones. This is caused by needle movement due to a tight fit in its slot or a defective sinker. Needle Line:- a wale that is different in .... Defect Name:- Needle Line. Defect Type:- warp lines, vertical lines. Fabric Type:- Double Knit Fabrics. Description:- Needle Line:- The result of a bent needle. Severity:- Minor. / След От Трикотажной (или Вязальной) Иглы:- порок или дефект трикотажного полотна в виде спрессованных или разрыхлённых петельных столбиков.

NEEDLE LOOM = ИГОЛЬЧАТЫЙ ТКАЦКИЙ СТАНОК – Needle Loom is a machine for bonding a nonwoven web by mechanically orienting fibers through the web. The process is called Needling, or Needlepunching. Barbed needles set into a board punch fiber into the batt and withdraw, leaving the fibers entangled. The needles are spaced in a nonaligned arrangement. By varying the strokes per minute, the advance rate of the batt, the degree of penetration of the needles, and the weight of the batt, a wide range of fabric densities can be made. For additional strength, the fiber web can be needled to a woven, knit, or bonded fabric. Bonding agents may also be used. Needle Loom is a high-speed narrow fabric-weaving machine (loom) that uses a needle to insert filling across a warp. A Needle loom uses a catch cord system to make a selvage on one edge of the weave and to return the pick after anchoring it within the selvage. / уточина .

NEEDLE LOOP = ИГОЛЬНАЯ ПЕТЛЯ – Needle Loop is a loop of yarn drawn through a loop made previously. / Игольная Петля при вязании иглами.

NEEDLE PICK = XX – Needle Pick:- failure of operator to replace a dull needle. Sewing Room Defects. / Порок или дефект швейного производства.

NEEDLE PICKING = XX – Needle Picking:- threads broken or material weave distorted by sewing machine needle having burred point. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или дефект от машинного оборудования.

NEEDLEPOINT = ШИТОЕ ИГЛОЙ (или ИГЛОПРОШИВНОЕ) – Needlepoint:- lace worked with a needle over a paper pattern.

NEEDLEPOINT LACE = КРУЖЕВО, ШИТОЕ ИГЛОЙ – Needlepoint Lace is a lace made with a sewing or embroidery needle to form buttonhole stitches as the basis of the design.

NEEDLEPUNCHING = ИГЛОПРОШИВАНИЕ – Needlepunchung is the process of converting batts or webs of loose fibers into a coherent nonwoven fabric on a needle loom.

NEEDLE SET–OUT = XX – Needle Set-Out is a term that refers to long periods of time when certain needles are removed from the knitting cycle. The process is used to make sweater cuffs.

NEEDLE SLOT = ИГОЛЬНЫЙ (или ИГОЛЬЧАТЫЙ) ПАЗ (или КУЛИССА, или ЩЕЛЬ, или ВЫЕМКА, или ПРОРЕЗ) – Needle Slot is a groove that houses a needle in the cylinder or dial of a circular-knitting machine or the needle bed of a flat-bed machine. / жёлоб или паз (groove).

NEGATIVE ACKNOWLEDGEMENT = ПОДТВЕРЖДЕНИЕ В ОТКАЗЕ (или ПОДТВЕРЖДЕНИЕ В СБОЕ, или ПОДТВЕРЖДЕНИЕ НЕПРАВИЛЬНОГО ПРИЁМА) – A Negative Acknowledgement (NAK), sent by the system to the sender of an input message, notifying them that their message has been rejected. The reason for rejection is indicated by an error code. In the case of a payment message, the sender remains responsible for the payment.

NEGATIVE AMORTIZATION = ОТРИЦАТЕЛЬНАЯ АМОРТИЗАЦИЯ – Negative Amortization occurs when the monthly payments do not cover all the interest owed. The interest that is not paid in the monthly payment is added to the loan balance. This means that even after making many payments, you could owe more than you did at the beginning of the loan. Negative amortization can occur when an adjustable-rate mortgage (ARM) has a payment cap that results in monthly payments that are not high enough to cover the interest due or when the minimum payments are set at an amount lower than the amount you owe in interest. Negative Amortization is an increase in the principal of a loan, when the loan payments are insufficient to pay the interest due. The unpaid interest is added to the outstanding loan balance causing the principal to increase rather than decrease as payments are made. This situation typically occurs in an adjustable mortgage with an annual cap limiting any increases in the interest rate, and also in a graduated payment mortgage, which has low initial payments so moderate-income borrowers can afford to make the loan payments. / когда закладная с переоцениваемой ставкой (ЗПС; adjustable-rate mortgage (ARM)) имеет верхний предел платежа, который . Отрицательная Амортизация – условие финансирования, при котором ежемесячные платежи меньше, чем сумма истинных платежей в счёт погашения кредита и процентов, причём непогашенный остаток кредита превышает объём, до которого он должен был бы снизиться по условиям кредитования, а невыплаченные проценты прибавляются к остатку кредита. В некоторых случаях невыплаченные проценты присоединяются к основной сумме кредита и вместе с ней подлежат погашению по наступлении срока. Например, для 30-летнего ипотечного кредита процентные платежи за первые 6 месяцев начисляются по ставке 13%, но на самом деле они должны начисляться по ставке 18%; ставка должна повышаться каждые 6 месяцев. По условиям некоторых кредитов отрицательная амортизация может вводиться для того, чтобы погасить дефицит средств от снижения заёмщиком уровня платежей. Федеральное законодательство требует от ипотечных кредиторов заверений, что заёмщики согласны на условия отрицательной амортизации по нескольким вариантам процентных ставок, то есть заранее ознакомлены с документами, подробно раскрывающими условия кредитования.

NEGATIVE CARRY = ОТРИЦАТЕЛЬНЫЕ ЗАТРАТЫ (или РАСХОДЫ НА ПОКРЫТИЕ УБЫТКОВ, или НЕГАТИВНЫЕ НАКЛАДНЫЕ РАСХОДЫ) – Negative Carry is a situation in which the cost of holding a security exceeds the yield earned. A negative carry situation is typically undesirable because it means the investor is losing money. An investor might, however, achieve a positive after-tax yield on a negative carry trade if the investment comes with tax advantages, as might be the case with a bond whose interest payments were nontaxable. A negative carry would occur if an investor borrowed USD1 000 at 12.5% and used the USD1 000 to purchase a bond yielding 9.5%. The bond's coupons would not cover the interest owing, so the investor would end up paying 3% to make the investment. Negative Carry:- the cost of financing a financial instrument (the short-term rate of interest), when the cost is above the current return of the financial instrument. See also Carrying Charges, and Positive Carry. Negative Carry is a situation in which the cost of financing an income is greater than the income it generates. This is important where positions are financed by debt or short-selling. Negative carry does not necessarily mean that an investment will makes a loss; carrying cost may be less than a capital gain. It may not even be a particularly important factor in the profitability of a position. Apart from simple borrowing (where the carry cost is the interest), carry cost may be incurred by short selling. This is important, for example, in a number market netural strategies where a short position in security is matched against a long position in another. Situations where negative carry may be important include:- (i) reversed convertible arbitrage; (ii) highly geared positions, particularly if they are held for more than a short time; (iii) investments in property funded by mortgage borrowing; and (iv) foreign exchange trading. The opposite of negative carry is Positive Carry. / Отрицательный Результат Хранения актива – ситуация, при которой стоимость заёмных средств, необходимых для финансирования покупки ценных бумаг, выше дохода по ценным бумагам. Например, если инвестор занимает средства под 10%, чтобы финансировать покупку облигации, приносящую 8% доход, то он получит отрицательный результат. Однако отрицательный результат не обязательно означает убыток для инвестора, и после налогообложения доход может оказаться положительным. В указанном случае 8% доход от облигации может исключаться из налогообложения, в то время как проценты; уплачиваемые по 10% займу, не могут вычитаться из налогообложения.

NEGATIVE FEED = ПРОТИВОПОЛОЖНАЯ (или ОБРАТНАЯ) ПОДАЧА – Negative Feed:- when the yarn is pulled off the warp beam by the knitting action of the needles during the loop forming step. See also Positive Feed.

NEGATIVE INTEREST = ОТРИЦАТЕЛЬНЫЙ ПРОЦЕНТ (или ВЫЧТЕННЫЙ ПРОЦЕНТ) – Negative Interest:- a charge made by a bank for holding funds for a certain time. Interest which is deducted from the principal. Also known as Interest Charge.

NEGATIVE MORTGAGE CLAUSE = ОГОВОРКА О НАЛОЖЕНИИ ВЕТО НА ЗАКЛАДНУЮ – Negative Mortgage Clause:- the promise made by a mortgage borrower to the creditor not to establish any mortgage liens in favor of third parties without the creditor's consent and not to raise existing ones on his property. Usually agreed in writing. See also Negative Pledging Clause.

NEGATIVE PLEDGING CLAUSE = ОГОВОРКА ОБ ОТКАЗЕ ИСПОЛЬЗОВАНИЯ ЗАЛОГА (или ОГОВОРКА О НАЛОЖЕНИИ ВЕТО НА ЗАЛОГ) – Promise made by the borrower to the creditor not to mortgage any assets (claims, goods, securities, etc) without the agreement of the creditor. See also Negative Mortgage Clause. Negative Pledge Clause:- in the context of long-term loans and bonds, a negative covenant is an obligation on the part of a debtor not to encumber certain assets or not to encumber them at a higher rate – in particular real property – as security to a lender or not to grant other lenders any pieces of collateral without allowing the present lenders to participate equally in this. Also:- Negative Covenant. / Оговорка Об Отрицательном Залоге – отрицательный залог или обещание, вносимое в соглашение об эмиссии ценных бумаг или в доверительное соглашение (indenture), в котором говорится, что корпорация не будет использовать в качестве залога какие-либо из своих активов, если результатом этого станет ухудшение уровня обеспечения долговых обязательств, указанного в соглашении. Также называется Положением о Равном Покрытии (Covenant of Equal Coverage).

NEGATIVE YIELD CURVE = ОБРАТНАЯ КРИВАЯ ДОХОДНОСТИ (или КРИВАЯ ОТРИЦАТЕЛЬНОЙ ДОХОДНОСТИ) – Negative Yield Curve:- an unusual relationship between bond yields and maturity lengths that results when interest rates on long-term bonds are lower than interest rates on short-term bonds. Negative refers to the downward slope of the curve that is drawn to depict this relationship. Also called Inverted Yield Curve. Compare Positive Yield Curve. What should investors do when short-term rates exceed long-term rates? By its very existence, a negative yield curve should be viewed as a market consensus or prediction that interest rates are going to fall, because the market in general has commanded a higher yield for short maturity periods than it has required to attract investment Dollars for longer maturity periods. A negative yield curve is usually followed by a flattening and then by a positive yield curve. When this happens, yields on short maturities would probably fall substantially. This shift could occur for various reasons. For example, it could happen as a result of the market coming to expect an easing of inflation; then, yields on longer maturities would also be expected to decline. The longer the maturity, the greater the profit potential for a given decline in yields. Negative Yield Curve:- when the yield on a short-term security is higher than the yield on a long-term security, partially because high interest rates are creating a greater demand for short-term borrowing. See also Yield Curve. Negative Yield Curve:- a negative, or inverted, yield curve results when the yield on short-term US Treasury issues is higher than the yield on long-term Treasury bonds. You create the curve by plotting a graph with yield on the vertical axis and maturity date on the horizontal axis and connecting the dots. When the curve is negative the highest point is to the left. A positive yield curve – one that's higher on the right – results when the yield on long-term bonds is higher than the yield on the short-term bills. A level curve results when the yields are essentially the same. In most periods, the yield curve is positive because investors demand more for tying up their money for a longer period. But there are times, such as when interest rates seem to be on the upswing, that the pattern is reversed and the yield curve is negative. / Смотрите также Кривая Доходности (Yield Curve). Отрицательная Кривая Доходности:- ситуация, при которой процентные ставки по краткосрочным ценным бумагам выше, чем ставки по долгосрочным ценным бумагам аналогичного качества. Как правило, долгосрочные процентные ставки выше краткосрочных, поскольку лица, связывающие свои средства на более длительный период времени, принимают на себя больший риск. Но если процентные ставки поднимаются достаточно высоко, то заёмщики не желают связывать себя высокими процентными ставками на длительный период времени и привлекают краткосрочные займы. Таким образом, доход по краткосрочным кредитам растёт, а доход по долгосрочным кредитам снижается или остаётся прежним. Также называется Перевернутой Кривой Доходности (Inverted Yield Curve). Смотрите также Yield Curve.

NÉGLIGÉE = НЕГЛИЖЕ – Négligée is a woman's long flowing usually sheer dressing gown; careless informal or incomplete attire. / Утреннее домашнее платье.

NEGLIGENCE = НЕБРЕЖНОСТЬ – (1) Imprudent action or omission which may cause injury, damage or loss. Negligence is a form of tort or breach of a legal duty of care where the victim is entitled to some form of compensation, e.g., damages for harm suffered.

(2) Failure to use the degree of care expected from a reasonable and prudent person. Negligence is the failure to use such care as a reasonably prudent and careful person would use under similar circumstances; it is the doing of some act which a person of ordinary prudence would not have done under similar circumstances or failure to do what a person of ordinary prudence would have done under similar circumstances. The term refers only to that legal delinquency which results whenever one fails to exhibit the care which one ought to exhibit, whether it be slight, ordinary, or great.

NEGOTIABLE = ОБОРОТНЫЙ (или ОТЧУЖДАЕМЫЙ, или ПЕРЕУСТУПАЕМЫЙ, или ОБРАЩАЕМЫЙ, или НЕГОЦИИРУЕМЫЙ) – A term Negotiable refers to an instrument that may be freely traded and transferred. In terms of documents, Negotiable means that, e.g., a Bill of Lading may be sold to another party whereby the ownership of the cargo is transferred by means of an endorsement of the Bill of Lading to the order of the other party whom is subsequently entitled to take possession of the goods. Refers to a security, title to which is transferable by delivery. Negotiable:- a quality belonging to a document of being able to transfer ownership of money, goods, or other items of value specified in the document by endorsement and/or delivery of the document. Checks, drafts, promissory notes, bonds, stock certificates, bills of lading, and warehouse receipts are examples of documents often issued in negotiable form. / , например, . 'Оборотный документ смешанной перевозки', разработанный на основе 'оборотного коносамента', – также выдаваемый в виде комплекта нескольких равноценных 'оригиналов', – явился результатом естественного развития документации с появлением морских смешанных перевозок контейнерных грузов (при перевозке грузов наземным, внутренним водным или воздушным транспортом до или после морского участка перевозки и/или при перевозке на 'фидерном судне' до специализированного 'океанского контейнеровоза', курсирующего между 'региональными' специализированными контейнерными портами). Передаваемый или Переуступаемый:- в общем значении:- (1) Подлежащий продаже или передаче. Нечто, что может быть продано или передано иной стороне в обмен на некоторую денежную сумму или в качестве исполнения обязательств. (2) Подлежащий обсуждению, являющийся предметом взаимной договорённости. Вопрос, являющийся взаимно важным для одной или более сторон, связанный с условиями, которые должны быть оговорены при взаимном удовлетворении сторон. Например, в соглашении между кредитором и заёмщиком могут подлежать обсуждению процентные ставки; при продаже ценных бумаг могут быть предметом взаимной договорённости брокерские комиссионные, хотя в течение долгого времени они были фиксированными; при рассмотрении дел о разводе супружеских пар с детьми условия предоставления прав на посещение детей обычно также являются предметом взаимной договорённости. В финансах:- подлежащий продаже или передаче другому лицу. Финансовый документ, удовлетворяющий требованиям Кодекса Унифицированных Коммерческих (торговых) правил (Uniform Commercial Code), касающихся подлежащих продаже или передаче иному лицу финансовых документов. Смотрите также Negotiable Instruments. В инвестициях:- свободно обращающийся, оборотный. Тип ценных бумаг, право владения которыми может быть передано другому лицу. Например, должным образом оформленные сертификаты с доверенностью на акции, являются свободно обращающимися ценными бумагами.

NEGOTIABLE BILL OF LADING = ОБОРОТНЫЙ КОНОСАМЕНТ – Negotiable Bill Of Lading:- something that can be negotiated, transferred or assigned from one person to another in return for equivalent value by being delivered either with endorsement (as of an instrument to order) or without endorsement (as of an instrument to bearer) so that the title passes to the transferee who is not prejudiced in his rights by any defect or flaw in the title of prior parties nor by personal defenses available to prior parties among themselves provided in both cases that the transferee is a bona fide holder without notice, e.g., bills of lading, bills of exchange, promissory notes, and cheques that are payable to bearer or order are negotiable instruments, as are also, in some jurisdictions, some other instruments (as bonds, some forms of stock), i.e. negotiable paper/negotiable securities. 'Negotiable' used analogously for 'transferable'. See also Negotiability, and Transferability. Original Bill of Lading (B/L) endorsed by shipper that is used for negotiating documents with bank. A bill of lading is negotiable if the bill states that the goods are to be delivered to the consignee and does not contain an agree-ment with the shipper that the bill is not negotiable. 49 USC §80103(a) (2005; 49 USC is short for the United States Code:- Title 49). If the bill of lading is negotiable, 'it controls possession of the goods and is one of the indispensable documents in financing the movement of commodities and merchan-dise'. The B/L is a title document to the goods, issued to the order of a party, usually the shipper, whose endorsement is required to effect is negotiation. Thus, a shipper's order (negotiable) B/L can be bought, sold, or traded while goods are in transit and is commonly used for letter-of-credit transactions. The buyer must submit the original B/L to the carrier in order to take possession of the goods. Negotiable Bill Of Lading, also known as Order Bill of Lading, is a negotiable document by which a transportation line acknowledges receipt of freight and contracts for its movement. The surrender of the original straight bill of lading, properly endorsed, is required by transportation lines upon delivery of the freight, in accordance with the terms of the bill of lading. / заслуживающий доверия или действительный (bona fide).

NEGOTIABLE INSTRUMENTS = ОБОРОТНЫЕ ИНСТРУМЕНТЫ (или ОТЧУЖДАЕМЫЕ ИНСТРУМЕНТЫ, или ПЕРЕУСТУПАЕМЫЕ, или ОБРАЩАЕМЫЕ, или НЕГОЦИИРУЕМЫЕ ИНСТРУМЕНТЫ) – Negotiable Instrument is a document that may be freely exchanged, usually by endorsement, and which entitles the bearer to a sum of money. Negotiable Instruments:- a document of title (such as a bill of exchange, certificate of deposit, check, draft, promissory note, or bill of lading) transferable from one person to another in good faith for a consideration. Non-negotiable bills of lading are known as Straight Consignment. Negotiable bills are known as Order Bills of Lading. / Оборотный Инструмент или Отчуждаемый Инструмент или Обращающийся Инструмент или Переуступаемый Инструмент – финансовый или кредитно-денежный документ, подлежащий продаже или передаче иному лицу. Безусловный приказ или обязательство о выплате определённой суммы, легко передаваемое одним лицом другому. Примеры:- чеки, простые векселя, переводные векселя. Кодекс Унифицированных Коммерческих (торговых) правил (Uniform Commercial Code) установил, что обращающимся может быть финансовый документ, подписанный выдавшим его лицом или составителем, содержащий безусловный приказ или обязательство о выплате определённой суммы, подлежащий оплате по требованию или по истечении определённого периода времени указанному лицу или предъявителю.

NEGOTIABLE ORDER OF WITHDRAWAL ACCOUNT = СЧЁТ С ОБОРОТНЫМ РАСПОРЯЖЕНИЕМ НА СПИСАНИЕ (или СЧЁТ С ОТЧУЖДАЕМЫМ ПОРУЧЕНИЕМ НА ИЗЪЯТИЕ СРЕДСТВ) – In the United States, the Negotiable Order of Withdrawal (NOW) account is an interest-earning account on which checks may be drawn. Withdrawals from NOW accounts may be offered by commercial banks, mutual savings banks, and savings and loan associations and may be owned only by individuals and certain nonprofit organizations and governmental units. A Negotiable Order of Withdrawal Account (NOW Account) is an interest-earning bank account with which the customer is permitted to write drafts against money held on deposit. The Transaction Account Guarantee Program covers NOW accounts paying an interest rate at or below 0.5%.

NEGOTIABLE WAREHOUSE RECEIPT = ОТЧУЖДАЕМАЯ СКЛАДСКАЯ РАСПИСКА – Negotiable Warehouse Receipt is a document showing proof that the quantity and grade of commodity is held in storage. Ownership can be transferred by endorsing the warehouse receipt. See also Warehouse Receipt, and Warehousing Agreement.

NEGOTIATE = ОТЧУЖДАТЬ (или НЕГОЦИИРОВАТЬ) – Negotiate:- to buy documents representing ownership of money, goods, or other items of value. The seller is also said to 'negotiate to' the buyer. Unless otherwise agreed between the buyer and seller (e.g., by negotiating 'without recourse'), the seller continues to be fully responsible for the enforceability of the documents. A bank that negotiates documents under a letter of credit advances funds to the presenter before submitting the documents to the issuing bank for payment. / , например, .

NEGOTIATING BANK = ИСПОЛНЯЮЩИЙ БАНК (или НЕГОЦИИРУЮЩИЙ БАНК) – Negotiating Bank is a bank where a shipper negotiates documents or where documents are first presented, usually at country of origin. Also, often referred to as the Advising Bank. In a letter of credit operation, the bank which accepts the documents for the purpose of examining and crediting the documentary credit amount from the exporter (beneficiary). The name derives from the fact that the Negotiating Bank is normally authorized by the issuing bank to negotiate documents, but it may or may not choose actually to do so. Furthermore, recognizing that this bank may be authorized to pay or accept drafts, rather than negotiate them, UCP 500 now uses the term Nominated Bank rather than Negotiating Bank. Unless otherwise instructed, negotiating banks in North America generally examine the documents for discrepancies before forwarding them to the issuing bank, but this is properly viewed as a service separate from negotiating and is not even necessary when negotiating with recourse. / Исполняющий Банк – банк, уполномоченный банком эмитентом произвести платёж или принять на себя обязательство платежа с рассрочкой, или акцептовать переводный(е) вексель(я) (тратту(ы)), или произвести негоциацию, если выполнены все условия аккредитива.

NEGOTIATION = ОТЧУЖДЕНИЕ (или НЕГОЦИАЦИЯ, или НЕГОЦИЯ) – Negotiation is the purchase by the nominated bank of drafts (drawn on a bank other than the nominated bank) and/or documents, by either advancing or agreeing to advance funds to the beneficiary. Negotiation means the purchase by the nominated bank of drafts (drawn on a bank other than the nominated bank) and/or documents under a complying presentation, by advancing or agreeing to advance funds to the beneficiary on or before the banking day on which reimbursement is due to nominated bank. / Негоциация – оплата стоимости (покупка) банком переводного векселя (тратты) и/или документов по аккредитиву. В гражданском праве под Отчуждением понимается передача имущества в собственность другого лица. Оно является одним из способов осуществления собственником правомочия распоряжения своим имуществом. Различаются возмездное отчуждение (купля-продажа) и безвозмездное отчуждение (дарение). Под устаревшим термином Негоция, от Латинского слова Negōtium, означающее Дело, понималась коммерческая сделка. Негоциация (как способ исполнения аккредитива):- исполняющий банк после проверки документов и признания их соответствующими условиям аккредитива производит оплату документов, после чего требует возмещения расходов у банка эмитента. Чаще всего негоциация сопровождается индоссированием тратты бенефициара, плательщиком по которой является банк эмитент, в пользу исполняющего банка. Возмещение исполняющему банку суммы, уплаченной бенефициару, происходит после получения банком эмитентом тратты и её погашения в пользу индоссанта, то есть исполняющего банка.

NEGOTIATIONS = ПЕРЕГОВОРЫ – Negotiations are the communications between two or more parties towards the development and maintenance of contractual relationships. / Общения между двумя или более сторонами относительно развития и поддержания контрактных взаимоотношений. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

NEHRU JACKET = ЖАКЕТ В СТИЛЕ НЭРУ – Nehru Jacket:- named after Jawaharial Nehru, the first Prime Minister of independent India. The jacket was well known for its lack of lapels and lack of a collar. The Nehru Jacket is a hip-length tailored coat for men or women, with a mandarin collar, and with its front modeled on the South Asian achkan or sherwani, an apparel worn by Pandit Jawaharlal Nehru, the Prime Minister of India from 1947 to 1964. / (achkan) или шервани (sherwani), Пандит Джавахарлал Нэру (Pandit Jawaharlal Nehru).

NEKTON = НЕКТОН – Nekton:- swimming animals capable of navigation. / Под Нектоном, от Греческого слова Nēktós, означающее Плавающий, понимается совокупность активно плавающих животных, обитающих в толще воды, способных противостоять течению и перемещаться на значительные расстояния. К нектонам относятся кальмары, киты, ластоногие, морские змеи и черепахи, пингвины, рыбы и другие.

NEMA = NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION

NEMATICIDE = НЕМАТИЦИД – Nematicide is a chemical compound or physical agent that kills or inhibits nematodes. / Под Нематицидом, от Нематоды и Латинского слова Caedo, означающее Убиваю, понимается .

NEMATODE = НЕМАТОДА (или КРУГЛЫЙ ЧЕРВЬ, или УГРИЦА) – Nematode is an unsegmented roundworm with elongated rounded body, pointed at both ends. Most Nematodes are free-living in soil, fresh and salty water, but some are important parasites of animals and humans. Nematoda with over 20 000 species described, is the most common phyla of animals. Nematode is any of the class or phylum Nematoda of elongated cylindrical worms parasitic in animals or plants free-living in soil or water. Generally microscopic, wormlike animals that live saprophytically in water or soil. / Под Нематодами или Круглыми Червями понимается класс первичнополостных червей. Длиной от 80 мкм до 9.5 м. Около 15 000 видов (species). Многие – паразиты растений, животных и человека (анкилостомиды, аскариды, ришта, сингамы и другие); свободноживущие обитают в морях, пресных водоёмах и почве. Вызывают нематодные болезни растений, у животных и человека – нематодозы.

NEMS = NATIONAL EXCHANGE MARKET SYSTEM

NEO = NONEQUITY OPTIONS

NEOBULK = ШТУЧНЫЙ ГРУЗ – Neobulk:- shipments consisting entirely of units of a single commodity, such as cars, lumber, or scrap metal. / Грузовые отправки, целиком состоящие из единиц штучного товара или сырья, такого как автомобили, кругляк (древесина) или металлолом.

NEOTYPE = НЕОТИП – Neotype is a specimen selected to serve as the taxonomic species type when the original type material is missing. / Под Неотипом, от Греческих слов Néos, означающее Незрелый или Новый или Юный, и Týpos, означающее Образец или Отпечаток или Форма, понимается образец, избираемый с тем, чтобы служить в качестве таксономического типа видов, когда материал первоначального типа утерян.

NEPPINESS = УЗЕЛКОВАТОСТЬ – (1) Neppiness may be due to entanglement of fibers in ginning process or immature fibers. Entangled fibers can be sorted out by careful processing But, Neps due to immature fiber will stay on in the end product and cause the level of yarn defects to go higher. The quality of having a nep; abundance of nep, as on cloth. / Порок или дефект. Ситуация, когда в хлопковом волокне в большом количестве присутствуют. Под Мушковатостью понимается распространённый порок в виде наличия на поверхности полотна небольших комочков перепутанных волокон, прочно удерживающихся на её поверхности

(2) Neppiness is an excessive amount of tangled mass of fiber appearing on the face of the fabric. Due to low cellulose content of the neps, clumps of these fibers do not accept dye. Therefore, when a fabric is dyed, the mechanical and biological neps formed by fine or immature fibers create undyed spots in the finished fabric. See also White Specks. / комки этих волокон не воспринимают краситель.

NEPPY = ЗАСОРЁННАЯ УЗЕЛКАМИ (или ГОРОШИСТАЯ) – Defect Name:- Neppy. Defect Type:- Isolated Defects. Fabric Type:- Bottomweights – Sateen Derivatives. Description:- Neppy:- This condition is characterized by an excessive amount of neps (small tangles and/or knots of fiber) appearing on the surface of the fabric. Severity:- Major.

NEPPY COTTON = ХЛОПОК С ПОВЫШЕНЫМ СОДЕРЖАНИЕМ УЗЕЛКОВ – Neppy Cotton is a Cotton obtained when the gin is overcrowded or the saws have been set too close together. This stock is not desirable for spinning. See also Neps. Neppy Cotton is a Cotton containing many neps or pin-head specks of tangled fiber.

NEPPY FABRIC = ЗАСОРЁННАЯ УЗЕЛКАМИ (или ГОРОШИСТАЯ) ТКАНЬ – Neppy Fabric:- an excessive number of small tangles or knots of fiber appearing on the fabric surface. Note:- this defect is often caused by poor carding or combing of fiber or by contamination during preparation for spinning. / Засорённая Узелками Ткань (neppy fabric):- порок ткани; большое количество небольших подплетин или узелков волокон, появляющихся на поверхности ткани. Примечание:- этот порок часто вызывается плохой стрижкой и чисткой ткани во время подготовки к отделке.

NEPS = УЗЕЛКИ – Neps in staple textiles are broadly defined to be small clumps or entanglements of fiber. They are one of the three main constituents of staple fiber. However, neps may be broken down into three further categories; mechanically generated neps, seed coat neps, and shiny (or immature) neps. A mechanically generated nep is created during the opening, ginning, and carding of the cotton and can range from 0.1 mm to 5 mm in diameter. They are tightly knotted cotton or man-made fibers consisting of a tangled core and a long fiber tail that cannot be opened during processing. Seed coat neps or seed coat fragments are composed of a collection of fibers that remain attached to the shell of the cotton seed. When viewed in visible light, they are small tufts of fibers attached to a dark central core. A shiny nep or dye resistant nep is a collection of very immature or dead cotton fibers.These are formed on the cotton seed when a part or all of the cotton seed undergoes stress that stops the maturation process of the fibers. The resulting fibers are very thin and weak with very little lateral stiffness and can easily form tight clumps of closely packed, parallel fibers. These very immature fibers cannot absorb dyestuffs properly and result in white specks and discolorations in finished fabric. These shiny neps may or may not be attached to the seed coat. Neps are small, pinhead-size entanglements of fibers in cotton that show up in ginned lint, card web, yarns, and cloth. Neps are objectionable in the textile industry because they may cause yarn breakages and improper dyeing. Neps sometime detract from visual appearance. A nep is a small tangled knot of fiber often caused by mechanical processing. Neps can now be measured by an Advanced Fiber Information System (AFIS) nep tester and are reported as total neps per 0.5 gram of cotton and average diameter in millimeters. Properly equipped and set machinery will minimize nep formation during processing. The AFIS equipment can now be used to measure fiber length and trash content as well as neps. It is very effective at measuring any small amount of residual trash present in bleached cotton. Neps:- very small, snarled masses or clusters of fibers that look like dots or specks in the cotton lint and are difficult to remove. If not removed, they will appear as defects in the yarn and fabrics. There are two groups of neps, mechanical and biological, and observed that mechanical neps are similar to the classical the American Society for Testing and Materials (ASTM) definition, where they are formed from mechanical actions on the fibers. They also reported that fibers with low micronaire values tend to form mechanical neps because the fibers are finer and less mature, and are therefore less rigid. Biological neps are clumps of very immature fibers that can be found in seed cotton before mechanical processing has occurred. They also reported that fibers with low micronaire values (finer and immature fibers) tend to form mechanical neps because of the weak, poorly developed, less rigid fibers. A Nep is a tightly tangled knot-like mass of unorganized fibers. Due to low cellulose content of the neps, clumps of these fibers do not accept dye. Therefore, when a fabric is dyed, the mechanical and biological neps formed by fine or immature fibers create undyed spots in the finished fabric. See also White Specks. A small knot of entangled fibers commonly regarded as a fault but sometimes introduced as an effect. Little knots of immature or incompletely developed tangled fibers. Their presence is usually the result of improper ginning though sometimes caused through careless picking and carding. It is hard to spin or dye. Very small, snarled masses or clusters of fibers that look like dots or specks in the cotton lint, and are difficult to remove. The removal of neps from the lint is difficult, costly, and frequently impossible. If not removed, they will appear as defects in the yarn and fabrics. Neps are difficult for the classer to detect or evaluate. Small, knotted, or tangled clumps of cotton fibers. Neps are small knots of tangled fiber, usually consisting of short, dead or immature fiber, or caused by over-processing. See also Dirt, and Shives. Neps:- small bundle of tangled undeveloped fibers. The undeveloped fibers do not take dyestuff, and thus neps appear as small white dots in fabric. Normally used in the plural, as you seldom find just one nep. Spinning defect. Neps:- pinhead structure like fiber mass more than 3 mm size. Un-opened fibers due to poor carding action at back process. Roller with high moistures and if the pins tips of the gill box's fallers are broken or blunt. Ring travellers on ring frames needs to change or the rings surfaces are not perfectly smooth having burrs or tending to formation of burrs. Neps:- pinhead structure like fiber mass. Neps:- it has to be made a differentiation in the two faults – thick places and neps. Frequently-occurring thick places exhibit a length that corresponds with the mean staple length of the fiber. A nep is a very short thick place in the yarn, a small fault having a length of 2 mm diameter of 3 times or more at a standard setting of 200%. It can either be a fiber nep, a seed coat nep or a trash particle. It can be thicker than +200% of the average yarn diameter. The increase for neps is calculated to a reference length of 1 mm. They can be a bunch of entangled fibers commonly not bigger than pin ball head. Nep is a small knot of entangled fibers that usually will not straighten to a parallel position during carding or drafting. Neps (+280%):- number of places that have mass increases of +280% or more with respect to the mean value and a reference length of 1 mm. Note that +200% is the sensitivity level normally used in the test. The results would have been dThese short thick places in a yarn are often the results of vegetable matter or entangled fibers. Nep is a tightly tangled knot-like mass of unorganized fibers. Compare Pills. Neps are the small bunches of tangled fibers generally observed in cotton yarns and attributed to poor cleaning or carding, or to the presence of immature cotton fibers. American Society for Testing and Materials (ASTM). Neps:- minute, tangled masses of Cotton fibers. Nep is a small tangled bundle of fibers. Neps are generally defined as small knots of entangled fibers and occur mostly in the form of fiber neps or seed coat neps. A fiber nep is comprised of a knot of tangled immature or dead fibers while a seed coat nep is an entanglement of fibers attached to a fragment of seed coat. Neps can also be distinguished as either mechanical or biological. Mechanical neps are classified as those made up of only entangled fibers while biological neps are those containing entangled fibers attached to a foreign matter particle fragment such as a seed coat, husk, stem or leaf. Neps in raw cotton can be created by several factors including the growing environment of the cotton plant, plant variety selection, and fiber processing during harvesting, ginning and textile processing. Given the entangled and knotted nature of neps, they are generally considered as a contaminant and reduction of neps at the mill is therefore necessary to reduce quality defects in yarn and fabric. Another type of nep is a white speck nep that shows up as dye resistant neps in fabric. These neps are made up of tangled immature fibers. Immature fibers lack sufficient secondary wall development and therefore have low cellulose content which is necessary for dye uptake. Finally, sticky neps are entanglement of any mature or immature fibers maintained as fiber nep by the presence honeydew deposit that glue involved fibers together. Nep content is measured in terms of the number of neps per gram and the mean nep size. Some instruments are capable of providing these measurements separately for fiber neps and seed coat neps. Unit, Range, Significance in Commercial Standardization of Instrument Testing of Cotton (CSITC) Harmonization Process:- (i) Nep count per gram, mean nep size in microns. (ii) Short name or abbreviation:- Nep count and nep size. (iii) Usual range for nep count of raw cotton is between 150 to 400 neps/gram. Usual range for the average nep size is 600 to 700 microns. Concerning seed coat neps, the usual range for seed coat nep count is 10 to 40. The usual

range for seed coat nep size is 1 000 to 1 300. These figures are test results on raw cotton and indicative only. The amount of neps in a yarn or a fabrics depends also from the treatment of the cotton during the processing steps. (iv) Significance at CSITC:- currently not at CSITC. Description Of Any Relation Between 'Manual And Visual Grading' And 'Instrument Classing' Evaluation Results:- The largest neps, in general, are about twice the size of a pinhead. Therefore, small neps in raw cotton are most of all not visible to manual classers. Larger knotted entanglements are readily visible to classers. A general description in respect of fiber crimp, fiber neps, seed coat neps, fiber twists and fibers attached to other particles is possible by classers. The staple pulling provides a first impression about the content of fiber entanglements, but a more exact measurement is possible by instrumental testing only. Evaluation Results Present In 'Manual And Visual Grading' But Missing In 'Instrument Classing' Evaluation Results:- The preparation and the number of twisted or entangled fibers can give a first indication about the potential creation of neps during processing besides the already existing and measurable neps. Use Of Neps Results For Cotton Production:- Picking cotton early before bolls are allowed to properly mature increases the number of immature fibers resulting in an increase in neps. Late picked cotton can also have increased nep content due to weakened fiber resulting from over exposure to sun and moisture. Additionally, late picked bolls have a higher proportion of immature fiber and undeveloped seeds which increases nep content. Seed-coat neps are variety and growing conditions related, and breeding programs may improve the situation. Use Of Neps Results In Ginning:- Immature bolls are typically removed early in the cleaning process at the gin. Immature bolls are not extracted can be broken open during the ginning process releasing and mixing immature fibers with mature fibers. The resulting mix of mature and immature fibers will result in higher nep content. Seed-coat fragments are created when breakage of the seed-coat occurs during ginning. Fibers attached to the fragments of seed-coats form seed-coat neps. Seed-cotton with low moisture content is susceptible to seed-coat breakage during harvesting and ginning. In addition, some cotton varieties have weak seed coats that can break apart easily. Use Of Neps Results For Trading:- The use of a neps guaranty in contracts is not usual in the international trade. Test results may be provided to buyers as an indication. In rare cases, the allowed number of neps is mentioned in a contract based on a test result provided earlier based on an agreed applicable test device. It is recommended to use the same method and preferably the same device in a laboratory to re-check results. In general words, there is a lack in testing speed, precision, accuracy and in harmonization of the results of the available devises. In addition, these methods may be more expensive than SITC (Standardized Instrument For Testing Cotton) testing and not suitable for testing big volumes. The usually performed number of tests also limits the value of the tests results. Use Of Neps Results For Spinning Mills/Textile Processing:- Most neps in the textile process are created in the blow room where the rolling of cotton tends to entangle fibers into neps. Carding does a good job of reducing neps but also creates some new neps in the process. The combing process also does a good job of removing neps. Proper setting and use of textile machines will reduce the creation of and increase the removal of neps. / Американское Общество по Испытаниям и Материалам (АОИМ). Маленькие комочки . Порок или дефект. и приведут к появлению белых крапинок и изменению цвета в готовой ткани. Очень маленькие спутанные массы или пучки волокон, похожие на крапинки (dots) или частички (specks) в хлопковом волокне, трудные для удаления. Удаление узелков из волокна достаточно сложный, дорогостоящий процесс, и часто невозможный. Если их не удалить, то в пряже и тканях они обнаружатся в качестве дефектов. Классёру бывает достаточно сложно обнаружить и оценить узелки.

CATEGORIZATION OF NEPS ACCORDING TO THEIR NUMBER / КАТЕГОРИЗАЦИЯ УЗЕЛКОВ В СООТВЕТСТВИИ С ИХ ЧИСЛОМ		
Description / Описание	**Neps / Gram** / Узелков / Грамм	**Seed Coat Neps / Gram** / Узелков С Кожицей Семян / Грамм
Very Low / Очень Низкая	< 100	< 10
Low / Низкая	101 – 200	11 – 20
Medium / Средняя	201 – 300	21 – 30
High / Высокая	301 – 450	31 – 45
Very High / Очень Высокая	> 451	> 46

NEPTUNE = НЕПТУН – Neptune (maritime term):- the mythical god of the sea.

NERC = NATIONAL ENVIRONMENT RESEARCH CENTER

NERC = NORTH AMERICAN ELECTRIC RELIABILITY COUNCIL

NERI = НЕСЧЁТНОЕ – Neri:- of a species with a large number of a particular differentiated structure from the Greek Nêrithmos = Countless, e.g., countless spines = nerispina, nerispinus. / .

NESTABLE PALLET = ГНЕЗДОВОЙ ПОДДОН – Nestable Pallet is a flat pallet with apertures in the top deck to accept the feet of a similar pallet for stacking when unloaded. / Гнездовой Поддон:- плоский поддон, имеющий на верхнем настиле углубления конической формы (гнёзда), которые служат опорами поддона при штабелировании. При складировании пустых поддонов конические опоры одного поддона входят в идентичные конические углубления (гнёзда) другого поддона.

NESTED = УКЛАДЫВАЮЩЕЕСЯ ОДНО В ДРУГОМ (или ГНЕЗДОВОЕ) – Nested:- three or more different sizes of the same item or commodity which must be enclosed, each smaller piece within the next larger piece, or three or more of the items must be placed one within the other so that the top item does not project above the lower item by more than 1/3 of its height. / Одинаковые изделия или заготовки, имеющие от трёх и более отличающихся друг от друга размеров, которые должны быть уложены, таким образом, что каждая более мелкая часть одного изделия вкладывается в более крупную часть другого изделия; или же данные изделия должны помещаться одно в другом от трёх и более штук таким образом, чтобы верхнее изделие не помещалось бы в нижнее изделие более, чем на 1/3 своей высоты.

NESTED SOLID = ПЛОТНАЯ УКЛАДКА ОДНОГО В ДРУГОМ – Nested Solid:- three or more of items must be placed on or inside the other, so that the external side surfaces of the top item is in contact with the internal side surfaces of the item below, and the top item does not project above the next lower item by more than 1/2 inch (1.27 centimeter). / Три и более изделий должны быть уложены одно на другое или одно в другом таким образом, чтобы вехнее изделие внешней стороной своих поверхностей находилось бы в контакте с внутренней стороной поверхностей нижнего изделия; и, при этом, верхнее изделие не должно выступать выше следующего нижнего изделия более, чем на 1.27 сантиметра (1/2 дюйма).

NESTING = УКЛАДКА ОДНОГО В ДРУГОМ – Nesting:- packing hollow-ware cargo, e.g., earthenware bowls, so that one item nests within another. Paper or straw may be used to separate each item and avoid damage. / Упаковывание в качестве груза изделий с

выемкой, например, глиняных чаш таким образом, чтобы одно изделие размещалось во внутренней части другого изделия. Для отделения одного изделия от другого и во избежание повреждений может быть использована бумага или солома.

NESTING FOOT = ГНЕЗДОВАЯ ОПОРА (или XX) – Nesting Foot is a foot located within the sides of a box pallet or cage pallet. See also Pallet. / Гнездовая Опора (Nesting Foot):- опора, расположенная на нижней стороне ящичного или сетчатого поддона. Смотрите также Поддон (Pallet).

NET = НЕТТО (или ЧИСТАЯ, или БАЛАНСОВАЯ) – (1) Net:- that which remains after all deductions and charges have been made. After deduction of the consumption of fixed capital. / То, что остаётся после того, как были произведены все вычеты и сборы. После вычета потребления фиксированного капитала. Под Нетто, от Итальянского слова Netto, означающее буквально Чистый, понимается чистый вес (масса) товара без тары; чистая масса продукции, сумма или размер или объём прибыли, бюджета после исключения потерь, расходов, отчислений и тому подобного. Сравните с Брутто (Gross).

(2) Net:- the gain or loss on an asset sale as measured by the selling price of an asset less the adjusted cost of acquisition. / Прибыль или убыток от продажи актива, измеряемые посредством вычета из цены продажи переоцененной цены приобретения данного актива.

(3) A term Net is used in the context of financial accounts and balance sheets to denote, for example, assets less liabilities. / Данный термин в контексте финансовых счетов или бухгалтерских отчётов и балансовых отчётов используется для обозначения, например, разницы между активами и пассивами.

NET = СЕТЬ (или СЕТКА, или ПАУТИНА, или ТЮЛЬ, или СЕТОЧКА) – Net is an open mesh fabric of rayon, nylon, cotton, or silk; made in a variety of geometric-shaped meshes of different sizes and weights, matched to various end-uses. The net is made by knotting the intersections of thread or cord to form the mesh. Net is an open fabric, which is created by connecting the intersections in a woven, knitted, or crocheted construction to form a mesh-like appearance that won't ravel. End-uses include veils, curtains, and fish nets. Net is an open-meshed fabric twisted, knotted, or woven together at regular intervals. Made on a lace machine or gauze or leno weaves. A mesh fabric made in a variety of geometric-shaped meshes of different sizes and weights. It is very open and light. It forms the foundation for a great variety of laces, curtains, millinery, fancy pillows, trims, evening and bridal wear. In cotton, some is used for mosquito netting and screening. Net is an open fabric made by knotting the intersections of thread, cord, or wires to form meshes. Net can be made by hand or machine in a variety of mesh sizes and weights matched to varying end uses, i.e. veils, curtains, fish nets, and heavy cargo nets. See also Tulle. / Найлан[T3] (Nylon[TM]). Крошэ, от Французского слова Crochet, означающее Крючок, . Тюль – ткань или прозрачное плетение из тонких ниток в виде равномерных мелких круглых ячеек. Сочетание ячеек, заполненных плетением и незаполненных, образует узор, чаще всего геометрический или растительный орнамент. Тюль был наиболее модным в эпоху ампир и использовался для пошива лёгких платьев-туник.

NETA = NEW ELECTRICITY TRADING ARRANGEMENTS

NET ASSETS = ЧИСТЫЕ АКТИВЫ – Net Assets are Total Assets minus Total Liabilities of an individual or company. For a company, also called Owner's Equity or Shareholders' Equity or Net Worth. Net Assets are excess of the value of securities owned, cash, receivables, and other assets over the liabilities of the company. Net Assets is total assets less current liabilities. It is a measure of the capital worth of the company. / Под Чистыми Активами компании понимается излишек стоимости владеемых ценных бумаг, наличности, поступлений, и иных активов против обязательств данной компании.

NET ASSET VALUE = СТОИМОСТЬ ЧИСТЫХ АКТИВОВ – The Net Asset Value (NAV) of a mutual fund corresponds to its total assets minus its liabilities. The price per unit (net asset value per share) is calculated by dividing the NAV of a fund by the number of outstanding units. In the case of open-ended funds the price at which a unit-holder can sell shares is known as the Bid Price. In the United Kingdom, Net Asset Value (NAV) of an investment fund refers to the total value of the fund's underlying investment portfolio, less any fees, charges, expenses and other liabilities accrued by the fund. The Dollar value of a single mutual fund share, based on the value of the underlying assets of the fund minus its liabilities, divided by the number of shares outstanding. Calculated at the end of each business day. For a mutual fund, it is computed by dividing the assets in the fund by the number of outstanding shares. Usually used in connection with investment companies to mean net asset value per share. An investment company computes its assets daily, or even twice daily, by totaling the market value of all securities owned. All liabilities are deducted, and the balance divided by the number of shares outstanding. The resulting figure is the net asset value per share. See Assets and Investment Company. The value of each unit of participation in a commodity pool. Basically a calculation of assets minus liabilities plus or minus the value of open positions when marked to the market, divided by the total number of outstanding units. Also known as Book Value in the United States.

(1) Net Asset Value is a value of an investment fund unit corresponding to the market value of the fund on a set reference date, minus liabilities and divided by the number of units outstanding.

(2) In the case of company valuations, the Net Asset Value refers to the intrinsic (market) value of the company's fixed and current assets. The capitalized income value, in contrast, is derived from capitalizing the gross or net income of the invested capital.

(3) In option trade, Net Asset Value is a difference between the price of the underlying and an option's strike (exercise) price. Amount by which a put or call option is in-the-money. / В торговле опционами под Стоимостью Чистых Активов понимается разница между ценой соответствующего актива и сходной ценой (или ценой исполнения) опциона. Иными словами сумма прибыльности опциона на продажу или покупку.

(4) In real estate, Net Asset Value is a value of land and buildings. / В сфере недвижимости термин Стоимость Чистых Активов относится к стоимости земли и зданий.

NET ASSET VALUE/NET ASSETS VALUE PER SHARE = СТОИМОСТЬ ЧИСТЫХ АКТИВОВ/СТОИМОСТЬ ЧИСТЫХ АКТИВОВ НА АКЦИЮ – Net Asset Value (NAV)/Net Assets Value Per Share:- the book value of the shareholders' interests in a company, usually excluding intangibles such as goodwill (NAV per share is NAV divided by the number of shares in issue).

NET ASSIMILATION RATE = ЧИСТАЯ СТАВКА АССИМИЛЯЦИИ (или ЧИСТАЯ ИНТЕНСИВНОСТЬ АССИМИЛЯЦИИ, или ЧИСТАЯ СТАВКА УСВОЕНИЯ) – Net Assimilation Rate is the rate of plant weight increase per unit leaf area. / В биологии под Ассимиляцией, от Латинского слова Assimilatio, означающее Слияние или Уподобление или Усвоение, понимается то же, что анаболизм, в более узком смысле – усвоение питательных веществ живыми клетками (корневая абсорбция, фотосинтез и так далее).

NETBACK = ЧИСТАЯ ЦЕНА БЕЗ НАКЛАДНЫХ РАСХОДОВ – Netback is the industry term referring to the net free on board cost of product offered on a delivered or cost, insurance, and freight basis. It is derived by subtracting all costs of shipment from the landed price.

NETBACK (TO POINT OF ORIGIN) = ЧИСТАЯ ЦЕНА БЕЗ НАКЛАДНЫХ РАСХОДОВ НА ТРАНСПОРТИРОВКУ К МЕСТУ ОТПРАВЛЕНИЯ – Netback (To Point Of Origin):- a sales price at destination minus the full cost of transportation (including working capital, the risk of price changes in transit, etc).

NET CAPABILITY = ЧИСТАЯ СПОСОБНОСТЬ (или ЧИСТАЯ МОЩНОСТЬ) – Net Capability is the maximum load carrying ability of the equipment, exclusive of station use, under specified conditions for a given time interval, independent of the characteristics of the load. Capability is determined by design characteristics, physical conditions, adequacy of prime mover, energy supply, and operating limitations as cooling and circulating water supply and temperature, headwater and tailwater elevations, and electrical use.

NET CAPACITY = ЧИСТАЯ ВМЕСТИМОСТЬ – Net Capacity is the number of tons of cargo which a vessel can carry when loaded in salt water to her summer freeboard marks. Also known as Cargo Carrying Capacity, Cargo Deadweight, and Useful Deadweight. / Известна также как Грузоподъёмность (Cargo Carrying Capacity), Грузовой Дедвейт (Cargo Deadweight), Полезный Дедвейт (Useful Deadweight).

NET CARRYING AMOUNT = ЧИСТАЯ ОСТАТОЧНАЯ ТЕКУЩАЯ СУММА – Net Carrying Amount (of insurance liabilities) is the carrying amount of insurance liabilities less related deferred acquisition costs or related intangible assets.

NET CASH FLOW = ЧИСТОЕ ДВИЖЕНИЕ ДЕНЕЖНЫХ СРЕДСТВ (или ЧИСТЫЙ ДЕНЕЖНЫЙ ПОТОК, или ЧИСТАЯ ОБОРАЧИВАЕМОСТЬ НАЛИЧНОСТИ, или ЧИСТЫЕ ДЕНЕЖНЫЕ СРЕДСТВА) – Net Cash Flow:- in accounting, net profits after income taxes plus optional provisions and reserves. See also Cash Flow.

NET CHANGE = ЧИСТОЕ ИЗМЕНЕНИЕ – Net Change is the change in the price of a security from the closing price of one day to the closing price on the next day on which the stock is traded. The net change is ordinarily the last figure in the newspaper stock price list. The mark +1-1/8 means up USD1.125 a share from the last sale on the previous day the stock traded. Net Change is the difference between the closing price of an instrument on the day's trading and the previous day's closing price. Net change can be positive or negative, and is quoted in terms of currency.

NET CLAIMS = ЧИСТАЯ СУММА ПРЕТЕНЗИЙ – Net Claims are gross claims less reinsurance recoveries. Insurance Claim is a formal request to an insurance company asking for a payment based on the terms of the insurance policy. Insurance claims are reviewed by the company for their validity and then paid out to the insured or requesting party (on behalf of the insured) once approved. Insurance claims cover everything from death benefits on life insurance policies to routine health exams at your local doctor. In many cases, claims are filed by third parties on behalf of the insured person, but usually only the person(s) listed on the policy is entitled to claims payment. / Валовая сумма претензий за вычетом возмещений по перестрахованию.

NET CREDIT POSITION = ЧИСТАЯ КРЕДИТОВАЯ ПОЗИЦИЯ (или ПОЛОЖИТЕЛЬНОЕ САЛЬДО ПО ПОЗИЦИЯМ) – Net Credit Position:- a participant's net credit or net debit position (in funds or in a particular security) at settlement time is called the net settlement position. These positions may be calculated bilaterally or multilaterally. The opposite of Net Debit Position.

NET CURRENT ASSETS = ЧИСТЫЕ ТЕКУЩИЕ АКТИВЫ (или ЧИСТЫЕ КРАТКОСРОЧНЫЕ АКТИВЫ) – Net Current Assets:- there are several ways to value a company and determine whether it is likely to be a sound investment. In accounting, there is a current asset formula that is a gauge of a company's financial condition. The term 'Net Current Assets' refers to the value of company's total current assets after all of its current liabilities have been subtracted. These are tangible assets that can include cash, inventory and accounts receivable, which is the money owed to a company. Also known as Working Capital, net current assets are a reflection of company's short-term health on a balance sheet, which is a financial statement filed with the regulatory body in a region. If net current assets are enough to pay current liabilities, there is a positive working capital ratio. In the event that assets are insufficient to meet short-term debt obligations, creditors will not be paid, and there is negative working capital. If liabilities continue to outweigh assets over a prolonged period of time, it could lead to the company filing for bankruptcy. This scenario could signal that revenues or sales are declining while the accounts receivable component on a balance sheet decreases, which would be a warning sign to investors. There are various types of current assets that constitute net current assets. They might include cash or other assets that can be liquidated or converted to cash in a relatively short period of time. Features might include assets that can be sold or consumed within a year without interfering with daily business operations. In addition to cash, current assets might include currency and deposit accounts, accounts receivable and short-term securities such as stocks that can be liquidated quickly. Additionally, inventory and pre-paid expenses, including insurance, are all types of current assets. In addition to repaying short-term debt obligations, a company might use net current assets to fund short-term expansion initiatives or for unplanned expenses. Investments that are less liquid and cannot easily be converted into cash are considered long-term investments. These assets could include real estate, bonds and company equipment. Long-term assets are designed to be held by a company for more than one year. Economist Benjamin Graham developed a trading strategy tied to purchasing stocks that were trading below the net current asset value. This is based on comparing a stock price to the amount of net current assets. Stocks that are trading significantly below this value could have the potential to be bargain investments. Net Current Assets is a difference between current assets and current liabilities, equal to the working capital. See also Working Capital. Net Current Assets = Current Assets – Current Liabilities. This amount indicates how much capital is being generated or used up by day-to-day activities. If net current assets are negative, the company may have difficulty financing its day-to-day operations. Also called Working Capital or Current Capital. / Смотрите также Собственные Оборотные Средства или Рабочий Капитал (Working Capital). Оборотные Средства – это средства, используемые предприятием для осуществления своей постоянной деятельности, оборотные средства включают в себя производственные запасы предприятия (основные и вспомогательные материалы, топливо), полуфабрикаты, незавершённое производство, запасы готовой и отгруженной продукции, дебиторскую задолженности, а также наличные деньги в кассе и денежные средства на счетах предприятия. Оборотные средства являются непременным условием для осуществления предприятием хозяйственной деятельности. По сути, оборотные средства – это денежные средства, авансированные в оборотные производственные фонды и фонды обращения, не стоит путать их с денежными средствами, вложенными в основные фонды. Сущность оборотных средств определяется их экономической ролью, необходимостью обеспечения воспроизводственного процесса, включающего как процесс производства, так и процесс обращения. В отличие от основных фондов, неоднократно участвующих в процессе производства, оборотные средства функционируют только в одном производственном цикле и независимо от способа производственного потребления полностью переносят свою стоимость на готовый продукт. Основные Средства бывают собственными и заёмными.

NET DEBIT CAP = ВЕРХНИЙ ПРЕДЕЛ ЧИСТОГО ДЕБЕТА – Net Debit Cap:- the maximum uncollateralized daylight-overdraft position that a depository institution is permitted to incur in its Federal Reserve Bank account at any point in the day, or on average over a two-week period.

NET DEBIT POSITION = ЧИСТАЯ ДЕБЕТОВАЯ ПОЗИЦИЯ (или ОТРИЦАТЕЛЬНОЕ САЛЬДО ПО ПОЗИЦИЯМ) – Net Debit Position:- a participant's net credit or net debit position (in funds or in a particular security) at settlement time is called the Net Settlement Position. These positions may be calculated bilaterally or multilaterally. The opposite of Net Credit Position.

NET DEBT = ЧИСТАЯ ЗАДОЛЖЕННОСТЬ (или ЧИСТЫЙ ДОЛГ) – In accounting, net debt is total debt less cash and bank deposits. Net Debt represents total debt less cash and cash equivalents and short-term investments. Our net debt calculation is commonly used as one of the bases for investors, analysts and credit rating agencies to evaluate and compare our periodic and future liquidity within the wireless telecommunications industry. The non-GAAP financial measures should be considered in addition to, butnot as a substitute for, the information prepared in accordance with US GAAP (short for the United States Generally Accepted Accounting Principles). / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

NET DEBT TO CAPITAL RATIO = СООТНОШЕНИЕ ЧИСТОЙ ЗАДОЛЖЕННОСТИ К КАПИТАЛУ – Net Debt To Capital Ratio:- total debt less the sum of cash and cash equivalents, time deposits, and marketable securities, as a percentage of total debt plus Chevron Corporation's stockholders' equity. / Шеврон Корпорэйшэн (Chevron Corporation).

NET EARNINGS = ЧИСТЫЕ ЗАРАБОТКИ – Net Earnings:- gross sales minus taxes, interest, depreciation, and other expenses. Net earnings are one of the most important measures of a company's performance, since the pursuit of earnings is the primary reason companies exist. Sometimes net earnings includes one-time and extraordinary items, and sometimes it does not. Also known as Net Income or Bottom Line. Net Earnings, also known as Retained Earnings, are a corporation's profits after paying all of its expenses. This money is available to pay dividends on common stock, make acquisitions or expand operations without incurring debt or issuing additional stock, or buy back outstanding shares. / Известны также как Чистый Доход (Net Income).

NET ELECTRICITY GENERATION = ЧИСТАЯ ВЫРАБОТКА ЭЛЕКТРИЧЕСТВА (или ПОЛЕЗНАЯ ВЫРАБОТКА ЭЛЕКТРИЧЕСТВА) – Net Electricity Generation is the amount of gross electricity generation less station use (the electric energy consumed at the generating station(s) for station service or auxiliaries). Electricity required for pumping at hydroelectric pumped-storage plants is regarded as electricity for station service and is deducted from gross generation. See also Gross Electricity Generation.

NET EXCESS (CAPACITY) = XX – Net Excess (Capacity):- in electricity, the net of gross excess and gross deficiency, therefore the total PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC) capacity resources in excess of the sum of load-serving entities' obligations. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

NET EXCHANGE (CAPACITY) = XX – Net Exchange (Capacity):- in electricity, capacity imports less exports.

NET EXPORTS = ЧИСТЫЙ ВЫВОЗ (или ЧИСТЫЙ ЭКСПОРТ) – Net Exports are exports minus imports. See also Net Imports. / Чистый Вывоз или Чистый Экспорт это возможный профицит или дефицит экспорта над привозом (или импортом), иными словами разница между вывозом (или экспортом) и привозом (или импортом). Смотрите также Чистый Привоз или Чистый Импорт (Net Imports). Чистый Вывоз или Чистый Экспорт (Товаров И Услуг) – сальдо всех экономических операций с товарами и услугами между резидентами и нерезидентами в течение отчётного периода. Чистый вывоз (или экспорт) равен вывозу (или экспорту) за вычетом привоза (или импорта). Чистый Вывоз или Чистый Экспорт – разница между вывозом (или экспортом) и привозом (или импортом) товаров, которые привозятся в страну и вывозятся из страны.

NET FOREIGN INVESTMENT = ЧИСТОЕ ИНОСТРАННОЕ КАПИТАЛОВЛОЖЕНИЕ (или ЧИСТОЕ ИНОСТРАННОЕ ИНВЕСТИРОВАНИЕ) – Net Foreign Investment is the sum of US exports of goods and services, receipts of factor income, and capital grants received by the United States (net), less the sum of imports of goods and services by the United States, payments of factor income and transfer payments to foreigners (net). It may also be viewed as the acquisition of foreign assets by US residents, less the acquisition of US assets by foreign residents. It includes the balance of payments account (BPA) statistical discrepancy.

NET GENERATION = ЧИСТАЯ ГЕНЕРАЦИЯ – Net Generation:- gross generation minus plant use from all electric utility owned plants. The energy required for pumping at a pumped storage plant is regarded as plant use and must be deducted from the gross generation. Net Generation:- gross generation less the electric energy consumed at the generating station for station use.

NET IMPORTS = ЧИСТЫЙ ИМПОРТ (или ЧИСТЫЙ ПРИВОЗ) – Net Imports are imports minus exports. See also Net Exports. / Чистый Привоз или Чистый Импорт это возможный профицит или дефицит привоза (или импорта) над вывозом (или экспортом), иными словами разница между привозом (или импортом) и вывозом (или экспортом). Смотрите также Чистый Вывоз или Чистый Экспорт (Net Exports). Чистый Вывоз или Чистый Импорт – разница между совокупным объёмом привоза (или импорта) страны и объёмом вывоза (или экспорта) тех видов товаров, которые привозятся в страну и вывозятся из страны.

NET INCOME = ЧИСТЫЙ ДОХОД (или БАЛАНСОВЫЙ ДОХОД) – In the United States, in accounting, Net Income is the difference between revenue from sales and other operations and costs and expenses over a given accounting period. See also Earnings. Amount of a company's total sales (revenue) remaining after subtracting all of its costs, in a given period of time. Also known as Attributable Profit, Profit Attributable To Shareholders, and Profit For The Year in the United Kingdom. Net Income is an excess or deficit of total revenues and gains compared with total expenses and losses for an accounting period. See also Income, and Loss. Net Income is the gross farm income minus total farm costs. / и затрат и расходов сверх данного отчётного периода. Известен также как Отводимая Прибыль (Attributable Profit), Прибыль, Отводимая Акционерам (Profit Attributable To Shareholders) и Прибыль За Данный Год (Profit For The Year) в Соединённом Королевстве. Чистый Доход:- в общем значении:- сумма, остающаяся после оплаты или вычета всех расходов; синоним терминов Чистые Заработки (Net Earnings), Чистая Прибыль (Net Profit), Чистый Убыток (Net Loss) (в зависимости от того, является ли этот показатель положительным или отрицательным). Для коммерческого предприятия:- разница между совокупным объёмом продаж или совокупным объёмом расходов и издержек. Совокупные расходы включают стоимость проданных товаров, в том числе амортизацию; совокупные издержки включают издержки на продажи, общие и административные издержки, а также вычеты из дохода (income deductions). Чистый доход обычно указывается до или после налогообложения подоходным налогом. Чистый доход после налогообложения представляет собой итоговую прибыль (bottom line), о которой обычно и говорят. Именно на основе этого показателя рассчитываются дивиденды. Смотрите также Operating Loss, и Operating Profit. Для частных лиц:- совокупный доход за вычетом расходов, понесённых с целью получения совокупного дохода. Эти расходы в большинстве случаев вычитаются до налогообложения. Чистый Доход – прибыль за вычетом налогов, полученная предприятием за определённый период.

NET INTERCHANGE = ЧИСТЫЙ ВЗАИМООБМЕН (или XX) – Net Interchange (energy):- gross import volume less gross export volume in MegaWatthour (MWh).

NET INTEREST = ЧИСТЫЙ ПРОЦЕНТ – (1) Net Interest is any interest after deduction of tax at source, such as interest paid into an account at a bank or building society. / Чистый Процент – прибыль от банковского предпринимательства за вычетом взаимных платежей из прибыли.

(2) Net Interest is the interest after deduction of the withholding tax (tax at source) on interest or dividend credit advices. In the case of bonds exempt from withholding tax (issues placed by foreign borrowers in Switzerland), net interest is equal to gross interest. Interest return on checking accounts is free of commission charges.

NET INTEREST MARGIN SECURITIES = ЦЕННЫЕ БУМАГИ С МАРЖОЙ В ВИДЕ ЧИСТЫХ ПРОЦЕНТОВ – Net Interest Margin Securities (NIMS), which are pay-through bonds supported by subordinated rights to receive interest spreads in mortgage securitizations. Those rights may be evidenced by Real Estate Mortgage Investment Conduit (REMIC) residual interests, Interest Only (IO) Interests or Interest-Only (IO) Strips. NIMS are generally created where the underlying mortgages involve a significant risk of default, so that there is a material spread between the rates of interest on the mortgages and the rates of interest on REMIC regular interests or other senior securities. A type of security that allows holders to access excess cash flows resulting from securitized mortgage loan pools. A security based on the value of excess cash flows received by a mortgage-backed security. That is, if an mortgage backed security (MBS) receives more cash flows than are needed to make coupon and principal payments to holders, it may place these cash flows into a different account and issue NIMS entitling the holders to these cash flows.

NET LIQUID ASSETS = ЧИСТЫЕ ЛИКВИДНЫЕ АКТИВЫ – A term Net Liquid Assets means current assets less current liabilities. / Этот термин означает разницу между краткосрочными активами и краткосрочными обязательствами.

NET LIQUIDATING VALUE = ЧИСТАЯ ЛИКВИДАЦИОННАЯ СТОИМОСТЬ – A term Net Liquidating Value means, with respect to any account, the total equity in such account plus the value of any long and short options in such account.

NET LOSS = ЧИСТЫЙ УБЫТОК – Net Loss is the amount of loss sustained by an insurer after giving effect to all applicable reinsurance, salvage, and subrogation recoveries. / .

NET MANIFEST = НЕТТО МАНИФЕСТ – Net Manifest is a manifest containing all freight details including negotiated disbursements. / Манифест, содержащий все сведения о фрахте, включая оговорённые выплаты.

NET MASS = НЕТТО МАССА – Net Mass is the difference between the gross mass and the corresponding tare, determined at the same time. See also Mass, and Net Weight.

NET NATIONAL PRODUCT = ЧИСТЫЙ НАЦИОНАЛЬНЫЙ ПРОДУКТ – In national accounting, Net National Product is the gross national product minus depreciation of the existing capital stock over the course of the period. / В национальном бюджетном процессе, валовой национальный продукт (ВВП) за вычетом . Чистый Национальный Продукт – суммарный объём всех произведённых в стране за определённый период, чаще всего за год, конечных товаров и услуг, исчисленных в денежном выражении (то есть валовой национальный, внутренний продукт) за вычетом амортизации основных средств.

NET NEW HIGHS = ЧИСТЫЕ НОВЫЕ МАКСИМУМЫ – Net New Highs:- market breadth indicators that can be used to identify strength or weakness behind market moves. Net New Highs are found by subtracting the number of new lows from the number of new highs and are usually calculated for the AMEX®, NASDAQ®, and NYSE®. / Индикаторы широты рынка, которые могут быть использованы для идентификации крепости или слабости в поведении рынка, а точнее того, что на нём произошло. Чистые новые максимумы определяются посредством вычитания числа новых минимумов из числа новых максимумов и, как правило, рассчитываются для рынков АФБ® или АМЭКС® (AMEX®), НЭЗДЭК® (NASDAQ®), и НЙФБ® или Эн.Уай.Эс.И.® (NYSE®).

NET OPERATING INCOME = ЧИСТЫЙ ОПЕРАЦИОННЫЙ ДОХОД – In the United States, Net Operating Income is an amount by which operating revenue exceeds operating expenses in an accounting period, without taking into account the extraordinary gains and losses as well as financial expenses (such as interest paid) and financial revenue (such as interest earned). Also known as Operating Profit in the United Kingdom. See also Operating Profit. / В Соединённых Штатах Америки, чистый операционный доход представляет собой сумму, на которую операционная выручка превышает операционные расходы за отчётный период без принятия в расчёт экстраординарных поступлений и потерь, а также финансовых расходов (таких как проценты к оплате (interest paid)) и финансовой выручки (такой как заработанные проценты (interest earned)). Известен также как Операционная Прибыль (Operating Profit) в Соединённом Королевстве.

NET OPERATING PROFIT = ЧИСТАЯ ОПЕРАЦИОННАЯ ПРИБЫЛЬ – Net Operating Profit refers to the amount of money that a company has earned after the cost of goods sold and operating expenses have been deducted. This is used to see whether a company is making more than it spends or is operating at a loss. Net profit also is referred to as 'The Bottom Line', because it is usually shown at the bottom of an income statement. This measurement of profit is important because it measures a company's profitability and how well its management is growing that profitability. Profitability simply refers to the company's ability to earn a profit. Expenses outside the company's own operations, such as investments in other firms and start-up costs, are not included in the equation for calculating net profit. This is so that it can serve as a true measure of a company's long-term profitability without deducting one-time expenses. There are several reasons for examining the net operating profit of a company. Businessmen who wish to invest in the company will learn about the management's skill in growing its profitability simply by looking at the bottom line. If the company's revenues exceed its operating and goods expenses, this speaks well for the future and longevity of the company. The management for the company itself will wish to study its net operating profit in order to plan for the future and make necessary adjustments in the present. Operating expenses are dynamic and tend to surge up and down as time passes. This is why they are also called Variable Expenses. As such, analysis of the bottom line can yield information on which variable expenses show an uphill trend and need adjustments made for them in order for the company to continue operating at a profit. A third reason for looking at the company's net profit is simply that it usually serves as the basis for determining income taxes. It commonly is listed on the income statement as two different entries. One entry is Net Operating Profit Before Tax, which refers to the earnings after deducting operating expenses but before deducting interest and taxes. The other entry is Net Operating Profit After Tax (NOPAT), which refers to the earnings after deducting operating expenses, interest and taxes. When analyzing net operating profit for reasons of investment or increasing profit, the historical data for the company also must be considered. Only with the data for the previous months and years can it be seen whether the company's profitability is growing or shrinking. Another source of data against which to measure the company's current performance is the industry's data for businesses of the same model. Comparison against the performance of other companies in the industry can yield some insight on how the company's profitability is growing versus the yardstick of its peers. See also Operating Profit.

NET PERFORMANCE = ДИНАМИКА ПО НЕТТО (или ЧИСТОЕ ИСПОЛНЕНИЕ) – Net Performance:- an increase or decrease in net asset value exclusive of additions, withdrawals and redemptions.

NET POSITION = ЧИСТАЯ ПОЗИЦИЯ (или САЛЬДО ПО ПОЗИЦИИ) – (1) Net Position is the difference between the open contracts long and the open contracts short, held by a market participant in any one commodity. The difference between an individual or firm's open long contracts and open short contracts in any one commodity. Net Position is the difference between the long open contracts and the short open contracts of a commodity for a specific trader or type of trader. A market player's total position, ascertained by offsetting purchases against sales. / Разница между открытыми купленными и проданными контрактами,

удерживаемыми участником рынка в отношении одного любого вида сырья. Разница между открытыми частным лицом или фирмой купленными или проданными контрактами по одному любому виду сырья. Итоговая позиция игрока на рынке, устанавливаемая посредством зачёта покупок и продаж.

(2) Net Position is the value of the position subtracting the initial cost of setting up the position. For example, if 100 options were purchased for USD1.00 each and the option is currently trading for USD9.00, the value of the net position is USD900.00 – USD100.00 = USD800.00. / Ценность позиции за вычетом первоначальных расходов на её открытие. Например, если 100 опционов были приобретены по 1.00 Доллару США за каждый, а сам этот опцион в настоящее время торгуется по цене в 9.00 Долларов, то ценность чистой позиции или сальдо по позиции будет составлять 900.00 – 100.00 = 800.00 Долларов США.

NET PREMIUMS = ЧИСТЫЕ ПРЕМИИ (или ЧИСТАЯ СУММА ПРЕМИЙ) – Net Premiums:- the amount of the premium that is left after the subtraction of some or all permitted deductions such as brokerage and (for certain types of business) profit commission. Net Premiums is a term variously used to mean gross premiums net of expenses, commission taxes, or any combination of these. / Сумма премии, которая остаётся после вычитания некоторых или всех разрешённых вычетов, таких как брокерская комиссия (brokerage) и (для определённых типов бизнеса) комиссии от прибыли (profit commission). Термин Чистые Премии может использоваться в разных случаях определяя валовые премии, очищенные от издержек (expenses), налогов с комиссионных (commission taxes) или любой их комбинации.

NET PRESENT RATE OF RETURN = ЧИСТАЯ ТЕКУЩАЯ (или ПРИВЕДЁННАЯ) СТАВКА ОТДАЧИ – Net Present Rate Of Return is the conventional interest rate used to calculate the net present value of a transaction. Also known as Yield.

NET PRESENT VALUE METHOD = МЕТОД ЧИСТОЙ ТЕКУЩЕЙ (или ПРИВЕДЁННОЙ) СТОИМОСТИ – Net Present Value Method is a method of calculating the present value of an investment by discounting it to the present at an assumed rate. This method is generally used as a basis for making investment decisions, and to compare two or more investment options with different initial costs and future returns.

NET PRESENT VALUE OF CASH FLOW = ЧИСТАЯ ТЕКУЩАЯ (или ПРИВЕДЁННАЯ) СТОИМОСТЬ ДЕНЕЖНОГО ПОТОКА – Net Present Value Of Cash Flow:- balance of the sum of the net present value of income from a planned investment and the net present value of expenses for that investment.

NET PROFIT = ЧИСТАЯ ПРИБЫЛЬ – Net Profit is the amount of profit remaining from Sales after deducting Cost of Goods Sold and Operating Expenses. Can be expressed as before (income) tax or after (income) tax Net Profit. Net Profit is the amount of net profit, before taking into account corporate income taxes, that a company shows on its 'bottom line'.

NET PROFIT BEFORE TAX = ЧИСТАЯ ПРИБЫЛЬ ДО НАЛОГООБЛОЖЕНИЯ – Net Profit Before Tax (NPBT), i.e. a measure of performance (i.e. net profit) without taking into account taxation. Since taxation is something management has little control over, it is often useful to see how much money a company is earning before having to pay any taxes.

NET RATE = ЧИСТАЯ СТАВКА – Net Rate:- in a fiber production process the total throughput less waste and inferior or off-grade material.

NET REGISTERED TONNAGE = ЧИСТАЯ РЕГИСТРОВАЯ ВМЕСТИМОСТЬ (или ЧИСТЫЙ РЕГИСТРОВЫЙ ТОННАЖ) – Net Registered Tonnage:- this tonnage is frequently shown on ship registration papers; it represents the volumetric area available for cargo at 100 cubic feet = 1 ton. It often is used by port and canal authorities as a basis for charges. / Под Регистровой Вместимостью судна понимается объём внутренних помещений судна, измеряемый в регистровых тоннах. 1 рег.т = 100 фут^3 = 2.831 685 м^3. Различают:- (i) валовую регистровую вместимость (все помещения), служащую для расчётов сборов в портах и так далее; и (ii) чистую регистровую вместимость (помещения для груза и пассажиров), характеризующую коммерчески эксплуатируемые помещения. Регистровая Вместимость судна, регистровый тоннаж судна, объём внутренних помещений гражданского судна. Регистровая вместимость служит характеристикой размеров судна и исчисляется в регистровых тоннах (1 регистровая т = 100 куб. футов = 2.83 м^3). Различают регистровую вместимость валовую (объём всех судовых помещений, кроме некоторых балластных цистерн и другого) и чистую (объём помещений для груза и пассажиров). Регистровая вместимость удостоверяется мерительным свидетельством, которое выдаётся классификационным обществом. Порядок определения регистровой вместимости устанавливается международными или местными правилами обмера судов (например, Панамского или Суэцкого Канала). От регистровой вместимости зависят взимаемые с судна сборы и пошлины (за пользование причалами, за лоцманские услуги и так далее).

NET REGISTERED TONS = ЧИСТЫХ РЕГИСТРОВЫХ ТОНН - Net Registered Tons (NRT):- this tonnage is frequently shown on ship registration papers. It represents the volumetric area available for cargo at 100 cubic feet = 1 ton. It often is used by port and canal authorities as a basis for charges.

NET REINSURANCE ASSETS = ЧИСТЫЕ ПЕРЕСТРАХОВОЧНЫЕ АКТИВЫ – Net Reinsurance Assets:- receivables related to deposit accounting contracts (contracts which do not meet risk transfer requirements) less payables related to deposit contracts.

NET SETTLEMENT = НЕТТО РАСЧЁТ – Net Settlement is a settlement in which a number of transactions between or among counterparties are settled on a net basis.

NET SETTLEMENT SYSTEM = СИСТЕМА НЕТТО РАСЧЁТА – Net Settlement System is a payment system in which payment orders may be exchanged on a multilateral or bilateral basis over a given period of time, but do not become final until the net settlement balances of the participants have been settled after the end of a defined period.

NET STORAGE AREA = ЧИСТАЯ ПЛОЩАДЬ ХРАНЕНИЯ (или ПОЛЕЗНАЯ ПЛОЩАДЬ ХРАНЕНИЯ) – Net Storage Area is a space in the warehouse (in square feet or meters) that is actually used for storage. This does not include aisles, docks, offices and staging areas.

NET SUMMER CAPABILITY = ЧИСТАЯ ЛЕТНЯЯ СПОСОБНОСТЬ (или ЧИСТАЯ ЛЕТНЯЯ МОЩНОСТЬ) – Net Summer Capability is the steady hourly output, which generating equipment is expected to supply to system load exclusive of auxiliary power, as demonstrated by tests at the time of summer peak load.

NETTING = ВЗАИМОЗАЧЁТ (или СВЕДЕНИЕ, или ЗАЧЁТ ВСТРЕЧНЫХ ТРЕБОВАНИЙ, или САЛЬДИРОВАНИЕ ВСТРЕЧНЫХ ПЛАТЕЖЕЙ, или ВЗАИМНОЕ ПОГАШЕНИЕ, или ВЗАИМНАЯ КОМПЕНСАЦИЯ) – Netting is the agreed offsetting of reciprocal obligations by trading partners or participants in a system, including the netting of trading obligations, for example, through a central counterparty, as well as agreements to settle instructions to transfer securities or fund assets on a net basis. The result is that delivery and payment obligations arising from trading are netted to reduce the number of settlement transactions. Netting is an offsetting of positions or obligations by counterparties. See also Close-Out Netting, and Payment Netting. Agreed Netting of mutual

items of liabilities of business partners or participants in a payment system. The netting reduces a large number of individual items or liabilities to a lower number of items and liabilities. Netting can take place in different forms, which can be implemented legally to a differing extent in the event of the opt-out of a participant. An agreement to offset mutual positions or obligations by participants in a clearance or settlement system. The netting reduces the number of individual positions. Netting may take several forms, some of which are more legally enforceable than others in the event of default of one of the parties. Mutual offsetting of claims and liabilities from identical types of transaction between two parties. Important in connection with the capital adequacy requirements applicable to banks. In industry, a method of optimizing intra-group capital transfers via a central account of net credits. Accounting technique in which bank balances of subsidiaries in a group of companies offset each other. This technique reduces bank charges and commissions and exchange rate risks. Multilateral netting is a procedure whereby a company with multinational trade flows balances its debits and credits among subsidiaries and affiliates, leaving only the balance to be settled, thereby reducing its need to acquire foreign currency. Netting shall mean the conversion of claims and obligations resulting from transfer orders which a participant or participants either issue to, or receive from, one or more other participants with the effect that only a net claim can be demanded or a net obligation be owed. / взаиморасчёт или сведение (netting). В гражданском праве под Зачётом Встречных Требований понимается один из способов прекращения обязательств путём зачёта однородных по содержанию требований сторон друг к другу, срок которых наступил.

NETTING = СЕТЕВЯЗАНИЕ (или ПЛЕТЕНИЕ СЕТЕЙ, или ПЕРЕПЛЕТЕНИЕ ТИПА СЕТОЧКИ) – Netting is the process of knotting threads into meshes that will not ravel.

NETTING = СЕТКА (или СЕТЬ) – Netting (maritime term):- a rope network. / Сетка в нижней части леерного ограждения.

NETTLE FIBERS = КРАПИВНЫЕ ВОЛОКНА – Nettle Fibers:- the nettle class of fibers comprise of Common Nettle (Urtica Dioica), China Grass (Urtica Nivea), and Ramie (or Rhea). / и Рами . Под Крапивой понимается род трав семейства Крапивных. Стебли и листья покрыты жгучими волосками. 40–50 видов, в умеренных и тропических поясах. В бывшем СССР насчитывалось 10 видов, почти повсеместно. Молодые побеги Крапивы употребляют для супов и салатов, на корм домашнему скоту и птице.

NET TONNAGE = ЧИСТАЯ ВМЕСТИМОСТЬ (или ЧИСТЫЙ ТОННАЖ) – Net Tonnage equals gross tonnage minus deductions for space occupied by crew accommodations, machinery, navigation equipment and bunkers. It represents space available for cargo (and passengers). Canal tolls are based on net (registered) tonnage. This is the gross tonnage of a ship less the machinery, boiler and bunker, crew and stores spaces. $(0.2 + 0.02 \log_{10}(Vc))\ Vc\ (4d/3D)^2$, for passenger ships the following formula is added:- $1.25\ (GT + 10\,000)/10\,000\ (N_1 + (N_2/10))$, where Vc is the volume of cargo holds, D is the distance between ship's bottom and the uppermost deck, d is the draught, N_1 is the number of cabin passengers, and N_2 is the number of deck passengers.) Ton is figured as an 100 cubic foot ton. Net Tonnage (maritime term):- the cubical space available for carrying cargo and passengers. Net Tonnage:- a volume measure of the useful capacity of a vessel determined in accordance with the provisions of the international convention on tonnage measurement of vessels. Also known as Net Registered Tonnage. / Под Регистровой Вместимостью судна понимается объём внутренних помещений судна, измеряемый в регистровых тоннах. 1 рег.т = 100 фут^3 = 2.831 685 м^3. Различают:- (i) валовую регистровую вместимость (все помещения), служащую для расчётов сборов в портах и так далее; и (ii) чистую регистровую вместимость (помещения для груза и пассажиров), характеризующую коммерчески эксплуатируемые помещения. Регистровая Вместимость судна, регистровый тоннаж судна, объём внутренних помещений гражданского судна. Регистровая вместимость служит характеристикой размеров судна и исчисляется в регистровых тоннах (1 регистровая т = 100 куб. футов = 2.83 м^3). Различают регистровую вместимость валовую (объём всех судовых помещений, кроме некоторых балластных цистерн и другого) и чистую (объём помещений для груза и пассажиров). Регистровая вместимость удостоверяется мерительным свидетельством, которое выдаётся классификационным обществом. Порядок определения регистровой вместимости устанавливается международными или местными правилами обмера судов (например, Панамского или Суэцкого Канала). От регистровой вместимости зависят взимаемые с судна сборы и пошлины (за пользование причалами, за лоцманские услуги и так далее).

NET TOTAL RETURN = ЧИСТОЕ ПОЛНОЕ ПОСТУПЛЕНИЕ (или ЧИСТАЯ ПОЛНАЯ ОТДАЧА) – Net Total Return:- in index trading, in addition to a total return calculation, Standard & Poor's offers a return series using net cash dividends. Net total return is a reflection of return to an investor, by reinvesting dividends after the deduction of withholding tax. See also Withholding Tax. / Стэндод энд Поз (Standard & Poor's).

NET–TRADER POSITIONS = САЛЬДО ПО ПОЗИЦИЯМ ТОРГОВЦЕВ (или ЧИСТЫЕ ПОЗИЦИИ ТОРГОВЦЕВ) – Net-Trader Positions:- the combined outstanding long and short positions of three trader groups (large speculators, commercials, and small traders) as reported by the Commodity Futures Trading Commission (CFTC) in its Commitments Of Trader Report. By creating a net-position for each group, traders can track not only the money flows into and out of a market, but have a historical perspective as to the relative size of the bet in place.

NET VALUE ADDED = НЕТТО ДОБАВЛЕННАЯ СТОИМОСТЬ (или ЧИСТАЯ ДОБАВЛЕННАЯ СТОИМОСТЬ) – Net Value Added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

NET WEIGHT = ВЕС НЕТТО – Net Weight is the weight, or mass, of the goods themselves without any packaging. Net Weight is a product weight before being packed with materials or packaging. The total weight of the product with deduction for tare or packaging. For example, the net weight on a roll is the total weight of the roll less the fiber core and wrap. Net Weigh is the weight of the merchandise, excluding all packing. Net Weight is a weight of the goods alone without any immediate wrappings, e.g., the weight of the contents of a tin can without the weight of the can. Also known as Actual Net Weight. Net Weight is the weight of the goods themselves without the inclusion of any wrapper. / Под Нетто Весом понимается вес или масса самих по себе товаров без какой-либо упаковки. Вес самого товара, за исключением всех составляющих упаковки. Вес непосредственно самих товаров без каких-либо средств обёртки, например, вес содержимого консервной банки без веса самой банки.

NET WINTER CAPABILITY = ЧИСТАЯ ЗИМНЯЯ СПОСОБНОСТЬ (или ЧИСТАЯ ЗИМНЯЯ МОЩНОСТЬ) – Net Winter Capability is the steady hourly output which generating equipment is expected to supply to system load exclusive of auxiliary power, as demonstrated by tests at the time of winter peak load.

NETWORK = СЕТЬ – (1) Network is a group of people or institutes located in different places but working together for a common goal.

(2) Network is a group of computers linked together to share information. Networks can consist of a number of linked computers in a specific physical location, a Local Area Network (LAN), or they may consist of computers located at different physical sites linked together by means of phone lines and modems or other forms of long distance communications. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

NETWORK CUSTOMERS = СЕТЕВЫЕ ЗАКАЗЧИКИ – Network Customers are the entities receiving transmission service pursuant to the terms of the Transmission Provider's Network Integration Tariff.

NET WORKING CAPITAL = ЧИСТЫЙ ОБОРОТНЫЙ (или БАЛАНСОВЫЙ, или РАБОЧИЙ) КАПИТАЛ – Net Working Capital:- cash and short-term assets expected to be converted to cash within a year less short-term liabilities. Businesses use net working capital to measure cash flow and the ability to service debts. A positive net working capital indicates that the firm has money in order to maintain or expand its operations. Net working capital tends not to add much to the business' assets, but helps keep it running on a day-to-day basis. Net Working Capital:- current assets minus current liabilities. Many lending institutions and financing facilities like to use working capital as one of the covenants that need to be maintained. Often simply referred to as Working Capital. See also Floating Capital. Net Working Capital = Current Assets – Current Liabilities. The formula for net working capital (NWC), sometimes referred to as simply Working Capital, is used to determine the availability of a company's liquid assets by subtracting its current liabilities. Current Assets are the assets that are available within 12 months. Current Liabilities are the liabilities that are due within 12 months. Use of Net Working Capital Formula:- net working capital is used in various other financial formulas that deal with cash flows. Examples of these formulas include the free cash flow to equity formula and free cash flow to firm formula. In the formula for free cash flow to equity, the change in net working capital is subtracted. An increase in net working capital is considered a negative cash flow and not available for equity. In other words, an increasing requirement for capital for short term operations in the company is not available to equity. The variables of the net working capital formula are the same as those used in the current ratio. The current ratio formula instead divides current assets by current liabilities. And such, a company with a current ratio of greater than 1 will have positive net working capital. These formulas, along with others, are referred to as Liquidity Ratios as they are measures of a company's ability to meet its short term obligations. Net Working Capital is one of the classic measures of a company's liquidity. Net working capital is a pure balance sheet measure, as such it can be calculated at any time without worrying about annualizing the calculation as is necessary when calculating ratios that use both the income statement and balance sheet together – such as accounts receivable turnover. / Смотрите также Оборотный Капитал (Floating Capital).

NETWORK INTEGRATION TRANSMISSION SERVICE = УСЛУГА ПЕРЕДАЧИ С УЧЁТОМ СЕТЕВОЙ ИНТЕГРАЦИИ – The Network Integration Transmission Service allows a Transmission Customer to integrate, plan, economically dispatch, and regulate its Network Resources to serve its Network Load in a manner comparable to that in which the Transmission Provider utilizes its Transmission System to serve its Native Load customers. Network Integration Transmission Service also may be used by the Transmission Customer to deliver non-firm energy purchases to its Network Load without additional charge.

NETWORK LOAD = НАГРУЗКА РАБОЧЕЙ СЕТИ (или СЕТЕВАЯ НАГРУЗКА) – Network Load is the designated load of a Transmission Customer, including the entire load of all Member Systems designated pursuant to Section 6.0. A Transmission Customer's Network Load shall not be reduced to reflect any portion of such load served by the output of any generating facilities owned, or generation purchased, by the Transmission Customer or its Member Systems. / Под Нагрузкой Электроэнергетической Системы понимается суммарная электрическая мощность, расходуемая всеми приёмниками (потребителями) электроэнергии, подключёнными к распределительным сетям системы, и мощность, идущая на покрытие потерь во всех звеньях электрической сети (трансформаторах, преобразователях, линиях электропередачи (ЛЭП)).

NETWORK SERVICE PROVIDER = ПОСТАВЩИК УСЛУГ В СЕТИ – Network Service Provider is an institution responsible for routing, and/or providing other value added network services, on information passing between acceptor and card issuer.

NET WORTH = ЧИСТАЯ (или БАЛАНСОВАЯ) СТОИМОСТЬ КОМПАНИИ (или СОБСТВЕННЫЙ КАПИТАЛ) – Net Worth is the value of the company as determined by deducting Liabilities from Assets. Also known as Shareholders Equity. Net Worth is the difference between the total assets and total liabilities of an individual. Total assets minus total liabilities. For corporations, net worth includes capital stock and capital surplus. For partnerships or sole proprietorships, net worth is the original investment plus accumulated and reinvested profits. Net worth is equal to shareholders' equity. Net Worth is similar to equity, the excess of assets over liabilities.

NEUSTON = НЕЙСТОН – Neuston:- organisms in contact with the surface layer of a water body. / Нейстон – организмы поверхностной плёнки воды. Под Нейстоном, от Греческого слова Neustós, означающее Плавающий, понимается совокупность организмов, обитающих у поверхностной плёнки воды (сверху или снизу от неё) пресных и морских водоёмов. В составе нейстонов:- простейшие, клопы-водомерки, жуки-вертячки, личинки комаров, некоторые моллюски и другие. К морским нейстонам относят также обитателей верхнего (0–5 сантиметров) слоя воды. Нейстон, совокупность организмов, прикрепляющихся к поверхностной плёнке воды, передвигающихся по ней сверху (эпинейстон) или снизу (гипонейстон). Нейстон составляют:- простейшие, одноклеточные Водоросли, Клопы-Водомерки, Жуки-Вертячки, личинки Комаров, некоторые Ветвистоусые Рачки, лёгочные Моллюски и другие мелкие, большей частью пресноводные, организмы. К морскому гипонейстону относят также обитателей самого верхнего слоя воды (0–5 сантиметров (см)), которые живут там круглосуточно или только ночью (мелкие Рачки, мальки Рыб и другие).

NEUTRAL = БЕСПОЛОЕ – Neutral:- applied to flowers with neither stamens nor pistils. / Бесполый:- применительно к цветкам без тычинок (stamens) и без пестиков (pistils).

NEUTRAL = НЕЙТРАЛЬ (или НУЛЕВОЙ ПРОВОД, или НЕЙТРАЛЬНЫЙ ПРОВОД) – Neutral is a conductor of an electrical system which usually operates with minimal voltage to ground. Depending on the type of system, it may carry little current or only unbalance current. Systems that have one conductor grounded use the neutral for this purpose. / В электротехнике под Нейтралью, от Французского слова Neutral, от Латинского слова Neuter, означающее Ни Тот, Ни Другой, понимается общая точка обмоток многофазных электрических генераторов, трансформаторов и тому подобного. Нейтралью называют также провод, соединённый с нейтральной точкой. Заземлённая нейтральная точка (или провод) называется нулевой.

NEUTRAL = НЕЙТРАЛЬНАЯ – Neutral:- applied to soils, liquids, etc which are neither acidic nor basic. / Нейтральная:- применительно к почвам, жидкостям и тому подобному, которые не являются ни кислотными, ни основными. Под Нейтральным, от Французского слова Neutral, от Латинского слова Neuter, означающее Ни Тот, Ни Другой, понимается .

NEUTRAL = НЕЙТРАЛЬНОЕ – Neutral:- achromatic or without hue.

NEUTRAL BEHAVIOR = НЕЙТРАЛЬНОЕ ОТНОШЕНИЕ (или НЕЙТРАЛЬНОЕ ПОВЕДЕНИЕ) – Neutral Behavior:- goods which are mutually compatible and compatible with their environment display neutral behavior.

NEUTRAL BODY = НЕЙТРАЛЬНЫЙ ОРГАН – Neutral Body is the investigating body designated by conference carriers to ensure that all regulations and rules are adhered to.

NEUTRALIZATION NUMBER = ЧИСЛО НЕЙТРАЛИЗАЦИИ (или КИСЛОТНОЕ ЧИСЛО) – Neutralization Number is a measure of the total acidity or basicity of an oil; this includes organic or inorganic acids or bases or a combination thereof (ASTM Designation D974-58T). American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ).

NEUTRAL MARKET = НЕЙТРАЛЬНЫЙ РЫНОК – Neutral Market:- neither bullish nor bearish for a given market within a specified time horizon. Typically thought of as being 'on the sidelines' watching for a breakout or technical signal that is strong enough to warrant a directional bias. / Нейтральный, от Французского слова Neutral, от Латинского слова Neuter, означающее Ни Тот, Ни Другой, .

