SPECIALIST SYSTEM = СИСТЕМА СПЕЦИАЛИСТА – Specialist System:- a type of trading commonly used for the exchange trading of securities in which one individual or firm acts as a market-maker in a particular security, with the obligation to provide fair and orderly trading in that security by offsetting temporary imbalances in supply and demand by trading for the specialist's own account. See also Board Broker System, and Free Crowd System.

SPECIAL ITEMS = СПЕЦИАЛЬНЫЕ СТРОКИ БАЛАНСА (или СПЕЦИАЛЬНЫЕ СТАТЬИ РАСХОДОВ) – Special Items describe one-time charges or one-time income that significantly affect the earnings of a segment or the BASF Group. Special items include, for example, charges arising from restructuring measures or earnings from divestitures. Special Items are the items which derive from events and transactions that need to be disclosed separately by virtue of their size or nature. / Бе.А.Эс.Эф. (BASF).

SPECIALIZATION = СПЕЦИАЛИЗАЦИЯ – Specialization:- in the economic sense, the social phenomenon of individual human beings or organizations each concentrating their productive efforts on a rather limited range of tasks. Specialization entails focussing on a narrow area of knowledge or skill or activity. It involves a person's or an organization's adapting for the unusually effective or efficient performance of some particular function, often at the expense of the individual's or organization's ability to perform most other functions for themselves, which are then necessarily left to others with more appropriate skills or talents or abilities. (For a related concept, see division of labor). Like the division of labor, specialization generally comes about because it is discovered (usually by trial and error) that the individuals or groups concerned can increase their productivity (and hence, under a market economy, their incomes) through greater specialization according to the principle of comparative advantage.

SPECIALIZED BANKS = СПЕЦИАЛИЗИРОВАННЫЕ БАНКИ – Specialized Banks:- depending on the volume of their business, banks can be divided into universal banks and specialized banks. Specialized banks generally restrict themselves to one or a few banking services pursuant to § 1 (1) German Banking Act. Specialized banks include, in particular, mortgage banks, building societies, special purpose banks (e.g., Industriekreditbank AG, the Landwirtschaftl. Rentenbank, the Deutsche Ausgleichsbank, etc), capital investment companies (e.g., DWS), central securities depositories (e.g., Deutsche Börse Clearing AG) and guarantee banks. / Индустрикрэдитбанк А.Ге. (Industriekreditbank AG), Ляндвиртшафтл. Рэнтэнбанк (Landwirtschaftl. Rentenbank), Дойчэ Аусгляйхс банк (Deutsche Ausgleichsbank), (например, Ди.Ви.Эс. (DWS)), (например, Дойчэ Бёрзэ Клырин А.Ге. (Deutsche Börse Clearing AG)).

SPECIALIZED FUND = СПЕЦИАЛИЗИРОВАННЫЙ ФОНД – Specialized Funds differ from normal investment funds in that they are focused on specific countries, industrial and business sectors or on specific securities such as convertible bonds or bonds with warrants. Investing in specialized funds requires a higher risk appetite and an understanding of business issues. Apart from the higher potential gains, the restriction to specific market segments also involves greater risks.

SPECIALLY–SHAPED STANCHIONS = СПЕЦИАЛЬНО СКЛАДЫВАЕМЫЕ СТОЙКИ – Specially-Shaped Stanchions:- these are collapsible stanchions that can be inserted and locked in place or unlocked and folded down. Stanchions are suitable for providing tight fitting lateral load securing for many types of load.

SPECIAL MARINE POLICY = СПЕЦИАЛЬНЫЙ МОРСКОЙ ПОЛИС (или ОСОБЫЙ МОРСКОЙ ПОЛИС) – Special Marine Policy:- issued under an open policy when the buyer wants evidence of insurance for the specific merchandise and voyage involved. / Специальный Морской Полис выдаётся в тех случаях, когда при наличии открытого полиса покупатель хочет получить свидетельство страхования по конкретной товарной продукции и рейсе, посредством которого осуществляется её перевозка.

SPECIAL MEETING = СПЕЦИАЛЬНОЕ СОБРАНИЕ (или ВНЕОЧЕРЕДНОЕ СОБРАНИЕ) – In the United States, a Special Meeting is a shareholder meeting called so that the shareholders may act on the specific matters stated in the notice of the meeting.

SPECIAL POLICY = СПЕЦИАЛЬНЫЙ ПОЛИС – Special Policy is a document prepared by the insured, the producer, or the insurance company to provide evidence of insurance to the buyer or bank for an export/import shipment. The certificate contains an abstract of the more important conditions in the policy. See also Certificate of Insurance.

SPECIAL PROTECTION SCHEME = СПЕЦИАЛЬНАЯ ЗАЩИТНАЯ СХЕМА – Special Protection Scheme (SPS):- a load transfer relaying scheme intended to reduce the adverse post-contingency impact on a protected facility.

SPECIAL PURPOSE ENTITY = ЮРИДИЧЕСКОЕ ЛИЦО ДЛЯ ОСОБЫХ ЦЕЛЕЙ – Special Purpose Entity (SPE):- as multinational enterprises mature, they diversify their investments geographically, through adequate organizational structures. These include certain Special Purpose Entities (SPEs) which facilitate financing of investments for the group from sources both internal and external to the multinational enterprises. Additionally, such SPEs also serve other functions such as sale and regional administration including management of foreign exchange risks and other activities aimed at profit maximisation. Special Purpose Entity is a generic label applicable to such organizational structures which are also variously referred to as Financing Subsidiaries, Conduits, Holding Companies, Base Companies and Regional Headquarters. In some instances, multinational enterprises use existing operational companies to perform functions usually associated with SPEs. Since these SPEs are an integral part of the organizational structure of a multinational enterprise, their transactions that arise from direct investment relationships should be reflected in the statistics and, if possible, shown as a sub-component. In some instances, these transactions may give rise to negative direct investment positions. For a more detailed description of the SPEs or of transactions that exhibit the characteristics of functions carried out through these entities. Xxxxx. Special Purpose Entity (SPE) is a generic label covering what, over the years, has had many different names. It includes holding companies, conduits, tax haven corporations, base companies, look-through companies, finance subsidiaries, and regional headquarters. SPEs may be structured in a number of ways, including separate legal entities and branches of legally constituted entities. SPEs formed out of separate legal entities are in most cases wholly owned subsidiaries, and may be directly held by the ultimate parent company or by an intermediate holding company of the multinational enterprise (MNE). Some of these subsidiaries are the financing entities of the MNE. Others are holding companies maintaining investment portfolios, and may be known as Regional Headquarters, investment companies or management companies. SPEs that are financing subsidiaries are principally engaged in raising funds or allocating funds from one unit of an MNE to another. Some of these companies may perform other functions as well. They may co-ordinate sales or perform other managerial functions, although these are not the primary purposes for which they were created. As well, some operating companies act as conduits transferring funds among different entities of the MNE. Here, too, acting as a conduit is typically not a major function of the firm. Rather, such firms are primarily operating companies which also happen to be convenient vehicles for re-channelling funds. However such operations should be distinguished from normal investment activities conducted by these corporations. SPEs are usually located in tax havens. They offer tax advantages for investment financing, and tax

sheltering for income from the provision of services. Tax havens include the Bahamas, Bermuda, Cayman Islands, Channel Islands, Hong Kong, Isle of Man, British Virgin Islands, Liechtenstein, Luxembourg, Netherlands Antilles, Panama and Switzerland. In recent years, SPEs have also been located in some other countries, such as Singapore, Vanuatu, Jamaica, and the Philippines. In addition, some relatively high-tax countries, such as Canada, are locations for SPEs. These locations may be used, among other things, to hide the true source of income or to take advantage of jurisdictions that permit less-than-full disclosure of the total income of MNEs.

SPECIAL RATE = ОСОБАЯ СТАВКА (или СПЕЦИАЛЬНАЯ СТАВКА) – Special Rate is a rate established for a specified commodity for a specific period of time. / Ставка, устанавливаемая для конкретых видов сырья в конкретный период времени.

SPECIAL REPORT = СПЕЦИАЛЬНЫЙ ОТЧЁТ – Special Report is a term applied to auditors' reports issued in connection with various types of financial presentations, including financial statements that are prepared in conformity with a comprehensive basis of accounting other than generally accepted accounting principles; specified elements, accounts or items of a financial statement. Compliance with aspects of contractual agreements or regulatory requirements related to audited financial statements. Financial presentations to comply with contractual agreements or regulatory provisions. Financial information presented in prescribed forms or schedules that require a prescribed form of auditors' reports. / строка баланса (item).

SPECIAL RICE VARIETIES = СПЕЦИАЛЬНЫЕ РАЗНОВИДНОСТИ РИСА – Special Rice Varieties:- essential for socio-religious functions; mostly local or traditional Varieties.

SPECIALTY FIBERS = СПЕЦИФИЧЕСКИЕ ВОЛОКНА – Specialty Fibers are the hair fibers from various breeds of goats and camels. Also included are cow- and horsehair, fur from rabbits, and feathers of the duck, goose, and ostrich.

SPECIATION = ВИДООБРАЗОВАНИЕ – Speciation is a process of differentiation of a single species into one or more distinct species. This can occur through geographic isolation, where the species no longer interbreed and their characteristics slowly change under different environmental pressures. / Под Видообразованием понимается возникновение новых биологических видов и изменение их во времени. Основа видообразования – наследственная изменчивость организмов, ведущий фактор – естественный отбор. Различают Аллопатрическое Видообразование и Симпатрическое Видообразование. Под Аллопатрическим Видообразованием, от Греческих слов Állos, означающее Другой, и Patris, означающее Родина, понимается способ видообразования в процессе эволюции, при котором новые виды организмов ведут начало от родственных групп с неперекрывающимися (изолированными) ареалами. Так, на разных островах из группы Галапагосских возникли различные виды Вьюрков. Под Симпатрическим Видообразованим, от Греческих слов Sýn, означающее Вместе, и Patris, означающее Родина, понимается способ видообразования в процессе эволюции, при котором новые виды организмов происходят от родственных групп с сильно перекрывающимися или совпадающими ареалами, то есть отсутствует географическая изоляция. Симпатрическое видообразование возможно в случаях, когда 2 формы, сосуществуя в пределах общего ареала или его части, не смешиваются.

SPECIE = ВИД – Specie (Sp.) is a distinct sort or kind of tree having some characteristics or qualities in common that distinguishes it from other groups. Sp. – abbreviation for Specie, used as the second part of a binomial name when the Genus is known, but not the Species. See also Class, Division, Family, Genus, Kingdom, Order, Phylum, Tribe, and Type. / Смотрите также Класс (Class), Отдел (Division), Отряд (Phylum), Порядок (Order), Род (Genus), Семейство (Family), Тип (Type), Триба или Колено (Tribe), и Царство (Kingdom). Specie or Sp. – Вид. Species (plural) or Spp. – Виды (Семейство). Под Видом понимается основная структурная и классификационная единица в системе живых организмов. Иными словами, Вид это совокупность популяции особей, способных к скрещиванию с образованием плодовитого потомства, обладающих рядом общих морфо-физиологических признаков, населяющих определённый ареал, обособленных от других нескрещиваемостью в природных условиях. В систематике животных и растений Вид обозначается в соответствии с бинарной номенклатурой, то есть двумя Латинскими словами:- первое, из которых, означает название Рода, а второе – видовой Эпитет (Epithet).

SPECIE = ДРАГОЦЕННОСТЬ – Valuable cargo such as money, precious metal, jewelry, etc. See also Loss Of Specie. Specie is any monetary gold or silver, whether in the form of bullion (bars) or coins. / любое монетарное золото или серебро, .

SPECIES = ВИДЫ – Species is a population of individuals recognizable by morphological characteristics and unified genetic relationship, sometimes capable of subdivision into Subspecies or Varieties which are sufficiently closely related for interbreeding to produce offspring classified within the same Species and with the same morphological characteristics. The combining of Species into commercial groups because of their similarity in appearance and physical properties. Species is the unit of taxonomic classification into which genera are subdivided. A group of similar individuals different from other similar arrays of individuals. The main characteristic is reproductive isolation. See also Class, Division, Family, Genus, Kingdom, Order, Phylum, Specie, and Type. Species is a group of related organisms with common characteristics that are capable of interbreeding. Loblolly and Virginia Pine are examples of two different Tree Species. / являются примерами двух различных Видов деревьев. Смотрите также Вид (Specie), Класс (Class), Отдел (Division), Отряд (Phylum), Порядок (Order), Род (Genus), Семейство (Family), Тип (Type), и Царство (Kingdom). Вид (Specie или Sp.) или Виды (Species или Spp.) – основная структурная единица в системе живых организмов, качественный этап их эволюции. Вследствие этого Вид – основное таксономическое подразделение в систематике животных, растений и микроорганизмов. У половых, перекрёстно оплодотворяющихся организмов, к которым относятся почти все животные, значительная часть растений и ряд микроорганизмов, Вид – совокупность популяций особей, способных к скрещиванию с образованием плодовитого потомства и вследствие этого дающих переходные гибридные популяции между местными формами, населяющих определённый ареал (территорию, акваторию), обладающих рядом общих морфо-физиологических признаков и типов взаимоотношений с абиотичной (косной) и биотичной (живой) средой, отделённых от других таких же групп особей практически полной нескрещиваемостью в природных условиях. Накопление в конце XVII века сведений о многообразии форм животных и растений привело к представлению о Видах как о вполне реальных группах особей, похожих друг на друга примерно так же, как походят друг на друга члены одной семьи, и отличимых от других таких же групп особей. Видами считались, например,Волк, Лисица, Ворона, Галка, Дуб, Берёза, Пшеница, Овёс и тому подобное. Возрастающее число описываемых Видов потребовало стандартизации их названий и построения иерархической системы Видов и более крупных систематических единиц. Основополагающая работа в этом направлении была проведена Шведским естествоиспытателем и медиком Каль фон Линиэ (Carl von Linné; 1707-Май-23–1778-Январь-10), заложившим основы современной систематики животных и растений в своём труде 'Система Природы' (1735). Объединив близкие Виды в Роды, а сходные Роды в Отряды и Классы, Линней ввёл для обозначения Вида двойную Латинскую номенклатуру (так называемую Бинарную Номенклатуру):- каждый Вид обозначался названием Рода и следовавшим за ним видовым названием. К концу XVIII века Система Линнея была принята большинством биологов во всём мире. В 1-й половине XIX века Французский учёный Жо Леопольд Николя Фредерик Кювье (Jean Léopold Nicolas Frédéric Cuvier, известный как Жорж Кювье (Georges Cuvier); 1769-Август-23–1832-Май-13) разработал понятие Типов строения, после чего Тип как высший таксон, то есть высшая систематическая категория, был введён в Линнеевскую систему. В то же время стали складываться представления об

изменении Вида в процессе развития живой природы, завершившиеся появлением эволюционной теории Английского натуралиста и путешественника Чалза Робёта Дарвина (Charles Robert Darwin; 1809-Февраль-12–1882-Апрель-19) (смотрите Дарвинизм), которая показала необходимость при построении естественной филогенетической системы исходить из преемственной генетической связи между формами живых организмов. К концу XIX века накопился большой материал по внутривидовой географической изменчивости и было введено понятие Подвидов. Накопление числа описанных Видов и Подвидов животных, растений и микроорганизмов (к середине XX века оно превысило 2 миллиона) привело, с одной стороны, к 'дроблению' Видов и описанию любых локальных форм в качестве Вида, с другой стороны, – стали 'укрупнять' Виды, описывая в качестве Видов группы или ряды географических рас (Подвидов), образующих совокупность явно родственных и обычно связанных друг с другом переходами форм. В результате в систематике появились понятия 'мелких' Видов – Жорданонов (по имени Французского ботаника Клёдэ Тома Алекси Жордо (Claude Thomas Alexis Jordan; 1814-Октябрь-29–1897-Февраль-07)), 'больших' Видов – Линнеонов (по имени Линнея), а среди последних стали различать монотипические и политипические Виды (последние состоят из ряда Подвидов). Классический период в развитии систематики завершила работа Русского натуралиста Андрея Петровича Семёнова-Тян-Шанского (1866-Июнь-21–1942-Март-08), принявшего за основу Линнеон и давшего определения различных подвидовых категорий (Подвид, Морфа, Аберрация). В 1930-е, когда был осуществлен синтез достижений современной генетики с эволюционным учением, стало развиваться учение о микроэволюции как совокупности пусковых механизмов эволюции и видообразования. Это привело к пересмотру основных определений и концепций в систематике низших таксонов (Американский учёный Русского происхождения Феодосий Григорьевич Добржанский (1900-Январь-24–1975-Декабрь-18), Британский эволюционный биолог Асо Дьжеймз Кейн (Arthur James Cain; 1921-Июль-25–1999-Август-20), Американский биолог Немецкого происхождения Эрнст Вальта Майа (Ernst Walter Mayr; 1904-Июль-05–2005-Февраль-03)). В современном определении понятия Вида существеннейшее значение имеет практически полная репродуктивная изоляция в природных условиях (некоторые в природе абсолютно изолированные Виды в искусственных условиях могут эффективно скрещиваться с другими Видами). Нескрещиваемость в природных условиях обычно приходится оценивать, изучая музейный материал из различных частей ареалов интересующих форм и устанавливая наличие или отсутствие гибридов, переходных форм и переходных зон в местах контакта этих ареалов. По территориальным взаимоотношениям Виды могут быть аллопатрическими, то есть занимающими разные неперекрывающиеся ареалы, или симпатрическими, у которых ареалы в большей или меньшей степени перекрываются или даже совпадают. Алло- или симпатричность Видов в большинстве случаев связаны с условиями их возникновения и с тем, какая форма изоляции – территориальная или биологическая – играла основную роль при образовании данного Вид. При детальном изучении почти все Виды оказываются политипическими; степень их политипии обычно возрастает с увеличением ареала, а также зависит от разнообразия физико-географических условий в отдельных его частях. Особый интерес представляют так называемые Виды-Близнецы, морфологически трудно различимые и обычно встречающиеся в смежных перекрывающихся ареалах; такие Виды, по-видимому, происходят в результате первичного возникновения одной из форм биологической изоляции. Принципиальные трудности возникают при установлении понятия Вида у облигатно агамных (бесполых), партеногенетических (смотрите Партеногенез) и самооплодотворяющихся форм. В этих случаях Видом можно условно назвать группы сходных клонов или линий, обладающих большим морфо-физиологическим сходством, занимающих определённый ареал и находящихся в сходных взаимоотношениях со средой обитания. Особенно трудно сравнивать и гомологизировать современные Виды с ископаемыми. В палеонтологии на первое место выступают смена форм и изменение Вида во времени в последовательных отложениях. Сравнение же одновременно существовавших форм в пространстве, как это делается для ныне живущих организмов, то есть в неонтологии, в палеонтологии затруднено неполнотой ископаемого материала. В связи с этим для обозначения понятия, эквивалентного Вида в палеонтологии, Советским зоологом Владимиром Георгиевичем Гептнером (1901-Июнь-22 – 1975-Июль-05; обрусевшим Немцем) (1958) предложен термин Фратрия. Под Видом понимается основная структурная и классификационная единица в системе живых организмов. Иными словами, Вид это совокупность популяции особей, способных к скрещиванию с образованием плодовитого потомства, обладающих рядом общих морфо-физиологических признаков, населяющих определённый ареал, обособленных от других нескрещиваемостью в природных условиях. В систематике животных и растений Вид обозначается в соответствии с бинарной номенклатурой, то есть двумя Латинскими словами:- первое, из которых, означает название Рода, а второе – видовой Эпитет (Epithet). Семейство, таксономическая категория (ранг) в биологической систематике. В Семейства (иногда сначала в Подсемейства) объединяют близкие Роды. Например, Семейства Беличьих включают роды:- Белки, Суслики, Сурки и другие. Семейства Сосновых образуют роды:- Ель, Пихта, Сосна и другие. В одних Семействах до 1 000 Родов, в других – немного или только 1 Род. Близкие Семейства объединяют в Отряд (в систематике животных) или в Порядок (в систематике растений), иногда сначала в Надсемейства. В биологической систематике под Родом понимается основная таксономическая категория (ранг). Род объединяет близкие по происхождению Виды. Например, разные Виды Кошек (Бенгальская, Дикая, Камышовая и другие) составляют Род Кошек; Виды Сосен (Обыкновенная, Сибирская и другие) – Род Сосен. Близкие Роды объединяют в Семейство.

SPECIES COMPOSITION = ВИДОВОЙ СОСТАВ (или СОСТАВ ВИДОВ) – Species Composition is the number of Species within a community of Plants.

SPECIES SHIFT = ВИДОВЫЙ СДВИГ (или СДВИГ ВИДОВ) – Species Shift is the selection and increase of naturally tolerant Weed Species.

SPECIFIC = ВИДОВОЕ (или СПЕЦИФИЧЕСКОЕ) – Specific:- pertaining to a Species. / Видовое:- относящееся к Видам.

SPECIFICATIONS = СПЕЦИФИКАЦИИ – (1) A Specification (often abbreviated as Spec) is an explicit set of requirements to be satisfied by a material, design, product, or service. Should a material, product, or service fail to meet one or more of the applicable specifications, it may be referred to as being out of specification; the abbreviation OOS may also be used. In casual usage, underspec or overspec are used when something is worse or better than specified (compare overengineering), though in general (such as for sizes) there is only a notion of 'in spec' or 'out of spec', not 'better' or 'worse'. A specification is a type of technical standard. A technical specification may be developed by any of various kinds of organizations, both public and private. Example organization types include a corporation, a consortium (a small group of corporations), a trade association (an industry-wide group of corporations), a national government (including its military, regulatory agencies, and national laboratories and institutes), a professional association (society), a purpose-made standards organization such as ISO, or vendor-neutral developed generic requirements (Telcordia Technologies). It is common for one organization to refer to (reference, call out, cite) the standards of another. Voluntary standards may become mandatory if adopted by a government or business contract. A Design or Product Specification describes the features of the solutions for the Requirement Specification. Sometimes the term specification is here used in connection with a data sheet (or spec sheet). This may be confusing. A data sheet describes the technical characteristics of an item or product as designed and/or produced. It can be published by a manufacturer to help people choose products or to help use the products. A data sheet is not a technical specification

as described in this article. Specifications are the contract terms specified by the exchange. Term referring to the properties of a given commodity product, which are 'specified' since they often vary widely even within the same grade of product. In the normal process of negotiation, seller will guarantee buyer that the product to be sold will meet certain specified limits. Specification or Spec is an exact statement of the particular needs to be satisfied, or essential characteristics that a customer requires (in a good, material, method, process, service, system, or work) and which a vendor must deliver. Specifications are written usually in a manner that enables both parties (and/or an independent certifier) to measure the degree of conformance. They are, however, not the same as control limits (which allow fluctuations within a range), and conformance to them does not necessarily mean quality (which is a predictable degree of dependability and uniformity). Specifications are divided generally into two main categories:- (i) Performance specifications:- conform to known customer requirements such as keeping a room's temperature within a specified range. (ii) Technical specifications:- express the level of performance of the individual units, and are subdivided into (a) individual unit specifications which state boundaries (parameters) of the unit's performance consisting of a nominal (desired or mandated) value and tolerance (allowable departure from the nominal value, (b) acceptable quality level which states limits that are to be satisfied by most of the units, but a certain percentage of the units is allowed to exceed those limits, and (c) distribution specifications which define an acceptable statistical distribution (in terms of mean deviation and standard Deviation) for each unit, and are used by a producer to monitor its production processes. See also Standard. / Под Спецификациями понимается перечисление подробностей, на которые необходимо обратить особое внимание. Под Спецификацией, от средневекового Латинского слова Specificatio, от Латинских слов Species, означающее Вид или Разновидность или Род или Семейство, и Facio, означающее Делаю, понимается:- (i) перечисление подробностей, на которые необходимо обратить особое внимание; или (ii) выполненный в форме таблицы документ, определяющий состав какого-либо изделия. Содержит обозначения составных частей и элементов, их наименования, материал, из которого они изготовляются, масса, число и другие данные. В комплекте технической конструкторской документации спецификация – основной документ, используемый для комплектования изделий, при планировании производства, разработке чертежей, изготовлении деталей, узлов, машин, продуктов и тому подобного. Спецификация (или технические условия) – документ, устанавливающий требования, которым должны удовлетворять продукция, процесс или услуга. Примечания:- (i) На практике желательно, чтобы требования были заданы вместе с предельными значениями показателей в соответствующих единицах физических величин. (ii) Требования относятся непосредственно к желаемому показателю или показателям качества, а не к тому, соответствует ли выборка требуемым критериям приёмки партии для плана контроля. Партию можно принять, поскольку она соответствует критериям приёмки, но некоторые отдельные единицы могут, тем не менее, не соответствовать техническим условиям.

(2) In patent law, a Specification is a written description of the invention and the manner and process of making and using the same.

SPECIFIC BORROWING = СПЕЦИФИЧЕСКОЕ ЗАИМСТВОВАНИЕ – A Specific Borrowing is funds borrowed specifically for the acquisition or construction of a fixed asset. See also Borrowing Costs.

SPECIFIC COMBINING ABILITY = СПЕЦИФИЧЕСКАЯ КОМБИНАЦИОННАЯ СПОСОБНОСТЬ – Specific Combining Ability:- deviation in the performance of a cross from the performance predicted on the basis of general combining ability of its parents.

SPECIFIC DUTY = СПЕЦИФИЧЕСКАЯ ПОШЛИНА – Specific Duty is a tax imposed on imported merchandise without regard to value. Usually based on the net weight or number of pieces, etc. / Специфическая Пошлина – налог, налагаемый на привозимую (или импортируемую) продукцию, не привязанный с её стоимости. Как правило, он базируется на нетто весе или количестве штук и тому подобном.

SPECIFIC GRAVITY = УДЕЛЬНЫЙ ВЕС (или УДЕЛЬНАЯ ТЯЖЕСТЬ) – Specific Gravity is a ratio of the mass of a material to the mass of an equal volume of water at 4 °C. The range for modern fibers is not too great and is dependent to some extent on the liquid used as an immersant in measurements, because of fiber swelling and of possible absorption of liquid into fiber voids. See also Density, and Gravity. Specific Gravity is the density of a fiber relative to that of water at 4° centigrade. Specific Gravity is the ratio of the density of a substance to the density of another substance (usually water at 4 °C) taken as a standard when both densities are obtained by weighing in air. Specific Gravity (liquid) is the ratio of the weight of a given volume of liquid to the weight of an equal volume of water. Specific Gravity is the ratio of the density of a substance at 60 degrees Farenheit (15.6 °C) to the density of water at the same temperature. See also Gravity. / Отношение плотности вещества при 60 градусах по Фаренгейту (15.6 °C) к плотности воды при той же самой температуре. Удельный Вес γ – отношение веса тела P к его объёму V, то есть величина $\gamma = P / V$. Удельный вес может быть определён также по формуле ($\gamma = \rho g$, где ρ – плотность вещества, g – ускорение свободного падения. В отличие от плотности удельный вес не является физико-химической характеристикой вещества, так как зависит от значения g в месте измерений. В качестве единиц удельного веса применяются:- Ньютон на кубический метр ($Н/м^3$) (в Международной Системе Единиц СИ), $дин/см^3$ (в СГС Системе Единиц), килограмм силы на кубический метр ($кгс/м^3$) (в МКГСС Системе Единиц). 1 $Н/м^3$ = 0.1 $дин/см^3$ = 0.102 $кгс/м^3$. Плотность (ρ), масса единичного объёма вещества. Величина обратная удельному объёму. Отношение плотности двух веществ называют относительной плотностью. Обычно плотность веществ определяют относительно плотности дистиллированной воды. Плотность – одна из основных физических характеристик вещества, равная отношению массы dm малого элемента вещества объёмом dV к этому объёму:- $\rho = dm / dV$. Единица плотности в Международной Системе Единиц СИ – $кг/м^3$.

SPECIFICITY = СПЕЦИФИЧНОСТЬ – Specificity is a measure of the host range of a biological control agent on a scale ranging from an extreme specialist only able to complete development on a single species or strain of its host (monophagous) to a generalist with many hosts ranging over several groups of organisms (polyphagous). / Под Специфичностью, от Латинского слова Specificus, означающее Особенный или Особый, понимается .

SPECIFIC LEAF AREA = УДЕЛЬНАЯ ПЛОЩАДЬ ЛИСТА – Specific Leaf Area is a leaf area per unit dry weight (cm^2/g).

SPECIFIC LEAF WEIGHT = УДЕЛЬНЫЙ ВЕС ЛИСТА – Specific Leaf Weight is a weight per unit leaf area (g/cm^2).

SPECIFIC PERFORMANCE = СПЕЦИФИЧЕСКОЕ ИСПОЛНЕНИЕ (или СПЕЦИФИЧЕСКАЯ РЕЗУЛЬТАТИВНОСТЬ) – Specific Performance:- the remedy sought by a plaintiff who, instead of damages for a breach of contract, seeks the enforcement of the terms of the contract.

SPECIFIC RESISTANCE = СПЕЦИФИЧЕСКАЯ УСТОЙЧИВОСТЬ (или УДЕЛЬНОЕ СОПРОТИВЛЕНИЕ) – (1) Specific Resistance:- the electrical resistance offered by a homogeneous unit cube of material to the flow of a direct current of uniform density between opposite faces of the cube. Also called Specific Resistance, it is an intrinsic, bulk (not thin-film) property of a material. Resistivity is usually determined by calculation from the measurement of electrical resistance of samples having a known length and uniform cross section according to the following equation, where ρ (the Greek letter 'rho' (ρ), which looks similar to a lower-case letter 'p') is the resistivity, R the measured resistance, A the cross-sectional area, and l the length. In the MKS system (SI), the unit of resistivity is the Ohm-meter. Therefore, in the equation below, resistance is expressed in Ohms, and the sample dimensions in meters.

ρ = R x A / l. The room-temperature resistivity of pure metals extends from approximately $1.5 \cdot 10^{-8}$ Ohm-meter for silver, the best conductor, to $135 \cdot 10^{-8}$ Ohm-meter for manganese, the poorest pure metallic conductor. Most metallic alloys also fall within the same range. Insulators have resistivities within the approximate range of 10^{8} to 10^{16} Ohm-meters. The resistivity of semiconductor materials, such as silicon and germanium, depends not only on the basic material but to a considerable extent on the type and amount of impurities in the base material. Large variations result from small changes in composition, particularly at very low concentrations of impurities. Values typically range from 10^{-4} to 10^{5} Ohm-meters. The temperature coefficients (changes with temperature) of resistivity of pure metallic conductors are positive. Resistivity increases by about 0.4% / K at room temperature and is nearly proportional to the absolute temperature over wide temperature ranges. As the temperature is decreased toward absolute zero, resistivity decreases to a very low residual value for some metals. The resistivity of other metals abruptly changes to zero at some temperature above absolute zero, and they become superconductors. Metals, and some semiconductors in particular, exhibit a change in resistivity when placed in a magnetic field. Theoretical relations to explain the observed phenomena have not been well developed.

(2) Specific Resistance (genotypes):- xxxxx. See also Vertical Resistance. Resistance to disease varies among plants; it may be either total (a plant is immune to a specific pathogen) or partial (a plant is tolerant to a pathogen, suffering minimal injury). The two broad categories of resistance to plant diseases are Vertical (Specific) and Horizontal (Nonspecific). A plant variety that exhibits a high degree of resistance to a single race, or strain, of a pathogen is said to be vertically resistant; this ability usually is controlled by one or a few plant genes. Horizontal resistance, on the other hand, protects plant varieties against several strains of a pathogen, although the protection is not as complete. Horizontal resistance is more common and involves many genes.

SPECIFIC RISK = СПЕЦИФИЧЕСКИЙ РИСК – Specific Risk, also known as Non-Systematic Risk, represents the price variability of a security that is due to factors unique to that security, as opposed to that portion that is due to systematic risk, the generalized price variability of the related interest rate or equity market. As an example, a US Treasury note would have no specific risk, as it deemed to have no risk other than movement in interest rates, while a corporate bond would have a degree of default risk as well as more generalized yield curve risk. Specific risk is also the term used by both the European Union's Capital Adequacy Directive and the Basel Capital Accord to refer to the risks unique to individual holdings that are not covered by capital dedicated to generalized market risk. Specific risks are considered to be only partially diversifiable, and capital dedicated to them is added to generalized market risk capital.

SPECIFIC RISK/ALPHA RISK = СПЕЦИФИЧЕСКИЙ РИСК/АЛЬФА РИСК – Specific Risk/Alpha Risk is the risk of holding a share which is unique to the industry or company and can be eliminated by having a suitably diversified portfolio of shares of differing types of companies. This is sometimes also referred to as Unsystematic Risk.

SPECIFIC TARIFF = СПЕЦИФИЧЕСКИЙ ТАРИФ – Specific Tariff is a tariff expressed as a fixed amount per unit.

SPECIFIC WEIGHT = УДЕЛЬНЫЙ ВЕС – Specific Weight is the weight of an object in relation to its volume. Commonly expressed as lb/ft^3. Thin, shrivelled grain will not mill to produce adequate amounts of clean, white flour. The specific weight test measures the weight of grain – in kilogrammes – that can be packed into a cylinder of fixed volume, normally 1 liter. / Удельный Вес – вес объекта в отношении к его объёму. Обычно выражается в фунтах на кубический фут (lb/ft^3). Под Удельным Весом понимается вес единицы объёма вещества. В отличие от плотности, удельный вес не является физико-химической характеристикой вещества, так как зависит от места измерения. Удельный Вес – величина γ, равная отношению силы тяжести dP малого элемента тела объёмом dV к этому объёму:- γ = dP / dV. Удельный вес связан с плотностью вещества ρ соотношением:- γ = ρg, g – ускорение свободного падения. Единица удельного веса в Международной Системе Единиц СИ – Ньютон на кубический метр ($Н/м^3$).

SPECIMEN = ОБРАЗЕЦ – (1) In the US patent law, a Specimen is a real-world example of how the mark is actually used on goods or in the offer of services. Labels, tags, or containers for goods are considered to be acceptable specimens of use for a trademark. For a service mark, specimens may be advertising such as magazine advertisements or brochures. Actual specimens, rather than facsimiles, are preferred. However, if the actual specimens are bulky, or larger than 8½" x 11", then the applicant must submit facsimiles, (e.g., photographs or good photocopies) of the specimens. Facsimiles may not exceed 8½" x 11". One specimen is required for each class of goods or services specified in the trademark application. Specimens are required in applications based on actual use in commerce, Section 1(a), 15 USC §1051(a), and must be filed with the Amendment to Allege Use, 15 USC §1051(c), or the Statement of Use, 15 USC §1051(d), in applications based on a bona fide intention to use the mark in commerce, Section 1(b), 15 USC §1051(b). Specimens are not required for applications based on a foreign application or registration under Section 44 of the Trademark Act, 15 USC §1126, or for applications based on an extension of protection of an international registration to the United States under Section 66(a) of the Trademark Act, 15 USC §1141f. / заслуживающий доверия или действительный (bona fide).

(2) Specimen is the sample and reference material. See also Test Specimen.

(3) Sample copy of a share certificate to be introduced. It lacks certain details such as the serial numbers and/or signature. / Предоставленный образец экземпляра сертификата на акции. Ему не достаёт отдельных деталей или сведений, таких как серийные номера и/или подпись.

SPECK = КРАПИНКА (или МУШКА) – (1) Speck is:- (i) a contaminant in polymer such as gels, metal, or dirt that shows up as a dark spot; and/or (ii) a small particle of foreign substance that has not been removed from the stock before spinning. / как тёмное пятно; и/или .

(2) Specks:- in woolen fabrics, small pieces of undyed vegetable matter which can be removed by carbonizing or can be covered by dyeing or inking. Compare Trash. / Под Мушковатостью понимается распространённый порок в виде наличия на поверхности полотна небольших комочков перепутанных волокон, прочно удерживающихся на её поверхности.

SPECKING = XX – Specking is the removal of burrs, knots, and other objects that impair the finished appearance of woolens and worsteds.

SPECKY = КРАПЧАТОЕ (или ПЁСТРОЕ) – Specky is a term used to describe dyed woolen fabric with specks of undyed vegetable matter on the face. The specks can be removed by carbonizing or covered by speck dyeing.

SPECTRA® = СПЭКТРА® – Spectra® fiber is one of the strongest and lighest fibers available. A bright white polyethylene, it is 15 times stronger than steel, more durable than polyester and has a specific strength that is 40% greater than aramid fiber. With outstanding toughness and extraordinary visco-elastic properties, Spectra® fiber can withstand high load strain rate velocities. Properties of Spectra® Fiber:- (i) one of the highest strength to weight ratios of any manmade fiber; (ii) oustanding toughness and visco-elasti properties; (iii) light enough to float; (iv) high resistance to chemicals, water and ultraviolet light; (v) excellent vibration damping, flex fatigue and internal fiber friction characteristics; (vi) low elongation; (vii) high resistance to abrasion; (viii) resists corrosion; and (ix) low dielectric constant. Applications:- (i) Industrial Rope and Cordage; (ii) Lifting Slings; (iii) Safety and Rescue Ropes; and (iv) Ropes for extreme sport climbing. Spectra®:- highly oriented polyethylene fibers produced by AlliedSignal, Inc. (Morristown, NJ, the USA; now

Honeywell International, Inc). Spectra® is an ultra-high-molecular-weight polyethylene (UHMWPE) made by Honeywell International, Inc. (Morristown, State of New Jersey, the United States of America), which offers superior UV resistance (on par with PET), very high initial modulus numbers (second only to high modulus Carbon Fiber), superior breaking strength, and high flex strength. However, it also exhibits permanent and continuous elongation under a sustained load (AKA:- Creep). This results in a change in shape as the sail ages. Because of this Spectra® is only used in spinnakers on high performance boats where the sails are replaced regularly. / Спэктра® (Spectra®). Хонивэл Интёнэшэнэл, Инк. (Honeywell International, Inc.).

SPECTRAL = СПЕКТРАЛЬНОЕ – Spectral:- for radiometric quantities, pertaining to monochromatic radiation at a specified wavelength or, by extension, to radiation within a narrow wavelength band about a specified wavelength.

SPECTRAL CHARACTERISTIC = СПЕКТРАЛЬНАЯ ХАРАКТЕРИСТИКА – Spectral Characteristic:- the reflectance, reflectance factor, transmittance, or transmittance factor as a function of wavelength, used to characterize a specimen.

SPECTRAL POWER DISTRIBUTION CURVE = КРИВАЯ РАСПРЕДЕЛЕНИЯ СПЕКТРАЛЬНОЙ ИНТЕНСИВНОСТИ (или МОЩНОСТИ) (или КРИВАЯ СПЕКТРАЛЬНОГО РАСПРЕДЕЛЕНИЯ МОЩНОСТИ) – Spectral Power Distribution Curve:- the intensity of radiant energy as a function of wavelength, generally gives in relative power terms.

SPECTROCOLORIMETER = СПЕКТРОКОЛОРИМЕТР – Spectrocolorimeter:- a spectrophotometer, one component of which is a dispersive element (such as prism, grating, or interference filter or wedge) that is normally capable of producing as output only colorimetric data (such as tristimulus values and derived color coordinates) but not the underlying spectral data from which colorimetric data are derived. / Спектроколориметр – спектрофотометр, предназначенный для измерений координат цвета или координат цветности цветовых стимулов. Спектроколориметр – прибор, предназначенный для измерения координат цветности и цветовой температуры.

SPECTROGONIOPHOTOMETER = СПЕКТРОГОНИОФОТОМЕТР – Spectrogoniophotometer is a goniophotometer having the capability of measuring as a function of wavelength. See the preferred term, Goniospectrophotometer.

SPECTROGRAPH = СПЕКТРОГРАФ – Spectrograph is a spectroscope equipped with a camera or some other device for recording the spectrum. See also Spectroscope. / Спектрографы одновременно регистрируют протяжённые участки спектра, развёрнутого в фокальной плоскости Ф на фотопластинках или фотоплёнках (фотографические спектрографы), а также на экранах передающих телевизионных трубок, электронно-оптических преобразователей с ‘запоминанием’ изображений и тому подобного. При хорошей оптике число каналов ограничивается лишь разрешающей способностью (зернистостью) фотоматериалов или числом строк телевизионной развёртки. В видимой области спектра для визуальных методов спектрального анализа широко используются простые спектроскопы и стилоскопы, в которых приёмником является глаз. Диапазон длин волн, в котором работают спектрографы, простирается от коротковолновой границы оптического диапазона и постепенно расширяется в ИК-область по мере достижения всё более высокой фоточувствительности слоев и развития методов тепловидения. Типы спектрографов отличаются большим разнообразием – от простейших приборов настольного типа для учебных целей и компактных ракетных и спутниковых бортовых приборов для исследования спектров Солнца, звёзд, планет, туманностей до крупных астроспектрографов, работающих в сочетании с телескопами, и лабораторных 10-метровых вакуумных установок с большими плоскими и вогнутыми дифракционными решётками для исследований тонкой структуры спектров атомов. Линейная дисперсия спектрографов (участок фокальной плоскости Dx, занимаемый интервалом длин волн Dl) может лежать в пределах от 10^2 до 10^5 мм/мкм, светосила по освещённости (отношение освещённости в изображении входной щели к яркости источника, освещающего входную щель) – от >> 0.5 в светосильных спектрографах до 10^{-3} и менее в длиннофокусных приборах большой дисперсии. Спектрограф – прибор для регистрации спектра исследуемого объекта. Основные части оптического спектрографа:- (i) щель для выделения узкой полоски изображения; (ii) коллиматор (объектив) для создания параллельных пучков света от каждой точки щели; (iii) призма или дифракционная решётка для разложения пучка света в спектр; и (iv) фотокамера или приёмник излучения для регистрации спектра.

SPECTROGRAPHIC ANALYSIS = СПЕКТРОГРАФИЧЕСКИЙ АНАЛИЗ – Spectrographic Analysis determines the concentration of elements represented in the entrained fluid contaminant.

SPECTROGRAPHIC OIL ANALYSIS PROGRAM = ПРОГРАММА СПЕКТРОГРАФИЧЕСКОГО АНАЛИЗА МАСЛА – Spectrographic Oil Analysis Program (SOAP):- procedures for extracting fluid samples from operating systems and analyzing them spectrographically for the presence of key elements.

SPECTROMETER = СПЕКТРОМЕТР – Spectrometer is an instrument for measuring a specified property as a function of a spectral variable. In optical radiation measurements, the spectral variable is wavelength or wavenumber and the measured property is (or is related to) absorbed, emitted, reflected, or transmitted radiant power. Spectrometer is an instrument for identifying and comparing materials by the dispersing of light and the study of the spectra formed. / Под Спектрометром, от Латинского слова Spectrum, означающее Образ или Представление, и Греческого слова Métron, означающее Мера, от Metréo, означающее Измеряю, в широком смысле понимается устройство для измерений функции распределения некоторой физической величины f по параметру x. Функция f(x) может определять распределение электронов по скоростям (бета-спектрометр), атомов по массам (масс-спектрометр), гамма-квантов по энергиям (гамма-спектрометр), энергии световых потоков по длинам волн l (оптический спектрометр) и тому подобного. В узком смысле спектрометрами называют спектральные приборы для измерений оптических спектров f(l) с помощью фотоэлектрических приёмников излучения.

SPECTROPHOTOMETER = СПЕКТРОФОТОМЕТР – Spectrophotometer is a photometric device for the measurement of spectral transmittance, spectral reflectance, or relative spectral emittance. Spectrophotometer is an instrument used to measure the transmission or reflectance of light as a function of wavelength. / Под Спектрофотометром, от Латинского слова Spectrum, означающее Образ или Представление, от Греческого слова Phos, родительный падеж Photós, означающее Свет (часть сложных слов:- (1) соответствующая по значению слову ‘фотографический’; (2) обозначающая:- относящийся к свету, действию света (например, фотосинтез, фотоэлемент), и Греческого слова Métron, означающее Мера, от Metréo, означающее Измеряю, понимается спектральный прибор, который осуществляет фотометрирование – сравнение измеряемого потока с эталонным (референтным) для непрерывного или дискретного ряда длин волн излучения. Спектрофотометр обеспечивает отсчёт или автоматическую регистрацию результатов сравнения в соответствующей двумерной шкале:- абсцисса – длина волны, ордината – результат фотометрирования на этой длине волны. Спектрофотометрами также называют аналитические приборы, которые не измеряют спектров, а определяют концентрации элементов в пробе по линиям абсорбции (или эмиссии) атомов в пламени (атомно-абсорбционные или пламенные спектрофотометры) или определяют концентрации компонент в смесях веществ по характеристическим полосам поглощения (например, двуволновые инфракрасные спектрофотометры или Спектрофотометры-анализаторы). Основные типы спектрофотометров описаны в статье Спектральные Приборы. Спектрофотометр – инструмент для измерения распределения энергии по спектру – количества света, приходящегося на

каждую из длин волн. Может применяться для проведения измерений света, исходящего от источника, либо отражённого от некоторого объекта или пропущенного через объект. Спектрофотометром называют прибор, который служит для исследования излучений электромагнитных волн от различных источников, анализируя при этом длины волн таких излучений, взаимодействующих с какими-либо предметами. Спектрофотометр определяет спектральные параметры источников излучений, что позволяет его применять в фотометрических анализах. Различают спектрофотометры, работающие с различными диапазонами длин волн, которые являются определяющим фактором при их использовании. Принцип действия этих приборов основан на сравнении потока излучений, попадающих на какой-либо предмет, с отражаемым от этого предмета потоком излучений. Также излучения могут поглощаться, либо рассеиваться, что тоже учитывается при проведении исследований. Результаты измерений, которые проводят спектрофотометры, будут зависеть от свойств поверхности предмета, его формы, а также от длин волн потока излучения. Кроме этого, при различных условиях, в которых проводятся исследования, их результаты также будут отличаться. Поэтому во время обследования нужно учитывать направление освещения на предмет, его поляризацию и температуру окружающей среды. Таким образом, спектрофотометр применяется при необходимости измерения концентрации какого-либо раствора, его оптической плотности, а также позволяет проводить кинетические измерения. При этом современные спектрофотометры обладают возможностью выводить результаты исследований в форме отчёта на свой дисплей или монитор персонального компьютера.

SPECTROPHOTOMETRIC CURVE = СПЕКТРОФОТОМЕТРИЧЕСКАЯ КРИВАЯ – Spectrophotometric Curve is the curve measured on a spectrophotometer:- hence a graph of relative reflectance or transmittance (or absorption) as the ordinate, plotted versus wavelength or frequency as the abscissa. In color, usually covering the practical visual range from 400–700 nm.

SPECTROPHOTOMETRY = СПЕКТРОФОТОМЕТРИЯ – Spectrophotometry is the quantitative measurement of reflection or transmission properties as a function of wavelength. / Спектрофотометрия, область измерительной техники, объединяющая спектрометрию, фотометрию и метрологию и занимающаяся разработкой системы методов и приборов для количественных измерений спектральных коэффициентов поглощения, отражения, излучения, спектральной яркости как характеристик сред, покрытий, поверхностей, излучателей. Смотрите также Спектральные Приборы.

SPECTRORADIOMETER = СПЕКТРОРАДИОМЕТР – Spectroradiometer is an instrument used for high-accuracy, automated spectral measurements over the UV to the infrared range. Spectroradiometer is a spectrometer for measuring emitted optical radiant power, normally of a light source. / Под Спектрорадиометром, от Латинских слов Spectrum, означающее Образ или Представление, Radio, означающее Испускаю Лучи, и Греческого слова Métron, означающее Мера, понимается .

SPECTROSCOPE = СПЕКТРОСКОП – Spectroscope is an instrument for forming a spectrum for visual examination.

SPECTROSCOPY = СПЕКТРОСКОПИЯ – Spectroscopy is the technique of splitting light (or more precisely electromagnetic radiation) into its constituent wavelengths (a spectrum), in much the same way as a prism splits light into a rainbow of colors. However, in general, a spectrum is generally more than a simple ‘rainbow’ of colors. The energy levels of electrons in atoms and molecules are quantised, and the absorption and emission of electromagnetic radiation only occurs at specific wavelengths. Consequently, spectra are not smooth but punctuated by ‘lines’ of absorption or emission. Old style spectroscopy was carried out using a prism and photographic plates. These days, modern spectroscopy uses diffraction gratings to disperse the light, which is then projected onto CCDs (Charge Coupled Devices) similar to those used in digital cameras. The 2-dimensional spectra are easily extracted from this digital format and manipulated to produce 1-dimensional spectra like the galaxy spectrum shown below. These 1-dimensional spectra contain an astonishing amount of useful data:- (1) The precise position (wavelength) at which known emission and absorption lines are detected can be used to measure the redshift of the observed object. For example, if the Hβ (486.2 nm) hydrogen line is detected at 487.8 nm, we calculate that the object has a recession velocity of 1 000 km/sec. Apart from measuring distances, this type of analysis can also be used to detect spectroscopic binaries and extrasolar planets. (2) The widths of both the absorption and emission lines can be used to measure the internal velocity dispersion of complex objects (e.g., the average velocity of stars within galaxies). This is achieved through measurement of spectral line broadening from which the velocity broadening can be calculated. (3) Many (indeed most) absorption and emission lines are produced by metals. The depths or heights of these lines can be used to estimate the abundances of the metals responsible. In stars, these also permit the measurement of the temperature and pressure of the stellar atmosphere. In objects such as galaxies, they permit an estimation of age, though the spectra are somewhat susceptible to the age-metallicity degeneracy making this a difficult procedure. (4) Finally, the overall shape of the spectrum contains clues to many other aspects of the observed population including age and interstellar reddening (extinction). The enormous quantities of information contained within a single spectrum makes spectroscopy one of the most powerful tools at an astronomer’s disposal. See also Abundance Ratio. Spectroscopy is the identification of materials by the analysis of their spectra. Spectroscopy, study of the absorption and emission of light and other radiation by matter, as related to the dependence of these processes on the wavelength of the radiation. More recently, the definition has been expanded to include the study of the interactions between particles such as electrons, protons, and ions, as well as their interaction with other particles as a function of their collision energy. Spectroscopic analysis has been crucial in the development of the most fundamental theories in physics, including quantum mechanics, the special and general theories of relativity, and quantum electrodynamics. Spectroscopy, as applied to high-energy collisions, has been a key tool in developing scientific understanding not only of the electromagnetic force but also of the strong and weak nuclear forces. Spectroscopic techniques have been applied in virtually all technical fields of science and technology. Radio-frequency spectroscopy of nuclei in a magnetic field has been employed in a medical technique called Magnetic Resonance Imaging (MRI) to visualize the internal soft tissue of the body with unprecedented resolution. Microwave spectroscopy was used to discover the so-called Three-Degree Blackbody Radiation, the remnant of the big bang (i.e. the primeval explosion) from which the universe is thought to have originated. The internal structure of the proton and neutron and the state of the early universe up to the first thousandth of a second of its existence are being unraveled with spectroscopic techniques using high-energy particle accelerators. The constituents of distant stars, intergalactic molecules, and even the primordial abundance of the elements before the formation of the first stars can be determined by optical, radio, and X-ray spectroscopy. Optical spectroscopy is used routinely to identify the chemical composition of matter and to determine its physical structure. Spectroscopic techniques are extremely sensitive. Single atoms and even different isotopes of the same atom can be detected among 10^{20} or more atoms of a different species. (Isotopes are all atoms of an element that have unequal mass but the same atomic number. Isotopes of the same element are virtually identical chemically.) Trace amounts of pollutants or contaminants are often detected most effectively by spectroscopic techniques. Certain types of microwave, optical, and gamma-ray spectroscopy are capable of measuring infinitesimal frequency shifts in narrow spectroscopic lines. Frequency shifts as small as one part in 10^{15} of the frequency being measured can be observed with ultrahigh resolution laser techniques. Because of this sensitivity, the most accurate physical measurements have been frequency measurements. Spectroscopy now covers a sizable fraction of the electromagnetic spectrum. The table summarizes the electromagnetic spectrum over a frequency range of 16 orders of magnitude. Spectroscopic techniques are not confined to electromagnetic radiation, however. Because the energy E of a photon (a quantum of light) is related to its frequency v by the relation E = hv, where h is Planck’s constant, spectroscopy is actually the measure of the interaction of photons

with matter as a function of the photon energy. In instances where the probe particle is not a photon, spectroscopy refers to the measurement of how the particle interacts with the test particle or material as a function of the energy of the probe particle. An example of particle spectroscopy is a surface analysis technique known as Electron Energy Loss Spectroscopy (EELS) that measures the energy lost when low-energy electrons (typically 5–10 electron Volts) collide with a surface. Occasionally, the colliding electron loses energy by exciting the surface; by measuring the electron's energy loss, vibrational excitations associated with the surface can be measured. On the other end of the energy spectrum, if an electron collides with another particle at exceedingly high energies, a wealth of subatomic particles is produced. Most of what is known in particle physics (the study of subatomic particles) has been gained by analyzing the total particle production or the production of certain particles as a function of the incident energies of electrons and protons. The following sections focus on the methods of electromagnetic spectroscopy, particularly optical spectroscopy. Although most of the other forms of spectroscopy are not covered in detail, they have the same common heritage as optical spectroscopy. Thus, many of the basic principles used in other spectroscopies share many of the general features of optical spectroscopy. / Под Спектроскопией, от Латинского слова Spectrum, означающее Образ или Представление, и Греческого слова Skopeo, означающее Наблюдаю или Рассматриваю или Смотрю, понимается раздел физики, посвящённый изучению спектров электромагнитного излучения. Методами спектроскопии исследуют уровни энергии атомов, молекул и образованных из них макроскопических систем и квантовые переходы между уровнями энергии, что даёт важную информацию о строении и свойствах вещества. Важнейшие области применения спектроскопии – спектральный анализ и астрофизика. Возникновение спектроскопии можно отнести к 1666, когда Английский астроном, физик, математик и теолог Сэр Айзэк Ньютчэн (или Исаак Ньютон; Sir Isaac Newton; 1643–1727) впервые разложил Солнечный свет в спектр. Важнейшие этапы дальнейшего развития спектроскопии – открытие и исследование в начале XIX века линий поглощения в Солнечном спектре (Фраунгоферовых линий), установление связи спектров испускания и поглощения (Немецкий физик Густаф Робат Кирххоф (Gustav Robert Kirchhoff; 1824–1887) и Немецкий химик Робэт Вильхэльм Эбахад Бунзэн (или Роберт Вильгельм Бунзен; Robert Wilhelm Eberhard Bunsen; 1811–1899), в 1859) и возникновение на её основе спектрального анализа. С его помощью впервые удалось определить состав астрономических объектов – Солнца, звёзд, туманностей. Во 2-й половине XIX–начале XX веков спектроскопия продолжала развиваться как эмпирическая наука, был накоплен огромный материал об оптических спектрах атомов и молекул, установлены закономерности в расположении спектральных линий и полос. В 1913 Датский физик Нильс Хэнрик Дэвид Бор (Niels Henrik David Bohr; 1885–1962) объяснил эти закономерности на основе квантовой теории, согласно которой спектры электромагнитного излучения возникают при квантовых переходах между уровнями энергии атомных систем в соответствии с постулатами Бора (смотрите Атомная Физика). В дальнейшем спектроскопия сыграла большую роль в создании квантовой механики и квантовой электродинамики, которые, в свою очередь, стали теоретической базой современной спектроскопии. Деление спектроскопии может быть произведено по различным признакам. По диапазонам длин волн (или частот) электромагнитных волн в спектроскопии выделяют радиоспектроскопию, охватывающую всю область радиоволн; оптическую спектроскопию, изучающую спектры оптические и содержащую инфракрасную спектроскопию, спектроскопию видимого излучения и ультрафиолетовую спектроскопию, Рентгеновскую спектроскопию и гамма-спектроскопию. Специфика каждого из этих разделов спектроскопии основана на особенностях электромагнитных волн соответствующего диапазона и методах их получения и исследования:- в радиоспектроскопии применяются радиотехнические методы, в Рентгеновской – методы получения и исследования Рентгеновских лучей, в гамма-спектроскопии – экспериментальные методы ядерной физики, в оптической спектроскопии – оптические методы в сочетании с методами современной радиоэлектроники. Часто под спектроскопией понимают лишь оптическую спектроскопию. В соответствии с различием конкретных экспериментальных методов выделяют отдельные разделы спектроскопии. В оптической спектроскопии – интерференционную спектроскопию, основанную на использовании интерференции и применении интерферометров, вакуумную спектроскопию, Фурье-спектроскопию, спектроскопию лазерную, основанную на применении лазеров. Одним из разделов ультрафиолетовой и Рентгеновской спектроскопии является фотоэлектронная спектроскопия, основанная на анализе энергий электронов, вырываемых из вещества при поглощении ультрафиолетовых и рентгеновских фотонов. По типам исследуемых систем спектроскопию разделяют на атомную, изучающую атомные спектры, молекулярную, изучающую молекулярные спектры, спектроскопию веществ в конденсированном состоянии (в частности, спектроскопию кристаллов). В соответствии с видами движения в молекуле (электронное, колебательное, вращательное) молекулярную спектроскопию делят на электронную, колебательную и вращательную спектроскопии. Аналогично различают электронную и колебательную спектроскопии кристаллов. В спектроскопии атомов, молекул и кристаллов применяют методы оптической спектроскопии, Рентгеновской спектроскопии и радиоспектроскопии. Особую область исследований представляет ядерная спектроскопия, в которую включают гамма-, альфа- и бета-спектроскопии; из них только гамма-спектроскопия относится к спектроскопии электромагнитного излучения. Под Спектроскопией, от Латинского слова Spectrum, означающее Образ или Представление, и Греческого слова Skopeo, означающее Наблюдаю или Рассматриваю или Смотрю, понимается раздел физики, изучающий спектры электромагнитного излучения. Спектры возникают при переходах между уровнями энергии в атомах, молекулах и образованных из них макроскопических системах. Различают спектры испускания (эмиссионные), поглощения (абсорбционные), отражения, рассеяния и люминесценции, которые изучают соответствующие виды спектроскопии (например, абсорбционная спектроскопия, комбинационного рассеяния спектроскопия, спектральный анализ, спектроскопия отражения). В зависимости от природы объекта исследования выделяют атомную и молекулярную спектроскопию, а также спектроскопию вещества в конденсированном состоянии, включая спектроскопию кристаллов. В соответствии с видами движения в молекуле молекулярную спектроскопию делят на электронную, колебательную и вращательную. Аналогично различают электронную и колебательную спектроскопию кристаллов. По диапазону длин волн (или частот) электромагнитного излучения выделяют радиоспектроскопию, микроволновую спектроскопию, оптическую спектроскопию, рентгеновскую спектроскопию и гамма-спектроскопию. Оптическую спектроскопию на практике иногда отождествляют со спектрофотометрией. В каждом разделе спектроскопии используются свои приборы для получения, регистрации и измерения спектров. В соответствии с различием конкретных экспериментальных методов выделяют специальные разделы спектроскопии, например, Фурье-спектроскопия, лазерная спектроскопия. Систематическое изучение спектров началось во второй половине XIX века. В 1859 Немецкий физик Густаф Робат Кирххоф (Gustav Robert Kirchhoff; 12 Марта 1824, Кёнигсберг – 17 Октября 1887, Берлин) сформулировал принципы спектрального анализа. Датский физик Нильс Хэнрик Дэвид Бор (Niels Henrik David Bohr; 07 Октября 1885, Копенгаген – 18 Ноября 1962, Копенгаген) в 1913 объяснил закономерности в расположении спектральных линий. Изучение спектров атомов послужило основой создания квантовой механики. По спектрам были открыты несколько химических элементов. Методы спектроскопии используют для исследования уровней энергии атомов, молекул и образованных из них макроскопических систем, изучения строения и свойств химических соединений, для проведения качественного и количественного анализа веществ.

SPECTRUM SPATIAL = ПРОСТРАНСТВЕННЫЙ СПЕКТР (или СПЕКТРАЛЬНОЕ ПРОСТРАНСТВО) – Spectrum Spatial arrangement of components of radiant energy in order of their wavelengths, wave number or frequency.

SPECULAR = ЗЕРКАЛЬНОЕ – Specular:- pertaining to flux (light) reflected from the surface of an object, without diffusion, at the specular angle.

SPECULAR GLOSS = ЗЕРКАЛЬНЫЙ ГЛЯНЕЦ (или ЛОСК, или БЛЕСК) – Specular Gloss:- relative luminous fractional reflectance from a surface in the mirror or specular direction. It is sometimes measured at 60° relative to a perfect mirror.

SPECULAR REFLECTANCE = ЗЕРКАЛЬНОЕ ОТРАЖЕНИЕ (или КОЭФФИЦИЕНТ ОТРАЖЕНИЯ, или ОТРАЖАТЕЛЬНАЯ СПОСОБНОСТЬ, или АЛЬБЕДО) – Specular Reflectance is the reflectance of a beam of radiant energy at an angle equal but opposite to the incident angle:- the mirror-like reflectance. The magnitude of the specular reflectance on glossy materials depends on the angle and on the difference in refractive indices between two media at a surface and may be calculated from the Fresnel Law.

SPECULAR REFLECTANCE EXCLUDED = ЗЕРКАЛЬНОЕ ОТРАЖЕНИЕ ИСКЛЮЧЕНО – Specular Reflectance Excluded (SCE):- measurement of reflectance made in such a way that the specular reflectance is excluded from the measurement:- diffuse reflectance. The exclusion may be accomplished by using 0° (perpendicular) incidence on the samples, thereby reflecting the specular component of the reflectance back into the instrument, by use of black absorbers or light traps at the specular angle when the incident angle is not perpendicular, or in directional measurement by measuring at an angle different from the specular angle. Used where surface finish is an important component of a color measurement.

SPECULAR REFLECTANCE INCLUDED = ЗЕРКАЛЬНОЕ ОТРАЖЕНИЕ ВКЛЮЧЕНО – Specular Reflectance Included (SCI):- measurement of the total reflectance from a surface, including the diffuse and specular reflectance (usually in a sphere instrument). Used when the surface finish is not critical to color measurement results.

SPECULAR REFLECTION = ЗЕРКАЛЬНОЕ ОТРАЖЕНИЕ (или ЗЕРКАЛЬНАЯ РЕФЛЕКСИЯ) – Specular Reflection is the reflection without diffusion, in accordance with the laws of optical reflection, as in a mirror. / Под Рефлексией, от Латинского слова Reflexio, означающее Обращение Назад, понимается .

SPECULATION = СПЕКУЛЯЦИЯ – Speculation is the practice of buying or selling stocks, commodities, land or other types of assets hoping to take advantage of an expected rise or fall in price. Originally:- risky transactions made in an attempt to anticipate future events; in other words, buying and selling on the basis of (anticipated) price movements, particularly on securities, commodities and property markets, and in stock market trading. A speculator buys securities hoping for a rapid rise in the market price and that he will be able to resell them at a profit (bull), or sells securities on the assumption that market prices will continue to fall, enabling him to buy them back cheaply (bear). Buying and reselling of commodities, securities or currency to derive profits from fluctuations in their prices. See also Buy-Up, Corner, and Currency Speculation. In finance, it is the practice of making investments or going into a business that involves risk. In certain markets, such as commodities and financial futures, speculation is clearly distinguished from transactions undertaken in the normal course of trading (physical buying or selling) or hedging (where the specific purpose is to minimize overall gains and losses arising from price movements). The employment of funds by a speculator. Safety of principal is a secondary factor. See also Investment. Assumption of risk in anticipation of a gain from a future change in the market but recognizing a higher-than-average possibility of loss. Specifically, speculation means high risk taking in transactions offering more than average profit or gain potential. Speculation is the attempt to anticipate commodity price changes and to profit through the purchase or sale of either the commodity futures contract or the physical commodity. / от флуктуаций (колебаний) в их ценах. Под Спекуляцией, от позднелатинского слова Speculatio, означающее Высматривание, понимается скупка и перепродажа товаров или иных предметов с целью наживы.

SPECULATION PERIOD = СПЕКУЛЯЦИОННЫЙ ПЕРИОД (или ПЕРИОД СПЕКУЛЯЦИИ) – Speculation Period is a period during which gains from the private sale of securities are taxable. In Germany, the speculation period for securities is 12 months. Capital gains arising from the purchase and sale of securities during this period are subject to income tax. Gains are offset against losses made in the corresponding year. A total net gain of less than EUR512.00 per calendar year is tax-exempt. If the tax exemption limit is exceeded, all gains made within the speculative gain is taxable.

SPECULATIVE BUBBLE = СПЕКУЛЯТИВНЫЙ ПУЗЫРЬ – Speculative Bubble is a rapid run-up in prices caused by excessive buying that is unrelated to any of the basic, underlying factors affecting the supply or demand for a commodity or other asset. Speculative bubbles are usually associated with a ‘bandwagon’ effect in which speculators rush to buy the commodity (in the case of futures, ‘to take positions’) before the price trend ends, and an even greater rush to sell the commodity (unwind positions) when prices reverse.

SPECULATIVE LIMIT = ЛИМИТ ПО СПЕКУЛЯЦИЯМ – Speculative Limit:- to protect futures markets from excessive speculation that can cause unreasonable or unwarranted price fluctuations, the Commodity Exchange Act (CEA) authorizes the Commission to impose limits on the size of speculative positions in futures markets. Core Principle 5, of Section 5(d) of the CEA, requires designated contract markets to adopt speculative position limits or position accountability for speculators, where necessary and appropriate, to reduce the potential threat of market manipulation or congestion, especially during trading in the delivery month. There are three basic elements to the regulatory framework for speculative position limits. They are:- (i) the size (or levels) of the limits themselves; (ii) the exemptions from the limits (for example, hedged positions); and (iii) the policy on aggregating accounts for purposes of applying the limits. See also Speculative Position Limit. Speculative Limit is the maximum position, either net long or net short, in one commodity future (or option) or in all futures (or options) of one commodity combined which may be held or controlled by one person as prescribed by an exchange and/or by the US Commodity Futures Trading Commission (CFTC).

SPECULATIVE LONG = СПЕКУЛЯТИВНЫЙ ПОКУПАТЕЛЬ – Speculative Long is a trader who has bought a forward or futures in the expectation of closing it out at a higher price. / Торговец, купивший форвард или фьючерс в ожидании избавиться от него по более высокой цене.

SPECULATIVE POSITION LIMIT = ЛИМИТ ПО СПЕКУЛЯТИВНЫМ ПОЗИЦИЯМ – The maximum position, either net long or net short, in one commodity futures or options, or in all futures or options of one commodity combined, which may be held or controlled by one person (other than a person eligible for a hedge exemption) as prescribed by an exchange and/or by the US Commodity Futures Trading Commission.

SPECULATIVE SHORT = СПЕКУЛЯТИВНЫЙ ПРОДАВЕЦ – Speculative Short is a trader who has sold a forward or futures in the expectation of buying it back at a lower price. / Торговец, продавший форвард или фьючерс в ожидании его выкупа по более низкой цене.

SPECULATOR = СПЕКУЛЯНТ – Speculator is a trader who assumes the price risk that hedges seek to avoid with a goal of receiving a profit resulting from price movements in the futures or options markets. Speculators provide liquidity and have the equity to absorb changes in price levels. Large quantities of risk capital are attracted to one location. Speculators help minimize price fluctuations by

increasing the number of bids and offers in the market-place. A publicly known value for a commodity is created and an alternative market is provided. In commodity futures, an individual who does not hedge, but who trades with the objective of achieving profits through the successful anticipation of price movements. Speculator is a market participant who hopes and tries to profit from buying and selling assets by anticipating asset price movements. Speculators assume market price risk and add liquidity and capital to the futures markets. A trader that enters the market looking for capital appreciation by assuming price risk. Not a hedger. Commodity Speculators are market participants that trade commodities with higher than average risk with the expectation of making higher than average profits. Commodity speculators try to forecast price changes and they base their futures positions on those forecasts. Speculators assume high risks, due to high price volatility in commodity markets, that hedgers try to avoid. If their forecasts are correct, speculators will obtain high profits from their positions. If their are not, their losses will be equally high. A person who attempts to anticipate price changes and through market activities makes profits. Speculator is a nonhedging trader, one who assumes risk positions with the hope of making a profit rather than hedging future cash purchases or sales. Speculator is a person who uses the futures or options market to make a profi t while risking a loss. Speculative trades are not coordinated with cash market transactions. / флуктуации (колебания) цены. Лицо, которое пытается получать прибыли от предчувствия изменения цен и ситуации на рынке. Спекулянт – нехэдьжирующий торговец, который занимает рисковые позиции в надежде на получение прибыли, но не от хэдьжирования предстоящих приобретений или продаж наличного сырья или товаров.

SPENCER = СПЭНСЁ (или ХХ) – Spencer is a short waist-length jacket. / короткий жакет до пояса.

SPENT BILL = РАСХОДНЫЙ КОНОСАМЕНТ – Spent Bill is a bill of lading that has been discharged by virtue of a qualitatively complete delivery by the carrier, to the person entitled to it, of the cargo that it covers and thus has ceased to be transferable. However, a bill of lading that is spent prior to its transfer can still operate to transfer rights against a carrier, under the Carriage of Goods by Sea Act 1992, section 2(2), provided that the transfer occurs by virtue of a transaction effected pursuant to arrangements made before the bill of lading became spent or as a result of its rejection to the transferee, also pursuant to arrangements made before the bill of lading became spent, by another person.

SPEQ = SPECIALIST PERFORMANCE EVALUATION QUESTIONNAIRE

SPF = SUN PROTECTION FACTOR

SPGT = SISTEMA DE PAGAMENTOS DE GRANDES TRANSACÇÕES

SPHAGNUM = СФАГНУМ – Sphagnum is any moss of the genus Sphagnum, sometimes used as a growing medium for, e.g., epiphytes. / Под Сфагнумом понимается единственный род листостебельных сфагновых мхов. Стебель прямостоячий с пучковидно расположенными ветвями. 320 видов; в бывшем СССР 42 вида. Растут на болотах плотными дернинами; из нижних отмерших частей образуется торф. Обладают бактерицидными свойствами. Сфагнум мягкий – в Красной Книге бывшего СССР.

SPHEROID = СФЕРОИД – Spheroid:- spherical with slightly flattened ends. / Под Сфероидом, от Греческих слов Sphâira, означающее Шар, и Éidos, означающее Вид, понимается сжатый эллипсоид вращения.

SPHERULITE = СФЕРОЛИТ – Spherulite is a common form of polymer crystallization from melts or concentrated solutions. These crystallites show a radial symmetry from a central point and have a distinctive maltese cross pattern of birefringence under the polarizing microscope. / Сферолит:- это жидко-керамическое покрытие, имеющее тепло- и гидроизоляционные свойства. Основа – микрокерамический наполнитель, интегрированный в смесь акриловых сополимеров. Используется как противогрибковое, антикоррозийное, теплозащитное покрытие для стен фасадов, коммуникаций отопления, канализации и водоснабжения, оконных откосов, цистерн и ёмкостей. Устойчив к перепаду температур –30/+150 градусов, воздействию соляных растворов, солнечных лучей. Сферолит, агрегат тонких игольчатых кристаллов в виде шариков радиально-лучистого строения. Сферолиты встречаются в магматических и осадочных горных породах.

SPI = STITCHES PER INCH

SPI = SWISS PERFORMANCE INDEX

SPICULE = СПИКУЛА – Spicule is a very small, fine spine or in Opuntioideae a glochid. / Спикула – очень маленький, тонкий шип или волосок у Опунциоидээ (Opuntioideae). Вторичный волосок (или колосок) у злаков. (1) В анатомии под Спикулами, от Латинского слова Spiculum, означающее Жало или Кончик или Остриё, понимаются:- (i) скелетные элементы у некоторых беспозвоночных, например, губок, иглокожих, асцидий; (ii) спикулы, или стилеты, части мужских половых органов у круглых червей. (2) В солнечной хромосфере под Спикулами понимаются отдельные столбы светящейся плазмы, видимые при наблюдении Солнца в монохроматическом свете (в спектральных линиях H, He, Ca^{+} и другие). Спикулы поднимаются из хромосферы в солнечную корону до высоты 6 000–10 000 километров (км), их диаметр – 200–2 000 км, среднее время жизни 5–7 минут. На Солнце одновременно существуют сотни тысяч спикул.

SPIDERING = ВНЕШНЕЕ КОЛЬЦЕВАНИЕ (или ОПОЯСЫВАНИЕ, или БАНДАЖ) – Spidering:- strengthening of circular tanks for transport, this prevents the tanks from becoming warped. The tanks are strengthened with steel or wood crossbeams giving a ‘spider’ appearance. / Под Бандажем, от Французского слова Bandage, означающее Повязка, понимается металлическое кольцо или пояс, насаживаемые на детали машин, конструкции для увеличения их прочности или уменьшения износа.

SPIFF = SPECIAL PROMOTIONAL INCENTIVE FROM FACTORY

SPIKE = КОЛОС (или СПАЙК) – Spike is simple inflorescence, an elongated multiple cluster of sessile florets directly attached to an unbranched flowering stem. Hence:- Adj. spicate. Spike is an unbranched elongated inflorescence with sessile (without a stalk) or almost-sessile flowers. / удлинённая гроздь (cluster) из цветочки (florets), непосредственно прикреплённые к . Колосистое или Колосовидное (Spicate). Под Колосом понимается соцветие, в котором на удлинённой главной оси расположены сидячие цветки (простой колос – у Вербены, Подорожника) или колоски (сложный колос – у Пшеницы, Ржи). Под Спайками или Синехиями, от Греческого слова Synécheia, означающее Непрерывность или Связь, понимаются врождённые или приобретённые (например, после воспаления) сращения между соседними органами или серозными поверхностями (например, синехии брюшины, плевры, перикарда).

SPIKE = ШИП (или ВЫСТУП) – Spike is an extreme rise or fall in price that occurs quickly. This usually signifies at least a short-term climax in buying (selling) pressure and may sometimes prove to be a major top or bottom in a security or market. Spikes are price bars that extend much higher or lower than surrounding price bars. Like many gaps, they usually reflect extreme market sentiment and can be followed by price reversals or consolidations. Again, where a spike occurs is important. In a trading range, a spike may just be a temporary price shock; when a spike occurs after an extended trend, it can be a sign of a price extreme, or blow-off, that signals price

exhaustion. A sharp rise or fall in price over a relatively short period of time. Spike:- a sharp price move that is out of the ordinary. This can either represent a climax prior to a reversal of trend, or the beginning of a run-away market. / В техническом анализе биржевых рынков, Шип Вверх или Шип Вниз – это соответственно суточный максимум, резко возвышающийся над максимумами предыдущих и последующих суток, или суточный минимум, резко углубляющийся, под минимумами предыдущих и последующих суток. При длительности той или иной тенденции на рынке данные шипы могут рассматриваться в качестве потенциального относительного максимума или минимума соответственно.

SPIKE = XX (или ШПИЛЬКА) – Spike:- (plural) shoes with spike heels; (plural) a pair of shoes with spikes attached to the soles to improve traction. / Обувь с каблуками в виде шипов. каблук шпилька. heel = каблук или пятка.

SPIKE BOTTOM = ПИКОВАЯ ВПАДИНА – Spike Bottoms and Tops are reversal patterns. They normally generate a reversal in trend. They are characterised by an extremely strong move at the end of a trend and a reversal that is normally more aggressive and lasting half the time of the final trending move. In a Spike Bottom price will decline sharply over a number of periods, accompanied by significant bearish sentiment. The reversal will occur with a sudden and normally unexpected power that brings a retracement of some 50% to 61.8% within a much shorter period. / В техническом анализе биржевых рынков, Пиковые Впадины и Пиковые Вершины являются моделями разворота. Это самый глубокий суточный минимум, уходящий намного глубже минимумов предыдущих и последующих суток.

SPIKELET = КОЛОСОК – Spikelet is:- (1) the basic unit of the Rice inflorescence consisting of two sterile lemmas, the rachilla, and the floret. (2) The unit of the grass flower that includes the two basal glumes subtending one to several florets. Spikelet is the unit of the Rice inflorescence consisting of the two sterile lemmas, the rachills and the floret. The two rudimentary glumes are considered to be a part of the spikelet.

SPIKELET ABORTION = АБОРТ КОЛОСКА (или НЕДОРАЗВИТИЕ КОЛОСКА) – Spikelet Abortion is a spikelet development checked due to some stress factor.

SPIKELET STERILITY = СТЕРИЛЬНОСТЬ КОЛОСКА (или БЕСПЛОДИЕ КОЛОСКА) – Spikelet Sterility is a situation in which there is no grain within the glumes of the Rice plant. / Под Стерильностью Колоска, от Латинского слова Sterilis, означающее Бесплодный, понимается .

SPIKE–TOOTH HARROW = ЗУБОВАЯ БОРОНА (или КОЛОСЧАТО–ЗУБЧАТАЯ БОРОНА) – Spike-Tooth Harrow is a tillage implement used to cover seeds that are broadcast or drilled in furrows.

SPIKE TOP = ПИКОВАЯ ВЕРШИНА – Spike Bottoms and Tops are reversal patterns. They normally generate a reversal in trend. They are characterised by an extremely strong move at the end of a trend and a reversal that is normally more aggressive and lasting half the time of the final trending move. In a Spike Top price will rally sharply over a number of periods, accompanied by significant bullish sentiment. The reversal will occur with a sudden and normally unexpected power that brings a retracement of some 50% to 61.8% within a much shorter period. The spike high capped off an uptrend on a weekly chart and turned out to be a fairly significant reversal point. To confirm such signals, it is advisable to wait for price to move convincingly in the desired direction – back below the low of the spike bar (at a minimum), in this case. / В техническом анализе биржевых рынков, Пиковые Впадины и Пиковые Вершины являются моделями разворота. Это самый высокий суточный максимум, уходящий намного выше максимумов предыдущих и последующих суток.

SPILL = ВОДОСБРОС (или СБРОС ВОДЫ, или ВОДОСЛИВ) – Spill:- release of water from a reservoir over a spillway rather than putting it through turbines to generate electricity. A spillway is the overflow structure of a dam. / Выпуск воды из водохранилища по водосбросу, в отличие от её направления на турбины для генерации электроэнергии. Водосброс представляет собой сооружение для сброса излишней воды из водохранилища. Водосброс или Водосбросное Сооружение, гидротехническое сооружение для сброса излишней (паводковой) воды из водохранилища, а также для полезных попусков воды в нижний бьеф. Водосброс может иметь отверстия:- поверхностные на гребне плотины (смотрите Водослив); погружённые под уровень верхнего бьефа, иначе глубинные (смотрите Водоспуск), или те и другие одновременно – двухъярусный водосброс. Пропуск воды через водосброс регулируется затворами (смотрите Гидротехнический Затвор). Некоторые типы водосбросов автоматического действия (например, сифонные и шахтные) затворами не оборудуются. Водосбросы, устраиваемые в обход бетонных и земляных плотин, называются Береговыми Водосбросами. Водослив, преграда (порог), через которую переливается поток воды; в гидротехнике водосливом называется водосброс со свободным переливом воды через его гребень. Для направления потока на гребне делают отверстия прямоугольной формы, ограниченные с боков устоями или промежуточными стенами (быками). По форме порога различают водосливы:- с тонкой стенкой, с широким порогом и практического профиля, построенный по координатам траектории свободно падающей струи и обладающий наибольшей пропускной способностью. Водослив практического профиля может быть вакуумным (если давление на гребне под струёй ниже атмосферного) или безвакуумным (давление выше атмосферного). Водосливы, применяемые в лабораторной и гидрометрической практике для измерения расхода воды, называются Мерными Водосливами. Водоспуск или Водоспускное Сооружение, напорное гидротехническое сооружение с отверстиями, служащее для опорожнения водохранилища, промыва донных насосов, а также для пропуска эксплуатационных расходов воды в нижний бьеф. Водоспуск обычно располагается в теле бетонной плотины (Трубчатый Водоспуск), а в плотинах из земли и камня – в основании плотины или в обход её, в массиве берега (Тоннельный Водоспуск). Для регулирования количества пропускаемой воды водоспуск оборудуется затворами (смотрите Гидротехнический Затвор). В период строительства гидроузла иногда через отверстия водоспуска пропускают воды реки (смотрите также Водосброс).

SPILL = СБРОС (или ПЕРЕПУСК, или ОБЕЗВЕТРИВАТЬ) – Spill (maritime term):- to empty the wind out of a sail. / Обезветривать парус.

SPIN = THE STANDARD AND POOR'S 500 SUBORDINATED NOTE INDEX

SPINATION = НАЛИЧИЕ ШИПОВ (или КОЛЮЧЕК, или ИГЛ) (или РАСПОЛОЖЕНИЕ ШИПОВ (или КОЛЮЧЕК, или ИГЛ)) – Spination is the characteristics and distribution of spines, which may in some cases be distinguishing features. / Под Спинальным, от Латинского слова Spina, означающее Позвоночный Столб или Хребет, понимается .

SPINDLE = ШПИНДЕЛЬ (или ВЕРЕТЕНО) – Spindle is a long, thin rod that is used on certain textile machines for twisting and holding textile fibers in manipulation from sliver form to spun yarn. This upright device is found on slubbers, roving frames, jack frames, spinning, winding, and twisting machines. Revolving at a very high rate of speed to perform its work, drawing, twisting, and winding, the spindle has a bobbin, tube, or cop set around it so that the finished stock may be wound evenly and easily. The spindle is one of the oldest textile devices known to man. It is driven on machines of today by means of spindle banding, which can drive a spindle over 12 000 rpm, if needs be. Spindle is a rounded rod, usually of wood, tapering toward each end, used in handspinning to twist into thread

the fibers drawn from the mass on the distaff, and on which the thread is wound as it is spun. Spindle is a slender, upright, rotating rod on a spinning frame, roving frame, twister, winder, or similar machine. A bobbin is placed on the spindle to receive the yarn as the spindle is rotated at high speed. / В текстильной отрасли под Шпинделем, от Немецкого слова Spindel, означающее буквально Веретено, понимается веретено прядильной машины. Веретено, основной исполнительный орган ровничных, прядильных и крутильных машин текстильного производства, служащий для скручивания и наматывания продукта прядения, кручения (ровницы, пряжи, корда и другого) на катушку, шпулю, патрон (копе), бобину и другое. Ручное веретено появилось в странах древнего Востока. Машины с веретёнами начали применять во 2-й половине XVIII века (смотрите Прядение). Различают веретёна для натуральных (хлопок, шерсть, лён) и для химических волокон. Веретено – длинный, сравнительно тонкий и гибкий стальной шпиндель сложной геометрической формы. Он имеет 2 опоры, как правило, расположенные в нижней его части, – ролико- и шарикоподшипники и подпятники скольжения. Верхняя часть веретена снабжена насадкой, конфигурация которой определяется формой тары продукта. Большинство веретён приводится во вращение гибкой передачей (ремнем или тесьмой), некоторые – винтовыми колёсами. Веретено для прядения химических волокон вращается индивидуальным высокочастотным электродвигателем, ротор которого насажен на веретено. Торможение веретена, необходимое для снятия наработанной паковки или ликвидации обрыва пряжи, осуществляется специальными тормозками (механический привод) или противотоком (электрический привод). Веретёна обычно крепятся к брусу машины при помощи специальных гаек, прокладок, пружин, некоторые веретёна могут совершать поворот на специальных кронштейнах. Все современные веретёна имеют демпфирующее устройство, уменьшающее вибрацию шпинделя при вращении. Частота вращения веретена колеблется при переработке различных волокон от 2 500 до 16 000 и более оборотов в минуту (об/мин). Серийное Веретено Для Прядения Натуральных Волокон:- На верхнюю часть шпинделя плотно надевается бумажный патрон или деревянная шпуля, на которую наматывается пряжа в виде початка. Нить по пути к веретену проходит через бегунок, скользящий по неподвижному кольцу вокруг веретена. При вращении веретена пряжа натягивается и заставляет бегунок двигаться по кольцу, тем самым осуществляются кручение пряжи и намотка её на патрон. Советскими специалистами было разработано оригинальное веретено для прядильно-крутильных машин, что позволило совместить прядение, трощение, скручивание и наматывание двух нитей. Полый шпиндель прядильно-крутильного веретена, вращается на двух шарикоподшипниках, заключённых в резиновые обоймы. Обоймы вставлены в гнездо, состоящее из двух половинок. На верхний конец шпинделя насаживается патрон с пряжей, взятой с прядильной машины, нижний конец пряжи пропускается в отверстие шпинделя. Стренга пряжи из вытяжного прибора поступает во внутренний канал веретена. При вращении веретена пряжа с патрона бегает по бортику канала шпинделя и заставляет вращаться вокруг своей оси стренгу, превращая её в пряжу. В верху веретена происходит трощение, а на пути от верха веретена до мотальных валиков две нити пряжи скручиваются в обратном направлении, далее нить наматывается на бобину. Электроверетено Для Формования (иногда неточно называемое прядением) Вискозных Волокон:- На втулке жёстко сидит ротор трёхфазного асинхронного двухполюсного электродвигателя. Для сообщения веретёнам частот вращения порядка 6 000–9 000 об/мин электродвигатель питают током повышенной частоты (100–200 Герц (Гц)), получаемым от специальных преобразователей. Вискозное волокно попадает через нитеводитель, совершающий возвратно-поступательное движение, в стакан и под действием центробежных сил укладывается по винтовой линии на его стенки. Таким же образом получают кручёную пряжу на различного рода центрифугальных веретёнах для натуральных волокон. В прядении химических волокон имеется тенденция создания электроверетён на шарикоподшипниках с закладной консистентной смазкой, сменяемой раз в 1–2 года. Для прядения шерсти получили некоторое распространение веретёна с жёстким Приводом, вращаемые от винтовой пары. Их основным преимуществом является стабильность частоты вращения шпинделя (постоянство крутки пряжи), что необходимо для получения высококачественной пряжи. С целью снижения числа обрывов пряжи применяются также прядильные машины с веретёнами, имеющими на конце шпинделя фигурные насадки. Последние уменьшают баллон, который образуется нитью при кручении, что ведёт к снижению натяжения пряжи и обрывности. В производстве толстых нитей для ковров, бельтинга, корда, верёвок и тому подобного используются веретёна двойного кручения. По сравнению с обычными они обладают двойной производительностью, но конструкция их сложна. В бывшем Союзе Советских Социалистических Республик (СССР) и за рубежом ведутся работы по замене жидкой смазки консистентной, опор скольжения опорами качения, повышению частот вращения веретён и массы нарабатываемых поковок, применению подшипников скольжения, изготовленных из особых материалов, не требующих смазки, использованию воздушных опор, повышению надёжности и долговечности работы веретён Советскими учёными разработана теория вибрации веретён. Веретено – вращающийся стержень, на который надевается патрон, шпуля, катушка и тому подобное; основной рабочий орган ровничных, прядильных, прядильно–крутильных, крутильных машин. Предназначается для скручивания ровницы, пряжи, нитей и образования паковки определённой формы и размера. Наиболее распространены кольцевые и крутильные веретена для прядильных и крутильных машин, полые – для прядильно-крутильных, рогульчатые – для ровничных машин. Под Шпинделем понимается:- (1) вращающийся вал станков с устройством для закрепления заготовок (например, у станков токарной группы) или режущих инструментов (например, у сверлильных, фрезерных и других станков); (2) вал прокатного стана, передающий вращение от двигателя к валкам; (3) рабочий орган хлопкоуборочной машины; (4) ось судового шпиля. Иногда шпинделями называют штоки некоторых клапанов. Под Шпинделем, от Немецкого слова Spindel, означающее буквально Веретено, понимаются:- (1) рабочий вал металлорежущего станка. На шпинделе закрепляется инструмент (фреза, сверло, шлифовальный круг и тому подобное) или обрабатываемое изделие. К шпинделям предъявляются высокие требования по точности вращения, существенно влияющей на точность обработки. Поэтому их устанавливают на подшипниках качения высокого класса точности или подшипниках скольжения, а особо быстроходные шпиндели внутришлифовальных станков (частота вращения до 100 000 оборотов в минуту (об/мин)) – на подшипниках скольжения с воздушной смазкой. Привод шпинделя осуществляется через зубчатую или ремённую передачу, а также непосредственно от встроенного электродвигателя или воздушной турбинки. (2) Промежуточный вал, через который приводится во вращение валок прокатного стана. Подвижные соединения концов шпинделя с валком и приводным валом допускают поперечное перемещение валка. (3) Веретено прядильной машины. (4) Рабочий орган хлопкоуборочной машины. (5) Стержень клапана или ось судового шпиля и другое.

SPINDLE OIL = ШПИНДЕЛЬНОЕ МАСЛО (или ВЕРЕТЁННОЕ МАСЛО) – Spindle Oil is a light-bodied oil used principally for lubricating textile spindles and for light, high-speed machinery. / Веретённые Масла – нефтяные масла для смазки веретён, маломощных электромоторов, токарных, сверлильных, шлифовальных станков и других механизмов. Относятся к группе Индустриальных Масел.

SPINDLE SPUN = СПРЯДЕНАЯ ВЕРЕТЕНОМ – Spindle Spun:- a yarn produced on a hand spindle.

SPIN–DRAWING = XX – Spin-Drawing is:- (i) the reduction of roving during spinning by a roller drafting mechanism similar to that used on the roving frame; and/or (ii) combined spinning and drawing in one operation in melt-spun fibers.

SPINE = ШИП (или КОЛЮЧКА, или ИГЛА, или ВОЛОСОК) – Spine is a sharp outgrowth from the epidermis which may be stout and woody or fine and hair-like. In Cactaceae, always arising multiply from an areole and originating as a modified leaf. Spines are classified as central spines located centrally on the areole and radial spines around the margins of the areole. Spines protect the plant from some predators, albeit inefficiently. In some species, spines act as a drip tip where atmospheric moisture from dews, mists and rain precipitates on the spines and drips off the tip onto the soil near the base of the plant for uptake by the shallow root system. Compare with Thorns. / посредством неглубокой корневой системы. Колючка листового происхождения. В Кактусовых (Cactaceae) . осадок (precipitate).

SPINE CAR = СОЧЛЕНЁННЫЕ ФИТИНГОВЫЕ ПЛАТФОРМЫ (или СКРЕПЛЁННЫЕ ФИТИНГОВЫЕ ПЛАТФОРМЫ) – Spine Car is an articulated five-platform railcar. Used where height and weight restrictions limit the use of stack cars. It holds five 40-foot containers or combinations of 40- and 20-foot containers. / Сочленённый из пяти платформ железнодорожный вагон. Он используется в тех случаях, когда ограничения по высоте и весу делают невозможным использование штабельных вагонов. Такой вагон перевозит пять 40-футовых контейнеров, десять 20-футовых контейнеров или различные комбинации из 40- и 20-футовых контейнеров.

SPIN FINISH = XX – Spin Finish:- no textile component is more often processed and reprocessed than synthetic fiber. Because of its well-proven properties, its versatility and its durability, synthetic fiber is used in a wide-ranging area of applications; in customised areas as well as in specialised applications. Schill+Seilacher GmbH develop and manufacture spin finishes for polyamide 6, polyamide 6.6, polyester, polypropylene, rayon, acetate and for elastomeric – and have done so since 1937. Experience, expertise and innovative technologies guarantee a seamless manufacturing process that comprehensively meets the manufacturing demands and the reprocessing of synthetic fibers and their secondary products. See also Lubricant. / Немецкая компания Шил+Зайляха Ге.эм.бе.Ха. (Schill+Seilacher GmbH).

SPIN MULTIPLIER = МНОЖИТЕЛЬ СВИВКИ (или КОЭФФИЦИЕНТ ЗАКРУТКИ, или КОЭФФИЦИЕНТ КРУЧЕНИЯ) – Spin Multiplier:- xxxxx. See also Twist Multiplier.

SPINNERET = ФИЛЬЕРА – A Spinneret is a piece of industrial equipment used in the production of polymer fibers. Using an extrusion process, a facility can force liquid polymers through the spinneret, turning them into long strands that harden into usable fibers. This process is similar to that seen with spider silk, and the name of this equipment is derived from the organ spiders used to produce thread for webs and other activities. The process of creating fiber with a spinneret starts with preparing the polymers, either through melting or solvent treatment to turn the polymer into a liquid substance. Dyes can be added to create colored products, or the finished fiber can be dyed after processing, depending on the type and intended use. As it is forced through tiny holes in the head of the spinneret, the chains in the polymers align, and create long strands. Air or liquid on the other side provides a cooling bath to harden and temper the fibers so they will be usable, and the company can wind them onto spools for distribution. This process is known as Gel or Polymer Spinning. Manufacturers with this capability can distribute the resulting fiber to textile companies, or produce their own textiles in house, depending on the types of products and services they wish to offer. Synthetic fibers produced using this technique tend to be strong and durable, and range from Kevlar® for bulletproof vests to polyester for garments. Conditions at the spinneret must be tightly controlled to yield the best results. The head of each spinneret represents a point of vulnerability in the system. The tiny holes can clog with polymers and impurities and render the device useless. Cleaning techniques are available, including in-service cleaning and removal of the heads for treatment in a different facility to remove layers of polymers and other materials that may be clogging them. Firms offering cleaning services are available for companies that do not wish to handle their own maintenance needs. Research and development departments constantly analyze spinneret production of fibers. These departments look at new ways to produce synthetic fibers and work on the development of new types of fiber to meet the needs of consumers. Some also study ways to improve the design of spinnerets to address common problems or make the production of unusual fibers possible. Textile engineers who perform this kind of research usually have advanced degrees and are very familiar with the physics behind polymers and the formation of polymer fibers. Spinneret is a metal disc containing numerous minute holes used in manufactured fiber extrusion. The spinning solution or melted polymer is forced through the holes to form the fiber filaments. Spinneret is a metal nozzle type device with very fine holes used in the spinning process of manufactured fibers. The spinning solution is forced or extruded through the small holes to form continuous filament fibers. The holes in the spinneret can vary in diameter to produce fibers of various denier. Spinneret:- glandular opening on the silkworm where the silk is extruded. A Spinneret, which looks very much like a showerhead (a jet or nozzle containing very fine holes), is used in the manufacture of man-made fibers. The material from which the fibers are forrned is forced through holes in the spinneret (extruded) while it is in a syrupy or melted state. The resulting long strands harden into filament fibers. See also Fiber, and Filament. / Экструзия или Выдавливание (Extrusion). Кэвла® или Кевлар® (Kevlar®). Отверстия в фильере могут отличаться друг от друга в диаметре. За счёт этого появляется возможность формования волокна с разными показателями денье. Под Фильерой, от Французского слова Filière, от Fil, означающее Волокно или Нить или Проволока, понимается:- (1) деталь машин в виде колпачка или пластины с отверстиями диаметром 0.06–0.8 миллиметров для формования химических волокон; (2) в металлообработке – волока с одним отверстием. Под Фильерой понимается:- (1) деталь машины для формирования химических волокон – колпачок или пластина с отверстиями. Изготовляются обычно из адгезионно- и коррозионностойких сплавов (например, никелевых) и нержавеющих сталей. (2) Рабочий орган волочильных станов – волока с одним волочильным глазком. Обычно выполняется из высокопрочных сталей и твёрдых сплавов. Фильера для получения тонкой и тончайшей проволоки изготовляют из алмазных кристаллов, кристаллов сапфира или искусственных алмазов, отверстия в которых (диаметром от 2 до 0.006 миллиметров (мм)) образуют лазерным лучом.

SPINNER'S DOUBLE = XX – Spinner's Double:- it is mainly created due to ring frames end breakages and join to neighbouring end. Also at feed when roves from side by side mixed together. It appears as Thick End or Thick Pick/Weft in the fabric. Spinning defect. / Порок или дефект прядения.

SPINNER'S TYPE = ТИП ПРЯДИЛЬЩИКОВ – Spinner's Type:- a fleece that is strong, regular, of good color and character, and nearly free of vegetation and dirt.

SPINNING = ПРЯДЕНИЕ – Spinning:- collectively, all of the operations in manufacturing a yarn from fibrous raw material. The Spinning Process:- (i) Mixing and Blowing (Importation of Staple Fiber):- to begin the spinning process, the compressed staple fiber delivered to the spinning plant is unraveled using a mixing and blowing machine. It is then cleaned by removing substance such as leaves, seeds, or sand adhering to it. Finally, the staple fiber is processed into sheet-shaped 'lap'. (ii a) Carding (Lap or Chute):- the sheet-shaped lap processed in the mixing and blowing process is combed using the carding machine to separate the fibers and remove fine dust and short fibers. Remaining long fibers are aligned nearly parallel and collected to be processed into the string-shaped 'carded sliver'. (iii a) Sliver Lap Former (Carded Sliver):- from 18 to 24 carded slivers are fed together and side by side. They are drafted and a loose form of web is created. The web is rolled up to a lap. This is called 'Sliver Lap'. (iv a) Combing (Sliver Lap):- The carded sliver is further combed to remove short fibers and dust that could not be removed in the carding process. Fibers are then

arranged parallel to obtain uniform combed sliver. This process is essential to manufacture uniform, high-quality yarn. (ii b) Combing (Sliver Lap):- The carded sliver is further combed to remove short fibers and dust that could not be removed in the carding process. Fibers are then arranged parallel to obtain uniform combed sliver. This process is essential to manufacture uniform, high-quality yarn. (iii b) Drawing (Combed Sliver):- six to eight slivers after the carding or combing process are gathered and elongated to six to eight times their original length using a drawing machine to straighten and remove uneven thickness from the fibers. This process transforms fibers into string-like 'drawn sliver'. (iv) Roving (Drawn Sliver):- Since the drawn sliver is too thick to produce yarns directly, it is further elongated using a roving machine. Twisting is first applied to fibers in this process to obtain the green yarn, which is wound onto a bobbin. (v) Spinning (Green Yarn):- in the fine spinning process, the last of the main spinning processes, the green yarn resulting from the roving process is further elongated to obtain a desired thickness and then twisted. The final product, or the finished yarn, is wound on a bobbin. (vi) Winding (Cop):- The winding process involves rewinding the finished yarn onto bobbins into the cheese or cone according to its purpose. And to Weaving Process. Spinning is the last process in yarn manufacturing. Spinning is final operation in the production of a natural yarn, consists of of the drawing, twisting, and the winding of the newly spun yarn onto a device such as a bobbin, spindle, cop, tube, cheese, etc. In manufactured fibers, the spinning process is the extrusion of a spinning solution into a coagulation bath, a heated air chamber, or a cooling area in order to form a continuous filament or tow. Spinning is the process of making yarn by drawing out, twisting, and winding fibrous substances into yarn or thread. Spinning is a method of drawing out and twisting together fibers to make a continuous thread or yarn. Spinning also refers to the manufacture of man-rnade fibers as they are formed by fcucing the material from which they are made through a spinneret. In conventional spinning, the tighter the twist, the stronger the yarn, but too tight a twist can weaken the final yarn. Crêpe yarns have such an extremely high twist that the yarn actually turns back on itself (kinks), producing the characteristic crêpe or corkscrew look. Fabrics can be given shadow effects by the Lise of two yarns which have been twisted in opposite directions during spinning. This will strike each of these yarns in a different way producing this effect. See also Spinneret. Spinning is the process of drawing fibers that may be in roving or rope form, twisting the appropriate number of turns per inch, and winding the yarn on a bobbin or other suitable holder. Spinning is the process or processes used in the production of single yarns or of fabrics generated directly from polymer. (1) Yarn From Staple Fiber:- the formation of a yarn by a combination of drawing or drafting and twisting prepared strands of fibers, such as rovings. (2) Filament Yarn:- in the spinning of manufactured filaments, fiber forming substances in the plastic or molten state, or in a solution, are forced through fine orifices in a metallic plate called a Spinneret, or Jet, at a controlled rate. The solidified filaments are drawn-off by rotating rolls, or godets and wound onto bobbins or pirns. There are several methods of spinning manufactured filaments:- (2.1) Dry Spinning is a process in which a solution of the fiber-forming substance is extruded in a continuous stream into a heated chamber to remove the solvent, leaving the solid filament, as in the manufacture of acetate. (2.2) Gel Spinning is a spinning process in which the primary mechanism of solidification is the gelling of the polymer solution by cooling to form a gel filament consisting of precipitated polymer and solvent. Solvent re-moval is accomplished following solidification by washing in a liquid bath. The resultant fibers can be drawn to give a product with the highest tensile strength and modulus. (2.3) Melt Spinning is a process in which the fiber-forming substance is melted and extruded into air or other gas, or into a suitable liquid, where it is cooled and solidified, as in the manufacture of polyester and nylon. (2.4) Phase-Separation Spinning is a fiber extrusion process of polymer and solvent at high temperature into a cooling zone. During the cooling process, a phase separation occurs, usually accompanied by crystallization of the solvent. Solvent can be removed before or after drawing. (2.5) Reaction Spinning is a process in which an initial prepolymer is formed and then extruded into a reagent bath where polymerization and filament formation occur simultaneously. Spandex fibers can be made by this process. See also Chemical Fiber. Spinning:- in the manufacture of yarns composed of natural fibers or of cut man-made fibers, the process whereby these fibers are converted to a finished yarn from some intermediate process in which they are first cleaned and aligned. In the production of man-made fibers and yarns, this term is used to describe the process whereby the fiber-forming solutions are extruded through small holes to produce the individual filaments. Fiber Spinning:- spinning is the twisting together of fibers to form yarn (or thread, rope, or cable). Earlier fiber was spun by hand using simple tools like spindle and distaff. Later the use of spinning wheel gained importance. Industrial spinning started in the XVIII century with the beginning of the Industrial Revolution. Hand-spinning remains a popular handicraft. Industrial Spinning:- fibers can not be used to make clothes in their raw form. For this purpose, they must be converted into yarns. The process used for yarn formation is spinning. Spinning by hand was a slow and laborious process. Thus, Many implements and methods were invented for making it faster and simple. Eventually, the techniques were refined and industrial spinning started manufacturing yarn in various ways. The methods selected depend upon the factors such as the manufacturer's preference of equipment, the economic implications, the fibers to be used and the desired properties of yarn to be produced. Ring method is the oldest and the most used technique. Open-end spinning is another important method. The basic manufacturing process of spinning includes carding, combing, drafting, twisting and winding. As the fibers pass through these processes, they are successively formed into lap, sliver, roving and finally yarn. A brief description of the journey from fibers to yarns will help in understanding industrial spinning in a better way. The raw fiber arrives at a spinning mill as compressed mass which goes through the processes of blending, opening and cleaning. Blending is done to obtain uniformity of fiber quality. Opening is done to loosen the hard lumps of fiber and disentangle them. Cleaning is required to remove the trash such as dirt, leaves, burrs and any remaining seeds. Carding is the initial straightening process which puts the fiber into a parallel lengthwise alignment. This makes the tangled mass of fiber ready to produce yarn. Now the fiber is called Lap. The lap is treated for removing the remaining trash, disentangling and molding it into a round rope like mass called Sliver. The sliver is then straighten again which is called Combing. In it, fine-toothed combs continue straightening the fibers until they are arranged in such a parallel manner that the short fibers are completely separated from the longer fibers. This procedure is not required for man made staple fiber because they are cut into predetermined uniform lengths. This process forms a 'comb sliver' made of the longest fibers. The combing process is identified with better quality because long staple yarn produces stronger, smoother and more serviceable fabrics. Drawing pulls the staple lengthwise over each other. As a result longer and thinner slivers are produced. After several stages of drawing out, the sliver is passed to the spindles where it is given its first twist and is then wound on bobbins. 'Roving' is the final product of the several drawing-out operations. It is the preparatory stage for the final insertion of twist. Till now, enough twist is given for holding the fibers together but it has no tensile strength. It can break apart easily with a slight pull. The roving, on bobbins, is placed in the spinning frame, where it passes through several sets of rollers running at high speed and finally the 'Yarn' is produced of the sizes desired. Spinning Machines Traditional v/s Modern Techniques:- hand spinning was replaced by powered spinning machines which was very fast. Initially it was done by water or steam power and then by electricity. The Spinning Jenny, a multi-spool spinning wheel significantly reduced the amount of work required to produce yarn. A single worker was now able to work eight or more spools at a time. Then came the spinning frame which produced a stronger thread than the Spinning Jenny. As it was too large to be operated by hand, a spinning frame powered by a waterwheel was invented. It was then called the Water Frame. The elements of the Spinning Jenny and water frame were combined to create the spinning mule. / Найлан^{T3} (Nylon^{TM}). филаментная (комплексная) пряжа (filament yarn). Экструзия или Выдавливание или Продавливание (Extrusion). высокая крутка . Прядущая Дьжени (Spinning Jenny). Прядение, изготовление пряжи или ровницы на прядильной машине. В широком смысле слова под прядением понимают совокупность технологических процессов, составляющих прядильное производство. Прядильное Производство, совокупность технологических процессов, необходимых для выработки (из

относительно коротких волокон) непрерывной нити – Пряжи (Yarn), используемой для изготовления текстильных изделий:- тканей, трикотажа, гардин, сетей, шнуров, ниток, канатов и других. Иногда прядильное производство называют Прядением. В зависимости от вида перерабатываемых волокон различают хлопко-, шерсто-, льнопрядение и тому подобное. В прядильном производстве волокна, поступающие на переработку, разрыхляются и очищаются, затем из волокон формируется лента, из которой после вытягивания и укрепления (кручения или сучения) получают Ровницу (Roving). В дальнейшем из ровницы или из ленты вытягиванием или дискретизацией (разделением) с последующим сложением и кручением вырабатывается пряжа. Ручное прядение известно с эпохи позднего неолита. Было распространено почти у всех народов, за исключением народов Крайнего Севера, где носили меховые одежды. Древнейшими материалами для прядения были волокна шерсти, льна, конопли, а в некоторых местах и крапивы; в Индии – хлопка. Наиболее примитивный способ прядения заключался в образовании пальцами ленточки из волокон и в сучении её ладонями в отвесном положении или на коленях. Первыми орудиями прядения были ручные гребни для расчёсывания волокон и ручные веретёна для скручивания. Волокна, приготовленные для прядения, привязывались к прялке с подставкой (донцем) или прялись непосредственно с гребня. Прялки и Пряслица (грузики для веретён) на территории бывшего Союза Советских Социалистических Республик (СССР) известны по раскопкам со 2-го тысячелетия до Нашей Эры. Первым этапом в усовершенствовании ручного прядения было создание прялки с приводом веретена от вращающегося колеса и изобретение самопрялки, имевшей веретено с рогулькой, что позволяло одновременно скручивать и наматывать пряжу. Самопрялки с ножным приводом известны в Европе с XV века. С середины XVIII века начало развиваться машинное прядение. В Великобритании в 1738 была запатентована машина непрерывного (ватерного) прядения с вытяжным прибором (Люис Пол (Lewis Paul); –1759), на которой осуществлялось вытягивание, кручение и наматывание пряжи; в 1748 сконструирована кардочёсальная машина; в 1765 Британским плотником и ткачом Дьжеймзом Хагрэйвзом (James Hargraves; 1720–1778) создана прядильная машина периодического (сельфакторного) прядения, на которой сначала вырабатывались отрезки пряжи определённой длины, а затем шло наматывание. В 1772–79 её усовершенствовал Самьюэл Кромптэн (Samuel Crompton; 1753–1827) (улучшенную конструкцию стали называть Прядущим Мулом (Spinning Mule), а в России мюль-машиной). В 1823–30 была предложена автоматическая прядильная машина периодического действия, а в 1870 – кольцепрядильная машина непрерывного действия. Гребнечёсальную машину для льняного волокна изобрёл Французский инженер Жозви Эйльман (Josué Heilmann; 1796–1848) в 1845. В России в 1760 Русский механик Родион Глинков организовал в Серпейске (ныне Калужской Области) льнопрядильную фабрику, где были установлены созданные им гребнечёсальные машины и многоверетённые прядильные машины с механическим приводом, в пять раз повысившие производительность труда; хлопкопрядильная фабрика (Александровская Мануфактура близ Петербурга) начала работать в 1799. На этой фабрике в 1833 были изготовлены и внедрены в производство двухзонные вытяжные приборы высокой вытяжки с уплотнителем. К середине XX века кольцевые прядильные машины непрерывного действия вытеснили менее производительные и более сложные машины периодического действия, были созданы вытяжные приборы высокой и экстравысокой вытяжки, а также новые конструкции разрыхлительно-трёпальных агрегатов и чёсальных машин, усовершенствованы веретёна ровничных и кольцепрядильных машин и так далее. В прядильном производстве различают 3 основных этапа переработки волокон:- (i) подготовку волокон к прядению и формирование ленты; (ii) предпрядение – получение ровницы; и (iii) прядение – формирование пряжи. В некоторых случаях первые этапы объединяются (аппаратная система прядения) или исключается 2-й этап, а пряжа производится непосредственно из ленты (безровничное прядение). Подготовка волокон к прядению начинается с разрыхления (разделения на мелкие клочки) спрессованного сырья при помощи игл, колков, зубьев и других рабочих органов питателей, рыхлителей, разрыхлителей и других машин. Очистка волокон от примесей производится главным образом механическим способом в трёпальных машинах (возможны также аэродинамические и электропневматические способы). Разрыхление обычно сопровождается очисткой волокон, а очистка (трепание) – разрыхлением. В шерсто- и льнопрядении трепание – основной процесс, при котором волокнистая масса одновременно разрыхляется и очищается. Для равномерного распределения в смеси волокон различного вида, то есть для придания материалу одинаковых свойств, волокна смешиваются. В прядильном производстве применяются организованный способ смешивания (продольное сложение слоёв, потоков, лент и тому подобных) и неорганизованный, или случайный (распределение волокон в результате ворошения – перемешивания). Смешивание осуществляется в специальных смешивающих машинах, а неорганизованное смешивание – также в разрыхлительных машинах как сопутствующий процесс. Разрыхлительные, трёпальные и смешивающие машины агрегатируются, образуя разрыхлительно-трепальную установку в хлопкопрядении, или объединяются в поточную линию в шерсто- и льнопрядении. Затем обрабатываемый материал подвергается чесанию, в результате которого волокна разъединяются и окончательно очищаются от мелких и цепких примесей и пороков. Различают 2 основные метода чесания:- (i) Кардочесание (Carding), при котором волокна подвергаются воздействию игл или зубьев рабочих органов шляпочной или валичной чёсальной машины (смотрите Кардолента); и (ii) гребнечесание (Combing), которое осуществляется на гребнечёсальных машинах. В результате кардочесания образуется тонкий слой мало распрямлённых и слабо ориентированных волокон (Ватка-Прочёс), который на тех же чёсальных машинах формируется в ленту. После гребнечесания получается ватка-прочёс, состоящая из более длинных и хорошо распрямлённых ориентированных волокон. Этап подготовки волокон в прядильном производстве завершается на ленточных машинах вытягиванием ленты до заданной тонины и сложением её. При вытягивании, обычно осуществляемом механическим вытяжным прибором, лента в результате смещения волокон утоняется, волокна при этом распрямляются, разъединяются и ориентируются. В процессе сложения лент отдельные участки их складываются в самых разнообразных комбинациях, что обусловливает выравнивание продукта. Для получения эффективного распрямления и смешения волокон процессы вытягивания и сложения повторяются 2–3 раза. Наиболее эффективно выравнивание толщины ленты с помощью автоматического регулятора, который изменяет размеры вытяжки в вытяжном приборе в зависимости от толщины входящей в прибор ленты. Прядение непосредственно из ленты на кольцевых прядильных машинах не получило широкого распространения, так как в этом случае конструкция вытяжных приборов машин усложнялась. Поэтому на этапе предпрядения из ленты вырабатывается Ровница (Roving). На ровничных машинах осуществляются процессы вытягивания и кручения (или сучения) ленты, а также наматывание ровницы на катушку. Кручение придаёт ровнице необходимую прочность и осуществляется с помощью рогульчатого веретена. Интенсивность кручения характеризуется круткой $K = n_в / v_{вц}$, где $n_в$ – частота вращения веретена, и $v_{вц}$ – скорость выпуска ровницы из вытяжного прибора. Процесс сучения осуществляется на ровничных машинах шерстопрядильного производства. На последнем этапе прядильного производства – прядении, ровница вытягивается до тонины пряжи в вытяжных приборах, скручивается, то есть превращается в пряжу, из которой формуется Паковка (Початок). Кручение и наматывание пряжи ведётся крутильно-мотальным механизмом, включающим веретено, кольцо и бегунок. Перспективны безверетённые способы прядения, обеспечивающие увеличение производства в 2–3 раза. При таком прядении процессы кручения и наматывания осуществляются самостоятельными рабочими органами. Учитывая вид сил, действующих на волокна, различают следующие способы безверетённого прядения:- (i) пневмомеханический, (ii) вихревой и (iii) электромеханический. Например, при пневмомеханическом прядении дискретизированные волокна струёй воздуха подаются в быстро вращающуюся камеру, где отбрасываются на сборную поверхность (жёлоб) камеры, образуя

ленточку, которая выводится из камеры и наматывается на бобину. Кручение пряжи происходит в результате вращения камеры. Для производства гребенной пряжи из шерсти, используется безверетённое самокруточное прядение. При формовании самокруточной пряжи осуществляется вытягивание продукта (ровницы или ленты) в вытяжном приборе; реверсивное кручение ленточек в крутильном устройстве; самоскручивание при продольном соединении 2 продуктов, имеющих крутку периодически меняющегося направления; наматывание пряжи. В зависимости от свойств перерабатываемого волокна и требуемых свойств пряжи применяется несколько систем прядения, которые отличаются главным образом видом чесания. Кардная Система Прядения (кардочесальные машины) используется для производства пряжи средней и большой линейной плотности из однородных волокон средней длины, например, средневолокнистого хлопка, химических волокон, коротковолокнистого льна и очёсов. Гребенная Система Прядения (кардочёсальные и гребнечёсальные машины) применяется при получении гребенной пряжи малой и средней линейной плотности из длинных относительно равномерных волокон и смесей, например, длинноволокнистого хлопка, равномерной по длине шерсти, очёсов льна, химических волокон, отходов шёлка. По гребенной системе без кардочесания изготовляют пряжу малой и средней линейной плотности из наиболее длинных однородных волокон, например, длинноволокнистого льна, пеньки, отходов шёлка и самой длинной шерсти. Аппаратная Система Прядения, характеризующаяся применением 2–3 переходов валичных чёсальных машин и отсутствием ленточных и ровничных машин, предназначается для изготовления пряжи большой линейной плотности из коротких и неравномерных волокон различных видов и их смесей, например, короткой и неравномерной по длине шерсти, коротковолокнистого хлопка, химических волокон. Такая пряжа более рыхлая, пушистая и неравномерная, чем кардная. Штапельная Система Прядения используется при производстве пряжи из жгута элементарных химических нитей. В этой системе отсутствуют процессы разрыхления, трепания и чесания. Лента формируется на штапелирующих машинах из волокон, образующихся при разрезании или разрыве нитей. В однопроцессной штапельной системе пряжа образуется на прядильной машине, на которой осуществляются штапелирование, вытягивание ленточки, кручение и наматывание пряжи. Если штапелирование ведётся на ровничной машине, а пряжа вырабатывается из ровницы на кольцепрядильной машине, то система называется Двухпроцессной Штапельной Системой Прядения. Текстурированную (высокоэластичную) пряжу получают на кардной или гребенной системе из смесей разноусадочных химических волокон. Меланжевая пряжа изготовляется из смеси разноокрашенных волокон. Кручёная пряжа производится на прядильно-крутильных машинах или крутильных машинах. Технологический режим работы машин прядильного производства регламентируется планом прядения и зависит от свойств перерабатываемого сырья, назначения пряжи и характеристик машин. В план прядения включаются важнейшие технологические параметры:- линейная плотность выходящего продукта, крутка и вытяжка, число сложений и так далее. Дальнейшее совершенствование прядильного производства связано с созданием высокопроизводительных машин и поточных линий, использованием оптимального объёма паковок и автоматизацией их съёма и транспортировки, применением централизованного контроля режима работы машин и характеристик продукта, внедрением автоматизированной системы управления технологическими процессами. В Прядении задействованы следующие машины:- разрыхлительные, трёпальные, кардочёсальные, смешивающие, ровничная каретка, гребнечёсальные, ленточные, ровничные, кольцевые и другие. Рабочие органы прядильных машин:- (i) в разрыхлительных машинах:- разрыхлительный валик, колковый барабан, колосниковая решётка, ножевой барабан; (ii) в трёпальных машинах:- колосниковая решётка, планочное трепало, игольчатое трепало, игольчатая решётка; (iii) в кардочёсальных машинах:- барабан, съёмный гребень, валик; (iv) в смешивающих машинах:- игольчатый барабан; (v) в ровничных каретках:- ремни; (vi) в гребнечёсальных машинах:- верхний гребень, гребенный барабанчик, щётка, гребенное полотно; (vii) в ленточных машинах:- гребень; (viii) в ровничных машинах:- веретено, бобина, накатный валик; (ix) в кольцевых машинах:- ремни, веретено, уплотнитель, нитепроводник, бегунок; и так далее. Прядение заключительный процесс изготовления пряжи на прядильной машине. В широком смысле – то же, что прядильное производство. Прядильное Производство – совокупность процессов, применяемых для выработки непрерывной нити – пряжи. В зависимости от вида перерабатываемых волокон различают льно-, хлопко-, шерстопрядение и тому подобное. В прядильном производстве волокна, поступают на переработку, очищаются и разрыхляются, затем из волокон формируется (вытягивается) лента, из которой после укрепления (кручения или сучения) получают ровницу. В дальнейшем из ровницы (реже из ленты) вытягиванием, а также дискретизацией и последующим кручением вырабатывают пряжу на кольцепрядильных, пневмопрядильных, самокруточных и других прядильных машинах. В заключение пряжа может подвергаться отделочным операциям – перемотке и другим. Прядильное Производство предполагает под собой совокупность в основном механических и пневматических технологических процессов, в результате которых из массы коротких тонких натуральных и химических текстильных волокон, обладающих сравнительно небольшой прочностью, получают непрерывную нить (пряжу) определённой линейной плотности и прочности. В зависимости от вида перерабатываемых волокон имеются джуто-, льно-, пенько-, хлопко-, шерсто- и шёлкопрядильные производства. Прядильное производство включает процессы разрыхления, трепания, смешивания, чесания, сложения, вытягивания и прядения. Система Прядения определяется совокупностью технологических процессов и машин, применяемых в производстве пряжи. По способу чесания волокнистого материала система прядения подразделяется на:- (i) гребенную (гребнечесание) и (ii) кардную (кардочесание); а по способу утонения потока волокон – на (i) вытягивание и (ii) деление. В кардной системе прядения чесание волокнистого материала осуществляется на шляпочных кардочёсальных машинах, а утонение продукта – в вытяжных приборах. В гребенной системе прядения чесание волокон осуществляется на шляпочных кардочёсальных и гребнечёсальных машинах периодического действия, а утонение продукта – в вытяжных приборах. В хлопкопрядильном производстве для переработки хлопкового волокна и его смесей с химическими волокнами применяют либо гребенную, либо кардную, либо в сочетании эти системы прядения. В хлопкопрядении имеет наибольшее распространение кардная система прядения. Она используется для выработки пряжи пневмомеханического способа прядения на безверетённых пневмомеханических прядильных машинах и кольцевой пряжи на кольцевых прядильных машинах. Гребенная система прядения хлопка применяется для выработки кольцевой пряжи малой линейной плотности широкого ассортимента. По гребенной системе получают пряжу, используемую в ткацком и трикотажном производствах, для выработки швейных ниток и текстильно-галантерейных изделий и для других целей. Из средневолокнистого хлопка длиной от 33/34 до 37/38 миллиметров производят пряжу 11.5–20 текс, из более длинного хлопка от 37/38 до 39/40 производят более тонкую пряжу 5–11.5 текс. Гребенная система прядения имеет большое число переходов по сранению с кардной, более дорогое сырьё используется в этой системе, больше и отходов. Всё это значительно повышает себестоимость вырабатываемой пряжи. В шерстопрядильном производстве для переработки чистошерстяных и полушерстяных смесей волокон применяют три системы прядения:- (i) аппаратную или суконную; (ii) гребенную камвольную; и (iii) кардную. В аппаратной системе прядения чесание волокон осуществляется на валичных кардочёсальных машинах, а утонение полуфабрикатов методом деления – на ровничных каретках кардочёсальных аппаратов и вытягивание – на прядильных машинах. В льнопрядильном производстве в зависимости от свойств сырья и назначения пряжи её можно вырабатывать по четырём различным системам прядения:- (i) аппаратная; (ii) очёсная (кардная система прядения); (iii) очёсно-гребенная (гребенная система с кардочесанием); и (iv) система прядения длинного льна (гребенная система без кардочесания). Схема прядильного производства для волокон всех видов в основном одинакова. Прядильное

производство включает три главных этапа:- (i) подготовка текстильных волокон к прядению – изготовление ленты; (ii) предпрядение – изготовление ровницы; и (iii) прядение – изготовление пряжи. В настоящее время широко используются способы прядения, в которых исключается второй этап и пряжа вырабатывается непосредственно из ленты, например, кардная пряжа на машинах безверетённых способов прядения. Разработчики прядильного оборудования ведут работы по созданию одноперехoдной системы прядения хлопковой пряжи. Кардное Прядение – система прядения, применяемая для изготовления средней по толщине и прочности пряжи из неравномерных по длине волокон, но, как правило, из средневолокнистого хлопка. Ранее она имела наибольшее распространение в хлопкопрядении. По кардной системе прядения пряжа вырабатывается на кольцевых прядильных машинах или на безверетённых пневмомеханических прядильных машинах. Кардное Прядение:- от Французского слова Carde, означающее Чёсальная Машина, – получение пряжи из чёсальной ленты или ровницы с использованием различных по длине волокон. Пряжа кардного прядения отличается повышенной неравномерностью по линевой плотности, по крутке, по относительной разрывной нагрузке. Особенность кардного прядения – отсутствие процесса гребнечесания волокон. Гребенное Прядение – система прядения, применяемая для изготовления тонкой, прочной, гладкой пряжи из длинных и тонких волокон. В гребенном прядении лента после кардочесания подвергается сложению, вытягиванию и гребнечесанию, обработке на ленточных и ровничных машинах. Полученная ровница поступает в прядильную машину. В прядении шерсти гребенное прядение называют также камвольным прядением. Гребенная Система Прядения:- по гребенной системе вырабатывается пряжа малой линейной плотности или средней, но с повышенной прочностью. Для выработки такой (гребенной) пряжи используются тонковолокнистые сорта Хлопчатника. По сравнению с кардной гребенная пряжа более прочная, ровная, гладкая и чистая. Чтобы получить такую пряжу, в процесс дополнительно добавляется гребнечёсальный переход. На этом переходе волокна прочёсываются гребнем (гребнечесание), в результате чего из продукта вычёсываются и удаляются короткие волокна (очёс). Лента, выходящая в гребнечёсальной машины, состоит из длинных, ровных, хорошо распрямлённых волокон, и поэтому пряжа получается высокого качества. Для того чтобы процесс гребнечесания проходил без излишней потери длинных волокон и их повреждения, последние должны быть достаточно распрямлены, а продукт, поступающий на машину – равномерным. Поэтому лента с кардочёсальных машин проходит дополнительно две подготовительные операции:- соединение в холстики по 16–20 лент и вытягивание (утонение) холстиков. Гребенное Прядение – получение тонкой прочной пряжи из длинных и тонких волокон для выработки тканей и трикотажа с уменьшенной поверхностной плотностью. В гребенном прядении волокна после кардочесания прочёсываются гребнями гребнечёсальных машин (отсюда название). В прядении шерсти гребенное прядение называют так же камвольным. Меланжевая Система Прядения:- по меланжевой системе прядения вырабатывается пряжа, состоящая из смеси хлопка, окрашенного в разные цвета в один цвет. При этой системе разрыхлённое волокно окрашивается в аппаратах, сушится и снова поступает на разрыхлительные машины. После этого волокно смешивается, проходит трепание и все последующие операции одной из описанных систем прядения. Главной целью процесса Прядения является получение текстильной нити (пряжи) из разрозненной массы хлопковых волокон. При этом пряжа должна соответствовать определённым физико-механическим свойствам и отвечать необходимым качественным стандартам. В зависимости от предназначения пряжи различают и разные способы её получения, разные системы прядения – кардная, гребенная, аппаратная, меланжевая. Прядение – получение пряжи из волокна. Назначение Прядения заключается в том, чтобы получить пряжу из полуфабриката (ленты и ровницы), поступающего в прядильный отдел. Сущность прядения заключается в утонении поступающего полупродукта до заданной линейной плотности, в придании полученному продукту (пряже) посредством кручения требуемой прочности и формировании путём наматывания определённой паковки:- початка или бобины. К прядению как к заключительному этапу получения пряжи предъявляются определённые требования:- (i) процесс прядения должен обеспечить высокое качество пряжи, удовлетворяющее технологическим и потребительским свойствам; (ii) процесс по возможности должен идти непрерывно; (iii) необходимо минимизировать обрывы пряжи при прядении – при высокой обрывности происходит снижение производительности машины и увеличение угаров, плюс к этому, пряжа, выработанная при высокой обрывности на прядильной машине, плохо перерабатывается в ткацком производстве. В зависимости от способов утонения и формирования продукта (способов прядения) различают кольцевые (веретённые) и безверетённые прядильные машины. Кольцевые прядильные машины, в свою очередь, подразделяются на основные и уточные. На основных машинах пряжа наматывается на бумажные патроны в паковки (початки) с массой 60–100 г, пряжа с початков перематывается в бобины. На уточных машинах пряжа наматывается на деревянные шпули и используется в таком виде непосредственно на ткацком станке (при использовании в ткачестве челночных ткацких станков). В последние годы появились прядильные кольцевые машины, обеспечивающие высокую степень утонения продукта (вытяжка до 60 или 100). На таких машинах полупродукт может поступать в виде ленты, минуя ровничный переход. Таким образом, кольцевые прядильные машины могут быть ровничные (обычные) и безровничные. Из безверетённых прядильных машин практическое применение в промышленности нашли машины пневмомеханического действия типа БД-200. Также применяются машины роторного прядения (пневмомеханического), механического, электромеханического и гидравлического способов прядения. Прядильные машины любого способа прядения предназначены для утонения продукта (ленты или ровницы) посредством его вытягивания на вытяжных приборах различных конструкций, обеспечивающих вытяжку от 10 до 100; формирование из мычки прочной пряжи с помощью крутильного механизма – веретена и бегунка на кольцевых машинах и пневматической камеры на безверетённых машинах и наматывания изготовленной пряжи на паковку – початок (шпулю) или цилиндрическую бобину. Пряжа – бесконечно длинное тело (нить), состоящее из соединений между собой силами сцепления и крутки текстильных волокон. Совокупность технологических процессов, применяемых для переработки этих волокон в пряжу определённой толщины и прочности – прядение. Совокупность машин и процессов, посредством которых волокна перерабатывают в определённый вид пряжи, называют Системой Прядения. Прядение:- в текстильном производстве хлопок, лен, шерсть, натуральный шёлк и химические волокна перерабатывают в изделия. Совокупность технологических процессов, применяемых для переработки этих волокон в пряжу определённой толщины и прочности – прядение. Совокупность машин и процессов, посредством которых волокна перерабатывают в определённый вид пряжи, называют системой прядения. Задача прядильного процесса – получить из массы хлопковых волокон текстильную нить (пряжу), из которой в дальнейшем можно получить различные текстильные изделия:- ткань, трикотаж, нетканые материалы, нитки и другое. Пряжа – бесконечно длинное тело (нить), состоящее из соединений между собой силами сцепления и крутки текстильных волокон. Различают два типа требований, предъявляемых к пряже:- технологические и эксплуатационные. Технологические требования определяют способность пряжи хорошо перерабатываться при выработке тканей и других изделий, а эксплуатационные – обладать определёнными свойствами в изделии (ткани) при носке. Пряжа должна удовлетворять следующим требованиям:- (i) иметь заданную линейную плотность с минимальными отклонениями и быть ровной по длине, как на малых, так и на больших отрезках. В противном случае снижается качество тканей, ухудшается процесс их выработки или перерасходуется хлопок; (ii) обладать заданной прочностью и минимальной неровнотой по прочности. (iii) обладать заданным удлинением и жёсткостью при растяжении с минимальными отклонениями от этих показателей по длине. Удлинение, особенно упругое, и жёсткость во многом определяют строение ткани и эксплуатационные свойства; (iv) иметь заданную крутку и быть равномерной по крутке. В

связи с тем, что многие свойства пряжи зависят от её крутки, соблюдение этого требования имеет большое значение; и (v) быть чистой, с минимальным количеством сорных примесей и пороков внешнего вида. Нарушение этих требований приводит к повышенной обрывности пряжи при её переработке и снижению качества изделий. Пряжа является законченной продукцией прядильного производства и поэтому контроль её качества в отличие от контроля полуфабриката имеет более важное значение. Каждый вид пряжи должен удовлетворять определённым требованиям, которые записаны в государственных стандартах или технических условиях. Однако на пряже при её выработке по разным причинам появляются пороки (дефекты), снижающие её качество. Для оценки качества пряжи разработаны специальные методы. Качество пряжи оценивается по физико-механическим показателям и по порокам внешнего вида. Кроме того, оценивается качество намотки пряжи на паковку-початок, бобину.

SPINNING COUNT = НУМЕРАЦИЯ ПРЯДЕНИЯ – Spinning Count:- the fineness of which a yarn may be spun. The number of hanks of 560 yds each in length to 1 pound of top. Thus, 1 lb of fine top that will spin 64 hanks is called 64's.

SPINNING FRAME = ПРЯДУЩИЙ СТАН (или ПРЯДУЩАЯ РАМА, или ПРЯДИЛЬНАЯ МАШИНА) – Spinning Frame is a machine used for spinning staple yarn. It drafts the roving to the desired size, inserts twist, and winds the yarn onto a bobbin. The term is generally used to indicate a ring spinning frame, although it does cover flyer spinning and cap spinning on the worsted system. Water Frame is an machine to create cotton thread first used in 1768. It was able to spin 128 threads at a time, making it an easier and faster method than ever before. It was developed by Richard Arkwright, who patented the technology in 1767. The design was partly based on a spinning machine built for Thomas Highs by clock maker John Kay, who was hired by Arkwright. The Spinning Frame or Water Frame was developed by Richard Arkwright who along with two partners patented it in 1769. The design was partly based on a spinning machine built for Thomas High by clock maker John Kay, who was hired by Arkwright. For each spindle, the water frame used a series of four pairs of rollers, each operating at a successively higher rotating speed to draw out the fiber, which was then twisted by the spindle. The roller spacing was slightly longer than the fiber length. Closer spacing caused the fibers to break while further spacing caused uneven thread. The top rollers were leather-covered and loading on them was applied by a weight that kept the twist from backing up before the rollers. The bottom rollers were wood and metal, with fluting along the length. The water frame was able to produce a hard, medium count thread suitable for warp, finally allowing 100% cotton cloth to be made in Britain. A horse powered the first factory to use the spinning frame. Arkwright and his partners used water power at a factory in Cromford, Derbyshire in 1771, giving the invention its name. Richard Arkwright is credited with a list of inventions, but these were actually developed by such people as Thomas Highs and John Kay. Arkwright nurtured the inventors, patented the ideas, financed the initiatives, and protected the machines. He created the cotton mill, which brought the production processes together in a factory, and he developed the use of power – first horse power and then water power – which made cotton manufacture a mechanized industry. / Сэр Ричад Акрайт (Sir Richard Arkwright; 1732–92). Томэс Хайз (Thomas Highs) и Дьжон Кэй (John Kay). Прядильная Машина – машина для получения пряжи из ровницы или ленты. Первая механическая прядильная машина была создана в Великобритании в 1738. В кольцевых (веретённых) прядильных машинах ровница (лента) вытягивается в вытяжном приборе, скручивается и наматывается с помощью веретена и бегунка на патрон или шпулю. В безверетённых пневмомеханических прядильных машинах (были наиболее распространены в конце XX века) ровница (лента) разъединяется на отдельные волокна, которые потоком воздуха подаются в быстровращающуюся камеру, где из них формируется волокнистая ленточка, скручиваемая затем в пряжу, наматываемую на бобину. Производительность безверетённых прядильных машин в 2–3 раза выше, чем кольцевых. Прядильная Машина, вырабатывает пряжу из ровницы или ленты; завершает обработку волокнистого материала в прядильном производстве. По виду используемого волокна различают прядильные машины для прядения хлопка, лубяных волокон, шерсти, шёлковых отходов. Пряжу из химических волокон получают на машинах для натуральных волокон. Основной для прядения всех видов волокон является кольцевая прядильная машина непрерывного действия, на которой выполняются утонение полуфабриката и образование ленточки, скручивание её в пряжу и наматывание последней в паковку. Ровница, сматываемая с катушки, поступает в питающую пару вытяжного прибора. Выходящая из него ленточка скручивается, получаемая пряжа направляется в нитепроводник, проходит через бегунок, надеваемый на кольцо, и затем наматывается па шпулю или патрон, надетые на веретено. Пряжа вырабатывается с коэффициентом крутки 50–140; частота вращения веретён достигает 10 000–12 000 оборотов в минуту (об/мин), диаметр колец 30–60 миллиметров (мм). Зарубежные машины имеют частоту вращения веретён до 15 000–17 000 об/мин. Диаметр колец 30–70 мм. Кольцевые прядильные машины в основном достигли максимальных показателей по производительности и качеству пряжи. Созданы прядильные машины безверетённого прядения, на которых осуществляются дискретизация (разделение на отдельные волокна) питающего продукта, транспортирование дискретного потока волокон, сложение или сгущение их для формирования непрерывного продукта, скручивание в пряжу и её наматывание. Из этих машин наибольшее распространение в промышленности получила пневмомеханическая прядильная машина, разработанная в конце 1960-х Советскими и Чехословацкими специалистами. Лента (или ровница) направляется питающим цилиндром на дискретизирующий (или расчёсывающий) валик, где она разъединяется на отдельные волокна или их группы. Получаемый дискретный поток волокон подаётся воздухом по каналу в быстровращающуюся камеру (30 000–60 000 об/мин). В жёлобе камеры образуется волокнистая ленточка в результате укладки кольцами потока волокон, то есть происходит циклическое сложение, дающее выравнивание линейной плотности дискретного потока в 15–20 раз. Вращение камеры обусловливает наложение крутки на участок сформировавшейся ленточки, перемещающийся от внутренней стенки камеры к отверстию направляющей трубки. Готовая пряжа отводится из камеры выпускными валиками и наматывается на бобину. Пряжа вырабатывается с коэффициентом крутки 160–190. По сравнению с кольцевой пневмомеханическая прядильная машина имеет в 2–3 раза большую производительность при выработке пряжи одинаковой толщины, масса выходных паковок достигает 1.5 килограмма (кг) (паковка аналогичной пряжи с кольцевой прядильной машины весит 120–140 граммов (г)), что позволяет в большинстве случаев использовать пряжу непосредственно в ткацком производстве. Для прядения гребенной пряжи из шерсти и химических волокон созданы прядильные машины с использованием самокруточного прядения. Развитие прядильных машин безверетённого прядения направлено на повышение скорости прядения, усовершенствование дискретизирующих устройств, снижение крутки пряжи при одновременном повышении её прочности, на расширение диапазона толщины вырабатываемой пряжи и автоматизацию съёма готовых бобин. Об истории развития прядильных машин смотрите толкование к термину Прядильное Производство. Прядильно-Крутильная Машина, машина текстильного производства для выработки кручёной нити из различных волокон. Создана в бывшем Союзе Советских Социалистических Республик (СССР) в 1956–61. На прядильно-крутильной машине осуществляется процесс совместного прядения и кручения, разработанный Советским изобретателем Петром Константиновичем Кориковским. Этот процесс объединяет 4 операции – прядение, трощение, кручение и намотку, выполнявшиеся ранее на различных машинах. При работе прядильно-крутильной машины ровница с катушек поступает в вытяжной прибор, где вытягивается в мычку необходимой тонины. Из вытяжного прибора мычка поступает в осевой канал веретена, которым закручивается в пряжу. В этот же канал поступает пряжа с початка, установленного на веретене. В канале веретена происходит трощение выпрядаемой и сматываемой с початка пряжи, а после выхода из канала – их скручивание. Готовая кручёная нить наматывается на бобину.

Прядильно-крутильная машина позволяет повысить скорость кручения и производительность труда, снизить затраты электроэнергии, расходы на амортизацию оборудования.

SPINNING JENNY = ПРЯДУЩАЯ ДЬЖЕНИ – The Spinning Jenny is a multi-spool spinning frame. It was invented in 1764 by James Hargreaves in Stanhill, Oswaldtwistle, Lancashire in England. The device reduced the amount of work needed to produce yarn, with a worker able to work eight or more spools at once. This grew to 120 as technology advanced. The Spinning Jenny is attributed to James Hargreaves. He was born in Oswaldtwistle, near Blackburn, around 1720. Blackburn was a town with a population of about 5 000, known for the production of 'Blackburn greys', cloths of linen warp and cotton weft. They were usually sent to London to be printed. At the time cotton production could not keep up with demand, and Hargreaves spent some time considering how to improve the process. The flying shuttle had increased yarn demand by the weavers by doubling their productivity, and now the Spinning Jenny could supply that demand by increasing the spinners' productivity even more. The machine produced coarse yarn. The idea was developed as a metal frame with eight wooden spindles at one end. A set of eight rovings was attached to a beam on that frame. The rovings when extended passed through two horizontal bars of wood that could be clasped together. These bars could be drawn along the top of the frame by the spinners left hand thus extending the thread. The spinner used his right hand to rapidly turn a wheel which caused all the spindles to revolve, and the thread to be spun. When the bars were returned, the thread wound onto the spindle. A pressing wire (faller) was used to guide the threads onto the right place on the spindle. In the XVII century, England was famous for its woollen and worsted cloth. That industry was centered in the east and south in towns such as Norwich which jealously protected their product. Cotton processing was tiny:- in 1701 only 1 985 868 pounds (900 775 kg) of cotton-wool was imported into England, and by 1730 this had fallen to 1 545 472 pounds (701 014 kg). This was due to commercial legislation to protect the woollen industry. Cheap calico prints, imported by the East India Company from 'Hindustan', became popular. In 1700 an Act of Parliament was passed to prevent the importation of dyed or printed calicoes from India, China or Persia. This caused grey cloth (calico that hadn't been finished – dyed or printed) to be imported instead, and these were printed in southern England with the popular patterns. Lancashire businessmen produced grey cloth with linen warp and cotton weft, which they sent to London to be finished. Cotton-wool imports recovered and by 1720 were almost back to 1701 levels. Again the woollen manufacturers, in true protectionist style, claimed this was taking jobs from workers in Coventry. Another law was passed, to fine anyone caught wearing printed or stained calico; muslins, neckcloths and fustians were exempted. It was this exemption that the Lancashire manufacturers exploited. The use of colored cotton weft, with linen warp was permitted in the 1736 Manchester Act. There now was an artificial demand for woven cloth. In 1764, 3 870 392 pounds (1 755 580 kg) of cotton-wool was imported. In England, before canals, and before the turnpikes, the only way to transport goods such as calicos, broadcloth or cotton-wool was by packhorse. Strings of packhorses travelled along a network of bridleways. A merchant would be away from home most of the year, carrying his takings in cash in his saddlebag. Later a series of chapmen would work for the merchant, taking wares to wholesalers and clients in other town, with them would go sample books. Before 1720, the handloom weaver spent part of each day visiting neighbours buying any weft they had. Carding and spinning could be the only income for that household, or part of it. The family might farm a few acres and card, spin and weave wool and cotton. It took three carders to provide the roving for one spinner, and up to three spinners to provide the yarn for one weaver. The process was continuous, and done by both sexes, from the youngest to the oldest. The weaver would go once a week to the market with his wares and offer them for sale. A change came about 1740 when fustian masters gave out raw cotton and warps to the weavers and return to collect the finished cloth. The weaver organized the carding, spinning and weaving to the master's specification. The master then dyed or printed the grey cloth, and took it to shopkeepers. Ten years later this had changed and the fustian masters were middle men, who collected the grey cloth and took it to market in Manchester where it was sold to merchants who organized the finishing. To handweave a 12 pounds (5.4 kg) piece of eighteenpenny weft took 14 days and paid 36 shillings in all. Of this nine shillings was paid for spinning, and nine for carding. So by 1750, a rudimentary manufacturing system feeding into a marketing system emerged. In 1738 John Kay started to improve the loom. He improved the reed, and invented the raceboard, the shuttleboxes and the picker which together allowed one weaver to double his output. This invention is commonly called the Fly-Shuttle. It met with violent opposition and he fled from Lancashire to Leeds. Though the workers thought this was a threat to their jobs, it was adopted and the pressure was on to speed up carding and spinning. The shortage of spinning capacity to feed the more efficient looms provided the motivation to develop more productive spinning techniques such as the Spinning Jenny, and triggered the start of the Industrial Revolution. Hargreaves kept the machine secret for some time, but produced a number for his own growing industry. The price of yarn fell, angering the large spinning community in Blackburn. Eventually they broke into his house and smashed his machines, forcing him to flee to Nottingham in 1768. This was a center for the hosiery industry, and knitted silks, cottons and wool. There he set up shop producing Jennies in secret for one Mr Shipley, with the assistance of a joiner named Thomas James. He and James set up a textile business in Mill Street. On 12 July 1770, he took out a patent (no. 962) on his invention, the Spinning Jenny – a machine for spinning drawing and twisting cotton. By this time a number of spinners in Lancashire were using copies of the machine, and Hargreaves sent notice that he was taking legal action against them. The manufacturers met, and offered Hargreaves £3 000. He at first demanded £7 000, and stood out for £4 000, but the case eventually fell apart when it was learned he had sold several in the past. The Spinning Jenny succeeded because it held more than one ball of yarn, making more yarn in a shorter time and reducing the overall cost. The Spinning Jenny would not have been such a success if the flying shuttle had not been invented and installed in textile factories. Its success was limited in that it required the rovings to be prepared on a wheel, and this was limited by the need to card by hand. It continued in common use in the cotton and fustian industry until about 1810. The Spinning Jenny was superseded by the spinning mule. The Jenny was adapted for the process of slubbing, being the basis of the Slubbing Billy. The most common story told about the invention of the device and the origin of the Jenny in the machine's name is that a daughter (or his wife) named Jenny knocked over one of their own spinning wheels. The device kept working as normal, with the spindle now pointed upright. Hargreaves realized there was no particular reason the spindles had to be horizontal, as they always had been, and he could place them vertically in a row. The name is variously said to derive from this tale. The Registers of Church Kirk show that Hargreaves had several daughters, but none named Jenny (neither was his wife). A more likely explanation of the name is that 'Jenny' was an abbreviation of 'Engine'. Thomas Highs of Leigh has also claimed to be the inventor and the story is repeated using his wife's name. Thomas Earnshaw invented a spinning device of a similar description – but destroyed it fearing he might be taking bread out of the mouths of the poor. Spinning Jenny is an early spinning machine having more than one spindle, enabling a person to spin a number of yarns simulatenously. Spinning Jenny is a multi-spindle spinning frame, one of the key developments in the industrialization of weaving during the early Industrial Revolution. It was invented in 1764 by James Hargreaves in Stanhill, Oswaldtwistle, Lancashire in England. The device reduced the amount of work needed to produce yarn, with a worker able to make eight or more spools at once. In 1764, James Hargreaves invented the Spinning Jenny, which he patented in 1770. It was the first practical spinning frame with multiple spindles. The spinning frame or water frame was developed by Richard Arkwright who along with two partners patented it in 1769. The design was partly based on a spinning machine built for Thomas High by clock maker John Kay, who was hired by Arkwright. Key Inventions:- The textile industry drove groundbreaking scientific innovations. The Flying Shuttle was patented in 1733 by John Kay and saw a number of subsequent improvements including an important one in 1747 that doubled the output of a weaver It became widely used around Lancashire after 1760 when John's son, Robert, designed a method for deploying multiple shuttles simultaneously, enabling the use of wefts of more than one color and making it easier for the weaver to produce cross-

striped material. These shuttles were housed at the side of the loom in what became known as the Drop Box. Lewis Paul patented the roller spinning frame and the flyer-and-bobbin system for drawing wool to a more even thickness. The technology was developed with the help of John Wyatt of Birmingham. Paul and Wyatt opened a mill in Birmingham, which used their new rolling machine powered by a donkey. In 1743, a factory opened in Northampton with 50 spindles on each of five of Paul and Wyatt's machines. It operated until about 1764. A similar mill was built by Daniel Bourn in Leominster, but it burnt down. Both Paul and Bourn patented Carding Machines in 1748. Based on two sets of rollers that traveled at different speeds, these were later used in the first cotton spinning mill. Lewis's invention was advanced and improved by Richard Arkwright in his Water Frame and Samuel Crompton in his Spinning Mule. In 1764 in the village of Stanhill, Lancashire, James Hargreaves invented the Spinning Jenny, which he patented in 1770. It was the first practical spinning frame with multiple spindles. The Jenny worked in a similar manner to the spinning wheel by first clamping down on the fibers then drawing them out, followed by twisting. It was a simple, wooden-framed machine that cost only about £6 for a 40-spindle model in 1792 and was used mainly by home spinners. The Jenny produced a lightly twisted yarn only suitable for weft, not warp. The device reduced the amount of work needed to produce yarn, with a worker able to work eight or more spools at once. This grew to 120 as technology advanced. / привоз (importation). Прядильный станок периодического действия. Дьжеймз Хагрэйвз (James Hargreaves; 1720–78). Хиндюстан (Hindustan). Дьжон Кэй (John Kay). Г-н Шипли (Mr Shipley). Томэс Дьжеймз (Thomas James). Томэс Хайз (Thomas Highs) из . Томэс Иншо (Thomas Earnshaw) изобрёл прядильное устройство похожего описания, но разрушил его, побоявшись, что он . Дьжени (Jenny).

SPINNING MULE = ПРЯДУЩИЙ ГИБРИД (или ПРЯДУЩИЙ МУЛ) – Samuel Crompton's Spinning Mule, introduced in 1779, was a combination of the Spinning Jenny and the Water Frame. Crompton's mule spun thread was of suitable strength to be used as warp and finally allowed Britain to produce good-quality calico cloth. Edmund Cartwright developed a vertical power loom that he patented in 1785. Samuel Horrocks and Richard Roberts successively improved Crompton's invention. The textile industry was also to benefit from other developments of the period. In 1765, James Watt modified Thomas Newcomen's engine (based on Thomas Savery's earlier invention) to design an external condenser steam engine. Watt continued to make improvements on his design, producing a separate condenser engine in 1774 and a rotating separate condensing engine in 1781. Watt formed a partnership with a businessman Matthew Boulton and together they manufactured steam engines that could be used by industry. With Cartwright's loom, the spinning mule, and Boulton and Watt's steam engine, the pieces were in place to build a mechanized textile industry. From this point there were no new inventions, but a continuous improvement in technology as the mill-owner strove to reduce cost and improve quality. Steam engines were improved, the problem of line-shafting was addressed by replacing the wooden turning shafts with wrought iron shafting. In addition, the first loom with a cast-iron frame, a semiautomatic power loom, and, finally a self-acting mule were introduced. Spinning Mule is a machine used to spin cotton and other fibers in the British mills, used extensively from the late 18th to the early 20th century. It was invented between 1775 and 1779 by Samuel Crompton. The machines were worked in pairs by a minder, with the help of two boys:- the little piecer and the big or side piecer. The carriage carried up to 1 320 spindles and could be 150 feet (46 m) long; it could move forward and back a distance of 5 feet (1.5 m) four times a minute. See also Spinning Jenny, and Water Frame. Samuel Crompton's Spinning Mule, introduced in 1779, was a combination of the Spinning Jenny and the Water Frame. The spindles were placed on a carriage that went through an operational sequence during which the rollers stopped while the carriage moved away from the drawing roller to finish drawing out the fibers as the spindles started rotating. Crompton's mule was able to produce finer thread than hand spinning at a lower cost. Mule spun thread was of suitable strength to be used as warp and finally allowed Britain to produce good-quality calico cloth. The Spinning Mule spins textile fibers into yarn by an intermittent process. In the draw stroke, the roving is pulled through rollers and twisted. On the return it is wrapped onto the spindle.

SPINNING QUALITY = КАЧЕСТВО ДЛЯ ПРЯДЕНИЯ – Spinning Quality:- the ease with which fibers lend themselves to yarn-manufacturing processes.

SPINNING RESERVE = ВРАЩАЮЩИЙСЯ РЕЗЕРВ – Spinning Reserve:- that reserve generating capacity running at a zero load and synchronized to the electric system. Spinning Reserve:- reserve capability which is required in order to enable an area to restore its tie lines to the pre-contingency state within 10 minutes of a contingency that causes an imbalance between load and generation. During normal operation, these reserves must be provided by increasing energy output on electrically synchronized equipment or by reducing load on pumped storage hydroelectric facilities. During system restoration, customer load may be classified as spinning reserve. / Вращающийся Резерв – резерв в генераторах, присоединённых к шинам и готовых к принятию нагрузки.

SPINNING SOLUTION = ПРЯДИЛЬНЫЙ РАСТВОР (или ПРЯДИЛЬНЫЙ РАСПЛАВ) – Spinning Solution is a solution of a fiber-forming polymer (e.g., cellulose acetate) in a suitable condition to be extruded by either dry spinning or wet spinning. / ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate).

SPINNING TOP = ВЕРШИНА В КОЛЮЧКАХ – Candlestick lines that have small bodies with upper and lower shadows that exceed the length of the body. Spinning tops signal indecision.

SPINNING TWIST = КРУТКА ПРИ ПРЯДЕНИИ – Spinning Twist is the twist added to yarn during spinning to give it strength and other desired characteristics.

SPINNING WASTES = ОТХОДЫ ПРЯДЕНИЯ – From the Roving Frames, the twisted rope-like strands are moved on bobbins to the Spinners. From hereon, the go through successive operations involving Spinning, Winding and Spooling. Wastes from this process consist of ends of the Rovings and of the soft and hard threads. Sized hard threads and conically-shaped masses of matted soft and hard threads are also thrown off. The wastes from the Spinning Room are known as Cops, Noils, Slasher, Spoolers, and Thread Waste. List Of Waste In Cotton Spinning Mill With Percentage:- (1) Blow-room of waste – 3%; (2) Carding of waste – 3–5%; (3) Draw frame of waste – 0.5%; (4) Lap former of waste – 0.5%; (5) Comber of waste – 12–18%; (6) Simplex of waste – 0.5%; (7) Ring frame of waste – 2–3%; and (8) Winding section of waste – 1%. Major Factors For Waste Generation In Spinning Mill:- (i) errors and mistakes during weighing; (ii) loose cotton falling from bales while transportation; (iii) rejection from faulty work; (iv) poor sliver can topping and replenishing procedure; (v) poor housekeeping; (vi) quality standards not met; (vii) poor work practices; (viii) improper material handling; (ix) poor condition and performance of machines; and (x) higher end breakage rate and lapping tendency. Blow Room Waste:- Amount of waste extracted in blow room is mostly determined by the trash level in cotton. The cleaning at blow room should always be considered along with the following things:- (1) The cleaning efficiency of blow room machines for, seed coats is much less than for leafy matter and sand dust taken together. (2) The cleaning efficiency and waste increases as trash content increases. (3) No aspect of yarn quality other than neps and foreign matter is influenced by the quality of blow room processing. (4) An optimum level of opening is essential for cleaning of cotton. Improving Cleaning Efficiency And Reducing Waste At Blow Room:- To improve cleaning efficiency of beater, first examine the mechanical condition of machine, spikes on krischner beater, blades and fingers on bladed and porcupine openers and repair or replace as required. The inter grid bars space should be check for any chock up. The Waste Is Affected By Changes Such As:- (i) distance between the grid bars and the angle of inclination of bars; (ii) speed of beater; (iii) fan speed in relation to the beater speed; (iv) setting between feed rollers and beaters; and (v) setting between beater and brid bars.

Carding Waste:- Waste extracted in cards is usually in the range of 4–7%, depending upon the type of card and mixing. Between the same type of cards and mixing, the waste % should not vary more than 0.5% from the average. The card waste is also governed by the cleaning efficiency achieved in blow room. Thus, while assessing the waste, combined waste extracted in blow room and cards should be taken into account. The Behavior Of Waste And Cleaning At Cards Depends On The Following Considerations:- (i) The total collected waste at card does not show any close relationship with the trash in the lap feed to the card. (ii) The cleaning efficiency achieved in mills is about 80% for most mixing. However, for fine and superfine mixing for which very high flat speed and low production rates are employed, a cleaning efficiency of 85% or more is achieved. The overall effect is that the lint loss in card waste will increases with decreasing trash content in lap. (iii) There is a tendency for the card to compensate for any lack of cleaning in blow room. The overall cleaning efficiency achieved in the blow room and the card taken together remains within a narrow range of 93–95%. Controlling The Waste At Carding:- The following facts should be kept in mind while controlling the waste and cleaning at cards:- (1) use of only one mote knife, placed slightly below the normal position of the top mote knife to give less waste and better cleaning in cotton mixing; (2) higher lickerin speed or greater wire point density on lickerin gives higher cleaning efficiency accompanied by some increase in the lint lost under the lickerin; (3) use of perforated undercasing helps in reducing waste; (4) with other speeds and setting held constant, the flat strip waste varies almost proportionately with the flat speed; (5) wider front plate and back plate setting increases flat strip waste; (6) for controlling cleaning of the card, almost the only place is the lickerin region; (7) card is excellent cleaning machine for seed coats especially the cylinderflat region which removes 80% of the seed coats; and (8) the tandem card gives 5–7% higher cleaning efficiency and better removal of seed coats. Waste can be controlled by maintaining the correct setting in the licker-in zone and carding zone. The waste % to be removed in the carding process depends on the process and quality requirements of the product. Cylinder to cylinder undercasing setting influences air currents and leads to fly generation, and too wide setting causes the loss of fibers. Closer setting of licker-in to licker-in undercasing increases the good fiber loss with waste. If the setting between the feed plate and licker-in is too close, more lint loss will occur, and it will increase the waste%. The speed of the flat is also directly related to the amount of waste removed in the form of flat strips; that is, the higher the flat speed, the heavier the flat strips. Comber Waste:- One of the main functions of combing is to remove short fibers through taking out a certain amount of comber waste. The waste thus removed also contains a large number of neps and foreign matter. Obviously, combing is not required for manmade fibers as they are free from short fibers and foreign matter. A higher % of comber waste need not always means that better removal of short fibers and neps, and therefore may not always be advantageous either for yarn quality or performance beyond a certain level. Technological Consideration:- For an effective removal of short fibers, retention of long fibers and removal of neps, the following considerations are of up-most importance:- (1) The card trailing hooks are longer and more numerous than the leading hooks. They are removed when fed as leading hooks by keeping an even number of reversals between the cards and the comber. (2) The waste at comber can be reduced by increasing pre-comber draft without affecting the resultant yarn quality. However, a high comber draft also results in extremely low inter fiber cohesion causing excessive lap linking, frequent sliver breaks at comber, draw frame and the can feed inter creel. Therefore, a pre-comber draft of 30–40 for counts upto 40s is adequate. Pre-comber draft of above 20 is suitable only for very long staple cottons. (3) The proper place for controlling neps is carding and no combing. It is often more economical to run cards at somewhat low production rate than to take out extra comber waste. The Waste At Comber Needs To Check And Controlling Due To The Following Reasons:- (i) more waste other than the nominal means financial loss; (ii) less waste other than the nominal could lead to unacceptable yarn quality and performance; and (iii) comber waste variation could contribute to lea count variation. Ring Frame Waste:- At many stages of spinning process waste is removed to clear the cotton or to separate the short fibers but at the stage of ring spinning there is no need to remove waste. This step is exclusively for drafting twisting and packing the yarn in the shape of bobbin. Whatsoever material is wasted here is because of our inability to control the machine, process or processing condition. Thus to control the waste we have to control all factors. Factors Responsible For Waste Generation In Ring Frame:- (i) yarn breakage rate; (ii) time taken in attending to the yarn breakage; (iii) working practice and culture; (iv) housekeeping and material handling; (v) mechanical breakdown and failures; and (vi) methods of attending to the break downs. Waste Control In Ring Frame:- This is done in the following steps:- (1) analysis and segregation of the waste of different types; (2) weigh that waste and recording that section wise, person wise, shift wise; (3) comparison with the standards; and (4) feed backs and action to improve waste generation. Control Of Hard Waste:- Waste generated in the yarn manufacturing process can be classified into soft waste and hard waste. Reusable wastes such as sliver, lap bits, roving ends, and pneumafil waste are normally termed as Soft Waste. Yarn waste obtained from ring frame and winding department is not reusable, hence it is called as Hard Waste. The occurrence of hard waste must be controlled as it affects the productivity of the spinning mill. Hard waste generation in winding department must be less than 1%. The Various Causes Of Hard Waste Generation Are:- (i) over end piecing of yarns while attending end breakage during doffing; (ii) control of end breakage immediately after doffing; (iii) reducing the cop rejection % in winding; (iv) adopting proper material handling procedures; and (v) proper work practices in ring frame and winding. In many mills, there is good scope for improving yarn realisation and reducing wastes. Because in the spinning mill wastes are generated in more amount and it can be controllable and reducible at some extent. For controlling waste in spinning mill need waste investigation. The waste investigation should be done in order to take preventive measure as well as to take action where abnormality is noted in processes. Investigate the existing system of waste collection for different types of waste. Follow up waste collection procedure. More effective and reliable method of collecting and reporting of wastes could be considered where there is malfunctioning. Besides for reducing waste and control in spinning mill these steps may taken. Such as investigation of waste problems, suggestions needed, work out details, and set-up control. I think these will be effective to control waste in spinning mill. / концов ровниц или ровничных концов (Rovings).

SPINNING WHEEL = ПРЯДУЩЕЕ КОЛЕСО (или ПРЯЛКА, или САМОПРЯЛКА) – Spinning Wheel is a device used for spinning fiber into yarn or thread, consisting essentially of a single spindle drive by a large wheel (see also Great Wheel) or a flyer unit driven by a treadle.

SPIN OFF = РАЗМЕЖЕВАНИЕ (или ОТДЕЛЕНИЕ) – Spin Off is a sale of a subsidiary so that it becomes a separate company. Ordinarily, the parent corporation distributes shares in the subsidiary to its own shareholders, who then become the new company's owners. Also known as Split-Up in the United Kingdom. The separation of a subsidiary or division of a corporation from its parent by issuing shares in a new corporate entity. Shareowners in the parent receive shares in the new company in proportion to their original holding and the total value remains approximately the same.

SPIN–ON FILTER = ЦЕНТРОБЕЖНЫЙ ФИЛЬТР – Spin-On Filter:- a throw-away type bowl and element assembly that mates with a permanently installed head. See also Filter. Spin-On Filters (low pressure) are used as process and safety filters to protect individual pumps, valves or the entire hydraulic circuit from contamination as per ISO 4406. Operating pressure 12 bar. In-line Spin-On Filters can be used for the following purposes:- (i) suction filters; (ii) on the return circuit, for mounting on the line or on the tank cover; and (iii) in-line for low pressure. Spin-On filters are available in 4 configurations:- (i) single cartridge in-line; (ii) in-line with two parallel cartridges on the same axis; (ii) in-line with two parallel cartridges mounted side by side; and (iv) with single cartridge flange for installation to the tank cover. All versions may be equipped with visual and/or electrical blockage indicators. Spin-On Filters (high pressure) are used as process and safety filters to protect individual pumps, valves or the entire hydraulic circuit from contamination as per ISO 4406.

Operating pressure 35 bar. In-line Spin-On Filters can be used for the following purposes:- (i) on the return circuit, for mounting on the line or on the tank cover; and (ii) in-line for low and medium pressures. Spin-On filters are available in single cartridge in-line. All versions may be equipped with visual and/or electrical blockage indicators.

SPINSTER = ПРЯДИЛЬЩИК – Spinster:- a spinner whose occupation is spinning. Updated to be politically correct.

SPIRACLES = ДЫХАЛЬЦА (или XX) – Spiracles are breathing pores; any of several tracheal openings in the exoskeleton of an insect. / в наружном скелете насекомого.

SPIRAL = СПИРАЛЬНОЕ – Spiral:- corkscrew-shaped. Of leaves or other parts arranged around a stem or other structure with the spirals in Fibonacci number ratios. See also Leaf. / Спиральное:- в форме штопора. О листьях или иных органах, расположенных вокруг стебля или о иной структуре со спиралями в соотношениях с числами Фибоначчи. Смотрите также Лист (Leaf). Под Спиральным, от Греческого слова Spéria, означающее Виток, понимается кривое, закручивающееся вокруг точки на плоскости или вокруг оси.

SPIRAL CLEANER = СПИРАЛЬНЫЙ ОЧИСТИТЕЛЬ – The Spiral Cleaner removes flat seeds from yellow mustard seed.

SPIRALITY = СПИРАЛЬНОСТЬ – Spirality:- over twisted yarn. Spirality; wale spirality:- a distortion in a weft-knitted fabric in which the wales are clearly not at right angles to the courses. Note:- this defect is caused by twist-lively yarn (due to insufficient setting). Knitted fabric defect. Fabric Spirality:- distortion of plain knitted fabric. Wales are not perpendicular to courses. Causes:- (i) yarn twist too high; (ii) number of feeder to high; and (iii) bad combination between yarn twist direction and machine rotation direction. Solutions:- (i) control of yarn twist (yarn twist should never be above 700 tr/m); (ii) reduction of feeders number; (iii) use of Z-twist yarn with machines having needles watch rotation direction, and vice versa; and (iv) appropriate finishing reduces fabric spirality. / Порок или дефект.

SPIRAL YARN = СПИРАЛЬНАЯ ПРЯЖА – Spiral Yarn is a specialty yarn made by winding heavier, slackly twisted yarn around a finer yarn with a hard twist to give a slubby appearance. / Спиральная Пряжа – пряжа фасонной крутки.

SPIROPLASMA = СПИРОПЛАЗМА – Spiroplasma:- pleomorphic, wall-less microorganisms that are present in the phloem of diseased plants. They are often helical in culture and are thought to be a kind of mycoplasma. / Плеоморфные, безперегородочные или безстеночные микроорганизмы, которые представлены . Под Спироплазмой, от Латинского слова Spiro, означающее Дую или Дышу, и Греческого слова Plásma, означающее Вылепленное или Оформленное, понимается . Спироплазма – спиралевидная, подвижная бактерия, напоминающая спирохеты, но лишённая в отличие от последних клеточной стенкию Спироплазмы являются возбудителями некоторых заболеваний растений, а также внутриклеточными симбионтами различных видов насекомых (в частности, присутствие спироплазм летально для самцов Дрозофил, являющихся потомками заражённых самок).

SPITALFIELDS = СПИТЭЛФИЛДЗ – Spitalfields is an English town and the home of Huguenot weavers, it is now a lace-making center. In this town, the hand-woven Jacquard silk Spitalfields tie originated. Spitalfields is a former parish in the borough of Tower Hamlets, in the East End of London, near to Liverpool Street station and Brick Lane. The Liberty of Norton Folgate and the neighbouring Liberty of the Old Artillery Ground were merged into Spitalfields in 1921. The area straddles Commercial Street and is home to several markets, including the historic Old Spitalfields Market, and various Brick Lane Markets on Brick Lane and Cheshire Street. Petticoat Lane Market lies on the area's south-western boundaries. / Жакяр (Jacquard). нескольких рынков, включая Старый Спитэлфилдзский Рынок (Old Spitalfields Market) – тайник модников и модниц, и . Спитэлфилдз – район в Ист Энде, Лондон. Брик Лэйн (Brick Lane) и Чэша (Cheshire Street). Рынок Пэтикот Лэйн (Petticoat Lane Market).

SPLASH LUBRICATION = СМАЗЫВАНИЕ РАЗБРЫЗГИВАНИЕМ – Splash Lubrication is a system of lubrication in which parts of a mechanism dip into and splash the lubricant onto themselves and/or other parts of the mechanism. See also Lubrication.

SPLASH YARN = XX ПРЯЖА – Splash Yarn is an elongated nub yarn that has been tightly twisted around a base yarn.

SPLICE = СПЛЕСЕНЬ (или СРОСТОК) – Splice (maritime term):- the joining of two ends of a rope or ropes by so intertwining the strands, as but slightly to increase the diameter of the rope. / Сросток кабеля.

SPLICES = СПЛЁТКИ (или СТРОСТКИ, или СРАЩИВАНИЯ) – Splices:- rolls can be composed of several spliced parts. Rolls shall be accepted that contains splices less than that agreed between mill and factory. In case of piece goods, the fabric length and the number of splices / roll are strictly followed as per the requirement between mill and factory.

SPLICING = СРАЩИВАНИЕ (или СПЛЁТКА, или СТРОСТКА) – Splicing is:- (1) the joining of two ends of yarn or cordage. There are several methods used, e.g., by interweaving the strands, by the use of knots, by tapering, lapping, and cementing the ends, etc. (2) A method of reinforcing knits, e.g., the heels and toes of hosiery, by introducing an additional yarn for strength. / Введение в носок и пятку особой пряжи для увеличения прочности чулка.

SPLINTER = ЗАУСЕНИЦЫ – Splinter:- two or more staple fibers adhering together, causing a stiff cluster that resists pulling apart in normal processing, and reacting in the yarn spinning process similarly to higher than nominal denier fiber.

SPLINTER COUNT = ПОДСЧЁТ ЗАУСЕНИЦ – Splinter Count is a measure of the number of coalesced fibers, mealy particles, or other such matter in staple fiber.

SPLIT = ДРОБЛЕНИЕ – Split is a division of a corporation's outstanding shares of stock into a larger number of shares, without any change in total shareholders' equity. As a result, the price of each share and dividends per share decline proportionately. The division of a stock into multiple shares. In a 2-for-1 split, the stockholder's shares will double in quantity, though the value of each stock will be halved. A stock split is usually an attempt to make high stock prices seem more attractive to investors and generally occurs in the face of new highs. The division of the outstanding shares of a corporation into either a larger or smaller number of shares, without any immediate impact in individual shareholder equity. For example, a 3-for-1 forward split by a company with 1 million shares outstanding results in 3 million shares outstanding. Each holder of 100 shares before the split would have 300 shares worth less, although the proportionate equity in the company would stay the same. A reverse split would reduce the number of shares outstanding and each share would be worth more. Division of a share into several shares with smaller par values to make trading more liquid. The opposite of Reverse Split. See also Reverse Split, and Stock Split. / Смотрите также Объединение или Обратное Дробление (Reverse Split) и Дробление Капитала (Stock Split).

SPLIT = ЗУБ БЁРДА (или ТРЕЩИНА, или ЩЕЛЬ, или РАСЩЕЛИНА, или ПРОРЕЗЬ, или РАЗРЕЗНАЯ КРОМКА) – In textile, Split:- xxxxx. See also Reed. / Зуб Бёрда – промежуток между двумя соседними зубьями.

SPLIT APPLICATION = ДРОБНОЕ ВНЕСЕНИЕ – Split Application is an application of chemical or fertilizer divided into two or more parts and applied at given intervals.

SPLIT–AWAY CHASSIS = РАЗДЕЛЯЮЩЕЕСЯ ШАССИ – Split-Away Chassis is a 40’ chassis constructed so that it detaches at midpoint and becomes two 20’ chassis, each fitted with tie down corner fittings for receiving and securing a 20’ container. The two single-axle bogies work in tandem when the chassis are joined together to form a 40’ unit, but separate (one under each chassis) when the unit is split into two, 20’ chassis.

SPLIT BILL OF LADING = РАЗДРОБЛЕННЫЙ КОНОСАМЕНТ – Split Bill Of Lading is ane of two or more bills of lading (B/L’s) which have been split from a single bill of lading.

SPLIT CAPITAL INVESTMENT TRUST = ИНВЕСТИЦИОННЫЙ ТРЕСТ С РАЗДЕЛЬНЫМ КАПИТАЛОМ (или ХХ) – Split Capital Investment Trust is an investment trust where the ordinary share capital consists of income shares and capital shares. Holders of income shares receive all (or most) of the distributed income while holders of capital shares receive little or no income but receive the residual value of the assets after income shares have been redeemed at a fixed value when the trust is wound up.

SPLIT CLOSE = ДРОБЛЕНИЕ ПО ЗАКРЫТИИ – Split Close is a condition that refers to price differences in transactions at the close of any market session. / Условие, относящееся к разнице в ценах сделок по закрытии любой сессии того или иного рынка.

SPLIT–COUPON BOND = ОБЛИГАЦИЯ С РАЗДРОБЛЕННЫМИ КУПОНАМИ – For a Split-Coupon Bond, the interest rate does not remain constant over the entire term. However, the amount of interest earned is fixed in advance and does not depend on developments on the capital markets. The interest rate changes according to a schedule agreed at the time of issue. The agreement generally provides for several interest-free years with an above-average coupon for the remaining years.

SPLIT–DRAFT MÉTIER = СТАНОК, РАЗДЕЛЯЮЩИЙ ХХ – Split-Draft Métier is an extrusion cabinet for dry spinning in which the drying medium (hot air) is introduced between the jet and the yarn outlet and flows in both directions. See also Split-Flow Métier. / Экструзия или Выдавливание (Extrusion). outlet = припуск сверх шва.

SPLIT END = РАЗДЕЛЁННАЯ (или РАССЛОЕННАЯ) ПРОДОЛЬНАЯ НИТЬ – Split End is:- (1) a defect in fabric caused by breakage of some of the singles yarns in a plied warp yarn. (2) A defect in manufactured filament yarn caused by breakage of some of the filaments. See also Broken Filament. / филаментная (комплексная) пряжа (filament yarn).

SPLIT FILAMENTS = ПЕРЕВИВОЧНЫЕ (или РАЗДЕЛЁННЫЕ, или РАССЛОЕННЫЕ, или ИЗОДРАННЫЕ) (ЭЛЕМЕНТАРНЫЕ) НИТИ – Split Filaments:- xxxxx. See also Broken Filament. Fabrics defect.

SPLIT–FLOW MÉTIER = СТАНОК, РАЗДЕЛЯЮЩИЙ ПОТОК – Split-Flow Métier:- xxxxx. See also Split-Draft Métier.

SPLIT MONTH BILLING = ВЫСТАВЛЕНИЕ СЧЁТОВ С РАЗБИВКОЙ ПО МЕСЯЦАМ – Split Month Billing is a variation on monthly billing. The client is charged:- a ‘regular’ rate for inbound storage in the first half of the month; and a ‘reduced’ rate (i.e. 50% discount) for inbound storage with a receipt date after the 15th of the month. This billing option can address client resistance to monthly billing (having to pay for a whole month’s storage for inbound stock that arrives later in the month).

SPLIT ORDER = РАСПОРЯЖЕНИЕ НА ДРОБЛЕНИЕ – Split Order:- a large securities transaction that is divided into smaller orders that are spread out over some period of time to avoid large fluctuations in the market price. / Крупная сделка с ценными бумагами, распределённая на небольшие распоряжения, рассчитанные на исполнение в течение какого-то периода времени таким образом, чтобы избежать резких флуктуаций (колебаний) цен на этом рынке.

SPLIT–PLOT DESIGN = ДИЗАЙН РАСЩЕПЛЁННЫХ ДЕЛЯНОК (или ДРОБНО–ДЕЛЯНОЧНАЯ СХЕМА) – Split-Plot Design is an experimental design that can be used only for factorial experiments. It divides factors into two groups, one assigned to main plots and another to subplots. The precision of the measurement of effects related to the main plot factors is sacrificed to improve that of the subplot factors.

SPLIT SHIPMENT = РАЗДРОБЛЕННАЯ ОТГРУЗКА – Split Shipment is a partial shipment where the remainder of the order is on backorder and the warehouse cannot fulfill the entire request.

SPLIT–STITCH = РАЗРЕЗАННЫЙ СТЕЖОК – Split-Stitch:- in knitted fabrics, a stitch in which one part of the yarn is knit and the other part is dropped. Fabrics defect.

SPLITTER = ДЕЛИТЕЛЬ (или РАСКОЛЬЩИК, или РАСКРЫВЩИК) – Splitter (colloquial) is one who takes a narrow view of a genus, dividing up variant forms into individual species. / род (genus), .

SPLITTING = РАЗДЕЛЕНИЕ (или РАССЕЧКА, или РАСКАЛЫВАНИЕ, или РАСЩЕПЛЕНИЕ) – Splitting:- (1) in the processing of tow, a defect in which the integrity of opened tow is disturbed by separation or division into two or more segments longitudinally. Splitting can be continuous or intermittent, long or short term. (2) In slashing, the separation of sized yarn ends before takeup on the slasher beam. / Под Рассечкой понимается распространённый порок в виде раздвинутых нитей основы из-за нарушения плотности зубьев бёрда.

SPLIT YARN = ИЗОДРАННАЯ (или ОБОРВАННАЯ) ПРЯЖА – Split Yarn is the yarn which appears in the fabric as a thin yarn. Note:- this defect is often caused by abrasion or excessive tension during winding or weaving which breaks a part of the yarn (e.g., a filament of a continuous-filament yarn or a ply of a two-fold yarn) that is subsequently held back during weaving. / Оборванная Нить В Кручёной Нити (split yarn):- порок кручёной пряжи в тканых полотнах в виде участка, на котором отсутствует одна или более составляющих нитей. Примечание:- порок возникает в результате трения, или чрезмерного натяжения кручёной нити во время перематывания или ткачества, которые приводят к разрыву составляющих нитей.

SPODOPTERA LITTORALIS (BOISDUVAL) = СПОДОПТЭРА ЛИТТОРАЛИС (БОЙСДУВАЛ) – Spodoptera Littoralis larvae feed mainly on leaves and stems and can seriously retard growth or reduce production of the cotton crop. During heavy infestations, however, they can also penetrate flowers and bolls. The genus Spodoptera includes many species which constitute pests of economic importance for different crops, in different countries. In Brazil, the main species is Spodoptera Frugiperda, which causes about 38% to 60% loss in maize production. The Egyptian Cotton Leafworm. A new distribution map is provided for Spodoptera Littoralis (Boisduval (Boisd.)) (Lepidoptera, Noctuidae) (Cotton Leafworm of Egypt or Egyptian Cotton Worm). Host Plant:- Polyphagous. Information is given on the geographical distribution in Europe:- Crete, France, Greece, Italy, Majorea, Malta, Spain; in Asia:- Bahrain, Cyprus, Dodecanese Islands, Iran, Iraq, Israel, Jordan, Lebanon, Saudi Arabia, South Arabian Protectorates, Syria, Turkey; in Africa:- Aldabra Islands, Algeria, Angola, Ascension Island, Burundi, Cameroun, Canary Islands, Central African Republic, Chad, Comores Islands, Congo (Kinshasa), Egypt, Eritrea, Ethiopia, Fernando Póo, Gambia, Ghana, Guinea, Kenya, Libya, Madagascar, Madeira, Malawi, Mali, Mauritania, Mauritius, Morocco, Mozambique, Niger, Nigeria, Principe, Réunion, Rhodesia, Rodriguez Islands, Rwanda, St Helena, São Tomé, Senegal, Seychelles, Sierra Leon, Somalia, South Africa, Sudan, Tanzania, Togo, Tunisia, Uganda, Upper Volta, Zambia. Also known as Spodoptera Littoralis Boisd. First-instar larvae of the Egyptian Cotton Worm (Spodoptera Littoralis Boisd.) were

fed on detached leaves of these plants. / Виды (Species). В переводе с Латинского языка, Хлопковая Совка Египетская. Хлопковая Совка (Heliothis Armigera), бабочка Семейства Совок (Ночниц), Вредитель Хлопчатника. Распространена широко. Крылья серовато-жёлтые. Питаются (гусеницы – Коробочный Червь) бутонами, цветками, завязями, семенами.

SPODOPTERA LITURA (FABRICIUS) = СПОДОПТЭРА ЛИТУРА (ФАБРИСИУС) – Spodoptera Litura (Fabricius) (Lepidoptera: Noctuidae), the common Cutworm, is an economically serious and polyphagous Pest in India. This Pest is reported to attack a wide range of food Plants (112 cultivated Plants belonging to 44 families worldwide and 60 Plants in India). A multifaceted approach is required for the control of this Pest because it has developed resistance against a range of insecticides and because other control measures are inadequate when applied alone. / В переводе с Латинского языка, Хлопковая Совка Азиатская. Хлопковая Совка, бабочка Семейства Совок (Ночниц), Вредитель Хлопчатника. Распространена широко. Крылья серовато-жёлтые. Питаются (гусеницы – коробочный червь) бутонами, цветками, завязями, семенами.

SPOILAGE = ПОРЧА – Spoilage is a negative change in the physical condition of perishable stock to its detriment including, but not limited to, thawing, freezing, warming, and solidification.

SPONGE CLOTH = ГУБЧАТОЕ ПОЛОТНО (или ОБТИРОЧНОЕ ПОЛОТНО) – Sponge Cloth:- any of various soft porous fabrics especially in a loose honeycomb weave. / .

SPONGING = ДЕКАТИРОВКА – Sponging removes residual shrinkage, or removal of any distortion in the size of the fabric caused by tension applied during production. The fabric is dampened with steam or water and allowed to dry in a relaxed state. Residual shrinkage (also called Relaxation Shrinkage) is different than the shrinkage caused by felting, and sponged fabrics are not necessarily shrinkproof. Sponging is a pre-shrinkage process which involves the dampening with a sponge to woolen and worsted fabrics. The process is accomplished by rolling in moist muslin, or by steaming. This procedure is performed at the fabric mill prior to cutting to insure against a contraction of the material in the garment. Sponging is a method of shrinking wool fabrics involving the application of water to the fabric followed by drying it, usually with some heat, in order to shrink it. Some wool fabrics sold by the yard are labeled sponge shrunk, ready for the needle, and they should not shrink again when cleaned. / раскрой (cutting); нарезка ткани определённой длины по требованию заказчика (cutting) . Под Декатировкой ткани, от Французского слова Décatir, означающее Уничтожать Блеск, понимается обработка некоторых видов тканей (например, шерстяных) паром или горячей водой для предотвращения усадки в готовом изделии и улучшения качества (уплотнение, увеличение мягкости). Декатировка, от Французского слова Decatir, означающее (основное значение) Уничтожать Блеск, обработка шерстяных тканей паром или горячей водой для предотвращения усадки при последующей обработке и носке и улучшения внешнего вида. Декатировка производится на специальных аппаратах – декатирах. Различают декатиры для сухой и мокрой декатировки. Декатир для сухой декатировки представляет собой герметически закрывающийся цилиндрический котёл, внутри которого находится вращающийся полый цилиндр с перфорированной поверхностью, приспособленный для наматывания ткани. Подаваемый в котёл пар проходит через слои ткани, намотанной с минимальным натяжением, внутрь цилиндра и отсасывается через его открытый конец. В декатире для мокрой декатировки цилиндр с намотанной на нём тканью вращается в корыте с горячей (50–60 °C) водой. Декатир соединён не только с паропроводом, но и с водопроводом.

SPONSORING BANK = СПОНСИРУЮЩИЙ БАНК – The Sponsoring Bank is the creditor's bank that initially sponsors the creditor into a National Direct Debit Scheme. The sponsoring bank acts as guarantor of the creditor's direct debiting procedures.

SPONTANEOUS COMBUSTION = СПОНТАННОЕ ЗАГОРАНИЕ – Spontaneous Combustion:- a rise in temperature of an organic solid without external heat to a point where the solid ignites spontaneously.

SPONTANEOUS IGNITION TEMPERATURE = ТЕМПЕРАТУРА САМОВОСПЛАМЕНЕНИЯ (или ТЕМПЕРАТУРА СПОНТАННОГО ВОСПЛАМЕНЕНИЯ) – Spontaneous Ignition Temperature is the lowest temperature at which a substance will start burning spontaneously without an external source of ignition. / Минимальная температура, при которой вещество в отсутствие источника воспламенения начинает самовозгораться. Самовоспламенение – автоускорение химических реакций, приводящее к воспламенению системы без её соприкосновения с пламенем или раскалённым телом. Самовоспламенение может быть обусловлено накоплением в системе активных промежуточных продуктов реакции (цепное самовоспламенение) или воздействием высокой температуры (тепловое самовоспламенение). Характеризуется температурой самовоспламенения (минимальной температурой, при которой возникает автоускорение) и периодом индукции (временем, в течение которого развивается предвзрывное автоускорение). Количественные выводы теории самовоспламенения имеют важное практическое значение для расчётов в производствах, связанных с процессами окисления, в частности горения.

SPOOL = КАТУШКА – Spool is a cylinder of wood, plastic, cardboard, or other material on which wire, thread, or string is wound. Spool, a usually low-flanged or unflanged cylinder on which thread, wire, cable, paper, film, or tape is wound for distribution or use. Spool is a flanged wooden or metal cylinder upon which yarn, thread, or wire is wound. The spool has an axial hole for a pin or spindle used in winding. See also Beam.

SPORE = СПОРА – Spore is a single-celled or multi-celled reproductive unit that is capable of infecting host tissue. Spores may be produced sexually, asexually or vegetatively and many fungi produce two or more spore types. Spore (Fungi) is a single- to many-celled reproductive structure of a Fungus. Spore is a single, vegetative, reproductive cell formed by lower plants (cryptogams), that does not contain an embryo. / низшими растениями (криптогамными растениями (cryptogams)), которые не содержат эмбриона. Под Спорами, от Греческого слова Sporá, означающее Посев или Семя, понимаются бесполые репродуктивные образования, состоящие из одной или нескольких клеток. Споры покрыты, как правило, плотной, устойчивой к внешним воздействиям оболочкой. Они развиваются в органах размножения водорослей, грибов, лишайников, моховидных, папоротниковидных и других растений, а также у бактерий и паразитических простейших (споровиков). Споры служат для размножения и сохранения организмов в неблагоприятных условиях (у бактерий – только для выживания в неблагоприятных условиях). По ископаемым спорам устанавливают возраст осадочных отложений. Споры:- микроскопические структуры для размножения нецветковых растений, таких, как Мхи и Папоротники. Могут быть посеяны как семена, но требуют специального ухода.

SPOROCARP = СПОРОКАРПИЙ – Sporocarps are:- (1) the spore-containing structures. (2) The fruit cases of certain ferns containing sporangia or spores. / или споры. Под Спорокарпием, от Греческих слов Sporá, означающее Посев или Семя, и Karpós, означающее Плод, понимается .

SPOROPHYTIC = СПОРОФИТНОЕ – Sporophytic:- a condition in which sterility/fertility is imparted to the pollen by the plant upon which the pollen is borne and the genotype of the pollen has no bearing per se. It may be controlled by more than one gene with multiple alleles. / Под Спорофитом, от Греческих слов Sporá, означающее Посев или Семя, и Phytón, означающее Растение, понимается бесполое поколение или этап жизненного цикла растений от зиготы до образования споры. В цикле развития чередуется с гаметофитом; характерен двойной (диплоидной) набор хромосом.

SPOROPOLLENIN = СПОРОПОЛЛЕНИН – Sporopollenin is a polysaccharide biopolymer, made from cross-linked phenolics and hydrocarbons, forming a large proportion of the outer wall ofpollengrains. Sporopollenin is highly resistant to acids, bases and decay processes so identifiable pollengrains persist in ancient deposits as a fossil record of plants flowering in that era. / Фенольное (Phenolic).

SPORTSWEAR = СПОРТИВНАЯ ОДЕЖДА – Sportswear:- clothing suitable for recreation; broadly, clothing designed for casual or informal wear. Sportswear is a clothing worn for active or spectator sports or recreational activities.

SPORT–WEIGHT YARNS = СПОРТИВНЫЕ–ВЕСОВЫЕ ПРЯЖИ – Sport-Weight Yarns:- these yarns knit to a gauge of 5-1/2 to 6-1/2 stitches per inch on size 4, 5, or 6 US needles. These yarns have approximately 1 200–1 600 yards per pound. This category of yarns is used for slightly more durable fabrics, like socks, and for multiple-color knitting like fairisle where the fabric created is bulky due to the number of 'floats' carried along the wrong side of the fabric.

SPOT = НАМЕЧАТЬ (или ПОМЕЩАТЬ) – Spot:- to place a trailer in a designated location or warehouse door. / размещать прицеп в обозначенном месторасположении или двери склада.

SPOT = С БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКОЙ – Price for exchange-traded securities if the transaction is effected in cash, i.e. payment and delivery are immediate. In foreign exchange dealing, spot means a transaction against cash with immediate delivery. Spot is a term that describes a one-time open market transaction where physical commodity is traded at current market rates. Spot is a term which describes one-time open market case (Change To Cash) transaction, where a commodity is purchased 'on the spot' at current market rates. Spot transactions are in contrast to term sales, which specify a steady supply of product over a period of time. Actual (also called Spot) commodity. Market of immediate delivery and payment of the product. In foreign exchange dealing, spot means a transaction against cash with immediate delivery. Also refers to the nearby delivery month on a futures contract. The opposite of Forward. / Фактическое (называемое также С Безотлагательной Поставкой) сырьё. Рынок безотлагательной поставки товара и его безотлагательной оплаты. При сделках с иностранной валютой, данный термин означает сделку против оплаты живыми деньгами за безотлагательную поставку. Также относится к ближайшему месяцу поставки по фьючерсному контракту. В противовес Форвардному (Forward). , то есть .

SPOT = ПЯТНО (или ПЯТНЫШКО) – Spot is a small discolored area on, or in, a fabric. Fabrics defect. Spots:- Fabric:- taffeta dress goods; Construction:- (i) Count:- 180 x 56; (ii) Warp:- 75/20 bright acetate rayon; (iii) Filling:- 300/104 dull acetate rayon; Finish:- plain dyed light blue. Defect:- small dark spots scattered throughout the piece. Analysis:- microscopic and chemical analysis showed that the spots were due to small particles on the surface of the fabric, apparently caused by undissolved dyestuff's becoming deposited on the cloth during or after dyeing. In order to prevent this type of defect, the dispersible dyestuff most commonly used for acetate-rayon fabrics must be prepared very carefully before being added to the dye bath. / Уточина:- 300/104 . Под Пятном понимается местный порок в виде загрязнённых или другого цвета мест различной величины. Примечание:- разновидностью пятен являются краб и щелчок. Пятна:- от загрязнений, масляные, затеки от крашения, подмочка, належки и другое.

SPOT BONDING = СКРЕПЛЕНИЕ ПЯТНАМИ (или СВЯЗЫВАНИЕ ПЯТНАМИ, или ТОЧЕЧНОЕ СКРЕПЛЕНИЕ) – Spot Bonding:- the preparation process before lamination to ensure lamination quality. See also Bonding, and Point Bonding.

SPOT CHECK = ВЫБОРОЧНАЯ ПРОВЕРКА (или ВНЕЗАПНЫЙ КОНТРОЛЬ) – Spot Check is the inspecting a sampling of containers in a shipment to determine if the quality of the entire shipment.

SPOT–CLEANING STAINS = РАЗВОДЫ ОТ ВЫВЕДЕНИЯ ПЯТЕН (или РАЗМЫВЫ ОТ ВЫВЕДЕНИЯ ПЯТЕН, или ПОТЁКИ ОТ ЧИСТКИ ПЯТЕН, или РАЗМЫВЫ ОТ ЧИСТКИ ПЯТЕН) – Spot-Cleaning Stains:- Garments:- women's underwear (slips and gowns); Fabric Construction:- (i) Count:- 150 x ???; (ii) Warp:- 75/50 bright acetate rayon; (iii) Filling:- 75/30 voile-twist viscose rayon. Complaint:- a garment manufacturer reported the formation of rings when soiled places were spot-cleaned. Analysis:- laboratory tests made on the garments returned and also on file head ends showed that, if standard commercial spot-cleaning fluids were not used properly, the cleaning rings appeared. These rings were composed of concentrated residues of dyestuff and finish, which accumulated at the outer edges of the cleaned areas when the dry-cleaning solvents evaporated. However, when the proper technique was used to spot-clean soiled places with selected commercial dry-cleaning compounds which did not evaporate too readily, there was no ring formation. Practically all rayon underwear fabrics of this type contain a small amount of finish to give the proper hand and appearance. These finishes are seldom of a permanent type and the garment manufacturer is expected to exercise reasonable care to avoid excessive oil staining during cutting and sewing, or those entrusted with the later spot cleaning should be well-trained to prevent injury to the fabric. / Уточина:- 75/30 .

SPOT COLOR = ПЯТНИСТЫЙ ЦВЕТ – Spot Color:- where specific colors of ink are printed as either solids or halftones. Note:- a halftone is a uniform series of dots that give the appearance of a lighter shade of a solid color. The number of dots-per-inch is called the Line Count or Frequency. The amount of coverage is determined by the percentage of dots.

SPOT CONTRACT = КОНТРАКТ С БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКОЙ – A Spot Contract is an agreement to buy or sell an asset today. The price agreed upon in this contract is referred to as the Spot Price.

SPOT COMMODITY = СЫРЬЁ С БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКОЙ – (1) Spot Commodity is the actual commodity as distinguished from a futures contract. / Реальное сырьё, отличающееся от предполагаемого фьючерсными контрактами сырья.

(2) Spot Commodity:- this term sometimes is used to refer to cash commodities available for immediate delivery. Also known as Actuals, Cash Commodity, and Spot Goods. / Этот термин используется иногда для обозначения наличного сырья для немедленной поставки. Известно также как Реальные или Фактические Товары (Actuals), Кассовое или Наличное Сырьё (Cash Commodity) и Наличные Товары (Spot Goods).

SPOT COTTON = ХЛОПОК С БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКОЙ – Spot Cotton is a Cotton which is on the spot ready for inspection, purchase, and delivery. The samples or redraws from the actual bales are available for inspection, and the price is fixed on the spot.

SPOT CREDIT = БЕЗОТЛАГАТЕЛЬНЫЙ КРЕДИТ – Spot Credit is a short-term credit, usually from one to three months, granted by a bank to a customer to meet special needs. The amount of credit and conditions for repayment are negotiated on a case-by-case basis. / выплата (repayment) .

SPOT DATE = ДАТА БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКИ – Spot Date is the normal settlement date for a transaction done today. This kind of transaction is referred to as a Spot Transaction or simply Spot. The spot date may be different for different types of financial transactions. A transaction which has settlement date after the spot date is called a Forward Contract or just Forward.

SPOT DEFERRED = ОТСРОЧЕННАЯ БЕЗОТЛАГАТЕЛЬНАЯ ПОСТАВКА – Spot Deferred:- a forward contract in which the contracts may be rolled forward as they mature. There is thus no pre-specified delivery date, and as each contract comes to maturity it is rolled forward with fresh interest rates. The facility is, however, set up to terminate within a pre-determined maximum period (a client may, for example, roll forward every three months for up to ten years). Also known as Floating Rate Forward. Spot Deferred is a hybrid forward contract offering floating interest rates and no fixed delivery. It is more flexible than conventional spot or forward contracts. Spot Deferred is a forward sale contract with no fixed delivery, but with the facility to roll forward the pricing of a contract at pre-determined intervals on the basis of current interest rates. This gives more flexibility than conventional forward contracts.

SPOT EXCHANGE = БЕЗОТЛАГАТЕЛЬНЫЙ ОБМЕН (ВАЛЮТЫ) – Spot Exchange:- the purchase or sale of foreign exchange for immediate delivery.

SPOT FREIGHT RATE = БЕЗОТЛАГАТЕЛЬНАЯ ФРАХТОВАЯ СТАВКА – Spot Freight Rates apply to the carriage of a single cargo from one specified port to another in the immediate future. They typically include all expenses of operating the vessel, from fuel to crew, but exclude costs related to the cargo, e.g., inspection fees. / , например, .

SPOT INTEREST RATE = БЕЗОТЛАГАТЕЛЬНАЯ ПРОЦЕНТНАЯ СТАВКА – Spot Interest Rate:- the n year spot interest rate is the geometrical average of the interest rates that are expected to apply over the next n years. It is the redemption yield on an n year zero coupon bond.

SPOT MARKET = РЫНОК С БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКОЙ (или НАЛИЧНЫЙ РЫНОК) – (1) Spot Market is a market in which immediate exchange of the physical commodity takes place. Payment for the commodity is received on or soon after the day of exchange. Also known as Cash Market. See also Spot Transaction. The here-and-now market for immediate delivery and payment of commodities. / Рынок здесь-и-сейчас, обозначающий немедленную поставку сырья при его оплате.

(2) A Spot Market is a market where an agreed deal including delivery, acceptance and payment occurs immediately, in contrast to forward contracts, where the delivery, acceptance and payment occurs at a point in time after the conclusion of the deal. The Spot Market is the physical/cash crude, refined product, gas or electricity market. The market for immediate delivery rather than future delivery. The term Spot Markets is used to describe transactions which involve the near-term purchase and sale of a commodity, such as crude oil and refined products. In the crude oil market, 'spot' contracts typically involve delivery of crude over the coming month, e.g., a contract signed in June for delivery in July. Spot markets are often referred to as the 'Physical Market' since they entail the buying and selling of physical volumes. These markets consist of many buyers and sellers, including refiners, traders, producers, and transporters, transacting throughout the chain of supply – from the oil well right through to the refinery. These markets provide the benefit of allowing buyers and sellers, e.g., refiners and marketers, to more easily adjust their crude supplies to reflect near-term supply and demand conditions in both the product markets and the crude oil markets.

SPOT MONTH = МЕСЯЦ БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКИ (или БЛИЖАЙШИЙ МЕСЯЦ) – Spot Month is the nearest deliverable month. The futures contract that matures and becomes deliverable during the present month. Also known as Current Delivery Month and Nearby Delivery Month.

SPOT NEXT = НА СЛЕДУЮЩИЙ ДЕНЬ ПОСЛЕ БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКИ – Spot Next:- foreign exchange term for the purchase of currency for delivery on the working day after the spot date.

SPOT PRICE = ЦЕНА ДЛЯ БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКИ – (1) Spot Price is a current market price of some product, commodity, security or currency ready for immediate delivery. Also referred to as Spot Rate. It is the price at which the asset changes hands on the spot date. Quoted price for immediate commodity sale and delivery. Selling price of a physical commodity for immediate rather than future delivery. Spot Price is a current price of a security. The price at which a physical, actual or spot commodity is selling at a given time and place, and if the transaction is effected in cash, i.e. payment and delivery are immediate. The price for spot delivery which in the gold market is two days from the trade date. / Цена Для Безотлагательной Поставки – цена, по которой физическое, действительное или наличное сырьё продаётся в данном месте, и если данная сделка оплачивается живыми деньгами (наличными), то есть когда платёж и поставка производятся немедленно. Наличная (текущая) цена финансового инструмента или товара.

(2) In the Cotton industry of the United States, Spot Price is a spot or cash market price represents the price for which cotton of various qualities was sold at warehouse locations in seven market areas designated by the Secretary of Agriculture. Spot market quotations are published daily by the Agricultural Marketing Service from price quotations furnished by cotton buyers. Spot prices are used to establish premiums and discounts for the Government's cotton loans to producers and for selling futures contracts. The spot market price also represents the market value of cotton in the early stages of the wholesale marketing chain. Spot Price represents cash sales of cotton. See also Raw Cotton Price. Spot market quotations are issued by committees made up of local members of a voluntary trade organization known as the Cotton Exchange. These exchnages provide a mean of establishing premiums and discounts for government cotton loans and for setting futures contracts.

(3) In oil and gas industry, Spot Price is the price for quite large quantities of product at a few key trading centers around the world. See also Wholesale Price.

SPOT PURCHASES = БЕЗОТЛАГАТЕЛЬНЫЕ ПРИОБРЕТЕНИЯ (или ПРИОБРЕТЕНИЯ ДЛЯ БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКИ) – Spot Purchases:- a single shipment of fuel or volumes of fuel, purchased for delivery within 1 year. Spot purchases are often made by a user to fulfill a certain portion of energy requirements, to meet unanticipated energy needs, or to take advantage of low fuel prices.

SPOT QUOTATIONS = РАСЦЕНКИ ДЛЯ БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКИ (или КОТИРОВКИ ДЛЯ БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКИ, или ПРЕЙСКУРАНТ ДЛЯ БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКИ) – Spot Quotations:- reported prices for all specific quality designations on a certain trading day. / Цены, декларируемые в определённый торговый день, по всем товарным позициям определённого качества. Под Котировкой, от Французского слова Coter, означающее Метить или Нумеровать, понимается установление курсов иностранных валют, ценных бумаг или цен товаров и сырья на бирже. Под Прейскурантом, от Немецкого слова Preiskurant, понимается систематизированный сборник цен (тарифов) по группам и видам товаров и услуг. Прейскурант – наименование продукции и её цены.

SPOT RATE = СТАВКА ДЛЯ БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКИ (или ТЕКУЩАЯ СТАВКА) – (1) In foreign exchange dealing, Spot Rate is a rate quoted for immediate payment and delivery.

(2) Spot Rate is a freight rate agreed on the basis of current market level.

SPOTS DURING PRESSING = ПЯТНА В ПРОЦЕССЕ УТЮЖКИ (или ПРЕССОВАНИЯ) – Spots During Pressing:- Fabric:- dress goods; Construction:- (i) Count:- 108 x 84; (ii) Warp:- 30/1 combed cotton; (ii) Filling:- 40/1 combed cotton; Finish:- plain dyed in three shades:- purple, green, and blue. Defect;- customer claimed that fabric showed spots during pressing. Analysis:- one set of finished fabric samples was spotted in the laboratory with water and pressed with a hand iron. Another set was merely water-spotted and allowed to dry without ironing. In each case, the tests were repeated after soap scouring and ironing of all samples. It was found that only the purple-dyed cutting spotted easily both in the original state and after scouring. The blue-dyed sample showed slight staining in the original state, but not after scouring. These two colors also showed a distinct change in shade under hot pressing. It was concluded that the purple dyestuff was sensitive to both moisture and dry heat, whereas the blue-dyed fabric contained a finish which was sensitive to water-spotting only. Both of these faults were considered the dyer's responsibility. / Уточина:- 40/1 гребенная хлопковая.

SPOTS ON COLLARS = ПЯТНА НА ВОРОТНИЧКАХ – Spots On Collars:- Garments:- fused shirt collars; Fabric Construction:- laminated, fused collars made with white cotton broadcloth and acetate-and-cotton collar lining. Complaint:- a shirt manufacturer detected numerous red spots on the white shirting fabric after the collars were fused. As he had previously encountered color stains which were traced to the finisher of the broadcloth, he assumed that the red stains were of similar origin. Analysis:- laboratory chemical tests showed that the red stains were not dyestuff. Microscopic examination proved them to be slight deposits on the outer surface of the broadcloth. It was possible to trace all the defective collars to one operator, who was performing the fusing task, and it was subsequently determined that the stains were due to red fingernail polish coming off during the application of the acetone solvent used in the lamination of the three plies of fabric. Obviously, the origin of this defect would have been extremely difficult to determine if it had not been for the fullest cooperation of the shirt manufacturer. / развод (или потёк (stain)).

SPOTS OR STAINS = ПЯТНА ИЛИ РАЗВОДЫ (или ПЯТНЫШКИ ИЛИ ПОТЁКИ) – (1) Spots or Stains:- normally the result of a defective machine or a dirty work area. Sewing Room Defects. / Порок или дефект швейного производства.

(2) Spots or Stains:- caused by wet steam, rust or oil. Machinery defects, and namely – Part Forming Machines. / Порок или дефект от машинного оборудования.

SPOT SETTLEMENT = БЕЗОТЛАГАТЕЛЬНЫЙ РАСЧЁТ – Spot Settlement:- delivery of metal and payment of money, which takes place two business days after the transaction date.

SPOTS IN BROADCLOTH SHIRTS = ПЯТНА НА РУБАШКАХ ИЗ ШИРОКОГО ПОЛОТНА – Spots In Broadcloth Shirts:- Complaint:- a shirt manufacturer returned several new white broadcloth shirts to the converter, calling attention to the fact that the fabric showed rings when manufacturing soil and stains were spot-cleaned with standard-type, organic-solvent cleaning solutions. It is fairly common practice for manufacturers to remove machine oil and dirt stains from new garments which may have become soiled while they were being cut and sewed. Analysis:- examination of the shirts indicated that the spots were due to faint blue 'rings' which had formed around the cleaned areas. Although it appeared that these rings were caused by the migration of a small amount of blue coloring material which had been used to provide a 'blue-white' finish in the broadcloth, it was not possible to reproduce the effect in the laboratory. This led to the conclusion that the shirt manufacturer had been careless in his application of the cleaning solution, or that the solution itself had become contaminated with small amounts of accumulated blue coloring from repeated use on similar white fabrics. / развод (или потёк (stain)).

SPOT SPRAYING = ОПРЫСКИВАНИЕ ПЯТНАМИ – Spot Spraying is targeting of individual weeds with herbicides.

SPOTTER = МЕТЧИК (или ОТМЕТЧИК, или НАВОДЧИК, или КОРРЕКТИРОВЩИК, или УКАЗЧИК) – Spotter is a terminal yard driver who parks vehicles brought in by regular drivers, also a supervisor who observes the activities of drivers on the road. See also Yardbird. Spotter is a logistics depot driver who moves trailers in and out of dock doors. / Смотрите также Дворовая Птица (Yardbird).

SPOTTING = ВЫБОРОЧНОЕ РАЗМЕЩЕНИЕ (или РАЗМЕЩЕНИЕ В ОПРЕДЕЛЁННОМ МЕСТЕ) – Spotting:- the placing of a container or railcar in that designated place where required to be loaded or unloaded.

SPOTTING HORSE = ЛОШАДЬ В ЯБЛОКАХ – Spotting Horse is a specialized tractor used only to move trailers around the warehouse facility and place them at doors where they can be loaded or unloaded.

SPOT TRANSACTION = БЕЗОТЛАГАТЕЛЬНАЯ ТРАНЗАКЦИЯ (или БЕЗОТЛАГАТЕЛЬНАЯ ОПЕРАЦИЯ) – Spot Transaction is a single outright transaction involving the exchange of two currencies at a rate agreed on the date of the contract for value or delivery (cash settlement) within two business days. The spot legs of swaps were not included among spot transactions but were treated as swap transactions even when they were for settlement within two days, i.e. including 'tomorrow/next day' transactions. Spot Transaction is a foreign exchange transaction in which each party promises to pay a certain amount of currency to the other on the same day or within one or two days. Spot Transaction is a transaction where delivery and cash payment for the instruments of goods (e.g., securities, foreign currencies or commodities traded on exchanges) are immediate. In the securities trading, a spot transaction is usually settled on the third working day following the transaction. In the foreign exchange business, at the latest two working days later. The opposite of Forward Transaction (foreign exchange), and Future Transaction (commodity trading). In business, transaction involving immediate cash payment and delivery, as opposed to future terms. In commodities or foreign exchange trading, a spot market is a market for buying and selling commodities or foreign exchange for immediate, rather than future, delivery. The price for such commodities is called the Spot Price. In the foreign exchange surveys, spot business is defined as the exchange of two currencies for settlement within two business days. Spot trades are simple, highly standardized transactions taking place in a very liquid market. While the spot market used to be the most important segment of the foreign exchange market, accounting as recently as 1989 for 59% of total turnover, this ratio has now (in 1995) almost been inverted, with forward transactions accounting for 56% of the total. Nevertheless, over the period 1992–95, the spot market grew by 30%, to an estimated daily turnover net of local and cross-border inter-dealer double-counting of USD520 billion worldwide. Broken down by country, turnover has grown most in Canada, France, the United States and Australia, as well as in some smaller markets. The currency distribution in the spot market is less diversified than in the forward market, in that the ten most heavily traded currency pairs in the spot market (including Swiss Franc/Deutsche Mark trading) account for 77% of total turnover, compared with 73% for the ten largest currency pairs in all market segments together. In contrast, contracts involving the Deutsche Mark tend to account for a greater share of the spot market than of the forward markets. For example, fully 29% of the spot market is accounted for by US Dollar/Deutsche Mark trading, compared with a proportion of 19% in the outright forward and 17% in the foreign exchange swaps market. The role of the Deutsche Mark as a vehicle currency appears to be particularly strong in spot turnover between foreign exchange dealers, where the proportion of business involving this currency on one side (57%) almost rivals the 69% of the US Dollar. In contrast, in foreign exchange swaps the proportions are 20% for the Deutsche Mark and 97% for the US Dollar. In the customer spot market the Deutsche Mark continues to be involved in four of the ten most actively traded currency pairs (including trades involving the Swiss Franc), but with Deutsche Mark/French Franc transactions with

customers outpacing those in Sterling/Deutsche Mark. / Безотлагательная Операция это разовая неотложная операция, заключающаяся в обмене двух валют . , например, .

SPOT VALUE = СТОИМОСТЬ ДЛЯ БЕЗОТЛАГАТЕЛЬНОЙ ПОСТАВКИ – Spot Value is the value or price at which current transactions of goods and services take place. Also known as Spot Price. The spot market is the market in which goods and services are traded for immediate delivery and payment. Purchased or sold 'on the spot' as opposed to some later time.

SPOT (VOYAGE) = БЕЗОТЛАГАТЕЛЬНЫЙ (РЕЙС) – Spot (Voyage):- a charter for a particular vessel to move a single cargo between specified loading port(s) and discharge port(s) in the immediate future. Contract rate ('spot' rate) covers total operating expenses, i.e. bunkers, port charges, canal tolls, crew's wages and food, insurance and repairs. Cargo owner absorbs, in addition, any expenses specifically levied against the cargo.

SPOT WASHING = ПРОМЫВКА ПЯТЕН – Spot Washing is the term used to describe an operation performed at the weaving mill on some types of gray goods, to clean badly soiled places in the fabric before it is shipped to the dyer and finisher, or to make easier their removal in normal wet processing. Any number of cleaning solutions may be used, some containing water and others containing dry-cleaning solvents, depending on the nature of the stain to be removed. Extreme caution must be exercised to avoid the use of excessive rubbing or of compounds which may produce damage that will be more of an imperfection in the finished goods than the original stain. / развод (или потёк (stain)).

SPOT WEAVE = ВЫШИТОЕ (или ВЫШИВНОЕ, или УЗЕЛКОВОЕ) ПЕРЕПЛЕТЕНИЕ – Spot Weave is a woven construction in which patterns are built in at spaced intervals through the use of extra warp and/or extra fill yarns are placed in selected areas. These yarns are woven into the fabric by means of a dobby or Jacquard attachment. / Жакяр (Jacquard). Крупноузорчатое (жаккардовое) переплетение.

SPP = SPECIES

SPQR = SMALL PROFITS, QUICK RETURNS

SPR = STRATEGIC PETROLEUM RESERVE

SPRAY BONDING = СКРЕПЛЕНИЕ СПРЫСКИВАНИЕМ (или РАЗБРЫЗГИВАЮЩЕЕ СВЯЗЫВАНИЕ, или РАСПЫЛЯЮЩЕЕ СВЯЗЫВАНИЕ) – In Spray Bonding, binders are sprayed onto moving webs. Spray bonding is used for fabric applications that which require the maintenance of highloft or bulk, such as fiberfill and air-laid pulp wipes. The binder is atomized by air pressure, hydraulic pressure, or centrifugal force and is applied to the upper surfaces of the web in fine droplet form through a system of nozzles. Lower-web-surface binder addition is accomplished by reversing web direction on a second conveyor and passing the web under a second spray station. After each spraying, the web is passed through a heating zone to remove water, and the binder is cured (set/cross-linked) in a third heating zone. For uniform binder distribution, spray nozzles are carefully engineered. See also Bonding. Spray Bonding is a process of binding fibers into a nonwoven fabric involving the spray application of a fabric binder. Spray Bonding uses a PVA binder sprayed on both sides of the web to hold the fibers together. This gives the product a slightly firmer feel and holds the surface fibers down. Spray bonding is also used for filtration media to add the color as well as a tackifier. Spray bonding has been the traditional method used for bonding a highloft web.

SPRAY DRIFT = СНОС ОПРЫСКИВАНИЯ – Spray Drift is a movement of airborne spray from the intended areas of application. See also Herbicide Drift.

SPRAY SPINNING = РАЗБРЫЗГИВАЮЩЕЕ ПРЯДЕНИЕ (или РАСПЫЛЯЮЩЕЕ ПРЯДЕНИЕ) – Spray Spinning is a novel (2009-September) method for making alginate/chitosan fibrous scaffold or, by other words, a process of obtaining alginate/chitosan polyelectrolyte complex (PEC) hybrid fibers. In spray-spinning, a chitosan solution was sprayed into a flowing sodium alginate solution and sheared into streamlines. The elongated streamlines subsequently transformed into alginate/chitosan PEC fibers. Average diameter of the fibers increased with the increasing of chitosan concentration used in spinning. The fibers showed a high water-absorbability of about 45 folds of water to their dry weight and retained their integrity after incubation in Minimum Essential Medium (MEM) for up to 30 days. In vitro co-culture experiments indicated that the fibers could support the three-dimensional growth of HepG2 cells and did not display any cyto-toxicity. Moreover, in vivo implanting experiments indicated that the connective tissue cells infiltrated into the implanted fibrous scaffolds in 3 weeks after surgery. These results demonstrated the potential applications of the as-spun fibers in regenerative medicine and tissue engineering. See also Bonding, and Spun-Bonded Products.

SPREAD = КУРСОВАЯ РАЗНИЦА (или СПРЭД) – (1) In securities trading, Spread is the difference (spread) between the best buy and sell price for a security at a certain time. The narrower the gap between the bid and ask price, the higher the market liquidity of the security and the lower the transaction costs for the investor. The term is also used to compare two different interest rates, for example the difference between the interest rate of a fixed-income security to a benchmark security (e.g., government bond, Pfandbrief) or a reference rate (EURIBOR, LIBOR). In general, Spread is the difference between two prices, usually a buying price and a selling price. Spread is the difference between the sell quote and the buy quote or the bid and offer price. For example, if EUR/USD quotes read 1.0749/51, the spread is the difference between 1.0749 and 1.0751, or 2 pips. In order to break even on a trade, a position must move in the direction of the trade by an amount equal to the spread. Spread is the difference of price between two futures contract months. It also refers to the simultaneous purchase and sale of the same or related commodities with expectation that the price differential will result in a profit. / ЮРИБО или ЮРАЙБО (EURIBOR), (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)). Под Курсовой Разницей понимается разница в ценах на иностранную валюту и ценные бумаги в связи с изменением их курсов на валютных, сырьевых, товарных и фондовых биржах.

(2) Spread is a difference between two prices, usually a buying and selling price. The difference between the bid and offer price. The difference between the bid and the ask. Generally speaking, more liquid (heavy volume) stocks usually have smaller bid/ask spreads. Less liquid stocks (light volume) usually have larger spreads. See also Ask, Bid, and Size. Spread is the difference between Bid (the price a buyer is prepared to pay for gold) and Ask (the price a seller offers) prices. Spread is the difference between Bid (the price a buyer is prepared to pay for gold) and Ask (the price at which a seller offers to sell) prices.

(3) Spread:- to take simultaneous long and short positions, aimed at a profit via fluctuation of a differential in two prices. Also sometimes called a Straddle. See also Bearish Credit Spread, Bearish Debit Spread, Bullish Credit Spread, Bullish Debit Spread, and Spreading. / от флуктуации (колебания) дифференциала в двух ценах. Спрэд – операция, предполагающая одновременную покупку или продажу разных опционных контрактов для получения прибыли и/или ограничения риска. Обе части спрэда выполняются одновременно. Смотрите также:- (Bearish Credit Spread), (Bearish Debit Spread), (Bullish Credit Spread), и (Bullish Debit Spread).

(4) Three basis types of Spreads exist in the commodity and financial markets:- inter-commodity spreads, interdelivery spreads, and intermarket spreads. Spread is the difference between the price of a futures month and the price of another month of the same commodity. In futures trading, Spread is the simultaneous purchase and sale of futures contracts for different months, different commodities, or different grades of the same commodity. In options trading, the purchase and sale of options which vary in terms of type (call or put), strike prices, expiration dates, or both. May also refer to an options contract purchase (sale) and the simultaneous sale (purchase) of a futures contract for the same underlying commodity. See also Arbitrage. Difference in the prices of a currency between various future deliveries, or between the spot market and a future delivery. There are two spread modes:- Carry Mode, and Inverted Mode. Carry mode is the difference between the prices of two futures contract months and equals the cost of carrying commodity during the interval between the expiration dates for the two contracts. Inverted mode is where prices for nearby futures contract months are higher than prices of future months; this typically occurs in tight markets.

(5) Simultaneous purchase and sale of options of the same class with different strike prices and/or different maturities. In option trading, purchase of a call option at one price and resale at another. Spread is the purchase of one futures or options delivery month contract against the sale of another futures or options delivery month contract on the same asset. The purchase of one delivery month of one commodity against the sale of that same delivery month of a different commodity. / Одновременные приобретение одного фьючерсного или опционного контракта и продажа другого фьючерсного или опционного контракта на один и тот же актив.

(6) Spread is the purchase of one commodity in one market against the sale of the commodity in another market, to take advantage of a profit from a change in price relationships.

(7) In the Euromarket, Spread is a difference between the interest rate at which a bank borrows money on the interbank market and the rate at which it grants a rollover credit in Eurocurrency. Difference between interest rates or yields for the same maturity in different currencies.

(8) Spread:- simultaneous positions in the same contract but in different months or simultaneous positions in related contracts for the same or a different month. Spread is the difference in price between two futures contracts with different contract delivery months. A positive spread means that the distant month price (e.g., March) is higher than the nearby month (e.g., December). Spread can also be the difference in contract price between different commodities (e.g., Corn and Soybeans) or between exchanges (e.g., Chicago and Kansas City) and the same commodity. See also Carry, Carrying Charges, Full Carrying Charge, Inter-Crop Spreads, Intra-Crop Spreads, and Inverted Market.

SPREAD = ОДЕЯЛО – Spread is any kind of covering. A bedspread is usually a decorative covering that covers the blanket and pillows on a bed during the day. Bedspreads are available in many styles from simple throws ar ranged casuaily over the bed to tailored box spreads. A box spread is a shaped and fitted bedspread with a tailored appearance. The corners are square, giving the spread its name. See also Throw.

SPREAD = РАСШИРЕНИЕ (или РАСПРОСТРАНЕНИЕ) – Spread is an expansion of the geographical distribution of a Pest within an area.

SPREADER = КЛЕЩЕВОЙ ЗАХВАТ (или СПРЭДЁР, или ГРУЗОЗАХВАТНОЕ ПРИСПОСОБЛЕНИЕ) – Containers were traditionally handled using four wire ropes and cranes. However as the opening angle of the wire ropes placed considerable horizontal pressure on the tops of the containers, steel framed constructions (spreaders) were introduced in order reduce these forces. These spreaders have undergone constant development and are still used on container gantries today. Spreader is a piece of equipment designed to lift containers by their corner castings. Spreader is a piece of equipment designed to lift containers by their corner castings. Beam or frame that holds the slings vertical when hoisting a load, to prevent damage to cargo. Device used for lifting containers and unitised cargo. Spreader is a device used to lift containers with a locking mechanism at each corner. Used on container cranes, straddle carriers or other machinery to lift containers. Spreader is:- (i) a horizontal steel beam which is attached to a crane wire and is used to spread lifting wires apart so they are vertically aligned to lift cargo safely and efficiently without bending or flexing; (ii) spreaders used for lifting containers have 4 remotely operated twist locks to attach to the corners of the container; and (iii) a bar on the mast of a sailboat used to keep lines apart and taut. / контейнеров за их угловые отливки. Под Грузозахватным Приспособлением понимается устройство или механизм грузоподъёмной машины для захвата, перемещения и разгрузки различных грузов. Грузозахватные приспособления навешиваются на рабочий орган грузоподъёмной машины. Различают грузозахватные приспособления:- (i) для наливных грузов – бадьи, специальные ёмкости; (ii) для насыпных грузов – грейферы, ковши, кюбели; (iii) для штучных грузов – чалочные стропы, скобы, траверсы, клещи или клещевые захваты. Разновидность грузозахватных приспособлений – подъёмные электромагниты, вакуумные грузозахваты и тому подобное. К грузозахватным приспособлениям относят также автостропы.

SPREADER = РАЗБРАСЫВАТЕЛЬ – Spreader is an agricultural implement used to disperse seed or fertilizer in the field.

SPREADER BAR = ШТАНГА СПРЭДЁРА (или РАМА КЛЕЩЕВОГО ЗАХВАТА) – Spreader Bar is the part of the crane that engages into the container corner post casting to lift container on or off the vessel. / в угловые стоечные отливки контейнера .

SPREADING = ИСПОЛЬЗОВАНИЕ КУРСОВОЙ РАЗНИЦЫ (или ИСПОЛЬЗОВАНИЕ СПРЭДОВ) – Spreading is the simultaneous purchase and sale of two different futures contracts. Unlike traders who look at absolute price levels and initiate outright positions in one contracts, spread traders form opinions on how the price relationship between two contracts will change. They then buy the relatively ‘cheap’ contract and sell the relatively ‘expensive’ contracts. If market prices move as expected, spread traders can liquidate the spread and profit from the change in the price relationship between the contracts. The economic contributions of spreading are twofold. Spreading provides market liquidity. More important, however, spreading corrects distortions in price relationships. Because of this corrective influence, all market participants, spreaders or not, nust have at least some understanding of spread relationships. Traders find spread attractive for several reasons. First, spreads generally are less risky than outright positions. The prices of two different futures contracts for the same commodity, for example, exhibit a strong tendency to move up or down together. Spread trading of this sort thus offers some protection against losses caused by unexpected or extreme price volatility. This ‘protection’ exists because gains from one side of the spread more or less offset losses from the other side. The short side of a futures spread, for example, might generate a loss due to a price increase, but the long side should produce a profit offsetting much of that loss. Of course, this is not always the case. For example, inter-commodity spreads, such as long Wheat and short Corn, may not always be less risky than an outright position. Wheat prices might unexpectedly decrease and Corn prices might increase during the life of the spread. If so, spread traders would lose on both legs of the spread. Spreads usually are less risky than outright positions, though, so spread margin rates are generally lower. Lower margin rates allow traders to diversify their portfolios with a smaller amount of capital. Another caveat, however:- spread margins may not be lower for intermarket spreads, in which traders spread the same futures contracts at two different futures exchanges. Separate clearinghouses may not recognize other market positions in determining margin requirements. Spreads are quoted as the price difference between two related contracts. For example, to calculate an

agricultural spread such as the July/November Soybean spread, traders suntract the price of the November contract from the price of the July contract. Generally, this difference will result in a positive number, as ag commodity prices are typically lowest at harvest and trend higher during the marketing year as storage, interest, and insurance costs accumulate. As a result, July Soybeans (old-crop beans) are usually priced higher than November Soybeans (new-crop beans). For July Soybeans to gain on November Soybeans, one of four possible market scenarios must occur:- (i) in a bull market, July Soybeans rise more than November Soybeans; (ii) in a bear market, July Soybeans fall less than November Soybeans; (iii) July Soybeans remain unchanged, while November Soybeans fall; and (iv) July Soybeans rise, while November Soybeans remain unchanged. Spread traders form opinions on the likelihood of these and other scenarios and put on spreads to capitalize on the expected price relationship changes. Spread relationship exist between any number of financial futures contracts (e.g., T-bond futures, bond index futures etc) and vary in reaction to and in anticipation of changes in economic circumstances. Just as in the agricultural markets, when traders expect financial market price relationships to shift, they initiate spread trades to take advantage of these transitions. Spreading is the simultaneous buying and selling of two related markets or commodities in the expectation that a profit will be made when the position is offset. Examples include:- buying one futures contract and selling another futures contract of the same commodity but different delivery month; buying and selling the same delivery month of the same commodity on different futures exchanges; buying a given delivery month of one futures market and selling the same delivery month of a different, but related, futures market.

SPREADING = РАСПРОСТРАНЕНИЕ (или РАЗРАСТАНИЕ, или РАСШИРЕНИЕ, или РАЗВЕСИСТОЕ, или РАСКИДИСТОЕ) – Spreading is growing outwardly by means of new shoots or advancing outwards by means of rooting from reclining stems. In Cactaceae, an array of radial spines projecting obliquely outwards around an areole, but not lying flat against the surface of the plant. / средствами укоренения из . У Кактусовых (Cactaceae) .

SPREADING PANICLE BRANCHES = РАЗРАСТАЮЩИЕСЯ ВЕТВИ МЕТЁЛКИ – Spreading Panicle Branches (SPR) are the primary panicle branches extend obliquely outward so that they appear spreading and lax.

SPREAD LOSS = РАЗРАСТАНИЕ УБЫТКА (или РАЗБРОС УБЫТКА) – In reinsurance, Spread Loss is a form of reinsurance under which premiums are paid during good years to build up a fund from which losses are recovered in bad years. This reinsurance has the effect of stabilizing a cedant's loss ratio over an extended period of time.

SPREAD OPTIONS = ОПЦИОНЫ НА КУРСОВУЮ РАЗНИЦУ – Spread Options:- the purchase of one option and the simultaneous sale of a related option, such as two options of the same class but different strike prices and/or expiration dates. Also known as Spread. An option trade in which two or more open positions are established in order to trade the differentials and offset risk. Option spreads may use different strike prices and/or expiry dates. Spread Option:- the underlying for a spread option is the price differential between two assets (a difference option) or the same asset at different times or places. An example of a financial difference option is the credit spread option, the underlying for which is the spread between two debt issues which derives from the relative credit rating of the issuers. Another is the cross-currency cap, where the underlying is the spread between interest rates in two different currencies. A calendar spread, a pair of options with the same strike price but different maturities, pays out the price difference for a single asset on two different dates. Spread options, including calendar spreads, are particularly popular in the commodity markets. Variations include:- (i) location spreads, based on the price of the same commodity at two different locations. These can be used to hedge the basis risk incurred when taking delivery of a commodity at one location but required at another. (ii) Processing spreads, known as Crack Spreads in the crude oil market and frac spreads in the natural gas market. These are based on the price differential between a feedstock (e.g., crude oil or natural gas) and the products that can be obtained by refining or fractionating it (e.g., heating oil or propane). (iii) Quality spreads, based on the differential between different grades of the same commodity, such as 'sweet' and 'sour' crudes or heating oils of varying sulfur content. / Опционная торговая сделка, в рамках которой создаются две или более открытых позиций в целях использования дифференциалов и нейтрализации рисков. Опционы на курсовую разницу могут использовать различные сходные цены и/или даты прекращения признания.

SPREAD ORDER = РАСПОРЯЖЕНИЕ НА КУРСОВУЮ РАЗНИЦУ – Spread Order is an order listing the series of options that the customer wants to buy and sell and the desired spread between the premiums paid and received for the options. / Распоряжение, перечисляющее серии опционов, которые заказчик хочет купить и продать, и желаемую разницу в ценах между оплачиваемыми и получаемыми премиями за эти опционы.

SPREAD POSITION = ПОЗИЦИЯ ПО КУРСОВОЙ РАЗНИЦЕ – Spread Position:- the status of an account after a spread order has been carried out.

SPREAD PRICE = РАЗНИЦА В ЦЕНАХ (или ЦЕНОВАЯ РАЗНИЦА) – Spread Price shall mean the mathematical result of subtracting the price of the second (2^{nd}) delivery month of the underlying futures contract in the spread option from the price of the first (1^{st}) delivery month of the underlying futures contract in the spread option. / Разница в ценах должна означать математический результат вычитания цены соответствующего фьючерсного контракта со вторым (2-м) месяцем поставки, вовлечённого в данный опцион на разницу в ценах, из цены соответствующего фьючерсного контракта с первым (1-м) месяцем поставки, также вовлечённого в данный опцион на разницу в ценах.

SPREAD STITCH = РАСШИРЕННЫЙ (или РАСТЯНУТЫЙ) СТЕЖОК (или РАСШИРЕННАЯ (или РАСТЯНУТАЯ) ПЕТЛЯ) – Spread Stitch:- xxxxx. See also Pin Hole.

SPREAD TRADE = ТОРГОВЛЯ НА КУРСОВОЙ РАЗНИЦЕ – Spread Trade is the simultaneous buying and selling of two related markets in the expectation that a profit will be made when the position is offset. Examples include:- buying one futures contract and selling another futures contract of the same commodity but different delivery month; buying and selling the same delivery month of the same commodity on different futures exchanges; buying a given delivery month of one futures market and selling the same delivery month of a different, but related, futures market. Spread Trade is the purchase of one futures contract and the simultaneous sale of another in order to take advantage of relative price changes. Examples include buying one futures contract and selling another futures contract of the same underlying asset but different delivery month; buying a given delivery month of one futures contract and selling the same delivery month of a different, but related, futures contract. Spread Trading is the simultaneous purchase of one futures contract and sale of another. The purpose is to exploit price disparities and profit from a change in the price relationship. See also Calendar Spread, Bear Spread, Bull Spread, Intercommodity Spread, and Intermarket Spread.

SPREAD VEHICLE = РАЗРОСШЕЕСЯ ПРЕДПРИЯТИЕ – At the Corporation of Lloyd's, Spread Vehicle is a corporate member which participates in a number of syndicates. Spread Vehicle is a corporate member underwriting on a number of different syndicates.

SPREGO = SPINNING AND REGULATION MARKET–CLEARING SOFTWARE

SPRI = SOCIÉTÉ DE PERSONNES À RESPONSABILITÉ LIMITÉE

SPRING = ОТСКОК ВНИЗУ (или НИЖНЕЕ СПРУЖИНИВАНИЕ, или СКАЧОК) – Spring is a situation that occurs when prices break below support, but soon reverse course and move back above support. Prices are said to 'spring' back from their support break and indicate that the bulls are still alive. A spring can also be referred to as a Failed (Bearish) Signal and is considered bullish. Generally, the reversal should occur within 1–3 days of the support break for the failed signal to be considered valid. The opposite of Upthrust. Originally a Wyckoff term, is used to denote an impulsive move often associated with a test of support. / Выкоф (Wyckoff).

