BROADCAST PLANTING = СПЛОШНАЯ ПОСАДКА (или РАЗБРОСНАЯ ПОСАДКА) – Broadcast Planting is a method of planting in which the seeds or seedlings are dropped or thrown over the entire surface area of the field. / Под Разбросным Посевом понимается размещение семян на поверхности почвы без междурядий. Самый древний способ посева, заменён рядовым.

BROADCAST TILLAGE (TOTAL SURFACE TILLAGE) = СПЛОШНАЯ ВСПАШКА (или РАЗБРОСНАЯ ВСПАШКА, или СПЛОШНАЯ ОБРАБОТКА ПОЧВЫ) – Broadcast Tillage (Total Surface Tillage):- complete coverage of the entire surface area as contrasted to partial coverage in bands or strips. / Под Боронованием (Harrowing) понимается рыхление поверхностного слоя почвы боронами и вращающимися мотыгами. Предохраняет почву от высыхания, выравнивает её поверхность, разрушает почвенную корку, уничтожает сорняки.

BROADCLOTH = ШИРОКОЕ ПОЛОТНО – Although the term Broadcloth originally meant any fabric made on a loom of a certain width, it now means a fine, tightly woven fabric with a faint rib. Originally, it was made of mercerized cotton, but today the term is used to describe several dissimilar fabrics made with different fibers, weaves, and finishes. (1) Originally, a silk shirting fabric so named because it was woven in widths exceeding the usual twenty-nine inches. (2) A plainweave, tightly woven, high-count cotton fabric, with fillingwise rib finer than poplin. Best grades are made of combed Pima or Egyptian Cotton, usually with high thread counts (136 x 60 or 144 x 76). The fabrics are usually mercerized, sanforized, and given a soft lustrous finish, and are used for women's blouses, tailored summer dresses, and men's shirts. (3) A closely woven, medium-weight wool cloth with a smooth nap, velvety feel, and lustrous appearance. Wool broadcloth can be made with a two-up-and-two-down twill weave or plain weave. In setting up a loom to make the fabric, the loom is threaded wide to allow for a large amount of shrinkage during the filling process. The fabric takes its name from this wide threading. High-quality wool broadcloth is fine enough for garments that are closely molded to the figure or draped. Its high-luster finish makes it an elegant cloth. Wool broadcloth is ten to sixteen ounces per yard and is now being made in chiffon weights. (4) A fabric made from silk or man-made filament fiber yarns and woven in a plain weave with a fine crosswise rib obtained by using a heavier filling than warp yarn. Broadcloth is a fine, closely woven, lustrous cotton or cotton/poly blend made in plain weave with a fine rib in the weft. The filling yarn is heavier and has less twist than the warp. The cloth is usually mercerized, and has a soft, firm finish. Modern Broadcloth is a term used today with no particular significance, and it covers a host of materials. Unless made of cotton, the cloth in the woolen and worsted trade, with regard to quality and classification, is a splendid fabric made is staple colors, has a compact weave, and receives a high, lustrous appealing finish. In men's wear, black broadcloth is still popular in legislators', diplomats', and other formal circles. Popular broadcloth runs from 10 to 16 ounces per yard. An ideal weave to use it is a 2-up and 1-down twill, with the goods woven face down. Some of the material may be made with plain weave. These fabrics find much use in shirting, dress goods, coats, pajamas, waist, etc. Broadcloth is a plain weave tightly woven fabric, characterized by a slight ridge effect in one direction, usually the filling. The most common broadcloth is made from cotton or cotton/polyester blends. Broadcloth is a dense, woolen cloth. Modern broadcloth can be composed of cotton, silk or polyester, but traditionally, broadcloth was made solely of wool. The dense weave lends sturdiness to the material; it is often used to make quilts or skirts. Standard construction of the gray fabric in Japan:- 100% cotton, (1) 40's x 40's, 120 x 60 threads per inch, 44"; (2) 40's x 40's, 123 x 67 threads per inch, 47.5"; and (3) 40's x 40's, 133 x 72 threads per inch, 38". The term 'Poplin or Broadcloth' means plain weave fabrics, not of square construction, whether or

not napped, but does not include the following types:- (i) fabrics weighing not more than 200 grams per square meter, containing 33 or less warp ends and filling picks per square centimeter; and (ii) fabrics weighing more than 200 grams per square meter, of average yarn number 26 or lower number. Broadcloth:- cotton and silk, and rayon. Plain weave and in most cotton broadcloths made with a very fine crosswise rib weave. Originally indicated a cloth woven on a wide loom. Very closely woven and in cotton, made from either carded or combed yarns. The filling is heavier and has less twist. It is finer than poplin when made with a crosswise rib and it is lustrous and soft with a good texture. Thread count ranges from high quality 144 x 60 count down to 80 x 60. Has a smooth finish. May be bleached, dyed, or printed; also is often mercerized. Wears very well. If not of a high quality or treated, it wrinkles very badly. Finest quality made from Egyptian or combed Pima Cotton – also Sea Island. Used in shirts, dresses, particularly the tailored type in plain colors, blouses, summer wear of all kinds. (Wool Broadcloth) Usually a twill with a two up and one down construction. Some also in the plain weave. Has a napped face, closely sheared and polished, producing a silky gloss – in same group of fabrics as kersey, beaver cloth, melton. One way nap, must be handled like velvet when cutting. It comes in a variety of colors and weights. It is 'dressy' fabric and must be handled with care – form fitting and drapes well. Broadcloth is:- (1) originally, a silk shirting fabric so named because it was woven in widths exceeding the usual 29 inches. (2) A tightly woven, lustrous cotton or polyester/cotton blend fabric in a plain weave with a crosswise rib. It resembles poplin, but the rib is finer, and broadcloth always has more picks that poplin. The finest qualities are made with combed Pima or Egyptian Cotton. (3) A smooth, rich-looking, woolen fabric with a napped face and a twill back. Better grades have a glossy, velvety hand. / уточина. (1) Тонкосуконная ткань саржевого переплетения. (2) Тонкая плотнотканая мерсеризованная хлопчатобумажная ткань рубашечная полотняного переплетения, схожая с поплином, аналогичная ткань из искусственного шёлка, штапельного волокна.

BROAD ECONOMIC POLICY GUIDELINES = РУКОВОДСТВА ПО ШИРОКОЙ ЭКОНОМИЧЕСКОЙ ПОЛИТИКЕ – Broad Economic Policy Guidelines (BEPGs):- the Treaty obliges the Member States to coordinate their economic policies within the EU Council. The BEPGs constitute the main instrument of this coordination. They contain recommendations to policy-makers on macroeconomic and structural policies and provide a yardstick for ex post assessment in the context of multilateral surveillance within the EU Council. The EU Council, acting on a recommendation from the European Commission, formulates a draft of the BEPGs and reports its findings to the European Council. The EU Council then adopts a recommendation on the BEPGs based on the European Council's conclusions.

BROADFALL = ШИРОКАЯ ФАЛДА (или ХХ) – Broadfall:- the wide falling front flap of breeches or trousers such as those of sailors. Split falls are the narrower type of flap found on lederhosen and some jodhpurs. The plural broadfalls is sometimes used to mean trousers having a broadfall.

BROAD GOODS = ШИРОКИЕ ТОВАРЫ – Broad Goods:- in textile, the woven fabrics 18 inches or more in width. / Сотканые ткани шириной от 18 дюймов (46 сантиметров) и более.

BROAD–LEAF WEED = ШИРОКОЛИСТНОЕ СОРНОЕ РАСТЕНИЕ (или ШИРОКОЛИСТНЫЙ СОРНЯК) – Broad-Leaf Weeds or Broadleaf Weeds are generally the easiest to identify of all the Weeds. They have leaves that are broad, and are generally produced in pairs or multiples, have wide, flat leaves situated on a stem. Broadleaf Weeds are distinctive from and are botanically not closely related to grasses and sedges. Broadleaf leaves may be simple (having one leaflet, like dandelion) or compound (having more than one leaflet, like clover). Veins within the leaf give a netted appearance in most cases. A dense, healthy stand of grass is the best way to reduce broadleaf weeds in home lawns. To achieve a healthy lawn, plant the best-adapted turfgrass species and use accepted turf management practices. Even with proper management, however, the best-cared-for lawns can still be invaded by troublesome broadleaf weeds. These may require the careful and selective use of broadleaf weed control herbicides. Common broadleaf weeds:- Broadleaf Dock, Broadleaf Plantain, Buckhorn Plantain, Carolina Geranium, Carpet Weed, Chickweed, Curly Dock, Dandelion, Ground Ivy (Glechoma Hederacea; also known as Creeping Charlie), Henbit, Lambsquarter, Violets (Viola Species), White Clover, Wild Strawberry, and Yellow Wood Sorrel. See also Dicots. Broadleaf Weeds are Weeds belonging to either Subclass Monocotyledonae or Dicotyledonae. They are identified by their fully expanded, broadleaf structure and netted venation. / Самыми распространёнными Широколистными Сорняками являются:- Туполистный Щавель (Broadleaf Dock), Широколистный Подорожник (Broadleaf Plantain), Ланцетолистный (или Олений Рог) Подорожник (Buckhorn Plantain), Каролинская Герань (Carolina Geranium), Ковровый Сорняк (Carpet Weed), Мокрица или Звездчатка (Chickweed), Курчавый Щавель (Curly Dock), Одуванчик (Dandelion), Плющевидная Будра (Ground Ivy (Glechoma hederacea); известная также как Ползучий или Стелющийся Чарли (Creeping Charlie)), Белокудренник или Яснотка (Henbit), Белая Марь (Lambsquarter), Фиалки (Violets (Viola species)), Белый (ползучий) Клевер (White Clover), Дикая (Лесная) Земляника (Wild Strawberry), и Жёлтая Обыкновенная Кислица (Yellow Wood Sorrel). Под Сорными Растениями или Сорняками понимаются Растения, произрастающие в посевах сельскохозяйственных культур (Сегетальные Растения – Осот, Пырей и многие другие), а также по обочинам дорог, вдоль оград, в мусорных местах (Рудеральные Растения – Белена, Дурман, Крапива и другие). Несколько тысяч Видов.

BROAD–LEAVED TREES = ДЕРЕВЬЯ ЛИСТВЕННЫХ ПОРОД – Broad-Leaved Trees are the trees which shed their leaves in the autumn. Most broadleaved or deciduous trees are hardwoods and have broad leaves. / К Лиственным Породам относятся деревья и кустарники обычно с пластинчатыми черешковыми листьями, на которых ярко выражено разветвлённое жилкование. Подразделяются на:- (i) мягколиственные породы – Липа, Ольха, Тополь и другие; и (ii) твёрдолиственные породы – Бук, Граб, Дуб, Клён, Саксаул, Ясень и другие. Деревья лиственных пород используются для получения древесины, в полезащитном лесоразведении, озеленении и в других целях. Плоды некоторых лиственных пород деревьев являются съедобными, например, Груши, Каштана, Грецкого Ореха, Рябины, Яблони.

BROADLOOM = ШИРОКИЙ ТКАЦКИЙ СТАНОК – Broadloom is a term that refers to carpets woven in widths from 54 inches to 18 feet, as distinguished from narrow loom widths of 27 to 36 inches.

BROAD SPECTRUM ANTIMICROBIAL = АНТИМИКРОБНОЕ СРЕДСТВО ШИРОКОГО СПЕКТРА – Broad Spectrum Antimicrobial:- an antimicrobial that effectively controls or kills at least 3 of the basic microorganism groups. This term is important to help give a specific encompassing term to technologies that offer protection from the gamut of microorganisms, without the sometimes vague nature of the term antimicrobial, which could mean kills just one type or kills many types.

BROAD–SPECTRUM PESTICIDE = ПЕСТИЦИД ШИРОКОГО ДЕЙСТВИЯ – Broad-Spectrum Pesticide is a pesticide that kills a large number of unrelated species. There are also soft pesticides and narrow-spectrum pesticides. / Пестицид, уничтожающий большое число разнообразных неродственных видов вредителей. Существуют также пестициды, не загрязняющие окружающую среду (лёгкие пестициды), и пестициды узкого спектра действия.

BROAD/UNEVEN SELVEDGE = ШИРОКАЯ/НЕРОВНАЯ КРОМКА – Broad/Uneven Selvedge:- tail of weft comes in fabric after tuck-in and more than 15 mm tuck in width called broad selvedge and some places width of the selvedge varies called uneven selvedge. Weaving defect. / Порок или Дефект ткачества.

BROB = BUNKER REMAINING ON BOARD

BROCADE = ПАРЧА – Brocade fabric is one of the several shuttle-woven fabrics that intricate patterns that often include a selection of flowers, plants and other natural images. Usually woven with a selection of various types of silk that are accented with metallic threads as a means of adding texture and visual interest, brocade is used in a number of different applications around the home, as well as a desirable element in formal wear and stage costuming. Brocade is often created with the use of a draw loom. Employing both a standard weft and a supplemental weft during the weaving process develops the detail of the pattern. The two-fold approach gives the finished product an appearance that is not unlike a piece of fabric that has been embroidered. The double weft technique also often provides a level of stiffness to the design of the brocade, and also helps to make the material sturdy enough for use in applications that require a heavier fabric. Brocade for many years was a favorite choice of fabric for upholstering formal pieces of furniture. While the practice declined after the middle of the XX century, brocade is still considered an ideal option when restoring antique sofas, chairs, settees, and chaise lounges. Along with use as upholstery, brocade has remained a desirable textile for window treatments. Draperies created from brocade are understood to provide a hint of formality to living space, and are often employed in formal living rooms and as part of the curtains for a canopy bed. Wall hangings that are constructed with silk brocade are often used to add color and visual interest to a room or hallway. Brocade is also a popular option as material for wedding dresses, especially designs that wish to recapture the luxury and opulence of the Victorian era. Brocade may also be used to create cummerbunds for tuxedos. In the entertainment world, brocade continues to be a desirable option for costuming for stage shows, such as plays or concerts. Essentially, brocade is an ideal fabric option when clothing that is both elegant and sophisticated is desired, and is meant to focus attention on the wearer. Brocade is a Jacquard weave with an embossed effect and contrasting surfaces. Can also be woven with synthetic or man-made fibers. Brocade (Silk):- an elaborate and richly figured fabric woven on a Jacquard loom using satin weave. The warp float gives a raised appearance. Originally woven in silk with additional silver or gold threads, but now can be made with man-made fibers. Was first produced in China. Light weight brocade is used for apparel and heavier weights for furnishings. A brocatine is brocade with a raised pattern imitating embroidery. The word brocade comes from the Latin word brocare, meaning to figure. Brocade is a heavy, exquisite Jacquard type fabric with an all-over raised pattern or floral design. Common end-uses include such formal applications as upholstery, draperies, and eveningwear. Brocade is:- (1) a rich, Jacquard-woven fabric with an all over interwoven design of raised figures or flowers. The pattern is emphasized by contrasting surfaces or colors and often has gold or silver threads running through it. The background may be either a satin or a twill weave. (2) A term describing a cut-pile carpet having a surface texture created by mixing twisted and straight standing pile yarns. Brocade is a class of richly decorative, shuttle-woven fabrics, often made in colored silks (rayon, nylon, cotton and satin can also be used) and with or without gold and silver threads. Commonly used for draperies, upholstery and handbags. Brocade is a rich oriental silk fabric with raised patterns in gold and silver. Cotton brocade often has the ground of cotton and the pattern of rayon and silk. Pattern is in low relief. Generally weaved in Jacquard and dobby. Rich, heavy, elaborate design effect. Sometimes with colored or metallic threads making the design usually against a satin weave background. This makes the figures stand out. The figures in brocade are rather loose, while in Damask the figure threads are actually bound into the material. The pattern may be satin on a twill ground or twill on a satin ground. Often reversible. The motifs may be of flowers, foliage, scrollwork, pastoral scenes, or other designs. Generally reputed to have been developed from the Latin name 'Brocade' which means to figure. Brocade is used as a drapery or upholstery fabric. It has a Jacquard weave with an allover interwoven design, normally figures or flowers. The name is derived from the French word meaning 'to ornament'. The brocade pattern is accentuated with varying surfaces or colors and often has gold, silver, or other metallic threads running through it. Although true brocades still are produced, nowadays the term is also used for knits with a similar luxurious look. A brocade rug, in carpeting, is one in which different yarns of the same color create a subtle pattern. / Жакяр (Jacquard). Найлан (Nylon). Под Парчой понимается ткань с рельефным жаккардовым узором сложного переплетения. Под Парчой, от Персидского слова Парче, означающее Материя, понимается сложноузорчатая художественно-декоративная ткань с шёлковой основой, содержащая в утке (реже в основе) металлические нити (из золота, серебра или имитирующих их материалов). Выработка парчи известна с начала Нашей Эры в Китае, в России – с XVI века. Используется в основном как отделочный и декоративный материал. Парча – (от Персидского слова Парче, означающее Материя), сложноузорчатая художественно-декоративная ткань с шёлковой основой, содержащая в утке (реже в основе) металлические нити с золотом, серебром или имитирующими их материалами. Золотые и серебряные нити в парче только в древности вырабатывались из чистого драгоценного металла, позднее сплавы с незначительным содержанием драгоценных металлов заменили в парче золото и серебро. Обычно металлической ленточкой обвивают шёлковую или хлопчатобумажную (мишура) нить, что обеспечивает необходимую гибкость ткани и одновременно придаёт ей достаточную массивность и блеск. Выработка парчи была известна ещё в начале Нашей Эры в Китае, откуда это искусство перешло в страны Малой Азии (Сирия, Персия и другие), а затем на юг Европы (Сицилия, Византия, Италия, Испания, Франция). В России первые попытки производства парчи относятся к концу XVI века, когда в Москву был выписан из Италии мастер Чипони. Парча использовалась для торжественной одежды людей высших классов, служителей культов, отделки интерьеров и других целей. В настоящее время вырабатывается в очень ограниченных количествах, используется в основном для исторических театральных костюмов, как отделочный и декоративный материал и тому подобное. Заменяется тканями из синтетических нитей, вырабатываемых, например, из полосок плёнок, дублированных фольгой.

BROCADED SATIN = ВЫШИТЫЙ АТЛАС (или ВЫШИВНОЙ АТЛАС, или ПАРЧОВЫЙ АТЛАС) – Brocaded Satin is a satin fabric with raised designs in Jacquard weave. / Жакяр (Jacquard).

BROCATELLÉ = БРОКАТЁЛЕ (или ПОЛУПАРЧА, или ИМИТАЦИЯ ПАРЧИ) – Brocatelle:- silk, rayon, cotton, and synthetics. Jacquard – double or backed cloth. Originally supposed to be an imitation of Italian tooled leather – satin or twill pattern on plain or satin ground. It is recognized by a smooth raised figure of warp-effect, usually in a satin weave construction, on a filling effect background. True brocatelle is a double weave made of silk and linen warp and a silk and linen filling. Present-day materials may have changed from the XIII and XIV century fabrics, but they still have the embossed figure in the tight, compact woven warp-effect. While brocatelle is sometimes classed as a flat fabric, it shows patterns which stand out in 'high relief' in a sort of blistered effect. Brocatellé is a fabric similar to brocade with a satin or twill figure in high relief on a plain or satin background. Brocatellé is a fabric similar to brocade but made of a Jacquard loom. It is used as drapery and upholstery fabric and made in double-cloth construction with a silk- or rayon-fibered face. / Жакяр (Jacquard). уточина. Под Брокатёле, от Французского слова Brocatellé, означающее , понимается (1) Декоративная жаккардова ткань. (2) Полушёлковая (с льняным утком) декоративная ткань. Льняной уток придаёт ткани прочность и не выступает на лицевую сторону ткани. Брокатёле – лёгкая полушёлковая материя, вытканая небольшими цветами, золотыми или серебряными букетами, иногда оттенёнными цветными нитками. Во второй половине XVII века использовалась для весенних платьев. Изящность и интимность брокатёле в XVIII веке развилась в особый стиль тканей – органди и кисеи с вышивкой металлическими нитями.

BROGAN = БРОГАН (или БАШМАК) – Brogan:- a heavy shoe, especially a coarse work shoe reaching to the ankle. Origin:- Irish Brógán, diminutive of Bróg. / рабочий полусапог на пряжках или шнурках деревянношпилечного или гвоздевого крепления.

BROGUE = БАШМАК – Brogue:- a stout coarse shoe worn formerly in Ireland and the Scottish Highlands; a heavy shoe often with a hobnailed sole, brogan; a stout oxford shoe with perforations and usually a wing tip. / грубый тяжёлый полуботинок (1) шпилечного или винтового крепления; или (2) с фигурным перфорированным носком.

BROKEN AND MISSING PICK = ОБОРВАВШАЯСЯ (или ОБОРВАННАЯ) И ОТСУТСТВУЮЩАЯ (или ПРОПУЩЕННАЯ, или НЕДОСТАЮЩАЯ, или ПРОСКОЧИВШАЯ) ПОПЕРЕЧНАЯ НИТЬ – Broken And Missing Pick:- the pick seems to have broken over a short number of warps and then continued. Possible Cause:- perhaps this was a float which has broken or been plucked out. This is a minor defect. However, it could have been major depending on the frequency and visibility. Weaving defect. / Под Разрывом Утка понимается местный порок в виде оборванной уточной нити на очень коротком участке по ширине ткани.

BROKEN CHECK = СБИТАЯ КЛЕТКА – Broken Check is a check pattern in which the checks are irregular instead of perfect squares. / Сбитая Клетка – клетка в виде шашечного рисунка.

BROKEN COLOR PATTERN = РИСУНОК С ОБОРВАННЫМ (или СО СБИТЫМ) ЦВЕТОМ – Broken Color Pattern (wrong color pattern defects):- on the woven fabric, the pattern of this case refers to the discontinuity in the use of silk weaving machine through color pattern described in the weft when the error or fault repair the loom when the image fills chain after re-set incorrectly could lead to the formation of such defects; of the knitted fabric, this situation is changing by the shuttle tube error generated. Fabric Printing Defect. Broken Color Pattern:- usually caused by color yarn out of place on frame. Knitted fabric defect. Defect Name:- Broken Color Pattern. Defect Type:- Pattern Defects. Fabric Type:- Double Knit Fabrics. Description:- Broken Color Pattern:- This defect is the result of a colored yarn being out of place in the creel. Severity:- Major. / Порок или Дефект набивки тканей. Под Непропечатанным Рисунком понимается распространённый порок, выраженный в виде отсутствия в некоторых местах изображения деталей рисунка или нечётком изображении рисунка. Нарушенный Цветовой Рисунок (broken color pattern):- порок ткани в виде отсутствия в некоторых местах изображения деталей рисунка или нечётком изображении рисунка. Примечание:- этот порок часто вызывается сбоем работы ткацкого станка.

BROKEN DATE = НЕСТАНДАРТНАЯ ДАТА – Broken Date is a term used in Forex trading for a forward exchange contract or money market contract with delivery of currency, etc on a nonstandard date, e.g., 28 days instead of 1 month. / Термин, используемый в торговле на Форэксе для срочных биржевых контрактов или контрактов на рынке валют для поставки валюты и прочего в нестандартную дату, например, 28 дней вместо 1 месяца.

BROKEN END = ОБОРВАВШАЯСЯ ПРОДОЛЬНАЯ НИТЬ (или ОБОРВАННАЯ ПРОДОЛЬНАЯ НИТЬ, или БЛИЗНА) – Broken End, Broken Pick:- a warp end or filling pick that has become broken at some point in the weaving on the loom. Broken threads are fixed by the weaver's knot, by twisting the two broken ends together, or by an ordinary knot. Broken yarn should be fixed at once, otherwise the fabric may have to be classed as a 'second'. Broken threads or small holes in fabric may be mended with a needle after the goods have come from the loom. Fastening a bright-colored yarn to the end will facilitate finding it when mending or sewing. Broken Ends are warp threads which have broken during the weaving or finishing, showing as a defect in the cloth. Broken End:- broken warp end, after warp breaks loom doesn't stop immediately it runs 2 to 3 picks or some time more than this without warp end. Broken End:- in woven fabrics, a void in the warp direction due to yarn breakage. Broken Ends:- (i) condition of Warp stop motion; (ii) warp breakage rate and shed staggering; (iii) staffing of ends due to bends and knots; (iv) fluff fiber dust accumulation at heald eye or reed; (v) timely cleaning; (vi) proper attachments to heald wires to heald frames; and (vii) condition of contact bar and guide bar in warp stop motion. Broken End (decapitation defects):- this defect refers to warp after fracture and after repair of the place, its common features can be seen woven into the fabric of which the breakage. Fabric Printing Defect. Broken End is a broken, untied warp thread in a fabric. There are numerous causes, such as slubs, knots, improper shuttle alignment, shuttle hitting the warp shed, excessive warp tension, faulty sizing, and rough reeds, heddles, dropwires, and shuttles. See also End Out. Broken Ends:- if a warp yarn is absent in the fabric for a very short or long distance and then this fabric defect is called Broken Ends. Broken Ends:- this is a void in the warp direction due to yarn breakage. This defect is caused by bunch of broken ends woven in the fabric. Weaving Defect. Broken Ends:- this defect is caused by a bunch of broken ends woven in the fabric. Defect Name:- Broken End. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Plain Weave Derivatives. Description:- Broken End:- This is the result of a warp end breaking and the excess yarn being woven into the filling direction of the fabric. This should have been cleaned up or manicured by the weaver when the broken end was repaired. Severity:- Major. Broken End is a defect in fabric caused by a warp yarn that was broken during weaving or finishing. / уточная поперечная нить. Порок или Дефект ткачества. Близна – отсутствие одной-двух нитей основы вследствие их обрыва; дефект хорошо виден на просвет, особенно в тканях полотняного переплетения. Близна ухудшает внешний вид тканей и уменьшает срок их службы. Близны в одну нить; Размер порока – до 25 сантиметров (см). Близны в две параллельные нити; Размер порока – до 10 см. Под Близнами понимается дефект суровой или готовой ткани, заключающийся в отсутствии одной или нескольких нитей основы на определённом участке ткани, причина этого порока – разладка основонаблюдателя. Оборванная Основная Нить; Обрыв Основы (broken end; end out; missing end):- порок основы, представляющий собой отсутствие нити основы по длине ткани. Примечание:- этот порок часто вызывается порывом пряжи основы, который не восстановлен.

BROKEN ENDS AT REGULAR INTERVALS = ОБОРВАННЫЕ НА РЕГУЛЯРНЫХ ИНТЕРВАЛАХ ПРОДОЛЬНЫЕ НИТИ – Broken Ends At Regular Intervals:- Possible Cause:- not determined, however this has to be a post weaving defect as the loom would have automatically stopped had the ends broken during production. A single line in fabric if strategically incorporated in the end product will not make much of a difference in the appearance of the fabric. This defect was part of the back pocket of a trouser. In my opinion it is minor. Pretreatment/Finishing/Stitching defect.

BROKEN ENDS WOVEN IN A BUNCH = ОБОРВАННЫЕ ПРОДОЛЬНЫЕ НИТИ, ЗАТКАНЫЕ В БУХТУ (или ПУЧОК) – Broken Ends Woven In A Bunch:- this defect is caused by a bunch of broken ends woven into the fabric. Cause:- failure of the weaver in attending the warp breaks properly. Mending:- the broken ends woven in a bunch can be removed by using a plucker and the resulting loose ends should be cut with clipper. As a result, a bare patch occurs and combing in both directions with a metallic comb can fill this up.

BROKEN FILAMENT = ОБОРВАННАЯ (ЭЛЕМЕНТАРНАЯ) НИТЬ (или ОБОРВАВШАЯСЯ (ЭЛЕМЕНТАРНАЯ) НИТЬ) – Broken Filament:- in multifilament yarn, breaks in one or more filaments. Synonym:- Skin Back, and Strip Back. Fabrics defect. Broken Fitaments:- in a fabric made from flat or low twist continuous-filament yarns, a fibrous or hairy surface appearance that maybe localized or general. Note:- this defect is caused by rupture of individual filaments, usually during winding or knitting. Broken Filaments:- occurs when the individual filaments constituting the main yarn are broken. Yarn Defect. / низкая крутка . Под Оборванной Элементарной Нитью понимается порок в виде выступающих на поверхности текстильного полотна концов элементарных нитей. Порванные Элементарные Нити (broken filaments):- порок пряжи в тканых полотнах в виде выступающих на поверхности тканого полотна концов элементарных нитей. Примечание:- порок возникает в результате разрыва отдельных элементарных нитей во время намотки или кручения.

BROKEN GRAIN = БИТОЕ ЗЕРНО (или ДРОБЛЁНОЕ ЗЕРНО) – Broken Grain or Brokens is a grain that has broken into two or more pieces during milling.

BROKEN KERNELS = БИТАЯ ЗЕРНОВКА (или БИТЫЕ ЯДРА, или ДРОБЛЁНЫЕ ЯДРА) – Broken Kernels are parts of the Rice kernel that are less than three-fourths of the whole Rice kernel. Brokens are used in pet foods and to make Rice flour. / К Битой Зерновке (Дроблёным Ядрам) относятся части рисового ядра, составляющие менее трёх четвертей целого рисового ядра. Дроблёнка или сечка Риса используется в качестве корма для домашних животных и для производства рисовой муки.

BROKEN PATTERN = НАРУШЕННЫЙ УЗОР (или НАРУШЕННЫЙ РИСУНОК) – Broken Pattern:- this defect may be due to wrong drawing of thread, inserting a pick in the wrong shed, incorrect lifting of warp thread. Defect Name:- Broken Pattern. Defect Type:- Pattern Defects. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- Broken Pattern:- The color pattern is broken by the insertion of two picks of white filling in the blue filling wise stripe. This is most likely due to the failure of a weaver to properly reset the pattern chain after servicing the loom for a missing or broken pick. Severity:- Major. Broken Pattern:- it is the discontinuity of weave or design pattern. Weaving Defect. A Broken Pattern is the non continuity of a weave/design/pattern. Causes:- (i) wrong drawing in of threads; and (ii) incorrect shedding. Mending:- non mendable. / Порок или дефект ткачества.

BROKEN PATTERN DUE TO DEFECTIVE PILES = НАРУШЕННЫЙ УЗОР ВСЛЕДСТВИЕ ДЕФЕКТНЫХ ВОРСИНОК – Broken Pattern Due To Defective Piles:- a broken pattern is the result of non-continuity of the design/pattern in the pile fabric. Causes:- (i) improper working of terry motion on loom; (ii) improper functioning of Jacquard; and (iii) missing pick. Mending:- non mendable. Fabric defect in terry fabrics. Broken Pattern Due To Defective Piles:- a broken pattern is the result of non continuity of the design/pattern in the pile fabric. Piling and Raising Defects. / Жакяр (Jacquard).

BROKEN PATTERN or COLOR MISDRAW = XX – Defect Name:- Broken Pattern or Color Misdraw. Defect Type:- Pattern Defects. Fabric Type:- Shirting and Dress Goods – Oxford or Basket. Description:- Broken Pattern or Color Misdraw:- This is a very subtle defect and is the result of a wrong draw in the color pattern. It is probably done during the tying on a new warp. If the tying-in machine misses one end of a particular color, it will break the pattern for the rest of the width of the fabric. Severity:- Major.

BROKEN–PERIOD INTEREST = ПРОЦЕНТ ЗА НЕПОЛНЫЙ ПЕРИОД – Broken-Period Interest:- the concept of the Broken period interest or the accrued interest arises as interest on bonds are received after certain fixed intervals of time to the holder who enjoys the ownership of the security at that point of time. Therefore an investor who has sold a bond which makes half-yearly interest payments three months after the previous interest payment date would not receive the interest due to him for these three months from the issuer. The interest on these previous three months would be received by the buyer who has held it for only the next three months but receive interest for the entire six month periods as he happens to be holding the security at the interest payment date. Therefore, in case of a transaction in bonds occurring between two interest payment dates, the buyer would pay interest to the seller for the period from the last interest payment date up to the date of the transaction. The interest thus calculated would include the previous date of interest payment but would not include the trade date. Also known as Accrued Interest. Broken Period Interest:- the first payment for a borrower may be for an amount greater than their normal payment as it includes interest charged from the settlement date to the start of the borrower's repayment cycle. / Известен также как Начисленные Проценты (Accrued Interest).

BROKEN PICK = ОБОРВАВШАЯСЯ ПОПЕРЕЧНАЯ НИТЬ (или ОБОРВАННАЯ ПОПЕРЕЧНАЯ НИТЬ, или ПРОЛЁТ) – Broken End, Broken Pick:- a warp end or filling pick that has become broken at some point in the weaving on the loom. Broken threads are fixed by the weaver's knot, by twisting the two broken ends together, or by an ordinary knot. Broken yarn should be fixed at once, otherwise the fabric may have to be classed as a 'second'. Broken threads or small holes in fabric may be mended with a needle after the goods have come from the loom. Fastening a bright-colored yarn to the end will facilitate finding it when mending or sewing. Broken Picks are weft threads broken in the weaving and showing as a flaw. Broken Picks:- in plain woven fabrics, this defect materializes by the presence of two picks in the same shed for a part of the width of the fabric. The main cause of weft breaks are rough surfaces of shuttle, shuttle box, rough or incorrect placement of shuttle eye, loose fitting of pirn in the shuttle, incorrect alignment of pirn with shuttle eye and low yarn strength. Broken Pick:- in woven fabrics, a discontinuity in the filling direction caused by a break or cut in the filling yarn. Weaving defect. Broken Picks:- awareness is created among the operator so that broken picks may not go in bigger length in the fabric. Mainly it is due to the Faulty gripper which should be checked at the time of Beam gaiting. Mixing of Projectiles running is one for the same. Broken Pick:- weft way gap in fabric 5" to 6" long at Both side end of the fabric. Weaving defect. Broken Pick:- weft way gap in fabric of one pick or more in full width of fabric or of smaller length at left side or right side of the fabric. Tension in weft, operator work practices, yarn quality, check points are:- (i) weft tension; (ii) condition of projectile brake linings and their setting; (iii) conditioning of projectile, i.e. gripper jaw is damaged or gripping force had reduced or not; (iv) condition of projectile feeder; (v) length variation in projectile; (vi) thickness variation in projectile; (vii) projectile returned setting; (viii) projectile gripper opening and receiving side; (ix) selvedge gripper opening; (x) play in telescopic shaft; (xi) dobby crossing point; (xii) Jacquard crossing point; (xiii) sley setting; (xiv) dobby and Jacquard chain tension; (xv) condition of projectile lifter and its cover plate settings; (xvi) condition of cam driving shaft teeth; (xvii) shed opening and staging; (xviii) knocking at VSD; (xix) cutter action, timing; (xx) package separations etc. A pick missing from a portion of the width of the fabric due to rough shuttle-eyes which snag the weft. Broken Picks occurs if a weft break takes place outside the shuttle eye is caught by the warp, on the same or the next pick, before the weft fork comes into operation and stops the loom. Weaving thus continues without the broken pick being taken out. So the next pick will be in the same shed. If there are repeated weft breaks on alternate picks, then it will appear as if three or more picks were inserted in the same shed. This defect is caused because of the rough surface of pirn, shuttle, shuttle-box, rough or incorrect placement of shuttle-eye, loose fitting or pirn in shuttle, incorrect alignment of pirn with the shuttle-eye, high unwinding tension, and low yarn strength. Fabric Printing Defect. Broken Pick is a broken filling thread in a fabric. Usual caused include too much shuttle tension, weak yarn, or filling coming into contact with a sharp surface. Broken Pick (broken filling defect):- this means that, as a result of the fabric weft fault width is missing part of the weft. Broken Picks in warp faced twill. Possible Cause:- the picks broke most probably because of abrasion on the back side of the fabric. Depends on the location of the defect. If it is close to the selvedge it's definitely minor. The frequency of such defects is normally not high unless the fabric is severely mistreated or one of the treatment machines has pointed parts. Weaving defect. Broken Picks:- if a weft yarn is absent in the fabric for a very short or long width, and then this fabric defect is called Broken Picks. Broken Pick:- this defect is due to discontinuity in the filling direction caused by a break or cut in the filling yarn. It causes sharp discontinuity in the weave pattern over the part of the pick length. Also it is due to the failure of the weaver to detect it and replace it in time. Controlling the weft breaks by improving the quality of yarn, looking into the factors responsible for weft breaks due to pirn and shuttle accessories and training the weaver are the remedies to reduce defects of this kind. Minor Defect Classification:- < Half width of fabrics. Major Defect Classification:- > Half width of the fabrics. Broken Pick:- it is due to presence of two picks in the same shed for a part of the width of the fabric or it is due to partial pick inserted in the fabric because of weft break of weft exhaustion. (1) Defect Name:- Broken Pick. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Oxford or Basket. Description:- Broken Pick:- This description best suits the appearance of the defect; however, this is not a broken pick. The check in this fabric is achieved filling-wise

by three picks of filling in one shed; that is, the shed stays open for three picks. The filling must be trapped by each selvage while the shed is open. In this instance, the tape selvage failed to trap the filling allowing it to be jerked back into the body of the fabric, resulting in two picks missing for a portion of the width. Severity:- Major. (2) Defect Name:- Broken Pick. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Broken Pick:- This is where the pick is missing for a portion of the width of the fabric. In an Oxford weave, when one pick is missing, the picks on either side come together in the same shed giving the effect of a double pick. Severity:- Major. (3) Defect Name:- Broken Picks. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Plain Weave Derivatives. Description:- Broken Picks:- This is the result of the filling yarn becoming snarled or entangled on the filling bobbin. It appears to have been broken and caught up several times while the loom continued to run. The 100% textured polyester yarn tends to fray badly when the yarn breaks. Severity:- Minor. Broken Pick:- a filling yarn that is broken in the weaving of a fabric appears as a defect. Improper functioning of weft stop motion results in broken picks undetected and going in to the fabric. / Жакяр (Jacquard). Порок или Дефект ткачества. Уточная поперечная нить. Пролёты в одну уточную прокидку. Размер порока – за каждое место. Под Пролётом понимается местный порок ткани, заключающийся в отсутствии одной или нескольких уточных нитей по всей ширине ткани или на ограниченном участке. Под Разрывом Утка понимается местный порок в виде оборванной уточной нити на очень коротком участке по ширине ткани. Порванная Уточная Нить; Пропущенная Уточная Нить (Broken Pick; Dropped Pick):- порок утка в виде отсутствия одной или нескольких уточных нитей на всей ширине полотна или на её части. Примечание:- этот порок вызван обрывом уточной пряжи, окончанием, или преждевременной потерей её во время прокладки уточной нити.

BROKEN QUILTED STITCHES = ОБОРВАННЫЕ ПРОСТЁГАНЫЕ СТЕЖКИ (или ПЕТЛИ) – Broken Quilted Stitches:- occur in the quilting of the garment lining and which are not apparent until after the garment has come to the inspection department. Interlining defects. / Порок или Дефект .

BROKEN RICE = ДРОБЛЁНЫЙ РИС – Broken Rice:- the kernel of Rice can become cracked in the field, during the drying process, or during the milling process. Cracks are usually caused by moisture migrating too quickly within the kernel (drying too fast, or moisture being added back to a dry kernel). Often these cracks cause the kernels to break during milling and so broken Rice is generated. The percentage of broken kernels (relative to total milled Rice) generated during milling usually ranges from 12% to 24% in the United States. Most brokens are removed during the milling process to less than 4% in order to give the consumer a high quality Rice. Broken Rice tends to get mushy during cooking and makes a poor quality table Rice. There are different sizes of broken kernels. With long grain Rice in the south brokens are often separated into different sizes. From largest to small they are called; second heads, screenings, and brewers. In California, where the kernel is smaller to begin with, the brokens kernels are only separated into second heads and brewers. In the past most broken Rice in the United States went to the beer industry. Today, most of the Rice going into beer is now whole kernel. The dog food industry uses the majority of the broken Rice. They tend to start with the lower quality brewers Rice and then move into the more expensive screenings and second heads as needed. The Rice flour industry is growing and tends to use the higher quality sorted second heads and screenings. The beer industry still takes some of the higher quality second heads. Some brokens are now being exported to Japan out of California. Broken Rice, during the milling process, broken Rice is separated from the white Rice, who shape remains intact. In other words, broken Rice is the damaged white Rice. A grain of broken Rice gives a low fiber texture and low nutrient level, while retaining its high energy content. / дроблёнка или сечка (brokens). высевки (screenings).

BROKENS = ДРОБЛЁНКА (или СЕЧКА) – Brokens mean broken Rice kernels that have the length as from 2.5 parts but have not reached the length of head Rice. This includes split kernels that retain the area less than 80% of the whole kernel. / К Дроблёнке (Сечке) относятся битая рисовая зерновка (битые рисовые ядра), имеющая длину не менее 2.5 части целиковой зерновки, но не достигающие длины основного зерна риса. Эта фракция рисового зерна состоит из битой зерновки (дроблёных ядер), составляющей менее 80% поверхности целиковой зерновки (целого ядра).

BROKEN SELVAGE = ОБОРВАННАЯ (или ДРАНАЯ) КРОМКА – Broken Selvage:- Fabric:- spun-rayon and cotton dress goods; Construction:- (i) Count:- 100 x 44; (ii) Warp:- 1 end 30/1 1%-in. 1^4-den. bright viscose rayon; 1 end 30/1 carded cotton; (iii) Filling:- 15/1 VA-‘m. 1%-den. bright viscose rayon; Finish:- plain dyed blue. Defect:- selvages broken in wet processing by finisher. Analysis:- the finisher complained of a ‘tight’ selvage condition which, he stated, made it impossible to process these goods without frequent breakouts and torn edges. Physical tests on yarns from the selvages and body of the fabric (warp ends) showed no abnormally tight edge. Construction analysis, however, disclosed the fact that the selvages were much heavier and thicker than the body of the goods, most of the pieces examined having as many as four tw T o-ply ends weaving as one. Furthermore, the selvage yarns were made of all spun-viscose rayon. It was agreed that the finisher was not at fault in this case, since such heavy edges are extremely difficult to process without breaking, especially when the wet goods must pass through nip rolls, which exert considerable pressure. In this fabric, too, the edges, being 100 ^ rayon, lost about one-half of their strength when wet and thus became more susceptible to damage than if they had been made of cotton. See also Cut Selvage. / Уточина:- .

BROKEN STITCHES = ОБОРВАННЫЕ СТЕЖКИ (или ОБОРВАННЫЕ ПЕТЛИ) – (1) Broken Stitches:- often times the fault of wrong type of stitch for specific seam construction. Could be caused by excessive tightness in machine tensions. Sewing Room Defects. / Порок или Дефект швейного производства.

(2) Broken Stitch:- caused by tight tension, excessive machine speed, sharp feeds or too much pressure. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или Дефект от машинного оборудования.

BROKEN STITCHES DUE TO ABRASION = ОБОРВАННЫЕ СТЕЖКИ (или ПЕТЛИ) ИЗ–ЗА АБРАЗИИ (или ИЗНОСА, или ИСТИРАНИЯ) – Broken Stitches Due To Abrasion:- where thread on the stitch line is broken during stone-washing, sand blasting, hand sanding, etc. Broken stitches must be repaired by restitching over the top of the stitch-line. Here the looper thread has been broken due to harsh abrasion during stone-washing. Row of Stitch on right sewn with Perma Core NWT. Minimizing broken stitches due to abrasion:- (1) use a higher performance Perma Core or D-Core thread; (2) use a larger diameter thread on operations where excessive abrasion is occuring (ex:- use T-120 on Waistband); (3) make sure stitches are balance properly; (4) use a Magic air entangled thread in the Looper due to its lower seam profile making it less susceptible to abrasion (ex:- use T-90 or T-135 Magic in loopers of the Yoke, Seat and Waistband seam); and (5) Monitor the Finishing Cycle for compliance to specs. A&E’s (American & Efird, Inc., USA) new Perma Core NWT was designed to today’s more demanding finishing processes. Note the Picture to the left. The seam on the right was sewn with this new thread. Fabrics defect. / Эй.ЭндИ. (A&E; Амэрикэн Энд Ифёд, Инк. (American & Efird, Inc.), США).

BROKEN STITCHES DUE TO CHEMICAL DEGRADATON = ОБОРВАННЫЕ СТЕЖКИ (или ПЕТЛИ) ИЗ–ЗА ХИМИЧЕСКОЙ ДЕГРАДАЦИИ – Broken Stitches Due To Chemical Degradation:- where thread is being compromised by the chemicals used during laundering resulting in loss or change of color and seam failure. Here is an example of where the Cotton wrapper has been degraded by the harsh chemicals during laundering. (i) Too much chemical. (ii) Too long wash or drying cycles. (iii) Improper Rinsing. (iv) Too

high of Temperature. Note:- corespun threads with their continuous filament core has much greater resistance to chemical degradation than spun polyester threads. Minimizing broken stitches due to chemical degradation:- (1) use a higher performance Perma Core NWT that has greater resistance to chemical degradation; (2) it is recommended to go to larger thread sizes when the Denim Garments will be subject to Harsh Chemical washes; (3) to achieve the best laundering results make sure that the water temperatures and PH Levels are correct and that the proper amounts and sequence of chemical dispersion are within guidelines; (4) make sure the garments are being rinsed properly to neutralize the chemicals in the fabric; and (5) monitor the drying process, cycle times, and temperatures to make sure they are correct so that the best possible garment quality can be achieved. Fabrics defect.

BROKEN STITCHES DUE TO NEEDLE CUTTING = ОБОРВАННЫЕ СТЕЖКИ (или ПЕТЛИ) ИЗ–ЗА ИГОЛЬНОЙ ПРОРУБКИ – Broken Stitches Due To Needle Cutting:- where the thread is being broken where one seam crosses another seam (ex: bartacks on top of waistband stitching, seatseam on top of riser seam) resulting in stitch failure. Minimizing broken stitches due to needle cutting:- (1) use a higher performance Perma Core or D-Core thread; (2) use a larger diameter thread on operations where the thread is being cut; (3) make sure the proper stitch balance is being used; on a chainstitch seam on denim, you normally would like to maintain a 60%/40% relationship of Needle thread to Looper thread in the Seam; (4) use needles with the correct needle point; and (5) change the needles at regular intervals on operations where the Needle Cuts are occurring frequently. Note:- using the proper thread and maintaining the proper stitch balance are the two best ways to minimize broken stitches due to Needle Cutting. Fabrics defect. / на шве цепного стежка на .

BROKEN STOWAGE = НЕЗАПОЛНЕННОЕ СКЛАДОЧНОЕ ПОМЕЩЕНИЕ – (1) Broken Stowage:- the loss of space caused by irregularity in the shape of packages. / Потеря полезного пространства, вызванная разнообразием форм пакетов груза.

(2) Broken Stowage:- any void or empty space in a vessel or container not occupied by cargo. / Любое пустое или опустевшее пространство на судне или в контейнере, не занятое грузом.

BROKEN SUPPLEMENTARY WARP = ОБОРВАВШАЯСЯ (или ОБОРВАННАЯ) ДОБАВОЧНАЯ (или ДОПОЛНИТЕЛЬНАЯ) ОСНОВА – Broken Supplementary Warp:- Possible Cause:- the fabric in the image is folded to show the front as well as back sides of a vertical strip of fabric. It shows a missing end in the motive along the entire length. This has occurred due to a broken supplementary warp yarn. This is a major defect as the missing end affects the entire length of fabric. Weaving defect.

BROKEN WARP ENDS = ОБОРВАННЫЕ (или ОБОРВАВШИЕСЯ) ПРОДОЛЬНЫЕ НИТИ ОСНОВЫ – Broken Warp Ends:- Fabric:- fancy shirting; Construction:- (i) Count:- 100 x 60; (ii) Warp:- 30/1 combed cotton and decorative stripes of 150/40 dyed bright viscose rayon; (iii) Filling:- 40/1 combed cotton; Finish:- plain Sanforized. Defect:- black warp stripes broke out during the finishing. Analysis:- single-strand breaking-strength and elongation tests made on the colored rayon yarns in a gray head end from the lot in question showed that the black yarns were significantly weaker than the other colors of dyed yarns. Investigation by the weaver disclosed the fact that the commission dyer who had processed the rayon yarns had used a lot of previously dyed yarn and had redyed it black. The extra handling had resulted in excessive tendering of the yarns. Evidently the lowered breaking strength and elongation of the redyed black yarn were bad enough to result in the rupture of those ends in the normal finishing of the woven fabrics. / Уточина:- .

BROKER = БРОКЕР (или МАКЛЕР) – (1) Broker is a firm that communicates bid and ask levels to potential principals and otherwise arranges transactions as agent for a fee, without acting as counterparty in the transactions. See also Brokerage; and Brokerage House. Brokers, persons employed as middlemen to transact business or negotiate bargains between different merchants or individuals. They are sometimes licensed by public authority, and sometimes not. Brokers are divided into different classes; as bill or exchange brokers, stockbrokers, ship and insurance brokers, pawnbrokers, and brokers simply so called, or those who sell or appraise household furniture distrained for rent. Exclusive, too, of the classes now mentioned, the brokers who negotiate sales of produce between different merchants usually confine themselves to some one department or line of business; and by attending to it exclusively, they acquire a more intimate knowledge of its various details, and of the credit of those engaged in it, than could be looked for on the part of a general merchant; and are consequently able, for the most part, to buy on cheaper and to sell on dearer terms than those less familiar with the business. It is to these circumstances – to a sense of the advantages to be derived from using their intervention in the transacting of business – that the extensive employment of brokers in London and all other large commercial cities is wholly to be ascribed. The number of brokers in London is unlimited; but by the statute 8 & 9 Will. 3. c. 20. they are to be licensed by the lord mayor and aldermen, under such restrictions and limitations as they may think fit to enact. By the 57 Geo. 3. c. 60., brokers acting without being duly admitted are made liable in a penalty of 100l. the fee on admission is fixed by the same act at 5l.; and there is, besides, an annual payment also of 5l. The following are some of the regulations established by the mayor and aldermen pursuant to the act of Will. 3.:- That every person shall, upon his admission, take an oath truly and faitbfully to execute and perform the office of broker between party and party, in all things pertaining to the duty of the said office, without fraud or collusion, to the best and utmost of his skill and knowledge; that he shall in all cases reveal the name of his principal; and neither deal in goods on his own account, nor barter and sell again, nor make any gain in goods beyond the usual brokerage; and that he shall regularly register all the contracts, &c. into which he enters. Brokers grant a bond under a penalty of 500l. for the faithful performance of the duties sworn to in the oath of admission. A medal is delivered to the broker, with his name engraved thereon, which he may produce, if required, as evidence of his qualification. Twelve persons professing the Jewish religion are permitted to act as brokers within the city, under the same regulations, and receive the silver medal accordingly. This medal is transferable; and is sold generally at from 800l. to 1 500l., exclusive of the expense of transfer, which is uncertain. Upon the decease of any of the holders of the medal without its having been transferred, the appointment falls to the lord mayor for the time being; and for it the sum of 1 500l. has not unfrequently been given. If goods in the city of London be sold be a broker, to be paid for by a bill of exchange, the vendor has a right, within a reasonable time, if he be not satisfied with the sufficiency of the purchaser, to annul the contracts, provided he intimate his dissent as soon as he has an opportunity of inquiring into the solvency of the purchaser. In a case of this sort (Hodgson v. Davies, 2 Camp. N.P.C. 536.), Lord Ellenborough was, at first, rather inclined to think that the contract concluded by a broker must be absolute, unless his authority were limited by writing, of which the purchaser had notice. But the special jury said, that ‘unless the name of the purchaser has been previously communicated to the seller, if the payment is to be by bill, the seller is always understood to reserve to himself the power of disapproving of the sufficiency of the purchaser, and annulling the contract’. Lord Ellenborough allowed that this usage was reasonable and valid. But he clearly thought that the rejection must be intimated as soon as the seller has had time to inquire into the solvency of the purchaser. The jury found, in the case in question, that five days was not too long a period for making the necessary inquiries. See also Bill Brokers, Custom-House Brokers, Pawn Brokers, Ship And Insurance Brokers, and Stock Brokers. Brokers, simply so called, in their character of appraisers and sellers of goods distrained for rent, are regulated by 57 Geo. 3. c. 93., which enacts, that no such person making any distress for rent, where the sum due does not exceed 20l., shall take more than the following sums; viz.:- (1) For Levying – £ – 0, s. – 3, d. – 0; (2) For Men Keeping Possession, Per Day – £ – 0, s. – 2, d. – 0; (3) Advertisements, If Any – £ – 0, s. – 10, d. – 0; (4) Catalogues, Sale, Commission, &c. In The Pound On The Nett Produce – £ – 0, s. – 1, d. – 0; and (5) Stamp Duty, Lawful Amount. Appraisements, whether by one broker or more, 6d. per pound on the value of the goods, under a penalty of treble the amount of the money unlawfully

taken, with costs, to be recovered summarily before a justice of the peace. In France, the brokers who deal in money, exchange, merchandise, insurance, and stock, are called Agents De Change, and their number, at Paris, is limited to sixty (in 1844). The company of agents de change is directed by a chamber of syndics (chambre syndicale) chosen annually by the company. They are severally obliged to give bonds to the amount of 125 000 Francs for the prevention of abuses. They are also obliged to keep books; are restricted to a charge of from 1/8 to 1/4 per cent.; and are interdicted from carrying on, or having any interest in, any commercial or banking operations. In the United States, Brokers are not licensed, nor do they give bonds. Any person, other than a bank, engaged in the business of buying or selling securities on its own behalf or for others. Also known as Dealer. Broker is an agent/middleman who for a fee or commission negotiates contract, e.g., purchase and sale (such as real estate, commodities or securities) between buyers and sellers without himself taking title to that which is the subject of negotiation and usually without having physical possession of it. A person who negotiates the exchange (buying or selling) of securities and receives a commission or fee. Brokers are required to be licensed and their activities are regulated by the Securities and Exchange Commission. Broker is an independent agent who buys and sells stocks and bonds on the stock exchange in his own name but for the account of the customer. An individual who is paid a fee or commission for acting as an agent in making contracts, sales, or purchases. In securities trading, Broker is an agent who acts as an intermediary between buyer and seller in securities transactions, and handles the public's orders to buy and sell any assets in return for a commission or fee (brokerage). A broker may also provide advice and information to clients. Stockbrokers specialize in stocks, commodity brokers specialize in commodities, and broker-dealers buy for their own accounts as well as for customer. A broker who is registered with the regulatory agency is also called a Registered Representative or Customer's Man. Also known as Account Executive. Broker is a company or individual that executes futures and options orders on behalf of financial and commercial institutions and/or the general public. A person who is paid a fee or commission for executing buy or sell orders for a customer. In futures trading, the term may refer to:- (i) a Floor Broker, i.e. an exchange member who executes orders on the trading floor of an exchange; (ii) an Account Executive or Associated Person who deals with customers in the offices of Futures Commission Merchants; or (iii) the Futures Commission Merchant. Brokers are securities traders on a stock exchange in the United States of America or the United Kingdom. They advise investors in the investment decisions, execute buy and sell orders and receive a commission, called Brokerage, for doing so. Broker is an intermediary between traders for physical, futures and over-the-counter deals. Brokers receive a fixed commission predetermined between the broker and his/her client. Broker is a person who buys or sells merchandise for other individuals and earns a commission or profit based upon a percent of product. Broker is one who executes futures trading orders for customers. The broker may be an employee in a local office of a brokerage firm, or a floor broker or pit broker executing orders on the trading floor. / Лицо, получающее сбор или комиссию за исполнение для заказчиков распоряжений на закупку или продажу. В торговле фьючерсами, данный термин может относиться к:- (i) Брокеру На Полу (Floor Broker), то есть члену биржи, который исполняет распоряжения на торговом полу биржи; (ii) Исполнителю По Счёту (Account Executive) или Ассоциируемому Лицу (Associated Person), который контактирует с заказчиками через офисы Торговцев Фьючерсами, Работающих За Комиссию; и (iii) Торговцу Фьючерсами, Работающему За Комиссию (Futures Commission Merchant). Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении). Брокер – посредник при заключении сделок между покупателями и продавцами товаров, ценных бумаг, валют и других ценностей и услуг на фондовых и товарных биржах, валютных, страховых и фрахтовых рынках. Брокеры выступают как 'чистые' посредники, поскольку обычно не имеют товаров в своём распоряжении. Основные условия реализации диктуются производителями. Брокер стимулируется только за проданную продукцию. Доходы Брокера могут определяться как определённый процент от стоимости проданных товаров и как фиксированное вознаграждение за каждую проданную единицу товара.

(2) The term Broker means a person, other than a motor carrier or an employee or agent of a motor carrier, that as a principal or agent sells, offers for sale, negotiates for, or holds itself out by solicitation, advertisement, or otherwise as selling, providing, or arranging for, transportation by motor carrier for compensation. Brokers are not subject to Carmack liability. A ship agent who acts for the ship owner or charterer in arranging charters. A person or firm, other than a motor carrier or agent of a motor carrier that as a principal or agent sells, offers for sale, or holds itself out by solicitation, advertisement or otherwise as selling, providing or arranging for transportation by motor carrier for competition. A broker is a middleman that brings together the shipper and carrier; a broker does not take responsibility for the transportation.

(3) Broker is an intermediary who acts as an agent for insurers and on behalf of the insured, and who is regulated by a professional body and codes of practice. There are two types of broker involved in arranging insurance and reinsurance at Lloyd's:- insurance brokers and reinsurance brokers. Some brokers act both as insurance brokers and reinsurance brokers. / При Лойде имеются два типа брокеров, вовлечённых в организацию страхования и перестрахования:- брокеры по страхованию и брокеры по перестрахованию. Некоторые брокеры действуют и как брокеры по страхованию и как брокеры по перестрахованию.

(4) Broker, as relates to the US/Canada Greenhouse Certification Program, a broker is an exporter who does not own or operate a facility for producing plants, but ships plants produced by other designated facilities.

BROKERAGE = БРОКЕРАЖ (или БРОКЕРСТВО, или БРОКЕРСКАЯ КОМИССИЯ, или КУРТАЖ) – (1) Brokerage is the service fee charged by a broker to a client for executing purchase or sale orders for securities, commodities, etc. Brokerage fee scales are usually degressive, i.e. the percentage rate for large-volume orders is less than for small orders. Fee or commission paid to a broker for a securities transaction. Brokerage or broker's fee or broker's commission is a fee to be paid to the broker when a securities trade is concluded on the stock exchange. It is charged by the bank instructed to settle the trade. The size is determined as a percentage of market value in the case of equities or nominal value for bonds. Fee paid to stockbroking firm for buying or selling of shares. Brokerage is the fee charged by brokerage firms for the execution of a transaction. Also called Commission. This fee may vary from firm to firm. Brokerage, the commission, or percentage, paid to brokers on the sale or purchase of bills, funds, goods, etc. See also Factorage. / Вознаграждение, взимаемое брокером за оказание услуги клиенту по исполнению распоряжений на закупку или продажу ценных бумаг, сырья и тому подобного. Шкала брокерского вознаграждения обычно носит понижательный характер, то есть процентная ставка за исполнение крупных распоряжений ниже ставки за исполнение небольших распоряжений. Вознаграждение или комиссия, уплачиваемая брокеру за операцию с ценными бумагами. Вознаграждение, уплачиваемое брокерской фирме, действующей на фондовом рынке, за покупку или продажу акций. Брокерская Комиссия – плата, получаемая брокером с клиента, по поручению которого брокер выполняет сделки, за посредническую деятельность, за рекомендации. Величина её обычно пропорциональна сумме сделки и регламентируется биржевым комитетом (советом).

(2) Brokerage:- freight forwarder/broker compensation as specified by ocean tariff or contract. Fee paid to forwarder by the Carrier for services performed.

(3) Brokerage:- the commission that is payable to a broker for placing an insurance or reinsurance contract with an insurer or a reinsurer. Although brokerage is payable by the insured as part of the gross premium the amount of brokerage is agreed by the insurer. The insured may request his broker to state the amount of his brokerage on a given placement. Similar considerations apply to

reassureds under reinsurances. Sometimes the term Brokerage may be used to refer the business of a broker. / Комиссия, которая уплачивается брокеру за размещение контракта страхования или перестрахования у страховщика или перестраховщика. Несмотря на то, что брокерская комиссия уплачивается страхователем как часть общей премии, сумма брокерской комиссии оговаривается страховщиком. Страхователь может потребовать от своего брокера указать сумму его брокерского вознаграждения при данном размещении. Аналогичные соображения применяются и в случае с перестрахователем при организации перестрахований. Иногда термин Brokerage может быть использован для обозначения самой деятельности брокера.

BROKERAGE = БРОКЕРАЖ (или БРОКЕРСТВО, или БРОКЕРСКОЕ ОБСЛУЖИВАНИЕ) – Brokerage is an act of serving as an intermediary between buyer and seller in futures, options, and securities transactions. See also Broker; and Brokerage House. Brokerage is the fee charged by brokerage firms for the execution of a transaction. Also called Commission. This fee may vary from firm to firm. / Вид деятельности, связанный с обслуживанием в качестве посредника между покупателем и продавцом при сделках с фьючерсами, опционами и ценными бумагами.

BROKERAGE FEE = ВОЗНАГРАЖДЕНИЕ ЗА БРОКЕРСТВО (или БРОКЕРСКОЕ ВОЗНАГРАЖДЕНИЕ) – Brokerage Fee is a fee charged by an agent, or agent's company to facilitate transactions between buyers and sellers. The brokerage fee is charged for services such as negotiations, sales, purchases, delivery or advice on the transaction. There are many types of brokerage fees added in areas such as insurance, realty, delivery services or stocks. Brokerage fees will usually be based on a either a percentage of the transaction or a flat fee. They can also be a combination of the two. Here is an example of the fee breakdown from a typical stock brokerage:- (i) Stock Price Over USD2: USD28 flat rate up to 999 shares, 3 cents per share over 999 shares. (ii) Stock Price USD2 and Under:- 1.4% of principal trade with a minimum of USD28 charged. See also Commission Fee. / Смотрите также Комиссионное Вознаграждение (Commission Fee).

BROKERAGE HOUSE = БРОКЕРСКИЙ ДОМ – A Brokerage House, also called a Brokerage Firm, is a company licensed to buy and sell stocks or securities. Acting as an intermediary between buyers and sellers, a brokerage house typically employs brokers who carry out the wishes of the firm's clients as they pertain to the trading of stocks. Broker services are usually provided on a commission basis. Commission amounts charged for the buying and selling of securities vary with each brokerage house. Often, the price per trade is indicative of the level of service the firm offers. For example, a brokerage house that charges fees on the lower end of the scale may not execute trades as quickly as one that charges higher fees. Likewise, a firm that charges higher commissions usually offers more personalized service. In addition to commissions, a brokerage firm may charge various other fees. These fees may include charges for transferring assets, closing an account, and wiring money. Additionally, a brokerage firm may require the payment of IRA custodian fees, as well as annual services charges and fees related to periods of account inactivity. Depending on the policies of the brokerage house, a client's account may also incur a fee for failing to meet a minimum required account balance. A brokerage house may offer a variety of investment products or specialize in just one or two. Typical choices include stocks, mutual funds, and options, as well as government and corporate bonds. Over-the-counter (OTC) bulletin board stocks may be offered as well. There are several different ways of executing trades. A brokerage house may choose to employ all or just some of them. For example, a firm may allow for trading over the phone or via the Internet, as well as other methods. In addition to the trading of various investment products, a brokerage firm may offer certain banking services. These services may range from money market sweeps and check writing to visa and ATM cards. Cash kept in a brokerage house money-market account may carry a higher interest rate than money held in a regular bank account. Often, a brokerage house may offer market research and investing strategies as well. Though much of the information uncovered by such research may be available on the Internet, many individuals don't have the time or the inclination to look for it. In such cases, having an account with a firm that conducts in-depth investment research may be extremely beneficial. See also Broker; Brokerage; and Futures Commission Merchant. Brokerage House is an organization that buys and sells for the accounts of customers. Also called Commission House or Wire House. A Brokerage House is a place from which a broker conducts business. The term brokerage house is often referred to as a Broker, Brokerage, or a Brokerage Firm. Working through a licensed brokerage house, your broker buys and sells shares of stock for your portfolio as per your instructions. A full service brokerage house provides a wide range of services to its clients, including advice and recommendations concerning which stocks to buy and when to sell. With your permission your brokerage house may allow your broker to buy and sell shares in your name at the broker's discretion. In exchange for these services, a full-service brokerage house often charges higher commissions than a discount brokerage house. A discount brokerage house typically provides few services other than the actual placement of buy and sell orders. A discount brokerage house typically refrains from offering recommendations or advice. As the name implies, a discount brokerage house typically has lower commission rates.

BROKERAGE LICENCE = ЛИЦЕНЗИЯ НА БРОКЕРСКОЕ ОБСЛУЖИВАНИЕ – Brokerage Licence is the authority granted by the Interstate Commerce Commission (ICC) to persons to engage in the business of arranging for the transportation of persons or property in interstate commerce.

BROKER ASSOCIATION = БРОКЕРСКАЯ АССОЦИАЦИЯ – Broker Association:- two or more persons with exchange trading privileges who (i) share responsibility for executing customer orders; (ii) have access to each other's unfilled customer orders as a result of common employment or other types of relationships; or (iii) share profits or losses associated with their brokerage or trading activity.

BROKER BOOTH SUPPORT SYSTEM = СИСТЕМА ПОДДЕРЖКИ БРОКЕРСКИХ КАБИНОК – Broker Booth Support System is an order management and routing system for brokers. This state-of-the-art order-management system designed exclusively for New York Stock Exchange members. Broker Booth Support System (BBSS) enables member firms to quickly and efficiently process and manage their orders and selectively route orders via SuperDot directly to either the trading post or the booths on the New York Stock Exchange (NYSE®) Trading Floor. / Система обработки и направления распоряжений для брокеров. Эта доведённая до совершенства система обработки распоряжений специально разработана для членов Нью Йоркской Фондовой Биржи. Система Поддержки Брокерских Кабинок (СПБК) позволяет компаниям членам быстро и эффективно обрабатывать и управлять своими распоряжениями, а также избранно направлять распоряжения через систему СуперДот напрямую либо на торговую точку, либо в кабинки на Торговом Полу Нью Йоркской Фондовой Биржи (НЙФБ® или Эн.Уай.Эс.И.® (NYSE®)).

BROKER INTERMARKET TRADING SYSTEM = БРОКЕРСКАЯ СИСТЕМА МЕЖРЫНОЧНОЙ ТОРГОВЛИ – Broker Intermarket Trading System (or Broker ITS, or BITS):- preopening indications service received on trading floor at broker terminals. Copies of Preopening Indications delivered through the Broker to Booth System in relevant issues.

BROKER ITS = BROKER INTERMARKET TRADING SYSTEM

BROKERS' LOAN = БРОКЕРСКИЙ ЗАЙМ (или ЗАЁМ У БРОКЕРОВ) – Brokers' Loans are the money borrowed by brokers from banks for uses such as financing specialists' inventories of stock, financing the underwriting of new issues of corporate and municipal securities, and financing customer margin accounts. Money borrowed by brokers from banks or other brokers for a variety of uses. It

may be used by specialists to help finance investments of stock they deal in; by brokerage firms to finance the underwriting of new issuers of corporate and municipal securities; to help finance a firm's own investments; and to help finance the purchase of securities for customers who prefer to use the broker's credit when they buy securities. See also Margin. / закупку ценных бумаг для заказчиков, которые предпочитают использовать кредит брокера для покупки ценных бумаг. Смотрите также Маржа (Margin).

BROMOCRESOL GREEN = БРОМКРЕЗОЛОВЫЙ ЗЕЛЁНЫЙ – Bromocresol Green is a brominated dye which acts as a pH indicator. In studies to determine the feeding activity of hoppers, bromocresol green-treated filter paper reacts by changing color when it comes in contact which honeydew.

BRONZE = БРОНЗОВЫЙ (или БРОНЗА) – Bronze:- a moderate yellowish brown.

BRONZE WILT = БРОНЗОВЫЙ ВИЛТ – Bronze Wilt:- wilt disease can be one of the most devastating problems in cotton. A third type of wilt, called Bronze Wilt, is rarely seen at all in the High Plains, though it can occur commonly in other parts of Texas. This wilt is not well understood, and may not even be disease related. However, like other wilts, losses can be quite severe when it occurs (which is usually late in the growing season). There is much about bronze wilt that is not understood. In fact it is not known for sure what causes bronze wilt. There are major differences between bronze wilt and Fusarium and Verticillium wilt. The purpose of this section is not to describe bronze wilt in detail, but to point out the differences between bronze wilt, Fusarium wilt, and Verticillium wilt. Bronze wilt occurs infrequently in the High Plains of Texas, but much more frequently in the rest of the state. It requires higher nighttime temperatures than are usually found in west Texas. It comes in late in the season (usually in the last 2 weeks of August) in the areas near Big Spring. The wilt starts from the top of the plant, with the leaves exhibiting a distinct lack of turgor. Leaves may also have a bronze shade. There generally is not vascular discoloration. The problem occurs in specific varieties, and is usually more severe in fields pushed for high and early yields. One solution is to grow bronze wilt tolerant varieties. Many picker-type varieties are now listed as to their sensitivity to this problem in the company brochures. Some areas of the country that have associated nutrient deficiencies with this problem, recommend using potassium or phosphorus to correct the problem. Application of potassium or phosphorus on fields with Verticillium Wilt or Fusarium Wilt will not correct those disease problems. See also Fusarium Wilt, Sudden Wilt, and Verticillium Wilt. / изменение цвета сосудов. Вилт известен также как Трахеомикоз (Трахеомикозная Болезнь). Смотрите также Вертициллиозный Вилт (Verticillium Wilt), Внезапный или Скоротечный Вилт (Sudden Wilt) и Фузариозный Вилт (Fusarium Wilt).

BRONZING = БРОНЗОВАТОСТЬ (или БРОНЗОВОСТЬ, или БРОНЗИРОВАНИЕ) – Bronzing:- a coppery lustre on a fabric surface. This defect is caused by excessive dyestuff present during dyeing, or by precipitation of the dyestuff. / Место С Блеском (bronzing):- порок заключительной отделки ткани в виде участка с нежелательным медно-красным блеском на поверхности полотна. Примечание:- этот порок возникает при избытке красящего вещества или осаждением красителя.

BRONZY COLOR = БРОНЗОВАТЫЙ ЦВЕТ (или БРОНЗОВЫЙ ЦВЕТ, или ЦВЕТ БРОНЗОВОГО ОТЛИВА) – Bronzy Color (or Bronzing):- a metallic coloration observed when viewing the light reflected at angles near the angle of specular reflection, the color usually being quite different from that observed for other directions, i.e. paint samples.

BROOD = ВЫВОДОК (или ПОМЁТ) – Brood is all individuals that hatch at about one time from eggs laid by one set of parents and which normally mature at about the same time. / Под Выводком понимается совокупность молодых членов семьи птиц или млекопитающих (птенцов, детёнышей). Иногда под выводком понимают потомство вместе с обоими или одним (у полигамов) родителем. Число детёнышей в выводке у различных видов животных сильно колеблется в зависимости от плодовитости:- например, у птиц от 1 до 24 птенцов; у млекопитающих от 1 до 20 детёнышей. Количество детёнышей изменчиво и у одного вида, в частности оно зависит от климатических условий года и других факторов.

BROOKFIELD VISCOSITY = ВЯЗКОСТЬ ПО БРУКФИЛДУ – Brookfield Viscosity:- apparent viscosity in cP determined by Brookfield viscometer, which measures the torque required to rotate a spindle at constant speed in oil of a given temperature. Basis for ASTM Method D 2983; used for measuring low temperature viscosity of lubricants. American Society for Testing and Materials (ASTM). See also Viscosity. Brookfield Viscosity usually refers to a viscosity measurement performed with a Brookfield Viscometer, sometimes refered to as a Brookfield Viscosimeter. There are several models of viscometer available from Brookfield but the majority operate in the same manner:- the viscometer motor rotates the spindle at a defined speed (measured in rpm) or shear rate and the viscometer measures the resistance to rotation and reports a viscosity value. Various spindle designs can be employed, depending on the nature of the sample and the requirements. Here is a brief introduction to the most popular arrangements:- (i) Dip-in LV Spindles & RV Spindles:- labelled as LV or RV spindle sets, these comprise simple shafts ending in a disk or cylinder. A sample of 400–600 ml in a suitable container is placed under the viscometer which is then lowered to dip the spindle into the sample up to an immersion mark on the spindle shaft. The dip-in spindle is suitable for comparative testing of the viscosity of free-flowing fluids. (ii) Small Sample Adapter (SSA):- the Small Sample Adapter is a concentric cylinder measuring system, often know as a coaxial or 'cup and bob' system. In the small sample adapter a small sample (typical only 5–10 milliliters (ml)) is sheared between the moving inner cylinder and stationary outer cylinder or chamber. The accessory was, as its name suggests, originally designed for measuring samples of limited quantity however due to its fairly narrow clearances the system operates in a degree of defined shear – a valuable capability of you wish to perform viscosity/shear rate profiles on a sample. (iii) Ultra Low Adapter (ULA):- the ULA is nothing more than a large concentric cylinder designed specifically for bringing lower viscosity liquids into the measuring range of the viscometer. (iv) T-Bar and Helipath:- this accessory enables the viscometer to take measurements of soft solids such as pastes, creams and ointments. The Helipath system is a special stand that incorporates a motor that can slowly drive the head of the viscometer down. At the same time the viscometer motor is set to rotate at a low rate (typically 2–5 revolutions per minute (rpm)) and the downward motion of the head causes the t-bar spindle to cut a helical path down through the sample. Best practice here is to take several measurements over a period of 30 to 60 s and take an average. So here's the kicker:- all the above accessories will deliver a different result when measuring the same sample! So which is the right one? Well that's out of the scope of this article (get some advice) but it is clear that any reported viscosity specification for a material must therefore quote the relevant instrument set-up and measurement conditions. The most critical parameters that should be included in such a specification include:- (i) torque range:- in order of increasing torque (and hence viscosity) range:- LV, RV, HA or HB. The torque range usually prefixes the model number, for example, RVDVI+ or LVDVII+; (ii) spindle, e.g., RV2, LV3, T-C, speed of rotation:- 10 rpm etc; and (iii) measurement temperature. For many samples the following must also be stipulated:- (i) container size and fill level details; (ii) instrument model:- for example DVI+, DVII+ etc; (iii) measurement time:- how long you run the test before taking a reading – critical for thixotropic samples; and (iv) sample pre-conditioning instructions:- pre-mixing or rest periods. So a typical spec may look like:- Brookfield LVDVII+, 500 ml of sample in 600 ml beaker, spindle 3 at 20 rpm, 25 °C, take measurement after 30 s. Here are some typical reported test methods and viscosity specs for a range of products:- (i) Viscosity of anti-icing fluid, ASTMD2196 Method B:- Brookfield LVT Viscometer with Small Sample Adapter SC4-31/13R, 0.3 rpm; (ii) Viscosity of resin for plastisols:- Brookfield LVT or equivalent, spindle 3 at 12 rpm, temperature 25°, measure viscosity after 60 s; (iii) Viscosity of gel-coats:- Brookfield RV viscometer, spindle 4 at 4 rpm, 25 °C; (iv) Brookfield 'thixotropic index' for gelcoats:- the ratio of RV4 spindle viscosity at 4 rpm to 20 rpm at 25 °C. Note:- 'The term Thixotropic Index for this test is now outdated and the test is usually

re-labelled ‘shear-thinning index’. (v) Aluminum hydroxide gel viscosity for antacid formulations:- Brookfield LV spindle 2 at 12 rpm. / Американское Общество по Испытаниям и Материалам (АОИМ).

BROWN = КОРИЧНЕВЫЙ (или БУРЫЙ) – Brown:- any of a group of colors between red and yellow in hue, of medium to low lightness, and of moderate to low saturation.

BROWN PLANTHOPPER = БУРЫЙ ДЕЛЬФАЦИД (или БУРАЯ ЦИКАДА) – Brown Planthopper is an Insect that causes burnt-like appearance on rice when in large numbers. Scientific name:- Nilaparvata Lugens. Plant Hoppers – Delphacidae. / .

BROWN RICE = БУРЫЙ РИС – After the husk is removed the remaining product is called Brown Rice. Brown Rice is more nutritious than white Rice, but very little Rice is consumed in the brown form. Brown Rice contains a bran layer that is about 12% of the brown kernel by weight. The protein in white Rice is much more nutritious than most cereal grains but has a low level of the essential amino acid, lysine. The protein level in bran layer of brown Rice is higher and has more lysine. The protein in brown Rice has one of the most complete essential amino acid profiles of any vegetable crop. (No vegetables alone are complete.) The Rice bran layer of brown Rice also contains digestible fiber as well as minerals and vitamins not found in milled Rice. It was learned that incidences of beriberi were dramatically reduced when diets where switched from white milled Rice to brown Rice or even parboiled Rice which contained more thiamin. The oil content of the Rice bran contains several vitamin E components and valuable nutrients. Because minerals and vitamins are lost when the bran is removed, years ago many states passed laws requiring white Rice to be fortified with vitamins and minerals. Despite its nutritional value, consumption of brown Rice is low because it takes almost one hour to cook and many people do not care for the taste and texture. Unfortunately, once the husk is removed from Rice, the bran layer starts going rancid and this contributes to the bitter taste of brown Rice. Very little brown Rice is actually consumed in the United States or the world for that matter. Some Rice is exported in the brown form (primarily to Japan and Europe) for further processing. Brown Rice is the least processed form of Rice. It has the outer hull removed, but still retains the bran layers that give it that characteristic tan color and nut-like flavor. The outer layer of the bran gives this Rice a chewier texture than white Rice. Brown Rice is a whole or broken kernels of Rice from which the hulls have been removed. There are four classes of brown Rice for processing:- (i) Long Grain Brown Rice for Processing; (ii) Medium Grain Brown Rice for Processing; (iii) Short Grain Brown Rice for Processing; and (iv) Mixed Brown Rice for Processing. Classes shall be based on the percentage of whole kernels, broken kernels, and types of Rice. Brown Rice is a Rice from which only hull has been removed. When cooked, it has a slightly chewy texture and nut-like flavor. This is a natural source of bran. It cooks in approximately 30–45 minutes. The only difference between these two Varieties (white Rice and brown Rice) is the milling. As a result, in brown Rice, only the husk is removed while the bran layer remains. Because of the bran layer, brown Rice contains more nutrients than white Rice. In particular, brown Rice is very high in fiber and vitamin B. See also White Rice. Brown Rice is the complete form of the Rice grain. Brown Rice is either sold as natural brown Rice, or value-added as a quicker cooking Rice. Brown Rice (syn. Husked Rice, and Cargo Rice):- the caryopsis or dehulled grain. Brown Rice is a Rice grain with its hulls removed but not polished. Brown Rice:- kernels of Rice from which only the hull has been removed. Brown Rice may be eaten as is or milled into white Rice. Cooked brown Rice has a slightly chewy texture and a nut-like flavor. The light brown color of brown Rice is caused by the presence of bran layers which are rich in minerals and vitamins, especially the B-complex group. Brown Rice characteristics:- (i) higher protein content; (ii) chewy texture; and (iii) nut-like flavor. Applications:- (i) health food products; (ii) frozen/prepared meals; (iii) prepared salads; (iv) ethnic dishes; (v) hot and ready-to-eat cereals; (vi) extruded snacks, rice cakes; and (vii) packaged rice mixes. / лизин (lysine). К Бурому Рису относится целиковая или битая зерновка Риса, у которой была удаленная плодовая оболочка. Бурый Рис (иногда его называют коричневым или нешлифованным). У него явный ореховый привкус. Обычно его продают как продукт, очень богатый витаминами и предназначенный для здорового питания. Поскольку с зерна снимают только шелуху и не шлифуют (или шлифуют лишь немного), этот Рис сохраняет коричневатую отрубевидную оболочку, в которой и сосредоточена основная масса витаминов и минералов.

BROWN ROT = БУРАЯ ГНИЛЬ (или БУРАЯ ТРЕЩИНОВАТАЯ ГНИЛЬ) – Wood decay in which the attack concentrates on the cellulose and associated carbohydrates rather than on the lignin, producing a light to dark brown pliable residue and sometimes referred to as Dry Rot. Brown Rot is a decay characterized by degradation of cellulose and hemicelluloses, but practically no lignin. The wood usually becomes brown and loses fibrous structure. Brown Rot is brown because carbohydrates are removed, leaving brownish, oxidized lignin. There is no fibrous texture because the cellulose is broken up early. The wood shrinks on drying and cross-checking is seen in later stages. It is often called ‘Cubical’ Brown Rot for that reason. There are a handful of ‘brown pocket rots’. They only occur in living trees, and more specifically trees that have unusually durable wood, with otherwise effective antifungal chemicals in the heartwood. One can speculate that the occurrence of brown pocket rots in such tree species is probably related to the chemical protection of the wood, but how is a mystery that is yet to be solved. The initial stage is non-enzymatic. Fungus produces some small chemical agent (involving oxalic acid and hydrogen peroxide) that zips around in the cell wall like a little pair of scissors, snipping chains of cellulose and hemicellulose into smaller pieces. This happens throughout the wall in fairly early stages. The carbohydrates become partly soluble, enzymes work on them, releasing sugars, and they are slowly absorbed by the fungus. / виды (species). Гниение или загнивание древесины, в которой , вырабатывающая гибкий осадок от светлого до тёмно-бурого цвета и иногда относимая к сухой гнили (dry rot). Под Бурой Гнилью или Бурой Трещиноватой Гнилью понимается гниль, характеризующаяся пониженной твёрдостью и бурым (изредка серым) цветом различных оттенков и трещиноватой призматической структурой. Поражённая древесина иногда содержит в трещинах беловатые или желтоватые грибные плёнки. При сильном разрушении древесины распадается на части и легко растирается в порошок. Синева Древесины (Blue Stain) – порок древесины в виде местной ненормальной сине-серой или сине-зелёной окраски заболони (наружных молодых слоёв древесины). Синева портит внешний вид древесины и снижает её сопротивляемость ударным нагрузкам.

BROWN SPOT = БУРАЯ ПЯТНИСТОСТЬ – Brown Spot is a disease of Rice caused by the fungus Helminthosporium oryzae, with leaf symptoms consisting of brown and oval spots with gray or whitish centers. The disease is also observed on the grains. The disease is closely associated with abnormal or poor soil and its occurrence serves as an indicator of poor soil conditions for Rice production. It is sometimes called ‘Poor Man’s Disease’.

BROWN STAINS = БУРЫЕ РАЗВОДЫ (или КОРИЧНЕВЫЕ ПОТЁКИ) – Brown Stains:- Fabric:- spun-rayon dress goods; Construction:- (i) Count:- 96 x 50; (ii) Warp:- 20/1 75% 2-in. 3-den. dull viscose rayon 25% 2-in. 1%-den. dull viscose rayon S twist; (iii) Filling:- same as warp but Z twist; Finish:- plain dyed yellow. Defect:- numerous brown stains in finished goods. Analysis:- inspection of a number of pieces showed no regular pattern to the defect, the stains being, in general, fairly small and scattered. Chemical tests revealed the presence of iron. By a study of a great many of the discolored areas under the microscope it was discovered that there were small bits of fine wire spun into the yarn in four or five different places. Further investigation revealed that these wire particles came from the steel wool used in floor-cleaning machines recently put into use in the mill and had been accidentally discharged through a hole in the dust-collecting bag, so contaminating some of the rayon stock prior to its being spun. The metal particles rusted when the goods were processed at the finishing plant and batched up while wet, and most of the stains were due to mark-offs from the

original heavily rusted areas. The finisher was able to correct this defect by treatment of the goods with oxalic acid, to remove the stains before dyeing. / Уточина:- .

BROWN STINK BUG = БУРЫЙ ВОНЮЧИЙ КЛОП – Brown Stink Bug (Euschistus Servus) is a brownish, medium-sized member of the Stink Bug Family (Pentatomidae) that usually undergoes a generation on hosts, such as Corn and other Grass Species, before moving into Cotton, often during boll formation. Feeding by adults and large nymphs with needle-like stylets, often on bolls of all sizes, causes small, rounded, dark spots on the exterior carpel wall; feeding can transmit hardlock organism, resulting in unharvestable bolls and low-quality lint. Brown Stink Bugs are more difficult to control with pyrethroids than Green Stink Bugs. This species' life cycle (egg to adult) typically takes 40 days.

BRP = BROWN RICE PROTEIN

BRRI = BANGLADESH RICE RESEARCH INSTITUTE

BRUISE = ПОМЯТОСТЬ (или ПОДТЁК) – Bruise (scratch defect):- this refers to:- as the ongoing or have been knitting yarn woven fabric finished by the wear and tear, leading to fiber loss of sense of direction and lead to distortion of the fabric appearance. Fabric Printing Defect. Bruise:- in fabrics, an area that has been subjected to impact or pressure, that differs from the adjacent normal fabric. Synonym Pressure Mark. See also Abrasion Mark. Bruise:- an area of localized within a fabric. Compression. Note:- this defect is often caused by the squeezing or crushing of the fabric. / Порок или Дефект набивки тканей. Волнистость (bruise):- порок заключительной отделки ткани в виде неровностей поверхности полотна вызывающих его неполное прилегание к плоскости. Примечание:- этот порок возникает при ненамеренном сдавливании полотна.

BRUNET = ХХ (или БРЮНЕТ, или ТЁМНОЕ) – (1) Brunet:- (also brunette) of a dark-brown or black color. (2) Brunet is a person having brown or black hair and often a relatively dark complexion – spelled brunet when used of a boy or man and usually brunette when used of a girl or woman.

BRUSHED MICRO JERSEY = ЧЁСАНОЕ МИКРО ДЖЕРСИ (или ЧЁСАНОЕ МИКРО ДЬЖОЗИ) – Brushed Micro Jersey (BMJ):- it's really a misnomer, because the fabric maybe a brushed interlock.

BRUSHED RAYON = ЧЁСАНЫЙ РЭЙОН (или ЧЁСАНАЯ ГИДРАТЦЕЛЛЮЛОЗА) – Brushed Rayon is a rayon fabric that has been heavily napped. Brushed rayon is highly flammable.

BRUSHED SILK = ЧЁСАНЫЙ ШЁЛК – Brushed Silk:- produced by gently brushing the fabric surface to pull up fibers from the yarn, producing a luxuriously soft & downy feel to its surface.

BRUSHED WOOL = ЧЁСАНАЯ ШЕРСТЬ – Brushed Wool:- finished yarn or material that has been brushed to raise all loose fibers to the surface, i.e. the commercially-spun mohair yarn.

BRUSHING = ОЧИСТКА (или ОТБОЙКА ВОРСА) – (1) Brushing is a finishing process for knit or woven fabrics in which brushes or other abrading devices are used on a loosely constructed fabric to permit the fibers in the yarns to be raised to create a nap on fabrics or create a novelty surface texture. Brushing is a finishing process in which rotating brushes raise a nap on knit or woven fabrics. Brushing is used on sweaters, scarves, knit underwear, wool broadcloths, etc. This process, applied to a wide variety of fabrics, is usually accomplished by bristle-covered rollers. The process is used to remove loose threads and short fiber ends from smooth-surfaced fabrics and is also used to raise a nap on knits and woven fabrics. Brushing is frequently applied to fabrics after shearing, removing the cut fibers that have fallen into the nap. / Отбойка Ворса – поднятие ворса перпендикулярно к полотну ткани.

(2) Brushing (Silk) is an act of transferring newly hatched silkworms from the egg sheets on to the rearing trays; or act of removal of floss from the cooked and boiled cocoons for collection of ends for reeling. / Удаление верхнего спутанного покрова кокона ударами веничка и задеванием щёткой в процессе кокономотания.

BRUSSELS LACE = БРЮССЕЛЬСКОЕ КРУЖЕВО – Brussels Lace may be either a bobbin lace or a needlepointlace.It is usually worked on a machine-made ground and sometimes the designs are appliqued onto the ground. Because of the importance of Brussels, Belgium, in the history of lace-making (many patterns developed there), several different laces are called Brussels Lace. See also Bobbin Lace, and Needlepoint Lace. Brussels Lace:- any of various fine needlepoint or bobbin laces with floral designs made originally in or near Brussels.

BRUSSELS TARIFF NOMENCLATURE = БРЮССЕЛЬСКАЯ НОМЕНКЛАТУРА ТАРИФОВ – Brussels Tariff Nomenclature is the old Customs Cooperation Council Nomenclature for the classification of goods. Now replaced by the Harmonized System (HS). A once widely used international tariff classification system which preceded the Customs Cooperation Council Nomenclature (CCCN) and the Harmonized System Nomenclature. / Номенклатура – классифицированный перечень.

BTU = BRITISH THERMAL UNIT

BTX = BENZENE, TOLUENE, AND XYLENE

BUBA = BUNDESBANK

BUBBLE JUNKIE = ТОРЧКИ ОТ ПУЗЫРЕЙ – Bubble Junkie:- those entrepreneurs that were caught up in the 1999–2000 euphoria surrounding internet stock deals. They got 'addicted' to concepts of easy money, high spending, grow big or go home ideas.

BUBBLE POINT = ТОЧКА ПОЯВЛЕНИЯ ПУЗЫРЬКА (или ТОЧКА НАЧАЛА КИПЕНИЯ) – Bubble Point:- the differential gas pressure at which the first steady stream of gas bubbles is emitted from a wetted filter element under specified test conditions. / Точка Появления Пузырька или Точка Начала Кипения. Температура Фазового Перехода, температура, при которой в физической системе происходит равновесный фазовый переход первого (кипение, плавление) или второго рода (переход в сверхпроводящее состояние и другое). Температура фазового перехода зависит от внешнего давления согласно Уравнению Клапейрона-Клаузиуса (для фазовых переходов первого рода) и Соотношениям Эренфеста (для фазовых переходов второго рода).

BUBBLE WRAP = ПУЗЫРЧАТАЯ ОБТЯЖНАЯ ПЛЁНКА – Bubble Wrap:- sheet of plastic with air bubbles that is used as a packing material. / Пупырка – жаргонный термин.

BUCK = ЗАМША (или НУБУК, или ЛОСИНА) – Buck is an article of clothing, as a shoe, made of buckskin. Yes, you are correct that a buck also refers to a piece of paper money worth one Dollar. Also a buck is a mature male of various mammals (especially deer and antelope).

BUCKETING = ЖУЛЬНИЧЕСТВО (или МОШЕННИЧЕСТВО) – Bucketing:- directly or indirectly taking the opposite side of a customer's order into the broker's own account or into an account in which the broker has an interest, without open and competitive execution of the order on an exchange. / При осуществлении биржевых операций . Под Мошенничеством понимается преступление, заключающееся в завладении государственным, общественным или личным имуществом (или в приобретении прав на имущество) путём обмана или злоупотребления доверием.

BUCKET SHOP = ЗАБЕГАЛОВКА – Bucket Shop:- 1870–75, Americanism; originally a cheap drinking establishment, allegedly so called because liquor was mixed or sold in buckets. Bucket Shop is an unregistered firm of stockbrokers that engages in speculation with clients' funds. Bucket Shop is an office or a place where facilities are given for betting small sums on current prices of stocks, petroleum, etc. Bucket Shop is a brokerage enterprise that 'books' (i.e. takes the opposite side of) a customer's order without actually having it executed on an exchange. Bucket Shop:- one day in August 1887 President Abner Wright of the Chicago Board of Trade forcibly removed the instruments of the Postal Telegraph Company and the Baltimore and Ohio Telegraph Company from the floor of the exchange, literally throwing their equipment out of the building. A few months later, on the night of December 15, Wright discovered some mysterious electrical cables leading out of the basement of the exchange building. Thinking that they were telegraph lines, he cut them with an axe. Wright was neither deranged nor a Luddite. Instead, his forceful actions were dramatic examples of the troublesome technological, cultural, and economic relationship between the telegraph industry, finance capitalism, and organized gambling in the United States during the Gilded Age and Progressive Era. Wright's actions occurred in the context of a 25-year struggle between the Chicago Board of Trade and hundreds of bucket shops. Bucket shops, depending on whom one believed, were either gambling dens or small brokerage houses. Brokers and directors of the large exchanges claimed that bucket shops were nothing more than betting

parlors in which patrons wagered on the price movements of stocks and commodities. Defenders of the bucket shops denied that they were gambling dens and asserted instead that they were independent brokers attempting to compete with the plutocrats and monopolists who controlled the New York and Chicago exchanges. In either case, bucket shops flourished between about 1880 and 1910. They purchased ticker service from the telegraph companies and depended upon the market quotations from the major exchanges to conduct their trades. They charged lower commissions, required minimal margins, and traded in smaller lot sizes than brokers on the major exchanges. In this sense they democratized speculation:- anyone with a few Dollars could become part of the action on the Chicago and New York exchanges. However, customers' trades were fictitious; bucket shops could not deliver actual stock certificates or grain to their patrons. Bucket shops were able to take root and to flourish in the late XIX and early XX centuries for two major reasons, one technological and the other cultural. During the 1870s, two important innovations revolutionized the American telegraph industry. In the late 1860s Edward Calahan (check name and date) invented the ticker, a low-cost and low-maintenance printing telegraph which allowed brokers to monitor transactions on exchange floors. Several inventors working for Western Union, including Thomas Edison, brought the ticker to a state of technical perfection by the mid-1870s. During the same period, Edison invented the quadruplex, a system which allowed four messages to travel simultaneously over one telegraph wire. The quadruplex gave Western Union a great deal of flexibility in handling its traffic. On major trunk routes, it effectively quadrupled its circuit capacity without requiring the costly installation of more lines. More significantly from the standpoint of financial markets, the quadruplex allowed Western Union to lease excess circuit capacity to financiers and bucket shops. Taken together, the ticker and the quadruplex allowed Western Union to exploit the growing demand for realtime financial information. After about 1880 Western Union aggressively marketed its ticker service and private wire leases. Within a few years, both brokers and bucket shops were leasing thousands of tickers and circuit miles to obtain real-time market quotations. Ticker service and wire leases soon became Western Union's most lucrative activities. The company was reluctant to abandon this highly profitable market, and it did so halfheartedly around 1910 only under pressure from the major exchanges, courts of law, and antigambling reformers. At the same time that Western Union earnestly began to exploit the demand for its ticker service, there existed widespread confusion about the difference between legitimate and economically useful speculation and illegitimate and harmful gambling. Farmers who blamed the Chicago Board of Trade for their economic woes, judges who protected the right of bucket shops to receive ticker service, economists who sought to explain how financial markets worked, and even brokers themselves all equated speculation with gambling. Many Americans saw little difference between the transactions on exchange floors and in bucket shops. Bucket shops came to the notice of exchange officials in the late 1870s. The leadership of the Chicago Board of Trade first recognized their growing threat in the summer of 1880, and they asked telegraph companies transmitting the Board's market quotations to cease supplying ticker service to them. By 1890, anti-gambling reformers estimated that 5 000 bucket shops existed throughout the country, including some 200 in New York, over 100 in Chicago, and at least one in each town with a population of 10 000. One reformer claimed in 1887 that bucket shops had so penetrated rural areas that they accounted for 90% of commodity trading in the countryside, and that they had depressed the price of agricultural commodities by a total of some USD2.5 billion since 1880. Stock brokers as well as commodity traders felt serious competition from bucket shops. One prominent broker on the New York Stock Exchange complained in 1889 that the 'indiscriminate distribution of stock quotations to every liquor-saloon and other places has done much to interfere with business. Any person could step in a saloon and see the quotations'. Indeed, by 1889 competition from bucket shops had depressed the value of a seat on the New York Stock Exchange by nearly half, from USD34 000 to USD18 000, and a seat on the Chicago Board of Trade by over two-thirds, from USD2 500 to USD800. When they first opened for business in the late 1870s and early 1880s, bucket shops were small, independent store-front operations, typically located in the vice districts of large towns and cities. Like the rest of the American economy in this period, bucket shops soon exhibited a trend toward consolidation and monopoly. As early as 1890 the New York Times reported that a syndicate popularly known as the 'Big Four' controlled all the bucket shops in Manhattan, had offices in 'every city of consequence in the Union', and possessed capital amounting to 'millions of Dollars'. By the turn of the century the major bucket shops had relocated to the heart of the financial districts of America's cities, had outfitted their offices to appear similar to brokers' offices, and had come to control dozens of branch offices throughout the country. For example, the Haight and Freese Company, specializing in New York stocks, operated some 70 branches in the northeastern US, from Richmond, VA to Pittsburgh and Buffalo. The Coe Commission Company of Minneapolis, specializing in grain quotations, operated 100 offices across the country, from Boston to Spokane. The M.J. Sage Company of New York, specializing in cotton quotations, controlled 200 branches in the south. The larger offices of these chains made annual profits of USD100 000 to USD500 000. Merrill A. Teague, a muckraking journalist who wrote a four-part expose on the bucket shops in 1904, charged that bucket-shop customers lost a total of USD100 million a year and that bucketshop owners made an annual profit of about USD35 million. The remaining USD65 million was 'tribute to the obstensibly respectable accomplices of the thieves', including the telegraph and telephone companies who 'lend eager aid, collecting in exchange for their assistance great slices of the loot of thievery'. As Teague's remarks suggest, telegraph service was essential to the operations of the bucket shops and telegraph companies profited enormously from this service. The largest bucket shop chains spent tens of thousands of Dollars annually to lease private telegraph networks. The Philadelphia office of Haight and Freese, for example, paid both Western Union and Postal at least USD10 000 each per year to lease private telegraph circuits. A large bucket shop in St. Louis was Western Union's biggest account in that city, making up about half of the company's total telegraph tolls. (Western Union contracts with bucket shops for ticker service ranged from USD6 to USD40 a week depending on class of service, and the contracts were subject to one day's notice for cancellation of service, an indication of the precarious and illicit nature of the bucket shop business). It is difficult to determine exactly how much money Western Union made by supplying bucket shops with quotations, because the company's accounts did not distinguish between legitimate brokers and bucket shops. However, in 1890 Western Union's president Norvin Green testified to Congress that just under half of his company's message traffic was 'purely speculative', including 'stock-jobbing, wheat deals in futures, cotton deals in futures', and horse racing odds. It is also suggestive to note that Western Union's income from a kindred service – providing racing results to gamblers – generated USD2 million in income and USD216 000 in profit in 1904. (Western Union's reformation was short-lived, however. The company did stop providing racing results directly to pool rooms, but allowed gambling syndicates, such as that controlled by Moe Annenberg in the 1930s, to lease thousands of circuit miles to transmit the results. As late as 1950, in Congressional hearings on organized crime, the chairman of the Federal Communications Commission castigated Western Union for receiving over USD1 million annually for wire leases used for race gambling). In addition to Western Union's ticker service, widespread public confusion about the differences between speculation and gambling allowed the bucket shops to flourish. Farmers who blamed Eastern financiers for their economic woes saw little difference between speculation in futures contracts and outright gambling. Referring to grain speculators, one farmers' newspaper in 1883 charged, 'Their business is gambling, too, and they operate upon the same telegraphy reports that the bucket shops do …. The principle of gambling is the same in both places and demands the same condemnation and the same treatment by authorities'. A few years later, the New York Times reported on an imminent police crackdown to arrest bucket shop proprietors on the charge of 'just plain ordinary gambling'. But, the reporter asked, 'suppose some zealous citizen should come along and want to press the same sort of charge against the Stock Exchange?' Speculators themselves admitted that there existed little difference between their activities and just plain ordinary gambling. In 1888 Benjamin Hutchinson, one of the senior traders on the floor of the Chicago Board of Trade, publicly denied that speculators served a useful economic function;

instead, he claimed, ‘we’re gamblers’. Even economists who studied the nation’s financial markets were ambivalent about the social utility of speculation. In 1896 Henry Crosby Emery, an economics professor at Columbia University, admitted in his standard treatise on stock and commodity exchanges that ‘the gaming instinct’ was integral to speculation. However, he continued, ‘Speculation is not mere gambling. Whether it is better or worse than gambling is a question on which opinions will long differ’. Legislators, too, found little difference between speculation and gambling. In 1909 New York Governor Charles Evans Hughes of New York appointed a committee to investigate abuses in organized speculation, and the committee found that speculation exhibited ‘most of the pecuniary and immoral effects of gambling on a large scale’. Indeed, the committee concluded, ‘only a small part of the transactions upon the Exchange is of an investment character; a substantial part may be characterized as virtually gambling’. A year later, during Congressional hearings on a bill to ban the interstate transmission of gambling information, one representative argued that futures quotations should be banned from the wires along with horse race odds. Not surprisingly, bucket shop proprietors seized on these moral and economic ambiguities to claim that they democratized speculation. In 1899 Haight and Freese issued a Guide to Investors to solicit new business, and claimed that their facilities were ‘designed for the benefit of The Million’ who lacked the capital and experience to invest with high-priced brokers. Indeed, in 1905 the manager of Haight and Freese’s Philadelphia office maintained in courtroom testimony that his firm was ‘a competitior of the New York Stock Exchange’. In 1906 Everybody’s Magazine gave C.C. Christie, the ‘Bucket Shop King’, an opportunity to reply to Merrill Teague’s four-part expose’ of the bucket shop industry. Christie defended his operation as an ‘independent’ broker by citing figures showing that only about 1% of trades on the Chicago Board of Trade resulted in delivery of actual grain. Traders concluded the other 99% of their transactions by settling on the basis of price differences, exactly as bucket shops settled accounts with their customers. Therefore, Christie charged, the Chicago exchange was ‘the biggest bucket shop on earth’. He accused the major exchanges of being grasping monopolists seeking ‘to crush the independents. It is a case of Greed versus Freedom’. Teague, in his brief rejoinder, reiterated that bucket shops were gambling dens. However, he admitted, ‘I’ll have no quarrel with Christie about the Chicago Board of Trade’. Between 1880 and 1910 the major exchanges sought to stamp out the bucket shops for two reasons. On the one hand, bucket shops competed directly with brokers who traded on the New York and Chicago exchanges. Many brokers keenly felt this competition and pressed the directors of exchanges to take decisive action. On the other hand, bucket shops cast doubt on the legitimacy of speculation on the grain and stock exchanges by revealing that the same acquisitive drive and addictive thrill lay behind both gambling and speculation. The major exchanges, especially the Chicago Board of Trade, sought to eliminate the bucket shops by denying them access to market quotations. However, cutting off the flow of quotations was no easy matter. It required over twenty years of investigation, expensive litigation, a sustained public relations campaign, and protracted negotiations with the major telegraph companies. Indeed, Abner Wright’s headstrong and controversial actions in 1887 demonstrated the frustration and futility many exchange officials felt in their attempts to cut off the bucket shops through legal and contractual means. In attempting to cut off the flow of market quotations to the bucket shops the leaders of the Chicago Board of Trade confronted a ticklish dilemma. If they decided to strike at the bucket shops by restricting distribution of its quotations, the Board risked losing its pre-eminience among the legitimate exchanges. Many speculators and grain dealers would use the ticker of another exchange – perhaps the Board’s rivals in New York or St. Louis – as the basis of their transactions. The Chicago Board of Trade would cease to set the national market for farm produce if it choked off its quotations. But if it continued to provide its market to all comers, the bucket shops would flourish. The Board attempted to navigate between these two unpleasant options from 1882, when it first decided to eliminate the ‘bucket shop evil’, to 1905, when the US Supreme Court ruled that the exchange had property rights over its quotations. In 1882 the Chicago Board of Trade renegotiated its contracts with the telegraph companies transmitting its quotations, and included a provision giving it the right to deny applications for its ticker quotations. In this way the Board could ensure that legitimate brokers continued to receive its market quotations while cutting off the bucket shops. While simple in conception, this method was quite difficult in practice. The telegraph companies, Western Union especially, were reluctant to withdraw from the lucrative bucket shop market. Furthermore, the bucket shops were quite successful at securing court injunctions prohibiting Western Union and the Board of Trade from removing their tickers. The net result, therefore, was a protracted and three-cornered contest between the Chicago Board of Trade, Western Union, and the bucket shops. This contest did not go well for the Chicago Board of Trade for about twenty years. In a series of rulings at the state and Federal levels between 1883 and 1903, the courts continually upheld the right of bucket shops to obtain market quotations. The judges in these cases uniformly ruled that scant moral and economic difference existed between trades on the exchange floor and transactions in the bucket shops, and that bucket shops had as much right to the quotations as brokers. For instance, in an important 1903 case in federal appellate court, a panel of three judges ruled that the vast majority of transactions on the Board of Trade were ‘in all essentials gambling transactions’ and that the Board itself violated an Illinois statute banning bucket shops. The judges concluded that ‘the Board of Trade does not come with clean hands, nor for a lawful purpose, and for these reasons its prayer for aid must be denied’. In May 1905 the protracted and inconclusive litigation between the Board of Trade, Western Union, and the bucket shops came to an end. The United States Supreme Court ruled that the Chicago Board of Trade owned its quotations and could provide or deny them to anyone it wished. The basis of the court’s decision was that organized speculation on the legitimate exchanges did serve a useful public purpose, while bucket shop transactions were mere gambling wagers. Armed with this decision, the Chicago Board of Trade and other major exchanges spent the next several years tracking down and closing bucket shops. Within a few years the bucket shops had ceased to exist. The twenty-five-year war between the exchanges and the bucket shops brought out the dangers as well as benefits of instant telegraphic communication. Court rulings regarding their property rights over quotations, negotiations with the telegraph companies, and widely-held assumptions about speculation and gambling all defined the boundaries within which the major exchanges sought mastery over their informational destiny. In their struggle exchange leaders came to realize that control over the legal, business, and cultural environments were absolutely necessary to solve the dilemma in which the telegraph and the ticker had placed them. The reliance of exchanges upon telegraphy simultaneously consolidated and undermined both their economic dominance and cultural authority over national financial markets. In the final analysis, the exchanges’ relationship with the telegraph had little to do with the imperatives of large technological systems or the inexorable laws of neoclassical economics. Rather, it was a vital piece in the exchanges’ construction of an accepted and legitimate role for themselves within a modernizing society. For exchange leaders, to confront directly their dependence upon telegraphy was to question the morality and desirability of speculation on their trading floors. In the end, exchanges like the Chicago Board of Trade gained control over the flow of information only by redefining themselves and the nature of economic relations. (Partners in Crime:- The Telegraph Industry, Finance Capitalism, and Organized Gambling, 1870–1920. David Hochfelder, IEEE History Center, Rutgers University). / Эдэсэн (Edison). Мёрыл Эй. (Merrill A.). Предприятие, оказывающее брокерские услуги, которое якобы бронирует, то есть занимает встречную позицию в отношении распоряжения заказчика, но при этом реально не исполняющее его на бирже.

BUCKET SPINNING = ВЕДЁРНОЕ ПРЯДЕНИЕ – Bucket Spinning:- xxxxx. See also Pot Spinning.

BUCK FLEECE = РУНО САМЦОВ – Buck Fleece is a fleece from a ram. The wool usually has a heave shrinkage due to excessive wool grease; thus wool of this type is not worth as much in the grease as a similar wool from ewes or wethers. Some buck fleeces have a distinctive odor that many find objectionable. / Руно от самцов – баранов/козлов.

BUCKLING = ВЫПУЧИВАНИЕ (или КОРОБЛЕНИЕ) – Buckling is a drying and consequential bulging of the exterior of paper packages on pallets.

BUCKRAM = БОРТОВКА (или ЛОЩЁНКА) – Buckram is a stiff, open-weave fabric made from coarse yarns and used primarily for stiffening in interfacings and hat shaping. Originally, buckram was sized with starch that was not permanent, but today most buckrams have a permanent stiff finish. Buckram is a scrim fabric with a stiff finish, often used as interlining. Buckram is a stiff-finished heavily sized fabric of cotton or linen used for interlinings in garments, for stiffening in millinery, and in bookbinding. Softens with heat. Can be shaped while warm. Name from Bokhara in Southern Russia, where it was first made. Also called Crinoline Book Muslin or Book Binding. / редкая ткань . Бортовка, плотная полульняная или хлопчатобумажная ткань полотняного переплетения, употребляется при шитье верхней одежды в качестве прокладки, придающей устойчивость её формам (борта, грудь, плечи и так далее). Бортовка при отделке пропитывается аппретом с целью повышения упругости при изгибе (жёсткости) и уменьшения растяжимости.

BUCKSKIN = БУКСИН (или ЛОСИНА, или ОЛЕНЬЯ КОЖА, или ЛОСИНАЯ КОЖА) – Buckskin is a fairly inexpensive leather from Deer and Elk skins. Also, a fabric made in a form of satin weave with a napped finish. Originally wool, the term buckskin is now applied to various synthetic fabrics with smooth surfaces, with or without the napped finish. See also Leather. Buckskin:- (plural) buckskin breeches. (i) Buckskin (leather); (ii) Buckskins (clothing). / оленья кожа или лосиная кожа (buckskin). недорогие кожи с Оленя (Deer) и Лося (Elk).

BUCKWHEAT = ГРЕЧИХА – I History:- Buckwheat (Fagopyrum Sagittatum Gilib) has been grown in America since colonial days, and the crop once was common on farms in the Northeastern and Northcentral United States. Production reached a peak in 1866 at which time the grain was a common livestock-feed and was in demand for making flour. By the mid 1960's the acreage had declined to about 50 000 acres. The leading buckwheat states are New York, Pennsylvania, Michigan, Wisconsin, Minnesota, and North Dakota. Canada has more Buckwheat acreage than the United States. Buckwheat enjoyed a resurgence of popularity in the mid 1970's that was brought on by the demand for commercially prepared breakfast cereal and by exports to Japan for making Buckwheat noodles. This boom was due to the nutritional excellence of Buckwheat. USDA-ARS analyses indicate that the grain has an amino acid composition nutritionally superior to all cereals, including Oats. Buckwheat protein is particularly rich (6%) in the limiting amino acid lysine. Uses:- Until the recent increased interest in Buckwheat for human food, about 75% of the grain produced was used for livestock and poultry, about 5–6 % for seed, with the remainder milled into Buckwheat flour. Between 5 and 10% of the seeded acreage was turned under for green manure. Several thousand acres were harvested green for extracting rutin. Today, the major use of Buckwheat is for human food. The composition of Buckwheat grain and its byproducts. Average Amino Acid Concentrations In Buckwheat:- (i) amino acid – glumtamic, in seed – 1.99%, in groat – 2.72%, in protein – 18.02%; (ii) amino acid – arginine, in seed – 1.47%, in groat – 2.01%, in protein – 13.27%; (iii) amino acid – aspartic acid, in seed – 1.20%, in groat – 1.64%, in protein – 10.86%; (iv) amino acid – valine, in seed – 0.85%, in groat – 1.17%, in protein – 7.71%; (v) amino acid – leucine, in seed – 0.75%, in groat – 1.02%, in protein – 6.75%; (vi) amino acid – lysine, in seed – 0.66%, in groat – 0.90%, in protein – 5.99%; (vii) amino acid – glysine, in seed – 0.61%, in groat – 0.83%, in protein – 5.52%; (viii) amino acid – phenylalanine, in seed – 0.46%, in groat – 0.63%, in protein – 4.17%; (ix) amino acid – serine, in seed – 0.46%, in groat – 0.62%, in protein – 4.12%; (x) amino acid – alanine, in seed – 0.45%, in groat – 0.61%, in protein – 4.03%; (xi) amino acid – threonine, in seed – 0.43%, in groat – 0.58%, in protein – 3.87%; (xii) amino acid – proline, in seed – 0.41%, in groat – 0.55%, in protein – 3.66%; (xiii) amino acid – isoleucine, in seed – 0.39%, in groat – 0.53%, in protein – 3.48%; (xiv) amino acid – tyrosine, in seed – 0.23%, in groat – 0.32%, in protein – 2.12%; (xv) amino acid – histidine, in seed – 0.23%, in groat – 0.32%, in protein – 2.11%; (xvi) amino acid – cystine, in seed – 0.18%, in groat – 0.25%, in protein – 1.66%; (xvii) amino acid – methionine, in seed – 0.15%, in groat – 0.21%, in protein – 1.37%; and (xviii) amino acid – tryptophan, in seed – 0.14%, in groat – 0.19%, in protein – 1.29%. Table:- Percent composition of buckwheat grain and buckwheat byproducts:- (i) Grain or By Product – Whole Grain, Moisture – 10.0%, Protein – 11.2%, Fat – 2.4%, Fiber – 10.7%, N-Free Extract – 64.0%, Ash – 1.7%; (ii) Grain or By Product – Light Flour, Moisture – 12.1%, Protein – 7.8%, Fat – 1.5%, Fiber – 0.7%, N-Free Extract – 76.7%, Ash – 1.2%; (iii) Grain or By Product – Dark Flour , Moisture – 11.7%, Protein – 15.0%, Fat – 2.8%, Fiber – 1.1%, N-Free Extract – 67.7%, Ash – 1.7%; (iv) Grain or By Product – Groats, Moisture – 10.6%, Protein – 11.2%, Fat – 2.4%, Fiber – 0.6%, N-Free Extract – 73.7%, Ash – 1.5%; (v) Grain or By Product – Hulls, Moisture – 8.0%, Protein – 4.5%, Fat – 0.9%, Fiber – 47.6%, N-Free Extract – 36.8%, Ash – 2.2%; (vi) Grain or By Product – Middlings, Moisture – 10.7%, Protein – 27.2%, Fat – 7.0%, Fiber – 11.4%, N-Free Extract – 39.1%, Ash – 4.6%; and (vii) Grain or By Product – Farina, Moisture – 12.0%, Protein – 2.7%, Fat – 0.4%, Fiber – 0.4%, N-Free Extract – 83.0%, Ash – 0.5%. (a) Food For Humans:- most of the buckwheat grain utilized as food for humans is marketed in the form of flour. The flour is generally dark colored due to presence of hull fragments not removed during the milling process. Buckwheat flour is used primarily for making buckwheat griddle cakes, and is more commonly marketed in the form of pancake mixes than as pure buckwheat flour. These prepared mixes may contain Buckwheat mixed with Wheat, Corn, Rice, or Oat flours and a leavening agent. Buckwheat flour is never produced from tartary Buckwheat because of a bitter taste that makes it undesirable as human food. Some Buckwheat grain is utilized in the form of groats (that part of the grain that is left after the hulls are removed from the kernels). The product may be marketed as whole groats, cracked groats, or as a coarse granular product. These products are used for breakfast food, porridge, and thickening materials for soups, gravies, and dressings. Buckwheat may cause a rash on the skin of certain individuals, especially if it is eaten frequently or in large quantities. Buckwheat flour and groats must be used fresh because their fat content is high and they soon become rancid. This poor keeping quality makes buckwheat products difficult to handle in the summer. (b) Feed For Livestock:- Buckwheat is a satisfactory partial substitute for other grains in feeding livestock. It has a lower feeding value than Wheat, Oats, Barley, Rye, or Corn. The grain should be ground and mixed with at least two parts of Corn, Oats, or Barley to one part Buckwheat. When fed continually or in large amounts to certain animals, Buckwheat grain may cause a rash to appear on the skin. This rash is confined to the white-haired parts of the hide of the animal, and apparently occurs only when animals are exposed to light. The substances that produce the rash are in the Buckwheat hulls. Tartary Buckwheat has a lower feeding value for livestock than the common varieties, but it was used extensively as an ingredient of scratch feeds for poultry. The small, smooth, rounded seed of tartary makes it more satisfactory for poultry than the larger and more angular seeds of common Buckwheat. Buckwheat middlings are rich in protein, fat, and minerals, and are considered a good feed for cattle when not fed in large amounts or as the only concentrate. They may also be used satisfactorily as a substitute for linseed meal in a ration consisting of tankage, linseed meal, and Alfalfa hay. Buckwheat middlings apparently have no harmful effect on dairy cows or dairy products. They are not satisfactory for pigs when fed as the only concentrate, and are not palatable to pigs as are other ground grains. Buckwheat hulls have little or no feeding value, but they contain most of the fiber of the seed. They are sometimes combined with middlings and sold as buckwheat feed or bran. They are also used as soil mulch and poultry litter in the United States and for pillow stuffing in Japan. Buckwheat straw is sometimes used for feed when well preserved, but may cause digestive disturbances when fed in large amounts. Buckwheat seed is an ingredient in commercial bird feed mixes and the seed is sometimes planted to provide feed and cover for wildlife. (c) Honey Crop:- with the exception of tartary, buckwheat is sometimes used as a honey crop. It has a long blooming period, especially in September when other sources of nectar are limited. The honey is dark in color, and has a strong flavor unpleasant to some persons but highly favored by others. Buckwheat was once an important honey crop in this

country, especially in the Northeast where climatic conditions are most favorable to nectar flow. When Buckwheat was commonly grown, it was one of the beekeepers' greatest sources of nectar, and the supply of Buckwheat honey generally exceeded the demand. However, because of the decline of Buckwheat as a grain crop, Buckwheat honey now is so uncommon that it may command a price higher than that of almost any other honey. Buckwheat nectar flow is favored by adequate moisture combined with clear, still days and cool nights. Under these conditions, an acre of Buckwheat may support a hive of bees and yield up to 150 pounds of honey in a season. Reports are that it is not uncommon for a strong colony to glean 10 pounds of honey per day while foraging Buckwheat. Although Buckwheat is one of the most dependable and highest yielding honey plants, it normally yields nectar only during the morning and bees are unable to complete a full day of nectar collection. As a result, bees working Buckwheat may not be very amiable to the beekeeper should he visit his hives in the afternoon. Buckwheat may fill a special need for the beekeeper since the honey flow comes late in the season when other nectar is scarce. Thus, it may be possible to obtain a crop of Buckwheat honey in an area where an earlier flow has been harvested from other sources. The variety Tokyo is reported to produce a lighter colored honey than most Buckwheats. (d) Smother Crop:- although modern weed control methods have reduced the need for smother crops, Buckwheat may still be useful for this purpose. Buckwheat is a good competitor because it germinates rapidly, and the dense leaf canopy soon shades the soil. This rapid growth soon smothers most weeds. Buckwheat has been cited as a useful crop for control of quackgrass in the Northeastern states, but rapid and complete control should not be expected. A heavy crop of Buckwheat should smother most of the quackgrass if the land has been previously cultivated to break up the quackgrass sod, and then fall – or early spring-plowed and disked or field cultivated occasionally until planting time. Other weeds may be more effectively controlled by growing Buckwheat. Scientists have reported that the crop can be used to eradicate Canada thistle, sowthistle, creeping jenny, leafy spurge, Russian knapweed and perennial peppergrass (Marshall and Pomeranz). Because of Buckwheat's early competitiveness, it is not useful as a companion crop for establishing legumes. (e) Green Manure Crop:- Buckwheat is a useful green manure crop. It can produce significant amounts of dry matter. Up to 3 tons of dry matter per acre has been obtained after 6 to 8 weeks of growth on relatively unproductive land under Pennsylvania conditions. When plowed under, the plant material decays rapidly, making nitrogen and mineral constituents available for the succeeding crop. The resulting humus improves physical condition and moisture-holding capacity of soil. Where a second crop of green manure is desired, rye may be drilled into the buckwheat stubble and plowed under in the spring. The rye frequently can be drilled into the buckwheat stubble without previous disking or plowing. Buckwheat green manure may also fit into fairly tight rotations such as when a crop is harvested prior to mid-July and a succeeding crop is not scheduled until fall. If volunteer buckwheat is harmful in the succeeding crop, then the green manure crop of buckwheat should be destroyed before a large number of seeds mature. (f) Milling Buckwheat:- a few mills still use old-fashioned stone burs to produce buckwheat flour, but the greater number use steel rolls. Some buckwheat flour is milled so finely and is so refined that it is as white as wheat flour. Usually, however, small particles of hull remain in the flour and give it a characteristic dark color. Flours are milled to meet. the protein and fiber specifications of the buyer. One hundred pounds of clean, dry buckwheat yields 60 to 75 pounds of flour, 4 to 18 pounds of middlings, and 18 to 26 pounds of hulls. Not more than 52 pounds of pure white flour from 100 pounds of grain is obtained in milling. Buckwheat more than 1 year old is reported to make flour inferior to that made from freshly harvested grain. The middlings, composed mostly of the gem and the inner covering of the grain just beneath the hull, are used for feed. (III) Growth Habits:- Buckwheat has an indeterminate growth habit. Consequently the plant grows vegetatively and flowers until terminated by frost. There has been little effort to improve the crop through plant breeding since Buckwheat is naturally cross-pollinated and cannot be inbred because of self-incompatibility. Therefore, Buckwheat yields, unlike those of other crops, have remained relatively stable and thus have discouraged production. Flowers of cross-pollination species of Buckwheat attract insects because of their secreted nectar. However, studies at Pennsylvania indicate that insect activity is not essential to get effective fertilization and seed set. (IV) Environment Requirement:- (A) Climatic Requirements:- Buckwheat grows best where the climate is moist and cool. It can be grown rather far north and at high altitudes, because its growing period is short (10 to 12 weeks) and its heat requirements for development are low. The crop is extremely sensitive to unfavorable weather conditions and is killed quickly by freezing temperatures both in the spring and fall. High temperatures and dry weather at blooming time may cause blasting of flowers and prevent seed formation. Generally, buckwheat seeding is timed so that the plants will bloom and set seed when hot, dry weather is over. Often seeding is delayed until three months prior to the first killing frost in the fall. (B) Soil Requirements:- Buckwheat grows on a wide range of soil types and fertility levels. It produces a better crop than other grains on infertile, poorly drained soils if the climate is moist and cool. It is an efficient crop in extracting phosphorous of low availability from the soil. In addition, buckwheat tends to lodge badly on fertile soils. It is often better suited than most other grains on newly cleared land, on drained marsh land, or on other rough land with a high content of decaying vegetative matter. Buckwheat has higher tolerance to soil acidity than any other grain crop. It is best suited to light to medium textured, well-drained soils such as sandy loams, loams and silt loams. It does not grow well in heavy, wet soils or in soils that contain high levels of limestone. It grows well where alfalfa or red clover would not. On soils high in nitrogen, lodging may occur and cause a reduction in yield. Once lodged, a buckwheat plant does not return upright. Crusting on clay soils may result in an unsatisfactory stand because of poor seedling emergence. (C) Seed Preparation And Germination:- Buckwheat will germinate at temperatures ranging from 45 to 105 °F. Freshly harvested seed of some types may not germinate until after 30–60 days of drying and storage. The seed may retain its viability for several years, but seed that is no more than one year old is best to use for planting. Buckwheat plants will emerge from the soil 3–5 days after planting. The time required is influenced by depth of seeding and the temperature and moisture content of the soil. (V) Cultural Practices:- (A) Crop Sequence And Rotation:- serious diseases affecting other dicot field crops have not been important in buckwheat; therefore the volunteer plant problem is the main problem in crop sequences. Volunteer sunflower, rapeseed, mustard, and corn can be serious weeds in buckwheat planted before June 15. Volunteer buckwheat can be a problem in crops following buckwheat, but herbicides will control these in most crops. (B) Seedbed Preparation:- a firm seedbed is best for successful buckwheat production because of its relatively small seed size and its shallow root system. A firm seedbed facilitates absorption of nutrients essential for rapid growth, and tends to reduce losses from drought. If soil has been plowed for a previous crop which has failed, only disking or harrowing may be required. Rolling or cultipacking the seedbed just prior to seeding is sometimes helpful. (C) Seeding Date:- Buckwheat may be sown at any time after all danger of killing frost is past. Since the crop grows rapidly and matures in a short growing season, the most common practice is to seed the crop only 10–12 weeks before a killing frost is expected. For Wisconsin, seeding in mid-June is advised. For Minnesota, plantings in June in the north, before July 15 in the central, and before July 25 in the extreme southern part of the state may mature sufficiently before normal frost dates. The crop produces seed within one month after planting and continues to flower and produce seed until killing frosts occur. Thin stands of buckwheat produce strong plants that branch and resist lodging on good land. Thick stands produce plants that are spindly and have short branches and poor seed set. (E) Fertilizer And Lime Requirements:- Buckwheat has a modest feeding capacity compared to most other grains, and if fertilizer is not applied, the removal of nutrients by a buckwheat crop may have a depressing effect on the yield of the following crop. Typical nutrient removals by the grain for a 1 200 lb/a crop are 9 lb/a N, 3 lb/a P_2O_5 and 12 lb/a K_2O. However, in Minnesota, a 2 000-pound yield of seed removed 40 pounds N, 20 of P_2O_5 and 13 pounds per acre of K_2O or about the same as a 2 000 pound crop of sunflower seed. The crop grows well on acid soils and gives little response to liming above a pH of 5.0. It has about the same acid tolerances as oat and potatoes. Soils should be limed for the crops grown in rotation with buckwheat. It is unlikely that buckwheat will respond to additional P or K at soil tests above 30 lb/a P or 300 lb/a K. The following table

shows the recommended fertilizer rates for buckwheat yielding 30–50 bu/a for Wisconsin and Minnesota. Table:- Wisconsin and Minnesota recommended fertilizer applications for a goal of 30 to 50 bu/a buckwheat yield:- (i) Soil Test – Very Low Or Low, N^1 – 30 lb/a, P_2O_5 – 60–80 lb/a, K_2O – 60–90 lb/a; (ii) Soil Test – Medium, N^1 – 30 lb/a, P_2O_5 – 30–40 lb/a, K_2O – 30–60 lb/a; (iii) Soil Test – High , N^1 – 30 lb/a, P_2O_5 – 15–20 lb/a, K_2O – 15–30 lb/a; and (iv) Soil Test – Very High Or Excessively High , N^1 – 30 lb/a, P_2O_5 – 0 lb/a, K_2O – 0 lb/a. Recommended nitrogen rate ranges from 0 to 50 lb N/a depending on cropping history and organic matter level. If the previous crop was alfalfa, no nitrogen is recommended. If the previous crop was corn or small grains the recommended nitrogen rate is 50 lb N/a where soil organic matter is <2%, and 15 lbs N/a where the organic matter is 2–5%. (D) Method And Rate Of Seeding:- the most satisfactory method of sowing buckwheat is with a grain drill that plants the seed one to two inches deep. Poor stands are likely when seedings are more than two inches deep. A seeding rate of 36 to 72 pounds per acre or 16 seeds per square foot of clean, viable seed is sufficient. At least 48 pounds per acre should be used of large-seeded varieties such as Pennquad. (F) Variety Selection:- because little breeding work has been done on buckwheat, there are only a handful of varieties that are grown in the United States. Dr. Harold Marshall, formerly with the USDA at Penn State University did much of the variety improvement work in the 1960's to 1980's. The tetraploid variety Pennquad was released by Dr. Marshall's program in 1966 and is still grown on some of the buckwheat acreage. Most of the available buckwheat varieties are diploids. Since buckwheat is cross pollinated, variety designations may not be valid except for Certified seed lots. Varieties that have been grown in the United States in the past 20 years include:- (i) Mancan:- large-seeded diploid variety. Has low test weight but good market acceptability. Released by Agriculture Canada and licensed in 1974. (ii) Manor:- large-seeded diploid variety. Has low test weight but good market acceptability. Released by Agriculture Canada and licensed in 1980. Production of certified seed is limited to Canada. (iii) Pennquad:- very large-seeded tetraploid variety. Has good lodging resistance. The grain is especially well suited for milling because of its large, uniform size. Released by the Pennsylvania Agricultural Experiment Station in 1966. (iv) Tempest:- small-seeded diploid variety with high test weight. Selected by Agriculture Canada from a Russian seedlot and licensed in 1971. (v) Tokyo:- small-seeded diploid type with high test weight. Developed by Agriculture Canada from a Japanese introduction. (vi) Winsor Royal:- large-seeded diploid type with low test weight, but has good market acceptability. Released by Winsor Grain Company, Minneapolis, Minnesota, in 1982. Sale of seed is regulated by the US Variety Protection Act. (vii) Common:- seed lots tested under this name range from small to medium in seed size and often have medium to high test weight. (G) Weed Control:- (1) Mechanical:- the best means of controlling weeds is to destroy the young weed seedlings with tillage prior to planting buckwheat. Good, solid stands of buckwheat will compete with weeds which may germinate later. (2) Chemical:- there are no herbicides registered for use on buckwheat in Wisconsin or Minnesota. (H) Diseases And Their Control:- diseases are not a problem in buckwheat production, although a leaf spot caused by species of the fungus Ramilaria and a root rot caused by Rhizoctonia sometimes occur. (I) Insects And Other Predators And Their Control:- Wireworms and Aphids may attack buckwheat, but do not cause serious losses. Japanese Beetles are particularly fond of buckwheat flowers and may occasionally do considerable damage. When birds are numerous, they may do considerable damage to buckwheat grain before the crop is ready for harvest. Deer and other wildlife may also damage buckwheat if the field is adjacent to a wooded area or other cover for wildlife. Rats and mice can be very destructive in buckwheat fields, especially when the plants have lodged. (J) Harvesting:- the best practice is to direct combine when the maximum number of seeds have matured (75% of seed brown or black) and the plants have lost most of their leaves. When immature plants are harvested, green seeds and moist fragments of the plants may cause difficulties in storing the grain. However, considerable grain loss from shattering may occur if the crop is left standing, especially after a killing frost. Cylinder speed (about 650 RPM) and cylinder concave clearance (1/8–1/2 in) of the combine should be set to prevent excessive cracking and breaking of the grain. Losses and broken kernels should be checked to refine combine adjustments. Proper selection of the sieves and adjustment of the chaffer and air settings are also important to insure minimal losses. Sieve openings of 1/4 to 3/8 in. are suggested. (K) Drying And Storage:- grain harvested with a combine may contain green plant fragments and require careful drying for safe storage. Drying of buckwheat grain prior to cleaning facilitates the removal of plant fragments and immature seeds. Seed should be dried prior to storage if its moisture percentage exceeds 16. With the use of a grain drier, buckwheat can be harvested at a much higher moisture content, thus minimizing the loss due to shattering. Market grades have been established for buckwheat and discounts are common if the seed doesn't meet the grade standards. (VI) Yield Potential And Performance Results:- Buckwheat yields in Wisconsin and Minnesota typically range from 500 to 2 000 pounds/acre. With good management and favorable weather, buckwheat should yield 1 200 to 1 600 pounds/acre in a cool, moist climate that is common in northern Wisconsin or Minnesota. No yield trials have been conducted in Wisconsin in recent years. Performance of three buckwheat varieties in 23 tests in Minnesota from 1982 through 1987 is summarized in the following Table. Table:- Performance of buckwheats in Minnesota tests, 1992–87:- (i) Variety – Mancan, Yields – 1 003 lbs/a, Test Weight – 44 lb/bu, Days to First Bloom – 32, Height – 40 in, No. of Seeds per lb – 15 770; (ii) Variety – Manor, Yields – 1 070 lbs/a, Test Weight – 44 lb/bu, Days to First Bloom – 32, Height – 40 in, No. of Seeds per lb – 16 256; and (iii) Variety – Winsor Royal, Yields – 1 124 lbs/a, Test Weight – 44 lb/bu, Days to First Bloom – 32, Height – 40 in, No. of Seeds per lb – 15 230. (VII) Economics of Production and Markets:- the profitability of growing buckwheat today is quite variable. Buckwheat has not been grown extensively in recent years because other crops were more profitable. Before planting buckwheat, growers are urged to ask themselves the following questions:- (1) Where will I purchase good quality seed? (2) What will be the seed price? (3) For what purpose will I raise the crop? – for feeding to livestock on my own farm? – to sell as a cash crop? – to be used personally for food? – to be left for wild game feed? (4) If I plan to sell, is there a buyer in the area? What price will I receive if I sell? Are there quality requirements? (5) If I plan to use it for food, how will I process it? Xxxxxx. Buckwheat:- 10 Health Benefits:- (1) Best source of high-quality, easily digestible proteins. This makes it an excellent meat substitute. High protein buckwheat flour is being studied for possible use in foods to reduce plasma cholesterol, body fat, and cholesterol gallstones. (2) Fat alternative. Buckwheat starch can also act as a fat alternative in processed foods. (3) The high level of rutin is extracted from the leaves for medicine to treat high blood pressure. (4) Non allergenic. Buckwheat hulls are used as pillow stuffing for those allergic to feathers, dust, and pollen. (5) May help diabetes. New evidence has found that buckwheat may be helpful in the management of diabetes according to Canadian researchers in the Journal of Agricultural and Food Chemistry. With a glycemic index of 54, it lowers blood sugars more slowly than rice or wheat products. (6) Great for the digestion. 'The properties of buckwheat are:- neutral thermal nature; sweet flavor; cleans and strengthens the intestines and improves appetite. Is effective for treating dysentery and chronic diarrhea'. According to Paul Pitchford in Healing with Whole Foods (1993). (7) Chemical free. Buckwheat grows so quickly that it does not usually require a lot of pesticides or other chemicals to grow well. (8) Buckwheat is good at drawing out retained water and excess fluid from swollen areas of the body. Read how to make a Buckwheat Plaster. (9) Buckwheat is a warming food. It is classified by macrobiotics as a yang food. It is great for eating in the cold winter months. (10) Buckwheat contains no gluten and is not a grain. It is therefore great for celiacs and those on grain free and gluten sensitive diets. I use it often in my Healthy Web BootCamps. Interesting trivia:- (i) There is a King Buckwheat and a Lady Agriculture, the queen is Queen Ceres, named after the mythological goddess of agriculture at the Preston County Buckwheat Festival every year. (ii) Buckwheat is related to rhubarb and sorrel. (iii) Buckwheat nectar is used to make honey. (iv) Buckwheat seedlings emerge and grow quickly so it is an unusually fast-growing crop. (v) In the growing of buckwheat disease has not been a problem so you will not find a lot of pesticides used in growing it. It will die when grown with most chemicals. (vi) It has been used as a substitute for other grains in gluten-free beer. Nutrition:- (i) Has high quality protein, containing all nine essential amino acids, including

lysine. (ii) Rich in iron. (iii) Very high in carbohydrates (80%). (iv) Very high in antioxidants. (v) Filled with many minerals and vitamins such as zinc, copper, and niacin. (vi) Contains a high level of rutin. History:- Buckwheat has been eaten since the eighth millennium BC. It was gathered from the wild in where it grew naturally. When cultivation began is not known. Buckwheat is native to Northern Europe and Asia. It was cultivated in China from the X through the XIII century. Then in the XIV and XV centuries it spread to Europe and Russia. Later it came to the United States by the Dutch during the XVII century. How to Store:- store in a airtight container in a cool dry place. Buckwheat flour is best stored in the refrigerator. Tips for eating or cooking:- rinse buckwheat under running water before cooking to remove dirt or debris. (i) Buckwheat can be milled into flour to make things like pancakes and pasta. (ii) The groats and grits make a tasty cereal. (iii) In Russia they roast the whole groats to make kasha. (iv) Buckwheat groats roasted are a very tasty addition to soups and other grain dishes. (v) Buckwheat is gluten-free; this makes it a great substitute for grains. (vi) In Japan they use buckwheat flour to make one of my favorites: Soba noodles, which is a traditional dish. (vii) Buckwheat is also used in the chocolate bar and snack food industry. Please Note Use and Safety:- if you need to be gluten-free; when buying buckwheat products like soba noodles do check the label as wheat flour is often added. Chinese medicine cautions against buckwheat for individuals with spleen qi deficiency. Macrobiotics indicates buckwheat will only do well in the intestines when Candida has been dealt with. A Japanese study found that 194 children out of 92 680 children exhibited allergy symptoms in response to buckwheat. Check with an allergy specialist before feeding buckwheat pasta to your child. Xxxxx. Common Buckwheat (Fagopyrum Esculentum) is a pseudo-cereal crop that produces short, wide-spreading plants bearing bright green, heart-shaped leaves and small white flowers. Although it may seem a bit odd to end our Grain of the Month adventure with a pseudo-cereal like Buckwheat, it has played an important role in diets around the world, mainly in Asia and Eastern Europe. Buckwheat has been providing essential nutrients, vitamins, energy, and fiber to humanity for approximately 8 000 years. Its first starring role as a cultivated crop appears circa 4000 BC in the Balkan region of Europe, but its thought to have truly taken hold inland in Southeast Asia and from there spread to Central Asia, Tibet, the Middle East, and Europe. There are accounts that Japan's Emperor Gensho ordered buckwheat cultivation throughout the entire country to prepare for dry weather in 722. Here in the United States (US), Buckwheat first hitched a ride with European colonists and, since that time, can be found growing in just about every corner of the globe. In fact, some early American crop yields are recorded by Dr. Jonathan Pireria in his book A Treatise on Food and Diet, published in New York in 1843 – complete with a recipe for Buckwheat cakes! Even before assessing the importance of buckwheat groats themselves, buckwheat has proved itself to be a valuable crop in the fields. As a short-season crop that performs well in acidic and under-fertilized soil, buckwheat can perform as a 'smother' crop, used to keep weeds at bay, and to keep soil erosion to a minimum while fields 'rest' during crop rotation. It performs best when sown in June, and because it blooms for quite a while (even into September), its nectar provides for late-season honey that can be dark amber in color and rich in flavor. Once the flowers have yielded buckwheat groats and it's time to harvest, the plant stalks can be dried further and used as straw for livestock, or the entire plants can be tilled under to help next year's soil retain more moisture. As a grain, it more than makes up for its less-than-striking appearance as a plant. Buckwheat groats are shaped almost like a pyramid, or a triangle with a rounded bottom and gently tapered sides. This unusual seed shape is actually how buckwheat got its common name, something that had been a point of no small discussion and debate at WGC Headquarters. Buckwheat is neither a relative of wheat nor a grain popular with bucks, but rather, its seeds so closely resemble the much-larger seeds of the beech tree that the plant has been called 'Beech Wheat', or Buckwheat, ever since. If the shape of these grains in all their un-grain-like wonder doesn't surprise, try this one on for size:- Buckwheat has a gene that lets it make red or green immature fruit, but the hull of common buckwheat becomes dark brown or almost black as the seeds reach maturity and are ready to harvest. Buckwheat Health Benefits:- Buckwheat contains higher levels of zinc, copper, and manganese than other cereal grains, and the bioavailability of zinc, copper, and potassium from buckwheat is also quite high. Potassium helps to maintain the water and acid balance in blood and tissue cells, zinc helps to bolster the immune system, and copper deficiency leads to a number of really scary-sounding neurodegenerative diseases and disorders with terrifyingly long names. Bottom line? Having buckwheat in your diet can help you stay fit, nimble, and healthy. Buckwheat also provides a very high level of protein, second highest only to oats. Not only is buckwheat protein well-balanced and rich in lysine, its amino acid score is 100, which is one of the highest amino acid scores among plant sources as well. Before you pin a gold star on buckwheat for its perfect test score, it's important to note there is some evidence that the protein digestibility in humans can be somewhat low. While this makes it a less than ideal source of protein for growing children or anyone with digestive tract issues, it's perfectly fine for the grown-ups of the world. Besides, humans are meant to have a varied, omnivorous diet, so it's good to obtain protein from a variety of sources. But let's get back to buckwheat! If we continue to focus on its role in the digestive tract, then buckwheat can play two important roles for most adults:- (i) It's high in soluble fiber, helping to slow down the rate of glucose absorption. This can be especially important in people with diabetes and anyone else trying to maintain balanced blood sugar levels. One Slovenian study in 2001 showed boiled buckwheat groats or bread made with at least 50% Buckwheat flour induce much lower postprandial (after-meal) blood glucose and insulin responses than white wheat bread. (ii) It's a potential source of resistant starch, a type of starch that escapes digestion in the small intestine. Resistant starch is often considered the third type of dietary fiber because it possesses some of the benefits of insoluble fiber and some of the benefits of soluble fiber. While most of the starch in buckwheat is readily digestible, the small portion that is resistant (about 4–7%) can be highly advantageous to overall colon health. In addition to the health benefits of consuming buckwheat groats and buckwheat flour themselves, there are even some studies focusing on the health benefits of buckwheat protein isolates and buckwheat flavonoids. And the buck doesn't stop there. Additional health benefits have been charted in buckwheat protein isolate, thought to be a useful functional food ingredient to treat hypertension, obesity, and constipation. Even on the molecular level, in sprout form, or taken as extracts from either the groat or the hull, buckwheat's benefits abound. Close examination of buckwheat's flavonoid compounds (naturally occurring plant pigments in red, purple-red, and purple) reveals groats contain rutin, a particular bioflavonoid thought to help control blood pressure as well as to possess anti-inflammatory and anti-carcinogenic properties. Finally, we can't close the health benefits of buckwheat without mentioning it's a naturally gluten-free whole grain. With the number of gluten-intolerant people continuing to rise, buckwheat can play an important – and tasty! – role in any gluten-free diet. Boltin' Down The Buckwheat!:- Soba noodles … Galettes (Crepes) and Blinis (Blintz) … Kasha … Pancakes … When you stop and look around at some of the world's most savory and satisfying foods, don't be surprised to see buckwheat on the ingredient list. Every culture puts its own spin on cooking with buckwheat, making the recipe or dish wholly their own. For example, soba noodles first made an appearance in post-Edo Japan in the late 1800s and can be found in straight-up soba, green tea, or sweet yam flavors. It's possible to enjoy these noodles in either hot or cold dishes throughout the year, but cold soba noodles with various dipping sauces are most popular in Japan's hot summer months. Korean buckwheat noodles (naeng myun) are usually a combination of buckwheat flour and potato or sweet potato starch, while the Chinese version are usually solely made with buckwheat flour. Travelers exploring the northern heights of Italy's Lombardy region can dine on a dish made with Swiss chard, potatoes, and pizzoccheri, a type of short, flat ribbon pasta made with buckwheat and wheat flour. If you're in the Brittany region of France, you'd best not call your galettes 'crepes' – unless you're already planning a fast get-away to the western-most part of the region, where it's acceptable to call these wide pancakes by the 'c' name. And depending on where you are in the world, you may sit down to blinis made from buckwheat and potato, blintz smeared with butter and jam, or buckwheat blinis rolled around salty caviar with sour cream for dipping. However you serve it, buckwheat makes a nutty and robust addition to any meal. Cooking buckwheat groats comes with only one caution from our WGC Test Kitchens:- If you skip the 'coat with egg or oil, then heat in

a skillet until dry' step in any recipe you use, don't be surprised when the groats swell to comedic proportions and collapse into a thick, oatmeal-like mass. Limited cooking liquids can also help spare you this surprise, but make no mistake – buckwheat groats, even roasted as kasha, really want to mash together and give up most if not all of their individuality. If attempting a pilaf, tabouleh, or any other dish where individual grains are desired, take the extra five or so minutes and break out an egg, an egg white, or a little bit of oil. Bonkers For Buckwheat – The Strange, Interesting, And Miscellaneous:- (i) If it ever shows up on Team Trivia night, one hundred pounds of clean, dry buckwheat yields 60 to 75 pounds of flour and 18 to 26 pounds of hulls. (ii) There's an International Symposium on Buckwheat held every three years. It's organized by the International Buckwheat Research Association (IBRA) and has been held in Slovenia, Japan, Poland, Russian, China, Japan, Canada, South Korea and the Czech Republic since its inauguration in 1980. Most recently, the 11th International Symposium on Buckwheat was held July 19–July 23, 2010 in Orel, Russia. (iii) If the next International Symposium on Buckwheat proves too far for your frequent flyer miles to carry you, there's also a Northeast Buckwheat Growers Association (NBGA) operating out of Cornell University. Not only does this group disseminate some great information about growing buckwheat, if you're lucky, you can go on a tour of a real buckwheat field! The most recent tour, the 2010 Northeast Buckwheat Field Day, took place in August 2010 and was hosted by the Institute for Sustainability at Alfred State College in Alfred, NY. Thomas Bjorkman of Cornell University led a tour of demonstrations on best management techniques for buckwheat grain production, and nationally known cover crop consultant Dr. Elizabeth Dyck discussed summer cover crops, including buckwheat. (iv) Fear not, Canadian growers! You've got your own specialized association to turn to for questions on best buckwheat growing, harvesting, and marketing practices – the Canadian Special Crops Association (CSCA). (v) Buckwheat's been here in the US for a long time, and no one knows this better than the folks at Birkett Mills. Nestled in a town called Penn Yan in upstate New York, Birkett Mills was established in 1797 and they have been providing buckwheat products since. (In case you're wondering, the name Penn Yan came about as a way to honor the town's Pennsylvania and Yankee settlers.) Birkett Mills 'serves as America's buckwheat capital, right in the heart of New York's picturesque Finger Lakes region'. (vi) If you live in West Virginia and fancy a bit of a road trip in late September, be sure not to miss the Preston County Buckwheat Festival, soon to be entering its 70th year! Preston High School Juniors begin preparing for the festival when snow still sits on the ground, then the finalists go on to compete in the Buckwheat Royalty Pageant in May each year, competing for the Festival's King Buckwheat and Queen Ceres (Roman goddess of agriculture; counterpart of Greek Demeter). And guess who performed at the 2010 Preston County Buckwheat Festival? None other than American Idol finalist and country singer Bucky Covington! We can't help but wonder who will perform in 2011! (vii) Ever wonder what happens to all those discarded buckwheat hulls? Well, it turns out buckwheat hulls have long been popular as the filling in homeopathic pillows. They're also used in heating/cooling packs, which are often scented with lavender or other stress-relieving herbs. Just be careful not to eat that pillow! According to a case study published in The Journal of Allergy and Clinical Immunology back in February of 2009, two patients experienced separate allergic reactions when buckwheat was consumed, after a history of sleeping on buckwheat pillows. (viii) Did you know that the character of Buckwheat from The Little Rascals was originally a girl? It's true! The Buckwheat character first appeared as Stymie's sister in a few shorts back in 1934, when the role was played by two different female actresses. Later that year, child actor Billie Thomas nabbed the part – even though Thomas was a boy! The Buckwheat character didn't become a boy until 1935 when the Stymie character left the series. (ix) One of the most famous buckwheats to date is undoubtedly Buckwheat Zydeco. Under his aforementioned stage name, American accordionist and zydeco musician Stanley Dural, Jr. has been entertaining audiences far and wide with his rollicking Cajun music for more than 30 years. (x) Buckwheat Zydeco may be a great musician, but even he can't claim to have sung about foods made with his namesake. That dubious honor belongs to none other than British band 3 Mustaphas 3, who released their country track titled 'Soba Song' (sung appropriately in Japanese, of course) on their 1990 album Soup of the Century. (xi) If all that music and dancing makes it hard to fall asleep at night, legendary Danish author Hans Christian Andersen wrote a fable about buckwheat. Granted, it's more of a cautionary tale about the cost of pride and isn't really suitable for a child's bedtime story, but perhaps grown-ups will appreciate the moral of the story. / Дьжени (Jenny). (Stanley Dural, Jr.) (Cajun). (Zydeco). (3 Mustaphas 3). (Hans Christian Andersen). Гречиха (Fagopyrum), Род Травянистых Растений Семейства Гречишных, крупяная культура. 4–5 Видов, в бывшем Союзе Советских Социалистических Республик (СССР) – 2 дикорастущих Вида. Гречиха посевная, или съедобная (Fagopyrum Sagittatum, или Fagopyrum Esculentum), возделывается во многих, в основном Европейских странах, в том числе в бывшем СССР (в культуре с 3-го тысячелетия до Нашей Эры, родина – Гималаи). Гречиха посевная – яровая, влаголюбивая, теплолюбивая (всходы погибают от заморозков 2 °C) культура. Вегетационный период – 60–120 суток. Опыляется Пчёлами. Лучшие почвы – чернозёмы и окультуренные торфянистые. Пищевое (из зерна крупа, мука) растение. Лузгу, солому и мякину используют на корм. Хороший медонос (до 60 килограммов (кг) мёда с 1 гектара (га)). Основные районы выращивания в бывшем СССР:- УССР, БССР, Центральночернозёмные области РСФСР, Поволжье, Предуралье. Средняя урожайность зерна 8–12, в передовых хозяйствах – 20–25 центнеров с одного гектара (ц/га). Лучшие предшественники – Зернобобовые, сахарная Свёкла, Картофель. Сорта:- Юбилейная 2, Калининская, Казанская крупнозёрная, Виктория, Галлея, Сокуровская, Аромат, Минчанка, Баллада, Нектарница и другие. Сорт Сумчанка имеет потенциальную урожайность зерна 25 ц/га. Гречиха отзывчива на азотные (30–45 кг/га N), на бедных почвах фосфорные (30–60 кг/га P_2O_5) и калийные (60 кг/га K_2O) минеральные удобрения. Высевают Гречиху в достаточно прогретую почву обычным рядовым или широкорядным способом, норма посева семян соответственно 80–100 и 45–50 кг/га, глубина посева 4–7 см. Убирают раздельным способом. Вредители – Медяницы, Тли; болезни – ложная мучнистая роса, серая гниль. Внедряется в производство интенсивная технология возделывания и уборки Гречихи. Она включает:- размещение посевов после лучших предшественников, выращивание высокоурожайных сортов, своевременный сев в хорошо подготовленную почву, обеспечение оптимального питания растений в расчёте на запланированную урожайность, интегрированную систему защиты растений от сорняков, вредителей и болезней, выполнение комплекса агротехнических приёмов, способствующих защите почв от эрозии, точное соблюдение технологической дисциплины, то есть сроков и качественных показателей намеченных операций. Из дикорастущих Видов в бывшем СССР на Сахалине произрастает Многолетняя Гречиха Полукустарниковая (Fagopyrum Suffruticosum). Однолетняя Гречиха Татарская (Fagopyrum Tataricum) – распространённый Сорняк. Гречишные (Polygonaceae), Семейство Двудольных Цветковых Растений. Одно- и многолетние травянистые растения, кустарники и лианы, иногда небольшие деревья. Листья, как правило, очередные, простые, с раструбом при основании. Цветки мелкие, правильные, большей частью обоеполые с 3- или (редко) 2-членным простым околоцветником (тычинок 6–9, плодолистиков 2–4), собраны в сложные соцветия. Плод ореховидный. Семя с развитым мучнистым эндоспермом и прямым или изогнутым зародышем. В Семействе около 30 Родов (около 800 Видов). Распространены по всему земному шару, но в основном в умеренном поясе Северного полушария. В бывшем СССР – свыше 300 Видов из 9–11 Родов. Среди них крупяные (Гречиха), овощные (Ревень, Щавель) культуры, лекарственные, дубильные (Виды Горца, Ревень), кормовые, декоративные (Гречиха Бальджуанская) растения; Джузгун используют для закрепления песков, в озеленении, на топливо, его зелёные побеги – корм для скота. Издавна Гречка ценится на Руси. Даже в наш высокотехнологичный век эта культура остаётся экологически чистой, поскольку не требует химических обработок. Выгодно и перспективно по многим причинам и возделывание Гречихи:- она используется на продовольственные (крупа) и медицинские (рутин) цели, а также имеет ряд агротехнических преимуществ. В частности может быть страховой культурой для пересева погибших озимых. Гречиха является и ценным медоносным

растением. С одного гектара её посева можно получить от 60 до 140 кг мёда. Поэтому увеличение посевных площадей под Гречихой способствует повышению продукционных, средообразующих и ресурсосберегающих функций агроэкосистем. В Российской Федерации посевные площади под Гречихой в 2014 составили 1 014 600 га, в том числе:- в Алтайском Крае – 464 400 га, Башкортостане – 91 900 га, Оренбургской Области – 84 700 га, Орловской Области – 60 400 га. Валовые сборы Гречихи заметно колеблются по годам в зависимости от урожайности, связанной с погодными условиями. Размеры посевных площадей Гречихи во многих хозяйствах определяются также в соответствии с текущей конъюнктурой рынка. По экспертным оценкам ёмкость рынка гречневой крупы в России ежегодно составляет около 300 000 тонн. Практически вся потребляемая Гречка – Российского производства. Гречневую крупу производят на 47 предприятиях (по данным на Июнь 2015). На 4 крупнейших предприятия приходится 20%, а 20 ведущих предприятий производят более 40% этой крупы. Среди регионов России крупнейшим по объёмам производства гречневой крупы является Сибирский Федеральный Округ, на его долю в 2013/14 МГ пришлось 46% от производства данной продукции в стране (181 800 тонн), ещё 27% приходится на Центральный Федеральный Округ (106 900 тонн). В 2013 в России собрали 833 400 тонн зерна Гречихи, это те объёмы, которые привели к снижению цен на зерно Гречихи и крупу. Всероссийский Научно-Исследовательский Институт Зернобобовых и Крупяных Культур (Стрелецкий, Орловская Область) создал серию высокоурожайных сортов Гречихи, адаптированных к широкому диапазону почвенно-климатических условий. Скороспелые сорта (Скороспелая 86, Темп); ограниченно ветвящиеся сорт (Молва), приспособленные к пониженным температурам и невысокому уровню агротехники; детерминантные сорта с повышенной устойчивостью к полеганию Деметра, Дождик (крупнозёрные), Дикуль (короткостебельный, отзывчивый на внесение повышенных доз минеральных удобрений, пригодный к однофазной уборке), Девятка (крупнозёрный, отличается повышенной конкурентоспособностью в условиях пониженных температур и раннего посева). Созданы перспективные сорта Диалог, Дружина (крупнозёрные, короткостебельные, дружносозревающие), Дизайн (зеленоцветковый, что обеспечивает повышенную устойчивость плодов к осыпанию и дополнительный потенциал фотосинтеза). Наряду с увеличением урожайности у современных сортов наблюдается улучшение большинства показателей качества зерна и крупы:- увеличение массы 1 000 зёрен на 5.2 г, выравненности крупы – на 7.6%, выхода ядрицы – на 1.6%, крупности крупы – на 20.4%. Новые сорта способны давать высокие (3–4 т/га) урожаи не только на сортоучастках, но и в производственных условиях, однако средняя урожайность Гречихи в стране в несколько раз ниже потенциальной и составляет около 8 ц/га. Это объясняется рядом причин. Прежде всего, далеко не всегда соблюдается необходимая агротехника. В частности, Гречиху необходимо размещать на хорошо аэрируемых почвах. Недостаток почвенного воздуха приводит к нарушению поглощающей способности корней и накоплению в них ядов в процессе дыхания. Гречиха требовательна к кислотности почвы – при pH 4.6–4.7 она не отзывается на удобрения и формирует низкий урожай (5.0–6.0 ц/га). Наличие в её посевах высокостебельных сорняков снижает урожайность Гречихи до 5.5 ц/га. Необходимо сбалансированное внесение азота, фосфора и калия, которое повышает урожай зерна Гречихи на 3.2–4.6 ц/га. Однако хлорсодержащие калийные удобрения необходимо вносить с осени. При весеннем внесении ионы хлора снижают нектаропродуктивность растений Гречихи, от которой на 95% зависит опыление цветков и, в конечном итоге, урожайность. Для лучшего опыления необходимо иметь на 1 га 2–3 пчёлосемьи. Для увеличения продуктивности Гречихи и снижения затрат на её производство целесообразна внекорневая подкормка комплексными минеральными удобрениями с микроэлементами в фазу плодообразования. Общим недостатком при возделывании Гречихи является затягивание с уборкой, что ведёт к значительным потерям от осыпания. Одним из проявлений недостаточно внимательного отношения к Гречихе со стороны производственников является и то, что до сих пор сортовые посевы составляют лишь около 50% от общей площади посевов Гречихи, что, безусловно, негативно сказывается на уровне урожайности культуры. Учитывая то, что себестоимость одной тонны зерна Гречихи составляет 4 500 Рублей, а переработчики принимали его в начале уборки по 7 000–8 000 Рублей за тонну, то очевидно, что Гречиха высокодоходная культура даже в кризисных условиях. Гречиха Обыкновенная – Греча, Гречка, Гречуха, Греческая Пшеница (Polygonum) – хлебное и прекрасное медоносное Растение, семена которого идут в пищу человека и отчасти животных. Возделывается преимущественно в России. В Англии, Франции и Германии Гречиха разводится для корма Птиц (в особенности Фазанов). Гречиха отличается коротким периодом произрастания (12–16 недель), и хотя семена её могут прорастать при низкой температуре, но заморозки в 2–3 °C совершенно уничтожают её всходы. В общем более других хлебов страдая от неблагоприятных условий погоды, Гречиха крайне неприхотлива к почве. Гречневая крупа делится на сорта. Ядрица – крупа из целых зёрен Гречихи. Применяется для приготовления рассыпчатых каш. Смоленская крупа – мелкая гречневая крупа, скатанная до величины макового зерна. Применяется для начинок пирогов, для сладких и полусладких каш на молоке. Продел – дроблёная гречневая крупа. Применяется для приготовления вязкой каши-размазни.

BUD = ПОЧКА – Bud:- tree buds may be vegetative or reproductive. Vegetative buds continue to produce height growth units unless or until they are induced to form flowers. When a shoot apical meristem is induced to form a reproductive bud, its existence terminates when the pollen or seeds are shed. Exactly what induces the formation of a reproductive bud varies with species, but changes in the number of daylight hours is a common signal in many plants. Changes in the levels of hormones and carbohydrates are among the factors that signal the physiological factors that directly result in flowering. Bud is an unopened flower or a growing tip surrounded by its immature perianth segments or leaves. In a maturing stem, the area where a leaf attaches to the stem is called a Node, and the region between successive nodes is called an Internode. Stems bear leafy shoots (branches) at the nodes, which arise from buds (dormant shoots). Lateral branches develop either from axillary, or lateral, buds found in the angle between the leaf and the stem or from terminal buds at the end of the shoot. In temperate-climate plants these buds have extended periods of dormancy, whereas in tropical plants the period of dormancy is either very short or nonexistent. The precise positional relationship of stem, leaf, and axillary bud is important to understanding the diversity of the shoot system in angiosperms. Understanding this relationship makes it possible to identify organs such as leaves that are so highly modified they no longer look like leaves, or stems that are so modified that they resemble leaves. Bud is a short embryonic stem tip bearing leaves or flowers or both. / виды (species). У растений под Почкой понимается зачаток побега. Различают:- (i) вегетативные почки, состоящие из зачаточного стебля (оси) и зачатков листьев; и (ii) генеративные почки, несущие также зачатки соцветий и цветков. По месту формирования почки подразделяются на:- (i) верхушечные почки, формирующиеся на верхушке стебля и продолжающие рост главного стебля в длину; (ii) пазушные почки, формирующиеся в пазухах листьев и дающие начало ветвям. Почки, не развивающиеся в побеги несколько лет, называются спящими. Спящие почки дают побеги в случае повреждения или обрезки вышележащих участков ствола и ветвей, что используется при прививке одних видов растений на другие. Почка представляет собой зачаточный побег, закладываемый осенью, и является одним из основных признаков для определения растения в безлистном (зимнем) состоянии. Снаружи почки обычно прикрыты плотными, кожистыми почечными чешуями. Такие почки называются чешуйчатыми, Но иногда чешуи совсем отсутствуют и тогда называются обнажёнными. Кроме того, выделяют почки генеративные, внутри которых находятся бутоны и вегетативные, содержащие непосредственно вегетативный побег и листья. По расположению и прикреплению к стволу почки бывают:- верхушечные (конечная почка), пазушные (боковые), сидячие – прикрепляющиеся непосредственно к побегу, черешчатые (стебельчатые) – прикрепляющаяся к стволу с помощью ножки, свободные – возвышающаяся над стволом, и скрытые в ткани побега или под листовой подушкой, рубцом, остатками листа.

BUDAPEST STOCK EXCHANGE LIMITED = БУДАПЕШТСКАЯ ФОНДОВАЯ БИРЖА ЛИМИТИД – The Budapest Stock Exchange Ltd. (BSE) aims to ensure a transparent and liquid market for its listed securities issued either in Hungary or abroad. As the key institution of the domestic financial market, the stock exchange provides various economic entities with an opportunity to raise capital in an open market and offers investors effective investment opportunities. Through the concentration of supply and demand, it is the most important institution of price discovery. The stock exchange actively participates in promoting the continuous improvement of the financial culture of domestic companies and investors. The four main activities of the stock exchange:- (i) Listing services:- the BSE allows economic entities to acquire the financial resources required for their expansion in a cost-effective way. In addition, the BSE provides access to the dynamically growing assets of domestic institutional investors and to domestic investor savings. The exchange also provides investors with the simplest access to the global investor community. (ii) Trading services:- the BSE acts as the main platform to trade financial instruments. Currently, over 40 domestic and foreign broker companies take part in the exchange trading. (iii) Dissemination of market information:- the Exchange supplies real-time and accurate trading data of its listed securities and provides news services on issuers and section members. Through the exchange's extensive data vendor network, both institutional and individual investors can access market data in a timely and efficient manner. (iv) Product development:- the BSE provides a trading opportunity for financial innovations, and offers a wide and constantly growing product range for investors on the futures and option markets. Index futures and options are calculated directly by the exchange. Investors seeking hedging opportunities or gearing can select from a wide array of individual stocks and currency, interest rate and commodity derivatives. The Exchange's main goal is to become the financial centre and primary trading venue of Hungarian securities, and to successfully take part in the competition for issuers. This is achieved by a client-oriented operation, a commitment to continuously improve its services and an application of timely and effective technological improvements and solutions. The Hungarian Stock Exchange, the ancestor of today's Budapest Stock Exchange (BSE) started its operation on 18 January 1864 in Pest. Although the institution was set up as a stock exchange, four years after its inception it acquired the Grain Hall, the centre of grain trade, becoming the newly created Budapest Stock and Commodity Exchange (BSCE). Following 1889 the stock prices of companies listed on the Budapest Stock Exchange were also published in Vienna, Frankfurt, London and Paris, attesting to the international importance of the BSE. From the1890s Hungarian government bonds were regularly traded on the stock exchanges of London, Paris, Amsterdam and Berlin. Following World War II, after the nationalisation of the majority of private Hungarian firms, the government officially dissolved the Budapest Stock and Commodity Exchange, and the exchange's assets became state property. After the re-establishment, on 21 June, 1990, the BSE re-opened its doors with 41 founding members and one single equity, IBUSZ, the Budapest Stock Exchange. The open-outcry system of the physical trading floor that characterized the spot market functioned with partial electronic support until 1995. From 1995 until November, 1998 securities trading took place concurrently on the trading floor and in a remote trading system, when the new MultiMarket Trading System (MMTS), based entirely on remote trading was launched. The traditional 'battlefield rumble' of the physical trading floor ceased within a year by September 1999, at which time physical trading was entirely replaced by the electronic remote trading platform of the derivatives market. In April, 2000, after twelve years of operations as an independent legal person, the new BSE Council decided to convert to a business association in order to maintain and strengthen its competitive position. The year 2004 brought some decisive events in the life of the Exchange. A major restructuring took place in the ownership structure of the BSE, involving the purchase of a majority stake in the Exchange by strong Austrian banks, together with Wiener Börse and Österreichische Kontrollbank AG. Due to the integration of the activities of the Budapest Stock Exchange and of the Budapest Commodity Exchange, as of 02 November 2005, commodity trading also started on the BSE. Since 14 January 2010, the BSE is a subsidiary of the CEESEG AG holding company, that owns 50.45% of the BSE. The joint average monthly turnover of the Group is around two-thirds of equity turnover in the CEE region (July 2009). From one single source, the Group offers both information and easy access to four attractive markets with long-term growth potential. The Budapest Stock Exchange Limited (in Hungarian:- Budapesti Értéktőzsde Zrt.) had its origins in the Hungarian Stock Exchange, which was formed in 1864. Following World War II, the Exchange was dissolved by the government and was re-established on 21 June 1990. Commodity trading was introduced on 02 November 2005. Website:- http://www.bse.hu. / Вина Бёрзэ А.Ге. (Wiener Börse AG). Ёстэрайхишэ Контрольбанк А.Ге. (Österreichische Kontrollbank AG). Ёстэрайхишэ Национальбанк (Ё.Эн.Бэ.; Österreichische Nationalbank (ÖNB)).

BUDDING = ПОЧКОВАНИЕ – In biology, Budding is a form of asexual reproduction in which a new individual develops from some generative anatomical point of the parent organism. In some species buds may be produced from almost any point of the body, but in many cases budding is restricted to specialized areas. The initial protuberance of proliferating cytoplasm or cells, the bud, eventually develops into an organism duplicating the parent. The new individual may separate to exist independently, or the buds may remain attached, forming aggregates or colonies. Budding is characteristic of a few unicellular organisms (e.g., certain bacteria, yeasts, and protozoans); however, a number of metazoan animals (e.g., certain cnidarian species) regularly reproduce by budding. In horticulture the term budding refers to a method of plant propagation in which a bud of the plant to be propagated is grafted onto the stem of another plant. / виды (species). разведение или распространение (propagation). В биологии под Почкованием понимается тип бесполого размножения, при котором дочерние особи формируются из выростов тела материнского организма (почек). Почкование характерно для многих грибов, печёночных мхов и животных (простейшие губки, кишечнополостные, некоторые черви, мшанки, крыложаберные, оболочники). В ряде случаев почкование приводит к образованию колоний. Привой:- (i) почка (глазок) или черенок одного растения, привитые на другое растение – подвой; или (ii) наземная часть растения, например, яблони, развившаяся из привитых черенка или почки.

BUDGET = БЮДЖЕТ – Budget is a statement of a government's planned or expected financial position for a specified period of time (usually one year) based on estimates of the expenditures to be made by the government's main subdivisions (wages and salaries of government employees; consultants' fees; purchases of equipment, supplies, real estate, etc; money transferred to beneficiaries of various programs, and so on) during the specified period, along with estimates of the revenues to be realized from the various sources of income that will be available for paying for these expenditures. The budget of a government may be seen as a comprehensive plan of what the government will spend for its various programs during the next fiscal year and how it expects to raise the money to pay for them (tax receipts, charges for services, sale of assets, borrowing, new emissions of currency, etc). Somewhat confusingly, the same term is used to denote both the advance estimate or plan of what the government will be taking in and spending and also the actual amounts that finally end up being taken in and spent – even though the planned and actual numbers never really match perfectly when the returns come in! Budget is a financial plan that serves as an estimate of future cost, revenues or both. A plan of future income and expenses during a specified period (frequently one year). Plan listing all expected revenues and expenses for an economic entity for a given period of time. A budget is a basic tool for organizing the financial future of a person, business or institution. It serves as a framework for keeping track of income and expenditures. Budget is an itemized summary of probable income and expenses for a given period. / доходов и расходов за данный период. Под Бюджетом понимается:- (i) роспись государственных доходов и расходов на определённый срок, утверждённая в законодательном порядке; или (ii) предположительное исчисление ожидаемых доходов и расходов государства, учреждения или отдельного лица на определённый срок.

BUDGET AMENDMENT = БЮДЖЕТНАЯ ПОПРАВКА – Budget Amendment:- revision of some aspect of a previous budget request, submitted to the legislature by the executive before the legislature completes action on the appropriations act.

BUDGET APPROPRIATION = БЮДЖЕТНОЕ ВЫДЕЛЕНИЕ (или БЮДЖЕТНОЕ РАСПРЕДЕЛЕНИЕ, или БЮДЖЕТНОЕ АССИГНОВАНИЕ) – Budget Appropriation:- authorization by an act of the legislature that permits federal agencies to incur obligations and to make payments out of the treasury for specified purposes. An appropriation act is the most common method of providing budget authority.

BUDGET AUTHORITY = ОДОБРЕНИЕ БЮДЖЕТА – Budget Authority is an authority provided by law to government agencies to enter into obligations that will result in immediate or future outlays of government funds. Budget authority does not include authority to insure or guarantee the repayment of indebtedness incurred by another person or government. / выплаты (repayment) .

BUDGET DEFICIT = БЮДЖЕТНЫЙ ДЕФИЦИТ – Budget Deficit is the amount by which total government spending is more than government income during a specified period; the amount of money which the government has to raise by borrowing or currency emission in order to make up for the shortfall in tax revenues. Amount by which the government's budget outlays exceed its receipts for a given fiscal year. / Сумма, на которую расходы бюджета государства превосходят доходы по данному отчётному году. Под Бюджетным Дефицитом понимается превышение расходов государственного бюджета над его доходами.

BUDGET SURPLUS = БЮДЖЕТНЫЙ ПРОФИЦИТ – Budget Surplus is the amount by which government revenues are more than government spending during a specified period.

BUD IMPRINT = ЗАПЕЧАТЛЕНИЕ ПОЧКИ (или ОТПЕЧАТОК ПОЧКИ, или СЛЕД ПОЧКИ) – Bud Imprint is the outline of the margins, teeth or other features of one leaf impressed on another leaf while the two leaves are pressed together in the bud and remaining as a permanent marking after the leaves become separated. This effect is particularly marked in certain species of Agave.

BUFF = БУЙВОЛОВОЕ (или ТУСКЛО–ЖЁЛТОЕ, или БИЗОН) – Buff is:- (1) a moderate orange yellow; a light to moderate yellow.

(2) Buff is a garment, as a uniform, made of buff leather. / сделанное из кожи буйвола.

(3) Buff, a sort of leather prepared from the skin of the buffalo, dressed with oil, after the manner of chamois. The skin of elks, oxen, and other like animals, when prepared after the same manner as that of the buffalo, is like-wise called Buff. It is used in making sword-belts and other articles, where great thickness and firmness are required.

BUFFER = БУФЕР (или БУФЕРНЫЙ РАСТВОР, или АМОРТИЗАТОР) – Buffer:- in chemistry, a compound that resists change in pH when moderate amounts of acid or base are added to a solution of it. Buffers help to keep the pH of a dyebath from changing significantly as the process progresses. Sodium acetate is one such buffer.

BUFFER CARRYOVER STOCKS = XX – Buffer Carryover Stocks are the carryover stocks in excess of pipeline stocks that are carried over for use in the next marketing year. Buffer stocks fluctuate substantially from year to year.

BUFFERING = БУФЕРНОСТЬ (или БУФЕРНОЕ ДЕЙСТВИЕ) – Buffering:- chemically, the ability to resist change in pH.

BUFFERING AGENT = БУФЕРНЫЙ АГЕНТ – Buffering Agents:- they work by upgrading or protecting the cleaning efficiency of the surfactant. As washing proceeds, the alkalinity or pH drops. Under acidic (low pH) conditions, cleaning is reduced. Buffering agents stabilize the pH, and keep this drop from being too severe and reducing the cleaning. / Щёлочность (Alkalinity).

BUFFER STOCK = НЕПРИКОСНОВЕННЫЙ ЗАПАС (или БУФЕРНЫЙ ЗАПАС) – Buffer Stock is a quantity of goods or articles kept in storage to safeguard against unforeseen shortages or demands. / Количество товаров или изделий, удерживаемое на складах в качестве страхового варианта при возникновении непредвиденных случаев нехватки или повышенного спроса. Под Неприкосновенным Запасом (НЗ) понимается запас продовольствия, боеприпасов и других материальных средств, который хранится в установленных количествах в войсках и расходуется только с разрешения старших начальников, в том числе при чрезвычайных обстоятельствах.