NEUTRAL SOIL = НЕЙТРАЛЬНАЯ ПОЧВА (или ПОЧВА С НЕЙТРАЛЬНОЙ РЕАКЦИЕЙ) – Neutral Soil:- specifically, a soil in which the surface layer, at least down to normal plow depth, is neither acid nor alkaline in reaction. Practically, a soil in which the pH of the surface soil ranges between 6.6 and 7.4. / Щелочное (Alkaline).

NEUTRAL SPREAD = НЕЙТРАЛЬНАЯ КУРСОВАЯ РАЗНИЦА (или НЕЙТРАЛЬНЫЙ СПРЭД) – Neutral Spread is another name for a delta neutral spread. Spreads may also be lot neutral, where the total number of long contracts and the total number of short contracts of the same type are approximately equal.

NEUTRAL ZONE = НЕЙТРАЛЬНАЯ ЗОНА – Neutral Zone is a 6 200 square-mile area shared equally between Kuwait and Saudi Arabia under a 1992 agreement. The Neutral Zone contains an estimated 5 billion barrels of oil and 8 trillion cubic feet of natural gas. / Нейтральная Зона – территория площадью 6 200 квадратных миль, равномерно распределённая в соответствии с соглашением от 1992 между Кувейтом и Саудовской Аравией. Эта Нейтральная Зона, как было подсчитано, содержит в себе 5 миллиардов баррелей нефти и 8 триллионов кубических футов природного газа.

NEUTRON–ABSORBING FIBER = НЕЙТРОНЫ–АБСОРБИРУЮЩЕЕ ВОЛОКНО (или ВОЛОКНО, НЕЙТРОНОАБСОРБИРУЮЩЕЕ ВОЛОКНО, или НЕЙТРОНОПОГЛОЩАЮЩЕЕ ВОЛОКНО) – Neutron-Absorbing Fiber is a polyethylene fiber modified with boron used in the nuclear industry for reducing neutron transmission. / Нейтроноабсорбирующее Волокно – полиэтиленовое волокно, модифицированное бором, используемое в атомной промышленности для уменьшения пропускания нейтронов.

NEWCASTLE COAL = НЬЮКАСЭЛСКИЙ УГОЛЬ – Newcastle Coal is thermal coal exported (delivered FOB) out of the port of Newcastle in New South Wales, Australia. It is the price benchmark for seaborne thermal coal in the Asia-Pacific region. Newcastle coal futures are traded at the ICE Futures Europe® under ticker symbol NCF. Contract size is 1 000 tons quoted in US Dollars and Cents per ton. Contract is cash-settled at a price equal to the globalCOAL® Monthly NEWC Index™ (Newcastle index is a reference price for thermal coal delivered on an FOB basis at Newcastle Port in New South Wales, Australia). globalCOAL® introduced the NEWC Index in July 2002 in response to persistent demand for an independently established, transparent and reliable reference price for spot FOB Newcastle (NEWC) thermal coal. The NEWC Index™ now forms the basis of a substantial OTC swap market as well as the globalCOAL ICE NEWC Futures contract trading on ICE Futures Europe®. The NEWC Index™ is calculated based on a combination of bids and offers posted on the platform and transactions executed on the platform. The globalCOAL® Monthly NEWC Index™ is the simple average of each Weekly NEWC Index™ as calculated on each Friday falling in that Index Month. The globalCOAL® Monthly NEWC Index™ is published on the last Friday of each calendar month after 17:00 London time. Like its weekly counterpart, the Monthly NEWC Index™ is calculated in US Dollars (USD) per metric tonne to two decimal places (rounding fractions of 0.005 and higher up, and rounding fractions below 0.005 down, to the nearest US cent). Delivery takes place all calendar months. Global Coal Limited (London, UK; has office in Singapore) is authorised and regulated by the UK's Financial Services Authority (FSA).

NEW COMPUTERISED TRANSIT SYSTEM = НОВАЯ КОМПЬЮТЕРИЗИРОВАННАЯ СИСТЕМА ТРАНЗИТА – New Computerised Transit System (NCTS) is electronic data interchange system which was introduced as the transit declaration and is due to replace the traditional paper procedure in the Community as well as in the EFTA (short for the European Free Trade Association) countries (Iceland, Norway, Switzerland).

NEW CONSTRUCTION = НОВОЕ СТРОИТЕЛЬСТВО – New Construction:- energy efficiency program promotion to encourage the building of new homes, buildings, and plants to exceed standard government-mandated energy efficiency codes; it may include major renovations of existing facilities.

NEW CROP = НОВЫЙ УРОЖАЙ – New Crop represents the crop to be harvested for the coming crop year. Depending on the commodity and contract month, futures contracts reflect either new crop or old crop production.

NEWEX = NEW EUROPEAN EXCHANGE

NEW FOR OLD = НОВОЕ ВМЕСТО СТАРОГО (или НОВОЕ ЗА СТАРОЕ) – New For Old:- when new material or parts replace damaged material or parts during repairs to a ship underwriters are entitled to make a deduction from the claim as a result of betterment but they waive this right in practice. Average adjusters may apply the principle in general average for vessels over 15 years old.

NEW HIGHS AND NEW LOWS = НОВЫЕ МАКСИМУМЫ И НОВЫЕ МИНИМУМЫ – In the technical analysis, New Highs refers to the number of stocks recording their highest price level in 52-weeks. New Lows are the number of stocks recording their lowest price level in 52-weeks. Lists of stocks making New Highs And New Lows are available for the AMEX®, NASDAQ®, and NYSE®. As an indicator, New Highs And New Lows are usually shown as moving averages to smooth the results and are often plotted together for easy comparison. / В техническом анализе биржевых рынков, . АФБ® или АМЭКС® (AMEX®), НЭЗДЭК® (NASDAQ®), и НЙФБ® или Эн.Уай.Эс.И.® (NYSE®).

NEW ISSUE = НОВАЯ ЭМИССИЯ (или ПЕРВАЯ ЭМИССИЯ, или ПЕРВЫЙ ВЫПУСК) – New Issue:- a stock or bond sold by a corporation for the first time. Proceeds may be used to retire outstanding securities of the company, for new plants or equipment, for additional working capital, or to acquire a public ownership interest in the company for private owners.

NEWLY INDUSTRIALIZING COUNTRIES = МОЛОДЫЕ ИНДУСТРИАЛЬНО–РАЗВИВАЮЩИЕСЯ СТРАНЫ (или НЕДАВНО ИНДУСТРИАЛИЗИРУЮЩИЕСЯ СТРАНЫ) – The Newly Industrializing Countries is a term, originated by the Organisation for Economic Co-operation and Development (OECD), describes nations of the Third World that have enjoyed rapid economic growth and can be described as 'middle-income' countries, such as Singapore and the Republic of Korea.

NEWMARKET = НОВЫЙ РЫНОК – Newmarket is a long close-fitting coat worn in the XIX century.

NEW ORDERS = НОВЫЕ ЗАКАЗЫ – In the official statistics of US Census Bureau, New Orders:- a new order is a communication of an intention to buy for immediate or future delivery. Orders data are not collected from industries that have mostly immediate deliveries. See Part H to determine if the M3 survey request orders data for your industry category. Only orders supported by binding legal documents (such as signed contracts, letters of intent, or letters of award) should be included. Reported data should include all new orders received during the month less cancellations. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

NEW ORLEANS COTTON EXCHANGE = НОВООРЛЕАНСКАЯ БИРЖА ХЛОПКА – The New Orleans Cotton Exchange was founded in 1871. It was first designated in 1936. The last futures trade occurred in 1964. In 1981, another entity called the New Orleans Cotton Exchange, was designated as a contract market. In 1981, an exchange to trade both cotton and rice was established in New Orleans. The enterprise leased space in the Board of Trade building on Magazine Street. Business was brisk for a time, but the exchange closed in 1982. See also Chicago Rice and Cotton Exchange. The exchange dissolved in the 1960s as the Cotton futures market evaporated, and the building was sold in 1962. The New Orleans Cotton Exchange was established in New Orleans, Louisiana, in 1871 as a centralized forum for the trade of Cotton. It operated in New Orleans until closing in 1964. Occupying several buildings over its history, its final location, the New Orleans Cotton Exchange Building, is now a National Historic Landmark. The New Orleans Cotton Exchange was conceived and financed by a group of cotton factors at a time when one-third of the entire production of cotton in the United States was sent through New Orleans. The Exchange sought to bring order to what was a highly speculative and often erratic cotton pricing system by providing a centralized trading office where people involved in the cotton business could obtain information about market conditions and prices. The Exchange also established standards for classification of cotton and facilitated payments between buyers and sellers. The New York Cotton Exchange opened in 1870. Concerned that trading of cotton in New York would be more advantageous to buyers than sellers, and eager to modernize their operations, New Orleans merchants agreed to form their own exchange. Consequently, the New Orleans Cotton Exchange opened for business on February 20, 1871 at the corner of Gravier and Carondelet Streets, in an area already frequented by cotton merchants. The Exchange was notable for developing advanced techniques for gathering information about various aspects of the cotton market. Led by Colonel Henry G. Hester, for many years the secretary of the Exchange, reports were compiled and then transmitted by telegraph, a novel method at the time. Col. Hester also brought the practice of futures trading to the Exchange. These advanced business methods benefited the local cotton market greatly, so much so that it 'enabled New Orleans to regain its position as the primary spot market of the world and to become a leading futures market, outranked only by Liverpool and New York'. Later years saw the decline of the Exchange as fluctuating market conditions, government regulations, price supports, the decline of cotton in the South, and various other factors conspired to shrink the Southern cotton market drastically. The Exchange closed in 1964. A handful of attempts were made in later years to restart a similar exchange, but none were successful. Some would say New Orleans was built on Cotton. In the mid-XIX century, when one-third of all Cotton produced in the USA was routed through New Orleans, the receiving docks on the levee were perpetually covered by tall stacks of Cotton bales ready to be shipped out. The Cotton Exchange was founded in 1871 to regulate trade and prices. / Новоорлеанская Биржа Хлопка – вторая крупнейшая биржа хлопка в США до приостановления торгов 09 Июля 1964. Зарегистрирована 17 Января 1871, немногим позже создания Нью Йоркской Биржи Хлопка в 1870. Функционировала на основе устава от 06 Мая 1873 с внесёнными позже поправками. Впоследствии, в 1983, Новоорлеанская Биржа Хлопка переместилась в Чикаго. Это произошло в результате слияния её со Среднеамериканской Биржей Сырья. Сейчас функционирует под названием – Чикагская Биржа Риса и Хлопка. В 1986 её фьючерсные контракты на неочищенный Рис стали предлагаться в торговом зале Чикагской Торговой Биржи. Расчёты по контрактам Чикагской Биржи Риса и Хлопка осуществляются через клиринговую корпорацию торговой биржи.

NEW SHARES = НОВЫЕ АКЦИИ (или ДОПОЛНИТЕЛЬНАЯ ЭМИССИЯ) – New Shares stem from capital increases and do not or do not fully entitle their shareholders to receive a dividend for the ongoing financial year. First after the following dividend payment date are they equivalent to 'older' shares. In the event that there are two capital increases in a financial year, the shares last issued are called 'Newest Shares'. The existing shareholders usually have a right to subscribe to the new shares. By purchasing them, shareholders can maintain their percentage holding in the company's share capital even after the capital increase. New Shares issued on the occasion of a capital increase which do not yet entitle the owner to receive the full dividend for the year and are therefore traded separately until the dividend is distributed.

NEW–TO–EXPORT = НОВИЧКИ В ВЫВОЗЕ (или НОВИЧКИ В ЭКСПОРТЕ) – As defined by the US International Trade Administration, a New-To-Export action is one that results from documented assistance to a company that assists the client's first verifiable export sale. Either the company has not exported to any destination during the past 24 months or prior exports have resulted from unsolicited orders or were received through a US-based intermediary.

NEW–TO–MARKET = НОВИЧКИ РЫНКА – As defined by the US International Trade Administration, a reportable New-To-Market export action is one that results from documented assistance to an exporter that facilitates a verifiable sale in a new foreign market. Either the company has not exported to that market during the past 24 months or previous exports to that market have resulted from unsolicited orders or were received through a US based intermediary. See also Old-To-Market.

NEWTON = НЬЮТОН – Newton is the absolute unit of force in the meter-kilogram-second (MKS) system of physical units. It is defined as that force necessary to provide a mass of one kilogram with an acceleration of one meter per second per second. One Newton is equal to a force of 100 000 dynes in the centimeter-gram-second (CGS) system, or a force of about 0.224 8 pound in the foot-pound-second (English, or customary) system. The Newton was named for Sir Isaac Newton (born December 25, 1642 (January 4, 1643, New Style), Woolsthorpe, Lincolnshire, England, died March 20 (March 31), 1727, London, England), whose second law of motion describes the changes that a force can produce in the motion of a body. / Под Ньютоном (по имени Английского физика и математика Сэра Айзэка Ньютчэна (или Исаака Ньютона; Sir Isaac Newton; 1642–1727)) понимается единица силы и веса в Международной Системе Единиц СИ. Обозначение:- Н (N). 1 Ньютон равен силе, сообщающей телу массой 1 кг ускорение 1 м/с^2 в направлении действия силы. 1 Н = 10^5 дин = 0.102 кгс. Ньютон, единица силы Международной Системы Единиц (СИ). Названа в честь Исаака Ньютона; Русское обозначение Н, международное N. Ньютон равен силе, сообщающей телу массой 1 килограмм (кг) ускорение 1 м/сек^2 в направлении действия силы. С введением в практику Международной Системы Единиц Ньютон должен заменить другие единицы силы, в частности килограмм-силу (1 кгс = 9.806 65 Н), тонну-силу (1 тс = 9 806.65 Н), дину (1 дин = 10^{-5} Н), Английскую фунт-силу (1 lbf = 4.45 Н) и другие.

NEWTONIAN FLUID = НЬЮТОНОВСКАЯ ЖИДКОСТЬ – Newtonian Fluid is a fluid with a constant viscosity at a given temperature regardless of the rate of shear. Single-grade oils are Newtonian fluids. Multigrade oils are NON-Newtonian fluids because viscosity varies with shear rate. The Newton is named for Isaac Newton (1642–1727), the British mathematician, physicist, and natural philosopher. He was the first person to understand clearly the relationship between force (F), mass (m), and acceleration (a) expressed by the formula F = ma. See also Non-Newtonian Fluid. / Ньютоновская Жидкость – вязкая жидкость, жидкость, подчиняющаяся при своём течении Закону Вязкого Трения Ньютона. Для прямолинейного ламинарного (слоистого) течения этот закон устанавливает наличие линейной зависимости (прямой пропорциональности) между касательным напряжением τ в плоскостях соприкосновения слоёв жидкости и производной от скорости течения v по направлению нормали n к этим плоскостям, то есть $\tau = \eta (dv / dn)$, где η – динамический коэффициент вязкости. В общем случае пространственного течения для Ньютоновской жидкости имеет место линейная зависимость между тензорами напряжений и скоростей деформаций. Свойствами Ньютоновской жидкости обладают большинство жидкостей (вода, смазочное масло и другие) и все газы. Течение Ньютоновской жидкости изучается в гидроаэромеханике. Жидкости, для которых указанные выше зависимости не являются

линейными (например, при прямолинейном течении $\tau = \eta (dv / dn)^k$, где k 1), называются Неньютоновскими Жидкостями. К ним относится ряд суспензий и растворов полимеров. Такие течения изучает реология.

NEW WORLD = НОВЫЙ СВЕТ (или НОВЫЙ МИР) – The New World is one of the names used for the Western Hemisphere, specifically the Americas, certain Atlantic and Pacific oceanic islands to which the closest continental shelf is that of the Americas (such as Bermuda), and sometimes Oceania (Australasia). The term originated in the early XVI century, shortly after America was discovered by European explorers, expanding the geographical horizon of the people of the European Middle Ages, who had thought of the world as consisting of Europe, Asia, and Africa only:- collectively now referred to as the Old World. The Americas were also referred to as the 'Fourth Part Of The World'. The term was first coined by the Florentine explorer Amerigo Vespucci, in a letter written to his patron Lorenzo di Pier Francesco de' Medici in the Spring of 1503, and published (in Latin) in 1503–04 under the title Mundus Novus. Vespucci's letter contains arguably the first explicit articulation in print of the hypothesis that the lands discovered by European navigators to the west were not the edges of Asia, but rather an entirely different continent, a 'New World'. Vespucci probably came to this realization in June of 1502, during a famous chance meeting between two different expeditions at the watering stop of 'Bezeguiche' (the Bay of Dakar, Senegal) – his own outgoing expedition, on its way to chart the coast of newly-discovered Brazil, and the vanguard ships of the Second Portuguese India armada of Pedro Alvares Cabral, returning home from India. Having already visited the Americas in prior years, Vespucci probably found it difficult to reconcile what he had already seen in the West Indies, with what the returning sailors told him of the East Indies. Vespucci wrote a preliminary letter to Lorenzo, while anchored at Bezeguiche, which he sent back with the Portuguese fleet – at this point only expressing a certain puzzlement about his conversations. Vespucci was finally persuaded when he proceeded on his mapping expedition through 1501–02, covering the huge stretch of coast of eastern Brazil. After returning from Brazil, in the Spring of 1503, Amerigo Vespucci composed the Mundus Novus letter in Lisbon to Lorenzo in Florence, with its famous opening paragraph:- 'In passed days I wrote very fully to you of my return from new countries, which have been found and explored with the ships, at the cost and by the command of this Most Serene King of Portugal; and it is lawful to call it a new world, because none of these countries were known to our ancestors and all who hear about them they will be entirely new. For the opinion of the ancients was, that the greater part of the world beyond the equinoctial line to the south was not land, but only sea, which they have called the Atlantic; and even if they have affirmed that any continent is there, they have given many reasons for denying it is inhabited. But this opinion is false, and entirely opposed to the truth. My last voyage has proved it, for I have found a continent in that southern part; full of animals and more populous than our Europe, or Asia, or Africa, and even more temperate and pleasant than any other region known to us'. Vespucci's letter was a publishing sensation in Europe, immediately (and repeatedly) reprinted in several other countries. The Vespucci passage above applied the 'New World' label to merely the continental landmass of South America. At the time, most of the continent of North America was not yet discovered, and Vespucci's comments do not eliminate the possibility that the islands of the Antilles discovered earlier by Christopher Columbus might still be the eastern edges of Asia, as Columbus continued to insist down to his dying day. A critical step in the transition was the conference of navigators (Junta de Navegantes) assembled by the Spanish monarchs at Toro in 1505, and Burgos in 1508, to digest all existing information about the Indies, come to an agreement on what had really been discovered, and set out the future goals of Spanish exploration. Amerigo Vespucci attended both conferences, and seems to have had an outsized influence on them – Vespucci ended up being appointed the first piloto mayor, the chief of navigation of Spain at Burgos. Although proceedings of the Toro conference are missing, it is almost certain that Vespucci articulated his recent 'New World' thesis to his fellow navigators there. It was during these conferences when Spanish officials seem to have finally accepted that the Antilles and the known stretch of Central America were definitely not the Indies they had originally sought, and Columbus had insisted they were, and set out the new goal for Spanish explorers: to find a strait through the American landmass which would permit them to sail to East Asia proper. While it became generally accepted after Vespucci that Columbus's discoveries were not Asia but a 'New World', the geographic relationship between the two continents was still unclear. That there was a large ocean between them was implied by the known existence of vast continuous sea along the coasts of East Asia. Even prior to Vespucci, several maps, e.g., the Cantino planisphere of 1502 and the Canerio map of 1504, placed a large open ocean between China on the east side of the map, and the inchoate largely water-surrounded American discoveries on the western side of map. Although, out of uncertainty, they depicted a finger of the Asian land mass stretch across the top to the eastern edge of the map, that did not carry over into the western hemisphere. However, other maps, e.g., the 1506 Contarini-Rosselli map and the 1508 Johannes Ruysch map, bowing to Ptolemaic authority and Columbus's assertions, have the northern Asian landmass stretching well into the western hemisphere and merging with known North America (Labrador, Newfoundland, etc). These maps place the island of Japan near Cuba and leave the South American continent – Vespucci's 'New World' proper – detached and floating below by itself. The Waldseemüller map of 1507, which accompanied the famous Cosmographiae Introductio volume (which includes reprints of Vespucci's letters) comes closest to modernity by placing a completely open sea distinction (with no stretching land fingers) between Asia on the eastern side and the New World on the western side – which that same map famously labels simply 'America'. However, Martin Waldseemüller's map of 1516 retreats considerably from his earlier map and back to classical authority, with the Asian land mass merging into North America (which he now calls Terra de Cuba Asie partis), and quietly drops the 'America' label from South America, calling it merely Terra Icognita. The western coast of the New World – the Pacific Ocean – was only discovered in 1513 by Vasco Núñez de Balboa. But it would take a few more years – Ferdinand Magellan's voyage of 1519–22 – to determine that the Pacific definitely formed a single large body of water separating Asia from America. And even several more years before the Pacific Coast of North America was mapped. Of course, until the discovery of the Bering Straits in the XVII century, there was no absolute confirmation that Asia and America were not connected, and some European maps of the XVI century still continued to hopefully depict North America connected by a land bridge to Asia, e.g., the 1533 Johannes Schöner globe. In 1524, the term was used by Giovanni da Verrazzano in a record of his voyage that year along the Atlantic coast of North America, land that is now part of the United States and Canada. While Amerigo Vespucci is usually credited for coming up with the term 'New World' (Mundus Novus) for the American continent in his 1503 letter, certainly giving it its cachet, similar terms had nonetheless been used and applied before him. The Venetian explorer Alvise Cadamosto had used them term 'un altro mundo' ('an other world') to refer to sub-Saharan Africa, which he explored in 1455 and 1456 on behalf of the Portuguese. The Italian-born Spanish chronicler Peter Martyr d'Anghiera often shares credit with Vespucci for the new designation of the Americas as a new world. Peter Martyr used the term Orbe Novo (literally, 'New Globe', but often translated as 'New World') in the title of his history of the discovery of the Americas as a whole, which began to appear in 1511 (cosmologically, 'orbus' as used here refers to the whole hemisphere, while 'mundus' refers to the land within it). Peter Martyr had been writing and circulating private letters commenting on Columbus's discoveries since 1493 and, from the start, doubted Columbus's claims to have reached East Asia ('the Indies'), and consequently came up with alternative names to refer to them. Only a few weeks after Columbus's return from his first voyage, Peter Martyr wrote letters referring to Columbus's discovered lands as the 'western antipodes' ('antipodibus occiduis', letter of May 14, 1493), the 'new hemisphere of the earth' ('novo terrarum hemisphaerio', September 13, 1493), and in a letter dated November 01, 1493, refers to Columbus as the 'discoverer of the new globe' ('Colonus ille novi orbis repertor'). A year later (October 20, 1494), Peter Martyr again refers to the marvels of the New Globe ('Novo Orbe') and the 'Western hemisphere' ('ab occidente hemisphero'). Christopher Columbus touched the continent of South America in his 1498 third voyage. In his own 1499 letter to the Catholic Monarchs of Spain, relating the results of his third voyage, Columbus relates how the massive waters of the Orinoco

delta rushing into the Gulf of Paria implied that a hitherto-unknown continent must lie behind it. However, bowing to the classical tripartite division of the world, Columbus discards that hypothesis and proposes instead that the South American landmass is not a 'fourth' continent, but rather the terrestrial paradise of Biblical tradition, not an previously unknown 'new' part of the world, but a land already 'known' (but location undiscovered) by Christendom. In another letter (to the nurse of Prince John, written 1500), Columbus refers to having reached a 'new heavens and world' ('nuevo cielo e mundo') and that he had placed an 'other world' (or 'another world', 'otro mundo') under the dominion of the Kings of Spain. The terms 'Old World' vs. 'New World' are primarily meaningful in historical context and for the purpose of distinguishing the world's major ecozones. One can speak of the 'New World' in a historical context, e.g., when discussing the voyages of Christopher Columbus, the Spanish conquest of Yucatán and other events of the colonial period; additionally, the term 'New World' is sometimes used in a biological context, when one speaks of Old World (Palearctic, Afrotropic) and New World species (Nearctic, Neotropic). For lack of alternatives, the term is also still useful to those discussing issues which concern the Americas and the nearby oceanic islands, such as Bermuda and Clipperton Island, collectively. The term has been criticized as being Eurocentric, patronizing and also for taking an apologetic tone with regard to colonialism. New World – colloquial – the north, central and southern Americas. / Амэриго Вэспучи (Amerigo Vespucci), в письме, написанном его патрону Лорэнцо ди Пьер Франчэско дэ Медичи (Lorenzo di Pier Francesco de' Medici). Педру Алварис Кабрал (Pedro Álvares Cabral). Карта Контарини-Россэлли (Contarini-Rosselli) и 1508 карта Йоханэса Рауща (Johannes Ruysch), Тчолэмэйк (Ptolemaic). Питэр Мартир д'Ангеэра (Peter Martyr d'Anghiera). Кристофё Колумбас (Christopher Columbus). , от Латинского слова Affirmo, означающее Утверждаю, . Йоханэс Шоня (Johannes Schöner). Новый Свет, название части Южного заатлантического материка, открытой Португальцами в 1500 и 1501–02, предложенное Итальянским мореплавателем Амэриго Вэспуччи (Amerigo Vespucci; 1451-54–1512) (1503). Позднее это название стали применять ко всему Южному материку, а с 1541, вместе с названием Америка, оно было распространено и на Северный материк, обозначая четвёртую часть света после Европы, Азии и Африки.

NEW YORK AREA FIRMS ADVISORY COMMITTEE = СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ ДЛЯ ФИРМ НЬЮ ЙОРКСКОЙ ТЕРРИТОРИАЛЬНОЙ ЗОНЫ – New York Area Firms Advisory Committee advises on the likely impact of important policy decisions on specialty firms, and presents its views on the problems and needs of these firms. Its members are principals of smaller, non-specialist member firms headquartered in the New York metropolitan area. / в метрополитенском ареале Нью Йорка.

NEW YORK BOARD OF TRADE = НЬЮ ЙОРКСКАЯ ПАЛАТА ТОРГОВЛИ (или НЬЮ ЙОРКСКОЕ ТАБЛО ТОРГОВЛИ) – 2001-September-11, was a difficult and defining moment for the NYBOT® exchanges when the destruction of the World Trade Center forced NYBOT® to re-locate to its back up facility in Long Island City and remain there for two years. In 2003, NYBOT® moved into a new state-of-the-art facility in the World Financial Center. With that return, the New York Board of Trade continued its long history in Lower Manhattan of providing effective risk management tools for major international industries and opportunities for well-informed investors. For well over a century, the diverse markets of the New York Board of Trade (NYBOT®) have demonstrated that a product innovation becomes a market tradition when it solves fundamental problems and creates ongoing opportunities. This tradition of innovation has guided the creation and growth of the world's premier markets for the trading of citrus, Cocoa, Coffee, Cotton and sugar futures and options. The NYBOT® agricultural, financial and index markets have provided high quality tools for price discovery and price risk management and continuous opportunities for commodities investment. In 1998, the union of the Coffee, Sugar & Cocoa Exchange, Inc. (CSCE – founded in 1882) and the New York Cotton Exchange (NYCE® – founded on 20 July 1870 and officially opened for business on 10 September 1870) created the New York Board of Trade (NYBOT®). The new parent company brings together markets of unsurpassed integrity, strength and the longest sustained tradition of market excellence in the history of the world's financial center – New York City. A Tradition of Innovation:- throughout their history, the original NYBOT® futures markets have maintained their commitment to innovative management tools for key internationally traded agricultural commodities. In 1982, for example, world sugar options were introduced as the first exchange-traded option on a commodity futures contract since 1936. Since the 1980s, other industries including the interbank market and professional money management have demonstrated a need for the risk transfer and price discovery capabilities of futures and options markets. In response, the NYBOT® marketplace has expanded to include a wide array of currency, index and government securities contracts. Commodity and equity index products are traded on NYBOT's New York Futures Exchange, Inc. (NYFE®) (1978). NYBOT's global currency division, FINEX® (1985), trades a broad array of currency futures and options. The Cantor Exchange (CX) (1998), a NYBOT® venture with eSpeed, Inc. (Cantor Fitzgerald), provides the first full-time, electronic market for US Treasury and Agency futures. From its World Trade Center Facility in Manhattan, the New York Board of Trade faces the challenges of a new century with its proven tradition of managing change. NYBOT® History:- 1870 – The New York Cotton Exchange (NYCE®) founded. 1882 – Coffee Exchange of the City of New York founded. 1914 – Coffee Exchange adds sugar futures. 1915 – Commodity Clearing Corporation (CCC) founded as the clearinghouse for the NYCE®. 1916 – New York Cocoa Exchange begins trading Cocoa futures. 1966 – New York Cotton Exchange adds frozen concentrated orange juice (FCOJ) futures. 1979 – New York Futures Exchange, Inc. (NYFE®). 1979 – New York Coffee and Sugar merges with New York Cocoa Exchange forming the Coffee, Sugar & Cocoa Exchange, Inc. (CSCE). 1982 – CSCE introduces options on sugar futures, first US exchange-traded option. 1982 – NYFE® begins trading New York Stock Exchange, Inc. (NYSE®) Composite Index® futures. 1983 – NYFE® adds options on NYSE Composite Index® futures. 1985 – NYCE® adds FCOJ options. 1986 – CSCE adds Cocoa and Coffee options. 1988 – NYFE® adds options on CRB Index futures. 1993 – CSCE launches dairy futures and options. 1994 – NYCE® acquires NYFE®. 1994 – FINEX® opens Dublin trading floor, begins trading a series of cross-rate contracts, including several Deutsche Mark and US Dollar-paired futures. 1996 – NYFE® launches PSE Technology Index℠ futures and options; PSE Technology Index℠ is a service mark of the Pacific Exchange, Inc.. 1998 – CSCE and NYCE® form New York Board of Trade® (NYBOT®). 1998 – NYBOT® and Cantor Fitzgerald open Cantor Exchange (CX) – the first full-time, electronic market for US Treasury and Agency futures. 1999 – CCC becomes the New York Clearing Corporation (NYCC®) – the designated clearinghouse for all NYBOT® markets. 1999 – NYBOT®/NYFE® introduces futures and options based on the Russell 1000® Index of large capitalization US stocks. The Historic Role of the Exchange:- before the founding of the NYBOT® exchanges, cash markets in Coffee or Cotton, for example, were subject to extreme price swings. Sudden and unpredictable shifts in the balance of supply and demand could cause sharp price changes that sometimes threatened the economic stability of whole segments of an industry. To bring some order to the pricing process of certain commodity markets, merchants organized a central marketplace where they could meet and trade – a marketplace where price could be openly and fairly negotiated and some of the price risk inherent to the commodity could be more effectively managed. They did not simply buy and sell stockpiles of Coffee or Cotton in the exchange, however; they traded futures contracts on the commodity. By standardizing the terms of the legal and tradeable contract (size and standard of commodity and terms of delivery), the buyers and the sellers could negotiate the one and only variable – the price. The futures contract became the focus of negotiation for a generally accepted market price of a standard measure of the underlying commodity to be delivered at a specific future date. The buying and selling of futures contracts provided the industry with a reliable price discovery process. It allowed industry participants, who were vulnerable to tremendous price volatility, to negotiate the best current futures-market price and to lock in a price in anticipation of a cash-market commodity delivery at some later date. The exchange enables anyone involved in the buying and selling of a commodity to cease being a speculator in the cash market and provides them with a unique mechanism for transferring price risk to investors or

speculators within and outside the industry. Growers, producers, merchants, processors and manufacturers can reduce (hedge) their price risk exposure in the cash market by taking equal and opposite positions in the futures market. Futures markets do not act as an alternative for the actual buying and selling of a commodity; they are used as a form of forward pricing. A merchant (hedger) can actually negotiate a price in May for a specific quantity of a commodity (e.g., sugar) that may not be harvested, delivered or processed for months. Investors assume the hedgers' risk and seek to profit from changing prices during the trading life of each contract. The Business of the Exchange:- although the markets of the New York Board of Trade provide a variety of industries with price discovery and risk management capabilities, in each case the instruments traded are the same:- a futures contract that offers greater hedging precision and a futures option contract that offers greater hedging flexibility. A Futures Contract is a standardized, legal agreement between two parties to make or take delivery of a specific quantity of a particular grade and type of a commodity or a cash settled equivalent on a specified date, at an established point and an agreed upon price. A Futures Option Contract grants the right. But not the obligation, to buy or sell a futures contract at a given price on or before a stipulated date. The principle of trading in the NYBOT® exchanges and subsidiaries is also the same:- an open and competitive auction market. The transaction traditionally takes place through 'open outcry' on the floor of the exchange. The rest of the trade process, before and after the transaction, may be routed by hand or by an electronic order routing system. Bids to buy and offers to sell are called out in the trading ring, making the information immediately available to all traders in the particular market. In the ring, the traders recognize each other's bids and offers; sellers accept bid prices and buyers take offer prices. When transactions take place, subsequent bids and offers for futures contracts may be affected and prices may change. Through the open outcry system, the market user has access to a proven price discovery process, a wide array of specialized strategic trading capabilities and a valuable market information source. In open outcry and in electronic trading all market participants are given the opportunity to buy or sell at the best available current price. Futures prices are disseminated throughout the world and become the benchmark for cash market pricing. While the most NYBOT® markets call for physical delivery of a product (in some cases contracts are cash settled against a cash market price), the great majority of market participants (approximately 98%) liquidate their contracts prior to delivery date. Actual physical delivery of commodities is usually much easier to accomplish through normal cash market channels. The NYBOT® exchanges require that market participants make original and variation margin payments. Original Margins are 'good faith deposits' established to guarantee market performance by ensuring that market participants will meet their contractual financial obligations. Original margins are constantly monitored by the exchanges and are periodically adjusted to reflect changing market conditions, such as increased price volatility. In addition, at the close of each trading day, margin accounts are marked-to-the-market (adjusted to reflect price movements in the futures market). When prices move unfavorably to a trader's position, additional or variation margin payments may be necessary to restore margin to required levels. Unlike the cash or the over-the-counter (OTC) markets, the performance of a contract traded in any of the NYBOT® markets does not depend on the individuals involved in the transaction. Contracts traded on the exchanges are fully guaranteed by the New York Clearing Corporation (NYCC®) – the designated clearinghouse for all NYBOT® trades. The performance reliability of these contracts does not vary with the ups and downs of the marketplace. For over 125 years, the integrity of the contracts has been a primary pillar of the exchange. The Structure of the Exchange:- the New York Board of Trade is a not-for-profit membership organization. It was established as the parent company of the two exchanges (CSCE, NYCE®) and their subsidiaries and divisions. The subsidiary exchanges, divisions and ventures of the New York Board of Trade, as the designated contract markets, do not participate directly in price determination. They provide the physical facilities for trading and for the processing of trading data and the rapid dissemination of prices. They establish the rules that govern the marketplace, monitor for compliance and oversee market activity. The exchange environment provides a central location where the competing forces of supply and demand interact to perform the vital economic functions of 'price discovery' and 'price risk transfer'. NYBOT's futures markets serve as equitable and transparent pricing mechanism. The futures market primarily consists of hedgers and investors. Hedgers are commercial firms who trade futures and options to reduce their price risk exposure in the cash market, protect their profit margins and assist in business planning. Several large multinational corporations are members of the NYBOT® exchanges and, along with many other traders, use the markets on a daily basis. Investors, who seek to profit from fluctuating prices, typically place orders through commodities brokerage firms known as Futures Commission Merchants (FCMs) or through Introducing Brokers (IBs) who have clearing relationships with FCMs. Investors also participate in the markets by pooling money with other investors in commodity funds, which are managed by Commodity Trading Advisors (CTAs). All such individuals, firms and their associated persons must be registered with the Commodity Futures Trading Commission (CFTC) – the government agency responsible for oversight of the futures industry. The CFTC also requires all registrants to hold membership in the National Futures Association (NFA) – one of the self-regulatory organizations registered with the CFTC that is charged with enforcing ethical standards and customer protection in the futures industry. Hedgers and investors are joined in the markets by Floor Traders ('Locals') who trade for their own accounts and by Floor Brokers (exchange members who may execute customer orders and trades for their own account). These traders add liquidity to the market enabling commercial hedgers and individual investors to more easily achieve their price objectives. Floor traders and floor brokers are exchange members. Only exchange members can trade directly on the exchange. The membership of the exchanges includes representatives from every segment of the underlying industries served by the NYBOT® markets. Memberships are also held by futures commission merchants, floor brokers, floor traders and managed futures funds. A full membership is one of the NYBOT® subsidiaries enables members to trade any of that exchange's futures and options contracts at the member fee rates. The exchanges also issue associate memberships that allow the trading of options contracts. To gain membership status, members must meet certain ethical and financial requirements and all floor traders must be guaranteed by a member of the New York Clearing Corporation (NYCC®). The New York Board of Trade is governed by a Board of Directors comprised of representatives of futures commission merchants, commercial firms, floor traders and public members. Each subsidiary of NYBOT®, as a designated contract market, has a Board of Managers that establishes and interprets that exchange's rules and regulations and is responsible for all rule changes and contract modifications. Exchange committees, comprised of members and public members, work with the NYBOT® staff to develop policy and recommend changes to the contracts and operations. The executive staff of NYBOT®, under the leadership of the President and CEO and the direction of the Board of Directors, is responsible for the day-to-day management of the exchanges. A range of departments including administration, marketing and communications, market development, legal, membership services, systems and technology, economics, surveillance, compliance and grading, serve the NYBOT® markets. As self-regulatory organizations, the NYBOT® exchanges ensure the adherence to fair trading practices by its members through compliance and market surveillance operations. While the NYBOT® exchanges monitor member firms for compliance with minimum financial and reporting requirements, the NFA is responsible for the formal auditing of the financial condition of members and member firms, as well as the positions of large traders. Market Integrity and Financial Strength:- all of the details of each trade are entered into the NYBOT® Trade Input Processing System (TIPS®). Trades are matched on an ongoing basis and allocated to clearing members of the New York Clearing Corporation (NYCC®). At the end of each day, all trades are financially settled by the NYCC® as the clearinghouse assumes the opposite side of the clearing members' positions, serving as buyer to every seller and seller to every buyer. Since the NYCC® provides financial security for all transactions, counterparty credit risk is not a concern. The exchanges' clearing process allows firms and individuals to exit positions without the need to find the original trading partner. The strength of the futures contract is drawn from the clearinghouse guarantee of performance. The safeguards used by the NYCC® include stringent financial

requirements and clearing member position limits. All trading on the NYBOT® markets is closely monitored by the appropriate subsidiary exchange according to guidelines established by the Commodity Futures Trading Commission (CFTC). TIPS® provides a number of trade monitoring functions and allows the exchanges to electronically establish an audit trail for each transaction. NYBOT® uses its advanced technology to perform a variety of surveillance and compliance procedures. NYBOT® is committed to maintaining markets of the highest quality. The New York Board of Trade Markets That Work:- The Agricultural Markets:- when someone in the world wants a benchmark price for Brazilian sugar or Florida frozen concentrated orange juice, that individual looks to the NYBOT® markets. The NYBOT® futures and options markets provide effective pricing and hedging tools for a number of traditional agricultural commodities. Industry users worldwide and throughout the marketing chain, from production to retail, utilize NYBOT® agricultural futures and options to held reach management goals. Individual and institutional investors also pursue opportunities provided by NYBOT's liquid and efficient markets. The New York Board of Trade exchanges currently offer futures and options contracts on Cocoa, Coffee, Cotton, frozen concentrated orange juice (FCOJ), milk and sugar. Through close cooperation with the citrus, Cocoa, Coffee, Cotton, dairy and sugar industries, the NYBOT® markets have led the way in development of innovative and internationally recognized futures and options contracts that reflect the basic needs of the underlying commodity. The NYBOT® exchange contract committees, in conjunction with the industry, carefully and continuously scrutinize these contracts and trading practices (old and new) to adjust specifications and procedures and introduce new contracts when cash market conditions warrant such change. As the risk management needs and investment opportunities in the global marketplace grow more complex, NYBOT® offers market participants an expanding range of products that can serve inter-market strategies as well as individual industry management goals. To remain competitive in the global marketplace, managers in basic commodity industries must attend to an increasing array of factors that directly affect the bottom line. A manufacturer, for example, might have risk exposure to rising commodity prices, which is compounded by foreign exchange uncertainty. In that case, the NYBOT® markets provide specialized management tools such as financial cross-rate contracts to complement the agricultural markets. The Currency Markets:- FINEX®, NYBOT's global currency futures and options division, introduced its currency markets with the launch of the US Dollar Index® (USDX®) futures in 1985. In greatly expanded its currency complex by adding individual currency cross-rates in 1994. In the same year, it became the first exchange to provide trading floors ob two continents with two facilities (in New York and in Dublin). In 1998, FINEX® was a pioneer in the introduction of a series of products based on the new Euro currency. It introduced its new Euro-based contracts as a strategic response to the historic process of European Economic and Monetary Union (EMU). Through FINEX®, NYBOT® provides futures and options markets for a variety of currency contracts:- Euro-paired, US Dollar-paired and other key cross-rates (such as Swiss Franc/Japanese Yen), as well its original contract based on the US Dollar Index® (USDX®). Through its trading capabilities and product flexibility, FINEX® quickly and effectively responds to the challenges of currency evolution. By consistently identifying interbank market signals and customer needs, FINEX® has created strategic currency contracts and defined trading procedures that serve the business goals of the institutional financial manager or investor. Comprehensive investment strategy requires an understanding of the growing interrelationship among key market sectors. The influence of the huge US Securities cash market on other sectors underscores this connection. With US Treasury interest rates and prices serving as key intermarket indicators, the US Treasury futures market represents an important business-planning component. The US Treasury Markets:- the Cantor Exchange (CX) – a venture with e Speed, Inc. (Cantor Fitzgerald) and the newest NYBOT® exchange – provides the first full-time electronic market for US Treasury and Agency futures. Building on the most technologically sophisticated electronic system available (eSpeed, Inc.), this screen-based marketplace continues to define the arena of computer trading. The Cantor Exchange provides easy, fast and cost efficient trading, by giving traders direct eccess to the market through keyboard interface or a Terminal Operator. The CX proprietary system provided by eSpeed, Inc. allows futures style and cash market trading simultaneously on the same electronic platform. The Cantor Exchange is expanding its presence on a global scale. The Cantor System continues to add new features and new trading capabilities such as 'limit' and 'stop limit' in order to create a futures style electronic marketplace alongside its cash market counterpart. The evolution of the Cantor System is built upon the impressive size and depth of the Cantor Fitzgerald cash market and the development of the advanced technology of eSpeed, Inc. Interest rates on the US Treasury 30-year Bond represent but one of the key economic indicators used by investors. Money managers and economic planners have also relied on board market indexes (equity, commodity, financial, price, etc) for a century. Equity indexes alone have been in use since the XIX century. The unprecedented bull equities market of the 1990s combined with the rapid globalization of trade has raised the competitive bar and created new standards of investment performance in the financial and investment community. The increasing role of indices has created new risk management needs. As the equities market grows in size and complexity, equity indices become more precise and asset allocation strategies become more demanding. The Equity and Commodity Index Markets:- in 1982, the futures industry introduced equity index futures and options to provide institutional investors a new resource for reaching and surpassing performance goals. This innovation brought the advantages of futures markets to professional money managers and generated new opportunities for institutional and individual investors. In 1982, the New York Futures Exchange, Inc. (NYFE®), a wholly owned subsidiary of NYBOT®, began trading futures contracts based on the NYSE Composite Index®. In 1986, NYFE® introduced a contract based on the world's leading indicator of commodity prices – the Bridge/Commodity Research Bureau (Bridge/CRB) Index. Since that time, NYFE has added futures and options contracts on the PSE Technology 100 Index (1996 – a key benchmark for the technology sector) and on the Russell 1000 Index of large cap US equities (1999). The New York Board of Trade More Than the Numbers:- a primary function of an exchange is the dissemination of market information. This job involves far more than market trading data. It includes the design and development of educational materials and programs. The New York Board of Trade extends its innovative commitment to promoting and developing its markets and to guiding potential and existing market users in the use of the market products. NYBOT® utilizes a variety of avenues for its instructional efforts including a rapidly expanding website (http://www.nybot.com); video, audio and software presentations; and, a wide range of brochures, publications and other printed materials. In addition to professional presentations at industry-sponsored events and conferences, NYBOT® develops and presents a large number of workshops and seminars with its own professional staff or in conjunction with the broker community, technical market analysts and other underlying or futures industry specialists. NYBOT® has developed an outstanding relationship with the broker community as part of its outreach efforts to expand the use of futures and options for hedging by under-represented segments of the marketing chain, such as small producers. A prime example of the NYBOT® approach to its educational responsibilities can be found in the United States Department of Agriculture's (USDA) Dairy Options Pilot Program (DOPP) – a program based on a proposal that was created, designed, developed by NYBOT's CSCE subsidiary. Through this program, dairy farmers are instructed and financially assisted in the use of milk 'put' options to establish a price floor for their milk deliveries. NYBOT® also works with government and trade associations throughout the world to encourage and assist in the use of futures and options for risk management. The staff and membership of NYBOT® help commodities-related businesses in developing countries to utilize the tools available in its world recognized futures and options markets. Business and government leaders from many countries, from Costa Rica to Côte d'Ivoire, have visited the exchanges and participated in the educational programs. NYBOT® is active in the development of public policy and legislation – at the national level in Washington, DC studying and debating regulatory issues or in the international community working with such institutions as the World Bank to assist developing countries to encourage market-based approaches to building their commodities-based economies. The New York Board of Trade Changing Markets in the Next Century:- the futures contract exists

because of the constant presence of change in the marketplace. Cash market conditions change, exposing everyone in the marketing chain – from producer to retailer – to the risk of rapidly rising or falling prices. The futures and options industry itself now faces enormous change in the next century. The New York Board of Trade responds to the challenge of change with the strength of tradition and the capacity for innovation. To support its traditional open outcry markets, NYBOT® continues to streamline and refine the entire trading process, including the development of electronic order routing and trade confirmation capabilities. By enhancing the proven strengths of the open outcry system, NYBOT® supplies market users with greater efficiency and value. Whatever form the exchange of the XXI century takes, the New York Board of Trade is committed to providing markets of the highest standards of integrity, strength and excellence. The IntercontinentalExchange, Inc. (ICE®) announced its intent to acquire the New York Board of Trade® (NYBOT®) on 2006-September-14. ICE® announced on 2007-July-26 that effective 2007-September-03, NYBOT® will be renamed ICE Futures US, Inc., reflecting the successful integration of NYBOT® with ICE®. The have changed the NYBOT's name to ICE Futures US® as of 2007-September-03. The New York Board of Trade® (NYBOT®) traces its history to 1870, when the New York Cotton Exchange, or NYCE®, was founded, and to 1882, when the Coffee Exchange of New York City, or the Coffee Exchange, was founded. In 1914, the Coffee Exchange began trading sugar futures (currently NYBOT's largest market) and in 1916 became the New York Coffee and Sugar Exchange. In 1925, the New York Cocoa Exchange was founded to trade cocoa futures, and merged with the New York Coffee and Sugar Exchange in 1979 to form the Coffee, Sugar & Cocoa, Exchange, Inc., or CSCE. In 1998, the CSCE and the NYCE® formed the Board of Trade of the City of New York, Inc. as their parent company; they entered into a merger agreement, which was to occur in several stages. In June 2004, the two exchanges merged formally and completely into NYBOT® thereby establishing one exchange known as the New York Board of Trade, a not-for-profit membership organization. The NYCE's and CSCE's contract market designations were extinguished and transferred to NYBOT®. See also New York Cotton Exchange. NYBOT® has established a reputation as a premier global marketplace for the trading of futures contracts and options on futures contracts on soft agricultural commodities. NYBOT® provides highly liquid markets and a number of benchmark contracts for several of the world's longest-traded agricultural commodities. Several of NYBOT's core products serve as global benchmarks for managing risk relating to exposure to price movements in the underlying commodities. NYBOT's Sugar No. 11 futures contract serves as the benchmark for raw sugar, a basic commodity now produced in over 120 countries and consumed by every country in the world. NYBOT's Coffee 'C' and Cotton No. 2 contracts are also recognized as benchmark contracts. These product brands have been synonymous with the two predecessor exchanges that formed the NYBOT® – the Coffee, Sugar & Cocoa Exchange and the New York Cotton Exchange. NYBOT® believes that its existing liquidity and history and that of its predecessors in trading these core products for over 100 years sets it apart from larger US derivatives exchanges that are not as closely identified with these particular products and has led to sustained business activity and the development of strong industry relationships. On 2006-September-14, NYBOT® agreed to become a unit of ICE and this transaction was completed on 2007-January-12. NYBOT's and its predecessors' long relationship with the Cotton, Cocoa, Coffee, sugar and citrus industries has led to NYBOT's substantial involvement with the physical marketplace for these commodities. NYBOT® provides services directly and indirectly to the physicals market, including warehouse licensing for Coffee, Cocoa and wood pulp, grading and certification for Coffee and Cocoa, and electronic documentation and transfer capabilities for Coffee, Cocoa and orange juice (both exchange deliveries and commercial transactions) through NYBOT's electronic commodity operations and processing system known as eCOPS. NYBOT® also provides market data services to the trading community through third party vendors and by making its real time market data directly available to users over the Internet through NYBOTLive, a direct data link that can be customized by individual users. NYBOT's exchange is supported by its designated clearing house, the New York Clearing Corporation, or NYCC®, a wholly-owned subsidiary of NYBOT®, which clears and provides financial security to its clearing members for each contract traded on its exchange. NYBOT® owns its own clearing house, the New York Clearing Corporation (NYCC®), which clears and settles contracts traded on or subject to the rules of NYBOT®. NYCC and its predecessor clearing houses have provided continuous financial security for NYBOT's markets for over 90 years. NYCC® is a Commodity Futures Trading Commission (CFTC) registered derivatives clearing organization that is subject to CEA and CFTC regulation. In 1999, NYBOT® began offering Russell Equity Index products with the launch of Russell 1000® Index futures and options. 2001-September-11, was a difficult and defining moment for NYBOT® when the destruction of the World Trade Center forced NYBOT® to re-locate to its back up facility in Long Island City, New York and remain there for two years. In 2003, NYBOT® moved into a new state-of-the art trading facility in the World Financial Center, continuing its long history in lower Manhattan. The New York Board of Trade® was created in 1998, and NYBOT® is the parent company of the CSCE, NYCE® and NYFE®. NYBOT®, New York's first futures exchange, is a leading global futures and options exchange for trading in a broad array of 'soft' agricultural commodities, including Cocoa, Coffee, Cotton, frozen concentrated orange juice, or FCOJ, and sugar. For well over a century, NYBOT® and its predecessors provided marketplaces that bring together industry representatives, traders and investors to engage in price discovery, price risk transfer and price dissemination for their commodities. NYBOT's exchange also provides trading in futures and option contracts for a variety of financial products, including its exclusive futures and options contracts based on the US Dollar Index®, or USDX®. As an open-outcry exchange, NYBOT® provides floor-based trading for all of its agricultural and financial products. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). НАЙБЭТ® (NYBOT®):- 22 Декабря 1997 Биржа Кофе, Сахара и Какао, Инк. (THE COFFEE, SUGAR AND COCOA EXCHANGE, INC., сокращённо – CSCE) и Нью Йоркская Биржа Хлопка договорились о слиянии с формированием новой общей холдиньговой компании – Нью Йоркской Палаты Торговли (или, если быть более точными, Нью Йоркского Табло Торговли; THE NEW YORK BOARD OF TRADE, сокращённо – НАЙБЭТ® (NYBOT®)); 24 Апреля 1998 Американская Комиссия по Торговле Сырьевыми Фьючерсами (КТСФ; COMMODITY FUTURES TRADING COMMISSION (CFTC)) одобрила планы этих бирж и началось их поэтапное слияние; а с 10 Июня 2004 после завершения формального поглощения сами преобразовались с переименованием на Нью Йоркскую Палату Торговли. Новая структура просуществовала самостоятельно относительно недолго и с 03 Сентября 2007, после окончательного поглощения МежконтинентальнойБиржей, Инк. (THE INTERCONTINENTALEXCHANGE, INC.), стала именоваться Ай.Си.И. Фьючез Ю.Эс., Инк. (ICE FUTURES US, INC.). Новая биржа сформировала объединённый рынок непревзойдённой целостности и силы (по некоторым фьючерсным контрактам), неся в себе давние традиции важного превосходного рынка в международном финансовом центре – Нью Йорке. 11 Сентября 2001 стало сложным и определяющим моментом для бирж НЙПТ® (НАЙБЭТ® (NYBOT®)), когда разрушение Всемирного Торгового Центра (the World Trade Center) вынудило НЙПТ® переехать в своё поддерживаемое сооружение в центре Лонг Айлэнд (Long Island City) и оставаться там в течение двух лет. В 2003, НЙПТ® переехала в новое доведённое до совершенства сооружение (state-of-the-art facility) во Всемирном Финансовом Центре (the World Financial Center). С этим возвращением, Нью Йоркская Палата Торговли продолжила свою длинную историю в Нижнем Мэнхэтэне (Lower Manhattan) обеспечивая крупные международные индустрии инструментами для эффективного управления риском и возможности для хорошо информированных инвесторов. 14 Сентября 2006 МежконтинентальнаяБиржа, Инк. (МКБ®; The IntercontinentalExchange, Inc. (ICE®)) заявила о своём намерении поглотить Нью Йоркскую Палату Торговли® (НЙПТ®; New York Board of Trade® (NYBOT®)). 26 Июля 2007 МКБ заявила о том, что 03 Сентября 2007 НЙПТ® будет переименована в Ай.Си.И. Фьючез Ю.Эс., Инк. (ICE Futures US, Inc.), отражая тем самым успешную интеграцию НЙПТ® в МКБ. И действительно, 03 Сентября 2007 название НЙПТ было заменено на Ай.Си.И. Фьючез Ю.Эс. ® (ICE Futures US®). Нью Йоркская Палата Торговли® (Нью Йоркское Табло Торговли®; сокращённо – НЙПТ®; New York

Board of Trade® (NYBOT®)) уходит своими историческими корнями к 1870, когда была основана Нью Йоркская Биржа Хлопка (НЙБХ®; New York Cotton Exchange (NYCE®)), и к 1882, когда была основана Биржа Кофе Города Нью Йорка (Coffee Exchange of New York City) или просто Биржа Кофе (Coffee Exchange). В 1914 Биржа Кофе начала торговать фьючерсами на сахар (sugar futures) (в самом начале 2000-х – самый крупный рынок НЙПТ®) и в 1916 она стала Нью Йоркской Биржей Кофе и Сахара (New York Coffee and Sugar Exchange). В 1925 для торговли фьючерсами на какао (cocoa futures), была основана Нью Йоркская Биржа Какао (New York Cocoa Exchange), слившаяся в 1979 с Нью Йоркской Биржей Кофе и Сахара с образованием новой биржи – Биржа Кофе, Сахара и Какао, Инк. (БКСК; Coffee, Sugar & Cocoa, Exchange, Inc. (CSCE)). В 1998, БКСК и НЙХБ® сформировали Палату Торговли Города Нью Йорка, Инк. или Табло Торговли Города Нью Йорка, Инк. (Board of Trade of the City of New York, Inc.) в качестве своей материнской компании (parent company). В 2004, эти две биржи формально слились воедино в лице НЙПТ® (NYBOT®), утвердив тем самым одну биржу, известную как Нью Йоркская Палата Торговли или Нью Йоркское Табло Торговли (New York Board of Trade), в статусе бесприбыльной членской организацией (not-for-profit membership organization). 14 Сентября 2006 НЙПТ® согласилась стать подразделением Ай.Си.И. (a unit of ICE), и эта операция была завершена 12 Января 2007. Нью Йоркская Палата Торговли® (Нью Йоркское Табло Торговли®, если быть более точными) была образована в 1998, и НЙПТ® является материнской компанией для Биржи Кофе, Сахара и Какао (CSCE), Нью Йоркской Биржи Хлопка (NYCE®) и Нью Йоркской Биржи Фьючерсов (НЙБФ (NYFE®)), а в 2004 эти биржи сами реорганизовались в НЙПТ®. Рассэл (Russell) . Кэнто Фицджерэлд (Cantor Fitzgerald).

NEW YORK CLEARING CORPORATION = НЬЮ ЙОРКСКАЯ КЛИРИНГОВАЯ КОРПОРАЦИЯ – The New York Clearing Corporation (NYCC®) clears and settles contracts traded on or subject to the rules of the New York Board of Trade® (NYBOT®). NYCC® and its predecessor clearing houses have provided continuous financial security for NYBOT's markets for over 90 years. NYCC® is a Commodity Futures Trading Commission (CFTC) registered derivatives clearing organization that is subject to CEA and CFTC regulation. In 2005, NYCC® implemented the Extensible Clearing System, known as ECS. NYCC® purchased the source code, for the version of ECS used by NYCC®, from OnExchange, Inc. This flexible Internet-based clearing system has given NYCC® the ability to provide its clearing members with real-time clearing information and the ability to complete clearing processes more efficiently. Since its introduction, end-of-day processing time has been reduced by over 50%. ECS permits NYCC® to increase its capacity by simply adding hardware to the system. NYCC® is a key part of NYBOT's identity as a reliable and secure marketplace for global transactions. With a recognized and highly respected clearing operation, NYBOT® believes that NYCC's assurance of performance to its clearing members is a major attraction to its markets by substantially reducing counterparty risk. The organization which acts as a medium for clearing transactions in commodities for futures delivery, or for effecting settlements of contracts for futures delivery, for the between clearing members of the New York Board of Trade. In conjunction with its January 2007 acquisition of the New York Board of Trade (NYBOT®), ICE acquired the New York Clearing Corporation (NYCC®). NYCC® was renamed ICE Clear US℠ effective 2007-June-01 and continues to operate as a registered Derivatives Clearing Organization under the oversight of the US Commodity Futures Trading Commission (CFTC). The designated clearinghouse for all NYBOT® markets. See also ICE Clear US, Inc.. NYBOT's clearing house, NYCC®, was founded in 1915 as the Commodity Clearing Corporation, which served as the clearing house of the New York Cotton Exchange (NYCE®). NYCC® now serves as the designated clearing house for all NYBOT® transactions. NYBOT's predecessor exchanges have changed names, merged, expanded and added new products over the years, including financial products such as futures and options based on the USDX®. / НАЙБЭТ® (NYBOT®). Назначенная для всех рынков НЙПТ клиринговая (расчётная) палата. Смотрите также Ай.Си.И. Клыэ Ю.Эс., Инк. (ICE Clear US, Inc.). Нью Йоркская Палата Торговли (или Нью Йоркское Табло Торговли, если быть более точными) .

NEW YORK COTTON EXCHANGE = НЬЮ ЙОРКСКАЯ БИРЖА ХЛОПКА – The New York Cotton Exchange (NYCE®) was founded by cotton brokers and merchants in September 1870 to trade cotton futures. It is the oldest futures exchange in New York, the United States. Over the years, it established various subsidiaries to trade non-cotton contracts, including the Wool Associates, the Tomato Products Associates, the Citrus Associates, and FINEX® (the Financial Instruments Exchange). In 1998 the NYCE® and the CSCE entered into a merger agreement to form the New York Board of Trade (NYBOT®), which was to occur in several stages. On June 10, 2004 when the merger was completed, the NYCE's and the CSCE's contract market designations were extinguished and transferred to NYBOT®. See also New York Board Of Trade. In 1994, NYCE® opened a trading floor in Dublin for FINEX®, NYBOT's financial instruments division, and added a number of currency cross-rate futures contracts. In the same year, NYCE® further expanded its product line when it acquired the New York Futures Exchange, Inc. (NYFE®), from the New York Stock Exchange, Inc. and began trading futures and options based on the NYSE Composite Index® and the Commodity Research Bureau, or CRB, Futures Price Index (which has since been revised to become the Reuters Jefferies Futures Price Index). The New York Cotton Exchange (NYCE®) was a commodities exchange founded in 1870 by a group of one hundred cotton brokers and merchants at 1 Hanover Square (aka India House) in New York City. The oldest commodities exchange in the city, well into the XX century, Cotton was a leading American commodity for both export and domestic consumption. In that era, other major exchanges existed in the United States. Several were founded within a few years of the founding of New York Cotton Exchange:- the New Orleans Cotton Exchange, the Mobile Cotton Exchange, the Memphis Cotton Exchange, and the Savannah Cotton Exchange. Another important exchange was that of the Liverpool Cotton Exchange in Liverpool, England. The NYCE® and the Memphis Cotton Exchange are the only organizations of that group still active today. Annually until 1958, the NYCE® published the Cotton Year Book that contained the year's statistics on the Cotton industry. Over the years, the NYCE® created various subsidiaries to trade non-cotton contracts, including the Wool Associates, the Citrus Associates, the Tomato Products Associates, and the Financial Instruments Exchange (FINEX®). In 1998, the New York Board of Trade (NYBOT®) became the parent company of both the New York Cotton Exchange and the Coffee, Sugar and Cocoa Exchange (founded 1882). The New York Cotton Exchange was a tenant at 4 World Trade Center on the 8th floor until 2001-September-11. Following the terrorist attacks that day it had to relocate to temporary facilities in Long Island City that had been set up as an emergency backup location following the 1993 World Trade Center bombing. Since 2003, its headquarters and trading facility have been in the New York Mercantile Exchange Building in Lower Manhattan. The CSCE and NYCE® formed the Board of Trade of the City of New York, Inc. as a parent company in 1998, a merger process completed in June 2004 when the two exchanges became the New York Board of Trade (NYBOT®). The development of the steam ship changed the way cotton was bought and sold. When information could travel faster on a steamship ahead of the actual goods that followed on a sailing ship, the process of negotiating cotton prices became more complex and speculative. Forward contracts on expected delivery of cotton still on the docks on the other side of the Atlantic began to replace immediate transactions of cotton arriving in port. Movement of market information instead of the physical arrival of the commodity in port became a dominant factor in pricing cotton. Moreover, the successful installation of the transatlantic cable and the use of the telegraph made key market information instantaneously available on both sides of the Atlantic (New York and Liverpool), and intensified trade of forward contracts on cotton. As the practice of forward pricing increased and market information played a greater role, the need to bring some order to this process necessarily led to the creation of the cotton futures exchange – a place where market information, competitive buying and selling, and the shifting of risk exposure could take place in an organized manner. Futures trading started on the American side of the Atlantic in 1870 in New York because cotton traders could no longer agree

on who should assume the price risk inherent in a forward contract during the six weeks time it took for a shipment to make its way across the Atlantic. On 20 July 1870, 106 cotton merchants and brokers signed an agreement to support plans for an organized marketplace where some sense of order could be brought to the business of buying, selling and (most important) pricing of cotton. The result – the New York Cotton Exchange (NYCE®) – officially opened for business on 10 September 1870. NYCE® quickly grew into a highly visible, liquid futures marketplace. The addition of options on Cotton futures in 1984 affirmed NYCE's central role. In 1998, NYCE® merged with the Coffee, Sugar and Cocoa Exchange, Inc (CSCE) to become the New York Board of Trade® (NYBOT®). As a result of the tragic events of 11 September 2001, NYBOT's location at 4 World Trade Center in downtown Manhattan was lost, and NYBOT® united with the New York Mercantile Exchange (NYMEX®) and the Commodities Exchange (COMEX®) in a new Manhattan building. NYCE® (NYBOT®) holds the distinction of being the oldest commodity exchange in New York. It is also the longest-running Cotton exchange in terms of continuous operation in the world. Price risk has always been a central characteristic of the Cotton industry. The need for transparent and effective price discovery and price risk transfer has made cotton futures and options critical risk management tools for all those who grow, trade, and mill cotton as well as to those involved in the manufacturing and selling of cotton goods, and the NYBOT® remains a premier marketplace for cotton futures and options and the central pricing mechanism for the cotton industry internationally. NYCE®, FINEX®, US Dollar Index® and USDX® are registered service marks of the New York Cotton Exchange. The New York Cotton Exchange provides (source:- December 1980) trading in two Cotton futures contracts:- No. 1, basis Middling 15/16 inch, and No. 2, basis SLM 1-1/16 inch. The volume of trading in Contract No. 2 is very large, while Contract No. 1 has been inactive for years. In addition to the information given herein on futures trading and the two contracts, future information can be obtained on rules, definitions, types of orders, etc, from the New York Cotton Exchange. / НАЙБЭТ® (NYBOT®). НАЙМЭКС® (NYMEX®). Ройтас Дьжефёриз (Reuters Jefferies). Эсошиэтс (Associates). Сводный Индекс от НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). 20 Июля 1870 106 коммерсантов и брокеров, вовлечённых в торговлю хлопком подписали соглашение о поддержке планов по созданию организованной рыночной площадки, а уже 10 Сентября 1870 Нью Йоркская Биржа Хлопка официально открылась для ведения дел. Она является старейшей биржей фьючерсов в Нью Йорке, Соединённые Штаты Америки. Смотрите также Нью Йоркская Палата Торговли (New York Board Of Trade; Нью Йоркское Табло Торговли, если быть более точными). Нью Йоркская Биржа Хлопка (НЙБХ) – старейшая сырьевая биржа в Нью Йорке, основанная в 1870 группой хлопковых брокеров и купцов. ФАЙНЭКС® (FINEX®) (Financial Instruments Exchange) – Финансовая Биржа – отдел финансовых фьючерсов и опционов биржи начал действовать в 1985. В Декабре 1993 NYCE® приобрела Нью Йоркскую Биржу Фьючерсов (NYFE) у Нью Йоркской Фондовой Биржи, которая являлась дочерней компанией последней. NYCE® торгует хлопковыми фьючерсами и опционами (10:30–14:40). Через Ассоциацию Цитрусовых Компаний (Citrus Associates), созданную New York Cotton Exchange Inc., NYCE® торгует фьючерсами и опционами на замороженный концентрированный апельсиновый сок (10:15–14:15). В Июне 1994 в Дублине была открыта FINEX Europe, создающая 24-часовой рынок для большинства контрактов FINEX®. FINEX/FINEX Europe торгует фьючерсами и опционами на Индекс по Доллару США (USDX®), а также валютными индексными фьючерсами, опционами и фьючерсами на Доллар США (19:00–22:00, 03:00–08:00, 08:05–15:00); а также фьючерсами на кросс-курсы валют (19:00–22:00, 03:00–09:00, 09:05–15:00). Биржа также торгует опционами на фьючерсы на кросс-курсы валют. Фьючерсы и опционы на фьючерсные контракты по пяти- и двухлетним Казначейским среднесрочным облигациям продаются (08:20–15:00) только в Нью Йорке.

NEW YORK FUTURES EXCHANGE = НЬЮ ЙОРКСКАЯ БИРЖА ФЬЮЧЕРСОВ – The New York Futures Exchange (NYFE®) is a former subsidiary of the New York Cotton Exchange (NYCE®). The New York Futures Exchange traded options and futures on the NYSE Composite Index®. The NYCE® was acquired by the New York Board of Trade (NYBOT®) in 2003. The NYCE® joined the Coffee, Cocoa and Sugar Exchange in 1998, to form the New York Board of Trade (NYBOT®). NYBOT® was acquired in January, 2007 by IntercontinentalExchange (ICE), which changed NYBOT's name to ICE Futures. The New York Futures Exchange (NYFE®) was the subsidiary of the New York Board of Trade. The NYFE® was a subsidiary of the New York Cotton Exchange (NYCE®) that focused on the trading of financial futures contracts. The NYCE® was acquired by the New York Board of Trade (NYBOT®) in 2003 and then in February, 2007, the IntercontinentalExchange (ICE) acquired the NYBOT® and its name was changed to ICE Futures. Surviving contracts that were traded on the NYFE® and now traded on ICE. NYFE® is a registered trademark of the New York Futures Exchange. The New York Futures Exchange (NYFE®) originally was established in 1980 as a subsidiary of the New York Stock Exchange (NYSE®). It was sold to the NYCE® in 1994. All NYFE® contracts were transferred to the NYCE® on August 01, 2003 and then to the NYBOT® on June 10, 2004. NYFE® is wholly owned subsidiary of the NYSE that trades futures and options on the NYSE composite index®. The New York Futures Exchange (NYFE®) traded futures contracts on stock indexes mostly in the small-cap sector until it was subsumed by its overall parent, the New York Board of Trade (NYBOT®) in 2003. NYBOT® had earlier bought NYFE's owner, the New York Cotton Exchange (NYCE®). NYFE® began as a subsidiary of the New York Stock Exchange (NYSE®) in 1980 and was sold to the New York Cotton Exchange (NYCE®) in 1994. The exchange was subject to a Rule Enforcement Review by the Commodity Futures Trading Commission (CFTC) in 1997 although no discplinary procedures followed, and a year later the NYFE® became part of NYBOT® when it was formed by the merger of NYCE® and the Coffee, Sugar and Cocoa Exchange (CSCE). Up until it was subsumed into NYBOT®, the NYFE® had been trading mostly small-cap and more niche-market futures contracts, including e-mini Russell 1000 and Russell 2000, NYSE Small Composite Index and Reuters CRB Index. On August 01, 2003 NYFE's active contracts were transferred to NYCE® and then in June 2004 to NYBOT® itself, eliminating both exchanges. The NYBOT® defined the NYFE's products as 'index contracts' to allow for delisting them and then exchanged all NYFE® memberships for FINEX memberships. These allowed former NYFE® allow members to trade both NYBOT's 'financial contracts' and the NYFE's 'index contracts'. / Ройтас (Reuters). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Нью Йоркская Биржа Фьючерсов (НЙБФ (NYFE®)) была дочерним предприятием Нью Йоркской Биржи Хлопка (НЙБХ) (New York Cotton Exchange (NYCE®)), и в последствии – Нью Йоркской Палаты Торговли (Нью Йоркского Табло Торговли, если быть более точными); New York Board of Trade (НАЙБЭТ® (NYBOT®)). Эта биржа специализируется на торговле финансовыми фьючерсными контрактами. Нью Йоркская Биржа Фьючерсов – дочерняя компания Нью Йоркской Биржи Хлопка (NYCE®), приобретённая у Нью Йоркской Фондовой Биржи в Декабре 1993. NYFE® торгует фьючерсами и опционами на Сводный Индекс Нью Йоркской Фондовой Биржи (NYSE Composite Index®), основанными на приблизительно 2 000 обыкновенных акций, продаваемых на Нью Йоркской Фондовой Бирже (09:30 – 16:15); а также фьючерсами и опционами на индекс Кей.Ар.-Си.Ар.Би. (KR-CRB) (Найт-Ридё–Исследовательское Бюро по Сырью (Knight-Ridder–Commodity Research Bureau)), состоящий из 21 товарно-сырьевого компонента (09:40 – 14:45).

NEW YORK HARBOR ETHANOL = ЭТАНОЛ ИЗ НЬЮ ЙОРКСКИХ ПОРТОВ – New York Harbor Ethanol is denatured fuel ethanol that must conform to standard specification ASTM D4806 and shall meet any state requirements at the time and place of delivery. It is delivered FOB at the seller's terminal facility in New York Harbor. New York Harbor is a key hub for the import, storage and distribution of ethanol on the East Coast. New York Harbor futures trade at the NYMEX® under ticker symbol QE. Contract size is 1 000 US barrels quoted in US Dollars and Cents per barrel. Settlement is done by physical delivery. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). НАЙМЭКС® (NYMEX®).

NEW YORK HARBOR NO. 2 HEATING OIL = ТОПЛИВО ПЕЧНОЕ БЫТОВОЕ № 2 ИЗ НЬЮ ЙОРКСКИХ ПОРТОВ – New York Harbor No. 2 Heating Oil is a liquid petroleum distillate used as fuel for burning in furnaces and boilers in buildings. It accounts for 25% the yield of a barrel of crude oil, the second largest cut after gasoline. It must conform to ASTM standard D396. Heating oil futures are used to hedge diesel fuel and jet fuel, both of which trade in the cash market at an often stable premium to heating oil futures. New York Harbor No. 2 Heating Oil contracts trade at the NYMEX® under ticker symbol HO. Contract size is 42 000 gallons (1 000 barrels) quoted in US Dollars and Cents per gallon. Contract is settled with physical delivery, based on delivery in New York harbor, the principal cash market trading center. They also trade at the ICE Futures Europe® under ticker symbol O. Contract size and quote are the same as for NYMEX®. Contract is settled with cash settlement. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). НАЙМЭКС® (NYMEX®).

NEW YORK HARBOR ULTRA–LOW SULFUR DIESEL = ДИЗЕЛЬ ИЗ НЬЮ ЙОРКСКИХ ПОРТОВ С УЛЬТРА НИЗКИМ СОДЕРЖАНИЕМ СЕРЫ – New York Harbor Ultra-Low Sulfur Diesel (ULSD) is the new standard for highway diesel fuel in the United States since December, 2010. It is physically delivered at different New York Harbor fuel stations. New York is one of two key trading centers in the cash market for diesel. New York Harbor Ultra-Low Sulfur Diesel futures are traded at the NYMEX® under ticker symbol LH. Contract size is 42 000 gallons (1 000 barrels) quoted in US Dollars and Cents per gallon. Delivery takes place all calendar months. Contract settled by physical delivery. / НАЙМЭКС® (NYMEX®).

NEW YORK MERCANTILE EXCHANGE, INC. = НЬЮ ЙОРКСКАЯ ТОВАРНАЯ БИРЖА, ИНК. (или НЬЮ ЙОРКСКАЯ МЕРКАНТИЛЬНАЯ БИРЖА, ИНК.) – The New York Mercantile Exchange, Inc., the world's largest physical commodities exchange, offering futures and options trading in energy, metals and other contracts and clearing services for more than 400 off-exchange contracts. Through a hybrid model of open outcry floor trading and electronic trading on the CME Globex® electronic platform, as well as clearing off-exchange instruments through NYMEX ClearPort® Clearing, NYMEX® offers crude oil, petroleum products, natural gas, coal, electricity, gold, silver, copper, aluminum, platinum group metals, emissions, and soft commodities contracts for trading and clearing virtually 24 hours each day. A US futures exchange consisting of two divisions, NYMEX® (the New York Mercantile Exchange) and COMEX® (the Commodities Exchange). Website:- http://www.nymex.com. On 2008-March-17, CME Group, Inc. (CME Group, Inc. is the world's largest and most diverse exchange. Formed by the 2007 merger of the Chicago Mercantile Exchange® (CME®) and the Chicago Board of Trade (CBOT®)) and NYMEX Holdings, Inc. (NYMEX Holdings, Inc. is the parent company of the New York Mercantile Exchange, Inc.) announced they have signed a definitive agreement under which CME Group will acquire NYMEX Holdings (NYMEX®), the parent company of New York Mercantile Exchange, Inc. on the terms previously announced. The transaction joins the complementary product offerings of two of the industry's leading and most dynamic exchanges. This combination will further diversify the company's revenues, with products in every major asset class. It also will better position the company to compete globally with other cash, over-the-counter (OTC) and regulated markets and participate in the fast-growing global energy market. The transaction also is expected to deliver significant customer benefits through clearing capital efficiencies related to equity holding requirements, portfolio margining and security deposits for joint clearing members. Additional benefits will include harmonized trading and administrative technology systems, building on the existing CME Group/NYMEX® exclusive electronic trading agreement. The combined company will provide global market participants access to the leading financial and agricultural exchange and the leading energy and metals exchange in a regulated, transparent marketplace distributed around the world through the enhanced speed and capacity of the CME Globex® platform. NYMEX® customers will benefit from a single point of contact from trade matching through clearing. CME Group will continue to offer multiple venues for execution, including trading floors in Chicago and New York, clearing on the NYMEX ClearPort® platform, as well as electronic trading on CME Globex®, which is available to customers worldwide virtually 24 hours each trading day. The combined company will continue to operate a trading floor in New York City as long as both revenue and profitability thresholds are achieved going forward. On 2008-August-22, CME Group, Inc. announced that it has completed its acquisition of NYMEX Holdings, Inc.. The combined companies will provide customers around the world with access to all major benchmark asset classes, including interest rates, equity indexes, foreign exchange, energy, agricultural commodities and metals. CME Group Class A common stock will continue to trade on the NASDAQ® under the ticker symbol 'CME'. NYMEX Holdings, Inc. common stock is being delisted and will no longer trade on the NYSE®. Corporate headquarters of the combined company will remain in Chicago at 20 South Wacker Drive. CME Group's New York office will be located at the NYMEX® World Headquarters, One North End Avenue. The companies also announced they will begin integrating NYMEX® business operations in order to achieve approximately USD60 million in expected cost synergies. The timetable for integration includes:- (i) completing the staffing process 60 days post-closing; (ii) integrating membership systems in first-quarter 2009; (iii) integrating fee systems in second-quarter 2009; (iv) migrating the NYMEX® and COMEX® trading floors into one in second-quarter 2009; (v) combining clearing systems in third-quarter 2009; and, (vi) integrating price reporting systems in third-quarter 2009. The New York Mercantile Exchange (NYMEX®) is the largest commodities futures exchange. It was founded in 1872 as The Butter and Cheese Exchange of New York and became the New York Mercantile Exchange in 1882. The NYMEX® is a central point for trading future contracts for natural gas, crude oil, heating oil, gasoline, and other products similar to other commodities sold on the futures markets such as beef, coffee, sugar, etc. NYMEX® prices serve as accurate reference prices of crude oil and wholesale gasoline in other North American markets, adjusted for transportation costs and quality differences. The New York Mercantile Exchange merged with the Commodity Exchange, Inc., in August 1994 to become the world's largest physical commodity futures exchange. The Butter and Cheese Exchange of New York was founded in 1872 by a group of dairy merchants who were trying to bring order and standardization to the chaotic conditions that existed in their industry. Gradually, the product base was broadened and the name was changed to the New York Mercantile Exchange 10 years later in 1882. Over the years, the Exchange shifted towards industrial products. It was the first Exchange to successfully trade energy futures and options with the introduction of the heating oil futures contract in 1978. Today, the Exchange is the world's preeminent energy market and precious metals markets; agricultural products do not trade on the Exchange. The Exchange's divisions, the NYMEX® Division and the COMEX® Division, were formed by the merger of the New York Mercantile Exchange and the Commodity Exchange Inc, in 1994. The trading operations of each exchange were continued as the two divisions, offering trading in their respective futures and options contracts – energy, platinum, and palladium for the NYMEX® Division; gold, silver, and copper on the COMEX® Division (aluminum was added since the merger). Trading rights on each division are bought, sold, and leased separately, but there are occasions when cross-divisional trading privileges in specific markets are granted to the opposite division. The New York Mercantile Exchange, Inc. is the world's largest physical commodity futures exchange and the preeminent trading forum for energy and precious metals. The Exchange has stood for market integrity and price transparency for more than 130 years. Transactions executed on the Exchange avoid the risk of counterparty default because the Exchange clearinghouse acts as the counterparty to every trade. Trading is conducted through two divisions, the NYMEX® Division, home to the energy, platinum, and palladium markets; and the COMEX® Division, on which all other metals trade. The Exchange pioneered the development of energy futures and options contracts 26 years ago as means of bringing price transparency and risk management to this vital market. / НЭЗДЭК® (NASDAQ®) . Чикагская Палата Торговли (Чикагское Табло Торговли, если быть более точными; СИБАТ® (CBOT®)) . печное бытовое топливо (heating oil) . НАЙМЭКС® (NYMEX®). КОМЭКС® (COMEX®). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Нью Йоркская Товарная Биржа – крупнейшая в мире биржа по

объёму торговли фьючерсами на товары и сырьё, что явилось следствием её слияния в 1994 с Сырьевой Биржей (Commodity Exchange (COMEX®)). После слияния биржа действует как два подразделения. Подразделение НАЙМЭКС® торгует фьючерсами и опционами на лёгкую сырую нефть, печное бытовое топливо, неэтилированный бензин, природный газ и платину; фьючерсами на сырую нефть, пропан и палладий; экспериментальными спрэд-опционами (межтоварными спрэдами) на печное бытовое топливо – сырую нефть и неэтилированный бензин – сырую нефть. Подразделение КОМЭКС® торгует фьючерсами и опционами на медь, золото и серебро, фьючерсами и опционами на индекс Eurotop 100. Также продаются пятидневные опционы на медь, золото и серебро. НАЙМЭКС® проводит торги с 08:10 до 15:20, кроме Субботы и Воскресенья, КОМЭКС® – с 08:10 до 15:00, кроме Субботы и Воскресенья. После окончания работы электронной системы торговли на бирже действует ЭКСЭС® (ACCESS®) (с Понедельника по Четверг с 17:00 до 08:00), а в Воскресенье вечером с 19:00 начинается торговля фьючерсами и опционами на сырую нефть, печное бытовое топливо и бензин, фьючерсами на платину, медь, золото и серебро. Биржа имеет электронную связь с Сиднейской Биржей Фьючерсов (Sydney Futures Exchange (SFE)), что позволяет членам последней торговать нефтепродуктами непосредственно на НАЙМЭКС®, а не члены биржи вступают в торги через электронную систему торговли CYCOM на SFE.

NEW YORK MERCANTILE EXCHANGE AUTOMATIC COMPUTER–CONTROLLED ELECTRONIC SCANNING SYSTEM® = АВТОМАТИЧЕСКАЯ ЭЛЕКТРОННАЯ СИСТЕМА СКАНИРОВАНИЯ, КОНТРОЛИРУЕМАЯ КОМПЬЮТЕРОМ, НЬЮ ЙОРКСКОЙ ТОВАРНОЙ БИРЖИ – The New York Mercantile Exchange's Automatic Computer-Controlled Electronic Scanning System (NYMEX ACCESS®) is an international after-hours electronic trading system began operation in 1993. The exchange provides the user with the equipment, software, and services. This system allows overnight trading in light, sweet crude oil, heating oil, New York harbor gasoline, natural gas, gold, silver, platinum, copper, and aluminium. Propane trades in an abbreviated session while electricity and Middle East crude are available for trading virtually around the clock. Terminals are in use in major cities in the United States and in London, UK, Sydney, Australia, Singapore, and Hong Kong, China. / НАЙМЭКС ЭКСЭС® (NYMEX ACCESS®). печное бытовое топливо (heating oil) .

NEW YORK PRODUCE EXCHANGE = НЬЮ ЙОРКСКАЯ БИРЖА ПРОДОВОЛЬСТВИЯ – The New York Produce Exchange was the first exchange to trade soybean oil, beginning in 1940. In 1970, it apparently merged with the International Commercial Exchange.