SPRING CROPS = ЯРОВЫЕ КУЛЬТУРЫ – Spring Crops are the cereals which are sown in the spring. Also known as Spring Grains. / Яровые Культуры, однолетние растения (Бахчевые, Зерновые, Овощные, технические и другие), нормально развивающиеся (в отличие от озимых культур) при посеве весной. Дают урожай в год посева. Яровые Культуры – однолетние сельскохозяйственные растения, высеваемые весной и дающие урожай в год посева. Для нормального развития яровые культуры, в отличие от озимых культур, нуждаются в более коротком (весеннем) периоде воздействия пониженными температурами (3–12 °C). Группа яровых культур включает большинство возделываемых растений, например:- Зерновые хлеба – яровые Пшеница, Рожь (Ярица), Ячмень; крупяные – Просо, Гречиха, Рис; Зернобобовые – Горох, Фасоль, Чечевица; масличные – Подсолнечник, Соя, Кунжут; прядильные – Лён, Хлопчатник; овощные – Огурец, Кабачок, Укроп, Салат; кормовые травы – Сераделла, яровая Вика, Суданская Трава. В агрономии к яровым культурам относят двулетние растения, дающие урожай в год посева (Капуста, многие корнеплоды), а также многолетние, выращиваемые в однолетней культуре (Томат, Табак, Клещевина). В мировом земледелии наибольшие площади занимают Рис, Пшеница, Кукуруза, Фасоль, Соя, Хлопчатник и другие. Выращивание яровых культур возможно во всех земледельческих районах, в том числе на Крайнем Севере, где озимые культуры не возделывают из-за суровых условий зимы. В бывшем СССР яровые культуры высевают на 165.3 миллиона гектар (га), что составляет около 80% посевных площадей (1977); из них наибольшие посевы яровых зерновых (103 миллиона га), Кукурузы на силос (17.2 миллиона га) и технических культур (14.7 миллионов га).

SPRING LINE = ШПРИНГ – Spring Line (maritime term):- usually of the best wire hawsers; one of the first lines sent out in mooring. 'Springs in and springs out' a vessel. / носовой задний или кормовой передний швартов.

SPRING MULCH TILLAGE = ВЕСЕННЯЯ ЗЯБЛЕВАЯ ОБРАБОТКА ПОЧВЫ (или ВЕСЕННЯЯ ОБРАБОТКА ПОЧВЫ С ОБРАЗОВАНИЕМ МУЛЬЧИРУЮЩИМ СЛОЕМ (или ВЕСЕННЯЯ ВСПАШКА С МУЛЬЧИРОВАНИЕМ, или ВЕСЕННЯЯ ЗЯБЛЕВАЯ ВСПАШКА) – Spring Mulch Tillage:- The best practice for reducing erosion and input costs is to eliminate fall tillage. Producers working on fine-textured soils, where crop residues are high following Corn, Wheat or other crops, may be apprehensive about leaving soils untouched in the fall. Following Soybeans or dry edible beans, there is little justifcation for doing fall tillage on most felds in Ontario, Canada. Considerations following other crops include risk of soil erosion, availability of equipment to handle spring residue and field drainage. Producer experience with spring mulch tillage systems has shown that working undisturbed soils in the spring obtained better results when using high-clearance tines, narrow teeth and/or when packers or rollers were used in conjunction with the field cultivator. / Зяблевая Обработка Почвы или Зябь или Зяблевая Вспашка, летне-осенняя обработка почвы под посев яровых культур весной следующего года. В Восточной Европе применялась ещё в Киевской Руси. В мелком крестьянском хозяйстве дореволюционной России, а также в первые годы Советской власти господствовала весновспашка. В Западной Европе получила распространение с начала XIX века. Широкое применение зяблевой обработки почвы в бывшем Союзе Советских Социалистических Республик (СССР) началось в крупном социалистическом сельском хозяйстве – совхозах и колхозах. Вспаханная на зиму почва хорошо впитывает осенние осадки, лучше поглощает талые воды; в ней накапливаются доступные для растений питательные вещества, образующиеся в результате жизнедеятельности аэробных бактерий. Зяблевая обработка почвы позволяет успешно бороться со многими Сорняками и засорённостью почвы, вредителями, зимующими в растительных остатках и верхних слоях почвы, и болезнями сельскохозяйственных культур; способствует раннему проведению весенних полевых работ, уменьшая их напряжённость. Зяблевую обработку почвы проводят после уборки предшествующей культуры; после зерновых и других культур сплошного посева почву сначала лущат, затем через 15–20 суток, когда появятся всходы Сорняков, пашут. Под вспашку вносят органические и минеральные удобрения, а на кислых почвах и известь. Основной приём зяблевой обработки почвы – вспашка плугом с предплужником, при которой почва лучше крошится и создаётся более выровненная поверхность. На подзолистых почвах пашут на глубине не менее 22–23 сантиметров (см), применяя различные способы углубления пахотного слоя. На плодородных (чернозёмных, каштановых, орошаемых серозёмных и других) почвах глубина вспашки нередко достигает 35 см. Значительно повышает урожай сельскохозяйственных культур, особенно в засушливых районах и в нечернозёмной полосе, ранняя зябь, поднимаемая в Августе. На полях из-под многолетних трав проводят вспашку на полную глубину, минуя лущение; из-под пропашных культур при тщательном уходе за ними и отсутствии многолетних сорняков применяют более мелкую обработку почвы (на 12–16 см) лемешными лущильниками; в районах, подверженных ветровой эрозии (Северный Казахстан, Западная Сибирь и другие), хороший эффект даёт безотвальная обработка почвы. Вспаханное под зябь поле обычно оставляют на зиму неборонованным. Исключение составляют некоторые районы Восточной Сибири и Дальнего Востока (почва при бесснежной зиме и ветрах сильно высыхает) и отдельные степные районы, особенно на Юге Украины и Северном Кавказе, где иногда применяют осеннее боронование и культивацию зяби для борьбы с Сорняками.

SPRING NEEDLE = ПРУЖИННАЯ ИГЛА (или КРЮЧКОВАЯ (ТРИКОТАЖНАЯ) ИГЛА) – Spring Needle is a knitting machine needle with a long, flexible hook, or beard, that allows the hook to be closed by an action known as Pressing so that the loops can be cast off. The hook springs back to its original position when the presser bar is removed. Also known as Bearded Needle. See also Latch Needle, and Needle (2). / Пружинная Игла – игла трикотажной машины с длинным, гибгим крючком (hook) или бородкой (beard), которая позволяет крючку быть закрытым (прижатым) . Известна также как Крючковая (Трикотажная) Игла (Bearded Needle). Смотрите также Язычковая (Трикотажная) Игла (Latch Needle), Игла (2; Needle (2)).

SPRING STRIP–TILLAGE = ВЕСЕННЯЯ ПОЛОСНАЯ ОБРАБОТКА ПОЧВЫ (или ВЕСЕННЯЯ ПОЛОСНАЯ ВСПАШКА) – Spring Strip-Tillage offers an opportunity to prepare fine, residue-free seedbeds in which a planter can operate. Most spring strip-tillage operations are restricted to the lighter textured soils but in some cases medium textured soils that are well drained are suitable for this one pass tillage option. The spring strip-tillage operation usually precedes the planter by no more than 6–12 hours in order to prevent the seed zone from drying out excessively. Producers have also used spring strip-tillage as a technique for applying all or part of a Corn crop's nitrogen (N), phosphorus (P) and potassium (K) requirements. From a soil conservation perspective, spring strip-tillage also offers the advantage of eliminating the presence of fall strips that can potentially funnel water and be susceptible to erosion, especially if implemented up and down the slope.

SPRINGWOOD = ВЕСЕННЯЯ ДРЕВЕСИНА – Springwood is the portion of the annual growth ring that is formed during the early part of the season's growth; it is usually less dense, lighter in color, and weaker mechanically than summerwood. Also known as Early Wood. / Известна также как Ранняя Древесина (Early Wood).

SPRING WOOL = ВЕСЕННЯЯ ШЕРСТЬ – Spring Wool:- the 6:7 months of wool produced by sheep shorn in the spring following fall shearing.

SPRINKLER SYSTEM = СПРИНКЛЕРНАЯ СИСТЕМА (или СИСТЕМА РАЗБРЫЗГИВАТЕЛЕЙ) – Sprinkler System is an arrangement of pipes throughout a building, with outlets suitably placed for sprinkling water or other extinguishing fluid to put out fire. / Под Спринклёром понимается разбрызгиватель – автоматически включающаяся оросительная головка, устанавливаемая на трубопроводах систем водяного и пенного пожаротушения. Она снабжена тепловым замком-клапаном, закрытым легкоплавким припоем. Спринклёр начинает действовать автоматически при нагревании его до определённой температуры (58, 72, 93, 141, 182 °C). В качестве запорного элемента в спринклере обычно используется легкоплавкий замок или стеклянная ампула с легкокипящей жидкостью. Различают спринклеры с обычной (9–12 м^2) и повышенной (до 54 м^2) площадью орошения.

SPROUT = РОСТОК (или ПОБЕГ, или ПОРОСЛЬ) – Sprout is a germinated seed; to grow from the seed or to grow from another part of the plant. / Под Побегом понимается стебель с расположенными на нём листьями и почками; один из основных органов высших растений. У однолетних растений побеги живут один сезон; у многолетних – несколько лет. Многолетние подземные побеги нередко видоизменены в клубни, корневища, луковицы, надземные – в колючки, усики. Под Порослью понимаются молодые побеги растений, развивающиеся из придаточных или спящих почек на пнях или корнях лиственных деревьев.

SPROUTED KERNELS = ПРОРОСШАЯ ЗЕРНОВКА (или ПРОРОСШИЕ ЯДРА) – Sprouted Kernels:- kernels are classed as Sprouted when any of the following conditions exist:- (i) growth is evident in the germ area; (ii) bran is noticeably split over the germ; (iii) the germ is removed and there is discoloration normally attributable to sprouting; and (iv) the germ, though intact, is distinctly swollen because of growth. / и изменение цвета обычно присущее ; и (iv) . Солод относится к продукту проращивания зёрен злаков (овса, пшеницы, ржи, ячменя). Применяется в производстве дрожжей, кваса, пива, спиртных напитков и так далее.

SPS = SINGLE PAYMENT SCHEME

SPS = SPECIAL PROTECTION SCHEME

SPS AGREEMENT = THE WTO AGREEMENT ON SANITARY AND PHYTO–SANITARY MEASURES

SPUDDING = ЗАБУРИВАНИЕ – Spudding:- settling the legs of a drilling rig in the seabed. Spudding is the initial drilling of a well. / Забуривание – это первоначальное бурение скважины.

SPUN–BONDED PRODUCTS = СВЯЗАННЫЕ ПРЯДЕНИЕМ ПРОДУКТЫ – Spun-Bonded Products are the nonwoven fabrics formed by filaments that have been extruded, drawn, then laid on a continuous belt. Bonding is accomplished by several methods such as by hot roll calendering or by passing the web through a saturated-steam chamber at an elevated pressure.

SPUN–DYED = КРАШЕННОЕ В ПРЯДЕНИИ (или ВЫПРЯДЕННОЕ КРАШЕННОЕ) – Spun-Dyed:- dyed during the spinning process –used of a synthetic filament, staple, or yarn. See also Dyeing, and Mass-Colored.

SPUN DYED VISCOSE STAPLE FIBER = ПРЯДОМОЕ КРАШЕННОЕ ВИСКОЗНОЕ ШТАПЕЛЬНОЕ ВОЛОКНО – Spun-Dyed Viscose Staple Fibers (VSF):- whilst commodity VSF are sold in bleached or raw-white state, the specificity of spun-dyed VSF is that they are already dyed in the dissolving bath, that is to say before the fibers are formed by pressing the dope through spinnerettes. The notifying party claims that spun-dyed VSF can be substituted by raw-white commodity VSF as the latter may also be dyed at a later stage in the production process. The EU Commission's market investigation has, however, not confirmed this view. On the contrary, the results of this investigation suggest a distinction between commodity VSF and spun-dyed VSF. Customers interviewed by the EU Commission stated that, compared to fibers dyed further downstream in the production process, spun-dyed VSF had superior colorfastness, particularly when exposed to sunlight (light-fastness). In addition, customers also mentioned that the investment necessary for dyeing fibers in the downstream production process was considerable. It was also pointed out that there were applications for which the use of spun-dyed VSF was absolutely necessary, in particular colored household wipes and certain kinds of fancy yarn (bi-color yarn). / устойчивость (fastness).

SPUN DYEING = КРАШЕНИЕ В ПРЯДЕНИИ – Spun Dyeing:- xxxxx. See also Dope Dyeing, Dyeing, and Solution Dyeing.

SPUN FABRIC = ВЫПРЯДЕННАЯ ТКАНЬ – Spun Fabric is a fabric made from staple fibers that may contain one or a blend of two or more fiber types.

SPUN FIBER YARN = ВЫПРЯДЕННАЯ ИЗ ВОЛОКНА ПРЯЖА – Spun Fiber Yarn is:- (1) the yarn twisted by spinning. (2) The yarn made from staple lengths of man-made fibers instead of the long filaments in which man-made fibers are formed. To accomplish this, long filament fibers are chopped into staple lengths and spun to imitate natural fiber yarns. See filament arrd staple.

SPUN IN LINT = XX – Spun In Lint:- accumulated fly twisted with the yarn. Spinning defect. / Порок или дефект прядения.

SPUNLACED FABRIC = ГИДРОСПЛЕТЁННАЯ ТКАНЬ – Spunlaced Fabric is a nonwoven fabric produced by entangling fibers in a repeating pattern to form a strong fabric free of binders.

SPUNLACE NONWOVEN = НЕТКАНЫЙ МАТЕРИАЛ В ВИДЕ СПРЯДЕННОГО КРУЖЕВА – Spunlace Nonwoven is one kind of nonwoven. Through entanglement by high press water jet, fiber web can be formed into spunlace nonwoven. Interlining is one of applications of spunlace nonwoven fabric. Spunlace nonwoven fabric can be used in substrate for synthetic leather, medical and sanitary material for wipes, matress etc. It's application is very wide.

SPUNLIKE FILAMENT YARNS = ПРЯЖИ ИЗ (ЭЛЕМЕНТАРНОЙ) НИТЕЙ, ВЫГЛЯДЯЩИЕ КАК ВЫПРЯДЕННЫЕ – Spunlike Filament Yarns:- Lambda® is the registered trademark for a new generation (January 1978) of Fortrel® spun-like filament polyester yarns produced by Fiber Industries and sold and serviced by Celanese Fibers Marketing Company (New York, NY, the United States). This line of spun-like yarns has been designed to offer the advantages associated with filament yarns while providing the aesthetics of spun yarns. Lambda yarns are available for knitting, weaving and package dyeing. They can be used in circular knit, warp knit or woven constructions in 100% form or in combination with false twist textured Fortrel and/or spun yarns for a variety of effects. They can provide a spun-like hand when combined with conventionally textured polyester. They can be substituted for expensive spun yarns without loss of fabric aesthetics. Lambda fabrics are thicker and bulkier than fabrics of false twist textured polyester, yet perform equally as well. The spun-like aesthetics of Lambda yarns are created by a special texturing process which produces a filament yarn with a multitude of closed loops on the yarn surface. In finished fabrics these loops are responsible for the increased bulk and spun-like aesthetics of Lambda fabric. Fabrics of Lambda can be pressure dyed using generally accepted trade practices for disperse dyeable polyester. Finishing conditions should be selected to enhance the spun-like aesthetics that have been engineered into Lambda yarns. When properly constructed and finished, Lambda fabrics have the resilience and bounce of a filament yarn fabric and the classic hand

of a spun worsted. See also Simulated Spun Yarns. / филаментная (комплексная) пряжа (filament yarn) Лямбда® (Lambda®) Фотчрэл® (Fortrel®) Сэлэниз Файбёз Маркэтин Кампэни (Celanese Fibers Marketing Company).

SPUN POLYESTER = ВЫПРЯДЕННЫЙ ПОЛИЭСТЕР (или ВЫПРЯДЕННЫЙ СЛОЖНЫЙ ПОЛИЭФИР) – Spun Polyester:- Spun Poly or otherwise known as Spun Polyester is made by spinning 100% polyester fibers into yarns. These yarns are then taken and made into thread which consists of two or three ply constructions. One thing to realize about spun poly is that it is not all created equal. The spun poly threads can be created in two different ways. The first and less quality way is by using a ring twisting machine which can cause imperfections in the thread. The second way to create the threads is by using a 2 to 1 twisting technology which reduces thread and needle breaks. KNG, Inc. (Nampa, ID, the United States) only uses the 2 to 1 technology to ensure the highest quality material. Why Choose Spun Poly Vs. Poly Cotton? Choosing the right material for your restaurants apparel can be a little confusing. This is why we decided to break down the benefits of spun poly versus Poly Cotton. (1) Spun Poly is guaranteed to last twice as long as Poly Cotton. If you have the seemingly impossible task of evaluating apron quality, here is a frustration saving solution for you. Look at lint trapped after 100% cotton or a Poly Cotton apron has been dried. Those little fibers are from the apron. After a few washings, the apron needs to be replaced. Not so with the new Spun Poly aprons. (2) Spun Poly does not require ironing. Never worry about your wait staff coming in with wrinkled clothes ever again. Spun Poly will look the same if it has been sitting in the dryer for a week or just pulled out of the dryer. This way you can ensure your staff looks great all the time. (3) Spun Poly does not shrink. By using Spun Poly you will not have to worry about one of your staff drying his or her uniform at the wrong temperature and reducing the size of their uniform or apron. Spun Poly will stay the same size if you have washed it 1 or 100 times. (4) Spun Poly has greater wash-ability. The last thing you want is your staff to look like they are wearing a uniform that they have had since they were a kid. Spun Poly is going to keep its color twice as long as Poly Cotton and resist breakdown. Poly Cotton fibers rub on each other and breakdown during every wash. This is what causes your lint traps to fill up. Spun Poly is almost like plastic and can take the abrasion of the washing cycle much better. (5) Spun Poly has color-fast material that doesn't stain like Poly Cotton. Nothing makes a restaurant look worse than having a staff with stains all over their uniforms. This is why the plastic like fibers of Spun Poly is so great because it will not stain as easily as Poly Cotton. Poly Cotton acts like a sponge when something is spilt on it. Spun Poly will not only resist stains much better but when you do get a stain it is much easier to remove in Spun Poly compared to Poly Cotton. (6) Looks, breathes, and feels better than Poly Cotton. At KNG we realize that our opinion doesn't mean anything if the customer doesn't feel the same. This is why we asked our customers directly what they thought of the Spun Poly versus the Poly Cotton. Every time the customer preferred the Spun Poly over the Poly Cotton. Time and time again customers claimed that it felt lighter, more comfortable, and fit better. In the end Spun Poly may be a little more up front but will last twice as long as Poly Cotton and looks great the entire time. See also Spun Fiber Yarn. / Кей.Эн.Дьжи., Инк. (KNG, Inc.).

SPUN RAYON = ВЫПРЯДЕННЫЙ РЭЙОН (или ВЫПРЯДЕНННАЯ ГИДРАТЦЕЛЛЮЛОЗА) – Spun Rayon is:- (1) the yarn produced by spinning short, uniform lengths of rayon filaments into a continuous strand; and (2) a fabric woven from this yarn. See also Spun Fiber Yarn. Spun Rayon:- simulated cotton or wool made with staple fibers in a continous strand to give this effect. Wears well and is washable. Made in different weights. Comes in plain colors and prints. Has soft, fuzzy surface. Blends well with cotton. Plain weave.

SPUN SILK = ВЫПРЯДЕННЫЙ ШЁЛК (или ПРЯДОМЫЙ ШЁЛК) – Spun Silk Yarn:- the weak filament of the transparent silken envelope remaining from the reeling process – as well as the damaged, discolored, or imperfectly shaped cocoons – become the raw material for lustrous, creamy colored spun silk yarn. This cocoon 'waste' must first have the sericin removed (degummed) with soap and water. Next, the fiber is cut into uniform lengths and carded to remove short tangled bits as well as the brown pupa inside the cocoons. Combing lays all the fibers parallel in a sliver which is spun into a shimmering yarn. Spun silk is the most familiar yarn made available to handworkers. Spun Silk:- yarn or fabric made from short fibers of pierced cocoons or from short ends at the outside and inside edges of the cocoons that cannot be reeled. Spun Silk is a yarn composed of fibers of silk which have not been reeled from the cocoon, but have produced by piercing the cocoon, and then shredding it into lengths of 3 to 15 inches, often from tussah cocoons. See also Doupioni, Reeled Silk, and Schappe. / при процессе разматывания – а также повреждённые, .

SPUN YARN = ВЫПРЯДЕННАЯ ПРЯЖА (или ПРЯДОМАЯ ПРЯЖА) – (1) Spun Yarn is a yarn made by taking a group of short staple fibers, which have been cut from the longer continuous filament fibers, and then twisting these short staple fibers together to form a single yarn, which is then used for weaving or knitting fabrics. Spun Yarn is the yarn made of staple fibers usually bonded together by twist. A yarn made by taking a group of short staple fibers, which have been cut from the longer continuous filament fibers, and then twisting these short staple fibers together to form a single yarn, which is then used for weaving or knitting fabrics. Yarn spun from staple fiber held together by twist. Spun Yarns are produced from chemical or natural fibers. Under certain conditions, needle wear problems can occur when using either of these yarn types. Some chemical fibers contain matting agents such as titaniumdioxide which can induce needle wear. Natural fibers containing foreign particles exercise a similar effect. Depending on where they are cultivated, the harvesting method, weather conditions and gin treatment (cleaning process after harvesting), for example, cotton fibers can contain varying degrees of impurity. Some cotton is contaminated by sand dust which is not eliminated by the preparations for spinning and during the spinning process itself. The inevitable result is wear, not only of needles, but also of yarn carriers, sinkers and cams. The abrasive effect can be minimized by careful selection of raw materials and intensive purification and dust removal during preparation for spinning and during the spinning process. The position of the abrasive particles in the yarn is of decisive importance in determining the degree of wear. A particle attached to the surface of the yarn will clearly exercise the most serious abrasive effect. Yarns manufactured using the open end (OE) spinning method tend to demonstrate a greater degree of dust on the yarn surface. Where particles such as oxides or silicates, which are harder than needle steel, are carried on the surface of the spun yarn, the needle surface will become scratched, inevitably resulting in abrasion of the needle material. Spun Yarn is:- (1) a yarn consisting of staple fibers usually bound together by twist; and (2) a meltspun fiber before it is drawn. Spun Yarn is a textile yarn spun from staple-length fiber. / в истирании . Пряжа, выработанная из штапельного волокна, соединённого вместе посредством скручивания. Выпряденная Пряжа – текстильная нить, изготовленная из штапельных волокон обычно путём скручивания.

(2) In nautics, Spun Yarn is a rope made of long tow hemp, loosely twisted, tarred and then well-rubbed to keep from opening; the component strands are twisted to the right, the rope itself to the left, having usually two or three strands.

SPUR = ШПОРЕЦ (или БРАХИПЛАСТ (ПЛОДОВОЙ ВЕТОЧКИ), или ШПОРА, или ШИП, или КОЛЬЧАТКА, или КОПЬЕЦО, или ПЛОДУШКА, или ПЛОДУХА, или ПЕНЁК (ВЕТОЧКИ)) – Spur is a usually slender hollow projection formed by the fused bases of the lower petals, often containing nectar, in some flowers or a short fruit-bearing stalk.

SPUR GEAR = ЦИЛИНДРИЧЕСКАЯ ПРЯМОЗУБАЯ ПЕРЕДАЧА (или ЦИЛИНДРИЧЕСКОЕ ПРЯМОЗУБОЕ КОЛЕСО, или ЦИЛИНДРИЧЕСКАЯ ПРЯМОЗУБАЯ ШЕСТЕРНЯ) – Spur Gear:- this is the simplest variation of gear. It consists of a cylinder or disk, with the teeth projecting radially. Each tooth edge is straight and aligned parallel to the axis of rotation. Such gears can be meshed together correctly only if they are fitted to parallel axles. See also Gear. Spur Gears are the most easily visualized common

gears that transmit motion between two parallel shafts. Since the tooth surfaces of the gears are parallel to the axes of the mounted shafts, there is no thrust force generated in the axial direction. Also, because of the ease of production, these gears can be made to a high degree of precision. The unit to indicate the sizes of spur gears is commonly stated, as specified by ISO, to be 'module'. In recent years, it is usual to set the pressure angle to 20 degrees. In commercial machinery, it is most common to use a portion of an involute curve as the tooth profile. Even though not limited to spur gears, profile shifted gears are used when it is necessary to adjust the center distance slightly or to strengthen the gear teeth. They are produced by adjusting the distance between the gear cutting tool called Hobbing Tool and the gear in the production stage. When the shift is positive, the bending strength of the gear increases, while the negative shift slightly reduces the center distance. The backlash is the play between the teeth when two gears are meshed and is needed for the smooth rotation of gears. When the backlash is too large, it leads to increased vibration and noise while the backlash that is too small leads to tooth failure due to the lack of lubrication. All KHK (brand of Japanese gears) spur gears have involute tooth shape. In other words, they are involute gears using part of the involute curve as their tooth forms. Looking generally, the involute shape is the most wide-spread gear tooth form due to, among other reasons, the ability to absorb small center distance errors, easily made production tools simplify manufacturing, thick roots of the teeth make it strong, etc. See also Gear. / Смотрите также (Зубчатая) Передача (Gear).

SPUR LINE = ВЕТКА (или ПОДЪЕЗДНОЙ ПУТЬ) – Spur Line is a railroad track that connects a company's plant or warehouse with the railroad's track. The user bears the cost of the spur track and its maintenance. / Железнодорожный Путь, который соединяет завод или склад компании с путями железных дорог. Данный пользователь несёт расходы за его использование и техническое обслуживание. Под железнодорожным Путём понимается комплекс сооружений и устройств, образующих дорогу с направляющей рельсовой колеёй. Состоит из верхнего строения (рельсов, шпал, стрелочных переводов, мостовых брусьев, балластного слоя), земляного полотна (насыпей, выемок) с дренажными устройствами, а также искусственных сооружений (мостов, путепроводов, тоннелей и так далее). Оборудуется сигнальными знаками (указательными и пикетными столбиками и тому подобными).

SPYWARE = ШПИОНСКАЯ ПРОГРАММА – The term Spyware has been used in two ways. In its narrow sense, Spyware is a term for Tracking Software deployed without adequate notice, consent, or control for the user. In its broader sense, Spyware is used as a synonym for what the Anti Spyware Coalition (ASC) calls 'Spyware (and Other Potentially Unwanted Technologies)'. Technologies deployed without appropriate user consent and/or implemented in ways that impair user control over: Material changes that affect their user experience, privacy, or system security; Use of their system resources, including what programs are installed on their computers; and/or Collection, use, and distribution of their personal or other sensitive information. See also Malware, and Virus. Spyware is a generic term for a range of surreptitious malware such as keyloggers, Remote Access Trojans, and backdoor Trojans, especially those that allow remote surveillance of passwords and other sensitive data. When used for frankly criminal activities may also be referred to as Crimeware. The term can also refer to 'more aggressive adware', which collects users' personal data such as visited websites, installed applications, etc. The acquired information can then be exploited for targeted advertising, for instance.

SQUALL = ШКВАЛ – Squall (maritime term):- a sudden and violent gust of wind. / Под Шквалом, от Английского слова Squall, понимается резкое, кратковременное усиление ветра, сопровождающееся изменениями его направления. Скорость ветра при шквале нередко превышает 20–30 метров в секунду (м/сек), продолжительность несколько минут, иногда с повторными порывами. Шквалы возникают при приближении грозовых облаков, а также облаков перед холодными атмосферными фронтами и часто сопровождаются ливнями, градом, грозами. Сильные шквалы вызывают большие разрушения.

SQUARE = КВАДРАТ (или СКВЭА) – (1) A Square is a superficial measurement, used chiefly for boarding, and contains 100 square feet (9.29 square meters). Square (sq) is a traditional unit of area, often used for measuring roofing material, finished lumber, and other building materials. One square equals 100 square feet, 11.111 square yards, or about 9.290 square meters. / Квадрат является мерой измерения площади поверхности, используемой преимущественно для количественного учёта пиломатериалов в виде досок, и содержит 100 квадратных футов (9.29 квадратных метров).

(2) Xxxxx. In metal type, the point size of the font described the height of the metal body on which the typeface's characters were cast. In digital type, letters of a font are designed around an imaginary space called an Em Square. When a point size of a font is specified, the font is scaled so that its em square has a side length of that particular length in points. Although the letters of a font usually fit within the font's em square, there is not necessarily any size relationship between the two, so the point size does not necessarily correspond to any measurement of the size of the letters on the printed page. Em is a printer's unit of relative distance. One em is the height of the type size (in points) being used. If 12 point type is being set, then one em is 12 points, and so on. The 'em' is a typographic measurement equal to the current point size (usually an 'em square' or 'em quad' in two dimensions), but since it relates to point size, it too has no precise measurement relationship to anything one sees in print or on screen. See also Point; and Quad. / В полиграфии под Квадратом понимается единица линейных типографических величин:- крупных, так называемых афишных шрифтов, формата полосы набора, размеров полос изданий. 1 квадрат = 48 пунктам = 18.041 2 миллиметров (мм). Квадратом называется также пробельный материал, применяемый при ручном наборе текста, таблиц, формул, а также при вёрстке. Квадрат в полиграфии, единица линейных мер, применяемая для измерения шрифтов, ширины и высоты полос набора, полей и так далее. 1 квадрат = 48 пунктам = 18.041 2 миллиметров (мм).

SQUARE = БУТОН (или ПОДЦВЕТНИК) – Square is the flower bud of a Cotton Plant with a central corolla containing the pollen anthers and sepals and surrounded by three (or sometimes four) bracts; squares are often a preferred site of insect feeding, e.g., plant Bugs, Boll Weevils, Bollworms. The flower buds that appear on the Cotton Plant about 2 months after planting. A Cotton flower bud. / чашелистики (sepals) окружённый тремя (а иногда – четырьмя) прицветничками (bracts); , например, . Бутон цветка или цветочная почка Хлопчатника. Под Бутоном, от Французского слова Bouton, означающее Почка, понимается цветочная почка растений, дающая при распускании цветок. Бутон обычно отличается от листовых почек (дающих лиственный побег) того же растения более крупными размерами и часто более притуплённой верхушкой. Все части цветка в бутоне уже сформированы. По поперечным разрезам бутона составляют диаграммы цветка, дающие наглядное представление о числе и взаимном расположении отдельных его частей. На бутонах изучают также характер взаимного прикрывания друг другом чашелистиков и лепестков (так называемое Почкосложение) и способ складывания лепестков в бутон (так называемое Листосложение) – признаки, играющие роль в морфологической характеристике различных Семейств Растений.

SQUARE = РАСКВИТАТЬСЯ – Square:- to be flat is to be neither long or short, or to have no positions, or if all the positions held cancel each other out. Also known as Flat. Inventory of market maker with net zero position (neither long nor short). / От Свести или Сводить.

SQUARE CONSTRUCTION = КВАДРАТНАЯ КОНСТРУКЦИЯ – The term 'Square Construction' means fabrics of the following types:- (i) containing less than 79 warp ends and filling picks per square centimeter, of which the difference between the total count of warp ends per centimeter and the total count of filling picks per centimeter is less than 11; or (ii) containing 79 or more warp ends and

filling picks per square centimeter, of which the total count of warp ends per centimeter and the total count of filling picks per centimeter are each less than 57 percent of the total count per square centimeter of such warp ends and filling picks. See also Balanced Cloth. / менее 79 основных продольных нитей и уточных поперечных нитей на квадратный сантиметр, .

SQUARE CUT STAPLE FIBERS = НАРЕЗАНЫЕ КВАДРАТОМ ШТАПЕЛЬНЫЕ ВОЛОКНА – Square Cut Staple Fibers are the staple fibers obtained by cutting into bundles of essentially constant length; they are specified by a single nominal length. See also Staple Fibers.

SQUARE KILOMETER = КВАДРАТНЫЙ КИЛОМЕТР (или КИЛОМЕТР В КВАДРАТЕ) – Square Kilometer:- 1 square kilometer (sq.km or km^2) equals 0.386 102 16 square miles (statute). 1 sq.km equals 247.105 38 acres. 1 sq.km equals 100 hectares. 1 sq.km equals 1 000 000 square meters (sq.m or m^2).

SQUARE RETENTION = УДЕРЖИВАНИЕ БУТОНА – Square Retention is the proportion of squares, usually expressed as a percentage, retained by the cotton plant (often employed early in the growth of a cotton plant as an index of plant development).

SQUARING NODES = УЗЛЫ БУТОНИЗАЦИИ – Squaring Nodes:- Collective term for Nodes Above First Square (NAFS) (prior to first flower) and Nodes Above White Flower (NAWF) (after first flower). Squaring nodes measure the number of sympodia above the first position oldest square/youngest flower throughout the effective fruiting period, and is equal to the number of fruiting branches arising from the main stem that are too young to have developed first-position flowers. Monitoring of squaring nodes may begin after the first square is set on the first or lowest sympodial branch. As the first square progresses to the white flower stage, the pace of plant structural development can be charted. Under near optimum growing conditions, one can expect about 9.25 squaring nodes by the time the first square reaches the white flower stage (this assumes 25 days from first square to white flower and a vertical flowering interval of 2.7 days). Stressed plants would be expected to have less than 9.25 squaring nodes. After flowering has begun, nodal development should slow as fruit development progresses. The rate of decline will depend upon the size of the boll load of the plant and the prevailing environmental conditions. Under conditions of excellent square retention and boll set a rapid decline in terminal growth should be expected. A decline greater than 0.2 nodes per day will suggest hazardous stress, while a decline less than 0.1 nodes per day will suggest failures in providing early plant structure and/or failure to sufficiently set early fruiting positions. See Nodes Above First Square, and Nodes Above White Flower.

SQUEEGEE = ЛОПАТА – Squeegee (maritime term):- a deck dryer composed of a flat piece of wood shod with rubber, and a handle. / Лопата для мытья палубы.

SQUEEGEE = СКВИДЬЖИ (или СКВИДЖ, или РЕЗИНОВЫЙ ВАЛИК (для удаления влаги), или СКРЕБОК, или РЕЗИНОВАЯ ПРОСЛОЙКА, или ПРОМЕЖУТОЧНЫЙ РЕЗИНОВЫЙ СЛОЙ) – Squeegee is the portion of a screen-printing apparatus consisting of a blade that forces the print paste through the screen onto the fabric. / загустка (print paste).

SQUEEZE = ПРОЛЁТ (или ВЫТЕСНЕНИЕ, или ВЫДАВЛИВАНИЕ, или ОТЖИМ, или ВЫЖИМАНИЕ, или ОТЖИМАНИЕ, или СТИСКИВАНИЕ, или ПРИНУЖДЕНИЕ К УБЫТКУ, или ВЫМОГАТЕЛЬСТВО, или СЖАТИЕ, или СЖИМАНИЕ, или СДАВЛИВАНИЕ, или ВЫНУЖДЕНИЕ, или ПРИНУЖДЕНИЕ) – Squeeze:- excess demand over supply on a particular prompt date or period that causes the price(s) for that date (period) to rise more sharply than surrounding prices. Squeeze is a market situation in which the lack of supplies tends to force shorts to cover their positions by offset at higher prices. See also Congestion and Corner. When players are forced to cover their positions by a change in technical or fundamental conditions or the pending expiry of a commodity. Frequently occurs when sellers of a commodity do not have the physical material to deliver against a contract, and are forced to close out positions with a (limited number of) buyers waiting to receive delivery. Such market behaviour often occurs when a market is in short supply, but can also occur close to the expiry of a contract when time constraints may limit the ability of a player to conduct a physical transaction. Bull squeezes, where prices are forced higher are most frequently noted, but bear squeezes where buyers of paper contracts, who do not want to take physical delivery can also occur. Deliberate manipulation of futures markets is outlawed by most exchanges, who take action if inappropriate market behaviour is noted. Period when assets increase in price and investors who have sold short must cover their short positions to prevent loss of large amounts of money. Squeeze:- a relative shortage of available supplies of spot cotton at prevailing prices, together with rather large long market interests in near-month futures contracts, under some circumstances, may be favorable to a squeeze of the near-month futures contracts. The term Squeeze is used to describe a situation in which more cotton is expected to be called for in settlement of maturing futures contracts than it readily available for this purpose. As a result of a squeeze, prices of futures contracts maturing or about to mature may be raised above prices of contracts maturing in more distant months. They may also advance considerably in relation to spot prices of cotton not readily available for delivery on futures contracts. / Период времени, когда цены на активы растут, а инвесторы, занявшие короткие позиции (совершившие продажи), должны покрыть свои короткие позиции либо закрыть их покупкой для предотвращения убытков, которые могут привести к потере ещё больших денежных сумм.

SQUEEZE OUT = ВЫТЕСНЕНИЕ (или ВЫДАВЛИВАНИЕ) – Squeeze Out:- if a majority shareholder – either directly or indirectly – holds at least 95% of the share capital of a German company, he can buy out the company's remaining shareholders against a reasonable cash payment. A squeeze out requires a resolution by the General Meeting taken at the request of the majority shareholder. Upon entry of this resolution into the Commercial Register, the shares of the squeezed-out minority shareholders are transferred by operation of law to the majority shareholder. The appropriateness of the cash payment can – once the squeeze out has been carried out (entry of the resolution on the transfer of shares into the Commercial Register) – be reviewed by a court under arbitration proceedings initiated by a former shareholder.

SQUEEZE ROLL = ОТЖИМНОЙ ВАЛ (или ВЫЖИМНОЙ ВАЛИК) – Squeeze Roll are rolls used to apply pressure for removal of water or chemicals from fabric.

SQUIRREL–CAGE SWIFT = МОТОВИЛО 'БЕЛИЧЬЯ КЛЕТКА' (или МОТОВИЛО 'БЕЛИЧЬЕ КОЛЕСО') – Squirrel-Cage Swift has two rotating cylinders mounted on a vertical post. The cylinders can be shifted to adjust for different-sized skeins. An example of this can be seen on the Museum of the Welsh Woollen Industry page. Look in the lower right-hand corner of the image. / Squirrel – чистильный валик, обтянутый игольчатой лентой. Cage – сетчатый барабан; корзина центрифуги; или ящик для шпуль.

STABILISED FALSE TWIST YARN = СТАБИЛИЗИРОВАННАЯ (или УСТОЙЧИВАЯ) ПРЯЖА ЛОЖНОЙ КРУТКИ – Stabilised False Twist Yarn is the yarn, having a low crimp elongation and a low crimp contraction, obtained by false twisting, followed by heat-setting in a state where it is only partly relaxed from the straightened condition.

STABILISING = СТАБИЛИЗИРОВАНИЕ – Stabilising is a treating a fabric so that it will not shrink or stretch more than a certain percentage, perhaps 2%.

STABILITY = СТАБИЛЬНОСТЬ (или УСТОЙЧИВОСТЬ) – Stability is the property of a system or element by virtue of which its output will ultimately attain a steady state. The amount of power that can be transferred from one machine to another following a disturbance. The stability of a power system is its ability to develop restoring forces equal to or greater than the disturbing forces so as to maintain a state of equilibrium. Stability is a term used to describe the tendency of a fiber or fabric to return to its original shape after being subjected to external influence, such as tension, heat, or chemicals. / Под Устойчивостью энергосистемы понимается способность системы восстанавливать исходное (или близкое к нему) состояние после возмущения, проявляющегося в отклонении параметров системы от номинального значения. Обеспечивается, например, устройствами автоматического регулирования напряжения и частоты и средствами релейной защиты.

STABILITY AND GROWTH PACT = ПАКТ О СТАБИЛЬНОСТИ И РОСТЕ – Stability and Growth Pact consists of two EU Council Regulations, namely:- (i) Regulation (EC) No 1466/97 of 07 July 1997 on the strengthening of the surveillance of budgetary positions and the surveillance and coordination of economic policies; and (ii) Regulation (EC) No 1467/97 of 07 July 1997 on speeding up and clarifying the implementation of the excessive deficit procedure, and of a European Council Resolution on the Stability and Growth Pact adopted at the Amsterdam summit on 17 June 1997. It is intended to serve as a means of safeguarding sound government finances in Stage Three of Economic and Monetary Union (EMU) in order to strengthen the conditions for price stability and for strong, sustainable growth conducive to employment creation. More specifically, budgetary positions close to balance or in surplus are required as the medium-term objective for Member States.

STABILITY PROGRAMMES = ПРОГРАММЫ СТАБИЛЬНОСТИ – Stability Programmes are the medium-term government plans and assumptions provided by Euro area countries regarding the development of key economic variables. They set out the medium-term

objective of a budgetary position that is close to balance or in surplus, or the adjustment path towards this objective as referred to in the Stability and Growth Pact. Stability programmes must be updated annually. They are examined by the European Commission and the Economic and Financial Committee (EFC), whose assessments serve as the basis for the examination by the Economic and Financial Affairs (ECOFIN) Council.

STABILIZATION = СТАБИЛИЗАЦИЯ (или УПРОЧЕНИЕ) – Stabilization:- interruption of an upward or downward fluctuation at a given level or threshold. Stabilization may affect one market segment or economic group. It may occur through natural and spontaneous processes but is usually caused by intervention in a market. / Под Стабилизацией, от Латинского слова Stabilis, означающее Устойчивый, понимается упрочение, приведение в постоянное устойчивое состояние или поддержание этого состояния, а также само состояние устойчивости, постоянства. В экономике под Стабилизацией понимается перерыв или прекращение восходящей или нисходящей флуктуации (колебаний) цен на данном уровне или пороге. Стабилизация может воздействовать как на один сегмент рынка, так и в целом на всю соответствующую отрасль экономики (экономическую группу). Она может проявиться в результате естественных и спонтанных процессов, но, как правило, она вызывается интервенцией в данный рынок.

STABILIZED FIBER = СТАБИЛИЗИРОВАННОЕ ВОЛОКНО (или УСТОЙЧИВОЕ ВОЛОКНО) – Stabilized Fiber is a fiber that is heat or chemically treated to set the fiber properties and prevent deterioration, shrinkage, etc. See also Heat Setting, Heat Stabilized, and UV Absorber.

STABILIZERS = СТАБИЛИЗАТОРЫ – Stabilizers:- like propylene glycol, are ingredients that balance the charges of different detergent ingredients in, and maintain the cleaning, fabric care, and physical properties of, liquid detergent products during shipment and storage. / Под Стабилизаторами, от Латинского слова Stabilis, означающее Устойчивый, понимаются .

STABLE = СТАБИЛЬНЫЕ (или УСТОЙЧИВЫЕ) – Stable:- stock exchange quotations, foreign exchange rates or other kinds of prices and measures which remain close to a certain level. Also known as Unchanged.

STABLE KNIT = СТАБИЛЬНЫЙ ТРИКОТАЖ – Stable Knit is any knit unlikely to stretch excessively. Double knits are usually stable knits.

STABLE LINE = СТАБИЛЬНАЯ ЛИНИЯ – Stable Line is a breeding line that does not change its characteristics. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

STABLE MARKET = СТАБИЛЬНЫЙ РЫНОК (или УСТОЙЧИВЫЙ РЫНОК) – Stable Market is an active market which can absorb large sale or purchases of currency without major moves. / Стабильный Рынок – активный рынок, который способен абсорбировать крупные продажи или приобретения, например, валюты, без каких-либо значительных изменений цены.

STABLE RESISTANCE = СТАБИЛЬНОЕ СОПРОТИВЛЕНИЕ – Stable Resistance is a resistance that is stable across time and space.

STABLE TRANSFORMATION = СТАБИЛЬНАЯ ТРАНСФОРМАЦИЯ – Stable Transformation is the gene transfer that leads to the integration of introduced sequences into the chromosomes of the recipient plant and remains stable.

STACK = ТРУБА – Stack (maritime term):- the ship's funnel or smokestack.

STACK = ШТАБЕЛЬ – Stack is an identifiable amount of containers stowed in a orderly way in one specified location. Stack is an identifiable amount of containers stowed in a orderly way in one specified place on an (ocean) terminal, container freight station, container yard or depot (see container stack). / депо или парк (depot). Под Штабелем, от Немецкого слова Stapel, понимается ровно, в определённом порядке сложенный ряд чего-либо. Штабель (Stack):- вертикальная колонна из правильно сложенных рядов грузовых единиц.

STACK CAR = ШТАБЕЛЬНЫЙ ВАГОН – Stack Car is an articulated five-platform rail car that allows containers to be double stacked. A typical stack car holds ten 40-foot equivalent units (FEU's). / Штабельный вагон представляет собой сочленённый пяти-платформенный железнодорожный вагон, который позволяет перевозить контейнеры двойным штабелем. Типичный Штабельный Вагон способен перевозить десять транспортных средств, эквивалентных 40-футовым контейнерам, так называемых сорокафутовых эквивалентов (СФЭ; Forty-foot Equivalent Units (FEUs)).

STACKED = ШТАБЕЛИРОВАННЫЕ – Stacked:- using two or more genes in a Cotton Variety for expression of similar characteristics (Bollgard II will use two Bt genes to express different endotoxins for caterpillar control) or dissimilar characteristics (Bollgard gene plus Roundup Ready gene for herbicide tolerance to Roundup herbicide).

STACKED GENES = ШТАБЕЛИРОВАННЫЕ ГЕНЫ – Stacked Genes (or Pyramided Genes) are two or more genes inserted into the plant's DNA that express similar (though enhanced) activity, e.g., two genes that encode for separate Bacillus Thuringiensis endotoxin expression in the same Variety, such as in Bollgard II or Widestrike, or two genes that express different activities in the same Variety, such as Bollgard caterpillar resistance plus Roundup Ready glyphosate tolerance. / Вайдстрайк (Widestrike), Рандап Рэди (Roundup Ready).

STACKER CRANE = КРАН ШТАБЕЛЕУКЛАДЧИК (или КРАН ШТАБЕЛЁР, или КРАН СТАКЕР) – Stacker Crane is a crane with a forklift type mechanism used in automated (computer controlled) warehouses (known as an automated storage and retrieval system (AS/RS)). The crane moves on a track in an aisle of the warehouse. The fork can be raised or lowered to any of the levels of a storage rack and can be extended into the rack to store and retrieve product. The product can in some cases be as large as an automobile. Stacker cranes are often used in the large freezer warehouses of frozen food manufacturers. This automation avoids requiring forklift drivers to work in below freezing temperatures every day. / Под Краном Штабелёром понимается грузоподъёмный кран со сменным оборудованием для штабелирования грузов (кип, лесоматериалов, пакетов, тюков и других). Грузоподъёмность доходит до 6 тонн, а высота подъёма до 16.2 метров. Стакер – самоходный штабелировочный конвейер, скребковый (для штабелирования коротких лесоматериалов на лесных складах) или ленточный (для песка, гравия, руды, угля и тому подобных сыпучих материалов). Передвигается по уширенной рельсовой колее. Высота штабеля, укладываемого стакером, – до 35 метров. Иногда стакером называют отвалообразователем.

STACK HEIGHT = ВЫСОТА ШТАБЕЛЯ – Stack Height is the number of pallets rolls and skids that can be safely stacked on top of each other; the client supplies this information. See also Stacking. Note:- stack height is specifically defined by the number of unit loads which is normal practice in this type of storage. / Высота Штабеля (Stack Height) (количество ярусов грузовых единиц в штабеле):-

число грузовых единиц в штабеле, включая находящийся на земле. Примечание:- высота штабеля определяется количеством грузовых единиц, которое оптимально для данного вида хранения.

STACKING = ШТАБЕЛИРОВАНИЕ (или УКЛАДЫВАНИЕ ШТАБЕЛЯ) – Stacking is a placing stock on top of other merchandise in order to more efficiently use space. To pile containers, etc on top of each other. / Укладывать контейнеры и тому подобное друг на друга. Штабелирование (Stacking):- размещение поддонов с единицами грузов один на другой без помощи промежуточных полок или стеллажей.

STACKING AND STICKERING = ШТАБЕЛИРОВАНИЕ И ПРОКЛАДЫВАНИЕ – Stacking And Stickering:- lumber should be stacked immediately after sawing in neat, stickered piles. The stickers separate each layer of lumber and allow air to circulate and dry the boards. Stickers should be made from straight, dry wood 3/4 inch thick, 1-1/4 inches wide, and as long as the pile is wide. Although stickers may also be made of other materials such as plywood or aluminum, wood stickers are least expensive and easy to make. Each layer of lumber in the pile and each layer of stickers should be of uniform thickness in order to minimize warp. Stickers should be aligned in straight, vertical rows spaced 16 to 24 inches apart. Uneven alignment or excessively large spacing will increase the tendency of the lumber to bow. Lumber piles should rest on firm, level foundations with support directly under each vertical row of stickers. The piles should be placed on dry ground and should be kept free of weeds and debris. Foundations for air drying lumber should elevate the piles sufficiently to provide clearance and air flow between the lumber and ground. Piles should be top-weighted to reduce warp, particularly in the upper layers in the pile. A plywood panel placed over a layer of stickers on top of the lumber pile provides a base for a layer of concrete block, sand bags or other heavy material. / прокладки (stickers).

STACKING CONE = УПОРНАЯ ГОЛОВКА ДЛЯ ШТАБЕЛИРОВАНИЯ – Stacking Cone is a metal cone for guiding containers during stacking. / Металлические упорные головки, используемые для целенаправленной установки контейнеров в процессе штабелирования.

STACKING LOAD = НАГРУЗКА ПРИ ШТАБЕЛИРОВАНИИ – Stacking Load is the force acting on lower packing units as as a result of the units stacked on top of them. Standardized DIN and ISO symbols are used to identify the permitted stacking loads. / ДИН (DIN).

STACK TRAIN = ШТАБЕЛЬНЫЙ ПОЕЗД – Stacktrain is a rail service in which intermodal containers are loaded two-high on railcars. Truck trailer chassis' are not transported with the containers. See also Piggyback. Train with containers placed two high on rail flat car. Stack Train:- a rail service whereby rail cars carry containers stacked two high on specially operated unit trains. Each train includes up to 35 articulated multi-platform cars. Each car is comprised of 5 well-type platforms upon which containers can be stacked. No chassis accompany containers.

STACKWEIGHT = ВЕС ШТАБЕЛЯ – Stackweight is the total weight of containers and cargo in a certain row. / Общий вес контейнеров и груза в конкретном ряду.

STAFF COSTS = ЗАТРАТЫ НА ШТАТНЫХ ДОЛЖНОСТНЫХ ЛИЦ (или ИЗДЕРЖКИ НА РУКОВОДЯЩИЙ СОСТАВ) – Staff Costs is the total payment made for staffing during the period. It comprises wages and salaries, social security and pension costs.

STAFF COSTS/SALES (%) = ЗАТРАТЫ НА ШТАТНЫХ ДОЛЖНОСТНЫХ ЛИЦ/ПРОДАЖИ (%) – Staff Costs/Sales (%) is the staff costs expressed as a percentage of sales. Therefore it is a measure of labor intensity.

STAFF OFFICERS = ШТАТНЫЕ ДОЛЖНОСТНЫЕ ЛИЦА (или РУКОВОДЯЩИЙ СОСТАВ, или ПРАВЛЕНИЕ) – In the United States, the term Staff Officers means the President, the Secretary and such Vice Presidents, Assistant Secretaries and Assistant Treasurers as are appointed by the Board of Directors. / В Соединённых Штатах Америки, этот термин означает Президента (President), Секретаря (Secretary) и таких Вице Президентов (Vice Presidents), Помощников Секретаря (Assistant Secretaries) и Помощников Казначея (Assistant Treasurers), которые назначены Советом Директоров (Board of Directors).

STAFF SHARES = АКЦИИ ДЛЯ СОТРУДНИКОВ (или АКЦИИ ДЛЯ ШТАТНЫХ ДОЛЖНОСТНЫХ ЛИЦ) – Staff Shares are shares issued to the employees of a joint stock corporation to enable them to participate directly in the company's business performance or risk. Buyers of staff shares are usually subject to a black-out period of up to five years for the sale of their shares. Otherwise, the shares carry the same rights as other shares.

STAGES OF FLOWERING = СТАДИИ ЦВЕТЕНИЯ – Stages Of Flowering are the four phases of a flower's development – floral initiation, floral organization, floral maturation, and anthesis. / Стадии Цветения являются четырьмя фазами развития цветка:- инициация заложения цветочных зачатков, развитие из зачатков цветков вплоть до их раскрытия, xxxxx и антезис (период, в течение которого цветок полностью открыт и функционален).

STAGFLATION = СТАГФЛЯЦИЯ – Stagflation is a situation in which insufficient economic growth or recession (stagnation) is combined with rising prices (inflation). Stagflation is a 'stagnant economy coupled with price inflation'. Thus the term Stagflation ... it has nothing to do with Deer. In other words, in stagflation prices are going up while the economy is going down. The word was coined during the inflationary period of the 1970's. Under normal conditions one would expect inflation to heat up the economy, i.e. increase buying demand. That is one reason the FED generally increases interest rates during periods of higher inflation. This helps to cool the economy and prevent inflation from spiraling out of control. Of course, if you have read other articles on this site, you will know that the primary cause of inflation is an increase in the money supply. So clamping down on interest rates is kind of like stomping on the accelerator with one foot (increasing the money supply) and stomping on the brakes with the other (increasing interest rates). The net effect is not good for your car. In the same way it doesn't help the economy either. But we digress (back to stagflation). Remember, under normal circumstances increasing inflation equals an increasing economy as all that new money begins flowing around. Stagflation In The 1970's:- But in the 1970's we saw something unusual, inflation and a recession at the same time. This was so unusual that they coined a new term Stagflation to describe the situation. Basically, what happened in stagflation was that there was plenty of liquidity in the system and people were spending money as quickly as they got it because prices were going up quickly (price inflation). But the rapid price increases in the price of oil caused many businesses to become unprofitable, so they began laying off workers. This threw the economy into a tailspin as unemployment grew in spite of an increase in the money supply. The end result was stagflation, i.e. price inflation and high unemployment and a disastrous economy. Finally, the FED cut the money supply, oil prices moderated, and the economy was able to get back on it's feet. The major problem with stagflation is that the normal methods of increasing interest rates doesn't help the situation. The only reason it helps in times of high economic activity is because it slows the 'velocity of money' or the speed at which it changes hands. In contrast, when the economy is weak the standard medicine administered by the FED is to lower interest rates to stimulate the economy. Unfortunately, it is impossible to stimulate the economy by lowering rates while simultaneously fighting inflation by raising rates. So there is the catch. What do you do in Stagflation? Well at this point the Government is forced to face the real problem (which isn't interest rates at all but the money supply). It has to reduce the money supply and get the economy back on a firm footing. That is what finally happened in the early 1980's and that is what is happening now, although not by choice as the market collapses and banks fail the money supply and the velocity of money is contracting. The current

situation is a result of years of inflation because low foreign wages and high demand for US paper debt, were able to keep a cap on our inflation. But finally higher oil prices are igniting the old fires of inflation while the sub-prime mess is unraveling the economy placing us in much the same situation as in the 1970s. Unfortunately, currently the FED is still in denial about the stagflation situation and is trying to lower interest rates and increase the money supply by using massive bailouts, to fight the stalling economy and it isn't doing very well. Term coined in the 1970s to describe the combination of slow or non-existent economic growth (stagnation) with relatively strong price increases (inflation). Stagflation is a recently coined term that combines the economic effects of 'inflation', i.e. escalating prices, and 'stagnation', i.e. stagnant, or no economic growth in terms of GDP. Prices as measured by the consumer price index (CPI) may be increasing while the economy is not expanding. When an economy is not growing (stagnant), but prices are increasing, this is not a healthy situation for a country. This occurred in the 1970s when oil prices increased and the economy was slowing down. / Под Стагфляцией, от Латинских слов Stagno, означающее Делаю Неподвижным, и Inflatio, означающее Вздутие, понимается состояние экономики страны, при котором депрессия (застой) в производстве, торговле и так далее имеет место при одновременном развитии инфляционного процесса.

STAGGERED PLANTING = СМЕЩЁННАЯ ПОСАДКА – Staggered Planting is a planting different fields in a community or on a farm over a period of several weeks, in contrast with simultaneous planting wherein all fields are planted over a period of a week or less.

STAGGERED STITCH = ШАТАЮЩИЙСЯ (или КОВЫЛЯЮЩИЙ) СТЕЖОК (или ПЕТЛЯ) – Staggered Stitch:- usually caused by faulty feed motion or use of wrong type needle and/or fittings. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или дефект от машинного оборудования.

STAGGING = РАСКРУТКА – Stagging:- applying to several banks at once for newly issued shares or bonds in strong demand in the hope of securing a sizeable allotment. A stag is speculator engaging in this practice.

STAGING = СТОЯНКА (или ПОСТАНОВКА) – (1) Staging is the process of getting product from its storage area and placing it near the loading area for later shipment; or in cross docking, the process of unloading product and organizing it for immediate shipment.

(2) Staging is the act of parking a container in the marshalling yard.

STAGING AREA = ПЛОЩАДЬ ПОСТАНОВКИ (или ПЛОЩАДЬ СОСРЕДОТОЧЕНИЯ) – Staging Area is the designated area of the warehouse near the loading dock where product is placed or arranged for shipment.

STAGING RECEIPT = РАСПИСКА О ПОСТАНОВКЕ – Staging Receipt is a document prepared recording the booking and stowage information upon receipt of an outbound load at the marshalling yard.

STAGNATION = СТАГНАЦИЯ (или ЗАСТОЙ) – Stagnation is a phase during which an economy fails to grow or to grow at satisfactory levels. Stagnation may be caused by a specific factor of demand (investment, exports, consumption) or by a general decline in economic activity and production. / В экономике под Стагнацией, от Латинского слова Stagno, означаюее Делаю Неподвижным, понимается застой в производстве, торговле и так далее.

STAIN = РАЗВОД (или ПОТЁК, или ПЯТНО) – There are many different wood conditions grouped under the term Stain, with many different causes. The only one we need to really be concerned with here is blue stain. This is a blue-grey stain of wood that can tend to being black. It is caused by ascomycetes or deuteromycetes that have dark brown hyphae. The way light goes through the wood, it ends up looking bluish gray. The most common and well-known form of blue stain is found in conifers, especially pines, that have been invaded by bark Beetles. The Beetles either kill the tree or invade it as it is dying. They carry with them a Fungus in a group we will just call by the Genus Ophiostoma. When the Beetles attack, they inoculate the tree with their Fungus. The Fungus invades the wood, but especially the rays and the resin canals. The rays are heavily colonized. When you look closely at the wood, you can often see dark streaks where the resin canals were stuffed with hyphae. Such wood is common after salvage operations (harvesting recently killed trees), and when logs are stored after cutting under conditions that permit Beetle attack. One hypothesis on the relationship is that the Fungus helps the insect by killing cells in the sapwood such as rays and resin canal cells. This reduces the host reaction against the beetle. Another is that the Fungi may produce chemicals that are important in beetle maturation. Other things may be involved. In turn, the Beetles provides the Fungus with vectoring services. This is a symbiosis. The Fungus does not decay the wood, although some strength may eventually be lost. It is used for many purposes such as plywood, rough lumber, etc. It may even be sold as special decorative wood ('blue pine'). Xxxxx. When air drying, solar drying, or kiln drying lumber, it is costly and frustrating to have high quality boards damaged by stain, warp, and checking. These defects all result from biological characteristics of wood but each may be kept at a minimum by following a few common sense recommendations. Before discussing the suggested practices, a basic understanding of these problems is needed. Stain:- stain on the surface of lumber, which appears as unsightly purple or blue-black blemishes, is caused by mold or blue-stain fungi. Although the stain may sometimes be removed by bleaching or surfacing, it is especially troublesome since it indicates that the lumber has been exposed to conditions that may promote more serious fungal decay. Fungi thrive in a moist, warm, dark environment. Therefore freshly cut lumber stacked in unstickered piles is especially susceptible to stain. Protection from fungal infection may be obtained by dipping or coating lumber immediately after sawing with a commercial fungicide. Caution must be exercised by following the manufacturer's instructions for safe handling and application of toxic chemicals! Sticker marking, a brown discoloration, is caused by chemical change that occurs on the surface of the lumber in contact with the stickers. Maple, white ash, and magnolia are particularly prone to chemical brown stain. Sticker marking may be reduced by using dry stickers and by practices that promote rapid drying. See also Checking, and Warp. / синева (blue stain). грибок не загнивает древесину, хотя какая-то прочность может быть окончательно потеряна.

STAIN = РАЗВОД (или ПОТЁК) – (1) In textile industry, Stains or Daghi (in India) are caused by lubricants and rust. Most of the stains can be traced back to poor manintenance and material handling. Stains:- any type of stains on fabric like oil, grease, etc. Finishing defect. Stains such as grease, rust etc occur due to poor material handling. Weaving defect. See also Finishing Spot. Stain is an area of discoloration that penetrates the fabric surface. Stains:- Fabric:- dress goods; Construction:- (i) Count:- 104 x 76; (ii) Warp:- 33/1 carded cotton; (iii) Filling:- 40/1 carded cotton; Finish:- plain dyed light blue. Defect:- irregular blotches throughout the piece. Analysis:- examination of the full piece showed the presence of randomly distributed blotches dyed lighter than the balance of the piece. It was observed that many of the stains were around dirty warp or filling yarns or in areas where there appeared to be weaving imperfections which might have resulted in soiling of the fabric. Evidently the goods had been spot-washed in the gray mill. Inspection of several pieces of gray goods showed them to contain similar stains. Laboratory desizing and scouring of the gray-goods cuttings apparently eliminated these stains, but upon dyeing, they reappeared as lighter colored resist spots. Investigation disclosed that the gray goods had been held for more than 8 months before finishing. Finishers who kier-boiled these goods prior to bleaching reported no difficulty. It was concluded that the spot-washing compound underwent some changes on aging which made spots difficult to remove unless kier-boiling was used as standard procedure in finishing. Stain:- a discrete area of discoloration of a fabric. Stain:- it is caused by lubricants and rust and oil, which is major problem in textile mills. / Пятно. Уточина:- 40/1 кардная хлопковая. Порок или

дефект ткачества и заключительной отделки. Пятнистость (stain):- порок ткани; дискретный участок обесцвечивания ткани. Примечание:- этот порок вызван загрязнением ткани посторонними веществами, такими как грязь, масло или ржавчина.

(2) Stain:- excessive oil, dirt. Knitted fabric defect. / Порок или дефект.

(3) Stains:- ink stains from stamping or pin ticket machines. Cutting Room Defects, and namely – Shade Marking Defects. / Порок или дефект раскроя.

(4) Stains:- mill stains, oil spots, or other stains which are either in the basic fabric or which have been acquired in the sewing operation. Interlining defects. / разводы, масляные пятна, или иные разводы, которые . Порок или дефект.

STAINS AND HOLES = РАЗВОДЫ И ДЫРЫ (или ПОТЁКИ И ПРОБОИНЫ) – Stains And Holes:- Fabric:- rayon sport shirting; Construction:- (i) Count:- 114 x 48; (ii) Warp:- 150/40 dull acetate rayon; (iii) Filling:- 300/75 dull acetate rayon; Finish:- plain dyed cream. Defect:- stains and holes. Analysis:- examination of two full pieces showed discolored areas and fabric disintegration along one selvage. There was no regular pattern or repeat to this defect. The yarns in and around the stained places were very weak, and chemical tests showed a strong acid reaction. This defect was apparently caused in the finishing plant after the goods were dyed. If the damage had taken place in the gray goods, there would have been little or no acid remaining in the fabric after it had been wet-processed. / Уточина:- 300/75 .

STAINED GRAIN = ЗАПЯТНАННОЕ ЗЕРНО (или ПОТЕМНЕВШЕЕ ЗЕРНО, или ОКРАСИВШЕЕСЯ ЗЕРНО) – Stained Grain is the discolored grain usually due to fungal disease or infection.

STAINED KERNELS = ЗАПЯТНАННАЯ ЗЕРНОВКА (или ЗЕРНОВКА С ТЁМНЫМИ ОТТЕНКАМИ, или ЯДРА С ТЁМНЫМИ ОТТЕНКАМИ) – Stained Kernels:- staining can be artificial or natural. Artificial stain includes any stain on kernels caused by contact with foreign substances such as dye or adhered foreign material such as oil, grease, paint or soot. Artificial stain does not include any stain caused by poisonous substances. Natural stain is any stain on kernels caused by contact with natural substances such as smut spores, soil, or weeds.

STAINED WOOL = ЗАПЯТНАННАЯ ШЕРСТЬ (или ЗАМАРАННАЯ ШЕРСТЬ, или МАРАНАЯ ШЕРСТЬ, или ПОЖЕЛТЕВШАЯ ШЕРСТЬ) – Stained Wool is a wool that has become discolored by urine, dung, or whatever, which will not scour out white. Badly stained pieces should be removed at shearing before the fleeces are packed. See also Skirting.

STAINING = МАРАНЬЕ (или ОКРАШИВАНИЕ, или ЗАТЁК КРАСКИ, или НАЛЁЖКИ) – (1) Staining:- the undesired pickup of color by a fabric:- (1) when immersed in water, drycleaning solvent, or similar liquid medium that contains dyestuffs or coloring material not intended for coloring the fabric; or (2) by direct contact with other dyed material from which color is transferred by bleeding or sublimation. / (1) . Под Затёком Краски понимается местный порок в виде изменения оттенка окрашенной поверхности, образующегося при сушке ткани. (2) . Под Налёжками понимается распространённый порок в виде отпечатка рисунка от соседней окрашенной поверхности.

(2) Staining:- wool may be permanently stained greenish or yellow or a variety of other colors due to bacterial damage, fungal infections, and other problems. If you're planning to dye wool that's stained, it might not be a problem. Assess the extent of the stain carefully, and check for related faults such as breaks or weak wool.

(3) Staining on original Nike cardigan:- Possible Cause:- product being sold for Rs.100/- (Pakistani Rupee (PKR)) because of recurrent stains on garment. This defect is major and caused rejection of the article. Dyeing defect. Staining of fabric due to bleeding. Possible Cause:- poor wet fastness of dye, inadequate washing of fabric after dyeing. This is a major defect if the fabric is stitched on a garment of lighter shade. The fabric can, however, be used alone but care must be taken when washing. It should be washed separately or with dark colors. Dyeing/Stitching defect.

STAINLESS STEEL = НЕРЖАВЕЮЩАЯ СТАЛЬ (или НЕРЖАВЕЙКА) – Stainless Steel is a broad class of corrosion-resistant iron alloys. Stainless steel is often recommended for vessels for dyeing. It is made of iron alloyed with metals such as chromium, molybdenum, nickel, and others. There are a great many stainless steel alloys. The best alloy for chemical resistance is '316S'. '316' is almost as good, followed by '308', '304' and '18-8'. You will sometimes see these numbers on the packaging or literature for higher quality stainless ware. High chloride ion concentration, particularly at high temperature, can corrode even the best stainless steel. This is unlikely to cause concern for home dyers. Because there is a possibility that stainless steel pots can become pitted from use in dyeing, and the pits may make it hard to completely remove contaminants, such pots should not be used for food purposes. Beware of aluminum rivets that are sometimes used to fasten handles to inexpensive stainless steel pots. / Под Нержавеющей Сталью понимается легированная сталь, устойчивая к коррозии на воздухе, в воде, а также в некоторых агрессивных средах. Наиболее распространены хромоникелевая (18% Cr и 9% Ni) и хромистая (13–27% Cr) нержавеющие стали, часто с добавкой Mn, Ti и других элементов.

STAINLESS–STEEL FIBER = НЕРЖАВЕЮЩЕЕ СТАЛЬНОЕ ВОЛОКНО – Stainless-Steel Fiber:- textile fibers made of stainless steel. Steel fibers are used for antistatic purposes in carpets, for tire belt construction, and for high-temperature or heat-resistant end uses.

STAIN REPELLENT = РЕПЕЛЛЕНТ ОКРАШИВАНИЯ – Stain Repellent:- the ability of a fabric to resist wetting and staining by water.

STAIN RESISTANCE = УСТОЙЧИВОСТЬ ОКРАШИВАНИЯ (или ПЯТНОСТОЙКОСТЬ) – Stain Resistance:- a fiber or fabric property of resisting spots and stains. / устойчивых пятен и разводов (или потёков).

STAIN–RESISTANT POLYESTER FIBER = ПЯТНО–УСТОЙЧИВОЕ (СЛОЖНОЕ) ПОЛИЭФИРНОЕ ВОЛОКНО – The polyester fibers business of Teijin Fibers Ltd (Tokyo, Japan) has developed in 2011 a new stain-resistant polyester fabric that offers, for the first time in the world, both water absorption to eliminate stickiness and oil-repellency to resist oil-based soiling. The new material will be used for sportswear. Uniforms and apparel that require both oil-repellency and sweat absorption. Teijin Fibers Ltd will begin selling the new fabric in time for spring and summer 2012 sportswear and apparel. The new material also offers a soft texture because its special new coating is formed on each individual fiber, rather than the fabric as a unit. The key to this breakthrough was Teijin Fibers Ltd' leveraging of proprietary fiber processing and nanotechnologies to succeed in covering the fiber surface with a 100 nanometer coating that consists of separate hydrophilic and oil-repellent layers. When sweat or other moisture contacts the fabric, water content is selectively absorbed and quickly spread to the hydrophilic layer, whereas oil is repelled and later can be easily washed off. Polyester is essentially hydrophilic, so it neither absorbs water nor repels oil-based grime. Existing water-repellent and oil-repellent materials present problems, such as loss of breathability and texture, because the coating is applied only to the top surface of the fabric, rather than each individual fiber. / Тэйджин Файбёз Эл.ти.ди. (Teijin Fibers Ltd).

STAKEHOLDER = ДОЛЬЩИК (или ДЕРЖАТЕЛЬ ДОЛИ, или ДЕРЖАТЕЛЬ ПАЯ, или ПАЙЩИК) – (1) Stakeholder is anyone with an interest (a stake) in a company. These include shareholders, directors, management, employees, suppliers, government, regulators, non-governmental organizations and the community at large. People with an interest in industry activities that affect them. They may include nearby landowners, Aboriginal communities, recreational land users, other industries, environmental groups, governments and regulators. Stakeholders are persons or groups whose interests are interlinked with those of a company in a variety of ways. For example, BASF's stakeholders include shareholders, business partners, employees, neighbors and society. / Например, Бе.А.Эс.Эф. (BASF).

(2) Stakeholder:- maintaining effective stakeholder relationships is a process of continuous proactive engagement, taking the form of informational sessions, one-to-one engagements, community meetings, and everything in between. The first step is a thoughtful strategy of identifying, mapping, and prioritizing stakeholders in a given geographic region, who are central to a company's operational activities. Once a strategy is developed, engaging stakeholders can be as simple as holding a conversation or as complex as educating an entire community on operational processes. No matter how a company or operator engages with its stakeholders, transparent communication and collaboration is the cornerstone for building long-term sustainable relations. Although every relationship may not flourish, an operator is responsible for maintaining an environment conducive to responsible interactions and effective listening. Stakeholders will hold operators accountable for the commitments they make. Building long-term sustainable relationships is not always easy and requires strategic focus by a company or operator. Stakeholder is a person, group or entity that has interest or concern in an organization and its activities is considered a stakeholder. Stakeholders can affect or be affected by the organization's actions, objectives and policies. Some examples of key stakeholders are employees, partners, suppliers, investors, customers, communities, consumers and consumer associations, mineral rights owners and landowners, media, special interest groups and non-governmental organizations (NGO's), government (local, state and federal elected officials) and shareholders. Stakeholder Engagement comprises the interaction between a company and affected stakeholders by actively developing and sustaining relationships to the benefit of all parties. It includes a range of interactions over the life of a project to include activities such as stakeholder identification, information disclosure, stakeholder feedback, and the involvement of stakeholders in monitoring the project's impacts, mitigation, and benefits. Stakeholder engagement is an inclusive and continuous process that begins with identifying and prioritizing stakeholders by assessing their interests and concerns. Communicating information to stakeholders early in the process helps influence public perception and establishes a positive atmosphere that can cultivate relationships over the life of the project. Stakeholder Management is the process of forming, monitoring and maintaining constructive relationships with stakeholders by influencing their performance expectations, resulting in their participation. Stakeholder management helps a company or operator move toward its stated goals by keeping existing stakeholders engaged, and recruiting new stakeholders as necessary, in a responsible and ethical way. The process includes:- thinking strategically; analyzing and planning; strengthening engagement as the project life cycle evolves; building a process for long term engagements; and, ensuring lessons learned are captured and capitalized upon for future endeavors.

STAKEHOLDER VALUE = СТОИМОСТЬ ПО ОЦЕНКЕ ДОЛЬЩИКАМИ (или СТОИМОСТЬ ПО ОЦЕНКЕ ПАЙЩИКАМИ) – Stakeholder Value:- stakeholders include, apart from the shareholders (the owners), employees (including management), customers (e.g., demanding quality and reliability), suppliers, capital markets (including lenders) and the government (e.g., claim on tax revenues, environmental protection) and the general public (political parties, associations, the media etc). In contrast to the shareholder value principle, which is centered on the needs and expectations of the company's owners (e.g., the shareholders of a stock company), the stakeholder principle attempts to assess the company in its overall socio-economic context and reconcile the interests of the various stakeholder groups. Value of a company to someone who has a real or psychological 'stake' in it, such as employees, customers, suppliers. See also Shareholder Value. / Стоимость компании для того, кто имеет в ней реальную или психологическую 'долю', среди таковых – работники, заказчики, поставщики. Смотрите также Стоимость По Оценке Акционерами (Shareholder Value).

STALE BILL OF LADING = ПРОСРОЧЕННЫЙ (или ЗАПОЗДАЛЫЙ, или СТАЛИЙНЫЙ) КОНОСАМЕНТ – Stale Bill Of Lading is a late bill of lading (B/L). In banking, a B/L which has passed the time deadline of the L/C and is void.

STALE BULL = НАДОРВАВШИЙСЯ БЫК (или НЕСОСТОЯВШИЙСЯ БЫК) – Stale Bull:- speculator who has bought a commodity or trading instrument in the expectation of price rises and then sells on disappointment at the market's failure to fulfil his expectations.

STALE BULL LIQUIDATION = ЛИКВИДАЦИЯ НАДОРВАВШИМСЯ (или НЕСОСТОЯВШИМСЯ) БЫКОМ – Stale Bull Liquidation:- selling of a long position by a disappointed bull when the price has not performed up to his expectation.

STALE LONG = ПЕРЕДЕРЖАННАЯ ПОКУПКА – Stale Long:- generally a trader that has been holding a long position in the futures market for an extended period of time with little to no gains to show for the risk taken. The stale long has an increased likelihood of throwing in the towel and liquidating the position. Many times it is thought that a market cannot begin a good rally until the stale longs have been run out of the market first, allowing the smart money a better level of entry on the long side.

STALK = НОЖКА (или СТЕБЕЛЁК, или ЧУБУК) – Stalk is:- (i) a slender or elongated fleshy structure that supports a plant or plant part such as a leaf or flower or a fungus; and (ii) waste plant material consisting of stem, seed pod etc separated from harvested seeds. / мясистый (fleshy) структура . Чубук – черенок Винограда.

STALK POSITION = ПОЛОЖЕНИЕ ЧЕРЕШКА – Stalk Position:- different positions of tobacco leaves on the stalk which are harvested at different times.

STALWART PRINTING MACHINE = ПЕЧАТНАЯ МАШИНА СТАЛВОРТ (или ПЕЧАТАЮЩАЯ МАШИНА СТАЛВОРТ) – Stalwart Printing Machine is a carpet printing machine in which color is applied to the carpet with a neoprene sponge laminated to the pattern. The pattern is cut in a rubber base attached to a wooden roll. It is very similar to relief printing. Used primarily for overprinting random patterns on dyed carpets. Suitable for shags and plush carpets as well as level loop and needletuft types. / .

STAMEN = ТЫЧИНКА – Stamen is the part of the flower bearing the male reproductive cells; composed of the anthers on the filament (stalk). Stamen is pollen-bearing male sexual organ of a flower, consisting of anther and filament. Stamens:- the male floral whorl consists of 5 organs, but usually only 4 or 2 of them are fertile and produce pollen (stamens). The remaining 1 or 3 organs are infertile and usually reduced to small size (staminodes). Rarely, staminodes are lacking completely. In case of two fertile stamens, the lateral staminodes are usually longer and more elaborate than the median (dorsal) staminode which is usually a tiny rudiment or even completely aborted. The presence of five stamens is always associated with actinomorphy (radial symmetry) of the corolla (Ramonda, Thamnocharis, Bournea, Tengia, Conandron, Bellonia, Napeanthus p.p.). These flowers are mostly flat-faced (rotate), more rarely campanulate (Bournea) or suburceolate (Tengia). The actinomorphic flowers were formerly often regarded as primitive, but are now considered to represent a derived condition (Burtt 1970). They (or at least the flat-faced forms) exhibit the general syndrome of oligandric pollen flowers (see Pollination), and one of the reasons why actinomorphic flowers have evolved secondarily in the Gesneriaceae is apparently the switch to buzz-pollination. Reduction of the stamen number to 2 is only known in the paleotropical

Gesneriaceae (over 30 genera) and in a single genus of the Coronantheroid Gesneriaceae (Sarmienta), but not in the neotropical Gesneriaceae. It is usually the posterior (upper) pair that is reduced, but there are also some genera in which the anterior stamens are reduced (Opithandra, Epithema, Sarmienta). The fertile stamens are divided into a filament and an anther with 4 pollen chambers. In correlation with the corolla type, filament length varies considerably:- in the short-tubed and flat flowers, in which the anthers are exposed and form a cone, the filaments are very short, in the long-tubed flowers they are long, sometimes slightly contorted. Insertion of the filaments is mostly at the base, less commonly in the middle and rarely near the mouth of the corolla tube. Filament curving (for correct positioning of the anthers) and coiling (after pollen is shed) is often found when the anthers are coherent. The flat-flowered Species of Henckelia sect. Loxocarpus have conspicuous filament knees that bear a yellow blotch and apparently act as anther/pollen dummies. In many Species of Episcieae the filament bases are broad, sheath-like and fused to the dorsally split tube. The tube may provide protection for the superior ovary and channels the proboscis of a pollinator to the nectar, which is siphoned up from the nectary into the space between the corolla and the filament tube. The anthers exhibit a wide range of forms. Dehiscence is by longitudinal slits or less frequently by an apical or basal pore. Poricidal dehiscence and dry, powdery pollen is indicative of pollen flowers (see Pollination). The anthers are often connate or coherent, either side by side, face to face, or at the apices. This is achieved by interlocking and fusion of the epidermal cells. When 4 stamens are present, the 4 anthers may cohere all together, forming a cross-like structure, or, in case of different length of the filaments, they may cohere pairwise. The coherence is of functional importance, especially in flowers with exserted stamens:- the cross- or pairwise fusion holds the anthers in a stable position during pollination. Perhaps the most specialised anther configuration is found in a number of species of Drymonia, in which a kind of 'salt-shaker mechanism' is present:- in the bud the four anthers are grouped coherently around the style, with their thecae facing inwards. As the anthers mature, they become connate along the length of the thecal margins and at their upper end, thus forming a rectangular or columnar unit. The individual thecae open by a short basal slit or pore. Just before opening of the bud, lengthening of the corolla and the filaments, along with the curvature and the differential length of the filament pairs, cause the anthers to turn upside down so that the pores become located apically. When entering the flower, the (insect) visitor touches the bottom of the anther unit which then tips over briefly like a salt-shaker and dusts the visitor with dry pollen. Not all the pollen is shed at once, but several visits are required to empty the anther unit. After the pollen has been shed, the anthers are often removed from the corolla entrance by various filament movements (coiling, retraction, bending down- or upwards). / на тычиночной нити (ножке). Под Тычинкой понимается мужской орган цветка. Тычинка гомологична микроспорофиллу голосеменных, папоротникообразных, разноспоровых плауновидных. Обычно состоит из тычиночной нити и пыльника, в гнёздах которого развивается пыльца, служащая для оплодотворения. В цветках бывает от 1 до нескольких сотен тычинок. Совокупность всех тычинок цветка – андроцей.

STAMINATE = ТЫЧИНКОНОСНОЕ (или ОБРАЗУЮЩЕЕ ТЫЧИНКИ) – Staminate:- of a male flower possessing stamens but not a pistil. / тычинки (stamens), но не .

STAMINODE = СТАМИНОДИЙ – Staminode is a sterile stamen. / Стаминодий – стерильная (бесплодная) тычинка (stamen).

STAMMEL = СТЭМЭЛ (или XX) – Stammel:- the bright red color of stammel or a coarse woolen fabric usu dyed red.

STAMP DUTY = ГЕРБОВАЯ ПОШЛИНА (или ГЕРБОВЫЙ СБОР) – In Australia, Stamp Duty is a tax on written documents (instruments) and certain transactions including motor vehicle registrations and transfers, insurance policies, leases, mortgages, hire purchase agreements and transfers of property, such as businesses, real estate or shares. The rate of stamp duty varies according to the type and value of the transaction involved. Depending on the nature of the transaction, certain concessions and exemptions may be available. Stamp duty on publicly listed marketable securities will be abolished from 2001-July-01. As requirements vary between States, organizations should seek clarification from their local State/Territory revenue office. Stamp taxes levied on newly issued securities. In Switzerland, stamp duties arise for a Swiss company on the issuance of shares, bonds or money market papers (issue tax) or for a Swiss fiscal securities broker or a remote member of the SWX Swiss Exchange on the transfer of securities (transfer tax). Euro bonds denominated in non-Swiss currencies are exempt from transfer tax. A Swiss regulated bank, securities dealer or a Swiss company holding title to securities corresponding to an amount of at least CHF10 million are deemed to be fiscal securities brokers for stamp duty purposes. The tax rate is one per cent with respect to issue tax for capital exceeding CHF250 000.00 (CHF1 million as from 2006-January-01), 0.15 per cent with respect to the transfer of Swiss securities and 0.3 per cent with respect to the transfer of foreign securities. Stamp Duty is the tax paid by the purchaser on the transfer of various types of asset, including UK shares. Stamp Duty is a Government tax paid on purchase of certain assets, e.g., shares, houses. / Гербовый Сбор это особый государственный сбор, взимаемый с отдельных лиц и организаций при оформлении документов по гражданско-правовым сделкам. Взимание гербового сбора производится путём продажи гербовых бланков для составления документов или специальных гербовых марок. Гербовый сбор уплачивается либо в твёрдой сумме с каждого вида документа (Простой Гербовый Сбор), либо в зависимости от суммы сделки, указанной в документу (Пропорциональный Гербовый Сбор). Впервые был введён в Нидерландах в 1624. В России гербовый сбор был установлен Петром I в 1699. В бывшем СССР гербовый сбор взимался с 16 Февраля 1922 и был отменён при проведении налоговой реформы от 01 Октября 1930. При подаче заявлений в судебные органы взыскивается государственная пошлина. Гербовый Акт от 1765 – закон о налогообложении ('гербовом сборе') в Британских колониях в Северной Америке, принятый Английским Парламентом в 1765. Налогом облагались брачные документы, торговые сделки, деловые бумаги, печатные издания и тому подобное. Состоявшийся в Нью Йорке в Октябре 1765 межколониальный конгресс объявил решение Английского Парламента незаконным, так как колонисты не имели в парламенте своих представителей. Борьба колонистов, в частности бойкот Британских товаров, заставила Английское правительство в 1766 отменить Гербовый Акт. Гербовые Знаки – (i) специальные бланки, предназначенные для составления некоторых финансовых документов (векселей, чеков и других); а также (ii) особые марки, путём продажи которых государство взимает гербовый сбор при подаче заявлений в административные и судебные органы.

STAMP TAXES = ГЕРБОВЫЕ НАЛОГИ – Stamp Taxes:- levies (taxes) imposed in connection with the issuance of securities, the payment of insurance premiums and the transfer of ownership of securities and other documents or deeds. In securities trading a distinction is made between stamp tax (imposed when securities are issued) and turnover tax (levied on a transfer of title) Stamp duty rates differ according to the legal and economic nature of the securities.

STANCHION = ПИЛЛЕРС – Stanchions (maritime term):- wooden or metal uprights used as supports (posts). / Леерная стойка переборки. Под Пиллерсами, от Английского слова Pillars, множественное число от Pillar, означающее Колонна или Столб, понимается вертикальная металлическая стойка, служащая опорой для палубного перекрытия судна. Пиллерсы бывают постоянные или съёмные. Смотрите также Набор Корпуса Судна.

STANCHION = СТОЙКА – Stanchion:- rods or bars on the sides and corners of an open means of transport or container, used to secure the cargo. Removable stanchions are inserted into the stanchion pockets provided. / или стержни (или прутки (bars)) по сторонам и углам открытых . В теории машин и механизмов под Стойкой понимается звено механизма, принятое за неподвижное. Неподвижное звено механизма называют Стойкой.

STAND = НАСАЖДЕНИЕ – Stand is a group of plants or trees growing together in a given area. Stand (Effective Stand):- A term Stand generally refers to the number of plants per area, e.g., plants per hectare. Effective stand must consider not only the number of plants, but also uniformity of plant distribution, length of skips, and plant health. / Насаждение, участок леса (естественного или искусственного происхождения), включающий Деревья, Кустарники и различные лесные Растения. Состоит из древостоя и других компонентов леса, с характерными для данного участка признаками (происхождение, состав пород, форма, полнота, возраст, тип леса, бонитет и другие), в комплексе отличающими его от других насаждений.

STANDARD = СТАНДАРТ – As defined by the Multilateral Trade Negotiations 'Agreement on Technical Barriers to Trade' (Standards Code), a Standard is a technical specification contained in a document that lays down characteristics of a product such as levels of quality, performance, safety or dimensions. Standards may include, or deal exclusively with, terminology, symbols, testing and test methods, packaging, marking or labeling requirements as they apply to a product. Standard is a document established by consensus and approved by a recognized body, that provides, for common and repeated use, rules, guidelines or characteristics for activities or their results, aimed at the achievement of the optimum degree of order in a given context. Standard is a document, established by consensus and approved by a recognized body, that provides, for common and repeated use, rules, guidelines or characteristics for activities or their results. See also Standardization. / Устаревшим названием стандарта являлось Нормаль. Под Стандартом в широком смысле слова понимается модель, образец, эталон, принимаемые за исходные для сопоставления с ними других подобных объектов. Стандарт как нормативно-технический документ устанавливает комплекс нормальных правил, требований к группам однородной продукции и в необходимых случаях требований к конкретной продукции. Иными словами под стандартом понимаются правила, обеспечивающие разработку продукции, её производство и применение, а также требования к иным объектам стандартизации, например, единицам величин, физическим константам. Стандарт утверждается компетентным органом. Стандарт может быть разработан как на материальные предметы (продукцию, эталоны, образцы веществ), так и нормы, правила, требования различного характера. Применение стандарта способствует улучшению качества продукции, повышению уровня унификации и взаимозаменяемости, развитию автоматизации производственных процессов, росту эффективности эксплуатации и ремонта изделий. В бывшем СССР по сфере действия стандарты подразделялись на:- (i) государственные (ГОСТ) – на всей территории и для всех отраслей; (ii) отраслевые (ОСТ); (iii) республиканские (РСТ); и (iv) стандарты предприятий (объединений) (СТП). Под Стандартом, от Английского слова Standard, означающее Мерило или Норма или Образец, в широком смысле слова понимается образец, эталон, модель, принимаемые за исходные для сопоставления с ними других объектов; нормативно-технический документ по стандартизации, устанавливающий комплекс норм, правил, требований к объекту стандартизации и утверждённый компетентным органом. Стандарт может быть разработан на материально-технические предметы (продукцию, эталоны, образцы веществ), нормы, правила, требования организационно-методического и общетехнического характера. Стандарт распространяется на все сферы человеческой деятельности:- науку, технику, промышленное и сельскохозяйственное производство, строительство, здравоохранение, транспорт и так далее. В зависимости от сферы действия и уровня утверждения стандарты в бывшем СССР подразделялись на следующие категории:- Государственные Стандарты (ГОСТ), утверждаемые Госстандартом СССР (за исключением стандартов, утверждаемых Советом Министров СССР, Госстроем СССР и Министерством Здравоохранения СССР) и действующие на всей территории СССР; Отраслевые Стандарты (ОСТ), утверждаемые министерством и обязательные для всех предприятий отрасли; Республиканские Стандарты Союзных Республик (РСТ), утверждаемые Советом Министров Республики и обязательные для всех предприятий, расположенных на её территории, независимо от ведомственного подчинения; Стандарты Предприятий И Объединений (СТП), обязательные только для предприятия, утвердившего данные стандарты. В СССР также введены Стандарты СЭВ (СТ СЭВ), фиксирующие результаты конкретной деятельности органов СЭВ по стандартизации. Применение СТ СЭВ обязательно для всех предприятий, организаций и учреждений Союзного, республиканского и местного подчинения во всех отраслях народного хозяйства. Наряду со стандартами в СССР действовали Технические Условия (ТУ) на конкретные типы, марки, артикулы продукции. В зависимости от назначения различают стандарты:- общетехнические и организационно-методические правила и нормы; общие требования, показатели, нормы качества продукции; эксплуатационные свойства и технические характеристики, методы контроля групп однородной продукции межотраслевого применения; нормы техники безопасности и средства защиты работающих, термины и обозначения; единицы физических величин; государственные эталоны единиц физических величин и поверочные схемы; методы и средства поверки средств измерений; требования к стандартным образцам свойств и состава веществ и материалов; системы документации (конструкторской, технологической и другой); системы классификации и кодирования технико-экономической информации, системы организации производства, технические средства Научной Организации Труда (НОТ); важнейшие виды продукции. Стандарты на продукцию подразделяются на следующие виды:- стандарты технических условий, общих технических требований, параметров, типов, конструкции, марок, сортамента, правил приёмки, методов контроля, правил маркировки, упаковки, транспортирования, хранения, эксплуатации и ремонта, типовых технологических процессов. Все стандарты систематически пересматриваются и обновляются в соответствии с последними достижениями науки, техники, производства. Стандарты в СССР являются обязательными в пределах установленной сферы их действия, области и условий их применения. Порядок разработки и утверждения стандартов устанавливается ГОСТ 1.2-68. В ежемесячном Информационном Указателе Государственных Стандартов СССР и в ежегодном Указателе Государственных Стандартов СССР публикуется вся официальная информация о государственных стандартах СССР.

STANDARD AND POOR'S = СТЭНДОД ЭНД ПОЗ – Standard & Poor's, a subsidiary of The McGraw-Hill Companies, Inc, is the world's foremost provider of independent credit ratings, indices, risk evaluation, investment research and data. With approximately 10 000 employees, including wholly owned affiliates, located in 23 countries and markets, Standard & Poor's is an essential part of the world's financial infrastructure and has played a leading role for more than 140 years in providing investors with the independent benchmarks they need to feel more confident about their investment and financial decisions. Standard & Poor's traces its origins to the publication, in 1860, of Henry Varnum Poor's History of Railroads and Canals in the United States, a precursor of modern stock reporting and analysis. Since that time, Standard & Poor's has continued to deliver on its mission to support 'the investor's right to know', providing credit ratings, indices, investment research, risk evaluation and data. The following are just a few Red Letter dates from our past. A more exhaustive time line of events in Standard & Poor's storied history may be found by viewing the Timeline above (Flash). In 1906, the Standard Statistics Bureau was formed to provide previously unavailable financial information on US companies. In 1916, Standard Statistics began to assign debt ratings to corporate bonds, with sovereign debt ratings following shortly thereafter. In 1940, municipal bond ratings were introduced. In 1941, Poor's Publishing and Standard Statistics merged to form the Standard & Poor's Corporation. In 1966, The McGraw-Hill Companies, Inc acquired Standard & Poor's (S&P), and S&P became a Division of The McGraw-Hill Companies, Inc. Standard & Poor's (S&P) is a division of McGraw-Hill that publishes financial research and analysis on stocks and bonds. It is one of the top three companies in this business, along with Moody's Investors Service Ltd and Fitch Ratings Ltd. It is well known for its US-based S&P 500®, the Australian S&P/ASX 200 stock market index, and the Canadian S&P/TSX. Standard & Poor's is a leading provider of financial market intelligence. The world's foremost source of credit ratings, indices, investment research,

risk evaluation and data, Standard & Poor's provides financial decision-makers with the intelligence they need to feel confident about their decisions. Many investors know Standard & Poor's for its respected role as an independent provider of credit ratings and as the home of the S&P 500 benchmark index. But Standard & Poor's global organization also:- (i) provides a wide array of financial data and information; (ii) is the largest source of independent equity research and a leader in mutual fund information and analysis; and (iii) Maintains 79 major index families worldwide. As financial markets grow more complex, the independent analysis, critical thinking, opinions, news and data offered by Standard & Poor's are an integral part of the global financial infrastructure. Over USD1.45 trillion in investment assets is directly tied to S&P indexes and more than USD4.45 trillion is benchmarked to S&P indices – more than all other index providers combined. The total amount of outstanding debt rated by S&P globally is approximately USD34 trillion, in 100 countries. In 2005 alone, Standard & Poor's Ratings Services published more than 500 000 ratings, including new and revised ratings. The S&P Global 1200 covers 31 markets and approximately 70% of global market capitalization. Standard & Poor's Equity Research is among the world's leading providers of independent investment information, offering fundamental coverage on over 2 000 stocks. Standard & Poor's is the pre-eminent source of fundamental company and security data. Today, Standard & Poor's employs approximately 8 500 employees located in 21 countries and markets. Standard & Poor's Financial Services LLC is a subsidiary of The McGraw-Hill Companies, Inc. Headquartered in New York, State of New York (NY), the United States. Standard & Poor's (S&P) is a United States-based financial services company. It is a division of The McGraw-Hill Companies that publishes financial research and analysis on stocks and bonds. It is well known for the stock market indices, the US-based S&P 500, the Australian S&P/ASX 200, the Canadian S&P/TSX, the Italian S&P/MIB and India's S&P CNX Nifty. It is one of the Big Three credit rating agencies (Standard & Poor's, Moody's Investor Service and Fitch Ratings. Standard & Poor's traces its history back to 1860, with the publication by Henry Varnum Poor of History of Railroads and Canals in the United States. This book was an attempt to compile comprehensive information about the financial and operational state of US railroad companies. Henry Varnum went on to establish HV and HW Poor Co. with his son, Henry William, and published updated versions of this book on an annual basis. In 1906 Luther Lee Blake founded the Standard Statistics Bureau, with the view to providing financial information on non-railroad companies. Instead of an annually published book Standard Statistics would use 5" x 7" cards, allowing for more frequent updates. In 1941, Poor and Standard Statistics merged to become Standard & Poor's Corp. Then in 1966 S&P was acquired by The McGraw-Hill Companies, and now encompasses the Financial Services division. Standard & Poor's, as a credit rating agency (CRA), issues credit ratings for the debt of public and private corporations. It is one of several CRAs that have been designated a Nationally Recognized Statistical Rating Organization by the US Securities and Exchange Commission. It issues both short-term and long-term credit ratings:- (1) Long-term credit ratings:- S&P rates borrowers on a scale from AAA to D. Intermediate ratings are offered at each level between AA and CCC (e.g., BBB+, BBB and BBB–). For some borrowers, S&P may also offer guidance (termed a 'credit watch') as to whether it is likely to be upgraded (positive), downgraded (negative) or uncertain (neutral):- (i) Investment Grade:- (a) AAA:- the best quality borrowers, reliable and stable (many of them governments); (b) AA:- quality borrowers, a bit higher risk than AAA. Includes:- (ba) AA+:- equivalent to Moody's and Fitch Aa1; (bb) AA:- equivalent to Aa2; and (bc) AA–:- equivalent to Aa3; (c) A:- economic situation can affect finance:- (ca) A+:- equivalent to A1; and (cb) A:- equivalent to A2; and (d) BBB:- medium class borrowers, which are satisfactory at the moment. (ii) Non-Investment Grade (also known as Junk Bonds):- (a) BB:- more prone to changes in the economy; (b) B:- financial situation varies noticeably; (c) CCC:- currently vulnerable and dependent on favorable economic conditions to meet its commitments; (d) CC:- highly vulnerable, very speculative bonds; (e) C:- highly vulnerable, perhaps in bankruptcy or in arrears but still continuing to pay out on obligations; (f) CI:- past due on interest; (g) R:- under regulatory supervision due to its financial situation; (h) SD:- has selectively defaulted on some obligations; (i) D:- has defaulted on obligations and S&P believes that it will generally default on most or all obligations; and (j) NR:- not rated. (2) Short-term issue credit ratings:- S&P rates specific issues on a scale from A-1 to D. Within the A-1 category it can be designated with a plus sign (+). This indicates that the issuer's commitment to meet its obligation is very strong. Country risk and currency of repayment of the obligor to meet the issue obligation are factored into the credit analysis and reflected in the issue rating:- (a) A-1:- obligor's capacity to meet its financial commitment on the obligation is strong; (b) A-2:- is susceptible to adverse economic conditions however the obligor's capacity to meet its financial commitment on the obligation is satisfactory; (c) A-3: adverse economic conditions are likely to weaken the obligor's capacity to meet its financial commitment on the obligation; (d) B:- has significant speculative characteristics. The obligor currently has the capacity to meet its financial obligation but faces major ongoing uncertainties that could impact its financial commitment on the obligation; (e) C:- currently vulnerable to nonpayment and is dependent upon favorable business, financial and economic conditions for the obligor to meet its financial commitment on the obligation; and (f) D:- is in payment default. Obligation not made on due date and grace period may not have expired. The rating is also used upon the filing of a bankruptcy petition. Credit rating agencies such as Standard & Poor's have been subject to criticism in the wake of large losses beginning in 2007 in the collateralized debt obligation (CDO) market that occurred despite being assigned top ratings by the CRAs. Credit ratings of AAA (the highest rating available) were given to large portions of even the riskiest pools of loans. Investors, trusting the low risk profile that AAA implies, loaded up on these CDOs that later became unsellable. Those that could be sold often took staggering losses. For instance, losses on USD340.7 million worth of CDOs issued by Credit Suisse Group AG added up to about USD125 million, despite being rated AAA by Standard & Poor's. Despite common perception, Standard & Poor's didn't rate the two major Icelandic banks, Kaupthing and Landsbanki. Companies pay Standard & Poor's to rate their debt issues. As a result, some critics have contended that Standard & Poor's is beholden to these issuers and that its ratings are not as objective as they should be. In April 2009 Standard & Poor's called for 'new faces' in the Irish Government, which was seen as interfering in the democratic process. In a subsequent statement they said they were 'misunderstood'. On 2010-April-27, the Greek debt rating was decreased to 'junk' status by Standard & Poor's amidst fears of default by the Greek Government. They also cut Portugal's credit ratings by two notches to A, over concerns about Portugal's state debt and public finances on 2010-April-28. Standard & Poor's publishes a large number of stock market indices, covering every region of the world, market capitalization level, and type of investment, e.g., indices for REITs and preferred stocks. These indices include:- (i) S&P 500 – value weighted index of the prices of 500 large-cap common stocks actively traded in the United States; (ii) S&P 400 MidCap Index; (iii) S&P 600 SmallCap Index, etc. / Корп. (Corp.). Фитч Рэйтиньгз Лимитид (Fitch Ratings Ltd) . Мудиз Инвэстоз Сёвис Лимитид (Moody's Investor Service Ltd). Стэндод энд Поз (Standard & Poor's) . Крэди Свиссэ Груп А.Ге. (Credit Suisse Group AG). Хэнри Вилъйэм. с суверенными (самостоятельными) рэйтиньгами . надлежащую (причитающуюся) дату . (Kaupthing) и Ландсбанки (Landsbanki). Компания Стэндод энд Поз (Standard & Poor's) образовалась в результате слияния в 1941 двух корпораций:- Стэндод Стэтистикс (Standard Statistics) и Поз Паблишинь Кампэни (Poor's Publishing Company). Однако начало истории бизнеса Стэндод энд Поз принято связывать с выходом в 1860 исследования Хэнри Варнама По (Henry Varnum Poor) 'История Железных Дорог и Каналов в Соединённых Штатах' (History of Railroads and Canals in the United States). Именно в это время Хэнри По начал публиковать финансовую информацию, в которой остро нуждались Европейские инвесторы, озабоченные судьбой своих вложений в проекты создания инфраструктуры в Америке. В 1867 Хэнри По вместе с сыном открывают компанию Поз Рэйлвэй Мэньюэл Кампэни (Poor's Railway Manual Company) (впоследствии – Поз Паблишинь Кампэни). В 1906 Люсэр Ли Блэйк (Luther Lee Blake) создаёт Стэндод Стэтистикс Бьюро (Standard Statistics Bureau), предоставившее Американским компаниям ранее недоступную для них финансовую информацию. В 1916 Стэндод Стэтистикс стало присваивать кредитные рэйтиньги корпоративным облигациям, а вскоре после этого – и

рэйтиньги суверенных долговых обязательств. В 1940 появились первые рэйтиньги муниципальных облигаций. В 1941 Стэндод Стэтистикс и Поз Паблишинь Кампэни слились, образовав компанию Стэндод энд Поз. В 1966 Стэндод энд Поз была приобретена корпорацией МэкГро-Хил, Инк. (McGraw-Hill, Inc.). Основным принципом справочных изданий фирмы Генри Пура по вопросам инвестиций было 'право инвестора на информацию'. Этот принцип соблюдается и поныне, более 140 лет спустя. Компания Стэндод энд Поз стала признанным мировым лидером в области предоставления независимых высококачественных услуг по оценке кредитных рисков, изданию аналитических и справочных материалов для мирового финансового рынка. Стэндод энд Поз создала ряд продуктов и услуг для фондового рынка, в том числе системы отслеживания фондовых индексов и серию Интернет-услуг, облегчающих работу международных специалистов в области финансового анализа, планирования и инвестиционной деятельности. В штате Стэндод энд Поз насчитывается более 10 000 сотрудников, которые работают в офисах компании, расположенных в 23 странах мира; в их числе – более 1500 аналитиков, из них более 20 – в России на постоянной основе. Корпорация МэкГро-Хил (McGraw-Hill), основанная в 1888, специализируется в области предоставления информационных, образовательных и аналитических услуг в сфере финансов и бизнеса, предоставляя их под торговыми марками своих дочерних компаний, в частности Стэндод энд Поз, Бизнес Вик (Business Week), Дьжей.Ди. Павэ энд Эсошиэтс (J.D. Power and Associates). Корпорация имеет более 280 офисов в 40 странах мира. Объём продаж в 2008 составил 6.4 миллиарда Долларов США.

THE STANDARD AND POOR'S 100 INDEX = ИНДЕКС ПО 100 ОТ СТЭНДОД ЭНД ПОЗ – The Standard And Poor's (S&P) 100 Index is a market-capitalization weighted index consisting of 100 large blue chip stocks across various industries. Many fund managers use this index as a benchmark to measure the performance of large cap stocks overall. The market capitalization of the companies in the S&P 100 varies considerably, but in general large companies have a market cap greater than USD5 billion. / Стэндод энд Поз (Standard & Poor's) .

THE STANDARD AND POOR'S 500 INDEX = ИНДЕКС ПО 500 ОТ СТЭНДОД ЭНД ПОЗ – The Standard & Poor's 500 Index, also known as S&P 500®, is calculated using a base-weighted aggregate methodology; that means the level of the Index reflects the total market value of all 500 component stocks relative to a particular base period. Statisticians refer to this type of index, one with a set of combined variables (such as price and number of shares), as a composite index. Total market value of a company is determined by multiplying the price of the stock by the number of common shares outstanding. An indexed number is used to represent the results of this calculation in order to make the value easier to work with and track over time. It is much easier to graph a chart based on indexed values than one based on actual values. The S&P 500's base period is 1941–43. The actual total market value of the stocks in the Index during the base period has been set equal to an indexed value of 10. This is often indicated by the notation 1941–43 = 10. The formula used to calculate the Index is fairly straightforward. However, the calculation of the adjustments to the Index (commonly called Index Maintenance) is more complex. In practice, the daily calculation of the Standard & Poor's 500 Index is computed by dividing the total market value of the 500 companies in the Index by a number called the Index Divisor. By itself, the Divisor is an arbitrary number. However, in the context of the calculation of the S&P 500® Index, it is the only link to the original base period value of the Index. The Divisor keeps the Index comparable over time and is the manipulation point for all Index Maintenance adjustments. An example of how an index is calculated, using three stocks for illustrative purposes, follows. First, a starting point-or base period-is selected. Next, the initial total market value of the three-stock index at the base period is calculated by first taking each company's number of outstanding common shares and multiplying it by its price per share to determine the market value of each stock. Then, the three market values are added together. The total is the base period market value for the index. That total then is indexed (set equal to 10) and used to calculate the base period divisor. The base period divisor in this example (base period market value divided by base period index value) is 1 000 000. Suppose that the next day the per-share price of each of the three stocks in our index goes up exactly 10%. Since there have been no changes in the number of common shares outstanding, the market value of each company in the index also will go up 10%. That new market value is divided by the index divisor, which remained unchanged at 1 000 000. The new closing value of the index is 110, also exactly 10% higher than the previous day's closing value. This three-stock example illustrates the exact steps used every day to calculate the Standard & Poor's 500. The Index always is calculated by adding the market values of its 500 components and dividing that sum by the latest Index Divisor. The same procedure is used to calculate the four S&P 500 major industry sector indices (Industrials, Financials, Transportation, and Utilities) and the individual industry group indices. The closing S&P 500® Index value for 1993 was 466.45. This indicates that the 1993 closing market value for the Index was 46.6 times the average market value of the Index during the base period 1941–43. Therefore, a portfolio of stocks that exactly replicated the S&P 500® stock portfolio over the past 52 years would have increased in value by almost 4 565% not counting any dividends. The total-return calculation of the Standard & Poor's 500 Index has become increasingly important. Both the Association for Investment Management and Research's (AIMR) performance measurement standards and the SEC's executive compensation ruling require total return performance calculations and comparison to appropriate market benchmarks. Calculating the total return for any equity security is relatively straightforward: simply add dividend income and price appreciation for a given time period. The total return for the S&P 500® Index is calculated similarly; an indexed dividend return is added to the Index price change for a given time period. To actually calculate the total return for the Standard & Poor's 500 Index for a given time period, an indexed dividend for that time period is added to the closing S&P 500® Index value for that period. Then, this number is divided by the closing S&P 500® Index value at the beginning of the time period. The indexed dividend is an index number that represents the dividend distribution of the companies in the S&P 500® Index. It is calculated by adding the total daily dividends (based on the ex-dividend date) for all of the stocks in the Index for a given time period, converting it to an indexed number by dividing it by the same Index Divisor that is used to calculate the actual S&P 500® Index. The general formula to calculate the indexed dividend is:- Total Daily Dividends / Latest Index Divisor = Indexed Dividend. The Daily Indexed Dividend for the Standard & Poor's 500 Index on 1993-December-01, can be calculated using the above formula and the appropriate index divisor of 7 066.280 5. Indexed Dividend = 276.694 1 / 7 066.280 5 = 0.039 16. Standard & Poor's uses the ex-dividend date rather than the payment date to determine the total daily dividends for each day because the marketplace price adjustment for the dividend occurs on the ex-date. Treatment of special dividends, such as stock dividends and extraordinary dividends, within the S&P 500 Index calculation is decided upon on a case by-case basis. The Standard & Poor's 500 Index total-return calculation assumes the reinvestment of dividends on a daily basis. Monthly, quarterly, and annual total-return numbers for the S&P 500® Index are calculated by daily compounding of the reinvested dividends. The total-return calculations for the S&P 500 Index industry groups are calculated with dividends reinvested on a monthly, not a daily basis. The quarterly and annual industry total return numbers are calculated by compounding the monthly total returns. There are four different total-return indices for the Standard & Poor's 500 Index:- 1936, 1970, 1988, and year-to-date. Each one uses a different base period. The 1936 and 1970 total return indices were developed for historical use. Dividends are reinvested quarterly from 1936 through 1988 in the 1936 total-return index, and dividends are reinvested monthly from 1970 through 1988 in the 1970 total-return index. The 1988 total-return index is calculated based on daily reinvestment of dividends and uses 1988-January-01, as the base period. The year-to-date total-return index is also calculated assuming daily reinvestment of dividends; however, the base period is the last day of the prior year. The S&P 500® Index is an unmanaged index used as a measurement of change in stock market conditions based on the performance of a specified group of common stocks. Widely

regarded as the best single gauge of the US equities market, this world-renowned index includes 500 leading companies in leading industries of the US economy. Although the S&P 500® focuses on the large cap segment of the market, with approximately 75% coverage of US equities, it is also an ideal proxy for the total market. S&P 500® is part of a series of S&P US indices that can be used as building blocks for portfolio construction. S&P 500® is maintained by the S&P Index Committee, a team of Standard & Poor's economists and index analysts, who meet on a regular basis. The goal of the Index Committee is to ensure that the S&P 500® remains a leading indicator of US equities, refl ecting the risk and return characteristics of the broader large cap universe on an on-going basis. The Index Committee also monitors constituent liquidity to ensure efficient portfolio trading while keeping index turnover to a minimum. The S&P Index Committee follows a set of published guidelines for maintaining the index. Complete details of these guidelines, including the criteria for index additions and removals, policy statements, and research papers are available on the Web site at www.indices.standardandpoors.com. These guidelines provide the transparency required and fairness needed to enable investors to replicate the index and achieve the same performance as the S&P 500®. Criteria for index additions:- (i) US Company:- determining factors include location of the company's operations, its corporate structure, its accounting standards and its exchange listings. (ii) Market Capitalization:- companies with market cap in excess of USD3 billion. This minimum is reviewed from time to time to ensure consistency with market conditions. (iii) Public Float:- there must be public float of at least 50%. (iv) Financial Viability:- companies should have four consecutive quarters of positive as-reported earnings, where as-reported earnings are defi ned as GAAP Net Income excluding discontinued operations and extraordinary items. (v) Adequate Liquidity and Reasonable Price:- the ratio of annual Dollar value traded to market capitalization for the company should be 0.30 or greater. Very low stock prices can affect a stock's liquidity. (vi) Sector Representation:- companies' industry classifications contribute to the maintenance of a sector balance that is in line with the sector composition of the universe of eligible companies with market cap in excess of USD3 billion. (vii) Company Type:- constituents must be operating companies. Closed-end funds, holding companies, partnerships, investment vehicles and royalty trusts are not eligible. Equity Real Estate Investment Trusts (REITs) and business development companies (BDCs) are eligible for inclusion. Continued index membership is not necessarily subject to these guidelines. The Index Committee strives to minimize unnecessary turnover in index membership and each removal is determined on a case-by-case basis. Criteria for index removals:- (i) companies that substantially violate one or more of the criteria for index inclusion; and (ii) companies involved in merger, acquisition, or significant restructuring such that they no longer meet the inclusion criteria. The S&P 500® generally quoted is a price return index; there are also 'total return' and 'net total return' versions of the index. These versions differ in how dividends are accounted for. The price return version does not account for dividends; it only captures the changes in the prices of the index components. The total return version reflects the effects of dividend reinvestment. Finally, the net total return version reflects the effects of dividend reinvestment after the deduction of withholding tax. Standard & Poor's introduced its first stock index in 1923. Before 1957, its primary daily stock market index was the 'S&P 90', a value weighted index based on 90 stocks. By linking this index to the S&P 500® index, the latter has been extended back to 1918. Standard & Poor's also published a weekly index of 423 companies. The S&P 500® index in its present form began on 1957-March-04. Thanks to the computer technology emerging at the time, this index could be calculated and disseminated in real time. The S&P 500® is widely employed as a measure of the general level of stock prices, as it includes both growth stocks and the generally less volatile value stocks. The index reached an all-time intraday high of 1 552.87 in trading on 2000-March-24 during the dot-com bubble, and then lost approximately 50% of its value in a two-year bear market, spiking below 800 points in July 2002 and reaching a low of 768.63 intraday on 2002-October-10 during the stock market downturn of 2002. The S&P 500® remained below its year 2000 all-time high somewhat longer than the popular Dow Jones Industrial Average and the more comprehensive Wilshire 5000. However, on 2007-May-30, the S&P 500® closed at 1 530.23 to set its first all-time closing high in more than seven years. The highest point reached was 1 565.15 on 2007-October-09. In mid-2007, difficulties stemming from subprime mortgage lending began spreading to the wider financial sector, resulting in the second bear market of the XXI century. The resulting crisis became acute in September 2008, ushering in a period of unusual volatility, encompassing record 100-point moves in both directions and reaching the highest levels since 1929. On 2008-November-20, the index closed at 752.44, its lowest close since early 1997. A modest recovery the following day still left the index down 45.5% for the year. This year-to-date loss was the greatest since 1931, when the broad market declined more than 50%; the total losses that ushered in the Great Depression exceeded 80% over a three-year period. The market continued to decline between late 2008 and early 2009 surrounding the events involving the financial crisis of 2008, reaching a nearly 13-year closing low at 676.53 on March 09. Subsequently, the index has recovered sharply to close at 1 115.10 on December 31, up over 65% from the low but still down by more than 30% from the 2007 high; this respite has been alternately characterized as heralding a return to economic growth, or a significant counter-trend bear market rally. The index has traditionally been market-value weighted; that is, movements in the prices of stocks with higher market capitalizations (the share price times the number of shares outstanding) have a greater effect on the index than companies with smaller market caps. The index is now float weighted. That is, Standard & Poor's now calculates the market caps relevant to the index using only the number of shares (called 'Float') available for public trading. This transition was made in two steps, the first on 2005-March-18 and the second on 2005-September-16. In the derivatives market, the Chicago Mercantile Exchange® (CME®) offers futures contracts that track the index and trade on the exchange floor in an open outcry auction, or on CME's Globex® platform, and are the exchange's most popular product. Additionally, the Chicago Board Options Exchange, Inc. (CBOE®) offers options contracts on the S&P 500® as well as S&P 500® ETFs (short for the exchange-traded funds), inverse ETFs and leveraged ETFs. Investors have used options on the S&P 500® (SPX™) index for a variety of purposes over the past two decades, including investing, hedging, asset allocation, and the management of risk. Investors appreciate many features of the SPX options, including:- (i) the fact that the options are tied to the world's leading benchmark for institutional investors; (ii) SPX options are powerful, flexible tools that allow investors to synthetically adjust their positions to a 500-stock portfolio; (iii) these listed options minimize counterparty risk – they are guaranteed by The Options Clearing Corporation, a triple-A rated clearinghouse; and (iv) there is price discovery in competitive, SEC-regulated auction markets. The Standard & Poor's 500 Index is a capitalization-weighted index of 500 stocks from a broad range of industries. The component stocks are weighted according to the total market value of their outstanding shares. The impact of a component's price change is proportional to the issue's total market value, which is the share price times the number of shares outstanding. These are summed for all 500 stocks and divided by a predetermined base value. The base value for the S&P 500® Index is adjusted to reflect changes in capitalization resulting from mergers, acquisitions, stock rights, substitutions, etc. The Standard & Poor's 500 Index (S&P 500® Index) is one of several indices designed to measure changes in price of a broad array of stocks. Source:- compiled by Standard & Poor's. Available in most major newspapers and several on-line market information sources. Frequency:- daily through newspapers; instantaneous through on line information sources. Reason:- the stock market is one measure of the current value of the nation's stock of capital and is often viewed as a barometer of business and consumer confidence regarding the future. A high and/or rising stock market may signal robust growth of business investment and consumer spending in the near future while a low and/or falling stock market may signal sluggish spending. For this reason, the S&P 500® is one component of the Index of Leading Indicators. The S&P (Standard & Poor's) 500 Index is a broad market index comprising 500 stocks. As such it is a much broader measure of market activity than is a narrow high end index like the DOW (which is based on 30 blue-chips). The S&P 500® Index is widely regarded as the best single gauge of large-cap US equities and serves as the foundation for a wide range of investment products. The index includes 500 leading companies and captures approximately 80% coverage of

available market capitalization. / Дау Дьжонз (Dow Jones). Вилшир Эсошиэтс, Инк. (Wilshire Associates, Inc.). экстраординарные дивиденды . строка баланса (item). пузырь (bubble). Стэндод энд Поз (Standard & Poor's). СИБО® (СВОЕ®). Индекс по 500 от Стэндод энд Поз (Standard & Poor's 500 Index), или сокращённо – Индекс по 500 от Эс.Энд.Пи. (S&P 500® Index), является индексом широкого рынка, состоящим из 500 акций. И коль так, то он является намного более широкой мерой активности рынка, нежели узкий отборный индекс типа Дау (который основан на 30 голубых фишках). Индекс по 500 от Стэндод энд Поз (Standard & Poor's 500 Index) – широкобазисное измерение изменений условий фондового рынка, основанное на усреднённых значениях стоимости 500 широко распространённых акций; известен также как Индекс по 500 от Эс.Энд.Пи. (S&P 500® Index). Отбор акций, их относительная оценка с целью отражения различий в числе акций, находящихся на руках акционеров, и публикация индексов является одной из основных услуг, предоставляемых корпорацией Стэндод энд Поз Корпорэйшэн (Standard & Poor's Corporation). Компания предоставляет консультации в области финансов, устанавливает рэйтиньг ценных бумаг и публикует его. Индексы отражают котировки акций промышленных, транспортных, финансовых компаний и компаний, предоставляющих коммунальные услуги. С середины 1989 сводный индекс по 500 акциям стал более гибким и число выпусков, представленных в каждом секторе, стало различным.

THE STANDARD AND POOR'S 500 SUBORDINATED NOTE INDEX = ИНДЕКС ПО 500 СУБОРДИНИРОВАННЫМ БИЛЕТАМ ОТ СТЭНДОД ЭНД ПОЗ – The Standard And Poor's 500 Subordinated Note Index is a special form of indexed money market paper. / Специальная форма индексируемой бумаги денежного рынка.

THE STANDARD AND POOR'S DEPOSITARY RECEIPT = ДЕПОЗИТАРНАЯ РАСПИСКА СТЭНДОД ЭНД ПОЗ – Referred to as 'Spider', it stands for Standard And Poor's Depositary Receipt (SPDR). SPDRs have three letter symbols (MDY, SPY, and XLK) and trade just like stocks on the AMEX®. They offer a convenient means to buy and sell the S&P 400, S&P 500® and select S&P sectors. Three of the more popular SPDRs include:- (i) MDY – an index-linked security designed to track the S&P Mid Cap 400 Index that sells for approximately 1/5 the value of the underlying index; (ii) SPY – an index-linked security designed to track the S&P 500® that sells for approximately 1/10th the value of the underlying index; and (iii) XLK – a security linked to a basket of technology stocks and designed to track the performance of the technology sector. There are also sector SPDRs representing basic industry (XLB), consumer services (XLV), consumer staples (XLP), cyclicals/transports (XLY), energy (XLE), financial (XLF), industrial (XLI), and utilities sectors (XLU). Standard & Poor's 500 Depository Receipts (SPDRs), pronounced 'spiders', were introduced in 1993. They were created as a trust that holds all 500 stocks included in the S&P 500 index. The trust, managed by State Street Global Advisors, has about USD17 billion in assets. Warehouse receipts are issued against the trust. Each receipt represents a SPDR, and gives its holder a pro rata interest in the securities that are held by the trust This enables the investor to transact a single security as though he were trading the entire S&P 500 index. SPDRs trade on the American Stock Exchange and can be expected to track the S&P 500 very closely. The dividends paid by the underlying stocks are aggregated and paid quarterly to the SPDRs holders. In 1998, the American Stock Exchange began trading subsets of SPDRs. Each subset represents an industry sector consisting of stocks belonging to an industry that are included in the S&P 500. / АФБ® или АМЭКС® (AMEX®) . SPDRs, произносимые как Спайдэрс (spiders). THE STANDARD AND POOR'S LARGE CAP 500 INDEX = ИНДЕКС ПО 500 АКЦИЯМ КОМПАНИЙ С КРУПНОЙ КАПИТАЛИЗАЦИЕЙ ОТ СТЭНДОД ЭНД ПОЗ – The Standard And Poor's (S&P) Large Cap 500 Index lists the 500 largest 'large-cap' stocks (stocks from major companies in various industries). In 1999, companies in the index ranged from USD500 million to USD400 billion in market capitalization. / Стэндод энд Поз (Standard & Poor's) . Фондовый Индекс по 500 от Стэндод энд Поз представляет собой усреднённую стоимость акций 500 компаний (425 промышленных и 75 железнодорожных и коммунальных), торгуемых на Нью Йоркской Фондовой Бирже, и отображает рыночную активность.

THE STANDARD AND POOR'S MIDCAP 400 INDEX = ИНДЕКС ПО 400 АКЦИЯМ КОМПАНИЙ СО СРЕДНЕЙ КАПИТАЛИЗАЦИЕЙ ОТ СТЭНДОД ЭНД ПОЗ – The Standard And Poor's (S&P) MidCap 400 Index lists 400 mid-size companies in various industries. According to S&P, it is a market-value weighted index. In 1999, the companies listed in the S&P 400 ranged from around USD200 million to USD10 billion in market capitalization. Introduced in 1991, the S&P MidCap 400 is now the most widely used index for mid-sized companies. Today, mid caps are being recognized as an independent asset class, with risk/reward profi les that differ considerably from both large caps and small caps. The S&P MidCap 400 covers over 7% of the US equities market, and is part of a series of S&P US indices that can be used as building blocks for portfolio construction. S&P MidCap 400 is maintained by the S&P Index Committee, a team of Standard & Poor's economists and index analysts, who meet on a regular basis. The goal of the Index Committee is to ensure that the index remains an accurate measure of midsized companies, refl ecting the risk and return characteristics of the broader mid cap universe on an on-going basis. The S&P Index Committee follows a set of published guidelines for maintaining the index. Complete details of these guidelines, including the criteria for index additions and removals, policy statements, and research papers are available on the Web site at www.indices.standardandpoors.com. These guidelines provide the transparency required and fairness needed to enable investors to replicate the index and achieve the same performance as the S&P MidCap 400. Criteria for index additions:- (i) US Company. Determining factors include location of the company's operations, its corporate structure, its accounting standards and its exchange listings. (ii) Market Capitalization. Companies with market cap in the range of USD750 million to USD3.3 billion. This range is reviewed from time to time to ensure consistency with market conditions. (iii) Financial Viability. Companies should have four consecutive quarters of positive as-reported earnings, where as-reported earnings are defi ned as GAAP Net Income excluding discontinued operations and extraordinary items. (iv) Public Float. There must be public float of at least 50%. (v) Adequate Liquidity and Reasonable Price. The ratio of annual Dollar value traded to market capitalization for the company should be 0.30 or greater. Very low stock prices can affect a stock's liquidity. (vi) Sector Representation. Companies' industry classifications contribute to the maintenance of a sector balance that is in line with the sector composition of the universe of eligible companies within the defined market cap range. (vii) Company Type. Constituents must be operating companies. Closed-end funds, holding companies, partnerships, investment vehicles and royalty trusts are not eligible. Equity Real Estate Investment Trusts (REITs) and business development companies (BDCs) are eligible for inclusion. Occasionally, additions to the S&P MidCap 400 are migrated up from the S&P SmallCap 600, or down from the S&P 500. These companies are still required to meet the above inclusion criteria. However, continued index membership is not necessarily subject to these guidelines. The Index Committee strives to minimize unnecessary turnover in index membership and each removal is determined on a case-by-case basis. Criteria for index removals:- (i) companies that substantially violate one or more of the criteria for index inclusion; and (ii) companies involved in merger, acquisition, or signifi cant restructuring such that they no longer meet the inclusion criteria. / и экстраординарные . Стэндод энд Поз (Standard & Poor's) .

THE STANDARD AND POOR'S SMALLCAP 600 INDEX = ИНДЕКС ПО 600 АКЦИЯМ КОМПАНИЙ С МАЛОЙ КАПИТАЛИЗАЦИЕЙ ОТ СТЭНДОД ЭНД ПОЗ – The Standard And Poor's (S&P) SmallCap 600 Index lists 600 small-cap stocks, chosen for market size, liquidity, and to represent various industry groups. In 1999, the companies listed in the S&P 600 ranged from around USD40 million to USD2 billion in market capitalization. Introduced in 1994, the S&P SmallCap 600 is fast becoming the preferred small cap index in the United States, covering approximately 3% of the domestic equities market. Measuring a segment of

the market that is typically renowned for poor trading liquidity and financial instability, the index is designed to be an efficient portfolio of companies that meet specific inclusion criteria to ensure that they are investable and financially viable. S&P SmallCap 600 makes up the final piece of the S&P US index series that can be used as building blocks for portfolio construction. S&P SmallCap 600 is maintained by the S&P Index Committee, a team of Standard & Poor's economists and index analysts, who meet on a regular basis. The goal of the Index Committee is to ensure that the index remains an accurate measure of small companies, refl ecting the risk and return characteristics of the broader small cap universe on an on-going basis. The S&P Index Committee follows a set of published guidelines for maintaining the index. Complete details of these guidelines, are available on the Web site at http://www.indices.standardandpoors.com. These guidelines provide the transparency required and fairness needed to enable investors to replicate the index and achieve the same performance as the S&P SmallCap 600. Criteria for index additions:- (i) US Company. Determining factors include location of the company's operations, its corporate structure, its accounting standards and its exchange listings. (ii) Market Capitalization. Companies with market cap in the range of USD200 million to USD1 billion. This range is reviewed to ensure consistency with market conditions. (iii) Financial Viability. Companies should have four consecutive quarters of positive as-reported earnings, where as-reported earnings are defi ned as GAAP Net Income excluding discontinued operations and extraordinary items. (iv) Public Float. There must be public float of at least 50%. (v) Adequate Liquidity and Reasonable Price. The ratio of annual Dollar value traded to market capitalization for the company should be 0.30 or greater. Very low stock prices can affect a stock's liquidity. (vi) Sector Representation. Companies' industry classifications contribute to the maintenance of a sector balance that is in line with the sector composition of the universe of eligible companies within the defined market cap range. (vii) Company Type. Constituents must be operating companies. Closed-end funds, holding companies, partnerships, investment vehicles and royalty trusts are not eligible. Equity Real Estate Investment Trusts (REITs) and business development companies (BDCs) are eligible for inclusion. Occasionally, additions to the S&P SmallCap 600 are derived from the S&P MidCap 400. These companies are still required to meet the above inclusion criteria. However, continued index membership is not necessarily subject to these guidelines. The Index Committee strives to minimize unnecessary turnover in index membership and each removal is determined on a case-by-case basis. Criteria for index removals:- (i) companies that substantially violate one or more of the criteria for index inclusion; and (ii) companies involved in merger, acquisition, or significant restructuring such that they no longer meet the inclusion criteria. / и экстраординарные . Стэндод энд Поз (Standard & Poor's) .

STANDARD ATMOSPHERE = СТАНДАРТНАЯ АТМОСФЕРА – Standard Atmosphere:- air maintained at 70 °F (21 °C) and 65% relative humidity. When international testing is involved, a standard temperature of 20 °C or, by agreement, 27 °C may be used. Special humidity and temperature conditions are sometimes prescribed for the testing of certain textiles for specific service predictions, resistance to water or biological action, etc Standard Atmosphere:- air at local atmospheric pressure with a relative humidity of 65% and a temperature of 20 degree Celsius. See also Atmospheres.

STANDARD ATMOSPHERE FOR TESTING = СТАНДАРТНАЯ АТМОСФЕРА ДЛЯ ТЕСТИРОВАНИЯ – Standard Atmosphere For Testing is the atmosphere, in which physical testing is carried out, shall be the standard atmosphere maintained with certain limits, to ensure that test results are not significantly influenced by changes in the atmosphere. Note:- the magnitude of these limits depends on the sorption behaviour of the tested material and is specified in the respective methods booklets.

STANDARD BAR = СТАНДАРТНЫЙ МЕРНЫЙ СЛИТОК – Standard Bar is:- (i) gold bar weighing approximately 400 ounces or 12.5 kilograms and having a minimum fineness of 995 parts per 1 000 pure gold; (ii) silver bar weighing approximately 1 000 ounces with a minimum fineness of 999; and (iii) platinum or palladium plate or ingot between 1 and 6 kilos with a minimum fineness of 999.5.

STANDARD CARRIER ALPHA CODE = СТАНДАРТНЫЙ КОД АЛЬФА ПЕРЕВОЗЧИКА – Standard Carrier Alpha Code (SCAC) is the unique 2 to 4 letter code assigned to transportation companies for identification purposes. SCAC codes are required for the electronic data interchange (EDI), and are printed on bills of lading and other transportation documents.

STANDARD CHARACTER DRAWING = СТАНДАРТНЫЙ ХАРАКТЕРНЫЙ ЧЕРТЁЖ (или ГРАФИЧЕСКИЙ МАТЕРИАЛ) – In the US trademark law, an applicant may submit a Standard Character Drawing if (i) all letters and words in the mark are depicted in Latin characters; (ii) all numerals in the mark are depicted in Roman or Arabic numerals; (iii) the mark includes only common punctuation or diacritical marks; and (iv) the mark does not include a design element.

STANDARD CHARACTER FORMAT = ФОРМАТ СТАНДАРТНОГО СИМВОЛА (или XX) – Standard Character Format:- an applicant may submit a standard character format representation of a mark if (i) all letters and words in the mark are depicted in Latin characters; (ii) all numerals in the mark are depicted in Roman or Arabic numerals; (iii) the mark includes only common punctuation or diacritical marks; and (iv) the mark does not include a design element.

STANDARD CHECK = СТАНДАРТНАЯ ПРОВЕРКА – Standard Check:- a Rice Variety or breeding line whose response to a treatment is known and which is repeatedly included in tests as basis for comparing the reactions of tests entries. A resistant and a susceptible check are usually included.

STANDARD COMBINATION ORDER = РАСПОРЯЖЕНИЕ ПО СТАНДАРТНОЙ КОМБИНАЦИИ – Standard Combination Order (SCO):- facilitate spread trading with implied-out functionality.

STANDARD COMPASS = ГЛАВНЫЙ КОМПАС (или СТАНДАРТНЫЙ КОМПАС) – Standard Compass (maritime term):- the magnetic compass used by the navigator as a standard.

STANDARD CONDITION = СТАНДАРТНОЕ УСЛОВИЕ – Standard Condition is that reached by a specimen when it is in moisture equilibrium with a standard atmosphere. Standard condition is seldom realized in practice since laboratory atmospheres are continually fluctuating between narrow limits, and it is not practical to wait for the attainment of moisture equilibrium which would require several days or more for tightly wound samples of high regain material. Practically, specimens are brought to moisture equilibrium in the standard atmosphere for testing as defined in these definitions. The term 'Standard Condition' should not be used as a synonym for the concept of 'Standard Atmosphere'.

STANDARD CONSTRUCTION PLYWOOD = СТАНДАРТНАЯ КОНСТРУКЦИОННАЯ ФАНЕРА – Standard Construction Plywood:- panels constructed of pairs of plies that are balanced as to grain direction and thickness about the central ply or panel centerline, in which the grain of each ply is at right angles to at least one other ply. See also Modified Construction Plywood, and Plywood. / .

STANDARD DENSITY BALE = КИПА СТАНДАРТНОЙ ПЛОТНОСТИ – Standard Density Bale is a cotton bale compressed to a density of at least 23 lb/ft^3 but less than 28 lb/ft^3. See also Bale Density. / Кипа Стандартной Плотности – это кипа хлопка, спрессованная до плотности, по крайней мере, 23 фунта на кубический фут, но не менее чем 28 фунтов на кубический фут.

STANDARD DEVIATION = СТАНДАРТНАЯ ДЕВИАЦИЯ (или СТАНДАРТНОЕ ОТКЛОНЕНИЕ) – Standard Deviation is the measure of variability given in mathematical terms of how much an observation differs from the mean set of observations. The positive

square root of the average squared deviations of the observations from the mean. Square root of variance. In statistics, a measure of the tendency of individual values to differ from the mean. The standard deviation is calculated by taking the square root of the variance (the sum of the squares of the deviation from the mean in a series of values), and dividing it by the sample size. A measure of variability expressed in a normalized form. Standard Deviation is a statistical term that provides a good indication of volatility. It measures how widely values (closing prices for instance) are dispersed from the average. The larger the difference between the closing prices and the average price, the higher the standard deviation will be and the higher the volatility. The closer the closing prices are to the average price, the lower the standard deviation and the lower the volatility. Standard Deviation is a statistical measure of the degree to which an individual value in a probability distribution tends to vary from the mean of the distribution. Indicates probability of a variable or price falling within a certain width or band around the mean. Standard Deviation is a measure of dispersion of data around its mean, both above and below. Target downside deviation is a measure of dispersion of data below some user-selectable target return with all above target returns treated as underperformance of zero. Big difference. Standard Deviation is a measure of data variability around the mean. Standard Deviation is a measure of the dispersion of a set of numbers based on the difference of the individual numbers from the mean. / Положительный квадратный корень из . Стандартное Отклонение, то же, что Квадратичное Отклонение. Квадратичное Отклонение (или уклонение) наблюдённых значений x_1, x_2, …, x_n от a – выражение $\sqrt{[(x_1 - a)^2 + (x_2 - a)^2 + \ldots + (x_n - a)^2] / n}$. В теории вероятностей квадратичное отклонение случайной величины – корень квадратный из её дисперсии. Стандартное Отклонение – статистический показатель разброса результатов взаимного фонда. Если фонд имеет высокое значение среднего квадратического отклонения, разброс его результатов очень велик, то есть фонд потенциально очень волатилен. Низкое значение среднего квадратического отклонения показывает, что доходность фонда является почти постоянной величиной. Среднегодовое среднее квадратическое отклонение фонда, указываемое в обзорах Morningstar, рассчитывается на основе статистических данных о доходности фонда за 36 месяцев. По определению, в течение приблизительно 68% времени общая доходность любого фонда не должна отклоняться от средней доходности в сторону увеличения или уменьшения на величину, превышающую среднее квадратическое отклонение. Кроме того, в течение приблизительно 95% времени общая доходность фонда не должна отклоняться в любую сторону от его средней доходности на величину, превышающую двукратное значение среднего квадратического отклонения. Соответствие этим параметрам означает, что показатели доходности фонда попадают на типичную колоколообразную кривую нормального распределения вероятностей. В любом случае, чем больше среднее квадратическое отклонение, тем выше волатильность фонда. Недостаток этого статистического показателя состоит в том, что значение среднего квадратического отклонения иногда может быть равно нулю, отражая последовательно низкие результаты фонда.

STANDARD ERROR = СТАНДАРТНАЯ ОШИБКА (или СТАНДАРТНАЯ ПОГРЕШНОСТЬ) – Standard Error is the measure of the average chance departure of a statistic from its expected value. It is sometimes known as the Standard Deviation Of The Means. The standard deviation of the sampling distribution of a statistic.

STANDARD EVALUATION SYSTEM FOR RICE = СТАНДАРТНАЯ СИСТЕМА ВЫЧИСЛЕНИЯ ДЛЯ РИСА – Standard Evaluation System for Rice is an international system of classifying responses of Rice to biological, chemical, and physical stresses, developed through cooperative efforts of Rice scientists and published by the International Rice Research Institute (IRRI; headquartered in Los Baños, Philippines) in a booklet.

STANDARD FORM = СТАНДАРТНАЯ ФОРМА – In the United States, a Standard Form (SF) is a type of form designation such as Form SF51, meaning a Standard Form used throughout the Federal Government.

STANDARD INDUSTRIAL CLASSIFICATION = СТАНДАРТНАЯ ПРОМЫШЛЕННАЯ КЛАССИФИКАЦИЯ (или СТАНДАРТНАЯ ОТРАСЛЕВАЯ КЛАССИФИКАЦИЯ) – Standard Industrial Classification (SIC) is the industrial classification applied to the collection and publication of a wide range of economic statistics. The current version, SIC92, is consistent with NACE, Rev.1 (NACE is short for French Nomenclature Statistique des Activités Économiques Dans la Communauté Européenne = Statistical Classification of Economic Activities in the European Community). Method of classifying business, manufacturing and all commercial activity for statistical purposes. A set of codes developed by the US Office of Management and Budget which categorizes industries into groups with similar economic activities. Replaced by NAICS (North American Industry Classification System). The Standard Industrial Classification (SIC) is the classification standard underlying all establishment-based US economic statistics classified by industry. Standard Industrial Classification (SIC) is a set of codes developed by the Office of Management and Budget, which categorizes business into groups with similar economic activities. / Стандартная Отраслевая Классификация (СОК) – разработанная на федеральном уровне система стандартной классификации и нумерации отраслей промышленности с целью классификации предприятий по отраслям промышленности и предоставления иной информации. Широко используется исследователями рынка. В компьютерных базах данных часто применяется именно эта система классификации.

STANDARD INTERNATIONAL TRADE CLASSIFICATION = СТАНДАРТНАЯ КЛАССИФИКАЦИЯ МЕЖДУНАРОДНОЙ ТОРГОВЛИ – The Standard International Trade Classification (SITC) was developed by the United Nations in 1950 and is used solely by international organizations for reporting international trade. The SITC has been revised several times; the current version is Revision 3.

STANDARDIZATION = СТАНДАРТИЗАЦИЯ – Standardization is a systematic process by which tangible or intangible subjects are harmonized by the joint efforts of the stakeholders for the benefit of society as a whole. Because of its well-proven full consensus processes, standardization has a high democratic legitimation and complies with anti-trust legislation. See also Standard. Standardization:- use of a set of measurable values, or standards, to compare goods in terms of their uses, characteristics, measurements, qualities and/or test methods. The application of standards to grade or rank products. See also Seal Of Quality. / Под Стандартизацией понимается процесс установления и применения стандартов. Под Стандартизацией понимается деятельность, заключающаяся в нахождении решений для повторяющихся задач в сферах науки, техники и экономики, направленная на достижение оптимальной степени упорядочения в определённой области. Главная задача стандартизации – создание системы нормативно-технической документации, определяющей прогрессивные требования к продукции, к её разработке, производству и применению, а также контроль за правильностью использования этой документации. Стандартизация – процесс установления и применения стандартов. Смотрите также Стандарт (Standard). Определение термина Стандартизация, данное Международной Организацией по Стандартизации (МОС или так называемая ИСО):- ‘Стандартизация – установление и применение правил с целью упорядочения деятельности в определённой области на пользу и при участии всех заинтересованных сторон, в частности, для достижения всеобщей оптимальной экономии при соблюдении функциональных условий и требований техники безопасности’. Объекты стандартизации – конкретная продукция, нормы, требования, методы, термины, обозначения и так далее, имеющие перспективу многократного применения, используемые в науке, технике, промышленном и сельскохозяйственном производстве, строительстве, транспорте, культуре, здравоохранении и других сферах народного хозяйства, а также в международной торговле. Стандартизация существенно

влияет на темпы развития и уровень производства. Базируясь на последних достижениях науки, техники и практического опыта, стандартизация во многом не только определяет достигнутый уровень производства, но и является одним из стимулов прогресса науки и техники. Стандартизация в бывшем Союзе Советских Социалистических Республик (СССР) была тесно связана с системой планирования и управления народным хозяйством, являлась одним из элементов государственной технической политики. В условиях плановой социалистической экономики важнейшая особенность стандартизации – её активная роль в управлении народным хозяйством, выражающаяся в деятельности государственных органов, предприятий и организаций по установлению и применению обязательных правил, норм и требований, направленных на ускорение научно-технического прогресса, повышение производительности труда и улучшение качества продукции. Первый документ Советского Правительства в области стандартизации – Декрет Совета Народных Комиссаров Российской Советской Федеративной Социалистической Республики (Совнарком РСФСР или СНК РСФСР) от 14 Сентября 1918 О Введении Международной Метрической Системы Мер И Весов. 15 Сентября 1925 СНК СССР принял решение о создании Комитета по Стандартизации при Совете Труда и Обороны (СТО) под председательством Валериана Владимировича Куйбышева (1888-Июнь-06–1935-Январь-25). Комитет 07 Мая 1926 утвердил первый общесоюзный стандарт:- ОСТ-1 ‘Пшеница. Селекционные Сорта Зёрен. Номенклатура.’, получивший силу государственного закона. В 1936–40 разработкой и утверждением стандартов занимались также народные комиссариаты, а с Июля 1940 – Всесоюзный Комитет по Стандартизации при СНК СССР, который в 1948 был включен в состав Государственного Комитета Совета Министров СССР По Внедрению Передовой Техники В Народное Хозяйство (Гостехника СССР). В 1951–53 центральным органом по стандартизации стало Управление по Стандартизации при Совете Министров СССР, в 1953–54 – Управление По Стандартизации при Госплане СССР. С 1954 стандартизацией руководил Комитет Стандартов, Мер и Измерительных Приборов при Совете Министров СССР, преобразованный в 1970 в Госкомитет Стандартов Совета Министров СССР (Госстандарт СССР). В систему органов и служб Госстандарта СССР входили республиканские управления, центры по стандартизации и метрологии, научно-исследовательские институты, лаборатории госнадзора за соблюдением стандартов. В отраслях промышленности в области стандартизации работало (1975) более 600 головных базовых организаций, в том числе отраслевые научно-исследовательские институты (в судостроении, авиационной, электротехнической, электронной и радиотехнической промышленности). В СССР действовала Государственная Система Стандартизация (ГСС), объединявшая работы по стандартизации на всех уровнях управления народным хозяйством и представляющая собой комплекс взаимоувязанных правил и положений, в которых содержатся:- основные цели и задачи стандартизации; планирование, организация и методика проведения работ по стандартизации; порядок разработки, внедрения, обращения нормативно-технических документов и внесения в них изменений, порядок госнадзора и ведомственного контроля за их внедрением и соблюдением; правила наблюдения за состоянием и применением средств измерений; объекты стандартизации, категории и виды стандартов; единые нормы построения, изложения, оформления стандартов. Планирование работ по стандартизации входило в систему государственного планирования и согласовалось с планами проведения научно-исследовательских, опытно-конструкторских и экспериментальных работ. Основные задачи стандартизации в СССР:- установление требований к техническому уровню и качеству продукции, сырья, материалов, полуфабрикатов и комплектующих изделий, а также норм, требований и методов в области проектирования и производства продукции, позволяющих обеспечить оптимальное качество и ликвидировать нерациональное многообразие видов, марок и типоразмеров; развитие унификации и агрегатирования промышленной продукции как важнейшего условия специализации производства, комплексной механизации и автоматизации производственных процессов, повышения уровня взаимозаменяемости, эффективности эксплуатации и ремонта изделий; обеспечение единства и достоверности измерений в стране, создание и совершенствование государственных эталонов единиц физических величин, а также методов и средств измерений высшей точности; установление унифицированных систем документации, систем классификации и кодирования технико-экономической информации; установление единых терминов и обозначений в важнейших областях науки, техники, в отраслях народного хозяйства; установление системы стандартов безопасности труда; установление систем стандартов в области охраны природы и улучшения использования природных ресурсов; создание благоприятных условий для внешнеторговых, культурных и научно-технических связей. Социалистическая стандартизация основывалась на методах опережающей и комплексной стандартизации. Принцип опережающей стандартизации заключался в установлении повышенных (по отношению к достигнутому на практике уровню) норм, требований к объектам стандартизации, которые, согласно прогнозам, будут оптимальными в последующее время. В зависимости от реальных условий в перспективных (ступенчатых) стандартах устанавливаются показатели, нормы, характеристики в виде ступеней качества с дифференцированными сроками их внедрения. Принцип комплексной стандартизации заключается в согласовании показателей взаимосвязанных компонентов, входящих в объекты стандартизации, и увязке сроков введения в действие стандартов. Комплексность стандартизации обеспечивается разработкой программ стандартизации, включающих изделия, сборочные единицы, детали, полуфабрикаты, материалы, сырьё, технические средства, методы подготовки и организации производства. Комплексная стандартизация, охватывая все стороны изготовления и потребления продукции, позволяет координировать межотраслевые производственные связи и обеспечивает наиболее полное и оптимальное удовлетворение требований заинтересованных организаций и предприятий. К началу 1975 в СССР действовало более 20 000 ГОСТов (к 1940 было около 6 000), охватывающих важнейшие виды промышленной и сельскохозяйственной продукции, более 6 000 республиканских, более 15 000 отраслевых стандартов и свыше 100 000 Технических Условий, зарегистрированных в Госстандарте СССР. Созданы и внедряются межотраслевые системы стандартов общегосударственного значения:- Единая Система Конструкторской Документации (ЕСКД), Единая Система Технологической Подготовки Производства (ЕСТПП), Единая Система Классификации И Кодирования Технико-Экономической Информации и другие. Для планомерного повышения качества выпускаемой продукции в СССР введены аттестация промышленной продукции по высшей, первой и второй категориям качества и присвоение Государственного Знака Качества. Госстандарт СССР разрабатывает и утверждает научно-техническую документацию о порядке оценки достигнутого уровня качества выпускаемой продукции и осуществляет контроль за проведением и соблюдением условий аттестации качества промышленной продукции. Стандартизация В Рамках Совета Экономической Взаимопомощи (СЭВ) согласуется с задачами Комплексной Программы Дальнейшего Углубления и Совершенствования Сотрудничества и Развития Социалистической Экономической Интеграции Стран-Членов Совета Экономической Взаимопомощи. Вопросами стандартизации в СЭВ занимаются Постоянная Комиссия по Стандартизации, Отраслевые Постоянные Комиссии, Институт СЭВ по Стандартизация и Отдел Стандартизация Секретариата СЭВ. Основные направления работ – создание систем нормативно-технических документов (система нормативно-технической документации СЭВ по стандартизации; автоматизированная информационно-управляющая система стандартизации и метрологии СЭВ; единая система проектно-конструкторской документации СЭВ; единая система допусков и посадок СЭВ), а также комплексных стандартов на продукцию, являющуюся предметом товарообмена между странами-членами СЭВ. Нормы и требования стандартов СЭВ соответствуют международным стандартам. К 01 Января 1975 было принято 4 900 рекомендаций СЭВ по Стандартизации и 120 стандартов СЭВ. 28-я Сессия СЭВ (21 Июня 1974) утвердила ‘Положение О Стандарте СЭВ (СТ СЭВ)’ и одобрила

Конвенцию О Прямом (Непосредственном) Применении Стандартов СЭВ. Конвенция о применении СТ СЭВ была ратифицирована Президиумом Верховного Совета СССР Указом от 17 Сентября 1974. Разработка и применение стандартов СЭВ оказывают решающее влияние на интенсификацию процессов социалистической экономической интеграции, совершенствование международного социалистического разделения труда, повышение уровня производства и качества продукции, на усиление конкурентоспособности продукции социалистических стран на мировых рынках и дают значительный экономический эффект. Использование стандартов СЭВ в народном хозяйстве стран-членов СЭВ обусловливает дальнейшее сближение национальных систем стандартизации. Стандартизация В Капиталистических Странах:- для проведения работ по стандартизации в капиталистических странах существуют национальные организации. В большинстве промышленно развитых стран эти организации неправительственные – ассоциации, общества, институты, членами которых являются фирмы, компании, торговые корпорации и частные лица. Вместе с тем в ряде капиталистических стран правительства оказывают финансовую поддержку организациям по стандартизации. В Японии, Италии, Мексике и других капиталистических странах действуют правительственные организации по стандартизации. Подавляющее большинство национальных стандартов не имеет законодательной силы, за исключением стандартов по технике безопасности, здравоохранению и защите окружающей среды. Для своей практической деятельности фирмы и компании разрабатывают и используют также фирменные стандарты, учитывающие спрос, конкуренцию на внутренних и внешних рынках и тому подобное. Всё большее распространение и использование получают международные стандарты. Международная стандартизация связана с развитием многостороннего научно-технического и экономического сотрудничества. 1970-е характеризуются интенсивным развитием работ по международной стандартизации. Вопросами стандартизации, метрологии, повышения качества продукции, кроме национальных организации, занимается более 300 международных и региональных организаций (1975). В области стандартизации действуют крупнейшие международные организации:- Европейская Экономическая Комиссия ООН (ЕЭК ООН), Международная Организация по Стандартизации (МОС или ИСО), Международная Электротехническая Комиссия (МЭК). Международные стандарты и рекомендации, разрабатываемые этими организациями, устанавливают показатели, соответствующие современным научно-техническим требованиям к качеству, надёжности, безопасности, и другие важнейшие свойства и характеристики различных видов продукции, являющейся предметом международной торговли, а также определяют унифицированные методы и средства испытаний и аттестации материалов и товаров. Применение международных стандартов способствует расширению научно-технических, экономических и торговых связей. Международные стандарты широко используются при разработке национальных стандартов, что позволяет значительно сократить сроки и стоимость их разработки и получить большой экономический эффект.

STANDARDIZE = СТАНДАРТИЗИРОВАТЬ – (1) Standardize:- to adjust instrument output to correspond to a previously established calibration using one or more homogeneous specimens or reference materials. (2) (calibrate, verify) This is the normal condition that is often referred to as ‘Field Calibration’ of a color instrument.

STANDARDIZED CONTRACT = СТАНДАРТИЗИРОВАННЫЙ КОНТРАКТ (или СТАНДАРТИЗИРОВАННЫЙ ДОГОВОР) – Standardized Contract (Over-The-Counter Market):- the commercial terms that govern OTC contracts and futures contracts tend to be standardized. For example, most OTC swaps are executed under common ISDA (International Swap Dealers Association) contract. Similarly, futures contracts, even on different exchanges, tend to be governed by a standardized set of commercial terms.

STANDARD MOISTURE REGAIN = ДОСТИЖЕНИЕ СТАНДАРТНОЙ ВЛАГИ (или СТАНДАРТНАЯ ВЛАГОПОГЛОЩАТЕЛЬНАЯ СПОСОБНОСТЬ, или СТАНДАРТНАЯ ВЛАЖНОСТЬ) – Standard Moisture Regain is the accepted moisture allowance for textile materials expressed in percentages of their dry weight.

STANDARD OBSERVER = СТАНДАРТНЫЙ НАБЛЮДАТЕЛЬ (или СТАНДАРТНЫЙ ОБОЗРЕВАТЕЛЬ) – Standard Observer is an ideal observer having visual response described by the CIE color-matching functions. Commission Internationale de l’Eclairage (CIE) is the French title of the International Commission on Illumination. / Комисьо Этэрнасьёналь дё л’Эклераж (Сэ.И.Е.; Commission Internationale de l’Eclairage (CIE)).

STANDARD OPERATING PROCEDURE = СТАНДАРТНАЯ ОПЕРАЦИОННАЯ ПРОЦЕДУРА – Standard Operating Procedure is the codified best laboratory practices for handling biological control agents in quarantine or containment.

STANDARD PORTFOLIO ANALYSIS OF RISK = АНАЛИЗ РИСКА СТАНДАРТНОГО ПОРТФЕЛЯ – The Standard Portfolio Analysis of Risk (SPAN®) Performance Bond System. A program that determines portfolio performance bond requirements for futures, options, cash, and other instruments. SPAN® is a portfolio based approach to risk performance bond calculations which may be applied easily to any exchange’s margining methodology, either gross or net, and may be incorporated into any firm’s bookkeeping system. CME Clearing uses SPAN® to margin clearing firms and clearing firms use SPAN to margin their customers. Developed by the Chicago Mercantile Exchange® (CME®) in 1988, the Standard Portfolio Analysis of Risk (SPAN®) performance bond margining system for calculating requirements has become the futures industry standard. SPAN® evaluates the risk of an entire account’s futures/options portfolio and assesses a margin requirement based on such risk. It accomplishes this by establishing reasonable movements in futures prices over a one day period. The resulting effect of these ‘risk arrays’ is to capture respective gains or losses of futures and options positions within that commodity. Each Exchange maintains the responsibility of determining these risk arrays as well as the option calculations that are needed to determine the effect of various futures price movements on option values. SPAN® recognizes the special characteristics of options, and seeks to accurately assess the impact on option values from not only futures price movements but also changes in market volatility and the passage of time. The end result is that the minimum margin on the portfolio will more accurately reflect the inherent risk involved with those positions as a whole. One of the special characteristics of options is that a long option position can never be at risk for more than its premium. In order for SPAN® to assess the risk of all positions in the portfolio and at the same time allow credit for the premium involved, SPAN® allows the excess of the option premium over the risk margin for any option position to be applied to the risk margin on other positions. Under SPAN®, firms will receive risk arrays from the respective clearing organizations to calculate margins for their accounts. These firms will then calculate minimum margin requirements for all of its accounts based on the arrays on a daily basis. Individuals are able to calculate their own margin requirements through loading the risk arrays and their positions into PC-SPAN. Under SPAN®, each Exchange will provide risk arrays for each commodity traded. These arrays are comprised of 16 ‘what if’ scenarios that cover a range of reasonable futures price and volatility changes over the course of a day. For example, what if crude oil futures prices rose by USD1.00 and volatility on crude oil options fell? Each scenario measures the impact on profit and loss of the hypothetical movements on futures and options positions within that commodity. Each answer becomes a component of the risk array, and SPAN® will take the largest loss from that array as the minimum margin for the day. In order to construct arrays, each Exchange provides both the futures and volatility scan ranges. The futures scan range is equal to a firm’s maintenance margin requirement for outright positions. This represents the interval that a futures contract’s prices are likely to move (up or down) over a single day. For example, if the scan range is USD1 500.00 for crude oil contracts, it implies that crude oil futures prices are most likely to fluctuate within a band of USD1.50/barrel up or down (since each contract represents 1 000 barrels) from the

last settlement price. To construct the risk arrays, SPAN sets fractions (multiples of 1/3) of the range both up and down as the plausible price changes. Each commodity traded has its own scan range. In addition to futures price changes, a major determinant of option value is the inherent volatility that is expected in the market. Each Exchange will set parameters, both up and down, for likely changes in expected market volatility. The impact on option value of these hypothetical changes are then used to capture the profit (or loss) on option positions, and hence the risk of options in a given portfolio. Each Exchange will set an extreme move parameter, usually set equal to a multiple of the futures scan range, as well as a percent of this move it believes it needs to be covered for possible abrupt changes of futures prices. SPAN® also recognizes that many commodities tend to experience similar price movements. For offsetting positions in different commodities that are related, SPAN® allows certain credits be given to the portfolio's total margin to reflect this lower overall risk. As developed by the Chicago Mercantile Exchange®, the industry standard for calculating performance bond requirements (margins) on the basis of overall portfolio risk. SPAN® calculates risk for all enterprise levels on derivative and non-derivative instruments at numerous exchanges and clearing organizations worldwide. The Standard Portfolio Analysis of Risk™ (SPAN®) system is a highly sophisticated methodology that calculates performance bond requirements by analyzing the 'what-ifs' of virtually any market scenario. Developed and implemented in 1988 by Chicago Mercantile Exchange® (CME®), SPAN® was the first system ever to calculate performance bond requirements exclusively on the basis of overall portfolio risk at both clearing and customer levels. How does SPAN® work? SPAN® evaluates overall portfolio risk by calculating the worst probable loss that a portfolio might reasonably incur over a specified time period. SPAN® achieves this number by comparing hypothetical gains and losses that a portfolio would sustain under different market conditions. SPAN® typically provides a 'Risk Array' analysis of 16 possible scenarios for a specific portfolio under various conditions. SPAN® methodology, however, allows users to request any number of scenarios to meet their particular needs:- (i) Each scenario consists of a 'what-if' situation in which SPAN® assesses the effects of variations in price, volatility and time to expiration. (ii) Each calculation represents a gain or loss based on the possible gains or losses due to changes in an instrument's price by X and volatility by Y. What type of SPAN® parameters does Variance Futures determine? Variance Futures and your clearing FCM determine the following SPAN® parameters, in order to reflect the risk coverage desired in any particular market:- (i) Price Scan Range:- a set range of potential price changes; (ii) Volatility Scan Range:- a set range of potential implied volatility changes; (iii) Intra-commodity Spread Charge:- an amount that accounts for risk (basis risk) of calendar spreads or different expirations of the same product, which are not perfectly correlated; (iv) Short Option Minimum:- minimum margin requirement for short option positions Spot Charge:- a charge that covers the increased risk of positions in deliverable instruments near expiration; and (v) Inter-commodity Spread Credit:- margin credit for offsetting positions between correlated products. SPAN® combines financial instruments within the same underlying for analysis, and refers to this grouping as the Combined Commodity group. For example, futures, options on futures and options on equities on the same stock could all be grouped under a single Combined Commodity. To calculate a performance bond requirement, for each Combined Commodity in a portfolio, SPAN® will:- (i) Sum the Scan Risk charges, any Intra-commodity Spread and Spot Charges; (ii) Apply the offsets for all Inter-commodity Spread Credits within the portfolio; (iii) Compare the above sum with any existing Short Option Minimum requirement; and (iv) Assess the greater of the two compared as the risk of the Combined Commodity. The Total Margin Requirement for a portfolio is the sum of the risk of all Combined Commodities less all credit for risk offsets between the different Combined Commodities. The CME® Clearing Risk team determines initial performance bond/initial margin utilizing the CME Group proprietary SPAN® margin system. The SPAN® system is a global industry standard, made available by license agreement, that:- (i) Monitors market activity, including large positions and concentrated positions; (ii) Performs a twice daily mark-to-market of open positions; (iii) Manages risk through multi-lateral netting by customer and house account per firm; and (iv) Assures the segregation of customer assets from firm assets. The Standard Portfolio Analysis of Risk (SPAN®) system is a highly sophisticated methodology that calculates performance bond requirements by analyzing the 'what-ifs' of virtually any market scenario. Developed and implemented in 1988 by Chicago Mercantile Exchange® (CME®), SPAN® was the first system ever to calculate performance bond requirements exclusively on the basis of overall portfolio risk at both clearing and customer level. In the years since its inceptions, SPAN® has become the industry standard for portfolio risk assessment. It is the official performance bond (margin) mechanism of 50 registered exchanges, clearing organizations, service bureaus and regulatory agencies throughout the world. SPAN® software is utilized by a wide range of end-users, including futures commission merchants (FCMs), investment banks, hedge funds, research organizations, risk managers, brokerage firms and individual investors worldwide. Although originally designed for use with derivatives, its extraordinary capabilities have led to its extensive use in assessing risk for many different types of financial instruments. Now in its fourth generation of functionality, SPAN® has evolved into a 'family' of three software products designed to meet the needs of a wide range of customers. PC-SPAN – a single-user desktop application that offers margin calculation across multiple exchanges. SPAN Risk Manager – a single-user desktop program that includes risk analytics in addition to margin calculation. SPAN Risk Manager Clearing – an institutional-level program used by exchanges, clearing organizations, services bureaus and regulatory agencies that employs all the functionalities of PC-SPAN and SPAN Risk Manager, and also offers real-time margining, risk array calculations and production of SPAN® risk parameter files. / СПЭН® (SPAN®). взаиморасчёт или сведение (netting) . Сегрегация или Выделение или Зейгерование или Разделение По Крупности (Segregation). экстраординарные . для неотложных позиций .

STANDARD SAMPLES = СТАНДАРТНЫЕ ПРОБЫ – Standard Samples:- in Canada, the Eastern and Western Standards Committees meet annually and recommend to the Canadian Grain Commission (CGC) primary and export standard samples of grain for use in grading during that crop year. / Под Стандартными Образцами понимаются меры для воспроизведения величин, характеризующих свойства или состав веществ или материалов. Стандартные образцы применяют при проведении метрологических работ и контроле качества сырья и продукции. Общие требования к стандартным образцам и порядок их аттестации стандартизованы.

STANDARD SETTLEMENT INSTRUCTIONS = СТАНДАРТНЫЕ ИНСТРУКЦИИ ПО РАСЧЁТАМ – Standard Settlement Instructions are the delivery instructions established between counterparties that may be transmitted as part of an electronic trade confirmation message, e.g., Society for Worldwide Interbank Financial Telecommunication (SWIFT) message. / Инструкции по поставке, установленные между встречными сторонами, которые могут быть переданы в качестве части электронного сообщения подтверждения торговли, например, сообщения Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

STANDARDS, MENTOR, ATTEMPT, REVIEW, TRANSITION = СТАНДАРТЫ, МЕНТОР, ПОКУШЕНИЕ, ОБЗОР, ПЕРЕХОД – Standards, Mentor, Attempt, Review, Transition (SMART) is an informal development program used for The United States Patent and Trademark Office's Office of the Chief Information Officer (USPTO's OCIO) employees that identifies standards to work towards and establishes a mentoring relationship between managers and their employees who must meet these standards.

STANDARD TEMPERATE ATMOSPHERE = АТМОСФЕРА СО СТАНДАРТНОЙ ТЕМПЕРАТУРОЙ – Standard Temperate Atmosphere is an atmosphere which has a relative humidity of 65% and a temperature of 20 °C. / Атмосфера Со Стандартной Температурой – атмосфера, которая имеет относительную влажность 65% и температуру 20 °C.

STANDARD TENDER = СТАНДАРТНЫЙ КОНКУРС – Standard Tender is a tender procedure used by the Eurosystem in its regular open market operations. Standard tenders are carried out within 24 hours. All counterparties fulfilling the general eligibility criteria are entitled to submit bids.

STANDARD TROPICAL ATMOSPHERE = АТМОСФЕРА, СТАНДАРТНАЯ ДЛЯ ТРОПИКОВ – Standard Tropical Atmosphere is an atmosphere which has a relative humidity of 65% and a temperature of 27 °C. / Атмосфера, которая имеет относительную влажность 65% и температуру 27 °C.

STAND BY = НАХОДИТЬСЯ В СОСТОЯНИИ ГОТОВНОСТИ (или СТОЯТЬ НАГОТОВЕ, или БЫТЬ НАГОТОВЕ) – Stand By (maritime term):- a preparatory order (wait: be ready).

STAND–BY COMMITMENT = РЕЗЕРВНОЕ ОБЯЗАТЕЛЬСТВО – Stand-By Commitment is a put option in Ginnie Mae® trading which gives the holder the right, but not the obligation, to make delivery. / Опцион на продажу в торговле Дьжини Мэй® (Ginnie Mae®), который предоставляет его держателю право, но не обязательство, совершить поставку.

STAND–BY CREDIT = РЕЗЕРВНЫЙ КРЕДИТ – (1) Stand-By Credit is a credit line granted against payment of compensation (commitment commission) for a specified term.

(2) Bridging loan extended to a country or central bank facing balance-of-payments difficulties, e.g., the stand-by facilities of the International Monetary Fund. / , например, .

STANDBY FACILITY = РЕЗЕРВНАЯ ВОЗМОЖНОСТЬ – Standby Facility is a facility that supports a utility system and is generally running under no load. It is available to replace or supplement a facility normally in service.

STAND–BY LETTER OF CREDIT = РЕЗЕРВНЫЙ АККРЕДИТИВ – The Stand-By Letter Of Credit serves a different function than the commercial letter of credit. The commercial letter of credit is the primary payment mechanism for a transaction. The standby letter of credit serves as a secondary payment mechanism. A bank will issue a standby letter of credit on behalf of a customer to provide assurances of his ability to perform under the terms of a contract between the beneficiary. The parties involved with the transaction do not expect that the letter of credit will ever be drawn upon. The standby letter of credit assures the beneficiary of the performance of the customer's obligation. The beneficiary is able to draw under the credit by presenting a draft, copies of invoices, with evidence that the customer has not performed its obligation. The bank is obligated to make payment if the documents presented comply with the terms of the letter of credit. Standby letters of credit are issued by banks to stand behind monetary obligations, to insure the refund of advance payment, to support performance and bid obligations, and to insure the completion of a sales contract. The credit has an expiration date. The standby letter of credit is often used to guarantee performance or to strengthen the credit worthiness of a customer. In the above example, the letter of credit is issued by the bank and held by the supplier. The customer is provided open account terms. If payments are made in accordance with the suppliers' terms, the letter of credit would not be drawn on. The seller pursues the customer for payment directly. If the customer is unable to pay, the seller presents a draft and copies of invoices to the bank for payment. The domestic standby letter of credit is governed by the Uniform Commercial Code. Under these provisions, the bank is given until the close of the third banking day after receipt of the documents to honor the draft. Stand-by Letter of Credit is the contractual arrangement guaranteeing financial or economic performance involving three parties:- (i) the issuer (bank), (ii) the account party (the bank customer) and (iii) the beneficiary. The bank guarantees that the account party will perform on a contract between the account party and the beneficiary. Standby Letters Of Credit:- Some beneficiaries prefer (and some banks can only issue) standby letters of credit (SBLCs) in lieu of on-demand contract bonds. SBLCs are standard banking practice in the US and in markets which follow US practice such as Taiwan and South Korea. SBLCs are a form of documentary letter of credit and perform in the same way as an on-demand bond:- (i) Under a payment letter of credit, the issuing bank agrees to pay against delivery of specified documents (e.g., invoices, bills of lading, warehouse receipts etc); (ii) Under a standby letter of credit, the bank undertakes to pay against presentation of specified documents which might be the beneficiary's simple demand for payment. Many suppliers seek to incorporate additional documents to be delivered (if only copies) on drawing from the SBLC to reduce the chance of beneficiary claiming the funds unfairly. A draft (an accepted bill of exchange) will often also be required. This draft is drawn up by the bank when the SBLC is set up. Documentary letters of credit usually incorporate the provisions of UCP 600 (Uniform Customs and Practice for Documentary Credits). However, UCP 600 is written for drawing payments when it can be demonstrated by documentary means that performance has been achieved, e.g. providing evidence of despatch in the format required under the letter of credit. UCP 600 does not always work well for SBLCs which are simply guarantees. This can lead to misunderstandings and disputed demands. For example, there is no mechanism in UCP 600 for reductions (such as when performance milestones are achieved or deliveries made), as would often be needed if the SBLC was guaranteeing Advance Payments. ISP98 (International Standby Practices) rules have been designed specifically for SBLCs. Some issuing banks will incorporate ISP98 into their SBLCs rather than UCP 600. ISP98 is designed to be compatible with the UN Convention on Standby Letters of Credit. ISP98 makes reference to choosing a governing law and states that the rules supplement the applicable law. An SBLC that is subject to English Law and issued by a UK bank has a distinct advantage in that it will expire automatically on its stated expiry date and on expiry does not have to be physically returned for cancellation. However, if the SBLC is silent as to the governing law, and particularly if it is issued by a non-UK bank, it can be difficult to get it cancelled. By comparison, URDG 758 (short for the Uniform Rules For Demand Guarantees – International Chamber of Commerce Publication No. 758), the succinct and clear rule-set for bonds, has the advantage that it implies a governing law in the absence of any express statement (Arts 34 & 35). Some beneficiaries see bonds as more flexible with regard to the wording, and in allowing the opportunity to incorporate local law and receive a local guarantee. Choice over whether the guaranteeing instrument is a bond or an SBLC is very much a matter of tradition and practice. Certain countries favour SBLCs, conversely, other countries favour bonds. Extend Or Pay:- If contract performance is taking longer than anticipated or your customer is not yet ready to release you from your bonding obligation, an extension is likely to be requested. The phraseology used is rather harsh, but do not be alarmed – it is quite normal to be told that your bond must be extended else it will be called. After all, if you do not extend the bond before it expires, the customer is left without its financial guarantee of your good performance. When an exporter is supplying complex equipment and systems in sectors such as power transmission and distribution which can be difficult to commission successfully within the times originally set out for completion of commissioning, the importance of the performance bond is magnified because customers may need to submit repeated 'extend or pay' demands under the bond and the exporter may need to extend the expiry date of the bond to allow more time for the non-commissioned equipment and systems to pass tests upon commissioning. In this circumstance, the act of extending the performance bond oils the wheels of the relationship between the parties at a time when a customer may view the performance of the exporter with some disdain and would otherwise contemplate terminating the contract due to the default of the exporter. ISP98 provides for 'extend or pay' demands to be made, so there is very little difference between an SBLC subject to ISP98 and an on-demand bond subject to URDG 758 in this respect. See Chapter 7 for more on the subject of extend or pay. A common form of bank guarantee in the USA and Asia. May be used for all types of guarantee, in particular as a payment guarantee. It also serves as security for the event a third party fails to meet a promised obligation. The Standby Letter of Credit comes from the banking legislation of the United States, which forbids

US credit institutions from assuming guarantee obligations vis-à-vis third parties. To circumvent this rule, the US banks created the standby letter of credit, which is based on the 'Uniform Customs and Practice for Documentary Credits (UCP 600)'. Like the guarantee, the standby letter of credit is of an abstract nature, i.e. legally separated from the underlying transaction. In the case of a standby letter of credit, the documents stipulated in the claim must be submitted within the specified period. These documents should show that the client (exporter) has not met or insufficiently fulfilled his or her performance obligations or the debtor has not met a payment on time. The standby basically fulfils the same purpose as a guarantee:- it is payable upon first demand and without objections or defences on the basis of the underlying transaction. It is up to the beneficiary to decide whether a standby may be given. On 1999-January-01, the ICC introduced the 'ISP 98' (International Standby Practices), new guidelines which were drawn up especially for 'standby letters of credit' business. In practice, however, standbys are generally still subject to the 'Uniform Customs and Practice for Documentary Credits', publication no. 600 (UCP 600). Standby letters of credit are used in import-export business, primarily with the Americas and frequently in the Far East as well, or wherever the contracting parties decide to use this legal form as a security instrument. They have a purpose to secure any claims by the obligee on the obligor due to non-contractual delivery or performance by the agreed date or credit repayment on the due date. Guarantee amount depends on purpose of security. Term depends on purpose of security. In contrast to the guarantee, a standby can be confirmed immediately (i.e. deferment of the country and credit risk), provided the standby conditions permit. As opposed to a commercial letter of credit, a letter of credit that does not cover the direct purchase of merchandise, so called because it is often intended to be drawn on only when the applicant for whom it is issued fails to perform an obligation. There is, nonetheless, a type of standby letter of credit that is intended to be drawn on, referred to as a 'Direct Pay Letter Of Credit'. Standby letters of credit are based on the underlying principle of letters of credit that payment is made against presentation of documents 3/4 whatever documents the applicant, beneficiary, and issuing bank may agree to, not necessarily documents showing shipment of goods. / или выплата кредита в надлежащую (причитающуюся) дату. Резервный Аккредитив – выдаваемое банком независимое обязательство выплатить определённую сумму средств бенефициару по простому требованию (заявлению) или по требованию с представлением соответствующих условиям аккредитива документов. Указанные документы подтверждают, что бенефициару причитается платёж вследствие неисполнения обязательства перед ним или возникновения иного обязательства, в погашение займа либо возврата аванса, в оплату срочной задолженности приказодателя либо иного лица. Резервный аккредитив является инструментом, посредством которого гарантируется выполнение обязательств (осуществление платежей, поставка товаров, услуг) перед бенефициаром данного аккредитива. Резервный Аккредитив фактически представляет собой банковскую гарантию, оформленную в виде аккредитива. Обобщённо, резервный аккредитив представляет собой обязательство банка уплатить в пользу бенефициара по аккредитиву гарантийную сумму по наступлению гарантийного случая (неисполнения приказодателем резервного аккредитива обязательств перед бенефициаром). Если, по мнению бенефициара, его партнер нарушил свои обязательства, то он может воспользоваться резервным аккредитивом. Как правило, для этого достаточно представления в банк его простого письменного заявления о том, что партнёр не выполнил оговорённых обязательств (часто в совокупности с другими документами в течение срока действия аккредитива и на оговорённых условиях). В случае соблюдения обязательств партнером – приказодателем аккредитива, аккредитив теряет силу по истечению срока его действия.

STANDBY SERVICE = УСЛУГА ОЖИДАНИЯ (или РЕЗЕРВНАЯ УСЛУГА) – Standby Service is a support service that is available, as needed, to supplement a consumer, a utility system, or to another utility if a schedule or an agreement authorizes the transaction. The service is not regularly used.

STANDING FACILITY = ОБЕСПЕЧЕНИЕ УСТОЙЧИВОСТИ (или ПОДДЕРЖКА ФИНАНСОВОЙ УСТОЙЧИВОСТИ) – Standing Facility is a central bank facility available to counterparties on their own initiative. The Eurosystem offers two overnight standing facilities:- the marginal lending facility and the deposit facility. The European Central Bank (ECB) offers commercial banks the opportunity to obtain credit within defined limits (marginal lending facility) or invest unlimited deposits (deposit facility). The interest rates of both of these facilities generally represent the upper and lower limit of the overnight rate (EONIA) in the Euro area. Prior to the introduction of the euro, the interest rate corresponding to the interest rate of the marginal lending facility, was the Lombard rate in Germany, while the discount rate was the rate corresponding to the interest rate of the deposit facility. The interest rate of the marginal lending facility is typically significantly higher than the corresponding market rate and the interest rate of the deposit facility significantly lower than the corresponding market rate. Banks therefore only use these facilities when they have no alternative. Standing Facility is a central bank facility available to credit institutions on their own initiative. The Eurosystem offers two standing facilities, the marginal lending facility and the deposit facility. The Eurosystem also offers two standing facilities, which set boundaries for overnight market interest rates by providing and absorbing liquidity:- (i) the marginal lending facility, which allows credit institutions to obtain overnight liquidity from the national central banks against eligible assets; and (ii) the deposit facility, which can be used by credit institutions to make overnight deposits with the national central banks in the Eurosystem. / для рыночных однодневных расчётных процентных ставок .

STANDING INTERPRETATIONS COMMITTEE = ПОСТОЯННЫЙ КОМИТЕТ ПО ИНТЕРПРЕТАЦИЯМ – Standing Interpretations Committee (SIC):- set up in 1997 by the IASC to clarify aspects of existing international standards. In 2001 it was replaced by the International Financial Reporting Interpretations Committee (IFRIC). It prepares the Interpretations of International Financial Reporting Standards to give authoritative guidance on issues that are likely to receive divergent or unacceptable treatment. Financial statements should not be described as complying with International Accounting Standards unless they comply with all the requirements of each applicable Standard and each applicable interpretation of the Standing Interpretations Committee. The term is also used by statisticians for Standard Industrial Classification.

STANDING ORDER = ПОСТОЯННОЕ ПОРУЧЕНИЕ – Standing Order:- instructions issued by a payer to his bank to pay fixed sums to a specified recipient at regular intervals. Standing orders are primarily used to pay rent, insurance premiums, taxes and the like. A direct debit order differs from a standing order inasmuch as the payee initiaties the transaction based on anauthorization to withdraw funds from the payer's account. Instruction issued by the customer for the regular payment by the bank (usually until expressly revoked) of certain obligations, such as insurance premiums, rent and the like. An order to a bank to make (usually) a series of payments on the customer's behalf. It is used to pay bills that are due at regular intervals. Also known as Banker's Order.

STANDING PART = КОРЕННОЙ КОНЕЦ (СНАСТИ) – Standing Part (maritime term):- that part of a line or fall which is secured.

STANDING RIGGING = СТОЯЧИЙ ТАКЕЛАЖ – Standing Rigging (maritime term):- that part of the ship's rigging which is permanently secured and not movable, such as stay, shrouds, etc.

STANDING WIRE = СТОЯЧАЯ ПРОВОЛОКА (или ПОСТОЯННАЯ ПРОВОЛОКА, или СТРОЕВАЯ ПРОВОЛОКА, или КОРЕННАЯ ПРОВОЛОКА) – Standing Wire is a broad term describing fixed rods or strips extending through the loom reed, that control the height of the pile in a woven pile fabric.

STANDSTILL = ЗАМОРАЖИВАНИЕ – Standstill refers to a commitment of GATT (short for the General Agreement on Tariffs and Trade) contracting parties not to impose new trade-restrictive measures during the Uruguay Round negotiations. See also Rollback. / Замораживание относится к обязательству договаривающихся по Генеральному Соглашению о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) сторон не налагать новых ограничительных мер на торговлю в ходе переговоров по Уругвайскому Раунду (Uruguay Round).

STAND–UP COLLAR = СТОЯЧИЙ ВОРОТНИК – Stand-Up Collar is a collar that rises from the neckline to form a narrow, circular strip or band around the neck.

STANS = SYSTEM FOR THEORETICAL ANALYSIS AND NUMERICAL SIMULATIONS

STAPLE = СКОБА (или ШПОНКА) – Staple is a round or square wire fastener, U-shaped with two legs, usually of the same length, connected by its crown, and with the legs usually pointed. See also Pallet. / Скоба (Staple):- круглый или квадратный проволочный элемент U-образной формы с двумя остроконечными прямоугольными ножками одинаковой длины, соединёнными спинкой. Смотрите также Поддон (Pallet).

STAPLE = ШТАПЕЛЁК (или ШТАПЕЛЬ) – Cotton is often spoken of as having ‘good staple’. This means that the stock has the necessary working properties for manipulation into a certain size or count of spun yarn. The average length of the bulk of fibers is called Staple. A 1-1/4 inch staple cotton, a 4-inch worsted fiber, a 9-inch woolen fiber. Staple is a cluster or group of wool fibers naturally clinging together in the fleece. Staple:- natural fibers or cut lengths from filaments. The staple length of natural fibers varies from less than 1 inch as with some cotton fibers to several feet for some hard fibers. Manufactured staple fibers are cut to a definite length, from 8 inches down to about 1-1/2 inches (occasionally down to 1 inch), so that they can be processed on cotton, woolen, or worsted yarn spinning systems. The term Staple (fiber) is used in the textile industry to distinguish natural or cut length manufactured fibers from filament. Cotton fiber considered with regard to its length and fineness. Short Staple:- less than 25 mm, Medium Staple:- 25 to 30 mm, Long Staple:- 30 to 37 mm and Extra Long Staple (ELS):- 37 mm and above. Staple:- short lengths of fiber, measured in inches or fractions of inches, like those naturally found in cotton and wool. These short lengths must be spun to obtain a length sufficient for weaving or knitting. Silk is the only natural fiber that does not come in staple lengths, but instead in filament lengths. Man-made fibers often are cut into staple lengths for spinning to imitate natural fibers. See also Filament, Spinning, and Spun Fiber Yarn. Staple:- filaments of rayon or other man-made fibers, cut to predetermined lengths for conversion to spun yarns (or for other uses). Also used to designate the average length of the natural fibers. / Хлопковое волокно обычно оценивается по его длине и тонине. Короткий Штапель:- менее 25 мм, Средний Штапель:- от 25 до 30 мм, Длинный Штапель:- от 30 до 37 мм, Экстра Длинный Штапель:- 37 мм и более.

STAPLE CROP = ВЕДУЩАЯ КУЛЬТУРА (или ПРОФИЛИРУЮЩАЯ КУЛЬТУРА) – Staple Crop is the crop grown as the basic diet of the population of a particular country or area.

STAPLE FABRIC = ШТАПЕЛЬНАЯ ТКАНЬ – Staple Fabric:- those cloths which, over a period of years, have a steady sale or demand. Such cloths as muslins, flannels, broadcloth, shanttung, and taffeta are staples that have to be kept in stock. See also Spun Fabric.

STAPLE FIBERS = ШТАПЕЛЬНЫЕ ВОЛОКНА – (1) Staple Fibers are short fibers, typically ranging from 1/2 inch up to 18 inches long. Wool, cotton, and flax exist only as staple fibers. Manufactured staple fibers are cut to a specific length from the continuous filament fiber. Usually the staple fiber is cut in lengths ranging from 1-1/2 inches to 8 inches long. A group of staple fibers are twisted together to form a yarn, which is then woven or knit into fabrics. See also Staple. Natural fibers whose length usually ranges from about 1 inch to 1-1/2 inches, such as Cotton. Staple Fiber is a textile fiber of limited but spinnable length. For man-made fibers the three principal categories are:- (i) square cut staple fibers; (ii) stretch-broken fibers; and (iii) variable length (or bias cut) staple fibers. / Под Штапельными Волокнами понимаются натуральные или природные волокна, длина которых варьируется в диапазоне приблизительно от 1 до 1-1/2 дюйма, например, такие как хлопок. Штапельное Волокно – элементарное волокно ограниченной длины.

(2) Staple Fibers are the manmade fibers which have been cut to the length of the various natural fibers to facilitate blending and further processing with other fibers. / Искусственные волокна, которые были порезаны до длины разнообразных натуральных волокон с тем, чтобы использовать их в смешивании и дальнейшей переработке с другими волокнами. Под Штапельными Волокнами понимаются химические волокна, получаемые разрезанием или разрыванием жгута продольно сложенных элементарных нитей на отрезки длиной 40–70 миллиметров, называемые штапелями. Они предназначаются для выработки текстильных материалов. Штапельное Волокно, от Немецкого слова Stapel, означающее Волокно, химическое волокно, получаемое разрезанием или разрыванием жгута продольно сложенных элементарных нитей на отрезки длиной 40–70 мм (называются штапели). Пряжа из штапельного волокна идёт на изготовление платьевых и других тканей. В России данный термин не рекомендуется ГОСТом.

STAPLE LENGTH = ШТАПЕЛЬНАЯ ДЛИНА (или ДЛИНА ШТАПЕЛЬКА) – Staple Length is the length of sheared locks obtained by measuring the natural staple without stretching or disturbing the crimp. The fiber regrowth or regeneration from one shearing to the next. Staple Length is the fiber length from a sample of fibers. A Wensleydale sheep has a standard staple length of about 12 inches. A Dorset has a staple length 2.5 and 4 inches. / Примечание (терминология из Государственного Стандарта (ГОСТ) СССР для хлопкового волокна):- Штапельная Массодлина – средняя массодлина всех волокон, длина которых больше модальной. Модальная Массодлина – средняя длина волокон, составляющих группу с наибольшей массой. Средняя Массодлина – отношение суммы произведений средних длин каждой группы на их массу к общей массе волокон всех групп.

STAPLE PROCESSING = ШТАПЕЛЬНОЕ ПРОИЗВОДСТВО (или ШТАПЕЛЬНАЯ ПЕРЕРАБОТКА) – Staple Processing is the conversion of staple into spun yarns suitable in evenness, size, twist, and strength for use in the weaving or knitting of fabrics. See also Textile Processing.

STAPLE YARN = ШТАПЕЛЬНАЯ ПРЯЖА – Staple Yarns, despite the name, are not basics to be kept on hand like staple foods would be in a pantry. Staple yarn is a type of yarn distinguished by the materials and method used to make it. Staple yarn may be called Spun Yarn or referred to by the fiber used to make it, rayon staple, for example. Staple yarns are typically used in clothing construction, rug making, needle-crafting and hobbies, and weaving. Yarns spun from long staple fibers are ideal for heavy-use objects like coats, rugs, blankets and warp threads. Short staple fibers produce more delicate yarns better suited for light-weight garments. See also Spun Yarn.

STARBOARD = ПРАВЫЙ БОРТ (или ШТИРБОРТ) – Starboard:- the right-hand side of a ship when facing the front or forward end. The starboard side of a ship during darkness is indicated by a green light. See also Port Side. Right side of the vessel facing the bow or front of the vessel. See also Port. Starboard is the right side of a vessel or airplane when onboard facing the bow. The word is derived

from ‘steer board’ referring to a steering board or oar located on the right side amidships (rather than at the stern) of early sailing ships, which was used as a rudder. See also Port. Starboard (maritime term):- the right side of the ship. / Смотрите также Бакборт или Левый Борт (Port Side). Борт судна (от Немецкого слова Bord), совокупность элементов набора и обшивки, образующая боковые стенки корпуса судна. Различают левый (бакборт) и правый (штирборт) борта, если смотреть от кормы к носу судна. От высоты борта зависит грузовместимость судна; высотой непроницаемого надводного борта определяется запас плавучести судна. Высота надводного борта влияет также на остойчивость при больших углах крена и на продольную прочность корпуса. Борта в средней части судна обычно вертикальны, иногда наклонены наружу (борт с развалом), а на ледоколах и некоторых других судах – наклонены внутрь (борт с завалом).

STARCH = КРАХМАЛ – Starch is an insoluble high molecular weight (typically several million kDa) polysaccharide formed from beta-D-glucose units linked together with alpha-1,4’ linkages (compare with cellulose). Amylose starches are long unbranched molecules whyle amylopectins are branched polysaccharides with alpha-1,6’ linkages at the branch point. Starches can be broken down easily into glucose, as required, by amylase enzymes in the tissues and are the principal food storage substance of plants. Starch can be recognized by forming a characteristic blue color with iodine. Starch is:- (1) the major storage carbohydrate of plants; a polymer composed of D-glucose units occurring as amylopectin and amylose and found in chloroplasts, amyloplasts, and endosperm. (2) Major carbohydrate source for animals. Starch is a polysaccharide with a much higher molecular weight than that of a sugar, but typically lower than that of cellulose; amylose and amylopectin are the major plant starches. The starches used in the textile industry are derived from plants. In North America, most starch comes from corn (maize), but starch from Rice or Tapioca is also common. Starch is extensively used as a size for warp yarns in commercial weaving. It must be removed before dyeing, because it can interfere with the uptake of dye by the fiber. It isn’t appropriate for thickening reactive dye solutions for printing or direct application because much of the dye will react with the starch instead of the fiber. It can be used to as a thickener for some other types of dye. Starches are also chemically processed to produce dextrin, starch ethers (see Monagum) and starch esters. Unmodified starch has very low solubility in water. / Дэкстрин (Dextrin). Под Крахмалом, от Польского слова Крохмал (Krochmal), от Немецкого слова Kraftmehl, понимается запасной углевод растений. Состоит из двух полисахаридов – амилозы и амилопектин, образованных остатками глюкозы. Накапливается в виде зёрен главным образом в клетках клубней, луковиц, семян, а также в листьях и стеблях. Крахмал – основная часть важнейших продуктов питания:- муки (75–80%), картофеля (25%), кукурузы, риса, саго и других. Калорийность крахмала около 16.8 кДж/г (около 4 ккал/г). Крахмал и его производные применяются при производстве бумаги (проклеивания бумаги, картона), текстильных изделий (для шлихтования тканей), клеёв, в литейном и других производствах, в медицине и фармацевтической промышленности (получение антибиотиков, витаминов, приготовление мазей, присыпок), в пищевой промышленности (производство кондитерских изделий, колбас), а также в аналитической химии (индикатор на йод, с которым даёт интенсивное синее окрашивание).

STARCH INDICATOR = УКАЗАТЕЛЬ ПО КРАХМАЛУ – Starch Indicator is a solution that is used to detect starch by a color reaction. Starch indicator is usually a solution of iodine and potassium iodide in water (typically about 2.3% potassium iodide and 0.33% iodine in distilled water). It will react with starch to produce a violet to blue-black color, depending on the specific type of starch. This can be useful for detecting starch size in fabrics. Mercerized cotton will also give a blue-black color with this test, though the color seems to appear slowly, whereas with starch it appears almost instantly.

STARCH LUMP = КРАХМАЛЬНЫЙ КОМ – Starch Lump:- xxxxx. See also Hard Size.

STARCHY ENDOSPERM = КРАХМАЛИСТЫЙ ЭНДОСПЕРМ (или МУЧНИСТЫЙ ЭНДОСПЕРМ) – Starchy Endosperm is the bulk of the endosperm within the aleurone layer, consisting largely of starch granules embedded in a proteinaceous matrix. The starchy endosperm also contains sugars, fats, and fibers. The bulk of the starchy endosperm survives the milling and polishing process as the milled white Rice. / Крахмалистый Эндосперм является частью эндосперма внутри алейронового слоя, в основном состоящего из гранул крахмала, вживлённых в белковую матрицу. Крахмалистый эндосперм содержит также сахар, жиры, и волокна. Часть крахмалистого эндосперма выдерживает процесс рушения и полирования, когда становится обрушенным белым рисом.

STARE DECISIS = СТОЯТЬ НА РЕШЁННОМ (или ПРИСТАЛЬНОЕ СОБЛЮДЕНИЕ) – Stare Decisis:- literally, ‘Let the decision stand’. The policy or practice of judges to abide by the legal rules or principles already established in earlier cases of the same sort.

STARTER FERTILIZER = СТАРТОВОЕ УДОБРЕНИЕ (или ПРИПОСЕВНОЕ УДОБРЕНИЕ) – Starter Fertilizer is a relatively small application of fertilizer applied with or near the seed for accelerating early growth of the crop. Starter Fertilizer is a fertilizer placed close to the seed, usually at planting. Also called ‘Pop-Up’ Fertilizer. / Известно также как Xxxxx Удобрение (‘Pop-Up’ Fertilizer).

STARTING MARK = НЕДОСЕКА ПРИ ПУСКЕ ТКАЦКОГО СТАНКА (или ЗАБОИНА ПРИ ПУСКЕ ТКАЦКОГО СТАНКА, или ОТМЕТИНА ОТ ПУСКА В ХОД) – Starting Marks:- this is a very subjective decision by the percher if light Let off is there For this we have to avoid the stopping of M/c due to Weft break or Warp breaks because in case if m/c stops then starting marks is seen in the fabric. It is more visible in case of light weight than medium or heavy weight quality. As a precautionary measure, we have to change the stopping points which helps in reduction of starting marks. Also, replacement all of Mechanical Let off to Electronic Let off on these m/c is required. Weaving defect. Starting Mark:- uneven pick density observed on fabric when machine starts after attending warp breaks or weft breaks or any other reason called Starting Mark. Starting Mark:- mechanical faults in loom, improper stopping in loom in open shed condition, excessive cloth release at loom stacking timing:- (i) play in sley or reed at 50 degrees machine position; (ii) eccentric take up roller bush and hexagonal stud; (iii) condition of take up timing; (iv) whip roller vibration; (v) M/c. stopping point between 290 degree – 300 degree; (vi) condition of main drive – brake band and its setting; (vii) working of free-wheeling device; (viii) let off mechanism; (ix) take up clutch pressure; (x) slippage of cloth at emery roll or not; (xi) condition of both side emery pin and gun metal bushes; and (xii) improper pick finding. / Порок или дефект ткачества. Под Пусковыми Полосами понимается дефект суровой ткани в виде поперечных полос по всей ширине ткани с небольшим уменьшением числа уточных нитей на 1 дециметр (дм) ткани. Эти полосы появляются на тканях со средним и ниже среднего числом уточных нитей на 1 дм ткани, когда станок пускается после останова. Причина порока – релаксация нитей основы и другое. Недосека – местный порок ткани в виде полосы во всю ширину ткани из-за пониженной плотности ткани по утку. Недосека с разрежением плотности свыше двух до четырёх нитей в 1 см. Размер порока – за каждое место. Под Недосеками понимается дефект суровой ткани в виде поперечных полос с пониженным числом уточных нитей на 1 дм ткани, причина разладка основного регулятора или товарного механизма. Забоина. Размер порока – за каждое место. Под Забоинами понимается дефект суровой ткани в виде поперечных полос во всю ширину ткани с повышенным числом уточных нитей на 1 дм ткани (то есть с повышенной плотностью ткани по утку), причина – разладка основного регулятора или товарного механизма.

STARTING MARK = ОТМЕТИНА ОТ ПУСКА В ХОД – Starting Mark:- uneven pick density observed on fabric when machine starts after attending warp breaks or weft breaks or any other reason called Starting Mark. Starting Mark:- the fault known as ‘Starting Place’ in cloth/fabric are caused as a result of stopping and starting a loom. The fault appears width way of the fabric. There are some other faults which are visible after dyeing. Few common faults of these categories are mentioned below. Weaving defect. Starting Mark:-

mechanical faults in loom, improper stopping in loom in open shed condition, excessive cloth release at loom stacking timing:- (i) play in sley or reed at 50 degrees machine position; (ii) eccentric take up roller bush and hexagonal stud; (iii) condition of take up timing; (iv) whip roller vibration; (v) M/c. stopping point between 290 degree – 300 degree; (vi) condition of main drive – brake band and its setting; (vii) working of free-wheeling device; (viii) let off mechanism; (ix) take up clutch pressure; (x) slippage of cloth at emery roll or not; (xi) condition of both side emery pin and gun metal bushes; and (xii) improper pick finding. / Порок или дефект ткачества.

STARTING PLACE = МЕСТО ПУСКА В ХОД – Starting Place:- restarting of loom. Woven fabric defect. / Порок или дефект ткачества.

START–UP MARKS = ОТМЕТИНЫ ОТ ПУСКА В ХОД – Start-Up Marks:- (1) blemishes caused by the 'start-up man' who, when the loom is supposed to be ready for the weaver, is responsible for all settings and timings so that when the weaver takes over the warp he should have clear sailing in weaving out the cuts of cloth in the warp. Usually of minor importance, easily remedied. (2) The cloth may show marks such as bright or dim streaks in the filling direction. Caused by the weaver not starting his loom under correct warp tension at the let-off or take-up motions. Sometimes, several filling picks will be woven into the goods before the loom picks become regular and even with the warp ends. Good weavers are constantly on the alert for poor start-up marks and always give the closest attention to the warp and the fabric tension before setting the loom into action. See also Set Mark. Start-Up Mark; stop mark; stopping line:- a band of several courses having stitch characteristics different from those in the normal fabric. Note:- this defect is caused by a change in yarn tension resulting from the deceleration and standing time when a machine stops. / в направлении уточины. Порок или дефект ткачества. Под Пусковыми Полосами понимается дефект суровой ткани в виде поперечных полос по всей ширине ткани с небольшим уменьшением числа уточных нитей на 1 дм ткани. Эти полосы появляются на тканях со средним и ниже среднего числом уточных нитей на 1 дм ткани, когда станок пускается после останова. Причина порока – релаксация нитей основы и другое.

STARVED AREA = ОБЕДНЁННЫЙ АРЕАЛ – Starved Area is an area in a plastic part that has an insumcient amount of resin to wet out the reinforcement completely. This condition may be due to improper wetting, impregnation, or resin flow; excessive molding pressure; or improper bleeder cloth thickness.

STARVED JOINT = ОБЕДНЁННОЕ ПРИКРЕПЛЕНИЕ (или СПАЙКА, или СОЕДИНЕНИЕ) – Starved Joint is an adhesive that has been deprived of the proper film thickness of adhesive due to insufficient adhesive spreading or to the application of excessive pressure during the lamination process.

STATE = ГОСУДАРСТВО – State is a specialized type of political organization characterized by a full-time, specialized, professional work force of tax-collectors, soldiers, policemen, bureaucrats and the like that exercises supreme political authority over a defined territory with a permanent population, independent from any enduring external political control and possessing a local predominance of coercive power (always supplemented with moral and remunerative incentives as well) great enough to maintain general obedience to its laws or commands within its territorial borders. The first known states were created in ancient times in Egypt, Mesopotamia, India, China, Mexico and Peru, but it is only in relatively modern times that states have almost completely displaced alternative 'stateless' forms of political organization of societies all over the planet. Roving bands of hunter-gatherers and even fairly sizable and complex tribal societies based on herding or agriculture have existed without any full-time specialized state organization, and these 'stateless' forms of political organization have in fact prevailed for all of the prehistory and much of the history of the human species. / Виды (Species).

STATE = ШТАТ – State is one of the component territorial political units in a larger federal state that are so called because, although they actually fall short of full independent statehood or sovereignty, they still possess a very large degree of autonomy in decision-making with respect to most of their internal affairs and are thus also legally allowed to exercise various forms of coercion over their regional populations Example – the 50 states of the United States.

STATE AUTHORITY = ВЛАСТИ ШТАТА – State Authority means an authority of a State designated under State law:- (i) to receive notice required to be given a State authority under subpart II of this part; or (ii) as the representative of the State before the Secretary of Transportation in any matter about which the Secretary is required to consult with or consider the views of a State authority under subpart II of this part.

STATE BANK = ШТАТОВСКИЙ БАНК (или БАНК ШТАТА) – In the United States, State Bank is a bank that is chartered by a state; may or may not be a member of the Federal Reserve System. / В Соединённых Штатах Америки под Штатовским Банком или Банком Штата подразумевается банк, который был декретирован штатом. Он может или не может быть членом (участником) Федеральной Резервной Системы.

STATE–CONTROLLED TRADING COMPANY = ПОДКОНТРОЛЬНАЯ ГОСУДАРСТВУ ТОРГОВАЯ КОМПАНИЯ (или КОНТРОЛИРУЕМАЯ ГОСУДАРСТВОМ ТОРГОВАЯ КОМПАНИЯ) – In a country with a state trading monopoly, State-Controlled Trading Company is a trading entity authorized by that country's government to conduct export business. See also State Trading Enterprises. / В странах с государственной монополией в торговле, торговое юридическое лицо, уполномоченное правительством данной страны, для осуществления вывозных (или экспортных) операций. Смотрите также Государственные Торговые Предприятия (State Trading Enterprises).

STATED REDEMPTION PRICE AT MATURITY = ЗАЯВЛЕННАЯ ЦЕНА ПОГАШЕНИЯ ПРИ САМОМ ПОГАШЕНИИ – In the United States, the Stated Redemption Price at Maturity = the amount fixed by the last modification of the purchase agreement and includes interest and other amounts payable at that time. It does not, however, include 'qualified stated interest'. Qualified stated interest is any interest based on a fixed rate and payable unconditionally at fixed periodic intervals of one year or less during the entire life of the instrument. The stated redemption price at maturity is frequently Par or USD1 000.00, but this is not always the case, as with Payment In Kind bonds (PIKs). See also Original Issue Discount.

STATE MEMBER BANK = ШТАТОВСКИЙ БАНК ЧЛЕН (или ШТАТОВСКИЙ БАНК УЧАСТНИК) – In the United States, the State Member Bank is a bank that is chartered by a state and has elected to join the Federal Reserve System. / В Соединённых Штатах Америки, штатовским банком членом или штатовским банком участником считается банк, декретированный штатом и по которому принято решение о его вступлении в Федеральную Резервную Систему.

STATEMENT OF ACCOUNTING STANDARD NO. 70 = СТАНДАРТ № 70 ДЛЯ ОТЧЁТА О БУХГАЛТЕРСКОМ УЧЁТЕ – In the United States, the Statement of Accounting Standard No. 70 (SAS 70), 'Reports on the Processing of Transactions by Service Organizations'. A SAS 70 is an examination of an organization's internal control structure; it may or may not include testing. Banks providing custody services to institutional customers typically have an annual SAS 70 performed by an independent auditor. Statements of accounting standards are issued by the Auditing Standards Board of the Association of Independent Certified Public Accountants. In the United Kingdom, a FRAG-21 is similar to a SAS 70.

STATEMENT OF CASH FLOWS = ОТЧЁТ О ДВИЖЕНИИ ДЕНЕЖНЫХ СРЕДСТВ – The Statement of Cash Flows explains the change in a company's cash (and cash equivalents) during the time interval indicated in the heading of the statement. The change is divided into three parts:- (i) operating activities, (ii) investing activities, and (iii) financing activities. The operating activities section explains how a company's cash (and cash equivalents) have changed due to operations. Investing activities refer to amounts spent or received in transactions involving long-term assets. The financing activities section reports such things as cash received through the issuance of long-term debt, the issuance of stock, or money spent to retire long-term liabilities. See also Cash Flow Statement. Statement of Cash Flows is a statement of cash flows is one of the basic financial statements that is required as part of a complete set of financial statements prepared in conformity with generally accepted accounting principles. It categorizes net cash provided or used during a period as operating, investing and financing activities, and reconciles beginning and ending cash and cash equivalents.

STATEMENT OF CHANGES IN STOCKHOLDERS' EQUITY = ОТЧЁТ ОБ ИЗМЕНЕНИЯХ В СОБСТВЕННЫХ СРЕДСТВАХ (или ДОЛЯХ) АКЦИОНЕРОВ – A Statement Of Changes In Stockholders' Equity summarizes all changes directly affecting account balances in the stockholders' equity section of the balance sheet. Such changes include net income, cash and stock dividends, issues of common or preferred stock and treasury stock transactions. These statements show changes in the number of shares (not included due to space limits) as well as Dollars between balance sheet dates. In the United States, Statement of Changes in Stockholders' Equity explains the effects of transactions on stockholders' equity during the accounting period. Also known as Reconciliation Of Movements In Shareholders' Funds in the United Kingdom. Summarizes the adjustments to stockholders' equity accounts over an accounting period. Statement of Stockholders' Equity is a summary of the changes in stockholders' equity of a corporation that have occurred during a specific period of time. Stockholders' Equity is total assets minus total liabilities. It is the same as Equity, Net Worth and Shareholders' Equity. This financial statement breaks down into more detail the changes in shareholder's equity (also called Stockholder's Equity) that occurred during the year. The more complicated and diverse the equity structure is, the more important this statement becomes. It gives a breakdown of the various types of stock transactions and effects on retained earnings. Notice the different categories of stock and how they changed. Be able to figure out what was paid out for dividends. Businesses that do not have stockholders equity may not need to make this statement in this form. However, all businesses need to keep track of their equity regardless of complexity. Even if your business does not make this statement, it is good practice to be able to read and understand what it means.

STATEMENT OF CHARGES = ОТЧЁТ О РАСХОДАХ (или ВЫПИСКА О РАСХОДАХ) – Statement Of Charges:- this document is a complete detailed statement of all charges sent to the importer in order, to show how the sum total of the charges debited to him has been arrived at. The statement of charges normally deals with charges incurred by the shipper in connection with the shipment to the importer and which are outside of the quoted or agreed price for services to be performed by the seller.

STATEMENT OF CLAIM = ВЫДВИЖЕНИЕ ПРЕТЕНЗИИ (или ВЫСТАВЛЕНИЕ ПРЕТЕНЗИИ, или ЗАЯВЛЕНИЕ ПРЕТЕНЗИИ) – Statement Of Claim is the first step in the pleadings to an action, in which the plaintiff particularizes his claim and the legal grounds on which it is based.

STATEMENT OF FINANCIAL POSITION = ОТЧЁТ О ФИНАНСОВОМ СОСТОЯНИИ (или ПОЛОЖЕНИИ) – Statement Of Financial Position:- formerly known as a Balance Sheet. A statement of assets, liabilities and owners' equity at a specific date. Also known as Statement Of Assets And Liabilities. / Ранее именовавшийся Бухгалтерским Балансом.

STATEMENT OF NET COST = ЗАЯВЛЕНИЕ О ЧИСТОЙ СТОИМОСТИ (или ПРОТОКОЛ О ЧИСТОЙ СТОИМОСТИ) – Statement of Net Cost compares fees earned to costs incurred during a specific period of time.

STATEMENT OF STOCKHOLDERS' EQUITY = ОТЧЁТ О СОБСТВЕННЫХ СРЕДСТВАХ АКЦИОНЕРОВ – The Statement Of Stockholders' (or Shareholders') Equity lists the changes in stockholders' equity for the same period as the income statement and the cash flow statement. The changes will include items such as net income, other comprehensive income, dividends, the repurchase of common stock, and the exercise of stock option. See also Stockholders' Equity. / откуп , . строка баланса (item).

STATEMENT OF USE = ОТЧЁТ ОБ ИСПОЛЬЗОВАНИИ – In the US patent law, a Statement Of Use (SOU) is a sworn statement signed by the applicant or a person authorized to sign on behalf of the applicant attesting to use of the mark in commerce. With a statement of use, the owner must submit:- (i) a filing fee of USD100 per class of goods/services; and (ii) one specimen showing use of the mark in commerce for each class of goods/services. Statements of use must be filed within 6 months from the date United States Patent and Trademark Office (USPTO) issues a notice of allowance. Failure to submit the statement of use in a timely manner results in abandonment of the application. The Amendment to Allege Use and the Statement of Use include the same information, and differ only as to the time when it is filed.

STATE OF EMERGENCY = ЧРЕЗВЫЧАЙНОЕ ПОЛОЖЕНИЕ – State Of Emergency:- In the event of a major incident, such as civil unrest or a major disaster, many governments maintain the right to declare a state of emergency, which gives them extensive powers over the daily lives of their citizens, and may include temporary curtailment on certain civil rights, including the right to trial. For instance to discourage looting of an evacuated area, a shoot on sight policy, however unlikely to occur, may be publicized. A State Of Emergency is a situation in which a government is empowered to perform actions or impose policies that it would normally not be permitted to undertake. A government can declare such a state during a natural disaster, civil unrest, armed conflict, medical pandemic or epidemic or other biosecurity risk. Such declarations alert citizens to change their normal behavior and orders government agencies to implement emergency plans. Justitium is its equivalent in Roman law – a concept in which the senate could put forward a final decree (senatus consultum ultimum) that was not subject to dispute. States of emergency can also be used as a rationale or pretext for suspending rights and freedoms guaranteed under a country's constitution or basic law, sometimes through martial law or revoking habeas corpus. The procedure for and legality of doing so vary by country.

STATE OF THE ART = СУЩЕСТВУЮЩИЙ УРОВЕНЬ ТЕХНОЛОГИИ – State Of The Art is a developed stage of technical capability at a given time as regards products, processes and services, based on the relevant consolidated findings of science, technology and experience.

STATE PHYTOSANITARY CERTIFICATE = ШТАТОВСКИЙ ФИТОСАНИТАРНЫЙ СЕРТИФИКАТ (или ФИТОСАНИТАРНЫЙ СЕРТИФИКАТ ШТАТА) – State Phytosanitary Certificate is a document issued by a plant regulatory official of a State Department of Agriculture attesting to the phytosanitary condition of commodities. A State certificate documents origin, treatment, active growth field inspection, virus indexing, or other special conditions. Under the current cooperator Memorandum of Understanding, State phytosanitary certificates are not to be utilized for international trade.

STATE PLANT HEALTH DIRECTOR = ШТАТОВСКИЙ ДИРЕКТОР ПО ЗДОРОВЬЮ РАСТЕНИЙ – State Plant Health Director (SPHD) is an administrator within USDA-APHIS-PPQ (short for the United States Department of Agriculture – Animal and Plant Health

Inspection Service – Plant Protection and Quarantine) who is responsible for pest prevention and the export certification program within their assigned state(s).

STATE PLANT REGULATORY OFFICIAL = ШТАТОВСКОЕ ОФИЦИАЛЬНОЕ ЛИЦО ПО РЕГУЛИРОВАНИЮ РАСТЕНИЙ – State Plant Regulatory Official (SPRO) is an administrator of the section of his or her state's Department of Agriculture that deals with pest prevention and export certification. The main administrator in conjunction with the Federal State Cooperators' Memorandum of Understanding, i.e. State Entomologist, State Plant Pathologist.

STATE TRADING ENTERPRISES = ГОСУДАРСТВЕННЫЕ ТОРГОВЫЕ ПРЕДПРИЯТИЯ – State Trading Enterprises (STEs) are entities established by governments to import, export and/or produce certain products. Examples include:- government-operated import/export monopolies and marketing boards or private companies that receive special or exclusive privileges from their governments to engage in trading activities. See also State-Controlled Trading Company.

STATIC = СТАТИКА (или СТАТИЧЕСКОЕ) – Static:- an accumulation of negative or positive electricity on the surface of fibers or fabrics because of inadequate electrical dissipation during processing. Static results in an electrical attraction or repulsion of the fibers relative to themselves, to machine parts, or to other materials, preventing the fiber from traveling in a normal path in the process.

STATIC ADHESION = СТАТИЧЕСКАЯ АДГЕЗИЯ (или СТАТИЧЕСКОЕ ПРИЛИПАНИЕ) – Static Adhesion:- in tire cord, the measurement of the strength of a cord-to-rubber bond under static conditions or very low strain rate.

STATIC CRACK = СТАТИЧЕСКАЯ ТРЕЩИНА (или СТАТИЧЕСКАЯ ЩЕЛЬ) – (1) Static Crack:- the exterior walls of an occupied building should, among other things, prevent excessive air and water from entering to the interior. In Florida, stucco is a common choice for exterior wall cladding, but after time, cracking can become a problem. Although control joints are typically used during construction to minimize stucco cracking and to accommodate building or thermal movement, and although construction standards apply to the use of these joints, cracks can still occur. In most cases, stucco cracking is simply a normal part of the aging of a building during the first few years after construction since the building will experience settling and movement that commonly appears as cracks in the stucco. However, stucco cracks can compromise the weather resistance of the exterior wall, and under the right conditions are potential moisture intrusion points. Factors such as crack/void size, location, wind direction and wind speed will determine where and how rapidly the water enters into or through the stucco. Stucco cracks should be repaired, but too often we see that an elastomeric coating is recommended because it provides the 'advantage' of a crack bridging ability. While these coatings can accommodate the thermal movement, withstand wind driven rain, and provide a long term warranty, they do not bridge or repair existing cracks. The crack bridging ability applies to new cracks that may occur after the stucco has been coated. When exterior building maintenance is undertaken after the first few years of building life, or anytime thereafter, cracks need to be repaired as part of preparation for a the new paint coating. This is a standard coating manufacturer's requirement, and these repairs are normally included as part of the manufacturer's warranty. By correctly identifying the cracks and implementing the proper repair before re-coating walls, it is possible to provide successful long term performance. Stucco cracks generally include two types. These are static or dynamic (moving) cracks. Static cracks are often hairline in size and less than $1/16^{th}$ inch in width, and these tend to have a crazed or spider web pattern. The reasons for this type of cracking vary, but the cracks are considered non-moving. Dynamic cracks are normally larger and occur because of ongoing movement occurring at the crack location. The most common locations for dynamic cracks are cold joints between different substrates such as the joints between poured concrete and wall framing or CMU blocks. Other common locations include intersections of vertical walls and the corners of wall openings such as for windows and doors. / Трещины в железобетонных панелях жилых зданий.

(2) Static Crack:- xxxxx. See also Shier.

STATIC FRICTION = СТАТИЧЕСКОЕ ТРЕНИЕ (или ТРЕНИЕ ПОКОЯ) – Static Friction is the force just sufficient to initiate relative motion between two bodies under load. The value of the static friction at the instant relative motion begins is termed break-away friction. See also Friction. / Трение Покоя – трение двух тел при микросмещениях без макросмещения.

STATIC SEAL = СТАТИЧЕСКОЕ УПЛОТНЕНИЕ – Static Seal is a seal between two surfaces which have no relative motion. See also Seal.

STATIONARY SEAL = СТАЦИОНАРНОЕ УПЛОТНЕНИЕ – Stationary Seal is a mechanical seal in which the flexible members do not rotate with the shaft. See also Seal.

STATION BILL = РАСПИСАНИЕ ПОСТОВ (или ТАБЕЛЬ ПОСТОВ, или КОРАБЕЛЬНОЕ РАСПИСАНИЕ) – Station Bill is a list which shows the vessel's complement and details their various duties in connection with fire and boat drills. Station Bill (maritime term):- the posted bill showing stations of the crew at maneuvers and emergency drills.

STATISTIC = СТАТИСТИЧЕСКАЯ ВЕЛИЧИНА (или СТАТИСТИЧЕСКИЙ ПОКАЗАТЕЛЬ) – Statistic is a single datum or term in a collection of statistics. It is an estimate of a parameter made from a sample, with the quantity computed from a sample.

STATISTICAL PROCESS CONTROL = СТАТИСТИЧЕСКИЙ КОНТРОЛЬ ПРОЦЕССА – Statistical Process Control (SPC):- the use of control charts to track and eliminate variables in repetitive manufacturing processes, in order to ensure that the product is of consistent and predictable quality. If a chart reveals only chance variations that are inherent in the system, the process is said to be in a state of 'statistical control'. If the chart reveals variations traceable to changes in equipment, procedures or workers, the process is said to be 'out of control'. Statistical process control differs from statistical quality control in that the former monitors manufacturing process parameters and the latter monitors product quality parameters.

STATISTICAL PROGRAMME COMMITTEE = КОМИТЕТ ПО СТАТИСТИЧЕСКИМ ПРОГРАММАМ – Statistical Programme Committee (SPC) – senior managing and comitology Committee of the European Statistical System (ESS) – includes DGs of Eurostat and Member States – chaired by Eurostat DG.

STATISTICS = СТАТИСТИКА – Statistics is:- (1) an analysis and interpretation of numerical data used to define scientific experiments; and (2) an orderly arrangement of facts collected for study in general information, e.g., production of a crop or a country. / Под Статистикой, от Немецкого слова Statistik, от Итальянского слова Stato, означающее Государство, понимается получение, обработка, анализ и публикация информации, характеризующей количественные закономерности жизни общества (технико-экономические, социально-экономические, социально-политические явления, культура) в неразрывной связи с их качественным содержанием. В более узком смысле статистика – совокупность данных о каком-либо явлении или процессе. В естественных науках понятие 'Статистика' означает анализ массовых явлений, основанных на применении методов теории вероятностей. Статистика разрабатывает специальную методологию исследования и обработки материалов:- массовые статистические наблюдения, метод группировок, средних величин, индексов, балансовый метод, метод графических изображений. Статистика как наука включает разделы:- общая теория статистики, экономическая статистика, отраслевые

статистики – промышленности, сельского хозяйства, строительства, транспорта, связи, труда и другого; формируется социальная статистика (в узком смысле слова).

STATISTICS COMMITTEE = СТАТИСТИЧЕСКИЙ КОМИТЕТ (или КОМИТЕТ ПО СТАТИСТИКЕ) – Statistics Committee (STC) of the European System of Central Banks. Composed of Euro area National Statistical Institutes and/or Central Bank Statistics departments.

STATUTE–BARRED = ИСКЛЮЧЁННЫЙ СТАТУТОМ (или ИСКЛЮЧЁННЫЙ ПОЛОЖЕНИЕМ) – Statute-Barred:- a debt the claim to which is barred by lapse of time under Statutes of Limitation. / Долг, претензия (требование) по которому считается недействительной по истечении времени, утверждённого Статутами об Исковой Давности (Statutes of Limitation). Под Статутом, от Латинского слова Statuo, означающее Постановляю, понимается законодательный акт.

STATUTE LAW = СТАТУТНОЕ ПРАВО (или ЗАКОНОДАТЕЛЬНОЕ ПРАВО) – Statute Law, otherwise known as Acts of Parliament, which may create entirely new law, over-rule, modify, or extend existing principles of common law or repeal or modify existing statute law. / Статутное Право или Законодательное Право, именуемое также как Акты Парламента (Acts of Parliament), подразумевает под собой право, которое может создавать абсолютно новое право, отклонять, модифицировать или расширять существующие принципы общего права или отменять или модифицировать существующее статутное право. В Великобритании с XIII века совокупность правовых норм, содержащихся в законодательных актах высших органов государственной власти (статутах). Статутное право считается главной частью Английской правовой системы, приоритетной по отношению к общему праву. В странах Англо-Американской правовой системы нормы, содержащиеся в статутах и функционирующие наряду с общим правом. Статутное право – главная часть права, создаваемая законодательными органами, в противоположность обычному и прецедентному праву и актам, принимаемым административными органами.

STATUTE OF LIMITATIONS = СТАТУТ ОБ ИСКОВОЙ ДАВНОСТИ (или ПОЛОЖЕНИЕ ОБ ИСКОВОЙ ДАВНОСТИ) – Period during which parties taking judicial action to enforce rights must file the claims. The period varies depending on the type of claim. Receivables secured by mortgages have no statute of limitations. Statute Of Limitations is a law limiting the time in which claims or suits may be instituted. / Исковая давность, исковое заявление, истец, ответчик. Закон, ограничивающий возможный срок подачи претензий или исков. Под Статутом, от Латинского слова Statuo, означающее Постановляю, понимается законодательный акт. Под Давностью в праве понимается установленный законом срок, истечение которого влечёт юридические последствия, например:- (i) утрату права на иск (исковая давность); (ii) на принудительное исполнение решения суда, арбитража и тому подобного (исполнительная давность); (iii) исключение уголовной ответственности либо возможности исполнения обвинительного приговора; и (iv) при определённых условиях давность владения вещью служит основанием приобретения права собственности (приобретательская давность).

STATUTE OF THE EUROPEAN SYSTEM OF CENTRAL BANKS AND OF THE EUROPEAN CENTRAL BANKS = СТАТУТ О ЕВРОПЕЙСКОЙ СИСТЕМЕ ЦЕНТРАЛЬНЫХ БАНКОВ И О ЕВРОПЕЙСКИХ ЦЕНТРАЛЬНЫХ БАНКАХ –Statute of the European System of Central Banks and of the European Central Bank (Statute of the ESCB) is the organic law of the European System of Central Banks (ESCB) and of the European Central Bank (ECB), annexed as a Protocol to the EC Treaty.

STATUTORY DISCLAIMER = СТАТУТОРНЫЙ ОТКАЗ ОТ ОТВЕТСТВЕННОСТИ – Statutory Disclaimer:- under 35 USC § 253 (paragraph 1) and 37 CFR (short for the US Code of Federal Regulations) 1.321(a), the owner (in part or in entirety) of a patent may relinquish all rights to a complete claim or claims of the owner's patent.

STATUTORY INVENTION REGISTRATION = УСТАНОВЛЕННАЯ ЗАКОНОМ (или ЗАКОНОДАТЕЛЬНАЯ) РЕГИСТРАЦИЯ ИЗОБРЕТЕНИЯ – A published Statutory Invention Registration (SIR) contains the specification and drawings of a regularly filed nonprovisional application for a patent without examination if the applicant – (i) meets the requirements of section 112 of this title; (ii) has complied with the requirements for printing, as set forth in regulations of the Commissioner; (iii) waives the right to receive a patent on the invention within such period as may be prescribed by the Commissioner; and (iv) pays application, publication, and other processing fees established by the Commissioner. A request for a statutory invention registration (SIR) may be filed at the time of filing a nonprovisional application for patent, or may be filed later during pendency of the nonprovisional application. / чертёж (drawing).

STAUNCH = БЕЗОПАСНЫЙ ДЛЯ ПЛАВАНИЯ – Staunch (maritime term):- still, seaworthy, able. / Безопасный Для Плавания (о судне).

STAX = STACKED INCOME PROTECTION PLAN (IN THE UNITED STATES)

STAY = ОПОРА (или ПОДСТАВКА, или ПОДПОРКА, или ПОДДЕРЖКА) – Stay is a piece of fabric used to hold another piece of fabric in place, or to add strength to a seam or tack.

STAY = ШТАГ – Stay (maritime term):- a rope of hemp, wire or iron leading forward or aft for supporting a mast.

STAYS = ВЫСОКИЙ ПОЯС (или КОРСЕТ, или ХХ) – Stays is an old type of corset. / устаревший тип корсета.

STB = SHORT THE BASIS

STB = SPECIAL TAX BOND

STB = SURFACE TRANSPORTATION BOARD

STC = SAID TO CONTAIN

STC = STATISTICS COMMITTEE

STCW = INTERNATIONAL CONVENTION ON STANDARDS OF TRAINING, CERTIFICATION AND WATCHKEEPING FOR SEAFARERS, 1978

STD = SAO TOME AND PRINCIPE DOBRA

STE = SHORT–TERM EMERGENCY

STEADY = ТАК ДЕРЖАТЬ – Steady (maritime term):- an order to hold a vessel on the course she is heading.

STEAK = ХХ – Steak:- a variation of generally varying width which may or may not be parallel to the length direction.

STEAM BAND = ПАРОВОЕ СВЯЗЫВАНИЕ – Steam Band:- improper binding of fabric on beam of KD TMT (KD – возможно Kier Decatizer steam conditioning; TMT Machinery, Inc; the Japanese company is jointly incorporated by the three leading manufacturers of synthetic fiber machinery in Japan – Toray Engineering, Murata Machinery and Teijin Seiki) m/c, strip near selvedge. Finishing defect. /

Ти.Эм.Ти. Мэшинэри, Инк. (TMT Machinery, Inc). Торэ Эндьжинирин (Toray Engineering), Мюрата Мэшинэри (Murata Machinery) и Тэйджин Сэйки (Teijin Seiki). Порок или дефект заключительной отделки.

STEAM CHEST = ПАРОСБОРНИК – Steam Chest is a steam-heated cabinet used in manufactured fiber production. Usually refers to the heated cabinet in which spin-drawing is done or to the cabinet around a stuffer-box crimper.

STEAM CRACKING = ПАРОВОЙ КРЕКИНГ – Steam Cracking is a petrochemical process which produces olefins, particularly ethylene, and, in some cases, aromatics. Similar to thermal cracking. / Нефтехимический процесс, позволяющий получать олефины (или алкены), в частности этилен, а в некоторых случаях – ароматические углеводороды. Аналогичен термическому крекингу.

STEAM ELECTRIC PLANT = ПАРОВАЯ ЭЛЕКТРИЧЕСКАЯ СТАНЦИЯ (или ПАРОВАЯ ЭЛЕКТРОСТАНЦИЯ) – Steam Electric Plant (conventional) is a plant in which the prime mover is a steam turbine. The steam used to drive the turbine is produced in a boiler where fossil fuels are burned. / паровая турбина. преобразующая энергию водяного пара сначала в механическую работу, и потом в электрическую энергию.

STEAM PATCHES = ПАРОВЫЕ НАСТРОЧКИ – Steam Patches:- uneven steaming in KD TMT (KD – возможно Kier Decatizer steam conditioning; TMT Machinery, Inc; the Japanese company is jointly incorporated by the three leading manufacturers of synthetic fiber machinery in Japan – Toray Engineering, Murata Machinery and Teijin Seiki) m/c & blowing. Finishing defect. / Ти.Эм.Ти. Мэшинэри, Инк. (TMT Machinery, Inc). Торэ Эндьжинирин (Toray Engineering), Мюрата Мэшинэри (Murata Machinery) и Тэйджин Сэйки (Teijin Seiki). Порок или дефект заключительной отделки.

STEAMSHIP = ПАРОХОД (или ПАРОВОЕ СУДНО) – Steamship is a ship or seagoing vessel propelled by the power of steam. Also known as Steamer. A large vessel propelled by one or more steam-driven screws, propellers, or paddles. / Известен также как Пароход (Steamer). Пароход, судно, приводимое в движение паровой машиной или турбиной (турбинные пароходы называют обычно турбоходами). Первый в мире колёсный пароход Клэмэнт или Клермо (Clermont) был построен Американским изобретателем Робэтом Фултаном (Robert Fulton) в Нью Йорке в 1807 и зарегистрирован в 1808. Изобретатель использовал для его обозначения Английский термин Steamboat. В России первый пароход Елизавета был сооружён в 1815 для рейсов между Петербургом и Кронштадтом. Пароход или Паровое Судно – самоходное судно, приводимое в движение паровым двигателем (паровой машиной или турбиной); турбинные пароходы называют также Турбоходами. Пароходы начали строить после изобретения паровых машин, но практическое применение они нашли лишь с начала XIX века. Первый пароход построен в Северной Америке в 1807 Робэтом Фултаном. Первым пароходом в России считается Елизавета. Он был построен в 1815 для рейсов между Петербургом и Кронштадтом. В современном флоте основной тип самоходного судна – теплоход, главным двигателем которого является двигатель внутреннего сгорания.

STEAMSHIP CONFERENCE = КОНФЕРЕНЦИЯ ПО ПАРОХОДСТВУ – Steamship Conference is a group of vessel operators joined together for the purpose of establishing freight rates. / Группа операторов судов, объединившихся с целью установления ставок фрахта.

STEAMSHIP GUARANTEE = СУДОВАЯ ГАРАНТИЯ (или ПАРОХОДНАЯ ГАРАНТИЯ) – Steamship Guarantee is an indemnity issued to the carrier by a bank; protects the carrier against any possible losses or damages arising from release of the merchandise to the receiving party. This instrument is usually issued when the bill of lading is lost or is not available.