BUFFER STOW = БУФЕР ШТИВКИ (или БАМПЕР ШТИВКИ, или АМОРТИЗАТОР ШТИВКИ) – Buffer Stow:- also called Buffer is required when transporting a heavy load with a high mass and small surfaces for distributing the forces acting upon the object. Lumber beams are usually used for this purpose. For certain types of load, the effort involved in this load securing method can be reduced by using part of the load as a buffer. Round bars are a good example, as they are (i) capable of bearing high loads, and (ii) suffer no damage as a result of being used as a buffer. For this method, a round bar is first loaded across the end wall of the container. This then acts as a buffer and, in the event of jolts during transport, cushions or distributes the forces evenly across the end wall. Since the buffer is created by the way the cargo is loaded, this method is referred to as Buffer Stow. / Обычно для этой цели используются деревянные бруски. Буфер это приспособление для смягчения ударов на транспортных средствах. Буферы на локомотивах и вагонах воспринимают ударные и сжимающие усилия, возникающие при движении поезда. При автосцепке буферы на локомотивах и грузовых вагонах не ставятся. Автомобильные буферы (бамперы) служат главным образом для восприятия и смягчения случайных ударов.

BUFFER ZONE = БУФЕРНАЯ ЗОНА – Buffer Zone is an area surrounding or adjacent to an area officially delimited for phytosanitary purposes in order to minimize the probability of spread of the target pest into or out of the delimited area, and subject to phytosanitary or other control measures, if appropriate. Buffer zone is an area in which a specific pest does not occur or occurs at a low level and is officially controlled, that either encloses or is adjacent to an infested area, an infested place of production, a pest free area, a pest free place of production or a pest free production site, and in which phytosanitary measures are taken to prevent spread of the pest. / Буферная Зона – охраняемая зона вокруг заповедника.

BUG = КЛОП – Bug is a loose term used for a number of Insects referring to the Suborder Hemiptera, including winged and wingless Species. In the strict sense, it refers to Suborder Heteroptera. / Ряда Насекомых, относящихся к Подпорядку Полужёсткокрылых (Hemiptera), относится к Подпорядку Полужёсткокрылых (Heteroptera). Под Клопами или Полужёсткокрылыми понимается Отряд Насекомых. Передние крылья у основания кожистые, вершины – перепончатые. Ротовой аппарат колюще-сосущий. Характерны кожные пахучие железы. Длиной 0.7–12 сантиметров (см). 25–30 тысяч видов. Распространены широко. В бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось около 2–2.5 тысяч Видов. Паразиты, например, Постельный Клоп, хищные и растительноядные; многие Черепашки и другие повреждают сельскохозяйственные культуры. Клопы (Heteroptera) или Полужёсткокрылые (Hemiptera), Отряд Насекомых, наиболее близкий к Равнокрылым Насекомым (Homoptera), то есть Цикадовым, Листоблошкам, Тлям, Белокрылкам и Червецам; иногда Клопов объединяют с ними (как Подотряд) в Отряд Членисто-Хоботных (Hemiptera). Длина от 0.7 миллиметра (мм) до 12 сантиметров (см). Ротовой аппарат сосущего типа, имеет вид членистого хоботка, образованного свёрнутой в трубку нижней губой и 2 парами стилетов (верхние и нижние челюсти); хоботок прикреплён на вершине головы и отделён от её основания горловой пластинкой. Усики

из 4 или 5, иногда 1–3 члеников. Крыльев 2 пары, в покое они обычно плоско сложены, прикрывая сверху брюшко. Верхние крылья (надкрылья) состоят из основной кожистой части (обычно подразделённой на 2–4 отдела) и плёнчатой вершинной части, или перепоночки; редко надкрылья целиком кожистые или ячеистые. Перепоночки противоположных надкрылий обычно перекрываются. Нередко наблюдается короткокрылость и даже бескрылость (например, у Постельного Клопа). Как правило, имеются пахучие железы; их отверстия располагаются у взрослых Клопов на нижней стороне груди, у личинок – на брюшке. Выделения желез имеют характерный неприятный запах, служащий для отпугивания врагов и привлечения особей своего вида. Развитие от яйца до взрослого насекомого проходит с неполным превращением:- личинки относительно похожи на взрослых Клопов, стадия куколки отсутствует. Клопы распространены всесветно, известно 25 000–30 000 Видов, объединяемых в 50 Семейств (в бывшем Союзе Советских Социалистических Республик (СССР) 2 000–2 500 Видов, относящихся к 40 Семействам). Основные Семейства Клопов:- из водных – Гребляки, Гладыши, Водяные Скорпионы; из наземных – Слепняки, Кружевницы, Хищнецы и Щитники. Наиболее богата фауна Клопами в тропиках, а в бывшем СССР – в Средней Азии и Закавказье. Образ жизни очень разнообразен. Подавляющее большинство видов живёт на суше, но некоторые перешли к обитанию в воде (Водные Клопы) и на её поверхности (Водомерки). Наземные Клопы живут чаще открыто на растениях, иногда на поверхности почвы и в верхнем слое её, в подстилке, по берегам водоёмов, под корой и тому подобным. Водные Клопы плавают или ползают по дну и растениям, но дышат атмосферным воздухом (лишь представители Семейства Aphelocheiridae дышат кислородом, растворённым в воде). Водомерки скользят по поверхности озёр и рек, представители Рода Halobates – единственные Насекомые, живущие на поверхности воды открытых морей и океанов (в СССР отсутствовали). Большинство наземных Клопов питается соками растений, главным образом их генеративных органов и семян. Часть наземных Клопов, а также большинство Водных Клопов и все Водомерки – хищники, они высасывают различных Насекомых, их личинок и яйца, клещей и тому подобное. Нередки виды со смешанным питанием (например, Гребляки питаются и мелкими беспозвоночными, и водорослями). Некоторые Клопы, обитающие в воде (Гладыши, Гребляки), наносят вред рыбному хозяйству, высасывая икру и мальков рыб. Паразитами человека, Летучих Мышей, а также Голубей, Ласточек и других птиц являются Постельные Клопы. Виды Семейства Polyctenidae паразитируют в тропиках на Летучих Мышах. Некоторые обитающие в Центральной и Южной Америке Виды Семейства Хищнецов (Triatoma, Rhodnius) сосут кровь Млекопитающих, в том числе и человека. Среди растительноядных Клопов много вредителей сельского и лесного хозяйства. Высасывание Клопами соков растений приводит к недоразвитию и снижению всхожести семян, замедлению роста, опадению листьев и даже к гибели растений, особенно саженцев. В СССР наиболее сильно вредили:- Хлебным Злакам – Вредная Черепашка (Eurygaster Integriceps), Остроголовые Щитники (Род Aelia), Блуждающий и Хлебный Слепняки (Роды Notostira и Trigonotylus); Свёкле – Свекловичные Клопы (Род Poeciloscytus); Овощным культурам – Крестоцветные Клопы (Род Eurydema); Бобовым травам – Люцерновый Клоп (Adelphocoris Lineolatus); Плодовым деревьям – Грушевый Клоп; посадкам Сосны – Сосновый Подкорник (Aradus Cinnamomeus). Из многоядных Клопов наиболее вредны Виды Родов Lygus, Dolycoris, Carpocoris. Некоторые растительноядные Клопы служат переносчиками вирусных заболеваний растений. В борьбе с Клопами используют различные инсектициды, а против Вредной Черепашки – также биологический метод (разводят и выпускают на заражённые Вредной Черепашкой поля Яйцееда Теленомуса). Постельный Клоп наносит вред здоровью человека, нарушая нормальный сон. Клопы-Триатомиды – переносчики опасной для человека болезни Шагаса (Американский трипаносомоз). Многие хищные Клопы (особенно из Родов Orius и Nabis) полезны, так как уничтожают вредных для сельского и лесного хозяйства Тлей, Клещей, Гусениц, личинок Жуков и других.

BUG CHECKING = ПРОВЕРКА НА НАЛИЧИЕ КЛОПОВ – Bug Checking is the process of regularly monitoring a Cotton crop for insect pests to determine if control measures are needed. / Процесс регулярного обследования урожая Хлопчатника на предмет наличия насекомых вредителей для определения необходимости принятия соответствующих мер борьбы.

BUILDER = (ОСНОВНОЙ) КОМПОНЕНТ – What is a Builder and what it is use for? Builders are materials that can bind cations (mainly calcium, Ca^{2+}, and magnesium Mg^{2+}) contained in wash solutions, resulting in water softening. Builders improve the quality of the water, hence letting the detergents work in a more efficient way. They soften water by binding free water hardness ions (magnesium, calcium). This prevents those particles to react with other detergent ingredients, which would cause them to work less efficiently or precipitate from solution (soap scum). They can form insoluble salts that become encrusted in the fabrics and deposit on solid surfaces inside the washing machine. In this way builders extend the life of the washing machine. Soil molecules are often bound to the fabric surface by calcium ion bridging; removal of hardness from the environment therefore helps stain removal. Sometimes more than one builder is used in a product, to create a builder system with improved cleaning performance. What do builders look like, and how do they work? There are different types of builders and sometimes more than one type of molecule is involved, in which case we have a builder system. Builders are STPP, Zeolites, Carbonate, Citrate, SKS6, Silicate and they have 3 jobs to perform:- (i) body soil like perspiration that needs neutralizing; (ii) help remove the calcium and magnesium salts found in hard water and this allows surfactant to get on with their job of cleaning; and (iii) finally they help to remove particulate soils made up of clay, dirty and fatty lipid stain. STPP is the most effective builder available yet it is negatively perceived from an environmental stand point. Zeolite is more environmentally friendly yet it provides less efficiency. STPP are no longer used in our Western European laundry detergents since many years. There are 3 types of builders:- sequestrating builders like STPP and citrate. They are soluble builders and form soluble complexes with hardness. Precipitating builders like carbonate and soap. They are soluble builders and form insoluble complexes with hardness. Ion exchanger builders like Zeolite and SKS-6. They are insoluble builders and form insoluble complexes with hardness. In laundry detergent they are used at a range of 20–40% while in hard surface cleaner only at 1–3%. An example of an alkali type builder:- Sodium Carbonate $2CO_3$) improves cleaning performance by raising the pH of the wash solution. Under alkaline conditions, soils and fabrics become more negatively charged and thus there is more electrostatic repulsion between them. Soda ash also ‘builds’ the wash solution by removing water hardness, which precipitate out in the form of insoluble calcium and magnesium salts. The use of precipitating builders by themselves has gone out of fashion because of the problems associated with the deposition of insoluble salts onto washing machine surfaces and also onto the fabrics, resulting in incrustation hence diminished cleaning performance. An example of an ion exchange type builder:- Zeolite A. Zeolites are synthetic sodium aluminum silicates – or synthetic clays – that are used in detergents (among other applications) for their cation-exchanging capacity. Most modern laundry detergent powders and tablets that do not contain phosphate, contain zeolites. Zeolites replace the water hardness ions (Ca^{2+} and Mg^{2+}) with Na^{+} ions. Zeolites, like clays, are insoluble in water and are present in the wash as finely dispersed crystals (with a diameter of ca. 4 microns). Zeolite is a silicate mineral with a crystalline structure of linked tetrahedra, as shown below. Macroscopically, a zeolite particle consists of thousands of stacked layers. Na+ cations are loosely held inside the structure and are readily replaced with Ca^{2+} and/or Mg^{2+} ions, which are held more tightly. Zeolite A is a form of zeolite that is optimized for use in detergents, also known under the trade name of Sasil®. The level of Zeolite A used in laundry detergents typically ranges from 20 to 34%. A newer version of zeolite is Zeolite P, which offers the advantages of stronger calcium binding and a larger surface area-to-weight ratio relative to Zeolite A. Examples of complex builder systems:- Polyacrylate + Zeolite. There are different types of builders and, as stated, sometimes more than one type of molecule is involved in the ‘builder system’. In this section we focus on the Polycarboxylate – Zeolite type of association. Polycarboxylate (PAA) are

water-soluble polymers that have a high capacity to adsorb divalent cations such as Ca^{2+} and Mg^{2+} from solid surfaces - the fabrics, in this case - and transport them through the wash solution. A necessary 'partnering' ingredient is a cation exchanger, which accepts the cations from the builder, irreversibly binds them and in exchange releases cations (usually Na+) that will not negatively impact the performance of the detergent. A well known cation exchanger is Zeolite A or sodium aluminum silicate. The PAA-Zeolite A binary builder system is commonly used instead of sodium triphosphate in today's phosphate-free granular laundry detergents. Once PAA releases the bivalent cations to the ion exchanger, the builder is re-used. The PAA molecule thus functions as a shuttle for divalent cations between the fabric surface and the ion exchanger. In addition to its capacity as a co-builder, PAA also has dispersing properties in aqueous solutions. All water-soluble polyanionic polymers are more or less effective as dispersants. / развод (или потёк) . Щёлочь (Alkali). Щелочное (Alkaline). осадок (precipitate). твёрдость (hardness).

BUILDING AREA = ОБЛАСТЬ ЗАСТРОЙКИ – Building Area is the greatest horizontal area of a building above grade within the outside surface of exterior walls or within the outside surface of exterior walls and the centerline of firewalls. / внешних стен и центровой/осевой линии противопожарных стен.

BUILDING CONTRACTOR'S GUARANTEE = ГАРАНТИЯ СТРОЯЩЕГО ПОДРЯДЧИКА – The Building Contractor's Guarantee is widely used in Switzerland and functions as a simple or joint and several guarantee to secure any claims by the client (beneficiary of the surety) on the contractor due to possible defects appearing after delivery and/or installation of the goods, painting or plastering work, etc. Amount of the contractor's guarantee:- 5% to 10% of the value of the contract. Term:- in general 2 to 5 years following completion of the work and/or delivery of the goods.

BUILDING HEIGHT = ВЫСОТА ЗАСТРОЙКИ – Building Height is the number of storeys contained between the roof and the floor of the first storey. / .

BUILDINGS AND PERSONAL PROPERTY COVERAGE FORM = ФОРМА ПОКРЫТИЯ ЗДАНИЙ, СООРУЖЕНИЙ И ЛИЧНОГО ИМУЩЕСТВА – Buildings And Personal Property Coverage Form is a commercial property coverage form designed to insure most types of commercial property (buildings or contents or both). It is the most frequently used commercial property form, and has replaced the General Property Form, Special Building Form, Special Personal Property Form, and others.

BUILDING SOCIETY = СТРОИТЕЛЬНОЕ ОБЩЕСТВО – A 'Building Society' is defined by the UK Building Societies Act 1986. According to this Act, a society may be established as a building society if its purpose or principal purpose is that of making loans which are secured on residential property and are funded substantially by its members. The 1986 Act also contains requirements regarding the constitution and powers of a building society. The list of building societies published by the Financial Services Authority (FSA) is intended to be used solely as a guide. The FSA does not warrant, nor does it accept any responsibility for, the accuracy or completeness of the list or for any loss which may arise from reliance by any person on information contained in the list. In the United Kingdom, those institutions as defined in the Building Society Acts (1962 and 1986). They offer housing finance largely to the households sector and fund this largely by taking short term deposits from the households sector. They are part of the monetary financial institutions sub-sector. A Building Society is a financial institution owned by its members as a mutual organization. Building societies offer banking and related financial services, especially mortgage lending. These institutions are found in the United Kingdom (UK) and several other countries. The term 'Building Society' first arose in the XVIII century in Great Britain from cooperative savings groups. In the UK today, building societies actively compete with banks for most consumer banking services, especially mortgage lending and savings accounts. Every building society in the UK is a member of the Building Societies Association. At the start of 2008, there were 59 building societies in the UK, with total assets exceeding £360 billion. The number of societies in the UK fell by four during 2008 due to a series of mergers brought about, to a large extent, by the consequences of the financial crisis of 2007–10. With three further mergers in each of 2009 and 2010, and a demutualisation and a merger in 2011, the current number of building societies is at 47.

BUILDUP = НАРАЩИВАНИЕ (или НАКОПЛЕНИЕ, или УВЕЛИЧЕНИЕ, или СОСТАВНОЕ) – Buildup is a term applied to substantivity of dye for a textile material. It refers to the ability of a dye to produce deep shades. / Субстантивность (Substantivity).

BUILT–IN–DIRT = ВСТРОЕННЫЙ В ГРЯЗЬ (или ВМОНТИРОВАННЫЙ В ГРЯЗЬ) – Built-In-Dirt:- material passed into the effluent stream composed of foreign materials incorporated into the filter medium.

BULB = ЛУКОВИЦА – Bulb is an underground food and water storage organ consisting of a short stem with one or more buds surrounded by modified leaves (scales). Bulb is an underground fleshy offspring of a plant that develops roots and shoots. / Луковица это подземный пищевой и хранящий воду орган, состоящий из короткого стебля с одной или более почками, окружённый модифицированными листьями (чешуями). Луковица – подземное мясистое потомство растения, которая развивает корни и поросли. Под Луковицей понимается видоизменённый, обычно подземный побег растений с коротким плоским стеблем (донцем) и мясистыми бесцветными листьями (чешуями), запасающими воду и питательные вещества на неблагоприятный период. Характерна для многих линейных (Гиацинт, Кринум, Лилия, Лук, Тюльпан). Служит для вегетативного возобновления растений. Луковица:- хотя термин часто используют широко, понимая под ним клубнелуковицы и клубни, строго говоря, луковица – это структура, состоящая из модифицированных листьев, которые защищают зачаточные побеги и цветки следующего сезона.

BULBIL = ЛУКОВИЧКА – Bulbil is a small vegetatively derived plant produced on an inflorescence. / соцветие (inflorescence). Луковичка:- мелкая луковица, которая формируется в наземной части некоторых растений. Луковички можно удалить и посадить в горшок, чтобы вырастить нормальные луковицы.

BULBS AND TUBERS = ЛУКОВИЦЫ И КЛУБНИ – Bulbs And Tubers is a commodity class for dormant underground parts of plants intended for planting (includes corms and rhizomes). / (включает клубнелуковицы и корневища).

BULGE = НАДУВАНИЕ (или ВЗДУТИЕ) – Bulge is a rapid advance in futures prices. Bulge is a sudden sharp price advance. / В техническом анализе биржевых рынков, быстрый рост цен на фьючерсы.

BULK = НАВАЛОМ – Bulk:- cargo shipped in loose condition and of a homogeneous nature. Cargoes that are shipped unpackaged either dry, such as grain and ore, or liquid, such as petroleum products. Bulk service generally is not provided on a regularly scheduled basis, but rather as needed, on specialized ships, transporting a specific commodity. Cargo moved in bulk form, such as gypsum (dry bulk), diesel (bulk liquid), etc. / Навалом – способ перевозки грузов, таких как гипс (насыпью), дизельное топливо (наливом) или других.

BULK = НАСЫПЬ – Bulk is all the seeds of the same crop species mixed together.

BULK AREA = УЧАСТОК (или ОБЛАСТЬ, или ПЛОЩАДКА, или ЗОНА) НАВАЛА (или БАЛКА) – Bulk Area is a storage area for large items which at a minimum are most efficiently handled by the palletload.

BULK BAGS = МЕШКИ ДЛЯ НАВАЛОЧНОГО ГРУЗА – Bulk Bags:- a large polythene liner that can be fitted to a 20' General Purpose container (20' GP) as an alternative to bulk containers.

BULK BREEDING METHOD = МЕТОД МАССОВОГО РАЗВЕДЕНИЯ (или МЕТОД МАССОВОЙ СЕЛЕКЦИИ) – Bulk Breeding Method is the growing of genetically diverse populations of self-pollinated crops in a bulk plot with or without mass selection, followed by single plant selection.

BULK CARGO = МАССОВЫЙ ГРУЗ (или НАВАЛОЧНЫЙ ГРУЗ) – Bulk Cargo:- not in packages or containers; shipped loose in the hold of a ship without mark and count. Grain, coal and sulfur are usually bulk freight. Unpacked homogeneous cargo poured loose in a vessel's hold or a container, e.g., oil and grain. / , например, .

BULK CARGO CODE = КОД МАССОВОГО ГРУЗА (или КОД НАВАЛОЧНОГО ГРУЗА) – Bulk Cargo Code (BC Code):- safe working practice code for solid bulk cargo.

BULK CARRIER = БАЛКЕР (или НАВАЛОЧНИК, или СУДНО–НАВАЛОЧНИК, или НАВАЛОЧНОЕ СУДНО) – (1) Bulk Carrier is a single deck vessel designed to carry homogeneous unpacked dry cargoes such as grain, iron ore and coal. Single deck vessel designed to carry homogeneous unpacked dry bulk cargoes. Bulk Carriers:- as the name suggests, a bulk carrier is primarily used in carrying unpackaged bulk cargo items such as metal ores, coal, cement, grains and other similar cargo. Today, bulk carriers constitute of 40% of the merchant fleets in the world. They can be categorised in six major categories according to their deadweight tonnage capacity. The categories mainly include Handysize, Handymax, Panamax, Capesize and Very Large. Very large bulk carriers are normally counted into Capesize category, but sometimes they are considered as a separate category. Some regional categories such as Seawaymax, Kamsarmax, Setouchmax, Dunkirkmax, and Newcastlemax can also be included in the category of bulk carriers. South Korea is the largest builder of bulk carriers in the world. The size of a bulk carrier can range from a small mini-bulker with a capacity of under 10 000 dwt to the giant capesize vessels with a capacity of up to 400 000 dead weight tonnage (DWT) or even more. Handysize and Handymax (including the latest Supramax) bulkers represent the majority of bulk carriers over 10 000 DWT. These bulkers are primarily used for carrying dry cargo such as iron ore, coal, cement, finished steel, fertilizer, and grains. Panamax and New Panamax are medium-sized vessels with a cargo capacity ranging between 5 000 TEU to 13 000 TEU. These ships have been designed strictly in accordance with the dimensions of new locks at the Panama Canal. Capesize bulkers are huge with a dwt between 150 000 and 400 000. According to estimates, 93% cargo of capesize bulkers comprises of iron ore and coal. All vessels designed to carry bulk cargo such as grain, fertilizers, ore, and oil. / Под Балкером, от Английского слова Bulk, означающее Наваливать или Насыпать, понимается специализированное судно для перевозки грузов насыпью или навалом. Дедвейт (полная грузоподъёмность) до 150 000 тонн. Известен также как Навалочник (Breakbulk Vessel).

(2) Bulk Carrier is a ship specifically designed to transport vast amounts of cargoes such as chemicals, coal, grain, liquefied natural gas, oil, ore, sugar, and wine. / Специально разработанное судно для перевозки огромных количеств груза, такого как вино, зерно, каменный уголь, нефть, руда, сахар, сжиженный природный газ и химикаты.

BULK CLASSING = КЛАССИРОВКА ПАРТИЙ – Bulk Classing is a term used when fleece wools of different brands and descriptions, but of similar type, yield, etc, are emptied out of their containers (bales) bulked together and rebaled under another or various brands into large lines. Grading and pooling of small lots of wool from a number of owners into standard lines.

BULK CONTAINER = КОНТЕЙНЕР ДЛЯ СЫПУЧИХ ГРУЗОВ – Bulk Container is a container designed for the carriage of dry cargoes in bulk, which are loaded through hatchways in the roof of the container and discharged through hatchways at one end of the container. / и разгружен через .

BULK CONTAINER PALLET = ПОДДОН БОЛЬШОЙ ВМЕСТИМОСТИ (или ХХ) – Bulk Container Pallet is a box pallet with solid or close boarded sides, one or more of which can have hinged or removable gates for access. Note 1:- a box pallet can be fitted with a lid. Note 2:- definitions concerning roll con-tainers can be found in EN 12674-1 [11]. / Поддон Большой Вместимости:- ящичный поддон со сплошными, решетчатыми или сетчатыми стенками. Примечание 1:- ящичный поддон может иметь крышку. Примечание 2:- определение ящичного поддона приведено в стандарте EN 12674-1 [11].

BULK DEVELOPMENT = МАССОВОЕ РАЗВИТИЕ (или РАЗВИТИЕ В МАССЕ) – Bulk Development:- any of various relaxation treatments to produce maximum bulk in textured or latent crimp yarns or in fabrics made therefrom. The essential conditions are heat, lubrication, movement, and the absence of tension. Bulk development may be accomplished during wet processing or may be a separate operation such as hot-air tumbling, steam-injection tumbling, or dry cleaning.

BULKED CONTINUOUS FILAMENT = РАСТРЁПАНАЯ (или ОБЪЁМИСТАЯ) НЕПРЕРЫВНАЯ (ЭЛЕМЕНТАРНАЯ) НИТЬ – Bulked Continuous Filament (BCF) is a continuous filament fiber containing a degree of crimp or bulk.

BULKED CONTINUOUS FILAMENT YARNS = РАСТРЁПАНАЯ (или ОБЪЁМИСТАЯ) ПРЯЖА ИЗ НЕПРЕРЫВНЫХ (ЭЛЕМЕНТАРНЫХ) НИТЕЙ – Bulked Continuous Filament (BCF) Yarns are the yarns for carpet trade, usually nylon, polypropylene, or polyester. / Найлан (Nylon).

BULKED YARN = РАСТРЁПАНАЯ (или ОБЪЁМИСТАЯ) ПРЯЖА – Bulked Yarn:- a method and apparatus for producing a composite bulked or texturized yarn having a generally uniformly bulked core yarn component of continuous filaments having groups of core yarn filaments extending outwardly from the core component in undulatory waves having substantially less filament density than the core component, and having a varyingly bulked effect yarn component of continuous filaments having groups of effect yarn filaments extending outwardly from the effect yarn component in undulatory waves such that the groups of effect yarn filaments form slubs at regions along the length of the composite yarn. The filaments forming the slubs return to each respective nucleus portion of the segment on each side of the slub. Selected filaments within the waves have different lengths so that the waves are comprised of filaments based at various distances from the core and are spaced from one another within the wave. The product is further characterized by the absence of closed or crunodal loops and by the undulatory shape of the waves. Bulked Yarn is a qualitative term to describe a textured yarn. A bulked yarn develops more bulk than stretch in the finished fabric. The method of producing a bulked yarn comprises advancing a core and an effect yarn to a zone of fluid turbulence and deflecting the effect yarn from its primary path over randomly varying distances at randomly varying intervals to randomly vary the speed of the effect yarn entering the zone of fluid turbulence. The composite yarn formed is collected at a speed less than the speed at which the core and effect yarns are advanced to the zone of fluid turbulence. Furthermore, the bulked strand is tensioned to permanently reduce the bulkiness of the core yarn and to permanently increase the difference in bulkiness between the slubbed and non-slubbed portions and to lock the filaments of the effect yarn among the filaments of the core yarn. See also Textured Yarns.

BULK FREIGHT = МАССОВЫЙ ГРУЗ (или НАВАЛОЧНЫЙ ГРУЗ) – Bulk Freight:- not in packages or containers, shipped loose in the hold of the ship. Grain, coal and sulfur are usually bulk freight.

BULK–FREIGHT CONTAINER = КОНТЕЙНЕР ДЛЯ ПЕРЕВОЗКИ СЫПУЧИХ ГРУЗОВ – Bulk-Freight Container is a container with a discharge hatch in the front wall; allows bulk commodities to be carried. A term Bulk-Freight Container refers to a container which allows bulk commodities to be grasped by roll loading hatches and which has front wall discharge hatch. / разгрузки, расположенным в .

BULK GRADE = МАССОВЫЙ СОРТ (или ПРЕОБЛАДАЮЩИЙ СОРТ) – Bulk Grade:- the largest percentage of grade in a lot of original-bagged wool.

BULKHEAD = ПЕРЕГОРОДКА (или ПЕРЕБОРКА) – (1) Bulkhead is a name given to any vertical partition which separates different compartments or spaces from one another. Vertical partition dividing compartments on board a vessel. Upright partition dividing compartments on board a vessel. The functions of bulkheads are:- (i) to increase the safety of a vessel by dividing it into watertight compartments; (ii) to separate the engine room from the cargo holds; (iii) to increase the transverse strength of a vessel; and (iv) to reduce the risk of spreading fire to other compartments. Bulkhead is transverse or longitudinal partitions separating portions of the ship ('walls' in a ship). / Под Перегородкой понимается внутренняя ограждающая конструкция, разделяющая смежные помещения в здании. Перегородки могут устраиваться на всю высоту этажа (ограждающие) или не доходящими до потолка (выгораживающие). Различают перегородки:- раздвижные (трансформируемые), сборно-разборные и стационарные. В современном строительстве для устройства перегородок используют в основном плиты, керамические и легкобетонные камни, стеклоблоки, реже – кирпич и железобетон. В жилых и общественных зданиях наиболее рациональны сборные перегородки из крупноразмерных элементов заводского изготовления например, гипсобетонные панели размером на комнату. Под судовой Переборкой понимается вертикальная или наклонная поперечная или продольная перегородка, ограничивающая помещения на судне. Бывают проницаемые и непроницаемые (для воды, газов или нефти).

(2) Bulkhead is a vertically mounted board to provide front wall protection against shifting cargo and commonly seen on platform trailers (road cargo). Bulkhead is a movable railcar partition that is used to secure a load.

(3) Bulkhead is a partition in a container, providing a plenum chamber and/or air passage for either return or supply air. It may be an integral part of the appliance or a separate construction.

(4) Bulkhead is a vertically mounted wall separating the fore respectively aft compartment from the rest of the aircraft (aircargo). / В перевозках авиационных грузов .

BULKING = НАБУХАНИЕ – Bulking is a yarn finishing process in which the yarn is made thicker or 'bulkier' by heat setting crimp into the filaments or by looping individual fibers with an air jet. Bulking gives yarn and fabrics a less shiny, fluffier appearance. Bulking is often used in making sweater yarns.

BULK LIQUID = НАЛИВОМ – Bulk Liquid:- means liquid or semi liquid which is contained within, or is discharged from any one vessel, tank or other container which has the capacity of 20 gallons or more. A liquid occuring in large and/or undivided quantities. / или разгружены из одного судна, . Способ перевозки жидких грузов. Смотрите также Навалом (Bulk).

BULK MODULUS = МОДУЛЬ ОБЪЁМНОГО СЖАТИЯ (или ОБЪЁМНЫЙ МОДУЛЬ УПРУГОСТИ, или МОДУЛЬ ВСЕСТОРОННЕГО СЖАТИЯ) – Bulk Modulus (of elasticity) is a ratio of normal stress to a change in volume. A term used in determining the compressibility of a fluid. Data for petroleum products can be found in the International Critical Tables. / Модуль Объёмного Сжатия, отношение величины равномерного всестороннего давления к величине относительного объёмного сжатия, вызванного этим давлением (смотрите Модули Упругости). Модули Упругости, величины, характеризующие упругие свойства материала. В случае малых деформаций, когда справедлив Закон Гука, то есть имеет место линейная зависимость между напряжениями и деформациями, модули упругости представляют собой коэффициент пропорциональности в этих соотношениях. Одностороннему нормальному напряжению s, возникающему при простом растяжении (сжатии), соответствует в направлении растяжения модуль продольной упругости E (Модуль Юнга). Он равен отношению нормального напряжения s к относительному удлинению e, вызванному этим напряжением в направлении его действия:- E = s/e, и характеризует способность материала сопротивляться растяжению. Напряжённому состоянию чистого сдвига, при котором по двум взаимно перпендикулярным площадкам действуют только касательные напряжения t, соответствует модуль сдвига G. Модуль сдвига равен отношению касательного напряжения t к величине угла сдвига g, определяющего искажение прямого угла между плоскостями, по которым действуют касательные напряжения, то есть G = t/g. Модуль сдвига определяет способность материала сопротивляться изменению формы при сохранении его объёма. Всестороннему нормальному напряжению s, одинаковому по всем направлениям (возникающему, например, при гидростатическом давлении), соответствует модуль объёмного сжатия K – объёмный модуль упругости. Он равен отношению величины нормального напряжения s к величине относительного объёмного сжатия D, вызванного этим напряжением:- K = s/D. Объёмный модуль упругости характеризует способность материала сопротивляться изменению его объёма, не сопровождающемуся изменением формы. К постоянным величинам, характеризующим упругие свойства материала, относится также Коэффициент Пуассона n. Величина его равна отношению абсолютного значения относительного поперечного сжатия сечения e" (при одностороннем растяжении) к относительному продольному удлинению e, то есть n = |e"|/e. В случае однородного изотропного тела модули упругости одинаковы по всем направлениям. Четыре постоянные величины E, G, K и n связаны между собой двумя соотношениями:- G = E / (2(1 + v)), K = E / (3(1 – 2v)). Следовательно, только две из них являются независимыми величинами и упругие свойства изотропного тела определяются двумя упругими постоянными. В случае анизотропного материала постоянные E, G и n принимают различные значения в различных направлениях и величины их могут изменяться в широких пределах. Количество модулей упругости анизотропного материала зависит от структуры материала. Анизотропное тело, лишённое всякой симметрии в отношении упругих свойств, имеет 21 модуль упругости. При наличии симметрии в материале число модулей упругости сокращается. Модули упругости устанавливаются экспериментально-механическим испытанием образцов изучаемых материалов. Модули упругости не являются строго постоянными величинами для одного и того же материала, их значения меняются в зависимости от химического состава материала, от его предварительной обработки (термическая обработка, прокат, ковка и другие). Значения модулей упругости также зависят от температуры материала.

BULK SEGREGANT ANALYSIS = ВАЛОВОЙ АНАЛИЗ СЕГРЕГАНТА – Bulk Segregant Analysis is a detection strategy used to define molecular regions controlling a certain phenotype. Large populations of organisms are usually pooled (bulked) into two classes representing distinguishing phenotypes. DNA profiling by DNA amplification fingerprinting (DAF) or Random Amplified Polymorphic DNA (RAPD) is used to detect distinguishing band patterns.

BULK SHIPMENTS = ОТГРУЖЕННЫЕ ПАРТИИ НАВАЛОЧНЫХ ГРУЗОВ – Bulk Shipments:- shipments which are not packaged, but are loaded directly into the vessel's holds. Examples of commodities that can be shipped in bulk are coal, fertilizers, fuel oil, grain, iron, ores, scrap, tallow, vegetable oil, and similar commodities.

BULK STORAGE = БЕСТАРНОЕ ХРАНЕНИЕ (или ХРАНЕНИЕ НАВАЛОМ, или ХРАНЕНИЕ НАСЫПЬЮ, или ХРАНЕНИЕ НАЛИВОМ) – Bulk Storage is a storage of large quantities of product in shipping containers. May also be the storage of product that is not packed (loose).

BULK UTILIZATION CHARGE = СБОР ЗА ИСПОЛЬЗОВАНИЕ БАЛКА – Bulk Utilization Charge is a charge which applies to consignments carried from airport of departure to airport of arrival, entirely in Unit Load Devices (aircargo). / В перевозках авиационных грузов .

BULKY = БОЛЬШОЙ (или ОБЪЁМИСТЫЙ, или ГРОМОЗДКИЙ) – Bulky:- in wheels, a term used for a wheel with a wide orifice. This allows the creation of a thicker yarn suitable for blanket wefts.

BULKY–WEIGHT YARNS = ХХ ПРЯЖИ – Bulky-Weight Yarns:- these yarns knit to a gauge of up to 3-1/2 stitches per inch on size 10, 10-1/2, and 11 US needles, or larger. Yarns in this category can range from 500 to 1 000 yards per pound. These yarns are used for heavy fabrics such as coats, blankets, and heavy bulky outdoor sweaters.

BULL = БЫК – Bull is a person who expects prices (especially of shares and commodities) to go up and buys in the hope of selling later at a profit, generally on the stock market. A person who believes prices will advance and might be described as having a bullish outlook. One who anticipates an increase in price or volatility. Bull is a trader who believes the market will rise and speculates on the rise in prices. Bulls, expecting price to go up, buy assets forward in the hope of selling them back at a higher price before delivery. The opposite of Bear. Bull is someone who expects prices to rise. Bull is someone who anticipates that prices will rise. / Все участники рынков образно делятся на две категории:- быки и медведи. Бык – лицо, которое рассчитывает, что цены (особенно акций и сырья) должны вырасти, и покупает в надежде продать позже с прибылью, главным образом на фондовом рынке. Лицо, которое верит в то, что цены будут повышаться. Он мог бы быть обозначен как имеющее бычий взгляд. Тот, кто принимает участие в повышении цен или лихорадочности. Бык – торговец или инвестор, который верит в то, что рынок будет расти и спекулирует на данном росте цен. Быки, ожидая повышения цен, заранее скупают активы в надежде продать их обратно по более высокой цене в ближайшем будущем до поставки. В противоположность Медведю (Bear). Бык – тот, кто рассчитывает на то, что цены вырастут. Бык – тот, кто предвкушает то, что цены будут расти. Быки и Медведи – это главные героические тотемы биржевых рынков, олицетворяющие собой две основные рыночные силы, то есть Покупателей и Продавцов. Бык, он же торговец или инвестор, который уверен в том, что рынок будет расти. Именно он открывает длинную позицию, способствуя увеличению спроса и подъёму цен, то есть ‘поднимает врага на рога’. Есть ещё жадные Свиньи, которые передерживают свои позиции, чтобы прибыль увеличилась, даже когда рынок развернулся в обратном направлении. Кроме того имеются и боязливые Овцы, которые никогда не имеют собственного мнения и слепо следуют за своими гуру. Короче говоря, как только рынок начинает работать, быки покупают, медведи продают, а свиньи и овцы ‘путаются у них под ногами’. Смотрите также Медведь (Bear).

BULL BEAR RATIO = СООТНОШЕНИЕ БЫКОВ С МЕДВЕДЯМИ – Bull/Bear Ratio:- Overview:- each week a poll of investment advisors is taken and published by Investors Intelligence of New Rochelle, New York. Investment advisors are tracked as to whether they are bullish, bearish, or neutral on the stock market. The Bull/Bear Ratio shows the relationship between the bullish and bearish advisors. Interpretation:- the Bull/Bear Ratio is a market sentiment indicator. Dr. Martin Zweig sums up sentiment indicators in his book Winning On Wall Street by saying, ‘Beware of the crowd when the crowd is too one-sided’. Extreme optimism on the part of the public and even professionals almost always coincides with market tops. Extreme pessimism almost always coincides with market bottoms. High readings of the Bull/Bear Ratio are bearish (there are too many bulls) and low readings are bullish (there are not enough bulls). In almost every case, extremely high or low readings have coincided with market tops or bottoms. Historically, readings above 60% have indicated extreme optimism (which is bearish for the market) and readings below 40% have indicated extreme pessimism (which is bullish for the market). Example:- the following chart shows the Bull/Bear Ratio and the S&P 500. ‘Buy’ arrows were drawn on the S&P 500 when the advisors were extremely bearish, and ‘Sell’ arrows were drawn when advisors were extremely bullish. Calculation:- the Bull/Bear Ratio is calculated by dividing the number of bullish advisors by the number of bullish plus bearish advisors. The number of neutral advisors is ignored. Bull / Bear Ratio = (Bullish Advisors / (Bullish Advisors + Bearish Advisors)) x 100. Bull Bear Ratio is the Investors Intelligence’ (a leading provider of research and technical analysis; now headquartered in London, the United Kingdom) market sentiment indicator which shows the relationship between bullish and bearish advisors. It is interpreted as a contrary indicator, meaning that if it reflects extreme bullishness, the market is probably at a top. The Bull / Bear Ratio indicates overall investor sentiment in the market by comparing the number of bullish and bearish investors. This market indicator is calculated and published weekly by the Investors Intelligence Sentiment Survey. How It Works/Example:- each week, survey data is gathered from investors and investment professionals to determine who is bullish (optimistic) and who is bearish (pessimistic) about the market climate. The bull/bear ratio is calculated by dividing the number of bullish respondents by the number of bearish respondents. The ratio is a contrarian indicator, interpreted as follows:- a high bull/bear ratio (greater than 1) indicates that there are too many bulls in the market, and you should take a bearish stance; a low bull/bear ratio (less than 1) indicates that there are too many bears in the market, and you should take a bullish stance. To illustrate, suppose Investors Intelligence surveys 100 investors and investment professionals in a given week. Of these 100 respondents, 18 are bullish and 82 are bearish. The ratio is calculated as follows:- 18 bulls / 82 bears = 0.22. Since the ratio is a contrarian indicator, this low bull/bear ratio predicts a bullish future for the markets. To illustrate in the other direction, suppose Investors Intelligence surveys another 100 people the next week. Of these 100, 70 respond as bullish and 30 respond as bearish. The calculation would be:- 70 bulls / 30 bears = 2.33. Again, reading the ratio as a contrarian indicator, this high bull/bear ratio would predict a bearish future. Why It Matters:- the bull/bear ratio is a real quantitative measure based on the feelings of actual people working in the market and/or with a stake in the market. The bull/bear ratio measures how people feel ‘right now’ (i.e. at the time of the survey). By the time Investors Intelligence publishes the ratio, these same peoples’ feelings regarding the future of the market could have changed. It is the ‘present’ nature of this data that accounts for the contrarian interpretation of the consequent bull/bear ratio. This is because high optimism about current market conditions (high ratio – greater than 1.0) indicates that the market is probably going to top-off and begin to go down. On the other hand, high pessimism about current conditions (low ratio – less than 1.0) indicates that the market is probably going to bottom-out and begin an upward trend. Such information could influence potential investors in the market. Bull/Bear Ratio is a market-sentiment indicator published weekly by Investors Intelligence that uses information polled directly from market professionals. This index reflects the sentiments of market participants that deal daily within the financial markets and it gives a more relevant measure. Bull / Bear Ratio = Bullish Investment Advisors / Bearish Investment Advisors. High readings of the ratio indicate a bearish sentiment, whereas low readings indicate a bullish one. Typically, extremely high and low readings have shown simultaneous market tops and bottoms. / Соотношение Быков С Медведями – является индикатором предчувствия рынков от Инвесторских Известий (Investors Intelligence; ведущий поставщик исследований и технического анализа; теперь штабквартира размещается в Лондоне, Соединённое Королевство), который показывает взаимоотношение между бычьими и медвежьими советниками. Он интерпретируется как противоположный (или обратный) индикатор, подразумевая то, что если он отражает экстремальную бычность, то рынок, вероятно, находится на вершине).

BULL CALL SPREAD = БЫЧЬЯ КУРСОВАЯ РАЗНИЦА ПО ОПЦИОНАМ НА ПОКУПКУ (или БЫЧИЙ СПРЭД ПО ОПЦИОНАМ НА ПОКУПКУ) – The combined long- and short-call option positions at a lower and higher strike price respectively is often referred to as a Bull Call Spread, which provides the holder with the opportunity to hedge against any losses occurring at a range within the two loss ratios (strike prices). The establishment of such a spread position is usually cheaper than buying a single call option because it entails the simultaneous sale of a call option. Bull Call Spread is the purchase and sale of call options at different exercise prices but with the same expiry date. The purchased (or long) calls have a lower price than the written (or short) calls. The investor expects a rise in the price of the underlying asset.

BULL DENIM = САМЦОВЫЙ ДЁНИМ – Bull Denim:- a 3 x 1 twill weave piece dyed fabric, made from coarse yarns. Weights can vary from 9 oz/sq yard up to the standard 14 oz/sq yard. Bull Denim is essentially a denim without indigo.

BULLDOG = БУЛЬДОГ – Bulldog is a Sterling denominated foreign bond issued by an overseas borrower in the traditional UK bond market.

BULLDOG BONDS = ОБЛИГАЦИИ 'БУЛЬДОГИ' – Bulldog Bonds are the bonds issued by foreign borrowers in Pounds Sterling for sale on the UK market. Also known as Bulldogs.

BULLET = ПУЛЯ – Bullet is a security with one principal payment on the workout date.

BULLET = XX – Bullets are low twisted double yarn seen weft wise in fabrics. Those are generally zero twisted parallel yarns. Practical causes of faults are improper functioning of bunch motion, incorrect yarn path through spindle, loose tensioners, capsule and spring working, insufficient yarn as bunch and knot is not applied after removing bunch yarn. Bullets:- zero twisted or low twisted double yarn. Spinning defect. Bullets are low twisted double yarn seen weft wise in fabrics. Those are generally zero twisted parallel yarns. Practical causes of faults are:- (i) proper functioning of bunch motion is not there; (ii) incorrect yarn path through spindle; (iii) loose tensioners; (iv) capsule and spring working; (v) in-sufficient length of yarn as bunch; and (vi) knot is not applied after removing the bunch yarn. / некручёная (zero twist) или двойная пряжа с низкой круткой (low twisted double yarn). Порок или Дефект прядения.

BULLET BONDS = ОБЛИГАЦИИ 'ПУЛИ' – Bullet Bonds are the bonds with fixed maturities that may not be called and may not be amortized early by the borrower.

BULLET YIELD = ДОХОДНОСТЬ ПУЛИ – Bullet Yield is a yield that assumes one principal payment on the workout date (no prepayments). A bullet yield is always a bond equivalent yield.

BULL FLAG = БЫЧИЙ ФЛАГ (или ФЛАГ БЫКА) – Bull Flag:- a sharp, strong volume rally on a positive fundamental development, and several days of sideways- to-lower price action. The vertical uptrend that precedes a flag may occur because of buyers' reactions to a favorable company earnings announcement, or a new product launch. The sharp price increase is sometimes referred to as the 'Flagpole' or 'Mast'. / В техническом анализе биржевых рынков, .

BULLION = КАНИТЕЛЬ – Bullion is a twisted, shiny, cord-like fringe used primarily in upholstery.

BULLION = СЛИТОК – Bullion is the generic word for gold and silver in bar or ingot form. Originally meant 'mint' or 'melting place' from the old French word bouillon, which means boiling. Originally meaning melting place, from the French bouillon, boiling (пузыриться, кипеть, закипать, бурлить, вскипать). Derived from the French billon – an ingot. Precious metals cast into bars or other uncoined form. Bars or ingots of precious metals, usually cast in standardized sizes. Bullion, uncoined gold and silver in the mass. See also Gold, and Silver. / Под Слитком понимается литая металлическая заготовка для дальнейшей переработки путём пластической деформации, переплава или електролиза. Под Слитком понимается металл, затвердевший при кристаллизации в изложнице; чаще всего имеющий форму усечённой пирамиды, призмы (квадратной, прямоугольной или многогранной), цилиндра или конуса. Слиток служит полуфабрикатом для дальнейшей переработки, главным образом прокаткой или ковкой. При массовом производстве стали в цехах с высокопроизводительными агрегатами большой вместимости отливают крупные слитки (массой в несколько десятков тонн) для последующего обжатия на блюмингах или слябингах. Под Слитком понимается литая металлическая заготовка, предназначенная для дальнейшей переработки путём пластической деформации (прокатка, ковка, прессование), переплава (получение фасонных отливок, приготовление сплавов) или электролиза (аноды из черновой меди, никеля и другого). Слитки получают путём разливки жидкого металла в формы сравнительно простых очертаний – изложницы, а также методом непрерывного литья и наплавления в водоохлаждаемом кристаллизаторе (электрошлаковый переплав, переплав в дуговых вакуумных печах). Слитки, отлитые в изложницы и предназначенные для дальнейшей обработки давлением, имеют чаще всего форму усечённой пирамиды или усечённого конуса. Если металл кристаллизуется с усадкой, как, например, спокойная сталь, то в слитке имеется прибыльная часть (прибыль), где концентрируется усадочная раковина; при дальнейшем переделе эту часть отрезают и направляют на переплавку. Кипящая сталь затвердевает без образования сосредоточенной усадочной раковины, поэтому в слитках такой стали нет прибыльной части. Слитки, отлитые методом непрерывного литья, имеют форму призм (квадратного, прямоугольного, многоугольного сечения) или цилиндров. Иногда отливают слитки более сложной формы, например, полые. В верхней части непрерывнолитых слитков также располагается усадочная раковина (сравнительно небольшого размера); эту часть отделяют при резке заготовки на мерные длины. В слитках электрошлакового и вакуумно-дугового переплава усадочная раковина значительно меньше, что обусловлено снижением скорости наплавления на заключительном этапе формирования слитков. Масса слитков, предназначенных для обработки давлением, от нескольких килограмм (кг) до 250 тонн (т) и более. Наиболее употребительны стальные слитки массой от 0.5 до 20 т. Слитки чугуна и некоторых цветных металлов, предназначенные для переплава, имеют обычно форму небольших усечённых пирамид с большой конусностью. Такие слитки называются Чушками. Их масса не превышает, как правило, 30–40 кг. Из других форм слитков можно отметить так называемые Штыки (медные), различные болванки и так далее. В связи с тем что условия кристаллизации металла существенно изменяются в ходе затвердевания, строение и химический состав металла в слитках весьма неоднородны (смотри Ликвация). Чем крупнее слиток, тем сильнее выражена в нём химическая и структурная неоднородность. Слитки, получаемые методом непрерывного литья или путём наплавления в кристаллизаторе, значительно более однородны, чем слитки, отлитые в изложницы. Слиток:- золотой резерв Федеральной Резервной Системы (Federal Reserve System (FRS)) США хранится в виде металлических слитков. Частные инвесторы могут хранить слитки ценного металла, такого, как золото или серебро, или приобрести сертификат, дающий им право на долевое участие во владении слитком.

BULLION ACCOUNT = СЛИТКОВЫЙ СЧЁТ – Bullion Accounts are:- (i) Unallocated Accounts:- this is an account where specific bars are not set aside and the customer has a general entitlement to the metal. It is the most convenient, cheapest and most commonly used method of holding metal. The units of these accounts are one fine ounce of gold and one ounce of silver based upon a 995 LGD (London Good Delivery) gold bar and a 999 fine LGD silver bar respectively. Transactions may be settled by credits or debits to the account while the balance represents the indebtedness between the two parties. Credit balances on the account do not entitle the

creditor to specific bars of gold or silver, but are backed by the general stock of the bullion dealer with whom the account is held. The client is an unsecured creditor. Should the client wish to receive actual metal, this is done by 'allocating' specific bars or equivalent bullion product, the fine gold content of which is then debited from the allocated account. (ii) Allocated Accounts:- these accounts are opened when a customer requires metal to be physically segregated and needs a detailed list of weights and assays. The client has full title to the metal in the account, with the dealer holding it on the client's behalf as a custodian. Clients' holdings are identified in a weight list of bars showing the unique bar number, gross weight, the assay or fineness of each bar and its fine weight. Credits or debits to the holding will be effected by physical movements of bars to or from the client's physical holding. Also known as Metal Account. See also Allocated Accounts, and Unallocated Accounts. / Известен также как Металлический Счёт (Metal Account).

BULLION COIN = ИНВЕСТИЦИОННАЯ МОНЕТА – Bullion Coin or Precious Metal Coin is a legal tender coin whose market price depends on its gold content, rather than its rarity or face value. Bullion Coin is a term for current coins minted in large series sold at a small premium above the gold value. Examples of such coins are the Krugerrand, Maple Leaf, Mexican Peso, and Sovereign. Bullion Coins are the contemporary precious metal coins minted in unlimited numbers for investment purposes. Bullion Coin is a precious metal coin whose market value is determined by its inherent precious metal content. They are bought and sold mainly for investment purposes. / Кругеран (Krugerrand), Кленовый Лист (Maple Leaf), Мексиканский Песо (Mexican Peso), и Соверен (Sovereign). Монета из драгоценного (благородного) металла, рыночная цена которой определяется наличием в ней самого драгоценного металла. Они покупаются и продаются, главным образом, для инвестиционных целей. Под Монетой, от Латинского слова Moneta, понимается денежный знак, отчеканенный из благородного металла, например, золота.

BULLION OPTION = ОПЦИОН НА СЛИТОК – Bullion Option is a transaction in which one party grants to the other party (in consideration for a premium payment) the right, but not the obligation, to purchase (in the case of a call) or sell (in the case of a put) a specified number of Ounces of Bullion at a specified strike price. The option may be settled by physical delivery of Bullion in exchange for the strike price or may be cash settled based on the difference between the market price of Bullion on the exercise date and the strike price. For purposes of Bullion Option, Bullion means gold, palladium, platinum, or silver, and Ounce means, in the case of gold, a Fine Troy Ounce, and in the case of palladium, platinum, and silver, a Troy Ounce. / закупить (в случае с опционом на покупку) или продать (в случае с опционом на продажу) .

BULLION SWAP = СВОП НА СЛИТКИ – Bullion Swap is a transaction in which one party pays periodic amounts of a given currency based on a fixed price or a fixed rate and the other party pays periodic amounts of the same currency or a different currency calculated by reference to a Bullion reference price (e.g., Gold-COMEX® on the Commodity Exchange Of New York, a division of New York Mercantile Exchange) or another method specified by the parties. Bullion Swaps include Cap, Collar or Floor Transactions in respect of Bullion. For purposes of Bullion Swap, Bullion means gold, palladium, platinum, or silver, and Ounce means, in the case of gold, a Fine Troy Ounce, and in the case of palladium, platinum, and silver, a Troy Ounce. / (например, Золото-КОМЭКС® (Gold-COMEX® на Сырьевой Бирже Нью Йорка, подразделении).

BULLION TRADE = ТОРГОВЛЯ СЛИТКАМИ – Bullion Trade is a transaction in which one party agrees to buy from or sell to the other party a specified number of Ounces of Bullion at a specified price for settlement either on a spot or two-day basis or on a specified future date. A Bullion Trade may be settled by physical delivery of Bullion in exchange for a specified price or may be cash settled based on the difference between the market price of Bullion on the settlement date and the specified price. For purposes of Bullion Trade, Bullion means gold, palladium, platinum, or silver, and Ounce means, in the case of gold, a Fine Troy Ounce, and in the case of palladium, platinum, and silver, a Troy Ounce.

BULLISH = БЫЧИЙ – Factors which are likely to raise prices are defined as bullish. Bullish:- a news item is considered bullish if it is expected to result in higher prices. The belief an asset or market will move up in price in the future. / Уверенность в том, что актив или рынок в ближайшее время будет расти в цене.

BULLISH PENNANT = БЫЧИЙ ВЫМПЕЛ – Bullish Pennant:- a sharp, strong volume rally on a positive fundamental development, and several days of narrowing price consolidation on much weaker volume, followed by a second, sharp rally to new highs on strong volume. / В техническом анализе биржевых рынков, .

BULLISH PERCENT INDEX = ИНДЕКС ПО 'БЫЧЬЕМУ' ПРОЦЕНТУ – Bullish Percent Index (BPI):- a popular market breadth indicator that is calculated by dividing the number of stocks in a given group (an exchange, an industry, etc) that are currently trading with point and figure buy signals, by the total number of stocks in that group. BPI can be used to determine overbought/oversold conditions and can generate buy/sell signals. It is important to note that the BPI is not something that can be applied to a single stock but rather an index that is calculated for a group of stocks. / В техническом анализе биржевых рынков, .

BULL MARK = XX ОТМЕТИНА – Bull Mark:- when a slub or extra piece of yarn is woven into the fabric. This is often removed by a 'burling tool'. This will usually leave an open place in the fabric. Woven fabric defect. / 'чистящим инструментом'. Порок или Дефект ткачества.

BULL MARKET = БЫЧИЙ РЫНОК (или РЫНОК БЫКОВ) – Bull Market is a long period of time when prices in the market are generally increasing. Bull markets occur when roughly 80% of all stocks advance over an extended period of time. 1982–87 and 1995–99 have been referred to as Bull Markets. Bull Market:- a time of high confidence among investors when they are keen to buy shares and prices rise. Bull Market is the term used to refer to a strong, healthy stock market. Prices and share volumes are increasing in a Bull Market. The opposite to this is a Bear Market. It has nothing to do with 'Bull' or 'BS', although that may be what causes some stocks to increase unreasonably. A period of rising market prices. A condition of the asset market when prices of assets are generally rising over a period of months or years. A news item is considered bullish if it is expected to result in higher prices. The opposite of Bear Market. A market in which prices are generally rising. Bull Market:- the rise in the market prices of securities on the stock exchange; synonymous with cyclical upswing and a booming economy. The general 'rise in prices' usually lasts for some time. Frequently restricted to individual market sectors. A bull market operator is someone who speculates on a rising market. The opposite of a bull market is a Bear Market. Bull Market is a market in which the trend is for prices to increase. The difference between a Bubble and a Bull Market is a potentially expensive one. Here are some ways to distinguish one from the other. We are the dot-com generation. As such, we lived through a historic boom and bust bubble cycle that was significantly injurious to the economy. Every American was affected in some way by this event. A key characteristic of the price run-up was that so few were willing to admit there was a problem, and even fewer still were willing to act on that belief. Now that we're on the other side of the burst, we may feel as though we're experts on bubbles. Although we hear talk about bubbles all the time, the truth is that they tend to be rare events. Nevertheless, we look at current market trends and wonder whether it is a bubble or just a strong bull market. What is the difference? According to one standardized definition (Wikipedia), a speculative bubble is distinguished by 'trade in high volumes at prices that are considerably at variance with intrinsic values and could also be described as a situation which asset prices appear to be based on implausible or inconsistent views about the future'. In other words, it's a mania. A common historic example is the Dutch tulip price

bubble of the mid-1600s when tulip bulbs sold for more than 10 times the income of a skilled craftsman. The only explanation of such a scenario is psychological. In his book 'Extraordinary Popular Delusions and the Madness of Crowds', Charles Mackay explains how a crowd will behave irrationally from time to time. Another popular theory about manias and bubbles is the so-called 'Greater Fool Theory' that describes market participants beliving they can speculate on an asset, and no matter how overpriced it gets, they can resell it to some other speculator. This explanation certainly sounds familiar to those caught up in the housing bubble that peaked around 2006. Riding The Bull:- we now need to differentiate bubbles from bull markets, which is a trend of confidence and increasing asset prices over a long period of time. A secular trend can last anywhere from five to 20 years. The two most powerful secular stock market trends in the second half of the XX century lasted 17 years (1949–66) and 18 years (1982–2000). While a bull market can end with a bubble, most of the time investors were optimistic about the future but did not view the future implausibly until the end. The main difference between a bull and a bubble is the speculative component. One example is a company called Norris Communications. This was a bulletin board company that changed its name to e.Digital in 1999 when it traded that January at USD0.06 per share. By December 31, 1999, it was trading at USD2.91. Three weeks later it was at USD24.50. It quickly collapsed and resumed its former low price at USD0.10. Perhaps the key component is the implausibility factor. In the British railway mania of the 1840s, total railway revenues in Britain in 1845 were £6 million. The expectation was for £60 million by 1852 while the actual revenues came in at £15 million. While tenfold increases are the expectation for new technologies or industries, by the 1840s the rails were no longer considered a new technology or industry. There had been a smaller rail bubble in the 1830s in Britain where revenues did increase tenfold. But to continue at that rate invoked the implausibility factor. A bull and a bubble also can be differentiated by obvious market sentiment. While a bull market climbs a wall of worry – or caution – the characteristic sentiment of a bubble is a laissez-faire attitude and the belief that 'this time is different'. After the financial crisis bottomed in 2009, media commentators would interview many guests and ask if they thought there would be a double-dip recession. The question was asked continuously while the market kept rising. In a bubble, nobody talks about recessions or is even worried about the possibility of a decline. In fact, the key psychological component is denial that prices ever could decline to past levels. Applying this analysis to today's rising stock market, it would suggest that this is a true bull market, as caution and worry have certainly accompanied the higher prices. Technical Matters:- although the psychological characteristics are interesting, we can turn to chart examples to examine more concrete factors. There are different ways to define a normal bull market technically, but the best way is simple observation. While a bubble's key characteristic is a parabolic move, bull markets can have parabolic moves as well. One reliable method is utilizing Andrews' pitchfork. Many bull patterns in various time frames will stay close to the confines of the upper channel. Consider a weekly chart of the S&P 500 index (see 'Steady rise', right. In the mid-2000s, the stock market advanced steadily. Prices held and ultimately formed a powerful trend move.). During the bull market from 2002–07, it stayed within the upper channel until the end. It also never strayed far from the 50-week moving average. By contrast, 'Fast runner' (right) shows the housing stock Lennar Corp. from 1999 until the stock split in January 2004 (Lennar Corp. rose sharply beyond common technical trend parameters, suggesting the trend and prices were not sustainable). Already we can see a move far away from the Andrews' channel and the 50-week moving average. The stock peaked at USD68.86 in July 2005, which is pre-split price of USD137. If straying from a standard Andrews channel can be a clue a bubble has materialized, then we also might grow wary from a pattern that requires multiple Andrews' channels to complete. By itself, this probably isn't a strong enough signal, but when combined with the psychological aspect of market participants, it can contribute to a fuller understanding. The gold market during the last decade comes to mind. Here's a market that grew more than 650% within a decade. But it probably wasn't the move itself that defined the bubble; it was likely the behavior that propelled the action. When gold was trading under USD1 000, per ounce, experts expected it to go to USD3 000, or higher. According to a Fortune magazine article on October 12, 2009, when gold futures were trading at USD1 045, top-ranked manager John Hathaway of Tocqueville Gold Fund offered the prediction that gold could rise to more than USD5 000. The traditional reason for the forecast was inflationary fears, but like stock prices that rise in a bubble because of implausible views of the future, gold prices do the same. Dire predictions of social unrest, political uncertainty and the collapse of the dollar caused prices to soar. By the end, many pundits were giving lip service to the 'bubble' word. If judged by the technical pattern alone, gold's run certainly looks like a bubble (see 'Get some gold', page 28. Gold's move technically looks like a bubble. However, caution was, and continues to be, widespread with respect to the yellow metal. Bubbles tend to be marked by an overwhelming lack of concern that prices could ever fall again). However, when the psychological picture is assessed, the analysis could go either way. By the end of the price run, Utah passed a bill allowing gold and silver coins issued by the Federal government as legal currency. Utah was the first of 13 states to propose such laws. What the law did was to treat gold and silver coins issued by the US Mint as legal tender for a set value as opposed to market price of the physical metal. For instance, if you had a one-ounce coin worth a one Dollar face value, and gold was trading at USD1 400 per oz, the value of the coin would be the currency value and not the market value. If someone wanted to buy a candy bar with a coin really worth several hundred Dollars, they could do it. This kind of behavior supports the notion that gold indeed was a bubble. However, the key consideration is that market participants deny a bubble even exists. By the time the precious metals started turning down, there were numerous reports that a bubble had burst. Indeed, while prices were rising, there were also numerous sources suggesting precious metals were forming a bubble. When a real bubble materializes, few, if any, 'experts' admit the possibility that mania has set in. Next In Line?:- today, pundits speculate on what the next bubble might be. There is talk that the fouryear rally in the stock market is a bubble, as well as debate on whether or not the bond market should be considered a bubble. Because credit has been so cheap for years, is the value of debt unsustainable? The longer-term continuation chart for the 30-year Treasury bond grew from roughly 55 to 152 in 32 years. By that standard, it's hardly a bubble. But with the cheap money and engineering by the Federal Reserve, we can hardly call this price rise a bubble built on mania. The Fed has attempted to keep rates low and prices high to stimulate the economy. It's not implausible behavior considering how much damage was done to the economy in the financial crisis. Many bull markets, such as the bond market bull from 1949–66, supported three Andrews' channels with many validations by the time it peaked in 1966 (see 'Bond power', left. Although the bond market put in a stupendous run in the 1950s and early '60s, it never took on the full attributes of a bubble.). However the market never went parabolic, nor was the behavior in the 1950s predicting implausible behavior about the future. However, by the end of every bull market, there is a built-in confidence and optimism about the future, as there is at the end of every business cycle. Hence in determining a mania, speed of the move and the size of the move go hand in hand. The Nasdaq® went from 1343 to 5132 in 18 months. That's a 282% leap. The bond market, on the other hand, grew 176% in 30 years. And we have the psychological aspect. The implausible factor must be present. Denial must be widespread. If these factors aren't in place, the bubble is mostly likely a simple bull market. Trade accordingly. Bull Market is a market where prices are increasing. Bull Market is a market where a small supply and/or large demand results in a price rise. / Корп. (Corp.). НЭЗДЭК® (NASDAQ®) . Рынок, на котором цены главным образом растут. Бычий Рынок – рынок, на котором в течение длительного периода времени происходит повышение цен. Смотрите также Медвежий Рынок или Рынок Медведей (Bear Market).

BULL PUT SPREAD = БЫЧЬЯ КУРСОВАЯ РАЗНИЦА ПО ОПЦИОНАМ НА ПРОДАЖУ (или БЫЧИЙ СПРЭД ПО ОПЦИОНАМ НА ПРОДАЖУ) – Bull Put Spread:- the purchase and sale of put options at different exercise prices but with the same expiry date. The puts purchased have a lower exercise price than the puts written. The investor expects the price of the underlying asset to rise.

BULL RINGS = КРЕПЁЖНЫЕ КОЛЬЦА (или ГНЁЗДА, или ПРОУШИНЫ, или ОБОДЫ, или ФЛАНЦЫ, или КОЛЬЦА ДЛЯ БЫКОВ) – Cargo securing device mounted into floor of containers which provides for the lashing and securing of cargo. Bull Rings are rings for lashing the cargo in containers (flatracks or artificial tweendecks). Bull Rings are the cargo-securing devices mounted in the floor of containers; allow lashing and securing of cargo. Upright partition dividing compartments on board a vessel. The functions of bulkheads are:- (i) to increase the safety of a vessel by dividing it into watertight compartments; (ii) to separate the engine room from the cargo holds; (iii) to increase the transverse strength of a vessel; (iv) to reduce the risk of spreading fire to other compartments; and (v) A vertically mounted board to provide front wall protection against shifting cargo and commonly seen on platform trailers (road cargo).

BULL SPREAD = БЫЧЬЯ КУРСОВАЯ РАЗНИЦА (или БЫЧИЙ СПРЭД) – (1) In most commodities and financial instruments, the term refers to buying the nearby month, and selling the deferred month, to profit from the change in the price relationship. Long the nearby future and short the deferred in anticipation of an increase in the general level of prices, with the nearby future expected to increase more than the deferred contract. A Bull Spread strategy implies the speculator is long (buys) the nearby commodities futures contract and is short (sells) the distant futures contract. Under normal market conditions, the speculator will profit if the price difference between contracts narrows. Under an inverted market the speculator will profit if the price difference widens. Bull Spread:- the simultaneous purchase and sale of two futures contracts in the same or related commodities with the intention of profiting from a rise in prices but at the same time limiting the potential loss if this expectation is wrong. This can usually be accomplished by buying the nearby delivery and selling the deferred. Bull Spread is a simultaneous purchase of a nearby futures contract and sale of a deferred contract, with the expectation that the nearby contract will gain relative to the deferred. See also Bear Spread, and Spread. A term Bull Spread usually refers to the simultaneous purchase of the nearby contract month and sale of the distant contract month. / Одновременная закупка и продажа двух фьючерсных контрактов на одно и тоже или взаимосвязанное сырьё с намерением получить прибыль при росте цен, но в то же самое время, органичить себя от потенциального убытка в случае, если данное предположение окажется неверным. Это может обычно сопровождаться покупкой ближайшего к поставке и продажей отдалённого от текущей поставки фьючерсов.

(2) Bull Spread is a combination of the purchase of a call option and the sale of a call option with a higher strike price or of the purchase of a put option and the sale of a put option with a higher strike price. The combined options must be identical in terms of underlying asset and maturity. This construction can be used as a (restricted) hedge against rising prices of the underlying asset. The opportunities and risks in these combinations are limited. A Delta-positive options position composed of both long and short options of the same type, either calls or puts, designed to be profitable in a rising market. An option with a lower strike price is bought and one with a higher strike price is sold. When to use:- if you think the market will go up, but with limited upside. Good position if you want to be in the market but are less confident of bullish expectations. You're in good company. This is the most popular bullish trade. Profit characteristics:- profit limited, reaching maximum if market ends at or above strike price B at expiration. If call-vs.- call version (most common) used, break-even is at A + net cost of spread. If put-vs.-put version used, break-even is at B – net premium collected. Loss characteristics:- what is gained by limiting profit potential is mainly a limit to loss if you guessed wrong on market. Maximum loss if market at expiration is at or below A. With call-vs.-call version, maximum loss is net cost of spread. Decay characteristics:- if market is midway between A and B, little if any time decay effect. If market is closer to B, time decay is generally a benefit. If market is closer to A, time decay is generally detrimental to profitability. Category:- directional. Long call A, short call B. Long put A, short put B. A strategy involving the simultaneous purchase and sale of options of the same class and expiration date but different strike prices. In a bull vertical spread, the purchased option has a higher delta than the option that is sold. For example, in a call bull spread, the purchased option has a lower exercise price than the sold option. Also known as Bull Vertical Spread. / Одна из стратегий торговли. Позиция по опционам с положительным значением Дельты заключается в покупке и продаже опционов одного и того же типа, либо опционов на покупку либо опционов на продажу, и предназначается для получения прибыли на растущем рынке. Опцион с более низкой сходной ценой покупается, а опцион с более высокой сходной ценой продаётся. Стратегия, заключающаяся в одновременной закупке и продаже опционов одного и того же класса и даты прекращения признания, но с различными сходными ценами. При бычьей вертикальной курсовой разнице закупаемый опцион имеет более высокое значение дельты, нежели у продаваемого опциона. Например, при бычьей курсовой разнице в случае с опционом на покупку, закупаемый опцион имеет долее низкую цену исполнения нежели продаваемый опцион.

BULL TRAP = БЫЧЬЯ ЛОВУШКА – In exchange trading, Bull Trap is one of trading traps. A situation that occurs when prices break above a significant level and generate a buy signal, but suddenly reverse course and negate the buy signal, thus 'trapping' the bulls that acted on the signal with losses. A bull trap is another form of Whipsaw and relates to the Upthrust. A short term declining market which will resume its previous rising trend. Bull Trap is one of the most reliable point & figure chart patterns. Bull Traps occur when an upward breakout retreats back below the new support level. A false breakout of chart resistance to the upside where prices quickly reverse, thus trapping the new buyers with losing positions. / В техническом анализе биржевых рынков, под Бычьей Ловушкой понимается одна из ловушек торговли. Ситуация, которая возникает когда цены пробиваются выше существенного уровня и генерируется сигнал на покупку, но затем движение цены внезапно разворачивается в обратную стону, и сигнал на покупку сводится на нет, в результате чего быки попадают в капкан убытков, сработавший по данному сигналу. Медвежья Ловушка является ещё одной формой Подрезания (Whipsaw) и связана с Откатом (Upthrust). Краткосрочно снижающийся рынок, который возобновит свою предыдущую тенденцию на повышение. Бычья Ловушка – одна из наиболее надёжных моделей графика крестики и нолики. Бычьи ловушки возникают в тех случаях, когда восходящий пробой отступает назад ниже нового уровня поддержки. Ложный пробой графика сопротивления до верхней границы, на которой цены быстро разворачиваются в обратную сторону, загоняя таким образом новых покупателей в убыточные позиции.

BULL VERTICAL SPREAD = БЫЧЬЯ ВЕРТИКАЛЬНАЯ КУРСОВАЯ РАЗНИЦА (или БЫЧИЙ ВЕРТИКАЛЬНЫЙ СПРЭД) – Bull Vertical Spread is a strategy used when an investor expects that the price of a commodity will go up but at the same time seeks to limit the potential loss should this judgment be in error. This strategy involves the simultaneous purchase and sale of options of the same class and expiration date but different strike prices. For example, if call options are spread, the purchased option must have a lower exercise or strike price than the sold option. See also Bull Spread. / Бычья Вертикальная Курсовая Разница или Бычий Вертикальный Спрэд – это стратегия, используемая в тех случаях, когда торговец или инвестор предвкушает, что цена биржевого актива или сырья пойдёт вверх, но в то же самое время задумывается об ограничении потенциального убытка на тот случай, если данное суждение было ошибочным. Эта стратегия заключается в одновременной закупке и продаже опционов одних и тех же класса и даты прекращения признания (или экспирации), но по разным сходным ценам. Например, если речь идёт о курсовой разнице по опционам на покупку, то приобретаемый опцион должен иметь более низкую цену исполнения или сходную цену, нежели продаваемый опцион. Смотрите также Бычья Курсовая Разница или Бычий Спрэд (Bull Spread).

BUMP = ТАЗ – Bump is a cylinder of coiled, prepared fibers ready for spinning. This is how commercially prepared fibers are delivered. Rather like if you had access to a really big ball winder and used it to wind the top you had just hand combed.

BUMP AND RUN REVERSAL = РАЗВОРОТ РОСТ И БЕГСТВО – Bump And Run Reversal:- a reversal chart pattern that forms after excessive speculation drives prices up too far, too fast. It is designed to identify speculative advances that are unsustainable for a long period. / В техническом анализе биржевых рынков, .

BUNAD = ПЮЭНАД (или БЮНАД) – Bunad is a Norwegian traditional costume. The designs are typically elaborate, with embroidery, scarves and hand-made silver or gold jewelry. / Бюнад, от Норвежского слова Бюнодырь (Bunader), – собирательное название традиционных Норвежских костюмов, обычно крестьянских. В данной публикации речь идёт о более праздничном, не совсем повседневном варианте бюнада. Реконструкции таких праздничных костюмов называют ещё 'Фестдракт'. Дизайн такого бюнада, как правило, сложный, украшенный всевозможными вышивками и изделиями из олова (в оригинале это было именно оно). Женский костюм обычно состоит из вышитой блузы, юбки, жилета, чулков и, безусловно, аксессуаров. Мужской костюм включает в себя рубаху, укороченные брюки, жакет, жилет, чулки, различные аксессуары (без шляпы образ будет уже неполным). Как и в любой стране, в Норвегии каждый регион отличается своим неповторимым дизайном национальной одежды. Наиболее узнаваемым и популярным считается костюм области Телемарк, Юго-Западная часть Восточной Норвегии. А в области Нюмедал (то же Юг, только чуть центральнее) традиционный красный цвет уже сменяется на зелёный, хотя расстояние между двумя территориями ничтожно. В области Халлиндал (Hallingdal) популярен цветочный орнамент. Крой становится заметно проще, хотя область далеко не восточная.

BUNCH = БУХТА (или ПУЧОК) – Bunch is:- (1) the reserve yarn on the filling bobbin to allow continuous weaving between the time of indication from the midget feeler until a new bobbin is put in the shuttle; (2) xxxxx. See also Slug. Fabrics defect. / уточина.

BUNCHED ORDER = КОЛЛЕКТИВНОЕ РАСПОРЯЖЕНИЕ – Bunched Order is a discretionary order entered on behalf of multiple customers. / Осмотрительное распоряжение, оформленное от имени нескольких заказчиков.

BUNCHING UP = ПУЗЫРЕНИЕ – Bunching Up:- this is largely influenced by take-up mechanism and whether it functions properly or not. Causes:- (i) fabric take-up too weak; and (ii) thick place in yarn. Mending:- non mendable. Knitted fabric defect.

BUNCHY TOP = КУСТИСТОСТЬ ВЕРХУШКИ – Bunchy Top occurs in small patches and occasionally whole fields. The cause has not been confirmed. Symptoms include small leaves and bolls, short internodes and a pale angular mottle near the edges of leaves. Some branches can be unaffected. The leaf mottle may occur without the bunchy growth habit and, on leaves in full sun, may turn red on the upper surface of the leaf. A proliferation of small leaves, short internodes and small bolls usually becoming apparent as the crop approaches maturity and usually on the upper parts of the plant. When bunchy top is severe the whole plant is affected and the crop takes on a 'climbing ivy' appearance. Some leaves may exhibit a mottling with pale green margins and darker green centers. Symptoms may be more common in unsprayed or poorly sprayed areas of the field. The cause of bunchy top is uncertain and it is possible that there could be several agents capable of producing similar symptoms. The condition usually occurs in circular patches and often in association with prolonged aphid activity. There is some evidence for the involvement of a 'virus-like' pathogen vectored by aphids. Plants with sublethal infection by the Fusarium Wilt pathogen also may develop bunchy top symptoms as they approach maturity. Varieties vary considerably in symptom expression with some varieties severely affected and others seemingly immune. / угловатая крапчатость (angular mottle). Фузариозный Вилт (Fusarium Wilt). с продолжительной активностью тлей.

BUND = ЗАГРАЖДЕНИЕ – Bund:- an impervious embankment of earth, or a wall of brick, stone, concrete or other suitable material, which may form part or all of the perimeter of a compound that provides a barrier to retain liquid. Since the bund is the main part of a spill containment system, the whole system (or bunded area) is colloquially referred to within industry as the 'bund'. The bund is designed to contain spillages and leaks from liquids used, stored or processed above-ground, and to facilitate clean-up operations. A bund consists of:- (i) an impervious bund wall or embankment surrounding the facility or tanks; (ii) an impervious floor within the bunded area; (iii) any joints in the floor or the wall, or between the floor and the wall; and (iv) any associated facilities designed to remove liquids safely from the bunded area without polluting the environment. As well as being used to prevent pollution of the receiving environment, bunds are also often used for fire protection, product recovery and process isolation. The requirement for bunding should be determined on a site-by-site basis. There are several different types of bunds:- (i) channel to contain or direct to blink tank; (ii) hump bund; (iii) ramp bund; and (iv) square bund. Area designed to contain any spills. The Bund floor and wall must be built of materials impervious to the contents of any tank or container within the bund. It should be of sufficient strength and structural integrity to ensure that it is unlikely to burst or leak in ordinary use, and should not have a damp course. The use of un-reinforced materials is not recommended for bund wall construction. The bunded area must be capable of preventing the migration of any spillage or leakage to the surrounding environment. Earthen bunds are not recommended, except where there is no other viable alternative. Bund is an embankment used to control the flow of water; a division between fields. / :- (i) заграждение в форме канала для сдерживания или перенаправления в отстойник; (ii) заграждение вального или бугоркового типа; (iii) заграждение рампового типа; и (iv) прямоугольного или параллелепипедообразного типа. Зона, формируемая для сдерживания любых аварийных розливов.

BUNDESANSTALT FÜR FINANZDIENSTLEISTUNGSAUFSICHT = БУНДЭСАНШТАЛЬТ ФЮР ФИНАНЦДИНСТЛАЙСТУНСАУФСИХТ (или ФЕДЕРАТИВНОЕ УПРАВЛЕНИЕ ПО ФИНАНСОВОМУ НАДЗОРУ) – The Federal Financial Supervisory Authority (in German, Die Bundesanstalt für Finanzdienstleistungsaufsicht (BaFin):- Since it was established in May 2002, the Federal Financial Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht – known as BaFin for short) has brought the supervision of banks and financial services providers, insurance undertakings and securities trading under one roof. BaFin is an independent public-law institution and is subject to the legal and technical oversight of the Federal Ministry of Finance. It is funded by fees and contributions from the institutions and undertakings that it supervises. It is therefore independent of the Federal Budget. BaFin operates in the public interest. Its primary objective is to ensure the proper functioning, stability and integrity of the German financial system. Bank customers, insurance policyholders and investors ought to be able to trust the financial system. BaFin's By-Laws represent a major set of precepts for how it acts. They contain regulations governing its structure and organisation and its rights and obligations. Banking Supervision, Insurance Supervision and Securities Supervision/Asset Management are three different organisational units within BaFin – the so-called Directorates. BaFin must cover its expenditure entirely out of its own income. It receives no funding from the Federal budget. BaFin raises the funds required to cover its costs from the undertakings it supervises instead. The legal foundation for this is the Act Establishing the Federal Financial Supervisory Authority (Finanzdienstleistungsaufsichtsgesetz – FinDAG). The large number of players operating on the global financial markets has been increasing steadily for many years now. Even though there is no legal framework that is binding internationally, markets are still expanding across borders. Financial supervision, however, is still largely inward-looking, since sovereign powers usually end at the national border. Article 144 of the recast Banking Directive (Directive 2006/48/EC) stipulates that all EU member states must publish information on national implementation of Basel II. To mark the German implementation of Basel II the Deutsche Bundesbank and

BaFin have therefore published a joint website. Headquartered in Bonn (Banking and Insurance Supervision) and Frankfurt am Main (Securities Supervision/ Asset Management), Germany. The Federal Financial Supervisory Authority (BaFin) with official domiciles in Bonn and Frankfurt am Main was founded on 2002-May-01 and took over the duties of the former supervisory offices for banking, insurance and securities trading. In Germany, therefore, there is an official bancassurance regulator under one roof covering about 2 600 banks, 800 financial services providers and roughly 700 insurance companies. The Authority is funded exclusively from fees and charges paid by the supervised institutions and companies and is independent of the Federal budget. The overriding goal of the BaFin is to safeguard the functional operability of the entire financial sector in Germany. Sub-targets can be derived from this. Firstly, protecting the solvency of banks and financial services providers, and secondly ensuring customer and investor protection. The BaFin itself is subject to legal and material supervision by the Federal Ministry of Finance. / Федеративное Управление по Финансовому Надзору или, как это звучит на Немецком языке, Ди Бундэсанштальт фюр Финанцдинстлайстунсауфсихт (БаФин; Die Bundesanstalt für Finanzdienstleistungsaufsicht (BaFin)).

BUNDESBANK = БУНДЭСБАНК (или ФЕДЕРАТИВНЫЙ БАНК) – Full name Deutsche Bundesbank, the central bank of Germany, with headquarters in Frankfurt. It was established on 1957-August-01, when it replaced the Bank Deutscher Länder, founded in 1948. The Deutsche Bundesbank is the central bank of the Federal Republic of Germany. Eurosystem monetary policy is the Bundesbank's core business area. Other core business areas include the financial and monetary system, banking supervision, cashless payments and cash operations. Two aspects common to all core business areas are active participation in international organisations and research. In addition to these core business areas, the Bundesbank is also responsible for the management of the reserve assets and various tasks in the field of statistics and as the Government's fiscal agent. It also advises the Federal Government on matters of monetary policy. The Bundesbank's decision-making body is the Executive Board. It comprises the President, the Vice-President and other members. The Bundesbank's Central Office is in Frankfurt am Main, Germany. The Bundesbank also has a nationwide network of 9 Regional Offices and 47 branches. The Executive Board is the Bundesbank's supreme decision-making body. It comprises the President and Vice-President of the Deutsche Bundesbank and five other members. The President of the Bundesbank is a voting member of the Governing Council of the ECB and takes part in the monthly monetary policy decision-making process. The reserve bank of Germany. Refers to the central bank of Germany. This is the US equivalent of the Federal Reserve. The Bundesbank was in charge of the German Deutsche Mark but now that the country has adopted the Euro, it is part of the European system of central banking. Headquartered in Frankfurt am Main, Germany. The Bundesbank, and the other central banks of member states which have adopted the euro, together with the European Central Bank (ECB) constitute the Eurosystem, the monetary authority of the euro area. Monetary and other policy decisions for the Eurosystem are taken by the ECB Governing Council, which is made up of the governors of the national central banks in the Euro area and the members of the ECB Executive Board. The resolutions of the Governing Council are applied by the national central banks. The Bundesbank's tasks and functions are governed by the Bundesbank Act (BBankG) and the EEC Treaty. The Bundesbank has five strategic pillars:- price stability in the Euro area, a stable financial and monetary system, secure and efficient payment and settlement systems, efficient cash supply and infrastructure, smooth functioning of German banks and financial service providers. / Полное название банка – Дойчэ Бундэсбанк или Немецкий Федеративный Банк (Deutsche Bundesbank). Это центральный банк Германии со штабквартирой во Франкуфурте; в США его назвали бы резервным банком по аналогу с Федеральным Резервом. Банк с этим названием был образован в 1957, когда заменил предшествовавший ему Банк Немецких Земель или, как это звучит на Немецком языке, Банк Дойча Ленда (Bank Deutscher Länder), основанный в 1948.

BUNDLE = ПУЧОК (или КЛУБОК, или МОТОК, или ПОЧАТОК, или ВЯЗКА) – (1) Bundle is an Irish linen term which means that there are 60 000 yards of yarn in 10 pounds. Linen yarn measure, equal to 60 000 yards, weighing 10 pounds. Bundle is a general term for a collection of essentially parallel filaments or fibers. See also Hanks, Package, and Skein. / Моток:- ровно смотанные, намотанные на что-нибудь нитки, пряжа, проволока, например, шерсть в мотках. Клубок:- смотанные шариком нитки, а также вообще комок чего-нибудь мягкого, спутанного, например, клубок пряжи. Пучок:- длинные пряди волос или коса, закрученная в узел.

(2) Hanks or skeins of yarn set up in 5- or 10-pound packages.

BUNDLE = СВЯЗКА – Bundle is a stack of copper cathodes strapped together for shipping. / Штабель медных катодов, закреплённых вместе для отгрузки.

BUNDLING = КОМПЛЕКТНОЕ УПАКОВЫВАНИЕ (или ПАКЕТИЗАЦИЯ, или СВЯЗЫВАНИЕ В ПАКЕТЫ) – Bundling is an assembling of pieces of cargo, secured into one manageable unit.

BUNDS = БУНДС (или ФЕДЕРАТИВКИ, или ФЕДЕРАТИВНЫЕ ОБЛИГАЦИИ) – In Germany, federal government bonds with a maturity of 10 and 30 years and Euro equivalent of the bond denominated in US Dollars. The 10-year bund serves as the benchmark for the German and other European bond markets. See also Bobls, and Schätze. Bund Future, also known as Euro-Bund-Future. This is a futures contract traded on Eurex® based on a notional Federal Treasury bond bearing a nominal interest rate of 6% and a residual term to maturity of 8.5 to 10.5 years. The nominal value of a contract is EUR100 000.00. The maturities are determined in accordance with Bund Future delivery months available at the same time. These are always the nearest three months in the cycle March, June, September and December. / Ойрэкс® или Юрэкс®. Бундс или Федеративки это общепринятое сокращение от Немецкого слова Бундэсанлайен (Bundesanleihen), означающее Федеративный Займ. В Германии, облигации федерального правительства со сроком погашения в 10 и 30 лет, а также Евро эквиваленты этих облигаций, деноминированные в Долларах США. 10-летние облигации служат ориентиром для Немецкого и других Европейских рынков облигаций. Смотрите также Боблс или Федеративные Ноты (Bobls), и Щяцэ или Федеративные Казначейские Ноты (Schätze).

BUNG = КРЫШКА (или ПРОБКА) – Bung is a threaded cap, cork or other stopper for the opening (bulk hole) in a barrel, keg or drum. Can be located on lid or side.

BUNG HOLE = ОТВЕРСТИЕ ПОД КРЫШКУ – Bung Hole is the hole in a barrel, keg or drum through which liquid can be poured in or drawn out. Can be located on lid or side.

BUNK = КОЙКА – Bunk (maritime term):- built-in bed aboard ship.

BUNKER ADJUSTMENT FACTOR = ФАКТОР ПЕРЕОЦЕНКИ БУНКЕРНОГО ТОПЛИВА (или ПОПРАВОЧНЫЙ ФАКТОР ПО КОТЕЛЬНОМУ ТОПЛИВУ, или ПОПРАВОЧНЫЙ ФАКТОР ПО БУНКЕРНОМУ ТОПЛИВУ) – Bunker Adjustment Factor (BAF) refers to floating part of sea freight charges which represents additions due to oil prices. Usually BAF charges are determined by Carrier Conferences to be applicable for a certain period on a certain trade route. These Carrier Conferences are seen as a cartel for fixing prices. The European Comission and Japan Fair Trade Commission are studying the possibility to eliminate the immunity the carriers have today. Bunker Adjustment Factor (BAF) is a fuel surcharge expressed as a percentage added or subtracted from the freight amount, reflecting the movement in the market place price for bunkers. Bunker Adjustment Factor (BAF) is a surcharge assessed by carrier which is applied to freight rates to supplement an unexpected rise in fuel costs. An adjustment in shipping charges

to offset price fluctuations in the cost of bunker fuel. Also known as a Bunker Surcharge (B/S). Bunker Adjustment Factor (BAF) is used to compensate steamship lines for fluctuating fuel costs. Sometimes called Fuel Adjustment Factor or FAF. Adjustment applied by shipping lines or liner conferences to offset the effect of fluctuations in the cost of bunkers. Adjustment applied by shipping lines or liner conferences to compensate for the effect of fluctuations in the cost of fuel. Freight surcharges are no longer updated by conferences. Please refer to shipping line agents or freight forwarders for their values. Bunker Adjustment Factor (BAF) is an adjustment to shipping companies' freight rates to take into account fluctuations in the cost of fuel oil (bunkers) for their ships. Bunker Adjustment Factor:- surcharge calculated at a percentage of the basic ocean freight, to take into account the fluctuations of the price of fuel, adapted as needed. / судоходными линиями или линейными конференциями . флуктуаций (колебаний) цена на котельное топливо. топливная надбавка или доплата (surcharge).

BUNKER C FUEL OIL = КОТЕЛЬНОЕ ТОПЛИВО СИ (или БУНКЕРНОЕ ТОПЛИВО СИ, или ФЛОТСКИЙ МАЗУТ ВЫСОКОЙ ВЯЗКОСТИ) – Bunker C Fuel Oil:- a fuel used for ships. Generally refers to a No. 6 grade of residual fuel oil with an American Petroleum Institute gravity about 10.5°. Also known as Bunkering Fuel. A residual fuel used as ship's fuel, which usually has a high sulfur content and high viscosity. / Остаточное топливо, используемое в качестве судового топлива, обычно отличается высоким содержанием серы и высокой вязкостью.

BUNKER CHARGE = СБОР ЗА КОТЕЛЬНОЕ ТОПЛИВО (или СБОР ЗА БУНКЕРНОЕ ТОПЛИВО) – Bunker Charge is an extra charge sometimes added to steamship freight rates; justified by higher fuel costs. Also known as Fuel Adjustment Factor or FAF.

BUNKERING = БУНКЕРОВКА (или ПОПОЛНЕНИЕ КОТЕЛЬНЫМ ТОПЛИВОМ) – Bunkering is the operation of filling or replenishing a ship with fuel. / Операция по заправке или дозаправке судна топливом.

BUNKERING FUEL = КОТЕЛЬНОЕ ТОПЛИВО (или СУДОВОЕ ТОПЛИВО, или БУНКЕРНОЕ ТОПЛИВО, или ФЛОТСКИЙ МАЗУТ) – Bunkering Fuel is a fuel used for ships. Generally refers to a No. 6 grade of residual fuel oil with an American Petroleum Institute gravity about 10.5°. Also known as Bunker C Fuel Oil. Any hydrocarbon mineral oil used or intended to be used for the operation or propulsion of a ship. Also known as Bunker Fuel. Small molecules like those in propane gas, naphtha, gasoline for cars, and jet fuel have relatively low boiling points, and they are removed at the start of the fractional distillation process. Heavier petroleum products like diesel and lubricating oil are much less volatile and distill out more slowly, while bunker oil is literally the bottom of the barrel; the only things more dense than bunker fuel are carbon black feedstock and bituminous residue which is used for paving roads (asphalt) and sealing roofs. Bunker Fuel is technically any type of fuel oil used aboard ships. It gets its name from the containers on ships and in ports that it is stored in; in the days of steam they were coal bunkers but now they are bunker fuel tanks. The Australian Customs and the Australian Tax Office define a bunker fuel as the fuel that powers the engine of a ship or aircraft. Bunker A is No. 2 fuel oil, bunker B is No. 4 or No. 5 and bunker C is No. 6. Since No. 6 is the most common, 'bunker fuel' is often used as a synonym for No. 6. No. 5 fuel oil is also called Navy Special Fuel Oil or just Navy Special; No. 5 or 6 are also called Furnace Fuel oil (FFO); the high viscosity requires heating, usually by a recirculated low pressure steam system, before the oil can be pumped from a bunker tank. In the context of shipping, the labeling of bunkers as previously described is rarely used in modern practice. Since the 1980s the International Organization for Standardization (ISO) has been the accepted standard for marine fuels (bunkers). The standard is listed under number 8217, with recent updates in 2005 and 2010. They have broken it down to Residual and Distillate fuels. The most common residual fuels in the shipping industry are RMG and RMK (the RMK category's carbon reside limit was lowered to 20% for all grades). The differences between the two are mainly the density and viscosity, with RMG generally being delivered at 380 centistokes (50 °C) or less, and RMK at 700 centistokes (50 °C) or less. Ships with more advanced engines can process heavier, more viscous, and thus cheaper, fuel. Governing bodies (i.e. California, European Union) around the world are starting to limit the maximum sulfur of fuels burned in their ports to limit pollution. This is where Marine Distillate Fuels come into play. They have similar properties to Diesel #2 which is used as road Diesel around the world. The most common grades used in shipping are DMA (the minimum viscosity requirement of DMA was raised from 1.5 cSt to 2 cSt) and DMB (minimum viscosity requirement of 2 cSt was added to DMB). / Дробная Перегонка или Фракционная Перегонка (Fractional Distillation).

BUNKERS = КОТЕЛЬНОЕ ТОПЛИВО (или СУДОВОЕ ТОПЛИВО, или БУНКЕРНОЕ ТОПЛИВО, или ФЛОТСКИЙ МАЗУТ) – Bunkers is a maritime term referring to fuel used aboard the ship. Coal stowage areas aboard a vessel in the past were in bins or bunkers. Fuel for a vessel's propulsion plant (engine). Fuel consumed by the engines of a ship; compartments or tanks in a ship for fuel storage. Bunker Fuels is a term used to refer to fuels consumed for international marine and air transport. In the maritime field another type of classification is used for fuel oils:- (i) MGO (Marine gas oil):- roughly equivalent to No. 2 fuel oil, made from distillate only; (ii) MDO (Marine diesel oil):- a blend of heavy gasoil that may contain very small amounts of black refinery feed stocks, but has a low viscosity up to 12 cSt so it need not be heated for use in internal combustion engines; (iii) IFO (Intermediate fuel oil):- a blend of gasoil and heavy fuel oil, with less gasoil than marine diesel oil; (iv) MFO (Marine fuel oil):- same as HFO (just another 'naming'); and (v) HFO (Heavy fuel oil):- pure or nearly pure residual oil, roughly equivalent to No. 6 fuel oil. Marine diesel oil contains some heavy fuel oil, unlike regular diesels. Also, marine fuel oils sometimes contain waste products such as used motor oil. / К котельному топливу относятся тяжёлые продукты переработки нефтей, каменных углей, горючих сланцев. Оно используется в корабельных, судовых и стационарных котельных установках и в промышленных печах различного назначения.

BUNKER SURCHARGE = НАДБАВКА ЗА КОТЕЛЬНОЕ ТОПЛИВО (или НАДБАВКА ЗА БУНКЕРНОЕ ТОПЛИВО, или ДОПЛАТА ЗА КОТЕЛЬНОЕ ТОПЛИВО) – Bunker Surcharge is a surcharge assessed by carrier which is applied to freight rates to supplement an unexpected rise in fuel costs. Also known as Bunker Adjustment Factor. / надбавка или доплата (surcharge).

BUNT = ТВЁРДАЯ ГОЛОВНЯ – Bunt is characterized the presence of bunt balls or black spores. Infected grain may have a fishy odor. Common bunt is a Wheat disease caused by two closely related Fungi, Tilletia Caries and Tilletia Foetida. The disease is also called Stinking or Covered Smut. In infected plants, kernels on headed plants are replaced with bunt balls containing black powdery spores of the fungus. Bunt balls can be removed by following procedures for cleaning for grade improvement, as long as there is no odor. If there is an odor, the presence of bunt balls is a grading factor in Wheat. If there is no odor, but kernels are tagged with bunt, the sample is considered naturally stained. Bunt reduces yield of infected crops, and it reduces the value of the crop, even in mildly infected crops. / Болезнь, вызываемая Головнёвыми Грибами. У инфицированных растений, в зерновке (ядрах) . Под Головнёй понимается болезнь растений, вызываемая Головнёвыми Грибами. Несколько видов:- пузырчатая, пыльная, стеблевая, твёрдая. Наиболее вредоносна для Злаков (Кукуруза, Пшеница, Рожь и другие). Колосья, метёлки, початки, стебли и листья превращаются в тёмную споровую массу.

BUNTING = ТКАНЬ ДЛЯ ФЛАГОВ – Bunting is a soft, flimsy, loose-textured, plain weave cloth most frequently used in flags. Bunting was originally made from cotton or worsted yarns, but today's flags are made primarily from nylon or acrylic fibers. Bunting can be either a cotton or wool fabric, woven in a plain open weave, similar to cheesecloth, and dyed in the piece. Cotton bunting is often woven with plied yarns. Wool bunting is woven with worsted worsted yarns, using strong, wiry wool. Bunting is a loosely woven fabric used primarily for flags and draping. Bunting used in public places must be flameproof. Bunting is also a term used to describe a simple

rectangular square of material in which a baby is wrapped for warmth. Bunting is a lightweight loosely woven fabric used chiefly for flags and festive decorations. / Найлан (Nylon).

BUOY = БУЙ (или БАКЕН, или ПОПЛАВОК, или БАКАН) – Buoy is a floating object employed as an aid to mariners to mark the navigable limits of channels, their fairways, sunken dangers, isolated rocks, telegraph cables, and the like; floating devices fixed in place at sea, lake or river as reference points for navigation or for other purposes. Buoys (in the UK, 1840's), pieces of wood, cork, or some light substance, moored and floating on the water. Those of wood are sometimes solid, and sometimes hollow, like a cask, and strongly hooped; they are made of various shapes and sizes; and are either private or public. Private Buoys are so called from their belonging to private individuals. They are principally employed to mark the place of the ship's anchor, being fastened to it by a rope or chain, so that the men who go in the boat to weigh it may readily find out where it is. By the 1 & 2 Geo. 4. c. 75. § 11. it is enacted, that if any person or persons shall wilfully cut away, cast adrift, remove, alter, deface, sink, or destroy, or in any way injure or conceal, any buoy, buoy-rope, or mark, belonging to any ship or vessel, or which may be attached to any anchor or cable belonging to any ship or vessel, whether in distress or otherwise, such person or persons so offending shall upon conviction be adjudged guilty of felony, and shall be liable to be transported for any term not exceeding 7 years, or to be imprisoned for any number of years, at the discretion of the court. Public Buoys, being intended for the public service, cannot be placed, altered, or removed, except by competent authority. They are generally of a pretty large size; and are firmly moored by chains or cables to rocks, large stones, anchors, etc. By floating on the surface of the water, they serve at once to mark the channels through which it is safe to steer, and to point out dangers to be avoided, such as sunken rocks, shoals, wrecks of vessels, etc. The places in, and the purposes for, which buoys are exhibited, are always specified in good charts:- and as the leading buoys are generally of a peculiar figure or colour, which is also indicated in the chart, the navigator, as soon as he recognises them, shapes his course accordingly. Hence the great importance of having buoys properly placed, and of their being carefully marked in charts. / Под Буем, от Голландского слова Boei, понимается плавучий знак (поплавок) различных форм и цвета для ограждения опасных для судоходства мест, обозначения фарватеров или местонахождения каких-либо предметов (например, якоря), поддержания частей рыболовного трала, спасания людей (спасательный буй), измерения степени волнения (волномерный буй) и других целей. Иногда на буи устанавливают фонари и источники их питания, дополнительные устройства для подачи звуковых или радиосигналов. Под Бакеном, от Голландского слова Baken, понимается плавучий знак, устанавливаемый на якоре для обозначения навигационных опасностей и/или фарватеров. Бакены часто оборудуют осветительными устройствами, светоотражателями или звуковыми сигнальными устройствами. Под Рейдовой Бочкой, понимается стальной поплавок, поддерживающий цепь (бридель), идущую от якоря большой массы, лежащего на грунте ('мертвый' якорь). Рейдовые бочки бывают разных размеров. Их устанавливают в гаванях и на рейдах для стоянки боевых кораблей или торговых судов вне причалов. Корабль закрепляется за бридель стальным тросом или своей якорной цепью, временно отклепанной от якоря. Стоянка 'на бочке' позволяет кораблю быстро выйти в море, так как не требуется поднимать якорь с затратой длительного времени.

BUOYANT = ОЖИВЛЁННЫЙ (или ПЛАВАЮЩИЙ) – Buoyant:- a market in which prices have a tendency to rise easily with a considerable show of strength.

BUR = СТВОРКА (КОРОБОЧКИ) – Bur is the rough casing of the boll. Often referred to as Hulls after separation from the Cotton. Also known as Burr. / У Хлопчатника Створки коробочки составляют её грубую оболочку. После отделения от хлопкового волокна они часто соотносились с кожицами (hulls). В Англоязычном мире может быть известна также как Burr.

BUREAU INTERNATIONAL POUR LA STANDARDISATION DES FIBRES ARTIFICIELLES = БЮРО ЭТЭРНАСЬЁНАЛЬ ПУР ЛЯ СТАНДАРДИЗАСЬЁН ДЭ ФИБР АРТИФИСИБЛЬ (или МЕЖДУНАРОДНОЕ БЮРО ПО СТАНДАРТИЗАЦИИ ИСКУССТВЕННЫХ ВОЛОКОН) – The International Bureau For The Standardization Of Man-Made Fibers (Bureau International pour la Standardisation des Fibres Artificielles (BISFA)) is the international association of man-made fiber producers. It was founded in 1928 under the French name of Bureau International pour la Standardisation des Fibres Artificielles, hence the abbreviation BISFA. Headquartered in Brussels, Belgium. The objectives of the association are:- (i) BISFA establishes terminology of man-made fibers for the continuous improvement of intercompany, customer and consumer communications. BISFA aims to establish technical rules for fibers and yarns for delivery conditions which have to be applied for each type of man-made fiber and which are mandatory for all members of the association. Therefore BISFA establishes internationally agreed procedures and test methods for different categories of man-made fibers and sets general rules for settling of disputes between seller and buyer of man-made fibers. (ii) BISFA provides an international voice for the man-made fiber industry in these matters and promotes the adoption of its methods and terminology by standardization organizations such as CEN (short for the Comité Européen de Normalisation, in French, or the European Committee for Standardization (ECS), in English) and ISO (short for the Interational Organization for Standardization) and by the European Commission responsible for textile labeling and the customs authorities. Neutral testing houses can apply those methods. CEN and ISO – with which BISFA has formal contacts – have adopted several BISFA methods as a basis for their own standards. The producers affiliated to BISFA accept responsibility for their consignments only within the limits and only for products within the scope of the methods as presented in the relevant booklets. These booklets are updated periodically to take account of any developments in testing equipment and procedures, sampling and statistical methods. Generic names for textile fibers are used for customs purposes and textile product labeling in the context of the EU Directives 96/74/EC dated 16/12/1996 and 97/37/EC dated 19/6/97. BISFA principally considers generic names for textile but also for non textile end uses. A generic name or class can cover a range of products but always has to refer to basic technologies and properties. BISFA defines generic fiber names and enters them into the BISFA generic classification of fibers, published in the BISFA booklet on 'Terminology of Man – Made Fibres'. BISFA restricts new generic names to those categories which are produced on an industrial scale and are of commercial significance. Fibers which have recently emerged from research or which are still at the stage of development are not yet included. BISFA, after approval by its General Assembly, retains the option of modifying or withdrawing an existing generic name. The BISFA generic classification aims to be the basis for a subsequent application at the EU Commission or at the US Federal Trade Commission, and for inclusion in the ISO standard 2076 (on fiber names). At the request of the EU Commission (DG Enterprise), BISFA shall furnish its support and expertise, according to BISFA's policy and procedures for introducing new generic fiber names. Generic names, covering fiber products with the same basic technologies and properties from several producers, are completely distinct from trademarks which are used by individual producers for marketing purposes. / обозначение . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Международное Бюро по Стандартизации Искусственных Волокон (МБСИВ) или, как это звучит на Французском языке по месту регистрации, Бюро Этэрнасьёналь пур ля Стандардизасьён дэ Фибр Артифисибль (БИСФА; Bureau International pour la Standardisation des Fibres Artificielles (BISFA)) является международной ассоциацией производителей искусственных волокон. СЭН (CEN) и (ISO).

BUREAU OF LABOR STATISTICS = БЮРО ПО УЧЁТУ ЗАНЯТОСТИ – The Bureau of Labor Statistics (BLS) of the US Department of Labor is the principal Federal agency responsible for measuring labor market activity, working conditions, and price changes in the economy. Its mission is to collect, analyze, and disseminate essential economic information to support public and private decision-

making. As an independent statistical agency, BLS serves its diverse user communities by providing products and services that are objective, timely, accurate, and relevant. Vision:- the Bureau of Labor Statistics will meet the information needs of a rapidly changing US and global economy by continuously improving its products and services, investing in its work force, and modernizing its business processes. BLS History:- the Bureau of Labor Statistics has provided essential economic information to support public and private decision-making since 1884. Learn about past BLS milestones, anniversaries, and commissioners. Customer Satisfaction:- since July 2009, the Bureau of Labor Statistics has measured customer satisfaction for the full BLS website using the American Customer Satisfaction Index (ACSI). Customers are encouraged to participate in our survey. BLS results are summarized for July 2009 to June 2011 and July 2011 to June 2012. Bureau Of Labor Statistics (BLS) is a research agency of the US Department of Labor; it compiles statistics on hours of work, average hourly earnings, employment and unemployment, consumer prices and many other variables. Headquartered in Washington, DC, the United States. Bureau Of Labor Statistics (BLS) is a government agency that produces economic data that reflects the state of the US economy. This data includes the Consumer Price Index, the unemployment rate and the Producer Price Index. This arm of the US Department of Labor researches and publishes a range of data, from inflation and consumer spending to employment, productivity and wages, as well as other economic measures. These reports can have a significant effect on market sentiment.

BURGONET = БЮГОНЭТ (или БЮРГОНЭ, или БУРГИНЬОТ) – Burgonet is a helmet of either of two XVI century styles. Burgonet is a close-fitting XVI century helmet with cheek guards. Origin:- modification of Middle French Bourguignotte. / Происхождение:- модификация Французского слова Бургиньёт (Bourguignotte). Бургиньот – тип сферического шлема в стиле XVI столетия.

BURGUNDY = БУРГУНДСКОЕ (или БОРДОВОЕ) – Burgundy:- a reddish purple color. / .

BURKA = БУРКА (или ПАРАНДЖА) – Burka or Burqa is:- (1) a full body cloak worn by some Muslim women. (2) Burka (Caucasus) a traditional man's coat made from felt or karakul.

BURL = ЗАВИТОК – Burl:- swirl or twist in wood grain usually occurring near a knot, valued as the source of highly-figured burl veneers used for ornamental purposes. / Завихрение или закручивание в расположении волокон древесины, обычно возникающее вблизи сучка, оцениваемое в качестве источника шпона с высоко-узорчатыми завитками, используемого в декоративных целях. Под Завитком понимается местное искривление годичных слоёв, обусловленное влиянием сучков или проростей. Завитки наблюдаются в виде частично перерезанных, скобообразно изогнутых концентрических контуров, образованных искривлёнными годичными слоями. Различают:- (i) односторонние завитки – завитки, выходящие на одну или две смежные стороны пилопродукции или детали; и (ii) сквозные завитки – завитки, выходящие на две противоположные стороны пилопродукции или детали. В пилопродукции и деталях завиток измеряют по его ширине и длине и учитывают по количеству в штуках на 1 метр длины или на всей стороне сортимента.

BURL = XX – (1) Defect Name:- Burl. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Plain Weave Derivatives. Description:- Burl:- This is the result of a jerked-in piece of yarn having been removed by pulling it from the selvage. While no yarns ruptured, an open place is left in the fabric. Severity:- Major. (2) Defect Name:- Burl. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- Burl:- This is the result of a piece of wild filling having been removed with a burling tool. Severity:- Major. (3) Defect Name:- Burl. Defect Type:- Isolated Defects. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Burl:- This is the result of a knot after burling. Severity:- Minor.

BURLAP = ДЖУТОВАЯ МЕШОЧНАЯ ТКАНЬ (или ДЖУТОВОЕ ПОЛОТНО, или ДЕРЮГА) – Burlap is a coarse, heavy, plain weave fabric constructed from singles yarn of Jute. Used for bags, upholstery lining, in curtains and draperies. Burlap is a loosely constructed, heavy weight, plain weave fabric used as a carpet backing, and as inexpensive packaging for sacks of grain or Rice. Also, as fashion dictates, burlap may also appear as a drapery fabric. Burlap is a coarse woven fabric usually made from Jute fibers and allied vegetable fibers. It is often used to make sacks and bags to ship goods like Coffee beans. It is breathable and thus resists condensation and associated spoilage of the contents. Due to its coarse texture, it is not commonly used in modern apparel, but it can be used to make things like draperies and other decorative items. Burlap is a coarse heavy plain-woven fabric usually of Jute or Hemp used for bagging and wrapping and in furniture and linoleum manufacture. Burling:- in the dry finishing department of a woollen or worsted mill, it is the removal of as much objectionable matter as possible from the goods.

BURLING = ОЧИСТКА ОТ ПОСТОРОННИХ ВКЛЮЧЕНИЙ И УЗЛОВ – Burling is:- (1) the process of removing loose threads and knots from fabrics with a type of tweezers called a Burling Iron. (2) The process of correcting loose tufts and replacing missing tufts following carpet construction.

BURL MARK = ОТМЕТИНА ОТ XX – Burl Mark (spots defect):- this is a result of certain substances in excessive deformation caused by these substances package including woolen lines, waste, and is using the patch tool to remove the floating veil. Fabric Printing Defect. Defect Name:- Burl Mark. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Plain Weave Derivatives; and Shirting and Dress Goods – Chambray. Description:- Burl Mark:- This is the result of a slub or piece of wild filling having been removed with the use of a burling tool. Severity:- Major. / Порок или Дефект набивки тканей.

BURNER TIP FUEL PRICE = ЦЕНА XX – Burner Tip Fuel Price:- the cost of fuel delivered to the generator site equaling the fuel commodity price plus all transportation costs.

BURNING COST = СЖИГАЮЩИЙ РАСХОД – In reinsurance, a Burning Cost is a term most frequently used in spread loss property reinsurance to express pure loss cost or more specifically the ratio of incurred losses within a specified amount in excess of the ceding company's retention to its gross premiums over a stipulated number of years.

BURNING RATE = СКОРОСТЬ ГОРЕНИЯ (или СКОРОСТЬ СГОРАНИЯ, или СКОРОСТЬ ВЫГОРАНИЯ, или СКОРОСТЬ ОБГОРАНИЯ) – Burning Rate is the speed at which a fabric burns. It can be expressed as the amount of fabric affected per unit time, in terms of distance or area traveled by the flame, afterglow, or char.

BURNOOSE = БУРНУС (или XX) – Burnoose is a one-piece hooded cloak worn by Arabs and Berbers. See also Burnous. / , одеваемый Арабами и Берберами. Смотрите также Xxxxx (Burnous).

BURN–OUT = ВЫТРАВНОЕ – Burn-Out:- a brocade-like pattern effect created on the fabric through the application of a chemical, instead of color, during the burn-out printing process. (Sulfuric acid, mixed into a colorless print paste, is the most common chemical used.) Many simulated eyelet effects can be created using this method. In these instances, the chemical destroys the fiber and creates a hole in the fabric in a specific design, where the chemical comes in contact with the fabric. The fabric is then over-printed with a simulated embroidery stitch to create the eyelet effect. However, burn-out effects can also be created on velvets made of blended fibers, in which the ground fabric is of one fiber like a polyester, and the pile may be of a cellulosic fiber like rayon or acetate. In this case, when the chemical is printed in a certain pattern, it destroys the pile in those areas where the chemical comes in contact with the

fabric, but leave the ground fabric unharmed. Burn-Out or Devoré is typically used on specially constructed composite fabrics. These are fabrics composed of cellulose/synthetic blends or cellulose/protein blends. During the burn-out process the cellulose fibers are physically burned out of the composite fabric with acid, leaving the rest of the fabric intact. Cut velvet is an example of burn-out. It is important to sample before working on large projects. This recipe makes 1 quart (1 liter) of burn-out paste. Devoré 'to devour' is a method of printing where you screen print a with caustic paste to burn-out or etch designs into cloth. When printing on a blended fiber (e.g., 50/50 cotton/polyester) your design will etch into the top layer of the fabric, resulting in a translucent print. This process is often used with velvet pile to create a lacy embossed effect. Or completely burn-out patterns to create the 'bullet-hole' look by printing on 100% natural fibers. Printing Paste is including in workshop along with a detailed handouts and recipes. / вышивальным стежком для создания эффекта . загустка (print paste). Фасонная Вытравная Ткань – ткань, выработанная из двух различных материалов; узор получен путём вытравливания кислотонеустойчивого волокна.

BURN–OUT PASTE = ВЫТРАВНАЯ ПАСТА (или ВЫТРАВНАЯ МАСТИКА) – Burn-Out Paste:- burn out acid paste is made in two parts. The first part is a thickener paste that creates a paste that is thick enough to hold its shape on the fabric. The thickening paste must be made at least a few hours before it will be used. Using a large bowl made of plastic or stainless steel, add 2 cups of room temperature water. Begin blending the water using a hand blender or a standing mixer. Slowly add 1/3 cup guar gum, which can be purchased at most grocery stores, to the water with the mixer or blender running. Once the mixture has blended completely, allow the paste to stand for several hours until it has thickened. The second part of making a burn out paste is mixing the burn out acid, which will dissolve the rayon. Add 3/4 cup and 2 tablespoons of water to a pot and bring to 100 degrees Fahrenheit. Dissolve 1/2 cup of sodium bisulfate, which can be purchased at a home supply store, in the water. Once the sodium has dissolved, add 1 cup of glycerine, which can be found at most pharmacies, and the thickening paste to the water. Blend the mixture thoroughly. See also Etchant. Burnout Paste is an eco-friendly waterbase ink that gives special print effects. Burn-Out Paste:- use to burn out pure cotton and rayon fibers or cotton and rayon fibers inside of T/C,T/R,CVC knitted fabric for transparency. Remark:- since there are different kinds of fabrics, test the burn out effect prior to mass production.

BURN–OUT PRINTING = ВЫТРАВНОЕ ПЕЧАТАНИЕ (или ПРОТРАВНОЕ ПЕЧАТАНИЕ) – Burn-Out Printing is a method of printing to obtain a raised design on a sheer ground. The design is applied with a special chemical onto a fabric woven of pairs of threads of different fibers. One of the fibers is then destroyed locally by chemical action. Burn-out printing is often used on velvet. The product of this operation is known as a Burnt-Out Print. See also Printing. Burn-Out Printing describes a process in which a fabric consisting of two different fibers is treated with chemicals partly take away one fiber to create a structure on the surface of the fabric. For example, sculptured velvet is produced with this method. / Вытравное Печатание – один из распространённых способов получения рисунка на ткани. При вытравном печатании на поверхность предварительно окрашенной ткани наносятся в определённых местах печатные составы, которые разрушают окраску, благодаря чему на ткани появляется рисунок. Различают белое и цветное вытравное печатание. В первом случае в печатный состав краситель не вводится и после окончания процесса получается белый рисунок на окрашенном фоне, во втором – в состав печатной краски добавляется краситель, устойчивый к действию вещества, разрушающего окраску фона, и получается цветной рисунок на окрашенной ткани. Обычно для цветного вытравного печатания применяют кубовые красители. Протравное Печатание применяется, когда на тёмных хлопковых тканях требуется нанести изображение так, чтобы картинка не ощущалась на ощупь. В результате реакции краска вытравливает под собой краситель ткани и замещает его своим красителем. В этом случае прокрашиваются нити ткани.

BURN–OUT VELVET = ВЫТРАВНОЙ БАРХАТ – Burn-Out Velvet:- conceived from two different fibers, the velvet is extracted with chemicals in a pattern, leaving the backing fabric sound. Used for more unconstructed and loose-fitting garments. / Фасонная Вытравная Ткань вырабатывается из двух различных волокнистых материалов; а узор на ней получается путём вытравливания кислотоустойчивого волокна.

BURN RATE = ТЕМП ГОРЕНИЯ – Burn Rate:- this term is particularly applicable to start up companies or to companies which do not yet have substantial revenues. It refers to the monthly rate of consumption of cash. For example, if total monthly operating costs for rent, salaries, etc are CAD50K, one would say that the burn rate is CAD50K/month. When compared to available cash-on-hand it tells us how much time the company has before it will run into serious cash flow difficulties and 'flame-out'.

BURR = ОБРУЧИК (или НАКОНЕЧНИК, или ХОМУТИК, или ТУПАЯ КРЮЧКОВАТАЯ ИГОЛОЧКА ИГОЛЬЧАТОЙ ЛЕНТЫ) – Burr is a device that assists in loop formation on circular-knitting machines equipped with spring needles.

BURRS OR ROUGH SPOTS = ЗАУСЕНЕЦЫ (или ЗАЗУБРИНЫ) ИЛИ ГРУБЫЕ ПЯТНА – Burrs Or Rough Spots:- not immediately apparent. Can cause snagging and early wear on the zipper tape. Closure defects, and namely – Zippers:- Slider Defects. / Порок или Дефект застёжек.

BURRY = СОРНОРЕПЕЙНАЯ (или В ЗАУСЕНИЦАХ, или В ЗАЗУБРИНАХ, или ВОРСИСТАЯ) – Burry is a term applied to wool containing certain seed pods, mainly of the Medicago species. Wool carrying a percentage of burr. Light burr in combing wools can be removed by the comb or card in manufacture. Heavy burry combing wools and any short types carrying burr or excessive vegetable matter are carbonized before carding.

BURRY WOOL = СОРНОРЕПЕЙНАЯ ШЕРСТЬ (или ШЕРСТЬ В ЗАУСЕНИЦАХ) – Burry Wool is the wool heavy in vegetable matter – including burs, leaves, seeds, and twigs, which requires special and expensive processing in removal.

BURSE = КОШЁЛКА (или КОШЕЛЬ) – Burse:- purse. / .

BURSTING = ПРОРЫВ – Bursting; cutting:- the presence in a fabric of several individual stitches which have been severed. Note:- this defect is caused by the knitting elements cutting or damaging the yarn during stitch formation and may not become apparent until tensions are imposed during finishing.

BURSTING STRENGTH = ПРОЧНОСТЬ НА ПРОРЫВ – Bursting Strength is:- (1) the ability of a material to resist rupture by pressure. (2) The force required to rupture a fabric by distending it with a force applied at right angles to the plane of the fabric under specified condition. Bursting strength is a measure widely used for knit fabrics, nonwoven fabrics, and felts where the constructions do not lend themselves to tensile tests. The two basic types of bursting tests are the inflated diaphragm method and the ball-bust method. Bursting Strength is the mechanical test done commercially on fibers to show how strong they are.

BURST PRESSURE RATING = РЭЙТИНЬГ (или ЗНАЧЕНИЕ) ПРОРЫВНОГО (или РАЗРУШАЮЩЕГО ВНУТРЕННЕГО) ДАВЛЕНИЯ (или РЭЙТИНЬГ ДАВЛЕНИЯ РАЗРЫВА) – Burst Pressure Rating:- the maximum specified inside-out differential pressure that can be applied to a filter element without outward structural or filter-medium failure.

BURST SELVEDGE = РВАНАЯ (или РАСПУЩЕННАЯ) КРОМКА – Burst Selvedge:- poor construction selvedge. Woven fabric defect. / Порок или Дефект ткачества. Продавленная Кромка; Разорванная Кромка; Оторванная Кромка (burst selvedge; ripped selvedge; torn selvedge):- порок кромки ткани; нарушение целостности кромки. Примечание:- этот порок часто вызывается плохим конструированием кромки или неправильным натяжением во время процесса ткачества или отделки.

BUS = XX – Bus (in electricity) is an interconnection point.

BUSBAR = ШИНА – In reference to electricity, Busbar is the point at which power is available for transmission. A conductor, or group of conductors, that serve as a common connection for two or more circuits, generally in the form of insulated cable, rigid rectangular or round bars, or stranded overhead cables held under tension. The equivalent, in electric power terms, of the gas plant tailgate. / По отношению к электричеству, точка присоединения, в которой имеется доступ к получению электроэнергии. Проводник или группа проводников, которые служат в качестве общего подключения для двух или более цепей или распределительных устройств, обычно в виде изолированного кабеля, жёстких прямоугольных или круглых стержней или шин, или кабелей в изоляции, находящихся под напряжением. В терминах для электроэнергии эквивалент распределительному устройству газовой установки. Электрическая Шина, алюминиевый, медный, значительно реже стальной неизолированный проводник, используемый в качестве сильноточного токопровода, например, в распределительных устройствах.

BUSBY = КИВЕР (или ГУСАРСКИЙ КИВЕР) – Busby is a military full-dress fur hat with a pendant bag on one side usually of the color or regimental facings. / гусарская шапка.

BUSH = КУСТАРНИК (или КУСТАРНИЧКИ, или ПУСТОШЬ) – Bush or Shrub is a low, often woody, plant normally branching from the base, rather than having a single stem that branches higher up. Also applied to a thicket or to an area covered with trees, bushes or scrubby vegetation in, e.g., Australia or South Africa, or generally to any wilderness area. Bush is a low woody plant with a number of a branches at, or near, ground level. / Кустарник или Куст, низкое, часто древесное, растение, обычно ветвящееся из основания, нежели имеющее один ствол, который ветвится выше. Также применяется к чаще (thicket) или ареалу, покрытому деревьями, кустарниками или низкорослой растительностью, например, в Австралии или Южной Африке, или, в общем, к любой нетронутой (человеком) местности. Под Кустарниками понимаются многолетние деревянистые растения высотой 0.8–6 метров, не имеющие во взрослом состоянии главного ствола; продолжительность жизни 10–20 лет. Распространены широко по границе лесов (кустарниковая степь, лесотундра). В лесах образуют подлесок. Хозяйственное значение имеют крыжовник, смородина и другие. Жизненная форма – фанерофиты. Под Кустарничками понимаются низкорослые многолетние растения с одревесневающими побегами, высотой 5–60 сантиметров, живут 5–10 лет. Распространены в тундре (Виды Ивы, многие Вересковые), хвойных лесах, на сфагновых болотах (Багульник, Клюква), в высокогорьях и так далее. Жизненная форма – хамефиты. Под Пустошью понимается растительность, образованная в основном вечнозелёными Кустарничками преимущественно на месте лесов, главным образом после вырубок или пожаров, например, верещатники в приморских районах Западной Европы. Пустошью называются также некоторые сходные типы растительности в Южной Африке и Южной Австралии. Кустарники – растения менее 5 метров высотой и, чаще всего, имеющие не один, а несколько стволов, среди которых невозможно выделить главный. Кустарнички отличаются от кустарников и меньшими размерами, до 60 см высотой, и меньшей продолжительностью жизни, 5–10 лет, одревесневшие побеги не имеют выраженного главного ствола. Полукустарники – растения с многочисленными побегами, которые деревенеют лишь снизу, в верхней части они травянистые.

BUSHEL = БУШЕЛЬ – A Bushel (bu, bsh) is an imperial and US customary unit of dry volume, equivalent in each of these systems to 8 gallons. It is used for volumes of dry commodities (not liquids), most often in agriculture. Bushels are now most often used as units of mass or weight rather than of volume. The bushels in which grains are bought and sold on commodity markets or at local grain elevators, and for reports of grain production, are all units of weight. These bushels depend on the commodities being measured and the moisture content. Some of the more common ones are:- Oats:- in USA:- 32 lb = 14.515 kg, in Canada:- 34 lb = 15.422 1 kg; Barley:- 48 lb = 21.772 4 kg; Malted barley:- 34 lb = 15.422 1 kg; Shelled maize (corn 15.5% moisture by weight):- 56 lb = 25.401 2 kg; Wheat (13.5% moisture by weight):- 60 lb = 27.215 5 kg; and Soybeans (13% moisture by weight):- 60 lb = 27.215 5 kg.

(1) Bushel is the unit of volume or capacity in the US Customary System, used in dry measure and equal to 4 pecks, 2 150.42 cubic inches, 35.239 07 liters, or 0.035 239 07 cubic meters. Abbreviation:- bsh or bu. / Единица объёма или вместимости в Обычной Системе Мер США, используемая для измерения сыпучих тел (сухих субстанций) и жидкостей. 1 бушель равен 4 пекам, 2 150.42 кубическим дюймам, 35.239 07 литрам, или 0.035 239 07 кубическим метрам. Обозначение:- бшл (bsh) или бу (bu).

(2) Bushel is an English Imperial measure of volume, of a container or basket used to measure such a volume, typically used to measure dry goods such as grain or fruit. Such a cylindrical container would be 18.5 inches in diameter and 8 inches deep. A bushel = 4 pecks, 8 English gallons (defined as the Winchester bushel by King Edward I in 1303), 1.284 4 cubic ft, 2 219.36 cubic inches (Metric:- 36.368 7 liters). A heaped bushel is traditionally 27.8 percent larger than a regular or struck bushel which has been leveled. Agricultural goods such as grain are traditionally sold by the bushel, but as they tend to settle during shipping disputes over volumes delivered can arise. Therefore bushels of a particular commodity are defined as standard weights, often enshrined in law and it is really the weight of goods that is sold rather than the volume. Bushel is the unit of volume or capacity in the British Imperial System, used in dry and liquid measure and equal to 2 219.36 cubic inches, 36.368 7 liters, or 0.036 368 7 cubic meters. / Единица объёма или вместимости в Британской Имперальной Системе, используемая для измерения сухих и жидких субстанций и равная 2 219.36 кубическим дюймам, 36.368 7 литрам, или 0.036 368 7 кубическим метрам. Сухой и жидкостный бушель.

BUSHING = ВТУЛКА (или ВКЛАДЫШ, или БУШИНГ) – Bushing is a cylindrical lining (sleeve) used for limiting the size of a bore, reducing friction and wear, supporting load, and/or serving as a guide. Mechanically, a bushing is identical to a bearing except that it is usually a one-part device whereas a bearing may have two or more parts. Bushing:- a short, externally threaded connector with a smaller size internal thread. Bushing is:- (1) in mechanical engineering, a type of bearing, a cylindrical lining designed to reduce friction and wear inside a hole, often used as a casing for a shaft, pin or hinge. (2) In mechanical engineering, an elastic bearing used as a type of vibration isolator, commonly made of rubber. An interface between two parts, damping the movement and the energy transmitted. (3) In mechanical engineering, a threaded bushing, is a fastener element that is inserted into an object, usually to add a threaded hole in a softer or thin material. (4) In electrical engineering, a lining for an opening through which a conductor passes, providing insulation and mechanical protection for the conductor. (5) An adapter for joining pipes of different size. Bushing is:- (1) In electricity, a lining for a hole, intended to insulate and protect from abrasion one or more conductors that pass through it. (2) In machinery:- (i) a replaceable thin tube or sleeve, usually of bronze, mounted in a case or housing as a bearing; or (ii) a replaceable hardened steel tube used as a guide for various tools or parts, as a drill or valve rod. / резьбовой соединитель с более малым размером внутренней резьбы. Втулка, деталь машины, механизма, прибора цилиндрической или конической формы, имеющая осевое отверстие, в которое входит другая деталь. В зависимости от назначения применяют втулки подшипниковые, закрепительные, переходные и другие. Подшипниковая Втулка – деталь неразъёмного подшипника скольжения, в отверстии которой вращается цапфа вала или оси. Такая втулка входит в корпусную деталь с натягом, иногда дополнительно крепится

винтами. Втулки изготовляют из антифрикционных материалов (чугуна, бронзы, графита, пластмасс); из чугуна или стали с тонким слоем антифрикционного материала на поверхности трения; из пористых металлокерамических самосмазывающихся материалов. Применение втулки в подшипниках скольжения сокращает расход дорогостоящего и обычно дефицитного антифрикционного материала (оловянистые бронзы и баббиты), а также упрощает ремонт, сводя его к замене изношенной втулки новой. Закрепительная Втулка служит для закрепления внутренних колец подшипников качения и других деталей на цилиндрических участках валов и осей. Втулка выполняется разрезной с наружной конической поверхностью и затягивается гайкой. Переходная Втулка служит для установки инструмента с коническим хвостовиком в шпиндель станка, имеющего отверстие большего размера, чем хвостовик инструмента. Вкладыш, деталь подшипника скольжения, на которую непосредственно опирается цапфа вращающегося вала или оси. Обычный разъёмный подшипник имеет два вкладыша, представляющих собой половинки полого цилиндра. Реже в подшипнике делают 3 или более вкладышей. Материал вкладыша, соприкасающийся с цапфой вала, должен иметь малое значение коэффициента трения, хорошо прирабатываться и обеспечивать небольшой износ цапфы и самого вкладыша. Этим условиям удовлетворяют антифрикционные сплавы, специальные металло-керамические и неметаллические материалы – текстолит, резина, древесина и другие (смотрите Антифрикционные Материалы). В двигателях внутреннего сгорания транспортных машин преимущественное распространение получили тонкостенные вкладыши, штампованные из стальной ленты толщиной 1.5–2.5 миллиметра (мм), снабжённой с одной стороны тонким слоем антифрикционного сплава. Такие вкладыши, наряду с малым расходом дорогостоящего материала, надёжны и значительно упрощают ремонт машин.

BUSH JACKET = ХХ ЖАКЕТ (или ОХОТНИЧЬЯ КУРТКА) – Bush Jacket is a long cotton jacket resembling a shirt and having four patch pockets and a belt.

BUSH SHIRT = ДОМОТКАНАЯ РУБАХА – Bush Shirt is a usually loose-fitting cotton shirt with patch pockets.

BUSINESS ANGEL = ДЕЛОВОЙ АНГЕЛ (или БИЗНЕС АНГЕЛ) – Business Angel is mostly experienced entrepreneurs who support young firms in the start-up phase with capital and their many years of management experience. As a rule, their commitment is rewarded with shares in the company. Business angels are often organized in networks. In Germany, there are roughly 40 such networks, in many cases with regional character. They serve as contact points for companies seeking capital and provide access to suitable business angels.

BUSINESS AUTO COVERAGE FORM = ФОРМА ПОКРЫТИЯ ГРУЗОВЫХ АВТОМОБИЛЕЙ – Business Auto Coverage Form is the latest commercial automobile insurance coverage form, which may be written as a monoline policy or as part of a commercial package. This form has largely replaced the Business Auto Policy.

BUSINESS COMBINATIONS = КОМБИНАЦИИ БИЗНЕСА (или КОМБИНАЦИИ ДЕЛ, или ОБЪЕДИНЕНИЯ БИЗНЕСА, или ДЕЛОВЫЕ КОМБИНАЦИИ) – IFRS 3 (short for the International Financial Reporting Standards No. 3) Business Combinations – The objective of this IFRS is to specify the financial reporting by an entity when it undertakes a business combination. A business combination is the bringing together of separate entities or businesses into one reporting entity. The result of nearly all business combinations is that one entity, the acquirer, obtains control of one or more other businesses, the acquiree. If an entity obtains control of one or more other entities that are not businesses, the bringing together of those entities is not a business combination. This IFRS:- (a) requires all business combinations within its scope to be accounted for by applying the purchase method. (b) requires an acquirer to be identified for every business combination within its scope. The acquirer is the combining entity that obtains control of the other combining entities or businesses. (c) requires an acquirer to measure the cost of a business combination as the aggregate of:- the fair values, at the date of exchange, of assets given, liabilities incurred or assumed, and equity instruments issued by the acquirer, in exchange for control of the acquiree; plus any costs directly attributable to the combination. (d) requires an acquirer to recognise separately, at the acquisition date, the acquiree's identifiable assets, liabilities and contingent liabilities that satisfy the following recognition criteria at that date, regardless of whether they had been previously recognised in the acquiree's financial statements:- (i) in the case of an asset other than an intangible asset, it is probable that any associated future economic benefits will flow to the acquirer, and its fair value can be measured reliably; (ii) in the case of a liability other than a contingent liability, it is probable that an outflow of resources embodying economic benefits will be required to settle the obligation, and its fair value can be measured reliably; and (iii) in the case of an intangible asset or a contingent liability, its fair value can be measured reliably. (e) requires the identifiable assets, liabilities and contingent liabilities that satisfy the above recognition criteria to be measured initially by the acquirer at their fair values at the acquisition date, irrespective of the extent of any minority interest. (f) requires goodwill acquired in a business combination to be recognised by the acquirer as an asset from the acquisition date, initially measured as the excess of the cost of the business combination over the acquirer's interest in the net fair value of the acquiree's identifiable assets, liabilities and contingent liabilities recognised in accordance with (d) above. (g) prohibits the amortisation of goodwill acquired in a business combination and instead requires the goodwill to be tested for impairment annually, or more frequently if events or changes in circumstances indicate that the asset might be impaired, in accordance with IAS 36 Impairment of Assets. (h) requires the acquirer to reassess the identification and measurement of the acquiree's identifiable assets, liabilities and contingent liabilities and the measurement of the cost of the business combination if the acquirer's interest in the net fair value of the items recognised in accordance with (d) above exceeds the cost of the combination. Any excess remaining after that reassessment must be recognised by the acquirer immediately in profit or loss. (i) requires disclosure of information that enables users of an entity's financial statements to evaluate the nature and financial effect of:- (i) business combinations that were effected during the period; (ii) business combinations that were effected after the balance sheet date but before the financial statements are authorized for issue; and (iii)some business combinations that were effected in previous periods. (j) requires disclosure of information that enables users of an entity's financial statements to evaluate changes in the carrying amount of goodwill during the period. A business combination may involve more than one exchange transaction, for example when it occurs in stages by successive share purchases. If so, each exchange transaction shall be treated separately by the acquirer, using the cost of the transaction and fair value information at the date of each exchange transaction, to determine the amount of any goodwill associated with that transaction. This results in a step-by-step comparison of the cost of the individual investments with the acquirer's interest in the fair values of the acquiree's identifiable assets, liabilities and contingent liabilities at each step. If the initial accounting for a business combination can be determined only provisionally by the end of the period in which the combination is effected because either the fair values to be assigned to the acquiree's identifiable assets, liabilities or contingent liabilities or the cost of the combination can be determined only provisionally, the acquirer shall account for the combination using those provisional values. The acquirer shall recognise any adjustments to those provisional values as a result of completing the initial accounting:- (a) within twelve months of the acquisition date; and (b) from the acquisition date. / МСБУ 3 (сокращение для Международного Стандарта Бухгалтерского Учёта № 3) – .

BUSINESS CORPORATION ACT = АКТ О БИЗНЕС КОРПОРАЦИИ (или АКТ О ДЕЛОВОЙ КОРПОРАЦИИ) – In Canada, the Business Corporations Act requires that all limited liability companies operating in the Northwest Territories be incorporated or

registered to do business in the territory. Once registered, the Act places statutory requirements on the corporations to file documents notifying the Registrar and the public of changes in a corporation such as:- Annual Returns; Amendments; Revivals; Dissolutions; Name Changes; Amalgamations; Continuances; and Liquidations. The Canada Business Corporations Act, also known as Bill C-44, is a Canadian act respecting Canadian business corporations. The Canada Business Corporations Act was based on the Dickerson Report. In the United States, a Business Corporation Act is the collection of laws in each state that governs corporations.

BUSINESS CYCLE = БИЗНЕС ЦИКЛ (или ДЕЛОВОЙ ЦИКЛ, или ЦИКЛ ДЕЛОВОЙ АКТИВНОСТИ) – Business Cycle:- more or less regular swings or wave-like fluctuations in the pace of a country's economic growth, well above and well below the long-term trend in the growth rate of total production; the ups and downs of overall business activity, as evidenced by surges and declines in GNP and GDP, unemployment rates, and the general price level; the boom-and-bust pattern of recession (or depression) and recovery. In older economic literature (and still today in British usage) the term 'Trade Cycle' is often used as a synonym for 'Business Cycle'. What causes business cycles has been one of the hottest and longest running theoretical debates in political economy. There is a fair amount of agreement on what at least some of the factors are that are associated with the alternation of economic booms and busts, but different schools of thought differ considerably in the relative weight and the causal priority they assign to these various factors. Some schools of thought emphasize uneven government economic policies as the principal cause of business cycles, while others see government economic policies as the key influences working to even out business cycles allegedly brought on by inherent features of the market economy. Nearly all of these competing theories key in on one or more of the factors believed to influence the expansion and contraction of total saving by the public and of new capital investment undertaken by business firms as the most immediate causes of booms and busts in the larger economy. John Maynard Keynes's explanation of the business cycle emphasized periodic shifts in the public's allocation of their incomes between current spending for immediate consumption and savings for future consumption – which leads to shifts in the overall level of demand for consumers' goods, which in turn encourages producers of consumers' goods disproportionately to expand or contract their own purchases of producers's goods like raw materials and machinery (and labor) more or less all at once in response to improvements or declines in their current sales. Keynes believed that the public typically tends to save too much and consume too little, thereby throttling aggregate (total) demand, unless the government steps in from time to time through its fiscal policies to artificially increase aggregate demand by spending more on goods and services than it takes away from consumers' purchasing power in taxes ('running a budget deficit'). Other non-Keynesian theorists of the business cycle have focussed on other (often psychological) factors besides the growth or decline of their current sales that influence businessmen's optimism or pessimism about future economic conditions (and hence their investment plans). Still other theorists emphasize the role of occasional 'supply shocks' – sudden and unexpected changes in the supply of key resources resulting from weather cycles, natural disasters, international conflicts, big regulatory or tax changes by government, etc. For example, the formation of the OPEC oil producers' cartel and their two massive waves of concerted production cuts/price increases in the 1970s. Joseph Schumpeter's theory of 'creative destruction' stresses the role of waves of massive innovation (major technological breakthroughs, introduction of major new products that create whole new industries) in precipitating major adjustments and reallocation of resources as old industries die and are replaced by new ones. 'Monetarist' theories of the business cycle analyze the impact of shifts in decisions of the government monetary authorities (such as the Board of Governors of the US Federal Reserve Banking System) to expand or contract the money supply in their efforts to manipulate short-term interest rates and foreign exchange rates (often for selfish political reasons). 'Supply-side' theorists of the business cycle tend to emphasize the impact of periodic changes in government tax policies (especially changes in the marginal rates of taxation on various forms of investment expenditures and business income) as the major precipitant of booms and busts. Also known as the Economic Cycle. The rise and fall of the economy, from a peak, or boom, to a trough (sometimes called a Depression) and back to a peak. The length and duration of each phase is not predictable. Economic fluctuations characterized by alternating expansion and contraction. Cyclical theories pertaining to market economies evolved from the analysis of economic crises. There are four phases in a business cycle. The first phase of expansion or prosperity gradually creates pressures that trigger the second phase of crisis, characterized by an economic downturn or contraction of varying severity. This provokes the third phase of recession, or possibly depression, which lasts until the interplay of growth factors initiates the recovery stage, bringing the economy full circle. A new cycle then begins. In analyzing cyclical fluctuations, economists have identified four main business cycles fluctuations, economists have identified four main business cycles that differ in duration and are named after the individual who developed the theory:- the Kitchin cycle (about 40 months), the Juglar cycle (8 to 14 years), the Spiethoff cycle (20 to 30 years), and the Kondratieff or long-wave cycle (about 50 years). Western nations have successfully avoided major crises over the past 50 years, but most of them have gradually adopted 'stop and go' policies. While they are able to exert a certain degree of control over their economies, this reflects an acceptance of the inevitability of cyclical fluctuations:- the crisis phase is offset by a substantial decline in economic growth. / Флуктуации (колебания) экономики характеризуются .

BUSINESS DAY = ОПЕРАТИВНЫЕ СУТКИ (или ДЕЛОВЫЕ СУТКИ) – In the United States for electric utilities, as determined by the North American Electric Reliability Council (NERC) and differs for each reliability council. The business day typically begins at 07:00 am Eastern Standard Time (EST; EST = GMT – 5) for a 24-hour period. Holidays are also determined by NERC and are separate from the US-designated holidays. / Как определено Северо-Американским Советом по Надёжности Поставок Электричества (САСНПЭ) для электростанций в Соединённых Штатах Америки и с учётом возможных отличий для каждого конкретного регионального совета по надёжности поставки электроэнергии, рабочий день обычно начинается в 07:00 дп по Восточному Стандартному Времени (ВСВ, ВСВ = ВГМ – 5) для 24-часового периода. Праздничные дни также определяются САСНПЭ и отделены от официальных праздничных дней в США.

BUSINESS DAY = РАБОЧИЙ ДЕНЬ (или ДЕЛОВОЙ ДЕНЬ) – (1) Business Day is any day other than Saturday, Sunday, or Official Holiday. / Любой день иной нежели Суббота, Воскресение или Официальный Праздничный день.

(2) Monday to Friday inclusive, except New Year's Day, Good Friday, Easter Monday, Christmas Day, Boxing Day, and any other day that exchange declares is not a business day. / С Понедельника по Пятницу включительно, кроме Нового Года, Страстной Пятницы, Светлого Понедельника, Рождества, Дня Рождественских Подарков и любых других дней, которые биржа декларирует как нерабочие.

(3) Business Day shall mean a day on which the relevant payment service provider of the payer or the payment service provider of the payee involved in the execution of a payment transaction is open for business as required for the execution of a payment transaction.

BUSINESS ENTERPRISE = ДЕЛОВОЕ ПРЕДПРИЯТИЕ – The term Business Enterprise (in the US; 1975-March-01) means a corporation, association, business trust, partnership, joint venture, pool, syndicate, sole proprietorship or any other form of business not specifically listed herein, whether or not such enterprise has engaged in transactions with the designated bank. The term Business Enterprise also includes any personal or family trust and any charitable, social, fraternal, civic, governmental or recreational association, trust, club, agency or other organization if, and only if, such enterprise has engaged in any transaction with the designated bank, other than making a deposit or soliciting or receiving contributions, during the last year. The term Business Enterprise excludes:-

(1) The designated bank; (2) a corporation, partnership, or joint venture which is 50 percent or more owned by the designated bank; joint venture which is 50 percent or more owned by the designated bank; and (3) a holding company whose control of the designated bank is registered with or approved by the Board Of Governors of the Federal Reserve System, pursuant to sections 3 or 5 of tho Bank Holding Company Act, (12 ULC 1842, or 1844), or any of such holding company's subsidiaries the control of which has been registered with or approved by the Board of Governors of the Federal Reserve System pursuant to section 3, 4, or 5 of the Bank Holding Company Act, (12 USC 1842, 1843 or 1844).

BUSINESS INCOME COVERAGE FORM = ФОРМА ПОКРЫТИЯ ДОХОДОВ ОТ ДЕЛА – Business Income Coverage Form is a commercial property form providing coverage for 'indirect losses' resulting from property damage, such as loss of business income and extra expenses incurred. It has replaced earlier Business Interruption and Extra Expense forms. / Экстра Расходы .

BUSINESS INTERRUPTION INSURANCE = СТРАХОВАНИЕ НА СЛУЧАЙ ПЕРЕРЫВА В ПРОИЗВОДСТВЕННОЙ ДЕЯТЕЛЬНОСТИ (или СТРАХОВАНИЕ НА СЛУЧАЙ ПЕРЕРЫВА В ДЕЛЕ) – A type of policy that pays for loss of earnings when operations are curtailed or suspended because of property loss. Business Interruption Insurance is an insurance covering the loss of earnings resulting from, and occurring after, destruction of property. Also known as Business Income Protection Insurance, or Loss Of Profits. / Известно ткаже как (Business Income Protection Insurance), или Потеря Прибыли (Loss Of Profits).

BUSINESS LIABILITY = ОТВЕТСТВЕННОСТЬ ПРЕДПРИЯТИЯ (или ОТВЕТСТВЕННОСТЬ БИЗНЕСА, или ОТВЕТСТВЕННОСТЬ ДЕЛА) – Business Liability is the term used to describe the liability coverages provided by the Businessowners Liability Coverage Form. It includes liability for bodily injury, property damage, personal injury, advertising injury, and fire damage. / Она включает ответственность за телесные повреждения, повреждение имущества, .

BUSINESS PERSONAL PROPERTY = ПЕРСОНАЛЬНАЯ СОБСТВЕННОСТЬ ПРЕДПРИЯТИЯ (или ПЕРСОНАЛЬНАЯ СОБСТВЕННОСТЬ БИЗНЕСА, или ПЕРСОНАЛЬНАЯ СОБСТВЕННОСТЬ ДЕЛА) – Business Personal Property:- traditionally known as Contents, this term actually refers to furniture, fixtures, equipment, machinery, merchandise, materials, and all other personal property owned by the insured and used in the insured's business.

BUSINESS PLAN = БИЗНЕС ПЛАН – Business Plan is a description of a business (normally over a 1–5 year period). A basic business plan includes:- product(s) and/or service(s), the market, competitor analysis, the key people involved, financing needs, and the financial rewards if the business plan is implemented successfully. A well-prepared business plan plays two important roles, firstly, it is a useful management tool that can help management plot a course for the company, and secondly, it is a vital sales tool that will impress funding sources, e.g., venture capitalists or the board of directors, with management's planning ability and general competence. Other things being equal, a well prepared business plan will increase a company's chances of obtaining a financial commitment to fund the business.

BUSINESS PROCESS RE–ENGINEERING = РЕИНЖЕНЕРИЯ ДЕЛОВОГО ПРОЦЕССА (или КАРДИНАЛЬНЫЙ ПЕРЕСМОТР РАБОЧЕГО ПРОЦЕССА) – Business Process Re-Engineering:- the fundamental analysis and radical redesign of everything:- business processes and management systems, job definitions, organizational structures and beliefs and behaviors to achieve dramatic performance improvements to meet contemporary requirements. Information technology (IT) is a key enabler in this process.

BUSINESS REFERENCE MODEL = ДЕЛОВАЯ СПРАВОЧНАЯ МОДЕЛЬ – Business Reference Model (BRM) is an organized, hierarchical way to describe the day-to-day business operations of the Federal government; this model presents the business using a functionally driven approach regardless of organizational structure.

BUSINESS SECTOR = ХОЗЯЙСТВЕННЫЙ СЕКТОР (или БИЗНЕС СЕКТОР, или ДЕЛОВОЙ СЕКТОР) – Business Sector:- in national accounting, one of four areas into which an economy is divided for the purpose of examining flows between the sectors. See also National Income Accounting. / В национальном бюджетном процессе, .

BUSINESS STATISTICS DIRECTORS GROUP = ДИРЕКТОРСКАЯ ГРУППА ПО ДЕЛОВОЙ СТАТИСТИКЕ – Business Statistics Directors Group (BSDG):- the Directors of Business Statistics Departments from EU national statistical Institutes meet every year at Eurostat.

BUSINESS SUIT = ДЕЛОВОЙ КОСТЮМ – Business Suit is a man's or women's suit consisting of matching coat and trousers and sometimes a vest.

BUSINESS TO BUSINESS = ОТ ПРЕДПРИЯТИЯ ПРЕДПРИЯТИЮ (или ОТ БИЗНЕСА БИЗНЕСУ, или ОТ ДЕЛА ДЕЛУ) – Business To Business:- transactions between businesses using computer and telecommunications networks, including the Internet. Also known as B2B or BtoB. B2B:- an Internet strategy of dealing directly with businesses, rather than consumers, i.e. business to (2) business (or B2B). B2B e-commerce is simply defined as e-commerce between companies. This is the type of e-commerce that deals with relationships between and among businesses. About 80% of e-commerce is of this type, and most experts predict that B2B ecommerce will continue to grow faster than the B2C segment. The B2B market has two primary components:- e-frastructure and e-markets. Efrastructure is the architecture of B2B, primarily consisting of the following:- (i) logistics – transportation, warehousing and distribution (e.g., Procter and Gamble); (ii) application service providers – deployment, hosting and management of packaged software from a central facility (e.g., Oracle and Linkshare); (iii) outsourcing of functions in the process of e-commerce, such as Web-hosting, security and customer care solutions (e.g., outsourcing providers such as eShare, NetSales, iXL Enterprises and Universal Access); (iv) auction solutions software for the operation and maintenance of real-time auctions in the Internet (e.g., Moai Technologies and OpenSite Technologies); (v) content management software for the facilitation of Web site content management and delivery (e.g., Interwoven and ProcureNet); and (vi) Web-based commerce enablers (e.g., Commerce One, a browser-based, XMLenabled purchasing automation software). E-markets are simply defined as Web sites where buyers and sellers interact with each other and conduct transactions.10 The more common B2B examples and best practice models are IBM, Hewlett Packard (HP), Cisco and Dell. Cisco, for instance, receives over 90% of its product orders over the Internet. Most B2B applications are in the areas of supplier management (especially purchase order processing), inventory management (i.e. managing order-ship-bill cycles), distribution management (especially in the transmission of shipping documents), channel management (i.e., information dissemination on changes in operational conditions), and payment management (e.g., electronic payment systems or EPS). eMarketer projects an increase in the share of B2B e-commerce in total global ecommerce from 79.2% in 2000 to 87% in 2004 and a consequent decrease in the share of B2C e-commerce from 20.8% in 2000 to only 13% in 2004. Likewise B2B growth is way ahead of B2C growth in the Asia-Pacific region. According to a 2001 eMarketer estimate, B2B revenues in the region are expected to exceed USD300 billion by 2004. Benefits of B2B E-Commerce in Developing Markets:- The impact of B2B markets on the economy of developing countries is evident in the following:- Transaction costs. There are three cost areas that are significantly reduced through the conduct of B2B e-commerce. First is the reduction of search costs, as buyers need not go through multiple intermediaries to search for information about suppliers, products and prices as in a traditional supply chain. In terms of effort, time and money spent, the Internet is a more efficient information channel

than its traditional counterpart. In B2B markets, buyers and sellers are gathered together into a single online trading community, reducing search costs even further. Second is the reduction in the costs of processing transactions (e.g. invoices, purchase orders and payment schemes), as B2B allows for the automation of transaction processes and therefore, the quick implementation of the same compared to other channels (such as the telephone and fax). Efficiency in trading processes and transactions is also enhanced through the B2B e-market's ability to process sales through online auctions. Third, online processing improves inventory management and logistics. Disintermediation. Through B2B e-markets, suppliers are able to interact and transact directly with buyers, thereby eliminating intermediaries and distributors. However, new forms of intermediaries are emerging. For instance, e-markets themselves can be considered as intermediaries because they come between suppliers and customers in the supply chain. Transparency in pricing. Among the more evident benefits of e-markets is the increase in price transparency. The gathering of a large number of buyers and sellers in a single e-market reveals market price information and transaction processing to participants. The Internet allows for the publication of information on a single purchase or transaction, making the information readily accessible and available to all members of the e-market. Increased price transparency has the effect of pulling down price differentials in the market. In this context, buyers are provided much more time to compare prices and make better buying decisions. Moreover, B2B e-markets expand borders for dynamic and negotiated pricing wherein multiple buyers and sellers collectively participate in price-setting and two-way auctions. In such environments, prices can be set through automatic matching of bids and offers. In the emarketplace, the requirements of both buyers and sellers are thus aggregated to reach competitive prices, which are lower than those resulting from individual actions. Economies of scale and network effects. The rapid growth of B2B e-markets creates traditional supply-side cost-based economies of scale. Furthermore, the bringing together of a significant number of buyers and sellers provides the demand-side economies of scale or network effects. Each additional incremental participant in the e-market creates value for all participants in the demand side. More participants form a critical mass, which is key in attracting more users to an e-market. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Операции между предприятиями, использующими компьютер и доступ к сетям дальней связи, включая Интернет. Известны также под Англоязычными обозначениями B2B или BtoB.

BUSINESS TO BUSINESS INTEGRATION = ИНТЕГРАЦИЯ ОТ ПРЕДПРИЯТИЯ ПРЕДПРИЯТИЮ (или ИНТЕГРАЦИЯ ОТ БИЗНЕСА БИЗНЕСУ, или ИНТЕГРАЦИЯ ОТ ДЕЛА ДЕЛУ) – Business To Business Integration (B2BI) is a form of Supply Chain Management – manufacturers implement integration at the business process, application, data, and network layers to accomplish tight synchronization with their supply chain partners. Business To Business Integration (B2BI) projects promise to extend the enterprise to encompass business partners in much the same way the enterprise currently encompasses internal departments.

BUSINESS TO CONSUMER = ОТ ПРЕДПРИЯТИЯ ПОТРЕБИТЕЛЮ (или ОТ БИЗНЕСА ПОТРЕБИТЕЛЮ, или ОТ ДЕЛА ПОТРЕБИТЕЛЮ) – Business To Consumer (B2C):- transactions between businesses and private consumers using computer and telecommunication networks, including the Internet. Aslo known as B2C or BtoC. Business To Consumer (B2C):- business transactions between a company and the end consumers of its products. Business-To-Consumer e-commerce, or commerce between companies and consumers, involves customers gathering information; purchasing physical goods (i.e. tangibles such as books or consumer products) or information goods (or goods of electronic material or digitized content, such as software, or e-books); and, for information goods, receiving products over an electronic network. It is the second largest and the earliest form of e-commerce. Its origins can be traced to online retailing (or e-tailing). Thus, the more common B2C business models are the online retailing companies such as Amazon.com, Drugstore.com, Beyond.com, Barnes and Noble and ToysRus. Other B2C examples involving information goods are E-Trade and Travelocity. The more common applications of this type of e-commerce are in the areas of purchasing products and information, and personal finance management, which pertains to the management of personal investments and finances with the use of online banking tools (e.g., Quicken). eMarketer estimates that worldwide B2C e-commerce revenues will increase from USD59.7 billion in 2000 to USD428.1 billion by 2004. Online retailing transactions make up a significant share of this market. eMarketer also estimates that in the AsiaPacific region, B2C revenues, while registering a modest figure compared to B2B, nonetheless went up to USD8.2 billion by the end of 2001, with that figure doubling at the end of 2002-at total worldwide B2C sales below 10%. B2C e-commerce reduces transactions costs (particularly search costs) by increasing consumer access to information and allowing consumers to find the most competitive price for a product or service. B2C e-commerce also reduces market entry barriers since the cost of putting up and maintaining a Web site is much cheaper than installing a 'brick-and-mortar' structure for a firm. In the case of information goods, B2C e-commerce is even more attractive because it saves firms from factoring in the additional cost of a physical distribution network. Moreover, for countries with a growing and robust Internet population, delivering information goods becomes increasingly feasible. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Операции между предприятиями и частными потребителями, использующими компьютер и доступ к сетям дальней связи, включая Интернет. Известны также под Англоязычными обозначениями B2B или BtoC.

BUSINESS TO GOVERNMENT = ОТ ПРЕДПРИЯТИЯ ПРАВИТЕЛЬСТВУ (или ОТ БИЗНЕСА ПРАВИТЕЛЬСТВУ, или ОТ ДЕЛА ПРАВИТЕЛЬСТВУ) – Business-To-Government e-commerce or B2G is generally defined as commerce between companies and the public sector. It refers to the use of the Internet for public procurement, licensing procedures, and other government-related operations. This kind of e-commerce has two features: first, the public sector assumes a pilot/leading role in establishing e-commerce; and second, it is assumed that the public sector has the greatest need for making its procurement system more effective.15 Web-based purchasing policies increase the transparency of the procurement process (and reduces the risk of irregularities). To date, however, the size of the B2G ecommerce market as a component of total e-commerce is insignificant, as government e-procurement systems remain undeveloped.

BUSINESS TYPE = ТИП БИЗНЕСА – Business Type uses data available from a company's final accounts to provide a description of the type of business. The measures that might be used to describe the business are as follows:- Sales Per Employee; Operating Profit/Employee; Staff Costs/Sales (%); Plant & Mach./Employee; Inventories/Cost of Goods Sold; Account Receivables/Sales; Depreciation/Staff Costs (%); Distribution Costs/Sales (%); Administration Costs/Sales (%); and Other Costs/Sales (%). These measures will vary from industry to industry and, for example, manufacturing industries will be very different from retail businesses.

BUSKIN = КАЛИГИ (или КОТУРН, или ХХ) – Buskin:- a laced boot reaching halfway or more to the knee. / (1) Полусапог с тканевым верхом на шнурках. (2) Женская обувь низкого покроя с клиновидной эластичной вставкой на подъёме (стопы).

BUSTIER = БЮСТЬЕ (или БЮСТГАЛЬТЕР БЕЗ БРЕТЕЛЕК, или МАЙКА) – Bustier is a tight-fitting often strapless top worn as a brassiere or outer garment. / .

BUST GIRTH = ОБХВАТ БЮСТА – Bust Girth or Bust:- measure around the fullest part of your bust at the apex (nipple), wearing the most comfortable bra without push-up. Bust Girth:- with arms relaxed down at sides, measure around fullest part of bust, under your arms keeping tape parallel to the floor. Bust Girth:- position the tape comfortably around the fullest part of the bust making no extra allowances. Keep the tape under arms and around the shoulder blades at back. See also Chest Girth. Bust:- measure by nipples. Bust:- measure across the fullest part around your bust / Обхват Груди (для мужчин):- максимальный горизонтальный обхват,

имеренный в сантиметрах при нормальном дыхании. Человек стоит прямо, измерительная лента проходит по лопаткам, подмышкам и груди (выступающим точкам грудных желез. Обхват Бюста (груди для женщин):- максимальный горизонтальный обхват, измеренный в сантиметрах при нормальном дыхании. Человек стоит прямо, измерительная лента проходит через лопатки, подмышки и выступающие точки грудных желез. Обхват Груди – сантиметровая лента проходит по наиболее выступающим точкам груди, далее – под подмышечными впадинами, на спине – немного выше. Обхват Груди – расстояние на уровне груди под проймами рукавов. Обхват Груди – это второе число, указанное на ярлыке. Размер одежды – это обхват груди, делённый на два. Например, обхват груди 88 см соответствует 44-му размеру и так далее. Если при измерении Вы получили промежуточную величину, например, 90 см, то следует выбирать одежду ближайшего размера в сторону увеличения. В данном случае 92 см, то есть 46-ой размер.

BUTANE = БУТАН – Butane is a component of natural gas consisting of four carbon atoms and 10 hydrogen atoms; condenses into a liquid at relatively low temperature and pressure. / Компонент природного газа, состоящий из четырёх атомов углерода и десяти атомов водорода. Конденсируется в жидкость при относительно низких температурах и давлении. Бутан это бесцветный и без запаха газ, содержащийся в нефти и природных газах и в газах нефтепереработки. Известны 2 изомера:- (i) нормальный бутан $CH_3(CH_2)_2CH_3$ с $t_{кип}$ –0.5 °C; и (ii) изобутан $(CH_3)_2CHCH_3$ с $t_{кип}$ –11.7 °C. Содержатся в природном горючем газе и в газах нефтепереработки. Из нормального бутана получают бутадиен (сырьё для производства синтетических каучуков), уксусную кислоту, малеиновый ангидрид. Из изобутана получают высокооктановые компоненты бензинов. В смеси с пропаном бутан используется в качестве топлива.

BUTCHER RAYON = ПАЛАЧЕСКИЙ РЭЙОН (или ПАЛАЧЕСКАЯ ГИДРАТЦЕЛЛЮЛОЗА) – Butcher Rayon is a coarse rayon, or rayon and acetate blend, mediumweight fabric woven in a plain weave and originally intended as a substitute for butcher linen.

BUTCHER'S LINEN = ПАЛАЧЕСКИЙ ЛЁН – Butcher's Linen is a plain weave, stiff fabric with thick and thin yarns in both the warp and the filling. The fabric was originally made of linen but is now duplicated in 100% polyester or a variety of blends such as polyester/rayon or polyester/cotton. Butcher's Linen is a strong, heavy, plain weave fabric, originally of linen (and originally worn by butchers), now made of any fiber. / уточина.

BUTT = БОЧКА (или ХХ) – Butt, a vessel or measure for wine, containing 2 hogsheads, or 126 wine gallons.

BUTTED DECKBOARD = ДОСКА НАСТИЛА, СОЕДИНЁННАЯ ВСТЫК – Butted Deckboard is an inner deckboard placed tightly against an adjacent lead deckboard during pallet assembly. See also Deckboard, and Pallet.

BUTTED LEAD BOARD = КРАЙНЯЯ ДОСКА, СОЕДИНЁННАЯ ВСТЫК – Butted Lead Board is a lead board with the next board butted up to it for extra strength against horizontal forces. See also Pallet. / Крайняя Доска, Соединённая Встык:- доска проёма, соединённая с несколькими досками встык для обеспечения дополнительной прочности горизонтальной поверхности настила. Смотрите также Поддон (Pallet).

BUTTERFLY = БАБОЧКА (или БАТТЕРФЛЯЙ) – (1) Butterfly is an option strategy involving the purchase of one put (or call), the sale of two puts (or calls) at a higher exercise price, and purchasing one put (or call) at an equally higher price.

(2) Butterfly is a common term for any member of Lepidoptera belonging to Rhopalocera. / Под Бабочками или Чешуекрылыми понимается Отряд Насекомых. Крылья (2 пары) покрыты различно окрашенными чешуйками. У крупных особей крылья в размахе до 30 сантиметров, у мелких – около 3 миллиметров. Взрослые (имаго) живут от нескольких часов до нескольких недель (зимующие – несколько месяцев). Около 140 000 Видов. В бывшем Союзе Советских Социалистических Республик (СССР) около 15 000 Видов. Многие Бабочки способствуют опылению растений; из коконов Тутового и других Шелкопрядов получают шёлк. Личинки многих Бабочек (гусеницы) повреждают сельскохозяйственные и лесные культуры, продовольственные запасы, изделия из шерсти и меха. 104 Вида Бабочек находились в Красной Книге СССР.

BUTTERFLY SPREAD = КУРСОВАЯ РАЗНИЦА БАБОЧКА (или СПРЭД БАБОЧКА, или СПРЭД БАТТЕРФЛЯЙ) – (1) Butterfly Spread:- the placing of two interdelivery spreads in opposite directions with the center delivery month common to both spreads. Also known as Sandwich Spread. A futures Butterfly Spread is a spread trade in which multiple futures months are traded simultaneously at a differential. The trade basically consists of two futures spread transactions with either three or four different futures months at one differential.

(2) Butterfly Spread Options:- Butterflies Aren't Free:- because you're able to calculate an accurate target ahead of a catalyst event, you can set up advanced strategies that allow for a huge profit potential on invested capital. Butterflies are an example of a spread that uses a specific target yet still profits within a range. Using the measured move target can greatly increase your chance of success when trading butterflies. A butterfly basically is a combination of a long and short vertical spread. For example, a call butterfly would involve buying the E-mini S&P 500 1 715–1 720–1 725 call butterfly for 0.25. Here, we are buying the 1 715 call, selling two of the 1 720 calls and buying the 1 725 call. This sets up the same as buying the 1 715–1 720 call spread while selling the 1 720–1 725 call spread. The risk for this trade is USD12.50 per one lot, with a potential reward of USD237.50. Breakeven is at 1 717.25 and 1 724.75. While butterflies usually set up for large reward-to-risk ratios, the profit potential of this trade is not typical. Returns in the area of eight- or nine-toone are more typical. Again, sell the strike closest to the upside measured move target. In this case, it is the 1 720 strike. 'Butterfly call profits' (see page 31) illustrates the profit zone for this trade. In a put buying example, we would buy the E-mini August 09 weekly 1 685–1 680–1 675 put butterfly for 0.30. Here you would buy 1 685 puts, sell two 1 680 puts and buy 1 675 puts. This sets up the same as buying the 1 685–1 680 put spread while selling the 1 680–1 675 put spread. The risk is USD15 per one lot. and the reward is USD235 per one lot. The breakeven is 1 684.7 and 1 675.3. 'Butterfly put profits' (see page 31) shows where the market must move for this trade to be profitable. Using the downside measured move target, you're able to set up a bearish trade with a great reward potential. An options Butterfly Spread is a combination of a bear and bull spread trade in which multiple options months and strike prices are traded simultaneously at a differential. The trade basically consists of two options spread transactions with either three or four different options months and strikes at one differential. As of this writing (September 2013) the current spot price for crude oil is USD108.67 per barrel. The price for the December futures contract on the NYMEX® is USD106.36 per bbl. Just to show how the world has changed, in June 2008 oil was approaching USD150 a barrel. Within six months the price free fell by almost 65%. Of course, that price drop was in the midst of a complete economic meltdown. Actually, over the past three years the price of oil has been in the USD80–100 vicinity. While economic meltdowns aren't usually telegraphed ahead of time, the markets don't seem to be anticipating one. The drumbeats of war are once again reverberating in the Middle East. The United States is considering an attack on Syria, which has little oil of its own but oil exports could be curtailed if the potential conflict spreads throughout the region. A drop in supply could send prices skyrocketing. So how can you take advantage of this price action? Of course you can buy the December futures contract at 106.36, but there would be a big downside risk should the price of oil drop, even temporarily. Margin calls would require throwing more cash into your position. Placing a stop order might take you out of your position. So to take advantage of the current energy action, a bullish options position would work to the upside while still being able to define the risk involved in the trade. Skewed View:- let's take a

look at the 'volatility skew' on options on oil futures. Volatility skew refers to the relative pricing of different options at different strike prices. The CO Dec 90 puts are trading at 0.58 while the CO Dec 123 calls are trading at 0.69. Both options are approximately equidistant from the current futures price. Because the calls are priced higher than the puts, this means options traders are implying that any upward move in the futures will happen more rapidly than a downward move. There is a slight bias to the upside in the volatility pricing although the skew is relatively flat. This is important because the time value in an option premium is a wasting asset. If the out-of-the-money call is priced significantly lower than the equidistant out-of-the-money put, then establishing a ratio spread that is net short calls (long the lower strike price and short the higher strike price) would work. If the opposite is true, establishing a ratio spread that is net long calls (short the lower strike price and long the higher strike price) would work. Because the skew is relatively flat, neither of these spreads is a particularly attractive choice. So if you are anticipating an upward move, the purchase of a CO Dec 120 call for 0.95 (USD950) would benefit from an upside move. But the risk in the purchase of a naked out-of-the-money call is the erosion of time value. The price of oil has to move up quickly enough so that the decay in time value does not outpace the added value that comes from an upward move. Selling another out-of-the-money call against the long CO Dec 120 call would reduce that risk. The CO Dec 125 call is trading at 0.56 (USD560). The CO Dec 120–125 call spread can be purchased for 0.39 (USD390). The maximum possible loss for the spread is less than half of the loss for the purchase of the naked call. The profits are capped out at USD125 or higher, however. The upside breakeven point is 125.29. The maximum possible profit is USD4 710 for the spread. The downside risk can be reduced even further by selling an additional CO Dec 125 call for 0.56. This 1X2 spread can be established for a credit of 0.17 (USD170). There is no downside risk but above 130 the risk is unlimited. Those pesky margin people will make the trader's life miserable as well. So the next step is a purchase of a CO Dec 130 call for 0.37 (USD370), which will eliminate any losses above 130. The net premium for this spread is a 0.20 (USD200) debit. This is called a Butterfly Spread. The 120 and 130 wings are purchased against the two times sale of the 125 body. The purchase price of the CO 120–125 call vertical is reduced by selling the CO 130–125 call spread against it. The profit range is between 120.20 and 129.80. All of the scenarios mentioned here occur at expiration and would require a 15% up move to be profitable. If the Dec oil futures merely rose 5% within the next month, the value of the butterfly could easily double. There is an excellent risk/reward in this trade. A three-legged option spread in which each leg has the same expiration date but different strike prices. For example, a butterfly spread in soybean call options might consist of one long call at a USD5.50 strike price, two short calls at a USD6.00 strike price, and one long call at a USD6.50 strike price. A Butterfly Spread is a neutral option trading strategy using multiple puts and/or calls to make a bet on future volatility without having to guess in which direction the market will move. A long butterfly strategy is constructed from three sets of either puts or calls having the same expiration date but different exercise prices (strikes). For example, with the underlying asset trading at 100, a long butterfly strategy can be built by buying puts (or calls) at 95 and 105, and selling (shorting) twice as many puts (or calls) at 100. If the underlying does not change price by expiry, the puts at 95 and 100 will expire worthless, and the puts at 105 will be worth 5 (from 105–100). If the underlying is greater than 105 at expiration, all the puts expire worthless, and the initial cost of the butterfly is the amount of the loss. If the underlying is less than 95 at expiration, the gain from the purchased put at 105 will offset the losses from the shorted puts at 100, and the loss is again limited to the initial cost of initiating the butterfly strategy. In essence, this is a limited-risk, limited-gain approach to shorting the volatility of the underlying, as the maximum profit comes when the underlying has no volatility at all. A short butterfly strategy is the converse; a limited-risk, limited-gain approach to being long (betting on an increase in) the volatility of the underlying. By buying the inside strike and selling the outside strikes, the position has its greatest loss when the underlying does not move, and its greatest gain when it moves beyond either of the outside exercise prices. A short butterfly strategy profits as equally from a large move up as it does from a large move down. A regular butterfly strategy uses either all calls or all puts. A long iron butterfly sells a put and a call at the inside strike, and buys a put at the lowest strike and a call at the highest strike. A short iron butterfly buys a put and a call at the inside strike, and sells a put at the lowest strike and a call at the highest strike. In terms of profit and loss potentials, iron butterflies look very much like regular butterfly built from either all puts or all calls. In general, the only time there is an advantage to choosing one type of butterfly strategy over another is if there is a pricing disparity in puts and calls making one of them cheaper to purchase or more profitable to sell. Butterfly Spread is the simultaneous purchase of an out-of-the-money strangle and sale of an at-the-money-straddle. The buyer profits if the underlying remains stable and has limited risk in the event of a large move in either direction. Butterflies:- where vertical spreads require you to have an opinion just on direction, a butterfly requires more precision because, not only do you have to have an opinion on direction, but also a target price. Essentially, a butterfly is a combination of a vertical bull spread with a vertical bear spread using either all calls or all puts. 'The way a butterfly is formed is by buying an in-the-money and an out-of-the-money call or put, and then selling two calls or puts at the middle strike', which is your price target, Joseph Burgoyne, Director of institutional and retail marketing for the Options Industry Council, says. One reason a trader may use a butterfly over a vertical spread is because it is usually cheaper, Marty Kearney, Senior Instructor at CBOE® Options Institute, says, because you are selling two options. This changes the risk/reward ratio. Looking again at Kearney's USD63 stock, if we think it will be at USD70 at expiration, a butterfly could make a lot of sense. To put it on, we again buy the 60–70 vertical bull call spread by buying an in-the-money 60 call and selling an out-of-the-money 70 call, but we then add a 70–80 vertical bear call spread by selling a second out-of-the-money 70 call and buying an out-of-the-money 80 call. In this example, our reward is maximized if the stock settles at USD70 on expiration, in which case our 60 call is 10 points in-the-money and the other three calls all expire worthless. Even if it doesn't settle at USD70, as long as the stock increased in value, our butterfly still could be profitable within a range of prices. If the stock either stagnates or only rises a little, or if it takes off and completely overshoots our USD70 target, our loss is limited to the cost of the butterfly because of the wings on either side. 'The risk/reward on a butterfly usually is very good', Kearney says. 'Once again, though, we have four commissions entering the trade and two to four on the way out, so it is commission-intensive'. / СИБО® (CBOE®). НАЙМЭКС® (NYMEX®). Дьжосэф Бургойн (Joseph Burgoyne). Мати Кони (Marty Kearney), Старший Инструктор в Институте Опционов СИБО® (CBOE®). прибыль от закупленного опциона на продажу . Спрэд Бабочка – опционная стратегия, в которой применяется сочетание бычьего и медвежьего спрэдов и используются четыре опциона (четыре крыла бабочки) с разными сходными ценами или разными датами исполнения. Например, длинный спрэд бабочка создаётся путём покупки прибыльного опциона (in-the-money option), продажи двух бесприбыльных опционов (at-the-money options) и покупки одного убыточного опциона (out-of-the-money option). Как правило, данная стратегия применяется, когда может быть получен кредит, то есть когда полученная премия превышает уплаченную премию.