NEW YORK STOCK EXCHANGE = НЬЮ ЙОРКСКАЯ ФОНДОВАЯ БИРЖА – The New York Stock Exchange (NYSE®) the world's largest marketplace for securities. The exchange evolved from a meeting of 24 men under a buttonwood tree in 1792 on what is now Wall Street in New York City. It was formally constituted as the New York Stock and Exchange Board in 1817. The present name was adopted in 1863. Membership, limited to 1 366 since 1953, is obtained by purchasing (since 1868) a seat from an existing member. Greater commercial activity in the United States after the War of 1812 and speculation in railroad stocks in the 1830s increased demand for capital and stimulated trading at the exchange. After the Civil War, the exchange provided the capital for the accelerating industrialization of the United States. After the Panic of 1837, when many investors suffered heavy losses, the exchange began to demand that companies disclose to the public information about their finances as a condition of offering stock. The Stock Market Crash of 1929, which signaled the start of the Great Depression, led to investigation by the federal government and regulation by the Securities and Exchange Commission. To be listed on the NYSE®, a corporation must have aggregate pretax earnings of USD6 500 000 over the previous three years and at least 1 100 000 shares of stock outstanding, give common shareholders voting rights, and publish periodical financial statements. A shift from fractional to decimal pricing occurred in 2001. On 1985-June-03 the New York Stock Exchange began trading stock options. In 1790 – the federal government refinances all federal and state Revolutionary War debt, issuing USD80 million in bonds. These become the first major issues of publicly traded securities, marking the birth of the US investment markets. In 1792 – there are five securities traded in New York City. Three are government bonds and two are bank stocks. In 1815 – in the aftermath of the War of 1812, the market for securities in New York begins to grow. Along with government bonds, bank and insurance stocks now trade. The origins of the New York Stock Exchange (NYSE®) can be traced to the Buttonwood Agreement of 1792, although the Exchange Board itself was not organized until 1817. The New York Stock Exchange traces its origins to 1792, when 24 New York City stockbrokers and merchants signed the Buttonwood Agreement. This agreement set in motion the NYSE®'s unwavering commitment to investors and issuers. The NYSE Group merger brings together three institutions, each with a vibrant history. The union of the New York Stock Exchange (NYSE®), Archipelago (Arca), and the Pacific Exchange (PCX) is the largest-ever among securities exchanges. Twenty-four prominent brokers and merchants gather on Wall Street to sign the Buttonwood Agreement, agreeing to trade securities on a commission basis. The New York Stock Exchange traces its beginnings to this historic pact. Founded in 1792, this is the largest and oldest organized securities exchange in the United States. It operates as an auction market where orders are brought to the trading floor for execution. Specialists posted at various locations on the floor are assigned specific stocks for trading to centralize the flow of trades. The specialist brings external buyers and sellers together in addition to buying and selling for their own accounts. Requirements for a company to trade on the NYSE®:- pre-tax earnings of USD1 million or more; outstanding shares of at least USD1.1 million and a minimum market value of USD20 million. The largest organized securities market in the United States, founded in 1792. The exchange itself does not buy, sell own, or set the price of securities traded there. The prices are determined by the public supply and demand. The exchange is a not-for-profit corporation of 1 366 individual members, governed by a board of directors consisting of 12 public representatives, 12 member firm representatives, and a fulltime chairman, executive vice chairman and president. On 2006-June-01, NYSE Group, Inc. and Euronext NV announced an agreement to combine the leading US and pan-European securities trading exchanges in a merger of equals. This new group, to be named NYSE Euronext, will globally redefine the marketplace for trading cash and derivatives securities, producing significant benefits for shareholders, issuers and users. NYSE Euronext, the holding company created by the combination of NYSE Group, Inc. and Euronext NV, was launched on 2007-April-04. NYSE Euronext operates the world's largest and most liquid exchange group and offers the most diverse array of financial products and services. NYSE Euronext, which brings togethersix cash equities exchanges in five countries and six derivatives exchanges, is a world leader for listings, trading in cash equities, equity and interest rate derivatives, bonds and the distribution of market data. With a leading USD28.5 trillion/EUR21.5 trillion total market capitalization of listed companies and average daily trading value of its combined markets of approximately USD102 billion/EUR77 billion (as of 2007-February-28), NYSE Euronext seeks to provide the highest standards of market quality and integrity, innovative products and services to investors, issuers, and all users of its markets. NYSE Group, Inc operates two securities exchanges:- the New York Stock Exchange (NYSE®) and NYSE Arca (formerly known as the Archipelago Exchange, or ArcaEx®, and the Pacific Exchange). NYSE Group is a leading provider of securities listing, trading and market data products and services. NYSE Group, Inc., a wholly owned subsidiary of NYSE Euronext, operates two securities exchanges:- the New York Stock Exchange LLC (NYSE®) and NYSE Arca, Inc (formerly known as the Pacific Exchange). NYSE Group is a leading provider of securities listing, trading and market data products and services. The NYSE® is the world's largest and most liquid cash equities exchange. The NYSE® provides a reliable, orderly, liquid and efficient marketplace where investors buy and sell listed companies' common stock and other securities. NYSE Arca, the first open, all-electronic stock exchange in the United States, has a leading position in trading exchange-traded funds and exchange-listed securities. NYSE Arca is also an exchange for trading equity options. NYSE Arca's trading platforms provide customers with fast electronic execution and open, direct and anonymous

market access. NYSE® Regulation, an independent not-for-profit subsidiary, regulates member organizations through the enforcement of marketplace rules and federal securities laws. NYSE® Regulation also ensures that companies listed on the NYSE® and NYSE Arca meet their financial and corporate governance listing standards. NYSE Arca Options offers immediate, cost-effective electronic order execution in nearly 2 000 options issues with greater transparency, reliability and performance. NYSE® Bonds is the largest centralized and most transparent bond market of any US exchange or other self-regulatory organization. It offers investors a broad selection of bonds:- corporate (including convertibles), agency and government bonds. SIAC (Securities Industry Automation Corporation), a wholly owned subsidiary of NYSE Group, serves a variety of technology and communications needs for the NYSE®, NYSE Arca, and others in the financial services industry. The NYSE Composite Index® is a registered trademark of the New York Stock Exchange, Inc., which is not a market for futures and options and not affiliated with New York Futures Exchange, Inc. (NYFE®). The New York Stock Exchange (NYSE®), sometimes known as the 'Big Board', is an American stock exchange located at 11 Wall Street, Lower Manhattan, New York City, New York, United States. It is the world's largest stock exchange by market capitalization of its listed companies at USD19.69 trillion as of May 2015. The average daily trading value was approximately USD169 billion in 2013. The NYSE® trading floor is located at 11 Wall Street and is composed of 21 rooms used for the facilitation of trading. A fifth trading room, located at 30 Broad Street, was closed in February 2007. The main building, located at 18 Broad Street, between the corners of Wall Street and Exchange Place, was designated a National Historic Landmark in 1978, as was the 11 Wall Street building. The NYSE® is owned by Intercontinental Exchange (ICE), an American holding company it also lists (NYSE®:- ICE). Previously, it was part of NYSE Euronext (NYX), which was formed by the NYSE's 2007 merger with the fully electronic stock exchange Euronext. NYSE® and Euronext now operate as divisions of Intercontinental Exchange. The NYSE® has been the subject of several lawsuits regarding fraud or breach of duty and was sued by its former CEO for breach of contract and defamation. History:- the earliest recorded organization of securities trading in New York among brokers directly dealing with each other can be traced to the Buttonwood Agreement. Previously securities exchange had been intermediated by the auctioneers who also conducted more mundane auctions of commodities such as Wheat and Tobacco. On May 17, 1792 twenty four brokers signed the Buttonwood Agreement which set a floor commission rate charged to clients and bound the signers to give preference to the other signers in securities sales. The earliest securities traded were mostly governmental securities such as War Bonds from the Revolutionary War and First Bank of the United States stock, although Bank of New York stock was a non-governmental security traded in the early days. In 1817 the stockbrokers of New York operating under the Buttonwood Agreement instituted new reforms and reorganized. After sending a delegation to Philadelphia to observe the organization of their board of brokers, restrictions on manipulative trading were adopted as well as formal organs of governance. After re-forming as the New York Stock and Exchange Board the broker organization began renting out space exclusively for securities trading, which previously had been taking place at the Tontine Coffee House. Several locations were used between 1817 and 1865, when the present location was adopted. The invention of the electrical telegraph consolidated markets, and New York's market rose to dominance over Philadelphia after weathering some market panics better than other alternatives. The Civil War greatly stimulated speculative securities trading in New York. By 1869 membership had to be capped, and has been sporadically increased since. The latter half of the XIX century saw rapid growth in securities trading. Securities trade in the latter XIX and early XX centuries was prone to panics and crashes. Government regulation of securities trading was eventually seen as necessary, with arguably the most dramatic changes occurring in the 1930s after a major stock market crash precipitated an economic depression. The Stock Exchange Luncheon Club was situated on the seventh floor from 1898 until its closure in 2006. The NYSE® announced its plans to merge with Archipelago on April 21, 2005, in a deal intended to reorganize the NYSE® as a publicly traded company. NYSE's governing board voted to merge with rival Archipelago on December 06, 2005, and become a for-profit, public company. It began trading under the name NYSE Group on March 08, 2006. A little over one year later, on April 04, 2007, the NYSE Group completed its merger with Euronext, the European combined stock market, thus forming the NYSE Euronext, the first transatlantic stock exchange. Wall Street is the leading US money center for international financial activities and the foremost US location for the conduct of wholesale financial services. 'It comprises a matrix of wholesale financial sectors, financial markets, financial institutions, and financial industry firms' (Robert, 2002). The principal sectors are securities industry, commercial banking, asset management, and insurance. Prior to the acquisition of NYSE Euronext by the ICE in 2013, Marsh Carter was the Chairman of the NYSE® and the CEO was Duncan Niederauer. Presently, the Chairman is Jeffrey Sprecher. Notable Events:- the exchange was closed shortly after the beginning of World War I (July 31, 1914), but it partially re-opened on November 28 of that year in order to help the war effort by trading bonds, and completely reopened for stock trading in mid-December. On September 16, 1920, a bomb exploded on Wall Street outside the NYSE® building, killing 33 people and injuring more than 400. The perpetrators were never found. The NYSE® building and some buildings nearby, such as the JP Morgan building, still have marks on their façades caused by the bombing. The Black Thursday crash of the Exchange on October 24, 1929, and the sell-off panic which started on Black Tuesday, October 29, are often blamed for precipitating the Great Depression. In an effort to try to restore investor confidence, the Exchange unveiled a fifteen-point program aimed to upgrade protection for the investing public on October 31, 1938. On October 01, 1934, the exchange was registered as a national securities exchange with the US Securities and Exchange Commission (SEC), with a president and a thirty-three-member board. On February 18, 1971, the non-profit corporation was formed, and the number of board members was reduced to twenty-five. One of Abbie Hoffman's well-known publicity stunts took place in 1967, when he led members of the Yippie movement to the Exchange's gallery. The provocateurs hurled fistfuls of dollars toward the trading floor below. Some traders booed, and some laughed and waved. Three months later the stock exchange enclosed the gallery with bulletproof glass. Hoffman wrote a decade later, 'We didn't call the press; at that time we really had no notion of anything called a media event'. On October 19, 1987, the Dow Jones Industrial Average (DJIA) dropped 508 points, a 22.6% loss in a single day, the second-biggest one-day drop the exchange had experienced. Black Monday was followed by Terrible Tuesday, a day in which the Exchange's systems did not perform well and some people had difficulty completing their trades. Subsequently, there was another major drop for the Dow on October 13, 1989 – the Mini-Crash of 1989. The crash was apparently caused by a reaction to a news story of a USD6.75 billion leveraged buyout deal for UAL Corporation, the parent company of United Airlines, which broke down. When the UAL deal fell through, it helped trigger the collapse of the junk bond market causing the Dow to fall 190.58 points, or 6.91 percent. Similarly, there was a panic in the financial world during the year of 1997; the Asian Financial Crisis. Like the fall of many foreign markets, the Dow suffered a 7.18% drop in value (554.26 points) on October 27, 1997, in what later became known as the 1997 Mini-Crash but from which the DJIA recovered quickly. This was the first time that the 'circuit breaker' rule had operated. On January 26, 2000, an altercation during filming of the music video for 'Sleep Now in the Fire', which was directed by Michael Moore, caused the doors of the exchange to be closed and the band Rage Against the Machine to be escorted from the site by security after band members attempted to gain entry into the exchange. Trading on the exchange floor, however, continued uninterrupted. In the aftermath of the September 11, 2001 terrorist attacks, the NYSE® was closed for 4 trading sessions, one of the rare times the NYSE® was closed for more than one session and only the third time since March 1933. On May 06, 2010, the Dow Jones Industrial Average posted its largest intraday percentage drop since the October 19, 1987, crash, with a 998-point loss later being called the 2010 Flash Crash (as the drop occurred in minutes before rebounding). The SEC and CFTC published a report on the event, although it did not come to a conclusion as to the cause. The regulators found no evidence that the fall was caused by erroneous ('fat finger') orders. On October 29, 2012, the stock exchange was shut down for 2 days due to Hurricane Sandy. The last time the stock exchange was closed due to

weather for a full two days was on March 12 and 13 in 1888. On May 01, 2014, the stock exchange was fined USD4.5 million by the Securities and Exchange Commission to settle charges it violated market rules. On August 14, 2014, Berkshire Hathaway's A Class shares, the highest priced shares on the NYSE®, hit USD200 000 a share for the first time. On July 08, 2015, technical issues affected the stock exchange, halting trading at 11:32 am ET. The NYSE® reassured stock traders that the outage was 'not a result of a cyber breach', and the Department of Homeland Security confirmed that there was 'no sign of malicious activity'. Trading eventually resumed at 03:10 pm ET the same day. Trading:- The New York Stock Exchange (sometimes referred to as 'the Big Board') provides a means for buyers and sellers to trade shares of stock in companies registered for public trading. The NYSE® is open for trading Monday through Friday from 09:30 am – 04:00 pm ET, with the exception of holidays declared by the Exchange in advance. The NYSE® trades in a continuous auction format, where traders can execute stock transactions on behalf of investors. They will gather around the appropriate post where a specialist broker, who is employed by a NYSE® member firm (that is, he/she is not an employee of the New York Stock Exchange), acts as an auctioneer in an open outcry auction market environment to bring buyers and sellers together and to manage the actual auction. They do on occasion (approximately 10% of the time) facilitate the trades by committing their own capital and as a matter of course disseminate information to the crowd that helps to bring buyers and sellers together. The auction process moved toward automation in 1995 through the use of wireless hand held computers (HHC). The system enabled traders to receive and execute orders electronically via wireless transmission. On September 25, 1995, NYSE member Michael Einersen, who designed and developed this system, executed 1 000 shares of IBM through this HHC ending a 203-year process of paper transactions and ushering in an era of automated trading. As of January 24, 2007, all NYSE® stocks can be traded via its electronic hybrid market (except for a small group of very high-priced stocks). Customers can now send orders for immediate electronic execution, or route orders to the floor for trade in the auction market. In the first three months of 2007, in excess of 82% of all order volume was delivered to the floor electronically. NYSE® works with US regulators like the SEC and CFTC to coordinate risk management measures in the electronic trading environment through the implementation of mechanisms like circuit breakers and liquidity replenishment points. Until 2005, the right to directly trade shares on the exchange was conferred upon owners of the 1366 'seats'. The term comes from the fact that up until the 1870s NYSE® members sat in chairs to trade. In 1868, the number of seats was fixed at 533, and this number was increased several times over the years. In 1953, the number of seats was set at 1 366. These seats were a sought-after commodity as they conferred the ability to directly trade stock on the NYSE®, and seat holders were commonly referred to as members of the NYSE®. The Barnes family is the only known lineage to have five generations of NYSE® members:- Winthrop H. Barnes (admitted 1894), Richard W.P. Barnes (admitted 1926), Richard S. Barnes (admitted 1951), Robert H. Barnes (admitted 1972), Derek J. Barnes (admitted 2003). Seat prices varied widely over the years, generally falling during recessions and rising during economic expansions. The most expensive inflation-adjusted seat was sold in 1929 for USD625 000, which, today, would be over six million Dollars. In recent times, seats have sold for as high as USD4 million in the late 1990s and as low as USD1 million in 2001. In 2005, seat prices shot up to USD3.25 million as the exchange entered into an agreement to merge with Archipelago and become a for-profit, publicly traded company. Seat owners received USD500 000 in cash per seat and 77 000 shares of the newly formed corporation. The NYSE® now sells one-year licenses to trade directly on the exchange. Licenses for floor trading are available for USD40 000 and a license for bond trading is available for as little as USD1 000 as of 2010. Neither are resell-able, but may be transferable in during the change of ownership of a cooperation holding a trading license. Following the Black Monday market crash in 1987, NYSE® imposed trading curbs to reduce market volatility and massive panic sell-offs. Following the 2011 rule change, at the start of each trading day, the NYSE® sets three circuit breaker levels at levels of 7% (Level 1), 13% (Level 2), and 20% (Level 3) of the average closing price of the S&P 500 for the preceding trading day. Level 1 and Level 2 declines result in a 15-minute trading halt unless they occur after 03:25 pm, when no trading halts apply. A Level 3 decline results in trading being suspended for the remainder of the day. (The biggest one-day decline in the S&P 500 since 1987 was the 9.0% drop on October 15, 2008.). Merger, acquisition, and control:- on February 15, 2011 NYSE® and Deutsche Börse announced their merger to form a new company, as yet unnamed, wherein Deutsche Börse shareholders will have 60% ownership of the new entity, and NYSE Euronext shareholders will have 40%. On February 01, 2012, the European Commission blocked the merger of NYSE® with Deutsche Börse, after commissioner Joaquin Almunia stated that the merger 'would have led to a near-monopoly in European financial derivatives worldwide'. Instead, Deutsche Börse and NYSE® will have to sell either their Eurex derivatives or LIFFE shares in order to not create a monopoly. On February 02, 2012, NYSE Euronext and Deutsche Börse agreed to scrap the merger. In April 2011, Intercontinental Exchange (ICE), an American futures exchange, and NASDAQ OMX Group had together made an unsolicited proposal to buy NYSE Euronext for approximately USD11 billion, a deal in which NASDAQ® would have taken control of the stock exchanges. NYSE Euronext rejected this offer twice, but it was finally terminated after the United States Department of Justice indicated their intention to block the deal due to antitrust concerns. In December 2012, it was announced that ICE had proposed to buy NYSE Euronext in a stock swap with a valuation of USD8 billion. NYSE Euronext shareholders would receive either USD33.12 in cash, or USD11.27 in cash and approximately a sixth of a share of ICE. The Chairman and CEO of ICE, Jeffrey Sprecher, will retain those positions, but four members of the NYSE Board of Directors will be added to the ICE board. Opening and Closing Bells:- The NYSE's opening and closing bells mark the beginning and the end of each trading day. The 'opening bell' is rung at 09:30 am ET to mark the start of the day's trading session. At 04:00 pm ET the 'closing bell' is rung and trading for the day stops. There are bells located in each of the four main sections of the NYSE® that all ring at the same time once a button is pressed. There are three buttons that control the bells, located on the control panel behind the podium which overlooks the trading floor. The main bell, which is rung at the beginning and end of the trading day, is controlled by a green button. The second button, colored orange, activates a single-stroke bell that is used to signal a moment of silence. A third, red button controls a backup bell which is used in case the main bell fails to ring. History:- the signal to start and stop trading wasn't always a bell. The original signal was a gavel (which is still in use today along with the bell), but during the late 1800s, the NYSE® decided to switch the gavel for a gong to signal the day's beginning and end. After the NYSE® changed to its present location at 18 Broad Street in 1903, the gong was switched to the bell format that is currently being used. A common sight today is the highly publicized events in which a celebrity or executive from a corporation stands behind the NYSE® podium and pushes the button that signals the bells to ring. Many consider the act of ringing the bells to be quite an honor and a symbol of a lifetime of achievement. Furthermore, due to the amount of coverage that the opening/closing bells receive, many companies coordinate new product launches and other marketing-related events to start on the same day as when the company's representatives ring the bell. This daily tradition wasn't always this highly publicized either. In fact, it was only in 1995 that the NYSE® began having special guests ring the bells on a regular basis. Prior to that, ringing the bells was usually the responsibility of the exchange's floor managers. Notable Bell-Ringers:- many of the people who ring the bell are business executives whose companies trade on the exchange. However, there have also been many famous people from outside the world of business that have rung the bell. Athletes such as Joe DiMaggio of the New York Yankees and Olympic swimming champion Michael Phelps, entertainers such as rapper Snoop Dogg and members of the band Kiss, and politicians such as Mayor of New York City Rudy Giuliani and President of South Africa Nelson Mandela have all had the honor of ringing the bell. Two United Nations Secretaries General have also rung the bell. On April 27, 2006, Secretary-General Kofi Annan rang the opening bell to launch the United Nations Principles for Responsible Investment. On July 24, 2013, Secretary-General Ban Ki-moon rang the closing bell to celebrate the NYSE® joining the United Nations Sustainable Stock Exchanges initiative. In addition there have been many bell-ringers

who are famous for heroic deeds, such as members of the New York police and fire departments following the events of 9/11, members of the United States Armed Forces serving overseas, and participants in various charitable organizations. The reception they receive is often significantly more vocal than that accorded to even the most famous celebrities. There have also been several fictional characters that have rung the bell, including Mickey Mouse, the Pink Panther, Mr. Potato Head, the Aflac Duck, and Darth Vader. Founded in 1792, the New York Stock Exchange (NYSE®) is the most important stock exchange in the world. Shares of the largest US stock corporations are traded on the NYSE®. NYSE Group Inc. is a holding company and operator of the trading platform as well as a listed company. Synonym:- Wall Street. / ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE). Марш Катё (Marsh Carter) был Председателем НЙФБ® или Эн.Уай.Эс.И.® (NYSE®) и the CEO был Данкэн Нидааya (Duncan Niederauer). В настоящее время Председателем является Дьжефри Шпрэхя (Jeffrey Sprecher). Эби Хофмэн (Abbie Hoffman). Майкэл Моэ (Michael Moore). Бёкшё Хасэвэй (Berkshire Hathaway). Мики Маус (Mickey Mouse), За Пинк Пэнсё (the Pink Panther), Мистё Потчэйтчо Хэд (Mr. Potato Head), За Эфлэк Дак (the Aflac Duck), и Дас Вэйдё (Darth Vader). Нью Йоркская Фондовая Биржа – старейшая (с 1792) и крупнейшая биржа в мире и США, расположенная по адресу 11 Wall Street, New York City; также известна как ‘Большое Табло’ (Big Board) и ‘Биржа’ (The Exchange). Нью Йоркская Фондовая Биржа является ассоциацией некорпорационного типа, управляемой правлением, состоящим из председателя и 20 членов, представляющих общественность, и членов биржи приблизительно в равной пропорции. Оперативными подразделениями Нью Йоркской Фондовой Биржи являются следующие:- по рыночным операциям, регулированию и надзору за деятельностью фирм – членов биржи, финансовым и офисным услугам, планированию и разработке услуг, а также маркетинговым услугам и взаимоотношениям с клиентами. Группы работников осуществляют и другие специальные функции, такие, как решение юридических проблем, взаимоотношения с государственными организациями и экономические исследования; определённые функции выполняются корпорациями-филиалами, такими, как Депозитарная Трастовая Компания (Depository Trust Company (DTC)), Национальная Клиринговая Корпорация по Ценным Бумагам (National Securities Clearing Corporation (NSCC)), Корпорация Автоматизации Индустрии Ценных Бумаг (Securities Industry Automation Corporation (SIAC)). Общее число индивидуальных членов равно 1 366, это – частные лица, обычно партнёры или руководящие работники фирм, занимающихся операциями с ценными бумагами. Число представленных фирм равно примерно 550, 150 из которых являются ‘специалистами’, ответственными за поддержание упорядоченного рынка конкретных ценных бумаг. Большинство членов биржи исполняют приказы своих клиентов, хотя небольшое число фирм – около 30, которые называются торговцами на полу (floor traders), ведут операции исключительно за свой собственный счёт. На Нью Йоркской Фондовой Бирже котируется более 1 600 компаний, которые являются крупными фирмами, удовлетворяющими необычайно строгим требованиям биржевой котировки (listing requirements). Операции с акциями (stocks), облигациями (bonds), варрантами (warrants), опционами (options) и правами (rights) ведутся на 22 подковообразных торговых постах (tradingposts) в торговом зале (floor) биржи. В середине 1990-х акции, котирующиеся на Нью Йоркской Фондовой Бирже, составляли более 50% общего числа акций, операции с которыми проводились на зарегистрированных биржах в США. Часы работы биржи:- 09:30 – 16:00, с Понедельника по Пятницу.

NEXT DAY = СЛЕДУЮЩИМ ДНЁМ – Next Day:- a spot contract that provides for delivery of a commodity on the next calendar day or the next business day. Also known as Day Ahead. / Следующим Днём:- контракт с безотлагательной поставкой, который предусматривает поставку сырья на следующий календарный день или следующий рабочий день. Известен также как Днём Вперёд (Day Ahead).

NEXT–DAY AVAILABILITY CHECK = ЧЕК ДОСТУПНОСТЬЮ НА СЛЕДУЮЩИЙ ДЕНЬ – In the United States, Next-Day Availability Check means a check deposited in an account that must be made available for withdrawal no later than the business day after the banking day on which the funds were deposited. Types of checks with next-day availability include, under certain conditions, on-us checks, Treasury checks, US Postal Service money orders, Federal Reserve Bank or Federal Home Loan Bank checks, state or local government checks, and cashier’s, certified, or teller’s checks.

NICs = NEWLY INDUSTRIALIZING COUNTRIES

NICHE = НИША – Niche is the position that an organism occupies within its environment. Niche is a role and function of an organism specific in its habitat. / Ниша – комплекс специфических условий обитания. Под Нишей, от Французского слова Niche, означающее Углубление, от Итальянского слова Nicchia, понимается углубление различного размера и происхождения на склоне или у подножия возвышенности, берега. Различают:- волноприбойные (или абразионные), дефляционные, карстовые, нивационные, эрозионные и другие. Ниша:- (1) в архитектуре – углубление в стене здания или сооружения для установки статуй, ваз, размещения встроенных шкафов и прочего. Иногда ниши применяют для пластической обработки стены. (2) В геоморфологии Ниша – волноприбойная, выемка в нижней части уступа абразионного берега, возникающая в результате разрушительного действия прибойного потока. По мере углубления ниши увеличивается вес нависающего над ней карниза коренной породы. Карниз в конце концов обрушивается и образуется отвесная стенка абразионного уступа – клифа. (3) В военном деле – углубление в стенке окопа, траншеи, хода сообщения. Служит для хранения боеприпасов, воды и другого, защиты от пуль, осколков снарядов и мин, является также укрытием в плохую погоду. В слабых грунтах стенки и потолок ниши обшивают досками или подручными материалами.

NICKEL = НИКЕЛЬ – Nickel is a metallic chemical element in the periodic table that has the symbol Ni and atomic number 28. Nickel is a silvery white metal that takes on a high polish. It belongs to the transition metals, and is hard and ductile. It occurs combined with sulfur in millerite, with arsenic in the mineral niccolite, and with arsenic and sulfur in nickel glance. Nickel is used in many industrial and consumer products, including stainless steel, magnets, coinage, and special alloys. It is also used for plating and as a green tint in glass. Nickel is pre-eminently an alloy metal, and its chief use is in the nickel steels and nickel cast irons, of which there are innumberable varietes. It is also widely used for many other alloys, such as nickel brasses and bronzes, and alloys with copper, chromium, aluminum, lead, cobalt, silver, and gold. One of the most widely used alloying elements in steel. In amounts 0.50% to 5.00% its use in alloy steels increases the toughness and tensile strength without detrimental effect on the ductility. Nickel also increases the hardenability, thus permitting the steel to be oil-hardened instead of water quenched. In larger quantities, 8.00% and upwards, nickel is the constituent, together with chromium, of many corrosion resistant and stainless austenitic steels. / легирование или легирующее (alloying). Никель (на Латинском Niccolum), от названия минерала Kupfernickel от Немецких слов Kupfer, означающее Медь, и Nickel, означающее Злой Дух, Мешавший Получению Меди, химический элемент VIII группы периодической системы Менделеева, символ Ni, атомный номер 28, атомная масса 58.69. Никель – серебристо-белый металл, тугоплавкий, плотность 8 900 кг/м^3, $t_{пл}$ 1 453 °C, ферромагнитен (точка Кюри 364 °C). Никель очень стоек к действию воздуха, воды. В природе встречается в виде сульфидных медно-никелевых и силикатных руд. Основные минералы – миллерит, никелин, пентландит. Обогащённую руду окислительным обжигом переводят в оксид NiO, который восстанавливают в дуговых печах. Чистый порошковый никель получают также термическим разложением карбонила. Около 80% никеля идёт на никелевые сплавы (с железом, хромом, медью и другими металлами), обладающие ценными механическими, антикоррозионными, магнитными или электрическими свойствами, жаропрочностью и жаростойкостью (нержавеющие стали, хромоникелевые сплавы). Применяют также для производства щелочных аккумуляторов, химической аппаратуры, для антикоррозионных покрытий (никелирование), как катализатор многих химических процессов, в сплавах с медью – для изготовления монет и так далее. Никель (на Латинском Niccolum), Ni, химический элемент первой триады VIII группы Периодической Системы Менделеева, атомный номер 28, атомная масса 58.70; серебристо-белый металл, ковкий и пластичный. Природный никель состоит из смеси пяти стабильных изотопов:- ^{58}Ni (67.76%), ^{60}Ni (26.16%), ^{61}Ni (1.25%), ^{63}Ni (3.66%), ^{64}Ni (1.16%). Историческая Справка:- Металл в нечистом виде впервые получил в 1751 Шведский минералог и химик Барон Аксэль Фредрикь Кронстэдт (или Кронштедт; Axel Fredrik Cronstedt; 1722–1765), предложивший и название элемента. Значительно более чистый металл получил в 1804 Немецкий химик Йерэмиас Бэнъямин Рихьта (или Рихтер; Jeremias Benjamin Richter; 1762–1807). Название ‘Никель’ происходит от минерала купферникеля (NiAs), известного уже в XVII веке и часто вводившего в заблуждение горняков внешним сходством с медными рудами (от Немецких слов Kupfer, означающее Медь, и Nickel, означающее Горный Дух, якобы подсовывавший горнякам вместо руды пустую породу). С середины XVIII века никель применялся лишь как составная часть сплавов, по внешности похожих на серебро. Широкое развитие никелевой промышленности в конце XIX века связано с нахождением крупных месторождений никелевых руд в Новой Каледонии и в Канаде и открытием ‘облагораживающего’ его влияния на свойства сталей. Распространение В Природе:- Никель – элемент земных глубин (в ультраосновных породах мантии его 0.2% по массе). Существует гипотеза, что земное ядро состоит из никелистого железа; в соответствии с этим среднее содержание никеля в земле в целом по оценке около 3%. В земной коре, где никель $5.8 \cdot 10^{-3}$%, он также тяготеет к более глубокой, так называемой базальтовой оболочке. Ni в земной коре – спутник Fe и Mg, что объясняется сходством их валентности (II) и ионных радиусов; в минералы двухвалентных железа и магния никель входит в виде изоморфной примеси. Собственных минералов никеля известно 53; большинство из них образовалось при высоких температурах и давлениях, при застывании магмы или из горячих водных растворов. Месторождения никеля связаны с процессами в магме и коре выветривания. Промышленные месторождения никеля (сульфидные руды) обычно сложены минералами никеля и меди (смотрите Никелевые Руды). На земной поверхности, в биосфере никель – сравнительно слабый мигрант. Его относительно

мало в поверхностных водах, в живом веществе. В районах, где преобладают ультраосновные породы, почва и растения обогащены никелем. Физические И Химические Свойства:- При обычных условиях никель существует в виде b-модификации, имеющей гранецентрированную кубическую решётку (a = 3.523 6Å). Но никель, подвергнутый катодному распылению в атмосфере H_2, образует a-модификацию, имеющую гексагональную решётку плотнейшей упаковки (a = 2.65Å, c = 4.32Å), которая при нагревании выше 200 °C переходит в кубическую. Компактный кубический никель имеет плотность 8.9 г/см^3 (20 °C), атомный радиус 1.24Å, ионные радиусы:- Ni^{2+} 0.79Å, Ni^{3+} 0.72Å; $t_{пл}$ 1 453 °C; $t_{кип}$ около 3 000 °C; удельная теплоёмкость при 20 °C 0.440 кДж/(кг·К) [0.105 кал/(г°C)]; температурный коэффициент линейного расширения $13.3\cdot10^{-6}$ (0–100 °C); теплопроводность при 25 °C 90.1 вм/(м·К) [0.215 кал/(см·сек·°C)]; то же при 500 °C 60.01 вм/(м·К) [0.148 кал/см (сек·°C)]. Удельное электросопротивление при 20 °C 68.4 ном·м, то есть 6.84 мком·см; температурный коэффициент электросопротивления $6.8\cdot10^{-3}$ (0–100 °C). Никель – ковкий и тягучий металл, из него можно изготовлять тончайшие листы и трубки. Предел прочности при растяжении 400–500 МегаНьютонов на квадратный метр (МН/м^2) (то есть 40–50 килограмм-силы на квадратный миллиметр (кгс/мм^2)), предел упругости 80 МН/м^2, предел текучести 120 МН/м^2; относительное удлинение 40%; модуль нормальной упругости 205 ГигаНьютонов на квадратный метр (ГН/м^2); твёрдость по Бринеллю 600–800 МН/м^2. В температурном интервале от 0 до 631 К (верхняя граница соответствует Точке Кюри) никель ферромагнитен. Ферромагнетизм никеля обусловлен особенностями строения внешних электронных оболочек ($3d^84s^2$) его атомов. Никель вместе с Fe ($3d^64s^2$) и Co ($3d^74s^2$), также ферромагнетиками, относится к элементам с недостроенной 3d-электронной оболочкой (к переходным 3d-металлам). Электроны недостроенной оболочки создают нескомпенсированный спиновый магнитный момент, эффективное значение которого для атомов никеля составляет 6 $m_Б$, где $m_Б$ – Магнетон Бора. Положительное значение обменного взаимодействия в кристаллах никеля приводит к параллельной ориентации атомных магнитных моментов, то есть к ферромагнетизму. По той же причине сплавы и ряд соединений никеля (окислы, галогениды и другие) магнитоупорядочены (обладают ферро-, реже ферримагнитной структурой, смотрите Магнитная Структура). Никель входит в состав важнейших магнитных материалов и сплавов с минимальным значением коэффициента теплового расширения (пермаллой, монель-металл, инвар и другие). В химическом отношении Ni сходен с Fe и Co, но также и с Cu и благородными металлами. В соединениях проявляет переменную валентность (чаще всего 2-валентен). Никель – металл средней активности, Поглощает (особенно в мелкораздробленном состоянии) большие количества газов (H_2, CO и другие); насыщение никеля газами ухудшает его механические свойства. Взаимодействие с кислородом начинается при 500 °C; в мелкодисперсном состоянии никель пирофорен – на воздухе самовоспламеняется. Из окислов наиболее важна закись NiO – зеленоватые кристаллы, практически нерастворимые в воде (минерал Бунзенит). Гидроокись выпадает из растворов никелевых солей при прибавлении щёлочей в виде объёмистого осадка яблочно-зелёного цвета. При нагревании никель соединяется с галогенами, образуя NiX_2. Сгорая в парах серы, даёт сульфид, близкий по составу к Ni_3S_2. Моносульфид NiS может быть получен нагреванием NiO с серой. С азотом никель не реагирует даже при высоких температурах (до 1 400 °C). Растворимость азота в твёрдом никеле приблизительно 0.07% по массе (при 445 °C). Нитрид Ni_3N может быть получен пропусканием NH_3 над NiF_2, $NiBr_2$ или порошком металла при 445 °C. Под действием паров фосфора при высокой температуре образуется фосфид Ni_3P_2 в виде серой массы. В системе Ni–As установлено существование трёх арсенидов:- Ni_5As_2, Ni_3As (минерал Маухерит) и NiAs. Структурой никель-арсенидного типа (в которой атомы As образуют плотнейшую гексагональную упаковку, все октаэдрические пустоты которой заняты атомами Ni) обладают многие металлиды. Неустойчивый карбид Ni3C может быть получен медленным (сотни часов) науглероживанием (цементацией) порошка никеля в атмосфере CO при 300 °C. В жидком состоянии никель растворяет заметное количество C, выпадающего при охлаждении в виде графита. При выделении графита никель теряет ковкость и способность обрабатываться давлением. В ряду напряжений Ni стоит правее Fe (их нормальные потенциалы соответственно –0.44 В и –0.24 В) и поэтому медленнее, чем Fe, растворяется в разбавленных кислотах. По отношению к воде никель устойчив. Органические кислоты действуют на никель лишь после длительного соприкосновения с ним. Серная и соляная кислоты медленно растворяют никель; разбавленная азотная – очень легко; концентрированная HNO_3 пассивирует никель, однако в меньшей степени, чем железо. При взаимодействии с кислотами образуются соли 2-валентного Ni. Почти все соли Ni (II) и сильных кислот хорошо растворимы в воде, растворы их вследствие гидролиза имеют кислую реакцию. Труднорастворимы соли таких сравнительно слабых кислот, как угольная и фосфорная. Большинство солей никеля разлагается при прокаливании (600–800 °C). Одна из наиболее употребительных солей – сульфат $NiSO_4$ кристаллизуется из растворов в виде изумрудно-зелёных кристаллов $NiSO_4\cdot7H_2O$ – никелевого купороса. Сильные щёлочи на никель не действуют, но он растворяется в аммиачных растворах в присутствии $(NH_4)_2CO_3$ с образованием растворимых аммиакатов, окрашенных в интенсивно-синий цвет; для большинства из них характерно наличие комплексов $(Ni(NH_3)_6)^{2+}$ и $(Ni(OH)_2(NH_3)_4)$. На избирательном образовании аммиакатов основываются гидрометаллургические методы извлечения никеля из руд. NaOCl и NaOBr осаждают из растворов солей Ni (II), гидроокись Ni $(OH)_3$ чёрного цвета. В комплексных соединениях Ni, в отличие от Co, обычно 2-валентен. Комплексное соединение Ni с диметилглиоксимом $(C_4H_7O_2N)_2Ni$ служит для аналитического определения Ni. При повышенных температурах никель взаимодействует с окислами азота, SO_2 и NH_3. При действии CO на его тонкоизмельчённый порошок при нагревании образуется карбонил $Ni(CO)_4$ (смотрите Карбонилы Металлов). Термической диссоциацией карбонила получают наиболее чистый никель. Получение:- Около 80% никеля от общего его производства (без бывшего СССР) получают из сульфидных медно-никелевых руд. После селективного обогащения методом флотации из руды выделяют медный, никелевый и пирротиновый концентраты. Никелевый рудный концентрат в смеси с флюсами плавят в электрических шахтах или отражательных печах с целью отделения пустой породы и извлечения никеля в сульфидный расплав (штейн), содержащий 10–15% Ni. Обычно электроплавке (основной метод плавки в бывшем СССР) предшествуют частичный окислительный обжиг и окускование концентрата. Наряду с Ni в штейн переходят часть Fe, Co и практически полностью Cu и благородные металлы. После отделения Fe окислением (продувкой жидкого штейна в конвертерах) получают сплав сульфидов Cu и Ni – файнштейн, который медленно охлаждают, тонко измельчают и направляют на флотацию для разделения Cu, и Ni. Никелевый концентрат обжигают в кипящем слое до NiO. Металл получают восстановлением NiO в электрических дуговых печах. Из чернового никеля отливают аноды и рафинируют электролитически. Содержание примесей в электролитном никеле (марка 110) 0.01%. Для разделения Cu и Ni используют также так называемый карбонильный процесс, основанный на обратимости реакции:- $Ni + 4CO \leftrightarrow Ni(CO)_4$. Получение карбонила проводят при 100–200 атм и при 200–250 °C, а его разложение – без доступа воздуха при атмосферном давлении и около 200 °C. Разложение $Ni(CO)_4$ используют также для получения никелевых покрытий и изготовления различных изделий (разложение на нагретой матрице). В современных ‘автогенных’ процессах плавка осуществляется за счёт тепла, выделяющегося при окислении сульфидов воздухом, обогащенным кислородом. Это позволяет отказаться от углеродистого топлива, получить газы, богатые SO_2, пригодные для производства серной кислоты или элементарной серы, а также резко повысить экономичность процесса. Наиболее совершенно и перспективно окисление жидких сульфидов. Всё более распространяются процессы, основанные на обработке никелевых концентратов растворами кислот или аммиака в присутствии кислорода при повышенных температурах и давлении (автоклавные процессы). Обычно никель переводят в раствор, из которого выделяют его в виде богатого сульфидного концентрата или металлического порошка (восстановлением водородом под давлением). Из силикатных (окисленных) руд

никель также может быть сконцентрирован в штейне при введении в шихту плавки флюсов – гипса или пирита. Восстановительно-сульфидирующую плавку проводят обычно в шахтных печах; образующийся штейн содержит 16–20% Ni, 16–18% S, остальное – Fe. Технология извлечения никеля из штейна аналогична описанной выше, за исключением того, что операция отделения Cu часто выпадает. При малом содержании в окисленных рудах Co их целесообразно подвергать восстановительной плавке с получением ферроникеля, направляемого на производство стали. Для извлечения никеля из окисленных руд применяют также гидрометаллургические методы – аммиачное выщелачивание предварительно восстановленной руды, сернокислотное автоклавное выщелачивание и другие. Применение:- Подавляющая часть Ni используется для получения сплавов с другими металлами (Fe, Cr, Cu и другие), отличающихся высокими механическими, антикоррозионными, магнитными или электрическими и термоэлектрическими свойствами. В связи с развитием реактивной техники и созданием газотурбинных установок особенно важны жаропрочные и жаростойкие хромоникелевые сплавы (смотрите Никелевые Сплавы). Сплавы никеля используются в конструкциях атомных реакторов. Значительное количество никеля расходуется для производства щелочных аккумуляторов и антикоррозионных покрытий. Ковкий никель в чистом виде применяют для изготовления листов, труб и так далее. Он используется также в химической промышленности для изготовления специальной химической аппаратуры и как катализатор многих химических процессов. Никель – весьма дефицитный металл и по возможности должен заменяться другими, более дешёвыми и распространёнными материалами. Переработка руд никеля сопровождается выделением ядовитых газов, содержащих SO_2 и нередко As_2O_3. Очень токсична CO, применяемая при рафинировании никеля карбонильным методом; весьма ядовит и легко летуч $Ni(CO)_4$. Смесь его с воздухом при 60 °C взрывается. Меры борьбы:- герметичность аппаратуры, усиленная вентиляция. Никель в организме является необходимым микроэлементом. Среднее содержание его в растениях $5.0 \cdot 10^{-5}$% на сырое вещество, в организме наземных животных $1.0 \cdot 10^{-5}$%, в морских – $1.6 \cdot 10^{-5}$%. В животном организме никель обнаружен в печени, коже и эндокринных железах; накапливается в ороговевших тканях (особенно в перьях). Физиологическая роль никеля изучена недостаточно. Установлено, что никель активирует фермент аргиназу, влияет на окислительные процессы; у растений принимает участие в ряде ферментативных реакций (карбоксилирование, гидролиз пептидных связей и другие). На обогащённых никелем почвах содержание его в растениях может повыситься в 30 раз и более, что приводит к эндемическим заболеваниям (у растений – уродливые формы, у животных – заболевания глаз, связанные с повышенным накоплением никеля в роговице:- кератиты, кератоконъюнктивиты).

NIDDY–NODDY = НИДИ–НАДИ – The Niddy Noddy is a very useful accessory for winding yarn from the spinning wheel bobbin and creating a 1.5 m (5 ft) skein. Made from turned Silver Beech hard wood the specially shaped crossbars allow the skein (hank) of yarn to slide off easily when made. It is easy to dismantle for storage or transportation. Niddy-Noddy:- a traditional, low-tech way to wind a skein and measure yarn. For the less crafty, or to dry damp skeins, consider making one out of 3/4 or 1” pvc.

NIE = NEWLY INDUSTRIALIZED ECONOMY

NIF = NOTE ISSUANCE FACILITY

NIG = NATIONAL INSTITUTE OF GENETICS

NIGHT–AND–DAY VAULT = КРУГЛОСУТОЧНОЕ ХРАНИЛИЩЕ – Night-And-Day Vault is a safe for depositing cash, cheques, bills of exchange and other documents outside business hours and for which the ‘Conditions for the Use of Night-and-Day Vaults’ are applicable.

NIGHTCAP = НОЧНОЙ КОЛПАК – Nightcap is a cloth cap worn with nightclothes.

NIGHTCLOTHES = НОЧНЫЕ ОДЕЖДЫ (или XX) – Nightclothes:- garments for wear in bed.

NIGHTDRESS = НОЧНОЕ ПЛАТЬЕ (или XX) – Nightdress:- nightgown; nightclothes.

NIGHTGOWN = НОЧНАЯ СОРОЧКА (или XX) – Nightgown is a loose garment for wear in bed.

NIGHTIE = НОЧНУШКА (или НЕГЛИЖЕ) – Nightie:- a nightgown for a woman or child.

NIGHT RAIL = НЕГЛИЖЕ (или НОЧНОЙ ХАЛАТ) – Night Rail:- (archaic) nightgown.

NIGHT SAFE = НОЧНОЙ СЕЙФ – Night Safe is a money safe at a bank that is accessible from the street into which traders can deposit takings after the bank has closed for the day. The money is credited to the trader’s account the following day. Night depository in the form of a vault which is used mainly by commercial clients to deposit their takings in safeboxes or safebags outside opening hours. Their use is regulated by a written agreement. / Ночной Сейф – денежный сейф в банке, к которому имеется доступ с улицы, в который торговцы могут депонировать .

NIGHTSHIRT = НОЧНАЯ РУБАШКА – Nightshirt is a nightgown resembling a shirt.

NIKKEI 225 = 225 ОТ НИККЭЙ – The Nikkei 225 began to be calculated on 1950-September-07, retroactively calculated back to 1949-May-16. A history of the Nikkei 225 Stock Average is provided in our Nikkei Index History. The average peaked at 38 915.87 points on 1989-December-29. Which stocks currently make up the Nikkei 225? Go to the Nikkei Constituents page and select all industry categories to see a complete list of components. How are stocks weighted on the Nikkei 225? All companies are given an equal weighting based on a par value of 50 Yen per share. Events such as stock splits, removals and additions of constituents impact the effective weighting of individual stocks and the divisor. Are industries weighted differently within the Nikkei 225 Stock Average? The Nikkei 225 is designed to reflect the overall market, so there is no specific weighting of industries. When do changes occur and how do I find out about them? The stocks are reviewed annually and review results are announced in September. Changes, if required, are made at the beginning of October. Changes may take place at any time if a stock is found to be ineligible, e.g., delistings, etc. Changes to the Nikkei 225 will be announced in Nikkei’s newspapers and on the page:- http://www.nikkei.com. Corporation:- Nikkei Inc., Tokyo, Japan. The stock price indices are statistical indicators of trends in the financial market. TOPIX and Nikkei 225 are commonly used indices in Japan. As important economic indicators, precision and continuity are vital to their calculation. Nikkei 225:- provider:- Nihon-Keizai-Shimbun (newspaper publisher) Nikkei Digital Media; issue composition:- 225 companies listed on the Tokyo Stock Exchange (TSE) First Section; No. of constituents:- 225; methodology:- average price weighted (Nikei 225 is affected by high-priced stocks); and unit:- Yen. Nikkei 225 is calculated from a selection of 225 domestic common stocks listed on the First Section of TSE. In order to provide accurate market movements and sector balance, constituent review of indices for the Nikkei 225 is conducted annually. See also TOPIX. The Nikkei 225 (Nikkei heikin kabuki 225), more commonly called the Nikkei, the Nikkei index, or the Nikkei Stock Average is a stock market index for the Tokyo Stock Exchange (TSE). It has been calculated daily by the Nihon Keizai Shimbun (Nikkei) newspaper since 1950. It is a price-weighted average (the unit is yen), and the components are reviewed once a year. Currently, the Nikkei is the most widely quoted average of Japanese equities, similar to the Dow Jones Industrial Average. In fact, it was known as the ‘Nikkei Dow Jones Stock Average’ from 1975 to 1985. The Nikkei 225 began to be calculated on 1950-September-07, retroactively

calculated back to 1949-May-16. Since January 2010 the index is updated every 15 seconds during trading sessions. The Nikkei 225 Futures, introduced at Singapore Exchange (SGX) in 1986, the Osaka Securities Exchange (OSE) in 1988, Chicago Mercantile Exchange® (CME®) in 1990, is now an internationally recognized futures index. The Nikkei average has deviated sharply from the textbook model of stock averages which grow at a steady exponential rate. The average hit its all-time high on 1989-December-29, during the peak of the Japanese asset price bubble, when it reached an intra-day high of 38 957.44 before closing at 38 915.87, having grown sixfold during the decade. Subsequently it lost nearly all these gains, closing at 7 054.98 on 2009-March-10 – 81.9% below its peak twenty years earlier. Another major index for the Tokyo Stock Exchange is the Topix. On 2011-March-15, the second working day after the massive earthquake in the northeast part of Japan, the index dropped over 10% to finish at 8 605.15, a loss of 1 015 points. This put it at its lowest close since 2009-April-01. Stocks are weighted on the Nikkei 225 by giving an equal weighting based on a par value of 50 yen per share. Events such as stock splits, removals and additions of constituents impact upon the effective weighting of individual stocks and the divisor. The Nikkei 225 is designed to reflect the overall market, so there is no specific weighting of industries. Stocks are reviewed annually and announcements of review results are made in September. Changes, if required, are made at the beginning of October. Changes may also take place at any time if a stock is found to be ineligible, e.g., delisting. All proposed changes will be announced in Nikkei's Japanese newspapers and will appear on NNI (short for the Nikkei Net Interactive on the page:- http://www.nikkei.com). After a stock has been replaced, the divisor is reviewed and modified to ensure a smooth transition of the stock index. / Нихон Кэйзай Симбюн (Nihon Keizai Shimbun). Дау Дьжонз (Dow Jones). пузырь (bubble). индекс по 225 от Никкэй (полное название – Nikkei 225 Stock Average) основной индекс в семействе индексов Никкэй. Кроме его есть также следующие индексы:- Nikkei 300 (полное название – Nikkei Stock Index 300) и Nikkei 500 (полное название – Nikkei 500 Stock Average), Nikkei JASDAQ Average, Nikkei All Stock Index, и Nikkei Style Indices. Индекс по 225 от Никкэй (Nikkei 225 index) по компаниям, выбранным Нихон Кэйзай Симбюн (Nihon Keizai Shimbun). 225 от Никкэй (Nikkei 225) или (Nikkei 225 Stock Average) – один из важнейших фондовых индексов Японии. Индекс вычисляется как простое среднеарифметическое значение стоимости 225 акций наиболее активно торгуемых компаний первой секции Токийской Фондовой Биржи (ТФБ) с крупной капитализацией. Изначальная расчётная база индекса была определена 16 Мая 1949, а Токийская Фондовая Биржа впервые опубликовала его 07 Сентября 1950 под названием Переоцениваемое Усреднение Фондовых Цен от ТФБ (TSE Adjusted Stock Price Average). С 1970 года индекс вычисляется Японской газетой Нихон Кэйзай Симбюн. Новое название индекса произошло от сокращённого названия этой газеты – Никкэй (Nikkei). Список компаний, охватываемых индексом по 225 от Никкэй, пересматривается как минимум раз в год, в Октябре. Усреднённый Фондовый индекс от Никкэй (Nikkei Stock Average) – индекс по стоимости 225 ведущих акций, операции с которыми проводятся на Токийской Фондовой Бирже. До Мая 1985 назывался Усреднённым Фондовым Индексом от Никкэй и Дау Дьжонз (Nikkei Dow Jones Stock Average); аналогичен усреднённому Промышленному Индексу от Дау Дьжонз (Dow Jones Industrial Average), поскольку включает репрезентативные компании, акции которых называются 'голубыми фишками' (blue chip) и взвешены по цене (price-weighted index). В Японии они называются компаниями 'первой секции' – first-section. Это означает, что изменение котировок каждой из акций в Долларах США или Йенах взвешивается равным образом (несмотря на рыночную капитализацию). Усреднённый Фондовый индекс от Никкэй, неформально называемый индексом от Никкэй или просто Никкэй Дау (Nikkei Dow), публикуется Японской экономической газетой Нихон Кэйзай Симбюн (Nihon Keizai Shimbun) (Japan Economic Journal) и является наиболее широко известным Японским фондовым индексом. Также широко известным является индекс котировок Токийской Фондовой Биржи ТОПИКС (TOPIX) всех выпусков ценных бумаг, входящих в 'первую секцию'.

NIKKI DAMAGE = ПОВРЕЖДЕНИЕ XX – NIKKI Press Machine Damage:- any particles goes in side the plate of machine may damage the fabric. Finishing defect. / Порок или дефект заключительной отделки.

NIL = NEAR–ISOGENIC LINE

NIL = NOT IN LOCATION

NILE GREEN = НИЛЬСКОЕ ЗЕЛЁНОЕ (или XX) – Nile Green:- a pale yellow green.

NIMBY = NOT IN MY BACK YARD

NINETY–DAY DEPOSIT = ДЕВЯНОСТА–ДНЕВНЫЙ ВКЛАД (или ДЕВЯНОСТА–ДНЕВНЫЙ ДЕПОЗИТ) – Ninety-Day Deposit is a deposit of a sum of money placed for a fixed term of three months by a private party or corporate customer (time deposit) or by another bank (due to banks) with a banking institution and drawing higher interest than a demand deposit.

NINHYDRIN = НИНГИДРИН – Ninhydrin is a chemical for the colorimetric determination of amino acids, which becomes violet to red when in contact with honeydew on filter paper. It is used to determine the feeding activity of the brown planthopper. / Нингидрин, $C_9H_6O_4$, . Нингидрин – сильный окислитель (трикетогидринденгидрат), образующий при взаимодействии с амино и иминокислотами окрашенные соединения; используется в лабораторной практике для выявления и количественного определения α аминокислот (в частности, на хроматограммах).

NINON = НИНО – Ninon is a lightweight, plain weave, made of silk or manufactured fibers, with an open mesh-like appearance. Since the fabric is made with high twist filament yarns, it has a crisp hand. End uses include evening wear and curtains. Ninon is a stout French chiffon; used for summer dresses. Ninon is a sheer fabric of silk, rayon, or nylon made in a variety of tight smooth weaves or open lacy patterns. Ninon – very delicate sheer silky material. Usually made of silk, rayon, or nylon. It is sometimes also referred to as 'French Tergal'. Available in a variety of solid colors and tone-on-tone woven vertical stripes. Some ninon fabrics have embroidered borders. Pronounced 'nee-no'. Ninon is a sheer, fairly crisp fabric, heavier than chiffon. Much like voile, but more body. The warp yarns are often grouped in pairs. Washes well, particularly in the synthetics. Mostly used for curtains, and some for evening or bridal wear. Ninon is very sheer, crisp, open, plain weave fabric made of silk originally, and of manufactured filament fibers more recently, too. It is generally heavier than chiffon. In the United Kingdom, ninon voile is a sheer cotton fabric made in imitation of ninon. Uses:- Dresses, scarves, eveningwear, lingerie. / Найлан^{Т3} (Nylon^{TM}). 'Французский Тэргаль' ('French Tergal'). Поскольку ткань вырабатывается из филаментной (или комплексной) пряжи (filament yarn) высокой крутки, .

NIO = NICARAGUAN CORDOBA ORO

NIP = NORMAL INVESTMENT PRACTICE

NIP = УТОНЕНИЕ (или ЗАЗОР) – Nip is:- (1) the line or area of contact between two contiguous rollers. (2) A defect in yarn consisting of a thin place. / Зазор между валами.

NIPA = NATIONAL INCOME AND PRODUCT ACCOUNTS

NIP CREASES = ЗАЛОМЫ ОТ ЗАЖИМОВ – Nip Creases are the creases occurring at regular intervals along a fabric selvage subsequent to a nipping operation such as calendering or padding. Such creases are caused by a loosely wound selvage or improper

let-off tension which allows the fabric to fold over or gather at the selvage prior to entering the nip of the rolls. / зажим или защепление (nipping). Под Заломом понимается местный порок в виде неустранимых следов складок. Размер порока – по всему куску.

NIPLECC = NATIONAL INTELLECTUAL PROPERTY LAW ENFORCEMENT COORDINATION COUNCIL

NIR = NEAR–INFRARED REFLECTANCE

NIRD = NATIONAL INSTITUTE FOR RURAL DEVELOPMENT

NIRS = NATIONAL IRRIGATION RESEARCH STATION

NISA = NATIONAL INVASIVE SPECIES ACT OF 1996

NIST = NATIONAL INSTITUTE OF STANDARDS AND TECHNOLOGY

NIT = NEGATIVE INCOME TAX

NITL = NATIONAL INDUSTRIAL TRANSPORTATION LEAGUE

NITRATE ASSIMILATION = УСВОЕНИЕ НИТРАТОВ (или АССИМИЛЯЦИЯ НИТРАТОВ) – Nitrate Assimilation is an uptake of nitrate by living organisms and conversion to cell substances. / Под Нитратами понимаются азотнокислые соли и эфиры – производные азотной кислоты HNO_3. Соли $M(NO_3)_n$ (M – металл со степенью окисления n) – кристаллы; удобрения, протравы при крашении, компоненты взрывчатых веществ (ВВ). Нитраты аммония, щелочных и щелочноземельных металлов часто называют Селитрами. Эфиры $RONO_2$ (R – органический радикал) – бесцветные или светло-жёлтые, приятно пахнущие жидкости; эфиры, содержащие несколько групп –ONO2, например, нитроглицерин, применяются в качестве ВВ и лекарственных препаратов. В биологии под Ассимиляцией, от Латинского слова Assimilatio, означающее Слияние или Уподобление или Усвоение, понимается то же, что анаболизм, в более узком смысле – усвоение питательных веществ живыми клетками (корневая абсорбция, фотосинтез и так далее).

NITRATION = НИТРОВАНИЕ – Nitration:- nitration products are formed during the fuel combustion process in internal combustion engines. Most nitration products are formed when an excess of oxygen is present. These products are highly acidic, form deposits in combustion areas and rapidly accelerate oxidation. / Нитрование – введение нитрогрупп – NO_2 в молекулы органических соединений при действии различных нитрующих агентов. В зависимости от строения нитруемого соединения и условий реакции нитрование может сопровождаться введением в молекулу других функциональных групп, например – F (нитрофторирование), –OH (окислительное нитрование) и других. Нитрование – один из наиболее изученных в теоретических и практических отношениях процессов. Нитрование ароматических соединений осуществляется азотной кислотой, нитрующими смесями или неорганическими солями нитрония NO; вначале образуется комплекс (I) между катионом нитрония и бензолом; затем отщепляется протон с образованием нитросоединения (II). Реакция осуществляется при комнатной или пониженной температуре. Для введения последующих нитрогрупп требуются более жёсткие условия. При прямом нитровании в ароматическое ядро можно ввести максимально три нитрогруппы. Наличие функциональных групп, обогащающих кольцо электронами, например, амино-, сульфо-, оксигрупп, облегчает нитрование, причём в некоторых случаях эти группировки могут замещаться на нитрогруппы. Так, при нитровании фенолсульфокислот сульфогруппа замещается нитрогруппой. Характер заместителей существенно влияет на ориентацию вступающей нитрогруппы (смотрите Правила Ориентации). Нитрование ароматических соединений ускоряется в присутствии нитратов ртути, причём процесс может сопровождаться окислением (образуются как нитросоединения, так и нитрофенолы). О промышленном получении некоторых ароматических нитросоединений смотрите, например, Нитроанилины, Нитробензол, Нитротолуолы, Нитронафталины. Нитрование алифатических соединений ненасыщенного ряда, например, смесью уксусного ангидрида и азотной кислоты, начинается с атаки двойной связи катионом нитрония; образующийся катион (III) стабилизируется отщеплением протона с образованием нитроолефина (IV) или присоединением аниона (X), находящегося в реакционной смеси:- xxxxx. (X = CH_3COO^-, Cl^-, OH^- и другие). Продукты реакции – обычно смеси нитросоединений. Нитрование ненасыщенных соединений двуокисью азота в инертных растворителях происходит по радикальному механизму, например:- xxxxx. Процесс также осложняется образованием смесей различных продуктов. Нитрование углеводородов парафинового ряда разбавленной азотной кислотой впервые осуществил Русский химик Михаил Иванович Коновалов (1858–1906) в 1888 (смотрите Реакция Коновалова). Нитрование алканов окислами азота или крепкой азотной кислотой происходит преимущественно по радикальному механизму:- $N_2O_4 \rightarrow 2O_2N$; $R–H + \cdot NO_2 \rightarrow \cdot R + HNO_2$ (то есть под действием диоксида азота из углеводорода образуется радикал $R\cdot$ и азотистая кислота, которая при взаимодействии с азотной кислотой снова даёт диоксид азота); $R\cdot + \cdot NO_2 \rightarrow R – HNO_2$. Обычно нитрование алифатических соединений сопровождается окислительно-деструктивными процессами, приводящими к образованию смесей нитро- и кислородсодержащих соединений. В промышленности высшие разветвлённые парафины нитруют при температуре около 100 °C (выход низших нитропарафинов до 75%); парафины ($C_1–C_5$) – в газовой фазе при 250–500 °C (иногда под давлением), выход нитропарафинов не превышает 40%. Реакция нитрования взрывоопасна. Промышленное нитрование проводят в специальных антикоррозионных нитраторах в тщательно контролируемых условиях; процессы полностью автоматизированы. Нитрование – введение нитрогруппы $-NO_2$ в молекулу органического соединения. Продуктами реакции являются нитросоединения. В зависимости от того, с каким атомом связана нитрогруппа, различают C–, O– и N–нитросоединения. Нитрование является одной из важнейших реакций органического синтеза и широко используется в лабораторной практике и производстве. Нитрование может осуществляться как прямым, так и непрямым путём. К процессам прямого нитрования относят реакции замещения атома водорода на нитрогруппу или присоединение нитрующих агентов по кратной связи, к непрямому нитрованию – замену других атомов или групп атомов на нитрогруппу (например, галогенов, сульфогруппы). К методам непрямого нитрования можно отнести реакции окисления азотсодержащих веществ до нитросоединений, а также реакции конденсации, приводящие к нитросоединениям.

NITRIFICATION = НИТРИФИКАЦИЯ – Nitrification is the biochemical oxidation of ammonium (NH4+) to nitrate (NO3-). / Под Нитрификацией, от Греческого слова Nitron, означающее первоначально Природная Сода, затем – Селитра, от новолатинского слова Nitr(ogenium), означающее Азот, и Латинского слова Facio, означающее Делаю, понимается превращение так называемыми нитрифицирующими Бактериями аммонийных солей почвы и водоёмов в нитраты, усваиваемые растениями. Играет первостепенную роль в круговороте азота в биосфере. Свидетельствует о завершении процесса минерализации в экосистеме. Обработка почвы, улучшающая её аэрацию, усиливает нитрификацию. Чрезмерное накопление нитратов в почве нежелательно, так как они легко вымываются и загрязняют воду. Под Нитрификацией понимается процесс микробиологического превращения аммонийных солей в нитраты. Протекает в почве и водоёмах. Имеет большое значение для круговорота азота в природе. Нитрификация завершает минерализацию органических соединений азота, начатую в процессе аммонификации. В нитрификации участвуют нитрифицирующие Бактерии (Nitrosomonas Europaea, Nitrobacter Winogradskii и другии). Протекает в две стадии:- ион аммония окисляется в нитрит-ион, затем нитрит-ион – в

нитрат-ион. Образующиеся нитраты хорошо усваиваются растениями. Нитрификация успешно протекает в аэрируемых почвах при pH 5–9.

NITROGEN ASSIMILATION = АЗОТОУСВОЕНИЕ (или АССИМИЛЯЦИЯ АЗОТА) – Nitrogen Assimilation is the incorporation of nitrogen into organic cell substances by living organisms. / В биологии под Ассимиляцией, от Латинского слова Assimilatio, означающее Слияние или Уподобление или Усвоение, понимается то же, что анаболизм, в более узком смысле – усвоение питательных веществ живыми клетками (корневая абсорбция, фотосинтез и так далее).

NITROGEN CYCLE = КРУГОВОРОТ АЗОТА – Nitrogen Cycle is the series of chemical and biochemical changes of nitrogen and nitrogenous compounds taking place in the soil – plant – atmosphere continuum.

NITROGEN DEFICIENCY SYMPTOMS = СИМПТОМЫ АЗОТНОЙ НЕДОСТАТОЧНОСТИ (или СИМПТОМЫ АЗОТНОГО ГОЛОДАНИЯ) – Nitrogen Deficiency Symptoms are characteristics of a plant at suboptimal N supply usually indicated by yellowing leaves, reduced tillering, and stunted growth.

NITROGEN FIXATION = АЗОТФИКСАЦИЯ (или ФИКСАЦИЯ АЗОТА) – Nitrogen Fixation:- this process occurs in some free-living microorganisms, e.g., blue-green algae and in bacterial-induced nodules of legumes. The conversion of elemental nitrogen into organic nitrogen or to forms readily utilized in biological processes. Nitrogen Fixation is a conversion of available nitrogen to insoluble or unavailable nitrogen. / Под Азотфиксацией понимается связывание молекул азота атмосферы и перевод его в азотистые соединения. Биологическая азотфиксация осуществляется клубеньковыми Бактериями, живущими в симбеозе с высшими растениями (симбиотическая азотфиксация), а также свободноживущими азотфиксаторами – азотобактером, микобактериями, спириллами, цианобактериями, энтеробактериями (несимбиотическая азотфиксация). Азотфиксация играет важную роль в круговороте азота в природе и обогащении почвы и водоёмов связанным азотом (симбиотическая азотфиксация ежегодно может обогащать 1 га почвы на 200–300 кг азота, несимбиотическая азотфиксация – на 15–30 кг). В промышленности азотфиксация происходит при синтезе аммиака из газообразных H_2 и N_2 в условиях относительно высоких температуры и давления. Показана возможность азотфиксации при комнатной температуре и атмосферном давлении под действием комплексов переходных металлов.

NITROGEN FIXING = АЗОТФИКСИРУЮЩЕЕ – Nitrogen Fixing:- of plants, often legumes, which are able to extract and fix nitrogen from the air by means of a symbiotic relationship with bacteria (e.g., Rhizobium species) often in root nodules. / Азотфиксирующее:- о растениях, часто Бобовых, которые способны экстрагировать и фиксировать азот из воздуха посредством симбиотического взаимоотношения с Бактерией (например, Видов Клубеньковых (Rhizobium species)) в корневых клубеньках.

NITROGEN RESPONSE = ОТЗЫВЧИВОСТЬ НА АЗОТ – Nitrogen Response is an increase in grain yield (and other growth parameters) after N fertilizer application.

NITROUS OXIDE = ЗАКИСЬ АЗОТА (или АЗОТИСТЫЙ ОКСИД) – Nitrous Oxide is a chemical compound made up of nitrogen and oxygen, N_2O. It is a liquid that turns into a gas when injected into an engine. / Закись Азота (N_2O) – веселящий газ, один из окислов азота (смотрите Азота Окислы); в медицине применяют в смеси с кислородом как средство для ингаляционного наркоза при хирургических операциях, родах, иногда при инфаркте миокарда. Назван Веселящим Газом Английским химиком и изобретателем Сэром Хамфри Дэйви (Sir Humphry Davy; 1778–1829), который, изучая на себе действие закиси азота (1799), обнаружил в начальной фазе возбуждение, сопровождающееся смехом и беспорядочными телодвижениями, в последующем – потерю сознания. Окислы Азота – соединения азота с кислородом. Известны N_2O, NO, N_2O_3, NO_2 (и его димер N_2O_4), N_2O_5; есть сведения о существовании NO_3, не выделенного в свободном состоянии. При высокой температуре в пламени вольтовой дуги, а в природе – при электроразряде из смеси азота с кислородом образуется окись азота NO, которая при охлаждении переходит в NO_2. Другие окислы азота получают косвенным путём. N_2O_5 – твёрдое вещество; остальные окислы при обычных условиях газообразны. Закись Азота N_2O – бесцветный газ со слабым приятным запахом и сладковатым вкусом; вдыхание смеси воздуха с N_2O вызывает состояние, напоминающее опьянение (отсюда название – Веселящий Газ). Плотность при 0 °C и 101 325 Н/м^2 (760 мм рт.ст.) 1.980 4 кг/м^3, $t_{кип}$ – 89.5 °C, $t_{пл}$ – 102.4 °C. 1 объём N_2O при 5 °C растворяет 1.048 объёма N_2O. Химически N_2O с водой, растворами кислот и щёлочей не реагирует, кислородом не окисляется. Выше 500 °C разлагается:- $2N_2O = 2N_2 + O_2$; поэтому при повышенных температурах действует как сильный окислитель и поддерживает горение. Получают N_2O термическим разложением нитрата аммония:- $NH_4NO_3 = N_2O + 2H_2O$. В медицине служит для общей анестезии. Окись Азота NO – бесцветный газ, буреющий при соприкосновении с воздухом вследствие окисления до NO_2. Плотность при 0 °C и 101 325 Н/м^2 (760 мм рт.ст.) 1.340 2 кг/м^3, $t_{кип}$ – 151.8 °C, $t_{пл}$ – 163.6 °C. В воде мало растворима (0.073 8 объёма в 1 объёме H_2O при 0 °C). С водой, кислотами и щёлочами химически не взаимодействует. Образует многочисленные продукты присоединения, например, нитрозилхлорид NOCl. Получают NO действием разбавленной азотной кислоты на некоторые металлы, например:- $3Cu + 8HNO_3 = 3Cu(NO_3)_2 + 4H_2O + 2NO$. Окись азота – важный полупродукт окисления аммиака при получении азотной кислоты. Азотистый ангидрид (трёхокись азота) N_2O_3 – в обычных условиях неустойчивое соединение. Разлагается уже при 0 °C:- $N_2O_3 \leftrightarrow NO + NO_2$; около 3.5 °C кипит с разложением, при 25 °C содержит только 10% недиссоциированного N_2O_3. При низкой температуре может быть получен в виде тёмно-голубой жидкости, при сильном охлаждении – светло-голубой массы с $t_{пл}$ – 102 °C. С водой образует азотистую кислоту:- $N_2O_3 + H_2O = 2HNO_2$, со щёлочами – соли (смотрите Нитриты). N_2O_3 получают по реакции:- $N_2O_4 + 2NO = 2N_2O_3$; практического применения не находит. Двуокись Азота NO_2 – бурый газ с удушливым запахом, при 21.15 °C – буро-красная жидкость, бледнеющая при дальнейшем охлаждении из-за образования четырёхокиси азота N_2O_4, $t_{отв}$ – 11.2 °C. Взаимодействует с водой с образованием азотной кислоты и окиси азота:- $3NO_2 + H_2O = 2HNO_3 + NO$; со щёлочами образует нитраты и нитриты. Двуокись азота – сильный окислитель; в токе NO_2 энергично сгорают уголь, сера, фосфор, органические соединения. В промышленности NO_2 получают окислением NO при производстве азотной кислоты, в лаборатории – термическим разложением некоторых нитратов:- $2Pb(NO_3)_2 = 2PbO + O_2 + 4NO_2$. Применяют NO_2 как нитрующий агент (смотрите Нитрование Органических Соединений). Азотный Ангидрид (пятиокись азота) N_2O_5 – бесцветные очень летучие кристаллы. Крайне неустойчив и взрывоопасен. Взаимодействует с водой, давая азотную кислоту:- $N_2O_5 + H_2O = 2HNO_3$, со щёлочами образует соли – нитраты. В лаборатории получают по реакции:- $2HNO_3 + P_2O_5 = N_2O_5 + 2HPO_3$. Практического применения не находит. Все окислы азота физиологически активны.

NK = NOTCHED KERNEL

NL = THE NETHERLANDS

NL = NO LOAD

NLB = NEEM LEAF BITTERS

NLG = DUTCH GUILDER

NLGI = NATIONAL LUBRICATING GREASE INSTITUTE

NLGI AUTOMOTIVE GREASE CLASSIFICATIONS = КЛАССИФИКАЦИИ АВТОТРАКТОРНЫХ ПЛАСТИЧНЫХ СМАЗОК ПО НИСПС – NLGI Automotive Grease Classifications:- automotive lubricating grease quality levels established jointly by the Society of Automotive Engineers (SAE), American Society for Testing and Materials (ASTM) and National Lubricating Grease Institute (NLGI). There are several categories in two classifications:- Chassis Lubricants and Wheel bearing Lubricants. Quality or performance levels within each category are defined by ASTM tests. / Американское Общество по Испытаниям и Материалам (АОИМ).

NLGI CONSISTENCY GRADES = СОРТА КОНСИСТЕНЦИИ ПО НИСПС – NLGI Consistency Grades:- simplified system established by the National Lubricating Grease Institute (NLGI) for rating the consistency of grease.

NLRA = NATIONAL LABOR RELATIONS ACT

NLRB = NATIONAL LABOR RELATIONS BOARD

NM = NOT MEANINGFUL

NM^3 = NORMAL CUBIC METER

NMAB = NATIONAL MARKET ADVISORY BOARD

NMB = NATIONAL MEDIATION BOARD

NMC = NONMORPHOGENIC CALLI

NME = NON–MARKET ECONOMY

NMR = NUCLEAR MAGNETIC RESONANCE

NMS = NATIONAL MARKET SYSTEM

NMS = NORMAL MARKET SIZE

NMU = NATIONAL MARITIME UNION

NNL = NETWORK AND NATIVE LOAD

NNP = NET NATIONAL PRODUCT

NO = NORWAY

NOA = NOTICE OF ALLOWANCE

NOAEL = NO OBSERVED ADVERSE EFFECT LEVEL

NOBLE = НОБЛ – In November 1983, the Noble Platinum Coin (one-ounce) from the Isle of Man was introduced as the first platinum investment coin. The Isle of Man is an ancient British protectorate, and well known for producing a variety of high-quality coins with innovative and unusual designs. From 1983 through 1989, The Pobjoy Mint of England produced the Platinum Noble in sizes ranging from 10 ounces to 1/10 ounce, with the face value shown in 'Nobles', a value equal the platinum content in troy ounces. Design:- the Noble is a beautiful platinum coin, which features a historic Viking longship, 'Thusly', shown under full sail, on its reverse, the young Queen Elizabeth II with crown, on its obverse. Nobles are not presently being minted. Coin/Diameter/Face/Purity:- (i) 0.10-Oz, 16.5 mm, 0.10 Noble, 0.9995; (ii) 0.20-Oz, 13.9 mm, 0.20 Noble, 0.9995; (iii) 0.25-Oz, 22.0 mm, 0.25 Noble, 0.9995; (iv) 0.50-Oz, 27.0 mm, 0.50 Noble, 0.9995; and (v) 1.00-Oz, 32.7 mm, 1.00 Noble, 0.9995. The face value shown above is in 'Nobles', a value equal the platinum content in troy ounces. Noble is the Isle of Man platinum coin with a fineness of 999.5. The first platinum investment coin, the one-ounce Noble from the Isle of Man, was introduced in November 1983. The Isle of Man is an ancient British protectorate, and well known for producing a variety of high-quality coins with innovative and unusual designs. From 1983 through 1989, The Pobjoy Mint of England produced The Platinum Noble in sizes ranging from 10 ounces to 1/10 ounce, with the face value shown in 'Nobles', a value equal the platinum content in troy ounces. The reverse of all coins features an historic Viking longship, 'Thusly', shown under full sail. The obverse features the young Queen Elizabeth II with crown. / Нобл – инвестиционная платиновая монета, которая находится в обращении на Острове Мэн. Чистота платины составляет 999.5. Впервые она была представлена на этом острове в качестве первой платиновой инвестиционной монеты в Ноябре 1983 и имела вес в одну унцию.

NOBLE COMB = ПРЕВОСХОДНЫЙ ГРЕБЕНЬ – Noble Comb:- used commercially in producing worsted yarn.

NOBO = NON–OBJECTING BENEFICIAL OWNER

NOB SPREAD = NOTE AGAINST BOND SPREAD

NOCC = NETWORK OPERATIONS CONTROL CENTER

NO CONTROL LIMIT = БЕЗ КОНТРОЛЬНОГО ЛИМИТА – No Control Limit (NCL) is allowed. / Разрешается Без Контрольного Лимита (БКЛ).

NOCP = NASDAQ® CLOSE = NASDAQ® OFFICIAL CLOSING PRICE

NOCTUIDS = НОЧНИЦЫ (или СОВКИ) – Noctuids:- any night-flying moth of the Family Noctuidae, the larvae of which are destructive Pests. / Под Ночницами или Совками понимается Семейство бабочек. Крылья в размахе до 30 сантиметров (см) (у самой крупной бабочки – Тизании), обычно 2.5–3.5 см; свыше 25 000 Видов; в бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось свыше 2 000 Видов. В основном ночные. Многие Совки – Вредители сельскохозяйственных, садовых культур и леса, 8 Видов, в том числе 4 Орденские Ленты, находились в Красной Книге бывшего СССР. Совки или Ночницы (Noctuidae), Семейство Бабочек. Размах крыльев от 1 до 30 см (у Тизании – самой крупной бабочки), но обычно 3–5 см. Усики щетинковидные, у некоторых Видов гребенчатые. Передние крылья удлинённые, треугольные, в большинстве случаев серые или бурые с характерным рисунком из 3 пятен (круглого, почковидного и клиновидного) и нескольких извилистых поперечных полос. Задние крылья шире, более округлые, серые, реже цветные (красные или жёлтые с чёрными перевязями и так далее). Гусеницы обычно с 5 парами брюшных ног (иногда с 4 или 3 парами), голые, в малозаметных щетинках (лишь у Подсемейства Apatelinae волосистые). Окукливаются они, как правило, в почвенных 'колыбельках', у некоторых Родов – в рыхлых коконах на растениях. Большинство Совок, как и их гусеницы, активны ночью. Около 20 000 Видов (по другим данным, до 30 000); распространены по всему земному шару. В бывшем СССР свыше 2 000 Видов. Среди Совок много Вредителей сельскохозяйственных, садовых культур и леса. Так, полевые и огородные культуры повреждают

подгрызающие Совки – Озимая Совка и Восклицательная Совка; Капусту и Свекловицу – Капустная Совка; технические, бахчевые и другие культуры – Хлопковая Совка и Совка Гамма; зерновые культуры – Яровая и Зерновая Совки; хвойные леса – Сосновая Совка. Меры борьбы:- повышение уровня агротехники (например, глубокая зяблевая вспашка), использование Энтомофагов (например, Трихограммы), при массовом появлении вредителей опыление или опрыскивание посевов инсектицидами, предпосевная обработка семян.

NOCTURNAL = НОКТЮРНОВЫЙ (или НОЧНОЙ) – Nocturnal:- belonging to the night, as of flowers that open at night. Nocturnal is a term applied to organisms that move or are active at night. / цветок, открывающийся ночью. Под Ноктюрновым, от Французского слова Nocturne, означающее буквально Ночной, понимается.

NO CURE – NO PAY = НЕТ ЗАБОТЫ – НЕТ ОПЛАТЫ (или НЕТ СПАСАНИЯ – НЕТ ВОЗНАГРАЖДЕНИЯ) – No Cure – No Pay is the principle of pure salvage whereby the salvor who fails in his task receives no reward for his effort. / Принцип добросовестного спасания, предполагающий тот факт, что если спасатель нарушает выполнение поставленной перед ним задачи, то он и не получит никакого вознаграждения за свои усилия.

NODAL ROOTS = УЗЛОВЫЕ КОРНИ – Nodal Roots are roots developing from the upper nodes when deepwater Rice varieties are flooded. / Под Корнем понимается один из основных органов растений, служащий для укрепления в почве, поглощения воды, минеральных веществ, синтеза органических соединений, а также для выделения некоторых продуктов обмена. Корень может быть местом хранения запасных веществ (например, у Моркови, Свёклы), органом вегетативного размножения (у Осины, Сирени и других). Многие корни съедобны. Корни, содержащие крахмал, масла, красящие и другие ценные вещества, применяются в промышленности и медицине.

NODAL SEPTUM = УЗЛОВАЯ ПЕРЕГОРОДКА (или НОДАЛЬНАЯ СЕПТА) – Nodal Septum is the solid partition in the node separating two adjoining internodes.

NODAL TILLERS = УЗЛОВЫЕ ПОБЕГИ – Nodal Tillers are the tillers arising from the upper nodes in elongated deepwater Rice stems while the field is flooded. / Под Побегом понимается стебель с расположенными на нём листьями и почками; один из основных органов высших растений. У однолетних растений побеги живут один сезон; у многолетних – несколько лет. Многолетние подземные побеги нередко видоизменены в корневища, клубни, луковицы, надземные – в усики, колючки.

NODE = УЗЕЛ – (1) Node is the solid portion of the culm, panicle axis, and panicle branches. From the axils of nodes on the culm may arise a leaf, a tiller, or adventitious roots; from nodes on the panicle, the branches or spikelets. A joint of a stem from which leaves and branches arise. Node is a leaf-bearing joint of a stem, an important character for plants mapping in Cotton where nodes refer to the leaves or abscised leaf scars on the main stem. See also Internode, and Nodes Above White Flower (NAWF). Node is the place on a stem where leaves or branches originate. Node is:- (1) the joint of a stem from which leaves or branches arise. (2) The solid portion of the culm, panicle axis, and panicle branches. Leaves, tillers, and adventitious roots arise from nodes on the culm. Node is a point, usually along the main stem, at which lateral vegetative and fruiting branches arise. Node is a 'joint' of the stem or branch at which branches, leaves or reproductive structures develop. See also Main-Stem Node. / Важная особенность для картирования Растения Хлопчатника, где узлы относятся к листьям или рубцам от опавших листьев на основном стебле. Смотрите также Междоузлие (Internode) и Узлы Над Месторасположением Белого Цветка (NAWF). и придаточные корни, вырастающие из узлов на . В ботанике под Узлом понимается место на стебле растения (иногда утолщённое), откуда отходит лист. В пазухе листа (над узлом) возникает почка, из которой может развиться боковая ветвь.

(2) Node is a specific connection point in a network.

NODE BLAST = ЗАПАЛ УЗЛА – Node Blast is a form of blast disease where the node becomes infected. The node rots with dark discoloration and breaks apart, remaining connected only by the nodal septum.

NODE OF FIRST FRUITING BRANCH = УЗЕЛ ПЕРВОЙ ПЛОДОНОСЯЩЕЙ ВЕТВИ – Node Of First Fruiting Branch:- xxxxx. See also First Fruiting Node.

NODES ABOVE CRACKED BOLL = УЗЛЫ ВЫШЕ ТРЕСНУВШЕЙ КОРОБОЧКИ – Nodes Above Cracked Boll is a term applied to the number of mainstem nodes from the highest first position cracked boll to the plant terminal (often used as a method of assisting with measurements of Cotton readiness for defoliation).

NODES ABOVE FIRST SQUARE = УЗЛЫ ВЫШЕ ПЕРВОГО БУТОНА (или УЗЛЫ ВЫШЕ ПЕРВОГО ПОДЦВЕТНИКА) – Nodes Above First Square (NAFS) is a measure of the number of main-stem nodes above the first fruiting node or first square. See also First Fruiting Node, and Squaring Node.

NODES ABOVE WHITE FLOWER = УЗЛЫ ВЫШЕ БЕЛОГО ЦВЕТКА – Nodes Above White Flower (NAWF) is a measure of the number of main-stem nodes above the uppermost white flower in the first fruiting position. More precisely, NAWF is a measure of the number of squaring nodes after first flower. Used as an indication of the maturity of the boll load by reference to the amount of 'vegetative' growth (above the uppermost white flower) relative to the reproductive growth below. The upper highest node on the main-stem, for practical counting purposes, is considered to be the node at which the most recent mainstem leaf has unfolded (other states have used a leaf size of 1 inch). See also Squaring Nodes, and White Flower. Term applied to the number of mainstem nodes from the last developed first-position white bloom to the plant terminal; used as a measure of plant growth, e.g., to assist in growth regulator assessments or as an index of degree of cutout. All plants will not have a first-position white bloom. Nodes Above White Flower (NAWF), this is a measurement documenting the number of nodes separating the uppermost first position bloom and the terminal of the plant. When the Cotton Plant first begins to bloom there will be approximately 9 to 10 NAWF. As the season progresses, the number of NAWF decreases. This reduction in NAWF can be related to the source to sink relationship of carbohydrate supply. NAWF generally decreases more quickly after bloom in early-maturing varieties than in mid or full season varieties. As the flowers develop into bolls, they become stronger sinks for carbohydrates and their combined demand for carbohydrates increases. Eventually the carbohydrate supply produced by the leaves will be used primarily by developing bolls, leaving less and less available for the production of new vegetative growth. As flowering progresses up the plant, less top growth is produced, allowing the NAWF to decrease. As the flowering approaches the top of the plant, the plant eventually puts all of its energy into boll development and ceases flower development. This event is termed cutout. Cutout generally occurs at 4 or 5 NAWF. Cutout occurs when carbohydrate supply equals demand and vegetative growth ceases. At cutout, no more harvestable fruit is set. / Данный термин применяется к ряду узлов на главном стебле от последнего развившегося белого цветения первого расположения к верхушке растения; используется как мера роста растения, например, . Не все растения будут иметь белое цветение первого расположения. число узлов, отделяющих самое верхнее первое месторасположение цветка и верхушку растения. показатель степени прореживания (ветвей в кроне) . По мере того, как цветки перерастают в коробочки, они становятся прочными вместилищами (стоками) для углеводов и их . возникает когда снабжение углеводами становится равным потребности и .

NODULES = КЛУБЕНЬКИ – Nodules:- swelling caused by bacteria Rhizobium Spp. which live on the roots or stems of Leguminous Plants. / Клубеньки:- набухания, вызванные воздействием Бактерий Видов Клубеньковые (или Ризобиум (Rhizobium)), которые живут на корнях или стеблях Бобовых Растений (Leguminous Plants).

NOE = NOT OTHERWISE ENUMERATED

NoET = NUMBER OF EFFECTIVE TILLERS/HILL

NoFG = NUMBER OF FILLED GRAINS/PANICLE

NOIL = ОЧЁС – Noils are the short fibers that are removed from the fiber in the combing or top-making process. Wool noil is satisfactory for the manufacture of felts and woolens. Silk noil is sportier in appearance and created by short fibers, often from the innermost part of the cocoon. Shorter fibers separated from longer fibers in combing. The short fibers taken from any machine operation in the processing of textile fibers. They are obtained mostly in carding and combing operations. The stock may be high in quality but very short in length, too short to admit its being manipulated into yarn by itself. Noil is worked in with longer staple fibers to make yarn. Some noil may be medium or inferior quality. Also known as Comber, Comber Frame Noil, or Comber Noil. See also Recomber's Noil. Noil is a short fiber that is rejected in the combing process of yarn manufacture. Silk Noil (sometimes incorrectly called Raw Silk) comes from the use of very short fibers (called, appropriately, 'Silk Noils') to weave the fabric. The short fibers are separated from the long fibers during combing in the fiber preparatory processes before spinning. Noil has a nubby feel with a low sheen. It resembles cotton in surface texture and sews easily. When these short fibers are spun into yarns, the resulting yarns have occasional slubs and specks that add to its appeal. Nubs vary between different weaves. Sportier in appearance, noil has the look of hopsack but is much softer. Higher quality noil yarns are easy to use. It is a good practice to tug on a noil yarn to be sure of its practicality as a warp. The majority of plied noils can be used for warp but most single-ply noil yarns are too easily broken to withstand warping, though work well as weft. Noil has the strongest silk odor due to impurities in the yarn. The majority of the smell dissipates after washing, but can return again when wet. Noil is a short fiber removed during the combing of a textile fiber and often separately spun into yarn. / Масса неравномерного по длине (28–29 мм – кардный и 29–32 мм – гребенной) волокна с наличием незначительного количества пороков и сорных примесей органического происхождения от переработки хлопкового волокна. Образуются на гребнечёсальных машинах и на шляпочных полотнах чёсальных машин, чёсальных агрегатов и чёсальных аппаратов. Известен также как Гребенной Очёс (Comber или Comber Noil) и Очёс С Гребнечёсальной Машины (Comber Frame Noil). Смотрите также Очёс С Повторных Гребней (Recomber's Noil). Под Очёсом понимаются короткие волокна льна, хлопка, шерсти, химического волокна и другого, полученные при чесании волокнистых материалов. Очёс сильно засорён примесями. Почти все виды очёсов перерабатываются в пряжу, как правило, в смеси с доброкачественным волокном. Под Очёсом понимаются отходы волокнистого материала, получаемые при чесании. В зависимости от способа чесания различают гребенной очёс и кардный очёс.

NOISE = ШУМ – Noise is a normal everyday market movement, up and down without really going anywhere. The ebb and flow of everyday market movement.

NOK = NORWEGIAN KRONE

NOMENCLATURE = НОМЕНКЛАТУРА – Nomenclature is the study of the systematic naming of taxa, using Latin names so that they will be intelligible and uniform in all countries. / Под Номенклатурой, от Латинского слова Nomenclatura, означающее Перечень или Роспись Имён, понимается:- (i) перечень названий, терминов, категорий, употребляемых в какой-либо отрасли науки, техники и прочем, например, в экономике – классифицированный перечень производимой продукции; и (ii) система абстрактных и условных символов, назначение которых дать максимально удобное с практической точки зрения средство для обозначения предметов.

NOMENCLATURE OF THE CUSTOMS COOPERATION COUNCIL = НОМЕНКЛАТУРА СОВЕТА ПО ТАМОЖЕННОМУ СОТРУДНИЧЕСТВУ – The Customs Cooperation Council Nomenclature (CCCN) is a system for classifying goods for customs purposes, formerly known as the Brussels Tariff Nomenclature (BTN). Now it has been superseded by the Harmonized System Nomenclature to which most of the major trading countries, including the United States, adhere. The customs tariff used by many countries worldwide, including most European nations, but not the United States. It was formerly known as the Brussels Tariff Nomenclature (BTN). / Таможенный тариф, используемый большинством стран мира. Раньше она была известна как Брюссельская Номенклатура Тарифов (Brussels Tariff Nomenclature).

NOMEN CONSERVANDUM = НОМЭН КОНСЭРВАНДУМ (или КОНСЕРВИРУЕМОЕ НАЗВАНИЕ, или ОХРАНЯЕМОЕ НАЗВАНИЕ, или СОХРАНЯЕМОЕ НАЗВАНИЕ) – A Conserved Name or Nomen Conservandum (plural Nomina Conservanda, abbreviation Nom. Cons.) is a scientific name that has specific nomenclatural protection. Nomen Conservandum is a Latin term, meaning a 'name which should be conserved'. The terms are often used interchangeably, such as by the International Code of Botanical Nomenclature, while the International Code of Zoological Nomenclature favors 'conserved name'. The process for conserving botanical names is different from that for zoological names. A Nomen Conservandum, although the term is not explicitly defined within the International Code of Botanical Nomenclature (ICBN), is '... any name of a genus, family, or taxon of intermediate rank that must be adopted in accordance with special legislation (Arts. 14, 15) as a correct name although otherwise contrary to the rules'. The principle of conservation has since been extended to specific names as well. Nomen Conservandum or conserved name is the name of a taxon, usually one in which the name is in common usage, which is internationally agreed to be exempt from the usual rules of priority of publication. / На Латинском языке – Сохранённое Наименование . сохранение (conservation). Латинское слово Номэн (Nomen), означающее Имя или Название.

NOMEN NUDUM = НОМЭН НУДУМ (или ЛИШЁННОЕ НАЗВАНИЕ, или ГОЛОЕ НАЗВАНИЕ, или НЕЗАЩИЩЁННОЕ НАЗВАНИЕ, или ПРОСТОЕ НАЗВАНИЕ) – The phrase Nomen Nudum (plural Nomina Nuda) is a Latin term, meaning Naked Name, used in taxonomy and in zoological and botanical nomenclature. It may or may not be written in italics, depending on style. The term is used to indicate a designation which looks exactly like a scientific name of an organism, and may well have originally been intended to be a scientific name, but fails to be one because it has not (or has not yet) been published with an adequate description (or a reference to such a description), and thus is a 'bare' or 'naked' name, one which cannot be accepted as it currently stands. Because a Nomen Nudum fails to qualify as a formal scientific name, a later author can publish a real scientific name that is identical in spelling. If one and the same author puts a name in print, first as a Nomen Nudum and later on publishes it for real, accompanied by a description that does meet the formal requirements, then the date of publication of the latter, formally correct publication becomes the name's date of establishment. Nomen Nudum or Naked Name is a name published without an accompanying description. / На Латинском языке – . Выражение Номэн Нудум (Nomen Nudum или Nom. Nud. или N. N.) после семейства употребляют для обозначения ещё или уже недействительного названия.

NOMEX® = НОМЭКС® (или НОМЕКС®) – Nomex® (styled NOMEX®) is a registered trademark for flame-resistant meta-aramid material developed in the early 1960s by DuPont™ and first marketed in 1967. Nomex® and related aramid polymers are related to nylon, but have aromatic backbones, and hence are more rigid and more durable. Nomex is the premier example of a meta variant of the aramids (Kevlar® is a para aramid). Unlike Kevlar®, Nomex® cannot align during filament formation and has poorer strength. However, it has excellent thermal, chemical, and radiation resistance for a polymer material. The polymer is produced by condensation reaction from the monomers m-phenylenediamine and isophthaloyl chloride. It is sold in both fiber and sheet forms and is used as a fabric wherever resistance from heat and flame is required. Nomex® sheet is actually a calendered paper and made in a similar fashion. Nomex® Type 410 paper is the original and one of the larger grade types made, mostly for electrical insulation purposes. Nomex® fiber is made in the USA and in Spain (Asturias). Wilfred Sweeny (1926–2011), the DuPont scientist responsible for discoveries leading to Nomex®, earned a DuPont™ Lavoisier Medal partly for this work in 2002. The paper is used in electrical laminates such as circuit boards and transformer cores as well as fireproof honeycomb structures where it is saturated with a phenolic resin. Honeycomb structures such as these, as well as mylar-Nomex® laminates are used extensively in aircraft construction. Both the firefighting and vehicle racing industries use Nomex® to create clothing and equipment that can withstand intense heat. A Nomex® hood is a common piece of racing and firefighting equipment. It is placed on the head on top of a firefighter's face mask. The hood protects the portions of the head not covered by the helmet and face mask from the intense heat of the fire. Race car drivers wear driving suits constructed of Nomex® and or other fire retardant materials, along with Nomex® gloves, long underwear, balaclavas, socks, helmet lining and shoes to protect them in the event of a fire. The Fédération Internationale de l'Automobile (FIA) and the SFI Foundation Inc. provide specifications for flame-resistant drivers clothing to be used in racing. The standards range from single layer suits that provide some protection against flash fires to much thicker multilayer SFI-15 suits required by the National Hot Rod Association that can protect a driver for up to 30 seconds against the intense heat and almost invisible flames generated by the nitromethane, ethanol and methanol fuels that are used in championship drag racing (straight line acceleration contests). Military pilots and aircrew wear flight suits made of over 92 percent Nomex® to protect them from the possibility of cockpit fires and other mishaps. Recently, troops riding in ground vehicles have also begun wearing Nomex®. The remaining material is typically Kevlar® thread used to hold the fabric together at the seams. Military tank drivers also typically use Nomex hoods as protection against fire and extreme cold. In the US space program, Nomex® has been used for the Thermal Micrometeoroid Garment on the Extravehicular Mobility Unit (in conjunction with Kevlar® and Gore-Tex) and The Advanced Crew Escape Suit (ACES) or 'pumpkin suit' or pressure suit, both for fire and extreme environment (water immersion to near vacuum) protection, and as thermal blankets on the payload bay doors, fuselage, and upper wing surfaces of the Space Shuttle Orbiter. It has also been used for the airbags for the Mars Pathfinder and Mars Exploration Rover missions, the Galileo atmospheric probe, the Cassini-Huygens Titan probe, as an external covering on the Autonomous Extravehicular Activity Robotic Camera Sprint (AERCam Sprint is a NASA experiment to demonstrate the use of a prototype free-flying television camera that could be used for remote inspections of the exterior of the International Space Station), and is planned to be incorporated into NASA's upcoming Crew Exploration Vehicle. Nomex® has also been used for its acoustic qualities, the first time being used in Troy, NY, at Rensselaer Polytechnic Institute's Experimental Media and Performing Arts Center (EMPAC's) main concert hall. A ceiling canopy of Nomex® reflects high and mid frequency sound, providing reverberation, while letting lower frequency sound partially pass through the canopy. According to the Rensselaer Polytechnic Institute's (RPI, Troy, State of New York (NY)) President Shirley Ann Jackson, EMPAC is the first venue in the world to use Nomex® for acoustic reasons. Nomex (like Kevlar®) is also used in the production of loudspeaker drivers. Honeycomb-structured Nomex® paper is also used as a spacer between layers of lead in the Toroidal Large Hadron Collider (LHC) Apparatus (ATLAS) Liquid Argon Calorimeter. Nomex® is a trade name for a heat resistant fiber used in the manufacture of firefighter's protective clothing. Also known as Aramid; the generic name. Flame Resistant Nomex® Brand Fiber – Trusted Thermal Protection:- mass transit systems, wind energy, transformers, filtration – not all industries that rely on the inherent protection of Nomex® are life-saving ones. But they're still essential to our way of life. It started with a flight suit. And 40 years later, DuPont™ Nomex® fiber is still a first choice for workers who rely on its inherently flame resistant properties to help keep them safe from the everyday hazards they face. We go beyond basic test methods to help ensure that workers stay protected. Our Thermo-Man® testing lab puts garments made of Nomex® fiber through a rigorous series of fire scenarios that simulate real-life situations – making it one of the most advanced thermal burn injury evaluation devices in the world. Our dedication to safety has made Nomex® the go-to fabric for manufacturers who make products for protecting firefighters, Air Force pilots, and industrial workers. And we're not stopping there. We're constantly working with mills and garment manufacturers to help them make products made from flame resistant Nomex® brand fiber stronger, more durable and safer. We've expanded its uses and applications to include transformers, motors, and generators. Our commitment to innovation is the same as it's been for the past four decades. Our mission is to: help people and materials perform better – even in extreme conditions. Xxxxx. Nomex® fiber is an aromatic polyamide (aramid) fiber and can be used in Military and Industrial Applications. Nomex® excels in performance areas such as flame resistance and thermal protection. Its thermal technology resists the hazards associated with electric arcs and flash fires – including intense heat and flame. Nomex® is engineered to stand up to flame temperatures in excess of 2 000 °F. Unlike flame-retardant treated materials, Nomex® fibers are inherently flame resistant and will not diminish during the life of the fiber. The fibers low stiffness and high elongation give it textile-like characteristics. In addition to its flame resistance, Nomex® fiber offers dimensional stability and resistance to degradation by a wide range of chemicals and industrial solvents. It shows no embrittlement or degradation at cryogenic conditions (temperatures as low as –320 °F. Nomex® Fiber Properties:- (i) excellent flame resistance and thermal protection; (ii) stands up to flame temperatures in excess of 2 000 °F; (iii) fibers do not melt or drip; (iv) outstanding resistance to degradation by radiation; (v) outstanding resistance to degradation at cryogenic conditions; (vi) resistant to chemicals and industrial solvents; (vii) resistant to insects and fungi; (viii) low stiffness of fiber due to chemical bonding arrangement; (ix) high elongation; (x) cut resistant; and (xi) abrasion resistant. Nomex® Fiber Applications:- Industrial Rope and Cordage; Military Rope and Cordage; Safety Rope; Firefighter Rope; and Extreme environment Rope and Cord. / Найлан^{T3} (Nylon™). The Advanced Crew Escape Suit (ACES) or 'Pumpkin Suit' = СКАФАНДР. Фенольное (Phenolic). Кэвла® или Кевлар® (Kevlar®). Го-Тэкс (Gore-Tex). ДюПо^{T3} (DuPont™). Номэкс® – торговое название жаропрочного волокна, используемого при изготовлении защитного обмундирования пожарных. Известно также как Арамид (Aramid), обобщённое название.

NOMINAL AMOUNT = НОМИНАЛЬНАЯ СУММА – Nominal Amount (N) is the amount in name only that you hold of the stock/security and which has to be converted into the actual cash you will receive back at the redemption date of the security.

NOMINAL BREAKING LOAD = НОМИНАЛЬНАЯ РАЗРЫВНАЯ НАГРУЗКА – Nominal Breaking Load is a breaking load (BL):- specifies the load at which a material will fail. / Под Номинальной Разрывной Нагрузкой понимается разрывная нагрузка (РН), которая специфицирует нагрузку, при которой материал будет разорван.

NOMINAL CHANGE = ИЗМЕНЕНИЕ ПО ОТНОШЕНИЮ К НОМИНАЛУ – Nominal Change is a change in a security's par value to its current price in the market. / Изменение номинальной цены ценной бумаги по отношению к её текущей цене на рынке.

NOMINAL FILTRATION RATING = НОМИНАЛЬНЫЙ РЭЙТИНЬГ ФИЛЬТРАЦИИ – Nominal Filtration Rating:- an arbitrary micrometer value indicated by a filter manufacturer. Due to lack of reproducibility this rating is deprecated. See also Absolute Filtration Rating, and Filtration. A Nominal Filtration Rating is attached to filters that can be shown under controlled conditions to remove an acceptable statistical amount of particles of a certain size, even though the actual pores or openings of the filter may be much larger than the particles being removed. The typical way that a nominal filter rating is reported would be in the form of a statement such as:- 'Removes >99.9% of particles 3 µm (micron) or larger'. This means that under field conditions, a user can be confident that the filter will remove greater than 99.9% of pathogenic organisms larger than 3 µm. This information is obtained by challenging filters with test waters containing suspensions of 3 µm spheres. A similar cryptosporidium or giardia claim would require a challenge using live cryptosporidium or giardia organisms. Nominal ratings are usually applied to depth filters.

NOMINAL INTEREST RATES = НОМИНАЛЬНЫЕ ПРОЦЕНТНЫЕ СТАВКИ – Nominal Interest Rate is contractually agreed interest rate based on the nominal value of a debt instrument. Nominal Interest Rates are the current stated rates of interest paid or earned. Current stated rates of interest paid or earned. Compare Real Interest Rates.

NOMINAL LENGTH = НОМИНАЛЬНАЯ ДЛИНА – Nominal Length is the length quoted on commercial documents. See also Fiber Length.

NOMINAL LINEAR DENSITY = НОМИНАЛЬНАЯ ЛИНЕЙНАЯ ПЛОТНОСТЬ – Nominal Linear Density is the linear density mentioned on the documents of sale (contracts, invoices, etc).

NOMINAL LOAD = НОМИНАЛЬНАЯ НАГРУЗКА – Nominal Load R:- lowest load value, for the purposes of comparison, for the specified support conditions, independent of the type of load (excluding concentrated loads) [ISO/TS 8611-2:2005, definition 3.4]. Note:- intended use is described in 7.1 of ISO/TS 8611-2:2005 [1]. The three main types of general use are as follows:- (1) handling of goods without stacking or without racking; (2) handling of goods with stacking but without racking; and (3) handling of goods with racking and stacking. / Номинальная Нагрузка R:- наименьшее значение безопасной нагрузки для установленных условий расположения (крепления), независимо от типа нагрузки (за исключением сосредоточенных нагрузок) (стандарт ISO/TS 8611-2:2005 [1], 3.4). Примечание:- утановленные условия расположения (крепления) касаются диапазонов условий применения по (стандарт ISO/TS 8611-2:2005 [1], 7.1). Существуют три основных способа применения поддонов:- (1) транспортирование нагруженных поддонов с укладкой на стеллажи или штабелированием; (2) транспортирование нагруженных поддонов с укладкой на стеллажи и без штабелирования; и (3) транспортирование нагруженных поддонов без укладки на стеллажи и без штабелирования.

NOMINAL PRICE = НОМИНАЛЬНАЯ ЦЕНА – Nominal Price is the computed price quotation on futures for a period in which no actual trading took place, usually an average of bid and asked prices. Also known as Nominal Quotation. Price quotation on futures for a period in which no actual trading took place. Nominal Price is the declared price for a futures month sometimes used in place of a closing price when no recent trading has taken place in that particular delivery month; usually an average of the bid and asked prices. Nominal Price is the estimated futures price quotation for a period when no actual trading took place. / Ценовая котировка на фьючерсы для периода времени, когда фактические сделки не заключались.

NOMINAL QUOTATION = НОМИНАЛЬНАЯ РАСЦЕНКА (или НОМИНАЛЬНАЯ КОТИРОВКА) – Nominal Quotation is the computed price quotation on futures for a period in which no actual trading took place, usually an average of bid and asked prices. Also known as Nominal Price. See also Quotations. / Расчитанная компьютером котировка цены фьючерса для моментов, когда не было заключено конкретных сделок. Как правило, такая котировка просчитывается в качестве среднеарифметического значения цен спроса и предложения. Известна также как Номинальная Цена (Nominal Price). Смотрите также Расценки (или Прейскуранты (Quotations)).