STEAM TURBINE = ПАРОВАЯ ТУРБИНА – Steam Turbine is a mechanical device that extracts thermal energy from pressurized steam. The energy is converted into a rotary motion that drives a device. / Паровая Турбина – первичный паровой двигатель с вращательным движением рабочего органа – ротора и непрерывным рабочим процессом; служит для преобразования тепловой энергии водяного пара в механическую работу. Поток водяного пара поступает через направляющие аппараты на криволинейные лопатки, закреплённые по окружности ротора, и, воздействуя на них, приводит ротор во вращение. В отличие от поршневой паровой машины, паровая турбина использует не потенциальную, а кинетическую энергию пара. Попытки создать паровую турбину делались очень давно. Известно описание примитивной паровой турбины, сделанное Героном Александрийским (I век до Нашей Эры). Однако только в конце XIX века, когда термодинамика, машиностроение и металлургия достигли достаточного уровня, Шведский инженер и изобретатель Коль Гюстав Потрик дэ Лаваль (Karl Gustaf Patrik de Laval; 1845-Май-09–1913-Февраль-02) и Английский инженер и предприниматель Сэр Чарлз Алдьжонон Пасэнз (Sir Charles Algernon Parsons; 1854-Июнь-13–1931-Февраль-11) независимо друг от друга в 1884–89 создали промышленно пригодные паровые турбины. Лаваль применил расширение пара в конических неподвижных соплах в один приём от начального до конечного давления и полученную струю (со сверхзвуковой скоростью истечения) направил на один ряд рабочих лопаток, насаженных на диск. Паровые турбины, работающие по этому принципу, получили название Активных Паровых Турбин. Пасэнз создал Многоступенчатую Реактивную Паровую Турбину, в которой расширение пара осуществлялось в большом числе последовательно расположенных ступеней не только в каналах неподвижных (направляющих) лопаток, но и между подвижными (рабочими) лопатками. Паровая турбина оказалась очень удобным двигателем для привода ротативных механизмов (генераторы электрического тока, насосы, воздуходувки) и судовых винтов; она была более быстроходной, компактной, лёгкой, экономичной и уравновешенной, чем поршневая паровая машина. Развитие паровых турбин шло чрезвычайно быстро как в направлении улучшения экономичности и повышения единичной мощности, так и по пути создания специализированных паровых турбин различного назначения. Невозможность получить большую агрегатную мощность и очень высокая частота вращения одноступенчатых паровых турбин Лаваля (до 30 000 оборотов в минуту (об/мин) у первых образцов) привели к тому, что они сохранили своё значение только для привода вспомогательных механизмов. Активные паровые турбины развивались в направлении создания многоступенчатых конструкций, в которых расширение пара осуществлялось в ряде последовательно расположенных ступеней. Это позволило значительно увеличить единичную мощность паровой турбины, сохранив умеренную частоту вращения, необходимую для непосредственного соединения вала паровой турбины с вращаемым ею механизмом. Реактивная паровая турбина Пасэнза некоторое время применялась (в основном на военных кораблях), но постепенно уступила место более компактным комбинированным активно-реактивным паровым турбинам, у которых реактивная часть высокого давления заменена одно- или двухвенчатым активным диском. В результате уменьшились потери на утечки пара через зазоры в лопаточном аппарате, турбина стала проще и экономичнее. Классификация Паровых Турбин:- в зависимости от характера теплового процесса паровые турбины обычно подразделяют на 3 основные группы:- чисто конденсационные, теплофикационные и специального назначения. Чисто Конденсационные Паровые Турбины служат для превращения максимально возможной части теплоты пара в механическую работу. Эти паровые турбины работают с выпуском отработавшего пара в конденсатор, где поддерживается вакуум. Чисто конденсационные паровые турбины могут быть Стационарными или Транспортными. Стационарные Паровые Турбины в соединении с генераторами переменного электрического тока (турбогенераторы) – основное оборудование конденсационных электростанций. Чем больше мощность турбогенератора, тем он экономичнее и тем ниже стоимость 1

килоВатта (кВт) установленной мощности. Поэтому мощность паровой турбины растёт из года в год и к 1974 достигла 1 200 МегаВатт (МВт) в агрегате (при давлении свежего пара до 35 МН/м^2 (1 Н/м^2 = 10^{-5} кгс/см^2) и температуре до 650 °C). Принятая в бывшем Союзе Советских Социалистических Республик (СССР) частота электрического тока 50 Герц (Гц) требует, чтобы частота вращения паровой турбины, непосредственно соединённой с двухполюсным генератором, равнялась 3 000 об/мин. В зависимости от назначения паровые турбины для электростанций могут быть Базовыми, несущими постоянную основную нагрузку; Пиковыми, кратковременно работающими для покрытия пиков нагрузки; Турбинами Собственных Нужд, обеспечивающими потребность электростанции в электроэнергии. От базовых паровых турбин требуется высокая экономичность на нагрузках, близких к полной (около 80%), от пиковых паровых турбин – возможность быстрого пуска и включения в работу, от паровых турбин собственных нужд – особая надёжность в работе. Все паровые турбины для электростанций рассчитываются на 100 000 часов (ч) работы (до капитального ремонта). Транспортные Паровые Турбины используются в качестве главных и вспомогательных двигателей на кораблях и судах. Неоднократно делались попытки применить паровые турбины на локомотивах, однако паротурбовозы распространения не получили. Для соединения быстроходных паровых турбин с гребными винтами, требующими невысокой (от 100 до 500 об/мин) частоты вращения, применяют зубчатые редукторы. В отличие от стационарных паровых турбин (кроме турбовоздуходувок), судовые паровые турбины работают с переменной частотой вращения, определяемой необходимой скоростью хода судна. Теплофикационные Паровые Турбины служат для одновременного получения электрической и тепловой энергии. К ним относятся Паровая Турбина С Противодавлением, С Регулируемым Отбором Пара, а также С Отбором И Противодавлением. У паровой турбины с противодавлением весь отработавший пар используется для технологических целей (варка, сушка, отопление). Электрическая мощность, развиваемая турбоагрегатом с такой паровой турбиной, зависит от потребности производства или отопительной системы в греющем паре и меняется вместе с ней. Поэтому турбоагрегат с противодавлением обычно работает параллельно с конденсационной паровой турбиной или электросетью, которые покрывают возникающий дефицит в электроэнергии. В паровой турбине с регулируемым отбором часть пара отводится из 1 или 2 промежуточных ступеней, а остальной пар идёт в конденсатор. Давление отбираемого пара поддерживается в заданных пределах системой регулирования. Место отбора (ступень паровой турбины) выбирают в зависимости от нужных параметров пара. У паровой турбины с отбором и противодавлением часть пара отводится из 1 или 2 промежуточных ступеней, а весь отработавший пар направляется из выпускного патрубка в отопительную систему. Давление пара паровой турбины для отопительных целей обычно составляет 0.12 МН/м^2, а для технологических нужд (сахарные, деревообрабатывающие, пищевые предприятия) 0.5–1.5 МН/м^2. Паровые Турбины Специального Назначения обычно работают на отбросном тепле металлургических, машиностроительных, и химических предприятий. К ним относятся Паровые Турбины Мятого Пара, Двух Давлений и Предвключённые (Форшальт). Паровые Турбины Мятого Пара используют отработавший пар поршневых машин, паровых молотов и прессов, имеющий давление немного выше атмосферного. Паровые Турбины Двух Давлений работают как на свежем, так и на отработавшем паре паровых механизмов, подводимом в одну из промежуточных ступеней. Предвключённые Паровые Турбины представляют собой турбины с высоким начальным давлением и высоким противодавлением; весь отработавший пар этих паровых турбин направляют в другие паровые турбины с более низким начальным давлением пара. Необходимость в предвключённых паровых турбинах возникает при модернизации электростанций, связанной с установкой паровых котлов более высокого давления, на которое не рассчитаны ранее установленные на электростанции паровые турбины. Паровые Турбины Специального Назначения не строят сериями, как конденсационные и теплофикационные паровые турбины, а в большинстве случаев изготовляют по отдельным заказам. Все стационарные паровые турбины имеют нерегулируемые отборы пара из 2–5 ступеней давления для регенеративного подогрева питательной воды. В бывшем СССР было установлено 4 ступени начальных параметров пара:- (i) давление 3.5 МН/м^2, температура 435 °C для паровых турбин мощностью до 12 МВт; (ii) 9 МН/м^2, 535 °C для паровых турбин до 50 МВт; (iii) 13 МН/м^2, 565 °C для паровых турбин до 100 МВт; и (iv) 24 МН/м^2, 565 °C для паровых турбин мощностью 200 и 300 МВт. Давление отработавшего пара 3.5–5 кН/м^2. Удельный расход тепла от 7.6 кДж/(Вт·ч) у самых мощных паровых турбин до 13 кДж/(Вт·ч) у небольших конденсационных турбин. Тепловой Процесс Паровых Турбин:- кинетическая энергия, приобретённая паром при его расширении, эквивалентна уменьшению его энтальпии в процессе расширения. Работа пара (в кгс·м, 1 кгс·м = 10 Дж) равна:- $W = 427(i_0 – i_1)$, а скорость истечения (в м/сек):- $c = 91.5\sqrt{(i_0 – i_1)}$, где i_0 – начальная, а i_1 – конечная энтальпия пара. Мощность (в кВт), которую можно получить от турбины при расходе пара D кг/ч, равна:- $N = D(i_0 – i_1) / 860$, а расход пара (в кг/ч) соответственно:- $D = 860N / (i_0 – i_1)$. Если под $i_0 – i_1$ подразумевается адиабатическое изменение энтальпии, то вышесказанное справедливо только для идеальной паровой турбины, работающей без потерь. Действительная мощность на валу реальной паровой турбины (в кВт) равна:- $N_e = \eta_{oe}\cdot((D(i_0 – i_1)) / 860)$, где η_{oe} – относительно эффективный кпд, представляющий собой отношение действительной мощности, полученной на валу паровой турбины, к мощности идеальной турбины. $\eta_{oe} = Ne / N = 860 / de(i_0 – i_1)$, где d_e – расход пара в кг/(кВт·ч). Для существующих паровых турбин удельный расход пара определяется экспериментально, а $i_0 – i_1$ находят по i-s диаграмме (смотрите Энтальпия, Энтропия). В активной паровой турбине свежий пар с давлением p_0 и скоростью c_0 поступает в сопло и расширяется в нём до давления p_1, при этом скорость пара возрастает до c_1, с которой поток пара и входит на рабочие лопатки. Поток пара, оказывая давление на лопатки вследствие изменения направления в криволинейных междулопаточных каналах, заставляет диск и вал вращаться. На выходе с лопаток поток пара имеет скорость c_2 меньшую, чем c_1, так как значительная часть кинетической энергии преобразовалась в механическую энергию вращения вала. Давление p_1 на входе в канал равно давлению p_2 на выходе из него, так как междулопаточные каналы имеют одинаковое сечение по длине и расширения пара в них не происходит (у реально существующих активных турбин сечения междулопаточных каналов выполняют несколько возрастающими по ходу пара для сохранения равенства давлений на входе и выходе, так как энтальпия пара при его протекании между лопатками увеличивается из-за трения и ударов о кромки лопаток). Однако в различных местах криволинейного канала давления неодинаковы:- именно разность давлений на вогнутую и выпуклую сторону каждой лопатки создаёт момент, заставляющий ротор вращаться. Таким образом, в активной турбине падение давления пара происходит в сопле (или нескольких соплах), а давление пара при входе на лопатки и выходе с них одинаково. Кинетическая энергия будет полностью использована, если абсолютная скорость пара c_2 при выходе с лопаток равна нулю. Это условие соблюдено, если $c_1 = 2u$, где u – окружная скорость. Окружная скорость (в метрах в секунду (м/сек)) равна:- $u = (\pi\cdot d\cdot n) / 60$, где d – средний диаметр лопаточного венца в метрах (м), а n – частота вращения в минуту (мин). Следовательно, оптимальная окружная скорость лопаток должна быть $u = c_1 / 2$. Очевидно, что в реальной турбине c_2 не может быть равна 0, так как пар должен уходить с лопаток в конденсатор. Однако выходную скорость стремятся получить минимальной, так как кинетическая энергия уходящего потока пара представляет собой потерю полезной работы. Отступление от оптимального отношения u/c_1 вызывает сильное снижение кпд турбины. Это делает невозможным создание одноступенчатых турбин с высокими начальными параметрами пара, так как ещё (начало 1970-х) не существует материалов, способных выдержать напряжения от центробежных сил при окружных скоростях, значительно превышающих 400 м/сек. Поэтому одноступенчатые активные турбины применяют только для привода быстроходных вспомогательных механизмов, экономичность которых не имеет решающего значения. Хорошая экономичность паровой турбины, работающей с умеренными окружными скоростями при

большом теплопадении, достигается применением ступеней давления. Если разделить располагаемый перепад давления на несколько ступеней с равными перепадами тепла, то в этих ступенях скорость истечения (в м/сек) равна:- $c_1 = 91.5\sqrt{((i0 - i1)/z)}$, где z – число ступеней. Следовательно, в каждой ступени скорость будет в $\sqrt{z}$ раз меньше, чем в одноступенчатой паровой турбине. Соответственно ниже будет и оптимальная окружная скорость u, то есть частота вращения ротора. Корпус паровой турбины с несколькими ступенями давления разделяют диафрагмами на отдельные камеры, в каждой из которых помещён один из дисков с рабочими лопатками. Пар может проникать из одной камеры в другую только через сопла, расположенные по окружности диафрагм. Давление пара снижается после каждой ступени, а скорости истечения пара c1 остаются примерно одинаковыми, что достигается выбором соответствующих размеров сопел. Число ступеней давления у мощных турбин с высокими начальными параметрами пара достигает 30–40. Поскольку объём пара по мере его расширения увеличивается, сечения сопел и высоты лопаток возрастают от первой ступени к последней. Последние ступени мощных паровых турбин обычно выполняют сдвоенными, а у самых больших паровых турбин – строенными и даже счетверёнными ввиду неприемлемо больших размеров лопаток последних ступеней, которые были бы необходимы для пропуска всего объёма пара через 1 ступень. В ступени давления возможно использовать кинетическую энергию не в одном, а в нескольких венцах лопаток, применив ступени скорости. Для этого на ободе диска размещают 2 (редко 3) венца рабочих лопаток, между которыми установлен венец неподвижных направляющих лопаток. Пар с давлением p_0 подводится к соплам и со скоростью c_1 поступает на первый ряд рабочих лопаток, где его скоростной напор частично превращается в работу, а направление потока изменяется. Выйдя со скоростью c_2 с первого ряда рабочих лопаток, пар проходит через направляющие лопатки и, снова изменив направление, входит во второй ряд лопаток со скоростью c_1', несколько меньшей, чем c_2, вследствие потерь в направляющих лопатках. Второй ряд лопаток пар покидает с незначительной скоростью c_2'. Теоретически при 2 ступенях скорости оптимальная окружная скорость u будет в 2 раза меньше, чем для одновенечной ступени, использующей тот же перепад энтальпии. Для z ступеней скорости оптимально $u / c_1 = 1 / 2z$. Однако много ступеней скорости практически не применяют из-за больших потерь в лопатках. Наиболее распространённым типом турбины можно считать активную паровую турбину с одним двухвенечным диском в первой ступени давления и одновенечными дисками в остальных ступенях. Значение двухвенечного диска в том, что, используя значительную часть располагаемого перепада энтальпии в первой ступени давления, он позволяет понизить температуру и давление в корпусе паровой турбины и одновременно уменьшить нужное число ступеней давления, то есть укоротить и удешевить паровую турбину. Характерной особенностью реактивных паровых турбин является то, что расширение пара происходит у них в каналах неподвижных и подвижных лопаточных венцов, то есть как в соплах, так и на рабочих лопатках. Отношение приходящейся на долю рабочих лопаток части располагаемого адиабатического перепада энтальпии h_2 к общему адиабатическому перепаду ступени $h_0 = h_1 + h_2$ (где h_1 – теплопадение в направляющих лопатках) называется степенью реактивности $\rho = h_2 / (h_1 + h_2)$. Если $\rho \geq 1/2$, то такую турбину принято называть реактивной. У чисто активной турбины должно бы быть r = 0, но практически активные турбины всегда работают с небольшой степенью реактивности, более высокой в последних ступенях. Это даёт некоторое повышение коэффициента полезного действия (кпд), особенно на режимах, отличных от расчётного. Венцы рабочих лопаток реактивной паровой турбины устанавливают в пазах ротора барабанного типа. В промежутках между ними размещают венцы неподвижных направляющих лопаток, закреплённых в корпусе турбины и образующих сопловые каналы. Профили подвижных и неподвижных лопаток обычно одинаковы. Свежий пар поступает в кольцевую камеру, откуда идёт в первый ряд неподвижных лопаток. В междулопаточных каналах этого ряда пар расширяется, давление его несколько понижается, а скорость возрастает от c_0 до c_1. Затем пар попадает в первый ряд рабочих лопаток. Между ними пар также расширяется и его относительная скорость возрастает. Однако абсолютная скорость c_2 на выходе с рабочих лопаток будет меньше c_1, так как за счёт уменьшения кинетической энергии получена механическая работа. В последующих ступенях процесс повторяется. Для уменьшения утечек пара через зазоры между лопатками, ротором и корпусом паровой турбины располагаемый перепад давлений делят на большое число (до 100) ступеней, благодаря чему разность давлений между смежными ступенями получается небольшой. В бывшем СССР не строили стационарных реактивных паровых турбин, но отдельные зарубежные фирмы традиционно продолжали выпускать паровые турбины с активной частью высокого давления и последующими реактивными ступенями. Конструкция Паровых Турбин:- по направлению движения потока пара различают Аксиальные Паровые Турбины, у которых поток пара движется вдоль оси турбины, и Радиальные Паровые Турбины, направление потока пара в которых перпендикулярно, а рабочие лопатки расположены параллельно оси вращения. В СССР строили только аксиальные паровые турбины. По числу корпусов (цилиндров) паровые турбины подразделяют на Однокорпусные и 2-, 3-, редко 4-корпусные. Многокорпусная конструкция позволяет использовать большие располагаемые перепады энтальпии, разместив большое число ступеней давления, применить высококачественные металлы в части высокого давления и раздвоение потока пара в части низкого давления; однако такая паровая турбина получается более дорогой, тяжёлой и сложной. По числу валов различают Одновальные Паровые Турбины, у которых валы всех корпусов находятся на одной оси, и 2-, редко 3-вальные, состоящие из 2 или 3 параллельно размещённых одновальных паровых турбин, связанных общностью теплового процесса, а у судовых паровых турбин – также общей зубчатой передачей (редуктором). Неподвижную часть паровой турбины – корпус – выполняют разъёмной в горизонтальной плоскости для возможности монтажа ротора. В корпусе имеются выточки для установки диафрагм, разъём которых совпадает с плоскостью разъёма корпуса. По периферии диафрагм размещены сопловые каналы, образованные криволинейными лопатками, залитыми в тело диафрагм или приваренными к нему. В местах прохода вала сквозь стенки корпуса установлены концевые уплотнения лабиринтового типа для предупреждения утечек пара наружу (со стороны высокого давления) и засасывания воздуха в корпус (со стороны низкого). Лабиринтовые уплотнения устанавливают в местах прохода ротора сквозь диафрагмы во избежание перетечек пара из ступени в ступень в обход сопел. На переднем конце вала устанавливают предельный регулятор (регулятор безопасности), автоматически останавливающий паровую турбину при увеличении частоты вращения на 10–12% сверх номинальной. Задний конец ротора снабжают валоповоротным устройством с электрическим приводом для медленного (4–6 об/мин) проворачивания ротора после останова паровой турбины, что необходимо для равномерного его остывания.

STEEL = СТАЛЬ – Steel is a very tough material when it is cold. However, if it is heated past a particular temperature (usually a red-heat) it immediately turns plastic and can be bent, formed, hammered, and squeezed very easily. For example, few of us would be able to bend a bar of 1" thick steel at room temperature no matter how hard we tried, but if the middle of the bar were heated until it glowed a healthy cherry red color (about 1650 degress Fahrenheit), most of us would have very little trouble bending the bar back upon itself until both ends touched. And when it cooled it would regain it's toughness and strength in that bent condition. This means that the intricate profiles apparent in, say, a Beam or Channel are formed fairly easily in the hot condition, but would be impossible to produce in the cold condition, and only flat, hex or round shapes that are relatively simple profiles are available in Cold Finished Steels. / Под Сталью, от Польского слова Stal, от Немецкого слова Шталь (Stahl), понимается деформируемый (ковкий) сплав железа Fe (основа) и углерода C (до 20%) и другими элементами. Получают главным образом из смеси чугуна со стальным ломом в кислородных конвертерах, мартеновских печах и электропечах. По химическому составу различают сталь углеродистую и легированную, по назначению – конструкционные, инструментальные, стали с особыми физическими и химическими

свойствами (жаропрочная, нержавеющая, электротехническая и другие), по характеру застывания металла и изложнице – спокойную, полуспокойную и кипящую. Мировое производство стали в 1984 составляло около 700 миллионов тонн; в бывшем СССР 154 миллиона тонн.

STEEL ALLOY = СТАЛЬНОЙ СПЛАВ – A Steel Alloy is an alloy that is primarily iron, with small quantities of other elements mixed in during the melting process which vary the properties of the iron to maximize a particular characteristic of the final alloy. Some make the iron not rust (chromium and nickel), some make the iron possible to harden with heat treatment (carbon), Some make the iron easy to machine (lead), and so on. By varying the type and amount of the alloying element, even in minute quantities, a huge range of steels is produced, used for a myriad of industrial purposes. There are lots of steel alloys, and they are very important to the eventual success of the project, but are more an issue for the engineers and fabricators than the architect. They will be far more aware of which physical characteristics of each of the alloys will dictate the appropriate alloy for the job, and their choice of alloy will not affect the final aesthetic or finish since the Hot Rolled Steel alloys all have similar finish characteristics. What it all means is, that for aesthetic purposes all the alloys are interchangeable. / легирование или легирующее (alloying).

STEEL BLUE = СИНЕВАТО–СТАЛЬНОЕ (или СТАЛЬНОЕ СИНЕЕ) – Steel Blue:- a grayish blue. / серовато-голубое.

STEEL CORD = СТАЛЬНОЙ КОРД – Steel Cord is a formed structure composed of two or more steel filaments when used as an end product or combination of strands or filaments and strands.

STEEL FILAMENT = СТАЛЬНАЯ (ЭЛЕМЕНТАРНАЯ) НИТЬ – Steel Filament is a steel fiber used as an individual element in a strand or cord. See also Filament.

STEER = ВОЛ – Steers are the castrated male Cattle (including dairy breeds) intended for slaughter. See also Cattle. / Смотрите также Крупный Рогатый Скот (Cattle).

STEERAGE WAY = САМЫЙ МАЛЫЙ ХОД – Steerage Way (maritime term):- the slowest speed at which a vessel steers. / Наименьшая скорость хода, при которой судно слушается руля (сохраняет управляемость).

STEER/CORN RATIO = СООТНОШЕНИЕ ВОЛ/КУКУРУЗА – Steer-Corn Ratio is the relationship of cattle prices to feeding costs. It is measured by dividing the price of cattle (hundredweight) by the price of Corn (bushel). When Corn prices are high relative to cattle prices, fewer units of Corn equal the Dollar value of 100 pounds of cattle. Conversely, when Corn prices are low in relation to cattle prices, more units of Corn are required to equal the value of 100 pounds of beef. See also Corn-Hog Ratio, Feed Ratio, and Hog-Corn Ratio. Steer-Corn Ratio is the number of bushels of Corn that are equal (in value) to one hundred pounds of cattle; that is, the price of cattle per hundredweight divided by the price of Corn per bushel. A favorable (high) ratio is usually followed by an increase in cattle production; an unfavorable (low) ratio, by a decrease. / Вол – кастрированный бычок.

STEERING WHEEL = ШТУРВАЛ (или ШТУРВАЛЬНОЕ КОЛЕСО) – Steering Wheel (maritime term):- the wheel operating the steering gear and by which the vessel is steered.

STEGANOGRAPHY = СТЕГАНОГРАФИЯ – Steganography:- the concealment of information inside other data. For example, encoded into audio or visual files where they can neither be seen nor heard because they do not significantly change the sound or image, or as metadata in documents that are not typically visible to the user. / Под Стеганографией, от Греческих слов , означающее Скрытое, и Grapho, означающее Пишу или Рисую или Черчу, понимается наука о скрытой передаче информации путём сохранения в тайне самого факта передачи. Этот термин ввёл в 1499 Немец Иоганн Тритемий (Iohannes Trithemius; 1462–1516) в своём трактате ‘Стеганография’ (Steganographia), зашифрованном под магическую книгу. В отличие от криптографии, которая скрывает содержимое секретного сообщения, стеганография скрывает сам факт его существования. Как правило, сообщение будет выглядеть как что-либо иное, например, как изображение, статья, список покупок, письмо или судоку. Стеганографию обычно используют совместно с методами криптографии, таким образом, дополняя её. Преимущество стеганографии над чистой криптографией состоит в том, что сообщения не привлекают к себе внимания. Сообщения, факт шифрования которых не скрыт, вызывают подозрение и могут быть сами по себе уличающими в тех странах, в которых запрещена криптография. Таким образом, криптография защищает содержание сообщения, а стеганография защищает сам факт наличия каких-либо скрытых посланий.

STELLATE = ЗВЕЗДЧАТОЕ (или ЗВЕЗДООБРАЗНОЕ) – Stellate:- star-shaped.

STEM = СТЕБЕЛЬ – Stem is the main support structure of the aboveground part of a plant from which leaves, tillers or branches, flowers, and fruits develop. Stem is the main axis of a plant which may carry other parts. / Стебель является основной поддерживающей структурой надземного органа растения, из которого развиваются, листья, ростки или ветви, цветки и плоды. основная ось. Стебель Хлопчатника это ось всего растения. Под Стеблем понимается вегетативный орган высших растений, представляющий ось побега и несущий на себе листья, почки и цветки. Стебли бывают надземные и подземные, травянистые и деревянистые, вьющиеся, лазящие, лежачие и прямостоячие. Длина стебля, в зависимости от отдела растения, может составлять 1–1.5 миллиметра (Пресноводная Вольфия) до 300 метров (тропические Пальмы Ротанги), диаметром от долей миллиметра (мхи) до 11 метров (Баобаб, Секвойя). Стебель (Caulis), осевой орган высших растений, вместе с листьями составляющий побег, служит для передвижения воды и веществ между корнями и листьями, для увеличения ассимилирующей поверхности растения путём ветвления и упорядоченного расположения листьев, а также цветков и плодов; может участвовать в накоплении воды и запасных питательных веществ, в фотосинтезе. Участки стебля, от которых отходят боковые органы (ветви, листья и другие), называются Узлами, участки между узлами – Междоузлиями. Стебли бывают травянистыми и деревянистыми. Главный стебель древесных растений называется Стволом. Форма стеблей разнообразна:- цилиндрическая (наиболее распространена), трёхгранная (Осоки), четырёхгранная (Губоцветные), многогранная, уплощённая (Кактусы) и другие. По положению в пространстве различают стебли прямостоячие, наклонные, изогнутые, дуговидные, поникающие, лежачие, ползучие, укореняющиеся в узлах, восходящие, коленчато-восходящие, изломанные, извилистые, вьющиеся, цепляющиеся, лазающие, всползающие, вплетающиеся, свисающие, плавающие, всплывающие, погружённые в толщу воды; надземные и подземные. Длина стеблей от 1–1.5 миллиметров (мм) (пресноводная Вольфия) до 200–300 метров (м) (тропические Пальмы-Ротанги), диаметр от долей мм (Мхи) до 10–11 м (Баобаб, Секвойя). Стебель растёт в длину за счёт деятельности верхушечной меристемы побега, составляющей конус нарастания. Кроме верхушечного роста, у некоторых Растений в основании междоузлий происходит ещё интеркалярный (вставочный) рост (например, у Злаков). В стеблях выделяют анатомо-топографические зоны:- наружную – Эпидермис, внутреннюю – Центральный Цилиндр, или Стелу, и расположенную между ними зону первичной коры, внутренний паренхимный слой которой превращён в Эндодерму. Последняя граничит с периферической зоной стелы (представленной паренхимной или механической тканями) – Перициклом (у некоторых Растений его нет). Большая часть стелы состоит из проводящих тканей, флоэма находится снаружи от ксилемы. У лиственных Мхов в центре стебля расположен ‘проводящий пучок’, элементы

которого лишь внешне сходны с проводящими элементами флоэмы и ксилемы. У сосудистых растений формированию проводящих тканей предшествует развитие Прокамбия. У Плаунов ксилема разделена на лентовидные тяжи, окружённые флоэмой, сердцевины нет. У Хвощей закрытые коллатеральные пучки с так называемой каринальной полостью вместо ксилемы располагаются вокруг центральной воздушной полости. У Папоротников проводящие ткани кольцом окружают сердцевину. В стеблях семенных растений встречаются пучковый и сплошной типы строения проводящей системы, пересечённой радиально расходящимися паренхимными сердцевинными лучами. Наружная часть прокамбия дифференцируется в первичную флоэму, на периферии которой нередко развиваются механические волокна, внутренняя – в первичную ксилему. Между проводящими тканями остаётся слой клеток, образующих камбий, который откладывает наружу элементы вторичной флоэмы – Луба, внутрь – вторичной ксилемы – Древесины, обусловливая утолщение стелы. Строение стеблей в зоне узлов отличается от строения средней части междоузлия наличием листовых и веточных лакун (прорывов). У Двудольных часты трёхлакунные узлы (Яблоня), реже встречаются однолакунные (Сирень) и многолакунные (Бузина). Наиболее активное вторичное утолщение свойственно многолетним древесным растениям, во вторичной древесине которых (а иногда и в лубе) можно видеть границы годичных приростов. С возрастом вследствие развития перидерм первичная кора, а позднее и наружная часть луба отмирают, образуя Корку. Для большинства однодольных характерен пальмовый тип прохождения закрытых коллатеральных пучков, обусловливающих их диффузное расположение на поперечных срезах. Лишь у некоторых злаков со стеблем-соломиной, у Традесканции и Диоскореи имеется тенденция к круговому расположению пучков. Вторичное утолщение свойственно только древовидным Лилейным (Элоэ, Драцена), у которых в перицикле или первичной коре формируется меристема, образующая концентрические пучки и межпучковую (часто одревесневающую) паренхиму. Смотрите также Стелярная Теория.

STEM = НОС (или ФОРШТЕВЕНЬ) – Stem is the vertical part of a vessel's bow between the waterline and the main deck where the sides of the vessel come together. Most stems are angled forward to increase buoyancy as the vessel dips through the waves, but some older vessels (e.g., TITANIC) were designed with a plumb (i.e. straight up and down) bow. The bow or foremost part of a vessel. Stem (maritime term):- the timber at the extreme forward part of a boat secured to the forward end of the keel. / Нос или передняя часть судна. Нос судна или носовая часть судна, передняя оконечность судна. Обычно к носу судна относят судовые конструкции, примыкающие к форштевню; иногда этот термин относят лишь к очертаниям носовой оконечности. Форма носа зависит от назначения судна, его размеров; форма носовых обводов (смотрите Обводы Судна) влияет на такие эксплуатационные характеристики судна, как сопротивление воды движению, всхожесть на волну, ледопроходимость. Типичные формы носовой оконечности морских судов:- обыкновенный нос судна с прямым наклонным форштевнем; нос судна ледового плавания (полуледокольная форма); нос ледокола; клиперский нос с 'бульбом' быстроходного пассажирского судна; бульбообразный нос крупного танкера; ложкообразный нос рыбопромыслового судна. Под Форштевнем, от Голландского слова Voorsteven, от Voor, означающее Впереди, и Steven, означающее Стояк или Штевень, понимается деталь набора корпуса судна в виде бруса по контуру носового заострения, на котором замыкается наружная обшивка корпуса. В нижней части форштевень соединяется с килем. Форштевень, прочный брус по контуру носового заострения, на котором замыкается наружная обшивка набора корпуса судна. В нижней части форштевень соединяется с килем. На стальных судах форштевень кованый, литой или сварной; на деревянных судах форштевень, обычно составленный из нескольких частей, оковывается стальной полосой.

STEM BORER = СТЕБЛЕВОЙ ТОЧИЛЬЩИК – Stem Borer is an Insect belonging to the Order Lepidoptera that infects stems of Rice. The adults of most Stem Borer Species are nocturnal and are attracted to light, especially ultraviolet light. Deadhearts and whiteheads are two visible symptoms caused by Stem Borer larva infestation. / мёртвые сердцевины и белые метёлки являются двумя видимыми симптомами, . Под Точильщиками понимается Семейство Жуков. Длиной 2–8 миллиметра. Около 1 500 Видов. Распространены широко. В бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось свыше 100 Видов. Обитают главным образом в мёртвой сухой древесине. Домовый Точильщик повреждает деревянные постройки, мебель; Хлебный Точильщик – муку, хлебные изделия, книги.

STEM DISSECTION = ДИССЕКЦИЯ СТЕБЛЯ (или РАССЕЧЕНИЕ СТЕБЛЯ) – Stem Dissection is the cutting open the stem to study its structures or evaluate internal damage. / или вычислить внутреннее повреждение.

STEM ELONGATION = ВЫХОД В ТРУБКУ (или УДЛИНЕНИЕ СТЕБЛЯ) – Stem Elongation is:- (1) increase in length of the upper stem internodes which begins before panicle initiation. This process is associated with exsertion of the panicles from the sheath to allow flowering and pollination. (2) Increase in length of internodes of deepwater Rice in response to flooding.

STEM LUMEN = СТЕБЛЕВАЯ ПОЛОСТЬ – Stem Lumen is the hollow, tubular section of the plant internode, also called the Internodal Lacuna, and Pith or Medullary Cavity.

STEM ROT = СТЕБЛЕВАЯ ГНИЛЬ – Stem Rot is a fungal disease caused by Magnaporthe Salvinii (Nakataea Sigmoidea) and Helminthosporium Sigmoideum var Irregulare. The disease starts with a small, blackish, irregular lesion on the outer leaf sheath near the water line. The lesion enlarges as the disease progresses, with the Fungus penetrating into the inner leaf sheath. Finally, the leaf sheath is partially or entirely rotted.

STEM THE TIDE = ИДТИ ПРОТИВ ПРИЛИВНОГО ТЕЧЕНИЯ – Stem The Tide (maritime term):- stemming the tide or sea means to head the vessel's bow directly into the current or waves. Overcome adverse circumstances.

STENANT = SHARE TENANT

STENCIL PRINTING = ПЕЧАТАНИЕ ПО ТРАФАРЕТУ – Stencil Printing is a type of resist printing where portions of the design are covered with metal or wood so the covered parts do not take the dye. See also Printing, and Resist Printing.

STENCILS = ТРАФАРЕТНЫЕ НАДПИСИ (или ТРАФАРЕТЫ, или ШАБЛОНЫ) – Stencils are markings placed on the product with the ID information required by the customer for the product that they are receiving. This can be in different forms dependent on the specifics for the customer. It can be a label or just a chalk inscription with the product ID.

STENTER = ШИРИЛЬНАЯ МАШИНА (или ШПАНРАМА) – Stenters or Stenter Machines are widely used for stretching, drying, heat-setting and finishing of Fabrics. The stenter frame is usually 80–100 feet long and 70–100 inches wide. The speed ranges from 10–45 m/min with a maximum setting time in the setting zone 30 sec at temperature ranging from 175 to 250~ depending upon the thickness and type of the material. See also Tenter Frame.

STENTER DAMAGE = ПОВРЕЖДЕНИЕ ШИРИЛЬНОЙ МАШИНОЙ – Stenter Damage:- damage due to pin or fabric entanglement from delivery side of machine. Finishing defect. / клупп ширильной машины. Порок или дефект заключительной отделки.

STEP1 = XX1 – STEP1:- This is efectively the same as EURO1, but members are not able to settle directly. Members of STEP1 have to use a EURO1 member to settle their end-of-day obligations. The membership comprises banks that do not comply with the strict EURO1 admission criteria. On a daily basis, STEP1 processes approximately 20 000 transactions for a total value of more than 1 billion Euros.

STEP2 = XX2 – STEP2:- This is a pan-European ACH service, run by the EBA Clearing. It is restricted to intra-EU/EEA EURO transactions (i.e. SEPA Credit Transfer – SCT and SEPA Direct Debit – SDD).

STEP–DOWN TRANSFORMER = ПОНИЖАЮЩИЙ ТРАНСФОРМАТОР – Step-Down Transformer:- in reference to electricity, an electrical device or equipment that converts voltage and current from one level to another, where the output at the customer side of the transformer has a lower voltage that the input at the grid side of the transformer. / По отношению к электричеству, электрическое устройство или оборудование, которое переводит напряжение и силу тока из одного уровня в другой, и в котором на выходе потребителю достаётся более низкое напряжение, чем на входе трансформатора со стороны энергосистемы.

STEP–IN = ЖЕНСКИЙ ГАРНИТУР (или XX) – Step-In:- a garment put on by being stepped into, as a shoe or short panties for women (usually used in plural). / типа узкой юбочки для пристёжки чулков. Без Задников (у обуви), Без Застёжки (у одежды). Step-In = женская туфля типа глубокой лодочки с отрезной союзкой и настроченным широким ремнём в области подъёма.

STEP–POINT METHOD = ГНЕЗДОВОЙ (или ШАГОВЫЙ, или ПОШАГОВЫЙ) МЕТОД – Step-Point Method is a method for randomly selecting plants within a field. While walking at an angle across the field select the plant nearest the right foot at the completion of a pre-selected number (e.g., 30) of steps. Continue across the field until the required number of plants has been assessed/sampled.

STERE = СТЕР – Stere:- timber measurements are the most complicated and laborious of all the various measurements in use for shipping purposes. The unit of measurement in use in the United Kingdom (UK), North European countries, etc is ‘a standard’ of which there are many varieties, bearing no relation one to the other. In North America the unit of measurement is the 1 000 board feet; in France, Italy, Belgium, etc, the unit is the ‘Stere’, equivalent to the cubic metre of the metric system, while ‘Petrograd standard’ is almost exclusively used in the UK. Stere (st) is a metric unit of volume, equal to one cubic meter or one kiloliter (about 35.314 7 cubic feet or 1.307 95 cubic yards). Although it dates from the origin of the metric system in 1798, the stere has never been used as much as the liter. In Europe it is used primarily as a measure for firewood; for this purpose, the stere equals about 0.279 5 cord or 2.207 cord feet. The name comes from the Greek Stereos, Solid. See also Board Foot. / Смотрите также Досочный Фут или Фут Доски или Бордфут (Board Foot).

STERILE = СТЕРИЛЬНОЕ (или БЕСПЛОДНОЕ) – Sterile:- incapable of engaging in the process of sexual reproduction. Sterile:- failing to produce or incapable of producing offspring. / Под Стерильным, от Латинского слова Sterilis, означающее Бесплодный, понимается организм, лишённый способности к воспроизводству потомства.

STERILE GLUMES = СТЕРИЛЬНЫЕ (или НАРУЖНЫЕ) КОЛОСКОВЫЕ ЧЕШУИ – Sterile Glumes are glumes at the base of the spikelet of the Rice plant which do not produce a flower.

STERILE INSECT = СТЕРИЛЬНОЕ НАСЕКОМОЕ (или БЕСПЛОДНОЕ НАСЕКОМОЕ) – Sterile Insect is an insect that, as a result of a specific treatment, is unable to reproduce.

STERILE INSECT TECHNIQUE = ТЕХНИКА СТЕРИЛИЗАЦИИ НАСЕКОМОГО – Sterile Insect Technique is a method of Pest control using area-wide inundative release of sterile Insects to reduce reproduction in a field population of the same Species.

STERILE LEMMAS = СТЕРИЛЬНЫЕ (НИЖНИЕ) ЦВЕТКОВЫЕ ЧЕШУИ (или ТРЕТЬИ ЦВЕТКОВЫЕ ЧЕШУИ) – Sterile Lemmas are the two flowerless bracts at the base of the spikelet. Sterile Lemmas (syn. Glumes, Empty Glumes, Outer Glumes, Lower and Upper Glumes, Non-Flowering Glumes, First and Second Glumes, Sterile Glumes, Lower and Upper Empty Lemmas) are the two flowerless bracts at the base of the spikelet. The two sterile lemmas may differ in length and shape.

STERILIZATION RESCRIPTION = РЕСКРИПЦИЯ ДЛЯ СТЕРИЛИЗАЦИИ (или СТЕРИЛИЗУЮЩАЯ РЕСКРИПЦИЯ) – Sterilization Rescription:- short- to medium-term money market paper issued by the state or the central bank in order to mop up excess liquidity. / От кратко- до среднесрочной бумаги денежного рынка, выпущенная штатовским или центральным банком с тем, чтобы испарить (выветрить) излишнюю ликвидность.

STERLING = СТЁЛИНЬ (или СТЕРЛИНГ) – Slang for British Pound. Also known as Cable. Pound Sterling is the basic monetary unit of Great Britain, divided (since 1971) decimally into 100 new pence. The term is derived from the fact that, about 775, silver coins known as ‘Sterlings’ were issued in the Saxon kingdoms, 240 of them being minted from a pound of silver, the weight of which was probably about equal to the later Troy pound. Hence large payments came to be reckoned in ‘Pounds of Sterlings’, a phrase later shortened to ‘Pounds Sterling’. After the Norman Conquest the Pound was divided for accounting purposes into 20 shillings and into 240 pennies, or pence. In medieval Latin documents the words libra, solidus, and denarius were used to denote the pound, shilling, and penny, which gave rise to the use of the symbols £, s., and d. On 1971-February-15, the Pound Sterling was officially decimalized into 100 new pence. The symbol £ was retained for the Pound Sterling; the letter p. was chosen for the new penny. / Паунд Стёлинь или Фунт Стерлингов или просто Стерлинг – жаргонный термин для обозначения Британского Фунта. Известен также как Кабель (Cable). Денежная единица Великобритании, равная 100 пенсам. До 15 Февраля 1971 один Фунт Стерлингов (£) был равен 20 шиллингам (shillings (s.)) и 240 пенсам (pennies, или pence (d.)). Фунт Стерлингов (на Английском Pound, или Pound Sterling), денежная единица Великобритании, делится на 100 пенсов (до 15 Февраля 1971 1 Фунт Стерлингов = 20 шиллингам = 240 пенсам). С XI века чеканились монеты из серебра и с середины XIV века также из золота. Выпуск банкнот в Фунтах Стерлингов начат Английским Банком (Bank of England; центральный эмиссионный банк Великобритании) с 1694. В 1816 в стране был введён Золотомонетный Стандарт (существовал до Августа 1914):- официальное золотое содержание Фунта Стерлингов установлено в 7.322 382 граммов (г) чистого золота. С Апреля 1925 по Сентябрь 1931 действовал Золотослитковый Стандарт. После отмены золотого стандарта и прекращения размена банкнот на золото Фунт Стерлингов обесценился:- его паритет к Доллару США снизился с 4.866 53 Долларов до 3.5 Долларов в 1932. В дальнейшем Фунт Стерлингов неоднократно девальвировался. В Ноябре 1967 его курс к Доллару США составлял 2.4 Доллара (официальное золотое содержание равнялось 2.132 81 г). С Июня 1972 валютный паритет Фунта Стерлингов и относительно узкие рамки колебаний его курса официально не поддерживаются (введён ‘плавающий курс’). В Июне 1977 курс Фунта Стерлингов к Доллару США составлял 1.72 Доллара. По курсу Госбанка СССР (Июнь 1977) 1 Фунт Стерлингов = 1 Рубль 28 Копеек.

STERN = КОРМА – Stern is the rear or aft part of a vessel, opposite the bow. The upright post or bar of the bow of a vessel. The end or aftermost part of a vessel. The opposite of Bow. Stern (maritime term):- the after part of the vessel (back of). / Оконечность или задняя часть судна. В противовес Носу (Bow). Корма, задняя оконечность судна. Форма подводной части кормы влияет на

сопротивление воды движению судна, его управляемость и на условия работы судового движителя, а очертания её надводной части определяют удобство расположения судовых устройств (рулевого, швартовного, буксирного и других) и судовых помещений. Для современных морских транспортных судов наиболее характерна крейсерская корма; разновидность крейсерской кормы – ледокольная корма. Обыкновенная корма с подзором чаще встречается у морских и речных судов старой постройки, транцевая – у трейлерных судов, контейнеровозов, траулеров и других. Подводную часть кормы современных морских судов обычно делают с незамкнутым ахтерштевнем (открытая корма).

STERN ANCHOR = КОРМОВОЙ ЯКОРЬ (или ВСПОМОГАТЕЛЬНЫЙ ЯКОРЬ, или СТОП–АНКЕР) – Stern Anchor (maritime term):- an anchor carried at the stern.

STERN BOARD = ЗАДНИЙ ХОД (или ИНЕРЦИЯ ЗАДНЕГО ХОДА) – Stern Board (maritime term):- progress backwards.

STERN THRUSTER = КОРМОВОЕ ПОДРУЛИВАЮЩЕЕ УСТРОЙСТВО – Stern Thruster is a propeller or water jet system set in the stern of the ship and positioned to give a sideways thrust to assist maneuvering in a confined space. / Подруливающее Устройство – средство активного управления судном при малых скоростях хода и без хода. В качестве подруливающего устройства используются крыльчатые движители, поворотные винтовые колонки, а также гребные винты или насосы, устанавливаемые в поперечных гидроканалах, проходящих через корпус судна, как правило, в носу, способные создавать тягу в двух противоположных направлениях, перпендикулярных диаметральной плоскости судна.

STERNWAY = ЗАДНИЙ ХОД – Sternway:- the reverse movement of a vessel. / Движение судна задним ходом.

STETSON® = СТЭТСЭН® – Stetson® is a trademark used for a broad-brimmed high-crowned felt hat. One of America's first hat makers, the John B. Stetson Co. The company's namesake, John B. Stetson, was born in 1830 into a family of New Jersey hat makers. As a young man, Stetson was diagnosed with tuberculosis and was told he could heal his lungs by going out West to breathe the industry-free fresh air. He first traveled to St. Joseph, MO (State of Missouri), and then set out by foot to Pikes Peak, CO (State of Colorado), a gold-mining hub where he thought he might be able to find fortune. While Stetson never discovered gold in the Rockies, he found a group of cowboys who needed a way to keep the sun from burning their eyes and skin. Stetson made for them the first wide-brimmed, felt 10-gallon hat, and they came back for more. It was then that Stetson came up with a business plan. At age 35, Stetson left Colorado and went to Philadelphia to set up a factory, where he produced not only Western styles, but also dress and straw hats. By the early XX century, the company became the world's largest hat maker, producing 2 million fedoras, Panamas and cavalry hats. After Stetson's death in 1906, family members ran the company, taking it to its peak in the 1920s, '30s and '40s, when men and women topped their heads with brimmed felts. The hats sold even during the Great Depression but fell out of fashion in the 1950s and 1960s. After closing their hat-making plant, the family sold the Stetson trademark in 1970 to a Brooklyn jewelery shop owner named Ira Guilden. When Guilden was a young traveling salesman in his late teens, he headed out to Oregon, and his train was held up by a pack horsemen. The image of the rugged cowboys in their hats stuck in Guilden's mind throughout the years. Stetson was a romantic brand to Guilden. He bought the name, knowing he wanted to bring the hats back into fashion, and so he set up a licensing agreement with a southern manufacturer and slowly rebuilt the company. When the movie Urban Cowboy was released in 1980, followed by Indiana Jones, with a hat-topped Harrison Ford, in 1981, Stetson thrived. After that, Guilden worked with fragrance company Coty to start a cologne line, and in 1982, the first year of production, Coty pulled in USD12 million in sales of the woodsy Stetson scent. Just when Stetson was growing, Guilden died at age 86 in 1983. He left the company to his two sons, Richard and Paul. Richard led the company until his death in 2006. Since then, Paul has taken over and has full ownership of the company. At age 78, he's seen the death of his family members, but he refuses to see the death of his company. He intends on passing it down to his 27-year-old daughter, but before he does that, he wants to rebuild it. The biggest mistake was not being proactive about reviving Stetson sooner, he says, but even in the downturn he believes he can do it. 'My father had one vision, my brother had his own and now I've got mine', he said. 'Pam knows it means too much to my family history and to American history to let Stetson disappear'. Fields, who worked as a consultant specializing in brand revamps before she joined Stetson full time, is pushing Stetson as 'Made of America', something that it plays up on in-store ads, logos and hanging tags. This consistency is new for licensees. That theme might help move Stetson among members of the US military this year. Stetson products are or will be offered in stores on most bases across America. A military-themed calendar is in the works for 2010, featuring soldiers who win yet another Stetson contest. Later this year, the company plans to post a call for video submissions to their site on military blogs and publications. The best heroic tales will win a spot on the calendar and a Stetson wardrobe. / Дьжон Би. Стэтсэн Ко. (John B. Stetson Co.). Индиэна Дьжонз (Indiana Jones), Хэрисан Фод (Harrison Ford), Стэтсэн® (Stetson®).

STEVEDORE = СТИВИДОР (или ГРУЗЧИК) – Stevedor is the person having charge of the loading and unloading of vessel. The act of loading and/or unloading a vessel. A firm or company which specializes in the loading and/or unloading of vessels. Stevedore (maritime term):- a professional cargo loader and unloader. Stevedore is a terminal operator who is designated to facilitate the operation of loading and discharging vessels and various terminal activities. Also known as Longshoreman. Individual or firm that employs longshoremen and who contracts to load or unload the ship. Terminal operator entrusted with the operation of loading and discharging vessels and various terminal activities. Individual or company employed to load and unload a vessel or a ship's cargo. Stevedores are the dockers specialized in the proper and adequate storing (called Stowage) of cargo in vessels' holds; also in containers. / Лицо или компания, нанятая для погрузки и разгрузки судна или корабельного груза.

STEVEDORE PALLET = ПОДДОН ГРУЗЧИКОВ – Stevedore Pallet is a pallet designed for use on seaport shipping docks, normally of heavy-duty, double-wing construction.

STEWARD ASSISTANT = СТЮАРД ПОМОЩНИК – Steward Assistant (steward department):- clean galley and mess halls, set tables, prepare salads, clean living quarters.

STEWART = СТЮАРТСКИЙ – Stewart:- the tartan of the royal family of Great Britain. Stewart tartan has narrow stripes of yellow, blue, and white widely spaced on a red or white ground. / Стюартский тартан.

STICKER = ЗАЛИПАЮЩЕЕ (или ЗАСТРЕВАЮЩЕЕ, или ВЫСТУП) – Sticker is:- (1) a distortion in the weave characterized by tight and slack places in the same warp yarns. The principal causes are rolled ends on the beam, warp ends restricted by broken filament slubs, and knots catching at lease rods, drop wires, heddles, or reeds. See also Draw-Back. (2) See also Hard Size. Sticker:- a distortion in a weave characterized by tight and slack places in the same warp yarn or fabric. Weaving defect. / Порок или дефект ткачества.

STICKINESS = КЛЕЙКОСТЬ – In Cotton industry, a Stickiness occurs when excessive sugars present on fibers are transferred to equipment and interfere with processing. Sugars may be insect- or plant-derived. Though sugars are ubiquitous in lint, they usually occur at levels that pose no processing difficulties. This details the sources and components of problem sugars on harvested lint, the processing impacts of stickiness, and strategies for avoiding or mitigating stickiness. Cottons contaminated with stickiness cause

multiple problems in the spinning mills. The honeydew present on the cotton lint is able to contaminate all the mechanical instruments used in the transformation process from fiber to yarn, i.e. opening, carding, drawing, roving and spinning operations. These contaminants are mainly sugar deposits produced either by the Cotton plant itself (physiological sugars) or by the feeding Insects (entomological sugars), the latter being the most common source of contamination. Honeydew, when present in sufficient quantity, is the main source of sugars that can result in sticky lint. Honeydew is excreted by certain phloem-feeding insects including such common Pests of Cotton as Aphids and Whiteflies. These Insects are capable of transforming ingested sucrose into over twenty different sugars in their excreted honeydew. The major sugars in Cotton Insect honeydew are trehalulose, melezitose, sucrose, fructose and glucose. Another source of stickiness is free plant sugars sometimes found in immature fibers. Cotton fiber is largely cellulose that is formed from sugars synthesized by the plant. Dry, mature cotton fibers contain little free sugar, while immature cotton fibers contain glucose, fructose, sucrose, and other sugars. If immature cotton fiber is subjected to a freeze, complex sugars may be broken down to release additional simple sugars. Less commonly, oils released by crushed seed coat fragments can also result in stickiness. In this case, raffinose is the characteristic sugar. Sugars differ in their stickiness. For example, sucrose, melezitose, and trehalulose are all significantly stickier when deposited on fiber than are glucose or fructose. Further, trehalulose-contaminated fiber is stickier than fiber with an equivalent amount of melezitose. Mixtures of sugars, such as occur in honeydew, tend to be stickier than single sugars. Localized concentration of sugars like honeydew is at higher risk of causing stickiness than more evenly distributed sources like plant sugars. Sticky Cotton can reduce cotton gin output (in bales/hr) by up to 25%. At the textile mill, excessive wear and increased maintenance of machinery may occur even with slightly sticky cotton. In severe instances mill shutdown with a thorough cleanup is required. The adhesive property of a substance; the principle of glue. Some Cottons from various origins induce a stickiness phenomenon during spinning and thus lead to considerable production losses or quality problems. The problem is very complex because the stickiness of Cottons from different geographical origins may be due to a set of factors, whose effects are detailed in the specialized literature:- (i) various contaminants such as crush kernel, insecticide, oil, wax, etc; (ii) physiological sugars; and (iii) entomogical sugars. Stickiness is primarily due to insect excretions, known as Honeydew, and mainly produced by Aphids, Aphis Gossypii (Glover), and Whiteflies, Bemisia Tabaci (Gennadius). These are composed of sugars, which give the cotton its sticky potential. When no control system is in place to determine its stickiness level, a production may be labeled in its entirety as ‘Sticky Cotton’ and, as a consequence, is subjected to systematic downgrading. However, preliminary studies have shown that even in countries that suffer particularly from stickiness, a significant proportion of the harvest is not contaminated. It is therefore essential that the stickiness of the Cotton produced is monitored and evaluated. If the Cotton is too sticky, the deposits on the machine parts should be cleaned atleast once in a week, before it obstruct the movement of the fiber. Cotton Stickiness occurs when excessive sugars present on fibers are transferred to equipment and interfere with processing. Sugars may be insect- or plant-derived. Though sugars are ubiquitous in lint, they usually occur at levels that pose no processing difficulties. This details the sources and components of problem sugars on harvested lint, the processing impacts of stickiness, and strategies for avoiding or mitigating stickiness. Cottons contaminated with stickiness cause multiple problems in the spinning mills. The honeydew present on the Cotton lint is able to contaminate all the mechanical instruments used in the transformation process from fiber to yarn, i.e. opening,carding, drawing, roving and spinning operations. These contaminants are mainly sugar deposits produced either by the Cotton plant itself (physiological sugars) or by the feeding insects (entomological sugars), the latter being the most common source of contamination. Honeydew, when present in sufficient quantity, is the main source of sugars that can result in sticky lint. Honeydew is excreted by certain phloem-feeding insects including such common pests of cotton as aphids and whiteflies. These insects are capable of transforming ingested sucrose into over twenty different sugars in their excreted honeydew. The major sugars in Cotton insect honeydew are trehalulose, melezitose, sucrose, fructose and glucose. Another source of stickiness is free plant sugars sometimes found in immature fibers. Cotton fiber is largely cellulose that is formed from sugars synthesized by the plant. Dry, mature Cotton fibers contain little free sugar, while immature cotton fibers contain glucose, fructose, sucrose, and other sugars. If immature Cotton fiber is subjected to a freeze, complex sugars may be broken down to release additional simple sugars. Less commonly, oils released by crushed seed coat fragments can also result in stickiness. In this case, raffinose is the characteristic sugar. Sugars differ in their stickiness. For example, sucrose, melezitose, and trehalulose are all significantly stickier when deposited on fiber than are glucose or fructose. Further, trehalulose-contaminated fiber is stickier than fiber with an equivalent amount of melezitose. Mixtures of sugars, such as occur in honeydew, tend to be stickier than single sugars. Localized concentration of sugars like honeydew is at higher risk of causing stickiness than more evenly distributed sources like plant sugars. Sticky Cotton can reduce Cotton gin output (in bales/hr) by up to 25%. At the textile mill, excessive wear and increased maintenance of machinery may occur even with slightly sticky Cotton. In severe instances mill shutdown with a thorough cleanup is required. Stickiness is defined as the presence of honeydew deposits on Cotton fibers. A Cotton bale is declared ‘sticky’ if during spinning or any one phase of its preparatory process, its stickiness level disturbs processing, leading to a lower performance of spinning machines and/or reduced quality of the final products. Also known as Stickness. Stickiness originates from various sources:- vegetal parts, oil traces, waxes, Plant sugars and Insect sugars. The most important and problematic cause of stickiness is due to the entomological sugars from insect secretions. Stickiness induces productivity and quality losses as sticky points remain in the material from fibers in the field to the textile processes. The behavior of contaminated fibers during processing is highly dependent upon the quantity and the type of the main and complex sugars present in fibers in relation to the transformation machine types and settings as well as on the ambient conditions of transformation. Various techniques may be used to estimate a possible contamination of fibers by honeydew, expecting that these methods measure a same property of the fibers, which should be in relation to ‘the propensity to fibers to stick to spinning parts during their processing’. According to the latest results, this still needs to be confirmed for several currently used methods. Unit, Range, Significance In CSITC Harmonization Process:- (i) There is no universal unit or range for stickiness measurement, as each technique has its own unit, range and level. (ii) Short name or abbreviation:- None. (iii) Usual range:- the units reflect the stickiness level of the tested fibers from no stickiness to heavy stickiness. (iv) Significance at the Commercial Standardization of Instrument Testing of Cotton (CSITC):- currently not at CSITC. Existing Measuring Instruments For Measuring Stickiness:- Existing techniques are probably not all measuring the same property of the fibers. Therefore, as far as we know, the ‘purely stickiness measuring methods’ are listed at this point in this table. All methods participating to the ITMF-ICCTM inter-laboratory round-test for stickiness measuring methods are visible at:- https://www.itmf.org/committees/international-committee-on-cotton-testing-methods. (Notes:- ITMF is short for the International Textile Manufacturers Federation; and ICCTM is short for the International Committee on Cotton Testing Methods.) Description Of Any Relation Between ‘Manual And Visual Grading’ And ‘Instrument Classing’ Evaluation Results:- It seems that this is not possible to evaluate any stickiness by manual or visual grading unless fumagine developed of fibers; fumagine looks as a black deposit onto fibers and is the results of the development of fungi on the honeydew of the fibers. This only occurs when initial honeydew content is very high on the fibers. Therefore, only in rare cases, a manual inspection may reveal the first suspicious indications of higher stickiness, such as the degree of yellowness, if the normal characteristics of Cotton from a certain origin are known. Later, after fumagine finishes developing, fibers are generally not sticky anymore, but the intrinsic cellulose of the fibers may have been affected during the storage time. Evaluation Results Present In ‘Manual And Visual Grading’ But Missing In ‘Instrument Classing’ Evaluation Results:- No organoleptic appreciation can clearly identify stickiness in cotton samples with high reproducibility proven in a scientific way. However, it may be that some very extremely contaminated samples with stickiness

could be detected by a very sensitive manual perception. Use Of Stickiness Results For Cotton Production:- As stickiness measurements are usually made on fiber samples, therefore after picking and ginning, it is almost too late to have actions on the cotton production side by controlling Insect populations in Cotton fields, unless to plan detections of insects in the fields and actions to limit insect infestations for next cropping seasons. Use Of Stickiness Results In Ginning:- Nowadays, stickiness characterization is made on fiber samples, which only can be taken after the ginning operations. Therefore, no 'predictive' measurement can be done from seed-cotton samples to predict seed-cotton processing at the gin in the stickiness dimension. There are essentially two types of cotton ginning techniques, namely saw and roller ginning. Saw gins are generally used to process Upland type cottons of short to medium staple length (< 25.4 mm to 31.0 mm) and is consequently the most prevalent type of gin in the world. All Extra Long Staple (ELS) cottons (≥ 35.0 mm) are ginned on roller gins, and, in addition, it is estimated that, currently, 15 to 20% of Long Staple Upland (LS) and medium staple cottons (≥ 27 mm) are also ginned on roller gins. Roller-ginned cotton is adversely affected by moderate levels of stickiness while saw-ginned cotton is less sensitive to moderate levels of stickiness and is usually first detected in the textile mill. Roller gins are more susceptible to stickiness due to their design, with the ginning process reliant on friction, and a build-up of sticky spots on the ginning roller and the stationary knife will result in a decrease in ginning efficiency. Saw ginning does not rely on friction but on the mechanical pulling of fiber by saw teeth through two closely spaced ribs and thus moderate levels of stickiness will not affect production rates. In terms of saw ginning, sticky deposits can clog the saws in the saw gin and disrupt the baling process due to accumulation of lint on the lint slide of the battery condenser. This disruption can reduce gin production in bales/hour by up to 25%, or up to 15 pounds per hour for roller ginning, which is about 50% of the normal rate of roller ginning. These disruptions result in longer and more expensive ginning seasons, due to higher labor costs and additional spare parts, as saws and blades need to be replaced more regularly. Use Of Stickiness Results For Trading:- Stickiness measurement results on bale samples are assumed to predict the fiber behavior during their processing at the spinning mill, especially at the most critical steps which are when the fiber flow becomes thinner (from the card on). It has been shown that knowing the stickiness potential of cotton fiber bale from sample testing helps in managing the bale lots according to at least two categories based on a given threshold:- not sticky and sticky. From there, bale lots can be traded according to their real quality and their according financial value, not only based on the reputation. In consequence, the production side could organize sales lots based on stickiness characterization results in order to properly feed his customers and help in improving the cotton production by medium/long-term remediation actions. However, the current testing methods for stickiness are missing testing precision and accuracy for use in quality guarantees. Despite the ITMF recommendations, there are various methods available. The evaluation results may serve well in a local context, but not for the international trade due to high differing results on different samples and testing devices that are not acceptable. The lack of repeatability of tests, the dissenting interpretation of results, the costs of tests as well as the not very common use at origin may cause a high risk for contract parties. Use Of Stickiness Results For Spinning Mills/Textile Processing:- Knowing the stickiness level of cotton bales for organizing bale laydowns helps to manage the raw material so that the adhesive effect is not perceived in terms of productivity and/or quality later on. It has been shown that the mixing of non-sticky cotton with sticky cotton on one side, and the management of ambient air conditions in the spinning rooms on the other side greatly reduce the impact of stickiness on the spinning process and the yarn quality. / выработка (output). , то есть . контаминация . Под Клейкостью понимается наличие медовой росы (honeydew) на хлопковых волокнах. Хлопковая кипа заявляется 'с клейкостью', если в процессе прядения или любой другой фазы подготовительного процесса прядения, её уровень клейкости нарушил обычный режим переработки, приведя к меньшей производительности прядильных машин и/или снижению качества конечной продукции. Основные причины появления клейкости – это вредители и медовая роса, выделяемая Хлопчатником при поражении Тлями, что в свою очередь может быть вызвано недостатком влаги, применением фосфороорганических препаратов и несбалансированных минеральных удобрений, интенсивным азотным питанием при позднем севе, сроками сбора хлопка-сырца, а также в процессе прядения за счёт повышенных скоростей новых высокопроизводительных станков.

LIST OF INSTRUMENTS MEASURING STICKINESS / ПЕРЕЧЕНЬ ИНСТРУМЕНТОВ, ИЗМЕРЯЮЩИХ КЛЕЙКОСТЬ		
Instrument / Инструмент	**Machine Type** / Машинный Тип	**Additional Linked Measured Characteristics*** / Дополнительные Связанные Измерительные Характеристики*
Contest-S / Кантэст-Эс.	**Thermomechanical** / Термомеханический	
Contest-F / Кантэст-Эф.	**Thermomechanical** / Термомеханический	Fiber characteristics such as Length and Strength (UHML, UI, Strength, SFI, Elongation), Moisture, Color (Rd, +b, Grade), Trash (Count, Area, Leaf), Micronaire, Maturity, Fineness
High Speed Stickiness Detector (H2SD) / Высоко-Скоростной Детектор Клейкости (ВСДК)	**Thermomechanical** / Термомеханический	
Mini-Card** / Мини-Кард**	**Mechanical** / Механический	
Sticky Cotton Thermodetector (SCT)*** / Термодетектор Клейкого Хлопка (ТКХ)***	**Thermomechanical** / Термомеханический	

Notes / Примечание:- * **Depending of the model used** / В зависимости от используемой модели; ** **ITMF-ICCTM Reference method (1986), the one to which all other methods' results should be compared** / Справочный метод ITMF-ICCTM (1986), метод, для которого должны сравниваться результаты всех иных методов; *** **ITMF-ICCTM Recommended method (1994)** / Рекомендуемый метод ITMF-ICCTM (1994).

STICKINESS = НАЛИПАЕМОСТЬ (или ЛИПКОСТЬ, или КЛЕЙКОСТЬ) – In exchange trading, a Stickiness is the tendency to stick to the maximum or minimum of their interval during strong trends.

STICK–SLIP MOTION = СКАЧКООБРАЗНОЕ ДВИЖЕНИЕ – Stick-Slip Motion:- erratic, noisy motion characteristic of some machine ways, due to the starting friction encountered by a machine part at each end of its back-and-form (reciprocating) movement. This undesirable effect can be overcome with a way lubricant, which reduces starting friction. / Скачкообразное Движение при трении – явление чередования относительного скольжения и относительного покоя или чередования увеличения и уменьшения относительной скорости скольжения, возникающее самопроизвольно при трении движения. Примечание:- примером скачкообразного движения может служить движение, возникающее вследствие автоколебаний при понижении коэффициента трения с увеличением скорости скольжения.

STICKY = КЛЕЙКОЕ (или ЛИПКОЕ) – Sticky:- grains that stick together when cooked. A characteristic of glutinous Rice.

STICKY POINTS = КЛЕЙКИЕ ТОЧКИ – Sticky Points:- entanglement of fibers or individual fibers that are attached to a working surface as a result of the inherent stickiness of the cotton. Stickiness Level:- number of sticky points indicating the incidence of cotton fiber stickiness. Thermodetection:- action of revealing sticky points through the combined application of heat and pressure. Application of Heat and Pressure:- the sample is then placed on a strip of aluminum foil originating from a roll. The aluminum foil is rolled along a conveyor belt which transfers the sample in front of each station. The aluminum strip is rolled up at the other end of the machine. Pressure is then applied to the sample for (25 ±2) s while the heating element is in contact with the cotton. The heating element exerts

a force of (1 700 ±100) N. Its surface area is (192 ±1) cm^2. Application of Pressure at Ambient Temperature:- another pressure is then applied for (25 ±2) s at ambient temperature immediately after the hot pressure phase. This fixes the sticky points to the aluminum foil. The same amount of pressure is applied as during the hot-pressure phase. Its surface area is (192 ±1) cm^2. Image Analysis:- the sticky points are counted by a video camera as it scans the sheet. The image is then analyzed by computer. The software used calculates the number of sticky points and produces a histogram of sticky point areas. Note:- As each station processes independently, it is therefore possible to process up to 5 test specimens simultaneously, which means that a result is obtained almost every 30 seconds. Aluminum Foil:- a sheet of aluminium, whose thickness is (15 ±5) microns – or (40.5 ±13.5) g/m^2 – having at least one bright surface exhibiting no traces of oxidation and a width of at least 250 mm. / Клейкие Точки:- С 2005 Узбекский центр Sifat в Ташкенте осуществляет оценку клейкости хлопкового волокна на термодетекторе SCT. Этот новейший прибор позволяет в кратчайшие сроки дать количественную оценку клейкости. Принцип определения состоит в чередовании горячего и холодного прессования хлопкового волокна, помещённого между листами алюминиевой фольги. Для обнаружения клейких мест (точек) холстик хлопкового волокна, полученный на механическом разрыхлителе, размерами (540 ±20) миллиметров (мм) на (160 ±20) мм и массой (2.5 ±0.05) граммов (г), помещают между двумя листами алюминиевой фольги, затем укладывают на нижнюю плиту термодетектора SCT и подвергают поочередному контрастному воздействию верхней нагревательной плиты (температура (84.4) °C, усилие прижатия (780.50) Ньютонов (Н), продолжительность (12.2) секунд) и верхней охлаждающей плиты (комнатная температура, усилие прижатия (590.50) Н, продолжительность (120.10) секунд). Фольгу с пробой для испытаний снимают с нижней плиты термодетектора SCT и перекладывают на нижний столик термодетектора, где выдерживают в течение (60 ±5) минут при комнатной температуре. По истечении необходимого времени фольгу с пробой для испытаний вновь помещают на нижнюю плиту термодетектора SCT, осторожно снимают верхний лист алюминиевой фольги и откладывают его в сторону матовой стороной вверх. По нижнему листу алюминиевой фольги без какого-либо усилия в двух противоположных направлениях проводят очистителем, удаляя пробу для испытаний, после чего на фольге остаются налипшие волокна (клейкие точки). Обнаруженные на алюминиевой фольге клейкие точки подсчитывают для оценки степени клейкости волокна. Лист алюминиевой фольги с налипшими волокнами просматривают при местном боковом освещении и воздействии воздушного потока, создаваемом вентилятором. Специальным маркером на листе фольги возле налипших вибрирующих волокон (клейких точек) делают пометки и затем подсчитывают их. Аналогично ведут подсчёт клейких точек на верхнем листе фольги, применяя очиститель только один раз в одном направлении. Количество точек клейкости по каждой пробе для испытаний определяют как сумму клейких точек на верхнем и нижнем листах фольги. За результат испытаний образца хлопкового волокна принимают среднее арифметическое трех параллельных определений. По количеству клейких точек в соответствии с данными Таблицы производят оценку степени клейкости волокна. Таблица:- Степень Клейкости – Число Точек:- (i) Нет Клейкости – 0–5 клейких точек; (ii) Слабая Степень Клейкости – 6–16 клейких точек; (iii) Средняя Степень Клейкости – 17–35 клейких точек; (iv) Сильная Степень Клейкости – 36–53 клейких точек; и (v) Очень Сильная Степень Клейкости – Свыше 53 клейких точек. Примечание:- в международном понимании клейкости число клейких точек несколько иное, в частности:- (i) Не Определяемая (Not Detectable) – до 2 клейких точек; (ii) Лёгкая (Light) – 2–16 клейких точек; (iii) Средняя (Medium) – 17–32 клейких точек; (iv) Сильная (Strong) – 33–50 клейких точек; и (v) Очень Сильная (Very Strong) – Свыше 50 клейких точек.

CATEGORIZATION OF DEGREE OF STICKINESS ACCORDING TO STICKY POINTS / КАТЕГОРИЗАЦИЯ СТЕПЕНИ КЛЕЙКОСТИ В СООТВЕТСТВИИ С КЛЕЙКИМИ ТОЧКАМИ	
Degree of Stickiness / Степень Клейкости	**Number of Sticky Points** / Число Клейких Точек
Not Detectable / Не Определяемая	≤ 2
Light / Слабая	2 – 16
Medium / Средняя	17 – 32
Strong / Сильная	33 – 50
Very Strong / Очень Сильная	> 50

STICKY SPOTS = КЛЕЙКИЕ ПЯТНА (или ЛИПКИЕ ПЯТНА) – Sticky Spots:- Fabric:- taffeta dress goods; Construction:- (i) Count:- 104 x 76; (ii) Warp:- 70 20 bright acetate rayon; (iii) Filling:- 100/40 bright acetate rayon; (iv) Finish:- plain dyed beige. Defect:- small spots scattered throughout piece. Analysis:- microscopic examination showed that the spots were in the form of amorphous sticky deposits, confined to the warp yarns only, although in many cases the filling had also been contaminated from contact with the warp. It was practically impossible to remove this substance but chemical tests indicated that it was of a rubberlike nature. The defect was traced to similar deposits in the gray goods and, by checking the looms on which the fabric was woven, it was learned that the surface of the crepe-rubber-covered take-up rolls was spongy and sticky. Apparently the damage was caused by some of the sticky rubber's adhering to the warp during weaving. It was later determined that some components of the warp sizing were causing the deterioration of the rubber and it was possible to correct this condition by changing the size formula. / Уточина:- 100/40 .

STIFFNESS = ЖЁСТКОСТЬ (или НЕСГИБАЕМОСТЬ, или НЕГИБКОСТЬ, или ПРОЧНОСТЬ) – Stiffness is the property of a fiber or fabric to resist bending or to carry a load without deformation. It is based on the fiber modulus. Stiffness is a resistance to bending, characterised by the bending moment required to produce a bent configuration under specified conditions.

STIFF–STOCK STEEL NAIL = НЕГНУЩИЙСЯ ХХ СТАЛЬНОЙ ГВОЗДЬ – Stiff-Stock Steel Nail is a pallet nail made of medium-high carbon steel without heat treatment and tempering with Morgan Impact Bend Angle Nail Tester (MIBANT) angle between 29 and 46 degrees. / Моргэн.

STIGMA = РЫЛЬЦЕ (или СТИГМА, или ДЫХАЛЬЦЕ) – Stigma is receptive surface or structure for pollen at apex of style or pistil. One style may bear multiple stigmas, in Cactaceae usually 3–20. Stigma is the terminal part of the pistil to which pollen grains adhere. / для пыльцы на верхушке столбика (стиля) или пестика, у Кактусовых (Cactaceae) обычно 3–20. В ботанике – Рыльце; в зоологии – Стигма. Под Рыльцем понимается верхняя часть пестика в цветке, воспринимающая пыльцу при опылении. Рыльце (stigma), орган растения, служащий для восприятия пыльцы при опылении. Развивается обычно на верхушке столбика или стилодия, при их отсутствии – непосредственно на завязи (так называемое сидячее рыльце); имеет различную форму. Часто покрыто сосочками или волосками, способствующими удержанию попавшей на него пыльцы. Смотрите также Пестик, и Цветок. Под Стигмой, от Греческого слова Stigma, означающее Пятно или Угол, понимается:- (i) дыхальце, отверстие органов дыхания на поверхности тела некоторых Членистоногих; (ii) жаберное отверстие в глотке Асцидий; (iii) светочувствительный

глазок, или глазное пятно, у окрашенных одноклеточных организмов; (iv) в Древней Греции метка или клеймо на теле раба или преступника.

STIGMA RECEPTIVITY = РЕЦЕПТИВНОСТЬ РЫЛЬЦА (или ВОСПРИИМЧИВОСТЬ РЫЛЬЦА) – Stigma Receptivity is the characteristic of a stigma that facilitates germination and penetration of pollen upon deposition on its surface.

STILLAGE = СТЕЛЛАЖ – Stillage is a platform with two uprights or four feet and with free entry. Note:- stillages cannot be handled by pallet trucks conforming to ISO 509 (2). / Стеллаж:- площадка с двумя или четырьмя опорами и со свободным входом вилочного захвата. Примечание:- в соответствии со стандартом ISO 509 (2) стеллаж не может использоваться как поддон.

STILL GAS = НЕКОНДЕНСИРУЮЩИЙСЯ ГАЗ (или ГАЗ НЕФТЕПЕРЕРАБОТКИ, или НЕФТЕЗАВОДСКОЙ ГАЗ, или СУХОЙ ОТБЕНЗИНЕННЫЙ ГАЗ) – Still Gas is any form or mixture of gas produced in refineries by distillation, cracking, reforming, and other processes. The principal constituents are methane, ethane, ethylene, normal butane, butylenes, propane, and propylene. It is used primarily as refinery fuel and, petrochemical feedstock. Also known as Refinery Gas. / Газ, получаемый при перегонке в кубах; постоянный неконденсирующийся газ, получаемый при перегонке нефти; нефтезаводской газ. Любая форма или смесь газа, произведённая нефтеперегонными предприятиями посредством дистилляции, крекинга, риформинга, и иных процессов. Основными составными частями являются метан, этан, этилен, обычный бутан, бутилены, пропан и пропилен. Этот газ используется, главным образом в качестве топлива для нефтеперегонного предприятия и в качестве сырья для нефтехимии.

STIPE = СЕМЯНОЖКА – Stipe is a short supporting stalk. / Под Семяножкой или Фуникулусом понимается часть семяпочки, соединяющая её с плацентой.

STIPITATE = ИМЕЮЩЕЕ НОЖКУ (или ОБРАЗОВАВШЕЕСЯ НА НОЖКЕ, или СТЕБЕЛЬКОВОЕ) – Stipitate:- having, supported or elevated on a stipe.

STIPULATE = ИМЕЮЩЕЕ ПРИЛИСТНИКИ – Stipulate:- of a part furnished with stipules. Of a stem or leaf stalk (petiole) with a pair of growths resembling leaf stipules at the base.

STIPULE = ПРИЛИСТНИК – Stipule is a small leafy growth, often found in pairs, at the base of a leaf or stalk. Stipule is the leaf-like appendage at the base of the leaf stalk. / Под Прилистниками понимаются парные выросты близ основания листа. Имеют листовидную (Горох) или чешуевидную формы (Клевер, Лиственные деревья), иногда превращены в колючки (Жёлтая Акация). Защищают почку. Прилистники (Stipulae), два боковых придатка у основания листа, развивающиеся по одному с каждой стороны. Реже срастаются с черешком листа и между собою. У многих растений прилистники отсутствуют. У основания черешка листочков сложных листьев имеются аналогичные образования, называемые Прилистничками (например, у Фасоли). Как правило, прилистники мелкие, но у Чины, Гороха, Фиалки они крупные. Прилистники по форме похожи на листья (у Подмаренника, Асперулы и других) или отличаются от листьев (например, у Белой Акации). Прилистники часто играют защитную роль. Срастаясь между собой и охватывая стебель, они образуют так называемый Раструб (у Гречихи, Щавеля), который защищает молодые листья. В почках многих растений прилистники частично прикрывают снаружи молодые листья (Дуб, Липа, Вяз) и опадают после развёртывания листа. Прилистники:- листовидные или плёнчатые придатки при основании листового черешка. Обычно малы и невзрачны.

STITCH = СКРЕПКА (или XX) – Stitch is a staple-type of fastener which is formed at the point of assembly from wire coil stock. See also Pallet. / Скрепка (Stitch):- элемент, который формируется как точечный или сосредоточенный из проволоки, намотанной на катушку. Смотрите также Поддон (Pallet).

STITCH = СТЕЖОК (или СТЁЖКА, или ПЕТЛЯ (В ВЯЗАНОМ ИЗДЕЛИИ), или СТРОЧКА) – (1) Stitch is a single passage of a threaded needle through fabric and back again, as in sewing or embroidery. Stitches may be made by hand or done on a sewing machine to hold layers of fabric together or to clecorate fabric such as embroidery, stitchery, and needlepoint. The most commonly used hand stitches follow. See also Embroidery, Needlepoint, and Stitchery.

(2) Stitch (Backstitch):- used at the beginning and end of stitching to reinforce and prevent raveling. Also called Backtack or Stay-Stitch. / Сплошной или Непрерывный Стежок:- втачивание (stitching).

(3) Stitch (Baste):- a stitching which holds the fabric in place until permanent stitching has been completed. / втачивание (stitching).

(4) Stitch (Blind):- a stitch that is not visible on one side of the fabric. / Потайная Строчка или Потайный Стежок:- .

(5) Stitch (Chain/Class 100):- a stitch formed with one or more needle threads, the loops of which are passed through the material and through the loops of the preceding threads. / Цепной Стежок/Класс 100:- .

(6) Stitch (Contrasting):- when the stitching thread contrasts the garment color. / втачивание (stitching).

(7) Stitch (Dbl. lock/class 400):- a stitch formed with two or more groups of threads that interlace each other. The loops of needle thread are passed through the material where they are secured by looper threads; no bobbins used. This stitching ravels in one direction. / Двойной Закрытый Стежок или Сдвоенная Закрытая Петля/Класс 400:- . втачивание (stitching).

(8) Stitch (Flat seam/class 600):- multi-needle stitches that provide the elasticity necessary for knits.

(9) Stitch (hand/class 200):- a stitch formed by hand with one or more needles – one thread per needle passing in and out of the material.

(10) Stitch (Lock/class 300):- a stitch formed with two or more groups of threads that interface each other. The loops of needle threads are passed through the material where they are secured by bobbin threads. / Закрытый Стежок/Класс 300:- стежок, образованный двумя или более группой нитей, .

(11) Stitch (overedge/class 500):- a stitch formed with one or more groups of threads at least one of which passes around the edge of the material. / Краеобмёточный Стежок/Класс 500:- стежок, образованный одной или более группой нитей, .

(12) Stitch (safety):- a combination chain-stitch and overedge stitch made simultaneously on the same sewing machine.

(13) Stitch (Top):- a second row of stitching close to the edge of a seam, after two or more pieces of fabric have been sewed together and turned to bury the raw seam margin side. / втачивание (stitching).

(14) Stitch (Zig-zag):- a stitch made on a sewing machine in which the needle bar comes down alternately on the right and left side of an imaginary center line. Also refers to the type of machine producing this stitch.

STITCH = СТРОЧКА (или СТЕЖОК, или ПЕРЕПЛЕТЕНИЕ) – In knitting, a Stitch is the loop geometry of a particular pattern repeat. It may be in the form of a knitted, a tuck or a float loop. / геометрия пели в конкретном повторении узора. Она может быть в форме вязаной, .

STITCH BONDING = СКРЕПЛЕНИЕ ПРОШИВОМ (или ПРОШИВНОЕ СВЯЗЫВАНИЕ) – Stitchbond is a nonwoven construction where the fabric is formed by stitching or knitting the fibers to form a fabric with the appearance of a knit fabric. In the most common cases it involves warp knitting of yarns through a fibrous mat. It can also be knitting of fibers without yarns or knitting of yarns around laid warp and filling yarns which do not interlace with each other. Fabrics are predominantly made of polyester fibers of various linear density (from 0.33–1.7 tex). Depending on the sphere of application and demands of a customer, viscose fibers, cotton and other kinds of fiber raw materials can be used in production. By means of varying the fibers, the weight and the width of a fabric, the length of a stitch and the size of loops it is possible to modify the fabric according to the demands of the customer and the specific sphere of application. If necessary, the fabrics can be further finished – dyed, printed, imbued, bonded. Stitch Bonding is a method of making wire connections between two or more points on an integrated circuit by using impulse welding or heat and pressure while feeding the connecting wire through a hole in the center of the welding electrode. See also Bonding. Stitch Bonding is a bonding technique for nonwovens in which the fibers are connected by stitches sewn or knitted through the web. Also known as Quilting. / основные и уточные пряжи, которые .

STITCHED PLACE = XX МЕСТО – Stitched Placeis an area where the interlacing of the warp and weft threads does not conform to the planned weave. Note:- this defect is frequently caused by one or more ends being lifted out of sequence by an adjacent end or heddle. / Сбой Рисунка Переплетения (stitched place):- порок ткани; участок, где переплетение нитей основы и утка не соответствует разработанному плану. Примечание:- этот порок часто вызывается основными нитями, неправильно пробраными в ремиз или поломкой ремиз.

STITCHERY = СТАЧИВАНИЕ – Stitchery:- the contemporary approach to traditional embroidery in which the same basic stitches are used, but in a freer, less restricted manner to create their own form and shapes. The yarns used in stitchery go beyond traditional wool and silk embroidery floss. Anything can be used to make the stitches from ribbon and cord to narrow strips of fabric or even fishline. Stitchery may be used to decorate clothing, home furnishings items, and for wall hangings. See also Embroidery.

STITCHES = ПОДНЫРКИ (или ПЕТЛИ, или XX) – Stitches:- a single thread float. Causes:- (i) two adjacent ends sticking together during shedding for a brief period of time; and (ii) in case of synthetic yarns, ends sticking together due to static charge during weaving. Mending:- stitches are cut with a clipper from both the ends. Combing in both the directions with the help of a metallic comb may rectify the resultant bare patch formed. Fabrics defect. Stitches:- more specifically it is a single thread float either warp or weft way. A place in the fabric where warp and weft yarns escape required interlacement. Main causes are entanglement of warp threads due to delay in repairing a broken end, knots with long tail ends, breakage of wire healds on running loom and unsatisfactory working of warp stop motion. Minor Defect Classification:- Not prominent if < 1 cm (5). Major Defect Classification:- Prominent >= 1–5 cm. Stitches:- a single thread float either in the warp or weft way. It is very prominent in case of different colors of warp and weft. Weaving Defect. / Поднырки не более 5 сантиметров (см). Размер порока – до 1 см. Под Подныpками понимается дефект суровой ткани, когда уточные нити на коротких участках не переплетаются с основными, а выступают в виде скобочек или петель сверху или снизу полотна; причины – нечистый зев, несвоевременный ввод уточной нити в зев, провисание нитей основы, излишне высокое или низкое расположение шпаруток и другое.

STITCH FORMATION = ПЕТЛЕОБРАЗОВАНИЕ (или ОБРАЗОВАНИЕ ПЕТЛИ, или ОБРАЗОВАНИЕ СТЕЖКА, или ФОРМИРОВАНИЕ СТРОЧКИ) – Stitch Formation:- improper adjustment of tension, fittings or machine timing. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или дефект от машинного оборудования.

STITCHING = ПОДНЫРКА (или ВЫСТУП, или ПРОВАЛ, или ПРОШИВ, или ПЕРЕВЯЗКА) – Stitching:- it is a major defect particularly in good quality cloth. It is a common fabric fault in which the ends and the picks are not interlaced according to correct order of the pattern. Fabrics defect. Stitching or Undershot:- a weftways float on the back or face of the fabric, usually extending over several warp yarns. This defect is caused by the shuttle leaving the shed prematurely and travelling above or beneath the warp threads due to incorrect loom geometry, incorrect angle of shuttle launch, poor condition of shuttle, or ends clinging together. / Выступание уточной нити на одной из сторон ткани. Поднырки не более 5 см. Размер порока – до 1 см. Под Подныpками понимается дефект суровой ткани, когда уточные нити на коротких участках не переплетаются с основными, а выступают в виде скобочек или петель сверху или снизу полотна; причины – нечистый зев, несвоевременный ввод уточной нити в зев, провисание нитей основы, излишне высокое или низкое расположение шпаруток и другое. Пролёт (stitching; undershot):- порок утка; не переплетённые с утком нити основы, лежащие на поверхности полотна на ограниченном участке его ширины. Примечание:- этот порок вызван челноком, оставляющим зев раньше времени и двигающемся выше или ниже нитей основы из-за неправильной геометрии ткацкого станка, неправильного угла запуска челнока, плохого состояния челнока.

STITCHING = СТЕГАНИЕ (или СШИВАНИЕ, или СШИВКА, или ПРОШИВКА, или ПЕРЕВЯЗКА, или СТРОЧКА, или СТЁГАНЫЙ УЗОР) – (1) Stitching is the process of passing a fiber or thread through the thickness of fabric layers to secure them. In composite manufacture, stitching is used to make preforms or to improve damage tolerance of complex-shaped parts.

(2) Stitching:- every sewing machine has a straight stitch, practical stitches and a range of decorative stitches. Some models have hundreds of stitches that can be used to embellish almost any type of project – garments, pillows, quilts, purses, baby clothes, and more. To get the best results when sewing decorative stitches, there are several items that you need to address:- the type of thread you use, the presser foot you select, and how you prepare your fabric for stitching. The type of thread you use plays an important part in the look of your final stitching. Workbook 1 (Basic Operation) offers information on the fiber content and properties of threads that are on the market today. There are many from which to choose and if you try them all you'll find a few favorites. Cotton embroidery thread, especially in a heavier weight such as 30, gives a beautiful look to the stitches and has a nice luster to it. If you want a high sheen, rayon or polyester embroidery thread are good choices. It often comes down to a personal preference and what looks best on your project. The presser foot you select is critical for good results because it can affect the way the fabric feeds under the needle, influencing the stitch formation. Usually the key to selecting the correct presser foot is the sole. If you are creating heavy, satin stitched patterns, you will need a foot that is not flat on the bottom. It should have some type of indentation that allows the foot to ride over the completed stitch without dragging or inhibiting the feed of the fabric. Stitches that are more open and have less thread will stitch well with an all-purpose or zigzag presser foot. Reverse Pattern Foot #1/1C/1D has small indentations in front of and behind the needle that allow the fabric to move in a 'back and forth' manner when forming the stitches. Embroidery Foot #6 has a wedge-shaped indentation behind the needle, perfect for allowing heavy compact stitches to flow freely from under the back of the presser foot. Open Embroidery Foot #20/20C/20D and Clear Embroidery Foot #39/39C/39D both have the same shape but offer more visibility of the stitching area. Preparing your fabric correctly can take the frustration out of your stitching, giving you a positive experience with beautiful results. The fabric needs to be stable enough to support the stitching without tunneling or puckering. This can be accomplished in several ways,

sometimes with a combination of techniques. The fabric itself might be heavy enough to support the stitching but in many cases extra stabilization will be needed. Interfacing (fusible or sew-in) is applied to the wrong side of the fabric and left in the project. Stabilizers are used as a temporary form of support. For the exercises in this class you will be using lightweight tear away stabilizer that can be removed after stitching if desired.

STITCH MARKS = ОТМЕТИНЫ ОТ СТЕЖКОВ (или ОТМЕТИНЫ ОТ СТЁЖКИ) – Stitch Marks:- Possible Cause:- due to removal of incorrectly placed pocket from a shirt. This is a major defect as it will leave unwanted marks on the fabric. Stitching defect.

STLE = SOCIETY OF TRIBOLOGIST AND LUBRICATION ENGINEERS

STN = SWIFT TRANSPORT NETWORK

STOCHASTIC = СТОХАСТИЧЕСКОЕ – Stochastic means random. A stochastic process is one whose behavior is non-deterministic, which means that a system's subsequent state is determined both by the process's predictable actions and by a random element. / Под Стохастическим, от Греческого слова Stochastikós, означающее Умеющий Угадывать, понимается случайный, вероятностный.

STOCHASTIC (OSCILLATOR) = СТОХАСТИЧЕСКИЙ (ОСЦИЛЛЯТОР) – Stochastic (Oscillator) is a momentum indicator developed by George Lane that measures the price of a security relative to the high/low range over a set period of time. The indicator oscillates between 0 and 100, with readings below 20 considered oversold and readings above 80 considered overbought. A 14-period Stochastic Oscillator reading of 30 would indicate that the current price was 30% above the lowest low of the last 14 days and 70% below the highest high. The Stochastic Oscillator can be used like any other oscillator by looking for overbought/oversold readings, positive/negative divergences and centerline crossovers. Stochastic indicator was developed by George Lane to track market momentum. The stochastic oscillator comprises two lines:- %K and %D. One of the family of momentum oscillators that is used primarily as an overbought/oversold indicator. Developed by George Lane, the stochastic evaluates the relative position that the settlement price has with regard to the session's high and low over a specified period of time. Unlike many momentum oscillators, the stochastic has two lines instead of one, allowing a crossover signal. An overbought and oversold indicator that is based on the observation prices tend to close near the high of the period while in a uptrend and near the low of the period during a downtrend. Developed by George Lane, this momentum oscillator shows the location of the current close relative to the high/low range over a specified period. Closing levels near the top of the range indicate buying pressure, while closing levels near the base of the range indicate selling pressure. A computerized tool measuring overbought and oversold conditions in an asset over a certain period. / В техническом анализе биржевых рынков Стохастический (Осциллятор) является индикатором момента, разработанный Дьжодьжем Лэйном (George Lane), измеряющий цену актива относительно диапазона максимум/минимум . при наблюдении ценовой тенденции. Под Стохастическим, от Греческого слова Stochastikós, означающее Умеющий Угадывать, понимается случайный, вероятностный.

STOCHASTIC MODELS = СТОХАСТИЧЕСКИЕ МОДЕЛИ (или СЛУЧАЙНЫЕ МОДЕЛИ) – Stochastic Models are the liability-matching models that assume that the liability payments and the asset cash flows are uncertain. Related Deterministic Models.

STOCHRSI = СТОК.АР.ЭС.АЙ. (или СТОХАСТИЧЕСКИЙ АР.ЭС.АЙ.) – StochRSI (Stochastic Relative Strength Index) is an oscillator used to identify overbought and oversold readings in RSI. Because RSI can go for extended periods without becoming overbought (above 70) or oversold (below 30). StochRSI provides an alternative means to identify these extremities. This indicator is found by applying the Stochastics formula to RSI readings – hence its name. As an indicator of RSI, it measures the value of RSI relative to its high/low range over a set number of periods. When RSI records a new low for the set period, StochRSI will be at 0. When RSI records a new high for the set period, StochRSI will be at 100. / В техническом анализе биржевых рынков под Сток.Ар.Эс.Ай. или Стохастический Ар.Эс.Ай. (StochRSI) понимается Стохастический Индекс по Относительной Силе (Stochastic Relative Strength Index), являющийся осциллятором, используемым для идентификации значений перекупленности и перепроданности в значениях технического индикатора Ар.Эс.Ай..

STOCK = АКЦИЯ (или ДОЛЯ, или ПАЙ, или УСТАВНЫЙ КАПИТАЛ, или УСТАВНЫЙ ФОНД) – In the United States, a Stock represents ownership in a corporation. It may be represented by a certificate and can be common or preferred, voting or non-voting, redeemable, convertible, etc. The classifications and special designations, if any, of the stock are set forth in the articles of incorporation. Stock:- an equity security issued by a corporation. Some classes of stock may convey (i) a preferred right to a fixed dividend, (ii) a preferred right to payment upon liquidation, and (iii) a right to convert to another class of stock. Ownership of a corporation represented by shares that are claims on the company's assets and earnings. When you own a stock, you are an actual part owner of the company itself. Also known as Equity; and Ordinary Shares in the United Kingdom. See also Capital Stock, Common Stock, Preferred Stock, and Share. / Если вы владеете долей, вы являетесь фактическим владельцем части компании. Под Уставным Капиталом понимается первоначальная сумма капитала предприятия (фирмы), необходимая для начала его деятельности и определённая его уставом или договором об основании предприятия, акционерного общества, компании, корпорации или иного объединения предпринимателей. Уставный капитал формируется в основном за счёт выручки от продажи акций, а также вложений частных капиталов или государственных средств. Для обозначения уставного капитала употребляются также термины Акционерный Капитал, Основной Капитал, Разрешённый Капитал. Законодательством ряда стран (Германия, Франция) устанавливается обязательный размер уставного капитала, при наличии которого предприятия и объединения регистрируются как действующие. В Великобритании и Соединённых Штатах Америки размер уставного капитала законодательством не лимитируется. Уставный капитал значительно меньше привлечённого в форме кредитов, инвестиций и облигаций и тому подобного капитала. Вместе с резервным капиталом он составляет собственные средства предприятия. Так как соответствие уставного капитала общему объёму хозяйственной деятельности считается признаком финансовой устойчивости, при высоких темпах инфляции предприятия и банки регулярно увеличивают размер уставного капитала путём размещения вновь выпускаемых акций.

STOCK = ЗАПАС – (1) Stock is an inventory.

(2) Stock is a purified seed in storage for future multiplication; the available amount of seed.

STOCK = ОБЛИГАЦИЯ – Stock:- normally in UK refers to the fixed interest securities which you buy on the stock market, e.g., Question:- How much British Government Stock do you hold? Answer:- I hold £100 nominal of Treasury 9% Stock (see also Security). Stocks issued by the British Government are also called Gilt-Edged Stocks or Gilts for short. You will find the daily prices of these listed in the Financial Times. The Americans refer to securities issued by the US Government as US Treasury Bonds or US Treasury Notes. You will find the prices of these listed in the Wall Street Journal. The word can also refer to ordinary shares particularly in America, as for example What stocks do you hold? Reply I hold Microsoft, Intel and IBM. / В зависимости от того, где произносится это Англоязычное слово Stock – в Соединённом Королевстве или в Соединённых Штатах Америки – оно будет иметь абсолютно

разный смысл. В частности, в Соединённом Королевстве под этим словом будут пониматься, как правило, Облигации – ценные бумаги с фиксированным процентом, которые покупаются на фондовом рынке. Например, вопрос:- Как много Британских Правительственных Облигаций (British Government Stock) вы удерживаете? Ответ:- Я удерживаю Казначейские 9% Облигации номиналом в 100 Фунтов Стерлингов. Облигации, выпущенные Британским Правительством называются также Окаймлёнными Позолотой Облигациями (Gilt-Edged Stocks), а вкратце – Гилтами или Позолотами (Gilts). Дневные цены на эти ценные бумаги можно найти в публикуемых списках знаменитой Британской экономической газеты Файнэншэл Таймз (Financial Times). В Соединённых Штатах Америки аналогичные ценные бумаги, выпускаемые Американским Правительством называются Облигациями Казначейства США (US Treasury Bonds) или Нотами Казначейства США (US Treasury Notes). Дневные цены на эти ценные бумаги можно найти в публикуемых списках знаменитой Американской экономической газеты Вол Стрит Дьжонэл (Wall Street Journal). И конкретно в Америке Англоязычное слово Stock относится к обыкновенным акциям. Например, вопрос:- Какие акции вы удерживаете? Ответ:- Я удерживаю акции Майкрософт (Microsoft), Интэл (Intel) и Ай.Би.Эм. (IBM). Смотрите также Ценная Бумага.

STOCK = ШИРОКИЙ ГАЛСТУК (или ШАРФ) – Stock is a wide band or scarf worn about the neck especially by some clergymen.

STOCK ALLOCATION = ВЫДЕЛЕНИЕ (или РАЗМЕЩЕНИЕ) ТОВАРНЫХ ЗАПАСОВ (или МАТЕРИАЛЬНЫХ ЦЕННОСТЕЙ) – Stock Allocation:- when the 'computer looks for and allocates stock', it checks to see if it is available. Available stock can be used to fill the orders. When an order is input, the system will automatically look for available stock and allocate the stock to the particular order.

STOCK–BASED COMPENSATION = КОМПЕНСАЦИЯ, ОСНОВАННАЯ НА АКЦИЯХ – Stock-Based Compensation:- in the balance sheet, the company accounts for stock-based compensation applying Accounting Principles Board (APB) Opinion. Consequently, compensation expenses are recorded for the difference between the exercise price of the option and the estimated market value of the shares at the measurement date of the compensation plan. The compensation expense is allocated over the vesting period of the stock options.

STOCK BONUS ISSUE = БОНУСНЫЙ ВЫПУСК АКЦИЙ – Stock Bonus Issue:- similar to a stock dividend. The issue of stock to existing shareholders at a set ratio.

STOCKBROKER = ФОНДОВЫЙ БРОКЕР – Stockbroker is an agent professionally engaged in the purchase and sale of securities on a stock exchange on behalf of clients. Agent who buys or sells stocks and bonds. See also Broker, and Brokerage. Stock Brokers (in 1844) are employed to buy and sell stock in the public funds, or in the funds of joint stock companies. Their business is regulated by certain acts of parliament, by which, among other things, it is enacted, that contracts in the nature of wagers, or contracts apparently framed for the sale or purchase of stock, but really intended only to enable the parties to speculate on contingent fluctuations of the market, without any stock being actually sold, shall be void, and those engaging in them subjected to a penalty of 500l. (7 Geo. 2. c. 8., made perpetual by 10 Geo. 2. c. 8.). And by the same act, any one contracting to sell stock of which he is not actually possessed, ot to which he is not entitled, forfeits 500l.. Brokers not keeping a book in which all contracts are regularly inserted, are liable in a penalty of 50l. for each omission; half to the king, and half to those who sue for it. The charge for brokerage on all public funds, except Exchequer bills and India bonds, is 2s. 6d. per cent.; on these it is 1s. per cent.. No transaction with respect to the purchase and sale of stock in the public funds can be concluded except by the intervention of a licensed broker, unless by the parties themselves.

STOCK CERTIFICATE = СВИДЕТЕЛЬСТВО НА АКЦИИ (или АКЦИОНЕРНЫЙ СЕРТИФИКАТ, или СЕРТИФИКАТ НА ДОЛЮ (В УСТАВНОМ ФОНДЕ)) – (1) Stock Certificate:- confirmation that a certain number of shares have been deposited. This is used to enable or facilitate stock market trading. Stock Sertificate is an evidence of ownership of shares in a corporation. May also be referred to as a Share Certificate.

(2) Stock Certificate:- a special form is the fractional certificate, which, as the name implies, is made out for a fraction of the whole share.

(3) Stock Certificate:- instrument embodying a specific number of shares if a corporation has only a few shareholders and no individual shares are issued.

STOCK CHANGE = ИЗМЕНЕНИЕ СТОИМОСТИ АКЦИИ – Stock Change is the difference between stock levels at the beginning and end of the period. A negative number indicates a stockdraw while a positive number represents a stockbuild. / Под Учредительской Прибылью понимается прибыль, присваиваемая учредителями акционерного общества в виде разницы между доходом от реализации акций и вложенным капиталом.

STOCK CULTURE = ИСХОДНАЯ КУЛЬТУРА (или ЧИСТАЯ КУЛЬТУРА) – Stock Culture is an insect culture which serves as a source of insects for beginning a rearing program.

STOCK DIVIDEND = ДИВИДЕНД НА АКЦИЮ – Stock Dividend is a dividend paid in securities rather than cash. The dividend may be additional shares of the issuing company, or in shares of another company (usually a subsidiary) held by the company. Dividend paid in additional shares of stock. In certain countries these issues may be traded for a short period of time. A mutually agreed upon merger of two companies in which the holders of the companies being acquired receive the acquiring company's stock in exchange for their shares. Distribution of a dividend in the form of shares in the same company. Stock Dividends are distributions of additional shares to stockholders in proportion to the number of shares they own They must be reported by transferring an amount equal to the fair value of the additional shares from undivided profits to a category of permanent capitalization (common stock and surplus). The amount transferred from undivided profits may not be less than the par or stated value of the additional shares. A Stock Dividends is a pro rata distribution of the corporation's own stock to stockholders.

STOCK DYEING = КРАШЕНИЕ В ВОЛОКНЕ – Stock Dyeing:- 'dyed-in-the-wool' is another term for stock dyeing because the fiber is still in the form of loose fleece. Most stock-dyed wool is made into woolen yarns. Worsted wool is never dyed until after it is combed and dyeing at this stage is called Top Dyeing. Both methods produce the highest penetration of dye and the highest quality of colored yarns. Wool dyed this way is also used to make speckled yarns of mixed colors and subtle heathers. Stock Dyeing:- the yarn was undyed when tufted and then the unfinished carpet is dyed. Stock Dyeing is dyeing raw fibers, also called Stock, before they are aligned, blended, and spun into yarns. Stock Dyeing is the dyeing of fibers in staple form. Stock Dyeing:- the fiber is dyed even before it is spun. Stock dyeing is used to dye fibers. In this process, the staple fibers are packed into a vessel and then dye liquid is forced through them. Although the dye solution is pumped in large quantities, the dye may not penetrate completely into the fibers and some areas may be left without dyeing. However, the following blending and spinning processes mix up the fibers in such a thorough way that it results in an overall even color. Woolens are usually stock dyed.

STOCKER = XX – A term Stockers refers to weaned calves grazing pasture to enhance growth prior to finishing and slaughter; they are usually younger, weigh less, and are of lower condition (finish) than 'feeders'. See also Feeders, Slaughter Cattle, and Weaned Cattle.

STOCK EXCHANGE = ФОНДОВАЯ БИРЖА – Stock Exchange is the organized public market where traders buy and sell marketable securities, stocks and shares, either for themselves or on behalf of their customs. Also known as Securities Exchange. An organized marketplace for securities featured by the centralization of supply and demand for the transaction of orders by member brokers for institutional and individual investors. See also New York Stock Exchange. Stock Exchange is a place where dealers meet regularly to conclude commercial transactions in negotiable assets, especially securities and commodities. A stock exchange brings supply and demand together in the same way as a market. The aim is to facilitate the conclusion of contracts according to standard business conditions between persons admitted to trading. A market on which securities are regularly traded. Stock Exchange is an organization, usually a non-government corporation, that manages the trading (i.e. the buying and selling) of shares of companies is called a Stock Exchange. It provides a market (i.e. the 'stock market') place (physical or electronic) where buyers and sellers go to trade shares in corporations. Stock exchanges differentiate themselves by the quality of companies that they list for trading. Some exchanges will only list large, highly valued firms while others, such as junior exchanges, may list fledgling companies looking for speculative investors. / Фондовая Биржа, в капиталистических странах рынок ценных бумаг, главным образом акций и облигаций. Смотрите также Биржа.

STOCK EXCHANGE ACT = АКТ О ФОНДОВОЙ БИРЖЕ – The German Stock Exchange Act regulates the organization of the German stock exchanges. It consists of six sections:- (i) general provisions on exchanges and exchange bodies; (ii) pricing on stock exchanges and the broker system; (iii) admission of securities to stock exchange trading on the official market; (iv) admission of securities to and their inclusion in trading on the regulated market; unofficial regulated market; (v) provisions concerning electronic trading facilities and quasi-stock-exchange systems; (vi) provisions on penalties and fines; concluding provisions.

STOCK EXCHANGE AND SECURITIES TRADING ACT = АКТ О ФОНДОВОЙ БИРЖЕ И ТОРГОВЛЕ ЦЕННЫМИ БУМАГАМИ – In Switzerland, the Federal Act on Stock Exchanges and Securities Trading of 1995-March-24 (also known as SESTA, or Stock Exchange Act) regulates stock exchanges, securities dealers, and insofar as listed companies are concerned, mandatory disclosures of shareholdings and public offers. While the provisions relating to disclosure of shareholdings and public offers came into force on 1998-January-01, the remainder of SESTA's provisions entered into effect on 1997-February-01. Since the coming into force of SESTA, listed companies and their shareholders must comply with a comprehensive regime regarding disclosure of shareholdings and public offers. SESTA makes disclosure of shareholdings mandatory if shares of a company which is incorporated in Switzerland and whose equity securities are listed are purchased or sold and if, as a result of a purchase or sale, certain thresholds are exceeded, irrespective of whether or not voting rights are exercisable. The relevant percentages are 5, 10, 20, 33-1/3, 50 and 66-2/3 per cent of the voting rights. The notification must be made both to the stock exchange and the company concerned within four trading days after the disclosure obligation arises. Non-observance of these reporting duties is an offence which can result in a (large) fine. Furthermore, in the context of a public offer, each person who holds at least 5 per cent of the voting rights in the target company or in the company whose shares are offered as consideration must notify both the Takeover Board and the stock exchange of each transaction in these shares by midday on the trading day following the transaction. The Exchange and Securities Trading Act came into effect on 1997-February-01. It obliges banks and other institutions or persons engaged in securities trading to inform all securities clients of the risks inherent in the various types of transaction and securities. However, securities and transactions derived from them (derivatives) also offer opportunities. Anyone purchasing or selling for his own account, directly, indirectly or in concert with third parties, shares of a company registered in Switzerland whose equities are listed at least partially in Switzerland, thus attaining, exceeding or falling below the threshold of 5%, 10%, 20%, 33-1/3%, 50% or 66-2/3% of the voting rights, whether these are exercisable or not, must report this to the company and the exchanges on which the equities are listed.

STOCK EXCHANGE BANK = БАНК, ТОРГУЮЩИЙ НА ФОНДОВОЙ БИРЖЕ (или ИНВЕСТИЦИОННЫЙ БАНК) – Stock Exchange Bank is a bank that trades in securities on the stock exchange. In the case of a stock exchange that trades under the 'a la criee' system, the term ring bank is used, i.e. a bank authorized to trade on the ring. / Банк, который торгует на бирже ценными бумагами. В случае, когда используется термин банк на ринге фондовой биржи, которая проводит торги по системе открытого оглашения, имеется в виду, что этот банк уполномочен торговать на этом ринге.

STOCK EXCHANGE CENTRE = ЦЕНТР ФОНДОВОЙ БИРЖИ – Stock Exchange Centre is a place at which a stock exchange is located. In the Federal Republic of Germany, there are seven stock exchanges:- Berlin-Bremen, Düsseldorf, Frankfurt am Main, Hamburg, Hanover, Munich and Stuttgart. Up to the First World War, there were 29 stock exchanges in Germany, including the product exchanges. In 1935, there were still 21, reduced to nine after the National-Socialist stock exchange reform:- Berlin, Breslau, Düsseldorf, Frankfurt, Hamburg (including Bremen), Hanover, Leipzig, Munich and Stuttgart.

STOCK EXCHANGE COUNCIL = СОВЕТ ФОНДОВОЙ БИРЖИ – In Germany, Stock Exchange Council consists of 18 honorary members elected for 3 years. They include representatives of banks, market participants, issuers and capital investors. The duties of the stock exchange council are set out in the stock exchange rules. They include the issuance of the stock exchange rules and the fee regulations, the rules of procedure for the management, the conditions for transactions on the stock exchange, the arbitration rules (stock exchange arbitration tribunal) and the business conditions for futures and options trading on the exchange.

STOCK EXCHANGE DAILY OFFICIAL LIST = ПОСУТОЧНЫЙ ОФИЦИАЛЬНЫЙ БЮЛЛЕТЕНЬ ФОНДОВОЙ БИРЖИ – Stock Exchange Daily Official List:- numbering system that the London Stock Exchange uses for UK securities and other securities. / Система нумерации, используемая Лондонской Фондовой Биржей для ценных бумаг Соединённого Королевства или иных ценных бумаг.

STOCK EXCHANGE'S AUTOMATED TRADING SYSTEM = АВТОМАТИЗИРОВАННАЯ ТОРГОВАЯ СИСТЕМА ФОНДОВОЙ БИРЖИ – The Stock Exchange's Automated Trading System provided for the trading of securities on the Australian Securities Exchange (ASX). / Автоматизированная Система Торговли Фондовой Биржи, обеспечивающая торговлю ценными бумагами на Австралийской Бирже Ценных Бумаг (АБЦБ).

STOCK EXCHANGE PROSPECTUS = ПРОСПЕКТ ФОНДОВОЙ БИРЖИ – Stock Exchange Prospectus:- for the admission of securities to trading on the official or regulated market, the Stock Exchange Act and the Securities Prospectus Act, among other things, impose a general duty to write a prospectus and to file it with the stock exchange listing office. The prospectus contains all important information about the security, the issuer, the company's structure, its financial situation, business activities and all bodies and companies involved in the issue. It should allow the formation of an accurate judgement of the issuer's assets and liabilities, financial situation, profits and losses and future prospects. The Federal Financial Supervisory Authority checks the prospectus for formal, but not material, correctness. The issuer and issuing syndicate are responsible and liable for the correctness of the content.

STOCK EXCHANGE QUOTATION = КОТИРОВКА ФОНДОВОЙ БИРЖИ (или РАСЦЕНКА ФОНДОВОЙ БИРЖИ, или КУРС ФОНДОВОЙ БИРЖИ) – Stock Exchange Quotation:- also known as Price Fixing, the fixing of market prices for all securities listed on the stock exchange. Exchange prices in floor trading on the Frankfurt Stock Exchange are determined by the official brokers. The process is governed by the Exchange Rules. The trade is concluded at the price at which most orders (purchases and sales) can be executed (principle of maximum possible execution). The market price of securities can be quoted once during a trading day on the stock exchange (standard quotation) or more than once a day on a continuous basis (variable quotation).

STOCK GRANT = ГРАНТ В ВИДЕ АКЦИИ – Stock Grant:- somewhat different from a Restricted Stock Unit (RSU), a stock grant consists of shares actually issued and delivered to someone as a bonus or payment for service. These grants can either be 'non-restricted' or 'restricted'. A non-restricted stock grant is an outright award of stock. A restricted grant is contains conditions that the holder must satisfy such as vesting over time. time-based vesting, which requires the employee to remain with the company for a certain length of time before full ownership of all of the shares is transferred. Departure prior to fulfilling the required service will result in the forfeiture of the unvested stock back to the company. For stock grants that are not restricted, the tax implications are straightforward. The fair market value (FMV) of the stock at the time it is granted is taxed as ordinary income.

STOCKHOLDER = АКЦИОНЕР (или УЧАСТНИК, или ДОЛЬЩИК, или ПАЙЩИК) – Stockholders are the owners of a corporation based on their holdings. They own an interest in the corporation rather than specific corporate property. Stockholder is a person who owns stock in a company and is eligible to share in profits and losses. Also known as Shareholder. / Известен также как Акционер или Дольщик или Пайщик (Shareholder).

STOCKHOLDER MEETING ANNOUNCEMENTS = ОБЪЯВЛЕНИЯ О СОБРАНИИ АКЦИОНЕРОВ (или ОБЪЯВЛЕНИЯ О СОБРАНИИ УЧАСТНИКОВ) – Stockholder Meeting Announcements are the announcements of regularly scheduled and special stockholder meetings. Meeting announcements and any accompanying proxy materials are typically passed on to the beneficial owners of the securities.

STOCKHOLDER OF RECORD = АКЦИОНЕР ПО ЗАПИСИ (или ЗАРЕГИСТРИРОВАННЫЙ УЧАСТНИК, или УЧАСТНИК ПО РЕЕСТРУ) – Stockholder Of Record is a stockholder whose name is registered on the books of the issuing corporation. See also Registrar. / Участник, чьё имя зарегистрировано в книгах эмитирующей корпорации. Смотрите также Регистратор (Registrar).

STOCKHOLDERS' EQUITY = СОБСТВЕННЫЕ СРЕДСТВА (или ДОЛЯ) УЧАСТНИКОВ – In the United States, Stockholders' Equity is the residual of assets minus liabilities, i.e. net assets. Due to the number of fraudulent manipulations involving stocks, many states have legislated accounting for stockholders' equity transactions, and they are controlled to some degree, e.g., conditions under which dividends may be paid. Stockholders' Equity is classified into:- (i) contributed capital, and (ii) earned capital. Contributed capital (paid-in capital):- (a) is the amount advanced by stockholders for use in the business, and (b) includes the par value of stock and any premium or discount on issuance of stock. Earned capital consists of undistributed profits. The value of all the stock owned by the shareholders of a particular company. Also known as Net Worth. Stockholders' Equity is the total value of funds that belong to the stockholders. Thus it is the sum of the value of Issued Stocks, Paid in Surplus and Retained Earnings. Also known as Shareholders' Equity in the United Kingdom. / Стоимость всех акций, принадлежащих акционерам конкретной компании. Известны также как Чистая Стоимость Компании (Net Worth).

STOCKHOLDERS' EQUITY/FIXED ASSETS = СОБСТВЕННЫЕ СРЕДСТВА (или ДОЛЯ) УЧАСТНИКОВ/НЕДВИЖИМЫЕ АКТИВЫ (или ОСНОВНЫЕ ФОНДЫ) – Stockholders' Equity/Fixed Assets is the ratio of the total stockholders' equity to fixed assets. It provides a measure of financial risk. A typical value is 1:1.

STOCKHOLDERS' EQUITY OTHER THAN COMMON STOCK = СОБСТВЕННЫЕ СРЕДСТВА (или ДОЛЯ) УЧАСТНИКОВ ИНЫЕ, НЕЖЕЛИ В ОБЫКНОВЕННОМ УСТАВНОМ КАПИТАЛЕ – In the United States, Stockholders' Equity is the portion of the balance sheet that represents the capital received from investors in exchange for stock (paid-in capital), donated capital and retained earnings. Stockholders' equity represents the equity stake currently held on the books by a firm's equity investors. It is calculated either as a firm's total assets minus its total liabilities, or as share capital plus retained earnings minus treasury shares. Also known as Shareholders' Equity. Stockholders' Equity is the ownership interest in a business; Assets = Liabilities + Common Stock + Retained Earnings. Stockholders' Equity, a company's common stock equity as it appears on a balance sheet, equal to total assets minus liabilities, preferred stock, and intangible assets such as goodwill. This is how much the company would have left over in assets if it went out of business immediately. Since companies are usually expected to grow and generate more profits in the future, most companies end up being worth far more in the marketplace than their stockholders' equity would suggest. For this reason, stockholders' equity is of more interest to value investors than growth investors. Also known as Book Value. Stockholder's Equity is the residual claims that stockholders have against a firm's assets, calculated by subtracting all current liabilities and debt liabilities from total assets. Stockholders' Equity is often referred to as the book value of the company, and it comes from two main sources. The first and original source is the money that was originally invested in the company, along with any additional investments made thereafter. The second comes from retained earnings that the company is able to accumulate over time through its operations. In most cases, especially when dealing with older companies that have been in business for many years, the retained earnings portion is the largest component. Stockholders' Equity is total assets minus total liabilities. It is the same as Equity, Net Worth and Shareholders' Equity. Also known as Reserves in the United Kingdom. See also Common Stock, and Stockholders' Equity.

STOCK INDEX = ФОНДОВЫЙ ИНДЕКС (или ИНДЕКС ПО АКЦИЯМ) – Stock Index is a way of using a select group of stocks for long-term evaluation. The performance of a group of stocks that experts regard as important is averaged, and over time that average serves as an indicator of the market's general movement. An indicator used to measure and report value changes in a selected group of stocks. How a particular stock index tracks the market depends on its composition the sampling of stocks, the weighting of individual stocks, and the method of averaging used to establish an index. Stock Indices like the DOW or the S&P 500 or the T-Net20 are designed to track a particular, defined market, e.g., top blue chip companies, broad market, or a specific group like the 20 most valuable BC (the Province of British Columbia) tech companies. Instead of following specific stocks, this let's us see how 'the market' is performing – like a weighted price average. / Дау (Dow).

STOCK INDEX FUTURES = ФЬЮЧЕРСЫ НА ФОНДОВЫЙ ИНДЕКС (или ФЬЮЧЕРСЫ НА ИНДЕКС ПО АКЦИЯМ) – Futures contracts based on market indexes. Futures contracts on a stock index, such as the Standard And Poor's 500 or the Dow Jones Industrial Average. Stock index futures contracts are a derivative of the underlying index, and are cash-settled. Stock Index Futures is a futures contract on a stock index. Most are cash-settled. The theoretical price of a stock index future equals the cost of carrying the underlying stock for that period: the opportunity cost of the funds invested minus any dividends. If the cost of buying and holding the underlying stocks is less than the futures price, an arbitrageur can sell futures and buy the underlying stocks. The higher interest rates are (compared with the dividend yield), the greater the opportunity cost of holding the stocks, hence the futures price should be higher than the current index price. If interest rates are less than the dividend yield, the opportunity cost of holding stocks is less and the

futures price should fall below the current index price. There is usually a so-called Arbitrage Band in which, although the futures and underlying prices diverge, it is not worthwhile arbitraging the two. This arises as a result of transaction costs from bid-ask spreads, the market impact of buying and selling stock, and execution risks. Forward contracts based on the development of specific stock exchange indexes. / Стэндод энд Поз (Standard & Poor's) или Дау Дьжонз (Dow Jones).

STOCKINETTE = СТОКИНЭТЧ (или ГЛАДЬ, или ВЫРЕЗНОЙ ТРИКОТАЖ, или КРОЕЧНЫЙ ТРИКОТАЖ) – Stockinette is a knit fabric in tubular or flat form made with a plain stitch from yarns of wool, cotton, manufactured fibers, or a combination of these fibers. Stockinette fabrics are used for underwear, industrial applications, and other purposes. In heavier constructions, dyed and napped stockinette finds apparel uses. Also spelled Stockinet. Stockinette is a soft elastic usually cotton fabric used especially for bandages and infants' wear. / .

STOCKINETTE FABRIC = ТКАНЬ (ЛИЦЕВАЯ) ГЛАДЬ (или ТКАНЬ СТОКИНЭТЧ, или ТРИКОТАЖНАЯ ТКАНЬ) – Stockinette Fabric:- knitting on the front pops the stitch heads to the back of this fabric, while purling on the back pops the heads to the front. When stockinette is knitted flat – when it is made on alternating sides of the fabric (knit the front, then purl the back) the result is all the heads aligned on the back, and all the arms aligned on the front. See also Reverse Stockinette Fabric. Stockinette Fabric:- made of a machine-knitted elastic fabric used, esp formerly, for stockings, undergarments, bandages, etc. / Гладь – трикотажная (кулирная, однофонтурная), наиболее простое и распространённое трикотажное переплетение, при котором на лицевой стороне трикотажа видны прямые отрезки нитей (arms), соединяющих дуги петель (heads), а на изнанке – только дуги. Гладь применяется на одинарных трикотажных машинах при выработке чулочных и бельевых изделий, перчаток и тому подобного. Второе название Лицевой Глади – Кулирная Гладь. Кулирная Гладь (или, в простонародье, Кулирка) – это тонкий гладкий материал, образованный с помощью поперечного одинарного переплетения, лицевая сторона которого образована при помощи столбиков, изнаночная – протяжками и дугами. Одна из самых долговечных и стойких к износу тканей. Кулирка – 100-процентный хлопок, хотя довольно часто материал разбавляют лайкрой, причем качество такого полотна ничуть не хуже. Кулирная гладь бывает трёх видов:- гладкокрашеная, набивная и меланжевая. Данный вид материала обладает хорошей эластичностью, хорошо тянется в ширину и почти не тянется в длину. Несмотря на то, что это тонкий материал, он обладает хорошей прочностью. Следует сказать, что этот материал не требует особого ухода, не садится и не вытягивается после стирки и вообще хорошо держит форму. Ненужных складок на вашей одежде тоже не возникнет, так как этот материал практически не мнется. Хорошо ложатся на кулирную гладь все виды нанесения:- шёлкография, термопечать, при достаточно высокой плотности – хорошо смотрится вышивка. Кулирную гладь используют для пошива футболок, юбок, шорт, лёгких халатов, рубашек и это – далеко не весь список. Одежда из этого материала получается воздушной и лёгкой. Одним из главных достоинств кулирной глади является высокая воздухопроницаемость, поэтому в летнее время одежда, изготовленная из кулирки, просто не заменима. Так же, это гигиенический материал, который отлично впитывает воду. Неудивительно, что из этого материала шьют одежду для самых маленьких детей (кулирка набивная детская). Ребёнку в такой одежде будет очень удобно и не доставит дискомфортных ощущений. Часто эти материалы выбирают для пошива одежды для фитнеса. Выбирая одежду для себя и своих родных, конечно же, следует остановить свой выбор на изделиях из натуральных материалов, которая будет доставлять максимум комфорта и радовать на протяжении долгого времени. Одежда, изготовленная из кулирной глади, подойдёт на все сто процентов. Кулирная Гладь:- (i) имеет выраженную лицевую и изнаночную сторону. Лицевая сторона гладкая, ровная с чётко выраженными петельными столбиками, идущими вдоль полотна, изнаночная сторона характеризуется поперечными полосами – рядами. (ii) Легко распускается в направлении вязания и в направлении обратном вязанию. (iii) Закручивается по краям, причём по линии петельного столбика – на изнаночную сторону, а по линии петельного ряда – на лицевую сторону. Закручиваемость трикотажа приводит к ряду трудностей при раскрое и пошиве изделий. В зависимости от поверхностной плотности и состава полотна меняются потребительские свойства кулирного полотна. Для бельевого трикотажа используется полотно с меньшей поверхностной плотностью из хлопка с малой долей вложения химических волокон, в результате полотно более сминаемое, подвержено усадке, менее формоустойчиво. Для верхнего трикотажа используется полотно с большей поверхностной плотностью. Изделия из такого полотна более формоустойчивы, менее сминаемы (из-за большего вложения химических волокон), естественно прилегают к фигуре. Кулирная Гладь или Кулирка – название полотна определено переплетением – порядком расположения петель в полотне. В данном случае имеет место поперечно вязаное одинарное переплетение. Лицевая сторона гладкая, с чётко выраженными петельными столбиками (arms), а на изнаночной стороне имеются поперечные полосы, образованные игольными дугами (heads) и протяжками. Кулирная гладь (кулирка) хорошо тянется в ширину и почти не тянется в длину. Основное практическое применение этого полотна – пошив летней и домашней верхней одежды – маек, блузок и так далее.

STOCKINETTE STITCH = СТЕЖОК СТОКИНЭТЧ (или ТРИКОТАЖНАЯ СТРОЧКА, или ТРИКОТАЖНАЯ СТЕЖКА) – Stockinette Stitch:- in hand weft knitting, characterized by vertical wales on the face and horizontal courses on the back of the fabric. See also Plain Stitch.

STOCKING = ЧУЛОК (или ЧУЛОЧНО–НОСОЧНОЕ ИЗДЕЛИЕ, или НОСОК) – Stocking is a usually knit close-fitting covering for the foot and leg; sock.

STOCKING CAP = ВЯЗАНАЯ ШАПОЧКА (или ХХ) – Stocking Cap is a long knitted cone-shaped cap with a tassel or pom-pom worn especially for winter sports or play.

STOCK KEEPING UNIT = ЕДИНИЦА УЧЁТА ЗАПАСОВ – Stock Keeping Unit (SKU) is a number (product code) assigned to a single item or items by the manufacturer. Stock Keeping Unit (SKU); a product code assigned by the owner of the goods. A Stock Keeping Unit (SKU) is a unique identifier for each distinct product and services that can be ordered from a supplier. Usage of the SKU system is rooted in data management, enabling the merchant to systematically track their inventory, such as in warehouses and retail outlets. A Stock Keeping Unit (SKU) is a smallest unit grouping for goods, normally indicating a single retail item. Usually, several SKUs will be under one purchase order.

STOCK LENDING = ОДАЛЖИВАНИЕ АКЦИЙ – Stock Lending is the lending of stock from one institutional investor to another (usually a market maker) often to allow the borrower to go short. The lender continues to be entitled to income generated by the stock and receives an additional consideration. Many institutional investors, such as pension funds, forbid their fund managers to undertake stock lending.

STOCK LOT = ЗАПАСНЫЙ ЛОТ – Stock Lot is a term used to describe multiples of the same item. Example:- a Stock lot of apparel would be one garment in various sizes (Same style). When making purchases, ask the selling company for clarification when inquiring.

STOCK MARKET = ФОНДОВЫЙ РЫНОК – Stock Market is an association where security trading is conducted in an organized system. A market in which shares of stock are bought and sold. / Фондовый Рынок – рынок, на котором покупаются и продаются акции уставного капитала компаний.

STOCK MARKET CRASH = КРАХ ФОНДОВОГО РЫНКА – Stock Market Crash is a sudden drop in stock prices. A crash can occur when economic growth slows down abruptly or if the market is in technically poor condition due to excessive prices caused by speculation. Serious stock market crashes were seen on 1929-May-13, in Germany, and on 1929-October-29, and 1987-October-19, in New York, although the latter was less severe than its predecessors.

STOCK MARKET PRICE = ЦЕНА НА ФОНДОВОМ РЫНКЕ – Stock Market Price is the currently quoted price for the company's Stocks on the Stock Exchange.

STOCK MARKET SUPERVISION = НАДЗОР ЗА ФОНДОВЫМ РЫНКОМ – In Germany, in organizational terms, Stock Market Supervision has a three-tier structure:- Federal Financial Supervisory Authority (BaFin), the regional Exchange Supervisory Authority and the Trading Surveillance Office as a self-governing entity of the stock exchange. These regulatory institutions are not structured hierarchically, but separated on a parallel basis by their respective functional competences and committed to cooperation. The exchange supervisory authorities and the trading surveillance offices are responsible for monitoring the proper formation of prices on the stock exchanges. The Federal Financial Supervisory Authority, on the other hand, is responsible for investigating breaches of insider law and for compliance with disclosure regulations.

STOCK MARKET TURNOVER = ОБОРОТ ФОНДОВОГО РЫНКА – Stock Market Turnover is the total value of trades concluded in a particular security or the total market in the respective currency at a certain point in time or within a certain period.

STOCKMASTER = ФОНДОВЫЙ МАСТЕР – Stockmaster:- electronically regulated device which can be used to poll information on securities. / Электронно регулируемое устройство, которое может быть использованро для опроса по информации о ценных бумагах.

STOCK OPTION = ОПЦИОН НА АКЦИЮ – Sock Option is the right to purchase shares of a corporation under specific conditions and at a specific price. An employee stock option plan is an incentive plan which enables employees to purchase stock in their corporation at favorable prices, within a specified time period. Stock Option is a right to purchase or sell a specified number of shares of stock at specified prices and times. Stock Options give employees of companies the right to buy shares at a certain price (usually the trading price on the date granted) for a certain period of time. If the shares increase, then a handsome profit can be realized at no risk by selling shares at current market prices while at the same time buying shares at below market prices. These are usually called Incentive Stock Options and can augment an employees salary considerably. In many corporations, managers earn far more by exercising stock options than they do by means of a pay cheque. There are also trading options. These are created in the marketplace between buyers and sellers. There are both call options and put options that are based on an underlying stock. Call options allow the holder to buy shares of a company at a particular price for a specified time period. Put options allow the holder to sell shares of a company at a particular price for a specified time period.

STOCK OPTION EXPIRATION CYCLES = ЦИКЛЫ ПРЕКРАЩЕНИЯ ПРИЗНАНИЯ ОПЦИОНОВ НА АКЦИЮ – Stock Option Expiration Cycles:- deciding to trade a stock option requires choosing an expiration month. Because option strategies require making modifications during the life of a trade, you need to know in what months the options will expire. The expiration month you choose will have a significant impact on the potential success of any option trade, so it is important to understand how the exchanges decide what expiration months are available for each stock. At any given time, there are at least four different expiration months available for every stock on which options trade. The reason for this is that when equity options first started trading in 1973, the Chicago Board Options Exchange (CBOE®) decided there would be only four months wherein options could be traded at any given time. Later, when long-term equity anticipation securities (LEAPS) were introduced, it was possible for options be traded for more than four months. Not All Stocks Trade the Same Options:- you may have noticed that not all stocks have the same expiration months available. Let's look at the expiration months available from September 2008 for three different stocks, e.g., Microsoft (Nasdaq®:- MSFT), CitiGroup (NYSE®:-C) and Progressive (NYSE®:- PGR):- (i) Microsoft:- September 2008, October 2008, January 2009, April 2009, January 2010 and January 2011; (ii) Progressive:- September 2008, October 2008, November 2008 and February 2009; and (iii) CitiGroup:- September 2008, October 2008, December 2008, January 2009, March 2009, January 2010 and January 2011. The first thing you may notice is that all three have September and October options available. Next, both Microsoft and CitiGroup have options available in January 2009, January 2010 and January 2011, while Progressive does not. But then it gets more confusing. For the third month out, not one of the months matches those for any of the other two. And CitiGroup has an extra month trading:- March 2009. Exactly how do the exchanges decide what expiration months should be available for each stock? To answer that question, you need to understand the history of how the exchanges have managed the option expiration cycles. When stock options first began trading, each stock was assigned to one of three cycles:- January, February or March. There is no meaning as to which cycle a stock was assigned – it was purely random. Stocks assigned to the January cycle had options available only in the first month of each quarter:- January, April, July and October. Stocks assigned to the February cycle had only the middle months of each quarter available:- February, May, August and November. Stocks on the March cycle had the end months of each quarter available:- March, June, September and December. The Modified Expiration Cycles:- as options gained in popularity, it soon became apparent that both the floor traders and individual investors preferred to trade or hedge for shorter terms. So the original rules were modified, and in 1990, the CBOE decided that every stock would always have the current month plus the following month available to trade. This is why all three of the stocks in the above example have September and October options available. Every stock has at least four expiration months trading. Under the new rules, the first two months are always the two near months, but for the two farther-out months, the rules use the original cycles. It may help to look at an example. Let's say it is the beginning of January, and we are looking at a stock assigned to the January cycle. Under the newer rules, there is always the current month plus the following month available, so January and February will be available. Because four months must trade, the next two months from the original cycle would be April and July. So, the stock will have options available in January, February, April and July. What happens when January expires? February is already trading, so that simply becomes the near-month contract. Because the first two months must trade options, March will begin to trade on the first trading day after the January expiration date. So the four months now available are February, March, April and July. Now comes the tricky part: once the February options expire, March becomes the current contract. The following month, April, is already trading. But with March, April and July contracts trading, that's only three expiration months, and we need four. So, we go back to the original cycle and add October because it is the next month in the January cycle after July. So the March, April, July and October options will now be available. The same reasoning determines what months are trading for stocks on the February and March cycles. Adding LEAPS:- if a stock has LEAPS available, then more than four expiration months will be available. Only the most popular stocks have LEAPS available. That is why in our example above, Microsoft and CitiGroup had them while Progressive did not. (For background reading on LEAPS, see Using Options Instead Of Equity, Using LEAPS With Collars and Using LEAPS In A Covered Call Write.) Once you understand the basic option cycle, adding LEAPS is not difficult. LEAPS are long-term options that, with some exceptions, are no more than three years out and usually trade with a January expiration date. If a stock does have LEAPS, then new LEAPS are issued in May, June or July depending on the cycle to which the stock is assigned. When it is time to add (or go beyond) January in the normal rotation (not including the current or near-term contract),

the January LEAPS that has been 'hit' becomes a normal option, which also means the root symbol changes and a new LEAPS year is added. Let's go back and look at our original examples and walk through what happened to Microsoft and CitiGroup. For Microsoft we go back to May of 2008. The months available for Microsoft then were May 2008, June 2008, July 2008, October 2008, January 2009 and January 2010. Once the May options expired, another month needed to be added. The two front months, June and July, were already trading, as was the next month in the cycle:- October. So, following the rules for the January cycle, we would need to add the January expiration month. For a stock that did not have LEAPS, no further action would be necessary, and it would trade the four months of June, July, October and January 2009. But Microsoft already had LEAPS trading that expire in January 2009. So, instead those were converted to standard options (with an accompanying symbol change), and January 2011 LEAPS were added. Nothing out of the ordinary happened to CitiGroup when the May options expired, since it is on the March cycle. June was already trading, so only the month of July had to be added. After the May expiration, CitiGroup now traded the months of June, July, September and December, plus LEAPS in January 2009 and 2010. But let's follow through what happens after the June expiration. For the regular options, July, September and December were already trading, so all they needed to do was add the second front month: August. But for March cycle stocks like CitiGroup the January 2009 LEAPS converted to standard options after the June expiration date, and the January 2011 LEAPS were introduced at the same time. So, on the Monday after the June expiration, CitiGroup had options trading in July, August, September, December and January 2009, as well as LEAPS in January 2010 and January 2011. Cycle-three stocks follow the same procedure, whereby the 2009 LEAPS convert to regular options after the July expiration date, and the 2011 LEAPS are added. How Can You Tell What Cycle a Stock Is On? You cannot tell what cycle a stock is on by looking at the front two months: all stocks will have those months available. To figure out the cycle, you need to look further out at the third and fourth months. You can usually tell from the third expiration month available. Just keep adding three months to the third month until you reach January, February or March. CitiGroup has December as the third contract month, so if we add three months we arrive at March. We therefore know that CitiGroup is on the March cycle. That said, you have to be careful if the third month out happens to be January. While that may indeed mean the stock is on the January cycle, any stock with LEAPS will also have January options trading. In that case, you need to look farther out to see what the fourth month is to confirm what cycle the stock is on. In the above example, Microsoft has April available, so we know for sure that it is on the January cycle. Conclusion:- option-expiration cycles for stocks may seem a bit confusing, but if you take a little time to understand them, they become second nature. Because you may need to make adjustments during the life of a trade, it can be very important to know what expiration months will become available in the future. Understanding the expiration cycles is just one more way to help you increase your success rate when trading options. / СИБО® (СВОЕ®). Майкрософт (Microsoft). Сытигруп Инк. (Citigroup Inc.). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). НЭЗДЭК® (NASDAQ®) .

STOCK ROTATION = РОТАЦИЯ ТОВАРНЫХ ЗАПАСОВ (или РОТАЦИЯ МАТЕРИАЛЬНЫХ ЦЕННОСТЕЙ) – Stock Rotation:- a way of prolonging shelf-life by moving or replacing product in a warehouse.

STOCKS = ЗАПАСЫ – Stocks:- a supply of fuel accumulated for future use. This includes coal and fuel oil stocks at the plant site, in coal cars, tanks, or barges at the plant site, or at separate storage sites. It is a collection of raw materials or goods held by a manufacturer, wholesaler, retailer or end-user. Also known as Inventories in the United States, and Stock-In-Trade. Inventory of raw materials and goods in a company's possession that will be used to make finished products or that are held for resale. In manufacturing companies, stocks include raw materials or goods used to produce the items sold, parts, work in process and finished goods. In retail companies, stocks consist of merchandise held for resale.

STOCKS ABOVE THEIR 50–DAY MOVING AVERAGE = АКЦИИ С ЦЕНОЙ ВЫШЕ ИХ 50–СУТОЧНОЙ СКОЛЬЗЯЩЕЙ СРЕДНЕЙ ВЕЛИЧИНЫ (или АКЦИИ С ЦЕНОЙ ВЫШЕ ИХ 50–ДНЕВНОГО СКОЛЬЗЯЩЕГО СРЕДНЕАРИФМЕТИЧЕСКОГО) – Stocks Above Their 50-Day Moving Average:- a market breadth indicator that represents the number of stocks in a given group that have closing prices that are currently above their 50-day simple moving average. Common techniques for using this indicator include locating overbought/oversold levels and finding positive or negative divergences between this indicator and the underlying group's composite index. / и соответствующим сводным индексом группы.

STOCKS ABOVE THEIR 200–DAY MOVING AVERAGE = АКЦИИ С ЦЕНОЙ ВЫШЕ ИХ 200–СУТОЧНОЙ СКОЛЬЗЯЩЕЙ СРЕДНЕЙ ВЕЛИЧИНЫ (или АКЦИИ С ЦЕНОЙ ВЫШЕ ИХ 200–ДНЕВНОГО СКОЛЬЗЯЩЕГО СРЕДНЕАРИФМЕТИЧЕСКОГО) – Stocks Above Their 200-Day Moving Average:- a market breadth indicator that represents the number of stocks in a given group that have closing prices that are currently above their 200-day simple moving average. Common techniques for using this indicator include locating overbought/oversold levels and finding positive or negative divergences between this indicator and the underlying group's composite index. / и соответствующим сводным индексом группы.

STOCK SEED = ИСХОДНОЕ СЕМЯ (или ЭЛИТНОЕ СЕМЯ) – Stock Seed is a seed stored for multiplication.

STOCK SOLUTION = МАТОЧНЫЙ РАСТВОР (или КОНЦЕНТРИРОВАННЫЙ РАСТВОР) – Stock Solution is a solution of known strength, made up with the intent of dilution or mixing before final use. Stock solutions are a convenient way of avoiding the need to weigh chemicals each time you need to use some. For example, if you need 0.27 grams of Smurf extract in a blue dye formula, and you have a stock solution of 10% extract, you would measure 2.7 milliliters of stock solution to get that amount. Some chemical solutions have limited shelf life.

STOCK SPLIT = ДРОБЛЕНИЕ АКЦИЙ (или ДРОБЛЕНИЕ УСТАВНОГО ФОНДА) – A Stock Split is very much like a stock dividend in that it involves the issuance of additional shares of stock to stockholders according to their percentage ownership. In a stock split, the number shares is increased in the same proportion that the par or stated value per share is decreased, i.e. in a 2-for-1 split, one share of USD10.00 par value stock is exchanged for two shares of USD5.00 par value stock. A stock split does not have any effect on total paid-in capital, retained earnings, and total stockholders' equity. With a stock split the number of shares outstanding increases. An increase in the corporation's total number of outstanding shares accompanied by a proportionate decrease in the value per share. Example:- in a 2 for 1 stock split, the shareholder receives an additional share for every share that they owned on the split's record date. If the holder owned 10 shares valued at USD100.00 per share, after a 2 for 1 split they will own 20 shares valued at USD50.00 per share. / Дробление Акций – разбивка акций на несколько штук с меньшим номиналом путём выпуска нескольких акций вместо одной. При этом общая сумма капитала не изменяется, а количество акций увеличивается. Смотрите также Консолидация или Обратное Дробление (Reverse Split).

STOCK SPLIT/CONSOLIDATION = ДРОБЛЕНИЕ/КОНСОЛИДАЦИЯ АКЦИЙ (или ДРОБЛЕНИЕ/КОНСОЛИДАЦИЯ УСТАВНОГО ФОНДА) – Stock Split/Consolidation:- a company can split its shares, i.e. issue 2 for 1 or 3 for 1 new shares for each old share. Companies do this when their share prices appear too high for the average investor. It also increases the 'float', i.e. number of shares in the market, allowing for more liquidity in the market (less easy to corner or control a market). Sometimes companies also do a reverse split, or consolidation of shares. This is less common. It happens if a company has too high a float and/or too low a price. This may be important to a company if it is trying to raise more capital and does not want to appear to be a 'penny' stock.

STOCK SPLIT/PAR VALUE CHANGE = ИЗМЕНЕНИЕ НАРИЦАТЕЛЬНОЙ СТОИМОСТИ АКЦИИ ЗА СЧЁТ ДРОБЛЕНИЯ – Stock Split/Par Value Change:- issuance of additional stock to existing shareholders, typically expressed as a ratio, e.g., 2-for-1 split. In a reverse split, the number of shares are reduced, e.g., a 1-for-3 ratio of new shares for old. / Выпуск дополнительного уставного капитала для существующих акционеров, выражаемый, как правило, в качестве коэффициента, например, дробление 2-за-1. При консолидации или, так называемом обратном дроблении (reverse split) количество акций уменьшается, например, коэффициент 1-за-3, то есть одна новая акция за три старые.

STOCK SYMBOL = ФОНДОВЫЙ СИМВОЛ (или СИМВОЛ АКЦИЙ) – Stock Symbol is a unique four- or five-letter symbol assigned to a NASDAQ® security. If a fifth letter appears, it identifies the issue as other than a single issue of common stock or capital stock. A list of fifth-letter identifiers and a description of what each represents follows:- A – Class A; B – Class B; C – Issuer qualifications exceptions, the letter 'C' as a fifth character in a security symbol, indicates that the issuer has been granted a continuance in NASDAQ® under an exception to the qualification standards for a limited period; D – New; E – Delinquent in required filings with the SEC; F – Foreign; G – First convertible bond; H – Second convertible bond, same company; I – Third convertible bond, same company; J – Voting; K – Nonvoting; L – Miscellaneous situations, such as depositary receipts, stubs, additional warrants, and units; M – Fourth preferred, same company; N – Third preferred, same company; O – Second preferred, same company; P – First preferred, same company; Q – Bankruptcy Proceedings; R – Rights; S – Shares of beneficial interest; T – With warrants or with rights; U – Units; V – When-issued and when distributed; W – Warrants; Y – ADR (American Depositary Receipt); Z – Miscellaneous situations such as depositary receipts, stubs, additional warrants, and units. / НЭЗДЭК® (NASDAQ®) .

STOCK TICKER SYMBOLS = ФОНДОВЫЕ ТИКЕРНЫЕ СИМВОЛЫ (или ТИКЕРНЫЕ СИМВОЛЫ АКЦИЙ) – Stock Ticker Symbols:- every corporation whose transactions are reported on the AMEX® or NYSE® ticker or on NASDAQ® has been given a unique identification symbol of up to four letters. These symbols abbreviate the complete corporate name and facilitate trading and ticker reporting. Some of the most famous symbols are:- GM (General Motors), IBM (International Business Machines), S (Sears Roebuck), T (American Telephone And Telegraph), XON (Exxon), and XRX (Xerox). / АФБ® или АМЭКС® (AMEX®) или НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). НЭЗДЭК® (NASDAQ®) . Дьжи.Эм. (GM; Дьженерэл Мотоз (General Motors)), Ай.Би.Эм. (IBM; Интёнэшэнэл Бизнэс Мэшинз (International Business Machines)), Эс. (S; Сиаз Робак (Sears Roebuck)), Ти. (T; Амэрикэн Тчэлэфон Энд Тчэлэграф (American Telephone And Telegraph)), Экс.Оу.Эн. (XON; ЭКСАН (Эксан Мобл Корпорэйшэн; EXXON (Exxon Mobil Corporation))), и Экс.Ар.Экс. (XRX; Зиракс (Xerox)).

STOCK TIE = ОБЫЧНЫЙ ГАЛСТУК (или ШАРФ, или КАШНЕ, или ХХ) – Stock Tie is a long, wide piece of fabric wrapped around the neck several times and looped over itself in front. / длинный, широкий кусок ткани, обёрнутый несколько раз вокруг шеи и закреплённый спереди в петлю.

STOCK–TO–DISAPPEARANCE RATIO = СООТНОШЕНИЕ ЗАПАСА К ИСЧЕЗНОВЕНИЮ – The Stock-To-Disappearance Ratio is defined as the ratio of stocks held by the main exporters to their disappearance (i.e. domestic utilisation plus exports). For Wheat the eight major exporters are considered, namely the United States, Argentina, the European Union, Canada, Australia, Russian Federation, Ukraine and Kazakhstan. In the case of coarse grains, United States, Argentina, the European Union, Canada, Australia, Russian Federation, Ukraine and Brazil are considered. For Rice Viet Nam, Thailand, India, Pakistan and the United States enter this ratio calculation.

STOCK–TO–USE RATIO = СООТНОШЕНИЕ ЗАПАСА К ПОТРЕБЛЕНИЮ – The Stock-To-Use Ratio for cereals is defined as the ratio of cereal stocks to its domestic utilisation.

STOCK–TYPE SETTLEMENT = РАСЧЁТ ПО ТИПУ С АКЦИЯМИ – Stock-Type Settlement is a settlement procedure in which the purchase of a contract requires immediate and full payment by the buyer to the seller. In stock-type settlement, the actual cash profit or loss from a trade is not realized until the position is liquidated. The New York Mercantile Exchange (NYMEX®) Division energy and platinum options have this type of settlement procedure, which differs from that in the futures market where gains and losses are realized on a daily basis. / НАЙМЭКС® (NYMEX®) .

STOCKWATCH = СИСТЕМА НАДЗОРА ЗА ОПЕРАЦИЯМИ НА ФОНДОВОМ РЫНКЕ – Stockwatch is the New York Stock Exchange's state-of-the-art computer surveillance unit. StockWatch monitors the stock market for suspicious signals and detects illegal transactions.

STOCK WITH WARRANT = АКЦИЯ С ВАРРАНТОМ – Stock With Warrant:- share of stock with a coupon attached entitling the owner to purchase additional shares of stock. The warrant may be sold separately from the share, and may give rise to a separate contract, or option. Also known as Share With Share Warrant in the United Kingdom. / Акция уставного капитала с прикреплённым купоном, предоставляющая владельцу приобретать дополнительные акции уставного капитала. Варрант может быть продан отдельно от акции, а может привести и к отдельному контракту или опциону. В Соединённом Королевстве известен как Акция С Варрантом На Акцию (Share With Share Warrant).

STOGIE = ТЯЖЁЛЫЙ РАБОЧИЙ БОТИНОК (или ГРУБЫЙ САПОГ) – Stogie is a stout coarse shoe, brogan. / Тяжёлый рабочий ботинок гвоздевого или деревянношпилечного крепления.

STOKE = СТОКС – Stoke or Stokes (St) is a CGS unit of kinematic viscosity. Kinematic viscosity is defined to be dynamic viscosity (see Poise) divided by the density of the liquid; this gives a quantity which depends only on the type of the liquid, independent of its concentration or density. The quotient turns out to have units length^2/time. Being a CGS unit, the Stokes is therefore defined to be 1 cm^2/s, equivalent to 10^{-4} m^2/s or 0.001 076 391 ft^2/s. The SI has no named unit of kinematic viscosity, requiring the use instead of m^2/s. The unit, called the Stokes in Britain and the Stoke in the United States, is named for a British mathematician and physicist, Sir George Gabriel Stokes (1819–1903), who described the basic principles of fluid mechanics in 1845. Stoke (St) is a kinematic measurement of a fluid's resistance to flow defined by the ratio of the fluid's dynamic viscosity to its density. See also Kinematic Viscosity, and Viscosity (2). / Стокс – устаревшая и более не подлежащая применению единица кинематической вязкости (Kinematic Viscosity) ν (ν = η/ρ, где ρ – плотность жидкости или газа) в так называемых Системах Единиц СГС, но до сих пор используется в Англоязычных странах. Была названа в честь Английского физика Сэра Дьжодьжа Гейбриэла Стокса (Sir George Gabriel Stokes; 1819–1903). Обозначение:- Ст (St или S). 1 Ст = 1 см^2/с = 10^{-4} м^2/с. Чаще использовалась дольная, в 100 раз меньшая единица – сантиСтокс (сСт). 1 сСт = 1 мм^2/с = 10^{-6} м^2/с. Чем гуще жидкость, тем выше её вязкость. Международные производители смазочных масел до сих пор используют в основном единицу измерения Стокс (Ст), несмотря на то, что в настоящее время все страны мира официально перешли на использование единиц измерений Международной Системы Единиц, так называемой системы СИ (или SI по первым буквам первых двух слов полного Франкоязычного наименования Système International d'Unités; введена в действие в бывшем Союзе Советских Социалистических Республик (СССР) с 01 Января 1963 для предпочтительного применения). Стокс – единица кинематической вязкости, входит в СГС Систему Единиц. Стокс равен кинематической вязкости, при которой динамическая вязкость среды плотностью 1 грамм на кубический

сантиметр (г/см^3) равна 1 Пз (смотрите Пуаз). Обозначения:- Русское Ст, международное St. 1 Ст = 1 см^2/сек = 10^{-4} м^2/сек. На практике часто применяется в 100 раз меньшая единица – сантиСтокс (сСт, cSt).

STOLE = ПАЛАНТИН (или ОРАРЬ, или ЕПИТРАХИЛЬ) – (1) Stole is a long loose garment, robe; an ecclesiastical vestment consisting of a long usually silk band worn traditionally around the neck by bishops and priests and over the left shoulder by deacons; a long wide scarf or similar covering worn by women usually across the shoulders.

(2) Stole is a long rectangle or triangle of fabric or fur worn as a wrap around the shoulders.

STOLL QUARTERMASTER UNIVERSAL WEAR TESTER = КВОТЭМЭСТЧЁ УНИВЕРСАЛЬНЫЙ ТЕСТЕР НОСКИ ШТОЛЯ – Stoll Quartermaster Universal Wear Tester is a versatile testing apparatus for measuring wear resistance of fabrics, yarns, thread, etc. It can be equipped with either of two testing heads, one for testing abrasion resistance of flat surfaces and the other for testing resistance to flexing and abrasion. This test method is based upon the development described by Dr Reiner G. Stoll. The Universal Wear Tester (UWT), originally called the Stoll Abrader, was designed by Dr. Reiner G. Stoll (Celanese Corporation of America, Charlotte, North Carolina) in the 1940's as part of a research program on wear resistance for the Textile, Clothing and Footwear Section of the US Army Office of the Quartermaster General. The UWT performs a variety of abrasion tests including flat, flex, fold, frosting and edge wear. It is used for testing woven and knitted fabrics, pile fabrics, hosiery, non-woven and coated fabrics, yarns and threads, as well as other materials. However, the older mechanical design of the instrument contributed to high levels of variation within and between laboratories. Application:- to determines the wear and abrasion resistance of fabric used in clothing, footwear and industrials. Supplied with surface abrasion head (inflated diaphragm method and flex abrasion head as well as necessary weights and initial supply of abradents. Fitted with built-in timer and mechanical cycle counter. / Американский учёный Немецкого происхождения Доктор Райна Ге. Штоль (Dr. Reiner G. Stoll) из компании Сэлэниз Корпорэйшэн оф Амэрика, Шарлотт, Северная Каролина (Celanese Corporation of America, Charlotte, North Carolina). Армейское Управление США (US Army Office) Генерального Квартирмейстера (Quartermaster General).

STOLON = СТОЛОН – Stolon is a prostrate basal branch above or below the ground which can root and produce new plants at its tip. Stolon is a modified aboveground stem creeping and rooting at the nodes. / Столон это стелющаяся базальная ветвь выше или ниже земли, которая может иметь корень и продуцировать новые растения на своём острие. и укореняющееся в узлах. Под Столоном, от Латинского слова Stolo, означающее Корневой Побег, понимается боковой побег с удлинёнными междоузлиями и недоразвитыми листьями, на котором развиваются луковицы, клубни, розеточные побеги. Служит для вегетативного размножения. У Картофеля столоны подземные (на которых развиваются клубни), у Земляники, Лапчатки – стелющиеся по земле и укореняющиеся в узлах (усы).

STOMA = УСТЬИЦЕ (или СТОМА) – Stoma (pl. stomata) is a very small opening or pore through the plant's epidermis, through which repiration and transpiration occurs, surrounded by two guard cells. The stoma is usually capable of active opening and closing through changes in shape of the guard cells. Stomata are found on the plant body of cacti and on any leaves. / в форме замыкающих клеток. Под Стомой, от Греческого слова Stóma, родительный падеж Stómatos, означающее Рот, . Под Устьицем понимается микроскопическое отверстие в кожице листьев и травянистых стеблей растений вместе с ограничивающими его двумя замыкающими клетками. Периодически закрываясь и открываясь, регулируют газообмен и испарение.

STOMACH POISON = ЖЕЛУДОЧНЫЙ ЯД – Stomach Poison is a poison which enters the body of the insect on food intake (ingestion). Stomach poisons are usually administered using artificial bait.

STOMATA = УСТЬИЦА (или СТОМАТА) – Stomata are small openings in the epidermis of the leaf or other plant parts which control exchange of gases and water vapor; controlled by the guard cells.

STONE = КОСТОЧКА – Stone is the hard woody inner layer of the pericarp of fruits known as Drupes (e.g., cherries, peaches, plums) within which is the seed. / перикарпия (околоплодника) плодов, известный как Костянки (Drupes), например, у Вишни, Персиков, Слив, внутри которых находится семя (или ядро). Плоды Абрикоса, Вишни, Сливы, Черешни и других – одногнёздные костянки, состоящие из твёрдой косточки, покрытой сочной мякотью. В ядре (съедобно) косточки Абрикоса и других до 60% жира – косточкового масла.

STONES = КАМНИ – Stones are hard shale, coal, hard earth pellets, and any other non toxic materials of similar consistency. Fertilizer pellets are assessed as stones, except in domestic mustard seed, when constituting 1.0% or less of the net sample weight. Stones are considered foreign material in grain samples. Stones removed are classified as dockage if they are readily removable by ordinary cleaning methods or by special cleaning procedures.

STOP CHAMFER = ХХ (или ЧАСТИЧНЫЙ СКОС) – Stop Chamfer is a chamfer of limited length. See also Chamfer, and Pallet. / Частичный Скос (Stop Chamfer):- фаска на части длины доски настила. Смотрите также Поддон (Pallet).

STOP–CLOSE–ONLY ORDER = РАСПОРЯЖЕНИЕ НА ФИКСАЦИЮ ТОЛЬКО ПРИ ЗАКРЫТИИ – Stop-Close-Only Order is a stop order that can be executed, if possible, only during the closing period of the market. See also Market-On-Close Order. / Распоряжение на фиксацию, которое может быть исполнено, если при этом такое будет возможно, только в период закрытия рынка. Смотрите также Распоряжение 'По Рынку' При Закрытии (Market-On-Close Order).

STOPING = ВЫРАБОТКА (или ВЫЕМКА, или ОТРАБОТКА) – Stoping is the removal of the wanted ore from an underground mine leaving behind an open space known as a Stope. Stoping is used when the country rock is sufficiently strong not to cave into the stope, although in most cases artificial support is also provided. As mining progresses the stope is often backfilled with tailings, or when needed for strength, a mixture of tailings and cement. In the past stoping took place with manual tools or by fire-setting; later gunpowder was used, and from the XIX century various other explosives and power-tools came into use. In old mines, stopes frequently collapse at a later time, leaving craters at the surface. They are an unexpected danger when records of underground mining have been lost with the passage of time. A stope can be created in a variety of ways, depending on the geology of the ore body being mined. It is common to dig shafts vertically downwards to reach the ore body and then drive horizontal levels through it. Stoping then takes place from these levels, in its simplest form as overhand and underhand stoping, which refer to the removal of ore from above or below the level, respectively. In steeply-dipping ore bodies, such as lodes of tin, the stopes become long narrow near-vertical spaces, which, if one reaches the surface is known as a Gunnis or Coffen. A common method of mining such vertical ore bodies is stull stoping. When the ore body is more or less horizontal, various forms of room and pillar stoping, cut and fill, or longwall mining can take place. Types of stoping:- (i) Stull Stoping is a form of stoping used in hardrock mining that uses systematic or random timbering ('stulls') placed between the foot and hanging wall of the vein. The method requires that the hanging wall and often the footwall be of competent rock as the stulls provide the only artificial support. This type of stope has been used up to a depth of 3 500 feet (1 077 meters) and at intervals up to 12 feet (3.7 meters) wide. The 1893 mining disaster at Dolcoath mine in Cornwall was caused by failure of the stulls holding up a huge weight of waste rock. (ii) Shrinkage Stope mining, or shrinkage stoping, is most suitable for steeply dipping ore

bodies (70–90°). In shrinkage stoping, mining proceeds from the bottom upwards, in horizontal slices (similar to cut and fill mining), with the broken ore being left in place for miners to work from. Because blasted rock takes up a greater volume than in situ rock (due to swell factor), some of the blasted ore (approximately 40%) must be removed to provide working space for the next ore slice. Once the top of the stope is reached all the ore is removed from the stope. The stope may be backfilled or left empty depending on the rock conditions. (iii) Underhand Stoping, also known as Horizontal-Cut Underhand or Underbreaking Stoping, is the working of an ore deposit from the top downwards. Like shrinkage stoping, underhand stoping is most suitable for steeply dipping ore bodies. (iv) Long Hole Stoping can be the lowest cost method when large ore bodies are located in strong country rock. In operation, it is similar to an underground version of quarrying. Activity of extracting ore underground. Stoping, in mining engineering, the opening of large underground rooms, or stopes, by the excavation of ore. Stoping is practiced in underground mineral mining when the surrounding rock is strong enough to permit the drilling, blasting, and removal of ore without caving. In mines where the rock requires no artificial support, the operation is known as Open Stoping. A common open-stoping method is room-and-pillar mining, in which pillars of ore are left standing to support the rock over a flat-lying ore body. In many mining operations, stopes must be supported artificially. The principal supported-stoping method, practiced on steeply dipping ore bodies, is cut-and-fill mining, in which the opened stope is back-filled with waste materials as each layer of ore is removed. / (Dolcoath). Забой (stope) – поверхность, ограничивающая горную выработку и перемещающаяся в результате горных работ.

STOP LIMIT ORDER = РАСПОРЯЖЕНИЕ НА ФИКСАЦИЮ С ОГРАНИЧЕНИЕМ (или РАСПОРЯЖЕНИЕ НА ОСТАНОВ С ОГРАНИЧЕНИЕМ) – A Stop Limit Order is an order that goes into force as soon as there is a trade at the specified stop price. The order, however, can only be filled at the stop limit price or better. The stop price and the limit price can be the same or different. The stop price is the price level specified in the order. A Stop Limit Order is an order that goes into force as soon as there is a trade at the specified price. The order, however, can only be filled at the stop limit price or better. A variation of a stop order in which a trade must be executed at the exact price or better. If the order cannot be executed, it is held until the stated price or better is reached again. A Stop Limit Order is a stop order that becomes a limit order after the specified stop price has been reached. See also Limit Order and Stop Order. / Распоряжение На Останов С Ограничением – условное распоряжение, посредством которого клиент поручает биржевому брокеру открыть или закрыть позицию в финансовых инструментах только в случае достижения ими определённого уровня. Например, если бумаги торгуются по цене 100, распоряжение на останов с ограничением на покупку по достижении цены 101 требует, чтобы торговец вступил в торги, если они будут торговаться на уровне 101 и не выше. Данный подход часто хорошо срабатывает как сигнал о вхождении в ценные бумаги в момент прорыва ими точки сопротивления:- инвестор знает, какова будет цена в случае открытия позиции. Однако он не рекомендуется для приказов о выходе из ценных бумаг, поскольку они могут упасть ниже уровня останова с ограничением, и, если они продолжат падение, выйти из них будет вообще невозможно.

STOP LOSS = ЭКСЦЕДЕНТ УБЫТОЧНОСТИ (или ОСТАНОВ УБЫТКА) – (1) Stop Loss:- any provision in a policy designed to cut off the insurance company's loss at a given point. Aggregate benefits and maximum benefits are an example.

(2) Stop Loss is a form of reinsurance under which the reinsurer pays some or all of a cedant's aggregate retained losses in excess of a predetermined Dollar amount or in excess of a percentage of premium. Stop Loss is a type of reinsurance designed to transfer the loss from the ceding company to the reinsurer at a given point. / Тип перестрахования, разработанный для передачи убытка от уступающей компании перестраховщику в данном пункте.

STOP LOSS ORDER = РАСПОРЯЖЕНИЕ НА ФИКСАЦИЮ УБЫТКА (или ПОРУЧЕНИЕ НА ОСТАНОВ УБЫТКА) – Stop Loss Order (SLO) is an order that will close out a loss making position when the price reached a specific level. Such trades are carried out on a best efforts basis, since it cannot be guaranteed that a specific price will be traded if the markets are moving rapidly (as they often are when large amounts of stop losses are triggered). A stock market order designated to limit a possible loss. A stop-loss order instructs the bank or the broker to sell securities 'at best' if the price for the security falls below a specified limit. Can also be used in short selling if the price exceeds a stipulated limit. A resting order designed to close out a losing position when the price reaches a level specified in the order. It becomes an at-the-market order when the 'stop' price is reached. Customers also use stops to enter the market when the prices reach a specified level. These orders serve to either protect customers' profits or limit customers' losses. Also known as Stop Order. An order that immediately becomes a market order when the stop level is reached. Its purpose is to limit losses. It may be either by buying order or selling order. A Stop-Loss Order is a strategy for avoiding extensive losses in securities trading. With a stop-loss order, a sell order is executed automatically if a share price falls below a previously defined level. The investor must not constantly follow the share price and can limit his losses if the market moves unexpectedly. Stop Loss Order is an order to close a position should the market rise above or below a stated level in order to minimize loss. An order placed to liquidate an open position when the price reaches a specified level in order to prevent further losses. These orders are only handled on a 'best efforts' basis, as there is no guarantee that an order can be executed at the specified price if the market is highly volatile and prices move so fast, or 'gap', that the order cannot be carried out at the price requested. Stop-Loss Order is an attempt to limit market risk by placing a liquidation order to be executed if the price moves to a designated level. Stop-Loss Order is a standing order with a broker to close out a futures position if prices reach a specified level. Such an order is used to limit speculative losses or protect speculative profits. / Распоряжение, которое немедленно становится рыночным распоряжением при достижении уровня фиксации. Его целью является ограничение убытков. Таким распоряжением может быть как распоряжение на покупку, так и распоряжение на продажу. Поручение на Останов Убытка – распоряжение клиента брокеру осуществить выход из финансовых инструментов после их снижения до определённого уровня. Многие торговцы акциями размещают поручения на останов убытков примерно на 8–10 пунктов ниже первоначально уплаченной цены, тогда как торговцы опционами часто нуждаются в более широком пороге ограничения убытков в размере 25 или даже 50 пунктов, принимая в расчёт большую лихорадочность колебаний рынка опционов.

STOP LOSS REINSURANCE = ПЕРЕСТРАХОВАНИЕ ЭКСЦЕДЕНТА УБЫТОЧНОСТИ – Stop Loss Reinsurance is a form of excess of loss reinsurance which provides that the reinsurer will pay some or all of the reassured's losses in excess of a stated percentage of the reassured's premium income in respect of its whole account or a specified account, subject (usually) to an overall limit of liability which may be expressed as a percentage of the relevant premium income or an amount. Also known as Excess Of Loss Ratio Reinsurance. / Известно также как Перестрахование Соотношения Эксцедента Убытков или Перестрахование На Основе Эксцедента Убытка или Эксцедентное Перестрахование (Excess Of Loss Ratio Reinsurance).

STOP MARK = ОТМЕТИНА ОТ ОСТАНОВА – Stop Mark:- narrow band of different weave density, across the width of a woven fabric, caused by improper warp tension adjustment after a loom stop. A well trained weaver can reduce this type of defects. Stop Mark:- when the loom is stopped, the yarn elongates under tension, when loom starts again, the slack is woven into the fabric. Woven fabric defect. Defect Name:- Stop Mark. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Stop Mark:- This defect is the result of yarn elongating under tension during a loom stop. When the loom is restarted, the

slackness is woven into the fabric. This is more common in polyester and polyester blends than in all-cotton. Severity:- Major. Stop Mark:- a visible change in the density of the weave across the width of the fabric caused by the tension on the warp not being adjusted properly after the loom has been stopped. See also Set Mark. / Порок или дефект ткачества.

STOP MOTION = МЕХАНИЗМ ОСТАНОВА (или ОСТАНОВОЧНЫЙ МЕХАНИЗМ, или САМООСТАНОВ) – Stop Motion:- any device that automatically stops a textile machine's operation on the occurrence of a yarn break, a high defect count, etc.

STOP ORDER = РАСПОРЯЖЕНИЕ НА ФИКСАЦИЮ (или ПОРУЧЕНИЕ НА ОСТАНОВ) – Stop Order (SO) is an order to buy at a price above or sell at a price below the current market. Stop buy orders are generally used to limit loss or protect unrealized profits on a short sale. Stop sell orders are generally used to protect unrealized profits or limit loss on a holding. A stop order becomes a market order when the stock sells at or beyond the specified price and, thus, may not necessarily be executed at that price. Stop Order is an order that becomes a market order when a particular price level is reached. A sell stop is placed below the market, a buy stop is placed above the market. Stop Order is an order to buy or sell and that becomes a market order when the asset reaches a particular price level. A sell stop is placed below the market, a buy stop is placed above the market. A stop order to sell becomes a market order when the asset trades (or is offered) at or below the stop price. A stop order to buy becomes a market order when the asset trades (or is bid) at or above the stop price. Also known as Stop Loss Order. Stop Order (SO):- if the market reaches the conditions specified at the time the order was entered, the order will convert into the specified order type. Stop Order is an order to buy or sell futures contracts when prices reach a specified level. Stop orders become market orders if the specified prices are reached. / Поручение на Останов – распоряжение клиента брокеру купить или продать финансовый инструмент, когда (и если) будет достигнут определённый уровень цены. Предназначено для ограничения возможных потерь.

STOPPAGE IN TRANSITU = ОСТАНОВ В ТРАНЗИТЕ (или ПРИОСТАНОВИТЬ ОТГРУЗКУ) – Stoppage In Transitu is a right of a seller of goods to stop them while on their way to the buyer and resume possession of them (as on discovery of the buyer's insolvency). Right of a seller to give instruction to a carrier or other bailee to withhold delivery to the buyer, usually due to non-payment for the goods. Stoppage In Transitu is a right of the unpaid seller to stop the delivery (and regain possession) of goods in transit to the buyer who has been declared bankrupt or insolvent. If this right is not exercised in time, the goods on delivery become part of the estate of the buyer and may be sold to pay off the secured creditors.

STOPPER = ОСТАНАВЛИВАЮЩИЙ (или ОСТАНОВЩИК, или СТОПОР) – (1) Stopper is the clearing member who stops the notice of delivery of the underlying commodity and is responsible to receive and pay for the underlying commodity. Stopper of a notice of delivery must make a written demand (Demand Letter or Stopping Notice) on the issuer for delivery of the underlying commodity. Also called Receiver. / Клиринговый член, останавливающий уведомление о поставке соответствующего сырья и ответственный за принятие и оплату этого сырья. Останавливающий уведомление о поставке должен направить эмитенту этого уведомления письменный запрос (Письмо Требования или Уведомление об Остановке) на поставку соответствующего сырья. Также именуется как Получатель (Receiver).

(2) Stopper is a person, who enters stop loss order at a predetermined price to attempt to liquidate his position if the market moves against him. / Лицо, которое выставило распоряжение на фиксацию для предотвращения убытков при предрешённой цене в попытке ликвидации своей позиции (выставленного распоряжения на покупку или продажу), если рынок движется против него.

STOPPER = СТОПОР – Stopper (maritime term):- a short length of rope secured at one end, and used in securing or checking a running rope, e.g., deck stopper, boat fall stopper, etc.

STOPPING LIST = СПИСОК ОСТАНОВЛЕННЫХ (или ПЕРЕЧЕНЬ ОСТАНОВЛЕННЫХ) – Stopping List is a list of securities which have been reported as lost or stolen. / Перечень ценных бумаг, которые были заявлены в качестве утерянных или украденных.

STOPPING NOTICE = УВЕДОМЛЕНИЕ ОБ ОСТАНОВКЕ – Stopping Notice:- in the cotton futures trading, the stopper of a notice must make a written demand on the Issuer for the delivery of the cotton. The Demand Letter must include the date of delivery, the warehouse and the point of delivery, the contract number, the number of bales, and information as to whom the documents are to be delivered. Also known as Demand Letters.

STOPS = СТОПОРЫ (или УПОРЫ–ОГРАНИЧИТЕЛИ, или РЕГИСТРЫ) – Stops are the metal pieces inserted between die halves. Used to control the thickness of a press-molded part.

STOP TRADING = СТОПОР ТОРГОВЛИ – Stop Trading:- this term of Electronic Exchange of Switzerland (EBS) for a 'circuit breaker' that automatically triggers a halt in the trading of a security as soon as a deal exceeds the percentage limits on either side of the reference price.

STORAGE = ХРАНЕНИЕ – (1) Storage is a warehousing; cargo remaining in sheds, warehouses, etc pending departure, transhipment, collection, is in storage. Storage companies will generally provide an estimate on request. Before accepting your goods for storage the storage company must provide you with a written cost estimate which is usually free of charge although in some states a maximum nominal fee can be applied. It is important to stress that the choice of company should not be based solely on price. Remember the cheapest estimate may have the worst service and the last thing you need is to take your important business documents or home furnishings out of storage after a period of time and find they have been damaged due to poor service. The estimate a warehouse will give you differs from an estimate a mover can give you in the sense that no extra charges can be applied without being agreed to by the customer. The storage facilities reputation must always be considered. Ask family and friends and business colleagues for referrals and check with the better business bureau on any complaints they have on file on a particular warehouse you may be looking in to and how these were resolved. It is highly recommended that you obtain at least three estimates before making a final decision. All estimates must be based on the warehouse operator physically inspecting the items to be stored in person and you should always receive a written copy of the estimate. If you are offered an estimate over the phone do not accept this and think twice about using this company. Here is a guide on what to expect in an estimate:- (i) name, address and telephone number of company; (ii) address of actual storage location (this may be different from the office location especially in larger companies); (iii) warehouse storage rate per unit; (iv) minimum monthly storage charges; (v) minimum number of month's storage; (vi) any applicable charges for storage preparation, padding or packing; (vi) any charges applied for transportation if this service is available and accepted; and (vii) other charges the warehouse may apply. In the rare case where you may want the warehouse operator to accept your goods without physically inspecting them first you will be asked to sign a statement waiving your right to a written estimate and you will be required to sign this also. Within five days of receipt of your goods the warehouse operator must send you a statement based on the actual examination of your goods detailing the monthly charges and any packing and special storage condition charges. This statement should also include any limitations on liability for negligent loss or damage. The cost of storage can vary depending on the options you decide to accept. The basic cost will cover items such as light, electricity, insurance, security and pest control. In order to calculate the

actual costs it is important to think through the storage options you need. I stress the word need because if your goods do not require conditioned storage to remain in good condition it is probably not worth paying for it, however if your goods do need special storage conditions it is advisable to pay for it as it will be worth it in the end. For example, paper products going in to storage should be stored in rooms that have humidity control. You will pay extra for environmentally controlled rooms such as temperature and humidity control and you will also pay extra for non standard insurance. A warehouse must insure goods against loss or damage for a minimum of about USD0.30 per pound per article up to USD2 000. The figure may vary slightly depending on the state. If your antiques china set weighing 10 pounds and valued at USD1 500 is broken in the warehouse you would be entitled to the tidy sum of USD3.00. You may want to take out additional insurance and the warehouse operator is required to inform you that additional insurance is available. Be sure you understand what the insurance covers in the unlikely event any goods become damaged. For example if you take out USD3 000 worth of insurance on USD12 000 worth of goods, i.e. 1/4 of the value, if there is USD4 000 worth of damage you would be covered for only USD1 000 of the loss. Storage is the activity of placing goods into a store or the state of being in store, e.g., a warehouse. Here are some important factors to keep in mind when making your storage decision:- (i) Location:- if you choose a self storage facility, consider its' location to your residence and the time and expense associated with frequent visits to the location. Many consumers find that storage facilities located closer to their residence better meet their needs. If you choose a mobile storage option, you may choose to maintain your mobile storage unit on your own property or have it stored in a storage facility or another location. (ii) Security:- understand the security in the storage facility that you choose. How will your household goods be stored within the storage unit? What kind of security does the facility have both during regular business hours and after hours? If you choose a mobile storage option, understand how your storage unit will be secured. (iii) Convenience:- while the location of the facility is important, you may also be interested in the accessibility of your storage facility on weekends and evenings. (iv) Size:- most storage facilities and mobile storage options will offer a wide range of storage options for you. Discuss your needs, both current and future, and the facility can help you to find the storage unit size that best matches your storage needs and your budget. (v) Price:- storage facilities can have a range of prices for their storage units, depending on the size of the unit, the length of time that you will be renting the storage unit and their own marketing objectives. Storage facilities operate in many ways like other real estate options. They are seeking to optimize the use of their available space. They fuller they are at a given time, the less likely they will have special offers or discounts available. Mobile storage companies will often provide incentives for longer rental of their storage units. (vi) Insurance:- ask about what would happen to your stored items in case of fire, flood or other natural disaster. Storage facilities will have their own insurance but it is important to understand what would happen in case of a disaster, especially if you plan to be storing high value items. (vii) Special Needs:- many locations offer environmental storage units that are climate controlled or provide other special storage accessories. Just discuss your needs with your sales representative and he or she will help you to find the best option for you. Questions for Your Storage Company:- (i) Are you a member of any industry associations? If they are a member of the Self Storage Association (SSA) for example, it shows that the company has been in business for a while and takes their business seriously. Some storage facilities are part of a larger moving company, this is also a good sign. (ii) Are there weight limits on my storage? You need to know how to pack the moving boxes you will be storing. Many facilities will allow small boxes that weigh no more than 75 pounds and large boxes that weigh no more than 100 pounds. (iii) When do you drop off the containers and do you have packing supplies? If using mobile storage, you can expect containers within 24 to 48 hours from when you make the request. If you need any moving supplies like bubble wrap, shrink wrap or moving boxes you'll need to request them when ordering the container. (iv) What kind of insurance do you provide? This is a key question. Most facilities will include details of their plan and rates in the welcome kit. But if you are storing anything of value, you might want to have the contents insured under your homeowners insurance policy if they are not already covered. (v) What is your pest control policy? Ask to see the pest control log books, which show how regularly the facility is sprayed and if there have been any infestation issues in the past. (vi) How quickly can I have access to my items in storage? If your mobile storage units have been taken to the storage facility, you will need to request that the units be brought back to your home, which will usually take 24 to 48 hours. For self-storage and full-service facilities, access will depend on the hours the facilities keep. (vii) What kind of security system do you have? You want to find a place that has 24-hour security with digital cameras inside and outside the facility. Using a storage facility for keeping furniture and possessions safe when moving between houses (or just for storing things away that you don't currently need) can be a great idea. Before you use a storage facility, be sure to ask these questions:- (i) What's the Access Like? Can you go around at any time of day (and night) to deliver and collect, and are there enough loading bays? Moving companies charge by the hour when delivering and collecting, and will be unrelenting when it comes to charging for their wasted time. (ii) How Secure Will My Space Be? This is one of the most important questions since you are leaving your personal belongings in someone elses hands. You should ask questions about the security methods such as if there is a guard, alarms, and whether the facility is gated. (iii) Do You Offer Insurance? This is perhaps the most important question of all. Most storage facilities work with insurance companies to provide their customers with the best plans. Depending on the value of your items you may want to insure your entire unit or just a few items listed. Ask about the various plans and its terms. (iv) What's Included in the Price? Prices will vary from facility-to-facility based on size, storage period and the location of a storage company. Read over the contract carefully and ask about hidden fees, security deposits, cleaning fees and notice periods. (v) What Help Do You Provide For My Belongings? It can cause chaos when your moving firm arrives to deliver and collect and finds nobody there. A professional firm has a permanent office presence and a skilled person to manage technical interfaces. If not, then what happens if a crook has access as customer too, and nobody else is there? (vi) What Special Features Do You Offer? Depending on your goods you may need a climate-controlled storage unit or specific temperature settings for your furs or your vintage wine. When researching and looking for a self storage facility be sure to visit and tour a facility and ask numerous questions. Also, be sure that a facility is registered through the Self Storage Association or the local Chamber of Commerce. / пузырь (bubble). , например, в склад. В гражданском праве под Хранением понимается договор, в силу которого одна сторона (хранитель) обязуется хранить имущество, переданное ей другой стороной (поклажедателем), и возвратить его в сохранности. Поклажедатель – сторона, передающая или сдавшая на хранение что-либо.

(2) In Rice industry, Storage Area shall be clean, in good hygiene, capable to protect the Rice from external wet and contamination from pests such as rodents, insects, and birds including pets in such a way that can lead to unsafe and unfit for consumption. Storage area, including storage operation, shall provide good ventilation to prevent moisture and heat accumulation. In case of Rice stored in sacks, the stack of Rice sacks shall be arranged in such a way that the space between the wall and Rice stack is well enough to introduce good ventilation, convenient for cleaning, and inspecting activities. It is recommended to regularly inspect the stored Rice in order to estimate the damage and to set an appropriate management.

STORAGE = ХРАНИЛИЩЕ – (1) Storage:- in oil industry, typically onland tankage facilities for short- or longterm storage of crude or products; sometimes used in economic parlance interchangeably with the concept of oil stocks. / В нефтяной отрасли, как правило, наземные резервуары для кратковременного или долговременного хранения нефти или нефтепродуктов. Иногда в Англоязычном экономическом жаргоне этот термин употребляется в качестве аналога термину запасы нефти (oil stocks).

(2) Storage:- in natural gas industry, facilities used to store natural gas which has been transferred from its original location. Usually consists of natural geological reservoirs like depleted oil or gas fields, water-bearing sands sealed on top by an impermeable cap rock,

underground salt domes, bedded salt formations, or in rate cases, abandoned mines. / В газовой отрасли под Хранилищем понимается место, используемое для хранения природного газа, доставленного из места его добычи. Как правило, представляет собой природные геологические резервуары, например, истощённое нефтяное или газовое месторождение, водоносные пески, запертые сверху непроницаемой плотной породой, подземные соляные купола или, в редких случаях, заброшенные шахты.

(3) Storage:- an investment with a cost recovery schedule that was initially approved by regulatory action that subsequent regulatory action or market forces has rendered not practically recoverable. Costs that utilities are currently permitted to recover through their rates but whose recovery may be impeded or prevented by the advent of competition in the industry. / Капиталовложение, по которому график возмещения затрат изначально был одобрен решением надзорного органа, при том, что последующие решения этих органов или воздействия рынка привели к тому, что возмещение вложенных средств оказалось практически невозможным. Затраты, которые электростанциям в настоящее время разрешено возмещать посредством своих тарифов, но возмещение которых может быть затруднено или исключено с развитием конкуренции в отрасли.

STORAGE BOBBINS = БОБИНЫ ДЛЯ ХРАНЕНИЯ – Storage Bobbins are the bobbins used to store the yarn for subsequent plying. Depending on your school of thought, using a storage bobbin allows you more evenly wind on (then when you were spinning). This means that the plying process should also be more even.

STORAGE CHARGE = СБОР ЗА ХРАНЕНИЕ – Storage Charge is a charge to client for holding stock that has not moved. Storage Charge is a charge for goods held in storage facilities (warehouses) under a fixed agreement for periods of time, and which is not included in other arrangement. Fee for keeping goods in warehouse/terminal after free time runs out. Storage Charge is a charge for goods held in railroad or other warehouses under fixed agreement for periods of time, and which is not included in other service arrangements.

STORAGE CLIMATE CONDITIONS = КЛИМАТИЧЕСКИЕ УСЛОВИЯ ХРАНЕНИЯ – Storage Climate Conditions refers to the specific external conditions (humidity, temperature, ventilation) in which particular products can be stored without risk of a reduction in value or of damage to the products.

STORAGE HEDGE = ХЭДЬЖ ХРАНЕНИЯ – Storage Hedge is a short hedge placed following harvest with grain being stored on the farm or in a commercial elevator. Storing the grain allows the producer to take advantage of strengthening basis, should it occur, while the short hedge locks in a general price level and reduces price risk.

STORAGE OF DRY LUMBER = ХРАНЕНИЕ СУХОГО ПИЛОМАТЕРИАЛА – Storage Of Dry Lumber:- one of the most common mistakes relating to drying defects is improper storage of dry lumber. If dry lumber is exposed to high humidities it will gain moisture. As the lumber is again exposed to drier air it will lose the moisture it has regained. It is not uncommon for ‘dry’ lumber to shrink, swell, warp, check, or stain if subjected to changes in environment. It is recommended that dry lumber be stored flat under the same temperature and relative humidity as it will be exposed to in use. Thus, lumber intended for manufacture into high quality furniture should be stored under the same conditions as expected in a heated home (approximately 6% equilibrium moisture content). / развод (или потёк (stain)).

STORAGE RATE = СТАВКА ЗА ХРАНЕНИЕ – Storage Rate is a charge to client for all storage costs, usually on a month-to-month basis.

STORAGE WAREHOUSES = ПЕРЕВАЛОЧНЫЕ СКЛАДЫ – Storage Warehouses are the warehouses which store product for periodic delivery to a manufacturer or distribution center. This is often associated with providing just in time delivery of the product to the consignee. This could be imported raw materials or items used in the manufacturing process, such as cans or sub-assemblies. Items are generally tracked by lot, with the lot often being specified for delivery. Handling, storage and accessorial charges are similar to distribution warehouses.

STORE = ПРИПАСЫ – Store is a general term for provisions, materials and supplies used aboard ship for the maintenance of the crew, and for the navigation, propulsion and upkeep of the vessel and its equipment. Stores are consumable supplies carried aboard a vessel for use during the voyage, e.g., provisions for the crew and fuel for the engine.

STORE CODES = СКЛАДСКИЕ КОДЫ – Store Codes (as it relates to closeout merchandise) are numbers, one or two digits, that represent actual retail stores. Most companies will refer to merchandise as being from Store Code (fill in the blank) to give you an idea of quality and contents of lot or pallet. Store codes are not usually posted on websites so you must request a listing breakdown. There are roughly 12–15 codes you will see all the time, as they are the most popular. They are standard codes used in the industry, however some companies may have their own coding system. Ask for clarification when you call your company/agent.

STORE–DOOR DELIVERY = ПОСТАВКА ДО ДВЕРЕЙ МАГАЗИНА – Store-Door Delivery is a movement of goods to the consignee’s place of business, customarily applied to movement by truck.

STORED PRODUCT = ПРИПАСЁННЫЙ ПРОДУКТ – Stored Product is the unmanufactured plant product intended for consumption or processing, stored in a dried form (this includes in particular grain and dried fruits and vegetables).

STOREROOM = КЛАДОВАЯ – Storeroom (maritime term):- the space provided for stowage of provisions or other materials.

STORM = ШТОРМ – Storm is a general term for strong winds accompanied by rain, snow or other violent weather conditions. Storms originating at sea are known by different names in different areas of the world:- see Hurricane, Typhoon, and Cyclone. Other local names for storms having their origin over land:- Tornado; Williwaw; and some local ones:- Willy-Willy in Australia; Baguio in the Philippines; Cordonazo in Mexico and the west coast of Central America; Mistral in the Mediterranean; Monsoon and Dafeng in China. / Тонэйдо (Tornado); Виливо (Williwaw); Вили-Вили (Willy-Willy) в Австралии; Багио (Baguio) в Филиппинах; Кордонасо (Cordonazo) в Мексике и западном побережье Центральной Америки; Мистраль (Mistral) в Средиземноморье; Мансун (Monsoon) и (Dafeng) в Китае. Под Штормом, от Голландского слова Сторм (Storm), понимается буря, длительный очень сильный ветер, свыше 9 баллов по Шкале Бофорта и скоростью более 20 метров в секунду (м/с). Наблюдается обычно при прохождении циклона. Сопровождается сильным волнением на море и разрушениями на суше.

STORM SHELL = ШТОРМОВАЯ ОБОЛОЧКА – Storm Shell:- wind proof, wind resistant outerwear.

STORM WARNING = ШТОРМОВОЕ ПРЕДУПРЕЖДЕНИЕ – Storm Warning (maritime term):- an announced warning of an approach of a storm.

STOVE = ПЛИТА (или ПОЛУЧИТЬ ПРОБОИНУ) – Stove (maritime term):- broken in.

STOVEPIPE = ЦИЛИНДР (или ДЫМОХОД, или ПЕЧНАЯ ТРУБА, или СУШИЛЬНАЯ ТРУБА) – Stovepipe is a silk hat.

STOW = УКЛАДЫВАТЬ (или РАЗМЕЩАТЬ, или ШТИВАТЬ, или ЗАКРЕПЛЯТЬ, или КРЕПИТЬ) – Stow (maritime term):- to put in place.

STOWAGE = КЛАДОВАЯ (или ТРЮМ, или ОТСЕК) – Stowage refers to the location or hold where grain has been loaded to a vessel. / Под Отсеком судна понимается пространство внутри корпуса судна, ограниченное непроницаемыми поперечными и продольными переборками. Деление судна на отсеки во многом определяет его непотопляемость.

STOWAGE = ШТИВКА (или УКЛАДКА) – A Stowage is the placing of goods in a ship in such a way as to ensure the safety and stability of the ship not only on a sea or ocean passage but also in between ports when parts of the cargo have been loaded or discharged. The placing and securing of cargo or containers on board a vessel or of cargo in a container. A marine term referring to loading freight into ships' holds. A term Stowage means storage in ships' holds or in containers. / Размещение и укрепление груза или контейнеров на борту судна или груза в самом контейнере. Под Штивкой груза понимается перемещение груза в грузовых помещениях судна с целью его разравнивания или заполнения подпалубных пустот. Обычно производится при погрузке навалочных и насыпных грузов. Например, при погрузке зерна в грузовые помещения неспециализированных сухогрузных судов без штивки невозможно заполнить зерном все подпалубное пространство, что требуется по правилам перевозки зерна, чтобы предотвратить его смещение. Штивка может быть ручной и механической. Штивка:- (1) укладка груза в трюме судна, надлежащее его размещение; (2) стоимость работ по укладке груза, товара.

STOWAGE FACTOR = ФАКТОР ВМЕСТИМОСТИ (или УДЕЛЬНАЯ ГРУЗОВМЕСТИМОСТЬ, или УДЕЛЬНЫЙ ПОГРУЗОЧНЫЙ ОБЪЁМ) – The Stowage Factor specifies how many cbm or cbf of hold space in a ship will be taken up by a metric tonne (1 000 kg), a US ton (907.18 kg), or an Imperial ton (1 016 kg) of a cargo taking into account gaps, shape of the hold, number of tween decks, supports and the use of dunnage. Cubic space (measurement tonne) occupied by one tonne (2 240 lb/1 000 kg) of cargo. Ratio of a cargo's cubic measurement to its weight, expressed in cubic feet to the ton or cubic meters to the ton, used in order to determine the total quantity of cargo which can be loaded in a certain space. / Под Грузовместимостью транспортного средства понимается суммарный объём помещений, используемых для перевозки грузов. У судов различают:- (i) теоретическую грузовместимость; (ii) зерновую грузовместимость для сыпучего груза; (iii) киповую грузовместимость для штучного груза; и (iv) грузовместимость для жидкого груза. Теоретическую грузовместимость определяют по теоретическим обводам. Зерновая грузовместимость меньше теоретической на объём корпусных конструкций и оборудования (набора, трубопроводов, деревянного настила, обшивки и прочего). При определении киповой грузовместимости исключают также объём между элементами набора, примыкающий к палубам, переборкам и бортам. Грузовместимость для жидкого груза равна зерновой грузовместимости за вычетом объёма, соответствующего тепловому расширению груза. Под Удельным Объёмом понимается величина v, равная отношению объёма, занимаемого веществом, к его массе:- $v = dV / dm$, где dm – масса вещества, заключённого в малом объёме dV. Удельный объём – величина, обратная плотности ρ:- $v = 1 / \rho$. Единица удельного объёма в Международной Системе Единиц СИ – $м^3/кг$.

STOWAGE PLAN = ГРУЗОВОЙ ПЛАН – Stowage Plan is a plan indicating the locations on the vessel of all the shipments for the benefit of stevedores and vessel's officers. / Под Грузовым Планом понимается схема размещения грузов, перевозимых в грузовых помещениях и на верхней палубе судна. Грузовой план составляют для наилучшего использования грузовместимости и грузоподъёмности судна при обеспечении сохранности грузов в процессе перевозки, удобства и быстроты их погрузки и выгрузки, а также достаточной остойчивости судна, общей и местной прочности его корпуса, допускаемой осадки и прочего. Известен также как Карго План.

STOWAWAY = БЕЗБИЛЕТНЫЙ ПАССАЖИР (или БЕЗБИЛЕТНИК, или НЕЛЕГАЛЬНЫЙ ПАССАЖИР) – Stowaway is a person who is secreted on a ship, or in cargo which is subsequently loaded on the ship, without the consent of the shipowner or the master or any other responsible person and who is detected on board the ship after it has departed from a port, or in the cargo while unloading it in the port of arrival, and is reported as a stowaway by the master to the appropriate authorities. Stowaway is an unwanted person who hides on board of a vessel to get free passage, to flee a country, to evade port officials etc. Stowaway is a person who is secreted on a ship, or in cargo which is subsequently loaded on the ship, without the consent of the shipowner or the Master or any other responsible person and who is detected on board the ship after it has departed from a port, or in the cargo while unloading it in the port of arrival, and is reported as a stowaway by the master to the appropriate authorities. Unnoticed by the Master, the crew, port and customs authorities, stowaways may gain access to the ship with or without the assistance of port personnel. Once on board the ship stowaways hide in empty containers, cargo holds, tanks, tunnels, behind false panels, stores, accommodation area, engine rooms, void spaces, cranes, chain lockers. The presence of stowaways on board ships may bring serious consequences for ships and, by extension, to the shipping industry as a whole; the ship could be delayed in port; the repatriation of stowaways can be a very complex and costly procedure involving masters, shipowners, port authorities and agents; and the life of stowaways could be endangered as they may spent several days hidden, with the risk of suffocation and without any water/provisions. The International Maritime Organization strongly encourages that appropriate measures be taken to reduce risks of unauthorized persons boarding ships. The Convention of Facilitation of International Maritime Traffic, the so-called FAL Convention (the convention was adopted by the International Conference on Facilitation of Maritime Travel and Transport on 09 April 1965; it entered into force on 05 March 1967) has clear ship/port 'Preventive measures' and recommended practices on the 'Treatment of stowaways while on board' and 'Disembarkation and return of a stowaway'. The Facilitation Committee, at its thirty seventh session (FAL 37), in 2011, adopted resolution FAL.11(37) in 'Revised guidelines on the prevention of access by stowaways and the allocation of responsibilities to seek the successful resolution of stowaway cases'. This resolution is particularly addressed to Member Governments which are not contracting Governments of the FAL Convention and to those Member States which find it impracticable to comply with the relevant Recommended Practices of the FAL Convention. The Facilitation Committee invited IMO Member Governments and international organizations in consultative status, through Circular FAL.2/Circ.50.Rev.2, to provide the Organization with information on stowaway incidents. The information is collated and issued quarterly as a FAL.2 Circular. Taking into account that incidents of stowaways represent a serious problem for the shipping industry and that no signs of improvements have been seen regarding the reduction of stowaway cases, the Organization strongly encourages Member States to fully implement the International Convention for the Safety of Life at Sea (SOLAS), chapter XI-2 on measures to enhance maritime security, and the ISPS Code, which also contain clear specifications on access control and security measures for port facilities and ships. Stowaway (maritime term):- a person illegally aboard and in hiding. / хозяин (или капитан). В России у термина Безбилетник имеется аналог – жаргонный широко распространённый термин Заяц.

STOXX (LIMITED) = СТАКС (ЛИМИТИД) – The DJSI STOXX index is designed to track the stock market performance of the leading sustainability companies in Europe. All the companies in the DJSI STOXX investable universe are assigned, based on the company's primary revenue source, to one of the 58 DJSI sectors. All indexes are calculated as price and return indexes in both US Dollars and Euros. The DJSI STOXX Index Design Committee is composed of two representatives from each – STOXX Limited and SAM Group.

(1) The DJSI STOXX, the DJSI EURO STOXX, the DJSI STOXX ex All and the DJSI EURO STOXX ex All are all weighted according to free float market capitalization and are calculated with the Laspeyres formula. The base date for the DJSI STOXX, the DJSI EURO STOXX, the DJSI STOXX ex All and the DJSI EURO STOXX ex All is 1998-December-31. The corresponding base value is 100. The DJSI STOXX, DJSI EURO STOXX, DJSI STOXX ex All, and DJSI EURO STOXX ex All are freefloat market-capitalization weighted. The weighting of the components is based on the free-float portion of the total number of shares outstanding. Free-float is defined as the total number of shares outstanding less the block ownership. Block ownership is defined as the sum of all holdings larger than 5% – held by companies, governments, families and private investors, but excluding those by investment companies and funds – that have to be reported to the domestic regulatory agencies. The weightings for these indexes are reviewed during the third month of each calendar quarter. Changes are implemented following the third Friday of that month. The weightings are effective on the next trading day, following a minimum notification period of 2 trading days. (2) The DJSI STOXX 40 and DJSI EURO STOXX 40 are weighted based on sustainability scores. The base date for the DJSI STOXX 40 and the DJSI EURO STOXX 40 is 2001-October-15. The corresponding value is 1 000. The DJSI STOXX 40 and the DJSI EURO STOXX 40 are weighted according to sustainability scores. The score for each component is normalized based on the best score that a company in the component's DJSI sector has achieved. For example, if the component is assigned to the chemicals sector and has a score of 60 and the best company in the chemicals sector has achieved a score of 80, then the normalized score is 60/80 = 75%. The weighting of each component at the annual review date reflects the normalized score of the company divided by the total sum of the normalized scores of all components. As the weighting for DJSI STOXX 40 and DJSI EURO STOXX 40 is based on a stock's normalized sustainability score, a weighting factor is introduced that reflects the initial stock's weighting at the annual review. The weighting factor for a company has a similar role as the product of the number of shares and float figures have for free float market capitalization weighted indices. The weighting factor for the DJSI STOXX 40 and DJSI EURO STOXX 40 are calculated as follows:- (i) Determine the initial weight of each company in the index based on the normalized sustainability score, i.e. initial weight = normalized sustainability score of a company / sum of the normalized sustainability scores for each company in the index; and (ii) Determine the weighting factor for each stock, i.e. weighting factor = 1 000 000 000 * initial weight / closing price of stock and rounded to integers. The weighting factor will be adjusted in the event of a corporate action. The European indexes, the Dow Jones STOXX Sustainability Indexes (DJSI STOXX) were first published on 2001-October-15. STOXX Limited (http://www.stoxx.com) publishes the Dow Jones STOXX indices which measure stock price developments in Europe as a whole. The Dow Jones EURO STOXX index is one member of this index family. This index aggregates the prices of a broad range of stocks from those countries belonging to the euro area. Furthermore, three types of sector index (economic and market sectors as well as industry groups) are available for the Dow Jones EURO STOXX index. Group of European share indices developed by the Deutsche Börse AG, Swiss Exchange, and Société des Bourses Françaises jointly with Dow Jones And Company Inc. In addition to a broad index and a blue chip index for Western Europe (EMU), STOXX also has 19 cross-border sector subindices serving as benchmarks for pan-European investment strategies. Also known as Dow Jones STOXX. A series of market indexes that are representative of the European and global markets. These indexes cover a wide range of market segments including the broad market, blue chips, individual sectors and global indexes. While there are global STOXX® indexes, the majority of the focus is placed on the European market. The STOXX® indexes were created out of a venture between Dow Jones, Deutsche Boerse AG, and the SWX group. These indexes are tradable on the futures and options market and are also used as benchmarks for funds that trade in the European and global markets. The Dow Jones Industrial Average in the United States is similar to the Dow Jones STOXX 50 Index. December 2009:- Deutsche Börse AG and SIX Group AG become sole shareholders of STOXX after Dow Jones & Company leaves the joint venture. March 2010:- STOXX® renames all indices by removing the 'DJ/Dow Jones' prefix. July 2010:- STOXX becomes the marketing agent for Deutsche Börse's and SIX Swiss Exchange's indices, amongst them the DAX and SMI indices. November 2010:- STOXX extends its worldwide equity index offering by adding indices for global regions and emerging markets. February 2011:-Full, comprehensive expansion of the index universe with a broad range of global indices; and relaunch of the STOXX brand. STOXX Ltd. is the marketing agent for all indices of Deutsche Börse AG and SIX Group AG, among them the DAX® and SMI® indices. DAX® is the leading blue-chip index for Germany, comprising the 30 largest and most liquid German equities. The SMI® is its Swiss counterpart. The index comprises the 20 largest stocks from the Swiss Performance Index® (SPI). Headquartered in Zurich, Switzerland. Our logo is a distinctive, black wordmark against a white background. The STOXX® name appears in our company typeface, Bryant Condensed. The two Xs in the logo are modified to reveal forward-pointing arrows, symbolizing the brand's progressive character. The STOXX® logo identifies us as a progressive and innovative company. At the same time, it reflects the solidity of STOXX® and underscores its leading role as a global index provider. / СТАКС Лимитид (STOXX Limited). Дау Дьжонз (Dow Jones). , то есть . Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG). (Примечание:- в Русском языке нет точного соответствия звуку при произношении буквы Ö Немецкого алфавита. Разные источники по-разному интерпретируют его. Буквосочетание ЫО может более менее точно передавать произношение буквы Ö лишь при быстром и кратком их произношении, напоминая в отдалении произношение буквы Ё Русского алфавита.) . Общество Французских Бирж или, как это звучит на Французском языке по месту расположения, Сосьете дэ Бурс Франсэз (Société des Bourses Françaises).

STP = STRAIGHT THROUGH PROCESSING

STR = SHORT TANDEM REPEAT

STRADDLE = ОДНОВРЕМЕННЫЕ РАЗНОНАПРАВЛЕННЫЕ ОПЕРАЦИИ (или СТРЭДЛ) – (1) The term Straddle means, (i) with respect to the rules governing margin, the purchase (or sale) of an exchange futures contract in one delivery month for an account which is offset by (A) the sale (or purchase) of another exchange futures contract in the same form involving the same commodity in a different delivery month for such account, or (B) the sale (or purchase) of another exchange futures contract in a different form involving the same commodity in the same or a different delivery month for such account, and (ii) with respect to any other rules of an exchange, shall have the meanings, if any, set forth in the rules. In futures trading, the same as the Spread. Straddles (spreads) are between delivery months. The purchase of one futures month against the sale of another futures month of the same commodity. A straddle trade is based on a price relationship between the two months. Also known as Spread. / В сделках с сырьевыми и валютными фьючерсами Стрэдл предполагает покупку и продажу опционов или одновременную покупку и продажу одного и того же сырья или одной и той же валюты с поставкой в будущем, часто на различных рынках. Сочетание одновременной покупки одного товара и продажи другого.

(2) Straddle:- expression for a combined option operation where the buyer obtains the right, against the payment of a premium, to purchase shares within a specified period for a stipulated option price (call option) and/or to sell them (put option), or to forgo either action thereby losing the premium. Similar to a put and call option. Question:- How can you profit from high time value prior to a news event while protecting yourself from a limit move? Answer:- Sell a straddle prior to the announcement while buying tail protection with long out-of-the-money options. The US Department of Agriculture (USDA) grain report is released some time during the second week of each month. The most recent report came out May 09, 2014. The May grain report does not have a lot of hard data to work with. There are plenty of adjusted projections as opposed to real results that affect futures and options pricing. We will be taking a look at

how the USDA grain report affects the Corn, Wheat and Soybean markets. The premium level in options pricing generally will not drop until after the results of the grain report are released. Option premium comprises both expiration value and time value. Expiration value is the price that the premium will be trading at the conclusion of the expiration cycle. Let's use the example of the December 530 corn puts. December futures settled at USD4.98¾ on May 09. The Dec 530 puts closed at 56.75. The Dec 530 puts would be priced at 31.25 at the end of the expiration cycle. That is the 'in-the-money' portion of the current premium price. The remaining 31.25 is the time value. Time value is a wasting asset that vanishes completely at expiration. If there is a degree of uncertainty or fear in the marketplace then the rate of decay in the time value can be slowed down or even reversed. The settlement price for July corn futures was USD5.11-¼ on May 08. The Dec 510 calls closed at 40.5 and the Dec 510 puts closed at 40. The straddle was at 80.50 with 79.25 being time value. Theoretically time value should recede after a grain report because the degree of uncertainty in the marketplace will have diminished. Shorting the Dec 510 corn straddle at 80.50 is one way to take advantage of that. If December corn makes too much of a move it won't matter how much time value recedes because the other part of the premium, expiration value, will have gained so much. The size of the straddle covers a lot of ground to the upside and the downside, but if there is a limit move to either the downside or upside the losses can be catastrophic. In order to define the risk in the position a trader can go long 'tails'. The tails are the insurance policies that stop the bleeding in the position. Going long both an out-of-the-money call and an out-of-the-money put accomplishes this purpose. This trade of going long Dec 590 calls for 15.25 and going long the Dec 430 puts for 9.25 comprises a net debit of 24.5. The combined position now has a net credit of 56. This reduces the trades' maximum possible profit by 24.5 but the maximum possible loss at expiration is now 24 as opposed to being unlimited to the upside and USD4.29 ½ to the downside. At noon EDT the crop report came out and December futures settled at USD4.98¾. The Dec 510 straddle declined to 77.25 from 80.50 despite moving 12.5¢ further away from the strike price. The long tails, however, dropped from 24.5 to 22.375. The tails cut the profitability of the trade from 3.25¢ to 1.125¢. The trader also can place wider tails on such as going long the 610 calls and 510 puts. The premium that a trader has to pay for this insurance is not as large but the coverage is also not as good. The maximum possible loss would increase to 44 from 24. Let's take a look at how this strategy worked for wheat. On May 08, July wheat settled at USD7.29½. The Dec 730 straddle closed at 60.375. The tails, which were comprised of the Dec 670 puts and the Dec 790 calls, were priced at 15. The composite position logged in at a credit of 45.375. The maximum possible loss at expiration would be 14.625¢. On May 11, July wheat settled at USD7.22½. The short straddle declined in price to 56.5 for a gain of 3.875¢. The tails actually increased in price to 16.125¢, thereby increasing the overall profitability to 5.125¢. Note:- Theta decreases more quickly after USDA grain report is released. A similar strategy in soybeans resulted in a net loss under a penny despite a move in the July futures of 28.5. The greater the movement in the underlying futures contract the less effective the strategy is. If there isn't a great deal of movement the results are instantly profitable.

(3) Straddle:- if you think a stock is due to make a big move either to the upside or downside but don't know which way it could break, a straddle can allow you to take advantage of that implied volatility. Typically, a long straddle involves buying an at-the-money call and an at-the-money put, thus straddling where the stock currently is trading. Marty Kearney, Senior Instructor at CBOE® Options Institute, uses the example of a stock trading at USD50 going into an earnings report. Although he doesn't know if it is going to do well or poorly, he expects there to be an outsized reaction to earnings, so he initiates a straddle by buying a 50 call and a 50 put. 'Hopefully the stock goes to either USD80 or USD10. If we go to USD80, then my put is worthless, but my call is USD30 in-the-money; if we go to USD10, then my call is worthless, but my put is USD40 in-the-money', he says. A straddle makes the most sense if you think something exceptional is going to happen, but that implied volatility already likely is high, which would make the at-the-money call and put fairly expensive. 'The market isn't stupid', says Joseph Burgoyne, Director of institutional and retail marketing for the Options Industry Council. 'Especially with companies that don't manage their expectations with the street very well, the market expects a big move so the (implied volatility) will go up in advance of earnings'. Anything less than a 10% move can cause a loss because the position is so expensive to put on. Your maximum risk is right at the strike price. If in our example the stock only moves to USD53 or USD46, we may get USD3 or USD4 back on a position that may have cost USD5 or USD6 to initiate. If it works in your favor, though, the potential profit is open-ended. A straddle would have worked very well for an investor going into Apple Inc.'s (AAPL) first quarter earnings report. The stock closed at USD514 on January 23, 2013, and options prices indicated investors expected the stock to trade in a USD32 range the next day. AAPL opened the next morning at USD460 and closed the day near USD450. A straddle on the 515 strike would have done very well. Although you also can initiate a short straddle by selling a call and a put if you think the stock is likely to stagnate, Kearney says most beginning investors may not be approved by their brokers for the strategy because it would give you unlimited loss potential on the upside or the stock 'could get clobbered on the downside', resulting in massive losses. Straddle:- purchase or sale of call and put options for the same underlying asset with the same expiry date and strike price. The sale or purchase of a put option and a call option, with the same strike price, on the same underlying and with the same expiry. The strike is normally set at-the-money. The purchaser benefits, in return for paying two premiums, if the underlying moves enough either way. It is a way of taking advantage of an expected upturn in volatility. Sellers of straddles assume unlimited risk but benefit if the underlying does not move. Straddles are primarily trading instruments. In options trading, the purchase or sale of both a put and a call options from the same strike price and expiration. Straddle is a purchase or sale of an equal number of puts and calls of the same underlying asset with the same strike prices and the same expiration dates. The purchase or sale of both a put and a call having the same strike price and expiration date. The buyer of a straddle benefits from increased volatility, and the seller benefits from decreased volatility. Straddle is an options strategy with which the investor holds a position in both a call and put with the same strike price and expiration date. Straddles are a good strategy to pursue if an investor believes that a stock's price will move significantly, but is unsure as to which direction. The stock price must move significantly if the investor is to make a profit. As shown in the diagram above, should only a small movement in price occur in either direction, the investor will experience a loss. As a result, a straddle is extremely risky to perform. Additionally, on stocks expected to jump, the market tends to price options at a higher premium, which ultimately reduces the expected payoff should the stock move significantly. Straddle is an option strategy involving one call and one put with the same strike and same expiry date. / окупаемость (payoff). СИБО® (CBOE®). Мати Кони (Marty Kearney). Дьжосэф Бургойн (Joseph Burgoyne). Эпл Инк. (Apple Inc.). Стрэдл – разновидность курсовой разницы:- одновременная покупка или продажа одинакового количества опционов на продажу и покупку на определённые финансовые инструменты с одними и теми же ценами исполнения и датами исполнения. Покупатель стрэдла рассчитывает получить прибыль от сравнительно сильных изменений в цене финансовых активов, лежащих в основе опционов, независимо от направленности этих изменений.

STRADDLE CARRIER = КОЗЛОВЫЙ АВТОПОГРУЗЧИК (или ПОРТАЛЬНЫЙ ТРАНСПОРТЁР) – Straddle Carrier is a mobile 4-wheeled vehicle which straddles a container and lifts and transports it to and from the vessel within the container yard. A vehicle equipped with a spreader bar capable of picking up and carrying a container within its own framework. A Straddle Carrier is a road going truck or semi-trailer used to hoist, stack and transport ISO standard containers. The containerlift loads and unloads the container utilising a pair of hydraulic powered cranes mounted at each end of the vehicle chassis. Special self-propelled vehicle for moving containers within the terminal. Mobile truck equipment with the capacity for lifting a container within its own framework. Wheeled vehicle designed to lift and carry shipping containers within its own framework. It is used for moving, and stacking containers at a container terminal. Large machine that straddles a container, lifts and moves it within a container yard. Capable of straddling a single

row of containers three-high. A large, peculiar looking machine that is used to carry containers around the port. The driver sits in an elevated position with the container slung below him or her. / Погрузчик – машина периодического или непрерывного действия для погрузки, выгрузки, транспортирования грузов на небольшие расстояния. Применяется на складах, в цехах, портах и так далее. Погрузчик может оснащаться сменными рабочими органами (навесным оборудованием):- вилочным захватом, ковшом, бадьёй, специальными захватами для пакетов и так далее. По роду привода различают автопогрузчики и электропогрузчики. В различных отраслях экономики используют специальные погрузчики:- в горной промышленности на базе врубовой машины – погрузчики для транспортирования горных пород, в сельском хозяйстве – картофелепогрузчики, свеклопогрузчики, машины для погрузки сена, минеральных удобрений, торфа и так далее.

STRADDLE CRANE = КОЗЛОВЫЙ КРАН – Straddle Crane is a crane usually running on rails and spanning an open area such as rail-tracks or roadways. / Козловый Кран представляет собой пдъёмный кран в виде моста на жёстких опорах (козлах), передвигающихся по рельсовому пути или бетонному основанию. На мосту устанавливается грузовая тележка или таль. Козловые краны применяют для обслуживания открытых складов и в строительстве. Грузоподъёмность козловых кранов доходит до 800 тонн, а размер пролёта до 170 метров.

STRAGGLING = ОТБИВАЮЩЕЕСЯ ОТ СТАДА (или ОДИНОКОСТЬ, или ОДИНОЧНОСТЬ) – Straggling:- spreading out irregularly.

STRAIGHT BILL OF LADING = ИМЕННОЙ КОНОСАМЕНТ – Straight Bill is a bill of lading (B/L) that is not transferable by either delivery or indorsement and delivery, e.g., because it is marked ‘not negotiable’ or is not made out to ‘bearer’, to ‘order’ or to ‘assigns’. Straight bills of lading are used, for example, for ‘in house’ shipments between divisions of large multinationals or when it is known for certain, prior to shipment of the cargo, that the intended consignee will not sell the cargo on. A straight bill of lading is properly characterised as a bill of lading but, because it lacks the characteristic of transferability, does not operate as a document of title and is not treated as a bill of lading for purposes of the Carriage of Goods by Sea Act 1992. Since a straight bill of lading is not a document of title, it does not attract the mandatory application of the Hague-Visby Rules as a matter of English law. A straight bill of lading can, however, fall within the definition of ‘Sea Waybill’ adopted for purposes of the Carriage of Goods by Sea Act 1992. The principal difference between transferable and straight bills of lading, for purposes of the 1992 Act, thus is that the conclusive evidence provision of section 4 of the 1992 Act does not apply to straight bills of lading. A negotiable document by which a transportation line acknowledges receipt of freight and contracts for its movement. The surrender of the original Straight of Lading is not required by transportation lines upon delivery of the freight, exept when necessary for the purpose of identifying the consignee. This bill states that the goods are consigned to a specified person and it is not negotiable free from existing equities, i.e. any endorsee acquires no better rights than those held by the endorsor. So, for example, if the carrier or another holds a lien over the goods as security for unpaid debts, the endorsee is bound by the lien although, if the endorsor wrongfully failed to disclose the charge, the endorsee will have a right to claim damages for failing to transfer an unencumbered title. Also known as Non-Negotiable Bill Of Lading. Indicates the shipper will deliver the goods to the consignee. It does not convey title (non-negotiable). Most often used when the goods have been pre-paid. A ‘Straight Bill Of Lading’ states that the goods are consigned or destined to a person whose name is specified in the bill of lading. A ‘straight bill of lading’ is not a negotiable bill. 49 USC §80103 (2005; 49 USC is short for the United States Code:- Title 49). This type of bill of lading obligates the carrier issuing it to transport or arrange for the transportation, and to be responsible for the shipment through its destination even though the shipment may require transportation over lines or routes beyond those of the receiving carrier and by means of connecting carriers or other modes of transportation. A non-negotiable bill of lading which states a specific identity to whom the goods should be delivered. See also Bill Of Lading. Shippers usually use a Straight Bill of Lading when the delivery is prepaid before the actual delivery date. This documentation specifies that the shipper delivers the product or items to the organization, business or person. / , то есть .

STRAIGHT BOND = ОБЫЧНАЯ (или ЧИСТАЯ, или ПРЯМАЯ) ОБЛИГАЦИЯ – Bond issues without conversion or warrant clauses but with a fixed interest rate for the entire period to maturity. Also known as Straight Fixed-Interest Stock.

STRAIGHTENED LENGTH = ВЫПРЯМЛЕННАЯ ДЛИНА – Straightened Length is the length of a test specimen under a specified tension sufficient to remove crimp.

STRAIGHT FRAME = ПРЯМАЯ РАМА – Straight Frame is a type of chassis used to move containers. 40 foot straight frame chassis are needed for 40 foot containers without tunnels. Some custom built 40 foot containers are being built without tunnels which makes it impossible for the container to fit a standard 40 foot gooseneck type chassis. So if you are carrying custom made containers it important to identify whether your container has a tunnel. The 40 foot straight frame chassis will carry flat and tunnel type containers 8 foot 6 inches high. Chassis is designed and built according to Association of American Railroads (AAR), the US Federal Motor Vehicle Safety Standards (FMVSS), International Standards Organization (ISO), American National Standards Institute (ANSI), the US Department of Transportation (DOT), American Bureau of Shipping (ABS), Society of Automotive Engineers (SAE), and Truck Trailer Manufacturers Association (TTMA) standards. Chassis come standard with 10x20 tires on 5 spoke wheels and spring suspension. Options include air suspension and 11R22.5 tires on 10-hole disc wheels. / Тип шасси, используемый для перевозки контейнеров.

STRAIGHT GRADES = СУХИЕ СОРТА (или ТВЁРДЫЕ СОРТА) – Straight Grades of grain are those within accepted limits of moisture. With increasing moisture content, grain is graded straight, tough, damp, moist, and wet. / К Сухим или Твёрдым Сортам зерна относятся те сорта, влажность зерна которых находится в пределах допустимой нормы. В случае увеличения содержания влаги зерно будет последовательно отсортировано как сухое или твёрдое (straight), средней сухости или мягкое (tough), влажное или вязкое (damp), сырое (moist) и мокрое (wet).

STRAIGHT MINERAL OIL = ПРЯМОГОННОЕ МИНЕРАЛЬНОЕ МАСЛО (или ДИСТИЛЛЯТНОЕ МИНЕРАЛЬНОЕ МАСЛО, или МИНЕРАЛЬНОЕ МАСЛО БЕЗ ПРИСАДОК) – Straight Mineral Oil is a petroleum oil containing no additives. Straight mineral oils include such diverse products as low-cost once-through lubricants and thoroughly refined white oils. Most high-quality lubricants, however, contain additives.

STRAIGHTNESS = ВЫПРЯМЛЕННОСТЬ (или ПРЯМОТА) – Straightness is the ability of a steel cord to lie flat between two straight parallel lines which are a prescribed distance apart.

STRAIGHT NOTE = ОБЫЧНЫЙ (или ЧИСТЫЙ, или ПРЯМОЙ) БИЛЕТ (или ХХ НОТА) – Straight Note:- note issues without conversion or warrant clauses but with a fixed interest rate for the entire period to maturity.

STRAIGHT OIL = ПРЯМОГОННОЕ МАСЛО (или ДИСТИЛЛЯТНОЕ МАСЛО, или МАСЛО БЕЗ ПРИСАДОК) – Straight Oil is a mineral oil containing no additives. / минеральное масло, не содержащее присадок.

STRAIGHT–RUN = ПРЯМОГОННЫЙ – Straight-Run is a term applied to a product of petroleum made by distillation without conversion. / Термин, применяемый к нефтепродукту, получаемому посредством дистилляции без обратимости.

STRAIGHT–RUN GASOLINE = ПРЯМОГОННЫЙ БЕНЗИН – Straight-Run Gasoline is a gasoline which is obtained directly from crude oil by fractional distillation. Straight-run gasoline generally must be upgraded to meet current motor fuel specifications. Also known as Naphtha, and Raw Gasoline. / Дробная Перегонка или Фракционная Перегонка (Fractional Distillation). Известен также как Нафта (Naphtha) и Технологический Бензин (Raw Gasoline).

STRAIGHT SLEEVE = ПРЯМОЙ РУКАВ – Straight Sleeve is a narrow, tube-like short or long set-in sleeve. / короткий или длинный вшивной рукав.

STRAIGHT THROUGH PROCESSING = НЕПОСРЕДСТВЕННАЯ ОБРАБОТКА (или СКВОЗНАЯ ОБРАБОТКА ТРАНЗАКЦИЙ) – Straight-Through Processing (STP) is the capture of trade details directly from front-end trading systems and complete automated processing of confirmations and settlement instructions without the need for rekeying or reformatting data. To provide an open gateway to a common and standard transaction structure that eliminates repetitive data entry, from order generation to settlement completion for all markets, instruments, and participants. Used in the payment transfer area for the automated full processing of payments, i.e. from the issuer of the order to the final recipient. The abbreviation STP is also used in connection with securities, but does not have the same significance. / Обозначение .

STRAIN = ДЕФОРМАЦИЯ (или НАПРЯЖЕНИЕ, или НАТЯЖЕНИЕ, или РАСТЯЖЕНИЕ, или УСИЛИЕ, или НАГРУЗКА, или РАСТЯЖИМОСТЬ) – (1) Strain:- when load is applied to a specimen a certain amount of stretching takes place. The amount will vary with the initial length of the specimen. The 'Strain' is the term used to relate the stretch or elongation with the initial length; Strain = Elongation / Initial Length. Strain is the change in length per unit length of a material in any given direction. / Изменение длины на единицу длины материала в любом выбранном направлении.

(2) Strain is the ratio of the extension of a test specimen to its initial length. See also Elongation.

STRAIN = ШТАММ – Strain is a sub-grouping of a pathogen Species based on genetic uniformity. Derived from a single spore. / Подгруппирование Видов патогенов, основанное на генетической однородности. Выделяется из одной и той же споры. Под Штаммом, от Немецкого слова Stamm, понимается чистая культура микроорганизмов одного Вида, у которого изучены морфологические и физиологические особенности. Разные штаммы микроорганизмов одного и того же Вида по ряду свойств, например, чувствительность к антибиотикам, отличаются друг от друга.

STRAIN = ЭЛИТА (или ЛИНИЯ) – Strain is a group of plants within a variety that share common, recognizable features in morpho-agronomic characters, physiological differences, or reactions to specific disease pathogens or insect pests. A strain, may include several lines with similar features. See also Elite. / свойства (characters), . Под Элитой, от Французского слова Élite, означающее Лучшее или Отборное, понимаются лучшие, отборные семена, растения или животные, полученные в результате селекции и используемые для дальнейшего размножения или разведения. В селекции растений под Элитой понимают лучшие растения, отбираемые из популяции для выведения новых сортов; в семеноводстве – потомство лучших отобранных растений возделываемого сорта. Элитные семена наиболее полно передают наследственные признаки и свойства сорта, имеют наивысшую по сравнению с другими репродукциями сортовую чистоту (типичность), свободны от заболеваний, имеют высокие физические качества и посевные качества не ниже I класса стандарта. Элитные семена выращивают научно-исследовательские учреждения, учхозы сельскохозяйственных ВУЗов для проведения сортосмены и сортообновления. В животноводстве к классам Элиты и Элиты-Рекорд относят наиболее ценных по экстерьеру, конституции, наследственным качествам и продуктивности сельскохозяйственных животных, превышающих требования к I бонитировочному классу.

STRAINER = СИТО (или ФИЛЬТР ГРУБОЙ ОЧИСТКИ, или СЕТЧАТЫЙ ФИЛЬТР) – Strainer is a coarse filter element (pore size over approximately 40 µm). See also Filter.

STRAIN RECOVERY CURVE = КРИВАЯ ВОССТАНОВЛЕНИЯ ДЕФОРМАЦИИ (или КРИВАЯ ДЕФОРМАЦИОННОГО ВОЗВРАТА) – Strain Recovery Curve:- xxxxx. See also Tensile Hysteresis Curve.

STRAITJACKET = СМИРИТЕЛЬНАЯ РУБАШКА (или ТЕСНЫЙ (или УЗКИЙ) ЖАКЕТ) – Straitjacket:- used as a devise to constrain the wearer. Often used on people that are out of control, crazy, lost their marbles.

THE STRAITS TIMES INDEX = ИНДЕКС ОТ ЗЭ СТЧРЭЙЦ ТАЙМЗ (или ИНДЕКС ОТ НАПРЯЖЁННЫХ (или ПРОЛИВНЫХ) ВРЕМЁН) – The Straits Times Index (STI) is the most globally-recognised benchmark index and market barometer for Singapore. With a history dating back to 1966, it tracks the performance of the top 30 companies listed on the Singapore Exchange ranked by market capitalisation. The STI adopts FTSE's international methodology for compiling stock indices and has been designed to be tradable to meet the needs of both domestic and international investors. It is also the headline index of the FTSE ST Index Series, a family of indices created by Singapore Press Holdings (SPH), Singapore Exchange (SGX) and FTSE Group (FTSE), that aims to offer a wider set of investment choices and opportunities by segmenting the Singapore market. Features:- (i) the STI is the headline index of the FTSE ST Index Series, which comprises a total of 77 indices; (ii) the index has been designed for the creation of structured products, index tracking funds and ETFs, or for use as a performance benchmark; (iii) stocks are free-float weighted to ensure that only the investable opportunity set is included within the indices; (iv) stocks are liquidity screened to ensure that the index is tradable; (v) capital and total return indices are available within this series; and (vi) the STI is now distributed on an intra-second streaming basis, providing investors with the fastest and most up to date read of the Singapore market to respond more rapidly to market events. The indices are calculated in accordance with the Industry Classification Benchmark (ICB), a global standard developed in partnership between FTSE Group and Dow Jones Indexes. The ICB contains four classification levels:- Industries (x10), Supersectors (x19), Sectors (x41), and Subsectors (x114). Global presence – ICB is adopted by stock exchanges representing over 65% of the world's market capitalization. Index Universe:- FTSE ST All-Share Index. Index Launch:- 10 January 2008. Base Date:- 09 January 2008. Base Value:- 3 344.53. Investability Screen:- free float adjusted and liquidity screened. Index Calculation:- real-time and end-of-day indices available. Real-time calculated on intra-second streaming basis. End-of-Day Distribution:- indices available at 19:00 Singapore local time (11:00 hours UK time GMT or 12:00 hours BST) via FTP and email. Currency:- EUR, GBP, USD, JPY, SGD. Real-time calculated in SGD only. Review Dates:- semi-annually in March and September. The FTSE ST Index Series and the Straits Times Index (Index Series) are calculated by FTSE International Limited (FTSE) in conjunction with SPH Data Services Pte Ltd (SPH) and data from Singapore Exchange Securities Trading Ltd (SGX-ST). The Straits Times Index (also called the STI) is the benchmark index for the Singapore Exchange. It covers 30 companies which are deemed representative of the Singapore market. The Singapore Exchange works with the UK Based Financial Times Stock Exchange 100 Index (UKX-LN) in order to maintain the FTSE ST Index Series. The STI was evolved as a market capitalization weighted index. It involves the total market capitalization of the companies weighted by their effect on the index, so the larger stocks would make more of a difference to the index as compared to a smaller market cap company. The basic formula for any index is (be it capitalization weighted or any other stock index):- Index Level = Σ(Price of Stock x Number of Shares) x Free Float Factor / Index Divisor. The Free float Adjustment factor represents the proportion of shares that is free floated as a percentage of issued shares and then its rounded up to the nearest mulitple of 5% for calculation purposes. To find the free-float

capitalization of a company, first find its market cap (number of outstanding shares x share price) then multiply its free-float factor. The free-float method, therefore, does not include restricted stocks, such as those held by company insiders. While one might track this portfolio's value in Dollar terms, it would probably be an unwieldy number – for example, the S&P 500 market value is roughly USD11.8 trillion. Rather than deal with ten or more digits, the figure is scaled to a more easily handled number, currently around 1250. Dividing the portfolio market value by a factor, usually called the Index Divisor, does the scaling. Continuity in index values is maintained by adjusting the divisor for all changes in the constituents' share capital after the base date. This includes additions and deletions to the index, rights issues, share buybacks and issuances, and spin-offs. The divisor's time series is, in effect, a chronological summary of all changes affecting the base capital of the index. The divisor is adjusted such that the index value at an instant just prior to a change in base capital equals the index value at an instant immediately following that change. For a security to be eligible for the Straits Times Index:- (i) all classes of the ordinary shares in issue the exchange are eligible for inclusion in the STI; (ii) convertible preference shares and loan stocks are excluded until converted. Companies whose business is that of holding equity and other investments, e.g., Investment Trusts; (iii) free float restrictions apply to all stocks, but the stock has to have at least 15% of the shares being traded on the exchange at any given time; and (iv) the securities must have a turnover of at least 0.05% of their shares in the market (after the application of any kind of weighting) based on a median daily trade per month in ten of the twelve months of the year. The revamped The Straits Times Index (STI), calculated and disseminated by FTSE, comprises the top 30 SGX Mainboard listed companies selected by full market capitalization. The index was revamped effective 2008-January-10. To see the old Straits Times Index prior to reconstruction please see STIOLD Index. The Straits Times Index (STI) comprises of the stocks of 30 representative companies listed on the Singapore Exchange. The index is calculated based on market-value weighted stock market index. The Straits Times Industrials Index (STII) was replaced by The Straits Times Index. The index began trading on 1998-August-31 at 885.26 points, the same level where the STII was halt. The index was constructed by the Singapore Press Holdings, the Singapore Exchange and Professor Tse Yiu Kuen from the Singapore Management University. The formal review of index is done at least once annually, and may also be reviewed on an ad-hoc basis when required. Criteria for stock inclusion in the Straits Times Index:- all classes of the ordinary shares in issue the exchange are eligible for inclusion in the STI. Convertible preference shares and loan stocks are excluded until converted. Companies whose business is that of holding equity and other investments, e.g., Investment Trusts. Free float restrictions apply to all stocks, but the stock has to have at least 15% of the shares being traded on the exchange at any given time. The securities must have a turnover of at least 0.05% of their shares in the market (after the application of any kind of weighting) based on a median daily trade per month in ten of the twelve months of the year. The Straits Times is an English-language broadsheet newspaper based in Singapore, currently owned by the Singapore Press Holdings Limited (SPH). It is the country's highest-selling paper in any language, with a daily circulation of 388 500 in August 2006. As of 2008, it has an estimated readership of 1.23 million. The Straits Times is one of the region's oldest English-language daily newspapers. It is the flagship publication of the publicly-listed Singapore Press Holdings group. First published on 1845-July-15, The Straits Times is the most widely read newspaper in Singapore. The Sunday Times, which is produced by the same team of journalists, has a circulation of nearly 400 000 and a readership of 1.23 million. The Straits Times strives to be an authoritative provider of news and views, with special focus on Singapore and the Asian region. It has nine bureaus in Asia and a worldwide network of other contributors. Headquartered in Singapore, Singapore. / Зэ Стчрэйц Таймз (The Straits Times). Дау Дьжонз (Dow Jones). График Индекса от Зэ Стчрэйц Таймз показывает среднее движение стоимости акций 30 наиболее крупных компаний в листинге Сингапурской Биржи. Общая капитализация компаний в индексе с 18 Марта 2005 составляет около 75% от капитализации всего индекса.

STRAKE = ПОЯС – Strake (maritime term):- a continuous planking or plating fitted out to and from stem to stern of a vessel's side.

STRAND = ПРЯДКА (или ЖГУТ, или СТРЕНГА, или ПРЯДЬ (КАНАТА), или ОДИН КОНЕЦ или ОДНО СЛОЖЕНИЕ КРУЧЁНОЙ ПРЯЖИ, или ПУЧОК ВОЛОКОН, или ЛЕНТА ДО ГРЕБНЕЧЕСАНИЯ) – Strand is a general expression for linear textile assemblies, particularly yarns which are components of ropes and cordage. Note for steel:- a group of filaments twisted together to form a unit product to be processed further. A strand may be considered as a cord if it is the end product for tyre reinforcement or if it may be an element in a more complex structure. Strand is:- (i) a single fiber, filament, or monofilament; and (ii) an ordered assemblage of textile fibers having a high ratio of length to diameter and normally used as a unit; includes slivers, roving, single yarns, plies yarns, cords, braids, ropes, etc. / мононить (monofilament).

STRAND = СТРЕНДЬ (или ПРЯДЬ) – Strand (maritime term):- a number of yarns, twisted together and which in turn may be twisted into rope; a rope is stranded when a strain is broken; rope may be designated by the number of strands composing. Rope is commonly three-stranded. A vessel run ashore is said to be stranded. / Стрендь троса кабельного спуска. Прядь троса тросового спуска.

STRANDED COSTS = НЕОКУПАЕМЫЕ РАСХОДЫ – Stranded Costs are costs that were incurred by a regulated utility prior to a switch from a regulated to competitive system for generating and selling electricity and are not expected to be recoverable from customers buying power at market prices. A utility may be granted the right to collect a transition charge from consumers in its service area to compensate it for stranded costs. In a stranded cost securitization, those charges are used to support nonrecourse debt issued by the utility through a special purpose entity.

STRANDING = ВЫБРОС НА СУШУ – Stranding is the grounding of the vessel, causing it to remain fast for an appreciable length of time. Mere contact of the vessel with the bottom without losing momentum and proceeding on course is commonly termed as 'touch-and-go' and is not considered a stranding. The running of a ship on shore on a beach. Stranding can occur for a number of reasons:- (i) bad navigation, (ii) bad weather, (iii) engine breakdown, (iv) faulty navigation instruments, etc.