BUTTERNUT = МАСЛЯНЫЙ ОРЕХ (или ХХ) – Butternut:- a light yellowish brown.

BUTTERSCOTCH = ХХ (или ИРИС) – Butterscotch:- a moderate yellowish brown.

BUTT JOINT = СТЫКОВОЕ СОЕДИНЕНИЕ (или СОЕДИНЕНИЕ ВСТЫК) – Butt Joint is an end joint formed by abutting the squared ends of two pieces. / Торцевое соединение, формируемое стыковкой прямоугольных торцов двух изделий.

BUTTON = ПУГОВИЦА (или КНОПКА) – Button:- button-makers categorized buttons by types of holes, shape, size, and color. Finishers drilled two holes, four holes, or self-shank holes, or inserted a metal shank. Names like fisheye, ring fisheye, French bevel, English rim and cup described the various styles in which holes were drilled. The basic shapes of buttons were disc (two-hole and four-hole), ball (half-sphere), geometric (diamond, prism, square, rectangle, and parallelogram), and realistic (animals, flowers). Sizing in

the button trade uses the measure ligne, the traditional English and French measure that is still used today, along with inches and millimeters. One inch is equal to 40 English ligne, 11 French ligne, and 25.5 mm. 12–18 ligne buttons were sold for trim, shirts, and children's dresses; 20–60 size for dresses, jackets and coats; shoe buttons were usually 14 ligne, and specialty buttons were usually 45–60 ligne. Buttons are well known articles, serving to fasten clothes, etc. They are manufactured of an endless variety of materials and forms.

BUTTON–DOWN = С ПУГОВИЧКАМИ СНИЗУ – Button-Down:- a shirt with a button-down collar. / рубашка с воротничком, уголки которого снизу пристёгиваются на пуговички к нагрудной части рубашки.

BUTTONHOLE = ПЕТЛЯ (ДЛЯ ПУГОВИЦЫ) (или ПЕТЛИЦА, или ПРОРАНКА) – (1) Buttonhole (eyelet):- formed by a contoured patch of zig-zag stitching, followed by a cut – a portion of which is circular. Eyelet buttonholes are usually used on heavy fabrics and/or with large buttons. A gimp or cord is usually contained within the stitches to provide a reinforcement along the edge of the hole. / зиг-заговой строчки или втачивания (stitching), . Под Проранкой понимается прорезанная петля под пуговицу на одежде.

(2) Buttonhole (straight):- formed by two pairs of straight, parallel rows of zigzag stitching, followed by a single, straight knife cut. Each end of the row of stitching is secured by a bartack. / зиг-заговой строчки, .

BUTTONHOLE SELVAGE = ПЕТЕЛЬНАЯ КРОМКА (или КРОМКА ПЕТЛИЦЫ) – Buttonhole Selvage (hanging edge defect):- this is a fabric woven edge defects, replace the weft yarn before weaving shuttle on the accumulation of excessive tension is caused by such defects. This tension tends to limit the right weft selvage off and staggered, thereby creating a defect similar to a buttonhole. Fabric Printing Defect. Defect Name:- Buttonhole Selvage. Defect Type:- warp lines, vertical lines. Fabric Type:- Denim Bottomweights – Indigo Dyed. Description:- Buttonhole Selvage:- This defect is the result of tension build up in the shuttle. It can be caused by several things:- a crooked bobbin, bobbins not ringing properly, placing the tip of the bobbin too close to the shuttle eye, waste restrictions in the eye of the shuttle. The taut filling, pulling the selvage toward the body of the fabric, results in shed-splitting near the edge of the fabric. This defect may occur in isolated instances or continuously with the running out of each bobbin depending upon the cause. Severity:- Major. / Порок или Дефект набивки тканей.

BUTTONHOLE TWIST = ПЕТЕЛЬНАЯ КРУТКА – Buttonhole Twist:- a thick, twisted silk cord. Buttonhole twist is lustrous and is used for topstitching. It is also used for sewing buttons onto a garment as well as for making buttonholes or embroidery.

BUTTONS = ГАЙКИ (или ШИШЕЧКИ) – Buttons or Skin Back:- balls of fiber that encircle the warp yarns and are woven into the fabric. This defect is often caused by the chafing of the warp yarns by the reed, heald eyes, or drop wires and is usually found in unsized or low-twisted yarns. / Под Шишковатостью понимается распротранённый порок в виде наличия на поверхности полотна коротких утолщений пряжи в результате скопления волокон или элементарных нитей. Шишковатость (buttons; skin back):- порок основы в виде наличия на поверхности полотна небольших комочков перепутанных волокон, прочно удерживающихся на её поверхности. Примечание:- этот порок часто вызывается истиранием и начёсыванием волокон пряжи основы бёрдом, ремизными отверстиями или ламелями.

BUTTONS = ПУГОВИЦЫ – Buttons are specified by design, size, color, and type – such as brass, melamine, or pearl, buttons are either shanked (attached by passing threads through the shank's eye) or holed (attached by passing threads through the button's holes). Buttons are well known articles, serving to fasten clothes, etc. They are manufactured of an endless variety of materials and forms.

BUTTONWOOD AGREEMENT = СОГЛАШЕНИЕ У ПЛАТАНА (или СОГЛАШЕНИЕ ПОД ПЛАТАНОМ) – Buttonwood is one of the names of the American Plane Tree (Platanus Occidentalis). A 1792 trade agreement banding the original 24 brokers in New York together into an investment community. The agreement was named for a Buttonwood tree that served as their informal meeting place on Wall Street. The New York Stock Exchange (NYSE®) the world's largest marketplace for securities. The exchange evolved from a meeting of 24 men under a buttonwood tree in 1792 on what is now Wall Street in New York City. It was formally constituted as the New York Stock and Exchange Board in 1817. The present name was adopted in 1863. Membership, limited to 1 366 since 1953, is obtained by purchasing (since 1868) a seat from an existing member. See also New York Stock Exchange. The origins of the New York Stock Exchange (NYSE®) can be traced to the Buttonwood Agreement of 1792, although the Exchange Board itself was not organized until 1817. / Вол Стрит (Wall Street). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®).

BUY = КУПИТЬ (или ПОКУПАТЬ) – Buy:- to place an opening trade at the offer price of a spread in anticipation of the underlying market rising, commonly referred to as an 'Up Trade', 'Taking A Long Position', or 'Going Long'. You can also buy at the offer price to close an existing short position.

BUY AND WRITE = ПОКУПАЙТЕ И ВЫПИСЫВАЙТЕ – Buy And Write:- a strategy requiring the simultaneous purchase of underlying securities and the writing of calls representing the same number of shares. / Стратегия, заключающаяся в одновременном приобретении соответствующих ценных бумаг и выписывании (продаже) опционов на покупку, представляющих то же самое количество акций.

BUYBACK = ВЫКУП – (1) Buyback:- a company that is originally financed by venture capital may pay back the capital invested either by seeking a quotation or by being taken over. In either case, it will be buying itself back from the venture capitalist. A company's repurchase of it's own shares of stock. / Откуп компанией своих собственных акций акционерного капитала.

(2) In the context of general insurance this refers to the purchase of cover in respect of an otherwise excluded peril by means of the payment of additional premium. / В контексте общего страхования это относится к приобретению покрытия в отношении какой-либо иной исключённой угрозы посредством оплаты дополнительной премии.

BUYBACK OF OWN SHARES = ВЫКУП СОБСТВЕННЫХ АКЦИЙ – Buyback Of Own Shares is a program by which a corporation buys back its own shares on a stock exchange. In Germany, companies can buy back up to 10 percent of their own shares on the stock exchange. Share buybacks must be approved by shareholders at the company's General Meeting. Companies buy back their own shares when they wish to invest excess capital or avoid a hostile takeover. Share buybacks typically boost the share price as earnings per share rise due to the lower number of shares outstanding. Share buybacks generally send a positive signal to the capital markets.

BUY BASIS = ПОКУПАТЬ БАЗИС – Buy Basis:- the basis level quoted to sellers. See also Sell Basis, and Long The Basis. Buying-The-Basis is the Buying an investment in the cash markets, such as Wheat or S&P 500® futures, and then selling a futures position in an attempt to profit from a narrowing of the basis. Also called Cash-And Carry Trade.

BUYDOWN = ПОДКУП (или ВЫГАДАТЬ) – (1) Buydown is a lump sum payment made to the creditor by the borrower or by a third party to reduce the amount of some or all of the consumer's periodic payments to repay the indebtedness.

(2) With a Buydown, the seller pays an amount to the lender so that the lender can give you a lower rate and lower payments, usually for an initial period in an adjustable-rate mortgage (ARM). The seller may increase the sales price to cover the cost of the buydown. Buydowns can occur in all types of mortgages, not just ARMs. / в случае с закладной с переоцениваемой ставкой (ЗПС) (adjustable-rate mortgage (ARM)).

BUYER = ПОКУПАТЕЛЬ – (1) Buyer is an enterprise that arranges for the acquisition of goods or services and agrees to payment terms for such goods or services.

(2) Buyer is the person who buys calls, puts, or any combination of calls and puts. See also Option Buyer. A market participant who takes a long futures position or buys an option. In option trading, Buyer is a market participant who takes a long futures position or buys an option. An option buyer is also called Holder, Owner, or Taker. Option buyers receive the right, but not the obligation, to assume a futures position. / В торговле опционами, участник рынка, который занимает длинную позицию по фьючерсу или покупает опцион. Покупатели опционов получают право, но не обязательство, принимать позицию по фьючерсу. Известен также как Держатель (Holder), Владелец (Owner) или Взявший (Taker).

BUYER'S CALL = ВОСТРЕБОВАНИЕ ПОКУПАТЕЛЕМ – Buyer's Call:- a purchase of a specified quantity of a specified grade of a commodity at a fixed number of points above or below a specified delivery month futures price with the buyer allowed a period of time to fix the price either by purchasing a futures contract for the account of the seller or telling the seller when he wishes to fix the price. See also Seller's Call. / Закупка определённого количества сырья определённого сорта по зафиксированному количеству пунктов выше или ниже цены фьючерса с определённым месяцем поставки в отводимый покупателю период времени для фиксации цены либо приобретением фьючерсного контракта за счёт продавца либо сообщением продавцу момента, когда он хочет зафиксировать данную цену. Смотрите также Востребование Продавцом (Seller's Call).

BUYER'S DELIVERY COMMITMENT = ОБЯЗАТЕЛЬСТВО ПОСТАВКИ ПОКУПАТЕЛЯ – Buyer's Delivery Commitment:- the written notice given by the buyer of his intention to take delivery against a long futures position on delivery day. / Письменное уведомление, предоставленное в день поставки покупателем о его намерении принять поставку по купленному фьючерсу.

BUYER'S MARKET = РЫНОК ПОКУПАТЕЛЯ – A Buyer's Market is considered to exist when goods can easily be secured and when the economic forces of business tend to cause goods to be priced at the purchaser's estimate of value. In other words, a state of trade favorable to the buyer, with relatively large supply and low prices. Buyer's Market is a market in which there are too many sellers and not enough buyers, so that buyers are in a position to influence prices or conditions of purchase. Buyer's Market is a condition of the market in which there is an abundance of goods available and hence buyers can afford to be selective and may be able to buy at less than the price that previously prevailed. The opposite of Seller's Market. Buyer's Market is a market where grain is in surplus supply and buyers can obtain lower prices. / или условия закупки.

BUY–IN = ПРИКУП – Buy-In:- a purchase of securities in the open market by a lender because the borrower cannot deliver the securities to the lender in accordance with the terms of the transactions. The borrower pays all costs related to the buy-in. / Закупка ценных бумаг на открытом рынке займодавцем (ссудодателем) вследствие того, что заёмщик не может поставить ценные бумаги займодавцу согласно положений и условий операций. Заёмщик оплачивает все затраты, связанные с этим прикупом.

BUY IN = ПРИКУПИТЬ – Refers to a situation in which a seller of shares, etc fails to deliver on the agreed date, which sometimes happens if the seller is selling short. In this case the buyer is entitled to buy shares from another source and to charge the seller with any expenses incurred. This process is know as Buying In. To cover or close out a short position. See also Offset. / Покрыть или закрыть короткую позицию. Смотрите также Зачёт или Офсет (Offset). любые понесённые расходы.

BUYING CLIMAX = КУЛЬМИНАЦИЯ ПОКУПОК – Buying Climax:- a sudden upward movement in the market value of a security characterized by a gap in the prices between one trading session and the next. Used by technical analysts and often considered an indication that a security has been overbought and the price will fall.

BUYING HEDGE = ХЭДЬЖ ПОКУПКОЙ – Buying futures contracts to protect against possible increased costs of commodities that will be needed in the future. Buying Hedge:- hedging transaction in which futures contracts are bought to protect a short cash market position against possible increases in the prices of commodities, securities, indexes or currencies. Also known as Buy Hedge, or Long Hedge. See also Purchasing Hedge. / Сделка по хэдьжированию, в которой фьючерсные контракты покупаются с целью защиты короткой позиции в реальном рынке от возможных повышений цен на сырьё, ценные бумаги, индексы или валюты. Известен также как Хэдьж Покупкой (Buy Hedge), или Длинный Хэдьж (Long Hedge). Смотрите также Хэдьж Закупкой (Purchasing Hedge).

BUYING ON MARGIN = ПОКУПКА ПОД МАРЖУ – Buying On Margin:- a risky short-term strategy where a buyer borrows money from a broker to make an investment. The buyer believes the stock price will rise and is trying to maximize profits by investing more money in the stock. / Рискованная краткосрочная стратегия, при которой покупатель занимает деньги у брокера с тем, чтобы инвестировать их в какой-то биржевой актив или инструмент. Покупатель верит, что цена этого актива или инструмента будет расти и поэтому предпринимает попытку максимизировать возможные прибыли, инвестируя в этот актив или инструмент больше денежных средств.

BUYING PRICE = ЦЕНА ПОКУПКИ – Buying Price is the price at which someone buys or can buy something the price at which a dealer will buy shares, bonds etc, rather than the price at which they are willing to sell them. Also known as Bid Price, and Offer Price. Buying Price is the price at which units in a unit trust are bought by investors. / Известна также как Предлагаемая Цена Покупки или Цена Предложения На Покупку (Bid Price).

BUY ON CLOSE = КУПИТЬ ПРИ ЗАКРЫТИИ – Buy On Close:- to buy at the end of the trading session at a price within the closing range. Buy On Close:- an order to buy a commodity within the closing price range at the end of the day's trading. / Купить при закрытии торговой сессии по цене, складывающейся в период закрытия сессии.

BUY ON OPENING = КУПИТЬ ПО ОТКРЫТИИ – Buy On Opening:- to buy at the beginning of the trading session at a price within the opening range. Buy On Opening:- an order to buy a commodity within the opening price range at the beginning of the day's trading. / Купить в начале торговой сессии по цене, складывающейся в период открытия сессии.

BUYOUT = ВЫКУП – In finance, a Buyout is an investment transaction by which the ownership equity of a company, or a majority share of the stock of the company is acquired. The acquiror thereby 'buys out' the present equity holders of the target company. A buyout will often include the purchasing of the target company's outstanding debt, which is referred to as 'Assumed Debt' by the purchaser. The term may apply more generally to the purchase by one party of all of the rights of another party with respect to an ongoing transaction between the two. For example:- (i) an employer may 'buy out' an employee's contract by making a single prepayment, so as to have no ongoing obligation to employ the person; and (ii) a landlord may buy out the remainder of a tenant's lease, effectively paying them to vacate. Buyout is the purchase of an entire company. Buyout is the purchase of a company's shares

in which the acquiring party gains controlling interest of the targeted firm. Incorporating a buyout strategy is a common technique used to gain access to new markets and is one of the most common methods for inorganically growing a business. A leveraged buyout is accomplished by borrowed money or by issuing more stock. Buyout strategies are often seen as a fast way for a company to grow because it allows the acquiring firm to align itself with other companies that have a competitive advantage in a specific area. Buyout is an act or instance of buying out, esp. of buying all or a controlling percentage of the shares in a company. / Приобретение всей компании целиком.

BUY SIDE = ПОКУПАЮЩАЯ СТОРОНА – Buy Side is an institution who buys services from a broker/dealer, i.e. pays a commission on the execution of an order. / Институт, который приобретает услуги у брокера/дилера, то есть оплачивает комиссию за исполнение распоряжения.

BUY SIGNAL = СИГНАЛ К ПОКУПКЕ – Buy Signal is a condition that indicates a good time to buy a stock. The exact circumstances of the signal will be determined by the indicator that an analyst is using. For example, it's considered a buy signal when the MACD crosses above its signal line. Buy Signal:- in technical analysis, a chart pattern which indicates a key reversal upwards in price and the time to buy. / В техническом анализе биржевых рынков, . МЭКДИ (MACD) .

BUY–STOP = ФИКСАЦИЯ ПОКУПКОЙ – Buy-Stop:- a buy order usually placed above the current price, ensuring that a security would have to trade at the set level before the buy order would be activated. By placing a buy stop order just above resistance, a trader can ensure that the security will break resistance before going long. On the other hand, traders looking to catch a bottom or intraday low might place a buy stop below the current price, but near support. A type of market order that is placed above the current price and becomes a market order when touched. Buy-stops tend to accumulate just above important resistance levels. These orders are primarily used to exit the market, although they can be used for new position entry. Many traders believe the market goes looking for these pockets of buy-stops in order to get them executed, only to then reverse direction.

BUY–UP = СКУПКА – Gradual, and usually discreet, purchase of shares in a corporation listed on a stock exchange to acquire an ownership interest therein. / Постепенная и обычно сдержанная закупка долей в корпорации, акции которой котируются на фондовой бирже, с целью приобретения процента владения в ней.

BWR = BOILING–WATER REACTOR

BWS = BLUE WATER SCARCITY

BXN COTTON = ХЛОПЧАТНИК БИ.ЭКС.ЭН. – BXN Cotton:- (i) Host Organism:- Gossypium Hirsutum L.L. (Cotton). (ii) Trait:- Oxynil herbicide tolerance, including bromoxynil and ioxynil; (iii) Trait Introduction:- Agrobacterium Tumefaciens-mediated plant transformation; (iv) Proposed Use:- Production of Cotton for fiber, cottonseed and cottonseed meal for livestock feed, and cottonseed oil for human consumption; (v) Company Information:- Calgene Inc., Davis, State of California (CA), the United States. BXN™ Cotton is a Cotton Variety that has been genetically altered to tolerate the herbicide Buctril (bromoxynil). Transgenic Cotton (Gossypium Hirsutum L.) line BXN™ was developed using recombinant DNA techniques to be tolerant of herbicides in the oxynil family, principally bromoxynil (tradename Buctril). The oxynil family of herbicides is active against dicotyledonous plants by blocking electron flow during the light reaction of photosynthesis. This transgenic line was produced by inserting a gene that encodes for a bacterial enzyme, nitrilase, from Klebsiella pneumoniae. The nitrilase enzyme hydrolyses the herbicides ioxynil and bromoxynil into non-phytotoxic compounds. Specifically the nitrilase enzyme breaks down bromoxynil into 3,5 dibromo-4-hydroxybenzoic acid (DBHA), eliminating its herbicidal activity. An antibiotic resistance marker gene (neo) encoding the enzyme neomycin phosphotransferase II (NPTII), which inactivates aminoglycoside antibiotics such as kanamycin and neomycin, was also introduced into the genome of these transgenic lines. This gene was derived from a bacterial transposon (Tn5 transposable element from Escherichia Coli) and was included as a selectable marker to identify transformed plants during tissue culture regeneration and multiplication. The expression of the neo gene in these plants has no agronomic significance and the safety of the NPTII enzyme as a food additive was evaluated by the United States Food and Drug Administration in 1994 (US FDA, 1994). The BXN™ line of Cotton (Gossypium Hirsutum) was developed through a specific genetic modification to be resistant to the activity of oxynil-containing herbicides, such as bromoxynil. The oxynil family of herbicides is active against dicotyledonous plants by blocking electron flow during the light reaction of photosynthesis. The novel variety was developed by insertion of a gene encoding a bacterial enzyme that hydrolyses ioxynil and bromoxynil into non-phytotoxic compounds. The modified Cotton line permits farmers to use oxynil-containing herbicides for weed control in the cultivation of Cotton. The BXN™ Cotton line was created by Agrobacterium-mediated transformation in which the transfer-DNA (T-DNA) contained the gene encoding the enzyme nitrilase from the soil Bacterium Klebsiella Pneumoniae Subsp. Ozaenae. In addition, the T-DNA contained sequences encoding the enzyme neomycin phosphotransferase II (NPTII) from the Tn5 transposon of Escherichia Coli, strain K12. There was no incorporation of translatable plasmid DNA sequences outside of the T-DNA region. Refined edible cottonseed oil does not contain any detectable protein and consists of purified glycerides. Using a sensitive Western blotting technique that was capable of detecting the enzymes nitrilase and NPTII at levels of 0.1 ppm and 0.01 ppm, respectively, there were no detectable amounts of either

of these proteins in refined oil from BXN™ Cotton. Modification Method:- the BXN™ Cotton line was created by Agrobacterium-mediated transformation in which the transfer-DNA (T-DNA) contained the gene encoding the enzyme nitrilase from the soil Bacterium Klebsiella Pneumoniae Subsp. Ozaenae. For expression in plants, all but 11 bp of the 5? and 96 bp of the 3? non-translated regions of the gene were used. In addition, the T-DNA contained sequences encoding the enzyme neomycin phosphotransferase II (NPTII) from the Tn5 transposon of Escherichia Coli, strain K12. Characteristics of the Modification:- (i) The Introduced DNA:- southern blot analysis of genomic DNA from BXN? Cotton demonstrated the presence of one or two sites of integration of the T-DNA within the host genome. There was no evidence of integration of plasmid DNA sequences outside of the T-DNA region. (ii) Expressed Material:- the nitrilase enzyme was expressed at very low levels in unprocessed whole cottonseed, cottonseed hulls, and cottonseed meal, which are used in livestock feed. It was estimated that the enzyme comprised about 0.000 6% of seed protein, which itself makes up a very small proportion of total meal protein. Refined cottonseed oil, which is the major Cotton product consumed by humans, did not contain any detectable amounts of nitrilase enzyme. This result was expected as refined oils are generally free of DNA and protein. Field Testing:- transgenic BXN™ Cotton was field tested in the United States at a total of 57 sites in 13 states. Field tests were also conducted in Argentina, Bolivia, and South Africa in accordance with national regulatory requirements. Based on data collected from these trials, it was concluded that this transgenic cotton line did not exhibit weedy characteristics, and had no effect on nontarget organisms or the general environment. Outcrossing:- Cotton (Gossypium Hirsutum) is mainly a self-pollinating plant, but insects, especially bumblebees and honeybees, also routinely transfer pollen. The pollen is heavy and sticky and the range of natural crossing is limited. Outcrossing rates of up to 28% to other Cotton Cultivars have been observed under field conditions and decline rapidly with distance from the pollen source. Given proximity and the availability of insects as pollen vectors, transgenic Cotton line BXN™ is likely to hybridize with other Cotton Varieties. In the United States, compatible species include Gossypium Hirsutum (wild or under cultivation), Gossypium Barbadense (cultivated Pima Cotton), and Gossypium Tomentosum. It was reported that gene movement from Gossypium Hirsutum to Gossypium Barbadense may be possible given suitable conditions, while gene transfer to Gossypium Tomentosum is less probable due to chromosomal incompatibility and non-synchronous flowering periods. Overall, the probability of gene transfer in the wild is unlikely due to the relatively isolated distribution of Gossypium Species, different breeding systems, and genome incompatibility. Hybrids resulting from artificial crosses between Cotton and wild Species are generally sterile, unstable and of poor fitness. Weediness Potential:- the introduced genes were not expected to confer an ecological advantage to transgenic Cotton line BXN™ and its potential hybrid offspring. Tolerance to bromoxynil herbicide and kanamycin resistance will not render Cotton weedy or invasive of natural habitats since none of the reproductive or growth characteristics have been modified. There are no specific problems with Cotton as a weed. Cottonseed may remain in the field after harvesting and germinate under favorable conditions. Seeds may also survive mild and dry winters. Suitable treatments for any volunteers in the next crop include cultivation and the use of herbicides other than bromoxynil. Secondary and Non-Target Adverse Effects:- the novel proteins, nitrilase and NPTII, are not known to have any toxic properties on any nontarget organisms. The lack of known toxicity for these proteins and the low levels of their expression in plant tissue suggest no potential for deleterious effects on beneficial organisms such as bees and earthworms. Both nitrilase and NPTII act on a narrow range of substrates making it unlikely that these compounds would react with other substances to produce novel toxic compounds in organisms that consume these transgenic Cotton lines. Impact on Biodiversity:- this transgenic Cotton line has no novel phenotypic characteristics that would extend its use beyond the current geographic range of Cotton production. As the risk of gene transfer to wild relatives in the United States is very remote, it was determined that the risk of transferring genetic traits from BXN™ Cotton to species in unmanaged environments was not significant. Dietary Exposure:- only refined cottonseed oil and cellulose from processed linters of cottonseed are consumed by humans. Processed linters are essentially pure cellulose (>99%) and are subjected to heat and solvent treatment that would be expected to remove and destroy DNA. It is generally accepted that the refined oil does not contain protein. The refining process for cottonseed oil includes heat, solvent and alkali treatments remove and destroy DNA and protein. The refined cottonseed oil from these lines was tested for the presence of nitrilase and NPTII, which were undetectable. It was concluded that there would be no dietary exposure to the novel proteins expressed in these cotton lines. Nutritional Data:- compositional comparison of cottonseed oil, cottonseed and meal from BXN™ Cotton was made to the same materials from commercial non-transgenic Cotton. Parameters measured included proximate analysis (moisture, crude fat/oil, protein, and ash) of cottonseed meal; fiber analysis (crude fiber, acid detergent, and neutral detergent fibers) of cottonseed; fatty acid composition of refined cottonseed oil; and amino acid profiles of cottonseed meal. No significant differences between the transgenic lines and the traditionally bred lines were observed for any of these parameters. Toxicity:- cottonseed contains a high number of anti-nutritional factors and the raw seed is unsuitable for monogastric animals. Gossypol has numerous toxic effects on mammals, including heart damage and heart failure, such that whole cottonseed or cottonseed meal is not used in human foods and the presence of gossypol limits its use in animal feed. However, removal or inactivation of gossypol during processing enables the use of some cottonseed meal in feed for fish, poultry and pigs. The cyclopropenoid fatty acids, sterculic acid (C-17), dihydrosterculic acid (C-19) and malvalic acid (C-18), are unique fatty acids common in cotton and produce undesirable biological effects, including the inhibition of biodesaturation of stearic to oleic acid, affecting phospholipid biosynthesis. The levels of gossypol and cyclopropenoid fatty acids in the transgenic Cotton line were measured and found to be within the normal range of variation reported for traditionally bred Cotton cultivars. Allergenicity:- refined cottonseed oil and cellulose from linters are devoid of protein and, given that most allergens are proteins, their consumption is unlikely to result in an allergic reaction. Therefore the potential for cottonseed oil or linters from BXN™ Cotton to constitute a source of allergens is extremely low. In addition, the enzyme nitrilase does not have the properties of known allergens, such as glycosylation, protease stability, and presence in food at high concentrations. Also, an amino acid sequence homology search against public domain databases did not reveal any homologies between known protein allergens or toxins and the nitrilase enzyme. / Щёлочь (Alkali).

BY = BELARUS

BYB = BELARUSIAN ROUBLE

BYLAWS = УСТАВ (или РЕГЛАМЕНТ) – In the United States, Bylaws are the internal operating rules of a corporation, which are usually set out in a document of less than twenty pages. Bylaws govern such matters as holding meetings, voting, quorums, elections, and the powers of directors and officers. The bylaws must include:- the name of the organization; the mission or purpose of the organization; the geographic area served by the organization; the members' responsibilities, dues, quorum, and voting procedures; likewise, the duties, quorum, and voting procedures of the board of directors; the rules of order; and procedures for amending the bylaws. In the United States, rules and regulations adopted by an organization, corporation or similar entity for its internal administration and management. For example, by laws often identify the duties of officers, the fiscal year end of the organization and the disposition of assets upon the organization's dissolution. Corporate and organizational bylaws regulate only the organization to which they apply and are generally concerned with the operation of the organization, setting out the form, manner or procedure in which a company or organization should be run. Corporate bylaws are drafted by a corporation's founders or directors under the authority of its Charter or Articles of Incorporation. Bylaws widely vary from organization to organization, but generally cover topics such as how directors are elected, how meetings of directors (and in the case of a business, shareholders) are conducted, and what officers the organization will have and a description of their duties. A common mnemonic device for remembering the typical articles in

bylaws is NOMOMECPA, pronounced 'No mommy, see pa!' It stands for Name, Object, Members, Officers, Meetings, Executive board, Committees, Parliamentary authority, Amendment. Bylaws generally cannot be amended by an organization's Board of Directors; a super-majority vote of the membership, such as two-thirds present and voting or a majority of all the members, is usually required to amend bylaws. In the United States, Bylaws are the regulations of a corporation that, subject to statutory law and the articles of incorporation, provide the basic rules for the conduct of the corporation's business and affairs Also known as Articles Of Association in the United Kingdom. Bylaw (sometimes also spelled by-law or byelaw) can refer to a law of local or limited application, passed under the authority of a higher law specifying what things may be regulated by the bylaw, or it can refer to the internal rules of a company or organization. In the context of local laws, 'bylaw' is more frequently used in this context in Canada, the United Kingdom and some Commonwealth countries, whereas in the United States, the words code, ordinance or regulation are more frequent. Accordingly, a Bylaw enforcement officer is the Canadian equivalent of the American Code Enforcement Officer or Municipal Regulations Enforcement Officer. The term was originally the Viking town law in the Danelaw. Contrary to popular etymology the element by has nothing to do with the preposition by. It is the Old Norse word for larger settlement as in Whitby and Derby (compare with the modern Danish-Norwegian word 'By' meaning Town, or the modern Swedish word 'By', meaning Village). / Уставом понимается свод правил, регулирующих деятельность компании, её взаимоотношения с другими лицами, её права и обязанности в определённой сфере хозяйственной деятельности. Устав:- (1) свод правил, регулирующих организацию и порядок деятельности в какой-либо определённой сфере отношений или какого-либо государственного органа, предприятия, учреждения, например, в бывшем Союзе Советских Социалистических Республик (СССР) действовали Устав Железных Дорог СССР, Устав Средней Общеобразовательной Школы. Уставы регулировали также деятельность Вооружённых Сил СССР (смотрите Воинские Уставы). Общие уставы утверждались, как правило, высшими органами государственной власти СССР, уставы отдельных учреждений и организаций – соответствующими министерствами и ведомствами. Уставы имели общественные организации (добровольные спортивные общества, творческие союзы, дачно-строительные и жилищно-строительные кооперативы и другие). (2) Уставы имеются у большинства международных организаций в качестве основных актов, определяющих задачи, принципы образования и деятельности данной организации (например, Устав Объединённых Наций (или Организации Объединённых Наций (ООН)).

BY ORDER OF … = ПО УКАЗАНИЮ … (или ПО РАСПОРЯЖЕНИЮ …, или ПО ПОРУЧЕНИЮ …) – By Order Of …:- according to a somebody's instructions. Also known as To Order Of ….

BYPASS FILTRATION = ПЕРЕПУСКНАЯ (или ОБХОДНАЯ) ФИЛЬТРАЦИЯ (или ОЧИСТКА ПЕРЕПУСКНЫМ ФИЛЬТРОМ) – Bypass Filtration is a system of filtration in which only a portion of the total flow of a circulating fluid system passes through a filter at any instant or in which a filter having its own circulating pump operates in parallel to the main flow. See also Filtration.

BYPASS VALVE = ПЕРЕПУСКНОЙ КЛАПАН – Bypass Valve (Relief Valve) is a valve mechanism that assures system fluid flow when a preselected differential pressure across the filter element is exceeded; the valve allows all or part of the flow to bypass the filter element. See also Valve. / Предохранительный Клапан или Разгрузочный Клапан или Клапан Сброса Давления или Клапан Стравливания Давления (Relief Valve).

BY–PRODUCTS = ПОБОЧНЫЕ ПРОДУКТЫ – (1) Byproduct is a secondary or additional product resulting from the feedstock use of energy or the processing of nonenergy materials. For example, the more common byproducts of coke ovens are coal gas, tar, and a mixture of benzene, toluene, and xylenes (BTX). / Побочный Продукт:- .

(2) In mining industry, By-Products are products obtained as result of copper processing. For example, the Los Pelambres mine produces molybdenum concentrate and also receives credit for the gold and silver content in the copper concentrate sold. By-Product is a material of some economic value produced in a process which is focused on extracting another material. For example, palladium is produced as a by-product of platinum mining in South Africa. / (Los Pelambres).

(3) By-Product is a substance obtained during the manufacture of another substance, e.g., bran is a by-product of milled Rice.

BYSSUS = БИСАС (или БИССОН) – Byssus is a fine probably linen cloth of ancient times. / Бисас:- тонкое, предположительно льняное полотно античных времён.

BYTE = БАЙТ – Byte (B) is a data unit of eight bits (b). / Байт (Б) – единица данных из 8 бит (б). Байт:- единица хранения и обработки цифровой информации; совокупность битов, обрабатываемая компьютером одномоментно. В современных вычислительных системах Байт состоит из восьми битов и, соответственно, может принимать одно из 256 (2^8) различных значений (состояний, кодов). Однако в истории компьютерной техники существовали решения с иными размерами Байта (например, 6, 32 или 36 битов), поэтому иногда в компьютерных стандартах и официальных документах для однозначного обозначения группы из 8 битов используется термин 'Октет' (от Латинского слова 'Octet'). Термин 'Байт' был впервые использован в 1956 Американским компьютерным учёным Немецкого происхождения Венаром Бухольцем (Werner Buchholz; 1922–2019) при проектировании первого суперкомпьютера IBM 7030 Stretch для пучка одновременно передаваемых в устройствах ввода-вывода шести битов. Позже, в рамках того же проекта, Байт был расширен до восьми бит. Ряд электронно-вычислительных машин (ЭВМ) 1950-х и 1960-х (БЭСМ-6, М-220) использовали 6-битовые символы в 48-битовых или 60-битовых машинных словах. В некоторых моделях ЭВМ производства крупного Американского изготовителя делового оборудования – Бороуз Корпорэйшэн (Burroughs Corporation) (ныне Юнисис Корпорэйшэн (Unisys Corporation)) – размер символа был равен 9 битам. В Советской ЭВМ Минск-32 использовался 7-битный Байт. Байтовая адресация памяти была впервые применена в системе IBM System/360. В более ранних компьютерах адресовать можно было только целиком машинное слово, состоявшее из нескольких Байтов, что затрудняло обработку текстовых данных. Байт стал равен восьми битам лишь с 1970, поскольку именно тогда ввели на это стандарт. Давайте хотя бы разберемся, почему восемь бит выбрали в качестве стандарта. Так, в одной из старых вычислительных систем одна цифра занимала четыре бита. И поэтому Байт, равный восьми битам, позволял вмещать в себя двухзначные числа и, таким образом, Байт шестибитный стал бесполезен, так как две цифры в Байт уже попросту не вмещалось. Еще одна версия, почему приняли стандарт равный восьми, заключается в том, что все числа, связанные с компьютером, кратны именно восьмёрке. Пример:- оперативная память. Вначале идёт 128 МегаБайт, далее 256, чуть позже 512, а потом уже идут Гигабайты (один, два, четыре, восемь и так далее). Вот и результат:- четыре бита – слишком мало, 16 никогда не применялись, а вот восемь – как раз то, что надо. Переводим биты в Байты и обратно. Давайте теперь попробуем ответить на вопрос, сколько бит содержит 2 байта? Итак, мы знаем, что один байт равен восьми, соответственно, восемь нужно умножить на два, получится шестнадцать. Получается, что в двух байтах содержится шестнадцать бит. Полезно знать, что 1 024 Байта составляют килоБайт (или можно сказать, что килоБайт – это 8 192 Байта), 1 024 килоБайта – МегаБайт, а 1 024 МегаБайта – ГигаБайт. Соответственно, ТераБайт – это уже 1 024 ГигаБайта. Надо сказать, что в последнее время информацию стали мерить уже и ТераБайтами, поэтому и эти знания нам вскоре пригодятся.

BY VOLUME = ПО ОБЪЁМУ – v/v is an abbreviation for By Volume, used in chemistry and pharmacology to describe the concentration of a substance in a mixture or solution. Thus 2% v/v means that the volume of the substance is 2% of the total volume of the solution or mixture. See also w/v.

BY WEIGHT = ПО ВЕСУ – w/w is an abbreviation for By Weight, used in chemistry and pharmacology to describe the concentration of a substance in a mixture or solution. Properly speaking, 2% w/w means that the mass of the substance is 2% of the total mass of the solution or mixture. The metric symbol g/g has the same meaning as w/w. See also Weight/Weight. Weight/Weight (W/W):- solutions are sometimes specified as being made as some percentage weight/weight. Both the substance dissolved and the final solution are measured by weight. For example, a 10% solution of urea w/w would be made by dissolving one pound of urea in 9 pounds of water, and would be labeled 'Urea 10% w/w'. This method is sometimes preferred in industry since automatic mixing equipment is often designed to handle everything by weight rather than volume. See also Weight/Volume.

BZ = BELIZE

BZD = BELIZEAN DOLLAR

CAAS = CANADIAN ASSOCIATION OF AFRICAN STUDIES

CAAS = CHINESE ACADEMY OF AGRICULTURAL SCIENCES

CABI = CENTRE FOR AGRICULTURE AND BIOSCIENCES INTERNATIONAL

CABIN = КАЮТА – Cabin (maritime term):- the captain's quarters. The enclosed space of decked-over small boat.

CABINET = ШКАФ (или КОРПУС, или ХХ) – Cabinet is a basic part of the manufactured-fiber spinning machine where, in dry spinning, the filaments become solidified by solvent evaporation and, in melt spinning, the filaments are solidified by cooling.

CABLE = КАБЕЛЬ – Cable is a slang used among traders to indicate GBP/USD exchange rate. / Жаргон, используемый среди торговцев, для указания валютного курса GBP/USD (Британского Фунта к Доллару США).

CABLE = КАБЕЛЬ (или КАНАТ, или ТРОС) – Cable (maritime term):- a chain or line (rope) bent to the anchor. Cables are strong ropes or chains, principally used in the anchoring or mooring of ships. (1) Rope Cables are, in Europe, principally manufactured of hemp; but in the East they are very frequently made of coir, or the fibrous part of the Cocoa nut, and in some places, particularly on the Red Sea, of the coating of the branches of the date tree. Hemp cables are formed of three principal strands, every strand of three

ropes, and every rope of three twists. The twists have more or fewer threads according to the greater or less thickness of the cable. All vessels have ready for service three cables, which are usually designated the sheet cable, the best bower cable, and the small bower cable; but besides these, most ships have some spare cables. The ordinary length of a cable is from 100 to 120 fathoms. The following are the existing regulations as to the manufacture of hemp cables and cordage:- No persons shall make or sell any cordage for shipping in which any hemp is used, called short chucking, half clean, whale line, or other toppings, codilla, or any damaged hemp, on pain of forfeiting the same, and also treble the value thereof. Cables, hawsers, or ropes, made of materials not prohibited by this act, and whose quality shall be inferior to clean Petersburgh hemp, shall be deemed inferior cordage, and the same shall be distinguished by marking on the tally, staple or inferior. Manufacturers making default herein forfeit for every hundred weight of cordage, 10s.. Manufacturers are to affix their names and manufactory to new cordage before sold, under the like forfeiture; and putting a false name is a forfeiture of 20l.. Persons making cables of old and overworn stuff, containing above 7 inches in compass, shall forfeit four times the value. Vessels belonging to British subjects, having on board foreign-made cordage, are to make entry thereof, on entering into any British port, on penalty of 20s. for every hundred weight. But this is not to extend to cordage brought from the East Indies, nor to materials at present used by any vessels built abroad before this act (25 Geo. 3. c. 56.). (2) Iron Cables:- The application of strong iron chains or cables to the purposes of navigation is a late and an important discovery, for which we are indebted to Captain Samuel Brown, R.N.. It is singular, indeed, that this application should not have been made at a much earlier period. On rocky bottoms, or where coral is abundant, a hempen cable speedily chafes, and is often quite destroyed in a few months, or perhaps days. A striking instance of this occurred in the voyage of discovery under the orders of M. Bougainville, who lost six anchors in the space of nine days, and narrowly escaped shipwreck; a result, says that able seaman, which would not have happened, 'si nous eussions été munis des quelques chaines de fer. C'est une précaution que ne doivent jamais oublier tousles navigateurs destinés à de pareils voyages' (Voyage autour du Monde, p. 207. 4to. ed.). The work from which this extract is taken was published in 1771; and yet it was not till nearly forty years after, that any attempt was made practically to profit by so judicious a suggestion. The difficulties in the way of importing hemp from 1808 to 1814, and its consequent high price, gave the first great stimulus to the manufacture of iron cables. Iron cables are constructed in different ways (see Encyc. Metrop.); but they are uniformly tried by a machine, which strains them by a force greater than the absolute strength of the hempen cable they are intended to replace. By this means the risk of accident from defective links is effectually obviated; and there are exceedingly few instances in which an iron cable has broken at sea. Their great weight also contributes to their strength, inasmuch as the impulse of the ship is checked before the cable is brought nearly to a straight line, or that the strain approaches to a maximum. Bolts and shackles are provided at every fathom or two fathoms, by striking out which the ship may, if necessary, be detached from her anchors with less difficulty than a hempen cable can be cut. Even in their most defective form, iron cables are a great deal stronger than those of hemp; and as to durability, no sort of comparison can be made. No wonder, therefore, that they should be rapidly superseding the latter; which are now almost wholly laid aside in the navy, and, to a great extent, also, in the merchant service. / Капитан Самьюэл Браун, Ар.Эн. (Captain Samuel Brown, R.N.). Эм. Бугавилле (M. Bougainville). 'если бы мы были обеспечены железными цепями. Эта мера предосторожности, о которой никогда не должны забывать все моряки, отправляющиеся в такие вояжи' ('si nous eussions été munis des quelques chaines de fer. C'est une précaution que ne doivent jamais oublier tousles navigateurs destinés à de pareils voyages').

CABLE = КАБЕЛЬТОВАЯ СВИВКА (или КОЛИЧЕСТВО И ПОСЛЕДОВАТЕЛЬНОСТЬ СЛОЖЕНИЙ, или КАБОЛКА) – Cable:- two or more plied yarns twisted together. One or more part of a cabled yarn can be a single. So if you took two 2-ply and plied them again, you would have a cabled yarn. It is important to remember that you reverse the twist for each step. So if you spun your singles Z, the 2-ply would be spun S, and the cabled yarn would be produced by plying Z. You will need to have extra twist in the singles and the first ply to produce a balanced yarn. A 3–2 cable refers to three 2-ply. A yarn forming by twisting together two or more plied yarns. To twist together two or more folded yarns. / Скручивать вместе две или более нитей в несколько сложений.

CABLE ADDRESS = АДРЕС ДЛЯ КАБЛОГРАММ – Cable Address is a code word of less than 10 letters, registered annually with the Central Bureau of Registered Addresses, used in lieu of the entire name and address of a firm receiving or sending cablegrams in order to reduce the number of words required in a cablegram.

CABLE CORD = КОРД ТРОСОВОЙ КРУТКИ – Cable Cord is the result of twisting singles together in various directions, e.g., S/Z/S or Z/S/Z. Connected to:- S twist, Z twist.

CABLED YARN = КРУЧЁНАЯ (или КАБЕЛЬТОВАЯ) ПРЯЖА (или ПРЯЖА ТРОСОВОЙ КРУТКИ, или КАБОЛКА) – Cabled Yarn:- two or more plied yarns twisted together. One or more part of a cabled yarn can be a single. So if you took two 2-ply and plied them again, you would have a cabled yarn. It is important to remember that you reverse the twist for each step. So if you spun your singles Z, the 2-ply would be spun S, and the cabled yarn would be produced by plying Z. You will need to have extra twist in the singles and the first ply to produce a 'balanced yarn'. A 3–2 cable refers to three 2-ply. Cabled Yarn is the yarn formed by twisting together two or more plied yarns. Cabled Yarn is the yarn with two or more components of which at least one is a folded yarn, combined by one or more twisting operations. Note:- for certain industrial uses the word cord is used for folded or cabled yarns. Cabled Yarn:- two or more ply yarns twisted together. Cabled Yarn:- single yarns → folded yarns → cabled yarn; two or more components; more than one twisting operation; similar or dissimilar components. / ; более одной операции кручения; . Однокруточная Кручёная Пряжа – кручёная пряжа из нитей, скрученных вместе одной круткой. Многокруточная Нить (S(C)abled Yarn) – кручёная нить из двух или более текстильных нитей, одна из которых однокруточная, скрученная вместе за одну или более операций кручения.

CABLE FOR AUTHORITY = ЭЛЕКТРОННЫЙ ЗАПРОС ПОЛНОМОЧИЙ – Cable For Authority is a request for permission to pay a letter of credit drawing despite discrepancies, sent electronically by the negotiating bank to the issuing bank.

CABLE–LAID = КАБЕЛЬТОВОЙ СВИВКИ (или КАБЕЛЬНОЙ РАБОТЫ) – Cable-Laid (maritime term):- the same as hawser-laid.

CABLE–LENGTH = КАБЕЛЬТОВ (или ДЛИНА КАБЕЛЯ) – Cable-Length (maritime term):- 100 fathoms or 600 feet (6 feet to a fathom). See also Cable. / Кабельтов, от Голландского слова Kabeltouw, внесистемная единица длины, применяемая в мореходной практике. 1 кабельтов = 0.1 мили (морской) = 185.2 метров (м).

CABLE NEWS NETWORK (LP) = КЭЙБЛ НЬЮЗ НЭТВОК (ЭЛ.ПИ.) – The Cable News Network LP (CNN) debuted its news website CNN.com (then known as as CNN Interactive or CNNi) on 1995-August-30. Initially an experiment, interest in CNN.com grew steadily over its first decade and today CNN.com is now one of the most popular news websites in the world. The wide-spread growth of blogs, social media and user-generated content has had a profound effect on the network, and blogs in particular have focused CNN's previously scattershot online offerings, most noticeably in the development and launch of CNN Pipeline in late 2005. CNN Pipeline is the name of a paid subscription service, its corresponding website, and a content delivery client that provides streams of live video from up to four sources, on-demand access to CNN stories and reports, and optional pop-up 'news alerts' to computer users. The installable client is available to users of PCs running Microsoft Windows. There is also a browser-based 'web client' that does not require installation. A companion network, Headline News (originally called CNN2) was launched in 1982 and featured a continuous 24-hour cycle of 30-minute news broadcasts. Headline News broke from its original format in 2006 with the addition of Headline Prime. Current

programs feature confrontational personalities like radio talk-show host Glenn Beck and former Fulton County, Georgia prosecutor Nancy Grace. Despite its domestic standing, CNN remains a distant second in international news coverage, reaching just over half of the audience of the older BBC News. Unlike BBC's network of reporters and bureaus, CNN International makes extensive use of affiliated reporters that are local to, and often directly affected by, the events they are reporting. The effect is a more immediate, less detached style of on-the-ground coverage. This has done little to stem criticism, largely from Middle Eastern nations, that CNN International reports news from a pro-American perspective. This is a marked contrast to domestic criticisms that often portray CNN as having a 'liberal' or 'anti-American' bias. Since its launch on 1980-June-01, CNN has expanded its reach to a number of cable and satellite television networks, several web sites, specialized closed-circuit networks (such as CNN Airport Network), and two radio networks. The network has 42 bureaus, more than 900 affiliated local stations, and several regional and foreign-language networks around the world. The network's success made a bona-fide mogul of founder Ted Turner and set the stage for the Time Warner conglomerate's eventual acquisition of Turner Broadcasting. CNN.com is among the world's leaders in online news and information delivery. Staffed 24 hours, seven days a week by a dedicated staff in CNN's world headquarters in Atlanta, State of Georgia, the United States, and in bureaus worldwide, CNN.com relies heavily on CNN's global team of almost 4 000 news professionals. CNN.com features the latest multimedia technologies, from live video streaming to audio packages to searchable archives of news features and background information. The site is updated continuously throughout the day. Time Warner Inc. is the CNN's parent company. Time Warner Inc. is a leading media and entertainment company, whose businesses include interactive services, cable systems, filmed entertainment, television networks and publishing. The Cable News Network, commonly known as CNN, is a major cable television network founded in 1980 by Ted Turner. It is a division of the Turner Broadcasting System, owned by Time Warner. CNN introduced the idea of 24-hour television news coverage, and celebrated its 25th anniversary on 2005-June-01. In terms of cumulative (Cume) Nielsen ratings or 'unique viewers', CNN rates as America's No. 1 cable news network. However, CNN trails Fox News Channel in terms of average viewership. CNN broadcasts primarily from its headquarters at the CNN Center in Atlanta, Time Warner Center in New York City, and studios in Washington, DC. As of December 2004, it is available in 88.2 million US households and more than 890 000 American hotel rooms. The US version of CNN is also shown in Canada. Globally, the network airs through CNN International and has combined branded networks and services that are available to more than 1.5 billion people in over 212 countries and territories. CNN has come under criticism by conservatives, mainly on network ratings rival Fox News, claiming it has a liberal bias and by liberals claiming it has a conservative bias. / За Кэйбл Ньюз Нэтвок Эл.Пи. (Си.Эн.Эн.; The Cable News Network LP (CNN)). и более 890 000 комнат в Американских гостиницах.

CABLE SHIP = КАБЕЛЬНОЕ СУДНО – A Cable Layer or Cable Ship is a deep-sea vessel designed and used to lay underwater cables for telecommunications, electric power transmission, or other purposes. Cable ships are distinguished by large cable sheaves for guiding cable over bow or stern or both. Bow sheaves, some very large, were characteristic of all cable ships. Newer ships are tending toward pure stern layers with stern sheaves only as seen in the photo of CS Cable Innovator at the Port of Astoria on this page. The names of cable ships are often preceded by 'C.S.' as in CS Long Lines. The first transatlantic telegraph cable was laid by cable layers from 1857–58. It briefly enabled telecommunication between Europe and North America before misuse resulted in failure of the line. In 1866 the SS Great Eastern (Steamships Great Eastern was an iron sailing steam ship designed by Isambard Kingdom Brunel, and built by J. Scott Russell & Co. at Millwall on the River Thames, London) successfully laid two transatlantic cables, securing future communication between the continents. The Her Majesty's Telegraph Ship (HMTS) Monarch (the largest cable ship afloat at that time, with four cable tanks, each 41 ft in diameter, having a storage capacity of 125 000 cubic feet and providing storage for 2 500 nm of deep sea telegraph cable; renamed CS Sentinel 13 October 1970) completed the first transatlantic telephone cable, Transatlantic No. 1 (TAT-1; it was inaugurated on September 25, 1956, initially carrying 36 telephone channels) in 1956 from Scotland to Nova Scotia for Britain's General Post Office (GPO). In addition to cable layer ships, there were cable repairing ships which were tasked with finding and repairing under sea cables that broke or for whatever reason became inoperable. Cable Ship is a specially constructed ship for the laying and repairing of telegraph and telephone cables across channels, lakes, oceans and seas. / Специально сконструированное судно для укладки и замены телеграфных и телефонных кабелей, проходящих по дну каналов, морей, озер и океанов. Под Кабельным Судном понимается морское судно для прокладки, подъёма и ремонта подводных (морских, океанских) кабелей связи. Кабель большими отрезками укладывают в расположенные в трюме баки (тэнксы), вмещающие до 5 000–8 000 километров кабеля. Кабельное судно оснащено кабелеукладочными механизмами (кабельными машинами) с электроприводом:- кормовым – для опускания кабеля на дно и носовым – для подъёма кабеля со дна. Водоизмещение кабельных судов 7 000–20 000 тонн. Во время прокладки к кабелю через определённые интервалы подключаются полупроводниковые усилители электрических колебаний, обладающие большим сроком службы и высокой надёжностью. С помощью кабельного судна кабель прокладывается на глубину до 6 000 метров со скоростью до 15 километров в час.

CABLE STITCH = КАБЕЛЬНЫЙ СТЕЖОК – Cable Stitich is a knit effect produced by crossing a group of stitches over a neighboring stitch group.

CABLE STITCH FABRIC = ТКАНЬ КАБЕЛЬНОГО СТЕЖКА – Cable Stitch Fabic is a knit fabric. The pattern looks like a plaited rope running lengthwise down the fabric. It is mainly used for sweaters.

CABLE TRANSFER = ТЕЛЕГРАФНЫЙ ПЕРЕВОД – The Cable Transfer is a form of wire transfer that involves the transmission of funds from a financial institution located in one country to a bank or financial institution located in another country. This type of electronic transfer makes it possible for individuals and corporations to engage in buying and selling outside national boundaries, without a great deal of impediments to receiving and making payments for goods and services rendered. Many people tend to use the terms of cable transfer and wire transfer interchangeably. Historically, there is a slight difference. While it is true that cable transfers and wire transfers are both methods for electronically moving funds from one location to another, one has to do with domestic transactions, while the other is focused on international transfers. The term of wire transfer is more properly used to describe an electronic funds transfer in which the point of origin and the point of termination are located in the same country. In the United States, a wire transfer is conducted using the electronic system put in place by the Federal Reserve System. By contrast, a cable transfer involves electronic funds transfers that originate with an entity located in one country, but terminate with a financial institution in a different country. In times past, the cable transaction was characterized by the use of submerged wires that supplied the medium for the international funds transfers. Internet technology has made the process of conducting a cable transfer much easier for the average consumer. In fact, many banks provide the ability for a customer to initiate a cable transfer by simply providing the needed information on a template. When completed, the template is processed by the bank and the cable transfer is completed. The customer receives a message via his or her online access to the bank accounts that the transfer request is completed, along with a confirmation number. Cable Transfer is a method of transferring funds by telegram or telex. Also known as Telegraphic Transfer, and Wire Transfer. Wire and Cable Transfers are available in many currencies and can also be made through a branch representative. For a wire or cable transfer, you need:- (i) the international bank account number (IBAN) (for Europe); (ii) the bank identifier code (BIC) or the SWIFT code; (iii) a CLABE number (for Mexico); (iv) complete contact information for the recipient, including a full address; and (v) any specific

details that the receiving institution may require or have requested. / При дословном переводе с Английского языка этот термин звучал бы как Перевод По Кабелю или Кабельный Перевод. Метод перевода денежных средств с помощью телеграммы или телекса. Известен также как Телеграфный Перевод (Telegraphic Transfer) и Электронный Перевод (Wire Transfer).

CABLE TWIST = ТРОСОВАЯ КРУТКА – Cable Twist or Cabled Twist is a construction of thread, yarn, cord, or rope in which each successive twist is in the direction opposite the preceding twists, i.e. an S/Z/S or Z/S/Z construction. / Тросовая Крутка – слагаемые нити второго кручения скручены в сторону, противоположную направлению крутки слагаемых нитей первого кручения, например, S/Z/S или Z/S/Z.

CABO–DLO = CENTRUM VOOR AGRIBIOLOGISCH ONDERZOEK = CENTRE FOR AGROBIOLOGICAL RESEARCH

CABOTAGE = КАБОТАЖ – (1) Cabotage:- trade or transport in coastal waters or between two ports/points within a country especially by parties other than domestic carriers. Many countries, such as the United States, have laws requiring domestic-owned vessels to perform domestic interport water transportation services. Transport of goods between two locations within the same country. Water transportation term applicable to shipments between ports of a nation; commonly refers to coast-wise or inter-coastal navigation or trade. Many nations, including the United States, have cabotage laws which require national flag vessels to provide domestic interport service. Also known as Coasting. Cabotage is the carriage of goods or passengers for remuneration taken on at one point and discharged at another point within the territory of the same country. Transport of goods between two ports or places located in the same country. A term Cabotage refers generally to the transport of passengers and goods. Originally, it referred specifically to shipping, but cabotage also applies to airlines, trucking, and trains. Many nations have cabotage laws which dictate the terms which carriers must follow when transporting people or materials within their borders. Many of these laws are designed to promote the development of domestic transport companies, and some cabotage laws have been criticized because they can restrict free trade. The word comes from the French Caboter, which means 'to sail along a coast'. While the word initially referred to navigation and trade in coastal waters, it has come to refer also to the right of a country to restrict its airspace. Cabotage rights are guaranteed to all nations because a threat to national airspace can threaten national security, and therefore countries need to be able to protect themselves by protecting their airspace. In addition to keeping themselves safer, many nations used cabotage laws to protect their economies and to promote a strong national shipping industry. Many countries give preference to domestic carriers in the air and in ports. The United States is one such example; airlines operating domestic flights in the United States must be American, although foreign carriers may fly into American airports. In ports, under the Jones Act, domestic cabotage must be carried out by American ships, although foreign carriers are welcome in international ports with trade goods and passengers. Foreign ships which make multiple stops, like cruise ships, may be receive special dispensation so that they do not violate cabotage laws. As an example of how cabotage works, if you board an plane in Peru which is operated by a Peruvian airline, the plane will be allowed to fly you to any international airport in the United States. If the plane lands in Chicago but continues on to New York, you can choose to disembark in either city. However, the plane may not take on new passengers in Chicago, because this would violate cabotage laws by transporting passengers domestically within the United States. In terms of shipping, cabotage laws are very important. The Jones Act is credited as being the driving force behind America's Merchant Marine, which numbers in hundreds of ships and thousands of skilled sailors. By restricting domestic cabotage to American-flagged ships, the United States government ensured that American carriers would enjoy a wide range of privileges which some foreign companies believe to be unfair. The justification for these cabotage laws is that the Merchant Marines benefit the United States by ensuring that the country has a large fleet of ships when it needs it, and the Merchant Marine would not be possible without the assurance of cabotage restrictions. / и разгружен в другом пункте . Под Каботажем, от Французского слова Cabotage, понимается судоходство между портами одной страны. Различают Большой Каботаж между портами разных морей, например, Балтийским и Чёрным, и Малый Каботаж между портами одного или двух смежных морей, например, Чёрным и Азовским.

(2) Cabotage is a transport of cargo in a country other than the country where the vehicle is registered (roadcargo). / Каботаж – перевозка груза в страну, которая не является страной регистрации транспортного средства (автодорожный груз).

(3) Cabotage is the carriage of a container from a surplus area to an area specified by the owner of that container, in exchange for which and during which the operator can use this container. / Под Каботажем или Каботажной Перевозкой понимается перевозка контейнера из области, в которой они в излишке, в область, указанную владельцем такого контейнера, .

CABOTAGE POLICIES = КАБОТАЖНЫЕ ПОЛИСЫ – Cabotage Policies:- reservation of a country's coastal (domestic) shipping for its own flag vessels.

CAC = CONSUMER ADVISORY COUNCIL

CAC 40® = COTATION ASSISTÉE EN CONTINU QUARANTE

CACM = CENTRAL AMERICAN COMMON MARKET

CACMI = COMITE AFRICAIN POUR LA COORDINATION DES MOYENS D'INFORMATION = AFRICAN COMMITTEE FOR THE COORDINATION OF INFORMATION MEDIA

CA CONTAINER = CONTAINER WITH CONTROLLED ATMOSPHERE

CACTI = КАКТУСЫ – Cacti, as relates to the US/Canada Greenhouse Certification Program, Cacti are Plants that are adapted for storing water for extended periods of drought. They generally do not have leaves, and almost all Species are spiny, with spines growing from small cushion-like structures called Areolas. Cacti include Barrel Cactus, Prickly Pear, Christmas Cactus, and Easter Cactus. / Парник (Greenhouse). Под Кактусовыми или Кактусами понимается Семейство Двудольных Многолетних Растений, обычно с мясистыми, сочными стеблями, покрытыми колючками, волосками и щетинками. Древовидные, кустарниковидные и лиановидные формы. Свыше 3 000 Видов, главным образом в тропических и субтропических пустынях Америки. Плоды и мякоть стеблей некоторых Кактусовых съедобны. Используют как топливо, в строительстве; выращивают в комнатах и оранжереях.

CACTIFORM = КАКТУСООБРАЗНОЕ (или КАКТУСОВИДНОЕ) – Cactiform:- with the growth habit of a dwarf Cactus, having a ribbed or tuberculate green stem that is not much taller than wide. / :- с габитусом роста карликового Кактуса, имеющее . Под Кактусовыми или Кактусами понимается Семейство Двудольных Многолетних Растений, обычно с мясистыми, сочными стеблями, покрытыми колючками, волосками и щетинками. Древовидные, кустарниковидные и лиановидные формы. Свыше 3 000 Видов, главным образом в тропических и субтропических пустынях Америки. Плоды и мякоть стеблей некоторых Кактусовых съедобны. Используют как топливо, в строительстве; выращивают в комнатах и оранжереях.

CACTINE = КАКТИН – Cactine is an alkaloid supposedly present in some Cactaceae such as Selenicereus grandiflorus but of doubtful reality. Cactine is said to have a digitalis-like action on the heart and to have diuretic properties. / в некоторых Кактусовых

(Cactaceae), таких как, Род Селеницереус (или Луносвечник; Selenicereus):- Стелющиеся или Вьющиеся Цереусы, редко эпифиты, с относительно тонкими 5–8-гранными колючими стеблями. Характерно образование воздушных корней на стеблях. Цветки крупные, с колючками на цветочной трубке. Известно 24 Вида. Распространены от Северной границы Штата Техас через Мексику, Вест-Индию, Центральную Америку до Аргентины. Жители тропических лесов и побережий. Многие Виды получили название Царица Ночи. Крупный цветок, до 35 см длиной и диаметром, раскрывается ночью и увядает на следующее утро. Золотисто-жёлтые чашелистики, белые лепестки, необыкновенное время цветения, а также аромат ванили, издаваемый цветком, делают его неповторимо прекрасным. Царица Ночи – Растение лекарственное. Цветок и стебель содержат алкалоид Кактин, который повышает кровяное давление. В качестве лекарства используют спиртовой или водный экстракт лепестков и стеблей. В медицине впервые употребил его врач Рубини в 1864. В настоящее время экстракт цветков используется во многих странах под названием Золотые Капли. Чаще в ботанических садах выращивают Селеницереус Крупноцветковый (Selenicereus Grandiflorus) с 6–7-рёберным стеблем; Селеницереус г-жи Макдональд (Selenicereus Macdonaldiae) с 5–6-рёберным стеблем и Селеницереус крючковидный (Selenicereus Hamatus) с 4–5-рёберным стеблем и крупными крючковидными отростками по краям стебля.

CACTUS = КАКТУС – Cactus (Greek:- Kaktos = a Prickly Plant (Spanish Artichoke) from Sicily) is a Spiny, Succulent, Dicotyledonous Plant of the Family Cactaceae (Linnaeus 1737) native mainly to arid regions of North and South America, although some species are rainforest epiphytes. The fleshy stems and branches are characteristically furnished with tufts of hairs or spines coming from a common areole, a structure unique to this family. Only a few Species of cacti have leaves. In the majority of Species, photosynthesis is carried out on the green surface of enlarged stems that also serve as water storage organs. / Семейства Кактусовых (Family Cactaceae). Виды (Species). Под Кактусом понимается Семейство Двудольных Многолетних Растений, обычно с мясистыми, сочными стеблями, покрытыми колючками, волосками или щетинками. Древовидные, кустарниковидные и лиановидные формы. Свыше 3 000 Видов, главным образом в тропических и субтропических пустынях Америки. Плоды и мякоть стеблей некоторых кактусовых съедобны. Используют как топливо, в строительстве; выращивают в комнатах и оранжереях.

CAD = CANADIAN DOLLAR

CAD = CARD ACCEPTING DEVICE

CAD = CASH AGAINST DOCUMENTS

CAD = COMPUTER–AIDED–DESIGN

CAD/CAM = COMPUTER AIDED DESIGN/COMPUTER AIDED MANUFACTURING

CADDIS = ХХ (или ГАРУС, или ШЕРСТЯНАЯ ТЕСЬМА, или СУКОННАЯ САРЖА) – Caddis is the worsted yarn specifically a worsted ribbon or binding formerly used for garters and girdles. / .

CADDISFLY = РУЧЕЙНИК – Caddisfly (Order Trichoptera), any of a group of mothlike Insects that are attracted to lights at night and live near lakes or rivers. Because fish feed on the immature, aquatic stages and trout take flying adults, Caddisflies are often used as models for the artificial flies used in fishing. Adult Caddisflies are commonly 3 to 15 millimeters (0.118 to 0.590 inch) in length. Their anterior wings usually range from 4 to 20 millimeters in length, providing wing spans of 8 to 40 millimeters. The wings at rest are folded rooflike and cover the top of the body. One family (Hydroptilidae), commonly known as Microcaddis, are only 1.5 millimeters in length, with anterior wings of 2 to 5 millimeters. Caddisfly wings either are covered with hairs or have hairs on the veins; the posterior pair are often broader than the anterior. Caddisflies are widely distributed in freshwater habitats throughout the world. The larva of one marine Species, Philanisus Plebeius, occurs in intertidal zones of New Zealand and Southern Australian coasts. The larva of one terrestrial European Species, Enoicyla Pusilla, lives in damp leaf litter, while one or two other Species occur in brackish water. Approximately 7 000 Species of Caddisflies are known. Caddisfly is any of the mothlike aquatic Insects that constitute the Order Trichoptera. The adult, attracted to light at night, often lives near lakes or rivers. Because fish feed on immature, aquatic stages and trout take flying adults, caddisflies are used as models for fishermen's 'flies'. General Features:- adult caddisflies are commonly 3 to 15 millimeters (0.118 to 0.590 inch) in length; their anterior wings usually range from 4 to 20 millimeters in length, providing wing spans of 8 to 40 millimeters. The wings at rest are folded rooflike and cover the top of the body. One family (Hydroptilidae), commonly known as Microcaddis, are only 1.5 millimeters in length, with anterior wings of 2 to 5 millimeters. Caddisfly wings either are covered with hairs or have hairs on the veins; the posterior pair are often broader than the anterior. Caddisflies are widely distributed in freshwater habitats throughout the world. The larva of one marine species, Philanisus plebeius, occurs in intertidal zones of New Zealand and southern Australian coasts. The larva of one terrestrial European species, Enoicyla pusilla, lives in damp leaf litter, while one or two other species occur in brackish water. Approximately 7 000 Species of caddisflies are known. Natural History:- Life Cycle:- Caddisflies undergo complete metamorphosis. Males generally have complicated external genitalia. Spermatozoa are transferred either directly or in spermatophores (capsules transferred to females). In the females of some species the terminal segments of the abdomen are modified to form a long ovipositor. Eggs, in masses numbering up to 800, are laid within a jelly that swells on contact with water. A female may wash off a partially extruded egg mass by dipping her abdomen into water during flight, or she may place the mass on stones in the water or on aquatic plants just above the water. Young larvae, crawlers with strong legs, hatch within a few days and feed on vegetable material or algae. In some species the larvae form webs of debris for protection; others form a funnel-like web between stones in running water to catch food. Some protect their bodies with cases; others spin protective lairs or are free-living. Larvae may be herbivorous, carnivorous, or omnivorous. They produce silk from glands on the lower lip (labium), and many herbivorous species spin tubular protective cases, open at both ends, that enlarge as the larvae grow; sand grains or vegetable debris, added to cases, provide protection and rigidity. In casebearing forms the head and thorax protrude from the case, which is pulled along by the abdomen. Larvae of one Species (Triaenodes Bicolor) swim by means of long, slender, hair-fringed posterior legs, dragging their cases through the water. Undulating movements of the enclosed larvae circulate water to provide oxygen for respiration. Prior to the last molt before the pupal stage, the larva fixes the case to some solid object and closes both ends for further protection, leaving only water circulation holes. The larva pupates inside the larval case (which then becomes a cocoon) or inside a specially constructed cocoon. After two or three weeks the pupa bites its way out of the cocoon and swims or crawls to the water surface, using its hair-fringed middle pair of legs; then the winged caddisfly adult emerges and lives several weeks. Adults sometimes emerge in large numbers, often forming swarms. Caddisflies usually mate on vegetation or rocks surrounding water. There is generally one complete life cycle per year. Ecology:- essentially, caddisflies are aquatic insects associated with a wide range of freshwater habitats. Oxygen concentration, associated with water velocity, is important to their larvae, as is the chemical content of the water. In fact, certain species have been used as indicators of pollution. Larvae feed on aquatic plants, algae, diatoms, or plant debris; a few are predatory on other aquatic insects, crustaceans, and mollusks; some are omnivorous. The larvae, often numerous, play an important role in the aquatic community, reducing plant growth and disposing of animal and plant debris; they use vegetation and debris in casemaking and for food. Most adult caddisflies, incapable of feeding on solids, imbibe liquids (e.g., nectar from flowers); one species pollinates an Alpine flower as it feeds. Sponges and algae grow on the protective cases, and protozoans and mites grow on the larvae of some species. Two hymenopterans parasitize

caddisflies; the parasitic wasp seeks its host underwater and lays its eggs inside the caddisfly larval case. The parasitic larva devours the caddisfly larva and remains inside the case to pupate; the adult parasite overwinters in the case and emerges in the early summer. Caddisflies are important as food for other animals. Freshwater fish, particularly trout, and eels feed on larvae and swimming pupae; trout, birds, lizards, frogs, spiders, dragonflies, and bats feed on adults. Day flight of caddisflies includes stationary swarming, usually centring around some obvious object on the shore, or mobile swarming, in which the swarms seem to move haphazardly. Most species fly at night, however, and are strongly attracted to light. Night flight may be bimodal, continuous, or intermittent. Warm moist nights are particularly conducive to caddisfly flight. Form And Function:- Trichopteran adults are characterized by four wings that bear hairs on the membrane or prominent veins, or both. The head and thorax are also usually hairy. The many-jointed antennae, usually about the length of the anterior wing, may be longer than the wingspan. Mouthparts have nonfunctional mandibles but well-developed maxillary and labial palpi (or sensory appendages); the hypopharynx is modified to form a sucking tongue for imbibing fluids. Various sensory and scent organs may occur on the head or wings. Each of the three thoracic segments bears a pair of walking legs. Several of the ten abdominal segments may bear lateral filaments (or cerci), often with complicated external genitalia terminally in males, sometimes with prominent ovipositors in females. Evolution And Paleontology:- the caddisflies were long classified in the order Neuroptera; the two groups are now thought, however, to represent different evolutionary lines. Ancestral Mecoptera (scorpionflies) probably gave rise to the Neuroptera (lacewings), Trichoptera (caddisflies), and Lepidoptera (moths, butterflies). The closely related Trichoptera and Lepidoptera may have arisen from a common offshoot. Early aquatic trichopterans may have diverged from the terrestrial line in the Late Triassic Period (about 200 000 000 years ago). The earliest known trichopteran fossils are from the Early Jurassic Period (about 185 000 000 years ago). A few fossil wing prints from the Cretaceous Period (about 65 000 000 to 136 000 000 years ago) are known; many fossils in Oligocene Baltic amber (about 26 000 000 to 38 000 000 years ago) belong to or are related to living genera. Later fossil wing prints occur in Miocene deposits. Classification:- Distinguishing Taxonomic Features:- Caddisflies are mothlike insects with two pairs of hairy wings (sometimes a few scales) folded rooflike over the abdomen. Antennae are long and many jointed with a large basal joint. Large compound eyes are present; simple eyes (ocelli) number three or are absent. The number of maxillary palpal joints usually is five but varies between two and six. Posterior wings are broader than anterior; the pattern of veins is generalized and sometimes reduced. Legs are long and slender, tarsi five-jointed; tibial leg segments may bear variable numbers of spurs. Male genitalia, often complex, have been used for specific identification; female genitalia are of increasing taxonomic significance. Another system relies on the internal characters (e.g., internal head skeletal structures, known collectively as the Tentorium). Larvae are essentially aquatic. Campodeiform (elongated and flattened) larvae are free-living or net forming; eruciform (caterpillar-like) larvae are casebearing. In some groups head capsules, functional mandibles, thoracic shields, abdominal gills, abdominal prolegs or hooks, and types of nets or cases are distinct; in all groups antennae are short, and spiracles absent. Pupae have functional mandibles, free limbs, and hook-bearing dorsal plates. Annotated Classification:- the number of living families has recently increased. Nineteen were listed in 1953 and 34 (based on a different method of classification) in 1967. The following is based on the later scheme. Order Trichoptera (Caddisflies):- insects with 2 pairs of wings held rooflike over the body in repose; the wing membrane or veins with hairs, or both; wing vein pattern generalized; tibiae usually with spurs, tarsi 5-jointed; larvae and pupae aquatic, with functional mandibles; larvae with terminal abdominal hooked prolegs or hooks, free-living, net spinning, or casemaking, pupate in larval case or cocoon. (1) Suborder Annulipalpia:- terminal segment of maxillary palpi annulate (with ringed appearance) or subdivided; larvae, net spinners. Superfamily Hydropsychoidea:- Antennae usually anterior wing length or less. Family Philopotamidae:- Ocelli medium to small; larval head elongated. Family Stenopsychidae:- closely related to Philopotamidae; ocelli large or absent; larval head elongated. Family Xiphocentrionidae:- closely related to Psychomyiidae; ocelli absent. Family Psychomyiidae:- Ocelli absent. Family Polycentropodidae:- Ocelli absent. Family Dipseudopsidae:- closely related to Polycentropodidae. Family Hydropsychidae:- Antennae mostly about anterior wing length or slightly longer; ocelli absent; larvae with many-branched ventral abdominal gills on most segments. (2) Suborder Integripalpia:- terminal segment of maxillary palpi undivided; larvae free-living or case makers. (i) Superfamily Rhyacophiloidea:- Antennae shorter than anterior wing length. Family Rhyacophiloidae:- Ocelli present; larvae free-living, produce a single line of silk. Family Glossosomatidae:- adults similar to Rhyacophilidae; larvae, saddle case makers with modified terminal prolegs and hooks. Family Hydroptilidae (Microcaddis):- Ocelli present or absent; wings reduced, narrow, with long hair fringes; larvae purse case makers or tube case makers in last larval stage; earlier stages free-living. (ii) Superfamily Limnephiloidea:- larvae, tube case makers. Limnephilid Branch:- Antennae about anterior wing length; ocelli usually present; adult mandibles reduced or lost. Family Limnocentropodidae:- primitive articulating mandibles. Family Brachycentridae:- maxillary palpi 3-jointed in male. Family Phryganeidae:- maxillary palpi usually 4-jointed in male. Family Phryganopsychidae:- male maxillary palpi 4-jointed. Family Goeridae:- Ocelli absent; maxillary palpi of male 3-jointed. Family Thremnidae:- closely related to Limnephilidae. Family Limnephilidae:- maxillary palpi of male 3-jointed. Family Plectrotarsidae:- closely related to Limnephilidae; specialized elongated mouthparts. Family Lepidostomatidae:- Ocelli absent; maxillary palpi 3-jointed in male. Family Rhynchopsychidae:- closely related to Lepidostomatidae, but mouthparts elongated. Leptocerid Branch:- Antennae about anterior wing length or less, except Leptoceridae; ocelli absent. Family Pisuliidae:- male maxillary palpi 3-jointed. Family Calocidae:- maxillary palpi 5-jointed. Family Pycnocentrellidae:- maxillary palpi 5-jointed. Family Beraeidae:- maxillary palpi 5-jointed. Family Sericostomatidae:- male maxillary palpi 3-jointed or less. Family Helicophidae:- maxillary palpi 5-jointed, both sexes. Family Philanisidae:- maxillary palpi 5-jointed in both sexes; larvae only in marine littoral zone. Family Antipodoeciidae:- apparently related to Odontoceridae; male maxillary palpi 3-jointed. Family Odontoceridae:- maxillary palpi 5-jointed. Family Molannidae:- maxillary palpi 5-jointed; claws specialized. Family Philorheithridae:- maxillary palpi of males 5-, 4- and 3-jointed, basal joint with nodule. Family Helicopsychidae:- maxillary palpi of male 2-jointed; larval cases look like small snail shells; very small in size, traditionally placed in Sericostomatidae; many adult characters reduced or absent; relationships uncertain. Family Calamoceratidae:- maxillary palpi 5- or 6-jointed. Family Leptoceridae:- Antennae longer than wingspan; maxillary palpi 5-jointed; anterior wings elongated; vein pattern reduced. Critical Appraisal:- many species of caddisflies have been described from male characteristics, particularly genitalia only, family characters being assumed. Work in recent years on female characters, internal adult characters, and larval characters has revealed new sources of taxonomic information. Further progress in classification depends upon these detailed studies. The classification used above reveals the extent of progress thus far. Caddisfly is a member of the Insect Order Trichoptera. / Под Ручейниками или Власокрылыми понимается Отряд Насекомых. Длиной 0.5–30 миллиметров (мм), крылья в размахе до 70 мм, покрыты волосками. Свыше 3 000 Видов. Распространены широко. В бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось около 300 Видов. Личинки (в чехликах) и куколки обычно живут в воде, взрослые – на суше у воды (отсюда название). Личинки – пища Рыб, некоторые повреждают Рис.

CADS = CASH AVAILABLE FOR DEBT SERVICE

CADUCOUS = КАДУКОУС (или РАНО ОПАДАЮЩИЙ) – Caducous:- falling off early.

CADY = КАДИ (или КЭЙДИ, или КЕПКА) – Cady is a precious silk fabric, slightly fulled, originally produced in the French region of Languedoc, for couture and evening gowns. Generally produced in 2 plies. Some manufacturers will use a high-quality 3-ply cady, which is finished to create a denser, heavier, pre-washed effect, increasing the fabric's luxurious feel. / .

CAERULEA = КЭРУЛЭА (или СИНЕЕ, или ГОЛУБОЕ) – Caerulea (-is, -um):- blue.

CAESPITOSE = ДЕРНИСТОЕ (или ДЕРНОВОЕ, или РАСТУЩЕЕ ПУЧКАМИ) – Caespitose or Cespitose is forming a cluster or clump of stems by repeated branching of the stem above ground, at or near the base of the plant. Of plants that offset freely to form a large clump. / гроздь (cluster) .

CAF = COST, ASSURANCE AND FREIGHT

CAF = CURRENCY ADJUSTMENT FACTOR

CAFE = CORPORATE AVERAGE FUEL ECONOMY

CAFÉ AU LAIT = КАФЕ О ЛЕ (или КОФЕ С МОЛОКОМ) – Café Au Lait:- the color of Coffee with milk. Café Au Lait (French for 'Coffee With Milk') is a French Coffee drink. / .

CAFFEINE = КОФЕИН – Caffeine is a methyl-xanthine alkaloid occurring naturally in some plants used to make beverages and foods including Coffea Arabica berries (Coffee), Thea sinensis leaves (Tea), Cola acuminata nuts (Coca Cola), Themobroma Cacao beans (chocolate) and added to a wide range of manufactured foods. Caffeine is one of the most widely used mood-altering drugs and has probably been used through the whole of human history. / Под Кофеином понимается алкалоид, содержащийся в семенах Кофейного дерева, листьях чайного куста, ореха Кола и других. Оказывает возбуждающее действие на центральную нервную и сердечно-сосудистую системы. Применяется как стимулирующее средство, при отравлении наркотиками и другое.

CAFR = COMPREHENSIVE ANNUAL FINANCIAL REPORT

CAFTAN = КАФТАН – Caftan is a usually cotton or silk ankle-length garment with long sleeves that is common throughout the Levant.

CAGE = КЛЕТЬ (или КЛЕТКА, или КАРКАС, или ИЗОЛЯТОР) – (1) Cage is a secure enclosed area for storing highly valuable items. Special section specifically for Ad Valorem type cargo.

(2) Cage is a pallet-sized platform with sides that can be secured to the tines of a forklift and in which a person may ride to inventory items stored well above the warehouse floor. / Платформа размером с поддон со сторонами, которые могут быть прочными при контакте с зубцами или лапами подъёмника, и в которой лицо может перевозить товарно-материальные изделия, размещённые должным образом над полом склада.

(3) Slang in energy industries. A 'Cage' is a type of elevator used in a mineshaft to move miners and equipment. / Клетка – жаргонный термин в сфере энергетики, означающий тип лифта (элеватора), используемого в стволе шахты для перемещения шахтёров и оборудования.

(4) Cage is an enclosure for confining plants and insects.

CAGE PALLET = КЛЕТЬЕВОЙ ПОДДОН (или СЕТЧАТЫЙ ПОДДОН) – Cage Pallet or Mesh Box Pallet is a pallet with mesh, rodded or barred sides, one or more of which may have a hinged or removable gate for access. / Сетчатый Поддон – ящичный поддон с сетчатыми или решетчатыми стенками, одна или несколько стенок которого имеют шарнирные или съёмные двери для доступа.

CAGE WHEEL = РЕШЁТЧАТОЕ КОЛЕСО (или СКЕЛЕТНОЕ КОЛЕСО) – Cage Wheel is cage-type steel wheel commonly used on hand tractors.

CAGR = COMPOUND ANNUAL GROWTH RATE

CAH = CARD ACCEPTING HOST

CaHa = CALCIUM HUMATES

CaHa = КаXX – CaHa is the older fraction of humic acid bound to calcium.

THE CAIRNS GROUP = КАЙРНСКАЯ ГРУППА – The Cairns Group is a group of agricultural exporting nations lobbying for agricultural trade liberalization. It was formed in 1986 in Cairns, Australia just before the beginning of the Uruguay Round. Current membership (in 2012):- WTO members (19):- Argentina, Australia, Bolivia, Plurinational State of, Brazil, Canada, Chile, Colombia, Costa Rica, Guatemala, Indonesia, Malaysia, New Zealand, Pakistan, Paraguay, Peru, Philippines, South Africa, Thailand, Uruguay. The Cairns Group, established in 1986, is an informal association of agricultural exporting countries. Members include:- Argentina, Australia, Brazil, Canada, Chile, Colombia, Hungary, Indonesia, Malaysia, New Zealand, Philippines, Thailand and Uruguay. The Cairns Group is an interest group of 18 agricultural exporting countries, composed of Argentina, Australia, Bolivia, Brazil, Canada, Chile, Colombia, Costa Rica, Guatemala, Indonesia, Malaysia, New Zealand, Pakistan, Paraguay, the Philippines, South Africa, Thailand, and Uruguay. The Group takes its name from the Australian city of Cairns, where its inaugural meeting took place in 1986. The Australian Government led the formation of the group, though some of the South East Asian countries had been working together on agricultural trade through ASEAN. The move to form the group was largely a response to the spiralling trade subsidies of the European Union's Common Agricultural Policy and the USA's Export Enhancement Program. Particularly, the objection came to the double standards between the GATT (short for the General Agreement on Tariffs and Trade) forcing countries to liberalise their economies, whilst the United States (US) were granted a waiver for agricultural protection in the 1950's. The Cairns Group's objective is to bring about liberalization of global trade in agricultural produce. In particular, its members aim to abolish export subsidies and trade-distorting ('amber box') domestic support measures for agricultural products and seek to improve market access for exported agricultural goods. The coalition attempts to present a common front in multilateral trade negotiations at the World Trade Organization, tabling joint proposals and occasionally working with like-minded groups such as the G20 group of developing nations. The Cairns Group successfully forced agriculture onto the agenda of the Uruguay Round. This eventually led to the Agreement on Agriculture. In the ongoing Doha Round of trade negotiations, they are mainly opposed by WTO members seeking to uphold their high level of agricultural protection on grounds of public policy, such as the European Union, Japan, Norway, South Korea, Switzerland and United States of America (dubbed the 'multifunctionalists'). / Кайрнская Группа была сформирована в 1986 в качестве неформальной ассоциации стран, вывозящих (или экспортирующих) сельскохозяйственную продукцию. Членами этой группы являются:- Австралия, Аргентина, Бразилия, Венгрия, Индонезия, Канада, Колумбия, Малайзия, Новая Зеландия, Таиланд, Уругвай, Филиппины и Чили. Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)).

CAK = CONTRACT

CAKES = БРИКЕТЫ (или КЕКИ, или КОКСОВЫЕ ПИРОГИ, или КУЛИЧИ, или ПОКОВКА, или ЧЁРНАЯ (МЕДЬ), или ШТЫКОВАЯ (МЕДЬ), или ШТАНГИ, или СУХАРЬ) – Cakes:- cuboid semi-finished copper product that is used to make other semi-

finished or finished products. / кубоидный полуфабрикат из меди, который используется для выработки других полуфабрикатов или готовых продуктов. Под Кеком понимается слой твёрдых частиц, остающийся после фильтрации суспензий (пульпы), или нерастворимый остаток, получаемый после выщелачивания ценных компонентов из руды или промышленного продукта. Содержит 12–20% влаги. Под Поковкой понимается промежуточная заготовка или изделие, полученное ковкой или объёмной штамповкой. Брикет:- (1) Медная или из сплавов меди литая заготовка, прямоугольная в поперечном сечении, используемая для прокатки в лист или ленту. (2) Спекшаяся масса неспрессованного металлического порошка. Сухарь – обезвоженный шлам после вакуумирования.

CAKE = ЖМЫХ – Cake is the mass resulting from the pressing of seeds in order to remove oils, fats, or other liquids. / Под Жмыхом понимаются семена масличных растений после выделения из них жира прессованием; побочный продукт маслобойного производства. Концентрированный корм для сельскохозяйственных животных с большим содержанием протеина (15–40%); один из компонентов комбикормов.

CAKE = КУЛИЧ (или ВЫПЕЧКА) – Cake:- after extrusion from the spinnerets, one way of gathering rayon and some other filaments is in a 'Cake' formation. They are given a slight twist and run into a fast-spinning hollow cylinder or pot where they are then collected by centrifugal force in a round shape with an open center called the 'Cake', and made up of thousands of yards of the continuous filament. / Кулич (прядильный); Каравай (каучука). Экструзия или Выдавливание (Extrusion).

CAKING = СПЕКАНИЕ (или СЛЁЖИВАНИЕ) – Caking:- hardening of bulk cargo caused by a release of water vapor. Causes the formation of lumps if moisture is present in salts or sugars. / Закалка или Упрочнение (Hardening). В технике под Спеканием понимается соединение мелкозернистых и порошкообразных материалов в куски при повышенной температуре. Спеканию подвергаются материалы при агломерации, коксовании и так далее.

CALA = COMPLEXE AGRICOLE DU LAC ALAOTRA = AGRICULTURAL COMPLEX OF LAKE ALAOTRA

CALCAR = ШПОРНЫЙ ВЫСТУП (или ШПОРЕЦ) – Calcar is an anatomical spur (spine or spike) or spur-like projection in an insect.

CALCARATE = ИМЕЮЩЕЕ ШПОРУ – Calcarate:- with a spur.

CALCAREOUS = КАРБОНАТНОЕ (или ИЗВЕСТКОВОЕ) – Calcareous:- chalky, derived from limestone, or with an excess of lime.

CALCAREOUS SOIL = КАРБОНАТНАЯ ПОЧВА – Calcareous Soil is a soil that contains sufficient calcium carbonate or calcium-magnesium carbonate to effervesce visibly when treated with cold 0.1N hydrochloric acid.

CALCICOLE = КАЛЬЦЕФИЛЬНОЕ – Calcicole:- growing only in limestone soils. / Обитающий на известняках или известковых почвах.

CALCIFUGE = КАЛЬЦЕИЗБЕГАЮЩЕЕ (или КАЛЬЦЕФОБ) – A Calcifuge (from French, Calcifugous, from Calc + Latin Fugere to flee more at fugitive) is a plant that does not tolerate alkaline (basic) soil. The word is derived from the Latin to flee from chalk. These plants are also described as ericaceous, as the prototypical calcifuge is the Genus Erica (heaths). Calcifuge or Calciphobe is a plant unable to stand chalky (limy) soil. / Щелочное (Alkaline). Кальцеизбегающее или Кальцефоб – растение, неспособное насаждать меловую (известковую) почву. Под Кальцефобами (Calciphobe), от Латинского слова Calx, родительный падеж Calcis, означающее Известь, и Греческого слова Phóbos, означающее Страх, понимаются растения, плохо растущие на известковых почвах. Сфагновые Мхи, Виды Пушицы, Подбела.

CALCIPHYTES = КАЛЬЦЕФИТЫ – Calciphytes are plants that require or tolerate considerable amounts of calcium or, are associated with soils rich in calcium. / Кальцефиты – меловые (известковые) растения. Под Кальцефитами, от Латинского слова Calx, родительный падеж Calcis, означающее Известь, и Греческого слова Phytón, означающее Растение, понимается .

CALENDAR = КАЛАНДР – Calendar is a machine used in finishing to impart a variety of surface effects to fabrics. A calendar essentially consists of two or more heavy rollers, sometimes heated, through which the fabric passes under heavy pressure. See also Calender. Calendar:- cotton fabric is passed through heat and pressure (rollers) so that the a glossy appearance or luster is added.

CALENDAR LINE = ЛИНИЯ ОТ КАЛАНДРА (или КАЛАНДРОВАЯ ЗАСЕЧКА) – Calendar Line:- sharp pressmark on fabric due to the calendar during the processing. Fabrics defect. / Засечки Каландровые без разрывов ткани. Размер порока – до 20 см. Засечки от Каландра:- имеют вид устойчивых складок, образуются при прохождении через каландр плохо расправленной ткани.

CALENDAR ROLLS = КАЛАНДРОВЫЕ ВАЛЫ (или ПЛЮЩИЛЬНЫЕ ВАЛИКИ) – Calendar Rolls are:- (1) the main cylinders on a calendar. (2) Smooth or fluted rolls used on various fiber processing machines such as pickers and cards to compress the lap or sliver as it passes between them.

CALENDAR SPREAD = КАЛЕНДАРНАЯ КУРСОВАЯ РАЗНИЦА (или КАЛЕНДАРНЫЙ СПРЭД) – (1) Calendar Spread is the simultaneous purchase of futures in one delivery month and sale of futures in another delivery month. Calendar Spread is the purchase of one delivery month of a given futures contract and simultaneous sale of a different delivery month of the same futures contract. Calendar Spread is an options or futures spread established by simultaneously entering a long and short position on the same underlying asset but with different delivery months. Sometimes referred to as an Interdelivery, Intramarket, Time or Horizontal Spread. An example of a calendar spread would be going long on a crude oil futures contract with delivery next month and going short on a crude oil futures contract whose delivery is in six months. / Закупить конкретный фьючерсный контракт с одним месяцем поставки и одновременно продать аналогичный фьючерсный контракт, но с другим месяцем поставки.

(2) Calendar Spread is an options position comprised of the purchase and sale of two options contracts of the same type that have the same strike prices but different expiration dates. Also known as Horizontal Spread or Time Spread. See also Interdelivery Spread. The purchase of a put or call option and the simultaneous sale of the same type of option with typically the same strike price but a different expiration date. Calendar Spread options, based on the price differential between two delivery dates for the same commodity, are designed to help market participants mitigate the considerable price risk that is often present between contract months of a futures contract. The price between contract months of some commodities (e.g., energy products) can be extremely volatile because such markets are more sensitive to weather and news than any other market. A widening of the month-to-month price relationships can expose market participants to severe price risk which could adversely affect the effectiveness of a hedge or the value of inventory. Calendar Spread is the simultaneous purchase and sale (or vice versa) of an option of the same strike for different months. Calendar Spread is a strategy that involves buying and selling options or futures with the same (strike) price but different maturities. Such a strategy is used in futures when one contract month is theoretically cheap and another is expensive. With options, the strategy is often used to play expected changes in the shape of the volatility term structure. For example, if one-month volatility is high and one-year volatility low, arbitrageurs might buy one-year straddles and sell short-term straddles, thereby selling short-term volatility and buying

long-term volatility. If, all else being equal, short-term volatility declines relative to long-term volatility, the strategy makes money. Calendar Spread is created by selling a call option with a certain exercise price and buying a longer maturity call option with the same exercise price. Alternatively a put option can be sold while simultaneously buying a longer maturity put with the same exercise price. / Календарная Курсовая Разница или Календарный Спрэд – опционная позиция, заключающаяся в закупке и продаже двух опционных контрактов одного и того же типа, которые имеют одинаковые сходные цены, но различные даты прекращения признания. Известна также как Горизонтальная Курсовая Разница или Горизонтальный Спрэд (Horizontal Spread), или Срочная Курсовая Разница или Временной Спрэд (Time Spread). Смотрите также Курсовая Разница По Различным Срокам Поставки или Спрэд По Различным Срокам Поставки (Interdelivery Spread). Закупка опциона на продажу или на покупку и одновременная продажа этого же самого типа опциона с типично той же самой сходной ценой, но с отличающейся датой прекращения признания. Опционы с Календарной Курсовой Разницей или Опционы с Календарным Спрэдом, базирующиеся на ценовом дифференциале между двумя датами поставки для одного и того же сырья, предназначены для того, чтобы помочь участникам рынка ослабить значительный ценовой риск, который присутствует зачастую между контрактными месяцами фьючерсного контракта. Цена между контрактными месяцами для некоторых видов сырья (например, энергоносителей) может быть экстремально лихорадочной вследствие того, что такие рынки более подвержены изменениям погоды и новостям, нежели любой другой рынок. Расширение ценовой взаимосвязи между различными месяцами поставки по таким фьючерсным контрактам может подвергнуть участников рынка серьёзному ценовому риску, который мог бы неблагоприятно воздействовать на эффективность хэдьжа или на стоимость инвентаря (или товарно-материальных ценностей). Календарный Спрэд – опционная стратегия, осуществляемая путём одновременной покупки и продажи опционов с одинаковой сходной ценой, но разными датами исполнения. Максимальный риск ограничен разницей между премиями. Максимальная прибыль зависит от стоимости опциона с более отдалённым сроком исполнения на момент истечения опциона с более близким сроком. Данная стратегия используется в периоды относительно низкой лихорадочности цен. Называется также Горизонтальным Спрэдом (Horizontal Spread).

CALENDER = КАЛАНДР – Calender is a machine used in finishing to impart a variety of surface effects to fabrics. A calender essentially consists of two or more heavy rollers, sometimes heated, through which the fabric passes under heavy pressure. Calender is a system of rollers, usually heated and varying in composition, through which fabric is passed to obtain a particular kind of finish. / Под Каландром, от Французского слова Calandre от Calandrer, означающее Лощить или Прокатывать, понимается машина (или её часть), состоящая из системы валов (от 2 до 20), между которыми пропускают материал (ткань, бумагу, резину и другой) для придания ему плотности, гладкости, лоска, нанесения тиснением рисунка или узора. Каландры применяют в текстильном, бумажном и резиновом производствах, при изготовлении полимерных плёнок и изделий из пластмасс.

CALENDER COATING = НАНЕСЕНИЕ ПОКРЫТИЯ КАЛАНДРОВАНИЕМ – Calender Coating is a type of roller coating that is actually a laminating operation. The coating is formed into a sheet, then joined with the fabric. See also Coating.

CALENDERING = КАЛАНДРИРОВАНИЕ – Calendering is the process of passing fabric through a machine consisting of heavy rollers which rotate under pressure to smooth and flatten fabric, to close the intersection between the yarns, or to confer surface glaze. Often used with cellulose fabrics like linen and cotton. Calendering is a process for finishing fabrics in which such special effects as high luster, glazing, embossing, and moiré are produced. Calendering is a final process in which heat and pressure are applied to a fabric by passing it between heated rollers, imparting a flat, glossy, smooth surface. Lustre increases when the degree of heat and pressure is increased. Calendering is applied to fabrics in which a smooth, flat surface is desirable, such as most cottons, many linens and silks, and various man-made fabrics. In such fabrics as velveteen, a flat surface is not desirable, and the cloth is steamed while in tension, without pressing. When applied to wool, the process is called Pressing, and employs heavy, heated metal plates to steam and press the fabric. Calendering is not usually a permanent process. Moiréing, embossing, glazing and ciréing, and polishing. These are all variations of the calendering process. Moiré is a wavy or 'watered' effect imparted by engraved rollers that press the design into the fabric. The process, applied to cotton, acetate, rayon, and some ribbed synthetic fabrics, is only permanent for acetates and resin-treated rayons. Embossing imparts a raised design that stands out from the background and is achieved by passing the fabric through heated rollers engraved with a design. Although embossing was formerly temporary, processes have now been developed to make this effect permanent. Glazing imparts a smooth, stiff, highly polished surface to such fabrics as chintz. It is achieved by applying such stiffeners as starch, glue, shellac, or resin to the fabric and then passing it through smooth, hot rollers that generate friction. Resins are now widely employed to impart permanent glaze. Ciré (from the French word for waxed) is a similar process applied to rayons and silks by the application of wax followed by hot calendering, producing a high, metallic gloss. Ciré finishes can be achieved without a sizing substance in acetates, which are thermoplastic (e.g., can be softened by heat), by the application of heat. Polishing, used to impart sheen to cottons without making them as stiff as glazed types, is usually achieved by mercerizing the fabric and then passing it through friction rollers. Calendering is a mechanical finishing process for fabrics to produce special effects, such as high luster, glazing, moiré, and embossed effects. In this operation, the fabric is passed between heated rolls under pressure. Calendering is a term for the finishing process for fabrics that produces a shiny and smooth surface. The cloth is passed through recessed and heated cylinder rolls by running it through a friction or glazing calender. / Муаре (Moiré). , шеллак (shellac), или . Каландрирование – процесс обработки материалов (ткань, бумага, резина) на каландре. В бумажном производстве каландрирование осуществляется на машинных каландрах, устанавливаемых в конце сушильной части бумагоделательной машины, или на отдельно стоящих суперкаландрах. Бумага, обработанная на суперкаландре, называется каландрированной или лощёной; бумага, пропущенная через машинный каландр и имеющая меньший глянец, – бумагой 'машинной гладкости'. Гладкость бумаги, получаемая при каландрировании, зависит от рода валов (она более высока при сочетании чугунных и бумажных валов), их температуры (при нагревании гладкость повышается), состава и влажности бумаги (бумага, содержащая больше каолина, лучше каландрируется), а также давления между валами каландра. Каландрирование в резиновом производстве применяется для изготовления резиновых листов и пластин различной толщины, для пластификации и нагревания резиновой смеси, для промазки ткани резиновой смесью и другого. В текстильном производстве путём каландрирования уплотняют хлопчатобумажные, льняные, джутовые и другие ткани, придают им блеск, наносят тиснёный рисунок.

CALENDERING ROLLS = КАЛАДРОВЫЕ ВАЛЫ (или КАЛАНДРОВЫЕ ВАЛИКИ, или ПЛЮЩИЛЬНЫЕ ВАЛЫ) – Calendering Rolls are:- (1) the main cylinders on a calender. (2) Smooth or fluted rolls used on carious fiber-processing machines such as pickers and cards to compress the lap or sliver as it passes between them.

CALGON T = КЭЛГОН ТИ. (или КОЛГЭН ТИ.) – The original Calgon, or Calgon T, is sodium hexametaphosphate. It is sold as a powder. This is the water softener you want to use for tie-dyeing. You can mail-order it from PRO Chemical & Dye as 'Metaphos' (a name which is also applied to something else in other fields), from Dharma Trading Company as 'Water Softener', and from Jacquard Products as 'Calgon'. (Always check the fine print to make sure that whatever stuff you are ordering is indeed sodium hexametaphosphate.) This is great stuff. It is exactly what you want. It keeps soda ash from forming insoluble white crumbs that you can never get to dissolve, it prevents soap scum from forming a barrier on your fabric, it helps your dye work as efficiently as possible,

it prevents the formation of alginate gels if you're adding a thickener to your dye mixtures, and it prevents the formation of dye-calcium complexes that are very difficult to wash out, even though they have not bonded properly to the fabric. The only problem with sodium hexametaphosphate is that it acts as a fertilizer, which in the form of pollution from sewage or farm run-off can encourage algae to grow in rivers and lakes. However, the amount you will use for hand-dyeing is so tiny compared to the vast quantities from farm and industrial use that you do not need to worry about it at all. (It will be different if you start a factory to do this on a larger scale!) Unfortunately, the stuff labeled 'Calgon' that you can buy in the grocery store in liquid form is a completely different chemical, a chemical which is said to interfere with the action of the dyes. From what some people say, it might cause paler colors, or streakiness. You can't rely on it to perform the same functions as hexametaphosphate. Dharma Trading Company says that it inhibits dye from transferring to and adhering to fabric. If you get a package of Calgon that says that it is phosphate-free, then it is not 'real' Calgon, but instead a totally different chemical which is not what you want for dyeing. Phosphate-free liquid Calgon contains polycarboxylate instead of hexametaphosphate. Don't use it for dyeing; buy it only if you have some specific non-dye-related reason to use it for. I suspect that hexametaphosphate works better than polycarboxylates for almost any purpose you might use either one for. If you've already been using the 'wrong' type of Calgon, you might find you get a better color yield, and a faster washout after dyeing, when you use the good stuff. The difference might not be noticeable, though, if your water is reasonably soft. Calgon T is the Albright & Wilson trade name for sodium hexametaphosphate. Calgon T from Albright & Wilson is sodium hexametaphosphate without additives. Water softener products sold at retail under the Calgon name usually contain additives such as fragrances and surfactants. Calgon T is a combined product based on condensed phosphates. Appearance white very fine agglomerated hygroscopic powder. CALGON T new is a speciality product based on condensed phosphates; when stirred thoroughly, the product is readily soluble in water. Thanks to its anionic character, CALGON T new is perfectly compatible with other anionic or non-ionic auxiliaries. A special combination of medium-and-high-molecular phosphates imparts CALGON T new fairly versatile poperties; its use in almost all fields of the textile finishing industry (wet processes) goes along with a multitude of economical and technical advantages. / Жакяр (Jacquard). Гексаметафосфат Натрия (Sodium Hexametaphosphate).

CALIBRATE = КАЛИБРОВАТЬ (или СЛИЧАТЬ) – Calibrate:- to find and eliminate systematic errors of an instrument scale or method of instrument by use of material standards and techniques traceable to an authorized national or international measurement system.

CALIBRATION = КАЛИБРОВАНИЕ (или КАЛИБРОВКА) – Calibration is an adjustment of model parameters to obtain model behavior that corresponds with observed behavior.

CALIBRATION OF SPRAYER = КАЛИБРОВАНИЕ ОПРЫСКИВАТЕЛЯ – Calibration Of Sprayer is a series of steps done primarily to determine the volume of spray solution and time needed to spray a given area of field considering other factors, e.g., swath of the sprayer, pressure exerted inside the sprayer, or the sprayman's walking speed at an even pace.

CALICO = КЭЛЫКО (или ВЫБОЙКА, или СИТЕЦ) – Calico is a plain, closely woven, inexpensive cloth, usually cotton or a cotton/manufactured fiber blend, characteristically having figured patterns on a white or contrasting background. Calico is typically used for aprons, dresses, and quilts. Calico from Calicut, an Indian city now called Kozhikode, which was Vasco da Gama's first stop in India in 1498. Calico, cloth made of cotton; so called from Calicut, on the Malabar coast, whence it was first imported. In England, all white or unprinted cotton cloths are denominated calicoes; but in the United States this term is applied to those only that are printed. Historical Notice Of The Art Of Calico Printing:- this art, though apparently one of the most difficult, has been practised from a very remote æra. Herodotus mentions (Lib 1. § 202.), that a nation on the shores of the Caspian were in the habit of painting the figures of animals on their clothes, with a colour formed from the leaves of trees bruised and soaked in water; and he adds, that this colour was not effaceable, and was as durable as the clothes themselves. It is difficult to imagine that the colours could have been so permanent, had not those using them been acquainted with the use of mordants. There is, however, a passage in Pliny (Hist. Nat. Lib. XXXV. § 11.), which, though in some respects obscure, shows that the ancient Egyptians were fully acquainted with the principle of calico printing. 'They paint', says he, 'the clothes, not with colours, but with drugs (sorbentibus medicamentis) that have no colour. This being done, they immerse them in a vat full of boiling dye, and leave them there for a little:- when they take them out, they are painted of various colours. It is extraordinary, seeing that there is only one colour in the vat (unus in cortina color), that a variety of colours should be produced by the operation of the drugs'. Pliny further states, that the colours were so adhesive they could not be washed out; and that clothes were the stronger for being dyed. A similar process is known to have been followed in India from the earliest times. The chemical and mechanical inventions of modern ages have been the cause of vast improvements in this ingenious and beautiful art; but the passage now quoted shows distinctly that we have, in this instance, been only perfecting and improving processes practised in the remotest antiquity. Calico Printing In This Country:- Duties On Calicoes:- in Great Britain the printing of cottons has formed, for a considerable period, a very important and valuable business, which may be truly said to have grown up amongst us in despite or repeated efforts for its suppression. To prevent the use of calicoes from interfering with the demand for linen and woollen stuffs, a statute was passed in 1721, imposing a penalty of 5l. upon the weaver, and 20l. upon the seller, of a piece of calico! Fifteen years after this extraordinary statute was so far modified, that calicoes manufactured in Great Britain were allowed to be worn, 'provided the warp thereof was entirely of linen yarn'. This was the law with respect to calicoes till after the invention of Sir Richard Arkwright introduced a new æra into the history of the cotton manufacture, when its impolicy became obvious to every one. In 1774, a statute was passed, allowing printed goods, wholly made of cotton, to be used, after paying a duty of 3d. a yard (raised to 3-1/2d. in 1806); and enacting some regulations as to the marks to be affixed to the ends of the pieces, the stripes, etc. Calico is a tightly-woven cotton type fabric with an all-over print, usually a small floral pattern on a contrasting background color. Common end-uses include dresses, aprons, and quilts. Calico in British usage is a plain-woven textile made from unbleached, and often not fully processed, cotton. It may contain unseparated husk parts, for example. The fabric is less coarse and thick than canvas or denim, but owing to its unfinished and undyed appearance, it is still very cheap. Originally from the city of Kozhikode (known by Europeans as Calicut in the XI century) in Kerala, India. The fabric was made by the traditional weavers called Chaliyans. The raw fabric was dyed and printed in bright hues and calico prints became popular in Europe. History:- Calico originated in Kozhikode (also known as Calicut) in India during the XI century. It was mentioned in Indian literature by the XII century when the writer Hemacandra described calico fabric prints with a lotus design. By the XV century calico from Gujarat made its appearance in Egypt. Trade with Europe followed from the XVII century onwards. Calico was woven using Surat cotton for both the warp and weft. The Politics Of Cotton:- in the XVIII century, England was famous for its woollen and worsted cloth. That industry, centred in the east and south in towns such as Norwich, jealously protected their product. Cotton processing was tiny:- in 1701 only 1 985 868 pounds (900 775 kg) of cotton-wool was imported into England, and by 1730 this had fallen to 1 545 472 pounds (701 014 kg). This was due to commercial legislation to protect the woollen industry. Cheap calico prints, imported by the East India Company from 'Hindustan', had become popular. In 1700 an Act of Parliament was passed to prevent the importation of dyed or printed calicoes from India, China or Persia. This caused grey cloth (calico that had not been finished – dyed or printed) to be imported instead, and these were printed in southern England with the popular patterns. Also, Lancashire businessmen produced grey cloth with linen warp and cotton weft, known as Fustian, which they sent to London to be finished. Cotton-wool imports

recovered and by 1720 were almost back to their 1701 levels. Again the woollen manufacturers, in true protectionist style, claimed that this was taking away jobs from workers in Coventry. Another law was passed, to fine anyone caught wearing any printed or stained calico; muslins, neckcloths and fustians were exempted. It was this exemption that the Lancashire manufactures exploited. The use of colored cotton weft with linen warp was permitted by the 1736 Manchester Act. There now was an artificial demand for woven cloth. In 1764, 3 870 392 pounds (1 755 580 kg) of cotton-wool was imported. It has been noted that this was a key part of the process of the reduction of the Indian economy from sophisticated textile production to a mere supplier of raw materials which occurred under colonial rule, a process described by Nehru and more recent scholars as 'de-industrialization'. Calico Printing:- early Indian chintzes, that is a glazed calico with large floral pattern, were primarily produced by painting techniques. Later, the hues were applied by means of wooden blocks, and it was the wooden block printing that was used in London. Confusingly, linen and silk that was printed by this method was known as Linen Calicoes and Silk Calicoes. The early European calicoes (1680) would thus be a cheap equal weft and warp plain weave cotton fabric in white, cream or unbleached cotton, with a block printed design using a single alizarin dye, fixed with two mordants giving a red and black pattern. Polychromatic prints could be done, with two sets of blocks and an additional blue dye. The Indian taste was for dark printed backgrounds while the European market preferred a pattern on a cream base. As the century progressed the European preference moved from the large chintz patterns to a smaller, tighter patterns. Thomas Bell patented the technique of printing by copper rollers in 1783, and the first machine was set up by Livesey, Hargreaves and Company near Preston in 1785. Production of printed cloth in Lancashire in 1750 was estimated to be 50 000 pieces of 30 yards (27 m), but in 1850 it was 20 000 000 pieces. From 1888, block printing was limited to short run specialist jobs. After 1880, profits from printing became smaller, there was over capacity and the firms started to form combines. The first was when 3 Scottish firms formed the United Turkey Red Co. Ltd in 1897, and the second, in 1899, was the much larger Calico Printers' Association. 46 printing concerns and 13 merchants combined, representing 85% of the British printing capacity. Some of this capacity was removed and in 1901 they had 48% of the trade. In 1916, they and the other printers joined and formed a trade association. This then set minimum prices for each 'price section' of the industry. This held until 1954 when it was challenged by the government Monopolies Commission. Over the intervening period much trade had been lost overseas. Printed calico was imported into the United States from Lancashire in the 1780s, and here a linguistic separation occurred, while Europe maintained the word calico for the fabric, in the States it was used to refer to the printed design. These colorful, small-patterned printed fabrics gave rise to the use of the word calico to describe a cat coat color:- 'calico cat'. The patterned fabric also gave its name to two species of North American crabs; see the calico crab. Calico is a plain-woven cotton textile, often used to make quilts. The fabric is less coarse and thick than canvas or denim, and almost always machine washable. Calico is a smooth-surfaced, plain weave cloth. Today, the term is almost always applied to fabric with bright, sharply contrasting, usually small-print designs. Calico is usually woven, although calico prints may appear on knits. Calico is a traditionally popular fabric for patchwork. It is also used for dresses, sportswear, and aprons. In the United States, Calico is a Cotton fabric with a small, all-over floral print. In the United Kingdom, Australia and New Zealand, Calico is a simple, cheap equal weft and warp plain weave fabric in white, cream or unbleached cotton. Calico is a cotton cloth imported from India; a plain white cotton fabric that is heavier than muslin; any of various cheap cotton fabrics with figured patterns. Originated in Calcutta, India, and is one of the oldest cottons. Rather coarse and light in weight. Pattern is printed on one side by discharge or resist printing. It is not always fast in color. Sized for crispness but washes out and requires starch each time. Designs are often geometric in shape, but originally elaborate designs of birds, trees, and flowers. Similar to Percale. / Томэс Бэл (Thomas Bell) Ливзи, Хагрэйвз энд Кампэни (Livesey, Hargreaves and Company). Юнайтид Тёки Рэд Ко. Эл.ти.ди. (United Turkey Red Co. Ltd). Сэр Ричад Акрайт (Sir Richard Arkwright; 1732–92). привоз (importation). Кэлико или Выбойка или Ситец – недорогая плотнотканая ткань полотняного перплетения, обычно из хлопка или смеси . Под Ситцем, от Голландского слова Sits, понимается лёгкая хлопчатобумажная ткань, получаемая отделкой сурового миткаля. Из ситца шьют лёгкое женское и детское платье, сорочки и тому подобное. Под Ситцем, от Голландского слова Sits, первоисточник Санскритского слова Ситрас, означающее Пёстрый, понимается лёгкая хлопчатобумажная ткань полотняного переплетения из отбеленной пряжи. Нити утка и основы одинаковой толщины. Орнамент наносится набойкой. Первоначально ситец изготавливался в Бенгалии, Индия, в России – с XVII века. Как ткань для модных платьев стал использоваться в XVIII веке. Ограничения в его использовании объяснялись тем, что ручная набойка трудоёмкая и дорогостоящая операция, а первые печатные машины могли давать только одно-, двуцветные ткани. В 30-х годах XIX века в промышленность была внедрена первая многоцветная печатная машина – перротина, дававшая высокое качество набойки.

CALICO ACTS = АКТЫ О КЭЛЫКО (или АКТЫ О ВЫБОЙКАХ, или АКТЫ О СИТЦАХ) – Calico Acts are two legislative acts, one of 1700 and one of 1721, that banned the import of most cotton textiles into England, followed by the restriction of sale of most cotton textiles. The exemption of raw cotton from the 1721 Calico Act saw two thousand bales of cotton imported annually from Asia and the Americas, forming the basis of a new indigenous industry. This triggered the development of a series of mechanized spinning and weaving technologies to process the material. This production was concentrated in new cotton mills, which slowly expanded. During the second half of the 17th century, the newly established factories of the East India Company in South Asia started to produce finished cotton goods in quantity for the UK market. The imported calico and chintz garments competed with and acted as a substitute for indigenous wool and linen produce. That resulted in local weavers, spinners, dyers, shepherds, and farmers petitioning the Parliament to request a ban on the import and later the sale of woven cotton goods. They eventually achieved their goal via the 1700 and 1721 Calico Acts. The acts banned the import and later the sale of finished pure cotton produce, but did not restrict the importation of raw cotton or the sale or production of fustian (a cloth with flax warp and cotton weft). The exemption of raw cotton from the 1721 Calico Act saw 2 000 bales of cotton imported annually from Asia and the Americas and forming the basis of a new indigenous industry, initially producing fustian for the domestic market. More importantly, though, it triggered the development of a series of mechanized spinning and weaving technologies to process the material. This mechanized production was concentrated in new cotton mills, which slowly expanded. By the beginning of the 1770s, 7 000 bales of cotton were imported annually. The new mill owners put pressure on Parliament to remove the prohibition on the production and sale of pure cotton cloth as they could now compete with imported cotton. Since much of the imported cotton came from New England, ports on the West coast of Britain such as Liverpool, Bristol, and Glasgow were crucial to determining the sites of the cotton industry. Lancashire became a center for the nascent cotton industry because the damp climate was better for spinning the yarn. As the cotton thread was not strong enough to use as warp, wool, linen, or fustian had to be used and Lancashire was an existing wool center.

CALL(S) = CALL OPTION(S)

CALL = ОПЦИОН НА ПОКУПКУ – Call is the abbreviated term for 'Call Option', e.g., as in 'I bought five Nortel CAD10 Calls'. See also Call Option, and Stock Options. / Нортэл (Nortel).

CALL = ОТЗЫВ (или ВОСТРЕБОВАНИЕ) – Call:- the possibility provided for in bond conditions for the bonds to be redeemed (repayment) before maturity. The trigger or call of the bonds is permitted at the earliest after five years. When a bond is called, instead of the repayment through installments, the securities issued are redeemed. The requirement that a financial instrument be returned to the issuer prior to maturity, with principal and accrued interest paid off upon return.

CALL = ЗАХОД (или ВИЗИТ) – Call is the visit of a vessel to a port. The vessel's stay in port.

CALL = ЗВОНОК – Call is a period at the opening and the close of some futures markets in which the price for each futures contract is established by auction. / Период по открытии и закрытии некоторых рынков фьючерсов, в который цена по каждому фьючерсному контракту устанавливается посредством аукциона.

CALL = ОТЗЫВ (или ТРЕБОВАНИЕ УПЛАТЫ ДОЛГА) – Call:- often No Liability (NL) and sometimes Limited Liability (Ltd) companies have shares that are not fully paid. A call may be made for the payment of part, or all, of this outstanding capital. Holders of shares in NL companies may choose not to pay the call and forfeit their shares, hence the name No Liability. Holders of shares in Limited Liability companies cannot forfeit the shares and are legally obliged to pay a call. See also Contributing Share.

CALLABLE = ОТЗЫВАЕМЫЙ – Callable:- a bond issue, all or parts of which may be redeemed by the issuing corporation under specified conditions before maturity. The term also applies to preferred shares that may be redeemed by the issuing corporation. Callable Bond is a bond that can be redeemed by the issuer prior to its maturity. Usually a premium is paid to the bond owner when the bond is called. Also known as a Redeemable Bond. The main cause of a call is a decline in interest rates. If interest rates have declined since a company first issued the bonds, it will likely want to refinance this debt at a lower rate of interest. In this case, company will call its current bonds and reissue them at a lower rate of interest. / Выпуск облигаций, который целиком или частично может быть выкуплен самой выпускающей корпорацией на особых условиях до его погашения. Этот термин может также относиться к привилегированным акциям, которые могут быть выкуплены самой компанией эмитентом этих акций.

CALL AROUND MARKET = СОЗЫВАЕМЫЙ НА СТОРОНЕ РЫНОК – Call Around Market is a market, commonly used for options on futures on European exchanges, in which brokers contact each other outside of the exchange trading facility to arrange block trades.

CALL DEPOSIT = ВКЛАД ДО ВОСТРЕБОВАНИЯ (или ДЕПОЗИТ ДО ВОСТРЕБОВАНИЯ) – Call Deposit is a bank deposit where the lender has immediate access to the money deposited. Interest rates can usually vary daily.

CALLED = ВОСТРЕБОВАН – Called is another term for exercised when an option is a call. In the case of an option on a physical, the writer of a call must deliver the indicated underlying commodity when the option is exercised or called. In the case of an option on a futures contract, a futures position will be created that will require margin, unless the writer of the call has an offsetting position.

CALLED–UP SHARE CAPITAL = АКЦИОНЕРНЫЙ КАПИТАЛ К ОПЛАТЕ (или ВОСТРЕБОВАННЫЙ АКЦИОНЕРНЫЙ КАПИТАЛ) – In the United Kingdom, Called-Up Share Capital is a value of the issued shares which have remained fully or partially unpaid, and whose holders have now been called upon to pay the balance. Also known as Common Stock Issued And Fully Paid in the United States. In the United Kingdom, ordinary shares, issued and fully paid. The amount of share capital that shareholders had originally promised to contribute that has now been paid up or is due for payment if it is still outstanding. Value of the issued shares which have remained fully or partially unpaid, and whose holders have now been called upon to pay the balance. The amount of the issued share capital of a company for which payment has been requested (called up). When the issued share capital of a company consists of partly paid shares, that part of the share capital that has been paid in by subscribers. Compare Paid-Up Share Capital; Reserve Capital. Called Up Share Capital is the total amount of issued capital for which the shareholders are required to pay. This may be less than the subscribed capital as the company may ask shareholders to pay by instalments. The issued share capital of a company when this consists of fully paid shares, payment for which has been received. Compare Called-Up Share Capital. Called Up Share Capital is the value of the issued shares which are not fully paid, and whose holders have now been called upon to pay for them, or (if they've paid part of the cost), pay the balance. If you had 100 x £1 shares and you have paid the company the £100 needed to cover the cost of these, you have no called up share capital – all your capital has been 'called up, issued and fully paid'.

CALLER = ЗВОНАРЬ – (1) Caller is the exchange employee designated to conduct the opening or closing call. / Сотрудник биржи, назначенный выполнять звонки по открытии или закрытии.

(2) Caller is a person who plans timber stows on a ship.

CALL LOAN = ССУДА ДО ВОСТРЕБОВАНИЯ (или ОТЗЫВНЫЙ ЗАЙМ, или ОНКОЛЬНАЯ ССУДА) – Call Loan is a loan provided to a brokerage firm and used to finance margin accounts. The interest rate on a call loan is calculated daily. The resulting interest rate is referred to as the Call Loan Rate. Call loans use securities as collateral for the loan. It is important to note that a call loan can be canceled at any time. Call Loan:- loans, usually granted to brokers, dealers or investment bankers, which may be called by the lender or repaid by the borrower at any time without notice.

CALL LOAN RATE = СТАВКА ПО ССУДЕ ДО ВОСТРЕБОВАНИЯ (или СТАВКА ПО ОТЗЫВНОМУ ЗАЙМУ, или СТАВКА ПО ОНКОЛЬНОЙ ССУДЕ) – Call Loan Rate is the short term interest rate charged by banks on loans extended to broker-dealers. A call loan rate is an interest charged on loans made to broker-dealers who use the funds to make margin loans to their margin account clients. These loans are payable by the broker-dealer on call (i.e. on demand or immediately) upon receiving such request from the lending institution. The call loan rate forms the basis upon which margin loans are priced. The call loan rate can fluctuate daily in response to factors such as market interest rates, funds' supply and demand, and economic conditions. The rate is published in daily publications including the Wall Street Journal and Investor's Business Daily (IBD). Also called Broker's Call. A call loan is a loan given to a broker-dealer that is used to finance client margin accounts. The interest rate on a call loan is calculated daily; this rate is known as the Call Loan Rate, or Broker's Call. A margin account is a type of brokerage account in which the broker lends the client cash that is used to purchase securities. The loan is collateralized by the securities held in the account, and by cash that the margin account holder is required to have deposited. A margin account enables investors to use leverage; that is, they are able to trade larger positions than they would otherwise be able to. While this has the potential to magnify profits, trading on margin can also result in magnified losses. Clients must be approved for margin accounts and are required to make a minimum initial deposit, known as the Minimum Margin, in the account. Once the account is approved and funded, investors can borrow up to 50% of the purchase price of the transaction. If the account value falls below a stated minimum (known as the Maintenance Margin), the broker will require the account holder to deposit more funds or liquidate position(s) to pay down the loan. / За Вол Стрит Дьжонэл (The Wall Street Journal).

CALL MARKET = РЫНОК ВОСТРЕБОВАНИЯ – Call Market is a type of market in which each transaction takes place at predetermined intervals and where all of the bid and ask orders are aggregated and transacted at once. The exchange determines the market clearing price based on the number of bid and ask orders. A call market is contrasted to an auction market, where orders are filled as soon as a buyer/seller is found for any given order at an agreed upon price. In a call market, the price is set by the exchange so the market will clear, or almost clear, every time orders are filled. This is in stark contrast to the auction market, where prices are determined by buyers and sellers. Because the call market groups transactions together, there is a substantial increase in liquidity. Although liquidity is generally considered to be a good quality in any marketplace, sellers may lose some of the liquidity premium, which is can be substantial.

CALL MONEY = ОТЗЫВНЫЕ ДЕНЬГИ (или ДЕНЬГИ ДО ВОСТРЕБОВАНИЯ) – Call Money is a term used in interbank trading besides time deposit. Call money refers to unsecured loans or overnight cash deposits. The reference rate is the EONIA (Euro Overnight Index Average). The amount is repaid the following day (overnight), including interest. Apart from call money, there are tomorrow/next day (T/N) transactions. Money dealers agree today that one counterparty will provide the other counterparty with a sum of money from tomorrow to the day after tomorrow. On the day after tomorrow, the capital including interest is returned to the lender. In the case of spot/next transactions (spot-against-next day), borrowers and lenders agree on a cash loan that is paid to the borrower with a value date of two business days and repaid to the lender on the following business day including interest. Funds lent by the banks to one another in round amounts which can be called for repayment by the lending bank on demand and can be paid by the borrower at any time without notice. Also known as Day-To-Day Money. Call Money:- money loaned by a bank that must be repaid on demand. Unlike a term loan, which has a set maturity and payment schedule, call money does not have to follow a fixed schedule. Brokerages use call money as a short-term source of funding to cover margin accounts or the purchase of securities. The funds can be obtained quickly. Brokerages know that they are taking on risk by using funds that can be called at any time, so they typically use call money for transactions that will be resolved quickly. If the bank recalls the funds then the broker can issue a margin call on its clients in order to make the repayment. The call money rate is used as the interest rate on the loans. / выплата (repayment). Денежные средства по займам для брокеров с биржи ценных бумаг.

CALL OPTION = ОПЦИОН НА ПОКУПКУ – Call Option is a contract that entitles the buyer (holder or taker) the right, but not the obligation, to purchase a fixed quantity of a commodity or underlying asset or, by other words, to go or obtain a long futures position at a stated strike price at any time during the life of the option. The seller (grantor or writer) has the obligation, upon exercise, to enter into a underlying futures contract to sell a commodity for delivery in such option month or, by other words, to enter into a short futures position at such strike price. The buyer pays a one-time premium to the seller for this contract. A call option is bought with the expectation of a rise in prices of the underlying asset. The owner of the call option is speculating that the price of the underlying asset will go up and is therefore bullish. Call Option is a contract to buy a fixed number of shares (typically 100 shares per call contract) at a fixed price in the future. This contract expires at specified dates and with it the right to buy the stock at that fixed price. Calls in the United States grant the purchaser of the call the right to buy the stock at the specified price anytime before the expiration date. This is a term used in option business. A Call Option entitles the buyer to buy a certain quantity of underlying assets (e.g., one share) at a pre-determined price up to or at a certain point in time. The counterparty in this contract, the seller of the call option, is called the 'Writer' of the option and, in the event of the option being exercised, has to have the agreed underlying assets available. In return, the call buyer pays the seller a premium. The buyer of a call option expects the price of the underlying asset to rise, whereas the seller of a call option expects falling or at least stagnating prices. In the latter case, it is unlikely that the counterparty will exercise the option, which means that the option writer can book the premium received as profit. Opposite:- Put Option. Call Option is a buy option with which the buyer can profit disproportionately from rising prices. Call Option is a contract that gives the holder the right, but not the obligation, to buy metal futures at a set price (the strike price) on a given date. An option which gives the purchaser the right, but not the obligation, to buy an asset at a pre-determined price on or by a set date. Call Option is an agreement that gives an investor the right (but not the obligation) to buy a stock, bond, commodity, or other instrument at a specified price within a specific time period. It may help you to remember that a call option gives you the right to 'call in' (buy) an asset. You profit on a call when the underlying asset increases in price. Call Option is the right, but not the obligation, to buy a specified asset on a set date in the future for a specified price. Call Option is a contract that gives the buyer of the option the right but not the obligation to take delivery of the underlying security at a specified price within a certain time. Call Option is the right, but not the obligation, to buy a specified asset on a specified date, at a specified price. Call Option is a contract that entitles buyer/taker to buy a fixed quantity of a commodity or underlying instrument at a stipulated basis or striking price at any time up to the expiration of the option. The buyer pays a premium to the seller/grantor for this contract. A call option is bought with the expectation of a rise in prices. See also Put Option. Call Option is an option that gives the buyer the right, but not the obligation, to purchase (go 'long') the underlying futures contract at the strike price on or before the option's expiration date. Call Option is an option contract giving the buyer the right, but not the obligation, to buy a futures contract at a specific price during a specific time period. The call option seller is obliged to sell futures to the call option buyer if the buyer exercises the option. / Опцион На Покупку – контракт, который предусматривает для покупателя (держателя или взявшего) право, но не обязательство, закупить фиксированное количество сырья или соответствующего актива или, иными словами, . Продавец (предоставивший или выписавший) . Опцион На Покупку – право, но не обязательство, оформленное как соглашение или контракт на покупку спецификационного актива в спецификационную дату по спецификационной цене. Опцион На Покупку – опционный контракт, который даёт покупателю право, но не налагает на него обязанности, покупать определённое количество финансовых инструментов, лежащих в основе опциона, по заранее установленной сходной цене (или цене исполнения) в течение определённого периода времени. Продавец опциона на Покупку обязуется, в случае желания покупателя исполнить опцион, продать последнему финансовые инструменты в основе опциона по установленной цене на дату исполнения контракта или до её наступления. Владелец опциона на покупку (имеющий по нему длинную позицию, то есть позицию покупки) рассчитывает на то, что бумаги в основе опциона вырастут в цене. Смотрите также Опцион На Продажу (Put Option).

CALL POOL = ГРУППА ПОКУПАТЕЛЕЙ – Call Pool:- delivery alternative for Australian Cotton growers whereby they commit a quantity of Cotton to a particular marketing organization, while retaining the freedom to hedge using futures and options. Each grower can choose when to 'lock in' (in effect, ensure receipt of) the then quoted May or July US futures price, and likewise when to 'lock in' the Australian basis and the rate of exchange of US Dollars into Australian Dollars.

CALL PRICE = ЦЕНА ОТЗЫВА (или ЦЕНА ДОСРОЧНОГО ПОГАШЕНИЯ) – Call Price is the price at which a bond or a preferred stock can be redeemed by the issuer. This price is set at the time the security is issued. Also referred to as Redemption Price. For example, let's say the TSJ Sports Conglomerate issues 100 000 preferred shares with a face value of USD100 with a call provision built in at USD110. This means that if TSJ were to exercise its right to call the stock, the call price would be USD110. A company may exercise its right to call preferred stock if it wishes to discontinue payment of the dividend associated with the shares. It may choose to do this in an effort to increase earnings for common shareholders. Call Price is a price at which a security can be redeemed when called. The Call Price is the price a bond issuer or preferred stock issuer must pay investors if it wants to buy back, or call, all or part of an issue before the maturity date. How It Works/Example:- the bond indenture will stipulate when and how a bond can be called, and there are usually multiple call dates throughout the life of a callable bond. Many corporate and municipal securities have 10-year call provisions. For example, let's consider an XYZ bond issued in 2000 and maturing in 2020. The indenture might stipulate that Company XYZ may call the bond in the second, fourth, and tenth year. The call provision in the indenture sets forth the call price, which is what the issuer must pay to redeem the bond if it does so before maturity. In our example, the indenture might say, 'The XYZ bond due June 01, 2020, is callable on June 01, 2004, at a price of 105% of par'. The indenture typically provides a table of call dates and corresponding prices as well. Note that the call price is normally higher than the face value of the bond, but it decreases the closer the bond is to maturity. For example, Company XYZ is offering 105% of face value if it calls the bond after four years, but it may only offer 102% if it calls the bond in ten years, when it is closer to its maturity date. The difference between the face value and the call price is

called the Call Premium. In our example, the call premium is 5% in 2004. In many cases, the call premium is equal to one year's interest if the bond is called in the first year. Why It Matters:- it's extremely important for investors to realize the presence of an embedded call option in a bond affects the value of the bond. A callable bond is worth less to an investor than a noncallable bond because the company issuing the bond has the power to redeem it and deprive the bondholder of the additional interest payments he'd be entitled to if the bond was held to maturity. From the company's perspective, having the ability to call the bonds adds value because the company is given the flexibility to adjust its financing costs downward if interest rates decline. But the company has to take the call price into account when determining whether or not it is worth it for them to refinance its debt. Typically, bonds are called when interest rates fall so dramatically, the issuer can save money by floating new bonds at lower rates. If by the time of the call date interest rates have significantly dropped, the issuer is motivated to call the bonds because doing so will allow it to refinance its debt at a cheaper level. From another perspective, the issuer is incentivized to buy bonds back at par value, because as interest rates go down, the price of the bonds goes up. Callable bonds are attractive to investors because they usually offer higher coupon rates than non-callable bonds. But as always, in return for this investment advantage comes greater risk. If interest rates drop, the bond's issuer will be strongly motivated to save money by replaying it callable bonds and issuing new ones at lower coupon rates. In these circumstances, the investor that holds the bonds will see his interest payments stop and obtain his principal early. If the investor then reinvests this principal in bonds again, chances are that he will be forced to accept a lower coupon rate that is in line with the prevailing (and lower) interest rates (called Interest Rate Risk).

CALL RATE = СТАВКА ПО ОТЗЫВНЫМ ЗАЙМАМ (или СТАВКА ПО ЗАЙМАМ ДО ВОСТРЕБОВАНИЯ) – Call Rate is the overnight inter-bank interest rate. / Межбанковская процентная ставка по однодневным расчётным кредитам (кредитам овернайт).

CALL RATIO BACKSPREAD = ОБРАТНО СООТНОСИМАЯ (или ПРОПОРЦИОНАЛЬНАЯ) КУРСОВАЯ РАЗНИЦА НА ОПЦИОНЫ НА ПОКУПКУ – Call Ratio Backspread is a very bullish investment strategy that combines options to create a spread with limited loss potential and mixed profit potential. It is generally created by selling one call option and then using the collected premium to purchase a greater number of call options at a higher strike price. This strategy has potentially unlimited upside profit because the trader is holding more long call options than short ones. An investor using this strategy would sell fewer calls at a low strike price and buy more calls at a high strike price. The most common ratios used in this strategy are one short call combined with two long calls, or two short calls combined with three long calls. If this strategy is established at a credit, the trader stands to make a small gain if the price of the underlying decreases dramatically. When to use:- normally entered when market is near B and shows signs of increasing activity, with greater probability to upside. Profit characteristics:- profit limited on downside (if net credit taken in when position was established) but open-ended in rallying market. Loss characteristics:- maximum loss, is amount of B – A – initial credit (or B – A + initial debit), realized if market is at B at expiration. This loss is less than for equivalent long straddle, the trade-off for sacrificing profit potential on the downside. Decay characteristics:- dependent on the net time value purchased or sold via this strategy. If more time value sold than bought, then time value decays work to the benefit of the holder. Category:- precision. Short call A, long 2 or more calls B. As the name suggests, Call Ratio Backspreads are Ratio Backspreads, which means volatile options strategy. Backspreads profit when the underlying stock breaks out to upside or downside and loses money when the stock remains stagnant. This is what happens with the Call Ratio Backspread but with a slight twist. Call Ratio Backspreads are credit spreads but retained the unlimited profit potential of debit volatile options trading strategies! Yes, credit backspreads such as the Short Butterfly Spread and Short Condor Spread have only limited profit potential, whereas the Call Ratio Backspread has unlimited profit potential when the stock breaks out to upside and limited profit potential when the stock breaks out to downside, opening up one direction for unlimited profit. This tutorial shall cover how Call Ratio Backspreads work, when to use it, how to use it and its advantages and disadvantages. More a Bullish Strategy than a Volatile Strategy:- the Call Ratio Backspread is a vertical ratio spread. Even though the Call Ratio Backspread is technically a volatile options trading strategy due to the fact that it can profit either upwards or downwards, it does has a strong directional bias, which is upwards. Yes, Call Ratio Backspreads can be better understood as a bullish options strategy which still makes a limit amount of money even if the stock goes down strongly. It makes an unlimited profit if the stock goes up and a small profit if the stock goes down. Of course, like all bullish options trading strategies, it loses money if the stock stays still. If understood this way, the Call Ratio Backspread becomes the only credit bullish options strategy to have unlimited profit potential. Indeed, the Call Ratio Backspread does empitomize the versatility and flexbility of ratio spreads, creating unique options trading risk/reward profiles. If the stock is assessed to have a greater chance of breaking out strongly to downside rather than upside, then the Put Ratio Backspread should be used instead in order to open up the downside for unlimited profit. When To Use Call Ratio Backspread? One should use a Call Ratio Backspread when one is confident in a strong rise in the underlying instrument, wishes to profit from that rise without any upfront payment and not lose any money should the stock falls. How To Execute Call Ratio Backspread? The Call Ratio Backspread involves buying more at the money or out of the money call options than the number of in the money call options are shorted. Because In The Money (ITM) call options costs more than At The Money (ATM) or Out of the Money (OTM) call options, a lesser number of In The Money (ITM) call options is needed to cover the cost of the ATM or OTM options while still gaining in value slower than the combined number of ATM or OTM options when the underlying stock rises. Example:- (i) Assuming QQQQ at USD44. (ii) Buy To Open 2 QQQQ Jan 44 Call @ (at) USD1.05, Sell To Open 1 QQQQ Jan 41 Call at USD3.15; and (iii) As the 2 Jan 44 Call costs USD1.05 x 2 = USD2.10, the 1 Jan 41 Call actually covers the entire price of the long call options and results in a net credit of USD1.05. The ratio of long and short call options depends largely on the preference of the individual trader. A common ratio is the 2 : 1 ratio spread where you sell to open 1 In The Money (ITM) call option for every 2 At The Money (ATM) or Out of the Money (OTM) call options that was bought. What Strike Prices To Use In Call Ratio Backspread? The main deciding factor when determining what ratio to establish the Call Ratio Backspread with is strike price. Here are the effects of different strike prices being used:- (1) The wider the strike price difference between the short and long call options, the lesser In The Money (ITM) call options you would need to sell in order to cover the price of the long call options, the bigger the profit if the stock goes down but the further the lower breakeven point becomes. (2) The narrower the strike price difference between the short and long call options, the higher the potential profit and the nearer the lower breakeven point, but the lower the profit would be if the stock goes down instead. From the guidelines above, it is obvious that the higher we expect the net credit to be, the lower the stock needs to drop in order to profit to downside. This is the kind of compromise every options traders should be familar with in options trading. As such, we should always choose to sell the nearest in the money (ITM) call options which covers the total price of the long call options without exceeding the number of long call options bought. The profitability of a call ratio backspread can be enhanced or better guaranteed by legging into the position properly. Profit Potential of Call Ratio Backspread:- the Call Ratio Backspread has an unlimited profit potential to upside and will keep making more profit as long as the underlying stock keeps rising. It also has limit profit potential to downside and will make the net credit as profit if the stock drops below the lower breakeven point. Profit Calculation of Call Ratio Backspread:- Profit = (Profit on Long Calls) – (Loss on Short Calls). Profit Calculation of Call Ratio Backspread:- (i) assuming QQQQ at USD44. Buy To Open 2 QQQQ Jan 44 Call at USD1.05, Sell To Open 1 QQQQ Jan 41 Call at USD3.15; (ii) assume QQQQ rises to USD50 during expiration; (iii) Profit = (6.00 – 1.05) x 200 – (9.00 – 3.15) x 100 = 990 – 585 = USD405 profit; and (iv) because you paid nothing to put on this position, profit % is infinite. You made money

out of nothing. Maximum loss = Intrinsic Value of short call options – total credit received. Maximum Loss Calculation of Call Ratio Backspread:- (i) assuming QQQQ at USD44; (ii) buy To Open 2 QQQQ Jan 44 Call at USD1.05, Sell To Open 1 QQQQ Jan 41 Call at USD3.15; (iii) Maximum Loss = USD300 – USD105 = USD195. Risk / Reward of Call Ratio Backspread:- Upside Maximum Profit:- unlimited; Maximum Loss:- limited. Maximum loss occurs when the underlying stock closes exactly at the strike price of the Long Call Options. Break Even Point of Call Ratio Backspread:- there are 2 breakeven points for a Call Ratio Backspread. The Upper Breakeven Point is point above which the position will start to make a profit. The Lower Breakeven Point is the point below which the position will make in profit the net credit received. Upper Breakeven Point = long call strike + (number of contracts sold x Difference Between Strike) – net credit. Upper Breakeven Point Calculation of Call Ratio Backspread:- (i) assuming QQQQ at USD44. Buy To Open 2 contracts of QQQQ Jan 44 Call at USD1.05, Sell To Open 1 contract of QQQQ Jan 41 Call at USD3.15; (ii) Net credit = USD105; and (iii) Upper Breakeven Point = 44 + (1 x 3) – 1.05 = USD45.95. Lower Breakeven Point = strike price of short call + (net credit / contracts sold). Lower Breakeven Calculation of Call Ratio Backspread:- continuing from the previous example:- (i) Lower Breakeven Point = 41 + (1.05 / 1) = USD42.05; (ii) if the stock drops below USD42.05, it will start to make a profit with maximum profit attainable as net credit received. Note:- as you noticed from above, the Call Ratio Backspread offers the best of both worlds as long as the underlying stock moves significantly up or down. Advantages Of Call Ratio Backspread:- (i) Credit Spread, no upfront payment needed; and (ii) Unlimited profit potential to upside and limit profit potential to downside. Disadvantages Of Call Ratio Backspread:- (i) Broker needs to allow the trading of credit spreads; and (ii) Makes less profit than a long call option strategy on the same rise in the underlying stock. Alternate Actions Before Expiration:- (1) If the position is already in profit and the underlying stock is expected to continue it's rally, you could buy to close the short call options, transforming the position into a Long Call Option in order to maximise profits. (2) If the position is in profit and the underlying stock is expected to reach a certain price by expiration or stay stagnant at a certain higher price, one could buy to close the short call options and then sell to open call options at the strike price which the underlying stock is expected to rise to. This transforms the position into a Bull Call Spread. The Call Ratio Backspread is an exciting strategy that enables us to make accelerated profits provided that the stock moves sharply upwards. Increasing volatility is very helpful because we net long in calls. The worst thing that can happen is that the stock doesnt move at all, and even a sharp move down can be profitable, or at the very least, preferable to no movement at all. The Call Ratio Backspread involves buying and selling different numbers of the same expiration calls. Typically we buy and sell calls in a ratio of 2:1 or 3:2, so we are always a net buyer. This gives us the uncapped profit potential. It also reduces the net cost of doing the deal such that we can even create a net credit! Furthermore, our risk is capped, though we need to investigate the strategy further in order to understand it more.The Call Ratio Backspread is a hedged, directional trade in which we profit from a strong upward movement-similar to a straight call position-while protecting our downside. If we are wrong and the market moves against us, we either do not lose or may even move into a small profit zone. Strategy Snapshot:- (i) Outlook:- Very Bullish; (ii) Risk:- Limited; (iii) Reward:- Unlimited; (iv) Time Frame:- 2 Months+; (v) Trade Type:- Credit/Even; and (vi) Volatility:- Medium/High. Structure Of The Trade:- the structure of the trade is the shorting of lower strike calls while buying multiples of higher strike calls. Typically, we want to enter at even or for a credit. If we are correct and profit in a strong upward movement, we can close the trade prior to expiration to avoid assignment of the short calls. If we are wrong and the market moves against us, we can exit or ride the trade out to expiration-possibily with a profit. The risk is also buffered in the interim stage of the trade if we decided to exit early. To best illustrate the concept of a Call Ratio Backspread, we will use basketball players' contracts as an analogy. We sell a contract on a basketball player (this will be like selling a call option). The player we are going to use is Magic Johnson. When Magic was in his prime, his contract was very expensive. When we sell that contract we take cash in. Understand, we do not own his contract: we do not need to in the financial markets. Rather than putting all that cash in our pocket, we reinvest it, purchasing a contract, picking, in this case, Michael Jordan when he was a rookie. Obviously, we can afford to buy more than one Michael contract when he is still a rookie with the money from Magic's contract. In this analogy, we are buying two Michael contracts from the one Magic contract that we sold. There might be money left over. If so, we would put it in our pocket. Let's take a look at how this plays out. If Michael's value goes up, we make money from owning two of his contracts. If Michael's value goes down, we still do not lose because we paid for Michael's contracts by selling Magic's contract. We possibly had even put some change in our pocket. How does this apply to the financial market? In entering this trade, we sell a lower strike call. From the money received, we simultaneously buy two higher strike calls. Whatever cash is left over from selling the lower strike call and buying the higher strike calls will be credited to our account. Now, let's evaluate the trade with the following three market conditions:- (1) Stock Moves Down:- since we are in long and short call positions, if the stock drops in value, both the short and long contracts go down in value. They will both move, not necessarily precisely together, but they will move in the same general direction. If both positions drop in value and expire worthless, we lose nothing. In fact, we took in a small credit. This is why we are typically looking for opportunities to enter this trade at even or better. (2) Stock Moves Up:- the second consideration is if the stock goes up in value. We have one position that we have shorted and two positions in which we have gone long. As the stock goes up, the position that we shorted will likewise go up, which is a negative to us. However, the two positions that we bought will make money at a faster rate than the position that we have sold because we own two of them for each one that we sold. This gives us an unlimited upside-as high as the stock goes. (3) Stock Stays the Same:- if the stock does not move or stays directly on the strike that we bought, the short position will have intrinsic value. While the position that we are long will be worthless, the value in the short position will be our loss. It can be no greater than the spread between the two strike prices minus whatever credit we took in when we entered the transaction. Finding the Right Stock:- In a Call Ratio Backspread, we typically look for volatile stocks that will have fairly significant upward movement. Indicators that could be effectively applied to a Call Ratio Backspread might be earnings reports, potential changes in interest rates, pending litigation outcomes, etc. Our probability of winning is better than most speculative trades since our profit zones are both on the upside and downside of the stock movement. We anticipate an upward move with a strong hedge if we are wrong. Case Study:- the best way to understand a Call Ratio Backspread trade is to work through a case study. We will use Cisco (CSCO). Cisco Systems (CSCO) – 55 3/8 on October 16, 1998; (Exp – Calls – Bid – Ask):- (i) Jan – 50 – 9 5/8 – 9 3/4; (ii) Jan – 55 – 6 3/4 – 6 7/8; (iii) Jan – 60 – 4 1/4 – 4 3/8; (iv) Jan – 65 – 2 5/16 – 2 5/8. Figure 1 contains a 1-by-2 Call Ratio Backspread for CSCO January 50 and 60 Calls. The graph illustrates the risk profile at expiration date. Entry:- (i) Buy 10 contracts of Jan 60 Calls; and (ii) Sell 5 contracts of Jan 50 Calls. Entry Cost:- 4 3/8 * 2 – 9 5/8 = –7/8; (7/8 of credit on entry). Maximum Reward:- (i) on the Upside:- unlimited; and (ii) on the Downside:- 7/8. (Entry credit is the maximum downside reward.) Maximum Risk:- maximum reward is when by expiration, the stock stays exactly at the long call strike price (USD60). Maximum Risk = Difference between the strikes of what we sold and bought, minus original credit of the trade. Maximum Risk = 60 – 50 – 7/8 = 9 1/8. Breakeven Point:- (i) Lower Breakeven = Lower call strike + credit received = 50 + 7/8 = 50 7/8. And (ii) Higher Breakeven = Higher call strike + Maximum Risk = 60 + 9 1/8 = 69 1/8. The benefit of this trade is the unlimited upside. If the stock drops below our short call price, we also have a limited profit (assuming we enter at a even or for a credit). What is the Correct Ratio in a Call Ratio Backspread? Typically, most traders place a 2:1 (ratio of 2) or a 3:2 (ratio of 1.5). This ratio can vary depending on the size of contracts. As a rule of thumb, a 3:2 is as low as we will consider. For example, a 7:4 (ratio of 1.75) is a still a viable Call Ratio Backspread choice. One key to remember in any spread trade: we will never enter any position that has more short contracts than long contracts! How do different ratios affect the risk graph? The graphs in Figure 2 are both for CSCO January 50 – 60 Call Ratio Backspread trades. One is a 2:1 ratio while the other one is a 3:2 ratio. The graph shows that a 2:3 ratio provides more credit on the downside than a 1:2 ratio; however, its window of risk is much

narrower than the 1:2. Evolution of Trade Over Time:- upon entry, the Call Ratio Backspread risk graph looks similar to a Call Option with a smaller range of loss. As the position evolves over time, the long Call option strike price dips more. As time progresses toward expiration, this dip gradually deepens, eventually maturing into 'V' shaped lines. Ideally, we do not want to hold this position until expiration day. To limit our risk and use the benefit of the initial lower risk profile, we will exit before too much depletion due to time decay. Generally speaking we will not be in a Call Ratio Backspread more than 50 percent of the time that we have bought. Another rule of thumb is to typically exit the trade one month prior to the expiration date. Volatility Impact:- it is ideal to enter upon low volatility with the anticipation of a fairly significant increase. If the current volatility is too high, it will be difficult mathematically to place the trade at even or for a credit. A rise in volatility will swell profits and further limit risk. We typically don't enter with less than a 3:2 ratio. A 2:1 ratio is better and a 3:1 is better still. As volatility picks up, the risk curve will become a sharper, upward curve with less of a dip at the long strike price. If volatility goes below our current entry point, we will begin to see a deeper dip. This dip will not be at maximum until expiration when the time premium completely depletes. Summary:- the value of this trade is multifold. We are entering a trade that does not take any of our own money (although there is a margin requirement), such that if the stock goes up in value we have an unlimited upside reward, and if the stock goes down we still walk a way with a little profit. The only risk is if there is no movement and even then the risk is manageable. Check List for Entering:- (i) minimum of 3:2-Long vs. Short Ratio; (ii) looking for even or credit net on entry; (iii) buy as much time as possible; (iv) smaller the spread, the narrower the window of risk; (v) expecting a big rise in stock movement; and (vi) take close consideration of timing on entry and exit. Item 1:- ratios other than 1:2 are possible. For instance, one could sell two lower strike calls contracts and use that cash to buy three higher strike call contracts. The higher the ratio of the Call Ratio Backspread, the narrower the window of risk will be (distance between the two breakeven points). In addition, the higher the ratio, the faster the upside gain will be. Because of this, a lower than 3:2 ratio requires significantly more stock movement to profit. Ideally the higher reward-to-risk ratio, the better. 3:1 being the ideal, we usually look for positions that have a 2:1 ratio. Item 2:- typically, if entry is not even or better, this will not be an attractive trade. Item 3:- in entering a Call Ratio Backspread, we are buying more time than we sell, and there comes a point when it is mathematically impossible to go beyond a certain time frame and still get an even or better net at entry. That time frame depends on multiple factors including volatility, where the stock is and what strike prices we are using. In general, we want to buy as much time as we can that will still allow us to enter at even or for a small credit. Item 4:- The wider the spread, the bigger the window of risk. For example, assume we entered a 2:1 net-even Call Ratio Backspread. A USD5 spread will have ten points between the two breakeven points, while a USD10 spread will have twenty points between the two breakeven points. We have a much greater likelihood of winning with a smaller window of risk. Item 5:- In this position we are either playing a strong trending stock or expecting a big move because of a pending event, while simultaneously hedging our downside. We are typically looking for a highly volatile stock. Item 6:- we want the longest time frame possible while maintaining an even or better net entry, with the typical time frame at two to three months. Sometimes we can even find good LEAPS candidates. We will structure the trade around available news, events or indicators and also allow ample time to exit if the stock does not perform as expected. By carefully planning the structure, we will limit our exposure as much as possible, since most of the risk is due to time decay in the last phase of the option timeline. / Одна из стратегий торговли. соотносительная (или пропорциональная) курсовая разница (ratio spread). Обратно Пропорциональный Спрэд По Опционам На Покупку – опционная стратегия с хэдьжирующим компонентом, позволяющая торговцу получать небольшую прибыль или выходить на уровень безубыточности в случае, когда торги складываются не в его пользу. Позиция характеризуется неограниченным потенциалом прибыли при ограниченном риске потерь. Обратно пропорциональный спрэд по опционам на покупку подразумевает продажу одного опциона на покупку и последующую покупку двух опционов на покупку с более высокой сходной ценой (могут использоваться и другие соотношения). Цель операции состоит в сохранении соотношения между проданными и купленными опционами на покупку ниже 0.67, что позволяет получить кредит для обеспечения прибыли при значительном колебании стоимости бумаг в основе опциона в любом направлении. Смотрите также Обратно Пропорциональный Спрэд По Опционам На Продажу (Put Ratio Backspread).

CALL RULE = ПРАВИЛО ОТЗЫВА (или ПРАВИЛО ВОСТРЕБОВАНИЯ) – Call Rule is an exchange rule whereby the official bidding price for a cash commodity is competitively established at the end of each trading day and held until the opening of the exchange the following trading day. The call rule attempts to reduce overnight volatility by ensuring commodity prices begin trading near the previous day's closing bid. Call Rule is an exchange regulation under which an official bid price for a cash commodity is competitively established at the close of each day's trading. It holds until the next opening of the exchange.

CALL SALES = ПРОДАЖИ С ВОСТРЕБОВАНИЕМ (ПРАВ СТОРОН) – Call Sales:- (i) sales of commodity – price not yet fixed; (ii) price fixed at the discretion of mill buyer; (iii) assures supply without having to fix price. See also On Call Sales. / Смотрите также Продажи С Востребованием (Прав Сторон) (On Call Sales).

CALL SIGN = ПОЗЫВНОЙ СИГНАЛ – Call Sign is a code published by the International Telecommunication Union in its annual List of Ships' Stations to be used for the information interchange between vessels, port authorities and other relevant participants in international trade. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Код, публикуемый Международным Союзом Дальней Связи (International Telecommunication Union) в его ежегодном Списке Станций Судов, который должен быть использован для информационного обмена между судами, портовыми властями и другими соотвествующими участниками международной торговли.

CALL SPREAD OPTION = КУРСОВАЯ РАЗНИЦА ПО ОПЦИОНУ НА ПОКУПКУ – A Call Spread Option entails the simultaneous purchase of a call option at a lower strike price and the sale of a call option at a higher strike price. The call spread option may be used by hedgers with a relatively strong market view to obtain cheaper risk coverage. / Курсовая Разница По Опциону На Покупку предусматривает одновременную закупку опциона на покупку с более низкой сходной ценой и продажу опциона на покупку с более высокой сходной ценой. Курсовая разница по опциону на покупку может быть использована хэдьжерами с относительно твёрдым взглядом на рынок для достижения более дешёвого покрытия риска.

CALLUS = КАЛЛЮС (или КАЛЛУС) – Callus is a mass of thin walled undifferentiated cells, developed as a result of wounding or culture on nutrient media. Plant cells which proliferate on a defined medium and lack morphological differentiation. Callus is a tissue composed of large thin-walled cells, usually produced in response to injury. / Под Каллюсом или Каллусом, от Латинского слова Callus, означающее Мозоль, понимается ткань, образующаяся у растений в местах повреждений в виде наплыва и способствующая их заживлению. Каллюс:- защитная ткань, которая формируется поверх раны, запечатывая и залечивая её..

CALM = ШТИЛЬ – Calm is a wind or force less than one knot (knot:- 1 nautical mile per hour). / Под Штилем, от Голландского слова Stil, понимается безветрие или очень слабый ветер со скоростью до 0.2 метров в секунду (м/с).

CALORIE = КАЛОРИЯ – (1) Calorie (cal) is the CGS unit of heat energy. This calorie (also called a Gram Calorie or Small Calorie) is the amount of heat required at a pressure of one atmosphere to raise the temperature of one gram of water by one degree Celsius. Unfortunately, this varies with the temperature of the water, so it is necessary to specify which degree Celsius is meant. A traditional choice was the degree from 14.5 °C to 15.5 °C; raising the temperature of water through this range requires 4.185 8 Joules, a quantity

called the 15° calorie. Another choice produces the thermochemical calorie, equal to exactly 4.184 Joules. More common today is the international steam table calorie, or IT calorie for short, defined by an international conference in 1956 to equal exactly 4.186 8 Joules, exactly 1.163 milliWatt hours, or about 0.003 968 32 British thermal units (Btu). The name of the unit comes from the Latin calor, heat.

(2) One energy calorie is equivalent to 4.186 8 Joules. Thus, it takes 500 000 calories of energy to boil a pot of coffee. One food calorie (Cal) equals 1 000 energy calories. Calorie is a unit of measure of energy in food. Calorie (kcal or Cal) is a common name for the MKS unit of heat energy. This unit is properly called the Kilocalorie; it is also called the Kilogram Calorie or Large Calorie. It is often (but certainly not always!) distinguished from the small calorie by capitalizing its name and symbol. The large calorie, or rather kilocalorie, is the amount of heat required at a pressure of one atmosphere to raise the temperature of one kilogram of water by one degree Celsius. Since this is 1 000 times as much water as mentioned in the definition of the small calorie, the kilocalorie equals 1 000 small calories, 4.186 8 kiloJoules, 3.968 3 Btu, or 1.163 Watt hours. These conversions assume the IT calorie is in use; see previous entry. These are the 'calories' that joggers are trying to get rid of, the ones we gain by eating. The use of the same term 'calorie' for two different-size units is endlessly confusing, but we seem to be stuck with it. / Под Калорией, от Латинского слова Calor, означающее Тепло, понимается не подлежащая применению внесистемная единица количества теплоты, термодинамического потенциала (внутренней энергии, энтальпии, свободной энергии, свободной энтальпии), теплоты фазового превращения, теплоты химической реакции. Обозначение:- кал. Одна международная тепловая калория равна 4.186 8 Джоулям. С тем, чтобы вскипятить воду в кофейнике потребуется 500 000 тепловых калорий. Одна пищевая калория равна 1 000 тепловых калорий. Одна термохимическая калория равна 4.184 Джоулям. В некоторых странах результаты исследований часто выражают с помощью так называемой 15-градусной калории, равной 4.185 5 Джоулям.

CALORIMETRY = КАЛОРИМЕТРИЯ – Calorimetry is the process of measuring quantities of absorbed or evolved heat, often used to determine specific heat. / Под Калориметрией, от Латинских слов Calor, означающее Тепло, и Metro, означающее Измеряю, понимается совокупность методов измерения количества теплоты, выделяющейся или поглощаемой при протекании различных физических или химических процессов. Методы калориметрии применяют при определении теплоёмкости, тепловых эффектов химических реакций, растворении, смачивании, адсорбции, радиоактивного распада и другого. Методы калориметрии также широко применяют в промышленности для определения теплотворной способности топлива. Основателем калориметрии можно считать Шотландского (Английского) химика и физика Дьжосэфа Блэка. Он был первым учёным, который заметил различие между теплом и температурой.

CALOTTE = КАЛЁТ (или СКУФЬЯ, или СКУФЕЙКА, или КАМИЛАВКА) – Calotte:- skullcap, especially zucchetto. / .

CALPAC = КАЛПАК – Calpac is a high-crowned cap worn in Turkey, Iran, and neighboring countries.

CALVING = ОТЁЛ – Calving is a giving birth, occurs nine months after joining.

CALVO DOCTRINE = ДОКТРИНА КАЛЬВО – Calvo Doctrine is an economic policy which says that jurisdiction in international investment disputes lies with the country where the investment is made. The Doctrine rejects right of foreign investors to appeal to their home country for help since this could result in violating the territorial sovereignty and judicial independence of the host countries. An investor, under this doctrine, has to use the local courts rather than courts of their home country. This doctrine was introduced by Carlos Calvo, an Argentine jurist, who thought it necessary to prevent abuse of jurisdiction of weak nations by more powerful nations. During the XX century, the Calvo Doctrine was adopted by several Latin American countries. The Calvo Doctrine (or principle) holds that jurisdiction in international investment disputes lies with the country in which the investment is located; thus, the investor has no recourse but to use the local courts. The principle, named after Carlos Calvo (an Argentinean jurist), has been applied throughout Latin America and other areas of the world. / домогательство (abuse). принцип недопустимости дипломатического или вооружённого вмешательства государств для взыскания долгов с другого государства. Был впервые провозглашён Аргентинским юристом и дипломатом Карлосом Кальво (Carlos Calvo) в 1868 в обстановке интервенции Европейских держав стран Латинской Америки под предлогом взыскаяния долгов их подданным с правительств этих стран. Доктрина Кальво, принцип недопустимости дипломатического или вооружённого вмешательства государств для взыскания долгов с другого государства; был впервые провозглашён Аргентинским юристом и дипломатом Карлосом Кальво (Carlos Calvo; 1824–1906) в 1868, в обстановке интервенции Европейских держав в странах Латинской Америки под предлогом взыскания долгов их подданным с правительств этих стран. Этот принцип был включён в ряд договоров, заключённых Латино-Американскими странами между собой и с Европейскими державами (Итало-Парагвайский Договор 1893, Франко-Мексикано-Никарагуанский Договор 1894 и другие). В начале XX века Доктрина Кальво была развита и несколько видоизменена в 1902 Луисом Мариа Драго (Luis María Drago), Министром Иностранных Дел Аргентины.

CALYPTRA = КАЛИПТРА (или ЧЕХЛИК, или КОЛПАЧОК) – Calyptra is a hood or covering over the calyx or other part. / Например, корневой чехлик, чехлик мха, колпачок спорогония.

CALYPTRAS = КАЛИПТРА (или КОЛПАЧОК, или ЧЕХЛИК) – Calyptras:- a Greek veil.

CALYX = ЧАШЕЧКА – Calyx is outer protective covering of the flower bud (square); the leaf-like green segment also called Sepals. Latin, the sepals of a flower considered as a group. Calyx is a small whorl of modified leaves (sepals) at the base of a flower and, where present, enclosing the other parts of the flower in bud. These may occur individually or joined into a cup or tube and may be of any color, but commonly green. Calyx is the outer ring of flower made up of separate or joined sepals, usually green and leaflike. The Calyx consists of five sepals which are either free to the base or fused to a variable extent. Normally, the sepals are of ± equal size. Bilabiate calyces result from a different extent of fusion and/or different size of the three upper and two lower sepal lobes. In Trisepalum the three upper lobes are almost completely connate while the two lower lobes are nearly free, so that the calyx appears to be trimerous. The shape of the sepals is usually simple (ovate, triangular, linear, etc), the margin is entire or sometimes dentate or serrate; peculiar pectinate sepals are found in some species of Columnea (e.g., C. incredibilis). The calyx is usually green, but may be vividly colored, especially in ornithophilous flowers, either being of the same color as the corolla (e.g., bright red calyces in Aeschynanthus spp.) or making a conspicuous contrast with the corolla (e.g., species of Columnea, Drymonia, Paradrymonia, etc). Remarkable are the tubular 'water calyces' of Aeschynanthus spp. in the Old World tropics and Chrysothemis in the neotropics. They are filled with a slimy secretion of the sepals, possibly mixed with rain water. The flower buds develop within this 'water bath'. / Чашелистик (sepal) цветка. Под Чашечкой понимается совокупность наружных листочков (чашелистиков), окружающих венчик в цветках с двойным околоцветником. Чашелистики обычно зелёные, свободные или сросшиеся между собой (раздельно- или сростнолистная чашечка). Биологическое значение чашечки – защита внутренних органов цветка и развивающегося плода, а также обеспечение его дополнительным питанием. У немногих Растений (Вереск, Гортензия, некоторые Лютиковые) чашечка крупная яркоокрашенная и служит для привлечения Насекомых вместо венчика, который в этом случае отсутствует или недоразвит; у одних Растений чашечка опадает при распускании цветка (например, у Мака), у других – после его отцветания (например, у Лютика); у большинства же Растений она остаётся после цветения, иногда даже разрастается и может

принимать участие в образовании плода. У Зонтичных, Сложноцветных и некоторых других Растений чашечка редуцируется совсем или превращается в волоски. В ботанике под Чашечкой понимается наружная часть двойного околоцветника, состоящая из чашелистиков. Она защищает бутон.

CAM = КУЛАЧОК (или КУЛАК) – Cams:- eccentric shafts used in most internal combustion engines to open and close valves. Cam is a rotating or sliding piece or projection used to impart timed or periodic motion to other parts of a machine. It is used chiefly as a controlling or timing element in machines rather than as part of a power transmission mechanism. Cams are particularly important in both knitting and weaving machinery. / открывать и закрывать клапаны. Под Кулаком или Кулачком понимается деталь кулачкового механизма в виде пластины, диска или цилиндра с поверхностью скольжения, профилированной таким образом, что при своём движении передаёт сопряжённой детали (толкателю или штанге) движение с заданным законом. Кулачок, звено кулачкового механизма, имеющее криволинейный профиль, переменная кривизна которого определяется кинематикой механизма. Кулачок соприкасается с толкателем, образуя двухподвижную кинематическую пару. Под Эксцентриком, от Латинских слов приставки Ex, означающая Отделение, и Centrum, означающее Центр, понимается деталь машин в виде цилиндра или диска, ось вращения которого сдвинута относительно геометрической оси на некоторе расстояние, называемое Эксцентриситетом. Иногда эксцентрик выполняет в машинах ту же роль, что и кривошип с малым радиусом.

CAMBER = ВЫПУКЛОСТЬ (или ВЫГНУТОСТЬ, или НАРОСТ, или НАПЛЫВ, или КАП, или ПРОГИБ) – (1) Camber is an upward vertical displacement built into a truss or glued-laminated beam to offset deflection. / в ферме или в балке из склеенных слоёв для зачёта прогиба.

(2) Camber:- slightly arched form of container floors to strengthen the construction. / Лёгкая выпуклость пола контейнера для придачи прочности конструкции.

CAMBIC HORIZON = КАМБИЧЕСКИЙ ГОРИЗОНТ – Cambic Horizon is a subsurface soil horizon that has undergone marked alteration due to the soil-forming processes.

CAMBIUM = КАМБИЙ – Cambium is a layer of tissue giving rise to secondary growth in stems and roots by cell division. Seasonal growth within the cambium produces annual growth rings. The corky bark of the cork oak tree is formed from cambium cells. A thin layer of tissue between the bark and the wood in a tree which repeatedly subdivides to form a new wood and bark cells. / Под Камбием, от позднелатинского слова Cambium, означающее Обмен или Смена, понимается тонкая прослойка образовательной ткани между корой и основным стволом дерева, обеспечивающая за счёт повторного деления формирование новых клеток древесины и коры, и, соответственно, рост дерева в толщину. Сезонные изменения активности камбия обусловливают образование годичных колец древесины. Образовательная ткань в стеблях и корнях преимущественно двудольных и голосеменных растений, дающая начало вторичным проводящим тканям и обеспечивающая рост их в толщину. Прокамбий, словосложение от Латинского слова Pro, означающее Вместо или Вперёд, и слова Камбий, специализированные участки меристематической ткани растений, дающие начало первичным проводящим тканям.

CAMBRIC = КЭМБРИК (или БАТИСТ) – Cambric is a type of finely woven linen or cotton cloth which is specially treated to create a glossy, stiff appearance. True cambric can be difficult to find, as a result of the rising popularity of other textiles. When cambric can be found, it tends to be of poor quality. Consumers purchasing cambric for use in projects should look for tight, even weaving, a crisp texture, and a shiny upper side. A variation on cambric, chambray, is much more widely distributed. Both types of fabric are named after Cambrai, a city in Southern France which contributed to the development of cambric. To make cambric, cotton or linen is tightly woven so that it will have a smooth, even grain. Once finished, the fabric is run through hot rollers in a process called Calendaring, which tightens the fibers and aligns them in the same direction. The resulting fabric is glossy and stiff, often through repeated washings. Cambric of a lower grade may need to be retreated after time to regain its original properties. Cambric first appeared in the late 1500s, and it quickly became a popular textile for a wide range of applications. The stiff neck ruffs of the Elizabethans were made from cambric, as were many curtains, wall hangings, petticoats, and a variety of other textile goods. Cambric was also known as Batist, especially when it was used for embroidery and lacework. The fine fabric took well to embroidery projects, and many women produced astounding embroidery on cambric. The widespread availability of other textiles and new manufacturing processes caused cambric to decline in popularity in the 1900s. However, chambray, a variation on cambric, continued to be popular. Traditional chambray is made by weaving colored threads through a white weft, somewhat more loosely than cambric is woven. The resulting chambray fabric is not calendared, so it stays soft, supple, and smooth. Chambray is often used to make shirts, which are typically designed to be loose fitting and comfortable. Some sewing supply companies still carry cambric. Chambray is readily available in a wide range of colors, although blue chambray is the most common. Cambric garments are very difficult to find, expect in vintage stores, or in the form of costumes which are not intended for extended wear. The cambric used in these garments is often of poor quality, unfortunately, leading many people to confuse cambric with low quality fabrics. Chambray shirts are readily available in many department stores. See also Chambray. Cambric is a lightweight cotton cloth used as fabric for lace and needlework. It is firm and closely woven and treated to product glossiness on one side. Cambric or Batiste, one of the finest and most dense kinds of cloth, is a lightweight plain weave cloth, originally from Cambrai, woven in greige, then bleached and piece-dyed, often glazed or calendered. Initially made of linen (flax), then cotton in the XIX century, it is also called Batiste. Cambric is used for linens, shirtings, handkerchieves and as fabric for lace and needlework. Cambric was originally a kind of fine white plain-weave linen cloth made at or near Cambrai. The word comes from Kameryk or Kamerijk, the Flemish name of Cambrai, which became part of France in 1677. The word is attested since 1530. It is a synonym of the French word Batiste, itself attested since 1590. Batiste itself comes from the Picard batiche, attested since 1401, derivation derived from the old French battre for bowing wool. The modern form batiste or baptiste comes from a popular merge with the surname Baptiste, pronounced Batisse, as indicated by the use of the expressions thoile batiche (1499) and toile de baptiste (1536) for the same fabric. The alleged invention of the fabric, around 1300, by a weaver called Baptiste or Jean-Baptiste Cambray or Chambray, from the village of Castaing in the peerage of Marcoing, near Cambrai, has no historic ground. Cambric was a finer quality and more expensive than lawn (from the French Laune, initially a plain-weave linen fabric from the city of Laon in France). Denoting a geographic origin from the city of Cambrai or its surroundings (Cambresis in French), cambric is an exact equivalent of the French Cambrésine, a very fine, almost sheer white linen plain-weave fabric, to be distinguished from cambrasine, a fabric comparable to the French lawn despite its foreign origin. Cambric is also close to chambray (from a French regional variant of Cambrai, a name which ‘also comes from Cambrai, the French city, where the material was originally made of linen yarn’. Chambray (also spelled Chambrai) appears in North American English in the early XIX century. Though the term generally refers to a cotton plain weave with a colored warp and a white weft, close to gingham, ‘silk chambray’ seems to have coexisted. Chambray was often produced during this period by the same weavers producing gingham. White linen cambric or batiste from Cambrai, noted for its weight and luster, was ‘preferred for ecclesiastical wear, fine shirts, underwear, shirt frills, cravats, collars and cuffs, handkerchiefs, and infant wear’. Technical use sometime introduced a difference between cambric and batiste, the latter being of a lighter weight and a finer thread count. Chambray, though the same type of fabric, had a colored warp and a white weft, though it could be ‘made from any color as you may wish, in the

warp, and also in the filling; only have them differ from each other. In the XVIII century, after the prohibition of imports in England of French cambrics, with the development of the import of Indian cotton fabrics, similar cotton fabrics, such as nainsook, from the Hindi nainsukh (eyes delight), became popular. These fabrics, initially called Scotch Cambrics to distinguish them from the original French cambrics, came to be referred to as Cotton Cambrics or Batistes. Some authors increased the confusion with the assumption the word batiste could come from the Indian fabric bastas. In the XIX century, the terms Cambric and Batiste gradually lost their association with linen, implying only different kind of fine plain-weave fabrics with a glossy finish. In 1907, a fine cotton batist had 100 ends per inch in the finished fabric, while a cheap-grade, less than 60. In the XIX century, with the development of the interest for color shirts, cambric was also woven in colors, such as the pink fabric used by Charvet for a corsage, reducing the difference between cambric and chambray. Moreover, the development and rationalization of mechanical weaving led to the replacement, for chambray, of colored warp and white weft by the opposite, white warp and colored weft, which allowed for longer warps. Cambric is a soft, white, closely woven, cotton or cotton blend fabric that has been calendered on the right side to give it a slight gloss. Cambric is used extensively for handkerchiefs. Cambric is a closely woven, plain weave, white fabric that is finished with a slightly glossy surface. The fabric is traditionally made from cotton or linen, but can be made from any fiber. It was formerly used in underwear and handkerchiefs, but today its major uses are to reinforce book bindings and to upholster the underside of chairs and sofas. Very low count, heavily sized glazed cambric is used for costuming. Cambric:- a plain weave construction, Cambric fabric is also calendered (passed between rollers under heat and pressure) to give the surface a shine. Originally made in Cambrai, France. Cambric:- soft, closely woven, light. Either bleached or piece dyed. Highly mercerized, lint free. Calendered on the right side with a slight gloss. Lower qualities have a smooth bright finish. Similar to batiste but is stiffer and fewer slubs. Launders very well. Has good body, sews and finishes well. Originally made in Cambria, France of linen and used for Church embroidery and table linens. Cambric, or Cambrick, a species of very fine white linen, first made at Cambray, in French Flanders, whence it derives its appellation. It is now (1850's) produced, of an equally good quality, in Great Britain. / уточина. от Французского слова Лон (Laune), первоначально означающее льняная ткань полотняного переплетения из города Ляон или Лан (Laon) во Франции). Камбрэ (Cambrai). Камэрик (Kameryk). Жан Батист (Jean-Babtiste). Камбрэзи (Cambresis). Камбрезин (Cambrésine). Шамбрэ (Chambray) Шамбрэ (Chambrai). Шарвэ (Charvet). туаль дё баптист (toile de baptiste).