NOMINAL SIZE LUMBER = ПИЛОМАТЕРИАЛ НОМИНАЛЬНОГО РАЗМЕРА – Nominal Size Lumber:- the size of lumber after sawing and prior to surface finishing by planing. / Пиломатериал Номинального Размера:- размер пиломатериала после распиловки, но до окончательной обработки поверхности строганием.

NOMINAL VALUE = НОМИНАЛЬНАЯ СТОИМОСТЬ – In fixed-income securities, the Nominal (or Face) Value is the sum to be repaid that bears interest. In shares, it is the proportional amount (par value) of the nominal capital indicated on the share certificate. According to German stock corporation law, the lowest par value is one Euro. The face value of a share or debenture. The nominal value may be more or less than the market value. Also known as Par Value.

NOMINATED BANK = ИСПОЛНЯЮЩИЙ БАНК (или НОМИНИРОВАННЫЙ БАНК) – Nominated Bank is the bank authorized by the issuing bank to honour or negotiate or, in the case of a freely available credit, any bank. Unless the credit stipulates that it is available only with the issuing bank, all credits must nominate the bank (the Nominated Bank) which is authorized to pay, to incur a deferred payment undertaking, to accept draft(s) or to negotiate. In a freely negotiable credit, any bank is a Nominated Bank. A Nominated Bank is a bank that was nominated by an issuing bank to perform certain tasks on its behalf and hence cannot be also a nominated bank by itself. / Исполняющий Банк – банк, назначаемый банком эмитентом в соответствии с инструкциями приказодателя, осуществлять исполнение аккредитива. Исполняющим банком может выступать как банк эмитент, так и любой авизующий банк. В случаях присутствия в сделке подтверждающего банка, исполнение аккредитива, как правило, отдается ему.

NOMINATION = НОМИНАЦИЯ – Nomination is the notification to put into effect a contract or part of a contract, e.g., a gas flow nomination from a shipper to advise the pipeline owner of the amount of gas it wishes to transport or hold in storage on a given day. / Под Номинацией, от Латинского слова Nominatio, означающее Наименование, понимается нотификация .

NOMINEE = НОМИНАЛЬНОЕ ЛИЦО (или ПОДСТАВНОЕ ЛИЦО) – Nominee is the legal entity established by a custodian solely for the purpose of registering securities. A custodian will register customer securities in its nominee name for ease of handling subsequent transfers or denomination changes, interest and dividend collections and other corporate actions. The customer remains the beneficial owner. Company formed in some countries by banks in order to facilitate the negotiating of registered shares by having the certificates made out in the name of said company. Securities registered in the name of a nominee can be used to create easily marketable certificates through blank endorsement. A Nominee is an individual or entity, which acts on behalf of a beneficial owner. Most often the nominee pretends to be the owner of an entity, asset, or transaction to provide a veil of secrecy as to the beneficial owner's involvement. Many offshore entities provide nominee services whereby they will provide a nominee to act as owner of your arrangement but generally will not act unless instructed to by the beneficial owner. Nominee is a person or entity named by another to act on his behalf. Securities are commonly held in nominee name (often the custodian's name) to facilitate their registration and changes in their legal ownership. A nominee does not have any rights of ownership.

NOMINEE AND CUSTODY SERVICE = УСЛУГА НОМИНАЛЬНОГО ЛИЦА И ДОВЕРИТЕЛЬНОГО УПРАВЛЕНИЯ – Typically NCS are arrangements for the holding of securities and associated maintenance such as the banking of dividends and the receipt of communications. They will usually provide some form of consolidated reporting. NCS will not have a menu of investments opportunities associated with them. A Nominee and Custody Service (NCS) is exempt from the managed investment and fundraising provisions of the Corporations Law. An issuer of securities through an NCS may do so using an ordinary prospectus. A Nominee and Custody Service (NCS) is an arrangement which does not have the characteristics of a managed investment scheme for which regulation is intended, with the following features:- (i) assets in which a client has an economic interest (or expects to derive a benefit) may be acquired or held by a custodian (which may or may not be the operator); (ii) the client has the sole discretion to decide what (but not necessarily when) assets are acquired or disposed of except where:- (a) there are any prior written directions to acquire or dispose of a particular asset in particular circumstances that the client has agreed not to vary (other than on the exercise of any discretion on the part of an operator), and (b) the client may authorise the operator or another person to give directions on their behalf, for the purpose of the other person receiving or securing payment of moneys owing by the client to the person; and (iii) the client does not expect to derive benefits from participation in the NCS consisting of:- (a) cost reductions by using assets contributed by a client or derived directly or indirectly from assets contributed by the client with assets contributed by other clients or derived directly or indirectly from assets contributed by other clients, or (b) access to investments that the client could not otherwise access directly. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

NOMINEE DIRECTOR = НОМИНАЛЬНЫЙ ДИРЕКТОР (или ПОДСТАВНОЙ ДИРЕКТОР) – Nominee Director:- every international business corporation (IBC; offshore company) must have a Board of Directors. The Board may consist of one person or many people. For instance, the beneficial owner of the IBC may appoint himself/herself as the director and sole officer of the corporation. However, most IBCs are formed with a nominee director. The nominee may be, but does not have to be, an individual who works and/or resides in the country where the IBC was formed. The nominee may be used to sign (contracts, loans, etc) for the IBC should the beneficial owner not want his/her signature to be connected with the corporation. Typically, the nominee director will have no knowledge of the IBC's affairs or accounts, cannot control or influence the IBC, and will not act unless instructed to by the beneficial owner.

NON–ACCESSORY GUARANTEE = ГАРАНТИЯ НЕСОУЧАСТНИКА (или ГАРАНТИЯ СТОРОННЕГО НАБЛЮДАТЕЛЯ) – With an Non-Accessory Guarantee the main principle is 'pay first – argue later'. From the beneficiary's point of view, this type of guarantee is often a better form of security. The beneficiary has the best security if the demand guarantee is strictly unconditional (a simple demand) and contains no additional requirements such as documentation that must be presented to support the claim. See also Accessory Guarantee. / Смотрите также Гарантия Соучастника (Accessory Guarantee).

NON–ADMINISTERED ESTATE = НЕАДМИНИСТРИРУЕМОЕ СОСТОЯНИЕ (или НЕАДМИНИСТРИРУЕМОЕ ИМУЩЕСТВО) – In the United States, Non-Administered Estate is an estate of a decedent the settlement of which is not supervised by the court and for which a legal representative has not been appointed by the court.

NON–ADMITTED REINSURANCE = НЕПРИЗНАВАЕМОЕ ПЕРЕСТРАХОВАНИЕ – Non-Admitted Reinsurance:- a company is 'non-admitted' when it has not been licensed and thereby recognized by appropriate insurance governmental authority of a state or country. Reinsurance is 'non-admitted' when placed in a non-admitted company and therefore may not be treated as an asset against reinsured losses or unearned premium reserves for insurance company accounting and statement purposes.

NONALLELIC INTERACTION = НЕАЛЛЕЛЬНОЕ ВЗАИМОДЕЙСТВИЕ – Nonallelic Interaction is an interaction between different genes.

NON–ASSESSMENT CERTIFICATE = НЕИСЧИСЛЯЕМОЕ (или НЕНАЧИСЛЯЕМОЕ, или НЕОБЛАГАЕМОЕ) СВИДЕТЕЛЬСТВО (или СЕРТИФИКАТ) – A Non-Assessment Certificate is issued by the local tax authority that an assessment of income tax will probably not be applicable for the taxpayer with unlimited tax liability (due to income below a certain level). As a result, the taxpayer is not assessed for income tax, which is why he is entitled to the total sum from the ownership in securities, such as dividends, interest payments, etc. The certificate is issued subject to revocation. Its period of applicability is limited to no more than three years and ends at the close of a calendar year.

NON–ASSET–BASED THIRD PARTY PROVIDERS = ТРЁХСТОРОННИЕ ПОСТАВЩИКИ УСЛУГ НА БЕЗАКТИВНОЙ ОСНОВЕ – Non-Asset-Based Third Party Providers are the third party providers who generally do not own assets, such as transportation and/or warehouse equipment.

NON–ASSIGNABLE = НЕПЕРЕУСТУПАЕМОЕ (или НЕОТЧУЖДАЕМОЕ) – Non-Assignable:- the licensing agreement and/or the rights, obligations and terms thereof may not be assigned to any party who is not a signatory to the agreement. For example, a library licensee may not assign the right to access licensed materials to another library. See also Non-Transferable.

NON–ASSOCIATED GAS = ГАЗ В ЧИСТОМ ВИДЕ (или СВОБОДНЫЙ ГАЗ, или ПРИРОДНЫЙ СВОБОДНЫЙ ГАЗ) – A reservoir where only natural gas is found. Non-Associated Gas is the natural gas in a reservoir which contains no crude oil. / Природный газ в резервуаре, который не содержит сырую нефть.

NON–BOARD GRAIN = ЗЕРНОВЫЕ, НЕПОДКОНТРОЛЬНЫЕ ПАЛАТЕ – In Canada, Non-Board Grain is grain marketed through the open market system. Such grain includes domestic feed Wheat and Barley, Rye, oilseeds and specialty crops.

NON–BUSINESS DAYS = НЕРАБОЧИЕ ДНИ – Non-Business Days are Sundays and bank holidays, when banks are closed for business. They are not included in days of grace, and bills of exchange that fall due on a non-business day are postponed until the next day.

NON–CANCELABLE POLICY = НЕОТМЕНЯЕМЫЙ ПОЛИС (или НЕАННУЛИРУЕМЫЙ ПОЛИС) – Non-Cancelable Policy is a policy which the insured has the right to continue in force by the timely payment of premiums set forth in the policy, during which period the insurer has no right to make unilaterally any change in any provision of the policy while the policy is in force. See also Guaranteed Renewable Policy.

NON–CASH GAINS/INCOME = БЕЗНАЛИЧНЫЙ ПРИРОСТ (или ПРИБАВЛЕНИЕ, или ПРИРАЩЕНИЕ, или ПРИБЫЛЬ)/ДОХОД – Non-Cash Gains/Income includes such items as:- (i) gains on the disposition of securities realized in the form of notes, securities or any other non-cash assets; (ii) income recognized under the equity method of accounting; (iii) dividends received in kind; (iv) interest income accrued on deferred interest notes, zero coupon bonds or similar instruments; and (v) delinquent accrued interest converted into a new note or added to the principal of an existing note (the amount of such interest which is included in Undistributed Net Realized Earnings must be reclassified to Non-Cash Gains/Income). Interest income recognized through normal year-end interest accruals associated with current-pay debt instruments should not be classified as Non-cash Gains/Income. Non-Cash Gains/Income represents realized earnings of an Small Business Investment Company (SBIC) that have been recognized in the

Statement of Operations. Such earnings are segregated in the Statement of Financial Position only because they are subject to certain restrictions under SBA (the US Small Bisiness Administration) regulations, primarily concerning distributions. In effect, Non-cash Gains/Income can be considered a type of restricted retained earnings. / строка баланса (item). (iii) дивиденды, полученные в натуре (dividends received in kind).

NONCELLULOSIC FIBERS = НЕЦЕЛЛЮЛОЗНЫЕ ВОЛОКНА – Noncellulosic Fibers are the fibers made from petroleum-derived chemicals. The major types are acrylic, nylon, polyester, and polypropylene. / Нецеллюлозные Волокна – волокна, производимые из химикатов, полученных из нефти. Основными типам являются акрил, Найлан^{T3} (или Нейлон; Nylon^{TM}), (сложный) полиэфир или лавсан, и полипропилен.

NON–CLIMACTERIC FRUITS = НЕКЛИМАКТЕРИЧЕСКИЕ ПЛОДЫ – Non-Climacteric Fruits:- (Latin:- climactericus – turning point, critical time) Fruits which are not (yet) ready to eat or ripe for consumption.

NONCODING REGION = НЕКОДИРУЮЩАЯ ОБЛАСТЬ (или НЕКОДИРУЮЩИЙ РЕГИОН) – Noncoding Region:- DNA sequences which lie outside of an open reading frame and which are not translated to become part of a protein. These might include DNA sequences that function either in the plant or other hosts to regulate or influence the expression or processing of gene products (e.g., introns or control regions such as promoters, operators, and terminators) or to facilitate replication, transposition, recombination, or cleavage of DNA (e.g., origins of replication or T-DNA borders). Others may be sequences of no known function, e.g., plasmid backbone sequences.

NONCOINCIDENTAL PEAK LOAD = НЕСЛУЧАЙНАЯ ПИКОВАЯ НАГРУЗКА – Noncoincidental Peak Load:- the sum of two or more peak loads on individual systems that do not occur in the same time interval. Meaningful only when considering loads within a limited period of time, such as a day, week, month, a heating or cooling season, and usually for not more than one year. / Под Пиковой Нагрузкой или Пиковой Мощностью, от Французского слова Pic, означающее Остроконечная Вершина или Пик, понимается максимальная электрическая нагрузка электроэнергетической системы в определённом интервале времени (обычно сутки). Например, в суточном графике электрической нагрузки города можно выделить утреннюю и вечернюю пиковую нагрузку. На время действия пиковой нагрузки включают резервные мощности энергосистемы или специальные пиковые электростанции.

NONCOMBUSTIBLE CONSTRUCTION = НЕСГОРАЕМАЯ КОНСТРУКЦИЯ – Noncombustible Construction:- that type of construction in which a degree of fire safety is attained by the use of noncombustible materials for structural members and other building assemblies. / Такой тип конструкции, у которой степень противопожарной безопасности достигается за счёт использования негорючих материалов для структурных элементов конструкции и других сборных строительных конструкций.

NON–COMMERCIALS = НЕСЫРЬЕВИКИ – Non-Commercials:- entities trading commodities in the futures market in the hope of profiting from a change in its market value but not involved in its production, processing, or merchandising. See also Commercial, and Commitments Of Traders Report. / юридические лица, торгующие различными родами сырья на рынках фьючерсов в надежде получения прибыли от изменения в их рыночной стоимости, но не вовлечённые в их производство, переработку или перепродажу. Смотрите также (Commercial), и (Commitments Of Traders Report).

NON–CONFERENCE CARRIER = ПЕРЕВОЗЧИК, НЕ ЯВЛЯЮЩИЙСЯ УЧАСТНИКОМ КОНФЕРЕНЦИИ – Non-Conference Carrier is an outsider or independent carrier not a member of the conference. See also Non-Conference Line.

NON–CONFERENCE LINE = ЛИНИЯ, НЕ ЯВЛЯЮЩАЯСЯ УЧАСТНИКОМ КОНФЕРЕНЦИИ – Non-Conference Line is a shipping line which operates on a route served by a liner conference but which is not a member of that conference. See also Non-Conference Carrier. / Судоходная линия, которая действует на маршруте, обслуживаемом линейной конференцией, но которая не является участником этой конференции. Смотрите также Перевозчик, Не Являющийся Участником Конференции (Non-Conference Carrier).

NON–CONFIRMATION = НЕПОДТВЕРЖДЕНИЕ (или НЕПОДКРЕПЛЕНИЕ) – Non-Confirmation:- a market is thought to be confirming either gains or losses when most averages or indicators are moving together. If parts are not doing so then a non-confirmation is said to be occurring.

NONCONTIGUOUS = НЕСМЕЖНЫЕ (или ХХ) – Noncontiguous:- domestic shipping routes serving Alaska and non-continental US States and territories.

NONCUMULATIVE = НЕКУМУЛЯТИВНЫЙ (или НЕ ПРЕДУСМАТРИВАЮЩИЙ НАКОПЛЕНИЯ ДИВИДЕНДА) – Noncumulative:- a type of preferred stock on which unpaid dividends do not accrue. Omitted dividends are, as a rule, gone forever. See also Cumulative Preferred.

NON–CUMULATIVE REVOLVING LETTER OF CREDIT = НЕНАКАПЛИВАЮЩИЙСЯ ВОЗОБНОВЛЯЕМЫЙ (или РЕВОЛЬВЕРНЫЙ) АККРЕДИТИВ – Non-Cumulative Revolving Letter Of Credit is a revolving letter of credit that does not permit the seller to carry over any amounts not drawn upon in previous periods. / Возобновляемый аккредитив, который не разрешает продавцу превышать любые суммы, не списываемые в предыдущие периоды.

NONCURRENT ASSETS = ВНЕОБОРОТНЫЕ АКТИВЫ (или НЕ ТЕКУЩИЕ АКТИВЫ, или ОСНОВНЫЕ ФОНДЫ) – Noncurrent Assets, those with a life longer than 1 year, include property, plant, and equipment; purchased technology and goodwill; and other assets. Noncurrent Assets:- total durable goods of all types that are acquired or produced by a business for long-term use in conducting its operations. Non-current assets include land, buildings, plant, equipment, vehicles, furniture, fixtures and leasehold improvements – all tangible assets – as well as intangible assets, such as patents and goodwill. They do not include goods acquired or produced by the company that are to be resold or used to produce goods for resale, such as raw materials, finished products, etc. / Под Основными Фондами понимается совокупность материально-вещественных ценностей, действующих в течение длительного времени. К ним относятся:- здания, машины, оборудование, рабочий и продуктивный скот, сооружения, транспортные средства и тому подобное. Основные фонды, функционирующие в сфере материального производства, называются производственными основными фондами, в непроизводственной сфере – непроизводственными основными фондами. Основные фонды являются важной частью национального богатства. Основные фонды, выраженные в денежном эквиваленте, называются основными средствами.

NON–CURRENT ASSETS HELD FOR SALE AND DISCONTINUED OPERATIONS = НЕ ТЕКУЩИЕ АКТИВЫ, УДЕРЖИВАЕМЫЕ ДЛЯ ПРОДАЖИ И ПРЕКРАЩАЕМЫХ ОПЕРАЦИЙ – IFRS 5 (short for the International Financial Reporting Standards No. 5) Non-current Assets Held for Sale and Discontinued Operations – The objective of this IFRS is to specify the accounting for assets held for sale, and the presentation and disclosure of discontinued operations. In particular, the IFRS requires:- (a) assets that meet the criteria to be classified as held for sale to be measured at the lower of carrying amount and fair value less costs to sell, and depreciation on such assets to cease; and (b) assets that meet the criteria to be classified as held for sale to be presented separately on the face of the

balance sheet and the results of discontinued operations to be presented separately in the income statement. The IFRS:- (a) adopts the classification 'held for sale'; (b) introduces the concept of a disposal group, being a group of assets to be disposed of, by sale or otherwise, together as a group in a single transaction, and liabilities directly associated with those assets that will be transferred in the transaction; (c) classifies an operation as discontinued at the date the operation meets the criteria to be classified as held for sale or when the entity has disposed of the operation. An entity shall classify a non-current asset (or disposal group) as held for sale if its carrying amount will be recovered principally through a sale transaction rather than through continuing use. For this to be the case, the asset (or disposal group) must be available for immediate sale in its present condition subject only to terms that are usual and customary for sales of such assets (or disposal groups) and its sale must be highly probable. For the sale to be highly probable, the appropriate level of management must be committed to a plan to sell the asset (or disposal group), and an active programme to locate a buyer and complete the plan must have been initiated. Further, the asset (or disposal group) must be actively marketed for sale at a price that is reasonable in relation to its current fair value. In addition, the sale should be expected to qualify for recognition as a completed sale within one year from the date of classification, except as permitted by paragraph 9, and actions required to complete the plan should indicate that it is unlikely that significant changes to the plan will be made or that the plan will be withdrawn. A discontinued operation is a component of an entity that either has been disposed of, or is classified as held for sale, and (a) represents a separate major line of business or geographical area of operations, (b) is part of a single co-ordinated plan to dispose of a separate major line of business or geographical area of operations or (c) is a subsidiary acquired exclusively with a view to resale. A component of an entity comprises operations and cash flows that can be clearly distinguished, operationally and for financial reporting purposes, from the rest of the entity. In other words, a component of an entity will have been a cash-generating unit or a group of cash-generating units while being held for use. An entity shall not classify as held for sale a non-current asset (or disposal group) that is to be abandoned. This is because its carrying amount will be recovered principally through continuing use.

NON–CURRENT INVESTMENTS = НЕ ТЕКУЩИЕ КАПИТАЛОВЛОЖЕНИЯ (или НЕ ТЕКУЩИЕ ИНВЕСТИЦИИ) – Non-Current Investments:- in the United States, this account group long-term investments are investments which are restricted beyond the current period as to sale or disposal. Also known as Fixed Asset Investments in the United Kingdom.

NON CURRENT LIABILITIES = ОТСРОЧЕННЫЕ ОБЯЗАТЕЛЬСТВА (или ДОЛГОСРОЧНЫЕ ОБЯЗАТЕЛЬСТВА, или НЕТЕКУЩИЕ ОБЯЗАТЕЛЬСТВА) – Non Current Liabilities:- shown in the company's annual report, it is the amount of debt due to be repaid after twelve months.

NON–DEDUCTIBLE VALUE ADDED TAX = НЕ ПОЛЕЖАЩИЙ ВЫЧЕТУ НАЛОГ НА ДОБАВЛЕННУЮ СТОИМОСТЬ – Non-Deductible Value Added Tax (VAT) is VAT payable by a purchaser which is not deductible from his own VAT liability, if any. See also Deductible Value Added Tax.

NON–DELIVERABLE FORWARD = НЕПОСТАВЛЯЕМЫЙ ФОРВАРД – Non-Deliverable Forward contracts (NDFs) – also called Dollar-Settled Forwards – are synthetic forwards which entail no exchange of currencies at maturity. Instead, settlement is made in US dollars based on the difference between the agreed contract rate at inception and a market reference rate at maturity. NDFs can be used to establish a hedge or take a position in one of a growing group of emerging market currencies where conventional forward markets either do not exist or may be closed to non-residents. As offshore instruments, NDFs offer the advantage of eliminating convertibility risk, since no emerging market currencies are exchanged at maturity.

NON–DELIVERY = НЕПОСТАВКА – Non-Delivery is a failure to deliver all or part of a shipment. / Срыв поставки всей или части грузовой отправки.

NON–DELIVERY WARNING = ПРЕДУПРЕЖДЕНИЕ О НЕПОСТАВКЕ – In a SWIFT system, Non-Delivery Warning is a system-generated message, warning that a payment message, for which delivery monitoring has been requested, has not been delivered within the obsolescence period specified for that message. / В системе Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) генерируемое системой сообщение, предупреждающее о том, что сообщение о платеже, . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

NONDESTRUCTIVE EVALUATION = НЕРАЗРУШАЮЩАЯ ОЦЕНКА – Nondestructive Evaluation (NDE):- broadly considered synonymous with nondestructive inspection (NDI).

NONDESTRUCTIVE INSPECTION = НЕРАЗРУШАЮЩАЯ ИНСПЕКЦИЯ – Nondestructive Inspection (NDI) is a process or procedure, such as ultrasonic or radiographic inspection for determining the quality or characteristics of a material, part, or assembly, without permanently altering the subject or its properties.

NONDESTRUCTIVE TESTING = НЕРАЗРУШАЮЩЕЕ ТЕСТИРОВАНИЕ – Nondestructive Testing (NDT):- broadly considered synonymous with nondestructive inspection (NDI).

NONDISCLOSURE = НЕРАЗГЛАШЕНИЕ – (1) Nondisclosure is an agreement to treat specific information confidentially. See also Confidentiality. / Соглашение рассматривать определённую информацию конфиденциальной или секретной. Смотрите также Конфиденциальность или Секретность (Confidentiality).

(2) Non-Disclosure is the failure by the insured or their agent to disclose a material fact or circumstance to the insurer before acceptance or renewal of the risk.

NON–DISCLOSURE AGREEMENT = СОГЛАШЕНИЕ О НЕРАЗГЛАШЕНИИ – Non-Disclosure Agreement (NDA) is a confidentiality agreement. It allows an inventor to show his ideas to another party with some assurance that the other party will not steal the idea (at least in theory).

NON–DUMPING CERTIFICATE = СВИДЕТЕЛЬСТВО ОБ ОТСУТСТВИИ ДЕМПИНГА (или СЕРТИФИКАТ О НЕДЕМПИНГЕ) – Non-Dumping Certificate:- some countries may require, for protection against the dumping of certain types of merchandise or products, the issuance of so-called Certificates Of Non-Dumping.

NONELASTIC WOVEN TAPE = НЕЭЛАСТИЧНАЯ ТКАНАЯ ТЕСЬМА – Nonelastic Woven Tape is a woven narrow fabric, weighing less than 15 ounces per square yard, made principally of natural and/or manufactured fibers, including monofilaments, but not containing rubber or other similar elastic stands. / мононить (monofilament).

NON–EURO AREA = НЕ ЕВРО ЗОНА (или ЗОНА НЕРАСПРОСТРАНЕНИЯ ЕВРО, или ЗОНА БЕЗ ЕВРО) – Non-Euro Area is the geographical area covered by those European Union countries which have not adopted the Euro as their currency.

NON–EXCLUSIVE = НЕИСКЛЮЧИТЕЛЬНЫЕ (или НЕЭКСКЛЮЗИВНЫЕ) – Non-Exclusive:- the rights granted to the licensee under the licensing agreement are not given just to that licensee. The licensor reserves the right to give the same or similar rights to use the licensed materials to other parties.

NON–FINAL OFFICE ACTION = НЕОКОНЧАТЕЛЬНОЕ ДЕЙСТВИЕ (или РЕШЕНИЕ, или ЗАКЛЮЧЕНИЕ) КОНТОРЫ (или ВЕДОМСТВА) – (1) Non-Final Office Action is an office (the United States Patent and Trademark Office (USPTO)) action letter that raises new issues and usually is the first phase of the examination process. An examining attorney will issue a non-final office action after reviewing the application for the first time. If a new issue arises after the applicant responds to the first non-final office action, the examining attorney will issue another non-final office action that sets forth the new issue(s) and continues any that remain outstanding. Applicants must respond to non-final office action letters within 6 months from the date they are issued to avoid abandonment of the application.

(2) Non-Final Office Action (rejection) is an office (the United States Patent and Trademark Office (USPTO)) action made by the examiner where the applicant is entitled to reply and request reconsideration or further examination, with or without making an amendment. On taking up an application for examination or a patent in a reexamination proceeding, the examiner is required to make a thorough study of the application and of the available prior art relating to the subject matter of the claimed invention. This examination must be complete with respect to:- (i) compliance of the application or patent under reexamination with the applicable statutes and rules; (ii) the patentability of the invention as claimed; and (iii) matters of form, unless otherwise indicated.

NON–FIRM ENERGY = УСЛОВНАЯ ЭНЕРГИЯ (или НЕЗАЯВЛЕННАЯ ЭНЕРГИЯ) – Non-Firm Energy:- electricity that is not required to be delivered or to be taken under the terms of an electric purchase contract. / Объёмы электричества, которые по условиям контракта закупки электроэнергии не обязательно поставлять или принимать.

NON–FIRM ENERGY = ЭНЕРГИЯ, ПОСТАВЛЯЕМАЯ С ПЕРЕБОЯМИ – Non-Firm Energy:- the quality sales of transmission service offered to customers that anticipates possible planned and unplanned interruption and flexibility of delivery. / Продажи высококачественных услуг по доставке электроэнергии потребителям, которые предполагают запланированные или назапланированные перерывы и гибкий график поставок.

NON–FIRM POWER = НЕОБЕСПЕЧЕННАЯ МОЩНОСТЬ (или УСЛОВНАЯ МОЩНОСТЬ, или ПЕРЕБОЙНАЯ МОЩНОСТЬ) – Non-Firm Power is a power or power producing capacity supplied or available under a commitment having limited or no assured availability. / Под электрической Мощностью понимается работа электрического тока в единицу времени. В цепи постоянного тока мощность равна произведению напряжения и тока. Произведение мгновенных значений переменного напряжения и тока – Мгновенная Мощность, её среднее за период значение – Активная Мощность, произведение действующих значений тока и напряжения – Полная Мощность, для синусоидального тока произведение полной мощности на синус угла сдвига фаз между током и напряжением – Реактивная Мощность. Под электрической Мощностью понимается величина, характеризующая скорость изменения (передачи, преобразования, рассеяния и тому подобного) электрической энергии. В цепях постоянного тока электрическая мощность равна произведению напряжения и силы тока. В цепях переменного тока различают:- активную, мгновенную, полную и реактивную электрическую мощность.

NON–FIRM TRANSMISSION SERVICE = УСЛУГА НЕОБЕСПЕЧЕННОЙ ПЕРЕДАЧИ (или УСЛУГА НЕТВЁРДОЙ ПЕРЕДАЧИ) – Non-Firm Transmission Service is a point-to-point transmission service that is reserved and/or scheduled on an as-available basis and is subject to interruption. Non-firm Transmission Service is available on a stand-alone basis as either Hourly Non-firm Transmission Service or Short-Term Non-firm Transmission Service.

NON–GLUTINOUS AROMATIC RICE = НЕГЛЮТИНОЗНЫЙ АРОМАТИЧНЫЙ РИС – Non-Glutinous Aromatic Rice or non-waxy aromatic Rice means white aromatic Rice, brown aromatic Rice and paddy aromatic Rice which their characteristics on white Rice provides translucent appearance. Some of the grain may or may not contain an opaque spot.

NONGLUTINOUS (NONWAXY) RICE = НЕГЛЮТИНОЗНЫЙ (НЕВОСКОВОЙ) РИС – Nonglutinous (Nonwaxy) Rice is a common nonwaxy Rice grain that contains >2% amylose in the starch, with translucent endosperm.

NONHUB AIRPORT = АЭРОПОРТ БЕЗ УЗЛА – Nonhub Airport means a commercial service airport (as defined in section 47102) that has less than 0.05 percent of the passenger boardings.

NONHYDROCARBON GASES = НЕУГЛЕВОДОРОДНЫЕ ГАЗЫ – Nonhydrocarbon Gases are the typical nonhydrocarbon gases which may be present in reservoir natural gas, such as carbon dioxide, helium, hydrogen sulfide, and nitrogen.

NONINFECTIOUS DISEASE = НЕИНФЕКЦИОННАЯ БОЛЕЗНЬ (или НЕЗАРАЗНАЯ БОЛЕЗНЬ) – Noninfectious Disease is a disease that is caused by an environmental factor, not by a pathogen. / Под Болезнью понимается нарушение нормальной жизнедеятельности организма, обусловленное функциональными и/или морфологическими изменениями. Возникновение болезни связано с воздействием на организм вредных факторов внешней среды (биологических, социальных, физических и химических), с его генетическими дефектами и так далее. У растений наряду с инфекционными (бактериальными, вирусными, грибными и другими) болезнями наблюдаются патологические процессы, обусловленные неблагоприятными абиотичными факторами среды. Болезни растений наносят ущерб сельскому и лесному хозяйству.

NON–IONIC = НЕИОННОЕ – Non-Ionic is a descriptive of a chemical that does not ionize in solution, but remains in intact molecular form. Some surfactants are non-ionic.

NON–LAWYER = НЕЮРИСТ (или НЕАДВОКАТ) – Non-Lawyer is a person who is not an attorney or lawyer.

NONLOCAL CHECK = НЕМЕСТНЫЙ ЧЕК – In the United States, Nonlocal Check means a check payable by a nonlocal paying bank. A nonlocal paying bank is a paying bank not located in the same Federal Reserve check-processing region as the bank of first deposit.

NON–MARKET OUTPUT = ВЫПУСК НЕ ДЛЯ РЫНКА – Non-Market Output is an output of own account production of goods and services provided free or at prices that are not economically significant. Non-market output is produced mainly by the general government and non-profit institutions serving households (NPISH) sectors.

NONMEMBER BANK = БАНК НЕ ЧЛЕН (или БАНК НЕ УЧАСТНИК, или БАНК, НЕ ЯВЛЯЮЩИЙСЯ УЧАСТНИКОМ) – In the United States, Nonmember Bank is the depository institution that is not a member of the Federal Reserve System. Specifically, a state-chartered commercial bank that has elected not to join the System. State-chartered commercial bank that is not a member of the Federal Reserve System.

NON–MEMBER TRADERS = ТОРГОВЦЫ НЕ ЧЛЕНЫ (или ТОРГОВЦЫ НЕ УЧАСТНИКИ, или ТОРГОВЦЫ, НЕ ЯВЛЯЮЩИЕСЯ ЧЛЕНАМИ БИРЖИ) – Non-Member Traders are the speculators and hedgers who trade on the exchange through a member or a person with trading privileges but who do not hold exchange memberships or trading privileges.

NON–NEGOTIABLE BILL OF LADING = НЕОБОРОТНЫЙ КОНОСАМЕНТ (или КОНОСАМЕНТ БЕЗ ПРАВА ОТЧУЖДЕНИЯ) – Non-Negotiable Bill Of Lading is a document not made out 'to order', but being a receipt and evidence of the contract of carriage, but which is not a document of title, e.g., a waybill and, in some jurisdictions (such as the United States of America), a (straight) consigned bill of lading. Copy of original Bill of Lading which cannot be negotiated with bank. Sometimes means a file copy of a Bill of Lading. See also Straight Bill Of Lading. A Non-Negotiable Bill Of Lading is similar to a 'straight bill of lading', and is defined by statute as a bill that states in writing that the goods are to be delivered to a consignee and that is 'non-negotiable' or 'not negotiable'. 49 USC §80103(b)(1)–(2) (2005; 49 USC is short for the United States Code:- Title 49). See also Negotiable Bill Of Lading. Non-Negotiable Bill of Lading, also known as Straight Bill of Lading, is a non-negotiable document by which a transportation company acknowledges receipt of freight and contracts for its movement. The surrender of the original straight bill of lading is not required by transportation lines upon delivery of freight, except when necessary for the purpose of identifying the consignee.

NON–NEGOTIABLE INSTRUMENT = НЕОБОРОТНЫЙ ИНСТРУМЕНТ – In Germany, Non-Negotiable Instrument is a security in the name of a specific person. The claim evidenced by a non-negotiable instrument can only be asserted by that person or his legal successor. The security is transferred according to in personam principles (§§ 398 pp. German Civil Code) either through agreement, assignment or transfer of the certificate. Only the respective holder of the right is entitled to ownership of the certificate.

NON–NEWTONIAN FLUID = НЕНЬЮТОНОВСКАЯ ЖИДКОСТЬ – Non-Newtonian Fluid is a fluid, such as a grease or a polymer-containing oil (e.g., multi-grade oil), in which shear stress is not proportional to shear rate. See also Newtonian Fluid.

NON–OPERATING ASSETS = НЕОБОРОТНЫЕ АКТИВЫ (или ВНЕОПЕРАЦИОННЫЕ АКТИВЫ) – Assets that are unnecessary to the ongoing operations of a business. Also known as Redundant Assets. Non-Operating Assets are the assets of a company that are not required for operational purposes. The opposite of Operating Assets.

NON–PAID UP CAPITAL = НЕОПЛАЧЕННЫЙ КАПИТАЛ (или НЕОПЛАЧЕННАЯ ДОЛЯ КАПИТАЛА) – Non-Paid Up Capital is a difference between the capital of a corporation (joint stock company) stipulated in the articles of association and the capital actually paid in.

NON PATENT LITERATURE = НЕПАТЕНТНАЯ ЛИТЕРАТУРА – Non Patent Literature (NPL) is documents and publications that are not patents or published patent applications but are cited as references for being relevant in a patent prosecution. For example, a magazine article or doctoral thesis relevant to a claimed invention might be cited as non-patent literature. Typically, references cited in an application are grouped into:- domestic patents and patent application publications; foreign patents; and non-patent literature. / Непатентная Литература – научные и технические журналы, монографии и тому подобное.

NON–PERFORMING LOAN = НЕИСПОЛНЯЕМЫЙ ЗАЁМ (или НЕПРОИЗВОДИТЕЛЬНЫЙ ЗАЙМ, или ПРОБЛЕМНЫЙ ЗАЙМ) – Non-Performing Loan is a loan on which the recovery of the contractual interest and capital is doubtful.

NONPERSISTENT VIRUS = НЕСТОЙКИЙ ВИРУС – Nonpersistent Virus is a virus that has short transmission time, is not recoverable from the hemolymph, is not transmitted following a molt of the vector, and when purified and inoculated into the hemocoele, does not make the vector infective. / вирус, не сохраняющийся в переносчике. Под Вирусами, от Латинского слова Virus, означающее Яд, понимаются мельчайшие неклеточные частицы, состоящие из нуклеиновой кислоты (ДНК или РНК) и белковой оболочки (капсида). Форма палочкообразная, сферическая и другие. Размер 15–350 нм и более. Открыты (вирусы табачной мозаики) в 1892 одним из основоположников вирусологии – Российским физиологом растений и микробиологом Дмитрием Иосифовичем Ивановским (1864–1920). Вирусы – внутриклеточные паразиты: размножаясь только в живых клетках, они используют их ферментативный аппарат и переключают клетку на синтез зрелых вирусных частиц – вирионов. Распространены повсеместно. Вызывают болезни Растений, Животных и Человека. Вирусы Бактерий (Бактериофаги) – классический объект молекулярной биологии.

NONPERSONAL TIME DEPOSIT = НЕПЕРСОНАЛЬНЫЙ СРОЧНЫЙ ВКЛАД – Nonpersonal Time Deposit is a time deposit held by a depositor other than an individual, for example, a corporation.

NON–PRE–AUTHORISED DIRECT DEBIT = НЕ УПОЛНОМОЧЕННОЕ ПРЕДВАРИТЕЛЬНО ПРЯМОЕ ДЕБЕТОВАНИЕ – Non-Pre-Authorised Direct Debit:- in banking, direct debits based on rules that require a specific agreement from the debtor for each individual transaction to be effected.

NONPREFERENCE (AVOIDANCE) = БЕСПРЕДПОЧТЕНИЕ (или БЕСПРИСТРАСТНОСТЬ) (ИЗБЕГАНИЕ) – Nonpreference (Avoidance) is a type of plant resistance to pests wherein insects do not like to feed upon, oviposit in, or use the plant for shelter.

NONPROBABILITY SAMPLING = НЕВЕРОЯТНОСТНЫЙ ОТБОР ПРОБ – Nonprobability Sampling is a method where the probability of a particular individual being included in the sample is not known.

NON–PRODUCING RESERVES = НЕРАБОЧИЕ РЕЗЕРВЫ – Non-producing Reserves:- reserves subcategorized as non-producing include shut-in and behind-pipe reserves. Shut-in reserves are expected to be recovered from (1) completion intervals which are open at the time of the estimate but which have not started producing, (2) wells which were shut-in for market conditions or pipeline connections, or (3) wells not capable of production for mechanical reasons. Behind-pipe reserves are expected to be recovered from zones in existing wells, which will require additional completion work or future recompletion prior to the start of production. See also Reserves.

NON–PROFIT INSTITUTIONS SERVING HOUSEHOLDS = НЕКОММЕРЧЕСКИЕ УЧРЕЖДЕНИЯ, ОБСЛУЖИВАЮЩИЕ ДОМОВЛАДЕНИЯ – In the United Kingdom, Non-Profit Institutions Serving Households (NPISH; S.15). These include bodies such as charities, universities, churches, trade unions or member's clubs.

NON–PROFIT ORGANIZATION = БЕСПРИБЫЛЬНАЯ ОРГАНИЗАЦИЯ (или НЕКОММЕРЧЕСКАЯ ОРГАНИЗАЦИЯ) – (1) In the United States, Non-Profit Organization, also called a Non-Profit, is an organization incorporated under state laws and approved by both the state's Secretary of State and its taxing authority as operating for educational, charitable, social, religious, civic or humanitarian purposes. There are many types of non-profits, working toward various educational, scientific, religious, and literary goals, such as humane societies, The Red Cross, literacy outreach groups, churches, etc. As with all organizations, a non-profit must generate revenues to fund its operations. Non-profits, however, differ from other business organizations because the primary sources of funding for non-profits are donations from public or private donors. Thus, non-profits generally must rely on a steady stream of donations to continue to serve the public good. Because of the important role non-profits play in serving the public good, the US Internal Revenue

Service (IRS) Code is designed to give nonprofits a 'tax break' – i.e. the 501(c)(3)designation. This designation allows non-profits to enjoy a special tax status to help them raise funds. Note that the mere fact that a corporation is organized under a not-for-profit corporation law does not mean that contributions to it are necessarily tax deductible.

(2) Nonprofit Organization:- for purposes of small entity determination per MPEP 509.02 – (1) a university or other institution of higher education located in any country; (2) an organization of the type described in section 501(c)(3) of the Internal Revenue Code of 1954 (26 USC 501(c)(3)) and exempt from taxation under section 501(a) of the Internal Revenue Code (26 USC 501(a)); (3) any nonprofit scientific or educational organization qualified under a nonprofit organization statute of a state of this country (35 USC 201(i)); or (4) any nonprofit organization located in a foreign country which would qualify as a nonprofit organization under paragraphs (e) (2) or (3) of MPEP section 509.02 if it were located in this country.

NON–PROPORTIONAL REINSURANCE = НЕПРОПОРЦИОНАЛЬНОЕ ПЕРЕСТРАХОВАНИЕ – Non-Proportional Reinsurance is a type of reinsurance in which the reinsurer does not share similar proportions of the premiums earned and the claims incurred by the reassured plus certain associated expenses. Excess of loss reinsurance is an example of non-proportional reinsurance. Form of reinsurance in which coverage is not in direct proportion to the original insurer's loss; instead the reinsurer is liable for a specified amount which exceeds the insurer's retention. Also known as Excess Of Loss Reinsurance.

NONPROVISIONAL PATENT APPLICATION = НЕВРЕМЕННАЯ (или НЕОБЕСПЕЧИТЕЛЬНАЯ) ПАТЕНТНАЯ ЗАЯВКА (или ЗАЯВКА НА ПАТЕНТ) – Nonprovisional Patent Application is an application for patent filed under 35 USC 111(a) that includes all patent applications (i.e. utility, design, plant, and reissue) except provisional applications. The nonprovisional application establishes the filing date and initiates the examination process. A nonprovisional utility patent application must include a specification, including a claim or claims; drawings, when necessary; an oath or declaration; and the prescribed filing fee.

NONQUARANTINE PEST = НЕКАРАНТИННЫЙ ВРЕДИТЕЛЬ – Nonquarantine Pest is a pest that is not a quarantine pest for an area.

NON–RAIN GROWN COTTON = ХЛОПЧАТНИК, ВЫРАЩЕННЫЙ НЕ ЗА СЧЁТ ДОЖДЕЙ – In the US Cotton futures trading, Non-Rain Grown Cotton is a Cotton grown in Arizona, California, Nevada, New Mexico (except Lea County), El Paso and Pecos Valleys of Texas. Deliveries under each contract shall be for only 'rain-grown' Cotton or for 'non-rain grown' Cotton.

NON–READILY–MARKETABLE COLLATERAL = СЛОЖНОЕ (или ТРУДНОЕ, или НЕЛИКВИДНОЕ) ДЛЯ ОБОРОТА НА РЫНКЕ ОБЕСПЕЧЕНИЕ – Non-Readily-Marketable Collateral:- security pledged as collateral (for a credit transaction) which cannot be sold easily or readily either because no market, or only a very restricted market, exists for it, e.g., unlisted bonds and shares. The opposite of Marketable Collateral. / , например, .

NON–RECOURSE FINANCING = ФИНАНСИРОВАНИЕ БЕЗ ПРАВА РЕГРЕССА – Non-Recourse Financing is a form of international project financing where the banks involved assume all risks, waiving the right of recourse on the company responsible for the project.

NONRECOURSE LOAN = ССУДА БЕЗ ПРАВА РЕГРЕССА – Nonrecourse Loan:- in the United States, delivery to the Commodity Credit Corporation (CCC) of the pledged and eligible commodity, or warehouse receipts representing stocks acceptable as to quantity and quality, constitutes repayment of the price support loan in full, regardless of the current market value of the commodity. / выплата (repayment) .

NON–RECOURSE LOAN PROGRAMME = ПРОГРАММА ДЛЯ ССУД БЕЗ ПРАВА РЕГРЕССА – Non-Recourse Loan Programme is a programme to be implemented under the US Federal Agriculture Improvement and Reform Act (FAIR Act) of 1996 for butter, non-fat dry milk and cheese after 1999 in which loans must be repaid with interest to processors to assist them in the management of dairy product inventories.

NONRECURRENT PARENT = РОДИТЕЛЬСКАЯ ФОРМА, С КОТОРОЙ ГИБРИД НЕ СКРЕЩИВАЕТСЯ ВНОВЬ – Nonrecurrent Parent is a donor parent used only once in a backcross program.

NON–RECURRING = НЕ ПОВТОРЯЮЩИЙСЯ (или НЕ ПЕРИОДИЧЕСКИЙ) – Non-Recurring:- in accounting in the United States, income statement item that is either unusual in nature or infrequent in occurrence. An example is the gain or loss on the sale of a fixed asset. Nonrecurring items are shown before arriving at income from continuing operations. They are not shown with a tax or earnings per share effect. See also Extraordinary Item. Also known as One-Off in the United Kingdom. Nonrecurrent:- as, the costs of a layoff are considered as a nonrecurring expense. / строка баланса (item).

NON–RENEWABLE RESOURCES = НЕВОЗОБНОВЛЯЕМЫЕ РЕСУРСЫ – Non-Renewable Resources are the natural resources that cannot be replaced after they have been consumed. This term applies particularly to fossil fuels such as coal, oil and natural gas, but also applies to other mineral resources found in the Earth's crust.

NON–RENOUNCEABLE RIGHTS = НЕОТВЕРГАЕМЫЕ ПРАВА – Non-Renounceable Rights:- the rights offer that may only be taken up or forfeited, and cannot be traded on the market. See also Rights Issue.

NON–REPORTING = НЕ ОТЧИТЫВАЮЩИЕСЯ – Non-Reporting:- entities whose volume of futures positions in a type of contract remains below the minimum reporting level set by the exchanges and/or the US Commodity Futures Trading Commission.

NON–REPUDIATION = НЕОТРИЦАНИЕ – Non-Repudiation is a process that involves delivering data in such a way that the receiver cannot deny receipt, and the sender cannot deny sending it. A principle according to which the receiver of a SWIFT message cannot deny having received that message, and the sender cannot deny having sent it. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

NON–RESIDENTS = НЕРЕЗИДЕНТЫ – Non-Residents are the persons who does not live in an area or state, or who live there but does not meet the legal requirements for residence. Private persons and legal entities treated as foreigners in the context of fiscal, currency control or other legislation. / Под Нерезидентами понимаются физические и юридические лица, рассматриваемые в качестве иностранцев, в контексте фискального законодательства, валютного контроля или иного законодательства.

NON–RESPIRING GOODS = НЕДЫШАЩИЕ ТОВАРЫ – Non-Respiring Goods are goods which do not cause a change in the ambient atmosphere (except perhaps a release of water). These include all frozen goods and goods sealed in gas-tight packaging, steel products and all products which are not subject to decomposition processes. Caution! Degradation processes occur even in scrap lumber/wooden chips, shredded scrap metal, waste paper, etc. Although these cannot be described as respiration, they nevertheless consume O_2 and release CO_2 to the extent that this may lead to the build-up of life-threatening concentrations in closed rooms.

NON–RESPONSIVE AMENDMENT = НЕОТВЕЧАЕМАЯ ПОПРАВКА – Non-Responsive Amendment is an amendment filed by the applicant that does not fully respond to the examiner's office (the United States Patent and Trademark Office (USPTO)) action in accordance with 37 CFR 1.111 (CFR:- short for the US Code of Federal Regulations).

NON–REVERSIBLE PALLET = НЕОБРАТИМЫЙ ПОДДОН – Non-Reversible Pallet is a pallet with bottom deckboard configuration different from top deck. Non-Reversible Pallet is a double-deck pallet with one load-carrying surface. / Необратимый Поддон:- плоский поддон с двойным настилом, при этом груз размещают только на одном настиле.

NONSELECTIVE HERBICIDE = ГЕРБИЦИД СПЛОШНОГО ДЕЙСТВИЯ (или НЕИЗБИРАТЕЛЬНЫЙ ГЕРБИЦИД, или НЕСЕЛЕКТИВНЫЙ ГЕРБИЦИД) – Non-Selective Herbicide is a herbicide that is generally toxic to all plants treated. See also Herbicide. Nonselective Herbicide is a herbicide that kills all vegetation with which it comes in contact. / Гербициды Сплошного Действия (неизбирательного действия) воздействуют на всю имеющуюся на поле растительность, проникая в растение через зелёную листовую поверхность. Их применяют тогда, когда культурные растения отсутствуют на поле (после уборки, на парах и тому подобном). Последние разработки позволяют применять некоторые гербициды сплошного действия таким же образом, как и избирательные. Это стало возможным благодаря выращиванию генетически модифицированных культур (в первую очередь Сои, Сахарной Свёклы, Картофеля). Такие культуры имеют ген устойчивости к определённым гербицидам, которые не оказывают на культуру отрицательного действия. Существуют различные способы применения гербицидов сплошного действия в зависимости от культуры:- (1) на однолетних культурах возможно проведение:- (i) предпосевной обработки поля для предотвращения появления сорняков и сокращения числа механических обработок; (ii) ранней послепосевной обработки до появления всходов культуры; (iii) послепосевной обработки при условии защиты культуры; (iv) предуборочной обработки с целью десикации сорняков и культуры; (v) послеуборочной обработки для подавления многолетних сорняков. (2) на многолетних культурах (сады, виноградники) проводят обработку между деревьями для предотвращения появления сорных растений, сохранения влаги, сокращения числа культиваций. Таким образом предотвращается эрозия почвы, вызываемая частыми механическими обработками. Как правило, в данном случае неизбирательные гербициды можно применять без риска воздействия на одревеснevшую часть культуры (ствол), но не на листья. Гербициды сплошного действия делятся на две основные группы:- (i) Контактные Гербициды и (ii) Системные Гербициды.

NON–SKID TAPE = НЕПОЛОЗНАЯ ЛЕНТА (или ПРОТИВОСКОЛЬЗЯЩАЯ ЛЕНТА) – Non-Skid Tape prevent slips or falls in your garage or workspace with our selection of non-slip and anti-slip tape. All of industrial anti-skid or non-skid tapes are backed with industrial-strength, permanent acrylic adhesive suitable for the harshest production environments. Non-Skid Tape is known as Anti-Skid Tape and Anti-Slip Tape. Non-Skid Tapes are backed with tough adhesive for the harshest production environments. Anti-Skid Tapes are backed with industrial strength, permanent acrylic adhesive that is suitable for even the harshest production environments. See also Pallet. / Антискользящая Лента (Non-Skid Tape):- лента, применяемая для предотвращения скольжения поддона. Смотрите также Поддон (Pallet).

NON–STANDARD COMBINATION ORDER = РАСПОРЯЖЕНИЕ ПО НЕСТАНДАРТНОЙ КОМБИНАЦИИ – Non-Standard Combination Order (NSCO):- in the same market division (agricultural/sugar), you are able to combine buy and/or sell orders of various prices in 2 contract months.

NON–STRUCTURAL SANDWICH PANEL = НЕНЕСУЩАЯ ПАНЕЛЬ СЛОИСТОЙ КОНСТРУКЦИИ (или НЕСТРУКТУРНАЯ СЭНДВИЧ ПАНЕЛЬ) – Non-Structural Sandwich Panel is a panel comprised of a foam core with plywood or oriented strand board (OSB) bonded to each face designed to enclose but not to be the main load-carrying elements. See also Structural Sandwich Panel. / . Под Панелью, от Немецкого слова Paneel, понимается плоский крупноразмерный элемент (конструкция) заводского изготовления, широко применяемый в современном строительстве зданий и сооружений различного назначения (например, панель покрытия, стеновая панель и другие).

NONSYMBIOTIC NITROGEN FIXATION = НЕСИМБИОТИЧЕСКАЯ ФИКСАЦИЯ АЗОТА (или НЕСИМБИОТИЧЕСКАЯ АЗОТФИКСАЦИЯ) – Nonsymbiotic Nitrogen Fixation is a biological nitrogen fixation performed by a group of autotrophic bacteria living free in the soil either aerobically or anaerobically and not dependent on plants.

NON–SYSTEMATIC RISK = НЕСИСТЕМАТИЧНЫЙ РИСК (или НЕСИСТЕМНЫЙ РИСК) – Non-Systematic Risk is a risk exposure dependent on factors which influence an individual security only, e.g., corporate results. The opposite of Systematic Risk. / , например, результаты корпоративной деятельности.

NONTARIFF BARRIERS = НЕТАРИФНЫЕ БАРЬЕРЫ – The Nontariff Barriers (NTBs) are market access barriers that result from prohibitions, restrictions, conditions or specific requirements and make exporting products difficult and/or costly. The term covers any restriction or quota, charge, or policy, other than traditional customs duties, domestic support programs, discriminatory labeling and health standards, and exclusive business practices which limit the access of imported goods. NTBs may result from government or private sector actions.

NONTARIFF MEASURES = НЕТАРИФНЫЕ МЕРЫ – While there is no specific definition of an Nontariff Measures (NTM), some of the most commonly-used NTMs include import quotas or other quantitative restrictions, non-automatic import licensing, customs surcharges or other fees and charges, customs procedures, export subsidies, unreasonable standards or standards-setting procedures, government procurement restrictions, inadequate intellectual property protection, and investment restrictions. Participants in the Tokyo Round attempted to address these barriers through the negotiations of a number of GATT (short for the General Agreement on Tariffs and Trade) codes, open for signature to all GATT members. Seven codes were negotiated during the Tokyo Round, covering customs valuations, import licensing, subsidies and countervailing duties, antidumping duties, standards, government procurement and trade in civil aircraft. Although the Tokyo Round codes had alleviated some of the problems caused by non-tariff measures, overall use of NTMs has increased since conclusion of the Tokyo Round. / таможенные надбавки или доплаты (customs surcharge) или иные . Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) .

NONTORQUE YARN = ХХ ПРЯЖА – Nontorque Yarn is the yarn that does not rotate or kink when permitted to hang freely. A nontorque yarn may be the result of plying two equal but opposite torque yarns. See also Textured Yarns.

NON–TRANSFERABLE = НЕПЕРЕВОДИМОЕ (или НЕПЕРЕДАВАЕМОЕ, или БЕЗ ПРАВА ПЕРЕДАЧИ) – (1) Non-Transferable:- describing a check that has been crossed so that it is payable only into the account of the named payee.

(2) Non-Transferable:- the licensing agreement and/or the rights, obligations and terms thereof may not be sold, given, assigned or otherwise conveyed to any party who is not a signatory to the agreement. For example, a library licensee may not sell or give the right to access licensed materials to another library. See also Non-Assignable.

NON–TRANSFERABLE LETTER OF CREDIT = НЕПЕРЕВОДИМЫЙ АККРЕДИТИВ – Non-Transferable Letter of Credit:- a letter of credit (L/C) can be transferable or non-transferable. The L/C usually indicates 'Transferable' in the case of a transferable credit. In the absence of such indication, the L/C is deemed to be non-transferable. See also Transferable Letter Of Credit.

NON–UNIFORM COLOR = НЕОДНОРОДНЫЙ ЦВЕТ – Non-Uniform Color:- this defect varies in degree and may not be serious enough to classify a garment as a second. Closure defects, and namely – Pearl and Plastic Buttons. / Порок или дефект застёжки.

NON–UNIFORM, INACCURATELY SPACED, CHIPPED OR BLOCKED SEW HOLES = НЕОДНОРОДНЫЕ, НЕАККУРАТНО РАЗМЕЩЁННЫЕ, ХХ ОТВЕРСТИЯ – Non-Uniform, Inaccurately Spaced, Chipped Or Blocked Sew Holes:- this type of detect is sometimes not noted during the garment manufacturing operation and can slip past inspection unnoticed, but it frequently causes needle breakage or cut thread. Closure defects, and namely – Pearl and Plastic Buttons. / Порок или дефект застёжки.

NONUTILITY POWER PRODUCER = НЕСТАНЦИОННЫЙ ПРОИЗВОДИТЕЛЬ МОЩНОСТИ – Nonutility Power Producer is a corporation, person, agency, authority, or other legal entity or instrumentality that owns electric generating capacity and is not an electric utility. Nonutility power producers include qualifying cogenerators, qualifying small power producers, and other nonutility generators (including independent power producers) without a designated franchised service area, and which do not file forms listed in the Code of Federal Regulations, Title 18, Part 141.

NONVALEUR = НОНВАЛЁР (или ОБЕСЦЕНЕННОЕ) – Nonvaleur is a term for historical securities that have lost their value and are no longer traded (collector's items). Also used for securities in circulation that have a particularly low value.

NON–VERSE = НО–ВЭРС (или НЕОПЛАЧЕННОЕ, или НЕВНЕСЁННОЕ, или БЕЗ ОПЛАТЫ) – Non-Verse is the French expression for the unpaid-for portion of the par value of a registered share. In some European countries, companies require shareholders to sign a special document obligating them to pay the remaining price of the share at a later date. / В переводе с Французского языка Verse – Проливное или Сведущее или Искусное или Осведомлённое, а Non-Verse – Без Оплаты или Неоплаченное или Невнесённое.

NON–VESSEL OPERATING COMMON CARRIER = НЕ ВЛАДЕЮЩИЙ СУДНОМ (НЕСУДОВЛАДЕЛЕЦ) ДЕЙСТВУЮЩИЙ ОБЩЕСТВЕННЫЙ ПЕРЕВОЗЧИК – Non-Vessel Operating Common Carrier (NVOCC) is a carrier offering an international cargo transport service through the use of underlying carriers and under their own rate structure in accordance with tariffs filed with the Federal Maritime Commission in Washington, DC, the United States. A cargo consolidator of small shipments in ocean trade, generally soliciting business and arranging for or performing containerization functions at the port. A cargo consolidator in ocean trades who will buy space from a carrier and sub-sell it to smaller shippers. The Non-Vessel Operating Common Carrier (NVOCC) issues bills of lading, publishes tariffs and otherwise conducts itself as an ocean common carrier, except that it will not provide the actual ocean or intermodal service. A party who undertakes to carry goods and issues in his own name a Bill of Lading for such carriage, without having the availability of any own means of transport. Non-Vessel-Operating Common Carrier (NVOCC), a ships agent, conducts business for the ship but does not operate the vessel.

NON–VOTING SHARE = НЕГОЛОСУЮЩАЯ АКЦИЯ (или АКЦИЯ БЕЗ ПРАВА ГОЛОСА) – Non-Voting Share:- shares that carry no voting rights. Non-voting shares are issued to raise additional capital for the company, while permitting existing shareholders to retain control of the company. Such shares are often known as A-Shares and generally rank pari passu with voting shares in respect of other rights. Non-Voting Share is a share issued primarily by European state-owned enterprises to attract investors without privatizing the firm. / Акция, выпущенная, главным образом, Европейскими государственными предприятиями для привлечения инвесторов без приватизации этой фирмы. Неголосующие Акции – акции, не дающие права голоса на общем собрании акционеров и выпускаемые в связи с попыткой поглощения акционерной компании или для разводнения капитала. Выпуск неголосующих акций не изменяет контрольный пакет акций.

NONWAXY ENDOSPERM = НЕВОСКОВОЙ ЭНДОСПЕРМ – Nonwaxy Endosperm (Rice) is the endosperm that contains both amylose and amylopectin as in most common nonglutinous Rices. Amylose content ranges from very low to high. Non-Waxy Endosperm (syn. Common, Non-Glutinous Rice) is a starchy endosperm in which the starch fraction contains both amylase and amylopectin. It stains dark blue with weak potassium iodide-iodine solution. The non-waxy type cooks drier than the gluey waxy type.

NONWOVEN FABRICS = НЕТКАНЫЕ МАТЕРИАЛЫ (или НЕТКАНЫЕ ТКАНИ) – Nonwoven Fabrics are an assembly of textile fibers held together by mechanical interlocking in a random web or mat, by fusing of the fibers (in the case of thermoplastic fibers), or by bonding with a cementing medium such as starch, glue, casein, rubber, latex, or one of the cellulose derivatives or synthetic resins. Initially, the fibers may be oriented in one direction or may be deposited in a random manner. This web or sheet of fibers is bonded together by one of the methods described above. Normally, crimped fibers that range in length from 0.75 to 4.5 inches are used. Nonwoven fabrics are used for expendable items such as hospitable sheets, napkins, diapers, wiping cloths, as the base material for coated fabrics, and in a variety of other applications. They can also be used for semi-disposable items and for permanent items such as interlinings. Material made primarily of randomly arranged textile fibers held together by an applied bonding agent or by fusion. Nonwoven Fabric is a textile structure held together by interlocking of fibers in a random web, accomplished by mechanical, chemical, thermal or solvent means. Generally, crimped fibers that range in length from 0.75 to 4.5 inches are used. Nonwoven Fabric:- water absorbent cloth underneath the container roof. Nonwovens:- a manufactured sheet, web or batt of directionally or randomly orientated fibers, bonded by friction, and/or adhesion, excluding paper and products which are woven, knitted, tufted, stitch bonded incorporating binding yarns or filaments, or felted by wet-milling, whether or not additionally needled. The fibers may be of natural or man-made origin. They may be staple or continuous filaments or be formed in situ. Manufacturing processes of nonwovens and relevant end-uses. The following schematic process flow sheets of nonwovens manufacturing from principal man-made fibers are described:- (i) Drylaid (carded with binder impregnation); (ii) Spunlaid; (iii) Airlaid (for short fibers); and (iv) Wetlaid. Also typical end uses derived from methods of web formation and bonding processes are shown. Nonwovens are a sheet, web, or batt of natural and/or man-made fibers or filaments, excluding paper, that have not been converted into yarns, and that are bonded to each other by any of several means. The various methods for bonding are:- (i) adding an adhesive; (ii) thermally fusing the fibers or filaments to each other or to the other meltable fibers or powders; (iii) fusing fibers by first dissolving, and then resolidifying their surfaces; (iv) creating physical tangles or tuft among the fibers; and (v) stitching the fibers or filaments in place. Nonwoven Fabric:- fabrics can be produced directly from molten or dissolved fiber-forming substances by several continuous processes:- (1) Flash Extrusion or (2) Spray Spinning. / (1) Экструзия или Выдавливание (Extrusion). Нетканые Материалы, текстильные изделия из волокон или нитей, соединённых между собой без применения методов ткачества. Крупное промышленное производство нетканых материалов появилось в 1940-е. Современные нетканые материалы – один из основных видов текстильной продукции во многих странах. В 1972 в мире было выпущено более 3 миллиардов квадратных метров. Нетканые материалы по способу производства можно разделить на две большие группы:- (i) материалы, получаемые физико-химическими способами, подразделяемые в свою очередь на:- (a) клеёные с пропиткой холста жидким связующим, (b) клеёные горячим прессованием, (c) нетканые материалы

с использованием бумагоделательных машин, (d) нетканые материалы, произведённые фильерным способом, и (e) нетканые материалы, произведённые структурообразующим способом; и (ii) материалы, получаемые механическими способами, подразделяемые в свою очередь на:- (a) холстопрошивные, (b) нитепрошивные, (c) полотнопрошивные, (d) нетканые материалы без применения нитей, (e) иглопробивные, и (f) валяльно-войлочные. Производство Нетканых Материалов является подотраслью текстильной промышленности. История развития нетканого производства сравнительно коротка. Наиболее широкое развитие оно получило лишь во второй половине XX века. Нетканые текстильные материалы (НТМ) классифицируются прежде всего по способам производства, основанным на механической, физико-химической и комбинированной технологиях. По механической технологии вырабатывают вязально-прошивные и иглопробивные (needlepunched) НТМ. По физико-химической технологии вырабатывают НТМ способом проклеивания, формованием из расплава или раствора полимера, горячего прессования и бумагоделательным способом. Комбинированные способы представляют собой комбинацию механической и физико-химической технологий. К ним относятся тафтинговый, электрофлокировальный, иглопробивной с пропиткой, валяльно-войлочный (entangling) и склеивающий способы. НТМ могут вырабатываться на базе волокнистого холста, системы нитей, плоских структур (ткани, трикотаж, плёнки). Нетканые текстильные материалы находят всё более широкое применение благодаря сравнительно низкой себестоимости и высоким эксплуатационным свойствам. Применение химических волокон и нитей значительно расширило ассортимент выпускаемых нетканых текстильных полотен. НТМ находят всё более широкое применение в быту, медицине, промышленности, в декоративно-художественном оформлении. Причём область их применения определяется характером особенностей, присущих НТМ:- воздухопроницаемость, объёмность, хорошая тепло- и звукоизоляционная способность и так далее. Ассортимент нетканых материалов бытового назначения очень широк и его можно разделить на две группы:- одёжные (костюмные, пальтовые, платьевые, подкладочные и тому подобные) и домашнего потребления (гардины, искусственные меха, ковры, одеяла, полотенца, салфетки, скатерти и тому подобные). В промышленности НТМ используют в качестве упаковочных, обивочных, изоляционных, фильтровальных, обтирочных материалов и так далее. В медицине НТМ используют в качестве перевязочных, компрессных, одёжных и других лечебно-профилактических и санитарно-гигиенических материалов как длительного, так и одноразового пользования. В конце 1980-х большое внимание уделялось увеличению производства НТМ типа тканей (вязально-прошивные НТМ на основе системы нитей). В качестве сырья в производстве НТМ используются волокна, пряжа и нити, прядомые и непрядомые отходы прядильного производства, ткани, трикотаж, плёнки. Если волокна используются в качестве основы (волокнистого слоя), то остальные рода сырья могут использоваться и как основа, и как связующие элементы. Волокнистый холст формируется из натуральных и химических волокон. Обычно это волокна низких сортов, отходы прядильных производств, регенерированные волокна из лоскута и тряпья. В качестве скрепляющих волокнистый слой или для производства НТМ типа ткани используют одиночную или кручёную пряжу из хлопка или капроновые, лавсановые, хлориновые нити и другое. Для выработки специальных НТМ применяют стеклянную или металлическую нить. Для изготовления ниточного, тканого и другого плоского каркаса используют пряжу из лубяных, хлопковых волокон, химические нити, пряжу из химических штапельных волокон, полимерные плёнки, металлические сетки и так далее. Сырьё, поступающее в нетканое производство, проходит этап подготовки. Процессы подготовки сырья выбираются в зависимости от вида сырья и способа производства НТМ. Подготовка волокнистого сырья включает разрыхление, очистку, смешивание, кардоческание и формирование холста. Подготовка волокон к кардочесанию и кардочесание осуществляются в зависимости от вида волокна. Холст может формироваться механическим (dry-laid nonwovens), аэродинамическим и гидравлическим способами, сущность которых состоит в следующем. Механический способ заключается в укладывании слоями прочёса с чёсальных машин на специальные конвейеры. При аэродинамическом способе (air forming process) волокна с чёсальной машины в потоке воздуха транспортируются к сетчатому барабану, на поверхности которого формируется слой неориентированных волокон. Сущность гидравлического способа (wet-forming process) заключается в формировании холстов из водной суспензии коротких волокон. Материал, сделанный главным образом из текстильных волокон, расположенных в хаотичном порядке и удерживающихся вместе за счёт применённой связующей пропитки или склеивания. К Нетканым Материалам относятся текстильные материалы, изготовливаемые из натуральных и химических волокон и нитей без применения методов ткачества (механическими, физикохимическими и комбинированными способами). Нетканые материалы изготовляют, например, прошиванием волокнистого холста пряжей (вязально-прошивные нетканые материалы), свойлачиванием (entangling) волокнистой массы с последующим прокалыванием (punching) полученного холста иглами с зазубринами (иглопробивные нетканые материалы) и другими методами. Производство нетканых материалов включает приготовление основы (холст, система нитей, плёнка волокнистой структуры и другое), скрепление её и отделку. Основа формируется из отдельных волокон или непрерывных нитей на специальном оборудовании. Скрепление основы по механической технологии достигается уплотнением волокон иглами с зазубринами (иглопробивные нетканые материалы) или провязыванием её нитями, волокнами (вязально-прошивные нетканые материалы), а также свойлачиванием во влажной среде и повышенной температуре (валяльно-войлочные изделия). По физикохимической технологии волокна основы скрепляются связующими (клеёные нетканые материалы (bonded fabrics)). Комбинированная технология включает несколько способов скрепления основы. Нетканые материалы широко используются в технике (брезенты, сукна бумагоделательных машин, изоляционные полотна, фильтры и другое), медицине (перевязочные материалы, салфетки, хирургические халаты и куртки и другое) и быту (ватин, гардины, искусственный мех, ковры, махровые полотна, одеяла, основа искусственной кожи, покрывала, утепляющие прокладки для одежды, обуви и тому подобного и другое). Нетканые Материалы – текстильные изделия из волокон или нитей, соединённых между собой без применения методов ткачества. Крупное промышленное производство нетканых материалов появилось в 1940-е. Современные нетканые материалы – один из основных видов текстильной продукции во многих странах. В 1972 в мире было выпущено нетканых материалов более 3 миллиардов квадратных метров. (1) Материалы, Получаемые Физико-Химическими Способами:- большинство нетканых материалов, так называемые (i) Клеёные Нетканые Материалы, производят способами, при которых соединение волокон осуществляется с помощью связующих веществ (клеёв). Наиболее распространены клеёные нетканые материалы, основой которых является так называемый Волокнистый Холст (слой текстильных волокон, масса 1 м^2 которого составляет от 10 до 1 000 г и более). Чаще всего холст формируют механическим способом из нескольких слоёв прочёса, поступающего со съёмного барабана чёсальной машины. Холст получают аэродинамическим методом, при котором волокна снимаются с барабана чёсальной машины потоком воздуха и для формирования холста переносятся на сетчатый барабан (конденсор) или на горизонтальную сетку с максимальной скоростью до 100 м/мин и более. Холст можно получать также из водной дисперсии волокон на сетке бумагоделательной машины. В зависимости от особенностей склеивания волокон различают несколько способов получения клеёных нетканых материалов. (ii) Самый распространённый Способ основан на Пропитке Холста Жидким Связующим – синтетическим латексом. Холст погружают в ванну со связующим или распыляют связующее над поверхностью холста. Иногда применяют пропитку, сходную с нанесением рисунка на поверхность ткани методом печати. Пропитанный материал высушивают и подвергают обработке в термокамерах, нагреваемых горячим воздухом или инфракрасными излучателями. Холст обычно формируют из хлопка, смеси вискозных и полиамидных волокон или из отходов текстильного производства, в

том числе непрядомых. Получаемые этим способом нетканые материалы (скорость 50 м/мин и более) используют в качестве бортовочных и прокладочных материалов, для фильтров, как тепло- и звукоизоляционные материалы в автомобильной промышленности и другом. (iii) При Способе Горячего Прессования склеивание волокон осуществляется термопластами (полиамиды, полиэтилен, поливинилхлорид и другие) под давлением до 2 МН/м^2 (20 кгс/см^2) при повышенных температурах, обычно на специальных каландрах. Склеиванию предшествует термообработка слоя волокон, содержащего связующее, которое вводят в холст на стадии его формирования (в виде легкоплавких волокон, сетки, нитей и дрогого) или в уже сформированный холст (в виде порошка). (iv) При получении нетканых материалов С Использованием Бумагоделательных Машин (скорость 100 м/мин и более) связующее (латексы, легкоплавкие волокна и другие) вводят в массу, поступающую на машину, или в уже отлитое полотно. Такие нетканые материалы дёшевы, широко используются в производстве изделий однократного применения (постельного белья для гостиниц, полотенец, скатертей, перевязочных материалов). (v) При Фильерном Способе синтетические волокна, образующиеся на выходе из фильер прядильной машины, проходят через каналы, в которых вытягиваются в воздушном потоке, а затем при укладке на движущемся транспортёре образуют полотно. Сформированный материал чаще всего закрепляют связующим; в некоторых случаях используют липкость самих волокон. (vi) При Структурообразующем Способе получение нетканых материалов возможно без использования волокон:- полотно формируют в результате образования из растворов или аэрозолей полимеров конденсационных структур (в виде пористого, иногда волокнистого осадка, который может содержать наполнители, затем вымываемые) или отверждением пены и другим. Такие нетканые материалы ‘дышат’ подобно ткани. Их можно использовать вместо ткани или бумаги в технике (для фильтров и другого) и для бытовых целей. (2) Материалы, Получаемые Механическими Способами:- (i) при изготовлении Холстопрошивных Нетканых Материалов (технология Маливатт (Maliwatt) – бывшая Германская Демократическая Республика (ГДР), Арахне (Arachne) – бывшая Чехословакия и другие) в движущемся через вязально-прошивную машину холсте волокна закрепляются в результате прошивания их нитями, которые укладываются и соединяются так же, как при основовязании на трикотажной машине. Такие нетканые материалы используются в качестве теплоизоляционных (взамен тканого ватина и другого) или упаковочных материалов, как основа в производстве кожи искусственной и другого. Производительность одного агрегата 3–8 м/мин и более. (ii) Нитепрошивные Нетканые Материалы (материалы Малимо (Malimo) – бывшая ГДР) получают прошиванием одной или нескольких систем нитей. Эти нетканые материалы используют для декоративных целей, для пляжной и верхней одежды, полотенец и другого. Особый интерес представляют нитепрошивные нетканые материалы с ворсовыми провисающими петлями (полупетлями), которые успешно конкурируют с ткаными махровыми материалами (типа Фротте). (iii) Полотнопрошивные Нетканые Материалы изготавливают прошиванием текстильного полотна ворсовой пряжей (материал Малиполь (Malipol) – бывшая ГДР), применение которой способствует улучшению структуры и свойств полотна. Для этой цели используют ткань, материал Малимо и другое. Нетканые материалы для пальто и юбок прошивают шерстяной пряжей, основу для тафтинг-ковров (шириной 550 см) – ковровой пряжей с помощью игл, протаскивающих её через ткань. При обратном движении иглы пряжа захватывается держателем, в результате чего образуются петли. Для закрепления петель на изнанку ковра наносят связующее. Производительность машины 5 м^2/мин и более. (iv) С помощью вязально-прошивных машин изготавливают Нетканые Материалы Без Применения Нитей (материалы Вольтэкс (Voltex) – бывшая ГДР, Арабева (Arabeva) – бывшая Чехословакия и другие). Такие нетканые материалы могут состоять, например, из ткани и холста, полученного из длинных волокон. После протаскивания волокон из холста сквозь тканый каркас на изнаночной стороне нетканых материалов образуются прочные петли, а на лицевой стороне – пушистый и высокий ворс. Такие нетканые материалы применяют в качестве утепляющей прокладки в спортивной одежде и демисезонных пальто, для изготовления головных уборов, тёплой обуви и другого. (v) Наиболее перспективны Иглопробивные Нетканые Материалы, изготавливаемые путём перепутывания волокон в холсте и прошивании его иглами с зазубринами. Прокалывание материала происходит при движении доски с иглами вниз (до упора). При её движении вверх материал продвигается вперёд (производительность машин 5 м/мин). Такие нетканые материалы используют в качестве ковров, которые успешно конкурируют не только с ткаными, но и с тафтинг-коврами, так как для изготовления не требуют пряжи. Иглопробивные нетканые материалы применяют также в качестве одеял, сукон для бумагоделательных машин, фильтров и другого. (vi) К числу нетканых материалов относят и Валяльно-Войлочные Текстильные Материалы (смотрите Валяние), при изготовлении которых используется способность волокон шерсти к свойлачиванию (при механической или тепловлажностной обработке). В состав таких нетканых материалов иногда вводят каркас из ткани. Технология их получения имеет многовековую историю (таким образом получают, например, валенки).

NONWOVEN MEDIUM = НЕТКАНАЯ СРЕДА – Nonwoven Medium is a filter medium composed of a mat of fibers. / Нетканая Среда – фильтрующая среда, составленная из мата волокон.

NO OBSERVED ADVERSE EFFECT LEVEL = НЕ ОБНАРУЖИВАЕМЫЙ УРОВЕНЬ ВРЕДНОГО ВОЗДЕЙСТВИЯ – The No Observed Adverse Effect Level (NOAEL) is the greatest concentration or amount of a substance, found by experiment or observation, which causes no detectable adverse alteration of morphology, functional capacity, growth, development, or life span of the target organism under defined conditions of exposure.

NOODLES = БАЛДЫ (или ДУРНИ) – Noodles are a product of Rice flour. A food paste made from Rice flour, with egg, and shaped into long strands (ribbon form).

NO. OF EMPLOYEES = NUMBER OF EMPLOYEES

NO PAR SHARES = АКЦИИ БЕЗ НОМИНАЛА – No Par Shares are pseudo no par value shares. They represent a specific amount of share capital specified in the articles of association. In contrast to par value shares, however, this amount is not expressed in a cash amount; rather, the share certificates specify a certain number of shares, for instance 10 or 1 000 shares. The individual shareholder’s stake and the scope of his rights are determined by the relationship of the number of shares he holds to the total number of shares issued. The amount of share capital attributed to a single share must be at least EUR1.00. Any capital increase leading to a change in the stake merely requires a change in the articles of association but does not require an adjustment of the share certificate.

NO–PAR STOCK = АКЦИИ БЕЗ НОМИНАЛА – No-Par Stock:- shares issued by a corporation with no par value shown on the face of the share. Used most frequently in the United States. See also Par Value. / Акции Без Номинала – акции, эмитированные корпорацией без указания номинальной стоимости на их лицевой стороне. Наиболее часто используются в Соединённых Штатах Америки. Смотрите также Нарицательная Стоимость (Par Value).

NO PAR VALUE SHARES = АКЦИИ БЕЗ НАРИЦАТЕЛЬНОЙ СТОИМОСТИ – No Par Value Share:- instead of indicating a fixed amount of capital, no par value shares certify only a share ownership in the company without specifying its nominal or relative value, or a percentage of the share capital of the company. The share can represent a portion of the ordinary share capital (pseudo no par value share) or a percentage of the entire assets of the company (real no par value share). In the United States, No Par Value Shares are shares for which the articles of incorporation do not fix a par value and that may be issued for any consideration determined by the

board of directors. No-Par Value Shares do not have a fixed monetary value but are issued as a share in the company without specifying a nominal or relative size or portion of the share capital of the company. The share may represent part of ordinary share capital (pseudo no-par-value share) or a share of the total assets of the company (real no-par-value share).

NORAD = NORWEGIAN AGENCY FOR DEVELOPMENT COOPERATION

NORAGRIC = NORWEGIAN CENTRE FOR INTERNATIONAL AGRICULTURAL DEVELOPMENT

NORDIC COUNCIL = НОРДИЧЕСКИЙ СОВЕТ (или СЕВЕРНЫЙ СОВЕТ, или НОРДИЙСКИЙ СОВЕТ) – The Nordic Council was formed in 1952. The Council has 87 elected members from Denmark, Finland, Iceland, Norway and Sweden as well as from the three autonomous territories; the Faroe Islands, Greenland and Åland. The members of the Council are members of the national parliaments, who are nominated by the party groups. There is no procedure for direct election to the Nordic Council. The Nordic Council, which is run by a Presidium, gathers at an autumn meeting called the Session at which the Nordic parliamentarians make decisions on issues that they call on the Nordic governments to implement. The President, Vice-President and members of the Presidium for the forthcoming year are elected at the Session. The Presidency rotates between the countries. The Session is held in the country holding the Presidency. On-going political work in the Nordic Council is conducted through committees and party groups. The Nordic Council is managed by a Secretariat which shares its premises with the Nordic Council of Ministers' Secretariat in Copenhagen. There is also a national secretariat in each of the Nordic parliaments. The Nordic Council and the Nordic Council of Ministers share human relations, finance and service departments. Information activities are managed by a joint communications department. The Nordic Council, established in 1952, is directed toward supporting cooperation among Nordic countries in communications, cultural, economics, environmental, fiscal, legal and social areas. Members include:- Denmark, Finland, Iceland, Norway and Sweden. The Nordic Council is the official inter-parliamentary body in the Nordic Region. Political discussions are held with members of the governments of the five Nordic countries and the three autonomous territories at the annual Session of the Nordic Council. It is a unique form of international co-operation. The Nordic Council Secretariat headquartered in Copenhagen (København), Denmark. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Северный Совет, консультативная организация представителей парламентов стран Северной Европы. Основана в 1952. Участники:- Дания, Исландия, Норвегия, Швеция и Финляндия (с 1955).

NORDIC INVESTMENT BANK = НОРДИЧЕСКИЙ ИНВЕСТИЦИОННЫЙ БАНК (или СЕВЕРНЫЙ ИНВЕСТИЦИОННЫЙ БАНК, или НОРДИЙСКИЙ ИНВЕСТИЦИОННЫЙ БАНК) – The Nordic Investment Bank (NIB) promotes sustainable growth of its member countries by providing long-term complementary financing, based on sound banking principles, to projects that strengthen competitiveness and enhance the environment. NIB promotes competitiveness and supports the environment by providing financing in the form of loans and guarantees for activities in which NIB can add value and complement other financing sources. Moreover, the Bank continues to assess the environmental aspects of all its financing. NIB remains flexible in terms of supporting different areas of the economy but puts particular emphasis on projects involving:- (i) investments in infrastructure; (ii) investments improving the environment; (iii) large investments by the corporate sector; and (iv) small and medium-sized enterprises, targeted in cooperation with financial intermediaries. While maintaining focus on activities in the member countries, the Bank aims at continued expansion of activities in the neighbouring areas and in other countries where a mutual interest is identified. NIB carries out this strategy by proactively applying the Bank's relative strengths:- (i) NIB's status as an international financial institution, which facilitates the financing of cross-border activities and strengthens the possibilities to manage risks; (ii) the highest possible credit rating, which emanates from high asset quality, a strong balance sheet and ownership, and enables a stable supply of long-term financing; (iii) NIB's experience in complex financing structures in cooperation with other international financial institutions and public and private sector lenders; and (iv) the Bank's professional and highly motivated staff. 1976:- operations begin in August, after Denmark, Finland, Iceland, Norway and Sweden decided in 1975 to set up the Nordic Investment Bank. During its more than 30 years of operations, NIB has financed over 1 800 investment projects around the world, thereby contributing to business cooperation, investing activity and exports. Nordic Investment Bank's (NIB) goal is the promotion of economic cooperation and development among its members (Denmark, Finland, Iceland, Norway and Sweden). Headquartered in Helsinki, Finland. International financial institution of the Nordic and Baltic countries:- NIB finances projects that strengthen competitiveness and enhance the environment. The Bank offers long-term loans and guarantees on competitive market terms to its clients in the private and public sectors. NIB is an international financial institution owned by Denmark, Estonia, Finland, Iceland, Latvia, Lithuania, Norway and Sweden. In 2005 Estonia, Latvia and Lithuania become members of NIB. The Bank has lending operations both in its member countries and in emerging markets in:- Africa and the Middle East; Asia; Europe and Eurasia; and Latin America. NIB acquires the funds for its lending by borrowing on the international capital markets. NIB's bonds enjoy the highest possible credit rating. / Целью Северного Инвестиционного Банка (СИБ) является продвижение экономического сотрудничества и развития своих стран участниц (Дании, Исландии, Норвегии, Финляндии и Швеции).

NORFOLK JACKET = НОФЭКСКИЙ ЖАКЕТ – Norfolk Jacket is a loose-fitting belted single-breasted jacket with box pleats.

NORMAL CHARGE = НОРМАЛЬНЫЙ СБОР – Normal Charge is the specified general cargo rate without any quantity discount (aircargo). / В перевозках авиационных грузов, под Нормальным (от Латинского слова Normalis, означающее Прямой) Сбором понимается спецификационная ставка для генерального груза безо всякой скидки на количество.

NORMAL DISTRIBUTION = НОРМАЛЬНОЕ РАСПРЕДЕЛЕНИЕ (или НОРМАЛЬНЫЙ РАЗБРОС) – Normal Distribution is the spread of data on a graph showing the normal bell-shaped curve which is assumed to be a continuous frequency distribution of infinite range. / .

NORMAL FIBERS = НОРМАЛЬНЫЕ ВОЛОКНА – Normal Fibers are the fibers which, after swelling, appear rod-like with a discontinuous lumen. Normal fibers have no well defined convolutions.

NORMAL GENERAL CARGO RATE = НОРМАЛЬНАЯ СТАВКА ПО ГЕНЕРАЛЬНЫМ ГРУЗАМ – Normal General Cargo Rate:- the under 45 kg rate or, if no under 45 kg rate exists, the under 100 kg rate (aircargo). / В перевозках авиационных грузов, ставка до 45 килограммов (кг) или если ставки до 45 кг не существует, то ставка до 100 кг.

NORMAL MARKET SIZE = НОРМАЛЬНЫЙ РЫНОЧНЫЙ РАЗМЕР – Normal Market Size (NMS) is the smallest block of shares in a particular company for which market makers can quote a price. It is approximately equal to the average number of the company's shares traded in a day.

NORMAL ORDER = НОРМАЛЬНОЕ РАСПОРЯЖЕНИЕ – Normal Order is a spot order for the purchase or sale of securities traded on the Swiss Exchange. May be entered with (limited) or without (unlimited) an indication of price. See also Spot Transaction. / Распоряжение на немедленное исполнение покупки или продажи ценных бумаг, торгуемых на Швейцарской Бирже. Оно может сопровождаться указанием (ограничиваемой) цены, а может быть и без каких-либо ограничений цены. Смотрите также Безотлагательная Сделка (Spot Transaction).

NORMAL PARAFFIN = НОРМАЛЬНЫЙ ПАРАФИН – Normal Paraffin is a hydrocarbon consisting of molecules in which any carbon atom is attached to no more than two other carbon atoms. Also called Straight Chain Paraffin, Linear Paraffin, and Paraffin.

NORMAL PUBLICATION = НОРМАЛЬНАЯ ПУБЛИКАЦИЯ – Normal Publication is a regular 18-month publication or redacted publication.

NORR = NET OVERRIDING ROYALTY

NORTH AMERICA ELECTRIC RELIABILITY COUNCIL = СЕВЕРОАМЕРИКАНСКИЙ СОВЕТ ПО НАДЁЖНОСТИ ПОСТАВОК ЭЛЕКТРИЧЕСТВА (или СЕВЕРОАМЕРИКАНСКИЙ СОВЕТ ГАРАНТИРУЮЩИХ ПОСТАВЩИКОВ) – On 1968-June-01, the National Electric Reliability Council (NERC) was established by the electric utility industry, in response to the 1965 blackout (on 1965-November-09:- the largest blackout to this date in history occurred, as 30 million people lost power in the northeastern United States and southeastern Ontario, Canada. New York City and Toronto were among the affected cities. Some customers were without power for 13 hours). Nine regional reliability organizations were formalized under NERC. Also formalized were regional planning coordination guides, which NERC maintained. The North American Power Systems Interconnection Committee (NAPSIC) operations criteria and guides continued to be maintained and practiced voluntarily. The North American Electric Reliability Corporation's (NERC) mission is to ensure the reliability of the North American bulk power system. NERC is the electric reliability organization (ERO) certified by the Federal Energy Regulatory Commission to establish and enforce reliability standards for the bulk-power system. NERC develops and enforces reliability standards; assesses adequacy annually via a 10-year forecast, and summer and winter forecasts; monitors the bulk power system; and educates, trains and certifies industry personnel. ERO activities in Canada related to the reliability of the bulk-power system are recognized and overseen by the appropriate governmental authorities in that country. An industry group formed in 1968 by the electric utility industry to promote the reliability and adequacy of bulk power supply in the electric utility systems of North America. The North America Electric Reliability Council (NERC) consists of 10 regional reliability councils and encompasses essentially all the power regions of the contiguous United States, Canada, and Mexico. The NERC regions are:- Alaskan System Coordination Council (ASCC), East Central Reliability Coordination Agreement (ECAR), Electric Reliability Council of Texas (ERCO), Mid-America Interpool Network (MAIN), Mid-Atlantic Area Council (MAAC), Mid-Continent Area Power Pool (MAPP), Northeast Power Coordinating Council (NPCC), Southeastern Electric Reliability Council (SERC), Southwestern Power Pool (SPP), and Western System Coordinating Council (WSCC). Headquartered in Princeton, NJ, the United States. North American Electric Reliability Council (NERC) is a voluntary organization of US and Canadian utilities and power pools established to assure coordinated operation of the interconnected transmission systems. North American Electric Reliability Council (NERC) is a council formed in 1968 by the electric utility industry to promote the reliability and adequacy of bulk power supply in the electric utility systems of North America. NERC consists of ten regional reliability councils and encompasses essentially all the power regions of the contiguous United States, Canada, and Mexico. The NERC Regions are:- Alaskan System Coordination Council (ASCC); East Central Area Reliability Coordination Agreement (ECAR); Electric Reliability Council of Texas (ERCOT); Mid-America Interconnected Network (MAIN); Mid-Atlantic Area Council (MAAC); Mid-Continent Area Power Pool (MAPP); Northeast Power Coordinating Council (NPCC); Southeastern Electric Reliability Council (SERC); Southwest Power Pool (SPP); and Western Systems Coordinating Council (WSCC). / Отраслевая группа, образованная в 1968 производителями электроэнергии с целью повышения надёжности и соответствия требованиям поставки валовой энергии в энергетические системы Северной Америки. Северо-Американский Совет по Надёжности Поставок Электричества (САСНПЭ) состоит из 10 региональных советов и включает в себя все смежные регионы энергопотребления Соединённых Штатов Америки, Канады и Мексики. Сфера действия САСНПЭ включает:- Аляскинский Совет по Координации Системы (АСКС), Координационное Соглашение о Надёжности Восток Центр (КСНВЦ), Техасский Совет по Надёжности Поставок Электричества (ТСНПЭ), Центральноамериканская Сеть Взаимодействия (ЦАСВ), Совет Среднеатлантической Зоны (ССАЗ), Энергетическая Группа Среднеконтинентальной Зоны (ЭГСКЗ), Северо-Восточный Координационный Совет по Энергетике (СВКСЭ), Юго-Восточный Совет по Надёжности Поставок Электричества (ЮВСНПЭ), Юго-Западная Энергетическая Группа (ЮЗЭГ) и Координационный Совет Западной Системы (КСЗС). Штабквартира расположена в Принстоне, Штат Нью Джерси, Соединённые Штаты Америки.