STRANGLE = ОГРАНИЧЕНИЕ ЦЕНОВОГО ДИАПАЗОНА (или СТРЭНГЛ) – A Strangle is the same idea as a Straddle, but you purchase the call and put at different strike prices. 'That's how the butterfly and condor varied', says Joseph Burgoyne, Director of institutional and retail marketing for the Options Industry Council. 'Typically you're going to be long an out-of-the-money call and an out-of-the-money put in a strangle'. Using our USD50 stock again, we buy the 45 put and the 55 call. The advantage is that by buying out-of-the-money options, our initial cost is much lower, but it also means we need to have a bigger move in the underlying for it to be profitable. If we were able to buy both the put and call for USD1 each, then stock will have to reach USD57 or USD43 just to break even (not including commissions). 'I am risking a lot less, but the chance is greater that I will lose my entire investment than with the straddle', says Marty Kearney, Senior Instructor at CBOE® Options Institute. Looking again at AAPL going into earnings, a trader could have initiated a strangle by buying the 505 put and 525 call. The move below USD460 would make our put about USD45 in-the-money, while our call would expire worthless. You also are able to short a strangle, but the same issues apply as if you were to short a straddle. With all of these strategies, you need to be aware of your positions going into expiration. If a portion of your strategy is in-the-money and you do not want to take possession, then you need to ensure you are able to exit that position before expiration. Although these strategies allow you to balance your risk vs. reward to your liking, Burgoyne advises that traders always should consider the worst-case scenario when taking on a trade. 'It all goes back to risk management. Look at that first, and proceed accordingly'. In options, Strangle is a speculative strategy of either buying or selling puts and calls, each with the same expiry date but with different

strike prices. Strangle is:- (1) as with a straddle, the sale or purchase of a put option and a call option on the same instrument, with the same expiry, but at strike prices that are out-of-the-money. The strangle costs less than the straddle because both options are out-of-the-money, but profits are only generated if the underlying moves dramatically, and the break-even is worse than for a straddle. Sellers of strangles make money in the range between the two strike prices, but lose if the price moves outside the break-even range (the strike prices plus the premium received). (2) The term Strangle is also used, by currency option traders, to denote the average difference in implied volatility between out-of-the-money call and put options with a 25% Delta and the implied volatility of at-the-money forward options. Practice of buying out-of-the-money call and put options that are close to expiry at a relatively low premium. If the price of the underlying futures rises or falls suddenly, the buyer makes a profit. Strangle is a purchase or sale of an equal number of puts and calls of the same underlying asset with the same expiration dates but different strike prices. An option position consisting of the purchase or sale of put and call options having the same expiration date, but different strike prices. Strangle is an options strategy where the investor holds a position in both a call and put with different strike prices but with the same maturity and underlying asset. This option strategy is profitable only if there are large movements in the price of the underlying asset. This is a good strategy if you think there will be a large price movement in the near future but are unsure of which way that price movement will be. The strategy involves buying an out-of-the-money call and an out-of-the-money put option. A strangle is generally less expensive than a straddle as the contracts are purchased out of the money. For example, imagine a stock currently trading at USD50.00 a share. To employ the strangle option strategy a trader enters into two option positions, one call and one put. Say the call is for USD55.00 and costs USD300.00 (USD3.00 per option x 100 shares) and the put is for USD45.00 and costs USD285.00 (USD2.85 per option x 100 shares). If the price of the stock stays between USD45.00 and USD55.00 over the life of the option the loss to the trader will be USD585.00 (total cost of the two option contracts). The trader will make money if the price of the stock starts to move outside of the range. Say that the price of the stock ends up at USD35.00. The call option will expire worthless and the loss will be USD300.00 to the trader. The put option however has gained considerable value, it is worth USD715.00 (USD1 000.00 less the initial option value of USD285.00). So the total gain the trader has made is USD415.00. Strangle is an option strategy involving one call and one put with different strike levels but with the same expiry date. / СИБО® (СВОЕ®). Дьжосэф Бургойн (Joseph Burgoyne). Мати Кони (Marty Kearney). Стрэнгл – покупка или продажа одинакового количества опционов на продажу и покупку на определённые финансовые инструменты с одними и теми же датами исполнения, но различными ценами исполнения. Покупатель стрэнгла рассчитывает получить прибыль от сравнительно сильных изменений в цене финансовых активов, лежащих в основе опционов, независимо от направленности этих изменений.

STRAP = ПРИВЯЗКА (или СВЯЗКА, или СТРЭП) – Strap is an options strategy created by being long in one put and two call options, all with the exact same strike price, maturity and underlying asset. A strap option is used when a trader believes that the future price movement of the underlying security will be large and more likely up than down. By adding two call options the trader has a large gain if he or she is right about the large upward movement. But if the forecast is wrong and the price has a large reversal, the trader is protected by the put option. Also known as Triple Option. Two calls and one put on the same underlying with the same strike price and expiry date. A Strap consists of a long position in two calls and one put with the same exercise price and expiry date. / Два опциона на покупку и один опцион на продажу одного и того же соответствующего инструмента с одной и той же сходной ценой, и одной и той же датой истечения срока.

STRAP = СТРОП (или ПОЯС, или НАКЛАДКА, или СТЯЖКА, или ЛЕНТА, или (ЛЕНТОЧНЫЙ) ХОМУТ, или РЕМЕНЬ) – Strap is a band of metal, plastic or other flexible material used to hold cargo or cases together. / Лента из металла, пластика или иного гибкого материала, используемая для удерживания скреплённым вместе груза или ящиков.

STRAP = СТРОП (или СТЫКОВАЯ ПЛАНКА, или ПАЗОВАЯ ПЛАНКА, или ПОДБРЮШНИК, или ОКОВКА БЛОКА) – Strap (maritime term):- a ring of rope made by splicing the ends, and used for slinging weights, holding the parts of a block together, etc. A rope, wire or iron binding, encircling a block and with a thimble seized into it for taking a hook. Small straps used to attach a handybilly to the hauling part of a line.

STRAP LOADING = ОБТЯНУТАЯ НАГРУЗКА – Strap Loading:- product is loaded onto a pallet and then secured with strapping.

STRAPPING = СТРОПОВКА (или КРЕПЛЕНИЕ, или ОБВЯЗКА, или ОБТЯГИВАНИЕ, или ОПОЯСЫВАНИЕ) – Strapping:- used for securing goods onto a pallet. Can be metal or plastic. Strapping:- thin flat bands used to secure load to pallet. See also Pallet. / Обвязка (Strapping):- гибкая лента из полимерного материала или металла, обычно плоская или круглого поперечного сечения, применяемая для скрепления грузов на поддоне.

STRAPPY SANDAL = РЕМЕШКОВАЯ САНДАЛЕТА (или ТЕСЁМОЧНАЯ САНДАЛИЯ) – Strappy Sandal is one of the oldest styles of sandle (some believe dating back to the stone age). The sandal has several thin straps and a heal.

STRAP SLOT = ПАЗ (или ЩЕЛЬ) ДЛЯ СТРОПА – Strap Slot:- recess or cutout on the upper edge of the stringer or the bottom of the top deckboard to allow tie-down of a unit load to the pallet deck with strapping/banding, also called the Banding Notch.

STRATEGIC PETROLEUM RESERVE = СТРАТЕГИЧЕСКИЙ РЕЗЕРВ НЕФТИ – Strategic Petroleum Reserve:- in the United States, petroleum stocks maintained by the Federal Government for use during periods of major supply interruption. With a capacity of 727-million-barrels, US Strategic Petroleum Reserve (SPR) is the largest stockpile of government-owned emergency crude oil in the world. Established in the aftermath of the 1973–74 oil embargo, the SPR provides the President with a powerful response option should a disruption in commercial oil supplies threaten the US economy. It is also the critical component for the United States to meet its International Energy Agency obligation to maintain emergency oil stocks, and it provides a national defense fuel reserve. At the end of December 2009, when fill to capacity was completed, the SPR held 726.6 million barrels. During July and August 2011, inventory was reduced to 695.9 million barrels after 30.59 million barrels were sold in response to sustained interruptions in global supplies due to civil unrest in Libya. President Obama authorized the sale as part of a larger coordinated release of petroleum by International Energy Agency countries. / В Соединённых Штатах Америки, запасы нефти, поддерживаемые Федеральным Правительством, для использования в течение периодов значительных перерывов в поставках.

STRATEGIC RISK = СТРАТЕГИЧЕСКИЙ РИСК – Strategic Risks take into account the risk that significant trends permanently affecting the activities of the bank have been wrongly interpreted so that countermeasures are hardly possible or only possible in the medium to long term. Business risk is a special kind of strategic risk and takes into account differences between the earnings position and the forecast trend. / Стратегический Риск – риск возникновения у кредитной организации убытков в результате ошибок (недостатков), допущенных при принятии решений, определяющих стратегию деятельности и развития кредитной организации (стратегическое управление) и выражающихся в неучёте или недостаточном учёте возможных опасностей, которые могут угрожать деятельности кредитной организации, неправильном или недостаточно обоснованном определении перспективных направлений деятельности, в которых кредитная организация может достичь преимущества перед конкурентами, отсутствии или обеспечении в неполном объёме необходимых ресурсов (финансовых, материально-технических, людских) и

организационных мер (управленческих решений), которые должны обеспечить достижение стратегических целей деятельности кредитной организации.

STRATIFICATION = СТРАТИФИКАЦИЯ – Stratification is a process of exposing sown seeds to low, near freezing temperatures to imitate natural over-wintering as an aid to germination. During the process, chemical inhibitors of germination are broken down. Stratification is the process of dividing a population into relative homogeneous subgroups to increase sampling efficiency. / Под Стратификацией Семян, от Латинских слов Stratum, означающее Слой, и Facio, означающее Делаю, понимается выдерживание семян труднопрорастающих пород во влажном мхе, песке, торфе при температуре 1–5 °С или под снегом для ускорения прорастания. Стратификация Семян, приём предпосевной подготовки семян для ускорения их прорастания. Применяется главным образом для труднопрорастающих семян древесных (плодовых, лесных, декоративных) пород и некоторых лекарственных растений. Семена переслаивают влажным субстратом (песок, опилки, торфяная крошка, мох), а затем выдерживают при пониженной температуре (1–5 °С) и свободном доступе воздуха. На 1 часть семян берут 3–4 части субстрата. Стратификация семян продолжается от одного до нескольких месяцев.

STRATUM = СТРАТА (или СТРАТУМ, или СЛОЙ, или ПЛАСТ) – Stratum:- Division of a field to enhance sampling designs. For representative sampling, each field may be divided into four or more strata with larger samples taken from strata with the greatest production management problems and/or plant diversity. / Под Стратами, от Латинского слова Stratum, означающее Настил или Слой, понимаются:- (1) светлые слои, периодически чередующиеся с тёмными промежутками в положительном столбе электрического разряда в газах. В одних случаях страты неподвижны, в других – перемещаются (бегущие страты), обычно от анода к катоду. Каждая страта обращена яркой и резкой стороной к катоду. Яркость страты, как правило, убывает к аноду. По современным представлениям в ‘голове’ страты (с катодной стороны) напряжённость электрического поля, температура и концентрация электронов велики. При перемещении электронов в процессе диффузии от ‘головы’ страты к аноду их концентрация и температура падают настолько, что прекращается ионизация. Затем возникает новый скачок электрического потенциала и образуется новая страта.

STRAW = СОЛОМКА (или СОЛОМА) – (1) Straw is a fairly stiff material made from the stems, leaves, bark, or stalks of various plants. It is usually braided or woven to form a fabric. Straw is used in large quantities for hats when they are in style. Most straw today is used for baskets and handbags of various kinds. Chip straw is used almost exclusively for baskets. It is a by-product of the lumber industry and is made from chips and other pieces of wood, including shavings. Leghorn straw is a braided straw popular for hats and is made from wheat grown in Italy. Panama, another braided hat straw, is made from the screw pine. Other types of straw include Bangkok, linen (straw made to resemble woverr linen), Milan, Ramie, Sisal (used for rugs and ropes), toyo, and Tuscan. Straw is a general term for plant fibers obtained from stems, stalks, leaves, bark, grass, etc. They are made into hats, bags, shoes, mats, etc, by weaving, plaiting, or braiding. Straw forms the raw material of some not unimportant industries. It serves for the thatching of roofs, for a paper-making material, for ornamenting small surfaces as a ‘Straw Mosaic’, for plaiting into door and table mats, mattresses, etc, and for weaving and plaiting into light baskets, artificial flowers, etc. These applications, however, are insignificant in comparison with the place occupied by straw as a raw material for the straw bonnets and hats worn by both sexes. Of the various materials which go to the fabrication of plaited head-gear the most important is wheaten straw. It is only in certain areas that straw suitable for making plaits is produced. The straw must have a certain length of ‘pipe’ between the knots, must possess a clear delicate golden color, and must not be brittle. The most valuable straw for plaits is grown in Tuscany, and from it the well-known Tuscan plaits and Leghorn hats are made. The straw of Tuscany, specially grown for plaiting, is distinguished into three qualities, – Fontederas Semone being the finest, Mazzuolo the second quality, from which the bulk of the plaits are made, while from the third quality, Santa Fioro, only ‘Tuscan pedals’ and braids are plaited. The wheat-seed for these straws is sown very thickly on comparatively elevated and arid land, and it sends up long attenuated stalks. When the grain in the ear is about half developed the straw is pulled up by the roots, dried in the sun, and subsequently spread out for several successive days to be bleached under the influence of alternate sunlight and night-dews. The pipe of the upper joint alone is selected for plaiting, the remainder of the straw being used for other purposes. These pipes are made up in small bundles, bleached in sulphur fumes in a closed chest, assorted into sizes, and so prepared for the plaiters. Straw plaiting is a domestic industry among the women and young children of Tuscany and some parts of Emilia. Tuscan plaits and hats vary enormously in quality and value; the plait of a hat of good quality may represent the work of four or five days, while hats of the highest quality may each occupy six to nine months in making. The finest work is excessively trying to the eyes of the plaiters, who can at most give to it two or three hours’ labor daily. The exports of plaits and manufactured hats from Leghorn average in value £64 800 000 annually, about one half of the goods going to America. The districts around Luton in Bedfordshire and the neighbouring counties have, since the beginning of the XVII century, been the British home of the straw-plait industry. The straw of certain varieties of wheat culti-vated in that region is, in favourable seasons, possessed of a fine bright color and due tenacity and strength. The straw is cut as in ordinary harvesting, but is allowed to dry in the sun before binding. Subsequently straws are selected from the sheaves, and of these the pipes of the two upper joints are taken for plaiting. The pipes are assorted into sizes by passing them through graduated openings in a grilled wire frame, and those of good color are bleached by the fumes of sulphur. Spotted and dis-colored straws are dyed either in pipe or in plait. The plaiters work up the material in a damp state, either into whole straw or split straw plaits. Split straws are pre-pared with the aid of a small instrument having a project-ing point which enters the straw pipe, and from which radiate the number of knife-edged cutters into which the straw is to be split. The plaiting of straw in the Luton district formerly gave employment to many thousands of women and young children; but now vast quantities of plaits are imported at a very cheap rate from Canton in China. The result is that, while the Luton trade is extending, the number of persons it there gives occupation is greatly diminished. In 1871 about 50 000 persons were employed in the straw industry, and in 1881 the number was only about 31 000. The plaits are sewed partly by hand and in a special sewing-machine, and the hats or bonnets are finished by stiffening with gelatin size, and blocking into shape with the aid of heat and powerful pressure, according to the dictates of fashion. The annual output of the straw-plait industry in England is estimated to amount in value to about £64 000 000. In the United States straw-plait work is principally centred in the State of Massachusetts. Many substances besides straw are worked into plaits and braids for bonnets. Among these may be noticed thin strips of willow and cane, and the fronds of numerous palms. ‘Brazilian’ hats made from the fronds of the palmetto palms, Sabal Palmetto and Sabal Mexieana, are now largely made at St Albans. The famous Panama hats, fine qualities of which at one time were worth £20 to £30 each, are made from the leaves of the screw pine, Carludovica palmata. They are now manufactured at Dresden, Strasburg, and Nancy, and can be purchased at 30s. or £2.

(2) Straw is the dry stems and leaves of a Rice plant that have been harvested and discarded from threshing.

STRAYING END = ШАЛЬНАЯ ПРОДОЛЬНАЯ НИТЬ – Straying End:- warp knit. Caused when an end of yarn breaks and the loose end strays and is knit irregularly into another area. Knitted fabric defect. Straying End:- in a warp-knitted fabric, a length of yarn that has been knitted incorrectly and irregularly into the fabric. Note:- this defect is caused by a broken and straying over adjacent needles and being knitted into adjacent wales at random. Note:- this defect is caused by amalfunctioning needle forming random tuck stitches. / Порок или дефект.

STREAK = ЗАТАСК – Streak is a variation of generally varying width which may or may not be parallel to the warp direction. Streak:- band-like recessed area generally of small depth, or area having a different surface texture. / Затаск – порок печатного товара в виде параллельных полос. Затаск от печати, не более 2 см. Размер порока – до 0.5 см. Размер порока определяют по наибольшей протяжённости. Неравномерная Ширина (streak):- порок в виде колебания ширины полотна.

STREAKED DYE = ПРОНЁСШИЙСЯ КРАСИТЕЛЬ – Streaked Dye:- not evenly applied. Thread defects, and namely – Dyeing. / Порок или дефект ниток.

STREAKINESS = ЗАТАСКАННОСТЬ – Streakiness:- if the solidity of the fabric looks poor, is called Streakiness. Dyeing defect. / Порок или дефект крашения.

STREAK OR STOP MARK = ЗАТАСК (или ОТМЕТИНА В ВИДЕ ПОЛОСКИ) ИЛИ ОТМЕТИНА ОТ ОСТАНОВА – Streak or Stop Mark:- a straight horizontal streak or stop mark in the knitted fabric is due to the difference in tension in the yarns caused by the machine being stopped and then restarted. Knitted fabric defect.

STREAKS = ЗАТАСКИ (или ЧЕРТЫ, или ПОЛОСКИ, или ПРОСЛОЙКИ) – (1) Streak is a discoloration (rust, oil, dye, grease, soap, etc) extended as an irregular stripe in the cloth. Fabrics defect. Streak:- an extended unintentional stripe of narrow width, often a single yarn. / Под Затаском понимается порок печатного товара в виде параллельных цветных полос. Затаск от печати, не более 2 см. Размер порока – до 0.5 см. Размер порока определяют по наибольшей протяжённости.

(2) Streaks:- markings caused by some types of turn boards or defectively finished trimmings. Finishing department defects, and namely – Trimming Defects. / Порок или дефект заключительной обработки.

STREAKY WARP = ЗАТАСКАНАЯ (или ПОЛОСАТАЯ) ОСНОВА – Streaky Warp:- faint warpways color variation of varying width and length. Note:- this defect is often caused by varying dye uptakes in the warp yarns due to uneven desizing or blending, or by irregularities in twist or linear density. / Зебристость Основы (streaky warp):- порок заключительной отделки ткани, представляющий собой наличие в ткани участков небольшой протяжённости по основе, возникающих от различной линейной плотности нитей. Примечание:- этот порок часто вызывается разным поглощением краски в пряже из-за неравномерной расшлихтовки, и различной толщины.

STREAM CIPHER = ПОТОЧНЫЙ ШИФР (или ПОТОЧНОЕ ШИФРОВАНИЕ) – Stream Cipher is a cryptographic algorithm which encrypts individual character (usually binary digits) of a plaintext message one at a time. A stream cipher may be defined as a block ciper where blocklength is equal to one. / Под Шифром, от Французского слова Chiffre, понимается совокупность условных знаков (условная азбука из цифр или букв) для секретной переписки, а также для передачи текста секретных сообщений по техническим средствам связи.

THE STREET = УЛИЦА – The Street is a colloquial name for brokers, many of whom have or had offices on Wall Street. 'To hold one's shares in street name' means the Depositary Receipt holder chooses not to have the Depositary Receipt registered in his or her name, but rather keeps it in a broker's account within the Depository Trust Company (DTC). / Вол Стрит (Wall Street).

STREET BOOK = УЛИЧНАЯ КНИГА – Street Book is a daily record kept by Futures Commission Merchants and clearing members showing details of each futures transaction, including date, price, quantity, market, commodity, future, and the person for whom the trade was made.

STREET NAME = УЛИЧНОЕ ИМЯ (или НА ИМЯ БРОКЕРА С УЛИЦЫ) – Street Name:- in the United States, securities held in the name of brokers, banks or their nominees, instead of in the customer's name. Securities held in the name of a broker instead of a customer's name are said to be carried in 'street name'. This occurs when the securities have been bought on margin or when the customer wishes the security to be held by the broker. Also known as Nominee Name. A type of account maintained by large institutions to safekeep the securities of individual investors. A brokerage, for example, will maintain all of the holdings of its individual client investors in one large street name account so that they can make trades and transfers quickly and easily.

STREMMA = СТРЭММА – Stremma is a traditional Greek unit of area, now redefined to equal exactly 1 000 square meters (m^2) or 0.1 hectare or 0.247 1 acre. / Стрэмма – традиционная мера площади в Греции. В настоящее время она приведена в точное соответствие 1 000 квадратным метрам ($м^2$) или 0.1 гектара или 0.247 1 акра.

STRENGTH = ИНТЕНСИВНОСТЬ (или СИЛА, или КРЕПОСТЬ, или ПРОЧНОСТЬ) – Strength is:- (1) the color quality that increases with an increase in the amount of colorant present, other conditions remaining constant. (2) In reflection colorants, a series of calculations based on the relative absorption of a given colorant.

STRENGTH = КРЕПОСТЬ (или УДЕЛЬНАЯ РАЗРЫВНАЯ НАГРУЗКА) – Historically, two instruments have been used to measure fiber tensile strength, the Pressley apparatus and the Stelometer. In both of these flat-bundle methods, a bundle of fibers is combed parallel and secured between two clamps. A force to try to separate the clamps is applied and gradually increased until the fiber bundle breaks. Fiber tensile strength is calculated from the ratio of the breaking load to bundle mass. Due to the natural lack of homogeneity within a population of cotton fibers, bundle fiber selection, bundle construction and, therefore, bundle mass measurements, are subject to considerable experimental error. Fiber strength, that is, the force required to break a fiber, varies along the length of the fiber, as does fiber fineness measured as perimeter, diameter, or cross section. Further, the inherent variability within and among cotton fibers ensures that two fiber bundles of the same weight will not contain the same number of fibers. Also, the within-sample variability guarantees that the clamps of the strength testing apparatus will not grasp the various fibers in the bundle at precisely equivalent positions along the lengths. Thus, a normalizing length-weight factor is included in bundle strength calculations. Cotton fiber strength is reported as Breaking Tenacity or grams of breaking load per tex, where tex is the fiber linear density in grams per kilometer. Both Pressley and stelometer breaking tenacities are reported as 1/8 inch gauge tests, the 1/8 inch (or 3.2 mm) referring to the distance between the two Pressley clamps. Flat-bundle measurements of fiber strength are considered satisfactory for acceptance testing and for research studies of the influence of genotype, environment, and processing on fiber (bundle) strength and elongation. Originally, HVI strength tests were calibrated against the 1/8 inch gauge Pressley measurement, but the bundle-strengths of reference cottons are now established by Stelometer tests that also provide bundle elongation-percent data. Fiber bundle elongation is measured directly from the displacement of the jaws during the bundle-breaking process, and the fiber bundle strength and elongation data usually are reported together. The HVI bundle-strength measurements are reported in grams-force tex^{-1} and can range from 30 and above (very strong) to 20 or below (very weak). In agronomic papers, fiber strengths are normally reported as kN m kg^{-1}, where one Newton equals 9.81 kg·force. Fiber strength is measured by HVI using 1/8 inch spacing between clamp jaws and reported in terms of grams per tex. A tex unit is equal to the weight in grams of 1 000 meters of fiber. Therefore, the strength reported is the force in grams required to break a bundle of fibers one tex unit in size. The fiber strength measurement is made by clamping and breaking a bundle of fibers from the same beards of cotton that are used for measuring fiber length. Results are reported in terms of grams per tex (a tex unit is equal to the

weight in grams of 1 000 meters of fiber). It expresses the force required to break a bundle of fibers one tex unit in size. Fiber strength is largely determined by variety. Strength measurements are performed by HVI in accordance with standard test methods. The fiber strength measurement is made by clamping and breaking a bundle of fibers, with a 1/8-inch spacing between the clamp jaws. Results are reported in terms of grams per tex to the nearest tenth. A tex unit is equal to the weight in grams of 1 000 meters of fiber. Therefore, the strength reported is the force in grams required to break a bundle of fibers one tex unit in size. Strength measurements are reported in terms of grams per tex. Therefore, the strength reported is the force in grams required to break a bundle of fibers one tex unit in size. Strength measurements are made on the same beards of cotton that are used for measuring fiber length. The beard is clamped in two sets of jaws, one-eighth inch apart, and the amount of force required to break the fibers is determined. Fiber strength is largely determined by variety. However, it may be affected by plant nutrient deficiencies and weather. There is a high correlation between fiber strength and yarn strength. Also, cotton with high fiber strength is more likely to withstand breakage during the manufacturing process. The following tabulation can be used as a guide in interpreting fiber strength measurements. Strength refers to the how much weight the fibers can bear. Some fibers, like Flax, actually get stronger when wet. / Высокопроизводительный Инструмент (ВПИ; High Volume Instrument (HVI). Прэсли (Pressley). измерительный прибор (gauge). / пучок (bundle). между двумя зажимами .

Degree of Strength / Уровень Крепости	**Very Strong** / Очень Прочная	**Strong** / Прочная	**Average** / Обычная	**Intermediate** / Средняя	**Weak** / Слабая
HVI Strength (grams per tex) / Крепость по Эйч.Ви.Ай. (грамм на текс)	31 & above	29 – 30	26 – 28	24 – 25	23 & below

STRENGTH = УКРЕПЛЕНИЕ – (1) The term Strength refers to the market's ability to move higher as well as stay firm during periods of brief price weakness. / Этот термин относится к способности рынка двигаться в сторону дальнейшего повышения цен, а также оставаться на определённом уровне при кратковременном истощении цены.

(2) The signal Strength is a long-term measurement of the strength of the signal compared to the strength of the signal historically. The strength can be one of the following five readings:- Maximum, Strong, Average, Weak, and Minimum. Maximum is the strongest this signal has been in the historical period, and minimum is the weakest the signal has been in the historical period. The stronger a signal strength, the less volatile the signal. For example, a maximum buy signal is less likely to change to a hold or a sell signal than a weak buy signal. A hold signal does not have any strength.

STRENGTH AT BREAK = КРЕПОСТЬ ПРИ РАЗРЫВЕ – Strength At Break:- the maximum stretching force that can be applied to fabric, yarn, carpet or other material before it breaks. Term still commonly used, but improperly, for the average of the results of breaking force measurements. See also Breaking Strength. The Tensile Strength At Break is the tensile stress at the moment at which a test specimen tears. Like elongation at break, this is also determined by tensile testing.

STRENGTH COUNT PRODUCT = ПРОДУКТ ПРОЧНОГО РАСЧЁТА – Strength Count Product:- xxxxx. See also Break Factor. Count Strength Product (CSP) is an old Strength value, which is not used in several countries anymore. It is a number which is derived by multiplication of count and lea strength (in lbs). Note:- the higher the value the better the yarn. Lea:- in one lea 120 yards length of yarn is wound by 80 wraps. Each wrap has a length (circumference) of 1.5 yards. Lea strength:- this is breaking load required to rupture one lea. It is generally expressed in pound. Note:- the higher the value the better the yarn. Yarn CSP Test (Count Strength Product):- a lea of 120 yards is wrapped with a wrap reel, having 1.5 yard circumference. The reel is fitted with a traversing mechanism that will minimize the bunching of yarn on the reel. These leas are relaxed on a skein holder and conditioned in the Standard atmosphere (temperature 27 °C and RH (relative humidity) 65%), for 24 hours. In the relaxed state 4 hours conditioning is sufficient. Lea Strength:- breaking load is tested with a lea strength tester which gives the breaking load in lb (pounds) force, this lea strength ester is a pendulum type with constant rate of traverse, the moving clam operating at a uniform speed of 12 inches/minute. After the strength is tested the same lea is taken and tested for cotton count with 'Auto Sorter'. The mean lea strength and the mean count are calculated after tests are completed. The product of the lea strength in lbs and count (Cotton Count System) is the Count Strength Product (CSP).

STRENGTHENING BASIS = УКРЕПЛЯЮЩИЙСЯ БАЗИС – A Strengthening Basis occurs when the difference between the cash market price of a given commodity and the futures price of the same commodity narrows. This happens when the cash market price increases relative to the futures price. The basis then, becomes less negative or more positive. Strengthening Basis is a basis movement over time that occurs when the cash price is rising relative to the futures price.

STRENGTH LIMIT STATES = ПРЕДЕЛЬНЫЕ СОСТОЯНИЯ ПО ПРОЧНОСТИ – Strength Limit States:- those states concerning safety and including the maximum load-carrying capacity of the structural materials of the connection as they relate to Limit States Design. / с Расчётом Предельных Состояний. В строительной механике под Предельным Состоянием понимается состояние конструкции (сооружения), при котором она перестаёт удовлетворять эксплуатационным требованиям. В строительной механике под Нагрузками понимаются силовые воздействия, вызывающие изменения напряжённо-деформированного состояния конструкций зданий и сооружений. По характеру изменений во времени различают:- (i) динамические нагрузки; и (ii) статические нагрузки. Статические нагрузки подразделяются на:- (a) временные нагрузки, в свою очередь делящиеся на неподвижные нагрузки (например, вес стеллажей и бункеров в складских помещениях) и подвижные нагрузки; и (b) постоянные нагрузки. По характеру приложения к телу, на которое они воздействуют, различают:- (i) распределённые нагрузки, прилагаемые ко всей поверхности (линии) или части её; и (ii) сосредоточенные нагрузки, прилагаемые к весьма малой площадке (точке). Распределённую нагрузку постоянной интенсивности называют равномерно-распределённой нагрузкой, а нагрузку, точки приложения которой непрерывно заполняют всю данную площадь (или отрезок), – сплошной нагрузкой. При расчёте строительных конструкций нагрузки подразделяют на:- (i) нормативные, отвечающие нормальным условиям эксплуатации; и (ii) расчётные – максимальные, определяемые умножением нормативных нагрузок на коэффициент надёжности по нагрузкам. При действии нескольких нагрузок в расчёте учитывают наименее выгодные их сочетания. Нормативные Нагрузки – наибольшие нагрузки, отвечающие нормальным условиям эксплуатации зданий и сооружений. Они используются при расчёте конструкций по предельным состояниям.

STRESS = СТРЕСС (или НАПРЯЖЕНИЕ, или УСИЛИЕ) – (1) Stress is the resistance to deformation developed within a material subjected to an external force, expressed as force per cross-sectional area. Note:- sometimes wrongly used in textile testing for tenacity, which is force per linear density. Pressure and Stress:- the unit of pressure and of stress is the Pascal (Pa). One Pascal is the force of one Newton which is acting on an area of one square meter. Stress is the resistance to deformation developed within a specimen subjected to an external force. Typical examples are tensile stress, shear stress, or compressive stress. Stress usually reaches a maximum at the time of rupture. When a textile material is subjected to a stress below that causing rupture, the stress gradually decreases or decays with time. Stress:- here, the merits of fine and coarse structures have to be compared, suitable units

must be chosen. In engineering the term 'Stress' is used. This is the ratio between the force applied and the cross-section of the specimen. Stress = (Force-applied) / (Cross-sectional area). The force is accurately expressed in dynes or pundals. Hence, the stress on a fiber may be given in terms of dynes per square centimeter (dyn/cm^2).

(2) Stress is the state or condition of injury caused by detrimental effects of environmental factors such as drought, excess water, temperature, and others. / Под Стрессом или Напряжением понимается состояние напряжения, возникающее у человека или животного под влиянием сильных воздействий.

STRESS AT SPECIFIED ELONGATION = НАПРЯЖЕНИЕ (или УСИЛИЕ) ПРИ СПЕЦИФИКАЦИОННОМ (или ЗАДАННОМ) УДЛИНЕНИИ – Stress At Specified Elongation (SASE) is the stress experienced by a yarn or cord at a given elongation.

STRESS–STRAIN CURVE = КРИВАЯ ЗАВИСИМОСТИ ДЕФОРМАЦИИ ОТ НАПРЯЖЕНИЯ (или КРИВАЯ НАПРЯЖЕНИЕ–ДЕФОРМАЦИЯ) – Stress-Strain Curve:- to enable more direct comparisons, to be made between different types of material and structures, it is more convenient to convert the load elongation curve to a stress-strain curve. To convert the curves to stress and strain curves we must draw up a table of values of stress and strain derived from measurements on the load-elongation curves. Stress-values are obtained by dividing load values by the denier and the strain values are calculated by dividing the actual elongation by 20 in the test length. The figure 1(a) below shows the load elongation curves of a 250 denier viscose rayon yarn and 30 denier nylon yarn. If at 1 inch elongation, the load on viscose was 272 g, the stress at this point would be 272 / 250, 1.08 g/denied. The corresponding strain was 1/20 or 0.25. Figure 1(b) shows the stress-strain curves derived from load elongation curve. The general shape of the curve remains the same but their relative position have changed. The superior strength of nylon is more clearly seen and the comparison between the two types of fiber made easier. Stress-Strain Curve is a graphical representation, showing the relationship between the change in dimension (in the direction of the applied stress) of the specimen from the application of an external stress, and the magnitude of that stress. In tension tests of textile materials, the stress can be expressed either in units of force per unit cross-sectional area, or in force per unit linear density of the original specimen, and the strain can be expressed either as a fraction or as a percentage of the original specimen length. See also Load-Deformation Curve. / Найлан^{T3} (Nylon^{TM}).

STRETCHABLE KNIT = РАСТЯЖИМАЯ ВЯЗАНАЯ ТКАНЬ (или РАСТЯЖИМЫЙ ТРИКОТАЖ) – Stretchable Knit is any knit that has a good deal of give or stretch. Most single knits are considered stretchable knits.

STRETCH BREAKING = РАЗРЫВАНИЕ РАСТЯЖЕНИЕМ (или ШТАПЕЛИРОВАНИЕ РАЗРЫВОМ) – Stretch Breaking:- in conversion of tow-to-top, fibers are hot stretched and broken rather than cut to prevent some of the damage done by cutting.

STRETCH–BROKEN FIBERS = ОБОРВАННЫЕ РАСТЯЖЕНИЕМ ВОЛОКНА – Stretch-Broken Fibers are staple fibers obtained by stretch-breaking a tow in a tow-to top process to a range of lengths up to a defined upper limit. See also Staple Fiber.

STRETCHED FILLING = РАСТЯНУТАЯ (или ВЫТЯНУТАЯ, или РАСПРЯМЛЁННАЯ) УТОЧИНА – Stretched Filling:- xxxxx. See also Tight Pick. Fabrics defect.

STRETCH FIBERS = РАСТЯГИВАЕМЫЕ ВОЛОКНА – Stretch Fibers:- rubber or man-made plastik fibers (such as spandex and anidex) that are naturally elastic or man-rnade fibers, highly twisted, heat-set, and untwisted to leave a strong crimp. Polyester has a certain degree ol natural streich and more can iue given to the yarn in the processing or in the finishing of the fabric. Occasionally, polyester woven fabrics are described as stretch fabrics. Usually, stretch implies a degree of visible give in a fiber or fabric that stretches and then returns quickly to its original shape. Stretch fabrics are sometirnes described as elastic. See also Anidex, Elastic, Crimp, Recovery, and Spandex.

STRETCH GROWTH = РАСТЯЖИМЫЙ РОСТ (или РОСТ НАТЯЖЕНИЯ) – Stretch Growth:- xxxxx. See also Secondary Creep.

STRETCHING = РАСПРАВЛЕНИЕ (или ВЫТЯГИВАНИЕ) – Stretching:- this is when the fibers are pulled taut while spinning.

STRETCH SPINNING = ПРЯДЕНИЕ С ВЫТЯЖКОЙ – Stretch Spinning is a term used in the manufacture of rayon. Rayon filaments are stretched while moist and before final coagulation to decrease their diameter and increase their strength.

STRETCH WRAP = ОБТЯГИВАЮЩАЯ (или СТЯГИВАЮЩАЯ) ПЛЁНКА (или НАТЯЖНАЯ ОБЁРТКА) – Stretch Wrap is a clear plastic film that is wrapped around a pallet of product to secure it. Stretch Wrap is a stretch film used to wrap cargo to form bales or to wrap cargo to pallets. Stretch Wrap is an elastic, thin plastic material that effectively adheres to itself, thereby containing product on a pallet when wrapped around the items. See also Pallet. / Растягивающаяся Плёнка (Stretch Wrap):- эластичная плёнка из модифицированного полиэтилена, применяемая для скрепления тарно-штучных грузов на поддоне методом спиральной навивки в один или несколько слоёв, при этом нагревание не требуется.

STRETCH YARN = РАСТЯГИВАЕМАЯ ПРЯЖА – Stretch Yarns:- continuous filament synthetic yarns that have been altered through special treatments or modification to give them elasticity. Techniques include:- twisting and untwisting, use of air jets, stuffer boxes, knife blades, crimping, heat setting, curling, steaming, or looping. Use of these yarns gives fabrics a degree of elasticity and comfort. See also Textured Yarn. Stretch Yarn is a qualitative term to describe a textured yarn. A stretch yarn develops more stretch than bulk in the finished fabric. Stretch Yarn is a textured yarn that has good stretch and recovery. It can also refer to yarns made of fibers that have elastic properties or to those yarns whose elastic properties are obtained by alterations of the basic fiber.

STRIATE = ИСЧЕРЧЕННОЕ (или ПОКРЫТОЕ УЗКИМИ ПОЛОСКАМИ (или БОРОЗДКАМИ), или ПОЛОСЧАТОЕ, или ЖИЛКОВАТОЕ, или ЖЕЛОБЧАТОЕ, или БОРОЗДЧАТОЕ) – Striate:- a surface marked with longitudinal (lengthwise) lines, in some cases exhibiting slight ridges or furrows. Striate:- marked with fine longitudinal lines or ridges. / гребни (или рёбра, или гряды) или бороздки (или желобки, или канавки).

STRIATIONS = ПОЛОСЧАТОСТИ (или БОРОЗДЧАТОСТИ) – Striations are the streaks or bands or various nature in fibers or fabrics. Striations are the many fine microscopic lines extending lengthwise on the viscose rayon fiber.

STRICK = ГОРСТЬ – Strick is the bundle of prepared (hackled) Flax fibers. / Горсть Льна.

STRICT LOW MIDDLING 1–1/16–INCH COTTON = ХЛОПОК СТРОГО НИЗКИЙ СРЕДНИЙ 1–1/16–ДЮЙМА (или ХЛОПОК СО ШТАПЕЛЬНОЙ ДЛИНОЙ ВОЛОКНА 1–1/16 ДЮЙМА КАЧЕСТВА СТРОГО НИЗКОГО СРЕДНЕГО) – In the Cotton industry of the United States, Strict Low Middling 1-1/16-Inch Cotton is the grade and staple length used as the basis on which the Commodity Credit Corporation (CCC) establishes its loan rates. Higher qualities receive loan premiums and generally higher market prices, while lower qualities receive lower loan rates and lower prices. See also Cotton Quality. / В хлопковой индустрии Соединённых Штатов Америки сорт и штапельная длина волокна использовались в качестве базы, по которой Корпорация по Кредитам на Сырьё (ККС; the Commodity Credit Corporation (CCC)) утверждает свои ставки по ссудам. Хлопковое волокно с более высоким качеством получает премию по ссуде и, как правило, имеет более высокие рыночные цены; в то время как хлопковое волокно с более

низким качеством получает и более низкие ставки по ссуде и имеет более низкие рыночные цены. Смотрите также Качество Хлопка (Cotton Quality).

STRIÉ = СТРУЙЧАТОЕ (или БОРОЗДЧАТОЕ, или ИЗБОРОЖДЁННОЕ, или РИФЛЁНОЕ, или ПОЛОСАТОЕ) – Strié is a term describing any cloth having irregular stripes or streaks of practically the same color as the background.

STRIKE = ЗАБАСТОВКА (или СТАЧКА) – Strike:- cessation of work on by employees to achieve certain objectives related to their working conditions, or wages, or for other reasons. Work stoppage does not breach the employment contract between employer and employees. / К Забастовке или Стачке относится коллективное прекращение работы рабочими и служащими, предъявляющими предпринимателям или правительству экономические или политические требования. По целям забастовки подразделяются на экономические и политические, а по формам – на всеобщие (охватывающие одну или несколько отраслей экономики), национальные (в масштабе всей страны), 'сидячие' (отказ от работы трудящихся, находящихся на своих рабочих местах), 'работу по правилам' (по бюрократическим предписаниям, что приводит к снижению темпов работы) и другие.

STRIKE EXPENSES = РАСХОДЫ, ВЫЗВАННЫЕ ЗАБАСТОВКОЙ – Strike Expenses are the expenses incurred as a result of a strike, such as forwarding costs for goods that cannot be discharged at the scheduled destination port or extra freight charged for overcarriage to another port when the scheduled discharge port is strikebound. These expenses are not covered by the marine policy with the standard strikes clauses attached thereto. / товаров, которые не могут быть разгружены в запланированном порту назначения или .

STRIKE–OFF = XX (или ОБРАЗЦЫ С ПРОБОПЕЧАТНОГО СТОЛА) – Strike-Off is a test length of fabric specially printed in order to check the pattern registration, pattern repeat and the matching shades in the design. Also known as S/Off. Strike-Off is a full-sized cropped section taken from the overall image/artwork; it is produced on the same material with the same finishing as the final product; it provides an exact sample of the final product.

STRIKE PRICE = СХОДНАЯ ЦЕНА – (1) Strike Price or Exercise Price is the price, specified in the option contract, at which the underlying futures or commodity will move from seller to buyer. The Strike Price is the price at which the underlying asset can be purchased at the end of the maturity (European option) or at any time during the maturity (American option). The strike price is also known as Exercise Price. Strike Price is the price, specified in the option contract, at which the buyer of a call has the right to purchase the underlying asset or futures contract during the life of the option or the price, specified in the option contract; at which the buyer of a put has the right to sell the underlying asset or futures contract during the life of the option. Also known as Exercise Price. In options, Strike Price is the pre-determined price at which an option may be exercised. Strike Price is the price of stock specified in a put or call contract. When a contract is called a Dell Jan 40 Call, USD40.00 is the strike price, or the price at which the option can be exercised if the call buyer chooses to exercise his or her right to buy shares at USD40.00 before January expiration. Strike Price is the price at which the holder of an option may choose to exercise his right to buy (call option) or sell (put option) the underlying futures contract. Strike Price is the price at which the buyer of a put or call option has the right to exercise the option. Each option has several strike prices to choose from. Each strike price has a different premium. / Сходная Цена – предопределённая цена, указанная в опционном контракте, по которой опцион может быть исполнен. Покупатель, в случае опциона на покупку (call), имеет право приобрести соответствующий актив или фьючерсный контракт в течение срока действия этого опциона; а в случае опциона на продажу (put) покупатель имеет право продать соответствующий актив или фьючерсный контракт в течение срока действия этого опциона. Действия покупателя опциона в любое время до окончания срока действия данного опциона возможны в случае опциона в Американском стиле; если опцион в Европейском стиле, то действия с ним возможны лишь по окончании его срока действия. Известна также как Цена Исполнения (Exercise Price). Сходная Цена – фиксированная цена, по которой активы в основе опциона могут быть куплены (в случае опциона на покупку) или проданы (в случае опциона на продажу) держателем опциона, если он пожелает исполнить опционный контракт. Также называется Ценой Исполнения (Exercise Price).

(2) Strike Price is the price at which employees allocated with share options can buy their shares from the share incentive trust. / Сходная Цена – цена, по которой служащие с предоставленными им опционами на акции могут приобрести данные акции из акционерной доверительной собственности, рассчитанной на поощрительные меры.

STRIKE PRICE INCREMENTS = ШАГИ СХОДНОЙ ЦЕНЫ (или ПРИРОСТЫ СХОДНОЙ ЦЕНЫ) – Strike Price Increments are the intervals established by the exchange between exercise prices on options. / Ценовые интервалы, установленные биржей для изменения цен исполнения опционов.

STRIKER = СКАЛКА – Striker:- the grain is leveled with the wooden striker, using three equal zig-zag movements at a 45 degree angle. The leveled grain is poured from the measure into the scale pan and a weight in grams is determined. Test weight is the weight of a measured volume of grain expressed in kilograms per hectoliter. Procedure of determining test weight:- (1) Fill the Ohaus measure to overflowing with the grain to be tested. (2) Ensure the slide is inserted into the Cox funnel. (3) Pour the contents of the 0.5 liter measure, plus an extra handful, into the Cox funnel. (4) Place the 0.5 liter measure on a solid base. (5) Position the Cox funnel on top of the 0.5 liter measure so that the notched legs of the Cox funnel fit securely onto the measure's rim. (6) Remove the slide on the Cox funnel quickly so that the grain drops evenly into the 0.5 liter measure. (7) Carefully remove the Cox funnel from the top of the 0.5 liter measure so as not to disturb the grain. Important:- Any jarring of the cup at this point will result in compaction of the grain in the 0.5 liter measure and could produce inaccurate results. (8) Place the hardwood striker on the rim of the 0.5 liter measure and, using three zigzag, equal motions, scalp off the excess the grain in the measure. (9) Pour the grain remaining in the 0.5 liter measure into the scale pan. (10) Determine the weight in grams of the grain in the scale pan. (11) Convert the grams in the 0.5 liter measure to kg/hl. In grain industry, Striker is a piece of round hardwood, 2.2 cm in diameter and approximately 23 cm in length. / В зерновой индустрии, предмет цилиндрической неполой формы из твёрдого дерева диаметром 2.2 сантиметра (см) и приблизительно 23 см в длину.

STRIKES, RIOTS AND CIVIL COMMOTION = ЗАБАСТОВКИ, ГРАЖДАНСКИЕ БЕСПОРЯДКИ И НАРОДНЫЕ ВОЛНЕНИЯ – SR&CC Warranty (Strikes, Riots & Civil Commotions) is a clause in marine insurance policies that excludes liability for losses caused by the acts of strikers, locked-out workers, or persons taking part in labor disturbances or riots or civil commotions or for losses which are directly caused by persons acting maliciously. This coverage may be restored to the policy by means of the SR&CC Endorsement, for an additional premium. Strikes, Riots and Civil Commotion (SR & CC) perils excluded in the basic marine cargo policy, but coverable by endorsement. Strikes-Riots-Civil Commotions:- these risks are not included in the so-called 'all-risks' policies and must be specified separately, as well as war risks. / Опасность Забастовки, Гражданских Беспорядков и Народных Волнений (ЗГБ и НВ) не включена в базовый полис морского страхования груза, но может быть покрываемой посредством размещения индоссамента или передаточной надписи.

STRINGENCY = ЖИЛИСТОСТЬ – Stringency is a term used to define the accuracy of nucleic acid interactions in southern or northern hybridization experiments.

STRINGER = ПРОДОЛЬНЫЙ БРУС (или ПРОДОЛЬНАЯ БАЛКА) – Stringer:- continuous, longitudinal, solid or notched beam-component of the pallet used to support deck components, often identified by location as the outside or center stringer. See also Pallet. Stringer or Bearer is a continuous longitudinal component underneath the top or between the top deck and bottom deck, which provides space for the entry of forklift forks and pallet-truck fingers. / Продольный Брус (Stringer or Bearer):- сплошные продольные детали под верхним настилом или между верхним и нижним настилами, которые образуют проёмы для прохода вил погрузчика или вилочной тележки.

STRINGERBOARD = ДОСКА ПРОДОЛЬНОГО БРУСА (или ПОПЕРЕЧНАЯ ДОСКА) – Stringerboard:- in block pallets, continuous, solid board member extending for the full length of the pallet perpendicular to deckboard members and placed between deckboards and blocks. See also Pallet. Stringerboard is a horizontal component linking the blocks and top or bottom deckboards. / Поперечная Доска (Stringerboard):- горизонтальная деталь, связывающая доски настила. Смотрите также Поддон (Pallet).

STRINGER CHORD DEPTH = ГЛУБИНА ХОРДЫ ПРОДОЛЬНОГО БРУСА (или ТОЛЩИНА ПРОДОЛЬНОГО БРУСА) – Stringer Chord Depth is a distance between the uppermost point of the notch and the top of the stringer. See also Pallet. / Толщина Продольного Бруса (Stringer Chord Depth):- расстояние между верхней точкой выемки и верхом продольного бруса. Смотрите также Поддон (Pallet).

STRINGER FOOT = ОПОРА ПРОДОЛЬНОГО БРУСА (или ОПОРНАЯ ЧАСТЬ ПРОДОЛЬНОГО БРУСА) – Stringer Foot is a short, bottom part of a notched stringer between notches and stringer ends. See also Pallet. / Опорная Часть Продольного Бруса (Stringer Foot):- короткая нижняя часть продольного бруса с выемкой – расстояние между выемками или между выемками и краем балки. Смотрите также Поддон (Pallet).

STRING SALES = ЧЕРЕДУЮЩИЕСЯ ПРОДАЖИ (или ПОСЛЕДОВАТЕЛЬНЫЕ ПРОДАЖИ) – String Sales:- in the sale of commodities, as opposed to the sale of manufactured goods, cargo is frequently sold several times during transit 'down a string'. When this happens, a seller in the middle of the string does not 'ship' the goods because these have already been shipped by the first seller in the string. The seller in the middle of the string therefore performs its obligations towards its buyer not by shipping the goods, but by 'procuring' goods that have been shipped. For clarification purposes, Incoterms® 2010 rules include the obligation to 'procure goods shipped' as an alternative to the obligation to ship goods in the relevant Incoterms rules.

STRING TIE = ГАЛСТУК ШНУРОК – String Tie is a narrow necktie tied in a bow or simply knotted.

STRINGUP = ПОДВЯЗКА (или ПЕРЕТЯЖКА, или ОСНАСТКА, или ПОДВЕСИТЬ) – Stringup:- xxxxx. See also Threadup.

STRINGY COTTON = ЗАВИТОЕ ХЛОПКОВОЕ ВОЛОКНО (или ИЗВИТОЕ ХЛОПКОВОЕ ВОЛОКНО, или ЗАПУТАННОЕ ХЛОПКОВОЕ ВОЛОКНО, или ЗАЖГУЧЕННЫЙ ХЛОПОК) – Stringy Cotton:- it is caused by many things such as ginning unripe seed cotton, wet-ginning, incorrect adjustments of the gin-saw brushes, etc. Also known as Curly Cotton.

STRINGY SELVAGE = КРОМКА С ЗАВИВКОЙ (или СВАЛЯННАЯ КРОМКА) – Stringy Selvage:- xxxxx. See also Slack Selvage.

STRIP = РАСТЕРЕБИТЬ (или ОПУСТОШИТЬ) – Strip:- to unpack/unload a container.

STRIP = СТРИП (или РАЗБИВКА НА ЧАСТИ) – (1) Strip is the simultaneous purchase (or sale) of futures positions in consecutive months. The average of the prices for the futures contracts bought (or sold) is the price level of the hedge. A six-month strip, for example, consists of an equal number of futures contracts for each of six consecutive contract months. Also known as Calendar Strip. / Под Стрипом понимается одновременное приобретение (или продажа) фьючерсных позиций в последовательных месяцах. Среднее значение цен купленных (или проданных) фьючерсных контрактов является ценовым уровнем хэдьжа. Например, шестимесячный стрип состоит из равного количества фьючерсных контрактов по каждому из шести последовательных месяцев поставки по данным фьючерсам. Известен также как Календарный Стрип (Calendar Strip).

(2) In options, Strip is a strategy created by being long in one call and two put options, all with the exact same strike price. Strip is an option contract consisting of two put options and one call options on the same underlying stock or stock index with the same strike and expiration date. Compare with Strap. Two puts and one call on the same underlying with the same strike price and expiry date. Strip is a combination of two puts and a call with the same exercise price. / В торговле опционами под Стрипом понимается стратегия, создаваемая наличием позиции покупки одного опциона на покупку и двух опционов на продажу с абсолютно одинаковыми сходными ценами. Стрип – опционный контракт, состоящий из двух опционов на продажу и одного опциона на покупку на одну и ту же соответствующую акцию или фондовый индекс с одной и той же сходной ценой и датой прекращения признания (или датой экспирации). Два опциона на продажу и один опцион на покупку на один и тот же соответствующий биржевой актив или инструмент, с одними и теми же сходной ценой и датой прекращения признания. Стрип – форма опционной стратегии, в которой соединяются приобретения одного опциона на покупку и двух опционов на продажу на один и тот же биржевой актив или инструмент с одинаковой сходной ценой и одинаковой датой истечения срока действия опциона. Премия в этом случае меньше, чем она была бы, если бы опционы покупались отдельно.

(3) For bonds, Strip is the process of removing coupons from a bond and then selling the separate parts as a zero coupon bond and interest paying coupons. Also known as Stripped Bond, or Zero Coupon Bond. In the context of bonds, stripping is typically done by a brokerage or other financial institution. Stripped US Treasury zero bond created by separating the corpus, or bond principal, from the interest coupons. Issued by American investment banks under various designations. See also CATS, and TIGR. Brokerage-house practice of separating a bond into its corpus and coupons, which are then sold separately as zero-coupon securities. The 1986 Tax Act permitted municipal bond strips. Some, such as Salomon Brothers' tax-exempt M-CATS, represent prerefunding backed by the US Treasury securities held in escrow. Other strips include Treasuries stripped by brokers, such as TIGERS, and stripped mortgage-backed securities of government-sponsored issuers like Fannie Mae. A variation known by the acronym STRIPS (Separate Trading of Registered Interest and Principal of Securities) is a prestripped zerocoupon bond that is a direct obligation of the US Treasury. / Казначейки (Treasuries). Саломон Бразёз (Salomon Brothers'). Фэни Мэй (Fannie Mae).

(4) Strip:- to buy stocks with the intention of collecting their dividends. Also known as Dividend Stripping. See also Dividend Rollover Plan.

STRIP BONDS = ОБЛИГАЦИИ С ОТСТРИЖЕННЫМИ КУПОНАМИ – Strip Bonds:- in the early 1980's, investment dealers in the United States began clipping coupons from bearer government bonds and selling the individual pieces as separate securities. The product allowed investors to lock in the very high yields that were available at that time, without worrying about the risk of not being able to re-invest future interest payments at the same high rates. Strip bonds had other advantages for investors, such as increased potential for capital gains (compared to conventional bonds) and allowing investors to customize the cash flows to meet their individual needs.

STRIP CROPPING = ПОЛОСНОЕ ЗЕМЛЕДЕЛИЕ (или ПОЛОСНОЕ ВОЗДЕЛЫВАНИЕ) – Strip Cropping is a growing two or more crops simultaneously in strips that can be alternate; strips can be independently cultivated.

STRIPE = ПОЛОСКА (или ПОЛОСА) – Stripe:- a variation within one or several threads, which may or may not be adjacent, in the warp direction. / Дорожка (stripe):- порок в виде нити, отличающейся от соседних по внешнему виду. Примечание:- к отличающимся нитям относятся нити, отличающиеся по натяжению, кручению, цвету, форме сечения.

STRIPED STEM BORER = ПОЛОСАТЫЙ СТЕБЛЕВОЙ ТОЧИЛЬЩИК – Striped Stem Borer:- the adult lays its eggs on the basal half of the leaves. The eggs hatch in about 5 days. The larva has three dorsal and two brownish abdominal stripes. The moth emerges after 5 days of pupation. The moth is straw-colored to light brown with silvery scales and several black dots at the tip of the forewing. The hindwing is yellowish-white. The moth lives for about 5 days. This Stem Borer has a life cycle of about 40 days. Scientific name:- Chilo Suppressalis.

STRIPINESS = ПОЛОСЧАТОСТЬ (или ПОЛОСАТОСТЬ) – Stripiness; warp-ways bars:- lengthways areas of several wales width appearing darker in color from normal fabric. Note:- this defect is caused by wale-consolidation or distortion arising from uneven width tension during knitting that is subsequently accentuated by dyeing and finishing, or from poor width control during open-width processing.

STRIPPED GAS = ОТБЕНЗИНЕННЫЙ ГАЗ – Stripped Gas is associated petroleum gas, containing ethane, propane and butane fractions, freed from gas naphta components (C_5 and higher). / Отбензиненный газ это попутный нефтяной газ, содержащий фракции этана, пропана и бутана, из которого извлечены компоненты газового бензина (C_5 + и выше).

STRIPPER = СБОРЩИК (или КОНТЕЙНЕР С ГРУЗОМ НЕСКОЛЬКИХ АДРЕСАТОВ) – Stripper is a container with freight for various consignees requiring unloading for the accomplishment of separation and delivery.

STRIPPER = ОБДИРЩИК – Stripper is a machine designed for pulling (stripping) the entire ripe Cotton bolls from the Cotton Plant. At the cotton gin, the hulls, seeds, and lint are separated. Stripper is a mechanical device that pulls the bolls off when they enter the rollers of the machine. / Машина, предназначенная для очёса (обдирки) зрелых коробочек хлопка-сырца целиком с растения Хлопчатника. В последствии, на хлопкоочистительной установке (джине) кожица, семена и волокно выделяются в отдельные составляющие.

STRIPPER HARVESTER = УБОРОЧНЫЙ КОМБАЙН ОБДИРЩИК – In the Northern America, Stripper Harvester is a machine that strips all bolls, opened (mature) and unopened (immature or green), from the plant; strippers are used on short Cotton Plants, grown in arid areas of Texas, Oklahoma, and New Mexico. They collect larger amounts of trash (leaves, stems, and sticks) than picker harvesters. / . Они собирают большие количества сора (листья (leaves), стебли (stems) и черешки листьев (sticks)) в сравнении с хлопкоуборочными комбайнами.

STRIPPER HARVESTING = УБОРКА УРОЖАЯ ОБДИРЩИКОМ (или УБОРКА УРОЖАЯ МАШИНОЙ ОЧЁСЫВАЮЩЕГО ТИПА) – Stripper Harvesting is a method of harvesting seed or leaf material where the seed or leaf is mechanically removed from plant in situ, usually by a comblike device. Stripper Harvesting is generally the cheapest way of harvesting dryland cotton. Stripper harvesters must be fitted with precleaners. Stripper harvesters can harvest both high and low yielding crops. On crops of less than around 3.5 b/ha, they are cheaper to operate than spindle pickers. In lower yielding crops a higher proportion of the bolls, those more difficult for spindles, will be harvested resulting in a higher yield. Stripper harvesters have a lower out-turn than spindle pickers (29% to 32% compared to 36% to 38%), and cotton may be a half grade lower (USD14.00 discount per bale) compared to spindle pickers. In some instances there has been a full grade difference. There is a higher risk of lower micronaire as more immature bolls may be harvested while excessive bark can also result in a discount of USD20.00 per bale. / Такая машина одновременно собирает не только хлопок-сырец из открытых коробочек Хлопчатника, но и нераскрытые коробочки Хлопчатника, оставляя лишь стебли.

STRIPPING = ОБЕСЦВЕЧИВАНИЕ – Stripping is a removal of dye from fabric. Stripping is usually done with a reducing agent such as thiox, formosul or sodium hydrosulfite and often requires hot to boiling conditions. Some dyes are difficult to strip, and the result often is not white.

STRIPPING = ОЧЁСЫВАНИЕ – Stripping is the removal of the short fibers and wastes from the carding machines. A cotton card, for example, will produce considerable amount of the waste, which becomes imbedded in the card clothing or wire of the cylinder, doffer, and revolving flats. / Удаление коротких волокон и угаров из кардных чесальных станков. Например, при кардочесании хлопка получается значительное количество отходов (угаров), которые оседают на стенках короба кардочёсального станка (card clothing) или проволке валика (cylinder), съёмном барабане (doffer), и вращающихся шляпках (revolving flats).

STRIPPING = РАЗГРУЗКА (или ОПУСТОШЕНИЕ) – Stripping is unloading goods from a container. Stripping is a physical removal of goods from the (carrier's) container(s). The unloading of cargo out of a container. Also known as Devanning, Unpacking, and Unstuffing.

STRIPPING = СРЫВАНИЕ (или СНИМАНИЕ, или ОЧЁСЫВАНИЕ, или ОТДИРАНИЕ) – (1) Stripping is a chemical process for removing color from dyed cloth by the use of various chemicals. Stripping is done when the color is unsatisfactory and the fabric is to be redyed. / Отдирание волокон от вымоченных стеблей Джута.

(2) Stripping is the physical process of removing fiber that in embedded in the clothing of a card.

(3) See also Degumming.

(4) Stripping is a removing brand labels from salvaged goods before resale.

STRIPS = СДИРЫ (или ПУХ–РАСПЫЛ) – Strips are the short immature cotton fibers removed in the process of spinning. A cotton card, for example, will produce considerable amount of the waste, which becomes imbedded in the card clothing or wire of the cylinder, doffer, and revolving flats. Also known as Card Strippings. / Короткие недозрелые волокна хлопка, удалённые в процессе прядения. Хлопковый кардочёсальный станок, например, будет вырабатывать значительное количество данных отходов, которые оседают на стенках короба кардочёсального станка или проволоке валика, съёмном барабане, и вращающихся шляпках.

STRIPS = SEPARATE TRADING OF REGISTERED INTEREST AND PRINCIPAL OF SECURITIES

STRIP SERVICE = SEPARATELY TRADED INTEREST AND PRINCIPAL SERVICE

STRIP TILLAGE = ПОЛОСНАЯ ОБРАБОТКА – Strip Tillage is a tillage operations performed in alternate strips of tilled and untilled soil. / Под Боронованием (Harrowing) понимается рыхление поверхностного слоя почвы боронами и вращающимися мотыгами. Предохраняет почву от высыхания, выравнивает её поверхность, разрушает почвенную корку, уничтожает сорняки.

STROLLER = XX (или ГУЛЯКА, или БРОДЯГА, или КОЛЯСКА) – Stroller is a three-quarter length fur coat.

STRONG ACID = СИЛЬНАЯ КИСЛОТА – A Strong Acid virtually completely ionizes in solution. All of the acid, represented by HA, exists in solution as H^+ (or H_30^+ – the hydrogen ion combines with a water molecule to make a ion called Hydronium) and A^-. Hydrochloric acid and sulfuric acid are common strong acids. Note that even in very dilute solution, these are still regarded as strong acids. See also Acid, and Weak Acid. / Сильная Кислота. Смотрите также Кислота (Acid), и Слабая Кислота (Weak Acid).

STRONGBACK = БРУС (или ТРАВЕРСА) – Strongback (maritime term):- a light spar set fore and aft on a boat, serving as a spread for the boat cover.

STRONG BASE = СИЛЬНОЕ ОСНОВАНИЕ – A Strong Base fully ionizes in solution. See also Base, and Weak Base. Sodium hydroxide is the most common strong base in textile processing. / Сильное Основание. Смотрите также Основание (Base), и Слабое Основание (Weak Base).

STRONG HANDS = КРЕПКИЕ РУКИ – (1) Strong Hands:- when used in connection with delivery of commodities on futures contracts, the term usually means that the party receiving the delivery notice probably will take delivery and retain ownership of the commodity.

(2) When used in connection with futures positions, the term usually means positions held by trade interests or well-financed speculators.

STROP = СТРОП – Strop is a slinging equipment from various materials. Strops are slung round the load and attached to the hook of the crane. / Под Стропом, от Голландского слова Strop, означающее буквально Петля, понимается простейшее грузозахватное приспособление в виде каната или цепи с захватными крюками (скобами). Строп может быть оборудован устройствами для автоматической застропки грузов (автостропы). Строп, грузозахватное приспособление, выполняемое обычно из каната или цепи (одна или несколько ветвей), снабжённое на конце крюком, скобой, кольцом и тому подобным. В качестве строп используют также ленты, сетки, полотнища и тому подобное. Строп с автоматически действующим захватом, называется автостропом, служит для зачалки и расчалки грузов в труднодоступных местах, находит применение для захвата контейнеров, пакетов и тому подобного. Стропами называют также элементы аэростатов и парашютов.

STROPHIOLE = СТРОФИОЛЬ (или СЕМЕННОЙ ПРИДАТОК) – Strophiole (syn. Caruncle):- of a band or twisted band; a crestlike, corky excrescence about the hilum of certain seeds, derived from the funicle. / семенного рубчика (hilum) определённых семян, от семяножки (funicle). , от Греческого слова Stróphos, означающее Кручёная Лента, .

STROPHIUM = СТРОФИУМ (или НАГРУДНАЯ ПЕРЕВЯЗКА) – Strophium is an early bra worn in ancient Rome. Roman women wore the Strophium, a brassiere. The strophium is a band of soft linen 6” to 8” wide (or a folded wider strip), long enough to go around the body at least twice. / .

STRUCTURAL BUSINESS STATISTICS = СТРУКТУРНАЯ ДЕЛОВАЯ СТАТИСТИКА – Structural Business Statistics (SBS):- the statistical domain in Eurostat on statistics on enterprises. The term refers also to the SBS EU Regulation.

STRUCTURAL DESIGN = СТРУКТУРНЫЙ ДИЗАЙН (или СТРУКТУРНЫЙ РИСУНОК) – Structural Design is a woven-in pattern as opposed to one printed on a fabric.

STRUCTURAL LUMBER = СТРУКТУРНЫЙ ПИЛОМАТЕРИАЛ (или КОНСТРУКЦИОННЫЙ ПИЛОМАТЕРИАЛ, или СТРОИТЕЛЬНЫЙ ПИЛОМАТЕРИАЛ) – Structural Lumber is a lumber which has strength in relation to the anticipated structural end use, as a controlling factor in grading or selecting. / Конструкционные Пиломатериалы – это пиломатериалы с гарантированными показателями прочности для изготовления деталей несущих конструкций (ГОСТ).

STRUCTURAL SANDWICH PANEL = НЕСУЩАЯ ПАНЕЛЬ СЛОИСТОЙ КОНСТРУКЦИИ (или СТРУКТУРНАЯ СЭНДВИЧ ПАНЕЛЬ, или КОНСТРУКЦИОННАЯ СЭНДВИЧ ПАНЕЛЬ, или СТРОИТЕЛЬНАЯ СЭНДВИЧ ПАНЕЛЬ) – Structural Sandwich Panels are the panels made of parallel framing members separated by expanded polystyrene which act as structural units in resisting horizontal or vertical loads. See also Non-Structural Sandwich Panel. / полистирол (polystyrene). К Несущим Конструкциям относятся конструктивные элементы, воспринимающие основные нагрузки зданий и сооружений и обеспечивающие их прочность, жёсткость и устойчивость. Несущие конструкции делятся на:- (i) вертикальные, воспринимающие главным образом сжимающие усилия (колонны, пилоны, стены, столбы); и (ii) горизонтальные, работающие преимущественно на изгиб и растяжение (балки и панели перекрытий, ригели рам, стропильные фермы и другие). Несущие конструкции здания (сооружения) в совокупности образуют его несущий остов. Изготовляют несущие конструкции из бетона, железобетона, природных и искусственных камней, кирпича, стали и дерева. Под Панелью, от Немецкого слова Paneel, понимается плоский крупноразмерный элемент (конструкция) заводского изготовления, широко применяемый в современном строительстве зданий и сооружений различного назначения (например, панель покрытия, стеновая панель и другие).

STRUCTURAL SUPPLY = СТРУКТУРНОЕ ПРЕДЛОЖЕНИЕ (или ПОСТАВКА) – Structural Supply:- a trade flow which normally occurs, even absent apparent economic signals. Also known as Baseload Supply.

STRUCTURED APPAREL = СТРУКТУРИРОВАННАЯ ОДЕЖДА – Structured Apparel:- clothing designs that give a garment shape even when not being worn. For example, a jacket that has padding, lining, binding, and a fitted waist.

STRUCTURED PRODUCTS = СТРУКТУРИРОВАННЫЕ ПРОДУКТЫ – Structured Products are the financial products made up of a combination of derivative and non-derivative components, and used to implement a specific investment strategy. See also Derivative Instruments. / Структурированные Продукты – финансовые продукты, созданные посредством комбинации производных инструментов и компонентов непроизводных инструментов, и используемые для осуществления специфической инвестиционной стратегии. Смотрите также Производные Инструменты (Derivative Instruments).

STRYCHNINE = СТРИХНИН – Strychnine is a bitter alkaloid poison found in the seeds of the Asian tree Strychnos nux-vomica native to India, Sri Lanka and Australia. Strychnine has been used as a poison for several hundred years and causes characteristic convulsions. / Стрихнин – горький алкалоидный яд, найденный в семенах Азиатского дерева Стрихнос (Strychnos; Чилибуха Аптечная (Nux-Vomica)), нативного для Австралии, Индии и Шри Ланки. Стрихнин использовался как яд несколько сотен лет и вызывает характерные конвульсии. Под Стрихнином понимается алкалоид, содержащийся в семенах тропических растений из рода Стрихнос (Чилибуха). Оказывает возбуждающее действие на центральную нервную систему, при больших дозах вызывает судороги. Соли стрихнина, а также экстракт и настойку применяют главным образом, как тонизирующее средство

при заболеваниях нервной системы и другом. Стрихнин, алкалоид, содержащийся в семенах одного из Видов Чилибухи – Рвотного Ореха (Strychnos nux vomica) и других Растений этого Рода, произрастающих главным образом в тропической Азии и Африке. Открыт в 1818 Французскими химиками и фармацевтами Пьером Жозэфом Пэльтье (Pierre Joseph Pelletier; 1788–1842) и Жозэфом Бьенэме Кявоту (Joseph Bienaimé Caventou; 1795–1877); структура стрихнина установлена в 1946 Английским химиком-органиком Сэром Робэтчом Робинсэном (Sir Robert Robinson; 1886–1975), в 1954 Американский химик-органик Робэтч Бёнз Вудворд (Robert Burns Woodward; 1917–1979) с сотрудниками осуществил полный синтез стрихнина (около 30 стадий). По химическому строению стрихнин – сложное полициклическое соединение состава $C_{21}H_{22}O_2N_2$:- сильное однокислотное основание, плохо растворим в воде, растворим в спирте и хлороформе. Стрихнин – высокотоксичный яд; применяется для истребления вредных животных. В лечебных дозах (в медицине применяется азотнокислая соль – нитрат, а также галеновы препараты, получаемые из семян Чилибухи). Стрихнин стимулирует рефлекторные функции спинного мозга, повышает возбудимость продолговатого (дыхательный, сосудодвигательный и центр блуждающих нервов) и вышележащих центров головного мозга. В токсических дозах вызывает характерные тетанические судороги (опистотонус, ‘сардоническая улыбка’). В основе действия стрихнина лежит его способность облегчать передачу возбуждения в межнейронных синапсах спинного мозга, преимущественно в области так называемых вставочных нейронов, играющих роль тормозных клеток, уменьшать время рефлекторной реакции в нервных центрах, усиливать распространение возбуждения в спинном мозге.

STS = SEQUENCE–TAGGED SITE

STS CRANE = SHIP TO SHORE CRANE

STUBBLE = СТЕРНЯ (или ЖНИВЬЁ) – Stubble is the lower portion of the stems remaining in the field after the Rice has been harvested. / Под Стернёй или Жнивьём понимается нижняя часть стеблей зерновых культур, оставшаяся на корню после уборки урожая.

STUBBLE MULCH = СТЕРНЕВАЯ МУЛЬЧА – Stubble Mulch:- the stubble of crops or crop residues left on the soil as a surface cover before and during the preparation of the seedbed and at least partly during the growing of a succeeding crop.

STUBBLE SHEARING = ВЫБОРОЧНАЯ СТРИЖКА – Stubble Shearing is the practice of shearing or cutting a portion of the wool at varying lengths, from sheep used for show purposes. See also Second Cuts.

STUB COTTON = СРЕЗАННЫЙ ПОД КОРЕНЬ ХЛОПЧАТНИК (или ПЕНЁЧНЫЙ ХЛОПЧАТНИК) – Stub Cotton (Gossypium Hirsutum):- the US Arizona’s year-round subtropical arid climate makes it seemingly an ideal place to grow Cotton – it rains less than 10 inches per year, but with irrigation water, the crop thrives in the dry climate. But no other Cotton Belt state has had to deal with the consortium of pests that have plagued Arizona:- Boll Weevil, Pink Bollworm, Whitefly and assorted other plant Bugs, Nematodes and Lepidopterous Pests – often one or more in the same year. The weather is so mild, it is the only state where Cotton, a perennial plant, can be grown as a recurrent crop – called ‘Stub’ or Ratooned Cotton. In the past, Arizona growers have left stalks of one year’s harvested crop in the fields over winter, mowed the stalks in the spring, irrigated, and produced a new cotton crop on last year’s roots. Stub Cotton is also a Cotton Boll Weevil’s dream:- an early breakfast and a late supper. The last time Arizona producers grew stub Cotton, the Boll Weevil took up permanent residence in the state. Growers were getting 4-bale Cotton yields from stub crops in the 1970s, but were paying dearly in insecticide bills. Eventually, Arizona initiated a Boll Weevil eradication program, and stub Cotton is now banned. The Boll Weevil is just one of the Cotton-loving Insects that have challenged Heiden and his fellow Arizona Cotton growers for decades. Also known as Ratoon Cotton. / Известен также как Хлопчатник Ретоньо (Ratoon Cotton).

STUD = КАРКАС (или РАСПОРКА, или СТОЙКА, или КОСЯК, или ШПИЛЬКА, или ШТИФТ, или БОЛТ, или СТЕРЖЕНЬ, или ПАЛЕЦ, или ШИП) – Stud is one of a series of vertical load bearing members used as supporting elements in walls and partitions. / Под Каркасом, от Французского слова Carcasse, означающее Скелет, понимается остов, скелет какого-либо изделия, здания или сооружения, состоящий из отдельных скреплённых между собой элементов (стержней, балок и других). Каркас определяет собой прочность, устойчивость, долговечность, форму изделия (сооружения). Каркас выполняется из дерева, железобетона, металла и других материалов. В строительстве каркас – несущая конструкция из вертикальных стоек и опирающихся на них горизонтальных элементов, воспринимающая основные нагрузки и обеспечивающая прочность и устойчивость сооружения в целом. Основой каркаса одноэтажного промышленного здания являются поперечные рамы (из стоек, вертикальных колонн, горизонтальных ригелей, ферм, балок) и связывающие их продольные элементы (фундаментные, обвязочные и подкрановые балки, подстропильные фермы, связи, прогоны). В многоэтажных зданиях продольными элементами являются панели перекрытий. В современном строительстве применяются преимущественно сборные каркасы с наружными ограждениями зданий из лёгких навесных панелей (каркасно-панельные конструкции). Неподвижное звено механизма называют Стойкой.

STUDS = СТАДЗ (или КЛЁПКИ, или ПУГОВКИ, или ШПИЛЬКИ, или КНОПКИ, или ЗАПОНКИ) – Studs are the small, decorative objects added to fabric. They are usually round and metallic and are occasionally jewelled. Studs have teeth on the bottom that are pushed through the fabric by hand or with a tool called a Stud Setter. The teeth are then bent against the fabric to hold the stud in place.

STUD WALL SYSTEM = КАРКАСНО–ПАНЕЛЬНАЯ КОНСТРУКЦИЯ (или СИСТЕМА ИЗ (ДЕРЕВЯННЫХ) КАРКАСНЫХ СТЕН, или СИСТЕМА СТЕН ИЗ СТОЕК, или СИСТЕМА ЧАСТОКОЛ) – Stud Wall System:- a combination of studs and sheathing panels or boards on one or both sides designed to bear vertical loads and to provide shearwall action. A metal Stud Wall System consists of exterior veneer masonry, isolated from the metal stud backup by a minimum 1” airspace and attached to the backup with corrosion – resistant metal ties. / Каркасно-Панельные Конструкции – конструкции зданий, состоящие из несущих элементов каркаса (железобетонных или стальных колонн и ригелей) и ограждающих конструкций (стен, стеновых панелей, плит, панелей покрытий и перекрытий), выполненных из панелей. Каркасно-панельные конструкции предназначены для строительства преимущественно многоэтажных зданий. В бывшем Союзе Советских Социалистических Республик (СССР) наиболее распространёнными были каркасно-панельные конструкции из бетонных и железобетонных элементов. Каркасно-панельные конструкции со стальным каркасом рациональны главным образом в высотных общественных зданиях (30 этажей и более). В общем каркасно-панельная конструкция состоит из:- вертикальных колонн, горизонтальных ригелей, горизонтальных панелей перекрытия, вертикальных диафрагм жёсткости и вертикальных панелей наружной стены. Под Ограждающими Конструкциями понимаются элементы конструкций, составляющие наружную оболочку здания или разделяющие его на отдельные помещения; могут одновременно служить и несущими конструкциями. Ограждающие конструкции делятся на вертикальные (стены, перегородки) и горизонтальные (перекрытия, покрытия). По способу выполнения могут быть монолитными и сборными. Сборные ограждающие конструкции (крупнопанельные и крупноблочные стены, крупнопанельные перекрытия и так далее) наиболее распространены в современном строительстве.

STUFF = НАПОЛНЯТЬ (или НАБИВАТЬ) – To Stuff:- to pack or load a container. To load a container. / Загружать контейнер.

STUFF = МАТЕРИЯ – Stuff is another name for fabric. Any braided, felted, woven, knitted, or nonwoven material, including cloth, hosiery, and lace. Stuff is also referred to as Cloth, Material, and Goods.

STUFFED = НАПОЛНЕНО (или НАБИТО) – Stuffed includes filled, consolidated, packed, loaded or secured.

STUFFER BOX = НАБИВОЧНАЯ КАМЕРА – Stuffer Box is a mechanism for crimping in which a fiber bundle (e.g., tow or filament yarn) is jammed against itself, causing it to crimp. By the suitable application of heat (usually wet steam) and pressure to the stuffed tow, a high and permanent crimp can be forced into the bundle. See also Stuffer Box Method, and Texturing. / филаментная (комплексная) пряжа (filament yarn).

STUFFERBOX CRIMPED YARN = НАБИВОЧНАЯ КУРЧАВАЯ (или ШЕРШАВАЯ, или ГОФРИРОВАННАЯ, или СВИТАЯ) ПРЯЖА – Stufferbox Crimped Yarn is a textured filament yarn obtained by overfeeding yam and compressing it into a chamber, which may be heated. / филаментная (комплексная) пряжа (filament yarn).

STUFFER BOX METHOD = МЕТОД НАБИВОЧНОЙ КАМЕРЫ (или МЕТОД САЛЬНИКА) – Stuffer Box Method:- the crimping unit consists of two feed rolls and a brass tube stuffer box. By compressing the yarn into the heated stuffer box, the individual filaments are caused to fold or bend at a sharp angle, while being simultaneously set by a heating device. See also Crinkle Yarn, and Textured Yarn.

STUFFERS = ПОДКЛАДКИ (или ПОДКЛАДНЫЕ ОСНОВЫ, или ПЕРЕВЯЗОЧНЫЕ ОСНОВЫ, или ГРУНТОВЫЕ ОСНОВЫ) – Stuffers are the extra yarns running in the warp direction through a woven fabric to increase the fabric's strength and weight.

STUFFER WARP = ПОДКЛАДНАЯ ОСНОВА – Stuffer Warp is a warp that passes straight through the carpet to form a stuffing.

STUFFING = НАПОЛНЕНИЕ (или НАБИВКА, или НАБИВАНИЕ) – (1) Stuffing is a placing goods into a container. Stuffing is a physical loading of goods into the (carrier's) container. Putting cargo into a container. The loading of cargo into a container. Also known as Packing, and Vanning. Stuffing is a loading in containers.

(2) Stuffing:- fibers spun from very large bundles of fiber, called Tow, are generally crimped in-line by feeding two tows into a stuffer box, where the tows fold and compress against each other to form a plug of yarn. The plug may be heated by steam injection so that, upon cooling, a zigzag crimp is set in the filaments. Following crimping, the tow is cut to staple and baled for shipping to the textile manufacturer.

STUNTING = НИЗКОРОСЛОСТЬ – Stunting is a dwarfing due to disease or physiological disorder.

S–TWIST = КРУТКА S (или ЛЕВАЯ КРУТКА) – S-Twist is a direction of twist in yarn or cord comparable with the spiral portion of the letter S. It was formerly known as Left Twist, or Reverse Twist. See also Direction Of Twist, Twist, and Z-Twist. S Twist is a direction of yarn twist which gives an 'S' like appearance to the yarn. Negative, or lefthand twist. S-Twist:- spinning clockwise. Traditionally, this is the direction 'singles' are spun. If your singles have been spun S-twist, you would ply Z-twist, and then cable S-twist. / В зависимости от направления вращения веретена Крутка волокнистых материалов может быть двух разных направлений. Если смотреть на веретено сверху, то есть со стороны поступающей на веретено нити, то направление вращения веретена определит знак или направление крутки на этом участке продукта. При вращении веретена против часовой стрелки получается крутка, которую принято называть Круткой S, так как направление витков в скрученном продукте здесь будет совпадать с направлением средней части этой буквы. Иногда крутку S называют Левой Круткой. В практике прядильного производства крутка S применяется редко:- ровница – всегда, а пряжа – в большинстве случаев изготовляется с круткой Z. Пряжа с круткой S необходима лишь для изготовления небольшого числа видов тканых и кручёных изделий, например начёсных тканей, в которых переплетение не должно быть заметно, и поэтому целесообразно различное направление крутки основных и уточных нитей.

STYLE = СТИЛЬ (или ФАСОН, или ПОКРОЙ, или МОДА, или ИЗЯЩЕСТВО, или ТИП ИЗДЕЛИЯ, или АРТИКУЛ, или СПОСОБ, или МЕТОД, или ВИД) – Style is the combination of crimp and crinkle ranging from good crimp and good crinkle to no crimp and no crinkle. / комбинация завивки (или гофрирования) и складок (или изгибов).

STYLE = СТОЛБИК (или СТИЛЬ) – Style is the elongated stalk of the pistil connecting the stigma and the ovary. Style is structure, usually slender connecting ovary and stigma. / завязь и рыльце. В ботанике под Столбиком понимается средняя часть пестика в цветке, несущая рыльце. Под Стилем, от Латинского слова Stylus, от Греческого слова Stýlos, означающее Палочка, понимается:- (i) в древности и в средние века заострённый стержень из дерева, кости или металла, которым писали на восковых дощечках или на берёсте. (ii) индивидуальные особенности чьей-либо речи; (iii) .

STYLET = СТИЛЕТ – Stylet is a long, slender, hollow feeding structure of nematodes and some insects.

STYLET SHEATH = ОБОЛОЧКА СТИЛЕТА (или ПОКРЫТИЕ СТИЛЕТА, или ВЛАГАЛИЩЕ СТИЛЕТА) – Stylet Sheath is a sheath formed in the plant from the saliva released by the stylets of hoppers during feeding.

STYLIZED MARK = СТИЛИЗОВАННЫЙ ЗНАК – Stylized Mark:- one type of drawing or depiction of the mark sought to be registered. Another name for this type of mark is 'Special Form'. If the mark includes a particular style of lettering, or a design or logo, the mark is considered to be stylized or in special form. Therefore, applicants must select the 'stylized or special form' drawing format when applying for these types of marks. The drawing page should show a black and white image of the mark, no larger than 3.5 inches by 3.5 inches (8 cm by 8 cm). The drawing in special form must be a substantially exact representation of the mark as it appears on the specimen or on the foreign registration, as appropriate. / чертёж (drawing).

STYRENE = СТАЙРИН (или СТИРОЛ) – Styrene is an unsaturated hydrocarbon, (C_6H_5–CH = CH_2), prepared from coal tar. Polystyrene is a colorless, transparent plastic used for molding various articles for insulation, transparent parts, radio parts, etc. Styrene:- the precursor styrene is primarily for captive use (backward integration). Styrenic plastics are used in many areas, for example, in the construction, packaging, automotive, electrical and leisure industries. / Под Стиролом или Винилбензолом понимается бесцветная жидкость, $t_{кип}$ 145.2 °C. Получают дегидрогенизацией этилбензола. Применяется для синтеза полистирола, бутадиен-стирольных каучуков, ионообменных смол, как компонент полиэфирных смол. Под Стиролом или Фенилэтиленом или Винилбензолом понимается бесцветная жидкость со специфическим запахом; $t_{пл}$ –30.6 °C, $t_{кип}$ 145.2 °C, плотность 0.906 грамма на один кубический сантиметр (г/см^3) (20 °C); практически нерастворима в воде, смешивается с большинством органических растворителей. Стирол легко окисляется, присоединяет галогены, полимеризуется и сополимеризуется с различными мономерами. Полимеризация происходит уже при комнатной температуре (иногда со взрывом), поэтому при хранении стирол стабилизируют антиоксидантами (например, треотбутилпирокатехином, гидрохиноном). Основной промышленный способ получения стирола – каталитическое дегидрирование этилбензола в токе водяного пара при 500–630 °C. Применяют стирол главным образом для производства полистирола, а также различных сополимеров, в том числе бутадиен-стирольных каучуков, полиэфирных смол, сополимеры стирола с дивинилбензолом

служат ионообменными смолами. Пары стирола раздражают слизистые оболочки; предельно допустимая концентрация их в воздухе 0.005 миллиграмма на один кубический дециметр (мг/дм^3).

SU = SET UP

SU = SOVIET UNION

SUB = SUBMERGENCE

SUB = СУБ (или ПОД) – Sub is a prefix to a descriptor meaning 'almost'. / Приставка Суб (Sub) в переводе с Латинского языка означает Под.

SUB–ACCOUNT = СУБСЧЁТ – Sub-Account is a division of an account for a financial institution's internal purposes. / Разбивка счёта исходя из внутренних целей финансового учреждения. В бухгалтерском учёте под Субсчётом понимается промежуточное учётное звено между синтетическими и аналитическими счетами. Субсчёт используется для объектов учёта с разнообразной номенклатурой. Субсчёт вводят для получения единых для всех предприятий обобщённых показателей, дополняющих показатели синтетических счетов.

SUB–BITUMINOUS COAL = СУББИТУМИНОЗНЫЙ УГОЛЬ – Sub-Bituminous Coal is lignite that has been subjected to an increased level of organic metamorphism. Reserves are found mainly in six US western states and Alaska. It is used primarily as fuel for steam-electric power generation. It has carbon content ranging from 35 to 45 percent and a heat value between 8 300 and 13 000 BTUs-per-pound. Although its heat value is lower than bituminous coal, it contains lower sulfur levels which makes it more environmentally-friendly. Exchange-traded sub-bituminous coal include the Powder River Basin coal, found in the region located in southeast Montana and northeast Wyoming, and Indonesian sub-bituminous coal, delivered FOB into ships from a range of East and South Kalimantan ports (Borneo). Both are traded at the ICE Futures Europe®. Sub-Bituminous Coal is a lignite that has been subjected to an increased level of organic metamorphism. This metamorphism has driven off some of the oxygen and hydrogen in the coal. That loss produces coal with a higher carbon content (71 to 77% on a dry ash-free basis). Sub-bituminous coal has a heating value between 8 300 and 13 000 British Thermal Units per pound on a mineral matter free basis. On the basis of heating value it is subdivided into sub bituminous A, sub bituminous B and sub bituminous C ranks. Subbituminous Coal, or black lignite, is dull black and generally contains 20 to 30 percent moisture. The heat content of subbituminous coal ranges from 16 to 24 million Btu per ton as received and averages about 18 million Btu per ton. Subbituminous coal, mined in the western coal fields, is used for generating electricity and space heating.

SUB–CLASS = ПОДКЛАСС – Sub-Class is a subdivision of a Class. / Подкласс – это подразделение Класса.

SUBCONTRACTING = СУБПОДРЯД – Subcontracting is an arrangement whereby one business (subcontractor) manufactures all or part of a specific product on behalf of another business (main contractor) in accordance with plans and technical specifications supplied by the main contractor. The main contractor has final economic responsibility in such an arrangement.

SUBCONTRACTOR = СУБПОДРЯДЧИК – A term Subcontractor includes but is not limited to the owners, charterers and operators of the vessel(s) other than the carrier, as well as stevedores, terminals and groupage operators, road and rail transport operators, warehousemen and any independent contractors employed by the carrier performing the carriage and any direct or indirect Subcontractors, servants and agents thereof whether in direct contractual privity or not.

SUBCULTURE = СУБКУЛЬТУРА – Subculture:- cells transferred from one nutrient medium to another.

SUB–CUSTODIAN = ПОДЧИНЁННЫЙ ДОВЕРИТЕЛЬНОМУ УПРАВЛЯЮЩЕМУ – Sub-Custodian is the local custodian through whom the global custodian holds securities. See also Local Agent, and Local Custodian.

SUBDIVISION = ДРОБЛЕНИЕ (или ПОДРАЗДЕЛЕНИЕ) – Subdivision is the division of existing stock into a greater number of shares of lesser value; the overall value of the holdings is unchanged. Similar to a Stock Split.

SUBDIVISION THE SHARES = ДРОБЛЕНИЕ АКЦИЙ (или ПОДРАЗДЕЛЕНИЕ АКЦИЙ) – Subdivision The Shares:- in The United Kingdom, a company can subdivide its share capital if authorised to do so by the articles. A subdivision is when shares are divided into smaller amounts. To subdivide shares, a company must pass an ordinary resolution, then send the resolution and a completed form 122 to Companies House within a month of the change. The opposite of Consolidation The Shares. / В противовес Консолидации Акций (Consolidation The Shares).

SUB–ERECT = ПРИПОДНЯТОЕ – Sub-Erect:- erect at the base, bending downward at the top.

SUBFIELD = ПОДПОЛЕ (или СУБПОЛЕ) – Subfield:- in a SWIFT message a data element which constitutes the smallest indivisible unit within a field and consisting of more than one data element. A group of two or more sub-fields constitutes a field. / В сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SUBFUND = ПОДФОНД (или СУБФОНД) – Subfund is a part of an Umbrella Fund.

SUBGENUS = ПОДРОД – Subgenus is a subdivision of a Genus into morphologically recognizable groupings of Species. See also Genus. / .

SUBJECT PREMIUM = СУБЪЕКТНАЯ ПРЕМИЯ – In reinsurance, a Subject Premium is a cedant's premiums (written or earned) to which the reinsurance premium rate is applied to calculate the reinsurance premium. Often, subject premium is gross/net written premium income (GNWPI) or gross/net earned premium income (GNEPI), where the term 'gross/net' means gross before deducting reinsurance premiums for the reinsurance agreement under consideration; but net after all other adjustments, e.g., cancellations, refunds, or other reinsurance. Normally, subject premium refers to premium on subject business. Also known as Base Premium.

SUBJECT TO COLLECTION = ПРЕДМЕТ ДЛЯ ИНКАССО (или ПРИ УСЛОВИИ ИНКАССО, или ВОПРОС ОБ (или ПОДВЕРЖЕННОСТЬ) ИНКАССО) – Subject To Collection is a clause by which the bank reserves the right to reverse or cancel a credit entry if the countervalue of promissory notes and other debt certificates (such as bills of exchange, drafts, and checks) cannot be collected.

SUBJECT TO SURVEY = ПРЕДМЕТ ДЛЯ ОПРОСА (или ПРИ УСЛОВИИ ОБСЛЕДОВАНИЯ, или ВОПРОС ОБ ОБСЛЕДОВАНИИ, или ПОДВЕРЖЕННОСТЬ ОБСЛЕДОВАНИЮ) – Subject To Survey is a phrase used by an insurer to signify provisional acceptance of a risk pending inspection by a surveyor whose report is then part of the assessment of that risk. The insurer

reserves the right to vary or withdraw any offer as a result of the survey. The insurer may also impose specific requirements or make recommendations for risk improvement.

SUBLIMATION = СУБЛИМАЦИЯ (или ВОЗГОНКА) – Sublimation is a phase change in which a substance, such as a dye, passes directly from the solid to the vapor phase without passing through a liquid phase. This process is the basis for transfer printing. Sublimation is a transition from the solid to gaseous state without passing through the liquid state. Sublimation is the conversion of a solid directly to a gas, without passing through a liquid phase. Some disperse dyes will sublime. This can make dyed fabric subject to fading due to heating, as from ironing at high temperature. Sublimation printing of synthetic fibers, mostly polyester, is used commercially. Typically, the pattern is printed on paper, then the dried pattern is heat transferred to the fabric. The dye gas penetrates the hot fiber, where it becomes physically trapped as it cools back to solid form. Washfastness is very high. There are now a number of special sublimation inks available for computer printers and others for screen printing, both for making transfers. One t-shirt maker also makes shirts that have a polyester outer layer and a cotton inner layer, also specifically for 'digital' transfer printing. / (1) Под Сублимацией, от средневекового Латинского слова Sublimatio, означающее Возвышение или Вознесение, от Латинского слова Sublimo, означающее Возвышаю или Возношу или Высоко Поднимаю, или Возгонкой понимается непосредственный переход вещества при нагревании из твёрдого в газообразное состояние (минуя жидкую фазу). Для сублимации к веществу необходимо подвести энергию, называемую теплотой сублимации. Сублимация возможна при давлениях и температурах меньше тех, которые соответствуют тройной точке рассматриваемого вещества. В технике возгонку используют, например, при очистке твёрдых веществ от примесей и для осуществления тепловой защиты космических аппаратов. Обратный процесс называется Десублимацией. (2) В психологии под Сублимацией понимается психический процесс преобразования и переключения энергии аффективных влечений на цели социальной деятельности и культурного творчества. Понятие введено Австрийским врачом-психиатром и психологом Зигмундом Фройдом (Sigmund Freud; 1856–1939), известным в России как Зигмунд Фрейд (1900), рассматривавшим сублимацию как один из видов трансформации влечений (либидо), противоположный Вытеснению.

SUBLISTATIC PRINTING = СУБЛИСТАТИЧЕСКОЕ ПЕЧАТАНИЕ – Sublistatic Printing is a technique in which the design, printed on rolls of paper, is pressed against the fabric. When heat is applied, the design is transferred to the fabric.

SUBLISTATIC® PROCESS = СУБЛИСТАТИЧЕСКИЙ® ПРОЦЕСС – Sublistatic® Process is a method of applying print designs to fabrics containing manufactured fibers by paper-transfer techniques. Developed by Sublistatic Corp. See also Heat Transfer Printing, and Printing. / Саблистэтик Корп. (Sublistatic Corp.).

SUBMERGE = ПОГРУЖАТЬ (или ЗАТОПЛЯТЬ) – Submerge:- to place or plunge under water or other liquid.

SUBMERGENCE = ПОГРУЖЕНИЕ (или ЗАТОПЛЕНИЕ) – Submergence (of plant) is a plant standing in water with at least part of the terminal above the water (partial submergence); or completely covered with water (complete submergence).

SUBMERGENCE TOLERANCE = ТОЛЕРАНТНОСТЬ К ПОГРУЖЕНИЮ (или ПЕРЕНОСИМОСТЬ ЗАТОПЛЕНИЯ) – Submergence Tolerance is an ability of a Rice plant to survive after being completely under water from a flash flood.

SUBMITTED SAMPLE = УТВЕРЖДЁННАЯ ПРОБА – The identity of a Submitted Sample of a commodity shall be considered lost if:- (i) the identifying number, mark, or symbol for the sample is lost or destroyed; or (ii) the sample has not been retained and protected by official personnel as prescribed in the regulations and the instructions. A Submitted Sample is an unofficial sample sent in by a grain company or producer for grading or for other tests. The Canadian Grain Commission (CGC) charges a fee for any analysis on a submitted sample.

SUBORDINATED BOND = СУБОРДИНИРОВАННАЯ ОБЛИГАЦИЯ – Subordinated Bond is a special form of bond: on the basis of a subordination agreement, the claims of owners of subordinated bonds are satisfied after those of owners of the issuing company's senior bonds. In the event of an insolvency, subordinated bonds are therefore not served first from the liquid assets.

SUBORDINATED DEBT = СУБОРДИНИРОВАННЫЙ ДОЛГ (или СУБОРДИНИРОВАННАЯ ЗАДОЛЖЕННОСТЬ) – Subordinated Debt is paid back after senior debt in a bankruptcy. This makes it riskier, and riskier securities have higher returns. Most corporate debt from banks and financial intermediaries is secured, while most publicly traded debt issued by US corporations is not secured by specific assets – it is backed by the general faith and credit of the borrowing company. Subordinated Debt is a debt that ranks behind another class (senior debt) for repayment.

SUBORDINATED ISSUES = СУБОРДИНИРОВАННЫЕ ЭМИССИИ (или СУБОРДИНИРОВАННЫЕ ВЫПУСКИ) – Subordinated Issues are the issues whose holders rank last in the event the borrower goes bankrupt. For example, banks in Switzerland can count up to 100% of subordinated issues with a residual term of 5 years as part of their equity capital; this percentage decreases as the term gets shorter.

SUB–PARTICIPATION = СУБУЧАСТИЕ – (1) Sub-Participation:- in lending, e.g., financial loans, sub-participations are created by the assignment of credit tranches. / , например, .

(2) In Eurocapital market issues, the banks and brokers with sub-participations are called selling group members and are not mentioned in the prospectus.

(3) In Switzerland, where a bank which is not a member of the underwriting syndicate participates in an issue; a syndicate member transfers part of its quota to the sub-participating bank.

SUBPRIME LENDING = ЗАИМСТВОВАНИЕ ПО РЯДОВЫМ СТАВКАМ – Subprime Lending is the lending provided to those who do not qualify for 'prime' rates, those rates reserved for borrowers with virtually blemish-free credit histories. Subprime lending that involves unscrupulous practices is considered predatory.

SUBROGATE = ЗАМЕЩАТЬ – Subrogate:- to put in place of another, i.e. when an insurance company pays a claim it is placed in the same position as the payee with regard to any rights against others. / В замен другого, то есть когда страховая компания оплачивает страховую претензию.

SUBROGATION = СУБРОГАЦИЯ (или ПЕРЕХОД ПРАВА ТРЕБОВАНИЯ) – (1) Subrogation:- the substitution of another person in the place of the creditor. The person so substituted succeeds to all the rights of the original creditor, all debts owing to the creditor becoming payable to the substituted person. Subrogation is a transmission of rights of claim and recovery to another party. / Под Аброгацией, от Латинского слова Abrogatio, понимается отмена устаревшего закона либо в силу его бесполезности, либо если он противоречит духу и нравам времени. Аброгация объявляется новым законом. Термин Аброгация заимствован из Римского права. Различают:- собственно аброгацию – полную отмену старого закона новым, дерогацию – частичную отмену старого закона, оброгацию – внесение необходимых изменений в старый закон и суброгацию – дополнение старого закона.

(2) Subrogation:- the right of an insurer which has paid a claim under a policy to step into the shoes of the insured so as to exercise in his name all rights he might have with regard to the recovery of the loss which was the subject of the relevant claim paid under the policy up to the amount of that paid claim. The insurer's subrogation rights may be qualified in the policy. In the context of insurance subrogation is a feature of the principle of indemnity and therefore only applies to contracts of indemnity so that it does not apply to life assurance or personal accident policies. It is intended to prevent an insured recovering more than the indemnity he receives under his insurance (where that represents the full amount of his loss) and enables his insurer to recover or reduce its loss. The legal process by which an insurance company seeks from a third party who may have caused the loss, recovery of the amount paid to the insured. The right enjoyed by an underwriter to take over the rights and remedies available to an assured, following payment of a claim on the policy, in order to recover up to the amount of the claim from another party who was responsible for the loss. Subrogation is an insurer's right to pursue action in the insured's name against the party considered legally liable for the loss or damage. Subrogation is the right of the insured which, under the terms of the policy, automatically transfer to the insurer upon settlement of a loss. Subrogation refers to the proceeds of negotiations or legal actions against negligent third parties and may apply to either property or casualty coverages. See also Salvage. Subrogation is the transfer of the assured's right of recovery to the insurance company after payment of a claim. The insurance company steps into the shoes of their assured (usually the cargo owner) and pursues recovery from any third parties responsible for the loss. The right of one such as an insurer, who has indemnified another in respect of a loss, to be put in the place of that other person with regard to all his other means of recouping the loss.

SUBROGATION FORM = АКТ О СУБРОГАЦИИ (или ФОРМА ДЛЯ СУБРОГАЦИИ) – Subrogation Form is a document declaring that the claimant indeed holds title to a particular cargo claim, for instance, an insurance company on behalf of a merchant. / Форма Для Суброгации:- документ о передаче страхователем своих прав на взыскание ущерба с третьих лиц страховщику после уплаты последним первому страхового возмещения. Акт О Суброгации – документ о передаче страхователем страховщику после получения от него суммы страхового возмещения прав на взыскание ущерба с третьих лиц, виновных в причинении такого ущерба.

SUBROGATION WAIVER = ОТКАЗ ОТ СУБРОГАЦИИ – Subrogation Waiver is a waiver by the named insured giving up any right of recovery against another party. Normally an insurance policy requires that subrogation (recovery) rights be preserved.

SUBSCRIBER = ПОДПИСЧИК – (1) Subscriber:- on the formation of a company, a persons who sign the articles of association and memorandum of association. / При создании компании, лица, которые подписывают устав и учредительный договор.

(2) Subscribers in the warrants market are the initial purchasers of the warrants in the primary issue. The subscribers to warrants may be referred to as the Takers, Buyers, Holders or Investors, as may subsequent purchasers of the warrants on the secondary market.

(3) In insurance, Subscriber is a person that bids for underwriting capacity in a capacity auction.

SUBSCRIBER IDENTIFICATION MODULE = МОДУЛЬ ИДЕНТИФИКАЦИИ ПОДПИСЧИКА (или МОДУЛЬ ОТОЖДЕСТВЛЕНИЯ ПОДПИСЧИКА) – Subscriber Identification Module (SIM) is a mobile operator's smart card that contains its subscriber's relevant data and applications, e.g., telephone application, message service, e-mail service, etc.

SUBSCRIBER IDENTIFICATION MODULE APPLICATION TOOLKIT = НАБОР ИНСТРУМЕНТОВ ПРИЛОЖЕНИЯ К МОДУЛЮ ИДЕНТИФИКАЦИИ ПОДПИСЧИКА – The Subscriber Identification Module Application Toolkit (SIM Application Toolkit or SATK) allows to develop applications on the SIM card (ETSI (European Telecommunication Standards Institute):- GSM 11.14). GSM (Global System of Mobile Communications) is 2nd generation mobile network standard. / Европейский Институт Стандартов Дальней Связи ():- . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SUBSCRIPTION = ПОДПИСКА – (1) Subscription is a type of licensing agreement by which a licensee pays for access to digital information by payment of a periodic fee. / Тип лицензионного договора (лицензионного соглашения), в соответствии с которым лицензиат (лицензеполучатель) за доступ к цифровой информации осуществляет оплату платежами периодических сборов.

(2) Subscription:- offer given to existing shareholders to buy newly issued securities before the new securities are offered to others. The subscription price is set below the prevailing market price. By subscribing a specific number of securities (bonds or shares), the buyer agrees to take them up (and pay for them) in the event of a definitive allocation (allotment) according to the conditions contained in the prospectus. In securities business, Subscription is a public invitation to investors to subscribe to new bonds, shares or other new issues at banks within a certain period. However, the subscription does not entitle the customer to a corresponding allotment. An issuance of stock in which preference is given to existing shareholders. An existing stockholder is allowed to purchase the new shares before the public can, typically at a discounted price.

(3) Subscription:- sum paid to a company for shares in a new issue. / Сумма, уплачиваемая компании за акции при новом выпуске.

SUBSCRIPTION FORM = ФОРМА (ДЛЯ) ПОДПИСКИ – Subscription Form is the order form used by a subscriber committing himself to take up and to pay for the allocated securities according to the terms of the prospectus.

SUBSCRIPTION PERIOD = ПЕРИОД ПОДПИСКИ – Subscription Period is the period during which subscriptions to a new securities issue can be accepted by the subscribing agent (usually a bank). / Период, в течение которого подписка на выпуск новых ценных бумаг может быть принята агентом по подписке (обычно банком).

SUBSCRIPTION PRICE = ЦЕНА ПОДПИСКИ – Subscription Price is a price of a new share in a capital increase for cash. A subscription price cannot be under par.

SUBSCRIPTION RATIO = СООТНОШЕНИЕ С ПОДПИСКОЙ – Subscription Ratio is:- (1) in a capital increase at a joint stock corporation, the subscription ratio states for how many existing shares one new share may be purchased.

(2) When referring to warrants, the subscription ratio states how many units of the underlying asset the holder of a warrant can buy or sell in case of exercise.

SUBSCRIPTION RIGHT = ПРАВО НА ПОДПИСКУ – Subscription Right is a shareholder's right to purchase new shares issued by a company in a capital increase in the proportion of his present holding in share capital to the increase in share capital. If a company raises its capital, for example, from EUR10 million to EUR11 million, the existing shareholder can subscribe 1 new share for ten 'old' shares at a price determined by the company; in this case, the subscription ratio is one for ten. On the other hand, if he does not take up the offer, he can sell his rights on the stock exchange. The profit on this sale is the compensation for the price loss which he suffers on his existing shareholding after the markdown for the rights issue and which is caused by the fact that the total market value of all previously issued shares is now spread over a larger number of shares following the capital increase. The arithmetic value of the subscription right is calculated on the basis of the following formula:- (Price Of Old Share) – (New Share Subscription Price) / (Subscription Ratio + 1) Example:- subscription ratio 1 for 10, new share subscription price EUR120.00, price of old share EUR140.00.

Value of subscription right R = (EUR140.00 – EUR120.00) / (10 + 1) = EUR1.82. Privilege given to a shareholder to purchase additional shares. / Привилегия, предоставляемая акционеру для приобретения дополнительного количества акций.

SUBSCRIPTION RIGHT VALUATION = ОЦЕНКА ПРАВ ПОДПИСКИ – Subscription Right Valuation:- on the basis of the primary determining factors, the theoretical value of a subscription right associated with a capital stock increase can be calculated before the start of trading. Assuming:- (i) that the last price of the stock before the capital stock increase was CHF500.00, (ii) that the subscription ratio is three old shares for one new share, and (iii) that the issue price of a new share is CHF100.00; the following calculation can be made:- 3 old shares at closing price CHF1 500.00; 1 new share (issue price) CHF100.00; total value of 4 shares CHF1 600.00; new average value per share CHF400.00; market value of share at closing price CHF500.00; theoretical value of subscription right CHF100.00. In trading, the actual subscription right price can fluctuate above and below the theoretical value, reflecting the mood of the market.

SUBSCRIPTION WARRANT = ПОДПИСНОЙ ВАРРАНТ (или ГАРАНТИЯ НА ПОДПИСКУ) – Subscription Warrant is a type of security, usually issued together with a bond or preferred stock, entitling the holder to buy a proportionate amount of common stock at a specified price for a period of years. Known simply as Warrant.

SUBSEA TEMPLATE = ДОННАЯ ПЛИТА – Subsea Template:- a frame which is anchored to the sea-bed containing one or more well heads. It is usually tied back to an existing platform or production vessel.

SUBSEQUENT DESIGNATION = ПОСЛЕДУЮЩЕЕ ПРЕДНАЗНАЧЕНИЕ (или ПОСЛЕДУЮЩЕЕ УКАЗАНИЕ) – Subsequent Designation:- a request by the holder of an international trademark registration for an extension of protection of the registration to additional Contracting Parties.

SUBSEQUENT EVENTS = ПОСЛЕДУЮЩИЕ СОБЫТИЯ – Subsequent Events are of two types:- (i) Those which affect the financial statements directly and should be recognized therein through appropriate adjustments. (ii) Those which do not affect the financial statements directly and require no adjustment of the account balances but whose effects may be significant enough to be disclosed with appropriate figures or estimates shown:- (a) probably adjust the financial statements directly; (b) disclosure; (c) neither adjustment nor disclosure necessary; and (d) probably adjust the financial statements directly.

SUBSIDIARY = ДОЧЕРНЕЕ ПРЕДПРИЯТИЕ (или ДОЧЕРНЯЯ СТРУКТУРА) – Subsidiary shall be a legal entity controlled by another legal entity (parent undertaking). Legal entities which are subsidiaries of the subsidiary shall be considered subsidiaries of the parent undertaking. Subsidiary is a corporation that is either wholly owned or controlled through ownership of a majority of its voting shares, by another corporation or business entity.

SUBSIDIARY (COMPANY) = ДОЧЕРНЯЯ (КОМПАНИЯ) – In the United States, a company that is controlled by another corporation (called the Parent Corporation), typically through stock ownership or voting control. Company X is a subsidiary of enterprise N if, and only if:- (i) enterprise N either (a) is a shareholder in or member of X and has the right to appoint or remove a majority of the members of X's administrative, management or supervisory body; or (b) owns more than half of the shareholders' or members' voting power in X; or (ii) company X is a subsidiary of any other company Y which is a subsidiary of N. Subsidiary is a company controlled by another business, i.e. parent. A body corporate is a subsidiary of another body corporate if the other body:- controls the composition at the first body's board; is in a position to cast, or control the casting of, more than one-half of the maximum number of notes that might be cast at a general meeting of the first body; or holds more than one-half of the ordinary share capital at the first body. A body corporate will also be a subsidiary of another body corporate if it is a subsidiary of a subsidiary of the body corporate. In the United Kingdom, companies owned or controlled by another company. Under Section 736 of the UK Companies Act of 1985 this means, broadly speaking, that another company either holds more than half the equity share capital or controls the composition of the board of directors. The category also includes subsidiaries of subsidiaries. Corporation in which more than 50% of the stock is owned by another company called the Parent Company. A corporation's capital stock is generally distributed among a number of shareholders in the form of shares of stock, which convey voting rights. Corporations can acquire a stake in other corporations by buying shares or blocks of shares. When Company A owns more than 50% of the stock in Company B, Company A is said to assume control of Company B, which becomes its subsidiary. Because ownership of a majority of the stock also gives Company A a majority of the votes at the annual shareholders' meeting, it has a dominant voice in defining Company B's policies. Also known as Affiliated Company. See also Branch, Parent Company, and Representation. / Смотрите также Представительский Офис или Представительство (Representative Office).

SUBSIDY = СУБСИДИЯ (или ДОТАЦИЯ) – In general, Subsidy is a special money payment by a government to one or more firms in a favored industry, usually for the purpose of enabling them to sell one or more of their products at a price below their costs of production (or at least at a price below the free market price). Subsidies are typically advocated either to promote more widespread consumption of some good or service deemed to be especially essential or meritorious by the government ('merit goods'), to boost the levels of production of goods whose manufacture or consumption involves sizable 'positive externalities' or partake of the nature of 'public goods', or sometimes simply to stave off bankruptcy and unemployment in a declining industry or segment of an industry whose owners and/or workers enjoy a lot of political influence. Sum paid to companies in certain industries to enable them to sell their goods or services at a price close to the prevailing market price. A subsidy is also used to provide financial support to a commercial or quasi-commercial activity that would otherwise not be viable in narrow profit-and-loss terms, usually in order to sustain broader economic or social benefits. WTO does not directly define subsidies. The US regards a subsidy as a bounty or grant paid for the manufacture, production, or export of an article. Export subsidies are contingent on exports; domestic subsidies are conferred on production without reference to exports. While governments sometimes make outright payments to firms; subsidies usually take a less direct form (R&D support, tax breaks, loans on preferential terms and provision of raw materials at below-market prices). The economic benefit granted by a government to producers of goods or services often to strengthen their competitive position. Financial aid granted by a government or other organization to an individual or legal entity for something that is considered to be of some advantage to the public. In the USA, payments made by the federal government to state governments are usually called Revenue Sharing or Grants-In-Aid; subsidies to individuals in the form of food stamps, aid to families with dependent children, Medicare and the like are a form of social welfare. Subsidies make up a substantial portion of transfer payments. Direct subsidies are financed by the taxpayers. Indirect subsidies are often financed by consumers in the form of higher prices. Current unrequited payments made by general government or the European Union to enterprises. Those made on the basis of a quantity or value of goods or services are classified as 'subsidies on products'. Other subsidies based on levels of productive activity (e.g., numbers employed) are designated Other subsidies on production. / временами производит неотложные платежи фирмам; .

SUBSPECIE = ПОДВИД – Subspecie (Ssp.) is a subdivision of a species, recognizable by morphological characteristics, but not isolated by genetic barriers from other members of the species. Sometimes designated as a variety. / Под Подвидом понимается таксономическая категория (ранг) в систематике животных и растений, рангом ниже вида. Подвид – совокупность

географически (реже экологически) обособленных популяций одного вида, особи которых отличаются определёнными, достаточно устойчивыми признаками (одним или несколькими) от особей других популяций того же вида.

SUBSTANDARD = НЕ СООТВЕТСТВУЮЩИЙ СТАНДАРТУ (или НИЖЕ УСТАНОВЛЕННОГО СТАНДАРТА, или СУБСТАНДАРТНЫЙ) – Substandard:- a loan that usually lacks current sound worth and paying capacity of borrower or collateral pledged.

SUBSTANTIVE(ITY) = СУБСТАНТИВНОЕ (или СУБСТАНТИВНОСТЬ, или СРОДСТВО) – Substantive(ity) is a tendency of a dye to move from a solution onto fibers in the solution. A dye that is substantive will leave the dye bath and be concentrated on the fiber in the bath. Without substantivity, most of the dye would simply remain in solution or dispersion in the bath. Dye substantivity is generally associated with the molecular structure of the dye, and often big molecules have high substantivity, while small molecules have low substantivity. Dye bath conditions, including temperature and additives such as salt influence substantivity. Substantivity is often produced in ways that differ from the final bond of the dye to the fiber. See also Affinity. / Субстантивное или Имеющее Сродство (Substantive); Субстантивность или Сродство (Substantivity), например красителя к материалу. Смотрите также Сродство (Affinity).

SUBSTANTIVE REASONS FOR REFUSAL = СУЩЕСТВЕННЫЕ ПРИЧИНЫ ДЛЯ ОТКАЗА – In the US patent law, Substantive Reasons For Refusal:- there are several substantive reasons for refusing registration of a mark. These include: likelihood of confusion; primarily merely descriptive or deceptively misdescriptive of the goods/services; primarily geographically descriptive or primarily geographically deceptively; misdescriptive of the goods/services; primarily merely a surname; or mere ornamentation. This is not a complete list of all possible grounds of refusal.

SUBSTATION = ПОДСТАНЦИЯ – In reference to electricity, Substation is an assemblage of equipment that switches, changes, or regulates voltage in the electric transmission and distribution system. Substation:- facility equipment that switches, changes, or regulates electric voltage. / По отношению к электричеству, совокупность оборудования, которое переключает, изменяет или регулирует напряжение электричества в системе распределения и подачи. Под Электрической Подстанцией понимается электроустановка или совокупность электрических устройств для преобразования электрического тока по напряжению (трансформаторная подстанция) или частоте (преобразовательная подстанция), а также для распределения электрической энергии между потребителями.

SUBSTITUTE CHECK = ЧЕК СУБСТИТУТ (или ЗАМЕНИТЕЛЬНЫЙ ЧЕК, или ЗАМЕЩАЕМЫЙ ЧЕК, или ЧЕКОЗАМЕНИТЕЛЬ) – The term Substitute Check means a paper reproduction of the original check that:- (i) contains an image of the front and back of the original check; (ii) bears a MICR line (short for the Magnetic Ink Character Recognition line; often pronounced Micker) containing all the information appearing on the MICR line of the original check, except as provided under generally applicable industry standards for substitute checks to facilitate the processing of substitute checks; (iii) conforms, in paper stock, dimension, and otherwise, with generally applicable industry standards for substitute checks; and (iv) is suitable for automated processing in the same manner as the original check. MICR is a process used by banks to make the processing of paper checks easier for both the bank and the customer. MICR characters are most often found on the bottom of paper checks in the form of numbers. These numbers are the MICR line, and are used by banks to glean information about individual checks. In order to read the MICR line, a bank's reader/sorter machine will pick up the magnetized ink and activate it in the machine's electromagnetic field. Once the ink is activated, the machine can then read the MICR line on the check and validate it. Once the check is validated, it can then be deposited into or withdrawn from a bank account. In the United States, Substitute Check means a paper reproduction of an original check containing an image of the front and back of the original check and printed in accordance with the American National Standards Institute (ANSI) X9.100-140 (specifications for an Image Replacement Document (IRD); electronic check processing standard). A substitute check is legally the same as the original check provided it meets Regulation CC's requirements for legal equivalence. In the United States, a Substitute Check is a special paper copy of the front and back of an original check. The substitute check may be slightly larger than the original check. Substitute checks are specially formatted so they can be processed as if they were original checks. The front of a substitute check should state:- 'This is a legal copy of your check. You can use it the same way you would use the original check'. The following sample shows what a substitute check looks like. Not all copies of a check are substitute checks. For example, pictures of multiple checks printed on a page (also known as an Image Statement) that is returned to you with your monthly statement are not substitute checks. Online check images and photocopies of original checks are not substitute checks either. You can use image statements and other copies of checks to verify that your bank has paid a check. Some banks find that exchanging electronic images of checks with other banks is faster and more efficient than physically transporting paper checks. In certain circumstances, however, banks may need to use a paper check. To address this need, Check 21 (the US federal law) allows a bank to create and send a substitute check that is made from an electronic image of the original check. In general, the law does not require your bank to return your original check. Many banks destroy original paper checks. Other banks may store original checks for some period of time and then destroy them. Check 21 ensures that you have the same legal protections when you receive a substitute check from your bank as you do when you receive an original check. Check 21 provides a special process that allows you to claim a refund (also known as an Expedited Recredit) when you receive a substitute check from a bank and you think there is an error because of the substitute check. For example, you may think that you were charged twice for the same check. You may use the special process to get a refund of the money you lost. The amount of your refund under the special process is limited to the amount of your loss or the amount of the substitute check that you received, whichever is less, plus interest on that amount if your account earns interest. If your loss is more than the amount of the substitute check, you may have the right under other laws to recover additional amounts of money. If your bank finds that your claim is valid, you should receive your refund by the next business day after the bank's finding. Unless your bank finds that your claim is not valid, you should receive up to USD2 500.00 of your refund (plus interest if your account earns interest) within 10 business days after your bank receives your claim. You should receive the rest of your refund (plus interest if your account earns interest) no later than 45 days after your bank receives your claim. If your bank finds that your claim is not valid, it will send you a notice explaining why. Your bank may reverse the refund (including any interest on the refund) if it can show that the substitute check did not cause an error in your account. If you notice a problem with a substitute check, you should contact your bank as soon as possible. In general, to use the special refund procedure for substitute checks, you should contact your bank no later than 40 days from the date your bank provided the substitute check or from the date of the statement that shows the problem. In general, you must:- (i) describe why you think the charge to your account is incorrect; (ii) describe why you believe the original check or a better version of the substitute check is needed to determine whether the substitute check should have been deducted from your account; (iii) estimate how much money you lost because of the substitute check. Include any fees you were charged as a result of the substitute check. Also, alert your bank to any interest you lost, if your account earns interest. And (iv) provide a copy of the substitute check, or give your bank information that will help it identify the substitute check and investigate your claim. A paper reproduction of an original check that contains an image of the front and back of the original check and is suitable for automated processing, just as the original check is. The Check Clearing for the XXI Century Act, commonly known as Check 21, allows depository institutions to truncate original checks, process check information electronically, and

deliver substitute checks to depository institutions if they require paper checks. / Под Субститутом, от Латинского слова Substituo, означающее Назначаю Взамен или Ставлю Вместо, понимается .

SUBSTITUTED EXPENSES = ЗАМЕЩАЕМЫЕ РАСХОДЫ – Substituted Expenses are expenses incurred in place of loss or expense which would be allowed as general average, e.g., cost of removal of a ship, with general average damage, to a place where repairs would cost less. Substituted Expenses are expenses incurred to prevent or reduce a loss for which the insurance company would have been liable.

SUBSTITUTE GOODS = ТОВАРЫ СУБСТИТУТЫ (или ЗАМЕЩАЕМЫЕ ТОВАРЫ) – Substitute Goods:- two (or more) products for which the demand schedules are related to each other in such a way that an increase in the price of one good (other things being equal) will result in a rightward shift of the entire demand schedule for the other good, so that more of the second good will then be demanded at any given available price of the second good. (By the same token, a decrease in the price of the first good will result in a leftward shift of the entire demand schedule for its substitute, so that less of the substitute good will then be demanded at any given available price for the substitute than before.) This kind of relationship occurs when the two kinds of goods can be consumed or used in place of each other in at least some of their common uses. (Of course, substitutability of one for the other is a matter of degree, ranging from almost perfect interchangeability to only partial interchangeability.) The relative costs of using one good versus its substitute is apt to play a major role in determining which one each user chooses to purchase. An example of substitutable consumer goods might be compact disks and cassette tapes, both of which can be used as media for selling recorded musical performances to the public, even though there are significant differences between the two in terms of sound quality, durability, and the cost of the equipment needed to play them. Essentially these represent alternative choices for the consumers, and the relative prices of the two alternatives are going to have a lot to do with which way many consumers will go in spending their music budgets. If the price of cassettes suddenly increases a good bit, other things being equal, we can expect cd sales to be larger at any given price than they would have been with cassettes still at the old price. Examples of substitutable producers' goods might include coal versus natural gas (versus fuel oil versus nuclear fuels versus windmills etc) as alternative means to power generators for producing electricity. If the price of coal increases sharply, one may expect demand for the various substitutes to be greater at any of their given prices than would have been the case if the coal price had remained unchanged. This is because at least some electricity producers will now find it financially worth their while to shift part or all of their electricity production over to these suddenly relatively cheaper technologies. Another common pattern is for various sorts of skilled or unskilled labor to be fairly substitutable in particular industries for each other and/or for various forms of labor-saving machinery because of the existence of alternative production technologies available for producing the same goods or services. If the price of purchasing electronic teller machines goes down, for example, other things being equal, banks' demand for human bank tellers is likely to be reduced. / Под Субститутом, от Латинского слова Substituo, означающее Назначаю Взамен или Ставлю Вместо, понимается .

SUBSTITUTE PATENT APPLICATION = ЗАМЕЩАЕМОЕ ЗАЯВЛЕНИЕ НА ПАТЕНТ – Substitute Patent Application is an application which is in essence a duplicate of a prior (earlier filed) application by the same applicant abandoned before the filing of the substitute (later filed) application; a substitute application does not obtain the benefit of the filing date of the prior application.

SUBSTITUTION = СУБСТИТУЦИЯ (или ЗАМЕНА) – Substitution:- recalling the securities lent from a borrower and replacing them with other securities of equivalent market value during the life of the securities loan. / Отзыв в период действия займа ценных бумаг заимствованных ценных бумаг у заёмщика и замена их другими ценными бумагами, эквивалентными по своей рыночной стоимости заменяемым. В праве под Субституцией, от позднелатинского слова Substitutio, от Латинского слова Substituo, означающее Назначаю Взамен или Ставлю Вместо, понимается назначение в завещании запасного наследника (субститута). Субституция или Замена:- В банковском деле:- замена одного обеспечения (collateral) – другим. В контрактах:- замена одной стороны контракта другим лицом. Смотрите также Novation. В экономике:- концепция, согласно которой, если продукт или услуга могут быть заменены другим продуктом или услугой, то их цены должны быть равны. В праве:- замена одного доверенного лица другим доверенным лицом при исполнении прав на акции в связи с покупкой и продажей ценных бумаг. Смотрите также Stock Power. В ценных бумагах:- (1) Обмен, или Своп (Swap), то есть обмен одних ценных бумаг на другие в портфеле вложений клиента (portfolio). Аналитики по ценным бумагам часто рекомендуют заменять акции, которые сейчас представляются им перспективными, на акций той же отрасли, но перспективы которых представляются им менее благоприятными. (2) Замена некоторых ценных бумаг на ценные бумаги равной стоимости, использующиеся в качестве залога (collateral) в операциях по счёту с маржёй (margin account). Смотрите также Same-Day-Substitution.

SUBSTITUTION DRAWBACK = СУБСТИТУЦИОННЫЙ ВОЗВРАТ – Substitution Drawback provides for a refund of duties paid on designated imported merchandise upon exportation of articles manufactured or produced with use of substituted domestic or imported merchandise that is of the same kind and quality as the designated imported merchandise. Same kind and quality means merchandise that is interchangeable in a specific manufacturing process. The imported materials must be used in a manufacturing process within 3 years after receipt by manufacturer, the domestic material of same kind and quality as imported materials must be used in manufacturing process within 3 years of receipt of imported material and the exported products must be manufactured within 3 years after receipt of the imported material by manufacturer, and exported within 5 years of the date of importation of designated material. See also Direct Identification Drawback, Drawback, and Same Condition Drawback. / вывоз (exportation). привоз (importation).

SUBSTRATE = ПОДСТИЛКА – Substrate is a fabric to which coatings or other fabrics are applied; a support. It can be of woven, knit, nonwoven, or weft-insertion construction. Generally, substrate properties are dependent both on fiber type and fabric construction. Usually the fabric is scoured, heat-set, and otherwise finished prior to coating or bonding. Many smooth-surfaced manufactured fiber fabrics require impregnation with a latex prior to coating to ensure adequate adhesion. Substrate is a fabric on which coatings or other fabrics are applied; a support. Substrate is an underlying support or foundation. An example is a fiber substrate prepared with a mordant before dyeing.

SUBSTRATE = СУБСТРАТ – Substrate is the material or substance on which a microorganism feeds and develops; also a substance acted upon by an enzyme. / В биологии под Субстратом, от позднелатинского слова Substratum, означающее Основа или Подстилка, от Sub, означающее Под, и Stratum, означающее Кладка или Постройка или Сооружение, понимается:- (1) химическое вещество, подвергающееся превращению под действием фермента. Концентрация субстрата в клетке оказывает регулирующее влияние на активность фермента. (2) Основа (предмет или вещество), к которой прикреплены животные и растительные организмы, а также среда постоянного обитания и развития организмов, например, питательная среда для микроорганизмов.

SUBSURFACE STABILIZATION FABRICS = ТАКНИ ДЛЯ ПОДПОВЕРХНОСТНОЙ СТАБИЛИЗАЦИИ – Subsurface Stabilization Fabrics are the fabrics used in the construction on access roads, railroads, parking and storage areas over soft, unstable soil. The fabric is placed between the subgrade and the stabilizing fill material where it provides separation of subsoil and fill, filtration of moisture at the subsoil/fill interface, and added tensile reinforcement of the compacted fill. Subsurface Stabilization Fabric is a type of

geotextile used to cover soft unstable soil prior to the construction of roads, railbeds and structures. A subsurface stabilization fabric is used as an interface between the soft soil and a fill layer. It provides moisture transfer while inhibiting the mixing of the two layers. See also Geotextile.

SUBSURFACE TILLAGE = ПОДПОВЕРХНОСТНОЕ РЫХЛЕНИЕ (или БЕЗОТВАЛЬНАЯ ОБРАБОТКА) – Subsurface Tillage is a tillage with a special sweeplike plow or blade which is drawn beneath the surface at depths of several inches and cuts plant roots and loosens the soil without inverting it or without incorporating the surface cover. / Подповерхностное Рыхление почвы – корни растения и . Под Безотвальной Обработкой почвы понимается рыхление почвы на глубину 20–30 сантиметров (без оборачивания пласта) плугами со снятыми отвалами. Основное звено системы обработки почвы, предложена в 1951 Российским новатором сельскохозяйственного производства, полеводом Терентием Семёновичем Мальцевым (10 Ноября (29 Октября) 1895 – 11 Августа 1994) для чернозёмов Зауралья и Западной Сибири. При безотвальной обработке почвы меньше распыляется почва. Под Боронованием (Harrowing) понимается рыхление поверхностного слоя почвы боронами и вращающимися мотыгами. Предохраняет почву от высыхания, выравнивает её поверхность, разрушает почвенную корку, уничтожает сорняки.

SUBTEND = СОПУТСТВУЮЩЕЕ – Subtend:- situated at the base of.

SUBTRACTIVE = СУБТРАКТИВНОЕ – Subtractive:- with reference to color, removal of colors from light reflected from a surface. A surface that is illuminated by white light and that reflects all visible colors will appear white. The surface can be made to appear some other color than white by altering it with materials that absorb or subtract colors present in the white light. The subtractive primary colors are designated cyan, magenta and yellow. If a white material is colored with something that absorbs magenta, for example, then cyan and yellow will be reflected, making the material look what is normally called green. If another material is added that absorbs the cyan component – 'subtracts' cyan, then only the yellow is reflected, and the material looks yellow. If all colors are subtracted or absorbed, then the material appears black. Dyes used on fabric work according to subtractive principals. In theory, if truly pure cyan, yellow and magenta dyes were available, any other color could be mixed from them. In practice, there are limitations. Color theory and practice are complex topics.

SUBTRACTIVE COLOR MIXTURE = СУБТРАКТИВНОЕ СМЕШЕНИЕ ЦВЕТОВ (или СУБТРАКТИВНАЯ СМЕСЬ ЦВЕТОВ, или РАЗНОСТНАЯ СМЕСЬ ЦВЕТОВ, или СМЕСЬ ВЫЧИТАТЕЛЬНЫХ ЦВЕТОВ) – Subtractive Color Mixture is a mixture of absorbing media or superposition of filters so that the spectral composition of light passing through the combination is determined by simultaneous or successive absorption.

SUBULATE = ШИЛОВИДНОЕ (или СУЖИВАЮЩЕЕСЯ К КОНЦУ) – Subulate:- slender or tapering and flattened into a narrow elipse in cross-section, awl-shaped.

SUCCULENT = СУККУЛЕНТ – Succulents:- as relates to the US/Canada Greenhouse Certification Program, succulents are thick fleshy plants capable of storing large quantities of water in their leaves and stems. Many succulent plants are spineless. Succulents with spines differ from cacti in that the spines grow directly from the plants tissue rather than from structures called Areoles. Succulent plants grown in greenhouses include jade plants, aloe vera, and crown-of-thorns. Succulent – juicy (Latin:- Succus = Juice, Sap), fleshy plants that store water in specially adapted thickened or swollen organs such as leaves, stems or roots. Succulent:- soft, juicy, and fleshy. / Под Суккулентами, от Латинского слова Succulentus, означающее Сочный, понимаются многолетние растения сухих местообитаний, сохраняющие запасы воды в сочных листьях (Агавы, Алоэ) или стеблях (Кактусы, некоторые Молочаи); тип ксерофитов.

SUCKER = ПОРОСЛЬ (или ПАСЫНОК, или ВОЛЧОК, или СОСУНОК, или ПРИСОСКА) – Sucker is a shoot of the plant arising from below the ground; a parasite from a host plant. Suckers are shoots or small plants arising from the base of a larger plant. / ростки (или побеги) или маленькие растения, вырастающие из основания более крупного растения. Волчок – стеблевая поросль. Под Порослью понимаются молодые побеги растений, развивающиеся из придаточных или спящих почек на пнях или корнях лиственных деревьев. Под Пасынками понимаются боковые побеги растений, вырастающие из пазух листьев.

SUCKLING BEEF CALVES = СОСУЩИЕ ТЕЛЯТА МЯСНОЙ ПОРОДЫ (или ТЕЛЯТА МЯСНОЙ ПОРОДЫ НА ПОДСОСЕ) – Suckling Beef Calves are the beef breed Cattle from birth until weaning. Veal calves are not considered suckling calves. See also Weaned Cattle.

SUCTION = ВСАСЫВАНИЕ (или РЕЗОРБЦИЯ) – Suction is the act or process of exerting a force upon a solid, liquid, or gaseous body by reason of reduced air pressure over part of its surface. Suction is the flow of a fluid into a partial vacuum, or region of low pressure. The pressure gradient between this region and the ambient pressure will propel matter toward the low pressure area. Dust is sucked into a vacuum cleaner when it is pushed in by the higher pressure air on the outside of the cleaner. This is similar to what happens when humans breathe or drink through a straw. Both breathing and using a straw involve contracting the diaphragm and muscles around the rib cage. The increased volume in the chest cavity decreases the pressure inside, creating an imbalance with the ambient air pressure, or atmospheric pressure. This imbalance results in air pushing into the lungs or liquid pushing up through a straw and into the mouth. / Всасывание или Резорбция, переход различных веществ через клеточные элементы тканей в кровь и лимфу. Всасывание происходит главным образом в пищеварительном тракте, а также из полости лёгких, плевры, матки, мочевого пузыря, с поверхности кожи и другого. Вода, соли и некоторые другие вещества (глюкоза, витамины) всасываются без предварительного изменения. Всасывание, или активный транспорт большинства питательных веществ через слизистую оболочку пищеварительного тракта в кровь и лимфу, происходит после их ферментативного превращения в более простые соединения, способные пройти через слой эпителиальных клеток. При всасывании вещества движутся как в результате физических процессов (диффузии, осмоса), так и вследствие активного транспорта – против концентрационного и электрохимического градиента, что сопровождается расходом энергии. Всосавшись в кровь и лимфу, вещества разносятся ко всем органам и тканям, где используются для энергетических и пластических процессов. Всасывание в пищеварительном тракте человека и позвоночных животных происходит главным образом через ворсинки кишечника и микроворсинки эпителиальных клеток. Во всасывании принимают участие внутриклеточные структуры (митохондрии, комплекс Гольджи, эндоплазматическая сеть). Всасывание углеводов происходит после расщепления их до моносахаридов. Всасывание белков – после расщепления до аминокислот. Всасывание аминокислот и сахаров способствует процесс фосфорилирования. Всасывание жира (триглицеридов) происходит после ступенчатого расщепления до ди- и моноглицеридов, а затем до глицерина и жирных кислот. Глицерин легко всасывается, а жирные кислоты подвергаются всасыванию после того, как они вступают в комплексное соединение с жёлчными кислотами. Внутри клеток слизистой оболочки происходит распад этого комплекса, жирные кислоты превращаются в нейтральный жир, а жёлчные кислоты возвращаются в просвет кишечника для транспортировки новых порций жирных кислот (хорошо эмульгированный жир, например, молоко, может частично всасываться и без расщепления). Всасывание воды, солей, витаминов и других веществ идёт и в других отделах

пищеварительного тракта также активно, с затратой энергии. Обратное всасывание происходит в секреторных и экскреторных органах, например, всасывание воды в почечных канальцах при мочеобразовании. Всасывание регулируется нервными и гуморально-гормональными механизмами. Нарушение всасывания приводит к истощению организма. Большей частью это связано с отсутствием некоторых ферментов и переносчиков, принимающих участие во всасывании питательных веществ. В некоторых случаях нарушения всасывания носят генетический (наследственный) характер. Такие дефекты устраняют введением в организм ряда ферментов, витаминов, солей и других веществ. Данные о процессе всасывания учитывают при выработке режима питания человека, при приготовлении питательных смесей для искусственного вскармливания.

SUCTION FILTER = ВСАСЫВАЮЩИЙ ФИЛЬТР (или ФИЛЬТР, РАБОТАЮЩИЙ ПОД РАЗРЕЖЕНИЕМ, или ФИЛЬТР НА ЛИНИИ ПОДАЧИ, или ВАКУУМ ФИЛЬТР) – Suction Filter is a pump intake-line filter in which the fluid is below atmospheric pressure. See also Filter. Suction Filters are used as safety filters to protect pumps from gross contamination which can cause them to grip. They are available in 3 styles:- (i) Suction Strainer; (ii) SF2 External Filters, for mounting semi-immersed under the oil level; and (iii) SF2 Semi-Immersed Filters, which shut off oil flow while the filter element is being replaced, replace the butterfly valves usually used for servicing hydraulic pumps.

SUCTION MARKS = ОТМЕТИНЫ ОТ ПРИСАСЫВАНИЯ – Suction Marks:- come from stenter cooling zone. Finishing defect. / зоны охлаждения ширительной машины. Порок или дефект заключительной отделки.

SUDDEN WILT = МОЛНИЕНОСНЫЙ ВИЛТ (или СКОРОТЕЧНЫЙ ВИЛТ) – Wilt disease can be one of the most devastating problems in Cotton. Sudden Wilt is caused by a weak pathogen that infects the roots and lower stem. Root damage from late cultivation can contribute. Plants wilt suddenly and defoliate, usually in hot weather after irrigation or rainfall. Plants die or occasionally re-grow. Affects single plants or small patches. Does not re-occur in the same place. Brown discoloration is confined to the woody parts of the roots and lower stem only. Sudden Wilt most commonly occurs mid-season when the final cultivation is followed by an irrigation or rainfall event and then fine hot weather. The plants wilt suddenly, drop their leaves and squares and, in some cases, then shoot again. Affected plants usually occur in patches extending along the rows, especially in low-lying areas of the field. All of the plants in a patch are affected simultaneously. Symptoms include a brown discoloration of the vascular tissue just below the bark on the lower stem and roots. Sudden wilt is not common and only occurs spasmodically. It does not re-occur in the same patch in subsequent years. Weakly pathogenic Fusarium spp. have been found associated with the condition. See also Bronze Wilt, Fusarium Wilt, and Verticillium Wilt. / Изменение цвета до бурого . Вилт известен также как Трахеомикоз (Трахеомикозная Болезнь). Смотрите также Бронзовый Вилт (Bronze Wilt), или Вертициллёзный Вилт (Вертициллиозный Вилт (Verticillium Wilt)) и Фузариозный Вилт (Fusarium Wilt). . вилт вызывается слабым патогеном, который инфицирует корни и нижнюю часть стебля. Растения умирают или иногда отрастают (дают отаву). или маленькие очаги (patches). только одеревеневшим частям корней и прикорневой части стебля (lower stem).

SUDS STABILIZER = СТАБИЛИЗАТОР МЫЛЬНОЙ ПЕНЫ – Suds Stabilizers are included in detergents to boost suds and keep them from decomposing. They are generally used in detergents where lasting suds are desirable (primarily high sudsing formulations) and in light-duty liquids designed for hand dish washing. The most widely used suds stabilizers are alkanolamides.

SUDS SUPPRESSOR = СУПРЕССОР МЫЛЬНОЙ ПЕНЫ (или ПОДАВИТЕЛЬ МЫЛЬНОЙ ПЕНЫ, или ГАСИТЕЛЬ МЫЛЬНОЙ ПЕНЫ) – Suds Suppressors:- they inhibit sudsing or control foam at a low level. Suds suppression is critical in dishwasher detergents, not only to ensure that the detergent itself produces a minimum of suds, but also to keep foodstuffs from creating suds. Suds suppressors are important for detergent compatibility with European and North American high-efficiency washers. / Под Супрессорами, от Латинского слова Suppressio, означающее Давление, понимается .

SUE AND LABOR CHARGES = СБОРЫ ЗА ИСПОЛНЕНИЕ ОБЯЗАННОСТИ ПО УМЕНЬШЕНИЮ УБЫТКОВ – Sue and Labor Charges (S&L Charges) are expenses incurred by a marine assured to prevent or minimize loss for which underwriters would have been liable. Expenditure incurred as part of a GA act is not allowed as sue and labor, nor are expenses incurred in a salvage operation involving a salvage award. Sue and Labor charges are recoverable under a marine insurance policy whether or not the purpose for which they were incurred was achieved. They are recoverable in addition to any other loss under the policy, even a total loss. Under a hull policy, except where they are associated with a total loss, S&L charges are subject to the policy deductible. Claims for S&L charges under a hull policy are subject to reduction to reflect underinsurance, if any.

SUE AND LABOR CLAUSE = ОГОВОРКА ОБ ОБЯЗАННОСТИ ПО УМЕНЬШЕНИЮ УБЫТКОВ – (1) Sue And Labor Clause:- this clause formed part of the SG policy form and was the basis for applying to the policy expenses incurred by the assured to prevent loss for which underwriters would have been liable. The clause was not retained when the MAR form of policy was introduced to replace the SG policy (Ship and Goods policy) in 1982 (cargo) and 1983 (hull), and was, therefore, omitted from the new cargo and hull clauses drafted for attachment to the MAR form of policy. Nevertheless, the effect of the sue and labor clause is incorporated in the 'duty of the assured' clause in the new clauses. A clause within marine and inland marine policies whereby the policyholder, in the event of a loss, is required to take all necessary means to save the property from further loss, and the insurer agrees to pay the costs even if the property becomes a total loss despite the policyholder's efforts. The insurer may pay a total loss plus the cost of the attempted salvage. Sue and Labor Clause provides coverage, in the event of a loss recoverable under the policy, for expenses reasonably incurred by the Assured or his agents to protect the cargo from further harm and to assist in recovering the damaged cargo in an effort to minimize the loss. Sue and Labor Clause is the clause in a marine policy requiring the assured, in the event of a loss, to act as a prudent uninsured to prevent or minimize damage by taking steps to save and preserve the property from further loss or damage. The clause provides that charges or expenses reasonably incurred in preserving the property are recoverable from the insurance company, if the loss itself is recoverable. The Sue and Labor Clause requires the ship owner to make every attempt to reduce or save the exposed interests from loss. Under the terms of the clause, the insurer pays for any necessary costs incurred in carrying out the requirements of the sue and labor clause. Thus, if a ship is stranded, under the sue and labor clause the hull owner would be required to hire salvors to attempt to save the ship. Such expenses are paid even if the salvage attempts fail. A clause in a marine insurance policy whereby the insurer accepts liability for charges incurred by the insured in seeking to preserve his property from loss or to minimise a loss that would be covered by the policy. The insured is said to sue and labor for the protection of his property.

(2) Sue And Labor Clause:- expenses incurred by the assured or their representatives with the intention of preventing or minimizing a loss for which the Underwriter would have been liable. They do not include expenses incurred in general average or salvage acts; these being recoverable under the policy only as part of the Underwriters' liability for contribution to general average or salvage, if any. Sue and labor charges are recoverable under a policy that incorporates a sue and labor clause (SG policy – Ship and Goods policy), or in accordance with the wording of the policy, e.g., under the 'duty of the assured' clause attached to a MAR policy. / Расходы, понесённые , например, .

SUEDE = НАЧЁСЫВАТЬ (или ВОРСОВАТЬ, или ЗАМШЕВОЕ) – Suede:- a process of raising fibers on the hide to give a velvet nap effect. Also, a specialty ink (plastisol) that gives your print designs a leather-like feel. You can find this ink at Union Ink company.

SUÈDE = СЮЭД (или ЗАМША) – Suède is a common name in leather for the hide of a cow with the fur removed. Soft, tanned leather with the flesh side buffed into a nap. Suède is a type of leather with a napped finish. However, it can also refer to a similar napped or brushed finish on many kinds of fabrics. Suède leather is made from the underside of the skin, primarily lamb, although goat, pig, calf and deer are commonly used. Its softness, thinness and pliability make it suitable for clothing and delicate uses. Suède was originally used for women's gloves. Due to its textured nature and open pores, suède may become dirty and absorb liquids quickly. / Под Сюэд, от Французского слова Suède, означающее Шведская Кожа или Шведка, понимается замша. Под Замшей, от Польского слова Zamsz, понимается кожа жирового или комбинированного (формальдегидно-жирового) дубления, выделанная из шкур диких коз, овец, оленей и так далее. Характеризуется мягкостью, бархатистостью, водонепроницаемостью. Изготовляют обувь, перчатки, одежду. Замша, от Польского слова Замш (Zamsz), от Немецких слов Сэмиш Леда (Sämisch Leder), кожа, выделанная жировым дублением из шкур оленя, овчины или опойка. Отличается мягкостью, бархатистостью, водонепроницаемостью. Замша красится в различные цвета. Для замши характерна большая пористость. Из замши изготовливают предметы одежды, обувь, перчатки, она используется также для фильтрации бензина (отделение воды), шлифовки оптических стекол и прочего. Замшу искусственную получают пропиткой ткани с замшевидным ворсом резиновым клеем (для обуви) или нанесением на ткань резинового клея, на который затем насыпают измельченное хлопчатобумажное волокно (для галантерейных изделий).

SUÈDE FABRIC = ТКАНЬ СЮЭД (или ТКАНЬ ЗАМША, или ЗАМШЕВАЯ ТКАНЬ) – Suède Fabric is a woven or knitted cloth finished to resemble suède leather, usually by napping, shearing, and sanding techniques. Standard construction of the gray fabric in Japan:- 100% polyester filament, 75d x 150d, 240 threads per inch, 44" or 58", WJL (on modern Water Jet Loom (WJL) machines). Suède Fabric is a woven or knitted fabric of cotton, man-made fibers, wool, or blends, finished to resemble suede leather. It is used in sport coats, gloves, linings, and cleaning cloths. / Замша Тканая – ткань, вырабатываемая атласным переплетением с плотным уточным застилом на лицевой поверхности и подвергаемая в отделке ворсованию и аппретированию, благодаря чему по внешнему виду и на ощупь она напоминает натуральную замшу. Замша тканая употребляется для изготовления спортивных костюмов, курток и тому подобного.

SUEZMAX VESSEL = СУДНО СУЭЗМЭКС (или СУДНО СУЭЦМАКС) – Suezmax Vessels are tankers of deadweight between 120 000 and 199 999 tons. Originally named through being the largest vessels able to transit the Suez Canal. Suezmaxes mostly carry dirty cargoes, especially crude oil, in parcel sizes of 130 000 tons (around one million barrels). Typical routes include West African exports to the United States and Europe, North Sea exports to the United States and Europe and some Arabian Gulf exports. / К судам Суэзмэкс или Суэцмакс относятся танкеры дедвейтом в диапазоне от 120 000 до 199 999 тонн. Изначально ими именовались самые крупные суда, способные проходить через Суэцкий Канал (открыт в 1869, длиной 161 километр, глубиной 16.5–17 метров, шириной 120–150 метров, без шлюзов), соединяющий Красное Море у города Суэц со Средиземным Морем у города Порт Саид. Суэзмэксы или Суэцмаксы перевозят, главным образом тёмные нефтепродукты, в большинстве своём сырую нефть, партиями по 130 000 тонн (приблизительно один миллион баррелей). К типичным маршрутам таких судов относятся вывозные (или экспортные) пути из стран Западной Африки в Соединённые Штаты Америки и Европу, вывозной (или экспортный) путь из Северного Моря в Соединённые Штаты Америки и Европу, и вывозной (или экспортный) путь из некоторых стран Персидского Залива.

SUFFERANCE WAREHOUSE = ТАМОЖЕННЫЙ СКЛАД – In Canada, Sufferance Warehouses are privately owned and operated facilities licensed by the Canada Border Services Agency (CBSA) for the short-term storage and the examination of imported goods pending release from customs. Sufferance warehouse keepers charge user fees to their clients for storage and handling. Your goods may stay in a sufferance warehouse for up to 40 days. If you do not claim your goods from the sufferance warehouse after 40 days, we transfer them, at your expense, to a place of safekeeping. If this happens, we notify you that if your goods are not formally released and accounted for or exported within 30 days from the date of the notice, they will be forfeit to the federal government to dispose of accordingly. You are responsible for all reasonable expenses incurred by the CBSA in the disposal of your goods where they are disposed of other than by sale. / В Канаде, Таможенный склад, обеспечиваемый банковским обязательством (гарантией).

SUFFERANCE WHARF = ПРИСТАНЬ ДЛЯ ХРАНЕНИЯ ГРУЗОВ ДО УПЛАТЫ ПОШЛИНЫ – Sufferance Wharf is a wharf licensed and attended by Customs authorities. / Под Причалом понимается совокупность сооружений и устройств для стоянки и обслуживания судов, посадки и высадки пассажиров, грузовых операций и тому подобного. Причальные сооружения (набережные, пирсы) оборудуют тумбами для закрепления судовых швартовов и отбойными приспособлениями (привальными брусьями, кранцами и другими), предохраняющими причал и борта судна от повреждений при навале. На причале располагают грузоподъёмные механизмы, склады и прочее. Причал, комплекс сооружений и устройств, предназначенных для подхода, швартовки, стоянки, обработки и обслуживания судов, посадки и высадки пассажиров, грузовых операций и тому подобного. Различают грузовые, пассажирские, судоремонтные и другие причалы. Под Пристанью понимается специально оборудованное место на внутренних водных путях для стоянки речных судов у берега. Предназначена для посадки и высадки пассажиров, перегрузочных и других операций. Пристани бывают стационарными и плавучими. Под Пристанью понимается небольшой порт на внутренних водных путях, имеющий обычно 1–2 причала.

SUGAR = САХАР – India, Brazil, China, Thailand, Cuba and Mexico are among the leading sugar cane producers. European Union nations, the Russian Federation and Ukraine produce the majority of all sugar beets. The European Union, Brazil, Thailand, Australia, Cuba and Ukraine are leading sugar exporters. Historically, the futures World Sugar No. 11 market has produced NYBOT's largest total annual volumes. In 2003, for example, total sugar futures and options accounted for more than 36% of all the contracts traded on the NYBOT® exchanges. The process of making sugar by evaporating juice from sugarcane developed in India around 500 BC. Sugarcane, a tropical grass, probably originated in New Guinea. During prehistoric times its culture spread throughout the Pacific Islands and into India. By 200 BC producers in China had begun to grow it too. Westerners learned of sugarcane in the course of military expeditions into India. Nearchos, one of Alexander the Great's commanders, described it as 'a reed that gives honey without bees'. Raw sugar futures are traded on the New York Board of Trade® (NYBOT®). White sugar futures are traded on the London International Financial Futures and Options Exchange (LIFFE). Table sugar (sucrose) comes from plant sources. Two important sugar crops predominate:- sugarcane (Saccharum spp.) and sugar beets (Beta vulgaris), in which sugar can account for 12% to 20% of the plant's dry weight. Some minor commercial sugar crops include the date palm (Phoenix dactylifera), sorghum (Sorghum vulgare), and the sugar maple (Acer saccharum). In the financial year 2001/02, worldwide production of sugar amounted to 134.1 million tons. The first production of sugar from sugar-cane took place in India. Alexander the Great's companions reported seeing 'honey produced without the intervention of bees' and it remained exotic in Europe until the Arabs started cultivating it in Sicily and Spain. Only after the Crusades did it begin to rival honey as a sweetener in Europe. The Spanish began cultivating sugar-cane in the West Indies in 1506

(and in Cuba in 1523). The Portuguese first cultivated sugar-cane in Brazil in 1532. Most cane-sugar comes from countries with warm climates, such as Brazil, Pakistan, India, China and Australia. In 2001/02 developing countries produced over twice as much sugar as developed countries. The greatest quantity of sugar comes from Latin America, the United States, the Caribbean nations, and the Far East. Beet-sugar comes from regions with cooler climates:- northwest and eastern Europe, northern Japan, plus some areas in the United States (including California). In the northern hemisphere, the beet-growing season ends with the start of harvesting around September. Harvesting and processing continues until March in some cases. The availability of processing-plant capacity, and the weather both influence the duration of harvesting and processing – the industry can lay up harvested beet until processed, but frost-damaged beet becomes effectively unprocessable. The European Union (EU) has become the world's second-largest sugar exporter. The Common Agricultural Policy of the EU sets maximum quotas for members' production to match supply and demand, and a price. Europe exports excess production quota (approximately 5 million tons in 2003). Part of this, 'quota' sugar, gets subsidised from industry levies, the remainder (approximately half) sells as 'C quota' sugar at market prices without subsidy. These subsidies and a high import tariff make it difficult for other countries to export to the EU states, or to compete with the Europeans on world markets. In non-scientific use, the term Sugar refers to sucrose (also called Table Sugar or Saccharose) – a white crystalline solid disaccharide. Humans most commonly use sucrose as their sugar of choice for altering the flavor and properties (such as mouthfeel, preservation, and texture) of beverages and food. Commercially-produced table sugar comes either from sugar-cane or from sugar-beet. Scientifically, sugar refers to any monosaccharide or disaccharide. Monosaccharides (also called Simple Sugars), such as glucose, store energy which biological cells use and consume. In a list of ingredients, any word that ends with 'ose' will likely denote a sugar. Sometimes such words may also refer to any types of carbohydrates soluble in water. In culinary terms, the foodstuff known as sugar delivers one of the primary taste sensations, that of sweetness. The English word Sugar may ultimately originate from the Sanskrit word Sharkara or Śarkarā, which means 'Sugar' or 'Pebble'. It probably came to English by way of the French, Spanish and/or Italians who derived their word for sugar from the Arabic Al Sukkar (whence the Portuguese word Açucar, the Spanish word Azúcar, the Italian word Zucchero, the Old French word Zuchre and the contemporary French word Sucre). The Arabs in turn presumably derived their word from the Persian Shakar, derived from the original Sanskrit. Note that the English word Jaggery (coarse brown Indian sugar) has similar ultimate etymological origins. Cane-sugar producers since the VI century BCE have crushed the harvested vegetable material to collect and filter the juice. They then treat the liquid (often with lime (calcium oxide)) to remove impurities and then neutralize it with sulfur dioxide. Boiling the juice then allows the sediment to settle to the bottom for dredging out, while the scum rises to the surface for skimming off. In cooling, the liquid crystallises, usually in the process of stirring, to produce sugar crystals. Centrifuges usually remove the uncrystallised syrup. The producers can then either sell the resultant sugar, as is, for use; or process it further to produce lighter grades. This processing may take place in another factory in another country. Beet-sugar producers slice the washed beets, then extract the sugar with hot water in a 'diffuser'. An alkaline solution ('milk of lime' and carbon dioxide from the lime kiln) then serves to precipitate impurities (see also Carbonatation). After filtration, evaporation concentrates the juice to a content of about 70% solids, and controlled crystallisation extracts the sugar. A centrifuge removes the sugar crystals from the liquid, which gets recycled in the crystalliser stages. When economic constraints prevent the removal of more sugar, the manufacturer discards the remaining liquid, now known as Molasses. / Щелочное (Alkaline). осадок (precipitate). в Нью Йоркской Палате Торговли (Нью Йоркском Табло Торговли, если быть более точными). НАЙБЭТ® (NYBOT®). Лондонской Международной Биржи Финансовых Фьючерсов и Опционов (London International Financial Futures and Options Exchange; сокращённо – ЛМБФФО или ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE)). Под Сахаром, от Греческого слова Sákchar от санскрита, понимается пищевой продукт, получаемый главным образом из Сахарной Свёклы и Сахарного Тростника. Выпускается в виде сахарного песка и сахара-рафинада. Энергетическая ценность (калорийность) 100 граммов сахара – 1.68 МДж (около 400 ккал). Сахарная Свёкла, группа разновидностей Свёклы обыкновенной корнеплодной; техническая культура, из корней которой получают сахар (его содержание до 19.5%). Сахарный Тростник, Род преимущественно Многолетних Трав Семейства Злаков, 5–7 Видов. Выращивают благородный Сахарный Тростник, в основном в Бразилии, Индии, Кубе, небольшие пробные плантации в республиках Средней Азии. В стеблях до 20% сахара. Другие Виды используют как салатные овощи, на корм животным, для производства бумаги. Жом – измельчённые корнеплоды Сахарной Свёклы после экстрагирования из них сахара, является побочным продуктом свеклосахарного производства. Жом свежий, силосованный (кислый) и сушёный используют в основном для откорма сельскохозяйственных животных. Сахароза, тростниковый или свекловичный сахар, дисахарид, образованный остатками глюкозы и фруктозы. Важная транспортная форма углеводов в растениях (особенно много сахарозы в Сахарном Тростнике, Сахарной Свёкле и других сахароносных растениях); легко превращается в запасные крахмал и инулин. Используется в пищевой и микробиологической промышленности. Бытовое название – сахар. Сахарное Производство – производство кристаллического белого сахара-песка и сахара-рафинада из Сахарной Свёклы и Сахарного Тростника. В бывшем Союзе Советских Социалистических Республик (СССР) сахар вырабатывался из Сахарной Свёклы, содержавшей в среднем около 17.5% сахара. Все процессы сахарного производства механизированы и выполняются непрерывным поточным способом в течение сезона обработки. Основные процессы сахарного производства:- мойка, резка свёклы в стружку, обработка её в диффузионных аппаратах, очистка диффузионного сока (дефекация), сатурация, сульфитация), выпаривание очищенного сока, уваривание сиропа до концентрации 92.5% сухих веществ (так называемый утфель), центрифугирование, высушивание и охлаждение кристаллов сахара, в результате чего получается сахар-песок. Сахар-рафинад вырабатывают из сахара-песка. Сахара – то же, что углеводы.

SUGAR NO. 11 = САХАР № 11 – The Sugar No. 11 contract is the world benchmark contract for raw sugar trading. The contract prices the physical delivery of raw cane sugar, free-on-board (FOB) the receiver's vessel in a port within the country of origin of the sugar. The seller pays to ship the sugar to a port, and is responsible for loading costs. The buyer, however, is responsible for unloading costs. In the case of landlocked countries, it would be delivered at a berth or anchorage in the customary port of export. Sugar No. 11 can be sugar originating from any one of 28 countries including the US, Brazil, Mexico, Argentina, etc. Its quality standard is defined as raw centrifugal cane sugar based on 96 degrees average polarization.

SUGAR NO. 14 = САХАР № 14 – Sugar No. 14 differs primarily from Sugar No. 11 in the shipping terms for the contract. Sugar No. 14 Calls for delivery of cane sugar in bulk at determined Atlantic and Gulf ports with Cost, Insurance and Freight (CIF) duty paid. The seller must pay the costs and freight to bring the goods to the port of destination, including insurance for the buyer. Maritime transport only. However, risk is transferred to the buyer once the goods have crossed the ship's rail.

SUGAR NO. 16 = САХАР № 16 – The Sugar No. 16 contract serves the hedging needs of US sugar producers, end users and merchants. The contract prices physical delivery of US-grown (or foreign sugar with duty fees paid by deliverer) raw cane sugar at one of five US refinery ports selected by the receiver: New York, Baltimore, Galveston, New Orleans, and Savannah. Its quality standard is defined as raw centrifugal cane sugar based on 96 degrees average polarization.

SUGGESTIVE MARK = СХОДНЫЙ ЗНАК (или СУГГЕСТИВНЫЙ ЗНАК) – Suggestive Mark:- secondary trademark register for the United States Patent and Trademark Office (USPTO). It allows for registration of certain marks that are not eligible for registration on

the Principal Register, but are capable of distinguishing an applicant's goods or services. Marks registered on the Supplemental Register receive protection from conflicting marks and other protections, but are excluded from receiving the advantages of certain sections of the Trademark Act of 1946. The excluded sections are listed in 15 USC §1094 (15 USC is short for the United States Code:- Title 15). If the applicant seeks registration on the Supplemental Register, the application should state that registration is requested on the Supplemental Register. If no register is specified, the Office will presume that the applicant seeks registration on the Principal Register. To register a mark on the Supplemental Register, applicants must either be using the mark or filing under Trademark Act Section 44 based on a foreign registration. Suggestive Marks are considered inherently distinctive and protectable without first acquiring secondary meaning. Examples of suggestive marks may include HERO for hire extinguishers or GREYHOUND for bus transportation services. Suggestive Mark is a mark that, when applied to the goods or services at issue, requires imagination, thought or perception to reach a conclusion as to the nature of those goods or services. / Суггестивный, от Латинского слова Suggestio, означающее Внушение или Намёк, .

SUINT = ЖИРОПОТ – Suint:- generally referred to as the perspiration of sheep and is naturally excreted from the glands at the roots of the wool. Suint consists of soapy compounds of potash and fatty acids, together with a little free fatty acid and saline matter. It is soluble in water. This is one part of what is called the Grease on an unwashed fleece. / Под Жиропотом шерсти понимается смесь выделений сальных и потовых желёз кожи овец. Количество жира в шерсти мериносовых овец 30–40%, полутонкорунных – 12–20%, грубошёрстных – около 4%. Жиропот смазывает и защищает шерсть от дейстия влаги, механических загрязнений и других внешних факторов, способствует лучшему сохранению физико-механических свойств шёрстных волокон. При недостатке жиропота шерсть делается сухой, теряет блеск; при избытке жиропота уменьшается выход чистой шерсти. Жиропот используют для получения ланолина.

SUITING = КОСТЮМНАЯ ТКАНЬ – Suiting:- original meaning implies a men's wear coat. In the garment trade it is the material used to make a man's suit in comparison with trouser material, fancy vesting, overcoating, sport coat material, etc. See also Cotton Suiting.

SUITOR = ПОГЛОТИТЕЛЬ – A term 'Suitor' is used to describe a company seeking to buy another company. See also Target Company.

SULCO = БОРОЗДИТЬ (или ВЗРЫХЛЯТЬ, или РЫТЬ, или ВСКАПЫВАТЬ, или ПРОПАЛЫВАТЬ) – Sulco:- of a plant or part with a groove or furrow (Latin:- Sulcus = Furrow or Groove). / Борозда или Колея (Sulcus). / жёлоб или паз (groove).

SULFAMIC ACID = СУЛЬФАМИЧЕСКАЯ КИСЛОТА (или СУЛЬФАМИНОВАЯ КИСЛОТА) – Sulfamic Acid, NH_2SO_3H, applied to wool typically by printing, followed by baking then steaming, fixes to the wool much like an acid dye. It is colorless and prevents the treated wool from taking up other acid dye, so it is an effective resist. / Сульфаминовая Кислота – моноамид серной кислоты NH_2SO_2OH.

SULFAR FIBER = СУЛЬФАРОВОЕ ВОЛОКНО (или ВОЛОКНО СУЛЬФАР) – Sulfar Fiber is a manufactured fiber in which the fiber-forming substance is a long chain, synthetic polysulfide in which at least 85% of the sulfide (–S–) linkages are attached to two aromatic rings. The raw material is polyphenylene sulfide which is melt spun and processed into staple fibers. These are high performance fibers with excellent resistance to strong chemicals and high temperature. They show excellent strength retention in harsh environments; are flame retardant; and are non-conducting. They find use in high-temperature filter fabrics, electrical insulation, coal-fired boiler bag houses, papermaker's felt, and highperformance composites.

SULFATED ASH = СУЛЬФАТНАЯ ЗОЛА (или СУЛЬФИРОВАННАЯ ЗОЛА) – Sulfated Ash is the ash content of fresh, compounded lubricating oil as determined by ASTM Method D 874. Indicates level of metallic additives in the oil. See also Ash. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ).

SULFATE PULP = СУЛЬФАТНАЯ ПУЛЬПА (или СУЛЬФАТНАЯ ЦЕЛЛЮЛОЗА) – Sulfate Pulp:- inexpensive, brown, durable paper that is not bleached, so that wood-pulp fibers are highly visible. Sulfate pulp is used primarily for making bags and cardboard boxes. See also Kraft Pulp. / Смотрите также Крафт Пульпа или Крафт Целлюлоза (Kraft Pulp). Под Пульпой, от Латинского слова Pulpa, означающее Мякоть, понимается:- (i) зубная мякоть, содержимое коронковой и корневой полостей зуба; или (ii) основная масса селезёнки.

SULFONATE = СУЛЬФОНАТ – Sulfonate is a hydrocarbon in which a hydrogen atom has been replaced with the highly polar (SO_2OX) group, where X is a metallic ion or alkyl radical. Petroleum sulfonates are refinery by-products of the sulfuric acid treatment of white oils. Sulfonates have important applications as emulsifiers and chemical intermediates in petrochemical manufacture, and substituted sulfonates are widely used as corrosion inhibitors. Synthetic sulfonates can be manufactured from special feedstocks rather than from white oil base stocks. / Сульфонаты – соли сульфокислот. Широкое применение нашли сульфонаты щелочных металлов (главным образом алкилсульфонаты натрия) как поверхностно-активные вещества (ПАВ), используемые для производства моющих средств.

SULFONATED = СУЛЬФИРОВАННОЕ – Sulfonated:- a term describing a material that has been reacted with sulfonic acid, usually to impart solubility, dyeability with cationic dyes, or other properties. / Сульфированное – содержащее сульфогруппу – SO_3H.

SULFONIC ACID = СУЛЬФОНОВАЯ КИСЛОТА (или СУЛЬФОКИСЛОТА) – Sulfonic Acid is any acid containing the sulfonic group, (SO_3H). / Под Сульфикислотами или Сульфоновыми Кислотами понимаются органические соединения, содержащие сульфогруппу – SO_2OH, связанную с органическим радикалом R. Получают сульфированием углеводородов, гидролизом сульфохлоридов RSO_2Cl и другого. Сульфокислоты – важные промежуточные продукты в производстве моющих средств, красителей, ионообменных смол, лекарственных веществ (например, сульфаниламидов).

SULFUR = СЕРА – Sulfur is a common natural constituent of petroleum products. While certain sulfur compounds are commonly used to improve the extreme pressure (EP), or load-carrying, properties of an oil, high sulfur content in a petroleum product may be undesirable as it can be corrosive and create an environmental hazard when burned. For these reasons, sulfur limitations are specified in the quality control of fuels, solvents, etc. Sulfur is one of the elements present in varying quantities in coal which contributes to environmental degradation when coal is burned. In terms of sulfur content by weight, coal is generally classified as low (less than or equal to 1 percent), medium (greater than 1 percent and less than or equal to 3 percent), and high (greater than 3 percent). Sulfur content is measured as a percent by weight of coal on an 'as received' or a 'dry' (moisture-free, usually part of a laboratory analysis) basis. An element that is present in some oil and gas as an impurity in the form of its various compounds. Elemental sulphur recovered in the treating processes in the refinery. / сверхвысокое давление . Сера (на Латинском Sulfur) S, химический элемент VI группы Периодической Системы Менделеева; атомный номер 16, атомная масса 32.06. Природная сера состоит из четырёх стабильных изотопов:- ^{32}S (95.02%), ^{33}S (0.75%), ^{34}S (4.21%), ^{36}S (0.02%). Получены также искусственные радиоактивные изотопы ^{31}S ($T_{1/2}$ = 2.4 сек), ^{35}S ($T_{1/2}$ = 87.1 сут), ^{37}S ($T_{1/2}$ = 5.04 мин). Историческая Справка:- сера в самородном состоянии, а также в виде сернистых соединений известна с древнейших времён. Она упоминается в Библии, поэмах Гомера и других.

Сера входила в состав ‘священных’ курений при религиозных обрядах; считалось, что запах горящей серы отгоняет злых духов. Сера давно стала необходимым компонентом зажигательных смесей для военных целей, например, ‘греческого огня’ (X век Нашей Эры). Около VIII века в Китае стали использовать серу в пиротехнических целях. Издавна серой и её соединениями лечили кожные заболевания. В период Арабской алхимии возникла гипотеза, согласно которой сера (начало горючести) и ртуть (начало металличности) считали составными частями всех металлов. Элементарную природу серы установил Французский химик Отвэн-Лёро дё Лявози (Antoine-Laurent de Lavoisier; 1743-Август-26–1794-Май-08) и включил её в список неметаллических простых тел (1789). В 1822 Немецкий химик Айльхард Митцалих (Eilhard Mitscherlich; 1794-Январь-07–1863-Август-28) обнаружил аллотропию серы. Распространение В Природе:- сера относится к весьма распространённым химическим элементам (кларк $4.7 \cdot 10^{-2}$); встречается в свободном состоянии (Самородная Сера) и в виде соединений – сульфидов, полисульфидов, сульфатов (смотрите Природные Сульфаты, Природные Сульфиды, Сульфидные Руды). Вода морей и океанов содержит сульфаты натрия, магния, кальция. Известно более 200 минералов серы, образующихся при эндогенных процессах. В биосфере образуется свыше 150 минералов серы (преимущественно сульфатов); широко распространены процессы окисления сульфидов до сульфатов, которые в свою очередь восстанавливаются до вторичного H_2S и сульфидов. Эти реакции происходят при участии микроорганизмов. Многие процессы биосферы приводят к концентрации серы – она накапливается в гумусе почв, углях, нефти, морях и океанах ($8.9 \cdot 10^{-2}$%), подземных водах, в озёрах и солончаках. В глинах и сланцах серы в 6 раз больше, чем в земной коре в целом, в гипсе – в 200 раз, в подземных сульфатных водах – в десятки раз. В биосфере происходит круговорот серы:- она приносится на материки с атмосферными осадками и возвращается в океан со стоком. Источником серы в геологическом прошлом Земли служили главным образом продукты извержения вулканов, содержащие SO_2 и H_2S. Хозяйственная деятельность человека ускорила миграцию серы; интенсифицировалось окисление сульфидов. Физические И Химические Свойства:- сера – твёрдое кристаллическое вещество, устойчивое в виде двух аллотропических модификаций. (i) Ромбическая a-S лимонно-жёлтого цвета, плотность 2.07 г/см^3, $t_{пл}$ 112.8 °C, устойчива ниже 95.6 °C; (ii) Моноклинная b-S медово-жёлтого цвета, плотность 1.96 г/см^3, $t_{пл}$ 119.3 °C, устойчива между 95.6 °C и температурой плавления. Обе эти формы образованы восьмичленными циклическими молекулами S8 с энергией связи S – S 225.7 кДж/моль. При плавлении сера превращается в подвижную жёлтую жидкость, которая выше 160 °C буреет, а около 190 °C становится вязкой тёмно-коричневой массой. Выше 190 °C вязкость уменьшается, а при 300 °C сера вновь становится жидкотекучей. Это обусловлено изменением строения молекул:- при 160 °C кольца S_8 начинают разрываться, переходя в открытые цепи; дальнейшее нагревание выше 190 °C уменьшает среднюю длину таких цепей. Если расплавленную серу, нагретую до 250–300 °C, влить тонкой струей в холодную воду, то получается коричнево-жёлтая упругая масса (Пластическая Сера). Она лишь частично растворяется в сероуглероде, в осадке остаётся рыхлый порошок. Растворимая в CS_2 модификация называется l-S, а нерастворимая – m-S. При комнатной температуре обе эти модификации превращаются в устойчивую хрупкую a-S. $t_{кип}$ серы 444.6 °C (одна из стандартных точек международной температурной шкалы). В парах при температуре кипения, кроме молекул S_8, существуют также S_6, S_4 и S_2. При дальнейшем нагревании крупные молекулы распадаются, и при 900 °C остаются лишь S_2, которые приблизительно при 1 500 °C заметно диссоциируют на атомы. При замораживании жидким азотом сильно нагретых паров серы получается устойчивая ниже –80 °C пурпурная модификация, образованная молекулами S_2. Сера – плохой проводник тепла и электричества. В воде она практически нерастворима, хорошо растворяется в безводном аммиаке, сероуглероде и в ряде органических растворителей (фенол, бензол, дихлорэтан и другие). Конфигурация внешних электронов атома S $3s^2 3p^4$. В соединениях сера проявляет степени окисления –2, +4, +6. Сера химически активна и особенно легко при нагревании соединяется почти со всеми элементами, за исключением N_2, I_2, Au, Pt и инертных газов. CO_2 на воздухе выше 300 °C образует окислы:- SO_2 – сернистый ангидрид и SO_3 – серный ангидрид, из которых получают соответственно сернистую кислоту и серную кислоту, а также их соли сульфиты и сульфаты (смотрите также Тиокислоты и Тиосульфаты). Уже на холоду S энергично соединяется с F_2, при нагревании реагирует с Cl_2 (смотрите Фториды Серы, Хлориды Серы); с бромом сера образует только S_2Br_2, иодиды серы неустойчивы. При нагревании (150–200 °C) наступает обратимая реакция с H_2 с получением сернистого водорода. Сера образует также многосернистые водороды общей формулы H_2S_x, так называемые Сульфаны. Известны многочисленные сераорганические соединения. При нагревании сера взаимодействует с металлами, образуя соответствующие сернистые соединения (сульфиды) и многосернистые металлы (полисульфиды). При температуре 800–900 °C пары серы реагируют с углеродом, образуя сероуглерод CS_2. Соединения сера с азотом (N_4S_4 и N_2S_5) могут быть получены только косвенным путём. Получение:- элементарную серу получают из серы самородной, а также окислением сернистого водорода и восстановлением сернистого ангидрида. О способах добычи серы смотрите Серные Руды. Источник сернистого водорода для производства серы – коксовые, природные газы, газы крекинга нефти. Разработаны многочисленные методы переработки H_2S; наибольшее значение имеют следующие:- (1) H_2S извлекают из газов раствором моногидротиоарсената натрия:- $Na_2HAsS_2 + H_2S = Na_2HAsS_3O + H_2O$. Затем продувкой воздуха через раствор осаждают серу в свободном виде:- $NaHAsS_3O + 1/2\ O_2 = Na_2HAsS_2O_2 + S$. (2) H_2S выделяют из газов в концентрированном виде. Затем его основная масса окисляется кислородом воздуха до серы и частично до SO_2. После охлаждения H_2S и образовавшиеся газы (SO_2, N_2, CO_2) поступают в два последовательных конвертора, где в присутствии катализатора (активированный боксит или специально изготовляемый алюмогель) происходит реакция:- $2H_2S + SO_2 = 3S + 2H_2O$. В основе получения серы из SO_2 лежит реакция восстановления его углём или природными углеводородными газами. Иногда это производство сочетается с переработкой пиритных руд. В 1972 элементарной серы в мире (без социалистических стран) произведено 32.0 миллиона тонн (т); основная масса её добывалась из природных самородных руд. В 1970-е первостепенное значение (в связи с открытием крупных месторождений сероводородсодержащих топливных газов) приобретают методы получения серы из H2S. Сорта Серы:- выплавленная непосредственно из серных руд сера называется Природной Комовой Серой; полученная из H_2S и SO_2 – Газовой Комовой Серой. Природная комовая сера, очищенная перегонкой, называется Рафинированной Серой. Сконденсированная из паров при температуре выше точки плавления в жидком состоянии и затем разлитая в формы – Черенковой Серой. При конденсации серы ниже точки плавления на стенках конденсационных камер образуется мелкий порошок серы – Серный Цвет. Особо высокодисперсная сера носит название Коллоидной Серы. Применение:- сера применяется в первую очередь для получения серной кислоты:- в бумажной промышленности (для получения сульфитцеллюлозы); в сельском хозяйстве (для борьбы с болезнями растений, главным образом Винограда и Хлопчатника); в резиновой промышленности (вулканизующий агент); в производстве красителей и светящихся составов; для получения чёрного (охотничьего) пороха; в производстве спичек. Сера, на Латинском языке Sulfur, символ S, химический элемент VI группы периодической системы Менделеева. Атомный номер 16, атомная масса 32.066. жёлтые кристаллы. Сера – твёрдое хрупкое вещество жёлтого цвета, имеет аллотропные модификации. Наиболее устойчива в двух модификациях:- (i) моноклинной (β–S, плотность 1 960 кг/м^3, $t_{пл}$ 119.3 °C, устойчивая от 95.6 до 119.3 °C) и (ii) ромбической (α–S, плотность 2 070 кг/м^3, $t_{пл}$ 112.8 °C, устойчивая ниже 95.5 °C). В воде нерастворима. На воздухе устойчива; при горении даёт SO_2, с металлами образует сульфиды. В природе сера встречается как в свободном состоянии – самородная сера, так и главным образом в виде соединений – сульфаты (барит, гипс, глауберова соль и другие) и сульфиды (пирит, или серный колчедан; сфалерит, или цинковая обманка; халькопирит, или медный

колчедан, и другие). Элементарную серу выплавляют из самородных руд; её получают также окислением кислородом воздуха сероводорода (H_2S), восстановлением серного ангидрида (SO_2), содержащихся в природном, нефтяном, коксовом газах и получаемых как побочный продукт при очистке нефти и природного газа, обжиге сульфидов и другими методами. Около 50% мирового производства серы идёт на получение серной кислоты, около 25% – на получение сульфитов – целлюлозы (используемой в бумажной промышленности), 10–15% – в сельское хозяйство для борьбы с болезнями и вредителями растений, остальная – в резиновой промышленности для вулканизации, в производстве искусственного волокна, взрывчатых веществ, спичек, в органическом синтезе красителей, медицине и других областях. Образование при сжигании углей оксидов серы во второй половине XX столетия было главной причиной загрязнения окружающей среды в промышленных развитых странах. Самородная Сера – минерал класса самородных элементов, химический состав соответствует элементарной сере, S. Цвет жёлтый, коричневый до чёрного (от примесей битума). В природе распространена главным образом ромбическая α–S с примесью As, Se, Te. Жёлтые натёки, почки, сплошные массы, кристаллы и другие. Твёрдость по минералогической шкале 1–2, плотность около 2 000 кг/м^3. Происхождение вулканическое, гипергенное; продукт жизнедеятельности микроорганизмов в морских бассейнах (осадочные месторождения). Сырьё для получения серной кислоты, целлюлозы, приготовления ядохимикатов; применяется также в резиновой промышленности, производстве искусственного волокна, взрывчатых веществ и другого.

SULFUR–COATED UREA = ПОКРЫТАЯ СЕРОЙ МОЧЕВИНА – Sulfur-Coated Urea is an urea fertilizer with a thin layer of sulfur on the surface to slow down nitrogen release, making it available to the plant for a longer time.

SULFUR DYES = СЕРНИСТЫЕ КРАСИТЕЛИ – Sulfur Dye is a class of dyes made by reacting sulfur with organic compounds; most are of unknown chemical structure. Sulfur dyes are insoluble in water, and must be converted to a soluble form for application. The process is a quite similar to that used for vat dyes. Sulfur dyes are typically inexpensive, but dull in color. They generally have good washfastness, but are sensitive to bleaches. Sulfur dyes on fabric, particularly some blacks, may decompose under warm, humid conditions, forming an acid. This can cause tendering of cellulose fibers, but can generally be prevented by making the finished fabric slightly alkaline. Sulfur dye is often used commercially to produce a good black at low cost on cellulosic fabrics. Sulfur Dyes is a class of water-insoluble dyes that are applied in a soluble, reduced form from a sodium sulfide solution and are then reoxidized to the insoluble form on the fiber. Sulfur dyes are mainly used on cotton for economical dark shades of moderate to good fastness to washing and light. They generally give very poor fastness to chlorine. See also Dyes. Sulfur Dyes or Sulphur Dyes are used in piece dyeing (cellulose and cellulose-polyester blends), yarn dyeing (sewing thread, warp yarn for denim fabric, yarn for colored woven goods), dyeing of flock, card sliver (wool-man-made fibers blends). Like vat dyes, sulphur dyes are insoluble in water, and, under alkaline conditions, are converted into the leuco-form, which is water-soluble and has a high affinity for the fiber. After adsorption into the fiber the colorant is oxidised and converted to the original insoluble state. The reducing agent, salts, alkali and unfixed dye are finally removed from the fiber by rinsing and washing. Mostly continuous dyeing methods are applied, although batch dyeing (in jigger, jet, and winch beck) is also possible. In continuous processes the material is impregnated with dye, reducing agent and wetting agent through a one-bath or a two-bath procedure. With the one-bath procedure (pad-steam process) the reducing agent and the dye are added at the same time. With the two-bath procedure (pad-dry/pad-steam) the material is padded in the liquor containing the dye and the wetting agent, while the reducing agent is applied, if necessary, in a second step, after intermediate drying. The material is then submitted to air-free steaming. After that, rinsing, oxidation and re-rinsing are carried out. Because the exhaustion is not too high, it is possible to re-use dyeing baths in continuous processes. Chemicals and auxiliaries applied to the substrate during the dyeing process are:- (i) reducing agents:- sodium sulphide, sodium hydrogensulphide and thiourea dioxide are the most commonly employed (although their use has decreased over the past decade). Binary systems made of glucose and sodium dithionite, hydroxyacetone and glucose or formamidine sulphinic acid and glucose are also used as alternative reducing agents; (ii) alkali (caustic soda); (iii) salt; (iv) dispersing agents (they are necessary in the process steps in which the pigment has not yet been reduced or has been re-formed by oxidation); (v) complexing agents:- ethylenediamine tetraacetic acid (EDTA) or polyphosphates are used in some cases, especially in circulating-liquor dyeing to avoid the negative effects of alkaline-earth ions on dyeing; and (vi) oxidising agents:- mainly hydrogen peroxide and halogen-containing compounds such as bromate, iodate and chlorite. Sulfur Dye is a dye derived from chemicals containing sulphur. It is used mostly for vegetable fibers. It has fair resistance to washing and poor resistance to sunlight. Sulphur (or sulphide) Dyes:- these are so called because they all contain sulphur in the molecule and are mostly applied from baths containing sodium sulphide. Like the vat dyes they are insoluble and are converted into alkali-soluble leuco-compounds for application, in this case generally by the use of sodium sulphide and sodium carbonate. The insoluble dye is regenerated on the fiber by oxidation, usually by the atmosphere. Sulphur dyes do not, as a class, give very bright colors, but mostly represent the cheapest form of intense fast color available for dyeing cotton goods in dark utility shades, black, navy, and khaki. Sulfur Dyes are insoluble and made soluble by the help of caustic soda and sodium sulfide. Dyeing is done at high temperature with large quantities of salt so that the color penetrates into the fiber. After dyeing the fabric is oxidized for getting desired shades by exposure to air or by using chemicals. Excess dyes and chemicals are removed by thorough washing. These dyes are fast to light, washing and perspiration and are mostly used for cotton and linen. / непрерывное крашение (continuous dyeing). Щелочное (Alkaline). устойчивость (fastness). диоксид тиомочевины (thiourea dioxide). Формамидин Сульфиновая Кислота (Formamidine Sulphinic Acid). Сернистые Красители – смеси органических веществ, молекулы которых включают гетероциклические фрагменты, ароматические и другие циклы, связанные между собой группами, содержащими серу. Нерастворимы в воде. При действии сульфида натрия переходят в растворимое лейкосоединение, которое окисляется на волокне кислородом воздуха, образуя прочные окраски неярких тонов. Применяются для крашения дешёвых хлопковых тканей и ниток.

SULFURIC ACID = СЕРНАЯ КИСЛОТА – Sulfuric Acid, H_2SO_4, is a very potent inorganic ('mineral') acid; a strong acid. Sulfuric acid is used in some preparation and dyeing process, most often with wool. Concentrated acid will absorb water very rapidly, releasing heat in the process. Skin burns are caused by both this heating and by corrosive action, and can happen within seconds. Extreme care is essential! See comments under acid regarding mixing. Sodium bisulfate (not bisulfite) can sometimes be used as an alternative. / Сильная Кислота (Strong Acid). Под Серной Кислотой, H_2SO_4, понимается сильная двухосновная кислота. Безводная серная кислота – бесцветная маслянистая жидкость, плотность 1.920 3 г/см^3, $t_{пл}$ = 10.3 °C, $t_{кип}$ = 296.2 °C. С водой смешивается во всех отношениях. Концентрированная серная кислота реагирует почти со всеми металлами, образуя соли – сульфаты. Серную кислоту получают растворением в воде SO_3, образующегося при окислении SO_2; последний получают главным образом обжигом природных сульфидов – пирита и других (так называемый контактный и башенный способы). Серная кислота – один из основных продуктов химической промышленности. Идёт на производство минеральных удобрений (суперфосфат, сульфат аммония), различных кислот и солей, лекарственных и моющих средств, красителей, искусственного волокна, взрывчатых веществ. Применяется в металлургии (разложение руд, например, урановых), для очистки нефтепродуктов, как осушитель и другое. Мировое производство серной кислоты в 1979 составляло около 132.8 миллионов тонн.

SULFURIZED OIL = ХХ МАСЛО (или СУЛЬФУРИРОВАННОЕ МАСЛО, или ОСЕРНЕННОЕ МАСЛО) – Sulfurized Oil is an oil to which sulfur or sulfur compounds have been added. Sulfurized Oil is any of various mineral oils and fatty oils containing active sulfur to increase film strength and load-carrying ability; used generally as cutting fluids. / Осернение масла. Осерненное Масло:- осернение масла проводится при 130–140 °С молотой серой. Для улучшения смазывающей способности масел к ним добавляют противоизносные и противозадирные присадки, которые способствуют созданию прочного пограничного слоя в условиях граничной смазки. В качестве противоизносных присадок используют производные дитиофосфорной кислоты (ЭФО, ЛЗ-309/2), а в качестве противозадирных – производные ксантата этилена (ЛЗ-6/9, ЛЗ-23К) и осерненные масла (ОТП, осерненный октол). Осерненное Масло – минеральное масло, в состав которого специально введено 1–2% серы. Применяется для повышения прочности масляной плёнки и в качестве антикоррозионной присадки. Добавляется к маслу в количестве 0.5–1.0% в зависимости от качества масла. Против действия пальмитиновой кислоты осерненное масло в количестве до 1.5% вообще неэффективно. Советский Профессор Борис Витальевич Лосиков показал, что элементарная сера, находящаяся в осерненном масле в коллоидно растворенном состоянии, образует на металлах (медь, кадмий, свинец) чрезвычайно быстро и уже при умеренных температурах сульфидную плёнку. Эта пленка обладает резко выраженным пассивирующим действием, однако прочность ее очень невысока она легко удаляется с поверхности, открывая для коррозии новую свежую поверхность. Именно поэтому осерненное масло как антикоррозионный компонент присадок оказалось малоэффективным. Осерненные Масла получают, вводя в минеральное, растительное и животное масла элементарную серу в количестве от 0.5 до 1.5–2.0%. Получаемые таким образом масла весьма активны, но сильно корродируют аппаратуру. Химически связанная сера менее активна, но зато не корродирует в широких температурных пределах (до 100° и выше). Для получения такого рода масел можно пользоваться нефтями, богатыми серой (до 2%). Наибольшей эффективности достигают, добавляя к осерненным маслам свинцовое мыло. Присадка серы, иногда вместе со свинцовым мылом, получила весьма широкое распространение на практике. Осерненное Масло – нефтяное масло, содержащее свободную серу. Присадка к моторным и трансмиссионным маслам для ускорения приработки трущихся деталей и снижения коррозионных свойств масел компонент некоторых смазочно-охлаждающих жидкостей, например, сульфофрезола.

SULPHUR RECOVERY = ВОССТАНОВЛЕНИЕ СЕРЫ – Sour gas is processed at recovery plants to extract sulphur for sale to fertilizer manufacturers and other industries in Canada and overseas. The average rate of sulphur recovery at Alberta's sulphur recovery plants has improved from 97.5 per cent in 1980 to 98.8 per cent in 2000. / Астраханский газ содержит в себе почти всю таблицу Менделеева. Выделяется в этом ряду своими объёмами сероводород, среднее содержание которого составляет 25% объёма, а также большое количество серокиси углерода (около 1 000 мг/м^3). Присутствие же меркаптоновой серы в газе по оценкам специалистов составляет 2 000 мг/м^3. Все эти отличительные свойства дают одно очень важное преимущество:- появляется возможность восстановления газовой серы из сероводородной фракции. В 1994 была создана Производственно-Коммерческая Фирма 'Каспийгаз', как Общество с Ограниченной Ответственностью, с целью переработки комовой газовой серы, получаемой путём восстановления из газоконденсата, в молотую и мелкодисперстную серу. Молотая и мелкодисперстная сера в виде смачивающего порошка, производимая ПКФ 'Каспийгаз', получила довольно широкое распространение. Астраханская газовая молотая сера нашла своё применение в крупных центрах шинной, резинотехнической и асбестотехнической промышленностей; мелкодисперстная сера – в сельском хозяйстве. На сегодняшний день, производственные мощности ПКФ 'Каспийгаз' достигли достаточно крупных для России размеров – до 1 000 тонн высококачественной серы в месяц.

SUM INSURED = СТРАХОВАЯ СУММА – Sum Insured:- the maximum amount that an insurer will pay under a contract of insurance. The expression is usually used in the context of property and life insurance where (subject to the premium cost) the insured determines the amount of cover to be purchased. / Максимальная сумма, которую выплатит страховщик по контракту страхования. Данное выражение обычно используется в контексте со страхованием имущества и жизни, когда страхователь, в зависимости от размера страховой премии, определяет сумму покрытия, которая должна будет приобретена в соответствии с контрактом.

SUMMARY BILL ENFORCEMENT PROCEDURE = УПРОЩЁННАЯ ПРОЦЕДУРА ПРИНУДИТЕЛЬНОЙ РЕАЛИЗАЦИИ ВЕКСЕЛЯ – Summary Bill Enforcement Procedure:- especially rapid summary bankruptcy proceedings brought against bill and check debtors whose names are entered in the commercial register.

SUMMARY INVESTIGATION = УПРОЩЁННОЕ РАССЛЕДОВАНИЕ – Summary Investigation is a 20-day investigation conducted by the US International Trade Administration immediately following filing of an antidumping petition to ascertain if the petition contains sufficient information with respect to sales at 'less than fair value' and the injury or threat of material injury to a domestic industry caused by the alleged sales at 'less than fair value' to warrant the initiation of an antidumping investigation.

SUMMARY TRANSFER = СУММАРНЫЙ ПЕРЕВОД – Summary Transfer is a simultaneous transfer of amounts by a single account holder to several beneficiaries. For this purpose, a summary list is prepared for each beneficiary. This type of transfer is used primarily in the giro network of the Deutsche Bundesbank. Summary transfers are used if an account holder submits more than five transfer orders on the bank's own forms or if a bank wants to forward its own credit advices through the central bank. / Дойчэ Бундэсбанк (Deutsche Bundesbank).

SUMMATION INDEX = ИТОГОВЫЙ ИНДЕКС (или ИНДЕКС ПО СУММАЦИИ) – Summation Index:- a cumulative sum of all daily McClellan Oscillator readings that provides longer range analysis of market breadth. / Совокупная сумма всех посуточных показателей Осциллятора Мэклэлэна (McClellan Oscillator), которая обеспечивает более глубокий анализ разброса цен на рынке. Под Суммацией, от позднелатинского слова Summatio, означающее Сложение, понимается.

SUMMER FALLOW = ЛЕТНИЙ ПАР (или РАННИЙ ПАР) – Summer Fallow is a special case of fallowing in which all vegetative growth is prevented by shallow cultivation during the summer months in order to conserve moisture. / В сельском хозяйстве под Паром понимается поле севооборота, не занимаемое посевами в течение всего вегетационного периода или части его и содержащееся в рыхлом и чистом от сорняков состоянии; средство повышения плодородия почвы и накопления в ней влаги. Чистый пар и занятой – посевы растений, убираемых в первую половину лета.

SUMMER–WEIGHT SUITING = ТКАНЬ ДЛЯ ЛЕТНИХ КОСТЮМОВ (или ЛЕТНЯЯ УТЯЖЕЛЁННАЯ КОСТЮМНАЯ ТКАНЬ) – Summer-Weight Suiting is another name for tropical suiting. A general term for many fabrics that have the characteristics of suiting fabrlcs: they are crisp, take sharp creases well, and are lightweight for wear in hot weather. A typical summer-weight suiting is linen.

SUMMERWOOD = ЛЕТНЯЯ ДРЕВЕСИНА – Summerwood:- the portion of the annual growth that is formed after the springwood (early wood) formation has ceased. It is usually more dense and stronger mechanically than springwood (early wood). / , чем весенняя древесина (ранняя древесина).

SUMMIT CONFERENCE = КОНФЕРЕНЦИЯ В ВЕРХАХ – A Summit Conference is an international meeting at which heads of government are the chief negotiators, major world powers are represented, and the meeting serves substantive rather than ceremonial

purposes. The term first came into use in reference to the Geneva Big Four Conference of 1955. / Конференция В Верхах – это международная встреча, на которой главы правительства являются главными переговорщиками, на которой представлены ведущие мировые державы, и которая преследует более значимые цели, нежели просто церемониальные мероприятия. Впервые этот термин был использован в отношении Женевской Конференции Большой Четвёрки в 1955.

SUM OF AMOUNTS = ИТОГО СУММ (или ВСЕГО) – Sum Of Amounts:- it is a field name in a SWIFT message:- the sum of all amounts appearing in designated fields within the message. / Это название поля в сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)):- . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SUM OF SQUARES = СУММА КВАДРАТОВ – Sum Of Squares is the sum or addition of the squares of the differences between the mean of a set of observations and individual observations.

SUNBURST (OR TAN) PLEATS = ВЕЕРНЫЕ СКЛАДКИ (или ЗАГОРЕЛЫЕ (ИЛИ ОТ ЗАГАРА) СКЛАДКИ) – Sunburst (or Tan) Pleats are the narrow pleats that begin at a central point and fan out to the edge ot a fabric. They are often narrow at the top of the fabric and wider at the edge and are especially popular for skirts.

SUNDRIES ACCOUNT = СЧЁТ ПРОЧИЕ СТАТЬИ – Sundries Account is an account for individual entries expected to be only temporary. Usually used for offsetting transactions by persons not maintaining an account with the bank.

SUNK COST = БЕЗВОЗВРАТНЫЕ ИЗДЕРЖКИ (или НЕВОЗВРАТНЫЕ ИЗДЕРЖКИ, или ПОНЕСЁННЫЙ РАСХОД) – Sunk Cost:- when an investment is made in an asset, there may be an unrecoverable expense associated with it. This is usually referred to as a Sunk Cost. It is sometimes used to refer to an expense incurred that is unlikely to produce any future payback. Sunk Costs are the costs that have already been incurred and cannot be recovered. For example, once a facility has been built, it is a sunk cost.

SUN PROTECTION FACTOR = ФАКТОР ЗАЩИТЫ ОТ СОЛНЦА – Sun Protection Factor (SPF) measures the effectiveness of sunscreen on the body. the test for SPF is done by using a living organism or body to measure the length of time it takes for the skin to redden without coverage or protection.

SUNRISE CLAUSE = ОГОВОРКА О ПРЕДШЕСТВУЮЩЕМ ПЕРИОДЕ – Sunrise Clause is a clause that provides retroactive cover in respect of losses occurring before the inception of a (re)insurance contract.

SUNSCALD = СОЛНЕЧНЫЙ ОЖОГ – Sunscald, or leaf dessication, may occur in late summer or early autumn, usually when a few days of cool cloudy weather is followed by a rapid rise in temperature and light intensity. Entire fields can be affected. Symptoms can resemble damage by chemical defoliants. Complete defoliation can occur 10 to 14 days after the initial symptoms develop. The symptoms of Sunscald have been compared to those resulting from an early application of defoliant. Upper leaves become dessicated, bleached and twisted before eventually dropping off the plant. Sunscald develops when a period of wet overcast weather is followed by a quick return to fine hot weather late in the season when bolls are filling. Well grown dryland (rain-grown) crops are most susceptible although symptoms have also been seen in small areas of some irrigated crops. / Солнечный Ожог или дессикация листа может возникнуть в конце лета или ранней осенью, обычно когда после нескольких дней холодной облачной погоды последовало стремительных повышений температуры и интенсивности света.

SUNSET CLAUSE = ОГОВОРКА О ПОСЛЕДУЮЩЕМ ПЕРИОДЕ – Sunset Clause is a clause which restricts cover to claims notified during the period from the inception of a (re)insurance contract to a specified date after the expiry of that contract.

SUPERABSORBENT = СУПЕРАБСОРБЕНТ (или СВЕРХАБСОРБЕНТ) – Superabsorbent is a material that can absorb many times the amount of liquid ordinarily absorbed by cellulosic materials such as wood pulp, cotton, and rayon.

SUPERANNUATION = ПЕНСИЯ ПО СТАРОСТИ – Superannuation may be described as a long term savings plan for people to accumulate wealth during their working life to provide them with an income when they retire. Superannuation (or super for short) is money set aside during your working life, to provide you with money to live on during your retirement. You generally begin accumulating super when you start work as your employer will start making contributions to a fund on your behalf. A superannuation fund is just a structure in which investments are held. All super funds are a type of trust with special rules to ensure that they primarily provide retirement benefits (either pensions or lump sums). The reasons for keeping investments in a superannuation fund are because it provides:- (i) a tax-advantaged environment; and (ii) an effective estate planning vehicle. The main disadvantages are:- (i) it is generally not possible to access your money until you retire from work, or after 55 years of age with a transitional pension; and (ii) there are special rules about how the fund must be run. This means that superannuation may not always be the best way to hold your investments. Other structures such as companies and discretionary trusts also have rules which are different to holding investments in your own name. You should read the investment structures page carefully before deciding that superannuation is the most appropriate investment structure for you. Case Study:- John and Wendy are both 45. They own their own house and have two children. They recently paid off their mortgage and would like to use this money to set up a savings plan. John's friend Jack has suggested that they should put the money into superannuation because of the tax advantages. John is not sure this is the best thing to do. John is right – they have a number of options and the most appropriate answer really depends on their goals and cash flow needs. For example, if their children are still at school they may need to keep some money outside the super system so they can easily access it (e.g., a family trust may be suitable), whereas if their children are no longer financial dependants they might consider not only superannuation, but also gearing into property or shares. Overall, they need to remember that any money placed into superannuation is not accessible until they are at least 60. So, whilst super may be appropriate, there are more issues to consider than just the tax advantages. / Дьжон (John) и Вэнди (Wendy).

SUPERCARGO = СУПЕРКАРГО – Supercargo is the cargo owner's agent or representative who travels on the ship with the cargo to supervise the loading, stowing, and discharging of the cargo and to handle any purchases or sale of cargo. Before the advent of rapid communications, supercargos were seagoing merchants engaged in trade as the vessel made its voyage. Today, they can still be found on chartered vessels. Person employed by a ship owner, shipping company, charterer of a ship or shipper of goods to supervise cargo handling operations. Also known as Port Captain. Experienced officer assigned by the charterer of a vessel to safeguard the effective utilisation of a vessel and protect the interests of the charterer. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Известный также как Капитан Порта (Port Captain).

SUPERCLEAN = СУПЕРЧИСТОЕ (или СВЕРХЧИСТОЕ) – Superclean:- 10 particles >10 micron per milliliter. See also Ultraclean.

SUPER DESIGNATED ORDER TURNAROUND SYSTEM = СИСТЕМА УСКОРЕННОЙ ОБРАБОТКИ РАСПОРЯЖЕНИЙ – Super Designated Order Turnaround System is the electronic order-routing system through which the New York Stock Exchange member firms transmit market and limit orders directly to the trading post where the security is traded or to the member firm's booth. After the order has been completed in the auction market, a report of execution is returned directly to the member firm office over the same

electronic circuit that brought the order to the trading floor. Transmits member firms' market and day limit orders, up to specified sizes in virtually all listed stocks, through the common message switch to the proper trading floor workstation. Specialists receiving orders through SuperDot execute them in the trading crowd at their posts, as quickly as market interest and activity permit, and return reports to the originating firm's offices via the same electronic circuit that brought them to the floor. SuperDot can handle daily volume exceeding 2 billion shares.

SUPERDOT = SUPER DESIGNATED ORDER TURNAROUND SYSTEM

SUPER ELITE = СУПЕР ЭЛИТА – Super Elite:- seeds, belonging to the original, produced from crop breeding kennel, meeting the requirements of national standards and other normative documents in the field of seed and intended for the production of elite seeds. See also Elite, and Seed Classification. / Под Суперэлитой, от Латинского слова Super, означающее Над или Сверху, и Французского слова Élite, означающее Лучшее или Отборное, понимаются семена лучших отборных растений, наиболее полно передающих все признаки и свойства данного сорта. Для выращивания семян суперэлиты закладывают питомники первичного семеноводства. К семенам суперэлиты предъявляются более высокие требования, чем к семенам элиты. Хранят семена суперэлиты в двойной таре с двумя этикетками:- одна – внутри тары, другая – снаружи. В сортовых документах на семена суперэлиты указывают результаты полевой апробации и контрольно-семенного анализа.

SUPERFICIAL DISCOLORATION = ПОВЕРХНОСТНОЕ ИЗМЕНЕНИЕ ЦВЕТА – In grain industry, the Superficial Discoloration is a reddish discoloration not penetrating the endosperm. This factor will be evaluated subjectively in relation to the degree of soundness without reference to specific tolerances. / В зерновой индустрии к поверхностному изменению цвета относится появление красноватой окрашенности, не затрагивающей эндосперм (endosperm). Этот показатель оценивается субъективно в отношении степени доброкачественности без ссылки на специфические отклонения.

SUPERFINE WOOL = СВЕРХТОНКАЯ ШЕРСТЬ – Superfine Wool:- from about 15 to 18 microns – is in a class by itself, comparable to fine cashmere, and is used to make fabrics of the highest quality. Superfine wool comes from strains of Merino sheep that have been developed to produce especially fine fibers.

SUPERIMPOSED TRIALS = СВЕРХНАВЯЗАННЫЕ ОПЫТЫ – Superimposed Trials are experiments composed of a small set of treatments that evaluate the performance of alternative component technology for a cropping pattern. The treatments are added, generally without replication, on four or more similar cropping pattern trial fields. / которые высчитывают .

SUPERIOR = ПРЕВОСХОДЯЩЕЕ – Superior:- above other parts, higher in rank or position.

SUPERIOR OVARY = ВЕРХНЯЯ ЗАВЯЗЬ – Superior Ovary is an ovary positioned above a receptacle of a flower, as in members of the mint family. A superior ovary occupies the center of the flower and is not attached to any other floral organs. The parts of the flower are in fives in calyx, corolla and stamens, followed by two carpels which unite to form a Superior Ovary.

SUPER LIGHT WEIGHT = СВЕРХ ЛЁГКИЙ ВЕС – Super Light Weight is a term used to describe a fabric used in outerwear, which allows for a minimum pack volume and weight. These lightweight, packable garments offer the most versatile weather protection. Some of these fabrics have a protection layer on the membrane, which provides durability. This means that the garments made from the extra lightweight fabrics need no separate lining.

SUPERMILLING = XX – Supermilling is a class of acid dye. Supermilling acid dyes offer moderate brightness and good to very good washfastness, but have poor to fair leveling tendency. Their leveling characteristics mean that extra care is required in the process to produce level results. There is no clear distinction between milling and supermilling acid dyes. These dyes are used for wool and work well on polyamide (nylon). / класс кислотного красителя. . Найлан^{T3} (Nylon^{TM}).

SUPERNATANT = СУПЕРНАТАНТ (или НАДОСАДОЧНАЯ ЖИДКОСТЬ) – Supernatant is a liquid left above a pellet after centrifuging. The Supernatant is the solution above the solid that has been forced to the bottom of the centrifuge tube. To remove the supernatant, carefully pour or pipette the solution away from the solid. If the solid becomes re-suspended as the supernatant is removed, centrifuge the sample again. / Супернатант – жидкость, располагающаяся над твёрдым слоем (осадком, седиментом) после центрифугирования или седиментации.

SUPERNUMERARY CARPELS = ИЗБЫТОЧНЫЕ (или СВЕРХЧИСЛЕННЫЕ) КАРПЕЛИ (или ПЛОДОЛИСТИКИ) – Supernumerary Carpels:- James Stewart from the University of Arkansas described Supernumerary Carpels as the result of a genetic stutter. A boll starts undergoing normal development of carpels, but instead of development stopping when it should, a second round of carpel development starts so that a 'mini-boll' with one or two carpels forms on the inside of the first one. It can best be seen in a cross section of the boll. They appear as a light-green, elongated growth in the center of a normal boll. / Дьжеймз Стюат (James Stewart). в результате генетической заминки (stutter). Под Плодолистиками понимаются спороносные листы (один или несколько) в цветке. Они несут семязачатки и при срастании краями или с другими плодолистиками образуют завязь пестика. Плодолистик (Carpellum), орган в цветке покрытосеменных растений, на котором развиваются Семезачатки (Семяпочки). Из 1 или нескольких плодолистиков образуется Пестик; совокупность плодолистиков называется Гинецеем. Плодолистики считают органом листового происхождения, гомологичным, однако, не листу, а Мегаспорофиллу. Под Плодолистиками понимаются спороносные листы (один или несколько) в цветке. Они несут семязачатки и при срастании краями или с другими плодолистиками образуют завязь пестика. Под Плодолистиками или Карпеллами понимаются сильно видоизменённые и специализированные мегаспорофиллы. Нередко плодолистик называют Пестиком (Простым Пестиком), однако этот термин применяется в разных смыслах и вносит путаницу. Наиболее примитивный тип плодолистика сохранился у родов Дегенерия (семейство Дегенериевые) и рода Тасмания из семейства Винтеровых. Он состоит из короткой ножки (гиноподия) и относительно тонкой адаксиально сложенной (кондупликатной) пластинки и внешне очень напоминает сложенные в почки кондупликатные листья. Вдоль плодолистика проходят 3 проводящих пучка (жилки), из которых средняя, или спинная (дорсальная), сильно ветвится. Между средней и боковыми жилками расположены многочисленные семязачатки, или семяпочки. На ранних стадиях развития края плодолистиков Дегенерии почти не соприкасаются между собой, а защита семязачатков во время цветения обеспечивается благодаря тесному сближению широких боковых участков плодолистика, расположенных между его краями и плацентами. Срастание этих сближенных внутренних поверхностей происходит лишь после цветения, то есть в процессе развития плода. У других представителей Винтеровых наблюдаются самые различные стадии срастания. У всех цветковых растений на плодолистике имеется особая, служащая для улавливания пыльцы железистая ткань, называемая Рыльцем. У Дегенерии и Тасмании рыльце примитивное и протягивается по всей длине плодолистика. Верхняя часть плодолистика, в которой оно локализуется, обычно вытягивается в тонкий стерильный столбиковидный вырост, приподнимающий рыльце над фертильной частью (завязью) плодолистика и служащий для прохождения пыльцевой трубки. Эта специализированная тонкая часть плодолистика называется Столбиком (нередко её называют Стилодием, оставляя термин столбик только для сросшихся стилодиев). На ранних стадиях эволюции столбика

(стилодия) он характеризуется низбегающим рыльцем, но в процессе дальнейшей эволюции рыльце постепенно локализуется на верхушке (головчатое рыльце). Совокупность плодолистиков в цветке называется Гинецеем. Наиболее примитивные типы гинецея со свободными плодолистиками (например, у Лютика, Магнолии, Пиона) называются апокарпными. В процессе эволюции плодолистики постепенно срастаются между собой, и из апокарпного гинецея возникает ценокарпный, в котором стилодии могут оставаться свободными или же срастаться, образуя столбик. Эволюция ценокарпного гинецея, как и эволюция апокарпного, обычно сопровождается уменьшением числа плодолистиков и в большинстве случаев также числа семязачатков. Крайняя форма редукции числа семязачатков в ценокарпном гинецее – так называемый псевдомономерный гинецей, у которого фертилен и полностью развит один плодолистик (у Ильма, Конопли, Крапивы, Шелковицы и других).

SUPERSEDING CERTIFICATES = ЗАМЕЩАЮЩИЕ СВИДЕТЕЛЬСТВА (или ЗАМЕЩАЮЩИЕ СЕРТИФИКАТЫ) – Superseding Certificates:- the term 'Supersede' refers to the situation when a new certificate is issued to substitute for a previously issued certificate that cannot be recovered. Generally, when an export certificate needs to be superseded, it is because the foreign National Plant Protection Organization (NPPO) has the original export certificate which contains errors. The superseding certificate may be the result of the Authorized Certification Official (ACO) error or at the request of an exporter for various reasons. The original certificate cannot be recovered and the shipment is not available for inspection. This is not the same situation as a lost certificate which is dealt with as a replaced certificate.

SUPERTANKER = СУПЕРТАНКЕР – Supertanker:- most international oil shipments move in oceangoing tankers. There are many different sizes of tankers used in the international transportation of oil, with capacities ranging from 50 000 deadweight tons to over 550 000 deadweight tons. A Supertanker is generally defined as a tanker with a capacity of over 250 000 deadweight tons. There are two categories of tankers that fall into this definition:- (i) the Very Large Crude Carrier (with a capacity up to 300 000 deadweight tons); and (ii) the Ultra Large Crude Carrier (with a capacity exceeding 300 000 deadweight tons). They must unload petroleum products at special deep-water petroleum terminals, e.g., such as Louisiana Offshore Oil Port (LOOP). See also Clean Tankers, Dirty Tankers, Ultra Large Crude Carrier, and Very Large Crude Carrier. / , например, .

SUPERVISORY AUTHORITIES = ВЕДОМСТВА ПО НАДЗОРУ (или ОРГАНЫ НАДЗОРА) – Supervisory Authorities:- legally appointed body whose remit is to supervise the activities of financial institutions. / Орган, назначенный в законодательном порядке, компетенцией которого является надзор за деятельностью, например, финансовых учреждений.

SUPERVISORY BOARD = ПАЛАТА ПО НАДЗОРУ (или НАБЛЮДАТЕЛЬНЫЙ СОВЕТ) – Supervisory Board is the supervisory board is typically one of the management bodies of a joint stock corporation. The two other management bodies are the management board and the annual general meeting. A supervisiory board can also be established at a German limited liability company (GmbH), the regulations of the German Stock Corporation Act then apply accordingly. The task of the supervisory board is to monitor the company's management, in other words the management board which it has elected, and to advise it on strategic issues. Furthermore, it has audit duties (in particular with respect to the company's annual and consolidated financial statements) and reporting duties. The legal basis for the work of the supervisory board is formed by the German Stock Corporation Act and the articles of association of the respective joint stock corporation. In addition, practically all supervisory boards have their own terms of reference. Many supervisory boards have committees for specific subjects, the most frequent ones here being the audit committee and the personnel committee. At most companies, the supervisory board consists of representatives of the shareholders and also – a feature peculiar to Germany – of representatives of the employees. The German Corporate Governance Code makes various demands on a supervisory board member's personal profile, especially of his/her specialist abilities and his/her loyalty to the company. / Ге.эм.бе.Ха..

SUPIMA® = СУПИМА® – Founded in 1954, Supima® is the promotional organization of the American Pima Cotton growers. The Board of Directors of this non-profit organization is composed of Pima growers from the states of Arizona, California, New Mexico and Texas. Supima's primary objective is to promote the increased consumption of American Pima Cotton around the world. Supima is a major sponsor of research programs to improve the quality of American Pima. Supima also works closely with Cotton industry organizations and government agencies to ensure a fair and viable marketing environment for American Pima Cotton growers. Over 370-fine count textile mills, manufacturers and brands/retailers from around the world are licensed to use the Supima® brand; licenses are given only to select, high-quality textile mills, apparel and textile manufacturers, and brands/retailers whose products are made of American Pima Cotton. Headquartered in Phoenix, AZ, the United States. Supima Cotton Advantages:- It takes a premium fiber to produce a luxury product. Supima® growers know there are no shortcuts to quality. Often referred to as 'The Cashmere Of Cottons', Supima® surpasses other Cottons in softness, strength, and brilliance of color. A Longer Staple Length:- The staple length of Supima® is 35% longer than regular Cottons. This increases softness and luster. Fewer fiber ends are exposed, minimizing the effects of abrasion resulting in less pilling. A Stronger Fiber:- Supima® is up to 45% stronger than regular Cottons. This makes Supima® products extraordinarily resilient. Even lighter-weight Supima® fabrics are incredibly durable, without compromising drape and comfort. A Vibrant Fiber:- Supima® absorbs and retains color better than regular Cottons. This means that Supima® products retain their brilliance over many years of use. Xxxxx. The name 'Supima®' is a licensed trademark owned by Supima® and its members. It is used to promote textile and apparel products made of American Pima Cotton, and is strictly controlled by the grower organization. The name 'Supima®' is a portmanteau of Superior Pima. Pima Cotton is a generic name for extra long staple (ELS) Cotton grown in the US, Australia, Peru and in very limited production in a few other locations around the world. Pima is from the Gossypium Barbadense Species, compared to Gossypium Hirsutum, to which Upland Cotton belongs. The primary differences between Pima (ELS growths) Cotton and Upland Cotton are staple length, strength of the fiber and fineness of the fiber. In the United States (US), Cotton is considered to be ELS or American Pima if it is an inch and 3/8 or longer. Its strength and uniformity measurements are considerably higher than those of Upland Cotton. The name 'Pima' is the generic term generally applied to ELS Cotton grown in the US, Peru, Israel and Australia. The name was given to the ELS Cotton being grown in the Southwest US in about 1910. It had previously been called American-Egyptian Cotton but was renamed to honor the Pima Indians who were growing the Cotton for the USDA in Sacaton, Arizona, where the government's ELS breeding program was being conducted. Supima® is the trademark name used to promote and market textile and apparel products made with American Pima Cotton. Supima® provides licensing agreements to textile mills, manufacturers and brands/retailers for the expressed purpose of promoting specific apparel and textile products in high-end retail outlets. Industry people often refer to American Pima Cotton as 'Supima® Cotton'. Not necessarily. In the past, some textile products that were labeled or marketed as 'Pima Cotton' goods were not always made of all-Pima Cotton. The Supima® trademark is the consumer's only guarantee that a product is made of 100% American Pima Cotton. The Federal Trade Commission ruled in June of 1997 that manufacturers and retailers would have to itemize Cotton source content on any apparel or textile product when the name of a premium fiber was being used. For example, a product made of 60% American Pima Cotton and 40% upland Cotton could be labeled and marketed as 100% Cotton. But if the retailer or manufacturer wants to mention the Supima® name in the labeling or marketing, they would have to list the content of both the Supima® and the Upland Cotton. The content should be listed based on weight percentage. All Cotton grown in Egypt is 'Egyptian' but it is not all ELS Cotton. Egypt is one of the largest producers of ELS Cotton in the world, but it consumes much of what it produces. The majority of what it exports is long staple Cotton, not ELS Cotton. However, the description 'Egyptian Cotton' conjures in the mind of many

consumers the image of the very finest and longest Cottons in the world. Egypt does produce and sell some of the best ELS Cotton in the world, but it amounts to only about 7% of annual global ELS/LS Cotton exports, and is approximately 25% of Egyptian Cotton exports. Supima® Cotton has become the Cotton of choice among the world's fine-count yarn spinners. Supima® accounts for only about three percent of annual Cotton production in the United States. Its fineness and longer staple length makes Supima® a premium Cotton fiber. It is used to spin finer count yarns, which can be knitted or woven into softer, finer and more luxurious fabrics. It is grown in select areas of the far West and South-West US where the Cotton can benefit from a long growing season in a hot, dry climate. Supima® Cotton is grown exclusively on furrowed rows where growers can closely regulate irrigation and other inputs. Its production costs can vary in different states and regions, but it generally runs a little more expensive as Upland Cotton costs in the same area due to extra management of the crop. Ginning is more expensive because Pima Cotton is roller-ginned, not saw-ginned like Upland Cotton. Supima is grown in Arizona, California, New Mexico and Texas. Products made from 100% American Pima – Supima® Cotton will have superior strength to a product made of Upland Cotton or upland/Pima blended Cottons, which will improve the durability and increase the lifespan of the textile and apparel products. Because of the fineness of Supima® Cotton, more fibers can be spun into a yarn of a given count, which will enhance the feel and softness, drapeability and brilliance of color of a fabric. Pima Cotton traces its ancestry to the famous Sea Island Cottons that were produced in the Southeast United States in the 1700's. That Cotton was then bred with Egyptian Cottons to produce the contemporary ELS Cottons that have evolved in the US since the turn of the XX century. The USDA's Pima Improvement Project has been responsible for the significant advances in Pima development over the last 50 years that have produced Varieties Pima S-5, Pima S-6 and Pima S-7. Each bore substantial improvement over its predecessor in yield potential and fiber characteristics. Commercial Varieties with fiber properties similar to Pima S-7 have since been released and improved upon. More than 90% of annual US Pima consumption is offshore. Most of the consumption today is seen in China and South Asia (Pakistan and India). Although Japan and Indonesia continue to be strong importers of Supima® Cotton, other nations such as Taiwan and Peru have also risen to the top in terms of Supima® Cotton imports. These nation's purchases account for over 80% of all the US Pima Cotton exports. Domestic textile mills are predominantly medium to coarse count yarn producers. However, the US does consume approximately 30 000 bales of US Pima Cotton a year. This figure has fallen from a high of about 120 000 bales of annual consumption several years ago. The decrease in annual domestic consumption speaks to the increasing cost of production in the US. In 1998/99 the US was the largest consumer of Supima® Cotton. However, as more of the brands/retailers in the US outsource their supply, foreign nations have jumped to the top of the list of Supima® consumers. Supima® can be found at finer department and specialty stores nationwide. Retailers carrying Supima® product include Bloomingdale's, Nordstrom, Brooks Brothers, Lord & Taylor, Bed Bath & Beyond and Costco. Supima® product can also be found in direct mail-order catalogs from Lands' End, Linensource and L.L. Bean. Examples of brands carrying Supima® trademarked-products include Ralph Lauren (towels), WestPoint Home (towels and sheets), Springs Wamsutta (sheets), Brooks Brothers (men's dress shirts), James Perse (casual knits) and Michael Stars (women's knits). The Supima® trademark is your guarantee that the product contains Supima®, the world's finest Cotton. No other trademark can guarantee a product's luxury cotton content. Supima® is the trademark of an Extra Long Staple (ELS) Cotton, commonly referred to as American Pima Cotton, produced in California, Arizona, New Mexico and West Texas. The Supima Association of America is a producer association headquartered in Phoenix, AZ. See also Extra Long Staple Cotton, Pima, and Upland Cotton. Extra Long Staple (ELS) Cotton has been grown in the Southwest United States since the early-1900's, but it wasn't until mid-century that much attention was given to the new Cotton. The real breakthrough came in 1951 when a seed was developed and introduced that produced an ELS Cotton with superior fiber properties, luster and silkiness ... as well as an unusually high yield. Subsequent Variety releases in the 1970's, 1980's and 1990's included Pima S-5, Pima S-6 and Pima S-7, all of which boasted higher yields and better spinning characteristics. The name 'Pima' was applied to ELS Cotton (previously called American-Egyptian) being developed in the US desert South-West in the early 1900's. The name was given in honor of the Pima Indians who were helping to raise the ELS Cotton on the USDA experimental farm in Sacaton, State of Arizona. Although South America is the center of origin of the Species Gossypium Barbadense, to which ELS Cottons belong, these Cottons were photoperiodic, and the fiber was medium staple in length and coarse, as typified by the current Tanguis Cottons of Peru. The origin of true extra-long staple Cottons can be traced to the introduction of Sea Island to the US in 1786 from seed received from the Bahama Islands, an area from which Columbus is reputed to have taken Sea Island samples to Europe in 1492. The Gossypium Barbadense Cotton that first appeared in the US in 1786, where it became known as Sea Island, had strikingly different fiber properties from the native Gossypium Barbadense of South America. The exact origin of Sea Island Cotton is unknown, but geneticists suggest that the most logical hypothesis to explain the ELS type was that it developed by transgressive inheritance through the introgression of length genes from outside the Species, possibly from Gossypium Hirsutum. The first successful crop of Sea Island was produced by William Elliott on Hilton Head Island, South Carolina in 1790. Although production of this ELS Cotton later expanded into the interior regions of Georgia and Florida, the best Sea Island Cottons were grown on the Sea Islands; James, Edisto, John and Wadmalaw. The crop continued until 1920, when a severe Boll Weevil infestation had made it unprofitable. Attempts to revive the Sea Island industry in the US in the 1930's failed. The evolution of ELS Cottons began in 1825 when Sea Island Cotton was brought into Egypt and crossed with a tree Cotton named Jumel. The crossing of Jumel and Sea Island resulted in the development of Ashmouni in about 1860. The next several Egyptian Cultivars were derived either by selecting within Ashmouni or from crosses of Ashmouni and Sea Island. The successful utilization of inbreeding between the years 1910 and 1940 led to the gradual development of Egyptian Cottons that could compete with the quality of Sea Island. (It's important to note here that during the development of these later Cottons, no germplasm from outside Egypt was used.) The first ELS Cultivar released by the USDA was 'Yuma' in 1908. It was selected from Mitafifi, an Egyptian Cultivar developed in 1887 from a cross of Ashmouni and Sea Island, and was introduced into the South-Western US in about 1900. The first commercial ELS crop in the US was produced in 1912 – 375 bales. Between 1908 and 1949, four additional Pima Varieties were developed from the Egyptian germplasm base and released:- 'Pima', 'SXP', 'Amsak' and 'Pima 32'. At about the same time 'Yuma' was being developed, the Egyptian Variety Mitafifi was introduced into Peru. The same source traces the arrival of American Pima Cotton seed into Peru to 1923. However, a Peruvian Cotton information sheet distributed by the Junta Nacional Del Algodon (National Cotton Association) says Peruvian Pima originated from the 'Yuma' Cotton developed in Sacaton, Arizona, and was first grown in Peru in 1918. Dr. Carl V. Feaster, a longtime Pima breeder and geneticist, and known around the world as the father of modern-day Pima Cottons, says he doubts the first Peruvian Pimas were actually Yuma, but more than likely were Pima, which was grown in the US from 1918–1941. He said Pima was a selection from 'Yuma' and its fiber characteristics more closely match those of Peruvian Pima's at the time. By 1930, Pima production had reached 28 307 bales in Peru, while the production of Mitafifi was quickly diminishing, soon to be all but extinct. Gossypium Hirsutum – or Upland Cotton – can be classified into four major types:- Acala, Delta, Plains and Eastern. Acala types in the United States are confined to irrigated regions in the South-West and far West. These Varieties produce the longest staple Cotton among the domestic upland styles, and their growing seasons most closely resemble that of American Pima Varieties. Yields in these areas are higher than those generated from Upland Cotton produced in Southern, mid-South and Eastern states because of the longer growing season, greater number of hot days and close control of irrigation. Because of the longer growing season and higher yields, however, these crops are more expensive to produce. Cotton varieties are developed to suit specific growing regions and their respective environmental and cultural conditions, with the objective of maximizing yield potential and improving fiber characteristics. The same applies somewhat

more loosely to the individual Cotton Species, which are limited to Pima (Gossypium Barbadense) and Upland (Gossypium Hirsutum). The only other native Cotton Species – Asiatic (Gossypium Arboreum) – is grown almost exclusively in South-East Asia. Supima® was formed in 1954 in El Paso, Texas. In its early years Supima® was primarily concerned with promotion, government regulations and agricultural research. In an effort to keep pace with the expanding interest worldwide in ELS Cotton, Supima broadened its responsibilities in 1978 when it merged with the Arizona Cotton Planting Seed Distributors, essentially overseeing the production and distribution of all certified American Pima planting seed. However, the division was sold to Delta and Pine Land Company in 1993 when commercial seed companies had entered the business. The sale also marked the end of Supima's 30-year-old partnership with the USDA in its Arizona-based Pima Improvement Program. Supima® had provided funding for the program designed to develop new and improved seed Varieties. Revenues from the seed division also was used to help finance ginning research and improved production practices. Supima® is represented by a board of directors composed of 11 Pima Cotton producers:- seven from California, two from Texas and one each from Arizona and New Mexico. Directors are elected by the general membership to three-year terms and are eligible for re-election. Board officers are elected to two-year terms by the directors as follows; chairman, vice-chairman and secretary-treasurer. The offices of president and executive vice president are full-time staff positions. See also Pima Cotton. / Вилъйэм Элыэт (William Elliott). Карл Ви. Фистё (Carl V. Feaster). Супима® (Supima®). SUPPLEMENTAL GASEOUS FUELS = ДОПОЛНИТЕЛЬНЫЕ ГАЗООБРАЗНЫЕ ВИДЫ ТОПЛИВА – Synthetic natural gas, propane-air, coke oven gas, refinery gas, biomass gas, air injected for Btu stabilization, and manufactured gas commingled and distributed with natural gas. Supplemental Gaseous Fuels:- any gaseous substance that, introduced into or commingled with natural gas, increases the volume available for disposition. Such substances include, but are not limited to, propane-air, refinery gas, coke oven gas, still gas, manufactured gas, biomass gas, or air or inert gases added for Btu stabilization.

SUPPLEMENTAL REGISTER = ДОПОЛНИТЕЛЬНЫЙ РЕГИСТР (или ДОПОЛНИТЕЛЬНЫЙ РЕЕСТР) – Supplemental Register is a secondary trademark register for the United States Patent and Trademark Office (USPTO). It allows for registration of certain marks that are not eligible for registration on the Principal Register, but are capable of distinguishing an applicant's goods or services. Marks registered on the Supplemental Register receive protection from conflicting marks and other protections, but are excluded from receiving the advantages of certain sections of the Trademark Act of 1946. The excluded sections are listed in 15 USC §1094. If the applicant seeks registration on the Supplemental Register, the application should state that registration is requested on the Supplemental Register. If no register is specified, the Office will presume that the applicant seeks registration on the Principal Register. To register a mark on the Supplemental Register, applicants must either be using the mark or filing under Trademark Act Section 44 based on a foreign registration.

SUPPLEMENTARY CREDIT = ДОПОЛНИТЕЛЬНЫЙ КРЕДИТ – Supplementary Credit:- emergency decree by the national government to increase the amount of credits authorized under budget law.

SUPPLEMENTARY DETAILS = ДОПОЛНИТЕЛЬНЫЕ СВЕДЕНИЯ – Supplementary Details:- in a SWIFT message an information for the account owner which may be added to individual statement entries. / В сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) информация для хозяина счёта, которая может быть дополнена к индивидуальным проводкам в отчётности. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SUPPLEMENTARY POLLINATION = ДООПЫЛЕНИЕ (или ДОПОЛНИТЕЛЬНОЕ ОПЫЛЕНИЕ) – Supplementary Pollination is the increase in pollination of the CMS (short for the cytoplasmic-genetic male sterile) spikelets done artificially by shaking the male parent at anthesis time particularly when wind velocity is less than optimum (2–3 m/s).

SUPPLEMENTARY WARP = ДОПОЛНИТЕЛЬНАЯ ОСНОВА – Supplementary Warp has become a part of fabric construction. Possible Cause:- one of the supplementary warps has become a part of the fabric foiling the appearance of the design. The reason could be insertion of a broken supplementary warp in an incorrect heddle eye. This is a minor defect as it does not heavily influence the motif. If it is very frequent it can be major. Weaving defect.

SUPPLIER CREDIT = КРЕДИТ ОТ ПОСТАВЩИКА – Supplier Credit:- period of time granted by a supplier of goods or services to a business customer, during which payment may be delayed. Form of credit often extended by businesses to other businesses. Terms of payment vary depending on the type of business, and usually correspond to the amount of time it takes the customer to sell the goods or recover their cost. Export credit extended overseas directly by UK firms other than to related concerns. / вывозной (или экспортный) кредит (export credit).

SUPPLY = ПРЕДЛОЖЕНИЕ – Supply is the willingness and ability of potential sellers to offer various specific amounts of a good or service for sale at each of a variety of alternative prices during a particular time period. Supply is the amount of a commodity available for meeting a demand or for purchase at a given price. Amount of a good that sellers are willing to sell at a specified price in a given market at a given time. By extension, all goods and services available to meet demand. / Количество товаров, которые продавцы желают продать по определённой цене на данном рынке в данное время. В более широком смысле, все товары и услуги, способные удовлетворить спрос.

SUPPLY ACCESS = ДОСТУП К ПРЕДЛОЖЕНИЮ – Supply Access:- assurances that importing countries will, in the future, have fair and equitable access at reasonable prices to supplies of raw materials and other essential imports. Such assurances should include explicit constraints against the use of the export embargo as an instrument of foreign policy. / Заверения в том, что привозящий (или импортирующие) страны будут иметь в будущем .

SUPPLY CHAIN = ЦЕПЬ ПОСТАВКИ – Supply Chain:- the movement of materials and information through the logistics process from acquisition of raw materials to delivery to end-user. The supply chain includes all vendors, service providers and customers.

SUPPLY CHAIN MANAGEMENT = УПРАВЛЕНИЕ ЦЕПОЧКОЙ ПОСТАВКИ – Supply Chain Management is the management and control of all materials and information in the logistics process from acquisition of raw materials to delivery to end-user.

SUPPLY CURVE = КРИВАЯ ПОСТАВКИ – Supply Curve is a graphical representation of a supply schedule. Conventionally, the supply curve is drawn between axes with price plotted along the vertical axis and number of units of the good or service supplied plotted along the horizontal axis. Where the law of supply applies to the particular market under consideration, the supply curve will slope (either gently or steeply) upwards from left to right.