CAM–DOOR LOCK = КУЛАЧКОВАЯ СИСТЕМА ДВЕРНОГО ЗАПОРА – Cam-Door Lock:- locking bar which secures container doors when closed. / Запирающий стержень, который закрепляет двери контейнера при их закрытии.

CAMEL = ВЕРБЛЮЖЬЕ (или ВЕРБЛЮД) – Camel:- a light yellowish brown. / от Латинского Camelus Bactrianus.

CAMEL = КАМЕЛЬ – Camel (maritime term):- a wooden float placed between a vessel and a dock acting as a fender. / Камель; судоподъёмный понтон; понтонный или бревенчатый плавучий кранец.

CAMELID = КАМЕЛИД (или ВЕРБЛЮДОВЫЕ) – Camelid is any animal that comes from the Camel Family. Obviously Camels, but also Alpaca and Llama. / Под Верблюдовыми понимается семейство парнокопытных животных отряда мозоленогих. Происходят из Северной Америки, откуда распространились в Южную Америку и Восточное полушарие. 2 рода:- верблюды и ламы.

CAMEL'S HAIR = ВЕРБЛЮЖЬЯ ШЕРСТЬ – Camel's Hair is a natural fiber obtained from the hair of the Bactrian Camel, a two-humped pack-carrying species. The fiber is used primarily in coats, sweaters, and suits. Camel's Hair comes from the soft lustrous underhair of the Bactrian, a two humped, pack-carrying Species of Camel. The fabric is fawn to brown in color. Because it is a luxury fabric and therefor very expensive, Camel's hair is nowadays very often blended with other fibers, sometimes sheep's wool, sometime manmade acrylic fibers. Camel's Hair is the soft, fine natural fiber attained from the underhair of the camel. Used for Oriental rugs, painter's brushes and coats. Camel Hair is a hair from the Camel. Sometimes blended with wool or imitated in wool. Twill or plain weave. Underhair is best. It is light weight, lustrous and soft. It ranges from a light tan to a brownish-black color. Usually left its natural tones but can be dyed-usually navy and some red. It has quite a long nap and is warm. Better grades are expensive. Sometimes blended with wool to reduce the cost and increase the wear. All wool Camel hair is not as lustrous and is spongy. Can have either a rich nap or a flat finish. Wears fairly well, particularly if blended. Camel's Hair is a hair from the two-humped Bactrian Camel, which is softer, lighter in weight and more fragile than wool. It provides warmth without weight, it never wrinkles and is water repellent. Camel Hair:- The Animal:- The two-humped Bactrian Camel (Camelus Bactrianus) is native to the steppes of Eastern and Central Asia. The current herd size is estimated at 1.4 million animals. The Camel's fine inner down is combed away, shorn or collected during the 6–8 weeks moulting season. An adult Camel yields about 5 to 10 kg of fleece per year. The Fiber:- The fine down fiber of the Bactrian Camel averages around 20 microns in diameter and varies in length from 2.5 to 12.5 cm. Baby Camel hair, which can measure as little as 16 microns (on a par with fine Cashmere), is the softest and most prized. Owing to its quality and scarcity, Camel hair is used in luxury textiles. Camel:- The best quality Camel yarn is spun on drop spindles by women in nomadic households of Mongolia and Inner Mongolia, China. Uses Of Camel Hair:- In Mongolia, Camel hair is used by nomadic herders to make yurts, winter clothing and carpets. Exported yarns are used for production of a wide range of garments – overcoats, suits, coats, blazers, jackets and sweaters – and winter accessories such as gloves, caps and scarves. Since it is a premium fiber, Camel hair is usually blended with wool to make it more economical. Nylon is sometimes used with virgin quality Camel hair in hosiery and other knitted products, while Camel/Cashmere blends are targeted at the luxury market. Producers:- The best quality Camel yarn is produced by nomadic households in Mongolia and Inner Mongolia, China, where women spin the collected hair on drop spindles. Other significant producers are Afghanistan and Iran. Owing to lack of infrastructure, only very limited quantities of Camel hair reach international markets. Production And Trade:- Statistics on world production of Camel hair are very limited. In the 1990s, production in China was estimated at about 2 000 tons, more than half of it from Inner Mongolia, while exports totalled around 500 tons. / Найлан (Nylon).

CAMERA LUCIDA = КАМЕРА ЛЮСИДА – Camera Lucida is a microscope with an attached mirror-like device that enables one to illustrate accurately objects seen through.

CAMISE = КАМИЗ – Camise is a light loose long-sleeved shirt, gown, or tunic. / Длинная мужская рубаха.

CAMISOLE = КАМИСОУЛ (или КАМИЗОЛЬ, или КОФТА, или НОЧНАЯ КОФТА) – Camisole is a short negligee jacket for women; a short sleeveless garment for women. / .

CAMLET = КАМЛИТ (или КЭМЛОТ) – Camlet is a medieval Asian fabric of Camel hair or Angora wool; a European fabric of silk and wool; a fine lustrous woolen. A garment made of camlet fabric, namely a fine lustrous woolen made of Camel hair, Angora wool, or silk.

CAM METABOLISM = МЕТАБОЛИЗМ МТК – CAM Metabolism (Crassulacean Acid Metabolism) is a metabolic adaptation allowing temporary storage of carbon-dioxide as C-4 organic acids (e.g., malate, aspartate) and later release of carbon-dioxide, by decarboxylation of these acids, for fixation into sugars. This allows uptake of carbon-dioxide during the cool nights, when water loss by transpiration is relatively low, while providing a store of carbon-dioxide for photosynthesis during the day. C-4 metabolism is typical of Agaves, Cactaceae, Crassulaceae and tropical grasses and can support high rates of growth under optimum conditions. / Метаболизм МКК (Метаболизм Крассулацианової Кислоты). Метаболизм МТК – метаболизм толстянковых кислот. , Кактусовых

(Cactaceae), . Под Метаболизмом, от Греческого слова Metabolē, означающее Перемена или Превращение, понимается обмен . САМ-Метаболизм – метаболизм карбоновых кислот по типу толстянковых (по начальным буквам Английских слов crassulacean acid metabolism).

CAMOUFLAGE = КАМУФЛЯЖ – Camouflage is an adaptation where the color of an organism's body blends with the background. / Под Камуфляжем, от Французского слова Camouflage, понимается способ маскировки, при котором на маскируемый предмет (объект) наносятся пятна, полосы различной формы и цвета. Камуфляж изменяет внешний вид и искажает контуры предмета.

CAMPANULATE = КАМПАНУЛЬНОЕ (или КОЛОКОЛЬЧАТОЕ, или КОЛОКОЛЬЧИКОВИДНОЕ) – Campanulate:- bell shaped, applied to the shape of a flower. / Кампанула – декоративный колокольчик. Колоколообразное.

CAMPBELL = КЭМПБЭЛ (или ПОХОДНЫЙ КОЛОКОЛ, или ХХ) – Campbell is a tartan made of green stripes on a blue ground, crossed with darker blue, narrower stripes. The blue ground is also crossed with darker blue, narrow stripes.

CAMPS = CUMULATIVE AUCTION MARKET PREFERRED STOCKS

CAMP SHIRT = ВЫПЕНДРЁЖНАЯ СОРОЧКА – Camp Shirt is a woman's shirt having a notched collar and often patch pockets.

CAMPYLOTROPOUS = КАМПИЛОТРОПНОЕ (или СОГНУТОЕ) – Campylotropous:- used with reference to an ovule or seed. So curved as to bring the apex and base nearly together. Horseshoe shaped. / Например, согнутая семяпочка.

CAN = ТАЗ – Can is:- (1) a cylindrical container, about 3 feet high and 10 to 12 inches in diameter, that is used to collect sliver delivered by a card, drawing frame, etc. (2) See also Drying Cylinders. In spinning process, a composition fiber wall and metal bottom, open-top, cylindrical can used to hold sliver or similar stock. The coiler can is found at the delivery end of the card, comber, drawing frame, etc. The can revolves when in action and is equipped with an automatic stop-motion when full. The sliver as it comes from the doffer roller in a weblike formation is then led to the coiler attachments, condensed to a sliver form, and deposited into the coiler can, which rests on a revolving plate at the delivery end of the frame. / со съёмного барабана . Цилиндр с дном для укладки ленты из ленточной машины в прядильном производстве.

CANADENSIS = КАНАДЭНСИС (или КАНАДСКОЕ) – Canadensis:- from Canada, or sometimes more loosely applied to originating from the northeastern USA. / .

CANADIAN CONTROLLED PRIVATE COMPANY = КАНАДСКАЯ КОНТРОЛИРУЕМАЯ ЧАСТНАЯ КОМПАНИЯ – Canadian Controlled Private Company (CCPC) is a special kind of company, i.e. it has certain tax ramifications. It is a private company that does not list its shares for trading on a recognized stock exchange and the company is not controlled (by shareholders or by agreement) in any way by non-Canadians. Note that a very large company can be a CCPC.

THE CANADIAN VENTURE EXCHANGE = КАНАДСКАЯ ВЕНЧУРНАЯ БИРЖА – The Canadian Venture Exchange (CDNX) was formed in late 1999 through the merging of the junior exchanges in Canada, i.e. the Vancouver Stock Exchange, the Alberta Stock Exchange, and various 'parts' of the other, more senior exchanges (the Toronto Stock Exchange and the Montreal Stock Exchange) as well as the CDN, Canadian Dealing Network (which really isn't a stock exchange but is more like the OTC-BB in the USA, i.e. a market for 'unlisted' stocks). The vision for the CDNX was to be the exchange for venture (i.e. young, emerging) companies. The CDNX listed (in 3 different categories) smaller, emerging companies such as junior technology ventures. In early 2002, the Toronto Stock Exchange (TSX) acquired the CDNX and renamed it the TSX-V, for TSX-Venture Exchange (TSX-V (short for the Toronto Stock Exchange – Venture Exchange)), with its head office in Toronto.

CANARIENSIS = КАНАРИЭНСИС (или КАНАРСКОЕ) – Canariensis(-e):- from the Canary Islands. / На Латинском языке Канариэнсис означает Канарское или из Канарских Островов.

CANARY–STAINED WOOL = ШЕРСТЬ С ЯРКО–ЖЁЛТЫМИ ПЯТНАМИ – Canary-Stained Wool is a yellowish coloration in the wool which cannot be removed by ordinary scouring methods. May be caused by bacterial growth or urine staining.

CANARY YELLOW = ЖЁЛТАЯ КАНАРЕЙКА (или КАНАРЕЕЧНО–ЖЁЛТОЕ, или ЯРКО–ЖЁЛТОЕ) – Canary Yellow:- a light to a moderate or vivid yellow.

CANCELABLE INSURANCE = РАСТОРГАЕМОЕ (или ОТМЕНЯЕМОЕ, или АННУЛИРУЕМОЕ) СТРАХОВАНИЕ – Cancelable Insurance is the insurance that may be canceled, at any time, by the insured party or by the insurance company. Aside from life insurance, most insurance policies can easily be. If the insurer cancels the policy, it must first give notice and must also refund prepaid premium on a pro rata basis. Before canceling an insurance policy, the insured party must make sure that he or she has replacement insurance coverage that is already confirmed. If there is no replacement coverage, the insured party can go completely uncovered for a period of time. One good reason for making certain of replacement coverage is that the insured party could face a situation in which certain medical conditions that developed during the prior health insurance coverage are excluded from coverage under the new insurance as 'preexisting conditions'. This is why it is essential to thoroughly research a new policy before the old one is canceled.

CANCELABLE POLICY = РАСТОРГАЕМЫЙ (или ОТМЕНЯЕМЫЙ, или АННУЛИРУЕМЫЙ) ПОЛИС – Cancelable Policy is a Policy that may be terminated either by the insured party or the insurance company (the insurer) at any time. Except life insurance, practically all types of insurance coverage is easily cancelable. If the insured cancels, the insurer will charge the higher premium rate (applicable to short-term policies) on the period already covered. If the insurer cancels, it must give the period of notice required in the policy and must refund prepaid premium on a pro rata basis. Cancelable Policy is a policy which may be terminated by the company or the insured by proper notification sent to the other party according to terms set forth in the policy. Cancelable Policy is a type of insurance policy that may be canceled by the insured or the insurer at any time, as long as the other person is notified according to the terms and conditions set forth in the policy, and the appropriate time is allowed during the notification process. / Полис, который может быть прекращён компанией или застрахованным лицом посредством должного извещения, направленного другой стороне в соответствии со сроками, установленными в данном полисе.

CANCELED = НЕДЕЙСТВИТЕЛЬНОЕ (или ОТМЕНЁННОЕ, или АННУЛИРОВАННОЕ) – In the US trademark law, Canceled:- trademark registration is no longer active. It may be due to the registrant's failure to file the required continued use affidavit under Section 8 of the Trademark Act, to a cancellation proceeding at the Trademark Trial and Appeal Board or to the outcome of a civil court action.

CANCELED BILL OF LADING = НЕДЕЙСТВИТЕЛЬНЫЙ (или ОТМЕНЁННЫЙ, или АННУЛИРОВАННЫЙ) КОНОСАМЕНТ – A Canceled Bill Of Lading is documentation that cancels a bill of lading in process. A canceled bill of lading is not the same as a voided bill of lading, which usually consists of combining at least two more bill of lading to an existing order in process. Canceled Bill of Lading

is:- a B/L status; used to cancel a processed B/L; usually per shipper's request; different from voided B/L. Canceled Bill Of Lading is a voided bill of lading. This is a B/L canceled on behalf of the cosignor.

CANCELED CLAIM = НЕДЕЙСТВИТЕЛЬНАЯ (или ОТМЕНЁННАЯ, или АННУЛИРОВАННАЯ) ПРЕТЕНЗИЯ – In the US patent law, a Canceled Claim is a claim that is canceled or deleted. 'Canceled' is the status identifier that should be used when a claim is canceled in an application.

CANCELING ORDER = АННУЛИРУЮЩЕЕ РАСПОРЯЖЕНИЕ (или ОТМЕНЯЮЩЕЕ ПОРУЧЕНИЕ) – Canceling Order is an order that deletes a customer's previous order. Cancelling Order is an order that cancels a previous order. / Аннулирующее Распоряжение – распоряжение, которое удаляет предыдущее распоряжение заказчика.

CANCELLATION = АННУЛИРОВАНИЕ (или АННУЛЯЦИЯ, или ОТМЕНА, или РАСТОРЖЕНИЕ) – (1) Cancellation is a request by the sender of the original message to cancel the original transaction. See also Reversal. Annulling an entry (reversing entry).

(2) Cancellation is a voiding of an agreement, either in due course (such as the discharge of a bill of exchange or the payment of a check) or by defacement or mutilation of a document.

(3) Cancellation is a termination of a policy before it is due to expire. Cancellation:- (a) run-off basis means that the liability of the reinsurer under policies, which became effective under the treaty prior to the cancellation date of such treaty, shall continue until the expiration date of each policy; (b) cut-off basis means that the liability of the reinsurer under policies, which became effective under the treaty prior to the cancellation date of such treaty, shall cease with respect to losses resulting from accidents taking place on and after said cancellation date. Usually the reinsurer will return to the company the unearned premium portfolio, unless the treaty is written on an earned premium basis.

CANCELLATION CLAUSE = ОГОВОРКА ОБ АННУЛИРОВАНИИ (или ОГОВОРКА О РАСТОРЖЕНИИ) – Cancellation Clause is a clause in an insurance contract which permits an insurer and/or an insured to cancel the contract before it is due to expire. The clause may provide for a return of premium in respect of the unused portion of the policy.

CANCELLATION OF SECURITIES = АННУЛИРОВАНИЕ ЦЕННЫХ БУМАГ (или ОТМЕНА ЦЕННЫХ БУМАГ, или ОБЪЯВЛЕНИЕ ЦЕННЫХ БУМАГ НЕДЕЙСТВИТЕЛЬНЫМИ) – Cancellation Of Securities is a legally prescribed procedure for declaring lost securities invalid. This improves the position of the owner of the securities by reinstating him with the same rights he had before the securities were lost. Only a court can declare securities invalid.

CANCELLATION PROCEEDING = ПРОИЗВОДСТВО ПО АННУЛИРОВАНИЮ (или ОБРАЩЕНИЕ ЗА ОТМЕНОЙ) – In the US trademark law, a Cancellation Proceeding is a proceeding before the Trademark Trial and Appeal Board in which the plaintiff seeks to cancel an existing registration of a mark. The proceeding may only be filed after issuance of a registration. A petition for cancellation may be filed by any person who believes that he or she is or will be damaged by the registration of the mark. / В законодательстве о товарных знаках, производство или слушание перед Советом по Судебным Разбирательствам и Аппеляциям по Товарным Знакам, в/на котором истец обращается за аннулированием существующей регистрации товарного знака. Это производство или слушание может быть проведено только после выдачи регистрации. Петиция об аннулировании может быть написана любым лицом, которое считает, что регистрации этого знака ущемляет или будет ущемлять его интересы.

CANDIDA = КАНДИДА (или БЕЛАЯ (ТОГА)) – Candida is the Latin name for a genus of fungal species which often causes yeast infections. Candida:- white. Candida is a Latin word which means Clear and White, with the whiteness of pure quartz rather than the whiteness of chalk (albus). / Под Тога, от Латинского слова Toga, от Tego, означающее Покрываю, понимается верхняя белая одежда граждан Древнего Рима, длинный плащ, обычно из белой шерсти.

CANDLE = СВЕЧА – Candle, from Latin Candela, a taper of tallow, wax, or sper-maceti, the wick of which is commonly of several threads of cotton spun and twisted together.

CANDLE = XX – Candle:- this refers to the stiffened fat on an unwashed fleece. Not a pleasing condition for hand spinners and often a condition when fleeces sit for years waiting to be spun.

CANDLE CHARTS = СВЕЧНЫЕ ГРАФИКИ – In visual analysis of charts, Candle Charts are a type of chart that consists of four major prices:- open, high, low, and close. The body of the candlestick bar is formed by the opening and closing prices. To indicate that the opening is higher than closing, the body of the bar is left blank. If the market closes below its opening, the body is filled. Also known as Candlestick Charts. A form of Japanese charting that has become popular in the West. A narrow line (shadow) shows the day's price range. A wider body marks the area between the open and the close. If the close is above the open, the body is white (not filled); if the close is below the open, the body is black (filled). Candle Charts:- a charting method developed by the Japanese in which each period is displayed with either a white rectangle or a black rectangle depending on whether the close is higher or lower than the open. The advantage to this type of chart is a visual picture concerning that period's activity. / В техническом анализе биржевых рынков, Свечные Графики основаны на Японском методе построения графиков. Свечные или Подсвечные Графики используют те же самые данные, что и Штриховые Графики, для каждого временного интервала. Разница заключается лишь в способе отображения этих данных. Толстая часть свечной линии называется собственно телом. Оно отображает ценовой диапазон между ценами открытия и закрытия для того или иного штриха соответствующего временного интервала. Светлое тело свечи или подсвечника возникает, когда цена закрытия выше цены открытия. В свою очередь, тёмное тело свечи или подсвечника возникает, когда цена закрытия ниже цены открытия. Тонкие линии над и/или под собственно телом называются тенями. Эти тени отображают ценовые экстремумы для того или иного штриха соответствующего временного интервала. Вершина верхней тени является максимумом штриха, а нижний уровень нижней тени является минимумом этого штриха. Настоящее тело – это сама сущность движения цены. Тени обычно рассматриваются в качестве второстепенных флуктуаций (колебаний) цены. Такие графики добавляют новое измерение и цвет в простой штриховой график. Сегмент штриха, который показывает диапазон между ценами открытия и закрытия, представлен двухмерным телом, а его продолжения к максимуму и минимуму изображены в виде линий или теней. Сутки, когда цены открытия и закрытия находятся вблизи суточного максимума или минимума, будут иметь протяжённое тело, тогда как сутки с незначительной разницей между ценами открытия и закрытия будут иметь короткое тело. Белый цвет тела указывает, что цена закрытия выше цены открытия, чёрный цвет – цена закрытия ниже цены открытия; хотя в зависимости от разработчика цвет может быть, например, зелёным и красным.

CANDLE FILTER = СВЕЧНОЙ ФИЛЬТР (или ФИЛЬТР ЦИЛИНДРИЧЕСКОЙ ФОРМЫ ИЗ ПОРИСТОГО МАТЕРИАЛА) – Candle Filter is a small filter interposed between the spinning pump and spinning jet to effect final filtration of the spinning solution prior to extrusion. / Экструзия или Выдавливание (Extrusion).

CANDLESTICK = ПОДСВЕЧНИК – Candlestick or Candles is a charting method used to display open, high, low and closing prices for a security, it uses the top and bottom of its bar to indicate high and low prices of the time frame indicated. Candle basics:- for those not

familiar with the details of candlestick charting, it's important to go over the fundamentals. The difference between the open and the close is called the 'Real Body' of the candlestick. The higher of these values creates the upper extreme of the real body, and the lower of these values creates the lower extreme. The amount the stock rose in price above the real body is called the Upper Shadow. The amount that the stock fell below the real body is called the Lower Shadow. If the candle is green or white, it means the lower extreme is defined by the opening price and that the stock's price rose during the period being charted. If the candle is red or black, then the lower extreme identifies the closing price, and the stock fell during the period. Candles may be created for any time period:- Monthly, weekly, hourly or even a minute. Regardless of the time frame, candlesticks should not be judged in isolation; traders should always look for follow-up action to confirm any signals during the following applicable period. / Японские Свечи:- график, используемый для рассмотрения колебания цен на данном рынке. Используя этот метод, можно увидеть самый высокий курс, самый низкий курс, курс на момент открытия и курс на момент закрытия торгов для определённого периода времени.

CANDLESTICK CHARTS = ПОДСВЕЧНЫЕ ГРАФИКИ – Candlestick Charts are based on a Japanese charting method. Candlestick charts use the same data points as bar charts for each time interval. The difference lies in the way the data is represented. The thick part of the candlestick line is called the Real Body. It represents the range between that bar's opening price and closing price. An Up Candlestick occurs when the close is higher than the open; a Down Candlestick occurs when the close is lower that the open. The thin lines above and/or below the real body are close is lower that the open. The thin lines above and/or below the real body are the shadows. These shadows represent the bar's price extremes. The peak of the upper shadow is the high of the bar and the bottom of the lower shadow is the low of the bar. The real body is the essential price movement. The shadows are usually considered as extraneous price fluctuations. Also known as Candle Charts. Candlestick Charts are one of the most powerful technical analysis tools in the trader's toolkit. They are also one of the most prevalent. Most technical analysis programs use candlesticks as the default mode of charting. Used correctly, candlesticks can give a signal in advance of much other market action. They can be a leading indicator of market activity. But familiarity doesn't necessarily breed expertise. There are perhaps more than 100 individual candlesticks and candlestick patterns. This is a daunting amount of information for a trader to understand and apply. As with most things, some candlestick patterns are more useful than others. Here, we will take a look at some of the most viable for stock traders. These are candlestick patterns that experience shows have the most relevance to making consistently profitable trading decisions. Used correctly, they should increase the accuracy of your predictions. / Известны также как Свечные Графики (Candle Charts).

CANDLE WATER TEMPERATURE = ТЕМПЕРАТУРА ВОДЫ XX – Candle Water Temperature is the temperature of the water surrounding the candle filter or within the heating jacket during fiber extrusion. / Экструзия или Выдавливание (Extrusion).

CANDLEWICK = СВЕЧНОЙ ФИТИЛЬ – Candlewick is a thick and mellow yarn used to form tufts by pulling it through a base fabric and then cutting it. The term Candlewick is also used for the fabric made by this method. Candlewick:- a soft cotton embroidery yarn.

CANDLEWICK FABRIC = ТКАНЬ ИЗ СВЕЧНЫХ ФИТИЛЕЙ – Candlewick Fabric is an unbleached muslin base fabric used to produce a chenille-like fabric by applying candlewick (heavy-plied yarn) loops and cutting the loops to give a fuzzy effect. Candlewick Fabric is an unbleached muslin bed sheeting (also called Kraft Muslin) used as a base fabric on which a chenille effect is formed by application of canlewick (heavy plied yarn) loops, which are then cut to give the fuzzy effect and cut yarn appearance of true chenille yarn. May be uncut also. (True chenille is a cotton, wool, silk, or rayon yarn which has a pile protruding all around at slight angles adn stimulates a caterpillar. Chenille is the French word for caterpillar). Used for bedspreads, drapes, housecoats, beach wear.

CANDY = КЭНДИ – Candy is a traditional weight unit of South Asia. The candy was quite variable, generally within the range 500 to 800 pounds (225 to 365 kilograms). In the international cotton trade, the candy was generally equal to exactly 7 (British) hundredweight, which is 784 pounds or 355.62 kilograms. / Кэнди – традиционная мера веса в Южной Азии. Значение кэнди в разных странах было абсолютно разным, колеблясь в пределах от 500 до 800 фунтов (225–365 килограмм). В международной торговле хлопком, кэнди, в основном, был точно равен 7 (Британским) хандредвейтам, составляющим 784 фунта или 355.62 килограмм.

CANDYING = ЗАСАХАРИВАНИЕ – Candying is a hardening caused by an excessively dry atmosphere, e.g., on dried fruits. / Затвердевание или упрочнение, вызванное чрезмерно жаркой атмосферой, например, на высохших плодах (фруктах).

CANE = ЛОЗА – Cane is a long woody pliable stem arising from the ground. / Под Лозой понимается удлинённый стебель (побег) или ветвь некоторых растений, Винограда, Ивы. Лозой также называют всё растение винограда, что неправильно.

CANESCENCE = СЕДОВАТОСТЬ – Canescence is a dense covering of very fine white or gray short hair.

CANNAGE = XX – Cannage or Tear Drop or Teariness:- short elliptical deviations of one or more adjoining picks, leading to local differences in light reflection in a fabric having a plain or other simple weave and a continuous-filament warp. This defect is often caused by the warp being too heavily sized, or the warp tension being too low during weaving, or by variations in the configuration of the weft yarns. / Переплетение; Раздвижка; Неровная Поверхность Ткани (cannage; tear drop; teariness):- порок ткани; небольшие эллиптические отклонения от одной или более смежных уточных нитей, что приводит к локальным различиям в отражении цвета ткани, имеющей гладкое или другое простое переплетение и филаментарную нить основы. Примечание:- этот порок часто вызывается слишком аппретированной основой или слишком низким натяжением основы во время процесса ткачества или изменениями конфигурации уточной пряжи.

CANOLA = КЭНОЛЭ – Canola, originally a syncopated form of the abbreviation 'Can.O., L-A.' (Canadian Oilseed, Low-Acid) that was used by the Manitoba government to label the seed during its experimental stages, is now a tradename for 'double low' (low erucic acid and low glucosinolate) rapeseed. Sometimes the 'Canola-quality' label is affixed to other varieties as well. See also Rapeseed. Canola is a name applied to edible oilseed rape. This plant belongs to the Mustard Family along with 3 000 other Species. Close relatives of this crop have been cultivated for food since the earliest recordings of man. Rapeseed has been important to Europe since the XIII century as a source of food and oil for fuel. Rapeseed production became popular in North America during World War II as a source of lubricants. Its oil has the property of adhering well to moist metal, making it an ideal lubricant for marine engines. The name 'Canola' was registered in 1979 by the Western Canadian Oilseed Crushers Association to describe 'double-low' varieties. Double low indicates that the processed oil contains less than 2% erucic acid and the meal less than 3 mg/g of glucosinolates. Erucic acid is a fatty acid that has been related to heart disease. Glucosinolates have breakdown products that are toxic to animals. Both characteristics make rapeseed products poor candidates for animal consumption. In the early 1960s, Canadian plant breeders isolated single lines free of erucic acid and began programs to develop double low varieties. Today annual worldwide production of canola is approximately 7.5 million tons on 4 million acres. Canada accounts for 15% of the world production and the European Economic Community for nearly 17%. The United States produces less than 1% of the world production. Minnesota and North Dakota are the major US production states with about 20 000 acres. Canola ranks 5th in production among the world's oilseed crops following Soybeans, Sunflowers, Peanuts and cottonseed. Like Soybean, Canola contains both high oil content as well as high protein content. It contains about 40% oil and 23% protein compared to 20 and 40%, respectively, for soybean. Like Soybean, when the oil is crushed out, it leaves a high

quality, high protein (37%) feed concentrate which is highly palatable to livestock. Commercial Varieties of Canola were developed from two Species; Brassica Napus (Argentine type) and Brassica Campestris (Polish type). Both Species of Canola produce seed that is high in polyunsaturated fatty acids (oleic, linoleic, and linolenic). Another potential for Canola is as an annual forage. Historically, it was used as a forage for field-raised swine and poultry. Canola can produce 1.0 to 2.0 tons of dry matter per acre in a single season. A study conducted in Kansas found winter rapeseed forage to have crude protein of 21–33%, compared to 24% for winter Wheat foliage. Both fall and spring seeded types of canola are available. Canola growth is characterized by six main growth stages. Much of the management of this crop is related to the length of time and plant characteristics within each of these stages. Stage 0 is preemergence. The germinating seedling may take from 4 to 10 days to emerge. During this time it is susceptible to many soil borne pathogens. In Canada, seed protectant fungicides are often used on spring types, however effective materials have not been registered for use in the United States. Speed of emergence depends on soil temperature and moisture, seed soil contact, and depth of planting. Stage I is the seedling stage where the very young plant has just emerged from the soil. Cotyledons are pushed through the soil surface by an active hypocotyl. At this stage, the seedling is still vulnerable to many soil pathogens, and to Flea Beetle infestation. Both pests are detrimental to stand establishment. Since the early canola crop is a poor competitor, it is extremely important to get a good stand. Stage 2 is the rosette stage characterized by an increasing leaf area index. Spring Canola will remain in this vegetative stage for several weeks. Winter Canola also stays in this stage for several weeks in the spring. Near the end of Stage 2, the crop is nearing its maximum leaf area index and at that point is a much better competitor. Increasing day length and temperatures initiate bolting and the beginning of Stage 3, the bud stage. The plants reach their maximum leaf area index at this time along with 30 to 60% of its total dry matter. A large accumulation of foliage is required to provide adequate sugars during flowering and pod fill. Flowering begins Stage 4 and continues for 14 to 21 days. Three to five flowers open per day and 40 to 55% of the flowers that open will develop pods. Ripening, or Stage 5, begins when the petals fall from the last formed flower on the main stem. Pod fill is complete 35 to 45 days after flower initiation, and the seeds contain about 40% moisture at this point. The crop is considered ripe and ready for swathing when 30 to 40% of the seed from pods on the main stem have turned color. Spring varieties of B. napus mature 74 to 140 days after seeding and B. campestris in 66 to 111 days. Canola is widely adapted, particularly to the cool extremes of the temperate zones. Minimum temperatures for growth have been reported to be near 32 °F. The crop will germinate and emerge with soil temperatures at 41 °F but the optimum is 50 °F. Winter annual varieties are grown where adequate snow covers or mild winters are common. The crop has been produced successfully in Michigan without benefit of snow cover. Planting date has a dramatic effect on survival however. Canola does best on medium textured, well drained soils. The crop is tolerant of a soil pH as low as 5.5 and saline conditions. Because of its tolerance to salinity, canola has been used as the first crop on newly drained dikes in the Netherlands. Canola requires approximately 16 to 18 inches of water through its growing season, with 8 to 8.3 inches used by annual varieties in July near flower and pod fill. White mold (Sclerotinia stem rot) can be a serious disease after flowering in seasons with cool, moist growing conditions. Infection occurs when dropped petals contact the stem and spores germinate on the dead petals. Bleached stem lesions occur around the initial infection, then white mold and black fungal bodies grow inside and outside the stem. Sudden wilting and premature dying of individual plants are usually the first noticeable symptoms. Since white mold is a problem in several other crops, its occurrence in Canola must be carefully monitored. Avoid planting Canola following such crops as soybeans and dry edible beans or sunflower. Many insects may infest Canola at various stages of its growth. Probably the greatest problem is caused by the flea beetle, a shiny black beetle about 10 to 15 mm long which attacks canola particularly at emergence, although it can be a problem later as well. Hot, sunny weather promotes feeding damage. Most growers control Flea Beetles with a granular insecticide mixed with the seed, but other seed-applied formulations and postemergence insecticides are also available. Seed-applied insecticides provide protection for about half as long as the granular materials. Flea Beetle has not been a problem with winter Canola types. Diamondback moth larvae can be a problem in dry years. The larvae are pale yellow to light green, 11 to 13 mm in length, and frequently hang by a spun thread. Larvae eat flowers and young pods, and peel older tissue. Seeds under peeled pods often fail to develop properly. Spraying with one of the recommended insecticides can be justified in situations where there are over 20 larvae per plant. Timely harvest of Canola is critical to prevent shattering. When pods first begin to yellow, the crop needs to be checked on a 3 to 4 day schedule. Harvest maturity can only be determined by observing the color of the seed. In canola that stands well, 30 to 40% of the seed on the main stem needs to be brownish-red in color prior to swathing. This corresponds to about 30 to 35% seed moisture. Canola does have a tendency to lodge, particularly with over-fertilization of susceptible Varieties. In severely lodged Canola, swathing should be done when 40 to 50% of the seed in exposed pods has turned color. Shattering can account for significant crop losses, therefore harvesting must not be delayed. Canola should be cut high on the stem and lightly pushed into the stubble with a windrower to prevent blowing. The crop is combined when it has dried to near 10% moisture. Direct combining with the use of a desiccant is possible in Canola that is standing well, but determining application time is difficult and field losses are higher. The cylinder speed should be set at 450–1 000 RPM and the cylinder concave clearance at 3/16 to 1/2 inch. Losses should be evaluated for further refinement of these adjustments. Canola that is to be stored for six months or more must be dried to near 8% moisture. Rapeseed must be handled and stored carefully. Tight storage bins are required. Seed can sweat in storage even at 9 to 20% moisture content. Inspection is required to prevent heating and spoilage in the bin. The small seed restricts air flow, so thin layers are necessary for drying wet seed. If much straw is present a scalper should be used to clean the crop. Yields of Canola in the upper Midwest have been extremely variable in recent studies. In Minnesota, yields have ranged from 150 to 2 500 lb/a with oil ranging from 39 to 47%. A test weight of 52 lb/bu is generally used for Canola. Studies conducted at several locations in Wisconsin have found yields of spring types ranging from 250 to 2 300 lb/a, while winter types frequently have not survived the Wisconsin winters. The term Canola was trademarked in 1978 by the Western Canadian Oilseed Crushers' Association to differentiate the new superior low-erucic acid and low-glucosinolate varieties and their products from older rapeseed varieties. The word Canola is derived from 'Canadian Oil, Low Acid' in 1978. In agriculture, Canola is a trademarked Cultivar of genetically engineered rapeseed variants from which rapeseed oil is obtained. Also known as Low Erucic Acid Rapeseed (LEAR) oil, Canola oil was initially bred in Canada by Keith Downey and Baldur Stefansson in the 1970s. Once considered a specialty crop in Canada, Canola has evolved into a major North American cash crop. Canada and the United States produce between 7 and 10 million metric tons of Canola seed per year. Preferred by food professionals and processors because of its nutritional profile and high smoke point, Canola oil has become even more valuable with high oleic varieties that reduce the need for hydrogenation. Exciting developments in the use of canola oil for biodiesel and lubricants are also underway. Canola seed (formerly rapeseed) futures began trading in Winnipeg in 1963 on the Winnipeg Commodity Exchange, now known as ICE Futures Canada, Inc.. Options on canola futures were introduced in 1991. Futures and options on futures are used by the domestic and global oilseeds industries to price and hedge transactions. Canola competes with palm oil, soybean oil, sunseed oil and other vegetable oils in the traditional foodstuffs market and in the emerging biodiesel market. As is the case with the ICE Futures US, Inc. Sugar No. 11 contract, Canola traders monitor food and energy markets simultaneously. Because this commodity is priced in Canadian Dollars (CAD) per metric tonne, canola traders may be exposed to a currency trade in addition to food and energy trades. Rapeseed is not a word that can be used in the place of canola. There are strict quality standards governing canola and products which do not meet government standards cannot use this trademarked term. Canola and Rapeseed are classes of the same botanical Family. The term Canola applies to Varieties that meet the Canola standards for low levels of erucic acid and glucosinolates. Production of Canola Varieties is widespread. Rapeseed

Varieties are produced in small volumes, usually under contract. Shipments and submitted samples of rapeseed must be clearly identified as rapeseed. Canola and rapeseed may be visually indistinguishable. However, their end uses are quite different. Canola is grown primarily in regions of Western Canada, with some acreage being planted in Ontario and the Pacific Northwest and North Central United States. Canola is also grown in other countries including Europe and Australia. The name 'Canola' is actually a contraction of Canadian Oil, Low Acid. It is a derivation from rapeseed, an oilseed whose name in turn derives from the Latin word 'Rapum' for Turnip. Rapeseed oil was used as an industrial lubricant in World War II, but was considered unsafe for human or livestock consumption due to its erucic acid and glucosinolate content. The first 'doublelow', or reduced erucic acid and glucosinolate plant was developed in 1974 by Dr. Baldur Stefansson at the University of Manitoba through plant breeding. Canola oil was added to the US Food and Drug Administration's Generally Recognized As Safe (GRAS) list in 1985. Today Canola oil is acknowledged as a premium vegetable oil for its low saturated fat content. This same feature also makes it a leading ingredient in biodiesel production in Europe, since Canola oil has the lowest cloud point of any competing vegetable oil. Canola is widely grown, with global production at around 43 million metric tons. The European Union (EU) has the largest production, followed by China and Canada. The EU and China are also among the world's leading importers, with Japan, Mexico, Pakistan and the USA also importing Canola. Canada is the world's largest exporter of Canola, with 66% of the market. This is why ICE Futures Canada's Canola futures correlate to world values. The Canola seed is approximately 40% oil by content. The residual canola meal is used as a highprotein additive in livestock feed mixes. / Англоязычное слово Кэнолэ (Canola) появилось в 1978 в результате сокращения от 'Канадский Масличный, Низко-Кислотный' Рапс. На Русском языке это выглядело бы как 'Канмнк'. первоначально Кэнолэ был выведен в Канаде Кэйтом Дауни и . Xxxxx (Dr. Baldur Stefansson).

CANOPY = (РАСТИТЕЛЬНЫЙ) ПОКРОВ (или ПОЛОГ) – Canopy is the foliage of a cotton crop; said to be closed when plant growth of adjacent rows closes over and shades row middles; direct sunlight penetration between rows constitutes an opened canopy. Canopy is the foliage cover of a plant community especially woodland. Canopy:- The covering formed by the leaves of the plant population in a crop. Full canopy refers to the stage when the leaves of the plants in adjacent rows meet in the inter-row. / – листовой . Полог – самый верхний ярус ветвей дерева.

CANTAR = КАНТАР – Cantar is an English spelling for the Arab form of the quintal. In recent years, the cantar has been interpreted as a metric unit equal to 50 kilograms or 110.23 pounds. Traditional cantars tended to be a few percent larger than this. / Кантар – произносимое по-Английски, заимствованное у Арабов слово 'Квинтал' (Quintal). В последние года, кантар стал интерпретироваться в качестве метрической единицы, равной 50 килограммам или 110.23 фунтам. Однако традиционные кантары имеют тенденцию рассматриваться на несколько процентов выше этих значений.

CANTILEVER = КОНСОЛЬ – Cantilever is the part of a truss or structural member that extends beyond its support. / Часть фермы или конструкционного элемента или детали, которая . Под Консолью, от Французского слова Console, понимается выступ в стене или заделанная одним концом в стену балка, поддерживающая балкон, вазу, карниз, фигуру и тому подобное.

CANTON CRÊPE = КАНТОНСКИЙ КРЭП – Canton Crêpe is heavier than Crêpe de Chine with a slightly ribbed crêpe filling. It was originally made of silk in Canton, China. Today it is as well made of rayon or acetate. / Кантонский Крэп тяжелее Крэп дё Шина . уточина.

CANTON FLANNEL = КАНТОНСКАЯ ФЛАНЕЛЬ – Canton Flannel:- made of Cotton. Four harness warp-faced twill weave. The filling yarn is a very loosely twisted and soft and later brushed to produced a soft nap on the back, the warp is medium in size. The face is a twill. Heavy, warm, strong and absorbent. Named for Canton, China where it was first made. Comes bleached, unbleached, dyed, and some is printed. Used in interlinings, sleeping garments, linings, coverings, work gloves. Canton Flannel is a heavy cotton or cotton blend material with a twilled face and a napped back. The fabric's strength, warmth, and absorbance make it ideal for interlinings and sleeping garments. Canton Flanell is a heavy and warm cotton material. While it has a twilled surface there is a long soft nap on the back. It is named for Canton because that's where it was first made. Canton flanell is strong and absorbent. / уточная пряжа.

CANTOR EXCHANGE™ = КЭНТО ЭКСЧЭЙНДЬЖ™ – Cantor Exchange™ (CX) is the same as Cantor Futures Exchange, LP.

CANTOR FUTURES EXCHANGE, LP = КЭНТО ФЬЮЧЕЗ ЭКСЧЭЙНДЬЖ, ЭЛ.ПИ. – Cantor Futures Exchange, LP is an electronic, online marketplace where investors can buy and sell domestic (US) box office receipt contracts, also known as DBOR Contracts or Movie Futures. The exchange, approved by the US Commodity Futures Trading Commission in April, 2010, allows investors to bet on how financially successful upcoming movie releases will be in theatres. The Cantor Exchange is similar to the Hollywood Stock Exchange (HSX) except that investors gain and lose real money. The exchange gets its name from its parent company, Cantor Fitzgerald, which also owns HSX. The Motion Picture Association of America, the Directors Guild of America and other major industry groups opposed the exchange, saying it created a risk of market manipulation and conflicts of interest. Supporters said it could help companies in the movie industry manage movie-production risk by hedging. Headquartered in New York, United States of America. Cantor Futures Exchange, LP (Cantor Exchange™) has been approved by the US Commodity Futures Trading Commission (CFTC) as a Designated Contract Market. Cantor Exchange™ establishes the rules of fair trading, offers the electronic trading platform for matching buyers and sellers, and supervises the trading practices of all participants in the market. Cantor Clearinghouse, LP (Cantor Clearinghouse), a sister company of Cantor Exchange™, has been approved by the CFTC as a registered Derivatives Clearing Organization. Cantor Clearinghouse settles all trades between buyers and sellers on the Cantor Exchange and ensures the integrity of the marketplace. All Participants in Cantor Exchange™, once approved, automatically become Participants in Cantor Clearinghouse upon funding of their accounts. Cantor Exchange is a subsidiary of Cantor Fitzgerald, LP (Cantor Fitzgerald), a leading global financial services firm at the forefront of financial and technological innovation that has been a proven and resilient leader for over 65 years. Cantor Fitzgerald is a preeminent capital markets investment bank serving more than 5 000 institutional clients around the world, recognized for its strengths in institutional equity and fixed income sales and trading and for its expanding presence serving the middle market with investment and merchant banking services, prime brokerage, and commercial real estate financing. Cantor Fitzgerald also is a leader in new businesses and marketplaces including gaming technology, emissions trading, e-commerce, insurance and other ventures. Also known as Cantor Exchange™ or CX. Cantor Exchange™ has filed an application with the Commodity Futures Trading Commission (CFTC) to become a federally regulated, internet-based marketplace where customers become members of the exchange and have direct access to trade in the market. The first product that Cantor Exchange™ intends to bring to the market will be based on movie box office revenue. Final approval of Domestic Box Office Receipt contracts, also known as Movie Box Office Contracts, is anticipated in the third quarter of 2009. Cantor Exchange™ is a division of Cantor Fitzgerald, LP, one of the world's leading financial services firms, and is partnered with Cantor Entertainment, another subsidiary of Cantor Fitzgerald, which provides services to the entertainment industry and owns the Hollywood Stock Exchange, the world's leading virtual entertainment stock market. Cantor Exchange™ leverages the credibility and integrity of Cantor Fitzgerald's position in the financial services industry along with the movie industry experience and expertise of Cantor Entertainment to bring to market a unique product offering that could change the landscape of financing and speculation in the film industry. The Cantor Financial Futures Exchange (CX) is a joint venture of the

NYBOT® and Cantor Fitzgerald & Co.. CX provides a proprietary electronic trading platform. It was established in 1998. Cantor Futures Exchange, LP (Cantor® Exchange or CX) has been approved by the US Commodity Futures Trading Commission (CFTC) as a Designated Contract Market. Cantor Exchange establishes the rules of fair trading, offers the electronic trading platform for matching buyers and sellers, and supervises the trading practices of all participants in the market. Cantor Clearinghouse, LP (Cantor Clearinghouse), a sister company of Cantor Exchange, has been approved by the CFTC as a registered Derivatives Clearing Organization. Cantor Clearinghouse settles all trades between buyers and sellers on the Cantor Exchange and ensures the integrity of the marketplace. All Participants in Cantor Exchange, once approved, automatically become Participants in Cantor Clearinghouse upon funding of their accounts. Cantor Exchange is a subsidiary of Cantor Fitzgerald, LP (Cantor Fitzgerald), a leading global financial services firm at the forefront of financial and technological innovation that has been a proven and resilient leader for over 65 years. Cantor Fitzgerald is a preeminent capital markets investment bank serving more than 5,000 institutional clients around the world, recognized for its strengths in institutional equity and fixed income sales and trading and for its expanding presence serving the middle market with investment and merchant banking services, prime brokerage, and commercial real estate financing. Cantor Fitzgerald also is a leader in new businesses and marketplaces including gaming technology, emissions trading, e-commerce, insurance and other ventures. Headquartered in New York, State of New York (NY), the United States of America. Cantor Futures Exchange, LP (Cantor Exchange™ or CX) is on the forefront of launching new futures products designed to stimulate the trading imagination of industry professionals and retail participants alike. Cantor Exchange is a federally regulated internet-based marketplace approved by the US Commodity Futures Trading Commission (CFTC) as a Designated Contract Market. The Cantor Exchange marketplace enables the buying and selling of futures contracts to industry participants, professional traders and individual investors. 1998-September-04 (date of work's beginning):- The Commodity Futures Trading Commission (CFTC) today approved the Cantor Financial Futures Exchange as a designated contract market to trade US Treasury futures contracts, ushering in a new era in financial futures trading. The Exchange, to be known as the Cantor Exchange (CX), will begin trading on Tuesday, September 08, 1998 at 03:00 pm (US EST), the beginning of the trading day for Wednesday, September 09, 1998. For the convenience of customers, mock trading sessions will be held on Friday, September 04 from 12:00 pm to 02:00 pm and on Tuesday, September 08 from 07:30 am to 11:00 am. At the core of the Cantor Exchange is a new and innovative Interactive Matching(TM) system which has been perfected by Cantor Fitzgerald in its vast US Treasury securities brokerage business since 1996. 'The unique infrastructure of the Cantor Exchange enables all market participants, no matter where they are physically located, to trade, on one level playing field, more directly, more anonymously, more efficiently and more cost effectively than ever before', said Howard Lutnick, President and CEO of Cantor Fitzgerald, LP. 'The Cantor Exchange brings an end to a monopoly in the US Treasury futures and introduces a new era of innovation and competition which will benefit all market participants', added Mr. Lutnick. 'This is a momentous event for the members of the Board of Trade of the City of New York who, with the introduction of the Cantor Exchange, have placed the Exchange at the forefront of technological innovation for financial markets where computerized trading can be very effective', stated Albert M. Weis, Chairman of the Board of Trade of the City of New York. The Cantor Exchange is designed to promote broad and direct access to the US Treasury futures market. Direct access to the Cantor Exchange is available to members of the Board of Trade of the City of New York, Cantor Exchange clearing members, National Futures Association (NFA) registrants and to Associate Members who may join the Cantor Exchange for a one-time fee of USD1 000. All trades on the Cantor Exchange must be cleared through a Cantor Exchange clearing member. In keeping with the philosophy of providing an open marketplace, Cantor Exchange data will be broadly available via all major market data vendors, on the Cantor Exchange web site, www.cx.cantor.com, and via Cantor Speed. The Cantor Exchange will initially operate from 07:30 am to 05:30 pm (US EST), providing continuous trading designed to coincide with the US Treasury cash market. The Cantor Exchange is operated jointly by the Board of Trade of the City of New York and Cantor Fitzgerald. The Board of Trade of the City of New York is responsible for oversight and clearing of all trades executed on the Cantor Exchange. Cantor Fitzgerald operates the trading platform for the Cantor Exchange, utilizing the trading and distribution systems that have been perfected in Cantor Fitzgerald's highly liquid US Treasury cash market. The Board of Trade of the City of New York is the parent company of the Coffee, Sugar & Cocoa Exchange (CSCE) and the New York Cotton Exchange (NYCE). Founded in 1870, the NYCE is the oldest futures exchange in New York. With its Citrus Associates, FINEX and New York Futures Exchange (NYFE) affiliates, NYCE offers a wide variety of agricultural, financial and stock-index products to market participants. NYCE trades a number of products on its complementary trading floor in Dublin. Founded in 1882, the CSCE is the world's leading marketplace for futures trading in coffee, sugar and cocoa and, since 1993, an innovator in futures and options trading in dairy products. Cantor Fitzgerald, LP provides a broad spectrum of institutional brokerage and execution services to global financial markets. It operates the world's largest electronic marketplace for G-10 sovereign debt, emerging markets, and Eurobonds and is also one the largest 'third-market' equity operations in the US stock market. Headquartered in New York City, Cantor Fitzgerald currently employs more than 2 100 people in offices throughout the US, Canada, Europe and Asia serving the world's largest banks and securities houses. / НАЙБЭТ® (NYBOT®). Кэнто Фитцдьжерэлд, Эл.Пи. (Cantor Fitzgerald, LP). Эсошиэтс (Associates).

CANVAS = КАНВА (или ПАРУСИНА, или ПАРУСНОЕ ПОЛОТНО, или ХОЛСТ) – Canvas or cloth, initially a wool, linen or cotton woven fabric (ticking, calico, percale, cretonne, etc), the simplest of all fabrics and the most commonly used. Waxed cloth is coated to make it waterproof. Métis has a cotton warp and linen weft. Canvas is an extremely heavy-duty, plain-woven fabric used for making sails, tents, marquees, backpacks and other items where sturdiness is required. It is also popularly used as a painting surface, typically stretched, and on fashion handbags and shoes. It is an important part of the trampoline, providing the surface that users bounce on for recreational and competitive purposes. See also Duck, Numbered Duck, and Sailcloth. Canvas is a general classification of strong, firm, closely woven fabrics usually made with cotton. A heavier, open weave comprised of plied yarns. Characteristics:- very hard-wearing, generally water-resistant. Canvas:- also known as Numbered Duck, this plain-weave cloth is rugged and heavy. The ply yarns used give much strength and body to the fabric. From 2-ply to 14-ply yarns are used to make the goods. It is manufactured in the gray state or natural condition, but is also dyed olive drab or khaki for armed services. Duck and canvas are more or less interchangeable terms today. Uses for canvas include tents, wagon covers, many types of army equipage equipment, sails, mail bags, sacks. Canvas is a cotton, linen, or synthetic fabric made with a basic plain weave in heavy and firm weight yarns for industrial or heavy duty purposes. Also referred to as 'Duck', although the term 'Canvas' usually relates to the heavier, coarser constructions. Canvas is a heavy, strong, usually plain weave fabric that historically was made of flax, hemp, or cotton. Today, it is usually made of cotton, but some fabrics made of man-made fibers or blends are also called Canvas. Canvas is, roughly speaking, heavier than duck or sailcloth although the three names are often used interchangeably. The unbleached fabric is used for coat fronts, lapels, and linings of men's suits. Hair canvas for interlinings is made of goat's hair and wool. Canvas is a firm closely woven cloth usually of linen, hemp, or cotton used for clothing and formerly much used for tents and sails. Plain weave. Mostly rugged, heavy material made from plyed yarns. Has body and strength. It is usually manufactured in the grey state but some is dyed for different uses. Canvas, unbleached cloth of hemp or flax, chiefly used for sails for shipping. Masters of ships are required to make entry of all foreign-made sails and cordage, not being standing or running rigging, in use on board their respective ships, under a penalty of 100l. Sails in actual use, and fit and necessary for such ship, are imported free; but when otherwise disposed of, they are liable to an ad valorem duty of 20 per. cent. – (3 & 4 Will. 4. c. 56). It had been the practice for a considerable period to grant bounties on the exportation of canvas or sail-cloth; these, however, finally

ceased on the 1st of January, 1832. By an act passed in the reign of Geo. 2., new sails were ordered to be stamped with the maker's name and place of above; but this regulation was repealed by the 10 Geo. 4. c. 43 § 9. / Метис (Métis) имеет . плотнотканые ткани, обычно выработанные из хлопка. Под Канвой, от Французского слова Canevas, понимается сетчатая хлопчатобумажная (реже льняная) сильно аппретированная ткань. Применяется как основа или трафарет для вышивания, иногда как прокладочный материал в одежде. Под Парусиной понимается тяжёлая плотная льняная или полульняная ткань из толстой пряжи. Первоначально употреблялась для парусов. Применяется неотделанная или пропитанная составами для изготовления брезента, верха обуви, а также для пошива специальной одежды. Канва, от Французского слова Canevas, сетчатая сквозная хлопчатобумажная, реже льняная ткань из кручёной пряжи, отбеленная или подкрашенная, сильно аппретированная. Вырабатывается полотняным или перевивочным переплетением. Применяется как основа или трафарет для вышивания, иногда в качестве прокладочного материала в одежде.

CAO = CHIEF ADMINISTRATIVE OFFICER

CAORF = COMPUTER–ASSISTED OPERATIONS RESEARCH FACILITY

CAOUTCHOUC = КАУЧУК – Caoutchouc (in 1844):- 'This substance, which has been improperly termed Elastic Gum, and vulgarly, from its common application to rub out pencil marks on paper, India Rubber, is obtained from the milky juice of different plants in hot countries. The chief of these are the Jatropha Elastica, and Urceola Elastica. The juice is applied in successive coatings on a mould of clay, and dried by the fire or in the Sun; and when of a sufficient thickness, the mould is crushed, and the pieces shaken out. Acids separate the caoutchouc from the thinner part of the juice at once, by coagulating it. The juice of old plants yields nearly two thirds of its weight; that of younger plants less. Its color, when fresh, is yellowish white, but it grows darker by exposure to the air. The elasticity of this substance is its most remarkable property; when warmed, as by immersion in hot water, slips of it may be drawn out to 7 or 8 times their original length, and will return to their former dimensions nearly. Cold renders it stiff and rigid, but warmth restores its original elasticity. Exposed to the fire, it softens, swells up, and burns with a bright flame. In Cayenne it is used to give light as a candle' (Ure's Dictionary). Caoutchouc has become an article of very considerable importance. Charles Marie de La Condamine, who was one of the first to communicate authentic information with respect to it, mentions, that, owing to its being impervious to water, it was made into boots by the Indians (Voyage de la Rivière des Amazones, p. 76.). It is now employed in a similar way here. Means have, within these few years, been discovered of reducing it to a state of solution; and when thin filaments of it are spread over cloth or any other substance, it is rendered impervious alike to air and water. Air cushions and pillows are manufactured in this way; as are water-proof cloaks, now in very extensive demand, hats, boots, shoes, &c. It is also extensively used in the manufacture of braces and other articles which it is desirable should possess considerable elasticity; and there can be little doubt that it will be employed still more extensively, and is a still greater variety of ways. Previously to 1830, the importations of caoutchouc were comparatively inconsiderable, having in that year amounted to only 52 000 lbs.; whereas, in 1840, the duty of 1s. a cwt, produced 322l., showing that 6 640 cwts., or 721 280 lbs, had been entered for consumption. It is principally imported from Brazil, Colombia, and other parts of South America. The imports from Brazil (Para) amounted, at an average of the 3 years ending with 1842, to 3 790 cwts. a year (Parl. Paper No. 309. Sess. 1843.). The price of caoutchouc varied in the London market, in January 1843, from 7d. to 1s. 3d. per lb. / Французский исследователь, географ и математик Шарль Мари дё Ля Кодамин (Charles Marie de La Condamine; 1701–1774). Под Натуральным Каучуком (НК), от Французского слова Caoutchouc, возникшего в качестве словосочетания двух слов на языке Южноамериканских Индейцев Тупи – Кау, означающее Дерево, и Учу, означающее Плакать или Течь, понимается природный полимер $[–CH_2CH(CH_3)=CHCH_2–]_n$, обладающий при обычных температурах высокоэластичными свойствами и используемый для получения резины. Он содержится преимущественно в млечном соке (латексе) Каучуконосных Растений; добывается главным образом из Бразильской Гевеи. Латекс извлекают подсочкой коры дерева; каучук выделяют коагуляцией с помощью муравьиной или уксусной кислот. Важнейшие типы – рифлёный смокед-шит (продукт светло-янтарного цвета) и светлый креп (продукт светло-кремового цвета). Основная составная часть НК (91–96%) – углеводород, рассматриваемый как полиизопрен $(C_5H_8)_n$, в котором 98–100% звеньев изопрена присоединены в положении 1.4–цис. Плотность 910–920 кг/м^3. Стоек к действию воды, хорошо растворим во многих органических растворителях, сильно набухает в маслах. При длительном хранении ниже 10 °C, а также при растяжении кристаллизуется, что обусловливает высокую прочность при растяжении ненаполненных резин (~30 МПа). Резины характеризуются также высокой эластичностью (относительное удлинение 600–900%), износо- и морозостойкостью; сравнительно невысокой атмосферостойкостью. Основные области применения – производство шин. Используется также для изготовления конвейерных лент, приводных ремней, амортизаторов. Значительную часть НК применяют в виде латекса. Натуральный Каучук представляет собой эластичный материал, получаемый коагуляцией латекса Каучуконосных Растений, главным образом Бразильской Гевеи. Вообще же Каучуконосные Деревья, к которым относятся Бразильская Гевея, Каучуконосный Фикус и некоторые Виды Рода Ландольфия, чаще всего называются Каучуковыми Деревьями. Основным компонентом каучука является полиизопрен. Вулканизацией натурального каучука получают прочную и эластичную резину. Натуральный каучук применяется в производстве шин, амортизаторов, изделий санитарии и гигиены и много другого. В 1979 мировое производство натурального каучука составляло порядка 3.9 миллионов тонн.

CAP = CAPITAL

CAP = CAPITALIZATION

CAP = COMMON AGRICULTURAL POLICY

CAP = ВЕРХНИЙ ПРЕДЕЛ (или ОПЦИОН НА ВЕРХНИЙ ПРЕДЕЛ, или ОПЦИОН НА ПРЕВЫШЕНИЕ ПРЕДЕЛА) – (1) For over-the-counter markets, Caps and Floors are options which provide the right, but not the obligation, to enter into a long or short position at a specified price. Caps and floors are similar to swaps since they provide price protection at a predetermined level. However, caps and floors are different from swaps in that allow producers and end users to benefit from favorable price changes. The buyer of the cap or floor pays an up-front cash premium for this price protection. With caps and floor purchases, all risks are predefined; the premium paid for the option will always be the maximum 'loss' or 'cost' incurred by the buyer. Caps are sometimes referred as Call Options. They provide full protection from rising prices. In addition, caps allow end users to benefit fully from decreases in the underlying asset. The opposite of Floor. A supply contract between a buyer and a seller, whereby the buyer is assured that he will not have to pay more than a given maximum price. This type of contract is analogous to a call option. Cap is an options contract whereby the seller agrees to pay to the purchaser, in return for a premium, the difference between a reference rate and an agreed strike price when the reference exceeds the strike on or before a specific date. Cap is an upper limit. For example, on a benefit, a contribution, benefit growth or a funding level. / На внеучётных рынках . За счёт закупки опционов на верхний и нижний пределы, все риски . Верхний Предел или Опцион На Верхний Предел – поставочный контракт между покупателем и продавцом, посредством которого покупатель застрахован в том, что ему не придётся платить свыше данной максимальной цены. Этот тип контракта аналогичен опциону на покупку (call option). Верхний Предел или Опцион На Верхний Предел – опционный

контракт, посредством которого продавец соглашается оплатить приобретателю взамен на получаемую премию, разницу между справочной ставкой и оговорённой сходной ценой в том случае, если справочная ставка превысит сходную цену или до указанной даты.

(2) Cap is a limit on the amount that your interest rate can increase. Two types of interest-rate caps exist:- (i) 'periodic adjustment caps' limit the interest-rate increase from one adjustment period to the next; and (ii) 'lifetime caps' limit the interest-rate increase over the life of the loan. By law, all adjustable-rate mortgages have an overall cap. Maximum interest rate on floating rate bonds. A Cap is an agreed maximum amount up to which the investor can profit from a rise in the price of an underlying asset. In the case of an interest rate cap, if the contractually agreed interest rate ceiling is exceeded on the interest determination date by a reference interest rate, the seller only has to pay the buyer the difference between the interest rate ceiling and the reference interest rate. / По закону все закладные с переоцениваемой ставкой (ЗПС; adjustable-rate mortgage (ARM)) имеют . Максимальная процентная ставка по облигациям с переменной ставкой.

(3) Cap is a contract whereby the seller agrees to pay to the purchaser, in return for an upfront premium or a series of annuity payments, the difference between a reference rate and an agreed strike rate when the reference exceeds the strike. Commonly, the reference rate is three- or six-month Libor. A cap is therefore a strip of interest rate guarantees that allows the purchaser to take advantage of a reduction in interest rates and to be protected if they rise. They are priced as the sum of the cost of the individual options, known as Caplets. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)).

(4) Individually structured interest option stipulating an interest ceiling as a long-term hedge for buyers.

(5) Cap:- to limit.

CAP = ШЛЯПКА (или КЕПКА, или ШАПКА, или КОЛПАЧОК) – Cap is a head covering especially with a visor and no brim; a distinctive head covering emblematic of a position or office, as a cardinal's biretta; mortarboard.

CAPABILITY = СПОСОБНОСТЬ (или ВОЗМОЖНОСТЬ, или МОЩНОСТЬ) – Capability:- the maximum load that a generating unit, generating station, or other electrical apparatus can carry under specified conditions for a given period of time without exceeding approved limits of temperature and stress.

CAPACITANCE = (ЭЛЕКТРИЧЕСКАЯ) ЁМКОСТЬ – Capacitance is the measure of the ability of a nonconductor to store electrical energy by means of the potential difference across the surfaces of the nonconductor.

CAPACITIVE BRIDGE UNIT = ВМЕСТИМОЕ МОСТОВОЕ ЗВЕНО – Capacitive Bridge Unit (CBU) is a component of a remote refrigerated container monitoring system where data is transferred via the power cable. A CBU is used to capacitively modulate the data signal (using a capacitor) over the power cable.

CAPACITIVE NETWORK = ВМЕСТИМАЯ СЕТЬ (или ЁМКОСТНАЯ ЦЕПЬ) – Capacitive Network is a data network with capacitive coupling to the power network for remote monitoring of refrigerated containers.

CAPACITOR = КОНДЕНСАТОР – Capacitor is a device that stores electrical charge usually by means conducting plates or foil separated by a thin insulating layer of dielectric material. The effectiveness of the device, or its capacitance, is measured in Farads. / Под электрическим Конденсатором, от Латинского слова Condenso, означающее Сгущаю или Уплотняю, понимается система из двух или более подвижных или неподвижных электродов (обкладок), разделённых диэлектриком (бумагой, воздухом, слюдой и другим). Обладает способностью накапливать электрические заряды. Применяется в радиотехнике, электронике, электротехнике и так далее в качестве элемента с сосредоточенной электрической ёмкостью. Под электрическим Конденсатором понимается устройство из двух или более подвижных или неподвижных электродов (обкладок), разделённых слоем диэлектрика, толщина которого мала по сравнению с размерами обкладок. Обладает способностью накапливать электрические заряды. Применяется в радиотехнике, электронике, электротехнике и так далее в качестве элемента с сосредоточенной электрической ёмкостью. Электрические конденсаторы часто включаются группами (в виде батарей); при параллельном соединении электрических конденсаторов общая ёмкость батареи $C_б = C_1 + C_2 + \ldots + C_n$; при последовательном соединении Сб = 1 / (1 / C_1 + 1 / C_2 + … + 1 / C_n), где C_1, C_2, …, C_n – ёмкости отдельных электрических конденсаторов, составляющих батарею. Электрические конденсаторы бывают постоянной и переменной ёмкости. В зависимости от типа диэлектрика, материала обкладок и конструктивного исполнения различают бумажные конденсаторы, воздушные конденсаторы, керамические конденсаторы, плёночные конденсаторы, слюдяные конденсаторы, электролитические конденсаторы и другие.

CAPACITY = ЁМКОСТЬ (или СПОСОБНОСТЬ) – Capacity is the amount of contaminants a filter will hold before an excessive pressure drop is caused. Most filters have bypass valves which open when a filter reaches its rated capacity. / Способность фильтра удерживать уловленные загрязняющие частицы.

CAPACITY = ПОТЕНЦИАЛ (или ЁМКОСТЬ, или СПОСОБНОСТЬ, или ГРУЗОВМЕСТИМОСТЬ) – (1) Capacity:- in relation to a member of Lloyd's, it is the maximum amount of insurance premiums (gross of reinsurance but net of brokerage) which a member can accept. In relation to a syndicate it is the aggregate of each member's capacity allocated to that syndicate. In insurance, this term may refer to:- (a) a member's allocated capacity; (b) syndicate allocated capacity; (c) the total underwriting capacity of all syndicates combined; or (d) the underwriting capacity of an insurance company or reinsurance company. Maximum amount of risk that can be accepted in insurance. One factor in determining capacity is government regulations that define minimum solvency requirements. Capacity also refers to the amount of insurance coverage allocated to a particular policyholder or in the marketplace in general. Capacity is the percentage of surplus or the Dollar amount of exposure that an insurer or reinsurer is willing to place at risk. Capacity may apply to a single risk, a program, a line of business, or an entire book of business.

(2) Capacity is the ability, in a given time, of a resource measured in quality and quantity. The quantity of goods which can be stored in or loaded into a warehouse, store and/or loaded into a means of transport at a particular time. The Capacity is stated according to the type of cargo the ship is designed for:- Container ships by the number of boxes, expressed in TEU, on a dry bulk carrier the weight it can carry, called tonnes (metric) deadweight, ditto on tankers, car carriers according the space for an average sized motor vehicle, RoRo vessels by lane meters for trucks, on reefer ships the cubic metres of feet of cooled space, gas carriers by the volume of their tanks, etc. It all depends on the commercial use of the vessel, for which there are specialised established markets and brokers, all with their own list of criteria. / Грузовместимость транспортного средства (вагона, автомобиля, судна, самолёта), объём его грузовых помещений. Грузовместимость – одна из основных эксплуатационных характеристик транспортного средства. Отношение занятого грузом объёма к грузовместимости называется коэффициентом использования грузовместимости. У судов различают грузовместимость:- зерновую (для сыпучих грузов) и киповую (для штучных грузов). Киповая грузовместимость, исключающая объёмы грузовых помещений, которые не могут быть использованы для укладки грузов, меньше зерновой

грузовместимости на 6–10%. Важное значение имеет удельная грузовместимость (объём грузовых помещений, приходящийся на единицу грузоподъёмности). Удельная грузовместимость современных крытых железнодорожных вагонов составляет 1.94–2.0 кубических метров на тонну ($м^3$/т), полувагонов – 1.08–1.16 и цистерн – 1.02–1.14 $м^3$/т, автомобилей-самосвалов – 0.6–0.7 $м^3$/т. Морские и речные суда в зависимости от назначения имеют различную удельную грузовместимость, например, рудовозы 0.5–1.0; суда для навалочных грузов и танкеры 1.2–1.4; суда для генеральных грузов 1.4–2.2 $м^3$/т. Удельная грузовместимость самолёта Ан-22 – 7.0–7.5 $м^3$/т. Для транспортных средств открытого типа (железнодорожные платформы, автомобили с бортовой платформой) удельную грузовместимость выражают отношением площади грузовых помещений к грузоподъёмности. Этот показатель для железнодорожных платформ составляет 0.58–0.94 квадратных метров на тонну ($м^2$/т), а для автомобилей общего назначения 1.2–6.0 $м^2$/т.

CAPACITY = НАГРУЗКА (или МАКСИМАЛЬНАЯ АКТИВНАЯ НАГРУЗКА, или МАКСИМАЛЬНАЯ ДОПУСТИМАЯ МОЩНОСТЬ) – In reference to electricity, Capacity is the maximum load that a generating unit or generating station can carry under specified conditions for a given period of time without exceeding approval limits of temperature and stress. Capacity (purchased) is the amount of energy and capacity available for purchase from outside the system. Capacity is the amount of electric power delivered or required for which a generator, turbine, transformer, transmission circuit, station, or system is rated by the manufacturer. / По отношению к электричеству, максимальная активная нагрузка, которую генерирующее устройство или генерирующая станция может нести при определённых условиях в течение данного периода времени, не превышая при этом утверждённые лимиты по температуре и напряжению. Под Электрической Нагрузкой понимается:- (i) суммарная электрическая мощность, расходуемая всеми приёмниками (потребителями) электроэнергии, присоединёнными к сети, включая мощность, расходуемую на покрытие потерь в процессе передачи и преобразования энергии; (ii) суммарная электрическая мощность, фактически отдаваемая источником электрической энергии, и соответствующий ей ток; и (iii) любой приёмник (потребитель) электрической энергии в электрической цепи. Под Установленной Мощностью понимается сумма номинальных мощностей электрических машин одного вида, например, генераторов, входящих в состав промышленного предприятия или электрической установки. Под Установленной Мощностью энергетической системы понимают суммарную номинальную активную мощность генераторов электростанций, входящих в состав системы. Рабочая Мощность Электроэнергетической Системы – располагаемая мощность электроэнергетической системы за вычетом мощности агрегатов, выведенных в ремонт. Располагаемая Мощность Электроэнергетической Системы – установленная мощность электроэнергетической системы за вычетом неиспользуемой мощности, обусловленной ограничениями по режимам работы оборудования электростанций и пропускной способности электрической сети. Установленная Мощность Электроэнергетической Системы – суммарная номинальная активная электрическая мощность агрегатов всех электростанций электроэнергетической системы в целом.

CAPACITY CHARGE = СБОР ЗА УСТАНОВЛЕННУЮ МОЩНОСТЬ – Capacity Charge:- an element in a two-part pricing method used in capacity transactions (energy charge is the other element). The capacity charge, sometimes called Demand Charge, is assessed on the amount of capacity being purchased.

CAPACITY CONTROL = УПРАВЛЕНИЕ НАГРУЗКОЙ (или РЕГУЛИРОВАНИЕ НАГРУЗКОЙ) – Capacity Control is a process of registering and steering of capacity. / Процесс учёта и перераспределения нагрузки.

CAPACITY CREDIT = ЁМКОСТНОЙ КРЕДИТ – Capacity Credit (in electricity) is an entitlement to a specified number of MW (MegaWatt) of unforced capacity from a capacity resource for the purpose of satisfying capacity obligations imposed under the RAA (short for the Reliability Assurance Agreement).

CAPACITY DEFICIENCY RATE = СТАВКА ЗА ДЕФИЦИТ ЁМКОСТИ (или XX) – Capacity Deficiency Rate (CDR) is based on the annual carrying charges for a new combustion turbine, installed and connected to the transmission system. To express the CDR in terms of unforced capacity, it must be further divided by the quantity 1 minus the EFORd (short for the Equivalent Demand Forced Outage Rate).

CAPACITY MARGIN = ЗАПАС (УСТАНОВЛЕННОЙ) МОЩНОСТИ (или НАГРУЗОЧНЫЙ РЕЗЕРВ, или РЕГУЛИРОВОЧНЫЙ РЕЗЕРВ) – Capacity Margin is the amount of capacity above planned peak system demand available to provide for scheduled maintenance, emergency outages, system operating requirements, and unforeseen demand. / Объём мощности за пределами требующейся для обеспечения плановой пиковой потребности системы, имеющийся в распоряжении для обеспечения планового обслуживания, аварийных остановок, эксплуатационных потребностей системы и непредвиденного спроса. В электроэнергетике Резервная Мощность – превышение рабочей мощности электроэнергетической системы над максимальной активной нагрузкой системы. Резервная мощность необходима для предотвращения перебоев в электроснабжении и поддержания в заданных пределах (в бывшем СССР ±1%) частоты электрического тока. Различают:- (i) аварийный резерв для замены агрегатов электростанций, выбывших из работы в результате аварии; (ii) нагрузочный (регулировочный) резерв для покрытия случайных колебаний и непредвиденного повышения нагрузки; (iii) народно-хозяйственный резерв для покрытия возможного превышения электропотребления против планируемого уровня; и (iv) ремонтный резерв для проведения планово-предупредительного ремонта оборудования электростанций.

CAPACITY MARKETS = РЫНКИ ЁМКОСТЕЙ (или XX) – Capacity Markets (in electricity) are all markets where PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC) members can trade capacity. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

CAPACITY QUEUE = ОЧЕРЁДНОСТЬ ЁМКОСТЕЙ (или XX) – Capacity Queue is a collection of RTEPP (short for the Regional Transmission Expansion Planning Process) capacity resource project requests received during a particular timeframe and designating an expected in-service date.

CAPACITY RELEASE = ВРЕМЕННОЕ ВЫСВОБОЖДЕНИЕ ПРОПУСКНОЙ СПОСОБНОСТИ – Capacity Release:- the temporary relinquishment of firm transportation capacity on a pipeline. The capacity holder releases the capacity in the open market and accepts bids for use of that capacity over a specific, limited period of time. / Временный отказ от выделенной фиксированной доли пропускной способности трубопровода. Владелец трубопровода с определённой пропускной способностью предлагает услуги по прокачке на открытом рынке и принимает предложения по использованию своего трубопровода в течение определённого ограниченного периода времени.

CAPACITY RELINQUISHMENT = ОТКАЗ ОТ ПРОПУСКНОЙ СПОСОБНОСТИ – Capacity Relinquishment is the permanent relinquishment of firm capacity on a pipeline. / Полный отказ от выделенной фиксированной доли пропускной способности трубопровода.

CAPACITY UTILIZATION RATE = УРОВЕНЬ ЗАГРУЗКИ МОЩНОСТЕЙ – Capacity Utilization Rate is the percentage of the economy's total plant and equipment that is currently in production. Usually, a decrease in this percentage signals an economic slowdown, while an increase signals economic expansion.

CAPE = КАПСКАЯ (или КАПЮШОН, или НАКИДКА С КАПЮШОНОМ, или КАПА, или ПЕЛЕРИНА) – Cape is a cloth that fits closely at the neck and hangs loosely over the shoulders by itself or as part of a garment. / cape = плащ с капюшоном. Кэйп (от Английского слова Cape, означающее Накидка) – это пальто-накидка свободного кроя, не имеющее рукавов. Кэйп может иметь прорези для рук, а может свободно ниспадать с плеч. Главная особенность кэйпа в том, что он имеет скроенную линию плеча. Как правило, кэйп имеет застёжку на шее, но может и полностью застегиваться на пуговицы или молнию, а также иметь другие детали (капюшон, большой или маленький воротник, погоны, карманы, пояс и прочее). Современная накидка-кэйп шьётся из самых разнообразных материалов – шерсти, кашемира, твида, вязаного полотна, а также шёлка, атласа, бархата и даже меха. В кэйпе могут сочетаться и элементы другой популярной верхней одежды, например, дафлкота или тренчкота. Кроме этого, кэйп может быть разной длины:- начиная от коротких, едва доходящих до линии бедра, и заканчивая моделями в пол. Первые накидки-кэйпы появились ещё в средневековой Англии. Такая верхняя одежда защищала от ветра и дождя, так как имела капюшон, и к тому же была удобна для езды на лошади. Кэйп был и неотъемлемой частью одежды монахов и церковных служителей. Затем кэйп стал популярен уже в викторианскую эпоху. Тогда кэйпы шились из дорогих нарядных тканей и дополняли вечерний образ дамы. В России тоже был свой аналог кэйпа – Салоп. Салопы получили своё распространение в XIX веке. Шилась такая накидка-салоп из дорогой ткани (бархата, шёлка или сукна) и имела меховую оторочку или меховой воротничок, так что позволить себе эту накидку могли только богатые дамы. Например, Графиня Александра Дмитриевна Толстая, которая на своём портрете изображена как раз в салопе из парчи с соболиной оторочкой. В начале XX века во времена 'золотого Голливуда' известные актрисы к вечерним платьям надевали струящиеся накидки с капюшоном из кружева или бархата. Затем уже в 1960-е кэйп приобрёл небывалую популярность, благодаря модельерам Оззи Кларку и Пьеру Кардену. Последний, кстати, сделал кэйп частью форменной одежды Французских стюардесс. В это время кэйп стал верхней одеждой не только женщин, но и мужчин. Одним из многочисленных поклонников этой накидки был известный музыкант Мик Джаггер (группа Rolling Stones). Далее интерес к кэйпу несколько убавился. Однако то и дело он появлялся в коллекциях разных дизайнеров, например, в 1978 у Джанни Вэрсачэ (Gianni Versace). В 2011 сразу несколько модных брэндов представили в своих коллекциях кэйпы:- Алыкзэндё Вэн (Alexander Wang) – лаконичные и простые накидки цвета camel, Клои (Chloe) – графичные модели с горизонтальными прорезями для рук. Их примеру последовали почти все марки и дизайнеры, и кэйп превратился в настоящую тенденцию, которая по-прежнему на пике популярности! Модные Кэйпы 2013:- на модных показах дизайнерами было представлено огромное количество разнообразных моделей кэйпов. Самые роскошные кэйпы получились у дизайнерского тандема Дольче и Габбана. Их бренд D&G предложил женщинам носить в этом сезоне роскошные кэйпы в стиле барокко. Чёрные, ниже колена, с маленькими аккуратными воротничками, выполненные из кружева или богато расшитые золотыми нитями, эти кэйпы – настоящее произведение искусства.

CAPELET = КАПЁЛЕ (или КАПЛЕ, или ПИПГАК) – Capelet is a small cape usually covering the shoulders. / Пипгак – опухоль на ноге у лошади.

CAPERATUS = КАПЭРАТУС (или ХХ, или КОЛЬЧАТОЕ) – Caperatus (-a, -um):- wrinkled. The specific epithet Caperatus is Latin for Wrinkled.

CAPESIZE VESSEL = КРУПНОТОННАЖНОЕ СУДНО (или СУДНО КЭЙПСАЙЗ) – Capesize Vessels are cargo ships too large to traverse either the Suez Canal or Panama Canal, i.e. larger than both Panamax and Suezmax vessels. To travel between oceans, such vessels must round the Cape of Good Hope and Cape Horn. Capesize vessels are typically above 150 000 deadweight tons, and ships in this class include VLCC and ULCC supertankers and bulk carriers transporting coal, ore, and other commodity raw materials. The term is most commonly used to describe bulk carriers rather than tankers, however. A standard capesize bulker is around 175 000 tons deadweight, although larger ships (normally dedicated to ore transportation) have been built, up to 400 000 dwt. The massive dimensions (and generally very deep drafts) of such large vessels mean that only the largest deep water terminals can handle them. The growth of the economy of the People's Republic of China (with its great demand for raw materials) and increasing congestion in the Suez and Panama canals has led to an increase in the number of capesize vessels ordered. Capesize is a category of bulk carrier that is too large to negotiate (or to traverse) the Suez and Panama Canals and so much round the Cape of Good Hope or Cape Horn to travel between oceans. Capesize bulkers are specialized, 93% of their cargoes being iron ore and coal. Capesize-Vessels over 80 000 dwt. While this is the traditional definition of a Capesize bulk carrier, in terms of deadweight, the sector is changing. As per the orderbook detailed below, there have been a number of new super-Panamaxes ordered, which are 82 000 dwt to 85 000 dwt, but which are able to transit the Panama Canal with a full cargo. Thus, a more modern definition of Capesize would be based on vessels over 100 000 dwt. The Capesize sector is focused on long haul iron ore and coal trade routes. Due to the size of the vessels there are only a comparatively small number of ports around the world with the infrastructure to accommodate them. Capesize – a ship of about 100 000–200 000 dwt. A vessel which is too large to transit the Panama Canal and thus has to sail via Cape of Good Hope from Pacific to Atlantic and vice versa. / 400 000 грп.

CAPEX = CAPITAL EXPENDITURE

CAPILLACEUS = КАПИЛЛАСЭУС (или ВОЛОСЯНОЕ, или ВОЛОСНОЕ) – Capillaceus (-a, -um):- slender, hair-like.

CAPILLARITY = КАПИЛЛЯРНОСТЬ (или ВОЛОСНОСТЬ) – Capillarity is a property of a solid-liquid system manifested by the tendency of the liquid in contact with the solid to rise above or fall below the level of the surrounding liquid; this phenomenon is seen in a smallbore (capillary) tube.

CAPILLARY ACTION = КАПИЛЛЯРНОЕ ДЕЙСТВИЕ – Capillary Action is a process by which liquids are drawn through the fabric and into pores found between fibers and yarns.

CAPILLARY CONDENSATION = КАПИЛЛЯРНАЯ КОНДЕНСАЦИЯ – Capillary Condensation is a condensation of vapors in the fine pores of adsorption media. / Под Капиллярной Конденсацией понимается образование жидкости в капиллярах, порах, микротрещинах твёрдого тела (сорбента) при давлении пара над ним, меньших давления насыщенного пара над плоской поверхностью. Понижение давления пара над вогнутой поверхностью жидкости обусловливает конденсацию пара в порах смачиваемых пористых тел (капиллярная конденсация), чем, например, объясняется гигроскопичность.

CAPILLARY VISCOMETER = КАПИЛЛЯРНЫЙ ВИСКОЗИМЕТР – Capillary Viscometer is a viscometer in which the oil flows through a capillary tube.

CAPILLATUS = КАПИЛЛАТУС (или ПОКРОТОЕ ВОЛОСАМИ, или ОБРОСШЕЕ ВОЛОСАМИ, или ДЛИННОВОЛОСОЕ) – Capillatus (-a, -um):- with hair. From Latin Capillatus = Having Long Hair.

CAPITAL = КАПИТАЛ – Capital (in the UK, 1840's), in political economy, is that portion of the produce of industry existing in a country, which may be made directly available, either for support of human existence, or the facilitating of production. – (Principles of Political Economy, 3d ed. p. 96) But in commerce, and as applied to individuals, it is understood to mean the sum of money which a merchant, banker, or trader adventures in any undertaking, or which he contributes to the common stock of a partnership. It signifies likewise the fund of a trading company, or corporation; in which sense the word Stock is generally added to it. Thus we say the Capital Stock of the Bank, etc. The profit derived from any undertaking is estimated by the Rate which it bears to the capital that was employed. Capital is assets intended to further production. The amount invested in a proprietorship, partnership, or corporation by its owners. Capital is the existing stock of goods which are to be used in the production of other goods or services and which have themselves been produced by previous human activities. Capital is conventionally subdivided into 'Fixed Capital' and 'Circulating Capital', although the distinction is mainly a matter of degree of durability rather than a clear-cut difference in kind. Fixed capital refers to durable producers' goods such as buildings, plant and machinery, while circulating capital refers to stockpiles of materials, semi-finished goods, and components that are normally used up very rapidly in production. Notice that 'capital' in the strictest economic sense refers only to real, physical means of production already in being, not to the sums of money put aside through savings to purchase real capital with in the future (although the total amount of capital in a particular firm may for convenience be described or summarized in monetary terms by the potential resale values of all the separate items of capital added together in one grand sum). Funding for investment in capital assets or to operate a business. Also refers to the value of an investment in a business, or in assets such as property or shares. Capital Assets are those which contribute to the productive process so as to produce an economic return. In other contexts the word can be taken to include tangible assets (e.g., buildings, plant and machinery), intangible assets and financial capital. See also Fixed Assets, and Inventories. A person's savings and other assets, which can be used as collateral for loans. Capital is divided into two tiers. Core Capital (Tier 1) is defined as the sum of core capital components, less goodwill and other nonqualifying intangibles. Tier 1 includes the purest and most stable forms of capital – common shareholder's equity (common stock, surplus, and retained earnings), noncumulative perpetual preferred stock, and minority interests in the equity accounts of consolidated subsidiaries. Supplementary (Tier 2) capital includes all cumulative perpetual and limited-life preferred stock, hybrid capital instruments, including mandatory convertible securities, term debt, and the allowance for loan and lease losses (ALLL), subject to certain limitations. Capital (financial) is the line items on the right side of a balance sheet that include debt, preferred stock, and common equity. A net increase in assets must be financed by an increase in one or more forms of capital. Capital:- money lent or money invested in a project or a security. In the case of a company it may borrow money (called Raising Capital) from investors and either offer investors a fixed payment of interest each year and a fixed repayment of the capital (this is called Raising Loan Capital) at the end of a certain term or offer investors a share of the company profits (this is called Share Capital or Equity Capital).The company only needs to repay the loan capital at the repayment date. An investor is not able to ask for repayment of his capital from the company at any time (only at the redemption date). If however the investor wants out of his investment he can sell it for cash to another investor through the medium of a Stock Exchange (i.e. a place where stocks and shares are exchanged) but this transaction does not involve the company. / Капитал – доля в активах после вычета из суммы активов компании всех её обязательств. В экономике под Капиталом, от Немецкого слова Kapital или Французского слова Capital, означающие Главное Имущество или Сумма, и от Латинского слова Capitalis, означающее Главный, понимается некая экономическая категория; стоимость, приносящая прибавочную стоимость в результате эксплуатации наёмных рабочих работодателями. Капитал возникает на определённой ступени развития товарного производства, когда рабочая сила становится товаром в результате разорения и насильственного лишения непосредственных производителей средств производства и сосредоточения последних в руках предпринимателей. Собственник капитала, покупая на рынке товары – рабочую силу и средства производства, соединяет их в процессе труда и после реализации вновь созданного товара получает большую стоимость, чем была им авансирована. Всеобщая формула капитала, выведенная Карлом Марксом, отражает процесс возрастания стоимости:- Д–Т–Д', где Д – деньги, Т – товар, и Д' – сумма денег с приростом, который и составляет прибавочную стоимость. Возрастание капитала происходит в процессе острой классовой борьбы между двумя основными антагонистическими классами капиталистического общества – буржуазией и пролетариатом. Капитал делится на постоянный и переменный; основной и оборотный; функционирует в формах промышленного, ссудного и торгового капитала. Переменный Капитал, часть авансированного капитала, затрачиваемая на покупку рабочей силы и возрастающая в процессе производства, поскольку рабочая сила воспроизводит эквивалент своей стоимости и сверх того создаёт прибавочную стоимость. Постоянный Капитал, часть авансированного капитала, затрачиваемая на покупку средств производства (машин, оборудования, зданий, сооружений, топлива, сырья, вспомогательных материалов) и не изменяющая величины своей стоимости в процессе труда. Оборотный Капитал, часть производительного капитала (затраты на сырьё, материалы, рабочую силу), которая переносит свою стоимость на вновь созданный продукт полностью и возвращается к капиталисту в денежной форме в конце каждого кругооборота капитала. Основной Капитал, часть производительного капитала (затраты на машины, оборудование, здания, сооружения), которая переносит свою стоимость на вновь созданный продукт частями и возвращается к капиталисту в денежной форме постепенно по мере снашивания, в течение ряда кругооборотов капитала. Прибавочная Стоимость, часть стоимости товаров, производимых на капиталистических предприятиях, которая создаётся неоплаченным трудом наёмных рабочих сверх стоимости их рабочей силы и безвозмездно присваивается капиталистами. Выражает специфическую капиталистическую форму эксплуатации, при которой прибавочный продукт принимает форму прибавочной стоимости. Производство и присвоение прибавочной стоимости составляет сущность основного экономического закона капитализма. Погоня за прибавочной стоимостью играет главную роль в развитии производительных сил при капитализме. На поверхности явлений прибавочная стоимость выступает в виде прибыли, распадающейся при реализации и распределении на предпринимательский доход, процент и земельную ренту. Прибавочный Продукт, часть совокупного общественного продукта, создаваемая непосредственно производителями в сфере материального производства сверх необходимого продукта, предназначенного для содержания самих производителей и их семей, а также для подготовки и обучения работников. В эксплуататорских формациях прибавочный продукт безвозмездно присваивается господствующими классами и служит источником их обогащения и паразитического существования. Прибавочный Труд, источник прибавочного продукта, создаваемого работниками сферы материального производства.

CAPITAL ACCOUNT = СЧЁТ ДВИЖЕНИЯ КАПИТАЛА (или КАПИТАЛЬНЫЙ СЧЁТ) – In balance of payment accounting, Capital Account is an account recording the inflows and outflows of investment funds for a specified period of time between a given country and the rest of the world. The Capital Account (in the United States) consists of capital transfers between residents and nonresidents and the cross-border acquisition and disposal of nonproduced nonfinancial assets. Capital transfers include debt forgiveness, investment grants, and certain disaster-related nonlife insurance claims. Nonproduced nonfinancial assets include the acquisition and disposal of natural resources, outright sales and purchases of franchises and trademarks, and fees paid by one sporting franchise to another for the transfer of a player. Capital account transactions are distinguished from current account transactions in that capital account transactions result in a change in the assets of one or both parties to the transaction without affecting the income or savings of either party. Capital Account is:- (1) an account stating the amount of funds and assets invested in a business by the owners or stockholders, including retained earnings. (2) A statement of the net worth of a business at a given time. Capital Account is a national

account that shows the net change in asset ownership for a nation. The capital account is the net result of public and private international investments flowing in and out of a country. May also refer to an account showing the net worth of a business at a specific point in time. The capital account includes foreign direct investment (FDI), portfolio and other investments, plus changes in the reserve account. The capital account and the current account together constitute a nation's balance of payments. Since large capital inflows or outflows can have destabilizing effects on a nation's economy, many countries have controls in place to regulate capital account flows.

CAPITAL ADEQUACY REQUIREMENT = ТРЕБОВАНИЕ К ДОСТАТОЧНОСТИ КАПИТАЛА – Capital Adequacy Requirement:- regulators try to ensure that banks and other financial institutions have sufficient capital to keep them out of difficulty. This not only protects depositors, but also the wider economy, because the failure of a big bank has extensive knock-on effects. The risk of knock-on effects that have repercussions at the level of the entire financial sector is called Systemic Risk. Capital Adequacy Requirements have existed for a long time, but the two most important are those specified by the Basel committee of the Bank for International Settlements. Basel 1:- the Basel 1 accord defined capital adequacy as a single number that was the ratio of a banks capital to its assets. There are two types of capital, tier one and tier two. The first is primarily share capital, the second other types such as preference shares and subordinated debt. The key requirement was that tier one capital was at least 8% of assets. Each class of asset has a weight of between zero and 1 (or 100%). Very safe assets such as government debt have a zero weighting, high risk assets (such as unsecured loans) have a rating of one. Other assets have weightings somewhere in between. The weighted value of an asset is its value multiplied by the weight for that type of asset. Basel 2:- the Basel 1 accord has largely been replaced by new rules. Basel 2 is based on three 'pillars':- minimum capital requirements, supervisory review process and market forces. The first 'pillar' is similar to the Basel 1 requirement, the second is the use of sophisticated risk models to ascertain whether additional capital (i.e. more than required by pillar 1) is necessary. The third pillar requires more disclosure of risks, capital and risk management policies. This encourages the markets to react to the taking of high risks. In addition to specifying levels of capital adequacy, most countries (including the UK) have regulator run guarantee funds that will pay depositors at least part of what they are owed. It is also usual for regulators to intervene to prevent outright bank defaults. Basel 3:- the Basel 2 rules looked increasingly inadequate in the wake of the financial crisis, and the Basel 3 rules were considerably tighter. The main changes were:- (i) the required level of tier one capital increased from 4% to 6%; (ii) required common equity increased from 2% to 4.5%; (iii) in addition, a further 2.5% in common equity is required as a conservation buffer; (iv) an additional variable amount of counter-cyclical (i.e. higher when the economy is strong, allowed to run down when the economy is weak) buffer is required. This will vary from 0% to 2.5%. (v) Total capital required rose to 8% – 10.5% including the conservation buffer, with the counter cyclical buffer on top of it. This represents a significant change in the capital structure of banks. Its impact is weakened by being phased in over an eight year period. The gradual shift was necessary as increases in capital adequacy requirements reduce banks ability to lend (more lending on the same capital base means lower ratios) which would be highly damaging at a time of economies still emerging from recession (2010). This is the minimum amount of capital required to be held, as determined by the authorities. Capital Adequacy Ratio (CAR) is a ratio that regulators in the banking system use to watch bank's health, specifically bank's capital to its risk. Regulators in the banking system track a bank's CAR to ensure that it can absorb a reasonable amount of loss. Regulators in most countries define and monitor CAR to protect depositors, thereby maintaining confidence in the banking system. Capital adequacy ratio is the ratio which determines the capacity of a bank in terms of meeting the time liabilities and other risk such as credit risk, market risk, operational risk, and others. It is a measure of how much capital is used to support the banks' risk assets. Bank's capital with respect to bank's risk is the most simple formulation, a bank's capital is the 'cushion' for potential losses, which protect the bank's depositors or other lenders. The Capital Adequacy Requirement is a bank regulation, which lays down a framework on how banks and depository institutions must handle their capital. The categorization of capital and assets is highly standardized so that it can be risk weighted.

CAPITAL ADEQUACY REQUIREMENT COVER = ПОКРЫТИЕ (или УДОВЛЕТВОРЕНИЕ) ТРЕБОВАНИЯ К ДОСТАТОЧНОСТИ КАПИТАЛА – The Capital Adequacy Requirement (CAR) Cover refers to the multiple by which an insurer's free assets exceeds its CAR, expressed as a ratio of free assets to CAR.

CAPITAL ALLOWANCES = КАПИТАЛЬНЫЕ ОТЧИСЛЕНИЯ (или ОТЧИСЛЕНИЯ КАПИТАЛА) – In the United Kingdom, Capital Allowance is a reduction in the amount of corporation tax payable, offered as an incentive for investment in large-scale projects (that increase a country's production capacity and stock of capital). A certain percentage of the capital asset's cost is allowed as capital allowance during the accounting period in which it was purchased. This amount is greater than the depreciation charge on the asset during that period. Also known as Tax Depreciation Allowances in the United States. Capital Allowance is a reduction in the amount of corporation tax payable, offered as an incentive for investment in large-scale projects (that increase a country's production capacity and stock of capital). A certain percentage of the capital asset's cost is allowed as capital allowance during the accounting period in which it was purchased. This amount is greater than the depreciation charge on the asset during that period. In Singapore, Capital Allowance is a deduction that you can claim for the wear and tear of the fixed assets that you have bought and used in your trade or business. Capital allowance is given in place of depreciation of fixed assets, which are not deductible for income tax purposes. Who Can Claim Capital Allowance? If you are carrying on a trade, business or profession, you can claim Capital Allowance on the plant and machinery that you have bought and used in your trade, business or profession. Assets that qualify for Capital Allowance:- (i) electrical and electronic equipment; (ii) plant and machinery; (iii) furniture and fixtures; (iv) office equipment; (v) motor vehicles (only commercial vehicles & Q-plate cars registered before 01 April 1998); and (vi) motorcycles and bicycles. Assets that do not Qualify for Capital Allowance:- (i) general lightings*; (ii) doors, roller shutters and gates*; (iii) windows*; (iv) fixed partitions*; (v) false ceiling, ceiling boards and other ceiling work*; and (vi) S-plate cars. Note:- *For renovation expenditure incurred from 16 February 2008, you may claim expenses incurred on renovation or refurbishment works done to your business premises. Calculating Capital Allowance:- there are three ways of calculating capital allowance:- (1) One-Year Write-Off (Section 19A):- you can use this method if you buy computers, computer peripherals, fax machines, and other automation equipment and these are used for your business. You can also use this method for assets costing no more than SGD1 000 each, bought from year 2004. Please see examples. Under this method, the full cost of the asset may be claimed as capital allowance in one year. However, for assets costing no more than SGD1 000 each, the claim for one-year write-off of all such low value assets must be capped at SGD30 000 per Year of Assessment (YA). From YA 2013New!:- as announced in Budget 2012, with effect from YA 2013, the threshold on the cost of each low value asset will be increased from SGD1 000 to SGD5 000. The aggregate cap of SGD30 000 per YA for one-year write-off of all such assets remains unchanged. This e-Tax Guide Simplification of Income Tax Rules and Procedures – 100% Capital Allowance for Items of Machinery or Plant Costing No More Than SGD1 000 will be revised to incorporate the tax changes announced in Budget 2012. (2) Three-Year Write-Off (Section 19A):- with effect from YA 2009, you can use this method to claim capital allowance for all assets that qualify for capital allowance. Under this method, the full cost of the asset can be claimed as capital allowance over three years. Please see examples. For YA 2008 and before, three years write-off is allowed for all qualifying assets except commercial vehicles with maximum laden weight not exceeding 3 000 kg and motorcycles. For details on how to compute capital allowance for motor vehicles, please refer to the next paragraph on Write-off over the working life of the asset (Section 19). (3) Write-Off Over The Working Life Of The Asset (Section 19):- you can use this method for all assets including Q-plate cars (certificate of entitlement (COE) issued before 01 April

1998), vans, pick-ups, trucks, buses, lorries, office equipment, furniture, etc. In the year that you buy the asset, you can claim:- (i) initial allowance equal to 20% of the cost of the asset; and (ii) annual allowances, which is calculated by taking 80% of the cost and dividing it by the working life of the asset. In the subsequent years up to the number of years of the working life of the asset, you can claim only the annual allowance. Please see examples. Buying The Asset In Cash As Compared To Buying The Asset Under Hire-Purchase Terms:- there is a slight difference when you calculate capital allowances for assets bought in cash as compared to these assets bought under hire purchase terms. When you calculate capital allowances for assets bought under hire purchase terms, you have to exclude the hire purchase interest from the calculation. You can claim the hire purchase interest as a separate business expense. (1) One-Year Write Off:- example 1:- in 2007, you bought a computer in cash for SGD3 000. You can claim the full cost of the computer in one year. Example 2:- on 01 September 2007, you bought a computer under hire purchase terms. The terms are:- Cash Price – SGD3 000; Down Payment – SGD300; Hire Purchase Interest – SGD600; Hire Purchase Price – SGD3 600; Amount For Each Instalment – SGD275; Total Number Of Instalments – 12. Workings:- in year 2007:- Down Payment Made – SGD300; + Instalments Paid:- 4 Months X SGD275 = SGD1 100; – Hire Purchase Interest Paid:- 4/12 X SGD600 = SGD200; Total Amount Paid Less Hire Purchase Interest – SGD1 200. In year 2008:- Instalments Paid:- 8 months X SGD275 = SGD2 200; – Hire Purchase Interest Paid:- 8/12 X SGD600 = SGD400; Total Amount Paid Less Hire Purchase Interest – SGD1 800. You can claim capital allowances as follows:- SGD1 200 paid in 2007 to be claimed over one year – SGD1 200 (in YA2008); SGD1 800 paid in 2008 to be claimed over one year – SGD1 800 (in YA2009); Total Capital Allowances:- SGD1 200 (in YA2008) plus SGD1 800 (in YA2009). (2) Three-Years Write-Off:- example 3:- in 2007, you bought an air-conditioner in cash for SGD3 000. You can claim capital allowances as follows:- 1st year (YA2008) – Annual Allowance – SGD3 000 / 3 = SGD1 000; 2nd year (YA2009) – Annual Allowance – SGD3 000 / 3 = SGD1 000; and 3rd year (YA2010) – Annual Allowance – SGD3 000 / 3 = SGD1 000. Example 4:- on 01 September 2007, you bought an air-conditioner under hire-purchase terms. The terms are:- Cash Price – SGD3 000; Hire Purchase Price – SGD3 600; Down Payment – SGD300; Amount For Each Instalment – SGD275; No. Of Instalments – 12; and Hire Purchase Interest – SGD600. Workings:- in year 2007:- Down Payment Made – SGD300; + Instalments Paid – 4 months X SGD275 = SGD1 100; – Hire Purchase Interest Paid – 4/12 X SGD600 = SGD200; Total Amount Paid Less Hire Purchase Interest – SGD1 200. In year 2008:- Instalments Paid – 8 months X SGD275 = SGD2 200; – Hire Purchase Interest Paid – 8/12 X SGD600 = SGD400; Total Amount Paid Less Hire Purchase Interest – SGD1 800. You can claim capital allowances as follows:- SGD1 200 paid in 2007 to be claimed over 3 years – SGD400 (in YA2008), SGD400 (in YA2009), SGD400 (in YA2010), and 0 (in YA2011); SGD1 800 paid in 2008 to be claimed over 3 years – 0 (in YA2008), SGD600 (in YA2009), SGD600 (in YA 2010), and SGD600 (in YA2011); Total Capital Allowances – SGD400 (in YA2008), SGD1 000 (in YA2009), SGD1 000 (in YA2010), SGD600 (in YA2011). Accelerated Write-Down (for plant and machinery acquired in the basis period for the Years of Assessment 2010 and 2011):- as announced in the Budget 2009 Statement, capital expenditure incurred on plant and machinery acquired in the basis periods for the Years of Assessment (YA) 2010 and 2011 can be allowed an accelerated write-down over two years instead of three years. This is to support businesses which intend to invest in new plants and machinery in preparation for the recovery from economic downturn. With this change, businesses can write down the costs of these newly acquired plants and machinery within two years with 75% of the write-down taking place in the first year of capital allowance claim alone. (1) For Asset Bought In Cash:- (i) Annual Allowance in Year 1 = 3/4 of the cost of asset; and (ii) Annual Allowance in Year 2 = 1/4 of the cost of asset. (2) For Asset Bought Under Hire Purchase Terms:- (i) Annual Allowance in Year 1 = 3/4 of the principal payment (and deposit paid where applicable); and (ii) Annual Allowance in Year 2 = 1/4 of the principal payment. Example 5:- in year 2009, you bought an office equipment for SGD3 000 by cash. Annual Allowance (AA) for YA2010 = 3/4 x 3 000 = 2 250. Annual Allowance (AA) for YA2011 = 1/4 x 3 000 = 750. The capital allowance schedule is as follows (Description – Office Equipment):- Cost – 3 000; YA2010 Annual Allowance – 2 250; Written Down Value (WDV) c/f – 750; YA2011 Annual Allowance – 750; and Written Down Value (WDV) c/f – 0. Example 6:- in year 2009, you bought an office equipment costing SGD2 000 under hire purchase terms. The terms are:- Purchase Price – SGD2 000; Deposit – SGD100; Hire Purchase Interest – SGD50; Number Of Instalment – SGD5; Amount Payable Per Instalment – SGD390; Hire Purchase Interest Per Instalment – 50 / 5 = SGD10; and Principal Payment Per Instalment – 390 – 10 = SGD380. Assuming that a deposit of SGD100 and two instalments were paid in year 2009 and the remaining three instalments were paid in year 2010. The deposit and principal payments in year 2009 = 100 + (2 x 380) = 860. The principal payments in year 2010 = 3 x 380 = 1 140. Annual Allowance for each YA is computed as follows (Year Of Payment – Deposit And Principal Amount Paid – Amount Of AA To Be Claimed In):- 2009 – 860 – 645 (in YA2010), and 215 (in YA2011); 2010 – 1 140 – 0 (in YA2010), 855 (in YA2011), and 285 (in YA2012); Total – 645 (in YA2010), 1 070 (in YA 2011), and 285 (in YA2012). The Capital Allowance Schedule is as follows (Description – Office Equipment):- Cost – 2 000; YA2010 Annual Allowance – 645; Written Down Value (WDV) c/f – 1 355; YA 2011 Annual Allowance – 1 070; Written Down Value (WDV) c/f – 285; YA 2012 Annual Allowance – 285; and Written Down Value (WDV) c/f – 0. (3) Write-Off Over The Working Life Of The Asset:- example 7:- in 2007, you bought a van in cash for SGD45 000. The van has a working life of six years. You can claim Capital Allowances as follows:- Initial Allowances (20% x cost of van) – SGD9 000 (in YA2008), 0 (in YA2009), 0 (in YA2010), 0 (in YA2011), 0 (in YA2012), and 0 (in YA2013); Annual Allowances (80% x cost of van) / 6 – SGD6 000 (in YA2008), SGD6 000 (in YA2009), SGD6 000 (in YA2010), SGD6 000 (in YA2011), SGD6 000 (in YA2012), and SGD6 000 (in YA2013); and Total Capital Allowances – SGD15 000 (in YA2008), SGD6 000 (in YA2009), SGD6 000 (in YA2010), SGD6 000 (in YA2011), SGD6 000 (in YA2012), and SGD6 000 (in YA2013). Example 8:- on 28 September 2007, you bought a van under hire purchase terms. The van has a working life of six years. The terms are:- Cash Price – SGD45 000; Down Payment – SGD15 000; Hire Purchase Interest – SGD3 000; Total No. Of Instalments – 24; and Amount For Each Instalment – SGD1 375. Workings:- in year 2007:- Down Payment Made – SGD15 000; + Instalments Paid – 4 months x SGD1 375 = SGD5 500; – Hire Purchase Interest Paid – 4/24 x SGD3 000 = SGD500; and Total Amount Paid Less Hire Purchase Interest – SGD20 000. In year 2008:- Instalments Paid – 12 months X SGD1 375 = SGD16 500; – Hire Purchase Interest Paid – 12/24 X SGD3 000 = SGD1 500; and Total Amount Paid Less Hire Purchase Interest – SGD15 000. In year 2009:- Instalments Paid – 8 months X SGD1 375 = SGD11 000; – Hire Purchase Interest Paid – 8/24 X SGD3 000 = SGD1 000; and Total Amount Paid Less Hire Purchase Interest – SGD10 000. You can claim capital allowances as follows:- Initial Allowances (20% x Total amount paid less hire purchase interest) – SGD4 000 (in YA2008), SGD3 000 (in YA2009), SGD2 000 (in YA2010), 0 (in YA2011), 0 (in YA2012), and 0 (in YA2013); Annual Allowances (80% x Cash price) / 6 – SGD6 000 (in YA2008), SGD6 000 (in YA2009), SGD6 000 (in YA2010), SGD6 000 (in YA2011), SGD6 000 (in YA2012), and SGD6 000 (in YA2013); Total Capital Allowances – SGD10 000 (in YA2008), SGD9 000 (in YA2009), SGD8 000 (in YA2010), SGD6 000 (in YA2011), SGD6 000 (in YA2012), and SGD6 000 (in YA2013). Table Of Assets And Their Working Life (Assets – Working):- Taxis – 5; Buses, Lorries, Trucks, Trailers and Vans – 6; Q-Plate Cars With COE Issued Before 01 April 1998 – 6; Motorcycles and Bicycles – 8; Plant and Machinery – 6. You may use the official Capital Allowance Calculator to compute capital allowance for your new and existing assets. How To Claim Capital Allowance? You can include the capital allowance as part of your allowable business expenses when you report your 4-line statement in the income tax return. You have to submit the certified statement of accounts of your business together with your Income Tax Return to the Inland Revenue Authority of Singapore (IRAS) if the turnover of your business is SGD500 000 or more. Defer Your Capital Allowance Claim If Your Business Makes A Loss? You may wish to defer your capital allowance claim if your business is in a loss position. If You Are Claiming Under Section 19:- you must claim the initial allowance (IA) in the YA the capital expenditure was incurred. If you did not claim IA, annual allowance (AA) will be computed based on the full cost of the asset

over its prescribed working life*. You can defer claiming AA and you need not claim AA consecutively over the prescribed working life of the asset. Note:- *The prescribed working life is based on the Sixth Schedule of the Income Tax Act (e.g., the working life for motor vehicle is six years and that for motor cycle is eight years). If You Are Claiming Under Section 19A:- before YA2009, once a claim is made, the capital allowance will be granted for three consecutive YAs. With effect from YA2009, you are allowed to defer the capital allowance claim made under Section 19A, i.e. the claim made need not be for three consecutive YAs. Similarly, under the two years write-off for capital expenditure incurred during YAs 2010 and 2011, you are allowed to defer your claim for capital allowance. The rates of 75% and 25% of capital expenditure for the purpose of computing your capital allowance will continue to apply when you subsequently make a claim for the capital allowance. What If I Sell Or Scrap My Fixed Assets? If you sell or scrap your fixed assets on which you have previously claimed capital allowances, you have to compute the Balancing Allowance or Balancing Charge. Balancing Allowance is given if the Written Down Value of the asset exceeds the sale/disposal proceeds. This balancing allowance can be deducted against income. Balancing Charge arises when the sale proceeds of the asset exceeds the Written Down Value. The amount of balancing charge is restricted to the actual capital allowances previously granted for the asset. The balancing charge is taxable. Written Down Value is the cost of the asset minus the amount of capital allowances previously claimed. To illustrate the Balancing Allowance/Balancing Charge computation, please see three examples below. Example 1:- Balancing Allowance:- you sold your asset in the year 2007 for SGD1 000. The original cost of your asset is SGD6 000. You have previously claimed total capital allowances of SGD4 000. Therefore, the written down value of the asset is SGD2 000. The balancing allowance is computed as follows:- Written Down Value as at 31 December 2006 – SGD2 000; Less:- Sales proceeds in year 2007 – SGD1 000; and Balancing Allowance – SGD1 000. As the sale proceeds is lower than the Written Down Value, you may claim SGD1 000 of the balancing allowance in YA2008. Example 2:- Balancing Charge:- you sold your asset in the year 2007 for SGD3 000. The original cost of your asset is SGD6 000. You have previously claimed total capital allowances of SGD4 000. Therefore, the written down value of the asset is SGD2 000. The balancing charge is computed as follows:- Written Down Value as at 31 December 2006 – SGD2 000; Less:- Sales proceeds in year 2007 – SGD3 000; and Balancing Charge – SGD1 000. As the sale proceeds is higher than the Written Down Value, SGD1 000 is taxable as balancing charge in YA2008. Example 3:- Balancing Charge Restricted To Actual Capital Allowances Previously Claimed:- you sold your asset in the year 2007 for SGD3 500. The original cost of your asset is SGD3 000. You have previously claimed total capital allowances of SGD1 000. Written Down Value as at 31 December 2006 – SGD2 000; Less:- Sales proceeds in year 2007 – SGD3 500; and Balancing Charge – SGD1 000. As the sale proceeds is higher than the Written Down Value, SGD1 000 is taxable as balancing charge. The balancing charge is restricted to actual capital allowances previously claimed instead of SGD1 500 (i.e SGD3 500 – SGD2 000). / в течение отчётного периода, в котором он был закуплен.

CAPITAL APPRECIATION FUND = ФОНД ПРИРОСТА КАПИТАЛА – Capital Appreciation Fund is a mutual fund that attempts to increase asset value primarily through investments in growth stocks. The heavy investment in growth stocks increases the risk associated with these types of funds. Also called Aggressive Growth Fund. As its name suggests, a capital appreciation fund seeks to deliver value to shareholders by investing in companies with appreciating share prices. This type of fund is the exact opposite of an income or dividend fund, which focuses on investing in companies that pay shareholders a dividend. In addition to risk tolerance, something else to consider when analyzing these different types of funds is the fact that capital gains are usually taxed lower than interest income. Capital Appreciation Fund is an investment fund in which most of the earnings are reinvested. Also known as Growth Fund. The opposite of Distribution Fund.

CAPITAL ASSESSMENT = ОЦЕНКА КАПИТАЛА – Capital Assessment is another way to say ‘stress tests’ which are a method of determining the financial health of an institution by calculating the institution’s ability to absorb losses.

CAPITAL ASSET = КАПИТАЛЬНЫЙ АКТИВ – Capital Asset is a type of asset that is not easily sold in the regular course of a business’s operations for cash and is generally owned for its role in contributing to the business’s ability to generate profit. Furthermore, it is expected that the benefits gained from the asset will extend beyond a time span of one year. On a business’s balance sheet, capital assets are represented by the property, plant and equipment figure. Examples include land, buildings, machinery, etc. Generally, these are assets that cannot quickly be turned into cash and are often only liquidated in a worst-case scenario. For example, a company might look at selling a capital asset if it was looking at restructuring or the business was engaged in bankruptcy proceedings. Depending on the business involved, capital assets may represent the majority of assets that are owned. For example, in equipment heavy operations such as oil exploration, it is not surprising to find the majority of a business’s assets to be capital assets. Capital Asset is an asset purchased for use in production over a long period of time, rather than for resale. Capital assets include fixed assets as well as long-term investments. The term ‘Capital Asset means property held by the taxpayer (whether or not connected with his trade or business), but does not include:- (i) stock in trade of the taxpayer or other property of a kind which would properly be included in the inventory of the taxpayer if on hand at the close of the taxable year, or property held by the taxpayer primarily for sale to customers in the ordinary course of his trade or business; (ii) property, used in his trade or business, of a character which is subject to the allowance for depreciation provided in section 167, or real property used in his trade or business; (iii) a copyright, a literary, musical, or artistic composition, a letter or memorandum, or similar property, held by:- (a) a taxpayer whose personal efforts created such property, (b) in the case of a letter, memorandum, or similar property, a taxpayer for whom such property was prepared or produced, or (c) a taxpayer in whose hands the basis of such property is determined, for purposes of determining gain from a sale or exchange, in whole or part by reference to the basis of such property in the hands of a taxpayer described in subparagraph (A) or (B); (iv) accounts or notes receivable acquired in the ordinary course of trade or business for services rendered or from the sale of property described in paragraph (i); (v) a publication of the United States Government (including the Congressional Record) which is received from the United States Government or any agency thereof, other than by purchase at the price at which it is offered for sale to the public, and which is held by:- (a) a taxpayer who so received such publication, or (b) a taxpayer in whose hands the basis of such publication is determined, for purposes of determining gain from a sale or exchange, in whole or in part by reference to the basis of such publication in the hands of a taxpayer described in subparagraph (a); (vi) any commodities derivative financial instrument held by a commodities derivatives dealer, unless:- (a) it is established to the satisfaction of the Secretary that such instrument has no connection to the activities of such dealer as a dealer, and (b) such instrument is clearly identified in such dealer’s records as being described in subparagraph (a) before the close of the day on which it was acquired, originated, or entered into (or such other time as the Secretary may by regulations prescribe); (vii) any hedging transaction which is clearly identified as such before the close of the day on which it was acquired, originated, or entered into (or such other time as the Secretary may by regulations prescribe); or (viii) supplies of a type regularly used or consumed by the taxpayer in the ordinary course of a trade or business of the taxpayer. / Актив, приобретённый для использования в производстве в течение длительного периода времени, а не для перепродажи. Капитальные активы состоят из недвижимых активов (основных средств), а также долгосрочных инвестиций (вложений).

CAPITAL CONSTRUCTION FUND = КАПИТАЛЬНЫЙ ФОНД НА СТРОИТЕЛЬСТВО – In the United States, the Capital Construction Fund (CCF) was created under a Merchant Marine Act to assist fisherman to acquire fishing vessels or improve a current

vessel. It is jointly administered by the National Marine Fisheries Service (NMFS) and the Internal Revenue Service (IRS). The CCF program allows taxpayers to defer taxable income by making contributions to a NMFS approved depository and eventually use the accumulated funds for purchasing or improving fishing vessels. CCF Deductions:- deductions are treated differently depending on your business structure. See this page to get more information on deductions and CCFs. CCF Qualified Withdrawals:- a qualified withdrawal from a CCF account is one that is approved by NMFS for acquiring a building, rebuilding qualified fishing vessels, or making principal payments on the mortgage of a qualified fishing vessel. CCF Non-Qualified Withdrawals:- a nonqualified withdrawal from a CCF account is any withdrawal that is not used for acquiring, building, re-building a qualified fishing vessel, or making principal payments on the mortgage of a qualified fishing vessel. CCF Eligibility Requirements:- (i) You must be a US citizen (individually), a corporation (the president and majority of the board must also be US citizens), or a partnership 75% owned by US citizens; (ii) You must own or lease a vessel; (iii) The vessel must be built in the United States; and (iv) The vessel must operate in the US fisheries or in US foreign trade, non-contiguous domestic trade (for example, Alaska to Seattle), or the Great Lakes. Tax Treatment of CCF Earnings:- do not report on your income tax return any capital gains from the sale of capital assets held in your CCF account. This includes capital gains distributions reported on Form 1099-DIV, Dividends and Distributions, or a substitute statement. However, you should attach a statement to your tax return listing the payers and the amounts. Identify the capital gains as 'CCF account earnings'. Do not report any ordinary income (such as interest and dividends) you earn on the assets in your CCF account. Nevertheless, you should attach a statement to your return to list the payers, the amounts and to identify them as 'CCF account earnings'. If you are required to file Form 1040, Schedule B, Interest and Ordinary Dividends, you can add these earnings to the list of payers and amounts on line 1, and identify them as 'CCF earnings'. Then subtract the same amounts from the list and identify them as 'CCF deposits'. Do not report tax-exempt interest from state or local bonds you held in your CCF account on your federal tax return. You are not required to report this interest on Form 1040, line 8b. CCF and Transfer of Assets:- normally transfers that occur when changing business structures (ex: from sole proprietor to corporation) under the provisions of IRC 351 are tax-free. However, it depends on your basis in the assets transferred, as well as any liabilities assumed by the corporation when determining gain or loss. If the liabilities transferred exceed the basis of the assets, a gain may be recognized to the extent of the excess. Caution: When determining basis you must reduce the basis by the amounts funded from your Capital Construction Fund account. Capital Construction Fund (CCF) is a tax benefit for operators of US-built, US-flag ships in the US foreign, Great Lakes, or noncontiguous domestic trades, by which taxes may be deferred on income deposited in a fund to be used for the replacement of vessels. The Capital Construction Fund (CCF) program was created to assist owners and operators of United States-flag vessels in accumulating the large amounts of capital necessary for the modernization and expansion of the US merchant marine. The program encourages construction, reconstruction, or acquisition of vessels through the deferment of Federal income taxes on certain deposits of money or other property placed into a CCF. CCF vessels must be built in the United States and documented under the laws of the United States for operation in the Nation's foreign, Great Lakes, Short-Sea Shipping or noncontiguous domestic trade or its fisheries. Participants must meet US citizenship requirements. Operators of American-flag vessels are faced with a competitive disadvantage in the construction and replacement of their vessels relative to foreign-flag operators whose vessels are registered in countries that do not tax shipping income. The CCF program helps counterbalance this situation through its tax-deferral privileges. Another goal of the program is to assist in the modernization and expansion of vessels used in the noncontiguous domestic trade and the Great Lakes trade. Companies utilizing the benefits of the CCF program represent a broad cross section of the US maritime industry. They include, for example:- (i) Liner companies that operate containerships and other specialized vessels from the West Coast of theUnited States to points in the Far East and Hawaii and from Gulf and East Coast ports to Europe, South America and Africa; (ii) Tanker operators who deliver crude oil from the North Slope of Alaska to the US mainland; (iii) Bulk vessel operators moving ore on the Great Lakes; (iv) Companies specialized in offshore towing and supply operations which serve oil drilling and production rigs off the coasts of the United States and in foreign waters; (v) Operators serving Caribbean and Central American ports; (vi) Tug and barge operators that provide service between Pacific Coast ports and points in Alaska, on the river system in Alaska, and in the Gulf of Alaska; (vii) Cruise vessels and tug-barge operators providing interisland service in the Hawaiian Islands; (viii) Operators providing ferry and passenger service on the Great Lakes; and (ix) Operators moving containers and Roll-on/Roll-off cargo in Short Sea Shipping trades. Thus, vessels constructed, reconstructed, or acquired under this program span a wide spectrum, including large containerships, Roll-On/Roll-Off vanships, barge-carrying vessels, and other general cargo vessels; crude oil and petroleum product tankers, sophisticated liquefied natural gas (LNG) carriers; self-unloading Great Lakes bulk carriers; tugs, barges, supply vessels, and ferry and passenger vessels. The operators range in size from large, consolidated companies to partnerships and sole proprietors. They have one thing in common. They have found that the CCF program can lower the effective cost to a company of replacing or adding new vessels, significantly accelerate the time frame for accumulating capital for such purposes, and be utilized to pay existing indebtedness on vessels if it is a part of an overall building program. Administrative Responsibility:- the CCF program is the responsibility of two agencies within the Federal Government – the Department of Transportation's, Maritime Administration and the Department of Commerce's National Oceanic and Atmospheric Administration (NOAA). The Maritime Administration administers the program with respect to vessels operated in the commerce of the United States other than in the fisheries. NOAA administers the program with respect to vessels operated in the fisheries of the United States. Xxxxx. The purpose of the Capital Construction Fund (CCF) Program is to improve the fishing fleet by allowing fishermen to accelerate their accumulation of funds with which to replace or improve their fishing vessels. Created by the Merchant Marine Act of 1936, as amended (46 USC 1177), the CCF Program enables fishermen to construct, reconstruct, or under limited circumstances, acquire fishing vessels with before-tax, rather than after-tax dollars. The program allows fishermen to defer tax on income from the operation of their fishing vessels. Under the CCF Program, the amount accumulated by deferring tax on fishing income, when used to help pay for a vessel project, is, in effect, an interest free loan from the Government. Any US citizen is eligible who owns or leases a US-built fishing vessel of at least two net tons and has an acceptable program for constructing, reconstructing, or acquiring a fishing vessel of at least two net tons. The term 'fishing vessel' includes vessels used commercially in the fisheries of the US for catching, transporting, and processing fish. Also included are commercial passenger-carrying vessels used for fishing parties. Applications are accepted at any time. However, to be applicable to any given tax year, a CCF agreement must be executed and entered on or before the due date (with extensions) for filing your Federal tax return for that tax year.

CAPITAL COVER = XX (или ПОКРЫТИЕ КАПИТАЛА) – Capital Cover is a calculation made for loans issued by companies. The capital cover is the number of times that the assets of the company (excluding intangibles and after notionally paying current Liabilities) cover the amount of the loan (including prior ranking loans).

CAPITAL EMPLOYED = КАПИТАЛОВЛОЖЕНИЯ (или ЗАДЕЙСТВОВАННЫЙ КАПИТАЛ, или ПРИВЛЕЧЁННЫЙ КАПИТАЛ) – Capital Employed may be calculated either by subtracting from the total assets the non-interest bearing current liabilities, or by summing the stockholders' equity and the borrowed funds. Capital Employed is:- (i) the total amount of capital used for the acquisition of profits; (ii) the value of all the assets employed in a business; (iii) fixed assets plus working capital; and (iv) total assets less current liabilities. This is a term that is frequently used, but very difficult to define because there are so many contexts it can be used in. All definitions generally refer to the investment required for a business to function. By 'employing capital' you are making an investment. Also known as Funds Employed. Capital Employed = Shareholders' Funds + Total Debt. The capital is use in a business. This is

usually calculated as fixed plus current assets less current liabilities. This will be the same as owner's capital (or shareholders' funds) plus long-term liabilities. Net assets before Net (Debt)/Cash. Capital Employed:- there is a very easy and simple formula to calculate capital employed regarding a particular business. In order to calculate capital employed we require total assets and the current liabilities of a firm. The formula of capital employed is as under:- Capital Employed = Total Assets – Current Liabilities. In other words the capital employed for a firm is equal to the non-current debt and the owner's equity that is invested in his business. The non-current debt and the equity are the sources of long term financing for the business. Other sources of the capital employed are the short term debts that are also a good source of financing but they remain visible at the end of the balance sheet of that particular year. The formula shows that capital employed involves the total assets of a business. The total assets of the business consist of owner's equity and capital derived from shares of the company. Total assets of a company also include the fixed assets and the current assets of the company. Another factor included in the total assets of the firm is the gross borrowings of the firm. Another formula to calculate capital employed is based on the figures of equity and loans. This formula is described as under:- Capital Employed = Equity + Loans. Here the loans are the considered to be the non-interest bearing liabilities of the firm. If you want to break down the assets and liabilities to calculate the capital employed by a firm you can use the formula as mentioned below:- Capital Employed = Share Holder Funds + Creditors Long Term Liabilities + Provisions Of Liabilities And Charges. In more clear terms see the formula mentioned below:- Capital Employed = Equity Share Capital + Pre Share Capital + Debenture Capital + Long Term Loans. Uses of calculating the Capital Employed:- one of the major uses of calculating and estimating capital employed is that it is used to calculate return over capital employed ratio. The return over capital employed is a ratio that is used equally in account finance and valuation matters of a company. The return over capital employed ratio can be calculated by the formula as described below:- Return Over Capital Employed Ratio = Net Operating Profit After Taxes / Capital Employed. The major purpose of calculating return over capital employed ratio is that it is used to compare the returns over the investment of a company. The return over capital employed ratio is somewhat similar to return over assets ratio. The net operating profit for the calculation of this ratio can be calculated as follows:- Net Operating Profit After Taxes = EBIT x (1 – Tax). The operating income here is the operating income less taxes less non-operating items. Return over capital employed ratio is used to measure the valuation of the business that it has gained from its current assets and liabilities. The return on capital employed ratio that have a lot of land in form assets will have lower ratio of return over the capital employed. Return ob capital ratio is basically a tool to analyze that how much business is gaining from its assets and how much it is loosing from its current liabilities. The return over capital employed ratio has a certain drawbacks as well such as it is used to measure the return in opposition to the book value of the assets of the business. The return of capital employed will increase in the case of depreciation of the assets even if the cash flow for that time period remains same. This means the business having depreciated assets have high ratio of return over capital employed as compared to the new businesses. Capital Employed:- the sum of Chevron Corporation stockholders' equity, total debt and noncontrolling interests. Average capital employed is computed by averaging the sum of capital employed at the beginning and end of the year. / Шеврон Корпорэйшэн (Chevron Corporation). Чистые активы до чистого долга или чистой наличности.

CAPITAL EXPENDITURE = КАПИТАЛЬНЫЕ ИЗДЕРЖКИ (или КАПИТАЛЬНЫЕ ВЛОЖЕНИЯ) – Capital Expenditure is an expenditure which is expected to produce benefits in a future period(s), and which is carried forward as an asset in the balance sheet at the end of the period. Expenditure incurred on:- (i) acquisition and improvement of fixed assets; and (ii) setting up a business. Capital Expenditure (CAPEX):- funds used by a company to acquire or upgrade physical assets such as property, industrial buildings or equipment. This type of outlay is made by companies to maintain or increase the scope of their operations. These expenditures can include everything from repairing a roof to building a brand new factory. The amount of capital expenditures a company is likely to have depends on the industry it occupies. Some of the most capital intensive industries include oil, telecom and utilities. In terms of accounting, an expense is considered to be a capital expenditure when the asset is a newly purchased capital asset or an investment that improves the useful life of an existing capital asset. If an expense is a capital expenditure, it needs to be capitalized; this requires the company to spread the cost of the expenditure over the useful life of the asset. If, however, the expense is one that maintains the asset at its current condition, the cost is deducted fully in the year of the expense.

CAPITAL EXPORT = ВЫВОЗ КАПИТАЛА – Capital Export:- flows of capital from one country to another, mainly in the form of credit, direct investments, and portfolio investments. In the case of remunerative capital exports, the exporting company acquires legal claims or participation rights abroad, whereas unrequited capital exports can take the form of non-returnable transfers to developing countries. See also Direct Investment, and Porfolio Investment. Capital Export is the flow of capital out of one country into overseas direct investments or loans, mainly in the form of short-term credit. Direct investments are usually made in shares of trade, industrial, and banking sectors. / Вывоз Капитала – перемещение (миграция) капитала из страны, где находится его собственник, в другую страну для систематического извлечения прибавочной стоимости, а также в политических целях. Часть извлечённой прибавочной стоимости переводится в страну, вывозящую капитал, часть капитализируется (то есть снова вкладывается в производство) в стране, привозящей (или импортирующей) капитал (или реинвестируется). В условиях домонополистического капитализма с полным господством свободной конкуренции вывоз капитала играл второстепенную роль. Вывоз товаров был главной формой международных экономических связей, на базе которых возник мировой товарный рынок. В эпоху господства монополий вывоз капитала, в отличие от вывоза товаров, становится одной из характернейших особенностей империализма. На пороге XX века в странах развитого капитализма образовались монополистические союзы капиталистов, создалась монополия на капитал немногих богатейших стран, в которых накопление капитала достигло гигантских размеров; образовался громадный 'избыток капитала'. Возможность вывоза его была создана тем, что ряд отсталых стран уже оказался втянутым в оборот мирового капитализма. В этих странах прибыль была высока, так как органическое строение капитала низкое, рабочая сила и сырьё дёшевы, а цена земли сравнительно невелика. Вывоз капитала стал необходимым в связи с тем, что '... в немногих странах капитализм 'перезрел', и капиталу недостаёт (при условии неразвитости земледелия и нищеты масс) поприщ 'прибыльного' помещения' (Владимир Ильич Ленин, Полное Собрание Сочинений, 5 Издание, Том 27, С. 360). Уже в 1899 доходы Великобритании от вывоза капитала были в 5 раз выше её доходов от внешней торговли. В 1968 доходы США от вывоза капитала были в 6 раз больше их доходов от внешней торговли. Объём вывоза капитала в целом и по отдельным капиталистическим странам, таким, как, например, США, Великобритания, Франция, Германия (а затем ФРГ), резко возрастал. Вывоз Капитала выступает в двух формах:- как (i) Вывоз Предпринимательского Капитала и как (ii) Вывоз Ссудного Капитала. Вывоз капитала в форме предпринимательского (или функционирующего) означает вложение капитала в промышленные, сельскохозяйственные, транспортные, торговые и другие предприятия (прямые и портфельные инвестиции). Прямые Инвестиции – вложения главным образом в акции промышленных, торговых, банковских предприятий, плантации и тому подобное, обеспечивающие полное владение или дающие возможность полного контроля над их деятельностью. Значительная часть (по США около 40%) всех прямых инвестиций осуществляется за счёт реинвестиций. Портфельные Инвестиции представляют собой вложения капиталов в заграничные ценные бумаги, формально не дающие их владельцам права на полное владение или полный контроль над иностранными предприятиями. Часто портфельные инвестиции маскируют вывоз капитала национальной вывеской из опасений возможной национализации, выступают как форма

‘сотрудничества’ иностранных и национальных компаний и так далее. За 1958–67 при росте прямых инвестиций США в Латинской Америке на 32% портфельные инвестиции выросли в 2.8 раза. Прямые инвестиции остаются главной формой вывоза капитала. Прибыль от прямых инвестиций в 1968 составляла 72% прибыли, получаемой США от вывоза капитала, и 84% всей прибыли от вывоза капитала Великобритании. Вывоз ссудного капитала происходит в виде краткосрочных – до 1 года (вклады в иностранные банки) и долгосрочных (внешние займы) кредитов. Главную роль играют межправительственные займы – форма вывоза капитала, возникшая в годы Первой Мировой Войны 1914–18 под названием ‘Межсоюзнических Долгов’. Удельный вес их в общей массе заграничных инвестиций в форме ссудного капитала составил 85% в конце 1947, 59% в конце 1968. С усилением государственно-монополистического характера империализма изменилась роль государства в сфере вывоза капитала. Государство превращается в крупнейшего экспортёра капитала. Одновременно оно принимает на себя страхование вывоза (или экспорта) частного капитала от коммерческого и политического риска, связанного с ростом антиимпериалистического движения в других странах. Иногда государство выступает как партнёр отдельных монополий при строительстве предприятий) принимая на себя реализацию наиболее невыгодных с коммерческой точки зрения проектов. В условиях обострившейся борьбы за рынки сбыта вывоз государственного капитала стимулирует также вывоз (или экспорт) товаров, выполняя тем самым функцию, которую раньше целиком осуществляли частные экспортёры капитала. Большие размеры принял вывоз капитала в форме займов международных государственных кредитных учреждений, главным образом Международного Банка Реконструкции и Развития (МБРР), его дочерних обществ – Международной Ассоциации Развития и Международной Финансовой Корпорации, а также региональных банков – Межамериканского Банка Развития, Азиатского Банка Развития, Европейского Инвестиционного Банка. Вывоз капитала – важнейшее экономическое орудие неоколониализма. Более 60% прямых инвестиций Великобритании вложено в пределах бывшей Британской Империи. Большая часть заграничных инвестиций Франции находилась в зоне Франка. Основной сферой вывоза капитала из США оставалась Долларовая зона – Канада и Латинская Америка, хотя их удельный вес сократился с 54% в 1946 до 43% в 1968; однако вырос удельный вес стран Азии, Африки и Австралии (с 11 до 24%). До Второй Мировой Войны и в первые послевоенные годы вывозимые монополистическом капиталом в развивающиеся страны средства шли в основном на закрепление аграрно-сырьевой структуры их экономики. В условиях распада колониальных империй и усиления борьбы за экономическую самостоятельность развивающихся стран империалистические державы стремятся путём вывоза капитала захватить ключевые позиции в ведущих отраслях обрабатывающей промышленности этих стран. За 1950–68 удельный вес обрабатывающей промышленности в прямых инвестициях США в наиболее развитых странах Латинской Америки – Аргентине, Бразилии и Мексике – вырос с 40 до 67%. Удельный вес вложений в обрабатывающую промышленность в инвестициях США в ЮАР (Африка) вырос с 31 до 48%. В странах Среднего Востока удельный вес инвестиций в обрабатывающую промышленность вырос с 0.1 до 3.4%. Основная масса средств, поступающих из империалистических держав в развивающиеся страны Азии, Африки и Латинской Америки, представляет собой вывоз капитала в форме государственных средств. Причём из общей суммы государственных средств, поступивших в эти страны в 1960-х, около 60% приходилось на безвозвратные субсидии, не включаемые официальной статистикой в общую сумму заграничных инвестиций, а остальные 40% на займы; субсидии и займы превратились в орудие проникновения империалистических держав в развивающиеся страны под видом ‘экономической помощи’. Государственные займы развивающимся странам значительно превосходят размеры ссудного капитала, вывозимого частными монополиями, и становятся главной формой вывоза государственного капитала. Под влиянием помощи социалистических стран капиталистические державы были вынуждены снижать ставки процентов по займам и удлинять их сроки. Вывоз капитала в значительных размерах направляется также из одних развитых капиталистических стран в другие и используется монополиями стран-экспортёров в борьбе за рынки сбыта и сферы приложения капитала. Особенно его размеры возросли после Второй Мировой Войны, что связано с распадом колониальной системы империализма и национализацией иностранных предприятий в ряде развивающихся стран. Развернувшаяся в середине XX века научно-техническая революция создала поле прибыльных крупных капиталовложений в экономике развитых капиталистических стран и вызвала важные изменения в направлениях и формах вывоза капитала. Монополии получили возможность выколачивать колоссальные прибыли путём строительства предприятий новых отраслей гражданского и военного производства как в своей стране, так и в других развитых капиталистических странах. С 1950 по 1968 общая сумма прямых заграничных инвестиций США увеличилась с 11.8 до 64.8 миллиардов Долларов (почти в 5.5 раза), а в Западной Европе инвестиции возросли с 1.7 до 19.4 миллиардов Долларов, или в 11.4 раза. В развитые страны вывозится в основном частный капитал. Вывоз капитала развивается крайне неравномерно, что обусловлено неравномерностью развития капиталистических стран. Если до Второй Мировой Войны на первом месте по заграничным инвестициям стояла Великобритания, то после войны лидерство прочно захватили США, заграничные инвестиции которых превышают сумму заграничных инвестиций всех капиталистических стран, вместе взятых. Второе место занимает Великобритания, третье – Франция, четвёртое – ФРГ. В эпоху империализма в немногих крупных капиталистических странах скапливаются громадные массы денежного капитала. Необычайно растёт слой рантье, лиц, живущих стрижкой купонов и совершенно отделённых от участия в каком бы то ни было предприятии. Вывоз капитала ‘... ещё более усиливает эту полнейшую оторванность от производства слоя рантье, налагает отпечаток паразитизма на всю страну, живущую эксплуатацией труда нескольких заокеанских стран и колоний’ (там же, Том 27, С. 397–98). Поэтому Владимир Ильич Ленин называл вывоз капитала ‘паразитизмом в квадрате’ (смотрите там же, Том 30, С. 164). В рантье превращаются целые государства. ‘Мир разделился на горстку государств-ростовщиков и гигантское большинство государств-должников’ (там же, Том 27, С. 398). Баланс международных инвестиций капиталистических стран, то есть сопоставление капитала, помещённого за границей в долгосрочной форме, с иностранным капиталом, помещённым в данной стране, позволяет определить, является ли данная страна государством-рантье или страной-должником. Так, на основе данных баланса международных инвестиций в 1967 к государствам-рантье могли быть отнесены наряду с крупнейшими странами – экспортёрами капиталов (США, Великобританией, Францией) такие страны, как Швейцария, Нидерланды, Бельгия, Швеция, Португалия, Ирландия. В государства-рантье быстрыми темпами превращались ФРГ, Япония и Италия. Остальные страны капиталистического мира выступали как страны-должники. Буржуазные экономисты рассматривают вывоз капитала как помощь развивающимся странам, но факты говорят о том, что страны-рантье получают из развивающихся стран гораздо больше средств, чем предоставляют им. Так, вывоз капитала из США в Латинскую Америку (включая экономические субсидии) за 1950–68 составил 12 миллиардов Долларов, а перевод процентов и дивидендов в США составил за эти годы 20 миллиардов Долларов. Вывоз капитала (включая субсидии) в страны Ближнего Востока составил 2 миллиарда Долларов, перевод дивидендов по ним в США 12.5 миллиардов Долларов. Предоставляя ссуды, страны-экспортёры капитала ставят в качестве условия покупку на эти средства вывозимых (или экспортируемых) ими товаров, и притом по монопольным ценам. Большую роль в вывозе капитала играют банки государств-рантье, создаваемые за рубежом, и их отделения, которые являются одним из оплотов неоколониализма. Рост вывоза государственного капитала придаёт вывозу капитала в современных условиях военно-полицейский характер. Вывоз капитала – одна из важнейших основ империалистической политики, роста милитаризма и агрессии.

CAPITAL FORMATION = ФОРМИРОВАНИЕ КАПИТАЛА – Capital Formation is a term used to describe net capital accumulation during an accounting period. Capital formation refers to net additions of capital stock such as equipment, buildings and other intermediate goods. A nation uses capital stock in combination with labour to provide services and produce goods; an increase in this capital stock is known as Capital Formation. Generally, the higher the capital formation of an economy, the faster an economy can grow its aggregate income. Increasing an economy's capital stock also increases its capacity for production, which means an economy can produce more. Producing more goods and services can lead to an increase in national income levels. Capital Formation:- acquisition less disposals of fixed assets, improvement of land, change in inventories and acquisition less disposals of valuables. Capital Formation is the transfer of savings from households and governments to the business sector, resulting in increased output and economic expansion.

CAPITAL–FORMING PAYMENTS = ПЛАТЕЖИ, ФОРМИРУЮЩИЕ КАПИТАЛ – What is called Capital-Forming Payments is money that is an optional, contracted part of the salary and is paid by the employer to employees, but going some special ways. In Germany, the amounts are 6.45 up to 40 Euros a month. The employer pays the money onto a separate savings-plan of the employee. The option of cash payment is not given. The capital-forming payments, just as the salary, are taxed and liable social-insurance-contributions. Originally, capital-forming payments were intended to stimulate acquisition of personal assets. Today, they serve the employees' financing of private or company pensions. They are even called 'Old-Age-Provision-Forming' payments (altersvorsorgewirksame Leistungen, AVWL). Depending on the form of the savings-plan, the state of Germany subsidizes such payments by the employer. The collective agreement or employment contract defines whether an employee is entitled to capital-forming payments, and also sets the amount paid by the employer himself. Normally, the following workers are entitled:- (i) Clerks; (ii) Judges; (iii) Soldiers; (iv) Apprentices; (v) Employees; and (vi) Part-Time Workers (pro-rata). A prerequisite for being entitled to capital-forming payments is to have contracted a capital-forming savings-plan. Different methods of investment are possible, here:- (i) Regular savings plan; (ii) Building-loan contract or its being paid off; (iii) Company old-age provision; (iv) Equity fund savings plan; and (v) Life insurance. A savings plan is paid into for 6 years. Subsequently, there is a retention period of up to one year within which the saved money including the bonus is not accessible. The state of Germany partly subsidizes the capital-forming payments through the employees-savings bonus. Prerequisite for subsidization is an income of less than 20 000 Euros (married couples 40 000) counting taxed parts a year, during the saving-years and the retention period (state of 2009). The bonus amounts to annual 20% for investment saving lasting for maximum 6 years. In result, there is a maximum subsidization amount of 80 Euros a year, that is 432 Euros in total for a saving amount of maximum 400 Euros. For building loans, the bonus is 8.8%. You will even receive the bonus if the employer does not pay any capital-forming extra income but you have contracted a savings plan. Those 7 years having expired, the revenue pays the respective subsidization sum corresponding to the form of investment. There is no government subsidization for bank savings plans and life insurances. That is why those forms of saving are reasonable for persons who are not entitled to employees-savings bonus. If you use the capital-forming payments for a company old-age provision, then the capital-forming payments are free from tax and social-insurance contributions. That applies for up to 2.520 Euros of savings a year. Since 2009, social-insurance contributions are also to be paid. In April of 2009, the following will change:- (i) Employees-savings bonus from 18 to 20%; (ii) The income limits from 17 900 to 20 000 Euros (married couples from 35 000 to 40 000); and (iii) The maximum subsidization amount from 72 to 80 Euros a year. Capital-Forming Payments are benefit payments paid by employers under the tariff agreement or as a salary component which the employer invests on the employee's behalf in accordance with the provisions of the 3. and 5. Capital Formation Act. For this investment, employees within certain income limits receive a state benefit, the employee savings allowance. Forms of investment sponsored are investment saving, i.e. investments in equity funds and investments in the employer's company, as well as building saving. Capital-Forming Payments are the payments which are not paid over to employees in freely disposable form but invested on their behalf (e.g., savings with building societies and participation in productive assets in the form of shares, certain investment fund certificates or holdings in private limited companies) or used by the employees for specified purposes (e.g., the construction or acquisition of their own home). The state encourages this with the employee savings supplement. Employees themselves decide on the particular type of investment, within the range of statutory possibilities. Employees have an entitlement to capital-forming payments over and above their remuneration only if provision has been made for these additional payments in a collective agreement, works agreement or individual contract of employment. / альтэрxxx Ляйстуэн, А.Фау.Ве.Эль. (altersvorsorgewirksame Leistungen, AVWL).

CAPITAL GAIN = ПРИРОСТ КАПИТАЛА – Capital Gain:- the difference between the proceeds from the sale of a security and the initial cost of the investment. If the proceeds exceed the cost this is said to be a capital gain. The difference between an asset's purchase price and selling price. It is a gain when the difference is positive and it is a loss when the difference is negative. The profit derived from the selling price exceeding its initial purchase price. A realized capital gain is an investment that has been sold at a profit. An unrealized capital gain is an investment that hasn't been sold yet but would result in a profit if sold. Capital gain is often used to mean realized capital gain. Profits earned through the sale of capital assets such as securities and real estate. Capital Gain is a portion of the total gain recognized on the sale or exchange of a noninventory asset which is not taxed as ordinary income. Capital gains have historically been taxed at a lower rate than ordinary income. Profit made on securities or any other assets, either through dividends or by selling the securities or any other assets for a higher price than they originally cost. Capital Gain is:- (1) an increase in the value of a capital asset (investment or real estate) that gives it a higher worth than the purchase price. The gain is not realized until the asset is sold. A capital gain may be short term (one year or less) or long term (more than one year) and must be claimed on income taxes. A capital loss is incurred when there is a decrease in the capital asset value compared to an asset's purchase price. Long-term capital gains are usually taxed at a lower rate than regular income. This is done to encourage entrepreneurship and investment in the economy. (2) Profit that results when the price of a security held by a mutual fund rises above its purchase price and the security is sold (realized gain). If the security continues to be held, the gain is unrealized. A capital loss would occur when the opposite takes place. Tax conscious mutual fund investors should determine a mutual fund's unrealized accumulated capital gains, which are expressed as a percentage of its net assets, before investing in a fund with a significant unrealized capital gain component. This circumstance is referred to as a Fund's Capital Gains Exposure. When distributed by a fund, capital gains are a taxable obligation for the fund's investors.

CAPITAL GAINS DISTRIBUTION = РАСПРЕДЕЛЕНИЕ ПРИРОЩЁННОГО (или НАКОПЛЕННОГО) КАПИТАЛА – Capital Gains Distribution is the payment of proceeds prompted by a fund manager's liquidation of underlying stocks and securities in a mutual fund. Capital gains distribution occurs when a mutual fund manager liquidates underlying positions that have made gains since they were added to the fund. Capital gains distributions will be taxed as capital gains to the person receiving the distribution. Holders of mutual fund shares will be required to pay capital gains tax on any capital gains distributions made by the funds they own. Before 1986, all mutual fund shareholders were charged long-term capital gains on distributions, regardless of how long they'd held the funds. With the passing of the 1986 Tax Reform Act, shareholders now pay long- or short-term capital gains tax based on the time they've owned the fund. Capital Gains Distribution is a realization of capital either in shares or cash. In the United States, Capital Gain Distributions:- mutual fund may distribute capital gains on investments they have sold off. These will be reported on your 1099-DIV box 2 as capital

gains distributions. If you have only capital gains distributions and no other capital gains, you may report the figure directly on Form 1040A line 10 or Form 1040 line 13 without filling out a Schedule D.

CAPITAL GAINS TAX = НАЛОГ НА ПРИРОСТ КАПИТАЛА – In Australia, Capital Gains Tax (CGT) is the tax you pay on a capital gain. It is not a separate tax, just part of your income tax. The most common way you make a capital gain (or capital loss) is by selling assets such as real estate, shares or managed fund investments. Capital Gains Tax (CGT) is a tax on the profit from the sale of capital assets such as shares or property. A Capital Gains Tax (CGT) is a tax on capital gains, the profit realized on the sale of a non-inventory asset that was purchased at a cost amount that was lower than the amount realized on the sale. The most common capital gains are realized from the sale of stocks, bonds, precious metals and property. Not all countries implement a capital gains tax and most have different rates of taxation for individuals and corporations. For equities, an example of a popular and liquid asset, national and state legislation often has a large array of fiscal obligations that must be respected regarding capital gains. Taxes are charged by the state over the transactions, dividends and capital gains on the stock market. However, these fiscal obligations may vary from jurisdiction to jurisdiction. Capital Gains Tax is a tax payable to the Inland Revenue and which is taken from the capital gain made on the investment.

CAPITAL GROWTH = РОСТ КАПИТАЛА (или ПРИРОСТ КАПИТАЛА) – Capital Growth is an increase in the value in an asset such as an investment in shares. Capital growth is realised as a capital gain when the asset is sold for more than its purchase price. Capital Growth is an increase in the market price of an asset. Also called Capital Appreciation.

CAPITAL INCREASE = УВЕЛИЧЕНИЕ КАПИТАЛА – A term Capital Increase means of raising company financing by increasing its share capital. For a stock corporation (Aktiengesellschaft) the following methods are possible:- (i) capital increase through the issue of new shares (pre-emptive rights); (ii) capital increase from retained earnings (bonus shares). Furthermore, another means of financing is through ‘conditional’ capital, which involves the issue of bonds with share subscription rights or convertible rights (bonds with warrants, convertible bonds). There is also ‘authorized’ capital, which is a kind of pre-approved capital, i.e. the management board is authorized in the articles of association to increase the share capital up to a certain amount by issuing new shares for contributions (in cash or in kind) without requiring a separate resolution of the general meeting. Move by a corporation (joint stock company) to raise its capital stock (share capital) by issuing additional shares or participation certificates. Capital Increase is a method used by corporations to raise share capital by giving existing shareholders the right to subscribe to new shares for cash. Alternatively, capital can be raised by exchanging assets such as shares in another company or by raising the par value of existing shares. New investors have the opportunity to become shareholders. Also known as Seasoned Equity Offering.

CAPITAL INVESTMENT LOAN = ССУДА НА КАПИТАЛЬНЫЕ ВЛОЖЕНИЯ (или ССУДА НА КАПИТАЛОВЛОЖЕНИЯ) – Capital Investment Loan is a credit granted for the financing of fixed assets, i.e. equipment, machines, plant, property, etc. Current assets are financed with a working capital credit. Capital Investment Loan is a type of interest-only, fixed-rate loan granted by banks for the acquisition of fixed assets such as property, equipment and other machinery. The loan can be used for any development activity. Current assets are funded with a working capital credit. / , то есть . Под Капитальными Вложениями понимаются затраты материальных, трудовых и денежных ресурсов, направляемых на создание новых, реконструкцию и расширение действующих основных фондов. В объём капитальных вложений включаются затраты на строительные работы, приобретение и монтаж оборудования, приобретение инструмента и инвентаря, включаемых в состав основных фондов.

CAPITALISM = КАПИТАЛИЗМ – Capitalism is an economic system based on a free market, open competition, profit motive and private ownership of the means of production. Capitalism encourages private investment and business, compared to a government-controlled economy. Investors in these private companies (i.e. shareholders) also own the firms and are known as Capitalists. In such a system, individuals and firms have the right to own and use wealth to earn income and to sell and purchase labor for wages with little or no government control. The function of regulating the economy is then achieved mainly through the operation of market forces where prices and profit dictate where and how resources are used and allocated. The United States is a capitalistic system. Capitalism is a form of economic order characterized by private ownership of the means of production and the freedom of private owners to use, buy and sell their property or services on the market at voluntarily agreed prices and terms, with only minimal interference with such transactions by the state or other authoritative third parties. Capitalism is an economic system based on the private ownership of the means of production, with the goal of making a profit. Central elements of capitalism include capital accumulation, competitive markets, and a price system. There are, however, multiple variants of capitalism, including laissez-faire, welfare capitalism, and state capitalism. Capitalism is considered to have been applied in a variety of historical cases, varying in time, geography, politics, and culture. There is general agreement that capitalism became dominant in the Western world following the demise of feudalism. Economists, political economists, and historians have taken different perspectives in their analysis of capitalism. Laissez-faire economists emphasize the degree to which government does not have control over markets and the importance of property rights. Others emphasize the need for government regulation, to prevent monopolies and to soften the effects of the boom and bust cycle. Most political economists emphasize private property as well, in addition to power relations, wage labor, class, and the uniqueness of capitalism as a historical formation. The extent to which different markets are free, as well as the rules defining private property, is a matter of politics and policy. Many states have what are termed mixed economies, referring to the varying degree of planned and market-driven elements in an economic system. Proponents of capitalism use historical precedent to claim that it is the greatest wealth-producing system known to man, and that its benefits are mainly to the ordinary person. Critics of capitalism associate it with economic instability and an inability to provide for the wellbeing of all people. The term capitalism, in its modern sense, comes from the writings of Karl Marx. In the XX century defenders of the capitalist system often replaced the terms capitalism with phrases such as free enterprise and private enterprise and capitalist with investor or rentier in reaction to the negative connotations sometimes associated with capitalism. There are a number of different elements in the capitalist socio-economic system. Capitalism is defined as a social and economic system where capital assets are mainly owned and controlled by private persons, where labor is purchased for money wages, capital gains accrue to private owners, and the price mechanism is utilized to allocate capital goods between uses. The extent to which the price mechanism is used, the degree of competitiveness, and government intervention in markets distinguish exact forms of capitalism. There are different variations of capitalism which have different relationships to markets and the state. In free-market and laissez-faire forms of capitalism, markets are utilized most extensively with minimal or no regulation over the pricing mechanism. In interventionist and mixed economies, markets continue to play a dominant role but are regulated to some extent by government in order to correct market failures, promote social welfare, conserve natural resources, and fund defense and public safety. In state capitalist systems, markets are relied upon the least, with the state relying heavily on state-owned enterprises or indirect economic planning to accumulate capital. Capitalism and capitalist economics is generally considered to be the opposite of socialism, which contrasts with all forms of capitalism in the following ways: social ownership of the means of production, where returns on the means of production accrue to society at large, and goods and services are produced directly for their utility (as opposed to being produced by profit-seeking businesses). Capitalism is a social system based on the principle of individual rights. Politically, it is the system of laissez-faire (freedom). Legally it is a system of objective laws (rule of law as opposed to rule of man). Economically, when such freedom is applied

to the sphere of production its' result is the free-market. / Лесе-Фэр (Laissez-Faire) = Представьте Делу Идти Своим Порядком; Позиция Невмешательства или Недоговорённости (на Французском). Под Капитализмом, от Немецкого слова Kapital или Французского слова Capital, означающие Главное Имущество или Сумма, и от Латинского слова Capitalis, означающее Главный, понимается общественно-экономическая формация, основанная на частной собственности класса буржуазии на средства производства и эксплуатации капиталом наёмного труда; является последней в истории человечества антагонистической формацией. Социалисты предполагали, что он сменяется коммунистической формацией. Генезис капитализма, возникающего в эпоху разложения феодализма и развития товарного производства, связан с так называемым первоначальным накоплением капитала. Прибавочная стоимость, создаваемая наёмным трудом в процессе капиталистического производства, выступает в форме прибыли, маскирующей эксплуатацию трудящихся капиталом. Производство и присвоение прибавочной стоимости – основной закон капитализма. Конкуренция вынуждает капиталиста постоянно увеличивать капитал и совершенствовать производство. Это способствует быстрому развитию производительных сил, постоянным переворотам в технике, сопровождающимся ростом обобществления капиталистического производства, а также углублением разделения труда. В ходе накопления капитала обостряется основное противоречие капитализма – между общественным характером производства и частнокапиталистической формой присвоения его результатов, между трудом и капиталом, развивается ряд других неразрешимых в рамках капитализма противоречий:- между проиводством и потреблением, планомерной организацией производства на отдельных предприятиях и анархией производства во всём обществе. Все они проявляются в периодически повторяющихся экономических кризисах, свидетельствующих о цикличном характере развития капитализма. Рост концентрации и централизации производства и капитала приводит к возникновению и господству капиталистических монополий. На рубеже XIX и XX веков капитализм перерастает в высшую и последнюю стадию – монополистическую, когда неизмеримо расширяется сфера эксплуатации народов монополистическим капиталом, складывается всевластие финансового капитала в развитых капиталистических странах и монопольное положение последних во всём мире. Одной из важнейших закономерностей развития капитализма становится тенденция к росту государственно-монополистического капитализма. Возник новый узел противоречий – между транснациональными корпорациями и национально-государственной формой политической организации общества. Первая Мировая Война и победа так называемой Октябрьской Революции в России положили начало общему кризису капитализма; капитализм перестал быть всеохватывающей системой хозяйства. После Второй Мировой Войны с образованием мировой социалистической системы хозяйства капитализм на какое-то время утратил господствующее положение в мировой экономике и политике, сузилась сфера его влияния. Распалась колониальная система империализма; углублялся общий кризис капитализма. Капитализм – это экономическая система, при которой:- (i) существует частное владение собственностью; (ii) накопление собственности и капитала приносит доход частным лицам или компаниям, владеющим ими; (iii) частные лица и компании могут относительно свободно конкурировать друг с другом в целях получения экономической выгоды; (iv) получение прибыли является основным стимулом в экономической жизни. Среди синонимов термина Капитализм – экономика, основанная на свободе действий (laissez-faire), система частного предпринимательства и система свободного ценообразования. В этом контексте понятия Экономика (Economy) и Система (System) являются взаимозаменяемыми.

CAPITALIZATION = КАПИТАЛИЗАЦИЯ – (1) Capitalization:- total amount of various securities issued by a corporation. Capitalization may include bonds, debentures, preferred and common stock, and surplus. See also Market Capitalization. Valuation of a company arrived at by multiplying the market price of the corporation's shares by the total number of outstanding shares. Any other equity paper issued by the company must also be included in the calculation of the capitalization. See also Market Capitalization. Capitalization is:- (1) in accounting, it is where costs to acquire an asset are included in the price of the asset. For example, if a machine has a price of USD1 million this value would be recorded in the assets, if there was also a USD20 000 charge for shipping the machine then this cost would be capitalized and included in assets. (2) The sum of a corporation's stock, long-term debt and retained earnings. Also known as Invested Capital. The capitalization of a firm can be overcapitalized and undercapitalized, both of which are potential negatives. (3) A company's outstanding shares multiplied by its share price, better known as Market Capitalization. If a company has 1 000 000 shares and is currently trading at USD10 a share, their market capitalization is USD10 000 000. / Под Капитализацей понимается:- (i) превращение прибавочной стоимости в капитал, то есть использование её на расширение производства; и (ii) процесс образования фиктивного капитала. Капитализация:- (1) превращение прибавочной стоимости в капитал, то есть использование её на расширение капиталистического производства. Капитализированная прибавочная стоимость образует фонд капиталистического накопления, который, так же как и капитал, распадается на 2 части:- на добавочный постоянный капитал, расходуемый на приобретение добавочных средств производства, и на добавочный переменный капитал, расходуемый на покупку добавочной рабочей силы (смотрите Накопление Капитала). (2) Процесс образования фиктивного капитала. В буржуазном обществе капитализируется каждый регулярно повторяющийся доход (земельная рента, дивиденд и тому подобное), который начисляется по средней норме ссудного процента, как доход на капитал, отданный в ссуду из этого процента. Всякий получаемый нетрудовой доход от владения ценными бумагами рассматривается как процент на некоторый капитал, которого в действительности не существует (мнимый капитал). Выпущенные ценные бумаги (акции, облигации корпораций и государства) становятся капиталом, приносящим проценты. Повышение курсов акций (капитализированных дивидендов), особенно в циклической фазе подъёма, ведёт к накоплению фиктивного капитала, которое качественно и количественно отличается от накопления действительного капитала и определяется своими закономерностями. В то же время чрезмерное разбухание фиктивного капитала и последующий биржевой крах могут серьёзно повлиять на процесс накопления капитала. Так как вся масса фиктивного капитала представляет собой капитализированный доход, то изменение его стоимости не зависит от движения стоимости реального (действительного) капитала, который он представляет. Капитализация означает дальнейшую фетишизацию капиталистических производственных отношений (смотрите Товарный Фетишизм).

(2) Capitalization:- the calculation of the capitalized value of regularly recurring services or sources of income (such as rental income) by applying a specific interest rate (capitalization rate).

(3) Capitalization:- technique used in life insurance whereby the amount of principal guaranteed at maturity is directly related to payments made by the insured or on the insured's behalf, usually by an employer. The capitalization formula is based on mortality (there are always fewer beneficiaries than there are policyholders) and the yield of the funds invested at maturity, i.e. their capitalization. Capitalization is an effective method in periods of monetary stability or low inflation, and works as long as the effective rate of return on money is higher than the decline in value of the money. However, in periods of high inflation, the face value of the guaranteed payments depreciates in constant terms at the same rate as the currency. / , то есть .

CAPITALIZATION OF EARNINGS = КАПИТАЛИЗАЦИЯ ЗАРАБОТКОВ – Capitalization Of Earnings is a method of determining the value of an organization by calculating the net present value (NPV) of expected future profits or cash flows. The capitalization of earnings estimate is done by taking the entity's future earnings and dividing them by the capitalization rate (cap rate). This will take into

account the risk that earnings will stop or be lower than the estimate. Formula:- Value = Earnings In Future Years / (d – g); where:- d = discount rate, and g = growth rate. This is an income-valuation approach that determines the value of a business by looking at the current benefit of realizing a cash flow now, rather than in the future. The capitalization of earnings is particularly useful when the future earnings can be predicted easily and accurately. For example, if a company had a business that made USD1.2 million last year and that was expected to grow at a 4% rate (plus a 3.25% inflation rate), the annual rate of return needed by a purchaser given the level of risk would be 26%. Expected value using the capitalization of earnings method would be USD6.4 million, calculated as:- - USD1 200 000 / (0.26 – (0.04 + 0.0325)); -USD1 200 000 / 0.1875; -USD6.4 million. Capitalization Of Earnings:- determining the worth of a business by calculating the net present value of expected future profits. Capitalization can also be used to determine the value of a given asset, such as a machine, which is in theory worth the present value of the future earnings it will generate. The capitalization rate is the relationship of income to capital investment or value, expressed as a percentage. See also Market Capitalization. Capitalization of Earnings:- a common income-based small business valuation method that establishes the business value by dividing the expected business economic benefit, such as the seller's discretionary cash flow, by the capitalization rate. What It Means? Capitalization of Earnings Method determines the business value using a single measure of the expected business economic benefit as the numerator. This is divided by the capitalization rate that represents the risk associated with receiving this benefit in the future. We discuss the capitalization and discounting business valuation methods in the Guide and show that the two are equivalent if the business earnings grow at a constant rate. In using this valuation method, care must be given to the proper selection of the economic benefit being capitalized and the appropriate capitalization rate. Accurate matching of the income being capitalized and selection of the capitalization rate are the key advantages of the Multiple of Discretionary Earnings business valuation method.

CAPITALIZATION OF RETAINED EARNINGS AVAILABLE FOR DISTRIBUTION = КАПИТАЛИЗАЦИЯ НЕРАСПРЕДЕЛЁННЫХ ЗАРАБОТКОВ, ДОСТУПНЫХ ДЛЯ РАСПРЕДЕЛЕНИЯ – Capitalization Of Retained Earnings Available For Distribution:- ordinarily, contributed capital and earned capital are maintained and reported separately. In the SBIC (Small Business Investment Company) program, however, a Licensee with positive Retained Earnings Available for Distribution (READ) has the option of 'capitalizing' such earnings by permanently reclassifying them as contributed capital. As a result of the reclassification, Undistributed Net Realized Earnings are reduced, while paid-in capital is increased; the net effect is the same as if the Licensee had made a distribution to its owners, who then reinvested the same amount in the Licensee. From a regulatory perspective, this action results in an increase in the Licensee's Leverageable Capital, thus increasing its eligibility for SBA (the US Small Business Administration (SBA)) leverage. Capitalization of READ reflects the intent of a Licensee to pursue long-term growth by reinvesting its earnings in small businesses. In order to be eligible to capitalize READ, an SBIC must have paid any amounts due to SBA on a priority basis (such as Prioritized Payments or the preferred dividends on 3 percent and 4 percent preferred stock). For all regulatory purposes, capitalization of READ constitutes a distribution to the Licensee's non-SBA investors.

CAPITALIZED VALUE = КАПИТАЛИЗИРОВАННАЯ СТОИМОСТЬ – Capitalized Value is the current value of an asset, based on the total income expected to be realized over its economic life span. The anticipated earnings are discounted (given a lower value) so they take into account the time value of money. Capitalized Value is a value of money expected to be earned or received in the future, calculated using a specific rate of interest. Calculation of the capitalized value is of particular importance in connection with the appraisal of real estate properties. Capitalized Value is the current value of a future stream of earnings or cash flow. The capitalized value of a rental property is the discounted value of all future cash flows, including rental income, tax benefits, and so forth. The capitalized value of an asset is heavily dependent on the rate at which the projected cash flow stream is discounted. Capitalized Value:- assessment of the value of an asset, based on the total income expected to be realized over its economic life span.

CAPITAL LEASE = АРЕНДА КАПИТАЛА (или ЛИЗИНГ КАПИТАЛА) – In the United States, a Capital Lease means of financing the purchase of business assets through a rental contract on equipment or real property that grants the lessor the right to purchase the leased property. Leasing made its first appearance in the United States in the 1950s as a means of financing acquisition of business property. It was later introduced in Europe, where the first leasing companies were created in 1962. Also known as Finance Lease in the United Kingdom. Capital Lease is a lease considered to have the economic characteristics of asset ownership. A capital lease would be considered a purchased asset for accounting purposes. An operating lease, on the other hand, would be handled as a true lease, or rental, for accounting purposes. The choice of lease classification will have important results on a firm's financial statements. A lease falls into this category if any of the following requirements are met:- (i) the life of the lease is 75% or greater of the assets useful life; (ii) the lease contains a purchase agreement for less than market value; (iii) the lessee gains ownership at the end of the lease period; and (iv) the present value of lease payments is greater than 90% of the asset's market value. A capital lease is an example of accrual accounting's inclusion of economic events. Generally, companies have a choice of which type of lease they wish to use for accounting purposes, however, both types of leases provide specific advantages and disadvantages to financial statements. For example, companies wishing to show a higher return on asset ratios would choose an operating lease, as the balance sheet would not account for the item as an asset, thus reducing the denominator in the ratio.

CAPITAL LOSS = КАПИТАЛЬНЫЙ УБЫТОК (или УБЫТОК КАПИТАЛА) – Capital Loss is the loss incurred when a capital asset (investment or real estate) decreases in value. This loss is not realized until the asset is sold for a price that is lower than the original purchase price. A capital loss is essentially the difference between the purchase price and the price at which the asset is sold, where the sale price is lower than the purchase price. For example, if an investor bought a house for USD250 000 and sold the house five years later for USD200 000, the investor would realize a capital loss of USD50 000. Capital Loss:- the difference between the proceeds from the sale of a security and the initial cost of the investment. If the cost exceeds the proceeds then this is said to be a capital loss. Capital Loss is a loss on the sale of an investment asset, such as stocks, bonds, or mutual funds. A loss is incurred if you sell the investmest for less than what you paid for it. Capital Loss Limitations:- if your total capital losses exceed your total capital gains for the whole year, then you have a net capital loss. Net capital losses are deductible up to a limit of USD3 000 per year. Net capital losses in excess of the USD3 000 limit are carried forward to next year's taxes. Wash Sale Rules:- the capital loss on a single investment transaction may be disallowed under the Wash Sale Rule. If you buy the same stock within one month of selling that stock for a loss, your loss will be disallowed under the Wash Sale Rule. The loss is not gone forever, however. The disallowed is added to your cost basis in the new stock position. Capital Losses for Deceased Taxpayers:- net capital losses expire in the the year that a taxpayer dies. Neither the taxpayer's estate nor the taxpayer's spouse can claim a capital loss carryover for investment assets held only in the name of the taxpayer.

CAPITAL MARKET = РЫНОК КАПИТАЛОВ – Capital Market is a market made up of the various sources of capital for (medium- or long-term) investment in new and already existing companies. Any place or system where the requirements of business enterprises and public authorities or governments for medium- and long-term capital funds can be met. The opposite of Money Market. Capital Market is long-term debt and equity capital is negotiated on the capital markets. Privately owned companies and public sector institutions use the capital markets to raise a significant portion of the capital they need to finance their investments and other expenditures. Those seeking capital procure long-term money by taking out long-term loans and borrower's note loans with banks and

by issuing bonds, stocks, debentures, bonds with warrants and convertible bonds. The trading of securities on an organized capital market is regulated by government authorities. The issuing of securities is approved by government regulators and checked by the banks involved. This is to ensure that the organized capital markets offer a sufficent guarantee for solid investing opportunities. The market in which corporate equity and longer-term debt securities (those maturing in more than one year) are issued and traded.

CAPITAL MORTGAGE = КАПИТАЛЬНАЯ ЗАКЛАДНАЯ – Capital Mortgage:- mortgage deed to secure a specific claim. The mortgage lien guarantees the repayment of principal, the costs of debt collection, and three years of defaulted interest at the time bankruptcy proceedings are opened or an application for the realization of the pledge is filed, as well as the interest payable since the last due date. / выплата (repayment) , со времени последней надлежащей (причитающейся) даты.

CAPITAL OUTPUT RATIO = СООТНОШЕНИЕ КАПИТАЛ ВЫРАБОТКА (или ВЫПУСК ГОТОВОЙ ПРОДУКЦИИ) (или КОЭФФИЦИЕНТ КАПИТАЛОЁМКОСТИ, или КАПИТАЛОЁМКОСТЬ, или ОКУПАЕМОСТЬ КАПИТАЛЬНЫХ ВЛОЖЕНИЙ) – A Capital Output Ratio which is abbreviated as COR is related to be availability of natural resources in a country. It is used to measure the capital ratio that would be used for the production of some output over a certain period of time. The capital output ratio tends to increase if the capital available in a country is cheaper than the other inputs. Therefore, the countries that are rich in natural resources have a low capital output ratio. This is because they can easily substitute the capital with natural resources in order to increase the output. When countries use their natural resources instead of capital then COR reduces. We can take the example of Norway. This country does not have much of the natural resources therefore its capital output ratio is high. The size of the capital ratio output can only be determined when the amount of capital that has been used for the production of output is known. If depreciation of capital is assumed as constant, then the capital output ratio is calculated by the ratio of GDP invested each year. Other things that determine the Capital output ratio include innovation and technical progression. If a lot of capital is used in order to undertake some project of technological development, then the Capital output ratio will increase. On the other hand, the countries that are labor intensive i.e. they employ more labor for undertaking a developmental project have a low Capital output ratio. Apart from all these factors, another thing that can determine the capital output ratio is an investment. The more the rate of investment is, the more will be the Capital output ratio. Similarly, low ratio of investment means low Capital output ratio. Countries which can double its capital in ten years than the one which can double in twenty years will have a higher Capital output ratio. Capital Output Ratio (COR) is a ratio of net investment in capital equipment to total value of output. The ratio is not a relationship between physical data, but between volumes, or between values in constant prices. It expresses a structural relationship between total production resources and the volume of output generated by these resources. The capital output ratio is used to characterize production functions. Occasionally, it is applied to the study of economic development plans for Third World countries. However, experience shows that applying an overall capital output ratio is a simplistic approach. Capital output ratios vary largely, depending on the type of industry, and change over time. Also known as Capital Coefficient in the United Kingdom. / Под Окупаемостью Капитальных Вложений понимается один из показателей эффективности капитальных вложений, выражаемый как отношение капитальных вложений к экономическому эффекту, получаемому благодаря этим вложениям.