NORTH AMERICAN FREE TRADE AGREEMENT = СЕВЕРОАМЕРИКАНСКОЕ СОГЛАШЕНИЕ О СВОБОДНОЙ ТОРГОВЛЕ – NAFTA is short for the North American Free Trade Agreement. NAFTA covers Canada, the United States and Mexico making it the world's largest free trade area (in terms of GDP). NAFTA was launched 20 years ago to reduce trading costs, increase business investment, and help North America be more competitive in the global marketplace. As of January 01, 2008, all tariffs between the three countries were eliminated. Between 1993–2009, trade tripled from USD297 billion to USD1.6 trillion. NAFTA was signed by President George Herbert Walker Bush, Mexican President Salinas, and Canadian Prime Minister Brian Mulroney in 1992. It was ratified by the legislatures of the three countries in 1993. The US House of Representatives approved it by 234 to 200 on November 17, 1993. The US Senate approved it by 60 to 38 on November 20, three days later. It was signed into law by President Bill Clinton on December 08, 1993 and entered force January 01, 1994. Although it was signed by President Bush, it was a priority of President Clinton's, and its passage is considered one of his first successes. The impetus for NAFTA actually began with President Ronald Reagan, who campaigned on a North American common market. In 1984, Congress passed the Trade and Tariff Act. This is important because it gave the President 'fast-track' authority to negotiate free trade agreements, while only allowing Congress the ability to approve or disapprove, not change negotiating points. Canadian Prime Minister Mulroney agreed with Reagan to begin negotiations for the Canada-US Free Trade Agreement, which was signed in 1988, went into effect in 1989 and is now suspended due to NAFTA. Meanwhile, Mexican President Salinas and President Bush began negotiations for a liberalized trade between the two countries. Prior to NAFTA, Mexican tariffs on US imports were 250% higher than US tariffs on Mexican imports. In 1991, Canada requested a trilateral agreement, which then led to NAFTA. In 1993, concerns about liberalization of labor and environmental regulations led to the adoption of two addendums to NAFTA. Article 102 of the NAFTA agreement outlines its purpose:- (i) grant the signatories Most Favored Nation status; (ii) eliminate barriers to trade and facilitate the cross-border movement of goods and services; (iii) promote conditions of fair competition; (iv) increase investment opportunities; (v) provide protection and enforcement of intellectual property rights; (vi) create procedures for the resolution of trade disputes; and (vii) establish a framework for further trilateral, regional and multilateral cooperation to expand NAFTA's benefits. NAFTA has eliminated trade barriers, increased investment opportunities, and established procedures for resolution of trade disputes. Most important, it has increased the competitiveness of the three countries involved on the global marketplace. This has become especially important with the launch of the European Union and the economic growth of China and other emerging market countries. In 2007, the EU replaced the US as the world's largest economy. Despite NAFTA's benefits, it has remained highly controversial. NAFTA's disadvantages are usually pointed out during Presidential campaigns. In 1992, before NAFTA was even ratified, Independent Presidential candidate Ross Perot famously warned that 'You're going to hear a giant sucking sound of jobs being pulled out of this country'. Ross predicted that the US would lose 5 million jobs – a whopping 4% of total US employment – to lower-cost Mexican workers. In fact, this never happened as Mexico entered a recession and the US entered a period of prosperity. True, American workers were displaced by low-cost Mexican imports. But research showed it was more like 2 000 per month. NAFTA

was attacked from all sides during the 2008 Presidential campaign. Barack Obama blamed NAFTA for growing unemployment. He said it helped businesses at the expense of workers in the US. It also did not provide enough protection against exploitation of workers and the environment along the border in Mexico. Hillary Clinton included NAFTA in her pledge to strictly enforce all existing trade agreements, as well as halt any new ones. Both candidates promised to either amend or back out of NAFTA all together. However, Obama hasn't done anything about NAFTA since becoming President. For more, see Has Obama Forgotten NAFTA Promise? In 2008, Republican candidate Ron Paul said he would abolish NAFTA. He said it was responsible for a NAFTA Superhighway and compared it to the European Union. However, unlike the EU, NAFTA does not enforce a single currency among its signatories. Paul has maintained this position in his 2012 campaign. Republican nominee John McCain supported NAFTA, as he did all free trade agreements. In fact, he wanted to enforce an existing section within NAFTA that promised to open up the US to the Mexican trucking industry. NAFTA stands for the North American Free Trade Agreement. Its objective was to help the United States and the other NAFTA members, Canada and Mexico, compete with the growing European trade area. It took three Presidents to make it happen – Reagan, Bush and Clinton – but it was finally signed in 1993. Nearly 20 years later, trade has more than quadrupled. However, success for many came with at a cost for quite a few. As a result, this massively important agreement has become a controversial lightning rod during every election. Find out who benefits from NAFTA, who suffered the consequences, and whether the world's largest trade agreement was worth it. NAFTA was created to strengthen economies of the United States, Mexico and Canada. It is also blamed for taking away US jobs and hurting Mexico's farmers and its environment. On 1994-January-01, the North American Free Trade Agreement (NAFTA) between the United States, Canada, and Mexico entered into force. All remaining duties and quantitative restrictions were eliminated, as scheduled, on 2008-January-01. NAFTA created the world's largest free trade area, which now links 444 million people producing USD17 trillion worth of goods and services. Trade between the United States and its NAFTA partners has soared since the agreement entered into force. US goods and services trade with NAFTA totaled USD1.1 trillion in 2008 (latest data available for Goods and Services trade). Exports totaled USD482 billion; Imports totaled USD596 billion. The US goods and services trade deficit with NAFTA was USD114 billion in 2008. The United States has USD735 billion in total (two ways) goods trade with NAFTA countries (Canada and Mexico) during 2009. Goods exports totaled USD334 billion; Goods imports totaled USD401 billion. The US goods trade deficit with NAFTA was USD68 billion in 2009. Trade in services with NAFTA (exports and imports) totaled USD110 billion in 2008 (latest data available). Services exports were USD69.8 billion; Services imports were USD40.2 billion. The US services trade surplus with NAFTA was USD29.6 billion in 2008. Exports:- The NAFTA countries (Canada and Mexico), were the top two purchasers of US exports in 2009. Canada USD204.7 billion and Mexico USD129.0 billion. US goods exports to NAFTA in 2009 were USD333.7 billion, down 19.1% (USD79 billion) from 2008, but 102% from 1994 (the year prior to Uruguay Round) and up 135% from 1993 (the year prior to NAFTA). US exports to NAFTA accounted for 31.6% of overall US exports in 2009, down slightly from 32.2% in 1994. The top export categories (2-digit HS) in 2009 were:- Machinery (USD52.0 billion), Electrical Machinery (USD44.2 billion), Vehicles (parts) (USD41.4 billion), Plastic (USD18.5 billion), and Mineral Fuel and Oil (USD17.4 billion). US exports of agricultural products to NAFTA countries totaled USD28.6 billion in 2009. Leading categories include:- red meats, fresh/chilled/frozen (USD2.5 billion), coarse grains (USD2.1 million), fresh fruit (USD1.7 billion), snack foods (excluding nuts) (USD1.7 billion), and fresh vegetables (USD1.7 billion). US exports of private commercial services (i.e. excluding military and government) to NAFTA were USD69.8 billion in 2008 (latest data available), up 5.6% (USD3.7 billion) from 2007, and up 146% since 1994. Imports:- The NAFTA countries were the second and third largest suppliers of goods imports to the United States in 2009. Canada USD224.9 billon, and Mexico USD176.5 billion. US goods imports from NAFTA totaled USD401.4 billion in 2009, down 27.7% (USD154 billion), from 2008, but 126% from 1994, and up 166% from 1993. US imports from NAFTA accounted for 25.8% of overall US imports in 2009, down from 26.9% in 1994. The five largest categories in 2009 were Mineral Fuel and Oil (crude oil) (USD89.0 billion), Vehicles (USD58.5 billion), Electrical Machinery (USD54.1 billion), Machinery (USD37.8 billion), and Special Other (returns) (USD12.2 billion). US imports of agricultural products from NAFTA countries totaled USD26.1 billion in 2009. Leading categories include:- fresh vegetable (USD3.7 billion), snack foods, (including chocolate) (USD3.4 billion), fresh fruit (excluding bananas) (USD2.1 billion), processed fruit and vegetables (USD1.9 billion), and wine and beer (USD1.7 billion). US imports of private commercial services (i.e. excluding military and government) were USD40.2 billion in 2008 (latest data available), up 0.5% (USD207 million) from 2007, and up 127% since 1994. Trade Balances:- The US goods trade deficit with NAFTA was USD67.7 billion in 2009, a 52.7% decrease (75 billion) over 2008. The US goods trade deficit with NAFTA accounted for 13.5% of the overall US goods trade deficit in 2009, up from 8.7% in 1994. The United States had a services trade surplus of USD29.6 billion with NAFTA countries in 2008 (latest data available). Investment:- US foreign direct investment (FDI) in NAFTA Countries (stock) was USD322.9 billion in 2008 (latest data available), down 0.7% from 2007. The US direct investment in NAFTA Countries is in the finance/insurance, nonbank holding companies, manufacturing and mining sectors. NAFTA Countries FDI in the United States (stock) was USD229.8 billion in 2008, up 7.3% from 2007 (latest data available). NAFTA countries direct investment in the United States is in the finance/insurance, manufacturing, and banking sectors. The North American Free Trade Agreement (NAFTA) is a proposed free trade agreement that would comprise Canada, Mexico and the United States, exceeding 360 million consumers and a combined output of USD6 trillion – 20 percent larger than the European Community in 1994. Preferential rates of duty in the special subcolumn of column. 1 followed by the symbol 'CA' are applicable to eligible goods of Canada, and those followed by the symbol 'MX' are applicable to eligible goods of Mexico, under the North American Free Trade Agreement, as provided in general note 12 to the HTS, effective January 01, 1994. NAFTA, or the North American Free Trade Agreement, was created 20 years ago to expand trade between the United States, Canada and Mexico. It's secondary purpose was to make these countries more competitive in the global marketplace. It has been wildly successful in achieving this. NAFTA is now the largest free trade agreement in the world. Why, then, is NAFTA so severely criticized? This success has come with a cost. One of the problems with NAFTA is that it's reduced US jobs. A second disadvantage is that it has exploited Mexico's farmers and its environment? Find out more about the how and why was NAFTA created, and whether it has successfully fulfilled its purpose. History and Purpose of NAFTA:- NAFTA was designed to make trade easier. It took three US Presidents over a decade to get NAFTA off the ground. President Ronald Reagan conceived of a North American trade agreement to compete with the Treaty of Rome, later to become the European Union. In fact, NAFTA and the EU's Treaty of Maastricht were both signed in 1993. The EU is now the world's largest economy (USD15.3 trillion GDP in 2011), but if you combined the economies of NAFTA's members – the United States (USD15.04 trillion), Canada (USD1.389 trillion) and Mexico (USD1.657 trillion) – it would be easily be the largest, at USD18.086 trillion. Advantages of NAFTA:- NAFTA lowers gas prices. By easing making trade between 444 million people in three countries, NAFTA has more than tripled trade in less than 20 years. Trade between its members – the United States, Canada and Mexico – grew from USD297 billion in 1993 to USD1.6 trillion in 2009 (latest figures available). US exports increased from USD142 billion to a peak of USD452 billion in 2007. US farm exports benefited from lower Mexican tariffs, and grew 156%. Services, such as banking and health care, quadrupled between 2003 and the 2007 peak. The US was a beneficiary of low-cost imports from Canada and Mexico, which increased from USD151 billion to a record USD568 billion in 2007. NAFTA reduced gas and food prices, by removing tariffs on Mexican oil imports. The 2008 financial crisis put a damper on trade, so that by 2009 US exports had only risen to USD438 billion, while imports had only recovered to USD397 billion. Disadvantages of NAFTA:- NAFTA costs US jobs. Growth comes with costs, and NAFTA was no exception. The economies of all three countries benefited, but some sectors suffered for it. NAFTA is criticized for destroying American jobs and lowering US wages. Others accuse NAFTA of exploiting Mexico's

workers, destroying its farms and polluting its environment. In addition, NAFTA increases the US trade deficit. How did NAFTA contribute to these problems? First, NAFTA cost more than half a million jobs, as manufacturers moved to Mexico to take advantage of lower labor costs. The four states that suffered the most were California, New York, Michigan and Texas because they had had a high concentration of motor vehicles, textiles, computers, and electrical appliances industries. Lower wages in Mexico meant that workers in the remaining US factories could not bargain for higher wages. Companies could now threaten to move to Mexico if labor unions negotiated too hard. Mexicans suffered, too. Rural Mexican farmers could not compete with low-cost corn and other grains that were exported by subsidized US farm corporations. NAFTA put more than a million Mexican farmers were out of business. The ones that remained were forced to use more fertilizers and farm marginal land, resulting in more pollution and deforestation. Labor was cheap in Mexico because they had no labor rights or health protection. Thanks to NAFTA, nearly a third of Mexico's labor force were in this 'maquiladora' program. One NAFTA disadvantage was prevented. NAFTA called for unlimited transportation between the three member countries. This would have created a dangerous situation, since Mexican trucks were not up to US safety standards, and Mexican roads could not have carried the heavier US trucks. This problem was averted in 2008, when Congress prohibited this portion of NAFTA from ever being carried out. US Regional Trade Agreements:- whenever other regional trade agreements are being proposed or negotiated, the facts about NAFTA are brought up over and over again. Find out how NAFTA fits within the context of other US regional trade agreements, such as the Dominican Republic-Central America-United States Free Trade Agreement (CAFTA-DR), the Free Trade Area of the Americas (FTAA), and the Middle East Free Trade Initiative (MEFTI)? North American Free Trade Agreement (NAFTA) is a trilateral agreement on trade, including agricultural trade, between Canada, Mexico and the United States, phasing out tariffs and revising other trade rules between the three countries over a 15-year period. The agreement was signed in December 1992 and came into effect on 01 January 1994. In 2018, a new agreement between the United States, Mexico and Canada (USMCA) was signed. It is scheduled to come into effect on 01 July 2020 and replace NAFTA. In 1988 Canada and the United States signed the Canada-United States Free Trade Agreement after which the US Congress approved implementing legislation. The American government then entered into negotiations with the Mexican government for a similar treaty, and Canada asked to join the negotiations in order to preserve its perceived gains under the 1988 deal. The climate at the time favored expanding trade blocs, such as the Maastricht Treaty (signed on 07 February 1992), which created the European Union in 1992. Following diplomatic negotiations dating back to 1986 among the three nations, the leaders met in San Antonio, Texas, on 1992-December-17, to sign NAFTA. US President George Herbert Walker Bush, Canadian Prime Minister Brian Mulroney and Mexican President Carlos Salinas, each responsible for spearheading and promoting the agreement, ceremonially signed it. The agreement then needed to be ratified by each nation's legislative or parliamentary branch. The goal of NAFTA was to eliminate barriers of trade and investment between the US, Canada and Mexico. The implementation of NAFTA on 1994-January-01, brought the immediate elimination of tariffs on more than one half of US imports from Mexico and more than one third of US exports to Mexico. Within 10 years of the implementation of the agreement, all US-Mexico tariffs would be eliminated except for some US agricultural exports to Mexico that were to be phased out in 15 years. Most US-Canada trade was already duty free. NAFTA also seeks to eliminate non-tariff trade barriers. / выработка (output). Бил Клынтчэн (Bill Clinton). Рос Пэро (Ross Perot). Барак Обама (Barack Obama). Хиллари Клынтчэн (Hillary Clinton). Рон Пал (Ron Paul). Дьжон МэКэйн (John McCain). Президент США Ранэлд Вилсэн Рэйген (Ronald Wilson Reagan; 1911–2004). были в этой программе 'макилядора' (или программе 'экспортной переработки' ('maquiladora' program)). Президент США Дьжодьж Хобэтч Вокё Бош (George Herbert Walker Bush; 1924–2018), Канадский Премьер Министр Брайэн Малрони (Brian Mulroney) и Мексиканский Президент Карлос Салинас (Carlos Salinas). Северо-Американское Соглашение о Свободной Торговле (The North American Free Trade Agreement; CACCT, или более привычное название, которое звучит на Английском языке как НАФТА (NAFTA)) предполагает соглашение о свободной торговле, которое включало бы Канаду, Мексику и Соединённые Штаты Америки, превосходящее 360 миллионов потребителей и объёдинённый выпуск продукции на сумму порядка 6 триллионов Долларов США (что на 20 процентов выше, чем у Европейского Сообщества в 1994). Трилатеральный (Trilateral), от Латинского слова Trilaterus, означающее Трёхсторонний, от Tri, в сложных словах означающее Три, и Latus, родительный падеж Lateris, означающее Сторона.

NORTH AMERICAN INDUSTRY CLASSIFICATION SYSTEM = СЕВЕРОАМЕРИКАНСКАЯ СИСТЕМА ПРОМЫШЛЕННОЙ КЛАССИФИКАЦИИ – The North American Industry Classification System (NAICS; pronounced 'Nakes') is the standard used by Federal statistical agencies in classifying business establishments for the purpose of collecting, analyzing, and publishing statistical data related to the US business economy. NAICS was developed under the auspices of the Office of Management and Budget (OMB), and adopted in 1997 to replace the Standard Industrial Classification (SIC) system. It was developed jointly by the US Economic Classification Policy Committee (ECPC), Statistics Canada, and Mexico's Instituto Nacional de Estadistica y Geografia, to allow for a high level of comparability in business statistics among the North American countries. The North American Industry Classification System (NAICS) is a coding system developed jointly by the United States, Canada and Mexico to classify business and industries according to the type of economic activity in which they are engaged. NAICS replaces the Standard Industrial Classification (SIC) codes. Developed in cooperation with Canada and Mexico, the North American Industry Classification System (NAICS) represents one of the most profound changes for statistical programs focusing on emerging economic activities. NAICS, developed using a production-oriented conceptual framework, groups establishments into industries based on the activity in which they are primarily engaged. Establishments using similar raw material inputs, similar capital equipment, and similar labor are classified in the same industry. In other words, establishments that do similar things in similar ways are classified together. NAICS provides a new tool that ensures that economic statistics reflect our Nation's changing economy. However, improved statistics will result in time series breaks. Every sector of the economy has been restructured and redefined: A new Information sector combines communications, publishing, motion picture and sound recording, and online services, recognizing our information-based economy. Manufacturing is restructured to recognize new high-tech industries. A new sub-sector is devoted to computers and electronics, including reproduction of software. Retail Trade is redefined. In addition, eating and drinking places are transferred to a new Accommodation and Food Services sector. The difference between Retail and Wholesale is now based on how each store conducts business. For example, many computer stores are reclassified from wholesale to retail. Nine new service sectors and 250 new service industries are recognized. NAICS uses a six-digit hierarchical coding system to classify all economic activity into twenty industry sectors. Five sectors are mainly goods-producing sectors and fifteen are entirely services-producing sectors. This six-digit hierarchical structure allows greater coding flexibility than the four-digit structure of the SIC. NAICS allows for the identification of 1 170 industries compared to the 1 004 found in the SIC system. NAICS 2007 includes revisions to NAICS 2002 across several sectors. The most significant revisions are in the Information Sector, particularly within the Telecommunications area. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

NORTH AMERICAN PLANT PROTECTION ORGANIZATION = СЕВЕРО–АМЕРИКАНСКАЯ ОРГАНИЗАЦИЯ ПО ЗАЩИТЕ РАСТЕНИЙ – The activities of The North American Plant Protection Organization (NAPPO) shape the regulatory framework for commerce involving plants and plant products within and beyond the North American region. For this reason, the work of NAPPO is relevant and important to a variety of industries ranging from plant-based agriculture and horticulture to forestry to transportation.

NAPPO has evolved to embrace active industry participation and funding support. The depth and breadth of industry participation in NAPPO is unique among regional plant protection organizations, and was highlighted as a key NAPPO strength in a recent external organizational review. NAPPO offers industry experts the opportunity to be involved in the design, and successful implementation, of regional standards governing plant protection and trade. From an industry perspective, if government develops standards without robust industry input, they may not be practical or realistic, and therefore not supported, adopted and adhered to by industry. The North American Plant Protection Organization (NAPPO) is a regional plant protection organization of the International Plant Protection Convention that coordinates the efforts among Canada, the United States and Mexico to protect their plant resources from the entry, establishment and spread of regulated plant pests, while facilitating intra/interregional trade. Headquartered in Ottawa, ON, Canada. NAPPO's mission:- Provide a forum for public and private sectors in Canada, the United States and Mexico to collaborate in the development of science-based standards intended to protect agricultural, forest and other plant resources against regulated plant pests, while facilitating trade. Participate in related international cooperative efforts. Structure of NAPPO:- NAPPO Executive Committee is the principle persons or designated alternate, representing the plant protection organization within each of the NAPPO countries; NAPPO Executive Director is the person appointed by the Executive Committee who is responsible for the financial and administrative operations of NAPPO and direction of the secretariat, panels and the working group (new); NAPPO Panel is a designated group charged with developing information and recommendations in its specific area of expertise; NAPPO Secretariat is the office consisting of the NAPPO Executive Director, the Executive Assistant, the Translator/Interpreter and such other staff required to achieve the NAPPO objectives as described in the NAPPO Constitution and By-Laws and the annual work plan (new); NAPPO Standards Panel is the panel responsible for oversight of standard setting activities within NAPPO; and NAPPO Working Group is the group consisting of a person designated by each of the executive committee members from the three NAPPO countries, chaired by the executive director, and responsible to ensure the continuity of NAPPO between annual meetings. The North American Plant Protection Organization has established itself as a key player in plant protection, both regionally and internationally, since its creation in 1967. It is a unique forum for public/private sectors and NGOs to collaborate in the protection of the plant resources (agricultural and forestry) of North America. International movement of goods and people continues to increase at a rapid pace and protection of plant resources is best achieved using a continental approach. Plant pests do not respect international boundaries. A renewed strategic plan and a solidified funding base will allow NAPPO to build on past achievements and develop strategies and actions to prepare for the ever-increasing plant protection challenges of the XXI century.

NORTH ATLANTIC COOPERATION COUNCIL = СЕВЕРОАТЛАНТИЧЕСКИЙ СОВЕТ ПО СОТРУДНИЧЕСТВУ – North Atlantic Cooperation Council (NACC): - against the background of these events, 1991 was marked by an intensification of visits and diplomatic contacts between NATO and the countries of Central and Eastern Europe in accordance with the decisions taken by NATO Heads of State and Government in London. With the publication of the Rome Declaration in November 1991, the basis was laid for placing this evolving relationship on a more institutionalised footing. The establishment of the North Atlantic Cooperation Council (NACC) in December 1991 brought together the member countries of NATO and, initially, nine Central and Eastern European countries, in a new consultative forum. In March 1992, participation in the NACC was expanded to include all members of the Commonwealth of Independent States and by June 1992, Georgia and Albania had also become members. The inaugural meeting of the NACC took place on 20 December 1991, just as the Soviet Union was ceasing to exist. Simultaneously, 11 former Soviet republics became members of the new Commonwealth of Independent States, entering a period of intense political and economic transformation, both internally and with respect to their international relations. Against this background, regional problems became increasingly dominant. In Nagorno-Karabakh, Moldova, Georgia and elsewhere, outbreaks of violence occurred and serious intra- and inter-state tensions developed. However it was the deteriorating situation, continuing use of force and mounting loss of life in the territory of the Former Yugoslavia which were the major causes of concern, marring the prospects for peaceful progress towards a new security environment in Europe. From the start of the crisis, the North Atlantic Council and the North Atlantic Cooperation Council consulted and supported efforts undertaken in other fora to restore peace. During the same period, discussion of measures designed to strengthen the role of the CSCE in promoting stability and democracy in Europe, including proposals outlined in the Rome Declaration issued by the Alliance, culminated in the signature of the 1992 Helsinki Document ('The Challenges of Change') at the CSCE Summit Meeting held in July 1992. The document described, inter alia, new initiatives for the creation of a CSCE forum for security cooperation and for CSCE peacekeeping activities, for which both the North Atlantic Council and the North Atlantic Cooperation Council expressed full support. In 1997, the North Atlantic Cooperation Council was replaced by the Euro-Atlantic Partnership Council (EAPC). 2011:- The EAPC brings together the 28 Allies and 22 Partner countries. The North Atlantic Cooperation Council (NACC), established in December 1991, is an extension of the North Atlantic Treaty Organization (NATO) made up of 35 members (in 1995) with the purpose of forming a forum to discuss cooperation concerning mutual political and security issues. The North Atlantic Cooperation Council (NACC) was a NATO organisation founded in December 1991 and was the precursor to the Euro-Atlantic Partnership Council. It initially brought together NATO and nine central and eastern European nations in a consultative forum. By March 1992, all members of the CIS joined, with Georgia and Albania becoming members in June of that year. / Штабквартира расположена в Брюсселе, Бельгия.

NORTH ATLANTIC TREATY ORGANIZATION = ОРГАНИЗАЦИЯ СЕВЕРОАТЛАНТИЧЕСКОГО ТРАКТАТА – If the Marshall Plan had military objectives (containment of Soviet influence) as much as economic ones (creation of markers for US industry), then NATO has a civilian, political and ideological role as much as a military one. NATO has been relatively neglected by students of 'supranational' organisations, and it is often Presumed to be just a treaty rather than a quasigovernmental organisation in its own right. Its highest political body, the North Atlantic Council, covers foreign policy issues as well as strictly military questions, and the North Atlantic Assembly works to influence the parliamentary members of individual countries. It falls within the brief of NATO to conduct propaganda and defend states the 'infiltration of ideas'. Few citizens of NATO countries are aware of the whole apparatus to which membership commits them, e.g., Plans 10 G and 100-1 under which in 'emergency situations' special US units would be activated to suppress any movement 'threatening to US strategic interests'. The North Atlantic Treaty Organization (NATO) is an Alliance that consists of 28 independent member countries. NATO members include (2011):- Albania, Belgium, Bulgaria, Canada, Croatia, Czech Republic, Denmark, Estonia, France (which has only partial membership), Germany, Greece, Hungary, Iceland, Italy, Latvia, Lithuania, Luxembourg, the Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Turkey, the United Kingdom, and the United States. With the end of 'cold war', NATO's role, originally defense-oriented is being redefined. The Marshall Plan and NATO:- the official version of the history of the creation of the Atlantic system reads like the lives and teachings of saints (Milward, 1992). in these school textbook accounts, each of the pillars of the post-war world order has its great founding father, whose photographs invariably appear in magazine articles:- (i) the IMF and the World Bank are the work of Keynes; (ii) European economic recovery is tee work of General Marshall NATO is the work of Ernest Bevin; and (iii) the European Community is the work of Jean Monnet (with his faithful discipline Schuman). These are not just myths; they are, in intelligence parlance, more like 'cover stories'. The Marshall Plan is named after the speech on 1947-June-05 by US Secretary of State Marshall, which invited European countries to join in a co-operative plan for economic reconstruction, with explicit requirements for trade liberalisation and increases in productivity. Over the next ten months there emerged the Foreign Assistance Act of 1948, which set up the Economic Co-operation Agency (ECA) to administer the

European Recovery Programme (ERP) – the so-called 'Marshall Aid' – which gave USD13 billion in aid to 16 western European states. In four years, the ECA was superseded by the Mutual Security Agency (MSA) in 1951 which in turn was transformed into the Foreign Operations Agency (FOA) in 1954, later the International Co-operation Agency (ICA) in 1955 and finally the Agency for International Development (AID) in 196l (Carew 1987 p. 6ff). it is generally recognised that this aid had a decidedly militaristic purpose, being essentially a prerequisite for the development of NATO. It is less generally acknowledged, however, that this unprecedented exercise of international generosity (dubbed by Churchill the 'most unsordid act in history') served direct economic purposes for the internationally oriented US corporations which promoted it. William Clayton, for example, the Under-secretary for Economic Affairs, whose tour of Europe and letters sent back to Washington played a key role in preparing the plan, and who pushed it through Congress, personally profited to the tune of USD700 000 a year; and his own company, Anderson, Clayton & Co. secured USD10 million of Marshall, Plan orders up to the summer of 1949. (Schuman 1954 p. 240). General Motors similarly got USD5.5 million worth of orders between July 1950 and 1951 (14.7% of the total) and they Ford Motor Company got USD1 million (4.2% of the total). The North Atlantic Treaty, signed in Washington on 1949-April-04, created an Alliance for collective defence as defined in Article 51 of the United Nations Charter. The Treaty is of indefinite duration. The NATO emblem was adopted as the symbol of the Atlantic Alliance by the North Atlantic Council in October 1953. The circle is the symbol of unity and cooperation and the compass rose suggests the common road to peace taken by the member countries. From 1945 to 1949, faced with the pressing need for economic reconstruction, Western European countries and their North American allies viewed with concern the expansionist policies and methods of the USSR. Having fulfilled their own post-war undertakings to reduce their defence establishments and demobilize their forces, Western governments grew increasingly alarmed as it became clear that the Soviet leadership intended to maintain its own military forces at full strength. Moreover, in view of the declared ideological aims of the Soviet Communist Party, it was evident that appeals for respect for the United Nations Charter, and for respect for the international settlements reached at the end of the Second World War, would not guarantee the national sovereignty or independence of democratic states faced with the threat of outside aggression or internal subversion. The imposition of undemocratic forms of government and the repression of effective opposition and basic human and civil rights and freedoms in many Central and Eastern European countries, as well as elsewhere in the world, compounded these fears. Between 1947 and 1949 a series of dramatic political events brought matters to a head. These included direct threats to the sovereignty of Norway, Greece, Turkey and other Western European countries, the June 1948 coup in Czechoslovakia, and the illegal blockade of Berlin which began in April of the same year. The signature of the Brussels Treaty in March 1948 marked the determination of five Western European countries – Belgium, France, Luxembourg, the Netherlands and the United Kingdom – to develop a common defence system and to strengthen the ties between them in a manner which would enable them to resist ideological, political and military threats to their security. The Brussels Treaty represented the first step in the post-war reconstruction of western European security and brought the Western Union Defence Organisation into being. It was also the first step in the process leading to the signature of the North Atlantic Treaty in 1949 and the creation of the North Atlantic Alliance. Negotiations with the United States and Canada then followed on the creation of a single North Atlantic Alliance based on security guarantees and mutual commitments between Europe and North America. Denmark, Iceland, Italy, Norway and Portugal were invited by the Brussels Treaty powers to become participants in this process. These negotiations culminated in the signature of the Washington Treaty in April 1949, which introduced a common security system based on a partnership among these 12 countries. The North Atlantic Treaty is signed on 1949-April-04 in Washington by Belgium, Canada, Denmark, France, Iceland, Italy, Luxembourg, the Netherlands, Norway, Portugal, the United Kingdom and the United States. North Atlantic Treaty Organisation (NATO) was created by the Washington Treaty in 1949 to provide collective defence for its members. NATO's purpose is primarily to safeguard the freedom and security of all its members by political and military means, to uphold the values of democracy, human rights and the rule of law and contribute to peace and stability of the entire Euro-Atlantic region. To achieve this, NATO performs the following security tasks:- (i) Security:- To provide one of the indispensable foundations for a stable Euro-Atlantic security environment, based on the growth of democratic institutions and commitment to the peaceful resolution of disputes, in which no country would be able to intimidate or coerce any other through the threat or use of force. (ii) Consultation:- To serve, as provided for in Article 4 of the Washington Treaty, as an essential transatlantic forum for Allied consultations on any issues that affect their vital interests, including possible developments posing risks for members' security, and for appropriate co-ordination of their efforts in fields of common concern. (iii) Deterrence and Defence:- To deter and defend against any threat of aggression against any NATO member state as provided for in Articles 5 and 6 of the Washington Treaty. And in order to enhance the security and stability of the Euro-Atlantic area:- (i) Crisis Management:- To stand ready, case-by-case and by consensus, in conformity with Article 7 of the Washington Treaty, to contribute to effective conflict prevention and to engage actively in crisis management, including crisis response operations. (ii) Partnership:- To promote wide-ranging partnership, cooperation, and dialogue with other countries in the Euro-Atlantic area, with the aim of increasing transparency, mutual confidence and the capacity for joint action with the Alliance. Headquartered in Brussels, Belgium. Some historical moments:- 1950 – The Korean war increases fears of Communist expansionism. 1951 – Supreme Headquarters Allied Powers Europe (SHAPE) opens near Paris. 1952 – Greece and Turkey join NATO. 1955 – The Federal Republic of Germany joins NATO; The Warsaw Pact is formed. 1956 – In the wake of Allied differences over the Suez crisis, the report of the Three Wise Men (foreign ministers of Canada, Italy and Norway) on non-military cooperation sets guidelines for political consultation among Allies and the development of NATO's political role. The Soviet Union crushes the Hungarian uprising. 1957 – Launching of Sputnik suggests Soviet long-range capability. 1961 – Erection of the Berlin wall. 1962 – Cuban missile crisis. 1966 – France withdraws from NATO's integrated military structure. 1967 – NATO HQ and SHAPE relocate to Belgium. The Harmel Doctrine defines NATO's two main future tasks as defence and détente. The Allies adopt a strategy of 'flexible response', integrating nuclear weapons into the whole of NATO's force structure and adopting high-readiness levels. 1968 – Warsaw Pact armed forces invade Czechoslovakia. 1970 – The Nuclear Non-Proliferation Treaty is signed. 1972 – US-Soviet agreements on strategic arms limitations (SALT I) and anti-ballistic missile systems are signed. 1973 – The Conference on Security and Cooperation in Europe (CSCE) opens in Helsinki. In Vienna, NATO and Warsaw Pact countries begin talks on mutual and balanced reductions in conventional forces. 1974 – Oil price hikes provoke global recession. NATO's concept of security widens to include economic factors. 1975 – The Helsinki Final Act of the CSCE recognizes Europe's existing frontiers and pledges respect for human rights and fundamental freedoms. 1979 – SALT II is signed but not ratified due to the Soviet deployment of SS-20s and the invasion of Afghanistan. NATO's double-track decision to deploy Pershing and Cruise missiles, while also pursuing arms control and confidence-building initiatives, paves the way for negotiations on intermediate-range nuclear weapons. 1981 – Martial law is declared in Poland in the wake of strikes, demonstrations and food shortages. US-Soviet talks on intermediate-range nuclear forces (INF) begin. 1982 – Spain joins the Alliance (and the integrated military structure in 1998). US-Soviet strategic arms reduction talks (START) begin but in December the Soviet side walks out of all arms control negotiations. 1985 – Mikhail Gorbachev comes to power, initiating a process of reform and openness, and rapprochement with the West. 1987 – The INF treaty is signed. 1988 – Warsaw Pact countries announce major reductions in conventional forces. Soviet troops start withdrawing from Afghanistan. 1989 – The Berlin Wall falls, signalling revolutionary change in the former Eastern bloc and the decline of Communism. 1990 – Allied leaders meet in London to adopt a plan to develop cooperation between East and West. Germany is reunified. 1991 – The Warsaw Pact is dissolved and the Soviet Union breaks up. Allied leaders adopt a new Strategic Concept reflecting Europe's new security environment, reorganize

NATO's military command structure, and create the North Atlantic Cooperation Council (NACC) as a forum for consultation and cooperation with new partner countries. 1992 – NATO offers to support UN peacekeeping activities in the former Yugoslavia. 1994 – NATO launches the Partnership for Peace (PfP) programme. NATO adopts the Combined Joint Task Forces (CJTF) concept designed to provide more mobile, flexible multinational forces to strengthen the European security and defence role. 1995 – NATO launches the Mediterranean Dialogue. NATO conducts air operations in Bosnia and Herzegovina against Bosnian Serb forces for 12 days in August and September paving the way for the Dayton Peace Agreement. Following the civil war in Bosnia and Herzegovina, a NATO-led Implementation Force (IFOR) deploys to the country with a UN mandate to implement the military aspects of the Dayton peace accords. 1996 – Russian forces deploy as part of IFOR along with many other NATO Partner countries. IFOR is succeeded by the Stabilisation Force (SFOR). 1997 – The NATO-Russia Founding Act on Mutual Relations, Cooperation and Security is signed, establishing the NATO-Russia Permanent Joint Council. The Euro-Atlantic Partnership Council (EAPC) replaces the NACC. The Charter on a Distinctive Partnership between NATO and Ukraine is signed, establishing the NATO-Ukraine Commission. 1999 – The Czech Republic, Hungary and Poland join the Alliance. NATO conducts an air campaign to end ethnic cleansing in Kosovo. At NATO's 50th anniversary Summit in Washington, Allied leaders adopt a new Strategic Concept and launch a series of initiatives to prepare NATO for the XXI century. A UN-mandated, NATO-led peacekeeping force (KFOR) deploys to Kosovo, where a UN interim administration mission is set up. 2000 – The Russian parliament ratifies the Comprehensive Test Ban treaty and START II. EU-NATO working groups are set up to define new forms of cooperation between the EU and NATO based on the principle of non-duplication and the need to strengthen the European role in the Alliance. 2001 – On the request of President Trajkovski, NATO deploys forces to the former Yugoslav Republic of Macedonia to help disarm extremists in the country and to protect civilian monitors. NATO helps to defuse the risk of civil conflict in Southern Serbia. On 11 September, large-scale terrorist attacks are perpetrated against the United States. For the first time the North Atlantic Council invokes Article 5 of the North Atlantic Treaty in response to the terrorist attacks on the United States and provides concrete military support. Operation Active Endeavour is launched in October to detect and deter terrorist activity in the Mediterranean. 2002 – The NATO-Russia Council is established in Rome, replacing the NATO-Russia Permanent Joint Council. NATO states that it will operate when and where necessary to fight terrorism. To prepare NATO against new threats the 'Summit of Transformation', held in Prague in November, introduces major structural and political reforms, including a NATO Response Force, a Prague Capabilities Commitment, a streamlined military command structure and a Military Concept for Defence against Terrorism; seven partner countries are invited for accession Talks. NATO and the EU publish a joint declaration on their evolving strategic partnership, facilitating the use of NATO assets and capabilities in EU-led operations. 2003 – NATO puts an end to its operations in the former Yugoslav Republic of Macedonia. The mission is taken over by the EU. The United States leads a military campaign against Iraq and overthrows Saddam Hussein's regime. The NATO Response Force (NRF) concept is adopted and NATO's military command structure is streamlined, with the creation of an Allied Command Transformation in the United States and an Operational Command at SHAPE in Europe. NATO supports Polish troops in Iraq. NATO leads the International Security Assistance Force (ISAF) in Afghanistan. 2004 – Terrorist attacks in Madrid. Bulgaria, Estonia, Latvia, Lithuania, Romania, Slovakia and Slovenia join NATO. Transfer of power to Iraqi Interim Government – NATO commits itself to the training of Iraqi security forces. NATO reinforces its Mediterranean Dialogue and, within the Istanbul Cooperation Initiative, offers to cooperate with countries from the broader Middle East region. 2005 – NATO agrees to support the expansion of the African Union Mission in Sudan by providing strategic airlift and training. Terrorist attacks in London. NATO provides humanitarian assistance to earth-quake stricken Pakistan. Since the end of the Cold War, NATO members have significantly reduced and reorganized their military forces and the Alliance's roles and missions have been recast to deal with new security challenges. NATO has also engaged in a series of partnerships with neighbouring countries to reinforce security and stability in the Euro-Atlantic area. The NATO Secretary General is the principal spokesman for the Alliance and the chairman of the North Atlantic Council and other major NATO committees and councils. He is a senior international statesman nominated by member governments. He has the authority to direct consultation and decision-making among members with a view to enabling them to achieve consensus. He is at the head of the International Staff, which supports the work of member countries. NATO is an Alliance that consists of 28 (in April 2009) independent member countries:- Albania, Belgium, Bulgaria, Canada, Croatia, Czech Republic, Denmark, Estonia, France, Germany, Greece, Hungary, Iceland, Italy, Latvia, Lithuania, Luxembourg, the Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Turkey, the United Kingdom, and the United States. Each member nation is normally represented on the North Atlantic Council by an Ambassador or Permanent Representative supported by a national delegation composed of advisers and officials who represent their country on different NATO committees. The Council also meets from time to time at the level of Heads of State and Heads of Government or Ministers of Foreign Affairs and Ministers of Defence. Twenty-eight NATO member countries contribute to promoting security and stability through diplomatic, political and military means. They are committed to the principle of collective defence, which means that an attack against one member or more is considered as an attack against all. NATO also develops partnerships with non-NATO countries and is involved in crisis management operations and missions. NATO has 22 (in April 2009) partners countries:- Armenia, Austria, Azerbaijan, Belarus, Bosnia and Herzegovina, Finland, Georgia, Ireland, Kazakhstan, Kyrgyzstan, the former Yugoslav Republic of Macedonia, Malta, Moldova, Montenegro, Russia, Serbia, Sweden, Switzerland, Tajikistan, Turkmenistan, Ukraine, and Uzbekistan. Partner countries are represented by Heads of Diplomatic Missions or Liaison Offices located at the NATO Headquarters. The Head and Staff of the Missions attend NATO committee meetings in cooperation formats and represent their countries at meetings of the Euro-Atlantic Partnership Council (EAPC), or at meetings of the NATO-Russia Permanent Joint Council or NATO-Ukraine Commission respectively. Meetings of these bodies also take place at Ministerial or Summit level, when Partner countries are represented by their Foreign or Defence Ministers or by their Head of State or Government. Mediterranean Cooperation Group established in 1997, it has overall responsibility for NATO's Mediterranean Dialogue and for conducting political consultations between NATO member countries and individual Mediterranean participants. Mediterranean Dialogue countries participate in a security dialogue with NATO to improve mutual understanding and contribute towards regional security through stronger practical cooperation. At present, there are seven participating countries, which can consult collectively and individually with NATO. At present, seven countries are involved:- Algeria, Egypt, Israel, Jordan, Mauritania, Morocco and Tunisia. They participate in political discussions and activities in fields such as defence reform, the fight against terrorism, science and information. / План Машэла (The Marshall Plan) и НЭТО (NATO):- (Milward, 1992). работа Кинза (Keynes); (ii) работа Ёнэста Бэвина (Ernest Bevin); и (iii) работа Жона Монэ (Jean Monnet) (Шумэн (Schuman)). Организация Североатлантического Трактата или Организация Североатлантического Пакта (ОСАТ или ОСАП, или как её ещё называют по Англоязычному сокращению – НАТО) является военно-политическим союзом, первоначально направленный против социалистических стран и национально-освободительного движения. Она была основана по инициативе Соединённых Штатов Америки (США) на основе Североатлантического Договора, подписанного 04 Апреля 1949 в Вашингтоне, Округ Колумбия, США следующими странами:- Бельгия, Великобритания, Дания, Исландия, Италия, Канада, Люксембург, Нидерланды, Норвегия, Португалия, Соединённые Штаты Америки, Франция. В 1952 к ОСАТ присоединились Греция и Турция, в 1955 – Федеративная Республика Германия, в

1982 – Испания. В 1966 из состава ОСАТ вышла Франция, в 1974 – Греция (в 1980 вернулась в организацию). Кроме того, Испания не входит в военную организацию ОСАТ. Главенствующую роль в ОСАТ играют США. По данным на 1995 ОСАТ состояла из следующих стран участниц:- Бельгия, Германия, Греция, Дания, Исландия, Испания, Италия, Канада, Люксембург, Нидерланды, Норвегия, Португалия, Соединённое Королевство, Турция и Франция (имеет ограниченное участие). С прекращением 'холодной войны', роль ОСАТ, изначально создаваемой для оборонительных целей, была пересмотрена. Однако, в отношении России у руководства ОСАТ по-прежнему оставалось предвзятое отношение и она активно продолжала использовать практику двойных стандартов во многих чрезвычайных и нечрезвычайных ситуациях. В рамках ОСАТ было создано объединённое военное командование. Высшим органом ОСАТ является Сессия Совета ОСАТ. Штабквартира расположена в Брюсселе, Бельгия. Организация Североатлантического Договора, или по её Англоязычной аббревиатуре – НАТО (North Atlantic Treaty Organization (NATO)), – военно-политический союз, направленный против социалистических стран и национально-освободительного движения; создана по инициативе США. Начала свою деятельность в разгар 'холодной войны', на основе Североатлантического Договора, подписанного в Вашингтоне 04 Апреля 1949 представителями правительств США, Великобритании, Франции, Бельгии, Нидерландов, Люксембурга, Канады, Италии, Португалии, Норвегии, Дании, Исландии; в 1952 к договору присоединились Греция и Турция, в 1955 – ФРГ. Статья 5 – важнейшая статья Североатлантического Договора – устанавливает, что в случае 'вооружённого нападения' на одного или нескольких его участников другие члены НАТО немедленно окажут помощь стране или странам, подвергшимся 'нападению', путём осуществления такого действия, какое они 'сочтут необходимым, включая применение вооружённой силы'. Географическая сфера действия договора, определяемая Статьёй 6 договора, охватывает территории всех участников договора, острова 'в Североатлантическом районе – к Северу от тропика Рака', находящиеся под юрисдикцией участников договора, и Средиземное Море. Статья 4 договора предусматривает консультации между странами-членами НАТО всякий раз, когда, по мнению любой из них, '... территориальная целостность, политическая независимость или безопасность любой из сторон окажется под угрозой'. Эта статья имеет целью 'обосновать', в случае надобности, вмешательство НАТО во внутренние дела её участников (например, в случае возникновения революционной ситуации в той или иной стране). В договоре не указывается срок его действия. Согласно Статье 13, любая страна, входящая в НАТО, имеет право отказаться от участия в договоре через 20 лет после его вступления в силу и выйти из него через год после уведомления о его денонсации. В Июле 1966 Франция вышла из военной организации НАТО, оставаясь участницей Североатлантического Договора. Своё решение Французское правительство обосновало стремлением 'восстановить на Французской территории полное осуществление своего суверенитета'. В Августе 1974 из военной организации НАТО вышла Греция. Высшие органы Североатлантического блока – сессии Совета НАТО и Комитет Военного Планирования, созываемые, как правило, 2 раза в год. На сессиях Совета НАТО правительства входящих в НАТО стран представлены министром иностранных дел и в зависимости от повестки дня также министром обороны, финансов, экономики. В периоды между сессиями Совет заседает в составе постоянных представителей государств-членов блока в ранге послов в качестве Постоянного Совета НАТО; заседания Постоянного Совета проводятся 2–3 раза в неделю. В связи с выходом Франции из военной организации блока и её отказом обсуждать в рамках НАТО военные вопросы, рассмотрение этих вопросов на уровне министров, а также на уровне постоянных представителей с 1966 проводится в Комитете Военного Планирования, в который входят государственные деятели такого же ранга и тех же стран (за исключением Франции), что и в Совет НАТО. Всю текущую работу и подготовку к заседаниям руководящих органов НАТО осуществляет Международный Секретариат под руководством Генерального Секретаря НАТО (с 1971 по 1984 – Йозэф Люнш (Joseph Luns), Нидерланды); штаб-квартира – в Брюсселе, Бельгия. Военные расходы НАТО неуклонно растут. В 1949 общие расходы стран НАТО на военные цели составляли 18.7 миллиардов Долларов США, в 1959 – 61.6 миллиардов, в 1969 – 106.4 миллиардов, в 1973 – свыше 120 миллиардов. Более 75% этой суммы приходится на долю США, которые занимают доминирующее положение в НАТО. Значительно укрепились военно-экономические позиции и возросло политическое влияние Федеративной Республики Германия (ФРГ) в НАТО. Военно-экономическое и политическое сотрудничество стран НАТО не устранило противоречий между членами этого агрессивного союза, в рамках которого сталкиваются интересы крупных и малых государств, государств, входящих и не входящих в 'Общий Рынок', а также экономические и политические интересы США и Европейских стран НАТО. Агрессивный характер деятельности НАТО и связанных с ней военно-политических союзов побудил социалистические страны создать организацию Варшавского Договора 1955, которая, будучи в отличие от НАТО оборонительной организацией, открыта для присоединения любого государства. НАТО упорно отвергала предложения организации Варшавского Договора о заключении пакта о ненападении между членами обоих союзов, так же как предложения о роспуске этих союзов или о ликвидации их военных организаций. Происходившая в начале 1970-х нормализация отношений между государствами, принадлежащими к противоположным общественным системам, общее улучшение международной обстановки содействовали распространению недовольства деятельностью этой организации среди широких масс населения стран НАТО и обострению противоречий между её участниками. Вооружённые силы НАТО подразделяются на Объединённые Вооружённые Силы (ОВС), переданные в НАТО, и вооружённые силы, остающиеся в национальном подчинении. В ОВС переданы объединения, соединения и части сухопутных войск и ВВС США, Великобритании, Канады, ФРГ, Бельгии, Нидерландов, Италии и Турции, ВВС Норвегии и Дании. В военное время и на период учений в их состав передаются ВМС перечисленных стран, а также основная часть вооружённых сил Норвегии, Дании, Португалии и Люксембурга. В национальном подчинении находятся межконтинентальные баллистические ракеты США, стратегическая авиация и атомные ракетоносные подводные лодки США и Великобритании, отдельные соединения и части сухопутных войск, военно-учебные заведения и другие формирования, обеспечивающие мобилизационное развёртывание и охрану национальных объектов стран-участниц НАТО. Вооружённые силы Франции, вышедшей из военной организации НАТО, периодически принимают участие в совместных учениях ОВС НАТО в Европе, а также координируют действия сил ПВО страны с силами объединённой системы ПВО НАТО. Всего в вооружённых силах стран НАТО в 1973 насчитывалось:- личного состава свыше 5.3 миллионов человек, дивизий свыше 70, отдельных бригад и полков около 130, межконтинентальных баллистических ракет 1 054, пусковых установок ракет оперативно-тактического и тактического назначения около 1 000, боевых самолётов свыше 12 000 (в том числе свыше 3 200 носителей ядерного оружия), танков свыше 17 000, орудий и миномётов около 27 000, кораблей основных классов в регулярных ВМС около 1 500. Из этого количества сил и средств в состав ОВС НАТО выделено:- дивизий свыше 50, пусковых установок ракет оперативно-тактического и тактического назначения свыше 350, боевых самолётов свыше 2 700 (в том числе около 1 000 носителей ядерного оружия), танков свыше 10 000, орудий и миномётов около 14 000, личного состава всего около 1.5 миллиона человек. Для вооружённых сил НАТО в Европе содержится на складах (1973) свыше 7 000 ядерных боеприпасов. Высший военный орган НАТО – Комитет Военного Планирования рассматривает вопросы, касающиеся руководящих военных органов, строительства и использования ОВС, утверждает стратегические концепции блока, определяет долю военного участия каждой из стран и другие. Высший исполнительный военный орган – Военный Комитет, в который входят начальники Генеральных Штабов стран-участниц блока (кроме Франции, Исландии и Люксембурга). Он разрабатывает военную стратегию и стратегические планы НАТО, определяет направление строительства ОВС. Военному Комитету подчинён Международный Объединённый Штаб. В период между

заседаниями Военного Комитета наблюдение за выполнением принятых им решений осуществляет Постоянный Военный Комитет, состоящий из представителей генеральных штабов стран НАТО. Консультативным органом НАТО является Комитет Ядерной Обороны, а рабочим органом комитета – Группа Ядерного Планирования, занимающиеся разработкой вопросов применения ядерного оружия ОВС. Непосредственное руководство ОВС на возможных театрах войны осуществляют стратегические (верховные) командования НАТО в Европе и на Атлантике, главное командование НАТО в зоне пролива Ла-Манш и региональная группа стратегического планирования США–Канада. В состав объединённых командований и штабов входят представители всех стран-участниц военной организации НАТО, но большую часть высших военных должностей занимают представители вооружённых сил США. Стратегическое (верховное) командование НАТО в Европе (возглавляется Верховным Главнокомандующим (Supreme Allied Commander)) предназначено для руководства ОВС на территории Европейских стран (включая Турцию и акваторию Средиземного Моря). На должность Верховного Главнокомандующего назначаются Американские генералы (в 1950–52 Двайт Дэвид Айзэнхауэ (Dwight David Eisenhower), в 1952–53 Мэсъю Банкё Ридьжвэй (Matthew Bunker Ridgway), в 1953–56 Алфрэд Эм. Грунтёр (Alfred M. Gruenther), в 1956–63 Лори Ностэд (Lauris Norstad), в 1963–69 Лаймэн Эл. Лэмнитцё (Lyman L. Lemnitzer), в 1969–74 Эндрю Дьжей. Гудпастё (Andrew J. Goodpaster), в 1974 – 79 Алэкзандё Эйч. Хэйг (Alexander M. Haig), в 1979–87 Бёнад Дабл.Ю. Радьжёз (Bernard W. Rogers), в 1987–92 Дьжон Ар. Гэлвин (John R. Galvin), в 1992–93 Дьжон Шаликашвили (John Shalikashvili), в 1993–97 Дьжодьж Дьжулвэн (George Joulvan), в 1997–2000 Вэзли Кларк (Wesley Clark), в 2000–02 Дьжосэф Дабл.Ю. Ралстэн (Joseph W. Ralston), в 2002– Дьжеймз Эл. Дьжонз (James L. Jones)). Верховному Главнокомандующему подчинены главные командования на 3 Европейских театрах военных действий:- Северо-Европейском (территории и прибрежные воды Норвегии, Дании, Западно-Германские земли Шлезвиг-Гольштейн и проливная зона Балтийского Моря); Центрально-Европейском (территории и прибрежные воды ФРГ без земли Шлезвиг-Гольштейн, Нидерландов, Бельгии и Люксембурга); Южно-Европейском (территории Италии и Турции, а также акватории Средиземного, Мраморного и Южной части Чёрного морей). Главнокомандующему на Северо-Европейском театре (на эту должность обычно назначается Английский генерал или адмирал) подчинены 3 объединённых командования НАТО:- в Северной Норвегии, Южной Норвегии и в зоне Балтийского Пролива; в состав ОВС переданы только соединения и части сухопутных войск и ВВС ФРГ, дислоцирующиеся в Шлезвиг-Гольштейне, и ВВС Норвегии и Дании. Главнокомандующему на Центрально-Европейском театре подчинены объединённые сухопутные войска и ВВС, в которые входят соединения и части США, Великобритании, ФРГ, Бельгии, Нидерландов и Канады. Сухопутные войска организационно объединены в Северную и Центральную Группы Армий, всего 22 дивизии. Войска размещены на территории ФРГ, за исключением отдельных Голландских, Бельгийских и Английских соединений и частей, дислоцирующихся на территории своих стран. ВВС сведены в два объединённых тактических авиационных командования (2-е и 4-е), насчитывающих до 1 500 боевых самолётов, в том числе свыше 500 носителей ядерного оружия. Главнокомандующему на Южно-Европейском театре подчинены объединённые сухопутные войска и ВВС. Сухопутные войска сведены в командование в Южной части театра (ему подчинены соединения и части, расположенные на территории Италии) и командование в Юго-Восточной части театра (подчинены соединения и части, расположенные в Турции), всего 36 дивизий. ВВС состоят из авиационных частей США, Италии и Турции, сведены в 5-е и 6-е тактические авиационные командования; насчитывают свыше 900 боевых самолётов. В ОВС НАТО в Европе созданы мобильные силы, состоящие из усиленных батальонов сухопутных войск США, Великобритании, ФРГ, Италии, Бельгии, Люксембурга и Канады, подготовленных к переброске по воздуху, а также отдельных эскадрилий тактической авиации. Подразделения мобильных сил дислоцируются в районах расположения соединений и частей, в состав которых они входят. Для прикрытия группировок войск и важных объектов на Европейском театре создана объединённая система противовоздушной обороны НАТО, состоящая из зон, районов и секторов ПВО и охватывающая территории всех Европейских стран НАТО. Стратегическое (верховное) командование НАТО на Атлантике (возглавляется Верховным Главнокомандующим, обычно на эту должность назначается Американский адмирал) предназначено для руководства операциями ВМС в военное время в зоне Атлантического Океана к Северу от тропика Рака (исключая территории Великобритании, её прибрежные воды, Пролив Ла-Манш и Южную часть Северного Моря). Для руководства ОВС созданы и постоянно действуют главные командования и штабы объединённых вооружённых сил НАТО в Западной, Восточной и Иберийской Атлантике, а также командование ударного флота НАТО на Атлантике. В подчинении Верховного Главнокомандующего в мирное время находится постоянное соединение ВМС, в которое периодически включаются надводные боевые корабли из состава ВМС США, Великобритании, Канады, ФРГ, Нидерландов, Дании, Норвегии и Португалии. Главное командование НАТО в зоне Пролива Ла-Манш предназначено для руководства боевыми операциями ВМС в зоне проливов Ла-Манш, Па-де-Кале и Южной части Северного Моря (исключая Гельголандскую Бухту). Региональная группа стратегического планирования США-Канада занимается разработкой вопросов, связанных с обороной территории США и Канады. В её состав входят представители комитетов начальников штабов вооружённых сил США и Канады. Со штабами и войсками НАТО проводятся многочисленные учения, военные игры, на которых отрабатываются вопросы ведения операций. Наиболее крупными являются проводимые стратегические командно-штабные учения ОВС НАТО типа ‘Уинтер’ (Winter), манёвры ‘Стронг Экспресс’ (Strong Express), оперативные командно-штабные учения на Европейских театрах военных действий типов ‘Колд Уинтер’ (Cold Winter), ‘Франт Сентрал’, ‘Дип Фарроу’ (Deep Furrow), учения ВВС и ПВО ‘Рено Рулет’, учения типа ‘Экспресс’ (Express) по переброске авиатранспортом мобильных сил НАТО в ‘угрожаемые’ районы. 01 Апреля 2009 в состав ОСАТ были приняты Албания и Хорватия. 2014-Апрель-10:- Глава МИД России Сергей Лавров считает, что русофобия, навязываемая меньшинством членов НАТО, оказалась для Североатлантического альянса важнее его желания обеспечивать безопасность в Североатлантическом регионе и мире в целом. ‘Подрывать основы стабильности в Европе, которые были заложены после исчезновения СССР и Варшавского Договора, те основы, которые ещё до совсем недавнего времени помогали нам эффективно сотрудничать по Афганистану, по борьбе с терроризмом, наркотрафиком и морским пиратством, – это означает только то, что для НАТО русофобия, навязываемая меньшинством – я в этом уверен – важнее тех задач, от решения которых зависит безопасность всего Евроатлантического региона, да и всего мира’, – сказал глава Российского МИД Агентству Интерфакс. Лавров добавил, что в публичных высказываниях НАТО оторвалась от реальности и от интересов народов, входящих в НАТО государств. Министр убеждён, что антироссийские настроения внутри НАТО провоцируют Восточноевропейские государства. По словам Министра, когда-то представители Альянса убеждали Российскую сторону, что, вступив в ряды альянса, Восточноевропейские государства ‘успокоятся’ по поводу мнимых угроз со стороны Москвы. ‘Так вот, они не успокоились, а стали делать всё, чтобы не просто успокоиться внутри НАТО, а заказывать музыку внутри НАТО и использовать принятые в НАТО и ЕС правила солидарности и консенсуса для того, чтобы удерживать НАТО в том, что касается сотрудничества с Россией, на позициях наименьшего знаменателя’, – сказал Лавров. Говоря о размещении военных сил НАТО вблизи Российских границ глава МИД подчеркнул, что станет нарушением международных обязательств Североатлантического Альянса. 2015-Май-06:- Около сотни генералов и старших офицеров армии бывшей ГДР подписали открытое письмо, которое озаглавили ‘Солдаты за мир’. В послании они осудили политику Запада в отношении России. По их словам, переустройство мира под руководством США и их союзников привело к многочисленным войнам, а история показывает, что ‘с Русскими лучше дружить, чем воевать’. Как сообщается, это открытое письмо с призывом остановить ‘военную истерию и русофобию’ направлено в Бундестаг и в

посольства стран НАТО. Текст письма под названием ‘Солдаты за мир’ опубликован на сайте Немецкой газеты Юнэ Вэльт (Junge Welt). ‘Мы хорошо знаем, что такое война, и выступаем за мир’, – говорится в послании. Обращение подписали экс-Министры Обороны бывшей ГДР Хайнц Кесля (Heinz Keßler) и Тиодор Хофман (Theodor Hoffmann), три генерал-полковника, 19 генерал-лейтенантов, 61 генерал-майор, в том числе первый Немецкий космонавт Зигмунд Йен (Sigmund Jähn), несколько адмиралов, а также полковники и капитаны. Спустя 70 лет после окончания войны, в которой погибли 27 миллионов Советских граждан, война снова стала спутником человечества, отмечается в обращении. ‘Переустройство мира под руководством США и их союзников привело к войнам в Югославии и Афганистане, Ираке, Йемене и Судане, Ливии и Сомали’, – подчёркивается в письме. Немецкие военные отмечают, что стратегия США направлена на ‘устранение России как конкурента и ослабление Евросоюза’. А попытка сделать Украину членом ЕС и НАТО, по их словам, говорит о стремлении создать ‘санитарный кордон от Балтии до Чёрного Моря с целью изолировать Россию от остальной Европы’, что сделает невозможным союз Российской Федерации и Германии. Подписавшиеся под документом отмечают также ‘беспрецедентную кампанию в СМИ’, ‘военную истерию и русофобию’. По их мнению, это противоречит той дипломатической роли, которую могла бы играть Германия, учитывая её ‘геополитическое положение, исторический опыт и объективные интересы народа’. ‘Поскольку мы очень хорошо знаем, что такое война, мы выступаем за мир, – подчеркнули военные. – Нам нужна не военная агитация против России, а взаимопонимание и мирное сосуществование. Нам нужна не военная зависимость от США, а собственная ответственность за мир’. ‘Как военнослужащие, мы хорошо знаем, что война не должна быть инструментом политики. Исходя из нашего опыта, мы хорошо можем оценить последствия для всей Европы’, – заявил на пресс-конференции экс-Министр Обороны бывшей ГДР адмирал Тиодор Хофман. По его словам, многие подписавшие письмо были свидетелями Второй Мировой Войны. Он также подчеркнул, что ключевые проблемы современности могут быть решены только в сотрудничестве с Россией. ‘Опыт показывает, что с Русскими лучше дружить, чем враждовать’, – добавил Хофман.

NORTHERN HYBRIDIZATION = СЕВЕРНАЯ ГИБРИДИЗАЦИЯ – Northern Hybridization is a method to detect RNA by use of a probe (c.f., southern hybridization). / Северная Гибридизация – гибридизация с использованием северного блоттинга (перенос РНК с геля на фильтр). Северный Блоттинг – метод определения фрагмента ДНК, содержащего искомую последовательность, путём гибридизации разделённых электрофорезом фрагментов с радиоактивным зондом, например, радиоактивный к ДНК. Под Гибридизацией, от Латинского слова Hibrida, означающее Помесь, понимается скрещивание разнородных в наследственном отношении организмов. Один из важнейших факторов эволюции биологических форм в природе. Применяют для получения хозяйственных ценных форм животных и растений. Скрещивание особей одного и того же вида (различных подвидов, сортов, пород или линий) называется внутривидовой гибридизацией, а различных видов или родов – отдалённой гибридизацией.

NORTHWEST EUROPE = СЕВЕРО–ЗАПАДНАЯ ЕВРОПА – Northwest Europe is the spot market for products from refineries clustered around Amsterdam, Rotterdam and Antwerp, called ARA in the oil trade. / Северо-Западная Европа – наличный рынок для продуктов нефтеперегонных заводов, сгруппированный вокруг Амстердама, Роттердама и Антверпена, именуемый в торговле нефтью как АРА.

NOS = NOT OTHERWISE STATED

NOSE = НОС (или ГОЛОВНАЯ ЧАСТЬ, или НОСОВАЯ ЧАСТЬ) – Nose is the front of the trailer or container. / Передний торец или передок прицепа или контейнера.

NOSEPIECE = НОСОВОЙ УПОР – Nosepiece is a piece of armor for protecting the nose.

NO SHOW = НЕ ПРЕДСТАВЛЕН (или НЕ ПРЕДОСТАВЛЕН) – No Show:- a container which was not loaded aboard the scheduled vessel due to the late arrival of the van. Cargo which has been booked but does not arrive in time to be loaded before the vessel sails. See also Windy Booking. Cargo that fails to appear for the vessel it was originally booked.

NOSTRO = НОСТРО (или НАШ) – Nostro:- from the Latin, meaning ‘Ours’. In banking, names given to its own positions in another bank’s books (nostro). See also Loro. / Смотрите также Лоро или Их (Loro).

NOSTRO ACCOUNT = СЧЁТ НОСТРО – Nostro Account:- a record kept by an account-owner bank of an account serviced on its behalf by an account-servicing bank. Also known as Due From Account. The account maintained by a domestic bank with a foreign bank in foreign currency. The opposite of Vostro Account. / Счёт в иностранной валюте, поддерживаемый отечественным банком в иностранном банке. В противовес Счёту Востро (Vostro Account). Счёт Ностро – счёт уполномоченного банка, открытый в банке корреспонденте.

NOSTRO TRANSACTION = ТРАНЗАКЦИЯ НОСТРО (или ОПЕРАЦИЯ НОСТРО) – Nostro Transaction is a bank’s transaction in securities for its own account; proprietary trading.

NOTA BENE = НОТА БЭНЭ (или НОТА БЭНА) – Nota Bene:- in Latin, Note Well. / В переводе с Латинского языка, ‘Заметь Хорошо’. Достаточно часто встречается в виде обозначения NB, обращающего внимание на данное место в тексте. Нота Бэна или Нота Бэнэ, от Латинского словосочетания Nota Bene, означающее Заметь Хорошо, понимается пометка N.B. или NB на полях книги или документа, подчёркивающая важный в каком-либо отношении отрывок текста.

NOTARY PUBLIC = ОБЩЕСТВЕННЫЙ НОТАРИУС (или ГОСУДАРСТВЕННЫЙ НОТАРИУС) – Notary Public is an official certified to take affidavits and depositions from members of the public.

NOT AVAILABLE INVENTORY = НЕДОСТУПНЫЙ ИНВЕНТАРЬ – Not Available Inventory is that portion of the inventory which is not available to be sold due to being damaged, waiting parts, being repaired or lost.

NOTCH = ВЫЕМКА (или ПАЗ, или ЖЕЛОБ, или ВЫРЕЗ) – Notch:- cutout in lower portion of the stringer to allow entry for the fork tine, usually 9” in length, 1 1/2” in depth. See also Pallet. Notch is a cut-out in the lower part of a stringer, providing an entry at right angles to the stringer for the fork arms of a forklift truck. / Выемка (Notch):- вырез в нижнем настиле продольного бруса для прохода вилочного захвата.

NOTCH DEPTH = ГЛУБИНА ВЫЕМКИ – Notch Depth is a vertical distance from the bottom of the stringer to the top of the notch. See also Pallet. / Глубина Выемки (Notch Depth):- вертикальное расстояние между нижней точкой продольного бруса и верхом выемки. Смотрите также Поддон (Pallet).

NOTCHED KERNEL = НАДКОЛОТАЯ ЗЕРНОВКА (или НАДКОЛОТОЕ ЯДРО) – Notched Kernel (NK) is a small wedge-shaped depression which occurs at the middle portion of the abdominal side of brown Rice.

NOTCHED STRINGER = ВЫЕМЧАТЫЙ ПРОДОЛЬНЫЙ БРУС (или XX) – Notched Stringer is a stringer with two notches spaced for fork-tine entry, (partial four-way entry). See also Pallet.

NOTCHED STRINGER PALLET = ПОДДОН С ВЫЕМЧАТЫМ ПРОДОЛЬНЫМ БРУСОМ – Notched Stringer Pallet is a flat pallet with stringers in each of which there are two notches permitting entry of the fork arms of forklift trucks.

NOTCHES = ВЫЕМКИ (или ЗАСЕЧКИ, или НАДСЕЧКИ, или ПРОРЕЗЫ, или ЗАРУБКА, или ВЫРЕЗ, или УСТУПЫ ЛАЦКАНОВ) – Notches:- misplaced, too deep, too shallow or omitted. Cutting Room Defects, and namely – Cutting Defects. / Порок или дефект раскроя. Засечки:- представляют собой полосы, окрашенные менее интенсивно, чем вся ткань, образуются при крашении в расправленном состоянии вследствие образования складок, часто из-за плохого оформления шва между кусками.

NOTCHES AND PUNCH MARKS = ОТМЕТИНЫ ОТ ВЫЕМОК И ХХ (или ХХ) – Notches And Punch Marks:- left out, not clearly marked or misplaced; Cutting Room Defects, and namely – Marking Defects. / Порок или дефект раскроя.

NOTCHES EXPOSED = УСТУПЫ ЛАЦКАНОВ ХХ – Notches Exposed:- poor operator technique and execution, in not covering notch with seam. Sewing Room Defects. / Порок или дефект швейного производства.

NOTCH FILLET RADIUS = РАДИУС ЗАКРУГЛЕНИЯ ВЫЕМКИ – Notch Fillet Radius is a radius of curvature of the concave transition between the top and end of a stringer notch. See also Pallet. / Радиус Закругления Выемки (Notch Fillet Radius):- радиус закругления между вершиной и краем выемки. Смотрите также Поддон (Pallet).

NOTCH LENGTH = ДЛИНА ВЫЕМКИ – Notch Length is a maximum distance between the two ends of a notch, measured along the stringer length. See also Pallet. / Длина Выемки (Notch Length):- максимальное расстояние между двумя краями выемки, измеренное вдоль части длины продольного бруса. Смотрите также Поддон (Pallet).

NOTCH LOCATION = МЕСТОПОЛОЖЕНИЕ ВЫЕМКИ (или ДЛИНА ОПОРНОЙ ЧАСТИ ПРОДОЛЬНОГО БРУСА) – Notch Location is a shortest distance measured from the end of the stringer to the start of the notch. See also Pallet. / Длина Опорной Части Продольного Бруса (Notch Location):- наименьшее расстояние между выемками или между выемками и краем бруса. Смотрите также Поддон (Pallet).

NOT COMBED = НЕГРЕБНЕЧЁСАНЫЕ – The term ‘Not Combed’ means fabrics wholly or in part of uncombed cotton, other vegetable textile fibers or wool or fine animal hair. See also Combed.

NOT COMMERCIALLY CLEAN = КОММЕРЧЕСКИ ЗАСОРЁННОЕ (или ЗАСОРЁННОЕ ДЛЯ КОММЕРЧЕСКОГО ИСПОЛЬЗОВАНИЯ) – Not Commercially Clean:- if any of the components exceed the allowable limits as defined in the tables, the shipment becomes not commercially clean, and dockage is assessed using procedures for primary samples. Shipments, which do not meet the standards for commercial cleanliness, are referred to as Not Commercially Clean. Such shipments are permitted only with the permission of the Canadian Grain Commission (CGC). Shipments of grain whose dockage content falls outside of allowed limits. See also Commercially Clean. / Грузовые отправки (отгрузки) зерна, содержание докеджа (легко отделяемых примесей) в котором переваливает за допустимые лимиты.

NOTE = БИЛЕТ (или НОТА, или (ЧАСТНЫЙ КОММЕРЧЕСКИЙ) ВЕКСЕЛЬ) – Note:- embody a medium-term money claim on the issuer (borrower). Depending on the market situation, notes offera higherr eturn than other forms of fixed-interest investment. Note is a financial instrument consisting of a promise to pay rather than an order to pay or a certificate of indebtedness. Essentially a credit instrument consisting of a written, unconditional promise to pay a sum of money at some specified future date to a named person or to bearer. In Switzerland, notes are medium-term paper (usually 5–7 years) in denominations of CHF50 000.00 minimum. See also Private Placements. Also known as Bill in the United Kingdom. / Под Нотой, от Латинского слова Nota, означающее Замечание или Знак, понимается .

NOTE AGAINST BOND SPREAD = КУРСОВАЯ РАЗНИЦА В ОТНОШЕНИИ БИЛЕТА И ОБЛИГАЦИИ (или КУРСОВАЯ РАЗНИЦА В ОТНОШЕНИИ БИЛЕТА И ОБЛИГАЦИИ, или СПРЭД НА НОТУ И ОБЛИГАЦИЮ) – Note Against Bond Spread:- a futures spread trade involving the buying (selling) of a ten-year Treasury note futures contract and the selling (buying) of a Treasury bond futures contract. / Сделка с фьючерсами на курсовую разницу, заключающаяся в покупке (продаже) фьючерсного контракта на десятилетнюю Казначейскую Ноту и продаже (покупке) фьючерсного контракта на Казначескую облигацию.

NOT EASILY MARKETABLE = ТРУДНОРЕАЛИЗУЕМЫЕ (или НЕЛИКВИДНЫЕ) – A term Not Easily Marketable refers to securities of such low investment quality that they cannot be readily sold to investors. / Относится к ценным бумагам с таким низким инвестиционным потенциалом, благодаря которому они не могут быть легко проданы инвесторам.

NOTE ISSUANCE FACILITY = ПОДДЕРЖКА ВЫПУСКА БИЛЕТОВ (или ОБЕСПЕЧЕНИЕ ВЫПУСКА НОТ) – Note Issuance Facility:- type of medium-term credit guarantee in which a bank provides funds to an issuer of promissory notes before the notes are actually issued; the guarantor usually buys any unsold notes. Note Issuance Facility (NIF) is the revolving credit arrangement in the Euromarket under which borrowers place short-term (usually 1, 2, or 3 month) notes via a group of prime banks (render panel). Similar to Revolving Underwriting Facilities.

NOTE–ISSUING BANK = БАНК, ВЫПУСКАЮЩИЙ БИЛЕТЫ (или ЭМИССИОННЫЙ БАНК) – Note-Issuing Bank is a bank vested with the right to issue bank notes (note-issuing privilege). In addition to performing this key historic function, today’s note-issuing banks are also responsible for organizing monetary operations in the broadest sense, mainly by implementing a monetary policy that serves the interests of the country. Also known as Bank Of Issue. / Под Эмиссионным Банком понимается банк, наделённый монопольным правом выпуска банковских билетов (банкнот). В большинстве стран мира эмиссионные банки национализированы или находятся под контролем государства.

NOTE–ISSUING PRIVILEGE = ПРИВИЛЕГИЯ ВЫПУСКА (или ЭМИССИИ) БИЛЕТОВ – Note-Issuing Privilege is the exclusive right to issue bank notes. For example in Switzerland, this privilege has been granted to the Swiss National Bank by the Federal Government. / Исключительное право выпускать банкноты. Например в Швейцарии, эта привилегия предоставлена Швейцарскому Национальному Банку Федеральным Правительством.

NOTES RECEIVABLE = БИЛЕТЫ К ПОЛУЧЕНИЮ (или НОТЫ К ПОЛУЧЕНИЮ) – Notes Receivable:- in accounting, this account group includes unconditional written promises, signed by makers, to pay sums certain in money on demand or at a fixed or determinable future time either to the bearer or to the order of a person designated therein. The note may be held by the reporting governmental unit as designated payee or by endorsement.

NOT–FOR–PROFIT CORPORATION = БЕСПРИБЫЛЬНАЯ КОРПОРАЦИЯ (или НЕКОММЕРЧЕСКАЯ КОРПОРАЦИЯ) – In the United States, a Not-For-Profit Corporation is generally organized for some socially beneficial purpose, rather than for the direct monetary benefit of the directors or members. Not all not-for-profit corporations are tax exempt and some make a profit. However, the profit is not distributed to the members or directors. Also known as Non-profit Corporation.

NOT–FOR–PROFIT ORGANIZATION = БЕСПРИБЫЛЬНАЯ ОРГАНИЗАЦИЯ (или НЕКОММЕРЧЕСКАЯ ОРГАНИЗАЦИЯ) – Not-For-Profit Organization is a corporation in which no shareholder or trustee shares in profits or losses, usually organized for charitable or educational purposes, such as schools, churches and foundations. Also known as Non-Profit Corporation.

NOTICE = УВЕДОМЛЕНИЕ (или НОТИС) – (1) Notice is an advice of a forthcoming action issued in advance, e.g., a notice to quit or notice of dismissal. In the United Kingdom, the term is generally applied to the period that elapses between the moment an employee is informed that his or her services are no longer required, or an employee hands in his or her resignation, and the day on which he or she actually leaves. / Уведомление – это извещение о . при его или её подаче в отставку (resignation).

(2) A Notice that must be presented by the seller of a futures contract to the clearing house. The clearing house then assigns the notice and subsequent delivery instrument to a buyer. / Уведомление, которое должно быть представлено клиринговой палате продавцом фьючерсного контракта. После этого клиринговая палата передаёт это уведомление и инструмент последующей поставки покупателю.

NOTICE DAY = ДЕНЬ УВЕДОМЛЕНИЯ – Notice Day is when a notice of delivery shall be issued and tendered. This term means the business day the Delivery Notice is issued to the receiver. According to Chicago Board of Trade rules, the second day of the three-day delivery process when the clearing corporation matches the buyer with the oldest reported long position to the delivering seller and notifies both parties. See also First Notice Day. Any day on which notices of intent to deliver pertaining to a specified delivery month on futures contracts may be issued. / День Уведомления (Notice Day) – день, когда уведомление о поставке будет выпущено и подано для участия в конкурсе. Согласно правил Чикагской Палаты Торговли (Чикагского Табло Торговли, если быть более точными), второй день. Любой день, в который могут быть выписаны уведомления о намерении поставки товара, соответствующей определённому фьючерсными контрактами месяцу поставки.

NOTICE OF ABANDONMENT = УВЕДОМЛЕНИЕ ОБ АБАНДОНЕ – Notice Of Abandonment is a written notification from the United States Patent and Trademark Office (USPTO) that an application has been declared abandoned or, in other words, is no longer pending. If the application was abandoned unintentionally or due to office error, the applicant has a deadline of two months from the issue date of the notice of abandonment to file either (1) a petition to revive the application or (2) a request to reinstate the application.

NOTICE OF ABANDONMENT = УВЕДОМЛЕНИЕ ОБ ОТКАЗЕ – Notice Of Abandonment:- the initial action to be taken by an assured who wishes to claim a constructive total loss. Notice to underwriters must be given with reasonable diligence as soon as the assured is aware of the circumstance. Its purpose is to give the underwriter the opportunity to take action to prevent or minimize the loss.

NOTICE OF ALLOWABILITY = УВЕДОМЛЕНИЕ О ДОПУСТИМОСТИ – Notice Of Allowability is a notification to the patent applicant that the application has been placed in condition for allowance.

NOTICE OF ALLOWANCE = УВЕДОМЛЕНИЕ О ПРИЗНАНИИ (или УВЕДОМЛЕНИЕ О ПРИНЯТИИ К РАССМОТРЕНИЮ) – Notice Of Allowance (NOA) is a written notification from the United States Patent and Trademark Office (USPTO) that a specific mark has survived the opposition period following publication in the Official Gazette, and has consequently been allowed for registration. It does not mean that the mark has registered yet. Receiving a notice of allowance is another step on the way to registration. Notices of allowance are only issued for applications that have been filed based on 'intent to use'. The notice of allowance is important because the issue date of the Notice of Allowance establishes the due date for filing a statement of use. After receiving the Notice of Allowance, the applicant must file a statement of use or a request for an extension of time to file a statement of use within 6 months from the issue date of the notice. If the applicant fails to timely file a statement of use or a request for an extension of time to file a statement of use, the application will be abandoned. / Уведомление о принятии пунктов формулы изобретения; решение о выдаче патента.

NOTICE OF ALLOWANCE AND FEES DUE = УВЕДОМЛЕНИЕ О ПРИЗНАНИИ (или ПРИНЯТИИ К РАССМОТРЕНИЮ) И ДОЛЖНЫЕ ВОЗНАГРАЖДЕНИЯ – Notice Of Allowance And Fees Due is a notification to the applicant that they are entitled to a patent under the law and requesting payment of a specified issue fee (and possibly a publication fee as well) within three months (non-extendable) from the mailing date of the notice of allowance.

NOTICE OF APPROVAL = УВЕДОМЛЕНИЕ О ДОПУЩЕНИИ – Notice Of Approval is a document issued by a government authorizing a request made by a business to conduct a certain activity. See also Government Approval. / Документ, выдаваемый соответствующими государственными органами и уполномочивающий предприятие на осуществление определённого вида деятельности по запросу данного предприятия. Смотрите также Одобрение Со Стороны Государства (Government Approval).

NOTICE OF ARRIVAL = УВЕДОМЛЕНИЕ О ПРИБЫТИИ – A Notice Of Arrival is a notice given to the consignee advising consignee about the arrival of freight.

NOTICE OF INTENT TO DELIVER = УВЕДОМЛЕНИЕ О НАМЕРЕНИИ ПОСТАВКИ – Notice Of Intent To Deliver is a notice that must be presented by the seller of a futures contract to the clearing organization prior to delivery. The clearing organization then assigns the notice and subsequent delivery instrument to a buyer. Also known as Notice Of Delivery.

NOTICE OF LOSS = УВЕДОМЛЕНИЕ ОБ УЩЕРБЕ (или УВЕДОМЛЕНИЕ О СТРАХОВОМ СЛУЧАЕ) – Notice Of Loss is a written notice of a loss to the insurance company as outlined in the conditions of the insurance policy. / Уведомление в письменной форме об ущербе или убытке в результате страхового случая, направленное на имя страховой компании в соответствии с условиями страхового полиса.

NOTICE OF PUBLICATION = УВЕДОМЛЕНИЕ О ПУБЛИКАЦИИ – Notice Of Publication is a written statement from the United States Patent and Trademark Office (USPTO) notifying an applicant that its mark will be published in the Official Gazette. If the examining attorney assigned to an application raises no objections to registration, or if the applicant overcomes all objections, the examining attorney will approve the mark for publication. The notice of publication provides the date of publication. Any party who believes it may be damaged by registration of the mark has thirty (30) days from the publication date to file either an opposition to registration or a request to extend the time to oppose. If no opposition is filed or if the opposition is unsuccessful, the application enters the next stage of the registration process. A Certificate of Registration will issue for applications based on use or on a foreign registration under § 44, or a Notice of Allowance will issue for intent-to-use applications.

NOTICE OF READINESS = УВЕДОМЛЕНИЕ О ГОТОВНОСТИ – (1) Notice Of Readness is a written document or telex issued by the master of a vessel to the charterer advising them the time at which a vessel is ready to load or discharge. / Документ в письменной форме или телекс, выписываемый хозяином (или капитаном) судна фрахтователю и оповещающий его о времени, когда судно будет готово к погрузке или разгрузке.

(2) Notice Of Readness is a document advising a consignee or his agent that cargo has arrived and is ready for delivery. / Документ, извещающий консигнатора (грузополучателя) или его агента о том, что груз прибыл и готов для поставки.

NOTICE OF REFERENCES CITED = УВЕДОМЛЕНИЕ О ПЕРЕЧИСЛЕННЫХ ССЫЛКАХ – Notice Of References Cited:- also known as a PTO-892 Form. A list of relevant references cited by a patent examiner in an office (the United States Patent and Trademark Office (USPTO)) action. The following are some examples of such references: domestic patents, domestic patent application publications, foreign patents or patent publications, publications, electronic documents, and affidavits.

NOTICE PRICE = ЦЕНА В УВЕДОМЛЕНИИ – The Notice Price is set on the business day immediately proceeding the day of issuance of the notice of delivery of the underlying commodity. It is based on the closing range of prices of the futures contract month involved for delivery of cotton.

NOTIFICATION = НОТИФИКАЦИЯ (или ОПОВЕЩЕНИЕ) – Notification is a formal advising of the borrower by the former or new creditor in the event of assignments of a claim or the pledging of assets as security (such as claims arising from life insurance policies). Under bill law, notification means the legally prescribed communication addressed by the check or bill owner to the previous holder and drawer or by the endorser to the previous endorser concerning the refusal of the drawee to pay under the bill. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Под Нотификацией, от Латинского слова Notifico, означающее Делаю Известным или Оповещаю, понимается официальное уведомление одним лицом другого о своей позиции по какому-либо вопросу, а также сообщение о каких-либо фактах, событиях. Нотификация – официальное извещение, направляемое одним государством другому и касающееся какого-либо конкретного факта, события, действия или документа. Необходимость нотификации иногда предусматривается в международных договорах, например, для извещения о вступлении в силу договора, о присоединении к договору, о денонсации договора и так далее.

NOTIFICATION OF CREDIT = НОТИФИКАЦИЯ КРЕДИТА – In banking, Notification Of Credit is a reporting to the beneficiary of incoming funds by the Beneficiary's Financial Institution (BFI) with or without additional remittance information. / или без дополнительной информации о перечислении.

NOTIFICATION OF IBAN = NOTIFICATION OF INTERNATIONAL BANK ACCOUNT NUMBER

NOTIFICATION OF INTERNATIONAL BANK ACCOUNT NUMBER = НОТИФИКАЦИЯ МЕЖДУНАРОДНОГО НОМЕРА БАНКОВСКОГО СЧЁТА – In banking, Notification Of International Bank Account Number is the one time operation of informing the account owning customer of the International Bank Account Number (IBAN) generated for the account.

NOTIFY ADDRESS = АДРЕСАТ ДЛЯ ОПОВЕЩЕНИЯ (или АДРЕСАТ ДЛЯ УВЕДОМЛЕНИЯ) – (1) Notify Address is an address of the party (other than the consignee) to be advised of the arrival of the goods. / Адрес стороны (иной, нежели консигнатор (грузополучатель)), которая должна быть извещена о прибытии грузов.

(2) Person named on a bill by the drawer, endorser or guarantor and expected to accept or pay should the need arise.

NOTIFY PARTY = ОПОВЕЩАЕМАЯ СТОРОНА (или УВЕДОМЛЯЕМАЯ СТОРОНА) – (1) Notify Party is the person or company to be advised by the carrier upon arrival of the goods at the destination port. Notify Party is the company/person who appears on the Bill of Lading to be notified when cargo arrives. Could be different from Consignee – usually actual receiver of goods. Notify Party is the company/person who appears on the bill of lading or waybill to be notified when the cargo arrives at destination. Could be different from the consignee, but is often the actual receiver of the goods. A notify party has no particular rights (beyond the notification) under the bill of lading or waybill.

(2) Notify Party:- address of party other than the consignee to be advised of arrival of goods. / Адрес стороны, иной нежели консигнатор (грузополучатель), которая должна быть оповещена о прибытии товаров.

NO–TILLAGE = БЕЗ ЗАПАХИВАНИЯ (или БЕЗ ОБРАБОТКИ, или МИНИМАЛЬНАЯ ОБРАБОТКА (ПОЧВЫ)) – No-Tillage is a minimum tillage practice in which the crop is sown directly into soil not tilled since the harvest of the previous crop. Weed control is achieved by the use of herbicides and stubble is retained for erosion control. It is typically practised in arable areas where fallowing is important. Also known as Zero Tillage.

NO–TILLAGE SYSTEM = СИСТЕМА БЕЗ ЗАПАХИВАНИЯ – No-Tillage System or No-Till System is a procedure whereby a crop is planted directly into a seedbed, not tilled since the harvest of the previous crop. No-Till Systems:- In no-till systems, tillage is not used to prepare a seedbed. Minimal soil loosening in a narrow band immediately ahead of the seed opener is performed by planter-mounted coulters and/or residue clearing devices. Successful no-till crop production is partially dependent on efective use of alternative production practices and field management strategies that deal with yield-limiting factors that otherwise would have been corrected with tillage. For successful no-till production it is important to:- (i) have good soil drainage and water infiltration; (ii) maintain a multi-crop crop rotation; (iii) incorporate residue management to maintain some soil cover all year; (iv) incorporate weed control strategies without use of tillage; (v) manage diseases and insects; (vi) start with adequate soil fertility levels and consider fertilizer placement; and (vii) minimize soil compaction.

NOT IN MY BACK YARD = НЕ В МОЁМ ЗАДНЕМ ДВОРЕ – 'Not in My Back Yard' (NIMBY) is a derogatory or critical term characterizing the opposition by residents to a proposal for a new development because it is too close to them, often with the connotation that such residents believe that the developments are needed in society, but should be located further away. Projects likely to be opposed include, but are not limited to, fracking operations, oil or natural gas wells, wind turbines, power plants, cell phone network towers, landfills, prisons, or highways. Why does this matter? It is important to realize that, while solutions to market problems may seem straightforward and economical, there are other obstacles that may delay development of any solution.

NOTIONAL AMOUNT = УСЛОВНАЯ СУММА (или ГИПОТЕТИЧЕСКАЯ СУММА) – An important feature of derivatives contracts is the Notional Amount, sometimes called the Notional Principal Amount when the underlying is a rate. When a derivatives contract is physically-settled, the notional amount is the number of units of underlying to which the contract applies. The outstanding notional amount is the gross par value of the contract, i.e. the notional amount multiplied by the contract price per unit of underlying. For example, if a physically-settled forward contract obligates a party to deliver 100 shares of a given company at USD2.00 per share in the future, the notional amount is 100 and the outstanding notional amount of the contract is USD200.00. When a derivatives contract is cash-settled, however, the notional amount is only an amount of the underlying upon which calculations are based. The amount is hypothetical because it is not exchanged between the parties. Thus, if the forward described in the previous paragraph were modified to be cash-settled, one party would have to pay the other an amount equal to 100 times the difference between the forward price of USD2.00 and the market price at maturity of the contract and no transfer of shares will take place. The notional amount again would be 100 and the outstanding notional amount of the contract again would be USD200.00. The notional amount in this type of contract is meaningful for calculation purposes only. Sometimes, a derivatives commodity contract requires parties to exchange principal a

number of times. In such a case, the outstanding notional amount would be equal to the contract quantity of underlying units multiplied by the contract price multiplied by the number of remaining payments. At other times, a derivatives contract is leveraged or its formulation contains a multiplier component, in which case the effective notional amount is the notional amount adjusted to reflect a true notional product. For example, an interest rate swap that requires a party to make periodic interest payments on a notional principal amount of USD1 million at a rate equal to three times the difference between the US Dollar prime rate and 3% has an effective notional principal amount of USD3 million. The Notional or Nominal Amount of a financial derivatives contract is that underlying a financial derivatives contract and is necessary for calculating payments or receipts, but which may or may not be exchanged. The ISDA® (short for the International Swaps and Derivatives Association, Inc.) Market Survey collects and reports Notional Amounts of outstanding transactions as of the reporting date, where notional amount refers to the underlying amounts specified in OTC derivatives transactions. More precisely, for interest rate derivatives, notional amount refers to the hypothetical underlying amount used to calculate cash flow obligations. For credit default swaps, notional amount refers to the par amount of credit protection bought or sold, equivalent to debt or bond amounts, and is used to derive the coupon payment calculations for each payment period and the recovery amounts in the event of a default. And for equity derivatives, notional amount can refer to the hypothetical amount used to calculate equity swap cash flows, to the value of the delivery obligation for physically-settled equity forwards, or to the number of shares times forward price or strike price for an equity forward or option. In most of these transactions, cash flow obligations are a small percent of notional amounts. The Market Survey uses notional amounts to measure the size of the market and the level of activity. The reason for using notional amount is that it is relatively simple to identify and gather, as well as similar to measures of underlying cash markets. In addition, it is consistent over time; that is, the notional for a deal does not change except in limited cases like equity swaps and amortizing swaps, neither of which is likely to have a significant effect on the overall measure. At the same time, however, notional amount most certainly overstates the level of activity because it represents a cumulative total of past transactions, many of which were used by dealers to make their daily adjustments to their risk positions. Even if activity were to fall during a reporting period, notional amount outstanding for the period would not necessarily fall. More problematic is the misinterpretation of notional amount as some measure of risk. In fact, notional amounts are only loosely related to risk. Risk managers might, for example, monitor notional position amounts along with other measures, but only because large concentrations or changes in notional amounts would suggest further investigation and not because notional amounts are in themselves a precise measure of risk. Indeed, in most OTC derivative transactions, cash flow obligations are a small percent of notional amounts and so are amounts at risk. The main exception is cross-currency interest rate swaps, which involve an exchange of notional amounts in different currencies, but cross-currency swaps are a small percent of OTC derivatives transactions. In contrast to the ISDA® Market Survey, the BIS Semi-annual OTC Derivatives Market Statistics report two numbers that are more closely related to risk than are notional amounts. The first is gross market value, which is the absolute value of positive and negative replacement values, where replacement value is the estimated amount that could be received or paid for unwinding a transaction on the reporting date. The second is gross credit exposure, which represents the current value of contracts that have a positive market value after taking account of legally enforceable bilateral netting agreements; in other words, it measures netted credit exposure between counterparties. Some consider gross market value to be a measure of market risk, but in fact it gives only a snapshot of changes in market values that have occurred from the deals' inception dates to the reporting date. Gross market value actually overstates market risk because it does not allow for offsetting positions. Suppose, for example, that a dealer has an interest swap with an end-user client and hedges that swap with an offsetting swap in the inter-dealer market. If the swap with the client takes on a positive value, the swap in the inter-dealer market will take on an offsetting negative value, but gross market value will simply add the two absolute values instead of offsetting them. Gross market value is therefore not a useful measure of market risk. Gross credit exposure, which nets market values between counterparties, does not attempt to measure market risk. It does help measure credit risk, however, by summing the netted exposures between reporting banks and their counterparties. In effect, gross credit exposure measures the residual risk that might not be transferred if a counterparty were to default, although the measure is backward looking because it only gauges exposure as of the reporting date. The nominal or face amount that is used to calculate payments made on swaps and other risk management products. This amount generally does not change hands and is thus referred to as Notional. The amount (in an interest rate swap, forward rate agreement, or other derivative instrument) or each of the amounts (in a currency swap) to which interest rates are applied (whether or not expressed as a rate or stated on a coupon basis) in order to calculate periodic payment obligations. Also known as Contract Amount, Currency Amount, Notional Principal Amount, and Reference Amount. / взаиморасчёт или сведение (netting) . Международная Ассоциация по Свопам и Деривативам, Инк. (МАСД®; The International Swaps And Derivatives Association, Inc. (ISDA®)).

NOTIONAL AMOUNTS OUTSTANDING = ЗАДЕЙСТВОВАННЫЕ УСЛОВНЫЕ СУММЫ – Nominal or Notional Amounts Outstanding provide a measure of market size, and can also provide a rough proxy of the potential transfer of price risk in derivatives markets. They are also comparable with measures of market size in related underlying cash markets and shed useful light on the relative size and growth of cash and derivatives markets. Nominal or notional amounts outstanding are defined as the gross nominal or notional value of all deals concluded and not yet settled at the reporting date. The data should in principle be reported on a consolidated basis, i.e. inter-company deals should always be excluded, even if they relate to transactions with affiliates which are unconsolidated based on ownership criteria but are in effect controlled by the reporting institution. For contracts with variable nominal or notional principal amounts, the basis for reporting should be the nominal or notional principal amounts at the time of reporting. The notional amount or par value to be reported for a derivative contract with a multiplier component is the contract's effective notional amount or par value. For example, a swap contract with a stated notional amount of USD1 000 000.00 whose terms called for quarterly settlement of the difference between 5% and LIBOR multiplied by ten has an effective notional amount of USD10 000 000.00. In BIS (short for the Bank for International Settlements) reports nominal or notional amounts outstanding are defined as the gross nominal or notional value of all deals concluded and not yet settled on the reporting date. For contracts with variable nominal or notional principal amounts, the basis for reporting is the nominal or notional principal amounts at the time of reporting. Nominal or notional amounts outstanding provide a measure of market size and a reference from which contractual payments are determined in derivatives markets. However, such amounts are generally not those truly at risk. The amounts at risk in derivatives contracts are a function of the price level and/or volatility of the financial reference index used in the determination of contract payments, the duration and liquidity of contracts, and the creditworthiness of counterparties. They are also a function of whether an exchange of notional principal takes place between counterparties. Gross market values provide a more accurate measure of the scale of financial risk transfer taking place in derivatives markets. Nominal or Notional Amounts Outstanding provide a measure of market size, and can also provide a rough proxy for the potential transfer of price risk in derivatives markets. They are also comparable to measures of market size in related underlying cash markets and shed useful light on the relative size and growth of cash and derivatives markets. Nominal or notional amounts outstanding were defined as the absolute gross nominal or notional value of all deals concluded and still open on the last business day of June (in 2007); end-June was chosen to provide consistency with the semiannual OTC derivatives market statistics for the G10 countries. As in the case of the turnover data, no distinction was made between sales and purchases of derivative instruments and the resulting claims and liabilities of open contracts. In the case of foreign exchange swaps, which were concluded as spot/forward transactions, only the unsettled forward part of the deal was reported. If foreign exchange swaps were executed on a forward/forward

basis, amounts outstanding were to be reported separately for both legs. For other forward contracts and swaps, the transactions were always to be reported as one transaction only. For transactions with variable notional principal amounts, notional principal amounts at the reporting date were to be provided. In contrast to the turnover part of the survey, data on notional amounts outstanding data were collected on a consolidated basis, i.e. including positions of all branches and (majority-owned) subsidiaries of a given institution. All these positions had to be added together and reported by the parent institution only to the monetary institution in the country where the parent institution had its head office. In addition, all in-house deals and deals with other domestic and foreign offices of the same institution had to be netted out. Amounts outstanding were reported to the BIS (short for the Bank for International Settlements) in US Dollar equivalents, with non-Dollar amounts converted into US Dollars using end-of-period exchange rates. See also Gross Market Values. Notional Amounts Outstanding provide useful information on the structure of the OTC derivatives market but should not be interpreted as a measure of the riskiness of these positions. While a single comprehensive measure of risk does not exist, a useful concept is the cost of replacing all open contracts at the prevailing market prices. This measure, called Gross Market Value, increased at a considerably lower rate (up to 85%) than notional amounts during the same reporting period. / , то есть . (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)). Чтобы легче было понимать суть этого термина, следует воспользоваться смысловым разъяснением. Задействованные условные суммы (Notional Amounts Outstanding) представляют собой совокупные суммы общих сумм всех внебиржевых контрактов (свопов и опционов) в том или ином сегменте внеучётного рынка, и она не является суммой реально задействованных в этом рынке денежных средств. Дело в том, что покупатель или продавец свопа, приобретая или продавая его у известного игрока или известному игроку (соответственно) внебиржевого рынка не уплачивает за эту сделку всей суммы контракта (в данном случае свопа), а размещает у этого игрока лишь своего рода страховой депозит в виде залога, который служит гарантией исполнения финансовых обязательств по данному свопу. Таким образом, общая сумма контракта (свопа) может быть, например, 100 000.00 Долларов США, в то время как этот страховой депозит может составлять всего 3 000.00 Долларов США. То есть в данной сделке реальных денег задействовано лишь 3 000.00, а условная сумма контракта равна 100 000.00. Приблизительно такая же ситуация и с внебиржевыми опционами, когда условная сумма опциона может составлять предположим также 100 000.00 Долларов США, а уплачиваемая за его покупку премия – 3 000.00 Долларов США. Только в случае со свопом залоговая сумма вернётся залогодателю, а в случае с опционом – нет. Эту сумму реальных денежных средств в размере 3 000.00 Долларов США в различных отчётах о ситуации на внебиржевых рынках называют Валовыми Средствами В Рынке (Gross Market Values). В зависимости от того, что это за рынок, а также от финансового состояния или кредитной истории участника сделки со свопом или опционом, и общей ситуации на рынке, размер реальных денежных средств, задействованных в данной ситуации может колебаться от 3 до 25%. В конечном итоге валовые средства в рынке измеряют стоимость замены всех существующих внебиржевых контрактов, и в этой связи они лучшим образом отображают и измеряют рыночный риск, нежели задействованные условные суммы. Поскольку с возрастанием риска на рынке начинают увеличиваться страховые залоговые депозиты за свопы и премии за опционы, и, стало быть, увеличиваются валовые средства в рынке.