SUPPLY PUSH = ТОЛЧОК К ПОСТАВКЕ – Supply Push:- when trade is motivated by what would otherwise have been surpluses at the point of origin, often signaled by weakness in local refining margins resulting from surplus refining capacity and/or by weak relative prices.

SUPPLY SCHEDULE = РАСПИСАНИЕ ПОСТАВКИ (или ГРАФИК ПОСТАВКИ) – Supply Schedule is a table or listing showing the exact quantities of a single type of good (or service) that potential sellers would offer to sell at each of a number of varying prices during some particular time period. Supply schedules may be drawn up to reflect the behavioral propensities of a single unique individual, household, or firm – or, more frequently encountered in microeconomic analysis, composite supply schedules for the particular good may be derived by adding up all the supply schedules of the large number of individuals, households or firms that are active or potentially active as sellers in the market under consideration.

SUPPLY–SIDE ECONOMICS = ЭКОНОМИКА ПРЕДЛОЖЕНИЯ – Supply-Side Economics:- the school of economics that developed in the United States in late 1970s and early 1980s, emphasizing supply instead of demand in economic analysis, and particularly the disincentive effects of high taxes upon productivity, investment, and growth. The belief that an adequate supply of goods is important in fighting inflation and that a higher rate of business investment is needed to produce those goods efficiently. A cut in the marginal rates of income taxes is advocated in order to encourage people to work harder as well as to save and invest more. Supply Side Economics is a school of thought within the economics profession emphasizing that the main source of a country's economic growth is constant improvement in the efficiency with which resources are allocated for production. While the policy recommendations of the rival Keynesian school tend to focus almost entirely on what government can do to stimulate or restrain aggregate demand in the short-run so as to even out the business cycle, supply-side policy analysts focus on barriers to higher productivity – identifying ways in which the government can promote faster economic growth over the long haul by removing impediments to the supply of, and efficient use of, the factors of production. Supply-siders believe that unwise provisions of the tax laws (and especially high marginal rates of personal and corporate income taxation) produce very damaging incentives that lead people to work less and to invest less (and to do both less efficiently) than they otherwise would. Supply-side policy recommendations typically include deregulation of heavily regulated industries, promotion of greater competition through lowering protectionist barriers to international trade, and measures to repeal special subsidies and tax loopholes targeting particular industries in favor of lower and more uniform tax rates across the board. Supply-side economics became particularly well-known to the general public during the 1980s because of its advocacy by one influential faction of economic policy-makers in the Reagan administration, leading to the use of the term 'Reaganomics' to denote many of the ideas of the supply-siders. Supply-siders played a much smaller role in economic policy-making under the Bush administration, as the focus of attention shifted toward controlling the size of the budget deficit and away from the earlier 'Reaganomics' preoccupation with accelerating the country's rate of economic growth. / Президент США Ранэлд Вилсэн Рэйген (Ronald Wilson Reagan; 1911–2004). Кэйнзиэнская школа (Keynesian school). Рэйгеномикс (Reaganomics). администрация Боша (Bush). Экономика Предложения:- экономическая теория, утверждающая, что резкое сокращение ставок налогообложения будет стимулировать эффективные инвестиции со стороны корпораций и обеспеченных частных лиц на благо всего общества. Впервые предложена в 1970-х Американским Профессором Арсуром Бэтц Лафёром (Arthur Betz Laffer) кривая Лафёра (Laffer curve) и другими. Согласно этой теории, ставки налога на прирост высоких доходов, или предельные ставки налогообложения (marginal tax rates), стали такими высокими (в результате раздувания государственного аппарата), что это привело к сокращению новых расходов на производственные помещения, оборудование и иные 'двигатели' экономического роста. Следовательно, сокращение размеров государственного аппарата и возвращение поглощённой им части полученных доходов должно стимулировать экономический рост. Сторонники экономики предложения утверждают, что их теория подтвердилась в первые годы правительства Президента Ранэлда Вилсэна Рэйгена (Ronald Wilson Reagan; 1911–2004), когда предельные ставки налогообложения были снижены, что послужило началом периода продолжительного экономического возрождения. Сторонники оппозиционной школы – последователи экономической теории Кейнза (Keynesian economics) утверждают, что экономическое возрождение было классическим примером 'экономики совокупного спроса', согласно которой рост стимулировался не увеличением предложения товаров, а увеличением потребительского спроса по мере увеличения располагаемого дохода. Противниками теории экономики предложения являются также монетаристы (monetarist). Они утверждают, что наиболее эффективным способом регулирования совокупного спроса является осуществляемый Федеральным Резервом контроль за ростом денежной массы. Смотрите также Aggregate Supply.

SUPPLY VESSEL = СУДНО СНАБЖЕНИЯ – Vessel which carries stock and stores to offshore drilling rigs, platforms. Supply Vessel is a vessel that carries supplies from shore to platforms (drilling rigs).

SUPPORT = ПОДДЕРЖКА – In technical analysis, a Support is the price level where new buyers are expected to emerge. Support:- price levels where buyers have shown a better-than-average willingness to buy. Support and Resistance:- the foundation of all classical technical analysis is support and resistance:- the behavior of buyers and sellers at key price levels. Trend theory is based on the performance of price at key support and resistance levels. Chart patterns similarly identify the behavior of buyers in relation to support and resistance. A support level is the price at which buyers are expected to enter the market in sufficient numbers to take controlfrom sellers. The market has a memory. When price falls to a new Low and then rallies, buyers who missed out on the first trough will be inclined to buy if price returns to that level. Afraid of missing out for a second time, they may enter the market in sufficient numbers to take controlfrom sellers. The result is a rally, reinforcing perceptions that price is unlikely to fall further and creating a support level. A price level at which there is sufficient demand for a stock to cause a halt in an downward trend and turn the trend up. Support levels indicate the price at which most investors feel that prices will move higher. The bottoms representing the price level where selling decreases and buying increases. Downward price movements are expected to slow down when coming close to support levels. A strong support can turn the market tide either into upside correction or upward trend reversal. In technical analysis, a price area where new buying is likely to come in and stem any decline. Support represents an area of price that is thought to support the price of the underlying asset. The price of the asset should not fall under this support area. This support may be determined by previous prices rebounding in this area or the use of support lines or by the use of mathematical formulas used on past prices. Support is where buyers will take control of prices and prevent them from falling further. A price point at which prices find an invisible base. The opposite of Resistance. Support:- an area of price decline failure where buyers have previously turned a selloff back higher. This level will continue to encourage buying until it can be penetrated, upon which the broken support will become resistance. A price at which buyers are likely to start buying in a downtrend. / В техническом анализе биржевых рынков под Поддержкой подразумевается некая горизонтальная линия в графике колебания цен, проводимая на уровне предыдущих важных минимумов и формирующая нижнюю границу торгового диапазона. В установившемся торговом диапазоне рынок обычно встречает поддержку на уровне предыдущих важных минимумов, то есть на его нижней границе. Цена, при которой существует наибольшая вероятность того, что покупатели начнут покупать товар при общей понижательной тенденции.

SUPPORTED VINYL = ПОДДЕРЖАННЫЙ ВИНИЛ – Supported Vinyl is a vinyl backed with fabric. Supported vinyl wears better than unsupported vinyl when used in upholstery. See also Vinyl.

SUPPORTING ORGANIZATIONS = ОРГАНИЗАЦИИ ПОДДЕРЖКИ – The Supporting Organizations (SOs) are the three specialized advisory bodies that will advise the Internet Corporation for Assigned Names and Numbers (ICANN) Board of Directors on issues relating to domain names (GNSO and CCNSO) and, IP addresses (ASO). / Организации Поддержки (ОП) – это три специальных консультативных органа, формирующих рекомендации для Правления Корпорации Интернета по Распределению Имён и Номеров (КИРИН) по вопросам, касающимся доменных имён (ОПРИ и ОПНИ) и ИП-адресов (ОПА).

SUPPORT LEVEL = УРОВЕНЬ ПОДДЕРЖКИ – A Support Level is the price at which buyers are expected to enter the market in sufficient numbers to take control from sellers. The market has a memory. When price falls to a new Low and then rallies, buyers who missed out on the first trough will be inclined to buy if price returns to that level. Afraid of missing out for a second time, they may enter the market in sufficient numbers to take control from sellers. The result is a rally, reinforcing perceptions that price is unlikely to fall further and creating a support level. Support levels, once penetrated, frequently become resistance levels and vice versa. The market logic is fairly simple:- buyers who purchase near a support level, only to see price fall, are likely to sell in order to recover their losses, when price rallies to near their break-even point. The support level then becomes a resistance level. Support Level – a price level that is below the market and has been tested at least once and held. The Support Level is stronger every time that price respects the support line and/or if high volumes are traded at the support level. Once penetrated, the support level may act as a resistance level. Traders who bought at the support level will be inclined to sell when price rallies back to that level, to recover their losses. / В техническом анализе биржевых рынков под Уровнем Поддержки понимается диапазон цен, отгораживаемый двумя параллельными линиями и определяемый по концентрации предыдущих относительных минимумов и максимумов в пределах общей границы поддержки. Уровень Поддержки – уровень цен, при достижении которого прекращается падение котировок ценных бумаг, поскольку возникающий спрос превышает предложение. Технические аналитики определяют уровень поддержки как минимальный уровень цен в прошлом. Когда цена акции падает по направлению к уровню поддержки, аналитики утверждают, что акции ‘тестируют свой уровень поддержки’, имея в виду, что цена акции должна подняться, как только она достигнет цены уровня поддержки. Если акции продолжают падать ниже уровня поддержки, то в перспективе такие акции считаются сильно склонными к понижению. Противоположностью уровню поддержки является Уровень Сопротивления (Resistance Level).

SUPPORT LINES = ЛИНИИ ПОДДЕРЖКИ – Support Lines:- the lines of support are shown on a chart by drawing a line connecting the previous lows. This line is extended into the future and is thought to provide support for an asset. Longer term support lines, which connect months if not years of data, are deemed more important than shorter term lines which may only contain weeks. / В техническом анализе биржевых рынков под Линиями Поддержки понимаются линии, прорисованные на графике изменения цены, которые соединяют предыдущие минимумы. Эта линия выносится на графике на предстоящий период движения цены и рассматривается в качестве обеспечения поддержки цены соответствующего биржевого актива. Линии поддержки в отношении более длительных сроков, которые соединяют помесячные, если не погодовые минимумы на графиках отображения движения цены в соответствующем временном отображении, рассматриваются в качестве более значимых, нежели линии поддержки на понедельных графиках изменения цены одного и того же биржевого актива.

SUPPORT PRICE = ЦЕНА ПОДДЕРЖКИ – Support Price:- prices fixed by government policy makers in order to determine, directly or indirectly, domestic market or producer prices. All administered price schemes set a minimum guaranteed support price or a target price for the commodity, which is maintained by associated policy measures, such as quantitative restrictions on production and imports; taxes, levies and tariffs on imports; export subsidies; and/or public stockholding.

SUPPORT PURCHASE = ПРИОБРЕТЕНИЕ В ПОДДЕРЖКУ – Support Purchase is a purchase to prop up the price of a security or to nurse a security or the exchange rate of a currency. / Приобретение с целью поддержания цены ценной бумаги, или удержания ценной бумаги или курса обмена валюты.

SUPPRESSION = СУПРЕССИЯ (или ПОТЕРЯ СПОСОБНОСТИ К РАЗВИТИЮ) – (1) Suppression is the application of phytosanitary measures in an infested area to reduce pest populations. A degree of reduction of plant growth, but not death. / Степень снижения роста растения, но не его смерть. Под Супрессией, от Латинского слова Suppressio, означающее Давление, понимается полное или частичное восстановление у наследственных изменённых форм организма (мутантов) нормального проявления признака в результате новой мутации. Под Супрессией, от Латинского слова Suppressio, от Supprimo, означающее Задерживаю или Подавляю, в генетике понимается явление, препятствующее проявлению у организма признака, возникшего в результате мутации; приводит к частичному или полному восстановлению нормального фенотипа. Супрессия может происходить в результате второй (супрессорной) мутации в том же гене, в котором возникла первая (прямая) мутация (внутригенная супрессия), или в других генах (межгенная супрессия) на значительном расстоянии от супрессируемого гена. При внутригенной супрессии белок, кодируемый данным геном, может вновь приобретать функциональную активность, хотя его исходная структура (в отличие от истинной обратной мутации – реверсии) не восстанавливается. При межгенной супрессии в одних случаях нормальный фенотип может восстановиться благодаря мутациям, открывающим обходные пути обмена веществ, для которых не требуется функционирования данного гена, в других – в результате мутаций, изменяющих процесс реализации генетической информации мутантного гена. Явление супрессиии, впервые обнаруженное в 1920 Американским генетиком Алфридом Хэнри Стётэвэнтом (Alfred Henry Sturtevant; 1891–1970), используется при изучении генетического кода и других проблем молекулярной генетики.

(2) Suppression of fire is all the work of extinguishing or confining a fire, beginning with its discovery.

SUPPRESSIVE SOILS = СУПРЕССИВНЫЕ ПОЧВЫ – Suppressive Soils are soils in which certain diseases are prevented because of the presence in the soil of microorganisms antagonistic to the pathogen. / Под Супрессивными Почвами, от Латинского слова Suppressio, означающее Давление, понимаются почвы, в которых определённые болезни предотвращены из-за наличия в почве микроорганизмов, антагонистических патогену.

SUPPRESSOR = СУПРЕССОР – Suppressor (inhibitor) (genetics) is a gene that prevents the expression of another gene. / В генетике под Супрессором, от Латинского слова Suppressio, означающее Давление, или Ингибитором понимается ген, который предотвращает проявление другого гена.

SURAH = СЮРА – Surah is a light weight, lustrous twill weave constructed fabric with a silk-like hand. Surah is the fabric of ties, dresses, and furnishings. It is available in silk, polyester, and rayon. Surah is a soft fabric of silk or filament polyester or acetate, usually a twill and often woven in a plaid. Surah is used for ties, mufflers, blouses, and dresses. Surah:- a silk recognized by its sheen and its fine twill weave. Surah is popular for dresses and neckties and is also imitated in man-made fibers. / Под Сюра, от Французского слова Surah, понимается мягкая шёлковая ткань саржевого переплетения.

SURCHARGE = НАДБАВКА (или ДОПЛАТА) – Surcharge is an extra charge imposed on those who purchase with a credit card instead of cash. Currently, surcharges for credit card purchases are prohibited. A charge above the usual or customary charge.

Surcharge is a charge levied in addition to other taxes and duties. Also called Surtax. An additional charge levied in addition to the usual or customary freight. Surcharges are additional charges above ocean freight. See also Add-Ons. Surcharge is an extra or additional charge. / Надбавка или доплата.

SURCHARGE DUE = ДОЛЖНАЯ НАДБАВКА (или ДОЛЖНАЯ ДОПЛАТА) – Surcharge Due is an additional fee that may be required due to late or insufficient payment of fees. / дополнительное вознаграждение, которое может взиматься вследствие несвоевременной или не в должном объёме оплаты соответствующих вознаграждений.

SURETY = ПОРУЧИТЕЛЬ – (1) Surety is the party in a surety arrangement who holds himself responsible to one person for the acts of another. / Поручитель – сторона в договорённости о поручительстве, которая принимает на себя ответственность перед одним лицом за действия другого лица.

(2) Surety is a natural or legal person (generally a bank or insurance company) who accepts responsibility in due legal form for the financial consequences of non-fulfilment of another's obligations to the Customs.

SURETY = ПОРУЧИТЕЛЬСТВО – In a contract of guarantee (i.e. Surety), the guarantor obligates himself toward the obligee of the principal obligor to answer for the latter's obligation. Types of surety:- (i) building contractor's guarantee; (ii) joint and several guarantee; and (iii) simple guarantee. Proof that funds are available to cover potential duties. A term loosely used to describe the business or suretyship or bonds. Suretyship is an arrangement whereby one party becomes answerable to a third party for the acts of neglect of a second party. Also known as Guarantee. / В гражданском праве под Поручительством понимается один из способов обеспечения исполнения обязательств. Поручитель принимает на себя обязательство перед кредитором за исполнение должником своего обязательства (полностью или в части). Поручительство:- (1) в гражданском праве один из способов обеспечения исполнения обязательств. Поручитель берёт на себя обязательство перед Кредитором какого-либо другого лица (Главного Должника) полностью или частично отвечать за исполнение им обязательства. По Советскому Праву (бывшего Союза Советских Социалистических Республик (СССР)) договор поручительства должен быть заключён в письменной форме. В случае неисполнения обязательства, обеспеченного поручительством, должник и поручитель отвечают перед кредитором как солидарные должники, если иное не предусмотрено договором. К поручителю, исполнившему обязательство вместо должника, переходят все права кредитора по этому обязательству. (2) В Советском Уголовно-Процессуальном Праве (бывшего СССР) одна из мер пресечения, заключающаяся в даче поручителями – отдельными лицами (не менее двух) или общественной организацией письменного обязательства в том, что они ручаются за надлежащее поведение и явку подозреваемого или обвиняемого по вызову лица, ведущего дознание, следователя, прокурора и суда.

SURETY BOND = ОБЯЗАТЕЛЬСТВО ПОРУЧИТЕЛЬСТВА – Surety Bond is a bond in which the surety agrees to answer to the obligee for the non-performance of the principal (known as the Obligor).

SURETY CREDIT = ПОРУЧИТЕЛЬСКИЙ КРЕДИТ – (1) Surety Credit is a credit for which a bank assumes liability under a bill guarantee up to a certain amount (guarantee line).

(2) Surety Credit is a credit for which the bank assumes liability to third parties for the obligations of its customers (such as work performed by craftsmen) up to a specified amount. Also known as Guarantee Credit.

SURETY PREMIUM = ПОРУЧИТЕЛЬСКАЯ ПРЕМИЯ (или ПРЕМИЯ ЗА ПОРУЧИТЕЛЬСТВО) – Surety Premium is the fee paid by a shareholder to cover the required insurance for replacing lost securities or by the estate of a deceased shareholder transferring shares without benefit of probate. The surety premium required in either case is generally 2% of the market value of the shares.

SURF = SETTLEMENT UTILITY FOR MANAGING RISK AND FINANCE

SURFACE AREA = ПЛОЩАДЬ ПОВЕРХНОСТИ – The Surface Area of soil is usually expressed as square meters per gram.

SURFACE CHARGE = ПОВЕРХНОСТНЫЙ ЗАРЯД – Surface Charge is the electrical charge on the surface of a substance. / Поверхностный Заряд – электрический заряд на поверхности субстанции.

SURFACE ENERGY = ПОВЕРХНОСТНАЯ ЭНЕРГИЯ – Surface Energy is:- (1) the free energy of the surfaces at an interface that arises because of differences in the tendencies of each phase to attract its own molecules; or (2) the work that would be required to increase the surface area of a liquid by one unit area. / Под Поверхностной Энергией понимается избыток потенциальной энергии вещества у поверхности какого-либо тела по сравнению с энергией в объёме.

SURFACE FATIGUE WEAR = КОНТАКТНО–УСТАЛОСТНЫЙ ИЗНОС (или УСТАЛОСТНЫЙ ИЗНОС ПОВЕРХНОСТИ, или ИЗНОС, ВЫЗВАННЫЙ УСТАЛОСТЬЮ ПОВЕРХНОСТИ) – Surface Fatigue Wear:- the formation of surface or subsurface cracks and fatigue crack propagation. It results from cyclic loading of a surface. Surface Fatigue Wear is repeated rolling or sliding contact, in which the shear stresses bring about microcracks, particles and form wear pits that destroy the surface. / трещины. Усталостный Износ – механический износ в результате усталостного разрушения при повторном деформировании микрообъёмов материала поверхностного слоя. Примечание:- усталостный износ может происходить как при трении качения, так и при трении скольжения.

SURFACE FILTER MEDIA = СРЕДА ПОВЕРХНОСТНОГО ФИЛЬТРА – Surface Filter Media:- porous materials which primarily retain contaminants on the influent face, performing the actual process of filtration. See also Filter.

SURFACE FILTRATION = ПОВЕРХНОСТНАЯ ФИЛЬТРАЦИЯ – Surface Filtration is a filtration which primarily retains contaminant on the influent surface. See also Filtration.

SURFACE HYDROLOGY = ПОВЕРХНОСТНАЯ ГИДРОЛОГИЯ – Surface Hydrology is a study that deals with dynamic status of surface flooding and the subsurface water table in an agricultural field.

SURFACE RUNOFF = ПОВЕРХНОСТНЫЙ СТОК – Surface Runoff is a water from a catchment area that is discharged or lost without entering the soil.

SURFACE SMOOTHNESS = ШЕРОХОВАТОСТЬ ПОВЕРХНОСТИ (или ГЛАДКОСТЬ ПОВЕРХНОСТИ) – Surface Smoothness:- there are three general levels of Surface Smoothness to which lumber is manufactured. Rough lumber is lumber which has been sawn, trimmed, and edged. The saw blades used for mass manufacturing are coarse toothed for speed of production and, as a result, rough lumber is usually characterized by striations or saw lines. Surfaced lumber is lumber which has been surfaced after sawing by passing through a planing machine for the purpose of adding smoothness and uniformity of size on one side (S1S), two sides (S2S), four sides (S4S), or a combination of sides and edges. / Шабрение или Шабровка, отделочная обработка поверхности снятием тонкой стружки шабером вручную или механическим путём. Применяется для точного сопряжения деталей, например, для герметизации соединений. Исходя из назначения пиломатериалов существуют три распротранённых уровня шероховатости

поверхности. К необработанному или черновому пиломатериалу (rough lumber) относится пиломатериал, который был распилен (sawn), оторцован/откалиброван (trimmed) и обрезан (edged). Лезвия пил, используемые для массового изготовления, крупно зазубрены для скорости производства и, как результат, черновой пиломатериал обычно отличается наличием заусенец (striations; известны также как облой) или рисок/борозд/линий распила (saw lines). К отёсанному пиломатериалу (surfaced lumber) относится пиломатериал, который был отёсан после распиловки посредством прохождения через строгальный станок (planning machine) с целью придания гладкости и однородности размера с одной стороны (S1S), с двух сторон (S2S), с четырёх сторон (S4S) или комбинации сторон и кромок/царги. Под Шероховатостью Поверхности понимается совокупность микронеровностей обработанной поверхности. Шероховатость поверхности описывается набором параметров, характеризующих средние и максимальные высоты неровностей и их ширины, средние расстояния между ними и так далее. Значения параметров для различных типов изделий и условий их эксплуатации устанавливаются стандартами. Шероховатость Поверхности подразделяется на:- (1) Волнистость – неплоский пропил или неровности на поверхности лесоматериала в виде закономерно чередующихся возвышений и впадин дугообразного профиля; (2) Ворсистость – присутствие на поверхности лесоматериала часто расположенных неполностью отделённых волокон древесины; (3) Мшистость – присутствие на поверхности лесоматериала часто расположенных пучков неполностью отделённых волокон и мелких частиц древесины; и (4) Риски – периодически повторяющиеся глубокие следы, оставленные на поверхности лесоматериала режущими инструментами (пилами, торцовыми фрезами, лущильными или строгальными ножами).

SURFACE TENSION = ПОВЕРХНОСТНОЕ НАТЯЖЕНИЕ – (1) Surface Tension:- the contractile surface force of a liquid by which it tends to assume a spherical form and to present the least possible surface. It is expressed in dynes/cm or ergs/cm^2. Surface Tension:- intermolecular forces acting on the molecules at the free surface of a liquid tend to minimize the surface area of the liquid and give the surface properties similar to those of an elastic skin under tension. When two dissimilar liquids make contact, these intermolecular forces will cause the shape of the interface to change until the potential energy of the entire molecular system is at a minimum. Surface Tension is the tendency of a liquid to minimize the area of its surface by contracting. This property causes liquids to rise in a capillary tube, affects the exchange of gases in the pulmonary alveoli, and alters the ability of various liquids to wet another surface. Surface Tension is an important thermodynamic characteristic of the interface of phases or bodies, defined as the energy required for the reverse isothermic formation of a unit of area of a given surface. In the case of a liquid interface, the surface tension may also be rightfully considered as the force acting on a unit of length of the surface contour and tending to contract the surface to a minimum for the given volumes of the phases. Both these definitions apply to mobile surfaces, although the first is preferred since it has a clearer physical sense. The surface tension at the boundary of two condensed phases is usually called the Interphase Tension. The energy required to form a new surface is expended on overcoming the forces of intermolecular cohesion in transferring molecules of a substance from the bulk of the body to the surface layer. The resultant of the intermolecular forces in the surface layer is not equal to zero, as in the bulk of the body, and is directed toward the interior of the phase with the greater cohesion. Thus, the surface tension is a measure of the lack of compensation of intermolecular forces in the surface (interphase) layer. In other words, it is a measure of the excess free energy in the surface layer relative to the free energy in the volumes of the contiguous phases. In accordance with these definitions, surface tension is expressed in units of Joules/m^2 or Newtons (N)/m (erg/cm^2 or dynes/cm). As a result of surface tension, in the absence of external forces a liquid adopts a spherical form corresponding to the minimum value of the surface and, consequently, to the smallest value of the free surface energy. Surface tension does not depend on the size and shape of the surface when the volumes of the phases are sufficiently great relative to the dimensions of the molecules. Surface tension decreases with increasing temperature as well as from the action of surfactants. Melts of metals have the greatest surface tension among liquids; for example, the surface tension of platinum at 2 000 °C is equal to 1 820 dynes/cm, and the surface tension of mercury at 20 °C is 484 dynes/cm. The surface tension of molten salts is considerably less, ranging from several dozens of dynes/cm to 200–300 dynes/cm. The surface tension of water at 20 °C is 72.8 dynes/cm, and the surface tension of most organic solvents ranges from 20 to 60 dynes/cm. The lowest surface tensions at room temperature, those of several fluoro-carbon liquids, are under 10 dynes/cm. With multicomponent systems, the change in the surface tension in accordance with the Gibbs thermodynamic equation for adsorotion is:- – $d\sigma = G_1 d\mu_1 + G_2 d\mu_2 + \ldots$, here G_1, G_2, … are surface excesses of the components 1, 2, … – hat is, the difference between the concentrations of the components in the surface layer and the volume of the solution or gas – and $d\mu_1$, $d\mu_2$, … are the changes in the chemical potentials of the corresponding components. (The minus sign indicates that the surface tension decreases with positive adsorption.) The surface pressure is determined by the difference in the surface tensions of the pure liquid and the liquid covered by the adsorption monolayer. At mobile liquid-gas (vapor) or liquid-liquid boundaries, the surface tension may be measured directly by many methods. The usual methods are by the mass of a drop separating from the end of a vertical tube (a stalagmometer), by the maximum pressure required to reduce a gas bubble to a liquid, and by the shape of a drop or bubble lying on a flat surface. It is difficult to determine by experiment the surface tensions of solids, since the molecules or atoms of solids are incapable of free displacement. An exception is the plastic flow of metals at temperatures close to the melting point. Because of the anisotropy of crystals, surface tensions on the different faces of a crystal vary. The concepts of surface tension and of free surface energy are not identical for solids. Defects in the space lattice, chiefly dislocations, edges, and apexes of crystals, as well as grain boundaries extending to the surface of polycrystalline bodies, contribute to the free surface energy. The surface tension of solids is usually determined indirectly from intermolecular and interatomic interactions. Many surface phenomena are determined by the magnitude and changes of surface tension, especially in disperse systems. / Под Поверхностным Натяжением понимается работа образования единицы площади поверхности раздела фаз (тел) при постоянной температуре. Поверхностное натяжение жидкости часто определяют как силу, действующую на единицу длины контура поверхности раздела фаз и стремящуюся сократить эту поверхность до минимума. Благодаря поверхностному натяжению капля жидкости при отсутствии внешних воздействий принимает форму шара. Поверхностное Натяжение – важнейшая термодинамическая характеристика поверхности раздела фаз (тел), определяемая как работа обратимого изотермического образования единицы площади этой поверхности. В случае жидкой поверхности раздела поверхностное натяжение правомерно также рассматривать как силу, действующую на единицу длины контура поверхности и стремящуюся сократить поверхность до минимума при заданных объёмах фаз. Применительно к легкоподвижным поверхностям оба определения равнозначны, но первое предпочтительнее, так как имеет более ясный физический смысл. Поверхностное натяжение на границе двух конденсированных фаз обычно называется Межфазным Натяжением. Работа образования новой поверхности затрачивается на преодоление сил межмолекулярного сцепления (Когезии) при переходе молекул вещества из объёма тела в поверхностный слой. Равнодействующая межмолекулярных сил в поверхностном слое не равна нулю (как в объёме тела) и направлена внутрь фазы с большей когезией. Таким образом, поверхностное натяжение – мера некомпенсированности межмолекулярных сил в поверхностном (межфазном) слое или, что то же, избытка свободной энергии в поверхностном слое по сравнению со свободной энергией в объёмах соприкасающихся фаз. В соответствии с определениями поверхностного натяжения его выражают в Дж/м^2 или Н/м (эрг/см^2 или дин/см). Благодаря поверхностному натяжению жидкость при отсутствии внешних силовых воздействий принимает форму шара, отвечающую минимальной величине поверхности и, следовательно, наименьшему значению свободной поверхностной энергии. Поверхностное натяжение не зависит от величины и формы поверхности, если объёмы фаз достаточно велики по

сравнению с размерами молекул; при повышении температуры, а также под действием поверхностно-активных веществ оно уменьшается. Расплавы металлов имеют наибольшее среди жидкостей поверхностное натяжение, например, у платины при 2 000 °C оно равно 1 820 дин/см, у ртути при 20 °C – 484. Поверхностное натяжение расплавленных солей значительно меньше – от нескольких десятков до 200–300. Поверхностное натяжение воды при 20 °C – 72.8, а большинства органических растворителей – в пределах 20–60. Самое низкое при комнатной температуре поверхностное натяжение – ниже 10 – имеют некоторые фторуглеродные жидкости. В общем случае многокомпонентных систем в соответствии с Термодинамическим Уравнением Гиббса при адсорбции изменение поверхностного натяжения:- $-d\sigma = \Gamma_1 d\mu_1 + \Gamma_2 d\mu_2 + ...$, где Γ_1, Γ_2, ... – поверхностные избытки компонентов 1, 2, ..., то есть разность их концентраций в поверхностном слое и объёме раствора (или газа), а $d\mu_1$, $d\mu_2$, ... – изменения химических потенциалов соответствующих компонентов (знак ‘минус’ показывает, что поверхностное натяжение при положительной адсорбции уменьшается). Разницей в поверхностных натяжениях чистой жидкости и жидкости, покрытой адсорбционным монослоем, определяется Поверхностное Давление. На легкоподвижных границах жидкость–газ (пар) или жидкость–жидкость поверхностное натяжение можно непосредственно измерить многими методами. Так, широко распространены способы определения поверхностного натяжение по массе капли, отрывающейся от конца вертикальной трубки (Сталагмометра); по величине максимального давления, необходимого для продавливания в жидкость пузырька газа; по форме капли (или пузырька), лежащей на плоской поверхности, и так далее. Экспериментальное определение поверхностного натяжения твёрдых тел затруднено из-за того, что их молекулы (или атомы) лишены возможности свободного перемещения. Исключение составляет пластическое течение металлов при температурах, близких к точке плавления. Ввиду анизотропии кристаллов поверхностное натяжение на разных гранях кристалла различно. Понятия Поверхностного Натяжения и Свободной Поверхностной Энергии для твёрдых тел не тождественны. Дефекты кристаллической решётки, главным образом дислокации, ребра и вершины кристаллов, границы зёрен поликристаллических тел, выходящие на поверхность, вносят свой вклад в свободную поверхностную энергию. Поверхностное натяжение твёрдых тел обычно определяют косвенно, исходя из межмолекулярных и межатомных взаимодействий. Величиной и изменениями поверхностного натяжения обусловлены многие поверхностные явления, особенно в дисперсных системах (смотрите также Капиллярные Явления).

(2) In living organisms, the Surface Tension of the cell is one of the factors determining the shape of the entire cell and its components. It is low for cells with rigid or semirigid surfaces:- such cells include those of Infusoria and many microorganisms and plant cells. For cells without a strong supramembranous structure (most animal cells, some protozoa, and the spheroplasts of bacteria), the surface tension largely determines the cell’s configuration; cells suspended within a liquid become almost spherical in shape. The shape of a cell attached to a substrate or to other cells depends primarily on such factors as contact structures and the cytoskeleton formed by the microtubules. It is assumed that local changes insurface tension are of importance in such phenomena as phagocytosis, pinocytosis, and gastrulation. The determination of the surface tension of the cell is a complex experimental problem; usually the surface tension of a cell does not exceed several dynes/cm (10^{-3} N/m). / В живых организмах Поверхностное Натяжение клетки – один из факторов, определяющих форму целой клетки и её частей. Для клеток, обладающих жёсткой или полужёсткой поверхностью (многие микроорганизмы, инфузории, клетки растений и так далее), значение поверхностного натяжения невелико. У клеток, лишённых прочной надмембранной структуры (большинство клеток животных, некоторые простейшие, сферопласты бактерий), поверхностное натяжение в основном определяет конфигурацию (клетки, находящиеся во взвешенном в жидкости состоянии, приобретают форму, близкую к сферической). Форма клетки, прикреплённой к какому-либо субстрату или к другим клеткам, зависит преимущественно от других факторов – цитоскелета, образуемого микротрубочками, контактных структур и так далее. Полагают, что локальные изменения поверхностного натяжения существенны в таких явлениях, как фагоцитоз, пиноцитоз, гаструляция. Определение поверхностного натяжения клетки – сложная экспериментальная задача; обычно поверхностное натяжение клетки не превышает несколько дин/см (10^{-3} Н/м).

SURFACE TRANSPORTATION BOARD = ПАЛАТА ПО НАЗЕМНОЙ ПЕРЕВОЗКЕ (или ХХ) – Surface Transportation Board (STB), an independent adjudicatory body administratively housed in the Department of Transportation responsible for the economic regulation of interstate surface transportation, primarily railroads.

SURFACE TREATING = ПОВЕРХНОСТНАЯ ОБРАБОТКА (или ОБРАБОТКА ПОВЕРХНОСТИ) – Surface Treating:- because it is the surface of a metal that people see and that reacts with the environment around it, special effort is sometimes made to add lustre, color, or texture to a surface. In addition, special corrosion-resistant layers are placed on the surface for some applications, and in yet others the surface is hardened to add strength and reduce wear. This section discusses surface treatments that add corrosion resistance or hardness. Corrosion Resistance:- (i) Barrier Protection:- when a metal corrodes in water, the atoms lose electrons and become ions that move into the water. This is called an Anodic Reaction, and for the corrosion process to proceed there must be a corresponding cathodic reaction that adsorbs the electrons. The process can be stopped by isolating the metal from the water with an impermeable barrier. One of the older applications of this idea is the tin can. Unlike steel, tin is not affected by the acids in food, so that a layer of tin placed on steel sheet protects the steel in the can from corrosion. The exterior surfaces of many large household appliances consist of steel covered with a layer of colored glass called Enamel. Enamel is inert and adheres tightly to the steel, thus protecting it from corrosion as well as providing an attractive appearance. Decorative chromium plating is another example of a protective-barrier coating on steel. Since chromium does not adhere well to steel, the steel is first electroplated with layers of copper and nickel before being plated with a thin layer of chromium. The protective layers described above are metallic, but the most common protective barriers are organic. Paints, polymers, and thin lacquer films are used for various applications near room temperature. The oxide layer that forms on metals when they are exposed to air also constitutes a protective barrier. Stainless steel and aluminum form the most stable and protective of such films. The thickness of the oxide film on aluminum is often increased by making the part function as the anode in an electrolytic cell. This process, called Anodizing, enhances the corrosion resistance somewhat and makes coloring the surface easier. The films that form on copper and steel as a result of corrosion (commonly known as Tarnish and Rust) are somewhat thicker and show a characteristic color that is often incorporated into the design of the part. (ii) Galvanic Protection:- protective films on steel are susceptible to being broken by flying stones or other sharp objects. This is especially true on the parts of an automobile that are close to the road. The barriers described above have limited ability for self-healing after they are broken, but protection of the underlying small exposed area of steel can be maintained if a metal that has a greater tendency than steel to give up electrons in water is attached to the surface. In this way, when the protective barrier is broken, the more reactive metal is corroded preferentially, and the steel is given ‘galvanic’ protection. A layer of zinc can be placed on a steel surface either by hot-dipping the steel in molten zinc or by electroplating zinc onto the surface. Galvanized steel is much more resistant to corrosion than ungalvanized steel. For this reason, it is often used in the lowest panels of automobiles, i.e. the parts exposed to corrosive salt spray from snowy roads. Electrodeposits of cadmium are also used for galvanic protection of steel. Hot-dip aluminum-coated steel is used in the exhaust systems of automobiles. At low temperatures its action is primarily galvanic, while at high temperatures it oxidizes to form a barrier layer. Other Coating Techniques:- among other methods for applying metal layers to metal is thermal spray coating, a generic term for processes in which a metal wire is melted by a plasma arc or a flame, atomized, and sprayed onto a surface in an inert gas. Another

method is vacuum coating, which produces thin, bright, attractive layers on a part by evaporating and depositing a coating metal in a high vacuum. Enhanced oxidation protection is imparted to high-temperature turbine parts made of superalloys by annealing the parts in a container containing volatile aluminum chloride. This is done at high temperatures, so that aluminum diffuses into the alloy to form an aluminum-rich surface layer. In high-temperature service, such a layer oxidizes to form a protective aluminum oxide coating. Hardening:- (a) Carburizing:- the strength of hardened steel increases rapidly as the percentage of carbon is increased, but at the same time the steel's toughness decreases. Often the most useful part is one in which the surface is higher in carbon and thus hard, while the interior is lower in carbon and thus tough. Such a combination of properties can be obtained by carburizing, or annealing the parts in a gas rich in carbon. The carburizing potential of the gas rises with the ratio of carbon monoxide to carbon dioxide. The carburizing temperature is high enough to transform the surface of the steel to the high-temperature austenite phase, which has a much higher carbon solubility than the low-temperature ferrite phase. At these temperatures, carbon deposited on the surface diffuses through the steel and into the solid. The thickness of the diffusion layer increases with time, although at a decreasing rate; depths of 1 to 2 millimeters (0.04 to 0.08 inch) in 4 to 16 hours are typical. Following diffusion, the part is quenched in oil. The high-carbon surface transforms into a hard, brittle martensitic structure, while the lower-carbon interior transforms into a tougher, softer structure. The part is then tempered to raise the toughness of the surface layer. Small machine parts, such as gears, are often carburized to increase their strength and resistance to wear. (b) Nitriding:- nitriding provides an alternative means of hardening a steel surface. The surface layer is only one-tenth the depth of a carburized layer, but it is appreciably harder. The steel part is heated to a lower temperature, so that its crystal structure remains ferritic. Heating is conducted in an atmosphere of ammonia (NH_3) and hydrogen, and nitrogen from the ammonia diffuses into the steel. Hardening is accomplished in one of two ways. One way is solid-solution hardening, which occurs in all steels. The other way is precipitation hardening. For example, if a steel contains aluminum, the aluminum and nitrogen will combine to form very fine particles that harden the steel quite effectively. Though it is extremely hard, the nitride layer does not tend to crack, because it is very thin and adheres well to the ductile steel beneath it. The part need not be quenched from the nitriding temperature, nor does it need to be tempered before it is put into service. Other Methods:- surfaces can also be hardened by heat treating with induction or laser heating. In other applications, surface hardening is accomplished by depositing a 'hard-facing alloy' on the base part. One example is 'hard chromium plating', in which a thick layer of chromium is deposited on a part. Automotive valve stems and piston rings and the bores of diesel engine cylinders are common applications. / (a) Цементация или Науглероживание (Carburizing). (b) Азотирование (Nitriding). эмаль (enamel). Коррозионная Стойкость или Стойкость К Коррозии (Corrosion Resistance):- (i) Барьерная Защита (Barrier Protection). (ii) Гальваническая Защита (Galvanic Protection):- . Закалка или Упрочнение (Hardening):- (a) Цементация или Науглероживание (Carburizing):- . твёрдость (hardness).

SURFACTANT = СУРФАКТАНТ (или ПОВЕРХНОСТНО–АКТИВНОЕ ВЕЩЕСТВО) – Surfactant is a surface-active agent that reduces interfacial tension of a liquid. A surfactant used in a petroleum oil may increase the oil's affinity for metals and other materials. A Surfactant or Surface Active Agent is a substance that, when dissolved in water, gives a product the ability to remove dirt from surfaces such as the human skin, textiles, and other solids. In more technical terms:- (i) they enable the cleaning solution to fully wet the surface being cleaned so that dirt can be readily loosened and removed; (ii) they clean greasy, oily, particulate-, protein-, and carbohydrate-based stains; and (iii) they are instrumental in removing dirt and in keeping them emulsified, suspended, and dispersed so they don't settle back onto the surface being cleaned. Each surfactant molecule has a hydrophilic (water-loving) head that is attracted to water molecules AND a hydrophobic (water-hating) tail that repels water and simultaneously attaches itself to oil and grease in dirt. These opposing forces loosen the dirt and suspend it in the water. The mechanical agitation of the washing machine helps pull the dirt free. Surfactants are one of the major components of cleaning products and can be regarded as the 'workhorses':- they do the basic work of breaking up stains and keeping the dirt in the water solution to prevent re-deposition of the dirt onto the surface from which it has just been removed. Surfactants disperse dirt that normally does not dissolve in water. As anyone who uses oil based dressings in the kitchen knows, oil and water do not mix unless shaken vigorously in the bottle. They separate almost immediately afterwards. The same is true when washing your dishes or clothes. With the addition of surfactants, oil, which normally does not dissolve in water, becomes dispersible and can be removed with the wash water. What does a surfactant actually do? Surfactants are also referred to as Wetting Agents and Foamers. Surfactants lower the surface tension of the medium in which it is dissolved. By lowering this interfacial tension between two media or interfaces (e.g., air/water, water/stain, stain/fabric) the surfactant plays a key role in the removal and suspension of dirt. The lower surface tension of the water makes it easier to lift dirt and grease off of dirty dishes, clothes and other surfaces, and help to keep them suspended in the dirty water. The water-loving or hydrophilic head remains in the water and it pulls the stains towards the water, away from the fabric. The surfactant molecules surround the stain particles, break them up and force them away from the surface of the fabric. They then suspend the stain particles in the wash water to remove them. What does a surfactant 'look like'? A tadpole! A surfactant consists of a hydrophobic (non-polar) hydrocarbon 'tail' and a hydrophilic (polar) 'head' group. This appearance is key to its behaviour. The dirt-loving or hydrophobic tail absorbs to the oil and grease in dirt and stains. Are surfactants of natural or synthetic origin? They can be either. Surfactants from natural origin (vegetable or animal) are known as Oleo-Chemicals and are derived from sources such as palm oil or tallow. Surfactants from synthetic origin are known as Petro-Chemicals and are derived from petroleum. Having the flexibility to use both oleochemical and petrochemical surfactants allows our formulators to create products that maximize the value in the bottle of detergent, so to speak, by optimizing cleaning ability under a variety of laundry conditions while keeping the price low in the current market. These days, our formulation scientists focus quite a lot on developing detergents that perform well at lower wash temperatures. This approach will continue to yield energy savings during the consumer use phase, hence a reduction of CO_2 emissions. Surfactants also have an important role in our body, where they are used to reduce surface tension in the lungs. The human body does not start to produce lung surfactants until late in foetal development. Therefore, premature babies are often unable to breathe properly, a condition called Respiratory Distress Syndrome. Untreated, this is a serious illness and is often fatal, but administration of artificial surfactants virtually eliminates this health problem. Are there different types of surfactants? There is a broad range of different surfactant types, each with unique properties and characteristics:- the type of dirt and fabric on which they work best, how they can cope with water hardness. Detergents use a combination of various surfactants to provide the best possible cleaning results. There are four main types of surfactants used in laundry and cleaning products. Depending on the type of the charge of the head, a surfactant belongs to the anionic, cationic, non-ionic or amphoteric/zwitterionic family. (i) Anionic surfactants:- in solution, the head is negatively charged. This is the most widely used type of surfactant for laundering, dishwashing liquids and shampoos because of its excellent cleaning properties and high sudsing potential. The surfactant is particularly good at keeping the dirt away from fabrics, and removing residues of fabric softener from fabrics. Anionic surfactants are particularly effective at oily soil cleaning and oil/clay soil suspension. Still, they can react in the wash water with the positively charged water hardness ions (calcium and magnesium), which can lead to partial deactivation. The more calcium and magnesium molecules in the water, the more the anionic surfactant system suffers from deactivation. To prevent this, the anionic surfactants need help from other ingredients such as builders (Ca/Mg sequestrants) and more detergent should be dosed in hard water. The most commonly used anionic surfactants are alkyl sulphates, alkyl ethoxylate sulphates and soaps. (ii) Cationic Surfactants:- in solution, the head is positively charged. There are 3 different categories of cationics each with their specific application:- (a) in fabric softeners and in detergents with built-in fabric softener, cationic surfactants provide softness. Their main use

in laundry products is in rinse added fabric softeners, such as esterquats, one of the most widely used cationic surfactants in rinse added fabric softeners. An example of cationic surfactants is the esterquat. (b) In laundry detergents, cationic surfactants (positive charge) improve the packing of anionic surfactant molecules (negative charge) at the stain/water interface. This helps to reduce the dirtl/water interfacial tension in a very efficient way, leading to a more robust dirt removal system. They are especially efficient at removing greasy stains. An example of a cationic surfactant used in this category is the mono alkyl quaternary system. (c) In household and bathroom cleaners, cationic surfactants contribute to the disinfecting/sanitizing properties. (iii) Non-Ionic Surfactants:- these surfactants do not have an electrical charge, which makes them resistant to water hardness deactivation. They are excellent grease removers that are used in laundry products, household cleaners and hand dishwashing liquids. Most laundry detergents contain both non-ionic and anionic surfactants as they complement each other's cleaning action. Non-ionic surfactants contribute to making the surfactant system less hardness sensitive. The most commonly used non-ionic surfactants are ethers of fatty alcohols. (iv) Amphoteric/Zwitterionic Surfactants:- these surfactants are very mild, making them particularly suited for use in personal care and household cleaning products. They can be anionic (negatively charged), cationic (positively charged) or non-ionic (no charge) in solution, depending on the acidity or pH of the water. They are compatible with all other classes of surfactants and are soluble and effective in the presence of high concentrations of electrolytes, acids and alkalis. These surfactants may contain two charged groups of different sign. Whereas the positive charge is almost always ammonium, the source of the negative charge may vary (carboxylate, sulphate, sulphonate). These surfactants have excellent dermatological properties. They are frequently used in shampoos and other cosmetic products, and also in hand dishwashing liquids because of their high foaming properties. An example of an amphoteric/zwitterionic surfactant is alkyl betaine. How do surfactants work in detail? Surfactants can work in three different ways:- roll-up, emulsification, and solubilization. Roll-up mechanism:- the surfactant lowers the oil/solution and fabric/solution interfacial tensions and in this way lifts the stain of the fabric. Emulsification:- the surfactant lowers the oil-solution interfacial tension and makes easy emulsification of the oily soils possible. Solubilization:- through interaction with the micelles of a surfactant in a solvent (water), a substance spontaneously dissolves to form a stable and clear solution. How can surfactants prevent dirt from being re-deposited? Surfactants have a vital role to play in preventing the re-deposition of soils like greasy, oily stains and particulate dirt on the surface or fabric from which they have just been removed. This works by electrostatic interactions and steric hindrance. Electrostatic interactions:- anionic surfactants are adsorbed on both the surface of the dirt which is dispersed in the detergent solution, and the fabric surface. This creates a negative charge on both surfaces, causing electrostatic repulsions. This repulsion prevents the soil from re-depositing on the fabric. In the presence of hardness, however, this mechanism acts like a 'bridge' between the suspended soil and the fabric. This is another reason why hardness sequestrants (a chemical that promotes Ca/Mg sequestration) are often used in detergents. Steric hindrance:- non-ionic surfactants like alcohol ethoxylates also adsorb on the dirt. Their long ethoxylated chains extend in the water phase and prevent the dirt droplets or particles from uniting, and from depositing onto the fabric surface. This is shown in the illustration below:- (i) dirt is present in solution; (ii) the non-ionic surfactants adsorb to the dirt particles; and (iii) their long hydrophilic heads extend in the water phase and as a result prevent the dirt particles/droplets from uniting and from re-depositing onto fabrics. Surfactant is a material that improves the emulsifying, dispersing, spreading, wetting or other properties of a liquid by modifying its surface characteristics. Surfactant is a surface active agent. When used in association with dyeing, this term almost invariably refers to a synthetic detergent. Detergents operate at the surface between a solvent (water) and some material that is to be removed from where it is, and made to enter solution or suspension in the solvent. One end of the surfactant molecule is hydrophilic ('likes' water, and the other is hydrophobic ('fears' or water; sometimes lipophilic – oil loving). Surfactants can be synthesized to have specific properties by varying the structure of the hydrophilic and hydrophobic ends. Surfactants are used to scour fibers or fabric, act as wetting agents in dyeing, as retarders in dyeing, and to help remove unfixed dye after dyeing. They may be classified as anionic, non-ionic or cationic. There are even types that can behave as anionic or cationic, depending on conditions. Some fabric softeners are surfactants. There is a vast array of surfactants on the market. Surfactant is a surface-active agent, i.e. a product that acts by modifying the surface or boundary between two phases. / Щёлочь (Alkali). твёрдость (hardness). Под Поверхностно-Активными Веществами (ПАВ) понимаются вещества, способные накапливаться на поверхности, соприкосновения двух тел (сред, фаз), понижая её свободную энергию (поверхностное натяжение). Важнейшие ПАВ – водорастворимые органические соединения, молекулы которых состоят из двух частей:- полярной (гидрофильной) и неполярной (гидрофобной). Различают ионные, то есть диссоциирующие в воде на ионы (мыла, моющие вещества типа алкилсульфатов), и неионные, например, полигликолевые эфиры алкилфенолов или жирных спиртов. ПАВ применяют в промышленности (например, при флотации), они входят в состав моющих средств, лаков и красок, пестицидных препаратов, пищевых продуктов. Поверхностно-Активные Вещества – вещества, способные накапливаться (сгущаться) на поверхности соприкосновения двух тел, называемой Поверхностью Раздела Фаз, или Межфазной Поверхностью. На межфазной поверхности поверхностно-активные вещества образуют слой повышенной концентрации – адсорбционный слой (смотрите также Мономолекулярный Слой). Любое вещество в виде компонента жидкого раствора или газа (пара) при соответствующих условиях может проявить поверхностную активность, то есть адсорбироваться под действием межмолекулярных сил на той или иной поверхности (смотрите Адсорбция), понижая её свободную энергию. Однако поверхностно-активными обычно называются лишь те вещества, адсорбция которых из растворов уже при весьма малых концентрациях (десятые и сотые доли %) приводит к резкому снижению поверхностного натяжения. Типичные поверхностно-активные вещества – органические соединения дифильного строения, то есть содержащие в молекуле атомные группы, сильно различающиеся по интенсивности взаимодействия с окружающей средой (в наиболее практически важном случае – водой). Так, в молекулах поверхностно-активных веществ имеются один или несколько углеводородных радикалов, составляющих олео-, или липофильную, часть (она же – гидрофобная часть молекулы), и одна или несколько полярных групп – гидрофильная часть (смотрите также Гидрофильность И Гидрофобность). Слабо взаимодействующие с водой олеофильные (гидрофобные) группы определяют стремление молекулы к переходу из водной (полярной) среды в углеводородную (неполярную). Гидрофильные группы, наоборот, удерживают молекулу в полярной среде или, если молекула поверхностно-активного вещества находится в углеводородной жидкости, определяют её стремление к переходу в полярную среду. Таким образом, поверхностная активность поверхностно-активных веществ, растворённых в неполярных жидкостях, обусловлена гидрофильными группами, а растворённых в воде – гидрофобными радикалами. По типу гидрофильных групп поверхностно-активные вещества делят на ионные, или ионогенные, и неионные, или неионогенные. Ионные Поверхностно-Активные Вещества диссоциируют в воде на ионы, одни из которых обладают адсорбционной (поверхностной) активностью, другие (противоионы) – адсорбционно неактивны. Если адсорбционно активны анионы, поверхностно-активные вещества называются Анионными, или Анионоактивными, в противоположном случае – Катионными, или Катионо-Активными поверхностно-активными веществами. Анионные Поверхностно-Активные Вещества – органические кислоты и их соли, катионные – основания, обычно амины различной степени замещения, и их соли. Некоторые поверхностно-активные вещества содержат и кислотные, и основные группы. В зависимости от условий они проявляют свойства или анионных, или катионных поверхностно-активных веществ, поэтому их называют Амфотерными, или Амфолитными, поверхностно-активными веществами. Все поверхностно-активные вещества можно разделить на две категории по типу систем, образуемых ими при взаимодействии с растворяющей средой. К одной категории относятся мицеллообразующие

поверхностно-активные вещества, к другой – не образующие мицелл. В растворах мицеллообразующих поверхностно-активных веществ выше критической концентрации мицеллообразования (ККМ) возникают коллоидные частицы (мицеллы), состоящие из десятков или сотен молекул (ионов). Мицеллы обратимо распадаются на отдельные молекулы или ионы при разбавлении раствора (точнее, коллоидной дисперсии) до концентрации ниже ККМ. Таким образом, растворы мицеллообразующих поверхностно-активных веществ занимают промежуточное положение между истинными (молекулярными) и коллоидными растворами (золями), поэтому их часто называют Полуколлоидными Системами. К мицеллообразующим поверхностно-активным веществам относят все моющие вещества (смотрите Моющее Действие, Моющие Средства, Мыла), эмульгаторы, смачиватели, диспергаторы и другие. В мировом производстве поверхностно-активных веществ (на 1971) большую часть составляют анионные вещества. Среди них можно выделить следующие основные группы:- карбоновые кислоты, а также их соли, алкилсульфаты (сульфоэфиры), алкилсульфонаты и алкиларилсульфонаты, прочие продукты. Наиболее распространены натриевые и калиевые мыла жирных и смоляных кислот; нейтрализованные продукты сульфирования высших жирных кислот, олефинов, алкилбензолов. Второе место по объёму промышленного производства занимают неионные поверхностно-активные вещества – эфиры полиэтиленгликолей. Большинство неионных поверхностно-активных веществ получают присоединением окиси этилена к алифатическим спиртам, алкилфенолам, карбоновым кислотам, аминам и другим соединениям с реакционноспособным атомом водорода. Ассортимент поверхностно-активных веществ чрезвычайно велик. Мировое производство поверхностно-активных веществ постоянно возрастает, причём доля неионных и катионных веществ в общем выпуске всё время увеличивается. В зависимости от назначения и химического состава поверхностно-активные вещества выпускают в виде твёрдых продуктов (кусков, хлопьев, гранул, порошков), жидкостей и полужидких веществ (паст, гелей). Особое внимание всё больше и больше уделяется производству поверхностно-активных веществ с линейным строением молекул, которые легко подвергаются биохимическому разложению в природных условиях и не загрязняют окружающую среду. Поверхностно-активные вещества находят широкое применение в промышленности, сельском хозяйстве, медицине, быту. Важнейшие области потребления поверхностно-активных веществ:- производство мыл и моющих средств для технических и санитарно-гигиенических нужд; текстильно-вспомогательных веществ, то есть веществ, используемых для обработки тканей и подготовки сырья для них; лакокрасочной продукции. Поверхностно-активные вещества используют во многих технологических процессах химических, нефтехимических, химико-фармацевтических, пищевой промышленности. Их применяют как присадки, улучшающие качество нефтепродуктов; как флотореагенты при флотационном обогащении полезных ископаемых (смотрите Флотация); компоненты гидроизоляционных и антикоррозионных покрытий и так далее. Поверхностно-активные вещества облегчают механическую обработку металлов и других материалов, повышают эффективность процессов диспергирования жидкостей и твёрдых тел. Незаменимы поверхностно-активные вещества как стабилизаторы высококонцентрированных дисперсных систем (суспензий, паст, эмульсий, пен). Кроме того, они играют важную роль в биологических процессах и вырабатываются для ‘собственных нужд’ живыми организмами. Так, поверхностной активностью обладают вещества, входящие в состав жидкостей кишечно-желудочного тракта и крови животных, соков и экстрактов растений.

SURGE = ЗЫБЬ (или НАГОН, или СГОН, или ПРОДОЛЬНЫЙ СНОС, или СГОННО–НАГОННОЕ ЯВЛЕНИЕ) – Surge (maritime term):- to ease a line to prevent it from parting or pulling, meanwhile holding the strain.

SURGE = ИМПУЛЬС (или ПИК, или БРОСОК, или ТОЛЧОК, или ПУЛЬСАЦИЯ, или ВСПЛЕСК, или ПЕРЕНАПРЯЖЕНИЕ) – Surge is a momentary rise of pressure in a circuit. / волна повышения давления (pressure surge).

SURGE CAPACITY = СПОСОБНОСТЬ К ВСПЛЕСКАМ (или ПЕРЕНАПРЯЖЕНИЯМ, или БОЛЬШИМ ВЫБРОСАМ) – Surge Capacity is the ability of an electrical supply to tolerate a momentary current surge or inrush imposed by the starting of motors or the energizing of transformers. / или пусковой бросок (inrush).

SURGICAL GAUZE = ХИРУРГИЧЕСКАЯ МАРЛЯ – Surgical Gauze is a cheesecloth that has been sterilized after bleaching. See also Gauze.

SURGICAL PROCEDURE = ХИРУРГИЧЕСКАЯ ПРОЦЕДУРА – Surgical Procedure is a procedure requiring surgery that is conducted to improve the long term welfare of a sheep. Usually conducted during lamb marking.

SURIF = SUKAMANDI RESEARCH INSTITUTE FOR FOOD CROPS

SURPLICE NECK = ВОРОТ МЫСИКОМ – Surplice Neck is a V-shaped neckline formed by diagonally overlapping fabric.

SURPLUS = ПРОФИЦИТ (или ЭКСЦЕДЕНТ, или НАКОПЛЕНИЯ, или ПРЕВЫШЕНИЕ, или ИЗБЫТОК, или ИЗЛИШЕК) – (1) The term Surplus generally denotes an excess of revenues over expenditures. In finance, excess of assets over liabilities, or of revenues over expenditures. In economics, excess of a resource over market outlets for that resource. Capital surplus is capital contributed in excess of Par Value. The opposite of Deficit, or Shortage.

(2) Surplus is the excess of assets over liabilities. Statutory surplus is an insurer’s or reinsurer’s capital as determined under statutory accounting rules. Surplus determines an insurer’s or reinsurer’s capacity to write business. / это превышение активов над пассивами. Эксцедент, от Латинского слова Exess, максимальная сумма собственного участия страховщика в покрытии какого-либо риска. Термин связан с перестрахованием, суть которого сводится к распределению страховщиком (цедентом) своих рисков, которое осуществляется путём передачи цедентом части своих рисков другой (перестраховочной) компании – цессионеру. Выделяются Эксцедент Убытка и Эксцедент Убыточности. При использовании системы эксцедента убытка по наступлении страхового случая и установления размера страховой суммы цедент выплачивает определённый в договоре перестрахования приоритет (то есть максимальную сумму своих обязательств при несении страхователем убытка), а перестраховщик выплачивает сумму превышения. Во втором случае (эксцедент убыточности) подсчитывается максимальная сумма ответственности страховщика за определённый период. Общая убыточность соответствующего периода. превышающая этот уровень, автоматически покрывается перестраховщиками (цессионерами). Эксцедент:- в страховом деле, система перестрахования, согласно которой страховая организация передаёт в перестрахование часть рисков, принятых на страхование. Различают следующие виды эксцедентов:- эксцедент риска – договорённость о перестраховании убытка по данной категории риска; эксцедент суммы – переестрахование, при котором перестраховочное возмещение выплачивается лишь при превышении определённого лимита, причём в отличие от безусловной франшизы показывается только это превышение; эксцедент убытка – часть страховой суммы, превышающая определённый размер по одной категории риска. Эксцедент – сумма риска, подлежащая перестрахованию сверх суммы собственного удержания страховой компанией, которая приняла этот риск. Эксцедент обычно составляет умноженную в определённое число раз сумму собственного удержания передающей компании. Если сумма такого эксцедента является недостаточной для полного перестрахования риска, за первым эксцедентом может следовать второй эксцедент, третий эксцедент и так далее до полного перестрахования перестраховываемого риска.

SURPLUS ENERGY = ИЗБЫТОЧНАЯ ЭНЕРГИЯ – Surplus Energy is the energy generating capability that is beyond the immediate needs of the producing system. This energy may be sold on an interruptible basis or as firm power. / Излишки произведённой электроэнергии, превышающие текущие потребности производящей энергосистемы. Такая энергия может быть продана на условиях подачи как с перебоями, так и без перебоев.

SURPLUS LINES INSURANCE = СТРАХОВАНИЕ ИЗБЫТОЧНОГО ПРЕДЕЛА УДЕРЖАНИЯ (или СТРАХОВАНИЕ ПРЕВЫШЕННОЙ ДОЛИ УДЕРЖАНИЯ) – Surplus Lines Insurance:- these are insurance risks that have been certified by a local broker as having been declined by a prescribed number (usually three or four) of licensed insurers in a given state in the United States of America and which therefore be underwritten as 'surplus lines'.

SURPLUS LINES INSURER = СТРАХОВЩИК ИЗБЫТОЧНОГО ПРЕДЕЛА УДЕРЖАНИЯ (или СТРАХОВЩИК ПРЕВЫШЕННОЙ ДОЛИ УДЕРЖАНИЯ) – Surplus Lines Insurer is an insurer that underwrites surplus lines insurance in the United States. Lloyd's underwriters are surplus lines insurers in all jurisdictions of the United States, except Kentucky and the US Virgin Islands.

SURPLUS SHARE = ДОЛЯ ПРЕВЫШЕНИЯ (или ИЗБЫТОЧНАЯ ДОЛЯ, или ДОЛЯ ПРОФИЦИТА) – In reinsurance, Surplus Share is a form of proportional reinsurance where the reinsurer assumes pro rata responsibility for only that portion of any risk which exceeds the company's established retentions.

SURPLUS TREATY = ТРАКТАТ О ПРЕВЫШЕНИИ – Surplus Treaty:- a type of reinsurance under which bands of cover known as Lines are granted above a given retention which is referred to as the Cedant's Line. Each line is of equivalent size and the capacity of the treaty is expressed as a multiple of the cedant's line so that with a retention of £2 million, a three line treaty would provide reinsurance cover of £6 million (£2 million X 3) excess of £2 million. The reinsurer receives an equivalent proportion of the full risk premium. A surplus treaty is a form of proportional reinsurance. Also known as Surplus Lines Treaty.

SURRENDER = (ДОСРОЧНЫЙ) ОТКАЗ – Surrender:- the termination of a life insurance policy while the life assured is still alive in return for a cash sum. / Прекращение действия полиса страхования жизни в то время, как застрахованное лицо продолжает жить, в обмен на денежную сумму.

SURRENDER VALUE = СУММА ЗА (ДОСРОЧНЫЙ) ОТКАЗ (или ВЫКУПНАЯ СТОИМОСТЬ) – Surrender Value is the amount an insurance company will repay to a policyholder who wishes to terminate his policy early. Usually, the life insurance policy premiums must have been paid for at least three years. The surrender value is used as a guideline for determining the credit line granted against the pledge of life insurance claims as collateral.

SURROUND = ОБРАМЛЕНИЕ (или ОКАЙМЛЕНИЕ, или КРАЙ, или КРОМКА, или БОРДЮР, или ОКРУЖЕНИЕ) – Surround is the portion of the visual field immediately surrounding the central field or pattern of interest.

SURROUNDING = ОКРУЖЕНИЕ – Surrounding is:- (1) enclosing with a fence, bund, or barricade. (2) The outside plants around a field. (3) The land outside the field in the same vicinity. (4) Adjacent fields in the same vicinity.

SURTAX = ДОБАВОЧНЫЙ НАЛОГ – (1) Surtax is an additional tax on certain kinds of income that has already been taxed. An additional extra tax. / Добавочный Налог:- дополнительный налог, взимаемый с акционерных компаний и частных лиц в том случае, если полученный ими доход превышает определённый уровень. Например, после принятия в 1993 Акта О Согласовании Доходов (Revenue Reconciliation Act of 1993) государство может взимать добавочный налог в размере 10% со всех лиц, чей скорректированный совокупный доход (adjusted gross income) превышает 250 000 Долларов США.

(2) Surtax:- levy an extra tax on; surtax luxury items that cost more than USD1 000.00.

SURVEILANCE = НАДЗОР – Surveillance is an official process which collects and records data on pest occurrence or absence by survey, monitoring or other procedures. / Надзор – официальный процесс, который предусматривает сбор и регистрацию данных о встречаемости или отсутствии насекомых вредителей с помощью обследования, наблюдения или иных процедур.

SURVEY = ОБСЛЕДОВАНИЕ (или ИЗЫСКАНИЕ) – In cargo insurance, Survey is an examination of damaged property to determine the cause, extent and value. In hull insurance, an inspection of the ship to help determine its insurability or, after a loss, the cause and extent of damage. An inspection of a certain item or object by a recognised or certified specialist. Survey is an inspection report issued by a marine surveyor to show the condition of cargo, vessel, or other maritime property, either before or after a loss. Survey is a collection of data about a given factor. Interviews to provide quantitative data for analysis. Survey is an official procedure conducted over a defined period of time to determine the characteristics of a pest population or to determine which species occur in an area. / Под Изысканием понимается предварительное исследование, разыскание для создания каких-нибудь проектов, разработок.

SURVEYOR = ОБСЛЕДОВАТЕЛЬ (или ИЗЫСКАТЕЛЬ, или СЮРВЕЙЕР, или СЪЁМЩИК) – Surveyor is a marine specialist who inspects cargo, vessels, and other maritime property to determine:- (i) The condition and/or value of property. Condition can include adequacy of packing, stowage aboard the vessel, and/or towage arrangements. The surveyor is not an insurance company loss adjuster, but an independent expert who acts without prejudice to the parties involved. (ii) The cause, nature, and extent of damage and recommended methods of repair and/or replacement. The surveyor is not an adjuster, and all actions are without prejudice to the insurance policy terms and conditions. Surveyor is a specialist who conducts surveys of cargo or hulls or cargo losses. Surveyor (in shipping/insurance terminology) is the expert who examines damaged goods and prepares a detailed report. A specialist who carries out surveys. / порядки и условия. Специалист, который производит обследования (осмотры) груза или корпусов судов или ущербов, нанесённых грузу. Под Изыскателем понимается специалист, занимающийся изысканиями в какой-нибудь области. Эксперт, осуществляющий по просьбе соответствующих правомочных заказчиков обследование судов и грузов и имеющий право давать квалифицированное заключение об их состоянии, характере, размере и причине повреждений при авариях, мореходности судна и тому подобном. По результатам такого обследования сюрвейер оформляет рапорт сюрвейера (surveyor's report), представляющий собой заключение об обследовании соответствующего объекта, или, в случае работы на страховую компанию, составляет аварийный сертификат, подтверждающий характер, размер и причины убытка. Услугами сюрвейеров пользуются владельцы груза или судна, фрахтователи, страховые компании и классификационные общества, осуществляющие независимую инспекцию. Выдаваемые сюрвейером по результатам обследований документы могут быть использованы в дальнейшем при разрешении возможных судебных споров или при оплате страховой компанией понесённых страхователем убытков. Под Обследователем понимается специалист, производящий обследование (осмотр и проверку) чего-нибудь.

(2) Surveyor is a person whose job is to examine buildings, etc, and report on their condition, perhaps for a mortgage provider.

SURVEY REPORT = ОПРОСНЫЙ ОТЧЁТ (или ОТЧЁТ ОБСЛЕДОВАНИЯ, или АВАРИЙНЫЙ СЕРТИФИКАТ) – Survey Report is the detailed report prepared by an insurance agent describing the damages suffered by goods, the possible cause of discrepancies, with all relevant shipping information, to enable insurers to give consideration to the case; expensive document not to be requested for minor claims.

SURVIVAL = ВЫЖИВАНИЕ – Survival:- longevity. Ability to remain viable or infective over time when exposed to seasonal and/or environmental influences. A pathogen may be adapted to survive in soil, in or on crop residues or in seed. Some pathogens produce spores that only remain viable for a few hours while others produce spores or survival structures that remain viable for many years. Some pathogens are able to survive as saprophytes in the absence of a susceptible host. Survival is the act of remaining alive or in existence.

SURVIVOR = ИЖДИВЕНЕЦ (или ВЫЖИВШИЙ) – Survivor:- A Survivor of a disaster, accident, or illness is someone who continues to live afterwards in spite of coming close to death. A Survivor of a very unpleasant experience is a person who has had such an experience, and who is still affected by it. If you describe someone as a Survivor, you approve of the fact that they are able to carry on with their life even though they experience many difficulties. A person's Survivors are the members of their family who continue to live after they have died. The loss of the family wage earner can be devastating both emotionally and financially. Social Security helps by providing income for the families of workers who die. Many people think of Social Security only as a retirement program. But some of the Social Security taxes you pay go toward survivors benefits for workers and their families. In fact, the value of the survivors benefits you have under Social Security is probably more than the value of your individual life insurance. When you die, certain members of your family may be eligible for survivors benefits. These include widows, widowers (and divorced widows and widowers), children, and dependent parents. In the US Survivors Benefits are benefits based on your record (if you should die) are paid to your:- (i) widow/widower age 60 or older, 50 or older if disabled, or any age if caring for a child under age 16 or disabled before age 22; (ii) children, if they are unmarried and under age 18, under 19 but still in school, or 18 or older but disabled before age 22; and (iii) dependent parents, if they are age 62 or older, and if you provided at least one-half of their support. An ex-spouse could also be eligible for a widow/widower's benefit on your record. A special one-time lump sum payment of USD255 may be made to your spouse or minor children. / Иждивение, полное содержание или помощь, являющаяся постоянным основным источником средств к существованию. В бывшем Союзе Советских Социалистических Республик (СССР) иждивение предоставлялось в силу закона или добровольно, как правило, нетрудоспособным лицам. Факт нахождения на иждивении имел юридическое значение при назначении пенсий по случаю потери кормильца, надбавок к государственным пенсиям по старости, по инвалидности, пособий, при возмещении ущерба, наследовании, предоставлении льгот по налогам, квартирной плате и другого. При отсутствии необходимых документов факт нахождения на иждивении мог быть установлен судом. В статистике различались иждивенцы государства, кооперативных и общественных организаций (пенсионеры, стипендиаты, воспитанники детских домов, учащиеся, находившиеся на государственном обеспечении, лица, проживавшие в домах для престарелых и инвалидов) и отдельных граждан (дети, домашние хозяйки и другие).

SUS = SAYBOLT UNIVERSAL SECONDS

SUSCEPTIBILITY = ВОСПРИИМЧИВОСТЬ (или ЧУВСТВИТЕЛЬНОСТЬ) – Susceptibility is the sensitivity to, or, degree to which, a plant is injured by a herbicide treatment.

SUSCEPTIBLE = ВОСПРИИМЧИВОЕ (или ЧУВСТВИТЕЛЬНОЕ) – Susceptible:- having little or no resistance to a specific infectious disease, insect pest, or other biological and physical stresses. When the host plant is unable to suppress or retard an injurious insect. Having no resistance to infection by the pathogen. The infection process, colonisation and production of spores by the pathogen is relatively unimpeded by the host plant.

SUSCEPTIBLE CHECK = ЧУВСТВИТЕЛЬНАЯ ПРОВЕРКА (или ПОДДАЮЩИЙСЯ КОНТРОЛЬ) – Susceptible Check:- xxxxx. See also Standard Check. / Смотрите также Стандартная Проверка (Standard Check).

SUSPENDED LOAD = ВЗВЕШЕННЫЙ НАНОС – Suspended Load:- finer particles of silts and clays carried long distances by rivers; as opposed to bed load (stones and coarse sand) and dissolved load (compounds in solution). / донный нанос (камни и крупный песок) и .

SUSPENSE ACCOUNT = СЧЁТ ПЕРЕХОДЯЩИХ СУММ (или ТРАНЗИТНЫЙ СЧЁТ) – Suspense Account is a temporary holding account for errors and omissions, items that having no proper classification pending until the determination of the proper account about their allocation. On liability side, it would be an account that is used to store short-term funds or securities until a permanent decision is made about their allocation. An account for the temporary entry of charges or credits, pending determination of their ultimate disposal. Frequently used in connection with doubtful accounts receivable. Also known as Interim Account. / Промежуточный Счёт (Suspense Account):- в бухгалтерском учёте это счёт, который используется временно для учёта поступлений и выплат до их анализа и последующей правильной классификации.

SUSPENSION = ПРИОСТАНОВКА – Suspension:- the end of the evening session for specific futures and option markets traded at the Chicago Board of Trade. / Приостановка:- конец вечерней сессии Чикагской Палаты Торговли (Чикагского Табло Торговли, если быть более точными)) для определённых рынков фьючерсов и опционов, торгуемых на этой бирже.

SUSPENSION = СУСПЕНЗИЯ (или ВЗВЕСЬ) – Suspension is a relatively coarse, noncolloidal dispersion of solid particles in a liquid. / Суспензия – относительно крупная, неколлоидная дисперсия твёрдых частиц в жидкости. Под Суспензией, от позднелатинского слова Suspensio, означающее Подвешивание, понимается дисперсная система с жидкой дисперсной средой и твёрдой дисперсной фазой, частицы которой достаточно крупны, чтобы противостоять броуновскому движению. В отличие от высокодисперсных систем, в суспензиях частицы сравнительно быстро выпадают в осадок или всплывают. Суспензии используют в строительной технологии, производстве лакокрасочных материалов, бумаги и прочего.

SUSPENSION CONCENTRATES = КОНЦЕНТРАТЫ СУСПЕНЗИИ (или СУСПЕНЗИОННЫЕ КОНЦЕНТРАТЫ) – Suspension Concentrates (SC) are also referred to as Flowable Concentrates. They are formulated by dispersing small particles in a liquid, usually water. Dispersing and suspending agents are added during formulation to keep these particles suspended in solution.

SUSPENSION CULTURE = СУСПЕНЗИОННАЯ КУЛЬТУРА – Suspension Culture is a type of culture in which cells grow and multiply while suspended in liquid medium. / , от позднелатинского слова Suspensio, означающее Подвешивание, .

SUSPENSION INQUIRY LETTER = ПИСЬМО–ЗАПРОС О ПРИОСТАНОВКЕ – In the US patent law, a Suspension Inquiry Letter:- an Office (the United States Patent and Trademark Office (USPTO)) action inquiring as to the status of the matter that is the basis for suspension of an application. The examining attorney will issue a suspension inquiry letter after an application has been suspended for

six months or more, unless the information is available to the examining attorney in the Office's databases. If the applicant does not respond to the suspension inquiry letter, the application will be abandoned.

SUSPENSION LETTER = ПИСЬМО О ПРИОСТАНОВКЕ – In the US patent law, a Suspension Letter suspends the action on an application. An application may be suspended for a variety of reasons. These include waiting for the disposition of a cited prior pending application to be determined or waiting for an assignment of ownership to be recorded. Applicants do not need to respond to suspension letters.

SUSPENSION OF INVESTIGATION = ПРИОСТАНОВКА РАССЛЕДОВАНИЯ – Suspension Of Investigation:- a decision to suspend an antidumping investigation if the exporters who account for substantially all of the imported merchandise agree to stop exports to the US or agree to revise their prices promptly to eliminate any dumping margin. An investigation may be suspended at any time before a final determination is made. No agreement to suspend an investigation may be made unless effective monitoring of the agreement is practicable and is determined to be in the public interest.

SUSPENSION OF LIQUIDATION = ПРИОСТАНОВКА ЛИКВИДАЦИИ – Suspension Of Liquidation:- if affirmative, the preliminary determination of dumping or subsidization, or final determination after a negative preliminary determination, provides for suspension of liquidation of all entries of merchandise subject to the determination which are entered, or withdrawn from warehouse, for consumption, on or after the date of the publication of the notice in the US Federal Register. Customs is directed to require a cash deposit, or the posting of a bond or other security, for each entry affected equal to the estimated amount of the subsidy or the amount by which the fair value exceeds the US price. When an administrative review is completed, Customs is directed to collect the final subsidy rate or amount by which the foreign market value exceeds the US price, and to require for each entry thereafter a cash deposit equal to the newly determined subsidy rate or margin of dumping. / , от Латинского слова Affirmo, означающее Утверждаю, .

SUSTAINABLE USE = ПОДДЕРЖИВАЕМОЕ ИСПОЛЬЗОВАНИЕ – Sustainable Use is the careful exploitation of natural resources without destroying them. / Поддерживаемое Использование:- бережная разработка природных ресурсов без их уничтожения.

SUSTAINED = УСТОЙЧИВОЕ (или НЕПРЕРЫВНОЕ, или ПОСТОЯННОЕ) – Sustained:- maintained regularly, ongoing over a period of time.

SUSTAINED YIELD = ПОДДЕРЖИВАЕМАЯ УРОЖАЙНОСТЬ – Sustained Yield is a continual annual or periodic yield of plants or plant material from a given area. This implies that the management practices are such, that they will maintain the productive capacity of the land. / Поддерживаемая (или Устойчивая) Урожайность:- постоянная ежегодная или периодическая урожайность растений или растительного материала из данного ареала. Она подразумевает то, что практики возделывания таковы, что они будут поддерживать продуктивный потенциал земли.

SV = EL SALVADOR

SVC = EL SALVADOR COLON

SVEs = SMALL, VULNERABLE ECONOMIES

SVFR = SPECIAL VISUAL FLIGHT RULES

SVRC = SHORT–RANGE VEHICLE TO ROADSIDE COMMUNICATION

SW2 = SAVONIUS WINDMILL–PISTON PUMP SETUP

SWAB = НАДРАИТЬ (или ПОДРАИТЬ, или СВАБ) – Swab (maritime term):- a mop. / швабра.

SWAG = ЛЁМБРЭКЯ (или ГИРЛЯНДА) – Swag is a decorative, draped fabric section placed over a window. Swags usually are used in conjunction with draperies or curtains. / Под Лёмбрэкя или Ламбрекеном, от Французского слова Lambrequin, понимается декоративная драпировка верхней части проёма окна, двери или алькова в виде короткой горизонтальной занавески во всю ширину карниза. Часто выполняется из плотной плиссированной ткани, может иметь дополнительные декоративные элементы в виде кистей, воланов, ритмически расположенных вырезов, например, в виде зубцов. Как правило, ламбрекены размещают поверх штор и крепят к ней же (либо к карнизу). Длина классического ламбрекена составляет 1/5 или 1/6 длины самой шторы. Нередко ламбрекены размещают над кроватью или картиной. Термин также используется в геральдике. В строительстве и архитектуре слово Ламбрекен используется в качестве синонима термина Наличник, обозначая резные или кованые украшения окон или крыш.

SWAK = SEALED WITH A KISS

SWALE = ВЛАЖНАЯ НИЗМЕННОСТЬ – Swale is an elongated trough or depression between a point bar and a river bank; usually seasonally wet or marshy and sometimes covered with dense vegetation.

SWAMP = ЗАЛИВАТЬ (или ЗАТОПЛЯТЬ, или ЗАТОНУТЬ ПРИ ЗАХЛЁСТЫВАНИИ ВОЛНОЙ) – Swamp (maritime term):- sink by filling with water.

SWAMP = ТОПЬ (или ТРЯСИНА, или ЗЫБУН, или СПЛАВИНА, или ЛЕСНОЕ БОЛОТО, или ЗАТОПЛЕНИЕ) – Swamp is an area saturated with water throughout much of the year but with the surface of the soil usually not deeply submerged. See also Bog, Marsh. A Swamp is a wetland that is forested. Many swamps occur along large rivers, where they are critically dependent upon natural water level fluctuations. Other swamps occur on the shores of large lakes. Some swamps have hammocks, or dry-land protrusions, covered by aquatic vegetation, or vegetation that tolerates periodical inundation. The two main types of swamp are 'true' or swamp forests and 'transitional' or shrub swamps. In the boreal regions of Canada, the word swamp is colloquially used for what is more correctly termed a bog or muskeg. The water of a swamp may be fresh water, brackish water or seawater. Some of the world's largest swamps are found along major rivers such as the Amazon, the Mississippi, and the Congo. Conservationists have worked hard to preserve swamps. For example, the swamps in Northwest Indiana have been preserved as part of the Indiana Dunes. Swamps are characterized by very slow-moving waters. They are usually associated with adjacent rivers or lakes. In some cases, rivers become swamps for a distance. Swamps are features of areas with very low topographic relief. Swamps were historically drained to provide additional land for agriculture, and to reduce the threat of diseases born by swamp insects and similar animals. Many swamps were also heavily logged, which also required construction of drainage ditches and canals. These contributed as well to drainage, and, along the coast, allowed salt water intrusion that converted swamps to marsh or open water. Large areas of swamp were therefore lost, or degraded. Louisiana provides a classic example of wetland loss from these combined factors. Europe has probably lost nearly half its wetlands. As another example, New Zealand has lost 90 percent of its wetlands over the past 150 years. It is now appreciated that swamps provide valuable ecological services including flood control, fish production, water purification, carbon storage, and wildlife habitat. In many parts of the world swamps are protected. In parts of Europe and North America, swamp restoration is becoming

widespread. Often the simplest steps to restoring swamps are to plug drainage ditches and remove levees. Famous Examples:- swamps can be found on all continents except Antarctica. The largest swamp in the world is the Amazon River floodplain, which is particularly significant for its large number of fish and tree species. (1) Africa:- the Sudd and the Okavango Delta are Africa's best known marshland areas. (2) Asia:- the Vasyugan Swamp is a large swamp in the western Siberia area of the Russian Federation. This is one of the largest swamps in the world, covering an area larger than Switzerland. The Tigris-Euphrates river system is a large swamp and river system in southern Iraq, traditionally inhabited in part by the Marsh Arabs. (3) Europe:- the Pripyat Swamps in Belarus and Ukraine divided the central and southern theatres of operation during World War II, and served as a hideout for Soviet and Polish partisans. In the summer of 1941, the SS Cavalry Brigade commanded by Hermann Fegelein during the course of 'anti-partisan' operations in the Pripyat Swamps killed nearly 18 000 people. (4) North America:- Atchafalaya Swamp at the lower end of the Mississippi River is the largest swamp in the United States. It is an important example of southern cypress swamp but it has been greatly altered by logging, drainage and levee construction. Other famous swamps in the United States are the Everglades, Okefenokee Swamp, Barley Barber Swamp and the Great Dismal Swamp. The Okefenokee is located in extreme South-Eastern Georgia and extends slightly into North-Eastern Florida. The Great Dismal Swamp lies in extreme southeastern Virginia and extreme northeastern North Carolina. Both are National Wildlife Refuges. Another swamp area, Reelfoot Lake of extreme Western Tennessee and Kentucky, was created by the New Madrid earthquake of 1812. Caddo Lake, the Great Dismal and Reelfoot are swamps that are centered at large lakes. Swamps are often called Bayous in the Southeastern United States, especially in the Gulf Coast region. Land Value and Productivity:- swamps and other wetlands have traditionally held a very low property value compared to fields, prairies, or woodlands. They have a reputation as being unproductive land that can't be easily utilized for human activities, other than perhaps hunting and trapping. Farmers for example typically drained swamps next to their fields so as to gain more land usable for planting crops. Societies now generally understand that swamps are critically important in the processes of providing fresh water and oxygen to all life, and are often breeding grounds for a wide variety of life. Indeed, floodplain swamps are extremely important in fish production. Government environmental agencies (such as the Department of Natural Resources in the United States) are taking steps to protect and preserve swamps and other wetlands. In Europe, major effort is being invested in the restoration of swamp forests along rivers. The worlds largest wetlands include significant areas of swamp, such as in the Amazon and Congo River basins. Further north, however, the largest wetlands are bogs. See also Bog, Fen, and Marsh. Swamp is a wetland dominated by tress or shrubs. Swamp is the wetland ecosystem characterized by mineral soils with poor drainage and by plant life dominated by trees. The latter characteristic distinguishes a swamp from a marsh, in which plant life consists largely of grasses. Swamps are found throughout the world. They exist in areas with poor drainage and sufficient water supply to keep the ground waterlogged, and they have a high enough supply of minerals in the water to stimulate decay of organisms and prevent the accumulation of organic materials. They are often found in regions of low relief associated with rivers that supply the water. Compare Marsh. Rivers in mature valleys frequently have extensive marshes and swamps along their sides. Floodplains elevated only a few feet above river level, abandoned river channels, and oxbows may have standing or sluggishly flowing water for appreciable parts of the year and thus support swamps and marshes. River swamps are abundant along the coastal plain in the southeastern United States. They are delightfully described in their primeval condition by William Bartram in his account Travels Through North and South Carolina, Georgia, East and West Florida, written in 1791. These were the swamps that Francis Marion used so successfully to escape the British forces during the Revolutionary War and the source of his nickname, 'the old swamp fox'. The Great Dismal Swamp, of North Carolina and Virginia, actually a mixture of waterways, swamps, and marshes, is a coastal-plain swamp, although it is not associated with a large river. The Mississippi and its lower tributaries, such as the Red River and parallel rivers in eastern Texas, have extensive swamps along the sluggish portions that flow through the coastal plain. The Paraná and Paraguay rivers in South America have extensive swamps and marshes along their courses. A mixture of swamps and marshes in Georgia called the Okefenokee Swamp is the source of the Suwannee River. The Florida Everglades constitutes a unique marsh-swamp combination growing on a limestone base. Because the region is near sea level, the water from the abundant rains does not drain but remains on the surface. Large cypress swamps occur to the northwest of the Everglades. Topography and water supply are the two most important features in determining the distribution of freshwater swamps. The nature of soils and bedrock is of importance in determining the drainage in a region, but wetlands may exist locally on any base from sands to impervious rock. The flow of water through wetlands is slow because of low gradients and retarding effects of the vegetation. Dead plant matter settles rather than being washed away. The slow replacement and lack of turbulence in the water result in a low rate of oxygen supply. Decay of the dead vegetation quickly uses up what oxygen is supplied, so that the mud and bottom waters are low or lacking in oxygen content. Under these conditions, the decay of organic matter is incomplete. This causes an accumulation of the more resistant fraction (humates and tannins) in the substratum. The familiar swamp water, varying from yellow to such a deep brown that it resembles strong tea or coffee, is the result. The number of plant species in swamps is few compared to the numbers that grow on well-watered but not waterlogged land. Cattails (Typha) and common reeds (Phragmites) are familiar swamp species around the world. Papyrus, a sedge, is widespread in the tropics. Bald cypress is an example of a tree adapted to growth in swamps, but gums, willows, alders, and maples are also common. Tropical swamps have many tree species including palms. Salt swamps are formed by seawater flooding and draining, which exposes flat areas of intertidal land. Regularly flooded, protected areas develop mangrove swamps in tropical and subtropical regions. Mangroves will grow in pure sand at the edge of the sea. Extensive swamps develop mainly where land runoff is sufficient to bring a supply of sediments that accumulate and extend the swamp. The deltas of the Mekong, Amazon, Congo, and Ganges and the North coast of Australia and of Sumatra have notable and extensive mangrove swamps. Tropical swamp trees often develop buttresses that apparently help support them, though buttresses are also common on many upland trees in the tropics. Generally, all swamp trees lack deep-growing roots. Roots tend to stay near the surface, probably because of the lack of oxygen in the soil. Being near the surface gives a large lateral spread to the root system, which also gives the tree support against lateral stresses from winds or water flow. The shallowness of the roots also often produces the appearance of buttresses in temperate swamp trees because the beginnings of the roots, usually hidden in the soil, are visible at the surface. Different species of trees that grow in temporary swamps differ considerably in their resistance to submersion, i.e. to lack of oxygen. This is serious during the submersion period but is not a problem in drier periods, at least in the shallow layers of the soil. In North American swamps, alders and willows will survive or even thrive on land immersed for periods as long as one month, whereas red gum survives only about two weeks. Cottonwood begins to show the effects of submergence after only two days and survives only one week. The tops of mangrove trees shelter a diverse group of animals that are unaffected by seawater, because they never contact it. In general, swamp animals are little affected by wetland conditions except as those conditions affect the species of trees growing in the swamp. Whereas the diversity of plants is limited by the stresses that the presence of water entails, the animal diversity is more a reflection of the plant diversity than the nature of the water supply. / Хэрман Фигеляйн (Hermann Fegelein). Фрэнсис Мэриэн (Francis Marion). Вилъйэм . Под Болотом понимается избыточно увлажнённый участок земной поверхности, заросший влаголюбивыми растениями. В болоте обычно происходит накопление неразложившихся растительных остатков и образование торфа. В основном в Северном полушарии; общая площадь около 350 миллионов га. Под Трясиной или Зыбуном понимаются участки зарастающих водоёмов, покрытые растительностью толщиной до 1–2 метров. Зыбун или Трясина или Сплавина, плавающий на воде зыбкий растительный

ковёр, образованный преимущественно Мхами или другими Растениями, свойственными болотам (Осоки, Вахта и другие). По мере роста зыбуна в толщину (до 1–2 метров) нижние слои его отмирают и падают на дно, превращаясь в торф.

SWAMP RICE = ТОПКИЙ РИС (или БОЛОТИСТЫЙ РИС, или ЗАБОЛОТИСТЫЙ РИС) – Swamp Rice is a Rice that usually grows in low-lying swampy conditions without water control or with little water control. Wet Paddy or Swamp Rice has been grown for a long time in Africa. This Rice is grown on land covered with water for moat of the year. (i) Along banks of rivers and streams:- when the water begins to rise at the beginning of the rainy season, and when the water begins to fall at the end of the rainy season. (ii) In lowland plains covered with water most of the year:- where these plains are covered with a very deep layer of water, people sow floating Rice the stems of floating Rice grow longer when the water rises. But yield varies very much according to how much it rains. With traditional methods it is impossible to give the Rice at the right time the amount of water it needs. The farmer cannot make the water come, when he needs it. He Is not In control of the water. It is impossible to make the water go away, to drain the land. The farmer cannot make the water go away when he does not need it. He is not in control of the water. It is impossible to cover the land with the depth of water that the Rice needs at any time in its life. Rice does not need the same depth of water at all times in its life. The farmer has no control over the depth of the water cover.

SWAP = МЕНА (или СВОП, или КОНТОКОРРЕНТ) – Swap is a contractual arrangements to exchange future cash flows. In the case of pure interest rate swaps, two borrowers with different credit ratings exchange interest payment obligations denominated in the same currency. It is important that interest rates payable on the same principal amount are subject to different interest rate calculations (fixed vs variable) and that no mutual capital claims arise as a result of the swap. The purpose of a swap is to exchange a more favorable credit rating for a corresponding fee. One party receives a consideration for the use of its credit rating, while the other party benefits from lower interest payments. The same applies to currency swaps. Here, exchanged payment obligations are denominated in different currencies. Swaps are transactions in which two parties agree to exchange payment streams based on a specified notional amount for a specified period. Forward-starting swap contracts are reported as swaps. Swaps and related over-the-counter (OTC) derivatives combine characteristics of loans with characteristics of traded capital market instruments. On the one hand, each swap transaction creates a credit relationship between the counterparties, the terms of which need to be negotiated and documented just as would the terms of a traditional loan. But unlike a loan, the credit exposure is two-way and unknown at the inception of the swap. On the other hand, swaps are traded in the market and might involve repeated interaction between two counterparties; renegotiation of credit terms for each transaction would be costly and would act as a drag on trading activity. Consequently, market participants developed the International Swap and Derivatives Association, Inc. (ISDA®) Master Agreement, which would contain the non-economic terms – such as representations and warranties, events of default, and termination events – leaving counterparties free to negotiate only the economic terms – that is, collateral, maturity, notional amount, price, rate, and so on. Additional benefits of the ISDA® Master Agreement include provisions that facilitate payment netting and close-out netting. Also known as Contracts For Differences. An agreement between two parties to exchange cash flows of underlying securities. For example, in an interest rate swap, the most common type of swap, one party agrees to pay a fixed interest rate in return for receiving a variable rate from the other party. Swaps are privately negotiated financial contracts in which two parties agree to exchange, or 'swap', specific price risk exposure over a predetermined period of time. They are over-the-counter (OTC) instruments that can be customised to meet a particular set of needs. Swaps allow for strategies designed to protect against market price fluctuations. There is no 'cost' for swap. When used in connection with floating price energy contracts, swaps afford a buyer and seller protection from adverse price movements, in exchange for giving up the ability to capitalize on benefit price movements. There are no standardised swap transactions. Nonetheless, most transactions involve an exchange of periodic payments between two parties, with one side paying a fixed price and the other side paying a variable price. Specific terms of swap agreements – including the fixed of the weather index and its floating price reference, the terms of the contract, and the quantity to be hedged – are established by the two parties involved, and can vary, subject to their specific needs and objectives. A swap contract is settled in cash, usually against as agreed-upon market price index, and is customised as to volume, timing, location, seasonality, and swing. A tailor-made contractual agreement between two parties for a given quantity and quality of a commodity providing for a series of periodic exchanges of money based on the variation in the market price from the agreed-upon fixed price of the commodity over the agreed-upon time period. Swaps are transactions in which two parties agree to exchange payment streams based on a specified notional amount for a specified period. Forward-starting swap contracts should be reported as swaps. For swaps executed on a forward/forward basis, both forward parts of the transaction should be reported separately. In contrast, in the case of foreign exchange swaps, which are concluded as spot/forward transactions, only the unsettled forward part of the deal is to be reported. Financial term for a combined or simultaneous buying and selling operation. Swap is a custom-tailored, individually negotiated transaction designed to manage financial risk, usually over a period of one to 12 years. Swaps can be conducted directly by two counterparties, or through a third party such as a bank or brokerage house. The writer of the swap, such as a bank or brokerage house, may elect to assume the risk itself, or manage its own market exposure on an exchange. Swap transactions include interest rate swaps, currency swaps, and price swaps for commodities, including energy and metals. In a typical commodity or price swap, parties exchange payments based on changes in the price of a commodity or a market index, while fixing the price they effectively pay for the physical commodity. The transaction enables each party to manage exposure to commodity prices or index values. Settlements are usually made in cash. Spot purchase of foreign exchange (currency swap), fixed or floating rate funds (interest rate swap) or assets (asset swap) with a simultaneous forward sale, or vice-versa. Loss on swap occurs if two things happen:- (i) the counterparty must default; (ii) the swap must have a positive value to the party that does not default. The amount of the loss depends on the credit exposure of the swap. The credit exposure of a swap is the amount that would be lost if default were to occur immediately. Credit exposure is generally equal to the current market value if positive, and zero if current market value is negative. Swap participants also calculate future exposures of swaps, which are potential positive values during the life of the swap; future exposures are used to establish credit charges (expected exposure) and credit limit usage (peak exposure). Swap is:- (1) simultaneous purchase and sale of spot against forward. (2) An exchange between locations. (3) A swap or exchange of different size or quality of gold bars. (4) An agreement whereby a floating price is exchanged for a fixed price over a specified period. Swap is:- (1) Simultaneous purchase and sale of spot against forward. (2) An exchange between different locations. (3) A swap or exchange of different size of quality of bullion bars or platinum/palladium ingots or plates. (4) An agreement whereby a floating price is exchanged for a fixed price over a specified period. Swap is a contract between two parties under which they agree to exchange a series of payments according to a pre-arranged formula. / взаиморасчёт или сведение (netting) . колебания цены. Международная Ассоциация по Свопам и Деривативам, Инк. (МАСД®; The International Swaps And Derivatives Association, Inc. (ISDA®)) . Головное Соглашение. Договор Мены; Сделка Мены; и Предмет Мены. В гражданском праве под Меной понимается договор, в силу которого между сторонами производится обмен одного имущества на другое. С этим понятием неразравно связан и термин Меновая Стоимость, под которым понимается количественное соотношение, в котором обмениваются товары как потребительской стоимости. В меновой стоимости проявляется стоимость товара. Мена, в гражданском праве один из видов договоров, в силу которого между сторонами производится обмен одного имущества на другое. После исполнения договора мены каждая из сторон утрачивает право собственности на передаваемое имущество и приобретает такое право на полученное имущество. Сходство договора

мены, состоящего в возмездной реализации имущества, с куплей-продажей позволяет распространять на него ряд правил о купле-продаже (такой же порядок был установлен в Советском законодательстве). Возникнув как примитивная форма товарного обращения, мена, вытесненная куплей-продажей, в основном утратила значение. По бывшему Советскому праву договор мены заключался обычно между гражданами, он мог совершаться кооперативными и другими общественными организациями. Договор мены с участием государственных организаций мог быть заключён в случаях, прямо предусмотренных законодательством бывшего Союза Советских Социалистических Республик (СССР) и Союзных республик. Мена или Своп:- обмен одних ценных бумаг на другие. Обмен может осуществляться с целью изменения срока погашения портфеля (portfolio) облигаций или качества выпусков в портфеле акций или облигаций или же в связи с изменением целей инвестиций. Инвесторы, которые понесли убытки по портфелю облигаций, часто обменивают свои ценные бумаги на высокодоходные облигации, чтобы увеличить доход по всему портфелю вложений и признать убытки в целях снижения налогообложения. В последние годы наблюдался резкий рост числа более сложных валютных свопов (currency swaps), которые всё больше используются для соединения мировых рынков капитала, и процентных свопов (interest-rate swaps), призванных уменьшить риск путём подбора сроков исполнения активов (duration) и обязательств финансовых институтов по мере роста и увеличения неустойчивости процентных ставок. В простых валютных свопах (свопы могут быть разных степеней сложности) две стороны продают друг другу валюту с обязательством при погашении сделки вернуть обратно основную сумму. Задуманные первоначально как меры, направленные на освобождение от контроля за обменом, валютные свопы широко используются для освоения новых рынков капитала, а фактически – для заимствования средств, независимо оттого, нужны ли заёмщику средства именно с данного рынка. Международный Банк Реконструкции и Развития (МБРР) – Всемирный Банк (International Bank For Reconstruction and Development (IBRD) – World Bank) был активным участником валютных свопов с корпорациями США. Процентный своп – это соглашение, по которому две стороны (контрагенты) вступают в него для обмена периодическими процентными платежами. Сумма в Долларах, которую стороны выплачивают друг другу, является периодически согласуемой процентной ставкой, умноженной на заранее определённую долларовую величину, называемую основной национальной суммой (notational principal amount). Стороны не обмениваются никакими основными суммами, они обмениваются только процентами. Самый простой и распространённый вариант свопа состоит в том, что одна сторона соглашается платить другой фиксированный процент в обмен на плавающую ставку. Выгода процентных свопов, которые позволяют продлить или сократить сроки активов или обязательств, состоит в том, что прямые изменения в контрактных характеристиках активов или обязательств становятся вопросами, затрагивающими только административные, правовые и инвестиционные банковские издержки. Смотрите также Bond Swap, и Substitution.

(1) An Interest Rate Swap is an agreement between two parties to exchange interest rate payments on a fixed (notional) amount of debt. In its standard (generic) form, one party to the swap agrees to pay a fixed interest rate in exchange for receiving a variable (floating) rate on the swap's notional amount. The reverse position is taken by the counterparty. Typically, the floating rate side of the swap is tied to the three- or six-month LIBOR (London Interbank Offer Rate). In foreign exchange, an exchange of bank balances. Swaps are used to exchange one currency for another and then back again for a fixed period of time. The swap rate calculation indicates the interest rate differential between two underlying currencies. Swaps between central banks serve to bridge international liquidity crises and are frequently carried out in connection with the International Monetary Fund (IMF). Swaps between a central bank and the commercial banks of a particular country:- in Switzerland, such swaps are executed by the Swiss National Bank (SNB) either to generate liquidity (e.g., by temporarily acquiring USD against CHF) or to drain liquidity (e.g., by acquiring CHF against USD). Such operations are still an important instrument for the control of the money supply. Swap is an arrangement between the central banks of two countries for standby credit to facilitate the exchange of each other's currencies. / , например, . (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)).

(2) Swap:- in general, the exchange of one asset or liability for a similar asset or liability for the purpose of lengthening or shortening maturities, or raising or lowering coupon rates, to maximize revenue or minimize financing costs. This may entail selling one securities issue and buying another in foreign currency; it may entail buying a currency on the spot market and simultaneously selling it forward. Swaps also may involve exchanging income flows; for example, exchanging the fixed rate coupon stream of a bond for a variable rate payment stream, or vice versa, while not swapping the principal component of the bond. Swaps are generally traded over-the-counter.

(3) Foreign Exchange Swaps serve to hedge the exchange rate of export balances.

(4) Money and Capital Market Swaps are carried out as cross-currency swaps, interest swaps, or combined cross-currency/interest swaps.

(5) Debt-Equity Swaps:- temporary assignment or conversion of debt into shares or similar equity paper.

(6) In the United States, Swap is a transaction used to minimize the impact of capital gains tax. A shareholder sells his or her holding after trading closes for the day, for tax purposes. Next morning, the shareholder buys his or her holding back. Also known as Bed And Breakfast Deal in the United Kingdom.

(7) Swap:- the risk transfer characteristics of cat-bonds can be replicated through a mechanism called Catastrophe Risk Swaps. In the risk swap the cedant makes fixed payments equal to the premiums paid in a cat-bond structure against receipt of claims compensation in case losses occur (indemnity basis). Just like the risk-linked securities, the catastrophe risk swap can be based on different types of triggers such as indemnity losses, loss indices, physical indicators, or parametric formulas. The potential benefit of the risk swap is that it can be established directly with a counter-party based on standardized swap documentation. This can be a faster and cheaper route to get risk coverage. However, the risk swap entails a counter-party credit risk, presumably on an insurance company or possibly a bank. There are formal regulatory limitations to the wider use of catastrophe risk swaps in most markets, with the exception of certain off-shore havens, because the swap agreements in many instances would be deemed insurance contracts that consequently could only be countered by chartered insurance companies. In other words, the insurance cover can only be realized if the swap counterpart is solvent when the trigger events occur. Hence, catastrophe risk swaps can increase flexibility when transacting in the conventional reinsurance market, but they impose additional credit risk exposures. This is in contrast to the risk securitization approach. Here the credit risk is very low because the proceeds from the bonds are placed in a trust fund as collateral for the underlying insurance contract. The risk-linked securities are placed among many institutional investors, which diversifies the risk exposure and provides access to a new source of catastrophe risk transfer.

(8) Swap is an agreement for an exchange of payments between two counterparties at some point(s) in the future and according to a specified formula. A Swap is a privately negotiated agreement between two parties to exchange cash flows at specified intervals (payment dates) during the agreed-upon life of the contract (maturity or tenor). Entering a swap typically does not require the payment of a fee. Cash-settled bilateral agreements between two parties. The swap transaction does not entail physical delivery of cotton. It is not exchange-traded, but rather an over-the-counter (OTC) instrument offered by brokers to customers to protect against adverse price movements, usually utilizing a non-New York quote, in order to avoid basis risk. There is a concrete buyer and a seller for each swap

contract, and parties are matched with the help of a broker. The buyer of a fixed price swap for a forward month is due money from the seller should the reference price in the forward month be higher than the agreed swap price on a predetermined quantity of cotton. Likewise, the buyer will owe money to the seller should the reference price in the forward month be lower than the agreed swap price. By entering into the swap transaction, parties can effectively lock in a fixed price by entering into the physical cotton market in the future to match their swap positions with a physical cotton position. This hedging strategy is similar to hedging with cotton futures. However, there is no basis risk for quality descriptions different from the New York futures contract. Most of the terms of the swap contract such as quantity, reference quote, settlement month or date are negotiable between the parties. As opposed to exchange-traded contracts, cotton swaps transactions involve a counterparty credit risk, and it is customary for counterparties to offer and/or request letters of credit for a specified percentage of the total value of the swap contract.

(9) Swaps or Forward Swaps:- in the conventions of the precious metals markets, the word 'Swap', unless otherwise qualified, refers to a buy metal spot/sell metal forward transaction from the borrower's perspective. From the lender's perspective, it is a sell metal spot/buy metal forward deal. Thus metal is lent or borrowed against currency, which some participants refer to as lending on the swap or borrowing on the swap to differentiate from loans and deposits. Swaps may be transacted with both legs of the deal for value dates beyond spot. Such transactions are termed forward/forward swaps. Somewhat confusingly, some non-traditional market participants use the word 'Swap' to refer to a cash-settled outright forward transaction. Such transactions, which were more commonly used in the mid-1990s, can also be referred to as 'Commodity-' or 'Financially-Settled Swaps'. Cash-settled swaps are outright forward transactions conducted with the intention that the deal will not be settled by delivery of metal and settlement of currency countervalue, but by the payment of the difference between the countervalue of the contract and the value of the contract at maturity. In other words the difference in value is 'cash-settled'. / На Внеучётном Рынке благородных металлов в Лондоне, СК, под Свопом понимается .

SWAP ARRANGEMENTS = ДОГОВОРЁННОСТИ О МЕНЕ (или ДОГОВОРЁННОСТИ О СВОПАХ) – In the United States, Swap Arrangements are the short-term reciprocal lines of credit between the Federal Reserve and 14 foreign central banks as well as the Bank for International Settlements. Through a swap transaction, the Federal Reserve can, in effect, borrow foreign currency in order to purchase Dollars in the foreign exchange market. In doing so, the demand for Dollars and the Dollar's foreign exchange value are increased. Similarly, the Federal Reserve can temporarily provide Dollars to foreign central banks through swap arrangements.

SWAP BODY = СЪЁМНЫЙ КУЗОВ (или СЪЁМНЫЙ ФУРГОН, СЪЁМНОЕ ТРАНСПОРТНОЕ СРЕДСТВО, или ЗАМЕНЯЕМОЕ ТРАНСПОРТНОЕ СРЕДСТВО) – The Swap Body derives from a progressive re-shaping of containers in order to improve the commercial and operational attraction for in-land European road freight traffic. The external dimension of the swap body was set at 2.5 m, in order to take the maximum benefit in road transport, the operational capability was restricted in order to reduce weight and expenses, so originally the swap body was not intended to be stackable one on top of the other. Most recent advances of the market lead to the definition of two series of swap bodies recognised also for marine use. Swap-Body means a cargo transport unit (CTU) with at least four fittings for accommodating twist locks that take into account ISO standard 1161:1983 not permanently attached to an underframe and wheels or to a chassis and wheels. A swap-body need not be stackable but is usually equipped with support legs, designed especially for combined road/rail transport. Swap Bodies are vehicle bodies that are not permanently fixed to the carrying vehicle. They are similar to containers and are locked to the carrying vehicles in the same way using twist locks. At the loading bays, the swap bodies can be stored standing on their own legs. They are suitable for use for multimodal transport by road and rail and have grappler pockets which allow them to be moved using gantry cranes. Also known as Demountable Body. / Под Фургоном, от Французского слова Fourgon, понимается специализированный закрытый кузов грузового или грузо-пассажирского автомобиля, прицепа или полуприцепа для перевозки грузов. Фургоны могут быть общего назначения или специализированными, последние имеют внутреннее оборудование, приспособления для перевозки грузов определённого вида (например, лотки для хлебобулочных изделий). Фургоны обычно делятся на цельнометаллические и дерево-металлические (с деревянным каркасом и металлической обшивкой). На автомобилях особо малой грузоподъёмности (до 1 тонны (т)) фургоны объединяют с кабиной, но грузовое помещение отделяют от кабины перегородкой со смотровым стеклом. Для погрузки и выгрузки служит задняя (иногда и боковая) одно- или двустворчатая дверь.

SWAP OPTION = ОПЦИОН НА СВОП – A Swap Option (Swaption) gives the holder the right – but not the obligation – to enter an interest rate swap at an agreed upon fixed rate until or at some future date. Swap Option is a transaction in which one party grants to the other party the right (in consideration for a premium payment), but not the obligation, to enter into a swap with certain specified term. In some cases the swap option may be settled with a cash payment equal to the market value of the underlying swap at the time of the exercise. Also known as Swaption.

SWAPPING = ВЫНУЖДЕННЫЙ ОБМЕН – Swapping:- selling one security and buying a similar one almost at the same time to take a loss, usually for tax purposes. / Продажа и практически одновременная покупка одной и той же ценной бумаги с несением при этом убытка, как правило, в целях налогообложения.

SWAPTION = СВОПЦИОН (или ОПЦИОН НА СВОП) – Swaptions are options under which the seller grants the purchaser the right, but not the obligation, to enter into a currency or interest rate swap at a predetermined price by or on a set date. In consideration, the seller receives a premium from the purchaser. Swaption is an option to enter an interest rate swap. A payer swaption gives the purchaser the right to pay fixed, a receiver swaption gives the purchaser the right to receive fixed (pay floating). Apart from those in the sterling market, many swaptions are capital-market driven. Good-quality borrowers are able to issue putable or callable bonds and use the swaptions market to reduce their financing costs. In the case of callable bonds, the issuer effectively buys an option from the investor in return for a slightly higher coupon, so that it may benefit if rates decline. Because many of these embedded options have traditionally been underpriced, good-quality borrowers have been able to monetize this anomaly by selling an equivalent swaption (a receiver swaption) to a bank at market rates. The profit from this arbitrage lowers funding costs. If the swaption is exercised against the issuer, it calls the bonds (although the issuer would almost certainly have called the issue given the reduction in rates). In the case of putable bonds, the borrower sells a swaption to the swaption market. The premium gained lowers the funding cost at the expense of leaving the borrower unsure of the maturity of the debt. An option to enter into a swap contract. An option to enter into a swap, i.e. the right, but not the obligation, to enter into a specified type of swap at a specified future date. A Swaption (Swap Option) gives the holder the right – but not the obligation – to enter an interest rate swap at an agreed upon fixed rate until or at some future date. Swaption is an option on a swap. Agreement giving the buyer of the option the right, in return for the payment of an option premium, to enter into a swap on a prearranged date, at a fixed term and rate of interest. / Опцион на операцию со свопом, то есть право, но не обязательство совершить сделку с указанным типом свопа на указанную дату в будущем. Свопцион или Опцион На Своп:- опцион для вхождения в процентный своп. Свопцион плательщика (payer swaption) даёт его покупателю право, но не обязательство, войти в процентный своп при данной ставке в пределах конкретного периода времени. Покупатель свопциона платит за это право премию продавцу. Свопцион получателя (receiver swaption) даёт покупателю право получать

фиксированные платежи. Продавец соглашается предоставить указанный своп, если придётся его востребовать, хотя он может захэдьжировать этот риск другими компенсирующими сделками.

SWARF = МЕТАЛЛИЧЕСКИЕ ОПИЛКИ (или МЕЛКАЯ МЕТАЛЛИЧЕСКАЯ СТРУЖКА) – Swarf:- the cuttings, and grinding fines that result from metal working operations.

SWATCH = ОБРАЗЧИК – Swatch is a small piece of fabric, usually large enough to show color and pattern. It is given to a potential buyer as a sample. Swatch is a piece of fabric used as a representative sample of any fabric. / Маленький образец ткани.

SWCB = SOUTHWESTERN CORN BORER

SWEAT DAMAGE = ПОВРЕЖДЕНИЕ ВСЛЕДСТВИЕ ОТПОТЕВАНИЯ (или ПОВРЕЖДЕНИЕ ВСЛЕДСТВИЕ КОНДЕНСАЦИИ) – Sweat Damage is the cargo damage caused by water condensing from humid air inside a container or hold of a vessel due to a drop in the outside temperature. Damage caused to cargo by condensation, usually due to lack of ventilation in a ship's hold. / Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

SWEATSHIRT = ТОЛСТОВКА (или ФУФАЙКА, или ФУТБОЛКА, или СВИТЕР) – Sweatshirt is a loose, collarless, heavy cotton Jersey pullover. It also is found in a lacket style with a hood. / Дьжози (Jersey).

SWEATSHIRT FABRIC = ФУФАЕЧНАЯ ТКАНЬ – Sweatshirt Fabric is a knitted fabric with a smooth face and a fleecy, pile back. Sweatshirts were originally designed for exercise during which perspiration was encouraged, but they are also worn for warmth in cold weather and are available in several styles. They were made of cotton for its absorbency, but acrylic versions are also available.

SWEEPER = СБОРЩИК – Sweeper:- container with freight to many destinations. / Контейнер с грузом во многие места назначения.

SWEEPINGS = (ГРЯЗНАЯ) ПОДМЕТЬ – Mill Sweepings, or Factory Sweepings and Mixed Wastes are apt to contain seed, fiber, twigs, dirt and almost any discarded material which litters the floor of a mill or factory. Also known as Mixed Wastes. / Цеховая Подметь (Mill Sweepings) или Фабричная Подметь (Factory Sweepings) и Смешанные Отходы (Mixed Wastes) подходят для описания семени, волокна, сбегов/рвани/веточек, грязной подмети и едва ли не к любому отброшенному материалу, которые засоряют пол в цехах или на фабриках. Известны также как Смешанные Отходы (Mixed Wastes).

SWEEP NET = СБОРНАЯ СЕТЬ (или САЧОК, или СЕТЬ РАЗВЁРТКИ) – Sweep Net is a sturdy net composed of a 15-inch (standard size) rigid wire support and a heavy-duty cloth bag used to 'sweep' across the upper canopy of cotton plants to assess insect populations.

SWEET CLASS = КЛАСС ПРЕСНОСТИ (или КЛАСС СЛАДКОСТИ) – Sweat Class:- classification of sweat water according to intensity. Grades range from 0 (no sweat water) through to 6 (greatest formation of sweat water). The classification is made by observing the volume of water produced per m^2 surface, thus how many grams of sweat water appear for each square meter for each of the grades.

SWEET CRUDE OIL = МАЛОСЕРНИСТАЯ НЕФТЬ – Sweet Crude Oil is considered Sweet if it contains less than 0.5% sulfur. In comparison, sour crude oil contains impurity sulfur levels larger than 0.5%. Sweet crude oil contains small amounts of hydrogen sulfide and carbon dioxide and it is commonly used for processing into gasoline, kerosene, and high-quality diesel. Before sour crude oil can be refined into gasoline, impurities need to be removed, therefore increasing the cost of processing. This results in a higher-priced gasoline than that made from sweet crude oil. For this reason sour crude is usually processed into heavy oil such as diesel and fuel oil rather than gasoline to reduce processing costs. The sweet light crude oil Western Texas Intermediate (WTI) is used as a benchmark in oil pricing. Industry term which denote the relative degree of a given crude oil's sulfur content. Sweet crude refers to those crudes with sulfur content of less than 0.5%. See also Sour Crude Oil. / Отраслевой термин, который означает относительную степень содержания серы в сырой нефти. Малосернистая относится к тем типам нефти, содержание серы в которых не превышает 0.5%. Смотрите также Сернистая Нефть (Sour Crude Oil).

SWEET DAMAGE = ДУШИСТОЕ ПОВРЕЖДЕНИЕ – Sweat Damage:- it is a well known fact that dampness seriously affects dry cargoes. Moisture trapped inside a container during a long trip causes packages to soften and deform, metal cars to rust, powders to harden, etc. Many types of cargoes (e.g., green Coffee) and packing materials can also contain moisture, especially after having been stored in wet or humid environments. Pallets, dunnage wood, wooden supports, filling materials and others can also be absorbent and retain moisture, especially when they are made from green (unseasoned) wood. When the container is closed, excess moisture in the air condenses on relatively cool surfaces. Particularly items near the floor of the container may become wet.

SWEET GAS = МАЛОСЕРНИСТЫЙ ГАЗ – Sweet Gas is the raw natural gas with a relatively low concentration of sulphur compounds, such as hydrogen sulphide. / Необработанный природный газ с относительно низким содержанием соединений серы, таких как сероводород.

SWEETHEART BUST = БЮСТ СЛАДКОЕ СЕРДЦЕ (или ГРУДЬ С СЕРДЕЧКОМ, или НА ГРУДИ СЕРДЕЧКОМ) – Sweetheart Bust is a type of bust line used to describe a garment – instead of collar type, because of the lack of a collar – when the bust line is shaped like the top of a heart (heart as in symbol, not organ). Commonly found in formal dresses from the 1950's.

SWEETHEART NECKLINE = ВЫРЕЗ В ФОРМЕ СЕРДЕЧКА – Sweetheart Neckline is a low-cut neckline with the bottom edge cut in a shape resembling the top of a heart.

SWEET RICE = СЛАДКОВАТЫЙ РИС (или СЛАДКИЙ РИС) – Sweet Rice, also called Sticky Rice, Waxy Rice, or Glutinous Rice, is characterized by short, plumpy, white-kerneled grains that stick together when cooked. Sweet Rice is more commonly used in commercial applications, as an ingredient in snacks and as a binder in gravies and sauces. / Сладкий Рис – вид маленького и гладкого Риса. Богат белком. После варки становится клейким. Из него готовят суши. Он подходит для стабилизации уровня сахара в крови при диабете. Не стоит применять его при обилии слизи и жидкости и при повышенной температуре.

SWELL = ВОЛНЕНИЕ (или НАКАТ) – Swell (maritime term):- a large wave. / большая волна.

SWELLABILITY = НАБУХАЕМОСТЬ (или РАЗБУХАЕМОСТЬ, или ВСПУЧИВАЕМОСТЬ) – Swellability is an increase in volume of solid substances, particularly hygroscopic substances, (paper, natural fibers) as a result of exposure to moisture.

SWELLING = ВАЛЕК (или ШИШКА, или НАБУХАНИЕ, или РАЗБУХАНИЕ) – Swelling:- in textile usage, expanding of a fiber caused by the influence of a solvent or chemical agent. A property often used to facilitate dyeing.

SWIFT = SOCIETY FOR WORLDWIDE INTERBANK FINANCIAL TELECOMMUNICATION

SWIFT = БАРАН МОТОВИЛА (или РОГУЛЬКА, или ФИГУРКА) – A Swift has an expanding core that can be adjusted to fit various skeins. This allows spinners to help keep the hank of yarn in some kind of order while unwinding it. I know of two main kinds of swifts:- the umbrella and squirrel cage. Swift is a tool for unwinding skeins.

SWIFT ACCESS POINT = ПУНКТ ДОСТУПА К СВМФДС – SWIFT Access Point is the local node of the distributed SWIFT II network, primarily used to provide users' connections, input message validation, and output message queues. Also known as SAP. / Локальный узел Сообщества по Всемирной Межбанковской Финансовой Дальней Связи II (СВМФДС II; The Society for Worldwide Interbank Financial Telecommunication (SWIFT II)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SWIFT ACKNOWLEDGEMENT = ПОДТВЕРЖДЕНИЕ СВМФДС – SWIFT Acknowledgement (SAK) that, a syntactically correct payment message has reached the network. / Подтверждение Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)), . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SWIFT ADDRESS = АДРЕС В СВМФДС – SWIFT Address:- a standard form of addressing and referring to SWIFT Members, Sub-members and Participants, using Bank Identifier Codes (BICs). / Стандартная форма адресования и ссылки на Членов, Суб-членов и Участников Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)), использующая Банковские Идентификационные Коды (БИКи; Bank Identifier Codes (BICs)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SWIFT CHARACTER SET = ТИПИЧНЫЙ КОМПЛЕКТ СВМФДС – SWIFT Character Set:- this character set is described in the SWIFT User Handbook 'Standards – General Information'. / описанный в пособии пользователя Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)), называемом 'Стандарты – Общая Информация' ('Standards – General Information'). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SWIFT'S OPERATING CENTER = ОПЕРАЦИОННЫЙ ЦЕНТР СВМФДС – SWIFT Operating Center:- SWIFT has operating centers in both Europe and the US where the transaction data is stored temporarily. Due to continuous data mirroring, the data stored on the operating center servers is always identical. This mirroring is carried out for security reasons so that if one operating center malfunctions, international payments can continue to be processed by the other operating center. Maintaining a geographically separated back-up infrastructure, to ensure continued operation, is in line with international standards and supervisory requirements. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) имеет операционные центры и в Европе и в США, . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SWIFT TRANSPORT NETWORK = СЕТЬ ПЕРЕДАЧИ ДАННЫХ СВМФДС – SWIFT Transport Network:- the collection of SWIFT-controlled equipment and circuits, located world-wide, which provides the user organization with access to SWIFT services, by facilitating physical communication between user computer-based terminals (CBTs) and SWIFT sites. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SWING = ОТКЛОНЕНИЕ (или РАСКАЧКА, или ЗАВИСАНИЕ, или КОЛЕБАНИЕ) – Swing:- variations in gas supply or demand. A contractual commitment allowing a buyer to vary up to specified limits the amount of gas it can take at the wellhead, beach or border; the maximum daily contract quantity is usually expressed as a percentage of the annual contract quantity (100% equates to zero swing). In the study, the swing is the maximum gas monthly delivery divided by the average monthly delivery in a given year. See also Swing Factor.

SWING CHARTING = МГНОВЕННОЕ ПОСТРОЕНИЕ ГРАФИКА (или ГРАФИЧЕСКАЯ ОЦЕНКА ЗАВИСАНИЙ (или РЕЗКИХ КОЛЕБАНИЙ)) – Swing Charting is a concept based on the use of a filter. Once prices have moved by the distance specified by this filter, a new line is drawn next to the previous one. In a nutshell, it is a chart that shows up and down price movement of a minimum size regardless of the time it takes.

SWING FACTOR = ФАКТОР ОТКЛОНЕНИЯ (или РАСКАЧКИ, или РАЗМАХА, или КОЛЕБАНИЯ) (или МГНОВЕННЫЙ ФАКТОР) – In gas purchasing agreements the Swing Factor is a measure of the flexibility to vary nominations and is expressed as a ratio of peak to average supplies. See also Swing.

SWINGING OVER = ОПРОКИДЫВАНИЕ – Swinging Over (maritime term):- swing of the boom from one side of the ship to the other when the tack is changed.

SWING SHIP = РАЗВОРАЧИВАЮЩИЙСЯ КОРАБЛЬ – Swing Ship (maritime term):- the evolution of swinging a ship's head through several headings to obtain compass errors for the purpose of making a deviation table.

SWING SUPPLY = ЗАВИСАЮЩЕЕ ПРЕДЛОЖЕНИЕ (или ПОСТАВКА СО СТОРОНЫ, или ПРОМЕЖУТОЧНАЯ ПОСТАВКА, или МГНОВЕННАЯ ПОСТАВКА) – Swing Supply:- a surplus in a location which gives flexibility with respect to destination. In the crude market, West African is the classic example of swing supply. In the product market, products from the Middle East and Northern Africa are swing supply.

SWING TRADE = ЗАВИСАЮЩАЯ ТОРГОВЛЯ (или ТОРГОВЛЯ С ЗАВИСАНИЕМ) – Swinging the market:- swing traders look for a profit that is at least twice as large as their risk. That usually means they will allow the market to pull back for several bars, even after the trade goes a considerable distance to their target. Pure swing trading means that traders do not exit the position until there is a signal in the opposite direction. If one triggers, they will exit and then may reverse. As the trend progresses, swing traders trail their protective stops. For example, in a bull trend, after the market pulls back and then makes a new high, many traders move their protective stops to just below the low of the most recent pullback. Eventually, the protective stops can be so far above their entry price that they still will have a sizable profit if they get stopped out. During the spike (strong) phase of a trend, traders should trade only in the direction of the trend and look for any reason to enter. For example, in a bull spike, traders will buy at the market, at the close of every bull trend bar, below the low of the prior bar and on the close of any bear bar (expecting any attempt to reverse the trend to be brief and unsuccessful). Swing Trade is a short term trading technique designed to capture quick moves in the markets. / Зависающая Торговля или Торговля С Зависанием – техника краткосрочной биржевой торговли, предназначенная для оседлания быстрых изменений цен на рынках.

SWING TRADER = ЗАВИСАЮЩИЙ ТОРГОВЕЦ – Swing Trader is a short-term trader that looks for small set up patterns as an entry to a trade that is expected to last less than two days, or until a predetermined profit objective has been met.

SWINT = XX – Swint:- perspiration on the wool fiber. / выпотевание на шерстяном волокне.

SWISS = ШВЕЙЦАРКА (или ШВЕЙЦАРСКАЯ) – Swiss is a fine, sheer, lightweight, crisp fabric of almost any fiber whose name has been almost forgotten except in the form of dotted (or figured) Swiss. It is used for curtains. See Dotted Swiss.

SWISS DOT = ШВЕЙЦАРСКИЙ ПУНКТИР – Swiss Dot is another term for Dotted Swiss. See also Dotted Swiss.

SWISS FRANC BOND ISSUES OF FOREIGN BORROWERS = ВЫПУСКИ ИНОСТРАННЫМИ ЗАЁМЩИКАМИ ОБЛИГАЦИЙ В ШВЕЙЦАРСКИХ ФРАНКАХ – Swiss Frank Bond Issues Of Foreign Borrowers:- CHF-denominated bond offerings (mostly straight, convertible or warrant issues) placed on the Swiss capital market by foreign borrowers (companies, government agencies or states). Usually run for 5 to 15 years.

THE SWISS INTERBANK CLEARING SYSTEM = ШВЕЙЦАРСКАЯ МЕЖБАНКОВСКАЯ КЛИРИНГОВАЯ СИСТЕМА – The Swiss Interbank Clearing (SIC) system is electronic interbank clearing system. It processes payment transfers among the banks under the supervision of the Swiss National Bank (SNB; headquartered in Berne, Switzerland). Swiss Interbank Clearing (SIC) is the central electronic Swiss payment system in which the participating financial institutions process their large-value payments as well as a part of their retail payments in Swiss Francs. SIC is operated on behalf of the Swiss National Bank (SNB) by SIX Interbank Clearing Ltd (SIC Ltd), a subsidiary of SIX Group Ltd. At the end of 2008, around 350 Swiss and foreign financial institutions were participating in SIC. Over 2008 as a whole, the system handled a daily average of 1.5 million payments with the value of CHF230 billion. On peak days, SIC processed over 4 million payments totalling up to CHF343 billion. The majority of cashless payment transactions in Switzerland are thus settled through SIC. In addition, the SIC system plays a central role in the implementation of the SNB's monetary policy. SIC is therefore very important for the functioning of the Swiss financial centre and is a key element in the Swiss Value Chain. The Swiss Value Chain is the term used to describe the fully electronic integration of the trade, clearing and settlement of shares, bonds, derivatives and structured products in Switzerland. This article aims to familiarise a wider audience with the way SIC works. The first section is devoted to matters of governance as well as the legal provisions. The article then continues with a description of the main features of the SIC system. The third section explains the risks inherent in a payment system and how they may be reduced or eliminated in SIC. Governance and legal provisions:- SIC has been operated by SIC Ltd on behalf of the SNB since June 1987. The SNB is the system manager. In this function, it lays down the conditions for admission to and exclusion from the SIC system. It provides the liquidity necessary for settlement in SIC, sets times when operations begin and end, and maintains the accounts of the participating financial institutions. In addition, the SNB monitors daily operations and is responsible for crisis management in the event of disruptions or incidents. SIC Ltd operates and maintains the processing centres as well as the communications and security installations. It also develops and maintains the software and manages the data files as well as the organisational and administrative rules of conduct in SIC. SIC Ltd is 75% owned by SIX Group Ltd (Swiss Infrastructure and Exchange), while PostFinance holds a 25% stake. The shareholders in SIX Group are the Swiss big banks (30.12%), foreign banks in Switzerland (22.68%), commercial and asset management banks (14.96%), cantonal banks (13.64%), private bankers (10.17%) and regional and Raiffeisen banks (4.09%). Other banks account for 1.23%. SIX Group and its companies hold the remaining 3.11%. The SNB considers the SIC payment system to be important for the stability of the Swiss financial system. It is therefore subject to SNB oversight. Principal features of the SIC system:- this section provides a description of main features of the SIC system. They comprise real-time gross settlement, account management, the process sequence of a settlement day, the supply of liquidity to SIC participants and the links to other payment and securities settlement systems. (1) Real-time gross settlement:- SIC is a real-time gross settlement system (RTGS). In contrast to net payment systems, where incoming and outgoing payments are accumulated and the net amount settled irrevocably and with finality at a later, predetermined time, the process is continuous at SIC, with each payment being settled individually, irrevocably and with finality. RTGS systems have been introduced in many countries in the last few years. In most cases, they are used exclusively for the settlement of large-value payments. In addition to large-value payments, SIC also processes retail payments individually and is, in this regard, an exception. (2) Account management:- the deposits which SIC participants hold in their sight deposit accounts at the SNB serve as the means of payment. Payments are thus settled with central bank money. A sight deposit account consists of a master account and a SIC settlement account. The master account is used for cash withdrawals and direct transactions with the SNB which are routed through the SNB's accounting system. Interbank transactions in SIC are routed via the SIC settlement account. The reason for having a separate master account and settlement account is of a technical nature; from a legal repoint of view, both accounts are considered as one. An additional SIC sub-account is available to those SIC participants that are linked to the international foreign exchange settlement system, Continuous Linked Settlement (CLS). In this sub-account, banks can reserve liquidity to be used exclusively for time-critical payments to CLS Bank. (3) Process sequence of a settlement day:- participants can enter their payment orders in SIC around the clock. Payments are processed for approximately 23 hours. The process sequence of a settlement day in SIC is described in more detail in the chart below. A settlement day starts at approximately 05:00 pm on the previous calendar day and ends on the value date at 04:15 pm. All payments entered by 03:00 pm (clearing stop 1) are settled as of the same value date. Customer payments entered after clearing stop 1, however, will be settled as of the following value date. Cover payments, however, may also be submitted for same-day settlement between 03:00 pm and 04:00 pm (clearing stop 2). Cover payments are bank-to-bank payments that are made in the name and on account of the bank issuing the transfer order. The reason for such payments may, for instance, be money market transactions. Consequently, the interval between clearing stop 1 and clearing stop 2 allows those participants whose payments could not be fully processed, to procure the necessary liquidity on the money market. In addition, between 04:00 pm and 04:15 pm (clearing stop 3), counterparties may also obtain liquidity from the SNB under the liquidity-shortage financing facility via special-rate repo transactions. The SIC day closes with end-of-day processing of payments. The system cancels all payments still pending and transfers the balance from the SIC settlement account to the master account. The next value date begins at approximately 05:00 pm, and the balances of the individual master accounts are transferred to the SIC settlement accounts. Payments are only settled in SIC if the remitting party has sufficient cover in its SIC settlement account. Any time the participant enters a new payment, it is first queued. If there is sufficient cover in the SIC settlement account, the payment order only remains in the queuing system for a few seconds and will then be settled immediately. If cover is insufficient, the payment remains in the queuing system until there are sufficient liquid funds. SIC participants can manage the settlement sequence of their payments by assigning payments to priority classes. The exact settlement sequence of the payments in the queuing system is then determined by an algorithm, the functioning of which is described in the box to the right. Payments in the queuing system can be revoked by the remitter at any time up to clearing stop 1 (03:00 pm) without the consent of the recipient (After clearing stop 1, the receiving bank must consent to the cancellation of a payment. This rule helps banks to better manage their expected liquidity inflows shortly before the end of the SIC processing day). Payments remaining in the queuing system at the end of the settlement day on account of insufficient cover will be deleted and must be resubmitted. In such a case, the recipient of the payment that was not settled is entitled to charge the remitter default interest amounting to the prevailing money market rate plus half a percentage point. (4) Liquidity supply:- in order to make

payments in SIC, participants must have sufficient liquidity in the form of sight deposits at the SNB. From the viewpoint of a participant, there are essentially two sources of liquidity:- other system participants and the SNB. The first source of liquidity are other system participants. In making payments, they supply a participant with liquidity in the course of the day. The incoming liquidity can be used immediately for settling one's own payments. In addition, participants can temporarily borrow liquidity from other system participants on the interbank money market (or lend excess liquidity). Both incoming and outgoing payments and money market transactions merely result in a redistribution of liquidity in the system. The SNB is the second source of liquidity for system participants. Unlike payments and money market transactions between banks, each transaction between the SNB and a system participant results in a change in the liquidity available in the system. With its monetary policy instruments, the SNB is therefore able to steer the aggregate level of liquidity in the SIC system. For the SNB's monetary policy instruments, a distinction is made between open market operations and standing facilities. In both cases, repo transactions are the SNB's principal monetary policy instrument. From the viewpoint of the payment transactions in SIC, standing facilities are of central importance. They include the intraday facility and the liquidity-shortage financing facility:- (i) intraday facility:- in order to facilitate the processing of payment transactions in SIC, the SNB provides SIC participants with interest-free liquidity during the day via repo transactions. Participants may notify the SNB of their intraday liquidity requirements on the preceding calendar day (at approximately 04:00 pm). The corresponding repo transactions will then be carried out at approximately 06:00 pm. Between 08:00 am and 02:45 pm, SIC participants have another opportunity to obtain additional intraday liquidity. The funds obtained must be repaid to the SNB by the end of the same value date at the latest. In this way, the sight deposit balances at the end of the day are not affected. In the event of late repayment, the SNB will charge penalty interest at the rate of one percentage point above the call money rate. (ii) Liquidity-shortage financing facility:- the SNB provides SIC participants with call money in the form of a liquidity-shortage financing facility, to enable them to bridge short-term liquidity bottlenecks. The interest rate for liquidity provided through this facility is half a percentage point above the call money rate. The prerequisite for using the liquidityshortage financing facility is that a limit be granted by the SNB and that this limit be covered by collateral eligible for SNB repos. SIC participants may use the liquidity-shortage financing facility between clearing stop 2 (04:00 pm) and clearing stop 3 (04:15 pm). (5) Links to other payment and securities settlement systems:- SIC is linked to the SECOM securities settlement system. This means that the delivery and payment obligations arising from the purchase or sale of securities can be settled simultaneously. The transfer of securities takes place in SECOM and the corresponding payment is settled in SIC. In addition, SIC is linked to CLS, a foreign exchange settlement system. CLS Bank is a participant in the SIC system. CLS participants can settle foreign exchange transactions in 17 currencies via CLS's accounts. CLS participants can therefore use SIC to transfer funds to their Swiss franc accounts at CLS Bank, where this liquidity is needed to settle foreign exchange transactions. Risk management:- the settlement of payments involves certain risks. The following is a description of the individual risks and the instruments and measures provided in SIC to reduce or eliminate them. (1) Credit risk:- credit risk is the risk that a party will not be able to meet its financial obligations either when they fall due or at any time thereafter. In connection with payment systems, a distinction is made between two types of credit risk:- (i) credit risk between direct participants: In the case of net payment systems, incoming and outgoing payments are accumulated, with the transfer taking place at a later, predetermined time. Up to the time of the final transfer, credit relationships can be established between participants, and this gives rise to a credit risk. In the case of SIC, no such credit relationships are established because, owing to the use of real-time gross settlement, all payments are settled individually, irrevocably and with finality. (ii) Settlement bank risk:- financial institutions that are not able or do not wish to participate in SIC directly, incur the risk that their settlement bank will default, causing them to lose their deposits. The SNB counters this risk by providing access to the payment system for as wide a range of participants as possible. Those financial institutions without access to SIC can minimise this risk by choosing an account-holding institution that is as solvent as possible. (2) Liquidity risk:- liquidity risk is the risk that a system participant does not have enough liquidity to meet its financial obligations when they fall due (but can do so at a later date). Different measures help to keep the liquidity risk for participants and the danger of a system gridlock as low as possible. First, participants can access different sources of liquidity, which allows them to react to fluctuating liquidity situations quickly and flexibly. The intraday and liquidity-shortage financing facilities, in particular, are worth mentioning in this regard (cf. chapter 2, section on liquidity supply). Second, SIC supports the efficient use and active management of the available liquidity. Participants are not only able to check their account balances and the pending incoming and outgoing payments in the queue at any time, they can also manage the queue by prioritising and cancelling payments, thus optimizing the payment stream. The option of being able to enter payments in the system up to five days prior to their due date also facilitates liquidity planning. Finally, the following measures help to reduce system-wide liquidity requirements:- (i) in accordance with the agreement with SIC participants, payments in excess of CHF100 million must be split up into smaller tranches, to prevent any gridlocks in the queuing system. (i) In case of a system-wide gridlock, SIC automatically activates its optimisation routine to unblock it. The system searches for any pending cross-payments from sending and receiving banks. If this is the case, and if sufficient cover is available, the payments are offset simultaneously and on a bilateral basis. (iii) The remitter of a payment pays a dual-component fee. One component depends on the time of initiation of the payment, the other on the time of settlement. Both fees increase in the course of the day. This creates an incentive for the participants to transfer payment orders to the system early, while at the same time providing sufficient liquidity so that settlement can occur equally early. The aim is to prevent participants from delaying their payments and waiting for incoming payments to finance their own outgoing payments. (3) Operational risk:- operational risk is the risk of losses or disturbances as a result of the inadequacy or failure of internal procedures, employees and systems, or due to external events. Payment systems must satisfy high security standards with regard to availability, integrity, confidentiality and traceability throughout the entire processing of transactions. An operational disruption or indeed a temporary failure of the SIC system would greatly impair cashless payment transactions in Swiss Francs. A whole range of organizational and technical measures help to reduce the likelihood of an operational disruption of the SIC system, and ensure that normal processing operations can be resumed quickly in the event of a disruption. Should the need arise, a semi-automatic back-up system (Mini-SIC) is available. In the event of technical disruptions affecting individual participants, the SNB can access the participants' SIC settlement accounts directly and execute payments on their behalf. Summary:- in addition to large-value payments between banks, the Swiss Interbank Clearing (SIC) payment system also settles a part of the retail payments in Swiss francs. Moreover, SIC is extremely important for the implementation of the SNB‘s monetary policy. SIC is operated by SIC Ltd on behalf of the SNB. As system manager, the SNB defines the conditions for admission to and exclusion from the system, provides the necessary liquidity, keeps the participants' accounts and monitors daily operations. The settlement of payments is associated with credit, liquidity and operational risks. A number of instruments and measures ensure that these risks are reduced or even completely eliminated in the SIC system. Real-time gross settlement, the flexible supply of liquidity and its efficient use, as well as a various measures to guarantee the smooth functioning of SIC operations, are of particular importance. The Swiss Interbank Clearing (SIC) interbank payment system commenced operations on 10 June 1987. SIX Interbank Clearing Ltd, a subsidiary of SIX Group Ltd, currently operates the system on behalf of the SNB. In the current terminology, SIC is a real-time gross system. This type of payment system is also known as a RTGS (real-time gross settlement) system. Such systems settle each payment individually on the participant's account with the central bank, provided adequate cover is available. The payment is irrevocable and final. In addition to gross systems, there are also net systems. Their essential feature is the advance netting of payments received against payments made. The central bank does not definitively post the net position to the reserve accounts (settlement) until the end of the settlement period. Settlement takes place either at

predetermined times or when a particular amount or a particular number of payment orders has been reached. Not until they are posted to the accounts with the central bank do all of the payments that have been netted off in advance become irrevocable and final. This payment process arrangement encourages the participants in a net system to draw on payments received that have not yet been definitively settled. This represents a system risk, since the payment system as a whole could be seriously destabilised if major participants were to default and other participants were also to become insolvent as a result ('domino effect'). In the SIC system the sight deposits on the reserve accounts with the SNB serve as a payment instrument. According to the Currency and Payment Instruments Act, credit balances on Swiss franc denominated sight accounts with the SNB are, like its banknotes, unlimited legal tender; that is, they can and must be accepted as payment in discharge of all Swiss franc monetary debts. A SIC participant's reserve account with the National Bank consists of two sub-accounts:- the master account and the SIC settlement account. This split is necessary for technical reasons. Legally, the sub-accounts represent a single account. The master account is used to settle cash drawings and transactions in direct payments business with the National Bank and is therefore managed on the SNB's accounting system. Interbank clearing transactions, on the other hand, pass through the SIC settlement accounts on the settlement system of SIX Interbank Clearing Ltd. The SIC system only processes a payment instruction on condition that execution of the instruction does not give rise to a negative balance on the account. If this condition is not met, the system places the payment in a holding file. It executes the payment instructions automatically as soon as incoming payments or a transfer from the master account has replenished the SIC settlement account with sufficient funds again. Payments in the holding file are processed in accordance with the 'first-in first-out' (FIFO) principle. The sender bank can, however, influence the settlement sequence by assigning a priority category to a payment order. Within any priority category the FIFO principle then governs the processing process once again. In certain circumstances (shortage of liquidity, unequal distribution of liquidity, large payments) the occurrence of 'settlement gridlocks' cannot be ruled out in RTGS systems. But experience with the SIC system shows that these can be minimised with a number of technical/organisational expedients. The most important of these are:- (i) during the course of the day the SNB provides its partners with interest-free intra-day liquidity by way of repos; (ii) the fee structure gives users of the system an incentive to input payments as early as possible (overnight processing); (iii) participants must break amounts of 100 million francs or more into several transactions (splitting); (iv) the banks can actively manage the holding file by – as mentioned above – allocating priority categories to payment orders; and (v) for all system participants, if the payment that is due to be executed next exceeds the balance on the account, the system switches over to simultaneous settlement of payments on a bilateral basis ('circles processing'). The system then searches automatically in the holding file for those banks which will allow the next payments to be settled bilaterally without cover problems. SIC system offers participants a round-the-clock service on all bank working days, during which time settlements can be made for around 23 hours. An SIC day begins at 05:00 pm and ends at 04:15 pm the following bank working day. Between 05:00 pm and 03:00 pm the following day payment orders can be processed without restriction. Following 'clearing stop (or cut-off) 1' at 03.00 pm, i.e. 75 minutes before the end of the SIC day – payment orders which are then still being entered are automatically given the next day as their settlement date. During the period of one hour up to 'clearing stop 2' at 04:00 pm participants whose payments could not be executed for lack of cover by 'clearing stop 1' can obtain the necessary liquidity on the money market or from the SNB. At 04:15 pm ('clearing stop 3') the time-slot for resorting to special-rate repos (also known as the 'Liquidity Shortage Facility') ends. SIC participants have no further opportunity to obtain liquidity. Pending payments are deleted and have to be input again. The SIC day concludes with the end-of-day processing. The system then deletes all pending payments that may still be in the holding file. If they are still to be processed, the bank concerned must give them a later settlement date and input them again. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). SWISS MARKET FEED = ИНФОРМАЦИОННАЯ СИСТЕМА ШВЕЙЦАРСКОГО РЫНКА – Swiss Market Feed is the information system of the Swiss Exchange showing prices, times and volumes. / Информационная система Швейцарской Биржи, отображающая цены, время совершения сделок и объёмы.

SWISS MARKET INDEX = ИНДЕКС ПО ШВЕЙЦАРСКОМУ РЫНКУ – Calculated on the basis of 21 major Swiss shares and an index base of 1988-June-30 = 1 500. The Swiss Market Index (SMI®) is computed continuously and also serves as underlying for index options (SMI® futures) traded on SOFFEX/Eurex®. As a blue chip index, the SMI® is Switzerland's most important stock index and comprises the 20 largest equities in the SPI. The SMI represents about 85% of the total capitalization of the Swiss equity market. It is free-float-adjusted, which means that only the tradable portion of the shares is taken into account in the index. It is published as a price index and, under the designation SMIC (SMI® dividend-adjusted), as a performance index. Because the SMI® represents the Swiss equity market, it is used as an underlying index for many financial products such as options, futures, structured products and exchange traded funds. On 30 June 1988, the SMI® was standardized at 1 500 points. Its composition is reviewed once a year. Calculation takes place in real time, i.e. each new transaction involving a stock included in the SMI® causes the index to be recalculated. / Рассчитывается на основе стоимости 21 акции ведущих Швейцарских компаний, проще говоря, на основе 21 голубой фишки Швейцарии, с увязкой к начальному показателю, равному 1 500 на 30 Июня 1988. Индекс по Швейцарскому Рынку (ИШР) вычисляется непрерывно и служит также соответствующим активом для опционов на индекс (фьючерсов на ИШР), находящихся в обращении на Швейцарской Бирже Опционов и Финансовых Фьючерсов SOFFEX/Eurex®. Ойрэкс® или Юрэкс®.

THE SWISS OPTIONS AND FINANCIAL FUTURES EXCHANGE = ШВЕЙЦАРСКАЯ БИРЖА ОПЦИОНОВ И ФИНАНСОВЫХ ФЬЮЧЕРСОВ – The Swiss Options And Financial Futures Exchange AG (SOFFEX) headquartered in Zurich, Switzerland is the subsidiary of the Swiss Exchange. SOFFEX operates an exchange and a clearing house for the electronic trading and settlement of derivative instruments. Merged with Deutsche Terminbörse (DTB), Frankfurt, Germany, in 1998 to form Eurex Switzerland. The Swiss Options and Financial Futures Exchange (SOFFEX) became the first-ever electronic exchange 20 years ago and fueled the subsequent rapid growth of electronic derivatives and equities markets. A decade later, SOFFEX joined Germany's DTB electronic exchange – a former customer – to form derivatives exchange powerhouse Eurex®. SOFFEX was launched in 1988 as the world's first all-electronic securities exchange. and helped break the ground for today's rapid expansion of electronic trading. It also helped fuel the rise of pan-European derivatives exchange Eurex® by licensing its proprietary trading system to the German all-electronic derivatives exchange DTB, which Deutsche Börse launched in 1990 and later snagged market share from Matif and LIFFE. DTB and SOFFEX, then owned and operated by SWX Swiss Exchange then merged in 1998 to form Eurex®, the world's first transnational derivatives market. SWX Swiss Exchange's parent company, SWX Group, joined the new Swiss Financial Market Services AG in 2007 after being part of a three-way merger with SIS Group and Telekurs Group. The new group plans to promote SWX Swiss Exchange and SWX Europe as 'pre-eminent liquidity venues for Swiss securities trading'. Eurex® was established in 1998 with the merger of Deutsche Terminbörse (DTB, the German derivatives exchange) and SOFFEX (Swiss Options and Financial Futures). Eurex® is considered one of the 'big three' derivative exchanges, along with NYSE Euronext Liffe and the Chicago Mercantile Exchange. It is owned by Deutsche Börse and SIX Swiss Exchange. On 1996-December-13 Deutsche Börse AG and Swiss Exchange signed a memorandum of understanding to create a joint trading and clearing system. Eurex® was formed on 1997-September-04 when DTB and SOFFEX officially announced in Bürgenstock/Switzerland to create a joint platform. In 1998 the DTB (Deutsche Terminbörse) and SOFFEX

(Swiss Options and Financial Futures Exchange) merged and became Eurex® (European Exchange). Since September 1998 members of both exchanges trade by using a joint trading and clearing platform. Thereby, becoming one of the first exchanges providing access to derivatives markets by using a full electronic trading and clearing platform. Eurex®, is jointly owned by Deutsche Börse and SWX Group. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Ойрэкс® или Юрэкс®. Бюргэншток (Bürgenstock). Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG). Дойчэ Тэминбёрзэ (Дэ.Тэ.Бэ.; Deutsche Terminbörse (DTB)), Франкфурт, Германия, в 1998 для создания Юрэкс Свицэлэнд (Eurex Switzerland). (Примечание:- в Русском языке нет точного соответствия звуку при произношении буквы Ö Немецкого алфавита. Разные источники по-разному интерпретируют его. Буквосочетание ЫО может более менее точно передавать произношение буквы Ö лишь при быстром и кратком их произношении, напоминая в отдалении произношение буквы Ё Русского алфавита.) ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE). Швейцарская Биржа Финансовых Фьючерсов и Опционов (Swiss Options and Financial Futures Exchange (SOFFEX)) – первая полностью автоматизированная мировая система торговли с полностью интегрированной и автоматизированной клиринговой системой. Контракты включают свободно обращающиеся опционы на обыкновенные акции, опционы с низкой ценой исполнения, фьючерсы и опционы на облигации Швейцарского правительства, а также фьючерсы и долгосрочные опционы (long-term option (LTO)) на Индекс по Швейцарскому Рынку – индекс, который включает акции с самым высоким уровнем капитализации, которыми торгуют на трёх фондовых биржах Швейцарии.

SWISS PERFORMANCE INDEX = ИНДЕКС ПО ШВЕЙЦАРСКОЙ РЕЗУЛЬТАТИВНОСТИ – The Swiss Performance Index (SPI®) is considered Switzerland's overall stock market index. It comprises practically all of the SIX Swiss Exchange Ltd-traded equity securities of companies that are domiciled in Switzerland or the Principality of Liechtenstein. Upon request, foreign companies with a primary listing on SIX Swiss Exchange may also be included in the SPI®, thereby enabling their future inclusion in the SLI or SMI Family. The SPI® does not include equity securities with a free float of less than 20% or shares of investment companies. These are included in the Swiss All Share Index. The SPI® is free-float-adjusted, which means that the market capitalisation is adjusted according to the number of shares in fixed ownership. Only the tradable portion of the shares is taken into account in the index. The SPI® is divided into sectors according to economic activity and according to size, i.e. small, medium-sized and large. The SPI® is a performance index. Dividend payments are taken into account in calculating the index. The SPI® is also calculated as a price index, i.e. without adjustment for dividends. The SPI® has been calculated since 01.06.1987, when it was standardized at 1 000 points. The index is recalculated and published every three minutes. Broadest based of the Swiss share indices. Broken down into many subindices, with index base 1987-June-01 = 1 000. The Swiss Performance Index (SPI®) covers all domestic companies listed on the Swiss Exchange. Weighted by capitalization and dividend-adjusted, the SPI® is an ideal benchmark for performance comparisons. / Цюрихская Фондовая Биржа (Zurich Stock Exchange) – самая крупная фондовая биржа Швейцарии после бирж в Женеве и Базеле. Все три биржи работают в одинаковое время и соединены между собой компьютерной связью, что позволяет исполнять распоряжения клиентов на любой из этих бирж. Торги происходят с голоса, хотя имеется также и электронная система передачи распоряжений. На всех трёх биржах действует система индексирования результатов торгов – Индекс по Швейцарской Результативности (Swiss Performance Index) – официальный индекс, который широко используется на вторичном рынке. Показатели индекса появляются на биржевом табло каждые три минуты и показывают динамику цен в режиме реального времени. На бирже действуют официальная система торгов, официальный параллельный рынок и неофициальный рынок. Официальные торги открыты с 10:00 до 13:00 и с 14:00 до 16:00, официальный параллельный рынок – с 09:15 до 10:00 с Понедельника по Пятницу. Расчёт по сделкам происходит на третий рабочий день после их заключения.

SWITCH = ПЕРЕНОС (или ПЕРЕКЛЮЧЕНИЕ, или ПЕРЕБРОСКА) – (1) Switch:- offsetting a position in one delivery month of a commodity and simultaneous initiation of a similar position in another delivery month of the same commodity, a tactic referred to as Rolling Forward. Liquidating an existing position and simultaneously reinstating that position in another contract month of the same asset. Switching, also referred as Rolling Forward, is a speculating strategy where a speculator extends the holding period of a commodity futures position by closing a position in a contract month close to the expiration date and at the same time, opens a position in a futures contract of the underlying commodity with a more distant expiration month. Switch is the simultaneous purchase and sale of the same asset for different maturity dates. / Ликвидация существующей позиции и одновременное открытие новой такой же позиции на один и тот же актив, но с другим месяцем поставки.

(2) Switch is a practice of transferring investment from one security to another, in a comparable class, in order to take advantage of price fluctuations or to improve a tax position. Also known as Switching. Transfer investment, e.g., the sale of securities with an unsatisfactory earnings outlook and use of the proceeds to purchase equities or bonds with better prospects. / колебания цены. Перевод инвестиций, например, продажа ценных бумаг с неудовлетворяющим инвестора доходом и использование полученных средств для приобретения ценных бумаг или обязательств с большим ожидаемым доходом. Перенос или Переброска:- продажа одних ценных бумаг и покупка других. В сфере взаимных фондов:- перевод активов из одного взаимного фонда в другой либо в рамках семьи фондов (family of funds), либо из одной семьи фондов в другую. За перевод средств в рамках одной семьи фондов, предлагающей большое число продающихся без наценки акций, облигаций и финансовых доходных фондов, плата не взимается. При переходе из одного взаимного фонда, где есть наценка за продажу ценных бумаг (load fiind), в другой такой же фонд взимается торговый сбор. Клиенты многих дисконтных брокерских фирм могут переходить из одной семьи фондов в другую, иногда бесплатно или с уплатой комиссионных брокеру. Переход обычно происходит по инициативе акционера в результате изменений в рыночных условиях или изменения целей инвестиции. Некоторые консультанты по инвестициям, а также справочники (бюллетени) дают рекомендации по поводу того, когда входить и когда выходить из различных взаимных фондов. Смотрите также (No-Load Fund). В сфере ценных бумаг:- продажа акций или облигаций для замены их другими акциями и облигациями с лучшими перспективами прибыли. Смотрите также Мена или Своп (Swap).

SWITCH ARRANGEMENTS = ДОГОВОРЁННОСТИ О ПЕРЕУСТУПКЕ – Switch Arrangements:- a form of countertrade in which the seller sells on credit and then transfers the credit to a third party. / Форма встречной торговли, в которой продавец продаёт в кредит, а затем передаёт этот кредит третьей стороне.

SWITCH BILL OF LADING = ПОДМЕННЫЙ КОНОСАМЕНТ (или ПРОВОЗНОЙ КОНОСАМЕНТ) – Switch Bill is a replacement bill of lading issued at the request of a consignee seller to replace the original bill of lading issued to that seller's supplier as shipper, so as to show the consignee seller as shipper and its own sub-purchaser as consignee. Such bills of lading are intended to keep the identity of the supplier from the sub-purchaser and thus to prevent future direct dealings between the supplier and the sub-purchaser. Such bills of lading are, however, problematic, particularly if issued by charterers rather than owners. For example, a charterer does not have apparent or ostensible authority to issue a second set of bills of lading on behalf of the disponent owner or owner of the vessel, which therefore will not to be treated as the contractual carrier under a switch bill of lading. Further, a switch bill of lading almost invariably will contain a statement of fact, as to the identity of the shipper of the cargo, that is known to the issuer to be inaccurate and the switch bill of lading thus can constitute a fraud on the consignee and/or contain a fraudulent misrepresentation. Any indemnity offered to the

issuer by a seller requesting a switch bill of lading thus could be unenforceable for illegality. A Bill of Lading that is re-made to effect movement from discharge port to final destination. Switch Bill Of Lading:- often called 'The Trader's Second Set' and intended to replace the first set of bills of lading issued. Usually used where a seller/trader wishes to keep the name of his supplier, named as the shipper, secret from the ultimate buyer of goods. Due care and consideration must be exercised when issuing such bills of lading because of inherent exposure to fraud/conversion of factual data. / Подменный/Провозной Коносамент является заменяемым коносаментом, выдаваемым по запросу консигнатора (получателя) продавцу на замену оригинала коносамента, выданного такому поставщику продавца, как отправителю, с тем чтобы отобразить консигнатору (получателю) продавца в качестве отправителя и его собственного суб-закупщика в качестве консигнатора (получателя). Такие коносаменты предназначены для сохранения обособленности поставщика от суб-закупщика с тем, чтобы в дальнейшем предотвратить прямые сделки между поставщиком и суб-закупщиком. Однако же, такие коносаменты могут быть весьма проблематичными, особенно в тех случаях, когда они выдаются фрахтователями, а не владельцами. Например, фрахтователь не имеет явного или выраженного полномочия на выдачу второго комплекта коносаментов от имени диспонентного (фактически распоряжающегося) владельца или владельца судна, который, следовательно, не должен рассматриваться в качестве перевозчика по контракту по подменному/провозному коносаменту. Более того, подменный/провозной коносамент почти всегда будет содержать в себе заявление о факте, с тем, чтобы идентифицировать/отождествлять отправителя груза, который известен выписывающему коносамент как неаккуратный, и таким образом подменный/провозной коносамент может возлагать мошенничество на консигнатора (получателя) и/или содержать искажение фактов с целью мошенничества. Коносамент, который был переделан с целью осуществления перемещения из порта разгрузки к конечному пункту назначения. Часто называемый 'вторым комплектом торговца' ('the trader's second set') и предназначенный для подмены первого комплекта выписанных коносаментов. Обычно используется в тех случаях, когда продавец/торговец желает сохранить имя своего поставщика, указываемого в качестве отправителя, в секрете от конечного покупателя товаров. При выписке таких коносаментов должны быть проявлены должная осторожность/осмотрительность и внимание в связи с тем, что действиям в отношении мошенничества/преобразования фактических данных свойственно рано или поздно вскрываться.

SWITCHING = SWITCH

SWITCHING COSTS = ЗАТРАТЫ НА ПЕРЕКЛЮЧЕНИЕ (или ЗАТРАТЫ НА ПЕРЕХОД) – Switching Costs are the costs incurred in changing suppliers or marketplaces. Net markets often seek to re-architect procurement, search, and other processes so buyers stay put, a key reason switching costs are higher in business-to-business than consumer e-commerce. See also Churn. Switching Costs are the costs incurred by a buyer (seller) when switching to a different supplier (distributor). This involves costs like identifying, investigating and negotiating a contract with a new supplier (distributor), the risk of quality problems, etc. The switching cost for a differentiated or unique produce can be substantial while the switching cost for a commodity can be very small or non-existent.

SWITCHING OPTIONS = ПЕРЕНОСЯЩИЕСЯ ОПЦИОНЫ – Switching Options:- a sequence of transactions in which exercise of one option creates one or more additional options. Investment-disinvestment, entry-exit, expansion-contraction, and suspension-reactivation decisions are switching options. / Последовательность операций, в которых исполнение одного опциона создаёт один или более дополнительных опционов. Решения по вложению-изъятию, входу-выходу, экспансии-сокращению и приостановлению-повторной активации являются переносящимися опционами.

SWITCHING STATION = КОММУТАЦИОННАЯ СТАНЦИЯ (или ФИДЕРНАЯ ПОДСТАНЦИЯ) – Switching Station is a facility equipment used to tie together two or more electric circuits through switches. The switches are selectively arranged to permit a circuit to be disconnected, or to change the electric connection between the circuits.

SWITCH ORDER = РАСПОРЯЖЕНИЕ О ПЕРЕНОСЕ – Switch Order is an order for the purchase (sale) of one asset and the sale (purchase) of another asset at a stipulated price difference. See also Contingent Order. / Распоряжение на приобретение (продажу) одного актива и продажу (приобретение) другого актива по обусловленному различию в цене.

SWITCH TRADING = ТОРГОВЛЯ С ПЕРЕУСТУПКОЙ – Imbalances in long term bilateral trading agreements sometimes lead to the accumulation of uncleared credit surpluses in one or other country. For example, Brazil at one time had a large credit surplus with Poland. These surpluses can sometimes be tapped by third countries so that, for example UK exports to Brazil could be financed from the sale of Polish goods to the United Kingdom or elsewhere. Such transactions are known as 'Switch' or 'Swap' deals because they typically involve switching the documentation (and destination) of goods on the high seas. Switch Trading is a form of bilateral clearing arrangement for settling financial claims arising from imports and exports from compensation and similar arrangements. If B has a credit in its account against A (arising through compensation or other payments arrangements), then B locates a country, C, which is interested in purchasing the products of A. B sells its credit (clearing currency units) at a discount to C to receive hard currency. C uses B's clearing currency to purchase goods from A. Many consider this to be more a form of financing than trade. Switch Trading involves a triangular rather than bilateral trade agreement. A third party is necessary to dispose of the merchandise, and this party pays hard currency for the unwanted merchandise at a considerable discount. A Switch Trade involves a third party to a countertrade agreement who agrees to assume the countertrade obligations of one of the parties. For example, an exporter may have agreed to counterpurchase goods for which it has no use, simply for the sake of completing the original sale. The exporter may switch its obligation to pay the importer to a third party, who is known as a Switch Trader, who then acquires the goods from the importer at a discount. The switch trader then sells the goods for hard currency, which is used to meet the exporter's payment obligation to the original importer. Under such agreements the size of the switch trader's discount depends on the importer's need for hard currency. Also known as Switch Deal. / Дисбалансы в долгосрочных двусторонних торговых соглашениях иногда приводят к накоплению непогашенной кредиторской задолженности (uncleared credit surpluses) у одной страны перед другой. Например, когда-то Польша накопила значительную кредиторскую задолженность (large credit surplus) перед Бразилией. Частично подобная задолженность могла бы быть выбрана третьими странами таким образом, чтобы, например, вывоз (или экспорт) Британской продукции в Бразилию финансировался за счёт продаж Польских товаров в Соединённое Королевство. Такие операции известны под названием сделки по переуступке (switch deals) или сделки по обмену (swap deals), поскольку они предполагают обмен документации (и место назначения) на товары в открытом море (on the high seas). Это форма двусторонней договорённости о погашении обязательств при расчёте по финансовым претензиям, возникшим при привозе (или импорте) и вывозе (или экспорте) из договорённостей о компенсации или тому подобном. Если B имеет кредиторскую задолженность перед A, возникшую в результате договорённостей о компенсации или иных формах оплаты, тогда B определяет страну C, которая заинтересована в приобретении продукции от A. B продаёт C свою кредиторскую задолженность (B sells its credit) в единицах расчётной валюты (clearing currency units) с дисконтом для получения твёрдой валюты. C использует причитающуюся B расчётную валюту (clearing currency) для приобретения товаров от A. Многие предпочитают рассматривать такую операцию как одну из форм финансирования, нежели торговли. Торговля с переуступкой предполагает скорее трёхстороннее, а не двустороннее соглашение. Роль третьей стороны заключается в том, чтобы взять на себя вывоз

непользующегося спросом товара, при этом, третья сторона производит оплату за данный товар твёрдой валютой, но со значительными скидками. Торговля с переуступкой вовлекает во встречное соглашение третью сторону, которая согласна принять на себя обязательства одной из сторон. Например, экспортёр может договориться о встречной закупке ненужных ему товаров только для того, чтобы осуществить расчёт по первоначальной продаже своей продукции. Таким образом, экспортёр переуступает свои обязательства по приёму оплаты от импортёра третьей стороне, именуемой вовлечённым в переуступку торговцем (switch trader), которая затем приобретает товары экспортёра у импортёра с торговой скидкой. Затем вовлечённый в переуступку торговец продаёт экспортёру, оценивая свои товары в твёрдой валюте, которая используется для погашения обязательства экспортёра по оплате перед первоначальным импортёром. При таких договорённостях размер скидки, предоставляемой вовлечённому в переуступку торговцу, зависит от степени нужды импортёра в твёрдой валюте. Известна также как Сделка по Переуступке (Switch Deal). Форма встречной торговли, в которой экспортёр и импортёр соглашаются обмениваться товарами и средствами при возникновении затруднений в двусторонних отношениях. Например, переуступка товаров в другую страну-импортёра в случае нехватки у импортёра финансовых средств.

SWITCH TRANSACTIONS = ТРАНЗАКЦИИ ПЕРЕУСТУПКИ (или ОПЕРАЦИИ ЧЕРЕЗ ТРЕТЬИ СТРАНЫ) – Switch Transactions:- the practice of exporting (or importing) goods through an intermediary country to final destination. / Практика вывоза (или экспорта) или привоза (или импорта) товаров в конечную страну назначения через страну посредницу. Под Транс..., от Латинского слова Trans, означающее За или Сквозь или Через, понимается часть сложных слов, означающая:- движение через какое-либо пространство, пересечение его (например, трансполярный перелёт); передачу или обозначение через посредство чего-либо (например, транслитерация).

SWP = SHALLOW WELL PUMP

SWRI = SURFACE WATER RETENTION INDEX

SWS = SOIL AND WATER SCIENCES

SWSL = SUPPLEMENTAL WEATHER SERVICE LOCATION

SX–EW = SOLVENT EXTRACTION AND ELECTRO WINNING

SY = SYRIA = SYRIAN ARAB REPUBLIC

SYMBIOSIS = СИМБИОЗ – Symbiosis (in Greek = Living Together) a balanced partnership in which two dissimilar organisms live together for their mutual benefit, e.g., the algae and fungae jointly forming lichens. See also Commensal, and Parasite. Symbiosis is the living together in intimate association of two dissimilar organisms, the cohabitation being mutually beneficial. / водоросли и грибы, совместно формирующие лишайники. Смотрите также . Под Симбиозом, от Греческого слова Symbiōsis, означающее Сожительство, понимаются формы совместного существования двух организмов разных видов, включая паразитизм (антагонистический симбиоз). Часто симбиоз взаимовыгоден для обоих симбионтов (мутуалистический симбиоз):- например, между раком-отшельником и актинией, между животными (человеком) и микроорганизмами, образующими нормальную кишечную флору, и тому подобное.

SYMMETRIC ALGORITHM = СИММЕТРИЧНЫЙ АЛГОРИТМ – Symmetric Algorithm is a cryptographic algorithm employing the same value of key for both enciphering and deciphering or for both authentication and validation. / Криптографический алгоритм, применяющий одно и то же значение ключа как для шифрования, так и для дешифрования (расшифрования), или для аутентификации (удостоверения подлинности) и утверждения.

SYMMETRICAL TRIANGLE = СИММЕТРИЧНЫЙ ТРЕУГОЛЬНИК – Symmetrical Triangle:- a sideways chart pattern between two converging trendlines in which the upper trendline is declining and the lower trendline is rising. This pattern represents an even balance between buyers and sellers, although the prior trend is usually resumed. The breakout through either trendline signals the direction of the price trend. A formation on a bar chart that is normally considered a consolidation pattern. The symmetrical triangle has a minimum of four points (or pivots) where a lower high and a higher low allow for two minor trendlines to form that will bisect each other at the apex. In being symmetrical, the angles of the two boundary lines are similar so that a flat side to the triangle does not form. While most traders expect the direction of the breakout to be with the major trend, this type of triangle has a higher probability of going either way, thus making it harder to anticipate. / В техническом анализе биржевых рынков, .

SYMPATHETIC DAMAGE = ВЗАИМОСВЯЗАННОЕ ПОВРЕЖДЕНИЕ – Sympathetic Damage:- loss suffered by cargo following damage to other goods in the same ship. An example would be taint arising from odor given off by another cargo. Such loss is not recoverable under a cargo policy except, possibly, where the odor was caused by an insured peril, e.g., seawater entering the hold. / Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

SYMPETALOUS = СПАЙНОЛЕПЕСТНЫЙ – Sympetalous or gamopetalous:- of a flower with a corolla composed of partially or wholly fused petals forming a tube or funnel. / Спайнолепестный или сростнолепестный (gamopetalous):- о цветке с венчиком (corolla), состоящем из частично или целиком слившихся лепестков, сформировав тем самым трубочку или воронку.

SYMPODIAL BRANCH (SYMPODIUM) = СИМПОДИАЛЬНАЯ ВЕТВЬ (СИМПОДИЙ) – Sympodial Branch (Sympodium) is a branch in Cotton upon which the flowers and resulting bolls arise. This is in contrast to monopodia which are vegetative stems, including the main stem, which do not give rise to bolls directly. A sympodium is ‘zigzag’ shaped with each section terminating in a node with a true leaf and a potential fruit.

SYMPTOMS = СИМПТОМЫ (или ПРИЗНАКИ) – Symptoms:- the set of visible signs indicating a deviation from normal, healthy growth, appearance and productivity. Symptoms may include death, destruction or discoloration of host tissue or abnormal growth or differentiation. Symptoms may be caused by (i) infection by a biological agent such as a fungus, bacteria, nematode, insect or virus, (ii) a nutritional imbalance such as a deficiency or toxicity, (iii) the impact of adverse environmental conditions such as frost, lightning, drought, waterlogging etc, or (iv) the impact of unwise decisions by the grower such as incorrect fertiliser placement, root pruning during cultivation, sowing depth, herbicide usage at planting, etc. Symptom is a visible or otherwise detectable change in the plant or associated parts arising from disease. / или изменение цвета . Под Симптомом, от Греческого слова Sýmptōma, означающее Признак или Совпадение, понимается признак какой-либо болезни. Различают объективные симптомы (полученные при обследовании больного, например, рентгенологический признак ‘ниши’ при язве желудка) и субъективные симптомы (основанные на описании больным своих ощущений, например, боли). В переносном смысле – признак какого-либо явления, представляющего собой отклонение от нормального течения какого-либо процесса.

SYNAPSIS = СИНАПСИС (или СИНАПС) – Synapsis is a pairing of homologous chromosomes during pachytene or zygotene. / Под Синапсисом, от Греческого слова Sýnapsis, означающее Связь или Соединение, понимается конъюгация хромосом, попарное временное сближение гомологичных хромосом, во время которого между ними может произойти обмен гомологичными участками. На этой стадии хромосомы под влиянием разных воздействий легко сжимаются в комок; это явление было описано Английским учёным Дьжоном Эдмэндом Мо (John Edmund Moore; 1870–1947) в 1895 под названием 'Синапсис'. Подробнее смотрите Мейоз. Синапс – коньюгация хромосом. Под Синапсом, от Греческого слова Sýnapsis, означающее Соединение, понимается область контакта (связи) нервных клеток (нейронов) друг с другом и с клетками исполнительных органов. Межнейронные синапсы образуются обычно разветвлениями аксона одной нервной клетки и телом, дендритами или аксоном другой. Между клетками имеется так называемая синаптическая щель, через которую возбуждение передаётся посредством медиаторов (химический синапс), ионов (электрический синапс) или тем и другим способом (смешанный синапс). Крупные нейроны головного мозга имеют по 4 000–20 000 синапсов, некоторые нейроны – только по одному. Под Синапсами, Греческого слова Sýnapsis, означающее Связь или Соединение, понимаются специализированные функциональные контакты между возбудимыми клетками, служащие для передачи и преобразования сигналов. Термин 'Синапсы' был впервые использован Английским физиологом Сэром Чалзом Скотом Шэрингтэном (Sir Charles Scott Sherrington; 1857–1952) в 1897 для обозначения контактов между нейронами. Контакты между аксонами нейронов и клетками исполнительных органов часто определяют как соединение, хотя они представляют разновидность синапсов. Поскольку синапсы – единственный путь, с помощью которого нейроны могут сообщаться друг с другом, они обеспечивают все основные проявления активности нервной системы и интегративную деятельность мозга. В синапсы входят пресинаптическая часть (синаптическое окончание), синаптическая щель (разделяющая 2 клетки) и постсинаптическая часть (участок клетки, к которому прилежит синаптическое окончание). Межнейронные синапсы в большинстве случаев образованы окончаниями аксонов одних нервных клеток и телом, дендритами или аксонами других. В соответствии с этим различают аксо-соматические, аксо-дендритные и аксо-аксонные синапсы. Ввиду того что поверхность дендритов преобладает, наиболее многочисленны аксо-дендритные синапсы. Число синаптических контактов на различных нейронах центральной нервной системы варьирует в широких пределах. На одних клетках оканчиваются сотни или тысячи отдельных пресинаптических волокон, другие нейроны имеют единственный синапс. Крупный нейрон ретикулярной формации ствола мозга получает свыше 4 000 синаптических контактов; на некоторых клетках примерное число синаптических контактов составляет более 10 000–20 000. Плотность расположения синапсов на поверхности нейрона может достигать 15–20 на 100 мкм^2. По функциональному значению синапсы могут быть возбуждающими и тормозящими в соответствии с тем, активируют они или подавляют деятельность соответствующей клетки. В том и в другом случае передача через синапсы может осуществляться с помощью химического или электрического механизма. Кроме того, существуют смешанные синапсы, сочетающие химические и электрические механизмы передачи. Более распространены синапсы с химическим механизмом. В них сигнал с пресинаптической мембраны передаётся на постсинаптическую с помощью медиатора – химические соединения, молекулы которого способны реагировать со специфическими рецепторами постсинаптической мембраны и изменять её проницаемость к ионам, вызывая генерацию местного, нерегенеративного потенциала. В электрических синапсах ток с активированной пресинаптической мембраны непосредственно воздействует на постсинаптическую мембрану. Синапсы с химическими и электрическими механизмами передачи характеризуются специфическими структурными особенностями. В первом типе синапсов пресинаптическое окончание содержит так называемые Синаптические Пузырьки, или Везикулы, содержащие высокие концентрации медиатора. Пре- и постсинаптические мембраны разделены синаптической щелью, ширина которой обычно составляет 150–200 Å, а в некоторых синапсах достигает 1 000 и более Å. Синаптические пузырьки имеют тенденцию концентрироваться у внутренней поверхности пресинаптические мембраны, противостоящей синаптической щели. Они могут выходить из пресинаптического окончания в местах перерыва мембраны, проникать в синаптическую щель и контактировать с постсинаптической мембраной. Расположение синаптических пузырьков и их количество изменяются в результате нервной активности. Для постсинаптической мембраны в химических синапсах характерны утолщения, на которых можно выделить особые активные зоны, по-видимому, связанные с хеморецепторной специализацией мембраны. В электрических синапсах щель между пре- и постсинаптическими мембранами отсутствует и иногда наблюдается их полное слияние. Схематически оба типа синапсов показаны на xxxxx. демонстрирует пресинаптическое окончание химических синапсов с упакованными в нём пресинаптическими пузырьками. Процесс передачи возбуждающих или тормозящих эффектов в синапсах с химическим механизмом сводится к следующим процессам:- нервный импульс, приходящий в пресинаптическое окончание, вызывает деполяризацию пресинаптической мембраны, что в свою очередь увеличивает её проницаемость к ионам кальция. Вхождение ионов кальция внутрь пресинаптического окончания вызывает освобождение медиатора, который диффундирует через синаптическую щель и реагирует с рецепторами постсинаптической мембраны. Эта реакция обычно приводит к увеличению проницаемости постсинаптической мембраны к одному или нескольким ионам и генерации потенциала постсинаптического. В случае возбуждающих синапсов увеличивается натриевая проводимость, иногда параллельно с калиевой проводимостью, что приводит к деполяризации и возбуждению постсинаптической клетки. В тормозящих синапсах увеличивается проницаемость постсинаптической мембраны к ионам хлора, а иногда параллельно к ионам калия. Этот эффект обычно сопровождается гиперполяризацией. Наиболее важное значение для осуществления синаптического торможения имеет именно увеличение проводимости постсинаптической мембраны, которое шунтирует возбуждающие эффекты. Медиатор может воздействовать также на метаболические процессы постсинаптического нейрона, вызывая длительные постсинаптические потенциалы. В синапсах с электрическим механизмом токи действия пресинаптического окончания прямо воздействуют на постсинаптическую клетку без участия промежуточного химического звена вследствие почти полного отсутствия синаптической щели (её ширина не превышает 20 Å). Это устраняет шунтирование тока, текущего от пресинаптической клетки к постсинаптической. Импульс, генерируемый в пресинаптической мембране, передаётся на постсинаптическую мембрану пассивно, электротонически, как по кабельным структурам. Особенность электротонических синапсов – существование каналов, позволяющих молекулам низкомолекулярных соединений проходить из цитоплазмы одной клетки в цитоплазму другой. Эти каналы не сообщаются с внеклеточным пространством и отсутствуют в других участках мембраны. Большая часть нервных процессов может осуществляться с помощью как химических, так и электротонических синапсов. Электротонические синапсы обеспечивают быстроту и стабильность передачи, менее чувствительны к колебаниям температуры. Химический механизм позволяет изменять эффективность синапсов в результате предшествующей активности, более надёжно обеспечивает односторонность проведения.

SYNDICATE = СИНДИКАТ – (1) Group of bankers and/or brokers formed to underwrite and distribute a new issue of securities or a large block of an outstanding issue. By extension, group of banks or brokerage firms involved in a Eurocredit or Eurobond issue. Also known as Consortium. See also Banking Syndicate. A group of investment bankers who together underwrite and distribute a new issue of securities or a large block of an outstanding issue. Association or group of persons who combine to carry out a financial or industrial project, such as the underwriting of a bond issue. An association of two or more persons, constituted for carrying out a projected commercial or public undertaking. Syndicate is a temporary association, in particular, of banks, to handle larger financing projects while

distributing the risk. Syndicates are now primarily formed to place securities (flotations). / Под Синдикатом, от позднелатинского слова Syndicatus, от Syndico, означающее Проверяю или Рассматриваю, понимается одна из форм монополистических объединений, характеризующаяся тем, что распределение заказов, закупки сырья и реализация произведённой продукции осуществляются через единую сбытовую контору. Участники синдиката сохраняют производственную, но утрачивают коммерческую самостоятельность. В современный период синдикаты не имеют большого распространения. Синдикат:- (1) одна из форм монополистических соглашений картельного типа, преследующая цель устранить конкуренцию между монополиями в области сбыта и закупок сырья путём установления контроля над рынком главным образом однородной массовой продукции для получения наивысших прибылей (смотрите Картель). В синдикате реализация продукции его участников, а также закупки сырья осуществляются через единый орган – контору по продаже. Последняя концентрирует все заказы и распределяет их в соответствии с обусловленными квотами между монополиями, которые сдают свои товары конторе по определённой, заранее установленной цене. Участники синдиката сохраняют производственную и юридическую самостоятельность, но, в отличие от картеля, утрачивают коммерческую самостоятельность. Наибольшее распространение синдикаты получили в начале XX века вплоть до Второй Мировой Войны 1939–45 в Германии, Франции и других странах преимущественно в отраслях добывающей промышленности. В Германии в период между двумя мировыми войнами было несколько сотен синдикатов. Крупнейшие из них – Рейнско-Вестфальский Угольный Синдикат, Германский Калийный Синдикат. В дореволюционной России действовали такие синдикаты, как 'Продамет', 'Продуголь', 'Медь', концентрировавшие сбыт подавляющей (до 90%) массы продукции соответствующих отраслей. В современных условиях синдикат как форма монополистических соглашений отраслевого характера утрачивает своё значение. В силу антитрестовского законодательства, ограничивающего горизонтальную (отраслевую) концентрацию, и высокого уровня монополизации в большинстве отраслей получают развитие другие, более гибкие формы монополистических соглашений (смотрите также Капиталистические Монополии). (2) В бывшем Союзе Советских Социалистических Республиках (СССР) в период НЭПа (Новой Экономической Политики) – тип хозяйственной организации, объединявшей группы промышленных трестов для оптового сбыта их продукции, закупок сырья и планирования торговых операций. Первый Советский синдикат был создан в 1922 (Всесоюзный Текстильный Синдикат), а всего в 1922–28 функционировало 23 синдиката. Они были ликвидированы в 1929–30.

(2) Syndicate is a member, or group of members, underwriting insurance business at Lloyd's through the agency of a managing agent. Group of people that come together to work for a common aim, e.g., in underwriting large risks for Lloyd's of London. A member or group of members underwriting insurance business at Lloyd's through the agency of a managing agent or a substitute agent to which a syndicate number is assigned by the Council. Except where it is expressly otherwise provided the several groups of members to which in different years a particular syndicate number is assigned by or under the authority of the Council shall be treated as the same syndicate, notwithstanding that they may not comprise the same members with the same individual participations. / В компании Корпорэйшэн оф Лойдз (Corporation of Lloyd's) .

SYNDICATED CREDIT = СИНДИЦИРОВАННЫЙ КРЕДИТ (или СИНДИКАТНЫЙ КРЕДИТ) – Syndicated Credit is a credit granted jointly by two or more banks, on of which acts as lead manager. Also known as Consortium Operation.

SYNDICATED LOAN = СИНДИЦИРОВАННАЯ ССУДА (или СИНДИКАТНАЯ ССУДА) – Syndicated Loans are based on mid to long-term loan agreements between a borrower and two or more banks that have joined together into a syndicate. The purpose of this constellation is to be able to satisfy the borrower's need for financing even if the volume of the loan exceeds the capabilities of one single bank. In addition, the credit risk is reduced for each of the individual banks in the syndicate. Long-term or short-term loan made to a single borrower and underwritten by a banking syndicate.

SYNDICATE POLICY = СИНДИКАТНЫЙ ПОЛИС (или ПОЛИС СИНДИКАТА) – At the Corporation of Lloyd's, Syndicate Policy is a policy issued on behalf of a group of companies sharing a risk or class of risks. A syndicate policy carries the names of all the participating companies and usually designates the share of the liability assumed by each company. / В компании Корпорэйшэн оф Лойдз (Corporation of Lloyd's) .

SYNDICATE STAMP = СИНДИКАТНЫЙ ШТАМП (или ШТАМП СИНДИКАТА) – At the Corporation of Lloyd's, a term Syndicate Stamp may refer to:- (i) a document which lists the names of the members of a syndicate for a given year of account and the amount of each member's overall premium limit that is allocated to that syndicate; (ii) the syndicate allocated capacity of a syndicate; or (iii) the underwriting stamp of a syndicate. / В компании Корпорэйшэн оф Лойдз (Corporation of Lloyd's) .

SYNDIOTACTIC POLYMER = СИНДИОТАКТИЧЕСКИЙ ПОЛИМЕР – Syndiotactic Polymer is a polymer structure in which the atoms that are not part of the backbone chain are distributed in a symmetrical and recurring manner above and below the backbone chain when the latter is in a single plane. See also Atactic Polymer, Isotactic Polymer, and Tactic Polymer. / Синдиотактические Полимеры, один из видов Стереорегулярных Полимеров. Стереорегулярные Полимеры, полимеры, линейные молекулы которых состоят из звеньев, имеющих либо одинаковые, либо разные, но чередующиеся в соответствии с некоторой закономерностью пространственные конфигурации. К первому типу стереорегулярных полимеров относятся, например, изотактические полимеры, 1,4-цис- и 1,4-транс-полидиены (смотрите Бутадиеновые Каучуки, Натуральный Каучук), ко второму – синдиотактические полимеры. Стереорегулярность молекулы в ряде случаев является необходимым условием реализации кристаллического состояния полимера. Стереорегулярные полимеры часто обладают лучшим комплексом механических свойств, чем соответствующие нестереорегулярные. К числу стереорегулярных полимеров относятся, например, выпускаемые промышленностью изотактический полипропилен, синдиотактический поливинилхлорид, стереорегулярный бутадиеновый каучук, а также некоторые природные полимеры, например, целлюлоза, натуральный каучук.

SYNERESIS = СИНЕРЕЗИС – Syneresis is a congregation of molecules, leads to 'sweating' in cereals. / Под Синерезисом, от Греческого слова Synáiresis, означающее Сжатие или Уменьшение, понимается самопроизвольное уменьшение объёма гелей, студней и высокомолекулярных дисперсных структур, сопровождающееся выделением жидкой фазы (жидкости). Синерезис может быть ускорен действием дополнительных напряжений, стремящихся сжать молекулярную структуру студня (например, центрифугированием). Синерезис – важный технологический процесс ряда производств. Имеет важное значение в технологии изготовления изделий из латексов, пластмасс, резин, химических волокон, при производстве сыра, творога, в хлебопечении. В ряде случаев (например, при черствении хлеба, 'выпотевании' избытка пластификатора из пластифицированных полимеров) синерезис представляет собой нежелательное явление, которое следует устранять.

SYNERGISM = СИНЕРГИЗМ – Synergism is an interaction of two or more factors such that the effect, when combined, is greater than the predicted effect, based on the response to each factor applied separately. / Под Синергизмом, от Греческого слова Synergós, означающее Вместе Действующий или Совместно Действующий, от Греческого слова Synergia, означающее Содействие или Сотрудничество, понимается:- (1) совместное и однородное функционирование органов (например, мышц) и систем. (2) Комбинированное действие лекарственных веществ на организм, при котором суммированный эффект превышает действие, оказываемое каждым компонентом в отдельности. Смотрите также Синергист (Synergist).

SYNERGIST = СИНЕРГИСТ – Synergist (for herbicides) is a non-herbicidal compound used to increase the phytotoxicity of a herbicide by a physiological mechanism. / В физиологии под Синергистами, от Греческого слова Synergós, означающее Вместе Действующий или Совместно Действующий, понимаются мышцы, действующие совместно для осуществления одного определённого движения, например, вдоха, в котором участвуют одновременно межрёберные, межхрящевые и мышцы диафрагмы. В других движениях эти же мышцы могут быть антагонистами. Синергисты:- (1) в анатомии и физиологии – мышцы (или их группы), действующие совместно и функционально однородно; принимают участие в одном движении. Например, у млекопитающих животных и человека такие синергисты, как наружные межрёберные и межхрящевые мышцы, а также мышцы диафрагмы, сокращаясь одновременно, обеспечивают акт вдоха. Однако мышцы, действующие при совершении определённого движения совместно, при других движениях могут оказаться антагонистами. Явление синергии обеспечивается регулирующей деятельностью центральной нервной системы (ЦНС). (2) В фармакологии – лекарственные вещества, при сочетанном (комбинированном) действии которых на организм суммированный эффект превышает влияние, оказываемое каждым из них в отдельности. Различают прямые синергисты, действующие на одни и те же реактивные системы организма, например, одновременное влияние 2 адреномиметических веществ; и непрямые синергисты, оказывающие один и тот же окончательный эффект, но различающиеся механизмом действия. Так, например, адреналин и атропин, воздействуя на глаз, вызывают расширение зрачка, хотя и разными путями; при совместном применении суммарное действие этих веществ на зрачок превышает действие их в отдельности.

SYNGAMY = СИНГАМИЯ (или СЛИЯНИЕ) – Syngamy is the union of gametes or sex cells to form a zygote. / Сингамия – слияние гамет. Под Сигнамией понимается то же, что оплодотворение – слияние мужских и женских половых клеток (гамет) у растений, животных и человека, в результате чего образуется зигота, способная развиваться в новый организм. Оплодотворение лежит в основе полового размножения и обеспечивает передачу наследственных признаков от родителей потомкам.

SYNONYM = СИНОНИМ – Synonym is an invalid name according to the International Code for Botanical Nomenclature. / Под Синонимами, от Греческого слова Synōnymos, означающее Одноимённый, понимаются слова, различные по звучанию, но тождественные или близкие по смыслу, а также синтаксические и грамматические конструкции, совпадающие по значению. Синонимы бывают полные (языкознание – языковедение) и частичные (дорога – путь).

SYNTAN = СИНТЭН (или СИНТАН, или СИНТЕТИЧЕСКОЕ ДУБЯЩЕЕ ВЕЩЕСТВО) – Syntan is a synthetic tanning agent. There are many syntans, and many are proprietary mixtures of chemicals. They are sometimes used as postdyeing treatments for wool or nylon to increase washfastness. / Найлан^{T3} (Nylon^{TM}). Синтэн или Синтан – синтетическое дубящее вещество. Дубящие Вещества, вещества, применяемые при выделке (дублении) кожи и меха. Дубящие вещества подразделяют на минеральные и органические. К минеральным дубящим веществам относят соединения хрома, алюминия, циркония, титана, кремния, железа и другого. Большинство этих соединений – основные соли серной кислоты (например, $CrOHSO_4$ и другие); их применяют для дубления в виде водных растворов. Наиболее широко распространено дубление соединениями хрома (так называемое Хромовое Дубление), которое применяют для всех основных видов кожи и меха, в особенности при комбинированных методах дубления. В последнем случае предварительное хромовое дубление (хромирование) обеспечивает высокую проницаемость кожаного полуфабриката, что резко ускоряет последующее дубление (додубливание) органическими дубящими веществами, повышает термостойкость и износостойкость кожи. Перспективные дубящие вещества – соединения циркония, сообщающие коже повышенную износостойкость, гладкую и плотную лицевую поверхность. Органические дубящие вещества подразделяют на животные и растительные, искусственные и синтетические. К животным дубящим веществам относят высоконепредельные жиры различных рыб и морских животных (так называемые Ворвани), применяемые для выработки замши. Дубящие вещества растительного происхождения – танниды, содержатся в различных органах растений. Эти дубящие вещества извлекают из измельчённого материала экстрагированием водой или слабыми растворами сернисто-кислых соединений при повышенной температуре. Затем растворы таннидов и сопутствующих веществ концентрируют, превращая в жидкий или твёрдый экстракты. Танниды, извлечённые из различных видов растений, отличаются химическим строением, свойствами и могут быть подразделены на:- гидролизующиеся, конденсированные и смешанные. В гидролизующихся таннидах составные части молекулы соединены с помощью эфирных связей. Типичные представители этой группы – таннины (сложные эфиры фенолкарбоновых кислот и простейших углеводов, преимущественно гексоз). Основу большинства конденсированных дубящих веществ составляют различные полиоксипроизводные 3-оксифлавана. В твёрдом виде танниды обычно аморфные вещества, растворяющиеся неограниченно в воде. Растворы таннидов могут быть использованы для дубления любых видов кожи (иногда шубной овчины), как самостоятельно, так и в комбинации с другими дубящими веществами. Искусственные дубящие вещества – высокомолекулярные органические соединения, обладающие дубящими свойствами. Эти дубящие вещества – побочные продукты производств, перерабатывающих органическое сырьё. Для удобства применения в качестве дубителей эти продукты концентрируют и иногда очищают. Типичные представители искусственных дубящих веществ – сульфитцеллюлозные экстракты, получаемые из заводских отходов переработки целлюлозы. Основной компонент любого сульфитцеллюлозного экстракта, определяющий его кожевенно-технологические свойства, – лигносульфоновые кислоты. Эти дубящие вещества обладают высокой устойчивостью и быстрее, чем танниды, проникают в кожаный полуфабрикат, однако их остальные показатели (температура сваривания, наполнение и формирование объёма кожи) хуже, чем у таннидов. Очищенные от солей кальция концентраты лигносульфоновых кислот широко применяют для получения высококачественных синтетических дубителей. Синтетические дубящие вещества, или синтаны, получают из различных органических соединений. Основным сырьём для производства синтанов служат фенол и его производные, ароматические углеводороды (например, нафталин), нафтолы, сульфоны, лигносульфоновые кислоты, формалин, мочевина и другие. Синтаны подразделяют на вспомогательные, применяемые в небольших количествах совместно с растительными дубящими веществами; заменители таннидов, используемые самостоятельно или в смеси с таннидами в количестве до 60% от массы всего дубителя; специального назначения, применяемые для дубления и одновременной окраски, отбеливания, жирования и других целей. Создание высококачественных синтетических дубящих веществ позволяет сократить или полностью прекратить переработку на дубильные экстракты ценной дубовой древесины, расширить ассортимент и свойства дубителей (применительно к различным схемам кожевенного производства), улучшить качество и интенсифицировать процесс производства кожи. Применение синтанов из года в год увеличивается и составляет в балансе органических дубящих веществ нашей страны (бывший Союз Советских Социалистических Республик (СССР)) около 40%. Из простейших органических веществ дубящими свойствами обладают хиноны и формальдегид. Последний применяют в комбинированном дублении с таннидами и соединениями хрома.

SYNTHESIS GAS = СИНТЕЗ–ГАЗ – Synthesis Gas is a mixture of carbon monoxide (CO) and hydrogen (H_2) which is the product of high temperature gasification of organic material such as biomass. Following clean-up to remove any impurities such as tars, synthesis gas (syngas) can be used to synthesize organic molecules such as synthetic natural gas (SNG – methane (CH_4)) or liquid biofuels such as synthetic diesel (via Fischer-Tropsch synthesis). / Фиша-Тропш (Fischer-Tropsch; в честь Немецких химиков Франца Фиша

(Franz Fischer; 1877–1947) и Ханса Тропша (Hans Tropsch; 1889–1935), осуществивших этот процесс в 1925). Синтез-Газ – смесь газообразных оксидов углерода с водородом или с донорами водорода. Синтез-Газ состоит из CO (40–60%) и H_2 (30–50%). Получают газификацией топлив или конверсией природного горючего газа с водяным паром и O_2. Сырьё в производстве углеводородов, метилового спирта и другого. Синтез-Газ – смесь газов, содержащая главным образом оксид углерода и водород. Применяется для получения синтетического жидкого топлива, метилового спирта и других веществ.

SYNTHETIC ASSET = СИНТЕТИЧЕСКИЙ АКТИВ (или ИСКУССТВЕННЫЙ АКТИВ) – A Synthetic Asset is a combination of long and short positions in financial instruments which has the same risk/reward profile as another instrument. For example, it is possible to replicate the pay-out and exposure of a short futures position by going short European-style call options and long European puts with identical strikes and expiries. Synthetic index options can be generated either through positions in the underlying and futures contracts, or with a basket of vanilla options. / Под Синтетическим, от Греческого слова Synthesis, означающее Соединение или Сочетание, . Синтетический Актив:- стоимость, созданная искусственно путём совместного использования других активов, например, ценных бумаг. Например, одновременная покупка опциона на покупку (call option) и продажа опциона на продажу (put option) на одни и те же акции создаёт синтетическую акцию (synthetic stock), имеющую ту же стоимость с точки зрения соотношения прибыли на капитал (capital gain), а также самой акции, лежащей в основе опционов.

SYNTHETIC COLLATERAL = СИНТЕТИЧЕСКОЕ ОБЕСПЕЧЕНИЕ (или ИСКУССТВЕННЫЙ ЗАЛОГ) – Synthetic Collateral is a low-risk debt instrument held by a collateralized bond obligation (CBO) issuer together with a default swap under which the CBO issuer is the protection seller. / Синтетическое Обеспечение представляет собой низкорискованный долговой инструмент, удерживаемый эмитентом обязательства по обеспеченной облигации (ООО; collateralized bond obligation (CBO)) вместе со свопом на несостоятельность (или свопом на дифолт; default swap), по которому эмитент ООО является защищённым продавцом.

SYNTHETIC COLLATERALIZED BOND OBLIGATION = СИНТЕТИЧЕСКОЕ ОБЯЗАТЕЛЬСТВО ПО ОБЕСПЕЧЕННОЙ ОБЛИГАЦИИ (или ОБЯЗАТЕЛЬСТВО ПО ОБЛИГАЦИИ С СИНТЕТИЧЕСКИМ ЗАЛОГОМ) – Synthetic Collateralized Bond Obligation (CBO):- investors can in effect create their own customized collateralized bond obligation (CBO) by entering into a total return swap on a basket of high yield bonds. The investor would choose the bonds and may be required to post initial margin in the form of cash collateral or securities. Merrill Lynch can provide an out of the money 'put' on the basket that limits the investor's loss to the initial margin amount. The net effect is similar to the leverage and limited risk inherent in an equity tranche in a CBO. The advantages of this transaction are its ease of setup, the ability of the counterparty to alter the bonds in the swap (subject to certain limitations), and the ability of the investor to customize the structure (size, put strike, fixed or floating funding). Synthetic Collateralized Bond Obligation (CBO) is a CBO equivalent created by combining a default swap under which a CBO issuer is the protection purchaser with a low-risk third party debt instrument. / Мёрл Лынч (Merrill Lynch).

SYNTHETIC COLLATERALIZED DEBT OBLIGATION = СИНТЕТИЧЕСКОЕ ОБЯЗАТЕЛЬСТВО ПО ОБЕСПЕЧЕННОМУ ДОЛГУ (или ОБЯЗАТЕЛЬСТВО ПО ДОЛГУ С СИНТЕТИЧЕСКИМ ЗАЛОГОМ) – A Synthetic Collateralized Debt Obligation (CDO) uses credit derivatives to transfer credit risk in a portfolio. This is in contrast to a traditional CDO which is typically structured as a securitization with ownership of the assets transferred to a separate special purpose vehicle (SPV). The assets are funded with the proceeds of debt and equity issued by the vehicle. In a synthetic CDO, an institution transfers the total return or default risk of a reference portfolio via a credit default swap, a total return swap, or a credit-linked note. The SPV then issues securities with repayment contingent upon the loss on the portfolio. Proceeds are either held by the vehicle and invested in highly rated, liquid collateral, or passed-on to the institution as an investment in a credit-linked note. Balance sheet synthetic CDOs are typically used by banks to manage risk capital and are easier to execute than traditional CDOs. Arbitrage synthetic CDOs are often used by insurance companies and asset managers and exploit the spread between the yield on the underlying assets and the reduced expense of servicing a CDO structure.

SYNTHETIC CRUDE = СИНТЕТИЧЕСКАЯ НЕФТЬ – Synthetic Crude:- crudes made by upgrading bituminous (e.g., tar sands) or extra-heavy crude oils, increasing their value and making them transportable by pipeline without dilution or heating. Unlike naturally occurring bitumen, synthetic crudes are generally excluded from the definition of conventional crude production. / Синтетическая Нефть – нефть, полученная посредством облагораживания (улучшения с помощью обработки) битуминозной (например, из смоляных песков) или сверхтяжёлой нефтей, повышая их ценность и делая их транспортабельными по нефтепроводам без разбавления или нагрева. В отличие от возникающей естественным путём битуминозной нефти, синтетические нефти, как правило, исключаются из определения общепринятой добычи нефти.

SYNTHETIC DETERGENT = СИНТЕТИЧЕСКИЙ ДЕТЕРГЕНТ (или СИНТЕТИЧЕСКОЕ ОЧИЩАЮЩЕЕ СРЕДСТВО) – Synthetic Detergent is a manufactured liquid or solid material able to dissolve oily materials and disperse them in water.

SYNTHETIC DYE = СИНТЕТИЧЕСКИЙ КРАСИТЕЛЬ – In 1856 the first commercially successful synthetic dye, mauve, was serendipitously discovered by British chemist William H. Perkin, who recognized and quickly exploited its commercial significance. The introduction of mauve in 1857 triggered the decline in the dominance of natural dyes in world markets. Mauve had a short commercial lifetime (lasting about seven years), but its success catalyzed activities that quickly led to the discovery of better dyes. Today only one natural dye, logwood, is used commercially, to a small degree, to dye silk, leather, and nylon black. The synthetic dye industry arose directly from studies of coal .... Synthetic Dye is a complex colorant derived from coal tar, but today synthetic dyes are usually petrochemical in origin. Natural Dyes have been used since ancient times. A garment that was discovered at Thebes, Egypt, and that dates from about 3000 BC, was dyed with indigo. By 2000 BC, linen and cloth dyeing had become a fairly common practice. The famous Tyrian purple, obtained from certain mollusks of the Mediterranean Sea, was manufactured by a secret process in the ancient Phoenician city of Tyre. The dye was so expensive that its use was reserved for royalty. A turning point in the history of dyes came in 1856. In that year an 18-year-old English chemist, named William Henry Perkin, was experimenting in his home laboratory, trying to synthesize the drug quinine. He did not succeed, but he noticed that some of the gummy mass at the bottom of a flask had a purplish glint. When he added alcohol, the mass turned a beautiful purple. Perkin had the substance tested as a dye, and when the tests proved satisfactory he founded a factory to produce the new dye. Perkin's new dye, named mauve, became very popular. It was the first of the synthetic dyes. Because it was made from aniline, which in turn was made from coal tar, mauve and many similar dyes synthesized thereafter were called Aniline Dyes or Coal-Tar Dyes. Coal-tar dyes are cheaper, more brilliant, and less likely to fade than any of the natural dyes. Furthermore, methods were found whereby even the natural dyes could be synthesized more cheaply than they could be obtained from nature. By the end of the XIX century synthetic dyes provided a vast number of colors. When Perkin's teacher, August Wilhelm von Hofmann, returned to his native Germany, he introduced synthetic dyes there. As the country most advanced in chemistry, Germany became, under Hofmann's leadership, the world center for dye manufacture. During World War I, America's supply of German dyes was cut off, and the American chemical industry was forced to manufacture dyes. As a result the United States became independent of any foreign supply About 80 000 tons of dyes are now manufactured each year in the United States, and more than 3

500 different dyes are used commercially. See also Natural Dye. Synthetic Dyes are classified based upon their chemical composition and the method of their application in the dyeing process. Sir William Henry Perkin, (born March 12, 1838, London, England – died July 14, 1907, Sudbury, near Harrow, Middlesex), British chemist who discovered aniline dyes. In 1853 Perkin entered the Royal College of Chemistry, London, where he studied under August Wilhelm von Hofmann. While Perkin was working as Hofmann's laboratory assistant, he undertook the synthesis of quinine. He obtained instead a bluish substance with excellent dyeing properties that later became known as Aniline Purple, Tyrian Purple, or Mauve. In 1856 he obtained a patent for manufacturing the dye, and the next year, with the aid of his father and his brother Thomas, he set up an aniline manufacturing plant near Harrow. In 1858 he and Baldwin Francis Duppa (1828–1873) synthesized glycine in the first laboratory preparation of an amino acid. They synthesized tartaric acid in 1860. After Carl Gräbe (1841–1927; German industrialist and academic chemist) and Carl Theodore Liebermann (1842–1914; German chemist) announced their synthesis of the red dye alizarin, Perkin developed a cheaper procedure, obtained a patent for his process, and held a monopoly on its manufacture for several years. In 1867 he discovered a chemical process for preparing unsaturated acids. The following year he used this process, which became known as the Perkin Reaction, to synthesize coumarin, the first artificial perfume. He also investigated other dyes, salicyl alcohol, and flavourings. About 1874 he abandoned manufacturing and devoted himself to research, not only studying chemical processes but also investigating the optical rotation of various substances. He was knighted in 1906, the 50th anniversary of his discovery of mauve. The synthetic organic chemical industry began in 1856 when English chemist Sir William Henry Perkin (1838–1907) prepared the dye mauve from coal-tar chemicals. Perkin built a factory near London to supply the world's first synthetic dye. Synthetic versions of alizarin and indigo, dyes previously derived from plants, followed. Although England had the early lead, Germany soon became the leading global supplier of a rainbow of brilliant colors. / Найлан[T3] (Nylon[TM]). Сэр Вильэм Хэнри Пёкин (Sir William Henry Perkin; 1838–1907). Немецкий химик Аугуст Вильхэльм фон Хофман (August Wilhelm von Hofmann; 1818–1892). его брат Томэс (Thomas). Болдвин Франсиз Дапэ (Baldwin Francis Duppa; 1828–1873). После того как Немецкий промышленник и академический химик Карл Грабэ (Carl Gräbe; 1841–1927) и Немецкий химик Карл Тиодор Либаман (Carl Theodore Liebermann; 1842–1914).

SYNTHETIC FIBERS = СИНТЕТИЧЕСКИЕ ВОЛОКНА – Synthetic Fibers:- natural fibers have been used for thousands of years, but there are not enough of them to meet the demands of today's world population. Therefore the invention of synthetic fibers was undoubtedly one of the most important discoveries of the XX century. Synthetic fibers were first produced from amorphous polymers such as nylon and polyester in the 1940's and 50's. Amorphous polymers are easily melt processable, and thus are easy to spin into fibers. These materials continue to dominate the general purpose fiber market because of their low cost and reliability. In more recent years highly crystalline polymer fibers have been introduced with 3–4 times the strength of their amorphous cousins. Aromatic polyamides (aramids) were the first 'super fibers', later to be followed by high modulus polyethylene (HMPE), aromatic polyester, and others. Many of the high performance fibers are made from liquid crystal polymers (LCP's). Man-made fibers made from a polymer that has been produced artificially, in contrast to fibers made from naturally occurring polymers such as cellulose. The term Synthetic Fibers is also used to refer to Synthetic Filaments. Synthetic Fibers are fibers made from petroleum-derived chemicals that were never fibrous in form. They are categorized as Noncellulosic Fibers. The term implied any of the so-called 'Non-Cellulosics' as diferentiated from the two 'cellulosics', rayon and acetate. Also known as Manmade Fibers or Man-Made Fibers. See also Manmade Fibers. Fibers or filaments produced from polymers. Not naturally occurring. Synthetic Fibers were developed mainly to supply the high demand for textile products. Rayon and Nylon were the first ones to be developed and commercialized. Nowadays, textile fibers are manufactured from a unique type of fiber or from a combination of several fibers, natural or synthetic, providing a huge variety of final products. Synthetic Fibers are:- Acrylic, Aramid, Chlorofiber, Elastane, Elastodiene, Elastolefin, Elastomultiester, Fluorofiber, Melanine, Modacrylic, Polyamide or Nylon, Polyester, Polyethylene, Polyimide, Polylactide, Polypropylene, and Vinylal. Synthetic Fibers are organic compounds of high molecular weight and are formed by polymerization. Synthetic fibers formed by condensation reactions include polyamides (nylon) and ployesters (dacron). Synthetic Fibers formed by addition reactions include vinyls, acrylic-vinyl, acrylic-nitril, and urethane. Synthetic Fiber is another term for Manufactured Fiber. Synthetic Fiber is a man-made textile fiber derived from natural bases or produced by chemical synthesis. These chemicals were never fibrous in form. / Найлан[T3] (Nylon[TM]). Синтетическое Волокно (Нить) – химическое волокно (нить), изготовленное из синтетических полимеров. Под Синтетическими Волокнами понимаются химические волокна, получаемые из синтетических полимеров. Синтетические волокна формуют либо из расплава полимера (полиамида, полиолефина, полиэфира), либо из раствора полимера (полиакрилонитрила, поливинилового спирта, поливинилхлорида) по сухому и мокрому методу. Впервые выпуск синтетических волокон в промышленном масштабе был организован в США и Германии в середине 1930-х. Синтетические волокна выпускают в виде текстильных и кордных нитей, моноволокна, а также штапельного волокна. Разнообразие свойств исходных синтетических полимеров позволяет получать синтетические волокна с различными свойствами, тогда как возможности варьировать свойства искусственных волокон очень ограничены, поскольку их формуют практически из одного полимера (целлюлозы или её производных). Синтетические волокна характеризуются высокой прочностью, водостойкостью, износостойкостью, эластичностью и устойчивостью к действию химических реагентов. В конце прошлого столетия производство синтетических волокон развивалось более быстрыми темпами, чем производство искусственных волокон. Это объяснялось доступностью исходного сырья и быстрым развитием сырьевой базы, меньшей трудоёмкостью производственных процессов и особенно разнообразием свойств и высоким качеством синтетических волокон. В связи с этим синтетические волокна постепенно вытесняют не только натуральные, но и искусственные волокна в производстве некоторых товаров народного потребления и технических изделий. В 1968 мировое производство синтетических волокон составляло 3 760 300 тонн (около 51.6% от общего выпуска химических волокон). Смотрите также Полиакрилонитрильное Волокно и Полиамидное Волокно. Все Синтетические Волокна получают на химических предприятиях в результате реакции полимеризации. Раствор или расплав полимера продавливают через фильеры, выходящие струи направляют в осадительную ванну, где происходит их затвердевание и превращение в волокнистый полимер. Свойства его определяются химическим строением и условиями формирования волокна. Так же как и природные волокна, синтетические построены в основном из углерода и водорода и, кроме того, могут содержать азот (полиамидные, полиакрилонитрильные), кислород (полиэфирные), хлор (полихлорвиниловые), фтор (фторсодержащие). Для синтетических волокон характерна более низкая степень полимеризации, чем для природных. Это объясняется ограниченной возможностью приготовления прядильных растворов и расплавов определённой вязкости, позволяющей продавливать их через фильеры. Все синтетические волокна отличаются высокой степенью кристалличности. Это обуславливает хорошие прочностные показатели, а с другой стороны, низкую гигроскопичность. Гигроскопичность синтетических волокон ниже таковой природных волокон. Это одновременно недостаток (для тканей бытового назначения) и достоинство (для технических тканей). Низкая гигроскопичность обусловлена не только плотной упаковкой макромолекул, но и отсутствием или меньшим количеством гидрофильных групп. Следствием гидрофобности является плохая накрашиваемость и высокая электризуемость синтетических текстильных материалов. Отличительным свойством синтетических волокон является термопластичность – способность деформироваться при нагревании. При высоких температурах они переходят в высокоэластическое состояние, увеличивается их внутренняя поверхность (количество и размер пор). Таким образом, создаются условия для эффективного проникновения красителя вглубь волокна, что и используется в процессах крашения.

Недостатки синтетических волокон и прежде всего низкая накрашиваемость устраняются путём модификации волокон. Модификация предполагает введение в структуру полимера из основного мономера небольшого количества (до 15%) другого мономера. Этот мономер имеет более объёмную структуру, что снижает уровень межмолекулярного взаимодействия, волокно становится более эластичным и способным окрашиваться. Новый мономер разрыхляет структуру волокна и вводит в него активные центры, способные взаимодействовать с красителями. Волокна и нити, произведённые из полимеров. Не естественного происхождения. Синтетические Волокна (главным образом полиамидные и полиэфирные) получают из продуктов химической переработки синтетических полимеров. Синтетические Волокна – химические волокна, получаемые из синтетических полимеров. Синтетические волокна формуют либо из расплава полимера (полиамида, полиэфира, полиолефина), либо из раствора полимера (полиакрилонитрила, поливинилхлорида, поливинилового спирта) по сухому или мокрому методу. Синтетические волокна выпускают в виде текстильных и кордных нитей, моноволокна, а также штапельного волокна. Разнообразие свойств исходных синтетических полимеров позволяет получать синтетические волокна с различными свойствами, тогда как возможности варьировать свойства искусственных волокон очень ограничены, поскольку их формуют практически из одного полимера (целлюлозы или её производных). Синтетические волокна характеризуются высокой прочностью, водостойкостью, износостойкостью, эластичностью и устойчивостью к действию химических реагентов. Производство синтетических волокон развивается более быстрыми темпами, чем производство искусственных волокон. Это объясняется доступностью исходного сырья и быстрым развитием сырьевой базы, меньшей трудоёмкостью производственных процессов и особенно разнообразием свойств и высоким качеством синтетических волокон. В связи с этим синтетические волокна постепенно вытесняют не только натуральные, но и искусственные волокна в производстве некоторых товаров народного потребления и технических изделий. Смотрите также Полиакрилонитрильные Волокна, Полиамидные Волокна, и Химические Волокна.

SYNTHETIC FUEL = СИНТЕТИЧЕСКОЕ (ЖИДКОЕ) ТОПЛИВО – Synthetic Fuel:- petroleum-like fuels produced from hydrocarbons including coal, natural gas, oil shale, peat, and tar sands. / Виды топлива, аналогичные полученным из нефти, только произведённые из других углеводородов, в том числе из каменного угля, природного газа, нефтеносных сланцев, торфа и битуминозных песчаников. Под Синтетическим Жидким Топливом понимается горючее, получаемое из бурых и каменных углей или сланцев деструктивной гидрогенизацией при 400–500 °C и давлении 10–70 МПа, газификацией с последующим каталитическим превращением синтез-газа при 180–260 °C и давлении 0.1–2.5 МПа или полукоксованием (швелеванием) при 500–600 °C с последующей гидрогенизацией первичного дёгтя. Производство синтетического жидкого топлива имеет перспективу развития (особенно на основе дешёвых углей открытой добычи) в связи с ограниченными запасами нефти. Под Синтетическим Жидким Топливом понимается горючее для двигателей внутреннего сгорания. Синтетическое жидкое топливо получают синтезом из смеси водорода и оксида углерода, вырабатываемой из природных газов, угля и другого сырья. В результате получают бензин с октановым числом 60–80, высококачественное дизельное топливо и парафин. Синтезируют также высокооктановые компоненты топлив, повышающие антидетонационные свойства; изооктан, алкилбензин, полимербензин, алкилбензол. Синтетическое Жидкое Топливо, горючие жидкости, получаемые синтетическим путём и применяемые в двигателях внутреннего сгорания. Синтетическое жидкое топливо синтезируют из смеси CO и H_2, вырабатываемой из природных газов и угля (смотрите Конверсия Газов, Газификация Топлив), процесс проводят при повышенных температуре и давлении и в присутствии катализаторов – Ni, Co, Fe и других (Метод Фишера и Тропша). В зависимости от условий процесса получаемое синтетическое жидкое топливо содержит различные количества парафиновых и олефиновых углеводородов в основном нормального строения. Впервые синтетическое жидкое топливо в значительных количествах производили в Германии во время 2-й Мировой Войны 1939–45, что было связано с недостатком нефти. Синтез проводили при 170–200 °C, давлении 0.1–1 МегаНьютонов на квадратный метр (МН/м^2) (1–10 атмосфер (ат)) с катализатором на основе Co; в результате получали бензин (когазин 1, или синтин) с октановым числом 40–55, высококачественное дизельное топливо (когазин II) с цетановым числом 80–100 и твёрдый парафин. Добавление 0.8 миллилитра (мл) тетраэтилсвинца на 1 литр (л) бензина повышало его октановое число с 55 до 74. Синтез с использованием катализатора на основе Fe проводился при 220 °C и выше, под давлением 1–3 МН/м^2 (10–30 ат). Бензин, получаемый при этих условиях, содержал 60–70% олефиновых углеводородов нормального и разветвлённого строения; его октановое число 75–78. В дальнейшем производство синтетического жидкого топлива из CO и H_2 не получило широкого развития ввиду его высокой стоимости и малой эффективности используемых катализаторов. Кроме синтетического жидкого топлива, синтетическим путём вырабатывают высокооктановые компоненты топлив, добавляемые к ним для повышения антидетонационных свойств. К ним относятся:- изооктан, получаемый каталитическим алкилированием изобутана бутиленами; полимербензин – продукт каталитической полимеризации пропан-пропиленовой фракции и другие.

SYNTHETIC FUTURES = СИНТЕТИЧЕСКИЕ ФЬЮЧЕРСЫ (или ИСКУССТВЕННЫЕ ФЬЮЧЕРСЫ) – Synthetic Futures:- a combination of a put and a call with the same strike price, in which both are bullish, called Synthetic Long Futures. Also, a combination of a put and a call with the same strike price, in which both are bearish, called Synthetic Short Futures. With futures locked limit up or locked limit down, this left only the ability to trade options. At such moments the term Synthetic Futures becomes a common/new term for many. Synthetic Futures is a position created by combining call and put options for the purpose of mimicking the payout schedule and characteristics of a futures contract. A synthetic long futures position is created by combining a long call option and a short put option for the same expiration date and the same strike price. A synthetic short futures position is created by combining a long put and a short call with the same expiration date and the same strike price. / Синтетические Фьючерсы или Искусственные Фьючерсы:- В моменты, когда на рынке становится невозможным торговать фьючерсами из-за срабатывания блокирования лимита на повышение или блокирования лимита на понижение, остаётся возможным лишь торговать опционами. В такие моменты понятие Искусственные Фьючерсы становится общепринятым новым понятием для многих участников рынка. Искусственные Фьючерсы – это позиция, созданная комбинацией опционов на покупку и опционов на продажу с целью имитации перечня выплат и иных характеристик обычного фьючерсного контракта. Искусственная длинная позиция по фьючерсу или искусственная покупка фьючерса создаётся комбинацией покупки опциона на покупку и продажи опциона на продажу с одной и той же датой прекращения признания и с одной и той же сходной ценой. Искусственная короткая позиция по фьючерсу или искусственная продажа фьючерса создаётся комбинацией покупки опциона на продажу и продажу опциона на покупку с одной и той же датой прекращения признания и с одной и той же сходной ценой.

SYNTHETIC HYDROCARBON = СИНТЕТИЧЕСКИЙ УГЛЕВОДОРОД – Synthetic Hydrocarbon:- oil molecule with superior oxidation quality tailored primarily out of paraffinic materials.

SYNTHETIC LUBRICANT = СИНТЕТИЧЕСКАЯ СМАЗКА – Synthetic Lubricant is a lubricant produced by chemical synthesis rather than by extraction or refinement of petroleum to produce a compound with planned and predictable properties. See also Lubricant. Synthetic Lubricant is a lubricant made of specifically composed chemically reacting substances that has pre-determined properties and characteristics.

SYNTHETIC NATURAL GAS = СИНТЕТИЧЕСКИЙ ГАЗ (или СИНТЕЗ–ГАЗ) – Synthetic Natural Gas (SNG) is a manufactured product, chemically similar in most respects to natural gas, resulting from the conversion or reforming of petroleum hydrocarbons that may easily be substituted for or interchanged with pipeline-quality natural gas. Also known as Substitute Natural Gas. / Синтез-Газ состоит из CO (40–60%) и H_2 (30–50%). Получают газификацией топлив или конверсией природного горючего газа с водяным паром и O_2. Сырьё в производстве углеводородов, метилового спирта и другого. Синтез-Газ – смесь газов, содержащая главным образом оксид углерода и водород. Применяется для получения синтетического жидкого топлива, метилового спирта и других веществ.

SYNTHETIC OIL = СИНТЕТИЧЕСКАЯ НЕФТЬ (или ИСКУССТВЕННАЯ НЕФТЬ) – Synthetic Oil is a marketable and transportable hydrocarbon liquid, resembling crude oil, that is produced by upgrading highly viscous or solid hydrocarbons, such as extra-heavy crude oil or oil sands.

SYNTHETIC OILS = СИНТЕТИЧЕСКИЕ МАСЛА – Synthetic Oils are the oils produced by synthesis (chemical reaction) rather than by extraction or refinement. Many (but not all) synthetic oils offer immense advantages in terms of high temperature stability and low temperature fluidity, but are more costly than mineral oils. Major advantage of all synthetic oils is their chemical uniformity. Synthetic Oil is a lubricant consisting of chemical compounds that are artificially made. Synthetic lubricants can be manufactured using chemically modified petroleum components rather than whole crude oil, but can also be synthesized from other raw materials. Synthetic oil is used as a substitute for petroleum-refined oils when operating in extreme temperature. Aircraft jet engines, for example, require the use of synthetic oils, whereas aircraft piston engines do not. Synthetic oils are also used in metal stamping to provide environmental and other benefits when compared to conventional petroleum and animal-fat based products. These products are also referred to as Non-Oil or Oil Free. The advantages of using synthetic motor oils include:- better low- and high-temperature viscosity performance at service temperature extremes; better (higher) Viscosity Index (VI); better chemical and shear stability; decreased evaporative loss; resistance to oxidation, thermal breakdown, and oil sludge problems; extended drain intervals, with the environmental benefit of less used oil waste generated; improved fuel economy in certain engine configurations; better lubrication during extreme cold weather starts; possibly a longer engine life; superior protection against ‘ash’ and other deposit formation in engine hot spots (in particular in turbochargers and superchargers) for less oil burnoff and reduced chances of damaging oil passageway clogging; increased horsepower and torque due to less initial drag on engine; and improved fuel efficiency – from 1.8% to up to 5% has been documented in fleet tests. However synthetic motor oils are substantially more expensive (per volume) than mineral oils and have potential decomposition problems in certain chemical environments (predominantly in industrial use). For automotive use, the oil change interval for synthetic oils is the same as for conventional oil, typically 7 000 miles to 10 000 miles following the manufacturer’s ‘severe service’ schedule (which is the schedule that covers city driving). Oil needs to be changed because it gets contaminated with combustion by-products that accumulate at about the same rate regardless of oil type. Extending the oil change interval with synthetics is likely to contribute to engine damage and is not recommended. The Basics of Synthetic Oil Technology:- in the 1930s, Dr. Hermann Zorn of Germany was searching for a lubricant with the properties of natural oils derived from crude oil but without the undesirable properties (high pour points, tendency to gum or gel in combustion engines, low oxidation resistance at higher temperatures, etc.). Germany was also in need of a product that was not derived from crude oil, as the nation’s access to crude oil was becoming increasingly scarce. By the mid-1940s, the fruit of Dr. Zorn’s labor included more than 3 500 different blends of esters, including diesters and polyolesters. The first real-world trial for these lubricants came during World War II when both Germany and US forces began using synthetic base oil in aircraft engines. They noticed the synthetics made engine starts much easier in colder climates (due to the high viscosity index) and significantly decreased soot deposits that would build up in oil radiators when using conventional (crude oil-derived) lubricants. Types & Terminology:- there are two American Petroleum Institute (API) base oil categories that include synthetics. The first is API Group IV. The only synthetic base oil included in this group is polyalphaolefin or PAO. PAOs are made by polymerizing an alpha-olefin molecule like ethylene. In an alpha-olefin molecule, there is a carbon-carbon double bond with hydrogen branching off. The second category is API Group V. These are non-PAO synthetic bases. Examples include diesters, polyolesters, alkylated benzenes, phosphate esters, etc. Basically, if it is a synthetic and it is not a PAO, it is a Group V. Some confusion has arisen recently regarding the use of the word ‘Synthetic’. Several petrochemical companies have developed processes involving catalytic conversion of crude oil base stock under high pressures and temperatures in the presence of hydrogen to form very high-quality mineral lubricants. These oils, which are known as API Group III, are so highly refined that their properties almost match that of the Group IV synthetics. They are so close in fact that the US court system sided with a manufacturer of these Group III ‘Synthetics’ when a lawsuit was brought up for false advertising. Even though these Group III base oils are derived from crude oil, they can now legally, from a marketing standpoint, call them synthetic. Possible Advantages Of Synthetic Oil:- (i) Higher Flash Point:- improved fire resistance and thermal stability; (ii) Lower Pour Point:- improved low-temperature pumpability/lubrication; (iii) Fire Resistance:- good for high-risk hydraulic applications; (iv) Oxidation Stability:- extended oil drains, resists severe conditions; (v) Oxidation Stability:- extended oil drains, resists severe conditions; (vi) Thermal Stability:- oil doesn’t degrade or thicken at high temperatures; (vii) High Viscosity Index:- functions like a multi-grade oil; (viii) Lower Friction:- reduced energy consumption costs; (ix) Natural Detergency:- helps keep surfaces clean of deposits; and (x) High Shear Strength:- no viscosity thinning, unlike multi-grade mineral oils. Possible Disadvantages:- (i) High Cost:- a synthetic can cost four to 15 times more than mineral oil; (ii) Toxicity:- phosphate esters may be a toxicity risk; (iii) Hazardous Disposal:- disposal of phosphate esters is more expensive; (iv) Solubility:- some additives are difficult to maintain in solution; (v) Seal Compatibility:- some seals may shrink or swell with synthetics, some incompatibility with coats (e.g., paints) and plastics; (vi) Hydrolitic Stability:- ester-based synthetics may degrade in the presence of water; and (vii) Mixability:- some are unmixable in other fluids (incompatible). / Доктор Хэман Цон (Dr. Hermann Zorn). Синтетические Масла – жидкости, применяемые главным образом в качестве смазочных материалов, теплоносителей, гидравлических жидкостей. На основе синтетических масел готовят некоторые пластичные смазки. В качестве синтетических масел используют синтетические углеводороды, эфиры (в частности, эфиры фосфорной кислоты), полиорганосилоксаны (смотрите Кремнийорганические Полимеры), галогениды углерода (смотрите Галогениды Углерода), полиалкиленгликоли и другие. Синтетические углеводороды получают полимеризацией олефинов (этилена, пропилена и других) или алкилированием ароматических углеводородов (бензола, ксилола и других). Область применения в основном та же, что и нефтяных масел. Эфиры получают главным образом взаимодействием одно- и двухосновных кислот с одно- и многоатомными спиртами. Наиболее часто используют сложные эфиры типа диоктилсебацината или пентаэритритовые эфиры одноосновных кислот. Они имеют хорошие вязкостно-температурные характеристики, низкую испаряемость, повышенную, по сравнению с маслами нефтяными, термическая и химическая стабильность. Применяются в авиационных двигателях, в качестве трансмиссионных масел и гидравлических жидкостей. Особо устойчивы к высоким температурам (до 300–400 °C) и радиации полифениловые эфиры и эфиры а-дигидроперфторспиртов. В качестве негорючих гидравлических жидкостей используют эфиры фосфорной кислоты. Все эфиры имеют хорошие противоизносные свойства. Полиорганосилоксаны – разновидность кремнийорганических полимеров – отличаются малой испаряемостью и достаточно высокой термической стабильностью. По вязкостно-температурной характеристике они превосходят все другие синтетические масла, но уступают им по смазочному действию.

Наиболее термически стабильные полифенилсилоксаны выдерживают нагревание выше 250 °С. Полиметилсилоксаны не застывают при температурах до –100 °С и ниже. Полиорганосилоксаны применяют для смазки малонагруженных узлов трения механизмов и приборов, работающих в широком диапазоне температур. Они используются также в амортизаторах, тормозных и демпферных устройствах, чему способствует высокая сжимаемость полиорганосилоксанов. Галогениды углерода – углеводороды, в молекулах которых атомы водорода замещены на фтор или фтор и хлор. Отличаются особой стойкостью к O_2, HNO_3, H_2O_2 и другим химически активным соединениям. Имеют плохую вязкостно-температурную характеристику, высокую испаряемость. Наиболее ценные характеристики имеют перфторалкилполиэфиры (стабилизированные полимеры окиси перфторпропилена). Используют такие синтетические масла в ядерной и ракетной технике, в химической промышленности, при эксплуатации в условиях высоких температур или в контакте с агрессивными средами. Полиалкиленгликоли – продукты взаимодействия окиси этилена или окиси пропилена (и их смесей) с водой, спиртом, этиленгликолем. Отличаются хорошими вязкостно-температурными свойствами; не дают отложений на деталях после разложения при нагревании. Используют в качестве высокотемпературных смазочных материалов и теплоносителей в бумажной, керамической, стекольной и других отраслях промышленности. В связи с довольно высокой стоимостью, дефицитностью и особенностями свойств потребление синтетических масел составляет лишь доли процента от нефтяных масел. С развитием техники и усложнением условий смазки применение синтетических масел расширяется.

SYNTHETIC POSITION = СИНТЕТИЧЕСКАЯ ПОЗИЦИЯ (или ИСКУССТВЕННАЯ ПОЗИЦИЯ) – Synthetic Position:- a hedging strategy combining futures and futures options for price protection and increased profit potential. For example, by buying a put option and selling (writing) a call option, a trader can construct a position that is similar to a short futures position. This position is known as a Synthetic Short Futures Position, and shows a profit if the futures prices decline, and receives margin calls if prices rise. Synthetic positions are a form of arbitrage. / В биржевой торговле стратегия хэдьжирования, совмещающая фьючерсы и опционы на фьючерсы для обезопасивания цены и повышенного потенциала прибыли. Например, покупкой опциона на продажу и продажей (выписыванием) опциона на покупку торговец может сконструировать позицию, которая аналогична позиции продажи фьючерса. Эта позиция известна как синтетическая позиция продажи фьючерса; она показывает прибыль при снижении цены фьючерса и может привести к требованию брокера пополнить маржинальный счёт, если цена фьючерса будет повышаться. Синтетические позиции являются формой арбитражирования.

SYNTHETIC REPO = СИНТЕТИЧЕСКОЕ РИПО (или ИСКУССТВЕННОЕ РИПО) – Synthetic Repo:- a money manager that anticipates spread tightening lacks current liquidity with which to fund investments. By receiving total return on one or more corporate bonds, the money manager can lock in the purchase price of assets while minimizing capital commitments, thereby disaggregating market timing from liquidity constraints.