CAPITAL PLANNING AND INVESTMENT CONTROL = КАПИТАЛЬНОЕ ПЛАНИРОВАНИЕ И ИНВЕСТИЦИОННЫЙ КОНТРОЛЬ – Capital Planning and Investment Control (CPIC):- envisioned in the Clinger-Cohen Act of 1996, The Office of Management and Budget (OMB) Circular A-130 (Management of Federal Information Resources) and other related guidance, this is a management process for ongoing identification, selection, control, and evaluation of investments in information resources. The process links budget formulation and execution, and is focused on agency missions and achieving specific program outcomes. Capital Planning and Investment Control (CPIC):- What is CPIC? The CPIC Program is a structured, integrated approach to managing Information Technology (IT) investments. It ensures that all IT investments align with the US Environmental Protection Agency (EPA) mission and support business needs while minimizing risks and maximizing returns throughout the investment's lifecycle. The CPIC relies on a systematic approach to IT investment management in three distinct phases:- select, control, and on-going evaluation, to ensure each investment's objectives support the business and mission needs of the EPA. Capital Planning and Investment Control (CPIC) is the US Department of Health and Human Services' (HHS) primary process for making investment decisions, assessing investment process effectiveness, and refining investment related policies and procedures. CPIC is mandated by the Clinger-Cohen Act which requires agencies to use a disciplined process to acquire, use, maintain and dispose of information technology (IT). CPIC accomplishes these requirements through three phases:- Select Phase, Control Phase, and Evaluate Phase. Several guiding principles govern the HHS CPIC process, they include:- (i) Define Accountability:- all parties will have clearly defined roles and responsibilities, and are expected to follow the process; (ii) Add Value:- CPIC is not merely a regulatory requirement, but an opportunity for HHS IT to better govern and manage its portfolio, increasing return on investment. Only metrics that will be acted on will be captured; (iii) Be Relevant:- the process will be simple and flexible, yet effective. HHS will seriously consider input from Operational Divisions (OPDIVs) on process and solution needs, and will strive for consistency and to accommodate unique OPDIV needs; (iv) Manage by Exception:- the emphasis in reporting will be on variances from approved milestones, issues requiring executive decisions. Investments that are performing in accordance with planned cost, schedule and performance baselines will have a lighter reporting burden; and (v) Generate Decisions:- decisions will be clearly sought, made, documented, and communicated by the appropriate governing body. The Information Technology Management Reform Act of 1996 was later renamed Clinger-Cohen Act for its co-sponsors, Rep. William Clinger, R-PA, and Senator William Cohen, R-ME. / Вилъйэм.

CAPITAL POOL COMPANY = КОМПАНИЯ ОБЪЕДИНЁННОГО КАПИТАЛА – Capital Pool Company (CPC) is a public company which has been established (under the rules of the Canadian Venture Exchange (CDNX)) for the sole purpose of acquiring an active business enterprise. It allows a group of individuals to create a vehicle which they can then use to finance and build an emerging venture. Unlike a dormant 'shell' company, a CPC brings with it a wealth of experience through its directors. A CPC's sole purpose in life is to acquire a business in what is referred to as its 'Qualifying Transaction'. After the completion thereof, the resulting merged company then trades as a normal venture company on the CDNX.

CAPITAL PROTECTED WARRANTS = ЗАЩИЩЁННЫЕ КАПИТАЛОМ ВАРРАНТЫ – Capital Protected Warrants are warrants where the issuer promises that the investor gets back at least a certain value set out by the issuer. The underlying securities for Capital Protected Warrants can be a single security or basket of securities quoted on the Australian Securities Exchange (ASX) or an overseas exchange. There are currently two types of Capital protected warrants:- Capital Plus and CaPELS.

CAPITAL PROTECTION LEVEL = УРОВЕНЬ ЗАЩИТЫ КАПИТАЛА – Capital Protection Level:- guaranteed minimum assets at the end of the investment horizon (loss containment).

CAPITAL RESERVE = РЕЗЕРВ КАПИТАЛА – (1) Capital Reserve is a type of account on a municipality's or company's balance sheet that is reserved for long-term capital investment projects or any other large and anticipated expense(s) that will be incurred in the future. This type of reserve fund is set aside to ensure that the company or municipality has adequate funding to at least partially finance the project. Contributions to the capital reserve account can be made from government subsidies, donated funds, or can be set

aside from the firm's or municipality's regular revenue-generating operations. Once recorded on the reporting entity's balance sheet, these funds are only to be spent on the capital expenditure projects for which they were initially intended, excluding any unforeseen circumstances. Capital Reserve is a reserve which is regarded as not being available for distribution as a dividend through the Statement of Financial Performance for statutory reasons or because of the requirements of the constitution of a company or because of a resolution of the directors. Capital Reserve is a resource created by the accumulated capital surplus (not revenue surplus) of an organization, such as by an upward revaluation of its assets to reflect their current market value after appreciation. Allocating such sums to capital reserve means they are permanently invested and will not be paid as dividends.

(2) Sometimes the term is used to describe a reserve which if distributed as a dividend is not subject to income tax in the hands of a shareholder that is an individual or to bonus issue tax if distributed as a bonus issue. / Под Резервным Капиталом понимается часть капитала акционерного общества для покрытия возможных потерь, пополнения основного капитала при его обесценении, выплаты дивидендов, если для этого недостаточно текущей прибыли. Образуется за счёт ежегодных отчислений от прибыли.

CAPITAL STOCK = АКЦИОНЕРНЫЙ КАПИТАЛ (или УСТАВНЫЙ ФОНД) – Capital Stock is ownership shares of a corporation authorized by its articles of incorporation. The money value assigned to a corporation's issued shares. The balance sheet account with the aggregate amount of the par value or stated value of all stock issued by a corporation. Capital Stock is the stock authorized by a company's charter, representing no ownership rights. Sum total of capital invested in a business by its owners or partners (stockholders). Capital stock consists of contributions of capital in cash and in kind from shareholders. The initial amount of capital may be modified depending on the legal form of the business. In the United States, all shares representing ownership of a business, including preferred and common. Also known as Share Capital in the United Kingdom. See also Common Stock, and Preferred Stock. Capital Stock:- the common and preferred stock a company is authorized to issue, according to their corporate charter. Capital stock represents the size of the equity position of a firm and can be found on the balance sheet (or notes) of a typical financial statement. Firms can both issue more capital stock, or buyback shares that are currently owned by shareholders. In financial statement analysis, an increasing capital stock account tends to be a sign of economic health, since the company can use the additional proceeds to invest in projects or machinery that will increase corporate profits and/or efficiency. On the other hand, however, firms that continually issue secondary issues of capital stock may be doing so to raise funds, due to poor company performance. The amount of money subscribed by the shareholders at par to a company equity. Capital Stock is simply a collective term for the ordinary shares of stock that companies issue. Large companies often divided their capital stock into various classes. In those cases, each class of stock enjoyed certain rights that distinguished it from other classes. In the United States, the two most popular classes of capital stock have always been common stock and preferred stock. Other typical classes include non-voting stock, employee stock, and ordinary stock. Debenture stock is a popular term seen on Canadian certificates. While there are several possible classes of stock, companies rarely issue more than two or three different types at one time. If a stock certificate is specifically labeled capital stock, and it lacks any other designation, then you can usually assume that the issuing company probably issued only one variety of stock at that time. In those cases, 'Capital Stock' is synonymous with 'Common Stock'. It has been normal behavior for companies to add additional classes of stock as they became increasingly successful. When that happened, preferred stock was usually added and capital stock was usually renamed as common stock. If you read the text on stock certificates specifically labeled as either common or preferred, you will find many contain the word 'Capital'. In fact, the earlier certificates were often labeled 'Common Capital Stock' or 'Preferred Capital Stock'. This tells you that common and preferred shares are really classes of capital stock. As indicated above, common shares and preferred shares have specific and different rights. / Под Уставным Капиталом понимается первоначальная сумма капитала предприятия (фирмы), определённая его уставом и формируемая в основном за счёт выручки от продажи акций. Под Уставным Фондом понимается сумма предоставленных в постоянное пользование и распоряжение предприятия основных и оборотных средств, фиксируемая в его уставе. Уставный Капитал, определяемая уставом или договором об основании капиталистических предприятий, акционерных обществ и различных объединений предпринимателей сумма капитала, необходимая для начала их деятельности. Создаётся за счёт выручки от продажи акций, государственных средств, вложений частных капиталов (последнее в современных условиях крайне редко). Для обозначения уставного капитала употребляются также термины Основной Капитал, Разрешённый Капитал, Акционерный Капитал. Законодательством ряда стран (Франция, ФРГ) установлен обязательный размер уставного капитала, при наличии которого предприятия и объединения регистрируются как действующие. В США и Великобритании размер уставного капитала законодательством не лимитируется. Уставный капитал значительно меньше привлечённого в форме кредитов, инвестиций и облигаций и тому подобного капитала. Вместе с Резервным Капиталом он составляет собственные средства предприятия. Так как соответствие уставного капитала общему объёму хозяйственной деятельности считается признаком финансовой устойчивости, при современных высоких темпах инфляции капиталистического предприятия и банки регулярно увеличивают размер уставного капитала путём размещения вновь выпускаемых акций. Уставный Фонд предприятий в бывшем СССР, материальные и денежные средства, безвозмездно выделяемые государством в постоянное распоряжение и управление социалистическому государственному производственному предприятию (объединению). Уставный фонд – основной источник собственных средств предприятия; из него формируются основные и оборотные средства. Большая часть уставного фонда (в промышленности примерно 4/5) сосредоточена в основных средствах. Первоначальный размер уставного фонда определяется уставом или действующим положением предприятия (объединения). В процессе хозяйственной деятельности размер уставного фонда увеличивается, если предприятию выделяются дополнительные средства, или уменьшается (при изъятии части средств). Изменения уставного фонда в течение года осуществляются в строго определённых законодательством случаях. Основные факторы увеличения уставного фонда:- финансирование централизованных капитальных вложений, ввод в действие производственных основных фондов за счёт фонда развития производства, осуществление капитального ремонта и модернизации оборудования, а также пополнение оборотных средств. Уставный фонд может увеличиться в результате пополнения оборотных средств за счёт государственного бюджетного финансирования, прибыли предприятия или средств вышестоящей организации в порядке перераспределения, переоценки товарно-материальных ценностей по решению правительства. Уменьшение уставного фонда наступает в связи с безвозмездным изъятием части основных и оборотных средств вышестоящими органами, в результате износа, уценки товарно-материальных ценностей, понесённых невозмещённых убытков и тому подобного. Продажа (покупка) излишнего, не используемого на предприятиях оборудования, сырья и материалов увеличивает (уменьшает) сумму средств уставного фонда. Колебания в величине уставного фонда отражаются в специальных бухгалтерских счетах и в годовых отчётах предприятия. Общая сумма уставного фонда на начало и конец отчётного периода отражается в пассиве баланса предприятия (объединения) и соответствует остаточной стоимости основных фондов и наличной сумме оборотных средств.

CAPITAL STOCK = ЗАПАСЫ КАПИТАЛА – Capital Stock is a measure of the cost of replacing the capital assets of a country, held at a particular point in time.

CAPITAL SURPLUS = ИЗЛИШЕК КАПИТАЛА – Capital Surplus:- equity which cannot otherwise be classified as capital stock or retained earnings. It's usually created from a stock issued at a premium over par value. Capital surplus is also known as Share Premium (UK), Acquired Surplus, Donated Surplus, Paid-In Surplus, or Additional Paid-In Capital. Capital Surplus includes share premiums from the issuance of shares, the consideration for warrants and negative goodwill from the capital consolidation resulting from acquisitions of subsidiaries in exchange for the issue of BASF SE shares at par value. What is Capital Surplus? In the past, capital surplus was used to describe what is now referred to as Paid-In Capital In Excess Of Par. For example, when a corporation issues shares of its common stock and receives more than the par value of the stock, two accounts are involved:- (i) the account Common Stock is used to record the par value of the shares being issued; and (ii) the amount that is greater than the par value is recorded in an account entitled Paid-in Capital in Excess of Par – Common Stock, or Premium on Common Stock. Many years ago, the account Paid-in Capital in Excess of Par – Common Stock and the account Premium on Common Stock were referred to as Capital Surplus. / Бе.А.Эс.Эф. (BASF).

CAPITAL TRANSFER = ПЕРЕДАЧА КАПИТАЛА (или ПЕРЕМЕЩЕНИЕ КАПИТАЛА) – A Capital Transfer in kind consists of the transfer of ownership of an asset (other than inventories and cash), or the cancellation of a liability by a creditor, without any counterpart being received in return. A capital transfer in cash consists of the transfer of cash that the first party has raised by disposing of an asset, or assets (other than inventories), or that the second party is expected, or required, to use for the acquisition of an asset, or assets (other than inventories). The second party, the recipient, is often obliged to use the cash to acquire an asset, or assets, as a condition on which the transfer is made. Capital transfers are different from current transfers by the fact that they involve the acquisition or disposal of an asset, or assets, by at least one of the parties to the transaction. Whether made in cash or in kind, they should result in a commensurate change in the financial, or non-financial, assets shown in the balance sheets of one or both parties to the transaction. Capital Transfers are the transfers which are related to the acquisition or disposal of assets by the recipient or payer. They may be in cash or kind, and may be imputed to reflect the assumption or forgiveness of debt.

CAPITAL WRITE–DOWN = УЦЕНКА КАПИТАЛА – Capital Write-Down is a reduction of capital stock and ensuing reverse split, combined with a subsequent capital increase through the issue of new shares. Serves to strengthen the capital base of a company in temporary difficulties.

CAPITULUM = КАПИТУЛ (или КАПИТУЛУМ, или ГОЛОВКА) – Capitulum (pl. capitula) is:- (i) a dense flat or globular cluster of sessile flowers or foliage, e.g., inflorescence of clover, cauliflower, daisy and dandelion, head of lettuce; (ii) a dense fruiting spike of a cereal plant such as corn; (iii) the upper branches and foliage of a tree forming the crown; and (iv) any part forming a knob-like protruberance. / Под Капитулом, от позднелатинского слова Capitulum, понимается:- (i) кафедральный капитулум – в каталической и англиканской церквах совет (из духовных лиц) при епископе, участвующий в управлении диоцезом (епархией); и (ii) в католических духовно-рыцарских и монашеских орденах коллегия руководящих лиц. Головка (capitulum) у растений, простое соцветие, в котором ось укорочена и иногда утолщена (но не плоская, как у корзинки). Цветки расположены на верхушке оси, сидят на коротких цветоножках. Примеры головки:- соцветия Клевера, Ворсянки и других.

CAP LEVEL = УРОВЕНЬ ВЕРХНЕГО ПРЕДЕЛА (или ПОТОЛОЧНЫЙ УРОВЕНЬ) – Cap Level:- some warrants have their upside potential capped at a certain level. This is sometimes called a Cap Level. A Cap level is fixed by the issuer when the warrant is issued. The disclosure document will provide details.

CAPM = CAPITAL ASSET PRICING MODEL

CAPOTE = КАПОТ (или ПЛАЩ С КАПЮШОНОМ, или ШИНЕЛЬ) – Capote:- a usually long and hooded cloak or overcoat. / .

CAPP = CENTRAL APPALACHIAN COAL

CAPPED NOTES = НОТЫ С ВЕРХНИМ ПРЕДЕЛОМ – Capped Note is a floating rate note with an agreed upper limit coupon rate on it. For example, an investor may be promised a London Inter-Bank Offer Rate (LIBOR) coupon of 125 basis points over a three-month LIBOR. Capped Notes are the floating rate notes with a maximum interest rate (cap). Also known as Capped Floating Rate Note. Capped Note is a floating rate instrument with a cap that places a maximum coupon rate on it. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)).

CAPPING = ПРЕДВАРЕНИЕ (или ВОССТАНОВЛЕНИЕ) – Capping:- effecting commodity or security transactions shortly prior to an option's expiration date depressing or preventing a rise in the price of the commodity or security so that previously written call options will expire worthless and the premium the writer received will be protecte. Effecting transactions in an instrument underlying an option shortly before the option's expiration date to depress or prevent a rise in the price of the instrument so that previously written call options will expire worthless, thus protecting premiums previously received. See also Pegging. Capping is:- (1) the practice of selling large amounts of a commodity or security close to the options expiry date in order to prevent a rise in market price. The investor who might practice capping is a call option writer. If practicing capping, he or she is trying to avoid having to transfer the underlying security or commodity to the option holder. The goal is to have the option expire worthless so that the premium initially received by the writer is protected. (2) An attempt to keep a stock's price low or move its price lower by putting selling pressure on it. This is a violation of NASD rules.

CAPPING FACTOR = ОГРАНИЧИВАЮЩИЙ ПРЕВЫШЕНИЕ ФАКТОР – Capping Factor:- the Conseil Scientifique has decided to limit the maximum weight of securities in the CAC 40® index to 15%. This measure came into effect on 2003-December-01. The 15% limit is reached by applying a coefficient called Capping Factor. When the index components are not capped, their capping factor is equal to 1. As with the free float, these factors are reviewed once a year except in case of significant changes in the market capitalization of the capped securities.

CAP RATE = CAPITALIZATION RATE

CAPRI PANTS = БРЮКИ КАПРИ (или УКОРОЧЕННЫЕ БРЮКИ, или ХХ) – Capri Pants:- close-fitting women's pants that end above the ankle. Also called Capris. Generally worn in warm weather climates. Leg opening starts approximately 3 or 4 inches above the ankle. Capri is a type of pant. / .

CAPROLACTAM = КАПРОЛАКТАМ – Caprolactam is a white, crystalline, cyclic amide ($C_6H_{11}NO$) which yields ε-amino-caproic acid on hydrolysis and is used as a raw material in the manufacture of nylon 6. / Найлан (Nylon). Капролактам, $C_5H_{10}CONH$, получается синтетическим путём из бензола. Применение:- является основным сырьём для получения полиамида-6 (нейлон, капрон). Выпускается в твёрдом кристаллическом и жидком виде. Упаковка и Хранение:- твёрдый капролактам упаковывают в полиэтиленовые мешки или в пятислойные бумажные мешки с полиэтиленовыми вкладышами. Масса нетто 25 кг. Твёрдый капролактам хранят в крытых помещениях, жидкий – в ёмкостях под азотной подушкой. Транспортирование:- твёрдый капролактам транспортируют в крытых железнодорожных вагонах, большегрузных контейнерах или в крытых автомобилях.

Жидкий капролактам транспортируют в специально оборудованных цистернах. Гарантийный Срок Хранения:- для твёрдого капролактама – 2 месяца, жидкого – 15 дней. Капролактам, лактам е-аминокапроновой кислоты; кристаллическое вещество белого цвета; $t_{пл}$ 68–69 °C, $t_{кип}$ 262.5 °C, показатель преломления n^{20}_D 1.4768. Капролактам хорошо растворим в воде и органических растворителях, например, в спирте, эфире, бензоле; водными растворами кислот и щёлочей гидролизуется до е-аминокапроновой кислоты $H_2N(CH_2)_5COOH$. Важное свойство капролактама – способность полимеризоваться с образованием ценного полимера – поликапроамида. Все промышленные способы производства капролактама включают стадии получения полупродукта – циклогексаноноксима – и его превращение (Бекмана перегруппировка) в капролактам под действием олеума или концентрированной H_2SO_4 при 60–120 °C. Так, один из основных методов производства капролактама из циклогексана (I) состоит в каталитическом окислении циклогексана кислородом воздуха до циклогексанона (II). Последний при взаимодействии с гидроксиламином превращается в циклогексаноноксим (III). Наиболее эффективный и экономичный способ – фотохимическое нитрозирование I непосредственно в хлоргидрат циклогексаноноксима. Метод прост:- раствор нитрозилхлорида NOCl в I при непрерывном насыщении газообразным HCl облучают ртутной лампой (мощность 10 кВт). Оксим (III) можно получить также из другого доступного сырья, например из бензойной кислоты C_6H_5COOH; последнюю гидрируют до циклогексанкарбоновой кислоты $C_6H_{11}COOH$, на которую действуют затем нитрозилсерной кислотой. Не потерял значения и первый промышленный способ производства капролактама из фенола. Полученный различными методами капролактам выделяют ректификацией или экстракцией (например, бензолом) с последующей ректификацией. Капролактам используют главным образом для получения полиамидных пластмасс, плёнок, волокон. Мировое производство капролактама в 1970 составило 1.6 миллиона тонн.

CAPRONE = КАПРОНЭ (или КАПРОН) – The Italian word Caprone means He Goat. Capron® – is trade name of BASF Corporation nylon based plastic products. Nylon 6 or polycaprolactam is a polymer developed by Paul Schlack at IG Farben to reproduce the properties of nylon 6,6 without violating the patent on its production. It is a semicrystalline polyamide. Unlike most other nylons, nylon 6 is not a condensation polymer, but instead is formed by ring-opening polymerization; this makes it a special case in the comparison between condensation and addition polymers. Its competition with nylon 6,6 and the example it set have also shaped the economics of the synthetic fiber industry. It is sold under numerous trade names including Perlon (Germany), Nylatron, Capron, Ultramid, Akulon, Kapron (former Soviet Union and satellite states), and Durethan. Synthesis:- Nylon 6 is synthesized by ring opening polymerization of caprolactam. Caprolactam has 6 carbons, hence 'Nylon 6'. When caprolactam is heated at about 533 K in an inert atmosphere of nitrogen for about 4–5 hours, the ring breaks and undergoes polymerization. Then the molten mass is passed through spinnerets to form fibers of Nylon 6. During polymerization, the amide bond within each caprolactam molecule is broken, with the active groups on each side re-forming two new bonds as the monomer becomes part of the polymer backbone. Unlike nylon 6,6, in which the direction of the amide bond reverses at each bond, all nylon 6 amide bonds lie in the same direction (see figure: note the N to C orientation of each amide bond). Properties:- Nylon 6 fibers are tough, possessing high tensile strength, as well as elasticity and lustre. They are wrinkle-proof and highly resistant to abrasion and chemicals such as acids and alkalis. The fibers can absorb up to 2.4% of water, although this lowers tensile strength. The glass transition temperature of Nylon 6 is 47 °C. Applications:- Nylon 6 finds application in a broad range of products requiring materials of high strength. It is widely used for gears, fittings, and bearings, in automotive industry for under-the-hood parts, and as a material for power tools housings. Nylon 6 is used as thread in bristles for toothbrushes, surgical sutures, and strings for acoustic and classical musical instruments, including guitars, sitars, violins, violas, and cellos. It is also used in the manufacture of a large variety of threads, ropes, filaments, nets, and tire cords, as well as hosiery and knitted garments. It can also be used in gun frames, such as those used by Glock, which are made with a composite of Nylon 6 and other polymers. It has the potential to be reused as a technical raw material for the production of new Nylon 6, by depolymerization to caprolactam. Biodegradation:- Flavobacterium sp. [85] and Pseudomonas sp. (NK87) degrade oligomers of Nylon 6, but not polymers. Certain white rot fungal strains can also degrade Nylon 6 through oxidation. / Бе.А.Эс.Эф. (BASF). Найлан (Nylon).

CAPS = CONVERTIBLE ADJUSTABLE PREFERRED STOCK

CAPSID = КАПСИД – Capsid is the protein coat of viruses forming the closed shell or tube that contains the nucleic acid. / Под Капсидом, от Латинского слова Capsa, означающее Вместилище или Ящик, понимается белковая оболочка вируса, предохраняющая его нуклеиновую кислоту от внешних воздействий. Состоит из отдельных одинаковых структурных единиц - капсомеров.

CAP SPINNING = ПРЯДЕНИЕ НА КОЛПАЧНОЙ ПРЯДИЛЬНОЙ МАШИНЕ (или КОЛПАЧНОЕ ПРЯДЕНИЕ) – Cap Spinning is a system of spinning employing a stationary, highly polished metal cap just large enough to fit over the take-up bobbin, which revolves at a high rate of speed. The cap controls the build and imparts sufficient tension to the yarn for winding. The yarn is twisted and wound onto packages simultaneously.

CAPSTAN = КАБЕСТАН (или ШПИЛЬ) – Capstan (maritime term):- the vertical barrel device used to heave in cable or lines.

CAPSTAN–BAR = ВЫМБОВКА – Capstan-Bar (maritime term):- a wooden bar which may be shipped in the capstan head for heaving around by hand (to heave up anchor or heavy objects by manpower).

CAPSULE = КАПСУЛА (или КОРОБОЧКА, или СУМКА, или ОБОЛОЧКА) – Capsule is a dry multi-chambered seed pod with many seeds per chamber that splits along several seams to open when dry and ripe. Capsule is:- (1) a fruit that sheds the seed when dry, consisting of more than one carpel. (2) A plastic structure enveloping a chemical. (3) A relatively thick layer of mucopolysaccharides that surrounds some kinds of bacteria. / Капсула или – сухой многокамерный семенной боб с многочисленными семенами в камерах, . Под Капсулой, от Латинского слова Capsula, означающее Коробочка или Ларчик или Футлярчик или Шкатулка или Ящичек, понимается:- (1) Дозированная лекарственная форма:- заключённые в крахмальную (желатиновую и тому подобные) оболочку порошкообразные или жидкие вещества, принимаемые внутрь. Предохраняет слизистую оболочку рта от раздражения, маскирует неприятный запах или вкус препарата. (2) Отделяемая часть космического летательного аппарата, достигающая поверхности небесного тела; одно из наименований спускаемых аппаратов космических кораблей США. В ботанике под Коробочкой понимается сухой многосемянный (иногда односемянный) вскрывающийся плод растений, образованный двумя или несколькими плодолистиками. Коробочки встречаются у Мака, Подорожника, Тюльпана, Хлопчатника и других. Коробочкой может называться также часть спорогония мхов, содержащая споры. Коробочка (Capsula):- (1) сухой многосемянный (иногда односемянный), вскрывающийся при созревании плод, образованный двумя или несколькими плодолистиками. Коробочка вскрываются крышечкой (Подорожник, Белена), дырочками (Мак, Колокольчик), зубчиками на верхушке коробочки (Примула, Гвоздика), продольными трещинами (створками), которые образуются или вдоль перегородок (Табак, Чемерица), или по створкам (Тюльпан, Лилия, Гиацинт и другие). (2) Часть спорогония Мхов, содержащая споры; коробочки бывают цилиндрические или шаровидные.

CAPTAIN OF THE HEAD = НАЧАЛЬНИК ГАЛЬЮНА – Captain of the Head (maritime term):- a guy who gets Head (toilet) cleaning detail. / Начальник или Командир или Капитан или Шкипер Гальюна (жаргон).

CAPTAIN'S PROTEST = ПРОТЕСТ КАПИТАНА (или МОРСКОЙ ПРОТЕСТ) – Captain's Protest is a document prepared by the captain of a vessel on arriving at port; shows conditions encountered during voyage, generally for the purpose of relieving ship owner of any loss to cargo and shifting responsibility for reimbursement to the insurance company. / Под Морским Протестом понимается письменное заявление капитана судна о наличии общей или частной аварии, о столкновении судов, или иного происшествия, которое может явиться основанием для предъявления судовладельцу имущественных требований, оформленное в установленном порядке, удостоверенное актом уполномоченного органа государственного управления и направленное на обеспечение доказательств для защиты прав и законных интересов судовладельца. Акт Морского Протеста, составленный нотариусом или должностным лицом консульского учреждения, при определённых обстоятельствах служит юридическим основанием для освобождения от таможенных платежей.

CAPTIVE PALLET = ПОДДОН ДЛЯ ВНУТРЕННЕГО ОБРАЩЕНИЯ (или ПОДДОН ВНУТРЕННЕГО ОБРАЩЕНИЯ) – Captive Pallet is a pallet intended for use within the confines of a single facility, system or ownership; not intended to be exchanged. See also Pallet. Captive Pallet is a pallet whose use cycle remains within a single firm or a closed logistic system. / Поддон Внутреннего Обращения (Captive Pallet):- поддон, применяемый одним предприятием или в одной ограниченной сфере обращения. Смотрите также Поддон (Pallet).

CAP TRANSACTION = ТРАНЗАКЦИЯ С ВЕРХНИМ ПРЕДЕЛОМ – Cap Transaction is a transaction in which one party pays a single or periodic fixed amount and the other party pays periodic amounts of the same currency based on the excess, if any, of a specified floating rate (in the case of an interest rate cap) or commodity price (in the case of a commodity cap) in each case that is reset periodically over a specified per annum rate (in the case of an interest rate cap) or commodity price (in the case of a commodity cap).

CAPTURE FISHERIES = ДОБЫВАЕМЫЕ РЫБНЫЕ ПРОМЫСЛЫ – Capture Fisheries refer to the hunting, collecting and gathering activities directed at removing or collecting live wild aquatic organisms (predominantly fish, molluscs and crustaceans) including plants from the oceanic, coastal or inland waters for human consumption and other purposes by hand or more usually by various types of fishing gear such as nets, lines and stationary traps. The production of capture fisheries is measured by nominal catches (in live weight basis) of fish, crustaceans, molluscs and other aquatic animals and plants, killed, caught, trapped or collected for all commercial, industrial, recreational and subsistence purposes.

CAPTURE OF IBAN = CAPTURE OF INTERNATIONAL BANK ACCOUNT NUMBER

CAPTURE OF INTERNATIONAL BANK ACCOUNT NUMBER = РАСПОЗНАВАНИЕ (или СБОР) МЕЖДУНАРОДНОГО НОМЕРА БАНКОВСКОГО СЧЁТА – Capture Of International Bank Account Number (IBAN) is the process of converting an IBAN from paper to electronic format.

CAPUCHE = КАПЮШ (или КАПОР, или СЪЁМНЫЙ КАПЮШОН) – Capuche:- hood, especially the cowl of a Capuchin friar. / .

CAPUCHIN = КАПЮЧИН (или ПЛАЩ С КАПЮШОНОМ, или КАПЮШИН, или КАПУЦИН) – Capuchin is a hooded cloak for women. / .

CAR = CAPITAL ADEQUACY REQUIREMENT

CAR = ВАГОН – In the United States, Car is a loose, quantitative term sometimes used to describe a contract, e.g., Car of Bellies. Derived from when quantities of the product specified on a contract often corresponded closely to the quantity carried in a railroad car. Also known as Wagon or Waggon in the United Kingdom. / В Соединённых Штатах Америки, слово Вагон относится к произвольному термину, описывающему количество, иногда используемому в тексте контракта, например, Вагон Свиных Брюшин. Возник исходя из того, что количества указанного в контракте товара часто соотносятся с партией товара, перевозимой одним железнодорожным вагоном. Известен также как Вагон (Wagon или Waggon) в Соединёном Королевстве. Под Вагоном, от Французского слова Wagon, от Английского слова Waggon, означающее Повозка, понимается транспортное средство, передвигающееся по рельсовым путям. Вагон обычно приводится в движение локомотивом, а также может иметь собственный привод (моторный вагон, вагон трамвая). Железнодорожные вагоны подразделяются на пассажирские и грузовые, самоходные и несамоходные, общесетевые и промышленного транспорта, общего назначения и специальные. Вагон используется для перевозки пассажиров и грузов. Основные типы пассажирских вагонов:- для перевозки пассажиров, почты и багажа, а также специального назначения (санитарные, лаборатории и так далее). Основные типы грузовых вагонов:- крытые, полувагоны, платформы, цистерны, изотермические и специального назначения – для перевозки громоздких и тяжеловесных грузов (транспортёры), цемента и других сыпучих грузов, а также вагоны для нужд железнодорожного транспорта (мастерские, пожарные и другие). Из вагонов формируются железнодорожные составы.

CARAT = КАРАТ – Carat is a unit of mass used for diamonds and other precious stones. Originally spelled Karat, the word comes from the Greek Keration, a carob bean; carob beans were used as standards of weight and length in ancient Greece in much the same way barleycorns were used in old England. Traditionally the carat was equal to 4 grains. The definition of the grain differed from one country to another, but typically it was about 50 milligrams and thus the carat was about 200 milligrams. In the United States and Britian, the diamond carat was formerly defined by law to be 3.2 Troy grains, which is about 207 milligrams. Jewelers everywhere now use a metric carat defined in 1907 to be exactly 200 milligrams. See also Karat. Abbreviation:- c or car. A unit of weight for precious stones, equal to 200 milligrams, or 0.2 grams. Derived from the word for 'carob' in various languages, it was originally equivalent to the weight of the seed of the carob tree. It has two meanings in modern usage:- (i) a measure of the weight of precious stones. 1 carat = 0.205 3 gm. (ii) A measure of the proportion of gold in a gold alloy, on the basis that 24 carat is pure gold, often expressed as K or k, e.g., 18 k is 75% gold. / Единица веса драгоценных камней, равная 200 миллиграммам, или 0.2 грамма. Под Каратом, от Итальянского слова Carato, через Арабское слово Кират, от Греческого слова Kerátion, означающее Стручок Рожкового Дерева, семена которого служили мерой массы, понимаются:- (i) внесистемная дольная единица массы драгоценных камней и жемчуга, применяющаяся в ювелирном деле. Обозначение:- кар (c или car). Метрический карат равен 0.2 г или 200 мг или $2 \cdot 10^{-4}$ кг; и (ii) мера содержания золота в сплавах, равная 1/24 массы сплава (Британский карат золота). Чистое золото соответствует 24 каратам.

CARBAMATES = КАРБАМАТЫ – Carbamates is a class of chemicals, usually insecticides, that inhibits cholinesterase, resulting in unregulated nerve-ending activation and paralysis in Insects, e.g., Temik, Sevin, Larvin.

CARBOHYDRATE = УГЛЕВОД – Carbohydrate is a chemical compound manufactured and accumulated by plants, e.g., sugar, starch, or cellulose. The name is derived from the fact that the relative proportions of C, H, and O in simple carbohydrates is $(CH_2O)x$. Carbohydrate is a diverse group of large food storage molecules formed by linking sugar monomers into polysaccharide chains by glycosidic bonds. / Под Углеводами понимается обширная группа природных органических соединений, химическая структура которых часто отвечает общей формуле $C_m(H_2O_2)_n$, то есть углерод + вода, отсюда и название. Различают моно-, олиго- и

полисахариды, а также сложные углеводы – гликозиды, гликолипиды, гликопротеиды и другие. Углеводы – первичные продукты фотосинтеза и основные исходные продукты биосинтеза других веществ в растениях. Составляют существенную часть пищевого рациона человека и многих животных. Подвергаясь окислительным превращениям, обеспечивают все живые клетки энергией (глюкоза и её запасные формы – гликоген, крахмал). Входят в состав клеточных оболочек и других структур, участвуют в защитных реакциях организма (иммунитет). Применяются в пищевой (глюкоза, крахмал, пектиновые вещества), бумажной и текстильной (целлюлоза), микробиологической (получение кислот, спиртов и других веществ сбраживанием углеводов) и других отраслях промышленности. Используются в медицине (гепарин, некоторые антибиотики, сердечные гликозиды). Углеводы – полиатомные альдегидо- или кетоспирты, которые подразделяются в зависимости от количества мономеров на моно-, олиго- и полисахариды. Моносахариды (глюкоза, фруктоза, галактоза и другие), олигосахариды (сахароза, мальтоза, лактоза) и перевариваемые полисахариды (крахмал, гликоген) являются основными источниками энергии, а также выполняют пластическую функцию. Неперевариваемые полисахариды, или пищевые волокна, являются эволюционно важным компонентом пищи. Поток таких модифицированных микрофлорой желудочно-кишечного тракта веществ необходим для нормального функционирования пищеварительного аппарата, организма в целом, созданию имунного ответа.

CARBON = УГЛЕРОД (или КАРБОН) – (1) Carbon is a non-metallic element – No. 6 in the periodic table. Diamonds and graphite are pure forms of carbon. Carbon is a constituent of all organic compounds. It also occurs in combined form in many inorganic substances, i.e. carbon dioxide, limestone, etc. / Периодическая Система Элементов Менделеева названа в честь создателя классификации химических элементов – Русского учёного Дмитрия Ивановича Менделеева (1834–1907). Под Углеродом понимается химический элемент, символ C (на Латинском языке – Carboneum), атомный номер 6, атомная масса 12.011. Обычными формами существования углерода в свободном состоянии являются алмаз и графит. Углерод обладает ещё одной – третьей аллотропной формой, называемой Карбином, крайне редко встречающейся в природе. Основное количество Углерода сосредоточено в природных карбонатах. Значительное количество углерода содержится в углях, нефти, торфе, природных горючих газах. В виде диоксида углерода CO_2 углерод входит в состав атмосферы Земли (0.03% по объёму). Простейшие соединения углерода (диоксид углерода, метан) обнаружены в атмосфере почти всех планет Солнечной системы (так атмосфера Марса состоит в основном из диоксида углерода). Все организмы растений и животных построены из соединений углерода (средняя массовая доля углерода 18%). Углерод – сильный восстановитель, что определяет его применение в металлургии. Широко используются промышленные продукты, близкие по составу к чистому углероду:- кокс, технический углерод, активный уголь и древесный уголь. Углерод (Латинское название Carboneum), C, химический элемент IV группы периодической системы Русского учёного Дмитрия Ивановича Менделеева (1834–1907), атомный номер 6, атомная масса 12.011. Известны два стабильных изотопа:- ^{12}C (98.892%) и ^{13}C (1.108%). Из радиоактивных изотопов наиболее важен ^{14}C с периодом полураспада (T = $5.6 \cdot 10^3$ лет). Небольшие количества ^{14}C (около $2 \cdot 10^{-10}$% по массе) постоянно образуются в верхних слоях атмосферы при действии нейтронов космического излучения на изотоп азота ^{14}N. По удельной активности изотопа ^{14}C в остатках биогенного происхождения определяют их возраст. ^{14}C широко используется в качестве изотопного индикатора. Историческая Справка:- углерод известен с глубокой древности. Древесный уголь служил для восстановления металлов из руд, алмаз – как драгоценный камень. Значительно позднее стали применять графит для изготовления тиглей и карандашей. В 1778 Шведский химик Каль Вильхэльм Шэеле (Carl Wilhelm Scheele; 1742–1786), нагревая графит с селитрой, обнаружил, что при этом, как и при нагревании угля с селитрой, выделяется углекислый газ. Химический состав алмаза был установлен в результате опытов Французского химика Отуана Лёро дё Лявуази (или Лавуазье; Antoine Laurent de Lavoisier; 1743–1794) (в 1772) по изучению горения алмаза на воздухе и исследований Английского химика Смитсэна Тченэнта (или Теннанта; Smithson Tennant; 1761–1815) в 1797, доказавшего, что одинаковые количества алмаза и угля дают при окислении равные количества углекислого газа. Углерод был признан химическим элементом в 1789 Лавуазье. Латинское название Carboneum углерод получил от Carbo – Уголь. Распространение В Природе:- среднее содержание углерода в земной коре $2.3 \cdot 10^{-2}$% по массе ($1 \cdot 10^{-2}$ в ультраосновных, $1 \cdot 10^{-2}$ – в основных, $2 \cdot 10^{-2}$ – в средних, $3 \cdot 10^{-2}$ – в кислых горных породах). Углерод накапливается в верхней части земной коры (биосфере):- в живом веществе 18% углерода, древесине 50%, каменном угле 80%, нефти 85%, антраците 96%. Значительная часть углерода литосферы сосредоточена в известняках и доломитах. Число собственных минералов углерода – 112; исключительно велико число органических соединений углерода – углеводородов и их производных. С накоплением углерода в земной коре связано накопление и многих других элементов, сорбируемых органическим веществом и осаждающихся в виде нерастворимых карбонатов, и так далее. Большую геохимическую роль в земной коре играют CO_2 и угольная кислота. Огромное количество CO_2 выделяется при вулканизме – в истории Земли это был основной источник углерода для биосферы. По сравнению со средним содержанием в земной коре человечество в исключительно больших количествах извлекает углерод из недр (уголь, нефть, природный газ), так как эти ископаемые – основной источник энергии. Огромное геохимическое значение имеет круговорот углерода (смотрите ниже раздел Углерод В Организме и статью Круговорот Веществ). Углерод широко распространён также в космосе; на Солнце он занимает 4-е место после водорода, гелия и кислорода. Физико И Химические Свойства:- известны четыре кристаллические модификации углерода:- алмаз, графит, карбин и лонсдейлит. Графит – серо-чёрная, непрозрачная, жирная на ощупь, чешуйчатая, очень мягкая масса с металлическим блеском. Построен из кристаллов гексагональной структуры:- a = 2.462 Å, c = 6.701 Å. При комнатной температуре и нормальном давлении (0.1 МегаНьютонов на квадратный метр ($МН/м^2$), или 1 килограмм силы на квадратный сантиметр ($кгс/см^2$)) графит термодинамически стабилен. Алмаз – очень твёрдое, кристаллическое вещество. Кристаллы имеют кубическую гранецентрированную решётку:- a = 3.560 Å. При комнатной температуре и нормальном давлении алмаз метастабилен (подробно о структуре и свойствах алмаза и графита смотрите в соответствующих статьях). Заметное превращение алмаза в графит наблюдается при температурах выше 1 400 °C в вакууме или в инертной атмосфере. При атмосферном давлении и температуре около 3 700 °C графит возгоняется. Жидкий углерод может быть получен при давлениях выше 10.5 $МН/м^2$ (105 $кгс/см^2$) и температурах выше 3 700 °C. Для твёрдого углерода (кокс, сажа, древесный уголь) характерно также состояние с неупорядоченной структурой – так называемый ‘Аморфный’ Углерод, который не представляет собой самостоятельной модификации; в основе его строения лежит структура мелкокристаллического графита. Нагревание некоторых разновидностей ‘аморфного’ углерода выше 1 500–1 600 °C без доступа воздуха вызывает их превращение в графит. Физические свойства ‘аморфного’ углерода очень сильно зависят от дисперсности частиц и наличия примесей. Плотность, теплоёмкость, теплопроводность и электропроводность ‘аморфного’ углерода всегда выше, чем графита. Карбин получен искусственно. Он представляет собой мелкокристаллический порошок чёрного цвета (плотность 1.9–2 грамма на кубический сантиметр ($г/см^3$)). Построен из длинных цепочек атомов C, уложенных параллельно друг другу. Лонсдейлит найден в метеоритах и получен искусственно; его структура и свойства окончательно не установлены. Конфигурация внешней электронной оболочки атома углерода $2s^2 2p^2$. Для углерода характерно образование четырёх ковалентных связей, обусловленное возбуждением внешней электронной оболочки до состояния $2sp^3$. Поэтому углерод способен в равной степени как притягивать, так и отдавать электроны. Химическая связь может осуществляться за счёт sp^3–, sp^2– и sp-гибридных орбиталей, которым соответствуют координационные числа 4, 3 и 2. Число валентных

электронов углерода и число валентных орбиталей одинаково; это одна из причин устойчивости связи между атомами Углерода. Уникальная способность атомов углерода соединяться между собой с образованием прочных и длинных цепей и циклов привела к возникновению громадного числа разнообразных соединений углерода изучаемых органической химией. В соединениях углерод проявляет степени окисления –4; +2; +4. Атомный радиус 0.77Å, ковалентные радиусы 0.77Å, 0.67Å, 0.60Å соответственно в одинарной, двойной и тройной связях; ионный радиус C^{4-} 2.60Å, C^{4+} 0.20Å. При обычных условиях углерод химически инертен, при высоких температурах он соединяется со многими элементами, проявляя сильные восстановительные свойства. Химическая активность убывает в ряду:- 'аморфный' углерод, графит, алмаз; взаимодействие с кислородом воздуха (горение) происходит соответственно при температурах выше 300–500 °C, 600–700 °C и 850–1 000 °C с образованием двуокиси углерода CO_2 и окиси углерода CO. CO_2 растворяется в воде с образованием угольной кислоты. В 1906 Немецкий химик-органик Ото Пауль Хэрман Дильс (Otto Paul Hermann Diels; 1876–1954) получил недоокись углерода C_3O_2. Все формы углерода устойчивы к щёлочам и кислотам и медленно окисляются только очень сильными окислителями (хромовая смесь, смесь концентрированных HNO_3 и $KClO_3$ и другие). 'Аморфный' углерод реагирует с фтором при комнатной температуре, графит и алмаз – при нагревании. Непосредственное соединение углерода с хлором происходит в электрической дуге; с бромом и иодом углерод не реагирует, поэтому многочисленные галогениды углерода синтезируют косвенным путём. Из оксигалогенидов общей формулы COX_2 (где X – галоген) наиболее известна хлорокись $COCl_2$ (фосген). Водород с алмазом не взаимодействует; с графитом и 'аморфным' углеродом реагирует при высоких температурах в присутствии катализаторов (Ni, Pt):- при 600–1 000 °C образуется в основном метан CH_4, при 1 500–2 000 °C – ацетилен C_2H_2, в продуктах могут присутствовать также другие углеводороды, например, этан C_2H_6, бензол C_6H_6. Взаимодействие серы с 'аморфным' углеродом и графитом начинается при 700–800 °C, с алмазом при 900–1 000 °C; во всех случаях образуется сероуглерод CS_2. Другие соединения углерода, содержащие серу (тиоокись CS, тионедоокись C_3S_2, сероокись COS и тиофосген $CSCl_2$), получают косвенным путём. При взаимодействии CS_2 с сульфидами металлов образуются тиокарбонаты – соли слабой тиоугольной кислоты. Взаимодействие углерода с азотом с получением циана $(CN)_2$ происходит при пропускании электрического разряда между угольными электродами в атмосфере азота. Среди азотсодержащих соединений углерода важное практическое значение имеют цианистый водород HCN (смотрите Синильная Кислота) и его многочисленные производные:- цианиды, гало-генцианы, нитрилы и другие. При температурах выше 1 000 °C углерод взаимодействует со многими металлами, давая карбиды. Все формы углерода при нагревании восстанавливают окислы металлов с образованием свободных металлов (Zn, Cd, Cu, Pb и другие) или карбидов (CaC_2, Mo_2C, WO, TaC и других). Углерод реагирует при температурах выше 600–800 °C с водяным паром и углекислым газом (смотрите Газификация Топлив). Отличительной особенностью графита является способность при умеренном нагревании до 300–400 °C взаимодействовать со щелочными металлами и галогенидами с образованием соединений включения типа C_8Me, $C_{24}Me$, C_8X (где X – галоген, Me – металл). Известны соединения включения графита с HNO_3, H_2SO_4, $FeCl_3$ и другими (например, бисульфат графита $C_{24}SO_4H_2$). Все формы углерода нерастворимы в обычных неорганических и органических растворителях, но растворяются в некоторых расплавленных металлах (например, Fe, Ni, Co). Народнохозяйственное значение углерода определяется тем, что свыше 90% всех первичных источников потребляемой в мире энергии приходится на органическое топливо, главенствующая роль которого сохранится и на ближайшие десятилетия, несмотря на интенсивное развитие ядерной энергетики. Только около 10% добываемого топлива используется в качестве сырья для основного органического синтеза и нефтехимического синтеза, для получения пластических масс и другого. О получении и применении углерода и его соединений смотрите также Алмаз, Графит, Двуокись Углерода, Карбонаты, Кокс, Окись Углерода, Сажа, Углеродистые Огнеупоры. Углерод В Организме:- углерод – важнейший биогенный элемент, составляющий основу жизни на Земле, структурная единица огромного числа органических соединений, участвующих в построении организмов и обеспечении их жизнедеятельности (биополимеры, а также многочисленные низкомолекулярные биологически активные вещества – витамины, гормоны, медиаторы и другие). Значительная часть необходимой организмам энергии образуется в клетках за счёт окисления углерода. Возникновение жизни на Земле рассматривается в современной науке как сложный процесс эволюции углеродистых соединений (смотрите Происхождение Жизни). Уникальная роль углерода в живой природе обусловлена его свойствами, которыми в совокупности не обладает ни один другой элемент периодической системы. Между атомами углерода, а также между углеродом и другими элементами образуются прочные химические связи, которые, однако, могут быть разорваны в сравнительно мягких физиологических условиях (эти связи могут быть одинарными, двойными и тройными). Способность углерода образовывать 4 равнозначные валентные связи с другими атомами углерода создаёт возможность для построения углеродных скелетов различных типов – линейных, разветвлённых, циклических. Показательно, что всего три элемента – C, O и H – составляют 98% общей массы живых организмов. Этим достигается определённая экономичность в живой природе:- при практически безграничном структурном разнообразии углеродистых соединений небольшое число типов химических связей позволяет намного сократить количество ферментов, необходимых для расщепления и синтеза органических веществ. Особенности строения атома углерода лежат в основе различных видов изомерии органических соединений (способность к оптической изомерии оказалась решающей в биохимической эволюции аминокислот, углеводов и некоторых алкалоидов). Согласно общепринятой гипотезе Советского биохимика, создателя научно обоснованной теории возникновения жизни на Земле Александра Ивановича Опарина (1894–1946), первые органические соединения на Земле имели абиогенное происхождение. Источниками углерода служили метан (CH_4) и цианистый водород (HCN), содержавшиеся в первичной атмосфере Земли. С возникновением жизни единственным источником неорганического углерода, за счёт которого образуется всё органическое вещество биосферы, является двуокись углерода (CO_2), находящаяся в атмосфере, а также растворённая в природных водах в виде HCO^-_3. Наиболее мощный механизм усвоения (ассимиляции) углерода (в форме CO_2) – фотосинтез – осуществляется повсеместно зелёными растениями (ежегодно ассимилируется около 100 миллиардов тонн (т) CO_2). На Земле существует и эволюционно более древний способ усвоения CO_2 путём хемосинтеза; в этом случае микроорганизмы-хемосинтетики используют не лучистую энергию Солнца, а энергию окисления неорганических соединений. Большинство животных потребляют углерод с пищей в виде уже готовых органических соединений. В зависимости от способа усвоения органических соединений принято различать автотрофные организмы и гетеротрофные организмы. Применение для биосинтеза белка и других питательных веществ микроорганизмов, использующих в качестве единственного источника углерода углеводороды нефти, – одна из важных современных научно-технических проблем. Содержание углерода в живых организмах в расчёте на сухое вещество составляет:- 34.5–40% у водных растений и животных, 45.4–46.5% у наземных растений и животных и 54% у Бактерий. В процессе жизнедеятельности организмов, в основном за счёт тканевого дыхания, происходит окислительный распад органических соединений с выделением во внешнюю среду CO_2. Углерод выделяется также в составе более сложных конечных продуктов обмена веществ. После гибели животных и растений часть углерода вновь превращается в CO_2 в результате осуществляемых микроорганизмами процессов гниения. Таким образом, происходит круговорот углерода в природе (смотрите Круговорот Веществ). Значительная часть углерода минерализуется и образует залежи ископаемого углерода – каменные угли, нефть, известняки и другое. Помимо основные функции – источника углерод CO_2, растворённая в природных водах и в биологических жидкостях, участвует в поддержании оптимальной для жизненных процессов кислотности

среды. В составе $CaCO_3$ углерод образует наружный скелет многих беспозвоночных (например, раковины моллюсков), а также содержится в кораллах, яичной скорлупе птиц и другом. Такие соединения углерода как HCN, CO, CCl_4, преобладавшие в первичной атмосфере Земли в добиологический период, в дальнейшем, в процессе биологической эволюции, превратились в сильные антиметаболиты обмена веществ. Помимо стабильных изотопов углерода в природе распространён радиоактивный ^{14}C (в организме человека его содержится около 0.1 мкКюри). С использованием изотопов углерода в биологических и медицинских исследованиях связаны многие крупные достижения в изучении обмена веществ и круговорота углерода в природе (смотрите Изотопные Индикаторы). Так, с помощью радиоуглеродной метки была доказана возможность фиксации $H_{14}CO^-_3$ растениями и тканями животных, установлена последовательность реакций фотосинтеза, изучен обмен аминокислот, прослежены пути биосинтеза многих биологически активных соединений и так далее. Применение ^{14}C способствовало успехам молекулярной биологии в изучении механизмов биосинтеза белка и передачи наследственной информации. Определение удельной активности ^{14}C в углеродсодержащих органических остатках позволяет судить об их возрасте, что используется в палеонтологии и археологии. Под Карбоном, от Латинского слова Carbo (Carbonis), означающее Уголь, понимается составная часть сложных слов, означающая отношение к углероду, углю, например, карбонаты или карботермия. Под Карбоном, от Латинского слова Carbo, родительный падеж Carbonis, означающее Уголь, понимается то же, что Каменноугольная Система (Период). Каменноугольная Система (Период) или Карбон, пятая по порядку система Палеозойской группы, соответствующая пятому периоду Палеозойской эры истории Земли. Начало каменноугольного периода радиогеологическими методами определяется в 350 миллионов лет тому назад, длительность его составляет 65–75 миллионов лет; следует за Девонской Системой и предшествует Пермской.

(2) Carbon (deposit):- solid black residue in piston grooves which can interfere with piston ring movement leading to wear and/or loss of power. / к износу и/или потере мощности.

CARBON = УГЛЕРОДНОЕ (или КАРБОНОВОЕ) – Carbon is inorganic fiber containing at least 90% by mass of carbon obtained by thermal carbonization of organic fiber precursors. Alphabetic code – CF; and relevant commercial allowance – .

CARBON–ARC LAMP = ЛАМПА С КАРБОНОВОЙ ДУГОЙ (или ЛАМПА С УГОЛЬНОЙ НИТЬЮ, или ЛАМПА С УГЛЕРОДНОЙ ДУГОЙ) – Carbon-Arc Lamp is a type of fading lamp which utilizes an arc between two carbon electrodes as the source of radiation.

CARBON–CARBON = УГЛЕРОД–УГЛЕРОДНЫЙ – Carbon-Carbon is a composite material consisting of carbon and graphite fibers in a carbon or graphite matrix.

CARBON CYCLE = УГЛЕРОДНЫЙ ЦИКЛ (или КРУГОВОРОТ УГЛЕРОДА) – Carbon Cycle is the sequence of transformations whereby carbon dioxide is fixed in living organisms by photosynthesis or by chemosynthesis, liberated by respiration and by the death and decomposition of the fixing organism, used by heterotrophic species, and ultimately returned to its original state. Carbon Cycle is the cycle by which carbon in various forms moves between the various components of the Earth's biosphere, between the atmosphere, hydrosphere (seas and oceans), lithosphere (rocks, soils and mineral deposits, including fossil fuels) and biological material including plants and animals. Carbon is constantly moving between some of these forms, maintaining a state of dynamic equilibrium. Other forms, most notably fossil fuels, can potentially store carbon indefinitely, however if they are burned the carbon is released and makes a net addition to the carbon cycle and raising the total free carbon. If biomass is used without replacement, as for instance can happen in the case of forest clearance such as in the Amazon rain forest, this too can make a net addition to the carbon cycle. Sustainable use of biomass, however, makes no such direct net addition as growing replacement plant material absorbs the carbon released by the harvested biomass.

CARBON FIBER = УГЛЕРОДНОЕ ВОЛОКНО (или КАРБОНОВОЕ ВОЛОКНО) – Carbon Fiber is the common name used to refer to plastic reinforced by a graphite textile. Less frequently, the term is used to describe the textile itself, but it is pretty much useless unless embedded in plastic. Carbon fiber is known alternatively as carbon fiber reinforced plastic or carbon fiber composite. The plastic typically used is epoxy. Carbon fiber is very expensive, but has a fantastic weight-to-strength ratio. Attempts to put it into mass production have so far failed, due to inadequate demand, the customized nature of most carbon fiber parts, and a lack of skilled craftsmen. The material is employed in high-quality cars, boats, bicycles, and planes, including popular Formula One racecars. Depending on the orientation of the fiber, the carbon fiber composite can be stronger in a certain direction or equally strong in all directions. A small piece can withstand an impact of many tons and still deform minimally. The complex interwoven nature of the fiber makes it very difficult to break. In terms of weight-to-strength ratio, carbon fiber composite is currently the best material that our civilization can produce in appreciable quantities. Introducing carbon nanotubes into the fiber is currently in research stages, and may offer improved ratios of 10 times or greater – a space age material indeed. Carbon fibers are chemically 'grown' on smaller frames with a high surface area, designed to bond to deposited carbon atoms. The frame typically constitutes 2% of the total fiber produced. A bicycle made of carbon fiber composite typically costs around a few thousand US Dollars (USD). Formula One racing cars, which travel at speeds over 320 km/h (200 mph), may cost over a million USD to build and maintain, a cost determined in no small part by the generous use of carbon fiber composite. Large commercial airplanes typically use carbon fiber composites, the increased production of which is the decisive factor for the rapid growth of carbon fiber demand in recent years. Both private and public spaceship projects use carbon fiber as part of the craft's chassis. In civil engineering, it has been determined that old bridges may be spared from destruction and rebuilding through simple carbon fiber reinforcements, which are comparatively cheaper. If the cost of carbon fiber can be significantly reduced, it may become a universal material for vehicles and small products designed for extreme durability and lightness. The current strategies used for manufacture vary based on application and quantity. Carbon Fiber is a high-tensile fiber or whisker made by heating rayon or polyacrylonitrile fibers or petroleum residues to appropriate temperatures. Fibers may be 7 to 8 microns in diameter and are more that 90% carbonized. Carbon Fiber:- it's easy to work and provides exceptional strength. It does have the drawback that it's expensive, an order of magnitude more than glass fiber, especially the lighter weaves; it's also very brittle and snaps suddenly with little bending beforehand. It's lighter than glass too coming in at ~1.8 g/cm^3. Areal weights are generally 100–200 gsm although I see that woven carbon is now available in Germany at 60 gsm – whether this is a result of a loose weave or some lighter variant of carbon fiber itself I do not know. Certainly, it's a useful addition to the range of cloths available for tailplanes, HLG's and the like. Carbon Fiber fabric is well known as one of the strongest and stiffest reinforcement materials available. While more expensive than glass, it easily justifies its premium when used in high performance applications. All Freeman (Freeman Manufacturing & Supply Company, Avon, State of Ohio, the United States) carbon fabrics are made exclusively from polyacrylonitrile (PAN) precursors, thus making them suitable for all high performance applications. The first Carbon Fiber for commercial use was fabricated by Thomas Edison. Sixth lightest element and carbon- carbon covalent bond is the strongest in nature. Edison made carbon fiber from bamboo fibers. Bamboo fiber is made up of cellulose. Precursor fiber is carbonized rather than melting. Filaments are made by controlled pyrolysis (chemical deposition by heat) of a precursor material in fiber form by heat treatment at temperature 1 000–3 000 °C. The carbon content in carbon fibers is about 80–90% and in Graphite fibers the carbon content is in excess of 99%. Carbon fiber is produced at about 1 300 °C while the graphite fiber is produced in excess of 1 900 °C. The carbon fibers become graphitized by heat

treatment at temperature above 1 800 °C. 'Carbon Fibers' term is used for both carbon fibers and graphite fibers. Different fibers have different morphology, origin, size and shape. The size of individual filament ranges from 3 to 147 μm. Maximum use of temperature of the fibers ranges from 250 °C to 2 000 °C. The use temperature of a composite is controlled by the use temperature of the matrix. Precursor materials:- there are two types of precursor materials (i) Polyacrylonitrile (PAN) and (ii) rayon pitch, that is, the residue of petroleum refining. Fiber properties vary with varying temperature. Fiber diameter ranges from 4 to10 μm. A tow consists of about 3 000 to 30 000 filaments. Small diameter results in very flexible fiber and can actually be tied in to a knot without breaking the fiber. Modulus and strength is controlled by the process. The procedure involves the thermal decomposition of the organic precursor under well controlled conditions of temperature and stress. Cross section of fiber is non-circular, in general, it is kidney bean shape. Heterogeneous microstructure consisting of numerous lamellar ribbons. Morphology is very dependent on the manufacturing process. PAN based carbon fibers typically have an onion skin appearance with the basal planes in more or less circular arcs, whereas the morphology of pitch-based fiber in such that the basal planes lie along radial planes. Thus, carbon fibers are anisotropic. Carbon Fiber is a fiber produced by the pyrolysis of organic precursor fibers, such as rayon, polyacrylonitrile (PAN), and pitch, in an inert environment. The term is often used interchangeably with graphite; however, carbon fibers and graphite fiber differ. The basic differences lie in the temperature at which the fibers are made and heat treated, and in the amount of elemental carbon produced. Carbon fibers typically are carbonized in the region of 1 315 °C (2 400 °F) and assay at 93 to 95% carbon while graphite fibers are graphitized at 1 900 to 2 480 °C (3 450 to 4 500 °F) and assay at more than 99% elemental carbon. Carbon Fibers are divided into two categories. One is PAN(Polyacrylonitrile)-type carbon fibers manufactured by burning a special acrylic fibers. Another is pitch-type carbon fibers manufactured from pitch (remaining products of distilled petroleum or coals). Carbon fibers have many advantageous characteristics such as very light weight, high tensile strength and elasticity, excellent heat resistance, electrical conductivity, and resistance to chemical agents. Carbon fibers are mainly used for reinforcement materials for plastics. In PAN-type carbon fibers, the degree of tensile strength and elasticity varies depending on the burning condition. Carbon fibers are divided into high-performance carbon fibers and universal-use carbon fibers. High-performance carbon fibers are widely used for aerospace applications, sporting equipment such as black shafts of golf club and ordinary industrial uses because of their extremely high tensile strength and elasticity. Universal-use carbon fibers are used mainly for reinforcement material of concrete and heat insulating materials. End-Uses:- Sporting Goods such as Golf Shaft, Fishing Rods, Tennis Rackets, Skis, Archery, Yachts, Boats, Racing Cars, Motorcycles, Bicycles, etc. Construction Materials in the Field of Aerospace and Space Shuttles:- Spring Plate, Brakes, X-ray Instruments, Precision Equipment, Reinforcement Materials of Concrete, Heat Insulating Material, etc. Features:- (i) high tensile strength and little extension even by pulling fibers; (ii) excellent in resistance to abrasion and dimensional stability; (iii) excellent in resistance to heat and to chemical agents; and (iv) excellent in electrical conductivity. / Эдэсэн (Edison). Под Углеродными Волокнами понимаются неорганические волокна, получаемые термической обработкой (900–3 000 °C) в среде инертного газа химических волокон (вискозного, полиакрилонитрильного), волокон из нефтяного и каменно-угольного пеков, феноло-формальдегидных смол, лигнина; содержат ≥ 85% углерода. Характеризуются высокой теплостойкостью (в бескислородных условиях – до 2 000 °C), химической устойчивостью, механической прочностью (для ориентиров. Углеродные волокна – до 3.5 ГПа), устойчивостью к воздействию ультрафиолетового (УФ) излучения. По удельному значению механических свойств (отношению модуля упругости или прочности к плотности) превосходят все известные жаростойкие волокнистые материалы. Применяются в виде нитей, жгутов, лент, нетканых материалов как армирующий наполнитель, в производстве фильтровальных материалов, электронагревательных элементов, защитной одежды, как сорбенты, носители катализаторов и так далее. Углеродное Волокно – волокно с массовой долей углерода не менее 90%, полученное путём пиролиза химических волокон.

CARBON RESIDUE = УГЛЕРОДИСТЫЙ ОСТАТОК (или КОКСОВЫЙ ОСТАТОК) – Carbon Residue:- coked material remaining after an oil has been exposed to high temperatures under controlled conditions. / Углеродистый Остаток кокса после перегонки и пиролиза нефтепродуктов.

CARBON TYPE = КАРБОНОВЫЙ ТИП (или ТИП УГЛЕРОДА) – Carbon Type:- the distinction between paraffinic, naphthenic, and aromatic molecules. In relation to lubricant base stocks, the predominant type present.

CARBONYL IRON POWDER = ЖЕЛЕЗНЫЙ КАРБОНИЛЬНЫЙ ПОРОШОК – Carbonyl Iron Powder is a contaminant which consists of up to 99.5% pure iron spheres.

CARBONIZATION = КАРБОНИЗАЦИЯ – Carbonization is the process of pyrolisis in an inert atmosphere at temperatures ranging from 800 to 1 600 °C (1 470 to 2 910 °F) and higher, usually about 1 315 °C (2 400 °F). Range is influenced by precursor, individual manufacturer's process, and properties desired.

CARBONIZING = КАРБОНИЗАЦИЯ – Carbonizing is a chemical process for eliminating cellulosic material from wool or other animal fibers. The material is reacted with sulfuric acid or hydrogen chloride gas followed by heating. When the material is dry, the carbonized cellulose material is dust-like and can be removed. Carbonizing is the removal of vegetable matter, such as burrs and seeds, from wool and wool fabrics by chemical treatment. Also used to remove vegetable fiber in recovering the wool in union and mixture fabrics. Mechanical, chemical process for removal of vegetable matter from wool. The usual agent for converting the fault to carbon is sulphuric acid. Most wools suitable for the woollen trade, such as lambs, locks, and crutchings carrying fault, are treated by this method. Carbonizing is the process of treating wool with chemicals, usually acids, to destroy and remove the burrs without seriously damaging the wool. The usual chemical used is sulphuric acid. Wool so treated is known as Carbonized Wool. Carbonizing is a treatment of wool with acid and heat to remove plant materials. Preparation of wool sometimes include treatment of the wool with sulfuric acid, followed by partial drying and heating. The hot acid will degrade or 'carbonize' bits of plant matter in the wool, so that it is easily removed by subsequent mechanical methods. / Под Карбонизацией понимается:- (1) обработка шерсти растворами кислот для удаления растительных примесей. (2) насыщение какого-либо раствора диоксидом углерода CO_2. Применяется в содовом производстве, строительстве и других отраслях промышленности. В пищевой промышленности карбонизация называется Сатурацией.

CARBON–NITROGEN RATIO = СООТНОШЕНИЕ УГЛЕРОДА С АЗОТОМ (или УГЛЕРОДНО–АЗОТНОЕ СООТНОШЕНИЕ) – Carbon-Nitrogen Ratio is the ratio of the weight of organic carbon to the weight of total nitrogen in soil or organic material.

CARBOXYL END GROUP = КАРБОКСИЛЬНАЯ КОНЦЕВАЯ ГРУППА (или КОНЦЕВАЯ КАРБОКСИЛЬНАЯ ГРУППА) – Carboxyl End Group is the chain-terminating (–COOH) group found in polyamide and polyester polymers.

CARBOXYMETHYL CELLULOSE = КАРБОКСИМЕТИЛ ЦЕЛЛЮЛОЗА – Carboxymethyl Cellulose is an acid ether derivative of cellulose formed by the reaction of alkali cellulose with chloroacetic acid. The sodium salt of this compound is commonly used as a stabilizer or an emulsifier.

CARBOXYMETHYL STARCH = КАРБОКСИМЕТИЛЬНЫЙ КРАХМАЛ – Carboxymethyl Starch is modified starch (starch ether). Carboxymethyl starch has had some of the hydroxyl groups replaced with carboxymethyl groups, which improves solubility and the stability of pastes. This compound is suitable as a thickener for printing of disperse dyes and vat dyes. It also has some resistance to

chlorine bleach, and may be used for thickening bleach for use in discharge techniques. Monagum is one trade name. / Карбоксиметильный Крахмал . хлорный отбеливатель (chlorine bleach).

CARCANET = КОЛЬЕ (или ОЖЕРЕЛЬЕ, или ХХ) – Carcanet:- (archaic) an ornamental necklace, chain, collar, or headband. / .

CAR CARRIER = АВТОВОЗ – Car Carrier is a unit equipped with wheels used to transport automobiles aboard a vessel and can be moved to any in-land point.

CARCINOGEN = КАНЦЕРОГЕН – Carcinogen is a cancer-causing substance. Certain petroleum products are classified as potential carcinogens OSHA (short for the Occupational Safety and Health Administration) criteria. Suppliers are required to identify such products as potential carcinogens on package labels and Material Safety Data Sheets. Carcinogenicity:- substances or preparations are defined as carcinogenic if they induce cancer or increase its incidence when they are inhaled or ingested or if they penetrate the skin. Classification criteria are given in Directive 93/21/EEC. The process of carcinogenesis is now recognized as resulting from the transition of target cells into cancer cells via a sequence of stages; the growth and differentiation of involved cells is recognized to play an important role in this process. Chemical carcinogens have conventionally been divided into two categories according to the presumed mechanism of action:- genotoxic and non-genotoxic. Genotoxic carcinogens induce cancer as a consequence of the direct interaction of the substance, or an active metabolite, with DNA. / последовательность стадий; . ДНК. Под Канцерогенностью, от Латинского слова Cancer, означающее Рак, и Греческого слова Génos, означающее Происхождение или Род, понимается . Под Канцерогенными Веществами, от Латинского слова Cancer, означающее Рак, и Греческого слова Genes, означающее Рождающий или Рождённый, понимаются бластомогенные вещества, канцерогены, карциногены, химические соединения, способные при воздействии на организм вызывать рак и другие злокачественные опухоли, а также доброкачественные новообразования. Известно несколько сот канцерогенных веществ, принадлежащих к разным классам химических соединений. Так, к сильным канцерогенным веществам относятся некоторые полициклические углеводороды с группировкой фенантрена в молекуле, азокрасители, ароматические амины, нитрозамины и другие алкилирующие соединения. Канцерогенные вещества найдены в составе некоторых промышленных продуктов, в воздухе, загрязнённом промышленными выбросами, в табачном дыме и другом. Первые представления о существовании канцерогенных веществ относятся к XVIII веку, когда случаи возникновения у Английских трубочистов рака кожи были поставлены в связь с её систематическим загрязнением каменноугольной смолой и сажей. В начале XX века удалось вызвать у животных рак кожи, смазывая её в течение многих месяцев каменноугольной смолой. Впоследствии из смолы были выделены канцерогенные вещества – 3,4-бензпирен и другие полициклические углеводороды. До внедрения соответствующих мер профилактики у работавших в анилинокрасочной промышленности, подвергавшихся воздействию канцерогенных веществ (бета-нафтиламин, бензидин, 4-аминодифенил), нередко возникал рак мочевого пузыря. Раком лёгкого курящие заболевают чаще, чем некурящие, а жители городов, где загрязнённость атмосферы выше, – чаще, чем живущие в сельской местности. Одно и то же канцерогенное вещество в зависимости от места воздействия может вызвать опухоли разных видов и локализации; опухоль определённого типа может быть вызвана различными канцерогенными веществами. По характеру действия все канцерогенные вещества можно условно разделить на три группы:- (1) местного действия; (2) органотропные, то есть вызывающие опухоли не на месте введения, а в определённых органах; (3) множественного действия, вызывающие различные опухоли в разных органах. Эффект канцерогенных веществ зависит как от дозы, так и от срока их действия; накопление (депонирование) в ткани или органе усиливает действие канцерогенных веществ. Новообразования возникают не сразу после начала воздействия канцерогенных веществ, а лишь через большой срок – 1/5–1/7 максимальной продолжительности жизни данного организма (для человека этот срок может быть равен 15–20 годам, для мыши – 4–6 месяцам). Развитию новообразования предшествуют так называемые предопухолевые (предраковые) изменения (смотрите Предрак). Близость химического строения канцерогенных углеводородов и многих биологически активных веществ – половых гормонов жёлчных кислот и других стероидов – позволила предположить, что нарушения стероидного обмена могут привести к образованию канцерогенных веществ в самом организме; впоследствии это предположение было подтверждено экспериментально. К таким канцерогенным веществам относятся, помимо некоторых продуктов нарушенного стероидного обмена, также некоторые метаболиты аминокислот, например, триптофана. Канцерогенное действие связывают с химической активностью и электронным строением определённой части молекулы канцерогенных веществ (‘Область К’), ответственной за образование комплексов с определёнными компонентами клетки (по-видимому, нуклеиновыми кислотами и некоторыми белками). Многие канцерогенные вещества обладают выраженным мутагенным действием (смотрите Мутагенез, Мутагены), что нельзя не учитывать при рассмотрении механизмов канцерогенеза под влиянием канцерогенных веществ. Предотвращение действия канцерогенных веществ на организм основано на изучении их распространения в окружающей человека среде и осуществлении профилактических мер в области профессиональной, коммунальной и личной гигиены. Важное значение в связи с этим имеет борьба с загрязнением воздуха, вод и почв промышленными выбросами, недопущение канцерогенных примесей в пищевых продуктах и питьевой воде. Выявление соединений, обладающих канцерогенной активностью, и устранение их из сферы жизнедеятельности человека – эффективный путь профилактики опухолей.

CARCINOGENICITY = КАНЦЕРОГЕННОСТЬ – Carcinogenicity:- substances or preparations are defined as carcinogenic if they induce cancer or increase its incidence when they are inhaled or ingested or if they penetrate the skin. Classification criteria are given in Directive 93/21/EEC. The process of carcinogenesis is now recognized as resulting from the transition of target cells into cancer cells via a sequence of stages; the growth and differentiation of involved cells is recognized to play an important role in this process. Chemical carcinogens have conventionally been divided into two categories according to the presumed mechanism of action:- genotoxic and non-genotoxic. Genotoxic carcinogens induce cancer as a consequence of the direct interaction of the substance, or an active metabolite, with DNA. / последовательность стадий; . ДНК. Под Канцерогенностью, от Латинского слова Cancer, означающее Рак, и Греческого слова Génos, означающее Происхождение или Род, понимается .

CAR COAT = ХХ (или ПОЛУПАЛЬТО, или ТРУАКАР) – Car Coat is a three-quarter-length overcoat.

CAR COVER = CAPITAL ADEQUACY REQUIREMENT COVER

CARD = CENTER FOR AGRICULTURAL RESEARCH AND DEVELOPMENT

CARD = COMMUNICATORS FOR AGRICULTURAL AND RURAL DEVELOPMENT

CARD = КАРДА (или КАРДНАЯ МАШИНА, или КАРДОЧЁСАЛЬНАЯ МАШИНА) – Card is a machine used in the manufacture of staple yards. Its functions are to separate, align, and deliver the fibers in a sliver form and to remove impurities. The machine consists of a series of rolls, the surfaces of which are covered with many projecting wired or metal teeth. Short staple systems employ flat strips covered with card clothing rather that small rolls. See also Flat Card. Card is a machine used to separate, align, and remove of short fibers from cotton. Card (in the UK, 1840’s), an instrument, or comb, for arranging or sorting the hairs of wool, cotton, etc. Cards are

either fastened to a flat piece of wood, and wrought by the hand; or to a cylinder, and wrought by machinery. / Смотрите также Кардочёсальная Машина Со Шляпками (Flat Card).

CARD ACCEPTING DEVICE = УСТРОЙСТВО ПРИЁМА КАРТ – Card Accepting Device (CAD) is the device used in conjunction with the card and the point of sale to perform a financial transaction.

CARD–ACCEPTING HOST = ХОЗЯИН ПРИЁМА КАРТ – Card-Accepting Host (CAH) is a host processing system that forms the interface between the Card-Accepting Scheme (CAS) and the Card-Issuing Scheme (CIS) and to which the Card Accepting Devices (CADs) are connected. The CAH collects from the CADs the data relating to the card transaction and initiates that data to the CIS. For the processing of security related data an Secure Cryptographic Device (SCD) is part of the CAH processing system. / Средство Криптографической Защиты (СКЗ) .

CARD–ACCEPTING SCHEME = СХЕМА ПРИЁМА КАРТ (или ПРОГРАММА ПРИЁМА КАРТ) – Card-Accepting Scheme (CAS) is a set of technical concepts, rules, protocols, algorithms, functions, commercial agreements and administrative procedures which form the basis for a card payment system. The CAS is controlled by its responsible Administrator (CAS Administrator).

CARD CHOKING = ЗАСОРЕНИЕ КАРДОЧЁСАЛЬНОЙ МАШИНЫ – Card Choking:- xxxxx. See also Cylinder Loading. / засорение машины.

CARD CLOTHING = КАРДНАЯ ЛЕНТА (или ИГОЛЬЧАТАЯ ЛЕНТА) – Card Clothing:- the material used to cover the working surfaces of the card, i.e. cylinder and rolls or flats. The clothing consists of either wire teeth set in a foundation fabric or rubber, or narrow serrated metal flutes which are spirally arranged around the roll. The metallic wire has the appearance of band-saw blade. / Кардная Лента или Игольчатая Лента или Игольчатая Поверхность рабочих частей чёсальной машины или Игольчатый Покров.

CARD CONVERSION EFFICIENCY = ЭФФЕКТИВНОСТЬ КАРДНОГО ПЕРЕВОДА – Card Conversion Efficiency is the efficiency of the carding process, expressed as a percentage obtained from ratio of sliver output to staple input.

CARDED = КАРДНОЕ – Carded:- an industrial yarn preparation. During the carding process raw cotton is separated, opened, cleaned and made into sliver. / Под Кардным Прядением понимается получение пряжи из чёсальной ленты или ровницы с использованием различных по длине волокон. Пряжа кардного прядения ранее отличалась повышенной неравномерностью по линейной плотности, по крутке, по относительной разрывной нагрузке. Особенность кардного прядения – отсутствие процесса гребнечесания волокон.

CARDED FIBERS = КАРДНЫЕ ВОЛОКНА (или ВОЛОКНА ИГОЛЬЧАТОГО ПРОЧЁСА) – Carded Fibers are the fibers that have been carded which opens them up.

CARDED SLIVER = КАРДНАЯ ЛЕНТА (или ЧЁСАЛЬНАЯ ЛЕНТА) – Carded Sliver is produced on a card which is fed either with blow room laps or directly by a chute feed system which links the opening and cleaning machines with the cards. The fibers of the sliver are laid parallel and the short, immature fibers are removed and are called Strips. They may make up about 4 to 6 per cent of the waste on the machine. The sliver is uneven in weight because of the stripping of the doffer and the cylinder. When the cylinder and doffer are full and require stripping, a heavier sliver will result. Immediately after stripping of the rollers, a lighter sliver will be apparent. The variation of weight per yard in card sliver is greater than the variation noted in combed sliver. / Холст, поступающий на чесальную машину, состоит в основном из клочков (flocks). Волокна в ленте выложены параллельно, а короткие, недозрелые волокна, называемые очёсами или сдирами (strips), удалены. Они могут составлять приблизительно от 4 до 6 процентов отходов на данных станках. Лента неравномерна в весе из-за очёсывания (stripping) съёмного барабана (doffer) и калика/цилиндра/барабана (cylinder). Когда валик/цилиндр/барабан и сьёмный барабан (doffer) переполнены, требуется очёсывание (stripping), иначе лента станет более тяжёлой. Сразу же после очёсывания (stripping) валов лента станет более лёгкой. Отклонений в весе ярда кардной ленты больше, нежели у гребенной ленты. Кардолента, от Французского слова Carde, означающее Чёсальная Машина, игольчатая лента, – лента со сплошной игольчатой поверхностью, предназначена для обтяжки расчёсывающих органов чёсальных машин прядильного производства. Кардолента заменяется цельнометаллической пильной лентой.

CARDED YARN = КАРДНАЯ ПРЯЖА – Carded Yarn is a cotton yarn that has been carded but not combed. Carded yarns contain a wider range of fiber lengths and, as a result, are not as uniform or as strong as combed yarns. They are considerably cheaper and are used in medium and course counts. Carded Yarn, made from short-staple cotton fibers which have been cleaned of most impurities by carding. Most cotton yarn are carded because bulk of cotton grown is too short for combing. Compared with combed yarn it is a fibrous, uneven yarn. Carded Yarns is a cotton yarn which has been carded but not combed. This type of yarn contains a wide range of fiber length. As a result, carded yarn is not as uniform as combed yarns and are considerably cheaper. See also Combed Yarn. / большинство примесей кардочесанием. Кардная пряжа по способу прядения относится к кардному прядению.

CARDERS = ЧЁСАЛЬНЫЕ МАШИНЫ (или ЧЁСАЛЬЩИКИ) – Carders, also known as Hand Carders (as opposed to Drum Carders). Some of the carders have curved backs, some straight backs. There is some belief that the reason why modern hand cards have the curved backs is because they were modeled after museum pieces. Unfortunately, the museum pieces were warped (curved). Early plans for carders show the straight backs. Now, having said that, let me add that if you like using curved-back cards, you should do so. I have a pair of Ashford hand cards (with curved backs) that I just love. As much hand carding as I do, this isn't a problem for me. A more critical requirement is that your cards have offset handles. This will save wear-and-tear on your hands.

CARD FLY = КАРДНЫЙ ПУХ (или ЧЁСАЛЬНЫЙ ПУХ) – Card Fly or Card Motes is the waste beneath the machine which consists of fiber, seed and dirt, and requires a permit or treatment certificate as a condition of entry. Also known as Card Motes.

CARD HOLDER = ДЕРЖАТЕЛЬ КАРТЫ – Cardholder is a customer associated with the account identification on the card or customer owning the card in the case of anonymous card products not related to any account. Card Holder is a person to whom a credit or signature card is issued. / Лицо, которому была выдана кредитная карта или карточка подписей.

CARDI = CARIBBEAN AGRICULTURAL RESEARCH AND DEVELOPMENT INSTITUTE

CARDIGAN = КАРДИГАН (или КОФТА) – Cardigan is:- (1) a modification of the rib-knitting stitch to allow tucking on one (half cardigan) or both (full cardigan) sets of needles. (2) A sweater that buttons down the front. Cardigan is a usually collarless sweater or jacket that opens the full length of the center front. / Кардиган – джемпер с застёжкой на пуговицах, без воротника.

CARDINAL = КАРДИНАЛЬ (или КАДИНАЛ) – Cardinal:- a woman's short hooded cloak originally of scarlet cloth. / .

CARDINALIS = КАРДИНАЛИС (или КАРДИНАЛЬНОЕ) – Cardinalis (-a, -um):- red.

CARDINAL POINTS = КАРДИНАЛЬНЫЕ ТОЧКИ (или СТРАНЫ СВЕТА) – Cardinal Points (maritime term):- the four principal points of the compass:- North, East, South and West.

CARDING = КАРДОЧЕСАНИЕ – Carding is the most important process which helps both to open the tufts into single fibers and to remove impurities and neps. The carding process also orients the fibers for the subsequent spinning processes. After this kind of preparation, high efficiency in the subsequent spinning process stages and very good yarn quality are achieved. High card output, which should contribute to the economy of the process, often results in losses in yarn quality. The higher the production rate, the more sensitive the carding process becomes and the greater the risk of a negative impact on quality. The latest technological developments in the carding process are striking. Modern machines achieve production rates of 60–220 kg/h, compared with output of 5–15 kg/h in 1970. It is important to point out that almost all the cotton is saw-tooth ginned. Saw-tooth ginned cotton contains more neps and seed trash; it is also very difficult to remove this seed trash in the blowroom. Most of it therefore has to be removed in the carding process. The average number of neps in the raw material is approximately 300–350 per gram of cotton. The nep count of the material in the card chute and thus fed to the card is approximately 390–450 per gram. See also Carding Machine. The disentanglement, cleaning and intermixing of fibers to produce a continuous web or sliver suitable for subsequent processing. This is achieved by passing the fibers between moving pins, wires or teeth. This is the process of arranging the fibers in a parallel fashion. This is necessary for all staple fibers; otherwise, it would be impossible to produce fine yarns from what is originally a tangled mass. Before the raw stock can be made into yarn, the remaining impurities must be removed, the fibers must be disentangled, and they must be straightened. The lap is passed through a beater section and drawn on a rapidly revolving cylinder covered with very fine hooks or wire brushes. A moving belt of wire brushes slowly moves concentrically above this cylinder. As the cylinder rotate, the cotton is pulled by the cylinder through the small gap under the brushes, the teasing action remove the remaining trash, disentangles the fibers and arranges them in a relatively parallel manner in the form of a thin web. This web is drawn through a funnel – shaped device that molds it into a round ropelike mass called the Card Sliver (about thickness of a broom stick). Preliminary process in the spinning of wool or cotton yarn. The fibers are disentangled and thoroughly mixed. In the cotton processing, Carding is a process in yarn manufacturing by which fibers are sorted, separated, partially aligned, and cleaned of foreign matter. Carding is a process in the manufacture of spun yarns whereby the staple is opened, cleaned, aligned, and formed into a continuous, untwisted strand called a sliver. Carding is the process of pulling the fibers into parallel alignment to form a thin web. High speed electronic equipment with wire toothed rollers perform this task. The web of fibers is eventually condensed into a continuous, untwisted, rope-like strand called a Sliver, (pronounced slyver). Carding is the process used to open out fleece so that it can be more evenly spun into a ‘woolen’ yarn. The process by which the fibers are opened out into an even film. Carding is a process which eliminates fibers too short for inclusion in the spun yarn. The process also removes dirt and foreign matter still remaining in the fiber mass, and arranges the fibers into a very thin layer. Carding is one of the most important processes in yarn manufacturing. It removes most of the impurities and a certain amount of short, broken or immature fibers .... / и удаления примесей. Кардочесание является одной из разновидностей чесания; второй разновидностью является Гребнечесание (Combing). Под чесанием понимается второй этап разрыхления поступаемого из спрессованных кип волокна. Первый этап разрыхления происходит на разрыхлительно-трёпальных машинах, где спрессованное волокно разделяется на клочки (flocks). Волокнистый материал, сформированный в виде холста (in lap form) или равномерного потока (continuous web), подаётся на чёсальные машины. В процессе чесания волокна производится разделение клочков волокнистого материала на отдельные волокна. Более точно, сущность кардочесания заключается в разъединении волокон, в вычёсывании мелких и цепких примесей и пороков волокон, а также в частичной ориентации волокон вдоль направления движения продукта. в равномерную, незакрученную, ленту (sliver). Волокнистый материал, сформированный в виде холста или равномерного потока трёпальной машиной, подаётся на чёсальные машины. Поступающий на кардочесание волокнистый материал представляет собой пучки спутанных волокон, в которых ещё сохраняются соринки, узелки волокон и очень короткие волокна. Сущность кардочесания заключается в разъединении волокон, в вычёсывании мелких и цепких примесей и пороков волокон, а также частичной ориентации волокон вдоль направления движения продукта. Кардочесание осуществляется с целью обеспечения индивидуального движения волокон в вытяжных приборах ленточных и других машин и получения равномерного продукта. Чесание волокнистых материалов – разделение клочков волокон на отдельные волокна, удаление сорных примесей и коротких волокон, перемешивание волокон и формирование волокнистой ленты или ровницы. Различают гребенное и кардное чесание. Гребенное чесание используется только в гребенном прядении. Выполняется на гребнечёсальных машинах, снабжённых игольчатыми гребнями. Кардочесание используется в различных системах прядения, а также в производстве нетканых материалов и валяльно-войлочных изделий. При кардочесании волокна пропускаются между рабочими органами машины, покрытыми кардолентой или пильчатой лентой. Чесание Волокна:- после разрыхления, смешивания и трепания смесь хлопка содержит ещё часть сорных примесей, волокна полностью не отделены одно от другого, перепутаны и составляют отдельные небольшие клочки. Дальнейшее трепание не позволяет полностью разделить волокна и подготовить хлопок для дальнейших технологических операций изготовления пряжи. Поэтому следующим переходом является процесс чесания волокна. Назначение процесса чесания и требования, предъявляемые к нему:- в процессе чесания происходит разделение клочков хлопка на отдельные волокна; очистка хлопка от оставшихся в нём сорных примесей и частичное удаление коротких волокон; частичное выпрямление и параллелизация волокон и, наконец, утонение продукта и формирование ленты. Выполнение этих задач происходит за счёт использования в чёсальных машинах специальной гарнитуры – пильчатой металлической ленты с зубцами или эластичной ленты с гибкими тонкими иглами. Взаимодействуя между собой и с волокнистой массой, рабочие органы, обтянутые указанной гарнитурой, растаскивают волокна из клочков, отделяют их от сорных примесей, в том числе и цепких, и располагают волокна более или менее параллельно в выходном продукте – чёсальной ленте. Чёсальный переход оказывает большое влияние на дальнейший процесс изготовления пряжи, так как именно здесь формируется почти готовый полупродукт. Кроме того, на этом процессе заканчивается удаление сорных примесей, и все оставшиеся волокна попадают уже в пряжу. Таким образом, основная задача процесса чесания – это получить продукт – чёсальную ленту с минимальным количеством сорных примесей, с высокой степенью разъединённости комплексов и хорошим распрямлением и параллелизацией волокон, а главное, высокой ровнотой ленты. На прядильных фабриках применяются в основном шляпочные чёсальные машины, которые можно разделить на три группы:- чёсальные машины больших (нормальных) размеров типа ЧМС-450, малогабаритные чёсальные машины типа ЧММ-14 и новые двухбарабанные чёсальные машины типа ЧМД-4, обеспечивающие высокое качество ленты. Применяются также валичные чёсальные машины.

CARDING CLOTH = ЧЁСАНОЕ ПОЛОТНО (или ВЫЧЁСЫВАЮЩАЯ ТКАНЬ) – Carding Cloth:- the Woolly Designs site has a close-up of Carding Cloth. The material is used on hand cards, drum carders, and carding boards. The spacing of the tines causes it to be classified as ‘fine’ or ‘coarse’. Many manufacturers refer to their combs as ‘Cotton Cards’ or ‘Wool Cards’. / к их гребням .

CARDING MACHINE = КАРДОЧЁСАЛЬНАЯ МАШИНА – Carding Machine is a machine in the manufacture of cotton textiles which receives the cotton in lap form as it comes from the finisher picker machine. The cylinder, and the revolving flats, arranged in an endless chain, parallel the fibers, remove great amounts of motes, shives, unripe seeds, and other impurities. The sliver as it comes

from the doffer roller in a weblike formation is then led to the coiler attachment, condensed to a sliver form, and deposited into the coiler can, which rests on a revolving plate at the delivery end of the frame. There is no twisting of the fibers in carding, and the draft will range from 90 to 120. Also known as Card. See also Carding. In spinning process, card is a machine used in the manufacture of staple yards. Its functions are to separate, align, and deliver the fibers in a sliver form and to remove impurities. The machine consists of a series of rolls, the surfaces of which are covered with many projecting wired or metal teeth. Short staple systems employ flat strips covered with card clothing rather that small rolls. Various carding and opening elements in the card, such as flats, cylinders, lickers-in, doffers and fixed flats, are responsible for the quality achieved by the carded sliver. In addition to these elements, special features of some carding machines also improve sliver quality. The following elements and special features are only a selection of the reasons for achieving very good quality at the same time as high card output. The flats make a major contribution toward reducing neps and seed trash in the yarn. With this knowledge, quality-conscious technicians replace flats twice as frequently as cylinder clothing. This means that the flats are already replaced after processing a volume of 500–600 tons of cotton. Cylinder clothing that has already processed 500 tons very often produces better yarn quality with new flats than if both – cylinder clothing and flats – are replaced. This illustrates that the flats are extremely important for carding quality. The degree of nep reduction generally depends on:- (i) clothing sharpness (flats and cylinders); (ii) distance between cylinders and flats; (iii) point density of the clothing; (iv) speed of the cylinders; (v) speed of the flats; (vi) direction of motion of the flats relative to that of the cylinders; and (vii) cylinder clothing profile. Output can be increased with the same point density and the same distance between cylinders and flats by increasing the surface area of the flats alone by 50%, while all other parameters remain unchanged. If the surface area of the flats is not increased, higher output with the same setting between cylinders and flats will result in more rapid wear of the cylinder and flats clothing. At the same time loss of quality must be expected within a very short time. The positioning of the clothing between the cylinder and the doffer has no obvious impact on detaching, but on carding as such. It is the only way to achieve compacting and ultimately form a web. The carding effect takes place between the cylinder and the doffer, since either the cylinder clothing protrudes through the captured fibers into the doffer clothing of the doffer clothing extends through the fibers into the cylinder clothing. Neps can still be removed here, while unopened fiber bundles can be opened slightly and separated during the next passage through the flats. Integrated carding system keeps the cylinder clothing consistently sharp by grinding it 280–400 times during the service life of the clothing. By continuously grinding the clothing and keeping it sharp, it prolongs its service life, since the surface area of the clothing points is smaller with comparable production performance. This is in contrast to conventional grinding, where a larger surface area of the clothing points has to be produced when the points are move severely worn than in simple sharpening. The enlarged surface area of the points prevents good fiber penetration and the card has to be re-clothed earlier. A gap of 0.5 mm between the fixed flat in the post-carding zone and the cylinder not only reduces wear on the flat clothing, but also promotes longer service lives of the fixed flats. The service life of the fixed flats with this setting is equivalent to up to 250 tons. A gap of 0.225 mm between the cylinder and the doffer prevents damage to the clothing points and displays trouble-free fiber transfer. While grinding the flat clothing both with an emery belt and with a grindstone, it was apparent that variations within and between the clothing are very small, and this contributes to the improvement of sliver quality. Modern cards are capable of producing slivers at 75–85 kg/h from standard cotton with a staple length of 1–1/8” and 1–3/32” and a Micronaire value of 3.8–4.7 for combed yarns in the Ne 20–30 count range with imperfection (IPI) values (IPI values are defined as the thick places, thin places, and neps per 1 000 meter yarn length) of less than 5% Uster Standard. Such machines operate with an efficiency of more than 98% if they are cleaned with the same care as other cards. The variance in sliver weight produced on such machines is less than 2% and is constant. / шлифование (grinding). и другие примеси. Оснастка. Уштэр Тчэкнолодьжиз А.Ге. (Цельвига Уштэр) (Uster Technologies AG (Zellweger Uster)), Уштэр (или Устер), Швейцария. В прядильном производстве. Предназначена для чесания волокна и смесей волокон с целью их распрямления, параллелизации, отделения примесей и удаления сора и пыли. Хлопковое волокно в виде холста поступает из трёпальной машины и укладывается на раскатывающий валик, а затем на гладкий питающий столик и под питающий цилиндр. Интенсивное расчёсывание волокон происходит в зоне взаимодействия приёмного барабана с питающим столиком и рабочей парой валиков. Дополнительная очистка происходит при взаимодействии волокон, находящихся на зубьях приёмного барабана, с сороотбойным ножом. Интенсивность расчёсывания бородки зависит от скорости приёмного барабана, разводки между ним и столиком, а также от профиля питающего столика. При чесании бородки приёмный барабан захватывает отдельные волокна, комплексы волокон и приставшие к ним сорные примеси и пороки. Сорные примеси сбрасываются в камеру для отходов. Интенсивность работы приёмного барабана, то есть степени чесания, оценивается числом воздействий зубьев приёмного барабана на одно волокно. С приёмного барабана волокно переходит на главный барабан. В зоне основного чесания происходит взаимодействие главного барабана и шляпок и главного барабана со съёмным барабаном. В этой зоне пучки волокон окончательно разъединяются до отдельных волокон, а сорные примеси и оставшиеся неразработанные комплексы волокон центробежной силой отбрасываются к шляпкам, образуя на шляпках очёс. Шляпки представляют собой чугунные пластины таврового сечения, покрытые на плоскости, обращённой к барабану, эластичной или полужёсткой гарнитурой. Шляпки соединены двумя бесконечными цепями в бесконечное полотно. Концы шляпок с обеих сторон скользят по гибким дугам, установка которых определяет величину разводки. В процессе работы гарнитура шляпок засоряется, образуется шляпочный очёс. Для его снятия на ходу машины устанавливается механизм очёсывания шляпок с пневматической системой удаления очёса. Главным в работе съёмного барабана является съём и уплотнение прочёсанного слоя волокон для дальнейшего формирования выходящей ватки-прочёса в ленту. Со съёмного барабана прочёс снимается съёмным валиком, покрытым зубчатой гарнитурой. Со съёмного валика волокна снимаются передающим валиком и ватка-прочёс направляется в давильные валы, предназначенные для разрушения сорных примесей, оставшихся после чесания. Между съёмным барабаном и давильными валами на машине происходит вытягивание ватки-прочёса (вытяжка до 1.41), что способствует некоторой ориентации волокон вдоль оси продукта. Далее ватка-прочёс проходит через воронку, где и формируется лента. Лента поступает в вытяжной прибор, в котором утоняется в 1.2–1.8 раза. На чёсальной машине с вытяжным прибором можно увеличить линейную плотность выходящей ватки-прочёса и тем самым повысить производительность машины при максимальной скорости съёмного барабана, а затем в вытяжном приборе ленту можно уплотнить до заданной линейной плотности. Из вытяжного прибора лента поступает в лентоукладчик, который имеет выпускные валики, направляющие ленту в канал верхней тарелки. Таз для сбора ленты установлен на нижней тарелке и вместе с ней вращается. Для уменьшения неровноты ленты на чёсальных машинах устанавливается автоматический регулятор вытяжки. За счёт изменения скорости выпуска ленты из вытяжного прибора при постоянной скорости подачи ленты в вытяжной прибор регулируется линейная плотность ленты. Для выравнивания линейной плотности ленты на длинных отрезках устанавливают регуляторы, изменяющие скорость подачи слоя волокон в машину, что приводит к изменению общей вытяжки на машине. Таким образом на чёсальной машине происходит изменение поперечного сечения и длины входящего продукта:- холст превращается в ленту. Приёмный барабан, раскатывающий валик, питающий столик и рабочей парой валиков, питающий цилиндр, сороотбойный нож. Пильчатая Лента – гибкая стальная лента с зубьями; используется для обтягивания рабочих органов чёсальной машины. Основание ленты мягкое и при обтягивании барабана (валика) плотно прилегает к его поверхности. Вершины зубьев пильчатой ленты закаливаются (для повышения износостойкости). Чёсальная Машина:- на чёсальных машинах любого типа при непрерывном чесании процесс состоит из трёх последовательных

операций:- утонение продукта (холста) и удаление крупных сорных примесей, прочёсывание волокон зубчатыми и игольчатыми поверхностями и снятие прочёса и формирование ленты. Устройство и принцип действия чёсальной машины показан на примере машины ЧММ-14. Холст укладывается между двумя холстовыми стойками и холстовой валик 2, вращаясь, раскатывает и подаёт его на питающий столик 3 под питающий цилиндр 4. Питающий цилиндр, подаёт холст в приёмный узел, где он последовательно разрабатывается барабанами – приёмным 5 и передающим 6 и валиками рабочей пары – рабочим 7 и чистителем 8. Волокно с передающего барабана 6 под действием зубцов пильчатой ленты переходит на главный барабан 9 и поступает в зону чесания:- главный барабан-шляпки. В результате взаимодействия хлопка с зубьями ленты главного барабана и иглами шляпок происходит интенсивное разделение комплексов волокон на отдельные, а также их параллелизация и частичное распрямление. Шляпочное полотно 10 состоит из 74 шляпок (планок) с игольчатым покрытием, из которых в работе находится 24. Расчёсанное волокно с главного барабана 9 переходит на съёмный барабан 11. Со съёмного барабана прочёс снимается валичным съёмом 12 и проходит через давильные валы 13, под действием которых происходит раздробление сорных примесей с последующим выпаданием из хлопка. Далее прочёс попадает в формирующую воронку 14, где формируется лента, затем в вытяжной прибор 15. Сформированная лента лентоукладчиком 16 равномерными кольцами укладывается в тазы. Машина оборудована самоостановами, останавливающими её при утонении или обрыве ленты, открывании крышки лентоукладчика, забивании лентой пространства между лентоводом и питающими валиками. Кроме того, на машине установлено обеспыливающее устройство с отсосом запыленного воздуха и механизмом удаления угаров из-под машин.

CARDING WOOLS = КАРДОЧЁСАНАЯ ШЕРСТЬ (или АППАРАТНАЯ ШЕРСТЬ, или СУКОННАЯ ШЕРСТЬ, или ШЕРСТЬ ИГОЛЬЧАТОГО ПРОЧЁСА) – Carding Wools are the wools that are too short to be treated by wool combing and must be processed into woolen yarns. Synonymous with Clothing Wool.

CARD–ISSUING SCHEME = СХЕМА (или ПРОГРАММА) ВЫПУСКА КАРТ – Card-Issuing Scheme (CIS) is a set of technical concepts, rules, protocols, algorithms, functions, commercial agreements and administrative procedures which form the basis for the issuance of a payment card. The CIS is controlled by its respective administrator (CIS Administrator).

CARD ISSUER = ЭМИТЕНТ КАРТЫ – Card Issuer is an institution, which issues the financial transaction card to the cardholder, and which bears ultimate financial responsibility for a card originated transaction.

CARD READER REPLACEMENT/HAND HELD TERMINAL = ЗАМЕНИТЕЛЬ СЧИТЫВАТЕЛЯ КАРТ/ПОРТАТИВНЫЙ ТЕРМИНАЛ – Card Reader Replacement/Hand Held Terminal:- wireless devices used to report trades and quotes to the market data system. Also used for supervisory functions relating to Trading Halt, Delay, Indication, etc.

CARDs = CERTIFICATES OF AMORTIZED REVOLVING DEBT

CARD SCHEME = КАРТОЧНАЯ СХЕМА – Card Scheme is a body representing a group of card issuers, one purpose of which is to facilitate the issuance and acceptance of the cards of that group. Interchange among the card scheme members must be covered by a set of operating procedures.

CARD SESSION = КАРТОЧНЫЙ СЕАНС – Card Session is a link between the card and the terminal starting with the Answer to Reset and ending with a subsequent reset or a deactivation of the contacts.

CARD STRIPS = КАРДНЫЕ ОЧЁСЫ (или КАРДНЫЕ СДИРЫ) – Card Strips are the waste fibers which are stripped from the various parts of the card machine. They take their specific names from the parts of the machine from which they are stripped. Individually, they are known as Flat Strips, Doffer Strips and Cylinder Strips. These various wastes may be removed either by brushing or by suction. When stripped by a suction process, they are called Vacuum Strips. Any of the wastes taken from parts of the card machine described in b. should appear to the inspector to be clean cotton fiber entirely free from seed, dirt and plant debris, except for occasional flocks or very small pieces of foreign matter. / Очёсы (Strips) в хлопкопрядении, а в шерстопрядении – Сдиры. они известны как Шляпочные Очёсы (Flat Strips), Очёсы Со Съёмного Барабана (Doffer Strips) и Очёсы С Валиков (Cylinder Strips). клочки (flocks) .

CARD WASTE = КАРДНЫЕ ОТХОДЫ – Card Waste:- from the picker machines, the processed cotton lint moves to the card machine which yields two types of waste:- (i) one type is thrown beneath the machine (Card Fly or Card Motes); and other (ii) accumulates on, and must be stripped from, certain parts of the machine (Card Strips). All wastes originating within the card machine described as Card Strips, and any wastes originating in machines after the card machine described as Comber Waste, Rovings, and Slivers, may be considered processed products exempt from permit and treatment certificate requirements. The cotton lint leaves the card machine in the form of a soft rope, about an inch in diameter, called a Sliver, which moves on to either the combers or to the drawing frame. See also Card Fly, Card Strips, Comber Waste, Rovings, and Slivers. Card Waste:- the short fibrous material removed as waste in the operation of a card. Card Waste:- Carding is a mechanical process that disentangles, cleans and intermixes fibers to produce a continuous web or sliver suitable for subsequent processing. It breaks up locks and disorganised clumps of fiber and then aligns the individual fibers to be parallel with each other. The waste arising from this process in called Card Waste. / Смотрите также Чёсальный или Кардный Пух (Card Fly), Кардные Очёсы (Card Strips), Отходы Гребнечесания (Comber Waste), Концы Ровницы или Ровничные Концы (Rovings), и Концы Ленты (Slivers).

CARE LABEL = ЯРЛЫК ПО УХОДУ – Care Label is the label that gives directions for cleaning, ironing, and otherwise maintaining a fabric of fiber product.

CARFLOAT = БАРЖА ДЛЯ ПЕРЕВОЗКИ ЖЕЛЕЗНОДОРОЖНЫХ ВАГОНОВ – Carfloat is a barge equipped with tracks on which up to about 12 railroad cars are moved in harbors or inland waterways.

CARGO = ГРУЗ – (1) Cargo:- any goods, wares, merchandise, and articles of every kind whatsoever carried on a ship, other than mail, ship's stores, ship's spare parts, ship's equipment, crew's effects and passengers' accompanied baggage. Cargo is the freight carried by a ship, an aircraft, or another vehicle. Plural:- cargoes or cargos. Whatever goods are transported by a ship or a plane is called as its Cargo. A shipment is an amount of a particular kind of cargo that is sent to another country on a ship, train, aeroplane or other vehicle. Cargo is a freight loaded into a ship. The words Cargo and Freight have become interchangeable in casual usage. Technically, 'Cargo' refers to the goods carried aboard the ship for hire, while 'Freight' refers to the compensation the ship or charterer receives for carrying the cargo. Goods transported or to be transported, all goods carried on a ship covered by a bill of lading (B/L). Freight loaded into a vessel. Examples include containers, breakbulk, Roll-on/Roll-off and bulk cargoes. Goods carried on a ship covered by a B/L. Cargo is everything we see about us, from raw materials to finished products, foodstuff, chemicals, minerals, steel, rubber, furniture, clothing, building materials, medical supplies and much more has been or will be a cargo at some stage of it's existence. Cargo means property, mail, or both. / Груз – общее название всех товаров, предназначенных для перевозки, или товары и имущество,

перевозимые на судне с целью получения фрахта. Груз или Карго:- в международной практике грузы или имущество, перевозимые морским судном с целью получения фрахта.

(2) Cargo is any goods, wares, merchandise, and articles of every kind whatsoever carried on a ship, other than mail, ship's stores, ship's spare parts, ship's equipment, stowage material, crew's effects and passengers' accompanied baggage.

(3) Cargo is any property carried on an aircraft, other than mail, stores and accompanied or mishandled baggage. Cargo:- freight, express, and airmail (for the purposes of this document). / Любое имущество, перевозимое самолётом, иное нежели почта, припасы и сопровождаемый или несопровождаемый багаж.

CARGO AIRCRAFT = ТРАНСПОРТНЫЙ САМОЛЁТ (или ГРУЗОВОЙ САМОЛЁТ) – Cargo Aircraft is any Aircraft other than a passenger aircraft or a combi (Freighter). / Любой самолёт, иной нежели пассажирский самолёт или комби (Грузовик (Freighter)).

CARGO ASSEMBLY = КОМПЛЕКТОВАНИЕ (или СОРТИРОВКА, или НАБОР) ГРУЗОВ – Cargo Assembly:- the separate reception of parcels or packages and the holding of them for later dispatches one consignment (aircargo). / В перевозках авиационных грузов .

CARGO BAYS = ГРУЗОВЫЕ ПРОЁМЫ – Cargo Bays:- doors in a warehouse where vehicles back up to load/unload cargo. Cargo Bays:- doors at cargo warehouse where vehicles back in to load/unload cargo. / Двери грузового склада, у которых размещаются транспортные средства под погрузку/выгрузку груза.

CARGO CLAUSES = ГРУЗОВЫЕ ОГОВОРКИ (или ОГОВОРКИ О ГРУЗЕ) – Cargo Clauses are the clauses used in policies insuring goods in transit – most commonly used set are issued by the Institute of London Underwriters. There are the following cargo clauses:- (i) Institute Cargo Clauses (A) 1/1/82; (ii) Institute Cargo Clauses (B) 1/1/82; (iii) Institute Cargo Clauses (C) 1/1/82; (iv) Institute War Clauses (Cargo) 1/1/82; (v) Institute War Clauses (Sendings by Post) 1/1/82; (vi) Institute Cargo Clauses (Air) (Excluding sendings by Post) 1/1/82; (vii) Institute War Clauses (Air Cargo) (Excluding sendings by Post) 1/1/82; (viii) Institute Strikes Clauses (Cargo) 1/1/82; (ix) Institute Strikes Clauses (Air Cargo) /1/82; (ix) Institute Classification Clauses 01/01/2001; (x) Institute Frozen Food Clauses (A) (Excluding Frozen Meat) 1/1/86; (xi) Institute Frozen Food Clauses (C) (Excluding Frozen Meat) 1/1/86; (xii) Institute Strikes Clauses (Frozen Food) (Excluding Frozen Meat) 1/1/86; (xiii) Institute Frozen Meat Clauses (A) 24 Hours Breakdown (not suitable for chilled, cooled or fresh meat) 1/1/86; (xiv) Institute Strikes Clauses (Frozen Meat) (not suitable for chilled, cooled or fresh meat) 1/1/86; (xv) Institute Timber Trade Federation Clauses Agreed with the Timber Trade Federation 1/4/86; (xvi) Institute Strikes Clauses (Timber Trade Federation) Agreed with the Timber Trade Federation 1/4/86; (xvii) Institute Container Clauses Time, Total Loss, General Average, Salvage, Salvage Charges, Sue and Labour 1/1/87; (xviii) Institute Radioactive Contamination Exclusion Clauses 1/10/90; (xix) Institute Cargo Clauses (A) 01/01/2009 CL382; (xx) Institute Cargo Clauses (B) 01/01/2009 CL383; (xxi) Institute Cargo Clauses (C) 01/01/2009 CL384; (xxii) Institute Cargo Clauses (Air) 01/01/2009 CL387; (xxiii) Institute War Clauses (Cargo) 01/01/2009 CL385; (xxiv) Institute War Clauses (Air Cargo) 01/01/2009 CL388; (xxv) Institute Strikes Clauses (Cargo) 01/01/2009 CL386; and (xxvi) Institute Strikes Clauses (Air Cargo) 01/01/2009 CL389. / выпускаемый Институтом Лондонских Расписчиков (Андеррайтеров).

CARGO CONSOLIDATION = КОНСОЛИДАЦИЯ ГРУЗА – Cargo Consolidation is a packing cargo usually into containers. Unpacking is referred to as Deconsolidation or Devanning Cargo. / Обычно это относится к погрузке партии грузов в доставленные контейнеры. Разгрузка же относится к деконсолидации или выгрузке груза из фургона.

CARGO DISASSEMBLY = РАЗУКОМПЛЕКТОВАНИЕ (или РАЗБИВКА, или РАЗБОРКА) ГРУЗОВ – Cargo Disassembly:- the separation of one or more of the component parts of a consignment (from other parts of such consignment) for any purpose other than that of presenting such part or parts to customs authorities at the specific request of such authorities (aircargo). / В перевозках авиационных грузов .

CARGO GEAR = КАТАБАЛКА (или ГРУЗОВАЯ СТРЕЛА, или КРАН–БАЛКА) – Cargo Gear is a ship's crane. / Судовой кран. Под Краном-Балкой, от Голландского слова Kraanbalk, понимается разновидность грузоподъёмного крана мостового типа, у которого таль с ручным или электрическим приводом передвигается по пролётной ездовой балке, оборудованной концевыми балками с ходовыми тележками. Тележки перемещаются по рельсам, уложенным обычно на верхних полках подкрановых балок, опирающихся на колонны, или по нижнему поясу балок, подвешенных к стропильным фермам (подвесная кран-балка). Грузоподъёмность крана-балки может достигать 5 тонн. Кран-балка на судах, так называемая Катабалка, является простейшим поворотным краном для подъёма и спуска становых (носовых) якорей. Она имеет вид изогнутой балки с блоком на конце или стрелы с укосиной. Подъём якоря осуществляют вручную или от брашпиля. На некоторых судах роль крана-балки выполняют два неподвижных кронштейна – так называемые крамболы. Под Грузовой Стрелой понимается судовое грузоподъёмное средство, представляющее собой балку-укосину, шарнирно закреплённую нижним концом на мачте или колонне, а верхним – подвешенную на тросе так, что она может поворачиваться вокруг вертикальной оси и изменять наклон. Груз поднимают и опускают с помощью лебёдки. Грузоподъёмность грузовой стрелы обычно не превышает 10 тонн, в особых случаях – до 300 тонн (тяжеловесные стрелы). Грузовое Устройство судна, совокупность приспособлений и механизмов для погрузки, выгрузки и перемещения грузов. Обычно суда оборудуют грузовыми устройствами периодического действия – грузовыми стрелами и кранами, иногда лифтами. Благодаря простоте в эксплуатации на судах распространены грузовые устройства со стрелами; современные суда чаще оборудуют кранами с электро- и гидроприводом. Грузоподъёмность стационарных судовых кранов обычно 5–8 тонн (т), иногда 15 т и более, а передвижных – до 30 т; последние устанавливают на контейнеровозах, лесовозах-пакетовозах, навалочниках и других. Лифты имеют грузоподъёмность 1–5 т; используются для перемещения людей и небольших грузов на пассажирских, промысловых и других судах. Грузовое устройство непрерывного действия (ленточные транспортёры, ковшовые элеваторы, пневматические перегружатели и другие) применяют в основном на саморазгружающихся судах – рудовозах, углевозах, цементовозах. Производительность транспортёрных грузовых устройств достигает 4 000 тонн в час (т/ч).

CARGO HANDLING = ПЕРЕВАЛКА ГРУЗОВ – Cargo Handling is the act of loading and discharging a cargo ship. The physical handling of goods. All procedures necessary to enable the physical handling of goods. / Физическая обработка товаров.

CARGO INFORMATION = ИНФОРМАЦИЯ О ГРУЗЕ – Cargo Information is an online system for transport professionals containing transport-related risk and damage preventation information which can be called up via TIS (http://www.tis-gdv.de).

CARGO INSURANCE = СТРАХОВАНИЕ ГРУЗОВ – Cargo Insurance is type of insurance is quite specialized and usually involves the use of many differing types of transport, i.e. sea, air, canal, rail and road. Manufacturing Companies, Suppliers, Wholesalers/Selling Agents, Repairers, and Service Companies could all have a need for cargo insurance. Cargo insurance is more for 'own goods' and is directed towards companies like manufacturers, suppliers, wholesalers etc. See also Freight Insurance.

CARGO INTEREST = ПРОЦЕНТ ПО ГРУЗУ – Cargo Interest is the insurable interest relating to cargo, other than the interest of the cargo owner.

CARGO MANIFEST = ГРУЗОВОЙ МАНИФЕСТ – Cargo Manifest:- a listing of the goods comprising the cargo (freight) carried in a means of transport or in a transport-unit. The Cargo Manifest which gives the commercial particulars of the goods, such as transport document numbers, consignors, consignees, marks and numbers, number and kind of packages, descriptions and quantities of the goods, may be used in place of the Cargo declaration. Examples of cargo manifests are Aircraft Cargo Manifests, Ship's Manifests, Goods Manifests and 'Bordereaux' (road traffic). A manifest that lists all cargo carried on a specific vessel voyage. Cargo Manifest is an invoice of all cargo loaded on board a vessel. Entire listing of all cargo on board a vessel is required by the relevant local authorities. Also known as Manifest.

CARGO NOS = CARGO NOT OTHERWISE SPECIFIED

CARGO NOT OTHERWISE SPECIFIED = ПРОЧИЙ (или ИНОЙ) НЕУКАЗАННЫЙ ТОВАР – Cargo Not Otherwise Specified:- usually the rate entry in a tariff that can apply to commodities not covered under a specific item or sub-item in the applicable tariff.

CARGO PLAN = ГРУЗОВОЙ ПЛАН (или КАРГО ПЛАН) – Cargo Plan is a plan giving the quantities and description of the various grades carried in the ship's cargo tanks, after the loading is completed. / Под Карго Планом, известным также как Грузовой План, понимается схема размещения грузов, перевозимых в грузовых помещениях и на верхней палубе судна. Грузовой план составляют для наилучшего использования грузовместимости и грузоподъёмности судна при обеспечении сохранности грузов в процессе перевозки, удобства и быстроты их погрузки и выгрузки, а также достаточной остойчивости судна, общей и местной прочности его корпуса, допускаемой осадки и прочего. Известен также как Карго План. Грузовой План или Карго План, схема размещения грузов, перевозимых в грузовых помещениях и на верхней палубе судна. Грузовой план служит руководством при погрузке и разгрузке и преследует цель обеспечить полное использование грузовместимости и грузоподъёмности судна, сохранность грузов при перевозке, удобную и быструю их погрузку и выгрузку, а также достаточную остойчивость судна, его допустимую осадку, общую и местную прочность корпуса. На грузовом плане указывается наименование грузов, число мест отдельных партий, их объём, положение центра тяжести и порт назначения.

CARGO PREFERENCE = ПРЕФЕРЕНЦИЯ НА ГРУЗЫ – Cargo Preference is a teserving a portion of a nation's imports and exports to national-flag vessels. Cargo reserved by a Nation's laws for transportation only on vessels registered in that Nation. Typically the cargo is moving due to a direct or indirect support or activity of the Government.

THE CARGO PREFERENCE ACT OF 1954 = АКТ О ПРЕФЕРЕНЦИЯХ НА ГРУЗЫ ОТ 1954 – The Cargo Preference Act or Cargo Preference refers generally to legal requirements for the carriage of government-impelled cargoes on the vessels flagged within the registry of that government for the purpose of promoting a national merchant marine. Cargo Preference is commonplace among the world's seafaring nations, including Australia, Brazil, France, Japan, Taiwan. United States law includes two main pieces of Cargo Preference legislation:- The Cargo Preference Act of 1954 (the '1954 Act') pertaining to the carriage of civilian cargoes and the Military Cargo Preference Act of 1904 (the '1904 Act'), which governs military cargoes. Cargo preference is administered by the United States Maritime Administration (MARAD). Originally, MARAD provided advice to shipper agencies, without being able to compel compliance. Finding the arrangement unsatisfactory, Congress passed the Merchant Marine Act of 1970, Pub. L. No. 91-469, which authorized MARAD to issue regulations governing cargo preference shipments by the other agencies. Section 27 of the 1970 Act added explicit cargo preference authority, which was amended in 2008 to provide MARAD with the authority to (a) 'direct agencies to require the transportation in United States-flagged vessels of cargo shipments not otherwise subject to (Cargo Preference) in equivalent amounts to cargo determined to have been shipped on foreign carriers in violation of (Cargo Preference)' and (b) 'impose on any person that violates (the Cargo Preference Act or a MARAD implementing regulation), a civil penalty of not more than USD25 000.00 for each violation willfully and knowingly committed, with each day of a continuing violation following the date of shipment to be a separate violation'. Although cargo preference contains exceptions where US-flag vessels are unavailable, as discussed infra, shipper agencies may determine non-availability only with MARAD concurrence. This act, as amended, requires that at least 50 percent of the gross tonnage of all government-generated cargo be transported on privately-owned, US-flag commercial vessels to the extent such vessels are available at fair and reasonable rates. In 1985, the Merchant Marine Act of 1936 was amended to require that the percentage of certain agricultural cargoes to be carried on US-flag vessels be increased from 50 to 75 percent. In the United States, a law which provides that 'whenever the United States contracts for, or otherwise obtains for its own account, or furnishes to or for the account of any foreign nation without provision for reimbursement, any equipment, materials or commodities', the United States shall ship in US flag vessels, to the extent that they are available at fair and reasonable rates, at least 50 percent of the gross tonnage involved. / Прерогатива Национального Перевозчика:- грузовая преференция (cargo preference) – преимущественное или исключительное право (законодательно закреплено в ряде стран), в соответствии с которым определённые категории вывозных (или экспортных) грузов должны полностью или частично перевозиться судами, плавающими под флагом страны-экспортёра. В США в 1954 принят Акт о Грузовой Преференции (Cargo Preference Act), в соответствии с которым не менее 50% вывозных (или экспортных) грузов, финансируемых Департаментом Сельского Хозяйства США, кредитуемых Экспортно-Импортным Банком (или Банком Вывоза-Привоза), должно перевозиться судами под Американским флагом.

CARGO RESTRICTION CODE = КОД ОГРАНИЧЕНИЯ ДЛЯ ГРУЗА – Cargo Restriction Code is a code indicating that the use of a certain container is restricted to particular cargo. / Код, указывающий на то, что для определённых грузов использование контейнера ограничено.

CARGO RICE = ТОВАРНЫЙ РИС – Cargo Rice (Loonzain Rice, Brown Rice, Husked Rice) means Rice that is dehusked only. / Товарный Рис (Рис Лоонзаин (Loonzain Rice), Бурый Рис, Шелушеный Рис) означает Рис, который подвергся только лишь шелушению.

CARGO SAMPLE = (ОБЪЕДИНЁННАЯ) ГРУЗОВАЯ ПРОБА – In Canadian grain industry, a Cargo Sample is a composite of average samples taken as a cargo of Wheat is loaded into a ship for export. Cargo samples are inspected and graded, and portions of them are sent to the Grain Research Laboratory for analysis. / В Канадской зерновой индустрии под грузовой пробой понимается совокупность средних проб, отобранных из партии Пшеницы при её погрузке в судно в качестве груза для вывоза (экспорта). Грузовые пробы инспектируются и сортируются, и их порции направляются в Лабораторию по Исследованию Зерна для анализа. В России, под совокупностью всех точечных проб, отобранных из партии зерна, понимается Объединённая Проба.

CARGO SELECTIVITY SYSTEM = СИСТЕМА ИЗБИРАТЕЛЬНОСТИ ГРУЗОВ – The Cargo Selectivity System, a part of the US Customs' Automated Commercial System, specifies the type of examination (intensive or general) to be conducted for imported merchandise. The type of examination is based on database selectivity criteria such as assessments of risk by filer, consignee, tariff number, country of origin, and manufacturer/shipper. A first time consignee is always selected for an intensive examination. An alert is

also generated in cargo selectivity the first time a consignee files an entry in a port with a particular tariff number, country of origin, or manufacturer/shipper.

CARGO SHIFT = СМЕЩЕНИЕ ГРУЗА – Cargo Shift is a term used to describe the shifting or moving of freight within a container and/or highway trailer.

CARGO SWEAT = ИСПАРИНА ГРУЗА (или ВЫПОТ ГРУЗА, или ВЫПОТЕВАНИЕ ГРУЗА, или ОТПОТЕВАНИЕ ГРУЗА) – Cargo Sweat is a condensation on the surface of the cargo. Condensation can form on the cargo as a result of climatic conditions. Cargo sweat can always occur when the temperature of the cargo is lower than or equal to the dew point. It can also occur during transportation from temperate latitudes, e.g., from northern-hemisphere winter to the tropics.

CARGO TEMPERATURE = ТЕМПЕРАТУРА ГРУЗА – Cargo Temperature is the temperature of the cargo within the container. Can vary according to place and time, e.g., during a cooling or warming process.

CARGO TONNAGE = ГРУЗОВОЙ ТОННАЖ – Cargo Tonnage:- most ocean freight is billed on the basis of weight or measurement tons (W/M). Weight tons can be expressed in short tons of 2 000 pounds, long tons of 2 240 pounds or metric tons of 1 000 kilos (2 204.62 pounds). Measurement tons are usually expressed as cargo measurement of 40 cubic feet (1.12 meters) or cubic meters (35.3 cubic feet). The weight ton in the United States is 2 000 pounds. A short ton or 2 240 pounds. A long ton and in British countries it is the English long or gross ton of 2 240 pounds. In France and other countries having the metric system, the weight ton is 2 204.64 pounds. The measurement ton is usually cubic feet, but in some instances a larger number of cubic feet is taken as weight ton. Most ocean freight is taken at weight or measurement (W/M), whichever provides greater revenue.

CARGO TRACER = ЗАПРОС О ПОТЕРЯННОМ ГРУЗЕ – Cargo Tracer is a document sent by the agent to all relevant parties, stating that certain cargo is either missing or overlanded. A message sent by an agent to all relevant parties, with the aim of establishing the whereabouts of missing or overlanded cargo.

CARGO TRANSPORT UNIT = ГРУЗОВАЯ ТРАНСПОРТНАЯ ЕДИНИЦА (или ГРУЗОВОЕ ТРАНСПОРТНОЕ СРЕДСТВО) – Cargo Transport Unit (CTU) means a freight container, swap-body, vehicle, railway wagon (railroad car) or any other similar unit.

CARGO TRANSPORT UNIT GUIDELINES = НАПРАВЛЯЮЩИЕ ГРУЗОВОЙ ТРАНСПОРТНОЙ ЕДИНИЦЫ (или НАПРАВЛЯЮЩИЕ ГРУЗОВОГО ТРАНСПОРТНОГО СРЕДСТВА) – Cargo Transport Unit (CTU) Guidelines are guidelines for the packing of loads except bulk goods either in or on CTUs for transport by means of any method of land-based or water-based transportation.

CARGO UNIT = ГРУЗОВАЯ ЕДИНИЦА (или ГРУЗОВОЕ СРЕДСТВО) – Cargo Unit is a vehicle, container, pallet, flat, portable tank or any other entity or any part thereof which belongs to the ship but is not permanently attached to that ship.

CARGO WAR RISK POLICY = ПОЛИС ПО ГРУЗУ ОТ ВОЕННЫХ РИСКОВ – Cargo War Risk Policy is a separate cargo insurance policy covering cargo while waterborne only (except at transshipping point, which may be on land or water). Insures against war risks. The Cargo War Risk Policy is designed to provide coverage where the standard cargo policy ends, in times or places of war or similar (excluded) upheaval. The War Risk Policy covers almost all of the war risk perils excluded under the former policy. It is generally written at the same time as the Standard Cargo Policy. There are several significant differences in coverage, however. The War Risk Policy may exclude coverage while the covered goods are within specific geographic areas (typically areas deemed to be extremely dangerous – this happened briefly under Lloyds of London policies and others in the Red Sea during the Gulf War crisis). The War Risk Policy may be cancelled on very short notice – typically 48 hours (versus the 30 days notice of the Standard Cargo Policy). The policy also sharply curtails coverage when not on board ship – prior to loading, when being transshipped or after offloading in the country of final destination.

CARI = CENTRAL AGRICULTURAL RESEARCH INSTITUTE

CARIBBEAN = КАРИБСКОЕ – Caribs is the tanker market abbreviation for Caribbean Sea. / Карибы (Caribs) – принятое на танкерном рынке сокращённое обозначение Карибского Моря (Caribbean Sea).

CARIBBEAN BASIN ECONOMIC RECOVERY ACT = АКТ О ВОССТАНОВЛЕНИИ ЭКОНОМИКИ СТРАН КАРИБСКОГО БАССЕЙНА – Caribbean Basin Economic Recovery Act (CBERA) was the first US trade program to contain intellectual property rights-related provisions; it contains both mandatory and discretionary criteria which must met before countries could be designated as beneficiary countries. The CBERA provided unilateral duty-free access for most goods to the US market to 24 beneficiary countries in Central America and the Caribbean. The US-Caribbean Trade Partnership Act (CBTPA), which first entered into force on October 01, 2000, expands the list of duty-free products and offers more market access opportunities to CBTPA-eligible countries. The CBTPA requires that each participating country must meet all the CBERA IPR criteria as well as satisfying the CBTPA's criteria that the country is meeting or exceeding its WTO TRIPS obligations and is taking steps to provide protection equivalent to standards found in bilateral IPR agreements. The CBTPA continued in effect until September 30, 2008 or the date, if sooner, on which the FTAA or another free trade agreement as described in legislation enters into force between the United States and a CBTPA beneficiary country. Because several beneficiary countries have entered into FTAs with the US, there are currently 19 eligible CBERA countries:- Antigua and Barbuda, Aruba, The Bahamas, Barbados, Belize, British Virgin Islands, Costa Rica, Dominica, Grenada, Guyana, Haiti, Jamaica, Montserrat, Netherlands Antilles, Panama, St. Kitts and Nevis, St. Lucia, St. Vincent and the Grenadines, and Trinidad and Tobago. Congress has reauthorized this program until September 20, 2020. Implementation Date:- 1984-January-01. CBERA Countries (on 2013-June-10):- Antigua and Barbuda, Aruba, The Bahamas, Barbados, Belize, British Virgin Islands, Dominica, Granada, Guyana, Haiti, Jamaica, Monserrat, Netherlands Antilles, St. Kitts and Nevis, Saint Lucia, Saint Vincent and The Grenadines, Trinidad and Tobago. The Caribbean Basin Initiative (CBI) was a unilateral and temporary United States program initiated by the 1983 'Caribbean Basin Economic Recovery Act' (CBERA). The CBI came into effect on January 01, 1984 and aimed to provide several tariff and trade benefits to many Central American and Caribbean countries. It arose in the context of a US desire to respond with aid and trade to leftist movements that were active in some countries of the region, such as the guerrillas in El Salvador and the Sandinista government in Nicaragua. Provisions in the CBERA prevented the US from extending preferences to CBI countries that it judged to be under the influence of Communists or that had expropriated American property. The 'Caribbean Basin Economic Recovery Expansion Act' of 1990, known as 'CBI II', made the CBI permanent. However, once the US entered into the North American Free Trade Agreement (NAFTA) in 1994 with Mexico it became easier for Mexico to export its products to the US. CBI countries had lost their advantage relative to Mexico, a major competitor in industries such as textiles and apparel, so they sought to increase their own preferences and achieve 'NAFTA parity'. Those efforts were not successful until the 2000 Caribbean Basin Trade Partnership Act, which was broadened in 2002. Several exports from the region continue to receive preferential status in the United States, however those preferences will likely be replaced by bilateral free trade agreements, and possibly by the proposed Free Trade Area of the Americas. The Caribbean Basin Economic Recovery Act (CBERA) affords nomeciprocal tariff preferences to developing countries in the Caribbean Basin area to

aid their economic development and to diversify and expand their production and exports. The CBERA enacted in title II of Public Law 98–67, implemented by Presidential Proclamation 5133 of November 30, 1983, and amended by the Customs and Trade Act of 1990, applies to merchandise entered, or withdrawn from warehouse for consumption, on or after January 01, 1984; this tariff preference program has no expiration date. Indicated by the symbol 'E' or 'E*' in the special subcolumn of column 1, the CBERA provides duty-free entry to eligible articles, and reduced-duty treatment to certain other articles, which are the product of and imported directly from designated countries, as set forth in general note 7 to the HTS.

CARIBS = CARIBBEAN

CARINATE = ЛАДЬЕВИДНОЕ (или КИЛЕВАТОЕ) – Carinate:- keeled. / Ладьевидное – килеватое.

CARIS = CURRENT AGRICULTURAL RESEARCH INFORMATION SYSTEMS

CARLOAD RATE = СТАВКА ЗА ВАГОН (или СТАВКА ЗА ВАГОННУЮ ЗАГРУЗКУ) – Carload Rate is a rate applicable to a carload of goods. / Ставка, применяемая при перевозке товаров вагонными партиями.

CARMACK AMENDMENT = ПОПРАВКА КАРМАКА – What is popularly known as the Carmack Amendment, when first enacted, was actually the Hepburn Act, Act of June 29, 1906, ch. 3591, 34 Stat. 584. Interstate cargo claims are governed by the Carmack Amendment ('Carmack'), 49 USC §14706. Carmack controls and limits the liability of common carriers for in-transit cargo and preempts common or state law remedies that increase the carrier's liability beyond the actual loss or injury to the property. Carmack was enacted in 1906 as an amendment to the Interstate Commerce Act of 1887, and is now part of the Interstate Commerce Commission Termination Act of 1995 ('ICC Termination Act'). 49 USC §14706 (2005; 49 USC is short for the United States Code:- Title 49). When enacted, Carmack established a uniform regime of recovery by interstate shippers against motor carriers and freight forwarders, and allowed a shipper to recover for actual loss or injury to the property. Now, Carmack protects the carrier from causes of action that may expose it to damages beyond the value of the goods, if all of the required conditions have been met. Carmack was, and continues to be under the ICC Termination Act, a codification of the common law rule imposing strict liability upon the common carrier without proof of negligence. Carmack preempts state and common law in instances where goods are lost, damaged or untimely delivered in interstate commerce. One purpose of Carmack is to relieve a shipper from searching for the particular carrier at fault from the often numerous carriers handling the shipment. Carmack's scope is determined by reference to 49 USC §13501, also a provision of the Interstate Commerce Act. In relevant part, §13501 extends the reach of Carmack to motor and rail transportation of property:- (i) between a place in a state and a place in another state; or (ii) between a place in the United States and a place in a foreign country 'to the extent the transportation is in the United States …'. 49 USC §13501(1)(A), (E) (2000). The ICC Termination Act fixes liability upon rail carriers, motor carriers, freight forwarders, and pipeline carriers under receipts and bills of lading. The former Carmack provisions, which were all in one section in the Interstate Commerce Act, were recodified separately for rail carriers, motor carriers and freight forwarders. Under the ICC Termination Act, the Secretary of Transportation and the Surface Transportation Board have jurisdiction over motor carrier transportation and the procurement of that transportation. 49 USC §13501(2005). An Interstate Commerce Act amendment that delineates the liability of common carriers and the bill of lading provisions. There is a federal statute enacted in 1906 called the Carmack Amendment. It was originally enacted in response to railroad barons who controlled the few railroads in existence and who were giving their friends favors in transportation rates and squeezing small farmers and everyone else. Back then, railroads were the major method of transporting goods across the still-developing country, and so the Interstate Commerce Commission (ICC) was set up, in effect, to regulate the monopoly that was the railroads. The Carmack Amendment forbade 'price discrimination'; that is, the railroad baron had to charge a set rate (contained in the railroad's tariff), approved by the ICC, to all shippers. When roads and trucking later arose, the ICC started overseeing that, too. The major van lines and their agent system first got organized, and wrote their tariffs, in the 1930s. The Carmack Amendment subjects a motor carrier transporting cargo in interstate commerce to absolute or strict liability for 'actual loss or injury to property'. By limiting a carrier's liability to the actual loss or injury to the transported property, Congress intended to provide certainty to both shippers and carriers, and to enable carriers to assess their risks and predict their liability for damages. Accordingly, Carmack permits the shipper a single method of recovery 'directly from the interstate common carrier in whose care their goods are damaged'. The strict liability imposed by Carmack is for the actual loss or injury to the property, subject to the right of the motor carrier to limit its liability as provided by the statute. See 49 USC §14706(a) (2005; 49 USC is short for the United States Code:- Title 49). Section 14706(a)(1) provides, in part, that the liability imposed under this para-graph is for the actual loss or injury to the property caused by (a) the receiving carrier, (b) the delivering carrier, or (c) another carrier over whose line or route the property is transported in the United States or from a place in the United States to a place in an adjacent foreign country when transported under a through bill of lading … 49 USC §14706(a)(1). The carrier's liability and duties under Carmack are determined pursuant to the bill of lading used in the shipment of the goods, and the limits are based on the carrier's rates or tariffs. See, e.g., 49 USC §§14706, 13501 (2005). Recovery under Carmack, however, is not limited to damaged goods. The phrase in Section 14706(a), the 'liability imposed … is for the actual loss or injury to the property …', has been long interpreted by the courts to cover more than mere physical loss or damage to the goods. It includes any injury to or invasion of tangible or intangible property rights and economic loss not directly related to physical damage. The bill of lading, the terms and conditions of which bind the shipper and all connecting carriers, sets forth the limitations of the carrier's liability to which Carmack applies. For the bill of lading to, in effect, limit the carrier's liability, the carrier must take four steps before transporting the goods:- (i) maintain a tariff, if required; (ii) obtain the shipper's agreement as to his or her choice of liability; (iii) give the shipper a reasonable opportunity to choose between two or more levels of liability; and (iv) issue a receipt or bill of lading prior to movement of the shipment. Carrier limits liability if there is fair agreement and if shipper has option to a higher recovery if a higher rate paid. In general, Carmack applies when motor carriers and surface freight forwarders are required to issue receipts and bills of lading when procuring interstate transportation or transportation services. 49 USC §§14706, 13501 (2005). When there is a written contract between the shipper and the carrier for the transportation of goods, which expressly waives any or all rights and remedies under §14101 et seq. for the transportation covered by the contract, Carmack does not apply even though a bill of lading exists. See 49 USC §14101(b) (2005). When determining whether Carmack applies, the focus is on whether the transportation was intended to be interstate or intrastate, on the relationship between the shipper and the carrier and on the nature of the goods. Carmack applies only to transportation by a motor carrier in the United States between a place in:- (i) a state and a place in another state; (ii) a state and another place in the same state through another state; (iii) the United States and a place in a territory or possession of the United States to the extent the transportation is in the United States; (iv) the United States and another place in the United States through a foreign country to the extent the transportation is in the United States; or (v) the United States and a place in a foreign country to the extent the transportation is in the United States. 49 USC §13501(1) (2005). Consequently, Carmack does not apply to intrastate shipments. 49 USC §23504 (1995). Nor does it apply to, for example, a shipment from Mexico to England via the United States. Likewise, Carmack does not apply to the imports of goods from an adjacent foreign country into the United States, because such imports are not regulated by the Interstate Commerce Commission (ICC; it was eliminated in 1994; Effective 1996-January-01, the US Department of Transportation (DOT) assumed the Interstate Commerce Commission's (ICC) remaining responsibilities for administering trucking regulations).

CARMINE = КАРМИН – Carmine is a precipitate of cochineal (carminic acid) made by adding alum, cream of tartar, stannous chloride, or potassium hydrogen oxalate to a solution of cochineal. Sometimes proteinaceous substances such as egg white, fish glue or gelatine are added before precipitation. Carmine is used as a food dye, to color alcoholic beverages, as a pigment in microbiology and in crimson ink. Carmine (in the UK, 1840's), from Latin Carminium, a powder of a very beautiful red color, bordering upon purple, and used by painters in miniature. It is a species of Lake, and is formed of finely pulverised cochineal. It is very high priced. / осадок (precipitate). Под Кармином, от Французского слова Carmin, от Арабского слова Кирмиз, означающее Кошениль, и Латинского слова Minium, означающее Киноварь, понимается красный краситель, добываемый из тел бескрылых самок насекомых – кошенили. Используется для окраски гистологических препаратов, как пищевой и парфюмерный краситель. Во всём мире для придания мясным изделиям естественного красного цвета наиболее часто применяется натуральный краситель животного происхождения – Кармин (Е120). Этот краситель является комплексным соединением карминовой кислоты с кальцием и алюминием. На основе этого пигмента могут производиться водо- и жирорастворимые красители, а также этот пигмент используется в виде лака – нерастворимого в воде и жирах комплексного соединения с кальцием и алюминием. Карминовый Лак имеет более светлый оттенок красного и легко смешивается с продуктами на водной и жировой основе. Такая форма этого красителя имеет низкую миграционную способность. Кармин зарекомендовал себя как один из самых устойчивых пищевых красителей:- не проявляет заметной чувствительности к свету, окислению и температурной обработке. Кроме того, он придаёт колбасным и деликатесным изделиям естественный сочный оттенок. Кармин используется как при производстве сырокопчёных и сыровяленых продуктов, так и при выработке колбасных изделий, подвергаемых термической обработке. Кармин в водорастворимой форме – единственный натуральный краситель, применяемый при инъекцировании варёной ветчины и для окраски оболочек в разные оттенки красного цвета (часто в сочетании с Аннато). Этот краситель позволяет получать стабильный цвет при производстве мясопродуктов, регулировать степень окрашивания продуктов в соответствии с их пожеланиями потребителя, а также улучшать их товарный вид. 50% кармин или карминовый лак (в виде порошка) в колбасах применяется в дозировке 0.005–0.02%.

CARMINE = КАРМИН (или КАРМИНОВОЕ) – Carmine:- vivid red.

CARMINE LAKE = КАРМИНОВЫЙ ЛАК – Carmine Lake is a pigment obtained by adding freshly precipitated alumina to a solution of cochineal (carminic acid). / (карминовая кислота). Во всём мире для придания мясным изделиям естественного красного цвета наиболее часто применяется натуральный краситель животного происхождения – Кармин (Е120). Этот краситель является комплексным соединением карминовой кислоты с кальцием и алюминием. На основе этого пигмента могут производиться водо- и жирорастворимые красители, а также этот пигмент используется в виде лака – нерастворимого в воде и жирах комплексного соединения с кальцием и алюминием. Карминовый Лак имеет более светлый оттенок красного и легко смешивается с продуктами на водной и жировой основе. Такая форма этого красителя имеет низкую миграционную способность. Кармин зарекомендовал себя как один из самых устойчивых пищевых красителей:- не проявляет заметной чувствительности к свету, окислению и температурной обработке. Кроме того, он придаёт колбасным и деликатесным изделиям естественный сочный оттенок. Кармин используется как при производстве сырокопчёных и сыровяленых продуктов, так и при выработке колбасных изделий, подвергаемых термической обработке. Кармин в водорастворимой форме – единственный натуральный краситель, применяемый при инъекцировании варёной ветчины и для окраски оболочек в разные оттенки красного цвета (часто в сочетании с Аннато). Этот краситель позволяет получать стабильный цвет при производстве мясопродуктов, регулировать степень окрашивания продуктов в соответствии с их пожеланиями потребителя, а также улучшать их товарный вид. 50% кармин или карминовый лак (в виде порошка) в колбасах применяется в дозировке 0.005–0.02%.

CARNATION = ТЕЛЕСНОЕ (или ГВОЗДИКА, или ХХ) – Carnation:- a pale to grayish yellow; a moderate red.

CARNET DE PASSAGES EN DOUANE = КАРНЭ ДЁ ПАССАЖ АН ДУАН (или КНИЖКА ДОПУСКОВ В ТАМОЖНЕ) – The CPD Carnet (in French, Carnet de Passages en Douane (CPD)) is a customs document that identifies a driver's motor vehicle. It is required in order to take a vehicle into a significant but diminishing number of countries around the world. The Carnet allows travellers to temporarily import their vehicles without having to leave a cash deposit at the border. It is, in essence, an international guarantee for payment of customs duties and taxes to a government should the vehicle not be re-exported from that country. Persons who temporarily import their vehicles into countries where the Carnet is required must agree to obey the laws and regulations of that country and particularly the conditions of temporary importation. The Carnet contains relevant information about the vehicle – make, model, color, engine capacity, seating capacity, registration number, owner and value. In order to obtain a Carnet, the owner of a vehicle is required to provide a security based on the age and market value of the vehicle. Generally three types of security are acceptable from motoring organizations:- (i) cash bond; (ii) banker's letter of indemnity; and (iii) insurance policy. Motorists can obtain a Carnet de Passages en Douane from their national automobile association or touring club. The following bodies are authorized to issue a Carnet:- (i) in the North America – the Canadian Automobile Association (CAA; headquartered in Ottawa, Canada); (ii) in the United Kingdom – the Royal Automobile Club (RAC; headquartered in Norwich, England, the United Kingdom); (iii) in India – Automobile Association of Southern India (headquartered in Chennai, India); (iv) in Norway – the Norwegian Automobile Federation (NAF; headquartered in Oslo, Norway); and (v) in Poland – Polski Zwiazek Motorowy (PZMot; headquartered in Warszawa, Poland). Countries where a CPD is required:- Argentina, Australia, Bahrain, Bangladesh, Belgium, Benin, Botswana, Brazil, Burkina Faso, Cameroon, Central African Republic, Chad, Chile, Colombia, Comoros, Congo, Costa Rica, Côte D'Ivoire, Denmark, Ecuador, Egypt, Finland, Gabon, Ghana, Greece, Guinea-Bissau, India, Indonesia, Iran, Iraq, Italy, Jamaica, Japan, Jordan, Kenya, Kuwait, Lebanon, Lesotho, Libya, Malawi, Malaysia, Mauritania, Myanmar, Namibia, Nepal, the Netherlands, the Netherlands Antilles (Bonaire, Curaçao, Saba, Sint Eustatius, and Sint Maarten), New Zealand, Niger, Oman, Pakistan, Paraguay, Peru, Qatar, Senegal, Singapore, Somalia, South Africa, Sri Lanka, Surinam, Swaziland, Syria, Tanzania, Togo, Trinidad and Tobago, Turkey, Uganda, the United Arab Emirates, Uruguay, Vanuatu, Venezuela, Yemen, Zimbabwe. In Australia, not required, but strongly recommended. This list has countries that are known to require a CPD but there may be more that are not yet verified. In Africa, Kenya, Egypt, Senegal (for vehicles older than 5 years), South Africa. All other African countries have a mechanism for temporarily importing a vehicle. This document is often referred as Passavant (in French), LaizzePasse or SalvoConducto (in Spanish). A small fee is often charged to obtain it, and it allows the vehicle to be imported and driven for up to 1 month. It replaces the Carnet in that country, and should be returned to the customs office upon leaving the country. The only countries which do not issue passavants, and hence a Carnet is required to enter are:- Senegal and Egypt. From 2006 Senegal is easing the requirement for a Carnet de Passage. It is only required at the North Border, and drivers usually get through without a Carnet by paying a variable amount between 80–100 Euros. Also from 2006, Egypt now has its own Carnet, available for those without a valid Carnet de Passage at the borders. It still requires a cash deposit (up to 2000 Euros) which is returned upon exit. The Carnet De Passages En Douane (CPD) is the international customs document which covers the temporary admission of motor vehicles. It is still required today in numerous countries around the world for the temporary admission of private automobiles, commercial vehicles or other categories of motor vehicles. The CPD is used within the framework of the United Nations

Customs Conventions of 1954 and 1956, which cover, respectively, the temporary importation of private and commercial road vehicles. The CPD also forms part of the 1990 Istanbul Convention (ATA Convention), administered by the World Customs Organization. Under these international conventions, the CPD facilitates the temporary importation of motor vehicles by providing security for the payment of any customs duties and import taxes chargeable should the vehicles not be re-exported. The CPD provides the assurance that the vehicle it accompanies is covered by an internationally valid guarantee. The CPD, which is normally valid for one year, may be used during its period of validity in the countries where the document is required or where it may facilitate entry formalities. The period of temporary importation is fixed by the laws or regulations of the country visited. The CPD system eliminates the need for cash deposit and reimbursement formalities as well as national temporary importation documents. It also helps to ensure that travellers and their vehicles can cross national borders with greater ease, fewer formalities, and without on-the-spot payment of additional fees or guarantees. Carnet de Passages en Douane or just the Carnet can be thought of as a passport for your car. It offers a guarantee to a foreign government that the vehicle identified in the Carnet, if granted temporary importation status, will be removed from the country within the time limit imposed by the respective jurisdiction. In the event that the vehicle is not removed within the imposed timeframe, the country may claim from your national automobile association all duties and taxes that would be required to permanently import the vehicle to that country. Using the Carnet is an alternative to leaving a cash security deposit with a foreign government. It allows free movement and unencumbered access between foreign countries. Most countries, but not all, allow this option. A Carnet is valid for one year from the date of issue. The carnet is available to CAA (Canadian Automobile Association) and AAA (American Automobile Association) members and non-members resident in Canada or the US and to others who have a car registered in either Canada or the US. Others must apply to the auto club or carnet issuer in their country of residence. An application for a Carnet de Passages en Douane can be obtained in person or by mail by contacting your local CAA office or by printing the online application form. Along with the application form, you will also need to supply the following:- (i) two photographs of the vehicle (one showing the front and right side and the second the rear and left side); (ii) two signed passport size photographs of the applicant; (iii) a copy of the vehicle registration/permit document (both sides); (iv) a copy of your passport (2 facing pages with picture and expiry date); and (v) application fee. Fees for Canadian residents:- (i) USD650 (plus taxes) for CAA members; and (ii) USD750 (plus taxes) for CAA non-members. Fees for American residents:- (i) USD650 for AAA Members; and (ii) USD750 for AAA non-members. When you have returned home from your trip you must courier (to ensure prompt delivery) the Carnet back to CAA National Office, In order to properly discharge the Carnet. It will have an entry and exit stamp for every foreign country visited on the stub of each page used. The Certificate of Location on the last page inside the Carnet must be endorsed by Canada customs (or US customs in the case of a vehicle returned to the US) confirming the final destination of the vehicle. It is proof to CAA that the vehicle is back in Canada or US (which ever is applicable). When the Carnet is properly discharged by CAA:- (i) 50% of your indemnity insurance premium (plus 8% of taxes less a 7.5% CAA administration fee) will be returned to you; or (ii) the financial guarantee or letter of credit will be returned to you by CAA. Both the carnet and if purchased the indemnity are valid for twelve months. If you plan to extend your overseas trip beyond twelve months a new Carnet and if applicable a further twelve month indemnity will need to be acquired. The fees for each will be the same as for the first twelve months. This will apply for each twelve month period that your trip is extended. In the case of the letter of credit it may be used to renew the Carnet for a second and third year. A new letter of credit will be required to guarantee any further Carnet renewals. See also Admission Temporaire – Temporary Admission Carnet, and Transports Internationaux Routiers Carnet. Carnet is a document, normally issued by a Chamber of Commerce which is a member of the International Chamber of Commerce (ICC) to enable the holder to temporarily take merchandise into certain countries, as samples or for display purposes, without the need to pay import duty or pay a bond for the duty. The issuer will require the holder to give them security by way of a bank guarantee. / привоз (importation). Этот документ часто упоминается как Пассаван (Passavant) на Французском языке, ЛезеПасс (LaizzePasse) или СальвоКондукто (SalvoConducto) на Испанском языке. В переводе с Французского Сэ.Пэ.Дэ. Карнэ или Книжка ДТ (CPD Carnet) это Книжка Допусков В Таможне, произносимая на Французском языке как Карнэ дё Пассаж ан Дуан (Carnet de Passages en Douane)). Смотрите также Адмисьён Тэмпорэр – Темпорэри Эдмишэн Карнэ или Книжка Временного Допуска (Admission Temporaire – Temporary Admission Carnet), и Транспор Этэрнасьёно Рутэр Карнэ или Книжка Международной Дорожной Перевозки (Transports Internationaux Routiers Carnet).

CARNET TIR = TRANSPORTS INTERNATIONAUX ROUTIERS CARNET

CARNIVORE = ПЛОТОЯДНОЕ – Carnivore is a flesh eater. An Insect eating another Insect.

CARNOY FLUID = ЖИДКОСТЬ КАРНУА (или ФИКСАТОР КАРНУА) – Carnoy Fluid is a fixative consisting of 6 parts 95% ethanol, 3 parts chloroform, and 1 part glacial acetic acid.

CAROTENOID = КАРОТИНОИД – Carotenoid – Carotene – a class of violet to orange or yellow fat-soluble unsaturated hydrocarbon pigments, usually with 9 conjugated double bonds, found in most higherplants and responsible for the color of carrots, squashes and sweet potatoes. Carotene assists photosynthesis by transmitting energy from absorbed light to chlorophyll. Dietary carotene is converted to Vitamin A in the liver of animals, which are unable to synthesise their own, and becomes concentrated in fat and cell membranes where it acts as an antioxidant. Carotene may cause a yellowish color in people who consume large amounts in their diet. Carotene pigments extracted from plants are used to color foods such as cheese and margarine. The oxygenated derivatives of carotenes are known as Xanthophylls. / Под Каротиноидами – Каротинами (Carotene) понимается группа природных пигментов жёлтого или оранжевого цвета. По химической природе – изопреноиды; ненасыщенные углеводороды (каротины) или их окисленные производные (ксантофиллы). Синтезируются некоторыми микроорганизмами и всеми растениями, в клетках которых участвуют в фотосинтезе и процессах, связанных с поглощением света (фототаксисы, фототропизмы и другие). Обусловливают окраску плодов, осенней листвы, колоний ряда микробов. В организме животных и человека из каротинов, поступающих с пищей, образуется витамин А (ретинол).

CAROUSEL = КАРУСЕЛЬ – (1) Carousel is a material handling equipment designed to bring product to picker so that the picker can remain stationed in a designated picking location without traveling. Ideally, order information is loaded or automatically transferred into the carousel system, and multiple orders are picked by multiple pickers at one time. Types of carousels include horizontal and vertical.

(2) Carousel is a rotating system of layers of bins and/or drawers that can store many small items using relatively little floor space.

CARPEL = КАРПЭЛЬ (или КАРПЕЛЬ, или ПЛОДОЛИСТИК, или ПЛОДНИК) – Carpel (from New Latin Carpellum, from Greek Karpos = Fruit) is a simple pistil, or a single member of a compound pistil. Carpel is female reproductive part of flower including ovary, style and stigma, which may be solitary, grouped or fused to form a single pistil. One of the individual female reproductive organs in a flower. A carpel is composed of an ovary, a style, and a stigma, although some flowers have carpels without a distinct style. In origin, carpels are leaves (megasporophylls) that have evolved to enclose the ovules. The term Pistil is sometimes used to refer to a single carpel or to several carpels fused together. Carpel is one of the floral units that compose the fruit. A simple pistil or one of the structures of a compound pistil. / – женский репродуктивный орган цветка, состоящий из завязи, столбика и рыльца, . Плодолистик (Carpellum), орган в цветке Покрытосеменных Растений, на котором развиваются Семезачатки (Семяпочки). Из 1

или нескольких плодолистиков образуется Пестик; совокупность плодолистиков называется Гинецеем. Плодолистики считают органом листового происхождения, гомологичным, однако, не листу, а Мегаспорофиллу. Под Плодолистиками понимаются спороносные листы (один или несколько) в цветке. Они несут семязачатки и при срастании краями или с другими плодолистиками образуют завязь пестика. Под Плодолистиками или Карпеллами понимаются сильно видоизменённые и специализированные мегаспорофиллы. Нередко плодолистик называют Пестиком (Простым Пестиком), однако этот термин применяется в разных смыслах и вносит путаницу. Наиболее примитивный тип плодолистика сохранился у Родов Дегенерия (Семейство Дегенериевые) и Рода Тасмания из Семейства Винтеровых. Он состоит из короткой ножки (гиноподия) и относительно тонкой адаксиально сложенной (кондупликатной) пластинки и внешне очень напоминает сложенные в почки кондупликатные листья. Вдоль плодолистика проходят 3 проводящих пучка (жилки), из которых средняя, или спинная (дорсальная), сильно ветвится. Между средней и боковыми жилками расположены многочисленные семязачатки, или семяпочки. На ранних стадиях развития края плодолистиков Дегенерии почти не соприкасаются между собой, а защита семязачатков во время цветения обеспечивается благодаря тесному сближению широких боковых участков плодолистика, расположенных между его краями и плацентами. Срастание этих сближенных внутренних поверхностей происходит лишь после цветения, то есть в процессе развития плода. У других представителей Винтеровых наблюдаются самые различные стадии срастания. У всех цветковых Растений на плодолистике имеется особая, служащая для улавливания пыльцы железистая ткань, называемая Рыльцем. У Дегенерии и Тасмании рыльце примитивное и протягивается по всей длине плодолистика. Верхняя часть плодолистика, в которой оно локализуется, обычно вытягивается в тонкий стерильный столбиковидный вырост, приподнимающий рыльце над фертильной частью (завязью) плодолистика и служащий для прохождения пыльцевой трубки. Эта специализированная тонкая часть плодолистика называется Столбиком (нередко её называют Стилодием, оставляя термин столбик только для сросшихся стилодиев). На ранних стадиях эволюции столбика (стилодия) он характеризуется низбегающим рыльцем, но в процессе дальнейшей эволюции рыльце постепенно локализуется на верхушке (головчатое рыльце). Совокупность плодолистиков в цветке называется Гинецеем. Наиболее примитивные типы гинецея со свободными плодолистиками (например, у Лютика, Магнолии, Пиона) называются апокарпными. В процессе эволюции плодолистики постепенно срастаются между собой, и из апокарпного гинецея возникает ценокарпный, в котором стилодии могут оставаться свободными или же срастаться, образуя столбик. Эволюция ценокарпного гинецея, как и эволюция апокарпного, обычно сопровождается уменьшением числа плодолистиков и в большинстве случаев также числа семязачатков. Крайняя форма редукции числа семязачатков в ценокарпном гинецее – так называемый псевдомономерный гинецей, у которого фертилен и полностью развит один плодолистик (у Ильма, Конопли, Крапивы, Шелковицы и других). Под Карпелем, от Греческого слова Karpos, означающее Плод, понимается один из элементов гинецея, или внутренней мутовки цветка. Содержит один или более семязачатков. Один или более Карпелей образуют пестик. Внутреннюю часть цветка, то есть верхушечную область цветоложа (которая у вдавленного цветоложа может быть расположена ниже остальной его части), занимают плодолистики, или карпеллы. Термин Плодолистик, представляющий собой Русский перевод Немецкого термина Fruchtblatt, явно неудачен, так как уже в самом названии органа дана определённая (в данном случае листовая) интерпретация. Ещё в 1817 был введён удачный термин Carpellum (латинизированное уменьшительное от Греческого слова Karpos, означающее Плод), первоначально для обозначения элементарной части плода, а затем он широко вошёл в Латинскую ботаническую терминологию и в Английский и Романские языки для обозначения плодолистика. В прошлом он переводился на Русский язык словом Плодник, которое, однако, впоследствии вышло из употребления. Нередко плодолистик называют пестиком (простым пестиком), однако этого термина желательно избегать, так как он применяется в довольно разных смыслах и вносит только путаницу.

CARPEL WALL = СТЕНКА ИЗ КАРПЕЛЛ (или СТЕНКА ИЗ ПЛОДОЛИСТИКОВ, или СТЕНКА ИЗ ПЛОДНИКОВ) – Carpel Wall is the thick outer walls of the boll. If insects (e.g., bollworms, green stink bugs) penetrate them, they may cause damage to locks or may cause boll rot, translating into lost yield or lower lint quality.

CARPET = КОВЁР (или НАСТИЛ, или КОВРОВАЯ) – Carpet is a heavy, often tufted fabric used a floor covering.

CARPET BACKING = КОВРОВАЯ ПОДКЛАДКА – Carpet Backing is a primary backing through which the carpet tufts are inserted is always required for tufted carpets. The backing is usually made of woven jute or nonwoven manufactured fiber fabrics. A secondary backing, again made of jute or manufactured fibers, is normally added at the latex backcoating stage. Carpet backings are an important end use for nonwoven fabrics.

CARPET BEETLE = КОВРОВЫЙ ЖУК – Carpet Beetle is the larvae of this Beetle eats wool and other protein fibers. Carpet Beetle may refer to any of the following types of Beetle:- (i) Dermestidae, a Family of Coleoptera; (ii) varied carpet Beetle, a 3 mm-long Beetle that can be a serious household Pest; (iii) black carpet Beetle, a Beetle, Attagenus unicolor, that can be a serious household Pest; (iv) Anthrenus, a Genus of skin Beetles (family Dermestidae); (v) brown carpet Beetle, Attagenus; and (vi) Attagenus pellio, a Pest damaging stored products. Carpet Beetles can damage fabrics, furnishings and clothing that contain natural animal fibers such as wool, silk, hair, bristles, fur or feathers. Synthetic items are resistant to attack, but mixtures of synthetic and natural fibers can be damaged. The natural habitats of carpet Beetles are nests of Birds, Rodents, Insects, and Spiders. They then can spread into homes to damage carpets, rugs, and clothing. They also may feed on pollen and can be carried into the house on cut flowers. The black carpet, common carpet, furniture carpet, and varied carpet beetles usually infest fabrics and carpets, and are of importance. Life Cycle of carpet Beetles can take from three months to two years. The adult female beetles lay up to 100 eggs which hatch into larvae in one to two weeks. The larvae can develop under a wide range of temperature and humidity conditions. They tend to avoid light and actively feed in dark cracks, crevices or folds. Most frequently they are found in the closets, drawers or inside upholstered furniture. A larva requires from nine months to as much as three years to complete its growth, depending upon climatic conditions and food. The larvae wander considerably and may be found anywhere in a building. Adults are attracted to light and often are found on windows or around flowers. The adults are good fliers and may spread in materials infested with eggs, larvae, or pupae. Black Carpet Beetle adults are 1/8 to 1/4” in length, black in color with brown legs. The larva is slightly less than 3/8” in length; body is narrow carrot-shaped and covered with short hairs and has long terminal bristles. Their life cycle is 180 to 650 days. These beetles inhabit in carpeting, clothing, furs, upholstered furniture, kid leather, books, bird nests, milk powders, and other articles containing animal products and natural fibers. It is also commonly found eating pollen, particularly that of spiraea. Common Carpet Beetle adults are about 1/8” in length, gray to black in color and whitish and orange scales on the back. The larva are carrot-shaped, reddish brown in color with many black to brown hairs. Their life cycle is 77 to 110 days. Common carpet beetles inhabit in fabrics, furnishings, and clothing retaining animal products such as wool, silk, hair, bristles, fur, feathers, etc. Furniture Carpet Beetle adults are about 1/8” in length with yellow, white, and black spots dorsally and white ventrally. The larva are about 3/16” long, carrot-shaped and dark red to brown in color. Their life cycle is 149 to 422 days. These Beetles inhabit in woolen upholstery and padding such as feathers and hair as well as materials containing animal products and natural fibers. Varied Carpet Beetle adults are about 1/8” in length, with white brown and yellowish scales dorsally and grayish-yellow scales ventrally. The larva are about 3/16” in length, carrot-shaped, with alternating light and dark brown transverse

stripes. Their life cycle is 249 to 354 days. Varied carpet beetles inhabit in carpets, woolen goods, furs, silks and other materials containing animal products and natural fibers. Control:- (i) Prevention:- carpet Beetle larva can feed on dust and lint. Good housekeeping prevents infestations. Frequent cleaning of floors to remove dust and lint eliminates much of the available food supply, and some of the carpet Beetles. However, regular cleaning will not remove dust and lint from air conditioning ducts and other inaccessible areas. Dry cleaning clothes not only removes oils and stains, it will also kill carpet Beetles. Clothes should be dry cleaned regularly. Stored materials subject to Beetle damage should be thoroughly cleaned before storage. The storage area should be a chest, closet, or other container that can be tightly closed and into which moth balls or flakes are usually labeled to be placed at the rate of 1 lb per 50 cubic feet of space. The initial treatment should kill the carpet beetles; however, this method should not be relied upon to protect stored fabrics over an extended period of several months or more. Stored materials should be periodically sunned and brushed. Cedar chests will not kill carpet beetles. (i) Inspection:- find sources of carpet beetle infestations. Although carpet beetles damage fabrics in a house, they may also be found in nests built by sparrows, starlings or pigeons on or inside the house or brought in on cut flowers. Wasp nests under eaves or in attics are also common sources of carpet beetles because the larvae will feed upon the skins and larvae of wasps. Dead Insects in attics or inaccessible areas may also be an important reservoir of infestation. Also, accumulations of debris in ventilation ducts in the house may be a source. (iii) Nonchemical Control:- adult carpet beetles can be captured on sticky fly paper baited with animal products. Cedar products can be used to protect susceptible items. Newly hatched larvae die when exposed to cedar, but older larvae and adults are not affected. The heartwood of red cedar has a vapor that is toxic to larvae, but after cedar is more than 36 months old it is useless for control. Bags containing cedar chips can be replaced regularly to help provide control. Plastic bags and tight containers can be used to store garments. These containers prevent adult beetles from laying eggs on or near susceptible clothing. But if the clothing is infested, the bags will confine the infestation to just a few items. Cold storage has been long used to protect articles attacked by carpet beetles. Clothing, coats and sweaters stored at 40 to 42 °F will be protected for long periods of time. Freezing has also been used to kill carpet beetles. Infested materials should be placed in plastic bags and loosely packed in a chest freezer at –20 °F for three days. Reducing the air in the bag eliminates the formation of ice. Heat has also been used to kill or repel carpet beetle larvae. Exposure of infested items to 105 °F for four hours is sufficient; placing infested items in the hottest rays of the sun causes larvae to abandon the fabric. (iv) Chemical Control:- insecticide sprays are registered for control of carpet beetles. Indoor spot or surface treatment with insecticides can provide effective control of carpet beetles, although more than one application may be necessary. Clothes should not be sprayed directly. Surfaces where clothes are stored can be sprayed and allowed to dry. Then clothes can be placed on those surfaces. When spraying or dusting rugs, closet areas, and storage areas, be sure to treat all known or suspected feeding and hiding places. Carpet beetles leaving the infested products will contact the sprayed surfaces and die. Space sprays are also effective in killing exposed stages of carpet beetles. These are most effective when an infestation is confined to a closet or other enclosed area. Calculate the volume of the space and treat with the recommended amounts of product. In cases where entire homes are infested, fumigation can be used. / разводы (или потёки).

CARPET MANUFACTURING = ИЗГОТОВЛЕНИЕ КОВРОВ – Carpet Manufacturing:- since time immemorial, carpets and rugs have been a part of home. Apart from decorating, carpets give a style statement and add character to a room. They come in a wide range of styles, all of which have specific functionality. Carpets and Rugs are tender to feet and bring warmth to the whole atmosphere. Besides the aesthetic sense spread by the hand woven traditional carpets, there are modern contemporary carpets too, having such amazing properties, such as sound absorption. Types of Carpets and their Manufacturing Process:- carpets differ in a variety of ways – their styles, the methods adopted for their manufacturing, the finishes given to them and the different applications they are put to. When it comes to carpet manufacturing, different techniques are adopted. The methods of carpet making vary from region to region. They are handwoven as well as manufactured through machines. Both of them have their own distinct characteristics. Carpets are sometimes decorated through embroidery or other crafts giving them grace and elegance. Machine made carpets are very good in their finish and have very smooth surface. Woven Carpets:- these type of carpets are woven on big looms, more or less like any other fabric is woven. They may have cut and uncut piles and loops. Various colorful yarns are used for making a variety of patterns and designs on the carpets. As too much of labor and toil is required for making these woven carpets, they are generally very expensive. Loop Pile Carpet:- in such a carpet, the pile forms a loop. When the yarn is threaded through the backing and then sewn back through, a loop of yarn is formed. Continuous rows of loops produce a wide variety of textures from thick and nubbly to smooth and plain. The twist and the density of the yarn determine the quality of a loop pile carpet. Cut Pile Carpet:- a cut pile carpet is made by cutting off loop tops for creating pile which stands upright with an even surface. It turns out to be very soft and creates a smooth, comfortable and luxurious feel. Like other carpets, it is also constructed in loops but the loops are then cut into pile manually or with the help of machines. Carpet with high density pile are far more better than carpets having low density pile. Cut Loop Pile Carpets:- these carpets have the features of both, the cut pile carpet and the loop pile carpet. They are manufactured with the combination of looped yarn and cut yarn. Some of the loops are tufted higher than the others. While shearing the carpets, the higher loops are cut whereas the lower loops remain untouched. The cut pile thus formed looks darker than the loops, creating interesting patterns giving a rich visual experience by reflecting light in varied manners. Sculptured effects can be produced by giving a variety of pile heights to it. Knotted Pile Weave Carpets:- these carpets are also referred to as Pile Weave Rugs or Pile Weave Carpets. They are manufactured with knots on them. For making such a carpet, each pile is knotted manually to the wrap threads according to the predetermined design. Knot is created in every row after which one or more strands of weft are passed through a complete set of warp strands. In the mid of every row with knots, one or more wefts are placed to secure the knots. This is done with the help of such simple tools as knife, hook, pair of scissors and a heavy comb, made of wood and metal. These equipment are used to beat the knots and weft in a row. After knotting whole of the carpet, the pile is shorn to the desired length. The carpet is finally washed or treated with chemicals according to the required finish. A pile weave rug has around 25 to over 1 000 knots per square inch. More number of knots per square inch means better quality of carpet. The knots also differ from region to region. Some of the prevalent knots are Persian Knots, Turkish Knots, Spanish Knots, double Knots, Tibetan Knots and others. Needlefelt Carpets:- Needlefelt Carpets are the modern carpets made with the help of advanced techniques. They are made by electrostatic attraction of individual synthetic fibers resulting in extremely durable carpets. In this process the fibers are compressed on to a backing of textile or other materials like foam etc. with the help of needles. A binding agent is used to make the fibers attach to the backing more durably. Although fibers can be bound or felted without a backing too but the backing is used to give extra protection. To make the binding strong and lasting, the needled substrate is subsequently subjected to further thermal or chemical treatment. Other Carpets and Rugs:- there are certain other carpets which are neither woven nor felted. Embroidered Carpets:- these carpets are made through stitches applied on to a cloth, often linen, as a base. They are not formed on a loom. A great craftsmanship is required to execute the details and sometimes, it almost takes a year to weave a single carpet with rich embroidery. Two types of stitches are generally used to make embroidered carpets:- the tent stitch and the cross stitch. The designs and patterns of the embroidered carpets vary with region, history and cultural traditions. The most popular carpets include Persian embroidered carpets, Kashmir embroidered carpets and Turkish embroidered carpets. They are the most prized home decor items. Braided Rugs:- these rugs come with unique weaving texture. The braids are arranged and combined in such a manner that it looks like as if the braids of yarn have been woven together. They are mostly used for indoor accents or as outdoor mats. Yarn used in such types of rugs may vary from jute, sisal and coir to wool, cotton or synthetic fibers. While selecting the fibers, characteristics such as

moisture resistance, stains resistance, strength against abrasion, environmental concerns, and price are considered. / Ковёр С Вытяжным Ворсом или Ковёр С Булавчатым Ворсом (Loop Pile Carpet). Бархатный Ковёр С Разрезным Ворсом (Cut Pile Carpet). Ковры С Разрезанными Ворсовыми Петлями (Cut Loop Pile Carpets). Плетёные Коврики (Braided Rugs).

CARPETS = КОВРЫ – Carpets are the heavy functional and ornamental floor coverings consisting of pile yarns or fibers and a backing system. They may be tufted or woven. See also Tufted Carpet.

CARPET THREAD = КОВРОВАЯ НИТЬ – Carpet Thread is a heavy thread used for repairing carpets and for sewing on buttons. Carpet thread was originally made of cotton, but usually is made of polyester today.

CARPET UNDERLAY = КОВРОВАЯ ПОДКЛАДКА – Carpet Underlay is a separate fabric which is used to provide cushioning for carpet. Carpet underlays are made of hair and jute, sponge rubber, bonded urethane or foamed urethane.

CARPET WOOL = ШЕРСТЬ ДЛЯ КОВРОВ – Carpet Wool is a coarse, harsh, strong wool that is more suitable for carpets than for fabrics. Very little of this type is produced in the United States. Some of the choicer carpet wools are used to make tweeds or other rough sport clothing. Some breeds, like Karakul, are mainly used for rugs.

CAR POOLING = ОБЪЕДИНЕНИЕ (или ФОРМИРОВАНИЕ, или ЦЕНТРАЛИЗАЦИЯ) ВАГОНОВ – Car Pooling:- use of individual carrier/rail equipment through a central agency for the benefit of carriers and shippers.