NOTIONAL PRINCIPAL = УСЛОВНЫЙ ПРИНЦИПАЛ (или УСЛОВНАЯ ОСНОВНАЯ СУММА, или ГИПОТЕТИЧЕСКИЙ ПРИНЦИПАЛ) – Notional Principal of a derivative contract is a hypothetical underlying quantity upon which interest rate or other payment obligations are computed. In an interest rate swap, forward rate agreement, or other derivative instrument, the amount or, in a currency swap, each of the amounts to which interest rates are applied in order to calculate periodic payment obligations. Also known as Contract Amount, Currency Amount, Notional Amount, and Reference Amount.

NOTIONAL SETTLEMENT = УСЛОВНЫЙ РАСЧЁТ (или ГИПОТЕТИЧЕСКИЙ РАСЧЁТ) – Notional Settlement:- a reference price based on trading activity during a certain range close to the end of the day that is used to calculate the maximum daily price fluctuation for trading on the NYMEX ACCESS® after-hours electronic trading system when the regular settlement price has not been established in time for the start of the NYMEX ACCESS® session. The system is then updated with final settlement prices later in the session. / используется для подсчёта максимального дневного колебания цены для торговли во внерабочее время в электронной торговой системе НАЙМЭКС ЭКСЭС® (NYMEX ACCESS®).

NOTIONAL VALUE = УСЛОВНАЯ СТОИМОСТЬ (или УСЛОВНЫЙ ОБЪЁМ) – Notional Value is the principal amount stated in a contract on which future payments will be made or benefits be received.

NOT MARKED BY DIRECTIONAL LINES = НЕ МАРКИРОВАННОЕ НАПРАВЛЯЮЩИМИ ЛИНИЯМИ – Not Marked By Directional Lines:- bias will not fit together, causing twisting, puckering, pleating and a general mismatching of component parts; Cutting Room Defects, and namely – Marking Defects. / Порок или дефект раскроя.

NOT OTHERWISE SPECIFIED/NOT ELSEWHERE SPECIFIED = НЕ УКАЗАННЫЙ ИНАЧЕ/НИГДЕ НЕ УКАЗАННЫЙ – Not Otherwise Specified/Not Elsewhere Specified:- this term often appears in ocean or airfreight tariffs respectively. If no rate for the specific commodity shipped appears in the tariff, then a general class rate (for example, printed matter NES) will apply. Such rates usually are higher than rates for specific commodities.

NOT STACKED IN NUMERICAL ORDER = НЕ ВЫЛОЖЕННЫЕ В ЦИФРОВОМ ПОРЯДКЕ – Not Stacked In Numerical Order:- bundle numbers not in order on rack, skid or box. Cutting Room Defects, and namely – Take Off and Bundling Defects. / Порок или дефект раскроя.

NOT SUFFICIENT FUNDS = НЕДОСТАТОЧНЫЕ ФОНДЫ – Not Sufficient Funds (NSF):- if an account does not have adequate capital to cover cheques written, it will return such cheques market, NSF. Engineers may be more familiar with NSF as an acronym for the National Science Foundation in the USA.

NOTTINGHAM LACE = НОТИНГЭМСКОЕ КРУЖЕВО – Nottingham Lace is one of the first of the machinemade laces. It originated in Nottingham, England. Today, the term Nottingham Lace is often used for any lace made by any machine.

NOT TO INURE CLAUSE = ОГОВОРКА О НЕПРИЕМЛЕМОСТИ – Not To Inure Clause is a clause in a cargo policy stating that the policy shall not inure to the benefit of a carrier or other bailee. The intention is to deny the right of carriers to benefit from the insurance when they claim such a right in the contract of carriage.

NOT TO ORDER CLAUSE = ОГОВОРКА О НЕВОЗМОЖНОСТИ УСТУПКИ – Not To Order Clause:- a bill or check marked ‘not to order’ cannot be transferred through endorsement. Transfer may only be effected by assignment since the ‘not to order’ clause changes an order paper into an instrument made out to name.

NOT UNDER COMMAND = НЕ ПОД КОМАНДОВАНИЕМ – Not Under Command (maritime term):- said of a vessel when unable to maneuver. / судно, лишённое возможности управляться.

NOT UNDER CONTROL = НЕ ПОД КОНТРОЛЕМ (или НЕ ПОД УПРАВЛЕНИЕМ, или НЕУПРАВЛЯЕМОЕ) – Not Under Control (maritime term):- same as not under command.

NOVELTY = ФАСОННОЕ (или НОВИНКА) – Novelty:- novelty fabrics are primarily made of 100% cotton and tend to have decorative designs. They are often used to make quilts, curtains and garments.

NOVELTY/ACCENT YARNS = НОВШЕСКАЯ/ХХ ПРЯЖИ (или ПРЯЖИ ФАСОННОЙ КРУТКИ/ХХ) – Novelty/Accent Yarns:- these yarns are very very fine and are not intended to be used by themselves; they are intended to be knit with another yarn and will provide additional color and texture to a finished fabric. They do possibly change the gauge of your fabric, so a swatch is recommended whenever you are going to use an accent yarn to make the necessary adjustment to your needle size.

NOVELTY YARN = ФАСОННАЯ ПРЯЖА – Novelty Yarn is the yarn produced for a special effect. Novelty yarns are usually uneven in size, varied in color, or modified in appearance by the presence of irregularities deliberately produced during their formation. In singles yarns, the irregularities may be caused by inclusion of knots, loops, curls, slubs, and the like. In plied yarns, the irregularities may be effected by variable delivery of one or more yarn components or by twisting together dissimilar singles yarns. Nub and slub are examples of novelty yarns. Novelty Yarn is the yarn that is intentionally produced to have a special or unique effect. These effects can be produced by twisting together uneven single yarns, by using yarns that contain irregularities, or by twisting yarns that contain a color variance. A slubbed yarn is an example of a novelty yarn. Yarns with an unusual character. Rather like marketing types referring to software bugs as 'features', many spinners call distinctive yarns 'novelty yarns'. / Фасонная Пряжа имеет неоднородную структуру, на её поверхности расположены различные утолщения в виде петель, пуков, узелков и другого. Широкое применение такой пряжи в ткачестве и в трикотажной промышленности позволяет расширить ассортимент изделий. К фасонной пряже основных видов относятся однониточная с утолщениями и цветными эффектами, многониточная, равномерно скрученная переслежистая и волнистая, многониточная, фасонно-кручёная пряжа – петлистая, узелковая, шишковатая, комбинированная пряжа фасонной крутки. Фасонная пряжа состоит не менее чем из двух или трёх и более нитей и изготовляется обычно в два этапа. Сначала на машине фасонного кручения скручиваются две или три нити, являющиеся стержневыми, затем эти нити подаются в зону кручения, куда одновременно поступает нагонная нить со скоростью, превышающей скорость подачи стержневых нитей. Эта скорость может быть переменной. Нагонная нить обвивает стержневую и в зависимости от соотношения скоростей обеих нитей образует на их поверхности петли, спирали, узелки или шишки. При повторном пропуске через крутильную машину вводится закрепительная нить, которая фиксирует положение нагонной и стержневой нитей или сама создаёт дополнительный эффект. Под Фасонной Нитью понимается текстильная нить с повторяющимися местными эффектами:- петлями, узелками, утолщениями и другим, получаемыми изменением структуры в процессах прядения и кручения, а также путём специальных видов обработки нити. Структура фасонных нитей может быть следующих типов:- комбинированная (узелки и спирали), комбинированная – эпонж, синель, спиральная (извилистая) и узелковая.

NOVEMBER = НОВЭМБЁ – November (pronunciation:- no-VEM-bur) or N is international nautical signal flag meaning:- No or negative. Abandonment and Re-sail (Sailing Regatta). Meaning:- no (negative).

NOVOLOID FIBER = НОВОЛОИДНОЕ ВОЛОКНО – Novoloid Fiber is a manufactured fiber containing at least 85% by weight of a cross-linked novolac. Novoloid is flame resistant and nonmelting. Its primary use is in flame-protective garments and products.

NOW = NEGOTIABLE ORDER OF WITHDRAWAL

NOW = NATIONAL ORGANIZATION FOR WOMEN

NOW ACCOUNT = NEGOTIABLE ORDER OF WITHDRAWAL ACCOUNT

NOXIOUS WEED = ПАГУБНЫЙ СОРНЯК (или ВРЕДНЫЙ СОРНЯК, или ЯДОВИТЫЙ СОРНЯК) – Noxious Weed is a Plant regulated or identified by law, as being undesirable, troublesome, and difficult to control. Precise definition varies according to legal interpretations.

NOZZLE = СОПЛО (или НАКОНЕЧНИК, или ПАТРУБОК) – Nozzle is:- (1) the spout through which something is discharged, i.e. oil in finish application or fibers in web laying. (2) A term sometimes used to refer to spinnerets.

NOZZLE DELIVERY = ПОДАЧА ЧЕРЕЗ СОПЛО (или ПОДАЧА ЧЕРЕЗ РАСПЫЛИВАЮЩИЙ НАКОНЕЧНИК, или РАСХОД ЧЕРЕЗ РАСПЫЛИВАЮЩИЙ НАКОНЕЧНИК) – Nozzle Delivery is the rate of water discharged from a nozzle during operation, usually expressed in liters per minute.

NP = NEPAL

NP = NITROGEN, PHOSPHATE

NP = NO PROTEST

NP = NOTARY PUBLIC

N/P = NOTES PAYABLE

NPBT = NET PROFIT BEFORE TAX

NPGRCC = NATIONAL PLANT GENETIC RESOURCES CONSERVATION CENTER

NPGRL = NATIONAL PLANT GENETIC RESOURCES LABORATORY

NPI = NET PROFITS INTEREST

NPISH = NON–PROFIT INSTITUTIONS SERVING HOUSEHOLDS

NPK = NITROGEN, PHOSPHATE, POTASSIUM

NPL = NON PATENT LITERATURE

NPL = NON–PERFORMING LOAN

NPPO = NATIONAL PLANT PROTECTION ORGANIZATION

NPR = NEPALESE RUPEE

NPR = NOMINAL PROTECTION RATE

NPRA = NATIONAL PETROCHEMICAL AND REFINERS ASSOCIATION

NPS = NEW PRICING SCHEME

NPT = NEW PLANT TYPE

NPV = NET PRESENT VALUE

NPV = NO PAR VALUE

NQB = NATIONAL QUOTATION BUREAU

NQB = NO QUALIFIED BIDDERS

NQLX LLC = ЭН.КЬЮ.ЭЛ.ЭКС. ЭЛ.ЭЛ.СИ. – NQLX LLC originally was designated as the NASDAQ LIFFE LLC futures exchange, and it operated as a joint venture of the NASDAQ stock market and the London International Financial Futures and Options Exchange (LIFFE). NQLX's relationship with NASDAQ ended on July 24, 2003, and it was renamed as NQLX. Headquartered in New York, State of New York (NY), the United States of America. NQLX LLC operates a market for futures on individual United States stocks. The exchange offers a broad range of contracts, via an all-electronic derivatives exchange. Nasdaq Liffe Markets, LLC (NQLX or the 'exchange') provides an electronic trading system that matches orders submitted to a transparent, anonymous central order book in strict price and time priority. We also allow our members, under certain circumstances, to use electronic or automated order-routing systems to transmit orders to the exchange's electronic trading system. Note that electronic trading systems differ from one another and traditional open outcry pit trading. Likewise, automated order-routing systems differ from manual order-routing methods. All electronic trading and order-routing systems present varying degrees of risk related to system access, varying response times, and security. In addition, trading through an electronic trading or order-routing system exposes you to risks associated with system or component failure. In the event of system or component failure, it is possible that, for a certain time period, you may not be able to enter new orders, execute existing orders, or modify or cancel orders that were previously entered. System or component failures may also result in loss of orders or order priority. NQLX, like many other exchanges offering electronic trading or order-routing systems, has adopted rules to limit our liability and the liability of our members and software and communication system providers for system failures and delays. / ЛАЙФ или Эл.Ай.Эф.Эф.И. NUB YARN = ШИШКОВАТАЯ ПРЯЖА (или ПРЯЖА С ШИШЕЧКАМИ) – Nub Yarn is a novelty yarn containing slubs, beads, or lumps introduced intentionally. / , наплывы или шарики или бисеринки или бусинки (beads), или . Пряжа С Шишечками – пряжа фасонной крутки.

NUCELLUS = НУЦЕЛЛУС – Nucellus is the central part of the ovule enclosing the female gametophyte. / Под Нуцеллусом, от Латинского слова Nucella, означающее Орешек, понимается центральная часть семяпочки, соответствующая мегаспорангию. В нуцеллусе образуются 4 мегаспоры, одна из которых даёт женский заросток (половое поколение) – зародышевый мешок у покрытосеменных и первичный эндосперм у голосеменных. Сохранившаяся в зрелом семени ткань нуцеллуса называется Периспермом (Perisperm).

NUCLEAR ENERGY = ЯДЕРНАЯ ЭНЕРГИЯ (или АТОМНАЯ ЭНЕРГИЯ) – Nuclear Energy is a power obtained by splitting heavy atoms (fission) or joining light atoms (fusion). A nuclear energy plant uses a controlled atomic chain reaction to produce heat. The heat is used to make steam run conventional turbine generators. / Под Ядерной Энергией или Атомной Энергией понимается внутренняя энергия атомных ядер, выделяющаяся при некоторых ядерных реакциях. Использование ядерной энергии основано на осуществлении цепных реакций деления тяжёлых ядер и реакций термоядерного синтеза лёгких ядер. Ядерная Энергия – внутренняя энергия атомного ядра, связанная с движением и взаимодействием образующих ядро нуклонов. Ядерная энергия изменяется при ядерных превращениях. Энергия выделяется, если в результате ядерных превращений образуются ядра, обладающие большой удельной энергией связи ω. В соответствии с характером зависимости ω от массового числа A возможны два способа получения ядерной энергии:- в результате цепной ядерной реакции деления тяжёлых ядер или при термоядерной реакции синтеза лёгких ядер. В ядерной энергетике пока используется только первый способ, так как использование второго связано с нерешённой ещё проблемой осуществления управляемой термоядерной реакции. Ядерные Цепные Реакции, самоподдерживающие реакции деления атомных ядер под действием нейтронов в условиях, когда каждый акт деления сопровождается испусканием не менее 1 нейтрона, что обеспечивает поддержание реакции. Ядерная цепная реакция является способом извлечения ядерной энергии. Ядерная Энергетика, отрасль энергетики, использующая ядерную энергию для электрификации и теплофикации; область науки и техники, разрабатывающая методы и средства преобразования ядерной энергии в электрическую и тепловую. Основу ядерной энергетики составляют атомные электростанции (АЭС). Первая АЭС (5 МВт), положившая начало использованию ядерной энергии в мирных целях, была пущена в СССР в городе Обнинске в 1954. К концу 1980-х в 26 странах мира работало около 400 энергетических ядерных реакторов общей мощностью свыше 317 ГВт. В связи с истощением мировых запасов органического топлива возрастает значение ядерной энергетики. Ядерная Энергия – атомная энергия, внутренняя энергия атомного ядра, выделяющаяся при ядерных реакциях. Энергия, которую необходимо затратить для расщепления ядра на составляющие его нуклоны, называется Энергией Связи Ядра $\xi_{св}$. Следовательно, энергия связи – максимальная ядерная энергия. Энергия связи, рассчитанная на один нуклон, называется Удельной Энергией Связи $\xi_{св}$ /A (A – Массовое Число). Энергия связи ядра складывается из энергии притяжения нуклонов друг к другу под действием ядерных сил и энергии взаимного отталкивания протонов под действием электростатических сил. Каждый нуклон сильно взаимодействует лишь с небольшим числом соседних. Поэтому уже начиная с ^{4}He удельная энергия связи слабо растёт с увеличением A. Максимум достигается в области Fe (A = 56), после чего идёт спад. Такой ход зависимости объясняется тем, что часть нуклонов находится на периферии ядра, и для них притяжение к остальным нуклонам является более слабым. В лёгких ядрах число таких нуклонов относительно велико. В результате уменьшения роли периферийных нуклонов с увеличением A значение $\xi_{св}$ /A растёт. В тяжёлых ядрах $\xi_{св}$ /A с ростом A убывает, так как энергия притяжения растёт с увеличением A линейно, а энергия электростатического отталкивания протонов растёт пропорционально квадрату числа протонов Z^2. Таким образом, экзотермическими являются реакции ядерного синтеза (образование лёгких ядер из легчайших), реакции расщепления тяжёлых ядер (деление ядер на более мелкие осколки) и спонтанный альфа-распад. При так называемых магических значениях Z и N (число нейтронов в ядре) зависимость $\xi_{св}$ /A от A имеет небольшие максимумы, связанные с наличием в ядре замкнутых оболочек. Из-за электростатического отталкивания протонов реакции ядерного синтеза могут развиваться, если кинетическая энергия ядер велика, то есть при высоких температурах среды. Реакции ядерного синтеза являются источником звёздной энергии. Реакции так называемого водородного цикла в звёздах протекают с образованием ^{4}He и выделением энергии ~7 МегаэлектронВольт на нуклон (МэВ/нуклон) ($1.8 \cdot 10^8$ кВт·ч/кг). В земных условиях осуществлены 2 термоядерные реакции:- слияние 2 дейтронов, сопровождающееся выделением энергии 1 Мэв/нуклон, и синтез дейтрона и тритона, при котором выделяется 3.5 МэВ/нуклон. В реакции деления ^{235}U под действием нейтронов выделяется около 214 МэВ в 1 акте деления (для изотопов Pu на 4–5% больше). Из них около 12 МэВ уносит в мировое пространство Нейтрино. Таким образом, реально выделяющаяся ядерная энергия составляет 0.85 МэВ/нуклон, или $2.2 \cdot 10^8$ кВт·ч/кг. Это в $2 \cdot 10^6$ раз превосходит энергию, выделяющуюся при сгорании 1 килограмма (кг) нефти. Пока в качестве промышленного источника ядерной энергии используются только реакции деления ядер.

NUCLEAR ENERGY AGENCY = АГЕНТСТВО ПО ЯДЕРНОЙ ЭНЕРГИИ (или АГЕНТСТВО ПО АТОМНОЙ ЭНЕРГИИ) – The Nuclear Energy Agency (NEA) is a specialised agency within the Organisation for Economic Co-operation and Development (OECD), an intergovernmental organisation of industrialised countries, based in Paris, France. The mission of the NEA is to assist its member countries in maintaining and further developing, through international co-operation, the scientific, technological and legal bases required for the safe, environmentally friendly and economical use of nuclear energy for peaceful purposes. To achieve this, the NEA works as a forum for sharing information and experience and promoting international co-operation; a centre of excellence which helps member countries to pool and maintain their technical expertise and a vehicle for facilitating policy analyses and developing consensus based on its technical work. The NEA's current membership consists of 29 countries in Europe, North America and the Asia-Pacific region:- Australia, Austria, Belgium, Canada, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Japan, Korea (Republic of), Luxembourg, Mexico, the Netherlands, Norway, Poland, Portugal, Slovakia, Spain, Sweden, Switzerland, Turkey, the United Kingdom, and the United States of America. Together they account for approximately 85% of the world's installed nuclear capacity. Nuclear power accounts for almost a quarter of the electricity produced in NEA member countries. The NEA works closely with the International Atomic Energy Agency (IAEA) in Vienna, Austria – a specialised agency of the United Nations – and with the European Commission in Brussels, Belgium. Within the OECD, there is close co-ordination with the International Energy Agency and the Environment Directorate, as well as contacts with other directorates, as appropriate. NEA areas of work:- nuclear safety and regulation; nuclear energy development; radioactive waste management; radiological protection and public health; nuclear law and liability; nuclear science; the Data Bank; information and communication. NEA strengths:- (i) the NEA is the only intergovernmental nuclear energy organisation which brings together developed countries of North America, Europe and the Asia-Pacific region in a small, non-political forum with a relatively narrow, technical focus; (ii) NEA membership represents much of the world's best nuclear expertise; (iii) by pooling this expertise, the NEA provides each member access to the substantial experience of

others and an opportunity to substantially leverage its resources in this field; (iv) homogeneity of NEA membership makes possible a like-minded approach to problems, a climate of mutual trust and collaboration, the full exchange of experience and a frank assessment of issues; (v) the NEA is relatively unfettered by political and bureaucratic constraints, and is able to focus effectively on the specific needs of its members; (vi) NEA scientific and technical work is in the forefront of knowledge and is known for its depth; (vii) the NEA publishes consensus positions on key issues, providing member countries with credible references; (viii) the NEA is cost-effective. It operates with a small staff, relying on member country experts, and provides significant added value; (ix) the NEA's system of standing technical committees enables the Agency to be flexible and responsive; (x) NEA joint projects and information exchange programmes enable interested members and non-members to join forces in carrying out research or scientific intercomparison exercises on a cost-sharing basis; and (xi) the NEA, as part of a larger multi-disciplinary organisation, is uniquely placed to address nuclear energy in the context of broader cross-cutting issues such as sustainable development. The NEA Secretariat serves seven specialised standing technical committees under the leadership of the Steering Committee for Nuclear Energy – the governing body of the NEA – which reports directly to the OECD Council. The standing technical committees, representing each of the seven major areas of the Agency's programme, are comprised of member country experts who are both contributors to the programme of work and beneficiaries of its results. The approach is highly cost-efficient as it enables the Agency to pursue an ambitious programme with a relatively small staff that co-ordinates the work. The substantive value of the standing technical committees arises from the numerous important functions they perform, including:- (i) providing a forum for in-depth exchanges of technical and programmatic information; (ii) stimulating development of useful information by initiating and carrying out co-operation/research on key problems; (iii) developing common positions, including 'consensus opinions', on technical and policy issues; (iv) identifying areas where further work is needed and ensuring that NEA activities respond to real needs; and (v) organising joint projects to enable interested countries to carry out research on particular issues on a cost-sharing basis. The Nuclear Energy Agency (NEA), with headquarters in Paris, France, is a companion organization to the International Energy Agency (IEA) and an element of the Organization for Economic Cooperation and Development (OECD). NEA promotes the safe and effective use of nuclear energy through the exchange of information among technical experts, the sharing of analytical studies, and undertaking joint research and development projects by member countries. Concerned with the rapidly increasing energy needs of post-World War II European economic recovery, and particularly the possibilities presented by nuclear power, the Council of the OEEC (the predecessor of the OECD) set up the European Nuclear Energy Agency (ENEA) in February 1958. The Agency's name was changed in 1972 to the Nuclear Energy Agency (NEA) to reflect its growing membership beyond Europe's boundaries. The first phase of the NEA's programme mainly consisted of laying the foundations for nuclear co-operation, and focused on launching several joint R&D undertakings such as the Halden and Dragon reactor projects, and the prototype Eurochemic plant for the reprocessing of spent nuclear fuels. This period came to a natural end during the late 1960s as the experimental phase of nuclear energy evolved into commercial, industrial development. By the early 1970s the Agency's role had changed to one where major emphasis was placed on providing a forum for co-ordinating the national nuclear programmes of member countries, particularly in the health, safety and regulatory areas. As nuclear energy gathered momentum in the 1970s, governments came under increasing pressure from their constituents to give greater priority to the environmental aspects of nuclear energy and to the safety and regulation of nuclear power plants. In the early 1990s, in the wake of the dissolution of the Soviet Bloc, the Agency followed the lead of the OECD and initiated a limited programme of outreach, focusing primarily on the countries of Central and Eastern Europe and the former Soviet Europe. Some of the activities in the outreach programme have increasingly become an integral part of the core programme of the Agency as additional countries with reactors of Soviet design have become members. While the Agency has evolved in important ways, it has maintained the key features from which it derives its comparative advantage, including the homogeneity of its membership, its flexible working methods, the depth and quality of its technical work, and its small size and cost-effectiveness. These features will continue to be the key to the role that the Agency plays in the future, as the role of nuclear power itself evolves. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

NUCLEAR ENERGY INSURANCE = СТРАХОВАНИЕ ЯДЕРНОЙ ЭНЕРГЕТИКИ – Nuclear Energy Insurance is a property and liability insurance for atomic reactors, power stations or any other plant related to the production of atomic energy or its incidental processes.

NUCLEAR EXCLUSION CLAUSE = ОГОВОРКА ОБ ИСКЛЮЧЕНИИ В СЛУЧАЕ ЯДЕРНОЙ ОПАСНОСТИ – Nuclear Exclusion Clause is a clause that is common to all insurance policies (though the wording may vary), whereby all loss of or damage to the subject matter insured arising from a nuclear weapon, or similar, is excluded from the policy cover. / Оговорка, являющаяся общей для всех страховых полисов (хотя формулировка может варьироваться), посредством которой весь ущерб или повреждение субъекту, являющемуся застрахованным, в результате воздействия ядерного оружия или чего-то подобного исключается из покрытия по данному полису.

NUCLEAR FUEL = ЯДЕРНОЕ ТОПЛИВО (или ЯДЕРНОЕ ГОРЮЧЕЕ) – Nuclear Fuel:- fissionable materials that have been enriched to such a composition that, when placed in a nuclear reactor, will support a self-sustaining fission chain reaction, producing heat in a controlled manner for process use. The main Nuclear Fuels are uranium and plutonium. These are radioactive metals. Nuclear fuels are not burnt to release energy. Instead, nuclear fission reactions (where the nuclei in atoms are split) in the fuels release heat energy. The rest of the process of generating electricity is then identical to the process using fossil fuels. The heat energy is used to boil water. The kinetic energy in the expanding steam spins turbines, which then drive generators to produce electricity. Advantages:- unlike fossil fuels, nuclear fuels do not produce carbon dioxide or sulfur dioxide. Disadvantages:- fossil fuels, nuclear fuels are non-renewable energy resources. If there is an accident, large amounts of radioactive material could be released into the environment. In addition, nuclear waste remains radioactive and is hazardous to health for thousands of years. It must be stored safely. / Ядерное Топливо используется для осуществления цепной ядерной реакции деления ядер в ядерном реакторе с целью получения энергии. Ядерное топливо, как правило, представляет собой смесь веществ (материалов), содержащих как делящиеся ядра (например, ^{235}U), так и ядра ^{238}U или (и) ^{232}Th, способные в результате нейтронной бомбардировки в активной зоне реактора образовывать делящиеся ядра ^{233}U и ^{239}Pu, не существующие в природе. Иногда ядерное топливо называют Ядерным Горючим, хотя термин 'Ядерное Горючее' используют также для обозначения делящихся ядер. Ядерное Топливо – вещество, которое используется в ядерных реакторах для осуществления ядерной цепной реакции деления. Существует только одно природное ядерное топливо – урановое, которое содержит делящиеся ядра ^{235}U, обеспечивающие поддержание цепной реакции (ядерное горючее), и так называемые 'сырьевые' ядра ^{238}U, способные, захватывая нейтроны, превращаться в новые делящиеся ядра ^{239}Pu, не существующие в природе (вторичное горючее). Вторичным горючим являются также не встречающиеся в природе ядра ^{233}U, образующиеся в результате захвата нейтронов сырьевыми ядрами ^{232}Th. Ядерное топливо используется в ядерных реакторах, тепловыделяющие элементы (ТВЭЛы) которых представляют собой обычно металлические оболочки различной формы и длины, содержащие ядерное топливо и герметично заваренные. По химическому составу ядерное топливо может быть металлическим (включая сплавы), окисным, карбидным, нитридным и другим. Основные требования к ядерному топливу:- хорошая совместимость с материалом оболочки ТВЭЛов; высокие температуры плавления и испарения, большая теплопроводность; слабое взаимодействие с теплоносителем; минимальное

увеличение объёма (распухание) в процессе облучения в реакторе; технологичность производства и минимальная стоимость; простая технология регенерации (смотрите ниже) и другое. Ядерное топливо, используемое в реакторах-размножителях на быстрых нейтронах, кроме того, должно обеспечить высокий коэффициент воспроизводства. Урановое ядерное топливо для ядерных реакторов на тепловых нейтронах, составляющих основу ядерной энергетики, имеет обычно повышенное содержание изотопа ^{235}U (2–4% по массе вместо 0.71% в естественном уране). Существенный недостаток реакторов на тепловых нейтронах – низкий коэффициент использования природного урана. Несравнимо более высокий коэффициент использования урана может быть достигнут в реакторах-размножителях на быстрых нейтронах. В них используется уран с более высоким содержанием урана ^{235}U (до 30%), а в будущем, по мере накопления запасов ^{239}Pu, будет использоваться смешанное уран-плутониевое ядерное топливо с 15–20% Pu. В этом случае вместо обогащённого урана может быть использован природный и даже уран, обеднённый 235U, которого накопилось в мире уже достаточно большое количество. Обеднённый уран (без Pu) используется также в экранной зоне реактора-размножителя (зоне воспроизводства), по весу превышающей в несколько раз активную зону. В реакторах на быстрых нейтронах, работающих на уран-плутониевом ядерном топливе, количество накапливающегося ^{239}Pu может существенно превышать количество сгораемого, то есть имеет место воспроизводство ядерного толива. Коэффициент воспроизводства зависит от состава ядерного топлива. По степени его возрастания ядерное топливо располагается в следующем порядке:- окисное (U, Pu) O_2, карбидное (V, Pu) C, нитридное (U, Pu) N и металлическое в виде различных сплавов. Производство уранового ядерного топлива (топливный цикл) начинается с переработки руд с целью извлечения из них урана. При предварительной сортировке руды по γ-излучению в отвал удаляют 20–30% породы с содержанием урана ≤ 0.01% (применяются и обычные методы обогащения). Гидрометаллургическая переработка руды состоит в её дроблении, кислотном выщелачивании, сорбционном или экстракционном извлечении U из осветлённых растворов или пульп и получении очищенной закиси-окиси урана U_3O_8. Для руд, бедных ураном и лёгких для выщелачивания (особенно в трудных для горных работ условиях), применяют подземное выщелачивание на самом месторождении (для пластовых месторождений – через систему скважин, для жильных – в подземных камерах с предварительной отбойкой и дроблением руды взрывными методами). Далее U_3O_8 переводят или в тетрафторид UF_4 для последующего получения металлического урана или в гексафторид UF_6 – единственное устойчивое газообразное соединение урана, используемое для обогащения урана изотопом ^{235}U. Обогащение осуществляется методом газовой термодиффузии или центрифугированием. Далее UF_6 переводят в двуокись урана, которая используется для изготовления сердечников ТВЭЛов или для получения других соединений урана с той же целью. К сердечникам ТВЭЛов предъявляются высокие требования в отношении стехиометрического состава и содержания посторонних примесей. Так, в сердечниках 113 UO_2 соотношение (по массе) кислорода и металла должно быть в пределах 2.00–2.02; допустимое содержание F и H_2O (по массе) соответственно не более 0.01–0.006% и 0.001%. Торий как сырьевой материал для получения делящихся ядер ^{235}U не нашёл широкого применения по ряду причин:- (1) разведанные запасы U в состоянии обеспечить ядерную энергетику ядерным топливом на многие десятилетия; (2) Th не образует богатых месторождений, и технология его извлечения из руд сложнее; (3) наряду с ^{235}U образуется ^{232}U, который, распадаясь, образует γ-активные ядра (^{212}Bi, ^{208}Te), затрудняющие обращение с таким ядерным топливом и усложняющие производство ТВЭЛов; (4) переработка облучённых ториевых ТВЭЛов с целью извлечения из них ^{233}U является более трудной и дорогостоящей операцией по сравнению с переработкой урановых ТВЭЛов. В процессе эксплуатации ТВЭЛов ядерное топливо выгорает далеко не полностью, в реакторах-размножителях имеет место воспроизводство ядерного топлива (Pu). Поэтому отработанные ТВЭЛы направляют на переработку с целью регенерации ядерного топлива для повторного его использования; U и Pu очищают от продуктов деления. Затем Pu в виде PuO_2 направляют для изготовления сердечников, а U, в зависимости от его изотопного состава, или также направляют для изготовления сердечников, или переводят в UF_6 с целью обогащения ^{235}U. Регенерация ядерного топлива – сложный и дорогостоящий процесс переработки высокорадиоактивных веществ, требующий защиты от радиоактивных излучений и дистанционного управления всеми операциями даже после длительной выдержки отработавших ТВЭЛов в специальных хранилищах. При этом в каждом аппарате ограничивается допустимое количество делящихся веществ, чтобы предупредить возникновение самопроизвольной цепной реакции. Большие трудности связаны с переработкой и захоронением радиоактивных отходов. Разрабатываются методы остекловывания и битумирования отходов, ‘закачка’ слабоактивных растворов в глубокие горизонты Земли. Стоимость процессов регенерации ядерного толпива и переработки радиоактивных отходов оказывает существенное влияние на экономические показатели атомных электростанций. Ядерное Горючее – делящееся вещество, нуклиды, которые входят в состав ядерного топлива и обеспечивают цепную реакцию деления ядер.

NUCLEAR POWER PLANT = АТОМНАЯ ЭЛЕКТРОСТАНЦИЯ – Nuclear Power Plant is a facility in which heat produced in a reactor by the fissioning of nuclear fuel is used to drive a steam turbine. / Под Атомной Электростанцией (АЭС) понимается электростанция, в которой ядерная (атомная) энергия преобразуется в электрическую. На АЭС теплота, выделяющаяся в ядерном реакторе, используется для получения водяного пара, вращающего турбогенератор. Первая в мире АЭС мощностью 5 МВт была пущена в Обнинске, Россия 27 Июня 1954. АЭС составляют основу ядерной энергетики. Сооружаются в большинстве стран и во многих развивающихся странах. Мощность крупнейших действующих многоблочных АЭС (в 1986) превышала 6 ГВт. Однако, после катастроф на АЭС в Чернобыле, Украина и Фукусима, Япония правительства многих стран стали пересматривать свою позицию в отношении использования ядерной энергии, пытаясь заменить её иной энергией. Некоторые страны и вовсе отказались от использования ядерной энергии на законодательном уровне. Под Атомной Электростанцией (АЭС) понимается электростанция, в которой атомная (ядерная) энергия преобразуется в электрическую. На АЭС теплота, выделяющаяся в ядерном реакторе в результате цепной реакции деления ядер некоторых тяжёлых элементов, в основном, ^{233}U, ^{235}U, ^{239}Pu, преобразуется в электрическую энергию так же, как и на обычных тепловых электростанциях. При делении 1 грамма (г) изотопов урана или плутония высвобождается около 22.5 МВт·ч энергии, что эквивалентно энергии, получающейся при сжигании 2.8 тонн (т) условного топлива. АЭС составляют основу ядерной энергетики. Наиболее часто на АЭС применяют два типа реакторов на тепловых нейтронах:- (i) корпусные водо-водяные реакторы и (ii) канальные графито-водные реакторы. В зависимости от вида и агрегатного состояния теплоносителя выбирается термодинамический цикл АЭС. Выбор верхней температурной границы цикла определяется максимально допустимой температурой оболочек тепловыделяющих элементов (твэлов), а также свойствами теплоносителя. Отличительная особенность большинства АЭС – использование пара сравнительно низких параметров, насыщенного или слабоперегретого. В высокотемпературных графито-газовых реакторах возможно применение обычного газотурбинного цикла. Реактор в этом случае выполняет роль камеры сгорания. При работе реактора концентрация делящихся изотопов в ядерном топливе уменьшается (твэлы выгорают). Со временем отработавшие твэлы заменяют новыми. Для исключения перегрева и нарушения герметичности оболочек твэлов предусматривается быстрое (в течение нескольких секунд) глушение ядерной реакции аварийной системой расхолаживания. Основное электротехническое оборудование АЭС такое же, как и на обычных тепловых электростанциях.

NUCLEATION = НУКЛЕАЦИЯ (или ЗАРОЖДЕНИЕ, или ЗАРОДЫШЕОБРАЗОВАНИЕ) – Nucleation is a process by which crystals are formed. Crystals form initially on minute traces of foreign substances that act as the nucleus, then grow by external addition. / Зародышеобразование – образование центров кристаллизации.

NUCLEIC ACID HYBRIDIZATION = ГИБРИДИЗАЦИЯ НУКЛЕИНОВЫХ КИСЛОТ – Nucleic Acid Hybridization is a procedure in which single-stranded nucleic acid segments are combined to form double-stranded segments through complementarity of base sequences; a technique to assess the extent of sequence homology among the nucleic acid segments. / Под Нуклеиновыми Кислотами или Полинуклеотидами понимаются высокомолекулярные органические соединения, образованные остатками нуклеотидов. В зависимости от того, какой углевод входит в состав нуклеиновой кислоты – дезоксирибоза или рибоза, различают дезоксирибонуклеиновую (ДНК) или рибонуклеиновую (РНК) кислоты. Последовательность нуклеотидов в нуклеиновых кислотах определяет их первичную структуру. Нуклеиновые кислоты присутствуют в клетках всех живых организмов и выполняют важнейшие функции по хранению и передаче генетической информации, участвуют в механизмах, при помощи которых она реализуется в процессе синтеза клеточных белков. В организме находятся в свободном состоянии и в комплексе с белками (нуклеопротеиды). Под Гибридизацией, от Латинского слова Hibrida, означающее Помесь, понимается скрещивание разнородных в наследственном отношении организмов. Один из важнейших факторов эволюции биологических форм в природе. Применяют для получения хозяйственных ценных форм животных и растений. Скрещивание особей одного и того же вида (различных подвидов, сортов, пород или линий) называется внутривидовой гибридизацией, а различных видов или родов – отдалённой гибридизацией.

NUCLEOLUS = НУКЛЕОЛЬ (или ЯДРЫШКО) – Nucleolus is a small round densely-staining region within the cell nucleus which contains ribosomal rRNA subunits and nuclear organizers (multiple copies of genes encoding rRNA (ribosomal RNA)). / Рибонуклеиновая Кислота (РНК). Под Нуклеолью или Ядрышком понимается плотное тельце внутри ядра клетки. Состоит в основном из рибонуклеопротеидов; участвует в образовании рибосом. Обычно в клетке одно ядрышко, реже несколько или много.

NUCLEOPROTEINS = НУКЛЕОПРОТЕИНЫ – Nucleoproteins are any of a class of conjugated proteins that are combinations of a protein and a nucleic acid, that occur in all living cells in the nuclei or the cytoplasm, and may constitute either the whole or the essential portion of genes and viruses, e.g., Tobacco mosaic virus. / Под Нуклеопротеидами понимаются комплексы белков с нуклеиновыми кислотами. Составляют основу заключённого в ядрах клеток наследственного вещества – хроматина, образуют многие вирусы, рибосомы, информосомы.

NUCLEOTIDE = НУКЛЕОТИД – Nucleotide is the building block of nucleic acids which consists of a phosphate group linked to a five-carbon-atom sugar which in turn is joined to a nitrogen-containing base (either cytosine, guanine, adenine, thymine, or uracil). / Под Нуклеотидами или Нуклеозидфосфатами понимаются фосфорные эфиры нуклеозидов; состоят из азотистого основания (пуринового или пиримидинового), углевода (рибозы или дезоксирибозы) и одного или нескольких остатков фосфорной кислоты. Соединения из одного, двух, трёх, нескольких или многих остатков нуклеотидов называются соответственно моно-, ди-, три-, олиго- или полинуклеотидами. Нуклеотиды – составная часть нуклеиновых кислот, коферментов и других биологически активных соединений.

NUCLEUS = НУКЛЕУС (или ЯДРО) – Nucleus is the distinctive component of eukaryotic cells. It is surrounded by a double membrane, and in which the majority of the genetic material of the cell is organized as chromosomes. Nucleus is a large organelle, usually located near the center of the cell and containing the DNA. / Дезоксирибонуклеиновая Кислота (ДНК). Под Нуклеусом, от Латинского слова Nucleus, означающее Ядро, или Ядром в биологии понимается обязательная часть клетки у многих одноклеточных и всех многоклеточных организмов. Типичное ядро отделено от окружающей цитоплазмы оболочкой, содержит ядрышко, хромосомы и кариоплазму. Размеры от 1 микрона (мкм) (у некоторых простейших) до 1 миллиметра (мм) (в яйцах некоторых рыб и земноводных). Управляет синтезом белков (в том числе ферментов) и через них всеми физиологическими процессами в клетке. Большинство клеток содержит одно ядро. По наличию или отсутствию в клетках оформленного ядра все организмы делят соответственно на эукариот и прокариот.

NUCLEUS SEED = ЯДРОВОЕ СЕМЯ – Nucleus Seed is the seed derived by a plant breeder from selected core plants to produce breeder seed.

NUDA = ГОЛОЕ (или ОГОЛЁННОЕ, или ЛЫСОЕ) – Nuda:- naked, without spines, wool etc.

NUDIFLORUS = ГОЛОЦВЕТКОВОЕ – Nudiflorus:- naked flowers without scales, spines, or wool on the ovary and flower tube. / Голоцветковые:- безлепестковые цветки без чешуек, волосков опушения или пуха на завязи и цветковой трубке.

NUE = NITROGEN USE EFFICIENCY

NUFFIC = NETHERLANDS UNIVERSITIES FOUNDATION FOR INTERNATIONAL COOPERATION

NULL HYPOTHESIS = НУЛЕВАЯ ГИПОТЕЗА – Null Hypothesis is the statistical hypothesis that states there is no measurable difference between the observed information and measured data, i.e. it assumes that the treatments have no effect. / Под Нулевой Гипотезой понимается исходное предположение в математической статистике, которое должно быть подтверждено или опровергнуто с помощью теории вероятностей. Используется при статистической проверке гипотез, например, о близости фактического распределения к теоретическому.

NULLIPLEX = НУЛЛИПЛЕКС – Nulliplex:- when a polyploid is recessive with all chromosomes in respect to a particular gene. / Нуллиплекс – чисто рецессивный полиплоид. Под Нуллиплексом, от Латинских слов Nullus, означающее Никакой, и Plexus, означающее Сплетение, понимается .

NULLISOMIC = НУЛЛИСОМИК – Nullisomic:- when a pair of chromosomes is absent resulting in a chromosome number of 2n-2. / Нуллисомик – организм в хромосомном наборе которого отсутствует одна пара гомологичных хромосом. Под Нуллисомиком, от Латинского слова Nullus, означающее Никакой, и Греческого слова Sōma, означающее Тело, понимается .

NUMBER = НОМЕР – The term ‘Number’, as applied to woven fabrics of chapter 53 of the Harmonized Tariff Schedule of the United States, means the average yarn number of the yarns contained therein. In computing the average yarn number, the length of the yarn is considered to be equal to the distance covered by it in the fabric in the condition as imported, with all clipped yarn being measured as if continuous and with the count being taken of the total single yarns in the fabric including the single yarns in any multiple (folded) or cabled yarns. The weight shall be taken after any excessive sizing is removed by boiling or other suitable process. Any one of the following formulas can be used to determine the average yarn number:- N = BYT / 1000 , or 100T / Z’, or BT / Z or ST / 10, when:- N is the average yarn number, B is the breadth (width) of the fabric in centimeters, Y is the meters (linear) of the fabric per kilogram, T is the

total single yarns per square centimeter, S is the square meters of fabric per kilogram, Z is the grams per linear meter of fabric, and Z' is the grams per square meter of fabric. Fractions in the resulting 'number' shall be disregarded.

NUMBER = НОМЕР (или ЧИСЛО) – Number is a traditional retail term indicating the resulting retail price of a product after doubling the cost. This is equal to a 50% Gross Margin or 100% Markup. Also known as Keystone.

NUMBER DELAYED TOWS = ЧИСЛО ЗАДЕРЖАВШИХСЯ БУКСИРУЕМЫХ СУДОВ – Number Delayed Tows is the total number of tows which experience a delay (i.e. wait time greater than zero minutes) between the arrival point and start of lockage.

NUMBER DUCK = НОМЕРНОЙ БРЕЗЕНТ (или НОМЕРНАЯ ПАРУСИНА, или НОМЕРНОЕ ГРУБОЕ ПОЛОТНО) – Number Duck:- they include naught ducks, narrow and extra-narrow ducks, sail ducks, and wide ducks. These ducks are the heaviest and strongest that are made. Carded ply yarns are always used, and since the warp yarns are strongly plied, they are not sized for weaving purposes. Maximum strength and weight is obtained by the use of multiple-ply yarns which range from 2 to 15 ply for the heaviest ducks. The strongest number ducks are usually in the gray state for utility purposes; in this condition they are naturally nonabsorbent and, in addition to the compact texture, are highly resistant to water penetration. Uses of number ducks include armored tank liners, army cots, conveyer belting, deck canvas, felt-dryer aprons, golf bags, heavy-duty bags, hose of many types and uses, knapsacks, laundry bags, mail bags, navy hammocks, oil-press cloth, portable water tanks, sailcloth, tarpaulin, tents, truck covers, and water buckets. Some of the fabric is made flame-resistant or mildew-resistant. Heavy ducks are usually made from 7's yarns in varying plies:- 7/3, 7/4, 7/5 up to 7/13 used for 12/0 duck. Lighter weight ducks usually employ 13's yarn of varying plies. See also Army Duck, Canvas, and Duck.

NUMBERED ACCOUNT = НОМЕРНОЙ СЧЁТ (или ПРОНУМЕРОВАННЫЙ СЧЁТ) – Numbered Account is a bank account that is identified by a number only, usually in order to keep the identity of the account holder confidential. Banks accounts administered by banks in Switzerland are most often numbered. Account operated under the designation of a number with no reference made to the accountholder's name. Securities safekeeping accounts can also be maintained as numbered safekeeping accounts. Numbered Account is a bank account that is maintained under the account number. Although the name and address of the accountholder are known to the bank, they are kept secret internally. This form of keeping accounts is prohibited in Germany but wide-spread in Switzerland. / Счёт Ответственного Хранения (Safekeeping Account). Пронумерованный Счёт – тип счёта в банке, где имя владельца банковского счёта держится в секрете, и он идентифицирует себя банку посредством кодового слова, известного только владельцу банковского счёта и ограниченному числу банковских служащих, таким образом предоставляя держателю степень частной жизни банка в их финансовых операциях. Пронумерованные счета в банке часто связываются в общественном мнении с желанием владельцем банковского счёта минимизировать правительственное расследование и налогообложение, и возможно скрыть незаконное или неэтичное происхождение денег на счёте. Поэтому пронумерованные счета в банке незаконны в большинстве банковской юрисдикции, но доступны (подчинены жёстким международным инструкциям) в некоторых западноевропейских странах с давней традицией специализации на международном банковском деле, таких как Швейцария и Австрия. В настоящее время, пронумерованные счета в банке не являются 'полностью анонимными', но они действительно служат для того, чтобы предоставить владельцу банковского счёта большую степень правовой защиты от расследования, минимизируя подвергание имени владельца банковского счёта в общественных параметрах настройки. Например, Швейцарская банковская система (в отличие от традиционных банков) не будет показывать информацию о пронумерованном владельце банковского счёта по требованию любому правительственному агентству, если доказательство преднамеренного мошенничества не будет представлено, не просто несообщение активов, чтобы избежать налогообложения. Чтобы ограничить использование пронумерованных счетов на отмывание денег и другие формы финансового мошенничества, Совет Европы передал под мандат в 1980, который пронумеровал счета в банке подвергнуться международным и внутренним инструкциям, имеющим отношение к проверке личностей владельцев банковского счёта и их действий. Под этими инструкциями, банки, которые ведут пронумерованные счета, могут требоваться постановлением суда показать имя владельца и финансовые детали, и личность держателя или подлинного владельца ценной бумаги, зарегистрированной на другое имя должна быть расследована на очевидные мошеннические намерения в начале банковских отношений. С 01 Июля 2005, Швейцария (как наибольший держатель Европейских пронумерованных банковских счетов) также зарядила удержанный налог на всех заработанных процентах в личных Швейцарских счетах жителей Европейского Союза, мера, разработанная, чтобы удовлетворить налоговые требования ЕС, все ещё сохраняя анонимность владельца банковского счёта.

NUMBERED SAFEKEEPING ACCOUNT = НОМЕРНОЙ СЧЁТ ОТВЕТСТВЕННОГО ХРАНЕНИЯ – Numbered Safekeeping Account is the safekeeping account where the name of the accountholder is known only to a small circle of people within the bank, as all transactions are processed under a number. Also known as Numbered Account. / Известен также как Номерной Счёт (Numbered Account).

NUMBER OF EMPLOYEES = ЧИСЛО РАБОТНИКОВ – No. of Employees is the total number of full-time-equivalent employees.

NUMBER OF STOCKS = ЧИСЛО АКЦИЙ – Number of Stocks is total number of stocks issued by the company.

NUMBER OF YARN = НОМЕР ПРЯЖИ (или ЧИСЛО ПРЯЖИ) – Count Of Yarn is a standard measure of the fineness of yarn, either calculated by number of specified lengths per specified weight, as for cotton, linen or wool (thus, the higher the yarn number, the finer the yarn); or calculated by number of specified weights per specified length, as nylon, rayon or silk (thus, the higher the number the thicker the yarn). The following systems, where higher counts indicate finer yarns, are used in the United States:- (i) Raw Silk = number of yards per ounce; (ii) Spun Silk = 840 yards per hank; (iii) Cotton = 840 yards per hank; (iv) Worsted = 560 yards per hank; (v) Woolen = 1 600 yards per run; (vi) Woolen = 300 yards per cut; (vii) Linen = 300 yards per cut. The cut system of woolen counts is principally used in the vicinity of Philadelphia. The yarn calculations applying to cotton will also apply to any of the above systems, using their respective standard lengths instead of 840. A number indicating the size or fineness of a yarn. Count Of Yarn is a size of yarn as distinguished by its weight and fineness. This term is applied to cotton, wool, and spun yarns. A number indicating the mass per unit length or the length per unit mass of yarn. Counts of Yarn or Numbers of Yarn:- the relationship of length to weight in determining the size of yarn. Although the term 'Numbers' is used quite extensively the more universal term 'Counts' will be given preference in this book. See also Count Of Yarn. / Найлан^{T3} (Nylon^{TM}). Номер Пряжи – стандартная мера тонины пряжи, рассчитывается либо (i) посредством числа спецификационных длин на спецификационный вес как, например, в случае с хлопком, льном или шерстью (таким образом, чем выше номер пряжи, тем она тоньше); либо (ii) числом спецификационных весов на спецификационную длину как, например, в случае с Найлан^{T3} (Nylon^{TM}), . Номер, указывающий вес для определённой длины или длину для определённого веса пряжи.

NUMERICAL COUNT SYSTEM = ЦИФРОВАЯ СИСТЕМА НУМЕРАЦИИ – Numerical Count System is a wool grading system. It divides all wools into 14 grades, and each grade is designated by a number.

NUMISMATICS = НУМИЗМАТИКА – Numismatics:- coins that are valued for their rarity, condition and beauty beyond the intrinsic value of their gold content. Generally, premiums for numismatic coins are higher than for bullion coins. The science and collecting of coins and other tokens closely resembling coins. Numismatics:- the specialized sector of the coin business for the study and collection of rare coins and other media of exchange, particularly those with archaeological and historic interest. / Под Нумизматикой, от Латинского слова Numisma, означающее Монета, понимается вспомогательная историческая дисциплина, изучающая историю монетной чеканки и денежного обращения по монетам, денежным слиткам и другому. Коллекционирование монет началось с XIV века. Нумизматика, как наука возникла в XVIII веке. Разделы нумизматики:- античная, византийская, восточная, западная, Русская.

NUN'S VEILING = ВУАЛЬ МОНАХИНИ – Nun's Veiling is a soft, lightweight, plain-weave fabric that usually comes in black and white, nun's veiling is a rather flimsy, open fabric but always of high quality. It may be made from fine woolen yarn or yarns spun from manufactured fibers such as nylon, acrylic, or polyester. / Найлан^{T3} (Nylon^{TM}). Плательная ткань полотняного переплетения из гребенной шерсти. В основе и утке пряжа одиночная.

NUOPAL BR^{TM} COTTON = ХЛОПЧАТНИК НЬЮОПЭЛ БИ.АР.^{T3} – NuOpal BR^{TM} Cotton is a Delta and Pineland variety with the added benefit of Monsanto's technology. NuOpal BR^{TM} Cotton is a combined Cotton variety containing two genes that are both helpful to reduce production costs and labor inputs for Cotton farming in general. The one gene provides the Cotton plant with tolerance to Roundup Ready® Plus herbicide (for improved weed control) and the other one resistance to lepidopteran pests, e.g., Helicoverpa Armigera or commonly known as the Bollworm, Diaparopsis Castenae or commonly known as Red Bollworm, and Earius Spp or commonly known as Spiny Bollworm. Initially these genes were used separately in the form of Bollgard® Cotton and Roundup Ready® Cotton. The two have now been combined into one cotton variety called NuOpal BR^{TM}. / Хлопчатник НьюОпэл Би.Ар.^{T3} (NuOpal BR^{TM} Cotton) – это разновидность Дэлтча (Delta) и Пайнлэнд (Pineland) технологии Монсэнто (Monsanto). чешуекрылые (lepidopteran) , например, . Хлопчатник Болгад® (Bollgard® Cotton) и Хлопчатник Рандап Рэди® (Roundup Ready® Cotton).

NURSE PLANT = ПОКРОВНОЕ РАСТЕНИЕ (или ЗАТЕНЯЮЩЕЕ РАСТЕНИЕ, или РАССАДНОЕ РАСТЕНИЕ) – Nurse Plant is a plant, often a shrub, which provides shelter and shade to developing seedlings of other plants. / Саженец (Nursery Plant). растение, часто куст, которое .

NURSERY = ПИТОМНИК – Nursery is a piece of prepared land where crop seedlings are raised for a short time pending their planting in permanent sites. A place where a large number of introduced or breeding Varieties or lines are first looked at or screened under field conditions. / Под Питомником понимается:- (i) хозяйство, занимающееся размножением и выращиванием сеянцев и саженцев Растений, а также Животных (Змей, Собак и других); или (ii) участок в опытном или научно-исследовательском учреждении для выращивания, размножения и изучения сельскохозяйственных Растений.

NURSERY ESTABLISHMENT = ПРЕДПРИЯТИЕ ПИТОМНИК – Nursery Establishment, as relates to the US/Canada Greenhouse Certification Program, a nursery establishment is a company that owns or operates a facility for producing plants. / Парник (Greenhouse). Под Питомником понимается:- (i) хозяйство, занимающееся размножением и выращиванием сеянцев и саженцев растений, а также животных (Змей, Собак и других); или (ii) участок в опытном или научно-исследовательском учреждении для выращивания, размножения и изучения сельскохозяйственных растений.

NUT = ОРЕХ (или СЕМЯНКА) – Nut is a fruit having a hard woody coat developed from a pistil with more than one carpel. Nut is a hard-walled fruit containing a single seed that does not split spontaneously. / Под Орехом понимается односемянный невскрывающийся плод растений с твёрдым деревянистым околоплодником (скорлупой), например, у Лещины. В быту орехом часто называют лишённую наружных слоёв околоплодника деревянистую косточку плодов – костянок, например, грецкий орех, миндальный орех. Орех (Nux), односемянный невскрывающийся синкарпный нижний плод с деревянистым околоплодником (например, у Лещины). Неправильно называют орехами семена некоторых Сосен ('Кедровый Орех'), косточку Грецкого Ореха ('Грецкий Орех'), сухую костянку Кокосовой Пальмы ('Кокосовый Орех'). Под Семянкой понимается односемянный нераскрывающийся плод растений с околоплодником, большей частью кожистым, не срастающимся с семенем. Например, у Подсолнечника, Сафлора. Семянка (Achenium), односемянный невскрывающийся плод покрытосеменных растений, образованный двумя плодолистиками с нижней завязью и имеющий сухой кожистый околоплодник (у Сложноцветных, Ворсянковых). На семянках нередко развиваются крыловидные выросты, хохолки, крючочки и другие образования, способствующие их распространению. Семянка Ворсянковых опадает с обёрточкой из сросшихся прицветников, у некоторых Сложноцветных (Дурнишник, Мордовник) – вместе с обёрткой корзинки. Иногда семянками ошибочно называют орешки, ценобии и другие типы плодов.

NUT–BROWN = ОРЕХОВО–КОРИЧНЕВОЕ (или КАШТАНОВОЕ) – Nut-Brown:- of the color of a brown nut.

NUTRIENT = ПИТАТЕЛЬНОЕ ВЕЩЕСТВО – Nutrient is a chemical substance that an organism ingests to enable it to survive, e.g., essential minerals. Nutrient is a chemical element essential for the growth and development of an organism. / Питательное Вещество – химическая субстанция, которую организм поглощает с целью поддержания жизни, например, незаменимые минералы.

NUTRIENT ANTAGONISM = АНТАГОНИЗМ ПИТАТЕЛЬНЫХ ВЕЩЕСТВ – Nutrient Antagonism is a reciprocal relationship among concentrations of two or more nutrients in plants. / Под Антагонизмом, от Греческого слова Antagōnisma, означающее Борьба или Спор, понимается противоречие, характеризующееся непримиримой борьбой враждебных сил, тенденций. В обществе антагонизм между противоположными классами разрешается в результате классовой борьбы, переворота.

NUTRIENT BALANCE = БАЛАНС ПИТАТЕЛЬНЫХ ВЕЩЕСТВ – Nutrient Balance:- an as yet undefined ratio among concentrations of nutrients essential for plant growth which permits maximum growth rate and yield.

NUTRIENT DEFICIENCY = НЕДОСТАТОЧНОСТЬ ПИТАТЕЛЬНЫХ ВЕЩЕСТВ – Nutrient Deficiency symptoms are not common and are usually induced by other factors such as waterlogging (Iron and Potassium), the absence of mycorrhizal fungi (Zinc and Phosphorus) or extended periods of overcast, cool weather late in the season when bolls are filling (Potassium). Some soil types are inherently low in Phosphorus or Zinc or Potassium and the addition of foliar or pre-plant fertilizer is therefore advantageous. (i) Zinc – plants stop growing and leaves become more 'shiny', cupping upwards with yellowing, and sometimes dead spots, developing between the veins. (ii) Phosphorus – slow, poor growth with leaves becoming a darker green. (iii) Potassium – See also Premature Senescence. (iv) Iron – transient yellowing (usually following an irrigation or waterlogging event) especially of the younger leaves and shoots at the top of the plant. / пучок или жилка (vein).

NUTRIENT INTERACTION = ВЗАИМОДЕЙСТВИЕ (или ВЗАИМОСВЯЗЬ) ПИТАТЕЛЬНЫХ ВЕЩЕСТВ – Nutrient Interaction is a statistical term used to denote departure from additive responses to two or more nutrients applied separately, and together.

NUTRIENT MEDIUM = ПИТАТЕЛЬНАЯ СРЕДА – Nutrient Medium is a mixture of substances on or in which cells, tissues, or organs can grow, with or without agar. / Под Питательными Средами понимаются жидкие или твёрдые смеси веществ, на которых выращивают микроорганизмы в лабораторных или промышленных условиях. Содержат соединения, служащие источниками углерода, азота, фосфора, витаминов и других компонентов, необходимых для жизнедеятельности микробов.

NUTRIENT STRESS = СТРЕСС, ВЫЗВАННЫЙ НАРУШЕНИЕМ ПИТАНИЯ – Nutrient Stress is a condition of plant growth when inadequate nutrient supply restricts growth.

NUTRITIONAL DISORDER = НАРУШЕНИЕ ПИТАНИЯ – Nutritional Disorder is any abnormality of the Rice plant caused by a deficiency of any essential element; or toxicity caused by a high level of any substance or ion in the soil; or any retarded growth due to a high osmotic pressure of the soil solution.

NV = NAAMLOZE VENNOOTSCHAP

NVOCC = NON–VESSEL OPERATING COMMON CARRIER

NWE = NORTHWEST EUROPE

NY = NEW YORK

NYAC = NEW YORK AREA FIRMS ADVISORY COMMITTEE

NYBOT® = NEW YORK BOARD OF TRADE

NY 'C' = NEW YORK ICE'S C CONTRACT FOR COFFEE

NYCC® = NEW YORK CLEARING CORPORATION

NYCE® = NEW YORK COTTON EXCHANGE

NYCSCE = NEW YORK COFFEE, SUGAR AND COCOA EXCHANGE

NYCTINASTY = НИКТИНАСТИЯ – Nyctinasty is of a movement in response to changing day and night conditions. See also Nastic. / Под Никтинастией, от Греческих слов Nýx, означающее Пух, родительный падеж Nyktós, означающее Ночь, и Nastós, означающее Уплотнённый, понимается ростовое движение листьев, лепестков и других органов растений, связанные со сменой дня и ночи, например, закрывание цветков с наступлением темноты.

NYCTN.CA = NEW YORK COTTON EXCHANGE, CITRUS ASSOCIATES

NYFE® = NEW YORK FUTURES EXCHANGE

NYH = NEW YORK HARBOR

NYLON™ FIBER = НАЙЛАНОВОЕ ВОЛОКНО (или НЕЙЛОНОВОЕ ВОЛОКНО, или ВОЛОКНО НАЙЛАН[T3]) – In October 1938, DuPont announced the invention of the first wholly synthetic fiber ever produced. Given the trade name Nylon™ (which has now become a generic term), the material was actually polyhexamethylene adipamide, also known as Nylon 6,6 for the presence of six carbon atoms in each of its two monomers. Commercial production of the new fiber began in 1939 at DuPont's plant in Seaford, States of Delaware, the United States, which in 1995 was designated a historic landmark by the American Chemical Society. Soon after the DuPont fiber was marketed, nylon 6 (polycaprolactam) was produced in Europe based on the polymerization of caprolactam. Nylon 6 and nylon 6,6 have almost the same structure and similar properties and are still the most important polyamide fibers worldwide. Nylon 6,6 was first synthesized at DuPont in 1935 by Wallace Hume Carothers by the condensation reaction of adipic acid and 1,6-hexamethylenediamine. As developed by Carothers, Julian Hill, and coworkers, the production process involved the use of a molecular still, which allowed polymerization to proceed more nearly to completion by eliminating water produced in the condensation reaction. Nylon arrived on the scene just in time to replace silk (a natural polyamide), whose East Asian supply sources had been cut off by imperial Japan. Women's stockings made of the new fiber were exhibited at the Golden Gate International Exposition in San Francisco and at the New York World's Fair in 1939. The next year they went on sale throughout the United States, touching off a nylon mania that survived diversion of the fiber to military use during World War II and continued after the war with such intensity that nylon virtually established the synthetic-fiber industry. The high strength, elasticity, abrasion resistance, mildew resistance, lustre, dyeability, and shape-holding properties of the material made it ideal for innumerable applications in apparel, home furnishings, automobiles, and machinery. In addition, extruded and molded plastic parts made of nylon exhibited high melting points, stiffness, toughness, strength, and chemical inertness; they found immediate use as gear wheels, oil seals, bearings, and temperature-resistant packaging film. Nylon is still a very important fiber, and its market has grown greatly since its introduction. However, it has yielded some market share to fibers of polyethylene terephthalate, which are cheaper to produce and display many superior properties. In apparel and home furnishings, nylon is an important fiber, especially in hosiery, lingerie, stretch fabrics and sports garments, soft-sided luggage, furniture upholstery, and carpets. For carpeting the nylon fiber is made in large-diameter filaments. Industrial uses of nylon fiber include automobile and truck tires, ropes, seat belts, parachutes, substrates for coated fabrics such as artificial leather, fire and garden hoses, nonwoven fabrics for carpet underlayments, and disposable garments for the health-care industry. As plastics the nylons still find employment as an engineering plastic – for example, in bearings, pulleys, gears, zippers, and automobile fan blades. Unlike rayon and acetate, nylon fibers are melt-spun – a process described in the article man-made fiber. Other polyamides of commercial importance include nylons 4,6; 6,10; 6,12; and 12,12 – each prepared from diamines and dicarboxylic acids; nylon 11, prepared by step-growth polymerization from the amino acid $H_2N(CH_2)_{10}COOH$; and nylon 12, made by ring-opening polymerization of a cyclic amide. Nylon™ – Produced in 1938, the first completely synthetic fiber developed. Known for its high strength and excellent resilience, nylon has superior abrasion resistance and high flexibility. Nylon™ is a manufactured fiber in which the fiber forming substance is any long chain synthetic polyamide having recurring amide groups (–NH–CO–) as an integral part of the polymer chain. The two principal nylons are nylon 66, which is polyhexamethylenedianime adipamide, and nylon 6, which is polycaprolactam. Nylon 66 is so designated because each of the raw materials, hexamethylenediamine and adipic acid, contains six carbon atoms. In the manufacture of nylon 66 fiber, these materials are combined, and the resultant monomer is then polymerized. After polymerization, the material is hardened into a translucent ivory-white solid that is cut or broken into fine chips, flakes, or pellets. This material is melted and extruded through a spinneret while in the molten state to form filaments that solidify quickly as they reach the cooler air. The filaments are then drawn, or stretched, to orient the long molecules from a random arrangement to an orderly one in the direction of the fiber axis. This drawing process gives elasticity and strength to the filaments. Nylon 6 was developed in Germany where the raw material, caprolactam, had been known for some time. It was not until nylon 66 was developed in the United States that work was initiated to convert caprolactam into a fiber. The process for nylon 6 is simpler in some respects than that for nylon 66. Although nylon 6 has a much lower melting point than nylon 66 (a disadvantage for a few applications), it has superior resistance to light degradation and better dyeability, elastic

recovery, fatigue resistance, and thermal stability. Two other nylons are:- (i) nylon 11, a polyamide made from 11-amino-undecanoic acid; and (ii) nylon 610, made from the condensation product of hexamethylenediamine and sebacic acid. Nylon 610 has a lower melting point than nylon 66 and the materials for its manufacture are not as readily available as those for nylon 66. Experimental work has been conducted on other nylons. Characteristics:- although the properties of the nylons described above vary in some respects, they all exhibit excellent strength, flexibility, toughness, elasticity, abrasion resistance, washability, ease of drying, and resistance to attack by Insects and microorganisms. End Uses:- Nylon is used for apparel such as stockings, lingerie, dresses, bathing suits, foundation garments, and wash-and-wear linings; for floor coverings; for tire cord and industrial fabrics; and in-home furnishings such as upholstery fabrics. Nylon™ is the generic term for man-made fibers composed of polyamides derived from coal and petroleum. Characteristics:- high strength, elasticity, low water absorption and quick-drying. Nylon™ stockings hit the market on 1940-May-15. Women rushed out to buy them, not in their thousands, but in their millions! Over 72 000 pairs of nylons were sold on the first day of release in America and 64 million by the time a year had passed. The allure of wrinkle free, bunching free, inexpensive legwear proved enormously popular putting a massive dent into all previous forms of established hosiery manufacture. Nylons remained popular until the 1960's where hem lines were raised again when Mary Quant's mini skirt became the must have fashion accessory. Unfortunatley, stockings could not be worn with a mini skirt without revealing the garter leading people to move towards tights which also appeared in the early 1960's and a decline in popularity of stockings amongst women. Nylon™ is the fiber composed of linear macromolecules having in the chain recurring amide linkages, at least 85% of which are joined to aliphatic cycloaliphatic units. Also known as Polyamide Fiber. Nylon™ is a polyamide used for fibers and solid plastic. There are several different types of Nylon™, each having different properties. Two common ones, based on molecular structure are nylon 6 and Nylon 6,6 (Nylon six six). Nylon™ is the oldest synthetic polymer used for textiles. It is usually dyed with acid dyes, but can be dyed with disperse dyes, particularly if barré is a problem. For acid dyeing, Nylon™ can be formulated specifically to take up only a little dye, 'normal' amounts of dye, or large amounts of dye. Nylon™ is a strong, elastic synthetic material that is stain-resistant and water-resistant. It is flexible, easily retains color and is also resistant to moths and mildew. Nylon™ – produced in 1938, the first completely synthetic fiber developed. Known for its high strength and excellent resilience, nylon™ has superior abrasion resistance and high flexibility. It is also stain and water resistant. Some of the hallmarks of nylon are its flexibility and color retention. It is also moth and mildew resistant. Nylon™ is also washable. Nylon Fiber is a manufactured fiber in which the fiber-forming substance is a long chain synthetic polyamide having recurring amide groups (–NH–CO–) as an integral part of the polymer chain. Nylon™ is a synthetically produced fiber which is very strong but lightweight. It is durable, provides excellent elasticity, and is resistant to abrasion, most acids and alkalis. Nylon™ fiber in braided cords and rope is flexible and has the ability to abssord shock load. It can be stored wet and is resistant to rot as well. Nylon™ is used in cord and rope applications including:- climbing rope, safety lanyards, mooring lines, tie down rope, sling rope. Properties of Nylon Cord Fiber:- (i) Excellent Strength; (ii) Good Resistance to acids; (iii) Chemical Resistant; (iv) Limited UV Resistance; (v) Excellent Abrasion Resistance; (vi) Melts at 480 °F; and (vii) Excellent elasticity. Nylon™ Fiber Cord & Rope Applications:- (i) Climbing Rope; (ii) Safety Lanyards; (iii) Mooring Lines; (iv) Tie-Down Rope; (v) Sling Rope; (vi) Winches; and (vii) Pulleys. Nylon™:- any of numerous strong tough elastic synthetic polyamide materials that are fashioned into fabrics. Nylon™ Fibers are one of the fibers having the longest history among synthetic fibers. They are used for a variety of uses from clothing to home furnishings and industrial uses. In Nylon™ fibers, there are many types depending on the raw materials. The fibers most manufactured in Japan is 'Nylon 6' fibers. In addition, 'Nylon 66' fibers, rather resistant to heat, are also manufactured. Recently, 'Nylon 46' fibers, improving their resistance to heat with higher than 290 in melting point, are put into practical application. Comparing other synthetic fibers, great advantages of Nylon™ fibers are resistant to abrasion and flexing, and of supple tactile feeling. Accordingly, thin, light and flexible woven or knitted fabric can be manufactured. Further-more, an advantage of easily dyeability makes possibility recent year to develop many fabrics for clothing. Nylon™ fibers can be produced in a variety of cross-section and fineness. Composite fibers, having unique appearance and tactile feeling, can also be produced by combining with other types of fibers. Heat storage or warmth retention fibers consisting of extremely fine filament yarns in which carbonaceous material converting the light to heat is inserted. Anti-static Nylon™ fibers inhibiting electro-static charge. Transparent Nylon™ fibers exhibiting more transparent and beautiful colors. Thus a wide variety of Nylon™ fibers are available giving much more performances and fabric hand. Almost all Nylon™ fibers are filament yarns ranging from very fine to coarse denier to be used for clothing such as sport wear, lingerie, pantyhose; home furnishing as carpets; and industrial uses such as fishing nets, ropes, and tire cords. Staple fibers are used, in the yarns blended with wool and acrylic fibers, for clothing; home furnishing such as carpets, upholstery; and other fields of sundries. End-Uses:- (i) For clothing:- Pantyhose, Socks, Ski Wear, Swimsuits, Sports Wear, Casual Wear, Lingerie, Women's Underwear, Rain Wear, Linings, etc. (ii) For home uses:- Cloth for Bags, Cover Cloth for Futon (Japanese Bedding), Furoshiki (Square Cloth for Wrapping Things), Cloth for Umbrella, Sewing Threads, Teeth Brush, Interlinings, etc. (iii) For home furnishing:- Carpets, Automotive Rugs, Upholstery, Artificial Turves, Rugs, etc. (iv) For industrial uses:- Tire Cords, Automotive Airbags, Fishing Nets, Fishing line, Computer Ribbon, Hoses, Industrial Sewing Thread, Footwear, Automotive Furnishings, Substrate for Synthetic Leather, etc. Features:- (i) One of the very strong fibers. Extremely resistant to abrasion and flexing; (ii) The specific gravity is 1.14 Very light, i.e. 80% of that of silk fibers, and 70% of that of cotton fibers; (iii) since nylon fibers absorb little water even though they are wetted, they dry fast and simple in laundering; (iv) Excellent in elasticity and resistant to wrinkle; (v) If properly set, nylon textiles little shrink/extend or little deform their shape due to thermoplasticity; (vi) Resistant to chemicals and oil. Non-attackable by sea water; (vii) Non-attackable by molds and insects. Care Instructions:- a white cloth of Nylon™ fibers tends to yellow gradually, not so severe as silk fibers, by exposing ultraviolet ray (sunlight). To prevent this phenomenon, a variety of countermeasures has been made. Recently, the yellowing has been improved considerably. A white cloth should be dried in the shade (Nylon™ fibers can be dried fast even in the shade due to their characteristics). Nylon™ fabrics should be ironed at the low temperature. Nylon™:- produced in 1938, the first completely synthetic fiber developed. Known for its high strength and excellent resilience, Nylon™ has superior abrasion resistance and high flexibility. A manufactured fiber in which the fiber-forming substance is a long chain synthetic polyamide. Nylon™ is a generic designation for a family of synthetic polymers known generically as Aliphatic Polyamides, first produced on February 28, 1935, by Wallace Carothers at DuPont's research facility at the DuPont Experimental Station. Nylon is one of the most commonly used polymers. Key representatives are nylon-6,6; nylon-6; nylon-6,9; nylon-6,10; nylon-6,12; nylon-11; nylon-12 and nylon-4,6. / развод (или потёк (stain)). Найлан[T3] (Nylon™). волокно ДюПо (DuPont) было , . В 1935 by Валэс Хьюм Коразёз (Wallace Hume Carothers) посредством реакции конденсации of adipic acid and 1,6-hexamethylenediamine. By Коразёз, Дьжулиэн Хил (Carothers, Julian Hill), . особенно в чулочно-носочных изделиях, нижнем белье, . , эластичность, устойчивость к истиранию, . Найлан[T3] или Нейлон[T3] – распространённое зарубежное торговое название полиамидного волокна. Найлан[T3] – широко распространённое за рубежом торговое название полиамидных волокон.

NYLON™ THREAD = НАЙЛАНОВАЯ[T3] НИТЬ (или НЕЙЛОНОВАЯ[T3] НИТЬ) – Nylon™ Thread is the thread introduced as an alternative to silk thread that has more give than most natural fiber threads. It is used extensively for sewing man-made fiber fabrics, especially knits. / Найлан[T3] (Nylon™).

NYM = NEW YORK MERCANTILE EXCHANGE

NYMEX® = NEW YORK MERCANTILE EXCHANGE

NYMEX ACCESS® = NEW YORK MERCANTILE EXCHANGE'S AUTOMATIC COMPUTER–CONTROLLED ELECTRONIC SCANNING SYSTEM

NYMEX® LOOK–ALIKE = ДВОЙНИК НАЙМЭКСА® – NYMEX® Look-Alike:- a lookalike swap or lookalike option that is based on a futures contract traded on the New York Mercantile Exchange (NYMEX®). Look-Alike Contracts:- a financial product, such as a swap or an option, that is traded over-the-counter and that is cash settled, based on the settlement price of a similar, exchange-traded futures contract, on a specific trading day. Futures look-alike contracts are regulated by the Commodity Futures Trading Commission (CFTC). A NYMEX® Look-Alike, for example, is a look-alike option or look-alike swap, based on a futures contract that is traded on the New York Mercantile Exchange (NYMEX®). The contract terms of a look-alike contract, closely correspond with the contract terms of the futures contract. Look-alike contracts are available on a variety of contracts including oil, coal, crude oil, natural gas, Brent (a major classification of crude oil) and WTI (West Texas intermediate, also known as Texas light sweet, a type of crude oil). / Своп двойник или опцион двойник – это то, что базируется на фьючерсном контракте, торгуемом на Нью Йоркской Товарной Бирже (НАЙМЭКС®).

NYMEX® SWAP = СВОП НАЙМЭКСА® – NYMEX® Swap:- a lookalike swap that is based on a futures contract traded on the New York Mercantile Exchange (NYMEX®). / Своп двойник – это то, что базируется на фьючерсном контракте, торгуемом на Нью Йоркской Товарной Бирже (НАЙМЭКС®).

NYMPH = НИМФА – Nymph is:- (1) any of various hemimetabolic insects in an immature stage. (2) In certain insects, the stage of development immediately after hatching wherein the individual resembles the adult but lacks fully developed wings and sexual organs. The immature stage of insects such as aphids, mirids and whiteflies that gradually aquire adult form through a series of moults without passing through a pupal stage. See also Larva, and Pupa. / Нимфа – (1) стадия в цикле полного превращения; и (2) личинка в цикле неполного превращения. Недоразвитая стадия насекомых, таких как тли, гнусы и белокрылки, которая со временем развивается во взрослую форму, проходя через серию линек без прохождения стадии окукливания. Смотрите также Личинка (Larva) и Куколка (Pupa). Под Нимфой, от Греческого слова Nýmphē, означающее Куколка или Личинка, понимается личиночная стадия развития членистоногих животных с неполным превращением (клещей, первичнобескрылых и некоторых крылатых насекомых). После многократных линек превращаются в половозрелую особь.

NYSE® = NEW YORK STOCK EXCHANGE

NYSE COMPOSITE INDEX® = СВОДНЫЙ ИНДЕКС ОТ НЙФБ® – The New York Stock Exchange (NYSE®) Composite Index® is an index that measures the market value of all common stocks listed on the NYSE® adjusted to account for capitalization changes, new stocks added to the list, and stocks removed from the list. Over 200 years old, the New York Stock Exchange is one of the oldest continuously operating exchanges in the world. It is associated with large-cap, blue chip stocks and is often used as a surrogate for the market as whole. The NYSE Composite Index® is designed to measure the performance of the world's most liquid and prominent companies – all common stocks listed on the NYSE®, including ADRs, REITs, tracking stocks and listings of foreign companies. The NYSE Composite Index® consists of more than 1 900 US and non-US stocks. The Index utilizes a transparent, rule based methodology, which includes free-float market cap weighting. The Index is calculated on both a price return and total return basis. In addition to serving as a broad-based benchmark, the NYSE Composite Index® establishes a universe from which other NYSE®-branded indexes are derived. The NYSE Composite Index® is made up of issues from more than 1 900 companies including more than 1 500 US companies and over 330 non-US companies. With a total float-adjusted market cap of over USD19 trillion, the Index provides an exceptional breadth of diversification and is a useful benchmark for investors who prefer to track global market performance in a single market or who may be precluded from investing in shares listed on non-US exchanges. The NYSE Composite Index® consists exclusively of NYSE®-listed companies. To become listed, all had to meet the NYSE's substantial original listing standards, providing a base level of quality for the Index's potential components. US and non-US stocks make up 64% and 36% respectively of the NYSE Composite Index® market cap and represent 38 countries. NYSE Composite constituents represent all of the 10 industries as defined by the Industry Classification Benchmark. Measures the performance of all the stocks on the NYSE® broken into the following four sectors:- industrial, utility, transportation and financial. The NYSE Composite (NYSE®:- NYA) is a stock market index covering all common stock listed on the New York Stock Exchange, including American Depositary Receipts, Real Estate Investment Trusts, tracking stocks, and foreign listings. Over 2 000 stocks are covered in the index, of which over 1 600 are from United States corporations and over 360 are foreign listings; however foreign companies are very prevalent among the largest companies in the index: of the 100 companies in the index having the largest market capitalization (and thus the largest impact on the index), more than half (55) are non-US issues. This includes corporations in each of the ten industries listed in the Industry Classification Benchmark. It uses free-float market cap weighting. It was originally given a value of 50 points, based on the market closing on 1965-December-31, and is weighted by the number of shares listed for each issue. It was re-introduced in January 2003 with a value of 5 000 points. The NYSE Composite outperformed the Dow Jones Industrial Average, the Nasdaq Composite, and the S&P 500 in 2004, 2005, and 2006 and closed above the 10 000 level for the first time on 2007-June-01. The NYSE Composite set a closing high of 10 311.61 on 2007-October-31 but failed to pass the intra-day high of 10 387.17 it reached in trading on 2007-October-11. On 2008-September-29, continuing troubles in the financial sector culminated in a loss of more than 8%. On 2008-November-20, the index plummeted below 5 000 to a multi-year bear market low near 4 650. Its lifetime low (as currently calculated) stands at 347.77 points, reached in October 1974. The index is continuously computed, and printed on ticker tape every half hour, with point changes in the index converted to Dollar amounts. In addition to the overall composite, there are separate indices for industrial, transportation, utility, and financial corporations. The index is the basis of the iShares NYSE Composite Index Fund (NYC), an exchange-traded fund. In January 2003 the NYSE® reintroduced the NYSE Composite Index® under a new methodology that is fully transparent and rule-based. Under the new methodology, all closed-end funds, ETFs, limited partnerships and derivatives are excluded from the index. As of year-end 2004, the NYSE Composite consists of over 2 000 US and non-US stocks. It is a measure of the changes in aggregate market value of all NYSE-listed common stocks, adjusted to eliminate the effects of capitalization changes, new listings and delistings. The index is weighted using free-float market capitalization and calculated on both price and total return basis. The composite index covering price movements of all common stocks listed on the New York Stock Exchange. It is based on the close of the market 1965-December-31 as 50.00 and is weighed according to the number of shares listed for each issue. The index is computed continuously and printed on the ticker tape. Point changes in the index are converted to Dollars and cents so as to provide a meaningful measure of changes in the average price of listed stocks. The composite index is supplemented by separate indexes for four industry groups:- industrial, transportation, utility and finance. See also Averages. / НЭЗДЭК® (NASDAQ®) . Дау Дьжонз (Dow Jones). (НЙФБ® или Эн.Уай.Эс.И.® (NYSE®)).

NYSE EURONEXT, INC. = ЭН.УАЙ.ЭС.И. ЮРОНЭКСТ, ИНК. – The World's largest stock exchange. The historic combination of NYSE Group and Euronext on 2007-April-04 marks a milestone for global financial markets. It brings together major marketplaces across Europe and the United States whose histories stretch back more than four centuries. The combination is by far the largest of its

kind and the first to create a truly global marketplace group. And that's just the beginning. NYSE Euronext will meet its customers' needs in new and enhanced ways, offering cross-border cash and derivatives products and services on a global scale, leveraging our reach across time zones and currencies. NYSE Euronext operates the world's leading financial markets, providing the platforms on which world-class companies raise the capital that drives the world's economy. Investors participate in that growth through our liquid, fair and accessible markets. NYSE Euronext provides the most compelling venues for investment products and services to the financial services industry. From the world's first stock exchange to state-of-the-art trading technology, NYSE Euronext's rich heritage combines the experience and expertise developed over four centuries with an innovative vision for the future. See also Euronext NV, and The New York Stock Exchange. Headquartered in New York, NY, the United States. NYSE Euronext, Inc., the holding company created by the combination of NYSE Group, Inc. and Euronext NV, was launched on 2007-April-04. As the world's leading and most liquid equities exchange group, NYSE Euronext powers the exchanging world and is comprised of equities and derivatives exchanges across the United States and Europe which trade cash equities, futures, options, fixed-income and exchange-traded products. With more than 8 000 listed issues, NYSE Euronext is home to the world's leading companies providing access to the global liquidity they need to collaborate, compete and grow. NYSE Euronext, Powering the Exchanging World. NYSE Euronext, Inc. (formerly NYSE Group, Inc. and Euronext NV) is a Euro-American for-profit corporation that operates multiple securities exchanges, most notably New York Stock Exchange (NYSE®), Euronext and NYSE Arca (formerly known as ArcaEx). NYSE® completed its acquisition of Archipelago Holdings via a 'double dummy' merger on 2006-March-07 in a USD10 billion deal to create the NYSE Group. The NYSE Group became a for-profit corporation and began trading publicly on its own stock exchange on 2006-March-08 under the NYX ticker. Owners of the 1 366 NYSE® seats received 80 177 shares of NYSE Group stock plus USD300 000.00 in cash and USD70 571.00 in dividends for each seat. NYSE Group merged with Euronext on 2007-April-04 to form the first global equities exchange. NYSE Regulation subsequently merged with the National Association Of Securities Dealers (NASD) to form the Financial Industry Regulatory Authority (FINRA) on 2007-July-26 and is therefore no longer managed by the exchange. On 2011-February-09, Bloomberg reported that the Deutsche Börse was in advanced talks to buy NYSE Euronext in a deal that would create the world's largest trading powerhouse. The shares of both companies were temporarily frozen on the news due to the risk of large price movements and clarifications of the deal. A successful deal would see the new company becoming the world's largest stock exchange operator with a market capitalization of listed companies equal to USD15 trillion. NYSE Euronext, Inc. (NYX), the world's leading and most diverse exchange group, completed its acquisition of the American Stock Exchange® (Amex®), becoming the third-largest US options marketplace and enhancing the company's leadership in ETFs, cash equities, closed-end funds and structured products. As a result, NYSE Euronext has begun to integrate AmexTrader content and data into the http://www.nyse.com and http://www.nyxdata.com websites. Effective the close of business, Monday, 2009-March-02, the AmexTrader website will be phased out. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). АМЭКС® (AMEX®). Блумбёг Эл.Пи. (Bloomberg LP). Эн.Уай.Эс.И. Арка (NYSE Arca). 01 Июня 2006 Юронэкст Эн.Фэй. или Юронэкст Эн.Ви. (Euronext NV) и НЙФБ® Группа, Инк. или Эн.Уай.Эс.И.® Груп, Инк. (NYSE® Group, Inc.) заявили о своём решении объединиться и создать совместное предприятие Эн.Уай.Эс.И. Юронэкст, Инк. (NYSE Euronext, Inc.). На момент создания новой компании объединённая капитализация двух ранее самостоятельных бирж составила 15 триллионов Евро (или 22 триллиона Долларов США). Процесс объединения завершился 04 Апреля 2007. 17 Февраля 2011 NYSE Euronext анносировала о желании слиться с Франкфуртской биржей Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG).

NYTRILE FIBER = НИТРИЛЬНОЕ ВОЛОКНО – Nytrile Fiber is a manufactured fiber containing at least 85% by weight of a long chain polymer of vinylidene dinitrile [–CH_2–$C(CN)_2$–] and having the vinylidene dinitrile group in no less than every other unit in the polymer chain. Nytril fibers have a low softening point so they are most commonly used in articles that do not require pressing such as sweaters and pile fabrics. They are also blended with wool to improve shrink resistance and shape retention. Nytril is a manufactured fiber, most often used in sweaters or pile fabrics, where little or no pressing is recommended, as the fiber has a low softening or melting point. However, it has also been successfully used in blends with wool for the purpose of minimizing shrinkage and improving the shape retention in garments. / Нитрилы карбоновых кислот, органические производные синильной кислоты общей формулы R–CN (R – углеводородный радикал, например, CH_3, C_6H_5, CH_2=CH). Получают дегидратацией амидов карбоновых кислот, взаимодействием галогенопроизводных углеводородов с цианидами щелочных металлов и другими способами. Применяют в производстве химических волокон, пластмасс и синтетических каучуков, в органическом синтезе, как растворители. Нитрилы – органические соединения, содержащие одну или несколько нитрильных групп (–C≡N), связанных с органическим радикалом, например, CH_3–, C_2H_5–, C_6H_5–. Легко вступают в реакцию полимеризации, присоединения и другие. Взаимодействием нитрила с водой получают карбоновые кислоты. Применяется в синтезе полимеров, пестицидов, аминокислот, лекарственных средств.

NZ = NEW ZEALAND

NZD = NEW ZEALAND DOLLAR

- O -

O = ОУ. – O is fifth letter of a NASDAQ stock symbol specifying that it is the company's second class of preferred shares. / Оу. (O) пятая буква фондового символа НЭЗДЭК® (NASDAQ®), указывающая на то, что .

O = OSCAR

OA = OSMOTIC ADJUSTMENT

OACS = OFFICE ACTION CORRESPONDENCE SYSTEM

OAG = OFFICIAL AIRLINE GUIDE

OAKUM = ПАКЛЯ (или ПЕНЬКОВЫЕ ОЧЁСКИ) – Oakum (maritime term):- material used for caulking the seams of vessels and made from the loose fibers of old hemp rope.

OAPEC = ORGANIZATION OF ARAB PETROLEUM EXPORTING COUNTRIES

OARS = OPENING AUTOMATED REPORT SERVICE

OAS = OPTION ADJUSTED SPREAD

OAS = ORGANIZATION OF AMERICAN STATES

OASIS = OPEN ACCESS SAME–TIME INFORMATION SYSTEM

OAT = ОВЁС – The Oat (Avena sativa) is a species of cereal grain, and the seeds of this plant. They are used for food for people and as fodder for animals, especially poultry and horses. Oat straw is used as animal bedding and sometimes as animal feed. Since Oats

are unsuitable for making bread on their own, they are often served as a porridge made from crushed or rolled oats, oatmeal, and are also baked into cookies (oatcakes) which can have added Wheat flour. As oat flour or oatmeal, they are also used in a variety of other baked goods (e.g., bread made from a mixture of oatmeal and Wheat flour) and cold cereals, and as an ingredient in muesli and granola. Oats may also be consumed raw, and cookies with raw oats are becoming popular. Oats are also occasionally used in Britain for brewing beer. Oatmeal stout is one variety brewed using a percentage of oats for the wort. Oats also have non-food uses. Oat straw is also used in corn dolly making, and it is the favorite filling for home made lace pillows. Oat extract can be used to soothe the skin conditions, e.g., in baths, skin products, etc. / Овёс Посевной (Avena sativa) относится к Семейству Злаковых зерновых культур , например, . Овёс относится к Роду Одно- и Многолетних Трав Семейства Злаков. В Австралии, Америке, Африке и Евразии насчитывается около 25 Видов. Кормовые Травы, Сорняки (Овсюг или Пустой Овёс), Зерновые культуры – Овёс Посевной, Овёс Византийский и другие. Фуражное и продовольственное зерно. Из предварительно пропаренных, высушенных, обжаренных и очищенных зёрен овса производится мука – толокно. Под Овсом (Avena) понимается Род Однолетних Травянистых Растений Семейства Мятликовых, зерновая культура. Около 25 Видов в Евразии и Северной Африке; в бывшем Союзе Советских Социалистических Республик (СССР) – 15 Видов. Овёс Посевной (Avena Sativa) возделывают (со 2-го тысячелетия до Нашей Эры, на территории бывшего СССР предположительно с VII века Нашей Эры) в странах с умеренным климатом. Овёс Песчаный (Avena Strigosa) – в Бельгии, Испании, Франции. Овёс Византийский (Avena Byzantina) – в Средиземноморье, на Юге США, в Австралии, Аргентине и других. Овёс Посевной – яровое или зимующее влаголюбивое, не требовательное к теплу растение. Вегетационный период ярового Овса 80–110 суток. Самоопылитель. Лучшие почвы – дерново-подзолистые, серые лесные, чернозёмы. 1 килограмм Овса по питательности составляет 1 кормовую единицу, содержит 87 грамм переваримого протеина. Основная зернофуражная культура. Солому, зелёную массу, особенно в смеси с Викой или Горохом, используют на корм. Зерно также перерабатывают на крупу и муку. Значительные площади посева Овса в США, Канаде, Европейских странах, Китае. Основные районы выращивания в бывшем СССР:- Нечернозёмная и Центральночернозёмная зоны России, лесостепь Украины, Белоруссия, Прибалтика, Северный Казахстан, Сибирь. Средняя урожайность зерна 20–25, высокая – 40–45 ц/га. Сорта – Льговский 1026, Надёжный, Орёл, Мирный, Руслан, Черниговский 27, Кубанский, Успех, Покровский, Тулунский 11, Буг, Синельниковский 29, Мара, Флаг и другие. Лучшие предшественники – Бобовые, пропашные, озимые. Средние дозы минеральных удобрений (кг/га):- 30–45 N, по 45–60 P_2O_5 и K_2O. Высевают рано весной обычным рядовым и узкорядным способами, норма посева семян 1.8–2.5 ц/га, глубокого посева 3–6 см. Убирают Овёс раздельным способом и прямым комбайнированием. Разработаны и внедрены в производство интенсивные технологии возделывания и уборки Овса. Вредители – Проволочники, Шведская Муха. Болезни – головня, ржавчина. Овёс Вздутый (Avena Ventricosa), распространённый в Восточном Закавказье (Апшеронский Полуостров), – в Красной Книге СССР. Овсюг или Овёс Пустой (Avena Fatua) – злостный сорняк в посевах яровых зерновых культур.

OATH = ПРИСЯГА – Oath:- in the United States, a solemn declaration before another, complying with the laws of the state or country where made, that the document in which an applicant for patent declares that:- (i) he or she is the original or sole inventor; (ii) shall state of what country he or she is a citizen; (iii) that he or she has reviewed and understands the contents of the specification and claims which the declaration refers to; and (iv) acknowledges the duty to disclose information that is material to patentability as defined by 37 CFR § 1.56. An oath or declaration must be filed in each nonprovisional patent application.