SYNTHETICS = СИНТЕТИЧЕСКИЕ ИНСТРУМЕНТЫ (или ИСКУССТВЕННЫЕ ИНСТРУМЕНТЫ) – Synthetics:- a financial instrument that is created artificially by simulating another instrument with the combined features of a collection of other assets. For example, you can create a synthetic stock by purchasing a call option and simultaneously selling a put option on the same stock. The synthetic stock would have the same capital-gain potential as the underlying security. Synthetic is a strategy of buying a combination of futures and put options to achieve the equivalent position of buying a call option or buying a combination of futures and call options to achieve the equivalent position of buying a put option. Customized hybrid instruments created by blending an underlying price on a cash instrument with the price of a derivative instrument. It is a combination of security holdings that mimics the price movement of another single security, i.e. Synthetic Call:- long position in an asset combined with a put on that position; a protected long sale; Synthetic Put:- short position in an asset combined with a call on that position; a protected short sale. / , то есть .

SYNTHETIC STOCK = СИНТЕТИЧЕСКАЯ АКЦИЯ (или ИСКУССТВЕННАЯ АКЦИЯ) – Synthetic Stock:- for example, you can create a synthetic stock by purchasing a call option and simultaneously selling a put option on the same stock. The synthetic stock would have the same capital-gain potential as the underlying security. / Например, можно создать синтетическую (искусственную) акцию посредством приобретения опциона на покупку и одновременной продажи опциона на продажу в отношении одной и той же акции. Синтетическая акция могла бы иметь тот же самый потенциал в плане прироста капитала, что и соответствующая ценная бумага.

SYNTHRAPOL = СИНТРАПОЛ – Synthrapol is a concentrated liquid wetting agent and surfactant compatible with all dye classifications. / Синтрапол – детергент, который применяется для удаления с окрашенной ткани излишков красителя и препятствует окращиванию этими остатками красителя соводных участков ткани. Применение синтрапола гарантирует вам яркие цвета рисунка и что белые участки будут оставаться неокрашенными после полоскания и стирки. На 10 литров воды необходимо примерно 30–40 мл синтрапола.

SYP = SYRIAN POUND

SYR = SYRACUSE HANCOCK INTERNATIONAL AIRPORT

SYRUP FORMATION = ОБРАЗОВАНИЕ СИРОПА – Syrup Formation is a formation of viscous liquids as a result of humidity and warmth, for example, in dried fruits. / Под Сиропом, от Французского слова Sirop, понимается концентрированный (40–80%) раствор отдельных сахаров (глюкозы, сахарозы и других) или их семей в воде или натуральном фруктовом соке.

SYSTEM = СИСТЕМА – (1) System is a social, economic or political organizational form. / Под Системой понимается социальная, экономическая или политическая организационная форма. Под Системой, от Греческого слова Sýstema, означающее Составное Из Частей или Целое, понимается множество элементов, находящихся в отношениях и связях друг с другом, образующих целостность, единство.

(2) In reference to electricity, a term System refers to the grid or the distribution system or any user system. Also a group of components connected and associated in a fixed configuration to perform a specified function. System:- physically connected generation, transmission, and distribution facilities operated as an integrated unit under one central management, or operating supervision. / По отношению к электричеству, относится к энергосистеме или системе распределения или любой системе потребителя. Также, это группа соединённых в определённой конфигурации и взаимосвязанных компонентов, выполняющих определённую функцию.

(3) System is a set of rules for trading. This can be a mental process or a computerized mechanical system which gives buy or sell orders from a set of indicators used to build the system. A system should contain at least all of the following:- the set up to the trade, the entry signal, the stop loss in case the entry signal was incorrect and the exit signal. / Свод правил для торговли. Это может быть некий логический процесс или механическая компьютеризированная система, которая выдаёт распоряжения на покупку или продажу от набора индикаторов, составляющих эту систему. Система должна содержать по крайней мере всё

нижеперечисленное:- настройку на торговлю, входящий сигнал, ограничение убытка в случае, когда входящий сигнал был неверным, и исходящий сигнал.

SYSTEMATIC RISK = СИСТЕМАТИЧЕСКИЙ РИСК – Systematic Risk:- a risk exposure dependent on factors which influence the entire market and cannot be reduced or eliminated by portfolio diversification. Market risk due to factors (such as price fluctuations) that cannot be eliminated by diversification. Systematic Risk is the risk of the individual share relative to the overall market which cannot be eliminated by diversification. It is measured by the Beta factor. A share with a Beta greater than 1 is said to be aggressive, i.e. the price of the share is expected to do better than the market when prices rise. Conversely, a share with a Beta less than 1 is a defensive stock, i.e. its price will be expected to fall by less than the market when prices fall. / Проявление риска зависит от факторов, которые оказывают воздействие на весь рынок в целом и не могут быть занижены или устранены за счёт диверсификации портфеля. Рыночный риск, способный проявиться вследствие таких факторов, как флуктуация (колебание) цены, и который не может быть устранён за счёт диверсификации. Систематический Риск:- часть риска, связанного с ценными бумагами, общая для всех ценных бумаг одного и того же класса (акций или облигаций), которая поэтому не может быть устранена с помощью диверсификации (diversification). Также известен как Рыночный Риск (Market Risk). Мерой систематического риска в отношении акции является коэффициент Бета (Beta coefficient). Смотрите также (Portfolio Beta Score); Теория Портфеля (Portfolio Theory).

SYSTEM CONTROL CENTRE = ЦЕНТР КОНТРОЛЯ СИСТЕМЫ – System Control Centre is one of the two manned sites from which the SWIFT II system is operated and controlled. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SYSTEM CONTROL PROCESSOR = ПРОЦЕССОР КОНТРОЛЯ СИСТЕМЫ – System Control Processor is a large computer, within the SWIFT II network, which monitors and controls the entire SWIFT II network as well as access to that network. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

LE SYSTÈME INTERNATIONAL D'UNITÉS = ЛЁ СИСТЭМ ЭТЭРНАСЬЁНАЛЬ Д'ЮНИТИ (или МЕЖДУНАРОДНАЯ СИСТЕМА ЕДИНИЦ) – Le Système International d'Unités (SI) or International System of Units is a modern metric system in which meters, kilograms, seconds, amperes, candelas and moles are the base units. See also International System of Units. / Лё Систэм Этэрнасьёналь д'Юнити (СИ) или Международная Система Единиц .

SYSTEM FOR ELECTRONIC DOCUMENT ANALYSIS AND RETRIEVAL = СИСТЕМА ЭЛЕКТРОННОГО АНАЛИЗА И ПОИСКА ДОКУМЕНТОВ – System for Electronic Document Analysis and Retrieval (SEDAR) is the Canadian depository for public corporate records. Before the internet, companies had to report regularly to securities commissions across Canada. Now, they all file with SEDAR and SEDAR makes all these filings available to the public via the SEDAR website:- http://www.sedar.com.

SYSTEM FOR THEORETICAL ANALYSIS AND NUMERICAL SIMULATIONS = СИСТЕМА ПО ТЕОРЕТИЧЕСКОМУ АНАЛИЗУ И ЧИСЛОВОМУ МОДЕЛИРОВАНИЮ – Risk exposure is a focal point of vital importance for all international markets and clearing organizations. As world financial derivatives markets expand and counterparty credit risk increases in size and complexity, an organization's ability to assess its exposure to credit risk has become even more critical. The Options Clearing Corporation's System for Theoretical Analysis and Numerical Simulations provides this capability. The Options Clearing Corporation (OCC) is the first derivatives clearinghouse in the world to use a large-scale Monte Carlo-based risk management methodology. This methodology – called 'STANS', for System for Theoretical Analysis and Numerical Simulations – is used to measure the exposure of portfolios of options, futures and cash instruments cleared and carried by OCC on behalf of its Clearing Members. STANS allows clearing institutions to measure, monitor and manage the level of risk exposure of their members' portfolios. Methodology:- (i) Net Asset Value Component:- the mark to market component takes the form of Net Asset Value (NAV) calculation that provides debits or requirements for net short positions and credits for net long positions. The debits and credits are netted to determine the NAV of every portfolio. The NAV component represents the cost to liquidate the portfolio at current prices by selling the net long positions and buying back the net short positions. (ii) Risk Component:- the additional risk component, the portion of the total requirement that covers market risk, is estimated by means of dynamic Expected Shortfall risk measures obtained from large-scale Monte Carlo implementation of copula-based approach with heavy-tailed marginal distributions. STANS generates a set of 10 000 hypothetical market scenarios intended to provide a realistic statistically consistent evaluation of risk at portfolio level. These simulated scenarios incorporate information extracted from the historical behavior of each individual security (risk factor) as well as its relationship to the behavior of other securities (risk factors). Scenarios are generated for over 7 000 risk factors, including a broad range of individual equities, exchange traded funds, stock indices, currencies and commodity products. In order to measure increased portfolio risk given atypical market conditions, STANS generates complementary sets of 10 000 scenarios intended to stress the distributions of the individual risk factors as well as their joint distributions. At every scenario all financial instruments are re-priced using advanced models and hypothetical portfolio Profit/Loss (P/L) is estimated. Iteration over all scenarios leads to the portfolio P/L distribution, which is used to extract common risk measures such as Expected Shortfall (ES). Complementary risk measure as Component ES and Incremental ES are estimated to account for risk-factor specific risk. The combination of the NAV component and the Risk component constitutes the total requirement for a given portfolio. The more accurate portfolio risk estimations in STANS should improve the financial stability of the derivatives markets, and produce clearing and settlement efficiencies beneficial to investors. / учитывать по рынку (mark to market).

SYSTEMIC = СИСТЕМНОЕ – Active throughout the plant despite application, or induction, to only a part of the plant. Active in a part of the plant remote from the point of application. Distributed throughout the host plant via the vascular system. Systemic:- the property of pesticides that penetrate and disperse throughout a plant. Systemic:- common to a plant system, generally distributed throughout an organism.

SYSTEMIC FUNGICIDE = СИСТЕМНЫЙ ФУНГИЦИД – Systemic Fungicide is a chemical substance absorbed by the Plant; it remains in the developing tissues and protects the Plant from fungal attack for a length of time.

SYSTEMIC HERBICIDE = СИСТЕМНЫЙ ГЕРБИЦИД – Herbicides or weed killers are chemicals that inhibit the growth of or kill undesirable, noxious and invasive Plants to clear the area for planting or give desirable vegetation a chance to grow healthy. Herbicides are classified as systemic or contact. Unlike contact herbicides that kill only those parts of the vegetation they are in contact with, systemic or translocated herbicides travel within the Plant to kill it completely. The foliar sprays are composed of mobile chemicals that travel within the plant and reach tissues present far apart from the point of application. Although systemic herbicides kill both annual and perennial Weeds, they are more effective against mature perennial Weeds. These herbicides destroy a greater amount of the Plant's tissue. Finale and Roundup-Pro are examples of systemic herbicides. Cover desirable plants with a tarp or plastic sheet when spraying nearby undesirable vegetation with systemic herbicides. The protective covering prevents accidental drips or sprays that

can kill desirable Plants. Also, because the amount of movement of the herbicide chemicals in the Plants depends on the season, always use the systemic herbicide during the time of year when the target perennial Weed is most susceptible. Systemic Herbicide is a chemical absorbed into the plant parts which inhibits growth. It is toxic to particular Plants only and designed to affect unwanted Plants or weeds. Systemic Herbicides are translocated through the plant, either from foliar application down to the roots, or from soil application up to the leaves. They are capable of controlling perennial plants and may be slower acting but ultimately more effective than contact herbicides. / Рандап-Про (Roundup-Pro). Системные Гербициды:- действующее вещество передвигается по растению от точки контакта с поверхностью растения к точкам роста растений, вызывая их отмирание. Отлично действуют против многолетних сорняков, имеющих мощную корневую систему. Как правило, эти препараты несколько медленнее впитываются и передвигаются по растению.

SYSTEMIC INFECTION = СИСТЕМНАЯ ИНФЕКЦИЯ – Systemic Infection occurs when a pathogen is translocated throughout the Plant tissues, causing extreme damage to the Plant.

SYSTEMIC INSECTICIDES = СИСТЕМНЫЕ ИНСЕКТИЦИДЫ – Systemic Insecticides are a chemical substance absorbed by the Plant tissues that affords protection for a reasonable amount of time against Insect Pests without harming the Plant.

SYSTEMIC PESTICIDE = СИСТЕМНЫЙ ПЕСТИЦИД (или ПЕСТИЦИД ВНУТРИРАСТИТЕЛЬНОГО (СИСТЕМНОГО) ДЕЙСТВИЯ) – A Systemic Pesticide is a pesticide that is taken up through the roots or leaf tissues into the cells of the Cotton Plant (as opposed to remaining on the surface), often in concentrations high enough to cause a biological change (e.g., a systemic might be an at-planting soil insecticide taken up by Cotton seedling roots and transported through the plant's vascular system to suppress or kill leaf-feeding thrips, or it might be Roundup herbicide absorbed into the vascular system of Weeds and translocated to the root zone in high enough concentrations to kill the weed). A pesticide that moves through the plant from the point of application, usually in the vascular system. / для воздействия или поражения Трипсов, питающихся листьями, в достаточно высоких концентрациях для поражения Сорняков. Пестицид, который распространяется внутри растения от точки внесения, обычно через сосудистую систему. гербицид Рандап (Roundup herbicide).

SYSTEMIC RISK = СИСТЕМНЫЙ РИСК – Systemic Risk is the risk that the failure of one participant in a payment or settlement system, or in financial markets generally, to meet its required obligations when due will cause other participants or financial institutions to be unable to meet their obligations (including settlement obligations in a payment and settlement system) when due. Such a failure may cause significant liquidity or credit problems and, as a result, might threaten the stability of financial markets. The risk that a default by one market participant will have repercussions on other participants due to the interlocking nature of financial markets. For example, customer A's default in X market may affect intermediary B's ability to fulfill its obligations in markets X, Y, and Z. Systemic Risk is a risk of disruption to financial services that is caused by an impairment of all or parts of the financial system and has the potential to have serious negative consequences for the real economy. If a bank loses money from a risky investment, that is not systemic. But institutional failure, market seizure, infrastructure breakdown or even a sharp rise in the cost of financial services can have serious adverse implications for many other market participants. In these cases, there is a systemic dimension. It is such negative externalities and the significant spillovers to the real economy that are the essence of systemic risk and which make a case for policy intervention. Risk that a disruption at a firm, in a market segment, to a settlement system, or in a similar setting will cause widespread difficulties at other firms, in other market segments, or in the financial system as a whole. / Риск того, что несостоятельность (дифолт) одного участника рынка справоцирует цепную реакцию несостоятельности других участников вследствие переплетающейся природы финансовых рынков. Например, несостоятельность субъекта А на рынке Х может воздействовать на способность посредника В исполнить свои обязательства на рынках X, Y и Z. Риск того, что срыв в исполнении обязательств некоей фирмой в отношении системы расчётов в одном сегменте рынка или в аналогичном формировании приведёт к распространению финансовых затруднений у других фирм в других сегментах рынка или во всей финансовой системе.

SYSTEM LAMBDA = СИСТЕМНАЯ ЛЯМБДА – System Lambda is the cost to the PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC) – US regional transmission organization) system of generating the next unit of output. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

SYSTEM MESSAGE = СИСТЕМНОЕ СООБЩЕНИЕ – System Message is a message from a user to SWIFT or from SWIFT to a user. / Сообщение от пользователя системе СВМФДС (Сообщество по Всемирной Межбанковской Финансовой Дальней Связи; SWIFT (The Society for Worldwide Interbank Financial Telecommunication)) или от системы СВМФДС пользователю. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SYSTEM OF NATIONAL ACCOUNTS = СИСТЕМА НАЦИОНАЛЬНЫХ СЧЕТОВ – System of National Accounts (SNA) is the internationally agreed standard system for macroeconomic accounts. The latest version is described in System of National Accounts 1993. / Под Системой Национальных Счетов понимается согласованная на международном уровне стандартная система счетов макроэкономики. Самая последняя версия была описана в Системе Национальных Счетов от 1993. Под Национальными Счетами понимается система таблиц в форме бухгалтерских счетов, характеризующая процесс производства, распределения и конечного использования совокупного общественного продукта и национального дохода, как правило, за год. В большинстве стран применяется стандартная система национальных счетов, принятая ООН в 1968 и пересмотренная в 1993.

SYSTEM OPEN MARKET ACCOUNT = СИСТЕМНЫЙ СЧЁТ ПО ОТКРЫТОМУ РЫНКУ – In the United States, The Federal Reserve's portfolio of US Treasury securities. Purchases and sales in this account – open market operations – are under the overall supervision of the manager of the System Open Market Account, subject to the policies and rules of the Federal Open Market Committee.

SYSTEM OPERATION CENTER = ОПЕРАЦИОННЫЙ ЦЕНТР СИСТЕМЫ – In reference to electricity in the United States, a center where the status of generation units is monitored and decisions are made to start and stop particular units based on economic and reliability factors. / По отношению к электричеству в Соединённых Штатах Америки, это центр, где отслеживается состояние генерирующих устройств и принимаются решения о включении или отключении отдельных устройств по экономическим соображениям и факторам надёжности.

SYSTEM PRESSURE = СИСТЕМНОЕ ДАВЛЕНИЕ (или ДАВЛЕНИЕ В СИСТЕМЕ) – System Pressure is the pressure which overcomes the total resistances in a system. It includes all losses as well as useful work.

SYSTEMS APPROACH = СИСТЕМНЫЙ ПОДХОД – Systems Approach(es) is the integration of different risk management measures, at least two of which act independently, and which cumulatively achieve the appropriate level of protection against regulated pests.

SYSTEMS THEORY MODELS OF DECISION–MAKING = МОДЕЛИ ПРИНЯТИЯ РЕШЕНИЯ НА ОСНОВЕ ТЕОРИИ СИСТЕМ – Systems Theory Models Of Decision-Making:- general systems theory emphasizes the way in which organized systems (human and non-human) respond in an adaptive way to cope with significant changes in their external environments so as to maintain their basic structures intact. Systems theory models of decision-making in human groups and organizations emphasize their interaction with 'outside' actors and organizations and concentrate on identifying the particular elements in the environment of the group or organization that significantly affect the outcomes of its decision-making. To understand what an organization did, try to find out what threat or opportunity it was responding to and how its pre-existing response mechanisms worked to do this.

SZ = SWAZILAND

SZL = SWAZI LILANGENI

- T -

T = ТИ. – T is fifth letter of a NASDAQ® stock symbol indicating that the stock has warrants or rights. / Ти. (T) пятая буква фондового символа НЭЗДЭК® (NASDAQ®), указывающая на то, что акция имеет варранты или права.

T = PAID IN STOCK IN PRECEDING 12 MONTHS, ESTIMATED CASH VALUE ON EX DIVIDEND OR EX DISTRIBUTION DATE

T = TANGO

T = TEMPERATURE

T = TERA = 10^{12}

T = TERTIARY TILLERS

t = TIME

t = (METRIC) TONNE

T = TRAINER AIRCRAFT DESIGNATION

T = TREASURY

T = T–VALUE

T+3 = ТИ.+3 – T+3:- the settlement date for securities transactions such as a stock sale. It refers to the obligation in the brokerage business to settle securities trades by the third day following the trade date. The settlement occurs when the seller receives the sales price (the broker's commission) and the buyer receives the shares.

T2S = TARGET2–SECURITIES

TA = TRADE ACCEPTANCE

TA = TRANSFER AGENT

TAA = TACTICAL ASSET ALLOCATION

T–ACS = AUXILIARY CRANE SHIP

TAAS = TERMINAL ADVANCE AUTOMATION SYSTEM

TAB = TAX ANTICIPATION BILL

TAB = НАШИВКА (или ПЕТЛИЦА, или ПЕТЕЛЬКА, или ВЕШАЛКА) – Tab is a small flap that often has a buttonhole at its end. / маленький клапан или отворот, который часто имеет .

TABARD = ТАБАР (или КОРОТКИЙ ПЛАЩ) – Tabard is a short loose-fitting sleeveless or short-sleeved coat or cape, as a tunic worn by a knight over his armor and emblazoned with his arms; a herald's official cape or coat emblazoned with his lord's arms; a woman's sleeveless outer garment often with side slits. / Табар – короткий широкий плащ рыцаря с боковыми разрезами, одевавшийся поверх лат.

TABBY = ТАБИЙСКАЯ – Tabby is a plain weave fabric. In the context of tyre cord fabric it refers to sections of closely spaced weft yarns in a special section of fabric woven to provide a sample. The origin of the word Tabby itself is unclear:- the Spanish word Tapia means a mud wall, and the Arabic word Tabbi means a mixture of mortar and lime. Similar words also appear in both Portuguese and Gullah. Tabby is a fabric with a watered pattern, esp silk or taffeta. From Old French Tabis = silk cloth, from Arabic al-'attabiya, literally:- the quarter of (Prince) 'Attab, the part of Baghdad where the fabric was first made. Tabby is a plain silk taffeta especially with moir finish; also, a plain-woven fabric. Tabby:- the common tabby cat derives its name from silk with a wavy pattern, from Arabic Utabi, the name of the quarter in Baghdad where the silk was made.

TABBY SAMPLE = ПОЛОСАТЫЙ ОБРАЗЕЦ – Tabby Sample is the section of a tyre cord fabric between two tabbies. / Полосатый Образец .

TABLE = СТОЛ – Table (bench):- chunk of wood with legs attached to bottom, and everything else attached to top. / Чурбан из дерева с ножками, прикреплёнными снизу, и с добавлением чего угодно сверху.

TABLECLOTH = СКАТЕРТЬ – Tablecloth is the traditional table covering for protection and decoration. Tablecloths range from informal ones made, for example, of checked fabrics, to formal, such as double damask. Napkins are usually matched to the tablecloth. See also Double Damask, and Napkin.

TABLE LINEN = СТОЛОВОЕ БЕЛЬЁ (или СКАТЕРТНОЕ ПОЛОТНО) – Table Linen is any fabric, regardless of fiber content, suitable for a table covering. Table Linen is a linen (as tablecloths and napkins) for the table.

TABLET TEST = ТЕСТ ТАБЛЕТКОЙ – Tablet Test:- Methenamine Tablet Test is recommended that the test chamber is placed in a laboratory fume hood. The conditioned specimens are placed on the removable base inside the test chamber and the metal plate with

a circular cut-out is placed on the sample. The tablet is placed at the center of the specimen and ignited. After the flame has extinguished, measurements are taken to assess the effects. Features and Benefits:- (i) complete with measuring grid and clamping ring; (ii) sliding panel for easy access; (iii) angled mirror for viewing; (iv) applicable to 2 different tests; and (v) enclosed unit for optimum safety. See also Flammability Tests, and Methanamine Pill Test. / Смотрите также Тесты На Воспламеняемость (Flammability Tests), и Таблетка Метенамина.

TAC = TECHNICAL ADVISORY COMMITTEE

TACAN = TACTICAL AIR NAVIGATION

TAC BOND = TARGETED AMORTIZATION CLASS BOND

TACK BUTTON = ЗАКРЕПКА ПУГОВИЦА (или ПУГОВИЦА КНОПКА) – Tack Button is the jeans button, that usualy comes in 27L diameter.

TACKINESS = ЛИПКОСТЬ – Tackiness is the property of being sticky or adhesive.

TACKING = ПРИМЕТКА (или СМЕТКА, или ПОДШИВКА) – Tacking is a temporary stiching in an object to hold it together while sewing (to be removed afterwards).

TACKING CUT = ПОРЕЗ ОТ ПОДШИВКИ (или ПРИМЕТКИ, или СМЕТКИ, или ЗАХВАТА) – Tacking Cut:- small holes or cuts along the selvage. Fabrics defect.

TACKLE = ТАЛИ – Tackle is the ship's own gear to load/unload cargo. FAS (free along side) is understood to be delivery 'under ship's tackle'.

TACKY = ЛИПУЧЕЕ (или СХВАТЫВАЕМОЕ, или ЗАХВАТЫВАЕМОЕ) – Tacky is a descriptive term applied to lubricating oils and greases which appear particularly sticky or adhesive. / описательный термин, применяемый к смазывающим маслам и смазкам, которые .

TACTIC = ОСЯЗАТЕЛЬНОЕ (или ТАКТИЧЕСКОЕ) – Tactic:- of a movement made by a whole organism, or by a freely motile part such as a gamete, in response to a directional stimulus which has a direct bearing on the direction of the elicited response. See also Phototaxis. / Смотрите также Фототаксис (Phototaxis).

TACTIC POLYMER = ТАКТИЧЕСКИЙ ПОЛИМЕР – Tactic Polymer is a polymer whose molecular structure exhibits regularity or symmetry of non-backbone side groups rather than random ordering. See also Atactic Polymer, Isotactic Polymer, and Syndiotactic Polymer. / Атактический Полимер или Стереонерегулярный Полимер (Atactic Polymer), Изотактический Полимер (Isotactic Polymer), и Синдиотактический Полимер (Syndiotactic Polymer).

TACV = TRACKED AIR CUSHION VEHICLE

TAD = TRANSIT ACCOMPANYING DOCUMENT

TAE = TRIS/ACETATE (BUFFER)

TAEL = ТАИЛ (или ТЧЭИЛ) – Tael or Tahil is a traditional unit of weight used throughout Eastern Asia. During the colonial period, the tael was more or less standardized throughout the region at 4/3 ounce avoirdupois (1/16 catty, 1/12 pound, or about 37.8 grams). In Japan, however, the tael was identified with a slightly smaller traditional unit and is considered equal to 1.323 ounces (37.51 grams). The tael is usually considered equal to the Chinese liang. Traditional Chinese unit of weight for gold. 1 tael = 1.203 37 Troy ounces = 37.429 grams. The nominal fineness of a Hong Kong tael bar is 990, but in Taiwan 5 and 10 tael bars can be 999.9 fine. / Таил – традиционная Китайская весовая единица для золота. Гон Конгский таил имеет номинальную чистоту 990, а Тайваньские 5 и 10 таилей могут быть 999.9 чистоты.

TAFFETA = ТАФЕТА (или ТАФТА) – Taffeta is a plain-weave fabric with a fine, smooth, crisp hand and usually a lustrous appearance. Taffeta fabric usually has a fine cross rib made by using a heavier filling yarn than warp yarn. Taffetas are produced in solid colors, yarn-dyed plaids and stripes, and prints. Changeable and moire effects are often employed. Although originally made of silk, manufactured fibers are now often used in the production of taffeta. Taffeta is a lustrous, medium weight, plain weave fabric with a slight ribbed appearance in the filling (crosswise) direction. For formal wear, taffeta is a favorite choice. It provides a crisp hand, with lots of body. Silk taffeta gives the ultimate rustle, but other fibers are also good choices. Taffeta is a type of fabric which was historically made from silk, but today can be made from many different fibers, including artificial fibers like nylon, and engineered fibers such as rayon. There are a number of uses for taffeta, ranging from lining windbreakers to making wedding gowns, and many people associate this fabric with luxury and high end garments. Many sewing stores carry taffeta, and it can also be ordered directly from fabric manufacturers. The term 'Taffeta' comes from the Persian words for 'Twisted' and 'Woven', which suggests that this fabric probably originated around this region, or that it was introduced to Europeans through Persia, a major stop along European and Asian trade routes. People have been familiar with taffeta for centuries, with documentations of the fabric being used in Medieval Europe. China, Japan, India, and Iran all have a history of taffeta production, originally on hand looms and eventually on modernized machine looms. This fabric usually has a very tight weave, and the weave is plain. Taffeta is famous for being very stiff and crisp, generating rustling sounds when people move in it. Yarn-dyed fabric tends to be especially stiff, while piece-dyed garments are softer and more flexible. The fabric is also very soft and smooth to the touch, and it has a famously lustrous and glimmery appearance. Silk taffeta, the finest version of this fabric, is used in specialty and designer garments such as gowns. Taffetas made from other fibers are utilized for a wide variety of garments, and they are especially popular as linings, because the taffeta can add insulation while helping the garment keep its shape. This fabric can also be used for applique and piecework. Care directions for taffeta vary, depending on how it is used and which fibers are involved. With silk, it is usually best to dry clean only, and the fabric should not be spot treated. If a garment does become stained, it should be taken to a dry cleaner as soon as possible, and the stain should be shown to the cleaner's staff so that special care can be taken. If a garment is an antique, it may require special attention, preferably from a dry cleaner who specializes in vintage and antique garments, such as a dry cleaner who handles costume care. Nylon and rayon garments may be washable by machine, and they usually include tags which indicate the best options for fabric care. Standard construction of the gray fabric in Japan:- (1) 100% Nylon, 190 threads per inch, 48"; (2) 100% Nylon, 210 threads per inch, 48"; and (3) 100% polyester filament, 50d x 75d, 48". Taffeta is a fine, yarn-dyed, closely woven, plain-weave, smooth on both sides, stiffened fabric with a crisp feel and a sheen on its surface. Taffeta was originally made of silk, but is also made of rayon, cotton, acetate, or other man-made fibers. It is named for the Persian fabric 'Taftan'. The rustle of silk taffeta is called Scroop, and it may be a solid color, printed or woven so that the colors appear iridescent. A list of the most common types of taffeta follows. It is used for dresses, blouses, ribbons, draperies, bedspreads, and curtains. See also Scroop. Taffeta is a crisp, smooth-woven fabric made from silk or synthetic fibers. It is considered to be a 'high-end' fabric, suitable for use in ball gowns, wedding dresses and in interiors for curtains or wallcoverings. There are two distinct types of

silk taffeta:- yarn-dyed and piece-dyed. Piece-dyed taffeta is often used in linings and is quite soft. Yarn-dyed taffeta is much stiffer and is often used in evening dresses. Taffeta:- silk, rayon, synthetics. Usually plain with a fine cross rib. A cloth supposed to have originated in Iran (Persia) and was called 'Taftah' (a fine silk fabric) – (in XVI century, became a luxury for women's wear). It is made in plain colors, fancy prints, watered designs, and changeable effects. It is smooth with a sheen on its surface. The textures vary considerably. They have a crispness and stiffness. Taffeta in silk will not wear, as long as other high quality silks, since weighting is given the fabric to make it stiff. If it is over weighted, the goods will split or crack. Taffeta is often used on care labels. / более тяжёлая уточная пряжа, нежели основная пряжа. развод (или потёк (stain)). Найлан[T3] (Nylon[TM]). Смотрите также Скрип или Хруст (Scroop). Под Тафтой, от Персидского слова Тафте, понимается плотная хлопчатобумажная или шёлковая ткань с мелкими поперечными рубчиками или узорами на матовом фоне. Из хлопчатобумажной тафты шьют мужские сорочки, женские платья, из шёлковой – блузки, юбки и тому подобное. Тафта – глянцевая шёлковая, а позднее хлопчатобумажная ткань из очень туго скрученных нитей утка и основы полотняного переплетения, была известна на Руси с XV до конца XVII века, широко применялась для пошива мужской и женской одежды. За счёт тугой закрутки пряжи тафта была достаточно жёсткой, несмотря на тонкость, и при пошиве топорщилась, создавая характерные складки драпировок.

TAFFRAIL LOG = ГАКАБОРТНЫЙ БУКСИРУЕМЫЙ (ЗАБОРТНЫЙ) ЛАГ – Taffrail Log (maritime term) is the log mounted on the taffrail and consisting of a rotator, a log line and recording device (to measure distance run through the water).

TAG = TACTICAL AIR GROUP

TAG = TRANSPORTATION ACRONYM GUIDE

TAG = TRANSPORTATION ALTERNATIVES GROUP (TRANSPORTATION 2020)

TAG = БИРКА (или ЯРЛЫК) – Tag is a card used as a supplement to advertising that is hung from a product. It may identify the manufacturer; give care instructions for the product; explain additional features; list the materials from which the product is made; tell the size, price, style, or color of the product; or bear the product guarantee. A label made of cardboard or plastic or metal. Tag is a strip of leather, paper, metal, or plastic attached to something or hung from a wearer's neck to identify, classify, or label. Tag is a small marker usually tied to a plant, bag, or packet and used for identification and classification of samples. Tag is a way to recognize a shipment or particular item. / Ярлыки и Бирки приклеиваются, прикладывается или подвешиваются к товару. Для них характерна меньшая информационная ёмкость по сравнению с этикетками, ограниченный перечень сведений, отсутствие рисунков. Бирки отличаются от ярлыков меньшей информативностью. Бирки могут быть очень лаконичными и указывать только наименование или фабричную марку, или только название фирмы-изготовителя. Ярлыки обычно содержат наименование товара, фирмы изготовителя, его адрес, сорт, цену, дату выпуска, а также ряд идентифицирующих данных. Так, на ярлыках, подвешиваемых к одежде, указываются артикул изделия, номер модели, размер, дата выпуска. Ярлык может содержать фирменный и товарный знаки, другие необходимые знаки и условные обозначения. Ярлык – вид товарного знака, обозначение на товаре в виде наклейки, этикетки или на прикреплённом к нему талоне, в котором указаны данные о товаре (вес, количество, цена, изготовитель, дата изготовления и другое).

TAG = МЕТКА – Tag is a two-digit identifier for a field in a SWIFT message, sometimes followed by a letter. It marks the presence and start of the field. A letter indicates the format option chosen for the field. / Двухцифровой идентификатор для поля в сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)), иногда сопровождаемый буквой. Она маркирует наличие и начало поля. Буква указывает формат выбранного для поля опциона. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

TAG–ALONG RIGHT = ПРАВО ДЕЙСТВОВАТЬ В ПАРЕ (или ПРАВО ПОСЛЕДОВАНИЯ) – A Tag-Along Right is a legal concept in corporate law. The right assures that if the majority shareholder sells his stake, minority holders have the right to join the deal and sell their stake at the same terms and conditions as would apply to the majority shareholder. Tag-Along Right:- a shareholder may be granted such a right, usually through a shareholders agreement. This right gives a minority shareholder the right to sell his shares on the same terms under which a majority shareholder is selling her shares. Tag-Along Rights:- a contractual obligation used to protect a minority shareholder (usually in a venture capital deal). If a majority shareholder sells his or her stake, then the minority shareholder has the right to join the transaction and sell his or her minority stake in the company. Also referred to as Co-Sale Rights. Tag-alongs effectively oblige the majority shareholder to include the holdings of the minority holder in the negotiations in order to facilitate the possibility that a tag-along right is exercised.

TAGGED IMAGE FILE FORMAT = ТЭГИРОВАННЫЙ ФОРМАТ ФАЙЛОВ ИЗОБРАЖЕНИЙ – Tagged Image File Format (TIFF):- a lossless, archival image file format – a type using G4 compression is used for patent images. TIFF (originally standing for Tagged Image File Format) is a file format for storing images, popular among graphic artists, the publishing industry, and both amateur and professional photographers in general. As of 2009, it is under the control of Adobe Systems (headquartered in San Jose, State of California, the United States). Originally created by the company Aldus Corporation (headquartered in Seattle, State of Washington, the United States) for use with what was then called 'Desktop Publishing', the TIFF format is widely supported by image-manipulation applications, by publishing and page layout applications, by scanning, faxing, word processing, optical character recognition and other applications. Adobe Systems, which acquired Aldus, now holds the copyright to the TIFF specification. TIFF has not had a major update since 1992, though several Aldus/Adobe technical notes have been published with minor extensions to the format, and several specifications, including TIFF/EP (ISO 12234-2), TIFF/IT (ISO 12639), TIFF-F (RFC 2306) and TIFF-FX (RFC 3949) have been based on the TIFF 6.0 specification. The phrases 'Tagged Image File Format' and 'Tag Image File Format' were used as the subtitle to some early versions of the TIFF specification; the 1992 specification, TIFF 6.0, does not use either subtitle phrase, but is simply 'TIFF'. TIFF was originally created as an attempt to get desktop scanner vendors of the mid-1980s to agree on a common scanned image file format, rather than have each company promote its own proprietary format. In the beginning, TIFF was only a binary image format (only two possible values for each pixel), because that was all that desktop scanners could handle. As scanners became more powerful, and as desktop computer disk space became more plentiful, TIFF grew to accommodate grayscale images, then color images. Today, TIFF is a popular format for high color-depth images, along with JPEG and PNG. The first version of the TIFF specification was published by Aldus Corporation in the autumn of 1986 after two major earlier draft releases. It can be labeled as Revision 3.0. It was published after a series of meetings with various scanner manufacturers and software developers. In April 1987 Revision 4.0 was released and it contained mostly minor enhancements. In October 1988 Revision 5.0 was released and it added support for palette color images and LZW compression. TIFF is a flexible, adaptable file format for handling images and data within a single file, by including the header tags (size, definition, image-data arrangement, applied image compression) defining the image's geometry. For example, a TIFF file can be a container holding compressed (lossy) JPEG and (lossless) PackBits compressed images. A TIFF file also can include a vector-based clipping path (outlines, croppings, image frames). The ability to store image data in a lossless format makes a TIFF file a useful image archive, because, unlike standard JPEG files, a TIFF file using lossless compression

(or none) may be edited and re-saved without losing image quality. This is not the case when using the TIFF as a container holding compressed JPEG. Other TIFF options are layers and pages. TIFF offers the option of using LZW compression, a lossless data-compression technique for reducing a file's size. Until 2004, use of this option was limited because the LZW technique was under several patents. However, these patents have expired. / Тэгированный Формат Фалов Изображений (ТФФИ) был разработан компаниями Aldus и Microsoft для хранения графических изображений. В этом формате изображение представлено значениями пикселов (pixel value), что приводит к значительному размеру файлов. TIFF (Tagged Image File Format) – формат хранения растровых графических изображений. TIFF стал популярным форматом для хранения изображений с большой глубиной цвета. Он используется при сканировании, отправке факсов, распознавании текста, в полиграфии, широко поддерживается графическими приложениями. TIFF был выбран в качестве основного графического формата операционной системы NeXTSTEP и из неё поддержка этого формата перешла в Mac OS X. Формат был разработан Aldus Corporation в сотрудничестве с Microsoft для использования с PostScript. Компания-владелец спецификаций – Aldus Corporation – впоследствии объединилась с Adobe Systems, владеющей в настоящее время авторским правом на эти спецификации. Изначально формат поддерживал сжатия без потерь, впоследствии формат был дополнен для поддержки сжатия с потерями в формате JPEG. Файлы формата TIFF, как правило, имеют расширение .tiff или .tif.

TAGGING = ОКОВКА – Tagging is the practice of cutting the dung locks off sheep. Usually this operation is done immediately prior to shearing, and it may be done prior to lambing.

TAG LOCKS = ОБОР (или ГРЯЗНЫЕ КРАЯ РУНА) – Tag Locks are large locks of britch wool clotted with dung and dirt.

TAGS = ОБОР (или КЛОК, или КИЗЯЧЬЯ ШЕРСТЬ, или НИЗКИЕ СОРТА ШЕРСТИ) – Tags:- broken or dung-covered wool and other wastes that are swept from the floor of shearing areas.

ТАНАР = THAI–AUSTRALIAN HIGHLAND AGRICULTURAL PROJECT

TAHKLI SPINDLE = ВЕРЕТЕНО ТАКЛИ – Tahkli Spindle is a small, metal-whorl supported spindle. These lightweight support spindles are good for spinning cotton and fine fibers. The Indian Tahkli weighs 0.5 oz, has a metal shaft and brass whorl and is ideal for spinning fragile or very fine yarns. The Pear Tahkli weighs 1 oz and has a 10.5" brass shaft and maple whorl. It can be used as a support or drop spindle to spin fine wool yarns. Takli or Tahkli is a small metal whorled spindle with a metal shaft which is pointed on the bottom end and hooked at the top. Generally used as a support spindle for spinning cotton.

TAIL = ПЕРИОД ОКОНЧАНИЯ (или ХВОСТ) – Tail:- this term has been used to describe both the exposure that exists after expiration of a policy and the coverage that may be purchased to cover that exposure. On 'occurrence' forms a claims tail may extend for years after policy expiration, and the losses may be covered. On 'claims made' forms tail coverage may be purchased to extend the period for reporting covered claims beyond the normal policy period. / Хвост:- обозначение цифры после запятой, разница. (1) В страховании:- разница в сроках между получением страховых взносов и выплатой; например, компании, занимающиеся перестрахованием (reinsurance), имеют более длинный срок между получением взносов и выплат, чем компании, занимающиеся страхованием от несчастных случаев (casualty insurance). (2) Для аукционов казначейских ценных бумаг:- разрыв в цене между низшим конкурентным предложением цены (competitive bid), принятым Министерством Финансов США при продаже краткосрочных векселей, облигаций и долгосрочных векселей, и средним предложением цены по всем этим предложениям на покупку этих казначейских ценных бумаг. Смотрите также Казначейки (Treasuries). (3) При размещении ценных бумаг:- десятые доли, следующие за целым числом в Долларах, указанным в ставке, сделанной андеррайтером (underwriter) при размещении выпуска ценных бумаг на основе конкурентных предложений (competitive bid). Например, десятичная доля ставки в 97.3347 Долларов за некоторый выпуск облигаций будет 0.3347.

TAIL = ЗАДНИЙ ТОРЕЦ (или ЗАД, или ХВОСТ) – Tail is the rear of container or trailer. The opposite to Front, or Nose. / Задняя часть контейнера или прицепа. В противоположность Переднему Торцу или Передку (Front), или Носу (Nose).

TAILCOAT = ФРАК (или ПИДЖАК С ДЛИННЫМИ ПОЛАМИ) – Tailcoat is a coat with tails, especially a man's full-dress coat with two long tapering skirts at the back.

TAILING = КЛЯКСА (или КРАКСА, или РАЗМЫВАНИЕ) – Tailing:- a continuous change in color along the length of a piece. Note:- this defect is often caused by a gradual change in dye-bath concentration or temperature. / Пятна (tailing):- порок заключительной отделки ткани в виде загрязнённых или другого цвета мест различной величины. Примечание:- этот порок возникает при быстром изменении концентрации или температуры красителя в красильной ванне.

TAILINGS = ХВОСТЫ (или ОТХОДЫ (ОБОГАЩЕНИЯ)) – Tailings:- fine grained remains of ore once most of the valuable material has been removed in the concentration process. / Под Хвостами понимаются отходы, получаемые в результате обогащения полезного ископаемого (получения концентрата). Содержание ценного компонента в хвостах гораздо ниже, чем в исходном материале. Иногда находят применение в промышленности, например:- хвосты, содержащие кварц, – как флюсы, хвосты, содержащие глинозём, – как сырьё для производства алюминия.

TAILINGS DAM = ОТВАЛ ХВОСТОВ – In mining industry, Tailings Dam is a construction used to deposit the rock waste which remains as a result of the flotation process after the concentrate has been extracted. / В горной (горнодобывающей) промышленности, порог хвостов (отходов обогащения) – это конструкция, используемая для складывания отходов горной породы, которая остаётся в результате процесса флотации после того, как концентрат подвергся экстракции/извлечению. Под Отвалом понимается насыпь на земной поверхности из пустых пород некондиционных полезных ископаемых или отходов. В карьерах различают внутренние (в контуре карьера) и внешние отвалы. Для образования и планировки отвала используют консольные отвалообразователи, экскаваторы, транспортно-отвальные мосты, бульдозеры. На обогатительных фабриках, металлургических заводах, электростанциях и другом в отвалах складируют шлаки, хвосты и другое.

TAIL SHAFT = ЗАДНИЙ ВАЛ (или ХВОСТОВОЙ ВАЛ) – Tail Shaft is the after section of the propeller shaft. Extreme section at the aft end of a ship's propeller shaft. / Крайняя секция на конце кормы у гребного вала судна.

TAILS OUT = ВЫСТУПАЮЩИЕ ХВОСТЫ – (1) Tails Out:- improper working of cutters on receiving side, timings of cutter and gripper cutter sharpness, freeness of working etc. Trailing pick is also due to accumulator setting, blade sharpness and scissor setting. Weaving defect. (2) Tails Out:- during mending repair if tails are not properly cut/trim which are not interlaced in tuck in. Mending defect. / Порок или дефект ткачества. Порок или дефект штопки (mending defect).

TAILWATER = ОТРАБОТАВШАЯ ВОДА (или СБРОСНАЯ ВОДА) – Tailwater is the excess irrigation water collected from the cotton field. Tailwater systems are designed to prevent possible off-site contamination by water containing pesticides, nutrients or sediment. Irrigation water that has drained from a cotton field. / Вода для орошения, которая была дренирована с поля

Хлопчатника. Для предотвращения возможного загрязнения извне водой, содержащей пестициды, питательные вещества (элементы) или отложения.

TAK DYEING = КРАШЕНИЕ ХХ – TAK Dyeing is a continuous dyeing process for producing random multicolor patterns which are usually less sharply defined than printed patterns. Colored dye liquor is applied to the carpet in a controlled pattern of droplets. Use of dye splattering techniques, sometimes called Tak Dyeing. The TAK printing system can still be found in the carpet industry. With this technique irregular patterns can be produced. The carpet, previously dyed with a ground shade, is provided with colored spots through dripping. The size and the frequency of the colored spots can be varied by adjusting the overflow groove placed along the carpet width. TAK Dyeing equipment, which manufacturers use to create designs by sprinkling flecks of dye onto the carpet material. In TAK Dyeing, carpet is conveyed under a dye applicator which drips or splatters dye onto carpet yarn conveyed below the applicator. The applicator includes a lick roll which picks up dye from a trough, and the dye is scraped from the lick roller by a doctor blade. The doctor blade includes a plurality of individual channels for dividing the dye into a plurality of separate dye streams. The dye streams, as they issue from the doctor blade, are broken up into smaller streams or drippings by mechanical dye stream interrupter elements positioned below the lower edge of the doctor blades. To randomize the pattern, various devices oscillate both the doctor blade carrying the separate streams, and the mechanical interrupter devices. Tak Dyeing is used to provide coloration for the nylon tufts. The TAK head is an apparatus for dispersing dyestuff droplets onto upstanding tufts of carpet or other textile material. While carpet is disclosed in the preferred embodiment it will be equally apparent that other textile materials can also be dyed with the instant invention. TAK Dyeing:- Küsters Dyeing Range is a continuous dye range for carpets. The unit wets the carpet, applies dyes and auxiliary chemicals by means of a doctor blade, fixes the dyes in a festoon steamer, and washes and dries the carpet in one pass through the range. An optional auxiliary unit may be installed to randomly drip selected dyes onto the background shade for special styling effects. This process is called TAK Dyeing. See also Küsters Dyeing Range. / цветные пятна . Найлан^{T3} (Nylon^{TM}). непрерывное крашение (continuous dyeing). Кюстас (Küsters).

TAKE A TURN = ЗАВЕРНУТЬ (или ЗАВЁРТЫВАТЬ) – Take A Turn (maritime term):- to pass a turn around a belaying pin or cleat. / Завёртывать трос на кнехт, утку.

TAKE IN = ВЫБИРАТЬ (или УБИРАТЬ, или СВЁРТЫВАТЬ, или ПРИНИМАТЬ) – Take In (maritime term):- to lower and furl the sails.

TAKE–IT–OR–LEAVE–IT = ЗАБИРАЙ–ЕГО–ИЛИ–ОСТАВЬ–ЕГО – Take-It-Or-Leave-It Pallet is a pallet fitted with fixed cleats on the top deckboards to permit fork truck tines to pass beneath the unit load and remove it from the pallet.

TAKE–OR–PAY = ЗАБИРАЙ–ИЛИ–ПЛАТИ – In a buyer's contract Take-or-Pay (ToP) is the obligation to pay for a specified amount of gas whether this amount is taken or not. Depending on the contract terms under-takes or over-takes may be taken as make-up or carry forward into the next contract period. When it is credited into another contract period this is called Make-Up Gas. See also Flat Gas.

TAKEOVER = ПОГЛОЩЕНИЕ – Takeover:- acquiring control of a corporation, called a Target, by stock purchase or exchange, either hostile or friendly. See also tender offer, leveraged buyout, merger, poison pill, raider, deal stock, in play, fairness opinion, golden parachute, highly confident letter, material information, proxy fight, raider, staggered board of directors, bulk transfer. See also Acquisition, and Merger. Buying of a proportion of another company's shares so that the purchaser gains control of the company or its assets. When companies or individuals wish to obtain control or to buy out the owners of an existing company, the bidder will circularise the shareholders bidding a certain price per share. There is usually a proviso that the offer may be conditional upon acceptance in respect of a minimum number of shares and within a certain date specified. Takeover is a merger, acquisition or other change in the controlling interest of a corporation. / Поглощение:- перекупка компании, выкуп контрольного пакета акций. Смена владельцев контрольного пакета акций компании. Выкуп контрольного пакета акций компании может быть произведён в ходе дружественного приобретения или в результате недружественной перекупки акций. Компания, являющаяся целью приобретения (target company), может бороться с попытками поглощения так называемым методом отпугивания акул (shark repellent techniques). Попытки недружественного поглощения компании (направленного на замену существующего руководства) обычно производятся путём открытых тендерных предложений (tender offer). Другие методы заключаются в неожиданном представлении директорам компании предложения о слиянии или в накоплении акций компании на открытом рынке, или действиях через доверенных лиц (proxy fights) с целью смены директоров.

TAKEOVER BID = ПРЕДЛОЖЕНИЕ О ПОГЛОЩЕНИИ – Takeover Bid:- offer to take over a controlling interest in a corporation by buying shares of stock in the stock market. The offer is made public, i.e. the existing shareholders of a listed company are informed that a buyer is willing to purchase their shares by paying a price that is higher than the price at which the share is currently traded on the stock market. If this price is paid in the form of securities (stocks or bonds), the takeover bid is called a Takeover Bid For Shares. / , то есть .

TAKEOVER FINANCING = ФИНАНСИРОВАНИЕ ПОГЛОЩЕНИЯ – Takeover Financing:- procurement of the necessary financial resources for the acquisition of a controlling interest in one company by another company. Such transactions are frequently combined with bank loans, bank guarantees and securities issues. See also Leveraged Buyout.

TAKER = ВЗЯВШИЙ – Taker is the buyer of an option contract. / Покупатель опционного контракта.

TAKE–UP = УКРУТКА – (1) Take-Up (twist) is the change in length of a filament, yarn, or cord caused by twisting, expressed as a percentage of the original (untwisted) length.

TAKE–UP = УРАБОТКА – Take-Up (yarn in fabric) is the difference in distance between two points in a yarn as it lies in a fabric and the same two points after the yarn has been removed from the fabric and straightened under specified tension, expressed as a percentage of the straightened length. In this sense, take-up is contrasted to the crimp of a yarn in a fabric, which is expressed as a percentage of the distance between the two points in the yarn as it lies in the fabric. Take-up is generally used in connection with greige fabric. Take-Up is the difference between yarn length as it lies in the cloth and its straightened-out length after removal from the cloth, expressed as a percentage of the original length before weaving.

TAKE–UP MOTION = НАМОТКА ТОВАРНОГО СУРОВЬЯ (или ПРИЁМНОЕ ДВИЖЕНИЕ, или СЪЁМНОЕ ДВИЖЕНИЕ) – Take-Up Motion:- the winding of the newly woven cloth onto the cloth roller at the front of the loom. The speed at which this roller turns is governed by a take-up pawl and a set of gears usually located at the lower right-hand side near the front of the loom. The pick-wheel governs the compactness of the goods and the pickage of the filling in the fabric being woven. / уточина.

TAKING ON MORE THAN YOU CAN CARRY = БРАТЬ БОЛЬШЕ, ЧЕМ ВЫ МОЖЕТЕ ПЕРЕВЕЗТИ (или ПРИНИМАТЬ БОЛЬШЕ, ЧЕМ МОЖЕТЕ ВЫНЕСТИ) – Taking On More Than You Can Carry (maritime term):- loaded with more cargo than a ship can safely navigate with. Drunk.

TALC = ТАЛЬК (или СЛЮДА) – Talc is a silicate mineral that is extremely soft and has a soapy or greasy feel; used as talc powder. / Под Тальком понимается минерал подкласса слоистых силикатов, $Mg_3Si_4O_{10}(OH)_2$. Белый, зеленоватый. Твёрдость 1, плотность 2.8 г/см^3. Разновидности:- агалит – тонковолокнистый, стеатит – плотный, благородный тальк – прозрачный светлый. Продукт гидротермального изменения магнезиальных силикатов ультраосновных пород. Наполнитель в парфюмерно-косметической, бумажной, резиновой промышленности; кислото-огнеупорный и электроизоляционный материал. Под Слюдами понимается группа породообразующих минералов (алюмосиликатов) подкласса слоистых силикатов, сложного и непостоянного состава (биотит, лепидолит, мусковит, флогопит и другие). Таблитчатые кристаллы, чешуйчатые массы. Расщепляются на тончайшие листочки, обладающие высокими диэлектрическими свойствами и термостойкостью. Магматического, пегматитового, пневмотолитового и метаморфического происхождения.

TALLITH = ТАЛИС (или ТАЛЛИС, или ТАЛИТ) – Tallith is a fringed shawl worn over the head or shoulders by Jewish men especially during morning prayers. / Молитвенное покрывало у Иудеев.

TALLY = УЧЁТ – Tally is a count performed when shipments are received in order to track and record their condition.

TALLY CLERKS = УЧЁТЧИКИ (или КЛЕРКИ ПО УЧЁТУ) – Tally Clerks are the persons checking the conformity of packages and cargo with the description given on documents.

TALLYMAN = ТАЛЬМАН (или УЧЁТЧИК) – Tallyman is a person who records the number of cargo items and/or containers together with the condition thereof at the time it is loaded into or discharged from a vessel. / Под Тальманом или Учётчиком понимается лицо, которое записывает количество грузовых изделий и/или контейнеров наряду с их состоянием во время их загрузки на или разгрузки из судна. Тальман – работник занимающийся подсчётом, обмером, контрольной перевеской грузов и другими операциями при проведении погрузо-разгрузочных работ на судне. Тальман несёт материальную ответственность за понесённые по его вине убытки, например, при недостаче.

T. AMAN = ТИ. АМАН – T. Aman or T-Aman Rice (Oryza Sativa L.) is a wet season Rice is used in Bangladesh and Eastern India for transplanted lowland Rice, grown in the wet season when water depth does not exceed 0.5 m, approximately from July to September. / (Посевной Рис (Oryza Sativa L.)).

TAMARIND KERNEL POWDER = ПОРОШОК ИЗ ЯДЕР ТАМАРИНДА – Tamarind Kernel Powder (TKP) is produced out of Tamarind Seeds. It is available in natural and de-oiled form. It has two primary uses in the Textile Industry:- (1) Sizing:- it is an ideal for sizing material and is extensively used for sizing in textile industry. (2) Thickener:- one of the biggest uses of this is as a textile thickener. Many users modify the natural powder in order to have better results in their specific end uses. It is also used in the Jute Industry. It is extensively used in sizing of jute yarns. Gradually it has replaced most other conventional starches in this industry. It is also used for sizing of cotton wraps. / Тамаринд – Индийский Финик.

TAMBOUR CURTAINS = ТАМБУРНЫЕ ШТОРЫ (или ШТОРЫ, ВЫШИТЫЕ КРУГЛЫМИ ПЯЛЬЦАМИ) – Tambour Curtains:- imported Swiss, heavily embroidered batiste, lawn, or polyester curtains.

TAM–O'SHANTER = ТЭМ–О'ШЭНТЁ (или ШОТЛАНДСКИЙ БЕРЕТ) – Tam-O'Shanter is a Scottish woolen cap with a tight headband, wide flat circular crown, and usually a pompon in the center.

TAN = TAX ACCOUNT NUMBER

TAN = TAX ANTICIPATION NOTE

TAN = TOTAL ACID NUMBER

TAN = TRANSACTION NUMBER

TAN = ПОДПАЛ (или ЗАГОРЕЛОЕ, или РЫЖЕВАТО–КОРИЧНЕВОЕ) – Tan:- a variable color that is a light yellowish brown. Plural tense:- tan-colored articles of clothing.

TANB = TRAILERABLE AIDS TO NAVIGATION BOAT

TANDEM = ТАНДЕМ (или 'ПАРОВОЗ') – Two axles less than nine feet apart. Tandem is a truck that has two drive axles or a trailer that has two axles. / Полуприцеп и двухосной задней тележкой. Тандем, расположение однородных устройств последовательно по одной геометрической оси.

TANGENT MODULUS = ТАНГЕНС МОДУЛЬ (или КАСАТЕЛЬНЫЙ, или ОТКЛОНЁННЫЙ, или ТАНГЕНЦИАЛЬНЫЙ МОДУЛЬ) – Tangent Modulus is the ratio of change in stress to change in strain derived from the tangent to any point on a stress-stain curve. See also Modulus. Tangent Modulus:- in a tenacity-strain curve, the ratio of the change in tenacity to the change in strain derived from the tangent at any point on the curve.

TANGERINE = МАНДАРИНОВОЕ (или ТАНЖЕРСКОЕ, или ТЭНЖЁРИН, или МАНДАРИН) – Tangerine:- a moderate to strong orange color (also a delicious fruit).

TANGIBLE ASSETS = МАТЕРИАЛЬНЫЕ АКТИВЫ – Tangible Assets:- these comprise produced fixed assets and non-produced assets. Tangible fixed assets, the acquisition and disposal of which are recorded in gross fixed capital formation, comprise buildings and other structures (including historic monuments), vehicles, other machinery and equipment and cultivated assets in the form of livestock and trees yielding repeat products, e.g., dairy cattle, orchards. Tangible nonproduced assets are assets such as land and sub-soil resources that occur in nature over which ownership rights have been established. Similar assets to which ownership rights have not been established are excluded as they do not qualify as economic assets. The acquisition and disposal of nonproduced assets in principle is recorded separately in the capital account. The distinction between produced and non-produced assets is not yet fully possible for the United Kingdom. Literally, assets that may be touched, such as buildings or stock. They may be contrasted with intangible or invisible assets, which are those that are not visible, such as company's goodwill or the expertise of its staff. Asset having physical substance and a life greater than one year. Tangible assets are not held for resale in the ordinary course of business. Examples are machinery, buildings and furniture. The opposite of Intangible Asset. Tangible Assets are assets having a physical existence, such as cash, land, buildings, machinery, or claims on property, investments, or goods in process. / Материальные Активы:- любые активы, не удовлетворяющие определению нематериальных активов (intangible asset), которые представляют собой нематериальные права на нечто, что представляет материальное преимущество на рынке, например, торговая марка

или патент. Таким образом, материально-вещественные активы – это материально ощутимые активы, например, наличные средства, недвижимость или оборудование. Тем не менее в бухгалтерском учёте такие активы, как дебиторская задолженность (accounts receivable), считаются материально-вещественными активами, хотя они не более материальны, чем лицензия или соглашение об аренде, причём оба эти вида активов считаются нематериальными. В целом:- если активы имеют физическую форму, они являются материальными; если активы не имеют физической формы, следует проконсультироваться с перечнем активов, которые бухгалтеры договорились считать нематериальными.

TANGIBLE FIXED ASSETS = МАТЕРИАЛЬНЫЕ НЕДВИЖИМЫЕ АКТИВЫ – In the United Kingdom, Tangible Fixed Assets are non-financial produced assets that consist of dwellings, other buildings and structures, machinery and equipment and cultivated assets. Also known as Property, Plant And Equipment in the United States. Assets that have physical substance and are held for use in the production or supply of goods or services, for rental to others, or for administrative purposes on a continuing basis in the reporting entity's activities.

TANGLED YARN = СПЛЕТЁННАЯ (или ЗАПУТАННАЯ) ПРЯЖА – Tangled Yarn is a term sometimes used as alternative for interlaced yarn. See also Interlaced Yarn.

TANGLELACED FABRIC = ХХПРОШИТАЯ ТКАНЬ – Tanglelaced Fabric is a nonwoven fabric prepared as a flattened mat of fibers. The fibers are formed into an entangled mass using jets of water or air. No binder or stitches are required to hold the fibers together. See also Spunlaced Fabric. Tangle Laced Fabric:- in formed fabrics, bonding done by tangling the fibers rather than by stitching or spot binding.

TANGO = ТЭНГО – Tango (pronunciation:- TANG-go) or T is international nautical signal flag meaning:- (i) International:- Keep clear; engaged in trawling. (ii) Navy:- Do not pass ahead of me. Meaning:- do not pass ahead of me. International Meaning:- Keep clear; engaged in trawling. With 4 numerals, local time. / Держитесь в стороне от меня.

TANK = БОРЦОВКА (или МАЙКА БЕЗРУКАВКА, или ТОПИК) – Tank is the abbreviated use of the word Tank Top; a sleeveless collarless shirt with usually wide shoulder straps and no front opening. Example of a sentence using the word tank:- the muscular men of the Apparel Search Company look good in a tank. This does not refer to the type of tank that is ridden by members of the army. It simply refers to a type of shirt.

TANK = ЦИСТЕРНА (или ТАНК) – Tank means a shell including its service and structural equipment. When used alone the term means tank-container, portable tank, demountable tank, fixed tank and tanks forming elements of a battery-vehicle or multiple-element gas container (MEGC).

TANK BARGE = БАРЖА ЦИСТЕРНА (или НЕФТЕНАЛИВНАЯ БАРЖА) – Tank Barge is a river barge designed for the carriage of liquid bulk cargoes. / Речная баржа, предназначенная для транспортировки жидких наливных грузов.

TANK CAR = ВАГОН ЦИСТЕРНА (или ЖЕЛЕЗНОДОРОЖНАЯ ЦИСТЕРНА) – Tank Car:- railcars designed to haul bulk liquid or gas commodities. / Железнодорожные вагоны, предназначенные для перевозки наливом жидких или газообразных типов сырья.

TANK CLEANING = МОЙКА (ГРУЗОВЫХ) ТАНКОВ (или ОЧИСТКА ЦИСТЕРН) – Tank Cleaning is a removal of all traces of a cargo from the tanks of a tanker normally by means of high pressure water jets.

TANK CONTAINER = КОНТЕЙНЕР ЦИСТЕРНА – Tank Container is a tank, surrounded by a framework with the overall dimensions of a container for the transport of liquids or gasses in bulk. Tank Container is a large container essentially comprising an ISO frame in which liquid containers are mounted. They must meet special requirements with respect to pressure-resistance as a result of the pressures they have to withstand. For this reason, the actual containers are generally cylindrical or spherical in form. Several containers can be mounted either horizontally or vertically in a single frame. Only specific containers must be used for foodstuffs and must be marked Potable Liquids Only. Tank containers for hazardous goods must meet the requirements of the IMDG code. Half-height tank containers serve to carry high-density liquids which cannot be carried in normal tank containers because they cannot be filled to a high enough level and are therefore subject to surging. / Контейнер Цистерна (КЦ) является транспортным оборудованием, предназначенным для безопасной перевозки грузов, относящихся к 3, 6, 8 и 9 классам опасности по ГОСТ 19433-88, автомобильным, железнодорожным и морским транспортом во внутреннем и международном сообщении и временного хранения их у грузополучателя. Контейнер изготавливается в восьми модификациях:- (i) ТКМ1-25СВП имеет цистерну, изготовленную из нержавеющей стали марки 12Х18Н10Т, ГОСТ 7350-77, с верхним расположением наливного (сливного) устройства и полированной внутренней поверхностью; (ii) ТКМ1-25УВЦ имеет цистерну, изготовленную из углеродистой низколегированной стали 09Г2С-14, ГОСТ 5520-79, с верхним расположением наливного (сливного) устройства и оцинкованной внутренней поверхностью; (iii) ТКМ1-25СНП имеет цистерну, изготовленную из нержавеющей стали марки 12Х18Н10Т, ГОСТ 7350-77, с нижним или, по требованию заказчика, одновременно с нижним и верхним расположением наливного (сливного) устройства и полированной внутренней поверхностью; (iv) ТКМ1-25УНЦ имеет цистерну, изготовленную из углеродистой низколегированной стали 09Г2С-14, ГОСТ 5520-79, с нижним или, по требованию заказчика, одновременно с нижним и верхним расположением наливного (сливного) устройства и оцинкованной внутренней поверхностью; (v) ТКМ1-25СВ имеет цистерну, изготовленную из нержавеющей стали марки 12Х18Н10Т, ГОСТ 7350-77, с верхним расположением наливного (сливного) устройства и механически очищенной внутренней поверхностью; (vi) ТКМ1-25УВ имеет цистерну, изготовленную из углеродистой низколегированной стали 09Г2С-14, ГОСТ 5520-79, с верхним расположением наливного (сливного) устройства и механически очищенной внутренней поверхностью без покрытия; (vii) ТКМ1-25СН имеет цистерну, изготовленную из нержавеющей стали марки 12Х18Н10Т, ГОСТ 7350-77, с нижним или, по требованию заказчика, одновременно с нижним и верхним расположением наливного (сливного) устройства и механически очищенной внутренней поверхностью; и (viii) ТКМ1-25УН имеет цистерну, изготовленную из углеродистой низколегированной стали 09Г2С-14, ГОСТ 5520-79, с нижним или, по требованию заказчика, одновременно с нижним и верхним расположением наливного (сливного) устройства и механически очищенной внутренней поверхностью. Под механической очисткой понимается дробеструйная обработка до степени не менее 2 по ГОСТ 9.402-80. Контейнер имеет габарит 1СС, относится к контейнерам цистернам типа IMO1, соответствует Российским национальным стандартам, стандартам ISO и международным конвенциям и соглашениям по контейнерам. Налив и слив перевозимого груза осуществляется открытым (с выходом паров груза в атмосферу) или закрытым (с отводом паров груза в специально предназначенные для этого ёмкости) способами. Налив и слив осуществляются через люк-лаз, верхнее или нижнее устройства налива (слива) самотёком, методом выкачивания насосом или передавливанием воздухом, парами перевозимого груза или инертным газом через верхнее или нижнее устройство налива (слива). Воздух, пары продукта или инертный газ подаются в цистерну при сливе и отводятся из неё при наливе через клапан воздушной (газовой) магистрали, расположенный в верхней части цистерны. Контейнер ТКМ1-25 всех модификаций изготовлен в климатическом исполнении 'У' (умеренное), категории размещения 1 по ГОСТ 15150-69, что позволяет

эксплуатировать его при температурах –50 – +50° С. Контейнер цистерна имеет прочную конструкцию, обеспечивающую многократное его использование. Контейнер цистерна ТКМ1-25 содержит следующие элементы:- (1) цистерну, предназначенную для заполнения перевозимым продуктом, изготовленную из нержавеющей стали марки 12Х18Н10Т (модификации, содержащие литеру С) или низколегированной стали 09Г2С-14 (модификация, содержащие литеру У), оборудованную люком-лазом. Цистерна контейнера представляет собой сварной сосуд, состоящий из цилиндрической обечайки и двух эллиптических днищ с внутренним диаметром 2 400 мм. В верхней части цистерны расположен предохранительный клапан пружинного типа, устройство верхнего слива (налива) продукта, клапан (кран) подсоединения воздушной (газовой) магистрали. Люк-лаз и другое оборудование размещены в отсеках (ящиках), стенки которых предотвращают разлив перевозимого продукта по наружной поверхности цистерны. Отсеки могут быть снабжены крышками. Для отвода пролитого продукта из отсеков на наружной поверхности цистерны установлены дренажные трубы. На цилиндрической части цистерны имеются ребра жесткости, предназначенные для обеспечения устойчивости оболочки цистерны при действии избыточного наружного давления. На поверхности заднего днища наклеена эмблема классификационного общества Российского Морского Регистра Судоходства (для Российских контейнеров цистерн). В нижней части заднего днища цистерны расположено устройство нижнего слива продукта (если не запрещено по условиям перевозки груза и установлено по требованию заказчика). Внизу цилиндрической части цистерны имеются опорные площадки, используемые при транспортировке контейнера автомобильным транспортом. (2) Переднюю и заднюю торцевые рамы, между которыми при помощи опорных обечаек и нижних подкосов и верхних подкосов жёстко закреплена цистерна. Нижние и врехние подкосы приварены к цистерне через подкладные листы. Рамы снабжены угловыми фитингами, соответствующими стандарту ISO 1161:1984 и ГОСТ 20527-82, предназначенными для подъёма контейнера, крепления его на транспортных средствах и соединения контейнеров между собой при штабелировании. Расположение угловых фитингов определяет габаритные размеры контейнера, которые по длине, ширине и высоте соответствуют требованиям стандарта ISO 668:1995 и ГОСТ 18477-79. На рамах имеются укосы и лестницы. На задней торцевой раме установлен пенал для документов, винт заземления контейнера и пластина для заземления. К ней же прикреплены листы с табличками с данными по цистерне, о допущении по безопасности и таможенной. Торцевые рамы передняя и задняя, до установки на задней раме листов для крепления табличек взаимозаменяемы и представляют собой сварные конструкции, состоящие из вертикальных стоек, поперечных балок и укосов. Элементы рамы изготовлены из низколегированной стали. В углах рамы расположены фитинги, предназначенные для погрузочно-разгрузочных операций с контейнером, крепления контейнера на транспортном средстве и соединения контейнеров между собой при их штабелировании. Форма и размеры угловых фитингов соответствуют стандарту ISO1161:1984. Рамы со стороны правой угловой стойки имеют лестницу, изготовленную методом сварки из холоднокатаных трубчатых элементов 25 х 4. В левой части задней торцевой рамы установлены листы для крепления табличек:- (i) с данными по цистерне; (ii) о допущении по безопасности; и (iii) о допущении к перевозке грузов под таможенной пломбой. На левой угловой стойке задней торцевой рамы закреплён пенал для временного хранения сопроводительных документов на перевозимый груз и контейнер. Нижние подкосы представляют собой коробчатые прямоугольные в сечении гнутые или катанные профили с номинальной толщиной стенки 6 мм, изготовленные из стали 09Г2С-14 ГОСТ 19281-89, предназначенные для передачи на цистерну транспортных нагрузок, действующих на нижние фитинги контейнера. Подкосы привариваются к цилиндрической части цистерны через подкладные листы. Верхние подкосы представляют собой коробчатые квадратные в сечении гнутые или катанные профили с номинальной толщиной стенки 4 мм, изготовленные из стали 09Г2С-14 ГОСТ 19281-89, предназначенные для передачи на цистерну транспортных нагрузок, действующих на верхние фитинги контейнера. Подкосы привариваются к цилиндрической части цистерны через подкладные листы. (3) Площадки обслуживания, расположенные в верхней части контейнера, состоящие из продольного и двух поперечных трапов. Настилы трапов изготовлены из просечно-вытяжного или аналогичного по условиям безопасности работы персонала стального или алюминиевого листа. Площадка обслуживания предназначена для доступа персонала к люку-лазу, запорно-предохранительной арматуре и угловым фитингам при погрузочно-разгрузочных операциях и техническом обслуживании контейнера. Для подъёма на площадку используются лестницы на передней и задней торцевых рамах. (4) Запорную арматуру для налива и слива продукта, включающая в себя устройство верхнего налива (слива), клапан (кран) воздушной (газовой) магистрали, устройство нижнего слива. Устройство верхнего слива (налива) груза состоит из:- (i) трубы слива с внутренним диаметром, равным 75 мм (3”), верхний конец которой закреплён во фланце, вваренном в цистерну, а нижний конец крепится к её внутренней поверхности при помощи специального устройства; (ii) шарового клапана или клапана типа баттерфляй с Ду 75 мм; и (iii) глухого фланца. Нижнее устройство слива (налива) груза состоит из внутреннего клапана, наружного клапана типа баттерфляй с резьбовой крышкой или фланцевой заглушкой, устанавливаемой после опорожнения цистерны. Условный проходной диаметр устройства нижнего слива равен 3” (75 мм). Внутренний клапан представляет собой запорное устройство, остающееся закрытым при разрушении наружных запорных устройств во время аварии. Предусмотрено также дистанционное управление клапаном. Верхнее и нижнее устройства слива являются разборными, что позволяет производить ремонт и замену вышедших из строя деталей. Присоединительные размеры арматуры для слива и налива продукта соответствуют требованиям стандарта ISO 9669:1990/2.2. (5) Предохранительный клапан, предназначенный для предотвращения повышения давления внутри цистерны более, чем на 10% от максимально допустимого рабочего давления (МДРД). Предохранительный клапан с условным диаметром проходного сечения, равным 2.5” (Ду = 63 мм), является предохранительным устройством пружинного типа и служит для выпуска паров перевозимого продукта, если их давление превысит максимально допустимое рабочее давление при недопустимом перегреве контейнера или непредвиденном повышении давления при его эксплуатации. Предохранительный клапан может быть снабжён разрывной мембраной, которая должна разрушаться при давлении, равном испытательному (0.6 МПа). При перевозке легко воспламеняющихся жидкостей (Класс Опасности 3) на предохранительном клапане должна быть установлена пламепрерывающая сетка. Для контроля герметичности разрывной мембраны на клапане предусмотрено отверстие для установки манометра, измеряющего давление в полости между мембраной и тарелкой клапана. При эксплуатации КЦ с ним выполняются следующие технологические операции:- налив продукта; погрузка на транспортное средство; транспортировка к месту слива; разгрузка с транспортного средства; временное хранение; слив продукта; очистка и промывка цистерны (при необходимости); и транспортировка к месту налива. Под Цистерной, от Латинского слова Cisterna, означающее Водоём или Водохранилище, понимается ёмкость для хранения или перевозки жидкостей, сыпучих тел и прочего. Различают стационарные и передвижные цистерны. К стационарным цистернам относятся бетонные или железобетонные и каменные сооружения, а также металлические цилиндрические резервуары. К передвижным цистернам относятся цистерны, транспортируемые на автомобиле, железнодорожных тележках. Вместимость автомобильной цистерны обычно составляет 1.5–5 м^3, Российской железнодорожной цистерны – до 140 м^3. Контейнер Цистерна включает в себя два основных элемента – цистерну (или цистерны) и каркас (рамные элементы), соответствующие требованиям международного стандарта ИСО 1496/3. За рубежом контейнеры цистерны выпускают и испытывают под надзором Регистра Лойда (Lloid Register), что подтверждается соответствующим сертификатом, оформляемым на каждую цистерну. По состоянию на начало 2002 90% выпускаемых в России контейнеров цистерн являлись разработками Научно-Технического Центра Металлокомпозит при ЦНИИ Специального

Машиностроения. Центр разработал, испытал и запустил в серийное производство контейнеры цистерны стандарта ISO (габарит 1CC) с цистернами из нержавеющих и углеродистых сталей для перевозки легковоспламеняющихся, ядовитых и химически агрессивных жидкостей и сжиженных газов (аммиак, углеводородные газы и другие) более 500 наименований. На сегодняшний день уже несколько крупных Российских заводов приступили к серийному изготовлению контейнеров цистерн для сжиженных газов ТКМ 5-25 вместимостью 25 $м^3$. Выпуск и испытания ведутся под надзором Российского Морского Регистра Судоходства, что подтверждается его сертификатом (Российский Регистр и Регистр Лойда, являясь членами Международной Ассоциации Классификационных Обществ (МАКО), признают сертификаты друг друга). Для перевозки пищевых продуктов (подсолнечное масло, патока, этиловый спирт и другие) изготавливают цистерны с повышенными требованиями к обработке внутренней поверхности, оснащённые специальной сливно-наливной арматурой. На сегодняшний день массовый выпуск контейнеров цистерн этого типа Российские предприятия пока не освоили. Контейнер для текучих веществ.

TANK DOWELS = ШТЫРИ ДЛЯ ЦИСТЕРН – Tank Dowels:- cones used to secure tank containers together which are generally thinner than standard cones to enable stacking two tank containers in the space of one regular-sized container. / Конусы, используемые для крепления между собой контейнеров цистерн, но которые обычно тоньше стандартных конусов. Они позволяют сформировать из двух контейнеров цистерн один объединённый, совпадающий по габаритам с контейнером распространённого размера. Под Шпонкой, от Польского слова Szponka, от Немецкого слова Шпан (Span), означающее Клин или Подкладка или Щепка, понимается деталь шпоночного соединения, закладываемая одновременно в паз в ступице шкива, зубчатого колеса и тому подобного и в тело вала. Различают клиновые, призматические, сегментные и тангенциальные шпонки. Седловидные вставки конической формы.

TANKER = ТАНКЕР (или НАЛИВНОЕ СУДНО) – Tanker is a ship designed to carry various types of liquid cargo, from oil and gasoline to molasses, water, and vegetable oil. A Tanker is a bulk carrier designed to transport liquid cargo, most often petroleum products. Oil tankers vary in size from small coastal vessels of 1 500 tons deadweight, through medium-sized ship of 60 000 tons, to the giant VLCCs (very large crude carriers). A vessel specially designed for the carriage of liquid cargo in bulk. Tanker is cargo ship fitted with tanks for carrying liquid in bulk. They may be characterized by their generation or age, their condition, the nature of the cargo they are designed to carry, the trade(s) and/or routes in which they normally operate, the maximum tonnage they can carry, their dimensions or operating limits, e.g., beam, or width, and draft, or how much of the boat is below the water-line, the details of their design, e.g., single or double-hull, and the flag under which they operate particularly whether or not it is considered a ‘Flag of Convenience’. Tankers or barges carrying crude oil or heavy persistent petroleum products (heavy fuel oil, for example, which coats the sides of the cargo tanks) are called Dirty Tankers. Distillates, gasoline and other light petroleum products must be carried in smaller, more expensive Clean Tankers or barges. Aframax tankers can carry from 80 000 to 105 000 deadweight tones, Panamax tankers (the largest ships capable of navigating in the Panama Canal) from 55 000 to 80 000 deadweight tones, Suezmax tankers from 120 000 to 160 000 deadweight tones, and very large crude carriers 200 000 deadweight tones or more. Ships fitted with tanks to carry liquid cargo such as:- crude petroleum and petroleum products; chemicals, liquefied gasses (LNG and LPG), wine, molasses, and similar product tankers. A Tanker is a bulk carrier designed to transport liquid cargo, most often petroleum products. Oil tankers vary in size from small coastal vessels of 1 500 tons deadweight, through medium-sized ship of 60 000 tons, to the giant VLCCs (Very Large Crude Carriers), ULCCs (Ultra Large Crude Carriers), and Supertankers. Tankers are further divided by whether they are providing clean or dirty service. Dirty tankers carry loads of crude oil and residual fuels, while clean tankers carry lighter products such as diesel, gasoline, No. 2 heating oil, and jet fuel. Light products cannot be carried in dirty tankers because they will become contaminated and no longer meet product specifications. Generally, smaller tankers carry clean cargoes of refined products, while the larger tankers carry crude oil and other dirty products. Usually, import levels for petroleum products and tanker rates display an inverse relationship, with low tanker rates encouraging higher imports and high tanker rates putting downward pressure on import levels. Freight rates for clean tankers usually are lowest in early autumn, after prime driving season in the United States but before the start of heating season. Tanker tracking indicators point to the possibility that crude oil imports could begin to increase sometime in April. Should imports of both crude oil and light products increase this summer, the increased demand for tankers could raise freight rates again and add to the cost of crude oil and light products, but probably not more than a few pennies per gallon. Tanker rates can be increased steeply, e.g., in the wake of hurricanes in the United States as exporters book shipments to the US for both light products and crude oil. See also Supertanker, Ultra Large Crude Carrier, and Very Large Crude Carrier. / 1 500 т грп, . печное бытовое топливо № 2 (No. 2 heating oil) . Под Танкером понимается судно для перевозки жидких грузов (кислоты, нефть, расплавленная сера, растительное масло и так далее) в судовых цистернах (танках). Дедвейт танкеров-нефтевозов превышает 500 000 тонн. Под Танкером или Наливным Судном понимается грузовое судно для перевозки наливом в грузовых цистернах (танках), расположенных в корпусе судна, жидких и полужидких грузов (бензин, битум, вино, нефть, сжиженные газы, смазочные и пищевые масла, спирт, химикалии и тому подобное). В зависимости от типа груза наливные суда разделяются на битумовозы, газовозы, пульповозы, танкеры, химовозы и другие. Приём груза на танкер производится по закрытому трубопроводу, выгрузка – судовыми насосами. Грузоподъёмность танкеров до 500 000 тонн. Наливные суда составляют наиболее многочисленную группу грузовых судов. По данным на 1986 общий тоннаж танкеров составляет свыше 40% суммарного тоннажа мирового транспортного флота. Судовой Танк – судовая цистерна, служащая для размещения жидких грузов, топлива или балласта. Под Танкером, от Английского слова Tanker, от Tank, означающее Бак или Резервуар или Цистерна, или Наливным Судном, понимается судно для транспортировки жидких грузов наливом. Танкеры перевозят сырую нефть и продукты её переработки, сжиженные газы, пищевые продукты (растительное масло, молоко, патоку, китовый жир, вино и другие), химикалии (кислоты, спирт и другие), расплавленную серу, асфальт, пресную воду и тому подобное. Со 2-й половины XIX века нефть и нефтепродукты начали перевозить наливом в трюмных ящиках (вкладных цистернах) или непосредственно в корпусе (ранее нефть перевозили на судах в бочках). Впервые перевозка наливом была осуществлена в России в 1873 на Каспийском Море судовладельцами братьями Артемьевыми на деревянной парусной шхуне ‘Александр’; позднее строились деревянные и металлические наливные баржи для перевозки нефти по Каспийскому Морю и Волге. В 1878 был построен первый Русский наливной железный пароход ‘Зороастр’ грузоподъёмностью 250 тонн (т) с 8 цилиндрическими вкладными цистернами, которые впоследствии были сняты, а нефть наливалась прямо в трюмы. Русский паровой танкер ‘Спаситель’ грузоподъёмностью 670 т, в основных чертах послуживший прообразом для современного танкера, был сооружён в 1882, на 4 года раньше Английского парового танкера ‘Глюкауф’ дедвейтом около 3 000 т почти такой же конструкции. К середине 1974 флот танкеров составил почти половину объёма мирового гражданского флота, всего на это время Английским ‘Регистром Судоходства Лойда’ зарегистрировано 7 855 танкеров общей валовой вместимостью около 155 миллионов регистровых тонн (рег.т) (учитывая суда вместимостью не менее 100 рег.т). К началу 1975 общий дедвейт строившихся или заказанных 1 268 танкеров дедвейтом не менее 2 000 т составил 168 миллионов тонн, почти 82% от объёма заказов всего мирового флота. Танкер представляет собой однопалубное самоходное судно с машинным отделением, жилыми и служебными помещениями в корме, с продольной (иногда поперечной по бортам) системой набора корпуса судна, обычно без двойного дна в грузовых танках. Грузовые

помещения разделены несколькими поперечными и 1–3 продольными переборками (в зависимости от размеров танкера) на танки, некоторые из которых служат только для приёма водяного балласта. Доступ в танки – через палубные горловины небольшого размера с непроницаемыми крышками. Погрузку танкера одним или несколькими сортами груза ведут береговыми средствами, разгрузку – судовыми насосами по проложенным по палубе и в танках трубопроводам. Для подогрева застывающих грузов (парафинистой нефти, мазута, битума и других) танки оборудуют теплообменниками – змеевиками, по которым пропускают водяной пар. Танкеры снабжают средствами предотвращения пожаров и борьбы с ними (например, установками для заполнения танков инертным газом, объёмного и поверхностного тушения с помощью пара, пены, мелкораспылённой воды). С целью улучшения мореходных качеств танкера при ходе без груза предусматривается приём водяного балласта в балластные, а также грузовые танки, которые оборудуют системой мойки горячей водой под давлением и средствами очистки нефтесодержащих вод. Для предотвращения разъедания внутренних поверхностей танков их защищают антикоррозийными покрытиями, танки танкеров-химовозов иногда изготавливают из коррозийностойких материалов. Танкеры-нефтевозы принадлежат к числу самых больших транспортных судов. В 1975 строились танкеры дедвейтом около 550 тысяч тонн, длиной 400 метров (м) и шириной 63 м, высота их борта 35 м, осадка 28.5 м, главные двигатели – 2 паровые турбины мощностью по 26 800 килоВатт (кВт) (32 400 лошадиных сил (л.с.)). Малые и средние танкеры обычно оборудуются дизельными энергетическими установками, на крупных танкерах преобладают паротурбинные установки.

TANKER OWNERS' VOLUNTARY AGREEMENT CONCERNING LIABILITY FOR OIL POLLUTION = ДОБРОВОЛЬНОЕ СОГЛАШЕНИЕ СОБСТВЕННИКОВ ТАНКЕРОВ, КАСАЮЩЕЕСЯ ОТВЕТСТВЕННОСТИ ЗА ЗАГРЯЗНЕНИЕ НЕФТЬЮ – 'Tanker Owners' Voluntary Agreement Concerning Liability for Oil Pollution' is an agreement subscribed by most tanker owners world-wide, whereby owners agree to pay jointly for clean-up costs incurred by Governments in respect of oil discharge from tankers belonging to such owners. / Добровольное Соглашение Собственников Танкеров, Касающееся Ответственности за Загрязнение Нефтью – соглашение, подписанное большинством собственников танкеров со всего мира, посредством которого собственники согласны совместно оплачивать затраты по очистке, понесённые государством в отношении разгрузки нефти из танкеров, принадлежащих таким собственникам.

TANKER–TRACKING DATA = ДАННЫЕ ПО ТАНКЕРАМ В ПУТИ (или ДАННЫЕ ПО ОТСЛЕЖИВАНИЮ ТАНКЕРОВ) – Tanker-Tracking Data:- information on the number and cargo size of crude oil tankers used in estimating production. Charter fixture data are a useful indicator of cargo volumes. / Информация о количестве и объёме груза в нефтеперевозочных танкерах, используемая в оценке добычи. Данные о задействованных чартерах (зафрахтованных судах) являются полезным индикатором объёмов груза.

TANK FARM = ФЕРМА ИЗ ЦИСТЕРН (или НЕФТЕБАЗА) – Slang in energy industries. A Tank Farm is a set of tanks used to store petroleum products. / Жаргон в отраслях энергетики. Ферма из Цистерн – сборище цистерн, используемых для запасания нефтепродуктами.

TANK PALLET = ПОДДОН–РЕЗЕРВУАР (или ПОДДОН ЦИСТЕРНА) – Tank Pallet is a sealed, four-sided box pallet, fitted with a sealable lid, which can be emptied by a tap fitted to the base or by aspiration through the top opening. Note 1:- a tank pallet is commonly used for carrying liquids and gases. Note 2:- some types of tank pallets can also be called Intermediate Bulk Containers (IBCs). Definitions concerning IBCs can be found in ISO 15867 [4]. / Поддон-Резервуар – ящичный поддон с четырьмя неразборными стенками и крышкой с запорным устройством. Слив груза осуществляют через сливное отверстие, расположенное в основании, или путём всасывания через крышку. Примечание 1:- поддон-резервуар применяют для транспортирования жидких и газообразных грузов. Примечание 2:- эти типы поддонов-резервуаров можно применять как крупнотоннажные контейнеры Intermediate Bulk Containers (IBCs). Определения контейнеров (IBCs) приведены в стандарте ISO 15867 [4].

TANK SUIT = ЦЕЛЬНЫЙ КУПАЛЬНИК (или ХХ) – Tank Suit is a one-piece bathing suit with usually wide shoulder straps.

TANKTAINER = ЦИСТЕЙНЕР (или ЦИСТЕРНЕР, или КОНТЕЙНЕР ЦИСТЕРНА) – Tanktainer is a cylindrically-shaped container intended for transport of liquid cargo. / Контейнер цилиндрической формы, предназначенный для перевозки жидких грузов.

TANK TOP = БОРЦОВКА (или МАЙКА БЕЗРУКАВКА) – Tank Top:- a sleeveless collarless shirt with usually wide shoulder straps and no front opening.

TANK TOP = ВТОРОЕ ДНО (или ПЕРЕКРЫТИЕ НАД ЦИСТЕРНАМИ ДВОЙНОГО ДНА) – Tank Top is the upper plating of the double bottom in a ship. / Верхняя обшивка двойного днища у корабля. Второе Дно – внутреннее дно судна, водонепроницаемый настил, привариваемый к верхним кромкам днищевого набора (флорам, вертикальному килю, стрингерам) и образующий вместе с днищем двойное дно. Второе дно является платформой, несущей большую часть нагрузки от перевозимых грузов, энергетической установки и прочего. При повреждении днища второе дно предотвращает попадание воды в корпус судна, а на танкерах – разлив нефти. Пространство двойного дна используется обычно для приёма топлива, жидкого балласта и тому подобного.

TANK TRAIN = МАРШРУТ ИЗ ЦИСТЕРН (или СОСТАВ ИЗ ЦИСТЕРН) – Tank Train:- a procedure in the rail shipment of crude oil, refined products, and other liquids developed by General American Transportation (GATX). Tank Train tank cars are interconnected, which permits loading and unloading of the entire train of cars from one connection. / Дьженерэл Амэрикэн Транспотэйшэн (General American Transportation).

TANK WAGON = ВАГОН ЦИСТЕРНА – Tank Wagon is a wagon designed for the bulk transport of liquids or gases. / Вагон, предназначенный для перевозки наливом жидкостей или газов.

TANNIC ACID = ДУБИЛЬНАЯ КИСЛОТА (или ДИГАЛЛОВАЯ КИСЛОТА) – Tannic Acid, $C_{14}H_{10}O_9$, is a mixture of compounds derived from Oak bark, nutgall and other natural sources; no well-defined chemical composition. Tannic acid treatment, followed by treatment with tartar emetic, has been used to improve the washfastness of dyed wool or nylon. Syntans and now used for this purpose. / Дубильная Кислота или Дигалловая Кислота. Найлан^{T3} (Nylon^{TM}). Дубильные Материалы, части растений или их экстракты, содержащие танниды, используемые в кожевенном производстве для дубления кожи. К основным дубильным материалам относятся:- древесина Дуба и Каштана (вместе с корой), кора Ивы, Лиственницы и Ели и некоторые корни (Таран, Чукра, Кермек и другие). В Дубе танниды содержатся во всех частях растения, однако дубильным материалом служит только древесина ствола и толстых сучьев (вместе с корой), непригодная для поделок, и пни. Содержание таннидов в древесине Дуба колеблется в зависимости от вида, района и времени заготовки от 4 до 6%; в древесине Каштана – от 7 до 8%; в Иве, Лиственнице и Ели танниды находятся в коре (от 8 до 20%). Возможности ежегодных заготовок еловой и лиственничной коры практически неограничены. Содержание таннидов в корневых дубильных материалах:- в Таране – до 22%, Чукре – 14.5% и Кермеке от 11 до 21%. Кроме перечисленных растительных дубильных материалов, на заводах иногда перерабатывают

валонею, Квебрахо, Акацию, Мангровые, Миробаланы и Чернильные Орешки. Валонея (чашечки жёлудей Дубов, произрастающих главным образом в Малой Азии и на Юге Европы) содержит таннидов в среднем 23.5%; чешуйки, покрывающие чашечку жёлудя, – до 45.5%, поэтому их отделяют и поставляют на рынок в виде самостоятельного дубильного материала под названием ‘Трилло’. В древесине Квебрахо находится таннидов около 19%, в коре деревьев Акации – в среднем 31.5%, в коре Мангровых Деревьев – от 14 до 48%, в плодах Миробаланов – от 35 до 50% и в Чернильных Орешках, в зависимости от Вида, – от 19 до 77%. В бывшем Союзе Советских Социалистических Республик (СССР) дубильные материалы непосредственно в кожевенном производстве для ‘сыпочного’ способа дубления не использовались с начала 1930-х. С развитием отечественной дубильно-экстрактовой промышленности все дубильные материалы перерабатываются на экстракты. Дубильные Вещества, то же, что Дубящие Вещества. Дубящие Вещества, вещества, применяемые при выделке (дублении) кожи и меха. Дубящие вещества подразделяют на минеральные и органические. К минеральным дубящим веществам относят соединения хрома, алюминия, циркония, титана, кремния, железа и других. Большинство этих соединений – основные соли серной кислоты (например, $CrOHSO_4$ и другие); их применяют для дубления в виде водных растворов. Наиболее широко распространено дубление соединениями хрома (так называемое Хромовое Дубление), которое применяют для всех основных видов кожи и меха, в особенности при комбинированных методах дубления. В последнем случае предварительное хромовое дубление (Хромирование) обеспечивает высокую проницаемость кожаного полуфабриката, что резко ускоряет последующее дубление (Додубливание) органическими дубящими веществами, повышает термостойкость и износостойкость кожи. Перспективные дубящие вещества – соединения циркония, сообщающие коже повышенную износостойкость, гладкую и плотную лицевую поверхность. Органические дубящие вещества подразделяют на животные и растительные, искусственные и синтетические. К животным дубящим веществам относят высоконепредельные жиры различных Рыб и морских Животных (так называемые Ворвани), применяемые для выработки замши. Дубящие вещества растительного происхождения – танниды, содержатся в различных органах Растений. Эти дубящие вещества извлекают из измельчённого материала экстрагированием водой или слабыми растворами сернисто-кислых соединений при повышенной температуре. Затем растворы таннидов и сопутствующих веществ концентрируют, превращая в жидкий или твёрдый экстракты. Танниды, извлечённые из различных видов Растений, отличаются химическим строением, свойствами и могут быть подразделены на:- гидролизующиеся, конденсированные и смешанные. В гидролизующихся таннидах составные части молекулы соединены с помощью эфирных связей. Типичные представители этой группы – таннины (сложные эфиры фенолкарбоновых кислот и простейших углеводов, преимущественно гексоз). Основу большинства конденсированных дубящих веществ составляют различные полиоксипроизводные 3-оксифлавана. В твёрдом виде танниды обычно аморфные вещества, растворяющиеся неограниченно в воде. Растворы таннидов могут быть использованы для дубления любых видов кожи (иногда шубной овчины), как самостоятельно, так и в комбинации с другими дубящими веществами. Искусственные дубящие вещества – высокомолекулярные органические соединения, обладающие дубящими свойствами. Эти дубящие вещества – побочные продукты производств, перерабатывающих органическое сырьё. Для удобства применения в качестве дубителей эти продукты концентрируют и иногда очищают. Типичные представители искусственных дубящих веществ – сульфитцеллюлозные экстракты, получаемые из заводских отходов переработки целлюлозы. Основной компонент любого сульфитцеллюлозного экстракта, определяющий его кожевенно-технологические свойства, – лигносульфоновые кислоты. Эти дубящие вещества обладают высокой устойчивостью и быстрее, чем танниды, проникают в кожаный полуфабрикат, однако их остальные показатели (температура сваривания, наполнение и формирование объёма кожи) хуже, чем у таннидов. Очищенные от солей кальция концентраты лигносульфоновых кислот широко применяют для получения высококачественных синтетических дубителей. Синтетические дубящие вещества, или Синтаны, получают из различных органических соединений. Основным сырьём для производства синтанов служат фенол и его производные, ароматические углеводороды (например, нафталин), нафтолы, сульфоны, лигносульфоновые кислоты, формалин, мочевина и другие. Синтаны подразделяют на вспомогательные, применяемые в небольших количествах совместно с растительными дубящими веществами; заменители таннидов, используемые самостоятельно или в смеси с таннидами в количестве до 60% от массы всего дубителя; специального назначения, применяемые для дубления и одновременной окраски, отбеливания, жирования и других целей. Создание высококачественных синтетических дубящих веществ позволяет сократить или полностью прекратить переработку на дубильные экстракты ценной дубовой древесины, расширить ассортимент и свойства дубителей (применительно к различным схемам кожевенного производства), улучшить качество и интенсифицировать процесс производства кожи. Применение синтанов из года в год увеличивалось и составляло в балансе органических дубящих веществ бывшего СССР около 40%. Из простейших органических веществ дубящими свойствами обладают хиноны и формальдегид. Последний применяют в комбинированном дублении с таннидами и соединениями хрома.

TANNIN = ТАННИН – Tannin:- synonym is Tannic Acid. Yellowish white to light brown, amorphous, bulky powder of flakes or spongy masses occurring in the bark and fruit of many plants, notably in the bark of the oak species, in sumac and myrobalan, and Chinese or Turkish nutgall. It gives insoluble precipitates with albumin, starch, gelatin and most – alkaloidal and metallic salts. The tannates, formed with the acetates of the heavy metals, such as those of aluminium, copper, chromium, lead, tin and zinc, are used as mordants in the dyestuffs industry. The tanning agents are largely employed in the tanning of leather, in dyeing, in sizing silk, and for the preparation of dyestuffs. Their application in dyeing is based on the fact that they are readily absorbed by the textile fibers, notably cotton, linen, silk and nylon, and on the property of forming insoluble compounds in the fibers, on the one hand, with the heavy metals and with antimony, and on the other hand with the basic dyestuff. The tannins are extensively employed in the preparation of silk, both to strengthen and to weigh the fiber. Tannin mordents are also used on wool, silk, and nylon to form a resist for cross dyeing. Tannin is a heterogeneous group of astringent phenolic substances, widely distributed in plants, and commercially used in tanning, dyeing and preparation of ink. / Найлан^{T3} (Nylon^{TM}). Дубильная Кислота или Дигалловая Кислота (Tannic Acid). Фенольное (Phenolic). осадок (precipitate). Таннин – гетерогенная (неоднородная) группа вяжущих фенольных субстанций, широко распространённых в растениях, и используемая в коммерческих целях при их выделении (производстве), для крашения и приготовления чернил. Под Таннинами или Таннидами, от Французского слова Tanner, означающее Дубить Кожу, понимаются фенольные соединения, содержащиеся во многих растениях. Способны образовывать прочные связи с белками и другими биополимерами. Применяются для дубления кож, протравливания тканей при крашении, в медицине в качестве вяжущих средств. Под Таннинами, от Французского слова Tannin, от Tanner, означающее Дубить Кожу, понимаются широко распространённая в растениях группа фенольных соединений, обладающих способностью образовывать прочные связи с белками и некоторыми другими природными полимерами (целлюлоза, пектиновые вещества). Термином Таннин первоначально (с конца XVIII века) называли экстрагируемую водой из ряда растений смесь веществ, обладающую свойством превращать сырую кожу в дублёную. Ныне к таннинам относят все встречающиеся в природе соединения с молекулярной массой от 500 до 3 000, содержащие большое число фенольных гидроксильных групп (в Советской литературе дубящие вещества растительного происхождения называют также Таннидами). Таннины делят на 2 класса:- образованные многоатомным спиртом (например, глюкозой), у которого гидроксильные группы частично или полностью этерифицированы галловой кислотой или родственными соединениями (так называемые Гидролизуемые Таннины, например, I), и образованные

конденсацией фенольных соединений, например, катехинов (так называемые Негидролизуемые, или Конденсированные, Таннины, например, II). Таннины содержатся в коре, древесине, листьях и (или) плодах дубильных растений, в галлах и других. Таннины применяют для дубления кож, как протраву при крашении хлопчатобумажных тканей, а также в медицине в качестве вяжущего средства. Водный раствор таннинов при нанесении на обожжённый участок кожи связывает ядовитые белковые продукты распада тканей и способствует заживлению раны. Таннины могут связывать в организме бактериальные токсины, а также ядовитые соли серебра, ртути, свинца.

TAP = TAPAK–TAPAK PUMP

TAP2 = 4–INCH DIAMETER TREADLE PUMP

TAPA = ТАПА – Tapa is a coarse cloth made in the Pacific islands from the pounded bark especially of the paper mulberry and usually decorated with geometric patterns.

TAPA CLOTH = ПОЛОТНО ТАПА – Tapa Cloth is a papery cloth made by pounding and flattening the inner bark of certain trees found in the Pacific Islands. It is often used in America for decorative wall hangings. See also Bark Cloth. / бумажная ткань, сделанная посредством колочения и сплющивания внутренней коры определённых деревьев, растущих на Тихих Островах (Pacific Islands) в Океании.

TAPE = ТЕСЬМА (или ЛЕНТА, или БЕЙКА) – Tape is:- (1) a narrow, woven fabric not over 8 inches in width. (2) In slide fasteners, a strip of material, along one edge of which the bead and scoops are attached, the bead sometimes being integral with the strip. See also Nonelastic Woven Tape, and Slit Tape. Tape is a narrow woven fabric. Tape is a fabric sewn to a garment at the front edges, armholes, shoulder, neck, sideseams, vents, bottoms, gorge seams, etc. It is usually designed to prevent distortion of a fabric edge or seam.

TAPERED BLOCKS = СУЖЕННЫЕ БЛОКИ – Tapered Blocks:- these are wedges cut at a narrow angle to allow small gaps between items of cargo to be braced. They are also referred to as Slim Wedges or Driving Wedges.

TAPERING RATE = СНИЖАЮЩАЯСЯ СТАВКА – Tapering Rate is a rate that increases with distance but not in direct proportion to the distance the commodity is shipped.

TAPESTRY = ГОБЕЛЕН (или ШПАЛЕРА, или КОВЁР–КАРТИНА) – Tapestry is a Jacquard woven fabric in cotton, wool, or man-made fibers. Traditionally, a decorative wall hanging woven to depict a scene. The filling threads are changed in color to fit the design. On the back, shaded stripes identify this fabric. It is used extensively for wall hangings, table covers, draperies, and upholstery. Some rugs are made in tapestry weaves. The word is also used for needlepoint, but this use is generally considered incorrect. Machine-made fabrics, also called Tapestry, have regular designs on the surface and a slightly looped pile. They are used for such things as coats and handbags. Tapestry is a heavy, often hand-woven, ribbed fabric, featuring an elaborate design depicting a historical or current pictorial display. The weft-faced fabric design is made by using colored filling yarns, only in areas where needed, that are worked back and forth over spun warp yarns, which are visible on the back. End-uses include wall hangings and upholstery. Tapestry is a form of textile art. It is woven by hand on a vertical loom. It is weft-faced weaving, in which all the warp threads are hidden in the completed work, unlike cloth weaving where both the warp and the weft threads may be visible. In this way, a colorful pattern or image is created. Most weavers use a naturally based warp thread, such as linen or cotton. The weft threads are usually wool or cotton, but may include silk, gold, silver or other alternatives. Tapestry is a heavy handwoven reversible textile used for hangings, curtains, and upholstery and characterized by complicated pictorial designs. / уточные нити . Жакяр (Jacquard). Гобелен, вытканный вручную ковёр-картина (шпалера). В строгом смысле – изделие действующей поныне Парижской Мануфактуры (учреждена в предместье Сен-Марсель (faubourg Saint-Marcel) в 1662 как Королевская; включила ряд частных шпалерных заведений, в том числе мастерскую Фламандских ткачей Марка дё Комо (Marc de Comans) и Фросуа дё ля Плошэ (François de la Planche), основана в 1607). Её главным зданием стала бывшая мастерская известных с XV века красильщиков Гобеленов (Gobelins), имя которых утвердилось за мануфактурой и её изделиями. Гобелены выполнялись цветными шерстяными и шёлковыми (иногда также серебряными и золотыми) нитями по рисункам (картонам) управлявшего мануфактурой художника Ш. Лебрена, а в XVIII веке Ф. Буше, Ж.Б. Удри и других. Гобелены ткались на специальных ручных станках методом выборочного ткачества, то есть по отдельным участкам, которые затем сшивались тонкой шёлковой нитью. Характерная особенность гобеленов – рубчатая поверхность лицевой стороны, создаваемая нитями основы, и неровная поверхность оборотной стороны, образуемая швами и нитями утка. Высокие художественные достоинства гобеленов XVII–XVIII веков (с историческими, мифологическими, религиозными и литературными сюжетами) сделали их настолько популярными, что гобелены стали называть вначале подражавшие им шпалеры других мануфактур Франции и других Европейских стран, а в XIX веке – вообще шпалеры и даже машинное обивочное полотно плотного плетения (так называемые гобеленовые ткани). В XIX веке художественный уровень гобеленов резко снижается. С 1930-х искусство гобеленов возрождается на новой художественно-стилевой основе. Картоны (рисунки) для гобеленов в конце XIX – начале XX веков создавали Гобелен Жефруа, К. Моне, Ж.Ф. Рафаэлли и другие. После 1945 заметно способствовали развитию искусства гобеленов картоны (рисунки) художника Ж. Люрса. Под Гобеленом понимается вытканный вручную ковёр-картина (шпалера). В узком смысле – изделие Парижской Мануфактуры, основанной в 1662 и названной по имени красильщиков Гобеленов или Гобэлё (Gobelins). Гобелены ткутся из цветных шёлковых и шерстяных нитей отдельными частями, которые затем сшиваются. Гобелен – пёстрая узорчатая ткань приглушенных цветов с расплывчатыми переходами от одного цвета к другому.

TAPE YARN = ФАСОННАЯ ПРЯЖА (или ПРЯЖА ДЛЯ ТЕСЬМЫ или ТРИКОТАЖНОЙ ЛЕНТЫ, или ЛЕНТОЧНАЯ ПРЯЖА, или ПЛЁНОЧНАЯ НИТЬ) – Tape Yarn is a yarn used for knitwear in the form of a tape with a large width-to-thickness ratio. Such yarns are typically formed by weaving or knitting. Knitted tape yarns are often made on circular knitting machines, giving them a tubular cross-section. See also Slit-Film Yarn. / Пряжа, используемая для производства одежды из трикотажа, в форме лент (или тесьмы) с большим соотношением ширины с толщиной. Такой вид пряжи обычно создаётся посредством ткачества или трикотажного производства. Трикотажная Ленточная Пряжа часто вырабатывается на кругловязальных машинах, придающих им форму трубчатого поперечного сечения. Плёночная Текстильная Нить (Tape Yarn) – плоская комплексная нить, полученная расщеплением текстильной плёнки или экструдированием в виде полоски.

TAP PANTS = XX (или БРЮКИ ТРУБОЧКИ) – Tap Pants:- a loose-fitting woman's undergarment of a style similar to shorts formerly worn for tap dancing.

TAP ROOT = ГЛАВНЫЙ КОРЕНЬ (или СТЕРЖНЕВОЙ КОРЕНЬ) – Taproot is a primary root growing straight down from a plant, and larger or longer than the branching fibrous roots. Often a thick storage organ as in a carrot. The primary descending root. / Стержневой или Главный Корень – первичный корень, растущий прямо вниз от самого растения, и крупнее и длиннее, чем боковые фиброзные корни. Часто толстый запасающий орган как у Моркови. Первичный нисходящий корень. Под Корневой

Системой понимается совокупность корней одного растения. В случае преобладания роста главного корня, корневую систему называют стержневой, например, у Люпина или Хлопчатника. В случае сильного развития придаточных корней, корневую систему называют мочковатой, например, у всех однодольных, а также Лютика и Подорожника. Растения с развитой корневой системой используют для закрепления оврагов, песков и эродированных почв.

TAR = СМОЛА – Tar is the naturally occurring, viscous and dense hydrocarbon. / Вязкий и плотный углеводород, возникший естественным путём. Под Природной Смолой или Натуральной Смолой понимаются продукты жизнедеятельности некоторых растений, выделяемые или на поверхность коры самопроизвольно или при ранении. Плавятся при нагревании, растворяются или набухают в органических растворителях, способны к плёнкообразованию. Наиболее важные природные смолы – канифоль, копалы, шеллак, янтарь. Раньше природную смолу широко применяли в производстве бумаги, граммофонных пластинок, клеёв, лаков. В современной промышленности успешно заменяются синтетическими смолами. Под Дёгтем понимается высоковязкая жидкость чёрного цвета, образующаяся при термическом разложении берёзовой древесины без доступа воздуха. Используется для получения креозота, креолина, для пропитки кож.

TARBOOSH = ФЕСКА (или ХХ) – Tarboosh:- a red hat similar to the fez worn especially by Muslim men.

TARC = TROPICAL AGRICULTURE RESEARCH CENTER

TARDIFLORA = МЕДЛЕННОРАСЦВЕТАЮЩЕЕ – Tardiflora (-um):- late flowering. / Позднецветущее (Tardiflorus).

TARDIFOLIA = МЕДЛЕННОРАСПУСКАЮЩЕЕСЯ – Tardifolia (-um):- late into leaf.

TARE = ТАРА – (1) Tare is the weight of the ties (or bands) and wrapping materials that contain the bale of cotton. The quoted net weight of a bale excludes the tare, whereas the gross weight includes tare. In the Cotton industry, a Tare is the weight of wrapping bands or wires used to cover cotton bales. Tare is the actual weight of the bagging and bands covering a bale of Cotton. In conformity with the change in trading of US upland Cotton to a net weight basis, ginners will certify to the warehouseman the tare weight of the bagging and bands used at the gin or enter tare weight on each gin bale tag (see also Permanent Bale Identification), which will be recorded in the Electronic Warehouse Receipt (EWR). Tare is the weight of all external and internal packing material (including bobbins, tubes, etc) of a case, bale, or other type of container. Tare is the sum of the masses of all the pallets, wrappers and containers, tie bands, and if appropriate all the yam supports such as bobbins, tubes, relating to a consignment or to any part of a consignment. Tare is the weight of packaging or a container without the goods. / В хлопковой отрасли, вес обёрточных поясов или проволоки, используемой для формирования хлопковых кип. Под Тарой, от Итальянского слова Tara от Арабского, понимается ёмкость для хранения, упаковки и транспортировки промышленных товаров и сельскохозяйственных продуктов. Различают тару жёсткую (бочки, бутылки, ящики), полужёсткую (картонные короба, корзины) и мягкую (кули, мешки).

(2) Tare:- weight of a (goods) vehicle without fuel; its unladen weight. Unladen weight of a container or trailer. The weight of a container, box or other carrier of goods when empty. / .

(3) Tare is the weight of the wrapping holding the goods. For rolls, the tare consists of fiber core and the wrap. For pallets, the tare consists of the pallet and the wrap. The tare is the difference between the net weight and gross weight. See also Mass. / Смотрите также Масса (Mass).

TARE WEIGHT = ВЕС ТАРЫ (или ТАРНЫЙ ВЕС) – (1) Tare Weight:- tare is the sum of the masses of all the pallets, wrappers and containers, tie bands, and if appropriate all the yam supports such as bobbins, tubes, relating to a consignment or to any part of a consignment. The weight of a container and the material used for packing. Tare Weight is a weight of an empty container. Gross Weight = Net Weight + Tare Weight. Tare Weight is the weight of the packaging or container. The weight of a container and/or packing materials without the weight of the goods it contains. Tare Weight is the weight of the packaging or container. / Вес Тары – вес пустого контейнера и/или упаковочных материалов без учёта веса самих товаров, содержащихся в них, называемого Нетто Весом. Брутто Вес = Нетто Вес + Вес Тары.

(2) Tare Weight:- as applied to a carload, the weight of the car exclusive of its contents.

TARE WEIGHT OF CONTAINER = ТАРНЫЙ ВЕС КОНТЕЙНЕРА – Tare Weight Of Container is a mass of an empty container including all fittings and appliances associated with that particular type of container. Tare Weight is the weight of a container and the material used for packing. / Масса порожнего контейнера, включая все фитинги и приспособления, связанные с конкретным типом контейнера.

TARGET = THE TRANS–EUROPEAN AUTOMATED REAL–TIME GROSS SETTLEMENT EXPRESS TRANSFER

TARGET = TRANSPORTABILITY ANALYSIS REPORTS GENERATOR

TARGET2 = ТАСВРРУП2 – TARGET2 is the second generation of the Trans-European Automated Real-Time Gross Settlement Express Transfer (TARGET) system, which is being developed to increase financial integration within the Euro area. The main objectives of TARGET2 will be:- (i) to better meet customers' needs by providing harmonised interfaces; (ii) to guarantee cost effectiveness by introducing a single price structure for core services; and (iii) to pave the way for the future, including developments related to the enlargement of the European Union and the Eurosystem. In TARGET2, the NCBs will remain responsible for the accounts and business relations with credit institutions. It is expected that the new system will become operational in the second half of this decade. TARGET2 is the Real-Time Gross Settlement (RTGS) system for transactions in euro. TARGET stands for TransEuropean Automated Real-Time Gross Settlement Express Transfers. TARGET2 is the second generation of TARGET. Payment transactions are settled one-by-one on a continuous basis in Central Bank money with immediate fnality. There is no upper or lower limit on the value of payments. Approximately 10 056 direct and 659 indirect participants and 4 091 correspondents are accessible via TARGET2. TARGET2 is operated by the Eurosystem (the European Central Bank and other EU Central Banks). Being an RTGS system, each payment is processed in real time, and settlement is immediate across the accounts that banks hold with their Central Bank. The system operates using SWIFT and the identifcation of banks within TARGET2 is through the use of the SWIFT BIC. TARGET2 opens at 07:00 Central European Time (CET) and closes at 17:00 CET for customer payments. An additional hour is available at the end of the day for direct participants to square their positions. See also EBA EURO1.

TARGET2–SECURITIES = ТАСВРРУП2–ЦЕННЫЕ БУМАГИ (или ТАСВРРЭП2–ЦЕННЫЕ БУМАГИ) – TARGET2-Securities (T2S) is one of the most ambitious projects that the Eurosystem has embarked upon, potentially leading to a transformational change in Europe's financial markets. T2S will provide harmonised delivery-versuspayment (DvP) settlement in central bank money in a variety of currencies for almost all heavily traded securities circulating in Europe. It will therefore be a major step forward in creating a single market in securities, removing many of the Giovannini barriers to cross-border clearing and settlement, as well as acting as a catalyst for further harmonisation in post-trading services. T2S will make cross-border settlement identical – in terms of cost, risk and technical

processing – to domestic settlement. Owned by the Eurosystem, operated on a cost-recovery basis and designed for the benefit of the users, T2S aims to be a state-of-the-art securities settlement platform. Furthermore, by leveraging the potentially substantial economies of scale, T2S will eventually become one of the most cost-efficient securities settlement services in the world. One of the main factors which will determine the success of T2S is achieving 'critical mass'. Since it is largely a fixed-cost business, the higher the number of settlement transactions, the lower the price for all users. By October 2009, 28 central securities depositories (CSDs) located in 26 European countries had signed a memorandum of understanding with the Eurosystem. This includes not only all the CSDs in the Euro area but also seven CSDs in EU countries outside the Euro area – Denmark, Estonia, Latvia, Lithuania, Romania, Sweden and the United Kingdom – and three CSDs in countries outside the EU – Iceland, Norway and Switzerland. Furthermore, several central banks from outside the Euro area have signalled their interest in allowing their national currency to be settled in T2S as well. T2S is therefore well on track to achieving a very high transaction volume. It shows the strong support for T2S among market participants in a large number of countries across the EU and even outside it. Xxxxx. T2S will be a single IT platform for settling almost all heavily traded securities in Europe, eliminating any differences between the settlement of domestic and cross-border transactions. It will truly be settlement without borders. T2S will integrate – horizontally across all countries in Europe – the most fundamental part of the securities infrastructure value chain:- settlement. Preliminary discussions on T2S between the Eurosystem and the market started in 2006. In the following two years, the Eurosystem in cooperation with market participants produced a first version of the T2S user requirements and an economic impact assessment which showed that the new integrated settlement engine could make a significant contribution to European economic growth and welfare. In July 2008, following the positive feedback received from the market in a public consultation, the Governing Council decided to go ahead with developing T2S. T2S will be a state-of-the-art settlement engine, providing commoditized and harmonized DvP settlement in central bank money on a real-time gross basis. This will extend the most secure settlement method throughout the whole of Europe. The use of DvP eliminates the risk for a market participant that its securities or cash could be transferred to a counterparty which then defaults before fulfilling its corresponding obligations. The use of 'central bank money' – such that the cash is transferred from one counterparty's cash account at a central bank to another counterparty's cash account also at the central bank – eliminates the settlement agent risk. The alternative – settlement in 'commercial bank money', in which the transfer of cash takes place between the counterparties' cash accounts held at the same commercial bank (with no changes in the central bank accounts) – entails the risk that the intermediating commercial bank could default. Settling on a real-time gross basis rather than netting further reduces risks arising if a counterparty defaults before a transaction is finally settled. Although most national CSDs already use these best practices for domestic transactions, for cross-border transactions DvP in central bank money is not possible at the moment in such an efficient and safe manner. In view of the recent financial turmoil, risk reduction initiatives such as those provided by T2S for cross-border transactions are highly valued by market participants. One of the key risk reduction features offered by T2S is a single IT platform to accommodate market participants' dedicated central bank cash accounts and securities accounts in the same place. This is the 'integrated model', which facilitates fast, highly efficient, low-risk settlement. It contrasts with the 'interfaced model', in which securities accounts are held at the CSD and the cash accounts with the central bank, and settlement requires the sending of messages to and from the CSD and the central bank to confirm the transfer of the securities and the cash. The interfaced model is less satisfactory, as it may involve delays in processing transactions and an increased risk of error, as well as making autocollateralisation less efficient. Although some markets already benefit from the integrated model at a national level, T2S will spread the benefits to the whole euro area and potentially to the rest of Europe. A key difference between the T2S integrated model and previously used integrated models is that T2S will be run by the central bank rather than the CSD. Instead of outsourcing its cash accounts to be managed by the CSD, in the T2S environment the central bank is insourcing the CDSs' securities accounts. The integrated model envisaged for T2S is fur ther enhanced because it will be developed and operated in conjunction with the Eurosystem's TARGET2 single shared plat form for cash payments. The close proximity of T2S and TARGET2 will not only provide synergies by al lowing market participants to optimise their collateral and liquidity management, but will also provide T2S with the same very high levels of availability, resilience, recovery time and security that are currently enjoyed by TARGET2. T2S (the part of the diagram in the white box) will be a single IT platform accommodating both the market participant's securities accounts , held at either one CSD or at multiple CSDs, and its dedicated central bank cash accounts. The T2S dedicated cash account(s) (which can only be used for the settlement of securities transactions and corporate actions in T2S) will be linked to the market participant's main cash account in TARGET2 or another non-Euro central bank RTGS account. All transfers between the two accounts will be done on a real-time basis. T2S will therefore take the integrated model to a new level, not only directly connecting the securities accounts of one CSD with the cash accounts of one NCB, but connecting any securities account at any participating CSD with any cash account at any participating central bank. All changes in the balances of cash and securities accounts, regardless of which CSD or NCB they belong to, can be made in real time. In this way, cross-border settlement will become identical to (and therefore as inexpensive as) domestic settlement. Another key aspect of T2S is that it will be a service to CSDs, but not a CSD in itself. CSDs which join T2S will be 'outsourcing' their settlement processes to T2S, however they will retain all their other functions and relations with their clients. Market participants will need to have a legal relationship with a CSD in order to use T2S and only CSDs will sign contracts with T2S. CSDs will still be responsible for opening and closing securities accounts in T2S, for liability vis-a-vis their clients, and so on. Furthermore, the rest of the post-trading value chain, in particular as set servicing, corporate action processing (Altough management of corporate action events remains with CSDs and other service providers, T2S will process the resulting settlement of these events) and tax and regulatory reporting, which require specific knowledge of national practices and are difficult to commoditise and automate, remains a core function of national CSDs. Another crucial innovation of T2S is its multicurrency dimension. Originally, the idea was for T2S to be restricted on the cash side to the euro and on the securities side to only those held in the euro area CSDs. The ECOFIN Council (On 27 February 2007, the EU Council's committee on Economic and Financial Affairs (ECOFIN) concluded that 'T2S should be open to non-euro area CSDs and currencies, subject to agreement between the concerned parties') explicitly asked that T2S should not be limited to the Euro area. The large number of non-euro area CSDs that signed a memorandum of understanding with the Eurosystem in July 2009 shows the strong interest of the securities industry in extending T2S beyond the Euro area. Reflecting this, several non-Euro area national central banks have already confirmed their interest in taking their currency into T2S, and other central banks are still considering whether to do so. Ultimately, T2S may be able to settle almost all securities in Europe, in several – if not all – of the most traded currencies in this part of the world. The choice of currency will not be restricted, unlike the situation today, where most CSDs organize DvP settlement in central bank money with one central bank. The securities in T2S could be settled against any of the currencies in T2S. TARGET (Trans-European Automated Real-Time Gross Settlement Express Transfer) is an interbank transfer system linking national real-time gross settlement systems in Europe. TARGET was developed by European central banks primarily to implement the European Central Bank's monetary policy. The advantage of TARGET is its ability to process payments quickly; 98% of payments are executed within five minutes. The TARGET2-Securities (T2S) vision – which is to create a 'domestic' borderless market for securities settlement for Europe – was launched four years ago in the summer of 2006 (T2S s tar ted in July 2006 when the Governing Council of the ECB announced that it would like to explore, together with the market, the feasibility of developing a single settlement platform for Europe). The T2S settlement platform is scheduled to be user tested in January 2014 and operations are planned to begin in September 2014. So, at the time of publication, the project is exactly half-way to delivering T2S. The journey so far

has not always been easy and, like all big projects, there have been ups and downs. But it is fair to say that a lot of progress has been made in the last four years. There is of course still much to be done in the coming years, not least on the development, testing and migration of the T2S platform, and many other tasks need completion to ensure that we reach our destination on time. This progress would not have been possible without the institutions and hundreds of individuals who have participated in this endeavour, from central securities depositories (CSDs) to banks and other market participants, non-Euro area central banks and, of course, the Eurosystem. We will continue to rely on your help. Given that we are exactly half-way through the project, it is an opportune moment to reflect on where we stand and to consider what we have already achieved, as well as what remains to be done. This is one of the purposes of this document. But there is another objective. At this half-way point, there is of course still some important open questions – in particular regarding which currencies will participate in T2S, how large the settlement volumes processed in T2S will be, how CSDs will reshape their legacy systems to the future T2S world, and how much it will eventually cost to settle transactions in T2S. These are important issues which will ultimately determine the success of the project. Therefore, this document also provides some reflections on these and other crucial questions that have been raised by the market. Before beginning, there are a number of aspects of the T2S project which should be highlighted. First, it is important to emphasise that T2S is for Europe; participation is not restricted to the 16 countries in the Euro area or even to the 27 countries in the European Union. It is for Europe as a whole. Very soon after the project got underway, T2S was designed, and is now being built, as a multi-currency securities settlement platform. This view was strongly supported by the Economic and Financial Affairs (ECOFIN) Council in February 2007 when it backed the idea of T2S on the condition that the future system would be open to other currencies as well as the euro. Not only is it fair that all European countries should have the opportunity to participate, but also, the more CSDs and currencies that are in T2S, the greater the benefits for everyone. It is a win-win scenario. By pooling more securities settlement together in the same place, market participants will achieve lower transaction costs and unimpeded access to an even wider range of securities. It will be another important step towards a truly integrated capital market on a European scale. Second, T2S will be a revolutionary force in Europe's financial markets. It will fundamentally change the way things are done – in some areas quite dramatically, in others more gradually. But it will be a peaceful revolution. T2S does not favor any particular business model. Both large and small players will have the opportunity to benefit from T2S, by expanding their client base or range of services, by providing high-quality, customized services to niche markets, or through increased cooperation and consolidation with other players. The key to success will be thinking ahead and adapting to T2S in the best possible way. As with the introduction of any new technology – whether it be the introduction of mechanical looms during the industrial revolution or the computer in the mid-XX century – it is initially perceived, at least by some people, as a threat. But in the end, we all know that such new technologies, rather than reducing possibilities for growth and development, have always increased opportunities. The same is true for T2S. In fact, it will be those who choose not to be a part of the T2S revolution who will be the ones losing out. Third, the CSDs' approach to the changes is particularly important for the success of T2S in improving the European securities markets. Most CSDs will utilise the new T2S infrastructure in an efficient way and, to the largest extent possible, reshape and decommission their legacy settlement systems. A CSD that adapts efficiently so that T2S becomes an integral part of its IT architecture, rather than simply adding it as another layer on top of its existing systems, will be in the best position to offer high-quality services at the lowest prices in the future T2S world. By fully relying on T2S and minimising the replication of data and systems, CSDs and their users will benefit the most from T2S. Such a route will, of course, not be easy and will require a certain amount of initial investment by CSDs to reshape their existing systems. But now is the time to think long term and strategically plan this work, and to take initiatives that will leverage the benefits of T2S to the largest extent. Finally, to support both CSDs in the process of adapting their legacy systems, and market participants in deriving the benefits, it is of course imperative that the T2S community – CSDs, market participants, but also, most importantly, public authorities – make further progress on harmonisation. As well as legal and fiscal barriers, the persistence of specific national market practices and regulations significantly hinders the ability of CSDs to decommission old systems and provides a justification for maintaining certain legacy infrastructures to deal with these specific processes. These national specificities also prevent the market from reaching a fully competitive level playing field for post-trading activities in Europe, as local players will continue to have an advantage over foreign players in terms of knowledge and technology. T2S is not just an IT project; it has a much wider programme, driving forward the integration of Europe's capital markets. In the settlement world as elsewhere, national authorities should act to reform processes in order to reap the full benefits of market opening. / виз-а-ви (vis-à-vis). взаиморасчёт или сведение (netting) . ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

TARGET BUSINESS DAY = РАБОЧИЙ ДЕНЬ ТАСВРРУП (или РАБОЧИЙ ДЕНЬ ТАСВРРЭП) – Any day other than a Saturday or Sunday on which the TARGET (Trans-European Automated Real-Time Gross Settlement Express Transfer) system is defined as being operational to effect payments, when at least two RTGS (Real-Time Gross Settlement) systems are open. / Любой день, отличный от Субботы или Воскресенья, в который ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам) признаётся действующей в отношении осуществления платежей тогда, когда открыты, по крайней мере, две системы ВРРРВ (Валовых Расчётов в Режиме Реального Времени).

TARGET COMPANY = НАМЕЧЕННАЯ КОМПАНИЯ (или КОМПАНИЯ МИШЕНЬ, или КОМПАНИЯ ЦЕЛЬ, или КОМПАНИЯ ЖЕРТВА, или ПОГЛОЩАЕМАЯ КОМПАНИЯ) – Target Company is a company that has been chosen as takeover candidate, as opposed to Suitor. Target is a corporation that is the focus of a takeover attempt. A company which is the object of a takeover attempt. See also Suitor, and Takeover. / Компания Мишень или Компания Цель – компания или корпорация, которая была выбрана в качестве кандидата на поглощение или объекта попытки поглощения; в противовес Поклоннику (Suitor). Компания Жертва – компания, являющаяся целью приобретения, перекупки, выкупа контрольного пакета акций. Компания, выбранная потенциальным покупателем в качестве привлекательного объекта для поглощения (takeover) или выкупа контрольного пакета акций. В США покупатель может приобрести до 5% акций компании, являющейся целью приобретения, не сообщая об этой операции, но он должен сообщать обо всех сделках и представлять другую информацию в Американскую Комиссию по Ценным Бумагам и Биржам, на биржу, где котируются ценные бумаги компании, являющейся целью приобретения, а также в саму компанию – как только он приобретает более 5% акций. Смотрите также Приобретение Точки Опоры (Toehold Purchase); Расписание 13Ди. (Schedule 13D); Спящая Красота (Sleeping Beauty); Конкурсная Оферта (Tender Offer); Акт Вилъйэма (William's Act).

TARGET CROP = КУЛЬТУРА МИШЕНЬ (или КУЛЬТУРА ЦЕЛЬ, или ЦЕЛЕВАЯ КУЛЬТУРА) – Target Crop is one that has the potential to be a major crop, increasing the farmer's production and income.

TARGET DEVELOPMENT CURVE = КРИВАЯ НАМЕЧЕННОГО РАЗВИТИЯ (или КРИВАЯ ЦЕЛЕВОГО РАЗВИТИЯ) – Target Development Curve is a benchmark curve for measuring the efficiency of management strategies that promote earliness in the Cotton

crop. It begins with first square at 35 days after planting and displays a progression in nodes above first square at a rate of 2.7 days per node. At 60 days, which approximates the time from planting to first flower, the curve reaches an apogee at 9.25 squaring nodes. The Target Development Curve then begins its descent and should reach Nodes Above White Flower (NAWF) = 5.0 at 80 days after planting, with an average descent of 0.2125 nodes per day. The target development curve may be used as a benchmark to interpret actual growth curves from Cotton production fields.

TARGET PRICE = НАМЕЧЕННАЯ ЦЕНА (или ЦЕЛЕВАЯ ЦЕНА) – In the United States, the Target Price is a price level established by law for Wheat, Corn, Sorghum, Barley, Oats, Rice, and upland and extra-long staple Cotton. Farmers participating in the Commodity Credit Corporation (CCC) commodity programs receive the difference between the target price and either the market price during a period prescribed by law or the price support (loan) rate, whichever is higher. Target Price:- an income supporting price level, established by law, for Wheat, Corn, grain Sorghum, Barley, Oats, Rice, and upland and extra-long staple Cotton. Producers participating in the federal commodity programs received the difference between the target price and either the market price, during a period prescribed by law, or the loan rate, whichever was higher. If the average market price did not equal the target price, qualifying producers could receive a deficiency payment or compensatory payment to make up part or all the difference. The target price mechanism was eliminated with the enactment of the Federal Agriculture Improvement and Reform Act of 1996. The target price concept was reintroduced in the Farm Security and Rural Investment Act of 2002. Under Section 1001(15), the target price is the price per bushel, pound, ton, or other appropriate unit of a covered commodity or peanuts used to determine the payment rate for counter-cyclical payments. The target prices are fixed for 2002 and 2003 and then raised to higher fixed levels for 2004 through 2007, except for Soybeans and Rice which remain at the 2002–03 levels. Unlike previous programs, counter-cyclical payments based on target prices are not tied to actual production. See also Deficiency Payment(s), and Loan Rate(s). / Целевая Цена или Намеченная Цена:- В финансах:- цена, по которой покупатель хотел бы приобрести компанию в ходе поглощения (takeover). Для опционов:- цена соответствующих ценных бумаг, после которой определённый опцион (option) станет для покупателя прибыльным. Например, лицо, приобретающее опцион на покупку акций XYZ по 50 Долларов за премию (premium) в 200 Долларов, может иметь целевую цену в 52 Доллара, после которой премия окупается и опцион на покупку может принести прибыль. Для акций:- цена, до которой, как надеется инвестор, вырастут приобретённые им акции в течение указанного периода времени. Например, инвестор может приобрести акции ATZ по 20 Долларов, в то время как его целевая цена составляет 40 Долларов в течение одного года.

TARGET SITE = НАМЕЧЕННЫЙ УЧАСТОК (или ЦЕЛЕВОЙ УЧАСТОК) – Target Site:- the particular Plant process to which a treatment is directed.

TARGET SPECIES = НАМЕЧЕННЫЕ ВИДЫ (или ЦЕЛЕВЫЕ ВИДЫ, или ВИДЫ ЦЕЛИ, или ВИДЫ МИШЕНИ) – Target Species are the Plant Species selected for treatment.

TARGET SYSTEM = TRANS–EUROPEAN AUTOMATED REAL–TIME GROSS SETTLEMENT EXPRESS TRANSFER SYSTEM

TARI = TAIWAN AGRICULTURAL RESEARCH INSTITUTE

TARIC = ТАРИК (или ИТАРС) – The TARIC (Le Tarif Intégré de la Communauté (in French)) is a Integrated Tariff of the Community, is a multilingual database in which are integrated all measures relating to tariff, commercial and agricultural legislation. By integrating and coding these measures, the TARIC secures their uniform application by all Member States and gives all economic operators a clear view of all measures to be undertaken when importing or exporting goods. It also makes it possible to collect Community-wide statistics for the measures concerned. The TARIC contains the following main categories of measures:- (i) tariff measures:- (a) third country duty rates – these are the full duties, outside any reductions, suspensions or preferences, as defined in the Combined Nomenclature; (b) suspensions of duties; (c) tariff quotas; and (d) tariff preferences; (ii) agricultural measures:- (a) agricultural components; (b) additional duties on sugar and flour contents; (c) countervailing charges; and (d) refunds for export of basic (i.e. non processed) agricultural goods; (iii) commercial measures:- (a) antidumping measures; and (b) countervailing duties measure; (iv) measures relating to restriction of movements:- (a) import and export prohibitions; (b) import and export restrictions; and (c) quantitative limits; (v) measures for gathering of statistical data:- (a) import surveillances; and (b) export surveillance. It does not contain information relating to national levies, such as rates of VAT and rates of excises. Daily transmissions of TARIC data via an electronic network guarantee immediate and correct information for the national administrations of the Member States, who use this data mainly to feed their national systems for customs clearance, with the goal of maximising automatic customs clearance. The same information is also disseminated towards third parties such as economic operators, international organisations, and trade associations. The database is available online on our website:- http://ec.europa.eu/taxation_customs/dds/tarhome_en.htm. The TARIC does not contain information relating to national levies such as rates of VAT and rates of excises. The legal base of the TARIC is Council Regulation (EEC) No 2658/87 of 23 July 1987 on the tariff and statistical nomenclature and on the Common Customs Tariff (Official Journal L 256, 07/09/1987), as amended. In the European Union, Le TARIC (Le Tarif Intégré de la Communauté (in French)) is a Integrated Tariff of the Community, held in a Commission database containing EC import and export measures applicable to specific goods, such as tariff suspensions, tariff quotas, tariff preferences, anti-dumping duties, quantitative restrictions, embargoes, export. TARIC is the EU's online customs tariff database. It is a multilingual database which integrates all measures relating to tariff, commercial and agricultural legislation. Daily transmissions of TARIC data via an electronic network guarantee that it is always up-to-date and correct. One of the purposes is to give traders easy access to tariff and trade legislation, updated daily, for free, in a user friendly way. It eliminates the need to search through hundreds of copies of the EU Official Journal – and presents the information in a much more readable and accessible form. All economic operators can have a clear view of the duties to pay and the restrictions to be observed when importing or exporting goods. The information is also widely used by international organisations and trade associations, and is useful to companies providing logistical, brokering and other services associated with the international supply chain of goods. One of the other purposes of TARIC is to allow national administrations of Member States to use the data to feed their national systems for customs clearance, with the goal of maximising automatic customs clearance. Because it integrates all measures relating to tariff, commercial and agricultural legislation, TARIC helps ensure these rules are applied uniformly by all Member States. TARIC also makes it possible to collect Community-wide statistics for the measures concerned. / ИТАРС (Интегрированный Тариф Сообщества) или, как это звучит на Французском языке по месту расположения, Лё ТАРИК (Лё Тариф Антэгрэ дё ля Коммюнотэ; Le TARIC (Le Tarif Intégré de la Communauté)).

TARIFF = ТАРИФ – (1) Tariff is a tax assessed by a government in accordance with its tariff schedule on goods as they enter (or leave) a country. May be imposed to protect domestic industries from imported goods and/or to generate revenue. Types include ad valorem, specific, variable or some combination. A tax imposed on imports by the customs authority of a country. Also known as Duty. Tariff is a tax imposed on goods imported from outside the country that is not imposed on similar goods from within the country. Import Tariffs may be levied on an ad valorem basis, i.e. as a certain percentage of the estimated market value of the imported item; or on a 'specific' basis, i.e. as a fixed Dollar amount per unit imported. Import Tariffs (or 'Duties') may be imposed mainly for the purpose of

raising revenues because they are relatively cheap and easy taxes for a small or poorly organized government to collect, but more usually in developed industrial societies they represent a tiny fraction of revenues and are imposed primarily for other reasons of economic policy. 'Protective' Tariffs allow domestic producers of the good in question an artificial competitive advantage over their foreign competitors (largely at the expense of domestic consumers of these products) by making it impossible for the foreign producer to sell his goods as cheaply as he otherwise would – thus allowing favored domestic producers to enjoy higher prices, a bigger market share, and bigger profits. / Под Тарифом, от Французского слова Tarif от Арабского, понимается система ставок, по которым взимается плата за услуги. Наиболее распространены тарифы коммунальные, связи, транспортные. Таможенные тарифы – за провоз товаров через государственную границу. Тариф:- (1) федеральный налог на привоз (или импорт) или вывоз (или экспорт), обычно устанавливается либо с целью увеличить поступления – доходный таможенный тариф (revenue tariff), либо с целью зашиты национальных компаний от конкуренции со стороны привоза (или импорта) – защитный тариф (protective tariff). Пошлина также может быть предназначена для корректировки баланса платежей. Средства, поступающие от уплаты пошлин, называются (duty) или таможенной пошлиной (customs duty). (2) Прейскурант ставок или сбор, обычно за грузовые перевозки.

(2) Tariff:- rates an regulated entity will charge to provide service to its customers as well as the terms and conditions that it will follow in providing service. / Ставка, взимаемая организацией, являющейся объектом регулирования, со своих потребителей, а также порядки и условия оказания услуг такой организацией.

(3) Tariff is a list of published rates, rules and regulations applicable to the transportation of goods in specified trade lanes or between two areas. Tariffs are publications containing the actual rates, charges, classifications, rules, regulations and practices of carriers. See 46 CFR §536.2 (46 CFR is short for the Code of Federal Regulations:- Title 46). Prior to 1995, motor car-riers were required to file their tariffs with the former Interstate Commerce Commission (ICC; it was eliminated in 1994; Effective 1996-January-01, the US Department of Transportation (DOT) assumed the Interstate Commerce Commission's (ICC) remaining responsibilities for administering trucking regulations) if they did not have a contract with a shipper. As of 1995, tariffs, when required, are filed with the Surface Transportation Board. 49 USC 13702(e) (1995; 49 USC is short for the United States Code:- Title 49). After 1995, the only transportation performed pursuant to tariffs filed with the Surface Transportation Board is transportation of household goods and of property in non-contiguous domestic trade. Registered motor carriers transporting any other type of goods can now enter into contracts and negotiate their tariffs. The rates imposed by a company. Tariff is a publication setting forth the charges, rates and rules of transportation companies. A schedule of rates and charges offered for ocean transportation. A schedule of rates or charges permitted a common carrier or utility; pipeline tariffs are the charges made by pipelines for transporting crude oil, refined products, or natural gas from an origin to a destination. Tariff is a tax on imports. Also called Duty. / Тариф – налог на привозы. Называется также Пошлиной.

TARIFF ANOMALY = ТАРИФНАЯ АНОМАЛИЯ – A Tariff Anomaly exists when the tariff on raw materials or semi-manufactured goods is higher than the tariff on the finished product. / Тарифная Аномалия присутствует в том случае, когда тариф на непереработанное сырьё или полуфабрикаты выше, чем тариф на готовый продукт.

TARIFF ESCALATION = ЭСКАЛАЦИЯ ТАРИФОВ (или ТАРИФНАЯ ЭСКАЛАЦИЯ) – Tariff Escalation is a situation in which tariffs on manufactured goods are relatively high, tariffs on semiprocessed goods are moderate, and tariffs on raw materials are nonexistent or very low. / Ситуация, при которой тарифы на готовые изделия относительно высокие, тарифы на полуфабрикаты – умеренные, а тарифы на сырьевые материалы либо отсутствуют, либо слишком низкие. Наиболее универсальными принципами построения привозных (или импортных) таможенных тарифов в интересах покровительствования национальному производству являются принцип Эскалации Тарифа и система его построения на основе принципа эффективной тарифной защиты. Использование указанных подходов позволяет упорядочить структуру ставок привозного (или импортного) тарифа. Общей предпосылкой в данном случае будет придание всему тарифу единой направленности на создание условий для облегчения конкуренции отечественных предприятий с иностранными поставщиками. Принцип эскалации тарифа основан только на учёте характера товара. Эскалация товара – повышение ставок тарифа на товары по мере повышения степени их обработки. Этому принципу следуют подавляющее большинство государств. На практике это выражается в установлении наиболее низких ставок пошлин на сырьё и наиболее высоких – на готовые изделия и продукцию высокой степени обработки. Таким образом, создаются стимулы для ввоза в страну в первую очередь необходимых сырья и механизмов. При этом создаются барьеры на пути ввоза готовых изделий и продукции высокой степени переработки, что создаёт стимулы для развития обрабатывающей промышленности внутри страны.

TARIFF QUOTA = ТАРИФНАЯ КВОТА – Tariff Quota:- any pre-set value or quantity, authorized for importation or exportation of given goods, during a specified period, with a reduction of the Customs duties, and beyond which any additional quantity of these goods can be imported by paying normal Customs duties. Application of a higher tariff rate to imported goods after a specified quantity of the item has entered the country at a lower prevailing rate. Tariff Quota:- application of a higher tariff rate on imported goods after a certain quantitative limit (quota) has been reached. / привоз (importation) или вывоз (exportation). Применение для ввозимых товаров повышенной тарифной ставки после того, как в данную страну было завезено определённое количество этой конкретной продукции, обложенной по пониженной преобладающей ставке.

TARIFF–RATE QUOTA = КВОТА С ИЗМЕНЯЕМОЙ СТАВКОЙ ТАРИФА – Tariff-Rate Quota (TRQ):- resulted from the Uruguay Round Agreement on Agriculture (URAA). Certain countries agreed to provide minimum import opportunities for products previously protected by non-tariff barriers. This import system established a quota and a two-tier tariff regime for affected commodities. Imports within the quota enter at a lower (in-quota) tariff rate while a higher (out-of-quota) tariff rate is used for imports above the concessionary access level. Tariff-Rate Quota (TRQ) is a two-tier tariff regime where imports within the quota enter at a lower ('inquota') tariff rate while a higher ('out-of-quota') tariff rate is used for imports above this level, As part of the Uruguay Round Agreement on Agriculture, certain countries agreed to provide minimum import opportunities for products they had previously protected by tariffs.

TARIFF–RATED QUOTA = КВОТА С ИЗМЕНЯЕМОЙ СТАВКОЙ ТАРИФА – Tariff-Rated Quota (TRQ):- quantitative restrictions on imports of a commodity from all sources are no longer acceptable under the WTO. But quantitative restrictions on goods coming from another country under preference schemes are permissible, at least as a part of a transition to free access or as a way of giving assistance to other countries (under certain circumstances). Moreover the Uruguay Round set up a large number of Tariff Rate Quotas (TRQs) in the process of opening up markets previously restricted by non-tariff barriers. The administration of TRQs has created significant problems and will be rationalized at the next trade round. The issue of preferences will probably be addressed at that time. To the extent that the Central Eastern European Free Trade Agreement (CEFTA) quantity limits on bilateral access are strictly temporary they are probably safe from challenge. Tariff-Rated Quotas were designed to protect domestic producers from competitive disadvantages of offshore producers. Abbreviation:- TRQ. Non-tarriff trade barriers should first be converted to tariffs, as required by the Uruguay Round of the GATT (short for the General Agreement on Tariffs and Trade). Following this, the issue of tariff harmonization will arise. The process of harmonization of tariff levels can occur in two different contexts. First, within the plans for a

customs union countries can agree to move over time their own tariffs toward the common level. Secondly, the national tariffs can converge over time as an outcome of decisions which are technically unrelated but which might be driven by similar pressures. People's Republic of China has chosen to implement its obligations contained in the bilateral and multilateral agreements on China's accession to the World Trade Organization with respect to cotton and cotton products. While China has issued regulations stating how it intends to implement the new tariff rate quotas and announced a TRQ for cotton of approximately 820 000 metric tons in February, 2002, our (US National Cotton Council) review of those regulations and information we have gathered from sources within China, indicate that China is not changing the way it approaches cotton and cotton textile trade. In other words, China is not implementing the United States' China bilateral agreement on China's WTO accession and the multilateral agreement on China's accession in a manner consistent with its obligations. China's entry into the WTO will dramatically cut import barriers currently imposed on American agricultural products. China will end its system of discriminatory licensing and import bans for bulk commodities, and will create market access opportunities by establishing a WTO-consistent Tariff-Rate Quota system. China will establish significant and growing TRQs for state-traded commodities such as Wheat, Corn, Cotton, Rice, and Soybean oil. China has also committed to low, within-quota tariffs of 1–3 percent, which will help American farmers take full advantage of the TRQs. In addition, China committed to allow a share of the TRQs for each commodity to be imported by entities other than state-trading entities and agreed to specific rules for the administration of these TRQs. The introduction of private trade, combined with increased transparency in the process, will ensure increased opportunities for American agricultural exports. Under the Agreement, China will establish a large, low-duty TRQ for cotton with a substantial share reserved for private importers, which should lead to expanded US cotton sales. (February, 2000). Government policies in China support cotton production by exercising border protection based on sliding scale duties or direct purchases by the government for reserves. Both measures were exercised during 2011/12. As a result of government interventions and quotas, domestic cotton prices in China were above international prices. Under the terms of its accession agreement into the WTO, China is obliged to establish a calendar year Tariff-Rate Quota (TRQ). The in-quota tariff is 1% for the first 894 000 tons of imports each calendar year. Additional import quotas are released by China based on requirements. The additional quotas can carry a tariff of 1%, or quotas can be based on a sliding scale of between 5% and 40%. The purpose of the sliding scale is to ensure that the effective cost of imported cotton exceeds international market prices and thus boosts domestic prices paid to farmers in China. The Secretariat of the International Cotton Advisory Committee (ICAC) uses the difference between domestic and imported cotton prices as an estimate of the support to Chinese cotton prices that results from government interventions. The price differential between the CC index (an index of mill delivered cotton in China) and the FC Index L (an index of imported cotton arriving in Chinese main ports), adjusted to include the value added tax, port charges and transportation to mills is used in calculations. The usual TRQ of 1% for 894 000 tons was released for calendar year 2011. In addition, the government opened an additional TRQ of 1.7 million tons, under a sliding scale duty going up to 40%. A fixed rate duty of 570 Yuan per ton applied for imported cotton priced above 11 397 Yuan per ton (respectively:- 4 cents and 80 cents per pound at the exchange rate of July 01, 2011). International cotton prices averaged well above this threshold during 2011 (A Index averaged 164 cents per pound in 2010/11). As a result, duties on imported cotton in 2010/11 were fixed at 570 Yuan per ton, representing about 2% of import costs. China imported 2.6 million tons of cotton during 2010/11. Domestic cotton prices in China stayed below international levels beginning in mid-December, 2010. Because world cotton prices were record high in 2010/11, the border protection measures used by China had no measurable impact on domestic cotton prices. A TRQ of 1% for 894 000 tons was released for calendar year 2012. In addition, the government opened an additional TRQ of 2.1 million tons, under a sliding scale duty going up to 40%. The threshold below which the sliding scale duty takes effect was raised from 11 397 yuan per ton to 14 000 yuan per ton (USD1.00 per pound at the exchange rate of end-July, 2012). Above the threshold, a fixed rate of duty of 570 yuan per ton applies. The Cotlook A Index averaged USD1.00 per pound during 2011/12. As a result, duties on imported cotton in this period likely averaged around 4%. China imported an estimated 3.5 million tons during January-July 2012. It is not known if and when the government of China will issue new import quotas, and if and when it will release some of the large quantities of cotton it accumulated in the national reserve between October 2011 and March 2012. The China National Cotton Reserve Corporation (CNCRC) is the agency that manages the state reserve. The estimate of benefits resulting from border protection measures in China received by producers in 2011/12 was about USD2.7 billion, or 17 US cents per pound of production. China maintains significant strategic reserves of cotton. China releases cotton to the market through a system of auctions when there is a shortage, the government replenishes the reserves when there is an abundance of supplies and prices are low. During the past decade, the largest sales of government reserves were made in 2009/10 (1.4 million tons) and in 2010/11 (1 million tons). Large purchases for the state reserve of 2.8 million tons were made in 2008/09. Release of the reserves to domestic mills reduces the need for imports and limits growth in world trade, while purchases for the reserve boost domestic prices in China and increase world trade. In 2011/12 China implemented a minimum cotton support price combined with the rebuilding of the national reserve. The state reserve procurement price for 2011/12 was set at 19 800 yuan per ton (Type 328) (USD1.41 per pound as of end-July, 2012). For 2012/13 the procurement price was increased to 20 400 yuan per ton (USD1.45 per pound as of end-July, 2012). China purchased for the strategic reserve 3.1 million tons of domestic cotton and about one million tons of imported cotton during 2011/12. This resulted in a significant increase in world imports in 2011/12 and supported domestic and international prices. It is estimated that the national reserve in China holds 4.5 million tons. It is likely that at some point in the future this cotton from the reserves will be auctioned to the spinning mills in China. In addition, the government of China pays growers a subsidy for using high-quality planting seeds, about USD180 million a year. During the past two seasons China provided subsidies for transportation of cotton from Xinjiang to mills in east and south China estimated at about USD150 million per year. All types of subsidies totaled an estimated USD3.1 billion in 2011/12, up from USD330 million in 2010/11. The Ministry of Finance (MOF) in China paid about USD290 million during the first half of 2011 to pay for the interest on loans that were given for agricultural projects benefiting cotton, grain and vegetable oil processing. / Обозначение:- . Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) . В Китае при недостаточности своего хлопкового волокна для местных текстильных предприятий государство выделяет квоту своим импортёрам для ввоза в Китай хлопка из других стран с применением для этого количества хлопка специальной уменьшенной ставки привозной (или импортной) пошлины.

TARIFF SCHEDULE = ТАРИФНЫЙ ПЕРЕЧЕНЬ – Tariff Schedule is a comprehensive list of the goods which a country may import and the import duties applicable to each product. Tariff Schedule is a list of the rate of duty to be paid to the government for their importation. / Тарифный Перечень – всеобъемлющий список торваров, которые страна может привозить (или импортировать) и привозные (или импортные) пошлины, применимые для каждого продукта. Номенклатура – классифицированный перечень.

TARLATAN = СИЛЬНО ПРОКРАХМАЛЕННАЯ КИСЕЯ – Tarlatan is a thin, open fabric used extensively for theatrical costumes and hangings. It is transparent, but layers are usually used to provide a degree of opacity. Tarlatan usually has a stiff glazed finish. See opacity. Tarlatan is a sheer cotton fabric in open plain weave usually heavily sized for stiffness. / Кисея – очень тонкая редко тканая полупрозрачная хлопчатобумажная ткань полотняного переплетения, цветная, узорчатая или с вышитым орнаментом. В первое десятилетие XIX века самой модной была белая кисея, как подражание античным традициям. По техническим и художественным качествам близка к муслину.

TARNISHED = ПОТУСКНЕВШАЯ (или ТУСКЛАЯ) – Tarnished:- does not generally interfere with operating qualities, but is a matter of appearance only. Judging this as a defect depends upon degree of tarnish. Closure defects, and namely – Zippers:- Slider Defects. / от степени потускнения. Порок или дефект застёжки.

TARNISHED OR OFF–COLOR = ПОТУСКНЕВШАЯ ИЛИ БЕСЦВЕТНАЯ (или НЕНОРМАЛЬНАЯ ОКРАСКА) – Tarnished Or Off-Color:- may be caused by improper finishing in button manufacturing process or by buttons being held in stock too long. Certain fabric finishes and dyes react unfavorably on metal plating. Nickel plating is most capable of resisting chemical reaction. Closure defects, and namely – Metal Buttons, Snap Fasteners, Rivets and Burrs. / Порок или дефект застёжки.

TARNISH–RESISTANT FABRIC = УСТОЙЧИВАЯ К ПОТУСКНЕНИЮ ТКАНЬ – Tarnish-Resistant Fabric is a fabric used for wrapping silver to keep it from becoming darkened by atmospheric pollution. The cloth itself is made to absorb sulfur from the atmosphere, a major cause of tarnish. / главную причину потускнения.

TARO = TANZANIA AGRICULTURAL RESEARCH INSTITUTE

TARP = TARPAULIN

TARPAULIN = ТЕНТ (или БРЕЗЕНТ, или СМОЛЁНАЯ ПАРУСИНА) – Tarpaulin or Tarp is a heavy canvas used as a covering. Tarpaulin is used to cover an open-top container. Tarpaulin is a water-resistant fabric used to protect loads or materials from the elements. May be a coated fabric, a fabric with waterproof finish, or a fabric that is tightly constructed to prevent water penetration. Waterproof sheet, e.g., canvas, to spread over cargo to protect it from getting wet. / непромокаемая ткань, используемая для защиты . например, парусина. Брезент или Парусина это ткань, пропитанная водоупорными или противогнилостными составами. Парусина – тяжёлая плотная льняная или полульняная ткань из толстой пряжи. Первоначально употреблялась для парусов (отсюда само название). Применяется неотделанная или пропитанная составами для изготовления брезента, верха обуви, а также для пошива специальной одежды. Под Брезентом, от Голландского слова Presenning, понимается плотная ткань из химических волокон, реже льняная, полульняная и хлопковая ткань, вырабатываемая из толстой пряжи, пропитанная водоупорными и противогнилостными составами. Брезент применяют для укрытия различных материалов, машин, а также для изготовления спецодежды, обуви. Брезент – грубая, плотная, непромокаемая ткань, пропитанная особым составом, применяется при изготовлении непромокаемой одежды.

TARR = TRADEMARK APPLICATION AND REGISTRATION RETRIEVAL

TARP = TRANSPORTATION ACCOUNTS RECEIVABLE AND PAYMENT SYSTEM

TAR SANDS = БИТУМИНОЗНЫЕ ПЕСЧАНИКИ – Tar Sands are a mixture of sands (with some rocks and clay), about 10% bitumen and small quantities of water. There are large deposits in Canada (Athabasca) and Venezuela. / Битуминозные Песчаники являются смесью песка (с некоторым количеством камня и глины), содержащего порядка 10% битума и малого количества воды. Крупные месторождения битуминозных песчаников имеются в Канаде (Атабаска) и Венесуэле.

TARTAN = КЛЕТЧАТЫЙ РИСУНОК (или ТАТЭН, или ШОТЛАНДКА) – Tartan is a pattern made of intersecting stripes. Each tartan pattern is associated with a certain specific family called a Clan. Plaid, a term used for tartan, is actually the name of a shawl made of tartan fabric. The use of plaid has become so general that tartan is almost always limited to authentic clan designs. Some of the most common tartans follow, but there are many others. Tartan is a twilled woolen fabric with a tartan design, namely a plaid textile design of Scottish origin consisting of stripes of varying width and color usually patterned to designate a distinctive clan; also, a fabric with tartan design. A garment of tartan design, namely a plaid textile of Scottish origin consisting of stripes of varying width and color usually patterned to designate a distinctive clan. / Плед – термин, используемый для , . Татэн или Шотландка – клетчатая шерстяная ткань. Шотландка – ткань, вырабатываемая из хлопчатобумажной, шерстяной пряжи, различных химических нитей саржевым переплетением с рисунком в крупную клетку, типичным для тканей национальной Шотландской одежды. Шотландку используют для пошива платьев и верхних мужских сорочек.

TARTAN PLAID = ТАТЭНСКИЙ ПЛЕД – Tartan Plaid is a narrow, lightweight, single cloth fabric, weighing from 2 to 2% ounces per yard finished, and is composed of regular cotton yarns from 1-20's to 1-26's in warp and filling. It is always woven about 23% inches in the reed, to finish about 22 inches wide. This is done to prevent it from coming too close to the gingham lines. Tartan plaids are generally woven with a –2/45 degree, right hand twill weave, and are always woven In plaid patterns in imitation of the Imported worsted fabric of this name. Each line of patterns has a standard name, which represents a significant style of color arrangement, such as Rob Roy, dress Stewart, Royal Stewart, Malcolm, Fraser, McGregor, Sinclair, Gordon, Drummond, Macphec-son, etc. Those colors most used are red, green, black, white, brown, drab, wine, dark green, scarlet, dark blue, etc. In the Rob Roy Style:- the pattern takes the form of a broad, two-colored check, 1*4 x 1*4 inches, either black and red, or black and white, viz.:- 72 black. 72 red in warp and filling. The dress Stewart pattern is composed principally of white yarn. The Royal Stewart has a decided red color effect. The Gordon pattern a very green color effect, etc. Aniline colors are used in dyeing the yarns for this fabric, the warp yarns being given an extra run, to insure an even shade, which, while not being exactly a fast color, is strong enough to withstand the action of a rather wet finish (gingham finish). The Fairmount 4 x 1 box roller loom is used for the 2, 3 and 4 shuttle tartan plaids and the Knowles 4 x 4 gingham loom for those styles having more than four colors in the filling. The warps for this fabric are ordered from the spinner in either 720 yards, 1 080 yards, 1 200 yards or 1 500 yards lengths, and have either 1 000 ends, 1 200 ends, 1 400 ends, or 2 000 ends, in them. The most popular are 720, or 1 080 yards, and 1 400 ends. The warp is dyed in bulk and the necessary number of ends of each color are then split off. When all the colors have been split or separated, the splittings, or separated bunches of ends of each color, are assembled in the beaming frame, and the yarn is arranged as per pattern in the rathe comb, and the warp run through this rathe on to the beam. After beaming the warp is drawn in in the regular manner. To finish this fabric, the goods are taken from the loom and run through the brasher, then through the sprinkler, after which they are very lightly sized, then run upon the tenterlng machine to prevent undue shrinkage in width, also to assist in drying, then calendered, but not to a glossy finish. / в основе и уточине. Роб Рой (Rob Roy), Стюат (Stewart), Ройэл Стюат (Royal Stewart), Мэлком (Malcolm), Фрэйзё (Fraser), МэкГрэго (McGregor), Синклэа (Sinclair), Годн (Gordon), Драмэнд (Drummond), Мэкфэк-сэн (Macphec-son).

TARTAR EMETIC = РВОТНЫЙ КАМЕНЬ (или ВИННОКИСЛЫЙ АНТИМОНИЛ–КАЛИЙ, или АНТИМОНИЛ–ТАРТРАТ КАЛИЯ) – Tartar Emetic is antimony potassium (or sodium) tartrate ($K(SbO)C_4H_4O_6 \cdot 1/2H_2O$). This was once commonly used with tannic acid to improve the washfastness of dyed wool or nylon. / Дубильная Кислота или Дигалловая Кислота (Tannic Acid). Найлан^{Т3} (Nylon^{TM}).

TAS = TELOMERE ASSOCIATED SEQUENCE

TAS = TRADE AT SETTLEMENT

TASC = TECHNICAL ASSISTANCE FOR SPECIALTY CROPS PROGRAM

TASK FORCE = ЦЕЛЕВАЯ СИЛА (или ЦЕЛЕВАЯ ГРУППА) – Task Force is the Eurostat group composed by at most 5 Member State representatives sharing an interest in particular subject matter – normally has specific deliverables, answers to a Working Group, and works in one language.

TASLIN® PROCESS = ПРОЦЕСС ТЭСЛИН® – Taslin® Process:- xxxxxx. See also Air Jet Method, and Texturing. Tasline is made by Tasman Textile Technologies, a New Zealand company manufacturing fishing braid locally in our factory in Christchurch, New Zealand. We use the highest quality yarns imported from the USA and have a range of modern braiding machines to braid our lines. Most of our lines are then heat-stretched to maximise the strength and reduce the diameter. This process also increases the 'stiffness' of the line which contributes to the amazing sensitivity of our braid. Tasline has been sold around New Zealand for more than 6 years now and has established itself as a quality braid equal to the best overseas brands at an attractive price. It is stocked by a range of specialist fishing shops across New Zealand.

TASS = TERMINAL AIR SURVEILLANCE SYSTEM

TASSE = ТАСС – Tasse is one of a series of overlapping metal plates in a suit of armor that form a short skirt below the waist. / .

TASSEL = КИСТЬ (или КИСТОЧКА) – Tassel:- several strands of yarn loops joined together below the top and cut at the end. Tassels are used in rows as home furnishings trimmings and singly for such uses as zipper pulls or on the corners of pillows.

TATCA = TERMINAL AIR TRAFFIC CONTROL AUTOMATION

TATTERSALL = ТЭТЁСОЛОВСКАЯ – Tattersall is a fabric woven or printed in a tattersall pattern, namely a pattern of colored lines forming squares of solid background.

TATTERSALL CHECK = ТЭТЁСОЛОВСКАЯ КЛЕТКА – Tattersall Checks are an overcheck pattern in two colors, usually on a white or other colored ground. An example is a pattern of brown lines going in one direction, crossed by green lines in the opposite direction, forming the checks on a yellow background. These checks were named for Richard Tattersall who used the pattern on horse blankets. See also Overcheck. / Ричад Тэтёсол (Richard Tattersall).

TATTING = ПЛЕТЕНИЕ (КРУЖЕВА) – Tatting is a method of lace-making worked with the fingers and a shuttle that holds the thread. Tatting forms a narrow, knotted lace, often used for edging. Tatting is a delicate handmade lace formed usually by looping and knotting with a single cotton thread and a small shuttle.

TAUPE = ТЧЁП (или ТОП, или ХХ) – Taupe:- a brownish gray. / серо-коричневатое.

TAUT = ВЫБРАННОЕ ВТУГУЮ (или ТУГО НАТЯНУТОЕ, или ИСПРАВНОЕ, или ДИСЦИПЛИНИРОВАННОЕ) – Taut (maritime term):- with no slack; strict as to discipline.

TAVT = TERMINAL AIRSPACE VISUALIZATION TOOL

TAWNY = СМУГЛОЕ (или ЗАГОРЕЛОЕ, или КОРИЧНЕВО–ЖЁЛТОЕ, или РЫЖЕВАТО–КОРИЧНЕВОЕ, или РЫЖЕВАТО–БУРОЕ) – Tawny:- a brownish orange to light brown.

ТАХ = НАЛОГ – Tax is a charge levied by a governmental unit on income, consumption, wealth, or other basis. / Под Налогами понимаются обязательные платежи, взимаемые государством с физических и юридических лиц. Налоги делятся на:- (i) прямые, которыми облагаются доходы и имущество; и (ii) косвенные, увеличивающие цены товаров. Налоги являются одним из главных источников (до 80%) доходов государственного бюджета. Налоги, обязательные платежи, взимаемые государством с юридических и физических лиц. Возникли с разделением общества на классы и появлением государства. Используются для финансирования его расходов. Социально-экономическая сущность налогов, их структура и роль определяются экономическим и политическим строем общества и вытекающими отсюда природой и функциями государства. 'В налогах, – указывал Карл Маркс, – воплощено экономически выраженное существование государства' (Карл Маркс и Фридрих Энгельс, Соч., 2 Изд., Т. 4, С. 308). В антагонистических общественно-экономических формациях налоги выступают как один из главных источников доходов эксплуататорского государства. Они основной тяжестью падают на трудящихся и выражают собой отношения их дополнительной эксплуатации. Уже в рабовладельческих и феодальных обществах действовала широкая система налогов, в основном в форме натуральных сборов (продовольствие, фураж, снаряжение для армии и флота и тому подобное) и в виде личных повинностей (участие в походах и другое). С развитием товарно-денежных отношений налоги стали взиматься преимущественно в денежной форме и наибольшее развитие получили при капитализме, особенно в эпоху империализма. В условиях государственно-монополистического капитализма происходит стремительный рост налогов под влиянием милитаризации экономики, разбухания государственного аппарата, расширения государственного регулирования капиталистической экономики в интересах монополистического капитала. Доля национального дохода, мобилизуемая через налоги в бюджет, составляла в развитых капиталистических странах (конец 1960-х):- Соединённые Штаты Америки (США) 35%, Великобритании 45%, Франции 37%, Федеративная Республик Германия (ФРГ) 38% и Японии 28%. За 1950–70 объёмы налогов в этих странах возросли в 3–6 раз и составили до 70–80% доходов их государственных бюджетов. По способу взимания налоги делятся на прямые и косвенные. Прямые Налоги взимаются с доходов или имущества юридических и физических лиц (смотрите Налоговая Ставка). Различают Реальные Прямые Налоги, которыми облагаются земельные участки, скот, недвижимое имущество, и Личные Прямые Налоги, взимаемые с доходов или имущества физических лиц (подоходный налог, поимущественный налог, налоги на денежный капитал, сверхприбыль, с наследства и дарения). Косвенные Налоги (или Акцизы) взимаются через цены товаров, в основном предметов широкого потребления. Это создаёт значительные привилегии для господствующих классов, так как почти целиком тяжесть этих налогов перекладывается на малоимущие слои населения, потребляющие большую часть этих товаров. Именно поэтому Владимир Ильич Ленин называл косвенные налоги налогами на бедных (смотрите Полное Собрание Сочинений, 5 Издание, Т. 6, С. 262). В эпоху империализма наблюдается тенденция к возрастанию объёма и удельного веса прямых налогов. Это вызывается усилением классовых противоречий и борьбы рабочего класса за более прогрессивное обложение (повышение ставок налогов с увеличением доходов), ростом военно-полицейских расходов государственного бюджета, для покрытия которых налогов с трудящихся становится явно недостаточно, а также борьбой различных группировок внутри господствующих классов. Это связано и с тем, что косвенные налоги, повышая цены товаров, ограничивают возможности расширения внутреннего рынка и вывоза (или экспорта) товаров. Налоги при капитализме носят антинародный характер, своей основной тяжестью ложатся на трудящихся. В начале 1970-х в США, ФРГ, Франции налоги поглощали до 25–30% доходов средней семьи трудящихся. Капиталисты стараются уклониться от уплаты налогов, пользуясь коммерческой тайной, прибегают к фальсификации своей отчётности и используют другие лазейки, чтобы скрыть свои действительные доходы от налогообложения. На современном этапе особенно широкое развитие получили формы прямого и скрытого государственного субсидирования монополий (военные заказы по завышенным ценам, ускоренная амортизация и другие), что обеспечивает им фактически возврат изъятых

через налоги средств. Классовый антинародный характер налогов проявляется также в целой системе льгот, предоставляемых капиталистам при налогообложении (специальные скидки и крупные вычеты из облагаемых доходов, специальные льготы для корпораций на истощение недр, проценты по задолженности и другие), в освобождении от налогов различных фондов (амортизационный, резервный, благотворительный и другие). (Смотрите также Налоговые Льготы.) В России основное место в системе налогообложения занимали косвенные налоги и среди них доход от винной монополии, составлявший 28.6% всех поступлений в бюджет в 1909–13. Крупные доходы приносили акцизы на сахар и другие предметы массового потребления. Значительно меньшую роль в бюджете играли прямые налоги:- поземельный, промысловый и другие. При их взимании большие льготы предоставлялись буржуазии и помещикам; тяжёлым бременем эти налоги ложились на широкие массы крестьянства. Характерной чертой системы налогов в России было отсутствие подоходного налога, введению которого сопротивлялись буржуазия и помещики. Он был введён только с 01 Января 1917 под давлением революционного движения. При социализме налоги являются одним из средств планового распределения и перераспределения части национального дохода в интересах коммунистического строительства. Социалистическая собственность на средства производства позволяет государству осуществлять прямое распределение национального дохода и за счёт поступлений от социалистического хозяйства обеспечивать подавляющую часть доходов государственного бюджета. В конце 1960-х этот источник составлял в доходах государственного бюджета бывшего Союза Советских Социалистических Республик (СССР) свыше 90%, Польской Народной Республики (ПНР) около 85%, Чехословацкой Социалистической Республики (ЧССР) около 90%. Налоги с населения занимали незначительный удельный вес в доходах государственного бюджета. Так, в доходах государственного бюджета СССР 1973 они составляли около 8%. Характерной чертой налогов является их возвратность. Средства, мобилизуемые через налоги, используются на общественные нужды. В 1973 ассигнования только на социально-культурные нужды и науку превышали налоговые платежи населения более чем в 4 раза. Налоговая политика социалистического государства проводится в соответствии с задачами, которые оно решает на различных этапах коммунистического строительства. После установления диктатуры пролетариата налоги использовались государством для подрыва экономической мощи буржуазии (например, чрезвычайные контрибуционные налоги). В переходный период система налогового обложения была направлена на ограничение и вытеснение капиталистических элементов города и деревни и укрепление союза рабочего класса с трудовым крестьянством. Льготное обложение середняцких хозяйств сочеталось с частичным и полным освобождением от налогов бедняцких крестьянских хозяйств. Подоходный налог с рабочих и служащих взимался с небольшой прогрессией, при значительном необлагаемом минимуме и льготах для низкооплачиваемых групп населения. Налоги с предприятий представляли собой одну из форм косвенного регулирования их деятельности. Наряду с прямыми налогами и налогами с доходов и имущества взимались также и косвенные налоги, однако в отличие от акцизов при капитализме наиболее высокими ставками облагались не товары массового потребления, а предметы роскоши. Налоговая реформа 1930 в СССР унифицировала налоговые и неналоговые платежи в государственный бюджет и заменила их для социалистических предприятий двумя формами изъятия средств в бюджет – налогом с оборота и отчислениями от прибыли. С победой социализма была перестроена и система налогов с населения. С ликвидацией капиталистических элементов такие налоги, как налоги на сверхприбыль и квартирный, были полностью отменены, а подоходный и сельскохозяйственный налоги были соответствующим образом перестроены. Удельный вес налогов с населения был резко снижен. В период Великой Отечественной Войны 1941–45 доля налогов с населения в доходах государственный бюджета возросла. Наряду с перестройкой действующих государственных и местных налогов были введены военный налог и налог на холостяков, одиноких и малосемейных граждан СССР. Это дало возможность государству мобилизовать дополнительные средства для нужд обороны страны. В послевоенные годы происходило неуклонное снижение налогов с населения. Был полностью отменён военный налог (1946) и значительно снижены налог на холостяков и сельскохозяйственный налог. 21-й Съезд Коммунистической Партии Советского Союза (КПСС) (1959) принял решение о постепенной отмене налогов с населения. Разработанный в соответствии с этим решением Закон ‘Об Отмене Налогов С Заработной Платы Рабочих И Служащих’ (Май 1960) проводится в жизнь путём постепенного повышения необлагаемого минимума доходов и расширения налоговых льгот. В 1972 в ряде районов страны, где минимальная заработная плата рабочих и служащих производственных отраслей народного хозяйства повышена до 70 Рублей в месяц, отменены налоги с заработков этого уровня и уменьшены в среднем более чем на 1/3 ставки налога с заработной платы до 90 Рублей в месяц. Программа КПСС предусматривала полную отмену налогов с населения.

TAX & DIVIDENDS DUE = ПРИЧИТАЮЩИЕСЯ НАЛОГ И ДИВИДЕНДЫ – Tax & Dividends Due is the value of tax and dividends that are owed and still have to be paid at the end of the period. It is shown as part of the current liabilities on the Balance Sheet. / Причитающиеся Налог И Дивиденды.

TAXATION = НАЛОГООБЛОЖЕНИЕ – Taxation is a process of instituting a charge against a legal entity’s person, property or activity for the support of government. For example, income taxes, sales taxes, duties and levies. Taxation is a compulsory transfer of money (or occasionally of goods or services) from private individuals, institutions or groups to the state. The amount and timing of the levy exacted from the individual taxpayer may be determined on the basis of any of a very large number of factors, but historically the most common sorts of tax have been levied based on the wealth or the income or some other characteristic of the particular taxpayer at a given time (‘direct taxes’ like income tax, social security tax, real property tax, estate tax, poll tax, business or professional license fees) or as some form of compulsory surcharge on one or more types of private trade or other voluntary transactions (‘indirect taxes’ like general sales taxes, specialized excise taxes, import tariffs, marriage licenses, and so on). In addition to the obvious function of raising revenue to finance government purchases of goods and services or income transfer programs, taxation may also be used deliberately as a policy instrument by which government seeks to influence the behavior of various segments of the citizenry by raising the costs of choosing to engage in the kinds of behavior on which taxes are imposed – the classic examples being ‘sin’ taxes to discourage consumption of tobacco and alcohol or protective import tariffs imposed to discourage the purchase of foreign-made products. Of course, all forms of taxation will have an impact on the incentives facing the citizenry and thus will affect their behavior – but frequently these non-revenue effects will not have been analyzed in advance and therefore do not represent deliberate policy. Legislators are rather regularly astonished by the unexpected – and often negative – secondary effects of their enactments, such as cigarette tax increases in New York producing diminished revenues due to increases in smuggling of cheap untaxed cigarettes, or newly imposed luxury taxes on yachts meant to soak the rich creating mass blue-collar unemployment in the boat-building industry due to greatly diminished sales. / надбавка или доплата (surcharge).

TAXATION OF INTERIM PROFITS = НАЛОГООБЛОЖЕНИЕ ВРЕМЕННЫХ (или ПРЕДВАРИТЕЛЬНЫХ, или ПРОМЕЖУТОЧНЫХ) ПРИБЫЛЕЙ – Taxation Of Interim Profits:- interim profits are payments included in the purchase or redemption price for received or accrued interest not distributed or reinvested by the fund and which, accordingly, are not taxable for investors (comparable, for instance, to accrued interest from fixed-income securities). Interim profits are determined in each unit value calculation and published on a daily valuation basis. Domestic taxpayers are liable to pay income and investment income tax on interest and interest claims generated by investment assets when they redeem or sell their fund shares. The tax withholding is an advance income

tax payment and must be entered in the appropriate tax form (in Germany, the KAP Form). Tax is not withheld if a tax exemption application or a certificate of non-assessment is submitted. / КАП Форм (KAP Form).

TAX BASE = НАЛОГОВАЯ БАЗА (или НАЛОГООБЛАГАЕМАЯ БАЗА) – Tax Base:- the form of income upon which tax is calculated, e.g., the tax base for income tax is a person's taxable income. Value used to determine the applicable tax rate in figuring the amount of tax due. Also known as Tax Basis. / Налоговая База:- общая стоимость актива, на основе которого рассчитывается размер налога. Актив или доход, который может облагаться налогом в рамках конкретной юрисдикции. Налоговая база города – стоимость домов и квартир (минус освобождённая от налога собственность), доход от бизнеса и другие источники налогооблагаемой деятельности. Если компания перемешается в другое место, то налоговая база в данной юрисдикции сужается и налоговое бремя перекладывается на остающихся владельцев домов и компании.

TAX BREAKS = НАЛОГОВЫЕ ПОСЛАБЛЕНИЯ (или НАЛОГОВЫЕ КАНИКУЛЫ, или НАЛОГОВЫЕ ЛЬГОТЫ) – Tax Breaks or 'Incentives' are advocated by the high tech industry – especially on stock options – as one way to help stem the brain drain. Another form of break is an investment tax credit to encourage investment or the research and development (R&D) credit to encourage companies to undertake more R&D. It is a means for governments to stimulate growth in certain economic activities.

TAX CREDIT = НАЛОГОВЫЙ КРЕДИТ – (1) Tax Credit is a form of tax cancellation or exemption. A tax is levied, but offset in whole or in part, usually by another tax paid. / Налоговый Кредит:- прямое (Доллар за Доллар) сокращение обязательств по уплате налогов, в отличие от вычетов из подлежащих налогообложению сумм, что сокращает налоги только на процент (долю) по соответствующему разряду налогообложения (tax bracket) данного налогоплательщика. Например, налогоплательщик, входящий в категорию налогообложения 315c, получит льготы в размере 31 цента с 1 Доллара на каждый вычет из налогообложения. В случае налогового кредита налогоплательщик, который должен заплатить 10 000 Долларов в виде налога, заплатит только 9 000 Долларов, если воспользуется налоговым кредитом в 1 000 Долларов. При определённых условиях налоговые кредиты предоставляются пенсионерам в возрасте старше 65 лет; на подоходный налог, уплаченный в иностранном государстве; на расходы по уходу за ребенком; на расходы, связанные с восстановлением исторических объектов; на расходы на исследование и развитие, постройку жилья для лиц с низким доходом, а также на создание рабочих мест лицам, находящимся в тяжёлом экономическом положении.

(2) Tax Credit:- that part of a dividend payment on which a company has already paid tax, thus relieving the shareholder of the necessity of doing so. / Та часть дивидендного платежа, по которой компания уже оплатила налог, и следовательно акционер освобождается от необходимости уплаты налога.

TAX DEDUCTION = НАЛОГОВЫЙ ВЫЧЕТ (или СУММА, УМЕНЬШАЮЩАЯ НАЛОГОВУЮ БАЗУ) – In taxation, Tax Reduction is an amount that can be used to reduce the amount of income tax or the tax base. In the United Kingdom, money removed from a person's salary or wages to cover income tax. In the United States, expenses that are deductible against tax. / Налоговый Вычет:- вычитаемый из налога расход, который уменьшает налогооблагаемую базу дохода для физических и юридических лиц. О легальных вычетах из налогов смотрите (Tax Deductible).

TAX DEFERRAL = НАЛОГОВАЯ ОТСРОЧКА – Tax Deferral means that income taxes that would otherwise be due on employment or investment earnings are postponed until some point the future, often when you retire. Then tax is due on the amounts you withdraw, at the same rate you pay on your regular income. For example, if you contribute pretax income to a retirement savings plan, such as a 401(k) (a 401(k) plan is an employer sponsored retirement savings plan) or 403(b) (a 403(b) plan, sometimes known as a Tax-Sheltered Annuity (TSA) or a Tax-Deferred Annuity (TDA), is an employer sponsored retirement savings plan for employees of not-for-profit organizations, such as colleges, hospitals, foundations and cultural institutions), you owe no tax on the contributions or any earnings in the plan until you withdraw those funds. In other plans, such as individual retirement accounts (IRA), the contribution may be taxable but the earnings are tax deferred. In the United States, Tax Deferral:- a taxpayer defers taxation when postponing reporting income for Federal income tax purposes in accordance with applicable tax laws and regulations. A term 'Tax Deferral' refers to instances where a taxpayer can delay paying taxes to some future period. In theory, the net taxes paid should be the same. Taxes can sometimes be deferred indefinitely, or may be taxed at a lower rate in the future, particularly for deferral of income taxes. It is a general fact of taxation that when taxpayers can choose when to pay taxes, the total amount paid in tax will likely be lower.

TAX–DEFERRED = ДО НАЛОГООБЛОЖЕНИЯ (или С ОТЛОЖЕННЫМИ НАЛОГАМИ) – In the United States, Tax-Deferred is a phrase referring to money that is not subject to income tax until it is withdrawn from an account, such as an individual retirement account or a 401(k) account. / С Отсрочкой Выплаты Налогов (Tax Deferred):- термин относится к инвестициям, накопленный доход по которым свободен от налогообложения до тех пор, пока он не поступит в распоряжение инвестора. Например, владелец индивидуального пенсионного счёта (individual retirement account) откладывает выплату налогов по процентам, дивидендам или на прирост капитала, если желает подождать исполнения 59.5 лет до обналичивания этих доходов. Другими примерами финансовых вложений с отсроченной выплатой налогов являются планы Кио (Keogh plans); аннуитеты (annuities); страхование жизни с плавающей суммой (variable life insurance); страхование жизни вплоть до смерти владельца полиса (whole life insurance), а также универсальный полис страхования жизни (universal life insurance); программы покупки акций служащими корпорации (stock purchase) или программы реинвестирования дивидендов в новые акции той же компании (dividend reinvestment plans); а также сберегательные облигации США (US savings bonds) серий EE и HH.

TAX DEPRECIATION ALLOWANCES = НАЛОГОВЫЕ ОТЧИСЛЕНИЯ ПО ОБЕСЦЕНЕНИЮ (или НАЛОГОВЫЕ ОТЧИСЛЕНИЯ ПО ИЗНОСУ) – Tax Depreciation Allowances:- in the United States, . Also known as Capital Allowances in the United Kingdom. In Australia, the final report of the Review of Business Taxation (RBT) had recommended in 1999 that some types of finance leases should be treated as loans for tax purposes. The consequence of such treatment would have been that the lessor would split lease receipts into principal and interest, with any tax depreciation allowances to be claimed by the lessee, who would be regarded as the owner for tax purposes. For assets with relatively high tax depreciation allowances, the lessor's tax position would be worse from a timing perspective, but the lessee would be in a better position – assuming it could actually use the tax deductions. Depreciation Allowance is the sum of money which is deducted from income each year so that funds are available to replace equipment etc. when it is worn out. In Australia, in residential property there are two types of tax depreciation allowance:- (i) the building; and (ii) the plant. Each are handled differently. The building allowance was introduced in 1985, and therefore any building prior to that does not qualify for the allowance. Although renovations and extensions built after that year are eligible for tax deductions. The plant is assessed at every purchase and valued accordingly at that date. A simple 1st year example of the benefits of claiming tax depreciation deductions are provided. Depreciation Allowance is granted to compensate the assessee for depreciation suffered by him in respect of specified assets. Depreciation is a measure of the effective life an asset owing to use or obsolescence. Many corporations do not claim all of their allowable tax depreciation deductions, despite apparently incurring a higher tax cost. There are several possible explanations. First, we find strong evidence that firms facing current tax losses or carrying forward past losses under-utilize depreciation in order to recover tax losses before they expire. Second, corporations with bad economic performance tend to under-utilize their deductions,

suggesting that corporations use costly 'window-dressing' on their accounting measures. Third, we find support for the hypothesis that tax compliance costs discourage the utilization of accelerated depreciation, especially by small firms. We do not find much support for other hypotheses. For example, we find no evidence of substitution between tax depreciation and private debt due to competition between the benefits of private bank monitoring and the tax savings from using tax allowances to postpone tax payments, as suggested in earlier literature. We also study the effects of the uniform reporting accounting system (typical of many European countries) which can, under certain circumstances, constrain dividends. The dividend constraint can be loosened by forgoing some tax depreciation, but the evidence does not support this motivation. Unusual access to extremely detailed individual firm tax returns forms in Norway made our empirical analysis possible. In addition, the 1992 Norwegian tax reform provided a natural experiment for testing some of the hypotheses. We use the time-series and cross-sectional variation across Norwegian corporations in 1988, 1991, 1992 and 1993. Depreciation Allowance is an allowance for loss due to depreciation. As a real estate investor, you can depreciate our rental property and enjoy the positive cash flow resulting from write-off of tax depreciation. Tax depreciation helps shelter rental income that is subject to 'ordinary income' rates which is generally higher than capital gain rates. The depreciation taken reduces our property's tax basis, which effectively increases our tax gain when we later sell. If the property is later sold at a gain, this gain may have resulted from the depreciation previously taken. To the extent the gain is attributable to depreciation taken, this gain is generally referred to as 'Recapture', or Internal Revenue Code (IRC) Section 1250 gain. / реновации и .

TAX EVASION = УКЛОНЕНИЕ ОТ УПЛАТЫ НАЛОГОВ – Tax Evasion is the illegal avoidance of tax payments. Evasion or fraud differs from tax avoidance in that it is deliberately illegal, although the distinctions are sometimes blurred. It generally involves filing falsified tax returns or failure to declare taxable income. Also known as Tax Fraud. Tax Evasion is the general term for efforts by individuals, corporations, trusts and other entities to evade taxes by illegal means. Tax evasion usually entails taxpayers deliberately misrepresenting or concealing the true state of their affairs to the tax authorities to reduce their tax liability, and includes, in particular, dishonest tax reporting (such as declaring less income, profits or gains than actually earned; or overstating deductions). Tax evasion is an activity commonly associated with the underground economy and one measure of the extent of tax evasion the amount of unreported income, namely the difference between the amount of income that should legally be reported to the tax authorities and the actual amount reported. In the 1970s and 80's, the US Internal Revenue Service (IRS) undertook the Taxpayer Compliance Measurement Program (TCMP) in an attempt to measure unreported income and the tax gap. The tax gap is the difference between the amount of tax legally owed and the amount actually collected by the government. The TCMP program was believed to produce the most reliable information about noncompliance, but these 'audits from hell' were deemed to be overly intrusive and were discontinued in 1988. The National Research Program was undertaken in the 1990s as a less intrusive means of measuring noncompliance and was described as 'the most careful and comprehensive estimates of the extent and nature of tax noncompliance anywhere in the world' However, critics point out numerous problems with the tax gap measure. The IRS direct audit measures of noncompliance are augmented by indirect measurement methods, most prominently currency ratio models. Tax avoidance, on the other hand, is the legal utilization of the tax regime to one's own advantage, to reduce the amount of tax that is payable by means that are within the law. Both tax evasion and avoidance can be viewed as forms of tax noncompliance, as they describe a range of activities that are unfavorable to a state's tax system. / Уклонение От Уплаты Налогов, обход закона в отношении уплаты налогов. Незаконная практика умышленной неуплаты налогов. Налогоплательщики, которые уходят от уплаты обязательных налогов, указывают неверную сумму своих доходов, преувеличивают налоговые вычеты и освобождения или участвуют в налоговых фальсификациях. Если налогоплательщик будет пойман на обмане, то такое уклонение от налогов будет квалифицироваться как уголовное преступление. Кроме того, он уплатит все просроченные налоги с процентами и будет оштрафован. Обход закона в отношении налогов отличается от снижения суммы взимаемых налогов законными средствами (tax avoidance), что является законным использованием Налогового Кодекса для сокращения долговых обязательств.

TAX EXEMPTION = ОСВОБОЖДЕНИЕ ОТ НАЛОГА – Tax Exemption:- not having to pay tax. In the United States, however, it is the proportion of income upon which tax is not payable. Sum that a taxpayer may deduct from taxable income for himself or herself, and for each dependent. The precise amount is determined by tax law and is usually indexed to reflect inflation.

TAX–EXEMPT ORGANIZATION = ОСВОБОЖДЁННАЯ ОТ НАЛОГОВ ОРГАНИЗАЦИЯ – In the United States, Tax-Exempt Organization is any organization that is determined by the Internal Revenue Service to be exempt from federal taxation of income. A tax-exempt may be required to operate exclusively for charitable, religious, literary, educational or similar types of purposes.

TAX FRAUD = НАЛОГОВОЕ МОШЕННИЧЕСТВО – Tax Fraud occurs when an individual or business entity willfully and intentionally falsifies information on a tax return in order to limit the amount of tax liability. Tax fraud essentially entails cheating on a tax return in an attempt to avoid paying the entire tax obligation. Examples of tax fraud include claiming false deductions; claiming personal expenses as business expenses; and not reporting income. Tax fraud involves the deliberate misrepresentation or omission of data on a tax return. In the United States, taxpayers are bound by a legal duty to voluntarily file a tax return and to pay the correct amount of income, employment and excise taxes. Failure to do so by falsifying or withholding information is against the law and constitutes tax fraud. Tax fraud is investigated by the Internal Revenue Service Criminal Investigation (CI) unit. Also known as Tax Evasion. / Известно также как Уклонение От Уплаты Налогов (Tax Evasion).

TAX–FREE SAVINGS ALLOWANCE = ОТЧИСЛЕНИЕ (или УСТУПКА) ПО БЕЗНАЛОГОВЫМ СБЕРЕЖЕНИЯМ – Tax-Free Savings Allowance is maximum total amount of tax-free investment income.

TAX HAVEN = НАЛОГОВОЕ УБЕЖИЩЕ – Tax Haven countries usually exhibit the following characteristics:- (i) relatively low rates of tax; (ii) high levels of bank or commercial secrecy; (iii) predominant financial sectors; (iv) modern communications facilities; (v) absence of currency controls; (vi) absence of requirements to file financial statements with regulatory or statistical agencies. Tax havens include the Bahamas, Bermuda, Cayman Islands, Channel Islands, Hong Kong, Isle of Man, British Virgin Islands, Liechtenstein, Luxembourg, Netherlands Antilles, Panama and Switzerland. In recent years, Special Purpose Entities (SPEs) have also been located in some other countries, such as Singapore, Vanuatu, Jamaica, and the Philippines. In addition, some relatively high-tax countries, such as Canada, are locations for SPEs. These locations may be used, among other things, to hide the true source of income or to take advantage of jurisdictions that permit less-than-full disclosure of the total income of multinational enterprises. Any locality or nation that levies very low taxes or none at all on foreigners, or where governments apply lenient and flexible fiscal and monetary policies and regulations on banking. Examples are The Bahamas, Cyprus, Isle of Man, Panama, etc. Tax Haven is a country, which provides a no-tax or low-tax environment. The United Kingdom (see also LLP) and the United States (see also LLC) are considered a tax haven by some countries. In some offshore jurisdictions the reduced tax regime is aimed towards entities organized in the country with all operations occurring outside the country. These countries seek to encourage investment and make up revenue losses by charging a variety of fees for the start up of the entity and on an annual basis. Country with liberal tax and banking regulations. In some instances it benefits companies to set up their registered offices in such a country, to avoid paying taxes in their own country. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Буквально Налоговый Рай или Налоговое Убежище:-

страна, предлагающая внешним физическим и юридическим лицам условия деятельности с крайне низкими налогами, где вообще никаких налогов не взимается. Создав такой фискальный 'оазис', несколько островов в Карибском Море, таких, как Острова Кайман, привлекают миллиарды Долларов в банковских депозитах. Они облегчают налоговое бремя в своих странах не только физическим и юридическим лицам, но также добиваются меньшего вмешательства государства в их финансовые дела, набрасывая на их деятельность ещё больший покров тайны.

TAX INCENTIVE = НАЛОГОВАЯ ЛЬГОТА – Tax Incentive:- tax benefit granted by the government to certain business or industries to encourage specific behaviors. Most tax incentives are designed to promote industrial and commercial modernization, to encourage regional development and research and development activities, or to protect the environment or preserve the national heritage. / Налоговые Льготы, полное или частичное освобождение от налогов юридических и физических лиц. Налоговые льготы устанавливаются государством. В докапиталистических формациях и при капитализме налоговыми льготами пользуются главным образом представители господствующих классов. Например, во многих буржуазных государствах по налогу с наследства существуют высокий необлагаемый минимум и специальные дополнительные скидки. В социалистических странах при определении налоговых льгот учитываются формы собственности, размеры и источники доходов, категории плательщиков. В бывшем Союзе Советских Социалистических Республик (СССР), например, кооперативные предприятия и колхозы полностью освобождаются от уплаты налога по некоторым видам своих доходов. По подоходному налогу действовал необлагаемый минимум доходов в размере до 60 Рублей в месяц. В 1972 в ряде районов страны, где минимальная заработная плата рабочих и служащих производственных отраслей народного хозяйства было повышена до 70 Рублей в месяц, необлагаемый минимум был повышен до этого уровня и снижены в среднем более чем на 1/3 ставки налога с заработной платы до 90 Рублей в месяц. Не облагаются налогами пенсии, вознаграждения за открытия, изобретения, рационализаторские предложения (не свыше 1 000 Рублей каждое), Ленинские и Государственные Премии и Премии Ленинского Комсомола, выигрыши по государственным займам, лотереям и тому подобное. Налоговые льготы предоставляются многосемейным гражданам и инвалидам. От налогов освобождаются некоторые объекты обложения, например, неудобные участки земли, некоторые виды имущества, строения и другое. В ряде случаев налоговые льготы устанавливаются в целях стимулирования того или другого вида производства или промысла.

TAX NOTICE = ТРЕБОВАНИЕ ОБ УПЛАТЕ НАЛОГА (или НАЛОГОВОЕ УВЕДОМЛЕНИЕ) – Tax Notice is a notice sent by a government advising a taxpayer that a tax payment is due.

TAXON = ТАКСОН – Taxon is a formally described category of individuals, distinct by some visible characteristics. / Под Таксоном, от Греческого слова Táxis, означающее Порядок или Расположение или Строй, понимаются соподинённые группы объектов.

TAX ON DIVIDEND INCOME AND CAPITAL GAINS = НАЛОГ НА ДОХОД ПО ДИВИДЕНДАМ И ПРИБЫЛИ С КАПИТАЛА – Tax On Dividend Income And Capital Gains:- tax levied on income from all banking and financial transactions, excluding interest income.

TAXONOMY = ТАКСОНОМИЯ – Taxonomy is the system and practice of classification. / Под Таксономией, от Греческих слов Táxis, означающее Порядок или Расположение или Строй, и Nómos, означающее Закон, понимается теория классификации и систематизации сложноорганизованных областей деятельности, имеющих обычно иерархическое строение (органический мир, объекты географии, геологии, языкознания, этнографии и так далее). Термин (предложен в 1813 Швейцарским ботаником Огюста Пирамю дё Кадоль (Augustin Pyramus de Candolle; 04 February 1778 – 09 September 1841)) длительное время употреблялся как синоним систематики. В 1960–70-х возникла тенденция определять таксономию как раздел систематики, как учение о системе таксономических категорий, обозначающих соподчинённые группы объектов – таксоны.

TAXPAYER = НАЛОГОПЛАТЕЛЬЩИК – Taxpayer is an individual or entity subject to the payment of a tax. The term applies to every individual and entity who is required to pay taxes. / Физическое или юридическое лицо, ответственное за уплату налогов. Данное понятие применяется для каждого физического или юридического лица, от которого требуется уплатить налоги.

TAXPAYER EQUITY AND FISCAL RESPONSIBILITY ACT = АКТ О СОБСТВЕННЫХ СРЕДСТВАХ НАЛОГОПЛАТЕЛЬЩИКА И ФИСКАЛЬНОЙ ОТВЕТСТВЕННОСТИ – Taxpayer Equity and Fiscal Responsibility Act is a legislation passed by the US Congress in 1984 that requires taxpayers to provide their correct TIN (Tax Identification Number) to financial institutions who report income from securities to the Internal Revenue Service. The TIN number is certified by completing a W-9 form. Failure to provide a certified TIN number can result in a withholding penalty of 31%.

TAXPAYER IDENTIFICATION NUMBER = ИДЕНТИФИКАЦИОННЫЙ НОМЕР НАЛОГОПЛАТЕЛЬЩИКА – In the United States, a Taxpayer Identification Number (TIN) is either a social security account number or employer identification number, depending on whether the number is assigned to an individual or to an entity, such as a trust, estate, corporation, etc. Both are nine-digit numbers. The employer identification number is assigned by the Internal Revenue Service (IRS; the US government agency responsible for tax collection and tax law enforcement).

TAX PLANNING STRATEGY = СТРАТЕГИЯ НАЛОГОВОГО ПЛАНИРОВАНИЯ (или СТРАТЕГИЯ ПЛАНИРОВАНИЯ НАЛОГООБЛОЖЕНИЯ) – Tax Planning Strategy:- an action (including elections for tax purposes) that meets certain criteria and that would be implemented to realize a tax benefit for an operating loss or tax credit carryforward before it expires. Tax-planning strategies are considered when assessing the need for and amount of a valuation allowance for deferred tax assets. An enterprise shall consider tax-planning strategies in determining the amount of valuation allowance required. Significant expenses to implement a tax-planning strategy or any significant losses that would be recognized if that strategy were implemented (net of any recognizable tax benefits associated with those expenses or losses) shall be included in the valuation allowance.

TAX RATE = НАЛОГОВАЯ СТАВКА – A Tax Rate is the percentage at which an individual or corporation is taxed. The tax rate is the tax imposed by the federal government and some states based on an individual's taxable income or a corporation's earnings. The United States uses a progressive tax rate system, where the percentage of tax increases as taxable income increases. To help build and maintain the infrastructures used in a country, the government usually taxes its residents. The tax collected is used for the betterment of the economy and all living in it. In the US and many other countries in the world, a tax rate is applied to some form of money received by a taxpayer. The money could be income earned from salary, capital gains from investment, dividends received as additional income, payment made for goods and services, etc. The percentage of the taxpayer's earnings or money is taken and remitted to the government. When it comes to income tax, the tax rate is the percentage of an individual's taxable income or a corporation's earnings that is owed to the state, federal and in some cases, municipal governments. In certain municipalities, regional income taxes are also imposed, increasing the tax burden for those residents. The tax rate that is applied to an individual's earnings depends on the marginal tax bracket that the individual falls under. The marginal tax rate is the percentage taken from the next dollar of taxable income above a pre-defined income limit. The marginal tax rate used by the US government is indicative of the progressive tax system implemented by the country. A progressive tax rate results in a higher dollar amount collected from individuals with higher incomes. Effective Tax Rates:- Let's use an example to illustrate the marginal and progressive tax rates. The marginal tax bracket for

2017 is:- (i) Annual Income – ≤ USD9 325, Tax Rate – 10%; (ii) Annual Income – USD9 326–37 950, Tax Rate – 15%; (iii) Annual Income – USD37 951–91 900, Tax Rate – 25%; (iv) Annual Income – USD91 901–191 650, Tax Rate – 28%; (v) Annual Income – USD191 651–416 700, Tax Rate – 33%; (vi) Annual Income – USD416 701–418 400, Tax Rate – 35%; and (vii) Annual Income – > USD418 400, Tax Rate – 39.60%. An individual who earns USD62 000 in 2017 will be taxed as follows:- [10% x first USD9 325] + [15% x (USD37 950 – USD9 325] + [25% x (USD62 000 – USD37 950)] = USD932.50 + USD4 293.75 + USD6 012.50 = USD11 238.75. Another individual who earns USD120 000 will be marginally taxed [10% x first USD9 325] + [15% x (USD37 950 – USD9 325] + [25% x (USD91 900 – USD37 950)] + [28% x (USD120 000 – USD91 900)] = USD932.50 + USD4 293.75 + USD13 487.50 + USD7 868 = USD26 581.75. Following this example, the single taxpayer who falls under the third marginal tax bracket will pay less tax than the single filer who falls in the fourth and higher bracket. Although both individuals fall in the third and fourth marginal brackets, they don't pay tax rates of 25% and 28%, respectively, due to the nature of the marginal tax calculation. If they paid their respective marginal tax rates, the first individual will pay 25% x USD62 000 = USD15 500 and the second will pay 28% x USD120 000 = USD33 600, which clearly is not the case. In effect, individual A in fact pays USD11 238.75/USD62 000 = 18.13% and the individual with the higher income pays USD26 581.75/USD120 000 = 22.15%. These rates are called the Effective Tax Rates, and represent the actual tax rate a household pays on income earned for the tax year. Filer Status:- The Dollar threshold for each tax rate is dependent upon the status of the filer, whether s/he is single, the head of a household, married filing separately, or married filing jointly. (i) Tax Rate – 10%, Single – ≤ USD9 325, Head Of Household – ≤ USD13 250, Married Filing Separately – ≤ USD9 275, and Married Filing Jointly – ≤ USD18 550; (ii) Tax Rate – 15%, Single – USD9 326–37 950, Head Of Household – USD13 251–50 400, Married Filing Separately – USD9 276–37 650, and Married Filing Jointly – USD18 551–75 300; (iii) Tax Rate – 25%, Single – USD37 951–91 900, Head Of Household – USD50 401–130 150, Married Filing Separately – USD37 651–75 950, and Married Filing Jointly – USD75 301–151 900; (iv) Tax Rate – 28%, Single – USD91 901–191 650, Head Of Household – USD130 151–210 800, Married Filing Separately – USD75 951–115 725, and Married Filing Jointly – USD151 901–231 450; (v) Tax Rate – 33%, Single – USD191 651–416 700, Head Of Household – USD210 801–413 350, Married Filing Separately – USD115 726–206 675, and Married Filing Jointly – USD231 451–413 350; (vi) Tax Rate – 35%, Single – USD416 701–418 400, Head Of Household – USD413 351–441 000, Married Filing Separately – USD206 676–233 475, and Married Filing Jointly – USD413 351–466 950; and (vii) Tax Rate – 39.60%, Single – > USD418 400, Head Of Household – > USD441 000, Married Filing Separately – > USD233 475, and Married Filing Jointly – > USD466 950. Corporate Tax Rates:- Companies are also required to pay a percentage of their profits as tax to the government to fund federal programs. As of 2017, the marginal corporate tax rates schedule is:- (i) Taxable Net Income From – USD0, But Not Over – USD50 000, Tax Rate – 15%; (ii) Taxable Net Income From – USD50 000, But Not Over – USD75 000, Tax Rate – 25%; (iii) Taxable Net Income From – USD75 000, But Not Over – USD100 000, Tax Rate – 34%; (iv) Taxable Net Income From – USD100 000, But Not Over – USD335 000, Tax Rate – 39%; (v) Taxable Net Income From – USD335 000, But Not Over – USD10 000 000, Tax Rate – 34%; (vi) Taxable Net Income From – USD10 000 000, But Not Over – USD15 000 000, Tax Rate – 35%; (vii) Taxable Net Income From – USD15 000 000, But Not Over – USD18 333 333, Tax Rate – 38%; and (viii) Taxable Net Income From – USD18 333 333, But Not Over – USD –, Tax Rate – 35%. A small business with a bottom line of USD100 000 at the end of its fiscal year will pay [15% x USD50 000] + [25% x (USD75 000 – USD50 000)] + [34% x (USD100 000 – USD75 000)] = USD7 500 + USD6 250 + USD8 500 = USD22 250. The business' effective tax rate is thus, USD22 250/USD100 000 = 22.25%. Other Tax Rates:- Tax rates don't only apply to earned income and corporate profits. Tax rates can also refer to other occasions where taxes are imposed, including sales tax on goods and services, real property tax, short-term capital gains tax, and long-term capital gains tax rate. When a consumer purchases certain goods and services from a retailer, a sales tax is applied to the sales price of the commodity at the point of sale. Since sales tax is governed by individual state governments, the sales tax rate will vary from state to state. For example, the sales tax rate in Georgia is 4%, while the tax rate in California is 7.5%, as of 2017. Not all states impose a sales tax rate though as can be seen in states such as Delaware and Oregon with 0% sales tax rate. Since additional income gained from investments are categorized as earnings, the government also applies tax rates on capital gains and dividends. When the value of an investment rises and the security is sold for a profit, the tax rate that the investor pays depends on how long s/he held the asset for. The tax rate on the capital gain of a short-term investment or an investment held for less than a year is equal to the investor's ordinary income tax. So, an individual who falls into the 25% marginal tax bracket will pay 25% on his or her short-term capital gains. The tax rate on profits from investments held longer than a year ranges from 0% to 20%, with individuals who fall in the 10% and 15% marginal bracket paying 0% taxes, and investors in the last bracket paying 20% tax rate on capital gains. Qualified dividends are subject to the same tax rate schedule that applies to long-term capital gains. Nonqualified dividends have the same tax rates as short-term capital gains. Tax rates vary from country to country. Some countries implement a progressive tax system, while others use regressive or proportional tax rates. A regressive tax schedule is one in which the tax rate increases as the taxable amount decreases. Countries such as Poland, Belgium, and Iceland use the regressive tax rates structure in which a larger percentage of tax is taken from low-income earners than from high-income earners. The proportional or flat tax rate system applies the same tax rates to all taxable amounts, that is irrespective of income levels. Russia, Hungary, and Saudi Arabia are examples of countries that have this system of taxes in place. / Налоговая Ставка, величина налога на единицу обложения (гектар (га) земли, Рубль дохода и другие). Выражает норму налогового изъятия (смотрите Налоги). Устанавливается государственными законодательными органами. По методам построения налоговой ставки различают:- твёрдые, пропорциональные, прогрессивные и регрессивные. Твёрдые Налоговые Ставки устанавливаются в абсолютных суммах на единицу (объект) обложения независимо от размеров доходов (применяются обычно при обложении небольших земельных участков). В бывшем Союзе Советских Социалистических Республик (СССР) применялись при взимании сельскохозяйственного налога с подсобных земельных участков колхозников. Пропорциональные Налоговые Ставки устанавливаются в одинаковом проценте с дохода независимо от его размера (в СССР, например, применялись при обложении подоходным налогом доходов потребительской кооперации). Прогрессивные Налоговые Ставки увеличиваются по мере роста размера облагаемого дохода. Различают простую и сложную (скользящую) прогрессию. При простой прогрессии налоговая ставка возрастает по мере роста облагаемого дохода и применяется ко всей сумме дохода (объекта обложения). При сложной прогрессии последняя возрастает только в части, превышающей предварительно установленную предыдущую ступень дохода. Прогрессивные ставки используются главным образом при взимании подоходного налога с населения в СССР и зарубежных странах. Регрессивные Налоговые Ставки понижаются по мере увеличения дохода. Регрессивность обложения резко проявляется в механизме косвенных налогов на предметы широкого потребления, существующих во всех капиталистических странах. Те или другие ставки применяются обычно при капитализме с целью создания определённых преимуществ для крупных фирм и корпораций.

TAX RECLAIMS = НАЛОГОВЫЕ ВОЗМЕЩЕНИЯ (или ВОЗВРАТЫ НАЛОГА) – Tax Reclaims:- service provided by global custodians involving reclaiming recoverable portions of taxes withheld from interest or dividend payments by foreign taxation authorities. Tax relief is governed by tax treaties between countries.

TAX REDUCTION = СНИЖЕНИЕ НАЛОГА – Tax Reduction:- lowering of income taxes authorized by the government to correct a mistake. / Уменьшение налогов на доходы, уполномоченное правительством с целью исправления ошибки.

TAX RISK = НАЛОГОВЫЙ РИСК – Tax Risk is the risk that the spread between the taxable and tax-exempt rate will change as a result of changes in income tax laws or other conditions.

THE TAYLOR RULE = ПРАВИЛО ТЭЙЛОРА – The Taylor Rule, named after the prominent economist John Taylor, is another guide to assessing the proper stance of monetary policy. It relates the setting of the federal funds rate to the primary objectives of monetary policy – that is, the extent to which inf lation may be departing from something approximating price stability and the extent to which output and employment may be departing from their maximum sustainable levels. For example, one version of the rule calls for the federal funds rate to be set equal to the rate thought to be consistent in the long run with the achievement of full employment and price stability plus a component based on the gap between current inflation and the inflation objective less a component based on the shortfall of actual output from the full-employment level. If inflation is picking up, the Taylor rule prescribes the amount by which the federal funds rate would need to be raised or, if output and employment are weakening, the amount by which it would need to be lowered. The specific parameters of the formula are set to describe actual monetary policy behavior over a period when policy is thought to have been fairly successful in achieving its basic goals. Although this guide has appeal, it too has shortcomings. The level of short-term interest rates associated with achieving longer-term goals, a key element in the formula, can vary over time in unpredictable ways. Moreover, the current rate of inflation and position of the economy in relation to full employment are not known because of data lags and difficulties in estimating the full-employment level of output, adding another layer of uncertainty about the appropriate setting of policy. / Дьжон Тэйлор (John Taylor). выработка (output).

TEA GOWN = ЧАЙНОЕ ПЛАТЬЕ (или ХХ) – Tea Gown:- a semiformal fancy gown in graceful flowing lines worn especially for afternoon entertaining at home.

TEAL = СИЗОЕ (или СИНЕ–ЗЕЛЁНОЕ, или ЧИРОК) – Teal:- teal blue.

TEAL BLUE = СИЗО–ГОЛУБОЕ (или ХХ) – Teal Blue:- a variable color averaging a dark greenish-blue.

TEAM = TECHNIQUES FOR EFFECTIVE ALCOHOL MANAGEMENT

TEAR = РВАТЬ(СЯ) (или РАЗДИРАТЬ, или РАЗЪЕДИНЯТЬ, или СООТНОШЕНИЕ ВЫХОДА ЛЕНТЫ И ОЧЁСА В ГРЕБНЕЧЕСАНИИ) – Tear is a percentage of tops to noils. A 4:1 tear would refer to wool that had 20% waste.

TEAR = РАЗРЫВ (или РАЗДИР) – (1) Tear:- usually the result of excessive strain or snagging on manufacturing machinery. Sewing Room Defects. / Порок или дефект швейного производства. Раздир (tear):- отверстие в фактуре ткани, в которой разъединены несколько нитей основы и утка или обоих.

(2) Tear:- results from machine malfunction or improper handling by operator. Machinery defects, and namely – Part Forming Machines. / Порок или дефект от машинного оборудования.

(3) Tears:- results from rough edges, corners protruding nails, screws, bolts, etc and/or careless handling. Machinery defects, and namely – Work Handling Equipment. / Порок или дефект от машинного оборудования.

TEAR DROPS = РАЗДВИЖКИ (или ВЫПАДЫ ПРИ РАЗРЫВЕ) – Tear Drops:- appearing in taffeta fabrics as short curved picks caused due to insufficient warp tension, incorrect heald timing, oversized warp and uneven penetration of sizing solution etc. Weaving

defect. Tear Drop:- in woven fabrics, short elliptical deviations of one or more adjoining picks. Synonym:- Teariness. / появление в ткани тафта . Порок или дефект ткачества. Раздвижка – порок ткани.

TEARINESS = НЕРОВНАЯ ПОВЕРХНОСТЬ – Teariness or Cannage:- short elliptical deviations of one or more adjoining picks, leading to local differences in light reflection in a fabric having a plain or other simple weave and a continuous-filament warp. Note:- this defect is often caused by the warp being too heavily sized, or the warp tension being too low during weaving, or by variations in the configuration of the weft yarns. See also Tear Drop. Fabrics defect. / Неровная Поверхность – порок ткани вследствие переклеенной основы.

TEAR STRENGTH = КРЕПОСТЬ НА РАЗРЫВ (или ПРОЧНОСТЬ НА РАЗРЫВ) – Tear Strength is the force necessary to tear a fabric, measured by the force necessary to start or continue a tear in a fabric. Expressed in pounds or in grams, the most commonly used method for determining the tear strength is the Elmendorf tear test procedure. Tear Strength is the force required to begin or to continue a tear in a fabric under specified conditions. / (Elmendorf).

TEAS = TRADEMARK ELECTRONIC APPLICATION SYSTEM

TEASE = РАСЩИПЫВАТЬ (или ЩИПАТЬ, или ВОРСИТЬ) – Tease:- to open and disentangle fibers prior to carding.

TEASEL = ВОРСИЛЬНАЯ ШИШКА (или ВОРСОВАЛЬНАЯ ШИШКА) – Teasel is a plant with a large prickly head (Dipsacus fullonum) used for raising or fulling fabric. The Trowbridge Museum has an excellent article showing teasels being used. Teasel is a plant with a prickly flower head. It is used for raising a nap on fabrics. See also Napping.

TEASEL BURR = РЕПЕЙ ВОРСЯНКИ (или ВОРСОВАЛЬНЫЙ НАКОНЕЧНИК, или ТУПАЯ КРЮЧКОВАТАЯ ИГОЛОЧКА ИГОЛЬЧАТОЙ ЛЕНТЫ) – Teasel Burr:- a mechanical substitute for the natural teasel in cloth-working. Many contrivances have been made for substituting metallic teasels mounted in self-acting machines. Cotton flannelette is a heavy, soft material that is given a napped or brushed finish. Napping is a finishing process that raises the fibers of a fabric to the surface by means of revolving cylinders covered with metal points or teasel burrs. See also Napping. Teasel Burr:- probably Dipsacus fullonum. Early agriculture was centered on dairy and grain. By 1850, the village and it's surrounding hamlets had grown in industry as well, producing wool cloth, mill machinery, carriages, sleighs, paper, bricks, ironwork and farm implements. The cultivation of the teasel, a natural burr used to raise the nap on woven wool, spurred the economy until the middle of the XX century. Teasel is the dried flower head or burr of the plant Dipsacus fullonum used for teaseling cloth. Skaneateles (Village of Skaneateles (Skan-ee-AT-les); New York (population:- 2 616) in SW Onondaga County) was once the 'teasel capital of the world'. The teasel plant is about 6 feet tall and is topped with a 4-inch conical head of burrs. The last crop of Oregon teasel was harvested in 1899 (by this time metal nappers had replaced teasel burrs in wool processing). / Репей или Шишка Ворсянки.

TECDAX® = ТЭКДАКС® – TecDAX® is an index reflecting the performance of the 30 largest technology shares (Technologieaktien, in German) of the Prime Standard ranking below the DAX® shares. The composition of the index is generally reviewed on a semiannual basis and adjusted in March and September. Criteria for weighting the shares in the TecDAX® are:- trading volume and market capitalization in terms of free float, as well as the company's position in the respective sector. / Тэхнологиакциэн (Technologieaktien).

TECHNICAL ANALYSIS = ТЕХНИЧЕСКИЙ АНАЛИЗ – Technical Analysis is the study of historical prices, examining patterns of price change, rates of change, and changes in volume of trading and open interest, in order to predict future price behavior. Technical analysis is usually performed in chart or graph form. In Technical Analysis, investors and analysts study charts of trading patterns and prices to predict changes in a security, commodity, currency or index. Technical Analysis helps investors predict the future price development of a stock based on historical price data such as price and trading volume. Instruments used in technical analysis include performance ratios such as market capitalization and volatility, as well as the beta factor and correlation coefficient of a stock with respect to a benchmark index. Chart analysis is the most important component of technical analysis. Factors other than fundamental or psychological ones, which influence futures price development used by chartists, e.g., moving averages, relative strength index, support and resistance lines, trend indicators. Technical Analysis is concerned with price data rather than economic factors, with a presumption that current prices already reflect supply and demand relationships. Price projections are made based on certain chart patterns. Market assessment based on the actual market and it mechanisms. A key component is chart reading, i.e. deriving future price movements from charts plotting historic price trends. Technical Analysis is the study of market action, usually with price charts, which includes volume and open interest patterns. An approach to forecasting commodity prices that examines patterns of price change, rates of change, and changes in volume of trading and open interest, and other statistical indicators without regard to underlying fundamental market conditions. Technical analysis can work consistently only if the theory that price movements are a Random Walk is incorrect. Also known as Chart Analysis, Market Analysis, Technicals, and Visual Analysis. See also Charting, and Fundamental Analysis. A method of analyzing historical price charts which also display indicators to manipulate the data. It is believed by technicians that observing past data, the future can be forecast. Technical Analysis is the attempt to forecast future market action on the basis of past price behaviour rather than economic factors, as are studied in Fundamental Analysis. The underlying assumptions are that price fluctuations are not strictly independent and that certain chart formations tend to correlate with subsequent price direction. Technical Analysis is the analysis based on movements in a market through chart study, moving averages, volume and other technical indicators. Technical Analysis is an estimation of future share prices based on the use of past share prices and/or trading volumes. Chartism is a form of technical analysis. Technical Analysis is the analysis concerned with price data rather than economic factors, as are studied in Fundamental Analysis. A term Technical Analysis refers to an analysis of the market based on technical aspects such as price chart formation, volume and open interest. Technical Analysis:- price forecasting that uses historical price and trading volume information in chart/graph formations. / Попытка прогнозирования ситуации на рынке фьючерсов на основе поведения прошлых цен, нежели экономических факторов, изучаемых в Фундаментальном Анализе. За основу оценки принимаются соответствующие предположения, что ценовые колебания не являются строго независимыми, и что определённые графические фигуры отражают взаимосвязь с последующим направлением цен. , например, . , то есть . флуктуации (колебания) цены . Больших приверженцев технического анализа на биржевом жаргоне именуют Технарями. Технический Анализ – анализ, основанный на поведении рынка и опирающийся на графики, скользящие средние показатели, объёмы заключаемых сделок и другие статистические данные. Технический Анализ рыночной конъюнктуры – исследование спроса и предложения ценных бумаг и товарно-сырьевой продукции, основанное на изучении объёма торгов и динамики цен. Технические аналитики используют графики или компьютерные программы для определения и прогнозирования ценовых тенденций на рынке по ценным бумагам или товарно-сырьевым фьючерсам. Большая часть анализа охватывает ближайшую и среднюю перспективу, но некоторые технические аналитики также прогнозируют долгосрочные циклы на основе графиков и иных данных. В отличие от Фундаментального Анализа (Fundamental Analysis) технический анализ не принимает во внимание финансового состояния компаний. TECHNICAL AND CLAUSES COMMITTEE = КОМИТЕТ ПО ТЕХНИЧЕСКИМ ВОПРОСАМ И ОГОВОРКАМ – Technical and Clauses Committee is a group of Lloyd's and company underwriters who meet to discuss, formulate and amend marine insurance clauses which are then recommended to the London market for general use. / Комитет По Техническим Вопросам И Оговоркам – группа Лойдз (Lloyd's) и .

TECHNICAL BARRIER TO TRADE = ТЕХНИЧЕСКИЙ БАРЬЕР ДЛЯ ТОРГОВЛИ – Technical Barrier To Trade is a specification that sets forth characteristics a product must meet in order to be imported. These characteristics include levels of quality, performance, and safety.

TECHNICAL CLOTH = ТЕХНИЧЕСКОЕ ПОЛОТНО (или ТЕХНИЧЕСКАЯ ТКАНЬ) – Technical Cloth is a kind of material which can be weaved from different types of thread. These include cotton, polyether, polyamide and other types of thread. Depending on this type of thread, a method of weaving and additional processing, the ready-made cloth can be used in a number of different industries. Food industry utilizes such cloth for filtration of juices and syrups; chemical industry makes use of the in filtration of solutions containing acids and alkalis, as well as a construction material in rubber products. These types of technical cloth have been widely used in medicine, metallurgy, petroleum industry, and ceramics. See also Fabric. / Техническая Ткань – текстильная ткань, используемая для изготовления деталей машин, установок, сооружений, а также различных технических изделий. Вырабатывается почти из всех видов волокон текстильных и нитей текстильных. В качестве технических тканей могут использоваться и некоторые бытовые ткани (например, марля, миткаль, саржа) для изготовления кальки, прокладок, чехлов и тому подобного. К техническим тканям обычно предъявляются повышенные требования по сравнению с бытовыми. Большинство технических тканей вырабатывают полотняным переплетением нитей (одно- и многослойным), так как оно обеспечивает наиболее прочную связь между основой и утком. В некоторых отраслях промышленности технические ткани заменяются синтетическими плёнками. Наибольшее распространение получили:- (i) Кордные, (ii) Ремнёвые, (iii) Транспортёрные, (iv) Рукавные, (v) Прессовые и (vi) Фильтровальные Ткани. (i) Кордная Прорезиненная Ткань используется для каркасов покрышек шин. Основные нити изготавливают из вискозных, полиамидных и полиэфирных комплексных нитей двойной крутки, в качестве утка применяется хлопчатобумажная пряжа. Плотность нитей по основе значительно больше (до 94 нитей на 100 миллиметров (мм)), чем по утку (до 30 на 100 мм). Разрывная нагрузка от 120 до 250 Ньютонов (Н) на 1 нить. Для защиты бортов покрышек от повреждения о закраины обода и для придания им жёсткости и прочности применяются ткани из хлопчатобумажной пряжи или мононитей. (ii и iii) Ремнёвые и Транспортёрные Ткани используются для изготовления конвейерных лент и приводных ремней. Плотность этих тканей по основе значительно больше, чем по утку (смотрите также Бельтинг). (iv) Рукавные Ткани применяют для передаточных устройств, работающих под давлением или разрежением (пожарные рукава и другие). Вырабатываются из льняных, хлопчатобумажных, комбинированных и синтетических нитей. Рукавные ткани образуют каркас рукава и обеспечивают прочность и стабильность размеров изделия. Изготавливаются на специальных круглых или плоских станках. Основные требование к рукавным тканям – равенство разрывных прочностей и удлинений по основе и по утку. Разрывная нагрузка этих тканей по основе и утку составляет от 1 250 до 5 000 Н на 50 мм. Иногда для изготовления рукавов используют так называемые Равнопрочные или Кордные Ткани. (v) Прессовые Ткани применяют для обтяжки отжимных валов на машинах полиграфической, текстильной и других отраслей промышленности, для прокладок прессов в маслобойной промышленности, для брошюровочно-переплётного производства и так далее. Изготавливают главным образом из шерстяной (технические сукна) или хлопчатобумажной пряжи. Имеют высокую прочность на истирание, гладкую поверхность и нормированную водопроницаемость. (vi) Фильтровальные Ткани служат для улавливания твёрдых частиц из жидкостей, газов и воздуха в химической, угольной, пищевой, целлюлозобумажной, медицинской и других отраслях промышленности. Изготовляются в основном из хлопка, шерсти, льна, асбеста, синтетических волокон и так далее. Разрывная нагрузка тканей должна соответствовать давлению фильтруемой жидкости или газа и поэтому колеблется в широких пределах (от 3 до 15 кН на 50 мм). Большое распространение получили фильтровальные ткани из синтетических волокон, которые обладают исключительной стойкостью к химическим реагентам (щелочам, кислотам, солям) и имеют большую разрывную нагрузку по сравнению с натуральными волокнами. Помимо перечисленных областей применения, технические ткани используют также для парашютов, оболочек надувных сооружений, тентов (смотрите Брезент), для гибких ограждений агрегатов на воздушной подушке, в качестве заменителей кожи (смотрите Кирза), для изготовления сит и тому подобного.

TECHNICAL CORRECTION = ТЕХНИЧЕСКАЯ КОРРЕКЦИЯ – Technical Correction is a price change against the trend. It is caused by such considerations as chart formations, volume, open interest, or delivery conditions, rather than by fundamental (supply/demand) reasons.

TECHNICAL DATA = ТЕХНИЧЕСКИЕ ДАННЫЕ – Technical Data:- the US Bureau of Export Administration (BXA) regulations define technical data as 'information of any kind that can be used, or adapted for use, in the design, manufacture, production, reconstruction or utilization of articles or materials. All software is technical data. Technical data can be either 'tangible' or 'intangible'. Models, blueprints, operating manuals (even if stored on recording media) or prototypes are examples of tangible technical data. Intangible technical data consists of technical services, such as training, oral advice, information guidance and consulting. / Руководство (Manual).

TECHNICAL DATA SHEET = ЛИСТ ТЕХНИЧЕСКИХ ДАННЫХ – A Technical Data Sheet (TDS) is used for both informational and advertising purposes. From an informational standpoint, a TDS has useful tips about product, such as how to use it, what it is made of, things to be wary of while using the product, and its official name and industry standard specifications. From a marketing standpoint, it may contain pictures and colorful illustrations as well as entire sections describing the benefits that the product will deliver to the end user. A TDS is not to be confused with a material safety data sheet (MSDS). The goal of the MSDS is to specifically inform the end user of any dangers that the product may present. This is not the goal of the TDS, although it may include several safety considerations. Furthermore, material safety data sheets must follow a set template guided by an industry standard, whereas a technical data sheet can be presented at the discretion of the product manufacturer and contain whatever information they deem suitable. Many countries mandate that a material or product have a MSDS; most do not require a TDS. See also Material Safety Data Sheet. / Лист Технических Данных. Смотрите также Лист Данных О Безопасности Материала (Material Safety Data Sheet).

TECHNICAL EXPERT GROUP = ТЕХНИЧЕСКАЯ ЭКСПЕРТНАЯ ГРУППА (или ГРУППА ТЕХНИЧЕСКИХ ЭКСПЕРТОВ) – Technical Expert Group (TEG) is the European Financial Reporting Advisory Group (EFRAG) – group of experts. It first met in September 2001– Chairman Johan van Helleman – The European Commission sits as an observer on the TEG. / Председатель Ёхан фан Хэлеман (Johan van Helleman).

TECHNICAL FACTORS = ТЕХНИЧЕСКИЕ ФАКТОРЫ – Technical Factors are the factors used in price forecasting such as open interest, volume of trading, degree of recent price movement, price chart formations, and the approach of the first delivery notice day.

TECHNICAL GRADE = ТЕХНИЧЕСКИЙ СОРТ – Technical Grade is a term applied to chemicals sold for general industrial purposes. Technical grade chemicals are usually somewhat less pure than 'reagent grade' or 'analytical grade' chemicals, and are much cheaper. Technical grade is now rather rare in small packages from laboratory chemical suppliers. Package sizes from industrial chemical vendors often range from about 25 kg or 50 pounds up to rail car lots. 'Tech' grade chemicals are very suitable for textile dyeing. See also Grades Of Chemicals.

TECHNICALLY JUSTIFIED = ТЕХНИЧЕСКИ ОБОСНОВАНО – Technically Justified:- justified on the basis of conclusions reached by using an appropriate pest risk analysis or, where applicable, another comparable examination and evaluation of available scientific information. / В области фитосанитарного контроля выражение 'Технически Обосновано' означает, что что-то было обосновано на основании выводов, полученных в результате соответствующего анализа риска проявления вредителя, или, если это подходит, другого сравнимого досмотра и оценивания имеющейся научной информации.

TECHNICAL PRICE MOVEMENTS = ТЕХНИЧЕСКИЕ ДВИЖЕНИЯ ЦЕН – Technical Price Movements is a change in prices resulting from conditions within the futures market not dependent on outside supply and demand factors. These conditions could include changes in degree of recent price movement, open interest, volume, and approach of contract expiry.

TECHNICAL RALLY = ТЕХНИЧЕСКОЕ ПОВЫШЕНИЕ – Technical Rally is a price movement attributed to conditions developing from within the futures market itself. These conditions include changes in open interest, volume and extent of recent price movement. / В техническом анализе биржевых рынков, Техническое Повышение – оживление на рынке; краткий подъём в ценах на ценных бумаги или товарно-сырьевые фьючерсы в рамках общей тенденции к спаду. Подобный подъём может возникнуть в результате того, что инвесторы ищут покупки по низкой цене или аналитики заметили наличие определённого уровня поддержки (support level), на котором падение котировок ценных бумаг обычно останавливается. Однако техническое повышение обычно бывает непродолжительным, и вскоре цены возвращаются к прежней тенденции к спаду.

TECHNICAL RALLY (OR DECLINE) = ТЕХНИЧЕСКОЕ ПОВЫШЕНИЕ (ИЛИ ПОНИЖЕНИЕ) – Technical Rally (Or Decline) is a price change led by technical market signals rather than supply and demand conditions.

TECHNICAL REACTION = ТЕХНИЧЕСКАЯ РЕАКЦИЯ – Technical Reaction:- trend reversal following a protracted and distinct market development, e.g., price setbacks after a prolonged bull market. / В техническом анализе биржевых рынков, , например, .

TECHNICAL RESEARCH = ТЕХНИЧЕСКОЕ ИССЛЕДОВАНИЕ – Technical Research:- analysis of the market and stocks based on supply and demand. The technician studies price movements, volume, trends and patterns, which are revealed by charting these factors, and attempts to assess the possible effects of current market action or future supply and demand for securities and individual issues. See also Fundamental Research.

TECHNICAL RESERVES = ТЕХНИЧЕСКИЕ РЕЗЕРВЫ – Thechnical Reserves consist of pre-paid premiums, reserves against outstanding claims, actuarial reserves for life insurance and reserves for with-profit insurance. They are treated in the economic accounts as the property of policy-holders. In insurance, reserves held by insurance companies to meet their obligations to the public. The change in reserves over a fiscal year measures the financing capacity of insurance companies. / В страховании, резервы, удерживаемые страховыми компаниями для удовлетворения их обязательств перед клиентами. Изменение объёма резервов за хозяйственный год отражает финансовую устойчивость страховых компаний.

TECHNICAL REVIEW BOARD = ПАЛАТА ТЕХНИЧЕСКОГО ОБОЗРЕВАНИЯ – The United States Patent and Trademark Office (USPTO) Technical Review Board (TRB) is an internal OCIO (short for the Office of the Chief Information Officer) group that reviews the information technology (IT) project development at critical stages for conformance with USPTO standards and guidance. Records Management and IT at USPTO fall under the purview of the Office of the Chief Information Officer, Office of Data Architecture and Services, Data Administration Division. Under this structure, the agency Records Officer and the Electronic Records Team Leader serve as consultants to the business units and the IT offices regarding the development of new electronic systems. They have no direct enforcement powers to approve or withhold approval of any USPTO automated information systems. Their Director, however, is able to enforce some level of compliance through the Technical Review Board upon which she sits and which governs the IT life cycle. The manager of the Division also enforces records management requirements through the Data Management Plan that all IT projects must prepare and adhere to through their life cycle.

TECHNICALS = ТЕХНИЧЕСКИЕ ФАКТОРЫ – Technicals:- factors other than fundamental or psychological ones, which influence futures price development used by chartists, e.g., trend indicators, moving averages, support and resistance lines, relative strength index. Short-term trends that technical analysts use to predict future price movements of securities and/or commodities. / Краткосрочные тенденции, которые используются специалистами технического анализа для предсказания будущих изменений цен на ценные бумаги и/или сырьё.

TECHNICAL SUPPORT STAFF = ПЕРСОНАЛ ТЕХНИЧЕСКОЙ ПОДДЕРЖКИ (или СОТРУДНИКИ ТЕХНИЧЕСКОЙ ПОДДЕРЖКИ) – Technical Support Staff (TSS) is the United States Patent and Trademark Office (USPTO) employees who support examination workflow processing.