CARRDI = CAMBODIAN RICE RESEARCH AND DEVELOPMENT INSTITUTE

CARRIAGE AND INSURANCE PAID TO = ПЕРЕВОЗКА И СТРАХОВАНИЕ ОПЛАЧЕНЫ ДО (или ПЕРЕВОЗКА И СТРАХОВАНИЕ ОПЛАЧЕНО ДО) – 'Carriage and Insurance Paid to …' (CIP), a term of INCOTERMS® 2000, means that the seller delivers the goods to the carrier nominated by him, but the seller must in addition pay the cost of carriage necessary to bring the goods to the named destination. This means that the buyer bears all risks and any additional costs occurring after the goods have been so delivered. However, in CIP the seller also has to procure insurance against the buyer's risk of loss of or damage to the goods during the carriage. Consequently, the seller contracts for insurance and pays the insurance premium. The buyer should note that under the CIP term the seller is required to obtain insurance only on minimum cover. Should the buyer wish to have the protection of greater cover, he would either need to agree as much expressly with the seller or to make his own extra insurance arrangements. Carrier means any person who, in a contract of carriage, undertakes to perform or to procure the performance of transport, by air, rail, road, sea, inland waterway or by a combination of such modes. If subsequent carriers are used for the carriage to the agreed destination, the risk passes when the goods have been delivered to the first carrier. The CIP term requires the seller to clear the goods for export. This term may be used irrespective of the mode of transport, including multimodal transport. Xxxxx. CIP (insert named place of destination) Incoterms® 2010:- this rule may be used irrespective of the mode of transport selected and may also be used where more than one mode of transport is employed. 'Carriage and Insurance Paid to' means that the seller delivers the goods to the carrier or another person nominated by the seller at an agreed place (if any such place is agreed between the parties) and that the seller must contract for and pay the costs of carriage necessary to bring the goods to the named place of destination. The seller also contracts for insurance cover against the buyer's risk of loss of or damage to the goods during the carriage. The buyer should note that under CIP the seller is required to obtain insurance only on minimum cover. Should the buyer wish to have more insurance protection, it will need either to agree as much expressly with the seller or to make its own extra insurance arrangements. When CPT, CIP, CFR or CIF are used, the seller fulfils its obligation to deliver when it hands the goods over to the carrier and not when the goods reach the place of destination. This rule has two critical points, because risk passes and costs are transferred at different places. The parties are well advised to identify as precisely as possible in the contract both the place of delivery, where the risk passes to the buyer, and the named place of destination to which the seller must contract for carriage. If several carriers are used for the carriage to the agreed destination and the parties do not agree on a specific point of delivery, the default position is that risk passes when the goods have been delivered to the first carrier at a point entirely of the seller's choosing and over which the buyer has no control. Should the parties wish the risk to pass at a later stage (e.g., at an ocean port or an airport), they need to specify this in their contract of sale. International Chamber of Commerce™:- The parties are also well advised to identify as precisely as possible the point within the agreed place of destination, as the costs to that point are for the account of the seller. The seller is advised to procure contracts of carriage that match this choice precisely. If the seller incurs costs under its contract of carriage related to unloading at the named place of destination, the seller is not entitled to recover such costs from the buyer unless otherwise agreed between the parties. CIP requires the seller to clear the goods for export, where applicable. However, the seller has no obligation to clear the goods for import, pay any import duty or carry out any import customs formalities. / ИНКОТЁРМЗ 2000. Перевозка Оплачена До (ПРО (CPT)), Перевозка И Страхование Оплачено До (ПСО (CIP)).

CARRIAGE FORWARD = ПЕРЕВОЗКА XX – Carriage Forward also, Carriage Collect, means freight payable at destination.

CARRIAGE OF DANGEROUS GOODS BY ROAD = ПЕРЕВОЗКА ОПАСНЫХ ТОВАРОВ ПО АВТОДОРОГАМ – Carriage of Dangerous Goods by Road is subject to the international regulations, binding in all the European countries. This is the European Agreement concerning the International Carriage of Dangerous Goods by Road, commonly known as ADR (from the French abbreviation Accord Européen Relatif au Transport International des Marchandises Dangereuses par Route) and its administrative acts:- the Government Declaration of 16 January 2009 concerning entering into force amendments to the Annexes A and B of the European Agreement concerning the International Carriage of Dangerous Goods by Road (ADR), drawn up in Geneva on 30 September 1957 (Journal of Laws No 27, item 162). Additionally, in Poland, the Act of 28 October 2002 concerning the carriage of dangerous goods by road, is in force. The purpose of this regulations is to eliminate or limit the risk related to the transport of dangerous goods, by limiting the probability of accidents and size of potential damages. Such actions should not result in placing bans on transport, but the carriage itself is subject to numerous legal requirements and limitations. These regulations concern, among other things:- (i) rules for classification of dangerous materials; (ii) conditions and methods of carriage of dangerous goods by road; (iii) labelling of the elements of consignment; (iv) additional requirements concerning the vehicle carrying respective dangerous materials; (v) equipment and crew of the vehicle; and (vi) documents required for the carriage, their templates and the course of issue. In compliance with the regulations concerning the carriage of dangerous goods by road, the entrepreneur and other entity performing the carriage of dangerous goods or loading and unloading connected with such carriage, is obliged to conduct the internal supervision over these actions and appoint, at his own expenses, a certified dangerous goods safety advisor (DGSA or ADR Advisor). See also The European Agreement Concerning the International Carriage of Dangerous Goods by Road. / Акорд Эропеэнн Рэлятиф о Транспор Этэрнасьёналь дэ Маршандиз Данжёрёз пар Рут (сокращённо – А.Дэ.Эр.).

CARRIAGE OF GOODS BY SEA ACT = АКТ О МОРСКОЙ ПЕРЕВОЗКЕ ГРУЗОВ – The Carriage Of Goods By Sea Act (COGSA) is a United States statute governing the rights and responsibilities between shippers of cargo and ship-owners regarding ocean shipments to and from the United States. It is the US enactment of the International Convention Regarding Bills of Lading, commonly known as the Hague Rules. It was found in Title 46 Appendix of the United States Code, starting at Section 1301, but has been moved

to a note in 46 United States Code 30701. The United States Congress, concerned that the Hague Rules did not offer shippers enough protection against damage to cargo by shipowners, amended the Hague Rules in a number of minor, but important, ways. It increased the amount that shipowners would have to pay cargo owners for damage in transit from GBP100.00 per package to USD500.00 per package or, for goods not shipped in packages, per customary freight unit. This 'package limitation' has become one of the most contentious and litigious areas in the field of cargo damage, particularly as it relates to the transportation of goods by ocean shipping containers. Carriage of Goods by Sea Act (COGSA) is a law enacted in 1936 covering the transportation of merchandise by sea to or from ports of the United States and in foreign trades. The Carriage of Goods by Sea Act of 1936 was meant to be a marked impovement on The Harter Act of 1893. COGSA governs all shipping involving American ports. Its purpose is to protect shippers from liability if cargo is damaged. If stated in the bill of lading, it can also apply to domestic shipping, this has become standard. Unlike Harter, where goods are the responsibility of the shipper from pier to pier, COGSA states that the shipper is responsible only while the cargo is on the ship, being loaded or, being unloaded. Like Harter, COGSA includes a list of immunities if damage results in certain situations. With these immunities comes some responsibility. There are several specific limitations in COGSA to further protect shippers from undue litigation. If the cargo is damaged, the claimant has one year from the stated delivery date on the bill of lading to proceed with litigation. Also, the complaint must be filed no later then three days from the date of delivery of the cargo. The Hague has recognized COGSA and has implimented it as the de-facto international standard. Unfortunately, the act is to long to copy and annotate here, so I will summarize. There are 17 situations in which the shipper is not responsible for damage to the cargo:- (i) errors in navigation; (ii) fires caused by non-malicious forces or accidents on the part of the shipper; (iii) perils of the Sea; (iv) an Act of God:- this is what freak accidents are attributed to; (v) acts of war; (vi) an act against the ship by public enemies. This includes terrorism, vandalism, and arson; (vii) seizure by customs or legal authorities; (viii) quarantine restrictions; (ix) act or ommission of the shipper. This is an ambiguous catch-all phrase, still open to interpretation. (x) strikes and lockouts. When stevedores are unable to unload a ship, damage can be caused to many goods, such as fruit, coffee, and frozen goods; (xi) riots and looting; (xii) rescuing or attempting a rescue at sea; (xiii) previous damage, inherent defects, and low quality; (xiv) bad packaging, for instance, when containerization came about, the responsibility for packing containers fell to the manufacturer. If a container full of computers was packed loosely, the computers would slide into each other at sea and break; (xv) bad markings:- this is why FRAGILE, LIFT HERE, and proper shipping directions are on everything; (xvi) any defects not discoverable by due diligence; (xvii) any other damage to the product not caused by the shipper. This is the catch-all phrase. The above 17 immunities can be enjoyed only if four conditions are met:- (i) the ship must be seaworthy; (ii) the ship must be manned and equipped properly; (iii) the cargo must be stowed properly; and (iv) the spaces in which the cargo is stored must be safe and proper for the cargo. This means that ammunition is not to be stored next to the boilers. There are several court cases that have further defined and shaped the current implimentation of COGSA. The US courts established that any litigation involving COGSA would have to be in US courts unless the two parties agreed to another location. In Indussa Corporation vs. The Ranborg, the bill of lading designated Dutch courts as the place for all litigation involving the cargo on that bill. The US court overturned that, saying US courts could not be discluded as a location for COGSA litigation. In Riverstone Meat Company vs. Lancashire Shipping Company, a shipyard forgot to replace a valve cover. The cargo in one hold ended up soaked in seawater. The fault was deemed to lie with the ship owner for not exercising due diligence in preventing an obvious mistake. This is related to the seaworthiness requirement. In Mississippi Shipping Company vs. Zander and Company, The DelSud grazed a pier. This happened while the ship was being tugged out. At the time, the crew and captain weren't on deck, as the harbor pilot had responsibility for the boat. The cargo was damaged by leaking seawater. The court said that the shipper was NOT liable, because the voyage had commenced, and it was an error in navigation, not a seaworthiness issue. US federal codification passed in 1936 which standardizes carrier's liability under carrier's bill of lading. US enactment of The Hague Rules.

CARRIAGE PAID TO = ПЕРЕВОЗКА ОПЛАЧЕНА ДО – 'Carriage Paid to …' (CPT), a term of INCOTERMS® 2000, means that the seller delivers the goods to the carrier nominated by him but the seller must in addition pay the cost of carriage necessary to bring the goods to the named destination. This means that the buyer bears all risks and any other costs occurring after the goods have been so delivered. Carrier means any person who, in a contract of carriage, undertakes to perform or to procure the performance of transport by air, rail, road, sea, inland waterway or by a combination of such modes. If subsequent carriers are used for the carriage to the agreed destination, the risk passes when the goods have been delivered to the first carrier. The CPT term requires the seller to clear the goods for export. This term may be used irrespective of the mode of transport including multimodal transport. CPT (insert named place of destination) Incoterms® 2010:- this rule may be used irrespective of the mode of transport selected and may also be used where more than one mode of transport is employed. 'Carriage Paid to' means that the seller delivers the goods to the carrier or another person nominated by the seller at an agreed place (if any such place is agreed between the parties) and that the seller must contract for and pay the costs of carriage necessary to bring the goods to the named place of destination. When CPT, CIP, CFR are used, the seller fulfils its obligation to deliver when it hands the goods over to the carrier and not when the goods reach the place of destination. This rule has two critical points, because risk passes and costs are transferred at different places. The parties are well advised to identify as precisely as possible in the contract both the place of delivery, where the risk passes to the buyer, and the named place of destination to which the seller must contract for the carriage. If several carriers are used for the carriage to the agreed destination and the parties do not agree on a specific point of delivery, the default position is that risk passes when the goods have been delivered to the first carrier at a point entirely of the seller's choosing and over which the buyer has no control. Should the parties wish the risk to pass at a later stage (e.g., at an ocean port or airport), they need to specify this in their contract of sale. The parties are also well advised to identify as precisely as possible the point within the agreed place of destination, as the costs to that point are for the account of the seller. The seller is advised to procure contracts of carriage that match this choice precisely. If the seller incurs costs under its contract of carriage related to unloading at the named place of destination, the seller is not entitled to recover such costs from the buyer unless otherwise agreed between the parties. CPT requires the seller to clear the goods for export, where applicable. However, the seller has no obligation to clear the goods for import, pay any import duty or carry out any import customs formalities. / ИНКОТЁРМЗ 2000. Перевозка Оплачена До (ПРО (CPT)).

CARRIER = ЛИЦО, ОТВЕТСТВЕННОЕ ПО РИСКУ – In the United States, Carrier is a commercial insurer contracted by the Department of Health and Human Services to process Medicare Part B claims payments. An insurance company which carries the insurance. The terms insurance company or insurer are preferred because of the possible confusion of carrier with transportation terminology. Carrier is an insurer or reinsurer.

CARRIER = НОСИТЕЛЬ – Carrier:- (1) transport proteins that bind specific solutes and undergo conformational change in order to transport the solute across the membrane. (2) A material necessary to hold pesticide and fertilizer elements in a form suitable for application. (3) With respect to disperse dyes, a chemical that aids dyeing at moderate temperature. In order to dye polyester with disperse dye in a reasonable time at the boil, it is necessary to use a carrier. Exactly how the carrier works seems to be a matter of some controversy, but it may work by swelling the fibers so that the dye can penetrate. The carrier will eventually evaporate from the fiber after dyeing is complete. Carriers are obsolescent in industrial process, partly because they are quite noxious and environmentally undesirable. Be sure to read and understand the material safety data sheet (MSDS) for any carrier chemical you contemplate using.

CARRIER = ПЕРЕВОЗЧИК – Carriers are owners or operators of vessels providing transportation to shippers. The term is also used to refer to the vessels. The Carrier transports goods from the client to Logistics Depot (LD) and from LD to the consignee. The carrier can be Logistics Depot, a transportation company, or the railroad. Responsibilities include carrying the goods safely, in good condition and in a timely manner. Any person or entity who, in a contract of carriage, undertakes to perform or to procure the performance of carriage by rail, road, sea, air, inland waterway or by a combination of such modes. A Carrier or Common Carrier is defined as a '… Motor Carrier, a Water Carrier, and a Freight Forwarder'. 49 USC §13102(3) (2005; 49 USC is short for the United States Code:- Title 49). The ICC (short for the Interstate Commerce Commission; it was eliminated in 1994; Effective 1996-January-01, the US Department of Transportation (DOT) assumed the Interstate Commerce Commission's (ICC) remaining responsibilities for administering trucking regulations) Termination Act deleted all references to 'Common Carrier', which is one that holds itself out to public as ready to carry goods for anyone who requests its services, as distinguished from a private carrier, which reserves the right to accept or reject employment as a carrier. Under the Act, there is not a distinction between a 'Carrier' and 'Common Carrier'. One who owns, operates or charters vehicles of transportation for movement of cargo. Carrier is a person or company that transports goods or people for any person or company and that is responsible for any possible loss of the goods during transport.

CARRIER = БЕГУНОК (или ПРОВОДНИК, или НОСИТЕЛЬ, или ПЕРЕНОСЧИК, или ДЕРЖАВКА, или ПЕРЕДАТОЧНАЯ ШЕСТЕРНЯ, или ГОЛОВКА ОПЛЁТОЧНОЙ МАШИНЫ) – (1) Carrier is a product added to a dyebath to promote the dyeing of hydrophobic manufactured fibers and characterized by affinity for, and ability to swell, the fiber. / Сродство (Affinity). Бегунок – деталь (в виде скобы), обеспечивающая совмещённый процесс кручения и намотки нити на кольцепрядильных и кольцекрутильных машинах.

(2) Carrier is a moving holder for a package of yarn used on a braiding machine.

(3) Carrier is a term sometimes used to describe the tube or bobbin on which yarn is wound.

CARRIER HAULAGE = ПОДВОЗ ПЕРЕВОЗЧИКОМ (или ДОСТАВКА ПЕРЕВОЗЧИКОМ) – Carrier Haulage:- the inland transport service, which is performed by under the sea-carrier's responsibility under the terms and conditions of a tariff and of the relevant transport document (B/L). The inland transport service which is performed by the sea-carrier under the terms and conditions of the tariff and of the relevant transport document. / порядки и условия .

CARRIERLESS DYEING VARIANTS = ВАРИАНТЫ КРАШЕНИЯ БЕЗ ПЕРЕНОСЧИКА – Carrierless Dyeing Variants are the polymers that have been modified to increase their dyeability. Fibers and fabrics made from these polymers can be dyed at the boil without the use of carriers.

CARRIER LIABILITY = ОТВЕТСТВЕННОСТЬ ПЕРЕВОЗЧИКА – Carrier Liability:- a common carrier is liable for all shipment loss, damage, and delay with the exception of that caused by act of God, act of a public enemy, act of a public authority, act of the shipper, and the goods' inherent nature.

CARRIER'S CERTIFICATE = СВИДЕТЕЛЬСТВО ПЕРЕВОЗЧИКА (или СЕРТИФИКАТ ПЕРЕВОЗЧИКА) – Carrier's Certificate is a release order used to advise customs of the details of the shipment, its ownership, port of lading, etc. By means of this document the carrier certifies that the firm or individual named in the certificate is the owner or consignee of the cargo. A US Customs form used in lieu of a bill of lading. Carrier's Certificate:- this document advises US Customs of shipment details such as ownership and port of lading. It is also used by the carrier to certify that the entity named in the certificate is the owner/consignee of the cargo. Also known as Carrier Certificate, or Release Order. US Custom's form used in lieu of Bill of Lading. Carrier's Certificate is a certificate required by US Customs to release cargo properly to the correct party. Used to advise customs of the shipment's details. By means of this document, the carrier certifies that the firm or individual named in the certificate is the owner or consignee of the cargo.

CARRIER'S LIEN = УДЕРЖАНИЕ (ГРУЗА) ПЕРЕВОЗЧИКОМ (или ПРАВО ПЕРЕВОЗЧИКА НА ОБРАЩЕНИЕ ВЗЫСКАНИЯ НА ПРЕДМЕТ ЗАЛОГА) – Carrier's Lien is a type of lien that gives a security interest in shipped goods to a shipper that publicly operates a business for the transporation of goods. This lien typically arises when the shipper takes possession of the goods and lasts until the shipper has been paid for their transporation. If someone fails to pay for shipment as promised, a carrier's lien allows the carrier to keep the goods as collateral. Carrier's Lien:- when the shipper ships goods collect, the carrier has a possessory claim on these goods, which means that the carrier can retain possession of the goods as security for the charges due. Carrier's Lien is the right of an individual or organization that publicly advertises itself for hire for the transportation of goods to keep possession of the cargo it has delivered to a destination until the person who is liable to pay the freight charges plus any other expenses incurred by its shipment has done so. Not all carriers are automatically entitled to have a lien for nonpayment of freight charges. A private carrier, one that does not offer its services to the public but transports goods pursuant to a special agreement, does not have a lien on property shipped unless provided by statute or under the terms of the carriage contract. When a carrier retains goods under a lien it must exercise reasonable care to protect the cargo. It will be liable for any damage to such property that might have been avoided if ordinary precautions had been taken. Damages resulting solely from the detention of the property are the responsibility of the person who has failed to pay the freight charges; he or she must absorb that loss. The carrier has the right to exercise a lien on cargo on freight collect shipments and thus retain possession of the goods as security for the charges due. In law, Carrier's Lien is the right to hold the consignee's cargo until payment is made for transporting it. In common law, a common carrier is entitled to retain possession of the goods until freight is paid but not to sell the goods or use them; the parties, however, may agree that the carrier shall have an active lien entitling him to sell the goods. Carriers in civil-law jurisdictions ordinarily have a privilege on the goods carried by them for the payment of the freight and of incidental expenses, including the right to sell the goods. Aside from this privilege, the carrier in .... The right to retain possession of goods pending payment of overdue freight charges. The term may refer, also, to the right of a carrier to retain cargo pending payment for a general average (GA) contribution; but may be discharged in such cases by the payment of a GA deposit or provision of an acceptable GA guarantee. Carrier's Liens:- the law strives everywhere to secure payment of the freight to a carrier who has carried the goods to their destination. In common-law jurisdictions, the carrier may have to this effect a common-law lien, a statutory lien, or even a contractual lien. In civil-law jurisdictions, the carrier has, ordinarily, a privilege on the things carried. A common carrier in common-law jurisdictions has a common-law lien under which he is entitled to retain possession of the goods until earned freight is paid to him. The carrier is not entitled to sell the goods or to use them; parties, however, may agree that the carrier shall have an active lien – namely, that he shall have the right to sell the goods. Thus, in maritime carriage in the United States, the shipowner is clearly entitled to seize and sell the goods carried by him in case of nonpayment of the freight. Parties may agree that the carrier shall have no lien at all or that he shall have a general lien on the goods carried, namely, a lien covering debts other than the pending freight. After the lien is exercised, the carrier has the rights and duties of a bailee. He may thus be liable for loss or damage occasioned by his negligence, and he may be entitled to recover expenses that were reasonably necessary for the preservation of the goods. Carriers in civil-law jurisdictions ordinarily have a privilege on the goods carried by them for the payment of the freight and of incidental expenses. In France and in systems following the French model, this privilege is available only to professional carriers who carry goods by contract of carriage. The civil-law privilege differs from a common-law lien in that it confers on the carrier power and

authority to sell the goods for the satisfaction of his claims. The privilege covers the whole shipment as determined by the documents of transport and is extinguished upon delivery of the goods to the consignee. Quite apart from the privilege, the carrier in civil-law jurisdictions may be entitled, under the general law of obligations, to refuse delivery of the goods until payment of the freight; moreover, he may secure payment of the freight by a variety of contractual arrangements. Carrier's Lien is the transporter's claim on the cargo being transported for the unpaid freight. See also Lien. Enforcement of Carrier's Lien:- (a) a carrier's lien on goods may be enforced by public or private sale of the goods, in bulk or in packages, at any time or place and on any terms that are commercially reasonable, after notifying all persons known to claim an interest in the goods. The notification must include a statement of the amount due, the nature of the proposed sale, and the time and place of any public sale. The fact that a better price could have been obtained by a sale at a different time or in a method different from that selected by the carrier is not of itself sufficient to establish that the sale was not made in a commercially reasonable manner. The carrier sells goods in a commercially reasonable manner if the carrier sells the goods in the usual manner in any recognized market therefor, sells at the price current in that market at the time of the sale, or otherwise sells in conformity with commercially reasonable practices among dealers in the type of goods sold. A sale of more goods than apparently necessary to be offered to ensure satisfaction of the obligation is not commercially reasonable, except in cases covered by the preceding sentence. (b) Before any sale pursuant to this section, any person claiming a right in the goods may pay the amount necessary to satisfy the lien and the reasonable expenses incurred in complying with this section. In that event, the goods may not be sold but must be retained by the carrier, subject to the terms of the bill of lading and this Article. (c) A carrier may buy at any public sale pursuant to this section. (d) A purchaser in good faith of goods sold to enforce a carrier's lien takes the goods free of any rights of persons against which the lien was valid, despite the carrier's noncompliance with this section. (e) A carrier may satisfy its lien from the proceeds of any sale pursuant to this section but shall hold the balance, if any, for delivery on demand to any person to which the carrier would have been bound to deliver the goods. (f) The rights provided by this section are in addition to all other rights allowed by law to a creditor against a debtor. (g) A carrier's lien may be enforced pursuant to either subsection (a) of this section or the procedure set forth in RCW62A.7-210 (b). (h) A carrier is liable for damages caused by failure to comply with the requirements for sale under this section and, in case of willful violation, is liable for conversion.

CARROTY = МОРКОВНОЕ – Carroty:- having the color of carrots.

CARRY = ЗАТРАТЫ (или ЗАНОСИТЬ В …) – Carry:- to transfer (an item) to another account, esp to transfer to the following year's account instead of writing off against profit and loss. Also (especial US):- Carry Over:- to carry a loss. See also Carrying Charges. / Смотрите также Накладные Расходы (Carrying Charges).

CARRY = ПЕРЕНОС (или ПЕРЕХОД, или ПЕРЕВОД) – Carry:- the simultaneous purchase and sale of the same tonnage of the same metal for delivery on different dates. See also Borrowing, and Lending. Carry:- the price spread between nearby and more distant futures contracts. This can be viewed as the amount the market is currently paying for storage.

CARRYBACK = ПЕРЕНОС В ПРОШЛЫЙ ПЕРИОД – Carryback:- deductions or credits that cannot be utilized on the tax return during a year that may be carried back to reduce taxable income or taxes payable in a prior year. An operating loss carryback is an excess of tax deductions over gross income in a year; a tax credit carryback is the amount by which tax credits available for utilization exceed statutory limitations. Different tax jurisdictions have different rules about whether excess deductions or credits may be carried back and the length of the carryback period. Carryback:- in taxation accounting, using a current tax year's deductions, business losses or credits to refigure and amend a previously filed tax return to reduce the tax liability. See also Carryover. Carry-Back:- the name given to the method provided under federal tax law that allows a taxpayer to apply net operating losses incurred during one year to the recomputation of Income Tax owed to the government for three preceding taxable years. Carryback is a loss sustained or a portion of a credit not used in a given period that may be deducted from taxable income of a prior period. Carryback is a technique for receiving a refund of back taxes by applying a deduction or credit from a current year to a prior year. Also called Tax Loss Carryback.

CARRYFORWARD = ПЕРЕНОС В БУДУЩИЙ ПЕРИОД – Carryforward:- deductions or credits that cannot be utilized on the tax return during a year that may be carried forward to reduce taxable income or taxes payable in a future year. An operating loss carryforward is an excess of tax deductions over gross income in a year; a tax credit carryforward is the amount by which tax credits available for utilization exceed statutory limitations. Different tax jurisdictions have different rules about whether excess deductions or credits may be carried forward and the length of the carryforward period. The terms Carryforward, Operating Loss Carryforward, and Tax Credit Carryforward refer to the amounts of those items, if any, reported in the tax return for the current year. Carryforward (in US income-tax law) a special provision allowing part of a net loss or of an unused credit in a given year to be apportioned over one or two subsequent years, chiefly in order to ease the tax burden. Carryforward:- in accounting, a way for a company to reduce its tax liability by applying losses to future tax years in which the company makes a profit. That is, carryforward allows companies to apply losses to profits that have not yet occurred and thereby reduce the taxes they pay on those profits. Carryforward is limited to seven years. For example, suppose a company loses USD500 000 in year one, then nets USD1 000 000 in year five. The company may carry forward the losses and only be liable for taxes on USD500 000 of its profit in year five. Independent contractors who file Schedule C with the US Internal Revenue Service (IRS) are required to use carryforwards, which is useful since most independent contractors lose money in their first few years of business. Some publicly-traded companies opt not to use it, as appearing to reduce profits may scare off potential investors who do not realize that the profits upon which taxes are paid do not equal the company's actual profits. Carryforward is:- (1) a business operating loss that, for tax purposes, may be claimed a certain number of years in the future, often up to 15 years. Thus, a loss in one year would be carried forward to a future year and used to offset profits up to the amount of the carryforward. Carryforwards are especially useful to firms operating in cyclical industries such as transportation. Also called Tax Loss Carryforward. (2) In taxation of individuals, net capital losses exceeding the annual limit of USD3 000 that may be carried to succeeding years so as to offset capital gains or ordinary income. There is no limit on the amount of capital losses that may be used to offset capital gains in any one year, only on the amount of losses in excess of gains that may be used to offset income. Also called Carryover.

CARRYING BROKER = ИСПОЛНЯЮЩИЙ БРОКЕР – Carrying Broker is a commodities or securities broker who provides back office functions such as clearing, settlement and custodial services to other brokers. The carrying broker therefore enables other brokers, known as Introducing Brokers, to provide full service to their clients without incurring the huge start-up and maintenance costs of running a back office. Introducing broker/carrying broker relationships have existed in the United States since the mid-1970s. The benefits of using a carrying broker include cost efficiencies, economies of scale and risk mitigation. It also allows the introducing broker to focus on its core competencies, such as portfolio management, client relationship management and marketing of products and services. Carrying brokers also provide additional services, such as maintaining records of client transactions and preparing and distributing client statements and confirmations. Some carrying brokers even provide financing for client margin accounts. Carrying Broker is a holder of trading privileges at an exchange, usually a Futures Commission Merchant, through whom another broker or customer elects to clear all or part of its trades. Carrying Broker is:- (1) a member of a commodity exchange who provides clearing services for other members or brokers. A carrying broker does this in addition to his/her other duties as a member of the exchange in

return for a fee. (2) A broker who, in exchange for a fee, performs the duties of other brokers who may be overworked or are otherwise unable to fill an order. A clearing member of a futures exchange, usually a futures commission merchant, through whom another broker or customer elects to clear all or some of his trades. Carrying Broker is a broker, usually a futures commission merchant, who conducts transactions for other individuals. A carrying broker can conduct trades for other brokers, or any customer. This broker is usually someone very active in the market, and who will conduct transactions for those who are not able or willing to do so themselves for any reason, including lack of knowledge, desire, or time. / Клиринговый член биржи фьючерсов, обычно торговец фьючерсами за комиссионное вознаграждение, через которого другой брокер или клиент выбирает исполнение всех или части своих закупок или продаж.

CARRYING CHARGES = НАКЛАДНЫЕ РАСХОДЫ (или НАКЛАДНЫЕ ИЗДЕРЖКИ) – Carrying Charges:- cost of storing a physical commodity or holding a financial instrument over a period of time. These charges include insurance, storage, and interest on the deposited funds, as well as other incidental costs. It is a carrying charge market when there are higher futures prices for each successive contract maturity. If the carrying charge is adequate to reimburse the holder, it is called a Full Charge. See also Contango, Negative Carry, and Positive Carry. The total cost of storing a physical commodity over a period of time. Includes storage charges, insurance, interest, and opportunity costs. For physical commodities such as cotton, grains or metals, the cost of storing over a period of time. The carrying charge includes cost of storage space, insurance, and interest on the invested funds as well as other incidental costs. In interest rate futures markets, it refers to the differential between the yield on a cash instrument and the cost of the funds necessary to buy the instrument. Also known as Carry or Cost of Carry. See also Basis. Cost to inventory a physical commodity or financial instrument over a period of time. Includes insurance, storage and interest on the invested funds as well as other incidental costs. Carrying Charge is the cost associated with storing a physical commodity or holding a financial instrument over a defined period of time. Carrying charges include insurance, storage costs, interest charges on borrowed funds, and other related costs. As carrying costs can erode the overall return on an investment, due consideration should be given to them in considering the suitability of the investment, and also while evaluating investment alternatives. May also be referred to as Cost Of Carry. Carrying costs can be a deterrent for retail investors who wish to invest in physical commodities, since storage and insurance costs can be quite significant and a burden to navigate. Such investors may be better served by commodity exchange-traded funds, which have surged in popularity in recent years. Carrying charges are generally incorporated into the price of a commodity futures or forward contract. Under normal market conditions, therefore, the price of a commodity for delivery in the future should equal its spot price plus the carrying charge. If this equation does not hold, due to abnormal market conditions or some other development, a potential arbitrage opportunity may exist. For example, assume that the spot price for a commodity is USD50 per unit, and the one-month carrying charge associated with it is USD2, while the one-month futures price is USD55. An arbitrageur could pocket a riskless profit of USD3 per unit in this case by buying the commodity at the spot price (and storing it for a month for USD2) while simultaneously selling it for delivery in a month at the one-month futures price of USD55. Carrying Charges:- the cost of storage and interest. Carrying Charge is:- (1) the cost of storage space, insurance, and finance charges incurred when storing a physical commodity. (2) In interest rate futures markets, the difference between the yield on a cash instrument and the cost of funds necessary to buy that instrument. Also called Cost Of Carry or Carry. (3) The charges a lender imposes on a business for lending money, in the form of interest, finance charges, and processing fees. Carrying Charge is a futures market condition in which distant futures contracts are trading at successively higher levels than nearby contracts and above cash price offers. Carrying charges often indicate a surplus situation. A 'Full Carrying Charge' refers to carrying charge levels high enough to fully cover storage and other associated ownership costs. / Затраты на инвентаризацию фактического товара или финансового инструмента сверх срока. Включают страхование, хранение и проценты по инвестированным средствам, а также иные сопутствующие затраты. К Накладным Расходам относятся дополнительные к основным затратам расходы для обеспечения процессов производства и обращения (издержки предприятий, хозяйственных организаций, строек, связанные с их управлением и обслуживанием, содержанием и эксплуатацией оборудования).

CARRYING MEMBER = ОБСЛУЖИВАЮЩИЙ ЧЛЕН (или ОБСЛУЖИВАЮЩИЙ УЧАСТНИК) – Carrying Member is a clearing member that carries one or more customer accounts. / Клиринговый член, обслуживающий один и более счетов заказчиков.

CARRYING TEMPERATURE = ТЕМПЕРАТУРА В ПРОЦЕССЕ ПЕРЕВОЗКИ – Carrying Temperature is a required cargo temperature during transport and storage. / Температура, которую требуется поддерживать в процессе перевозки и хранения груза.

CARRY MARKET = РЫНОК НАКЛАДНЫХ РАСХОДОВ (или РЫНОК ХХ) – Carry Market:- the difference in price between the nearby contract and the more distant delivery months (deferred). Compare the carry offered by the market to the costs of storing grain for the various delivery months.

CARRYOVER = ХХ (или ПЕРЕХОДЯЩЕЕ) – Carryover is the quantity of a commodity remaining at the end of marketing year.

CARRYOVER FUNDS = ПЕРЕХОДЯЩИЕ СРЕДСТВА – Carryover Funds are the amounts not used in budget appropriations for a prior year that are reallocated for use in the same category in the following year.

CARRYOVER STOCKS = ПЕРЕХОДЯЩИЕ ЗАПАСЫ – Carryover Stocks:- the quantity of a commodity which is available for marketing at the beginning of a marketing year or crop year. For example, beginning stocks of Cotton are frequently reported for the marketing year beginning August 01. Ending stocks reflect supply less disappearance, adjusted for any unaccounted cotton, for the year ending July 31. See also Beginning Stocks, and Ending Stocks. Big Carryover Stocks prevent commodity price increase. First, as a general rule, Carryover Stocks are held in countries that have lower carrying costs, which are probably exporting countries because they enjoy lower prices.

CARRYOVER TRANSACTION = ТРАНЗАКЦИЯ ПО ПЕРЕНОСУ (или ОПЕРАЦИЯ ПО ПЕРЕНОСУ) – Carry Over Transaction (COT) is equity repurchase transaction. Commonly known as Badla, COT is a financing arrangement whereby if a person buys shares but does not have funds to take delivery, he may enter into COT with the financier/lender. The financier agrees to buy the securities from the borrower and simultaneously sell back the same. Therefore, in a COT, the buyer in the 'first transaction' would become seller of the same shares in the 'second transaction'. In other words, COT is a financing transaction involving sale/repurchase of shares. COT market session takes place in the afternoon after the close of regular trading. The maximum transaction period is for 30 days, i.e. the financier/lender cannot withdraw his funds before 30 days whereas the borrower has the right to repay the borrowed funds anytime during the contracted period. The borrower pays interest for the duration of the time the funds are borrowed. Interest is accrued on daily basis and is represented by the difference in sale/repurchase price. Carryover Transaction (COT):- in securities trading, the prolongation of a bull transaction concluded on a forward basis from one closing or settlement date to the next. The buyer sells the securities from the liquidation at the spot rate to the bank participating in the transaction, pays the contango (premium) and buys them back as of the next closing date. Contango transactions generally take the form of a Lombard loan. Also known as Contango Transaction. The opposite of Backwardation Transaction.

CARRY SPREAD = КУРСОВАЯ РАЗНИЦА XX (или СПРЭД XX) – Carry Spread is when the nearby futures month is trading at a lower price than a distant futures contract.

CARs = CERTIFICATES OF AUTOMOBILE RECEIVABLES

CAR SEAL = ВАГОННАЯ ПЛОМБА – Car Seal is a metal strip and lead fastener used for locking freight car or truck doors. Seals are numbered for record purposes. / Под Пломбой, от Немецкого слова Plombe от Латинского слова Plumbum, означающее Свинец, понимается кусочек свинца или другого пластичного материала с оттиском печати, навешиваемый на закрытые двери, приборы, аппараты, товары и так далее так, что без повреждения оттиска нельзя открыть двери, использовать опломбированный предмет и так далее.

CARTAGE = ПОДВОЗ (или ДОСТАВКА) – A term Cartage usually refers to intra-city hauling on drays or trucks. Movement of freight via trucking, draying or carting. / Под Грузовой Перевозкой понимается перемещение грузов различными средствами транспорта.

CARTAINER = КОНТЕЙНЕР АВТОВОЗ – Cartainer is a car container used in transportation of automobiles from port to port. / Контейнер для легковых автомобилей, используемый при их транспортировке из порта в порт.

CARTEL = КАРТЕЛЬ – Cartel is a formal organization set up by a group of firms that produce and sell the same product for the purpose of exacting and sharing monopolistic rents. The intended purpose of a cartel is to reap monopoly profits by artificially restricting output and thus driving the price above the level that would prevail if they remained in competition with one another. This they normally accomplish by agreeing on a relatively high common asking price for their product that none of the member firms will be permitted underbid, but sometimes the member firms may simply agree to divide the market geographically and grant each other local monopolies without necessarily enforcing a uniform price structure. Since exceptionally high rates of profit in an industry normally would attract ambitious outside firms to make new investments to enter the industry and gain market share by cutting prices, a successful cartel must somehow secure the cooperation of all the significant producers in the industry. It also must find some way to exclude non-cartel firms from selling to customers within the cartel's market area(s) – such as by getting their national or local governments to grant cartel members a legal monopoly or to enact administrative or tax barriers to sales of the product by outsiders. Since the essence of the cartel's strategy is to restrict the total production of their product below the levels the member firms would produce if left to themselves (that is, to produce at levels where the marginal cost of production is well below the price per unit), the cartel must also work out some mutually acceptable formula for assigning maximum production quotas to each firm in the cartel and then find some way to enforce the output quotas against firms that might want to grab a larger share of the profits by producing at higher levels. (Lower cost producers in the industry generally would be able to make even larger profits by cutting prices and expanding their market share than by cooperating with the cartel.) If the cartel agreement were a legally enforceable contract, then the government and the court system could be counted upon to do the enforcement job for the cartel, and in many fascist and authoritarian countries (as well as a few present day democracies with recent histories of authoritarian government) this has in fact historically been a general practice. However, in the United States, Great Britain and most other advanced democratic capitalist states, cartel agreements are normally either unenforceable in the courts or are held to be positively illegal as 'restraints on trade' that are contrary to the public interest because of their adverse effects on consumers. Even in those countries that outlaw private cartels, however, it has often been possible for politically powerful but economically endangered high cost producer firms in a few industries to secure the 'cartelization' of their industry in a back-door fashion. Under the guise of establishing a government regulatory regime that allegedly will protect the interests of the consumer through establishing price controls, assigning exclusive market areas to prevent 'cut-throat competition', and excluding 'unqualified' competitors by restrictive licensing requirements, independent regulatory commissions in fact have often functioned mainly to serve the economic interests of the dominant high-cost firms in the industry being regulated. Group of companies that come together to monopolize a market, agreeing between them which company presides over which area of operation. Cartels are illegal in the United Kingdom and the United States. Cartel is an association or an organization of several independent national or international business organizations or producers that regulates competition by controlling the prices, the production, or the marketing practices of its members in order to limit competition and maximize their market power. Association of producers of the same or similar goods formed for the purpose of restricting or eliminating competition by regulating output and prices for a given product. See also Collusion. / Ассоциация производителей одного и того же товара или аналогичных товаров, созданная с целью ограничения или устранения конкуренции со стороны регулирования выработки и цен на данный продукт. Смотрите также Сговор (Collusion). Под Картелью, от Французского слова Cartel и Итальянского слова Cartello, означающих Бумага или Документ, относится к форме монополистического объединения, участники которого заключают соглашение о регулировании объёмов производства, условий сбыта продукции, найма рабочей силы в целях извлечения монопольной прибыли. Участники картеля сохраняют коммерческую и производственную самостоятельность. Международный картель представляет собой соглашение (союз) монополий разных стран о разделе рынков сбыта, источников сырья, об установлении монопольных (картельных) цен, использовании патентов и другом, чаще всего в рамках одной отрасли. Картельная цена, например, является разновидностью монопольной цены, устанавливаемой участниками картеля в целях устранения конкурентов и обеспечения условий для получения монопольной прибыли.

CARTER'S NOTE = НОТА КАТЁЗ – Carter's Note is a document you provide when your goods are taken by truck to the wharf or depot. The carter's note is carried by the driver who is delivering your goods. It contains information about where the goods are from, where the truck is to take them to and also shipping information. A Carter's Note is documentation (export form) provided when cargo is sent from the location where it is packed to the port for loading. It contains shipping instructions. Also known as Dock Receipt. Receiving cargo by the carrier:- all cargo will only be received on a completed Carters Note which shows:- Shippers Name, Consignee, Description of the Goods, correct measurement, Marks, Correct Weight, Vessel and Voyage Number and the Booking Reference Number. A Carter's Note is documentation provided when cargo is sent from the location where it is packed to the port for loading. It contains shipping instructions. / Распространены в Австралии и Новой Зеландии.

CARTMENT = ВНУТРЕННИЙ ТАМОЖЕННЫЙ ТРАНЗИТ (или ПЕРЕМЕЩЕНИЕ ПОД ТАМОЖЕННЫМ КОНТРОЛЕМ) – Cartment is the Customs form permitting in-bond cargo to be moved from one location to another under Customs control, within the same Customs district. Usually in motor carrier's possession while draying cargo.

CARTON = КОРОБ – Carton is the unit of product, a protective casing around a product.

CARTRIDGE BELT = ПАТРОНТАЖ (или ПОЯС ДЛЯ ПАТРОНОВ, или ПАТРОННЫЙ ПОЯС) – Cartridge Belt is a belt worn around the waist for attaching various equipment, as a cartridge case, canteen, or compass.

CARTRIDGE SEAL = УПЛОТНЕНИЕ ГИЛЬЗЫ – Cartridge Seal:- a completely self-contained assembly including seal, gland, sleeve, mating ring, etc, usually needing no installation measurement. See also Filter, and Seal.

CARUNCLE = КАРУНКУЛА (или ПРИСЕМЯННИК, или СЕМЕННОЙ ПРИДАТОК) – Caruncle is an outgrowth on a plant or animal such as a fowl's wattle or a protuberance near the hilum of certain seeds. Caruncle is an outgrowth on a seed developed by proliferation of integumentary tissue adjacent to the micropyle. / Кораллы – наросты на голове Индюка. Выступ на хилуме (семени). Под Присемянником понимается вырост на семени Растений, чаще сочный, мясистый. У Кувшинки, Тисса и других. Привлекает птиц, муравьёв, что способствует распространению семян. Иногда присемянник, так называемый ариллус, участвует в образовании мякоти плода, например, у Смородины.

CARYOPSIS = КАРИОПСИЗ (или ЗЕРНОВКА) – Caryopsis is a dry, indehiscent seed-like fruit with a thin pericarp adnate to the seed coat, typical of cereal grasses, e.g., Wheat. Caryopsis is the mature fruit of grasses in which the seed coat firmly adheres to the pericarp. Caryopsis is a small one-seeded dry indehiscent fruit (as in grasses) with a thin membranous pericarp adhering so closely to the seed that fruit and seed are incorporated in one body forming a single grain (Wheat and Barley). In Rice industry, brown Rice is the caryopsis. The caryopsis is the kernel of cereal grains and grasses with the hull removed. Caryopsis (syn. Brown Rice) is the mature fruit of grasses in which the seed coat firmly adheres to the pericarp. / Кариопсиз или Зерновка это ядро злаковых зерновых культур и трав с удалённой плодовой оболочкой. Другими словами, это сухой односемянный нераскрывающийся плод злаков с плёнчатым околоплодником, срастающимся с семенем. Зерновка – тип плода злаковых.

CAS = CARD ACCEPTING SCHEME

CASCADE = CENTRAL APPLICATION FOR SETTLEMENT, CLEARING AND DEPOSITARY EXPANSION

CASCADING STYLE SHEET = ЛИСТОК В КАСКАДНОМ СТИЛЕ – Cascading Style Sheet (CSS) is a technology used for webpages to format fonts and control layouts on the computer display.

CASE DRAIN FILTER = ФИЛЬТР ЁМКОСТИ ДЛЯ СЛИВА – Case Drain Filter is a filter located in a line conducting fluid from a pump or motor housing to reservoir. See also Filter. The Case Drain Filter assembly is contained within an aluminum canister that is about 1-1/4" in diameter and between 3" and 3-1/2" long. When removing the filter, make sure to plug the drain lines to avoid losing hydraulic fluid or introducing contamination into the system. To access the filter element, simply unscrew the hex nut. The cylinder contains contains a tapered filter element, two seals, and a spring to hold the filter element in place. In the image, you can see a disassembled case drain filter assembly. What Are Case Drain Filter Elements Made From? For most machines, the case drain filter element is made of sintered bronze. Let that process for a moment:- a filter made of solid metal? While it may appear almost solid, it is actually made from thousands of tiny spheres of bronze that have been sintered together. The sintering process allows the filter to be porous enough for hydraulic fluid to flow through it, but dense enough to capture contaminants like metal flakes, tiny pieces of rubber, or metal shavings. Note that the sintered bronze gives a new, clean case drain filter a shiny, gold or bronze appearance. How Are Case Drain Filter Elements Made? The process used to create the sintered filter element involves powder metallurgy, where a spherical bronze alloy powder is compacted under extreme pressure into the desired shape and then heated, or sintered, until the spheres begin to fuse together. The sintering process is controlled to achieve the correct porosity for filtering. The result is a filter element strong enough to handle high pressures if needed, yet porous enough to allow for the free flow of hydraulic fluid through it. Clean or Clogged? If your case drain filter is no longer gold or bronze in color, then it's time for it to be replaced. We recommend changing out your case drain filter any time you are changing out your other hydraulic filters or after you have experienced a final drive failure. What Happens When a Case Drain Filter Gets Clogged? When a case drain filter gets clogged, your travel motor will experience an extreme rise in pressure on the hydraulic side. This can lead to all kinds of problems:- (i) Blowing the piston shoes out of the rotator group; (ii) Blowing the seals, allowing fluid and lubrication to leak out and damaging contaminants to make their way inside; (iii) Serious damage to the cam in radial piston motors as the pistons lift completely off the cam during an inlet cycle and then hammering it during their outlet cycle; (iv) Catastrophically damaging the bearings; (v) Freewheeling of some types of hydraulic motors; and (vi) Cracking or blowing off the cover plate of the final drive. Can You Clean a Case Drain Filter? Some people may try to clean their case drain filters. We don't recommend this at all! Keep in mind that even if you try wire brushing or sandblasting a case drain filter element, it will just smear the trapped solids into the pores. That means you really aren't unclogging it – in fact, you may be clogging it even more. We recommend just purchasing a new filter element when your old one gets dirty. A new case drain filter is cheap, at least when compared to a new final drive! Conclusion:- You would be surprised at how many hydraulic motors arrive out our shop that have been destroyed because of a neglected case drain filter. That's why we dwell on the subject so much:- checking your case drain filter on a regular basis can save you hundreds and thousands of dollars in repairs and replacements. It may cost us some business, but we just hate to see an otherwise good final drive be destroyed because of a clogged case drain filter. Don't neglect this key aspect of final drive maintenance.

CASE DRAIN LINE = ХХ СЛИВ ЛИНИЯ – Case Drain Line is a line conducting fluid from a component housing to the reservoir. All piston-type hydraulic motors are going to leak hydraulic oil from the rotator group. This is a good type of leak because it serves to lubricate the piston shoes, the swash or thrust plate, and the area between the cylinder block and the valve plate. This oil must then be returned to the hydraulic tank under minimal pressure – that is the purpose of the Case Drain Line. The case drain line will have an in-line case drain filter to prevent contaminants from traveling from the hydraulic motor to the hydraulic tank.

CASE OF NEED = НА СЛУЧАЙ НАДОБНОСТИ – Case Of Need:- an agent of the exporter located in the country of the importer who is to be notified by the presenting bank under a draft collection of any difficulties in collecting payment. The case-of-need may be given the power to change the collection instructions or even the draft amount, or may just be expected to make arrangements to store the goods and locate an alternate buyer. Whatever authority the case-of-need has should be specified in the collection instructions letter. / представляющим банком при инкассо тратты в случае возникновения каких-либо сложностей со взысканием платежа.

CASEMENT CLOTH = ЗАНАВЕСОЧНОЕ ПОЛОТНО – Casement Cloth is a general term applied to lightweight, sheer fabrics used for curtains and for screening purposes and as a backing for heavy drapery fabrics of the decorative type. This type of fabric is sometimes made in small fancy weaves for dresswear. / лёгкая гладкокрашеная или набивная ткань с ткацким рисунком.

CASEWORM = КУКОЛКА (или КОКОН, или СУМОЧНЫЙ ЧЕРВЬ) – Caseworm is an Insect of the Species Nymphula Depunctalis whose larva lives in a case consisting of a piece of rolled Rice leaf.

CASH = НАЛИЧНОСТЬ (или ДЕНЕЖНЫЕ СРЕДСТВА, или КАССА) – (1) Cash:- ready money (coins and notes) or to turn something (such as a check) into ready money. A term Cash means of payment by coin and bank notes. Currency, coins, cheques, and balances in bank accounts – a current asset. You can literally hold cash in your hand in the form of notes and coins. Opposite:- Book Money. Cash (in the UK, 1840's), in commerce, means the ready money, bills, drafts, bonds, and all immediately negotiable paper in an individual's possession.

(2) Cash:- chip card system. Chips can be loaded with cash up to a set amount at a bancomat. Can be used as a cash substitute in shops and businesses displaying the CASH sign. PIN codes are not required, and the price of the purchase can be debited direct from the card.

CASH ACCOUNT = КАССОВЫЙ СЧЁТ (или СЧЁТ НАЛИЧНОСТИ) – Cash Account (in the UK, 1840's), in book-keeping, an account to which nothing but cash is carried on the one hand, and from which all the disbursements of the concern are drawn on the other. The balance is The Cash In Hand. When the credit side more than balances the debit, or disbursement side, the account is said to be In Cash; when the contrary, to be Out Of Cash. Cash Acount, in banking, is the name given to the account of the advances made by a banker in Scotland, to an individual who has given security for their repayment.

CASH ADVANCE = АВАНС НАЛИЧНЫМИ – Cash Advance:- a cash withdrawal using your credit card at an automated teller machine or bank teller. This cash is an instant loan from your credit card account. The credit card issuer will apply finance charges from the day you take the advance until the day you pay it off. A transaction fee may also be charged based on the amount of your withdrawal. Cash Advances may also include 'cash like' purchases such as travelers cheques.

CASH ADVANCE FEE = ВОЗНАГРАЖДЕНИЕ ЗА АВАНС НАЛИЧНЫМИ – Cash Advance Fee is a one-time fee for cash advances in addition to normal finance charges. This fee may be a percentage of the advance amount, a flat fee or a combination of the two.

CASH AGAINST DOCUMENTS = НАЛИЧНЫМИ ПРОТИВ ДОКУМЕНТОВ – Cash Against Documents (CAD) is a type of transaction in which the title for purchased goods is released to the buyer after the total sale price is paid using cash. Often, a commission house or a similar financial institution upon verification of the cash payment handles the actual transfer of title. Usage of the cash against document method is commonly employed with transactions that involve the purchase of exports. The process for CAD, or cash against documents, in an export environment is fairly straightforward. After accepting an order from an international customer, the exporter prepares the export documents required by both the country of origin and the destination. Among the documents is a form that is normally referred to as an Export Collection Form. This form, along with other manifests and copies of shipping documents, is forwarded to the bank used by the exporter. While it is not always necessary, many exporters choose to prepare a Bill of Exchange, and include that document with the other forms. As the next step in a purchasing using the cash against documents method, the exporter's bank forwards the necessary documents to the bank designated by the purchaser or importer. The documents are provided with a proviso that they are not to be released to the importer until payment for the shipment is made in full. Until the payment is received by the exporter's bank, the transaction is not considered complete. Once the importer's bank receives authorization to honor the exporter's invoice, cash payment is electronically transferred to the exporter's financial institution. After receiving confirmation that the payment was executed and posted properly, the importer's bank releases all documents pertaining to the transaction to the buyer. Many banks charge fees for executing a cash against documents transaction. In some instances, the seller covers all bank charges. However, it is more common for buyers to cover any charges issued by the banks at each end of the transaction. Typically, the seller adds the bank charges from the point of origin onto the invoice, while the importer's bank normally debits the account used to issue the cash against documents payment. Cash Against Documents (CAD) is a method of payment for goods in which documents transferring title are given the buyer upon payment of cash to an intermediary acting for the seller, usually a commission house. Cash Against Documents:- How can it help me? In a cash against documents transaction, you ship the goods but retain ownership and control of them until your buyer pays for them. What is it? You ship the goods before payment but don't release the documents to transfer ownership and possession of them ('shipping documents') until your overseas buyer has made an irrevocable payment for the goods. Your bank and your buyer's bank facilitate the transfer of the payment and shipping documents. Alternatively, you can use your agent in your buyer's country. How does it work? The main steps in a cash against documents transaction are:- (i) you ship the goods to your buyer in accordance with the export contract; (ii) either:- (a) you present the relevant shipping documents, including the document of title (usually the bill of lading) and invoice, to your bank, which sends the documents to the buyer's bank; or (b) you send the shipping documents to your agent in the buyer's country; (iii) your buyer provides payment for the goods to their bank or your agent, who in turn transfers the payment to your bank; and (iv) in return for the payment your buyer's bank or your agent hands over the shipping documents to the buyer, who then takes control of the goods. Who provides it? Banks are intermediaries in cash against documents transactions, or you can use your agent in the buyer's country. Method of payment for goods for export, whereby the documentation for a shipment is sent to an agent or bank at the destination. These are passed to the consignee, who makes the payment. The consignee is free to take delivery of the shipment when it arrives. Cash against document is a process of payment that is also used by large UK investment houses. Cash Against Documents (CAD) is a payment arrangement in which an exporter instructs a bank to hand over shipping and title documents (see document of title) to the importer when the importer fully pays the accompanying bill of exchange or draft. Also called Documents Against Payment. / Наличными Против Документов (НПД):- условия оплаты вывозных (или экспортных) товаров, в соответствии с которыми отгрузочные документы на товары отсылаются в банк, агенту и так далее в стране, куда отгружены товары, а покупатель затем получает эти документы, оплачивая наличными сумму, указанную в накладной, банку, агенту и так далее. Обладание отгрузочными документами позволит покупателю получить товары, когда они прибудут в порт назначения; такой порядок оплаты и получения товаров носит также название Документы Против Предъявления (Documents Against Presentation). Смотрите также Документы Против Акцепта (Documents Against Acceptance). Наличными Против Документов:- принцип расчётов по внешнеторговым поставкам, согласно которому оплата вывозных (или экспортных) товаров импортёром осуществляется после прибытия документов, подтверждающих отгрузку товаров по условиям контракта. Наличными Против Документов – форма расчётов, при которой экспортёр получает платёж после представления в банк отгрузочных документов или импортёр получает документы на товар после его оплаты.

CASH AND CARRY = ПЛАТИ И УВОЗИ – Cash & Carry is an arbitrage transaction involving the simultaneous purchase of a cash commodity with borrowed money and the sale of the appropriate futures contract. Cash & Carry is the purchase (or sale) of an underlying spot asset and the simultaneous sale (or purchase) of a futures or forward contract. / Арбитражная сделка, состоящая в одновременном приобретении наличного сырья на заёмные средства и продажи соответствующего фьючерсного контракта.

CASH AND CASH EQUIVALENTS = НАЛИЧНЫЕ И ЭКВИВАЛЕНТЫ НАЛИЧНЫХ (или ДЕНЕЖНЫЕ СРЕДСТВА И ЭКВИВАЛЕНТЫ ДЕНЕЖНЫХ СРЕДСТВ, или ДЕНЕЖНЫЕ СРЕДСТВА И ИХ ЭКВИВАЛЕНТЫ) – The term Cash And Cash Equivalents includes:- currency, coins, checks received but not yet deposited, checking accounts, petty cash, savings accounts, money market accounts, and short-term, highly liquid investments with a maturity of three months or less at the time of purchase such as US treasury bills and commercial paper. The items included as cash and cash equivalents must also be unrestricted. The amount of cash and cash equivalents will be reported on the balance sheet as the first item in the listing of current assets. The change in the amount of cash and cash equivalents during an accounting period is explained by the statement of cash flows. Cash And Cash Equivalents:- in a balance sheet, cash in excess of that necessary for operating requirements is invested in short-term, highly liquid, income-producing investments. Investments with maturities of three months or less are classified as cash and cash equivalents, which primarily consist of certificates of deposit, money market funds, and investment grade commercial paper issued by major corporations and financial institutions. Cash and cash equivalents are stated at cost, which approximates market value. Cash And Cash Equivalents is an asset that appears on the statement of financial position of a business and includes currency (coins and bank notes) held by a business (in hand and in bank accounts) and cash equivalents. Cash is a medium of exchange, a store of value and a unit of account and a

business needs to have sufficient cash in order to be able to pay its liabilities. Higher cash ratio (ratio of cash and cash equivalents to current liabilities) suggests that the business is liquid (i.e. it is expected not to face any difficulty in paying its very short-term liabilities). A business generates cash from sale of products and services, sale of assets, borrowings from banks and other creditors and from capital contributions by its owners. It uses cash to pay for its operating and capital expenditure, its liabilities and in paying dividends to its owners. Information about sources and uses of cash are presented in the statement of cash flows. Businesses keep a small amount of cash (called Petty Cash) for day to day cash expenses and keep a larger percentage of cash at its bank. Control over cash is vital for efficient and profitable operations of a business that is why businesses prepare their cash and bank reconciliations periodically. Cash equivalents are not precisely coins and bank notes but are marketable securities of very short-term maturity (typically always less than 3 months) which are not expected to deteriorate significantly in value till maturity. They are treated as equivalent to cash under IAS 7 Statements of Cash Flows. Cash And Cash Equivalents (CCE) is an item on the balance sheet that reports the value of a company's assets that are cash or can be converted into cash immediately. Examples of cash and cash equivalents are bank accounts, marketable securities and Treasury bills. Cash and Cash Equivalents:- according to International Accounting Standard 7 (IAS 7), Cash 'comprises cash on hand and demand deposits'. And cash equivalents 'are short-term, highly liquid investments that are readily convertible to known amounts of cash and which are subject to an insignificant risk of changes in value'. Cash:- cash is the money in the form of currency. Currency includes currency notes and coins. Any currency notes and coins held by an enterprise are part of the term Cash. Demand deposit is a type of an account from which funds can be withdrawn at any time without having to inform the bank or depository institution. Most of the checking and saving accounts are demand deposits. Cash Equivalent:- cash equivalents are investments that can be readily converted to cash. Common examples of cash equivalents include commercial paper, treasury bills, short term government bonds, marketable securities, and money market holdings. An item should satisfy the following criteria to qualify for cash equivalent:- (i) The investment should be short term. They should mature in less than three months. If they mature in more than three months they will be classified as other investments. (ii) They should be highly liquid. This means that they should be easily sold in the market. The buyers of these investments should be easily available. (iii) They should be convertible to known amounts of cash. This means that their market price should be available and this market price should not be subject to significant fluctuations. (iv) They should not be too risky. There should be very little risk of changes in their value. This means that equity shares cannot be classified as cash equivalents. But preferred shares purchased shortly before the redemption date can be classified as cash equivalents. In short, cash and cash equivalents mean the cash and those assets which are immediately convertible to cash. Cash and cash equivalents are the most liquid assets of any business. Cash and cash equivalents are very important for the liquidity of a business. A company should have sufficient cash and cash equivalents to meet its urgent liabilities when they fall due. Cash Equivalents are held for the purpose of meeting short-term cash commitments rather than for investment or other purposes. For an investment to qualify as a cash equivalent it must be readily convertible to a known amount of cash and be subject to an insignificant risk of changes in value. Therefore, an investment normally qualifies as a cash equivalent only when it has a short maturity of, say, three months or less from the date of acquisition. Equity investments are excluded from cash equivalents unless they are, in substance, cash equivalents, for example in the case of preferred shares acquired within a short period of their maturity and with a specified redemption date.

CASH & DEPOSITS = НАЛИЧНЫЕ И ВКЛАДЫ (или ДЕНЕЖНЫЕ СРЕДСТВА И ВКЛАДЫ, или НАЛИЧНЫЕ И ДЕПОЗИТЫ) – Cash & Deposits are the cash on hand plus credit balances at the bank.

CASH BASIS = КАССОВЫЙ БАЗИС (или НАЛИЧНЫЙ БАЗИС, или КАССОВЫЙ МЕТОД) – Cash Basis is a method of bookkeeping by which revenues and expenditures are recorded when they are received and paid. The recording of transactions when cash or other assets are actually transferred, rather than on an accruals basis. See also Accruals Basis. Cash Basis is a major accounting method that recognizes revenues and expenses at the time physical cash is actually received or paid out. This contrasts to the other major accounting method, accrual accounting, which requires income to be recognized in a company's books at the time the revenue is earned (but not necessarily received) and records expenses when liabilities are incurred (but not necessarily paid for). When transactions are recorded on a cash basis, they affect a company's books only once a completed exchange of value has occurred; therefore, cash basis accounting is less accurate than accrual accounting in the short term. For example, let's say a construction company secures a major contract in a given year, but will only be paid for its efforts upon completion of the project. Using cash basis accounting, the company will only be able to recognize the revenue from its project at its completion, while it will record the project's expenses as they are being paid out. If the project's time span is greater than one year, the company's income statements will be misleading:- the company will incur large losses one year and then great gains the next. Cash basis accounting is simpler and cheaper to perform than accrual accounting, but it can make obtaining financing more difficult due to its inaccuracy. / Внесение записи об операциях после того, как денежные средства или иные активы фактически переданы, в отличие от метода начислений. Смотрите также Метод Начислений (Accruals Basis).

CASH CARD = КАССОВАЯ КАРТА (или КАРТА ДЛЯ СНЯТИЯ НАЛИЧНЫХ, или КАРТА ДЛЯ ПОЛУЧЕНИЯ НАЛИЧНЫХ) – Cash Card is a plastic card that allows the holder, by using a personal identification number (PIN), to withdraw cash from his or her bank or building society account through a cash dispenser (machine that issues cash to holders of cash card). It may also allow access to such facilities as a display of the account balance and ordering bank statements and check books.

CASH COMMODITY = НАТУРАЛЬНОЕ СЫРЬЁ (или КАССОВОЕ СЫРЬЁ, или ДЕНЕЖНОЕ СЫРЬЁ, или НАТУРА) – Cash Commodity:- in futures trading, the cash commodity is delivered for payments. In certain contracts, a party is obligated to physically deliver the actual cash commodity, such as soybeans, oil, or treasury bills. Other contracts can be cash-settled, meaning that cash changes hand, rather than the physical commodity. In contrast to cash commodities, delivery on future contracts typically happens at a later date. A simplified view is that the futures market is comprised of two groups:- speculators and hedgers. Speculators are looking to make profits by betting on price changes and have no interest in taking possession of the underlying commodities. Hedgers are firms which either produce or require the underlying commodity. They are often interested in taking or making physical delivery of the underlying commodity, at a specified price. For example, an airline may hedge its operating costs by using a futures contract to lock in the price on future delivery of jet fuel. Cash Commodity is the physical or actual commodity as distinguished from the futures contract based on physical commodity. Sometimes called the Actuals or Spot Commodity. Cash Commodity is an actual physical commodity which is delivered at the completion of a contract, as opposed to a futures contract on that commodity. A futures contract will specify the number of units of the cash commodity that must be delivered, and also the specific features of the cash commodity. Also called Actuals. / Реальное или фактическое сырьё, отличающееся от предполагаемого фьючерсными контрактами сырья. Иногда ещё его называют Реальными или Фактическими Товарами (Actuals) или Сырьём Для Безотлагательной Поставки (Spot Commodity). Под Натурой понимаются товары, продукты как платёжное средство взамен денег.

CASH CONTRACT = НАТУРАЛЬНЫЙ КОНТРАКТ (или КАССОВЫЙ КОНТРАКТ, или КОНТРАКТ НА НАЛИЧНЫЙ ТОВАР) – Cash Contract is a financial arrangement that requires delivery of a particular amount of a specified commodity on a predetermined date. A cash contract is closely related to but should not be confused with a futures contract, in which positions are usually settled in

cash. Futures traders are often hedging or speculating to manage risk or turn a profit, and are not interested in physically owning the commodities. There are other important differences between cash contracts and futures contracts. A cash contract creates a direct obligation between the buyer and the seller, whereas a futures contract obliges each party to an exchange's clearinghouse. Also, a cash contract can be drawn up for any amount that a buyer and seller can agree on, whereas a futures contract must be written for a predetermined, standardized quantity allowed by the exchange. Cash Contract is a sales agreement for either immediate or future delivery of the actual product. Cash Contract is an alternative term for forward contract. See also Forward Contract. Cash Contract is a trade of a security or a derivative where settlement occurs on the same trading day. This is fairly unusual; most contracts are settled between one and three days later. Generally speaking, cash contracts are most common in the last week of the calendar year when many trades must be settled sooner to guarantee tax advantages for one or both parties. It is also called a Cash Trade. Cash Contract is a sale on a stock exchange requiring cash settlement by a certain time on the day the contract is made. Cash Contract (or Fixed Price Contract):- Futures + Basis – (Freight + Margin) = Cash. This is the most common contract used by the US Montana elevators. The producer calls the local elevator and is quoted a cash price for a particular commodity for a nearby delivery period. If he sells his grain on a cash contract, he has locked in both the futures price and the basis, effectively transferring all price risk to the buyer. Shipment is usually 'buyer's call' (whenever the elevator can take the grain) during the contract delivery period and full payment is made upon delivery. Advantages:- (i) Easy, no complications; (ii) Cash price, quantity, and delivery are known; (iii) Risk of price decrease is eliminated; (iv) No service or storage charges; (v) All proceeds available on delivery; and (vi) Income can be deferred. Disadvantages:- (i) Price locked in, can't participate in a market rally; (ii) Payment not received until grain is delivered; and (iii) Possible penalty for cancellation. Cash Contract:- a fairly unusual security transaction in which settlement with payment and security delivery are to occur on the same day as the trade date. This type of trade often occurs during the last week of a calendar year when sellers wish to settle early in order to realize a gain for tax purposes. Also called Cash Trade. / Смотрите также Форвардный Контракт (Forward Contract).

CASH COVERED = ОБЕСПЕЧЕННАЯ НАЛИЧНЫМИ – Cash Covered:- a derivatives position, such as a written option contract, where the option writer meets their margin obligations with cash.

CASH CROPS = НАТУРАЛЬНЫЕ (или ТОВАРНЫЕ) СЕЛЬСКОХОЗЯЙСТВЕННЫЕ КУЛЬТУРЫ – A Cash Crop is a crop that is grown for profit as opposed to crops grown for subsistence. Common cash crops include Coffee, Tea, Sugar Cane, Cotton, Wheat, Soybeans, other grains and oil-producing grains, Bananas, Oranges, etc. Prices for major cash crops (Coffee, grains, Cotton, Sugar among others) are determined in commodity markets around the world. Cash Crops are crops produced for direct sale for cash. / Под Натурой понимаются товары, продукты как платёжное средство взамен денег.

CASH EXTRACTION = КАССОВАЯ ВЫЖИМКА – Cash Extraction is a strategy where investors apply with their shares to receive a similar amount of instalment warrants plus a cash payment. Cash Extraction is a defensive strategy using warrants to replace the exposure to assets at a lower price, thereby releasing cash. Cash Extraction To Diversify Your Exposure:- Are you looking to spread your risk and build a broader asset base? Given the current market situation, some of you may be looking to continue to grow their share portfolio but are hesitant to invest further funds and/or are opposed to selling down a portion of their existing share portfolio, as this will trigger a Capital Gains Tax (CGT) event. This will also reduce the potential income stream (via dividends and franking credits) and result in them forgoing any further upside in the stock. An alternative method is to convert existing share holdings for instalments, which can diversify an investment portfolio in the sharemarket. The strategy is known as Cash Extraction or a Shareholder Application. It is ideal for those who do not have or wish to invest further funds into the market, or for those who have experienced significant capital growth in their existing share holdings and do not wish to trigger a CGT event. It also you the ability to spread risk and build a wider asset base. Implementing The Strategy:- cash extraction or a shareholder application involves lodging shares you already hold with the issuer (through the instalment's Product Disclosure Statement (PDS)), and in return receiving an equivalent number of instalments plus a cash payment. The cash payment represents a loan by the issuer to you of a portion of the value of your shares. The following formula is used to determine how much cash can be extracted from a share holding via the cash extraction strategy:- deciding which instalment to select for this strategy will generally depend on two factors:- (i) does the term to expiry of the instalment match your investment time horizon? and (ii) what level of gearing is suitable for your risk profile? (the higher the gearing the higher your tolerance for risk should be). This should allow you to narrow down your search to just a couple of instalments, where the final factor may be the comparison of funding cost between issuers of each instalment. Example:- National Australia Bank Limited (NAB) share is currently trading at AUD29.25. You presently own 2 000 NAB shares and wish to broaden your share exposure, that is re-weight your existing share portfolio. This will allow you to gain exposure to other sectors in the market and diversify your income stream. As an alternative to selling down your NAB holding you decide to compare this against converting the NAB shares for instalments, undertaking the cash extraction strategy. Out of many instalments available over NAB, you choose the one that best fits your risk profile, in this example a regular geared instalment. The performance of the strategy is largely dependant on how the cash component is invested, coupled with the ongoing performance of the NAB shares. By diversifying into other sectors of the market, such as listed property trusts, you are able to create a more balanced portfolio, in the event that the banking sector underperforms. Your income stream, made up of dividends and franking credits, is also diversified. Additionally you may receive tax benefits from pre-paid interest and the franking credits associated with dividends paid. Main Benefits of The Strategy:- (i) ability to leverage or diversity the existing portfolio without CGT consequences; (ii) maintain share exposure and income stream (dividends and franking credits); and (iii) no obligation to repay the loan – limited risk. Main Risks of The Strategy:- (i) the share price under performs over the term of the instalment; and (ii) the more highly geared the instalment, the greater the funding cost.

CASH FLOW = ДВИЖЕНИЕ ДЕНЕЖНЫХ СРЕДСТВ (или ДЕНЕЖНЫЙ ПОТОК, или ОБОРАЧИВАЕМОСТЬ НАЛИЧНОСТИ) – Cash Flow is a key acounting figure giving insight into a company's ability to pay. It is calculated on the basis of net income plus depreciation and amortization, changes in long-term provisions and income taxes. Conclusions about a company's financing potential can be drawn from the size of its cash flow and its development over time. An important key figure in equity analysis is P/CFR (price / cash flow ratio). Cash Flows are net of cash receipts and cash disbursements relating to a particular activity during a specified accounting period. Cash Flows are inflows and outflows of cash and cash equivalents. Cash comprises cash on hand and demand deposits. Cash equivalents are short-term, highly liquid investments that are readily convertible to known amounts of cash and which are subject to an insignificant risk of changes in value. Information about the cash flows of an entity is useful in providing users of financial statements with a basis to assess the ability of the entity to generate cash and cash equivalents and the needs of the entity to utilise those cash flows. The economic decisions that are taken by users require an evaluation of the ability of an entity to generate cash and cash equivalents and the timing and certainty of their generation. The cash flow statement shall report cash flows during the period classified by operating, investing and financing activities. Cash flows arising from transactions in a foreign currency shall be recorded in an entity's functional currency by applying to the foreign currency amount the exchange rate between the functional currency and the foreign currency at the date of the cash flow. The cash flows of a foreign subsidiary shall be translated at the exchange rates between the functional currency and the foreign currency at the dates of the cash flows. Unrealised gains and losses

arising from changes in foreign currency exchange rates are not cash flows. However, the effect of exchange rate changes on cash and cash equivalents held or due in a foreign currency is reported in the cash flow statement in order to reconcile cash and cash equivalents at the beginning and the end of the period. An entity shall disclose the components of cash and cash equivalents and shall present a reconciliation of the amounts in its cash flow statement with the equivalent items reported in the balance sheet. An entity shall disclose, together with a commentary by management, the amount of significant cash and cash equivalent balances held by the entity that are not available for use by the group. See also Cash Flow Statement. Money coming to an individual or business less money being paid out during a given period. In accounting, a company's net income (total sales minus operating expenses) plus amounts charged for amortization, depletion, depreciation, extraordinary charges to reserves, which are bookkeeping deductions and not paid out in actual Dollars and Cents. Cash flow represents the funds available for working capital and expansion. See also Amortization, and Depreciation. The total cash receipts (inflow) or cash payments (outflow) arising from a given asset, or group of assets, for a given period. Net cash flow is the inflows less the outflows. Cash Flow is the movement of money into or out of a business, project, or financial product. It is usually measured during a specified, limited period of time. Measurement of cash flow can be used for calculating other parameters that give information on a company's value and situation. Cash flow can be used, for example, for calculating parameters:- (i) to determine a project's rate of return or value. The time of cash flows into and out of projects are used as inputs in financial models such as internal rate of return and net present value. (ii) To determine problems with a business's liquidity. Being profitable does not necessarily mean being liquid. A company can fail because of a shortage of cash even while profitable. (iii) As an alternative measure of a business's profits when it is believed that accrual accounting concepts do not represent economic realities. For instance, a company may be notionally profitable but generating little operational cash (as may be the case for a company that barters its products rather than selling for cash). In such a case, the company may be deriving additional operating cash by issuing shares or raising additional debt finance. (iv) Cash flow can be used to evaluate the 'quality' of income generated by accrual accounting. When net income is composed of large non-cash items it is considered low quality. (v) To evaluate the risks within a financial product, e.g., matching cash requirements, evaluating default risk, re-investment requirements, etc. Cash flow is a generic term used differently depending on the subject. It may be defined by users for their own purposes. It can refer to past flows or projected future flows. It can refer to the total of all flows involved or a subset of those flows. Subset terms include net cash flow, operating cash flow and free cash flow. Statement of Cash Flow in a Business' Financials:- the (total) net cash flow of a company over a period (typically a quarter or a full year) is equal to the change in cash balance over this period:- positive if the cash balance increases (more cash becomes available), negative if the cash balance decreases. The total net cash flow is the sum of cash flows that are classified in three areas:- (i) Operational Cash Flows:- cash received or expended as a result of the company's internal business activities. It includes cash earnings plus changes to working capital. Over the medium term this must be net positive if the company is to remain solvent. (ii) Investment Cash Flows:- cash received from the sale of long-life assets, or spent on capital expenditure (investments, acquisitions and long-life assets). (iii) Financing Cash Flows:- cash received from the issue of debt and equity, or paid out as dividends, share repurchases or debt repayments. Ways Companies Can Augment Reported Cash Flow:- common methods include:- (i) Sales:- sell the receivables to a factor for instant cash (leading); (ii) Inventory:- don't pay your suppliers for an additional few weeks at period end (lagging); (iii) Sales Commissions:- management can form a separate (but unrelated) company and act as its agent. The book of business can then be purchased quarterly as an investment. (iv) Wages:- remunerate with stock options; (v) Maintenance:- contract with the predecessor company that you prepay five years worth for them to continue doing the work; (vi) Equipment Leases:- buy it; (vii) Rent:- buy the property (sale and lease back, for example); (viii) Oil Exploration Costs:- replace reserves by buying another company's; (ix) Research & Development:- wait for the product to be proven by a start-up lab; then buy the lab; (x) Consulting Fees:- pay in shares from treasury since usually to related parties; (xi) Interest:- issue convertible debt where the conversion rate changes with the unpaid interest; and (xii) Taxes:- buy shelf companies with Tax Loss Carry Forward's (TLCF). Or gussy up the purchase by buying a lab or O&G explore co. with the same TLCF. Cash Flow is the flow of money payments to or from a company. Expenditures are sometimes referred to as a Negative Cash Flow. The gross cash flow of a business is the gross profit (after payment of fixed interest) plus depreciation and provisions in any trading period, i.e. that sum of money which is available for investment, dividends or payment of taxes. The net cash flow is retained earnings plus depreciation and provisions before or after tax. The net cash flow of a particular project is usually defined as that arising after taxes have been paid, expenditure on repairs has been made and maintenance carried out. The opposite of Cash Drain. / экстраординарные . , то есть .

CASH FLOW BREAKEVEN SELLING PRICE = XX ЦЕНА – Cash Flow Breakeven Selling Price is the price needed to recover the cash expenditures associated with producing the commodity. See also Accounting Cost Breakeven Selling Price; Breakeven Selling Price; and Economic Cost Breakeven Selling Price.

CASH FLOW FORECAST = ПРОГНОЗ ДВИЖЕНИЯ ДЕНЕЖНЫХ СРЕДСТВ – Cash Flow Forecast is a financial statement that forecasts cash requirements in the future. This report looks at anticipated collections, accounts payable and future purchases to compute cash requirements or shortfalls. A Cash Flow Forecast indicates the likely future movement of cash in and out of the business. It's an estimate of the amount of money you expect to flow in (receipts) and out (payments) of your business and includes all your projected income and expenses. A forecast usually covers the next 12 months, however it can also cover a short-term period such as a week or month. The concept of cash flow is quite easy:- Net Cash Position = Receipts – Payments. Cash flow forecasts can help predict upcoming cash surpluses or shortages and help you to make the right decisions. It can help in tax preparation, planning new equipment purchases or identifying if you need to secure a small business loan. By including every case scenario in your cash flow forecast you will see how your business will cope if your business hits tough times or does better than expected. Prior warning allows you to work out solutions to anticipated temporary cash shortfalls or arrange short-term investments for temporary cash flow surpluses. How To Prepare A Cash Flow Forecast:- Step 1:- add cash inflows you expect to collect during the period including customer payments, interest earnings, dividends, sponsorship, grants and so on. Your cash inflows will rely on the method of payment your customers use – cash or credit. Enter the expected cash sales immediately and the credit sales when your customers are likely to pay you. Your credit sales income will depend on your credit management policy. Step 2:- add cash outflows from the items listed in your expenses forecast including supplier payments, salaries, loan repayments, credit card payments, and taxes. Consider regular, irregular, and seasonal payments such as rent, repairs and maintenance as required, and inventory purchases. Step 3:- simply add in an opening bank account balance, and add the revenue less the expenses for each weekly or monthly period to find out your likely cash position. Note:- be specific about when the money is due for collection and about the month and the amount your expenses falls due.

CASH FLOW FROM OPERATING ACTIVITIES = ДВИЖЕНИЕ ДЕНЕЖНЫХ СРЕДСТВ ОТ ОПЕРАЦИОННЫХ ВИДОВ ДЕЯТЕЛЬНОСТИ – Cash Flow From Operating Activities:- cash generated from the company's businesses; an indicator of a company's ability to fund capital programs and stockholder distributions. Excludes cash flows related to the company's financing and investing activities.

CASH FLOW HEDGE = ХЭДЬЖ ДВИЖЕНИЯ ДЕНЕЖНЫХ СРЕДСТВ – A Cash Flow Hedge is used when an entity is looking to eliminate or reduce the exposure that arises from changes in the cash flows of a financial asset or liability (or other eligible exposure) due to changes in a particular risk, such as interest rate risk on a floating rate debt instrument. The hedged item is accounted for under normal principles. The hedging derivative instrument is measured at fair value each period however the effective portion of the change in fair value is deferred in Other Comprehensive Income (OCI) and presented within equity (normally in a hedging reserve). The difference between the effective portion of the change in the fair value of the derivative hedging instrument and the full change in the fair value (the ineffective portion) is recognized immediately in profit or loss. A Cash Flow Hedge only has measured ineffectiveness where the change in the fair value of the derivative instrument exceeds the change in the present value of the future cash flows of the hedged item/exposure (referred to as an 'Over Hedge'). The change in fair value of the hedging instrument that is deferred in OCI is reclassified to profit or loss at a future date when the hedged item affects profit or loss (for example, when the interest payment on a floating rate debt instrument is made or when the payment associated with an anticipated transaction occurs). Cash Flow Hedge is a hedge of exposures to losses from variability in cash flows of an asset or liability, or a highly probable forecast transaction. A Cash Flow Hedge is a type of investment strategy set up to protect an individual against the risk of variable cash flow of a specific hedged item. Such a risk may be caused by particular assets or liabilities that generate revenue differently than expected, and are possibly reducing expected profits or increasing losses. For example, a cash flow hedge could protect against increases in the repayment installments of a variable rate loan, increases in the exchange rate of a foreign currency in which the individual expects to make a future transaction, or increases in the prices of planned inventory purchases. This financial strategy uses derivative instruments such as call options or put options to help limit the individual's exposure to such risks. Specific information, such as the strategy and risk of the original hedge, must be documented before a cash flow hedge can be properly established; in most cases, a financial advisor can help investors create financial protection for hedged items. Types of Risks:- in general, a cash flow hedge is put in place in to help protect against currency risks, price risks, or exposure to cash flow effects of financial instruments. Currency risks include those associated with a future transaction in a foreign currency or a debt denominated in a foreign currency. Price risks refer to the possibility of the purchase price of non-financial goods increasing or the sale price of non-financial goods decreasing. Fluctuating revenue of financial instruments could be due to price changes, benchmark interest rate changes, changes in the credit spread between the interest rate of the hedged item and the benchmark interest rate, and defaults or changes in creditworthiness. Call Versus Put Options:- two common instruments used to create a cash flow hedge are call and put options. Both options are legal agreements between two parties, the buyer and the seller, and both allow for a transaction to occur, without requiring it. A call option allows the investor to buy a predetermined amount of assets during a specific time period from the seller, but a purchase is not mandatory. Put options are the opposite in that the buyer of a put option may sell assets to the seller, in which case the seller is required to purchase them, but the buyer is not required to sell if he so chooses. For example, a farmer suspects that wheat prices might drop in the near future, reducing the sales price of his next harvest. The farmer sets up a cash flow hedge by buying put options on wheat futures, which would produce profits if wheat prices drop. This way, the profits from the put options would offset the losses from the reduced sales price if the price of wheat indeed drops. If the price of wheat increases, the farmer would lose the amount of money he used to buy the options, but he would profit from the higher wheat price. Qualifying Investments:- to qualify for cash flow hedge accounting treatment, a hedge fund must meet certain criteria. At the start of the original hedge fund process, the individual who sets up the investment must prepare documents stating both their objective and strategy, as well as the method that will be used to determine the effectiveness of the investment. Investors must also provide details regarding the risk and the date, or period of time, in which the cash flow would occur. The cash flow hedge has to sufficiently offset the revenue changes related to the hedged item. The transaction needs to be probable and is required to be conducted with another entity besides that of the original hedge. A Cash Flow Hedge is a hedge of the exposure to the variability of cash flow that:- (i) is attributable to a particular risk associated with a recognized asset or liability; such as all or some future interest payments on variable rate debt or a highly probable forecast transaction; and (ii) could affect profit or loss (IAS 39, §86b). This is mostly an accountant's definition.

CASHFLOW PER SHARE = ДВИЖЕНИЕ ДЕНЕЖНЫХ СРЕДСТВ НА АКЦИЮ – Cash Flow Per Share is a measure of a firm's financial strength, calculated as:- Cash Flow Per Share = (Operating Cash Flow – Preferred Dividends) / Common Shares Outstanding. Cash flow per share shows the after-tax earnings plus depreciation, on a per share basis. Many financial analysts place more emphasis on the cash flow per share value than on earnings per share values. While an earnings per share value can be easily manipulated to appear more positive than it really is, therefore putting its reliability in question, cash is more difficult to alter, resulting in what some analysts believe is a more accurate value of the strength and sustainability of a particular business model. A company's earnings per share is the portion of a company's profit that is allocated to each outstanding share of common stock, and, like cash flow per share, serves as an indicator of a company's profitability. Because the cash flow per share takes into consideration a company's ability to generate cash, it is regarded by some analysts as a more accurate measure of a company's financial situation than the earnings per share metric. Cash flow per share represents the net cash a firm produces, on a per share basis. Cashflow Per Share:- Ratio Cashflow Per Share = Cash Contributed From All Businesses / Total Issued and Fully Paid Shares at End of the Year. Cash Flow Per Share represents the portion of a company's cash flow allocated to each share of common stock. How It Works/Example:- cash flow per share can be calculated by dividing cash flow earned in a given reporting period (usually quarterly or annually) by the total number of shares outstanding during the same term. Because the number of shares outstanding can fluctuate, a weighted average is typically used. The formula for cash flow per share is:- Cash Flow Per Share = (Cash Flow – Preferred Dividends) / Shares Outstanding. Let's assume that during the fourth quarter, Company XYZ reported cash flow of USD4 million and distributed preferred dividends of USD500 000. During the same time frame, the company had a total of 10 million shares outstanding. We calculate the company's quarterly cash flow per share as follows:- (USD4 000 000 – USD500 000) / 10 000 000 = USD0.35. Why It Matters:- earnings per share (EPS) is a carefully scrutinized metric that is often used as a barometer to gauge a company's profitability per unit of shareholder ownership, but cash flow per share is even more important in some regards. Because of the nature of accounting rules, earnings can be easily manipulated, but cash flow is much harder to manipulate. As such, even though EPS is a key driver of share prices, many analysts look to cash flow per share as a 'check' on the reasonableness of a company's valuation and stock price.

CASH FLOW STATEMENT = ОТЧЁТ О ДВИЖЕНИИ ДЕНЕЖНЫХ СРЕДСТВ – IAS 1 (short for the International Accounting Standard No. 1) – Presentation of Financial Statements – requires the provision of information about the historical changes in cash and cash equivalents of an entity by means of a cash flow statement which classifies cash flows during the period from operating, investing and financing activities. Accordingly to the IAS 1 (short for International Accounting Standard No. 1) – Presentation of Financial Statements – titles of some of the financial statements have been changed. A 'cash flow statement' is referred to as a 'Statement Of Cash Flows'. The Cash Flow Statement details how a firm's income statement and changes to its balance sheet accounts contribute to cash flow for a specific period. A company needs cash flow to pay its bills and make debt service payments. Although accrual statements provide a better picture of a business's economic profits than a cash flow statement, a firm does not pay its bills with profits. We need to know the firm's actual cash flow to determine whether it can meet the payments for a proposed loan. Cash flow statements provide insight into how a firm generates and uses cash flow, which can indicate areas for improved management and operations. For

example, if a profitable company experiences cash flow problems due to large increases in its accounts receivables, then it needs to change its credit policies and collection practices. Another argument against preparing a cash flow statement is that a business's net cash flow for a period is revealed by the change in the balance sheet cash account for that period. By definition, the change in cash from one period to another is the firm's net cash flow. Why undertake the tedious work of constructing a cash flow statement when net cash flow is already known? Although net cash flow is significant, it is more important to understand what contributed to this end result. A firm that loses money from its core business, but has positive cash flow from the onetime sale of assets, is quite different from one with positive cash flow from its core operations and after other costs. Moreover, we do not know how the firm's cash flow related to its level of debt payments. A firm with USD40 000.00 in net cash flow and USD30 000.00 in annual debt service is a better credit risk than a business with the same net cash flow but debt payments of USD250 000.00. Cash Flow Statement is a financial statement showing the flow of cash in and out of the business, including sources and recipients over a specified time period. The success, growth and survival of an entity depends on its ability to generate or otherwise obtain cash. The Cash Flow Statement is one of the primary statements in financial reporting (along with the income statement, balance sheet and statement of changes in equity). It presents the generation and use of 'cash and cash equivalents' by category (operating, investing and finance) over a specific period of time. It provides users with a basis to assess the entity's ability to generate and utilize its cash. Operating activities are the entity's revenue-producing activities. Investing activities are the acquisition and disposal of non-current assets (including business combinations) and investments that are not cash equivalents. Financing activities are changes in the equity and borrowings. Management may present operating cash flows by using either the direct method (gross cash receipts/payments) or the indirect method (adjusting net profit or loss for non-operating and non-cash transactions, and for changes in working capital). Cash flows from investing and financing activities are reported separately gross (that is, gross cash receipts and gross cash payments) unless they meet certain specified criteria. The total that summarizes the effect of the operating, investing and financing cash flows is the movement in the balance of cash and cash equivalents for the period. Separate disclosure should be made of significant non-cash transactions (such as the issue of equity for the acquisition of a subsidiary or the acquisition of an asset through a finance lease). Non-cash transactions include impairment losses/reversals; depreciation; amortization; fair value gains/losses; and income statement charges for provisions. See also Statement Of Cash Flow. Cash Flow Statement is the statement of cash flows calculates and presents a company's incoming and outgoing payments during a financial year from ongoing operating, investing and financing activities. It also provides a reconciliation of the cash balances at the beginning and end of the financial year. This information should provide an indication of the company's capacity to earn positive cash flows, repay its liabilities and disburse dividends. A statement of cash flows is included in the standard audited financial statements prepared by a firm's independent accountants. Since many privately held companies, and most small businesses, do not produce audited financial statements, practitioners need to know how to prepare a cash flow statement for a specific period. To prepare a cash flow statement, the balance sheets for the beginning and end of the period and the income statement for the period are necessary. Two types of adjustments are made to the income statement to determine cash flow:- (i) noncash expense items (e.g., depreciation) are added back; and (ii) cash flows from changes in balance sheet accounts are incorporated. When preparing a cash flow statement, it is helpful to divide the statement into three sets of activities that affect cash flow:- operations (purchasing, production, and sales activities); investment activities (purchase of plant and equipment to support operations); and financing activities (securing or retiring debt and equity). Beyond showing the relative impact of operations, investment, and financing on a firm's cash flow, this format simplifies the calculation of debt service coverage ratios. It highlights the cash flow available to make debt service payments (i.e. the cash flow prior to financing activities) and the principal and interest payments for the period. For these reasons, the following explanation and example organizes the cash flow statement into these three components:- cash flow from operations, cash flow from investments, and cash flow from financing. This is not the only way to present a cash flow statement, but it is well suited to analyzing a business's borrowing capacity. The first step in cash flow analysis is finding the correct starting point from the firm's income statement. Since we need to compare cash flow to debt payments, the starting figure should exclude the interest expense. Therefore, begin with Net Income Before Interest and Tax Payments, which many firms list as a separate line on the income statement as income (or earnings) before interest and taxes (IBIT). Next, subtract the tax payments (or allowance for taxes) from the IBIT amount. When IBIT is not listed as a separate line on the income statement, begin with the final figure for net income after interest and taxes and add back the interest payment amount. Once net income after taxes and before interest payments is determined, the second step is adding back noncash expense items, which are accounting items that were subtracted from revenues as an economic expense but do not involve a real cash outflow. Depreciation is the most common noncash item, but amortization of patents, goodwill, and other costs is a second example. Third, incorporate the cash flow impact from balance sheet changes related to operating activities, for both assets and liabilities/owners' equity. The relevant asset accounts are accounts receivable, inventory, prepaid expenses, and other noninvestment related accounts. Liability accounts for this portion of the cash flow analysis are accounts payable, accrued expenses, deferred income, other payable accounts, and other liability accounts that are not debt or equity financing items. An increase in an asset account is a cash outflow (use of cash) that is a negative entry on the cash flow statement. Conversely, a decrease in an asset account is a cash inflow (source of cash) treated as a positive entry on the cash flow statement. Consider accounts receivable to see the relationship between asset accounts and cash flow. An increase in accounts receivable means that uncollected sales are higher, which reduces the cash flow received from the sales revenue shown on the income statement. If accounts receivable decrease, cash collections from sales exceed the sales revenue on the income statement, generating a cash flow increase. Liability accounts have the opposite effect on cash flow:- a decrease in a liability account is a cash outflow, whereas a liability account increase is a cash inflow. For example, when deferred income increases, the firm has received additional cash that is not included in the period's revenue on the income statement but needs to be added to represent true cash flow. If deferred income decreases, the business recognized some deferred income as revenue on its income statement in the period, although the associated cash inflow occurred in a prior period. Thus, a cash outflow deduction from net income is made to reflect the cash effect of the deferred income change. Once the cash flow impact of these balance sheet accounts is determined, they are summed up and added to the earlier figure for net income before interest payment plus noncash expenses. The resulting sum is Net Cash Flow From Operations. It indicates whether the firm is generating positive or negative cash flow from its core purchasing, production, and sales activities. A negative cash flow may indicate management problems, such as carrying too much inventory or slow accounts receivable collection. However, it may also indicate a well-managed firm that is expanding its inventory and accounts receivables as its sales grow, using internal cash flow to finance them. In the second part of the cash flow analysis, the cash impact from investment activities is calculated. Investment activities include the purchase of long-term assets to support the firm's operations and expand sales. These investments are shown on the balance sheet as increases in fixed asset accounts (plant and equipment), patents or purchased technology, and goodwill (intangible assets from the purchase of other businesses). A second type of investment activity is using excess cash to acquire marketable securities or other financial investments. Changes in any of these asset accounts are included in the investment activity part of the cash flow analysis. As with the operating assets, increases in these accounts are a cash outflow while decreases represent a cash inflow. In this case, it is intuitive that when a business purchases new equipment, for example, it uses cash; and when a fixed asset account declines, the firm is selling the asset and generating cash. These changes must be calculated based on the gross value asset accounts before any depreciation or amortization. The change in gross value represents the

actual cash transaction without the confusion of noncash deductions. Calculate the cash flow impact from changes in each investment-related account and then add these figures to the net cash flow from operations. The resulting figure is net cash flow after investing activities. This figure is used to determine the debt service coverage ratio, since it represents the firm's cash flow prior to its debt service payments and other financing activities. The final step incorporates the impact of the firm's financing transactions (i.e. new borrowing and stock sales, the repayment of debt, interest payments, and dividend payments) on cash flow. For this analysis, include both balance sheet and income statement items. From the balance sheet, calculate changes in debt accounts and total proceeds from stock sales. Since debt is divided into two accounts, current portion of long-term debt and long-term debt, the change in the sum of these two accounts must be calculated to determine the change in total debt. When this sum increases, there is a cash inflow from additional borrowing. On the other hand, when the sum of the current and long-term portions of debt declines, it represents a cash outflow from the firm to pay-down of debt. Debt-related cash flow also includes interest payments, which are obtained from the interest expense item on the income statement. For equity financing, cash flow from stock issuance equals the change in the total shareholders' paid-in capital. Total paid-in capital is the sum of stock par value and additional paid-in capital from the shareholders' equity section of the balance sheet. Note that retained earnings are excluded since they were already counted within the firm's net income. If the change in retained earnings is added, it will double count this portion of net income. An increase in total paid-in equity capital represents cash inflow from additional stock sales. A decrease indicates the use of cash to buy back stock. The final item included in cash flow from financing activities is the deduction of dividend payments itemized on the income statement. For the final net cash flow calculation, sum the cash flow changes from all the financing accounts and add them to net cash from after investing activity. This final figure, cash flow after financing activities, is the firm's net cash flow. To check the accuracy of the cash flow analysis, compare this net cash flow figure to the change in the balance sheet cash account for the period. The two figures should be identical. / МСБУ 1 (сокращение для Международного Стандарта Бухгалтерского Учёта № 1) – . строка баланса (item). выплата (repayment).

CASH FORWARD SALE = ФОРВАРДНАЯ ПРОДАЖА НАЛИЧНОГО ТОВАРА (или СРОЧНАЯ ПРОДАЖА НАЛИЧНОГО ТОВАРА) – Cash Forward Sale is the same as Forward Contract. A cash transaction common in many industries, including commodity merchandising, in which a commercial buyer and seller agree upon delivery of a specified quality and quantity of goods at a specified future date. Terms may be more 'personalized' than is the case with standardized futures contracts (i.e. delivery time and amount are as determined between seller and buyer). A price may be agreed upon in advance, or there may be agreement that the price will be determined at the time of delivery. See also Forward Contract. / Смотрите также Форвардный Контракт или Срочный Контракт (Forward Contract).

CASHGORA = КАШГОРА – Cashgora is a fiber produced by crossing Cashmere Goats with Angora Goats.

CASH IN ADVANCE = АВАНСОВЫЙ ПЛАТЁЖ (или ПРЕДОПЛАТА) – Cash In Advance:- when an importer must pay the exporter in cash before a shipment is made. The logic behind the structure of such a transaction is that if an exporter ships a product to an importer and the importer does not pay for the item, the exporter has very little recourse. This term can be used in a variety of businesses, but it is most common in the import/export business. Prior to receiving a shipment of a product from an overseas vendor, many importers are required to send cash in advance. By structuring the transaction in this manner, the exporter (or maker of the product) is protected against the possibility of non-payment by the importer. Cash In Advance is a method of payment for goods in which the buyer pays the seller in advance of the shipment of goods. Usually employed when the goods, such as specialized machinery, are built to order.

CASH ISSUES = КАССОВЫЕ ВЫПУСКИ – Cash Issues:- a new issue of shares for cash made to existing shareholders in proportion, e.g., 1 new share for every 2 shares held, to their existing shareholding for the purpose of raising additional capital for the company. It is usually issued at a discount to the market price. / в пропорции, например, 1 новая акция за каждые 2 удерживаемые акции, .

CASHLESS = БЕЗНАЛИЧНЫЙ – Cashless:- the transfer of funds without the use of a cash. In the case of cashless wage and salary payments, disbursements are not paid out to the employee but credited to his account (salary account). Cashless transactions are also becoming increasingly common in the retail trade and in tourism.

CASH LESS OVERDRAFT = НАЛИЧНЫЕ ЗА ВЫЧЕТОМ ПЕРЕРАСХОДОВ (или НАЛИЧНЫЕ ЗА ВЫЧЕТОМ ПЛАТЁЖНЫХ ССУД, или НАЛИЧНЫЕ ЗА ВЫЧЕТОМ ОВЕРДРАФТА) – Cash Less Overdraft is the immediate money situation. As it is often negative (overdrafts larger than cash) it may show immediate funding needs.

CASHLESS PAYMENTS = БЕЗНАЛИЧНЫЕ ПЛАТЕЖИ – The Cashless Payments:- the sum of all payment transactions performed in a given economic area without the use of cash. They take the form of book money dispositions on bank accounts by means of credit cards, cheques, remittances, debit transfers and bills of exchange. One method of making cashless payments is by electronic banking. In this context, the term 'Voucherless Payments' is also used if no vouchers are raised in cashless payments.

CASH LETTER OF CREDIT = КАССОВЫЙ (или ДЕНЕЖНЫЙ) АККРЕДИТИВ – Cash Letter Of Credit is a letter addressed by a bank to its correspondent bank to make funds available to the party named in the letter. The sum is deposited within the bank before letter is issued. Incorrect Cash Letter Credit (ICLC) – request to investigate a cash/return letter credit for which the depositor believes was functioned for an incorrect amount. For example, a deposit is made for USD320 900.55; however, the depositor received credit in the amount of USD300 900.55. If you discover an ICLC, submit an adjustment request to the Federal Reserve that functioned the cash/return letter credit.

CASH LOAN = ССУДА НАЛИЧНЫМИ – Cash Loan:- loans where the bank makes direct cash payment, e.g., current account loans or discount credit. The opposite of Guarantee Credit. / , например, .

CASH MANAGEMENT = УПРАВЛЕНИЕ НАЛИЧНОСТЬЮ – Cash Management:- the planning, implementation and monitoring of measures designed to ensure that adequate liquidity is maintained, surplus funds are profitably invested and shortfalls are made up in good time and at low cost. A term Cash Management refers to a broad area of finance involving the collection, handling, and usage of cash. It involves assessing market liquidity, cash flow, and investments. In banking in the United States, cash management, or treasury management, is a marketing term for certain services related to cash flow offered primarily to larger business customers. It may be used to describe all bank accounts (such as checking accounts) provided to businesses of a certain size, but it is more often used to describe specific services such as cash concentration, zero balance accounting, and automated clearing house facilities. Sometimes, private banking customers are given cash management services. Financial instruments involved in cash management include money market funds, treasury bills, and certificates of deposit.

CASH MARKET = КАССОВЫЙ РЫНОК (или НАЛИЧНЫЙ РЫНОК, или РЫНОК РЕАЛЬНЫХ ПОСТАВОК, или НАТУРАЛЬНЫЙ РЫНОК) – Cash Market is the market for the cash commodity (as contrasted to a futures contract) taking the form

of:- (i) an organized, self-regulated central market, e.g., a commodity exchange; (ii) a decentralized over-the-counter market; or (iii) a local organization, such as a grain elevator or meat processor, which provides a market for a small region. For example in physical oil products market, it may be Rotterdam spot market. The market where people buy and sell the actual commodities, i.e. grain elevator, bank, etc. See also Forward (Cash) Contract, and Spot. Market in which immediate exchange of the physical commodity takes place. Payment for the commodity is received on or soon after the day of exchange. Also known as Spot Market. The here-and-now market for immediate delivery and payment of commodities. Cash Market is the marketplace for immediate settlement of transactions involving commodities and securities. In a cash market, the exchange of goods and money between the seller and the buyer takes place in the present, as opposed to the futures market where such an exchange takes place on a specified future date. Also known as the Spot Market, since such transactions are settled 'on the spot'. Cash market transactions can take place either on a regulated exchange or over-the-counter (OTC). In contrast, transactions involving futures are conducted exclusively on exchanges, while forward transactions, such as currency forwards, are generally executed on the OTC market. For a specific commodity, the price in the cash market is usually less than its price in the futures market. This is because there are carrying costs, such as storage and insurance, involved in holding a commodity until it can be delivered at some point in the future. Cash Market is the market in which physical commodities are bought and sold. Refers not only to elevator companies and processors buying products but also to the organized cash sales at commodity exchanges and over-the-counter cash trading. / Рынок здесь-и-сейчас, обозначающий немедленную поставку сырья при его оплате. , например, . Рынок, на котором люди покупают и продают реальное сырьё, то есть зерновой элеватор, банк и тому подобное. Смотрите также .

CASHMERE = КАШЕМИР (или КАЖМИЭ) – Cashmere is a soft, silky fiber combed from the cashmere goat with a diameter of 18.5 microns or less. Cashmere has excellent insulating power, providing warmth without weight or bulk. It drapes beautifully, resists wrinkles, and sheds lint. Costly because of limited supply. Cashmere is a luxury fiber obtained from the soft fleecy undergrowth of the Kashmir goat of Tibet, Mongolia, China, Iran, Iraq, and India. Most commonly used in sweaters, shawls, suits, coats, and dresses. Cashmere or Kashmir:- from the Kashmir Goat, a hair fiber found in Kashmir India, Tibet, Iran, Iraq, and South West China. Often mixed with wool or synthetics to cut costs and improve the wear. All weaves but mostly plain or twill. All knits. Fiber is cylindrical, soft and silken. More like wool than any othe hair fiber. Has a very soft silky finish; very light in weight. Doesn't stand up to hard wear on account of extremely soft downy finish. True color is brownish, but can be dyed any shade. Comes in different weights. Cashmere is the extremely soft hair of the Cashmere Goat. Cashmere is often blended with sheep's wool in fabrics. Cashmere is the fine and soft undercoat hair of the cashmere goat which exists in Iran, India, Tibet, Mongolia, China and Iraq. Cashmere is one of the luxury fibers and today is usually blended with normal Sheep's wool or man-made fibers to reduce the cost. Another reason for the widespread blending is the fact that it makes the finished fabric more durable for original Cashmere fabrics are quite sensible. It is mainly used for clothing. Cashmere is a fiber obtained from the Cashmere Goat. It is fine in texture and it is also strong, light and soft; when it is made into garments, they are extremely warm to wear, much warmer than the equivalent weight in sheep's wool. Cashmere:- The Animal:- The only source of true Cashmere is the Kashmir Goat (Capra Hircus Laniger), native to the Himalayas. Its fine undercoat hair is collected by either combing or shearing during the spring moulting season. After sorting and scouring, the fibers are cleaned of coarse outer hairs. Annual yield of underdown averages around 150 g per animal. The Fiber:- US standards set an average fiber diameter for Cashmere of no more than 19 microns, and top quality fibre is just 14. It has natural crimp, allowing it to be spun into fine, lightweight fabrics. Cashmere has small air spaces between the fibers, which makes it warm without weight, while thin cuticle cells on the fiber surface make it smooth and lustrous. Cashmere:- Its luxurious, rare and expensive:- the wool of six Kashmir Goats is enough to make just one Cashmere sports jacket. Uses Of Cashmere:- Cashmere is luxurious, rare and expensive:- spun and woven, the annual fiber production of six Kashmir Goats is enough to make just one Cashmere sports jacket. The fabric is widely used as Cashmere sweaters because of its warmth and in babywear because of its softness. It is also used as blazers, coats, jackets and underwear. Pashmina is a type of Cashmere, used mainly in scarves and shawls, produced in the valley of Kashmir. Coarser Cashmere is used for rugs and carpets. To protect their industries, Cashmere manufacturers in Europe, North America and Japan are campaigning for stricter controls on the labelling of Cashmere garments. Producers:- China is the world's leading Cashmere producer, while Mongolia produces the finest fiber (with diameter of around 15 microns). Other, smaller producers include Australia, India, Iran, Pakistan, New Zealand, Turkey, and the USA. Production And Trade:- World annual production of coarse Cashmere is estimated at 15 000 to 20 000 tons, or 6 500 tons of 'pure Cashmere' after scouring and dehairing. China's output is estimated at 10 000 tons, followed by Mongolia (3 000 tons). While most of China's production is shipped to fabric and garment makers in Italy, Japan and the UK, the Chinese textile industry has begun to also make Cashmere garments for export. / Кашмирская или Кашемировая Коза – разновидность Тибетских Коз. Условное обозначение волокна Кашмир:- WS. Под Кашемиром, от Кашмир, лёгкая шерстяная, полушерстяная или хлопковая ткань с наклонными рубчиками. Из Кашемира шьют женские и детские платья и тому подобное. Кашемир – мягкая шерстяная или полушерстяная камвольная ткань саржевого переплетения, окрашенная в ровные цвета или набивная. Первоначально изготавливалась в Кашмире, Индия. Наиболее популярным изделием из неё являются шали. В конце 1880-х – начале 1890-х являлась самой модной тканью для мужской и женской верхней одежды.

CASH METHOD = КАССОВЫЙ МЕТОД – Cash Method is accounting method in which income and expenses are accounted for as they are paid. This is no longer a generally acceptable method for most businesses as it doesn't give a clear picture of operating efficiency. The check register of Cash Flow Statement will typically fulfill owners' needs in the area of cash management. See also Accrual Method. The Cash Method of accounting reports transactions only when cash is received or a payment is made. The other accounting method is accrual accounting.

CASH ON DELIVERY = НАЛОЖЕННЫЙ ПЛАТЁЖ (или НАЛИЧНЫМИ ПО (или В МОМЕНТ) ПОСТАВКЕ) – (1) Cash On Delivery:- terms of payment:- if the carrier collects a payment from the consignee and remits the amount to the shipper (aircargo). / В перевозках авиационных грузов . Под Наложенным Платежом понимается способ расчётов, при котором груз или почтовое отправление (бандероль, посылка) выдаётся получателю после оплаты установленной отправителем стоимости. Наложенный Платёж, способ расчётов, применяемый для погашения денежных обязательств гражданами и организациями при морской перевозке грузов и пересылке почтовых отправлений. Отправитель, сдавая груз, поручает предприятию транспорта или связи выдать этот груз получателю, предварительно взыскав с него платёж или удостоверившись в оплате его через банк. В бывшем Союзе Советских Социалистических Республик (СССР) широко применялся торговыми организациями, осуществлявшими книжную (книга – почтой) и посылочную торговлю.

(2) Cash On Delivery:- distribution system whereby the person in receipt of goods makes payment for them on the spot to the deliverer. Such a system is operated by the UK Post Office, where it is the postman who takes receipt of payment.

CASH OR TITLE OPTION = ОПЦИОН НА ДЕНЕЖНЫЕ СРЕДСТВА ИЛИ ПРАВО СОБСТВЕННОСТИ – Shareholders may opt to subscribe new shares, sell the Cash Or Title Option on the exchange or claim payment of the equivalent in cash from the issuer. Abbreviation:- COTO. Cash Or Title Option is a type of option given to shareholders to receive either dividends, subscribe to new shares, or sell them on the secondary market. This option is usually associated with the Swiss market which does not attract any tax

liabilities. / Учредители могут выбрать либо подписаться на новые акции, либо продать Опцион На Денежные Средства Или Право Собственности (ОДСИПС) на бирже, либо заявить эмитенту о платеже эквивалента денежными средствами. Обозначение:- ОДСИПС.

CASH PRICE = ЦЕНА ЗА НАЛИЧНЫЙ РАСЧЁТ (или КАССОВАЯ ЦЕНА, или ЦЕНА ДЛЯ НЕМЕДЛЕННОГО РАСЧЁТА, или НАТУРАЛЬНАЯ ЦЕНА) – Cash Price is a price at which goods may be bought using cash. The price paid in cash is usually different from the hire purchase price in that the latter normally includes interest. The price in the marketplace for actual cash or spot commodities to be delivered via customary market channels. Cash Price is the price for actual or spot underlying commodity that a futures contracts is based upon. In the case of Single-Stock Futures, the price of the underlying stock. The price at which a physical, actual or spot commodity is selling at a given time and place. Cash Price is the actual amount of money that is exchanged when commodities are bought and sold. The cash price usually will include all transaction, carry and transportation costs. Investors looking to benefit from changes in commodity prices can invest in commodity futures, which are anticipated cash prices. Changes in futures trading volume affect the volatility of cash prices. The cash price is not the same as the futures price. The cash price is the amount paid for commodities on the spot market, where large manufacturers commonly purchase the commodities they need. Commodities are physical products that are generally indistinguishable no matter which company brings them to the marketplace. Examples include Corn, crude oil, gasoline, gold, Cotton, beef and sugar. Cash Price is the current price in the market for cash/spot contracts. / Цена, по которой материальный, фактический или наличный товар продаётся по данной цене в данном месте. Под Натурой понимаются товары, продукты как платёжное средство взамен денег.

CASH PURCHASE TICKET = КАРТОЧКА ТОВАРОВЛАДЕЛЬЦА – In Canada, a Cash Purchase Ticket is a ticket issued indicating the grade, weight, price and amount payable to the owner of the grain for each delivery of grain to a primary elevator, process elevator or grain dealer. The ticket is a negotiable instrument and can be cashed at any chartered bank or credit union. / в любом декретированном банке или кредитном союзе.

CASH RATE = СТАВКА ЗА НАЛИЧНЫЕ – The Cash Rate is the interest rate that major banks charge to many of their best corporate borrowers. Each bank sets it own Cash Rate, though because the rate is so competitive, most of the time the rate is similar amongst all banks.

CASH REDEMPTION = ВЫКУП ЗА НАЛИЧНЫЕ (или ИЗЪЯТИЕ НАЛИЧНЫХ) – Cash Redemption (C):- means the cash actually paid at the redemption date, i.e. £N x R or equivalently £N x (100 + k) / 100.

CASH RESERVE = КАССОВЫЙ РЕЗЕРВ (или РЕЗЕРВ НАЛИЧНОСТИ) – Cash Reserve:- assets or capital which are immediately accessible or transferable into cash. In finance, Cash Reserves primarily refers to two things. One is a type of short-term, highly liquid investment that earns a low rate of return (perhaps 3% annually) such as investment company Fidelity's mutual fund called Fidelity Cash Reserves. This is where some individuals keep money that they want to have quick access to. The other type of cash reserves refers to the money a company or individual keeps on hand to meet its short-term and emergency funding needs. The commonly recommended eight-month emergency fund that individuals are advised to have is a type of cash reserves. Individuals hold their cash reserves in bank accounts or in short-term, stable investments that are not likely to lose value so that they can withdraw these funds or sell these investments at any time without losing money, regardless of how well the stock market is performing. An individual's cash reserves might consist of money in a checking account, savings account, money-market fund or money-market account, and short-term Treasury Bills and CDs. Individuals and businesses that lack sufficient cash reserves can resort to credit, or in extreme cases may be forced into bankruptcy.

CASH RETURN ON CAPITAL INVESTED = ПОСТУПЛЕНИЕ ДЕНЕЖНОЙ НАЛИЧНОСТИ ОТ ИНВЕСТИРОВАННОГО КАПИТАЛА – Cash Return On Capital Invested (CROCI) is a method of valuation that compares a company's cash return to its equity. Developed by the Deutsche Bank's global valuation group, CROCI provides analysts with a cash flow based metric for evaluating the earnings of a company. Also known as Cash Return On Cash Invested. CROCI is found by the following formula:- CROCI = EBITDA / Total Value Of Equity; where EBITDA is short for Earnings Before Interest, Taxes, Depreciation, and Amortization. Cash return on capital invested is a variation of the economic profit model. In essence, CROCI measures the cash profits of a company as a proportion of the funding required to generate them. It acknowledges both common and preferred share equity (as well as long-term funded debt) as sources of capital. Cash Return On Capital Invested (CROCI) is a key figure that describes the return generated by a company on its entire invested capital. A comparison between CROCI and a company's capital costs can be used to determine the company's value. CROCI is based solely on financial statements and annual reports, i.e. on verifiable quantitative historical data. Forecasts and analysts' estimates are not incorporated into the model. Cash Return On Capital Invested (CROCI) is metric that compares the cash generated by a company to its equity. It is also sometimes known as Cash Return On Cash Invested. It compares the cash earned with the money invested. This is a cash flow based measure as opposed to earnings based metric. Cash flow based metrics are more important for the investors because it is ultimately the cash that matters to the investors. Besides, cash flow based measures are superior to earnings based measures because the earnings can be manipulated with the help of accounting policies. A positive point about the cash return on capital employed is that it removes the effect of non-cash expenses such as depreciation and amortization. These non-cash items are of less significance to the investors because they are ultimately interested in the cash flows. This metric was developed by the Deutsche Bank Group and it is based on an economic profit model. Although there are no standards but the higher this measure is the better it is. A company with a higher cash return on capital invested is a good investment opportunity. Calculation:- cash return on capital invested is calculated by dividing the earnings before interest, taxes, depreciation and amortization by the total capital invested. Formula:- CROCI = Cash Return on Capital Invested = EBITDA / Capital Invested. The capital invested is defined as the equity capital and preferred shares. Long term loans are also included in the capital employed. Sometimes it is also referred to as Capital Employed. It can be calculated from the balance sheet by adding equity and long-term loans. Another method of calculating capital invested is by subtracting the current liabilities from the total assets. Norms and Limits:- investors should not base their decision on only this measure. It should be used with other financial ratios of performance measurement to better assess the performance of a company. It should be compared with the historical data and data from other companies to see whether the performance of a company is improving or deteriorating over time. / Дойчэ Банк А.Ге. (Deutsche Bank AG).

CASH SALE = ПРОДАЖА ЗА НАЛИЧНЫЙ РАСЧЁТ (или КАССОВАЯ ПРОДАЖА, или НАЛИЧНАЯ ПРОДАЖА) – Cash Sale is a transaction on the floor of the stock exchange that calls for delivery of the securities the same day. In regular way trades, the seller is to deliver on the third business day, except for bonds, which are the next day. See also Regular Way Delivery.

CASH SETTLED = С РАСЧЁТОМ НАЛИЧНЫМИ (или РАСЧЁТНЫЙ) – Cash Settled:- settling or meeting the obligations imposed by an expiring contract by means of cash payment, as opposed to physical delivery or receipt of a commodity. Cash payments are determined by value of contract, or market-to-market price. Most contract holders eliminate their positions through offsetting positions. Less than two percent of all futures contracts are held until expiration. If a futures contract holder chooses to hold the contract to expiration, a cash settlement may be made. A cash settlement essentially represents the difference between the contract value at the

time of original purchase or sale and the contract value at expiration. However, the buyer and seller do not exchange the full value of the contract, but the difference in the contract value, compared with the original price.

CASH SETTLED CONTRACTS = КОНТРАКТЫ С РАСЧЁТОМ НАЛИЧНЫМИ – Cash Settled Contracts:- upon expiration or exercise of commodity futures or option contracts, this settlement method allows the buyer to take the cash position associated with the commodity instead of the physical commodity itself. This settlement method is available for certain contracts. Commodity contracts settled by this method only include Uranium, Electricity, Propane and Brent Crude Oil.

CASH SETTLED WARRANT = ВАРРАНТ С РАСЧЁТОМ НАЛИЧНЫМИ (или РАСЧЁТНЫЙ ВАРРАНТ) – Cash Settled Warrants are settled by a cash payment by the warrant issuer to the warrant holder, e.g., most index warrants. The cash payment will be calculated as determined by the terms and conditions of the warrant. Some warrants may offer the choice to investors for cash settlement or physical delivery, e.g., Currency Warrants. Cash-Settled Warrants are the warrants that are not exercised in exchange for a physical asset, but for a cash amount equal to their intrinsic value. / , например, . порядки и условия . , например, .

CASH SETTLEMENT = НАЛИЧНЫЙ РАСЧЁТ (или РАСЧЁТ НАЛИЧНЫМИ, или ДЕНЕЖНЫЙ РАСЧЁТ) – Cash Settlement is the procedure by which index futures and index options contracts are settled. Because an investor cannot directly buy or sell an index, index futures and options contracts are cash settled by allocating a Dollar amount to each index point. A cash payment to close a futures contract. Transactions generally involving index-based futures contracts that are settled in cash based on the actual value of the index on the last trading day, in contrast to those that specify the delivery of a commodity or financial instrument. A method of settling certain futures or options contracts whereby the seller (or short) pays the buyer (or long) the cash value of the commodity traded according to a procedure specified in the contract. Also known as Financial Settlement, especially in energy derivatives. Cash Settlement (warrants) is aorm of settlement in which the issuer of the warrant pays a cash sum to the warrant holder instead of delivering the underlying instrument. If the underlying instrument cannot be physically delivered to the warrant holder (e.g., in the case of index warrants), the contract is settled in cash. The difference between the strike price stipulated in the contract and the current market value of the underlying instrument is calculated and paid to the warrant holder. Cash Settlement is a cash compensation based on the results of measuring futures and options trades which cannot be physically fulfilled, e.g., index-based options. Cash Settlement is a settlement method used in certain future and option contracts whereby, upon expiry or exercise, the seller of the financial instrument does not deliver the actual but transfers the associated cash position. For sellers not wishing to take actual possession of the underlying cash commodity, cash settlement is a more convenient method of transacting futures and options contracts. For example, the purchaser of a cotton future that is cash settled, rather than being required to take ownership of physical bundles of cotton, pays the difference between the spot price of cotton and the futures price. Performance of contractually stipulated obligations by making cash settlement as opposed to physically delivering the commodity underlying the contract. See also Financial Futures.

CASH/STOCK OPTION DIVIDEND = ОПЦИОН НА ДИВИДЕНД ЛИБО НАЛИЧНЫМИ, ЛИБО АКЦИЯМИ – Cash/Stock Option Dividend:- shareholder has the option of receiving cash dividends or additional shares. The shares are offered at a specific ratio, for example, one new share for each 50 shares owned. The bigger the company, the more likely it is to pay a dividend. Whereas more than three-quarters of the companies in the S&P 500 pay a dividend, only about half of all US-listed firms pay one. According to academic studies from 2005 (p. 797) and 2010, of those companies that do pay a dividend, the vast majority pay out cash, but 8% pay out dividends in the form of additional shares of stock. A Stock Dividend is similar to a stock split – a company issues new shares to stockholders in some proportion to the shares outstanding. Any stock dilution of 25% or greater is considered a split, so a 5-for-4 exchange is a stock split, not a stock dividend. Stock splits simply reduce the par value per share of stock outstanding. In contrast, stock dividends require the shifting of retained earnings into the company's capital stock account, which reduces the cash available to pay out classified as a dividend. Cash paid out that is greater than retained earnings is classified as a return of capital. Most stock dividends are in the 5% to 15% range. If a company pays a 5% stock dividend, each shareholder will receive one new share for every 20 shares they own. So a shareholder with 100 shares will own 105 shares after the dividend is paid. The total value of the firm does not change. Neither a cash nor a stock dividend changes the shareholder's net worth in the company. Cash-rich firms favor cash dividends, while growing firms or firms seeking to reduce their share prices may opt for stock dividends. A stock dividend is not taxable until sold – that is, if stock is the only option offered. Shareholders that are given the option of receiving either stock or cash dividends will be taxed even if they choose stock. In contrast, a cash dividend is always immediately taxable. Note:- the cash distributions of Master Limited Partnerships (MLPs) are not considered dividends and are almost entirely tax-deferred! Check out our free MLP Investing report to learn more about the advantages of investing in MLPs. Stock dividend proponents argue that a stock dividend gives shareholders maximum flexibility – if they want to reinvest in the business tax-free, they can hold onto the stock. If they want to cash out, they can sell the shares. I guess holding on to a stock dividend can be considered a form of reinvestment, but keep in mind that it is a type of reinvestment that just maintains – and does not increase – one's ownership stake in the company. Cash dividend proponents (including me) argue that requiring a company to return cash imposes fiscal discipline and prevents the company from squandering shareholder wealth. Furthermore, since many shareholder recipients of cash dividends do not reinvest them (silly them!), those that do reinvest gain a greater share of future company profits. And if you reinvest the cash when the stock price is low, all the better! In contrast, recipients of stock dividends cannot increase their ownership stake in the company without shelling out additional cash from their pocket. Others argue that you don't need either type of dividend to cash out because you can always sell existing shares. This is true, but it requires more work on the shareholder's part to remember to sell shares on a regular basis. Dividends (especially of the cash variety) do the work for you. Xxxxx. Stock Dividends versus Cash Dividends:- investors' preference for stock or cash depends on their inclinations toward factors such as liquidity, tax situation, and flexibility. Income From Dividends:- when choosing between cash or stock dividends, the trade-off is between liquidity in the short-term or income from capital gains in the long-term. Cash Dividends provide steady payments of cash that can be used to reinvest in a company, if the shareholder desires. Holders of Stock Dividends can sell their stock for (hopefully) high capital gains in the future, or they can sell it off immediately to get cash, much like a cash dividend. This flexibility is seen by some as a benefit of stock dividend. Cash dividends are immediately taxable as income, while stock dividends are only taxed when they are actually sold by the shareholder. If an investor is interested in long-term capital gains, he or she will likely prefer stock dividends. If an investor needs a regular source of income, cash dividends will provide liquidity. Firms can choose to issue stock dividends if they would like to direct their earnings toward the development of the firm but would still like to appease stockholders with some form of payment. Established firms with little more room to grow do not have pressing needs for all their cash earnings, so they are more likely to give cash dividends. Cash Dividends are those paid out in currency, usually via electronic funds transfer or by paper check. Stock Dividends:- stock or scrip dividends are those paid out in the form of additional stock shares of either the issuing corporation or another corporation. Cash Dividend:- a payment by the company to shareholders paid out in currency, usually via electronic funds transfer or a printed paper check. If a firm decides to parcel out dividends to shareholders, they have a choice in the form of payment:- cash or stock. Cash dividends are those paid out in currency, usually via electronic funds transfer or by paper check. This is the most common method of sharing corporate profits with the shareholders of a company. Stock or scrip dividends are those paid out in the form of additional stock shares of either the issuing corporation or another corporation.Cash

dividends provide investors with a regular stream of income. Stock dividends, unlike cash dividends, do not provide liquidity to the investors; however, they do ensure capital gains to the stockholders. Therefore, if investors are not interested in a long-term investment, they will prefer regular cash payments over payments of additional stock. Costs of taxes can also play a role in choosing between cash or stock dividends. Cash dividends are immediately taxable under most countries' tax codes as income, while stock dividends are not taxable until sold for capital gains (if stock was the only choice for receiving dividends). This can be seen as a huge benefit of stock dividends, particularly for investors of a high income tax bracket. A further benefit of the stock dividend is its perceived flexibility. Shareholders have the choice of either keeping their shares in hopes of high capital gains, or selling some of the new shares for cash, which is somewhat like receiving a cash dividend. If the payment of stock dividends involves the issuing of new shares, it increases the total number of shares while lowering the price of each share without changing the market capitalization of the shares held. It has the same effect as a stock split:- the total value of the firm is not affected. If the payment involves the issuing of new shares, it increases the total number of shares while lowering the price of each share without changing the market capitalization, or total value, of the shares held. As such, receiving stock dividends does not increase a shareholder's stake in the firm; by contrast, a shareholder receiving cash dividends could use that income to reinvest in the firm and increase their stake. For the firm, dividend policy directly relates to the capital structure of the firm, so choosing between stock dividends and cash dividends is an important consideration. A firm that is still in its stages of growth will most likely prefer to retain its earnings and put them toward firm development, instead of sending them to their shareholders. The firm could also choose to appease investors with stock dividends, which would still allow it to retain its earnings. Conversely, a firm that is already quite stable with low growth is much more likely to choose payment of dividends in cash. The needs and cash flow of the firm are necessary points of consideration in choosing a dividend policy.

CASH WITHDRAWAL = СНЯТИЕ НАЛИЧНЫХ – (1) Cash Withdrawal is a taking cash from account.

(2) Cash Withdrawal is a provision enabling a participant to withdraw part or all of an accumulation from an insurance policy or annuity.

CASH WITH ORDER = НАЛИЧНЫМИ ПРИ ЗАКАЗЕ (или НАЛИЧНЫМИ С ЗАКАЗОМ) – Cash With Order is a method of payment for goods in which cash is paid at the time of order and the transaction becomes binding on both buyer and seller. / Метод оплаты за товары, при котором наличные оплачиваются во время размещения заказа и операция становится обязательной как для покупателя, так и для продавца.

CASING = ОБСАДНАЯ ТРУБА (или ОБСАДНАЯ КОЛОННА) – Casing:- a series of tubular steel pipes joined by threads and couplings that lines the wellbore to prevent water and rock from entering. / Обсадная Труба – стальная труба, применяемая для крепления стенок буровой скважины.

CASINGHEAD GAS = ГОЛОВОЧНЫЙ ГАЗ (или ГАЗ ИЗ БУРОВОЙ СКВАЖИНЫ) – Casinghead Gas is the associated and dissolved gas produced along with crude oil from oil completions. Also known as Oil Well Gas. Gas present in an oil well that is removed when it flows to the surface at the well's casing. / Газ, сопутствующий нефти и выделяющийся из неё на поверхности обсадной колонны нефтяной скважины.

CASQUE = КАСКА (или ШЛЕМ) – Casque is a piece of armor for the head, helmet.

CASSIMERE = ХХ (или КАЗИМИР, или ЛЁГКОЕ СУКНО) – Cassimere:- a closely woven smooth twilled usually wool fabric (as for suits). / .

CASSOCK = РЯСА (или СУТАНА) – Cassock is a close-fitting ankle-length garment worn especially in Roman Catholic and Anglican churches by the clergy and by laymen assisting in services. / .

CAST = COUNCIL OF AGRICULTURAL SCIENCE AND TECHNOLOGY

CAST COATING = ПОКРЫТИЕ ЛИТЬЁМ (или ОТЛИВКОЙ) – Cast Coating is a method by which resinous materials such as vinyl are coated onto a fabric and cured by heated casting drums. See also Coating. / нагретыми отливочными барабанами.

CASTING = ОТЛИВКА (или ЛИТЬЁ) – Casting consists of pouring molten metal into a mold, where it solidifies into the shape of the mold. The process was well established in the Bronze Age (beginning c. 3000 BC), when it was used to form most of the bronze pieces now found in museums. It is particularly valuable for the economical production of complex shapes, ranging from mass-produced parts for automobiles to one-of-a-kind production of statues, jewelry, or massive machinery. Processes:- casting processes differ in how the mold is made and in how the metal is forced into the mold. For metals with a high melting temperature, stable refractory material must be used to avoid reaction between the metal and the mold. Most steel and iron castings, for example, are poured into silica sand, though some parts are cast into coated metal molds. For metals of lower melting point, such as aluminum or zinc, molds can be made of another metal or of sand, depending on how many parts are to be produced and other considerations. Gravity is most frequently employed to fill the mold, but some processes use centrifugal force or pressure injection. (i) Sand-Casting:- sand-casting is widely used for making cast-iron and steel parts of medium to large size in which surface smoothness and dimensional precision are not of primary importance. The first step in any casting operation is to form a mold that has the shape of the part to be made. In many processes, a pattern of the part is made of some material such as wood, metal, wax, or polystyrene, and refractory molding material is formed around this. For example, in greensand-casting, sand combined with a binder such as water and clay is packed around a pattern to form the mold. The pattern is removed, and on top of the cavity is placed a similar sand mold containing a passage (called a Gate) through which the metal flows into the mold. The mold is designed so that solidification of the casting begins far from the gate and advances toward it, so that molten metal in the gate can flow in to compensate for the shrinkage that accompanies solidification. Sometimes additional spaces, called Risers, are added to the casting to provide reservoirs to feed this shrinkage. After solidification is complete, the sand is removed from the casting, and the gate is cut off. If cavities are intended to be left in the casting – for example, to form a hollow part – sand shapes called Cores are made and suspended in the casting cavity before the metal is poured. Patterns are also formed for sand-casting out of polymers that are evaporated by the molten metal. Such patterns may be injection molded and can possess a very complex shape. The process is called Full-Mold or Evaporative Pattern Casting. A variant of sand-casting is the shell-molding process, in which a mixture of sand and a thermosetting resin binder is placed on a heated metal pattern. The resin sets, binding the sand particles together and forming half of a strong mold. Two halves and any desired cores are then assembled to form the mold, and this mold is backed up with moist sand for casting. Greater dimensional accuracy and a smoother surface are obtained in this process than in greensand-casting. (ii) Metal Molds:- other molds are made from metal. Here a die of the desired shape is machined from cast iron or steel. If the metal flows into the mold by gravity, the process is called Permanent Mold Casting. If the molten metal is forced in under pressure, the process is called Die Casting. Die-casting dies are water-cooled; consequently, they can produce parts with thinner walls at a higher rate than permanent mold machines. The rapid cooling creates a stronger part than sand-casting, but ductility may be poorer owing to entrapped gas and porosity. Since the initial cost of a die is substantial, metal molds are cost-effective only when many identical parts are to be made. Indeed, a die may be made to produce several parts at once. (iii) Investment Casting:- in investment casting a mold is made by drying a refractory slurry on a pattern made of wax or plastic. A series of layers is

applied and dried to make a ceramic shell, and the pattern is then melted or burned out to provide the mold. This process allows the mass production of parts with more complex shapes and finer surface detail than can be attained by other processes. It can be used with almost any metal and is customarily employed for casting relatively small parts. The wax pattern can be made by injection molding. (iv) Centrifugal Casting:- centrifugal casting forces the metal into a mold by spinning it. It is used for the casting of small precious-metal objects, so that essentially all of the metal goes into the casting instead of the gates and risers. It is also used to produce long, hollow objects without resorting to cores – for example, to cast pipe. Here the long, cylindrical mold is horizontal and is spun about the axis of the cylinder as metal is poured into the mold. (iv) Continuous Casting:- actually not a means of casting parts, continuous casting is practiced in the primary production of metals to form strands for further processing. The metal is poured into a short, reciprocating, water-cooled mold and solidifies even as it is withdrawn from the other side of the mold. The process is widely used in the steel industry because it eliminates the cost of reheating ingots and rolling them to the proportions of the billets, blooms, and slabs made by continuous casting. Metallurgy:- the mechanical properties of castings can be degraded by inhomogeneities in the solidifying metal. These include segregation, porosity, and large grain size. Grain size:- a fine-grained casting can be produced by rapidly cooling the liquid metal to well below its equilibrium freezing temperature, i.e. by pouring into a mold that cools the metal rapidly. For this reason, die castings have a finer grain size than the same alloy cast in a sand mold. In cast iron, remarkable changes in microstructure result from various alloying additions and casting temperatures. For example, normal cast iron solidified in a sand mold forms what is known as Gray Iron, an iron matrix containing about 20 percent by volume graphite flakes. This type of iron has limited ductility. However, when a small amount of magnesium is added to the melt before casting, the result is a 'spheroidal graphite' iron, in which graphite appears as spherical nodules and ductility is greatly increased. If the molten iron is chill cast (i.e. rapidly cooled), it will form a 'white' iron containing about 60 percent cementite, or iron carbide. This material is hard and wear-resistant, but it has no ductility at all. These cast irons are usually given a heat treatment to improve their mechanical properties. Segregation:- different parts of a casting may have different compositions, stemming from the fact that the solid freezing out of a liquid has a different composition from the liquid with which it is in contact. For example, when salt water is cooled until ice forms, the ice is essentially pure water while the salt concentration of the water rises. Minor segregation is unimportant, but large differences can lead to local spots that are exceptionally weak or strong, and both of these can lead to early failure in a part under stress. Porosity:- a major problem in castings, porosity is principally caused by the shrinkage that accompanies solidification. Molds are designed to feed metal to the casting in order to keep it full as solidification proceeds, but, if this feeding is incomplete, the shrinkage will show up as internal pores or cracks. If these cracks are large, the casting will be useless. If they are small, they will have relatively little effect on the properties. Another cause of porosity is the presence of gas-forming impurities in the liquid metal that exceed the solubility of the gas in the solid. In such cases, solidification is accompanied by the formation of bubbles as the gas is rejected. To eliminate this problem, gas-forming elements must be removed from the liquid before casting. Bubbling an inert gas such as argon through the liquid before casting is one means of doing this; vacuum degassing is another. Semi-finished casting products are intermediate castings produced in a foundry that need further processing before being a finished good. There are four types:- ingots, billets, blooms, and slabs. / Casting = (Кокильное) Литьё; (Кокильная) Отливка. прокатка (rolling). легирование или легирующее (alloying). (i) Литьё В Песчаные Формы или Отливка, Полученная В Песчаной Форме (Sand-Casting). металлические кокили или металлические литейные формы (metal molds). (ii) Литьё Под Давлением или Кокильное Литьё или Кокильная Отливка (Die Casting). пористость или рыхлость (porosity). (iii) Точное Литьё или Точная Отливка или Литьё По Выплавляемым Моделям (Investment Casting). (iv) Непрерывное Литьё или Непрерывная Разливка или Непрерывный Слиток (Continuous Casting). Центробежное Литьё или Отливка, Полученная Центробежным Способом (Centrifugal Casting). Сегрегация или Выделение или Зейгерование или Разделение По Крупности (Segregation). Размер Зерна или Величина Зерна (Grain Size). блюмы (blooms), и слябы (slabs). сопровождается образованием пузырей или раковин (bubbles) .

CASTLE WHEEL = КАСЛСКОЕ КОЛЕСО – Castle Wheel:- the Irish Castle Wheel is one of the few spinning designs that has a true home of origin – Donegal, and in particular, County Antrim. The design dates from perhaps the late XVII century; certainly there are example in museums dating prior to the last quarter of the XVIII century. By the 1830's, this type of wheel was being built in North America. The set-up has several advantages:- for one, it is quite stable. For another, the wheel is 'non-handed'; that is, it makes no difference if you are right or left handed. From the builder's point of view, the wheel does not require any planks or slabs in construction. It is a tall design, with our version (22-inch diameter wheel) reaching about 48 inches above the floor. The Irish Castle wheel does not break down for ease in packing and transport. The drive wheel may be dismounted from the frame, but you are still left with a rather heavy, robust 30-inch tall sort of three-legged barstool, and that part does not get any smaller. Irish Castle wheels were originally designed for the spinning of flax, a job that they do well at. For various mechanical reasons, there are obvious limits as to how large a flyer and bobbin can be fitted – which means that the set-up does best with garment-range yarns, say from 2 000 yards per pound (ypp) to 10 000 ypp. Since the tension adjustments are 'upside down' with respect to the operator, they take some getting used to. This wheel comes with your choice of flyer-bobbin arrangements, two additional bobbins, bobbin rack, oil bottle, threading hook, spare drive cord, bee's wax, and a ply sampling 'aid'. We recommend our #3/4 double-drive, bobbin-lead flyer array. The example wheel is in sugar maple; also available in oak. The flyer is usually mounted above the wheel, which means less floor space is used. A well-known example of this is the Castle Wheel at Alden Amos' site. Scottish Castle Wheel – like its cousin, the Irish Castle, this wheel takes advantage of its height (40+ inches) by putting a good-sized drive wheel (22 inch diameter) into a small floor space, or 'footprint'. Un-like the Irish Castle, this wheel may be built as 'right' or 'left' handed:- That is, the flyer orifice may be to either the left side of the bench, or to the right side of the bench. In addition, the wheel dis-assembles easily for transport and shipping. A traditional design, and one suited for the historical personage. Wheels of this basic design have been in use since the middle of the XVIII century, and this wheel is appropriate for spinning flax and wool to garment and domestic standards. Comes with your choice of flyer/bobbin array (we advise our #1, double-drive, bobbin-lead setup), two additional bobbins, bobbin rack, oil bottle, hunk of bee's wax, extra drive cord material, threading hook and a twist sampling aid. Available in Oak (traditional Scottish) or Sugar Maple (Colonial American). Example pictured has bench mounted distaff, available at xtra cost. Additional flyer/bobbin arrays are available, and are easily changed. Tensioning is of the strap type, similar to our Canadian wheels. / Ручные прялки на деревянной раме в форме башни.

CAST OFF = ОТДАВАТЬ (или ОТВАЛИВАТЬ, или СНИМАТЬСЯ) – Cast Off (maritime term):- to let go. / Отдавать (швартовы, буксир); отваливать (от причальной стенки); сниматься (с бочки).

CASTOR = КЕСТОР (или БОБРИК) – Castor is a beaver hat.

CASTRATION = КАСТРАЦИЯ – Castration is a removal of the testes from male calves.

CASUALTY BOOK = КНИГА О СЛУЧАЙНЫХ ПРОИСШЕСТВИЯХ – At Corporation of Lloyd's, Casualty Book is a book which stands in the center of the underwriting room and which records details of vessels which are or are likely to become total losses. The entries are made a by Lloyd's waiter using a quill pen.

CASUALTY BUSINESS = ДЕЛО НА СЛУЧАЙНЫХ ПРОИСШЕСТВИЯХ (или БИЗНЕС НА СЛУЧАЙНЫХ ПРОИСШЕСТВИЯХ) – Casualty Business is another term for liability insurance. / Ещё один термин для обозначения страхования ответственности.

CASUALTY INSURANCE = СТРАХОВАНИЕ ОТ СЛУЧАЙНЫХ ПРОИСШЕСТВИЙ – Casualty Insurance is that type of insurance that is primarily concerned with losses caused by injuries to persons and legal liability imposed for such injury or for damage to property of others. It also includes such diverse forms as Plate Glass, insurance against crime, such as robbery, burglary or forgery, Boiler and Machinery insurance, and Aviation insurance. Many casualty companies also write surety business. Branch of insurance – mainly comprising accident and liability business – which is separate from property, engineering and life insurance. In the United States this term is used for non-life insurance other than fire, marine and surety business.

CATALASE = КАТАЛАЗА – Catalase is an enzyme that catalyzes the degradation of hydrogen peroxide to water and the oxidation by hydrogen peroxide of alcohol to aldehydes. / Под Каталазой понимается фермент класса оксидоредуктаз; катализирует разложение токсичной для живых клеток перекиси водорода на воду и кислород. Содержится в лизосомах.

CATALOG = КАТАЛОГ – Catalog is an index of taxonomic literature arranged by taxa so as to provide ready reference to at least the most important taxonomic references to the taxon involved. / Под Каталогом, от Греческого слова Katálogos, означающее Список, понимается:- (1) перечень каких-либо предметов (книг, товаров, экспонатов), составленный в определённом порядке. (2) В библиотеках – библиотечный каталог – перечень произведений печати, имеющихся в библиотеке. В Российских библиотеках различаются:- по назначению (читательские и служебные каталоги), способу группировки (алфавитные, систематические, предметные каталоги), видам произведений печати и прочему.

CATALYSIS = КАТАЛИЗ – Catalysis:- (Greek:- katalysis – dissolution, decomposition) Change, usually the acceleration, of a chemical reaction by means of substances (catalysts) which appear to remain unchanged during the reaction process. / Под Катализом, от Греческого слова Katálysis, означающее Разрушение, понимается изменение скорости или возбуждение химических реакций веществами (катализаторами), которые взаимодействуют с реагентами, но в реакции не расходуются и не входят в состав конечных продуктов. Обычно под катализом понимают лишь ускорение реакции (положительный катализ), но возможен и обратный случай (отрицательный катализ). При гомогенном катализе исходные реагенты и катализатор находятся в одной фазе (газовой или жидкой), при гетерогенном газообразные или жидкие реагенты взаимодействуют на поверхности твёрдого катализатора. При автокатализе процесс ускоряется продуктом реакции или одним из промежуточных веществ. Катализ – ведущий метод химической промышленности; он позволяет проводить реакции с высокими скоростями при небольших температурах, направлять превращение в сторону образования определённого продукта из ряда возможных. С помощью катализа решена проблема синтеза аммиака, азотной и серной кислот; каталитические методы лежат в основной технологии нефтепереработки (получение моторного топлива с помощью крекинга, гидрокрекинга и так далее), нефтехимического и органического синтеза, полимеризации. На каталитических (ферментативных) реакциях основана вся сложная система управления процессами, происходящими в живых организмах.

CATALYST = КАТАЛИЗАТОР – Catalysts are substances which through their presence influence (increase) the process rates of chemical reactions and after completion of the reaction are still in an unchanged form. In theory, a catalyst is not consumed. Catalyst is a substance which accelerates the rate of a chemical reaction without itself being consumed in the process. Enzymes are catalysts. Catalyst is a chemical that speeds up a reaction without itself being consumed in the reaction. Catalysts are not common in dyeing, but are used in fabric preparation and finishing. Catalyst is a chemical that accelerates a reaction. The catalyst is not part of the reaction but increases the rate at which it takes place. Catalyst is a substance that initiates or increases the rate of a chemical reaction, without itself being used up in the process. / Под Катализатором понимается вещество, изменяющее скорость химической реакции. Обычно катализаторами называют лишь ускорители реакций. Вещества, замедляющие реакции, называются Ингибиторами. Биологические катализаторы называются Ферментами. Катализаторами служат синтетические алюмосиликаты, металлы платиновой группы, серебро, никель и другие. Катализаторы играют огромную роль в технике и природе. Катализаторы, вещества, изменяющие скорость химических реакций посредством многократного промежуточного химического взаимодействия с участниками реакций и не входящие в состав конечных продуктов (смотрите Катализ). Катализаторы повсеместно распространены в живой природе и широко используются в промышленности. Более 70% всех химических превращений веществ, а среди новых производств более 90% осуществляется с помощью катализаторов. Различные катализаторы, выпускаемые промышленностью, классифицируются по типу катализируемых реакций (кислотно-основные, окислительно-восстановительные); по группам каталитических процессов или особенностям их аппаратурно-технологического оформления (например, катализаторы синтеза аммиака, крекинга нефтепродуктов, катализаторы для использования в псевдоожиженном слое); по природе активного вещества (металлические, окисные, сульфидные, металлоорганические, комплексные и так далее); по методам приготовления. При помощи белковых катализаторов – Ферментов – осуществляется обмен веществ у всех живых организмов. Важнейшим свойством катализаторов является специфичность действия:- каждая химическая реакция или группа однородных реакций может ускоряться только вполне определёнными катализаторами. Наиболее ярко специфичность катализаторов проявляется в том, что они могут определять направление реакции – из одних и тех же исходных веществ в зависимости от вида катализатора образуются различные продукты. Например, из смеси окиси углерода и водорода в присутствии разных катализаторов можно получить метан, смесь жидких углеводородов, высокомолекулярные твёрдые углеводороды, смеси кислородсодержащих соединений различного состава, метиловый или изобутиловый спирты и другие продукты. Мерой специфичности катализаторов служит избирательность (селективность); её оценивают отношением скорости целевой реакции к общей скорости превращения исходных веществ в присутствии данного катализатора. Другим важным показателем каталитических свойств веществ является каталитическая активность, выражаемая в виде разности скоростей одной и той же реакции, измеренных при прочих равных условиях в присутствии и в отсутствие катализатора. Каталитическую активность относят к единице массы, объёма, концентрации или поверхности катализатора. Активность, отнесённую к 1 квадратному метру ($м^2$) поверхности катализатора, называют Удельной Каталитической Активностью. Если без катализатора реакция практически не идёт, за меру активности принимают скорость реакции в определённых условиях, отнесённую к единице количества данного катализатора. Из-за специфичности катализаторов сравнивать каталитическую активность веществ можно только по отношению к одной и той же реакции. В прикладных исследованиях активность катализаторов часто выражают в виде производительности – количества полученного продукта (или прореагировавшего вещества) в единицу времени на единицу объёма катализатора, а избирательность – в виде выхода целевого продукта по отношению к теоретически возможному. Наряду с активностью и избирательностью другой эксплуатационной характеристикой катализаторов является стабильность, которая часто определяет целесообразность промышленного использования катализаторов в том или ином процессе. Промышленные катализаторы с течением времени изменяются, снижаются их активность и избирательность в результате различных побочных процессов, например, вследствие взаимодействия с примесями, поступающими с сырьём (так называемое Отравление, смотрите Каталитические Яды), спекания и перекристаллизации вещества катализаторов под воздействием повышенной температуры или реакционной среды

(Старение), отложения смолистых веществ и кокса на поверхности катализатора, адсорбционного снижения прочности (Эффект Ребиндера). Поэтому по прошествии определённого времени катализаторы, если это возможно, подвергают специальной обработке (регенерации) или заменяют свежими. Срок службы промышленных катализаторов при непрерывных процессах в аппаратах с неподвижным слоем катализатора составляет в среднем 6–36 месяцев (мес.). Самые стабильные катализаторы непрерывно работают более 10 лет (например, ванадиевые катализаторы для окисления SO_2). Катализаторы, срок службы которых менее 1 – 2 мес., в реакторах с неподвижным слоем, как правило, не применяются. Для таких катализаторов и катализаторов, работающих в течение коротких циклов с частой регенерацией (например, алюмосиликатные катализаторы крекинга, катализаторы дегидрирования углеводородов), иногда оказывается эффективным применение реакторов с подвижным, в частности псевдоожиженным, слоем катализатора. При гомогенных каталитических процессах в качестве катализаторов применяются определённые химические соединения или их смеси; каталитические свойства катализаторов в этом случае целиком определяются их химическим составом и строением. В промышленности преимущественно используются гетерогенные каталитические процессы с твёрдыми катализаторами в виде пористых зёрен с развитой внутренней поверхностью. Каталитические свойства твёрдых катализаторов зависят, кроме состава и строения, от величины их внутренней поверхности и пористой структуры. Необходимыми этапами каталитических процессов на твёрдых катализаторах являются перенос реагирующих веществ, продуктов и тепла между потоком реакционной смеси и наружной поверхностью зёрен катализаторов (Внешний Перенос) и перенос веществ и тепла внутри пористых зёрен катализаторов (Внутренний Перенос). Чаще всего на работу промышленных катализаторов оказывает влияние внутренний диффузионный перенос веществ. При недостаточной его скорости степень использования (коэффициент полезного действия (кпд)) катализаторов уменьшается и общая интенсивность процесса падает. Кроме того, это может приводить к уменьшению выхода неустойчивых промежуточных продуктов, способных к дальнейшим превращениям на поверхности катализаторов, которые во многих случаях являются целевыми (например, в процессах неполного окисления углеводородов). Скорость диффузионного переноса внутри зёрен катализаторов определяется его пористой структурой. Если реагирующие вещества находятся в газовой фазе, то для медленных реакций целесообразно применять катализаторы с максимально развитой внутренней поверхностью и с порами диаметром около $1 \cdot 10^{-7}$ метра (м), обеспечивающими необходимую скорость встречной диффузии молекул реагирующих веществ и продуктов. Для реакций, протекающих со средней скоростью (2–10 киломоль в час (кмоль/ч) на 1 кубический метр ($м^3$) катализатора), оптимальный диаметр пор при однороднопористой структуре соответствует длине свободного пробега молекул. При атмосферном давлении он составляет около $1 \cdot 10^{-7}$ м и по мере повышения давления уменьшается. Во многих случаях наиболее благоприятной оказывается разветвлённая разнороднопористая структура зёрен, когда к крупным транспортным порам прилегают мелкие поры, создающие большую внутреннюю поверхность. При атмосферном давлении переход от зёрен с однороднопористой структурой к зёрнам с разветвлённой разнороднопористой структурой позволяет повысить активность единицы объёма катализатора в 3–9 раз. Развитие представлений о влиянии пористой структуры на активность и избирательность катализатора, разработка методов исследования удельной каталитической активности и пористой структуры и применение вычислительных машин для математического моделирования сложных процессов создало предпосылки для перехода от эмпирических к научно обоснованным методам разработки промышленных катализаторов. Для приготовления катализаторов применяют различные методы – осаждение из растворов, пропитку, смешение (например, в случае смешанных катализаторов), сплавление с последующим выщелачиванием неактивной части (скелетные катализаторы) и так далее. Многие катализаторы перед использованием подвергают специальной обработке – активации, во время которой происходит образование активного вещества (например, металла в высокодисперсном состоянии в результате восстановления окислов) и формирование пористой структуры. С целью стабилизации высокодисперсного состояния или экономии активное вещество (например, платину) распределяют на поверхности носителя. В качестве носителей используют различные вещества, устойчивые в условиях процесса, например, окись алюминия, силикагель, синтетические и природные силикаты, активные угли и другие. Носители могут оказывать влияние на каталитические свойства, и для промышленных катализаторов выбор носителя имеет большое значение. Наблюдается тенденция перехода от однокомпонентных катализаторов простого состава к сложным Многокомпонентным и Полифункциональным. Последние имеют на поверхности участки, различающиеся по характеру каталитического действия. На полифункциональных катализаторах в одном аппарате за один проход реакционной смеси осуществляется ряд последовательных химических превращений и часто, особенно в случае неустойчивости промежуточных веществ, достигается лучший выход целевого продукта по сравнению с раздельным проведением процесса с помощью монофункциональных катализаторов. Полифункциональными являются, например, Катализатор Лебедева для получения дивинила из этилового спирта, алюмоплатиновый катализатор для производства высокооктановых бензинов и другие. Всё более широкое применение находят также Промотированные Катализаторы, активность которых существенно увеличена добавлением веществ (Промоторов), которые, взятые в отдельности, могут и не обладать каталитическими свойствами. Для каждого промышленного процесса необходим свой катализатор, обладающий оптимальным комплексом свойств. Поэтому производится большое число разнообразных катализаторов, различающихся химическим составом, пористой структурой, размером и формой гранул. Объём мирового производства катализаторов составляет 500–800 тысяч тонн (т) в год; выпускается около 250 основных типов катализаторов, каждый тип включает ряд разновидностей. Между однородными по назначению катализаторами, производимыми в различных странах или разными фирмами, имеются определённые различия, особенно между катализаторами новых процессов. Повсеместно наблюдается концентрация производства катализаторов. Создаются крупные катализаторные фабрики и цехи, позволяющие улучшить качество продукции, механизировать и автоматизировать производство, а сами катализаторы, производившиеся ранее только для потребления внутри предприятий, стали поступать как товарные продукты на внутренний и международный рынки.

CATALYTIC CONVERTER = КАТАЛИТИЧЕСКИЙ ПРЕОБРАЗОВАТЕЛЬ (или КАТАЛИТИЧЕСКИЙ КОНВЕРТЕР) – Catalytic Converter is an integral part of vehicle emission control systems since 1975. Oxidizing converters remove hydrocarbons and carbon monoxide (CO) from exhaust gases, while reducing converters control nitrogen oxide (NOx) emissions. Both use noble metal (platinum, palladium or rhodium) catalysts that can be ‘poisoned’ by lead compounds in the fuel or lubricant. Catalytic Converters:- oxidizing catalytic converters remove hydrocarbons from the exhaust gas, while reducing catalytic converters reduce the NOx emissions. Both types contain noble metal (platinum, palladium or rhodium), which can be poisoned by lead or phosphorous present in fuel or lubricants. / Каталитический Преобразователь – устройство для улавливания продуктов сгорания из выхлопных газов.

CATALYTIC CRACKING = КАТАЛИТИЧЕСКИЙ КРЕКИНГ – Catalytic Cracking is a refinery process which breaks down the larger, heavier, and more complex hydrocarbon molecules into simpler and lighter molecules by the action of heat and aided by the presence of a catalyst but without the addition of hydrogen. In this way heavy oils (fuel oil components) can be converted into lighter and more valuable products (notably gasoline and middle distillate components). Cracking using catalysts to enhance molecule breaking, particularly in the production of high octane gasoline. Catalytic Cracking is a process for obtaining high-quality and stable gasoline by catalytic decomposition of heavy fractions into light fractions, carried out at high temperatures (500 degrees Celsius) using a catalyst. /

Крекинг с использованием катализаторов, повышающих эффективность разрушения молекул, особенно при производстве высокооктанового бензина. Под Каталитическим Крекингом понимается процесс, направленный на получение высококачественного и стабильного бензина путём каталитического разложения тяжёлых фракций на лёгкие, которое происходит при высоких температурах (500 °C) в присутствии катализатора.

CATALYTIC REFORMING = КАТАЛИТИЧЕСКИЙ РИФОРМИНГ – Catalytic Reforming is a process for obtaining high-octane gasoline components and aromatic compounds by turning low-octane straight-run gasoline into high aromatic gasoline fractions with use of a catalyst. / Каталитический Риформинг это процесс получения высокооктановых компонентов бензинов и ароматических соединений, в ходе которого низкооктановый прямогонный бензин на катализаторе превращается в высокоароматизированные бензиновые фракции.

CATAMARAN = КАТАМАРАН – Catamaran is a double or treble-hulled vessel constructed in wood, aluminum or reinforced glass fiber and is also composed of two or three hulls diagonally joined together by various methods. Normally no ballast is needed to counteract the center buoyancy since it enjoys good stability at sea. / Двух- или трёхкорпусное судно, построенное из древесины, алюминия или усиленного стеклянного волокна (стекловолокна), и составленное также из двух или трёх корпусов, соединённых различными методами вместе по диагонали. Обычно не нуждается в балласте для противодействия плавучести центра, поскольку катамаран обладает хорошей остойчивостью на море. Под Катамараном, от Тамильского слова Каттумарам, означающее Связанные Брёвна, понимается судно с двумя параллельно расположенными корпусами, соединёнными в верхней части. Оно обладает хорошими мореходными качествами, в частности остойчивостью. Катамараны могут быть грузовыми, рыболовными, пассажирскими, буксирными и спортивными судами. Под Тримараном понимается трёхкорпусное судно с одинаковыми корпусами, два из которых расположены рядом, а третий сдвинут в продольном направлении в корму или, чаще, в нос. Тримараном называют также узкие парусные суда, снабжённые двумя дополнительными корпусами-поплавками (аутригерами), закреплёнными на некотором расстоянии от его бортов с целью повышения остойчивости, и моторные катера, корпус которых имеет явно выраженные обводы с тремя килями (боковыми наделками-спонсонами).

CATAMARAN TUG = БУКСИР КАТАМАРАН – Catamaran Tug (Catug) is a rigid catamaran tug connected to a barge. When joined together, they form and look like a single hull of a ship; oceangoing integrated tug-barge vessels.

CATASTROPHE BONDS = ОБЛИГАЦИИ ПО КАТАСТРОФАМ (или КАТАСТРОФНЫЕ ОБЛИГАЦИИ) – Catastrophe Bond (CAT) is a high-yield debt instrument that is usually insurance linked and meant to raise money in case of a catastrophe such as a hurricane or earthquake. It has a special condition that states that if the issuer (insurance or reinsurance company) suffers a loss from a particular pre-defined catastrophe, then the issuer's obligation to pay interest and/or repay the principal is either deferred or completely forgiven. Advantages of CAT bonds are that they are not closely linked with the stock market or economic conditions and offer significant attractions to investors. For example, for the same level of risk, investors can usually obtain a higher yield with CAT bonds relative to alternative investments. Another benefit is that the insurance risk securitization of CATs shows no correlation with equities or corporate bonds, meaning they'd provide a good diversification of risks. Catastrophe Bonds are the risk-based securities that allow (re)insurance companies to transfer natural catastrophe insurance risk to institutional investors in the form of bonds. Cat bonds help to spread peak exposures. Also known as Cat-Bonds, and Natural-Catastrophe Bonds. See also Insurance-Linked Securities. On 2013-May-17:- the first quarter of 2013 saw USD1.6 billion in new catastrophe bond issuance through five deals, including three that closed at the beginning of the second quarter, according to a report from Willis Group Holdings PLC's Willis Capital Markets & Advisory unit. The first-quarter issuance compares with eight deals that brought USD1.3 billion in capacity to the market during the first three months of 2012, the Willis unit said. 'The growing capital inflows into the (insurance-linked securities) space suggest that the current drop in ILS pricing may be a long-term feature of the market', Willis said in the report. 'Both generalists and ILS specialists are putting more money to work'. The first-quarter deals covered US windstorm and earthquake exposures. The Willis report said 2013 catastrophe bond issuance may outpace 2012's USD5.9 billion, the second-highest annual issuance to date. 2007 was the largest year, when USD7.2 billion in cat bonds were issued. 'A reaction in some quarters is to dismiss the recent capital markets growth as unsustainable. This is a convenient reaction for those who see the world changing around them and are perhaps in denial', the report said. 'That said, it might of course be true the some investors will enter and exit over time. That is simply a sign of a healthy mature market'.

CATASTROPHE REINSURANCE = ПЕРЕСТРАХОВАНИЕ ОТ КАТАСТРОФ – Catastrophe Reinsurance is a form of reinsurance that indemnifies the ceding company for the accumulation of losses in excess of a stipulated sum arising from a catastrophic event such as conflagration, earthquake or windstorm. Catastrophe loss generally refers to the total loss of an insurance company arising out of a single catastrophic event.

CATASTROPHIC FAILURE = РАЗРУШЕНИЕ С КАТАСТРОФИЧЕСКИМИ ПОСЛЕДСТВИЯМИ (или ОТКАЗ С КАТАСТРОФИЧЕСКИМИ ПОСЛЕДСТВИЯМИ, или КАТАСТРОФИЧЕСКОЕ ПОВРЕЖДЕНИЕ) – Catastrophic Failure:- sudden, unexpected failure of a machine resulting in considerable cost and downtime.

CAT–BONDS = NATURAL–CATASTROPHE BONDS

CATCH CROP = ЛОВЧАЯ КУЛЬТУРА (или ПОЧВОЗАЩИТНАЯ КУЛЬТУРА, или ПОДСЕВНАЯ КУЛЬТУРА, или ПОЖНИВНАЯ КУЛЬТУРА, или ПРОМЕЖУТОЧНАЯ КУЛЬТУРА) – Catch Crop is a crop planted usually very early in the cropping season. It matures early or earlier than the main crop to produce some food before the main crop matures. Could be a short-duration crop grown in between two croppings of a main crop.

CAT CRACKING = CATALYTIC CRACKING

CATEGORY = КАТЕГОРИЯ – (1) Category (in banking):- the classification of SWIFT message types into major areas as indicated by the first digit of the message type number. The intention of the category classification is to assist with the internal routing of messages. / Под Категорией, от Греческого слова Kategoria, означающее Высказывание или Свидетельство, понимается . Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

(2) Category (relevance to customs clearance) means a grouping of textile or apparel goods defined in the Correlation:- Textile and Apparel Categories with the Harmonized Tariff Schedule of the United States, 1992 (or successor publication), published by the United States Department of Commerce, International Trade Administration, Office of Textiles and Apparel, Trade and Data Division, Washington, DC; and general import statistics means statistics of the US Bureau of the Census or its successor.

CATERPILLAR = ГУСЕНИЦА – Caterpillar is the immature damaging stage of a butterfly or moth. Larva is the general term for immature stages of moths (caterpillars), flies (maggots), beetles (grubs), and others. Caterpillar is the soft-bodied larva of butterfly and moth. / Под Гусеницей понимается личинка бабочки; интенсивно питается, растёт и после ряда линек превращается в куколку.

CATERPILLAR = СУКРУТИНА – Caterpillar is a large slub formed in a combination or plied yarn as a result of one of the ends breaking and sliding or skinning back along the other yarn.

CAT EYE = КОШАЧИЙ ГЛАЗ – Cat Eye:- xxxxx. See also Pinhole. Cat's-Eye:- any of a group of gemstones, esp. a greenish-yellow variety of chrysoberyl, that reflect a streak of light when cut in a rounded unfaceted shape.

CATFEED = КАТАЛИТИЧЕСКОЕ СЫРЬЁ – Catfeed:- feedstock to a catalytic cracker, usually vacuum gasoil. / Сырьё для установки каталитического крекинга, как правило, вакуумный газойль.

CAT GASOLINE = КАТАЛИТИЧЕСКИЙ БЕНЗИН – Cat Gasoline is a gasoline blending component made in a cat cracker. / Компонент бензиновой смеси, получаемый в установке каталитического крекинга.

CATHODE = КАТОД – Cathode is a flat rectangular piece of metal which has been refined by electrolysis. Copper is commonly traded and delivered in this form. Cathode is the negative pole in electrolysis. / Под Катодом, от Греческого слова Káthodos, означающее Возвращение или Ход Вниз, в широком смысле понимается электрод радио- или электротехнического прибора или устройства, например, гальванического элемента, электровакуумного прибора, электролитической ванны, электронной лампы, характеризующийся тем, что движение электронов (во внешней цепи) направлено к нему (в отличие от анода). В электровакуумных приборах катод является источником электронов. В электролитической ванне, электронных и других приборах катод соединяется с отрицательным полюсом источника электрического тока. В узком смысле под катодом понимается электрод ионных и электронных приборов, служащий источником электронов. По способу испускания электронов различают термоэлектронные катоды, эмитирующие электроны при нагревании, и холодные катоды, не имеющие специального подогрева (в том числе автоэлектронные, вторичноэмиссионные катоды, фотокатоды и другие).

CATHODE COPPER = КАТОДНАЯ МЕДЬ – In mining industry, Cathode Copper is a refined copper produced by electrolytic refining of impure copper by electro-winning. Copper Cathodes are pure copper produced from the processing of copper ores. However, cathodes are not in the final form of usage as copper materials. / В горной или, как её ещё называют, горнодобывающей промышленности катодной медью считается рафинированная (очищенная) медь, произведённая электролитическим рафинированием неочищенной меди электролизом (электрохимическим извлечением).

CATIE = CENTRO AGRONÓMICO TROPICAL DE INVESTIGACIÓN Y ENSEÑANZA = TROPICAL AGRICULTURAL RESEARCH AND HIGHER EDUCATION CENTER

CATION = КАТИОН – Cation is a positively charged ion. Many chemicals used in textile processing are described as cationic, meaning that when the compound ionizes in solution, it is the positively charged ion that is 'functional'. Many surfactants are cationic, as are many chemicals used as fabric finishes. See also Anion. / Под Катионом, от Греческого слова Katiōn, означающее буквально Идущий Вниз, понимается положительно заряженный ион. В электрическом поле (например, при электролизе) движется к отрицательному электроду (катоду).

CATIONIC DYEABLE VARIANTS = КАТИОННЫЕ ОКРАШИВАЕМЫЕ ВАРИАНТЫ – Cationic Dyeable Variants are the polymers modified chemically to make them receptive to cationic dyes.

CATIONIC DYES = КАТИОННЫЕ КРАСИТЕЛИ – Cationic Dye is a type of dye used on acrylic or on modified polyester or modified nylon yarn. Often used to achieve cross dyed effects:- Cationic dyeable yarn is woven in a pattern with regular yarn in the same fabric. The pattern becomes visible by dyeing the fabric in 2 baths, one for each of the types of yarn. See also Basic Dye, and Dyes. Cationic Dye is a dye that carries a positive charge in their molecule. Cationic Dyes known as Basic Dyes are widely used for dyeing of textile fibers such as cotton and polyester. These chemical materials often pose certain health hazards and environmental pollution. Therefore, environmental legislation has imposed stringent effluent limits on the concentrations of dye pollutants as chemical oxygen demand, biochemical oxygen demand, and/or color. Since many organic dyestuffs are harmful to human beings and toxic to microorganisms, removal of dyestuffs from wastewater has received considerable attention over the past decades. The antimicrobial cationic dyes were employed in dyeing acrylic fabrics. / Найлан (Nylon). Катионные Красители – группа ярких и прочных основных красителей, соли четвертичных аммониевых оснований. Образуют окраски различных цветов, устойчивые к свету и мокрым обработкам. Применяются для крашения полиакрилонитрильных волокон.

CATKIN = СЕРЁЖКА – Catkin is a cylindrical spike-like inflorescence consisting of a cluster of scaly bracts, often pendulous and unisexual. / Под Серёжкой понимается колосовидное соцветия на поникающей оси с множеством однополых цветков, например, у Берёзы, Ивы.