OATMEAL = ОУТМИЛ (или ТОЛОКНО, или ОВСЯНАЯ МУКА) – Oatmeal is a heavy, soft linen fabric with a pebbled or crêpe effect. / Торговое название ткани. Ткань крепового переплетения из кроссбредной шерсти. Рисунок переплетения сходен с овсяным зерном.

OAU = ORGANIZATION OF AFRICAN UNITY

OB = OR BETTER

OB = ОБ (или К, или ПЕРЕД, или ВСЛЕДСТВИЕ, или ИЗ–ЗА, или В ОБМЕН НА, или ЗА) – Ob is a prefix to another structural descriptor of a part, indicating attachment in the opposite or inverse way to that expected from the rest of the descriptor. Hence obovate = ovate but attached at the narrow end. / Приставка Об.

OBCONATE = ОБРАТНОКОНИЧЕСКОЕ – Obconate:- conical with the attachment at the apex of the cone. / :- коническое с .

OBCORDATE = ОБРАТНОСЕРДЦЕВИДНОЕ – Obcordate:- an inverted heart shape.

OBI = ORIGINATING BENEFICIARY INFORMATION

OBI = ОБИ – Obi is a broad sash worn especially with a Japanese kimono. / широкий пояс у Японок.

OBJECTIONABLE ODOR = НЕПРИЯТНЫЙ ЗАПАХ – An Objectionable Odor is one not normally associated with grain, such as skunk, sour, musty, oil, or gas. Heated or fireburnt odors are identified specifically and not included in the general category of objectionable odor. / Неприятный Запах, это такой запах, который при нормальных условиях не ассоциируется с зерном, к таковому относятся затхлый, прокисший, плесневый, масляный или просто газ. Спрелые и горелые запахи идентифицируются особо и не включаются в общую категорию неприятных запахов.

OBJECTIONABLE SEEDS = НЕЖЕЛАТЕЛЬНЫЕ СЕМЕНА – In Rice industry, Objectionable Seeds are the seeds other than Rice, except seeds of Echinochloa crusgalli, commonly known as Barnyard Grass, Watergrass, and Japanese Millet. / В рисовой индустрии семена отличные от самого Риса, за исключением семян Куриного Просо или Эхинохлоа Крусгалли (Echinochloa Crusgalli) или Обыкновенного Ежовника, общеизвестного как Трава Скотного Двора (Barnyard Grass), Горчица Полевая или Речная Трава (watergrass), и Японское Просо или Пайза (Japanese millet).

OBJECTIVE = ОБЪЕКТИВ (или ЦЕЛЬ) – Objective is a goal or purpose. In research, it is usually testing of hypothesis within the experimental framework. / Под Целью понимается идеальное мысленное предвосхищение результата деятельности. В качестве непосредственного мотива цель направляет и регулирует человеческую деятельность. Содержание цели зависит от объективных законов действительности, реальных возможностей субъекта и применяемых средств. В условном смысле термин ‘Цель’ в биологии и кибернетике обозначает состояние системы, достигнутое путём обратной связи.

OBL = ORIGINAL BILL OF LADING

OBLANCEOLATE = ОБРАТНОКОПЬЕВИДНОЕ (или ОБРАТНОЛАНЦЕТНОЕ, или ОБРАТНОЛАНЦЕТОВИДНОЕ) – Oblanceolate:- lanceolate, but with the widest part toward the apex. Oblanceolate:- lanceolate but attached at the narrow end. / Обратноланцетовидное:- ланцетовидное, но .

OBLANCEOLATE LEAF = ОБРАТНОЛАНЦЕТНЫЙ ЛИСТ (или ОБРАТНОКОПЬЕВИДНЫЙ ЛИСТ) – Oblanceolate Leaf:- inversely lanceolate, broader above the middle and tapering to the base, e.g., Ilex glabra. / Обратноланцетный Лист, например, Ива Виноградова.

OBLIGATE = ОБЛИГАТНОЕ – Obligate:- compulsory, essential, unable to exist under alternative conditions. Obligate:- an organism that can sustain life only when thriving in another living organism. / Под Облигатным, от Латинского слова Obligatus, означающее Обязательный, понимается .

OBLIGATE PARASITE = ОБЛИГАТНЫЙ ПАРАЗИТ (или БЕЗУСЛОВНЫЙ ПАРАЗИТ) – Obligate Parasite is a parasite that in nature can grow and multiply only under specific conditions such as on or in living organisms.

OBLIGATION = ОБЯЗАТЕЛЬСТВО (или XX) – Obligation (in electricity):- the sum of all load-serving entities' unforced capacity obligations as determined by summing the weatheradjusted summer coincident peak demands for the prior summer, netting out ALM (short for the Active Load Management) credits, adding a reserve margin and adjusting for the system average forced outage rate. Obligations are the amounts of orders placed, contracts and grants awarded, services received, and similar transactions during a given period, which will require payment during the same or a future period. / Обязательство, гражданское правоотношение, в силу которого одна сторона (должник) обязана совершить в пользу другой стороны (кредитора) определённое действие (передать имущество, выполнить работу, уплатить деньги) либо воздержаться от него. Кредитор, в свою очередь, имеет право требовать от должника исполнения его обязанности. По Советскому праву сторонами обязательства являются социалистические организации и граждане; возникают обязательства, как правило, из договора, актов планирования и иных административных актов, вследствие причинения имущественного вреда, подлежащего возмещению, неосновательного приобретения или сбережения имущества и так далее. В зависимости от содержания прав и обязанностей сторон различают обязательства, направленные на:- возмездное или безвозмездное отчуждение (приобретение) имущества в собственность или оперативное управление; возмездное или безвозмездное предоставление имущества в пользование; выполнение работ и оказание услуг; охрану социалистической и личной собственности, иных имущественных прав. При наличии в обязательстве нескольких кредиторов и нескольких должников порядок его исполнения участниками определяется в зависимости от предмета обязательства и условий соглашения сторон. Если каждый из участников обязательства обязан его исполнить в определённой (равной или неравной) доле, такое обязательство называется Долевым Обязательством. Если кредитор вправе требовать от любого из должников выполнения обязательства полностью (что означает освобождение от ответственности других участников обязательства), такое обязательство называется Солидарным Обязательством. Исполнение обязательства может обеспечиваться дополнительным обязательством (смотрите Обеспечение Исполнения Обязательств). Если обязательство не исполняется добровольно, к обязанному лицу могут быть применены меры государственного принуждения (путём обращения кредитора в суд или арбитраж). Обязательство прекращается после его исполнения путём зачёта встречных однородных требований; по соглашению сторон; в связи с невозможностью исполнения обязательства, за которую должник не отвечает; ликвидацией юридического лица (должника или кредитора), если исполнение обязательства в этом случае законодательство не возлагает на другое юридическое лицо, и другому.

OBLIGATION TO PROVIDE ADDITIONAL COVER = ОБЯЗАТЕЛЬСТВО ОБЕСПЕЧИТЬ ДОПОЛНИТЕЛЬНОЕ ПОКРЫТИЕ – Obligation To Provide Additional Cover is an obligation on the part of the borrower to return the cover for the loan to its contractually agreed level by furnishing additional collateral if the value of the objects pledged as security for the credit has declined.

OBLIGEE = ВЕРИТЕЛЬ – Broadly, Obligee is anyone in whose favor an obligation runs. This term is most frequently used in surety bonds, where it refers to the person, firm or corporation protected by the bond. / В широком смысле слова кто угодно, в чью пользу исполняется обязательство. Этот термин чаще всего используется при сделках с обязательствами поручительства, где он относится к лицу, фирме или корпорации, защищённой данным обязательством.

OBLIGOR = ОБЯЗУЮЩИЙСЯ – Obligor is one that places himself under a legal obligation. Commonly called the principal; one bound by an obligation. Under a bond, strictly speaking, both the principal and the surety are obligors. / Обязующийся:- лицо, принявшее на себя обязательства; должник. Сторона, принявшая на себя обязательства, например сторона, выпустившая облигации; лицо, получившее заём в банке или из другого источника; клиент, получивший кредит от коммерческого поставщика или розничного продавца. Лицо, принявшее на себя обязательства (obligator, debtor), по закону обязано выплатить долг, включая проценты, по наступлении срока платежа.

OBLIQUE = КОСОЕ (или ИСКРИВЛЁННОЕ, или НАКЛОННОЕ, или ОКОЛЬНОЕ) – Oblique:- sloping, having unequal sides (leaves). Oblique:- in a diagonal position.

OBLITERATION = ОБЛИТЕРАЦИЯ – Obliteration is a synergistic phenomenon of both particle silting and polar adhesion. When water and silt particles co-exist in a fluid containing long-chain molecules, the tendency for valves to undergo obliteration increases. / Под Облитерацией, от Латинского слова Obliteratio, означающее буквально Забвение, а здесь – Уничтожение, понимается:- (1) (в медицине) заращение или закрытие полостного или трубчатого органа вследствие разрастания ткани (чаще соединительной), идущего со стороны его стенок. Чаще всего облитерация наступает в результате воспалительного процесса, реже – при разрастании опухоли. Облитерация может вызвать тяжёлые расстройства в организме, например, эндартериит облитерирующий; облитерация железистых и других протоков приводит к развитию ретенционной кисты (атерома и другое), полная облитерация яйцеводов – к бесплодию и так далее. Наряду с этим облитерация, например, плевральной полости на почве плеврита – показатель излечения, облитерация влагалищного отростка брюшины – нормальный процесс развития. (2) (В ботанике) сплющивание клеток и тканей у растений, приводящее иногда к исчезновению внутриклеточных и межклеточных полостей; например, при разрастании стебля в толщину, а также в оболочках некоторых плодов, в тканях формирующегося зародыша и так далее.

OBLONG = ПРОДОЛГОВАТОЕ (или ВЫТЯНУТОЕ) – Oblong:- longer than broad with almost-parallel sides.

OBLONG LEAF = ОВАЛЬНЫЙ ЛИСТ – Oblong Leaf:- longer than wide, sides parallel, rectangular with rounded corners. / окантован (rectangular).

OBO SHIP = СУДНО ОУ.БИ.ОУ. (или СУДНО НИР) – OBO Ship (or Oil-Bulk-Ore Ship) is a multipurpose ship that can carry ore, heavy dry bulk goods and oil. Although more expensive to build, they ultimately are more economical because they can make return journeys with cargo rather than empty as single-purpose ships often must.

OBOVATE = ОБРАТНОЯЙЦЕВИДНОЕ – Obovate:- ovate, but the widest part toward the apex. Obovate:- ovate or ovoid but attached at the narrow end. / Обратнояйцевидное:- овальное или яйцеобразное.

OBOVATE LEAF = ОБРАТНОЯЙЦЕВИДНЫЙ ЛИСТ – Obovate Leaf:- inversely ovate, broader above the middle than below, e.g., Myrica pensylvanica.

OBO VESSEL = OIL BULK ORE VESSEL

OBOVOID = ОБРАТНОЯЙЦЕВИДНОЕ – Obovoid:- an inverted egg shape.

OBR = OVERSEAS BUSINESS REPORT

OBRA = OMNIBUS BUDGET AND RECONCILIATION ACT

OBSERVATION = НАБЛЮДЕНИЕ – Observation is a record of the facts and information in a sequence of events exactly, during the research program. / Под Наблюдением понимается целенаправленное восприятие, обусловленное задачей деятельности; выделяют научное наблюдение, восприятие информации на приборах, наблюдение как часть процесса художественного творчества и тому подобное. Основное условие научного наблюдения – объективность, то есть возможность контроля путём либо повторного наблюдения, либо применения иных методов исследования, например, эксперимента.

OBSERVATION WELL = НАБЛЮДАТЕЛЬНАЯ ЛУНКА (или НАБЛЮДАТЕЛЬНЫЙ КОЛОДЕЦ) – Observation Well is a perforated pipe inserted into the soil to record the level of the water table in relation to the soil surface.

OBSERVATION YIELD TRIAL = НАБЛЮДАТЕЛЬНЫЙ ОПЫТ УРОЖАЙНОСТИ – Observation Yield Trial is a preliminary yield trial with small plots, often unreplicated.

OBSERVER = НАБЛЮДАТЕЛЬ – Observer is the human viewer who receives a stimulus and experiences a sensation from it. In vision, the stimulus is a visual one and the sensation is an appearance.

OBSERVER METAMERISM = МЕТАМЕРИЗМ НАБЛЮДАТЕЛЯ (или МЕТАМЕРИЯ НАБЛЮДАТЕЛЯ) – Observer Metamerism is the property of specimens having different spectral characteristics and having the same color when viewed by one observer, but different colors when viewed by a different observer under the same conditions. / Метамерия или Метамеризм – свойство зрения, при котором свет различного спектрального состава может вызывать ощущение одинакового цвета. В более узком смысле, метамерией называют явление, когда два окрашенных образца цвета воспринимаются одинаковыми под одним источником освещения (имеют одну окраску), но теряют сходство при других условиях освещения (с другими спектральными характеристиками излучаемого света). Под Метамерией, от Греческих слов Metá, означающее Между или После или Через, и Méros, означающее Доля или Часть, понимается:- (1) в биологии, сегментация, расчленение тела многих двусторонне-симметричных животных на повторяющиеся более или менее сходные части – метамеры (сегменты), расположенные последовательно вдоль продольной оси тела. (2) В химии, частный случай изомерии, связанный с положением гетероатома в цепи алифатических соединений.

OBSOLESCENCE = МОРАЛЬНЫЙ ИЗНОС (или УСТАРЕВАНИЕ) – Obsolescence:- loss of the value of something when it becomes out of date. In accounting, obsolescence refers to an asset that has to be written off, not through deterioration, but when its continued use becomes uneconomic, e.g., a piece of machinery may be superseded by a new, faster version; it is therefore uneconomic for the company to continue to use it, and the asset becomes obsolete. Decrease in value of an existing asset or good due to a new invention, a change in demand or similar factors, but not wear and tear, which is the gradual physical deterioration of a good. Obsolescence is produced by a perceived loss in value by the customer or user. / Под Моральным Износом понимается уменьшение стоимости в результате старения находящихся в эксплуатации изделий (машин, бытовых товаров и другого) независимо от того, снизилась или не снизилась их физическая пригодность. Моральный износ является следствием трёх причин:- (i) снижения себестоимости производства (и соответственно цены) таких же изделий в результате повышения производительности труда в соответствующей отрасли; (ii) появления технически более совершенных изделий; и (iii) изменения потребительских требований, связанных со вкусом, модой.

OBSOLESCENCE PERIOD = ПЕРИОД НА ОТКЛИК (или ПЕРИОД УСТАРЕВАНИЯ, или ПЕРИОД НА ПОДТВЕРЖДЕНИЕ) – Obsolescence Period is a period of time, expressed in units of five minutes and specified by the sending user, after which, if that message remains undelivered, a non-delivery warning is generated and sent to the sender. / Период времени, выраженный в пяти-минутных единицах и специфицируемый отправляющим пользователем, по истечении которого если сообщение отправителя остаётся недоставленным (отсутствует отклик или соответствуюшее сообщение получателя), то генерируется предупреждение о недоставке, и оно направляется данному отправителю.

OBSOLETE = НЕЗАМЕТНОЕ (или НЕЯСНОЕ, или АТРОФИРОВАННОЕ) – Obsolete:- not developed.

OBSOLETE STOCK = ЗАЛЕЖАЛЫЙ (или УСТАРЕВШИЙ) ЗАПАС – Obsolete Stock is a stock that has no useable purpose that remains in the warehouse.

OBSOLETE TYPES = ВЫШЕДШИЕ ИЗ УПОТРЕБЛЕНИЯ ТИПЫ – Obsolete Types are the varieties of Rice that are considered of no importance at present or no longer popular and used by the community.

OBTUSE = ТУПОЕ (или ТУПОКОНЕЧНОЕ) – Obtuse:- with an angle greater than 90 degrees and less than 180 degrees, blunt. Obtuse:- blunt or rounded at the end. / тупое или округлённое на конце.

OBV = ON BALANCE VOLUME

OC = ONCARRIAGE

OC = OPERATING CIRCULAR

OC = OPPORTUNITY COST

OCC = OFFICE OF THE COMPTROLLER OF THE CURRENCY

OCC = THE OPTIONS CLEARING CORPORATION

OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION = АДМИНИСТРАЦИЯ ПО ПРОФЕССИОНАЛЬНОЙ БЕЗОПАСНОСТИ И ЗДОРОВЬЮ – Occupational Safety And Health Administration (OSHA) is a branch of the US Department of Labor. / филиал Департамента Труда США.

OCCURRENCE = ВСТРЕЧАЕМОСТЬ (или РАСПРОСТРАНЁННОСТЬ) – Occurrence is the presence in an area of a pest officially recognized to be indigenous or introduced and/or not officially reported to have been eradicated. / Встречаемость – наличие в ареале .

OCCURRENCE = НАСТУПЛЕНИЕ (СТРАХОВОГО СЛУЧАЯ) (или ПРОИСШЕСТВИЕ) – Occurrence is an adverse contingent accident or event neither expected nor intended from the point of view of the insured. With regard to limits on occurrences, property catastrophe reinsurance agreements frequently define adverse events having a common cause and sometimes within a specified time frame, for example 72 hours, as being one occurrence. This definition prevents multiple retentions and reinsurance limits from being exposed in a single catastrophe loss.

OCCURRENCE COVERAGE = СТРАХОВАЯ ЗАЩИТА ПО ПРОИСШЕСТВИЮ – Occurrence Coverage:- a policy providing liability coverage only for injury or loss that occurs during the policy period, regardless of when the claim is actually made. / Полис, обеспечивающий покрытие ответственности только за повреждение или убыток, которые возникают в период действия данного полиса, независимо от того, когда фактически заявлена страховая претензия.

OCEAN BILL OF LADING = ОКЕАНСКИЙ КОНОСАМЕНТ – Ocean Bill Of Lading is a document required for the transportation of goods overseas. An ocean bill of lading serves as both the carrier's receipt to the shipper and as a collection document. The document specifies the details of the goods being transported, such as quantity, type and destination. A non-negotiable ocean bill of lading allows the buyer to receive the goods upon showing identification. If the bill is deemed negotiable, then the buyer will be required to pay the shipper for the products and meet any of the seller's other conditions. An ocean bill of lading allows the shipper to move goods across international waters. If the goods are to be initially shipped over land, an additional document, known as an 'Inland Bill of Lading', will be required. The inland bill only allows the materials to reach the shore, while the ocean bill allows them to be transported overseas. See also Ocean Waybill. A contract for transportation between a shipper and a carrier. It also evidences receipt of the cargo by the carrier. A bill of lading shows ownership of the cargo and, if made negotiable, can be bought, sold or traded while the goods are in-transit. Ocean Bill Of Lading is a receipt for the cargo and a contract for transportation between a shipper and the ocean carrier. It may also be used as an instrument of ownership which can be bought, sold, or traded while the goods are in transit. To be used in this manner, it must be a negotiable Order Bill of Lading. Ocean Bill is the 'classic' marine bill of lading, which covers ocean port to ocean port carriage of cargo on a single ocean going vessel and no other stage or form of carriage. Also known as Port To Port Bill. An Ocean Bill Of Lading is a document required for the transportation of goods overseas across international waters. An ocean bill of lading serves as both the carrier's receipt to the shipper, and as a collection document or an invoice. The contract is a legally binding document between both the shipper and the carrier of the shipment. A bill of lading is a legal document or contract between the shipper and carrier which details the type, quantity, and destination of goods being carried. The bill of lading serves as a receipt of shipment when the goods are delivered at the predetermined destination. There are different kinds of bills of lading, each with unique stipulations and conditions. How an Ocean Bill of Lading Works? An ocean bill of lading allows the shipper to move goods across international waters. This document or contract provides the specifics involving the nature of the shipment including what and how much material is being transported, along with where the goods will be shipped. Other information outlined in the contract includes the value of the goods shipped and the type of packing used during transport. The shipper receives the contract when the goods are picked up. The document must be signed by both the shipper and the carrier. Once the shipment is complete, the document is given to the receiver. Upon delivery and receipt, the receiver must also sign the contract. There is an additional document – known as an Inland Bill of Lading – that is required if the goods are to be transported first over land. This inland bill only allows the materials to reach the shore, while the ocean bill allows the goods to be transported overseas. Important:- Inland bills of lading are required if the shipment needs to travel further in the destination country after it arrives at the dock. Example of Ocean Bill of Lading:- Ocean bills of lading, as mentioned above, are used when goods are transported overseas through waterways. When a car manufacturer ships vehicles to a dealership overseas, it needs an ocean bill of lading to complete the transfer of goods. If the vehicles must be transferred further into the destination country – so further from the port – it must have an inland bill of lading to move the vehicles. So a US-based dealership will sign an ocean bill of lading with a Japanese carmaker for the transport of vehicles to the United States. An additional inland bill of lading is required if the shipment arrives in Seattle, but is destined for Billings, Montana. Key Takeaways:- (i) an ocean bill of lading is a document required for the transportation of goods overseas across international waters; (ii) the contract is legal and outlines the type, quantity, and destination of goods being carried; and (iii) the shipper and carrier sign the ocean bill of lading upon shipment, and the receiver signs the document upon receipt. Common Types of Ocean Bills of Lading:- There are several different types of ocean bills of lading that are used. The straight bill of lading is non-negotiable and is marked as such. The only person who has a claim to the goods when they reach the destination port is the person named on the bill. These bills generally involve parties that have open accounts, where the shipper may not require the funds from the receiver up front. The non-negotiable ocean bill of lading allows the buyer to receive the goods upon showing identification. A shipper's order is a negotiable bill of lading and is generally put into place when the shipper wishes to ensure certain terms and conditions are met before the shipment is released to the receiver. This is used when the receiver's payment is backed by a letter of credit. / Океанский Коносамент:- договор на перевозку между отправителем и перевозчиком. Он также свидетельствует получение груза перевозчиком. Коносамент указывает владение товаром, но если оформлен оборотным (negotiable), то может быть куплен, продан или оставаться торгуемым до тех пор, пока товары находятся в транзите.

OCEAN MARINE INSURANCE = ОКЕАНСКОЕ МОРСКОЕ СТРАХОВАНИЕ – Ocean Marine Insurance is the oldest form of insurance, probably dating to the Middle Ages. The organization of Marine Insurance took great steps forward with the formation and development of an insurance market on Lombard Street in London, England and subsequently – since 1769 – Lloyds of London. Today, Lloyds still plays a prominent role in Marine Insurance. The first American insurer was Insurance Company of North America (now CNA, one of the companies that writes insurance for Morris Insurance Agency), formed in 1794. CNA has operated continuously since that time, and remains an important market for marine as well as other forms of property and casualty insurance. Because of its long tradition, marine policies tend to be the most traditionally worded policies in the insurance industry, and to have the longest tradition of case law legal decisions covering the various terms and clauses of the policies. While care should be taken with any insurance to clarify any definitions provided in the policies, this is especially true in marine coverages, where the defined terms may have long histories. There are four common policy types:- (i) Marine Cargo Policy; (ii) Cargo War Risk Policy; (iii) Hull Insurance; and (iv) Yacht Policy. / Лойдз оф Ландэн (Lloyds of London). Морис Иншурэнс Эйдьженси (Morris Insurance Agency).

OCEAN WAYBILL = ОКЕАНСКАЯ НАКЛАДНАЯ – Ocean Waybill is a document, issued by a shipping line to a shipper which serves as a receipt for the goods and evidence of the contract carriage. See also Ocean Bill Of Lading. Difference between Ocean, Sea Waybill (SWB) and Memo Bill of Lading:- A Bill of Lading (B/L) has 3 basic purposes or roles:- (1) Evidence of Contract of Carriage; (2) Receipt of Goods; and (3) Document of Title to the goods. There are also different types of bill of lading all of which perform 1 or 2 or 3 of the above roles. Ocean Bill of Lading is a bill of lading issued by the shipping line/carrier to their customer after the payment of all charges and submission of all customs/port documents relevant to that country. An Ocean Bill of Lading is a Negotiable document which serves also as an Evidence of Contract of Carriage, Receipt of Goods and Document of Title. Usually issued as 3 originals (signed and stamped and negotiable) + 6 non-negotiable copies. Using an Ocean Bill of Lading, shipper has the option to consign the shipment to either:- (i) To a direct customer (in this case the bill of lading becomes a Straight Bill of Lading and is no longer

Negotiable although it still retains the other two characteristics of a Receipt of Goods and Evidence of Contract of Carriage); (ii) To Order of a customer; (iii) To Order of a Bank; and/or (iv) To Order of Shipper (To Order). This bill of lading when consigned to either of the last three mentioned parties, allows the goods to be endorsed to another party in case the original buyer decides to resell the cargo. If it is a Straight Bill of Lading, cargo can be delivered to the nominated consignee but only after the bill of lading is presented to the discharge port agents. Sea Waybill of Lading (Also known as Express Release Bill of Lading or Straight Bill of Lading) is a bill of lading issued by the shipping line to their customer after the payment of all charges and submission of all customs/port documents relevant to that country. A Sea Waybill of Lading is not a Negotiable document as there is no original issued. It is also not a Document of Title. A Sea Waybill of Lading serves as an Evidence of Contract of Carriage and Receipt of Goods. This document is more relevant for non-commercial transactions, inter company sale or where there is no involvement of any documentary credits. A Sea Waybill of Lading cannot be consigned to order of someone else. It has to be consigned to a direct customer only. Delivery of cargo covered under a Sea Waybill of Lading can be made only to the consignee on the bill of lading or his authorised representative. A Consignee thus properly identified, is not required to present any transport document at the port of discharge. A Sea Waybill of Lading is usually issued:- (i) when the shipper and consignee are part of the same business group and there are no negotiations required between the two either directly or via bank for release of the cargo; (ii) the shipment doesn't involve any bank and the shipper doesn't really need to submit original bill of lading to secure his payment; (iii) when the shipper doesn't have the time to print the original bills and courier the same to the consignee; and (iv) the shipper is a freight forwarder and he wants to issue a house bill of lading to his customers. When the cargo covered under a Sea Waybill is released, the release maybe termed as Express Release. Memo Bill of Lading is a short for Memorandum bill of lading, it is basically a non-negotiable, non-transferable, unfreighted bill of lading that is only used as a receipt of goods and does not classify as a Document of Title. Trust this assists in clarifying the difference between Ocean Bill of Lading, Sea Waybill of Lading, Memo Bill of Lading. / Океанская Накладная это документ, выдаваемый отправителю судоходной линией, который служит в качестве расписки о приёмке товаров и свидетельства контрактной перевозки.

OCHA = OFFICE FOR THE COORDINATION OF HUMANITARIAN AFFAIRS

OCHER = ОХРА – Ochre (in English) or Ocher (in American English) (from Ancient Greek Ōkhrós = Pale) is a natural clay earth pigment which is a mixture of ferric oxide and varying amounts of clay and sand. It ranges in color from yellow to deep orange or brown. It is also the name of the colors produced by this pigment, especially a light brownish-yellow. Ocher:- the color of ocher, especially the color of yellow ocher.

OCLC = ON–LINE COMPUTER LIBRARY CENTER

OCMI = OFFICER IN CHARGE OF MARINE INSPECTION

OCO ORDER = ONE CANCELS THE OTHER ORDER

OCP = OVERLAND COMMON PORT

OCP SHIPMENT = OVERLAND COMMON PORT SHIPMENT

OCS = ON–LINE COMPARISON SYSTEM

OCTANE NUMBER = ОКТАНОВОЕ ЧИСЛО – Octane Number is a measure of the resistance of gasoline to pre-ignite or knock when burned in an internal combustion engine. The Octane Number of a fuel is a number equal to the percentage by volume of iso-octane in a mixture of iso-octane and normal heptane having the same resistance to detonation as the fuel under consideration in a special test engine. It is a measure of the anti-knock value of a gasoline. / Октановое Число является условной количественной характеристикой стойкости к детонации моторных топлив, применяемых в карбюраторных двигателях внутреннего сгорания. Октановое число численно равно процентному (по объёму) содержанию изооктана (октановое число которого принято за 100) в его смеси с н-гептаном (октановое число которого равно 0), эквивалентной по детонационной стойкости испытуемому топливу при стандартных условиях испытания. Не так давно октановое число наиболее распространённых марок автобензинов колебалось в диапазоне 76–89, а авиабензинов 91–95. Октановое Число – условный показатель антидетонационных свойств моторных топлив (бензина и выпускавшегося ранее тракторного керосина). Моторное топливо сравнивается со смесью изооктана (эталон при определении детонационной стойкости бензинов), октановое число которого условно принято за 100, н-гептана с октановым числом, равным 0. Процент изооктана в смеси, эквивалентной по детонационной стойкости испытываемому топливу, называется октановым числом топлива. Топливо испытывают на специальном двигателе.

OD = ORANGE DISCOLORATION

OD = OUTSIDE DIAMETER

ODA = OFFICIAL DEVELOPMENT ASSISTANCE

ODA = OVERSEAS DEVELOPMENT ADMINISTRATION

ODAI = OPÉRATION DE DÉVELOPPEMENT AGRICOLE INTÉGRÉ = OPERATION FOR INTEGRATED AGRICULTURAL DEVELOPMENT

ODASE = OPÉRATION DE DÉVELOPPEMENT DE AGRICOLE DE SUD–EST = OPERATION FOR THE AGRICULTURAL DEVELOPMENT OF THE SOUTHEAST REGION

ODC = OVERSEAS DEVELOPMENT COUNCIL

ODD LOT = НЕСТАНДАРТНЫЙ (или НЕПОЛНЫЙ) ЛОТ (или НЕПОЛНАЯ ПАРТИЯ) – Odd Lot is a collection of stocks and shares that is so small and varied that they inconvenience the broker who agrees to deal them, and which he or she will therefore buy only at a low price. In the United States, an add lot of fewer than 100 shares are dealt at a higher commission rate than larger quantities. An amount of stock less than a normal trading unit (which is 100 shares). Securities trade less than a round lot. Stock transactions that involve less than 100 shares. Odd Lot is securities trade made for less than the normal trading unit (termed a round lot). In stock trading, any purchase or sale of less than 100 shares is considered an odd lot, although inactive stocks generally trade in round lots of 10 shares. An investor buying or selling an odd lot pays a higher commission rate than someone making a round-lot trade. This odd-lot differential varies among brokers but for stocks is often 0.125 per share. For instance, someone buying 100 shares of XYZ at USD70 would pay USD70 a share plus commission. At the same time, someone buying only 50 shares of XYZ would pay USD70.125 a share plus commission. See also Fraction, and Round Lot. / Неполный Лот – неполная партия ценных бумаг:- сделка с ценными бумагами, совершённая с меньшим числом акций, чем в стандартной партии (normal trading unit), называемой также полным лотом (round lot). В операциях с акциями любая покупка или продажа менее чем 100 акций считается неполным

лотом, хотя операции с не пользующимися спросом акциями обычно проводятся с полными лотами в 10 акций. Инвестор, покупающий или продающий неполный лот, платит более высокие комиссионные, чем совершающий сделку с полным лотом. Дифференцированные комиссионные за неполный лот устанавливаются произвольно, но по акциям они часто составляют 1/8 пункта (12.5 центов за акцию). Например, инвестор, приобретающий 100 акций компании XYZ по 70 Долларов, заплатил бы 70 Долларов за акцию плюс комиссионные. В то же время инвестор, приобретающий только 50 акций компании XYZ, заплатит 70.125 Доллара за акцию плюс комиссионные.

ODEMO = OPÉRATION DE DÉVELOPPEMENT DU MOYEN–OUEST = OPERATION FOR THE DEVELOPMENT OF THE MIDDLE–WEST

ODEPA = OFICINA DE PLANIFICACIÓN AGRICOLA

ODI = OVERSEAS DEVELOPMENT INSTITUTE

ODM = OVERSEAS DEVELOPMENT MINISTRY

ODNRI = OVERSEAS DEVELOPMENT OF NATURAL RESOURCES INSTITUTE

ODOR SENSITIVITY = ЧУВСТВИТЕЛЬНОСТЬ К ЗАПАХУ – Odor Sensitivity is a sensitivity of the goods to foreign odors.

ODOR TAINTING = ПОРЧА ЗАПАХА (или ЗАТХЛОСТЬ ЗАПАХА) – Odor Tainting:- taking up of odors from foreign substances or gases in the environment.

ODR = OPÉRATION DE DÉVELOPPEMENT RIZICOLE = OPERATION FOR RICE DEVELOPMENT

ODS = OPERATING DIFFERENTIAL SUBSIDY

OECD = ORGANISATION FOR ECONOMIC COOPERATION AND DEVELOPMENT

OECS = ORGANISATION OF EAST CARIBBEAN STATES

OED = OFFICE OF ENROLLMENT AND DISCIPLINE

OEDF = OVERSEAS ECONOMIC DEVELOPMENT FUND

OEEC = ORGANISATION FOR EUROPEAN ECONOMIC COOPERATION

OEIP = OFFICE OF ELECTRONIC INFORMATION PRODUCTS

OEKO–TEX® STANDARD 100 = ОКО–ТЭКС® ШТАНДАРД ХУНДЭРЬТ (или ЭКО–ТЕКС® СТАНДАРТ 100) – The Oeko-Tex® Standard 100 is a normative document, published by the International Association for Research and Testing in the field of Textile Ecology (Oeko-Tex® Association, Zürich, Switzerland). This Standard specifies the general and special conditions for granting authorisation to mark textiles with the Öko-Tex® Standard 100 mark. If in a particular language Ö is not in use for printing or writing, it is permissible to use, for example, Oeko-Tex or Øko-Tex instead of Öko-Tex and for Öko-Tex® Standard 100. Oeko-Tex® Standard 100 is applicable for textile and leather products and articles of all levels of production, including textile and non-textile accessories. This standard is not applicable for chemicals, auxiliaries and dyes. The Oeko-Tex® Standard 100 mark 'Confidence in Textiles – Tested for harmful substances according to Öko-Tex Standard 100' refers to marking which may be applied to a textile product or to an accessory if the general and special conditions for granting authorization are fulfilled and if authorization to use this mark on a product has been granted by an institute or an authorised certification agency belonging to the International Association for Research and Testing in the field of Textile Ecology (Oeko-Tex). The mark 'Confidence in Textiles – Tested for harmful substances according to Oeko-Tex® Standard 100' states that the marked product fulfils the conditions specified in this standard, and that the product and its conformity test, as specified in this standard, are under the supervision of an institute belonging to the International Association for Research and Testing in the field of Textile Ecology (Oeko-Tex). The mark 'Confidence in Textiles – Tested for harmful substances according to Oeko-Tex® Standard 100' is not a quality label. The mark relates only to the as-produced state of the textile and says nothing about other properties of the product such as, e.g., fitness for use, reaction to cleaning processes, physiological behaviour in respect of clothing, properties relating to use in buildings, burning behaviour etc. The mark does not declare anything about harmful substances affecting single specimens of the marked textile as a result of damage during transportation or storing (and improper cleaning procedures thereafter), contamination caused by packaging, manipulation for sales promotion (e.g., perfuming) and inadequate sales display (e.g., outdoor presentation). In line with its importance the sign 'Confidence in Textiles – Tested for harmful substances according to Oeko-Tex® Standard 100' is protected comprehensively as a trademark. On a worldwide basis there are applications or registrations of the label as a trademark. To strengthen its legal protection not only the label as such, but also various device elements (e.g., the globe device element) and the words Oekotex, Oeko-tex, or Öko-Tex are registered as separate trademarks. A product class in the context of this standard is a group of different articles categorised according to their (future) utilization. In the different product classes not only may finished articles be certified but also their components at all stages of manufacture (fibers, yarns, fabrics) and accessories. The product classes differ generally in the requirements that the products have to fulfil and by the test methods applied. Products for babies (Product Class I) in the context of this standard are all articles, basic materials and accessories, which are provided for the production of articles for babies and children up to the age of 36 months with the exception of leather clothing. Products with direct contact to skin (Product Class II) are those, which are worn with a large part of their surface in direct contact with the skin (e.g., blouses, shirts, underwear, etc). Products without direct contact to skin (Product Class III) are those, which are worn with only a little part of their surface in direct contact with the skin (e.g., stuffings, etc). Decoration material (Product Class IV) in the context of this standard are all articles including initial products and accessories which are used for decoration such as table cloths, wall coverings, furnishing fabrics and curtains, upholstery fabrics, floor coverings and mattresses. The Oeko-Tex® 100 standard (developed by a European group of textile institutes) is a testing programme to screen for the presence of certain hazardous elements and compounds within consumer textiles. This standard defines the acceptable level of chemicals, known to be harmful to human health, that are found within textiles. In March 2011, the International Oeko-Tex® Association (headquartered in Zurich, Switzerland) has updated its criteria and limit values for use when testing textiles for harmful substances in accordance with the Oeko-Tex® Standard 100. After a three-month transitional period, new regulations will come into force for all Oeko-Tex® certification processes:- Short chain (C10 to C13) chlorinated paraffins and tris(2-chloroethyl)phosphate, which were already virtually banned under the Oeko-Tex® Standard 100 for use as flame-retardants, will now, in view of their classification as Substances of Very High Concern in the latest ECHA Candidate List, be explicitly included in the list of banned flame-retarding substances. A standard limit value of 90 ppm for total lead content has been set for all 4 Oeko-Tex® product classes, a limit which is well below that currently required by US legislation (CPSIA, Consumer Product Safety Improvement Act) of 300 ppm or, from August 2011, 100 ppm for articles for babies and children. The universal on-site visits which were introduced at the start of 2010 as a component of Oeko-Tex® certification will continue as planned. It is the aim of the Oeko-Tex Association to have visited all companies holding an Oeko-Tex® certificate by the end of 2013, in order to provide targeted

assistance in implementing the required criteria in their quality control procedures, optimize the framework conditions for certification as far as possible and give companies practical tips on product labeling. As usual the Oeko-Tex Association has updated the applicable test criteria and limit values for testing textiles for harmful substances according to Oeko-Tex Standard 100, effective as of January 01, 2012. The new requirements will come into force on April 01, 2012. The regular re-evaluation of the test parameters is based on current market and product developments, new toxicological findings and new legal requirements, also taking into consideration the REACh legislation, including the SVHC (short for the substance of very high concern) substances relevant to textile manufacturing which were added in 2011. More detailed information on the new version of the Oeko-Tex criteria catalogue at:- http://www.oeko-tex.com/limitvalues. / (Примечание:- в Русском языке нет точного соответствия звуку при произношении буквы Ö Немецкого алфавита. Разные источники по-разному интерпретируют его. Буквосочетание ЫО может более менее точно передавать произношение буквы Ö лишь при быстром и кратком их произношении, напоминая в отдалении произношение буквы Ё Русского алфавита.) .

OEKO–TEX® STANDARD 200 = ОКО–ТЭКС® ШТАНДАРД ЦВАЙ ХУНДЭРЬТ (или ЭКО–ТЕКС® СТАНДАРТ 200) – The Oeko-Tex® Standard 200 is a normative document, published by the International Association for Research and Testing in the field of Textile Ecology (Oeko-Tex® Association, Zürich, Switzerland). This Standard specifies the general and special conditions for granting authorisation to mark textiles with the Öko-Tex® Standard 200 mark. If in a particular language Ö is not in use for printing or writing, it is permissible to use, for example, Oeko-Tex or Øko-Tex instead of Öko-Tex and for Öko-Tex Standard 200. / (Примечание:- в Русском языке нет точного соответствия звуку при произношении буквы Ö Немецкого алфавита. Разные источники по-разному интерпретируют его. Буквосочетание ЫО может более менее точно передавать произношение буквы Ö лишь при быстром и кратком их произношении, напоминая в отдалении произношение буквы Ё Русского алфавита.) .

OEKO–TEX® STANDARD 1000 = ОКО–ТЭКС® ШТАНДАРД ТАУСЭНД (или ЭКО–ТЕКС® СТАНДАРТ 1000) – The Oeko-Tex® Standard 1000 is a normative document, published by the International Association for Research and Testing in the field of Textile Ecology (Oeko-Tex® Association, Zürich, Switzerland). This Standard specifies the general and special conditions for granting authorisation to mark textiles with the Öko-Tex Standard 1000 mark. If in a particular language Ö is not in use for printing or writing, it is permissible to use, for example, Oeko-Tex or Øko-Tex instead of Öko-Tex and for Öko-Tex® Standard 1000. The aim of the Oeko-Tex® Standard 1000 is an evaluation of the environmental performance of textile production sites and products and to document independently that certain environmental measures are undertaken and a certain level is achieved. Part A of the standard contains the requirements for certification of production sites, Part B covers the requirements for labelling of textile products. The system of Oeko-Tex® Standard 1000 consists in auditing the environmental performance of textile production sites as well as evaluating textile products for their environmental sound production. An essential feature of environmentally sound production is its continuous redefinition based on new research results and new technological opportunities. Manufacturing plants which have undergone the comprehensive examination and achieve the prescribed standard can attach the 'Confidence in textiles – Eco-friendly factory according to Oeko-Tex® Standard 1000' label to their production site. 35 plants have been certified for compliance with Oeko-Tex® Standard 1000 to December of 2007. With one exception, these are all European companies. In view of the growing suspicion with which European consumers regard Asian goods, textile producers in the Far East are well advised to consider comprehensive certification. Especially for the several thousand plants in China whose textile products have already been tested according to human ecological criteria, i.e. for hazardous residues in fabrics, and certified with the Oeko-Tex® Standard 100 label, it is worthwhile making additional investments in environmentally compatible and social production conditions. If a company is certified for compliance with Oeko-Tex® Standard 1000 and its products are already certified for compliance with Oeko-Tex® Standard 100, it can obtain the Oeko-Tex® Standard 100 plus label for these products under certain conditions. / (Oeko-Tex®) или Око-Тэкс (Öko-Tex) или (Øko-Tex). (Примечание:- в Русском языке нет точного соответствия звуку при произношении буквы Ö Немецкого алфавита. Разные источники по-разному интерпретируют его. Буквосочетание ЫО может более менее точно передавать произношение буквы Ö лишь при быстром и кратком их произношении, напоминая в отдалении произношение буквы Ё Русского алфавита.) .

OEL = OFFICE OF EXPORT LICENSING

OEM = ORIGINAL EQUIPMENT MANUFACTURER

OFAC = OFFICE OF FOREIGN ASSETS CONTROL

OFCF = OVERSEAS FARMERS' COOPERATIVE FEDERATION

OFF AND ON = ПЕРЕМЕННЫМИ КУРСАМИ (или ПЕРЕМЕННЫМИ ГАЛСАМИ, или ВДОЛЬ БЕРЕГА) – Off And On (maritime term):- standing toward the land and off again alternately. / Вдоль Берега (о движении судна).

OFF–BALANCE–SHEET OPERATIONS = ЗАБАЛАНСОВЫЕ ОПЕРАЦИИ – Off-Balance-Sheet Operations are the transactions conducted by the bank which are not reported in the balance sheet. Under Swiss law these include contingency liabilities (e.g., guarantees), guarantee credits, irrevocable commitments, margin calls, open derivative financial instruments, and fiduciary operations. These transactions must be underpinned by equity capital. Bank services such as investment counseling, asset management, securities trading and payment operations also fall under off-balance-sheet operations. / , например, .

OFF–BOARD = ВНЕ–ПАЛАТЫ (или ВНЕ–ТАБЛО) – Off-Board:- this term may refer to transactions over-the-counter in unlisted securities or to a transaction of listed shares that is not executed on a national securities exchange.

OFF–BOARD ELECTRONIC EQUIPMENT = ВНЕБОРТОВОЕ ЭЛЕКТРОННОЕ ОБОРУДОВАНИЕ (или ЗАБОРТНОЕ ЭЛЕКТРОННОЕ ОБОРУДОВАНИЕ) – Off-Board Electronic Equipment is electronic equipment, related software, antennas and accessories used to communicate with and track vehicles. The tracked vehicles must be on the road and transporting covered property.

OFF–CLIP = НЕСТРИЖЕНА (или НЕНАСТРИЖЕНА, или ОТХОДЯЩИЙ ПРИЖИМ, или ОТХОДЯЩИЙ КЛУППА) – Off-Clip:- xxxxx. See also Scalloped Selvage.

OFF–COLOR = НЕПРАВИЛЬНАЯ ОКРАСКА (или НЕНОРМАЛЬНАЯ ОКРАСКА) – (1) Off-Color:- this defect is quite apparent. Zipper manufacturers normally carry a complete range of tape colors. Due to similarity of different colors, one may be mistaken for another. It is also possible, because of color similarities or difference in dye lots, that the two halves of the zipper will have two different shades of tape. Closure defects, and namely – Metal Zippers and Nylon Spiral Zippers:- Tare and Cord Defects. / Порок или дефект застёжки. Найлан™ (Nylon™).

(2) Same as for metal zippers. Off-Color:- this defect is quite apparent. Zipper manufacturers normally carry a complete range of tape colors. Due to similarity of different colors, one may be mistaken for another. It is also possible, because of color similarities or

difference in dye lots, that the two halves of the zipper will have two different shades of tape. Closure defects, and namely – Nylon Spiral Zipper:- Tape and Cord Detects. / Порок или дефект застёжки. Найлан^{T3} (Nylon^{TM}).

OFF–DOCK LOCATION = ВНЕДОКОВОЕ МЕСТОПОЛОЖЕНИЕ – Off-Dock Location:- depot at a distance from the main terminal used to load/unload cargo -truck/rail and delivery of cargo to consignee.

OFFER = ОФЕРТА – Offer:- a statement that one party is willing to sell something, at a certain price and under certain conditions. If a particular buyer is willing to buy at the offer price or under the conditions of the offer, he or she may make a bid against the seller's offer. A motion to sell an asset at a specified price. The price at which a person is ready to sell. See also Bid And Asked. An indication of willingness to sell an asset at a given price. The opposite of Bid. Offer is a willingness to sell a commodity at a specified price. Also called Asking Price. Offer is the price at which a dealer is willing to sell. See also Ask. / Торговый документ или индикация в биржевой сводке, свидетельствующие о намерении продать актив по указанной цене. В противоположность Заявке На Покупку (Bid). Под Офертой, от Латинского слова Offero, означающее Предлагаю, понимается предложение заключить гражданско-правовой договор, содержащее все его существенные условия.

OFFER CONTRACT = КОНТРАКТ ОФЕРТА – Offer Contract:- a producer signs a contract with an elevator indicating his/her wishes to sell a specific number of bushels of grain any time cash price reaches a designated price. See also Basis Contract; Delayed Payment Contract; Elevator Cash Contract; Forward Contract; Hedge-To-Arrive Contract; Minimum Price Contract; and Price-Later (Delayed Price) Contract.

OFFER FOR SALE = ОФЕРТА ДЛЯ ПРОДАЖИ – Offer For Sale is a method of issuing shares of a previously unquoted company. The issuing house, often a merchant bank or specialised department of a stockbroker or clearing bank, underwrites the whole issue of the shares at a fixed price and offers them on to the public at a slightly higher price. An offer for sale may be made by tender. A minimum price is set and the public is invited to subscribe at this or a higher price. All shares are then issued at a common price – the striking price – which just satisfies the number of shares on offer. Any subscriber offering below the striking price will not receive any shares.

OFFER FOR SUBSCRIPTION = ОФЕРТА ДЛЯ ПОДПИСКИ – Offer For Subscription is a method of issuing shares of a previously unquoted company. The shares in the company are offered directly to the public. There is no underwriting. This method could be used in conjunction with a tender offer instead of a fixed price. / . Акции компании предлагаются напрямую публике. Расписывание отсутствует. Этот метод .

OFFERING MEMORANDUM = МЕМОРАНДУМ О ПРЕДЛОЖЕНИИ – Offering Memorandum:- similar to a prospectus, but slightly less stringent. It is a financing document (has to meet certain standards as prescribed by securities regulators) that companies can use to raise capital. It is similar to a business plan but generally has fewer forward-looking projections. In general, an offering memorandum – unlike a prospectus – does not need to be approved by a securities commission.

OFFER PRICE = ЦЕНА ОФЕРТЫ (или ЦЕНА ПРЕДЛОЖЕНИЯ) – Offer Price is the price at which a market maker is prepared to sell a particular security.

OFF EXCHANGE = ВНЕБИРЖЕВОЙ – Off Exchange:- Over-The-Counter (OTC) or Off-Exchange Trading is done directly between two parties, without any supervision of an exchange. It is contrasted with exchange trading, which occurs via these facilities. An exchange has the benefit of facilitating liquidity, mitigates all credit risk concerning the default of one party in the transaction, provides transparency, and maintains the current market price. In an OTC trade, the price is not necessarily made public information. OTC trading, as well as exchange trading, occurs with commodities, financial instruments (including stocks), and derivatives of such. Products traded on the exchange must be well standardized. This means that exchanged deliverables match a narrow range of quantity, quality, and identity which is defined by the exchange and identical to all transactions of that product. This is necessary for there to be transparency in trading. The OTC market does not have this limitation. They may agree on an unusual quantity, for example. In OTC market contracts are bilateral (i.e. contract between only two parties), each party could have credit risk concerns with respect to the other party. OTC derivative market is significant in some asset classes:- interest rate, foreign exchange, equities, and commodities. See also Over-The-Counter. / Смотрите также Внеучётный (Over-The-Counter).

OFF HIRE = ВНЕ АРЕНДЫ – Off Hire:- the time a vessel according to the charter party is not gaining charter hire, i.e. during drydocking, repairs, etc. / , то есть .

OFF–HIRE CLAUSE = ОГОВОРКА О ВЫХОДЕ ИЗ АРЕНДЫ – Off-Hire Clause:- in a time charter, the owner is entitled to a limited time for his vessel to be off hire until such time as the vessel may be repaired or dry-docked.

OFFICE = УПРАВЛЕНИЕ (или КОНТОРА, или ВЕДОМСТВО, или БЮРО) – Office (the United States Patent and Trademark Office (USPTO)):- in the context of actions or activities involving the USPTO this refers to the United States Patent and Trademark Office (USPTO) itself.

OFFICE ACTION = ДЕЙСТВИЕ (или РЕШЕНИЕ, или ЗАКЛЮЧЕНИЕ) УПРАВЛЕНИЯ (или КОНТОРЫ, или ВЕДОМСТВА) – Office Action:- a letter from a trademark examining attorney setting forth the legal status of a trademark application. There are several types of office (the United States Patent and Trademark Office (USPTO)) actions:- examiner's amendments, priority actions, non-final office actions, final office actions, and suspension inquiry letters.

OFFICE ACTION CORRESPONDENCE SYSTEM = КОРРЕСПОНДЕНТСКАЯ СИСТЕМА ДЕЙСТВИЙ УПРАВЛЕНИЯ (или КОНТОРЫ) – Office Action Correspondence System (OACS) is used by patent examiners to generate office (the United States Patent and Trademark Office (USPTO)) actions.

OFFICE EUROPÉEN DE LUTTE ANTIFRAUDE = ЕВРОПЕЙСКОЕ УПРАВЛЕНИЕ (или КОНТОРА) ПО БОРЬБЕ С МОШЕННИЧЕСТВОМ – Office Européen de Lutte Antifraude (OLAF; or the European Anti-Fraud Office headquartered in Brussels, Belgium) is the office of the European Commission which investigates fraud and other irregular action in the European Community in the case of a reasoned suspicion. In July 2003 the European Court of Justice (ECJ) ruled that OLAF's investigating powers also extend to the European Central Bank (ECB).

OFFICE FOR LEGISLATIVE AND INTERNATIONAL AFFAIRS = УПРАВЛЕНИЕ (или КОНТОРА, или ВЕДОМСТВО) ПО ЗАКОНОДАТЕЛЬНЫМ И МЕЖДУНАРОДНЫМ ДЕЛАМ – Office for Legislative and International Affairs (OLIA):- superceded; currently known as Administrator for External Affairs, comprised of Office of International Relations, Office of Congressional Relations, and Office of Enforcement.

OFFICE INTERNATIONAL DES ÉPIZOOTIES = МЕЖДУНАРОДНОЕ УПРАВЛЕНИЕ (или КОНТОРА, или ВЕДОМСТВО) ПО ЭПИЗООТИЯМ – The World Organisation for Animal Health – historically the Office International des Épizooties formed in 1924.

OFFICE INTERNATIONAL DES ÉPIZOOTIES TERRESTRIAL CODE = НАЗЕМНЫЙ КОДЕКС МЕЖДУНАРОДНОЙ КОНТОРЫ (или ВЕДОМСТВА) ПО ЭПИЗООТИЯМ – The Office International des Épizooties Terrestrial Code (OIE Terrestrial Code):- sets out standards for animal health and welfare and veterinary public health worldwide. / Офис Этэрнасьёналь дэ Эпизоотийс Тэрэстриэл Код (Office International des Epizooties Terrestrial Code).

OFFICE OF INDEPENDENT INVENTORS PROGRAMS = УПРАВЛЕНИЕ (или КОНТОРА, или ВЕДОМСТВО) ПО ПРОГРАММАМ НЕЗАВИСИМЫХ ИЗОБРЕТАТЕЛЕЙ – Office of Independent Inventors Programs or OIIP (prior), now part of the US Inventors Assistance Center.

OFFICE OF MANAGEMENT AND BUDGET = УПРАВЛЕНИЕ (или КОНТОРА, или ВЕДОМСТВО) ПО ПРАВЛЕНИЮ И БЮДЖЕТУ – Office Of Management and Budget (OMB), a branch of The Executive Office of the US President.

OFFICE OF PERSONNEL MANAGEMENT = УПРАВЛЕНИЕ (или КОНТОРА, или ВЕДОМСТВО) ПО УПРАВЛЕНИЮ КАДРАМИ – Office Of Personnel Management (OPM) is an agency of the US Government.

OFFICE OF PUBLIC RECORDS = УПРАВЛЕНИЕ ПУБЛИЧНЫХ ЗАПИСЕЙ (или КОНТОРА ПУБЛИЧНЫХ ЗАПИСЕЙ, или ВЕДОМСТВО ОБЩЕСТВЕННЫХ АРХИВОВ) – Office Of Public Records:- formerly, the US Office of Public Records (OPR); now known as Public Records Division (PRD).

OFFICE OF THE COMPTROLLER OF THE CURRENCY = УПРАВЛЕНИЕ (или КОНТОРА, или ВЕДОМСТВО) РЕВИЗОРА ДЕНЕЖНОГО ОБРАЩЕНИЯ – In the United States, the Office of the Comptroller of the Currency (OCC) is an independent bureau of the Treasury Department and the oldest federal financial regulatory body. The OCC oversees the nation's federally chartered banks and through a system of bank supervision and regulation promotes safety and soundness by requiring that national banks adhere to sound management principles and comply with the law, and encourages banks to satisfy customer and community needs while remaining efficient competitors in the financial services market. Office of the Comptroller of the Currency (OCC) charters and regulates all national banks. Headquartered in Washington, DC, the United States. The OCC's primary mission is to charter, regulate, and supervise all national banks. We supervise the federal branches and agencies of foreign banks. Our goal in supervising banks is to ensure that they operate in a safe and sound manner and in compliance with laws requiring fair treatment of their customers and fair access to credit and financial products. The OCC was established in 1863 as an independent bureau of the US Department of the Treasury. The President, with the advice and consent of the US Senate, appoints the Comptroller to head the agency for a five-year term. The Comptroller also is a director of the Federal Deposit Insurance Corporation and NeighborWorks® America. Headquartered in Washington, DC, the OCC has four district offices plus an office in London to supervise the international activities of national banks. The OCC's nationwide staff of bank examiners conducts on-site reviews of national banks and provides sustained supervision of bank operations. Examiners analyze banks' loan and investment portfolios, funds management, capital, earnings, liquidity, sensitivity to market risk, and compliance with consumer banking laws. They review banks' internal controls, internal and external audit, and compliance with law. They also evaluate bank management's ability to identify and control risk. In regulating national banks, the OCC has the power to:- (i) examine the national banks; (ii) approve or deny applications for new charters, branches, capital, or other changes in corporate or banking structure; (iii) take supervisory actions against national banks that do not comply with laws and regulations or that otherwise engage in unsound banking practices. Remove officers and directors, negotiate agreements to change banking practices, and issue cease and desist orders as well as civil money penalties. And (iv) issue rules and regulations, legal interpretations, and corporate decisions governing bank investments, lending, and other practices. The OCC does not receive appropriations from Congress. Instead, the OCC's operations are funded primarily by assessments on national banks. National banks pay for their examinations, and they pay for the OCC's processing of their corporate applications. The OCC also receives revenue from its investment income, primarily from US Treasury securities. The OCC's activities are predicated on four objectives that support the agency's mission to ensure a stable and competitive national banking system:- (i) ensure the safety and soundness of the national banking system; (ii) foster competition by allowing banks to offer new products and services; (iii) improve the efficiency and effectiveness of OCC supervision, including reducing regulatory burden; and (iv) ensure fair and equal access to financial services for all Americans. By law, the OCC is prohibited from releasing information from its bank safety and soundness examinations to the public. National banks must, however, submit a Report of Condition and Income (call report) four times a year to the Federal Deposit Insurance Corporation (FDIC). Call reports contain publicly available financial information about national banks. The FDIC makes these reports available on its Web site. In July 2007, the OCC launched www.HelpWithMyBank.gov to assist customers of national banks. HelpWithMyBank.gov provides answers to common National Banking questions. If you have a complaint about a national bank, the site also provides a means to filing that complaint online. Recognizing the important role that minority-owned banks play in addressing financial services needs in the communities they serve, the OCC is committed to encouraging the success of these banks. / НэйбоВоркс® Амэрика (NeighborWorks® America).

OFFICE OF THE UNITED NATIONS HIGH COMMISSIONER FOR REFUGEES = УПРАВЛЕНИЕ ВЕРХОВНОГО КОМИССАРА ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ДЕЛАМ БЕЖЕНЦЕВ – Office of the United Nations High Commissioner for Refugees (UNHCR):- organization established as the successor to the International Refugee Organization (IRO; 1946–52) by the United Nations (UN) General Assembly in 1951 to provide legal and political protection for refugees until they could acquire nationality in new countries of residence. International refugee assistance was first provided by the League of Nations in 1921 under the leadership of Fridtjof Nansen, who served as the League's Commissioner for Refugees. In 1943 the United Nations Relief and Rehabilitation Administration, which was succeeded by the IRO in 1946, was established to assist people who had been displaced by World War II. A humanitarian and nonpolitical organization, the UNHCR was awarded the Nobel Prize for Peace in 1954 and 1981. With its headquarters in Geneva, Switzerland, and branch offices in important countries of asylum, the UNHCR intervenes with various national governments in order to ensure such minimal rights as freedom from arbitrary expulsion, access to the courts, work and educational opportunities, and possession of identity and travel documents. The UNHCR initially focused its efforts on aiding the more than one million refugees and displaced persons in Europe after World War II. Since the 1960s the UNHCR's efforts have shifted to resettling refugees who are victims of war, political turmoil, or natural disasters in Africa and parts of Asia and Latin America. In addition to providing basic international legal protection for displaced persons, it works with other UN agencies including the World Food Programme and the World Health Organization – nongovernmental organizations, and regional organizations to provide housing, food, and material assistance and aid in repatriation and resettlement. The High Commissioner, who reports annually to the General Assembly through the Economic and Social Council, has become a key public figure in efforts to rally international support for refugee programs. Xxxxx. The Office of the United Nations High Commissioner for Refugees (UNHCR):- The UNHCR 'shows us that the unfortunate foreigner is one of us; it teaches us to understand that sympathy with other human beings, even if they are separated from us by national frontiers, is the foundation upon which a lasting peace must be built'. The Nobel Peace Prize for 1954:- The prize was awarded to the Office of the United Nations High Commissioner for Refugees in appreciation of its work in bringing relief and aid to the countless refugees and displaced persons to be found in Europe during the immediate post-war years. The Committee stated:- 'It was

given with a view to emphasising that the work must be continued, so that one would be ready to meet new refugee problems on the basis of the principles of humanitarianism and international justice on which the Office was built'. Nobel Committee:- 'Think of what it means to the individual refugee to feel and to know that he has not been forgotten, that in spite of everything there is someone willing to help him'. UNHCR began its work in 1951 and has sought to bring assistance to the refugees and to help the authorities understand their problems. Chairman of the Nobel Committee, Gunnar Jahn, said in his Award Ceremony Speech:- 'Think of what it means to the individual refugee to feel and to know that he has not been forgotten, that in spite of everything there is someone willing to help him (...). In addition, the provision of legal protection gives him some sense of security and so helps to maintain his morale and to encourage him to begin a new life'. 'There may perhaps be some who do not believe that work for the refugees is work in the cause of peace (…). But it is work for peace, if to heal the wounds of war is to work for peace, if to promote brotherhood among men is to work for peace. For this work shows us that the unfortunate foreigner is one of us; it teaches us to understand that sympathy with other human beings, even if they are separated from us by national frontiers, is the foundation upon which a lasting peace must be built'. In his Nobel Lecture, UN High Commissioner for Refugees Dr. Gerrit Jan van Heuven Goedhart said:- 'There can be no real peace in this world as long as hundreds of thousands of men, women, and children, through no fault of their own, but only because they sacrificed all they possessed for the sake of what they believed, still remain in camps and live in misery and in the greatest uncertainty of their future'. / под руководством Норвежского исследователя Фридтёва Нансэна (Fridtjof Nansen). Гюнар Йон (Gunnar Jahn). Управление Верховного Комиссара Организации Объединённых Наций по Делам Беженцев (УВКБ):- По словам Нобелевского комитета, 'возможно, кое-кто не считает, что работа в интересах беженцев служит делу мира (…). Это работа во имя мира, если врачевание ран, нанесённых войной, это работа во имя мира, если содействие укреплению братства между людьми – это работа во имя мира. Ибо она показывает нам, что иностранец, которому не повезло в жизни – это один из нас; учит, что сочувствие к другим людям, даже если они отделены от нас государственными границами, – это основа, на которой должен строиться прочный мир'. Нобелевская Премия Мира за 1954:- В своей Нобелевской Лекции Доктор Хэрит Ян фан Хюфэн Худхарт (Dr. Gerrit Jan van Heuven Goedhart), занимавший в то время пост Верховного Комиссара, заявил:- 'В мире не может быть реального мира, пока сотни тысяч мужчин, женщин и детей не по своей вине, а лишь потому, что они пожертвовали всем своим имуществом ради того, во что они верят, все ещё находятся в лагерях и живут в нищете при полной неопределённости будущего. В конечном счёте, если ждать слишком долго, эти покинувшие родные места люди неизбежно становятся лёгкой добычей политических авантюристов, уже причинивших миру неисчислимые страдания. Прежде чем произойдет что-либо подобное, давайте объединимся и приложим все усилия к тому, чтобы решить их проблему'. 'Идти В Ногу С Историей':- Вторую Нобелевскую Премию Мира получил не человек, а одно из специализированных учреждений ООН:- Управление Верховного Комиссара ООН по Делам Беженцев (УВКБ). Рассматривая себя как своего рода 'мост' между сообществом государств, представленных в ООН, и международным сообществом мужчин и женщин, многие из которых не являются подданными никакого государства, Управление привлекает внимание общественности к положению тех, кто живет за пределами установленных границ и страдает от предрассудков, преследований и бедности. Управление Верховного Комиссара по Делам Беженцев было создано после Первой Мировой Войны Лигой Наций на основе инициативы Фридтёва Нансэна, Норвежского исследователя, учёного и государственного деятеля, получившего Нобелевскую Премию Мира в 1922 за 'руководящую роль, энергию и энтузиазм' в деле оказания помощи беженцам. После его кончины 'Нансеновское Управление' продолжило его дело, и в 1938 также было награждено Нобелевской Премией Мира. Вскоре после того, как труд Нансэна был удостоен премии, началась Вторая Мировая Война, и появилось беспрецедентно большое число мужчин, женщин и детей, вынужденных покинуть родные места и скитавшихся по Европе. Международное сообщество мобилизовалось, создав Администрацию Помощи и Восстановления Объединенных Наций (ЮНРРА) и Международную Организацию по Делам Беженцев (МОБ). ЮНРРА оказала помощь в добровольной репатриации более чем 7 миллионам человек, а МОБ содействовало устройству 1.7 миллиона Европейских беженцев, не пожелавших вернуться на родину. Управление Верховного Комиссара ООН по Делам Беженцев, заменившее ЮНРРА и МОБ, было учреждено в Декабре 1950. Первоначально созданное на трёхлетний период для решения неотложных проблем, УВКБ перед самым его награждением в 1954 Нобелевской Премией Мира получило мандат на продление срока своих полномочий ещё на четыре года. Нобелевский Комитет подчеркнул, что это награждение – не только знак благодарности за прошлые достижения, но и демонстрация мировому сообществу, что эта работа должна продолжаться. Была подчёркнута важность прогнозирования будущих кризисов и готовности к решению новых задач помощи беженцам на основе принципов гуманизма и международной справедливости. В своём заявлении при представлении УВКБ на получение премии Нобелевский Комитет подчеркнул:- 'Это работа во имя мира, если врачевание ран, нанесённых войной, это работа во имя мира, если содействие укреплению братства между людьми – это работа во имя мира. Ибо она показывает нам, что иностранец, которому не повезло в жизни – это один из нас; учит, что сочувствие к другим людям, даже если они отделены от нас государственными границами, – это основа, на которой должен строиться прочный мир'. УВКБ, которое иногда называют 'Совестью Мира', наделено мандатом на то, чтобы возглавлять и координировать международные действия по защите беженцев и решению их проблем во всём мире, идёт ли речь о предоставлении убежища в другой стране или о праве на безопасное возвращение в своё государство, об интеграции в местную общину или устройстве в третьей стране. Управление работает с беженцами и перемещёнными лицами, помогая им вернуть чувство независимости, свободы, достоинства и надежды. Хэрит Ян фан Хюфэн Худхарт, который был Верховным Комиссаром ООН по Делам Беженцев с момента создания этого Управления, повторил в своей Нобелевской Речи в Декабре 1955, что 'не может быть реального мира во всём мире, пока сотни тысяч мужчин, женщин и детей не по своей вине всё ещё находятся в лагерях и живут в нищете, а их будущее остается крайне неопределённым'. Процесс выработки системы международных законов, конвенций и правил для защиты беженцев начался на заре XX века под руководством Лиги Наций, и его кульминацией стало одобрение 28 Июля 1951 специальной конференцией ООН Конвенции о Статусе Беженцев. Конвенция стала глобальным инструментом, в который вошли и Конвенция о Беженцах 1933, где говорится о международном статусе беженцев, и принципы, содержащиеся во Всеобщей Декларации Прав Человека 1948. Конвенция 1951 является ключевым юридическим документом, дающим определение понятию 'беженцы' и их правам, а также юридическим обязательствам государств в отношении беженцев. Принятый в 1967 Протокол ликвидировал географические и временные ограничения, предусматривавшиеся Конвенцией. Эти два документа – единственные юридические инструменты, охватывающие основные права беженцев, включая свободу вероисповедания и передвижения, право на труд, образование и доступ к проездным документам. В них также зафиксированы обязательства беженцев перед правительствами принимающих их стран и говорится, что беженцы не могут быть насильственно репатриированы в страну, где они опасаются преследований. УВКБ представляет интересы беженцев и перемещенных лиц. Деятельность этой гуманитарной организации финансируют государства-члены ООН, и, что ещё важнее, эти государства обеспечивают соблюдение минимальных норм в отношении беженцев, зафиксированных в Конвенции. В мире, где идёт борьба между государствами и внутри государств и возникают чрезвычайные ситуации гуманитарного характера, проблемы беженцев и перемещённых лиц внутри стран должны занимать одно из главных мест в повестке дня международного сообщества. Присуждение УВКБ Нобелевской Премии Мира за 1954

более полувека назад отражало именно эту цель. Задача сегодняшнего мира – сделать всё возможное, чтобы данная проблема по-прежнему оставалась в центре внимания.

OFFICE OF THRIFT SUPERVISION = УПРАВЛЕНИЕ НАДЗОРА ЗА СБЕРЕЖЕНИЯМИ – The Office of Thrift Supervision (OTS) was established in 1989 in response to the Savings and loan crisis. On television, President George Herbert Walker Bush said, 'never again will America allow any insured institution operate without enough money' and 'trashed' the predecessor independent Federal Home Loan Bank Board; soon thereafter, the sign was changed to the Office of Thrift Supervision. The Office of Thrift Supervision (OTS) is a United States federal agency under the Department of the Treasury. It was created on 1989-August-09 as a renamed version of another federal agency (that was faulted for its role in the Savings and loan crisis). Like other US federal bank regulators, it is paid by the banks it regulates. The OTS was initially seen as an aggressive regulator, but was later lax. Declining revenues and staff led the OTS to market itself to companies as a lax regulator in order to get revenue. The OTS also expanded its oversight to companies that were not banks. Some of the companies that failed under OTS supervision during the Financial crisis of 2007–10 include American International Group (AIG), Washington Mutual, and IndyMac. The OTS was implicated in a backdating scandal regarding the balance sheet of IndyMac. Reform proposals from Henry Paulson, Barack Obama, and the US Congress have all proposed to merge the OTS with the Office of the Comptroller of the Currency. Office of Thrift Supervision (OTS) regulates federal and state-chartered savings associations and savings banks. Headquartered in Washington, DC, the United States. The OTS is the federal bank regulator and supervisor of a dynamic industry of savings associations across the nation. The OTS also oversees the holding companies that own these thrift institutions. The OTS is an office within the Department of the Treasury. The OTS has a highly skilled staff of more than 1 000 employees operating out of its headquarters in Washington, DC, and four regional offices in Jersey City, Atlanta, Chicago and Dallas. The OTS examines each savings association every 12-to-18 months to assess the institution's safety and soundness, and compliance with consumer protection laws and regulations. In addition, examiners monitor the condition of thrifts through off-site analysis of regularly submitted financial data and regular contact with thrift personnel. OTS examinations and its ongoing supervisory oversight are tailored to the risk profile of each institution. The OTS receives no appropriations from Congress; the agency's operating budget is funded by periodic assessments to the thrift industry. Mission Statement:- to supervise savings associations and their holding companies in order to maintain their safety and soundness and compliance with consumer laws, and to encourage a competitive industry that meets America's financial services needs. In the United States, the Office of Thrift Supervision (OTS) is a bureau of the Treasury Department, established in August 1989, which has the authority to charter federal thrift institutions and serve as the primary regulator of approximately 2 000 federal and state-chartered thrifts. In early 1831, three town leaders in Frankford, Pennsylvania, outside of Philadelphia, met in a local tavern to plan how local townspeople could pool their money to accomplish together what they lacked the financial resources to do alone – buy their own homes. In doing so, they established the nation's first savings association, the Oxford Provident Building Association, modeled after mutual building societies in England. Each member paid an initial fee of USD5 per share and USD3 per month thereafter. As their savings grew, association members were able to finance their American dream of homeownership. The association provided its first mortgage in April 1831 to a local lamplighter named Comly Rich, who obtained a loan for a USD375 home that still stands on Orchard Street in Philadelphia County, Pennsylvania. By the late 1890s, there were more than 5 000 savings associations across the country. These institutions were typically founded by people who lived in the same neighborhoods or worked in the same factories. Thrifts continued to thrive in the early 1900s and, by the 1920s, there were about 12 000 savings institutions (known by various names, including savings and loans, building and loans, thrift and loans, thrifts, savings banks, building associations, thrift associations and savings associations). Industry growth during this time was fueled largely by the influx of Americans into the cities from rural areas, driving up the demand for housing. The end to these boom times came in the early 1930s when the Great Depression devastated the housing market and caused many savings associations to fail. The federal government soon stepped in with a series of laws to support homeownership. The first law established the Federal Home Loan Bank System of 12 regional Federal Home Loan Banks that provided mortgage funding for savings associations across the country. Next, Congress created the Federal Home Loan Bank Board, the predecessor agency of the OTS, to grant federal charters for savings associations and establish a regulatory system to promote homeownership. A third law founded the Federal Savings and Loan Insurance Corporation to insure deposits at the nation's savings and loan institutions. Strong industry growth returned after World War II when veterans sought homes and large suburban communities took root. Savings and loan associations, or S&Ls, were the major players in the growth of the housing markets and the housing economy during this time, providing mortgages for individual homes and entire new housing developments. Demand remained strong throughout the 1950s and 1960s, when S&Ls originated two-thirds of the nation's home mortgages. At the time, most savings associations held more than 80 percent of their assets in home loans, relying on a business model that hinged on interest received from mortgages being comfortably higher than the interest paid out to depositors. In the late 1970s, interest rates rose sharply and competition for deposits increased dramatically. Consumers seeking better deposit-rate returns had more choices among financial services providers. Also, a federal ban on adjustable-rate mortgages locked S&Ls into long-term, fixed-rate mortgage loans that produced below market-rate returns as interest rates rose. In the early 1980s, interest rates climbed to unprecedented levels, undermining the viability of the S&L business model. Many institutions were economically insolvent. In an effort to help the industry 'grow' out of its problems, the government deregulated the lending and investment powers of savings and loans, and gave them full access to federally insured deposits to fund their new lending and investment powers. Marginally profitable and unprofitable savings and loans began to engage in aggressive and risky investment and lending strategies that compounded their existing problems. As a result, hundreds of S&Ls failed and closed in the late 1980s and early 1990s. In 1989, Congress passed a law that dramatically restructured the banking business, moved deposit insurance for savings associations to the Federal Deposit Insurance Corporation and established the OTS to supervise, charter and regulate the thrift industry. Today, the thrift industry has fewer institutions than during its peaks in the past, but industry assets still exceed USD1 trillion. In addition, the industry stands on a strong foundation with solid capital. Many savings associations continue to focus on home lending, though the industry has grown more diverse and now includes an array of modern financial service enterprises that serve families, communities and small businesses across the nation. / Дьжодьж Хобэтч Вокё Бош (George Herbert Walker Bush; 1924–2018). Американская Международная Группа (American International Group; Эй.Ай.Дьжи. (AIG)), Вашингтэн Мъючуол (Washington Mutual), и ИндиМэк (IndyMac).

OFFICER = ДОЛЖНОСТНОЕ ЛИЦО (или КОНТОРСКИЙ СЛУЖАЩИЙ) – (1) Officers are individuals appointed by the board of directors who are responsible for carrying out the board's policies and for making day-to-day decisions.

(2) Officer is any of the licensed members of the ship's complement.

OFFICER OF THE WATCH = ВАХТЕННЫЙ НАЧАЛЬНИК (или ВАХТЕННЫЙ ОФИЦЕР, или ВАХТЕННЫЙ ПОМОЩНИК КАПИТАНА) – Officer Of The Watch (maritime term):- the officer in charge of the watch.

OFFICER'S INSTRUCTION = ИНСТРУКЦИЯ ДОЛЖНОСТНОГО ЛИЦА – An Officer's Instruction is a request or direction to a clearing agency in the name of the investment company by one or more persons authorized by its board of directors to give it.

OFFICIAL = ОФИЦИАЛЬНОЕ – Official:- established, authorized or performed by a National Plant Protection Organization. / Официальное – устанавливаемое, уполномочиваемое или выполняемое Национальной Организацией по Защите Растений.

OFFICIAL CARLOT UNLOAD SAMPLE = ОФИЦИАЛЬНАЯ ПРОБА ВЫГРУЖЕННОЙ ВАГОННОЙ ПАРТИИ – An Official Carlot Unload Sample is a sample taken by a Canadian Grain Commission (CGC) grain inspector or by any sampling device authorized by the CGC as a railcar is unloaded at a terminal elevator.

OFFICIAL CONTROL = ОФИЦИАЛЬНАЯ БОРЬБА (или ОФИЦИАЛЬНЫЙ КОНТРОЛЬ) – Official Control is the active enforcement of mandatory phytosanitary regulations and the application of mandatory phytosanitary procedures with the objective of eradication or containment of quarantine pests or for the management of regulated non-quarantine pests.

OFFICIAL DEVELOPMENT ASSISTANCE = ОФИЦИАЛЬНАЯ ПОДДЕРЖКА РАЗВИТИЯ – Official Development Assistance:- financial flows to developing countries and multilateral institutions provided by official agencies of national, state or local governments. Each transaction must be:- (i) administered with the promotion of the economic development and welfare of developing countries as its main objective; and (ii) concessional in character and contain a grant element of at least 25 percent.

OFFICIAL DISCOUNT RATE = ОФИЦИАЛЬНАЯ УЧЁТНАЯ СТАВКА – In Switzerland, Official Discount Rate is the discount rate of the Swiss National Bank applies only for bills of exchange with a maturity of at least 180 days, drawn on a party in Switzerland and bearing at least two signatures of parties which are independent of one another and are known to be solvent (bills eligible for Swiss National Bank discount). The official discount rate is also applied to bill-like instruments of undisputed standing. Also known as Bank Rate in Switzerland.

OFFICIAL FOREIGN EXCHANGE RESERVES = ОФИЦИАЛЬНЫЕ РЕЗЕРВЫ ИНОСТРАННОЙ ВАЛЮТЫ – Official Foreign Exchange Reserves:- assets denominated in foreign currencies held by a country's monetary authorities, for example in the United States, held by the Federal Reserve System and the Treasury Department.

OFFICIAL GAZETTE = ОФИЦИАЛЬНАЯ ГАЗЕТА (или ОФИЦИАЛЬНЫЙ ВЕСТНИК) – Official Gazette (OG; now in electronic format – eOG) is a weekly publication of the United States Patent and Trademark Office (USPTO) that includes regular and special notices of the office (the United States Patent and Trademark Office (USPTO)).

OFFICIAL GAZETTE EOG:P = ОФИЦИАЛЬНАЯ ГАЗЕТА И.ОУ.ДЬЖИ.:ПИ. – Official Gazette eOG:P or OG–Patents:- weekly publication of the United States Patent and Trademark Office (USPTO) that permits you to browse issued patents and view important notices.

OFFICIAL GAZETTE EOG:T = ОФИЦИАЛЬНАЯ ГАЗЕТА И.ОУ.ДЬЖИ.:ТИ. – Official Gazette eOG:T or OG–Trademarks:- weekly publication of the United States Patent and Trademark Office (USPTO) that includes marks that have been published for opposition. The five most recent issues are available online.

OFFICIAL GRADING = ОФИЦИАЛЬНАЯ СОРТИРОВКА ПО КАЧЕСТВУ – An Official Grading is one conducted by an inspector of the Canadian Grain Commission (CGC) on an unofficial sample.

OFFICIAL INSPECTION = ОФИЦИАЛЬНАЯ ИНСПЕКЦИЯ – An Official Inspection is done when an official sample of grain is graded by a Canadian Grain Commission (CGC) inspector.

OFFICIAL MARKET = ОФИЦИАЛЬНЫЙ РЫНОК – The Official Market is the securities trading segment with the highest turnover on German cash exchanges and, compared with the Regulated Market or Unofficial Regulated Market, is a market segment for securities with particularly strict listing conditions and post-listing duties. On the Frankfurt Stock Exchage, the Official Market is sub-divided into a General Standard with requirements prescribed by law and a Prime Standard with additional post-listing obligations.

OFFICIAL NUMBER = ОФИЦИАЛЬНЫЙ НОМЕР – Official Number is the registered number given to a merchant vessel and cut into the vessel's 'main beam', together with the net registered tonnage.

OFFICIAL QUOTATION = ОФИЦИАЛЬНАЯ КОТИРОВКА – Official Quotation:- security listed on an organized exchange, meaning that it has met the requirements set by the exchange. Also known as Listed Security, and Listing.

OFFICIAL SAMPLE = ОФИЦИАЛЬНАЯ ПРОБА – An Official Sample of grain is drawn under the direct control or continuous supervision of an authorized employee of the Canadian Grain Commission (CGC). / Официальная Проба зерна, взятая под непосредственным контролем или в присутствии официального сотрудника Канадской Комиссии по Зерну (ККЗ).

OFFICIAL STATE SEED POTATO CERTIFICATION AGENCY = ОФИЦИАЛЬНОЕ ШТАТОВСКОЕ АГЕНТСТВО ПО СЕРТИФИКАЦИИ СЕМЕННОГО КАРТОФЕЛЯ (или ОФИЦИАЛЬНОЕ ШТАТОВСКОЕ АГЕНТСТВО ПО СЕРТИФИКАЦИИ ПОСАДОЧНОГО КАРТОФЕЛЯ) – Official State Seed Potato Certification Agency is a state agency duly authorized by state law to provide seed potato certification services.

OFFICIAL WEIGHING = ОФИЦИАЛЬНОЕ ВЗВЕШИВАНИЕ – An Official Weighing is done on approved equipment under the supervision authorized by the Canadian Grain Commission (CGC) or in a manner authorized by the CGC.

OFF–LINE = НЕ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ – Off-Line:- deferred processing without direct communication. / Переработка с задержкой без прямой связи. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

OFF–LINE PERSONAL IDENTIFICATION NUMBER VERIFICATION = ВЕРИФИКАЦИЯ ЛИЧНОГО (или ПЕРСОНАЛЬНОГО, или ИНДИВИДУАЛЬНОГО) ИДЕНТИФИКАЦИОННОГО НОМЕРА НЕ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ – Off-Line Personal Identification Number Verification:- the process whereby the integrated circuit card checks the transaction Personal Identification Number (PIN).

OFF–LINE PIN VERIFICATION = OFF–LINE PERSONAL IDENTIFICATION NUMBER VERIFICATION

OFF–LINE TRANSACTION = ТРАНЗАКЦИЯ НЕ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ (или ОПЕРАЦИЯ НЕ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ) – Off-Line Transaction is a transaction that does not require a real-time connection to a secure application module.

OFF–LOAD = РАЗГРУЗКА (или ВЫГРУЗКА) – Off-Load:- discharge of cargo from a ship.

OFF–MARKET LOANS = НЕРЫНОЧНЫЕ ССУДЫ (или ССУДЫ НА ЛЬГОТНОЙ ОСНОВЕ) – Off-Market Loans are the loans granted to staff members at lower than market related rates. / Ссуды, выданные членам персонала по более низким, нежели рыночная, ставкам.

OFF–PEAK = ВНЕПИКОВАЯ – In reference to electricity, the load for the remaining hours that are not on-peak. See also On-Peak. Off Peak:- in the United States, for the PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC) Energy Market, off-peak periods are all NERC (short for the North American Electric Reliability Council) holidays (i.e. New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, Christmas Day) and weekend hours plus weekdays from the hour ending at midnight until the hour ending at 07:00 am. / По отношению к электричеству, внепиковая нагрузка – это нагрузка в сети в часы, не являющиеся пиковыми. Смотрите также Пиковой или Максимальной Нагрузки (On-Peak). Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

OFF–PEAK GAS = ВНЕПИКОВЫЙ ГАЗ – Off-Peak Gas is a gas that is to be delivered and taken on demand when demand is not at its peak.

OFF–PEAK HOURS = ЧАСЫ ВНЕПИКОВОЙ НАГРУЗКИ – Off-Peak Hours:- light load hours. The time of the day when an power system would experience its lightest load, usually in the middle of the night. For example in the United States, off-peak hours are from midnight to 07:00 am and 11:00 pm to midnight Mondays through Fridays; also all day Saturdays and Sundays and North American Electric Reliability Council (NERC) holidays. All times are prevailing local time. / Периоды низкой нагрузки. Время суток, в течение которого нагрузка энергетической системы минимальна, как правило, полночь. Например в Соединённых Штатах Америки, часами внепиковой нагрузки признаётся время с полуночи до 07:00 дп и с 11:00 пп до полночи с Понедельника по Пятницу; а также в течение всего дня в Субботу и Воскресенье и в праздничные дни, определяемые Северо-Американским Советом по Надёжности Поставок Электричества (САСНПЭ).

OFF–PRESSING = ЗАПРЕССОВКА – Off-Pressing:- pressing done after the garment is completely sewn.

OFF–SEASON CROP = ВНЕСЕЗОННАЯ КУЛЬТУРА – Off-Season Crop is a crop that is planted after the main planting season has been completed.

OFFSET = ОТВЕТВЛЕНИЕ (или ОТВОДОК, или БОКОВОЙ ОТРОСТОК, или БОКОВОЙ ПОБЕГ, или ОТПРЫСК, или ПОТОМОК) – Offset is a plant or plants growing from a side-shoot, rhizome or tuber that remains connected to the main plant, often easily removed for propagation. / или клубень (tuber), который . разведение или распространение (propagation). Под Побегом понимается стебель с расположенными на нём листьями и почками; один из основных органов высших растений. У однолетних растений побеги живут один сезон; у многолетних – несколько лет. Многолетние подземные побеги нередко видоизменены в клубни, корневища, луковицы, а надземные – в колючки, усики. Под Отпрыском понимается побег, отходящий от пня или корня. Под Отводком понимается часть наземного стебля с почками, отделённая от материнского растения и посаженная самостоятельно путём засыпания землёю для получения нового растения. Один из простых и старейших способов вегетативного размножения. Размножение отводками применяется при разведении Земляники, Крыжовника, Фикуса и других растений. Под Отводком понимается часть наземного стебля с почками, не отделяемая от материнского растения на период укоренения. Стебель с почками пригибают к земле и присыпают почвой. После его укоренения получают корнеспособные растения, которые сохраняют все биологические признаки материнской особи. Их отрезают и пересаживают на постоянное место. Используют в садоводстве, в том числе декоративном, лесоводстве. Отпрыск – это боковой побег, надземный или подземный, образующийся из почки в районе корневой шейки. Отпрыски, формирующиеся у большинства растений, как, например, у Молодило, укореняются медленно. Чтобы ускорить размножение, отпрыски обычно весной отделяют от материнского растения и высаживают либо в открытый грунт, либо в горшки. Для посадки используют почвенную смесь для черенкования с добавлением песка – субстрат должен иметь хороший дренаж и способствовать быстрому разрастанию корневой системы. В тех случаях, когда отпрыски развиваются слабо, удаляют верхушки растения. Эта операция, как и удаление верхушечной почки, стимулирует развитие отпрысков. Хотя термин Отпрыск обычно используется для обозначения растения, отделившегося в процессе роста от материнского куста, он нередко применяется и для обозначения медленно растущих боковых побегов, которые образуются преимущественно у однодольных растений вроде Юкки. Со временем эти побеги развиваются настолько, что их уже можно отсаживать от материнского растения. При созревании соплодия у Ананаса образуются отпрыски, которые можно использовать для размножения. В зависимости от положения на стебле их называют Корневыми Отпрысками, Волчками или Отростками. Срезайте те отпрыски, которые расположены как можно ближе к основанию соплодия, и сразу же высаживайте. Очень часто для размножения Ананаса используют и верхушечную розетку. Многие клубнелуковичные и луковичные растения вроде Рябчиков ежегодно образуют у своего основания миниатюрные луковички или клубнелуковички, которые часто называют Детками, Зубками и тому подобным. Отпрыск – так называется стебель, развившийся из придаточной почки корня. Отпрыск встречаются в виде корневых побегов как у травянистых растений, так и кустарников (Малина, Роза) и деревьев (Тополь, Вяз, Груша). Отпрыск – мелкое растение, образуемое рядом с родительским. Корневой Отпрыск (soboles), надземный побег растения, развивающийся из корневой придаточной почки. Служит для вегетативного размножения преимущественно двудольных растений – Осины, Сирени, Вишни, Осота и других. Корневой Отпрыск – побег, развившийся из придаточной почки, эндогенно возникшей на корнях. Корнеотпрысковое возобновление – один из способов вегетативного размножения высших растений. Для некоторых кустарников корневой отпрыск – важное эволюционное приспособление, ведущее к биологическому омоложению растений.

OFFSET = ОФСЕТ (или ЗАЧЁТ) – (1) Offset:- liquidating a purchase of futures or options through the sale of an equal number of contracts of the same delivery month, or liquidating a short sale of futures or options through the purchase of an equal number of contracts of the same delivery month. Taking a second futures or options position opposite to the initial or opening position. Offset is the liquidation of a futures contract position. For the purchaser of a futures contract (long position), offsetting requires selling an equal number of contracts for the same delivery month. For the seller of a futures contract (short position), offsetting requires purchasing an equal number of contracts for the same delivery month. Liquidation an existing long or short futures or option position with an equal and opposite transaction. Offset is the liquidation of an options contract position. For the purchaser of an option (put or call), offsetting requires selling an equal number of contracts for the same delivery month at the same strike price as originally purchased. For the seller of an option (put or call), offsetting requires purchasing an equal number of contracts for the same delivery month at the same strike price as originally sold. (The majority of options are offset as opposed to exercised). In spread positions, one side offsets the other without liquidating the entire position. Risk is reduced when one side offsets the other. See also Closing Out, and Cover.

(2) Offset:- matching total long with total short contracts for the purpose of determining a net long or net short position. See also Evening Up, and Liquidation. / Смотрите также Выравнивание (Evening Up) и Ликвидация (Liquidation).

(3) Offset:- in the United States, non-competitively matching one customer's order with another, a practice that is permissible only when executed in accordance with the Commodity Exchange Act, Commodity Futures Trading Commission regulations and rules of the futures exchange. / В Соединённых Штатах Америки сопоставление распоряжения одного заказчика с другим на не

конкурирующей основе является практикой, разрешаемой только в тех случаях, когда оно исполнено в соответствии с Актом о Сырьевой Бирже, предписаниями Комиссии по Торговле Сырьевыми Фьючерсами и правилами биржи фьючерсов.

OFFSET CLAUSE = ОГОВОРКА О ЗАЧЁТЕ – Offset Clause is a provision in reinsurance agreements which permits each party to net amounts due against those payable before making payment; especially important in the event of insolvency of one party which ceases to remit amounts due to the other.

OFFSETS = ЗАЧЁТЫ (или ВЗАИМОЗАЧЁТЫ) – In trade of defense items, 'Offsets' are industrial compensation practices mandated by many foreign governments when purchasing US defense systems. Types of offsets include mandatory coproduction, subcontractor production, technology transfer, countertrade, and foreign investment. Countries require offsets for a variety of reasons:- (i) to ease (or 'offset') the burden of large defense purchases on their economies, (ii) to increase domestic employment, (iii) to obtain desired technology or (iv) to promote targeted industrial sectors. In non-defense trade, governments sometimes impose offset requirements on foreign exporters, as a condition for approval of major sales agreements in an effort to either reduce the adverse trade impact of a major sale or to gain specified industrial benefits for the importing country. In these circumstances, offset requirements generally take one of two forms. In one formulation, an exporter may be required to purchase a specified amount of locally-produced goods or services from the importing country. For example, a commercial aircraft manufacturer seeking sales to an airline in another country might be required to purchase products as different from airplanes as canned hams. In other instances, an exporter might be required to establish manufacturing facilities in the importing country or to secure a specified percentage of the components used in manufacturing his product from established local manufacturers. An Offset deal is, normally, one in which a vendor government offsets the cost of an arms sale to a purchaser government by undertaking to invest in the purchaser country (or to persuade vendor country companies to do so). Offset investment is normally not in the arms sector, and typically involves technology transfer. / Зачётная сделка, как правило, представляет собой зачёт государством-продавцом стоимости оружия, проданного государству-покупателю в форме принятия на себя обязательств по инвестированию средств в экономику страны-покупателя (или обеспечению инвестирования таких средств компаниями страны-продавца). Оффсетные инвестиции осуществляются, как правило, не в оборонные отрасли и чаще всего связаны с передачей технологий. В гражданском праве под Зачётом Встречных Требований понимается способ прекращения обязательств путём зачёта однородных по содержанию требований сторон друг к другу, срок которых наступил.

OFFSETTING COMPLIANCE = ВОЗМЕЩАЮЩАЯ УСТУПКА – In the United States, when an Offsetting Compliance program is in effect, a producer participating in a diversion or acreage reduction program must not offset that reduction by overplanting the acreage base for that crop on another farm.

OFFSET TRANSACTIONS = ВЗАИМОЗАЧЁТНЫЕ ТРАНЗАКЦИИ (или ВЗАИМОЗАЧЁТНЫЕ ОПЕРАЦИИ) – (1) Offset Transactions:- the purpose of this paper is to investigate one of the main objections to offset transactions, i.e. the accusations of inefficient changes in trade flows due to these transactions. Offset transactions – as a type of countertrade – are defined as compensation practices used in procurement of military equipment or services in defence industry. The analysis was conducted in a theoretical model that captured trade creation and trade diversion in the market for a good acquired in an offset transaction by the developed country (DC) firm from the less developed country (LDC). In the model, the net outcome that results from the positive effect of trade creation and the negative effect of trade diversion is ambiguous. It depends on many characteristics of trade partners, especially transaction costs, import tariffs and export taxes. An empirical illustration of the model based on the US offset data shows that the extent of trade creation and trade diversion is rather small. Offset transactions are recognised as a modern and at the same time the most complex type of countertrade. They are defined as compensation practices used in procurement of military equipment or services in defence industry. Since the beginning of 1990s, we observe an unquestionable increase of their share in the world trade. The intensity of offset demands is linked to the end of the cold war period. (For example, in 1989–96 the estimated reduction in turnover on the world market for military equipment amounted to over 40 per cent.) The structure of relationships in the market for military equipment has rapidly changed from the horizontal ones to a complex system of interdependence between companies engaged in certain projects. The competition on this market has become dramatically sever. Numerous new firms specialising in intermediation and consulting services entered this business. Under these circumstances, the governments involved in expensive purchases of military equipment started widely practicing offset demands. Moreover, a key factor stimulating the increase of offset demands was an exemption of the military sector from the trade liberalisation requirements. This tendency has been reflected in the legal regulations of many countries and political organisations. For example, Article 223 of the Treaty of Rome and Article 196 of the Treaty of Amsterdam limit competition and provide protection of the defence industry for the EU members. Similar legal solutions can be found in the USA, where the Buy America Act provides protection for the US military sector through a requirement to make purchases exclusively from the US suppliers. An increase in the scale and scope of the use of offset transactions became a focus of analysis not only by practitioners, but also by a growing number of academic research. There are often controversial opinions on this issue. On the one hand, there is condemnation of offsets, but on the other hand, some analysts view them as the 'third way of development' and a chance to catch up with the economically most advanced countries. Due to these controversies, further directions of evolution of the trade practice based on offset demands that accompany multibillion governmental purchases of defence systems are hard to predict. In the environment of strict budget limits of firms, sever global competition and market satiation, the ability of the main exporters of the defence systems to fulfil offset requirements and to provide appropriate financial terms often constitutes a key competitive advantage in securing a contract. Therefore, in the opinion of many business and academic sources, it cannot be expected that offset phenomenon will be eliminated from trade practice in the foreseeable future. Offset transactions as a form of countertrade are heavily criticised by worldwide known international organisations such that WTO, World Bank, IMF. The arguments against them seem to be serious and are related to the destabilisation of international trade and payment system. Offset transactions are perceived as a sign of bilateralism in the relationships among the exchange participants. They are accompanied by negative phenomena such as inefficient change of trade flows, distortions of world economic exchange and the use of restrictive practices. Moreover, the opponents of this form of trade stress that a consequence of the observed processes are also several other negative phenomena, i.e. formation of national hyper-specialisations, reduction of competitiveness of the non-military industries, transformation of firms from the defence industry into trade companies, and also a faster proliferation of arms, worldwide increase of military expenses, creation of international cartel of producers of technologically advanced defence systems etc. The goal of this paper is to investigate one of the main objections to offset transactions, i.e. the accusations of inefficient changes in trade flows due to these transactions. The analysis is conducted in a theoretical model that captures trade creation and trade diversion in the market for a good acquired in an offset transaction by the firm from less developed country. Also known as Compensation Transactions.