TECHNOLOGY CENTER = ТЕХНОЛОГИЧЕСКИЙ ЦЕНТР (или ЦЕНТР ТЕХНОЛОГИЙ) – In the United States Patent and Trademark Office (USPTO), a Technology Center (or TC, also referred to as a Group) is a unit of several Group Art Units in the mechanical, electrical, chemical or design area, managed by one or more Group Directors. Formerly referred to as Groups. At the moment (in 2012) there are the following USPTO's TCs:- (i) Technology Center 1600:- Biotechnology and Organic Chemistry; (ii) Technology Center 1700:- Chemical & Materials Engineering; (iii) Technology Center 2100:- Computer Architecture and Software; (iv) Technology Center 2400:- Networking, Mulitplexing, Cable, and Security; (v) Technology Center 2600:- Communications; (vi) Technology Center 2800:- Semiconductors, Electrical and Optical Systems and Components; (vii) Technology Center 2900:- Designs; (viii) Technology Center 3600:- Transportation, Construction, Electronic Commerce, Agriculture, National Security, and License & Review; and (ix) Technology Center 3700:- Mechanical Engineering, Manufacturing, and Products & Designs. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

TECHNOLOGY SERVICE PROVIDER = ПОСТАВЩИК УСЛУГИ ТЕХНОЛОГИИ – Technology Service Provider (TSP):- TSP's provide technology support, Technology User Agreements (TUA), Roundup Ready Herbicide with PLANTSHIELD by Monsanto and cotton seed. You'll find a TSP at your local supplier of agricultural products, although not all suppliers are TSP's so check the website for a full list. / Монсэнто (Monsanto).

TECHNOLOGY TRANSFER = ПЕРЕДАЧА ТЕХНОЛОГИЙ – Technology Transfer:- this term is used to characterize 'the transfer of knowledge generated and developed in one place to another, where is it is used to achieve some practical end'. Technology may be transferred in many ways:- by giving it away (technical journals, conferences, emigration of technical experts, technical assistance

programs); by industrial espionage; or by sale (patents, blueprints, industrial processes, and the activities of multinational corporations). / Под Технологией понимается совокупность методов обработки, изготовления, изменения состояния, свойств, формы сырья, материала или полуфабриката, применяемых в процессе производства для получения готовой продукции; наука о способах воздействия на сырьё, материалы и полуфабрикаты соответствующими орудиями производства. Разработка технологии осуществляется по отраслям производства (технология машиностроения, приборостроения, строительного производства, производства обуви и так далее).

TECHNOLOGY USER AGREEMENT = СОГЛАШЕНИЕ С ПОЛЬЗОВАТЕЛЕМ ТЕХНОЛОГИИ – Technology User Agreement (TUA):- when you grow Bollgard 3, Bollgard II or Roundup Ready Flex Cotton, you must have a TUA. It is an agreement you have with Monsanto to grow Cotton using their genetic technology. / Монсэнто (Monsanto).

TECHNORA® = ТЭКНОРА® – Technora® fiber is a very strong para-aramid fiber ideal for dynamic performance applications involving significant motion. It is strong and light weight. Technora® is 8 times stronger than steel and 3 times stronger than fiberglass, polyester or nylon yarns. It shows little loss of strength even during repeated abrasion, flexing and stretching. Its molecular structure leads to a high modulus of elasticity, low creep and low stress relaxation, low thermal shrinkage and excellent dimensional stability. Technora® is highly resistant to acids, alkalis and organic solvents, and is not vulnerable to damage caused by steam or sea water. Technora® Fiber Properties:- (i) 8 times stronger than steel; (ii) abrasion resistant; (iii) low creep; (iv) low thermal shrinkage; (v) dimensional stability; (vi) resistant to acids, alkalis and organic solvents; (vii) does not degrade in sea water or steam; and (viii) thermal decomposition threshold of 932 °F. Technora® Fiber Applications:- (i) Industrial Rope and Cord; (ii) Parachute Cord; (iii) Aerospace Applications; (iv) Sports and Extreme Sports Rope and Cord; (v) Safety Rope; and (vi) Rescue Rope. / Найлан™ (Nylon™).

TECTORA = ТЭКТОРА (или ПОКРОВ) – Tectora (-um):- of roofs.

TEDDY = ТЭДИ (или НИЖНЕЕ БЕЛЬЁ КАК ОДНА ВЕЩЬ) – Teddy is a woman's one-piece undergarment, or chemise.

TED SPREAD = КУРСОВАЯ РАЗНИЦА ТЭД (или ТЭД СПРЭД) – TED Spread is the difference between the price of the three-month US Treasury Bill futures contract and the price of the three-month Eurodollar Time Deposit futures contract with the same expiration month. / Разница в ценах между фьючерсным контрактом на трёх-месячные Американские Казначейские Векселя (T от US Treasury Bill) и фьючерсным контрактом на трёх-месячные Евродолларовые Срочные Вклады (ED от Eurodollar Time Deposit) с одним и тем же месяцем прекращения признания. ТЭД Спрэд – разница между процентными ставками векселей Казначейства и Евродолларами. Термин ТЭД – сокращение названия Treasury over Eurodollars (Казначейки над Евродолларами). Многие биржевые брокеры на фьючерсных рынках активно используют ТЭД спрэд, учитывая, что разница между казначейками и Евродолларами будет расширяться или сужаться. ТЭД Спрэд также используется как показатель доверия к правительству США и общего уровня доверия к частным средствам финансирования на рынках. Узкий спрэд показывает доверие к финансовым рынкам вообще и к рынку правительственных бумаг в частности. Когда спрэд широкий, доверие уменьшается. Смотрите также Flight Of Quality.

T/E ENTRY = TRANSPORTATION AND EXPORTATION ENTRY

TEETH = ЗУБЬЯ – Teeth are sharp, pointed triangular structures arising on leaf margins.

TEFAP = TEMPORARY EMERGENCY FOOD ASSISTANCE PROGRAM

TEFILLIN = ТФИЛЛИН (или ТЭФИЛИН, или ФИЛАКТЕРИЯ) – Tefillin:- the phylacteries worn by Jews. In Jewish religious practice, one of two small, black leather, cube-shaped cases containing Torah texts written on parchment. / Тфиллин:- две коробочки из выкрашенной чёрной краской кожи, в которые кладут пергаментные листки с определёнными отрывками из Пятикнижия. Элемент молитвенного облачения мужчин-Иудеев, предназначенный для ношения во время утренних молитв:- одна коробочка прикрепляется к руке выше локтя, другая – над линией волос, между глаз.

TEFLON® = ТЭФЛОН® (или ТЕФЛОН®) – Teflon® is the registered trade name of the highly useful plastic material polytetrafluoroethylene (PTFE). PTFE is one of a class of plastics known as Fluoropolymers. A polymer is a compound formed by a chemical reaction which combines particles into groups of repeating large molecules. Many common synthetic fibers are polymers, such as polyester and nylon. PTFE is the polymerized form of tetrafluoroethylene. PTFE has many unique properties, which make it valuable in scores of applications. It has a very high melting point, and is also stable at very low temperatures. It can be dissolved by nothing but hot fluorine gas or certain molten metals, so it is extremely resistant to corrosion. It is also very slick and slippery. This makes it an excellent material for coating machine parts which are subjected to heat, wear, and friction, for laboratory equipment which must resist corrosive chemicals, and as a coating for cookware and utensils. PTFE is used to impart stain-resistance to fabrics, carpets, and wall coverings, and as weatherproofing on outdoor signs. PTIZE has low electrical conductivity, so it makes a good electrical insulator. It is used to insulate much data communication cable, and it is essential to the manufacture of semi-conductors. PTFE is also found in a variety of medical applications, such as in vascular grafts. A fiberglass fabric with PTFE coating serves to protect the roofs of airports and stadiums. PTFE can even be incorporated into fiber for weaving socks. The low friction of the PTFE makes the socks exceptionally smooth, protecting feet from blisters. PTFE was discovered accidentally in 1938 by a young scientist looking for something else. Roy Plunkett was a chemist for E.I. du Pont de Nemours and Company (Du Pont). He had earned a PhD from Ohio State University in 1936, and in 1938 when he stumbled upon Teflon®, he was still only 27 years old. Plunkett's area was refrigerants. Many chemicals that were used as refrigerants before the 1930s were dangerously explosive. Du Pont and General Motors had developed a new type of non-flammable refrigerant, a form of Freon called refrigerant 114. Refrigerant 114 was tied up in an exclusive arrangement with General Motor's Frigidaire division, and at the time could not be marketed to other manufacturers. Plunkett endeavored to come up with a different form of refrigerant 114 that would get around Frigidaire's patent control. The technical name for refrigerant 114 was tetrafluorodichloroethane. Plunkett hoped to make a similar refrigerant by reacting hydrochloric acid with a compound called Tetrafluoroethylene, or TFE. TFE itself was a little known substance, and Plunkett decided his first task was to make a large amount of this gas. The chemist thought he might as well make a hundred pounds of the gas, to be sure to have enough for all his chemical tests, and for toxicological tests as well. He stored the gas in metal cans with a valve release, much like the cans used commercially today for pressurized sprays like hair spray. Plunkett kept the cans on dry ice, to cool and liquefy the TFE gas. His refrigerant experiment required Plunkett and his assistant to release the TFE gas from the cans into a heated chamber. On the morning of April 06, 1938, Plunkett found he could not get the gas out of the can. To Plunkett and his assistant's mystification, the gas had transformed overnight into a white, flaky powder. The TFE had polymerized. Polymerization is a chemical process in which molecules combine into long strings. One of the best known polymers is nylon, which was also discovered by researchers at Du Pont. Polymer science was still in its infancy in the 1930s. Plunkett believed that TFE could not polymerize, and yet it had somehow done so. He sent the strange white flakes to Du Pont's Central Research Department, where teams of chemists analyzed the stuff. The polymerized TFE was curiously inert. It did not react with any other chemicals, it resisted electric currents, and it was extremely smooth and slick. Plunkett was able to figure out how the TFE gas had accidentally polymerized, and he took out a patent for the polymerized substance,

polytetrafluoroethylene, or PTFE. PTFE was initially expensive to produce, and its value was not clear to Plunkett or the other scientists at Du Pont. But it came into use in World War II, during the development of the atomic bomb. Making the bomb required scientists to handle large amounts of the caustic and toxic substance uranium hexafluoride. Du Pont provided PTFE-coated gaskets and liners that resisted the extreme corrosive action of uranium hexafluoride. Du Pont also used PTFE during the war for making nose cones of certain other bombs. Du Pont registered the trademark name Teflon® for its patented substance in 1944, and continued to work after the war on cheaper and more effective manufacturing techniques. Du Pont built its first plant for the production of Teflon® in Parkersburg, West Virginia in 1950. The company marketed Teflon after the war's end as a coating for machined metal parts. In the 1960s, Du Pont began marketing cookware coated with Teflon®. The slick Teflon® coating resisted the stickiness of even scorched food, so cleaning the pans was easy. The company marketed Teflon® for a variety of other uses as well. Other related fluoropolymers were developed and marketed in ensuing decades, some of which were easier to process than PTFE. Du Pont registered another variant of Teflon® in 1985, Teflon AF, which is soluble in special solvents. Teflon® Fiber:- Teflon® PTFE (short for the polytetrafluoroethylene) fluoropolymer fiber is the most chemically resistant fiber known. It is inert to powerful oxidizing agents, boiling sulfuric acid, fuming nitric acid, boiling aqua regia, and boiling sodium hydroxide. Teflon® fiber does not degrade at continuous temperature exposures below 400 °F. At extremely low temperatures Teflon® fiber becomes less ductile, but it can be used at temperatures as low as –450 °F. Teflon® Fiber has outstanding sunlight and weather resistance, and is one of the most non-flammable organic fibers available. Fibers do not melt or drip. Teflon® Fiber Properties:- (i) excellent chemical resistance; (ii) inert to powerful oxidizing agents; (iii) non-flammable; (iv) outstanding Sunlight resistance; (v) weather resistance; (vi) does not degrade at temperatures below 400 °F; (vii) can be used at extremely low temperatures; (viii) fibers do not melt or drip; and (ix) non-stick surface. Teflon® Fiber Applications:- (i) Aerospace & Aviation applications; (ii) Chemical & Oil Applications; (iii) Industrial Rope & Cord; (iii) Lacing Cords; (iv) Binders; and (v) Tie-downs. / Найлан™ (Nylon™). Тэфлон® (Teflon®). Рой Планкэт (Roy Plunkett). И.Ай. дю По дё Номур энд Кампэни (E.I. du Pont de Nemours and Company) (Дю По (Du Pont)). Дьженерэл Мотоз Фридьжидэа подразделение (General Motor's Frigidaire division). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

TEFRA = TAX EQUITY AND FISCAL RESPONSIBILITY ACT OF 1983

TEG = TECHNICAL EXPERT GROUP

TEGMEN = ТЕГМЕН (или ПОКРОВ, или ВНУТРЕННЯЯ ОБОЛОЧКА СЕМЕНИ) – Tegmen is a covering or integument, such as the tough, leathery forewing of certain Insects or the inner coat of a seed. Tegmen (syn. Seed Coat):- the two layers of cells lying next to the pericarp, representing the inner cell layers of the inner integuments of the ovule. The tegmen is often mistermed as testa which is derived from the outer integuments of the ovule and which is destroyed before the caryopsis ripens. / Тегмен – склеротизированное переднее крыло у Прямокрылых и Уховёрток.

TEGMEN LAYER = СЛОЙ ВНУТРЕННЕЙ ОБОЛОЧКИ СЕМЕНИ – Tegmen Layer:- two layers of cells next to the pericarp of a seed which represent the inner cell layers of the inner integuments of the ovule. The tegmen is often mis-termed as testa which is derived from the outer integuments in the ovule and which is destroyed before the caryopsis ripens.

TELEBANKING = ДИСТАНЦИОННОЕ БАНКОВСКОЕ ОБСЛУЖИВАНИЕ (или БАНКОВСКОЕ ОБСЛУЖИВАНИЕ НА ОТДАЛЕНИИ) – With Telebanking you are independent of time and place. You also have a better overview and better control of your finances. Bank in not only closer than ever before, but is also open longer, continuing to serve you outside office hours and on public holidays. So you can carry out your banking business whenever you want, at a time that suits you. Who can benefit from telebanking? For example, in Switzerland all holders of an account or custody account at the bank (except, for legal reasons, clients from the following countries:- Australia, Canada, Japan, New Zealand, Singapore, and the United States (as at 1999-April-06)). What telebanking can offer you? (i) Account information:- (a) overview of account balances (shown individually or in cumulative form); (b) last 30 to 100 accounts movements; and (c) detailed account statement. (ii) Payment transactions:- (a) domestic and foreign payments in national and foreign currencies; (b) enter and manage standing orders; (c) approve collective payments of all types (including salary payments); (d) account transfers; and (e) call up pending payments and check payments carried out. (iii) Investment business:- (a) issue, call up and cancel securities orders; (b) call up custody account information; and (c) call up asset information. (iv) Prices/rates and financial information:- (a) call up current stock market prices (slight time lag) free of charge via your bank Quotes (e.g., UBS Quotes) and personal stock exchange lists; (b) Limit-Minder by e-mail or SMS; (c) call up current foreign exchange rates via your bank Quotes (e.g., UBS Quotes); and (d) call up financial information. File transfer:- (a) call up account/custody account and asset information by file transfer; and (b) transmit payments in data carrier exchange format to your bank. Message service:- send messages to your bank or to your own customer advisor. Why telebanking is so secure? Telebanking offers you comprehensive security. A three-tier security system operates for identifying yourself. It consists of:- (i) contract number; (ii) personal password; and (iii) scratchlist number. In many telebanking data exchanges protection from unauthorized access is also provided by 128-bit-SSL-encryption software offering the following advantages:- (i) it encrypts your data on its journey to your bank and back using the very latest technology; and (ii) it ensures that confidential data cannot be read or interfered with by third parties during transmission. How UBS Telebanking helps you save money:- there's only one thing you can't afford to do and that is do without UBS Telebanking. UBS Telebanking offers not only convenience but also firm financial benefits:- (i) with the UBS personal account the annual account maintenance charge of CHF48 does not apply if you use UBS Telebanking; (ii) domestic payments in CHF from your UBS personal account or your UBS personal current account for private clients, and standing orders, are free of charge (charges are levied for payments/standing orders from the UBS savings account); (iii) you receive a 50% discount on foreign currency payment and foreign payment orders; (iv) when you place stock market orders, you receive a 10% discount on the brokerage fees; (v) to save you unnecessary connection costs, UBS Telebanking offers you an exclusive payment software package free of charge:- 'UBS Pay'. This enables you to enter and manage all your payments off-line on your PC and you only need to go on-line when you want to transmit the payments. What you need to get started with UBS Telebanking:- to take advantage of the many benefits of UBS Telebanking, you need:- (i) an account with UBS; (ii) a UBS 24h-Banking contract (free of charge). This contains regulations governing access and powers of attorney. Once the contract has been signed, you will receive your legitimation features:- contract number, personal password and personal scratch-list. System requirements for UBS Telebanking:- (i) for PC:- (a) Windows XP or higher; and (b) minimum 32 MB RAM; (ii) for Macintosh:- (a) Power PC or 68 K PC; (b) operating system 8.0 or higher; and (c) minimum 32 MB RAM; (iii) Browser:- UBS recommends MS IE 8; and (iv) Internet access:- any provider. Efficient means of settling bank transactions using a direct modem link from the customer's personal computer to the bank via Internet or via the online service. The transactions and services covered by telebanking include account information, entering stock market and payments orders, information on investment recommendations, economic reports and current prices. Also known as Homebanking. See also Electronic Banking. / Дистанционное Банковское Облсуживание или Банковское Обслуживание На Отдалении:- . Ю.Би.Эс. (UBS). С разработкой и внедрением в жизнь полупроводников, а также развитием связи и Интернета практически все крупные банки стали предлагать своим клиентам услугу, доступа к банковскому счёту на круглосуточной основе в режиме реального времени с помощью Интернета или связи. Данная услуга позволяет клиентам

банков получать информацию о состоянии своих банковских счетов и движении денежных средств по ним, а также совершать необходимые операции с хранящимися на них финансами, например, переводы или конвертирование валюты, не посещая при этом сам банк. Для того, чтобы воспользоваться данной услугой банка клиент должен иметь компьютер, имеющий доступ в Интернет, или мобильный телефон, поддерживающий Интернет-соединение. Первоначально системы Банк-Клиент требовали установки специального программного обеспечения в компьютер клиента. В настоящее время это практически нигде не требуется, вместо этого стали использоваться уникальное имя клиента с утверждённым для него паролем доступа и сеансовые ключи. Безопасность соединения обеспечивается современными средствами защиты банка, соответствующими мировым стандартам. Однако у этой услуги могут быть и свои недостатки, например, некоторые банки с целью снижения рисков устанавливают ограничения на перечисление денежных средств с использованием данной услуги. Кроме того, если клиент отдаёт своё распоряжение банку в нерабочий банковский день (например, праздничный или выходной), то банк вправе исполнить его в первый рабочий банковский день. Дистанционное банковское обслуживание может быть доступно клиенту банка только после подписания соответствующего соглашения.

TELEGRAPHIC TRANSFER = ТЕЛЕГРАФНЫЙ ПЕРЕВОД – Telegraphic Transfer (T/T) refers to an electronic wire transfer, usually in connection with payment in advance or payment by open account.

TELEMOTOR = ДВИГАТЕЛЬ С ДИСТАНЦИОННЫМ УПРАВЛЕНИЕМ (или ТЕЛЕМОТОР) – Telemotor is a machinery which operates the steering system of a ship. / Механизм, который приводит в движение систему управления рулём корабля.

TELEPHONE TRADING = ТОРГОВЛЯ ПО ТЕЛЕФОНУ (или ТОРГОВЛЯ С ПОМОЩЬЮ ТЕЛЕФОНА) – Telephone Trading:- off-exchange interbank trading by telephone in securities, currencies or precious metals. OTC trading is goverened by securities trading rules, but not statutory regulatory and supervisory rules. Participants follow generally accepted trade practices.

TELESCOPE CARTON = ТЕЛЕСКОПИЧЕСКИЙ КОРОБ – Telescope Carton:- the top of telescope cartons is fabricated as a separate part and overlaps all four sides of the carton, e.g., banana boxes.

TELETYPEWRITER = ТЕЛЕТАЙПНОЕ ЗАПИСЫВАЮЩЕЕ УСТРОЙСТВО – A Teletypewriter (TTY) is an input device that allows alphanumeric character to be typed in and sent, usually one at a time as they are typed, to a computer or a printer. The Teletype Corporation developed the teletypewriter, which was an early interface to computers. Teletype mode is the capability of a keyboard, computer, application, printer, display, or modem to handle teletypewriter input and output. Basically, this is a one-character-at-a-time mode of sending, receiving, or handling data, although it is often modified to handle a line of characters at a time. Since this mode requires little programming logic, it is often used where memory is limited. The Basic Input/Output Operating System (BIOS) sends messages to a PC display using teletype mode. Most printers offer a teletype mode. The simplest video display output format is text in teletype mode. Many modems today continue to include support for a TTY interface. Teletypewriter (TTY):- also known as a TDD (Telecommunications Device for the Deaf). TTY stands for Text Telephone (or Teletypewriter for the Deaf). It is also sometimes called a TDD, or Telecommunication Device for the Deaf. TTY is the more widely accepted term, however, as TTYs are used by many people, not just people who are deaf. A TTY is a special device that lets people who are deaf, hard of hearing, or speech-impaired use the telephone to communicate, by allowing them to type messages back and forth to one another instead of talking and listening. A TTY is required at both ends of the conversation in order to communicate. To use a TTY, you set a telephone handset onto special acoustic cups built into the TTY (some TTY models can be plugged directly into a telephone line). Then, type the message you want to send on the TTY's keyboard. As you type, the message is sent over the phone line, just like your voice would be sent over the phone line if you talked. You can read the other person's response on the TTY's text display. If you don't have a TTY, you can still call a person who is deaf, hard of hearing, or speech-impaired by using the Telecommunications Relay Service (TRS). With TRS, a special operator types whatever you say so that the person you are calling can read your words on his or her TTY display. He or she will type back a response, which the TRS operator will read aloud for you to hear over the phone. Toll free TRS services are available 24 hours a day, 365 days a year. A TTY (Teletypewriter) is a communication device used by people who are hard of hearing or have speech impairment. TTY (Teletypewriter) does not work from mobile to mobile. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

TELEX = ТЕЛЕКС – Telex:- used for sending messages to outside companies. Messages are transmitted via ITT (short for the International Telephone and Telegraph), RCA (short for the Radio Corporation of America) and Western Union. Being replaced by fax and internet. System of telegraphy in which printed messages or signals are sent from and to teleprinters connected to a public telecommunication network. By 1935, message routing was the last great barrier to full automation. Large telegraphy providers began to develop systems that used telephone-like rotary dialing to connect teletypes. These machines were called 'Telex' (TELegraph EXchange). Telex machines first performed rotary-telephone-style pulse dialing for circuit switching, and then sent data by Baudot code. This 'type A' Telex routing functionally automated message routing. The first wide-coverage Telex network was implemented in Germany during the 1930s as a network used to communicate within the government. At the rate of 45.45 (±0.5%) baud – considered speedy at the time – up to 25 telex channels could share a single long-distance telephone channel by using voice frequency telegraphy multiplexing, making telex the least expensive method of reliable long-distance communication. Canada-wide automatic teleprinter exchange service was introduced by the CPR Telegraph Company and CN Telegraph in July 1957 (the two companies, operated by rivals Canadian National Railway and Canadian Pacific Railway, would join to form CNCP Telecommunications in 1967). This service supplemented the existing international Telex service that was put in place in November 1956. Canadian Telex customers could connect with nineteen European countries in addition to eighteen Latin American, African, and trans-Pacific countries. The major exchanges were located in Montreal (01), Toronto (02), and Winnipeg (03). In 1958, Western Union started to build a Telex network in the United States. This Telex network started as a satellite exchange located in New York City and expanded to a nationwide network. Western Union chose Siemens & Halske AG, now Siemens AG, and ITT to supply the exchange equipment, provisioned the exchange trunks via the Western Union national microwave system and leased the exchange to customer site facilities from the local telephone company. Teleprinter equipment was originally provided by Siemens & Halske AG and later by Teletype Corporation. Initial direct International Telex service was offered by Western Union, via W.U. International, in the summer of 1960 with limited service to London and Paris. In 1962, the major exchanges were located in New York City (1), Chicago (2), San Francisco (3), Kansas City (4) and Atlanta (5). The Telex network expanded by adding the final parent exchanges cities of Los Angeles (6), Dallas (7), Philadelphia (8) and Boston (9) starting in 1966. The Telex numbering plan, usually a six-digit number in the United States, was based on the major exchange where the customer's Telex machine terminated. For example, all Telex customers that terminated in the New York City exchange were assigned a Telex number that started with a first digit '1'. Further, all Chicago based customers had Telex numbers that started with a first digit of '2'. This numbering plan was maintained by Western Union as the Telex exchanges proliferated to smaller cities in the United States. The Western Union Telex network was built on three levels of exchanges. The highest level was made up of the nine exchange cities previously mentioned. Each of these cities had the dual capability of terminating both Telex customer lines and setting up trunk connections to multiple distant Telex exchanges. The second level of exchanges, located in large cities such as

Buffalo, Cleveland, Miami, Newark, Pittsburgh and Seattle, were similar to the highest level of exchanges in capability of terminating Telex customer lines and setting up trunk connections. However, these second level exchanges had a smaller customer line capacity and only had trunk circuits to regional cities. The third level of exchanges, located in small to medium sized cities, could terminate Telex customer lines and had a single trunk group running to its parent exchange. Loop signaling was offered in two different configurations for Western Union Telex in the United States. The first option, sometimes called Local or Loop Service, provided a 60 milliAmpere loop circuit from the exchange to the customer teleprinter. The second option, sometimes called Long Distance or Polar was used when a 60 milliAmpere connection could not be achieved, provided a ground return polar circuit using 35 milliAmperes on separate send and receive wires. By the 1970s, and under pressure from the Bell operating companies wanting to modernize their cable plant and lower the adjacent circuit noise that these Telex circuits sometimes caused, Western Union migrated customers to a third option called F1F2. This F1F2 option replaced the DC Voltage of the local and long distance options with modems at the exchange and subscriber ends of the Telex circuit. Western Union offered connections from Telex to the AT&T Teletypewriter eXchange (TWX) system in May 1966 via its New York Information Services Computer Center. These connections were limited to those TWX machines that were equipped with automatic answerback capability per CCITT standard. In 1970, Cuba and Pakistan were still running 45.5 baud type A Telex. Telex is still widely used in some developing countries' bureaucracies, probably because of its reliability and low cost. The UN asserted at one time that more political entities were reliably available by Telex than by any other single method. Around 1960, some nations began to use the 'figures' Baudot codes to perform 'Type B' Telex routing. Telex grew around the world very rapidly. Long before automatic telephony was available, most countries, even in central Africa and Asia, had at least a few high-frequency (shortwave) Telex links. Often these radio links were first established by government postal and telegraph services (PTTs). The most common radio standard, CCITT R.44 had error-corrected retransmitting time-division multiplexing of radio channels. Most impoverished PTTs operated their Telex-on-radio (TOR) channels non-stop, to get the maximum value from them. The cost of TOR equipment has continued to fall. Although initially specialised equipment was required, many amateur radio operators now operate TOR (also known as RTTY) with special software and inexpensive hardware to adapt computer sound cards to short-wave radios. Modern 'cablegrams' or 'telegrams' actually operate over dedicated Telex networks, using TOR whenever required. / Вэстён Юнион (Western Union) выбрал Зимэнс Унд Хальскэ А.Ге. (Siemens & Halske AG), ныне Зимэнс А.Ге. (Siemens AG), и Ай.Ти.Ти. (ITT) . Тэлэтайп Корпорэйшэн (Teletype Corporation). ДаблЮ.Ю. Интёнэшэнэл (W.U. International). телепринтеров, подключённых к публичной сети дальней связи. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Под Телексом, сокращённым словосочетанием от Английских слов Тэлеграф (Telegraph) (Tel), означающее Телеграфная Связь, и Exchange (Ex), означающее Коммутатор, понимается международная коммутируемая сеть абонентского телеграфирования, оборудованная автоматическими телеграфными станциями и предназначенная для ведения документальных переговоров. В середине 1980-х телекс объединял национальные телеграфные сети около 150 стран. На наиболее ответственных участках телекса использовались каналы частотного телеграфирования.

TELOMERE = ТЕЛОМЕРА – Telomere is a terminal region of chromosomes characterized by repeated DNA sequences. / Теломера – конец хромосомы, лежащий дистально от центромеры. Под Теломерой, от Греческих слов Télos, означающе Конец, и Méros, означающее Доля или Часть, понимается концевой участок (сегмент) хромосомы. При разрывах хромосом (например, под действием ионизирующих излучений) отдельные их фрагменты могут вновь воссоединяться, но никогда не соединяются по теломерам. Следовательно, теломеры препятствуют присоединению других участков хромосом.

TELOTRISOMIC = ТЕЛОТРИСОМИК – Telotrisomic is a trisomic in which the extra chromosome has only one arm.

TEL QUEL BASIS = БАЗИС ТЭЛЬ КЕЛЬ (или БАЗИС ПО ФАКТУ, или БАЗИС КАК ЕСТЬ, или БАЗИС ХХ) – (1) Tel Quel Basis is the weight of sugar, regardless of its sucrose content (measured by polarisation). According with this clause the cargo is sold on 'as is' basis. Tel Quel (translated into English as, variously:- 'as is', 'as such', or 'unchanged') was a French avant-garde literary magazine published between 1960 and 1982. (2) Tel Quel Rate or Tale Quale rate. In foreign exchange dealings a tel quel or tale quale rate is a net rate. It includes commission, brokerage, or in brief, every charge, so that the rate is the total rate or price, to which there can be no addition of any kind.

TEMPERATE = УМЕРЕННОЕ – Temperate:- a climatic zone between boreal and tropical. Regions between the tropic of Cancer and the Artic Circle or the tropic of Capricorn and the Antarctic Circle. / Под Умеренными Поясами понимаются природные пояса Земли между 40 и 65° Северных широт и 42 и 58° Южных широт. В Северном полушарии свыше половины поверхности умеренного пояса занимает суша, в Южном – 98% территории покрыто морем. Характерна чёткая сезонность термического режима с образованием на суше снежного покрова и значительным ослаблением или прекращением зимой вегетации растений. В естественных ландшафтах умеренных поясов в Евразии с Севера на Юг последовательно сменяются хвойные, смешанные и широколиственные леса, лесостепи, степи, полупустыни и пустыни. В умеренном поясе находится большая часть России.

TEMPERATURE = ТЕМПЕРАТУРА – Temperature:- the Kelvin is the base unit for thermodynamic temperature and has wide scientific application but for practical purposes the degree Celsius is the unit in everyday use. The Kelvin and the degree Celsius represent the same interval of temperature, but zero on the Kelvin scale is at –273.15 °C. / Под Температурой, от Латинского слова Temperatura, означающее Надлежащее Смешение или Нормальное Состояние или Соразмерность, понимается физическая величина, характеризующая состояние термодинамического равновесия системы. Температура всех частей изолированной системы, находящейся в равновесии, одинакова. Если система не находится в равновесии, то между её частями, имеющими различную температуру, происходит теплообмен. Более высокой температурой обладают те тела, у которых средняя кинетическая энергия молекул, атомов выше. Измеряют температуру термометрами на основе зависимости какого-либо свойства тела (объёма, электрического сопротивления и тому подобного) от температуры. Теоретически температура определяется на основе второго начала термодинамики как производная от энергии тела по его энтропии. Так определяемая температура всегда положительная, её называют абсолютной температурой или температурой по термодинамической температурной шкале (обозначается Т). За единицу абсолютной температуры в СИ принят Кельвин (К). значения температуры по шкале Цельсия (t, °C) связаны с абсолютной температурой соотношением t = T – 273.5 K (1 °C = 1 K). Температура – физическая величина, характеризующая состояние термодинамического равновесия макроскопической системы. Температура одинакова для всех частей изолированной системы, находящейся в термодинамическом равновесии. Если изолированная система не находится в равновесии, то с течением времени переход энергии (теплопередача) от более нагретых частей системы к менее нагретым приводит к выравниванию температуры во всей системе (первый постулат, или нулевое начало термодинамики). Температура определяет:- распределение образующих систему частиц по уровням энергии (смотрите Статистика Больцмана) и распределение частиц по скоростям (смотрите Распределение Максвелла); степень ионизации вещества (смотрите Формула Саха); свойства равновесного электромагнитного излучения тел – спектральную плотность излучения (смотрите Закон Излучения Планка), полную объёмную плотность излучения (смотрите Закон Излучения Стефана-Больцмана) и так далее. Температуру, входящую в качестве параметра в распределение Больцмана, часто называют Температурой Возбуждения, в распределение Максвелла – Кинетической Температурой, в Формулу Саха – Ионизационной

Температурой, в Закон Стефана-Больцмана – Радиационной Температурой. Поскольку для системы, находящейся в термодинамическом равновесии, все эти параметры равны друг другу, их называют просто Температурой Системы. В кинетической теории газов и других разделах статистической механики температура количественно определяется так, что средняя кинетическая энергия поступательного движения частицы (обладающей тремя степенями свободы) равна 3/2 kT, где k – Постоянная Больцмана, T – температура тела. В общем случае температура определяется как производная от энергии тела в целом по его энтропии. Такая температура всегда положительна (поскольку кинетическая энергия положительна), её называют Абсолютной Температурой или Температурой По Термодинамической Температурной Шкале. За единицу абсолютной температуры в Международной Системе Единиц (СИ) принят Кельвин (К). Часто температуру измеряют по Шкале Цельсия (t), значения t связаны с T равенством t = T – 273.15 K (градус Цельсия равен Кельвину). Методы измерения температуры рассмотрены в статьях Термометрия, Термометр. Строго определённой температурой характеризуется лишь равновесное состояние тел. Существуют, однако, системы, состояние которых можно приближённо охарактеризовать несколькими не равными друг другу температурами. Например, в плазме, состоящей из лёгких (электроны) и тяжёлых (ионы) заряженных частиц, при столкновении частиц энергия быстро передаётся от электронов к электронам и от ионов к ионам, но медленно от электронов к ионам и обратно. Существуют состояния плазмы, в которых системы электронов и ионов в отдельности близки к равновесию, и можно ввести температуру электронов $T_э$ и температуру ионов $T_и$, не совпадающие между собой. В телах, частицы которых обладают магнитным моментом, энергия обычно медленно передаётся от поступательных к магнитным степеням свободы, связанным с возможностью изменения направления магнитного момента. Благодаря этому существуют состояния, в которых система магнитных моментов характеризуется температура, не совпадающей с кинетической температурой, соответствующей поступательному движению частиц. Магнитная температура определяет магнитную часть внутренней энергии и может быть как положительной, так и отрицательной (смотрите Отрицательная Температура). В процессе выравнивания температуры энергия передаётся от частиц (степеней свободы) с большей температурой к частицам (степеням свободы) с меньшей температурой, если они одновременно положительны или отрицательны, но в обратном направлении, если одна из них положительна, а другая отрицательна. В этом смысле отрицательная температура 'выше' любой положительной. Понятие Температура применяют также для характеристики неравновесных систем (смотрите Термодинамика Неравновесных Процессов). Например, яркость небесных тел характеризуют Яркостной Температурой, спектральный состав излучения – Цветовой Температурой и так далее.

TEMPERATURE–CONTROLLED TRANSPORT = ПЕРЕВОЗКА С КОНТРОЛИРУЕМОЙ ТЕМПЕРАТУРОЙ – Temperature-Controlled Transport is a transportation during which the optimum temperature for chilled and frozen products is maintained.

TEMPERATURE/DEW POINT DIFFERENCE = РАЗНИЦА ТЕМПЕРАТУРА/ТОЧКА РОСЫ – Temperature/Dew Point Difference is the difference between the temperature of the goods and the dew point temperature of the air surrounding the goods.

TEMPERATURE GRADIENT = ГРАДИЕНТ ТЕМПЕРАТУРЫ – Temperature Gradient:- differences in temperature within a spatial distance. / Под Градиентом, от Латинского слова Gradiens (Gradientis), означающее Шагающий, понимается вектор g, показывающий направление наискорейшего изменения параметра какого-либо скалярного поля u или φ(P), где P – точка пространства. Направление градиента совпадает с направлением максимальной интенсивности изменения u, а его модуль равен значению этой интенсивности. Обозначение:- grad u или g = grad φ (P). Примерами служат:- градиент давления, градиент потенциала, градиент температуры.

TEMPERATURE–HUMIDITY INDEX = ИНДЕКС ПО ТЕМПЕРАТУРЕ–ВЛАЖНОСТИ – A Temperature-Humidity Index (THI) has been developed by the US National Weather Service (NWS). It gives a single, numerical value in the general range of 70 to 80, reflecting the outdoor atmospheric conditions of temperature and humidity as a measure of comfort (or discomfort) during warm weather. The temperature-humidity index, THI, is defined as follows:- $THI = T_d – (0.55 – 0.55RH) * (T_d – 58)$ where T_d is the dry-bulb temperature and RH is the percentage of relative humidity.

TEMPERATURE OF ZERO BIREFRINGENCE = ТЕМПЕРАТУРА НУЛЕВОГО ДВУЛУЧЕПРЕЛОМЛЕНИЯ – Temperature Of Zero Birefringence is the temperature at which the refractive indexes of a material are equal in two perpendicular directions (longitudinally and transversely for a fiber). Birefringence is formally defined as the double refraction of light in a transparent, molecularly ordered material, which is manifested by the existence of orientation-dependent differences in refractive index. Many transparent solids are optically isotropic, meaning that the index of refraction is equal in all directions throughout the crystalline lattice.

TEMPERING = ТЕМПЕРИРОВАНИЕ – Tempering is a stage in the grain drying process during which heat-dried grain is allowed to cool off or drying air application is suspended for at least 4 hours to allow for uniform distribution of moisture and heat stresses within the grain before the next drying cycle or before milling. Term Tempering means drying the grain on a drying pad for a number of hours or in a grain dryer, then tempering the grain by allowing it to cool for a number of hours in a bin or bag. This process should be repeated at least twice until the moisture is consistently at 14%. / Выдержка при сушке для доведения продукта до состояния влажности среды.

TEMPLE BRUISE = XX (или ПОБИТОСТЬ) ШПАРУТКОЙ – Defect Name:- Temple Bruise. Defect Type:- warp lines, vertical lines. Fabric Type:- Denim Bottomweights – Indigo Dyed. Description:- Temple Bruise:- The discoloration is the result of scuffing or abrasion of the fabric by the loom temple. Severity:- Major.

TEMPLE CUTTING = ПОРЕЗ (или РАССЕЧКА) ШПАРУТКОЙ – Temple Cutting:- fracture or damage of the warp yarns, weft yarns, or both, adjacent to the edge of the fabric. This defect is often caused by hooked, flattened, or otherwise damaged temple pins during weaving. / Шпаруточный Разрез (temple cutting):- порок ткани; прокол с повреждением пряжи основы, утка или обоих систем нитей, смежных с краем ткани. Примечание:- этот порок часто вызывается искривлёнными, расплющенными или повреждёнными иным образом иглами шпарутки во время процесса ткачества.

TEMPLE MARK = ШПАРУТОЧНАЯ ОТМЕТИНА (или ШПАРУТОЧНЫЙ ПРОКОЛ, или ПРОКОЛ ШПАРУТКОЙ) – Temple Marks:- hole defects or rents in fabric caused by improper setting of the temples which keep the newly woven cloth at the proper width so that warp ends and filling picks may interlace at right angles. Temple Marks:- in this defect, the yarns are distorted from their true paths and fine holes are caused near the selvedges. Unsuitable choice of temples and poor mechanical condition of temples are the main causes of this defect. Temple Mark:- mark on fabric, which is caused due to jamming of temple rings or ring spikes are blunt. Weaving defect. Temple Marks:- incorrect setting of temple rollers, defective temples, wrong temples for fabrics. Sharpness of pins is on higher side also gives temple mark; bends and poor condition of temples also causes temple marks. Temple Mark:- holes or surface disturbances along the selvage of the fabric. Due to bad or improperly adjusted temples. Temple Marks:- when weaving fine cloths, the yarns are distorted from their true paths and fine holes are caused near the selvages. Heavy cloths are usually free from this defect. Providing the temple is properly set, the offending ring may be removed, but if the next one begins to mark the cloth, all the rings but two to hold the selvage will need to be taken off the barrel before the marks disappear. Temple Mark:- in woven fabrics, small holes or

distortions adjacent to the selvage. Temple Marks:- in this defect the yarns are distorted from their true paths and fine holes are caused near surfaces. / основные продольные нити и уточные поперечные нити могут . Порок или дефект ткачества. Проколы – нарушения целостности ткани иглами шпарутки, главным образом у кромок. Проколы с повреждением нитей на расстоянии не более 0.5 сантиметра (см) от кромки ткани. Размер порока – до 1 метра (м); распространённые по всему куску. Проколы от игольчатой рамы без нарушения целостности ткани, расположенные на расстоянии не более 1.0 см от кромки ткани, пороком не считают. Шпаруточный Прокол (temple mark):- нарушение ткани, смежное и параллельное кромке. Примечание:- этот порок часто вызывается плохо отрегулированной шпаруткой.

TEMPLES = ШПАРУТКИ – Temples are devices at each edge of the cloth to keep woven fabric at the proper width in the loom during weaving. Another purpose is to keep the warp ends at the correct width and angle so that they will weave at right angles with the filling yarn; acts as an auxiliary to the reed in this respect. / с уточной пряжей; .

TEMPORARY ADMISSION = ВРЕМЕННЫЙ ДОПУСК – Temporary Admission is a Customs procedure under which certain goods can be brought into a Customs territory conditionally relieved from payment of import duties and taxes; such goods must be imported for a specific purpose and must be intended for re-exportation within a specified period and without having undergone any change except normal depreciation due to the use made of the goods. Temporary admission subject to re-exportation in the same state is dealt with in the Istanbul Convention and in Annex E.5. to the Kyoto Convention. Temporary admission as defined in the Istanbul Convention excludes the application of prohibitions or restriction of an economic character. The definition also includes means of transport under the term 'Goods'. Authorization by customs for temporary, duty-free entry of intermediate goods intended for use in production of other goods that will be reexported. Temporary admission applies to merchandise used in the production of goods that the government deems to be in the national interest. / вывоз (exportation).

TEMPORARY DIFFERENCE = ВРЕМЕННАЯ РАЗНИЦА – Temporary Difference is a difference between the tax basis of an asset or liability and its reported amount in the financial statements that will result in taxable or deductible amounts in future years when the reported amount of the asset or liability is recovered or settled, respectively. Some temporary differences cannot be identified with a particular asset or liability for financial reporting, but those temporary differences (i) result from events that have been recognized in the financial statements and (ii) will result in taxable or deductible amounts in future years based on provisions of the tax law. Some events recognized in financial statements do not have tax consequences. Certain revenues are exempt from taxation and certain expenses are not deductible. Events that do not have tax consequences do not give rise to temporary differences.

TEMPORARY IMPORTATION = ВРЕМЕННЫЙ ВВОЗ (или ВРЕМЕННЫЙ ПРИВОЗ) – Temporary Importation (TI) is a customs procedure providing import duty relief for goods imported into the country provided they are re-exported in the same country and within a set time limit. / привоз (importation).

TENACITY = (УДЕЛЬНАЯ) ПРОЧНОСТЬ (или ТЯГУЧЕСТЬ, или ВЯЗКОСТЬ, или СВЯЗНОСТЬ, или УДЕЛЬНАЯ РАЗРЫВНАЯ НАГРУЗКА, или КРЕПОСТЬ НА РАЗРЫВ) – Tenacity:- the units used are the centiNewton per tex (cN/tex) or the milliNewton per tex (mN/tex). This unit is used to quantify all expressions of force per linear density, e.g., breaking tenacity, tenacity at specified elongation. Tenacity is a unit used to measure the strength of a fiber or yarn, usually calculated by dividing the breaking force by the linear density. The breaking strength of a fiber, filament, yarn, cord, etc, expressed in force per unit yarn number. The tensile force per unit of linear density of the unstrained specimen, expressed in centiNewtons per tex (cN/tex). The Tenacity of a material is the mass stress at break the units being of course grams per denier per tex. An alternative term for tenacity is 'Specific Strength'. The value used for the denier of a specimen is usually the nominal denier before testing, no account being taken of the decrease in denier as the specimen is stretched and becomes finer. Tenacity is a force devided by linear density. Tenacity:- calculated from the breaking force and the linear density, and expressed in centiNewton per tex (cN/Tex). Tenacity (cN/Tex) = (1 000 x Breaking Force (N)) / (Linear Density (dtex)). Tenacity is the tensile stress when expressed as force per unit linear density of the unstrained specimen, e.g., grams-force per denier or Newtons per tex. See also Breaking Tenacity. Tenacity is the tensile strength of a fiber, expressed as force per unit of linear density of an unstrained specimen. It is usually expressed in grams per denier or grams per tex. See also Tex. / Сила растяжения на единицу линейной плотности нерастянутого образца, выраженная в сантиНьютонах на текс (сН/текс). (Удельная) Прочность волокон, нитей, проволок и других подобных материалов – величина, равная отношению разрывного усилия, приложенного к волокну, нити, проволоке и так далее, к их линейной плотности. В Международной Системе Единиц СИ прочность выражается в Н·м/кг. Разрывная длина в 1 километр (км) соответствует прочности в 1 гс·км/г = 1 гс/текс = 10 мН/текс = 10 кН·м/кг. Смотрите также Текс (Tex).

TENACITY AT BREAK = (УДЕЛЬНАЯ) ПРОЧНОСТЬ НА РАЗРЫВ (или ПРИ РАЗРЫВЕ) – Tenacity At Break is the breaking force divided by the linear density of the unstrained material. Also known as Breaking Tenacity.

TENACITY AT SPECIFIED ELONGATION = (УДЕЛЬНАЯ) ПРОЧНОСТЬ ПРИ СПЕЦИФИКАЦИОННОМ УДЛИНЕНИИ – Tenacity At Specified Elongation is the tenacity associated with a specified elongation on the tenacity-elongation curve.

TENANT'S GUARANTEE = ГАРАНТИЯ АРЕНДАТОРА – Tenant's Guarantee is the deposit paid as security against a tenant's liabilities. Held in safekeeping in interest-bearing bank account, the net interest income accruing to the tenant. / Депозит, размещённый в качестве залога по обязательствам арендатора. Он удерживается в пользу арендатора на сберегательном, приносящем проценты счёте в банке. Чистый доход по накапливаемым процентам принадлежит арендатору.

TENCEL® = ТЭНЦЭЛЬ® – The TENCEL® fiber is well known for its positive skin properties. Due to the smooth fiber structure, it is particularly silky next to the skin. Its botanic origin ensures that it has good breathing properties – after all TENCEL® is extracted from wood. Equipped with the verifiable oceanic skin care complex (Chitosan), TENCEL® becomes even more cosmetic. Both raw materials come from nature and complement each other in an ideal way. Tencel® is a new fiber created from the wood pulp of specially selected trees, processed in a non-chemical, environmentally-safe way. Tencel was introduced to the world of apparel in 1992 and is the first new fiber introduction in over thirty years. The characteristics of the fiber are a subtle luster, high-wash stability, extremely low shrinkage, and good tear resistance. TENCEL®:- Acordis Fibres (Holdings) Ltd. trademark for their lyocell regenerated cellulose fibers. There are two types of TENCEL®. 'Conventional' TENCEL®, is subject to fibrillation, which is exploited to produce a 'peach skin' finish. TENCEL® A100 is treated to cause cross-linking of cellulose fibers, which prevents fibrillation. TENCEL® has much higher wet strength than other regenerated cellulose fibers such as viscose rayon. It can be dyed much like cotton. TENCEL® is a registered trademark of Tencel, Inc. for their brand of cellulosic staple fiber classified as lyocell. See also Lyocell. Tencel® is the registered trade name for Lyocell, which is a biodegradable fabric made from wood pulp cellulose. It started to grow in popularity in the late 1990s, and now you can find a variety of clothing made with the fabric. Most compare the original Tencel® garments to rayon in feel, but it can be made in different forms. Tencel A100® is a new form meant for stretchy knit garments. Earlier forms of Tencel® either had a blousy silky feel or a peach skin or moleskin finish. Blends with other fibers can produce a variety of different Tencel® finishes, but you will most commonly find peach skin type Tencel®. The manufacturer of Tencel® claims the fabric to be environmentally friendly and a good choice for

people with sensitive skin. Yet this may not always be true. While Tencel® is made from wood fibers and is biodegradable, it is difficult to dye the fabric without treatment with a number of different chemicals that are neither environmentally friendly nor suitable for people with sensitive skin. It's a good idea to check with Tencel® manufacturers to find out whether the fabric would be your best choice. The statements that makers of Tencel® make that are easy to verify are about its relative easy care. The garments are often sold as good for travel because they pack light and retain their shape. Many Tencel® pieces are machine washable; though you should follow the label's instructions for specific wear. If washed in cold water, Tencel® garments shrink about 3% with the first washing, but then won't shrink in future washes. Tencel® also dries quickly, so drip-drying it may not take long. While Tencel® was first primarily featured in women's clothing, it's now being used in a variety of applications. You may find Tencel® sheets, upholstery fabric, blankets, and towels. In towels, you can note that Tencel® is more absorbent than cotton even, and can make for quick drying after your morning shower. There are some conflicting opinions regarding the ability of this fabric to breathe. Some say it is quite breathable, while others state the fabric is unusually warm. You might want to consider trying a single piece before buying a whole set of Tencel® clothing. Many do agree that the fabric drapes beautifully, providing a great look when worn. Manufacturers of Tencel® also state that the fabric is inexpensively made, but this does not necessarily translate to inexpensive prices for clothing made from it. Currently, Tencel® is fairly expensive to purchase. A shirt/pants or shirt/skirt set is often over 100 US Dollars (USD). Tencel®:- created from wood pulp, Tencel® is very soft with great drape. It's usually a medium weight fabric that suitable for pants, skirts and jackets. Tencel® is the brand name for a fiber called Lyocell. Lyocell is a cellulosic fiber made from wood through a proprietary TENCEL® production process. This fiber is twisted or spun into yarns, which are woven or knitted into fabrics and garments. TENCEL® is a man-made fiber but natural in origin. This means it is very comfortable to wear because it is breathable and absorbent, like other natural fibers. TENCEL® is durable and this means that the clothes last. Tencel®:- also known as Lyocell, it is a fiber made from wood pulp cellulose. It is most commonly a mediumweight fabric, and is appropriate for the production of pants, coats and skirts. / Тэнцэль®. Акордиз Файбэз (Холдиньгз) Эл.ти.ди. (Acordis Fibres (Holdings) Ltd.). Люоцэль (Lyocell).

TENCEL® C = ТЭНЦЭЛЬ® ЦЭ. – The cellulose fiber manufacturer, Lenzing AG (headquartered in Lenzing, Austria) introduced a new lyocell fiber with cosmetic properties, TENCEL® C, on 2011-January-13, at Heimtextil in Frankfurt, Germany. TENCEL® C is soaked with the biopolymer chitosan. The substance Chitosan is extracted from the shells of shellfish and is then applied to the fiber. Chitosan is used in cosmetics and in the pharmaceutical industry and is well known for its ability to alleviate itching, regulate cells and protect the skin along with its antibacterial effect. The new fiber strengthens the skin barrier up to 50% by acting as a moisture reservoir and preventing moisture loss from the skin. Additionally, cell renewal is stimulated by the chitosan-soaked fiber. The skin is better able to regenerate itself. Chitosan is water-soluble and after processing steps it can dissipate from the fiber. The research scientists at Lenzing developed a special technology to prevent this. TENCEL® C can easily take up 50 wash cycles in a commercially available washing machine without losing the cosmetic properties of the oceanic substance. See also Lyocell. The special fiber TENCEL® C which features oceanic micro particles opens up a new dimension in skin care. When directly in touch with the skin, the fiber provides a cell-renewing effect. It also acts as a moisturizer and skin protector and keeps the skin elastic. Pure cosmetics from textiles! The skin is the largest organ in the human body. Its care and health are, therefore, particularly important. Yet, the skin can only remain healthy and attractive if it is in balance. Moisture content, protective function, elasticity and cell renewal are all critical requirements for healthy skin. The right moisture content is particularly important for the skin. If the skin is too dry, it wrinkles and cracks and can even begin to itch unpleasantly. With TENCEL® C, the optimal moisture content is maintained. Compared to cotton, the moisture loss is considerably lower. The skin plays a key role when it comes to protecting the body. The higher the protective function, the better. TENCEL® C reinforces the skin's barrier by up to 50% and acts like a moisture reservoir to preserve the skin's natural moisture and improve its protective function. Youthful skin is firm and elastic since it can store a lot of moisture. As we age, the skin loses moisture and thus its elasticity. To counteract this, the skin must be protected from losing moisture. Tests show that when wearing TENCEL® C moisture is maintained and a much better skin elasticity is achieved than when wearing cotton. The textile cosmetic properties of TENCEL® C are proven to stimulate skin cell renewal. When cells regenerate, the skin looks fresh and healthy. / Ленцин А.Ге. (Lenzing AG). Хитозан (Chitosan). ТЭНЦЭЛЬ® Цэ.:- когда речь заходит о красоте и молодости кожи, мы в первую очередь вспоминаем о кремах, масках, сыворотках и прочих косметических средствах. Между тем прогресс не стоит на месте и новым словом в косметике XXI века обещает стать так называемый косметический текстиль – ткани, обладающие косметическими свойствами. Создаются они уже сегодня с использованием новейших нанотехнологий, дающих возможность наделять ткани уникальными свойствами. Прекрасным примером внедрения нанотехнологий в текстильную промышленность может служить волокно ТЭНЦЭЛЬ® – первое целлюлозное нановолокно с высокими абсорбционными и гидрофильными свойствами, и очень высоким коэффициентом испарения. Ткань из этого волокна восстанавливает естественный баланс и структуру кожи. В 2011 Австрийская компания, входящая в группу компаний Ленцин Груп (Lenzing Group), после длительной исследовательской и экспериментальной работы, на Международной выставке текстиля Хаймтэкстиль 2011 (Heimtextil 2011) во Франкфурте-на-Майне, Германия представила новое поколение волокна ТЭНЦЭЛЬ®, обладающего уникальными косметическими свойствами, – ТЭНЦЭЛЬ® ЦЭ., способное поддерживать и восстанавливать естественный баланс и структуру кожи.

TENDER = КОНКУРС (или ТЕНДЕР) – (1) Tender is an offer to supply goods or services at a certain price and under certain conditions. A tender is usually submitted in response to an invitation to do so and is normally made in competition with other potential suppliers. / Оферта на поставку товаров или оказание услуг по определённой цене и на определённых условиях. Обычно конкурс проводится вслед за приглашением участвовать в нём и таким образом, чтобы между всеми конкурсантами – потенциальными поставщиками товаров или услуг возникла здоровая конкуренция. Под Конкурсом или Тендером, от Латинского слова Concursus, означающее буквально Встреча или Стечение или Столкновение, понимается соревнование с целью выявления наилучших из числа участников, представленных работ и тому подобного. Проводящий конкурс и конкурсант. Конкурс Торговый, по праву большинства капиталистических государств особый судебный процесс, открываемый при объявлении несостоятельности должника с целью равномерного удовлетворения требований кредиторов. При торговом конкурсе создаётся особый орган – конкурсное управление, на которое возлагается управление и распоряжение имуществом несостоятельного должника в интересах кредиторов. В разных странах вопрос о характере передаваемого конкурсному управлению и подлежащего реализации имущества (так называемой Конкурсной Массы) решается неодинаково. Например, в Федеративной Республике Германия (ФРГ) к конкурсной массе относится только имущество, принадлежащее несостоятельному должнику в момент открытия конкурса, в Великобритании, Соединённых Штатах Америки (США) и Франции – кроме того, и другое имущество, которое может оказаться у должника во время конкурсного процесса. В процессе торгового конкурса устанавливаются объём и характер требований кредиторов, а также очерёдность их удовлетворения. К требованиям, подлежащим удовлетворению, в первую очередь обычно относятся требования о выплате налогов, сборов, заработной платы, по покрытию связанных с ведением торгового конкурса расходов. Оставшееся имущество распределяется пропорционально суммам подлежащих удовлетворению требований. Раздел вырученных от реализации имущества сумм происходит постепенно, по мере накопления средств. Об окончании торгового конкурса выносится соответствующее судебное решение. Под Тендером, от Английского слова Tender, от Tend, означающее Обслуживать, понимаются:- (1) обычно прицепленная к

паровозу трёх-, четырёх-, шестиосная повозка с запасами воды и топлива. Иногда на тендере размещаются вспомогательные устройства (например, холодильник, дополнительная паровая машина). (2) Небольшое одномачтовое парусное судно. Тендер или Конкурс:- (1) сдача акций корпорации в ответ на предложение выкупить их по установленной цене. Смотрите также Конкурсная Оферта (Tender Offer). (2) Представлять формальное предложение цены при покупке ценных бумаг, как, например, на аукционе по продаже векселей Казначейства США. Смотрите также Датский Аукцион (Dutch Auction). (3) Предложение денег или товаров в погашение существующих задолженностей, как, например, при поставке товара по наступлении даты поставки по фьючерсному контракту (futures contract). (4) Согласованное средство платежа в ходе финансовых сделок, как, например, валюта США, на которой сделана следующая надпись:- 'Законное средство платежа (tender) по всем задолженностям общественного и частного характера'.

(2) Tender:- to give notice to the clearing organization of the intention to initiate delivery of the physical commodity in satisfaction of the futures contract. See also Retender. To offer for delivery, as of a futures contract. Tender is a delivery against a futures position.

(3) Tender:- an offer, especially an offer of money in settlement of a claim or debt, made in the form of an auction. The classic form of tender was developed by the UK Treasury, whereby applicants would tender for an issue of Treasury Bills, stating the price at which they would be willing to purchase them. The bills were then issued to the highest bidders. The same process has also been adopted by the corporate sector, primarily for the premature redemption of bonds or to purchase equities, e.g., for amortization purposes or the assumption of a majority shareholding. As a rule, all securities purchased as part of such a process are settled at a uniform price (the tender price). In the United States, Tender is an application or offer to purchase a US Treasury bill, note or bond. / , например, . В Соединённых Штатах Америки под Конкурсом или Тендером предполагается заявление или оферта на приобретение векселей, нот или облигаций Казначейства США.

(4) Tender:- to surrender one's shares in return for payment following a tender offer.

(5) Tender is the offer of goods for transportation or the offer to place cars or containers for loading or unloading.

TENDER = НЕЖНОЕ (или СЛАБОЕ, или ТЕНДЕР) – Tender:- of a plant that needs a minimum temperature of 60 °F, although occasional brief periods of lower temperatures may be tolerated.

TENDER = СИЛЬНО ОСЛАБЛЕННЫЙ ПРОДУКТ В ОДНОМ ИЗ ПЕРЕХОДОВ ПРОИЗВОДСТВА (или МЯГКАЯ, или НЕЖНАЯ) – Tender is a wool that is weak at one or more places along its length. See also Break. Please see McColl's Darkroom in Cyberspace for drawings showing a close-up of fiber. Tender is a generally weak fiber caused mostly by various extended stressors to the animal.

TENDERABLE GRADES = ПРИГОДНЫЕ (или УЧАСТВУЮЩИЕ В КОНКУРСЕ) СОРТА – A Tenderable Grade is a physical commodity, such as Cocoa or Coffee, of a quality suitable for delivery to settle a futures contract. Also known as Deliverable Grades or Contract Grades. See also Contract Grades. Tenderable Grades are those grades of a commodity which have been officially approved by an exchange as deliverable in settlement of a futures contract. / Смотрите также Контрактные Сорта (Contract Grades).

TENDER CLAUSE = ОГОВОРКА О ТЕНДЕРЕ (или ОГОВОРКА О КОНКУРСЕ) – Tender Clause is a clause in a policy covering hull and machinery of a ship. It specifies the measures the assured must take in the event of an accident, whereby a claim may arise under the policy, regarding advice to underwriters and Lloyd's agents and survey arrangements. The clause also gives underwriters rights regarding the taking of tenders for repairs, deciding the place and firm of repair and acceptance of the successful tender. It details the assured's rights in regard to delay experienced in awaiting further tenders requested by underwriters. A penalty is applied to the assured's claim for non compliance with the terms of the clause. / Лойдз. Под Тендером, от Английского слова Tender, от Tend, означающее Обслуживать, понимаются:- (1) обычно прицепленная к паровозу трёх-, четырёх-, шестиосная повозка с запасами воды и топлива. Иногда на тендере размещаются вспомогательные устройства (например, холодильник, дополнительная паровая машина). (2) Небольшое одномачтовое парусное судно.

TENDERER = КОНКУРСАНТ – At the Corporation of Lloyd's, Tenderer is a member that seeks to sell some or all of his underwriting capacity in a capacity auction. / В Корпорэйшэн оф Лойдз (Corporation of Lloyd's).

TENDER FABRIC = МЯГКАЯ (или ОСЛАБЛЕННАЯ) ТКАНЬ – Tender Fabric:- Fabric:- all-cotton pongee; Construction:- (i) Count:- 72 x 100; (ii) Warp:- 70/1 combed cotton; (iii) Filling:- 44/1 combed cotton; Finish:- plain dyed beige and Schreiner calendered. Defect:- goods said to be tender throughout the piece. Analysis:- fabric tensile-strength tests made on standard file head ends and portions of the piece in question confirmed the fact that tendering was in the warp direction only, strength loss being from 30 to 50%. Further investigation revealed the fact that the tendering was not uniform across the width of the goods, the warp near one selvage being appreciably weaker than either the center part or the opposite selvage. It was determined that these goods had been given a Schreiner-calender finish. This type of calender has finely engraved lines running at a slight angle with the length of the roll. The impression of these lines on the face of cotton fabrics enhances their appearance by imparting a subdued luster. Microscopic examination of the piece submitted for analysis showed that in places where the warp was tender the embossed Schreiner lines had penetrated through to the back of the cloth. It was evident, therefore, that this defect was due to uneven pressure on the Schreiner-calender roll, the finely engraved lines cutting across the warp yarns to such an extent on one side as to cause an appreciable weakening of the fabric. Tender Fabric:- Garment:- cotton poplin dress; Fabric Construction:- (i) Count:- 80 x 56: (ii) Warp:- 35/1 combed cotton; (iii) Filling:- 20/1 combed cotton. Complaint:- customer reported that fabric in dress became tender and showed holes after only a little wear and comparatively few launderings. Analysis:- breaking-strength tests confirmed the fact that the fabric in the dress was much weaker than should be expected after the little service which it was said to have had. However, careful examination and physical tests showed that the sewing thread was also appreciably weakened when compared with normal new sewing thread of the same size and quality as that used in making the garment. Chemical tests confirmed the presence of degraded cellulose, which is evidence of chemical deterioration, in both the fabric and the sewing thread. It was apparent, therefore, that the garment as a whole had been subjected to some severe chemical deterioration, probably in laundering rather than in wearing, and the supplier of the fabric could not be held responsible for this 'defect'. / Уточина:- 44/1 гребенная хлопковая; . Шрайна (Schreiner).

TENDER FILLING = МЯГКАЯ (или ОСЛАБЛЕННАЯ) УТОЧИНА – Tender Filling:- Fabric:- twill dress goods; Construction:- (i) Count:- 148 x 80; (ii) Warp:- 100/100 dull viscose rayon; (iii) Filling:- 150/90 dull viscose rayon; Finish:- plain dyed light blue. Defect:- filling found to be tender in several sections of the piece. Analysis:- tensile-strength tests made on the fabric in two places of the cutting submitted showed the filling to be decidedly weaker than normal. Examination of the yarn in those short sections disclosed the fact that it sized only about 60 denier and the filaments were stuck together and the rayon was very brittle. This was attributed to a rayon yarn defect, apparently produced through some fault in the spinning operation. It would have been impossible for the weaving mill or the dyer to have caused any such deterioration or change in the rayon yarn. / Уточина:- 150/90 .

TENDER GUARANTEE = КОНКУРСНАЯ ГАРАНТИЯ (или ТЕНДЕРНАЯ ГАРАНТИЯ) – Tender Guarantees often called for in support of contract tenders, particularly in international trade situations. It provides the beneficiary with a financial remedy if the

applicant fails to fulfil any of the tender conditions. Normally submitted with the other documents called for in the invitation to tender and remain valid during the period of tender, plus a grace period to allow the beneficiary to make demand. Also known as Bid Bond, Bid Guarantee, Tender Bond. Tender Guarantee supports the principal/applicant's obligation to execute a contract if the principal/applicant is awarded a bid. / Конкурсная или Тендерная Гарантия выдаётся в пользу организации, объявившей конкурс (тендер). Оформив такую гарантию, участники конкурса обязуются возместить определённую денежную сумму, если впоследствии откажутся от своего предложения или не подпишут договор после завершения конкурса. Тендерная Гарантия (Гарантия Оферты) – банковская гарантия, целью которой является гарантирование исполнения участником конкурса (тендера) предоставленной им оферты. Предоставление тендерной гарантии в пользу организаторов конкурса часто является одним из условий рассмотрения предложения участника конкурса. Тендерная гарантия обычно обеспечивает выполнение участником следующего обязательства:- (i) предложение не будет изменено или отозвано до срока, определённого условиями конкурса; или (ii) в случае выигрыша конкурса участником будет подписан соответствующий контракт и представлены гарантия его исполнения и другие гарантии, если таковые будут предусмотрены. Тендерная Гарантия – обязательство банка, выданное по приказу продавца товаров или услуг, участвующего в тендере, в пользу стороны, организовывающей тендер, выплатить последней определённую сумму при отказе продавца поставить товары или услуги в случае, если им выигран тендер.

TENDERING = РАЗМЯГЧЕНИЕ (или ОСЛАБЛЕНИЕ, или СНИЖЕНИЕ ПРОЧНОСТИ) – Tendering is a weakening of a fiber, normally meaning as a result of chemical degradation. Cellulose fibers can be tendered by acids or by excessive action of oxidative bleaches.

TENDERING AND HOLES = РАЗМЯГЧЕНИЕ И ДЫРЫ (или ОСЛАБЛЕНИЕ И ПРОБОИНЫ) – Tendering And Holes:- Garment:- white broadcloth shirt; Fabric Construction:- (i) Count:- 144 x 76; (ii) Warp:- 80/2 combed cotton; (iii) Filling:- same as warp. Complaint:- a white broadcloth shirt returned by the wearer to the shirt manufacturer after only a few wearings showed tendering and some small holes in the areas under the arms. Analysis:- chemical tests made on the fabric in the tender sections showed the presence of small amounts of hydrochloric acid. This is a fairly common complaint, more often appearing in women's cotton, linen, or rayon dresses, and usually traced to the use of under-arm deodorants. These compounds frequently contain aluminum chloride as the active ingredient. Careless or repeated use of such materials is definitely detrimental to cellulosic fibers because of the formation of hydrochloric acid, which has a tendering effect. In many cases the user probably applies the deodorant and then puts on a garment before the solution has a chance to dry on the skin or, if a paste is used, he allows some of it to come into direct contact with his clothing. It is obviously impossible for any garment or fabric manufacturer to take the responsibility for damage of this type; but fortunately the manufacturers of such products, as a rule, warn the user of the likelihood of such damage or, today, use chemical compounds which are comparatively harmless to textile materials. / Уточина:- такая же как основа.

TENDER OFFER = КОНКУРСНОЕ ПРЕДЛОЖЕНИЕ (или КОНКУРСНАЯ ОФЕРТА, или ТЕНДЕРНАЯ ОФЕРТА) – (1) Tender Offer is an offer for sale by tender. / Конкурсное Предложение или Конкурсная Оферта – предложение для продажи посредством конкурса.

(2) In the United States, Tender Offer is an offer made to the shareholders of a public company to buy their holding at a certain price, normally above the current market price. This may be done by a company in order to effect a takeover. A formal offer to purchase a holder's shares at a price higher than the market price. The offer may be for all of the outstanding shares or just a portion. An offer to purchase enough of a company's stock to gain controlling interest. A tender offer is made directly to the shareholders and does not require approval from the management of the company. Tender Offer is a takeover bid in the form of a public invitation to shareholders to sell their stock, generally at a price above the market price. Tender Offer is a public offer to buy shares from existing stockholders of one public corporation by another company or other organization under specified terms good for a certain time period. Stockholders are asked to 'tender' (surrender) their holdings for stated value, usually at a premium above current market price, subject to the tendering of a minimum and maximum number of shares. / Конкурсное Предложение – предложение о приобретении, предложение о покупке акций корпорации, обычно с премией (premium) сверх рыночной цены нкций, за наличные, другие ценные бумаги или и то и другое – часто с целью получения контроля над компанией, являющейся целью перекупки (target company). Конкурсное предложение может быть результатом дружественных переговоров между компанией и желающей её приобрести корпорацией, но может быть неожиданным и, возможно, недружественным предложением, в результате чего компания, являющаяся целью перекупки, принимает ответные меры. Комиссия по Ценным Бумагам и Биржам (SEC) требует, чтобы любая корпорация, желающая приобрести другую компанию и приобретающая более 5% акций компании, являющейся целью перекупки, представляла информацию в КЦББ, в компанию, являющуюся целью перекупки, и на соответствующую биржу. Смотрите также Schedule 13d, Takeover, и Treasury Stock.

TENDER RIG = (ПОЛУПОГРУЖНАЯ) ПЛАТФОРМА С БУРОВОЙ УСТАНОВКОЙ НА СВАЯХ (или БУРОВАЯ УСТАНОВКА С МАЛОЙ ОСТОЙЧИВОСТЬЮ) – Tender Rig:- in oil industry, a seadrill rig system that can extract oil at different water depths. Semitender rig is lowered from a ship and then is tethered to the ocean floor with legs. The ship contains living quarters for the crew and houses equipment. Water dept up to 2 000 meters. See also Drillship, Jack-Up Rig, Semisubmersible Rig, and Semitender Rig. / Смотрите также Буровое Судно (Drillship), Самоподъёмная Буровая Установка или Буровая Установка На Выдвижных Сваях (Jack-Up Rig), Полупогружная Буровая Установка (Semisubmersible Rig), Полупогружная Платформа С Буровой Установкой На Сваях (Semitender Rig). Плавучая Буровая Установка (ПБУ) – буровая установка для бурения нефтяных и газовых скважин в открытом море. Бурение производится с ПБУ, опирающейся на морское дно при помощи мощных колонн (при глубинах до 70 метров); с заякоренной ПБУ (от 60 до 300 м); с ПБУ с динамической стабилизацией (более 250–300 м).

TENDER SHIRTS = МЯГКИЕ (или ОСЛАБЛЕННЫЕ) РУБАШКИ – Tender Shirts:- Garments:- yarn-dyed striped cotton-broadcloth shirts; Fabric Construction:- (i) Count:- 96 x 60; (ii) Warp:- 35/1 combed cotton, yam dyed gray and red; (iii) Filling:- 40/1 combed cotton (white). Complaint:- new shirts which, in most cases, had been laundered only once were returned with evidence of tendering of the fabric. Analysis:- tensile-strength tests showed the goods to he tender. The fact that a great many garments of various patterns and made by different manufacturers were returned by laundries from widely scattered parts of the country precluded the possibility that faulty garment manufacture, excessive wear, or abnormal laundry practice was responsible for this defect. The shirting fabrics were all traced to one finishing plant, and it was learned that a small amount of urea formaldehyde resin had been used in finishing, presumably to aid in obtaining stabilization. If fabrics containing such resin are subjected to chlorine bleach and this is not followed by an antichlor agent, a reaction compound is formed which subsequently results in the liberation of hydrochloric acid when the goods are ironed. Despite the fact that theoretically commercial laundries do not use chlorine bleach on colored-yarn fabrics, it was evident that such a practice was common in many laundries at the time when the complaint arose. Also, although the use of an antichlor compound, such as sodium bisulphite, would remove the chlorine, it was not usual nor was it to be expected that all laundries would use such precautions, particularly as the bleach is readily removed by rinsing fabrics which contain no resin. / Уточина:- 40/1 гребенная хлопковая (белая).

TENDER SPOTS = МЯГКИЕ ПЯТНА (или ОСЛАБЛЕННЫЕ ПЯТНА) – Tender Spots:- Fabric:- crêpe dress goods; Construction:- (i) Count:- 120 x 72; (ii) Warp:- 100/40 dull viscose rayon; (iii) Filling:- 100/40 bright viscose-rayon crêpe woven 2 S and 2 X; Finish:- white discharge print on brown ground. Defect:- tender areas found throughout piece. Analysis:- tensile-strength tests made on portions of the piece showed that only the white-printed areas were tender. It was concluded that this defect was due to a processing fault in finishing, probably originating with washing at too high a temperature with an oxidizing agent after the discharge print had been applied with a sodium sulphoxylate paste. Similar damage may be encountered on delicate sheer fabrics, caused by embrittlement of the fibers by improper use of the thickener in the printing paste. In acetate-rayon fabrics, tender discharge prints are frequently attributed to the excessive weakening of the acetate yarns during the saponification treatment, prior to printing, or to improper use of swelling agents. While the use of bleaching solutions is generally avoided, the printer might have resorted to it in this case in an effort to obtain a better white. / Уточина:- 100/40 .

TENDRIL = УСИК (или УСООБРАЗНЫЙ ПРИДАТОК) – Tendril is a slender leafless side-shoot, often coiling around other objects, produced by many climbing plants as an aid to climbing and support. Tendril is a slender, clasping or climbing organ of a stem or leaf. / Усик Гороха; Плодоножка Арбуза. Под Усиками в зоологии понимаются то же, что антенны, а в ботанике – усы.

TEN–GALLON HAT = ДЕСЯТИГАЛЛОНОВАЯ ШЛЯПА (или СОМБРЭРО) – Ten-Gallon Hat is a cowboy hat. / Широкополая ковбойская шляпа.

TENNESSEE VALLEY AUTHORITY CONTROL AREA = ОБЛАСТЬ, КОНТРОЛИРУЕМАЯ УПРАВЛЕНИЕМ ТЕННЕССИЙСКОЙ ДОЛИНЫ (или ЗОНА КОНТРОЛЯ УПРАВЛЕНИЯ ТЕННЕССИЙСКОЙ ДОЛИНЫ) – In the United States, the Tennessee Valley Authority Control Area or the TVA Control Area means the electric power system(s) consisting of all of Tennessee Valley Authority's transmission and generating facilities in which a common automatic generation scheme is applied in:- (i) matching the power output of the generators within the system(s) and capacity and energy purchased from outside entities; and (ii) maintaining scheduled interchange and frequency with other Control Areas while providing sufficient generating capacity to maintain operating reserves. The TVA Control Area is recognized by the North America Electric Reliability Council (NERC). / В Соединённых Штатах Америки, Зона, Контролируемая Управлением Теннессийской Долины или Зона Контроля УТД означает энергосистему(ы), состоящую из всех передающих и генерирующих установок, принадлежащих Управлению Теннессийской Долины, в которых используется обычная автоматическая схема генерации, заключающаяся в следующем:- (i) соответствии выработки электроэнергии от генераторов внутри системы или систем и мощности и энергии, приобретаемой у сторонних предприятий; и (ii) поддержании запланированного взаимообмена и частоты с другими Зонами Контроля, при этом обеспечения достаточной генерируемой мощности для поддержания эксплуатационных резервов. Зона Контроля УТД признаётся Северо-Американским Советом по Надёжности Поставок Электричества (САСНПЭ).

TENNIS = ТЕННИСНЫЕ (или ТЕННИСКИ) – Tennis are the tennis shoes, sneakers.

TENNIS SHOE = ТЕННИСНЫЕ ТУФЛИ (или КРОССОВКИ) – Tennis Shoe:- a lightweight usually low-cut sneaker. One of the many uses is for playing tennis.

TENOR = СРОК (ОБЯЗАТЕЛЬСТВА) – Tenor is a period of time before a bill of exchange has to be paid. In effect it is the life of the bill. Tenor of draft:- time and date for payment of a draft. Time at which a draft indicates it is payable, e.g., 'at sight', '60 days after the bill of lading date', or 'on May 31, 2012'. / Срок платежа по тратте:- , например, 'по предъявлении', 'по истечении 60 дней с даты коносамента', или 'на 31 Мая 2012'.

TENSILE FACTOR = ФАКТОР РАСТЯЖЕНИЯ – Tensile Factor is the empirical factor $T \times E_{1/2}$ that describes the tenacity elongation exchange relationship for a large number of manufactured fiber systems.

TENSILE HYSTERESIS CURVE = ГИСТЕРЕЗИСНАЯ КРИВАЯ РАСТЯЖЕНИЯ – Tensile Hysteresis Curve is a complex load-elongation, or stress-strain curve obtained:- (i) when a specimen is successively subjected to the application of a load or stress less than that causing rupture and to the removal of the load or stress according to a predetermined procedure; or (ii) when a specimen is stretched less than the breaking elongation and allowed to relax by removal of the strain according to a predetermined procedure.

TENSILE RECOVERY CURVE = КРИВАЯ ВОССТАНОВЛЕНИЯ РАСТЯЖЕНИЯ – Tensile Recovery Curve:- for the tensile deformation, woven fabrics undergo loading and unloading cycle. This cycle can be described in the tensile stress-strain curve, for which the fabric specimen is extended from zero load to the maximum stress of 500 gf/cm in KES system (short for the Kawabata Evaluation System). The loading process follows the unloading process which releases the stresses from its maximum to zero. As woven fabrics are deformed in loading process, the residual strain is observed in the tensile recovery stress-strain curve. See also Tensile Hysteresis Curve. / Кавабата (Kawabata) (Япония).

TENSILE STRAIN = УСИЛИЕ (или ДЕФОРМАЦИЯ, или НАПРЯЖЕНИЕ) РАСТЯЖЕНИЯ – Tensile Strain is the relative length deformation exhibited by a specimen subjected to a tensile force. Strain may be expressed as a fraction of the nominal gauge length or as a percentage. See also Elongation.

TENSILE STRENGTH = ПРОЧНОСТЬ НА РАСТЯЖЕНИЕ – Tensile Strength (Breaking Stregth) is the strength shown by a fiber, yarn, or fabric to resist breaking under pressure. It is the actual number of pounds of resistance that a fabric will give before the material is broken on the testing machine. Tensile Strength is the amount of pulling a fiber can withstand before it stretches and breaks. Tensile Strength is:- (1) in general, the strength shown by a specimen subjected to tension as distinct from torsion, compression, or shear. (2) Specifically, the maximum tensile stress expressed in force per unit cross-sectional area of the unstrained specimen, e.g., kilograms per square millimeter, pounds per square inch. For maximum stress per unit linear density, see also Breaking Length or Breaking Tenacity. The longitudinal stress which a substance can bear without tearing apart. Tensile Strength of a thread of fabric is measured as the weight required to break it under tension or in other words under a steady pull as distinct from a sudden jerk. A number of factors affect tensile strength and among them are:- length of fiber, fineness of fiber, twist of fiber, wax content of the fiber, hygroscopicity (ability to absorb moisture) of the fiber, count of yarn, twist, and moisture content of the yarn while under test. The strength shown by a specimen subjected to tension, as distinct from torsion, compression or shear, and expressed as force per unit cross-sectional area of the unstrained specimen. Tensile Strength is the maximum tensile stress required to rupture a fiber, expressed as pounds per square inch or grams per square centimeter. / от скучивания (torsion), . Под Прочностью понимается свойство материалов в определённых условиях и пределах, на разрушаясь, воспринимать те или иные воздействия (нагрузки, неравномерные температурные, магнитные, электрические и другие поля, неравномерные высыхание или набухание, неравномерное протекание физико-химических процессов в разных частях тела и другие). Критериями прочности для различных случаев являются:- предел ползучести, предел пропорциональности, предел прочности, предел текучести и другие.

TENSILE STRESS = НАПРЯЖЕНИЕ ПРИ РАСТЯЖЕНИИ – Tensile Stress is the force per unit cross-sectional area of the unstrained specimen. Tensile Stress is the resistance to deformation developed within a specimen subjected to tension by external force. The tensile stress is commonly expressed in two ways, either as (1) the tensile strength, i.e. the force per unit cross-sectional area of the unstrained specimen, or as (2) tenacity, i.e. the force per unit linear density of the unstrained specimen. The latter is more frequently used in textile testing.

TENSILE TEST = ТЕСТ НА РАСТЯЖЕНИЕ – Tensile Test is a method of measuring the resistance of a yarn or fabric to a force tending to stretch the specimen in one direction.

TENSIOMETER = ТЕНЗИОМЕТР – Tensiometer is a device for measuring soil moisture, consisting of a buried tube of water that develops a partial vacuum as the surrounding soil dries out. Tensiometer is an instrument for measuring the amount of energy needed to extract water from the soil (usually expressed in kPa or cbars). / Прибор для измерения влажности почвы, состоящий из закапываемой пробирки с водой, которая под воздействием частичного вакуума, вызываемого осушкой почвы, испаряется. Тензиометр представляет собой герметически заполненную водой трубку с пористым керамическим наконечником на одном конце и манометром на другом. Большинство манометров калибруются в сотых долях бара (сентибарах) и имеют шкалу, размеченную от 0 до 100. Станция контроля уровня влаги поля состоит из одного-двух контрольных устройств, помещённых в борозду посредине между соседними растениями. Эти контрольные устройства размещаются в каждой части поля с разными типами грунта и разной глубиной верхнего почвенного слоя. Устройства должны находиться в борозде в течение всего сезона роста. Обычно в каждой части поля, которая может орошаться в течение одного дня, требуется, по крайней мере, одна станция. Для размещения контрольных станций следует избегать низинных районов. Обязательно пометьте станции, дабы механизаторы не повредили их при полевых работах. С учётом ежедневных колебаний величины всасывающего давления почвенной влаги, которые абсолютно аналогичны температурным колебаниям воздуха, при планировании сеансов полива, следует, в первую очередь, обращать внимание на показания тензиометра, полученные ранним утром. Если же принимать во внимание показания, полученные в дневное время, это может привести к чрезмерному поливу. По возможности, следует пользоваться кривой высвобождения почвенной влаги, разработанной для конкретной почвы, в которую помещён наконечник каждого тензиометра. При работе тензиометров в первое время после их установки, проходит определённый период их адаптации, пока в зоне замера не сформируется корневая система, и последние не будут контактировать с сенсором прибора. В этот период можно поливать с учётом факторов транспирации весовым методом с водной поверхности. Когда корневая система достаточно сформируется вокруг прибора (молодые корни, корневые волоски), то прибор показывает реальную потребность в воде. В это время могут наблюдаться резкие перепады давления. Это наблюдается при резком снижении влажности и является показателем для начала ирригации. Если растения хорошо развиты, имеют хорошую корневую систему и хорошо облиственны, – перепад давления, то есть уменьшение влажности почвы будет более сильным. Слабое изменение давления почвенного раствора и соответственно тензиометра указывает на слабую корневую систему, растение мало или совсем не поглощает воду. Если известно, что место, где установлен тензиометр, не соответствует типичности участка по причине заболевания растения, чрезмерной засоленности, недостаточной проветриваемости и другого, то тензиометры необходимо переместить на другое место, и, чем раньше, тем лучше.

TENSION = НАТЯЖЕНИЕ (или РАСТЯЖЕНИЕ) – Tension is a force tending to cause the extension of a body. Note:- an abbreviation for tensioning force. In fibers and yarns the tension applied is usually based on the linear density of the material.

TENSION CONTROL WEAVE = ПЕРЕПЛЕТЕНИЕ С КОНТРОЛЕМ НАТЯЖЕНИЯ – Tension Control Weave is a type of decorative weave, characterized by a puckered effect which occurs because the tension in the warp yarns is intentionally varied before the filling yarns are placed in the fabric. / переплетение. уточные пряжи .

TENSIONING FORCE = СИЛА НАТЯЖЕНИЯ (или РАСТЯГИВАЮЩАЯ СИЛА) – Tensioning Force:- the Tension Force is the force which is transmitted through a string, rope, cable or wire when it is pulled tight by forces acting from opposite ends. See also Tension.

TENSION LEG PLATFORM = ПЛАТФОРМА С РАСТЯНУТЫМИ ОПОРАМИ (или ПЛАТФОРМА НА ВЫТЯНУТЫХ ОПОРАХ) – Tension Leg Platforms (TLPs) are used in depths too great for conventional platforms – up to 7 000 feet – and consist of a floating structure with facilities and equipment much like that of a fixed platform, anchored to the seafloor with vertical tendons. Semi-submersible platforms also can be used in these water depths. See also Fixed Platform, Offshore Production Platform, and Spar Platform. / В Соединённых Штатах Америки. Смотрите также Стационарная Платформа (Fixed Platform), Морская Эксплуатационная Платформа (Offshore Production Platform), и Спаренная Платформа (Spar Platform).

TENTER FRAME = ШИРИТЕЛЬНАЯ РАМА (или ШИРИТЕЛЬНАЯ МАШИНА) – Tenter Frame is a machine that dries fabric to a specified width under tension. The machine consists essentially of a pair of endless chains on horizontal tracks. The fabric is held firmly at the edges by pins or clips on the two chains that diverge as they advance through the heated chamber, adjusting the fabric to the desired width. Tenter Frame is a finishing-plant machine in which cloth is gripped on either side by an endless moving chain, held by clips or pins, and used to dry cloth under tension or to hold it out to the desired width while drying.

TENTERING = ШИРЕНИЕ (или ПРОСУШИВАНИЕ ВОЙЛОКА (НА НАТЯЖНОЙ СУШИЛЬНОЙ РАМЕ)) – Tentering is used to straighten the fabric and dry it. The fabric is stretched taut while steaming or drying and held in place with clips or pins, called Tenterhooks. Giving rise to that slang expression of suspense, ‘on tenterhooks’. Tentering is a fabric finishing step in which the fabric is stretched on a frame to its finishecf width and final shape, then dried to maintain these dimensions. / щипальная машина (tenterhook).

TENTER MARK = ОТМЕТИНА ОТ ШИРИЛКИ – Tenter Mark is a visible deformation of selvage due to pressure from a tenter clip. See also Clip Mark. Fabrics defect. Tenter Mark is a visible deformation on the side edge or body of a fabric due to pressure from clips or pins. Synonym:- Clip Mark, and Pin Mark.

TENUI = ТОНКОЕ – Tenui:- slender, thin. Tenui from Teneo. / Teneo – держать; направлять путь; достигать или прибывать; постигать или понимать; владеть или обладать; овладевать или приобретать; держать или хранить; достигать или добиваться; удерживать или отстаивать; держаться или продолжаться; занимать или наслаждаться; связывать или обязывать; задерживать; удерживать; запирать.

TEPAL = ЛИСТОЧЕК – Tepal is any of the modified leaves making up a perianth. / околоцветник (perianth).

TERAI = ТЁРАИ (или ХХ) – Terai:- a wide-brimmed double felt sun hat worn especially in subtropical regions. / В Индии, широкополая фетровая шляпа с двойной тульёй; тераи (влажные подгорные леса).

TEREPHTHALIC ACID = ТЕРЕФТАЛЕВАЯ КИСЛОТА – Terephthlic Acid is a para-phthalic acid, $C_6H_4(COOH)_2$. Used to produce polyester resins, fibers, and films by combination with glycols. / Под Терефталевой Кислотой понимается одна из фталевых кислот, представляющих собой карбоновые кислоты ароматического ряда. Известны орто-фталевая кислота (фталевая),

метафталевая кислота (изофталевая), пара-фталевая кислота (терефталевая). Высокоплавкие кристаллические вещества. Сырьё в производстве полиэфиров, лекарственных средств, красителей. Большое значение имеют производные фталевой кислоты – фталевый ангидрид и эфиры фталевой кислоты, например, диметилтерефталат, дибутилфталат.

TERETE = ВАЛЬКОВАТОЕ (или ПОЧТИ ЦИЛИНДРИЧЕСКОЕ) – Terete is:- (1) cylindrical or tapering, circular in cross-section; (2) circular in cross-section.

TERM = ПОРЯДОК – (1) Term is a word or phrase; an expression, particularly one that has been defined in an agreement. / Слово или фраза; выражение, а более конкретно – то, что было определено в соглашении.

(2) Terms are the provisions specified in a loan agreement. Term is a clause or provision of an agreement. Terms are all policy provisions, limitations, exclusions, conditions and definitions that apply to this coverage. / Статья или положение соглашения. Порядок:- положение, в котором указывается характер соглашения или контракта, например:- порядки и условия (terms and conditions)

TERM = СРОК – (1) Term is the time period – original, extended, or from issue date to final maturity – during which a savings bond earns interest. Period of time during which something is valid. Term is a fixed and definite period of time. The term of a Licensing Agreement is the period of time during which the agreement is in effect. / Срок:- (1) период времени, в течение которого должны быть выполнены условия контракта. Это может относиться ко времени, в течение которого должны быть внесены платежи по займу, или ко времени, в течение которого должны быть выплачены проценты по депозитному сертификату или облигации. Это также может относиться к периоду времени, в течение которого действует страховой полис. Смотрите также Срочное Страхование Жизни (Term Life Insurance). (2) Длительность срока пребывания в должности избранного или назначенного официального лица или члена правления. Например, члены Совета Управляющих Федерального Резерва назначаются на 14 лет.

(2) Term is the period from when a loan is made until it is fully paid. / Под Сроком понимается период времени с момента получения ссуды и до её полной оплаты.

TERM DEPOSIT = СРОЧНЫЙ ВКЛАД (или СРОЧНЫЙ ДЕПОЗИТ) – Term Deposit is a bank deposit for a fixed term. The interest rate may be fixed for the whole term or may vary at specified intervals.

TERMINAL = ТЕРМИНАЛ – (1) Terminal is a building or structure where covered property is transferred from one vehicle or mode of conveyance to another. Area closely aligned to dock used to collect, store and dispatch containers and cargo. Terminal is an assigned area in which containers are prepared for loading into a vessel, train, truck, or airplane or are stacked immediately after discharge from the vessel, train, truck, or airplane. Terminals are the break points for carriers to strategically reload freight for delivery to the final destination. / немедленно после разгрузки из судна, поезда, грузовика или самолёта. Под Терминалом, от Латинского слова Terminalis, означающее Конечный или Относящийся К Концу, понимается часть порта, предназначенная для обработки контейнерных и пакетированных грузов.

(2) The word Terminal refers to a complete port facility for accommodating, loading/discharge of ships and for the storage, stacking and handling of cargo on shore, e.g., bulk cargo terminal, oil terminal, livestock terminal, etc.

(3) Terminal is a computer workstation linked to a server or other computer over a network on which a user may display information. When it is merely a video display, it may be referred to as a Dumb Terminal. / Терминал – оконечное устройство вычислительной системы, служащее для дистанционного ввода и вывода информации, например, при взаимодействии человека с ЭВМ, удалённой от него на расстояние (часто значительное) и связанной с терминалом каналами передачи данных. Различают терминалы пассивные, предназначенные только для ввода – вывода информации (дисплеи, телетайпы, телефонные аппараты), и активные, которые помимо ввода – вывода информации обеспечивают ещё и её накопление, частичную обработку, решают характерные частные задачи, управляют процессами передачи данных (микро- и мини-ЭВМ, микропроцессоры). Терминалы применяют в автоматизированных системах управления и проектирования, в информационно-поисковых системах, в системах программирования обучения и других.

(4) Terminal is any communication equipment approved by SWIFT that is connected to a SWIFT regional processor. / Любое оборудование для связи, одобренное Сообществом по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)), которое подключено к региональному процессору СВМФДС. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

TERMINAL = ТЕРМИНАЛЬНОЕ (или ОКОНЕЧНОСТЬ, или ОКОНЧАНИЕ, или ВЕРХУШЕЧНОЕ, или КОНЕЧНОЕ, или КОНЦЕВОЕ) – Terminal is the dominant, upper mainstem part of a Cotton Plant containing three to four expanding leaves and developing squares; if they are all retained, the number of squares typically is identical to the number of leaves. Also known as Apex. The growing tip of a stem, particularly the main stem. Terminal:- borne at the end of a stem, branch or other structure, e.g., terminal spine located at the end of a leaf. Terminal:- at the end of branch or a stem. Terminal:- Usually refers to the growing point in the Plant apex, but may also include the outer growing points of monopodial, and in some cases, sympodial branches. These growing points consist of meristematic tissue of multiple main-stem, monopodial, and sympodial position nodes. / Растущая верхушка стебля, особенно главного стебля. :- родившееся на конце стебля, ветви или иной структуры, например, верхушечная колючка (волосок), расположенная на конце листа. Под Терминальным, от Латинского слова Terminalis, означающее Относящийся К Концу, понимается конечный, концевой, например, терминальная артерия (в анатомии), терминальная группа в молекуле биополимера (в биохимии) и другие.

TERMINAL BUD = ТЕРМИНАЛЬНАЯ ПОЧКА (или ВЕРХУШЕЧНАЯ ПОЧКА) – Terminal Bud is the main area of growth in most plants where its own growth exhibits apical dominance, inhibiting the growth of axillary buds. Around the terminal bud is a complex arrangement of nodes and internodes with maturing leaves. The terminal bud is the end of the embryonic shoot that is undeveloped. Also known as the Apical Bud, the terminal bud on a stem releases a hormone that prevents axillary buds from growing. It causes the axillary buds to grow slowly, which then allows the plant to grow taller to reach more light. When the apical bud is removed, the hormone signal stops and the axillary buds can grow more vigorously. In Cannabis cultivation, removing the terminal bud is known as Pinching, or pinching back and is done to create a fuller, bushier plant. The apical buds occur at the end, or apex, of stems, and because of this location, they are also known as Terminal Buds. These axillary buds occur at a leaf node, which is where a leaf emerges from the stem of a stem. See also Apical Bud, and Pinching. The Terminal (Apical) Bud of a Cannabis plant is the primary growing point located at the apex (tip) of the stem and is the dominant bud. The terminal bud can cause all the axillary (lateral) buds below it to remain dormant. Terminal buds contain a special tissue called the apical meristem. The apical buds' cells can divide indefinitely and produce all the differentiated tissue, including vegetative and reproductive organs.

TERMINAL DISCLAIMER = ОТКАЗ ТЕРМИНАЛА ОТ ОТВЕТСТВЕННОСТИ – In the US patent law, a Terminal Disclaimer (TD) is a statement filed by an owner under 35 USC § 253 (paragraph 2) and 37 CFR § 1.321(b) or (c) to disclaim or dedicate to the public the entire term or any portion of the term of a patent or patent to be granted. A TD may be filed for the purpose of overcoming a judicailly created double patenting rejection.

TERMINAL ELEVATOR = ТЕРМИНАЛЬНЫЙ ЭЛЕВАТОР – A Terminal Elevator is a licensed elevator used principally to receive grain and condition grain for export. An inland terminal elevator is an elevator, licensed as a primary elevator, for receiving and conditioning of the grain for direct or indirect export. An elevator located at a point of greatest accumulation in the movement of agricultural products that stores the commodity or moves it to processors.

TERMINAL HANDLING CHARGE = СБОР ЗА ПЕРЕВАЛКУ НА ТЕРМИНАЛЕ (или ТЕРМИНАЛЬНЫЙ СБОР ЗА ПЕРЕВАЛКУ) – The Terminal Handling Charge (THC) is a terminal handling fee for containers moved through a container terminal. Freight surcharges are no longer updated by conferences. Please refer to shipping line agents or freight forwarders for their values. The Terminal Handling Charge (THC) is a charge assessed by the terminal for the positioning of containers within the terminal/yard. Terminal Handling Charge (THC), levied by CY and CFS operators for goods passing through their operations. THC are additional costs, on top of the sea freight, charged by the shipping company for the handling of containers at the container terminal before being loaded onboard a vessel. Examples include the unloading of the container from a truck, stacking and transport from the stacking location to just below the crane. This concerns FCL (Full Container Load) shipments. / Фрахтовые надбавки или доплаты (freight surcharges) .

TERMINAL MARKET = ТЕРМИНАЛЬНЫЙ РЫНОК (или СРОЧНЫЙ РЫНОК) – Terminal Market:- usually synonymous with commodity exchange or futures market, specifically in the United Kingdom. / Как правило, синоним бирже сырья или рынку фьючерсов, конкретно в Соединённом Королевстве.

TERMINAL NODE = ТЕРМИНАЛЬНЫЙ УЗЕЛ (или ВЕРХУШЕЧНЫЙ УЗЕЛ) – Terminal Node is the uppermost main-stem node on which the mainstem leaf is unfurled.

TERMINAL RECEIPT = ТЕРМИНАЛЬНАЯ РАСПИСКА (или РАСПИСКА ТЕРМИНАЛА) – Terminal Receipt is a document used to accept materials or equipment at a terminal. This provides the delivering carrier with proof of delivery and the terminal with a verification of receipt.

TERMINAL RECEIVING CHARGE = СБОР ЗА ПРИЁМКУ ТЕРМИНАЛОМ – Terminal Receiving Charge (TRC) is a charge assessed by the terminal for cargo being delivered for export.

TERMINATION = ПРЕКРАЩЕНИЕ – (1) Termination is the cancellation or ending of an agreement. / Отмена или окончание действия соглашения.

(2) Termination:- the time the coverage under an insurance policy ends, either because it's term has expired or because it has been cancelled by either party.

TERMINATION BENEFITS = ВЫПЛАТЫ ПРИ РАСТОРЖЕНИИ (или ВЫПЛАТЫ ПРИ ПРЕКРАЩЕНИИ) – Termination Benefits are employee benefits payable as a result of either:- (a) an entity's decision to terminate an employee's employment before the normal retirement date; or (b) an employee's decision to accept voluntary redundancy in exchange for those benefits. An entity shall recognise termination benefits as a liability and an expense when, and only when, the entity is demonstrably committed to either:- (a) terminate the employment of an employee or group of employees before the normal retirement date; or (b) provide termination benefits as a result of an offer made in order to encourage voluntary redundancy. Where termination benefits fall due more than 12 months after the balance sheet date, they shall be discounted. In the case of an offer made to encourage voluntary redundancy, the measurement of termination benefits shall be based on the number of employees expected to accept the offer. See also Employee Benefits. / Смотрите также Выплаты Работникам (Employee Benefits).

TERMINATOR TECHNOLOGY = ТЕРМИНАТОРНАЯ ТЕХНОЛОГИЯ (или ХХ) – Terminator Technology refers to plants that have been genetically modified to render sterile seeds at harvest – it is also called Genetic Use Restriction Technology or GURTS. Terminator technology was developed by the multinational seed/agrochemical industry and the United States government to prevent farmers from saving and re-planting harvested seed. Terminator has not yet been commercialized or field-tested but tests are currently being conducted in greenhouses in the United States. 'Terminator is a direct assault on farmers and indigenous cultures and on food sovereignty. It threatens the well-being of all rural people, primarily the very poorest'. Rafael Alegría of Via Campesina, an organization representing over 10 million peasant farmers worldwide. Genetic Use Restriction Technology (GURTs) is the 'official' name for Terminator Technology that is used at the United Nations and by scientists. It refers to technologies that, in their design, provide a mechanism to switch introduced genes on or off, using external inducers like chemicals or physical stimuli such as heat shock (called an Inducible System). This mechanism allows for restricted use or performance of transgenes. There are two tyoes of GURTs technologies that rely on the same mechanism, variety-related or V-GURTs and trait-related or T-GURTs. V-GURTs aim to control reproductive processes to result in seed sterility, thus affecting the viability of the whole variety; T-GURTs aim to control the use of traits such as insect resistance, stress tolerance or production of nutrients. The ability to switch the GURTs mechanism on or off externally would, theoretically, enable control over the viability of seeds or over traits. Why is Terminator a problem? The top 10 largest seed companies control half the world's commercial seed market. If Terminator is commercialized, corporations will likely incorporate sterility genes into all their seeds. That's because genetic seed sterilization would secure a much stronger monopoly than patents – instead of suing farmers for saving seed, companies are trying to make it biologically impossible for farmers to re-use harvested seed. Canadian farms of all sizes save seeds and this practice is growing as the farm income crisis gets worse each year. Across the world, over 1.4 billion people, primarily small-scale farming families in the developing world, depend on farm-saved seed as their primary seed source. Terminator seeds will force dependence on external seed sources and disrupt the age-old practice of farmer seed selection, exchange and breeding – centuries of Indigenous and farmer seed variety development is the foundation of the Canadian seed stock. What impact will Terminator seeds have on farmers? Terminator is a major violation of the rights of farmers to save and reuse their own seeds. Through pollen movement in the first generation, Terminator genes could contaminate farmers' crops – farmers might then unknowingly save and reuse seeds that are contaminated and will not germinate. This could also happen if imported grain contains Terminator genes. Farmers who depend on humanitarian food aid risk devastating crop loss if they unknowingly use food aid grain containing Terminator genes as seed. Terminator would ensure a corporate stranglehold on seeds and result in higher seed prices at a time when farmers are experiencing the worst income crisis in the history of modern agriculture. If Canadian farmers were forced to buy Terminator seeds every year, the cost would be crippling. For example, an estimated 90% of Canadian wheat is planted with saved seed – in total, the annual cost to buy this seed would be USD95 million Dollars. Who holds patents on Terminator? Monsanto has acquired Delta & Pine Land (DPL), the world's largest Cotton seed company, which jointly holds three US patents on Terminator technology with the US Department of Agriculture. In October 2005, DPL won new Terminator patents in both Europe and Canada. Also, the multinational seed and agrochemical company Syngenta is requesting a Canadian patent on its Terminator potatoes. But

Indigenous Potato farmers in the Andes of Peru have asked Syngenta destroy this patent. Will Terminator stop genetic contamination? The multinational seed industry is waging a public relations campaign to promote Terminator technology as a means to stop unwanted genetic contamination from genetically engineered (GE) plants (particularly for potential use in GE trees and plants modified to produce drugs and industrial chemicals). Escaped genes from GE plants are causing contamination and pose threats to agricultural biodiversity and the livelihoods of farmers. For example, Saskatchewan organic canola farmers are suing Monsanto and Bayer for GE contamination. Industry argues that engineered sterility would offer a built-in safety feature for GE plants because if genes from a Terminator crop cross-pollinate with related plants nearby, the seed produced from unwanted pollination will be sterile – it will not germinate. But Terminator technology is a complex system involving multiple inserted genes that all work together in a sequence. Scientists warn that Terminator will not be 100% effective. The likelihood of system failure means it could never be a reliable tool for 'biocontainment'. If Terminator is used for 'biocontainment' and fails, it would introduce new, dangerous biosafety risks. Victory! Global Moratorium Upheld! In 2000, the United Nations Convention on Biological Diversity recommended that governments not approve Terminator for field tests or commercial use. This created what is now recognized as an international moratorium. It was upheld and strengthened in March 2006 thanks to pressure from Canadians and people across the world. Canada still promotes Terminator:- in 2005, the Canadian government tried to overturn the UN moratorium. A leaked memo revealed that the government was preparing to push language to allow field-testing and commercialization. However, in March 2006, public pressure forced the government to agree to strengthen the moratorium. But our government has still not taken a stand against Terminator. Monsanto Buys Terminator:- on June 01, 2007 Monsanto concluded its deal to acquire Delta & Pine Land, the US seed company conducting greenhouse trials of Terminator. In 1999 Monsanto made a public commitment not to commercialize Terminator but 'Monsanto does not rule out the potential development and use of one of these technologies in the future'. Syngenta wants a Canadian patent on Terminator potatoes:- multinational corporation Syngenta has applied for a Canadian patent on its Terminator potatoes. But Indigenous farmers in the Andes of Peru are asking Syngenta to denounce this technology. Xxxxx. 2013-March-30:- Seeds of suicide and slavery versus seeds of life and freedom. Contrary to its claims, Monsanto's monopoly on seeds in India are the root cause behind the sharp increase in suicides. Monsanto and its PR men are trying desperately to delink the epidemic of farmers suicides in India from its growing control over the cotton seed supply. For us it is the control over seed, the first link in the food chain, the source of life which is our biggest concern. When a corporation controls seed, it controls life. Including the life of our farmers. The trends of Monsanto's concentrated control on the seed sector in India or across the world is the central issue. This is what connects the farmer suicides in India, to Monsanto v Percy Schmeiser in Canada, or Monsanto v Bowman in the US, to farmers in Brazil suing Monsanto for USD2.2 billion for unfair collection of royalty. Through patents on seeds, Monsanto has become the 'Life Lord' on the planet, collecting rents from life's renewal and from farmers, the original breeders. Patents on seed are illegitimate because putting a toxic gene into a plant cell is not the 'creation' or invention of the plant. They are seeds of deception – the deception of Monsanto being the creator of seeds and life, the deception that while it sues farmers and traps them in debt, it is working for farmers' welfare and 'improving farmers lives' – the deception that GMOs feed the world. GMOs are failing to control pests and weeds, and have instead led to the emergence of super pests and super weeds. In 1995, Monsanto introduced its Bt technology in India through a joint venture with the Indian company Mahyco. In 1997–98, Monsanto started open field trials of its propriety GMO Bt Cotton illegally, and had announced it would be selling the seeds commercially the following year. India has had rules for regulating GMOs since 1989 under the Environment Protection Act. Under these rules, it is mandatory to get approval from the Genetic Engineering Approval Committee under the Ministry of Environment for GMO trials. When we found out that Monsanto had not applied for approval, the Research Foundation for Science, Technology and Ecology sued Monsanto in the Supreme Court of India. As a result, Monsanto could not start commercial sales of its Bt Cotton seeds until 2002. But it had started to change Indian agriculture before that. 'Seeds of suicide':- The entry of Monsanto in the Indian seed sector was made possible with a 1988 Seed Policy imposed by the World Bank, requiring the government of India to deregulate the seed sector. Five things changed with Monsanto's entry. First, Indian companies were locked into joint ventures and licensing arrangements, and concentration over the seed sector increased. In the case of Cotton, Monsanto now controls 95 percent of the Cotton seed market through its GMOs. Second, seed which had been the farmers' common resource became the 'intellectual property' of Monsanto, for which it started collecting royalties thus raising the costs of seed. Third, open-pollinated cotton seeds were displaced by hybrids, including GMO hybrids. A renewable resource became a non-renewable patented commodity. Fourth, cotton which had earlier been grown as a mixture with food crops now had to be grown as a monoculture, with higher vulnerability to pests, disease, drought and crop failure. Finally, Monsanto started to subvert India's regulatory processes, and in fact started to use public resources to push its non-renewable hybrids and GMOs through so-called Public Private Partnerships (PPP). The creation of seed monopolies, the destruction of alternatives, the collection of superprofits in the form of royalties, and the increasing vulnerability of monocultures has created a context for debt, suicides, and agrarian distress. I have always been critical of reductionism. I look at systems, and at contextual causation. It is this system that Monsanto has created of seed monopoly, crop monocultures and a context of debt, dependency and distress – which is driving the farmers' suicide epidemic in India. This systemic control has been intensified with Bt Cotton. That is why most suicides are in the cotton belt. The highest acreage of Bt Cotton is Maharashtra, and this is also where the highest farm suicides are. According to P Sainath, who has covered farmer suicides extensively:- 'The total number of farmers who have taken their own lives in Maharashtra since 1995 is closing in on 54 000. Of these, 33 752 have occurred in nine years since 2003, at an annual average of 3 750. The figure for 1995–2002 was 20 066 at an average of 2 508'. Suicides have increased after Bt Cotton was introduced. The price of seed jumped 8 000 percent; Monsanto's royalty extraction and the high costs of purchased seed and chemicals have created a debt trap. According to data from the Indian government, nearly 75 percent rural debt is due to purchased inputs. Farmers' debt grows as Monsanto profits grow. It is in this systemic sense that Monsanto's seeds are those of suicide. An internal advisory by the agricultural ministry of India in January 2012 had this to say to the cotton growing states in India:- 'Cotton farmers are in a deep crisis since shifting to Bt Cotton. The spate of farmer suicides in 2011–12 has been particularly severe among Bt Cotton farmers'. Moreover, after the damning report of the parliamentary committee on Bt crops, the panel of technical experts appointed by the supreme court has recommended a 10-year moratorium on field trials of all GM food and termination of all ongoing trials of transgenic crops. And the ultimate seeds of suicide are Monsanto's patented Terminator Tecnology that create sterile seed. The Convention on Biological Diversity has banned its use, otherwise Monsanto would be collecting even higher profits from it. Seed Sovereignty:- 'Monsanto is an agricultural company. We apply innovation and technology to help farmers around the world produce more while conserving more'. 'Produce more. Conserve more. Improving farmers' lives'. This is the announcement on Monsanto India's website. All the pictures are of smiling prosperous farmers from the state of Maharashtra. However, we see that the reality on the ground is completely different. Farmers are in debt and in deep distress, and have become dependent on Monsanto's seed monopoly. Most of the farmers who have committed suicide in India did so due to being trapped in debt and are in the cotton belt – which has become a suicide belt now:- the highest suicides are in Maharashtra. Monsanto's talk of 'technology' tries to hide its real objectives of ownership, where genetic engineering is just a means to control seeds and the food system through patents and intellectual property rights. A Monsanto representative admitted that they were 'the patient, diagnostician, and physician all in one' in writing the patents on life sections in the TRIPS agreement of WTO. Stopping farmers from saving seeds and exercising their seed sovereignty was the objective. Monsanto has gone very far down the road of destroying biodiversity and seed sovereignty. It is now

extending its patents to conventionally-bred seed – as in the case of broccoli and capsicum, or the low-gluten wheat it had pirated from India, which we challenged as a biopiracy case in the European Patent Office. That is why we have started Fibres of Freedom in the heart of Monsanto's Bt Cotton/suicide belt in Vidharba. We have created community seed banks with indigenous seeds and helped farmers go organic. No GMO seeds, no debt, no suicides. We save and share seeds of life and freedom – diverse, open-pollinated, GMO-free, patent-free seeds. Dr Vandana Shiva is a physicist, eco-feminist, philosopher, activist, and author of more than 20 books and 500 papers. She is the founder of the Research Foundation for Science, Technology and Ecology, and has campaigned for biodiversity, conservation and farmers' rights – winning the Right Livelihood Award (Alternative Nobel Prize) in 1993. Xxxxx. Terminator Technology is the genetic modification of plants to make them produce sterile seeds. They are also known as Suicide Seeds. Terminator's official name – used by the UN and scientists – is Genetic Use Restriction Technologies (GURTs). Although Terminator seeds are not yet being sold, in 2007 biotech companies with the support of the US Department for Agriculture were conducting greenhouse tests for future commercialization. Good for biotech companies, bad for farmers:- Terminator spells trouble for peasant farmers throughout the developing world because they would no longer be able to save seeds to re-use from one harvest to the next. Many poor farmers cannot afford to buy seeds each year. Instead, they save, swap and share seeds that have been developed over generations. If farmers have no choice but to buy new seeds every year, the companies are guaranteed large profits at the expense of poor farmers' food security. Why is it being developed? The biotech companies argue that Terminator technology will prevent the contamination of non-GM crops with GM-crops. They say that if all GM varieties had the terminator trait they would not be able to spread into the environment, and so biosafety would be ensured. However, like any other GM genes, Terminator genes could spread to other crops by cross-fertilisation and by accidental mixing. So the GM Terminator genes would themselves contaminate non GM-crops, meaning that these non-GM crops would produce sterile seeds and would no longer be GM-free. Terminator spells the end of seed diversity:- farmers in the developing world have been breeding plants for generations and in doing so, have been responsible for developing thousands of varieties that thrive in local soils and climates. Terminator technology could spell the end of locally adapted agriculture. It would diminish the range of local and native seeds that are fundamental to local food systems. In the face of climate change, conserving plants adapted to local conditions becomes crucial. Nobody knows in advance which crops or varieties are capable of surviving heat waves, floods, droughts and pest invasions – so it has never been more important for farmers to cultivate a well chosen diversity of traditional crops. Corporate control over seeds:- having fewer and fewer companies in charge of the global seed supply has serious implications for global food security. In 2006, the world's top four seed companies – Monsanto, DuPont, Syngenta and Group Limagrain – accounted for half of the global seed market. Seeds are the first and essential element of the food chain:- without seeds, there is no agriculture and therefore there is no food. In 1994, the World Trade Organisation (WTO) made it compulsory for both developed and developing countries to provide some sort of monopoly rights on seeds. No serious consideration has been given to the impact that such protection can have on food security in poor countries. The seed corporations realised that the enforcement of intellectual property rights on seeds was costly and difficult. Having a self-enforcing biological way to do this would be a much more effective way for seed corporations to protect and gain from their intellectual property. This is the aim of Terminator technology. From Terminator to zombie:- the need to uphold the ban on Terminator becomes even more urgent as biotech companies are trying to develop a new type of terminator seeds – dubbed 'zombie' seeds by environmentalists. Zombie crops would be engineered to produce sterile seeds that could be brought back to life with the right treatment – probably a chemical sold by the seed companies. Zombie seeds would force farmers not only to pay for new seeds but for chemicals to make the seeds they save viable. This would create a new perpetual monopoly for the seed industry. Hope is not yet lost:- In recognition of the serious threat to the food security and livelihoods of poor farmers in developing countries, the UN's Convention on Biodiversity (CBD) established a ban on the field test and commercialisation of Terminator technology until studies show that it doesn't pose any harm to the lives of farmers or the environment. During 2005 Progressio worked with other organisations for the ban to be upheld at the March 2006 CBD meeting. Thanks to the strong support of the British public, over 250 MPs from all parties signed an Early Day Motion 1300 asking the UK Government to support the ban. This, together with the actions taken by many others around the world, was fundamental in reinforcing the international ban on Terminator technology. But the ban did not stop biotech companies from pressing ahead with Terminator. That's why Progressio campaigned for the ban on Terminator technology to be upheld at the May 2008 CBD meeting in Berlin. / Дэлца Энд Пайн Лэнд (Delta & Pine Land). Монсэнто против Пёрси Шмайза (Monsanto v Percy Schmeiser) в Канаде, или Монсэнто против Бомэна (Monsanto v Bowman) в США. Вандана Шива (Vandana Shiva). Монсэнто (Monsanto), ДюПо (DuPont), Сингэнта (Syngenta) и Груп Лимагра (Group Limagrain).

TERM INVESTMENT GROWTH RECEIPT = РАСПИСКА О РОСТЕ СРОЧНЫХ КАПИТАЛОВЛОЖЕНИЙ (или РАСПИСКА О РОСТЕ СРОЧНЫХ ИНВЕСТИЦИЙ) – For the Canadian Term Investment Growth Receipts (TIGRs), the trust company or bank would hold the physical strip bonds and allow the holder to exchange the registered certificate for a physical strip bond.

TERMITES = ТЕРМИТЫ – In African Rice industry, Termites:- General Information:- (i) Termites are the most significant soil pests of rice in Africa. They are primarily a problem in upland Rice ecosystem but may also occur in lowland areas in light textured soils. Of the 19 Species attacking Rice in Nigeria Macrotermes Sp. is the most common and destructive. (ii) Termite damage on Rice roots can also predispose the roots to secondary infection or invasion by pathogens. Symptoms:- (i) Damage is caused by the adults (workers) that consume the roots and fill the stem with soil. The reduced translocation of water and nutrients causes the attacked plant to dry up, become stunted, and to wilt or die. (ii) Damaged plants can easily be pulled up by hand because the roots are severed. Causes of termite outbreaks:- (i) presence of termite nests around field/farm; (ii) warm and dry climatic conditions (i.e. lack of rainfall); (iii) introduction of exotic crop species. Indigenous crop species are better able to cope with termite infestation as they have evolved some level of resistance; (iv) presence of unhealthy crop species that have been subjected to biotic and abiotic stresses such as drought, weeds, diseases, etc; and (v) lack of effective termite control measures. Control:- (i) effective traditional practices against termites include:- use of bamboo stems, smoking the termite nest, use of salt, and flooding of termite nests with water; (ii) biopesticides such as neem oil, neem powder and powdered tobacco are effective against termites because they serve as potential replacement for persistent chemical pesticides, such as Carbofuran which has already been banned in several countries; (iii) the entomopathogenic fungus Metarrhizium Anisopliae is an effective biological control strategy against termite attack on upland rice; and (iv) the application of red palm oil mixed with pawpaw is an indigenous biological control practice. The mixture attracts soldier ants that attack and drive away the termites. / Под Термитами понимается Отряд Общественных Насекомых. Общины, разделённые на касты, состоят из крылатых и бескрылых особей. Строят подземные и наземные (до 15 метров высотой) гнёзда (термитники). До 2 500 Видов, главным образом в тропиках; в бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось 7 Видов. Многоядны. Разрушают древесину, портят бумагу, кожу, сельскохозяйственные продукты и другое. Термиты, обитающие в почве, полезны как почвообразователи.

TERM LIFE INSURANCE = СРОЧНОЕ СТРАХОВАНИЕ ЖИЗНИ – Term Life Insurance:- a life insurance policy that pays the sum insured only if the life assured dies within the period of the policy which is for a fixed period. / Полис страхования жизни, предусматривающий выплату страховой суммы только в случае смерти застрахованного лица в период действия данного полиса, причём сам такой полис оформляется на какой-то фиксированный период времени. Срочное Страхование Жизни –

разновидность страхования жизни на определённый срок. От владельца полиса требуется внести только сумму страхования на случай смерти, то есть наличные средства не накапливаются, как в случае страхования жизни вплоть до смерти владельца (whole life insurance). Каждый раз при обновлении полиса сумма страхового взноса повышается, поскольку страхователь становится старше и статистическая вероятность его смерти увеличивается. Срочное страхование жизни значительно дешевле, чем полис страхования жизни вплоть до смерти владельца, что даёт владельцам полисов альтернативную возможность использовать сбережения для проведения собственных инвестиций.

TERM OF ART = ТЕРМИН ИСКУССТВА – Term Of Art is an expression or phrase that has a defined meaning when used in a particular context or knowledge environment, such as the patenting process, pharmaceuticals, computers, etc. For example, (i) 'Comprising' is a term of art used in claim language which means that the named elements are essential in describing the invention; and (ii) the word 'Claim' in the patent context is definitely a term of art. The term 'Art', for the purposes of the Canadian Patent Act, pertains to the application of knowledge to effect a desired result. To be statutory, an 'art' must belong to a field of technology and, consequently, be what the courts have termed a 'useful art' and a 'manual or productive art'. An art must be the practical application of knowledge, and must therefore be defined in a manner that gives practical effect to the knowledge. An art, therefore, is claimed as either a method or a use. A statutory 'method' must be an act or series of acts performed by some physical agent upon some physical object and producing in that object some change of either character or condition. Whether or not a method is statutory is not determined by whether or not it produces a statutory product. A 'use' is the application of certain means to achieve a specific result. A 'use' differs from a 'method' in that the contribution to the art must not be resident in the act or series of acts by which the result is achieved, but rather must arise solely from the recognition that the certain means can be applied (in an obvious way) to achieve the specific result see 12.06.08 for further guidance on 'use' claims.

TERMS OF BUSINESS AGREEMENT = СОГЛАШЕНИЕ О ПОРЯДКАХ ВЕДЕНИЯ БИЗНЕСА (или ПОРЯДКИ ДЕЛОВОГО СОГЛАШЕНИЯ) – Terms Of Business Agreement:- each Lloyd's broker that wishes to do business with a managing agent must enter into an agreement with the managing agent which records the general terms and conditions on which business will be conducted between them. / Соглашение О Порядках Ведения Дела или Порядки Делового Соглашения:- каждый брокер Лойдз, который желает заниматься делом с управляющим агентом, должен вступить в соглашение с управляющим агентом, которое прописывает генеральные порядки и условия, на которых будет вестись данное дело между ними.

TERMS OF FREIGHT = ПОРЯДКИ ФРАХТА (или ТЕРМИНЫ ФРАХТА) – Terms Of Freight:- all the conditions agreed upon between a carrier and a merchant about the type of freight and charges due to the carrier and whether these are prepaid or are to be collected. Note:- the so-called COMBITERMS based on the INCOTERMS® do make a distinction what of the freight and related costs is to be paid by the seller and what by the buyer. In the UN recommendation 23 a coding system is recommended to recognize the various items. / Все условия, оговорённые между перевозчиком и коммерсантом, в отношении типа фрахта и сборов, причитаемых данному перевозчику, и которые должны быть оплачены либо предварительно, либо по прибытии. Примечание:- так называемые КОМБИТЁРМЗ (COMBITERMS), основанные на ИНКОТЁРМЗ® (INCOTERMS®), вносят различия в отношении того, на каком этапе фрахт и связанные с ним расходы должны оплачиваться продавцом, а на каком – покупателем. В соответствии с Рекомендацией ООН № 23 было рекомендовано признавать различные положения.

TERMS OF PAYMENT = ПОРЯДКИ ОПЛАТЫ – The Terms of Payment (PAYTERMS) apply to commercial transactions relating to the provision of goods and/or services. An important part of a contract of sale is the conditions of payment under which the buyer will extinguish his or her debt to the seller. Lack of precision in terms of payment and different interpretations of such terms are known to give rise to disputes between trade partners. Requirements which must be fulfilled in order that a payment may be considered a valid means of extinguishing the debt to which it relates, and normally including statements regarding time-limit for payment, method of payment (whether or not involving a guarantee), the amount to be paid and the place where payment should be effected; it is understood that the terms do not prejudge the legal interpretation of these statements. / Порядки Оплаты (в Англоязычном исполнении могут употребляться как сокращение ПЭЙТЁРМЗ (PAYTERMS)) применяются в коммерческих сделках, связанных с предоставлением товаров и/или услуг. Важной частью контракта купли-продажи служат условия платежа, на которых покупатель погасит свой долг продавцу. Отсутствие точности в порядках оплаты и различные интерпретации таких порядков могут вызвать споры между партнёрами по сделке. Требования, которые должны быть выполнены с тем, чтобы платёж мог рассматриваться действительным, означают погашение долга соответствующему лицу и включают, обычно, такие параметры, как предельный срок оплаты, метод оплаты (с использованием или без использования гарантии), сумму, подлежащую оплате, место, в котором платёж должен быть произведён. При этом подразумевается, что сами порядки не предрешают интерпретации этих параметров с юридической точки зрения.

TERMS OF TRADE = ПОРЯДКИ ТОРГОВЛИ – Terms Of Trade:- a ratio of the change in export prices to the change in import prices. An increase in the terms of trade implies that the receipts from the same quantity of exports will finance an increased volume of imports. Thus measurement of real national disposable income needs to take account of this factor. Terms Of Trade:- the relationship over time between the price of a countries exports to the price of its imports.

TERMS SHEET = ЛИСТОК С ПОРЯДКАМИ – Terms Sheet is a document outlining the investment terms of a particular investment opportunity. It defines the terms and conditions of an investment, usually as dictated by an investor. It is the negotiating document that the parties must jointly agree to before a definitive investment agreement can be drafted.

TERM TRANSACTION = СРОЧНАЯ ТРАНЗАКЦИЯ (или СРОЧНАЯ ОПЕРАЦИЯ) – Term Transactions are the transactions with a fixed maturity date. / Операции или сделки с фиксированной датой исполнения.

TERP = TOBACCO EQUITY REDUCTION PROGRAM

TERPOLYMER = ТЕРПОЛИМЕР – Terpolymer is a product of the polymerization of three different monomers.

TERPS = TERMINAL INSTRUMENT PROCEDURES

TERRACE = ТЕРРАСА – Terrace is:- (1) bench-like portions of a former flat river floodplain left at higher levels by the downcutting action of a river; alluvial terraces and river terraces are generally considered as synonymous. (2) An artificially leveled field or series of fields made on sloping land. / Под Террасами, от Французского слова Terrasse, понимаются горизонтальные или несколько наклонные выровненные площадки на склонах речных долин, берегах озёр и морей, ограниченные уступами сверху и снизу. Образуются под действием проточной воды (речные террасы) или волн водоёмов (озёрные и морские террасы) на фоне неравномерных тектонических поднятий, климатических колебаний и изменений уровня воды в бассейне.

TERRA–COTTA = ТЭРРАКОТОВОЕ – Terra-Cotta:- brownish orange.

TERRESTRIAL = НАЗЕМНОЕ (или СУХОПУТНОЕ, или ЖИВУЩЕЕ НА или В ЗЕМЛЕ) – Terrestrial:- growing in or on the ground.

TERRESTRIAL PLANTS = НАЗЕМНЫЕ РАСТЕНИЯ – Terrestrial Plants are any plants (including epiphytic plants), except marine plants.

TERRITORIAL WATERS = ТЕРРИТОРИАЛЬНЫЕ ВОДЫ – Territorial Waters is that portion of the sea up to a limited instance which is immediately adjacent to the shores of any country and over which the sovereignty and exclusive jurisdiction of that country extend. / Территориальные Воды (Территориальное Море), морские воды, примыкающие к сухопутной территории или внутренним водам государства, входящие в состав его территории и находящиеся под его суверенитетом. Режим территориальных вод регулируется внутренним законодательством и Конвенцией ООН по Морскому Праву 1982. Эта конвенция установила для прибрежных государств ширину прибрежной морской полосы в 12 морских миль. В России ширина территориальных вод также составляет 12 морских миль. Ширина территориальных вод отсчитывается от линии наибольшего отлива как на материке, так и на островах. Для определения этой линии возможно также использование метода прямых исходных линий, который может применяться в местах, где линия берега глубоко изрезана и извилиста или где вдоль берега в непосредственной близости лежит цепь островов. Территориальные воды государства-архипелага начинаются за пределами его архипелажных вод. Ширина территориальных вод определяется прибрежным (или архипелажным) государством самостоятельно, но с учётом общепризнанных принципов и норм международного права. Прибрежное государство (государство-архипелаг) осуществляет полный суверенитет над территориальными водами, а также над воздушным пространством над ними и над морским дном и его недрами под ними. Территориальные воды отдельных принадлежащих какому-либо государству островов, находящихся за пределами общей внешней границы его территориальных вод, определяются в соответствии с положениями Раздела II Конвенции о Территориальном Море 1958 и Часте II и VIII Конвенции 1982. Порядок определения территориальных вод государств-архипелагов предусмотрен Частью IV Конвенции 1982. Обе упомянутые конвенции предусматривают право мирного прохода морских судов всех флагов через территориальные воды любого государства.

TERRITORY WOOL = ШЕРСТЬ ИЗ (ОПРЕДЕЛЁННОЙ) ТЕРРИТОРИИ (или ТЕРРИТОРИАЛЬНАЯ ШЕРСТЬ) – Territory Wool is a designation originally given to wools originating in regions west of the Missouri River. Now applies to western range wools, not including Texas and California.

TERRORISM = ТЕРРОРИЗМ – Terrorism is:- (i) any act of terrorism arising directly or indirectly out of or in any way connected with biological, chemical, radioactive, or nuclear pollution or contamination or explosion; or (ii) any action controlling, preventing, suppressing, retaliating against or responding to any act referred to in (i) above. An act of terrorism includes, but is not limited to, any act, preparation in respect of action or threat of action, designed to:- (i) influence a government or any political division within it for any purpose; and/or (ii) influence or intimidate the public or any section of the public with the intention of advancing a political, religious, ideological or similar purpose

TERRY CLOTH = МАХРОВОЕ ПОЛОТНО (или ЛОХМАТАЯ ТКАНЬ) – Terry Cloth is a typical uncut pile weave fabric. This fabric is formed by using two sets of warp yarns. One set of warp yarns is under very little tension; when the filling yarns are packed into place, these loose yarns are pushed backward along with the filling yarns, and loops are formed. Typical uses include towels, robes, and apparel. Terrycloth, Terry Cloth, Terry Towelling, Terry, or simply Towelling is a fabric with loops that can absorb large amounts of water. It can be manufactured by weaving or knitting. Towelling is woven on special looms that have two beams of longitudinal warp through which the filler or weft is fired laterally. The first industrial production of terrycloth towels was by the English manufacturer Christy company (also known as Christy UK and Christy Towels) is a long-established manufacturer of household linens and is known as the inventor of the first industrially produced looped cotton (terrycloth) towel. It was founded in 1850 in the mill town of Droylsden, Lancashire (now part of Great Manchester). There are two types of terry fabrics:- (i) Towell Terry is a woven fabric with long loops that can absorb large amounts of water. Its content is usually 100% cotton, but may sometimes contain polyester. (ii) French Terry is a fabric, used in men's, women's and children's clothes. One of its sides is flat, while the other side is with cross loops. It is either 100% cotton or contains polyester with elastaine (lycra). It is often warp knitted, and the term French Terry is colloquially used for all warp knitted Terry. It is the length of loops that determines how much fluid is absorbed by the cloth as longer loops provide more surface area to absorb and come in contact with the fluid. Items that may be made from terrycloth include babies' nappies (UK English) or reusable diapers (US English), towels, bathrobes, bedlinen, and sweatbands for the wrist or head. Terrycloth is also sometimes used to make sweat jackets. Terry toweling hats with a shallow brim were once popular with cricketers (like English wicketkeeper Jack Russell) but are no longer in fashion. An alternative fabric used for towels is waffle fabric. A modern synthetic alternative is microfiber. Terry Cloth is a cotton or cotton and man-made fiber fabric with a looped pile on one or both sides. It is made into towels for drying after a bath. It may also be used for dish towels. Terry Cloth or Turkish Toweling is a fabric composed entirely of cotton yarns. In effect it is a single cloth, having rows of loops, formed by warp yarn, in regular order, on each side of the cloth. In making this fabric, it is necessary to use two beams. No. 1 or the bottom beam contains the warp for making the body or ground of the cloth. No. 2, the top or terry beam, contains the warp for making the loops in the cloth or terry effect. Terry cloth is used in the manufacture of towels and Turkish bath robes, and, as to color, there are solid bleached towels, towels having side and cross border color effects, also stripe patterns for the bath robes, favorite colors being navy blue, old gold, cherry red, light green, etc. The warps are of 2/20's to 2/30's cotton and the filling 1/20's to 1/30's cotton. Terry cloth is a narrow fabric measuring about 25 inches from loom and can be made on the roller or cam loom or the dobby or Jacquard loom, either style of loom of course having the terry motion attached; the Jacquard machine being only necessary in making fancy border effects in conjunction with the filling box motion. Very good cross border patterns are produced on a mutual, loom, having terry motion and dobby attached. The terry weave is the three harness twill weave dissected, and the different parts of this weave placed together again in such a manner as to permit the forming of a series of loops on each side of the cloth in regular order, by the top or terry warp weaving slack, using only sufficient weight to permit of correct shedding. In making terry on a roller or cam loom, four harnesses and four cams are necessary, two cams being warp, effect and two cams filling effect. The top beam containing terry warp is drawn in on first and third harnesses and the bottom or ground warp on second and fourth harness, reeded two ends per split and placed in the loom, the first and third harnesses being strapped up to the first roller, the second and fourth harnesses being strapped up to the second roller. The harnesses are then connected with the treadles at the bottom of loom by means of jack straps, these treadles being in turn operated by the cams, which are set on a cam shaft. The terry motion is arranged thus:- at the bottom of the loom, near the side, there is a treadle, suspended in much the same manner as the cam treadles. To the treadle there is an iron (^ inch) rod attached and running up the inside of the loom and connected with an iron lever, which works upon a fulcrum, bolted to the loom side, the loom driving shaft rests in box or bearing on the side of the loom. This box is so shaped that it allows the shaft an eccentric motion, when the terry treadle is forced down by a cam, placed on the lower loom shaft for the purpose. When the terry cam, revolving on the lower loom shaft, strikes the terry treadle, the rod connected thereto pulls down on the lever connected with the box in which is resting the driving shaft, the whole action throws the loom shaft and loom sley forward out of line, and the top warp working slack the reed draws the yarn through; then the terry treadle regaining its original position, the loom shaft settles back to its correct position and the next pick of the loom binds in the slack warp, thus forming the loop in the cloth – the terry motion in this case working for two picks and stopping for one. In weaving toweling on a roller loom, it being of short lengths of terry, the weaver allows the

cloth to weave terry for any desired length, and to weave solid cloth without the loop. He throws the terry motion out of gear by dropping an iron finger down on the treadle. This holds the terry treadle out of the way of the revolving terry cam. This iron finger is usually either raised or lowered by means of a cord, fastened to the inner side of the breast beam and near the end of the loom. This finger can be worked automatically by the use of a dobby motion or Jacquard machine. The terry warp, by weaving slack and forming the loops, will weave out at the rate of about 100 per cent faster than the ground warp. It is then replaced by twisting another warp to it, this operation taking place at the loom and without removing the harnesses. A good grade of terry cloth can be made as follows:- Reed – 900, two ends per dent, 27 inches in reed; 2/30's cotton ground warp; 2/30's cotton terry warp; 1/30's cotton filling; 30 picks. Width from loom, 25 inches. To be drawn and woven as. stated above for a roller loom. Terry Cloth is a fabric with loops that can absorb large amounts of water used for home décor, summer apparel, towels, robes or bedlinens. It is easy to wash and does not require ironing. Terry Cloth is a pile fabric, typically cotton, with loops that are able to absorb large amounts of liquids. Terry cloth is manufactured through one of two methods, weaving or knitting. The predominant commercial method is weaving on a dobby loom. Terry cloth became available to consumers in the general public in the late XIX century. Cotton Terry Cloth:- the majority of terry cloth is made with cotton. Manufactures choose cotton because, unlike other materials that get weaker in water, cotton's absorbent fiber gets stronger when wet. Cotton can also be sanitized in hot water, using both bleach and detergent, without harm. Loop pile not only acts like sponges, but also can withstand rubbing, pulling, twisting and tugging. Another bonus to using cotton is that it can absorb 27 times its own weight in water. History of Terry Cloth:- the very first terry cloth was made in 1841 in France, out of silk. By 1845 in England, John Bright had begun making worsted terry cloth. In 1848 the first terry cloth was made out of cotton in England by Samuel Holt. Holt then patented the process in England and the United States. In 1864, Holt left London and came to the United States, where he opened a plant in New Jersey to manufacture the cotton terry cloth. Within two years, the company had sold the patents to the cotton terry cloth for USD250 000. How Terry Cloth Is Produced:- terry cloth has to first be made into a fabric, and is done through warping and weaving. Longitudinal threads are warped across a beam while at the same time latitudinal threads are woven over and under them. Manufactures use coatings of starch or wax to make the warp threads easier to weave. Terry cloth can only be woven using two warp beams; the ground warp is used to form the base of the towel while the pile warp is used to create the loops of thread that produce the texture and function. Benefits of Terry Cloth:- the terry cloth has benefits for manufacturers and consumers. Manufacturers find that cotton gives them flexibility to dye, allowing them to offer terry cloth products in several colors. For consumers it is easy to clean, can withstand high temperatures, and does not shrink with washing. Terry cloth is light, washable, comfortable and, most importantly, absorbent. Made From Terry Cloth:- the most common items made out of terry cloth include towels, bath robes, and beach cover ups. In recent years, terry cloth has been used in clothing and exercise wear. Many people purchase terry cloth towels and bath robes because they are more absorbent than the average towel or robe. Terry Cloth is a cotton or cotton-blend fabric having uncut loops on one or both sides. Made on a dobby loom with a terry arrangement or on a Jacquard loom. It is used for toweling, beach robes, etc. Terry Cloth is a type of cloth that features loops and soft piles of yarns, resulting in very absorbent, moisture wicking material. Almost everyone recognizes terry cloth, and we most commonly see the material used for bath towels, hand towels and the like. The way the fabric is made is perfect for drying off the body after baths, showers or swimming. Conversely, French terry can be called a version of terry cloth, most commonly used in clothing. There are several differences between this material and more standard terry cloth. First, French terry tends to feature looping and piling of the fabric on one side only. The other side of the fabric has a flat unlooped back. Second, and perhaps one of the most valuable features of the material, is its stretch. The fabric could be called Stretchy or Jersey Terry Cloth. You can find the occasional French terry towel, frequently ones especially designed for putting up the hair in a turban style after a shower. Yet you're much more likely to see it used in clothing. For many years now, women have especially enjoyed robes made of this material in a variety of lengths and styles. These are usually preferred to standard terry cloth robes that may be worn in the winter because they are much lighter and cooler. You may also find stretchy terry swimsuit cover-ups that will help dry the body more quickly after a quick swim. French terry is popular in sporty or casual clothing, such as in the athletic two-piece or jogging suit, made for jogging on cooler days. This suit is a great alternative to the warmer velour suits worn in the winter months. You'll also see French terry in clothing like shorts and athletic shirts. For a while in the early 1980s, terry cloth shorts, shirts, and tank tops were popular wear not just for athletics, but more for summer mainstream clothing. Another common use of French terry is in infant and toddler clothing. Footed and non-footed one-piece pajamas are often made in the fabric. Like the jogging suit made of this material, stretchy one-piece suits for young children are much more comfortable for use as weather turns warmer. A little stretch to the fabric accommodates a growing child, at least for a while. If you buy a terry outfit for a little one, you can always buy it a size larger to get a bit more wear out of the garment. The moisture wicking nature of stretchy terry cloth has inspired other athletic clothing. You can now find French terry yoga or Pilates pants, which some feel are some of the most comfortable to wear for workouts. The fabric is still most used in infant clothing, workout clothes, and in light summer robes. The name 'Terry' comes from the French word 'Tirer', which means to pull out, referring to the pile loops which were pulled out by hand to make absorbent traditional toweling. Latin 'Vellus', meaning hair, has the derivation 'Velour', which is the toweling with cut loops. In research conducted on terry weaving by the Manchester Textile Institute, it was concluded that original terry weaving was likely the result of defective weaving. This research indicates that this development occurred in Turkey, probably in Bursa City, one of the major traditional textile centers in Turkey. Terry weaving construction is considered a later development in the evolution of woven fabrics. Terry toweling is still known as 'Turk Fabric', 'Turkish Toweling' or 'Turkish Terry'. Terrycloth is a type of pile fabric which is famous for its softness and high absorbency. It is often used for towels and bathrobes, and it may be utilized to make athletic warmups and other accessories. Many department stores carry items made from terrycloth, and it is also possible to purchase this fabric by the yard for the purpose of making custom towels, robes, and other objects. Many sewing suppliers carry terrycloth, and it can also be ordered online or directly from manufacturers. This fabric can be produced through weaving or knitting, with weaving being common for commercially produced terrycloth. In either case, the fabric is characterized by thick, uncut loops which form a soft pile on one or both sides of the fabric. The loops increase the absorbency of the fabric by making more surface area available, and they also tend to make the fabric more heavy, as more thread is required to make the material. Cotton is a material of choice for terrycloth, since it is highly absorbent and easy to work with. It is also possible to use bamboo or linen, along with artificial fibers which have been designed for absorbency. The level of softness will be determined by the fiber used, and the color can easily be adjusted with dyes. Terrycloth can also be patterned by printing or using multicolored thread, and it can be decoratively embroidered as well. Industrially, terrycloth is made on a dobby loom, a specialized loom which allows for greater control of the tension of the threads. People can also knit or weave it by hand, using several different techniques, although handmade terrycloth is time consuming to make. Industrial methods of manufacture have been in use since the mid-1800s, which is around the time that this specialized fabric began to achieve widespread popularity. One of the big problems with terrycloth is that if the loops become caught in something and tear out, they can tear a whole line of loops with them, causing the fabric to become thin and structurally unstable. The fabric can also become ragged with torn ends if it is not cared for properly. The loops are also subject to uneven wear, which can made the fabric stiff or threadbare in some places and perfectly plush in others. Regularly rotating terrycloth products so that they do not see sustained heavy use is a good idea, as is following the care directions on their labels to ensure that the fabric stays in good condition. Terry Cloth is a looped pile fabric that is either woven or knitted. Very absorbent and used for towels, etc. French terry cloth is looped on one side and sheared pile on the other. Construction:- terry towels are woven as 2, 3, 4, 5 or more

pick terry weaves. The most common type is 3-pick terry toweling. Warps are divided into two systems, pile warps and ground warps, whereas weft consist of only one system. In basic Turkish Toweling, front side and back side pile warps and 1st and 2nd ground warps ends form a 2/1 rib weave with each other. The rib weave which is formed by the pile warps is one pick ahead of the rib weave which is formed by ground warp ends. Warps are ordered throughout the fabric width 1:1 or 2:2 pile and ground warps. In 1:1 warp order each ground warp end is followed by a pile warp end while in 2:2 warp order each two ground warp ends are followed by two pile warp ends. The weft count used for toweling is between 15 and 25 picks/cm. And warp count is between 20 and 30 ends/cm. During the weaving of borders, the weft count is increased 3 to 6 times the density in the pile areas. Pile/ground ratio is described as the length of pile warp per unit length of fabric in the warp direction. A practical way to find out this ratio is done by measuring a 10 cm length of toweling in the warp direction, then cut the pile warp from either ends of the measured length and measure the total length of the removed pile end per 10 cm length of fabric. Pile warp length per 10 cm fabric is usually between 20–100 cm. This ratio has a direct effect on the fabric weight and thickness. As the ratio increased, the weight and the thickness of the terry fabric increases. Terry Cloth Regular Weight – 9 oz or oz/sq.yd (305 g/sq.m (or GSM)). Terry Cloth (60" (or 152.4 cm) wide):- (i) Medium Weight – 10 oz or oz/sq.yd (339 g/sq.m (or GSM)); and (ii) Heavy Weight – 14 oz or oz/sq.yd (475 g/sq.m (or GSM)) and more up to 23.6 oz or oz/sq.yd (800 g/sq.m (or GSM); known as Luxury Hotel Quality). Terry:- an absorbent fabric with loops forming the pile; also called Terry Cloth. Terry Cloth:- pile, also Jacquard and dobby combined with pile. Either all over loops on both sides of the fabric or patterned loops on both sides. Formed with an extra warp yarn. Long wearing, easy to launder and requires no ironing. May be bleached, dyed, or printed. Better qualities have a close, firm, underweave, with very close loops. Very absorbent, and the longer the loop, the greater the absorbency. When the pile is only on one side, it is called Turkish Towelling. / уточина. Крысти (Christy). Дьжяк Расэл (Jack Russell). Жакяр (Jacquard). К 1845 в Англии, Дьжон Брайт (John Bright) начал вырабатывать ххх махровое полотно (worsted terry cloth). В 1848 в Англии из хлопка Сэмьюэлом Холтом (Samuel Holt) было выработано первое махровое полотно. Махровое Полотно представляет собой типичную тканую ткань с неразрезным ворсом. Эта ткань формируется с помощью двух комплектов основной пряжи. Один комплект основной пряжи имеет очень маленькое натяжение; когда уточная пряжа прокладывается соответствующим образом в данной ткани, то пряжа с ослабленным натяжением проталкивается в обратном порядке, формируя, таким образом, петли. Такое полотно обычно используют в производстве полотенец, халатов и другой одежды. Махровое Полотно (известное в Английском языке как Terrycloth или Terry Cloth), а также Махровое Полотенечное Полотно (Terry Towelling), Махра (Terry), или просто как Полотенечное Полотно (Towelling) представляет собой ткань с петлями, которые могут абсорбировать (поглощать) большие количества воды. Она может быть изготовлена посредством ткачества или вязания. Полотенечное полотно ткётся на специальных ткацких станках, которые имеют два навоя с продольными нитями основы, поперёк которых должным образом прокладывается уточина (или уток). Первое промышленное производство полотенец из махрового полотна было налажено Английским изготовителем – компанией Крысти (Christy; известной также как Крысти Ю.Кей. (Christy UK) и Полотенца от Крысти (Christy Towels)), которая существует достаточно давно в качестве изготовителя домашнего белья, и известная как изобретатель первого промышленно произведённого петельного полотенца из хлопкового махрового полотна. Она была основана в 1850 в фабричном городке Дройлсден, Графство Ланкашир (Droylsden, Lancashire; сейчас являющегося частью Великого или Большого Манчестера (Great Manchester). Существуют два типа махровых тканей:- (i) Полотенечная Махра (Towell Terry), которая является тканой тканью с длинными петлями, которые могут абсорбировать (поглощать) большие количества воды. В её состав входит обычно 100% хлопка, хотя иногда может содержать и полиэстер. В последнее время стало также активно использоваться вискозное бамбуковое (иногда называемое и искусственным, в зависимости от того, каким способом было изготовлено данное волокно) и вискозное модальное (выработанное из бука) волокно. (ii) Французская Махра (French Terry), называемая также Турецкое Полотенечное Полотно (Turkish Towelling), которая является тканью, используемой в производстве мужской, женской и детской одежды. Одна из её сторон гладкая (flat), в то время как другая сторона с путаными (или поперечными) петлями (cross loops). Она либо на 100% состоит из хлопка, либо содержит полиэстер с эластаном (лайкрой). Она зачастую основовязаная, а сам термин Французская Махра используется в разговорном плане для всей основовязаной махры (warp knitted terry). Длина петель определяет то, как много жидкости может быть абсорбировано (поглощено) данным полотном; чем длиннее петли, тем большую область поверхности они создают для абсорбирования (впитывания) и вовлечения в контакт с жидкостью. Изделия, которые могут быть сделаны из махрового полотна, включают детские пелёнки (babies' nappies (Английский СК)) или пелёнки многократного использования (reusable diapers (Английский США)), полотенца (towels), банные халаты (bathrobes), постельное бельё (bedlinen), и спортивные потнички (sweatbands) для запястья или головы. Махровое полотно используется также иногда для производства толстовок (или курток или мягких жакетов (sweat jackets)). Шляпы из махрового полотенечного полотна (terry toweling hats) с мелкими или неглубокими полями (shallow brim) когда-то даже были популярны среди игроков в крикет (cricketers; как у Английского ловящего мяч за воротцами Дьжяка Расэла (like English wicketkeeper Jack Russell), но сейчас они больше не в моде. В качестве альтернативной ткани, используемой для полотенец, выступает вафельная ткань (waffle fabric). Современной синтетической альтернативой махровому полотну служит микроволокно (microfiber). Махровое Полотно – ткань из хлопка или из хлопка и искусственных волокон с петлистым ворсом на одной или обеих сторонах. Оно используется в производстве полотенец для обсушивания после бани. Оно может быть использовано также и для посудных полотенец. Махровое Полотно (Terry Cloth) или, часто называемое как Турецкое Полотенечное Полотно (Turkish Toweling) является тканью, полностью произведённой из хлопковой пряжи. По сути, оно является одиночной тканью (single cloth), имеющей ряды петель, сформированных пряжей основы (warp yarn), в регулярном порядке на каждой стороне этого полотна. Для производства этой ткани необходимо использовать два навоя (beams). № 1 или нижний навой (bottom beam) содержит основу для производства тела (body) или грунта (ground) данного полотна. № 2, верхний (the top) или навой махры (terry beam), содержит основу для производства петель в данном полотне или для махрового эффекта (terry effect). Махровое полотно используется в производстве полотенец (towels) и Турецких банных халатов (Turkish bath robes), а что касается цвета, то существуют прочно отбеленные полотенца (solid bleached towels), полотенца, имеющие цветовые эффекты в виде продольных и поперечных бордюров (side and cross border), а также узоров в виде полосок (stripe patterns) для банных халатов, излюбленными цветами считаются тёмно-синий (navy blue), цвет старого (или червонного) золота (old gold), вишнёво-красный (cherry red), светло-зелёный (light green) и так далее. Для основ махрового полотна используется хлопковая пряжа Английских номеров (Ne) от 2/20's до 2/30's (Метрических номеров (Nm) от 33.9/2s до 50.8/2s соответственно; 2 – означает то, что пряжа выработана сложением 2 нитей, а s – направление крутки), а для уточин – хлопковая пряжа Английских номеров от 1/20's до 1/30's (Метрических номеров от 33.9/1s до 50.8/1s соответственно; 1 – означает то, что пряжа однониточная, а s – направление крутки). Махровое полотно вырабатывалось ранее, как правило, в виде узкой ткани, выходящей в суровом виде с ткацкого станка шириной 25 дюймов (63.5 сантиметра; в настоящее время махровые полотна вырабатываются, как правило, шириной от 59 до 87 дюймов (от 150 до 220 сантиметров). Махровое полотно вырабатывается на валичных (или барабанных) или камерных ткацких станках (roller or cam looms) и на кареточных или Жаккардовых ткацких станках (dobby or Jacquard looms), и на любом стиле ткацких станков, имеющих, конечно же, присоединённый механизм выработки махровой ткани (the terry motion attached); Жаккардовые машины используются только лишь в производстве махрового полотна с эффектом узорного бордюра (fancy border effects) совместно с

механизмом смены уточных челноков (filling box motion). Очень хорошие узоры в виде поперечных бордюров (cross border patterns) производятся на совмещённых ткацких станках (mutual looms), имеющих присоединённые механизм выработки махровой ткани (the terry motion attached) и каретку (dobby attached). Махровое переплетение (terry weave) является разобранным (или вскрытым) трёхремизным саржевым переплетением (the three harness twill weave dissected), и различные части этого переплетения, размещённые вместе снова таким образом, чтобы позволить формирование серий петель на каждой стороне данного полотна в регулярном порядке, by the top or terry warp weaving slack, используя лишь достаточный вес для достижения правильного зевообразования (correct shedding). При выработке махры на валичных (или барабанных) или камерных ткацких станках (roller or cam looms) необходимы четыре ремизки (harnesses) и четыре камеры (cams), из которых две камеры отвечают за основный эффект (two cams being warp effect) и две других – за уточный эффект (filling effect). Верхний навой (top beam), содержащий основу махры (terry warp) проходит через первую и третью ремизки (is drawn in on first and third harnesses), а нижняя или грунтовая основа (bottom or ground warp) – через вторую и четвёртую ремизки (on second and fourth harnesses), reeded two ends per split и размещены (placed) в ткацком станке, первая и третья ремизки being strapped up to the first roller, а вторая и четёртая ремизки being strapped up to the second roller. Затем ремизки соединены с подножками (connected with the treadles) внизу ткацкого станка (at the bottom of loom) посредством xxxxx (jack straps), эти подножки being in turn operated by the cams, which are set on a cam shaft. The terry motion is arranged thus:- at the bottom of the loom, near the side, there is a treadle, suspended in much the same manner as the cam treadles. To the treadle there is an iron (^ inch) rod attached and running up the inside of the loom and connected with an iron lever, which works upon a fulcrum, bolted to the loom side, the loom driving shaft rests in box or bearing on the side of the loom. This box is so shaped that it allows the shaft an eccentric motion, when the terry treadle is forced down by a cam, placed on the lower loom shaft for the purpose. When the terry cam, revolving on the lower loom shaft, strikes the terry treadle, the rod connected thereto pulls down on the lever connected with the box in which is resting the driving shaft, the whole action throws the loom shaft and loom sley forward out of line, and the top warp working slack the reed draws the yarn through; then the terry treadle regaining its original position, the loom shaft settles back to its correct position and the next pick of the loom binds in the slack warp, thus forming the loop in the cloth – the terry motion in this case working for two picks and stopping for one. In weaving toweling on a roller loom, it being of short lengths of terry, the weaver allows the cloth to weave terry for any desired length, and to weave solid cloth without the loop. He throws the terry motion out of gear by dropping an iron finger down on the treadle. This holds the terry treadle out of the way of the revolving terry cam. This iron finger is usually either raised or lowered by means of a cord, fastened to the inner side of the breast beam and near the end of the loom. This finger can be worked автоматически посредством использования кареточного устройства (dobby motion) или Жаккардовой машины (Jacquard machine). The terry warp, by weaving slack and forming the loops, will weave out at the rate of about 100 per cent faster than the ground warp. It is then replaced by twisting another warp to it, this operation taking place at the loom and without removing the harnesses. Хороший сорт махрового полотна может быть сделан со следующими параметрами:- бёрдо (reed) – 900, две продольные нити на зуб (two ends per dent), 27 дюймов в бёрдо (27 inches in reed); хлопковая пряжа для грунтовой основы (ground warp) Ne 2/30's (Nm 50.8/2s); хлопковая пряжа для основы махры (terry warp) Ne 2/30's (Nm 50.8/2s); хлопковая уточина (filling) Ne 1/30's (Nm 50.8/1s); количество поперечных нитей (picks):- 30. Ширина в суровом виде с ткацкого станка (width from loom):- 25 дюймов (inches; или 63.5 сантиметра). Должно быть вытянуто (drawn) и соткано, как указывалось выше, на валичном (или барабанном) ткацком станке (roller loom). Махровое Полотно – ткань с петельками, которые могут абсорбировать (впитывать) большие количества воды, используемое для домашнего убранства (home décor), летней одежды (summer apparel), полотенец (towels), халатов (robes) или постельного белья (bedlinens). Легко в стирке и не требует глажения (ironing). Махровое Полотно – ворсовая ткань, как правило, из хлопка, с петельками, которые способны абсорбировать (впитывать) большие количества жидкостей. Махровое полотно вырабатывается одним из двух методов, ткачеством или вязанием. Преобладающий коммерческий метод – ткачество на кареточном ткацком станке (dobby loom). Махровое полотно стало доступным рядовым потребителям в конце XIX столетия. Хлопковое Махровое Полотно:- большая часть махрового полотна делается из хлопкового волокна. Изготовители выбирают хлопок потому, что в отличие от других материалов, которые слабеют в воде, абсорбентное волокно из хлопка во влажном состоянии становится ещё прочнее. Хлопок также может быть подвергнут санитарной обработке в горячей воде (be sanitized in hot water), с использованием как отбеливателя (bleach), так и моющего средства (detergent), без причинения ему вреда. Петельный ворс (loop pile) действует не только как губки (sponges), но может также противостоять истиранию (или разглаживанию) (rubbing), выщипыванию (или выдёргиванию или вытягиванию) (pulling), скручиванию (twisting) и одёргиванию (tugging). Другим преимуществом для использования хлопка служит то, что он может абсорбировать в 27 раз большего своего собственного веса в воде (its own weight in water). История Махрового Полотна:- самое первое махровое полотно было сделано из шёлка в 1841 во Франции. К 1845 в Англии, Дьжон Брайт (John Bright) начал изготавливать камвольное махровое полотно (worsted terry cloth). В 1848 в Англии Сэмьюэлом Холтом (Samuel Holt) было сделано первое махровое полотно из хлопка. Холт затем запатентовал этот процесс в Англии и Соединённых Штатах Америки. В 1864, Холт покинул Лондон и уехал в Соединённые Штаты, и открыл там завод в Нью Джерси (New Jersey) по изготовлению махрового полотна из хлопка. В течение двух лет через свою компанию он распродал патенты на махровое полотно из хлопка на сумму в USD250 000 (USD – Доллар США). Как Производится Махровое Полотно:- прежде всего махровое полотно вырабатывается как тканая ткань, а это осуществляется посредством процессов сновки (warping) и ткачества. Продольные нити проснованы (are warped) в ширину навоя, в то же самое время поперечные нити затканы (are woven) над и под ними. Изготовители применяют покрытия из крахмала или воска (wax) для придания нитям основы лучшей способности к ткачеству. Махровое полотно может быть соткано лишь с использованием двух навоев с пряжей основы; грунтовая основа (ground warp) используется для формирования основания махровой ткани, а ворсовая основа (pile warp) используется для создания петелек нити, которая создаёт текстуру и функцию такой ткани. Выгоды Махрового Полотна:- махровое полотно имеет выгоды для изготовителей и потребителей. Изготовители находят то, что хлопок предоставляет им гибкость в крашении, позволяя им предлагать продукты из махрового полотна в нескольких цветах. Для потребителей оно легко в чистке, может выдерживать высокие температуры, и не усаживается при стирке. Махровое полотно – лёгкое, стираемое, удобное и, самое важное, абсорбентное. Изделия Из Махрового Полотна:- большинство ходовых изделий, сделанных из махрового полотна, составляют полотенца, банные халаты, и пляжные накидки (beach cover ups). В последние годы, махровое полотно стало использоваться в форменной (clothing) и тренировочной одежде (exercise wear). Многие люди приобретают полотенца и банные халаты из махрового полотна, поскольку они обладают большей способностью к абсорбированию, нежели полотенца и халаты из других полотен. Махровое Полотно – ткани из хлопка или смеси с хлопком, имеющая неразрезные петельки на одной или обеих сторонах. Оно вырабатывается на кареточных ткацких станках (dobby looms) с механизмом для махры (terry arrangement) или на Жаккардовых ткацких станках (Jacquard looms). Оно используется для полотенечного полотна (toweling), пляжных халатов (beach robes) и так далее. Махровое Полотно – тип полотна, которое характеризуется наличием петелек (loops) и мягких ворсинок из пряжи (soft piles of yarns), которые в конечном итоге создают очень абсорбентный, впитывающий влагу материал (very absorbent, moisture wicking material). Практически каждый человек узнает махровое полотно, и чаще всего мы видим его использование для банных полотенец (bath towels), полотенец для рук

(hand towels) и тому подобного. Готовая махровая ткань превосходна для обсушивания тела (drying off the body) после бани, душа или купания. И наоборот, Французская махра (conversely, French terry), которую можно было бы назвать версией махрового полотна, наиболее часто используется в производстве одежды (clothing). Имеются несколько различий между этим материалом и более стандартным махровым полотном. Во-первых, Французская махра отличается тем, что формирование петелек или ворса (looping and piling) производится только на одной стороне ткани. Другая сторона ткани имеет гладкую непетельчатую изнанку (flat unlooped back). Во-вторых, и конечно же одним из самых ценных отличий данного материала, служит его растяжимость (stretch). Ткань могла бы даже называться растяжимым махровым полотном или махровым полотном Дьжёзи (stretchy or Jersey terry cloth). В ряде случаев можно даже увидеть полотенца из Французской махры, зачастую они специально разрабатываются для укладки волос в стиле тюрбана после душа. Пока же наиболее часто её можно увидеть в предметах одежды. Сейчас, как и в течение многих лет, женщины особенно наслаждаются халатами различной длины и стилей, сделанными из этого материала. Как правило, существуют предпочтения к халатам из стандартного махрового полотна, которые могут носиться зимой, потому что они намного легче и прохладнее. Можно также встретить и накидки из растягиваемой махры, набрасываемые на купальные костюмы (stretchy terry swimsuit cover-ups), и которые помогут обсушить тело более быстро после непродолжительного купания. Французская махра популярна в производстве спортивной или будничной одежды (sporty or casual clothing), такой как в атлетический костюм из двух предметов (athletic two-piece suit) или костюм для бега трусцой (jogging suit), сделанные для бега трусцой в прохладные дни. Этот костюм является весомой альтернативой более тёплым велюровым костюмам (warmer velour suits), одеваемым в зимние месяцы. Французскую махру можно встретить также и в производстве такой одежды, как шорты и атлетические рубашки (shorts and athletic shirts). Одно время, в начале 1980-х, шорты из махрового полотна, рубашки, и футболки-безрукавки (так называемые борцовки; tank tops) были популярной одеждой не только для атлетики, но даже и как господствующая в моде летняя одежда. Другим общим использованием Французской махры является её использование в производстве одежды для малышей и ребятишек (infant and toddler clothing). Однопредметные пижамы, служащие и не служащие нижним бельём (footed and non-footed one-piece pajamas), часто изготавливаются из такой ткани. Как и костюм для бега трусцой, сделанный из этого материала, так и однопредметные растягиваемые костюмы (stretchy one-piece suits) для малолетних детей являются намного более комфортными для использования в момент, когда погода становится более тёплой. Небольшое растяжение для данной ткани подстраивается под растущего ребёнка, по крайней мене ненадолго. Если Вы покупаете махровый костюм (terry outfit) для небольшого ребёнка, Вы всегда можете купить его на размер больше для того чтобы продлить возможность выроста ребёнка из данного швейного изделия. Естественное свойство растягиваемого махрового полотна впитывать влагу подвигло на его использование в производстве различной атлетической одежды. Вы можете также встретить Французскую махру в штанах для занятия йогой или Пилатэс (yoga or Pilates pants), в которых некоторые люди испытывают наибольший комфорт, надевая такую одежду для тренировок. Данная ткань всё ещё наиболее часто используется в производстве одежды для младенцев (infant clothing), тренировочной одежде (workout clothes), и в лёгких летних халатах (light summer robes). В Английский язык слово Terry, означающее Махра, попало из Французского языка от слова Tirer, означающее Вытаскивать или Вытащить (to pull out), которое относилось в ворсовым петелькам (pile loops), которые вытаскивались вручную при создании абсорбентного традиционного полотенечного полотна (absorbent traditional toweling). Латинское слово Вэллус (Vellus), означающее Волос (Hair), легло в основу происхождения слова Велюр (Velour), под которым подразумевается полотенечное полотно с разрезными петельками (toweling with cut loops). В исследовании по ткачеству махры (on terry weaving), проведённому Манчестерским Текстильным Институтом (the Manchester Textile Institute), был сделан вывод о том, что изначально ткачество махры явилось результатом дефектного ткачества (result of defective weaving) или дефекта ткачества. Это исследование показывает, что развитие производства такого полотна возникло в Турции, вероятно в городе Бурса (Bursa City), одном из самых крупных традиционных текстильных центров в Турции. Построение ткачества махры (terry weaving construction) рассматривалось в дальнейшем развитии в эволюции тканых тканей. Махровое полотенечное полотно (terry toweling) до сих пор во многих странах известно как Тюркская Ткань (Turk Fabric), Турецкое Полотенечное Полотно (Turkish Toweling) или Турецкая Махра (Turkish Terry). Махровое Полотно – тип ворсовой ткани (pile fabric), которая известна за свою мягкость и высокую впитываемость (или абсорбентность (absorbency)). Оно часто используется для полотенец и банных халатов, и оно может быть применено для производства атлетических разогревателей (athletic warm-ups) и прочих аксессуаров. Многие промтоварные магазины торгуют изделиями из махрового полотна, и возможно также приобрести эту ткань на отрез или метражем (by the yard) с целью изготовления по своим меркам полотенец, халатов и прочих изделий. Многие поставщики-швейники продают махровое полотно (sewing suppliers carry terrycloth), и оно может быть заказано также в режиме реального времени через Интернет или напрямую у изготовителей. Эта ткань может быть выработана посредством ткачества или вязания; наиболее общепринятое производимое в коммерческом плане махровое полотно вырабатывается ткачеством. В любом случае, данная ткань характеризуется густыми, неразрезными петельками (thick, uncut loops), которые формируют мягкий ворс на одной или обеих сторонах данной ткани. Петельки увеличивают впитываемость (или абсорбенцию; absorbency) данной ткани, делая доступной большую площадь поверхности, и они также приводят к тому, что ткань становится более тяжёлой, поскольку больше нити требуется для выработки данного материала. Хлопок выбран основным материалом для махрового полотна, поскольку он является высоко абсорбентным и с ним легко работать. Можно также использовать бамбук или лён, в дополнение к искусственным волокнам, которые были разработаны для абсорбенции (absorbency). Уровень мягкости определяется использованным волокном, а цвет может быть легко урегулирован красителями. На махровое полотно может быть также нанесён рисунок посредством печати (printing) или использованием многоцветных нитей (multicolored threads), и оно также может быть декоративно вышито (decoratively embroidered). Что касается производства, то махровое полотно вырабатывается на кареточных ткацких станках (dobby looms), специализированных станках, которые обеспечивают больший контроль за натяжением нитей (tension of the threads). Люди могут также связать или соткать его вручную, используя несколько различных техник, хотя ручное изготовление махрового полотна затрачивает гораздо больше времени. Промышленные методы изготовления применяются с середины 1800-х, и именно это время связывают с разрастанием популярности использования данной специализированной ткани. Одной из значительных проблем махрового полотна является то, что если петельки зацепятся за что-нибудь (loops become caught in something) и вырвутся (или выдернутся; tear out), то они могут вырвать (или выдернуть) целую линию петелек (whole line of loops) за собой (with them), вызвав то, что ткань станет тонкой и структурно нестабильной (thin and structurally unstable). Данная ткань может также стать рваной у выдернутых концов (ragged with torn ends), если за этим не следить должным образом (if it is not cared for properly). Петельки являются также объектом неравномерного износа (subject to uneven wear), который может сделать данную ткань тугой (stiff) или потёртой в некоторых местах (threadbare in some places) и совершенно плюшевой (plush) в других. Хорошей идеей является чередование изделий из махрового полотна на регулярной основе с тем, чтобы они не выглядели бы заношенными от непрерывной чрезмерной носки (sustained heavy use), а также следование предписаниям за уходом, указанным на их этикетках с тем, чтобы сама эта ткань оставалась бы в хорошем состоянии. Махровое Полотно – ткань с петельным ворсом, которая либо соткана, либо связана. Весьма абсорбентное и используемое для полотенец и тому подобного. Французское

махровое полотно имеет петельки с одной стороны ткани и состриженный ворс – с другой (sheared pile on the other). типичная ткань с разрезным ворсом. Махра (Terry):- абсорбентная (или впитывающая) ткань (absorbent fabric) с петельками (loops), формирующими ворс (pile); называется также Махровым Полотном (Terry Cloth). Махровое Полотно:- ворсовое (pile), а также Жакардовое и кареточное, комбинированное с ворсом (Jacquard and dobby combined with pile). Вырабатывается с повсеместными (или всеми) петельками (all over loops) на обеих сторонах ткани, либо с узорчатыми петельками (patterned loops) на обеих сторонах. Формируется дополнительной пряжей основы (extra warp yarn). Обладает свойством длительной носки (long wearing), легко для стирки и не требует глажения (ironing). Может быть отбеленным (bleached), крашеным (dyed), или набивным (printed). Полотно наиболее лучшего качества имеет безукоризненное (close), крепкое (или твёрдое) (firm), xxxxx (underweave), с очень близкими петельками (with very close loops). Очень абсорбентное, и чем длиннее петельки, тем выше впитываемость (или абсорбенция (absorbency)). В том случае, когда ворс расположен только на одной стороне, ткань называется Турецким Полотенечным Полотном (Turkish Towelling). Под Махровой Тканью понимается ткань с ворсом из петелек основных нитей. Махровые Полотенца (Terry Towels):- ткань для махровых полотенец:- (1) Ворсовая Основа (Pile Warp):- Кардная или Гребенная Пряжа (Carded or Combed Yarns) Номеров Английских – Ne 16/1, 20/1 (Номеров Метрических – Nm 27/1, 33.9/1 соответственно); 240–255 кручений на метр (turns/meter). В большинстве случаев используется 100% хлопковая пряжа. Использование смеси хлопок-рэйон – незначительно, поскольку только 100% хлопок обеспечивает наилучшие ощущения на ощупь и текстуру, нежели смесовки. Для наиболее лучшего качества используется пряжа в два или более сложений. В этом случае возрастает абсорбция пряжи и повышается устойчивость ткани к слёживанию ворса (pile lay). Кроме того, использование пряжи в две нити улучшает внешний вид ткани. Кручёная пряжа используется и для формирования прямых петель (upright loops) в классической махровой ткани, в то время как однониточная пряжа может быть использована для формирования спиральных петель (spiral loops) в модной (или мастеровой) махровой ткани (fashion terry), известной как фабричные товары (milled goods) или отличные товары (fulled goods). Также с целью большей абсорбции и более приятного ощущения ткани на ощупь используется пряжа низкой крутки. Роторная Пряжа (Rotor Spun Yarns) может быть использована в качестве ворсовой основы, но качество полотенца при этом будет намного хуже. Петли бывают двух типов:- (i) Прямая Петля (Upright Loop); и (ii) Спиральная Петля (Spiral Loop). Они могут формировать Разноуровневый Ворс или Разные Высоты Ворса (Different Pile Heights). Прямые Петли используются в классических моделях махровых полотенец, которые обычно вырабатываются с применением Крашеной Пряжи (Dyed Yarns); в то время как полотенца модного типа Красятся В Изделии (Piece Dyed) или проходят процесс Набивки или Печатания (Printing). Спиральные Петли используются с целью придания полотенцу абразивности, которая стимулирует кожу при обтирании и сушке; пряжа при этом должна иметь хорошую абсорбцию. (2) Грунтовая Основа или Коренная Основа (Ground Warp):- Кардная Пряжа (Carded Yarns) Номеров Английских – Ne 20/2, 24/2 (Номеров Метрических – Nm 33.9/2, 40.6/2 соответственно); 550 кручений на метр (turns/meter). Пряжа В Два Сложения (2 Ply Yarn) выдерживает большее натяжение при ткачестве. Зачастую используется смесовая пряжа Хлопок/Полиэфир для выдерживания больших нагрузок. Роторная Пряжа (Rotor Spun Yarns) может быть использована в качестве грунтовой основы. (3) Уток (Weft):- Кардная Пряжа (Carded Yarns) Номеров Английских – Ne 16/1, 20/1 (Номеров Метрических – Nm 27/1, 33.9/1 соответственно); 240–255 кручений на метр (turns/meter). Роторная Пряжа (Rotor Spun Yarns) может быть использована в качестве утка. В производстве махровых полотенец может быть задействована также четвёртая нить – Бордюрный Уток (Border Weft). Конструкция Ткани:- махровые полотенца ткутся с помощью 2, 3, 4, 5 и более уточных махровых переплетений (pick terry weaves). В махровых полотенечных тканях наиболее распространённым типом переплетения является 3-уточное махровое переплетение (3-pick terry toweling). Нити основы подразделяются на две системы:- нити ворсовой основы (pile warps) и нити грунтовой или коренной основы (ground warps), в то время как уток состоит лишь из одной системы. В базовой Турецкой Полотенечной Ткани (Turkish Toweling), нити ворсовой основы наружной и изнаночной сторон (front side and back side pile warps) и 1-я и 2-я продольные нити грунтовой основы (1^{st} and 2^{nd} ground warps ends) формируют друг с другом рубчиковое (или репсовое) переплетение 2/1 (2/1 rib weave). Рубчиковое (или репсовое) переплетение формируется ворсовыми основами и одной поперечной нитью впереди (rib weave which is formed by the pile warps is one pick ahead) рубчикового (или репсового) переплетения, которое формируется продольными нитями грунтовой основы. Основы по всей ширине ткани прокладываются либо как 1:1, либо как 2:2 ворсовых и грунтовых основ (1:1 or 2:2 pile and ground warps). В основном раппорте 1:1 (in 1:1 warp order) каждая продольная нить грунтовой основы сменяется продольной нитью ворсовой основы (pile warp end); в то время как в основном раппорте 2:2 (in 2:2 warp order) каждые две продольные нити грунтовой основы сменяются двумя продольными нитями ворсовой основы. Число уточных нитей, используемое для махровой полотенечной ткани, обычно составляет 15–25 поперечных нитей на сантиметр (см; 15–25 picks/cm). Число основных нитей составляет обычно 20–30 продольных нитей/см (20–30 ends/cm). В процессе ткачества бордюров число уточных нитей увеличивается в 3–6 раз в сравнении с плотностью на участках ворса (the density in the pile areas). Соотношение ворс/грунт (pile/ground ratio) описывается как длина ворсовой основы на единицу длины ткани в направлении основы. Практический способ определения этого соотношения заключается в следующем:- в направлении основы отмеряется 10 см махровой полотенечной ткани, затем отрезается ворсовая основа (или снимаются петли основы) от любых продольных нитей отмеренной длины (cut the pile warp from either ends of the measured length) и измеряется итоговая длина вытянутой из ткани ворсовой основы на 10 см длины ткани (the total length of the removed pile end per 10 cm length of fabric). Длина ворсовой основы на 10 сантиметров ткани (pile warp length per 10 cm fabric) обычно колеблется в пределах 20–100 см. Это соотношение имеет прямое воздействие на вес и толщину ткани. С возрастанием этого соотношения возрастает вес и толщина махровой ткани. Слишком длинные петли теряют форму под собственной тяжестью после первой же стирки, а слишком короткие плохо впитывают влагу. Оптимальное значение этого параметра, полученное эмпирически, составляет около 5 мм. Роторная пряжа самая дешёвая и самая грубая, поскольку вырабатывается из волокна, имеющего короткую длину, и из отходов прядильного производства. Кардная пневмомеханическая пряжа недалеко ушла от неё по качеству. Самой качественной, но при этом и самой дорогой, считается гребенная кольцевая пряжа. Она вырабатывается из волокна средней длины и высокой длины. Из сверхдлинных волокон может быть выработана пряжа с нулевой круткой (zero twist). На её производство идёт хлопковое волокно со сверхдлинным штапелем (во времена бывшего Советского Союза оно называлось тонковолокнистым), к числу которого относятся разновидности Египетского Хлопчатника ГИЗА (GIZA) и Американского Хлопчатника ПИМА (PIMA). Ткань из такой пряжи обладает повышенной впитываемостью и необычайной нежностью при соприкосновении. Вес махровой ткани измеряется в граммах за квадратный метр (г/кв.м или г/м^2; gram per square meter (g/sq.m or GSM)) или в унциях за квадратный ярд (ounces per square yard (oz/sq.yd)), иногда обозначаемый просто в унциях (ounces or oz). Махровая Ткань (152.4 см (или 60”) шириной) в зависимости от своего веса может иметь следующую градацию:- (i) Среднего Веса (Medium Weight) – 339 грамм за квадратный метр (г/кв.м или г/м^2; 10 унций за квадратный ярд); и (ii) Тяжёлого Веса (Heavy Weight) – 475 грамм за квадратный метр (г/кв.м или г/м^2; 14 унций за квадратный ярд) и более, вплоть до 800 грамм за квадратный метр (г/кв.м или г/м^2; 23.6 унций за квадратный ярд). Полотенца из махровой ткани имеют градацию в зависимости от веса ткани, например, Принятого или Регулярного Веса (Regular Weight), когда вес ткани составляет 305 грамм за квадратный метр (г/кв.м или г/м^2; 9 унций за квадратный ярд); Шикарные (Plush), когда вес ткани составляет 600 грамм за

квадратный метр (г/кв.м или г/м^2; 17.7 унций за квадратный ярд), и Роскошного Гостиничного Качества (Luxury Hotel Quality), когда вес ткани составляет 700–800 грамм за квадратный метр (г/кв.м или г/м^2; 20.7–23.6 унций за квадратный ярд). Махровая Ткань или Петельная Ткань – льняная или хлопчатобумажная ткань, поверхность которой с одной или двух сторон покрыта ворсом из петель основных нитей. В отличие от ворсовых тканей, у которых ворс образуется под натяжением, в махровой ткани он получается за счёт свободной подачи слабо натянутой основы. Ворс махровой ткани менее равномерен и стоек, более прилегает к поверхности ткани. Махровые ткани обычно менее плотны, чем ворсовые ткани. Благодаря своей мягкости и способности легко впитывать в больших количествах влагу, махровые ткани употребляются для изготовления полотенец, купальных простынь, халатов, ковриков и тому подобного. Одной из последних тенденций в изготовлении махровых тканей является использование вискозы:- (i) бамбуковое волокно из Бамбука; и (ii) модальное волокно из Бука. Пористая структура бамбукового волокна позволяет обеспечивать более быстрое и мощное влагопоглощение и влагоиспарение, нежели хлопковое волокно. Махровая ткань из бамбукового волокна отличается необычайно мягкой шёлковистой поверхностью, не раздражающей кожу, и повышенной износостойкостью. Кроме того, бамбуковое волокно обладает природным свойством подавлять рост бактерий, то есть оно несёт в себе антибактериальный характер. Изделия из махровой ткани, изготовленной из бамбукового волокна, подходят для любого типа кожи и рекомендуются людям, склонным к аллергическим реакциям, и малышам. Махровая Ткань – это натуральная ткань, поверхность которой состоит из ворса (петель основных нитей). Ворс может быть как одинарным (односторонним), так и двойным (двусторонним). Махровые ткани обычно менее плотны, чем ворсовые, что придаёт им неповторимую природную особенность ‘свободного дыхания’. Махровые ткани обладают лёгким массажным воздействием на тело и не вызывают раздражения. Благодаря своим уникальным естественным качествам и способности хорошо поглощать влагу, позволяя телу свободно дышать, махровые ткани используются для изготовления халатов, полотенец, домашних тапочек, постельного белья. Махровые ткани различаются по плотности, типу кручения нити и высоты петли, так как именно от них зависит внешний вид и качество махрового изделия. Изделия из махровых тканей особо рекомендуемы для аллергиков. Ткань легко поддаётся стирке и после многократных операций остаётся точно такой же, как и до нее, обладая той же мягкой, нежной и пушистой фактурой. Единственное ограничение к махровым изделиям – им противопоказано глажение. Проглаженное махровое полотно выглядит неестественно и крайне неопрятно. Махровая Ткань или Петельная Ткань – льняная или хлопчатобумажная ткань, поверхность которой с одной или двух сторон покрыта ворсом из петель основных нитей. В отличие от ворсовых тканей, у которых ворс образуется под натяжением, в махровой ткани он получается за счёт свободной подачи слабо натянутой основы. Ворс махровой ткани менее равномерен и стоек, более прилегает к поверхности ткани. Махровые ткани обычно менее плотны, чем ворсовые ткани. Благодаря своей мягкости и способности легко впитывать в больших количествах влагу, махровые ткани употребляются для изготовления полотенец, купальных простынь, халатов, ковриков и тому подобного. Махровые Полотенца:- гладкокрашеное (однотонное) махровое полотенце изготавливается из пряжи Ne 16 (Nm 27) или Ne 20 (Nm 33.9), Ne – Номер Английский, а Nm – Номер Метрический. Пряжа Ne 16 – более толстая нить; полотенце, изготовленное из этой пряжи, на вид кажется более рыхлым. Предпочтение таким полотенцам отдаёт сфера гостиничного бизнеса, поскольку выглядит оно более эффектно, а по стоимости дешевле, чем полотенце, изготовленное из пряжи Ne 20. Пряжа Ne 20 – нить более тонкая. Для того чтобы изделие выглядело более плотным, две нити скручиваются в одну. Полотенце, изготовленное из двойной нити, предпочтительнее для домашнего обихода. По сравнению с другими, это полотенце выглядит более толстым, хотя плотность при этом сохраняется одна и та же. Полотенца окрашиваются по технологии, при которой выдерживают не менее 500 циклов стирки, не меняя при этом своих качеств. Окраска махровой ткани происходит по принципу стиральной машины, то есть ткань при очень высокой температуре в течение 8 часов непрерывно вращается в красильном барабане. После этого окрашенная ткань при ещё большей температуре простирывается в специальном аппарате, задача которого – убрать неустойчивые остатки красителя. Благодаря процессу мерсеризации (смягчения), полотенце становится более мягким. В результате, при стирке в домашних условиях, где температура стирки на порядок ниже, полотенца не красятся, не линяют, не теряют своей формы и мягкости. Не менее важно знать такие понятия как плотность, высота петли, кручение нити, так как они значительно меняют внешний вид махрового полотенца. Плотность махровых полотенец измеряется в граммах на квадратный метр и колеблется в пределах от 300 до 800 г/м^2. Всем известны преимущества махровых полотенец:- они прекрасно впитывают влагу, обладают мягким массирующим эффектом, не вызывают раздражения. Махровым полотенцам не страшна многократная стирка – они не теряют своей яркости и пушистости благодаря специальной технологии окраски и качественной махровой ткани. Возможно три варианта состава полотна:- 100% хлопок, 100% бамбук, смесь хлопка и бамбука. Как правило, используют три стандартных размера полотенец:- 35 х 70, 50 х 100, 70 х 140 см. Плотность махрового полотна может быть различной:- от 300 до 700 г/м^2. Чем выше плотность, тем пушистее и толще полотенце. Махровые Полотенца:- в первую очередь, стоит разобраться, какими основными характеристиками обладает махровая ткань? Два основных признака, по которым оценивают её качество, это Плотность (в остальном текстильном мире известная как Вес) и Высота Ворса. Плотность – это количество ворсинок на единицу площади. От плотности ткани зависит впитывающая способность полотенца. Плотность измеряется в граммах на квадратный метр. В большинстве случаев она колеблется от 300 до 800 г/м^2. Выбирая полотенце, стоит учесть, что крайности в обе стороны нежелательны. Ткань с низкой плотностью плохо впитывает влагу, а вот чрезмерно плотные полотенца – слишком тяжёлые и неудобные. На впитываемость, кроме плотности, влияет также тип используемой пряжи. Пряжа бывает одиночная (или в одну нить), двойная (или в две нити), кручёная. Лучше всего воду впитывает гребенная пряжа. Высота Ворса – это длина петель, из которых и состоит ворс. Эталонной считается длина в пять миллиметров, именно она лучше всего подходит для полотенец. Слишком длинные петли после нескольких стирок портят внешний вид полотенца, а короткие недостаточно хорошо справляются с основной задачей – впитывать воду. Мягкость:- не всегда мягкость полотенца говорит о хорошем качестве махры. Многие производители добавляют в хлопок вискозу (синтетику), что даёт ощущение мягкости, но плохо влияет на качество впитываемости воды. Типы Пряжи:- (i) Роторная Пряжа (Rotor Yarn) – тип пряжи из коротковолокнистого хлопка. Роторное полотно жёсткое, но в то же время устойчиво к потере формы. (ii) Кардная Пряжа (Carded Yarn) – более дорогой вид пряжи, который изготавливают из волокон хлопка средней длины. Ткани из него получаются более мягкими, чем из роторной пряжи. (iii) Гребенная Пряжа (Combed Yarn) – самый качественный вид хлопковой пряжи, изготавливается из хлопкового волокна с большей штапельной длиной. Из такой пряжи изготавливают самые дорогостоящие виды махровой ткани, шёлковистые, мягкие, приятные на ощупь. Очень часто основу и ворс полотенца изготавливают из разных типов пряжи. Таким образом, удаётся получить махровые изделия более высокого качества. В этом случае основа ткани будет состоять из роторной пряжи, а ворс, который чаще всего и вступает в контакт с кожей, из более мягкой кардной. Такая структура делает полотенца приятными на ощупь при довольно приемлемой цене. По способу нанесения рисунка полотенца бывают:- (i) Гладкокрашеные – полотенца одного цвета, без рисунков и орнаментов. Их производят из одноцветных неокрашенных нитей, а потом окрашивают, уже в виде готовых изделий. (ii) Однотонные Жаккардовые – одноцветные полотенца с рисунком, который образуется из-за разной длины ворсинок. Такие изделия производят на специальных ткацких станках с регулируемой длиной ворса, красят их так же, в готовом виде. (iii) Пёстротканые Жаккардовые – полотенца с рельефным рисунком, созданным за счёт различной длины ворса, окрашенные в несколько цветов. Их изготавливают на

более сложном оборудовании, позволяющем плести изделие из нитей, окрашенных в разные цвета. (iv) Пёстротканые Жаккардовые С Выбитым Рисунком – рисунок создаётся при комбинировании двух способов. Во-первых, чередуются участки с разной длиной ворса, а во-вторых, для изготовления этих изделий берут нити, окрашенные в разные цвета. Бамбуковые полотенца изготавливаются из бамбукового волокна. Прекрасно подойдут для пляжа, так как обладают охлаждающим эффектом.

TERRY OFF = ОТСУТСТВИЕ МАХРЫ – Terry Off:- a band in a terry section that has no terry loops. Note:- this defect is caused by incorrect let-off motion. / Отсутствие Махры (terry off):- порок ткани; полоса в куске махры, которая не имеет петелек махры. Примечание:- этот порок вызван неправильной настройкой механизма подачи-выпуска.

TERRY ON PLAIN = МАХРА НА ПОЛОТНЕ – Terry On Plain:- terry loops appearing within a plain area of a terry fabric. Note:- this defect is caused by incorrect let-off motion. / Махра На Полотняной Поверхности (terry on plain):- порок ткани; петельки махры, появляющиеся на участках полотняной поверхности махровой ткани. Примечание:- этот порок вызван неправильной настройкой механизма подачи-выпуска.

TERRY VELOUR = МАХРОВЫЙ ВЕЛЮР – Terry Velour is a pile weave cotton fabric with an uncut pile on one side and a cut pile on the reverse side. Terry velour is valued for its soft, luxurious hand. Typical uses include towels, robes, and apparel.

TERTIARY COLORS = ТРЕТИЧНЫЕ ЦВЕТА – Tertiary Colors:- shades that are obtained by mixing the three primary colors or by mixing one or more of the secondary colors with gray or black.

TERTIARY RECOVERY = ТРЕТИЧНЫЕ МЕТОДЫ ДОБЫЧИ (или ТРЕТИЧНЫЕ МЕТОДЫ РАЗРАБОТКИ, или ТРЕТИЧНЫЕ МЕТОДЫ НЕФТЕОТДАЧИ) – Tertiary Recovery:- methods of increasing the percentage of oil recovery beyond that achieved by secondary recovery. These include injecting solvents or high pressure carbon dioxide, igniting part of the oil in the reservoir to generate steam, and biological breakdown of oils to enable them to flow more easily.

TERTIARY STOCKS = ТРЕТИЧНЫЕ ЗАПАСЫ – In oil industry, Tertiary Stocks are stocks held by final end-consumers, they can be power plants, industrial entities or consumers in the residential/commercial sector. Tertiary Stocks are stocks held by end-consumers including industry, commerce and private stocks. / Третичные Запасы – это запасы, удерживаемые конечными потребителями, включая промышленные, коммерческие и частные запасы.

TERTIARY TILLERS = ТРЕТИЧНЫЕ ПОБЕГИ (или ТРЕТИЧНЫЕ ПОЧВОФРЕЗЫ) – Tertiary Tillers arise from secondary tillers and are the third group of tillers to grow during the plant's development.

TESS = TRADEMARK ELECTRONIC SEARCH SYSTEM

TESSELLATE = МОЗАИЧНОЕ – Tessellate:- a surface patterned like a mosaic or pavement. Hence tessellata.

TEST = ТЕСТ (или ИСПЫТАНИЕ) – Test is an official examination, other than visual, to determine if pests are present or to identify pests. / Под Тестом или Испытанием понимается:- (i) в психологии и педагогике стандартизированные задания, по результатам выполнения которых судят о психофизиологических и личностных характеристиках, а также знаниях, умении и навыках испытуемого; (ii) в физиологии и медицине пробные воздействия на организм с целью изучения различных физиологических процессов в нём, а также для определения функционального состояния отдельных органов, тканей и организма в целом; (iii) в вычислительной технике контрольная задача для проверки правильности работы электронной вычислительной машины (ЭВМ); или (iv) в распознавании образов множество функционально взаимозависимых признаков, характеризующих образ (класс). Тест или Испытание:- в общем значении:- экзамен, проводимый с целью определения знаний, компетентности или квалификации. В финансах:- критерий для определения соответствия требованиям финансовых коэффициентов, указанных в соглашениях о выпуске ценных бумаг или в иных кредитных соглашениях (например, проверка кратности текущих активов к текущим обязательствам или отношения задолженностей к чистому капиталу). Для ценных бумаг:- термин, описывающий изменение котировок, которые приближаются к уровню поддержки (support level) или к уровню сопротивления (resistance level), установившемуся ранее для товарно-сырьевых фьючерсов, ценных бумаг или рынка в целом. Испытание считается пройденным, если эти уровни не пересекаются, и не пройденным, если цены вырастают до новых высших или низших значений. Например, технические аналитики говорят, что если показатели среднего промышленного индекса от Дау Дьонза в последний раз отметили солидное сопротивление на уровне 1 000, а цены падают ниже 1 100, то приближается период испытаний. Если цены начинают расти после того, как индекс от Дау Дьонза достиг значения 1 000, и продолжают расти дальше, испытание выдержано. Однако, если цены падают ниже 1 000, то испытание не пройдено. Смотрите также Технический Анализ (Technical Analysis).

TESTA = ТЭСТА (или СКОРЛУПА, или СЕМЕННАЯ КОЖУРА, или СЕМЕННАЯ ОБОЛОЧКА, или ПАНЦИРЬ) – Testa is a hard external coating or integument of a seed. Testa is the outer protective seed-coat. / Семя состоит из семенной кожуры (спермодермы), и зародыша (молодого спорофита) и у многих растений из тканей с запасными питательными веществами, развивающимися вне зародыша, – перисперма или эндосперма. Кожура семян образуется из покровов семяпочки (интегументов), служит для защиты зародыша и часто содействует расселению семян. При развитии двух интегументов в семенной кожуре часто различают наружную (у Граната и Крыжовника – сочная) и внутреннюю семенные оболочки; при одном интегументе или разрушении второго в процессе развития семени она одинарная, но состоит обычно из нескольких слоёв клеток. Твёрдость кожуры повышается вследствие склерификации тканей. Тонкая кожура характерна для семян Паразитных Растений (Заразиховые) и Орхидных, а также для семян, заключённых в односемянные невскрывающиеся плоды (например, орехи). Семя без кожуры встречаются у Ремнецветных, Санталовых и других так называемых Полупаразитов.

TESTCROSS = АНАЛИТИЧЕСКОЕ СКРЕЩИВАНИЕ – Testcross is a cross made between cytoplasmic male sterile line and a test variety to identify maintainers and restorers.

TESTCROSS NURSERY = ПИТОМНИК ДЛЯ АНАЛИТИЧЕСКОГО СКРЕЩИВАНИЯ – Testcross Nursery is a breeding nursery where F_1 progenies of cytoplasmic male sterile lines and test varieties are screened for pollen sterility/fertility and spikelet fertility to identify maintainers and restorers.

TEST ENTRIES = ИСПЫТУЕМЫЕ (или ХХ) – Test Entries are Varieties or breeding lines being evaluated. / высчитаны.

TESTER = ИСПЫТАТЕЛЬ (или ИСПЫТАТЕЛЬНОЕ) – Tester is a cross between a selection, line, or clone and a common pollen parent which may be a variety, inbred line, or a single cross. The common pollen parent is called the Top Cross or Tester Parent.

TESTER STRAIN = ЛИНИЯ АНАЛИЗАТОР (или ИСПЫТАТЕЛЬНАЯ ПОРОДА) – Tester Strain is a common parent, generally male, used in crosses with a series of lines in order to analyze the combining ability of lines.

TESTICULAR = ТЕСТИКУЛЯРНОЕ (или СЕМЕННИКОВОЕ, или СЕМЕННОЕ, или ОТНОСЯЩЕЕСЯ К СЕМЕННИКАМ) – Testicular:- in the form of two oblong bodies. / например, тестикулярный корень.

TESTING = ТЕСТИРОВАНИЕ (или ПРОВЕДЕНИЕ ИСПЫТАНИЙ) – Testing is intended to validate various parameters with regard to the original commodity. Testing may be either chemical or physical in nature and may include further sample preparation. Tests are normally conducted on samples that have been produced as a result of a quantitative inspection or sampling exercise.

TEST INSECT = ТЕСТИРУЕМОЕ НАСЕКОМОЕ – Test Insect is the Insect Species and biotype against which a test entry is being evaluated. / высчитаны.

TEST KEY = ТЕСТОВЫЙ КЛЮЧ – In banking, Test Key is a code used to validate the source, and part or all of the text of a message, and which is capable of manual calculation. / В банковском обслуживании, код, используемый с целью утверждения источника, и части или всего текста сообщения, который поддаётся вычислению вручную.

TEST OF SIGNIFICANCE = ТЕСТ НА ЗНАЧИМОСТЬ – Test Of Significance is a statistical procedure designed to distinguish real treatment difference from that due to chance, i.e. random variation. To distinguish differences due to sampling error from differences due to discrepancy between observations and hypothesis.

TEST SPECIMEN = ТЕСТОВЫЙ ОБРАЗЕЦ – Test Specimen (synonym:- Specimen) is a portion of a laboratory sample or, in certain cases, the entire laboratory sample to be used for a testing procedure.

TEST WEIGHT = НАТУРА (или НАТУРНАЯ МАССА) – Test Weight is the weight of a measured volume of grain expressed in kilograms per hectoliter. / Пурка, весы для определения натуры зерна (массы определённого объёма). В странах бывшего СССР применяют одно- и двадцатилитровые пурки.

TETERON COTTON YARN = ТЭТЁРОНО–ХЛОПКОВАЯ ПРЯЖА – Teteron Cotton Yarn is the polyester mixed cotton yarn. The name Teteron is used for one of modification of polyester fibers (originally called Terylene). Terylene first viable polyester fiber was developed by English chemists in 1941. / Пряжа из смеси хлопкового и сложных полиэфирных волокон. Название Тэтёрон (в России более известно как Теторон) используется для одной из разновидностей сложных полиэфирных волокон (в Великобритании первоначально использовавшейся под торговым названием Тёрилин (Terylene)). Тэрилэн, как первое произведённое сложное полиэфирное волокно, было разработано Английскими химиками в 1941.

TETHERED = ПРИВЯЗАННОЕ – Tethered:- a rope, chain, or similar restraint for holding a sheep in place, allowing a short radius in which it can move about. / для удерживания овцы на месте, обеспечивая короткий радиус, в пределах которого она может перемещаться.

TETRA = ТЭТРА (или ТЕТРА, или ТЕТР) – Tetra:- four, as a prefix. / Под Тетра, от Греческого слова Tetra, означающее Четыре, понимается приставка как часть сложных слов, например, тетраэдр.

TETRACHLORIDE = ТЭТРАХЛОРИД – Tetrachloride is a chloride, such as carbon tetrachloride, containing four atoms of chlorine.

TETRADPLOID = ТЕТРАПЛОИД (или ТЕТРАПЛОИДНОЕ) – Tetradploid:- with twice the normal complement of chromosomes. / . Под Тетраплоидом, от Греческих слов Tetra, означающее Четыре, Diplóos, означающее Двойной, и Éidos, означающее Вид, понимается . Диплоид – клетка или особь с двумя гомологичными наборами хромосом.

TETRAFLUOROETHYLENE FIBER = ТЭТРАФТОРЭТИЛЕНОВОЕ ВОЛОКНО – Tetrafluoroethylene (TFE) Fiber:- Polytetrafluoroethylene (PTFE) is polymerized from the chemical compound Tetrafluoroethylene (TFE). A non-stick pan is composed of varying non-stick layers. TFE is synthesized from fluorspar, hydrofluoric acid, and chloroform. These ingredients are combined under high heat, an action known as Pyrolosis. TFE is a colorless, odorless, nontoxic gas which is, however, extremely flammable. It is stored as a liquid, at low temperature and pressure. Because of the difficulty of transporting the flammable TFE, PTFE manufacturers also manufacture their own TFE on site. The polymerization process uses a very small amount of other chemicals as initiators. Various initiators can be used, including ammonium persulfate or disuccinic acid peroxide. The other essential ingredient of the polymerization process is water. Making the TFE:- manufacturers of PTFE begin by synthesizing TFE. The three ingredients of TFE, fluorspar, hydrofluoric acid, and chloroform are combined in a chemical reaction chamber heated to between 1 094–1 652 °F (590–900 °C). The resultant gas is then cooled, and distilled to remove any impurities. See also Polytetrafluoroethylene Fiber. / Под Тэтрафторэтиленом или Перфторэтиленом, $F_2C{=}CF_2$, понимается бесцветный газ, $t_{кип}$ – 76.3 °C. Сырьё в производстве политэтрафторэтилена и фторкаучуков.

TETRAPLOID = ТЕТРАПЛОИД (или ТЕТРАПЛОИДНОЕ) – Tetraploid is an organism with four basic (n) sets of chromosomes. / Под Тетраплоидом, от Греческих слов Tetra, означающее Четыре, и и Éidos, означающее Вид, понимается .

TEU = TWENTY–FOOT EQUIVALENT UNIT

TEX = ТЕКС – Tex is a metric unit used in the textile industry to measure the density of a single fiber of yarn. Yarn number represents the ‘size’, ‘fineness’, or, more accurately, the relationship between weight and length of a yarn. The tex system has been chosen to replace the many conflicting systems now used, after extended study by the Technical Committee on Textiles of the International Organization for Standardization (ISO/TC 38). Delegates representing the textile industries of twenty-one nations including the United States and four international textile associations participated in the study and unanimously adopted this proposal. One tex equals a density of one gram per kilometer of length, or 1 mg/m. One tex equals 10 drex or 9 denier. 1 tex = 1 000 N_M. A Tex unit is equal to the weight in grams of 1 000 meters of fiber. A direct decimal count system for describing the linear density (mass per unit length) of fibers, filaments and yarns. The lower the number, the finer the thread. Tex is:- (1) the unit for expressing linear density, equal to the weight in grams of 1 kilometer of yarn, filament, fiber, or other textile strand. (2) The system of yarn numbering based on the use of tex units. See also Yarn Number. Tex is the unit of weight indicating the fineness of yarns and equal to a yarn weighting one gram per each 1 000 meters. The Tex system, originally devised in 1873, is a universal method developed for the measurement of staple fibre yarns and is also applicable to the measurement of filament yarns. It is based on the weight in grams of one kilometer (3 300 feet) of yarn. 1 tex = 1 gram/kilometer (g/km) = 1 milligram/meter (mg/m). Tex is a system of yarn numbering that measures the weight in grams of 1 000 meters of yarn. A 30-tex yarn weighs 30 grams per 1 000 meters. Tex is a system of yarn numbering that measures the weight in grams of one kilometer of yarn. / Единица измерения Текс эквивалентна весу в граммах 1 000 метров волокна. Непосредственно дециметровая система исчисления используется для описания линейной плотности (масса на единицу длины) волокон, нитей и пряжи. Чем меньше номер, тем тоньше нить. Под Тексом, от Латинского слова Texo, означающее Сплетаю или Тку, понимается внесистемная единица линейной плотности волокон или нитей, равная отношению их массы к длине. 1 текс = 1 г/км = 1 мг/м. Величина текс характеризует толщину однородных материалов. Текс заменил титр, в котором за единицу массы принимали денье (0.05 г), за единицу длины – 450 м.

TEXT = ТЕКСТ – Text is the part of a SWIFT message which is enclosed between the header and the trailer. That part (Block 4) of a SWIFT II message which contains the substance of the message. The text format varies according to the message type in question. It is enclosed between the header and the trailer. / Часть (электронного) сообщения, передаваемого по каналам связи СВМФДС (Сообщество по Всемирной Межбанковской Финансовой Дальней Связи; SWIFT (The Society for Worldwide Interbank Financial Telecommunication)), которая заключена между заголовком и концовкой. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Под Текстом, от Латинского слова Textus, означающее Соединение или Ткань, понимается последовательность предложений, слов (в семиотике – знаков), построенная согласно правилам данного языка, данной знаковой системы и образующая сообщение.

TEXTILE = ТЕКСТИЛЬ – Textile:- originally, woven fabric; now applied generally to any one of the following:- staple fibers and filaments able to be converted into woven, knit, or braided fabrics, or yarns made from natural of manufactured fibers. Any product made from fibers, including yarn, fabrics, and end-use products such as apparel, home furnishings, and industrial applications. Originally, a woven fabric; now applied generally to any one of the following:- (i) staple fibers and filaments suitable for conversion to or use as yarns, or for the preparation of woven, knit, or nonwoven fabrics; (ii) yarns made from natural or manufactured fibers; (iii) fabrics and other manufactured products made from fibers as defined above and from yarns; and (iv) garments and other articles fabricated from fibers, yarns, or fabrics when the products retain the characteristic flexibility and drape of the original fabrics. The term 'Textiles' relates to a number of items made up of man-made and natural fibers which are used in a variety of functions. Such objects include clothing, curtains, blankets, and household linen as well as shoes, belts, upholstrey and handbags. Textile is a woven or knit cloth. The term is used generically to define many various fabrics. The word is some times used to define an entire industry. For example, 'the Apparel Search Company is the leading informational resource for the Apparel & Textile Industry's. / Под Текстилем, от Латинского слова Textile, означающее Ткань, от Техо, означающее Сплетаю или Тку, понимаются изделия, выработанные из волокон и нитей (ткани, трикотаж, дублировочные материалы, нетканые материалы, валяльно-войлочные изделия, вата, сети, текстильная галантерея, кручёные изделия – швейные нитки, канаты и тому подобное).

TEXTILE DEFECTS = ТЕКСТИЛЬНЫЕ ПОРОКИ (или ТЕКСТИЛЬНЫЕ ДЕФЕКТЫ) – Textile Defects:- a portion of the textile fabric that has not met the requirement or an attribute of a fabric that is not in the statement of requirement is said to be a defect which leads to customer dissatisfaction. The various types of defects detected during quality controls are broadly classified as follows:- (i) Critical Defects:- Defects which are likely to result hazardous to the health of individuals using it. (ii) Major Defects:- More serious defects which are likely to comprise the purchase of the product. (iii) Minor Defects:- Include small faults which have no effects on the purchase of the product. Textile Defect Detection:- inspection is the process of determining whether a product has deviated from a given set of specifications. Texture defect detection can be defined as the process of determining the location and/or extend of a collection of pixels in a textured image with remarkable deviation in their intensity values or spatial arrangement with respect to the background texture. Manual Defect Detection:- in the textile industry, inspection, is needed to assure the fabric quality before any shipments are sent to customers, because defects in fabrics can reduce the price of a product by 45% to 65%. Currently, the quality assurance of web processing is mainly carried out by manual inspection. However, the reliability of manual inspection is limited by ensuing fatigue and inattentiveness. Indeed, only about 70% of defects can be detected by the most highly trained inspectors. Automated Defect Detection:- textile industries are facing increasing pressure to be more efficient and competitive by reducing costs. Therefore, automated detection of defects in textile fabrics, which results in highquality products and high-speed production, is definitely needed. Some of the advantages of automated detection of defects are:- (i) 100% inspection can be conducted; (ii) it is a more consistent process when compared with manual inspection; (iii) it is a non-contact inspection, thus avoiding problems that arise as a result of using some contact inspection devices; and (iv) it can usually result in:- (a) lower labor costs, (b) improved quality, (c) faster inspection, (d) increased reliability.

TEXTILE FABRIC = ТЕКСТИЛЬНАЯ ТКАНЬ – Textile Fabric materials are used to prepare different categories and types of fabric products in the textile industry. Natural fabric and synthetic fabric are the two different classification of textile fabric. Synthetic fabrics are fairly new and have evolved with the continuous growth in textile industry. According to the need and constant innovation in textile industry water proof, oil resistant, UV resistant and abrasive resistant fabrics are also available.

TEXTILE MATERIALS = ТЕКСТИЛЬНЫЕ МАТЕРИАЛЫ – Textile Materials is a general term for fibers, yarn intermediates, yarn, fabrics, and products made from fabrics that retain more or less completely the strength, flexibility, and other typical properties of the original fiber or filaments. / Текстильный Материал – текстильные волокна, нити, а также состоящие из них полуфабрикаты, полотна, изделия. Текстильный Полуфабрикат – текстильный материал, прошедший стадию предварительной переработки, предназначенный для дальнейшего использования в текстильном производстве. Текстильное Изделие – изделие, изготовленное целиком или преимущественно из текстильных материалов и пригодное для непосредственного употребления или для дальнейшей переработки в других отраслях промышленности.

TEXTILE MILL = ТЕКСТИЛЬНЫЙ КОМБИНАТ – Textile Mill is a business concern of factory which manufactures textile products by spinning, weaving, or knitting. / Текстильный Комбинат – деловой концерн, состоящий из фабрики, которая изготавливает текстильные продукты посредством прядения, ткачества, или трикотажного производства.

TEXTILE PROCESSING = ОБРАБОТКА ТЕКСТИЛЯ – Textile Processing is any mechanical operation used to translate a textile fiber or yarn to a fabric or other textile material. This includes such operations as opening, carding, spinning, plying, twisting, texturing, coning, quilling, beaming, slashing, weaving, braiding, and knitting.

TEXTILES CONVERTER = КОНВЕРТЁР ТЕКСТИЛЯ (или ПРЕОБРАЗОВАТЕЛЬ ТЕКСТИЛЯ) – Textiles Converter is a business that buys unfinished fabrics, has them bleached, printed, and finished by another business specializing in particular types of finishes, then sells the end product.

TEXTURALIZED = XX – Texturalized:- a method of adding texture to otherwise smooth yarns. See also Textured Yarn.

TEXTURE = ТЕКСТУРА (или СТРУКТУРА) – (1) Texture is the relative size and arrangement of the wood cells. / Под Текстурой, от Латинского слова Textura, означающее Строение или Ткань, понимается:- () древесная структура – естественный рисунок тангенциального или радиального разрезов древесины, определяющая её декоративную ценность и служащая для распознавания пород. Под Текстурой Древесины понимается рисунок, образующийся на поверхности древесины из-за перерезания анатомических элементов; зависит от направления разреза и породы. У хвойных пород текстура древесины обусловлена главным образом разницей в окраске ранней и поздней древесины годичных слоёв. У лиственных пород текстура древесины богаче. Она определяется наличием крупных сосудов, сердцевинных лучей, неправильно расположенными волокнами. Лесоматериалы с красивой текстурой используются для изготовления мебели, художественных изделий, отделки помещений и тому подобного.

(2) Texture is a term describing the surface effect of a fabric, such as dull, lustrous, wooly, stiff, soft, fine, coarse, open, or closely woven; the structural quality of a fabric. Texture is the surface effect of cloth or fiber as dull, lustrous, wooly, stiff, soft, fine, coarse, open or closely woven. Also known as Feel or Hand. Texture is one of the elements that determines the way in which a finished fabric looks. It is the surface effect of a fabric. / или плотнотканая; .

(3) Texture is the number of warp threads (ends) and filling (weft) yarn (picks) per square inch in a woven fabric. For example, 88 x 72 means there are 88 ends and 72 picks per square inch in the fabric. / Количество нитей основы (продольных нитей) и нитей уточины (утка) (поперечных нитей) на квадратный дюйм в сотканной ткани. Например, 88 х 72 означает, что в данной ткани имеется 88 продольных нитей и 72 поперечные нити на квадратный дюйм. На этикетках или рекламных вставках готовой швейной продукции, например, постельного белья, достаточно часто указывается суммарное число продольных и поперечных нитей на один квадратный дюйм. Структура ткани характеризуется взаимным расположением основы и утка и связью между ними. Структура ткани определяется многими факторами, основные из которых следующие:- (i) род сырья, из которого получены нити; (ii) линейная плотность основных и уточных нитей и соотношение этих плотностей; (iii) число нитей основы и утка на 1 см ткани и соотношение этих чисел; (iv) вид переплетения нитей основы и утка; (v) натяжение нитей основы и утка в процессе ткачества и соотношение натяжений; и (vi) технологические параметры заправки ткацкого станка (величина заступа, параметры зева, положение скала относительно грудницы и другие). Структура готовой ткани зависит от параметров отделки, усадки или притяжки (удлинения) ткани, её стабилизации и другого. Структура ткани определяет её физико-механические свойства:- гигроскопичность, драпируемость, жёсткость, несминаемость, прочность, теплозащитные свойства, удлинение, усадку при влажностной обработке, устойчивость к истиранию и другие. За пределами стран, входивших в состав Советского Союза, структура ткани обычно указывается следующим образом:- 100% cotton, 21 s / 21 s, 60 x 60, 63” или 100% cotton, 30 s / 30 s, 68 x 68, 63”. Грубо говоря, под этими цифрами таятся следующие параметры бязи и миткаля соответственно:- 100% хлопок, пряжа основа N_E 21 крутка S / уток N_E 21 крутка S, количество нитей основы на дюйм 60 х утка на дюйм 60, ширина ткани 63 дюйма, и 100% хлопок, пряжа основа N_E 30 крутка S / уток N_E 30 крутка S, количество нитей основы на дюйм 68 х утка на дюйм 68, ширина ткани 63 дюйма. Иногда после количества нитей по основе и утку и до параметра ширины ткани в цифровую структуру ткани добавляют вес ткани в унциях за квадратный ярд. Цена за такую продукцию обычно указывается в валюте за один ярд (погонный). На территории бывшего Союза Советских Социалистических Республик (СССР) номер пряжи указывался обычно в тексах или в качестве N_M (номер метрический, в отличие от N_E номер Английский), количество нитей основы и утка указывалось на 10 сантиметров ткани, и ширина ткани указывалась в сантиметрах. Цена за ткань указывалась в Рублях за погонный или квадратный метр. Зная коэффициенты пересчёта нетрудно определиться со структурой любой ткани, продаваемой за рубежом или за рубеж.

(4) Texture is the visible surface structure depending on the size and organization of small constituent parts of a material; typically, the surface structure of a woven fabric or surface finish of a painted part.

TEXTURED = ТЕКСТУРИРОВАННОЕ – (1) Textured:- an adjective used to describe continuous filament manufactured yarns (and woven and knit fabrics made therefrom) that have been crimped or have had random loops imparted, or that have been otherwise modified to create a different surface texture. See also Textured Yarn, and Texturing.

(2) Textured:- a surface woven with a nubby yarn construction. It may be made in any liber.

TEXTURED COATED BOARD = ПОКРЫТЫЙ ТЕКСТУРИРОВАННЫЙ КАРТОН – Textured Coated Board is a plywood board with a phenolic laminate backing to enhance durability. The laminate is textured with a screen-printing process.

TEXTURED FILAMENT YARN = ТЕКСТУРИРОВАННАЯ ПРЯЖА ИЗ ЭЛЕМЕНТАРНЫХ НИТЕЙ (или ВЫСОКООБЪЁМНАЯ ПРЯЖА ИЗ ЭЛЕМЕНТАРНЫХ НИТЕЙ) – Textured Filament Yarn is a filament yarn characterised by actual or latent filament crimps, coils or loops, with or without twist liveliness, by which it has, or can develop by after-treatment, bulk and/or stretch properties. / филаментная (комплексная) пряжа (filament yarn).

TEXTURED YARN = ТЕКСТУРИРОВАННАЯ ПРЯЖА (или ВЫСОКООБЪЁМНАЯ ПРЯЖА) – Textured Yarns are the yarns that result after undegoing the texturizing process, which can create crimping, looping, and otherwise modify the filament yarn for the purpose of increasing cover, abrasion resistance, insulation, warmth resilience, or moisture absorption, and to provide a different surface texture. When filament yarns are texturized, and then woven or knitted into fabrics, the result is that the finished fabric’s properties resemble a fabric that has been made from a spun yarn. Most of today’s filament polyester is texturized. Textured Yarn is a continuous filament yarn that has been processed to introduce durable crimps, coils, loops or other fine distortions along the lengths of the filaments. Textured Yarns are the yarns of synthetic fibers that differ from ordinary textile yarns in their greater bulk, strong crimp, loose structure, and, in some cases, high stretchability. The production of textured yarns stemmed from the need to broaden the area of use of synthetic fibers; applications of such fibers had previously been limited by the fibers’ low hygroscopicity and smooth surfaces, which had an unpleasant, glassy sheen. Texturing improves the use characteristics and hygienic properties of synthetic yarns. Textured yarns are used for manufacturing a wide variety of textile products:- hosiery, knitted underwear and outer wear, and shape-retaining knitted fabrics for men’s and women’s suits and overcoats. They are also used in the production of artificial fur, carpets, blankets, and drapery and upholstery fabrics. As of 1975, world production of textured yarns was approximately 1.5 million tons a year. The following types of textured yarns are distinguished by production method, properties, and use:- high-tensile, low-tensile, crimped, loop, shaped, bicomponent, combination, and high-bulk yarns. The ever increasing demand for textured yarns fosters the development of new texturing methods and the improvement of existing ones. Technical progress in texturing methods is being carried out in the following directions: increasing equipment productivity; developing new texturing principles, for example, separating jointly twisted yarn without using complicated and expensive false-twisting equipment; combining several processes, such as shaping, drawing, and texturing, in one unit; increasing the capacity of yarn packages; mechanizing and automating operations, such as the loading of machines, the eliminating of breaks, and the removal of the finished packages; and automatic control of production parameters by means of programming devices. Textured Yarn:- yarns that develop stretch and bulk on subsequent processing. Textured Yarns are the yarns that develop stretch and bulk on subsequent processing. When woven or knitted into fabric, the cover, hand, and other aesthetics of the finished fabric better resemble the properties of a fabric constructed from spun yarn. See also Texturing. There are the following types of textured yarns:- bulked yarn, coil yarn, core-bulked yarn, crinkle yarn, entangled yarn, modified stretch yarn, nontorque yarn, set yarn, stretch yarn, and torque yarn. Textured Yarn is a general classification for continuous filament man-made fiber yarn which have been treated to give them hand and appearance which is different from the untreated yarn and/or stretchy. These yarns in some cases exhibit spun yarn effect. The yarns may be crimped, curled, coiled, distorted through air jet process or given a false twist and then be heat set. / , устойчивости к истиранию, . филаментная (комплексная) пряжа (filament yarn). Под Текстурированной или Высокообъёмной Нитью понимается нить, имеющая в результате специальных обработок меньшую объёмную массу или повышенную обратимую деформацию по сравнению с исходной нитью. Под Текстурированной или Высокообъёмной Пряжей понимается нить, отличающаяся от обычной текстильной нити рыхлой структурой, большим

удельным объёмом, извитостью, иногда упругой растяжимостью. Производство возникло из-за необходимости расширить области применения синтетических волокон, ограниченные их низкой гигроскопичностью и гладкой поверхностью с неприятным ‘стеклянным’ блеском. Из текстурированной пряжи изготовляют ткани типа кримплен, искусственный мех, чулки и другое. Высокорастяжимую текстурированную нить в странах бывшего Советского Союза называют эластиком, в других странах – хеланка. Текстурированная Нить – текстильная нить, структура которой путём дополнительных обработок изменена для повышения удельного объёма и/или растяжимости. Текстурированные Нити – высокообъёмные нити, нити из синтетических волокон, отличающиеся от обычных текстильных нитей повышенным удельным объёмом, сильной извитостью, рыхлой структурой и в ряде случаев большой упругой растяжимостью. Производство текстурированных нитей возникло в связи с необходимостью расширить область применения синтетических волокон, которая ограничена тем, что они обладают низкой гигроскопичностью и гладкой поверхностью с неприятным ‘стеклянным’ блеском. Текстурирование улучшает эксплуатационные свойства и повышает гигиенические показатели синтетических нитей. Текстурированные нити успешно применяются для изготовления текстильных изделий широкого потребления:- чулок, носков, верхнего и нижнего трикотажа, формоустойчивого трикотажного полотна, используемого для пошива мужских и женских костюмов (кримплен), пальто, для производства искусственного меха, ковров, одеял, драпировочных и обивочных тканей и другого. В зависимости от способа получения, свойств и назначения различают следующие виды текстурированных нитей:- высокорастяжимые, малорастяжимые, извитые, петлистые, профилированные, бикомпонентные, комбинированные, а также высокообъёмную пряжу. Высокорастяжимые нити (в бывшем Союзе Советских Социалистических Республик (СССР) они назывались Эластик, за рубежом – чаще всего Хеланка (Helanka)) вырабатывают по схеме:- кручение комплексных синтетических нитей (полиамидных, полиэфирных и других) до 2 500–5 000 кручений на 1 м, термофиксация закрученной нити; раскручивание термостабилизированной нити. В результате нить приобретает спиралеобразную форму, большую упругую растяжимость (до 400%), пушистость. Смотрите также Эластик. Малорастяжимые нити отличаются от эластика повышенной объёмностью, большой извитостью и пушистостью при небольшом упругом удлинении. В бывшем СССР такие нити, полученные из комплексных капроновых нитей, назывались Мерон, из лавсановых нитей – Мелан; за рубежом – Саабо или Астралон (Astralon). Их вырабатывают путём дополнительной термообработки высокорастяжимых нитей. Смотрите также Малорастяжимые Текстурированные Нити. Извитые нити получают преимущественно способом гофрирования; при этом синтетическую нить плотно набивают в специальную камеру и в таком виде подвергают тепловой обработке (в бывшем СССР эти нити назывались Гофрон, за рубежом – Банлон (Ban-Lon или BanLon или Banlon)). Извитые нити отличаются большой пилообразной извитостью, мягкостью, высоким удельным объёмом, но сравнительно небольшой растяжимостью. Второй способ основан на том, что синтетическая нить при протягивании по лезвию стальной пластинки подвергается сложной деформации; в результате отдельные элементарные нити приобретают спиралеобразную форму. Такие нити в бывшем СССР назывались Рилон (Rilon), за рубежом – Аджилон (Ajilon). Извитые нити вырабатывают также трикотажным способом. При этом из обычных термопластичных комплексных нитей на высокоскоростных трикотажных машинах производят полотно, которое подвергают тепловой обработке, в результате чего нити после роспуска полотна приобретают устойчивую извитость. Петлистые нити получают, воздействуя воздушной струёй на комплексную нить в момент её прохождения через канал прибора, в который под давлением подают воздух. Эти нити в бывшем СССР назывались Аэрон, за рубежом – Таслан. Профилированные нити (полиамидные, полиэфирные и другие) формуют, используя фильеры с отверстиями не круглого, а фигурного сечения. В результате получают нити с различной конфигурацией поперечного сечения или же с внутренними каналами. При обычной растяжимости они имеют более низкую объёмную массу, матовый оттенок, обладают повышенной гигроскопичностью. Таким способом можно получить нити, по внешнему виду и свойствам похожие на натуральные. Бикомпонентные нити формуют из двух или более полимеров. При этом отверстия фильер разделены перегородкой на несколько (две или более) частей, к каждой из которых подаётся свой прядильный расплав. Образующиеся нити состоят из нескольких различных по химическому составу частей. После вытягивания они подвергаются тепловой обработке, в результате которой вследствие различной усадки полимеров нити приобретают извитость, повышенную объёмность, рыхлую структуру. Комбинированные (армированные, каркасные) нити получают при совместном текстурировании различных нитей (например, ацетатных и капроновых) или при скручивании уже готовых текстурированных нитей, обладающих различными структурой и свойствами, а также при скручивании обычных комплексных или высокорастяжимых нитей со штапельными волокнами. Высокообъёмная пряжа вырабатывается из смеси химических штапельных волокон (в основном полиакрилонитрильных), имеющих усадку 20–30%, с низкоусадочным волокном. При термообработке такой пряжи в свободном состоянии высокоусадочные волокна укорачиваются, а низкоусадочные почти не меняют своей длины, но, будучи связаны с высокоусадочными волокнами силами трения, изгибаются, придавая пряже пушистый вид. Потребность в текстурированных нитях непрерывно увеличивается, поэтому будут создаваться новые и совершенствоваться существующие способы текстурирования. Технический прогресс в технологии текстурирования осуществляется в следующих направлениях:- повышение производительности оборудования; создание новых принципов текстурирования, например, путём разделения совместно скручиваемых нитей без применения сложных и дорогостоящих механизмов ложного кручения; совмещение нескольких процессов, например, формования, вытягивания и текстурирования, на одном агрегате; увеличение ёмкости паковок; механизация и автоматизация операций (заправка машин, ликвидация обрывов, съём готовых паковок); автоматическое регулирование технологических параметров с помощью программирующих устройств и другое.

TEXTURING = ТЕКСТУРИРОВАНИЕ – Texturing is the process of crimping, imparting random loops, or otherwise modifying continuous filament yarn to increase cover, resilience, abrasion resistance, warmth, insulation, and moisture absorption or to provide a different surface texture. Texturing methods can be placed roughly into six groups. See also Textured Yarns. There are the following methods of texturing:- air jet method, edge crimping method, false-twist method, gear crimping method, knit-de-knit method, and stuffer box method. / упругости, устойчивости к истиранию, . филаментная (комплексная) пряжа (filament yarn). Несмотря на доступность и дешевизну исходного сырья, сравнительно низкие материальные и трудовые затраты на производство химических волокон и нитей, высокие их физико-механические свойства, они обладают рядом сдерживающих их распространение недостатков. Среди этих недостатков:- стеклообразная поверхность цилиндрической формы, сильный блеск, высокая электризуемость, низкая гигроскопичность и вследствие этого низкие гигиенические свойства. Кроме того ткани и трикотажные изделия, выработанные из комплексных химических нитей, обладают пониженной эластичностью и драпируемостью, что также ограничивает область их применения. Однако синтетическим комплексным нитям можно придать ряд ценных эксплуатационных свойств. Для этого используют их термопластичность, высокие упругие свойства и способность к изменению структуры полимера при физико-химических воздействиях. Химические нити с видоизменённой устойчивой структурой повышенного удельного объёма или растяжимости называются текстурированными. Сущность текстурирования заключается в том, что при физико-химических воздействиях на термопластичные нити происходит переориентация молекул волокнообразующего полимера, в результате чего элементарные нити изгибаются, принимают пространственную форму, а комплексная нить приобретает большую упругую растяжимость, пушистость и повышенную объёмность. Текстурирование осуществляется с целью повышения удельного объёма нитей или их растяжимости. В настоящее время способы

текстурирования подразделяются на две группы:- с тепловым воздействием и без него. К первой группе относится производство текстурированных нитей кручением, прессованием, протягиванием по острой грани (может осуществляться без теплового воздействия), трикотажным и комбинированным способами. Ко второй группе относятся аэродинамический способ производства текстерированных нитей, формование различного профиля поперечного сечения нити, бикомпонентное формование. Текстурированные нити широко применяются в трикотажном производстве для выработки чулочно-носочных изделий, спортивного и верхнего трикотажа и другого. Также успешно текстурированные нити используются в ткачестве для производства ковров, драпировочных тканей, платьевых и костюмных тканей. Эффективность текстурирования характеризуется тремя основными характеристиками:- растяжимостью, извитостью и объёмностью.

TEXTURIZING = ТЕКСТУРИЗАЦИЯ (или ТЕКСТУРИРОВАНИЕ, или СТРУКТУРИРОВАНИЕ) – Texturizing is a process performed on specialized machinery which create bulk, stretch to the yarn, and therefore creates new aesthetics to the finished fabric.

TF = FRENCH SOUTHERN TERRITORIES

TFHRC = TURNER–FAIRBANK HIGHWAY RESEARCH CENTER

TFM = TRAFFIC FLOW MANAGEMENT

TFP = TOTAL FACTOR PRODUCTIVITY

TFVC = TRAFFIC FLOW VISUALIZATION AND CONTROL

TG = TOGO

TGA = TRANS GLOBAL AIRLINES

TGIF = THANK GOD ITS FRIDAY

TGMS LINE = THERMOSENSITIVE GENIC MALE STERILE LINE

TH = THAILAND

TH = THRESHOLD

T/HA = TONS/HECTARE

THAI SILK = ТАЙСКИЙ ШЁЛК – Thai Silk is a silk made in Thailand. Most Thai silk is fairly heavy weight, often slubbed, and made in vivid colors that are usually iridescent or changeable.

THALLUS = ТАЛЛОМ (или СЛОЕВИЩЕ) – Thallus is a plantlike organism not divided into leaves, stem, and root. Mushrooms and Lichen are examples of thalli. Thallus is a multicellular plant body, usually flat and not organized into roots, stems, leaves or vascular system. / листья, стебель и корень. и Лишайники служат примерами . не образующийся в корни, стебли, листья или сосудистую систему. Под Талломом, от Греческого слова Thallós, означающее Зелёная Ветка, или Слоевищем понимается тело Низших Растений (Водорослей, Лишайников и других) и Грибов, не расчленённое на стебель, листья и корень.

THAT'S HIGH = ПРЕКРАТИТЬ ПОДЪЁМ – That's High (maritime term):- an order to stop hoisting.

THB = THAI BAHT

THC = TERMINAL HANDLING CHARGE

THEOCRACY = ТЕОКРАТИЯ – Theocracy is a form of government in which the clergy exercise or bestow all legitimate political authority and in which religious law is dominant over civil law and enforced by state agencies. / Под Теократией, от Греческих слов Theós, означающее Бог, и Krátos, означающее Власть, понимается форма правления, при которой глава государства (обычно монархического) является одновременно его религиозной главой.

THEORETICAL DENSITY = ТЕОРЕТИЧЕСКАЯ ПЛОТНОСТЬ – Theoretical Density:- pure solid lumber without cavities. / Под Плотностью понимается масса единичного объёма вещества.

THEORETICAL VALUE = ТЕОРЕТИЧЕСКАЯ ЦЕННОСТЬ – Theoretical Value is an option's value generated by a mathematical model given certain prior assumptions about the term of the option, the characteristics of the underlying futures contract, and prevailing interest rates. The value of an option according to a mathematical model. / Ценность опциона, генерируемая математической моделью, предоставляющей определённые заранее известные исходные положения о сроке данного опциона, характеристиках соответствующего фьючерсного контракта и преобладающих процентных ставках. Ценность опциона согласно математической модели. Теоретическая Ценность – оценочная стоимость опциона, рассчитанная при помощи математической модели, такой как формула Блэка-Шоулза (Black-Scholes Option Pricing Model).

THERM = ТЕРМИЯ – Therm is a commercial unit of heat energy. The therm is equal to 100 000 Btu. Because there have been several definitions of the Btu, there are two official definitions of the therm. In the United States, the legal definition (made in 1968) is that the therm equals 105.480 4 MegaJoules. The European Union's definition, made in 1979 using the more current IT Btu, is 105.505 585 262 MegaJoules. Either way the therm is equal to about 25 200 (large) calories or about 29.3 kiloWatt hours of electrical energy. One therm can also be provided by about 96.7 cubic feet of natural gas. The therm has sometimes been confused with the thermie. The names of both units come from the Greek word for heat, therme. Abbreviation:- thm. A Therm is 100 000 British thermal units (Btus). A dekatherm is 1 million Btus. / Термия равна 100 000 Британских единиц теплоты (Б.т.е.). Декатермия равна 1 миллиону Бте (МБте, в Англоязычном исполнении – MMBtu). Под Термией, от Греческого слова Thérmē, означающее Жар или Тепло, понимается вышедшая из употребления внесистемная единица количества теплоты, равная 1 000 ккал (15-градусных) или количеству теплоты, необходимому для нагревания 1 тонны воды от 14.5 до 15.5 °C. Обозначение:- (thm). 1 термия = 4.185 $5 \cdot 10^6$ Дж = 4.185 5 МДж.

THERMAL = ТЕРМАЛЬНОЕ – Thermal:- an adjective used to describe fabrics which are warmer for their weight than other fabries. It is usually limited to those fabrics woven in a honeycomb pattern leaving small spaces in which an can be trapped. Thermal fabrics are popular for underwear and blankets. See also Honeycomb.

THERMAL BONDING = ТЕРМАЛЬНОЕ СКРЕПЛЕНИЕ – Thermal Bonding is a technique for bonding fibers of a web with meltable powders or fibers, using infrared heating, hot air, or hot-calendering. Also known as Thermobonding.

THERMAL CHARACTER = ТЕПЛОВОЕ СВОЙСТВО (или ТЕРМАЛЬНЫЙ ХАРАКТЕР) – Thermal Character is a tactile property of a textile material. It is the difference felt in the temperature of the material and the skin of the person touching it.