CATS = CERTIFICATE OF ACCRUAL ON TREASURY SECURITIES

CATS = COMPUTER ASSISTED TRADING SYSTEM

CATTLE = КРУПНЫЙ РОГАТЫЙ СКОТ (или КРУПНОРОГАТЫЙ СКОТ) – Cattle, or Cows (female) and Bulls (male), are the most common type of large domesticated ungulates. They are a prominent modern member of the Subfamily Bovinae, are the most widespread Species of the Genus Bos, and are most commonly classified collectively as Bos Taurus. Cattle are commonly raised as livestock for meat (beef or veal, see Beef Cattle), for milk (see Dairy Cattle), and for hides, which are used to make leather. They are used as riding animals and draft animals (oxen or bullocks, which pull carts, plows and other implements). Another product of cattle is their dung, which can be used to create manure or fuel. In some regions, such as parts of India, cattle have significant religious meaning. Cattle, mostly small breeds such as the Miniature Zebu, are also kept as pets. Around 10 500 years ago, cattle were domesticated from as few as 80 progenitors in central Anatolia, the Levant and Western Iran. According to the Food and Agriculture Organization (FAO), there are approximately 1.5 billion cattle in the world as of 2018. In 2009, cattle became one of the first livestock animals to have a fully mapped genome. Taxonomy:- Cattle were originally identified as three separate Species:- (i) Bos Taurus, the European or 'Taurine' Cattle (including similar types from Africa and Asia); (ii) Bos Indicus, the Zebu; and (iii) the extinct Bos Primigenius, the Aurochs. The Aurochs is ancestral to both Zebu and Taurine Cattle. These have been reclassified as one Species, Bos Taurus, with three Subspecies:- (i) Bos Taurus Primigenius (distribution in Asia, Europe and North Africa); (ii) Bos Taurus Indicus (distribution in South Asia); and (iii) Bos Taurus Taurus (distribution in Near East). Complicating the matter is the ability of cattle to interbreed with other closely related Species. Hybrid individuals and even breeds exist, not only between Taurine Cattle and Zebu (such as the Sanga Cattle, Bos Taurus Africanus), but also between one or both of these and some other members of the Genus Bos – Yaks (the Dzo or Yattle), Banteng, and Gaur. Hybrids such as the Beefalo breed can even occur between Taurine Cattle and either Species of Bison, leading some authors to consider them part of the Genus Bos, as well. The hybrid origin of some types may not be

obvious, for example, genetic testing of the Dwarf Lulu breed, the only Taurine-type Cattle in Nepal, found them to be a mix of Taurine Cattle, Zebu, and Yak. However, cattle cannot be successfully hybridized with more distantly related Bovines such as Water Buffalo or African Buffalo. The Aurochs originally ranged throughout Europe, North Africa, and much of Asia. In historical times, its range became restricted to Europe, and the last known individual died in Mazovia, Poland, in about 1627. Breeders have attempted to recreate Cattle of similar appearance to Aurochs by crossing traditional types of domesticated cattle, creating the Heck Cattle breed. Etymology:- Cattle did not originate as the term for Bovine Animals. It was borrowed from Anglo-Norman Catel, itself from medieval Latin Capitale 'principal sum of money, capital', itself derived in turn from Latin Caput 'Head'. Cattle originally meant movable personal property, especially livestock of any kind, as opposed to real property (the land, which also included wild or small free-roaming animals such as chickens – they were sold as part of the land). The word is a variant of Chattel (a unit of personal property) and closely related to Capital in the economic sense. The term replaced earlier Old English Feoh 'cattle, property', which survives today as Fee (cf. German:- Vieh, Dutch:- Vee, Gothic:- Faihu). The word 'Cow' came via Anglo-Saxon Cū (plural Cȳ), from Common Indo-European Gwōus (genitive Gwowés) = 'a Bovine Animal', compare Persian:- Gâv, Sanskrit:- Go-, Welsh:- Buwch. The plural Cȳ became Ki or Kie in Middle English, and an additional plural ending was often added, giving kine, kien, but also kies, kuin and others. This is the origin of the now archaic English plural, 'Kine'. The Scots language singular is coo or cou, and the plural is 'kye'. In older English sources such as the King James Version of the Bible, 'cattle' refers to livestock, as opposed to 'deer' which refers to wildlife. 'Wild cattle' may refer to feral cattle or to undomesticated Species of the Genus Bos. Today, when used without any other qualifier, the modern meaning of 'cattle' is usually restricted to domesticated bovines. Terminology:- In general, the same words are used in different parts of the world, but with minor differences in the definitions. The terminology described here contrasts the differences in definition between the United Kingdom and other British-influenced parts of the world such as Canada, Australia, New Zealand, Ireland and the United States. An 'Intact' (i.e. not castrated) adult male is called a Bull. An adult female that has had a calf (or two, depending on regional usage) is a Cow. A young female before she has had a calf of her own and is under three years of age is called a Heifer. A young female that has had only one calf is occasionally called a First-Calf Heifer. Young cattle of both sexes are called Calves until they are weaned, then Weaners until they are a year old in some areas; in other areas, particularly with male beef cattle, they may be known as Feeder Calves or simply Feeders. After that, they are referred to as Yearlings or Stirks if between one and two years of age. A castrated male is called a Steer in the United States; older steers are often called Bullocks in other parts of the world, but in North America this term refers to a young bull. Piker bullocks are micky bulls (uncastrated young male bulls) that were caught, castrated and then later lost. In Australia, the term Japanese Ox is used for grain-fed steers in the weight range of 500 to 650 kg that are destined for the Japanese meat trade. In North America, draft cattle under four years old are called Working Steers. Improper or late castration on a bull results in it becoming a coarse steer known as a Stag in Australia, Canada and New Zealand. In some countries, an incompletely castrated male is known also as a Rig. A castrated male (occasionally a female or in some areas a bull) kept for draft or riding purposes is called an Ox (plural Oxen); ox may also be used to refer to some carcass products from any adult cattle, such as ox-hide, ox-blood, oxtail, or ox-liver. A Springer is a cow or heifer close to calving. In all cattle Species, a female twin of a bull usually becomes an infertile partial intersex, and is called a Freemartin. A wild, young, unmarked bull is known as a Micky in Australia. An unbranded bovine of either sex is called a Maverick in the US and Canada. Neat (horned oxen, from which neatsfoot oil is derived), beef (young ox) and beefing (young animal fit for slaughtering) are obsolete terms, although Poll, Pollard and Polled Cattle are still terms in use for naturally hornless animals, or in some areas also for those that have been disbudded or dehorned. Cattle raised for human consumption are called Beef Cattle. Within the American beef cattle industry, the older term Beef (plural Beeves) is still used to refer to an animal of either sex. Some Australian, Canadian, New Zealand and British people use the term Beast. Cattle bred specifically for milk production are called Milking or Dairy Cattle; a cow kept to provide milk for one family may be called a House Cow or Milker. A Fresh Cow is a dairy term for a cow or first-calf heifer who has recently given birth, or 'freshened'. The adjective applying to cattle in general is usually Bovine. The terms Bull, Cow and Calf are also used by extension to denote the sex or age of other large Animals, including Whales, Hippopotamuses, Camels, Elk and Elephants. Singular Terminology Issue:- 'Cattle' can only be used in the plural and not in the singular:- it is a plurale tantum. Thus one may refer to 'three cattle' or 'some cattle', but not 'one cattle'. 'One head of cattle' is a valid though periphrastic way to refer to one animal of indeterminate or unknown age and sex; otherwise no universally used single-word singular form of cattle exists in modern English, other than the sex- and age-specific terms such as cow, bull, steer and heifer. Historically, 'ox' was not a sex-specific term for adult cattle, but generally this is now used only for working cattle, especially adult castrated males. The term is also incorporated into the names of other Species, such as the musk ox and 'grunting ox' (yak), and is used in some areas to describe certain cattle products such as ox-hide and oxtail. Cow is in general use as a singular for the collective cattle. The word Cow is easy to use when a singular is needed and the sex is unknown or irrelevant – when 'there is a cow in the road', for example. Further, any herd of fully mature cattle in or near a pasture is statistically likely to consist mostly of cows, so the term is probably accurate even in the restrictive sense. Other than the few bulls needed for breeding, the vast majority of male cattle are castrated as calves and are used as oxen or slaughtered for meat before the age of three years. Thus, in a pastured herd, any calves or herd bulls usually are clearly distinguishable from the cows due to distinctively different sizes and clear anatomical differences. Merriam-Webster and Oxford Living Dictionaries recognize the sex-nonspecific use of cow as an alternate definition, whereas Collins and the OED do not. Colloquially, more general nonspecific terms may denote cattle when a singular form is needed. Head of cattle is usually used only after a numeral. Australian, New Zealand and British farmers use the term Beast or Cattle Beast. Bovine is also used in Britain. The term Critter is common in the Western United States and Canada, particularly when referring to young cattle. In some areas of the American South (particularly the Appalachian region), where both dairy and beef cattle are present, an individual animal was once called a 'Beef Critter', though that term is becoming archaic. Other Terminology:- Cattle raised for human consumption are called Beef Cattle. Within the beef cattle industry in parts of the United States, the term Beef (plural Beeves) is still used in its archaic sense to refer to an animal of either sex. Cows of certain breeds that are kept for the milk they give are called Dairy Cows or Milking Cows (formerly Milch Cows). Most young male offspring of dairy cows are sold for veal, and may be referred to as veal calves. The term Dogies is used to describe orphaned calves in the context of ranch work in the American West, as in 'Keep them dogies moving'. In some places, a cow kept to provide milk for one family is called a 'House Cow'. Other obsolete terms for cattle include 'Neat' (this use survives in 'neatsfoot oil', extracted from the feet and legs of cattle), and 'Beefing' (young animal fit for slaughter). An onomatopoeic term for one of the most common sounds made by cattle is Moo (also called Lowing). There are a number of other sounds made by cattle, including calves bawling, and bulls bellowing. Bawling is most common for cows after weaning of a calf. The bullroarer makes a sound similar to a bull's territorial call. Xxxxx. Cattle, domesticated bovine farm animals that are raised for their meat, milk, or hides or for draft purposes. The Animals most often included under the term are the Western or European domesticated Cattle as well as the Indian and African domesticated Cattle. However, certain other Bovids such as the Asian Water Buffalo, the Tibetan Yak, the Gayal and Banteng of Southeast Asia, and the plains Bison of North America have also been domesticated or semidomesticated and are sometimes considered to be Cattle. In the terminology used to describe the sex and age of Cattle, the male is first a bull calf and if left intact becomes a bull; if castrated he becomes a steer and in about two or three years grows to an ox. The female is first a heifer calf, growing into a heifer and becoming a cow. Depending on the breed, mature bulls weigh 450–1 800 kg (1 000–4 000 pounds) and cows 360–1 100 kg (800–2 400 pounds). Males retained for beef production are usually

castrated to make them more docile on the range or in feedlots; with males intended for use as working oxen or bullocks, castration is practiced to make them more tractable at work. The use of Cattle as commodities has been a point of philosophical contention throughout history, particularly regarding the raising of animals for food. Such issues are compounded by modern concerns about the ethics of industrial factory farming and the contribution of commercial meat production to global warming. (See also Livestock Farming:- Cattle; Vegetarianism.) All modern domestic cattle are believed to belong to the Species Bos Taurus (European breeds such as Shorthorn and Jersey) or Bos Indicus (Zebu breeds such as Brahman) or to be crosses of these two (such as Santa Gertrudis). Breeds as they are known today did not always exist, and many are of recent origin. The definition of a breed is difficult and inexplicit, although the term is commonly used and, in practice, well understood. It may be used generally to connote animals that have been selectively bred for a long time so as to possess distinctive identity in colour, size, conformation, and function, and these or other distinguishing characteristics are perpetuated in their progeny. Breeds have been established by generations of breeders aiming at the attainment and preservation of a particular type with its identifying characteristics. This is accomplished by working on the principle of 'like begets like'. It is only in relatively recent times that the science of genetics, and particularly population genetics, has contributed to breeding. (See also Animal Breeding.) There are many old established breeds in continental Europe – for example, the Charolais and Normande of France, the Holstein-Friesian of the Netherlands, and many others – but British breeds are of particular interest because of their influence in building up the vast herds that supply so much beef and dairy in other countries around the world. / Крупный Рогатый Скот (КРС), домашние Парнокопытные Жвачные Животные Семейства Полорогих. К ним относятся Буйволы, Яки и все домашние породы крупного рогатого скота, принадлежащие к Роду Настоящих Быков (Bos). Домашний Крупный Рогатый Скот (Bos Taurus) произошёл от Дикого Быка Тура (Bos Primigenius), который за несколько тысячелетий до Нашей Эры был распространён на всей территории Европы, Азии и Африки. Последние его представители исчезли в начале XVII века. Одомашнивание Туров началось около 8 000 лет назад, сначала в Индии, затем в Передней Азии, Средиземноморье, Средней Европе. По краниологическим признакам домашний Крупный Рогатый Скот делят на четыре основные Подвида:- (i) Европейский Скот степных и равнинных зон – Длиннорогий (Bos Taurus Primigenius), (ii) Европейский Скот горных и лесных зон – Короткорогий (Bos Taurus Brachyceros), (iii) Центрально-Азиатский Скот (Bos Taurus Turanomongolicus) и (iv) Южно-Азиатский и Северо-Африканский Горбатый Скот – Зебу (Bos Taurus Indicus). Продолжительность жизни коров около 20 лет, редко до 35 лет; быков 15–20 лет. Срок использования молочных коров 12–13 лет (к этому времени стираются зубы и продуктивность снижается). На мясо Крупный Рогатый Скот целесообразно забивать после откорма или нагула, в возрасте 1.5–2 лет. Племенных животных используют для воспроизводства стада 5–10 лет. Рост животных продолжается до 5 лет, у некоторых позднеспелых пород до 6–7 лет. Половая зрелость наступает у тёлок в 7–9 месяцев (мес), у быков в 6–8 мес. В случку тёлок пускают в 18–22 мес, бычков в 14–18 мес. Продолжительность сервис-периода (от отёла до первой охоты) около 3 недель. Стельность продолжается в среднем 285 суток. Коровы, как правило, одноплодны, двойни бывают редко (около 2%); встречаются случаи рождения одновременно 6–7 телят. Двойни чаще разнояйцевые (однополые и разнополые). Большинство тёлок из разнополых двоен не способны к воспроизводству (фримартинизм). Масса телят при рождении в зависимости от пород 18–45 килограммов (кг), иногда до 60 кг, масса бычков на 1–3 кг больше. Масса взрослых коров 200–600 кг, наивысшая более 1 000 кг; быков 300–900 кг, наивысшая 1 600 кг. Продуктивность скота определяется породными особенностями животных и условиями их кормления и содержания. Средние удои коров молочных пород, записанных в племенные книги, 3 500–4 000 кг, жирность молока 3.6–4%. В лучших хозяйствах удои около 6 000 кг. Рекордные удои за лактацию около 20 000 кг молока (Голландская порода). Максимальный суточный удой 82.2 кг (корова Ярославской породы). Наивысший пожизненный удой 120 247 кг молока (корова Костромской породы за 13 лактаций). Удои коров мясных пород за лактацию около 1 000 кг молока. Лактация у коров продолжается 280–320 суток, сухостой (время от запуска до отёла) 1.5–2 мес. Максимальные удои у скороспелых пород – в четвёртую лактацию, у позднеспелых – в пятую–шестую, иногда в седьмую. Молоко Крупного Рогатого Скота – ценный продукт питания людей и сырьё для пищевой промышленности. Цельное молоко и отходы его переработки используются также в кормлении молодняка сельскохозяйственных животных. Мясная продуктивность КРС выше у скота специализированных мясных пород. По сравнению с молочным мясной скот быстрее откармливается, даёт больший убойный выход и лучшее по качеству мясо. При откорме жир откладывается не только на внутренних органах и поверх туши, но и внутри мышечной ткани в виде тонких прослоек ('мраморное' мясо). Особенно ценно мясо откормленного молодняка. К 1.5–2-летнему возрасту молодняк достигает массы 400–450 кг. Говядина и телятина имеют высокие пищевые качества, калорийны, легко перевариваются, обладают диетическими свойствами. При забое КРС, кроме мяса, получают шкуры, из которых выделывают различные сорта кож, а при переработке боенских отходов – мясокостную, костную и кровяную муку, эндокринные препараты, стеарин, клей, мыло и так далее. Быков и волов некоторых пород используют также в качестве тягловой силы. КРС отличается неприхотливостью и хорошей приспосабливаемостью к условиям содержания. Обладая объёмистым сложным желудком, КРС способен переваривать большое количество грубого растительного корма. Основные корма – зелёная пастбищная трава, сено, силос, корнеклубнеплоды, концентраты, отходы технических производств (жмыхи, шроты, жом, барда и другие), а также протеиновые, минеральные и витаминные подкормки. Нормируют кормление в зависимости от массы животных, их продуктивности и физиологического состояния, по уровню питания, переваримому протеину, минеральным веществам и витаминам. В стойловый период основу рациона КРС составляют грубые и сочные корма, в пастбищный – зелёные. Системы содержания КРС – привязная и беспривязная на глубокой подстилке или в боксах. В летний период в районах, обеспеченных пастбищами, применяют пастбищное содержание, при недостатке пастбищ – стойловое. В районах с обширными отдалёнными пастбищами применяют отгонную систему содержания. Разводят КРС во всех странах. Мировое поголовье его на конец 1970–71 составило 1 141 миллионов. Создано большое количество пород, приспособленных к различным климатическим зонам. Смотрите также Животноводство, Скотоводство и статьи по породам – Голландская черно-пёстрая порода, Джерсейская порода и другие. Быки:- (1) Крупные Жвачные Животные Семейства Полорогих Отряда Парнокопытных. Близки к Буйволам. Характеризуются тяжёлым, грузным туловищем с короткой шеей и короткими сильными ногами; передняя часть верхней губы лишена волос, и на ней расположено голое и влажное 'носовое зеркало'; хвост длинный, обычно с кисточкой удлинённых волос на конце; на нижней части шеи и груди кожа у многих Видов образует свисающую складку (подгрудок); у самок по 4 соска. Рога у Быков, в отличие от Буйволов, округлые и гладкие, имеются как у самцов, так и у самок (кроме некоторых комолых пород домашнего скота). Дикие Виды Быков встречаются в Европе, Азии и Северной Америке; многочисленные породы домашнего Крупного Рогатого Скота распространены повсеместно. Дикие Быки живут в тропических лесах, в лесостепи, населяют открытые степные пространства и пустынные нагорья от областей, лежащих ниже уровня моря, до высоты 5 000 метров (м). Стадные животные. Питаются разнообразной растительной пищей. Самки рождают по одному телёнку. Различают 4 Рода Быков:- (1) Настоящие Быки, (2) Яки, (3) Лобастые Быки и (4) Бизоны. Настоящие Быки (Bos) не имеют диких представителей. К этому Роду принадлежал крупный Дикий Бык – Тур (Bos Primigenius), ранее широко распространённый в Юго-Восточной Азии и Европе. Последний Тур был убит в Европе в 1627. Тур был одомашнен и явился прародителем Крупного Рогатого Скота (Серая Украинская, Ярославская, Холмогорская породы и другие). Яки (Poephagus) представлены единственным диким Видом – Яком (Тибет и смежные с ним области). В одомашненном состоянии встречается в горных районах Средней и Центральной Азии (в бывшем

Союзе Советских Социалистических Республик (СССР) главным образом в Казахстане, Киргизии и Южной Сибири). Лобастые Быки (Bibos) включают 3 Вида Диких Быков из Южной Азии:- Гаур (Гаял – его одомашненная форма), Бантенг (домашняя форма Бантенга – так называемый Балийский Скот), Серый Бык, или Купрей (Bibos Sauveli), обитающий в лесах Камбоджи. Бизоны (Bison) включают 2 Диких Вида – Бизон и Зубр, которые не были одомашнены. (2) Самцы Крупного Рогатого Скота; смотрите также Бык. Бык или Бугай, самец Крупного Рогатого Скота, производитель. Бык выше коровы, с более массивным туловищем. Передняя часть туловища развита лучше, чем задняя, голова грубее, шея толще, грудь шире и глубже, плечи округлее. Живая масса быков молочных пород 750–850 килограммов (кг), мясных – 700–800 кг. Половая зрелость наступает в 6–8 месяцев (мес). В случку пускают (в зависимости от условий выращивания) быков скороспелых пород в 14–16 мес, позднеспелых – в 16–18 мес. На племя отбирают лучших быков. Учитывают породность, происхождение, экстерьер, конституцию, состояние здоровья, выраженность пола, половую активность, качество потомства. Срок использования в хозяйстве 6–8 лет, некоторые быки сохраняют потенцию до 12–14 лет. Нагрузка на одного быка при вольной случке 50–70 коров, при ручной – 150–200, при искусственном осеменении спермой одного быка осеменяют 1 000–3 000, а спермой лучших быков – 5 000 и более коров. Быков, дающих семя плохого качества, к случке не допускают. Роль производителя в совершенствовании стада велика, поэтому для быков-производителей создают наилучшие условия кормления и содержания. Рацион должен полностью обеспечивать потребность в протеине, минеральных веществах, витаминах. На 100 кг массы быкам дают в сутки:- сена 1–1.5 кг, корнеплодов 1–1.5 кг, силоса 0.8–1 кг; смеси концентратов 2–5 кг на голову в сутки. При повышенной нагрузке дополнительно включают корма животного происхождения и витамины. Содержат летом на пастбище (в лагерях), зимой в коровниках, в специальных стойлах. Обязательно выпускают на прогулки (на 2–3 часа в сутки) или используют на лёгких работах. Не пригодных на племя кастрируют, откармливают на мясо или используют в упряжи (смотрите также Вол). Вол, кастрированный самец Крупного Рогатого Скота в возрасте старше 2 лет (до 2 лет – Волик). Используется как мясное и рабочее животное. Кастрируют обычно бычков, неиспользуемых для племенных целей (выращиваемых на мясо – в возрасте 3–5, выращиваемых для рабочих целей – в возрасте 8–12 мес). Бычки-кастраты 1.5–2.5 лет хорошо нажировываются и достигают высокой упитанности при откорме. Убойный выход у волов мясных пород 60% и более. От волов получают тяжёлую подошвенную кожу. Работоспособность волов равна около 2/3 работоспособности Лошади. Корова, отелившаяся самка Крупного Рогатого Скота. Ни разу не отелившуюся стельную самку называют Нетелью. Коровы используются для воспроизводства стада Крупного Рогатого Скота и получения молочной и мясной продукции. Коровами иногда называют также самок некоторых других Крупных Парнокопытных Млекопитающих (Оленей, Лосей и других). Тёлка (heifer):- молодая нестельная самка крупного рогатого скота. Нетель (springer heifer):- тёлка, у которой при визуальном осмотре или ректальном исследовании обнаружены признаки стельности.

CATTLE FEEDER SPREAD = КУРСОВАЯ РАЗНИЦА ПО ОТКОРМОЧНОМУ КРУПНОМУ РОГАТОМУ СКОТУ (СПРЭД ПО ОТКОРМОЧНОМУ КРУПНОРОГАТОМУ СКОТУ) – A Cattle Feeder Spread is a processing spread trade where feeder cattle (thin cows) futures are bought (long) and live cattle (fat cows) futures are sold (short) simultaneously. Cattle feeders use this hedging strategy to hedge the later purchase price of feeder cattle and the later sale price of live cattle. Cattle feeders purchase feeder cattle, fatten them and then sell them as live cattle ready to be slaughter.

CATUG = CATAMARAN TUG

CATV = COMMUNITY ANTENNA TELEVISION

CATWALK = УЗКИЙ ПРОХОД – Catwalk is a raised bridge running fore and aft from the midship. It affords safe passage over the pipelines and other deck obstructions. Also known as Walkway.

CAUDAD = КАУДАЛЬНО – Caudad:- towards the tail. / Под Каудально, от Латинского слова Cauda, означающее Хвост, понимается по направлению к хвостовому концу.

CAUDEX = КАУДЭКС (или СТВОЛ, или СТЕРЖЕНЬ) – Caudex is a swollen base to the stem and upper part of the root system used as a storage organ. / и верхняя часть корневой системы, используемый как запасающий орган. Внешне довольно сходен с коротким корневищем так называемый Каудекс. Это утолщённое подземное или отчасти надземное образование, лишённое листьев, формирующееся из коротких оснований побегов. В отличие от корневищ Каудекс не отмирает в своей нижней части, а переходит в многолетний корень. Очень обычны Каудексы среди многолетних травянистых Бобовых (Люцерны, Люпина, Солодки). Каудекс имеется у Одуванчика. Во многих случаях Каудексы – место отложения запасных питательных веществ. Нередко в области Каудекса происходит разделение материнского растения на несколько дочерних особей (явление партикуляции).

CAUDICIFORM = СТВОЛОБРАЗНОЕ – Caudiciform:- of plants with a caudex. / о растениях со стволом.

CAUGHT PIECE = ПРИХВАЧЕННАЯ ЧАСТЬ – Caught Piece:- where a component part of garment has been caught in an unrelated operation. Sewing Room Defects. / Порок или Дефект швейного производства.

CAUSA CAUSANS = КАУСА КАУСАНС (или ПРИЧИНА ПРИЧИН) – Causa Causans:- in Latin, cause that causes all things; Immediate cause. The initiating cause; the primary cause. The cause of a cause. A legal doctrine used in determining 'proximate cause'. The cause of a cause of loss. / В переводе с Латинского языка означает Причина Причин; Первопричина.

CAUSAL ORGANISM = ОРГАНИЗМ ВОЗБУДИТЕЛЬ – Causal Organism (Causal Agent) is an organism (bacterium, fungus, virus, nematode, or mycoplasma) or agent that causes a disease or disorder. / Организм Возбудитель или Агент Возбудитель – организм (бактерия, гриб, вирус, нематода или микоплазма) или агент, который вызывает болезнь или расстройство.

CAUSA PROXIMA = КАУСА ПРОКСИМА (или БЛИЖАЙШАЯ ПРИЧИНА) – Causa Proxima:- in Latin, immediate cause. Proximate Cause. The full term is 'Causa Proxima non Remota Spectatur'. / В переводе с Латинского языка означает Ближайшая Причина. Полное выражение переводится как 'Принимается Во Внимание Ближайшая Причина, А Не Отдалённая' ('Causa Proxima non Remota Spectatur').

CAUSE OF LOSS = ПРИЧИНА УЩЕРБА – Cause Of Loss:- under the latest commercial property forms, this term replaces the earlier term Perils insured against.

CAUSTIC = КАУСТИК – Caustic is a highly alkaline substance such as sodium hydroxide. Caustic:- referring to a chemical that will 'burn' skin; may be acid or alkali; in dyeing, caustic is also often used as an abbreviation for Caustic Soda (sodium hydroxide). See also Caustic Soda. / Щёлочь (Alkali). каустическая сода или едкий натр (caustic soda). Под Каустиком или Каустической Содой или Гидроксидом Натрия (NaOH) понимается бесцветная кристаллическая масса плотностью 2 130 кг/м^3, $t_{пл}$ 320 °C, растворимость в воде 52.2% (при 20 °C). Сильное основание, на животную ткань действует разрушающе; особо опасно попадание капель гидроксида натрия в глаза. Получают NaOH электролизом растворов NaCl; одновременно образуется хлор. Гидроксид натрия

применяется в химической, текстильной, мыловаренной и многих других отраслях промышленности. Под Каустиком, от Греческого слова Kaustikós, означающее Жгучий, понимается техническое название едких щёлочей:- гидроокиси натрия NaOH и гидроокиси калия KOH.

CAUSTIC SODA = КАУСТИЧЕСКАЯ СОДА (или ЕДКИЙ НАТР, или БАРАБАННАЯ ЩЁЛОЧЬ, или СОДОВЫЙ КАМЕНЬ) – Caustic Soda, NaOH, is the common name for sodium hydroxide. See also Caustic, and Sodium Hydroxide.

CAVALRY TWILL = КАВАЛЕРИЙСКАЯ САРЖА (или РЕЙТУЗНАЯ ДИАГОНАЛЬ) – Cavalry Twill:- a pronounced, raised cord on a 63-degree twill weave characterizes this rugged cloth usually made from wool or wool blend yarns. Cavalry Twill is a strong cotton, wool, or worsted fabric constructed in double twill, used for apparel. Also called Tricotine. Cavalry Twill is a sturdy twill-weave fabric with a pronounced diagonal cord. It is used for sportswear, uniforms, and riding habits. Cavalry Twill is 100% pure new wool and heavy in weight, a traditional British twill fabric, used for garments. Cavalry Twill:- woolen or worsted. 63 twill weave; right hand twill. Pronounced narrow and wide wale, in groups of 2. Strong rugged cloth. Quite elastic. Similar to US elastique but elastique is smoother in rib, feel and effect, – (made of worsted yarn and a firmer weave). Also resembles tricotine but tricotine is much finer with a double diagonal. / Именуется также как Костюмное Трико (Tricotine), производимое из тонкой гребенной шерсти.

CAVITATION = КАВИТАЦИЯ – Cavitation is a formation of an air or vapor pocket (or bubble) due to lowering of pressure in a liquid, often as a result of a solid body, such as a propeller or piston, moving through the liquid; also, the pitting or wearing away of a solid surface as a result of the violent collapse of a vapor bubble. Cavitation can occur in a hydraulic system as a result of low fluid levels that draw air into the fluid, producing tiny bubbles that expand followed by rapid implosion, causing metal erosion and eventual pump destruction. The term Cavitation has been used to describe a breaking of the water column and entry of air into the plant's vascular tissue just below the developing fruiting structure. Some have argued that water entering the young developing boll is actively transported through the phloem rather than the xylem and that it is impossible for the water column in the xylem to break and cause the condition. / или изнашивание . Под Кавитацией, от Латинского слова Cavitas, означающее Пустота, понимается нарушение сплошности внутри жидкости, то есть образование в капельной жидкости полостей, заполненных газом, паром или их смесью (так называемая кавитация пузырьков, или каверн). Кавитация возникает в результате местного уменьшения давления ниже критического значения (для реальной жидкости оно приблизительно равно давлению насыщенного пара этой жидкости при данной температуре). Если понижение давления происходит вследствие местного повышения скорости в напорном потоке капельной жидкости, то кавитацию называют гидродинамической; в случае же повышения давления вследствие прохождения в жидкости акустических волн – акустической. Кавитация неблагоприятно отражается на работе гибротурбин, насосов, гребных винтов (вибрация, снижение коэффициента полезного действия (КПД), разрушение рабочих органов). Акустическая кавитация лежит в основе большинства практических применений ультразвука. Термин Кавитация относится к образованию в жидкости полостей (кавитационных пузырьков, или каверн), заполненных газом, паром или их смесью. Кавитация возникает в результате местного понижения давления в жидкости, которое может происходить либо при увеличении её скорости (гидродинамическая кавитация), либо при прохождении акустической волны большой интенсивности во время полупериода разрежения (акустическая кавитация). Перемещаясь с потоком в область с более высоким давлением или во время полупериода сжатия, кавитационный пузырёк захлопывается, излучая при этом ударную волну. Кавитация разрушает поверхность гребных винтов, гидротурбин, акустических излучателей и других устройств и деталей. Под Кавитацией, образование в капельной жидкости полостей, заполненных газом, паром или их смесью (так называемых Кавитационных Пузырьков, или Каверн). Кавитационные пузырьки образуются в тех местах, где давление в жидкости становится ниже некоторого критического значения $p_{кр}$ (в реальной жидкости $p_{кр}$ приблизительно равно давлению насыщенного пара этой жидкости при данной температуре). Если понижение давления происходит вследствие больших местных скоростей в потоке движущейся капельной жидкости, то кавитацию называют Гидродинамической Кавитацией, а если вследствие прохождения акустических волн – Акустической Кавитацией. Гидродинамическая Кавитация:- поскольку в реальной жидкости всегда присутствуют мельчайшие пузырьки газа или пара, то, двигаясь с потоком и попадая в область давления $p < pкр$, они теряют устойчивость и приобретают способность к неограниченному росту. После перехода в зону повышенного давления и исчерпания кинетической энергии расширяющейся жидкости рост пузырька прекращается и он начинает сокращаться. Если пузырёк содержит достаточно много газа, то по достижении им минимального радиуса он восстанавливается и совершает нескольких циклов затухающих колебаний, а если газа мало, то пузырёк захлопывается полностью в первом периоде жизни. Таким образом, вблизи обтекаемого тела (например, в трубе с местным сужением) создаётся довольно чётко ограниченная 'Кавитационная Зона', заполненная движущимися пузырьками. Сокращение кавитационного пузырька происходит с большой скоростью и сопровождается звуковым импульсом (своего рода гидравлическим ударом) тем более сильным, чем меньше газа содержит пузырёк. Если степень развития кавитации такова, что в случайные моменты времени возникает и захлопывается множество пузырьков, то явление сопровождается сильным шумом со сплошным спектром от нескольких сотен Герц (Гц) до сотен и тысяч килоГерц (кГц). Если кавитационная каверна замыкается вблизи от обтекаемого тела, то многократно повторяющиеся удары приводят к разрушению (к так называемой Кавитационной Эрозии) поверхности обтекаемого тела (лопастей гидротурбин, гребных винтов кораблей и других гидротехнических устройств. Если бы жидкость была идеально однородной, а поверхность твёрдого тела, с которым она граничит, идеально смачиваемой, то разрыв происходил бы при давлении, значительно более низком, чем давление насыщенного пара жидкости. Прочность на разрыв воды, вычисленная при учёте тепловых флуктуаций, равна 150 МН/м^2 (1 500 кг/см^2). Реальные жидкости менее прочны. Максимальное растяжение тщательно очищенной воды, достигнутое при растяжении воды при 10 °C, составляет 28 МН/м^2 (280 кг/см^2). Обычно же разрыв возникает при давлениях, лишь немного меньших давления насыщенного пара. Низкая прочность реальных жидкостей связана с наличием в них так называемых Кавитационных Зародышей:- плохо смачиваемых участков твёрдого тела, твёрдых частиц с трещинами, заполненными газом, микроскопических газовых пузырьков, предохраняемых от растворения мономолекулярными органическими оболочками, ионных образований, возникающих под действием космических лучей. При данной форме обтекаемого тела кавитация возникает при некотором, вполне определённом для данной точки потока, значении безразмерного параметра:- $X = 2 ((p – p_н) / (pv_∞^2))$, где p – гидростатическое давление набегающего потока, $p_н$ – давление насыщенного пара, r – плотность жидкости, $v_∞$ – скорость жидкости на достаточном отдалении от тела. Этот параметр называют 'Числом Кавитации', служит одним из критериев подобия при моделировании гидродинамических течений. Увеличение скорости потока после начала кавитации вызывает быстрое возрастание числа кавитационных пузырьков, вслед за чем происходит их объединение в общую кавитационную каверну, затем течение переходит в струйное (смотрите Струя). При этом течение сохраняет нестационарный характер только в области замыкания каверны. Особенно быстро струйное течение организуется в случае плохо обтекаемых тел. Если внутрь каверны, через тело, около которого возникает кавитация, подвести атмосферный воздух или иной газ, то размеры каверны увеличиваются. При этом установится течение, которое будет соответствовать числу кавитации, образованному уже не по насыщающему давлению водяного пара $p_н$, а по давлению газа внутри каверны $p_к$, то есть:- $X = 2 ((p_∞ – p_н) / (pv_∞^2))$. Всплывание такой кавитационной каверны будет определяться так называемым Числом Фруда:- $Fr = v_∞^2 / gd$, где g – ускорение силы тяжести, а d – некоторый характерный линейный размер. Так

как $p_к$ может быть много больше $p_н$, то в таких условиях возможно при малых скоростях набегающего потока получать течения, соответствующие очень низким значениям с, то есть глубоким степеням развития кавитации. Так, при движении тела в воде со скоростью 6–10 метров в секунду (м/сек) можно получить его обтекание, соответствующее скоростям до 100 м/сек. Кавитационные течения, получающиеся в результате подвода газа внутрь каверны, называют Искусственной Кавитацией. Гидродинамическая кавитация может сопровождаться рядом физико-химических эффектов, например, искрообразованием и люминесценцией. В ряде работ обнаружено влияние электрического тока и магнитного поля на кавитацию, возникающую при обтекании цилиндра в гидродинамической трубе. Исследование кавитации и борьба с ней имеют большое значение, так как кавитация оказывает вредное влияние на работу гидротурбин, жидкостных насосов, гребных винтов кораблей, подводных звукоизлучателей, жидкостных систем высотных самолётов и так далее, снижает коэффициент полезного действия (кпд) и приводит к разрушениям. Кавитация может быть уменьшена при увеличении гидростатического давления, например, помещением устройства на достаточной глубине по отношению к свободной поверхности жидкости, а также подбором соответствующих форм элементов конструкции, при которых вредное влияние кавитации уменьшается. Для уменьшения эрозии лопасти рабочих колёс изготавливают из нержавеющих сталей и шлифуют. Экспериментальные исследования кавитации производятся в так называемых Кавитационных Трубах, представляющих собой обычные гидродинамические трубы, оборудованные системой регулирования статического давления. Акустическая Кавитация:- при излучении в жидкость звука с амплитудой звукового давления, превосходящей некоторую пороговую величину, во время полупериодов разрежения возникают кавитационные пузырьки на так называемых Кавитационных Зародышах, которыми чаще всего являются газовые включения, содержащиеся в жидкости и на колеблющейся поверхности акустического излучателя. Поэтому кавитационный порог повышается по мере снижения содержания газа в жидкости, при увеличении гидростатического давления, после обжатия жидкости высоким (порядка 10^3 кгс/см^2 @ 10^2 МН/м^2) гидростатическим давлением и при охлаждении жидкости, а кроме того, при увеличении частоты звука и при сокращении продолжительности озвучивания. Порог выше для бегущей, чем для стоячей волны. Пузырьки захлопываются во время полупериодов сжатия, создавая кратковременные (порядка 10–6 сек) импульсы давления (до 10^3 МН/м^2 @ 10^4 кгс/см^2 и более), способные разрушить даже весьма прочные материалы. Такое разрушение наблюдается на поверхности мощных акустических излучателей, работающих в жидкости. Давление при захлопывании кавитационных пузырьков повышается при снижении частоты звука и при повышении гидростатического давления; оно выше в жидкостях с малым давлением насыщенного пара. Захлопывание пузырьков сопровождается адиабатическим нагревом газа в пузырьках до температуры порядка 10^4 °С, чем, по-видимому, и вызывается свечение пузырьков при кавитации (так называемая Звуколюминесценция). Кавитация сопровождается ионизацией газа в пузырьках. Кавитационные пузырьки группируются, образуя кавитационную область сложной и изменчивой формы. Интенсивность кавитации удобно оценивать по разрушению тонкой алюминиевой фольги, в которой кавитирующие пузырьки пробивают отверстия. По количеству и расположению этих отверстий, возникающих за определённое время, можно судить об интенсивности кавитации и конфигурации кавитационной области. Если жидкость насыщена газом, то газ диффундирует в пузырьки и полного захлопывания их не происходит. Всплывая, такие пузырьки уносят газ и уменьшают содержание газа в жидкости. Интенсивные колебания газонаполненных пузырьков как в свободной жидкости, так и вблизи поверхности твёрдых тел создают микропотоки жидкости. Появление кавитации ограничивает возможность дальнейшего повышения интенсивности звука, излучаемого в жидкость, вследствие уменьшения её волнового сопротивления и соответствующего снижения нагрузки на излучатель (смотрите Акустический Импеданс). Акустическая кавитация и связанные с ней физические явления вызывают ряд эффектов. Часть из них, например, разрушение и диспергирование твёрдых тел, эмульгирование жидкостей, очистка поверхностей, деталей, обязана своим происхождением ударам при захлопывании пузырьков и микропотокам вблизи них. Другие эффекты (например, инициирование и ускорение химических реакций) связаны с ионизацией газа в пузырьках. Благодаря этим эффектам акустическая кавитация всё шире используется для создания новых и совершенствования известных технологических процессов. Большое число практических применений ультразвука основано на эффекте кавитации. Акустическая кавитация имеет большое значение в биологии и медицине. Импульсы давления, возникающие в кавитационных пузырьках, обусловливают мгновенные разрывы микроорганизмов и простейших, находящихся в водной среде, подвергаемой действию ультразвука. Кавитацию используют для выделения из животных и растительных клеток ферментов, гормонов и других биологически активных веществ.

CAVITATION EROSION = КАВИТАЦИОННАЯ ЭРОЗИЯ – Cavitation Erosion is a material-damaging process which occurs as a result of vaporous cavitation. ‘Cavitation’ refers to the occurrence or formation of gas- or vapor-filled pockets in flowing liquids due to the hydrodynamic generation of low pressure (below atmospheric pressure). This damage results from the hammering action when cavitation bubbles implode in the flow stream. Ultra-high pressures caused by the collapse of the vapor bubbles produce deformation, material failure and, finally, erosion of the surfaces.

CAVITOMA = КАВИТОМА – Cavitoma is a term coined in the 1950’s to describe microbial damage to cotton fiber or the breakdown of the cellulose in fiber by micro-organisms. This damaging microbial activity starts in the field when lint in mature open bolls is exposed to wet weather and may continue while the seed cotton is in the module and when the lint is stored in the bale. Symptoms of fiber damage include elevated pH, reduced length and strength and reduced affinity for dyes. When harvest is delayed by rain it is important to keep module and bale moisture contents to a minimum. Microbial damage to fibers can be observed microscopically after placing fibers in 10% Potassium hydroxide. Unaffected fibers are cylindrical while affected fibers are distorted, swollen and obviously damaged. / Сродство (Affinity). уменьшенная длина и прочность и уменьшенное сходство для .

CAVITY = ПОЛОСТЬ (или РАКОВИНА, или ЛОЖБИНА, или ГНЕЗДО) – Cavity is the space inside a mold in which a resin or molding compound is poured or injected.

CCC = THE COMMODITY CREDIT CORPORATION

CCC INVENTORY = ИНВЕНТАРЬ ККС – In the United States, CCC Inventory is the quantity of a commodity owned by the Commodity Credit Corporation (CCC) at any specified time. For example, 8 610 bales of upland cotton were in the CCC inventory (owned by CCC) on 1989-June-01. See also Commodity Credit Corporation. Inventory Operations:- CCC is authorized to transport, store, process, and dispose of various agricultural commodities and their products. CCC provides storage adequate to fulfill its program needs by contracting with commercial warehouses to store agricultural commodities in county and terminal locations. In carrying out support programs, CCC acquires its inventory in two principal ways:- (1) Collateral Acquisition:- if a producer does not redeem the commodity by loan repayment time, CCC takes title and possession of the commodity that was pledged as collateral for the nonrecourse marketing assistance loan. Nonrecourse loans are defined as loans for which producers have the option of either repaying the principal and interest or forfeiting (delivering) the collateral (the commodity) to CCC in full settlement of the loan. Settlement of the loan is then based on the loan rate and the associated quantity and quality of the commodity involved. In lieu of securing a loan from CCC, a producer may be eligible for a loan deficiency payment (LDP). Market loan repayment and LDP provisions are intended to prevent delivery of loan collateral to CCC. These provisions considerably reduce the Federal government's acquisition of stocks that might otherwise occur, which could make US-produced commodities less competitive in world markets. (2) Purchases:- support for milk and milk products is carried out through purchases of butter, cheese, and nonfat dry milk from processors and handlers. There are no CCC support programs for processed products, other than dairy products, and sugar – raw cane sugar and refined beet sugar. Many commodities, such as wheat, corn, and oats are stored in raw, bulk form by CCC and require considerable processing before they can be used for food. Commodities and products acquired through direct purchases either go immediately into available outlets or are placed in CCC's inventory. CCC is authorized to contract for the use of privately owned facilities in carrying out its activities. CCC has no authority to acquire personal property except for ADP equipment. It may rent or lease office space necessary for its business. CCC is prohibited from acquiring real property, or any interest in property, except for the purpose of protecting its financial interests and for providing adequate storage to carry out its programs. / В Соединённых Штатах Америки, количество сырья, владеемого Корпорацией по Кредитам на Сырьё (ККС) в любое указываемое время. C CORPORATION = КОРПОРАЦИЯ (ТИПА) СИ. – C Corporation:- regular corporations are sometimes called C Corporations or C-Corps to distinguish the regular corporation from a newer counterpart, the Subchapter S Corporation, or S-Corps. Regular corporations are completely separate entities. They have their own tax identification number, and they file their own tax returns. If a corporation has a loss, that loss carries forward to offset next year's profits. Corporations can have several years of losses, and the accumulated losses carry forward to offset future profits. Entrepreneurs can realize significant tax benefits by forming a corporation. Let's say Mary, a freelance writer, has a loss in year 1 of USD10 000, followed by a loss in year 2 of USD5 000. In year 3, Mary's company makes a profit of USD50 000. The accumulated losses will reduce that profit to only USD35 000. Mary cannot deduct these business losses on her personal tax return. The losses are retained by the company, and are used to offset future profits. See also S Corporation. C Corporation is a legal structure that businesses can choose to organize themselves under in order to limit their owners' legal and financial liabilities. C corporations are legally considered separate entities from their owners. In a C corporation, income is taxed at the corporate level and is taxed again when it is distributed to owners. C corporations are an alternative to S corporations, where profits pass through to owners and are only taxed at the individual level, and limited liability companies, which provide the legal protections of corporations but are taxed like sole proprietorships. While the double taxation of C corporations is a drawback, the ability to reinvest profits in the company at a lower corporate tax rate is an advantage. Most corporations are C corporations. When a small business incorporates, it is automatically a C Corporation, also called a Regular Corporation. The most basic characteristic of the corporation is that it is legally viewed as an individual entity, separate from its owners, who are now shareholders. This means that when the corporation is sued, shareholders are only liable to the extent of their investments in the corporation. Their personal assets are not on the line, as they would be if the business was a partnership or sole proprietorship. Any debts that the corporation may acquire are also viewed as the corporation's responsibility. In other words, once the business is incorporated, shareholders are protected by the corporate veil, or limited liability. Because the corporation is a separate entity, it is viewed as an individual taxpayer by the Internal Revenue Service (IRS). As a result, corporations are subject to double taxation, which means that the profits are taxed once on the corporate level and a second time when they are distributed as dividends to the shareholders. If a business is eligible, it may elect S corporation status upon incorporating to avoid this negative characteristic of C corporations. Advantages:- (i) Limited Liability:- most small businesses that consider incorporating do so for the limited liability that corporate status affords. The greatest fear of the sole proprietor or partner – that his or her life's savings could be jeopardized by a law suit against his or her business or by sudden overwhelming debts – disappears once the business becomes a corporation. Although the shareholders are liable up to the amount they have invested in the corporation, their personal assets cannot be touched. Rather than purchase expensive liability insurance, then, many small business owners choose to incorporate to protect themselves. (ii) Raising Capital:- it can be much easier for a corporation to raise capital than it is for a partnership or sole proprietorship, because the corporation has stocks to sell. Investors can be lured with the prospect of dividends if the corporation makes a profit, avoiding the necessity of taking out loans and paying high interest rates in order to secure capital. However, from a banker's perspective, a newly formed corporation is a more risky loan applicant than an individual with a home and other assets. (iii) Attracting Top-Notch Employees:- corporations may find it easier to attract the best employees, who may be lured by stock options and fringe benefits. (iv) Fringe Benefits:- one advantage C corporations have over unincorporated businesses and S corporations is that they may deduct fringe benefits (such as group term life insurance, health and disability insurance, death benefits payments to USD5 000, and employee medical expenses not paid by insurance) from their taxes as a business expense. In addition, shareholder-employees are exempt from paying taxes on the fringe benefits they receive. To be eligible for this tax break the corporation must not design a plan that benefits only the shareholders/owners. A good portion of the employees (usually 70 percent) must also be able to take advantage of the benefits. For many small businesses, providing fringe benefits for all employees is too expensive, so in these cases the tax break is not a particular advantage. (v) Continuance of Existence:- transfer of stock or death of an owner does not alter the corporation, which exists perpetually, regardless of owners, until it is dissolved. While this is usually considered an advantage, Fred Steingold argues in The Legal Guide for Starting and Running a Small Business that, in reality, 'You don't need to incorporate to ensure that your business will continue after your death. A sole proprietor can use a living trust or will to transfer the business to heirs. Partners frequently have insurance-funded buy-sell agreements that allow the remaining partners to continue the business'. Disadvantages:- (i) Double Taxation:- after they deduct all business expenses, such as salaries, fringe benefits, and interest payments, C corporations pay a tax on their profits at the corporate level. If any of those profits are then distributed as dividends to the shareholders, those individuals must also pay a tax on the money when they file their personal tax returns. For companies that expect to reinvest much of the profits back into the business, double taxation may not affect them enough to be a serious drawback. In the case of the small business, most if not all of the company's profits are used to pay salaries and fringe benefits, which are deductible, and double taxation may be avoided because no money is left over for distributing dividends. (ii) Bureaucracy and Expense:- corporations are governed by state and federal statutes. In order to abide by all of the sometimes complex regulations related to C corporations, it is often necessary to hire lawyers and accountants to assist with tax preparation. Regular stockholder and board of directors meetings must be held and detailed minutes of those meetings must be kept. All of the actions taken by a corporation are to be approved by its directors and this necessity can reduce a company's ability to take quick action on pressing matters. Another difference between a sole proprietor and a C Corporation that imposes a bureaucratic burden arises if and when a corporation wishes to bring a case in small claims court. The corporation is required to be represented by a lawyer, whereas sole proprietors or partners can represent themselves. In addition, if the corporation does interstate business, it is subject to taxes in other states. (iii) Rules Governing Dividend Distribution:- a corporation's profits are divided on the basis of stockholdings, whereas a partnership may divide its profits on the basis of capital investment or employment in the firm. In other words, if a stockholder owns 10 percent of the corporation's stock, she may only receive 10 percent of the profits. However, if that same person was a partner in an unincorporated firm to which she had contributed 10 percent of the company's capital, she might be eligible to receive more than 10 percent of the business's profits if such an agreement had been made with the other partners. Strict rules, though, govern the way corporations divide their profits, even to the point, in some states, of determining how much can be distributed in dividends. Usually, all past operations must be paid for before a dividend can be declared by the corporation's directors. If this is not done, and the corporation's financial stability is put in jeopardy by the payment of dividends, the directors can, in most states, be held personally liable to creditors. Structure of a Corporation:- in small businesses, the owners often hold more than one or all of the following positions, which are required of all corporations:- (i) Shareholders:- they own the company's stock and are responsible for electing the directors, amending the bylaws and articles of incorporation, and approving major actions taken by the corporation like mergers and the sale of corporate assets. They alone are allowed to dissolve the corporation. (ii) Directors:- they manage the corporation and are responsible for issuing stock, electing officers, and making the corporation's major decisions. (iii) Officers:- the corporation must have a president, secretary, and treasurer. These officers are responsible for making the day-to-day decisions that govern the corporation's operation. (iv) Employees:- they receive a salary in return for their work for the corporation. Financing a Corporation:- financing the operations of a corporation may involve selling stock (equity financing), taking out loans (debt financing), or reinvesting profits for growth. (i) Equity:- this is cash, property, or services exchanged for stock in the company. Generally, each stock is equivalent to one dollar of investment. If the small business owner is planning to exchange property to the corporation for stock, then a tax advisor should be consulted; if the property has appreciated, taxes may be due on the exchange. (ii) Debt:- this is money lent by

banks or shareholders. In the former case, a personal guarantee by the corporation's principals is usually required, which makes an exception to the limited liability rule. The owner of a corporation who personally guarantees a loan is also personally responsible for paying it back if the corporation goes under. Many corporations have preferred to fund the corporation with shareholder money in exchange for promissory notes because unlike dividends, the repayment of debts is not taxable. The Internal Revenue Service monitors such debt closely, though, to make sure it is not excessive and that adequate interest is paid. It should be noted that the interest accrued on money borrowed is taxable when paid to the lender. Paying C Corporation Taxes:- after the C corporation deducts all business expenses, such as salaries, fringe benefits, and interest payments, it pays a tax on its profits at the corporate level. Then dividends may be distributed to the shareholders who must pay a tax on the money when they file their personal tax returns. In the case of the small business, though, double taxation may not be a consideration, because most, if not all of the company's profits are reinvested in the business or go to pay salaries and fringe benefits, which are deductible, and no money is left over for distributing dividends. To avoid double taxation, corporations sometimes pay their shareholder-employees higher salaries instead of distributing income as dividends. The IRS, however, watches out for such tax avoidance measures and often audits corporations, claiming that executive salaries are not 'reasonable' compensation. To prevent this charge, then, the corporation should consider the duties performed, the experience and/or special abilities of the employee, and how much other corporations pay for similar positions before determining 'reasonable' compensation. A corporation should keep salaries somewhat consistent over time as fluctuating salaries – high salaries in high earning years and low salaries in lean years – will attract a review of salary payments by the Internal Revenue Service. A charge might be made, for example, that the high salary payments were in fact dividend payments. Running a Corporation:- once a small business has been incorporated, the day-today management of business affairs should not be that much different than it was beforehand. It is important, though, that the business is treated like a corporation. The courts have been known on occasion to overlook a business's corporate status and find the shareholders/owners liable because the business was run as if it were still a sole proprietorship or partnership. Simply filing the articles of incorporation does not guarantee limited liability. In order to maintain corporate status in the law's eyes, these guidelines should be followed:- (i) Act Like a Corporation Before doing business, stock certificates should be issued to all stockholders, and a corporate record book should be established to hold the articles of incorporation, records of stock holdings, the corporation's bylaws, and the minutes of board and shareholder meetings. In addition, such meetings should be held regularly (once a year is the minimum requirement). In this way, the corporation can record all important actions taken and show that such actions were approved by a vote. It is also important to treat the corporation like the separate entity it is by keeping personal and corporate accounts separate. Whereas a small business owner may have previously used one account to pay the company's accounts and personal expenses, as a corporate shareholder, he now needs to receive a regular salary from the corporation, deposit it in a separate account, and pay his personal expenses from that account. In all respects, the corporation and owner must be treated as distinct individuals. Fred Steingold advises, 'document all transactions as if you were strangers. If the corporation leases property to you, sign a lease'. In addition, the corporation's full name (which should indicate the company's corporate status through use of 'Inc.' or an equivalent) must be used on all correspondence, stationery, advertising, phone listings, and signs. (ii) Act Like a Corporate Officer When the corporation's owner signs her name to checks, contracts, or correspondence for the corporation, she must always indicate that she is the president to show that she is not acting on her own but as an agent of the corporation. (iii) Adequate Capital Investment and Insurance Coverage It is important to protect the corporation against failure due to debts and lawsuits. In other words, simply trying to protect the owners' assets by becoming a corporation and neglecting to fortify the business can be viewed as reason to disregard a business's corporate status in a lawsuit. Therefore, enough capital should be invested in the corporation to handle all business activities. Likewise, if business activities pose a risk to employees or customers and reasonably priced insurance is available to protect against such risks, such coverage should be secured. C Corporation refers to any corporation that, under United States federal income tax law, is taxed separately from its owners. A C corporation is distinguished from an S corporation, which generally is not taxed separately. Most major companies (and many smaller companies) are treated as C corporations for US federal income tax purposes.

CEDEL (SA) = СЭДЭЛЬ (ЭС.А.) – Centrale de Livraison de Valeurs Mobilières SA (CEDEL SA) An institution founded in 1970 by leading banks and financial institutions in Luxembourg for the custody, administration and settlement of bonds and shares, especially internationally traded issues. In January 2000, the company merged with Deutsche Börse Clearing AG to form Clearstream International, which today is a 100% subsidiary of Deutsche Börse AG. An international central securities depository founded in 1970 and headquartered in Luxembourg. Cedel was renamed Clearstream after a 1999 merger. CEDEL SA is a name of an international clearing system established in 1970 in Luxembourg for the settlement of securities transactions, especially Eurobond operations. Another international clearing house performing similar functions is Euroclear. CEDEL (Centrale de Livraison de Valuers Mobilieres) is a securities clearing company that was purchased by Deutsche Borse in 2002. It is now known as Clearstream. Centrale de Livraison de Valeurs Mobilières SA – international clearing system established in 1970 by leading banks and financial institutions in Luxembourg for the settlement of securities transactions. CEDEL merged with Deutsche Börse AG Clearing in 2000 to form Clearstream. See also Clearstream International. / Сантраль дё Ливрезон дё Валёр Мобильер Эс.А.. Юроклыэ (Euroclear). Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG). (Примечание:- в Русском языке нет точного соответствия звуку при произношении буквы Ö Немецкого алфавита. Разные источники по-разному интерпретируют его. Буквосочетание ЫО может более менее точно передавать произношение буквы Ö лишь при быстром и кратком их произношении, напоминая в отдалении произношение буквы Ё Русского алфавита.) .

CEDENT = ЦЕДЕНТ – Cedent is a party to an insurance contract who passes financial obligation for certain potential losses to the insurer. In return for bearing a particular risk of loss, the cedent pays an insurance premium. The term cedent is most often used in the reinsurance industry, although the term could apply to any insured party. Insurance companies are regulated so that they may not write policies in excess of a certain percentage of their collateral. However, insurance companies do not have to hold collateral against policies that are reinsured. Most insurance companies employ some sort of reinsurance program in order to more efficiently manage their operations. Cedent is the ceding insurer or a reinsurer. A ceding insurer is an insurer that underwrites and issues an original, primary policy to an insured and contractually transfers (cedes) a portion of the risk to a reinsurer. A ceding reinsurer is a reinsurer that transfers (cedes) a portion of the underlying reinsurance to a retrocessionnaire. See also Ceding Company, and Reinsurer. / Под Цедентом, от Латинского слова Cedo, означающее Уступаю, понимается лицо, передающее принадлежащие ему по обязательству права другому лицу – цессионарию (приобретателю требования). Цедент:- (1) первоначальный кредитор по обязательству, осуществляющий уступку принадлежащего ему права другому лицу в порядке цессии. (2) Лицо, переуступающее право на операции с чем-либо или на собственность. Цессионарий – правопреемник, лицо, которому передаётся право на операции с чем-либо или на собственность. Цедент – страховщик проводящий вторичное размещение риска (перестрахование).

CEDIA = CENTRO DE INVESTIGACIONES ARROCERAS = RICE RESEARCH CENTER

CEDING COMMISSION = КОМИССИЯ ЗА УСТУПКУ – In reinsurance, a Ceding Commission is the cedant's acquisition costs and overhead expenses, taxes, licenses and fees, plus a fee representing a share of expected profits – sometimes expressed as a percentage of the gross reinsurance premium.

CEDING COMPANY = УСТУПАЮЩАЯ КОМПАНИЯ – Ceding Company is an insurance company that passes the part or all of its risks from its insurance policy portfolio to a reinsurance firm. Passing off risk in this manner allows the ceding company to hedge against undesired exposure to loss and frees up capital to use in writing new insurance contracts. The ceding company retains liability for the reinsured policies, so although claims should be reimbursed by the reinsurance firm, if the reinsurance company defaults, the ceding company may still have to make a payout on reinsured policy risks. Insurance is a highly regulated industry which requires insurance companies to write certain semi-standardized policies and maintain sufficient capital as collateral against losses. Insurance companies can use reinsurance to allow them more freedom in controlling their operations. For instance, in cases where the insurance company does not wish to carry the risk of certain losses in a standard policy, these risks can be reinsured away. An insurer can also use reinsurance to control the amount of capital it is required to hold as collateral. In reinsurance, a Ceding Company is the original or primary insurer; the insurance company which purchases reinsurance. Ceding Company is the insurer that cedes all or part of the insurance or reinsurance it has written to a reinsurer. See also Cedent, and Reinsurer. Ceding Company is the insurance company that transfers the insurance it has written to another insurance company.

CEDO = CENTRE FOR EDUCATIONAL DEVELOPMENT OVERSEAS

CEEAC = COMMUNAUTÉ ÉCONOMIQUE DES ÉTATS DE L'AFRIQUE CENTRALE

CEG = CANADIAN EXCHANGE GROUP

CEILING = ПОТОЛОК (или МАКСИМАЛЬНАЯ ВЕЛИЧИНА) – Ceiling is the upper limit, particularly a borrowing limit imposed on a bank customer. Maximum price or quantity. Ceiling is a recognized high point in market prices. This may be a point the market does not expect the price to exceed, the highest price achieved before the market declines or a level set by a customer as a maximum price to be paid. / Максимальная цена или количество.

CEINTURE = СЭНТЮР (или ПОЯСОК, или ПОЯС, или КУШАК) – Ceinture is a belt or sash for the waist. / .

CELADON = СЕРОВАТО–ЗЕЛЁНОЕ (или СЕЛАДОН, или МОРСКОЙ ВОЛНЫ) – Celadon:- a grayish yellow green.

CELANESE ACETATE = СЭЛЭНИЗСКИЙ АЦЕТАТ (или АЦЕТАТ ОТ СЭЛЭНИЗ) – Celanese Acetate is a business of Celanese Corporation, manufactures cellulose acetate products for use in diverse industries including:- (i) Filtration; (ii) Luxury Packaging; (iii) Insulation; (iv) Acetate Granules; (v) Medical; and (vi) Nonwovens. We are strategically positioned geographically to meet customer demand with manufacturing facilities and sales offices in the following locations:- United States, Europe, Mexico, and Asia. As a leading producer of cellulose acetate products, we are committed to delivering products, technological know-how and services that improve our customers' competitiveness and advance their goals. Headquartered in Irving, State of Texas (TX), the United States. See also Acetate Fiber. Celanese is a global chemicals company focusing mainly on basic, intermediate and specialty chemicals, emulsions, acetate products, technical polymers and food ingredients. Celanese is also one of the world's largest producers of acetate tow. / Сэлэниз Корпорэйшэн (Celanese Corporation).

CELL = КЛЕТКА – Cell is the basic structural unit, which may be capable of replication or differentiation, from which all living tissues are made. Hence:- Adj. cellular made from cells. General term for the minute units of wood structure, including wood fibers, vessel segments and other elements. Cell is a unit mass of protoplasm surrounded by a cell membrane and containing one or more units of nuclear material. / Под Клеткой понимается элементарная живая система, основа строения и жизнедеятельности всех животных и растений. Клетки существуют как самостоятельные организмы (например, бактерии, простейшие) и в составе многоклеточных организмов, в которых имеются половые клетки, служащие для размножения, и клетки тела (соматические), различные по строению и функциям (например, костные, мышечные, нервные, секреторные). Размеры клетки варьируют в пределах от 0.1–0.25 микрометра (мкм) (некоторые бактерии) до 155 миллиметров (мм) (яйцо страуса в скорлупе). У человека в организме новорождённого около $2 \cdot 10^{12}$ клеток. В каждой клетке различают 2 основные части:- ядро и цитоплазму, в которой находятся органоиды и включения. Клетки растений, как правило, покрыты твёрдой оболочкой. Наука о клетках – цитология.

CELL = СОТА (или ЯЧЕЙКА) – Cell:- the construction system employed in container vessels; permits ship containers to be stowed in a vertical line with each container supporting the one above it. Cell is a container slot where container fits into place on vessel. Cell is a single device which converts chemical energy into electrical current. Sometimes also referred to as a Battery.

CELL GUIDES = НАПРАВЛЯЮЩИЕ СОТ (или НАПРАВЛЯЮЩИЕ ЯЧЕЕК) – Cell Guides:- a structure which guides the container into the cell of a vessel hatch. A hatch can consists of ten cells, each containing ten containers. Cell Guides are vertical guides (similar to those in an elevator shaft) within which the container fits and is constrained at its four vertical corner posts. The containers are stacked one above the other and the bottom container takes the static and dynamic vertical loads resulting from those resting on it. These loads are transmitted through the corner posts of the containers to a reinforced doubling plate on the tank top, or bottom of the hold. Steel bars and rails used to steer containers during loading and discharging while sliding in the ship. Cell Guides are steel bars and rails used to steer containers during loading and discharging whilst loaded in the ship.

CELL LUMEN = ПОЛОСТЬ КЛЕТКИ – Cell Lumen:- pores in the wood structure.

CELLOPHANE = ЦЕЛЛОФАН – Cellophane is a generic term for regenerated cellulose film, which is used primarily for packaging. The film is transparent and may be dyed in many colors or coated to render it moisture proof or heat-sealable. / Под Целлофаном, от Французского слова Cellulose, от Латинского слова Cellula, означающее Комнатка или Клетка или Клетушка, и Греческого слова Phanós, означающее Светлый или Чистый, понимается прозрачная гидратцеллюлозная плёнка (толщиной 20–50 мкм), пластифицированная глицерином и иногда гидрофобизированная (лакированная), например, эфироцеллюлозным лаком. Получают продавливанием вискозы через плоскощелевую фильеру в осадительную ванну. Упаковочный материал для товаров широкого потребления и технических продуктов, колбасная оболочка (лакированный целлофан).

CELL POSITION = МЕСТОПОЛОЖЕНИЕ СОТ (или МЕСТОПОЛОЖЕНИЕ ЯЧЕЕК) – Cell Position is the location of a cell on board of a container vessel identified by a code for successively the bay, the row and the tier, indicating the position of each container on a vessel.

CELLULAR CONTAINERSHIP = СОТОВЫЙ КОНТЕЙНЕРОВОЗ (или ЯЧЕИСТЫЙ КОНТЕЙНЕРОВОЗ) – Cellular Containership is a vessel designed to carry standard freight containers in cells formed by a system of guides. The vessel hatch covers are specially arranged to carry several tiers of containers. Such vessels usually cannot carry other cargo without undergoing major conversion work.

CELLULAR VESSEL = СОТОВОЕ СУДНО (или ЯЧЕИСТОЕ СУДНО, или ЦЕЛЛЮЛЯРНОЕ СУДНО) – Cellular Vessel is a ship designed and constructed for the stowage of containers in vertical stacks, i.e. cells (containership). A vessel specially designed, built, and equipped for the transport of containers. Cellular Vessel is a vessel designed with internal ribbing to permit the support of stacked containers. / с внутренним оребрением для.

CELLULASE = ЦЕЛЛЮЛАЗА – The story of Cellulase:- for many years, the development of laundry detergent enzymes was predominantly focused on the removal of soils and stains. Our research confirms that consumers do indeed need an effective soil and stain-removal detergent. However, it also reveals other laundry related concerns amongst consumers:- softer fabrics and for garments to retain their bright colors after washing. Since 1983, it has been known that cellulase, a relatively new class of enzymes, might possess a performance mechanism to satisfy such consumer needs. The development of cellulase has allowed to improve the overall appearance of cotton garments and it preserves the smooth surface and bright colors. It can even revive that have become dull, faded and fuzzy after multiple washing and wearing. This is done by preventing formation of fuzz on the fabric surface. Cotton fabrics thus look cleaner and softer. The mechanism of this cellulase can be explained by its reaction to cotton fibers. After textiles are washed and dried many times, small micro fibrils form on the surface of the cellulose fibers. The micro fibrils give the fibers a hairy or fuzzy look. These tiny 'hairs' disperse incoming light, making the fabric colors look dull. Cellulase is an enzyme that breaks down cellulose. Cellulase is an enzyme that catalyzes the breakdown of cellulose. Cellulase enzymes are used for de-pilling and defibrillation of cotton fabrics. They can also be used to permanently soften cotton fabrics, as an aid in or replacement for stone washing of denim, and in methods for 'peaching' cotton fabrics. These enzymes are usually very difficult for the textile artist to obtain. / и разводы (или потёки). Под Целлюлазой понимается фермент, расщепляющий целлюлозу. Благодаря наличию целлюлазы некоторые микроорганизмы и отдельные Виды Беспозвоночных (Древоточцы, Черви) могут усваивать клетчатку. Травоядные Животные переваривают её за счёт целлюлазы микрофлоры кишечника. Целлюлаза, фермент класса гидролаз. Расщепляет полисахарид целлюлозу (клетчатку) с образованием глюкозы или дисахарида целлобиозы. Содержится в проросшем зерне, во многих Бактериях, Грибах (особенно активен в Домовых Грибах, развивающихся на древесине); имеется у некоторых Животных, питающихся древесиной (Корабельный Червь, Древоточцы). Способность Жвачных Животных переваривать клетчатку обусловлена присутствием в их желудке (главным образом в рубце) симбиотических микроорганизмов, выделяющих целлюлазу.

CELLULOSE = ЦЕЛЛЮЛОЗА (или КЛЕТЧАТКА) – Cellulose is a material derived from the cell walls of certain plants. Cellulose is used in the production of many vegetable fibers, as well as being the major raw material component used in the production of the manufactured fibers of acetate, rayon, and triacetate. The carbohydrate that is the principal constituent of wood. It forms the framework of wood cells. Cellulose is the major constituent of plant cell walls and probably the most abundant organic substance on earth with about 1 011 tons synthesized each year. Cellulose consists of beta-D-glucose units linked together with beta-1,4' linkages (compare with starch) into very long, high molecular weight polysaccharide molecules (typically up to several million kDa). Up to 50% of the carbon content of plants may be cellulose. Cellulose is a long-chain complex carbohydrate compound (polysaccharide) with the general formula $(C_6H_{12}O_6)n$. It is the chief substance forming cell walls and woody parts of plants. Cellulose is a polymer of a very large numbers of units, each of the general formula $C_6H_{10}O_5$. Cellulose is a structural polysaccharide made by plants. Essentially, units very similar to glucose are assembled into huge molecules that form strong fibers. Among cellulose textiles are Cotton, linen, Ramie, Jute and Hemp. Rayon is a man-made cellulose fiber (actually regenerated cellulose – natural cellulose is the starting material). Each unit of the cellulose molecule has a number of hydroxyl (–OH) groups. These are the binding sites for reactive dyes. Cellulose is a carbohydrate which is the chief component of the cell walls of plants. Cellulose is found in wood and in Cotton, linen, Jute, Hemp, and all of the bast, leaf, and stem fibers. It is a basic raw material in the manufacture of rayon, acetate, and triacetate fibers. Cellulose is the naturally occurring polymer (giant molecule) that forms the solid framework of plants. Cellulose from wood pulp is the base for rayon and acetate, both of which are man-made fibers. Cotton is more than ninety percent cellulose before it is cleaned (scoured). See also Acetate, Cotton, and Rayon. Cellulose is an organic compound, a polysaccharide consisting of a linear chain of several hundred to many thousands of β(1-4) linked D-glucose units. Cellulose is an important structural component of the primary cell wall of green Plants, many forms of Algae and the Oomycetes. Some Species of bacteria secrete it to form biofilms. Cellulose is the most abundant organic polymer on Earth. The cellulose content of cotton fiber is 90%. / Под Целлюлозой, от Французского слова Cellulose, от Латинского слова Cellula, означающее Комнатка или Клетка (в данном случае) или Клетушка, понимается клетчатка, $[C_6H_7O_2(OH)_3]_n$ высокомолекулярный углевод (полисахарид), образованный остатками глюкозы. Главная составная часть клеточных стенок Высших Растений, обусловливающая механическую прочность и эластичность растительных тканей. В коробочках Хлопчатника содержится 95–98% целлюлозы, в лубяных волокнах (Джут, Лён, Рами) – 60–85%, в стволовой древесине 40–55%, в зелёных листьях, траве – 10–25%. В природе разложение целлюлозы осуществляют организмы, имеющие целлюлазу. Техническую целлюлозу (волокнистый полуфабрикат, получаемый очисткой волокон растительных тканей от нецеллюлозных компонентов) применяют в производстве бумаги и картона, а также для химической переработки. При гидролизе целлюлозы образуются сахара, брожением которых получают этиловый спирт. Под Целлюлозой или Клетчаткой понимается один из самых распространённых природных полимеров (полисахарид); главная составная часть клеточных стенок Растений, обусловливающая механическую прочность и эластичность растительных тканей. Так, содержание целлюлозы в волосках семян Хлопчатника 97–98%, в стеблях Лубяных Растений (Лён, Рами, Джут) 75–90%, в древесине 40–50%, Камыше, Злаках, Подсолнечнике 30–40%. Обнаружена также в организме некоторых Низших Беспозвоночных. В организме целлюлоза служит главным образом строительным материалом и в обмене веществ почти не участвует. Целлюлоза не расщепляется обычными ферментами желудочно-кишечного тракта Млекопитающих (амилазой, мальтазой); при действии фермента целлюлазы, выделяемого микрофлорой кишечника Травоядных Животных, целлюлоза распадается до D-глюкозы. Биосинтез целлюлозы протекает с участием активированной формы D-глюкозы. Выделение целлюлозы из природных материалов основано на действии реагентов, растворяющих или разрушающих содержащиеся в растительных тканях нецеллюлозные компоненты (белки, жиры, воски, смолы, лигнин, а также полисахариды – спутники целлюлозы). Методы выделения зависят от типа растительного материала и назначения целлюлозы. Основные из них:- щёлочная варка (обработка растительных материалов разбавленным раствором едкого натра под давлением с последующей отбелкой – обработкой окислителями, например, гипохлоритом натрия применяемая главным образом для получения хлопковой целлюлозы; сульфитная варка (обработка под давлением водными растворами бисульфита кальция магния натрия или аммония, содержащими небольшое количество свободного SO2) и сульфатная варка (обработка под давлением водным раствором смеси едкого натра и сульфида натрия), используемые для выделения целлюлозы из древесины. Из соломы целлюлозу выделяют хлорно-щелочным методом (последовательной обработкой водным раствором едкого натра и хлором (Смотрите также Целлюлозно-Бумажная Промышленность). Структура И Свойства Целлюлозы:- Целлюлоза – волокнистый материал белого цвета, плотность 1.52–1.54 грамм на кубический сантиметр (г/см^3) (20 °C). Целлюлоза растворима в так называемом медно-аммиачном растворе (раствор амминкупрум (II)-гидроксида в 25%-ном водном растворе аммиака), водных растворах четвертичных аммониевых оснований, водных растворах комплексных соединений гидроокисей поливалентных

металлов (Ni, Co) с аммиаком или этилендиамином, щёлочном растворе комплекса железа (III) с виннокислым натрием, растворах двуокиси азота в диметилформамиде, концентрированной фосфорной и серной кислотах (растворение в кислотах сопровождается деструкцией целлюлозы). Макромолекулы целлюлозы построены из элементарных звеньев D-глюкозы, соединённых 1,4-b-гликозидными связями в линейные неразветвлённые цепи. Средняя степень полимеризации целлюлозы изменяется в широких пределах; например, для целлюлозы вискозного волокна она составляет 300–500, для целлюлозы хлопкового волокна и лубяных волокон – 10 000–14 000 (вискозиметрия. метод или по данным определения в ультрацентрифуге). Целлюлоза отличается значительной полидисперсностью по молекулярной массе; характер кривых молекулярно-массового распределения зависит от вида исходного целлюлозосодержащего материала и способа выделения из него целлюлозы. Целлюлозу обычно относят к кристаллическим полимерам. Для неё характерно явление полиморфизма, то есть наличие ряда структурных (кристаллических) модификаций, различающихся параметрами кристаллической решётки и некоторыми физическими и химическими свойствами; основными модификациями являются целлюлоза I (природная целлюлоза) и Целлюлоза II (гидратцеллюлоза). Целлюлоза имеет сложную надмолекулярную структуру. Первичный элемент её – микрофибрилла, состоящая из нескольких сотен макромолекул и имеющая форму спирали (толщина 35–100 Å, длина 500–600 Å и выше). Микрофибриллы объединяются в более крупные образования (300–1 500 Å), по-разному ориентированные в различных слоях клеточной стенки. Фибриллы ‘цементируются’ так называемым матриксом, состоящим из других полимерных материалов углеводной природы (гемицеллюлозы, пектина) и белка (экстенсина). Гликозидные связи между элементарными звеньями макромолекулы целлюлозы легко гидролизуются под действием кислот, что является причиной деструкции целлюлозы в водной среде в присутствии кислых катализаторов. Продукт полного гидролиза целлюлозы – глюкоза, эта реакция лежит в основе промышленного способа получения этилового спирта из целлюлозосодержащего сырья (смотрите Гидролиз Растительных Материалов). Частичный гидролиз целлюлозы протекает, например, при выделении её из растительных материалов и при химической переработке. Неполным гидролизом целлюлозы, осуществляемым таким образом, чтобы деструкция происходила только в малоупорядоченных участках структуры, получают так называемую микрокристаллическую ‘порошковую’ целлюлозу – белоснежный легкосыпучий порошок. В отсутствие кислорода целлюлоза устойчива до 120–150 °C; при дальнейшем повышении температуры природные целлюлозные волокна подвергаются деструкции, гидратцеллюлозные – дегидратации. Выше 300 °C происходит графитизация (карбонизация) волокна – процесс, используемый при получении углеродных волокон. Вследствие наличия в элементарных звеньях макромолекулы гидроксильных групп целлюлоза легко этерифицируется и алкилируется; эти реакции широко используются в промышленности для получения простых и сложных эфиров целлюлозы (смотрите Эфиры Целлюлозы). Целлюлоза реагирует с основаниями; взаимодействие с концентрированными растворами едкого натра, приводящее к образованию щёлочной целлюлозы (мерсеризация целлюлозы), – промежуточная стадия при получении эфиров целлюлозы. Большинство окислителей вызывает неизбирательное окисление гидроксильных групп целлюлозы до альдегидных, кето- или карбоксильных групп, и только некоторые из окислителей (например, йодная кислота и её соли) – избирательное (то есть окисляют OH-группы у определённых атомов углерода). Окислительной деструкции целлюлозу подвергают при получении вискозы (стадия предсозревания щёлочной целлюлозы); окисление происходит также при отбелке целлюлозы. Для устранения некоторых недостатков волокон из целлюлозы (невысокой эластичности, нестойкости к действию микроорганизмов, горючести) и придания им новых ценных свойств осуществляют модификацию целлюлозных материалов методами привитой полимеризации или обработкой тканей из целлюлозных волокон полифункциональными соединениями (например, метилольными производными мочевины, эпоксисоединениями). Таким образом получают малосминаемые ткани из целлюлозных волокон (главным образом хлопка), а также ионообменные, негорючие, гемостатические и бактерицидные материалы (Смотрите также Волокна Химические). Применение Целлюлозы:- Из целлюлозы производят бумагу, картон, разнообразные искусственные волокна – гидратцеллюлозные (вискозные волокна, медноаммиачное волокно) и эфироцеллюлозные (ацетатное и триацетатное – смотрите Ацетатные Волокна), плёнки (целлофан), пластмассы и лаки (смотрите Этролы, Гидратцеллюлозные Плёнки, Эфироцеллюлозные Лаки). Природные волокна из целлюлозы (хлопковое, лубяные), а также искусственные широко используются в текстильной промышленности. Производные целлюлозы (главным образом эфиры) применяют как загустители печатных красок, шлихтующие и аппретирующие препараты, стабилизаторы суспензий при изготовлении бездымного пороха и другого. Микрокристаллическую целлюлоза используют в качестве наполнителя при изготовлении лекарственных препаратов, как сорбент в аналитической и препаративной хроматографии. Целлюлоза ($(C_6H_{10}O_5)_n$, иногда называемая Клетчаткой, представляет собой высокомолекулярный полисахарид, являющийся главной составной частью клеточных стенок растений. Целлюлоза придаёт растительной ткани механическую прочность и эластичность и образует как бы скелет растения. Целлюлоза образуется в растениях в результате сложных биохимических превращений, начинающихся с фотосинтеза простейших углеводов; в конечном итоге эти превращения можно выразить суммарным уравнением:- $6nCO_2 + 5nH_2O \rightarrow (C_6H_{10}O_5)_n + 6nO_2$. В природе целлюлоза никогда не встречается в чистом виде. Волокна хлопка содержат 92–95% целлюлозы, в различных видах древесины содержание целлюлозы колеблется в пределах 40–60%. Важнейшими спутниками целлюлозы являются лигнин, гемицеллюлозы, пентозаны, пектиновые вещества, смолы и жиры. Способы отделения целлюлозы от спутников основываются на её весьма высокой стойкости к различным химическим воздействиям. Целлюлозу обычно выделяют, обрабатывая растительные материалы (хлопок-сырец, древесную щепу) растворами щёлочи (натронный и сульфатный способы) или бисульфита кальция (сульфитный способ) под давлением при температуре от 120 до 160 °C. Спутники целлюлозы при такой обработке растворяются. Наиболее чистые препараты целлюлозы получаются из лучших Сортов Хлопка путём последовательной обработки хлопковых волокон органическими растворителями и 1%-ным раствором NaOH в мягких условиях (в отсутствие кислорода воздуха). Содержание целлюлозы в таких препаратах достигает 99.85%. Попытки химического синтеза целлюлозы были пока безуспешны, однако она была выделена из плёнок, образованных биохимически in vitro бактериями Acetobacter xylinum, культивированными на водных растворах глюкозы, фруктозы и некоторых других сахаристых веществ. Интенсивно ведущиеся исследования механизма биосинтеза целлюлозы пока не привели к ясным результатам.

CELLULOSE ACETATE = АЦЕТАТ ЦЕЛЛЮЛОЗЫ (или АЦЕТИЛЦЕЛЛЮЛОЗА) – Cellulose Acetate is a cellulose in which most of the hydroxyl (–OH) groups of cellulose have been replaced with acetyl ($–OOCCH_3$) groups. Cellulose acetate is usually dyed with disperse dyes at a temperature of around 80 °C to 90 °C. It is quite easily damaged in alkaline conditions and loses its desirable lustre if boiled. / Щелочное (Alkaline).

CELLULOSE ACETATE AND CELLULOSE TRIACETATE FIBERS DYEING = КРАШЕНИЕ ВОЛОКОН ИЗ АЦЕТАТА ЦЕЛЛЮЛОЗЫ И ТРИАЦЕТАТА ЦЕЛЮЛОЗЫ – Cellulose Acetate (CA) and Cellulose Triacetate (CT) Fibers Dyeing:- in contrast to the other regenerated cellulose fibers, CA and CT are hydrophobic and therefore they can be dyed with disperse dyes under conditions which are very similar to those applying to Polyester (PES) fibers. Cellulose acetate is dyed by the exhaustion method with disperse dyes in the presence of non-ionic or anionic dispersing agents in weakly acidic conditions (pH 5–6). Dyeing is normally done at 80–85 °C. However, a series of less wetfast dyes already absorb onto the fiber at 50–60 °C, whereas more wetfast dyes require temperatures

up to 90 °C. Compared to CA, CT dyeing and finishing characteristics are more similar to purely synthetic fibers. CT, like CA, is dyed with disperse dyes in a weakly acidic medium in the presence of levelling auxiliaries. Applied dyeing techniques for CT are:- (i) batch dyeing process, usually at 120 °C, but if these conditions are not possible a dyeing accelerant (based on butyl benzoate or butyl salicylate) is required; and (ii) thermosol process.

CELLULOSE ACETATE FILTER = АЦЕТИЛЦЕЛЛЮЛОЗОВЫЙ ФИЛЬТР (или ФИЛЬТР ИЗ АЦЕТАТ ЦЕЛЛЮЛОЗЫ) – Cellulose Acetate Filter is a plastic film that eliminates UV-C radiation (wavelength less than 290 nm) and transmits UV-B and longer wavelengths. / Под Ацетилцеллюлозой или Ацетат Целлюлозой, $(C_6H_7O_2(OH)_{3-x}(OCOCH_3)_x)_n$, понимается продукт взаимодействия целлюлозы с уксусным ангидридом, хлористым ацетилом или кетеном; твёрдое вещество белого цвета. Термопластична, негорюча. Применяется в производстве ацетатного волокна, пластмасс, киноплёнки и другого.

CELLULOSE FIBERS DYEING = КРАШЕНИЕ ЦЕЛЛЮЛОЗНЫХ ВОЛОКОН – Cellulose Fibers Dyeing:- cellulose fibers can be dyed with a wide range of dyestuffs, namely:- (i) reactive dyes; (ii) direct dyes; (iii) vat dyes; (iv) sulphur dyes; and (v) azoic (naphtol) dyes.

CELLULOSE MEDIA = ЦЕЛЛЮЛОЗНАЯ СРЕДА – Cellulose Media is a filter material made from plant fibers. Because cellulose is a natural material, its fibers are rough in texture and vary in size and shape. Compared to synthetic media, these characteristics create a higher restriction to the flow of fluids.

CELLULOSIC FIBERS = ЦЕЛЛЮЛОЗНЫЕ ВОЛОКНА – A Cellulosic Fiber is the fiber composed of, or derived from, cellulose. Examples are cotton (cellulose), rayon (regenerated cellulose), acetate (cellulose acetate), and triacetate (cellulose triacetate). Cellulosic Fibers or cellulose fibers are the fibers produced form the cell walls of plants, i.e. cotton, hemp, ramie. All fiber of plant or vegetable origin. These fibers include natural fibers such as cotton, linen, and jute, and manmade fibers of wool pulp origin, such as rayon and acetate. Cellulosic Fibers are:- acetate, alginate, cupro, lyocell, modal, triacetate and viscose. Cellulose (vegetable) Fibers are:- (i) Bast Fibers (e.g., Banana, China Grass, Flax (Linen), Hemp, Jute, Kenaf, Lime Tree, Mallow, Nettle, Paco-Paco, Ramie (Rhea), Rosella, Sunn, Urena); (ii) Leaf Fibers (e.g., Agave, Banana, Bromelia, Caboga, Cantala, Henequen, Maguey, Manila Hemp, Mauritius Hemp, New Zealand 'Flax', Palm, Pineapple, Pita, Sisal, Yucca); and (iii) Seed Fibers (e.g., Coir, Cotton, Kapok, and Milkweed). Cellulosic Fibers are the fibers consisting of cellulose. / ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate). Целлюлозные Волокна – наиболее распространённые текстильные волокна, в основе которых лежит природный полимер целлюлоза. Все целлюлозные волокна делятся на природные и искусственные. Среди природных наибольшее значение имеют Хлопок и Лён (значительно реже используются Джут, Кенаф, Пенька, Рами, Сизаль). Эти волокна отличаются друг от друга по морфологическому, надмолекулярному строению, а также по количеству и составу примесей. Искусственные целлюлозные волокна производятся в условиях химических предприятий из высококачественной древесины. Древесную целлюлозу сначала растворяют с помощью какого-либо химического реагента (в зависимости от типа волокна), а затем раствор продавливают через фильеры и выходящие струи направляют в осадительную ванну, где они затвердевают и превращаются в волокно. Поперечное сечение волокна зависит в основном от условий производства. Искусственные волокна практически не имеют природных примесей. Все волокна растительного и животного происхождения. Эти волокна включают природные волокна, такие как джутовое, льняное и хлопковое волокно, и искусственные волокна, получаемые из шерстяной пульпы (wool pulp), такие как гидратцеллюлозное (rayon) и ацетатное (acetate) волокно. Природные (лубяные, хлопковые) и модифицированные волокна из целлюлозы используются в текстильной промышленности, в производстве бумаги, картона, лаков, пластмасс и прочего.

CELL WALL = КЛЕТОЧНАЯ СТЕНКА (или КЛЕТОЧНАЯ ОБОЛОЧКА, или ОБОЛОЧКА КЛЕТКИ) – Cell Wall is the rigid semi-solid layer surrounding a cell, protecting the interior from physical damage and resisting expansion from turgor pressure. Found in plants and many micro-organisms and constructed from a variety of materials:- (i) Plant cell walls are constructed from a matrix of insoluble polysaccharides including cellulose, hemicellulose and pectin. (ii) Algal cell walls contain cellulose and glycoproteins and a variety of other polysaccharides including alginic acid and sulphonated polysaccharides. Diatoms synthesise distinctive crystalline silica cell walls from orthosilicic acid. (iii) Fungal cell walls contain cellulose and chitin. (iv) Bacterial cell walls, especially those of Gram Positive species contain peptidoglycan, a polymer of N-acetyl muramic acid and archebacteria contain pseudopeptidoglycan N-acetyltalosaminuronic acid. / Под Клеточной Мембраной или Плазматической Мембраной или Плазмалеммой понимается биологическая мембрана, окружающая протоплазму растительных и животных клеток. Участвуют в регуляции обмена веществ между клеткой и окружающей её средой. Клеточная Стенка (оболочка) является неотъемлемым компонентом клеток растений и грибов и представляет собой продукт их жизнедеятельности. Она придаёт клеткам механическую прочность, защищает их содержимое от повреждений и избыточной потери воды, поддерживает форму клеток и их размер, а также препятствует разрыву клеток в гипотонической среде. Клеточная стенка участвует в поглощении и обмене различных ионов, то есть является ионообменником. Через клеточную оболочку осуществляется транспорт веществ. Клеточная стенка, формирующаяся во время деления клеток и их роста путём растяжения, называется первичной. После прекращения роста клетки на первичную клеточную стенку изнутри откладываются новые слои, и образуется прочная вторичная клеточная оболочка. В состав клеточной стенки входят структурные компоненты (целлюлоза у Растений и хитин у Грибов), компоненты матрикса (гемицеллюлоза, пектин, белки), инкрустирующие компоненты (лигнин, суберин) и вещества, откладывающиеся на поверхности оболочки (кутин и воск). Молекулы целлюлозы за счёт водородных связей объединяются в пучки – микрофибриллы. Переплетённые микрофибриллы составляют каркас клеточной оболочки. У большинства грибов микрофибриллы клеточной стенки состоят из хитина. Микрофибриллы погружены в матрикс клеточной стенки. Матрикс состоит из смеси различных химических веществ, среди которых преобладают полисахариды (гемицеллюлозы и пектиновые вещества). Гемицеллюлозы – это группа полисахаридов (полимеры пентоз и гексоз – ксилозы, галактозы, маннозы, глюкозы и другие). Молекулы гемицеллюлоз, как и целлюлозы, имеют форму цепи, но в отличие от последней их цепи короче, менее упорядочены и сильно разветвлены. Они легче растворяются и разрушаются ферментами. Пектиновые вещества – это полимеры, построенные из моносахаридов (арабинозы и галактозы), галактуроновой кислоты (сахарной кислоты) и метилового спирта. Длинные молекулы пектиновых веществ могут быть линейными или разветвлёнными. Молекулы пектиновых веществ содержат большое количество карбоксильных групп и поэтому способны соединяться с ионами Mg^{2+} и Ca^{2-}. При этом образуются клейкие, студнеобразные пектаты магния и кальция, из которых затем складываются срединные пластинки, скрепляющие стенки двух соседних клеток. Ионы двухвалентных металлов могут обмениваться на другие катионы (H^-, K^+ и так далее). Это обусловливает катионообменную способность клеточных оболочек. Пектиновыми веществами и пектатами богаты оболочки клеток многих плодов. Так как при их извлечении из оболочек и добавлении сахара образуются гели, пектины используют как желе-образующие вещества для изготовления мармелада и другого. Помимо углеводных компонентов, в состав матрикса клеточной стенки входит структурный белок экстенеин – гликонротеин, который по своему составу близок к межклеточным белкам животных – коллагенам. На долю матрикса приходится до 60% сухого вещества клеточной оболочки. Матрикс оболочки не просто заполняет промежутки между микрофибриллами, а образует прочные

химические (водородные и ковалентные) связи между макромолекулами и микрофибриллами, что обеспечивает прочность клеточной стенки, её эластичность и пластичность. Основным инкрустирующим веществом оболочки клеток растений является лигнин – полимер с неразветвлённой молекулой, состоящей из ароматических спиртов. Интенсивная лигнификация (пропитка слоёв целлюлозы лигнином) клеточных оболочек начинается после прекращения роста клетки. Лигнин может откладываться отдельными участками – в виде колец, спиралей или сетки, как это наблюдается в оболочках клеток проводящей ткани – ксилемы, или сплошным слоем, за исключением тех мест, где осуществляются контакты между соседними клетками в виде плазмодесм. Лигнин скрепляет целлюлозные волокна и действует как очень твёрдый и жёсткий каркас, усиливающий прочность клеточных стенок на растяжение и сжатие. Он же обеспечивает клеткам дополнительную защиту от физических и химических воздействий, снижает водопроницаемость. Содержание лигнина в оболочке достигает 30%. Инкрустация им клеточных оболочек приводит к их одревеснению, которое часто влечёт за собой отмирание живого содержимого клетки. Лигнин в сочетании с целлюлозой придаёт особые свойства древесине, которые делают её незаменимым строительным материалом. На клеточную оболочку могут откладываться также жироподобные вещества – суберин, кутин и воск. Суберин откладывается на оболочку изнутри и делает её практически непроницаемой для воды и растворов. В результате протопласт клетки отмирает и клетка заполняется воздухом. Такой процесс называется опробковением. Наблюдается опробковение оболочки клеток в покровных тканях многолетних древесных растений – перидерме, корке, а также в эндодерме корня. Поверхность эпидермальных клеток растений защищена гидрофобными веществами – кутином и восками. Предшественники этих соединений секретируются из цитоплазмы на поверхность, где и происходит их полимеризация. Слой кутина обычно пронизан полисахаридными компонентами (целлюлозой и пектином) и образует кутикулу. Воск часто откладывается в кристаллической форме на поверхности частей растений (листьев, плодов), образуя восковой налёт. Кутикула и восковой налёт защищают клетки от повреждений и проникновения инфекции, уменьшают испарение воды с поверхности органов. В оболочках эпидермальных клеток некоторых растений (злаков, осок и других) накапливается большое количество минеральных веществ (минерализация), в первую очередь карбоната кальция и кремнезёма. При минерализации листья и стебли растений становятся жёсткими, твёрдыми и в меньшей степени поедаются животными. Таким образом, клеточная стенка играет важную роль в жизни клеток растений и грибов и выполняет ряд специфических функций.

CELSIUS TEMPERATURE SCALE = ТЕМПЕРАТУРНАЯ ШКАЛА ЦЕЛЬСИЯ (или ТЕМПЕРАТУРНАЯ ШКАЛА СЭЛЬСИУСА) – Celsius Temperature Scale is a scale based on 0° for the freezing point of water and 100° for the boiling point of water. Invented in 1742 by the Swedish astronomer Anders Celsius (born on 1701-November-27 in Uppsala, Sweden and died on 1744-April-25 in Uppsala), it is sometimes called the Centigrade Scale because of the 100-degree interval between the defined points. The following formula can be used to convert a temperature from its representation on the Fahrenheit (°F) scale to the Celsius (°C) value:- °C = 5/9 x (°F − 32). The Celsius scale is in general use wherever the metric system of units has been adopted, and it is used in scientific work everywhere. Also known as Centigrade Temperature Scale. See also Fahrenheit Temperature Scale. Celsius Temperature Scale is a temperature scale devised by Anders Celsius in which the freezing point of H_2O or melting point of ice is set at 0 °C and the boiling point of water is set at 100 °C. Also called Centigrade. Anders Celsius is a Swedish astronomer who invented the Celsius temperature scale (often called the Centigrade Scale). Celsius was professor of astronomy at Uppsala University from 1730 to 1744, and in 1740 he built the Uppsala Observatory. In 1733 Celsius published a collection of 316 observations of the aurora borealis, or northern lights, made by himself and others from 1716 to 1732. He advocated the measurement of an arc of a meridian in Lapland and in 1736 took part in an expedition organized for that purpose, which verified Isaac Newton's theory that the Earth is somewhat flattened at the poles. In 1742 he described his thermometer in a paper read before the Swedish Academy of Sciences. His other works include Dissertatio de Nova Methodo Distantiam Solis a Terra Determinandi (1730; 'A Dissertation on a New Method of Determining the Distance of the Sun from the Earth') and De Observationibus pro Figura Telluris Determinanda in Gallia Habitis, Disquisitio (1738; 'Disquisition on Observations Made in France for Determining the Shape of the Earth'). 1 degree Celsius (°C) equals minus 32 plus five-ninths of the number of degrees Fahrenheit (°F). Celsius Scale is a temperature scale which places the freezing point of water at zero degrees, and the boiling point of water 100 degrees; formerly called Centigrade. To convert to Fahrenheit:- °F = (°C x 9/5) + 32. To convert from Fahrenheit:- °C = (°F – 32) x 5/9. / Шведский астроном и физик Андэрш Сэльсиус (известный в России как Андерс Цельсий (Anders Celsius); родился 27 Ноября 1701 и умер 25 Апреля 1744 в Уппсала, Швеция) – участник Лапландской экспедиции по измерению дуги меридиана (1736–37). В 1742 предложил температурную шкалу, названную его именем. Под Температурной Шкалой Цельсия понимается температурная шкала, в которой 1 градус (1 °C) равен 1/100 разности температур кипения воды и таяния льда при атмосферном давлении. Точка таяния льда принята за 0 °C, кипения воды – за 100 °C. Названа в честь Андерса Цельсия.

CEM = COLLEGE OF ECONOMICS AND MANAGEMENT

CEN = COMITÉ EUROPÉEN DE NORMALISATION

CENARGEN = CENTRO NACIONAL DE RECURSOS GENÉTICOS = NATIONAL CENTRE FOR GENETIC RESOURCES

CENELEC = COMITÉ EUROPÉEN DE NORMALISATION ELECTROTECHNIQUE

CENRADERU = CENTRE NATIONAL DE LA RECHERCHE APPLIQUE AU DEVELOPPEMENT RURAL = NATIONAL RESEARCH CENTER FOR RURAL DEVELOPMENT

CENSUS DIVISIONS = ЦЕНЗОВЫЕ ПОДРАЗДЕЛЕНИЯ (или ПОДРАЗДЕЛЕНИЯ ЦЕНЗА, или ПОДРАЗДЕЛЕНИЯ ПЕРЕПИСИ) – Census Divisions:- the nine geographic divisions of the United States established by the Bureau of the Census, US Department of Commerce, for the purpose of statistical analysis. The boundaries of Census divisions coincide with state boundaries. The Pacific Division is subdivided into the Pacific Contiguous and Pacific Noncontiguous areas.

CENTA = CENTRO NACIONAL DE TECNOLOGIA AGROPECUARIA

CENTERING MARK = ОТМЕТИНА ОТ ЦЕНТРОВАНИЯ (или ЦЕНТРОВКИ, или ЦЕНТРИРОВАНИЯ) – Centering Mark:- four centering marks shall be provided in order to facilitate the positioning of the drawing when reproduced. The form of centering marks may be chosen freely. They should be indicated by continuous lines starting at the grid reference border and extand 10 mm beyond the drawing frame. The form of centering marks may be chosen freely. See also Clip Mark. / Центрирующие Метки; Отметки От Игл; Отметки От Сушильно-Ширильной Машины; Отметки От Ширильной Рамы (centering marks; pin marks; stenter marks; tenter marks):- порок заключительной отделки ткани в виде мелких отверстий на поверхности полотна, в которых нити деформированы или оборваны. Примечание:- этот порок возникает из-за неправильной регулировки сушильно-ширильной машины.

CENTER LOOP = ЦЕНТРОВАЯ ПЕТЛЯ – Center Loop:- warp and weft loop fabrics. See also Kink. / Смотрите также Петля или Сукрутина (Kink).

CENTER OF DISTRIBUTION = ЦЕНТР РАСПРОСТРАНЕНИЯ – Center Of Distribution is a center of origin; the hypothesized geographical area from which any organism or species has spread.

CENTER OF GRAVITY = ЦЕНТР ТЯЖЕСТИ – Center Of Gravity is the point of equilibrium of the total weight of a containership, truck, train or a piece of cargo. The fixed physical center of the total combined weight of the container, its cargo, or center of the mass. / Под Центром Тяжести понимается точка, неизменно связанная с твёрдым телом и через которую проходит равнодействующая сил тяжести, действующих на частицы этого тела при любом положении тела в пространстве. У однородного тела, имеющего цетр симметрии (круг, куб, шар и так далее), центр тяжести находится в центре симметрии тела. Положение центра тяжести твёрдого тела совпадает с положением его центра масс. Центр масс или центр инерции тела (системы материальных точек), точка, характеризующая распределение масс в теле или механической системе. Понятие центра массы отличается от понятия о центре тяжести тем, что последнее имеет смысл только для твёрдого тела, находящегося в однородном поле тяжести.

CENTER TO SELVEDGE = ОТ ЦЕНТРА К КРОМКЕ – Center To Selvedge:- change in shade from center to selvedge. Shade of the fabric is not same in the centre as compared to the selvedge. Dyeing defect. / Порок или Дефект крашения.

CENTI = САНТИ – Centi:- hundredth. / Под Санти..., от Французского слова Cent, от Латинского слова Centum, означающее Сто, понимается приставка для образования наименований дольных единиц, по размеру равных 1/100 исходных единиц. Обозначения:- Русское с, международное c. Примеры:- 1 сантиметр (см) = 0.01 метра (м); 1 сантиСтокс (сСт) = 0.01 Стокса.

CENTIMORGAN = САНТИМОРГАН (или САНТИМОРГЭН) – CentiMorgan (cM) is the unit of genetic separation used in genetics and biotechnology. If two locations on a chromosome have a 1% probability of being separated during recombination in a single generation, then the distance between those locations is one centiMorgan. In humans, the centiMorgan is approximately equal to one million base pairs. The unit honors the pioneering American geneticist Thomas Hunt Morgan (1866–1945), who received the 1933 Nobel Prize in Medicine for his discoveries concerning the role played by the chromosome in heredity. CentiMorgan (cM) is the unit of recombination. Named after an American evolutionary biologist, geneticist and embryologist Thomas Hunt Morgan (1866-September-25 – 1945-December-04). One cM is equivalent to one percent recombination. / СантиМорган:- в качестве единицы для измерений генетических расстояний используется такое расстояние, на котором частота рекомбинантных гамет составляет один процент. Эта единица называется в честь Xxxxx Моргэна (или Томаса Ханта Моргана; 1866–1945) сантиМорганом (cM). Таким образом, утверждение, что генетическое расстояние между локусом ‘A’ и локусом ‘B’ равно 20 cM, означает, что частота рекомбинантных потомков в анализирующем скрещивании будет равна 20%. Генотип рекомбинантного и нерекомбинантного потомства зависит от генотипа родителей. Например, если бы в приведённом выше примере аллель ‘A’ находился в одной хромосоме с аллелем ‘B’, то рекомбинантными оказались бы особи с фенотипом ‘A, B’ и ‘не A, не B’. При этом количественное соотношение между рекомбинантными и нерекомбинантными потомками не должно изменяться.

CENTINEWTON = САНТИНЬЮТОН – CentiNewton (cN) is a metric unit of force equal to 0.01 newton. This unit has some popularity in engineering as a substitute for the gram of force (gf), since it equals about 1.019 72 gf (about 0.036 ounces of force in the English system). In the textile industry, the breaking strength of fibers is commonly expressed in centiNewtons per tex. CentiNewton (cN), it is a unit of force used to measure the strength of a textile yarn. See also Tenacity. / СантиНьютон (cH), единица измерения прилагаемого усилия при измерении разрывной нагрузки текстильной пряжи. Смотрите также (Удельная) Прочность (Tenacity). Ньютон, единица силы в Международной Системе Единиц СИ. Сила, сообщающая телу массой 1 кг ускорение 1 м/с^2 в направлении действия силы. Названа в честь Английского математика, механика, астронома и физика Сэра Исаака Ньютона (Sir Isaac Newton; 1643–1727). Обозначение:- H (N). 1 Ньютон (H) = 10^5 дин = 0.102 килограмма·силы (кгс). Санти, от Французского слова Cent, от Латинского слова Centum, означающее Сто, служит приставкой для образования наименования десятичной дольной единицы, соответствующая множителю 10^{-2}. Обозначение:- c (c). Примером образования дольных единиц является и .

CENTIPOISE = САНТИПУАЗ – CentiPoise (cP) is a unit of absolute viscosity. 1 centiPoise = 0.01 Poise. See also Dynamic Viscosity, Poise, and Viscosity. / Динамическая Вязкость (Dynamic Viscosity) η (входит в виде коэффициента пропорциональности в формулу Закона Ньютона), единицей которой в Международной Системе Единиц, так называемой системе СИ (или SI по первым буквам первых двух слов полного Франкоязычного наименования Système International d’Unités; введена в действие в бывшем Союзе Советских Социалистических Республик (СССР) с 01 Января 1963 для предпочтительного применения) является Паскаль-секунда (Па·с), в Англоязычных странах для обозначения динамической вязкости и в Системах Единиц СГС (системы единиц физических величин lmt (где l – длина, m – масса, t – время), в которых приняты три основные единицы:- сантиметр (см) – единица длины, грамм (г) – единица массы и секунда (с) – единица времени; отсюда и название системы по первым буквам названий этих трёх единиц) использовалась устаревшая и более не подлежащая применению единица измерения Пуаз (П (P); на Французском Poise, от имени Французского физика и физиолога Жона Луи Мари Пуазёйя (или Пуазёйля; Jean Louis Marie Poiseuille; 1799–1869)). 1 П = 0.1 Па·с. Чаще использовалась дольная единица – сантиПуаз (сП); 1 сП = 1 мПа·с. Чем гуще жидкость, тем выше её вязкость. Международные производители смазочных масел до сих пор используют в основном единицу измерения Пауз (П), несмотря на то, что в настоящее время все страны мира официально перешли на использование единиц измерений системы СИ.

CENTISTOKE = САНТИСТОКС – CentiStoke (cSt) is a unit of kinematic viscosity. 1 centiStoke = 0.01 Stoke. CentiStokes is a common metric unit of kinematic viscosity equal to 0.01 Stokes or 1 mm^2/s. The viscosity of lubricating oils and many other liquids is frequently stated in centiStokes. Although the centiStokes is not an SI unit it is likely to remain in use, since it provides a convenient and traditional name for an SI-appropriate quantity (1 mm^2/s). The older symbol cS should not be used for this unit, since S is now the symbol for the Siemens. See also Kinematic Viscosity, Stoke, and Viscosity (2). Measure of fuel volatility or viscosity, similar to seconds. / Единица измерения испаряемости топлива или кинематической вязкости. Стокс – устаревшая и более не подлежащая применению единица кинематической вязкости (Kinematic Viscosity) ν (ν = η/ρ, где ρ – плотность жидкости или газа) в так называемых Системах Единиц СГС, но до сих пор используется в Англоязычных странах. Была названа в честь Английского физика Сэра Дьжодьжа Гейбриэла Стокса (Sir George Gabriel Stokes; 1819–1903). Обозначение:- Ст (St или S). 1 Ст = 1 см^2/с = 10^{-4} м^2/с. Чаще использовалась дольная, в 100 раз меньшая единица – сантиСтокс (сСт). 1 сСт = 1 мм^2/с = 10^{-6} м^2/с. Чем гуще жидкость, тем выше её вязкость. Международные производители смазочных масел до сих пор используют в основном единицу измерения Стокс (Ст), несмотря на то, что в настоящее время все страны мира официально перешли на использование единиц измерений Международной Системы Единиц, так называемой системы СИ (или SI по первым буквам первых двух слов полного Франкоязычного наименования Système International d’Unités; введена в действие в бывшем Союзе Советских Социалистических Республик (СССР) с 01 Января 1963 для предпочтительного применения). Санти, от Французского слова Cent, от Латинского слова Centum, означающее Сто, служит приставкой для образования наименования десятичной дольной единицы, соответствующая множителю 10^{-2}. Обозначение:- c (c). Примером образования дольных единиц является и 1 сантиСтокс (сСт) = 0.01 Стокса.

CENTNER = ЦЕНТНЕР – (1) Centner is the English name for a German weight or mass unit, the zentner, equal to 50 kilograms or about 110.231 pounds. The name centner should not be used for the cental. / Центнер – это Английское название Немецкой меры веса или массы центнера (zentner), равной 50 килограммам или приблизительно 110.231 фунтам. Под Центнером, от Немецкого слова Zentner от Латинского Centenarius, означающий 100 единиц, Centum, означающий Сто, понимается внесистемная единица массы. Обозначение:- ц. Различают:- (i) метрический центнер, равный 100 килограммам (кг); (ii) Британский длинный центнер, равный 112 Британским фунтам или 50.802 3 килограммам; и (iii) Британский короткий центнер, равный 100 Британским фунтам или 45.359 2 килограммам.

(2) Centner is a Russian weight or mass unit equal to 100 kilograms or approximately 220.462 3 pounds. This centner, also used in Ukraine and the other former Soviet republics, is equal to the decitonne and to the metric quintal. It is twice the size of the centner (1) used in Western Europe. / Центнер – Российская мера веса или массы, равная 100 килограммам или ориентировочно 220.462 3 фунтам. Этот центнер, используемый также в Украине и других странах бывшего Советского Союза, равен децитонне и метрическому квинталу. Он в два раза больше значения центнера (1), используемого в Западной Европе. Центнер, от Немецкого слова Zentner от Латинского слова Centum, означающее Сто, кратная единица массы в Международной Системе Единиц СИ, равная 100 килограммам (кг).

CENTRAL = ЦЕНТРАЛЬНОЕ – Central:- positioned at or near the centre of an area, as opposed to being peripheral in position. A spine originating in the centre of an areole as opposed to those growing around the edge of the areole.

CENTRAL ACCOUNTING = ЦЕНТРАЛИЗОВАННЫЙ БУХГАЛТЕРСКИЙ УЧЁТ – Central Accounting is a facility is that is operated by the Corporation of Lloyd's whereby sums due to and from individual Lloyd's brokers and syndicates are processed centrally and their accounts debited and credited on a net basis regularly. Urgent one off payments may be made more quickly.

CENTRAL APPALACHIAN COAL = ЦЕНТРАЛЬНОАППАЛАЧСКИЙ УГОЛЬ – Central Appalachian Coal (CAPP) is coal produced in the Central Appalachian region comprised of the counties located in southern West Virginia, eastern Kentucky, southwest Virginia, and eastern Tennessee. West Virginia and Kentucky are considered the two largest coal producers. Production by both states represented 89% of the region's coal production in 2008. Central Appalachian coal is produced as steam coal used to generate electricity, and metallurgical coal (also known as 'Met' Coal) used primarily to manufacture steel. Central Appalachian met coal is high-grade bituminous coal (high in energy content, 12 500 btu/lb, and low impurities). Central Appalachian steam coal is generally high-grade bituminous coal as well, and some can be sold as met coal. Central Appalachian coal dominates the US met coal market, and has a major share on coal exports to the rest of the world, with little competition. Therefore, the price of met coal is largely driven by demand for the resource. In the case of steam coal, there is more competition and prices are determined by cost of production. Central Appalachian coal is traded at the NYMEX® under ticker symbol QL. Contract size is 1 550 tons quoted in US Dollar and Cents per ton. Settlement type is physical. It is also traded ah the ICE Europe under ticker symbol UCA. Contract size is 1 550 tons quoted in US Dollar and Cents per ton. Settlement type is physical. Central Appalachian Coal (CAPP) refers to the spot prices for Central Appalachian coal, the most widely referenced prices for eastern coal in the United States. Coal producers, electric utilities, merchant generators, non-utility industrial coal users, and other energy marketers use CAPP spot prices as a benchmark in both physical and financial transactions for short-term and long-term contracts. Changes in CAPP spot prices can affect fuel procurement and power dispatch decisions when compared to costs of others fuels, such as natural gas. Why does this matter? The economics of fuel switching for power generation have become a critical driver of both natural gas and electricity prices over recent years. / .

CENTRAL APPLICATION FOR SETTLEMENT, CLEARING AND DEPOSITARY EXPANSION = ЦЕНТРАЛЬНОЕ ПРИЛОЖЕНИЕ ДЛЯ РАСЧЁТА, КЛИРИНГА И ДЕПОЗИТАРНОЙ ЭКСПАНСИИ – Central Application For Settlement, Clearing and Depositary Expansion (CASCADE) is the securities clearing system of Clearstream Banking AG, Frankfurt (CBF). The system comprises order placement, matching, settlement services and regulation for securities and cash settlement of the over-the-counter (OTC) business as well as Eurex® surplus deliveries in collective custody. Regulation in securities and cash for trades in spot trading (XETRA®, floor trading) is also possible in the system. / Ойрэкс® или Юрэкс®. Ксэтра® (Xetra®).

CENTRAL BALANCE SHEET DATA OFFICES = ЦЕНТРАЛЬНЫЕ УПРАВЛЕНИЯ ПО ДАННЫМ БАЛАНСОВЫХ ОТЧЁТОВ – In nine Member States there is a routine collection of detailed accounting data carried out by central units known as Central Balance Sheet Data Offices (CBSO). These units can form part of the national statistical institute (NSI), part of the national bank, or be independent. The CBSO European Committee has set up a sub-group (known as WG III) to examine the impact of the International Accounting Standards (IAS) on their work.

CENTRAL BANK = ЦЕНТРАЛЬНЫЙ БАНК – Central Bank is an institution that injects money into the economy and is responsible for a country's or currency area's monetary policy. In Germany, the Deutsche Bundesbank. Since 1999-January-01, the Frankfurt-based European Central Bank (ECB) has taken on the responsibilities of the central banks. Policy instruments of a central bank are, among other things, interest rate policy (discount and Lombard rates), lending policy, minimum reserve policy (minimum reserve for banks), open market policy (buying and selling bonds) and intervention (foreign exchange market). Central Bank is the principal monetary authority of a nation, which performs several key functions, including issuing currency and regulating the supply of credit in the economy. The Federal Reserve is the central bank of the United States. Central Bank is an institution which – by way of a legal act – has been given responsibility for conducting the monetary policy for a specific area. A bank which is responsible for controlling a country's monetary policy. It is normally the issuing bank and controls bank licensing, and any foreign exchange control regime. Central Bank is a central monetary authority of a nation, which serves as the government's bank and the banker's bank. The central bank controls the issuance of bank notes and regulates credit and interest rates. Its primary role is to control the money supply in a manner consistent with the government's economic objectives. As the central component in the banking system, it regulates liquidity, acts as a clearing house for banking transactions and as a correspondent with foreign central banks. In the United States, the Federal Reserve serves as the central bank. Also known as Note-Issuing Bank. / Центральный Банк или государственный банк – банк страны, который:- (i) осуществляет эмиссию; (ii) проводит кредитно-денежную политику, включая операции на открытом рынке (open market operations); (iii) владеет депозитами, представляющими собой резервы остальных банков; и (iv) осуществляет сделки, направленные на облегчение ведения бизнеса, и защищает интересы широкой общественности. В США функции центрального банка осуществляет Федеральная Резервная Система (Federal Reserve System). Центральный Банк:- в большинстве стран посредством центрального банка правительство регулирует денежно-кредитную систему, включая деятельность коммерческих банков. К обязанностям центральных банков относится печать банкнот и выполнение прямых действий на рынке, призванных стабилизировать экономику страны и обеспечивать её рост. К основным понятиям кредитно-денежной политики относятся:- количество денег в обращении, процентные ставки, доступность кредита, размер резервов иностранной валюты, а также курс обмена валют внутри страны. Примите во внимание тот важный факт, что время от времени центральные банки оказывают косвенное влияние на рынок иностранной валюты и обменные курсы иностранных валют. Для достижения желаемых денежно-кредитных целей центральный банк имеет в своем распоряжении целый арсенал

средств, таких как:- выпуск правительственных облигаций, изменение размеров резервов иностранной валюты, внесение изменений в процентные ставки и воздействие на ликвидность коммерческих банков. Центральный банк Соединённых Штатов называется Федеральной Резервной Системой (или кратко – Федеральным Резервом). Центральным банком Европы является Европейский Центральный Банк (ЕЦБ). Центральный Банк – главный государственный банк страны, наделённый особыми функциями, в особенности правом эмиссии денежных знаков и регулирования деятельности коммерческих банков. Центральный банк является 'банком банков', органом, помогающим государству, правительству налаживать денежное обращение, управлять бюджетом. Основными функциями являются эмиссия денег, хранение золотовалютных резервов государства, кредитование и ведение счетов коммерческих банков и правительства, регулирование денежного обращения, контроль за деятельностью кредитных учреждений.

CENTRAL BANK INDEPENDENCE = НЕЗАВИСИМОСТЬ ЦЕНТРАЛЬНОГО БАНКА – Central Bank Independence:- legal provision which guarantees that a central bank can carry out its statutory tasks and duties without political interference. Article 108 of the EC Treaty establishes the principle of central bank independence for the Euro area.

CENTRAL BANK INTERVENTION = ИНТЕРВЕНЦИЯ ЦЕНТРАЛЬНОГО БАНКА – Central Bank Intervention is the buying or selling of currency, foreign or domestic, by central banks in order to influence market conditions or exchange rate movements. Central Bank Intervention:- currency intervention occurs when one central bank or more buys (or sells) a currency in the foreign exchange market in order to raise (or lower) its value against another currency. Intervention usually happens when a nation's currency is undergoing excessive downward or upward pressure from market players – usually speculators. A significant decline in the value of a currency has the following drawbacks:- (i) raises the price of imported goods and services and triggers inflation. This will push the central bank to raise interest rates, which will likely hurt asset markets and economic growth. This could also lead to additional losses in the currency. (ii) A nation with a large current account deficit (buys more goods and services than it sells from abroad) that is dependent upon foreign inflows of capital may undergo a dangerous slowdown in the financing of its deficit, which will require rising interest rates to maintain the value of the currency and, could risk serious repercussions on growth. (iii) Pushes up the exchange rate of the nation's trading partners and drive up the price of their exports in the global market place. This will also trigger serious economic slowdown, especially for export-dependent countries. Looking at the other side of the coin, central banks also intervene to stem excessive appreciation of their currency, which makes exports less attractive and weighs on the balance of payments. Means and Forms of Intervention:- foreign exchange (FX) intervention takes several shapes and forms. Here are the most common:- (1) Intervention:- also known as 'Jawboning', this occurs when officials from the Ministry of Finance (Treasury), central bank or other politicians 'talk up' (or talk down) a currency. This is either done by threatening to commit real intervention (actual buying/selling of currency), or simply by indicating that the currency is undervalued or overvalued. This is the cheapest and simplest form of intervention because it does not involve the use of foreign currency reserves. Nonetheless, its simplicity doesn't always imply effectiveness. A nation whose central bank is known to intervene more frequently and effectively than other nations is usually more effective in verbal intervention. (2) Operational Intervention:- this is the actual buying or selling of a currency by a nation's central bank, usually on behalf of the Finance Ministry or Treasury. (3) Concerted Intervention:- this happens when several nations co-ordinate in driving up or down a certain currency using their own foreign currency reserves. Its success is dependent upon its breadth (number of countries involved) and depth (total amount of the intervention). Concerted intervention could also be verbal when officials from several nations unite in expressing their concern over a continuously falling/rising currency. (4) Sterilized Intervention:- when a central bank sterilizes its interventions, it offsets these actions through its monetary policy practices (open market operations or interest rate targets adjustments). Selling a currency can be sterilized when the central bank sells money market instruments (short term securities) to drain back the excess funds in circulation as a result of the intervention. FX interventions only go unsterilized (or partially sterilized) when action in the currency market is in line with monetary and foreign exchange policies, i.e. when the case for intervention is urgent. This occurred in the concerted interventions of the 'Plaza Accord' in September 1985 when G7 collaborated to stem the excessive rise of the Dollar by buying their currencies and selling the greenback. The action eventually proved to be successful because it was accompanied by supporting monetary policies. Japan raised its short-term interest rates by 200 basis points (bps) after that weekend, and the 3-month euroyen rate soared to 8.25%, making Japanese deposits more attractive than their US counterpart. Another example of unsterilized intervention was in February 1987 at the 'Louvre Accord' when the G7 joined forces to stop the plunge of the Dollar. On that occasion, the Federal Reserve engaged in a series of monetary tightening, pushing up rates by 300 bps to as high as 9.25% in September. Impact on Currency Markets:- before listing the determinants of a successful FX intervention, it is important to define 'success'. Thus, a central bank that spends about USD5 billion (medium-size) on intervention and manages to raise/lift the value of its currency by about 2% against the major currencies over the next 30 minutes is said to be successful. Even if the currency ends up losing its gains over the next two trading sessions, the proven ability of that central bank to move the market in the first place gives it some kind of respect for the next time it 'threatens' to step in. (1) Size Matters:- the magnitude of the intervention is usually proportional to the resulting move of the currency. Central banks equipped with substantial foreign currency reserves (usually denominated in dollars outside the US), are those that command the most respect in FX interventions. As of Q3 2003, the three central banks with the highest amount of FX reserves were:- the Bank of Japan (USD550 billion); the Bank of China (USD346 billion) and European Central Bank (USD330 billion). (2) Timing:- successful FX interventions depend on timing. The more surprising the intervention, the more likely it is that market players are caught off-guard by a large inflow of orders. In contrast, when intervention is largely anticipated, the shock is better absorbed and the impact is less. (3) Momentum:- in order for the 'timing' element to work best, intervention is more ideally implemented when the currency is already moving in the intended direction of the intervention. The large volume of the FX market (USD1.2 trillion per day) dwarfs any intervention order of USD3–5 billion. So central banks usually try to avoid intervening against the market trend, preferring to wait for more favorable currents. This may be done through verbal posturing (jawboning), which sets the general tone for a more fruitful action when the actual intervention begins. (4) Sterilization:- central banks engaging in monetary policy measures in line with their FX actions (unsterilized intervention) are more likely to trigger a more favorable and lasting change in the currency. Implications for Traders:- during central bank interventions, currency traders are advised to take extra care when submitting orders and selecting stop losses. It is not advisable to trade against the currents of intervention. A single sell order by a central bank for instance, could trigger a series of stop loss orders by players that will exacerbate the selling and create gapping in the market. If you insist on trading against the market, then your stop loss orders must be somewhat closer to your positions than at normal market conditions. Be aware of levels of support. It is near these points (usually below them) at which central banks step in to lift currencies.

CENTRAL BANK POWERS = ПОЛНОМОЧИЯ ЦЕНТРАЛЬНОГО БАНКА – Central Bank Powers are the powers granted to a central bank in respect of credit, monetary and currency policy. Areas commonly covered include discount and lombard policy, repurchase transactions, open market policy and the definition of minimum reserves. / , операции откупа, .

CENTRAL COUNTERPARTY = ЦЕНТРАЛЬНЫЙ КОНТРАГЕНТ (или ЦЕНТРАЛЬНАЯ ВСТРЕЧНАЯ СТОРОНА) – Central Counterparty shall mean an entity which is interposed between the institutions in a system and which acts as the exclusive counterparty of these institutions with regard to their transfer orders. Central Counterparty is an entity that is the buyer to every seller

and seller to every buyer of a specified set of contracts. Central Counterparty (CCP):- on stock exchanges the CCP acts as a buyer for each seller and as a seller for each buyer. Splitting the transaction into two new transactions serves to keep trading anonymous and increase the efficiency of netting options. On the Frankfurt Stock Exchange, this service is provided by Eurex Clearing AG, a subsidiary of Deutsche Börse AG. / взаиморасчёт или сведение (netting) . Ойрэкс Клирин А.Ге. (Eurex Clearing AG), Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG).

CENTRAL EUROPEAN TIME = ЦЕНТРАЛЬНОЕВРОПЕЙСКОЕ ВРЕМЯ – Central European Time (CET) is in the Central European Time Zone. Central European Standard Time (CET) is 1 hours ahead of Greenwich Mean Time (GMT +1), i.e. Central European Standard Time = GMT +1. Like most states in Europe, Summer (Daylight-Saving) Time is observed in Central European Time (CET), where the time is shifted forward by 1 hour; 2 hours ahead of Greenwich Mean Time (GMT +2), i.e. Central European Summer Time = GMT +2. After the Summer months the time in Central European Time (CET) is shifted back by 1 hour to Central European Time (CET) or (GMT +1). See also Coordinated Universal Time, and Greenwich Mean Time. / Смотрите также Всемирное Координированное Время (Coordinated Universal Time), и Гринвичское Среднее Время (Greenwich Mean Time).

CENTRALIZED LUBRICATION = ЦЕНТРАЛИЗОВАННОЕ СМАЗЫВАНИЕ – Centralized Lubrication is a system of lubrication in which a metered amount of lubricant or lubricants for the bearing surfaces of a machine or group of machines are supplied from a central location. See also Lubrication.

CENTRAL MONETARY INSTITUTIONS = ЦЕНТРАЛЬНЫЕ МОНЕТАРНЫЕ УЧРЕЖДЕНИЯ (или ЦЕНТРАЛЬНЫЕ УЧРЕЖДЕНИЯ ПО ВОПРОСАМ ДЕНЕЖНО–КРЕДИТНОЙ ПОЛИТИКИ) – Central Monetary Institutions are the institutions (usually central banks) which control the centralized monetary reserves and the supply of currency in accordance with government policies, and which act as their governments' bankers and agents. In the United Kingdom this is equivalent to the Bank of England. In many other countries maintenance of the exchange rate is undertaken in this sector. In the United Kingdom this function is undertaken by central government (part of the Treasury) by use of the Exchange Equalisation Account.

THE CENTRAL MONEYMARKET OFFICE = ЦЕНТРАЛЬНЫЙ ОФИС ДЕНЕЖНОГО РЫНКА – Ownership of The Central Moneymarket Office (CMO) system was transferred from the Bank of England to CRESTCo in September 1999. The CMO provides safekeeping and settlement facilities for sterling- and Euro-denominated Treasury bills, local authority bills, bank bills, trade bills, bank and building society Certificates of Deposit (CDs) and commercial paper. All of these instruments are immobilised in the CMO depository (which is operated on CRESTCo's behalf by the Bank of England), except for CDs, which are dematerialised using a contractual structure. Settlement occurs in real time by means of book-entry transfer between accounts in the CMO system. The Bank of England uses CREST and the CMO to settle its daily open market (monetary policy) operations and to hold the Real-Time Gross Settlement (RTGS) collateral provided by its market counterparties. / Валовые Расчёты в Режиме Реального Времени (ВРРРВ) .

CENTRAL MORTGAGE BOND INSTITUTION = ЦЕНТРАЛЬНОЕ УЧРЕЖДЕНИЕ ПО ЗАКЛАДНЫМ (или ИПОТЕЧНЫМ) ОБЛИГАЦИЯМ – Central Mortgage Bond Institution:- special institutions set up to issue mortgage bonds and long-term loans to the affiliated banks. Two such institutions were established in Switzerland in 1930, namely the Central Mortgage Bond Institution of the Swiss Cantonal Banks and the Mortgage Bond Bank of the Swiss Mortgage Institutions.

CENTRAL MORTGAGE BOND INSTITUTION LOANS = ССУДЫ ЦЕНТРАЛЬНОГО УЧРЕЖДЕНИЯ ПО ЗАКЛАДНЫМ (или ИПОТЕЧНЫМ) ОБЛИГАЦИЯМ – Central Mortgage Bond Institution Loans are the long-term loans granted by the central mortgage bond institutions to their member banks to refinance credits secured by mortgage collateral.

CENTRAL REGISTRATION DEPOSITORY = ЦЕНТРАЛЬНОЕ РЕГИСТРАЦИОННОЕ ХРАНИЛИЩЕ – Central Registration Depository provides information on securities sales representatives and supervisory personnel. This data base is compiled from application forms, exchange developed examinations, reported enforcement actions, and related information. The NASD owns the Central Registration Depository (CRD) system and its facilities, operating them on behalf of the New York Stock Exchange, state regulators, and other users.

CENTRAL SECURITIES DEPOSITORY = ЦЕНТРАЛЬНЫЙ ДЕПОЗИТАРИЙ ЦЕННЫХ БУМАГ – Central Securities Depository (CSD) is a central depositary that handles the custody and transfer of securities in effective form or as book entries (dematerialized securities). Clearstream, for example, serves as central depositary for the German and Luxembourg stock markets. An institution created to hold physical securities so that securities transactions can be processed by book entry. The depository immobilizes (dematerializes) physical securities. See also Dematerialization, and Immobilization. A Central Securities Depository (CSD) is a specialist financial organization holding securities such as shares either in certificated or uncertificated (dematerialized) form so that ownership can be easily transfered through a book entry rather than the transfer of physical certificates. This allows brokers and financial companies to hold their securities at one location where they can be available for clearing and settlement. This is usually done electronically making it much faster and easier than was traditionally the case where physical certificates had to be exchanged after a trade had been completed. In some cases these organizations also carry out centralized comparison, and transaction processing such as clearing and settlement of securities. Scope:- a CSD can be national or international in nature, and may be for a specific type of security, such as government bonds. (i) Domestic Central Securities Depository:- many countries have one domestic CSD that was traditionally associated with the national stock exchange. These organisations are typically heavily regulated by the government and may or may not be be separate from the exchanges where trading in securities occurs. (ii) International Central Securities Depository (ICSD):- an International CSD is a central securities depository that settles trades in international securities such as eurobonds although many also settle trades in various domestic securities, usually through direct or indirect (through local agents) links to local CSDs. Examples of international CSDs include Clearstream (earlier Cedel), Euroclear and SIX SIS. Some view the US Depository Trust Company (DTC) as a national CSD rather than an ICSD, but it does holds over USD2 trillion in non-US securities and in American depositary receipts from over 100 nations. Functions:- (i) Safekeeping Securities may be in dematerialized form, book-entry only form (with one or more 'global' certificates), or in physical form immobilized within the CSD. (ii) Deposit and Withdrawal Supporting deposits and withdrawals involves the relationship between the transfer agent and/or issuers and the CSD. It also covers the CSD's role within the underwriting process or listing of new issues in a market. (iii) Dividend, interest, and principal processing, as well as corporate actions including proxy voting Paying and transfer agents, as well as issuers are involved in these processes, depending on the level of services provided by the CSD and its relationship with these entities. (iv) Other services CSDs offer additional services aside from those considered core services. These services include Securities Lending and Borrowing, Matching, and Repo Settlement. (v) Pledge:- central depositories provide pledging of share and securities. Every country require to provide legal framework to protect the interest of the pledgor and pledgee. However, there are risks and responsibilities regarding these services that must be taken into consideration in analyzing and evaluating each market on a case-by-case basis. Central Security Depositories allow brokers and other financial companies to deposit securities where book entry and other services can be performed, like clearance, settlement and securities borrowing and lending. / Юроклыэ (Euroclear).

CENTRAL SHOOTS = ЦЕНТРАЛЬНЫЕ ПОБЕГИ (или ЦЕНТРОВЫЕ ПОБЕГИ) – Central Shoots:- the new growth that emerges from the middle point of the plant.

CENTRE BLOCK = ЦЕНТРОВАЯ ШАШКА (или ЦЕНТРАЛЬНАЯ ШАШКА) – Centre Block is a block at or near the geometric centre of the pallet. See also Pallet. / Центральная Шашка (Centre Block):- шашка, расположенная в геометрическом центре поддона. Смотрите также Поддон (Pallet).

CENTRE CLUSTER = ЦЕНТРОВОЕ СКОПЛЕНИЕ (или ЦЕНТРАЛЬНЫЕ ДОСКИ) – Centre Cluster:- centre bottom deckboards of a two-way or partial four-way pallet. See also Pallet. / Центральные Доски Нижнего Настила (Centre Cluster):- доски, расположенные в центре нижнего настила двухзаходного или частично четырёхзаходного поддона. Смотрите также Поддон (Pallet).

CENTREWRITE LIMITED = СЭНТЭРАЙТ ЛИМИТИД – In the United Kingdom, CentreWrite Limited is a subsidiary of the Society of Lloyd's (the society incorporated by Lloyd's Act 1871 by the name of Lloyd's) that is permitted to underwrite run-off reinsurance contracts for syndicates in run-off and estate protection reinsurance for Names (an individual member underwriting with unlimited liability. Since 06 March 2003 no person has been admitted as a new member to underwrite on an unlimited liability basis). CentreWrite Limited was incorporated on 1990-October-24. Centrewrite Limited employed 1-4 people. Centrewrite Limited does not have any child companies. Headquartered in London, the United Kingdom. CentreWrite Ltd is a private company categorized under Insurance and located in London, United Kingdom. Our records show it was established in 1990 and incorporated in Register for free to see additional information such as annual revenue and employment figures. Companies like Centrewrite Ltd usually offer:- Loss Adjusters, Allstate Claims Adjuster, Integrated Insurance Services, Property Insurance Adjuster and General Auto Insurance.

CENTRIFUGAL POT = ЦЕНТРОБЕЖНАЯ БАНКА (или ЦЕНТРИФУГАЛЬНАЯ БАНКА) – Centrifugal Pot is a a revolving chamber, used in the spinning of manufactured filaments, in which the plastic fibers, subjected to centrifugal force, are slightly twisted and emerge in the form of yarn wound into the shape of a hollow cylinder. Also known as Centrifugal Box, Spinning Box, and Spinning Pot. See also Pot Spinning. / Смотрите также Центрифугальное Прядение (Pot Spinning).

CENTRIFUGAL SEPARATOR = ЦЕНТРОБЕЖНЫЙ СЕПАРАТОР – Centrifugal Separator is a separator that removes immiscible fluid and solid contaminants that have a different specific gravity than the fluid being purified by accelerating the fluid mechanically in a circular path and using the radial acceleration component to isolate these contaminants. / Под Сепаратором, от Латинского слова Separator, означающее Отделитель, понимается:- (1) аппарат для разделения механических смесей твёрдых или жидких тел, отделения от них примесей, удаления твёрдых или жидких частиц из газа. Принцип действия сепаратора разных типов основан на различии физических свойств компонентов смеси:- формы, массы, плотности частиц, коэффициент трения, магнитных и электрических свойств и тому подобные. Для разделения эмульсий и осветления жидкостей применяются обычно сепараторы центробежного типа (смотрите Центрифугирование), для механической очистки газов и выделения из них твёрдых или жидких частиц используются газовые сепараторы и циклоны (смотрите также Очистка Газов); для отделения зерна от примесей служат мукомольные сепараторы, работающие с помощью сит, воздушной струи, магнитов и прочего (смотрите Зерноочистительные Машины). Сепараторы используются в горной промышленности для обогащения полезных ископаемых, особенно бедных руд и зольных углей; в химической промышленности для разделения и очистки различных смесей; в литейном производстве при подготовке и очистке формовочных и стержневых смесей; на газовых промыслах для очистки газовых и газоконденсатных скважин от влаги, твёрдых частиц и других примесей; в пищевой промышленности для получения сливок, творога, очистки молока, осветления пива, вина, получения крахмала, дрожжей. Наибольшее распространение в народном хозяйстве получили магнитные, масляные и молочные сепараторы. Магнитный Сепаратор применяется для отделения полезных минералов от пустой породы и вредных примесей (смотрите Магнитное Обогащение). В сепараторах этого типа используется действие магнитного поля на минеральные частицы, обладающие различной магнитной восприимчивостью. С помощью магнитных сепараторов производится обогащение бедных железных (главным образом магнетитовых), а также марганцевых, титановых, вольфрамовых и других руд. При этом содержание полезных компонентов в получаемом магнитном концентрате доводится до 95% и более, а содержание вредных примесей значительно снижается. Существуют различные магнитные сепараторы для сухого и мокрого обогащения сильномагнитных и слабомагнитных материалов, например, барабанные магнитные сепараторы с замкнутой электромагнитной системой и постоянными магнитами (для магнетитовых руд и суспензий), валковые, роторные и полиградиентные барабанно-ручейковые сепараторы (для слабомагнитных руд). Мощные магнитные сепараторы обеспечивают производительность до 500 тонн в час (т/ч) для кусковых и до 200 т/ч для тонкоизмельчённых руд. Масляный Сепаратор выполняет отделение от масла воды и механических примесей методом центрифугирования. Используется для очистки смазочных и охлаждающих жидкостей в масляном хозяйстве электрических станций и подстанций, на промышленных предприятиях и тому подобном. Производительность масляных сепараторов до 1 500–2 000 литров в час (л/ч). Молочный Сепаратор служит для очистки и разделения молока на сливки и обезжиренное молоко. Основная часть молочного сепаратора – барабан, вращающийся с частотой 6–12 тысяч оборотов в минуту (об/мин). Внутри барабана смонтирована система конических тарелок, разделяющих молоко на слои; отверстия в тарелках образуют вертикальные каналы, из которых молоко растекается в межтарелочные зазоры, где под действием центробежной силы выделяются сливки. Молочные сепараторы имеют производительность до 25 тысяч л/ч и позволяют получать сливки как обычной (30–45%), так и повышенной (свыше 80%) жирности. Молочные сепараторы, предназначенные только для очистки молока (молокоочистители), обеспечивают производительность до 40 тысяч л/ч. Имеются сепараторы для обезвоживания белковых масс (творога) и для выделения из молока Бактерий (бактериофугирования); такие сепараторы обеспечивают удаление около 90% Бактерий от их первоначального содержания в молоке (а при последовательной установке двух сепараторов – до 99% Бактерий). (2) Сепаратор – металлическая или пластмассовая обойма с вырезами по размеру шариков или роликов в подшипниках качения. Предназначается для разделения и направления тел качения. Обычно сепараторы изготовляют штампованием из стальной ленты, однако при повышенных окружных скоростях (свыше 10–15 метров в секунду (м/сек)), а также для некоторых крупногабаритных подшипников применяют массивные сепараторы из антифрикционных материалов:- бронзы, латуни, текстолита, алюминиевых сплавов и так далее. (3) Сепаратор:- изолирующие прокладки из стекловойлока, дерева, поливинилхлорида, паронита и тому подобного в виде фасонных, перфорированных или пористых пластинок.

CENTRIFUGE = ЦЕНТРИФУГА – Centrifuge is a machine that employs centrifugal force to remove excess liquid from fabrics. In general, centrifuges are also used to separate materials of different densities. / В текстильном производстве под Центрифугой, от Латинских слов Centrum, означающее Средоточие или Центр, и Fugo, означающее Бег или Бегство, понимается установка для центрифугирования.

CENTROMERE = ЦЕНТРОМЕРА (или КИНЕТОХОР) – Centromere is a chromosomal region functioning as the spindle attachment region to allow chromosome and/or chromatid separation during mitosis and meiosis. / Под Центромерой, от слова Латинского

слова Centrum, означающее Центр Круга, и Греческого слова Méros, означающее Часть, или Кинетохором понимается участок хромосомы, удерживающий вместе две её нити (хроматиды). Во время деления центромера направляет движение хромосом к полюсам клетки.

CEO = CHIEF EXECUTIVE OFFICER

CEPGL = COMMUNAUTÉ ÉCONOMIQUE DES PAYS DES GRANDS LACS

CEPHALIC = ГОЛОВНОЙ – Cephalic:- the area of the head region. / Расположенное около головы.

CEPHALIUM = ЦЭФАЛИЙ (или ГОЛОВЧАТЫЙ СТЕБЕЛЁК) – Cephalium is modified flowering zone of stems of certain species of cactus, often ornamented by copious development of hairs or bristles. In some species (e.g., Melocactus) stem growth ceases once the cephalium is produced. In others, a pseudocephalium is produced while stem growth continues. / Под Цефалием, от Греческого слова Kephalē, означающее Голова, понимается деревянистое удлинение стеблей некоторых Кактусовых.

CEPHALOTHORAX = ЦЕФАЛОТОРАКС (или ГОЛОВОГРУДЬ) – Cephalothorax is the fused head and thorax in orders Arachnida and Crustacea. / Под Головогрудью понимается отдел тела некоторых членистоногих, образующийся в результате слияния головных и грудных сегментов.

CEPLAC = COMMISÃO EXECUTIVA DO PLANO DA LAVOURA CACAUERIA = EXECUTIVE COMMISSION FOR COCOA CULTIVATION PLANNING

CEPLAES = CENTRO DE PLANIFICACION Y ESTUDIOS SOCIALES

CERAMIC FIBER = КЕРАМИЧЕСКОЕ ВОЛОКНО – Ceramic Fiber is an aluminum silicate fiber made by heating aluminum fluoride at 1 000–1 200 °C with silica and water vapor. The crystals, or 'whiskers', obtained are up to 1 cm long and have high strength. Ceramic fibers are used in reinforced plastics. Ceramic is inorganic fiber, in textile form, obtained from ceramic materials. Alphabetic code – CEF; and relevant commercial allowance – (отсутствует). / Керамическое Волокно – волокно, керамического состава.

CERCLA = COMPREHENSIVE ENVIRONMENTAL RESPONSE, COMPENSATION AND LIABILITY ACT

CERCOSPORA LEAF SPOT = ЦЭРКОСПОРОЗНАЯ ПЯТНИСТОСТЬ ЛИСТЬЕВ – Cercospora Leaf Spot is a disease caused by the fungus Cercospora janseana characterized by the presence of short, elliptical to linear, brown lesions mainly on the leaves but also on leaf sheaths, pedicels, and glumes. The lesions are 2–10 mm long and 1 mm wide. Also referred to as Narrow Brown Leaf Spot.

CEREAL = ЗЛАК (или ЗЛАКОВЫЕ, или ХЛЕБ) – Cereal are seeds of flowering plants of the grass Family (Graminaceae) cultivated for the food value of their grains, e.g., Barley, Maize, Millet, Oat, Rice, Rye, Sorghum, and Wheat. Cereals:- defined as Wheat, Coarse grains and Rice. / Злаки (Gramineae) – Семейство Однодольных Цветковых Растений; то же, что Мятликовые (Poaceae). Одно-, дву- и многолетние Травянистые Растения, реже древовидные формы. Стебель (соломина) высотой от 1 сантиметра до десятков метров разделён поперечными, часто вздутыми узлами на междоузлия, обычно полые или заполненные рыхлой тканью. Очередные линейные или линейно-ланцетные листья отходят от узлов стебля. Цветки обычно обоеполые, редко раздельнополые (растения чаще однодомные), мелкие, невзрачные (тычинок 3, редко 6, плодолистиков 3), собраны в колоски, которые образуют сложные соцветия – сложный колос, метёлку, султан и другие. Плод – зерновка. Семя с крахмалистым эндоспермом. В Семействе около 650 Родов и около 10 000 Видов. Встречаются повсеместно, особенно в травостое лугов, прерий, степей и саванн. В бывшем Союзе Советских Социалистических Республик (СССР) – 150 Родов и свыше 1 900 Видов. К Мятликовым относятся Зерновые (Кукуруза, Пшеница, Рис, Рожь и другие) и Технические (Сахарный Тростник) культуры, Кормовые Травы (Житняк, Костер, Мятлик, Овсяница, Райграс, Тимофеевка и другие). Многие Мятликовые используют для укрепления песков, устройства лётных полей аэродромов, стадионов, в озеленении (газоны); некоторые Виды (например, Овсюг, Пырей Ползучий) – злостные Сорняки. 23 Вида Мятликовых находились в Красной Книге СССР. Злаковые Зерновые Культуры относятся к Семейству Однодольных Растений. Их мелкие цветки собраны в простые соцветия – колоски, образующие сложные соцветия – колос, метёлку, султан и другие. Среди них:- Кукуруза, Овёс, Пшеница, Рис, Рожь, Сорго, Ячмень и другие.

CEREAL CROPS = ЗЛАКОВЫЕ СЕЛЬСКОХОЗЯЙСТВЕННЫЕ КУЛЬТУРЫ (или ЗЕРНОФУРАЖНЫЕ КУЛЬТУРЫ) – Cereal Crops are mostly Grasses cultivated for their edible seeds (actually a fruit called a Grain, technically a Caryopsis). Cereal Grains are grown in greater quantities worldwide than any other type of crop and provide more calories to the human race. In some developing nations, Cereal grains constitute practically the entire diet of common folk. In developed nations, Cereal consumption is more moderate but still substantial. The word Cereal has its origin in the Roman goddess of grain, Ceres. Staple food grains are often called Corn. The Cereal crops are (in approximate order of greatest annual production):- (i) barley, grown for malting and livestock on land too poor for Wheat; (ii) Maize, a staple food of peoples in North America, South America, and Africa and of livestock worldwide; (iii) the Millets, a group of similar but distinct cereals that form an important staple food in Asia and Africa; (iv) Oats, formerly the staple food of Scotland and popular worldwide for livestock; (v) Rice, the primary cereal of tropical regions, and wild Rice, grown in small amounts in the United States; (vi) Rye and Triticale, important in cold climates; (vii) Sorghum, important staple food in Asia and Africa and popular worldwide for livestock; (viii) Spelt, a close relative of Wheat; (ix) Teff, popular in Ethiopia but scarcely known elsewhere; (x) Wheat, the primary cereal of temperate regions. In addition, several non-grasses are grown for their Seeds. These Pseudocereals include (in no particular order):- (i) Amaranth, (ii) Buckwheat, and (iii) Quinoa. While each individual Species has its own peculiarities, the cultivation of all Cereals crops is similar. All are annual Plants; consequently one planting yields one harvest. Wheat, Rye, Triticale, Oats, Barley, and Spelt are the cool-season Cereals. These are hardy Plants that grow well in moderate weather and cease to grow in hot weather (approximately 30° but this varies by Species and Variety). The other warm-season Cereals are tender and prefer hot weather. Cool-season Cereals are well-adapted to temperate climates. Most Varieties of a particular Species are either winter or spring types. Winter Varities are sown in the autumn, germinate and grow vegetatively, then become dormant during winter. They resume growing in the springtime and mature in late spring or early summer. This cultivation system makes optimal use of water and frees the land for another crop early in the growing season. Winter Varieties do not flower until springtime because they require vernalization. Where winters are too warm for vernalization or exceed the hardiness of the crop (which varies by species and variety), farmers grow spring Varieties. Spring Cereals are planted in early springtime and mature later that same summer, without vernalization. Spring Cereals typically require more irrigation and yield less than winter Cereals. Rye is the hardiest cereal, able to overwinter in the subarctic and Siberia. Wheat is the most popular. All cool-season Cereals are grown in the tropics, but only in the cool highlands, where it may be possible to grow multiple crops in a year. The warm-season Cereals are grown in tropical lowlands year-round and in temperate climates during the frost-free season. Cereal grains supply most of their calories as starch. They are also a significant source of protein, though the amino acid balance is not optimal. Whole grains (see below) are good sources of dietary fiber, essential fatty acids, and other important nutrients. Rice is eaten as cooked entire grains, although rice flour is also produced. Oats are rolled, ground, or cut into bits (steel-cut oats) and cooked into porridge. Most other cereals are ground into flour or meal, that is milled. The outer layers of

bran and germ are removed. This lessens the nutritional value but makes the grain more appealing to many palates. Health-conscious people tend to prefer whole grains, which are not milled. Overconsumption of milled cereals is sometimes blamed for obesity. Milled grains do keep better because the outer layers of the grains are rich in rancidity-prone fats. The waste from milling is sometimes mixed into a prepared animal feed. Once (optionally) milled and ground, the resulting flour is made into bread, pasta, desserts, dumplings, and many other products. Besides cereals, flour is sometimes made from potatoes, chestnuts and pulses (especially chickpeas). In American English, cold breakfast cereals and porridge are called simply Cereal. / Виды (Species). Тритикале (пшенично-ржаные амфидиплоиды или ржано-пшеничные гибриды, формы Пшеницы, полученные при скрещивании её с Рожью). Злаки (Gramineae) – Семейство Однодольных Цветковых Растений; то же, что Мятликовые (Poaceae). Одно-, дву- и многолетние Травянистые Растения, реже древовидные формы. Стебель (соломина) высотой от 1 сантиметра до десятков метров разделён поперечными, часто вздутыми узлами на междоузлия, обычно полые или заполненные рыхлой тканью. Очередные линейные или линейно-ланцетные листья отходят от узлов стебля. Цветки обычно обоеполые, редко раздельнополые (растения чаще однодомные), мелкие, невзрачные (тычинок 3, редко 6, плодолистиков 3), собраны в колоски, которые образуют сложные соцветия – сложный колос, метёлку, султан и другие. Плод – зерновка. Семя с крахмалистым эндоспермом. В Семействе около 650 Родов и около 10 000 Видов. Встречаются повсеместно, особенно в травостое лугов, прерий, степей и саванн. В бывшем Союзе Советских Социалистических Республик (СССР) – 150 Родов и свыше 1 900 Видов. К Мятликовым относятся Зерновые (Кукуруза, Пшеница, Рис, Рожь и другие) и Технические (Сахарный Тростник) культуры, Кормовые Травы (Житняк, Костер, Мятлик, Овсяница, Райграс, Тимофеевка и другие). Многие Мятликовые используют для укрепления песков, устройства лётных полей аэродромов, стадионов, в озеленении (газоны); некоторые Виды (например, Овсюг, Пырей Ползучий) – злостные Сорняки. 23 Вида Мятликовых находились в Красной Книге СССР. Зерновые Культуры, важнейшая группа возделываемых Растений, дающих зерно, основной продукт питания человека, сырьё для многих отраслей промышленности и корма для сельскохозяйственных животных. Зерновые культуры подразделяются на хлебные и зернобобовые. Большинство Хлебных Зерновых Культур (Пшеница, Рожь, Рис, Овёс, Ячмень, Кукуруза, Сорго, Просо, Чумиза, Могар, Пайза, Дагусса и другие) принадлежит к ботаническому Семейству Злаков; Гречиха – к Семейству Гречишных; Мучнистый Амарант – к Семейству Амарантовых. Зерно хлебных зерновых культур содержит много углеводов (60–80% на сухое вещество), белков (7–20% на сухое вещество), ферменты, витамины комплекса В (B_1, B_2, B_6), РР и провитамин А, чем и определяются высокая питательность его для человека и ценность для кормового использования. Хлебные зерновые культуры выращивают на всех континентах нашей планеты. Северные и Южные границы их ареала совпадают с границами земледелия. Среди хлебных зерновых культур наиболее распространены Пшеница, Рис (особенно в странах Азии), Кукуруза (наибольшие площади в Северной Америке), Рожь (главным образом в Европе), Овёс (в Северной Америке и Европе), Ячмень (в Европе, Азии, Северной Америке), Просо и Сорго (в Азии, Африке). Остальные культуры менее распространены:- Чумиза, Пайза в основном в Китае, Африканское Просо, Тефф в Эфиопии, Дагусса в Индии, Мучнистый Амарант в Перу. В 1970 мировая посевная площадь хлебных зерновых культур составляла 694 миллиона гектаров (га), в том числе Пшеницы 209.8 миллионов га, Риса 134.6 миллиона га, Кукурузы более 107.3 миллионов га; мировой валовой сбор зерна их 1 196 миллионов тонн (т). Урожайность хлебных зерновых культур сильно колеблется (в центнерах на один гектар (ц/га)):- например, урожай Риса в Индии 17–20, Японии более 50, Испании 58–62; Пшеницы в Индии 11–12, Германской Демократической Республике (ГДР) 35–37, Соединённых Штатах Америки (США) 20–21. В бывшем Союзе Советских Социалистических Республик (СССР) в 1971 хлебными зерновыми культурами было занято 110.8 миллионов га, в том числе (в миллионах га) Пшеницей 64, Рожью 9.5, Овсом 9.6, Ячменём 21.6, Рисом 0.4, Кукурузой 3.3, Просом 2.4; валовой сбор зерна их 172.66 миллиона т, средний урожай (1970) 15.6 ц/га (в Молдавии 29.3, Литве 24.5, Украине 23.4). По типу развития и продолжительности вегетации хлебные зерновые культуры делятся на озимые культуры и яровые культуры. Бобовые Зерновые Культуры (смотрите Зерновые Бобовые Культуры) – Горох, Фасоль, Соя, Вика, Чечевица, Бобы и другие – также очень распространённая группа культурных Растений, относящихся к Семейству Бобовых Подсемейства Мотыльковых (Лядвенцевых). Дают зерно, богатое белком (в среднем 20–40% на сухое вещество, Люпин до 61%). В зерне некоторых Бобовых Зерновых Культур много жира, например, в Сое до 27%, Арахисе до 52% на сухое вещество. Смотрите также Пшеница, Рис, Кукуруза, Рожь, Овёс, Ячмень, Горох, Чечевица, Фасоль, Соя и другие; о мировом производстве зерна смотрите в статье Зерновое Хозяйство. Зерновые Бобовые Культуры или Зернобобовые Культуры, Растения Семейства Бобовых Подсемейства Мотыльковых (Лядвенцевых), выращиваемые главным образом на зерно (семена), богатое белком. В мировом производстве известно более 60 Видов Зерновых Бобовых Культур, относящихся к 17 Родам. Зерно Зерновых Бобовых Культур имеет огромное продовольственное и кормовое значение. Его используют в пищу целиком, в виде крупы и муки, приготавливают из него консервы и концентраты. Зерно Зерновых Бобовых Культур содержит в среднем 20–40% белка на сухое вещество (в Люпине до 61%), в состав которого входят необходимые для питания Человека и Животных аминокислоты – лизин, триптофан, цистин, метионин, валин и другие, а также углеводы, жиры (особенно Соя и Арахис), витамины (С, комплекса В, провитамин А). По калорийности зерно Зерновых Бобовых Культур в 3.5 раза превосходит Картофель и в 6 раз Капусту. С 1 гектара (га) посева Зерновые Бобовые Культуры дают 300–800 килограммов (кг) белка, при высоких урожаях – до 1 тонны (т). Их зерно, жмых, шроты и зелёная масса – ценный, богатый протеином корм для скота. Зерно некоторых Зерновых Бобовых Культур является сырьём для получения казеина, клея (Чина, Соя), пластмасс. Содержащийся в семенах Канавалии фермент уреаза, а также белок Фасоли применяют в медицине. На корнях Зерновых Бобовых Культур образуются Клубеньковые Бактерии, которые обогащают почву биологическим азотом, усваивая его из воздуха. Благодаря этому Зерновые Бобовые Культуры – хорошие предшественники последующих культур:- яровых зерновых, технических. Люпин, Пелюшку и другие Зерновые Бобовые Культуры высевают на зелёное удобрение (смотрите Сидерация). В мировом земледелии из Зерновых Бобовых Культур наиболее распространены Соя (в основном в Соединённых Штатах Америки (США), Китайской Народной Республике (КНР), Бразилии, бывшем Союзе Советских Социалистических Республик (СССР), Индонезии), Горох (в Азии, Европе и Америке в районах с умеренным климатом), Чечевица, Чина и Бобы (в странах Средиземноморья, Индии, Афганистане, Аргентине), Фасоль (в Азии, Европе, Америке), Нут (главным образом в Индии). Остальные культуры – Люпин, Вигна, Маш, Канавалия и другие – занимают меньшие площади. В 1970 мировая посевная площадь Зерновых Бобовых Культур (без Сои) была 63.1 миллиона га, валовой сбор зерна 44.4 миллиона т. В бывшем СССР в 1970 под Зерновыми Бобовыми Культурами было занято 5.1 миллионов га, производство зерна составило 7.62 миллиона т, средний урожай 14.9 центнеров с одного гектара (ц/га). Смотрите также Горох, Фасоль, Чечевица, Вика, Бобы и другие. Зернофуражные Культуры, Растения, дающие зерно, используемое в основном на корм сельскохозяйственным Животным и Птице. К зернофуражным культурам обычно относят из злаков – Кукурузу, Ячмень, Овёс, Сорго, Чумизу и другие, а из Бобовых – Горох, Люпин, Вику, Чину, Кормовые Бобы и другие. Чёткой границы между зернофуражными культуры и продовольственными зерновыми нет, так как зернофуражная культура из конъюнктурных соображений может стать продовольственной и наоборот. Зерно зернофуражных культур – концентрированный корм, богатый углеводами (до 75%), переваримым белком (8–30%), витаминами Е и группы В; в 1 килограмме (кг) его 1–1.4 кормовой единицы. Зернофуражные культуры выращивают во всех странах, где имеется животноводство. Мировая посевная площадь зернофуражных культур (Кукурузы, Ячменя и Овса) 220.9 миллионов гектаров (га), валовой сбор зерна 448 миллиона тонн (т)

(1970). В связи с развитием интенсивного животноводства производство фуражного зерна с каждым годом увеличивается. Особенно большие площади заняты зернофуражными культурами в Соединённых Штатах Америки (США) (Кукуруза, Ячмень, Овёс) и Франции (Ячмень), которые являются крупными экспортёрами фуражного зерна. В бывшем Союзе Советских Социалистических Республик (СССР) основными зернофуражными культурами (Ячмень, Овес, Кукуруза) в 1970 было занято 33.9 миллиона га, валовой сбор зерна их 61.6 миллион т. В 9-й пятилетке (1971–75) планировалось значительно увеличить производство зерна зернофуражных культур. Смотрите также Ячмень, Овёс, Кукуруза, Горох, Зерновое Хозяйство.

CEREAL GRAINS = ХЛЕБНЫЕ ЗЕРНОВЫЕ КУЛЬТУРЫ (или ЗЛАКОВЫЕ ЗЕРНОВЫЕ КУЛЬТУРЫ) – Cereal Grains are Barley, Oats, Rye and Triticale, and Wheat. / К Злаковым Зерновым Культурам относятся Овёс, Пшеница, Рожь, Тритикале (пшенично-ржаные амфидиплоиды или ржано-пшеничные гибриды, формы Пшеницы, полученные при скрещивании её с Рожью) и Ячмень. Злаковые Зерновые Культуры относятся к Семейству Однодольных Растений. Их мелкие цветки собраны в простые соцветия – колоски, образующие сложные соцветия – колос, метёлку, султан и другие. Среди них:- Кукуруза, Овёс, Пшеница, Рис, Рожь, Сорго, Ячмень и другие.

CEREALS = ЗЛАКОВЫЕ – Cereals:- defined as Wheat, Maize, other coarse grains and Rice.

CERECLOTH = КЛЕЁНКА (или НАВОЩЁННОЕ ПОЛОТНО) – Cerecloth:- cloth treated with melted wax or gummy matter and formerly used especially for wrapping a dead body.

CEREIFORM = ЦЭРЭУСООБРАЗНОЕ (или ЦЕРЕУСОПОДОБНОЕ) – Cereiform:- with the growth habit of a cereus, having elongated, cylindrical and usually ribbed green stems. / :- с габитусом роста цереуса, имеющее удлиненные, цилиндрические и обычно ребристые зелёные стебли.

CERES = CROP ESTIMATION THROUGH RESOURCE AND ENVIRONMENT SYNTHESIS

CEREUS = ЦЭРЭУС (или ВОСКОВОЕ, или ВОСКОПОДОБНОЕ) – Cereus:- wax-like, candle-like. / Под Цэрэусом или Цереусом понимается род растений семейства Кактусовых. Стебли безлистные высотой до 20 метров, сочные, мясистые. Около 40 видов, главным образом в Центральной и Южной Америке и на Антильских островах. Выращивают в оранжереях. На родине стебли Цереуса используют на топливо. Одни из первых Кактусов, известные Европейцам. Долгов время род Cereus был сборным, включающим около 900 видов. К настоящему времени из него выделен целый ряд других родов, а собственно Cereus объединяет около 44 видов. Древовидные, кустарниковидные, реже стелющиеся (C. insularis) Кактусы 1.5–20 м высотой и 7–40 см диаметром. Стебли цилиндрические, с крупными рёбрами. Цветки крупные, воронковидные, чаще белые, цветущие ночью. Цветочная трубка с малочисленными чешуйками; завязь и плод голые. После цветения околоцветник опадает, а на завязи остаётся пестик. Плоды ягодообразные, жёлтые или красные. Вест-Индия, Центральная и Южная Америка, в саваннах, по песчаным морским побережьям, опушкам лесов. Интенсивно растущие Кактусы, поэтому за короткое время можно иметь крупные экземпляры. Имеют сильную корневую систему. Легко размножаются черенками.

CERI = CENTRE FOR EDUCATIONAL RESEARCH AND INNOVATION

CERISE = ВИШНЁВОЕ (или СВЕТЛО–КРАСНЫЙ) – Cerise:- moderate red.

CERTIFICATE = СВИДЕТЕЛЬСТВО (или СЕРТИФИКАТ) – (1) Record, attestation, confirmation. Certificate certifies participation in the performance of particular securities or securities products. The holder of a certificate participates, for example, directly in the performance of an underlying instrument. In many cases, this may be indices (index certificates) or specially created baskets of shares (basket certificates). / Под Сертификатом, от Французского слова Sertificat, понимается:- (i) заёмное финансовое обязательство государственных органов; (ii) страховой сертификат – документ, содержащий условия договора страхования, заменяет страховой полис; или (iii) документ, удостоверяющий качество товара. Под Свидетельством понимается письменный документ, официально подтверждающий наличие какого-либо факта, имеющего юридическое значение (свидетельство о браке, свидетельство о рождении), либо право лица (авторское свидетельство, свидетельство об окончании учебного заведения).

(2) Collective documents of title to one or more units in an investment fund.

(3) Certificate is the actual piece of paper that is evidence of ownership of stock in a corporation. Watermarked paper is finely engraved with delicate etchings to discourage forgery. Also known as Share Certificate. / Сертификат эмиссионной ценной бумаги должен содержать следующие обязательные реквизиты:- полное наименование эмитента и его юридический адрес; вид ценных бумаг; государственный регистрационный номер эмиссионных ценных бумаг; порядок размещения эмиссионных ценных бумаг; обязательство эмитента обеспечить права владельца при соблюдении владельцем требований законодательства Российской Федерации; указание количества эмиссионных ценных бумаг, удостоверенных этим сертификатом; указание общего количества выпущенных эмиссионных ценных бумаг с данным государственным регистрационным номером; указание на то, выпущены ли эмиссионные ценные бумаги в документарной форме с обязательным централизованным хранением или в документарной форме без обязательного централизованного хранения; указание на то, являются ли эмиссионные ценные бумаги именными или на предъявителя; печать эмитента; подписи руководителей эмитента и подпись лица, выдавшего сертификат; другие реквизиты, предусмотренные законодательством Российской Федерации для конкретного вида ценных бумаг. Обязательным реквизитом сертификата именной эмиссионной ценной бумаги является имя (наименование) её владельца. В случае расхождений между текстом решения о выпуске ценных бумаг и данными, приведёнными в сертификате эмиссионной ценной бумаги, владелец имеет право требовать осуществления прав, закреплённых этой ценной бумагой, в объёме, установленном сертификатом. Эмитент несёт ответственность за несовпадение данных, содержащихся в сертификате эмиссионной ценной бумаги, с данными, содержащимися в решении о выпуске ценных бумаг, в соответствии с законодательством Российской Федерации. Сертификат эмиссионной ценной бумаги – документ, выпускаемый эмитентом и удостоверяющий совокупность прав на указанное в сертификате количество ценных бумаг. Владелец ценных бумаг имеет право требовать от эмитента исполнения его обязательств на основании такого сертификата.

(4) Certificate is the public key and identity of a user, together with some other information, rendered authentic by signing the certificate with the private key of the certifying authority, which issued that public key certificate.

CERTIFICATE DATABASE = БАЗА ДАННЫХ ПО СВИДЕТЕЛЬСТВАМ (или БАЗА ДАННЫХ СЕРТИФИКАТОВ) – Certificate Database:- storage area in the PTD (personal trusted device) for service certificates and root certificates. See also Certificate (4).

CERTIFICATED CARRIER = СЕРТИФИЦИРОВАННЫЙ ПЕРЕВОЗЧИК – Certificated Carrier is a for-hire air carrier that is subject to economic regulation and requires an operating certification to provide service. / Нанимаемый воздушный перевозчик, .

CERTIFICATED COTTON = СЕРТИФИЦИРОВАННЫЙ ХЛОПОК – In the cotton futures trading, Certificated Cotton is a Cotton inspected, weighed, and sampled under supervision of The New York Board of Trade, and determined deliverable on futures contracts upon classification, micronaire testing and gram per tex reading under the United States Department of Agriculture (USDA) regulations. / Нью Йоркской Палаты Торговли (Нью Йоркского Табло Торговли, если быть более точными).

CERTIFICATED STOCKS = СЕРТИФИЦИРОВАННЫЕ ЗАПАСЫ – Certificated Stocks or Certified Stocks or Deliverable Stocks are (stored) stocks of commodities (do not misunderstand with stocks of companies) which are certified to meet the basis grade set by exchanges. The commodities are tested for both quality and quantity at a designated location and are used as delivery against futures contracts. Certification of commodity is done by an authorized representative of futures trading exchange; after that only the product is considered as acceptable for delivery. The process is widely used for agricultural and food products especially grains, where certified stock is known as 'Stocks In Deliverable Position'. In futures trading, there are many advantages of this certification process:- (i) the quality and quantity of underlying commodity is assured; (ii) sellers get a clear idea about what they are selling and buyers will be clear about what they are buying; (iii) trading of commodities which do not meet the requirements is reduced; (iv) helps in developing a warm relationship among the producer, the market and the buyer; and assures smooth functioning of market; and (v) create competition among producers to produce more quality products; today there are many producers who easily exceed the standards set by different markets. In grain industry, called Stocks In Deliverable Position. See also Deliverable Stocks. Stocks of a commodity that have been inspected and found to be of a quality deliverable against a futures contracts, stored at the delivery points designated as regular or acceptable for delivery by an exchange. Also known as Certified Stocks. / Запасы сырья, инспектированные и предопределённые по качеству для возможной поставки при исполнении фьючерсных контрактов. Эти запасы размещены на складах в пунктах поставки, назначенных биржей в качестве принятых или возможных для поставки. Известны также как Сертифицированные Запасы (Certified Stocks).

CERTIFICATED SUBREGISTER = СЕРТИФИЦИРОВАННЫЙ СУБРЕЕСТР – Certificated Subregister is that part of an entity's register for a class of its securities that is administered by the entity and records certificated holdings of securities in that class. Note:- the register may be of shares, options or other securities.

CERTIFICATE OF ACCRUAL ON TREASURY SECURITIES = СВИДЕТЕЛЬСТВО О НАКОПЛЕНИИ ПО КАЗНАЧЕЙСКИМ ЦЕННЫМ БУМАГАМ (или СЕРТИФИКАТ НАКОПЛЕНИЯ ПО КАЗНАЧЕЙСКИМ ЦЕННЫМ БУМАГАМ) – Certificates Of Accrual On Treasury Securities (CATS) issued by the US Treasury and stripped by a financial intermediary, these products are sold at a significant discount from face value and pay no interest during their lifetime. However, they return full face value and cannot be called away. These bonds were issued between 1982 and 1986. CATS are secure investments backed by the US government, and are part of the feline family of US Treasury zero-coupon offerings (CATS, COUGRs, LIONs and TIGRs). CATS became obsolete when the US government began directly issuing its own STRIPS in 1986. Certificate Of Accrual on Treasury Securities (CATS) refers to a zero-coupon US Treasury issue that is sold at a deep discount from the face value and pays no coupon interest during its lifetime, but returns the full face value at maturity. Issued by the US Treasury and stripped by a financial intermediary, these products are sold at a significant discount from face value and pay no interest during their lifetime. However, they return full face value and cannot be called away. Secure investments backed by the US Government, CATS are part of the feline family of US Treasury zero-coupon offerings (CATS, COUGRs and TIGRs). See also STRIPS. CATS (short for the Certificates of Accrual on Treasury Securities; invented by Salomon Brothers); COUGRs (short for the Certificate Of Government Receipts; offered by the AG Becker Paribas firm); LIONs (short for the Lehman Investment Opportunity Notes; issued by the US government through Lehman Brothers); STRIPS (short for the Separate Trading of Registered Interest and Principal Securities); and TIGRs (short for the Treasury Income Growth Receipts; introduced by Merrill Lynch). / Мёрл Лынч (Merrill Lynch).

CERTIFICATE OF ANALYSIS = СВИДЕТЕЛЬСТВО ОБ АНАЛИЗЕ (или СЕРТИФИКАТ ОБ АНАЛИЗЕ) – Certificate Of Analysis is a document, often required by an importer or governmental authorities, attesting to the quality or purity of commodities. The origin of the certification may be a chemist or any other authorized body such as an inspection firm retained by the exporter or importer. In some cases the document may be drawn up by the manufacturer certifying that the merchandise shipped has been tested in his facility and found conform to the specifications.

CERTIFICATE OF APPROVAL = СВИДЕТЕЛЬСТВО О ДОПУСКЕ (или СВИДЕТЕЛЬСТВО О ДОПУЩЕНИИ) – Certificate Of Approval is a legal document that permits and controls the manner in which activities are carried out, e.g., effluent quality limits. They are binding on the recipient and are directly enforceable by prosecution under provincial legislation. Also known as Approval Certificate.

CERTIFICATE OF AUTHORITY = СВИДЕТЕЛЬСТВО О ПОЛНОМОЧИИ (или СЕРТИФИКАТ О ПОЛНОМОЧИИ) – In the United States, a Certificate Of Authority is a certificate given to a company that has been granted permission to do business in a state different from its home state (the state where the company was registered). A certificate of authority is obtained after filing foreign qualification documents in the new state.

CERTIFICATE OF CLASSIFICATION = КЛАССИФИКАЦИОННОЕ СВИДЕТЕЛЬСТВО (или СВИДЕТЕЛЬСТВО О КЛАССИФИКАЦИИ, или СЕРТИФИКАТ КЛАССИФИКАЦИИ) – Certificate Of Classification is a certificate, issued by the classification society and stating the class under which a vessel is registered. A certificate, issued by the classification society which states the class of a vessel. / Свидетельство, выдаваемое регистром.

CERTIFICATE OF DELIVERY = СВИДЕТЕЛЬСТВО О ПОСТАВКЕ (или СЕРТИФИКАТ ПОСТАВКИ) – Certificate Of Delivery is a certificate indicating the condition of a vessel upon delivery for a charter including ballast, available bunkers and fresh water.

CERTIFICATE OF DEPOSIT = СВИДЕТЕЛЬСТВО О ВКЛАДЕ (или ДЕПОЗИТНЫЙ СЕРТИФИКАТ) – Certificate Of Deposit (CD) is a money market instrument issued by banks in the form of bearer paper. As a rule CDs have maturities of between 3 and 12 months, but in some cases up to 5 years. They can be traded without difficulty on secondary markets. In the United States, Certificate Of Deposit (CD) is a form of time deposit at a bank or savings institution; a time deposit cannot be withdrawn before a specified maturity date without being subject to an interest penalty for early withdrawal. Small-denomination CDs are often purchased by individuals. Large CDs of USD100 000.00 or more are often in negotiable form, meaning they can be sold or transferred among holders before maturity. A short term interest-paying instrument issued by deposit-taking institutions in return for money deposited for a fixed period. Interest is earned at a given rate. The instrument can be used as security for a loan if the depositor requires money before the repayment date. Certificates Of Deposit are certificates issued against funds deposited in a bank, are for a definite period of time, earn a specified rate of return, and are normally negotiable. A negotiable certificate in bearer form issued by a commercial bank as evidence of a deposit with that bank which states the maturity value, maturity rate and interest rate payable. CDs vary in size with maturities ranging from a few weeks to several years. CDs may normally be redeemed before maturity only by sale on the secondary market but may also be redeemed back to issuing bank through payment of a penalty. A time deposit with a specific maturity evidenced by a certificate. Large-denomination Certificates of Deposit (CDs) are typically negotiable. Certificate Of Deposit is a certificate issued by a

bank showing that a stated sum of money has been deposited for a specified time at a specified rate of interest. Certificates of deposit can be traded (i.e. sold) by the original depositor. Certificate for a time deposit in a commercial bank, earning a given rate of interest over a specified period. Certificates of Deposit are negotiable instruments and are traded in the money market. A Certificate Of Deposit (CD) is a money market instrument and negotiable claim issued by a bank in return for a short- to medium-term deposit, usually 1–12 months, but in exceptional cases up to 5 years. CDs were first issued in US Dollars in New York but are now also available in other currencies. CDs issued by the London branches of US banks are usually in Dollars. An agreement with a bank that any person will leave its money on deposit for a specified period of time in return for a specific amount of interest. Certificate Of Deposit is a certificate issued by a bank showing that a stated sum of money has been deposited for a specified time at a specified rate of interest. / выплата (repayment). / Свидетельство О Вкладе или Депозитный Сертификат – свидетельство, выданное банком, показывающее, что указанная в нём денежная сумма была вложена на спецификационное время по спецификационной ставке процента. Депозитный Сертификат – заёмное финансовое обязательство различных организаций.

CERTIFICATE OF EMPLOYERS' LIABILITY INSURANCE = СВИДЕТЕЛЬСТВО О СТРАХОВАНИИ ОТВЕТСТВЕННОСТИ РАБОТОДАТЕЛЕЙ (или СЕРТИФИКАТ О СТРАХОВАНИИ ОТВЕТСТВЕННОСТИ РАБОТОДАТЕЛЕЙ) – Certificate Of Employers' Liability Insurance is a document proving that you have a valid policy which must be displayed where employees can read it easily and kept for at least 40 years. / Свидетельство О Страховании Ответственности Работодателей служит документом, отражающим факт того, что у данного предприятия или организации имеется действующий полис, и он должен быть размещён в легко доступном всем работникам для обзора месте, и храниться он должен не менее 40 лет.

CERTIFICATE OF FREE SALE = СВИДЕТЕЛЬСТВО О СВОБОДНОЙ ПРОДАЖЕ (или СЕРТИФИКАТ СВОБОДНОЙ ПРОДАЖИ) – Certificate Of Free Sale is a certificate, required by some countries as evidence that the goods are normally sold on the open market and approved by the regulatory authorities in the country of origin. The US Government does not issue Certificate Of Free Sale. However, on request, the Food and Drug Administration, Silver Springs, MD (State of Maryland), will issue a Letter of Comment to US manufacturers whose products are subject to the Federal Food, Drug and Cosmetic Act or other acts administered by the agency to take the place of the 'free sale certificate'. / Правительство Соединённых Штатов Америки (США) не выдаёт Свидетельств О Свободной Продаже.

CERTIFICATE OF GOOD STANDING = СВИДЕТЕЛЬСТВО О БЛАГОСОСТОЯНИИ (или СЕРТИФИКАТ О БЛАГОСОСТОЯНИИ) – Certificate Of Good Standing is a certificate issued by a state official as conclusive evidence that a corporation is in existence or authorized to transact business in the state. The certificate generally sets forth the corporation's name; that it is duly incorporated or authorized to transact business; that all fees, taxes and penalties owed the state have been paid; that its most recent annual report has been filed; and, that articles of dissolution have not been filed. Certificates of good standing are also known as a Certificate Of Existence or Certificate Of Authorization or Certificate Of Status. Certificate Of Good Standing is a document issued by the secretary or state certifying that a corporation validly exists and is in compliance with all legal requirements including the payment of any taxes or fees. A document issued by an incorporating authority (federal, provincial, or territorial government) stating that the organization is duly incorporated and that it is in good standing with the authority. The name of the document may vary from jurisdiction to jurisdiction.

CERTIFICATE OF GOVERNMENT RECEIPTS = СВИДЕТЕЛЬСТВО НА ПРАВИТЕЛЬСТВЕННЫЕ РАСПИСКИ (или СЕРТИФИКАТ НА ПРАВИТЕЛЬСТВЕННЫЕ РАСПИСКИ) – Certificate Of Government Receipts (COUGRs) are the US Treasury fixed-income securities stripped of their coupon payments, providing payment of face value. These are synthetic securities offered by the firm AG Becker Paribas. Part of the 'feline' family of synthetic zero-coupon Treasury securities, which include CATS (short for the Certificates of Accrual on Treasury Securities; invented by Salomon Brothers), COUGRs and TIGRs (short for the Treasury Income Growth Receipts; introduced by Merrill Lynch). This default-free family of products provide safety of principal and transparent profits. The product is sold at a discount and redeemed at face value as there are no interest payments during the life of the security. Certificate Of Government Receipts (COUGRs):- the US Treasury fixed-income securities that are stripped of their coupon payments and provide payment of face value. These are synthetic securities offered by the AG Becker Paribas firm. COUGRs are part of the 'feline' family of synthetic zero-coupon Treasury securities, which includes CATS and TIGRs. This default-free family of products provides safety of principal and transparent profits. COUGRs sold at a discount and redeemed at face value because there are no interest payments during the life of the security. / Мёрл Лынч (Merrill Lynch).

CERTIFICATE OF INCORPORATION = СВИДЕТЕЛЬСТВО ОБ ИНКОРПОРАЦИИ (или СЕРТИФИКАТ ОБ ИНКОРПОРАЦИИ) – In the United States, Certificate Of Incorporation is the title of the document filed in many states to create a corporation. Also known as Articles Of Incorporation, or Corporate Charter.

CERTIFICATE OF INDEBTEDNESS = СВИДЕТЕЛЬСТВО О ЗАДОЛЖЕННОСТИ (или СЕРТИФИКАТ О ЗАДОЛЖЕННОСТИ) – In the United States, Certificate Of Indebtedness (C of I):- also known as a Zero-Percent Certificate of Indebtedness, this is a security that can be funded within your TreasuryDirect account and used to purchase other securities. It's issued daily with a one-day maturity that automatically rolls over at maturity – and continues to do so until you request redemption. It does not earn interest. The purpose of a C of I is to accumulate funds for the purchase of another eligible security in the TreasuryDirect system. There is no limit to the total amount that you can hold in the C of I. The Certificate Of Indebtedness is a short-term fixed income security issued by the United States Treasury that has a coupon. Unlike treasury bills – which are sold at a discount and mature at par value without a coupon payment – certificates of indebtedness offer fixed coupon payments. Certificates of indebtedness typically mature in one year or less.

CERTIFICATE OF INSPECTION = СВИДЕТЕЛЬСТВО ОСМОТРА (или СЕРТИФИКАТ ОСМОТРА) – Certificate Of Inspection is a document certifying that merchandise (such as perishable goods) was in good condition immediately prior to shipment. Preshipment inspection is a requirement for importation of goods into many developing countries. The document issued by the US Coast Guard certifying an American-flag vessel's compliance with applicable laws and regulations. Certificate Of Inspection is a certificate usually required for industrial equipment and meat products. There are companies in every port city that specialize in issuing certificates of inspection for machinery. The Meat Inspection Division of the US Department of Agriculture issues certificates of inspection for meat products that are recognized throughout the world. / привоз (importation).