(2) Offset Transactions:- in securities trading, clearing of clients' buying and selling orders among banks at the market price established during market trading.

(3) Offset Transactions:- in foreign trade, offsetting the countervalue of merchandise shipped to a particular country against the merchandise imported from that country. Compensation (offsetting) frequently only covers part of the deliveries, the rest being cleared in foreign exchange.

OFF–SHADES = РАЗНООТТЕНОЧНОСТЬ – Off-Shades:- defects which occur from lot to lot or within a lot, the shading wherein the interlinings in the garment show two or three different shades of the same basic color. Interlining defects. / Порок или дефект. Под Разнооттеночностью понимается распространённый порок в виде различия оотенка или интенсивности цвета по длине и/или ширине полотна.

OFF–SHOOT = ОТПРЫСК (или ОТВЕТВЛЕНИЕ, или ОТВОДОК, или СТОЛОН) – Off-Shoot is a lateral branch of the plant that may not be propagated. The term Offset (or Offshoot, as is sometimes used) also applies to lateral branches arising on stems of monocotyledons. / Под Столоном, от Латинского слова Stolo, означающее Корневой Побег, понимается боковой побег с удлинёнными междоузлиями и недоразвитыми листьями, на котором развиваются клубни, луковицы, розеточные побеги. Служит для вегетативного размножения. У Картофеля столоны подземные (на которых развиваются клубни), у Земляники, Лапчатки – стелющиеся по земле и укореняющиеся в узлах (усы). Отпрыск – это боковой побег, надземный или подземный, образующийся из почки в районе корневой шейки. Отпрыски, формирующиеся у большинства растений, как, например, у Молодило, укореняются медленно. Чтобы ускорить размножение, отпрыски обычно весной отделяют от материнского растения и высаживают либо в открытый грунт, либо в горшки. Для посадки используют почвенную смесь для черенкования с добавлением песка – субстрат должен иметь хороший дренаж и способствовать быстрому разрастанию корневой системы. В тех случаях, когда отпрыски развиваются слабо, удаляют верхушки растения. Эта операция, как и удаление верхушечной почки, стимулирует развитие отпрысков. Хотя термин Отпрыск обычно используется для обозначения растения, отделившегося в процессе роста от материнского куста, он нередко применяется и для обозначения медленно растущих боковых побегов, которые образуются преимущественно у однодольных растений вроде Юкки. Со временем эти побеги развиваются настолько, что их уже можно отсаживать от материнского растения. При созревании соплодия у Ананаса образуются отпрыски, которые можно использовать для размножения. В зависимости от положения на стебле их называют Корневыми Отпрысками, Волчками или Отростками. Срезайте те отпрыски, которые расположены как можно ближе к основанию соплодия, и сразу же высаживайте. Очень часто для размножения Ананаса используют и верхушечную розетку. Многие клубнелуковичные и луковичные растения вроде Рябчиков ежегодно образуют у своего основания миниатюрные луковички или клубнелуковички, которые часто называют Детками, Зубками и тому подобным. Отпрыск – так называется стебель, развившийся из придаточной почки корня. Отпрыск встречаются в виде корневых побегов как у травянистых растений, так и кустарников (Малина, Роза) и деревьев (Тополь, Вяз, Груша). Отпрыск – мелкое растение, образуемое рядом с родительским. Корневой Отпрыск (soboles), надземный побег растения, развивающийся из корневой придаточной почки. Служит для вегетативного размножения преимущественно двудольных растений – Осины, Сирени, Вишни, Осота и других. Корневой Отпрыск – побег, развившийся из придаточной почки, эндогенно возникшей на корнях. Корнеотпрысковое возобновление – один из способов вегетативного размножения высших растений. Для некоторых кустарников корневой отпрыск – важное эволюционное приспособление, ведущее к биологическому омоложению растений. Под Отводком понимается часть наземного стебля с почками, отделённая от материнского растения и посаженная самостоятельно путём засыпания землёю для получения нового растения. Один из простых и старейших способов вегетативного размножения. Размножение отводками применяется при разведении Земляники, Крыжовника, Фикуса и других растений. Под Отводком понимается часть наземного стебля с почками, не отделяемая от материнского растения на период укоренения. Стебель с почками пригибают к земле и присыпают почвой. После его укоренения получают корнеспособные растения, которые сохраняют все биологические признаки материнской особи. Их отрезают и пересаживают на постоянное место. Используют в садоводстве, в том числе декоративном, лесоводстве.

OFFSHORE = ОФШОРНОЕ – Offshore:- this term, when used in this context, and when referring to a country, means a jurisdiction that offers financial secrecy laws in an effort to attract investment from outside its borders. When referring to a financial institution, ‘offshore’ refers to a financial institution that primarily offers its services to persons domiciled outside the jurisdiction of the country in which the financial institution is organized. As terms the words ‘Offshore Business’ and ‘Offshore Company’ have no precise legal, tax or general business meaning, as the word ‘offshore’ often means nothing more than anywhere other than the place of physical location of the person using the word, i.e. Overseas.

OFFSHORE = ТЕРРИТОРИАЛЬНЫЕ ВОДЫ (или МОРСКИЕ ПРИБРЕЖНЫЕ РУБЕЖИ) – Offshore:- ocean waters and bottom within a given distance from a nation’s borders which may be leased or sold to individuals, firms or other nations for purposes of extracting oil and gas, or for fishing. By extension, the term applies to companies owned by citizens of a nation but located outside the borders of that nation. Offshore:- that geographic area that lies seaward of the coastline. In general, the coastline is the line of ordinary low water along with that portion of the coast that is in direct contact with the open sea or the line marking the seaward limit of inland water. / с открытым морем .

OFFSHORE COMPANY = ОФШОРНАЯ КОМПАНИЯ – Offshore Company:- there are a number of companies incorporated in one country with their management office in another country which do not trade in their country of incorporation. The management office holds all the assets of the company and the only transaction with the country of incorporation is that the management office pays dividends on behalf of the company to any resident shareholder of the company in the country of incorporation. These companies may also have direct investment in third countries, the dividend and capital flows then being between the third countries and the country of the management office. The third country will probably assume in its statistics that these transactions are with the country of incorporation, while the management office’s country will probably show the transactions as being between it and the third countries. An added complication is that the company owning the management office may itself be a subsidiary of an enterprise in another country. Jurisdiction (company):- Anguilla (International Business Company (IBC)), The Bahamas (International Business Company (IBC) or Foundation), Barbados (International Business Company (IBC)), Belize (International Business Company (IBC)), British Virgin Islands (International Business Company (IBC)), Brunei (International Business Company (IBC)), Cayman Islands (Exempt Company or Non-Resident Company), Cyprus (Private Company limited by share), Dominica (International Business Company (IBC)), Gibraltar (Private Company Limited by shares or Non Resident Company), Hong Kong (Private Limited Company), Ireland (Private Limited Company), Isle of Man (Limited Liability Company (LLC) or Private Limited Company or Trust or Foundation), Jersey (International Business Company (IBC)), Lanuan (Offshore Trading Company or Offshore Non-Trading Company), Liechtenstein (Aktiengesellschaft (AG) or Anstalt or Gesellschaft mit beschränkter Haftung (GmbH) or Stiftung), Luxembourg (Holding or Holding SA or Holding SARL), Malta (Private Limited Liability Company), Marshall Islands (International Business Company (IBC)), Mauritius (Global Business Company 1 (GBC1) or Global Business Company 2 (GBC2)), Panama (Sociedades Anonima (SA) or Non Resident or Foundation), Samoa (International Business Company (IBC)), The Seychelles (International Business Company (IBC) or Special License Company (CSL) or Trust), St Vincent (International Business Company (IBC)), The United Kingdom (Limited Liability Partnership (LLP)), The

United States of America (Limited Liability Company (LLC) in all states). Very low or zero tax offshore companies refer to, for example, the differing types of offshore companies that can be formed in offshore company formation centres such as the British Virgin Islands (BVI), Belize or the Seychelles or Brunei. Companies incorporated in jurisdictions which offer both offshore companies and onshore companies and which may benefit from favorable tax regulation and/or special offshore company regimes. For example:- Mauritius has two types of companies that are used for offshore business and international tax planning. The Mauritius GBCII Offshore Company pays zero tax and is effectively a tax haven company, similar in many respects to a BVI Company, whilst the Mauritius GBCI Company is tax resident and typically utilized for double tax treaty and international tax planning. Hong Kong, although not typically regarded as a tax haven, has a favorable tax regime which effectively means that correctly structured, managed and administered Hong Kong companies can be utilised for undertaking offshore business and international business without paying tax in Hong Kong provided that any profits arising are not made in Hong Kong. This type of tax regulation is known as 'Territorial Taxation'. The Limited Liability Company (LLC) and the Limited Liability Partnership (LLP) type of company, are a particular class of company used for offshore business, international business and tax planning because they have the advantage of limited liability but the flow-through characteristics of a partnership for tax purposes. By this, we mean that profits are divided amongst the members, in proportion to their respective holdings, and are taxed in their hands. In some circumstances, if all the members or partners are non-tax resident in the domicile of the LLC or LLP company and no business is undertaken in that country, neither the LLC or LLP company nor the members or partners will be subject to tax in the company's country of establishment. Such companies are said to be 'fiscally transparent' and examples include US LLCs, the Isle of Man LLC and the UK LLP. Companies incorporated in the many onshore countries which have tax regimes that are by statute tax advantageous for specific international purposes. The world of offshore is more complex than the black-and-white tax world inhabited by the media; offshore business consists not only of tax havens but also of onshore high tax countries competing fiercely to attract international companies and individuals with all manner of tax planning regulations and opportunities. These tax advantageous regulations are used for a wide variety of tax planning business, such as:- (i) double tax treaty planning relating to dividends, interest and royalty payment; (ii) the establishment of holding, international headquarter treasury and finance operations; (iii) specialist business, for example, leasing; and (iv) personal and family wealth management and tax planning. In fact, almost all countries offer tax regulations of one kind or another to encourage inward investment. International tax advisers have long been aware of the opportunities which exist for improving overall tax efficiency by using the special low tax regimes offered by high tax countries seeking to encourage international business. However, successful implementation of such structures is dependent on a wide variety of issues, often relating to matters such as anti-avoidance provisions, double tax avoidance, controlled foreign company and management and control tests and provisions, transfer pricing, thin capitalisation, participation exemptions, capital gains tax and a myriad of other ever-changing tax regulation. More recently, the weapons contained in the armoury of the tax collectors have been supplemented by exchange of information treaties and provisions. So today the offshore world includes the expert implementation of specific tax advantageous structures domiciled in high tax onshore countries as diverse as the UK, Portugal, Singapore, Greece, Belgium, Austria, Spain, Switzerland, Luxembourg and the Netherlands. Offshore Company is a company which establishes an operations center in a country other than its home country to conduct its international activities. Certain countries try to attract offshore companies by offering special privileges and incentives. Offshore or Non-Resident Companies are described as companies that conduct an insubstantial or zero volume of business within their jurisdiction of incorporation. More specifically, offshore companies have three characteristics:- Firstly, they should be registered as an entity within the jurisdiction of incorporation. Secondly, the 'incorporators' should be domiciled outside of the jurisdiction of incorporation. Finally, the company should transact the major majority of business outside of the jurisdiction of incorporation. However, most associate the term 'Offshore Company' as a means of increasing tax efficiency. The most important factor in choosing a jurisdiction is to be sure that your company will be incorporated in a country that has:- (i) reliable means of communication; (ii) political and economical stability; (iii) good reputation; and (iv) sophisticated corporate laws. All the jurisdictions we work with enjoy the above mentioned advantages. However, the right choice of jurisdiction also depends on where you live and on the business you conduct. Generally, we recommend the Seychelles or Belize due to the low fees, the rapid incorporation process and excellent confidentiality. Does my company have to provide accounts to any tax authority? No, generally not. This is one of the main advantages of 'offshore' companies. However, in a few select jurisdictions, such as Hong Kong, Cyprus, Gibraltar and the UK for example, it is indeed mandatory for companies to produce yearly accounts and to have them audited, and in some cases, to pay taxes. Every jurisdiction has its own incorporation timeframe. Once the company has been incorporated, it will generally take about 2–6 days for the corporate documents to reach you. Do I have to pay taxes on profit or interest earned by my company? No. Most of the jurisdictions we work with do not impose taxes on profits made or interest earned by the company. Some, like Hong Kong or Delaware, only tax profits made within the jurisdiction, whereas Cyprus charges a 10% flat tax. An offshore company may be of interest to a great number of people and it may be used for various activities:- (1) Businessmen:- creating an offshore company allows you to begin an activity without having to deal with the set-up of a complicated infrastructure. An offshore company allows you to benefit from fiscal advantages and ease of administration. (2) Commerce over the Internet (E-Commerce):- Internet traders can use an offshore company to maintain a domain name and to manage internet sites. An offshore company might be ideal for people whose business is on the internet. You might choose to incorporate the registered office of your company in an offshore jurisdiction to take advantage of the various benefits offered by these jurisdictions. (3) Consultants/Counsellors:- you can also carry on your consultancy or counselling business through an offshore company. You will find it easier to manage your company and will have reduced or even zero taxation depending on the jurisdiction in question. (4) International Business:- international commerce can be carried out through an offshore company. It will handle purchases and sales operations, taking advantage of the fact that its profit will not be taxed, or only at a low level, depending on the jurisdiction. This type of use is particularly interesting where goods from one country are sold in another country while you yourself are based in a third country. (5) Holding Intellectual Property Rights:- any kind of intellectual property right (a patent or trade mark) may be registered in the name of an offshore company. The company may also buy or sell this type of rights. It may also grant rights of use to third parties against payments which will be considered as revenues and will thus benefit from the low level or zero taxation of the jurisdiction in which it is registered. (6) For the Custody of Movable and Immovable Property:- offshore companies are used to hold both movable property (such as yachts) and immovable property (e.g., houses and buildings). In addition to confidentiality, the benefits and advantages they offer include exemption from certain types of taxes (e.g., inheritance tax). It should be noted, however, that some countries do not allow the acquisition of movable/immovable property through offshore structures and therefore those wishing to form an offshore structure are advised to check with a competent authority before proceeding. (7) For Inheritance Purposes:- an offshore firm that always stays afloat (provided all costs associated with running it are paid) may, in some countries, be used as a means of avoiding inheritance tax laws. With a view to optimizing inheritance tax liability, the offshore structure may also be combined with a trust or a foundation. (8) Stockbroker/Forex:- offshore companies are very often used for share or foreign exchange transactions. The main reasons being the anonymous nature of the transaction (the account can be opened under a company name) and the attractive fiscal conditions of offshore regulations (little or no tax levied on profits made). What is a Nominee Director? The nominee director service is used to ensure the highest degree of privacy and confidentiality, as the name of the director will appear in the corporate documents, in any business contract and eventually in the jurisdiction's business register. Upon appointment of a nominee director, a Nominee Service Agreement will be signed between the

client and the nominee. It will guarantee the client that the nominee can only act or sign documents upon the client's request and with the client's prior approval. Prefessional directors provided by ABC work with the highest level of integrity and confidentiality. What is a Nominee Shareholder? The nominee shareholder is appointed in order to shield the real owner of the company from being publicly associated with the ownership of that company. Upon appointment of nominee shareholder, a nominee service agreement (declaration of trust) will be signed between the client and the nominee. Nominee Shareholders provided by ABC work with the highest level of integrity and confidentiality. What is the Notarization and Apostille? A notarization means that a notary will check all the documents we issue for your company and that he will confirm their authenticity. An apostille is an internationally recognized certification and legalization of the corporate documents by the Government of the jurisdiction where your company has been incorporated. We highly recommend to choose this option if you consider opening a bank account or if you need your corporate documents for any legal proceedings (such as concluding a contract, for example). Companies incorporated on the Seychelles are exempt from any kind of taxation and may have clients, contractors, suppliers and employees from any country. They are empowered to conduct all types of business except ones that require a license such as financial services, banking, insurance, gambling, trust and similar. / Акциэнгэзэльшафт (Aktiengesellschaft) (А.Ге. (AG)) или Анштальт (Anstalt) или Гэзэльшафт мит бэшрянкта Хафтунг (Ге.эм.бе.Ха.) (Gesellschaft mit beschränkter Haftung (GmbH) или Штифтунг (Stiftung)), , Сосьэдадэс Анонима (Sociedades Anonima) Эсэ.А. (SA), . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Компания, которая учреждает операционный центр в стране, иной нежели страна её реального нахождения и осуществления деятельности, для ведения дел со своими международными активами. Некоторые страны пытаются привлечь организацию офшорных компаний за счёт предложения особых привилегий и стимулов.

OFFSHORE FINANCIAL CENTERS = ОФШОРНЫЕ ФИНАНСОВЫЕ ЦЕНТРЫ – Offshore Financial Centers is an expression applied originally only to the newly emerging financial centers in the Caribbean. Used today for all internationally oriented financial centers offering investors and financial institutions special advantages owing to their liberal economic and fiscal legislation, e.g., The Bahamas, Barbados, Bermuda, British Virgin Islands, Cayman Islands, Channel Islands, Liechtenstein, Mauritius, Netherlands Antilles, Panama, and the Seychelles. Also known as Offshore Markets. / Офшорные Финансовые Центры – выражение, использовавшееся первоначально только к вновь образуемым развивающимся финансовым центрам в государствах, расположенных в Карибском регионе. В настоящее время этот термин используется для всех международно ориентированных финансовых центров, предлагающих инвесторам и финансовым институтам особые льготы благодаря их либеральному экономическому и фискальному законодательству, например, Багамские Острова, Барбадос, Бермудские Острова, Британские Виргинские Острова, Кайман Остров ('священная корова' Американских бизнесменов), Кипр ('священная корова' Российских бизнесменов до Марта 2013), Лихтенштейн ('священная корова' Немецких бизнесменов), Маврикий, Остров Мэн ('священная корова' Британских бизнесменов), Нидерландские Антильские Острова, Нормандские Острова, Панама и Сейшельские Острова. Известны также как Офшорные Рынки (Offshore Markets). Термин Офшорный используется в США по отношению к любой финансовой организации, имеющей штаб-квартиру за пределами страны и не подпадающей под национальное регулирование. Например, взаимный фонд (mutualfund), юридический адрес которого находится на Багамских или Каймановых островах, называется офшорным фондом (offshore fund). Для того чтобы продавать свои акции в США, подобные фонды должны соответствовать всем относящимся к таким организациям федеральным правилам и правилам штатов. Многие банки имеют офшорные филиалы, которые занимаются деятельностью либо значительно ограниченной, либо вообще не разрешённой в США.

OFFSHORE FUNDS = ОФШОРНЫЕ ФОНДЫ – Offshore Funds is a term for investment funds domiciled in one of the offshore financial centers and which offer tax advantages to foreign investors, e.g., the Bahamas, Barbados, Bermuda, British Virgin Islands, Cayman Islands, Channel Islands, Mauritius, Netherlands Antilles, Panama, and the Seychelles. / Термин для инвестиционных фондов, имеющих зарегистрированную штабквартиру в одном из офшорных финансовых центров и предлагающих иностранным инвесторам налоговые льготы, например, Багамские Острова, Барбадос, Бермудские Острова, Британские Виргинские Острова, Кайман Острова, Маврикий, Нидерландские Антильские Острова, Нормандские Острова, Панама и Сейшельские Острова.

OFFSHORE–LOADED = ЗАГРУЖЕННАЯ В ТЕРРИТОРИАЛЬНЫХ ВОДАХ – Oil produced offshore is either moved onshore by pipeline or loaded offshore direct from Floating Production Storage And Off-Loading Vessels (FPSOs) or buoy-mooring facilities. See also Floating Production Storage And Off-Loading Vessel.

OFFSHORE MAIL FORWARDING ADDRESS = ОФШОРНЫЙ АДРЕС ДЛЯ ОТПРАВКИ ПОЧТЫ – Offshore Mail Forwarding Address:- often an international business corporation's (IBC's) offshore address is nothing more than a mail drop (PO Box) assigned to the IBC. Bank and brokerage statements and any other type of company mail may be sent to this address. The mail will typically be picked up twice monthly by the offshore facilitator. The IBC's mail will be put into a plain, brown envelope and mailed to the address of the beneficial owner's choice. Only the domestic return address and the recipient's address appear on the envelope. Thus, the discrete envelope arrives with the offshore IBC's mail inside. Using offshore mail forwarding insures that the wrong eyes will never view sensitive offshore mail.

OFFSHORE MARKET = ОФШОРНЫЙ РЫНОК – Offshore Markets are international financial centers with especially inexpensive locational characteristics, in particular, of a tax-related and/or regulatory nature. Offshore countries are, for example, the Bahamas, Bermuda, British Virgin Islands, Cayman Islands, Guernsey, Isle of Man, Jersey and Mauritius.

OFFSHORE PRODUCTION PLATFORM = МОРСКАЯ ЭКСПЛУАТАЦИОННАЯ ПЛАТФОРМА – In the United States, the main Offshore Production Platforms are:- (i) fixed platforms (FPs); (ii) compliant towers (CTs); (iii) tension leg platforms (TLPs); and (iv) mini-tension leg platforms (mini-TLPs). There are also different types of production facilities, based on the depth of water. Each of these platform systems is designed to withstand the wide range of wind and wave forces that can be expected at its offshore location, including severe winter storms or hurricanes. See also Fixed Platform, Spar Platform, and Tension Leg Platform. / В Соединённых Штатах Америки основными морскими эксплуатационными платформами (в порядке работы на разных глубинах) являются:- (i) стационарные платформы (СП; fixed platforms (FPs)), работающие на малых глубинах; (ii) податливые вышки/башни (ПВ/Б; compliant towers (CTs)), работающие на средних глубинах; (iii) платформы с растянутыми опорами (ПРО; tension leg platforms (TLPs)), работающие на глубоководье; и (iv) платформы с укороченными опорами (ПУО; mini-tension leg platforms (mini-TLPs)), работающие на больших глубинах, опоры у такой платформы крепятся на глубине к каркасным основаниям глубоководному подводному цилиндру, соединённому с надводной частью стационарной платформы. Смотрите также Стационарная Платформа (Fixed Platform), Спаренная Платформа (Spar Platform), и Платформа С Растянутыми Опорами (Tension Leg Platform).

OFFSHORE PROMOTER = ПРОДВИЖЕНЕЦ ОФШОРОВ – Offshore Promoter is a person or entity who markets offshore arrangements to the public. The promoter can be a financial institution, lawyer, accountant, broker, financial planner, or other individual.

OFFSHORE TRUSTEE = ОФШОРНЫЙ ДОВЕРИТЕЛЬНЫЙ СОБСТВЕННИК (или ОФШОРНЫЙ ДОВЕРИТЕЛЬНЫЙ УПРАВЛЯЮЩИЙ, или ОФШОРНЫЙ РАСПОРЯДИТЕЛЬ, или ОФШОРНЫЙ ПОПЕЧИТЕЛЬ) – Offshore Trustee is a trustee has a fiduciary duty to manage and conserve the assets of a trust over which he or she has control. The offshore trustee has an additional duty to maintain the financial privacy of the beneficial owner of the trust assets.

OFF–SORTS = НИЗКИХ СОРТОВ – Off-Sorts:- the by-products of sorting – shorts; britch wool, kemp, gray wool, stained wool, etc.

OFF–SQUARE = НЕ КВАДРАТНОЕ – Off-Square:- (1) a term to describe the difference between the percentage of warp crimp and the percentage of filling crimp. (2) A term referring to a fabric in which the number of ends and the number of picks per inch are not equal. / Не Квадратная ткань имеет не одинаковые проценты уработки основы и уточины.

OFF–TAKE = ЗАБОР – Off-Take is an actual amount of gas withdrawn. / Забор относится к фактическому объёму забираемого газа.

OFF–TYPE = НЕТИПИЧНОЕ – Off-Type:- different from the cultivar, variety, strain, or selection on the application for certification.

OFF–TYPES = НЕТИПИЧНЫЕ (или ОТКЛОНЯЮЩИЕСЯ ОТ ТИПА, или НЕ СООТВЕТСТВУЮЩИЕ ТИПУ) – Off-Types:- plant that differ in morpho-agronomic characters from the majority or representative plants of a variety; admixtures in a field; obvious contaminants such as tall plants in a semidwarf cultivar or vice versa. / свойства (characters) .

OFF–WHITE = БЕЛЁСОЕ (или ХХ, или НЕДОСТАТОЧНО БЕЛОЕ) – Off-White:- a yellowish or grayish white.

OFI = ORDERING CUSTOMER'S FINANCIAL INSTITUTION

OFS = OPTIONS ON FUTURES SPREADS

OG = OFFICIAL GAZETTE

OGC = OFFICE OF GENERAL COUNSEL

OGILVIE = ОГОЛВИ (или ХХ) – Ogilvie:- one of the more complicated tartans. It combines stripes of red, yellow, greenish blue, and dark blue in an intricate pattern. Ogilvie is a city in Kanabec County, State of Minnesota, the United States. / Tartan = общее название группы шерстяных пледов.

OGIP = ORIGINAL GAS IN PLACE

OH CRANE = OVERHEAD CRANE

OHIM = OFFICE FOR HARMONIZATION IN THE INTERNAL MARKET

OHM = ОМ – Ohm is the unit of electrical resistance. A circuit resistance of one Ohm will pass a current of one Ampere with a potential difference of one Volt. Abbreviated using the Greek letter Omega (Ω). Named for the German physicist George Simon Ohm 1854. Ohm is the unit of measurement of electrical resistance. The resistance of a circuit in which a potential difference of 1 Volt produces a current of 1 Ampere. / Под Омом понимается единица электрического сопротивления в системе единиц СИ. Названа по имени Немецкого физика Гэорга Зимона Ома (George Simon Ohm; 1787–1854). 1 Ом равен электрическому сопротивлению участка электрической цепи (проводника), на котором (между концами которого) постоянный ток силой 1 Ампер (А) вызывает падение напряжения 1 Вольт (В). Обозначение:- Ом. 1 Ом = $1.11 \cdot 10^{-12}$ единицы СГСЭ = 10^{9} единиц СГСМ.

OHM'S LAW = ЗАКОН ОМА – Ohm's Law defines the relationship between voltage, resistance, and current. In 1828 the German physicist George Simon Ohm showed by experiment that the current in a conductor is equal to the difference of potential between any two points divided by the resistance between them. This may be written as I = E / R where E is the potential difference in Volts, R is the resistance in Ohms, and I is the current in Amperes. / Под Законом Ома для участка электрической цепи (проводника), не содержащего источников электродвижущей силы (ЭДС), понимается закон, устанавливающий связь между силой тока в проводнике и разностью потенциалов (напряжением) на его концах:- сила тока прямо пропорциональна напряжению и обратно пропорциональна сопротивлению проводника. Закон Ома для замкнутой неразветвлённой цепи:- сила тока прямо пропорциональна ЭДС и обратно пропорциональна полному сопротивлению цепи. Закон Ома справедлив для постоянных и квазистационарных токов. Этот закон был открыт в 1826 Немецким физиком Гэоргом Зимоном Омом (George Simon Ohm; 1787–1854). Закон Ома – один из основных законов электрического тока. Согласно Закону Ома, сила постоянного электрического тока в участке электрической цепи прямо пропорциональна электрическому напряжению на этом участке. Если в участке 1–2 ток силой I идёт в направлении от 1 к 2, то по Закону Ома:- $I = U_{12} / R = ((\varphi_1 - \varphi_2) + E_{12}) / R$, где U_{12}, $(\varphi_1 - \varphi_2)$ и E_{12} – напряжение на рассматриваемом участке, разность потенциалов на его концах и ЭДС, приложенной на этом участке, а R – постоянная величина, называемая омическим сопротивлением участка. Закон Ома справедлив для металлических проводников и электролитов, температура которых при изменении электрического напряжения и силы тока поддерживается постоянной. Для тока в газах и вакууме, для некоторых контактов зависимость I от U_{12} нелинейная, то есть Закон Ома не выполняется. Закон Ома можно записать в форме $\rho j = E$, где j – плотность тока, ρ – удельное сопротивление проводника, а E – напряжённость результирующего (электростатического, стороннего и индуцированного) поля в проводнике. Закон Ома можно также применять для переменных (синусоидальных) квазистационарных токов:- I = U / Z, где I и U – амплитудные (или действующие) значения тока и напряжения, а Z – полное сопротивление участка цепи.

OHR = OFFICE OF HUMAN RESOURCES

OHS = OCCUPATIONAL HEALTH AND SAFETY

OIBDA = OPERATING INCOME BEFORE DEPRECIATION AND AMORTIZATION

OIC = ORGANISATION OF THE ISLAMIC CONFERENCE

OID = ORIGINAL ISSUE DISCOUNT

OID DEBT = ORIGINAL ISSUE DISCOUNT DEBT

OIE = OFFICE INTERNATIONAL DES EPIZOOTIES

OIIP = OFFICE OF INDEPENDENT INVENTORS PROGRAMS

OIL = МАСЛО – Oil is a greasy, unctuous liquid of vegetable, animal, mineral or synthetic origin. / Масла (нефтяные) – смеси высокомолекулярных углеводородов, получаемые из нефти и применяемые в основном в качестве смазочных материалов. Нефтяные масла используются также как гидравлические и смазочно-охлаждающие жидкости, электроизоляционные среды,

поверхностно-активные вещества, мягчители, компоненты пластичных смазок, лекарственных препаратов и другие. Существует две основные системы классификации нефтяных масел:- по способу их производства и по областям применения. По способу производства нефтяные масла делят на дистиллятные, получаемые вакуумной перегонкой мазутов; остаточные, получаемые из деасфальтизированных масляных гудронов, и компаундированные – подобранные по вязкости и другим показателям смеси дистиллятных и остаточных масел. Современные процессы производства (включающие вакуумную перегонку, деасфальтизацию, селективную очистку, депарафинизацию, контактную или гидродоочистку) обеспечивают достаточно полное извлечение масляных фракций из нефти, необходимую их очистку и требуемые физико-химические свойства; при этом качество масел зависит от химического состава и свойств исходной нефти. Перспективные, каталитические процессы получения масел (гидрокрекинг, гидроизомеризация, алкилирование, полимеризация и другие) позволяют получать масла заданных химического состава и свойств, с более высоким выходом из перерабатываемого сырья. Для производства нефтяных масел в бывшем Союзе Советских Социалистических Республик (СССР) использовались в основном сернистые нефти Урало-Волжского района (Ромашкинская, Мухановская, Туймазинская и другие) и нефти Западной Сибири (Усть-Балыкская, Самотлорская и другие). Эти нефти по своему химическому составу и свойствам (смотрите Нефть) обеспечивают получение масел с высокими эксплуатационными качествами. Перспективной для производства масел является также Мангышлакская нефть. По областям применения нефтяные масла разделяются на моторные масла, реактивные масла, трансмиссионные масла, индустриальные масла, цилиндровые масла (для паровых машин), электроизоляционные масла, технологические масла и так называемые Белые Масла, используемые в медицине и парфюмерии. Первые 5 из перечисленных групп относятся к смазочным маслам, остальные – к несмазочным маслам. Для каждого вида масел разработан и строго нормируется стандартами перечень физико-химических свойств, зависящий от условий использования. Существует, однако, ряд характеристик, относящихся практически ко всем нефтяным маслам. Это прежде всего вязкость (или внутреннее трение), измеряемая обычно при температурах 50 и 100 °С. Диапазон колебания вязкостей товарных масел очень велик – от 2.0–2.5 сантиСтокс сСт (1 сСт = 10^{-6} $м^2$/сек) при 100 °С у лёгких индустриальных масел до 60–70 сСт у тяжёлых цилиндровых. Для масел, используемых в арктических условиях (‘Северные Масла’), вязкость определяется также и при отрицательных температурах, –40 °С и ниже; важным показателем для них является так называемый Индекс Вязкости, характеризующий температурную зависимость вязкости. Температура застывания нефтяных масел может быть от 17 °С у тяжёлых цилиндровых до минус 45–60 °С у некоторых моторных и индустриальных. Эту характеристику следует учитывать при выборе условий транспортировки, хранения и использования смазочных продуктов. Допустимый высокотемпературный предел использования нефтяных масел косвенно характеризуется температурой вспышки. Важный показатель для нефтяных масел – фракционный состав, однако для подавляющего большинства нефтяных масел, в том числе моторных, он техническими стандартами не нормируется. Основным показателем электроизоляционных масел являются высокие диэлектрические свойства, характеризуемые прежде всего тангенсом угла диэлектрических потерь. Большинство нефтяных масел должно обладать также малой зольностью, высокой стойкостью к окислению. Эти показатели связаны с противоизносными, антинагарными и коррозионными свойствами масел. Для использования в современных двигателях и машинах с высокими скоростями, нагрузками и температурами нефтяные масла необходимо легировать различными добавками, присадками, улучшающими эксплуатационные качества масел (понижающими температуру застывания, повышающими противоизносные и диспергирующие свойства и так далее). Практически все товарные масла содержат присадки или их композиции в количестве от 0.5–1.0 до 25% и более. В ряде случаев вместо нефтяных масел используются Синтетические Масла, имеющие более высокие технические характеристики. Масла (минеральные), то же, что Нефтяные Масла. Масла (растительные) – жирные, растительные жиры, продукты, извлекаемые из масличного сырья и состоящие в основном (на 95–97%) из триглицеридов – органических соединений, сложных полных эфиров глицерина и жирных кислот (смотрите Жиры). Кроме триглицеридов (бесцветных веществ без запаха и вкуса), в состав жирных растительных масел входят воски и фосфатиды, а также свободные жирные кислоты, липохромы, токоферолы, витамины и другие вещества, сообщающие маслам окраску, вкус и запах. К жирным растительным маслам относятся:- абрикосовое, арахисовое, арбузное, буковое, виноградное, вишнёвое, горчичное, дынное, касторовое, кедровое, кокосовое, конопляное, кориандровое, кукурузное, кунжутное, льняное, маковое, масло какао, крамбе, ляллеманцевое, миндальное, молочайное, оливковое, ореховое, пальмовое, пальмоядровое, перилловое, персиковое, подсолнечное, рапсовое, рисовое, рыжиковое, сафлоровое, сливовое, соевое, сурепное, томатное, тунговое, тыквенное, хлопковое и другие. Свойства жирных растительных масел определяются в основном составом и содержанием жирных кислот, образующих триглицериды. Обычно это насыщенные и ненасыщенные (с одной, двумя и тремя двойными связями) одноосновные жирные кислоты с неразветвлённой углеродной цепью и чётным числом углеродных атомов (преимущественно C_{16} и C_{18}). Кроме того, в жирных растительных маслах обнаружены в небольших количествах жирные кислоты с нечётным числом углеродных атомов (от C_{15} до C_{23}). В зависимости от содержания непредельных жирных кислот меняется консистенция масел и температура их застывания:- у жидких масел, содержащих больше непредельных кислот, температура застывания обычно ниже нуля, у твёрдых масел – достигает 40 °С. К твёрдым растительным маслам относятся только масла некоторых растений тропического пояса (например, пальмовое). При контакте с воздухом многие жидкие жирные масла подвергаются окислительной полимеризации (‘высыхают’), образуя плёнки. По способности к ‘высыханию’ масла делят на ряд групп в соответствии с преимущественным содержанием тех или других непредельных кислот; например, масла, высыхающие подобно льняному маслу (льнянообразно высыхающие), из непредельных содержат главным образом линоленовую кислоту. Касторовое масло, содержащее в основном рицинолевую кислоту, вообще не образует плёнок. Плотность жирных растительных масел составляет 900–980 килограммов на кубический метр (кг/$м^3$), показатель преломления 1.44–1.48. Масла способны растворять газы, сорбировать летучие вещества и эфирные масла. Важным свойством масел, кроме касторового, является способность смешиваться в любых соотношениях с большинством органических растворителей (гексаном, бензином, бензолом, дихлорэтаном и другими), что связано с небольшой полярностью масел:- их диэлектрическая проницаемость при комнатной температуре равна 3.0–3.2 (для касторового масла 4.7). Этанол и метанол при комнатной температуре растворяют масла ограниченно; при нагревании растворимость возрастает. В воде масла практически не растворяются. Теплота сгорания масел составляет $(39.4–39.8)\cdot10^3$ Дж/г, что определяет их большое значение как высококалорийных продуктов питания. Химические свойства жирных растительных масел связаны главным образом с реакционной способностью триглицеридов. Последние могут расщепляться по сложноэфирным связям с образованием глицерина и жирных кислот. Этот процесс ускоряется под действием водного раствора смеси серной кислоты и некоторых сульфокислот (Реактив Твитчеля) или сульфонефтяных кислот (Контакт Петрова), при повышенных температурах и давлениях (Безреактивное Расщепление), а в организме под действием фермента липазы (смотрите Жировой Обмен). Триглицериды подвергаются алкоголизу, омылению водными растворами щёлочей, ацидолизу, переэтерификации, аммонолизу. Важным свойством триглицеридов является способность присоединять водород по ненасыщенным связям жирнокислотных радикалов в присутствии катализаторов (никелевых, медно-никелевых и других), на чём основано производство отверждённых жиров – саломасов (смотрите Гидрогенизация Жиров). Растительные масла окисляются кислородом воздуха с образованием перекисных соединений, оксикислот и других продуктов. Под действием

высоких температур (250–300 °C) происходит их термический распад с образованием акролеина. Основная биологическая ценность растительных масел заключается в высоком содержании в них полиненасыщенных жирных кислот, фосфатидов, токоферолов и других веществ. Наибольшее количество фосфатидов содержится в соевом (до 3 000 мг %), хлопковом (до 2 500 мг %), подсолнечном (до 1 400 мг %) и кукурузном (до 1 500 мг %) маслах. Высокое содержание фосфатидов отмечается только в сырых и нерафинированных растительных маслах. Биологически активным компонентом растительных масел являются стерины, содержание которых в различных растительных маслах неодинаково. Так, до 1 000 мг % стеринов и более содержит масло пшеничных зародышей, кукурузное масло; до 300 мг % – подсолнечное, соевое, рапсовое, хлопковое, льняное, оливковое; до 200 мг % – арахисовое и масло какао; до 60 мг % – пальмовое, кокосовое. Растительные масла полностью свободны от холестерина. Очень высоким количеством токоферолов (100 мг % и более) характеризуются масла пшеничных отрубей, соевое и кукурузное масла; до 60 мг % токоферолов в подсолнечном, хлопковом, рапсовом и некоторых других маслах, до 30 мг % – в арахисовом, до 5 мг % – в оливковом и кокосовом. Общее содержание токоферолов ещё не является показателем витаминной ценности масла. Наибольшей витаминной активностью обладает подсолнечное масло, поскольку все его токоферолы представлены а-токоферолом, меньшую Е-витаминную активность имеют хлопковое и арахисовое масла. Что касается соевого и кукурузного масел, то они почти полностью лишены витаминной активности, поскольку 90% общего количества их токоферолов представлены антиокислительными формами. Основные способы получения растительных масел – отжим и экстрагирование. Общими подготовительными стадиями для обоих способов являются очистка, сушка, обрушивание (разрушение) кожуры семян (Подсолнечника, Хлопчатника и других) и отделение её от ядра. После этого ядра семян или семена измельчают, получается так называемая Мятка. Перед отжимом мятку прогревают при 100–110 °C в жаровнях при перемешивании и увлажнении. Прожаренную таким образом мятку – Мезгу – отжимают в шнековых прессах. Полнота отжима масла из твёрдого остатка – Жмыха – зависит от давления, толщины слоя отжимаемого материала, вязкости и плотности масла, продолжительности отжима и ряда других факторов. Экстрагирование растительных масел производится в специальных аппаратах – Экстракторах – при помощи органических растворителей (чаще всего экстракционных бензинов). В результате получается раствор масла в растворителе (так называемая Мисцелла) и обезжиренный твёрдый остаток, смоченный растворителем (Шрот). Из мисцеллы и шрота растворитель отгоняется соответственно в дистилляторах и шнековых испарителях. Шрот основных масличных культур (Подсолнечника, Хлопчатника, Сои, Льна и других) является ценным высокобелковым кормовым продуктом. Содержание в нём масла зависит от структуры частиц шрота, продолжительности экстракции и температуры, свойств растворителя (вязкости, плотности), гидродинамических условий. По смешанному способу производства осуществляется предварительный съём масла на шнековых прессах (так называемое Форпрессование), после чего производится экстрагирование масла из жмыха. Растительные масла, полученные любым методом, подвергают очистке. По степени очистки пищевые растительные масла разделяют на сырые, нерафинированные и рафинированные. Растительные масла, подвергнутые только фильтрации, называются Сырыми Маслами и являются наиболее полноценными, в них полностью сохраняются фосфатиды, токоферолы, стерины и другие биологически ценные компоненты. Эти растительные масла отличаются более высокими вкусовыми свойствами. К Нерафинированным Маслам относятся растительные масла, подвергнутые частичной очистке – отстаиванию, фильтрации, гидратации и нейтрализации. Эти растительные масла имеют меньшую биологическую ценность, так как в процессе гидратации удаляется часть фосфатидов. Рафинированные Растительные Масла подвергаются обработке по полной схеме рафинации, включающей механическую очистку (удаление взвешенных примесей отстаиванием, фильтрацией и центрифугированием), гидратацию (обработку небольшим количеством горячей – до 70 °C – воды), нейтрализацию, или щелочную очистку (воздействие на нагретое до 80–95 °C масло щёлочью), адсорбционную рафинацию, в процессе которой в результате обработки растительных масел адсорбирующими веществами (животный уголь, гумбрин, флоридин и другие) поглощаются красящие вещества, а масло осветляется и обесцвечивается. Дезодорация, то есть удаление ароматических веществ, производится воздействием на растительные масла водяного пара под вакуумом. В результате рафинации обеспечивается прозрачность и отсутствие отстоя, а также запаха и вкуса. В биологическом отношении рафинированные растительные масла менее ценны. При рафинировании теряется значительная часть стеринов и растительные масла почти полностью лишаются фосфатидов (например, в соевом масле после рафинации остаётся 100 мг % фосфатидов вместо 3 000 мг % исходных). Для устранения этого недостатка рафинированные растительные масла искусственно обогащаются фосфатидами. Представление о большей устойчивости рафинированного растительного масла при продолжительном хранении исследованиями не подтверждается. Будучи лишено природных защитных веществ, оно не имеет каких-либо преимуществ в процессе хранения перед другими видами растительных масел (нерафинированных). Некоторые растительные масла нуждаются в обязательной очистке от примесей, которые не безвредны для здоровья человека. Так, семена Хлопчатника содержат ядовитый пигмент госсипол в количестве от 0.15 до 1.8% к массе сухого и обезжиренного семени. Путём рафинации этот пигмент удаляется полностью. В бывшем СССР производились главным образом (% в общем жировом балансе на 1969):- подсолнечное (77), хлопковое (16), льняное (2.3), соевое (1.8), горчичное, касторовое, кориандровое, кукурузное и тунговое масла. Области применения масел многообразны. Жирные растительные масла являются важнейшим пищевым продуктом (подсолнечное, хлопковое, оливковое, арахисовое, соевое и другие) и применяются для изготовления консервов, кондитерских изделий, маргарина. В технике из масел производят мыла, олифы, жирные кислоты, глицерин, лаки и другие материалы. Очищенные от примесей, отбелённые и уплотнённые растительные масла (преимущественно льняное, конопляное, ореховое, маковое) применяются в масляной живописи в качестве основного компонента связующих масляных красок и в составе эмульсий темперных (казеиново-масляных и других) красок. Растительные масла также используются для разбавления красок и входят в состав эмульсионных грунтов и масляных лаков. Растительные масла, высыхающие медленно (подсолнечное, соевое и другие), и растительные масла, не образующие плёнок на воздухе (касторовое), применяются в качестве добавок, которые замедляют высыхание красок на холсте (при длительной работе над картиной создавая возможность очищать и переписывать отдельные участки красочного слоя) или палитре, при долговременном хранении красок. В медицинской практике из жидких растительных масел (касторовое, миндальное) готовят масляные эмульсии; растительные масла (оливковое, миндальное, подсолнечное, льняное) входят как основы в состав мазей и линиментов. Масло Какао используют для изготовления суппозиториев. Растительные масла являются также основой многих косметических средств.

OIL ANALYSIS = АНАЛИЗ МАСЛА – Oil Analysis is the routine activity of analyzing lubricant properties and suspended contaminants for the purpose of monitoring and reporting timely, meaningful and accurate information on lubricant and machine condition.

OIL BAG = МАСЛЯНАЯ КИСА (или МЕШОК С МАСЛОМ) – Oil Bag (maritime term):- a bag filled with oil and triced over the side for making a slick in a rough sea (to keep seas from breaking).

OIL BULK ORE VESSEL = НЕФТЕРУДОВОЗ (или НЕФТЕНАВАЛОЧНИК) – An Ore-Bulk-Oil Carrier, also known as Combination Carrier or OBO, is a ship designed to be capable of carrying wet or dry cargoes. The idea is to reduce the number of empty (ballast) voyages, in which large ships only carry a cargo one way and return empty for another. These are a feature of the larger bulk trades,

e.g., crude oil from the Middle East, iron ore and coal from Australia, South Africa and Brazil. Oil Bulk Ore (OBO) Vessel is a vessel designed for the carriage of dry or liquid bulk cargo. A multipurpose ship that can carry ore, heavy dry bulk goods and oil. Although more expensive to build, they ultimately are more economical because they can make return journeys with cargo rather than empty as single-purpose ships often must. / Под Рудовозом понимается грузовое судно для перевозки навалом тяжёлых руд; один из типов навалочников. Рудовоз имеет две продольные переборки между которыми располагаются грузовые трюмы сравнительно небольшого объёма (удельная грузовместимость современных рудовозов 0.5–0.8 $м^3$/т), грузовые люки больших размеров и обычно высокое двойное дно. На некоторых рудовозах можно перевозить поочерёдно руду и нефть (нефтенавалочники или нефтерудовозы).

OIL CERTIFICATE = СВИДЕТЕЛЬСТВО НА НЕФТЬ (или НЕФТЯНОЙ СЕРТИФИКАТ) – In Europe, Oil Certificate is the negotiable instrument representing rights attached to non-voting shares in firms engaged in oil exploration, drilling and transformation. Only the government or entities with special authorization are allowed to issue oil certificates. / В Европе Нефтяной Сертификат является оборотным инструментом, представляющим права, закреплённые за акциями без права голоса, в фирмах, вовлечённых в разведку, добычу и переработку нефти. Выпускать нефтяные сертификаты разрешено только правительству или юридическим лицам с особыми разрешениями.

OIL CHANGE = ЗАМЕНА МАСЛА – Oil Change is the act of replacing dirty oil with clean oil.

OILCLOTH = КЛЕЁНКА – Oilcloth is any fabric treated with linseed-oil varnish to make it waterproof. It comes in plain colors and printed designs and is most commonly used for table covers or shelf covering. It has now been widely replaced by plastic coated fabrics. Oilcloth is a cloth treated with oil or paint and used for table and shelf coverings. / Клеёнка – ткань из химических волокон, реже хлопчатобумажная, льняная или вискозная, покрытая водонепроницаемой плёнкой из синтетического плёнкообразователя (например, поливинилхлорида) или растительного масла. Используется для бытовых нужд.

OIL CONSUMPTION = РАСХОД МАСЛА (или ПОТРЕБЛЕНИЕ МАСЛА) – Oil Consumption is the amount of lubricating fluid that is consumed by a machine, production line, plant or company over a given period of time.

OIL CONSUMPTION RATIO = СООТНОШЕНИЕ С РАСХОДОМ МАСЛА (или СООТНОШЕНИЕ С ПОТРЕБЛЕНИЕМ МАСЛА) – Oil Consumption Ratio:- annual oil purchases divided by machine charge volume. For example, if you purchased 10 000 gallons of oil in one year and the total amount of oil that all of your machine holds is 4 200 gallons, your consumption ratio is 2.4.

OIL DRAIN = СПУСК МАСЛА (или СПУСКНОЕ ОТВЕРСТИЕ ДЛЯ МАСЛА) – Oil Drain:- a large bolt or plug that secures the drain hole in the oil pan. It is generally fitted with a gasket or O-ring to prevent leakage. / спускное отверстие в маслосборнике (или масляном корыте). прокладкой (или сальником) или маслосъёмным кольцом для предотвращения утечки.

OIL–EQUIVALENT GAS = ГАЗ, РАВНЫЙ НЕФТИ (или НЕФТЬ–ЭКВИВАЛЕНТ ГАЗ) – Oil-Equivalent Gas:- the volume of natural gas needed to generate the equivalent amount of heat as a barrel of crude oil. Approximately 6 000 cubic feet of natural gas is equivalent to one barrel of crude oil.

OILER = МАСЛЁНКА – Oiler is a device for once-through lubrication. Three common types of oilers are:- drop-feed, wick-feed, and bottle-feed; all depend on gravity to induce a metered flow of oil to the bearing. The drop-feed oiler delivers oil from the bottom of a reservoir to a bearing one drop at a time; flow rate is controlled by a needle valve at the top of the reservoir. In a wick-feed oiler, the oil flows through a wick and drops from the end of the wick into the bearing; feed is regulated by chaining the number of strands, by raising or lowering the oil level, or by applying pressure to the wick. In a bottle-feed oiler, a vacuum at the top of the jar keeps the fluid from running out; as tiny bubbles of air enter, the vacuum is reduced and a small amount of oil enters the bearing or is added to a reservoir from wick the bearing is lubricated. / игольчатый затвор (needle valve).

OILER = СМАЗЧИК – Oiler is an unlicensed member of the engine room staff who oils and greases bearings and moving parts of the main engine and auxiliaries. Most of this work is now done automatically and the oiler merely insures it operates correctly.

OIL FILTER = МАСЛЯНЫЙ ФИЛЬТР (или ФИЛЬТР СМАЗОЧНОГО МАСЛА) – Oil Filter is a device which removes the inherent or introduced impurities from the oil that lubricates an internal-combustion engine. See also Filter. / Масляный Фильтр – устройство для очистки масла от загрязняющих его механических частиц, смол и других примесей. Масляные фильтры устанавливаются в системах смазки двигателей внутреннего сгорания, металлорежущих станков и других. Различают несколько типов масляных фильтров:- пластинчато-щелевые, со сменным бумажным патроном, центробежные и другие. В системах смазки двигателей наибольшее распространение получили центробежные масляные фильтры. Загрязнённое масло под давлением поступает в полость ротора такого масляного фильтра, через фильтрующую сетку подводится к жиклёрам и выбрасывается из них с большой скоростью. Вытекающие струи масла создают реактивную тягу, которая заставляет ротор вращаться. При давлении масла 0.25–0.3 МегаНьютонов на кубический метр (МН/$м^3$) (2.5–3 килограмм силы на кубический сантиметр (кгс/$см^3$)) частота вращения ротора достигает 5 000–6 000 оборотов в минуту (об/мин). Под действием центробежной силы тяжёлые частицы, засоряющие масло, отбрасываются к периферии и оседают на стенках ротора. Очищенное масло стекает в маслоприёмник, например, картер двигателя.

OIL FLUSHING = МАСЛЯНАЯ ПРОМЫВКА (или МАСЛЯНОЕ СМЫВАНИЕ) – Oil Flushing is a fluid circulation process that is designed to remove contamination and decomposition from a lubrication-based system.

OILINESS = МАСЛЯНИСТОСТЬ – Oiliness:- that property of a lubricant that produces low friction under conditions of boundary lubrication. The lower the friction, the greater the oiliness.

OILINESS AGENT = МАСЛЯНИСТЫЙ АГЕНТ (или МАСЛЯНИСТОЕ ВЕЩЕСТВО) – Oiliness Agent is an additive, usually polar in nature, used to improve the lubricity of a mineral oil. Now usually called a Boundary Lubrication Additive.

OIL IN TRANSIT = НЕФТЬ В ТРАНЗИТЕ – Changes in Oil In Transit represent estimates of the change in global crude oil stocks in transit at sea between producing and consuming countries.

OIL MIST LUBRICATION = СМАЗЫВАНИЕ МАСЛЯНЫМ ТУМАНОМ – Oil Mist Lubrication is a method of lubricant delivery in which oil is piped throughout the machine to desired locations and dispensed with a spray nozzle. Oil mist systems are employed to cool and lubricate many machine parts at once. See also Lubrication. / Смазывание Масляным Туманом – смазывание, при котором смазочный материал подводится к поверхности трения в виде лёгкого или густого тумана, обычно образуемого путём введения смазочного материала в струю воздуха или газа.

OIL MIST SYSTEM = СИСТЕМА МАСЛЯНОГО ТУМАНА – Oil Mist System is a device which delivers lubricant to multiple machine parts at once via a setup that includes piping and a spray nozzle.

OIL OR STAIN = МАСЛО ИЛИ РАЗВОД (или МАСЛО ИЛИ ПОТЁК) – Oil or other Stain:- these are spot defects of oil, rust, grease or other stains found in the fabric. Causes:- (i) improper oiling/greasing of looms; and (ii) oil stained take up roller. Mending:- (i) keep the stained portion of the fabric over an absorbent pad; apply the stain remover, wetting the stain and surrounding portion thoroughly; (ii) rub gently to quicken the penetration of the stain remover; and (iii) rubbing should be done towards the centre of stain to avoid spreading. Note:- delicate fabric needs reduced pressure, otherwise, hole formation or displacement of the fabric will occur.

OIL OXIDATION = ОКСИДИРОВАНИЕ МАСЛА (или ОКИСЛЕНИЕ МАСЛА) – Oil Oxidation occurs when oxygen attacks petroleum fluids. The process is accelerated by heat, light, metal catalysts and the presence of water, acids, or solid contaminants. It leads to increased viscosity and deposit formation.

OILPROOF = МАСЛОНЕПРОНИЦАЕМОЕ (или МАСЛОСТОЙКОЕ) – Oilproof is a term describing fabrics that are impervious to oil.

OIL RECORD BOOK = ЖУРНАЛ НЕФТЯНЫХ ОПЕРАЦИЙ – Oil Record Book is a book or log kept by the master of an oil tanker wherein every discharge or escape of oil is recorded. / Журнал Нефтяных Операций – книга или журнал, поддерживаемый хозяином (или капитаном) нефтяного танкера, в который записывается каждая разгрузка или утечка нефти.

OIL–REPELLENT = РЕПЕЛЛЕНТ МАСЛА (или МАСЛООТТАЛКИВАЮЩЕЕ) – Oil-Repellent is a term applied to fabrics that have been treated with finishes to make them resistant to oil stains. / развод (или потёк (stain)).

OIL RING = МАСЛОСЪЁМНОЕ КОЛЬЦО (или МАСЛОСБРАСЫВАЮЩЕЕ КОЛЬЦО) – Oil Ring is a loose ring, the inner surface of which rides a shaft or journal and dips into a reservoir of lubricant from which it carries the lubricant to the top of a bearing by its rotation with the shaft.

OIL SAMPLING = ОТБОР ПРОБЫ МАСЛА – Oil Sampling is a procedure which involves the collection of a volume of fluid from lubricated or hydraulic machinery for the purpose of performing oil analysis. Samples are typically drawn into a clean bottle which is sealed and sent to a laboratory for analytical work.

OIL SANDS = НЕФТЯНЫЕ ПЕСКИ – Oil Sands:- naturally occurring mixture of bitumen (a heavy, viscous form of crude oil), water, sand and clay. Using hydroprocessing technology, bitumen can be refined to yield synthetic oil.

OILSEED CROP = МАСЛИЧНАЯ КУЛЬТУРА – Major US Oilseed Crops are Cottonseed, Flaxseed, Peanuts, Rapeseed, Sesame seed, Soybeans, and Sunflower seed. Other oils including caster, coconut, olive, palm, and tung. / Под Масличными Культурами понимаются растения, возделываемые для получения жирных масел. Семена и плоды таких растений служат сырьём для масло-жировой промышленности. В мировом земледелии наибольшие площади масличных культур отводятся к Арахису, Горчице, Клещевине, Кунжуту, Маслине, Подсолнечнику, Рапсу и Сое.

OILSEED MEALS = ТИПЫ МАСЛИЧНОЙ МУКИ – Oilseed Meals:- defined as Rapeseed meal (Canola), Soyabean meal, and Sunflower meal in all countries, except in Japan where it excludes Sunflower meal.

OILSEEDS = МАСЛИЧНЫЕ СЕМЕНА – Oilseeds include Flaxseed and Solin, Canola and Rapeseed, Soybeans, Safflower and Sunflower seed. Oilseeds:- defined as Rapeseed (Canola), Soyabeans, Sunflower seed, Peanuts and Cotton seeds in all countries, except in Japan where it excludes Sunflower seed.

OILSKIN = ШТОРМОВКА (или НЕПРОМОКАНЕЦ, или МАСЛЯНАЯ ОБЩИВКА, или КЛЕЁНКА, или ПРОМАСЛЕННАЯ КОЖА) – Oilskin (maritime term):- waterproof clothing. Oilskin is an oiled waterproof cloth used for coverings and garments. An oilskin raincoat; (plural) an oilskin suit of coat and trousers.

OIL SLUDGE = ОСАДОК В МАСЛЕ (или МАСЛЯНЫЙ ШЛАМ) – Oil Sludge:- thick, dark residue with mayonnaise-like consistency, which builds up on the non-moving inner parts of the engine. Insoluble contaminants in the oil accelerates its buildup.

OIL SPOT = МАСЛЯНОЕ ПЯТНО – Oil Spots:- equipment improperly oiled or cleaned. (1) Defect Name:- Oil Spot. Defect Type:- Isolated Defects. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Oil Spot:- Oil spots are deposits of oil that have fallen onto the fabric from some processing step and are typically round or tear drop in shape. They can also have an irregular shape. Severity:- Minor. (2) Defect Name:- Oil Spot. Defect Type:- Isolated Defects. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Oil Spot:- Oil spots are deposits of oil that have fallen onto the fabric from some processing step and are typically round or tear drop in shape. They can also have an irregular shape. Severity:- Major. Cutting Room Defects, and namely – Cutting Defects. Oil Spot on the fabrics are caused by too much oiling on loom parts from other sources. However, oil stains in most fabrics may be removed by scouring process. / Порок или дефект раскроя. развод (или потёк (stain)).

OIL STAINS = МАСЛЯНЫЕ РАЗВОДЫ (или МАСЛЯНЫЕ ПОТЁКИ) – Oil Stains are stains and marks detrimental to goods. They are acquired in a great number of ways and must be removed in cloth scouring. Many oil spots are the result of carelessness as the cloth is moved from room to room in the cloth-finishing procedure. Oil Stain:- oil mark on the fabric. Oil Stains:- work practice, handling of material, and alertness at work, Air cleaning to avoid. Cleaning through vacuum should be preferred. Oil Stains:- weaving defect. Oil or Other Stain:- these are spot defects of oil, rust, grease or other stains found in the fabric. Minor Defect Classification:- Not prominent. Major Defect Classification:- >= 6 sq.cm. / Многие масляные пятна . Порок или дефект ткачества.

OIL TANKER = НЕФТЕТАНКЕР – Oil Tanker is a ship designed for the carriage of oil in bulk, her cargo space consisting of several or many tanks. Tankers load their cargo by gravity from the shore or by shore pumps and discharge using their own pumps. / и разгружают с использованием их собственных насосов.

OILY ENDS = ЗАМАСЛЕНЫЕ ПРОДОЛЬНЫЕ НИТИ – Oily Ends:- these are oily warp ends. Causes:- (i) improper handling and storage of material in spinning department; (ii) oil-contaminated guides and oily hands during process of warping; and (iii) improper handling of warp beams. Mending:- (i) keep the stained portion of the fabric over an absorbent pad; apply the stain remover, wetting the stain and surrounding portion thoroughly; (ii) rub gently to quicken the penetration of the stain remover; and (iii) rubbing should be done towards the centre of stain to avoid spreading. Note:- delicate fabric needs reduced pressure, otherwise, hole formation or displacement of the fabric will occur. Oily Ends:- it is oily or soiled warp threads. Weaving Defect. Oily Ends or Soiled Ends:- these are oily or soiled warp threads. / развод (или потёк (stain)).

OILY WEFT = ЗАМАСЛЕНЫЙ УТОК – Oily Weft:- these are oily weft picks. Causes:- (i) improper handling and storing in spinning department; (ii) weft package falling on oily ground; (iii) handling the weft with oily hands; (iv) weft carring baskets having oil; and (v) dropping of oil on weft package during oiling of the winding machine. Mending:- (i) keep the stained portion of the fabric over an absorbent pad; apply the stain remover, wetting the stain and surrounding portion thoroughly; (ii) rub gently to quicken the penetration of the stain remover; and (iii) rubbing should be done towards the centre of stain to avoid spreading. Note:- delicate fabric needs reduced pressure, otherwise, hole formation or displacement of the fabric will occur. Oily Weft:- it is a dirty or oily weft appearing across

the width of the fabric. Oily Weft:- streaks of dirty and oily weft appearing across the width of the cloth. Weaving Defect. / Масляные Нити по утку до двух нитей включительно по длине ткани. Размер порока – за каждое место. развод (или потёк (stain)).

OILY YARN = ЗАМАСЛЕНАЯ ПРЯЖА – Spinning defect. Oily Yarn:- oil stained yarn. Yarn stained with oil and grease mark causes due to material handling, bad work practices, work negligence etc:- (i) exclusive traveller oil; (ii) near bearing if more oil spread in drafting; (iii) maintenance people touches material; (iv) same reasons at each machine stage; (v) oil viscosity for oiling and greasing purpose; (vi) any material spoiled or falls on floor, which contain oil; and (vii) end breaks at ring frame not attended for a long duration by sider. / Порок или дефект прядения.

OIPE = OFFICE OF INITIAL PATENT EXAMINATION

ÖKO–TEX® STANDARD = OEKO–TEX® STANDARD

OLADE = ORGANIZACIÓN LATINOAMERICANA DE ENERGÍA

OLAF = OFFICE EUROPÉEN DE LUTTE ANTIFRAUDE

OLD CROP = СТАРЫЙ УРОЖАЙ – Old Crop represents the most recent crop harvested. Depending on the commodity and contract month, futures contracts reflect either new crop or old crop production.

OLD GOLD = СТАРОЕ ЗОЛОТО (или ЧЕРВОНОЕ ЗОЛОТО) – Old Gold:- a dark yellow. / тёмно-жёлтое.

OLD MAN = СТАРИК – Old Man (maritime term):- the captain of the ship.

OLD ROSE = СТАРАЯ РОЗА – Old Rose:- a variable color averaging a grayish red.

OLD SCHOOL TIE = СТАРЫЙ ШКОЛЬНЫЙ ГАЛСТУК – Old School Tie is a necktie displaying the colors of an English public school.

OLD–TO–MARKET = ЗНАТОКИ РЫНКА (или ВЕТЕРАНЫ РЫНКА) – As defined by the US International Trade Administration, Old-To-Market is a term which refers to committed/experienced larger-scale firms. A significant portion of manufacturing capability may be foreign sourced, export sales volume is often in excess of 15 percent of total sales. See also New-To-Market.

OLD WORLD = СТАРЫЙ СВЕТ (или СТАРЫЙ МИР) – The Old World consists of those parts of the world known to classical antiquity and the European Middle Ages. It is used in the context of, and contrast with, the 'New World', e.g., the Americas and sometimes Oceania, though excluding Australasia. The Old World comprises Africa, Asia, and Europe (collectively known as Afro-Eurasia), plus surrounding islands (or at least those parts known to classical geography before the XV century). In its modern usage, it usually includes Australasia. The concept of the three continents in the Old World goes back to classical antiquity. Their boundaries as defined by Ptolemy and other geographers of antiquity were drawn along the Nile and Don rivers. This definition remained influential throughout the Middle Ages and the Early Modern period. Old World – colloquial – Europe, Africa and Asia. / В отличие от Нового Света под Старым Светом понимаются континенты Европа, Азия и Африка, которые были известны Европейцам до открытия Америки.

OLEFIN FIBER = ОЛЕФИНОВОЕ ВОЛОКНО – Olefin Fiber is a manufactured fiber in which the fiber-forming substance is any long chain synthetic polymer composed of at least 85% by weight of ethylene, propylene, or other olefin units. Olefin fibers combine lightweight with high strength and abrasion resistance, and are currently being used in rope, indoor-outdoor carpets, and lawn furniture upholstery. See also Polyethylene Fiber, and Polypropylene Fiber. Olefin Fiber is a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 85% by weight of ethylene, propylene, or other olefin units. Olefin fiber is a generic description that covers thermoplastic fibers derived from olefins, predominately aliphatic hydrocarbons. Olefins are products of the polymerization of propylene and ethylene gases. Polypropylene (PP) and polyethylene (PE) are the two most common members of the family.

OLEFINS = ОЛЕФИНЫ (или АЛКЕНЫ, или ЭТИЛЕНОВЫЕ УГЛЕВОДОРОДЫ) – (1) Olefin, also known as Polypropylene or Polyethylene, is a long-chain polymer synthetic fiber. It is created when ethylene and/or propylene gases are polymerized under very specific conditions. Olefin was first manufactured in the late 1950s, and has a myriad of applications in manufacturing, household products and clothing. Use of olefin has steadily increased since the 1960s, and continues to gain in popularity every year as new uses for this easy, durable material are found. Olefin is created when the polymers are melted to a liquid, then run through a machine called a Spinneret, which forces the product into a long fiber through small holes. This fiber is then used to make the fabric, or the end product in which it will be used. Because olefin resists dyeing, any dye must be added during this melting process, instead of to the final fabric or product. It is highly favored due to its easy, inexpensive manufacturing process. Surprisingly, olefin is relatively environmentally 'friendly' due to the few byproducts produced during manufacturing. Olefin is also easily recycled. There are several benefits of using olefin. It is very tough and hard wearing, colorfast and stain resistant. The lightweight material – it has the lightest 'specific gravity' of any other fabric – dries quickly and wicks sweat and water from the skin. Materials made with olefin holds its shape extremely well, making it good for packing and active use. It also produces very little static, and weathers well in the sun, as long as special stabilizers are added during manufacturing. Olefin is also highly resistant to deterioration from chemicals and moisture. One of the drawbacks of olefin is that, because it has a low melting point, it is flammable and will melt if exposed to high heat. Olefin is manufactured under several different names, including some very well known such as Tyvek® by DuPont®, Thinsulate® by 3M® and Duraguard® by Kimberly-Clark®. The material is used in everything from active wear, clothing, car and furniture upholstery, truck liners, indoor/outdoor carpeting, wallpaper/wallcoverings, bedding construction and ropes. Olefin is also used in cigarette filters and diapers. In clothing, it is easy to care for – just wash normally and line dry or dry on low heat. Due to its sensitivity to heat, keep clothing made with olefin away from the iron and other sources of extreme heat. Olefin (polyolefin/polypropylene) is a manufactured fiber characterized by its light weight, high strength, and abrasion resistance. Olefin is also good at transporting moisture, creating a wicking action. End-uses include activewear apparel, rope, indoor-outdoor carpets, lawn furniture, and upholstery. Olefin is a class of unsaturated aliphatic hydrocarbons having one or more double bonds C=C, produced by cracking naphtha or other petroleum fractions at high temperatures, e.g., ethylene and propylene. / Тайвэк® (Tyvek®) by ДюПо® (DuPont®), Синсулэйт® (Thinsulate®) by СриЭм® (3M®) и Дюрагад® (Duraguard®) by Кимбёли-Клак® (Kimberly-Clark®). , и устойчивость к истиранию. Класс ненасыщенных алифатических (ациклических) углеводородов, содержащий в молекуле одну или более двойных связей C=C, получаемых посредством крекинга прямогонного бензина или иных фракций нефти при высоких температурах, например, этилен и пропилен. Под Олефинами или Алкенами понимаются ненасыщенные ациклические углеводороды, содержащие в молекуле двойную связь C=C. Первый член ряда олефинов – этилен $CH_2=CH_2$, поэтому олефины называются также Этиленовыми Углеводородами. Олефины содержатся в продуктах переработки нефти и природных газов. Они широко используются для синтеза полимеров и других ценных промышленных продуктов, например, бутилен, пропилен и этилен. Под Олефинами, от Французского слова Oléfiant, означающее Маслообразующий, от Латинских слов Oleum, означающее Масло, и Facio, означающее Делаю, понимаются

ненасыщенные углеводороды, молекулы которых имеют линейное строение и содержат одну двойную связь (родоначальник ряда – этилен). Способны к реакциям присоединения, в том числе к полимеризации. Содержатся в продуктах переработки нефти и природного горючего газа. Называются также Алкенами и Этиленовыми Углеводородами.

(2) Olefin is a manufactured fiber characterized by its light weight, high strength, and abrasion resistance. Olefin is also good at transporting moisture, creating a wicking action. End-uses include activewear apparel, rope, indoor-outdoor carpets, lawn furniture, and upholstery. Also known as Polyolefin, or Polypropylene. / Искусственное волокно, характеризуемое своим лёгким весом, высокой прочностью и стойкостью к истиранию. Олефин является также хорошим проводником влаги, при создании сплетений. На стадии конечного употребления олефин используется в одежде для активного отдыха, для создания веревки, ковриков для прихожей или на входе в дом/квартиру, мебели для газонов, и для обивки. Известно также как Полиолефин (Polyolefin) или Полипропилен (Polypropylene).

OLEOPHILIC = ОЛЕОФИЛЬНОЕ (или ГИДРОФОБНОЕ) – Oleophilic is a term describing a substance that has a strong affinity for oils. / Сродство (Affinity).

OLEOPHOBIC = ОЛЕОФОБНОЕ (или ГИДРОФИЛЬНОЕ) – Oleophobic is a term describing a substance that does not have a strong affinity for oils. / Сродство (Affinity).

OLIA = OFFICE FOR LEGISLATIVE AND INTERNATIONAL AFFAIRS

OLIGARCHY = ОЛИГАРХИЯ – Oligarchy is any system of government in which virtually all political power is held by a very small number of wealthy but otherwise unmeritorious people who shape public policy primarily to benefit themselves financially through direct subsidies to their agricultural estates or business firms, lucrative government contracts, and protectionist measures aimed at damaging their economic competitors – while displaying little or no concern for the broader interests of the rest of the citizenry. 'Oligarchy' is also used as a collective term to denote all the individual members of the small corrupt ruling group in such a system. The term always has a negative or derogatory connotation in both contemporary and classical usage, in contrast to aristocracy (which sometimes has a derogatory connotation in modern usage, but never in classical). / Под Олигархией, от Греческого слова Oligarchia, понимается режим, при котором политическая власть принадлежит узкой группе лиц (богачей, военных и тому подобных).

OLIGOGENE = ОЛИГОГЕН – Oligogene is a gene controlling the inheritance of a qualitative character or one showing typical Mendelian distribution. / свойство (character) . Под Олигогеном, от Греческих слов Oligos, означающее Незначительный или Немногий, и Genēs, означающее Рождающий или Рождённый, понимается .

OLIGOGENIC RESISTANCE = ОЛИГОГЕНИЧЕСКАЯ (или ОЛИГОГЕННАЯ) РЕЗИСТЕНТНОСТЬ (или ОЛИГОГЕНИЧЕСКАЯ СОПРОТИВЛЯЕМОСТЬ, или ОЛИГОГЕНИЧЕСКАЯ УСТОЙЧИВОСТЬ) – Oligogenic Resistance is a resistance governed by a few genes. Major gene resistance.

OLIGOMER = ОЛИГОМЕР – Oligomer is a polymer molecule consisting of only a few monomer units.

OLIGONUCLEOTIDE = ОЛИГОНУКЛЕОТИД – Oligonucleotide is a polymer of nucleotides usually 5–30 base pairs long. / Под Олигонуклеодидом, от Греческого слова Oligos, означающее Незначительный или Немногий, и Нуклеотид, понимается .

OLIGOPHAGOUS = ОЛИГОФАГНОЕ – Oligophagous:- eating only a few specific kinds of food – used especially for an insect subsisting on a few usually related plants. / Под Олигофагным, от Греческих слов Oligos, означающее Незначительный или Немногий, и Phágos, означающее Пожиратель, понимается .

OLIGOPOLY = ОЛИГОПОЛИЯ – Industry in which there are many buyers but few sellers. Such conditions give the producer or seller a certain amount of control over price, but leave him or her especially vulnerable to the actions of competitors. See also Monopoly. An Oligopoly is a market dominated by a few large suppliers. The degree of market concentration is very high (i.e. a large % of the market is taken up by the leading firms). Firms within an oligopoly produce branded products (advertising and marketing is an important feature of competition within such markets) and there are also barriers to entry. Another important characteristic of an oligopoly is interdependence between firms. This means that each firm must take into account the likely reactions of other firms in the market when making pricing and investment decisions. This creates uncertainty in such markets – which economists seek to model through the use of game theory. Economics is much like a game in which the players anticipate one another's moves. Game theory may be applied in situations in which decision makers must take into account the reasoning of other decision makers. It has been used, for example, to determine the formation of political coalitions or business conglomerates, the optimum price at which to sell products or services, the best site for a manufacturing plant, and even the behaviour of certain species in the struggle for survival. Adapted from Brittanica:- The ongoing interdependence between businesses can lead to implicit and explicit collusion between the major firms in the market. Collusion occurs when businesses agree to act as if they were in a monopoly position. Key Features of Oligopoly:- (i) a few firms selling similar product; (ii) each firm produces branded products; (iii) likely to be significant entry barriers into the market in the long run which allows firms to make supernormal profits; and (iv) interdependence between competing firms. Businesses have to take into account likely reactions of rivals to any change in price and output. Theories About Oligopoly Pricing:- there are four major theories about oligopoly pricing:- (1) oligopoly firms collaborate to charge the monopoly price and get monopoly profits; (2) Oligopoly firms compete on price so that price and profits will be the same as a competitive industry; (3) Oligopoly price and profits will be between the monopoly and competitive ends of the scale; and (4) Oligopoly prices and profits are 'indeterminate' because of the difficulties in modelling interdependent price and output decisions. The Importance of Price and Non-Price Competition:- firms compete for market share and the demand from consumers in lots of ways. We make an important distinction between price competition and non-price competition. Price competition can involve discounting the price of a product (or a range of products) to increase demand. Non-price competition focuses on other strategies for increasing market share. Consider the example of the highly competitive UK supermarket industry where non-price competition has become very important in the battle for sales:- (i) mass media advertising and marketing; (ii) Store Loyalty cards; (iii) Banking and other Financial Services (including travel insurance); (iv) in-store chemists / post offices / crèches; (v) home delivery systems; (vi) discounted petrol at hyper-markets; (vii) extension of opening hours (24 hour shopping in many stores); (viii) innovative use of technology for shoppers including self-scanning machines; (ix) financial incentives to shop at off-peak times; and (x) Internet shopping for customers. Price Leadership in Oligopolistic Markets:- when one firm has a dominant position in the market the oligopoly may experience price leadership. The firms with lower market shares may simply follow the pricing changes prompted by the dominant firms. We see examples of this with the major mortgage lenders and petrol retailers. Imperfect market competition in which the supply of a good or service is controlled by a very small number of sellers, or oligopolists. Oligopoly is a situation in which a particular market is controlled by a small group of firms. An oligopoly is much like a monopoly, in which only one company exerts control over most of a market. In an oligopoly, there are at least two firms controlling the market. The retail gas market is a good example of an oligopoly because a small number of firms control a large majority of the market. / Недобросовестная рыночная конкуренция, когда поставку товаров или услуг контролирует очень маленькая группа продавцов или олигополистов. Под

Олигополией, от Греческих слов Oligos, означающее Незначительный или Немногий, и Pōléō, означающее Продаю или Торгую, понимается термин, обозначающий одну из форм господства монополий в развитых капиталистических странах, когда несколько крупных конкурирующих фирм монополизируют производство и сбыт основной массы продукции в отрасли. Олигополия:- ситуация на рынке, при которой небольшое число поставщиков контролирует предложение на рынке ряда товаров или услуг и, таким образом, контролирует рыночные котировки. Олигополия может быть совершенной (perfect), когда все компании предлагают идентичные товары или услуги (цемент), или несовершенной (imperfect), когда продукция каждой компании имеет отличительные особенности, но в целом аналогична продукции других производителей (сигареты). Поскольку каждая компания в случае олигополии знает свою долю рынка предлагаемых товаров и услуг и поскольку любое изменение цены или доли рынка, контролируемой одной компанией, отражается на объёме продажи остальных компаний, между такими компаниями существует, как правило, жёсткая взаимозависимость. Каждая компания должна принимать решения в отношении своих цен и объёмов производства с учётом реакции других компаний олигополии. В ситуации олигополии цены, однажды установившись, долго остаются на одном уровне. Это поощряет неценовую конкуренцию, то есть конкуренцию с помощью рекламы, лучшей упаковки и обслуживания. Двумя примерами олигополии в США являются авиакомпании, обслуживающие одни и те же маршруты, и табачные компании. Смотрите также Олигопсония (Oligopsony).

OLIGOPSONY = ОЛИГОПСОНИЯ – Oligopsony:- similar to an oligopoly (few sellers), this is a market in which there are only a few large buyers for a product or service. This allows the buyers to exert a great deal of control over the sellers and can effectively drive down prices. A good example of an oligopsony would be the US fast food industry, in which a small number of large buyers (i.e. McDonald's, Burger King, Wendy's) controls the US meat market. Such control allows these fast food Mega-chains to dictate the price they pay to farmers for meat and to influence animal welfare conditions and labor standards. Oligopsony:- imperfect market competition in which the demand for a good or service is controlled by a very small number of buyers, or oligopsonists. An Oligopsony (from Ancient Greek Oligoi = Few + Opsōnia = Purchase) is a market form in which the number of buyers is small while the number of sellers in theory could be large. This typically happens in a market for inputs where numerous suppliers are competing to sell their product to a small number of (often large and powerful) buyers. It contrasts with an oligopoly, where there are many buyers but few sellers. An oligopsony is a form of imperfect competition. The terms monopoly (one seller), monopsony (one buyer), and bilateral monopoly have a similar relationship. One example of an oligopsony in the world economy is Cocoa, where three firms (Cargill, Archer Daniels Midland, and Callebaut) buy the vast majority of world Cocoa bean production, mostly from small farmers in third-world countries. Likewise, American Tobacco growers face an oligopsony of cigarette makers, where three companies (Altria, Brown & Williamson, and Lorillard Tobacco Company) buy almost 90% of all Tobacco grown in the United States. In each of these cases, the buyers have a major advantage over the sellers. They can play off one supplier against another, thus lowering their costs. They can also dictate exact specifications to suppliers, for delivery schedules, quality, and (in the case of agricultural products) crop varieties. They also pass off much of the risks of overproduction, natural losses, and variations in cyclical demand to the suppliers. / МэкДонэлдз (McDonald's), Богё Кин (Burger King), Вэндиз (Wendy's). Кагил (Cargill), Ачё Дэниэлз Мидлэнд (Archer Daniels Midland), и Калэбо (Callebaut). Олтриэ (Altria), Браун Энд Вильэмсэн (Brown & Williamson), и Лорилард Тчобэко Кампэни (Lorillard Tobacco Company). Недобросовестная рыночная конкуренция, когда спрос на товары или услуги контролируется очень маленькой группой покупателей или олигопсонистов. Олигопсония:- ситуация на рынке, при которой небольшое число крупных покупателей контролирует спрос и, следовательно, объём производства и рыночные цены на товары или услуги; ситуация, аналогичная олигополии (oligopoly), но на стороне покупателя. Цены в случае олигопсонии, как правило, ниже цен на рынках со свободной конкуренцией, точно так же, как в ситуации олигополии цены, как правило, выше. Например, крупные табачные компании приобретают всю продукцию мелких производителей Табака и, следовательно, имеют возможность полностью контролировать цены на это сырьё.

OLIVE = ОЛИВКОВОЕ – Olive:- any of several colors resembling that of the unripe fruit of the olive tree that are yellow to yellow green in hue, of medium to low lightness and of moderate to low saturation.

OLIVE DRAB = СЕРОВАТО–ЗЕЛЁНОЕ (или ОЛИВКОВО–ТУСКЛО–КОРИЧНЕВОЕ, или ОЛИВКОВО–ЖЕЛТОВАТО–СЕРОЕ, или ОЛИВКОВО–ТУСКЛОЕ) – Olive Drab is the wool or cotton fabric of an olive drab color, namely a grayish olive. A uniform of olive drab, namely a wool or cotton fabric of an olive drab color, namely a grayish olive. Grayish olive.

OLIVE OIL = ОЛИВКОВОЕ МАСЛО – Olive Oil:- xxxxx. Olive Oil And Ulcerative Colitis:- The results of a new study published in the Oxford Academic showed that patients suffering from inflammatory bowel disease (IBD) who ate extra virgin olive oil for six months daily saw a significant improvement in their condition. Their body mass index has decreased, and the volume of their figure has visually decreased. There were also lower markers of inflammation and less disease activity. 'Adopting a proper dietary habit based on a Mediterranean diet may be crucial in the clinical treatment of patients with inflammatory bowel disease', Fabio Cicco, lead author of the study, told Reuters. In his study, patients were evaluated for clinical and pathological activity and tested for possible steatosis (fatty liver disease) using abdominal ultrasound. Participants received personal dietary recommendations from a dietitian and were told to consume olive oil at each meal. A total of 142 patients with IBD were observed, including 84 with ulcerative colitis and 58 with Crohn's disease, 73 of 142 were considered obese. After six months, the number of patients with active disease (experiencing symptoms) decreased in this group, from 23.7% to 6.8% in patients with ulcerative colitis and from 17% to 3.8% in patients with Crohn's disease. It was also noted that the use of olive oil leads to a significant reduction in liver steatosis, which has completely disappeared in some patients. By the way, consumption of olive oil has been associated with the prevention of ulcerative colitis back in 2010, when researchers from the University of East Anglia concluded that a diet rich in oleic acid (a component of olive oil) significantly reduces the risk of developing this disease. In Russia, it gives the III Disability Group. / Ройтас (Reuters). Оливковое Дерево, вечнозелёное субтропическое плодовое дерево; то же, что Маслина. Маслина (Olea), Род Растений Семейства Маслиновых. Известно до 60 Видов. Хозяйственное значение имеет только Маслина Европейская (Olea Europaea, Маслина Культурная, Оливковое Дерево) – вечнозелёное субтропическое плодовое дерево высотой 4–12 метров (м). Листья мелкие, ланцетовидные или удлинённо-овальные, сверху тёмно-зелёные, снизу серебристо-серые живут 2–3 года. Цветки в основном обоеполые, мелкие, беловатые, по 8–40 в метельчатой кисти. Плод – костянка удлинённо-овальной или округлой формы, весит до 15 граммов (г), при полном созревании тёмно-фиолетового или чёрного цвета, часто с восковым налётом. Маслина – засухоустойчивая плодовая порода, выдерживает кратковременные морозы 13–18 °С. Лучше всего растёт на почвах рыхлых, супесчаных и суглинистых с достаточным содержанием извести. Растения, выращенные из семян, начинают плодоносить на 10–12-й год, из черенков – на 4–5-й год. Живёт 300–400 лет и дольше. Урожайность 20–40 килограммов (кг) плодов с дерева. Плоды используют для засолки, консервирования (зелёные и спелые), получения масла (в сырой мякоти плодов содержится от 25 до 80% масла). Получаемые при холодном прессовании плодов первые фракции называются Оливковым Маслом (лучшие Сорта его по названию Французской Провинции Прованс именуют Прованским), употребляемым в пищу, в консервной промышленности и медицине. Вторые фракции (Деревянное Масло) получают прессованием мезги и семян после подогревания; используют в мыловарении. Жмых Маслин идёт на корм скоту, древесина – ценный материал для токарных и столярных изделий. Маслина

– древняя культура, происходит с Ближнего Востока. Возделывается в полосе между 45° Северной широты и 37° Южной широты. Наибольшие площади под Маслиной в Испании (на 1970 – 2 200 тысяч гектаров (га)), Италии (1 500 тысяч га), Греции (500 тысяч га). На территории бывшего Союза Советских Социалистических Республик (СССР) культура Маслина известна с XIII века. Насаждения Маслин имелись в Крыму, Закавказье, Туркменской ССР, Краснодарском Крае. Известно около 500 Сортов Маслин, в бывшем СССР – около 80; лучшие – Агостино, Асколано, Никитский II, Крымский, Азербайджанский Сорт и другие. Маслину размножают корневыми отпрысками, черенками, отводками и прививкой. Сажают Маслину весной 2–3-летними саженцами (при штамбовой формировке дерева – 10 ' 10 м или 10 ' 8 м, при кустовой – 6 ' 6 м). Уход за Маслиной сходен с уходом за другими субтропическими плодовыми культурами. Оливковое Масло, масло растительное жирное, получаемое из мякоти оливок (смотрите также Маслина); иногда Оливковое масло называется Прованским. Масло характеризуется высоким содержанием глицеридов олеиновой кислоты (около 80%) и низким содержанием глицеридов линолевой кислоты (около 7%) и глицеридов насыщенных кислот (около 10%). Состав жирных кислот масла может меняться в довольно широких пределах в зависимости от климатических условий. Йодное число 75–88, температура застывания от –2 до –6 °С. Оливковое масло широко используется в консервной промышленности, в кулинарии – для приготовления салатов и тому подобного. Оно входит в состав косметических средств, применяется в медицине для изготовления растворов витаминов и препаратов для инъекций. Необычные Факты Об Оливе:- (1) Научно доказано, что Оливковое Дерево одно из самых древних на планете. Оказывается, уже в первобытном обществе люди умели употреблять в пищу его плоды; (2) Олива живёт от трёхсот лет до двух тысяч лет, в некоторых регионах есть деревья, которым и три тысячи лет; потрясающе, правда? (3) Культивация Оливкового Дерева началась в Древней Греции. Древние Греки научились мариновать оливки в соли и выжимать масло. Причём уже тогда оно различалось по сортам; (4) Древние Греки в обиходе использовали оливковое масло для увлажнения кожи постоянно; (5) Олива считалась у Греков символом непорочности, поэтому перед бракосочетанием девушку натирали маслом, а на голову надевали венок из веток; (6) Геракл, по легенде, орудовал в своих подвигах дубиной угадайте из какого дерева? Потом он посадил в Олимпии Оливковое Дерево. Из его ветвей и плели венки для победителей Олимпийских Игр. (7) Библейский Голубь, отправленный Ноем из ковчега на поиски суши, вернулся однажды именно с веткой Оливы в клюве, то есть это было первое Растение на Земле после потопа. Это символ милости Господней. (8) В Египетской мифологии Олива была даром человечеству от Верховной Богини Исиды. (9) В католицизме оливковая ветвь стала атрибутом Архангела Гавриила; на многих Итальянских полотнах он приходит именно с ней, а не с Лилией к Деве Марии сообщать благую весть. (10) Зелёные оливки содержат 113 ккал на 100 грамм, а чёрные маслины – 172 ккал на 100 грамм. Какие Сорта Испанских Оливок Самые Лучшие? На Иберийском Полуострове культивируют 260 Сортов Оливок и получают 45% мирового оборота оливковых масел. Почти никто не задумывается, какие же бывают Оливки? Самый популярный Сорт Пикуаль. По объёму он составляет четверть глобального урожая Оливок и практически половину плантаций Испании. Называются так, потому что плоды имеют заострённый кончик вроде пики. Это эталонный по вкусу Сорт Оливок, потому и такой популярный. Масло из Пикуаля особенно хорошо в салатах из свежих овощей, так как придаёт лёгкую горчинку и тёплые древесные ноты. И самое главное – это польза. В Оливках Пикуаль на 10% больше олеиновой кислоты, чем во всех других сортах, это аристократ среди Оливок. На втором месте Сорт Корникабра, он же Корнесуэло, из которых выжимают 15% оливковых масел всей Испании. Оливковое масло из Корникабры идеальный спутник овощей, мяса и птицы на гриле, тёплых салатов и Грибов. Знаменитая Арбекина – самый масляный Сорт Оливок, то есть даже мелкие, меньше сантиметра плоды, дают при прессовании больше оливкового масла Extra Virgin, чем относительно крупный Пикуаль, например. Их завезли в Испанию с Ближнего Востока ещё 1 000 лет назад и успешно культивируют до сих пор. Сорт Арбекина даёт мягкое, утончённое ярко-зелёное масло со свежим фруктовым ароматом с оттенками яблока и миндаля. Полезно Знать При Выборе Оливкового Масла:- Только механический отжим, сбор и переработка сырья в течение 24 часов, сохранение пищевой ценности до 2 лет, максимальная кислотность – 0.8%, идеально для салатов и соусов, вкус с горчинкой – вы уже догадались, что это словесный портрет оливкового масла Экстчрэ Вёдьжин (Extra Virgin). Свежие Оливки с дерева горькие. Поэтому оливковое масло первого отжима тоже горчит, хотя многие думают, что это брак и просрочка. Только такое масло, в отличие от рафинированного, содержит все полезные вещества и только с помощью отжима их можно сохранить на период 18–24 месяца. В этом состоит одна из главных ценностей масла Экстчрэ Вёдьжин (Extra Virgin). Если вы взяли рафинированное оливковое масло, и у него не нейтральный, а горький вкус – это не качественный товар. Чем ниже кислотность масла, тем оно лучше, и соответственно полезнее. Это главный показатель его качества. Кислотность представляет собой процент содержания олеиновой кислоты в 100 граммах продукта. По Европейскому стандарту 0.8% – это максимально допустимая кислотность для масла Virgin и Extra Virgin. Масло с кислотностью 0.5 или 0.3% уже считается целебным. Этот параметр может быть определён только лабораторным тестированием, он не имеет запаха и вкуса, поэтому вы не можете воспринимать его на вкус. Не путайте кислотность и горькость оливкового масла. Горьковатый привкус и щиплющие ощущения являются отличительными признаками хорошего Оливкового Масла Экстчрэ Вёдьжин (ОМЭВ) (Extra Virgin Olive Oil (EVOO)). В большинстве случаев, чем больше эти признаки выражены, тем ниже кислотность. Острота и горечь вырабатываются фенольными соединениями, ответственными за экстраординарные полезные свойства оливкового масла первого отжима, такими как олеокантал – противовоспалительное и противоопухолевое вещество (oleo = olive, canth = sting, al = aldehyde). Масло Экстчрэ Вёдьжин (Extra Virgin) давят из свежих плодов без использования химикатов и без тепловой обработки. Это традиционный и самый дорогой способ добычи, который делает оливковое масло таким ценным. А вот если у вас в руках оливковое масло с сертификатом BIO и/или Organic – то это касается уже сырья, а не производства. То есть, это органический продукт из Оливок, выращенных без использования пестицидов, удобрений и стимуляторов роста. Классификация Оливкового Масла:- Как различить и правильно выбрать оливковое масло? В зависимости от показателей качества, выявленных на основе физико-химических и органолептических свойств масла, Европейское законодательство подразделяет оливковое масло на различные категории. В Приложении № 3 Технического Регламента на Масложировую Продукцию ТР ТС 024/2011 можно ознакомиться с существующими наименованиями и характеристиками оливкового масла. На прилавках любого магазина можно увидеть четыре основных категории оливкового масла, пригодных для употребления в пищу:- (i) Масло Оливковое Нерафинированное Высшего Качества (Extra Virgin Olive Oil) или по-Испански – Асэйтэ дэ Олива Экстра Вирхэн (Aceite de Oliva Extra Virgen); (ii) Масло Оливковое Нерафинированное (Virgin Olive Oil) или по-Испански – Асэйтэ дэ Олива Вирхэн (Aceite de Oliva Virgen); (iii) Масло Оливковое Рафинированное С Добавлением Масел Оливковых Нерафинированных (Olive Oil) или по-Испански – Асэйтэ дэ Олива (Aceite de Oliva); и (iv) Масло Оливковое Из Выжимок Рафинированное С Добавлением Масла Оливкового Нерафинированного (Olive Pomace Oil) Оливковое Масло Второго Отжима или Памэйс (Pomace) или по-Испански – Асэйтэ дэ Орухо дэ Олива (Aceite de Orujo de Oliva). Самое лучшее и полезное оливковое масло – это масло оливковое нерафинированное высшего качества Экстра Виржен (смотрите далее категорию I), но все категории масел имеют свои определённые особенности и способы применения. В Испании принято иметь в своем распоряжении два или три варианта оливкового масло и в зависимости от момента употреблять одно или другое. Для заправки салатов, десертов, ‘тапас’ и соусов используется оливковое масло Высшего Качества (смотрите категорию I). По праздникам и в гостях у гурманов можно продегустировать и оценить ‘букет’ и необыкновенный вкус оливкового масла Высшего Качества ЗОП (DOP) (аббревиатура