THERMAL CONDUCTIVITY = ТЕПЛОПРОВОДНОСТЬ (или ТЕРМАЛЬНАЯ ПРОВОДНОСТЬ, или УДЕЛЬНАЯ ТЕПЛОПРОВОДНОСТЬ) – Thermal Conductivity is a measure of the ability of a solid or liquid to transfer heat. Thermal Conductivity is a measure of heat flow through a material. / Под Теплопроводностью понимается перенос энергии от более нагретых участков тела к менее нагретым в результате теплового движения и взаимодействия микрочастиц. Приводит к выравниванию температуры тела. Обычно количество переносимой энергии, определяемое как плотность теплового потока, пропорциональна градиенту температуры (Закон Фурье). Коэффициент пропорциональности называется коэффициентом теплопроводности. Теплопроводность – один из видов переноса теплоты (энергии теплового движения микрочастиц) от более нагретых частей тела к менее нагретым, приводящий к выравниванию температуры. При теплопроводности перенос энергии в теле осуществляется в результате непосредственной передачи энергии от частиц (молекул, атомов, электронов), обладающих большей энергией, частицам с меньшей энергией. Если относительное изменение температуры T на расстоянии средней длины свободного пробега частиц l мало, то выполняется основной закон теплопроводности (Закон Фурье):- плотность теплового потока q пропорциональна градиенту температуры grad T, то есть:- $q = -\lambda \operatorname{grad} T$, где λ – коэффициент теплопроводности, или просто теплопроводность, не зависит от grad T (l зависит от агрегатного состояния вещества, его атомно-молекулярного строения, температуры и давления, состава (в случае смеси или раствора) и так далее). Отклонения от Закона Фурье могут появиться при очень больших значениях grad T (например, в сильных ударных волнах), при низких температурах (для жидкого гелия He II) и при высоких температурах порядка десятков и сотен тысяч градусов, когда в газах перенос энергии осуществляется не только в результате межатомных столкновений, но в основном за счёт излучения (Лучистая Теплопроводность). В разреженных газах, когда l сравнимо с расстоянием L между стенками, ограничивающими объём газа, молекулы чаще сталкиваются со стенками, чем между собой. При этом нарушается условие применимости Закона Фурье и само понятие Локальной Температуры газа теряет смысл. В этом случае рассматривают не процесс теплопроводности в газе, а теплообмен между телами, находящимися в газовой среде. Процесс переноса теплоты – теплопроводность – в сплошной среде описывается Уравнением Теплопроводности.

THERMAL CRACKING = ТЕРМОКРЕКИНГ (или ТЕРМИЧЕСКИЙ КРЕКИНГ) – Thermal Cracking is a refining process in which heat and pressure are used to break down, rearrange, or combine hydrocarbon molecules. Thermal cracking includes visbreaking, fluid coking, delayed coking, and other similar processes. Heating of hydrocarbons to very high temperatures, usually above 450 °C. Thermal cracking is no longer widely used, except in delayed coking. Thermal Cracking is a process for obtaining light hydrocarbons from heavier hydrocarbons at high temperatures, for example, vacuum gasoil can be refined into light products. / , от Греческого слова Thérmē, означающее Жар или Тепло, и . Углеводороды нагреваются до очень высоких температур, как правило, свыше 450 °C. Термический крекинг в настоящее время больше не находит широкого применения, за исключением замедленного коксования. Термический Крекинг или Термокрекинг это процесс для получения лёгких углеводородов из более тяжёлых углеводородов под воздействием высоких температур, например, при осуществлении такого процесса вакуумные газойли перерабатываются в лёгкие нефтепродукты.

THERMAL DILATATION = ТЕПЛОВОЕ РАСШИРЕНИЕ – Thermal Dilatation:- (Latin:- Dilatare – To Extend) increase in the volume of a substance as a result of increased temperature. / , от Латинского слова Dilato, означающее Расширяю, . Под Тепловым Расширением понимается изменение размеров и формы тела при изменении его температуры; характеризуется коэффициентом объёмного расширения $\alpha_v = (1 / V)\cdot(\Delta V / \Delta T)_\xi$, а для твёрдых тел и коэффициентом линейного расширения $\alpha_л = (1 / l)\cdot(\Delta l / \Delta T)_\xi$, где Δl – изменение линейного размера, ΔV – объёма тела, ΔT – температуры, индекс ξ указывает на условия теплового расширения (обычно при постоянном давлении). Для изотропных тел = .

THERMAL DISSOCIATION = ТЕРМАЛЬНАЯ ДИССОЦИАЦИЯ (или ТЕРМИЧЕСКАЯ ДИССОЦИАЦИЯ) – Thermal Dissociation:- in this process the metal is first converted into some compound which is then decomposed into pure metal by heating. For example, impure nickel is heated with carbon monoxide at 60 °C to form nickel carbonyl $Ni(CO)_4$ which is then decomposed at higher temperature, 150–180 °C to give very pure nickel. Sometimes iron is also purified by this method.

THERMAL FIXATION = ТЕРМАЛЬНАЯ ФИКСАЦИЯ – Thermal Fixation is a process for dyeing polyester whereby the color is diffused into the fiber by means of dry heat.

THERMAL INSULATION = ТЕПЛОИЗОЛЯЦИЯ (или ТЕПЛОВАЯ ИЗОЛЯЦИЯ) – Thermal Insulation is the ability of a fabric to retain heat. / Под Теплоизоляцией или Тепловой Изоляцией понимается защита зданий, тепловых промышленных установок, холодильных камер, трубопроводов и другого от нежелательного теплового обмена с окружающей средой. Теплоизоляция обеспечивается специальными ограждениями из теплоизоляционных материалов; сами теплозащитные средства также называются теплоизоляцией.

THERMALLY STABILIZED = ТЕРМИЧЕСКИ СТАБИЛИЗИРОВАННОЕ – A term Thermally Stabilized might mean in regards to residual stresses. See also Heat Stabilized.

THERMAL SHRINKAGE = ТЕРМАЛЬНАЯ УСАДКА – Thermal Shrinkage:- the amount shrinkage of a fiber measured in dry air vs. that measured in its saturated state. Usually expressed as a %.

THERMAL STABILITY = ТЕРМАЛЬНАЯ СТАБИЛЬНОСТЬ – Thermal Stability is an ability of a fuel or lubricant to resist oxidation under high temperature operating conditions.

THERMAL WOVEN = ТЕРМАЛЬНОЕ СОТКАННОЕ – Thermal Woven:- a porous cloth so constructed that air warmed by the body is trapped between the yarns. First used in underwear, it is now used for blankets and the reverse sides of comforters.

THERMOBONDING = ТЕРМОСКРЕПЛЕНИЕ – Thermobonding is a technique for bonding fibers of a web with meltable powders or fibers, using infrared heating, hot air, or hot-calendering. See also Bonding, Bonding With Binder Fibers, and Powder-Bonded Non-Woven.

THERMOCHROMIC INKS OR DYES = ТЕРМОХРОМНЫЕ ЧЕРНИЛА ИЛИ КРАСИТЕЛИ – Thermochromic Inks Or Dyes are the temperature sensitive inks and dyes. The inks change color when exposed to heat. For example, a t-shirt that has a print design that changes color when you go into the sunlight.

THERMOCHROMISM = ТЕРМОХРОМИЗМ (или ТЕРМОХРОМИЯ) – Thermochromism is a change in color with temperature change. adj – thermochromatic. / Термохромизм – изменение цвета с изменением температуры.

THERMOCYCLER = ТЕРМОЦИКЛЕР – Thermocycler is an apparatus which changes temperatures according to precise programming. Usually used with Polymerase Chain Reaction (PCR), Random Amplified Polymorphic DNA (RAPD), Arbitrarily Primed Polymerase Chain Reaction (AP-PCR), and DNA amplification fingerprinting (DAF).

THERMOGRAPHY = ТЕРМОГРАФИЯ – Thermography:- the use of infrared thermography whereby temperatures of a wide variety of targets can be measured remotely and without contact. This is accomplished by measuring the infrared energy radiating from the surface of the target and converting this measurement to an equivalent surface temperature. / Под Термографией, от Греческих слов Thérme, означающее Жар или Тепло, и Grapho, означающее Пишу или Рисую или Черчу, понимаются:- (1) в широком смысле слова Термография – производимая различными способами регистрация теплового поля объектов, то есть поля их инфракрасного (ИК) излучения (смотрите, например, Инфракрасная Фотография, и Тепловидение). (2) В узком значении Термография – оперативный способ копирования и размножения рукописных, печатных и других чёрно-белых штриховых материалов. Светлые участки оригинального материала меньше нагреваются при ИК-облучении, чем тёмные, так как они слабее поглощают ИК-излучение. Благодаря этому копировальный материал, приведённый в контакт с оригиналом при ИК-облучении последнего, испытывает те или иные изменения на более нагретых участках и не испытывает их на менее нагретых. Чаще всего таким изменением служит разложение введённых в копировальный материал солей металлов (например, железа), в результате чего металл восстанавливается и темнеет в местах, контактировавших с более нагретыми участками оригинала. Достоинства термографии – быстрота и простота; вместе с тем разрешающая способность термография невелика, а цветные детали почти не передаются. Смотрите также Термокопировальный Аппарат, и Термокопирование.

THERMOGRAVIMETRIC ANALYSIS = ТЕРМОГРАВИМЕТРИЧЕСКИЙ АНАЛИЗ – Thermogravimetric Analysis is the analytical technique in which the rate of change in weight of a material undergoing continuous heating versus temperature is plotted. Used in analysis of polymers to provide information on such parameters as degree of crystallinity, glass transition temperature, thermal stability, etc.

THERMO KING UNIT = УСТАНОВКА СЁМО КИНГ – Thermo King Corporation, a unit of Ingersoll-Rand PLC (Dublin, Ireland), was founded in 1938 and manufactures transport temperature control systems for a variety of mobile applications, including trailers, truck bodies, buses, shipboard containers and railway cars. Headquartered in Minneapolis, State of Minnesota, the United States. Thermo King, mechanical refrigeration unit to cool or heat the inside of the refrigerated container. / Сёмо Кинг Корпорэйшэн (Thermo King Corporation), Ингёсол-Рэнд Пи.Эл.Си. (Ingersoll-Rand PLC). , от Греческого слова Thérmē, означающее Жар или Тепло, и . Сёмо Кинг (называемая в простонародье Термо Кинг), механическая рефрижераторная установка для охлаждения или обогрева содержимого рефрижераторного контейнера.

THERMO–MAN = ТЕРМО–ЧЕЛОВЕК – Thermo-Man is the instrumented mannequin system, interfaced with a computer, allows full scale testing of garments for protection capability or degree of flammability. The system was developed by Accurex Corporation for the US Air Force. / Акьюрэкс Корпорэйшэн (Accurex Corporation).

THERMOPHILIC MICROORGANISMS = ТЕРМОФИЛИЧЕСКИЕ МИКРООРГАНИЗМЫ (или ТЕПЛОЛЮБИВЫЕ МИКРООРГАНИЗМЫ) – Thermophilic Microorganisms:- (Greek:- Thermos – Heat, philos – love) Microorganisms that thrive on heat. / Под Термофилами, от Греческих слов Thérmē, означающее Жар или Тепло, и Philéō, означающее Люблю, понимаются организмы, нормально существующие и размножающиеся при температуре выше 45 °C (гибельной для большинства живых существ). Некоторые беспозвоночные (моллюски, насекомые, черви), рыбы, микроорганизмы и растения. Обитают в горячих источниках, верхних слоях почвы, прогреваемых солнцем, в самонагревающихся субстратах (зерно, навоз, торф).

THERMOPLASTIC = ТЕРМОПЛАСТИК – Thermoplastic is a word used to describe fibers that are heat-sensitive. Most man-made fibers are thermoplastic. A thermoplastic fiber has the property of softening or fusing when heated and of harderring agaln when cooled. With the application of heat and pressure, it can be molded and remolded. This can be both an udvarrtaKe and a disadvantage. lt is advantageous because in fabrics made of thermoplastic fibers, certain features like pleats can be made permanent through heat-setting. However, care must be taken in drying und ironiog fabrics made of thermoplastic fibers because of their sensitivity to heat. See also Heat-Setting, and Man-Made Fibers. Thermoplastic is a term used to describe a plastic material that is permanently fusible. The term as applied to manufactured fibers describes their tendency to soften at higher temperatures.

THERMOPLASTIC GLUES AND RESINS = ТЕРМОПЛАСТИЧЕСКИЕ КЛЕИ И СМОЛЫ – Thermoplastic Glues And Resins are glues and resins that are capable of being repeatedly softened by heat and hardened by cooling. / , от Греческого слова Thérmē, означающее Жар или Тепло, и . Клеи и смолы, которые способны к повторному размягчению при тепловом воздействии и к затвердеванию посредством охлаждения.

THERMO PLY OR PIN TICKET MARKING = ТЕРМО СЛОЖЕНИЕ ИЛИ ХХ – Thermo Ply or Pin Ticket Marking:- improperly placed or marked. Cutting Room Defects, and namely – Shade Marking Defects. / нетщательно размещённое или маркированное. Порок или дефект раскроя.

THERMOREGULATION = ТЕРМОРЕГУЛЯЦИЯ – Thermoregulation is the ability to maintain a constant temperature independent of dynamic (changing) environmental conditions. / Под Терморегуляцией, от Греческого слова Thérmē, означающее Жар или Тепло, и от Латинского слова Regulo, означающее Регулирую, понимается совокупность физиологических процессов, обеспечивающих постоянство температуры тела у теплокровных животных (птиц и млекопитающих) и человека. Осуществляется путём изменения интенсивности теплопродукции (при окислительных процессах в организме) и путём изменения теплоотдачи через кожу (испарение пота и другое).

THERMOSENSITIVE GENIC MALE STERILE LINE = ТЕРМОЧУВСТВИТЕЛЬНАЯ ГЕННАЯ МУЖСКАЯ СТЕРИЛЬНАЯ ЛИНИЯ – Thermosensitive Genic Male Sterile Line (TGMS) is the genic male sterile plant which responds to temperature for expression of its pollen sterility/fertility. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

THERMOSET = ТЕРМОСЕТ – Thermoset is a term used to describe a plastic that, once formed, does not melt when heated. A Thermosetting Plastic, also known as a Thermoset, is polymer material that irreversibly cures. The cure may be done through heat (generally above 200 °C (392 °F)), through a chemical reaction (two-part epoxy, for example), or irradiation such as electron beam processing. Thermoset materials are usually liquid or malleable prior to curing and designed to be molded into their final form, or used as adhesives. Others are solids like that of the molding compound used in semiconductors and integrated circuits (IC). Once hardened a thermoset resin cannot be reheated and melted back to a liquid form.

THERMOSETTING = ТЕРМООТВЕРЖДЕНИЕ – Thermosetting is a process for giving thermoplastic fibers or fabrics certain characteristics, such as erirnp or permanent pleats through the applicativm of heat. Thermosetting is also used to develop certain finishes in a fabric to produce desirable characteristics such as durable press. See also Durable Press, Heat Setting, and Thermoplastic.

THERMOSETTING GLUES AND RESINS = ТЕРМООТВЕРЖДАЮЩИЕ КЛЕИ И СМОЛЫ (или ТЕРМОРЕАКТИВНЫЕ КЛЕИ И СМОЛЫ) – Thermosetting Glues And Resins are glues and resins that are cured with heat but do not soften when subsequently subjected to high temperatures. / , от Греческого слова Thérmē, означающее Жар или Тепло, и .

THERMOSOL PROCESS = ТЕРМОСОЛ–ПРОЦЕСС – Thermosol Process is a thermal fixation dyeing process for textiles made of polyester or other thermoplastic fiber. See also Dyeing, and Thermal Fixation. Dyeing at higher temperatures (120–130 °C (248–266 °F)) under pressure avoids the need for carriers. With the Thermosol process, a pad-dry heat technique developed by the DuPont Company, temperatures of 180–220 °C (356–428 °F) are employed with contact times on the order of a minute. / ДюПо Кампэни (DuPont Company).

THERMOTROPIC POLYMER = ТЕРМОТРОПИЧЕСКИЙ ПОЛИМЕР – Thermotropic Polymer is a polymer that exhibits liquid crystal formation in melt form. In thermotropic polymers there must be a balance between having the necessary degree of molecular perfection to preserve the liquid crystal formation and the amount of imperfection to permit melting at workable temperatures. These polymers give high-modulus, highly oriented, extrusion products. / Экструзия или Выдавливание (Extrusion).

THERMOTROPISM = ТЕРМОТРОПИЗМ – Thermotropism:- bending, growth or movement of a part under the influence of a heat source. See also Tropism. / Смотрите также Тропизм (Tropism). Под Термотропизмом, от Греческих слов Thérmē, означающее Жар или Тепло, и Tróрos, означающее Направление или Поворот, понимается . Под Тропизмом, от Греческого слова Tróрos, означающее Направление или Поворот, понимается ростовое движение органов растений (корня, стебля, листьев), обусловленное направленным действием какого-либо раздражителя – света (фоторопизм), силы земного тяготения (геотропизм), температуры (термотропизм), прикосновения (гаптотропизм), воды (гидротропизм), кислорода (аэротропизм) и других химических веществ (хемотропизм). В основе тропизма лежит неравномерный рост, вызываемый перераспределением в растении фитогормонов.

THERMUS AQUATICUS = ТЭРМУС АКВАТИКУС – Thermus Aquaticus is a thermophylic bacterium found in hot springs. Its DNA polymerase enzyme is thermostable and is used in Polymerase Chain Reaction (PCR), Random Amplified Polymorphic DNA (RAPD), and DNA amplification fingerprinting (DAF).

THETA = ТЕТА – Theta measures the rate of decline in the value of an option due to the passage of time. Theta can also be referred to as the time decay on the value of an option. If everything is held constant, then the option will lose value as time moves closer to the maturity of the option. The sensitivity of an option's value to a change in the amount of time to expiration. Theta is a dynamic indicator of the decline in the time value of a warrant. The value of Theta reflects the percentage by which the warrant loses in value if the share price remains constant. The value of Theta increases as the time to expiration approaches. The derivative of the option price equation with respect to the remaining time to expiration of the option. A measure of the sensitivity of the value of the option to the passage of time. This measures the effect on an option's price of a one-day decrease in the time to expiration. The more the market and strike prices diverge, the less effect Theta has on a vanilla option's price. Theta is also non-linear for vanilla options, meaning that its value decreases faster as the option is closer to maturity. Positive Gamma is generally associated with negative Theta and vice versa. In options, Theta is the rate of change in the value of the option with respect to time with all else remaining the same. / В анализе ситуации биржевой торговли опционами название буквы Тета (прописная – Θ, строчная – θ) Греческого алфавита было использовано для обозначения ставки снижения ценности опциона вследствие течения времени. Тета – показатель изменения стоимости опциона с течением времени. Например, если опцион имеет Тета на уровне минус 0.25, его стоимость уменьшается примерно на 25 центов в день, при условии, что стоимость базисных активов и лихорадочность остаются постоянными величинами. Тета опционов, характеризующихся низкой лихорадочностью, меньше, чем Тета опционов с более высокой лихорадочностью. В качестве количественного индикатора 'временного разрушения' (time decay) стоимости опциона Тета увеличивается по мере приближения к дате исполнения, в связи с чем наиболее благоприятным временем для продажи опционов считается период 90–100 дней до истечения срока.

THI = TEMPERATURE–HUMIDITY INDEX

THICK AND THIN PLACES = УТОЛЩЁННЫЕ И УТОНЧЁННЫЕ МЕСТА (или УТОЛЩЕНИЯ И УТОНЕНИЯ) – Thick and Thin Places:- these are similar to weft bar, but unlike weft bars, it repeats at intervals. They are mainly due to irregular let-off, incorrect setting of holding and releasing pawls on the ratchet wheel of take-up motion, gears of take-up motion not meshing properly, and gear wheel teeth worn out or broken.

THICK–AND–THIN YARN = УТОЛЩЁННАЯ И УТОНЧЁННАЯ ПРЯЖА – Thick-And-Thin Yarn is a bovelty yarn of varying thickness. Thick And Thin Yarn:- produced by varying the diameters of man-made fibers.

THICK END = УТОЛЩЁННАЯ ПРОДОЛЬНАЯ НИТЬ – Thick End:- diameter is more than the normal yarn. Spinning defect. Thick End and Thick Picks:- diameter is more than the normal yarn. Rove count, top roller (pressure and mechanical condition of m/c. parts):- (i) piecening done at final gilling and rove creel to be removed by roving operator; (ii) thick roving to be removed at roving and ring frame; (iii) ring cop having spinner's double yarn to be sorted out and cut; (iv) draft, top roller pressure condensers and spacers on ring frame and roving frame; (v) regular checking in yarn clearer on Mach-Coner; and (vi) setting of Uster yarn clearers to be checked in every shift. / Порок или дефект прядения. Уштэр Тчэкнолодьжиз А.Ге. (Цельвига Уштэр) (Uster Technologies AG (Zellweger Uster)), Уштэр (или Устер), Швейцария.

THICK END AND THICK PICKS = УТОЛЩЁННАЯ ПРОДОЛЬНАЯ НИТЬ И УТОЛЩЁННАЯ ПОПЕРЕЧНАЯ НИТЬ – Thick End and Thick Picks:- higher diameter in yarn for a short distance can be due to improper piecing at spinning preparatory or drop in pressure on the drafting rollers for a short time. This also can happen due to not removing of spinners double, not piecing the end properly by removing the lapped materials, accumulation of fluff in condensers, cradles and in the necks of the top rollers.

THICK FILLING = УТОЛЩЁННАЯ УТОЧИНА – Thick Filling is the yarn larger in diameter than other yarns being used in the fabric. Also known as Coarse Pick, and Coarse Thread.

THICKNESS OF COATING = ТОЛЩИНА ПОКРЫТИЯ – Thickness Of Coating is the average thickness of the coating layer.

THICK PICK = УТОЛЩЁННАЯ ПОПЕРЕЧНАЯ НИТЬ – Thick Pick:- diameter is more than the normal yarn. Spinning defect. Thick End and Thick Picks:- diameter is more than the normal yarn. Rove count, top roller (pressure and mechanical condition of m/c parts):- (i) piecening done at final gilling and rove creel to be removed by roving operator; (ii) thick roving to be removed at roving and ring frame; (iii) ring cop having spinner's double yarn to be sorted out and cut; (iv) draft, top roller pressure condensers and spacers on ring frame and roving frame; (v) regular checking in yarn clearer on Mach-Coner; and (vi) setting of Uster yarn clearers to be checked in every shift. / Порок или дефект прядения. Уштэр Тчэкнолодьжиз А.Ге. (Цельвига Уштэр) (Uster Technologies AG (Zellweger Uster)), Уштэр (или Устер), Швейцария.

THICK PLACE = УТОЛЩЕНИЕ (или УТОЛЩЁННОЕ МЕСТО, или ТОЛСТОЕ МЕСТО, или ЗАБОИНА) – Thick Place:- in fabric, an unintentional change in fabric appearance characterized by a small area of more closely spaced yarns, or by a congregation of thick yarns as compared to the adjacent construction. Fabrics defect. Thick Place:- an unintentional change in the fabric appearance characterized by a small area of more closely spaced yarns or by congregation of thick yarns compared to the adjacent construction results into this kind of defect. Minor Defect Classification:- Up to 2 Picks for Lighter Variety. Major Defect Classification:- > 3 Picks. Thick Place:- the yarn with poor evenness will have thick and thin places along yarn length, while an even yarn will have little variation in mass or thickness along length. See also Thin Place. Thick Places (+50%):- number of places that have mass increases of 50% or more with respect to the mean value. Note that (+50%) is the standard sensitivity level used in the test. If a different sensitivity level (+35%, +70%, +100%) is used, the result would have been different. The number of thin places has a significant impact on yarn strength. Thick Place:- a prominent band in which an increase in stitch density, compared to the rest of the fabric, is apparent. Note:- this defect is often caused by a poor start-up of the machine, or uneven let-off or take-up. (1) Defect Name:- Thick Place. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Oxford or Basket. Description:- Thick Place:- This defect is the result of picks being forced closer together than normal for this construction. This could be the result of a faulty take-up or the weaver letting the cloth back too much trying to avoid a thin place. Severity:- Major. (2) Defect Name:- Thick Place. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Oxford or Basket. Description:- Thick Place:- This is the result of picks of filling having been packed too closely together, either because of a mechanical malfunction or the operator letting back on the cloth too far after servicing the loom for a filling break. Severity:- Major. / уточина. Забоина – порок ткани. Размер порока – за каждое место. Под Забоинами понимается дефект суровой ткани в виде поперечных полос с повышенным числом уточных нитей на 1 дециметр (дм) ткани, причина – разладка основного регулятора или товарного механизма. Под Утолщением понимается местный порок в виде утолщения нити на ограниченном участке. Под Забоинами понимается дефект суровой ткани в виде поперечных полос во всю ширину ткани с повышенным числом уточных нитей на 1 дм ткани (то есть с повышенной плотностью ткани по утку), причина – разладка основного регулятора или товарного механизма. Утолщение (thick place):- порок утка в виде утолщения нити на ограниченном участке. Примечание:- этот порок часто вызывается использованием пряжи неравномерной по толщине.

THICK PLACE or DOUBLING = УТОЛЩЕНИЕ (или УТОЛЩЁННОЕ МЕСТО, или ТОЛСТОЕ МЕСТО, или ЗАБОИНА) или ДУБЛИРОВАНИЕ – (1) Defect Name:- Thick Place or Doubling. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Sateen Derivatives. Description:- Thick Place or Doubling:- This is the result of two unwanted ends of roving running into one end of filling yarn during the spinning process causing the yarn to be twice its normal size. An end on the spinning frame can only run this way for a short time before the bobbin will become too large for the ring. Severity:- Major. (2) Defect Name:- Thick Place or Doubling. Defect Type:- weft lines, horizontal lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Thick Place or Doubling (face view):- This is the unwanted result of two ends of roving running into one end of filling during the spinning process, causing the yarn to be twice it normal size. Severity:- Major. (3) Defect Name:- Thick Place or Doubling. Defect Type:- weft lines, horizontal lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Thick Place or Doubling (back view):- This is the unwanted result of two ends of roving running into one end of filling during the spinning process causing the yarn to be twice it normal size. Severity:- Major. / уточная пряжа.

THICK YARN = УТОЛЩЁННАЯ (или ТОЛСТАЯ) ПРЯЖА – Thick places are determined where the yarn diameter is in excess of 50% of the average yarn diameter and the length is 8–12 mm. Thick Yarn:- Possible Cause:- one of the feeder is receiving yarn from a spool which has thicker yarn. This will also lead to barre till the spool exhausts or is changed. This is a major defect which will leave bands across the entire width of the fabric. Knitting defect. / Утолщённые Нити Основы от трёхкратной до пятикратной толщины включительно; Утолщённые Нити Утка от трёхкратной до пятикратной толщины включительно, идущие по всей ширине. Размер порока – за каждое место.

THIGH–SPUN = СПРЯДЕНАЯ ХХ – Thigh-Spun:- the yarn produced by aboriginal people.

THIGMOTAXIS = ТИГМОТАКСИС – Thigmotaxis:- (Greek:- thigma – contact, touch; taxis – arrangement, sequence) stimulus by touch. / Под Тигмотаксисом, от Греческих слов Thigma, означающее Прикосновение, и Táxis, означающее Расположение, понимается стимулирование или побуждение прикосновением.

THIGMOTROPISM = ТИГМОТРОПИЗМ (или ГАПТОТРОПИЗМ) – Thigmotropism or Haptotropism is a growth response to a touch stimulus. See also Tropism. / Смотрите также Тропизм (Tropism). Под Тигмотропизмом, от Греческих слов Thigma, означающее Прикосновение, и Tróрos, означающее Направление или Поворот, понимается тоже что и Гаптотропизм. Под Гаптотропизмом, от Греческих слов Háptō, означающее Прикрепляю, и Tróрos, означающее Направление или Поворот, понимаются ростовые движения органов растения (корня, листьев, стебля), обусловленные направленным действием раздражителя, в данном случае прикосновения. Под Тропизмом, от Греческого слова Tróрos, означающее Направление или Поворот, понимается ростовое движение органов растений (корня, листьев, стебля), обусловленное направленным действием какого-либо раздражителя – света (фоторопизм), силы земного тяготения (геотропизм), температуры (термотропизм), прикосновения (гаптотропизм), воды (гидротропизм), кислорода (аэротропизм) и других химических веществ (хемотропизм). В основе тропизма лежит неравномерный рост, вызываемый перераспределением в растении фитогормонов.

THIMBLE = КОУШ (или КОЛЬЦО, или НАКОНЕЧНИК, или ГИЛЬЗА, или СТАКАН) – Thimble (maritime term):- an iron ring with a groove on the outside for a rope grommet or splice.

THIN AND SHRUNKEN = ТОНКАЯ И ЩУПЛАЯ – Thin And Shrunken:- hot dry conditions during maturation of Wheat can severely reduce kernel size and cause shrunken kernels. As a result:- (i) test weight is reduced; (ii) flour yield is reduced; and (iii) more small kernels are removed during cleaning. / Сухие жаркие погодные условия в период созревания Пшеницы могут в серьёзной степени уменьшить размер зерновки (ядра) и вызвать формирование щуплой зерновки. Как результат:- (i) снижение веса при испытании; (ii) более низкий выход муки; и (iii) выделение в процессе очистки более мелких ядер.

THIN AND WEAK WHERE THREAD BUNCH OCCURS = ТОНКОЕ И СЛАБОЕ В МЕСТАХ СВЯЗКИ НИТОК – (1) Thin And Weak Where Thread Bunch Occurs:- this is not common but generally causes breakage at the bridge. Closure defects, and namely – Plastic Buttons. (2) Thin And Weak Where Thread Bunch Occurs:- this is not common but generally causes breakage at the bridge. Less applicable to ocean pearl than to fresh water. Closure defects, and namely – Pearl Buttons. / Порок или дефект застёжки.

THIN END = УТОНЧЁННАЯ (или ТОНКАЯ) ПРОДОЛЬНАЯ НИТЬ – Thin End is a warp yarn of smaller diameter than that normally used in the fabric. Also known as Fine End.

THIN FILLING = УТОНЧЁННАЯ (или ТОНКАЯ) УТОЧИНА – Thin Filling:- in woven fabrics, a filling yarn smaller in diameter than normal. Synonym:- Fine Filling, Fine Pick, Light Filling, Light Pick, and Thin Pick.

THIN FILM LUBRICATION = ТОНКОПЛЁНОЧНОЕ СМАЗЫВАНИЕ (или СМАЗЫВАНИЕ ТОНКОЙ ПЛЁНКОЙ, или ГРАНИЧНОЕ СМАЗЫВАНИЕ) – Thin Film Lubrication:- a condition of lubrication in which the film thickness of the lubricant is such that the friction between the surfaces is determined by the properties of the surfaces as well as by the viscosity of the lubricant. See also Boundary Lubrication, and Lubrication. / Смотрите также Граничное Смазывание (Boundary Lubrication), и Смазывание (Lubrication).

THIN MARKET = СЛАБЫЙ РЫНОК (или ТОНКИЙ РЫНОК, или ШАТКИЙ РЫНОК) – Thin Market is a market with a low number of buyers and sellers. Since few transactions take place in a thin market, prices are often more volatile and assets are less liquid. The low number of bids and asks will also typically result in a larger spread between the two quotes. Also known as Narrow Market. A thin market has high price volatility and low liquidity. If supply or demand changes abruptly, resulting in more buyers than sellers or vice versa, there will typically be a material impact on prices. Since few bids and asks are quoted, potential buyers and sellers may find it difficult to transact in a thin market. Thin Market is a market characterized by few potential traders and few or infrequent trades. Thin Market is a market in which trading volume is low and in which consequently bid and ask quotes are wide and the liquidity of the instrument traded is low. / Тонкий Рынок:- состояние рынка, когда котировки на протяжении продолжительного периода времени поступают в торговую платформу реже, чем в нормальных рыночных условиях. Как правило, такое состояние рынка характерно для рождественских каникул, национальных праздников в странах G7, в период с 23:00 до 03:00 по Московскому времени и так далее. Слабый Рынок – рынок, на котором выдвигается относительно небольшое число предложений продать и купить ценные бумаги. Этот термин может применяться по отношению к классу ценных бумаг или товарно-сырьевых фьючерсов, например, к акциям малых выпусков, продающимся на внеучётном рынке (over the counter) или на платиновом рынке, или он может относиться к некоторым конкретным акциям, котирующимся на бирже или на внеучётном рынке. В ситуации слабого рынка колебания цен обычно сильнее, чем когда рынок является ликвидным (liquidity), поскольку даже небольшое число сделок может серьёзно повлиять на котировки. Организации-инвесторы, приобретающие или продающие крупные пакеты акций, стремятся избегать слабых рынков, поскольку им трудно получить или ликвидировать позицию (position), не нарушая сложившихся котировок акций.

THINNING = ПРОРЕЖИВАНИЕ – Thinning is a removal of some plants to attain the desired population density. Thinning is the process by which crop plants are removed from the field to obtain a desired plant population with desired spacing. Objective Of Thinning:- (i) to maintain a desirable spacing; (ii) to maintain a desirable plant population; (iii) to ensure the optimum requirement of nutrient, light, moisture and aeration for plants; (iv) to keep the crop plants free from insects and diseases; and (v) to maintain the quality and quantity of the produce. Methods Of Thinning:- (A) Physical Method:- it includes the removal of crop plants by hand pulling. Advantages Of Physical Method Of Thinning:- (i) it is suitable for small area; and (ii) desired plants are not injured. Limitations Of Physical Method Of Thinning:- (i) more costly; (ii) time consuming; (iii) not suitable for large area; and (iv) uniform spacing may not be obtained. (B) Mechanical Methods:- it includes the thinning operation performed by using implements either manually or operated. Mechanical method includes:- (i) thinning by using Nirani in Rice, Jute or Wheat field (in Bangladesh Nirani is:- (a) a tool, made locally, with a wooden handle and semilunar in shape, along with pointed and sharp end with iron; and (b) the process, where weeding and scooping of soils go simultaneously; in case of Jute/Mesta cultivation, this nirani is used both for weeding and scooping the soils for aeration and for better respiration of roots); (ii) sickling in Jute; and (iii) raking in Rice, Wheat, Jute, etc. Advantages Of Mechanical Method Of Thinning:- (i) less time consuming; (ii) suitable for large area; and (iii) uniform spacing may be obtained specially by raking. Limitations Of Mechanical Method Of Thinning:- (i) sometimes desired plant species may be injured by implements; and (ii) Heavy implements like field rake can't be used in small area. / Прореживание Всходов, удаление из рядков или гнёзд лишних растений для улучшения условий произрастания оставшихся. Применяется на загущенных посевах Сахарной Свёклы, столовых и кормовых корнеплодов, Кукурузы, выращиваемой для получения зерна, Подсолнечника и других пропашных культур. Проводится культиватором или прореживателем, которые подрезают часть растений в рядке (механизированное прореживание, или букетировка), и вручную (прорывка). Всходы прореживают в начальный период их роста и развития (например, Сахарную Свёклу при образовании развитых семядолей, то есть в фазе вилочки, и не позднее появления пары настоящих листьев), овощные культуры (Морковь, Свёклу) – несколько раз для получения пучкового продукта (молодые растения или корнеплоды), используемого в пищу. При запаздывании с прореживанием всходы вытягиваются из-за недостаточного освещения и задерживают рост, что резко снижает урожай и может вызвать гибель посевов. Пунктирные посевы не нуждаются в прореживании. Прореживатель, машина для прореживания всходов Сахарной Свёклы. Может быть использована как в основной, так и в поливной зонах свёклосеяния. Основные рабочие органы прореживателя – фрезы и диски с закреплёнными на них Г-образными ножами. Промышленностью бывшего Союза Советских Социалистических Республик (СССР) выпускались прореживатели 4-, 6-, 8-, 12- и 18-рядные. Прореживатели направляют вдоль рядков растений. Фрезы, вращаясь в плоскости, перпендикулярной направлению движения агрегата, вырезают в рядках косые полоски глубиной 3–4 сантиметра (см), рыхлят почву и уничтожают сорняки в зоне рядка. Для обработки междурядий одновременно с прореживанием перед фрезами на грядилях закрепляют односторонние лапы. Прореживатели агрегатируют с тракторами класса 1.4 т и 2 т. Фрезы приводятся в действие от опорных колёс прореживателя. Аналогичные прореживатели применяют за рубежом.

THIN PICK = УТОНЧЁННАЯ (или ТОНКАЯ) ПОПЕРЕЧНАЯ НИТЬ – Thin Pick:- the weft whose thickness is unacceptably less than that of the adjacent yarns. Note:- this defect is caused by variation in the linear density of the yarn. See also Thin Filling. Fabrics defect. / Уточина.

THIN PLACE = УТОНЕНИЕ (или УТОНЧЁННОЕ МЕСТО, или ТОНКОЕ МЕСТО, или ПЕРЕСЛЕЖИНА, или НЕДОСЕКА) – Thin Places and Thick Places in a yarn can, on the one hand, quite consdierably affect the appearance of a woven or knitted fabric. Furthermore, an increase in the number of thin places and thick places refer to a particularly valuable indication that the raw material or the method of processing has become worse. On the other hand, it cannot be concluded from the increased number of thin place faults that this yarn, the downtime of weaving or knitting machines will be increased to a similar degree. Thin places usually exhibit a higher yarn twist, because of fewer fibers in the cross-section resulting in less resistance to torsion. The yarn tension does not become smaller proportionally with a reduced number of fibers. With thick place faults the contrary is the case. More fibers in the cross-section result in a higher resistance to torsion. Thick places have therefore, in many cases, a yarn twist which is lower than the average. The yarn tension in the yarn at the position of the thick place is only in very few cases proportional to the number of fibers. These considerations are valid primarily for ring-spun yarns. Thin Place:- often caused by the filling yarn breaking and the loom continuing to run until the operator notices the problem. Woven fabric defect. Thin Places (–50%):- number of places that have mass reductions of 50% or more with respect to the mean value. Note that (–50%) is the standard sensitivity level used in the test. If a different sensitivity level (–40%, –40%, –60%) is used, the result would have been different. The number of thin places has a significant impact on yarn strength. Thin Places are places in the yarn, that are thinner than – 50% or more than the average diameter of the yarn. There is no limitation in the length of the thin place. The less you find thin places in the yarn the better is it. See also Thick Place. Defect Name:- Thin Place. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Oxford or Basket. Description:- Thin

Place:- A place across the width containing less picks or lighter filling than that normal to the fabric. Severity:- Major. Thin Place:- in fabric, an unintentional change in fabric appearance characterized by a small area of loosely spaced yarns or by a congregation of thin yarns as compared to the adjacent construction. Fabrics defect. Defect Name:- Thin Place. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Sateen Derivatives. Description:- Thin Place:- This is the result of a filling fork failing to stop the loom after a filling break or change. It may have been caused by a bent fork or a dirty grate. Severity:- Major. Thin Place:- a prominent band in which a decrease in stitch density, compared to the rest of the fabric, is apparent. Note:- this defect is often caused by uneven yarn let-off or fabric take-up. Thin Place:- when the pick density at any place in the fabric decrease from the desired one a thin place is produced in the fabric. The causes for thick and thin places in the fabric are irregular setting of take-up, improper working of let off motion on the loom and insufficient care by the operator while adjusting the fell of the cloth at the time of float removal or repairing of smash. / уточная пряжа . или вязальных машин . скучиванию (torsion). Порок или дефект ткачества. Недосека – местный порок ткани в виде полосы во всю ширину ткани из-за пониженной плотности ткани по утку. Недосека с разрежением плотности свыше двух до четырёх нитей в 1 сантиметре (см). Размер порока – за каждое место. Под Недосеками понимается дефект суровой ткани в виде поперечных полос с пониженным числом уточных нитей на 1 дециметр (дм) ткани, причина разладка основного регулятора или товарного механизма. Переслежина – порок пряжи. Под Утонением понимается местный порок в виде утонения нити на ограниченном участке. Утонение (thin place):- порок утка в виде утонения нити на ограниченном участке. Примечание:- этот порок часто вызывается использованием пряжи неравномерной по толщине. Недосечка – поперечные полосы по всей ширине ткани, возникающие из-за пониженной плотности ткани по утку.

THIN PLACES IN FILLING = ТОНКИЕ МЕСТА ПО УТОЧИНЕ (или УТОНЕНИЯ ПО УТОЧИНЕ) – Thin Places In Filling:- Fabric:- taffeta dress goods; Construction:- (i) Count:- 96 x 48; (ii) Warp:- 150/40 bright viscose rayon; (iii) Filling:- same as warp; Finish:- navy-ground print. Defect:- 'Thin' places in the filling at frequent intervals throughout the piece. Analysis:- microscopic examination of those sections of the filling yarn which appeared 'thin' showed that the narrowing or thinning of the yarns was due to one or two filaments' being wrapped around the remainder of the yarn in spiral fashion. As a result, that part of the filling thread (from % inch to several inches in length, in this particular sample) was tightly bound by the 'wrapped' filament or filaments. Since the mill used this yarn just as it was received from the producer, this fault was obviously introduced by the rayon manufacturer.

THIN SPOT = УТОНЧЁННОЕ ПЯТНО (или ТОНКОЕ ПЯТНО – Thin Spot:- Fabric:- napped all-cotton soft-filled sheeting; Construction:- (i) Count:- 44 x 36; (ii) Warp:- 20/1 carded cotton; (iii) Filling:- 13/1 carded cotton; Finish:- plain dyed tan and napped. Defect:- thin, weak spots scattered through several pieces. Analysis:- tensile-strength tests confirmed the fact that the thin-looking spots were weak in the fillingwise direction. Examination showed that the filling yarns were very uneven and that, in the napping process, the thin yarns were frequently ruptured, with resultant open-appearing and tender areas. In this case the seller of the gray goods was aware of the fact that the fabric was intended for napping by the converter. Since earlier deliveries and most of the pieces processed in the same lot gave no trouble, the customer's complaint was recognized as justifiable. See also Crack Mark. Fabrics defect. / Уточина:- 13/1 кардная хлопковая.

THIN–WALLED FIBERS = ТОНКОСТЕННЫЕ ВОЛОКНА – Thin-Walled Fibers are the fibers which, when swollen, cannot be classed in the normal or dead groups. / Тонкостенные Волокна – такие волокна, которые после их разрыхления не могут классифицироваться ни как нормальная группа волокон, ни как мёртвая группа волокон.

THIN YARN = УТОНЧЁННАЯ (или ТОНКАЯ) ПРЯЖА – Thin Yarn:- Possible Cause:- one of the feeder is receiving yarn from a spool that has finer yarn. This is a major defect which will leave bands across the entire width of the fabric. Knitting defect.

THIODIGLYCOL = ТИОДИГЛИКОЛЬ – Thiodiglycol, also called Thiodiethylene Glycol or 2,2'-Thiodiethanol. Thiodiglycol is sometime used to increase solubility of acid dyes, particularly for making printing pastes. It is very hazardous if mixed with hydrochloric acid. It is difficult to obtain, and there may be restrictions on its sale in some countries. / Тиодигликоль, $(CH_2OHCH_2)_2S$, именуемый также Тиодиэтилен Гликоль (Thiodiethylene Glycol) или Тиодиэтанол 2,2' (2,2'-Thiodiethanol).

THIOUREA DIOXIDE = ДИОКСИД ТИОМОЧЕВИНЫ – Thiourea Dioxide is a thiox; a reducing agent used in discharge, stripping and vat dyeing; also called Formamidine Sulfinic Acid or Thiox; sometimes abbreviated TUDO; Colour Index Reducing Agent 11. Thiourea dioxide is popular discharge agent. It can also be used for bleaching wool, since will not damage the fiber like chlorine bleach will. Thiourea dioxide is considered to be safe, from a health risk point of view. Thiourea itself, which may exist in very minute proportions in thiox, is known to be a carcinogen. Extra care in handling is warranted. Thiox powder is flammable. Carboxymethyl starch (Monagum) is suitable as a thickener if required. / Формамидин Сульфиновая Кислота (Formamidine Sulfinic Acid). хлорный отбеливатель (chlorine bleach). карбоксиметильный крахмал (carboxymethyl starch).

THIOX = ТИОКС – Thiox is a Thiourea Dioxide. A safe replacement for sodium hydrosulfite in vat dyeing, discharge printing, and general color stripping on cellulose and protein fibers. Good shelf life if stored in a dry location. Five times stronger than sodium hydrosulfite. / Тиокс – Диоксид Тиомочевины.

THIRD ASSISTANT ENGINEER = ТРЕТИЙ ПОМОЩНИК МЕХАНИКА (или ТРЕТИЙ ПОМОЩНИК ИНЖЕНЕРА) – Third Assistant Engineer (engineer department (licensed)):- in charge of eight to twelve watch. Maintains lighting fixtures. Repairs malfunctioning accessories in living quarters. Assist other engineers as directed.

THIRD MARKET = ТРЕТИЧНЫЙ РЫНОК – (1) Third Market:- trading of stock exchange listed securities in the over-the-counter market by non-exchange-member brokers. / Третичный Рынок составляют брокеры-дилеры, не являющиеся членами биржи, а также организации-инвесторы, ведущие операции на внеучётном рынке (over the counter) с котирующимися на бирже ценными бумагами. Третичный рынок приобрёл большое значение в 1950-х, когда организации-инвесторы начали приобретать обыкновенные акции в качестве страховки от инфляции, а на биржах всё ещё действовали фиксированные ставки комиссионных. Совершая операции с крупными пакетами ценных бумаг через фирмы, не являющиеся членами бирж, они экономили комиссионные и избегали колебаний цен, которые вызывают на бирже крупные сделки. После того как в Мае 1975 были сняты ограничения со ставок комиссионных, большое число компаний, действовавших на третичном рынке, стало членами бирж, поскольку таким образом они могли вести операции как с членами бирж, так и не с членами. В то же время члены бирж начали во всё больших масштабах выводить крупные пакеты акций из биржевого зала, фактически становясь участниками третичного рынка. Однако до продажи ценных бумаг за рамками биржи компании, не являющиеся членами биржи, должны выполнить все лимитные распоряжения (limit orders), внесённые в журнал биржевого брокера (specialist's book), по той же или по более высокой цене. Смотрите также Off-Floor Order.

(2) In the United Kingdom, Third Market is a stock exchange market introduced in January 1987, with less stringent entry requirements than the unlisted securities market (USM). Also known as Third Tier.

THIRD MATE = ТРЕТИЙ ПОМОЩНИК – Third Mate:- in charge of eight to twelve watch. Makes sure emergency survival equipment (lifeboats, life rings, etc) are in order. Assists other officers as directed.

THIRD PARTY = ТРЕТЬЕ ЛИЦО (или ТРЕТЬЯ СТОРОНА) – (1) Third Party is a party who is not a signatory to an agreement but who may nevertheless have rights and obligations relating to that agreement. / Сторона, которая не является подписавшейся стороной соглашения, но которая, тем не менее, может иметь права и обязательства, связанные с данным соглашением. Под Третьим Лицом понимается участник гражданского процесса, юридически заинтересованный в исходе спора между сторонами.

(2) Third Party is a person who is injured or whose property is damaged by the policyholder (the first party). The second party is the insurer. In insurance, someone other than the insured or his insurer who has suffered injury or loss. / В страховании, кто-либо иной нежели застрахованное лицо (страхователь) или его страховщик, и который нанёс тяжкий вред здоровью или ущерб.

THIRD PARTY LIABILITY = ОТВЕТСТВЕННОСТЬ ПЕРЕД ТРЕТЬИМИ ЛИЦАМИ – Third Party Liability is a liability of the insured to a person or persons who are not directly involved in the insurance contract. The liability that an insured has to a third party. Legal liability to anyone other than another party to a contract, e.g., liability of one ship to another consequent upon a collision.

THIRD PARTY LOGISTICS = ТРЁХСТОРОННЯЯ ЛОГИСТИКА – A term Third Party Logistics (3PL) describes businesses that provide one or many of a variety of logistics-related services. Types of services may include public warehousing, contract warehousing, transportation management, distribution management, freight consolidation. A 3PL provider may take over all receiving, storage, value added, shipping, and transportation responsibilities for a client and conduct them in the 3PL's warehouse using the 3PL's equipment and employees, or may manage one or all of these functions in the client's facility using the client's equipment, or any combination of the above. Another term, 4PL, is sometimes used to describe businesses that manage a variety of logistics related services for clients by using 3PLs.

THIRD PARTY LOGISTICS MODEL = МОДЕЛЬ ТРЕТЬЕЙ СТОРОНЫ ЛОГИСТИКИ (или ТРЁХСТОРОННЯЯ МОДЕЛЬ ЛОГИСТИКИ) – Third Party Logistics (3PL) Model:- the manufacturer outsources a package of transport and logistic activities. The third party logistic service provider organises these activities and may hire third parties for the specific execution (subcontracting). This service provider often comes into contact not just with the manufacturer, but also with the supplier. As the third party, he organises the logistics between these two successive actors in the supply chain. The client often enters into a long-term partnership with the logistic provider in a cooperative environment. The client retains enough expertise in order to measure, evaluate and, if necessary, correct the logistic performances of the service provider.

THIRD PARTY LOGISTICS PROVIDER = ОБЕСПЕЧИВАЮЩИЙ ТРЕТЬЮ СТОРОНУ ЛОГИСТИКИ (или ПОСТАВЩИК УСЛУГ ТРЁХСТОРОННЕЙ ЛОГИСТИКИ) – Third Party Logistics (3PL) Provider is an organization that manages and executes a particular logistics function, using its own assets and resources, on behalf of another company.

THIRD PARTY PROVIDER = ОБЕСПЕЧИВАЮЩИЙ ТРЕТЬЮ СТОРОНУ (или ТРЁХСТОРОННИЙ ПОСТАВЩИК УСЛУГ) – Third Party Provider:- companies that can be employed (hired) to assume tasks that were previously performed in-house by the client.

THIRD PARTY WAREHOUSE = СКЛАД ТРЕТЬЕЙ СТОРОНЫ – Third Party Warehouse is a warehouse operated by a 3PL Company (Third Party Logistics Company) that houses the products of their clients.

THIRD WORLD = ТРЕТИЙ МИР – The Three Worlds as they were separated during the Cold War era, each with its respective allies as of the period between 30 April 1975 (the fall of Saigon) and 23 August 1975 (the communist takeover in Laos). Colors do not represent current economic development. First World:- the United States and its allies. Second World:- the Soviet Union, China, and their allies. Third World:- neutral and non-aligned countries. Etymology:- French demographer, anthropologist and historian Alfred Sauvy, in an article published in the French magazine L'Observateur, August 14, 1952, coined the term Third World, referring to countries that were unaligned with either the Communist Soviet bloc or the Capitalist NATO bloc during the Cold War. His usage was a reference to the Third Estate, the commoners of France who, before and during the French Revolution, opposed priests and nobles, who composed the First Estate and Second Estate, respectively. Sauvy wrote, 'Like the third estate, the Third World is nothing, and wants to be something'. He conveyed the concept of political non-alignment with either the capitalist or communist bloc. The 'Three Worlds Theory' developed by Mao Zedong is different from the Western theory of the Three Worlds or Third World. For example, in the Western theory, China and India belong respectively to the second and third worlds, but in Mao's theory both China and India are part of the Third Non-Aligned World. Third Worldism has been defined as 'the idea, popular among Third World autocrats and many American and French leftists in the late 1960s and 1970s, that – contrary to orthodox Marxism's view that the Western working class would deliver the world from the tyranny of capital that ... Third World elites were the privileged historical actor'. A number of Third World countries were former colonies, and with the end of imperialism, many of these countries, especially the smaller ones, were faced with the challenges of nation- and institution-building on their own for the first time. Due to this common background, many of these nations were 'developing' in economic terms for most of the XX century, and many still are today. This term, when used today, generally denotes countries that have not 'developed' to the same levels as OECD countries, and which are thus in the process of 'developing'. In the 1980s, economist Peter Bauer offered a competing definition for the term Third World. He claimed that the attachment of Third World status to a particular country was not based on any stable economic or political criteria, and was a mostly arbitrary process. The large diversity of countries that were considered to be part of the Third World, from Indonesia to Afghanistan, ranged widely from economically primitive to economically advanced and from politically non-aligned to Soviet- or Western-leaning. An argument could also be made for how parts of the US are more like the Third World. The only characteristic that Bauer found common in all Third World countries was that their governments 'demand and receive Western aid', the giving of which he strongly opposed. Thus, the aggregate term Third World was challenged as misleading even during the Cold War period because it had no consistent or collective identity among the countries it supposedly encompassed. Recently the term Majority World has started to be used since most people of the world live in poorer and less developed countries. Third World is another name for developing countries. The term Third World arose during the Cold War to define countries that remained non-aligned with either capitalism and NATO (which along with its allies represented the First World), or communism and the Soviet Union (which along with its allies represented the Second World). This definition provided a way of broadly categorizing the nations of the earth into three groups based on social, political, and economic divisions. Due to many of the Third World countries being extremely poor, it became a stereotype such that people commonly refer to undeveloped countries as 'third world countries', often used in a pejorative way. Over the last few decades, the term 'Third World' has been used interchangeably with the Global South and Developing Countries to describe poorer countries that have struggled to attain steady economic development. Third World countries includes most of Africa, Latin America, and Asia. However some exceptions exist to this rule. Some European countries were part of the non-aligned movement and a few were and are very prosperous, including Switzerland and Austria. In the so-called Dependency Theory of thinkers like Raul Prebisch, Theotonio dos Santos, and Andre Gunder Frank, the Third World has also been connected to the world economic division as 'periphery' countries in the world system that is

dominated by the 'core' countries. Due to the complex history of evolving meanings and contexts, there is no clear or agreed upon definition of the Third World and the term is now less popular than it was during the 1970s and 1980s. / Альфрэд Сови (Alfred Sauvy) Л'Обсэрватёр (L'Observateur). Мао Дзэдн (Mao Zedong). Пита Бауа (Peter Bauer). Одно из названий для обозначения развивающихся стран. Раул Прибиш (Raul Prebisch), Тэотонио душ Сантуш (Theotonio dos Santos), и Андрэ Гунда Франк (Andre Gunder Frank). Третий Мир – название для менее развитых стран Африки, Азии и Латинской Америки.

THIXOTROPY = ТИКСОТРОПИЯ – Thixotropy:- that property of a lubricating grease which is manifested by a softening in consistency as a result of shearing followed by a hardening in consistency starting immediately after the shearing is stopped. / Под Тиксотропией, от Греческих слов Thíxis, означающее Прикосновение, и Tropé, означающее Изменение или Поворот, понимается способность некоторых структурированных дисперсных систем самопроизвольно восстанавливать разрушенную механическим воздействием исходную структуру. Тиксотропия проявляется в разжижении при достаточно интенсивном встряхивании или перемешивании гелей, паст, суспензий и других систем с коагуляционной дисперсной структурой и их загущении (отвердевании) после прекращения механического воздействия. Тиксотропное восстановление структуры – механически обратимый изотермический процесс, который может быть воспроизведён многократно. В более широком смысле Тиксотропия – временное понижение эффективной вязкости вязко-текучей или пластичной системы в результате её деформирования независимо от физической природы происходящих в ней изменений. Тиксотропия имеет важное практическое значение. Тиксотропные материалы используют в технологии силикатов, пластических масс, пищевых продуктов. Тиксотропными свойствами обладают некоторые водоносные грунты (плывуны), биологические структуры, различные технические материалы (промывочные глинистые растворы, применяемые при бурении нефтяных скважин, краски, смазки и другие).

THE THOMSON CORPORATION = ЗА ТОМСЭН КОРПОРЭЙШЭН – The Thomson Corporation:- headquartered in Toronto, Canada. Since its founding by Roy Herbert Thomson, Thomson's history has developed alongside the media age. By the end of the 1950s, Thomson had grown from a single Canadian newspaper, The Timmins Press, into a global media concern. It held several prominent newspapers in the United Kingdom, including The Sunday Times and The Scotsman, and it owned Scottish Television. In the 1960s, Thomson's publishing realm expanded further to include Thomson Publication (UK), a consumer magazine and book publishing house, and the prestigious The Times of London. In 1965, Thomson Newspapers, Ltd was formed as a publicly traded company in Canada. Roy Thomson's prolific endeavors in publishing had earned him a hereditary title, Lord Thomson of Fleet. Yet, Thomson's interests moved beyond publishing with the creation of Thomson Travel and acquisition of Britannia Airways in 1965 and 1971, and a foray into a consortium exploring the North Sea for oil and gas. By the end of the 1970s, Thomson Newspapers' circulation in the United States had surpassed the 1 million mark. The company assumed its current name in 1989 with the merger of Thomson Newspapers and the International Thomson Organization. Over the years, the company has withdrawn from its holdings in the oil and gas business, the travel industry and department stores. When Kenneth Thomson took over from his father Roy in 1976, the company was worth about USD500 million. At Kenneth's death in June 2006, the company was valued at about USD29.3 billion. The Thomson Corporation is one of the world's largest information companies. It is active in financial services, healthcare sectors, law, science technology research, and tax and accounting sectors. The company operates through five segments (2007 onwards):- (i) Financial; (ii) Healthcare; (iii) Legal; (iv) Scientific; and (v) Tax and Accounting. Until recently, Thomson was also one of the world's leading providers of higher education textbooks, academic information solutions and reference materials. On 2006-October-26 Thomson announced the proposed sale of its Thomson Learning assets. The current company was created in 1989 by the merger of Thomson Organization and Thomson Newspapers. Roy Thomson, grandfather of the present Chairman, born on 1894-July-06. 1934 – Roy Thomson acquired his first newspaper in Canada, The Timmins Press, Ontario. 1953 – Roy Thomson acquired his first newspaper in the United Kingdom (UK), The Scotsman. 1954 – Roy Thomson moves to Scotland to begin a new phase of his career in the UK, by which time he owned the largest number of newspapers of any group in Canada. 1957 – Successful bid for commercial television franchise for Central Scotland, named Scottish Television. 1959 – Acquisition of the Kemsley Group, a UK publicly listed company, comprising national and regional newspapers including The Sunday Times, and merged them with Scottish Television and The Scotsman newspaper. 1961 – Thomson Publication (UK) formed to launch and acquire business and consumer magazines, and book publishing companies. 1964 – Roy Thomson given a hereditary barony and became Lord Thomson of Fleet. 1965 – (i) Creation of Thomson Travel in the UK by acquiring tour operating companies and Britannia Airways; and (ii) Formation of Thomson Newspaper, Ltd as a public company in Canada. 1967 – The Times of London acquired and, with The Sunday Times, formed Times Newspapers. 1970s – an interest in oil. 1971 – Thomson joins consortium to explore for oil and gas in the North Sea (UK). 1973 – Piper oil field discovery. 1974 – Claymore oil field discovery. 1976 – Roy Thomson passes away and is succeeded as Chairman by his son, Kenneth Thomson, the second Lord Thomson of Fleet. 1977 – (i) Final disposal of interest in Scottish Television; and (ii) Thomson Newspapers' total daily circulation in the US passed the 1 million mark. 1978 – (i) Major expansion in specialized information and publishing launched in the US with the acquisition of Wadsworth, a college textbook and professional book publisher; and (ii) Financial restructuring of UK activities and formation of International Thomson Organisation Limited, with headquarters in Toronto and two main operating subsidiaries in the United Kingdom and United States. 1980s – from oil to law. 1980 – (i) Thomson Newspapers' total daily circulation in Canada passes the one million mark; (ii) Thomson acquires Warren, Gorham & Lamont, a major information source for finance professionals; and (iii) Technical Data Corp, the predecessor to Thomson Financial, founded by former portfolio managers from Fidelity Investments. 1981 – (i) Thomson sells The Times of London to News International, Ltd (UK); (ii) Thomson acquires Litton (renamed Medical Economics), a publisher of high quality healthcare information; and (iii) Thomson acquires Delmar, a publisher of career, technical and vocational textbooks and course material. 1985 – (i) Thomson acquires Gale, a leading provider of information for libraries, schools, and businesses; and (ii) Thomson acquires AutEx, a business that helps traders identify, access and track liquidity in global securities markets. 1986 – (i) Thomson acquires Compu-Mark, a worldwide market leader in trademark research; and (ii) Thomson acquires South-Western Publishing, a leading provider of textbooks and instructional materials. 1987 – Thomson acquires legal publishing businesses in the UK (Sweet & Maxwell), Canada (Carswell) and Australia (The Law Book Company). 1988 – ILX Systems, a provider of market data systems for financial professional, founded by E.F. Hutton & Co executives, and funded by the International Thomson Organisation. 1989 – (i) Thomson Newspapers merges with International Thomson to form The Thomson Corporation; (ii) Thomson acquires Lawyers Co-operative Publishing Company, a US legal publisher, and its subsidiary, Research Institute of America, an information provider for accountants, tax, and human resource professionals; and (iii) Thomson disposes of interests in North Sea Oil in the UK. 1992 – (i) Thomson acquires MICROMEDEX, a leading information provider in the fields of healthcare, toxicology, and environmental health; (ii) Thomson acquires Institute for Scientific Information (ISI), a leading provider of information for researchers; and (iii) Thomson acquires Course Technology, a worldwide leader in computing education for business and technology training. 1994 – (i) Thomson acquires Information Access Company, a US provider of broad-based reference and database services; and (ii) Thomson acquires The Medstat Group, a US provider of healthcare information databases and decision support software. 1995 – (i) Thomson divests interests in UK newspapers; and (ii) Thomson acquires Peterson's, a leading provider of information about US colleges and universities. 1996 – Thomson acquires West Publishing, a leading US provider of legal information. 1997 – Richard J. Harrington named President and Chief Executive Officer. 1998 – Thomson nets USD2 billion from sale of Thomson Travel. 1999 – (i)

Thomson acquires Editorial Aranzadi SA, Spain's premier legal publisher; and (ii) Thomson acquires Macmillan Library Reference USA, a group of publishers specializing in high quality reference products for the library, secondary education, and college/university markets. 2000 – (i) Thomson sells community newspaper assets in North America for approximately 2.5 billion; (ii) Thomson acquires Greenhaven Press and Lucent Books, publishers of social issues and other nonfiction series for middle and high school students; (iii) Thomson acquires La Ley, a leading legal publisher in Argentina; (iv) Thomson acquires Primark, a leading provider of financial and economic information products and solutions to customers worldwide; (v) Thomson acquires Carson Group, a financial information services firm focused on corporate strategic intelligence and investor relations solutions; (vi) Thomson acquires IOB, one of Brazil's leading regulatory publishers; (vii) Thomson acquires online business of Dialog, a leading worldwide provider of online-based information services; (viii) Thomson acquires Wave Technologies International, a provider of a flexible blend of self-study, classroom training, proactive mentoring and testing; (ix) Thomson acquires Prometric, a global leader in computer-based testing and assessment services; and (x) Thomson acquires Physicians World, a full service provider of medical education and communications programs for physicians and allied healthcare professionals. 2001 – (i) Thomson acquires NewsEdge Corporation, a global provider of real-time news and information; (ii) Thomson acquires select higher education and corporate training businesses of Harcourt General; (iii) Thomson acquires FindLaw, the leader in free online legal information and services; and (iv) The Globe and Mail becomes part of Bell Globemedia, a Canadian multimedia company, in which The Thomson Corporation holds a 20% ownership position. 2002 – (i) Thomson announces USD300 million + five-year deal with Merrill Lynch to develop and implement a new financial workstation to support Merrill Lynch Financial Advisors – most significant information solutions deal of its kind in the financial services industry; (ii) Thomson acquires Current Drugs a global leader in the delivery of information solutions to the pharmaceutical and biotechnology industries; (iii) Thomson common share offering raises USD1 billion; (iv) Thomson begins trading on New York Stock Exchange under the symbol TOC; (v) David K.R. Thomson appointed Chairman of The Thomson Corporation; and (vi) Thomson acquires Gardiner-Caldwell, a leading global medical education and communication business. 2003 – (i) Thomson sells print-based healthcare magazines; (ii) Thomson acquires Elite Information Group, a leading provider of integrated practice and financial management applications for legal and professional services markets; and (iii) Thomson sells its 20% interest in Bell Globemedia Inc for USD279 million to The Woodbridge Company Limited. The sale of Bell Globemedia, including the Corporation's interest in The Globe and Mail, is the culmination of the Thomson strategy to exit the newspaper business undertaken in February 2000. 2004 – (i) Thomson acquires KnowledgeNet, a leader in live e-learning, to create integrated learning solutions for corporate, government, academic and professional business communities; (ii) Thomson acquires Capstar, a developer of learning and measurement solutions, from Educational Testing Service, to expand its academic testing and assessment business; (iii) Thomson acquires Information Holdings Inc, a provider of intellectual property and regulatory information for the scientific, legal, and corporate markets to further advance its capability to develop pharmaceutical and intellectual property solutions; (iv) Thomson acquires TradeWeb, a fast-growing and leading online global trading platform for fixed-income securities; (v) Thomson sells Thomson Media group, comprised of leading print-based information products, to Investcorp; (vi) Thomson acquires CCBN, a provider of web-based solutions for the investment community, to further expand its offerings for the corporate communications market; and (vii) Thomson sells DBM (Drake Beam Morin), which was acquired along with other Harcourt assets in 2001, to Compass Partners International Limited. 2005 – (i) Thomson Financial partnered with Merrill Lynch to complete the rollout of more than 23 000 workstations across more than 550 Merrill Lynch offices. Thomson is the largest provider of wealth management workstations to Merrill Lynch employees in North America; (ii) Thomson TradeWeb's 3rd quarter 2005 volume grows to record heights; USD11 trillion executed across its 13 online marketplaces; (iii) ABC News and Thomson Higher Education announced ABC News will provide access to more than 40 years of historic raw footage and video programming to support development of a wide range of Thomson educational materials; (iv) Thomson announces the offering of USD400 million of debentures due 2035; (v) Westlaw wins Law Office Computing Readers' Choice Awards for ninth consecutive year; (vi) Thomson Scientific solutions help Dow Pharmaceutical Sciences successfully obtain FDA approval for Rosacea treatment product submitted via a full electronic Common Technical Document (eCTD); (vii) Thomson acquires Global Securities Information, Inc, a leading provider of online securities and securities-related information and research services. GSI clients include all of the AmLaw 100; 80 percent of the top investment banking firms; and all of the top US accounting firms; (viii) Thomson Learning Asia and People's Education Press reaches 50 million copy milestone; textbooks used as part of curriculum reforms in 29 provinces and selected and adapted as a basal textbook series for middle schools in China; (ix) Canada's two oldest and most respected legal publishers collaborate to evolve the world of legal research; Canada Law Book Inc and Thomson Carswell collaborate in the development of the online research destination of choice for Canadian intellectual property practitioners; (x) The Webby Awards, hailed as the 'Online Oscars' by Time magazine, named FindLaw.com as the best Web site of 2005 in the category of law at the Ninth Annual ceremony; (xi) Mary Cirillo, former Chair and Chief Executive Officer of Opcenter, LLC, an internet consulting firm and former Chief Executive Officer of Global Institutional Services at Bankers Trust, is elected to the Thomson Board of Directors; (xii) Thomson names Sharon Rowlands President and CEO of Thomson Financial; (xiii) Thomson acquires Tax Partners®, LLC (http://www.taxpartners.com), the nation's largest sales and use tax compliance service firm enabling Thomson to offer end-to-end sales and use tax solutions; and (xiv) Thomson introduces the launch of Thomson Pharma bringing an indispensable information solution to the workflow of the drug discovery and development process. 2006 – (i) Kenneth R. Thomson, former chairman of the Board of The Thomson Corporation, dies at the age of 82; (ii) Thomson Healthcare acquires Solucient, a leading healthcare information provider of data and advanced analytics that hospitals and health systems use to improve performance and lower costs; (iii) Thomson names Michael Wilens EVP, Corporate Chief Technology and Operations Officer; (iv) Thomson names Richard Benson-Armer SVP, Corporate Chief Strategy Officer; (v) Thomson names Carl Urbania SVP, Corporate Chief Information Officer; (vi) Thomson names Gustav Carlson SVP, Corporate Communications; (vii) Thomson Scientific acquires Scholar One, web-based workflow solution for authoring, evaluating and publishing research to more than two million users. ScholarOne software enables publishers of scholarly research to produce journals, meeting abstracts and conference proceedings; (viii) Thomson Financial establishes presence in the Middle East by selecting Dubai International Financial Center as their base in the region; (ix) Thomson Financial acquires AFX News to further develop the European proprietary real-times news offering targeted to clients in the business and financial communities; (x) Thomson and Shin Nippon Hoki Shuppan announce a joint venture agreement establishing Westlaw Japan KK, a business that will develop a new, state-of-the-art online service created expressly for the world's second-largest legal information marketplace; (xi) Thomson Financial acquires Quantitative Analytics, Inc, a leading provider of database integration and analysis solutions to the financial services industry; (xii) Thomson Scientific honors leading Indian scientists by presenting the 'Thomson Citation Laureate Award' – an honor bestowed in recognition for their groundbreaking and influential contribution to, and accomplishments in, research and development worldwide; (xiii) Thomson Healthcare acquires MercuryMD, Inc, the leading provider of mobile information systems serving the healthcare market; and (xiv) Thomson Custom Solutions receives the 2006 Innovation Award from Harvard Business School Publishing. The award is presented to a partner who has demonstrated creativity and innovation in exemplifying new ways of helping professors reach today's students through case teaching. 2007-May-17 – The Thomson Corporation and Reuters Group PLC announce that they are in discussions for the combination of their two businesses. Canadian business information company Thomson will take over Reuters in an £8.7bn deal, after the Reuters Founders Share Company, which has a veto on any potential buyout, agreed that the acquisition would not challenge Reuters' editorial independence.

The two companies announced this morning that the takeover has been formalized along the same lines as previously indicated, with Thomson paying 691p a share for Reuters in a combination of cash and its own shares. The new company will be known as Thomson Reuters Corporation, although Reuters' financial information and newswire business will continue to operate under its historic name. Thomson announced its takeover in May with a deal that when closed will see Reuters shareholders get 352-1/2 pence in cash and 0.16 of one Thomson share for each Reuters share held. 2008-March-27 – Shareholders of Thomson Corporation voted Wednesday in favor of its takeover of Reuters Group PLC which is worth 17 billion Canadian Dollars (USD17 billion), Canadian Press reported. The vote was 99 percent in favor of the deal, the biggest in the history of the Canadian-based specialized data company. Reuters shareholders were to vote on the deal at a separate meeting in London and are also expected to endorse the transaction. The takeover has already secured regulatory approval and is scheduled to close on April 17. 2008 – The Thomson Corporation and Reuters Group PLC combine to form Thomson Reuters. THONG = ПЛЕТЁНКИ (или ВЬЕТНАМКИ, или РЕМЕНЬ) – Thong:- a sandal held on the foot by a thong fitting between the toes and connected to a strap across the top or around the sides of the foot. A thong is also a version of underwear or swimwear.

THORN = КОЛЮЧКА (или ШИП) – Thorn is a sharp woody outgrowth from the epidermis which unlike the spines of Cactaceae contains vascular tissue and arises from the underlying tissues (phylogenetically as a modified stem). Because of this, breaking a thorn off the plant damages the surrounding tissue. Compare with Spines. / Кактусовых (Cactaceae) содержит сосудистую ткань и .

THREAD = НИТЬ (или НИТКА) – (1) Thread is a slender, strong strand or cord, especially one designed for sewing or other needle work. Most threads are made by plying and twisting yarns. A wide variety of thread types is in use today, e.g., spun cotton and spun polyester, core-spun cotton with a polyester filament core, polyester or nylon filaments (often bonded), and monofilament threads. Thread is a fine cord of fibrous material spun out to considerable length, especially when composed of two or more plys twisted together. Thread is a special type of a thin, continuous length of tightly twisted ply yarn used primarily for sewing. Thread occasionally is used instead of yarn, as in the terms warp thread and filling thread. / основная нить и уточная нить. Найлан^{T3} (Nylon^{TM}). мононить (monofilament). Под Нитками понимаются изделия текстильной промышленности, вырабатываемые кручением льняной, хлопковой, шерстяной пряжи, шёлка-сырца, химических волокон. Различают нитки вышивальные, вязальные, швейные и штопку. Под Нитками, понимаются кручёные изделия, вырабатываемые из хлопчато-бумажной, шерстяной, льняной пряжи, натурального шёлка, химических волокон. В зависимости от назначения различают:- швейные, вышивальные, вязальные нитки и штопку. Нитки бывают белые, чёрные и цветные, матовой и глянцевой отделки, а также неотделанные – суровые. В зависимости от толщины нитки делят по торговым номерам:- чем тоньше нитки, тем выше их номер (например, хлопчато-бумажные нитки имеют номера от 80 до 10).

(2) Thread is a general term for yarns used in weaving and knitting, as in ‘thread count’ and ‘warp thread’. / Общий термин для пряжи, используемый в ткачестве и трикотажном производстве, например как номер нити (thread count) и нить основы (warp thread). Под текстильной Нитью понимается гибкое прочное тело с малыми поперечными размерами, значительной длины. Нити получают из волокон в основном скручиванием или склеиванием. Используются для изготовления тканей, трикотажа и других текстильных изделий. Основные виды нитей:- элементарные (химические), комплексные склеенные (шёлк-сырец), пряжа, кручёные нити (комплексные скрученные и кручёная пряжа), фасонные нити. Текстильная Нить – текстильный продукт неограниченной длины и относительно малого поперечного сечения, состоящий из текстильных волокон и/или филаментов, с круткой или без крутки. Текстильная Нить – тонкое, гибкое и прочное тело значительной длины; используется для изготовления текстильных изделий – тканей, трикотажа, нетканых материалов и тому подобного непосредственно или после предварительной обработки. Различают нити текстильные исходные, первичные и вторичные. К Исходным Текстильным Нитям относятся нити, не делящиеся в продольном направлении без нарушения:- элементарные (химические, натуральные, в том числе шёлк-сырец, и минеральные), мононити (химические), а также узкие полоски из бумаги, плёнки и тому подобного. В отличие от элементарных нитей, мононити непосредственно используются для выработки изделий – тонких чулок, сеток и другого. К Первичным Текстильным Нитям относятся пряжа, вырабатываемая из волокон текстильных, комплексные нити, состоящие из пучка (двух и более) элементарных нитей, соединённых скручиванием или другими способами, а также разрезные нити текстильные, получаемые скручиванием полосок. Пряжа может быть простая, фасонная, текстурированная (высокообъёмная) и армированная (смотрите Армированные Нити). Фасонными называются нити текстильные, структура которых периодически изменяется путём образования утолщений, петель и тому подобного. Текстурированными называются нити текстильные, структура которых видоизменена для повышения объёма или растяжимости. К Вторичным Текстильным Нитям относятся кручёные нити, обычно получаемые скручиванием нескольких первичных. Вторичные текстильные нити также изготовляют текстурированными и фасонными. Кроме того, по составу нити текстильные могут быть однородные – из материала одного вида (например, пряжа хлопчатобумажная, шерстяная, вискозная и так далее), смешанные – из смеси волокон (льно-лавсановая, полушерстяная пряжа и так далее) и неоднородные (скрученные ацетатно-вискозные комплексные нити). Нити текстильные, полученные скручиванием пряжи и комплексных нитей, называются комбинированными. Большое разнообразие ассортимента нитей текстильных достигается применением дополнительных операций и процессов при их выработке (например, опалка, крашение, отбеливание). Нити текстильные применяются также для изготовления искусственных мехов, дублированных материалов; некоторые виды нитей текстильных используются для получения швейных ниток, фильтров для химической промышленности, канатов и тому подобного.

THREAD BREAKS = ОБРЫВЫ НИТОК – Thread Breaks:- wrong thread application, sewing machine malfunction, defective thread. Sewing Room Defects. / Порок или дефект швейного производства.

THREAD COUNT = ЧИСЛО НИТЕЙ (или СЧЁТ НИТЕЙ) – The Thread Count (number of threads per square inch of fabric) is an important indicator of fabric quality for consumers who purchase textile bedding products such as bed sheets. Thread count has evolved over time as a key indicator used by consumers to make purchasing decisions. Generally, it is perceived that the higher the thread count, the better the end product. The common practice in the United States textile bedding industry for decades has been to count the number of threads in both the warp and filling directions. Yarns were counted as one yarn, regardless of whether the yarn was a single ply or multi-ply yarn. A multi-ply yarn is one yarn that has been created by twisting two or more yarns together. In recent years, however, some textile bedding suppliers have changed the way they have determined thread count by counting plied yarns individually. This practice inflates the thread count numbers to levels which double or triple (or more) the thread count as determined by the long standing, traditional way. This practice has also created confusion in the marketplace and has caused consumers to compare thread counts that may have been calculated in two dramatically different ways. Thread Count is:- (1) the number of ends and picks per inch in a woven cloth; (2) the number of wales and courses per inch in a knit fabric. See also Count Of Cloth. Thread Count:- measured by adding the number of warp ends per inch and filling picks per square inch in the woven fabric. The higher the number, the more dense the yarns are packed together, but unfortunately thread count has come to be the major determinant of quality in the US customer’s eyes. The quality of the cotton and the finishing process after weaving can often be more important to the soft hand and durability of a fabric than a high thread count. Thread Count is the number of yarns (threads) per inchin either the lengthwise (warp) or crosswise (weft or fill) direction of woven fabrics. Thread Count or Yarn Count is the number of yarn ends or threads per inch. Measured as warp ends and filling picks per inch in woven fabric. If two fabrics use the same yarn size, then the fabric with a higher yarn count is tighter woven and generally considered better. / основные продольные нити и уточные поперечные нити . На этикетках или рекламных вставках готовой швейной продукции, например, постельного белья, достаточно часто указывается суммарное число продольных и поперечных нитей на один квадратный дюйм ткани.

THREAD DETERIORATION = ПОРЧА (или УХУДШЕНИЕ) НИТКИ – Thread Deterioration:- due to improper storage such as exposure to acids, extreme heat or dryness. Thread defects, and namely – Storage. / Порок или дефект ниток.

THREAD DISCOLORATION AFTER LAUNDRY = ИЗМЕНЕНИЕ ЦВЕТА НИТИ ПОСЛЕ СТИРКИ – Thread Discoloration After Laundry is where the thread pics up the indigo dyes from the fabric giving the thread a ‘dirty’ appearance. A common discoloration would be the pick-up of a greenish or turquoise tint. (i) Improper PH level. (ii) Improper Water Temperature. (iii) Improper Chemical Selection. (iv) Shortcuts on Wash Method. Recommended Solutions to thread discoloration:- (1) use thread with proper color fastness

characteristics; (2) correct PH level (too low) and Water Temperature (too low) during laundry; (3) use the proper chemicals and laundry cycles; (4) use Denimcol PCC in wash or similar additive; and (5) do not overload washers with too many garments at one time. Fabrics defect.

THREADED NAIL = XX (или ВИНТОВОЙ ГВОЗДЬ) – Threaded Nail is a nail which has a portion of the shank formed so as to provide increased withdrawal resistance. See also Pallet. / Винтовой Гвоздь (Threaded Nail):- гвоздь, имеющий винтовую нарезку для обеспечения увеличения сопротивления при его удалении. Смотрите также Поддон (Pallet).

THREADED–ROLL PROCESS = ПРОЦЕСС XX – Threaded-Roll Process is a high-speed method developed by Celanese Corporation (Irving, State of Texas (TX), the United States) for converting crimped continuous filament tow into highly bulked, uniformly spread webs of up to 108-inch widths. The webs are useful in a variety of products, such as cigarette filters, sleeping pillows, and battings. / высокоскоростной метод, разработанный компанией Сэлэниз Корпорэйшэн (Celanese Corporation; Ирвин, Штат Техас, Соединённые Штаты Америки) для преобразования .

THREADLINES = НИТЕВЫЕ ЛИНИИ – Threadlines are the fiber lines of a manufactured fiber in extrusion or subsequent processes. / изготавливаемого волокна в процессе Экструзии (или Выдавливание (Extrusion)) или в последующих процессах.

THREAD NOT AS STATED ON LABEL = НИТКА НЕ ТАКАЯ, КАКАЯ УКАЗАНА НА ЭТИКЕТКЕ – Thread Not As Stated On Label:- (i) thread size; (ii) yardage of package; (iii) color; (iv) type of fastness of color; and (v) kind of finish (soft, mercerized, glazed or other). Thread defects, and namely – Labeling. / Порок или дефект ниток.

THREAD NOT TRIMMED or THREADS NOT TRIMMED TO SPECIFIED LENGTH = НИТКА НЕ ОБРЕЗАНА или НИТКИ НЕ ОБРЕЗАНЫ ДО СПЕЦИФИКАЦИОННОЙ ДЛИНЫ – Thread Not Trimmed or Threads Not Trimmed To Specified Length:- self-explanatory. Finishing department defects, and namely – Trimming Defects. / Порок или дефект заключительной обработки.

THREAD OUT = ОКОНЧАНИЕ НИТИ (или ВЫДЕРНУТАЯ НИТЬ) – Thread Out:- xxxxxx. See also End Out.

THREADUP = НАНИЗЫВАНИЕ (или ПРОТЯГИВАНИЕ) – Threadup is the process of directing or threading fiber or fabric through all machine positions to start or restart a process, or the configuration resulting therefrom.

THREATENED = ПОД УГРОЗОЙ – Threatened is defined as any species which is likely to become endangered within the foreseeable future throughout all or a significant portion of its range. The Endangered Species Act of 1973 defines Endangered as any species which is in danger of extinction throughout all or a significant portion of its range. Why do species become endangered? In many cases, declines in populations of plants and animals are caused by more than one event. Habitat degradation and destruction by humans are the most serious threats to wildlife and plants worldwide. Destruction occurs through development activities; environmental pollution; introduction of invasive, nonnative species; overharvesting of wild species; and conversion of habitat to other uses. See also Endangered Species Act.

THREE–BAR FABRIC = ТРЁХПЛАНОЧНАЯ ТКАНЬ – Three-Bar Fabric is a tricot fabric made on a machine equipped with three guide bars. / трикотажная ткань, сделанная на машине, оборудованной тремя направляющими планками.

THREE BLACK CROWS = ТРИ ЧЁРНЫЕ ВОРОНЫ – In technical analysis, Three Black Crows is a bearish reversal pattern consisting of three consecutive long black bodies where each day closes near below the previous low, and opens within the body of the previous day. / В техническом анализе биржевых рынков, термин Три Чёрные Вороны означает медвежью модель разворота, состоящую из трёх последовательных длинных чёрных тел, отмечающих закрытие каждой следующей торговой сессии немногим ниже предыдущего закрытия, но при этом, эти три торговые сессии открываются в пределах торгового диапазона предыдущей сессии.

THREE–BODY ABRASION = ТРЁХТЕЛЬНОЕ ИСТИРАНИЕ (или ТРЁХТЕЛЬНАЯ АБРАЗИЯ) – Three-Body Abrasion:- a particulate wear process by which particles are pressed between two sliding surfaces. See also Abrasion. / процесс износа .

THREE–DIMENSIONAL BRAIDING = ТРЁХМЕРНАЯ ОПЛЁТКА (или ПЛЕТЁНОЕ ИЗДЕЛИЕ) – Three-Dimensional Braiding is a fabric structure formed by the intertwining of yarns in a single basic direction. 3-D Braids can be formed in rectangular or cylindrical shapes, generally following the overall shape of the supporting loom. Longitudinal yarns can be introduced into the structure easily. Transverse yarns (either Y or Z) can be entered into the structure with additional operational processes. '2-step Braiding' is a special type of 3-D braiding, as are biaxial and triaxial braiding. / Braids = Басонные Изделия.

THREE–DIMENSIONAL POLYMER = ТРЁХМЕРНЫЙ ПОЛИМЕР – Three-Dimensional Polymer is a polymer formed when molecules unite in both length and width, producing a relatively rigid structure. This is typical of polymers used in processing.

THREE–DIMENSIONAL WEAVING = ТРЁХМЕРНОЕ ТКАЧЕСТВО – Three-Dimensional Weaving is a fabric formation process used to produce three-dimensional textiles. The yarns are simultaneously woven in three directions (length, width, and thickness) rather than in the conventional two. The fabric is formed of three basic components, longitudinal (axial), filling, and 'weavers'. The types of structures that can be produced fall into four broad classes:- (i) contoured fabrics; (ii) expandable fabrics; (iii) interwoven fabrics; and (iv) contoured interwoven fabrics. / уточина.

THREE–DIMENSIONAL WEAVING (3–D) = ТРЁХМЕРНОЕ ТКАЧЕСТВО (3–М) – Three-Dimensional Weaving (3-D):- to produce three-dimensional textiles, yarns are simultaneously woven in three directions (length, width, and thickness) rather than in the conventional two. The types of structures that can be produced fall into four broad classes:- (i) contoured fabrics; (ii) expandable fabrics; (iii) interwoven fabrics (see also Double Weave); and (iv) contoured interwoven fabrics.

THREE LEADER AGREEMENT = СОГЛАШЕНИЕ О ТРЕТЬЕМ ЛИДЕРЕ – Three Leader Agreement:- a condition in a slip or policy whereby the subscribing underwriters allow the leading underwriters to agree amendments etc, to the insurance on their behalf. Where both Lloyd's and Institute of London Underwriters (ILU) companies share the slip it is understood that the first two underwriters in each market subscribing the risk shall indicate their agreement to amendments, etc. It is, also, understood that the leaders' agreement relates only to changes which do not materially affect the cover, e.g., they cannot increase written lines. / Институтом Лондонских Расписчиков (Андеррайтеров).

THREE–LINE BREEDING = ТРЁХЛИНЕЙНОЕ РАЗВЕДЕНИЕ – Three-Line Breeding is a breeding methodology where three lines – cytoplasmic male sterile, maintainer, and restorer – are used to produce F_1 hybrids. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

THREE–PHASE = ТРЁХФАЗНАЯ – Three-Phase:- an ac electric system or load consisting of three conductors energized by alternating voltages that are out of phase by one third of a cycle. This type of system has advantages over single-phase including the ability to deliver greater power using the same ampacity conductors and the fact that it provides a constant power throughout each cycle rather than a pulsating power, as in single-phase. Large power installations are three-phase. / Под Трёхфазной Цепью понимается электрическая цепь переменного тока, в которой действуют 3 синусоидальных напряжения одинаковой частоты, сдвинутые по фазе друг относительно друга (обычно на 120°). Трёхфазные цепи экономичнее однофазных, дают существенно меньшие пульсации тока после выпрямления, позволяют простыми средствами получать вращающееся магнитное поле в электродвигателях. Трёхфазная Цепь или Трёхфазная Система, совокупность трёх однофазных электрических цепей переменного тока (называемых Фазами), в которых действуют три переменных напряжения одинаковой частоты, сдвинутых по фазе друг относительно друга; частный случай многофазной системы. Наиболее распространены симметричные трёхфазные системы, напряжения в которых синусоидальные, равны по величине и имеют сдвиг фаз, равный 120°. Трёхфазная система называется Электрически Несвязанной Системой, если отдельные фазы представляют собой независимые электрические цепи, и Электрически Связанной Системой, если её отдельные фазы электрически соединены между собой. Практическое применение имеют электрически связанные трёхфазные системы, образованные (в простейшем случае) фазными обмотками трёхфазного генератора, тремя приёмниками электроэнергии (фазами нагрузки) и соединительными (линейными) проводами. Если фазные обмотки генератора и фазы нагрузки соединены звездой (смотрите Соединения Треугольником И Звездой), то трёхфазная цепь, кроме линейных проводов, может включать нейтральный (нулевой) провод, соединяющий нейтральные точки генератора и нагрузки. Наличие нейтрального провода уменьшает взаимное влияние режимов работы фаз трёхфазной цепи и обеспечивает возможность подключения к трёхфазной цепи однофазной нагрузки. Напряжения между линейными проводами и протекающие по этим проводам токи называются Линейными Токами; токи, протекающие по фазным обмоткам генератора и фазам нагрузки, а также напряжения на них – Фазными Токами. В общем случае линейные токи и напряжения отличаются от соответствующих фазных. Трёхфазная система была предложена Русским электротехником Михаилом Осиповичем Доливо-Добровольским (1862–1919) в 1891, который разработал все основные звенья этой системы – генераторы, трансформаторы, линии передачи и двигатели трёхфазного тока. Она получила преимущественное распространение в электроэнергетике. По сравнению с однофазными цепями переменного тока трёхфазные цепи более экономичны, дают существенно меньшие пульсации тока после выпрямления. Применение трёхфазных цепей позволяет простыми средствами получать вращающееся магнитное поле в электродвигателях переменного тока.

THREE SHEETS TO THE WIND = ТРИ ШКОТА НА ВЕТЕР (или СИЛЬНО ВЫПИВШИЙ, или ВДРЫЗГ ПЬЯНЫЙ, или ПЬЯНЫЙ В СТЕЛЬКУ, или ПОДВЫПИТЬ) – Three Sheets To The Wind (maritime term):- sailing with three sheet ropes running free, thus making the ship barely able to keep headway and control. Drunk.

THREE–WAY CROSS = ТРЁХЛИНЕЙНОЕ СКРЕЩИВАНИЕ (или ТРЁХПОРОДНОЕ СКРЕЩИВАНИЕ) – Three-Way Cross:- when an F_1 hybrid is crossed to a third variety or breeding line.

THREE WHITE SOLDIERS = ТРИ БЕЛЫХ СОЛДАТА – In technical analysis, Three White Soldiers is a bullish reversal pattern consisting of three consecutive long white bodies, each with a higher close. Each should open within the previous body and the close should be near the high of the day. / В техническом анализе биржевых рынков, термин Три Белых Солдата означает бычью модель разворота, состоящую из трёх последовательных длинных белых тел, отмечающих закрытие каждой следующей торговой сессии немногим выше предыдущего закрытия, но при этом, эти три торговые сессии открываются в пределах торгового диапазона предыдущей сессии.

THRESHABILITY = ОБМОЛАЧИВАЕМОСТЬ – Threshability:- ease by which the grains are removed from the panicle.

THRESHING = МОЛОТЬБА (или ОБМОЛОТ) – Threshing is an operation of detaching or separating the Rice grains from the panicle by hand or mechanical means. / Под Молотьбой понимается выделение семян или плодов из бобов, колосьев, корзинок, метёлок, початков растений. Проводят комбайнами и молотилками в поле и на току, обычно совмещая с очисткой и сортированием. Под Молотьбой или Обмолотом, понимается выделение семян (или плодов) из колосьев, метёлок, корзинок, бобов, головок, початков растений. Одна из основных операций уборки зерновых и других сельскохозяйственных культур. Молотьбу проводят комбайнами и молотилками в поле и на току, обычно совмещая с очисткой и сортированием семян (зерна). Качество молотьбы оценивается степенью вымолота, количеством дроблёных и остающихся семян в соломе, полове и так далее.

THRESHOLD = ПОРОГ (или ПРЕДЕЛ, или КРИТИЧЕСКИЙ УРОВЕНЬ) – Threshold is:- (1) a phenomenon that can obscure the gene-character relationship; (2) a safe level of economic viability. A Threshold is a defined level beyond which action should occur. The point at which an action is taken; often applied to insects. Most thresholds are action thresholds; an action is taken when a level or number of eggs or caterpillars is reached. It can also be an economic threshold, which takes the commodity value and treatment cost into consideration. / свойство (character).

THRESHOLD LEVEL = ПОРОГОВЫЙ УРОВЕНЬ – Threshold Level or Economic Injury is the pest population density at which the loss caused by the pest is greater than the cost of controlling the pest. The pest density at which artificial control measures are economically justified. See also Economic Injury. / Смотрите также Экономическое Повреждение (Economic Injury).

THRESHOLD LIMIT VALUE = ПОРОГОВОЕ ПРЕДЕЛЬНОЕ ЗНАЧЕНИЕ (или ПОРОГОВОЕ ЗНАЧЕНИЕ ЛИМИТА) – The Threshold Limit Value (TLV) of a chemical substance is a level to which it is believed a worker can be exposed day after day for a working lifetime without adverse health effects. Strictly speaking, TLV is a reserved term of the American Conference of Governmental Industrial Hygienists (ACGIH). However, it is sometimes loosely used to refer to other similar concepts used in occupational health and toxicology. TLVs, along with biological exposure indices (BEIs), are published annually by the ACGIH. The TLV is an estimate based on the known toxicity in humans or animals of a given chemical substance, and the reliability and accuracy of the latest sampling and analytical methods. It is not a static definition since new research can often modify the risk assessment of substances and new laboratory or instrumental analysis methods can improve analytical detection limits. The TLV is a recommendation by ACGIH, with only a guideline status. As such, it should not be confused with exposure limits having a regulatory status, like those published and enforced by the Occupational Safety and Health Administration (OSHA). The OSHA regulatory exposure limits permissible exposure limits (PELs) published in 29CFR 1910.1000 Table Z1 are based on recommendations made by the ACGIH in 1968, although other exposure limits were adopted more recently. Many OSHA exposure limits are not considered by the industrial hygiene community to be sufficiently protective levels. The National Institute of Occupational Safety and Health (NIOSH) publishes recommended exposure limits (RELs) which OSHA takes into consideration when promulgating new regulatory exposure limits. The TLV for chemical substances is defined as a concentration in air, typically for inhalation or skin exposure. Its units are in parts per million (ppm) for gases and in milligrams per cubic meter (mg/m^3) for particulates such as dust, smoke and mist. The basic formula for converting between ppm and mg/m^3 for gases is ppm = (mg/m^3) x 24.45 / molecular weight. This formula is not applicable to airborne particles. Three types of TLVs

for chemical substances are defined:- (i) threshold limit value – time weighted average (TLV-TWA):- average exposure on the basis of a 8 h/day, 40 h/week work schedule; (ii) threshold limit value – short-term exposure limit (TLV-STEL):- spot exposure for a duration of 15 minutes, that cannot be repeated more than 4 times per day; and (iii) threshold limit value – ceiling limit (TLV-C):- absolute exposure limit that should not be exceeded at any time. There are TLVs for physical agents as well as chemical substances. TLVs for physical agents include those for noise exposure, vibration, ionizing and non-ionizing radiation exposure and heat and cold stress. Threshold Limit Value (TLV):- referring to harmful substances in the workplace.

THRESHOLD MOISTURE CONTENT = ПОРОГОВОЕ СОДЕРЖАНИЕ ВЛАГИ (или ПОРОГОВАЯ ВЛАЖНОСТЬ) – Threshold Moisture Content (in biology) is the minimum moisture condition, expressed either in terms of moisture content or moisture stress, at which biological activity just becomes measurable.

THRIFT INSTITUTION = СБЕРЕГАТЕЛЬНОЕ УЧРЕЖДЕНИЕ (или УЧРЕЖДЕНИЕ ПО СБЕРЕЖЕНИЯМ) – In the United States, the Thrift Institution is a general term encompassing savings banks, savings and loan associations, and credit unions. / Сберегательное Учреждение (Thrift Institution):- часто – ссудо-сберегательные ассоциации, финансовая организация, поощряющая личные сбережения. Организация, созданная главным образом в качестве депозитного учреждения для хранения потребительских сбережений; наиболее распространённым видом таких организаций являются ссудо-сберегательные ассоциации (savings and loan associations) и сберегательные банки (savings banks). Ранее сберегательные институты традиционно предоставляли большую часть вкладов на жилищные ипотечные займы и продолжали делать это после того, как в начале 1980-х был принят закон, расширяющий разрешённый спектр сберегательных услуг, позволивший им предоставлять коммерческие и потребительские кредиты. Закон, направленный на дерегулирование ссудо-сберегательных институтов, был, однако, использован для злоупотреблений. Широкое распространение получила противозаконная практика использования застрахованных в этих институтах депозитов для спекуляций недвижимостью. Для предотвращения такой практики в 1989 было создано Управление Надзора За Сберегательными Учреждениями (США) – (Office of Thrift Supervision) во исполнение Акта о Реформе, Поддержке и Исполнении Финансовых Учреждений (Financial Institutions Reform, Recovery and Enforcement Act (FIRREA)). В категорию финансовых организаций иногда включаются кредитные союзы (credit unions), поскольку основным источником вносимых в них вкладов также являются личные сбережения, хотя они традиционно предоставляют небольшие потребительские кредиты, а не ипотечные ссуды. Смотрите также Акт о Дерегулировании и Монетарном Контроле Депозитарных Институтов (Depository Institutions Deregulation and Monetary Control Act); Взаимная Ассоциация (Mutual Association); и Взаимный Сберегательный Банк (Mutual Savings Bank).

THRIFT INSTITUTIONS ADVISORY COUNCIL = СОВЕЩАТЕЛЬНЫЙ СОВЕТ СБЕРЕГАТЕЛЬНЫХ УЧРЕЖДЕНИЙ (или КОНСУЛЬТАТИВНЫЙ СОВЕТ СБЕРЕГАТЕЛЬНЫХ УЧРЕЖДЕНИЙ) – In the United States, the Thrift Institutions Advisory Council (TIAC) is a council, established following the passage of the Monetary Control Act of 1980, whose purpose is to provide information and views on the special needs and problems of thrifts. The group is comprised of representatives of savings banks, savings and loan associations, and credit unions. Group established by the Board of Governors to obtain information and opinions on the needs and problems of thrift institutions. Made up of representatives of savings and loan associations, savings banks, and credit unions. The Thrift Institutions Advisory Council (TIAC) was established in 1980 by the Board of Governors of the Federal Reserve System to provide information and views on the special needs and problems of thrift institutions. Unlike the Federal Advisory Council and the Consumer Advisory Council, TIAC is not a statutory body, but it performs a parallel function in providing first-hand advice from representatives of institutions that have an important relationship with the Federal Reserve. TIAC meets with the Board in Washington, DC, three times a year. The twelve members are representatives from savings and loan institutions, mutual savings banks, and credit unions. Thrift Institutions Advisory Council is a council that advises the Federal Reserve board of governors on the various needs and condition of savings institutions. The council is made up of representatives of all types of savings institutions, including banks, credit unions and savings and loans. The Thrift Institutions Advisory Council was established by the Monetary Control Act of 1980. It was created in order to foment communication between the Federal Reserve Board and the savings industry. The Fed is able to take action based on the reports that it receives from this council. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

THRIPS = ТРИПСЫ (или ПУЗЫРЕНОГИЕ) – Thrips:- Pest type:- Insect; crops affected:- Cotton, Wheat, Soybeans, Corn, Peanuts; scientific name:- Limothrips Cerealium, or Frankliniella Spp.; Pest Order:- Thysanoptera. Description:- adult Thrips are only 0.4–1.5 mm long and are various colors. These adults which are slender, torpedo shaped, fast-moving, and agile, generally have 2 or 4 wings. Eggs are usually oblong and a creamy color. Larvae are very small, i.e. about 0.25 mm long; and are white or cream-colored during the first instar, gaining more color during later stages. There is a prepupal stage and a pupal stage that occur in the soil. Damage:- both immatures and adults feed by rasping the buds and leaf surfaces with their mouth stylets and sucking up the sap which flows from the injured area. This injury causes distorted leaves with a silvery and/or flecked appearance. The tips of the leaves generally wither, curl up, and die. Thrips can also transmit viruses. Thrips are almost always present in a soybean field, but during outbreak years they are noticed and cause concern. In particular, during dry weather and on earlier planted soybeans, Thirp populations may soar when plants are growing slowly. Thrip injury on soybeans nearly always occurs early in the growing season and especially under dry conditions. Life Cycle:- adults overwinter in plant debris, under bark, and in other protected areas. The adults become active in April and May and lay eggs in host plant tissues. Larvae hatch and enter two instars before entering the soil to pupate. Adults are active from mid-May through September. Under favorable conditions, a complete life cycle may require only two weeks. Control Measures:- when economic thresholds are reached, Thrips can be controlled with insecticides; however, Thrip populations usually do not justify insecticide treatments. Still, when infestations are significant, contact local advisers for thresholds and control information. Geography:- several species of Thrips feed on small grains across the United States, and in Canada and Mexico. Thrips are tiny, active Insects of the Order Thysanoptera, which move in high numbers primarily into seedling Cotton, often because their alternative hosts are drying up. Thrips are sucking Insects that attack seedling Cotton soon after emergence and cause newly formed true leaves to be small and deformed. Effective control can be achieved by the use of appropriate insecticide seed treatments. Despite the damage done by Thrips they provide a valuable contribution to the control of mites later in the season. / Пузыреногие или Трипсы, Отряд Насекомых. Лапки имеют пузыревидные присоски. Длина 0.5–2 миллиметра (мм), редко до 14 мм. Свыше 2 000 Видов, распространены широко. Некоторые Пузыреногие вредят зерновым и огородным культурам. Трипсы от яйца до имаго:- Трипсы – мелкие Сосущие Насекомые, длина тела особей большинства Видов составляет 0.5–2 мм. В период вегетации Трипсы присутствуют практически на каждом растении. Довольно просто обнаружить их в цветках, где зачастую одновременно обитает несколько видов. Трипсы питаются соком, что значительно ослабляет Растения. Повреждённые листья испаряют значительно больше влаги, быстрее стареют и высыхают. Самые распространённые и опасные Виды Трипсов закрытого грунта, встречающиеся на Томате, – это Табачный и Западный Цветочный. Западный Цветочный, или Калифорнийский, Трипс (Frankliniella Occidentalis) – крайне опасный Вид для многих овощных и декоративно-цветочных культур. Повреждённые листья и цветки покрываются серебристыми штрихами, некротическими пятнами неправильной или округлой формы и постепенно увядают. В летнее время

Калифорнийский Трипс способен размножаться вне теплиц на разнообразной культурной и дикой растительности. При размножении Трипсов в притепличных цветниках велика опасность их залёта в теплицы. Трипс имеет следующие фазы развития:- яйцо, личинка первого и второго возраста (личинка I и II), нимфа первого и второго возраста (нимфа I и II), взрослая особь. Самки откладывают яйца в растительные ткани, чаще всего внутрь листовых жилок или вблизи них. Процесс выхода личинки из яйца длится около двух часов. Отрождение личинок чаще происходит в ночные и вечерние часы. На растении питаются личинки двух возрастов. Нимфальная стадия проходит развитие в почве, в редких случаях нимфы остаются на растении. При увеличении температуры скорость развития Трипса сокращается от 34 до 14 суток. Самка живёт примерно месяц. За это время она может отложить до 300 яиц. В отсутствие живых растений Трипсы способны выживать в теплице не более недели. Оптимальная температура для развития Западного цветочного Трипса – 25 °C, когда его численность удваивается за 4 дня. При температуре свыше 35 °C развитие останавливается, а также возрастает смерность всех стадий. Отмечается, что взрослые особи хорошо и активно летают, что позволяет им стремительно распространяться по культуре. На Томате Трипсы сосредотачиваются в среднем ярусе. Ещё одна важная особенность:- сочетание высокой температуры и низкой относительной влажности воздуха на Томатах неблагоприятно сказывается на численности Трипсов. Всё это стоит учитывать при построении защиты. Для контроля Западного цветочного Трипса на Томате могут использоваться следующие энтомофаги:- Фитосейидные Клещи (Amblyseius Andersoni, Amblyseius Montdorensis) и Энтомопаразитическая Нематода (Steinernema Feltiae). Трипсы – представители Насекомых Отряда Бахромчатокрылые (Thysanoptera), входят в перечни регулируемых вредных организмов большинства стран, имеющих такие перечни. В перечень Республики Корея включён 21 Вид Трипсов, Перу – 25 Видов, Аргентины – 15 Видов, Мексики – 14 Видов, Израиля – 10 Видов, и так далее. В перечень вредителей, болезней Растений и Сорняков, имеющих карантинное значение для территории Российской Федерации, включены два Вида Трипсов:- (1) Калифорнийский (Западный Цветочный) Трипс (Western Flower Thrips (Frankliniella occidentalis (Perg.))) и (2) Дынный Трипс (Melon Thrips (Thrips palmi Karny)). В проект (данные на 2014) Единого Перечня Карантинных Объектов Таможенного Союза включено ещё 9 Видов Трипсов:- (i) Ехинотрипс Американский (Poinsettia Thrips (Echinothrips Americanus Morg.)), (ii) Американский Табачный Трипс (Tobacco Thrips (Frankliniella fusca (Hinds))), (iii) Индийский Цветочный Трипс (Common Blossom Thrips (Frankliniella insularis (Franklin))), (iv) Томатный Трипс (Common Blossom Thrips (Frankliniella schultzei (Trybom))), (v) Восточный Цветочный Трипс (Eastern Flower Thrips (Frankliniella tritici (Fitch))), (vi) Кукурузный Трипс (Corn Thrips (Frankliniella Williamsi Hood)), (vii) Цитрусовый Трипс (Citrus Thrips (Scirtothrips citri (Moulton))), (viii) Индо-Китайский Цветочный Трипс (Yellow Tea Thrips (Scirtothrips dorsalis Hood)) и (ix) Гавайский Трипс (Banana Flower Thrips (Thrips hawaiiensis Morgan)). Описано свыше 6 000 Видов Трипсов. Вследствие чрезвычайно мелких размеров тела (в среднем около 1 мм) и большой подвижности имаго Трипсы быстро расселяются с заражённой и засорённой продукцией. В настоящее время в Европе отмечено 52 инвазионных Вида Трипсов. Если в первой половине XX века Трипсы попадали в Европу в основном из Америки, то затем преобладать стали инвазионные виды Трипсов Азиатского и Африканского происхождения. Эти особенности формирования местных фаун Трипсов следует иметь в виду при идентификации Трипсов, обнаруженных на растительной продукции из стран Европы. Основным путём расселения растительноядных инвазионных Трипсов являются облиственные растения (побеги):- посадочный материал (укоренённая рассада, черенки и прочее), срезы декоративных растений, листовые овощи (салаты), зеленные культуры, горшечные культуры и прочие. Плодовая овощная продукция (Томат, Огурец, Баклажан и прочее) также может иметь значение для распространения Трипсов. С растениями Трипсы распространяются на стадии яйца, личинки и имаго. Преимагинальные стадии – пронимфы и нимфы – могут находиться на почве или на упаковке (таре). Имеется возможность сохранения и расселения Трипсов с овощной продукцией, заложенной на хранение в виде так называемых укороченных побегов (кочаны, луковицы и так далее). Для выявления Трипсов в основном используют сбор на цветных клеевых ловушках (ЦКЛ) или визуальный поиск Трипсов и следов их жизнедеятельности на растениях. ЦКЛ состоят из бумажной (картонной) или пластмассовой пластины, на которую с двух сторон нанесён светоотражающий слой. На светоотражающий слой нанесена краска, покрытая прозрачным, долго сохнущим клеем без запаха. Считается, что для Трипсов привлекательна синяя часть спектра, хотя здесь имеет значение и ультрафиолетовая составляющая отражённых лучей света. Обычно используют ЦКЛ размером 25 х 50 сантиметров (см) для овощных теплиц и 12 х 30 см и 7.5 х 12.5 см для малогабаритных теплиц, ботанических садов и помещений. Ловушки развешивают равномерно, выдерживая расстояние между ними около 10 метров (м). На ловушки рекомендуют наносить вещества, запах которых привлекает Трипсов (анизальдегид, гераниол и другие). Визуально выявляются прежде всего повреждения, вызываемые Трипсами. На листьях растений такие повреждения выглядят как светлые пятна различной величины и формы. При питании взрослых Трипсов появляется так называемая серебристая штриховатость. Эта штриховатость представляет собой ряды мелких пятен, серебристый цвет которых возникает из-за попадания воздуха внутрь разрушенных тканей растения. Личинки Трипсов вызывают повреждения другого вида – возникают более крупные бесцветные пятна, которые, сливаясь, могут быстро переходить в некротические участки на листьях. Повреждения, вызываемые Трипсами, похожи на следы питания некоторых других сосущих беспозвоночных, например, Паутинных Клещей и Тлей, и на симптомы ряда заболеваний, связанных с появлением обесцвеченных пятен на растениях. Поэтому, чтобы сделать окончательный вывод о присутствии на растениях именно Трипсов, если не обнаружены сами вредители, необходимо обнаружить их экскременты. Жидкие экскременты Трипсов, высыхая на поверхности растений, образуют россыпи характерных мелких пятен, имеющих на зелёных частях растений тёмно-зелёную, почти чёрную, окраску. Окраска экскрементов Трипсов на лепестках цветков зависит от цвета последних:- на красных лепестках они тёмно-коричневые, на белых лепестках – обычно жёлтые. Если пользоваться увеличительным прибором, экскременты Трипсов можно выявить на растениях ещё до появления некрозов. Характерный признак некрозов, возникающих на листьях при питании на них Трипсов, – это их чёткие границы. Трипсы являются облигатными переносчиками тосповирусов. Появление на растениях признаков заболеваний, вызываемых вирусами этой группы, также является несомненным признаком присутствия Трипсов. Если на поверхности растений, носящих следы деятельности Трипсов, не удаётся обнаружить самих вредителей, такое растение следует встряхнуть над листом белой бумаги:- Трипсы и другие мелкие насекомые падают на бумагу, где они хорошо заметны. Для этой цели также предлагается использовать кюветы, часть дна которых окрашена в белый цвет, а часть – в чёрный (светлоокрашенные Трипсы лучше заметны на чёрном фоне). При использовании оптики, например, стереомикроскопа, внутри листьев и лепестков цветков легко обнаружить яйца яйцекладных Трипсов характерной почковидной формы. Однако идентификацию вида на этой стадии можно проводить только молекулярными методами. В настоящее время довольно интенсивно разрабатывают методы идентификации Трипсов по личинкам второго возраста. Но пока такие ключи разработаны для немногих групп и обычно на региональном уровне. Для целей идентификации собирают взрослых Трипсов (имаго), предпочитая самок. Самки хорошо отличаются от самцов более крупным, коренастым туловищем, с широким округлённым брюшком, края которого явственно выступают за края крыльев. Также присутствие имаго Трипсов можно определить по характерным повреждениям. При наличии цветущих растений имаго обычно концентрируются в цветках, где питаются пыльцой. С растений Трипсов собирают кисточкой в консервирующую жидкость. С ЦКЛ Трипсов собирают, растворяя клей ксилолом или его заменителями:- Цитрусовый Растворитель (Bio Clear), Clearene, Sub-X и другие. В качестве консервирующей жидкости можно применить

этиловый спирт концентрации от 70 до 96%. Для того, чтобы при случайном испарении спирта материал не испортился (высох), можно добавить в спирт от 2 до 5% глицерина. Универсальной консервирующей жидкостью для сохранения мелких членистоногих с нежными покровами считают смесь этилового спирта, глицерина и ледяной уксусной кислоты. Один из составов – так называемая жидкость AGA (alcohol, glycerin и acetic acid):- этиловый спирт (60%), глицерин и уксусная кислота в соотношении 10:1:1. Другой вариант – так называемая жидкость Удеманса:- 70% этиловый спирт – 87 частей, глицерин – 5 частей, ледяная уксусная кислота – 8 частей. Однако в этой жидкости происходит денатурация ДНК и материал становится непригодным для молекулярных методов идентификации. Кроме того, побывавший в глицерине материал становится малопригодным для исследования под электронным сканирующим микроскопом. Если материал предполагается использовать для таких целей, его надо хранить в 80–95% чистом этиловом спирте в морозильной камере в темноте. В смеси этилового спирта, глицерина и ледяной уксусной кислоты материал также надо хранить в темноте и при пониженных температурах, иначе он быстро выцветает. При длительном хранении в этиловом спирте, особенно крепком, материал черствеет и из него затем трудно изготовить качественный препарат. Поэтому рекомендуем заменять этиловый спирт изопропиловым спиртом или содержать материал в смеси Торне:- изопропиловый спирт – 1 000 кубических сантиметров ($см^3$), ледяная уксусная кислота – 30 $см^3$, 40% формалин – 3 $см^3$. Можно собирать Трипсов и в чистую молочную кислоту, при хранении в которой материал просветляется. Однако перед изготовлением постоянных препаратов Трипсов, извлечённых из молочной кислоты, их надо промыть в нескольких сменах дистиллированной воды. Если этого не сделать, после изготовления микропрепарата молочная кислота со временем кристаллизуется внутри Трипсов. Для сохранения и транспортировки Трипсов их помещают в небольшие пробирки, заполненные консервирующей жидкостью. В настоящее время для этой цели удобно использовать полимерные пробирки Эппендорфа ёмкостью 2 мл, имеющие связанную с пробиркой пробку. Можно использовать и стеклянные, так называемые энтомологические пробирки объёмом несколько миллилитров. Трипсами заполняют не более 1/3 объёма пробирки. В пробирки вкладывают полоски бумаги (этикетки), на которых обозначено время и место сбора, название растения или иного субстрата, с которого был собран Трипс, фамилия сборщика. Законсервированный таким образом материал пригоден для передачи, так и для длительного хранения с целью последующего приготовления препаратов. Если материал высох, Трипсы деформируются и их нужно размачивать в горячей молочной кислоте, но это не всегда помогает. Для идентификации Трипсов по морфологическим признакам из них необходимо приготовить тотальные (то есть из целого организма) микроскопические препараты. Этот этап очень важен. Точно определить вид Трипса по плохо приготовленному препарату зачастую невозможно даже при использовании самой современной оптики высококвалифицированным энтомологом. Препараты, предназначенные для рассматривания под микроскопом, изготавливают на предметных стёклах, представляющих собой прямоугольные пластинки. Требования к предметному стеклу (ISO Norm 8037/I):- длина 75–76.2 мм; ширина 24.6–25.8 мм; толщина 1 мм (ГОСТ 9284-75 Стёкла Предметные Для Микроскопов. Технические Условия.). Толщина современных покровных стёкол – 0.17 мм (ГОСТ 6672-75 Стёкла Покровные Для Микроскопов. Технические Условия). Размеры покровных стёкол различны, для квадратных – от 10 х 10 мм до 24 х 24 мм, в настоящее время применяют и круглые покровные стёкла, которые более удобны. Поскольку обычно на предметном стекле монтируют один экземпляр Трипса, экономичнее использовать стёкла меньшего размера. В центре предметного стекла помещают объект, сверху закрывают покровным стеклом. Существующие в настоящее время среды для приготовления препаратов Трипсов можно разделить на две группы:- водорастворимые и водонерастворимые (смолы). При заключении Трипса, особенно тёмного, в любую среду, его тело необходимо просветлить (осветлить), то есть сделать прозрачным, чтобы диагностические структуры были видны под микроскопом в проходящем свете. Для просветления в водорастворимых средах применяют молочную кислоту, смесь глицерина и ледяной уксусной кислоты (1:4) или специальные среды:- смесь Ессига. Иногда тёмноокрашенных Трипсов приходится мацерировать в калийной щёлочи (5–10%). Трипсов в щёлочи осторожно нагревают над пламенем горелки, не допуская закипания. Периодически Трипса рассматривают под стереомикроскопом, дожидаясь, когда его тело станет достаточно прозрачным. Затем материал переносят в 5–10% раствор фенола, где идёт нейтрализация КОН и расправление объектов. При мацерации в горячем КОН возможно повреждение хитиновых покровов Трипсов, а также возможно мацерировать Трипсов в холодном растворе щёлочи при комнатной температуре, но в этом случае процесс может длиться несколько суток. Окончательно Трипса монтируют в капле среды в центре предметного стекла перпендикулярно его длинной оси спиной вверх, усики, крылья и ноги отводят от туловища. Из водорастворимых сред наиболее распространены различные модификации гуммиарабиковых смесей, например, так называемая среда (смесь) Фора-Берлезе (в настоящее время правильное название – среда (смесь, жидкость) Хойера). Состав среды Хойера – 30 г гуммиарабика (камедь около 50 видов Акаций, лучший из Акации Сенегальской), 50 мл дистиллированной воды, 20 мл глицерина и 200 г хлоралгидрата. В жидкости Хойера хорошо видны все признаки, необходимые для диагностики Трипса (если он хорошо просветлён). Светлоокрашенных Трипсов можно помещать в эту смесь без предварительного просветления:- хлоралгидрат сам просветляет такие объекты через несколько часов. Из смол наиболее часто употребляют Канадский бальзам – смолу бальзамической Пихты. Канадский бальзам представляет собой куски твёрдого прозрачного вещества со ‘смолистым’ запахом, цвет кусков от светло-жёлтого до тёмно-красного, предпочтительнее светлый бальзам. Для растворения Канадского бальзама используют ксилол и его заменители. После растворения образуется вязкая жидкость, которую и применяют в качестве среды для микроскопирования. В настоящее время производятся синтетические смолы – заменители Канадского бальзама, например, Байо Маунт (Bio Mount). Процедура изготовления препарата в смоле требует предварительного обезвоживания объекта. В зависимости от того, в какой среде содержался Трипс, его последовательно проводят через 50, 60, 70, 80 и 96% и абсолютный (100%) спирты. Следует иметь в виду, что при полном обезвоживании Трипса он становится хрупким и его расправление уже невозможно без поломок, таким образом, эту процедуру необходимо проводить заранее. Весь процесс контролируют под стереомикроскопом. После обезвоживания Трипса просветляют. Для этого на Трипса наносят каплю карбол-ксилола. В карбол-ксилоле Трипс должен стать полностью прозрачным. После удаления карбол-ксилола Трипса промывают каплей чистого ксилола и помещают в каплю Канадского бальзама, накрывая сверху покровным стеклом. Если Трипс просветлился недостаточно, его можно дополнительно просветлить в гвоздичном масле, после чего опять промыть каплей чистого ксилола. Процедура заключения в бальзам облегчается тем, что образующиеся в среде пузырьки воздуха обычно быстро рассасываются в бальзаме, особенно если использовать нагревательный столик. После подсыхания препаратов Трипсы в смоле хорошего качества могут сохраняться практически неограниченное время. После изготовления препарата его необходимо поместить на нагревательный (гистологический) столик для окончательного ‘созревания’ в течение от нескольких часов до одних суток. При температуре 40–60 °С горячая среда быстро пропитывает объект и все признаки оптимизируются для оптического изучения. Кроме того, большинство пузырьков воздуха быстро рассасывается в горячей среде. Холодная среда застывает, не пропитав объект, и признаки, соответственно, видны гораздо хуже. В дальнейшем, после подсыхания среды, даже подогреванием препарат исправить уже не удаётся. Приготовленный любым способом препарат должен быть этикетирован:- справа от Трипса к предметному стеклу приклеивают этикетку, на которой указано время и место сбора Трипса, растение и часть растения, а также иной субстрат, с которого он был собран, фамилия и инициалы собравшего. Рядом с фамилией обычно помещают сокращение ‘leg.’ (от

Латинского слова Legulus, означающее Сборщик). Желательно указать, в какой среде изготовлен препарат:- жидкость Хойера (Hoyers Mountant, Hoyers Medium) или Канадский бальзам (Canada Balsam). Если Трипса удалось определить, то на этикетке, приклеиваемой слева от Трипса, указывают его полное Латинское название, пол Трипса, а также фамилию и инициалы определившего, поставив рядом с фамилией определившего сокращение 'det.' (от Латинского слова Determinavit, означающее Определил) и год определения. Желательно текст на этикетках наносить так, чтобы Трипс по отношению к нему находился вниз головой. Тогда при помещении препарата на предметный столик микроскопа текстом 'к себе' происходит оптическое переворачивание Трипса и его удобно рассматривать, имея возможность одновременно читать текст. Подсохшие препараты хранят в специальных коробках на ребре или в планшетах в горизонтальном положении. Имеются шкафы для хранения предметных стёкол, в которых препараты хранят в вертикальном положении перпендикулярно узкой стороне. В этом случае надписи на этикетках обычно наносят поперёк длинной стороны предметного стекла, в направлении к одной (обычно правой) узкой стороне. В настоящее время основным методом идентификации Трипсов остаётся морфологический метод. Молекулярные методы идентификации рекомендуют использовать в тех случаях, когда морфологические методы не применимы (стадия яйца, повреждённые экземпляры и так далее). Для надёжной морфологической идентификации Трипсов, как и других мелких членистоногих, необходимо сочетание следующих факторов:- соответствующая профессиональная (в данном случае энтомологическая) подготовка, доступность определителей (ключей) или специально созданных диагностических протоколов (методик выявления и идентификации данного организма или группы организмов) и наличие инструментария соответствующего уровня. Процедуру идентификации Трипсов в основном проводят при использовании светового (так называемого прямого) микроскопа. Стереомикроскопы небольшого увеличения с низким оптическим разрешением пригодны в данном случае только для предварительного разбора материала и приготовления препаратов. Надёжная идентификация Трипсов по морфологическим признакам, как и других очень мелких организмов, возможна только при использовании высококачественных оптических инструментов. Минимальные требования по увеличению – микроскопы должны получать полезное (то есть с выявлением новых деталей) увеличение объекта не менее чем до 400–600 раз, как рекомендовано в диагностическом протоколе Международной Конвенции по Карантину и Защите Растений (МККЗР) для Thrips palmi Karny. Однако этого недостаточно, в этом же протоколе использованы не только светлопольные методы исследований, но и фазовый контраст. Ведущие оптические фирмы производят микроскопы трёх категорий:- (1) исследовательского уровня, (2) лабораторные (лабораторно-исследовательские) и (3) рабочие ('клинические'). Для идентификации полностью пригодны микроскопы исследовательского и лабораторно-исследовательского уровня, рабочие микроскопы не только не могут использовать все методы контрастирования, но и, как, например, Олимпас Си.Экс.21 (Olympus CX21) обычно не могут быть настроены для оптимального освещения 'по Кёлеру'. Микроскоп должен быть снабжён комплектом объективов, позволяющих исследовать объект в различном увеличении (значение увеличения микроскопа равно произведению собственного увеличения объектива на увеличение окуляра). Полезно иметь комплект окуляров, что позволяет исследовать объект при разном увеличении с одним объективом. Для этого используют правило Аббе – полезное увеличение микроскопа при использовании данного объектива (без потери разрушения) обычно расположено в диапазоне от пятисот до одной тысячи числовых значений апертуры. Использование только светлопольного конденсора не позволяет во всех случаях однозначно разглядеть признаки Трипсов. Объективы и конденсор должны позволять использовать, как минимум, методы тёмного поля и фазового контраста. Устройство дифференциально-интерференционного контраста позволяет в большинстве случаев чётко различать признаки, плохо различимые при других методах. Надо сказать, что все вышеперечисленные методы микроскопии, которые до сих пор используются не всеми сотрудниками диагностических лабораторий, были разработаны до середины XX века, и уже в 1960-е промышленность бывшего Союза Советских Социалистических Республик (СССР) выпускала все соответствующие типы световых микроскопов. При идентификации Трипсов часто приходится использовать признаки, связанные с размерами отдельных морфологических структур или соотношением их размеров. Для этого можно использовать окуляр-микрометры, но их использование требует дополнительных вычислений, занимает много времени и особенно утомительно при экспертизе массового материала. Гораздо удобнее в этом случае применять современное программное обеспечение. Микроскоп через фотовидеовыход и соответствующую камеру связывается с компьютером, что позволяет проводить непосредственное измерение линий, углов и площадей объекта, сразу получая данные в микрометрах, при необходимости можно соединять детали объекта в высоком разрешении в режиме панорамы, увеличивать глубину резкости в режиме расширенного фокуса и так далее. Фирмы выпускают такие программы для компьютерного сопровождения своих микроскопов, например, Карл Цайс – Аксио Визион 4.6 (Carl Zeiss – Axio Vision 4.6); имеются аналогичные программы от сторонних разработчиков, например, Алтами Студио (Altami Studio 3.3), Морфология 5.2 и другие. Для идентификации Трипсов широко используют и электронный сканирующий микроскоп. Настольные модели таких микроскопов имеют габариты системного блока компьютера, но позволяют получить разрешение признаков Трипса в десятки раз более высокое, чем у лучшего светового микроскопа. Признаки, выявленные таким образом, включают в диагностические ключи Трипсов. Можно ожидать увеличения в таких ключах доли тонких диагностических признаков, выявленных при помощи электронного микроскопа. Морфологическая идентификация Трипсов исключительно по микропрепаратам особей, расправленных и располагаемых определённым образом, позволяет вводить элементы автоматизации этого процесса с использованием компьютерных программ. Обычно такие программы создаются для определённых выборок видов Трипсов – для некоторых семейств, родов или группы так называемых 'вредных' Трипсов. В последнем случае целью создания такой программы является ускорение процесса идентификации массового материала при экспертизе и при этом сведение к минимуму ошибок.

THROAT = ЗЕВ (или ГОРЛО, или ГОРТАНЬ, или ГЛОТКА) – Throat is the visible portion of a flower between the limb and tube. / Зев или Отверстие сростнолепестного цветка. Под Зевом понимается отверстие, соединяющее полость рта с глоткой и ограниченное сверху мягким нёбом, снизу – спинкой языка и по бокам – нёбными дужками с расположенными между ними миндалинами. Под Гортанью понимается начальный хрящевой отдел дыхательной системы человека и наземных позвоночных животных. Расположена между головой и трахеей; проводит воздух в трахею и выводит из неё. Участвует в образовании звуков, составляющих голос. Под Глоткой понимается участок пищеварительного канала беспозвоночных (начиная от кишечнополостных и низших червей) и позвоночных животных, а также человека; соединяет ротовую полость с пищеводом. Из стенок глотки развиваются жабры (у наземных позвоночных и человека – лёгкие), а также вилочковая, щитовидная и околощитовидная железы. Выполняет глотание и участвует в процессе дыхания.

THROUGH BILL OF LADING = СКВОЗНОЙ КОНОСАМЕНТ – Through Bill of Lading (Through B/L):- Transhipment is taking place along the journey. This can be either in a first port of unloading for transfer into another vessel serving the final destination, in a port for overland on-forwarding, or from an inland origin for carriage to a port where shipment will take place. Examples:- (i) Hamburg/Myanmar with transhipment in Singapore; (ii) London/Bamako, via Abidjan; and (iii) Geneva/New York, via Le Havre. These various features of B/L designating beneficiaries and routing can combine their elements, and there can be direct B/L to order, or a through B/L to bearer, for instance. Other provisions can be made on B/L, but the only one we would mention here is the 'clean B/L', meaning that the cargo has been accepted by the carriers without reservation, i.e. that the consignment has been received for shipment in sound, external

condition – therefore, the carriers must deliver it at the destination in the same sound, external condition. A contract of affreightment that covers goods throughout the period of transit, including both overland and sea transit. A Through Bill of Lading is an international bill between the United States and a foreign country. It may be a bill issued in a foreign country that governs a shipment throughout its transportation from abroad to its final destination in the United States. It can also govern its transportation from an inland point in the United States to a location in a foreign country. Bill of lading for a shipment to be handled by more than one carrier en route to its destination. Through Bill of Lading is a bill of lading covering more than one stage (or, sometimes, more than one form) of carriage. Through bills of lading differ from combined transport bills of lading in that the separate stages and/or forms of carriage, including distinct stages of ocean carriage, generally are intended to be undertaken by two or more successive carriers as primary carrier. Obvious characteristics are wide liberties to tranship and purported restrictions on the liabilities of each carrier to the stage of carriage that it performs. Through Bill of Lading is a single bill of lading covering receipt of the cargo at the point of origin for delivery to the ultimate consignee, using two or more modes of transportation. Also known as Through Bill, or Thru Bill. Through Bill of Lading is the B/L covering a carriage between two designated places but involving a transhipment or a transfer during the course of the journey. / Сквозной Коносамент – коносамент, который подтверждает наличие договора перевозки груза из одного места в другое в несколько этапов, из которых по крайней мере одним является морская перевозка, и в соответствии с которым выдающий такой документ перевозчик берёт на себя обязательство осуществить перевозку согласно условиям сквозного коносамента.

THROUGHPUT = ПРОПУСКНАЯ СПОСОБНОСТЬ – (1) Throughput is a term used to describe the total volume of raw materials that are processed by a plant such as an oil refinery in a given period. Throughput is the amount of raw material processed in a specific time. This is the actual amount, not a percentage. / Термин Пропускная Способность используется для описания всего объёма сырья, который должен быть переработан, например, нефтеперегонным заводом за определённый период времени. Пропускная Способность ЛЭП – одна из основных характеристик линии электропередачи, определяющая наибольшую мощность, которую можно передать по линии с учётом всех ограничивающих условий (устойчивости, потерь на корону, нагрева проводников и контактов и так далее). Пропускная способность зависит от напряжения в начале и в конце линии, её длины и волновых характеристик (волнового сопротивления и коэффициента распространения волны).

(2) Throughput is the total volume of crude oil and refined products that are handled by a tank farm, pipeline, or terminal loading facility. / Общий объём нефти и нефтепродуктов, которые обрабатываются нефтехранилищем, трубопроводом или станцией конечной загрузки.

(3) Throughput is the volume of gas flowing through a pipeline; ore processed by a concentrator; etc. / Объем газа, проходящего по газопроводу; количество руды, перерабатываемой обогатительной установкой; и тому подобное.

(4) Throughput is a method of calculating average product movement.

THROUGH RATE = СКВОЗНАЯ СТАВКА – Through Rate is a rate applicable from point of origin to destination. A through rate may be either a joint rate or a combination of two or more rates. The total rate from the point of origin to final destination. Through Rate is a lump sum for the carriage charges relating to consignments travelling on through Bs/L. / Итоговая ставка от места происхождения до конечного пункта назначения.

THROUGH THICKNESS BRAIDING = ПЛЕТЕНИЕ СКВОЗЬ ВСЮ ТОЛЩИНУ (или РАСПОЛОЖЕННАЯ ПОПЕРЁК СЛОЁВ (или РАВНОПРОЧНАЯ, или СКВОЗНАЯ) ОПЛЁТКА (или ПЛЕТЁНОЕ ИЗДЕЛИЕ)) – Through Thickness Braiding is a trade name for 3-D braiding by Atlantic Research Co.

THROW = НАКИДКА (или ШАЛЬ, или ШАРФ) – Throw is a woman's scarf or light wrap.

THROW = ПОКРЫВАЛО (или НАКИДКА, или ОТБРОС, или ОТБРАКОВКА) – Throw is any piece of fabric such as an Afghan or bedspread-that does not fit closely to the item it is covering, but instead is arranged on or over it casually. See also Afghan, and Spread.

THROWING = ТРОЩЕНИЕ (или КРУЧЕНИЕ) – Throwing is the combining and twisting of strands of reeled silk into tightly twisted yarn. Throwing is the operation of doubling or twisting silk or manufactured filament yarns. Throwing is the twisting of continuous filament man-made or silk yarn usually to medium (voile) or high (crêpe) twists. / филаментная (комплексная) пряжа (filament yarn). Трощение, соединение нескольких одинаково натянутых нитей и совместная параллельная намотка их (без крутки) на бобину. Вспомогательный процесс текстильного производства, служащий для подготовки пряжи к переработке на крутильных машинах. При трощении пряжа также очищается от пуха и сора, удаляются слабые и толстые участки. При намотке получается цилиндрическая бобина крестовой намотки (что удобно для дальнейшей переработки). Трощение осуществляется на тростильной машине (принципиальная схема тростильной машины:- питающие паковки; направляющий пруток; контрольная щель; натяжное устройство; датчик механизма выключения бабины; натяжные ролики; бобина; мотальный барабанчик). Пряжа сматывается с питающих паковок, число которых равно числу отращиваемых нитей, огибает направляющий пруток и поступает в контрольно-очистительный прибор. Этот прибор состоит из натяжного устройства и 2 металлических пластин или ножей, образующих так называемую контрольную щель. Ширина контрольной щели выбирается в зависимости от номинального диаметра нити, вследствие чего утолщения пряжи не проходят через эту щель и вызывают обрыв пряжи. В слабых местах нить, не выдерживая установленного натяжения, также обрывается. Скорость наматывания достигает 500 метров в минуту (м/мин). В производстве кручёного шёлка и химических нитей трощение часто сопровождается кручением и осуществляется на тростильно-крутильных машинах. Разработаны прядильно-крутильные машины, в которых совмещены процессы прядения, трощения, кручения и намотки.

THROWING A FISH = УСТРАИВАНИЕ ПОПУТНОГО ВЕТРА (или ХХ) – Throwing A Fish (maritime term):- saluting.

THROWSTER = КРУТИЛЬЩИК – Throwster is a company that specializes in putting additional twist in yarn. More recently, the term also applies to a company that specializes in texturing yarns.

THRUM = ЗАРАБОТОК (или ФАРТУК ТКАЦКОГО НАВОЯ, или БАХРОМА, или КАЗОВЫЙ КОНЕЦ КУСКА ТКАНИ) – Thrum is the fringe of warp yarns that remains on the loom when the woven fabric has been cut free. / Thrum:- незатканый конец нити основы; короткая распустившаяся нитка; бахрома или кайма пряжи основы, которая остаётся на ткацком станке, после того, как была оборвана сотканная ткань . Под Бахромой понимаются кончики утка, выходящие из ткани по краям кромок. Бахрома по Кромке – порок ткани размером более 1.5 см с одной стороны и более 2 см с другой стороны.

THRUST BEARING = УПОРНЫЙ ПОДШИПНИК (или ПОДПЯТНИК) – Thrust Bearing is an axial-load bearing. See also Bearing. / Упорный Подшипник – подшипник, воспринимающий нагрузку, действующую по оси вала, и компенсирующий его осевое смещение. Смотрите также Подшипник Качения, и Подшипник Скольжения. Подпятник или Упорный Подшипник – опора вращающихся деталей машин, воспринимающая только осевые нагрузки. Различают Подпятники Скольжения, у которых

трущиеся поверхности разделены слоем смазки, и Подпятники Качения, имеющие шарики или ролики. Смотрите также Подшипник. Упорный Подшипник или Подпятник – подшипник скольжения, воспринимающий нагрузку, направленную вдоль оси вращения вала.

THRUST DAYS = ДНИ РАЗГОНА – In technical analysis, an up-thrust day is when the close for the current period surpasses the previous period's close. A down-thrust day is when the close for the current period is below the previous period's close. Similar to spike and reversal days, thrust days signify both the strength in the market as well as the possibility of directional reversals. A series of up-thrust days would suggest a pronounced up trend, while a series of down-thrust days would indicate a downtrend dictated by seller dominance in the market. Thrust Days:- (i) an Upper Thrust day is a day when the market is closed higher than the high of the previous day; and (ii) a Lower Thrust day is a day when the close price is lower than the low of the previous day. Thrust – a comparison between the price difference of successively lower pivot bottoms or higher pivot tops. For example, a reduction in the difference between pivot bottoms shows loss of momentum; an increase in the difference shows increased momentum. / В техническом анализе биржевых рынков, Дни Разгона бывают двух типов:- (i) День Разгона Вверх, когда рынок закрывается выше максимума предыдущего дня; и (ii) День Разгона Вниз, когда рынок закрывается ниже минимума предыдущего дня. Единственный разгонный день не имеет особого значения, поскольку такие дни встречаются довольно часто. Однако серия из нескольких дней разгона вверх, при этом необязательно следующих один за другим, отражают явную силу рынка. Аналогичным образом, серия дней разгона вниз отражает явную слабость рынка. В период бычьего рынка дней разгона вверх намного больше дней разгона вниз. И наоборот в период медвежьего рынка дней разгона вниз намного больше дней разгона вверх.

THS = TERRITORIAL HIGHWAY SYSTEM

THWART = БАНКА – Thwart (maritime term):- the athwartships seats in a boat on which oars-men sit. / Под Банкой, от Немецкого слова Bank или Голландского Bank, понимаются:- (1) участки морского дна, над которыми глубины значительно меньше окружающих. В морях, возникших в результате трансгрессии, банки являются элементами остаточного рельефа суши; в океанах они имеют вулканическое или коралловое происхождение. Песчаные наносные банки под влиянием течений могут менять свои очертания и местоположение. Прогрев Солнцем неглубокого слоя воды создаёт на ряде банок исключительно благоприятные условия для развития органической жизни; многие банки служат районами интенсивного рыболовства. Очень богаты рыбой воды Большой Ньюфаундлендской Банки (близ Острова Ньюфаундленд) в Атлантическом Океане, Доггер-Банка в Северном Море, Медвежинской Банки в Баренцевом Море и других. Банки с малыми глубинами опасны для судов. (2) Сиденье для гребцов и пассажиров на шлюпках.

THWARTSHIPS = ПОПЕРЁК СУДНА – Thwartships (maritime term):- at right angles to the fore and aft line (across the ship).

THYRSE = ТИРС (или ПИРАМИДАЛЬНО–МЕТЁЛЬЧАТОЕ СОЦВЕТИЕ) – Thyrse is a dense cylindrical or ovoid inflorescence, a compact panicle; branched, the main axis indeterminate and the lateral branches determinate (i.e. with a terminal flower) or as a cyme. / основная ось (axis).

TI = TEMPORARY IMPORTATION

TI = TOBACCO INSTITUTE

TI = TRANSPORTATION INSTITUTE

TIA = TRANSPORTATION IN AMERICA

TIAC = THRIFT INSTITUTIONS ADVISORY COUNCIL

TIARA = ТИАРА (или ДИАДЕМА, или XX) – Tiara is a three-tiered crown worn by the pope; a jeweled or flowered headband for formal wear by women.

TIBIA = ТИБИА (или ГОЛЕНЬ) – Tibia is the fourth division of the insect's leg between the femur (thigh) and the tarsus or the foot.

TIC = TRAVELER INFORMATION CENTER

TICK = ПОКРЫВАЛО (или ЧЕХОЛ) – Tick is a covering for bed, stuffed pillow, etc.

TICK = ШАГ (или ТИК) – Tick is a smallest possible movement (up or down) in the price of a security. Also known as Minimum Fluctuation. An upward (uptick) or downward (downtick) movement in a security's price. Tick is the standardized minimum price movement of a futures or options contract. Each individual move from one stock trade to another. An Up-Tick means the price moved up on the last trade and Down-Tick means it moved down. If there is no change from the last trade, the Tick is considered neutral. The Tick statistic on the New York Stock Exchange (NYSE®) is the net of all Up-Ticks minus all Down-Ticks at a given point during the day. If 1 000 stocks advanced on their last trade or Tick, 500 declined and 200 were unchanged, the Tick would be +500 (1 000 minus 500 equals +500). The closing Tick is based on the last trade of the day. Tick statistics are available for the AMEX®, NASDAQ®, and NYSE®. Refers to a minimum change in price up or down. The smallest allowable increment of price movement allowed for a futures contract during a trading session. Also known as Minimum Price Fluctuation. Minimum price fluctuation of an asset, futures or options contract. See also Point. The Tick is the upward or downward movement of a stock's price, i.e. 'it just ticked up'. The tick, usually given as one of a number of market indicators, refers to the net tick on their last trade of all stocks being traded on a given day. This information is useful in determining the current direction of the market and strength of the market in a given direction. For example, the market could be up 50 points, but, if the tick were –400, it would indicate that the market had changed directions and was heading down. Or the market could be up 50 points with a tick of +750. This would indicate that the market was likely to go much higher since the momentum is clearly up. Tick is a smallest possible change in price according to the contract or trading conditions in transactions on futures or cash markets. Tick is the minimum movement of the market in question, also commonly referred to as a 'Point'. The value of a tick can vary by type or size of bet or trade. Stock indices have 'Points', futures have 'Ticks', forex has 'Pips'. Tick is the minimum upward or downward movement in the price of a security. The term 'Tick' also refers to the change in the price of a security from trade to trade. Since 2001, with the advent of decimalization, the minimum tick size for stocks trading above USD1 is 1 cent. Prior to April, 2001, the minimum tick size was 1/16th of a Dollar, which meant that a stock could only move in increments of USD0.0625. Needless to say, while the introduction of decimalization has benefited investors through much better bid-ask spreads and better price discovery, it has also made market-making a less profitable (and riskier) activity. The term 'Tick' is also used in reference to the direction of the price of a stock, with an 'Uptick' referring to a trade where the transaction has occurred at a price higher than the previous transaction, and a 'Downtick' referring to a transaction that has occurred at a lower price. In this context, the uptick rule refers to a trading restriction that prohibits short selling, except on an uptick, presumably to alleviate downward pressure on a stock when it is already declining. Tick is the same as Minimum Price Fluctuation. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). В техническом анализе биржевых рынков, . Известна также как Минимальная Флуктуация или Миниальное Колебание (Minimum Fluctuation). Минимальное колебание

цены актива, фьючерсных контрактов или контрактов по опционам. Смотрите также Пункт (Point). (НЙФБ® или Эн.Уай.Эс.И.® (NYSE®)). АФБ® или АМЭКС® (AMEX®), НЭЗДЭК® (NASDAQ®). Тик – изменение цены контракта в результате одной операции в любом направлении (в том числе наименьшее допустимое изменение). Каждая торговая операция может рассматриваться как Тик:- вверх тик (uptick), если она осуществлена по цене, более высокой, чем в ходе предыдущей сделки по данной бумаге, или вниз тик (downtick), если цена оказалась ниже, чем в ходе предыдущей сделки. Тик – минимальное изменение котировок. Рост или спад котировок в операциях с ценными бумагами. Технические аналитики наблюдают за последовательностью колебаний котировок ценных бумаг вверх или вниз для того, чтобы почувствовать общее направление тенденции в динамике котировок ценных бумаг. Этот термин может также относиться к рынку в целом. Смотрите также (Closing Tick); Вниз тик (Downtick); Минус Тик (Minus Tick); Плюс Тик (Plus Tick); (Short Sale Rule); Технический Анализ (Technical Analysis); (Trin); Вверх тик (Uptick); (Zero-Minus Tick); и (Zero-Plus Tick).

TICKER = ТИКЕР – A Ticker is a table and/or a graph or both, showing a trade by trade history of a said instrument. A ticker shows direction of a market movement. There are tickers for day trading showing a days movements and historic tickers showing long term movements. Traders like to use graphs as they show direction of market movement in an easy to understand format. A high-speed teletype machine that continuously provides the last sale prices and volume of assets transactions on exchanges. Information is either printed or displayed on a moving tape after each trade. Ticker is a telegraphic installation which immediately transmits the valid rates during a stock exchange session. It also transmits items of news. / Тикер – система, предназначенная для печати непрерывного отчёта о торговой деятельности на биржах. Называется информационной лентой, или лентой тикера (ticker tape). Название происходит от названия механизма, который ранее печатал информацию, пробивая дырочки в бумажной ленте, производя ‘тикающий’ звук. Сегодня лента тикера представляет собой дисплей компьютера. Этот термин используется также и по отношению к консолидированной информационной ленте (consolidated tape), на которой указывается символ акции (stock symbol), последняя цена, объём торгов на биржах, а также услуги для пользователей тикера. Смотрите также Quotation Board, и Ticker Tape.

TICKER PLANT FRANKFURT = ФРАНКФУРТСКОЕ УСТРОЙСТВО ТИКЕРОВ – The Ticker Plant Frankfurt (TPF) information distribution system developed by Deutsche Börse AG provides real-time share price information from all German stock exchanges as well as the Xetra® and Eurex® trading platforms. / система распределения информации, разработанная Немецкой Биржей АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG), которая обеспечивает информацией о ценах акций в реальном времени со всех Немецких фондовых бирж, а также из торговых платформ Ксэтра® (Xetra®) и Ойрэкс® (или Юрэкс® (Eurex®)).

TICKER SYMBOL = ТИКЕРНЫЙ СИМВОЛ – Ticker Symbol:- futures tickers are a little different from stocks. Each futures market has a ticker symbol that is followed by symbols for the contract month and the year. For example, NYMEX’s crude oil futures have a ticker symbol – CL. The complete ticker symbol for December 2012 Crude Oil Futures would be – CL Z2. The ‘CL’ stands for the underlying futures contract. The ‘Z’ stands for a December delivery month. Month Codes or Symbols:- F = January, G = February, H = March, J = April, K = May, M = June, N = July, Q = August, U = September, V = October, X = November, Z = December. The ‘2’ stands for the year – 2012. This is the standard formula for futures ticker symbols. Some quote services are a little different. Code abbreviation of an instrument for identification or transmission purposes, e.g., CT for a futures contract on cotton. / Кодовое обозначение названия инструмента, используемое с целью идентификации или передачи данных, например, CT для фьючерсного контракта на хлопок. Тикерный Символ:- буквы, используемые для идентификации ценных бумаг при указании торговых сделок на информационной ленте (consolidated tape). Например, символ XON – для корпорации Exxon. Смотрите также Stock Symbol, и Ticker Tape.

TICKET = БИЛЕТ (или КВИТАНЦИЯ) – In banking, Ticket is a downloaded object that shows that a fare or admission has been paid.

TICKET = КАРТОЧКА (или ФОРМУЛЯР) – Ticket:- the primary method of recording the basic information relating to a transaction. Also known as Deal Slip, or Trade Ticket. / Первичный метод записи базовой информации, касающейся операции. Известна также как (Deal Slip) или (Trade Ticket).

TICKET AGENT = БИЛЕТНЫЙ АГЕНТ – Ticket Agent means a person (except an air carrier, a foreign air carrier, or an employee of an air carrier or foreign air carrier) that as a principal or agent sells, offers for sale, negotiates for, or holds itself out as selling, providing, or arranging for, air transportation.

TICKING = ТИК – Ticking:- made in small twill constructions, ticking belongs in the loom-finished group of cloths:- canvas, chambray, denim, duck, webbing, etc. Boiling-off or wet-finishing treatment are not applied to the material. Ticking may be recognized by its alternate stripes of white and colored yarns. A typical ticking construction would be 64 ends of 12’s warp and 50 picks of 14’s filling. Uses include furniture covering, lining harness, mattress coverings, and base for rubberized materials. See also Bed Ticking. Ticking is a compactly woven cotton cloth used for containers, covers for mattresses and pillows, sportswear (hickory stripes), institution fabric, and work clothes. It is striped cloth, usually white background with blue or brown stripes in the motif. Ticking is a single cloth, of either medium or heavy weight, and is composed of single cotton yarns from 1/14’s to 1/22’s in warp and filling or combination of both, such as 18’s warp and 20’s filling. It is a good, stout cloth, having fine wearing qualities, and is used principally for making bed ticks and pillow and bolster cases. It is generally made with what is known as a Bed-Tick Weave or Twill, either right or left handed 45’s twill broken or herring-bone. It can be woven in any power loom, but is best adapted to and most always woven in the plain single box looms. Ticking belongs to the family of stiff, hard face cotton fabrics. This feature is created by using twill weaves (warp effect), and these weaves permit of the use of a imore than ordinary high warp texture. For Instance, take 3/1 twill:- in this weave there are interlacings of each warp thread in every four picks of filling, thus allowing ends to lie closely together – hence permitting an increase in ends per inch. These goods are usually made in two colored warp patterns – dark blue and white, red and white. White Filling Is Used In All Cases. Fast colors should be used in warp as bed-ticks are sometimes ripped open and the cloth washed. In this case the light and air renew the coloring on the yarns. Ticking is woven with from 60 to 84 ends and picks per inch in the loom, according to grade required. The greater the number of warp threads the stouter the fabric in proportion to counts of yarns used. To finish these goods, they are brushed and sheared to remove all lumps and foreign substances from the face of the cloth. Then the cloth is sized and calendered, which acts in the same manner as a hot press, after which the cloth is lapped or rolled into bolts, then stitched, and is ready to pack and ship. Construction of Ticking:- reed 725–33 inches, 4 ends per dent. 1/16’s warp, 1/20’s filling, 74 picks; 12% per cent take-up in weaving; 10 per cent size on warp, 7 per cent size of cloth in finish; 3–herring-bone twill weave; finish equals 31% inches, and includes brushing, shearing, sizing and calendering. Cardinc, and Spinning Particulars. The yarns used in ticking are made in mills of the first division as given in a previous article. The length of the raw stock used varies in different mills according to the grade of ticking to be made, but is generally % to 1% inches in length. This does not mean that raw stock of from % to 1% inches is used in the same mixing, but that the mixing is made up of stock of uniform length. The Mixings for this class of goods are generally made by hand and the bins should be made as large as possible so as to accommodate large mixings. It would be better to have two large bins Instead of one, so that one lot of raw stock could be opened and dried out while feeding the machines from the other bin. On this class

of goods comber waste is used in some mills and the cut roving waste is also mixed as has been before stated. An opener and two processes of picking are used and the lap should be made as heavy as possible without, of course, making it so heavy that it will bring up the cards and finisher picker. Keep the hopper of the opener as full as possible and you will find that an evener lap will be made. Ticking is a tightly woven, very durable fabric, usually made of cotton, and used for covering mattresses, box springs, pillows, and work clothes. The fabric can be made by using a plain, satin, or twill weave construction. Ticking is a broad term for extremely strong woven fabrics which are used as a covering for pillows, mattresses, and box springs, home-furnishings, and for work clothes and sports clothes. It is a heavy, tightly woven carded cotton fabric usually in a pattern of alternately woven stripes in the warp, Jacquard or dobby designs, or printed patterns. It is usually twill but may be sateen weave. When ticking is used in clothing, striped ticking with narrow woven stripes is usually most popular. Red and white, black and white, and navy and white are the most popular ticking color combinations. Ticking is a sturdy, closely woven linen or cotton fabric used in upholstery and as a covering for a mattress or pillow. Ticking is a durable, closely woven fabric used for covering box springs, mattresses, and pillows. Ticking may be woven in a plain, satin, or twill weave, usually with strong warp yarns and soft filling yarns. Ticking is a strong linen or cotton fabric used in upholstering and as a covering for a mattress or pillow. / уточина. Жакяр (Jacquard). плотнотканая ткань, используемая для . Под Тиком, от Голландского слова Tijk, в Английском языке – Tick, понимается плотная ткань саржевого или полотняного переплетения нитей с продольными широкими пестротканными или печатными цветными полосами. Вырабатывается из льняной или хлопчатобумажной пряжи. Используется для матрацев, мебельных чехлов, занавесей и тому подобного. Под Тиком понимается плотная льняная или хлопчатобумажная ткань с рисунком в виде продольных полос. Употребляется как обивочный материал, для изготовления матрацев, чехлов, тентов и тому подобного. Тик (Голландский Тэк (Tijk), Английский Tick), плотная прочная дешёвая ткань, льняная или хлопчатобумажная, полотняного переплетения, чаще всего полосатая, с сочетанием полос синего, красного, белого цветов. Использовалась представителями бедных слоев населения в XIX веке для пошива платья.

TICK SIZE = РАЗМЕР ШАГА (или РАЗМЕР ТИКА) – Tick Size is the size of the minimum movement in a quoted price, e.g., 1/32nd for UK gilts.

TICK VALUE = СТОИМОСТЬ ШАГА (или СТОИМОСТЬ ТИКА) – Tick Value is the change in the value of a futures contract when the price changes by one tick.

TICRS = TRADEMARK IMAGE CAPTURE & RETRIEVAL SYSTEM

TID = TRANSACTION IDENTIFIER

TIDAL FLATS = ПРИЛИВНО–ОТЛИВНЫЕ (или ЗАЛИВНЫЕ) РАВНИНЫ – Tidal Flats are the areas of nearly flat, barren mud periodically covered by tidal waters. Normally these places have an excess of soluble salt.

TIDAL WETLANDS = ПРИЛИВНО–ОТЛИВНЫЕ (или ЗАЛИВНЫЕ) СИЛЬНО УВЛАЖНЁННЫЕ ЗЕМЛИ – Tidal Wetlands are the areas where water levels in the ricefields fluctuate under the influence of tides.

TIDDER = МЕЛКАЯ ‘РЫБЁШКА’ – Tidder is:- (1) a small fish as a stickleback or minnow; (2) a small and unimportant person or thing.

TIDS = TOWER INTEGRATED DISPLAY SYSTEM

TIE = ГАЛСТУК – Tie is a neckwear.

TIE = ПОЯС (или СВЯЗЬ, или ОБВЯЗКА, или ПОПЕРЕЧИНА, или СТЯЖКА, или ВЯЗКА) – Tie:- units per layer.

TIEA = TAX INFORMATION EXCHANGE AGREEMENT

TIE–BACK = ЗАВЯЗКА (или ПОДВЯЗКА, или ПОДВЯЗЫВАТЬ) – Tie-Back:- a full length (either to the windowsill or to the floor) curtain or drapery looped back at the side of the window with a band of trimming or self-fabric. The curtain or drapery is closed at the top of the window, and almost entirely open at the point of the tie-back. The look is popular in informal houses in such fabrics as organdy and batiste and in formal houses in luxurious fabrics. See also Sticker.

TIED AID CREDIT = СВЯЗАННЫЙ С ОКАЗАНИЕМ ПОМОЩИ КРЕДИТ – Tied Aid Credit refers to the practice of providing grants and/or concessional loans, either alone or combined with export credits, linked to procurement from the donor country. / вывозной (или экспортный) кредит (export credit).

TIED LOAN = СВЯЗАННАЯ ССУДА (или ЦЕЛЕВОЙ ЗАЙМ) – Tied Loan is a loan made by a government agency that requires a foreign borrower to spend the proceeds in the lender’s country. Loan made by one country to another on condition that the money concerned is spent on the lending nation. Tied loans are a common form of foreign aid, because they create employment and have no effect on the lending nation’s balance of payments. / Связанная Ссуда – ссуда, предоставляемая одной страной другой при условии, что страна-заёмщик использует её для покупки товаров у страны-кредитора.

TIE DYEING = КРАШЕНИЕ УЗЛАМИ – Tie Dyeing is a form of resist dyeing. Items to be dyed are tied or knotted so that the folds of the fabric form barriers to the dye to create patterns or designs on the fabric. See also Dyeing, and Resist Dyeing. / Крашение Узлами – крашение с туго затянутыми узлами для получения произвольного пёстрого рисунка на пряже или ткани.

TIER = РАЗРЯД (или ПОРЯДОК, или УРОВЕНЬ) – Tier is a bank’s core capital. According to the definition of the Bank for International Settlements, it comprises share capital, open reserves and profit brought forward.

TIER = ЯРУС – (1) Tier is one of a series of bands, ruffles, or flounces arranged one above the other. Tiers are the vertical layers.

(2) Tier is a horizontal division of a vessel from bottom to top. The numbers run from bottom to deck and from deck upwards and are used as a part of the indication of a stowage place for containers. Tier is a layer in a container that is numbered from bottom to top. Numbering of horizontal container layers, or tiers:- the container tiers are numbered with even numbers, starting from the bottom. The conventional way is start with 02 in the hold and then count up with 04, 06 etc. In the case of deck cargoes, it is conventional to start numbering with 80 or 82. There are sometimes slight differences between ships. On this ship, the containers standing directly on the main deck are numbered 80 and those standing on the hatches are number 82. The number is incremented by two for each higher layer. See also Bay, and Row. / Горизонтальное деление судна от днищевой до верхней части. Номера исчиляются от днища к палубе и от палубы вверх и используются в качестве части индикации места размещения для контейнеров. Разметка внутри контейнера, с увеличением числа с низу вверх. Смотрите также Пролёт (Bay), и Ряд (Row).

TIER ONE COLLATERAL ASSET = АКТИВ ОБЕСПЕЧЕНИЯ ПЕРВОГО РАЗРЯДА – Tier One Collateral Asset is a marketable assets that must fulfil certain uniform eligibility criteria specified by the ECB for the entire Euro area to be used as collateral for bank’s credit transactions with the central banks of the Eurosystem. These criteria include denomination in Euros, issued (or guaranteed) by

entities located within the Euro area and deposited/registered with one of the national central banks or central securities depositories located within the Euro area.

TIER RATES = РАЗРЯДНЫЕ СТАВКИ – Tier Rates are the rates assessed based on volumes moved. / Ставки, определяемые на основе объёмов перевозимого.

TIER TWO COLLATERAL ASSET = АКТИВ ОБЕСПЕЧЕНИЯ ВТОРОГО РАЗРЯДА – Tier Two Collateral Asset is a marketable or non-marketable asset that can be used as collateral for banks' credit transactions with the central banks of the Eurosystem for which the eligibility criteria are established by the national central banks, subject to ECB approval.

TIE SILK = ГАЛСТУЧНЫЙ ШЁЛК – Tie Silk is a silk fabric of firm resilient pliable texture for neckties and for blouses and accessories.

TIFA = TRUCKS INVOLVED IN FATAL ACCIDENTS

TIFF = TAGGED IMAGE FILE FORMAT

TIFFANY = ТИФЭНИ (или ФЛЁР, или ГАЗ) – Tiffany is a sheer silk gauze formerly used for clothing and trimmings; a plain-woven open-mesh cotton fabric (as cheesecloth).

TIFTS = TRADE AND INVESTMENT FACILITATION TALKS

TIGER = TOPOLOGICAL INTEGRATED GEOGRAPHIC ENCODING & REFERENCING

TIGER = TREASURY INVESTORS GROWTH RECEIPT

TIGHT CLOSURE = ТУГАЯ (или ТЕСНАЯ) ЗАСТЁЖКА – Tight Closure:- attaching equipment is fitted with an adjustable feature permitting secure application of hook and eye to either light or heavy-weight goods. If closures seem too tight, then one should immediately check the attaching equipment for proper adjustment. Closure defects, and namely – Hooks and Eyes. / Порок или дефект застёжки.

TIGHT END = ПЕРЕНАТЯНУТАЯ (или ТУГАЯ, или УКРЕПЛЁННАЯ) ПРОДОЛЬНАЯ НИТЬ – Defect Name:- Tight End. Defect Type:- warp lines, vertical lines. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- Tight End:- This defect is caused by a warp end weaving tighter than the adjacent warp ends. The tautness forces the filling in that area to rise to the surface. Severity:- Major. / уточина.

TIGHT ENDS = ПЕРЕНАТЯНУТЫЕ (или ТУГИЕ, или УКРЕПЛЁННЫЕ) ПРОДОЛЬНЫЕ НИТИ (или НАТЯЖКИ) – Tight Ends:- to ensure that there is no bundle kept at the back of the beam of the weaving m/c which is used in place of the missing ends because there is a variation in tension as compared to the ends of the beam and these ends behave as tight ends or also to ensure that there should not be any cross ends in the warp sheet or any type of entanglements of warp ends. Warping is also a focus area to avoid the tight ends. To ensure from warping for Tight Ends, Creel Tension has to be checked for each yarn package and it should be with in the acceptable limit. Tight End:- high tension on particular warp end compared to other warp end. Weaving defect. Tight Ends:- this is due to following reasons:- (i) warping creel tension; (ii) variation in package unwinding tension; (iii) condition of warp stop motion at creel in warping; (iv) end to end knotting had to be done in proper manner; (v) loose bundles behind looms have to be avoided; in case if it is required then the ends must take as two rounds over warp beam before it taken for drawing in to heald wire and reed at the front of the loom; (vi) chaffing of ends due to knots or beads; (vii) trapping of ends in heald eye or reed; (viii) regular cleaning of reed; (ix) avoid cross ends/missing end; (x) weaver practice to attend work practices; (xi) knotting practice; and (xii) hindrance in warp flow towards fabrics. Fabrics defect. Tight End:- in woven fabrics, a yarn which was woven under excessive tension or has shrunk more than a normal amount. Tight Ends are the single warp yarns which appear to be under abnormal tension in the fabric, generally extending throughout the full pi<. Tight End:- warp yarn in a woven fabric that was under excessive tension during weaving or shrank more than the normal amount. / подтёки или наплывы или бисеринки или бусинки или шарики (beads). Порок или дефект ткачества. Стяжка (tight end):- порок основы в виде участка, который характеризуется меньшей извитостью нити основы, чем смежные нормальные нити. Примечание:- этот порок часто вызывается большим натяжением отдельной нити основы во время навивки, шлихтования или процесса ткачества.

TIGHTENING = УКРЕПЛЕНИЕ – In the United States, Tightening is the Federal Reserve action to raise interest rates. Undertaken when inflation is a concern. Compare Easing. / В Соединённых Штатах Америки действие Федерального Резерва по повышению уровня процентных ставок. Предпринимается такое действие в момент, когда начинает донимать инфляция. Сравните с Смягчение (Easing).

TIGHT FILLING = ПЕРЕНАТЯНУТАЯ (или ТУГАЯ) УТОЧИНА (или ПЕРЕТЯЖКА ПО УТОЧИНЕ) – Tight Filling or Tight Pick or Tight Weft is a weft yarn which is under greater tension, or exhibits less crimp, than the adjacent weft yarns. Note:- this defect is caused by a weft yarn having been inserted under a greater tension than that imposed on the other weft yarns, or relaxation of picks subsequent to insertion. See also Tight Pick. Fabrics defect. / Перетяжка По Утку – порок ткани. Натянутая Уточина; Натянутая Поперечная Нить; Натянутый Уток (tight filling; tight pick; tight weft):- порок утка; уточная пряжа, имеющая большее натяжение, чем смежная уточная пряжа. Примечание:- этот порок вызван уточной пряжей, проложенной в зев с большим натяжением, чем другие уточные нити или ослаблением уточных нитей, следующих за вставкой.

TIGHT FIT = ПЛОТНО ПОДОГНАННОЕ (или ПЛОТНО ВЫРАВНЕННОЕ) – Tight Fit is a method of securing the load by direct or indirect physical contact with load-bearing components of the means of transport or the transport container.

TIGHT OIL = ТРУДНАЯ НЕФТЬ (или ТЯЖЁЛАЯ НЕФТЬ) – Tight Oil:- liquid hydrocarbons produced from shale (also referred to as Shale Oil) and other rock formations with extremely low permeability. As with shale gas, production from tight oil reservoirs normally requires formation stimulation such as hydraulic fracturing.

TIGHT OR LOOSE END = ПЕРЕНАТЯНУТАЯ (или ТУГАЯ) или РАССЛАБЛЕННАЯ ПРОДОЛЬНАЯ НИТЬ – Tight or Loose End is a taut or slack warp end caused by too much or too little tension on an individual end while weaving, by ridgy section or warp beams, by incorrect tensions in beaming or sizing, or as a result of faulty fabric design. Weaving defect. / Порок или дефект ткачества.

TIGHT PICK = ПЕРЕНАТЯНУТАЯ (или ТУГАЯ) ПОПЕРЕЧНАЯ НИТЬ (или ПЕРЕТЯЖКА ПО ПОПЕРЕЧНОЙ НИТИ) – Tight Pick:- during mending repair if pick is filled tightly and not properly relaxed. Mending defect. Tight Pick:- in woven fabrics, a filling yarn which was woven under excessive tension or has shrunk more than a normal amount, which may cause puckering at the junction with normal picks. Compare Wavy Cloth. Tight Picks are the single filling yarns which appear to be under excessive tension in the fabric. / Порок или дефект штопки (mending defect). Перетяжка По Утку – порок ткани.

TIGHTS = КОЛГОТКИ – Tights:- a skintight garment covering the body from the neck or the waist down; (chiefly British) panty hose Tights. / Колготки – трикотажное изделие, плотно облегающее всю нижнюю часть тела и ноги, трусы и чулки вместе.

TIGHT SELVAGE = ТУГАЯ КРОМКА – Tight Selvage:- in woven fabrics, selvage yarns shorter than warp yarn in the body of the fabric. Fabrics defect. / Туго Натянутая Кромка (tight selvedge):- порок кромки ткани; кромка, которая короче чем смежная ткань. Примечание:- этот порок часто вызывается неправильным балансом структуры ткани между кромкой и основной тканью, пряжей основы кромки, сотканной при слишком высоком натяжении или небрежной обработкой ткани.

TIGHT SPOT = СТЯНУТОЕ ПЯТНО (или НАПРЯГ) – Tight Spot:- xxxxx. See also Twit. Twit or Tight Spot is a short section of real twist in false-twist yarn that prevents crimp development and hence causes a pinhole effect in fabric. Tight:- fixed or fastened firmly in place. In a Tight Spot also in a Tough Spot:- in a difficult situation. If there is a shortage of fuel, everyone who drives to work will be in a tight spot. Bob's in a tight spot right now because he has fallen behind in his work.

TIGHT THREAD TENSION = ПЕРЕНАТЯНУТОЕ (или ТУГОЕ, или ПОВЫШЕННОЕ) НАТЯЖЕНИЕ НИТИ – Tight Thread Tension:- tensions not adjusted correctly by operator. Sewing Room Defects. / Порок или дефект швейного производства.

TIGHT TWIST END = ТУГАЯ КРУЧЁНАЯ ПРОДОЛЬНАЯ НИТЬ (или НАТЯЖКА) – Tight Twist End is a single end with higher than normal twist. Synonym:- Hard End, and Wiry End. Fabrics defect. / Натяжка (Tight End) – порок ткани.

TIGR = TERM INVESTMENT GROWTH RECEIPT

TIGR = TREASURY INVESTMENT GROWTH RECEIPT

TIKING = ТИК (или ХХ) – Tiking:- cotton; usually twill (L2/1 or L3/1), some Jacquard, satin, and dobby. Very tightly woven with more warp than filling yarns. Very sturdy and strong, smooth and lustrous. Usually has white and colored stripes, but some patterned (floral). Can be made water-repellent, germ resistant, and feather-proof. 'Bohemian ticking' has a plain weave, a very high texture, and is featherproof. Lighter weight than regular ticking. Patterned with narrow colored striped on a white background or may have a chambray effect by using a white or unbleached warp with a blue or red filling. / чем уточных пряж. Жакяр (Jacquard). Под Тиком, от Голландского слова Tijk, в Английском языке – Tick, понимается плотная ткань саржевого или полотняного переплетения нитей с продольными широкими пестротканными или печатными цветными полосами. Вырабатывается из льняной или хлопчатобумажной пряжи. Используется для матрацев, мебельных чехлов, занавесей и тому подобного.

TILE = ЦИЛИНДР (или ХХ) – Tile is a hat, especially a high silk hat.

TILL = ОБРАБАТЫВАТЬ (или ВОЗДЕЛЫВАТЬ) – Till:- to plow and prepare for seeding; to seed or cultivate the soil.

TILLAGE = ВСПАШКА (или ПАХОТА, или ОБРАБОТКА ПОЧВЫ, или БОРОНОВАНИЕ) – Tillage is the agricultural preparation of soil by mechanical agitation of various types, such as digging, stirring, and overturning. Examples of human-powered tilling methods using hand tools include shovelling, picking, mattock work, hoeing, and raking. Examples of draft-animal-powered or mechanized work include ploughing (overturning with moldboards or chiseling with chisel shanks), rototilling, rolling with cultipackers or other rollers, harrowing, and cultivating with cultivator shanks (teeth). Small-scale gardening and farming, for household food production or small business production, tends to use the smaller-scale methods, whereas medium- to large-scale farming tends to use the larger-scale methods. There is a fluid continuum, however. Any type of gardening or farming, but especially larger-scale commercial types, may also use low-till or no-till methods as well. Tillage is often classified into two types, primary and secondary. There is no strict boundary between them so much as a loose distinction between tillage that is deeper and more thorough (primary) and tillage that is shallower and sometimes more selective of location (secondary). Primary tillage such as ploughing tends to produce a rough surface finish, whereas secondary tillage tends to produce a smoother surface finish, such as that required to make a good seedbed for many crops. Harrowing and rototilling often combine primary and secondary tillage into one operation. 'Tillage' can also mean the land that is tilled. The word 'Cultivation' has several senses that overlap substantially with those of 'Tillage'. In a general context, both can refer to agriculture. Within agriculture, both can refer to any kind of soil agitation. Additionally, 'Cultivation' or 'Cultivating' may refer to an even narrower sense of shallow, selective secondary tillage of row crop fields that kills weeds while sparing the crop plants. Tillage Systems:- (1) Reduced Tillage:- reduced tillage leaves between 15 and 30% residue cover on the soil or 500 to 1 000 pounds per acre (560 to 1 100 kg/ha) of small grain residue during the critical erosion period. This may involve the use of a chisel plow, field cultivators, or other implements. See the general comments below to see how they can affect the amount of residue. (2) Intensive Tillage:- intensive tillage leaves less than 15% crop residue cover or less than 500 pounds per acre (560 kg/ha) of small grain residue. This type of tillage is often referred to as conventional tillage but as conservational tillage is now more widely used than intensive tillage (in the United States), it is often not appropriate to refer to this type of tillage as conventional. Intensive tillage often involves multiple operations with implements such as a mold board, disk, and/or chisel plow. Then a finisher with a harrow, rolling basket, and cutter can be used to prepare the seed bed. There are many variations. (3) Conservation Tillage:- conservation tillage leaves at least 30% of crop residue on the soil surface, or at least 1 000 lb/ac (1 100 kg/ha) of small grain residue on the surface during the critical soil erosion period. This slows water movement, which reduces the amount of soil erosion. Conservation tillage also benefits farmers by reducing fuel consumption and soil compaction. By reducing the number of times the farmer travels over the field, farmers realize significant savings in fuel and labor. In most years since 1997, conservation tillage was used in US cropland more than intensive or reduced tillage. However, conservation tillage delays warming of the soil due to the reduction of dark earth exposure to the warmth of the spring sun, thus delaying the planting of the next year's spring crop of corn. No-Till:- never use a plow, disk, etc ever again. Aims for 100% ground cover. Strip-Till:- narrow strips are tilled where seeds will be planted, leaving the soil in between the rows untilled. Mulch-Till. Rotational Tillage:- tilling the soil every two years or less often (every other year, or every third year, etc). Ridge-Till. Zone Tillage:- a form of modified deep tillage in which only narrow strips are tilled, leaving soil in between the rows untilled. This type of tillage agitates the soil to help reduce soil compaction problems and to improve internal soil drainage. Effects Of Tillage:- (1) Positive:- Plowing:- loosens and aerates the top layer of soil or horizon A, which facilitates planting the crop; helps mix harvest residue, organic matter (humus), and nutrients evenly into the soil; mechanically destroys weeds; dries the soil before seeding (in wetter climates tillage aids in keeping the soil drier); and when done in autumn, helps exposed soil crumble over winter through frosting and defrosting, which helps prepare a smooth surface for spring planting. (2) Negative:- dries the soil before seeding; soil loses a lot of nutrients, like nitrogen and fertilizer, and its ability to store water; decreases the water infiltration rate of soil (results in more runoff and erosion since the soil absorbs water slower than before); tilling the soil results in dislodging the cohesiveness of the soil particles thereby inducing erosion; chemical runoff; reduces organic matter in the soil; reduces microbes, earthworms, ants, etc; destroys soil aggregates; compaction of the soil, also known as a Tillage Pan; eutrophication (nutrient runoff into a body of water); can attract slugs, cut worms, army worms, and harmful insects to the left over residues; and crop diseases can be harbored in surface residues. General Comments:- (i) The type of implement makes the most difference, although other factors can have an effect. (ii) Tilling in absolute darkness (night tillage) might reduce the number of weeds that sprout following the tilling operation by half. Light is necessary to break the dormancy of some Weed Species' seed, so if fewer seeds are exposed to light during the tilling process, fewer will sprout. This may help reduce the amount of

herbicides needed for weed control. (iii) Greater speeds, when using certain tillage implements (disks and chisel plows), lead to more intensive tillage (i.e. less residue is on the soil surface). (iv) Increasing the angle of disks causes residues to be buried more deeply. Increasing their concavity makes them more aggressive. (v) Chisel plows can have spikes or sweeps. Spikes are more aggressive. (vi) Percentage residue is used to compare tillage systems because the amount of crop residue affects the soil loss due to erosion. Definitions:- Primary Tillage loosens the soil and mixes in fertilizer and/or plant material, resulting in soil with a rough texture. Secondary Tillage produces finer soil and sometimes shapes the rows, preparing the seed bed. It also provides weed control throughout the growing season during the maturation of the crop plants, unless such weed control is instead achieved with low-till or no-till methods involving herbicides. The seed bed preparation can be done with harrows (of which there are many types and subtypes), dibbles, hoes, shovels, rotary tillers, subsoilers, ridge- or bed-forming tillers, rollers, or cultivators. The weed control, to the extent that it is done via tillage, is usually achieved with cultivators or hoes, which disturb the top few centimeters of soil around the crop plants but with minimal disturbance of the crop plants themselves. The tillage kills the weeds via 2 mechanisms:- uprooting them, burying their leaves (cutting off their photosynthesis), or a combination of both. Weed control both prevents the crop plants from being outcompeted by the weeds (for water and sunlight) and prevents the weeds from reaching their seed stage, thus reducing future weed population aggressiveness. History Of Tilling:- tilling was first performed via human labor, sometimes involving slaves. Hoofed animals could also be used to till soil via trampling. The wooden plow was then invented. It could be pulled by mule, ox, elephant, water buffalo, or similar sturdy animal. Horses are generally unsuitable, though breeds such as the scyne could work. The steel plow allowed farming in the American Midwest, where tough prairie grasses and rocks caused trouble. Soon after 1900, the farm tractor was introduced, which eventually made modern large-scale agriculture possible. Alternatives To Tilling:- modern agricultural science has greatly reduced the use of tillage. Crops can be grown for several years without any tillage through the use of herbicides to control weeds, crop varieties that tolerate packed soil, and equipment that can plant seeds or fumigate the soil without really digging it up. This practice, called No-Till Farming, reduces costs and environmental change by reducing soil erosion and diesel fuel usage. Tillage is:- (1) the mechanical alteration of some physical properties of the soil to provide a condition appropriate for crop growth. (2) To cultivate the land, to gain moisture in the soil. Conventional Tillage:- the traditional method of farming in which soil is prepared for planting by completely inverting it with a moldboard plow. Subsequent working of the soil with other implements is usually performed to smooth the soil surface. Bare soil is exposed to the weather for some varying length of time depending on soil and climatic conditions. Conventional Tillage is a tillage system using cultivation as the major means of seedbed preparation and weed control. Typically includes a sequence of soil tillage, such as ploughing and harrowing, to produce a fine seedbed, and also the removal of most of the plant residue from the previous crop. In this context the terms cultivation and tillage are synonymous, with emphasis on soil preparation. / Вспашка или Пахота, основной приём механической обработки почвы отвальными плугами. При вспашке происходит одновременно оборачивание, крошение и перемешивание почвы. Оборачиванием достигается заделка дернины, удобрений, семян сорных растений, многих сельскохозяйственных вредителей и возбудителей болезней. В нижней части пахотного слоя, перемещённой вспашкой на поверхность, под влиянием аэрации, повторного увлажнения и быстро активизирующейся полезной почвенной микрофлоры увеличивается содержание доступных растениям питательных веществ. Вспашка даёт возможность поддерживать мелкокомковатое сложение пахотного слоя. Степень оборачивания зависит от формы отвалов, соотношения глубины обработки и ширины пласта. Плуги с винтовыми отвалами наиболее полно оборачивают пласт, но слабо крошат почву (используются на тяжёлых глинистых и сильно задернелых землях); с цилиндрическими отвалами хорошо крошат почву, но неудовлетворительно оборачивают пласт; с культурной формой отвалов хорошо оборачивают и крошат пласт на почвах средней связности (с предплужниками и на задернелых почвах). Различают следующие виды вспашки:- (1) Оборот Пласта, когда пласт шириной до 40 сантиметров (см) при относительно небольшой глубине пахоты винтовым отвалом оборачивается на 180 градусов (°). Это самый древний вид вспашки дернины; он требует многих дополнительных обработок (боронование, культивация, дискование, прикатывание), приводящих к чрезмерному распылению почвы (под термином Оборот Пласта в практике сельскохозяйственного производства понимают также вторую вспашку целины, залежи или поля из-под многолетних трав). (2) Взмёт, когда пласты отвалами полувинтового типа оборачиваются на 135°, плотно прилегают друг к другу, располагаясь под углом в 45° к поверхности почвы. При взмёте целины или залежи дернина не успевает разложиться в течение нескольких месяцев; такая вспашка неприемлема и на старопахотных землях, она дополнительно требует многократного дискования и боронования. (3) Культурная Вспашка проводится плугом, каждый корпус которого снабжён предплужником. Предплужник срезает поверхностный слой почвы и сбрасывает его на дно борозды; отвал основного корпуса плуга поднимает жёсткий слой почвы и покрывает им оказавшийся на дне борозды верхний слой. Это самый совершенный вид пахоты. Площадь вспаханного поля получается ровной, что облегчает последующую предпосевную обработку (предплужник снимают лишь при запашке навоза или повторной вспашке парового поля). Глубину вспашки устанавливают в зависимости от мощности пахотного горизонта, биологических особенностей возделываемых растений, обработки почвы под предшествующие культуры, степени и характера засорённости поля, наличия вредителей и болезней сельскохозяйственных растений. Вспашка на глубину 20 см считается нормальной, на большую глубину – глубокой, на меньшую – мелкой. Вспашка на одну и ту же глубину нередко приводит к образованию на дне борозды уплотнённого слоя (плужная подошва), что нарушает нормальный водный режим почвы и затрудняет развитие корневой системы растений. Поэтому целесообразно в каждом поле севооборота периодически проводить пахоту несколько глубже обычной. Глубокая вспашка – одно из важнейших условий получения высоких и устойчивых урожаев. На почвах с пахотным горизонтом менее 20 см, ограничивающим глубину вспашки, постепенно создают мощный окультуренный пахотный слой. Большое значение при этом, как и при глубокой пахоте, может иметь вспашка с почвоуглубителем, разрыхляющим подпахотный горизонт почвы. Время вспашки зависит от зональных почвенно-климатических особенностей, агротехники возделываемых культур, сроков сева и ряда других условий. Наиболее совершенной является ранняя зяблевая вспашка, способствующая лучшему накоплению в почве влаги и питательных веществ в доступной для растений форме (смотрите Зяблевая Обработка Почвы). Летняя вспашка необходима при подготовке к посеву занятых паров и при посеве озимых по непаровым предшественникам. Весенняя вспашка под яровые того же года посева известна под названием Весновспашки. Весенние и летние, а иногда и осенние вспашки должны сопровождаться одновременно боронованием (для уменьшения потерь влаги на испарение). Наиболее распространён способ загонной пахоты. Предварительно поле разбивают на отдельные вытянутые полосы – Загоны, длина которых определяется размером, конфигурацией и рельефом поля. Ширина загона должна быть кратной ширине рабочего захвата агрегата и одинаковой по всей длине его. На концах загонов отбивают поворотные полосы. Вспашку проводят всвал или вразвал. Вспашку Всвал начинают с середины загона. Агрегат, сделав первый проход, поворачивают холостым ходом направо и проводят вторую борозду рядом с первой. Приваливаясь друг к другу, пласты образуют гребень. Дальше агрегат поворачивают также только вправо; заканчивается пахота на краях загона, где образуется по одной Борозде. Вспашку Вразвал, наоборот, начинают с краёв загона. Пройдя первый след, агрегат поворачивают налево, затем прокладывают с другого края загона второй след и так далее. В этом случае получается борозда в середине загона, а по краям его – Гребни. Существует способ Гладкой Пахоты, при которой нет необходимости отбивать поворотные полосы. Проводят её оборотными плугами с двойным набором корпусов (пласты кладутся лишь на одну сторону). На пашне не образуются разъёмные борозды

и свальные гребни. Этот способ вспашки применяют обычно на участках со значительным уклоном. Известна также Фигурная (Круговая) Вспашка, при которой неизбежны огрехи, низкое качество обработки и чрезмерное уплотнение почвы при поворотах агрегата. Большое агрономическое значение может иметь направление вспашки. Если необходимо задержать потоки талых и дождевых вод и не допустить смыва почвы, то целесообразно пахать поперёк склонов. Там, где лёгкие почвы и сильные ветры, – пашут перпендикулярно направлению преобладающих ветров, что в летний и весенний периоды ослабляет выдувание пахотного слоя, а зимой – способствует накоплению на полях снега. В каждом конкретном случае направление вспашки определяет агроном хозяйства, учитывая не только рельеф, но и приёмы последующих сельскохозяйственных работ на данном поле. Качество пахоты зависит от технологических свойств почвы – Связности, Пластичности, Прилипаемости к рабочим органам плуга. Эти свойства определяются главным образом механическим составом почвы. При вспашке глинистых и суглинистых почв необходимо учитывать степень их увлажнения. С вспашкой тяжёлых бесструктурных почв нельзя запаздывать даже на несколько часов, надо начинать её, как только почва приобретает состояние спелости (смотрите Спелость Почвы). К основным показателям качества вспашки относятся:- глубина, наличие огрехов, гребнистость, степень крошения, глыбистость, прямолинейность борозд (смотрите Оценка Качества Полевых Работ). К вспашке относят также плантаж, ярусную вспашку. Нередко в определённых почвенно-климатических и агротехнических условиях целесообразно проводить вместо вспашки безотвальную обработку почвы. Под Вспашкой понимается одновременное оборачивание, крошение и перемешивание почвы отвальными плугами, основной приём её обработки. Поддерживает рыхлость пахотного слоя, уничтожает сорняки, вредителей и возбудителей болезней. В районах с ветровой эрозией применяют также плоскорезную обработку почвы. Под Боронованием (Harrowing) понимается рыхление поверхностного слоя почвы боронами и вращающимися мотыгами. Предохраняет почву от высыхания, выравнивает её поверхность, разрушает почвенную корку, уничтожает сорняки. Ярусная Вспашка – послойная обработка почвы с перемещением почвенных горизонтов. Применяется для коренного улучшения солонцовых и подзолистых почв. Проводится ярусными плугами (на глубину до 40 сантиметров (см)) один раз в 5–6 лет; остальное время почву обрабатывают на обычную глубину. При ярусной вспашке солонцовых почв происходит их самомелиорация, улучшаются физические свойства. Ярусная вспашка подзолистых почв сопровождается известкованием, внесением органических удобрений, травосеянием и другим.

TILLER = ПОБЕГ (или РОСТОК, или ОТРОСТОК) – Tiller is a vegetative branch of the Rice Plant composed of roots, culm, and leaves which may or may not develop a panicle. Shoot arising from the main culm (stem). Tiller is a shoot, especially one that sprouts from the base of a grass. A Tiller is a stem produced by grass plants, and refers to all shoots that grow after the initial parent shoot grows from a seed. Tillers are segmented, each segment possessing its own two-part leaf. They are involved in vegetative propagation and, in some cases, also seed production. Term ‘Tillering’ refers to the production of tillers and is a property possessed by many Species in the Family Poaceae. This enables them to produce multiple stems (tillers) starting from the initial single seedling. This ensures the formation of dense tufts and multiple seed heads. Tillering rates are heavily influenced by soil water status. When soil moisture is low, grasses tend to develop more sparse and deep root systems (as opposed to dense, lateral systems). Thus tillering is inhibited; the lateral nature of tillering is not supported by lateral root growth in dry soils. Tiller is a plant shoot that springs from the root or bottom of the original stalk. A Tiller is vegetative branch from an adventitious bud arising at the base of a plant on or just under the surface of the ground and growing erect. Normally the term tiller is used to indicate a lateral shoot from a cereal or grass, but can be appropriate for any similar basal shoots of other herbaceous plant. In grasses these comprise several units arising from a leaf axil, normally at the base of an older tiller, each consisting of a stem (or culm), leaves and axillary bud (eventually with basal roots), it usually refers to the secondary tillers off the main shoot. Tiller is a sprout or stalk, especially one from the base of a plant or from the axils of its lower leaves. Tiller (syn. Stool, Branch, Innovation) is the intravaginal vegetative branch of the Rice plant, typically including roots, culm and leaves, but which may or may not develop a panicle. The primary tillers originate from the lower nodes of the main culm. The primary tillers give rise to secondary tillers and the latter to tertiary tillers. All tillers arise in an alternate pattern. Tiller is a shoot from the base of a plant. / из корней, . разведение или распространение (propagation). Под Побегом (Cormus) понимается стебель с расположенными на нём листями и почками; один из основных органов Высших Растений. Побег – единый орган:- листья и стебли обладают единой проводящей системой и формируются из общего конуса нарастания. У Однолетних Растений побеги живут один сезон, у Многолетних – несколько лет. Многолетние подземные побеги нередко видоизменены в корневища, клубни, луковицы, наземные побеги – в усики, колючки.

TILLER = ПОЧВОФРЕЗА – Tiller is a farm implement used to break up the surface of the soil (for aeration and weed control and conservation of moisture). Synonyms:- Cultivator. Tiller is a person or machine that tills the soil. / сохранение (conservation).

TILLER BLADES = ЛОПАСТИ ПОЧВОФРЕЗЫ – Tiller Blades:- the soil-engaging part of a rotary tiller or tillage tool that cuts and turns the soil over.

TILLERING ABILITY/CAPACITY = СПОСОБНОСТЬ/ПРОДУКТИВНОСТЬ К КУЩЕНИЮ – Tillering Ability/Capacity is the genetic potential of a given variety to produce a certain number of tillers. / Под Кущением понимается ветвление кустарниковых и травянистых растений, при котором боковые побеги развиваются (приземно или подземно) из почек, сидящих на тесно сближенных узлах у основания главного побега, и образуют куст; часто дают придаточные корни. Кущение хлебных злаков – одна из фаз развития, способствует увеличению урожая.

TILLERING STAGE = СТАДИЯ КУЩЕНИЯ (или ФАЗА КУЩЕНИЯ) – Tillering Stage is a growth stage of the Rice Plant that extends from the appearance of the first tiller until the maximum tiller number is reached. / Под Кущением понимается ветвление кустарниковых и травянистых растений, при котором боковые побеги развиваются (приземно или подземно) из почек, сидящих на тесно сближенных узлах у основания главного побега, и образуют куст; часто дают придаточные корни. Кущение хлебных злаков – одна из фаз развития, способствует увеличению урожая.

TILLER NUMBER = ЧИСЛО ПОБЕГОВ – Tiller Number is a number of tillers present in a Rice Plant.

TILLING = TARGETING INDUCED LOCAL LESIONS IN GENOMES

TILT = ГРУЗОВИК (или ФУРА) – A tilt hammer. Tilt – to cover (a vehicle) with a canopy or an awning. Tilt is a cover of coarse cloth, canvas, etc, as for a wagon; to furnish with a tilt. / Тентованный Хэмё (Hammer). Грузовой автомобиль с покрытым прицепом.

TILTH = ФИЗИЧЕСКАЯ СПЕЛОСТЬ ПОЧВЫ (или ПРИГОДНОСТЬ ПОЧВЫ К ОБРАБОТКЕ) – Tilth is the physical condition of the soil as related to its ease of tillage, fitness as a seedbed, and its impedance to seeding emergence and root penetration. / семенное ложе, и её импеданс к появлению всходов и проникновению корня. Под Спелостью Почвы понимается состояние почвы, при котором её легко обрабатывать (физическая спелость почвы) или она готова к посеву и посадке (биологическая спелость почвы).

TIMBER = ЛЕСОМАТЕРИАЛ (или ПИЛОПРОДУКЦИЯ) – The term Timber describes sawn wood or a piece of lumber that is 140 mm (5-1/2”) or more in its smallest dimension. There are two categories of timbers:- (i) rectangular ‘Beams and Stringers’ (width more

than 51 mm (2”) greater than thickness) are typically used as bending members; and (ii) square ‘Posts and Timbers’ (width less than 51 mm (2”) greater than thickness) are typically used for columns. Because very big logs are required to obtain large timbers, the larger timbers most often come from the west. Sizes up to 394 x 394 mm (15-1/2” x 15-1/2”) are generally available in the Douglas Fir-Larch and Hem-Fir species combinations; however S-P-F and Northern species timbers are available only in smaller sizes. Availability of large size and long length timbers should always be confirmed with suppliers prior to specifying. There has been little in-grade strength test data on timbers, due to the relatively small volume of timbers produced. Therefore, the design values for timbers continue to be determined on the basis of small clear testing adjusted for grade characteristics. Timbers, along with other materials, such as glulam and parallel strand lumber (PSL), are used in post and beam construction. Wood timbers were widely used in traditional construction although they are less commonly used today. Materials available from lumber yard stock are usually sawn to order from large timbers and should be regarded after cutting. See also Dimension Lumber, and Lumber. / Термин ‘Пилопродукция’ служит для обозначения распиленной древесины, меньший размер которой равен 140 миллиметрам (мм; или 5-1/2 дюйма) или более. Существуют две категории строительных пиломатериалов:- (i) Прямоугольные Балки/Брусья (Beams) и Продольные Балки (Stringers) (по своей ширине более чем на 51 мм (2 дюйма) превышающей толщину), обычно используемые в качестве направляющих составляющих; и (ii) Стойки/Столбы (Posts) и Лесоматериал (Timbers) квадратного сечения (по своей ширине менее чем на 51 мм (2 дюйма) превышающей толщину), обычно используемые в качестве опор/столпов/поддержки. Раньше древесные строительные пиломатериалы широко использовались в строительстве, но сейчас это встречается не так часто. Данные материалы продаются из дворовых запасов пиломатериалов (lumber yard stock) обычно распиленными под заказ из крупных строительных пиломатериалов и соотносимые/расцениваемые после разрезания/обрезки. Смотрите также Пиломатериал Установленного Размера/Мерный Пиломатериал/Размерные Заготовки/Размерный Пиломатериал (Dimension Lumber), и Пиломатериал (Lumber). Подтоварник – круглый лесоматериал (тонкие брёвна) диаметром в верхнем отрезе 6–13 см у хвойных, 8–11 см у лиственных пород древесины. Подтоварник применяется для вспомогательных и временных построек различного назначения. Продукция из древесины, полученная в результате продольного деления брёвен и продольного и поперечного деления полученных частей. Под Лесоматериалами понимаются материалы из древесины, сохранившие её природную физическую структуру и химический состав. Лесоматериалы подразделяют на необработанные и обработанные. Необработанные (круглые) лесоматериалы, или сортименты, получают из спиленных деревьев после очистки их от ветвей и раскряжёвки (разделения) ствола (хлыста) на части требуемых длин и толщин. Круглые сортименты после окорки применяются в строительстве, в качестве опор и столбов, крепёжного материала при подземных работах (рудничные стойки), как дрова и так далее. Как сырьё круглые лесоматериалы используются в лесопильном, целлюлозно-бумажном, лесохимическом производствах. К обработанным лесоматериалам относятся пиломатериалы (бруски, брусья, доски, шпалы), колотые лесоматериалы, строганный и лущёный шпон. К лесоматериалам относятся также пнево-корневые массы, сучья, неодревесневшие побеги и ветви, кора, опилки, щепа и другое.

TIMBER CONNECTOR = СОЕДИНИТЕЛЬ ПИЛОПРОДУКЦИИ – Metal ring, plate, or grid embedded in the wood of adjacent members to increase the strength of the joint. Timber Connector is a metal ring or plate that, by being embedded in adjacent wood faces or in one wood face, acts in shear to transmit loads from one timber to another, or from a timber to a bolt and, in turn, to a steel plate or another connector. / Металлическое кольцо, пластинка или сетка/решётка, внедрённая в древесину . , действует при срезе (или сдвиге или поперечной силе или сдвигающем усилии) для передачи нагрузок от одного , к болту (или стержню или шкворню или шпильке или затвору) .

TIME AND SALES TICKER = ТИКЕР ВРЕМЕНИ И ПРОДАЖ – Time And Sales Ticker:- part of the Chicago Board of Trade® Market Profile® system consisting of an on-line graphic service that transmits price and time information throughout the day. / Тикер Времени и Продаж:- часть системы Профиль Рынка® Чикагской Палаты Торговли® (Чикагского Табло Торговли, если быть более точными), которая предоставляет услугу построения графиков в режиме реального времени и передаёт информацию о ценах и времени, в которое они сформировались, в течение всего дня.

TIME CHARTER = ФРАХТОВАНИЕ СУДНА НА ВРЕМЯ (или ТАЙМ ЧАРТЕР, или СРОЧНЫЙ ЧАРТЕР) – Time Charter is a form of charter party wherein owner lets or leases his vessel and crew to the charterer for a stipulated period of time. The charterer pays for the bunkers and port charges in addition to the charter hire. The charterer has the use of the vessel for a specified period. The shipowner supplies the crew and provisions. The hiring out of a vessel complete with crew for a period of time. The hirer (time charterer) pays for voyage related costs, and pays the ship owner a charter hire of a specific amount per day or specific sum per dwt per month, i.e. time charter rate. A contract for leasing between the ship owners and the lessee. It would state, e.g., the duration of the lease in years or voyages. Time Charter is a contract whereby a vessel is let to a charterer for a determined period of time or a voyage, against a remuneration known as Hire. See also Bareboat Charter, Charter, and Demise Charter. / Договор имущественного найма. Смотрите также Фрахтование Судна Без Экипажа или Бербоут Чартер (Bareboat Charter), Фрахтование Судна С Экипажем или Димайз Чартер (Demise Charter), и Фрахтование Судна или Чартер (Charter). , то есть . , например, . Наём танкера или иного грузового судна на определённый срок, а не на отдельный рейс.

TIME DECAY = ВРЕМЕННОЕ УБЫВАНИЕ – Time Decay is the tendency of an option to decline in value as the expiration date approaches, especially if the price of the underlying instrument is exhibiting low volatility. See also Time Value. / Временное Убывание – тенденция опциона к снижению ценности в связи с приближением даты прекращения признания (так называемой даты экспирации), особенно если цена соответствующего инструмента проявляет слабую лихорадочность. Смотрите также Временная Ценность (Time Value). Временное Убывание – нелинейная потеря стоимости опциона с течением времени, когда все остальные факторы являются постоянными. Данная величина рассчитывается при помощи Тета.

TIME DEPOSIT = СРОЧНЫЙ ВКЛАД – Time Deposits:- funds deposited in an account that has a fixed term to maturity and technically cannot be withdrawn before maturity without advance notice, for example, a certificate of deposit. Time deposits may earn interest. Bank deposits which are to be held for a specified period of time (generally between 1 and 12 months) at a set rate of interest. Interest-bearing deposit account allowing multiple deposits, but sometimes limited withdrawals before maturity, such as Christmas club accounts. Time deposits are considered to be part of the M2 money supply. Deposit or investment that cannot be withdrawn without giving notice. Also known as Fixed Deposit in the United States. Time Deposits are deposits invested at banks with a fixed maturity (fixed-term deposit) or termination. Time deposits not withdrawn at the end of maturity are renewed as a demand deposit or at the current interest rate. / Срочный Вклад, вклад на срок (открытый счёт):- сберегательный счёт или депозитный сертификат (certificate of deposit), внесённый в финансовую организацию на определённый период времени или при условии, что вкладчик должен уведомлять о намерении снять средства со счёта. В то время как банк имеет право требовать предоставления уведомления за 30 дней до снятия средств со сберегательного счёта, средства со счёта со сберкнижкой обычно доступны немедленно. Депозитные сертификаты выпускаются на определённый срок (30 дней или более), и по ним взимается пеня за каждое снятие средств. Финансовые институты имеют право устанавливать любой срок погашения депозитного сертификата

по желанию клиента, но не менее 30 дней и выплачивать процентные ставки на любом – высоком или низком – уровне, приемлемом для рынка. Смотрите также Depository Institutions Deregulation and Monetary Control Act, Regulation Q.

TIME DRAFT = СРОЧНАЯ ТРАТТА – Time Draft is a draft that matures at a fixed or determinable time after presentation or acceptance. A draft so drawn as to mature at a certain fixed time after presentation or acceptance. Time Draft is a draft which matures either a certain number of days after acceptance or a certain number of days after the date of the draft. See also Draft. / Срочная Тратта – переводный вексель (draft), подлежащий оплате в указанный или определяемый срок, в отличие от векселя, оплачиваемого по предъявлении (sight draft), который оплачивается после предъявления и доставки.

TIME LIMIT = ЛИМИТ ВРЕМЕНИ – Time Limit is the maximum time allowed between the date of inspection of the commodity and the issuance date of an export certificate unless otherwise specified by the importing country. This limit is established by the importing country or Plant Protection and Quarantine (PPQ).

TIME LIMIT ORDER = РАСПОРЯЖЕНИЕ, ОГРАНИЧЕННОЕ ВО ВРЕМЕНИ (или ПОРУЧЕНИЕ С ЛИМИТОМ ВРЕМЕНИ) – Time Limit Order is a customer order that designates the time during which it can be executed. / Распоряжение заказчика, которое обозначает время, в течение которого оно может быть исполнено. Распоряжение клиента брокеру с ограничением периода времени, в течение которого оно может быть исполнено.

TIME OF ARRIVAL = ВРЕМЯ ПРИБЫТИЯ – Time Of Arrival is a time when a ship first comes to rest, whether at anchor or at a dock, in a port.

TIME–OF–DAY ORDER = РАСПОРЯЖЕНИЕ НА ВРЕМЯ ДНЯ – Time-Of-Day Order is an order that is to be executed at a given minute in the session. For example, Sell 10 March Corn at 12:30 pm. / Распоряжение на Время Дня – распоряжение, которое должно быть исполнено в данный час и в данную минуту торговой сессии, например, Продать 10 фьючерсов на Кукурузу с поставкой в Марте в 12:30 пп (Sell 10 March Corn at 12:30 pm).

TIMES COVERED = ПОКРЫТЫ РАЗ (или СООТНОШЕНИЕ ПОКРЫТИЯ) – Times Covered is the earnings divided by the amount of the dividend. See also Dividends/Earnings. Typically it is 3.

TIME SPREAD = СРОЧНАЯ КУРСОВАЯ РАЗНИЦА (или ВРЕМЕННОЙ СПРЭД) – A Time Spread is a simple contango trade whereby the difference (spread) between front month and back month futures is above the cost of carry (storage, insurance, ancillary). One of the most notable time spreads occurred in the steep contango of the West Texas Intermediate (WTI) market at the end of 2007 and early 2008. Participants of this trade were able to store WTI, Brent and other grades in offshore floating storage, evidenced by the parabolic change in rates for Very Large Crude Carriers (VLCCs) and other available tonnage at the time (prior to their subsequent 90+% collapse). The rates for VLCCs eventually caught up to the spreads; the arbitrage window closed and with it the demand for freight. Keeping an eye on freight rates at the various crude and product hubs can give you an idea as to how far contango spreads can blow out and, perhaps more importantly, in which direction arbitrage flows are moving. Time Spread is the selling of a nearby option and buying of a more deferred option with the same strike price. Also known as Calendar Spread and Horizontal Spread. / Продажа опциона с ближайшим сроком прекащения признания и покупка опциона с более дальним сроком прекащения признания, но по одной и той же сходной цене. Известен также как Горизонтальная Курсовая Разница или Горизонтальный Спрэд (Horizontal Spread), и Календарная Курсовая Разница или Календарный Спрэд (Calendar Spread). Временной Спрэд:- стратегия в операциях с опционами (option), при которой инвестор приобретает и продаёт опционные контракты на продажу (put option) и покупку (call option) с одной и той же ценой исполнения (exercise price), но различными сроками. Целью этой и других опционных стратегий является получение прибыли от разницы в опционных премиях (option premiums) – ценах, уплачиваемых за покупку опционов. Смотрите также Calendar Spread, Horizontal Spread, и Spread.

TIME–STAMPED = С ПРОСТАВЛЕННЫМ ВРЕМЕНЕМ (или С ПРОШТАМПОВАННЫМ ВРЕМЕНЕМ) – Time-Stamped:- part of the order-routing process in which the time of day is stamped on an order. An order is time-stamped when it is (i) received on the trading floor, and (ii) completed.

TIME–TO–BREAK = ВРЕМЯ НА РАЗРЫВ – Time-To-Break:- in tensile testing, the time interval during which a specimen is under prescribed conditions of tension and is absorbing the energy required to reach maximum load.

TIME VALUE = ВРЕМЕННАЯ ЦЕННОСТЬ – Time Value:- the amount of money option buyers are willing to pay for an option in the anticipation that over time a change in the underlying futures price will cause the option to increase in value. In general, an option premium is the sum of time value and intrinsic value. Any amount by which an option premium exceeds the option's intrinsic value can be considered time value. Part of the options premium which reflects the excess over the intrinsic value, or the entire premium if there is no intrinsic value. At given price levels, the option's time value will decline until expiration. It is this decrease in time value that makes options a wasting asset. Time Value:- that portion of an option's premium that exceeds the intrinsic value. The time value of an option reflects the probability that the option will move into-the-money. By other words, the time value of an option reflects the probability that the price of the underlying futures contract will change to a level at which it is profitable for the holder to exercise the option. Therefore, the longer the time remaining until expiration of the option, the greater its time value. Sometimes called Extrinsic Value. Also known as Extrinsic Value. See also Intrinsic Value. Time Value is a value of an option prior to expiration determined above all by an estimate of the price performance of the underlying instrument. Time value is calcuated from the difference between the option price and its intrinsic value. Determinants in calculating the time value are the remaining time to expiration of the option and the expected volatility of the underlying instrument. The shorter the time to expiration and the lower the volatility, the lower the time value. Time Value refers to options. The difference between an option's market price and its intrinsic value. Time Value is the excess of an option's value (or a security with an option feature) over its intrinsic value. Also known as Option Value. / Временной компонент премии по опциону. Как правило, временная ценность опциона падает по мере приближения даты его прекращения признания (так называемой даты экспирации). Известна также как Внешняя Ценность (Extrinsic Value). Смотрите также Внутреннюю Ценность (Intrinsic Value). Временная Ценность – часть опционной премии, представляющая собой разницу между размером опционной премии и внутренней стоимостью опциона. Срочная составляющая опционной премии находится в зависимости от количества времени, остающегося до истечения срока опционного контракта:- она снижается по мере приближения к дате исполнения. У опционов 'без денег', не имеющих внутренней стоимости, опционная премия эквивалентна срочной стоимости. Временная Ценность опциона:- (1) в общем значении цена за время, в течение которого инвестор должен ждать до погашения инвестиций, что определяется путём расчёта текущей ценности (present value) инвестиции в течение срока погашения. Смотрите также Yield To Maturity. (2) В отношении опционов:- часть премии (premium) на опционы на акции, которая отражает время, остающееся до истечения опционного контракта. Премия включает эту временную оценку, а также внутреннюю ценность (intrinsic value) опциона. (3) В отношении акций:- разница между ценой, по которой совершается перекупка компании, и ценой в момент поглощения (takeover). Например, если контрольный пакет компании XYZ должен быть перекуплен по цене 30 Долларов за акцию в течение двух месяцев, а акции компании в настоящий момент продаются по цене 28.50 Долларов, то разница в 1.50

Доллара представляет собой временную ценность, которую должны оплатить как раз те, кто желает подождать два месяца, чтобы продать свои акции по цене 30 Долларов за акцию. По прошествии двух месяцев временная ценность сокращается до тех пор, пока не исчезнет в момент перекупки. Время, в течение которого инвестор сохраняет акции XYZ, имеет цену, поскольку оно могло бы быть использовано для других вложений, приносящих более высокую прибыль. Смотрите также Opportunity Cost.

TIMING = ЛОВЛЯ МОМЕНТА – Timing:- in securities trading, the selection of exactly the right moment to buy or sell. / В торговле ценными бумагами, выбор правильного момента с тем, чтобы точно в данный момент купить или продать. Выбор Времени (Timing):- попытка выбрать лучшее время для принятия решения. Например, выбор момента продажи (market timing) подразумевает анализ фундаментальных и технических данных для решения, когда покупать и продавать акции, облигации, взаимные фонды и фьючерсные контракты. Выбор времени также важен для принятия потребительского решения, как например, когда произвести крупную покупку. Потребители могут захотеть выбрать время для покупки недвижимости в тот момент, когда цены и ипотечные ставки особенно привлекательны, или для покупки автомобиля, когда дилеры предлагают особенно хорошие цены.

TIMING = СОГЛАСОВАНИЕ (или СИНХРОНИЗАЦИЯ, или НАЛАДКА) – Timing is the order the needles in the dial and cylinder go through the knitting cycle in relationship to one another. The cylinder needles that correspond to dial needles may go through the knitting cycle before or after the dial needles.

TIMKEN® EP TEST = ИСПЫТАНИЕ ПО ТЧИМКИНСКИ НА СВЕРХВЫСОКОЕ ДАВЛЕНИЕ – Timken® EP (short for the Extreme Pressure) Test:- measure of the extreme-pressure properties of a lubricating oil. The test utilizes a Timken® machine, which consists of a stationary block pushed upward, by means of a lever arm system, against the rotating outer race of a roller bearing, which is lubricated by the product under test. The test continues under increasing load (pressure) until a measurable wear scar is formed on the block. / износ . Испытание смазочных масел на машине трения Тчимкина – определение смазочной способности (маслянистости) масел.

TIMKEN® OK LOAD = ОПТИМАЛЬНАЯ НАГРУЗКА ПО ТЧИМКИНСКИ – Timken® OK Load is the heaviest load that a test lubricant will sustain without scoring the test block in the Timken® Test procedures, ASTM Methods D 2509 (greases) and D 2782 (oils). American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ).

TIN = TAX IDENTIFICATION NUMBER

TIN = ОЛОВО – Tin is a chemical element in the periodic table that has the symbol Sn (in Latin, Stannum) and atomic number 50. This silvery, malleable poor metal that is not easily oxidized in air and resists corrosion is found in many alloys and is used to coat other metals to prevent corrosion. Tin is obtained chiefly from the mineral cassiterite, where it occurs as an oxide. Tin bonds readily to iron, and has been used for coating lead or zinc and steel to prevent corrosion. Tin-plated steel containers are widely used for food preservation, and this forms a large part of the market for metallic tin. Speakers of British English call them 'Tins'; Americans call them 'Cans' or 'Tin Cans'. One thus-derived use of the slang term 'Tinnie' or 'Tinny' means 'Can Of Beer'. The tin whistle is so called because it was first mass-produced in tin-plated steel. Other uses:- (i) some important tin alloys are:- bronze, bell metal, Babbitt metal, die casting alloy, pewter, phosphor bronze, soft solder, and White metal; (ii) the most important salt formed is stannous chloride, which has found use as a reducing agent and as a mordant in the calico printing process. Electrically conductive coatings are produced when tin salts are sprayed onto glass. These coatings have been used in panel lighting and in the production of frost-free windshields; (iii) most metal pipes in a pipe organ are made of varying amounts of a tin/lead alloy, with 50%/50% being the most common. The amount of tin in the pipe defines the pipe's tone, since tin is the most tonally resonant of all metals. When a tin/lead alloy cools, the lead cools slightly faster and makes a mottled or spotted effect. This metal alloy is referred to as Spotted Metal; (iv) window glass is most often made via floating molten glass on top of molten tin (creating float glass) in order to make a flat surface (this is called the Pilkington Process); (v) tin is also used in solders for joining pipes or electric circuits, in bearing alloys, in glass-making, and in a wide range of tin chemical applications. Although of higher melting point than a lead-tin alloy, the use of pure tin or tin alloyed with other metals in these applications is rapidly supplanting the use of the previously common lead-containing alloys in order to eliminate the problems of toxicity caused by lead; and (vi) tin foil was once a common wrapping material for foods and drugs; replaced in the early XX century by the use of aluminium foil, which is now commonly referred to as Tin Foil. Hence one use of the slang term 'Tinnie' or 'Tinny' for a small retail package of a drug such as cannabis or for a can of beer. Tin becomes a superconductor below 3.72 K. In fact, tin was one of the first superconductors to be studied; the Meissner effect, one of the characteristic features of superconductors, was first discovered in superconducting tin crystals. The niobium-tin compound Nb_3Sn is commercially used as wires for superconducting magnets, due to the material's high critical temperature (18 K) and critical magnetic field (25 T). A superconducting magnet weighing only a couple of kilograms is capable of producing magnetic fields comparable to a conventional electromagnet weighing tons. When present in steel it is an undesirable impurity which gives rise to temper brittleness. When used as a coating on steel, it has a good resistance to corrosion for many applications. / литьё или отливка (casting). Литьё Под Давлением или Кокильное Литьё или Кокильная Отливка (Die Casting). электрических микросхем . эффект Майснёра (Meissner effect). Олово, на Латинском Станнум (Stannum), Sn, является химическим элементом IV группы периодической системы Менделеева. Атомный номер 50, атомная масса 118.71. Серебристо-белый металл, мягкий и пластичный; $t_{пл}$ 231.91 °C. Олово полиморфно, так называемое белое олово, или β-Sn с плотностью 7.295 г/см^3 ниже 14 °C переходит в серое олово или α-Sn с плотностью 5.846 г/см^3. На воздухе олово тускнеет, покрываясь плёнкой оксида, стойкой к химическим реагентам. Главные промышленные минералы – касситерит (оловянный камень) и станин. Олово – основной компонент многочисленных сплавов, например, подшипниковых (баббитов), типографских (гарт). Олово идёт на покрытие других металлов для защиты их от коррозии (лужение), на изготовление белой жести для консервных банок. Оловянные Руды:- главным минералом является касситерит. Коренные месторождения сформировались в породах алюмосиликатного состава и представлены касситерит-кварцевыми и касситерит-сульфидными рудами (промышленное содержание 0.1–0.2%). Важное промышленное значение имеют россыпи (среднее содержание Sn около 300–500 г/м^3). Главными добывающими странами являются Боливия, Индонезия, Малайзия, Таиланд. Производство олова в концентрате в 1980-м составляло 192 000 тонн. Олово (общеславянское, название по цвету от корня Ol-, означающее Белый или Жёлтый) – химический элемент, символ Sn (на Латинском языке Stannum), атомный номер 50, атомная масса 118.71. Олово – серебристо-белый металл, мягкий и пластичный, медленно тускнеющий на воздухе. Олово полиморфно. Наиболее устойчиво так называемое белое олово или β-Sn, с плотностью 7 295 кг/м^3; при температуре ниже 13.2 °C стабильно серое олово, или α-Sn, с плотностью 5 846 кг/м^3. Аллотропный переход белого олова в серое служит причиной так называемой 'оловянной чумы' – разрушения на холоде изделий и припоя из олова. Плавится олово при температуре 231.9 °C. Из минералов олова промышленное значение имеют касситерит (оловянный камень) SnO_2 и в меньшей степени станин Cu_2FeSnS_4. Концентраты обжигают, выщелачивают олово, выделяют SnO_2, который восстанавливают до металла. Около 40% олова расходуется на производство белой жести для консервной промышленности. Это обусловлено стойкостью олова

против коррозии, лёгкостью покрытия им железа и безвредностью продуктов коррозии. Олово применяют для пайки, лужения, для изготовления бронз, латуней, типографских, подшипниковых и других сплавов. Сульфид SnS_2 входит в состав красок для золочения. Диоксид SnO_2 идёт на приготовление жаростойких эмалей и свинцово-оловянных глазурей. Олово высокой чистоты применяют в полупроводниковой технике и электронике. Соединение Nb_3Sn – один из важнейших сверхпроводников.

TIN CHLORIDE = ХЛОРИД ОЛОВА – Tin Chloride (tin (II) chloride, read tin two chloride) $SnCl_2$; also called Stannous Chloride. Formerly, tin (II) chloride was often used as a reducing agent for discharge printing. In most cases sodium formaldehyde sulfoxylate or zinc formaldehyde sulfoxylate has replaced it in modern processes. It still finds some application for discharge on acrylic fabrics. It is also used as a mordant with some natural dyes. / ; именуемый также Хлорид, Содержащий Двухвалентное Олово (Stannous Chloride). формальдегид сульфоксилат натрия (sodium formaldehyde sulfoxylate) или формальдегид сульфоксилат цинка (zinc formaldehyde sulfoxylate).

TIN HAT = СТАЛЬНОЙ ШЛЕМ (или ОЛОВЯННАЯ ШЛЯПА) – Tin Hat:- a metal helmet.

TINT = ОТТЕНЯТЬ (или ПОДЦВЕЧИВАТЬ, или ОКРАШИВАТЬ, или ТОНИРОВАТЬ) – Tint:- to adjust the color of a test specimen to be a closer color match to the standard.

TINT = ТОН (или ОТТЕНОК) – Tint:- coloration that produces a very pale shade. A tint usually represents the minimum amount of color that will give perceptible appearance of coloration. In yarn processing, fugitive tints are used for identification, then removed in wet processing. / подцветки (tints) используются для идентификации, а затем удаляются . Оттенок – цвет, получаемый из чистого цвета добавлением белого или чёрного, а также – в небольших количествах других цветов. Тон цветовой, одна из основных характеристик цвета (наряду с его светлотой и насыщенностью), определяющая его оттенок и выражающаяся словами ‘красный, синий, сиреневый’ и так далее; различия в названиях красок указывают в первую очередь на цветовой тон (например, ‘изумрудная зелень’, ‘лимонная’, ‘жёлтая’ и так далее). В живописи тоном называют также основной оттенок, обобщающий и подчиняющий себе все цвета произведения и сообщающий колориту цельность. Краски в тональной живописи подбираются с расчётом на объединение цветов общим тоном. В зависимости от преобладания тех или иных цветов и различия в их сочетаниях тон в картине может быть серебристым, золотистым, тёплым или холодным и так далее. Термином Тон в живописи определяют также светлоту цвета.

TINT = ФОН (или ТОН, или ОКРАС, или ОКРАСКА, или ПОДЦВЕТКА, или ПОДЦВЕЧИВАНИЕ, или ИНТЕНСИВНОСТЬ ЦВЕТА, или ПОДКОЛЕРОВКА, или РАСТРОВЫЙ ФОН (в полиграфии)) – Tint is the color produced by the mixture of white pigment with absorbing (generally chromatic) colorants. The color of the resulting mixture is lighter and less saturated than the color without the addition of the white. / Под Фоном, от Французского слова Fond, от Латинского слова Fundus, означающее Дно или Основание, понимается:- (1) основной цвет, тон, на котором пишется картина. (2) Задний пространственный план картины. (3) В переносном значении – среда, окружение, в которых происходит что-либо.

TINTED DENIM/DIRTY DENIM = ОТТЕНЁННЫЙ ДЁНИМ/ГРЯЗНЫЙ ДЁНИМ – Tinted Denim/Dirty Denim is a denim that is woven with indigo and khaki/yellow fibers instead of indigo and white; creates a ‘dirty’ look to the denim that shows through more and more with wash and wear; sandblasting (wearing out or scrubbing out indigo dye) can make tinting appear more prominent.

TIP = TO INSURE PROMPTNESS

TIP = TRANSPORTATION IMPROVEMENT PROGRAM

TIPBURN YELLOW = ПОБУРЕНИЕ КОНЧИКА ЛИСТА ХЛОРОЗ – Tipburn Yellow is a condition in which the yellowish seedlings die after the second foliage leaf is formed. The leaf apexes wither and die. / Tip – чехлик.

TIPPET = ЛОР (или ЛОРУМ, или (МЕХОВАЯ) ГОРЖЕТКА, или ПАЛАНТИН, или МЕХОВАЯ ПЕЛЕРИНА) – A Tippet is a scarf-like narrow piece of clothing, worn over the shoulders. It may also be likened to a stole in the secular rather than ecclesiastic sense of this word. Tippets evolved in the XIV century from long sleeves and typically had one end hanging down to the knees. In later fashion, a tippet is often any scarf-like wrap, usually made of fur, such as the XVI century zibellino or the fur-lined capelets worn in the mid-XVIII century. Tippet is a shoulder cape of fur or cloth often with hanging ends; a long black scarf worn over the robe by Anglican clergymen during morning and evening prayer. The ceremonial scarf worn by Anglican presbyters is called a Tippet. The tippet is worn with choir dress and hangs straight down at the front. Ordained clergy wear a black tippet, while licensed readers wear a blue one. In some countries it is normally simply referred to as a Preaching Scarf, Black Scarf, or Blue Scarf. The tippet is different from the stole, which although often worn like a scarf is a Eucharistic vestment, usually made of richer material, and varying according to the liturgical color of the day. Clergy who are entitled to wear medals, orders or awards may fix them to the upper left side of the tippet on suitable occasions (Remembrance Sunday for example). Sometimes the right end of the tippet is embroidered with the coat of arms of the ecclesiastical institution of which the cleric is a member, but some deplore this usage. Tippets are often worn for the Daily Offices of Morning Prayer and Evensong. (Cf. Canon B8 of the Church of England, nb. the word ‘Scarf’ is referring to the Tippet) Stricter low church clergy may wear the tippet and choir dress during any church service, whether Communion is celebrated or not. This follows a practice that was enforced from the Reformation until the late XIX century. By contrast, Anglican Catholics tend not to wear the tippet, often preferring to wear the choir habit of Roman Catholic clergy instead. Some Lutherans use the tippet, as well. Members of the Society of the Holy Trinity wear a tippet embroidered with the Society’s seal when presiding at the daily office. The black preaching scarf (rarely blue, grey or green) is also worn by some Scottish Presbyterian ministers and other non-conformist clergy.

TIPPY WOOL = ОБНОЖКА (или ЗАОСТРЁННАЯ ШЕРСТЬ) – Tippy Wool is the badly weathered ends of fleece, usually contain a considerable amount of grease, dirt and other debris. The tips dye differently from the rest of the fleece. Tippy Wool:- staples which are encrusted with wool grease and dirt at the weather end. Tippy Wool can be caused by sun damage or stress soon after shearing, or other factors. The result is the same – the very tip of each lock will break off quite readily. Some methods of hand preparation such as combing or precarding will remove these tips. Commercial processing will most likely break them off and thoroughly mix them in the roving or batt, causing tiny lumps which can make spinning a real pain. Tippy Wool is a wool in which the tip portions of the fibers have been so damaged by weathering during growth as to have markedly different dyeing properties. / Обножка – шерсть, состриженная с нижних частей конечностей.

TIPS = TREASURY INFLATION–PROTECTED SECURITIES

TIP–SHEARED CARPET = КОВЁР СО СТРИЖЕНЫМ ВЕРХОМ – Tip-Sheared Carpet is a textured pile carpet similar to a random-sheared carpet, but with a less defined surface effect.

TIR = TRAILER INTERCHANGE AND RECEIPT

TIR = TRANSPORTS INTERNATIONAUX ROUTIERS

TIR CARNET = ТЭ.И.ЭР. КАРНЭ (или КНИЖКА МДП) – TIR Carnet is a document facilitating transit by serving both as a customs declaration and as a guarantee in countries that are a contracting party to the TIR Convention (the Customs Convention on the International Transport of Goods Under Cover of TIR Carnets, 1975). See also Transports Internationaux Routiers Carnet. TIR Carnet is a document which can be issued to ease border crossings in Europe. Customs at a European location places a seal on a container and issues the TIR Carnet. The document and seal allow the container to cross borders without inspection to the consignee's door, where destination customs will then inspect the cargo. / Смотрите также Транспор Этэрнасьёно Рутэр Карнэ или Книжка Международной Дорожной Перевозки (Transports Internationaux Routiers Carnet). Книжка Международной Дорожной Перевозки или Книжка МДП – это документ таможенного транзита, используемый для подтверждения существования международной гарантии уплаты таможенных пошлин и налогов на товары, перевозимые по процедуре МДП, в пределах сумм, установленных договаривающимися сторонами, и на условиях, предусмотренных Конвенцией МДП. Каждая книжка МДП имеет уникальный идентификационный номер. Книжка МДП может содержать 4, 6, 14 или 20 отрывных листков. Так как в каждой стране используется комплект из двух отрывных листков, то количество листков в книжке указывает число стран, через которые можно проехать транзитом по данному типу книжки, включая страну отправления и назначения. Например, 20-страничные книжки могут быть использованы для перевозки МДП через максимум 10 стран. Каждая отдельная книжка МДП может быть использована только для одной перевозки МДП. По завершению перевозки МДП в таможне назначения, книжка МДП возвращается водителю, заверенная надлежащим образом таможенными органами назначения. Таможенные органы должны немедленно подтвердить в электронном виде прекращение перевозки МДП через SafeTIR. Книжка МДП возвращается в ассоциацию и отправляется затем в Международный Автотранспортный Союз (MAC) (или Международный Союз Автомобильного Транспорта (MCAT); International Road Transport Union (IRU)) для окончательного контроля и архивирования.

TIR CONVENTION = TRANSPORTS INTERNATIONAUX ROUTIERS CONVENTION

TIRE–BUILDER FABRIC = ТКАНЬ ФОРМИРОВАТЕЛЬ ШИНЫ (или ПОКРЫШКИ) – Tire-Builder Fabric is a fabric consisting of tire cord in the warp with single yarn filling at extended intervals. / уточина .

TIRE CONSTRUCTION = КОНСТРУКЦИЯ ШИНЫ (или КОНСТРУКЦИЯ ПОКРЫШКИ) – Tire Construction:- the geometry of the various layers of tire fabric in the final tire. Three constructions are commonly used:- (i) Bias Tire; (ii) Radial Tire; and (iii) Bias/Belted Tire. See also Bias Tire, Bias/Belted Tire, and Radial Tire. / Конструкция Шины или автомобильной покрышки:- . Смотрите также Диагональная Шина (Bias Tire), Диагональная/Ременная Шина (Bias/Belted Tire), Радиальная Шина (Radial Tire).

TIRE CORD = ШИННЫЙ КОРД (или КОРД ПОКРЫШКИ) – Tire Cord is a textile material used to impart the flex resistance necessary for tire reinforcement. Tire yarns of polyester, rayon, nylon, aramid, glass, or steel are twisted to 5 to 12 turns per inch. Two or more of these twisted yarns are twisted together in the opposite direction to obtain a cabled tire cord. The twist level required depends on the material, the yarn linear density, and the particular application of the cord. Normally, tire cords are twisted to about the same degree in the S and Z directions, which means that the net effect is almost zero twist in the finished cord. See also Tire Fabric. / Найлан^{T3} (Nylon^{TM}). некручёное или нулевая крутка (zero twist).

TIRE FABRIC = ШИННАЯ ТКАНЬ (или ТКАНЬ ДЛЯ ПОКРЫШЕК) – Tire Fabric is a loose fabric woven to facilitate large-scale dipping, treating, and calendaring of tire cords. Usually, 15 to 35 tire cords per inch of warp are woven into a tire fabric by 2 to 5 light filling yarns per inch. In these fabrics, the strength is in the warp and the filling only holds cords in position for processing. The filling yarns are normally broken during tire molding. The warp cords are polyester, rayon, nylon, aramid, glass, or steel and range in strength from 30 pounds to over 100 pounds per cord. A 60-inch fabric would normally have a warp strength of about 7 000 pounds. Such fabrics are used for tire carcasses and tire belts. More conventional square woven fabrics are used in certain parts of a tire such as the bead, chafer, and wrapping. See also Tire Cord. / в основе и уточине . Найлан^{T3} (Nylon^{TM}).

TIRES = TRANSPORTATION INTERFACE AND REPORTING SYSTEM

TIR GUARANTEE = ГАРАНТИЯ МДП – TIR Guarantee is the amount of the security covering the duties and taxes at risk. The TIR Convention recommends the amount of the guarantee should be USD50 000.00 per TIR carnet. The European Community has fixed the amount at EUR60 000.00 per TIR carnet.

TIS = TRANSPORT INFORMATION SERVICE

TISSUE = ТКАНЬ – (1) Tissue is a fine lightweight often sheer fabric.

(2) Tissue is any part of an organism consisting of aggregated cells with a similar structure and function. / Ткани (биологические) системы клеток, сходных по происхождению, строению и функциям. В состав тканей входят также межклеточные вещества и структуры – продукты клеточной жизнедеятельности. (1) Ткани (растений):- рост растения и развитие его внутренней структуры обусловлены деятельностью образовательной ткани, или меристемы, производные которой претерпевают сложную структурную и функциональную дифференцировку, превращаясь в элементы постоянных тканей. Классификации постоянных тканей основываются на морфологических, функциональных, генетических и других признаках. Различают, например, Ткани Паренхимные и Ткани Прозенхимные. Постоянные ткани относят к трём системам:- покровной, проводящей и основной, появление которых в онтогенезе растений отражает главные этапы внутренней дифференцировки растительного организма в процессе эволюции. По наиболее распространённой физиологической классификации тканей, предложенной Немецким физиологом растений Готлибом Хабэрландтом (Haberlandt; родился 28 Ноября 1854 в Мошонмадьяровар, Венгрия – умер 30 Января 1945 в Берлине, Германия), постоянные ткани составляют системы:- (i) покровную, представленную эпидермисом, пробкой и коркой; (ii) механическую, включающую колленхиму, состоящую из живых паренхимных клеток с неравномерно утолщёнными стенками, и склеренхиму, представленную одревесневшими волокнами и более или менее изодиаметрическими склереидами; (iii) абсорбционную, осуществляющую поглощение веществ с помощью ризоидов, корневых волосков, образованных эпиблемой, многослойного покрова (веламена) воздушных корней орхидных; (iv) ассимиляционную, состоящую из паренхимных клеток с обилием хлоропластов; (v) проводящую, представленную ксилемой, осуществляющей проведение воды, и флоэмой, участвующей в перемещении органических веществ; (vi) запасающую, состоящую из паренхимных клеток; (vii) секреторную, включающую гидатоды, млечники, вместилища выделений различного происхождения; (viii) систему проветривания, представленную межклетниками, устьицами, чечевичками. Все ткани, кроме покровной, проводящей и системы проветривания, можно считать разновидностями основной ткани. Ткани растений изучает Анатомия Растений. (2) Ткани (животных):- выделяют 4 типа тканей, соответствующие основным соматическим функциям организма. (i) Пограничная Ткань, или Эпителий, образует покровы тела и оболочки внутренних органов. Производные ее выполняют секреторную функцию, составляя, например, основную массу печени, поджелудочной железы. (ii) Соединительная Ткань, в том числе и ткань внутренней среды, осуществляет трофическую и защитную функции организма. Производные соединительной ткани – хрящ и кость – несут у позвоночных животных опорную функцию, образуя скелет. (iii) Мышечная Ткань выполняет двигательные функции, перемещая организм и вызывая сократительные движения его органов. (vi) Нервная Ткань регулирует

и координирует жизнедеятельность всех тканей, воспринимает сигналы из внешней среды и определяет ответные реакции организма. Развитие каждого типа ткани – результат определённого гистогенеза, протекающего в эмбриональном периоде. Во многих тканях гистогенезы продолжаются и у взрослых животных, обеспечивая регенерацию, а иногда и рост тканей. Специфические для каждого органа функции осуществляются обычно одной тканью или даже некоторыми специализированными её клетками. Но в любом органе взаимодействуют различные ткани, способствуя трофике и координации основных функциональных элементов. Активность тканевых клеток зависит как от непосредственных их контактов ткани, так и от отдалённых гормональных и нервных влияний. У низших многоклеточных ткани не столь строго детерминированы, как у высших. Эволюция организмов привела к специализации клеток, взаимообусловленности их функционирования и самого существования в многотканевой системе. Однако моделируя окружение клеток, можно не только обеспечить их жизнь вне организма, но и многие гистогенезы, что стало одним из основных методов изучения тканей. Ткани животных изучает Гистология.

TISSUE CULTURE = ТКАНЕВАЯ КУЛЬТУРА (или КУЛЬТУРА ТКАНИ) – Tissue Culture is a technique of growing large pieces of tissue (explant) from different parts of a plant in semisolid or liquid medium under aseptic conditions. After the culture, masses of undifferentiated tissue are produced or plants are regenerated.