CERTIFICATE OF INSURANCE = СВИДЕТЕЛЬСТВО О СТРАХОВАНИИ (или СТРАХОВОЙ СЕРТИФИКАТ) – Certificate Of Insurance is a document prepared by the insured, the producer, or the insurance company to provide evidence of insurance to the buyer or bank for an export/import shipment. The certificate contains an abstract of the more important conditions in the policy. See also Special Policy. Certificate Of Insurance is a document issued by insurers confirming that a particular consignment is held covered by their company, and giving the name of their agent to contact at destination. Depending on the context this term may refer to:- (i) a document which evidences the existence of insurance cover but which does not detail all its terms which are contained in a separate policy of insurance. Certain certificates are required as a matter of law in the United Kingdom, for example for motor insurance. (ii) A document that is issued by a coverholder which evidences the existence of insurance cover and details the terms of such cover. No

policy of insurance is issued where such a certificate is issued. / Страховой Сертификат – документ, содержащий условия договора страхования, заменяет страховой полис.

CERTIFICATE OF LIABILITY INSURANCE = СВИДЕТЕЛЬСТВО О СТРАХОВАНИИ ОТВЕТСТВЕННОСТИ (или СЕРТИФИКАТ О СТРАХОВАНИИ ОТВЕТСТВЕННОСТИ) – Certificates Of Liability Insurance are commonly used in business as evidence of one party's insurance that ostensibly protects it and its business partners in the event of a loss. A certificate of insurance provides numerous items of information including: named insured, agent/broker issuing the certificate, policy numbers, effective and expiration dates, types of policies, limits of insurance, key coverage details, intent to notify the certificate holder in the event of cancellation and disclaimers of all information therein by the party issuing the certificate.

CERTIFICATE OF MAILING = СВИДЕТЕЛЬСТВО О ПОЧТОВОЙ ОТПРАВКЕ (или СЕРТИФИКАТ ПОЧТОВОЙ ОТПРАВКИ) – In the US trademark law, Certificate Of Mailing is a certificate for each piece of correspondence mailed, prior to the expiration of the set period of time for response, stating the date of deposit with the US Postal Service and including a signature.

CERTIFICATE OF MANUFACTURE = СВИДЕТЕЛЬСТВО ОБ ИЗГОТОВЛЕНИИ (или СЕРТИФИКАТ ИЗГОТОВЛЕНИЯ) – Certificate Of Manufacture is a document (often notarized) in which a producer of goods certifies that the manufacturing has been completed and the goods are now at the disposal of the buyer. A document used under a letter of credit containing an affidavit that goods have been manufactured and are being held for the account and risk of the buyer. In war times when transportation facilities are disrupted, it is common for letters of credit to be paid against presentation of a certificate of manufacture. This is rare in ordinary times, except in the case of specially manufactured goods.

CERTIFICATE OF MOTOR INSURANCE = СВИДЕТЕЛЬСТВО ОБ АВТОМОБИЛЬНОМ СТРАХОВАНИИ (или СЕРТИФИКАТ О МОТОРНОМ СТРАХОВАНИИ) – Certificate Of Motor Insurance is a document proving that compulsory third party insurance is in place in respect of use of the vehicle covered by the policy.

CERTIFICATE OF ORIGIN = СВИДЕТЕЛЬСТВО О ПРОИСХОЖДЕНИИ (или СЕРТИФИКАТ ПРОИСХОЖДЕНИЯ (ТОВАРОВ)) – Certificate of Origin is a document used to assure the buying country precisely which country produced the goods being shipped. Usually completed by a recognised chamber of commerce. Certificate Of Origin is a document certified by chambers of commerce confirming the origin of goods, and required in some instances by Customs Authorities for clearance. Document issued by a qualified authority stating the country of origin of a good. In the United States, certificates of origin are required for all imported goods. Certain nations require a signed statement as to the origin of the export item. Such certificates are usually obtained through a semiofficial organization such as a local chamber of commerce. A certificate may be required even though the commercial invoice contains the information. A statement which must be submitted by an importer, certifying the country of origin of imported goods. Unless the goods themselves are clearly marked, this certificate must accompany the goods in domestic trade after they are imported. Certificate Of Origin is a certificate stating the country of origin of the goods. Depending on the importing country's requirements, this can be as simple as being issued by the seller or the manufacturer. In most cases however, it is required to be issued by a Chamber of Commerce in the country of origin. Formal document (required at destination) stating origin of cargo and relevant cargo details. See also EUR 1, and Movement Certificate. Certificate Of Origin is a specific document identifying the goods, in which the authority or body empowered to issue it certifies expressly that the goods to which the certificate relates originate in a specific country. This certificate may also include a declaration by the manufacturer, producer, supplier, exporter or other competent person. In this definition the word 'Country' may include a group of countries, a region or a part of a country. Specific forms for certificates of origin have been laid down in Annex D.2. to the Kyoto Convention and in the framework of preferential arrangements such as the Generalized System of Preferences. A certified document showing the origin of goods; used in international commerce. / Сертификат Происхождения товара – документ, выдаваемый компетентным органом (как правило – Торгово-Промышленной Палатой) в стране экспортёра, который чётко удостоверяет происхождение товара. Этот сертификат может содержать также декларацию изготовителя, поставщика, экспортёра или другого компетентного лица; термин 'Страна' может включать группу стран, регион или какую-либо часть страны. Такой документ обязателен при привозе (или импорте) в случае, если с происхождением товара, декларированного на таможне, связано предоставление привилегированного режима:- льготного тарифа, скидок с общего тарифа, беспошлинного ввоза, освобождения от дополнительного обложения и другое. Сертификат О Происхождении – документ, официально удостоверяющий страну происхождения соответствующего товара.

CERTIFICATE OF QUALITY = СВИДЕТЕЛЬСТВО О КАЧЕСТВЕ (или СЕРТИФИКАТ КАЧЕСТВА) – Certificate Of Quality is a certificate issued by a seller or recognised third party that goods are of a particular quality or quantity. Absent fraud, the certificate will be binding if so agreed between the parties. Certificate Of Quality is a certificate showing the grade of a soft commodity. / Сертификат Качества – свидетельство, удостоверяющее качество фактически поставленного товара. В нём даётся характеристика товара либо подтверждается соответствие качества товара определённым стандартам. Сертификат Качества выдаётся соответствующими компетентными организациями, государственными органами, торговыми палатами, специальными лабораториями как в стране вывоза (или экспорта), так и привоза (или импорта). Иногда стороны договариваются о предоставлении сертификатов различных контрольных и проверочных учреждений, институтов, палат мер и весов и других организаций. Сертификат Качества может выдавать (в соответствии с условиями контракта) и фирма изготовитель. Сертификат Качества – документ, удостоверяющий качество соответствующей партии товара.

CERTIFICATE OF REDELIVERY = СВИДЕТЕЛЬСТВО О ПЕРЕОТПРАВКЕ (или СЕРТИФИКАТ О ПЕРЕОТПРАВКЕ) – Certificate Of Redelivery is a certificate, indicating the condition of a vessel upon redelivery from a charter including ballast, available bunkers and fresh water.

CERTIFICATE OF REGISTRATION = СВИДЕТЕЛЬСТВО О РЕГИСТРАЦИИ (или СЕРТИФИКАТ РЕГИСТРАЦИИ) – In the US patent law, official document from the United States Patent and Trademark Office (USPTO) evidencing that a mark has been registered. / В патентном праве, официальный документ из Управления Соединённых Штатов Америки по Патентам и Товарным Знакам (УСШАПТЗ), свидетельствующий о том, что знак был зарегистрирован.

CERTIFICATE OF REGISTRY = СВИДЕТЕЛЬСТВО РЕГИСТРА (или РЕГИСТРОВЫЙ СЕРТИФИКАТ) – Certificate Of Registry is a document giving all particulars of the vessel, including the names of the owner and the master. A document specifying the nation registry of the vessel. / и хозяина (или капитана).

CERTIFICATE OF SHORT–LANDING = СВИДЕТЕЛЬСТВО О ХХ (или СЕРТИФИКАТ О ХХ) – Certificate Of Short-Landing is a document which must be issued by carriers or their agents when they fail to deliver a consignment of which a valid bill of lading has been issued.

CERTIFICATE OF TITLE = СВИДЕТЕЛЬСТВО О ПРАВЕ (или СЕРТИФИКАТ ТИТУЛА) – In the United States, the Certificate Of Title for a vehicle (also known as a Car Title or Pink Slip; or Pinks in the plural) is a legal form, establishing a person or business as the

legal owner of a vehicle. Vehicle titles in the US are commonly issued by the state DMV (Department of Motor Vehicles). While not standardized from state to state, the certificate of title normally specifies:- (i) identifying information about the vehicle, normally at minimum its vehicle identification number, make, and year of manufacture; (ii) the license plate number; (iii) technical information about the vehicle to define its taxation regime, e.g., its gross vehicle weight, motive power, and purchase price when new; (iv) the name and address of the purchaser or 'registered owner' who would normally possess and use it; and (v) if money is owed on the vehicle, the name of the lienholder or 'legal owner' to whom this money is owed. When a car is sold from one owner to another, the title must be transferred to the new owner. This is achieved by requesting approval by the state DMV.

CERTIFICATE OF TREATMENT = СВИДЕТЕЛЬСТВО ОБ ОБРАБОТКЕ (или СЕРТИФИКАТ ОБРАБОТКИ) – Certificate Of Treatment is a treatment certificate issued by an authorized Department of Agriculture representative at origin shall accompany each lot or shipment unless exempt. The certificate shall affirm that the shipment or lot accompanied thereby was cleaned, or otherwise treated to destroy boll weevil as prescribed by the director. Each certificate shall also set forth the kind and quantity of articles and commodities treated thereby, date and method of treatment, dosage used, the initials and number of the railway car, or license number of the truck in which shipped, and the names and addresses of the consignee and consignor. / , от Латинского слова Affirmo, означающее Утверждаю, .

CERTIFICATE OF WEIGHT = СВИДЕТЕЛЬСТВО О ВЕСЕ (или СЕРТИФИКАТ ВЕСА) – Certificate of Weight is an authoritative statement of the weight of a shipment. / Сертификат Весовой – ведомость, содержащая перечень каждой партии груза с указанием её массы. Составляется в портах и на железнодорожных станциях.

CERTIFICATE POLICY = ПОЛИТИКА В ОТНОШЕНИИ СЕРТИФИКАТОВ – Certificate Policy is a named set of rules indicating the applicability of a certificate to a particular community and/or class of application with common security requirements.

CERTIFICATE REVOCATION LIST = СПИСОК ОТЗЫВА СВИДЕТЕЛЬСТВ (или СПИСОК ОТМЕНЁННЫХ СЕРТИФИКАТОВ) – Certificate Revocation List (CRL) is a signed list of invalidated certificates. A Certificate Revocation List (CRL) is a list of certificates that have been revoked before their scheduled expiration date. There are several reasons why a certificate might need to be revoked and placed on a CRL. For instance, the key specified in the certificate might have been compromised or the user specified in the certificate may no longer have authority to use the key. For example, suppose the user name associated with a key is 'Alice Avery, Vice President, Argo Corp.'. If Alice were fired, her company would not want her to be able to sign messages with that key, and therefore the company would place the certificate on a CRL. When verifying a signature, one examines the relevant CRL to make sure the signer's certificate has not been revoked. Whether it is worth the time to perform this check depends on the importance of the signed document. A CRL is maintained by a CA, and it provides information about revoked certificates that were issued by that CA. CRLs only list current certificates, since expired certificates should not be accepted in any case: when a revoked certificate's expiration date occurs, that certificate can be removed from the CRL. CRLs are usually distributed in one of two ways. In the 'pull' model, verifiers download the CRL from the CA, as needed. In the 'push' model, the CA sends the CRL to the verifiers at regular intervals. Some systems use a hybrid approach where the CRL is pushed to several intermediate repositories from which the verifiers may retrieve it as needed. Although CRLs are maintained in a distributed manner, there may be central repositories for CRLs, such as, network sites containing the latest CRLs from many organizations. An institution like a bank might want an in-house CRL repository to make CRL searches on every transaction feasible. The original CRL proposals often required a list, per issuer, of all revoked certificates; new certificate revocation methods are more flexible. / Корп. (Corp.).

CERTIFICATION = СЕРТИФИКАЦИЯ – (1) Certification is the attestation by a neutral party that a product, process, system or person meets specified requirements.

(2) Certification, as relates to Potatoes, a process where employees of an official certification agency visually inspect growing grounds or facilities and crops thereon or therein, and have determined that the standards applicable have been met. Certification does not warrant that the seed potatoes to which official indicia or certification are attached or which are otherwise represented as certified, are merchantable or fit for particular purpose. / грунтов (grounds) или площадок или урожаев на них или в них, и .

(3) Certification is a process by which a bank or other financial institution guarantees a signature in the request for payment on a savings bond, a request for reissue, or other application or request relating to savings bonds.

CERTIFICATION AUTHORITY = СЕРТИФИКАЦИОННЫЙ ОРГАН – Certification Authority (CA) is an entity entrusted by one or more entities to create and assign certificates, and to manage the revocation of public key certificates.

CERTIFICATION MARK = СЕРТИФИКАЦИОННЫЙ ЗНАК (или ЗНАК СЕРТИФИКАЦИИ) – Certification Mark is any word, name, symbol, device, or any combination, used, or intended to be used, in commerce by someone other than its owner, to certify regional or other origin, material, mode of manufacture, quality, accuracy, or other characteristics of such person's goods or services, or that the work or labor on the goods or services was performed by members of a union or other organization. / Любое слово, название, символ, эмблема, или любая комбинация, используемые или предполагаемые к использованию в коммерции кем-то иным, нежели их владельцем, для удостоверения или сертификации регионального или иного происхождения, материла, режима производства, качества, точности или иных характеристик товара или услуги такого лица, или того факта, что работа по производству товара или оказанию услуги была проведена членами какого-либо союза или иной организации.

CERTIFICATION PATH = ПУТЬ СЕРТИФИКАЦИИ – Certification Path is an ordered sequence of certificates of entities, which, together with the public key of the initial entity in the path, can be processed to obtain the public key of the final entity in the path.

CERTIFICATION PRACTICE STATEMENT = ОТЧЁТ О ПРАКТИКЕ СЕРТИФИКАЦИИ – Certification Practice Statement (CPS) is a statement of the practices, which a Certification Authority employs in issuing certificates.

CERTIFICATOR = СЕРТИФИЦИРУЮЩИЙ (или ХХ) – In the US Cotton futures trading, a Certificator is one who submits cotton at delivery point for inspection and the United States Department of Agriculture (USDA) classification for possible tender on a futures contract. / В Американской индустрии торговли фьючерсами на Хлопок, .

CERTIFIED CHECK = СЕРТИФИЦИРОВАННЫЙ ЧЕК – Certified Check is a check for which a bank guarantees payment. When the check is certified, it legally becomes an obligation of the banks, and the funds to cover it are immediately from the depositor's account. Check bearing the guarantee of the issuing bank that the drawer has sufficient funds to cover payment of the check. Bank draft or a customer check guaranteed by the bank on which it is drawn. Also known as Marked Check. To facilitate your payments, bank can issue Certified Cheques upon request, provided there are sufficient funds available in your account.

CERTIFIED COPY = СЕРТИФИЦИРОВАННАЯ КОПИЯ – Certified Copy:- copies of original legal documents that contain a raised or impressed seal plus statements about the accuracy and authenticity of the documents.

CERTIFIED PUBLIC ACCOUNTANT = ДИПЛОМИРОВАННЫЙ ПУБЛИЧНЫЙ БУХГАЛТЕР – (1) Certified Public Accountant (CPA) is an accountant who has satisfied the educational, experience and examination requirements of his or her jurisdiction necessary to be certified as a public accountant. CPAs audit financial statements of both publicly and privately held companies. They serve as consultants in many areas, including tax, accounting, and financial planning. They are well-respected strategic business advisors and decisionmakers. CPAs work for public accounting firms – small, medium and large; and for companies in business and industry. Their roles range from accountants to Controllers, to Chief Financial Officers for Fortune 500 companies, and advisors to small neighborhood businesses.

(2) Firms or individuals who submit statements as Certified Public Accountants (CPAs) and firms which are registered members of the American Institute of Certified Public Accountants (AICPA) and who are acceptable to the Membership Committee of the New York Board Of Trade® (NYBOT®). / Нью Йоркской Палаты по Торговли (Нью Йоркского Табло Торговли, если быть более точными). НАЙБЭТ® (NYBOT®).

(3) Accountants or accountant firms registered under the laws of other countries where the requirements for registration are similar to the requirements for a Certified Public Accountant (CPA) certificate in the United States and which accountants or accountant firms are acceptable to the Membership Committee of the NYBOT®. / НАЙБЭТ® (NYBOT®).

CERTIFIED SEEDS = СЕРТИФИЦИРОВАННЫЕ СЕМЕНА – Certified Seed:- (a) Seed of a cultivar that has been verified for its genetic identity and purity by an official seed-certifying agency. Classes of certified seed are foundation, registered, and certified. (b) Class of certified seed that generally is produced from a planting of registered seed, but which also may be produced from foundation or certified seed. Certified Seeds are seeds used for commercial crop production produced from foundation or registered seeds under the regulation of a legally constituted agency. In hybrid Rice, they are first generation seeds produced directly from CMS x restorer lines grown as per certification standards.

CERTIFIED STOCKS = СЕРТИФИЦИРОВАННЫЕ ЗАПАСЫ – Certified Stocks are the stocks of a commodity that have been inspected and found to meet the quality requirements for commodities in order to fulfill the delivery requirements specified by a futures exchange. When certified stocks are delivered, they must be transported to one of half a dozen or so locations that the futures exchange has specified as delivery warehouses. See also Certificated Stocks. Certified Stocks are quantities of grain designated and certificated for delivery by the exchange under its grading and testing regulations, to delivery points and/or warehouses specified and approved for delivery by the exchange. / Смотрите также Сертифицированные Запасы (Certificated Stocks).

CERTIFIED TRUE COPY = ПРАВИЛЬНЫЙ СЕРТИФИЦИРОВАННЫЙ ЭКЗЕМПЛЯР – Certified True Copy is the endorsement of an official document (e.g., Phytosanitary Certificate) by an Authorized Certification Official (ACO) that accurately describes a commodity which entered US commerce from a foreign country.

CERTIFYING OFFICER = СВИДЕТЕЛЬСТВУЮЩИЙ СЛУЖАЩИЙ (или СЕРТИФИЦИРУЮЩЕЕ ДОЛЖНОСТНОЕ ЛИЦО) – In the United States, Certifying Officer is an officer or other employee of a bank, trust company, or credit union, who is expressly authorized by the institution to certify or guarantee signatures. Certifying Officer and Regional Certifying Officer mean a Department of Labor official, or such official's designee, who makes determinations about whether or not to certify labor condition applications.

CERULEAN = ЛАЗУРНОЕ (или НЕБЕСНО–ГОЛУБОЙ) – Cerulean:- resembling the blue of the sky.

CESR = COMMITTEE OF EUROPEAN SECURITY REGULATORS

CESSION = ЦЕССИЯ (или УСТУПКА ТРЕБОВАНИЯ) – (1) Cession is the act of giving up something, usually land, by the agreement in a formal treaty. For example, after a war, a losing country might make a cession of part of its land to the victor. The meaning (and spelling) of the word cession, began with the Latin word meaning 'A Giving Up' and retained that meaning throughout the word's evolution, passing through Old French and Middle English pretty much untouched. We can see its relationship to other words, such as secession, which is the idea of one government breaking away from another, or 'giving up' the connection between them, as happened in our own country and led to the Civil War.

(2) Cession:- the portions of the obligations in an insurance company's policy portfolio that are transferred to a reinsurer. Risk can be transferred to the reinsurer in one of two ways:- proportional or non-proportional. Proportional reinsurance is an arrangement where the insurer and reinsurer share an agreed percentage of both premiums and losses. Non-Proportional reinsurance is a system by which the reinsurer pays only when losses are over an agreed-upon amount. The reinsurance industry has become increasingly sophisticated due to competition within the insurance industry. Reinsurance creates an opportunity for insurer and reinsurers to profit at each others' expense based on the accuracy of the actuarial calculations which price the risk incurred. For example, suppose a reinsurer believes the risk of loss on a certain coverage is less than is actually the case. If an insurer has a more accurate risk model, he can recognize that a reinsurer is undercharging for this coverage. In this case, the insurer simply sells the policies to customers at the higher rate and buys reinsurance at the lower rate, locking in an arbitrage profit. Cession:- a particular risk exposure that is transferred under a reinsurance treaty. Insurance that is reinsured:- the passing of the insurer's risks to the reinsurer against payment of a premium. The insurer is referred to as the Ceding Company or Cedent. Also known as Assignment. / к уступающей компании или цеденту (cedent). Известна также как Уступка Требования (Assignment). Уступка Требования или Цессия, передача кредитором принадлежащего ему права требования другому лицу, которое становится новым кредитором (вместо выбывшего). По Советскому праву Уступка Требования возможна, если это не противоречит закону или договору, а также если передаваемое требование не связано непосредственно с личностью кредитора (например, нельзя уступить право на алименты). Уступка требования осуществляется по соглашению кредитора с лицом, которому это право уступается, независимо от согласия должника. Цессия, от Латинского слова Cessio, означающее Передача, – уступка, передача другим лицам своего права на обладание собственностью, средствами или на их получение. Например, кредитор (цедент) может передать своё право на получение долга другому лицу (цессионарию); используется как обозначение передачи риска на перестрахование. В этом случае перестрахователь выступает в роли цедента, а перестраховщик в роли цессионария.

CESSIONAIRE = ЦЕССИОНАРИЙ – Cessionaire is a term that is used in civil law to refer to a cessionary. A cessionary is a person who receives reassignments or cessions of private obligations from the person who cedes a personal obligation to another person. See also Cedent. Cessionary is a person who receives transfer or cession of a personal obligation from the ceden. / Цессионарий – приобретатель требования. Цессионарий – правопреемник, лицо, которому передаётся право на операции с чем-либо или на собственность. Смотрите также Цедент (Cedent). Цессионарий:- (1) лицо, становящееся кредитором в силу передачи ему права требования; (2) правопреемник, которому передаётся право на операции с финансовыми ценностями или на собственность; (3) страховая компания, принимающая риск на перестрахование (перестрахователь).

CESTUS = СЭСТУС (или ПОЯС, или КУШАК) – Cestus is a hand covering of leather bands often loaded with lead or iron and used by boxers in ancient Rome. / Латинское слово.

CET = CENTRAL EUROPEAN TIME

CET = COMMON EXTERIOR TARIFF

CETA = COMPREHENSIVE ECONOMIC AND TRADE AGREEMENT

CETANE NUMBER = ЦЕТАНОВОЕ ЧИСЛО – Cetane Number is a measure of the ability of diesel fuel to reduce engine knocking. The cetane number plays the same role in diesel engine technology that the octane number plays in conventional automobile engine technology. It is the percentage by volume of cetane which must be added to methylnaphthalene to give the mixture the same resistance to knocking as the diesel fuel sample being tested. Cetane is the name of a hydrocarbon compound whose molecules contain 16 carbon atoms and 34 hydrogen atoms, the 16 carbons being arranged in a long chain. Adding one oxygen atom to cetane produces cetyl alcohol, a waxy compound found in whale oil. The words cetyl and cetane are both derived from the Latin word Cetus for a whale. A measure of the ignitability of diesel fuel. Diesel fuel generally has to meet a cetane number specification of 40. As a measure of performance, the cetane number serves a similar purpose to the octane number of gasoline. The Cetane Number of a diesel fuel is a number equal to the percentage by volume of cetane in a mixture with alpha-methyl-naphthalene having the same ignition quality as the fuel under consideration. / к метилнафталину. 16 атомов углерода и 34 атомов водорода. атом кислорода. цетиловый спирт. восковое содержимое в . Оба слова и цетил и цетан происходят от Латинского слова Сэтус или Цетус (Cetus). Единица измерения воспламеняемости дизельного топлива. в смеси с альфа-метил-нафталеном. Под Цетановым Числом понимается условная количественная характеристика воспламенительных свойств дизельных топлив. Численно равно процентному (по объёму) содержанию цетана, цетановое число которого принято за 100, в его смеси с α-метилнафталином, цетановое число которого равно 0, эквивалентной по воспламенительным свойствам испытуемому топливу при стандартных условиях испытания. Цетан или Гексадекан, предельный углеводород нормального строения $C_{16}H_{34}$ или $CH_3(CH_2)_{14}CH_3$, бесцветная жидкость, $t_{кип}$ 286.5 °C. Цетан служит эталоном при определении цетанового числа дизельных топлив. Под Цетановым Числом понимается показатель воспламеняемости дизельного топлива в двигателе внутреннего сгорания. Цетановое число равно объёмному содержанию цетана в такой его смеси с α-метилнафталином, которая при стандартных условиях испытания имеет одинаковую воспламеняемость с исследуемым топливом. Для быстроходных двигателей цетановое число 40–55 – удовлетворительный показатель топлива.

CF = CENTRAL AFRICAN REPUBLIC

CF = CRUDE FIBER

CFA = COLONIES FRANÇAISES D'AFRIQUE

CFA = COMMUNAUTÉ FINANCIÈRE AFRICAINE

CFA = COMMUNAUTÉS FRANÇAISES D'AFRIQUE

CFA FRANC = СЭ.ЭФ.А. ФРАНК – The CFA Franc is the common currency of 14 African countries which are members of the Franc Zone, namely:- (i) Benin, Burkina, Côte d'Ivoire, Guinea Bissau, Mali, Niger, Senegal and Togo which form the West African Economic and Monetary Union (WAEMU), whose common central bank is the Central Bank of West African States (BCEAO); and (ii) Cameroon, Central African Republic, Congo, Gabon, Equatorial Guinea and Chad which form the Central Africa Economic and Monetary Community (CEMAC), whose common central bank is the Bank of Central African States (BEAC). The CFA Franc was created on 1945-December-26, the day when France ratified the Bretton Woods agreement and made its first declaration of parity to the IMF. At that time, it was standing for Franc des Colonies Françaises d'Afrique (Franc of the French Colonies of Africa). In 1958, it becomes Franc de la Communauté Française d'Afrique (Franc of the French Community of Africa). Nowaday, the denomination CFA Franc means Franc de la Communauté Financière d'Afrique (franc of the African Financial Community) for WAEMU member States, and Franc de la Coopération Financière en Afrique Centrale (Franc of Financial Cooperation in Central Africa) for countries belonging to the BEAC area. Parity of the CFA Franc:- (i) creation of the CFA Franc on 1945-December-26 – 1.00 CFA Franc = 1.70 French Franc; (ii) devaluation of the French Franc on 1948-October-17 – 1.00 CFA Franc = 2.00 French Francs; (iii) institution of the new French Franc in 1958 – 1.00 CFA Franc = 0.02 French Franc; and (iv) devaluation of the CFA Franc on 1994-January-12 – 1.00 CFA Franc = 0.01 French Franc. Convertibility:- (i) guaranteed in French Francs by the French Treasury; (ii) possible in foreign currencies on the Paris exchange market, with the French Franc as standard; (iii) total freedom of transfer within the Franc Zone; (iv) repurchase of CFA banknotes suspended since 1993-August-02 (previously and until 1993-August-01, the convertibility of banknotes was free and unlimited); and (v) repurchase of CFA banknotes between the WAMU zone and BEAC zone suspended as from September 1993. Between 1945 and 1958, CFA stood for Colonies Françaises d'Afrique (French Colonies of Africa); then for Communauté Française d'Afrique (French Community of Africa) between 1958 (establishment of the French Fifth Republic) and the independence of these African countries at the beginning of the 1960s. Since the time of their independence, CFA can have two meanings. The CFA Franc was created on 1945-December-26, along with the CFP Franc. The reason for their creation was the weakness of the French Franc immediately after World War II. When France ratified the Bretton Woods Agreement in December 1945, the French Franc was devalued in order to set a fixed exchange rate with the US Dollar. New currencies were created in the French colonies to spare them the strong devaluation. The West African CFA Franc (XOF) is just known in French as the Franc CFA, where CFA stands for Communauté Financière d'Afrique (Financial Community of Africa). It is issued by the BCEAO (Banque Centrale des États de l'Afrique de l'Ouest, i.e. Central Bank of the West African States), located in Dakar, Sénégal, for the 8 countries of the UEMOA (Union Économique et Monétaire Ouest Africaine, i.e. West African Economic and Monetary Union):- Benin, Burkina Faso, Côte d'Ivoire, Guinea-Bissau, Mali, Niger, Sénégal, and Togo. The Central Africa CFA Franc (XAF) is just known in French as the Franc CFA, where CFA stands for Coopération Financière en Afrique Centrale (Financial Cooperation in Central Africa). It is issued by the BEAC (Banque des États de l'Afrique Centrale, i.e. Bank of the Central African States), located in Yaounde, Cameroon, for the 6 countries of the CEMAC (Communauté Économique et Monétaire de l'Afrique Centrale, i.e. Economic and Monetary Community of Central Africa):- Cameroon, Central African Republic, Chad, Republic of the Congo, Equatorial Guinea, and Gabon. Equatorial Guinea, the only former Spanish colony in the zone, adopted the CFA in 1984. Strictly speaking, there actually exist two different currencies called CFA Franc:- the West African CFA Franc (ISO 4217 currency code XOF), and the Central Africa CFA Franc (ISO 4217 currency code XAF). They are distinguished in French by the meaning of the abbreviation CFA. These two CFA Francs have the same exchange rate with the Euro (EUR1.00 = XOF655.957 = XAF655.957), and they are both guaranteed by the French Treasury (Trésor public), but the West African CFA Franc cannot be used in Central African countries, and the Central Africa CFA Franc cannot be used in West African countries. The CFA Franc was created with a fixed exchange rate versus the French Franc. 1999-January-01 onward – 100.00 CFA Franc = 0.152 449 Euro or 1.00 Euro = 655.957 CFA Franc. (1999-January-01:- Euro replaced FRF at the rate of 6.55957 FRF for 1.00 Euro). The ISO currency codes are XAF for the Central African CFA Franc and XOF for the West African CFA Franc. It has a fixed exchange rate to the Euro:- 100.00 CFA Francs = 1.00 French (nouveau) Franc = 0.152 449 Euro; or 1.00 Euro = 655.957 CFA Francs. Although Central African CFA Francs and West African CFA Francs have the same monetary value against other currencies, West

African CFA coins and banknotes are not accepted in countries using Central African CFA Francs, and vice versa. / В то же время он воспринимался как Франк Французских Колоний Африки или, как это звучит на Французском, Франк дэ Колони Франсэз д'Африк' (Franc des Colonies Françaises d'Afrique). В 1958 он стал Франком Французского Сообщества Африки или, как это звучит на Французском, Франк дё ля Коммюноте Франсэз д'Африк' (Franc de la Communauté Française d'Afrique). В настоящие дни обозначение Сэ.Эф.А. Франк (CFA Franc) означает Франк Финансового Сообщества Африки, или как это звучит на Французском, Франк дё ля Коммюноте Финансьер д'Африк' (Franc de la Communauté Financière d'Afrique) . С 1945 по 1958 КФА (CFA) озбозначало сокращение для Французских Колоний Африки или, как это звучит на Французском, Колони Франсэз д'Африк' (Colonies Françaises d'Afrique); затем для Французского Сообщества Африки или, как это звучит на Французском, Коммюнотэ Франсэз д'Африк' (Communauté Française d'Afrique). Финансовое Сообщество Африки или, как это звучит на Французском, Коммюнотэ Финансьер д'Африк' (Communauté Financière d'Afrique). Он выпускается Центральным Банком Западно-Африканских Государств или, как это звучит на Французском, Банк Сантраль деЗета дё л'Яфрик' дё л'Юэст (Бэ.Сэ.Ё.А.О.; Banque Centrale des États de l'Afrique de l'Ouest (BCEAO)), расположенном в Дакаре, Сенегал, для 8 стран ЗАЭВС (Западно-Африканского Экономического и Валютного Союза или, как это звучит на Французском, Юньон Экономик э Монэтэр Уэст Африкэн (У.Ё.Эм.О.А.; Union Économique et Monétaire Ouest Africaine (UEMOA)):- Бенина, Буркина Фасо, Гвинеи Бисау, Кот д'Ивуара, Мали, Нигера, Сенегала, и Того. Финансовая Кооперация в Центральной Африке или, как это произносится на Французском языке по месту дислокации, Кооперасьён Финансьер ан Африк' Сантраль (Coopération Financière en Afrique Centrale). It is issued by the Банком Центрально-Африканских Государств (БЦАГ) или, как это произносится на Французском языке по месту регистрации, Банк дезЕта дё л'Яфрик' Сантраль (Бэ.Ё.А.Сэ.; Banque des États de l'Afrique Centrale (BEAC)), расположенном в Яунде, Камерун, для 6 стран Экономического и Валютного Сообщества Центральной Африки (ЭВСЦА) или, как это произносится на Французском языке по месту регистрации, Коммюноте Економик э Монетэр дё л'Яфрик' Сантраль (Сэ.Ё.Эм.А.Сэ.; Communauté Économique et Monétaire de l'Afrique Centrale (CEMAC)):- . Гарантированы Казначейством Франции или Трезор Пюблик (Trésor public). Западно-Африканский Сэ.Эф.А. Франк (Икс.О.Эф. или КсОФ) CFA Franc (XOF). Икс.А.Эф. или КсАФ (XAF). откуп банкнот Сэ.Эф.А. . Нуво Франк (Nouveau Franc). Обозначение . Сэ.Эф.А. Франк (в обиходе Африканский Франк) является денежной единицей 13 Африканских стран, входивших в валютную зону Французского Франка. Первоначально при его введении в обращение в 1945 обозначение Сэ.Эф.А. складывалось из начальных букв Французских слов Колони Франсэз д'Африк' (Colonies Françaises d'Afrique, означающие Французские Колонии Африки), с завоеванием бывшими колониями независимости во второй половине 1960-х оно стало расшифровываться как Коммюнотэ Финансьер д'Африк' (Communauté Financière d'Afrique, означающие Финансовое Сообщество Африки) и Кооперасьён Финансьер ан Африк' Сантраль (Coopération Financière en Afrique Centrale, означающие Финансовая Кооперация в Центральной Африке). То есть в двух последних названиях на Французском языке это обозначение осталось неизменным. Под Финансовым Сообществом Африки предполагалось сообщество 7 стран Западной Африки:- Бенин, Буркина Фасо, Кот д'Ивуар, Мали, Нигер, Сенегал и Того. Под Финансовой Кооперацией в Центральной Африке предполагалось сообщество из 6 стран Центральной Африки:- Габон, Камерун, Конго, Центрально-Африканская Республика, Чад и с 1984 Экваториальная Гвинея. Денежные знаки, имеющие хождение в странах Западной и Центральной Африки, различаются по внешнему виду, но имели одинаковое соотношение с Французским Франком (50 Франков Сэ.Эф.А. = 1 Французскому Франку) и другими валютами.

CHADOR = ЧАДРА – Chador is a large cloth worn as a combination head covering, veil, and shawl by Muslim women especially in Iran. / одеваемая Мусульманками особенно в Иране.

CHAETOTAXY = ХЕТОТАКСИЯ – Chaetotaxy is the arrangement of bristles in an insect's body.

CHAFE = ИСТИРАТЬСЯ (или ПЕРЕТИРАТЬСЯ, или ИЗНАШИВАТЬСЯ) – Chafe (maritime term):- to wear the surface of a rope by rubbing against a solid object.

CHAFE = ПОТЁРТОСТЬ (или ССАДИНА) – Chafe:- become damaged as a result of abrasion. Chafe:- (1) to wear or abrade by rubbing:- he chafed his shoes on the rocks; and (2) to make sore by rubbing:- her collar chafed her neck. Chafe:- to become worn or sore from rubbing:- his neck began to chafe from the starched collar. / становится повреждённым в результате истирания. протирание или притирка (rubbing). Под Истёртым Местом понимается местный порок в виде разворсованного или разрушенного места. Под Потёртостью понимается воспалительная реакция кожи (отёчность, покраснение) при длительном трении или давлении обувью, одеждой.

CHAFED END = ИСТЁРТАЯ ПРОДОЛЬНАЯ НИТЬ (или ПОТЁРТАЯ ПРОДОЛЬНАЯ НИТЬ) – Chafed End is a warp end that has been abraded during processing. It generally appears as a dull yarn often containing broken filaments.

CHAFED YARN = ИСТЁРТАЯ ПРЯЖА (или ПОТЁРТАЯ ПРЯЖА) – Chafed Yarn (abrasion yarn):- a defect that is subject to wear and tear of the yarn, the yarn will be worn after the loss of sense of direction and to make the yarn fiber distortion. This deficiency will affect the color of the yarn can be, and often lead to radial flowers article or the generation of zonal streaks. Fabric Printing Defect. / (истёртая пряжа) . Порок или Дефект набивки тканей.

CHAFE MARK = ОТМЕТИНА ОТ ИСТИРАНИЯ (или ОТМЕТИНА ОТ НАТИРАНИЯ) – Chafe Mark or Abrasion Mark:- an area of localized wear characterized by excessive surface hairiness or denuded fiber. This defect is often caused by chafing or oblique impact with a hard or rough surface. See also Abrasion Mark. Abrasion Mark is an area where a fabric has been damaged by friction.

CHAFER FABRIC = ТКАНЬ ЧЭФЁ – Chafer Fabric is a fabric, coated with unvulcanized rubber, that is wrapped around the bead section of the tire before vulcanization of the complete tire. The purpose of the chafer fabric is to maintain an abrasion-resistant later of rubber in contact with the wheel on which the tire is mounted.

CHAFFY WOOL = ЗАКОСТРЕННАЯ ШЕРСТЬ (или МЯКИННАЯ ШЕРСТЬ, или НЕПРИГОДНАЯ ШЕРСТЬ) – Chaffy Wool is a wool containing a considerable amount of chaff – finely chopped straw. / костра (chaff) – рубленое или нарезанное .

CHAFING GEAR = (ЗАЩИТНАЯ) ОБМОТКА (или ФАРТУК) – Chafing Gear (maritime term):- a guard of canvas or rope put around spars, mooring lines, or rigging to prevent them from wearing out by rubbing against something. / Приспособление для предохранения тросов от перетирания.

CHAIKIN MONEY FLOW = ДЕНЕЖНЫЙ ПОТОК ЧЭЙКИНА – In technical analysis, an oscillator that helps signal if a stock is undergoing accumulation or distribution. It is calculated from the delay readings of the Accumulation Distribution Line (ADL). The Chaikin Money Flow (CMF) is unlike a momentum oscillator in that it is not influenced by the daily price change. Instead, the indicator

focuses on the location of the close relative to the range for the period (daily or weekly). See also Chaikin Oscillator. Chaikin Money Flow is another popular indicator by Marc Chaikin based on the Accumulation Distribution line.The Chaikin Money Flow indicator often warns of breakouts and provides useful trend confirmation. Chaikin Money Flow (also referred to as CMF) measures Money Flow Volume over a period, typically 20 or 21 days. The indicator oscillates above and below the zero line which indicates a bullish or bearish trend. Money Flow Volume is also used to calculate Chaikin's Accumulation/Distribution (AD). Chaikin Money Flow is an oscillator based on the concept that that buying support is normally demonstrated by increased volume and repeated closes in the top half of the daily range and that selling pressure is shown by increased volume and recurrent closes in the lower half of the daily range. Rising prices typically accompany buying support and decreasing prices usually occur with selling pressure. The end result is a picture of how money is flowing into or out of a stock. To determine the CMF one must first determine the Close Location Value (CLV) as follows:- CLV = (($Close_1$ – Low_1) – ($High_1$ – $Close_1$)) / ($High_1$ – Low_1). The next step is to take the CLV and determine the CMF, as follows:- CMF = ($\Sigma^{t}_{t=20}CLV_t$ x $Volume_t$) / $\Sigma^{t}_{t=20}(Vol_t)$. Marc Chaikin is a stock analyst and Founder and CEO of Chaikin Stock Research, LLC. He is also the founder of Bomar Securities LP, which was sold to Instinet Corp. in 1992. He then went on to become Senior Vice President and Director at Instinet when owned by Reuters.com. Chaikin Analytics, a Philadelphia stock market analytics firm, produces Chaikin Power Tools. The firm was founded by its namesake Marc Chaikin, who spent over forty years developing stock market tools for institutional investors. The tools utilize algorithms to estimate the future direction of stock prices for individual investments, with basic app models offered to investors free of charge. These apps are offered in conjunction with OptionsXpress, a subsidiary of Charles Schwab. Chaikin Analytics, LLC (formerly Chaikin Stock Research) is a company founded by Marc Chaikin that produces tools utilized by individuals in the financial markets industry based upon Chaikin Indicators. Headquartered in Philadelphia, State of Pennsylvania (PA), the United States. / Марк Чэйкин (или Хайкин; Marc Chaikin). Ройтас (Reuters). Корп. (Corp.). В техническом анализе биржевых рынков осциллятор, который помогает сигнализировать о происходящем нарастании или затухании. Он рассчитывается на основе показателей задержки Линии Нарастания Затухания (ЛНЗ; Accumulation Distribution Line (ADL)). На Денежный Поток Чэйкина в отличие от осциллятора момента не влияет посуточное изменение цены. Вместо этот индикатор фокусируется на положении закрытия относительно некоторого диапазона изменений для периода (посуточного или понедельного). Смотрите также Осциллятор Чэйкина (Chaikin Oscillator). Денежный Поток Чэйкина является ещё одним популярным индикатором, разработанным Марком Чэйкиным (Marc Chaikin) и основанным на Линии Нарастания Затухания (ЛНЗ) (Accumulation Distribution Line (ADL)). Индикатор Денежный Поток Чэйкина часто предупреждает о пробоях и обеспечивает полезное подтверждение тенденции.

CHAIKIN OSCILLATOR = ОСЦИЛЛЯТОР ЧЭЙКИНА – Chaikin Oscillator:- in technical analysis, this is a moving average of the Accumulation Distribution Line (ADL). It was developed by Marc Chaikin. It is created by subtracting a 10 period exponential moving average of the accumulation/distribution line from a 3 period exponential average of it. See also Chainkin Money Flow. The Chaikin Oscillator was developed in the 1970s. The indicator is based upon the momentum of the Accumulation/Distribution (AD). AD calculates the position of a stock's daily closing price as a fraction of the daily price range of the stock – a fraction that is multiplied by the daily volume in order to quantify the net accumulation or distribution of a stock. AD is expressed mathematically as:- AD = cum (((C – L) – (H – C)) / (H – L)) x V; where AD represents the Accumulation/Distribution cumulative total running line, cum is an instructive abbrevation meaning 'calculate a cumulative total running line', C is the daily closing price, H is the daily high price, L is the daily low price, and V is the daily total volume. The Chaikin Oscillator is then measured as the difference between the 3-day exponential moving average (EMA) of the AD to the 10-day EMA of the AD. Chaikin Oscillator signals are made when crossing above or below the zero line or when bullish/bearish departures take place. These signals anticipate the change in direction of the AD. Stock Analysts will observe a Chaikin Oscillator graph to look for the signal to buy or sell a stock. Marc Chaikin's Chaikin Oscillator monitors the flow of money in and out of the market. Chaikin Oscillator is an oscillator which measures the accumulation distribution line of the MACD. The Chaikin Oscillator is calculated by subtracting a 10-day EMA from a 3-day EMA of the accumulation distribution line, and outlines the momentum implied by the accumulation distribution line. This indicator is named after its creator, Marc Chaikin. The goal of the Chaikin line is to recognize moving momentum levels within the MACD, more specifically the accumulation distribution line, in hopes of being able to act on said momentum. By being able to recognize momentum, technical traders hope that the momentum is the first step in the development of a trend that they can capitalize upon. / В техническом анализе биржевых рынков, . Линии Нарастания Затухания (ЛНЗ; Accumulation Distribution Line (ADL)).

CHAIKIN'S VOLATILITY = ЛИХОРАДОЧНОСТЬ ПО ЧЭЙКИНУ – Chaikin's Volatility:- calculate the exponential moving average of the difference between the daily high and low, lets call this 'range'. Volatility = Range Now minus Range n Days Ago / Range n Day's Ago. / Лихорадочность По Чэйкину:- рассчитайте экспоненциальное скользящеее среднее значение разницы между максимальной и минимальной ценой в течение дня, так называемый 'Диапазон'. Лихорадочность = Текущий Диапазон минус Диапазон n Дней Назад / Диапазон n Дней Назад.

CHAIN BINDERS = ЦЕПНЫЕ КРЕПЛЕНИЯ (или ЦЕПНЫЕ ЗАЖИМЫ, или СЦЕПЩИКИ, или ЦЕПНЫЕ РАСТЯЖКИ, или ЦЕПНЫЕ ОБВЯЗКИ) – (1) Chain Binders:- chain locking device used to secure cargo to a flat bed container.

(2) Chain Binders are the yarns running in the warp direction on the back of a woven carpet which hold construction yarns together.

CHAIN CONVEYOR = ЦЕПНОЙ КОНВЕЙЕР (или ЦЕПНОЙ ТРАНСПОРТЁР) – Chain Conveyor is a conveyor consisting of two or more strands of chain running in parallel tracks with the loads carried directly on the chains. / Конвейер или Транспортёр (нерекомендуемое название конвейера) – машина непрерывного действия для перемещения кусковых, сыпучих или штучных грузов. Основной классификационный признак конвейера – тип тягового и грузонесущего органов. Различают конвейеры с канатным, ленточным, цепным и другими тяговыми органами и конвейеры без тягового органа (вибрационные, винтовые, инерционные, роликовые). По типу грузонесущего органа конвейеры могут быть ленточными, пластинчатыми, скребковыми, тележечными и другими. Наиболее распространены ленточные конвейеры с грузонесущей резиновой или стальной лентой, движущейся со скоростью 1–8 м/с. Ленточный Конвейер – конвейер, у которого грузонесущим и одновременно тяговым органом является гибкая лента из прорезиненной ткани, тонкого стального цельнокатаного полотна или плетёная из стальной проволоки. Ленточные конвейеры используются во всех отраслях промышленности, сельского хозяйства, в строительстве для транспортирования различных сыпучих материалов и штучных грузов. Ленточные конвейеры часто объединяют в конвейерные линии, длина которых достигает 10–12 км и более при длине в одном ставе до 4.5 км.

CHAIN DYEING = ЦЕПНОЕ КРАШЕНИЕ – Chain Dyeing is a method of dyeing yarns and fabrics of low tensile strength of tying them endto- end and running them through the dyebath in a continuous process. See also Dyeing.

CHAINED DOLLARS = С УВЯЗКОЙ К ДОЛЛАРУ – Chained Dollars:- in the United States, a measure used to express real prices. Real prices are those that have been adjusted to remove the effect of changes in the purchasing power of the Dollar; they usually reflect buying power relative to a reference year. Prior to 1996, real prices were expressed in constant Dollars, a measure based on the weights of goods and services in a single year, usually a recent year. In 1996, the US Department of Commerce introduced the

chained-Dollar measure. The new measure is based on the average weights of goods and services in successive pairs of years. It is 'chained' because the second year in each pair, with its weights, becomes the first year of the next pair. The advantage of using the chained-Dollar measure is that it is more closely related to any given period and is therefore subject to less distortion over time.

CHAINED VOLUME MEASURES = СВЯЗАННЫЕ МЕРЫ СТОИМОСТИ – Chained Volume Measures are time series which measure GDP in real terms, i.e. excluding price effects.

CHAINETTE FRINGE = БАХРОМА ШЭНЭТ (или ЗАЦЕПЛЯЮЩАЯСЯ БАХРОМА) – Chainette Fringe is a yarn fringe designed to resemble chain. It is used as a trimming or window shades. / Под Шэнэт, от Французского слова Chainette, означающее Подвеска или Слабина или Тамбурная Строчка или Цепочка, понимается .

CHAIN LOCKER = ЦЕПНОЙ ЯЩИК – Chain Locker (maritime term):- a compartment forward where the chain cable is stowed.

CHAINS AND BINDERS = ЦЕПИ И ЗАЖИМЫ (или КРЕПЛЕНИЯ) – Chains And Binders:- equipment used to secure (brace & chock) oversized cargo to equipment. / Под Цепью понимается гибкое изделие из отдельных твёрдых звеньев, шарнирно соединённых между собой. Различают:- приводные цепи для передачи движения, тяговые цепи для перемещения грузов и грузовые цепи для подвески и подъёма грузов.

CHAIN STITCH EDGE = КРАЙ ЦЕПНОГО СТЕЖКА – Chain Stitch Edge are produce mostly on shuttle-less narrow fabric weaving machine weaving machine in which the pick is inserted by means of a needle. These machines run at a very high speed and the mechanism for forming chain does not affect high production operation. The chain stitch has not yet been used on wide weaving machines.

CHAIRMAN = ПРЕДСЕДАТЕЛЬ – (1) Chairman is a person who chairs a meeting. Also known as Chair or Chairperson.

(2) Chairman is the most senior director of a company, full title Chairman of the Board of Directors. Chairman of the Board, or one duly authorized to act with the authority of the Chairman of the Board. / Председатель Совета Директоров или тот, кто должным образом уполномочен исполнять полномочия Председателя Совета Директоров.

CHALCIDOIDEA = ХАЛЬЦИДОИДЭА – Chalcidoidea are animals belonging to superfamily Apocrita of order Hymenoptera that have reduced wing venation, pronofum separated from tegula by the prepectus, no subantennal groove, and hind tibia without a spur reduced for preening. / жёлоб или паз (groove).

CHALFIS = ШАЛЬФИ (или ХХ) – Chalfis is one of the softest fabrics made, it is named for the AngloIndian term Shalee, meaning soft. It is a fine, light-weight, plain-weave fabric, usually made of wool, cotton, or man-made fibers. Challis was traditionally printed with vivid floral patterns on dark grounds or with paisley designs, but now is produced in darker tones of allover prints and solid colors, in the finest quality fabrics. It is normally used for neckties, dresses, blouses, scarves, bed jackets, and infants' sacques.

CHALKINESS = МЕЛОВИДНОСТЬ – (1) Chalkiness:- (1) a dull, whitened appearance sometimes associated with certain extra-dull colors. (2) A fillingwise fabric defect observed as bands varying luster or sheen.

(2) Chalkiness:- if part of the milled Rice kernel is opaque rather than translucent, it is often characterized as 'chalky'. Chalkiness disappears upon cooking and has no effect on taste or aroma, however it downgrades milled Rice. Excessive chalkiness is caused by interruption during the final stages of grain filling. Though chalkiness disappears upon cooking and has no direct effect on cooking and eating qualities, excessive chalkiness downgrades the quality and reduces milling recovery.

CHALKING = ПОКРЫТИЕ МЕЛОМ – Chalking is the formation of a powdery coating on the surface of a paint film caused by disintegration of the binding medium by action of the weather. Characteristics – Distinguishing features which, by their extent, number and character, determine the quality of a piece of lumber. / .

CHALK STRIPES = МЕЛОВЫЕ ПОЛОСЫ – Chaik Stripes are the narrow white stripes usually on a dark colored ground fabric. See also Pinstripe.

CHALKY FILLING = МЕЛОВАЯ УТОЧИНА – Chalky Filling:- Fabric:- Alpaca-type dress goods; Construction:- (i) Count:- 68 x 52; (ii) Warp:- 50/1 combed cotton; (iii) Filling:- 150/40 bright viscose rayon; Finish:- plain dyed brown. Defect:- short 'chalky' or dull spots in the filling. Analysis:- microscopic examination revealed that the short 'chalky' spots were actually minute sections in which the filling yarn had been highly twisted, with the result of less light reflection than was given by the normally twisted sections. As the weaving mill was using the yarn as received from the producer without adding twist, it was concluded that these unevenly twisted places were introduced in the manufacture of the rayon. / пятна.

CHALKY KERNELS = МЕЛОВАЯ ЗЕРНОВКА (или МЕЛОВЫЕ ЯДРА) – Chalky Kernels are whole or large broken kernels of Rice which are one-half or more chalky. Chalky Kernels mean non-glutinous Rice kernels that have an opaque area like chalk covering the kernels from 50% onward. / означают неглютинозные ядра Риса, имеющие . В России, к меловым относят зёрна Риса, у которых половина и более поверхности имеют непрозрачный внешний вид, подобный мелу. Меловая Зерновка или Меловые Ядра:- обработанные зёрна Риса, целые и дроблёные, у которых половина или более поверхности имеет непрозрачный внешний вид, похожий на мел. Это недоразвитые (недозревшие) зёрна, которые имеют мучнистую (меловую) консистенцию и на разрезе. Они легко разрушаются при надавливании. Ухудшают качество Риса при готовке.

CHALLIS = ЧАЛЛИС (или ШАЛИ) – Challis is a lightweight, soft plain weave fabric with a slightly brushed surface. The fabric is often printed, usually in a floral pattern. Challis is most often seen in fabrics made of cotton, wool, or rayon. Châly (Шаль) from Hindi Shal, from English Shawl. Challis is a type of plain-weave fabric, usually made from cotton, wool or rayon, often printed with a design, often floral. Used to make dresses, skirts and other articles of clothing. Challis is a very soft, lightweight, plain-weave fabric, usually printed with a delicate floral pattern. The name is derived from the Anglo-Indian term 'Shalee' meaning soft. Challis (or Chalys):- wool-also made in cotton, hair fiber, rayon, and a silk warp and worsted filling. Plain weave. Anglo-Indian word 'Shallee' meaning soft. Soft, very lightweight. May be dyed or printed with a delicate floral pattern, paisleys, or geometric patterns and faint designs. Often washable. Originated in Norwich England in 1832. Generally used in women's and children's dresses and blouses, comforters, kimonos, neckties, and sportswear. In slacks or shorts it would have to be lined. / уточина. Под Чаллис или Шали, от Французского слова Châly, означающее Шаль, понимается шерстяной муслин крашеный или набивной. Штапельная имитация муслина; муслин из штапельного волокна.

CHAMBER = КАМЕРА (или ПОЛОСТЬ) – Chamber is a hollow space. Hence:- Chambered:- with hollow spaces. / В ботанике под Камерой, от позднелатинского слова Camera, означающее Комната или Палата, понимается .

CHAMBER OF SHIPPING OF AMERICA = ПАЛАТА СУДОХОДСТВА АМЕРИКИ – The Chamber of Shipping of America (CSA) will be recognized as the definitive organization representing owners, operators, and charterers of US and foreign flag ocean going

vessels, before US and international regulatory, legislative and administrative entities as well as the public at large. Founded in 1917, the Chamber of Shipping of America (CSA) is an organization representing US owners, operators and charterers of US and foreign-flag ocean-going vessels. CSA promotes sound public policy regarding marine safety, maritime security and environmental protection; and, supports the domestic maritime industry and promotes open international trade. The Chamber of Shipping of America will:- (i) represent members' interests with US and international legislative, regulatory and administrative entities as well as the public at large; (ii) provide the voice of the US maritime industry in promoting sound public policy through legislative and regulatory initiatives that include safety, security and environmental protection; (iii) cooperate with environmental groups, standards organizations, technical associations and professional societies, among others; and (iv) provide professional technical expertise, marine experience and knowledge, in order to be an authoritative and effective forum for US maritime issues. Headquartered in Washington, DC, the United States. The Chamber of Shipping of America (CSA) represents US based companies that either own, operate or charter oceangoing tank, container, or dry bulk vessels engaged in both the domestic and international trades and companies that maintain a commercial interest in the operation of such oceangoing vessels. Current members include companies that own or operate US flag or foreign-flag vessels. A company owning or operating only foreign-flag tonnage must have an office in the United States to qualify for membership. The Chamber of Shipping of America (CSA) represents US based companies that either own, operate or charter oceangoing tankers, container ships, chemical ships, dry bulk vessels, integrated tug barge units and other merchant vessels engaged in both the domestic and international trades or maintain a commercial interest in the operation of such oceangoing vessels. CSA is active in representing its members before the US Congress and administrative agencies such as the Coast Guard, Environmental Protection Agency and Customs Service. CSA sits on the US delegation to the International Maritime Organization in London, enjoying a direct input to the decisions of the US delegate. CSA is the US ship owner representative to the International Labor Organization. Two categories of membership in CSA are available. Full membership is open to any company that has a substantial presence in the US and owns, operates or charters vessels. Associate membership is open to companies who are not qualified for full membership yet have an interest in one or more of the issues addressed by the organization. The Chamber of Shipping of America will be recognized as the definitive organization representing owners, operators, and charterers of US and foreign flag ocean going vessels, before US and international regulatory, legislative and administrative entities as well as the public at large. The Chamber of Shipping of America will be recognized as the definitive organization representing owners, operators, and charterers of US and foreign flag ocean going vessels, before US and international regulatory, legislative and administrative entities as well as the public at large. Mission:- the Chamber of Shipping of America will:- (i) represent members' interests with US and international legislative, regulatory and administrative entities as well as the public at large. This includes the US Congress, US Coast Guard, Customs and Border Protection, Department of Homeland Security, Environmental Protection Agency, International Maritime Organization, International Labor Organization and others. (ii) Provide the voice of the US maritime industry in promoting sound public policy through legislative and regulatory initiatives that include marine safety, maritime security and environmentally protective operating principles. (iii) Cooperate with environmental groups, standards organizations, technical associations and professional societies, among others. (iv) Support a viable domestic maritime industry and promote open international trade in shipping services. (v) Provide strong technical expertise, marine experience and knowledge, in order to be an authoritative and effective forum for US maritime issues. (vi) Offer associate membership to marine service providers and other entities with compatible interests in marine industry matters. Strategy:- in support of its Mission, the Chamber of Shipping of America will:- (i) promptly and thoroughly inform its members of issues affecting the ocean going maritime industry arising internationally and in the United States; (ii) aggressively pursue the members' interests on legislative, regulatory and administrative matters; (iii) inform the American public and media about the maritime industry to raise their appreciation of this valuable national asset; (iv) establish and maintain relationships with legislative and regulatory officials, members of the media, persons in the international maritime community and other influential persons; and (v) develop goals with respect to the issues before it and be responsible for measurable results.

CHAMBRAY = ШАМБРЭЙ – Chambray is:- (1) a plain-woven fabric with an almost square count (80 x 76), a colored warp, and a white filling, that gives a mottled, colored surface. The fabric is named for Cambrai, France, where it was first made for sunbonnets. Although chambray is traditionally woven, the look itself is so popular it is imitated in knitting. It is similar in appearance to denim but much lighter in weight. It is used for women's and children's summer dresses and men's shirts. (2) A cotton print cloth made of yarn-dyed yarns that can also be woven in patterns and woven in stripes. (3) A similar but carded-yarn fabric used for work clothes and children's play clothes. See also Denim. (1) Chambray is a plain woven-spun fabric, almost square (i.e. 80 x 76), with a colored warp and a white filling. Lightweight chambrays are used for shirts, dresses, and children's clothes. (2) Chambray is a similar but heavier fabric of carded yam, used for work clothing. Chambray is a smooth, durable cloth made of a dyed warp and unbleached or white filling, featured by an all-white selvage. It is made of carded or combed yarn, and is somewhat on the order of gingham. Plain weave or dobby designs on a plain-weave ground are the constructions used to make this material, which is one of the most popular staples in the cotton trade. The cloth, which is much used for shirting, shorts, and dresses, is often made with an end-and-end arrangement; the warp plan is made up of alternate ends of colored and white yarn instead of being all one color. This same effect is used in broadcloth and Madras shirting. Chambray is made with a texture of about 80 x 76, or may be constructed with a square pick count. Cheaper cloth is used in children's dresses. This sturdy cloth is attractive either in plain or mottled effect, is easy to manipulate into a garment, wears very well, and gives good results in laundering. See also Cambric. Chambray is a general class of plain weave, usually cotton, made with a colored warp and white weft. Chambray:- made of Cotton. Weave:- plain weave or dobby designs on a plain-weave ground. Made with a dyed warp and a white or unbleached filling. Both carded and combed yarns used. Has a white selvedge. Some woven with alternating white and colored warp. 'Faded' look. Has very soft coloring. Some made with stripes, checks or embroidered. Smooth, strong, closely woven, soft and has a slight lustre. Wears very well, easy to sew, and launders well. If not crease resistant, it wrinkles easily. Originated in Cobrai, France, where it was first made for sunbonnets. Chambray is a plain woven fabric that can be made from cotton, silk, or manufactured fibers, but is most commonly cotton. It incorporates a colored warp (often blue) and white filling yarns. Chambray is a light-weight, single cloth fabric, that is always woven with a plain weave and always has a white selvedge. It is a staple fabric of many years' standing, being next in the line of cotton goods after the better grades of gingham. In effect it is a cloth having but one color in the warp, and woven with a white filling, this combination producing a solid color effect, the white filling having the chance of reducing any harshness of warp color in the cloth. Composition:- Chambray is composed of one warp and one filling, either all cotton, cotton and silk, or all silk. It is made 27 to 30 inches in width and of 1/30's cotton warp to 1/60's silk, the count of yarn being governed by the weight per yard desired. The weight' per finished yard is 2 to 3% ounces. Good Colors for the warp are navy blue, dark brown, pink, lavender, black, nile green, etc. This fabric is woven on any and all plain, looms that will wewe other light-weight cloths, the lightest running looms being the best on account of being easier on the fine warp yarns employed. It can be woven successfully on the Mutual or Fair-mount, Mason, Colvin, Lowell and other roller looms. Chambray, when made of cotton warp and filling, receives a regular gingham finish, and the loom width can be restored to the goods during the finishing by the process of ten-tering. Tentering means the running of the goods over a machine, fitted underneath with a series of coils of steam pipe; the top of rjhe machine is fitted with an endless chain (on either side). This chain has a row of steel needles-standing erect upon its face. These chains are adjustable. This-permits of altering the space between the chains, the idea being to set the chain the width desired, and as the machine runs, pass the needles through either selvedge, and the cloth is stretched to the width desired. To finish chambray, first

run through the sprinkler, then through a solution of warm size, to stiffen the fabric. After the sizing the good's are tentered, to widen and partly dry them, then run through the cylinders to complete drying and last the calender to remove wrinkles, and to produce smooth, evenly ironed finish. Chambray is a type of cotton popularly used in the manufacture of blue work shirts, and is where we get the term 'Blue-Collar'. Chambray is a fine, lightweight fabric that is woven with white threads across a colored warp. It tends to have a frosted appearance. Heavier chambrays are typically used for work clothes, while lighter chambrays are used for dresses and children's clothing. / крапчатый эффект (mottled effect). уточина. Под Шамбрэй понимается, как правило, двухцветная хлопчатобумажная ткань полотняного переплетения, почти квадратного (то есть 80 х 76 нитей на дюйм), с окрашенной основой (чаще голубого цвета) и белым утком. Шамбрэй вырабатывается также и из шёлка или искусственного волокна. Легковесные ткани шамбрэй используются при пошиве рубашек, платьев и детской одежды.

CHAMELEON = ХАМЕЛЕОН – Chameleon is a variable multicolored effect achieved by using warp yarns of one color and two filling yarns of different colors in each shed. It is sometimes used in taffeta, faille, or poplin made from silk or manufactured filament yarns. / , фай (faille) или поплин, сделанные из шёлка или изготовленные из . и двух уточных пряж разного цвета в .

CHAMFER = ХХ (или СКОС) – Chamfer is a bevel on the top edges of the bottom deck, bottom boards or bottom edges of the top deck to facilitate the passage of fork-arm wheels of a pallet truck. See also Pallet. / Скос (Chamfer):- фаска верхних краёв нижнего настила, досок настила или нижних краёв верхнего настила для обеспечения прохождения вил вилочного захвата. Смотрите также Поддон (Pallet).

CHAMFERED DECKBOARDS = ОТЁСАННЫЕ ДОСКИ НАСТИЛА – Chamfered Deckboards are the deckboards with edges of one or two faces beveled, either along the full or specified length of board or between the stringers of blocks, allowing easier entry of pallet jack wheels. See also Pallet.

CHAMOIS = ШАМУА (или ЗАМША, или СЕРНА) – Chamois is a soft, pliable leather from the skin of the Chamois goat, although other animal skins may be substituted. It is used for gloves and as a cloth for washing autos. Chamois cloth is woven to imitate the leather, usually has a slightly napped surface, and is usually yellow, as is the goat skin. It is also used in clothing. / из кожи козы Серны (Chamois goat). Под Серной понимается парнокопытное животное семейства полорогих. Высота в холке 65–70 см, весит до 40 кг. Рога у самцов и самок небольшие. Обитает в горах Европы и Малой Азии, в бывшем СССР на Кавказе. Объект охоты.

CHAMOIS CLOTH = ПОЛОТНО ШАМУА (или ЗАМШЕВОЕ ПОЛОТНО) – Chamois Cloth is a cotton fabric. Fabric is napped, sheared, and dyed to simulate chamois leather. It is stiffer than kasha and thicker, softer and more durable than flannelette. Must be designated as 'cotton chamoise-color cloth'. Plain weave. Used in dusters, interlining, storage bags for articles to prevent scratching. / .

CHAMOISETTE = ШАМУАЗЭТ – Chamoisette:- cotton, also rayon and nylon. Double knit construction. A fine, firmly knit fabric. Has a very short soft nap. Nylon chamoisette is more often called 'Glove Silk'. Used for gloves. / Найлан (Nylon).

CHAMPAGNE = ШАМПАНЬ (или ШАМПАНСКОЕ) – Champagne:- a pale orange yellow to light grayish yellowish brown. / .

CHANDLER = ПОСТАВЩИК (или МОСКАТЕЛЬЩИК) – Chandler is a person who deals in the selling of provisions, dried stores, etc. An individual or company selling equipment and supplies for ships. / Физическое лицо или компания, продающая оборудование и припасы судам. Под Москательными Товарами, от Персидского слова Мошк, означающее Мускус, понимается устаревший термин, обозначавший краски, клей, масла и другие химические вещества как предмет торговли.

CHANGEABLE FABRIC = ИЗМЕНЧИВАЯ ТКАНЬ – Changeable Fabric is a fabric woven with yarns of one color in the warp and another color in the filling so that the fabric seems to change color as the light strikes it. Other names for this type of fabric are iridescent and shot. / уточина.

CHANGEABLE TAFFETA = ИЗМЕНЧИВАЯ ТАФТА – Changeable Taffeta:- Shot Silk (also called Changeant, Changeable Silk and Changeable Taffeta) is a fabric which is made up of silk woven from warp and weft yarns of two or more colors producing an iridescent appearance. A 'shot' is a single throw of the bobbin that carries the weft thread through the warp, and shot silk colors can be described as '(warp color) shot with (weft color)'. The weaving technique can also be applied to other fibers such as cotton, linen, and synthetics. History:- a shot silk vestment of purple and yellow dating from about 698 is described in detail in a document written in about 1170, showing that the technique existed since at least the V century. An argument has been made that shot silk was also described as purpura at this time, the Latin word mainly applied to purple although there are multiple references to purpura being red, green and black-and-red, as well as 'varied'. Purpura is also used to mean iridescence and the play of light, and contemporary descriptions exist indicating that the textile purpura was a type of silk distinct to other silks in assorted colors. It has also been suggested that illuminations in the Lindisfarne Gospels of c.700 show garments of shot silk being worn by the Four Evangelists. Shot silks were popular in the XVIII and XIX centuries, including warp printing, where the warp was printed before weaving to create chiné or 'Pompadour taffeta'. Current Usage:- shot silks are used today to make neckties and other garments. Notably, some forms of academic dress use shot silks, such as that of the University of Wales. Most famously, the robe of a Doctor of Divinity of the University of Cambridge is faced with 'Dove-shot' silk, a three-way shot of pale gray, emerald green, and magenta. See also Changeable Fabric. / Уточный Шёлк (Shot Silk). до ткачества для создания шине или разноцветное (chiné) или Помпадур тафты (Pompadour taffeta).

CHANGE IN FILLING = СМЕНА В УТОЧИНЕ – Change In Filling:- xxxxx. See also Filling, and Mixed End.

CHANGE IN LENGTH ON UNTWISTING = ИЗМЕНЕНИЕ В ДЛИНЕ ПРИ НЕКРУЧЕНИИ – Change In Length On Untwisting is the increase or decrease in length measured when a specimen is untwisted. The change is expressed as the percentage extension or contraction of the nominal gauge length of the specimen, i.e. specimen length prior to untwisting.

CHANGE IN SHADE = СМЕНА В ОТТЕНКЕ (или ТЕНИ) – Change In Shade:- Garment:- woman's wine-colored chambray dress; Fabric Construction:- (i) Count:- 120 x 112; (ii) Warp:- 50/1 combed cotton, dyed wine; (iii) Filling:- 50/1 combed cotton (white). Complaint:- light-colored stains were discovered in various sections of the dress after the first laundering. Analysis:- laboratory tests showed that the light-colored spots could be duplicated by dry pressing with a very hot iron. When the garment was dampened, the resultant temperature of the hot iron was appreciably lower, owing to the cooling effect of the moisture evaporated, and there was no change in shade. Apparently, the dress had been ironed with a very hot iron and the parts of the garment which had been sprinkled or dampened were unchanged in color, while the dry portions turned lighter in shade. Subsequent analysis revealed that the dyestuff used was sensitive to heat. However, since it required an ironing temperature in excess of 375 °F to produce this change, neither the mill nor the garment manufacturer was considered at fault for this apparent defect. Change In Shade:- Garment:- black satin slip; Fabric Construction:- (i) Count:- 218 x 80; (ii) Warp:- 55/20 bright acetate rayon; (iii) Filling:- 300/80 dull acetate rayon. Complaint:- a garment manufacturer returned a slip which a consumer had worn once and had washed in neutral soap, with the result that it turned from black to a reddish-brown shade. Analysis:- swatches of a new black slip made from the same lot of finished goods delivered to the garment

manufacturer were washed in a 0.5% neutral soap solution at 100 °F, along with several cuttings of file head ends from other black-dyed lots. The swatches from the slip turned to a reddish-brown shade, similar to the color found in the worn slip, whereas the reference head ends remained black. The dye was identified as being a developed color. Although diazotized and developed blacks on acetate-rayon fabrics are generally sensitive to alkalis, they are fast to washing in neutral soap solution. In the case of the pieces represented by the slips submitted by the customer, it appeared that the color had not been properly diazotized and developed after dyeing, a defect for which the dyer was considered responsible. Change In Shade:- Garment:- nurse's uniform of white 'Luana'-type fabric; Fabric Construction:- (i) Count:- 108 x 48; (ii) Warp:- 150/40 dull acetate rayon; (iii) Filling:- 25/1 50% 1%-in. 1%-den. dull viscose rayon 50% 1/4-in. 3-den. dull acetate rayon. Complaint:- the customer returned the garment to the retailer because one sleeve of the uniform turned to a beige color after the first laundering. Analysis:- it was evident that the sleeve of the garment in question had come from a piece of goods representing a different finishing lot than did the goods in the remainder of the garment, since fabric constructions were identical. Chemical tests made on the beige-colored sleeve showed the presence of manganese. Apparently the finisher had used permanganate bleach on one or more pieces of this fabric in trying to obtain a good white, but had neglected to rinse the goods thoroughly, leaving a residue of colorless manganese salts. Subsequent oxidation of these compounds resulted in their changing to the brownish oxides, producing the beige discoloration. It was possible to eliminate this color by treatment with a reducing agent, such as sodium hydrosulphite solution. / разводы (или потёки) . Уточина:- . пятна.

CHANGE OF NAME = ИЗМЕНЕНИЕ ИМЕНИ (или СМЕНА НАЗВАНИЯ) – Change Of Name:- in trademark law, sometimes, owners of trademark applications and registrations change their names, even though the actual ownership of the application or registration has not been transferred. When this occurs, trademark owners should record the name change with the USPTO (the United States Patent and Trademark Office) Assignment Branch to maintain a clear record of ownership. Name changes are recorded in the same manner as assignments. / В законодательстве о товарных знаках, владельцы заявок на товарный знак и зарегистрированного товарного знака иногда изменяют свои имена, даже если фактическое владение заявкой или зарегистрированным товарным знаком не передаётся. Когда такое происходит, владельцы товарных знаков обязаны зарегистрировать изменение имени в Отделе Правопередачи УСШПТЗ (Управления Соединённых Штатов Америки по Патентам и Товарным Знакам) для соблюдения точности записи о владении. Изменения имени регистрируются таким же образом как и правопередачи или уступки.

CHANGE OF VOYAGE = ИЗМЕНЕНИЕ РЕЙСА (или ИЗМЕНЕНИЕ МАРШРУТА) – Change Of Voyage:- this applies only to 'voyage' policies (hull or cargo). A change of voyage occurs when the destination of the ship is voluntarily changed after commencement of the voyage. Unless arrangements have been made with the underwriters to continue cover, prior to the change, underwriters are discharged from all liability as from the time the decision to change the voyage is manifested; but without prejudice to any valid loss occurring prior to such time. Underwriters hold covered change of voyage; subject to prompt notice to underwriters, payment of n additional premium and change of conditions, if required.

CHANGEOMAT = ОБМЕНОМАТ (или ОБМЕННЫЙ АППАРАТ) – Changeomat is a note-changing machine which can be used irrespective of bank opening hours to change foreign currency notes into national currency and vice versa.

CHANGER = СМЕНЩИК (или МЕНЯЛЬЩИК) – Formerly, Changer is a clearing member of both the Mid-America Commodity Exchange (MidAm) and another futures exchange who, for a fee, would assume the opposite side of a transaction on the MidAm by taking a spread position between the MidAm and the other futures exchange that traded an identical, but larger, contract. Through this service, the changer provided liquidity for the MidAm and an economical mechanism for arbitrage between the two markets. The MidAm was a subsidiary of the Chicago Board of Trade (CBOT®). In recent years, the CBOT® has been de-listing MidAm contracts to the CBOT® and re-listing them as Mini contracts. The last of these transfers occurred in 2003. The CBOT® still uses changers for former MidAm contracts that are traded on an open outcry platform. / Чикагской Палаты Торговли (Чикагского Табло Торговли, если быть более точными; СИБАТ® (CBOT®)).

CHANNEL = КАНАЛ (или КОРИДОР, или РУСЛО) – Channel is an organized market movement that can be bounded by two parallel lines of support and resistance. These can be trending as well as sideways. A channel breakout is a preferred method of entering a new trade by some trading systems. Channel:- when prices trend between two parallel trendlines, this is referred to as a Channel. Like it sounds, a Channel in which prices are moving. Parallel trendlines are drawn along the lows and highs of a price chart, forming a channel in which prices move. The trendlines form areas of support and resistance. Depending on the trend, the channel can be a downchannel or an upchannel. / В техническом анализе биржевых рынков, . Как следует из самого термина, это – русло динамики цен. По значениям минимальных и максимальных цен на графике проводятся параллельные линии тенденции, которые и образуют русло динамики цен. Линии тенденции отмечают области поддержки и сопротивления. В зависимости от тенденции русло может быть восходящим или нисходящим.

CHANNELING = КАНАЛООБРАЗОВАНИЕ (или ОБРАЗОВАНИЕ НЕЗАПЛЫВАЮЩИХ КАНАВОК) – Channeling is the phenomenon observed among gear lubricants and greases when they thicken due to cold weather or other causes, to such an extent that a groove is formed through which the part to be lubricated moves without actually coming in full contact with the lubricant. A term used in percolation filtration; may be defined as:- a preponderance of flow through certain portions of the clay bed. / среди смазок для (зубчатых) передач и пластичных смазок, когда они . Образование Незаплывающих Канавок в толще смазки.

CHANNEL LINE = КАНАЛЬНАЯ ЛИНИЯ (или ЛИНИЯ КОРИДОРА, или ЛИНИЯ РУСЛА) – Channel Line is a straight line drawn parallel to the basic trendline. In an uptrend, the channel line slants up to the right and is drawn above rally peaks; in a downtrend, the channel line is drawn below price troughs and slants down to the right. Prices often meet resistance at rising channel lines and support at falling channel lines. / В техническом анализе биржевых рынков, .

CHANNEL OF DISTRIBUTION = КАНАЛ РАСПРЕДЕЛЕНИЯ – Channel Of Distribution is the path through which goods and services travel from the vendor to the consumer or payments for those products travel from the consumer to the vendor. A channel of distribution can be as short as a direct transaction from the vendor to the consumer, or may include several interconnected intermediaries along the way such as wholesalers, distributers, agents and retailers. Each intermediary receives the item at one pricing point and movies it to the next higher pricing point until it reaches the final buyer. Coffee does not reach the consumer before first going through a channel involving the farmer, exporter, importer, distributor and the retailer. Also called the Distribution Channel. Channel Of Distribution is a means by which a manufacturer distributes products from the plant to the ultimate user, including warehouses, brokers, wholesalers, retailers, etc. Distribution Channel is the chain of businesses or intermediaries through which a good or service passes until it reaches the end consumer. A distribution channel can include wholesalers, retailers, distributors and even the internet. Channels are broken into direct and indirect forms, with a 'direct' channel allowing the consumer to buy the good from the manufacturer and an 'indirect' channel allowing the consumer to buy the good from a wholesaler. Direct channels are considered 'shorter' than 'indirect' ones. Goods and services often pass to consumers through multiple channels. While increasing the number of ways in which a consumer can find a good has the potential to increase sales, it also creates a complex system that can make distribution management difficult. In addition, the longer the distribution channel the less profit a product manufacturer might get from the sale.

CHANTILLY = ШАНТИЛИ – Chantilly is the one of the most popular of bridal laces often used for the trimming on bridal veils. It is made by the bobbin method and has designs outlined by thick cords. See also Bobbin Lace. Chantilly Lace:- a delicate silk, linen, or synthetic lace having a six-sided mesh ground and a floral or scrolled design. / Кружево Шантили:- формирование Французского плетёного кружева и современная индустрия роскоши:- Шантили является одним из самых распространённых типов кружева. Он не только способствовал формированию и успеху Французского плетёного кружева, но также оказал значительное влияние на стилистические особенности современных кружевных изделий, предназначенных для модной индустрии. Плетёное кружево широко распространено во Франции, начиная с XV века. Это узкие полоски несложного по технике плетения кружева. Со времени основания мануфактурного производства шитых иглой кружев в середине XVII века, существенных успехов в области плетёного кружева, достигнуть не удалось. Все попытки воспроизвести кружево Аглетер оказались безрезультатны. Европейское признание:- Французское плетёное кружево получает только в XIX века, когда в 1840-е входит в моду кружево Шантили. На волне увлечения ретростилями, определявшими стилистические особенности произведений прикладного искусства второй четверти-конца XIX века, неорококо было так же актуально. Обращение к арсеналу художественных средств Алансонских кружев (Alençon laces) стало залогом популярности кружева Шантили. История этого маленького городка севернее Парижа достаточно типична для XIX века. Первоначально, в Шантили делали чёрное и белое плетёное шёлковое кружево, а также кружево из металлических нитей. Еще в первой четверти XIX века плетёное в Шантили кружево известно под названием модных тогда блонд. Под своим собственным именем Шантили появляется уже тогда, когда в самом городе его производство прекратилось. В XIX веке кружевом Шантили славятся такие Французские центры как Байе и Канн, где сначала плели блонды, а потом перешли на Шантили. Шантили представляет собой плетёное кружево из чёрных шёлковых нитей. Оно плетётся на большой плоской подушке. Маленькие вещи изготавливаются одним куском, изделия более крупного размера делаются отдельными сегментами, которые впоследствии соединяются незаметным сцеплением. Материалом для Шантили служит шёлковая нить – ‘Гренадин Алэ’. Характерная для XVIII века сетка фона представляет собой решётку из ромбов, образованную пересечением одной горизонтали двумя диагоналями, направленными в противоположную сторону и носит название Пуэн Шант (Point Chant) или Пуэн дё Пари (Point de Paris). Позже, в конце XVIII – начале XIX века, её заменяет сетка с сотовой ячейкой в подражание знаменитому и очень тогда популярному кружеву из Алансон. Орнамент узора, выполняется решёткой Пуэн Грий (Point Grille), которая в некоторых частях рисунка, для достижения глубины и объёма, плетётся более плотно. Контуры рисунка, равно как и ажурных сеток Пуэн Марьяж (Point Marriage), которые также называются Витр (Vitre) или Сэнк Тру (Cinq Trou), очерчивает более плотная шёлковая нить. Шантили является типичным кружевом времен Наполеона III. Как правило, это изделия большого размера:- мантильи, шарфы, пелерины, юбки, зонтики, а также, воланы, барбы, различные наколки и носовые платки. Стилистические особенности этих изделий вызывают в памяти кружево середины XVIII века. И, в то же время, они очень современны своей эпохе. Рисунок всегда отличается сложностью композиционного построения и совершенством исполнения отдельных деталей. Крупный узор с замысловатыми букетами из крупных реалистически трактованных цветов (Роз, Тюльпанов, Ирисов, Маков, Вьюнов, Колокольчиков) заполняет почти всю поверхность кружева, оставляя немного свободного места для фона, чтобы усеять его мушками и небольшими цветочками. Край изделия обрамляет характерный для времен Второй Империи, неизменно повторяющийся мотив свисающих ламбрекенами лент, отороченных рюшем или бахромой и орденских лент с кистями. В кружеве Шантили часто можно встретить изображение полос с узором, напоминающим тесьму и архитектурных профилей:- чередование выгнутых и вогнутых линий в сочетании с листьями Аканта. Они придают этим композициям декоративность и задают какой-то особенно торжественный ритм. Среди орнаментальных мотивов встречаются и некоторые стилистические реминесценции, например, элементы готики, китайщины – то есть налицо смешение стилей, свойственное эпохе историзма. Кружево Шантили изначально формируется в условиях невероятной популярности Фламандского плетёного кружева, прежде всего таких типов кружева как англетер, малин и Валансьен. На территории Франции и XVII, и в XVIII веках, плели великолепные кружевные изделия в таких, некогда Фламандских городах, как Валансьен, Лиль и Аррас. Весьма заманчиво было бы связать два этих факта и выдвинуть предположение о том, что своим успехом блонды и Шантили обязаны славе кружева бывших Фламандских городов, поставить успех блонд и Шантили в зависимость от влияния Фламандских традиций, однако это не так. Говорить так не позволяют следующие особенности их изготовления:- во-первых, материал, используемый для создания кружева. Француженки всегда любили эксперементировать с материалом. С самого начала своей истории Французское кружево использует и лён и шёлк, по колориту оно бывает как белое, так и цветное (чаще всего, чёрное). Достаточно распространённым было и изготовление металлических кружев. Фламандское кружево всегда отдавало предпочтение белой льняной нити. Её и пряли по-особому. Несмотря на то, что в XVI и в XVII веках Фландрия была частью Испанской короны, в отношении кружева у неё были свои пристрастия, свои традиции. Металлическое кружево не получило здесь такого распространения, как, скажем, в самой Испании или во Франции. Его, конечно же, использовали в костюме, особенно в середине XVII века, о чём можно судить по Фламандской и Голландской живописи, но документальных свидетельств об изготовлении металлического кружева на территории Фладндрии нам неизвестно. Во-вторых, сетка фона. Со второй половины XVIII века, в качестве фона для кружева, в Валансьене используется сетка с квадратной ячейкой. Лиль и Аррас используют очень простую и ясную сетку с ячейкой ввиде ромба (Лиль) или сетку ‘Point de Paris’. То есть здесь скорее обратная зависимость – Фламандские центры прибегают к сетке Французского кружева. Что касается сетки ‘Point de Paris’, которая также применяется и в кружеве Шантили, Лиль и Аррас к ней обращаются уже тогда, когда в Шантили начинают переходить к сотовой ячейке (во второй половине XVIII века). В-третьих, способ плетения. Если в кружеве Шантили только в XIX веке переходят к сцепному приёму (крупные изделия плетут отдельными полосками, которые впоследствии соединяют), то и в XVII и в XVIII веках в бывших Фламандских городах кружево плетут целиком:- от начала до конца – одним набором коклюшек, не разрывая нити. По ширине Французские изделия не превышают 8–9 см, однако качество их от этого только выигрывает – они очень прочные, что соответственно, сказывается на цене. Таким образом, Французское плетёное кружево XIX века, скорее, наследует национальные традции. К середине XIX века Шантили становится столь популярно, что его не только используют в костюме (и в Западной Европе и в Америке и в России), но и изготавливают в разных городах разных стран. Несколько центров по производству кружева Шантили было и в Бельгии (Грамон и Ангуэн). Огромная популярность, которой пользовалось кружево Шантили во второй половине XIX века, позволило ему занять крупное место в истории Западноевропейского кружева. Впрочем, на этом история Шантили не заканчивается. С появлением машинного производства кружева стало возможным воспроизводить аналогии знаменитых кружев, сплетённых или шитых, в том числе и Шантили. В XX веке во Франции сосуществуют как машинное, так и изготовленное вручную кружево. Производством кружев, выполненных на механических станках, занимается ряд компаний, расположенных в Кале и Кодри, многие из которых были основаны на рубеже XIX–XX веков. Отдельный сегмент кружевной продукции крупных фирм-изготовителей эксклюзивного кружева (Брюнэ Дантэль (Brunet Dentelles), Дантэль Андрэ Лод (Dentelles Andre Laude), Дантэль Мэри (Dentelles Mery), Жан Брак (Jean Bracq), Нойон-Дантэль (Noyon-Dentelle), Ришэр Марэко (Riechers Marescot), Солтис (Soltiss) и Софи Аллет (Sophie Hallette)) не только вызывает в памяти знаменитое Шантили, её выпускают под лэйблом этого типа кружева. Характерные стилистические особенности Шантили свойственны этим изделиям, созданным на станках Ливерс. Наличие сотовой ячейки тюлевой сетки, рельефный контур рисунка и ажурных сеток пуэн марьяж (point marriage) говорят об

этом. Современное кружево Шантили предназначено, главным образом, для декорирования эксклюзивных нарядов и создания рафинированных и утончённых образов. Кружево активно используется в сфере высокой моды и готового платья. Ведущие фирмы изготовители кружева работают с известными домами мод, под такими марками как Итальянская Прада (Prada), Американская Зэк Поузэн (Zac Posen), Французская Шанэль (Chanel), Французская Кристиан Лякруа (Christian Lacroix), Итальянская Валэнтино (Valentino), Французская Живанши (Givenchy), Ливанская Эли Сааб (Elie Saab), Французская Кристоф Жозэ (Christophe Josse) и другие. Подводя итоги, остаётся лишь подчеркнуть, что бережное отношение к традициям национальной культуры не только помогло Французскому кружеву Шантили занять значительное место в истории плетёного кружева и получить мировое признание, но позволило обогатить арсенал технических и художественных средств современных кружевных изделий.

CHAP = CLEARING HOUSE AUTOMATED PAYMENTS SYSTEM

CHAPA = XX (или ЧАПА, или ШАПА) – Chapa:- xxxxx. Minor Defect Classification:- < 2 or more picks missing & or < 2 ends missing. Major Defect Classification:- > 2 or more picks missing & or < 2 ends missing.

CHAPEAU = ШАПО (или ШЛЯПА) – Chapeau:- a hat. / .

CHAPLET = ЧАПЛЭТ (или ВЕНОК) – Chaplet is a wreath to be worn on the head. / .

CHAPS = CLEARING HOUSE AUTOMATED PAYMENT SYSTEM

CHAPS = КОЖАНЫЕ ШТАНЫ (или КОЖАНЫЕ ГАМАШИ) – Chaps:- leather leggings joined by a belt or lacing often with flared outer flaps and worn over the trousers, as by western ranch hands. / кожаные или меховые штаны для ковбоев.

CHAPS EURO = THE CLEARING HOUSE AUTOMATED PAYMENT SYSTEM EURO

CHAPTER I = ГЛАВА I – Chapter I is the first, mandatory phase under the Patent Cooperation Treaty that includes performance of an international-type search, issuance of an International Search Report, and publication of the application and Search Report by the International Bureau of the World Intellectual Property Organization (WIPO).

CHAPTER II = ГЛАВА II – Chapter II is the second, optional phase under the Patent Cooperation Treaty that includes examination of the international application and issuance of an International Preliminary Examination Report.

CHAPTER 7 = ГЛАВА 7 – In the United States, Chapter 7 is a provision of bankruptcy laws wherein a company is required to liquidate its assets to pay of its creditors. See also Bankruptcy.

CHAPTER 13 = ГЛАВА 13 – In the United States, adjustments of debts of an individual with regular income under the Federal Bankruptcy Code. Chapter 13 enables a debtor who is an individual to develop and perform a plan for the prepayment of creditors over an extended period. The plan might provide for full or partial repayment. Chapter 13 allows the debtor to retain his or her property, unless he or she agrees otherwise in the plan. See also Bankruptcy. / выплата (repayment).

CHARACTER = ОТЛИЧИТЕЛЬНЫЙ ПРИЗНАК (или ХАРАКТЕРНАЯ ОСОБЕННОСТЬ) – Character:- the evenness, distinctiveness, and uniformity of crimp characteristic of their respective wool classes. A well-bred wool of ‘good character’ will usually show a pronounced crimp and distinct staple formation.

CHARACTER = ХАРАКТЕР (или ПРИЗНАК, или СВОЙСТВО) – Character is an attribute of an organism resulting from gene action. Character is a characteristic trait or feature sufficiently unique to be of value in distinguishing forms and defining relationships. / Под Характером, от Греческого слова Characktēr, означающее Отличительная Черта или Признак, понимается:- (i) своеобразная особенность человека, вещи, явления, например, характер местности; (ii) в психологии индивидуальный склад личности человека, проявляющийся в особенностях поведения и отношения (установок) к окружающей действительности. Под Характеристикой понимается:- (i) описание характерных, отличительных качеств, черт, свойств чего-либо или кого-либо; (ii) отзыв, заключение о трудовой, общественной деятельности кого-либо.

CHARACTERIZATION = ХАРАКТЕРИЗАЦИЯ – Characterization is a description of the physical, biological or socioeconomic features of a system.

CHARACTERIZE = ОХАРАКТЕРИЗОВЫВАТЬ (или ХАРАКТЕРИЗОВАТЬ) – Characterize:- to specify the parameters or performance of an instrument, method of measurement, or material absorption and scatter.

CHARCOAL = РАСТИТЕЛЬНЫЙ УГОЛЬ (или ДРЕВЕСНЫЙ УГОЛЬ) – Charcoal is an amorphous form of carbon produced by partially burning or oxidizing wood or other vegetable material in fires from which air is partially excluded by covering with cut turf, or in large kilns in the absence of air. Uses include drawing material, as a fuel, filter, gas absorbent, etc. Charcoal (in the UK, 1840’s) (in Latin Carbo Ligni), a sort of artificial coal, consisting of wood burned with as little exposure to the action of the air as possible. It was customary among the ancients to char the outside of those stakes which were to be driven into the ground, or placed in water, in order to preserve the wood from spoiling. New-made charcoal, by being rolled up in clothes which have contracted a disagreeable odour, effectually destroys it. When boiled with meat beginning to putrefy, it takes away the bad taint:- it is, perhaps, the best tooth-powder known. When putrid water at sea is mixed with about 1/9 of its weight of charcoal powder, it is rendered quite fresh; and a much smaller quantity of charcoal will serve, if the precaution be taken to add a little sulphuric acid previously to the water. If the water casks be charred before they are filled with water, the liquor remains good in them for years:- this precaution ought always to be taken for long sea voyages. The same precaution, when attended to for wine casks, will be found very much to improve the quality of the wine. / вытяжка (drawing).

CHARCOAL = ДРЕВЕСНОУГОЛЬНОЕ (или ДРЕВЕСНЫЙ УГОЛЬ) – Charcoal:- a dark gray. / тёмно-серое.

CHARCOAL FIBER = ДРЕВЕСНОУГОЛЬНОЕ ВОЛОКНО – Charcoal Fiber:- charcoal is the remainder after natural wood is dissolved by heat without an additive at a high temperature (600–1 200 °C). As a pollution-free substance, it consists of 80–90% solid carbon. It is alkali with pH 8–9. It is also characterized by porosity caused by carbonized cell wall of wood. The internal surface area of 1 g charcoal is 200–400 m^2. In addition, it is very excellent in absorption, ventilation, keeping warm, water discharging capacity and heat accumulation capacity. It provides a good deodorization effect by generating negative ion with property of emitting far infrared rays.

CHARCOAL ROT = УГОЛЬНАЯ ГНИЛЬ (или УГЛИСТАЯ ГНИЛЬ) – Charcoal Rot is caused by the fungus Macrophomina Phaseolina which is a common and widespread pathogen of sorghum and sunflower and many other hosts. Affected plants die prematurely and become brittle. Numerous small black microsclerotia are produced in plant tissues at the base of the stem. This gives these parts of the plant a grey appearance when broken or cut open. The disease is favored by very hot and or dry conditions. /

Угольная Гниль или Углистая Гниль корней, корнеплодов или стеблей; возбудители:- Diplodia Natalensis, Macrophomina Phaseoli, Sclerotium Bataticola. патоген сарго.

CHARGAFF'S RULES = ПРАВИЛА ЧАРГАФФА – Chargaff's Rules stipulate that in double-stranded DNA, the amount of adenine (A) equals that of thymine (T) and the amount of guanine (G) equals that of cytosine (C). Accordingly, A binds to T and G to C by hydrogen bonds, giving the DNA molecule the properties needed for replication and information storage. / в двунитевой или двухцепочечной ДНК, . Австриец Эрвин Чаргафф (Erwin Chargaff; родился 11 Августа 1905, Черновцы, Австро-Венгрия – умер 20 Июня 2002, Нью-Йорк, США) – биохимик, работавший в Австрии, США (с 1928), Франции, Германии. Член Парижской АН (с 1963), Нидерландской Королевской АН (с 1964), Немецкой Академии Естетственных Наук 'Лэопольдина', член Национальной АН США (с 1965). Труды по химии нуклеиновых кислот. Установил соотношение пуриновых и пиримидиновых оснований в молекулах ДНК. Показал видовую специфичность ДНК.

CHARGE = СБОР (или ПЛАТА) – (1) Charge is a sum of money that must be paid on goods or services or the act of requesting that sum. / Сбор – это денежная сумма, которая должна быть оплачена за товары или услуги, или действие по затребованию такой суммы. Сборы – разнообразные виды налогов, платежей, изъятий, которые в обязательном порядке вносятся предприятиями, организациями, гражданами в порядке оплаты услуг, оказываемых им государственными органами. Основными видами сборов являются:- (i) административные, взимаемые с юридических и физических лиц за административные действия в их интересах; (ii) бандерольный, взимаемый посредством продажи бандеролей, наклеиваемых на товар в виде свидетельства об уплате акцизного сбора, налога; (iii) гербовый, взимаемый за регистрацию документов, государственная пошлина; (iv) грузовой, представляющий оплату грузовладельцем услуг, оказываемых ему морским портом; (v) клиринговый, взимаемый расчётной палатой за регистрацию фьючерсного контракта; (vi) комиссионные, взимаемые за посреднические услуги; (vii) консульские, взимаемые за услуги консульств; (viii) лицензионный, взимаемый за получение лицензий на вывоз (или экспорт) и привоз (или импорт); (ix) патентный, взимаемый с юридических и физических лиц, имеющих доходы при занятиях промыслом; (x) портовые – платежи, которыми порт .

(2) Charge is a fee charged by a bank for its services and deducted (usually quarterly or half-yearly) from the customer's account. Also known as Bank Charges. / Сбор – вознаграждение, взимаемое банком за его услуги и вычитаемое (обычно раз в квартал или раз в полгода) со счёта потребителя. Известны также как Банковские Сборы или Сборы Банка (Bank Charges).

(3) Charge is a debit made to an account to pay for a service. For example, utility charges are amounts charged by a landlord to a tenant to cover the tenant's share of water, electricity and gas paid by the landlord on behalf of the tenant.

(4) Charge is an amount to be paid for carriage of goods based on the applicable rate of such carriage, or an amount to be paid for a special or incidental service in connection with the carriage of goods.

(5) Charge:- with respect to securities, primarily bank commissions, broker's fees and overdraft and securities account charges. Third-party fees arise primarily when foreign securities are bought or sold.

CHARGEABLE WEIGHT = ВЕС, ПОДЛЕЖАЩИЙ ОПЛАТЕ (или ОПЛАЧИВАЕМЫЙ ВЕС) – Chargeable Weight is the shipment weight used in determining freight charges. The chargeable weight may be the dimensional weight or, for container shipments, the gross weight of the shipment less the tare weight of the container. Chargeable Weight is the weight for air shipment is the actual gross weight (gw) or the volume weight (vw), whichever is greater; gw is the figure that is indicated outright on a cargo weighing scale; vw is calculated based on a cargo's size, measurement or dimensions, and with the use of the following formula:- (i) Imperial System:- L x W x H in inches (in) / 165 = vw (in lbs); and (ii) Metric System:- L x W x H in centimetres (cm) / 6,000 = vw (in kg).

CHARGEBACK = ВОЗВРАТ СБОРА (или ВОЗВРАТ СПИСАННОЙ СУММЫ) – (1) Chargeback is a transaction from the card issuer to the acquirer and/or acceptor used to partially or completely reverse a previously completed financial transaction.

(2) Charge Back is an amount charged back to the vendor for repair fees incurred while servicing products under warranty. Charge Backs are either deducted as an accounts payable credit or applied as an accounts receivable debit to be paid by factory check. Also known as Vendor Charge Back. / продукты под ручательством.

CHARGE CARD = ПЛАТЁЖНАЯ КАРТА – Charge Card is a card that charges no interest but requires the user to pay his/her balance in full upon receipt of the statement, usually on a monthly basis. While it is similar to a credit card, the major benefit offered by a charge card is that it has much higher, often unlimited, spending limits. Costs associated with a charge card will often be a set fee for the card along with large penalties on any unpaid balances. This type of card does not allow cardholders to carry a balance from one month to the next as they would with a credit card. American Express and Diner's Club are examples of charge cards. Charge Card is a card issued by non-banks indicating that the cardholder has been granted a line of credit. The definition used by the Bank for International Settlements (BIS) to define a Travel and Entertainment card. Charge Card is a card that requires full payment of the balance upon receipt of the monthly statement. If payment is made on time, there are no finance charges. / Амэрикэн Экспрэс (American Express).

CHARGE–OFF = СНЯТИЕ С УЧЁТА (или ВЫНЕСЕНИЕ ЗА СЧЁТ, или ВЫВЕДЕНИЕ ИЗ РАСЧЁТА, или СНЯТИЕ С БАЛАНСА, или СПИСАНИЕ) – In the United States, a Charge-Off is generally an account receivable that is written off because it has become seriously delinquent. Charge-Off:- accounts receivable that will likely remain uncollectable and will be written off. Charge offs appear as an expense on the company's income statement, thus reducing net income. In general, companies make an estimate of charge off expenses that might be incurred in the current time period based on past records as part of the process of estimating earnings. Most companies make a charge off allowance since it is unlikely that all of their creditors will pay them in full. Also called Bad Debt. An accounting term to indicate that the creditor does not expect to collect the balance owed on an account. However, most creditors will continue to pursue collection of the debt. The term Charge-Off is used to describe the process of removing from the records of a company something that was once regarded as an asset but has subsequently become worthless. A classic case is the bad debt, which is an uncollectible debt. A bad debt is a permissible business tax deduction, and a non-business bad debt may also be claimed as a charge-off in the year the debt becomes entirely worthless. Charge-off is generally used in reference to a charge or debt that is not paid when due. Also known as Write-Off in the United Kingdom. Charge-Off is a term describing an expense on a company's income statement. A charge-off will fall under one of the following categories:- (i) a debt that is deemed uncollectible by the reporting firm and is subsequently written off. This type will be classified as 'Bad Debt Expense' on the income statement, and removed from the balance sheet. Bad debt expenses arise when a firm is unable to collect on some of its accounts receivable (AR). When this occurs, the firm has little recourse; it could either sell the probable bad debt to a collection agency (a sale will be recorded on the firm's books, but not as an expense), or it could just write-off the uncollectible amount as an expense on the income statement. (ii) A probable one-time extraordinary expense incurred by a company that negatively affects earnings and results in a write-down of some of the firm's assets. The write-down arises due to impairments of assets. Companies often say something like:- 'we will take a one-time charge

against earnings this quarter'. This means that an extraordinary event has occurred and, altough it affects present earnings, it is unlikely to occur again. As a result, a company will usually provide an earnings per share (EPS) figure with and without this charge. / Известно также как Списание (Write-Off) в Соединённом Королевстве.

CHARGE RATE = ТЕМП ЗАРЯДКИ – Charge Rate is the rate at which a battery or cell is recharged. Can be expressed as a ratio of battery capacity to current flow. / Под Темпом, от Латинского слова Tempus, означающее Время, понимается степень быстроты движения, осуществления, интенсивность развития чего-либо.

CHARGES = СБОРЫ – Charges means all fees, costs, and expenses incurred by the Commodity Credit Corporation (CCC) of the US Department of Agriculture in insuring, carrying, handling, storing, conditioning, and marketing the cotton tendered to CCC for loan. Charges also include any other expenses incurred by CCC in protecting CCC's or the producer's interest in such cotton.

CHARGE TYPE = ТИП СБОРА – Charge Type is a separate, identifiable element of charges to be used in the pricing/rating of common services rendered to customers. / Самостоятельный, опознаваемый элемент сборов, которые должны быть использованы в ценообразовании/рэйтиньге общих услуг, предоставляемых заказчикам.

CHARGING AREA = АККУМУЛЯТОРНАЯ (или УЧАСТОК ЗАРЯДКИ) – Charging Area is a warehouse area where a company maintains battery chargers and extra batteries to support a fleet of electrically powered materials handling equipment. The company must maintain this area in accordance with government safety regulations.

CHARGING OPTION = ВЫБОР В ОПЛАТЕ СБОРОВ – Charging Option:- a stipulation of how charges for a direct debit are split between the creditor and the debtor. / Обусловленность того, как сборы за прямое дебетование (прямое списание) будут поделены между кредитором и дебитором.

CHARKA = ЧАРКА (или КОЛЕСО) – Charka (means Wheel) was developed in India by Ghandi in early 1920's so the people of India could spin cotton thread and not be dependent on foreign materials. A wonderful description of the 'Khadi' or 'Swadeshi' movement can be found in 'A philosophy ... handspun' by G. Janani at the Hindu.com site. The book-size Charka is a mobile, self-contained charka. Charkas are designed for spinning fine fibers such as cotton, silk, angora, and cashmere, etc.

CHAR LENGTH = ДЛИНА ОБУГЛИВАНИЯ (или ЗОНА ОБУГЛИВАНИЯ) – Char Length:- in flammability testing, the distance from the edge of the sample exposed to the flame to the upper edge of the charred or void area. / Длина Обугливания при тесте на огнестойкость. горелой (обуглившейся) или пустой площади.

CHARLEY NOBLE = ЧАРЛИ НЁБЭЛ (или КАМБУЗНАЯ ТРУБА) – Charley Noble (maritime term):- the galley smoke-pipe (cook's stove pipe), named after The English sea captain who was noted for the scrupulous cleanliness and shine of the brass aboard his ship. / Камбузная Труба (жаргон).

CHARLIE = ЧАРЛИ – Charlie (pronunciation:- CHAR-lee) or C is international nautical signal flag meaning:- 'Yes' or 'Affirmative'. With three numerals, course in degrees magnetic. Change of Course (Sailing Regatta). Meaning:- affirmative.

CHARMEUSE = ШАРМЁЗ – Charmeuse Silk is a satin weave silk with a crêpe back (also called Crêpe Backed Satin). Fabric is woven with a satin weave, where the warp threads cross over three or more of the backing threads. The front side of the fabric has a satin finish, lustrous and reflective, and the back has a dull finish. Loved for its lustrous shine, beautiful drape, and sumptuous feel, silk charmeuse is the most widely recognized of the silk fabrics. Wonderfully versatile, this elegant fabric has medium weight and some natural elasticity, making it perfect for skirts, dresses, eveningwear, nightgowns, lingerie, and gently shaped tops. Charmeuse sews well, but is subject to snags and requires extra attention since it is a bit slippery. Charmeuse is a satin weave silk with a crêpe back sometimes called Crêpe-Backed Satin. Charmeuse is a lightweight fabric woven with a satin weave, where the warp threads cross over three or more of the backing (weft) threads. The front side of the fabric has a satin finish – lustrous and reflective – whereas the back has a dull finish. It can be made of silk, or a synthetic lookalike such as polyester. It differs from plain satin in that charmeuse is softer and lighter in weight. The luster and delicate hand make charmeuse suited to lingerie, flowing evening gowns and draped blouses. Bridal gowns sometimes use charmeuse, however, the fabric does not hold a shape well, so it is not used for full, flared skirts; the charmeuse tends to cling and hang against the body. It is best suited to a more fluid, slinky cut, and is too fragile and flimsy for more tailored clothing. It is not used in menswear, with the exception of underwear, such as charmeuse boxer shorts. Charmeuse:- (1) a lightweight silk, cotton or man-made fiber dress fabric which is soft and drapes well. It is smooth, has a semi-lustrous satin face and dull back. Hard twist yarn is used for the warp with a crêpe yarn filling. It is dyed in the piece or printed. (2) A soft, lustrous finish produced by mercerizing and schreinerizing. / уточина. Под Шармёз, от Французского слова Charmeuse, означающее Очаровывающий или Соблазнительный, понимается шёлковая ткань .

CHART = ГРАФИК – Chart:- avoid becoming hypnotized by movements on daily or intra-day charts. Always analyze charts in at least 2 time frames:- determine the strength and direction of longer term trends and gauge their effect on the cycle being traded. Then analyze the cycle being traded. Estimate the length of cycles by measuring the time taken between consecutive peaks (or troughs). Graphs on which individual share prices and price indices are plotted. Used by stock market analysts (chartists) to predict stock price movements over the short and medium term, taking into account trading volumes and other factors. Price Charts are a technical trader's portal to the markets and a primary means of making trading decisions. Today's market analysis platforms offer traders a variety of options for viewing price data on a chart, from chart style to interval. The style of the chart determines how price is displayed; for example, bar and candlestick charts. The chart interval dictates which data are used to construct the display. Here, we take a look at popular chart styles and intervals, including time, tick, volume and range bar charts. Chart Styles:- while there are many different chart styles, the two most common ways to display prices are bar and candlestick charts. These two styles show the same information:- the open (O), high (H), low (L) and closing (C) prices for a specified chart interval. Visually, however, bar and candlestick charts are quite different. On a bar chart (also called an OHLC Chart), the high and low prices for each specified interval appear as a vertical line, and two, small horizontal lines that represent the bar's opening and closing prices appear on either side, as shown in the left chart of 'Two styles' (above). Candlestick charts show the same open, high, low and closing prices with a different display. Here, the opening and closing prices form the body of the candlestick, and the high and low prices for the interval are represented by the wicks – thin lines that appear above and below the body, as shown in the right chart in 'Two styles'. The body of the candlestick appears black if the close is lower than the open and white if the close is higher than the open. It's common for traders to substitute colors for black and white. A green body, for example, means that price closed above its open (showing strength), while a red body often indicates that price closed below the open (showing weakness). Some traders use candlestick charts to spot price patterns that may indicate a reversal or a weakening of the trend. Patterns can be formed within the same candlestick by comparing the size of the body to the wick, or across several adjacent candlesticks. A bullish engulfing pattern, for example, is a reversal pattern that occurs when the body of an up-candle bar completely covers, or engulfs, the body of the prior bar, signaling the end of a downtrend, as shown in 'Time to turn' (above). Candlestick charting often works best when combined with other technical tools or indicators for confirmation.

Candlestick Charts can be used to identify price patterns, such as this bullish engulfing pattern example. Time-Based Charts:- most investors and traders are accustomed to viewing price charts that are based on time, such as daily, 60-minute or five-minute intraday intervals. With a time-based chart, one bar – be it a candlestick or OHLC bar – prints at the end of each specified time interval, regardless of the amount of trading activity that has occurred. On a five-minute chart, for example, a bar will print at 09:35, 09:40, 09:45, 09:50 and so forth until the end of the trading session. There always will be an equal number of bars per trading session when the same time interval is applied. Time-based charts can be as small as a few seconds to as large as weekly, monthly or yearly intervals. A trader's style often determines the size of the chart interval. Longer-term traders, such as swing and position traders, might use hourly, daily or even weekly charts. In contrast, short-term traders may prefer 30-second or one-minute charts to see the details of price action. Activity Intervals:- while time-based charts are perhaps the most widely used, activity-based price charts offer traders a different view of the markets, and as more bars print within a set amount of time, these charts can indicate an increase in volatility. Tick, volume and range-bar charts are examples of activity-based charts. These charts print a new bar at the close of a specified activity interval, regardless of how much time has elapsed. 'Activity driven' (above) shows a 15-minute chart of the E-mini S&P 500 (ES). The overlays in the chart show one 15-minute bar 'exploded' to illustrate the tick (on the left) and range bar (on the right) activity that took place during the same time. Activity-based charts can paint a more accurate picture of market action by showing the effect that the number of transactions or volume has on price. Here's a closer look at various types of activity-based charts. Tick Charts:- with a tick chart, each bar represents the price activity that took place during a specified number of transactions. A 100-tick chart, for example, prints a new bar each time 100 transactions have filled. Each transaction is counted just once, regardless of the size. Because tick charts are based on a certain number of transactions per bar, they help traders identify current market information. Acting much like the display on a gas pump that allows you to judge the flow of gas into your car by the speed at which price scrolls by, tick charts give traders instantaneous information about the speed of the market. The more time that a trader spends in a particular market using tick charts, the more the trader will be used to that market's tendencies. Periods of increased activity – and potential trading opportunities – then instantly can be recognized and acted upon. The interval of tick charts often is derived from Fibonacci numbers, a numerical series discovered by Leonardo Fibonacci in which each number is the sum of the previous two numbers. While traders can specify any number of transactions, popular Fibonacci-based intervals include 144-, 233-, 610- and 987-tick charts. It is common for traders to use different tick intervals across multiple charts of the same trading symbol. For example, a trader might make trades off of a 144-tick chart after finding confirmation on a 987-tick chart. Volume Charts:- volume charts record the prices for a specified number of contracts or shares traded. In a 1 000-volume chart, for example, a new bar prints every time 1 000 contracts (for futures/commodities markets) or shares (stocks and exchangetraded funds) have traded, regardless of the time that has elapsed. One bar might represent a single large transaction or numerous small trades and, similar to tick charts, traders can get an idea of how rapidly a market is moving simply by noting how many (and how quickly) bars are printing. 'Volume view' (above) shows a 5 000-volume chart of the E-mini S&P 500 contract. To illustrate how volume and activity can differ throughout the trading session, the first hour and lunch hour are highlighted in yellow. Note how there is significantly more trading activity during the open. Volume intervals are typically scaled to an individual symbol to reflect normal market activity for that symbol. A symbol that trades under large volume, such as the E-mini S&P 500, would require a larger interval to provide relevant charting analysis. Popular intervals include 500, 1 000, 2 000 and 5 000 volume charts (again, depending on the symbol), though virtually any number could be assigned. As with tick-based charts, Fibonacci intervals, such as 987, 1 597 and 2 584, are popular choices for volume charts. Volume bars can help traders identify periods of increased activity – and better trading opportunities. Range Bar Charts:- range bar charts are the relative newcomers to the charting world, and are composed of bars that are based only on price activity, thereby eliminating time, number of transactions and volume from the equation. Each bar represents a specified price movement, such as 10 cents or 50 cents, and once price has moved the specified amount, one bar will close and a new will open. The three governing rules of range bars are:- (i) each range bar has a high/low range that equals the specified range; (ii) each range bar opens outside the high/low range of the previous bar; and (iii) each range bar closes at either its high or low. Unlike time-based intervals where an equal number of bars print each trading session, any number of range bars can appear during a session depending on the volatility of the given market. Range bars can help traders view price in a consolidated manner. A lot of the noise that occurs when prices bounce back and forth in a narrow range can be reduced to one or two bars, helping traders distinguish what is happening to price. Because much of the noise is eliminated, range-bar charts make especially ideal charts on which to draw trendlines to point out areas of support and resistance, as shown in 'Home on the range' (left). Chart Views:- determining the best chart interval requires practice and screen time. The chart should match the trading style and the time frame in which the trader operates. It is important to remember that time and activity chart settings are relative to the market being traded, so no single setting is appropriate across all markets or trading styles. Chart is a part of so-called 'Technical Analysis'. Graphic representation of price fluctuations of individual securities or of industry and stock market indices. The chartist, an advocate of technical analysis, uses historical price curves to make price forecasts on the basis of characteristic and recurrent formations. / Под Графиком, от Греческого слова Graphikos, означающее Начертанный, понимается чертёж, применяемый для наглядного изображения зависимости какой-либо величины (например, цены) от другой (например, времени). График – совокупность цен, наложенных на временной интервал. В математике и статистике, графиком можно назвать временной ряд.

CHARTACEOUS = БУМАЖНОЕ – Chartaceous:- of or like paper or parchment. Usually not green.

CHART DATUM = МАЛАЯ ВОДА – Chart Datum:- depth of water at the lowest astronomical tide (spring tide). / Глубина воды при самом малом астрономическом приливе (сизигийном приливе). Под Малой Водой понимается наинизшее положение уровня воды в море или океане при отливе. Прилив и отлив обычно бывают два раза в сутки. Максимальное поднятие воды называют полной водой, минимальное – малой водой.

CHARTER = ХАРТИЯ (или ЧАРТЕР) – (1) Charter:- in general, a formal document (instrument) that creates a legal entity, exemption, immunity, privilege, or right. In case of an organization, a charter defines or mandates its function(s) and lays down rules for its conduct or governance.

(2) In incorporation, Charter is an alternative term for articles of incorporation, the US equivalent of the UK's memorandum of association. In the United States, the term Charter means the Certificate of Incorporation of the corporation. / В Соединённых Штатах Америки, термин Хартия/Чартер означает Сертификат об Инкорпорации (Certificate of Incorporation) данной корпорации. Хартия – документ публично-правового характера.

CHARTER = ЧАРТЕР (или ФРАХТОВАНИЕ СУДНА) – In transport, Charter is the non-scheduled transport service by air, land, or sea, usually by hired or leased vessels. See also Charterparty. Charter is the lease of a ship, for anything from a single voyage to a fixed period of time. Charter is the hiring of a vessel, or use of its carrying capacity, for either (i) a specified period of time or (ii) a specific voyage or set of voyages. See also Bareboat Charter, Demise Charter, and Time Charter. / Смотрите также Фрахтование Судна Без Экипажа или Бербоут Чартер (Bareboat Charter), Фрахтование Судна С Правом Выбора Экипажа или Димайз Чартер (Demise Charter), и Фрахтование Судна На Время или Тайм Чартер (Time Charter). Чартер, договор морской или воздушной перевозки грузов, заключённый с соблюдением условий, установленных в законе. Чартер – наём судна или

использование его перевозящей способности (i) либо в течение спецификационного периода времени; (ii) либо специфического рейса или набора рейсов. Чартер – договор между владельцем транспортного средства и нанимателем (фрахтователем) об аренде транспортного средства на определённый срок или рейс. Различают несколько видов чартеров в зависимости от распределения рисков. Чартер – договор между владельцем, транспортного средства и нанимателем (фрахтователем) этого средства об аренде транспортного средства (судна, самолёта) или его части на определённый срок или на один рейс. Чартер – договор морской перевозки груза, согласно которому перевозчик (фрахтовщик) обязуется при условии предоставления для перевозки всего судна, части его или определённых грузовых помещений, доставить груз в порт назначения и передать уполномоченному на его получение лицу, а отправитель (фрахтователь) обязуется уплатить за перевозку груза установленную плату (фрахт). Чартер – старейшая форма договора перевозки; применяется, как правило, при нерегулярном, так называемом Трамповом Судоходстве. Обычно чартер, кроме общих реквизитов (размер фрахта, данные о грузе, указание мест погрузки и разгрузки, порта назначения и другого), содержит довольно подробные сведения о судне (флаг, тоннаж, позиция, скорость), а также условия о праве судовладельца.

CHARTER AGREEMENT = ЧАРТЕРНОЕ СОГЛАШЕНИЕ (или СОГЛАШЕНИЕ О ФРАХТОВАНИИ СУДНА, или ДОГОВОР ФРАХТОВАНИЯ СУДНА) – Charter Agreement is a lease or agreement to hire an airplane, vessel, or other means of conveyance to transport goods to one or more designated locations. Among other specifications, the contract usually stipulates the exact obligations of the vessel owner (loading the goods, carrying the goods to a certain point, returning to the charterer with other goods, etc), or it provides for an outright leasing of the vessel to the charterer, who then is responsible for his own loading and delivery. In either case, the charter party sets forth the exact conditions and requirements agreed upon by both sides. / при неотложном лизинге судна .

CHARTER AIR CARRIER = ЧАРТЕРНЫЙ ВОЗДУШНЫЙ ПЕРЕВОЗЧИК – Charter Air Carrier means an air carrier holding a certificate of public convenience and necessity that authorizes it to provide charter air transportation.

CHARTER AIR TRANSPORTATION = ЧАРТЕРНАЯ ВОЗДУШНАЯ ТРАНСПОРТИРОВКА – Charter Air Transportation means charter trips in air transportation authorized under this part.

CHARTERED FINANCIAL ANALYST® = ДИПЛОМИРОВАННЫЙ ФИНАНСОВЫЙ АНАЛИТИК® – Chartered Financial Analysts® (CFA) Institute (headquartered in Charlottesville, State of Virginia (VA), the USA) offers CFA Charter, acclaimed as the 'gold standard' of financial analysis and investment management. It is an especially rigorous certification program which brings added value to CFA Charter and helps finance professionals develop expertise in several key areas of finance including financial analysis, equity research and financial modeling along with other things. CFA offers validation of expert capabilities in finance and enhances career prospects for professionals.

CHARTERED MARKET TECHNICIAN = ДИПЛОМИРОВАННЫЙ РЫНОЧНЫЙ ТЕХНАРЬ – Chartered Market Technician (CMT) is offered by the US Market Technicians Association (MTA) to help finance professionals develop technical analysis skills while acquiring a detailed understanding of the theoretical part as well as their practical application in varying contexts. There are a number of other certifications which provide exposure to technical analysis but this certification offers a broad-based knowledge of the principles of technical analysis along with the knowledge of professional ethical framework for market technicians. It is a globally recognized certification which can help finance professionals look for the finest work opportunities in different parts of the world.

CHARTERED OPERATIONS = ХХ ОПЕРАЦИИ – Chartered Operations:- reservation of an aircraft for private transport of goods and/or people.

CHARTERER = ФРАХТОВАТЕЛЬ – Charterer is the person to whom is given the use of the whole of the carrying capacity of a ship for the transportation of cargo or passengers to a stated port for a specified time. The signatory to a charter party with the owner of a vessel who thus hires or leases a vessel or a part of its capacity. Charterer is the legal person who has signed a charter party with the owner of a vessel or an aircraft and thus hires or leases a vessel or an aircraft or a part of the capacity thereof. The person to whom is given the use of the whole of the carrying capacity of a ship for the transportation of cargo or passengers to a stated port for a specified time. / Фрахтователь:- сторона в договоре фрахта. Обычно фрахтователем выступает грузоотправитель или его полномочный агент. Фрахтователь имеет право требовать от перевозчика (фрахтовщика) перевозки груза в порт назначения. Фрахтователь обязан уплатить установленную за перевозку плату (фрахт).

CHARTERER'S BILL = КОНОСАМЕНТ ФРАХТОВАТЕЛЯ – Charterer's Bill is a bill of lading by virtue of which the charterer of a vessel is the contractual carrier.

CHARTERER NOT REPORTED = ФРАХТОВАТЕЛЬ НЕ УКАЗАН – Charterer Not Reported is a tanker market term; when charterer is not reported. / Термин танкерного рынка, используемый в тех случаях, когда фрахтователь не указан.

CHARTERING = ФРАХТОВАНИЕ (или ЗАКЛЮЧЕНИЕ ЧАРТЕРА, или ПОДНАЁМ) – Chartering is an activity within the shipping industry. In some cases a charterer may own cargo and employ a shipbroker to find a ship to deliver the cargo for a certain price, called Freight Rate. Freight rates may be on a per-ton basis over a certain route (e.g., for iron ore between Brazil and China), in Worldscale points (in case of oil tankers) or alternatively may be expressed in terms of a total sum – normally in US Dollars – per day for the agreed duration of the charter. A charterer may also be a party without a cargo who takes a vessel on charter for a specified period from the owner and then trades the ship to carry cargoes at a profit above the hire rate, or even makes a profit in a rising market by re-letting the ship out to other charterers. Depending on the type of ship and the type of charter, normally a standard contract form called a Charter Party is used to record the exact rate, duration and terms agreed between the shipowner and the charterer. Time Charter Equivalent is a standard shipping industry performance measure used primarily to compare period-to-period changes in a shipping company's performance despite changes in the mix of charter types. Charter Types:- (i) A Voyage Charter is the hiring of a vessel and crew for a voyage between a load port and a discharge port. The charterer pays the vessel owner on a per-ton or lump-sum basis. The owner pays the port costs (excluding stevedoring), fuel costs and crew costs. The payment for the use of the vessel is known as Freight. A voyage charter specifies a period, known as Laytime, for loading and unloading the cargo. If laytime is exceeded, the charterer must pay demurrage. If laytime is saved, the charter party may require the shipowner to pay despatch to the charterer. (ii) A Contract of Affreightment is a contract similar to a voyage charter, but ship-owner undertakes to carry a number of cargoes within a specified period of time on a specified route. Agreed frequency of cargoes may require more than one ship. (iii) A Time Charter is the hiring of a vessel for a specific period of time; the owner still manages the vessel but the charterer selects the ports and directs the vessel where to go. The charterer pays for all fuel the vessel consumes, port charges, commissions, and a daily hire to the owner of the vessel. (iv) A Trip Time Charter is a comparatively short time charter agreed for a specified route only (as opposed to the standard time charter where charterer is free to employ the vessel within agreed trading areas). (v) A Bareboat Charter or demise charter is an arrangement for the hiring of a vessel whereby no administration or technical maintenance is included as part of the agreement. The charterer obtains possession and full control of the vessel along with the legal and financial responsibility for it. The charterer pays for all operating expenses, including fuel, crew, port expenses and protection & indemnity (P&I) and hull

insurance. In commercial demise chartering, the charter period may last for many years; and may end with the charterer acquiring title (ownership) of the ship. In this case, a demise charter is a form of hire-purchase from the owners, who may well have been the shipbuilders. Demise chartering is common for tankers and bulk-carriers. (In the context of the leisure industry, the term 'Demise Charter' will rarely be heard. Bareboat yacht chartering will typically be the short-term hire for only a few weeks or even less. Here, the owner will supply the yacht in seaworthy order, fully fuelled and possibly revictualled. The yacht may be hired as one of a flotilla; and at least one yacht may be manned by an employee of the owner. At the end of the hire period, the charterer will be expected to pay for the fuel used). / Под Фрахтованием понимается разновидность коммерческой деятельности, связанная с заключением договоров о перевозке грузов или пассажиров морским, речным, авиационным или автомобильным транспортом. Наиболее развито фрахтование в морских перевозках, где оно имеет различные формы:- (i) Фрахтование На Отдельные Рейсы; (ii) Фрахтование На Последовательные Рейсы; (iii) Фрахтование На Условиях Контрактов; и (iv) Фрахтование В Аренду. Договоры морской перевозки в трамповом судоходстве обычно имеют форму Чартер-Партия (Charter Party) и Букинг Нот (Booking Note) в линейном судоходстве. Фрахтование осуществляется, как правило, через частные специализированные посреднические (брокерские) компании. Однако во многих странах наблюдалось постепенное возрастание роли государства в области фрахтования. В бывшем Союзе Советских Социалистических Республик (СССР), например, фрахтование осуществлялось планомерно на основе государственной монополии на фрахтование, являвшейся составной частью государственной монополии внешней торговли, специализированными Всесоюзными организациями:- Аэрофлот (Aeroflot), Совинфлот (Sovinflot), Совтрансавто (Sovtransavto) и Совфрахт (Sovfracht). СССР состоял в членах ряда международных организаций, занимающихся вопросами международного судоходства и фрахтования, например, Комитета по Морскому Судоходству ЮНКТАД, Межправительственной Морской Консультативной Организации (ИМКО). Советские судоходные хозяйствующие организации являлись членами международных неправительственных организаций в области судоходства, например, Балтийская и Международная Морская Конференция (БИМКО) и других. В других бывших социалистических странах фрахтование также проводилось на основе государственной монополии. В рамках бывшего Совета Экономической Взаимопомощи (СЭВ) с 1963 действовал специализированный орган – Совещание Фрахтовых и Судовладельческих Организаций Стран-Членов СЭВ, целью которого была разработка и осуществление мероприятий сотрудничества социалистических стран в области морских перевозок и фрахтования в соответствии с Комплексной Программой Социалистической Экономической Интеграции Стран-Членов СЭВ (1971). Для развивающихся стран фрахтование играет важную роль. Не располагая необходимым флотом, эти страны были вынуждены первоначально использовать тоннаж международных монополий, уплачивая высокие тарифные ставки за перевозку, что отрицательно сказывалось на конкурентоспособности их товаров, с которыми они выступали и выступают на мировом рынке. С целью объединения усилий в борьбе с господством транснациональных судовладельческих монополий развивающиеся страны создавали региональные международные судовладельческие компании, например, Арабская Морская Нефтеперевозочная Компания (АМНПК) (Arab Maritime Petroleum Transport Company (AMPTC)) – компанию в Арабских странах-экспортёрах нефти, Малазийская Международная Судоходная Корпорация (Malaysia International Shipping Corporation) – компанию в странах Юго-Восточной Азии, Namucar – многонациональную грузоперевозочную компанию в странах Карибского Моря и другие. Фрахтование – процесс заключения условий договора фрахтования судна. В более широком смысле под фрахтованием понимается также работа по бронированию линейного тоннажа, которое оформляется подписанием букинг-нота. Фрахтование судна в трамповом судоходстве обычно осуществляется через экспедиторов – фрахтовых брокеров, а в линейном судоходстве – через разветвлённый аппарат аквизиторов. В торговом мореплавании применяются следующие основные виды фрахтования судна (1) Фрахтование на условиях Рейсового Чартера (Voyage Charter), которое делится на:- (а) фрахтование на один рейс (Single Voyage) – соглашение, по которому судовладелец за определённую плату (фрахт) обязуется на обусловленном судне перевезти обусловленный груз из одного или нескольких портов отправления в один или несколько портов назначения. Этот вид фрахтования судна оформляется рейсовым чартером; (б) фрахтование на последовательные рейсы (Consecutive Voyages) – разновидность рейсового чартера, применяемого при перевозках большого количества однородного груза в одном и том же направлении одним и тем же судном. Обычно такие договоры заключаются с условием, что судно после окончания выгрузки должно немедленно вернуться в порт погрузки для совершения следующего рейса или же вправе в балластном направлении перевозить грузы других фрахтователей. Количество последовательных рейсов может быть твёрдо оговорено в чартере либо ограничено определённым периодом времени. Соглашение обычно оформляется одним чартером с указанием количества рейсов, которое должно совершить судно; (в) фрахтование по Генеральному Договору (General Contract) – соглашение, по которому судовладелец обязуется в течение определённого времени перевезти обусловленное количество груза. При перевозках по генеральному контракту судовладелец вправе выделить для перевозки любые пригодные для этой цели суда, причём их наименование в соглашении не указывается. На каждый рейс судна, осуществляющего перевозку по генеральному контракту, выписывается отдельный чартер либо составляется лишь букинг-нот, в котором делается ссылка на то, что перевозка совершается в счёт исполнения генерального контракта. В настоящее время контрактация тоннажа получила широкое распространение, что поставило вопрос о создании стандартной формы контракта. Такая форма (Volume Contract) была разработана совместными усилиями Балтийской и Международной Морской Конференцией и Международной Ассоциацией Судовладельцев. (2) Фрахтование на условиях Тайм-Чартера (Time Charier), которое в зависимости от способа определения продолжительности нахождения судна в аренде делится на обычный тайм-чартер и на круговые рейсы. По условиям кругового рейса время аренды определяется фактической продолжительностью обусловленного рейса. (3) Фрахтование на условиях Бэрбоут-Чартера или Димайз-Чартера. По договору фрахта владелец морского транспорта (фрахтователь) обязуется предоставить своё судно для перевозки грузов отправителя (фрахтователя), а отправитель, в свою очередь, предоставляет судовладельцу возможность и право перевозки грузов. Обязательным условием договора фрахта является стоимость фрахта. Фрахт – это плата, взимаемая владельцем морского транспорта за перевозку груза или использование судна. Стоимость фрахта зависит от количества, габаритов, массы перевозимого груза, характеристик груза, дальности перевозки, требуемого транспортного средства, а также фрахтовых надбавок.

CHARTER PARTY = ЧАРТЕР ПАРТИЯ – Charterparty (in the UK, 1840's), the name given to a contract in writing, between the owner or master of a ship and the freighter, by which the former hires or lets the ship, or a part of the ship, under certain specified conditions, for the conveyance of the goods of the freighter to some particular place or places. Generally, however, a charterparty is a contract for the use of the whole ship:- it is in commercial law, what an indenture is at common law. Charter Party is a contractual agreement between a ship owner and a cargo owner, usually arranged by a broker, whereby a ship is chartered (hired) either for one voyage or a period of time. Charter Party means any agreement in writing executed by or on behalf of two or more parties whereby on party agrees to charter from another one or more ships (or any part of proportion of one or more ships) whether on a voyage, time or bareboat basis, whether the ship or ships are named in the agreement or are to be nominated subsequently and whether for the carriage of one cargo or for the carriage of a series of cargoes. It also includes an agreement, executed as above, to supply space on a ship or ships for the carriage of goods or containers on terms under which the carrier undertakes to carry and the charterer or shipper undertakes to ship a minimum quantity of cargo and containers during a period, from loading ports or ranges and to discharging ports or ranges specified in

the agreement. An agreement whereby the shipowner hires his vessel to the charterer subject to certain conditions. Charter Party is a lease or agreement to hire an airplane, vessel, or other means of conveyance to transport goods to one or more designated locations. Among other specifications, the contract usually stipulates the exact obligations of the vessel owner (loading the goods, carrying the goods to a certain point, returning to the charterer with other goods, etc), or it provides for an outright leasing of the vessel to the charterer, who then is responsible for his own loading and delivery. In either case, the charter party sets forth the exact conditions and requirements agreed upon by both sides. A written contract in which the shipowner agrees to place or to rent his vessel or part of its freight space at the disposal of a charterer for the purpose of carrying goods, against a freight per ton of cargo, or a daily hire. Charter Party is a written contract between the owner of a vessel and the person desiring to employ the vessel (charterer), who rents use of the vessel or part of its freight space; sets forth the terms of the arrangement such as duration of agreement, freight rate and ports involved in the trip. Charter-Party is a contract of hire of a vessel or part of a vessel. / при неотложном лизинге судна . Чартер Партия – чартер, отличающийся от обычного договора определёнными дополнениями и изменениями, отражающими особые условия транспортировки груза.

CHARTER PARTY BILL OF LADING = КОНОСАМЕНТ НА УСЛОВИЯХ ЧАРТЕР ПАРТИИ – A bill of lading issued under a charter party. It is not acceptable by banks under letters of credit unless so authorized in the credit. Charter Party Bill Of Lading is a bill of lading that indicates that it is subject to a charter. Charterparty bills of lading, e.g., Congenbill, characteristically contain far fewer detailed terms on their reverse than do other bills of lading, for the very reason that most of their detailed terms are set out in the material charter.

CHARTER RATES = ЧАРТЕРНЫЕ СТАВКИ – Charter Rates:- the tariff applied for chartering tonnage in a particular trade.

CHARTER VESSEL = ЧАРТЕРНОЕ СУДНО – Charter Vessel is a vessel whose owner makes vessels available on bid basis. / Судно, чей владелец делает суда доступными для аренды на основе реального спроса.

CHART HIGHS/LOWS = ГРАФИЧЕСКИЕ МАКСИМУМЫ/МИНИМУМЫ – Chart Highs/Lows are determined from the bars on each chart. / В техническом анализе биржевых рынков, Графические Максимумы/Минимумы выстраиваются по соответствующим значениям вертикальных штрихов, отображающих ценовой диапазон выбранного временного интервала.

CHARTING = ПОСТРОЕНИЕ ГРАФИКОВ – Charting is the use of graphs and charts in the analysis of market behavior, so as to plot trends of price movements, average movements of price, volume of trading, and open interest, in the hope that such graphs and charts will help one to anticipate and profit from price trends. Contrasts with fundamental analysis. Synonymous with Technical Analysis. Charting is the use of charts to analyze market behavior and anticipate future price movements. Those who use charting as a trading method plot such factors as open, high, low, and settlement prices; average price movements; volume; and open interest. Three basic price charts are bar charts, candle charts and point-and-figure charts. The use of graphs and charts in the technical analysis of markets to plot price movements, average movements of prices, volume and open interest or other statistical indicators of price movement. See also Bar Chart; Candlestick Chart; and Technical Analysis. Charting is a part of technical analysis for forecasting price movements which analyze past price behavior through the use of charts and graphs. / Использование диаграмм и графиков в техническом анализе биржевых рынков для построения движения цен, усредненных движений цен, объёма сделок и открытого интереса или иных статистических индикаторов движения цен. Смотрите также Технический Анализ (Technical Analysis).

CHARTIST = ГРАФИКОМАН (или СТРАСТНЫЙ ЛЮБИТЕЛЬ ГРАФИКОВ) – Chartist is an individual who studies graphs and charts of historic data to find trends and predict trend reversals which include the observance of certain patterns and characteristics of the charts to derive resistance levels, head and shoulders patterns, and double bottom or double top patterns which are thought to indicate trend reversals. Technical trader who reacts to signals derived from graphs of price movements. Chartist is an analyst who forecasts future price trends by the technical interpretation of chart patterns based on historical prices. / Технический торговец, реагирующий на сигналы движения цены на графиках. Графикоман – лицо, финансовый аналитик, изучающий тенденции ценообразования на рынке ценных бумаг и осуществляющий соответствующий прогноз эволюции биржевых курсов в виде схем и графиков на основании этого анализа.

CHART OF ACCOUNTS = ПЛАН СЧЕТОВ – The Chart Of Accounts is organized using three different methods:- First:- Accounting Types; Second:- Order of Liquidity - the ease of converting to cash without loss of value; and Third:- Account Numbers. The 7 Basic Accounting Types (In order) are:- (i) Assets:- things you own; (ii) Liabilities:- things you owe; (iii) Equity:- owners stake in company; (iv) Revenue:- income through sales of the products of the business; (v) Costs of Goods Sold:- costs to provide the service or to manufacture or acquire the product the business sells; (vi) Expenses:- things that are paid for that are consumable, they have no lasting value but are part of the cost of running a business; and (vii) Other Revenue and Expenses:- revenue and expenses that are unusual cases and are not directly related to the business product and are not usual costs of running a business. Order of Liquidity:- the Chart of Accounts' second method of organization is Order of Liquidity. Liquidity refers to the expectation that the item can be converted to cash at at least close to its current value within one year. Accounts are listed in descending order of liquidity within their accounting types, with cash at the top of the list for assets. The liquidity classification is so important that Assets and Liabilities are divided into the Subtypes of Current and Long Term/Fixed to group items of similar liquidity together. (1) Assets:- (i) Current Assets:- (a) Cash, (b) Receivables, and (c) Inventory; and (ii) Fixed Assets. (2) Liabilities:- (i) Current Liabilities; and (ii) Long Term Liabilities. The Order of Liquidity rule is only relevant to Balance Sheet Accounts and so it is not used for Revenue and Expenses because neither Type has lasting value or ability to convert to cash. When sorting Revenue and Expense Accounts, organize them by general subjects. For example, you might want to group office expenses like Rent, Office Supplies and Utilities together. The Accounts that were established in the previous Chart of Accounts Post, organized by Accounting Type and Order of Liquidity (ease of cash conversion) are:- (1) Assets:- (i) Current Assets:- (a) Checking Account, and (b) Accounts Receivable; and (ii) Fixed Assets:- (a) Office Equipment, and (b) Office Furniture; (2) Liabilities:- (i) Current Liabilities:- (a) Accounts Payable; (3) Revenue:- (i) Sales; (4) Expenses:- (i) Rent; (ii) Office Supplies; (iii) Subscriptions; (iv) Utilities; (v) Fuel; (vi) Repairs & Maintenance; and (vii) Credit Card Interest & Fees. Account Numbers:- the Chart of Accounts' final method of organization is Account Numbers. Part of the strength of this method is the ability it provides users to recognize the Accounting Type and in some instances the Order of Liquidity simply by the Account Number assigned to the Account. Assigning Account numbers starts by assigning a range of numbers to each Accounting Type. The range that I like and use the most is ranges of 1000. I like to assign numbers in the thousand ranges because the numbers contain a manageable amount of digits and it is unlikely (in a small to mid-size company) that you'll run out of numbers to use for Accounts. The number of digits will be important in your software system so when using ranges in the 1000's there are 4 digits, and the Account Numbers would range from 1000 to 9999. It really doesn't matter how you assign ranges as long as you assign them in order by Accounting Type and are consistent but it is important to understand the industry standards for your business prior to assigning number ranges. The reason it is important to understand industry standards is that different industries create their own Subtypes and will have a standard for assigning the number ranges to those Subtypes. Generally I assign the number ranges in this order:- (i) Assets:- 1000's:- (a) Current Assets:- 1000 – 1499, and (b) Fixed Assets:- 1500 – 1999; (ii) Liabilities:- 2000's:- (a) Current Liabilities:- 2000 – 2499, and (b) Long Term

Liabilities:- 2500 – 2999; (iii) Equity:- 3000's; (iv) Revenue:- 4000's; (v) Costs of Goods Sold:- 5000's; (vi) I leave the 6000's open to allow for a Cost of Goods Sold Subtype; (vii) Expenses:- 7000's; (viii) Other Revenue:- 8000's; and (ix) Other Expenses:- 9000's. Before assigning Account Numbers to individual Accounts, first sort by Accounting Type (and Subtype) and then by Order of Liquidity. After the initial sorting, Accounts can be sorted and Account Numbers can also be assigned any way you like. It is important to use intervals of at least 10 or 20 between similar Accounts and I try to skip to the next 100 for Accounts of different types (if one grouping ended at 7030, I'd start the next grouping at 7100). This strategy gives good clues to the user about the type of account and it allows for the addition of new Accounts later. The New Chart of Accounts – with Account Numbers. This Chart of Accounts only contains accounts I've used in previous examples. It is missing some standard accounts such as Equity and Cost of Goods Sold. Those Accounts will be added in subsequent posts:- (i) 1000 Checking Account; (ii) 1200 Accounts Receivable; (iii) 1500 Office Equipment; (iv) 1520 Office Furniture; (v) 2000 Accounts Payable; (vi) 4000 Sales; (vii) 7000 Rent; (viii) 7020 Office Supplies; (ix) 7040 Subscriptions and Dues; (x) 7060 Utilities; (xi) 7100 Fuel; (xii) 7200 Repairs & Maintenance; and (xiii) 7300 Credit Card Interest and Fees. Disclaimer:- all above information is from my (Erin Lawlor; on 2000-August-31) own experience and training. The guidelines I present are general and in my experience, standard practice. I do not write with authority from any Accounting Standards Boards. Chart Of Accounts is a listing of all general ledger accounts indicating the account number, description and type (Asset, Liability, Income, Expense, Capital). A Chart of Accounts (COA) is a way of showing a business's financial information in such a way that it is possible to make good financial decisions based on the information that it shows. The COA will be made up of all the individual accounts that make up the overall accounts of a business. These individual accounts (or 'pots') are the Nominal Codes. (See our article What is a Nominal Ledger for details on what a Nominal Codes and Accounts are, and their purpose). The Nominal Accounts make up the entire Nominal Ledger, but the Nominal Ledger just provides a list of these accounts, together with each account's current balance. This provides useful information, but it is not structured. Structure:- the COA provides the necessary structure to the Nominal Accounts to allow the overall picture of a company's financial health to be easily seen. The actual structure that the COA provides will vary. It will depend on the type of business that a company is involved with, and the type of information that is useful to the business owner or accountant. However, there are usually common elements to a COA; a Chart Of Accounts will normally always include the following sections:- (i) Assets; (ii) Liabilities; (iii) Income; and (iv) Expenses. Assets and Liabilities are generally included under a section called 'Balance Sheet Items', and Income and Expenses are in another section called 'Profit and Loss'. Therefore, the 'top level' of the Chart of Accounts is just two sections of:- (i) Balance Sheet Items; and (ii) Profit and Loss Items. The assets and liabilities etc are 'children' of these sections:- (i) Balance Sheet Items:- (a) Assets, and (b) Liabilities; and (ii) Profit and Loss Items:- (a) Income, and (b) Expenses. The totals of the assets and liabilities make up an overall total for the Balance Sheet Items. Similarly, the totals for the Income and Expenses make up an overall total for the Profit and Loss Items. This makes sense in our basic understanding of accounts. Our profit is calculated as whatever income we have received, minus any expenses incurred, and will give us an overall Profit or Loss.

CHARTREUSE = ШАРТРЁЗ – Chartreuse:- a variable color averaging a brilliant yellow green. Chartreuse:- yellow-green. The word Chartreuse is a derivative of the word 'Carthusian' and the 'Grande Chartreuse' which is the name of is the head monastery, or mother-house, of the Carthusian order of monks who originally made the liqueur from Alpine mountain herbs. The basic recipe for chartreuse was passed to the monks of the Grande Chartreuse from an 'elixir of long life' recipe from the marshal of artillery for King Henri IV to which the Carthusian monks added local alpine herbs. Chartreuse was originally intended to be taken as a medicine but the taste was so good it was soon used as a drink. The original recipe used by the monks at the Grande Chartreuse was changed when the order was exiled to Spain and they could not find the exact herbs required. The first monastery called the Grande Chartreuse was built by St. Bruno in 1084 on the spot marked by the chapel of Notre-Dame de Casalibus was destroyed by an avalanche in 1132. The Grande Chartreuse monastery was burnt a total of eight times between 1320 and 1676. The Chartreuse Color:- Chartreuse is the name given to a color. The color chartreuse is a shade of green with a slight yellow tint. It is very similar to the color lime. It was named after the Chartreuse brand of liqueur. / Картезианский . часовня Касалибусской Богоматери.

CHASED = ГРАВИРОВАННОЕ (или ЧЕКАНЕННОЕ) – Chased:- a calendered finish for cotton fabrics that imparts beetled 'bright-and-dim' surface effects.

CHASMATHUM = ХАЗМАТУМ (или РАЗМАШИСТОЕ, или БЕЗДОННОЕ) – Chasmathum (-a,-us):- with wide-open, gaping, flowers. / , от Греческого слова Chásma, означающее Глубокая Расселина, .

CHÂSSIS = ШАССИ – Châssis is the frame on which inland containers can be transported. A frame with wheels and container locking devices in order to secure the container for movement. Châssis is a trailer or wheeled unit on which a container is placed in order to move container over the road. Chassis is a frame with wheels that supports a container that is being transported over land. / Под Шасси, от Французского слова Châssis, означающее Рама или Каркас или Остов или Станина, от Латинского слова Capsa, означающее Вместилище или Ящик, в зависимости от контекста понимается:- (i) совокупность частей транспортных, сельскохозяйственных и других машин, служащих для передачи усилия от двигателя к движителю, для передвижения машин и управления ими; (ii) взлётно-посадочное устройство самолёта, в гидросамолётах шасси служат корпус или поплавки; или (iii) панель из листового металла (например, алюминия) или изоляционного материала (например, гетинакса), на которой крепятся детали аппаратуры (выпрямителя, радиоприёмника и тому подобного). Под Шасси понимается:- (i) грузовой автомобиль без кузова, но с кабиной, на базе которого изготовляют специализированные (самосвал, фургон, цистерна) и специальные (автокран, пожарная машина) автомобили; (ii) часть автомобиля без двигателя, кабины и кузова; (iii) совокупность опор самолёта (вертолёта) – устройств, необходимых для взлёта, посадки, передвижения и стоянки на земле, палубе корабля или воде. Различают шасси велосипедное, многоопорное и трёхопорное (с передней опорой, с хвостовой опорой). Оно может быть гусеничным, колёсным, лыжным, полозковым, поплавковым, на воздушной подушке, а также убирающимся, неубирающимся, сбрасываемым. У тяжёлых самолётов иногда число колёс доходит до 2–3 десятков, объединяемых в тележки. Для смягчения ударов при посадке в шасси встраивается жидкостный или жидкостно-газовый амортизатор. Колёсное (иногда и лыжное) шасси оборудуется тормозами. И (iv) панель из листового металла (например, алюминия) или изоляционного материала (например, гетинакса), на которой смонтированы основные детали радиоэлектронной аппаратуры. Самоходное Шасси – колёсный или гусеничный трактор, на шасси которого можно устанавливать разнообразные навесные машины и орудия или транспортную тележку.

CHASSIS FRAME = РАМА ШАССИ – Chassis Frame:- this unit serves as a chassis, but without fixed wheels. It is the center of a three-piece combination:- the container, the chassis frame and the bogie. The container is secured to the top of the chassis frame by four corner tie-down fittings. The bogie is secured to the bottom of the frame in the same manner as it would be secured to a container were it a two-piece combination. / Рама, несущая часть машины или установки.

CHASTITY BELT = ПОЯС ЦЕЛОМУДРИЯ – Chastity Belt is a belt device, as of medieval times, designed to prevent sexual intercourse on the part of the woman wearing it.

CHASUBLE = ШАЗЮБЛЬ (или РИЗА, или ФЕЛОНЬ) – Chasuble is a sleeveless outer vestment worn by the officiating priest at mass. / .

CHATTEL = ДВИЖИМОСТЬ – Chattel is a personal property that is movable. Chattel can be either animate or inanimate personal property and can be borrowed against using a chattel mortgage. It typically excludes freehold land and items such as fixtures or equipment permanently attached to a building or the ground. In accounting, chattel property and other personal property is tracked separately from land or improvements made to land because it can be depreciated more quickly. Additionally, legal systems consider rights to chattel differently compared to rights afforded to real property, with rights to real property typically having longer statutes of limitations and being harder to overturn. Chattel is a moveable property, as opposed to fixtures (property that cannot be moved). / Движимое имущество, в противовес недвижимости (имуществу, которое не может быть перемещено). В гражданском праве под Движимостью понимается один из видов имущества, к которому относится всё, кроме земли и того, что непосредственно связано с ней (например, здания, сооружения и тому подобное).

CHAUSSURE = ШОССЮР (или ОБУВЬ, или ТУФЛЯ, или БАШМАК, или БОТИНОК) – Chaussure:- footgear; (plural) shoes. / от Французского слова .

CHB = CUSTOMS HOUSE BROKER

CHE = COLLEGE OF HUMAN ECOLOGY

CHEAP = ДЕШЁВЫЙ – Cheap:- colloquialism implying that a commodity is underpriced. / Разговорное выражение, подразумевающее, что сырьё недооценено.

CHEAPEST = САМЫЙ ДЕШЁВЫЙ – Cheapest is an order with no limit to buy securities at the cheapest price available. The sale must be completed under all circumstances. Opposite:- At Best.

CHEAPEST TO DELIVER = САМЫЙ ДЕШЁВЫЙ ДЛЯ ПОСТАВКИ (или НАИБОЛЕЕ ВЫГОДНЫЙ ДЛЯ ПОСТАВКИ) – Usually refers to the selection of a class of bonds or notes deliverable against an expiring bond or note futures contract. The bond or note that has the highest implied repo rate is considered cheapest to deliver. A method to determine which particular cash debt instrument is most profitable to deliver against a futures contract. Cheapest-To-Deliver (CTD):- a bond that can be delivered to fulfil an interest rate future and which is deliverable at a price lower than any other. The difference between the invoice amount and the cost of delivering the cheapest-to-deliver is therefore the maximum profit or the smallest possible loss compared with the delivery of other bonds. / Метод для определения какой из способов (денежный расчёт или поставка актива) обеспечения фьючерсного контракта наиболее выгоден.

CHECK = ЗАДЕРЖИВАТЬ (или СДЕРЖИВАТЬ, или СТОПОРИТЬ) – Check (maritime term):- to ease off gradually (go slower and move carefully).

CHECK = КЛЕТКА – A Check is any small, regular pattern of squares woven or knitted into, or printed on, a fabric. Check is a fabric woven or printed with a pattern in squares that resembles a checkerboard.

CHECK = ПРОВЕРКА (или ЧЕК) – Check is:- (1) a row or plot of a selected variety included in an experiment for comparison with other treatments. (2) A standard for testing and evaluation. / Чек (в мелиорации). Проверка/Сверка. (2) стандарт для тестирования и вычисления.

CHECK = ТРЕЩИНА (или МЕТИКОВАЯ ТРЕЩИНА, или ТРЕЩИНА УСУШКИ) – Check is a lengthwise separation of the wood which extends across the rings of annual growth, usually resulting from stresses set up in wood during seasoning. Checking:- cracks that occur on the ends and surfaces of lumber during drying are known as Checks. Checking is caused by shrinkage differences between the surface and core of drying lumber. Since the ends and surfaces dry first, they tend to shrink first but are restrained by the swollen core. This results in stresses building up near the surfaces which, if they become too great, cause the lumber to check. Red and white oaks, sycamore, and beech are highly susceptible to checking. Generally, rapid drying will cause the build up of stresses that result in checking. Therefore, checking may be minimized by maintaining gentle drying conditions (lower temperatures and higher relative humidities), particularly at the beginning of the drying process. In kiln drying, the operator should follow prescribed kiln drying schedules for the species and thickness of lumber being dried. Air circulation through the lumber pile also should be monitored and kept within recommended limits. On hot, sunny days it may be necessary to open vents or partially cover the collectors of a solar kiln. This is especially important in drying oak or other check-prone species. Valuable and check-prone lumber should be sheltered from the elements during air drying. A shed or pile roof will protect lumber from excessive exposure to direct sunshine as well as rain or snow. Orienting piles parallel to prevailing winds will retard airflow through the pile and slow drying. This may or may not be an advantage depending upon species being dried and seasonal weather conditions. End checking may be greatly reduced by painting the ends of logs or freshly sawed lumber with a commercial end coating or aluminum based paint. The paint will retard drying from the ends of the lumber thus reducing the stress concentrations that cause end checks. Placing stickers as close to the ends of lumber piles as possible also reduces end checking. / Виды (Species). Метиковая Трещина (Check):- радиально направленная в ядре, отходящая от сердцевины и имеющая значительную протяжённости по длине сортимента. Она возникает в растущем дереве и увеличивается в срубленной древесине при сушке. В круглых лесоматериалах наблюдается на торцах; в пилопродукции или деталях – как на торцах, так и на боковых поверхностях, где обычно имеет вид длинных цепочек прерывистых трещин, разделённых узкими перемычками. Метиковая Трещина, порок древесины, радиально направленная трещина в ядре ствола, отходящая от сердцевины. Метиковая трещина имеет значительную протяжённость по длине комлевой части ствола, иногда достигая кроны. Встречается в стволах растущих деревьев всех пород, чаще в перестойных буке, сосне и лиственнице. В процессе просыхания срубленной древесины (или при повале дерева) увеличивается и может переходить в заболонь. В зависимости от расположения на торцах круглого лесоматериала метиковая трещина может быть простой, когда одна или две трещины расположены по одному диаметру и идут по длине в одной плоскости; сложной, когда две или несколько трещин на торце расположены под углом друг к другу, что возникает при спиральном расположении волокон. В пиломатериалах метиковые трещины обнаруживаются на торцах и на боковых поверхностях. Метиковые трещины возникают в результате внутренних напряжений роста под влиянием раскачивания дерева ветром. Метиковые трещины нарушают целостность лесоматериалов и иногда снижают их механическую прочность. Трещина Усушки (season check), порок древесины; наружные радиально направленные трещины различной глубины, возникающие при сушке срубленной древесины под действием внутренних напряжений. От метиковых трещин и морозных трещин трещины усушки отличаются меньшим протяжением по длине сортимента (обычно не более 1 м) и меньшей глубиной. Различают трещины усушки неглубокие, глубокие и сквозные. В круглых лесоматериалах трещины усушки подразделяют на торцовые и боковые, расположенные на боковых сторонах сортимента с выходом или без выхода на торцы. В пилёных сортиментах, кроме торцовых, различают пластевые и кромочные

трещины усушки. В шпоне оценивают по ширине (при ширине менее 1 мм трещины усушки называются сомкнутыми, более широкие – разошедшимися).

CHECK = ЧЕК – (a) Cheques, paper-based bills of exchange and promissory notes within the meaning of the Commercial Code or the relevant legislation of another Member State which is not party to the Geneva Convention under 'b'; and (b) paper cheques in accordance with the Geneva Convention or Convention Providing a Uniform Law for Cheques, signed at Geneva, Switzerland on 1931-March-19 providing a uniform law for cheques and paper-based bills of exchange and promissory notes in accordance with the Geneva Convention of 1930-June-07 1930 providing a uniform law for bills of exchange and promissory notes. Checks generally contain:- (i) place of issue; (ii) check number; (iii) date of issue; (iv) payee; (v) amount of currency; (vi) signature of the drawer; (vii) routing / account number in MICR format. In the United States (US), the routing number is a nine-digit number in which the first 4 digits identifies the US Federal Reserve Bank's check-processing center. This is followed by digits 5 through 8, identifying the specific bank served by that check-processing center. Digit 9 is a verification check digit, computed using a complex algorithm of the previous 8 digits. (a) Typically the routing number is followed by a group 8 or 9 MICR digits that indicates the particular account number at that bank. The account number is assigned independently by the various banks. (b) Typically the account number is followed by a group of 3 or 4 MICR digits that indicates a particular check number from that account. (viii) fractional routing number (US only) – also known as the Transit Number, consists of a denominator mirroring the first 4 digits of the routing number. And a hyphenated numerator, also known as the ABA Number, in which the first part is a city code (1–49), if the account is in one of 49 specific cities, or a state code (50–99) if it is not in one of those specific cities; the second part of the hyphenated numerator mirrors the 5th through 8th digits of the routing number with leading zeros removed. A check is generally valid indefinitely or for six months after the date of issue unless otherwise indicated; this varies depending on where the check is drawn. In Australia, for example, it is fifteen months. In the United States, it is six months. Legal amount (amount in words) is also highly recommended but not strictly required. In the US and some other countries, checks contain a memo line where the purpose of the check can be indicated as a convenience without affecting the official parts of the check. This is not used in Britain where such notes are often written on the reverse side. In the US, at the top (when check oriented vertically) of the reverse side of the check, there are usually one or more blank lines labeled something like 'Endorse here'. In the United States, checks are governed by Article 3 of the Uniform Commercial Code; and there are three forms of checks:- (i) bearer check, (ii) counter check, and (iii) order check. In the United States, the terminology for a check historically varied with the type of financial institution on which it is drawn. In the case of a savings and loan association it was a negotiable order of withdrawal; if a credit union it was a share draft. Checks as such were associated with chartered commercial banks. However, common usage has increasingly conformed to more recent versions of Article 3, where check means any or all of these negotiable instruments. Certain types of checks drawn on a government agency, especially payroll checks, may also be referred to as a Payroll Warrant. In the United States, the term Check means:- (i) means a draft, payable on demand and drawn on or payable through or at an office of a bank, whether or not negotiable, that is handled for forward collection or return, including a substitute check and a travelers check; and (ii) does not include a noncash item or an item payable in a medium other than United States Dollars. Check means a negotiable instrument drawn on a bank. For this study, please follow these guidelines:- (1) checks include:- (i) checks written by individuals, businesses, or government entities; (ii) share drafts; (iii) money orders; (iv) official checks (for example, cashier's checks, teller's checks); (v) traveler's checks; and (vi) payable through drafts. (2) Checks do not include:- (i) deposit slips; (ii) general ledger tickets; (iii) other non-check documents, such as payment coupons; (iv) checks handled as an intermediary bank (correspondent check volume); and (v) ARC payments. ARC payments (accounts receivable entries) means consumer checks received at a lockbox or drop-off location that are converted to automated clearinghouse (ACH) payments for processing. A written order to a bank to pay the amount specified from funds on deposit. Written order drawn on a bank to pay on demand a certain sum of money to a designated payee or to the bearer. Checks are the primary means for a depositor to use funds in a checking (demand deposit) account. They may be used by the depositor to withdraw funds, to transfer funds to third parties, and to shift funds from place to place. Together with bank transfers, checks are the chief instrument for circulating bank money to repay obligations. The use of checks enables individuals to make payments and transfers without carrying or handling currency, freeing them from the risks of carrying bank notes (theft, loss, destruction, etc). The use of checks reduces the number of bills in circulation and limits the amount of currency that must be held by financial institutions, thereby facilitating the implementation of monetary policy. Also known as Cheque in the United Kingdom. See also Certified Check, Crossed Check, Money, and Share draft. Bill of exchange, usually drawn on a bank. Unlike other drafts or bills, a check is always payable on demand, always purports to be drawn against funds already on deposit, cannot be withdrawn once signed except by stopping payment, and is not subject to acceptance to make it valid or payable. In some countries, checks may be drawn only on a bank or the post office. Checks made out to bearer can be transferred to others simply by handing them over. Crossed checks may only be paid into a checking account. Special types of check:- Correspondence Checks, Eurocheques, and Traveller's Check. In the United States, while cash is convenient for small-Dollar transactions, for larger-value transactions individuals, businesses, and governments generally use Checks or electronic funds transfers. Measured by the number used, checks continue to be the preferred noncash payment method; however, their use has begun to decline in favor of electronic methods. In 2001, the Federal Reserve conducted an extensive survey on the use of checks and other noncash payment instruments in the United States and compared the results with a 1979 study of noncash payments and similar data collected in 1995. The survey results indicated that check usage peaked sometime during the mid-1990s and has declined since then. For example, the survey found that checks represented 59.5 percent of retail noncash payments in 2000, compared with 77.1 percent just five years earlier and 85.7 percent in 1979. The total value of checks paid declined from an estimated USD50.7 trillion in 1979 to USD39.3 trillion in 2000 (both in 2000 Dollars). In 2004, the Federal Reserve conducted another study to determine the changes in noncash payments from 2000 to 2003. That study found that the number of noncash payments had grown since 2000 and that checks were the only payment instrument being used less frequently than in 2000. Of the estimated 36.7 billion checks paid in 2003, approximately 8.7 billion were 'on-us checks', that is, checks deposited in the same institution on which they were drawn. In 2003, the Reserve Banks processed more than 58 percent of interbank checks, checks not drawn on the institution at which they were deposited. Depository institutions cleared the remaining checks through private arrangements among themselves. These private arrangements include sending checks directly to the depository institution on which they are drawn, depositing the checks for collection with a correspondent bank, or delivering the checks to a clearinghouse for exchange. Processing interbank checks requires a mechanism for exchanging the checks as well as for the related movement of funds, or settlement, among the depository institutions involved. For checks collected through the Reserve Banks, the account of the collecting institution is credited for the value of the deposited checks in accordance with the availability schedules maintained by the Reserve Banks. These schedules reflect the time normally needed for the Reserve Banks to receive payments from the institutions on which the checks are drawn. Credit is usually given on the day of deposit or the next business day. In 2003, the Reserve Banks collected 16 billion checks with a value of USD15.8 trillion. Since it was established, the Federal Reserve has worked with the private sector to improve the efficiency and cost-effectiveness of the check-collection system. Toward that end, the Federal Reserve and the banking industry developed bank routing numbers in the 1940s. These numbers are still printed on checks to identify the institution on which a check is drawn and to which the check must be presented for payment. In the 1950s, the magnetic ink character recognition (MICR) system for encoding pertinent data on checks was developed so that the data could be read

electronically. The MICR system contributed significantly to the automation of check processing. In the 1970s, the Federal Reserve introduced a regional check-processing program to further improve the efficiency of check clearing, which resulted in an increase in the number of check-processing facilities throughout the country. In response to the recent decline in overall check usage, the Reserve Banks began an initiative to better align Reserve Bank check-processing operations with the changing demand for those services. As part of the initiative, the Reserve Banks standardized check processing, consolidated some operations, and reduced the overall number of their check-processing sites. Other improvements in check collection have focused on when a customer has access to funds deposited in a bank. Until the late 1980s, depository institutions were not required to make funds from check deposits available for withdrawal within specific time frames. In 1988, the Federal Reserve Board adopted Regulation CC, Availability of Funds and Collection of Checks, which implemented the Expedited Funds Availability Act. Regulation CC established maximum permissible hold periods for checks and other deposits, after which banks must make funds available for withdrawal. It also established rules to speed the return of unpaid checks. In late 1992, the Federal Reserve Board amended Regulation CC to permit all depository institutions to demand settlement in same-day funds from paying banks without paying presentment fees, provided presenting banks meet certain conditions. In addition to processing paper checks more efficiently, the Federal Reserve has also encouraged check truncation, which improves efficiency by eliminating the need to transfer paper checks physically between institutions. To that end, the Federal Reserve worked with Congress on the Check Clearing for the XXI Century Act, commonly known as Check 21, which became effective 2004-October-28. Check 21 facilitates check truncation by creating a new negotiable instrument called a Substitute Check, which is the legal equivalent of an original check. A substitute check is a paper reproduction of an original check that contains an image of the front and back of the original check and is suitable for automated processing, just as the original check is. Check 21 allows depository institutions to truncate original checks, process check information electronically, and deliver substitute checks to depository institutions if they require paper checks. In 2004, the Board amended Regulation CC to implement Check 21. Cheque Collection:- CHF15.00 per cheque. / представляющими банками. Под Чеком понимается:- (i) денежный документ установленной формы, содержащий приказ владельца счёта в кредитном учреждении о выплате предъявителю чека указанной в нём суммы; вид ценной бумаги; или (ii) квитанция кассы о приёме денег от покупателя в розничной торговле. Чекодатель. Чекодержатель. Именной Чек, Ордерный Чек и Чек на Предъявителя. Чеки акцептуются (акцептованный чек), лимитированный чек. Перечёркнутый чек. Акцепт Чека:- чекодержатель получает от банка указанную в чеке сумму. Чек – вид ценной бумаги, денежный документ строго установленной формы, содержащий приказ владельца счёта в кредитном учреждении о выплате определённому лицу или предъявителю чека указанной в нём суммы. Обычно плательщиком по чеку является банк. Чек может быть именным (выписанным на определённое лицо), ордерным (в пользу какого-либо лица) и предъявительским (на предъявителя). Чек обычно действителен в течение определённого срока. Чек – один из распространённых видов ценных бумаг, представляющих денежный документ установленной формы. По своей сути чек есть безусловное распоряжение, приказ чекодателя (лица, выписавшего чек) банку или другому кредитному учреждению о выплате держателю чека (лицу, которому выдан чек) указанной суммы денег. Эта сумма снимается с чекового счёта чекодателя в банке и переводится или непосредственно выдаётся банком чекодержателю. Такая чековая операция предварительно предусмотрена чековым договором между банком и чекодателем. Банк может оплатить чеки и в счёт кредита чекодателю. Чеки бывают именные (выписанные на определённое лицо), ордерные (выписанные в пользу какого-либо лица) либо предъявительские (на предъявителя). Чеки действительны в течение определённого срока. Для расчёта между банками используются банковские чеки. Чекодатель – лицо, выставляющее чек. Чекодатель – лицо, выписавшее чек. Чекодержатель – лицо, на которое выставляется чек либо лицо, которое является владельцем чека (такое уточнение необходимо, так как в силу конвенционных норм указание чекодержателя не является обязательным реквизитом чека, и, следовательно, чек может быть выставлен и на предъявителя). Чекодержатель – лицо, являющееся владельцем выписанного чека. Плательщик – лицо, которому чекодатель дает распоряжение об уплате чековой суммы (в качестве плательщика может выступать только банк или иная кредитная организация). В международных расчётах за поставку какой-либо продукции или за предоставленные услуги используются, в основном, два вида чеков:- (i) банковский ордерный и (ii) клиентский. Техника расчётов при использовании названных чеков одинакова. Разница заключается лишь в том, что при использовании первого вида – чек выписывает банк импортёра по поручению своего клиента, а при использовании второго вида – чек выписывает сам импортёр и сдаёт своему банку. Банк импортёра отсылает его к оплате в свой банк. Банк экспортёра оплачивает чек при помощи корреспондентских связей с банком импортёра. Инкассация Чеков:- крупные международные банки инкассируют (принимают к оплате или обналичивают) чеки зарубежных банков и клиентов, выписанные в Долларах США, Евро, Британских Фунтах Стерлингов и Канадских Долларах. Некоторые банки ограничивают сумму предъявляемого к оплате чека. Деньги по чеку может получить лишь то лицо, на имя которого был выписан данный чек, то есть к оплате не принимаются индоссированные (переписанные на другого получателя) чеки. Средства по принятым к оплате чекам зачисляются на счёт клиента, поэтому у клиента, предъявляющего чек к оплате, должен быть счёт в данном банке. За инкассацию чека банки взимают комиссию, которая, как правило, составляет определённую процентную ставку от суммы выписанного чека. В зависимости от уровня банка и его аппетита ставки комиссии могут быть разными. В дополнение к вышесказанному банки могут устанавливать определённые ограничения для суммы комиссии за инкассацию чека, например, независимо от процентной ставки может быть установлена минимальная или/и максимальная фиксированная сумма комиссии. Кроме того, клиент должен уплатить банку и комиссионные сборы иностранных банков, если таковые были предусмотрены. В случае возврата чека с отказом в оплате, клиент обязан оплатить банку комиссионные сборы иностранных банков, если таковые были предусмотрены. Отказ от оплаты чека может возникнуть по различным причинам, например, на счёте у лица, выписавшего чек, не достаточно средств или/и оно приостанавливает оплату чека. Отказ может возникнуть и вследствие того, что у лица, выписавшего данный чек, банковский счёт уже был закрыт. Имеются также и другие причины, по которым банк может отказаться от оплаты чека. Таким образом, наличие чека не гарантирует его оплату. Банк не обязан инкассировать (принимать к оплате) чеки, то есть, принимая чеки, банк может отказать в их инкассации или потребовать от клиента дополнительных гарантий. Со дня принятия чека к оплате до непосредственной оплаты может пройти в среднем 3–4 недели, хотя бывают случаи, когда до оплаты может пройти 1.5 месяца. Всё зависит от страны и банка, оплачивающего данный чек. Так происходит потому, что инкассируемые чеки обычной почтой отправляются в банки-корреспонденты, которые оплачивают, либо не оплачивают данный чек. Для того чтобы инкассировать чек, прежде всего необходимо убедиться в том, что он соответствует требованиям к документам такого рода и может быть принят банком на инкассо. Чек должен содержать следующие поля:- лицо или компания, выписавшие чек; чековая метка; дата выписки чека; валюта и сумма чека; номер чека; номер чека, дублируемый внизу самого чека; банк-плательщик по чеку; бенефициар (получатель выручки) по чеку; подпись лица или компании выписавшей чек; и срок действия чека. Следует обратить особое внимание на дату выписки чека и срок его действия. Все чеки имеют строго ограниченный срок действия, назначенный банком-плательщиком по счёту. Если лицевая сторона чека не содержит указания срока его действия, согласно международной практике чекового обращения он принимается равным шести месяцам с даты его выписки. В связи с этим не стоит медлить с представлением чека на инкассо. Просроченные чеки, либо чеки с истекающими в ближайший месяц сроками действия банками не принимаются. Стоит также обратить внимание на то, что чек может быть представлен на инкассо только получателем (бенефициаром), указанным на

лицевой стороне чека. Получатель лично представляет чек на инкассо. Представление чека на инкассо другим лицом, в том числе действующим по доверенности, не допускается. Не стоит забывать и о том, что исправления на чеке не допускаются. Не допускается также присутствие каких-либо надписей на оборотной стороне чека до момента его сдачи в банк на инкассо. Убедившись, что с данным чеком всё в порядке, необходимо явиться в свой банк и заполнить заявление на инкассо. При наличии нескольких чеков, необходимо заполнить заявление отдельно на каждый чек. Заявление предоставляется в двух экземплярах, один из которых остаётся у заявителя, а второй сдаётся в банк. При сдаче заявления сотрудники банка попросят заявителя предоставить удостоверение личности. В большинстве стран мира таковым выступает паспорт. Далее в присутствии сотрудника банка (ни в коем случае не делать это заранее) следует совершить передаточную надпись на чеке и поставить под ней свою подпись; также обычно требуется написание рядом с подписью её расшифровки, а именно имени и фамилии, Латинскими буквами. Свою комиссию за инкассацию чека банк спишет с имеющихся на счёте заявителя денежных средств. Если на данный момент их не окажется на счёте в необходимой сумме, потребуется внести их в кассу банка. В некоторых банках эта комиссия списывается непосредственно из суммы самого чека при поступлении денежных средств на счёт заявителя. После всего того, что было проделано с данным чеком, остаётся только дождаться поступления денежных средств на свой счёт и распорядиться ими по своему усмотрению. Об их поступлении можно справляться по телефону у сотрудника банка, принявшего данный чек на инкассо. В ряде стран мира, кроме всего прочего, в соответствии с действующим законодательством, регулирующим валютные операции на территории данной страны, при инкассировании чека сверх нормативной суммы, необходимо будет предоставить в банк документы, обосновывающие проведение данной операции. Конвенционные нормы не требуют указания в чеке валюты платежа в качестве обязательного реквизита. Это связано с наличием такого института, как оговорка эффективного платежа, включение которой в чек позволяет оплачивать его именно в обозначенной в нём валюте. Если же в чеке отсутствует оговорка эффективного платежа, то чековая сумма всегда может быть выплачена в национальной валюте страны места платежа. Это связано с тем обстоятельством, что в денежных обязательствах чётко различаются понятия валюты долга и валюты платежа, что позволяет выражать денежное обязательство в иностранной валюте, международных денежных или расчётных единицах, условных денежных или расчётных единицах, а реальный платёж, направленный на погашение денежного обязательства, производить в национальной валюте, иной иностранной валюте либо международных денежных единицах. Согласно конвенционным требованиям если чек выписан в валюте, не имеющей хождения в месте платежа, то сумма его может быть уплачена в местной валюте по курсу на день наступления срока платежа. Если платеж не был осуществлен по предъявлении чека к платежу, то чекодержатель может по своему усмотрению потребовать, чтобы сумма чека была выплачена в местной валюте по курсу либо на день наступления срока платежа, либо на день платежа. Курс иностранной валюты определяется согласно обычаям, действующим в месте платежа, однако чекодатель может обусловить, что подлежащая платежу сумма будет исчислена по курсу, обозначенному в чеке. Указанные выше правила не применяются в случае, когда чекодатель обусловил, что платёж должен быть совершен в определённой указанной в чеке валюте (оговорка эффективного платежа в какой-либо иностранной валюте). Если сумма чека обозначена в валюте, имеющей в стране выдачи чека и в стране платежа одинаковое наименование, но разный курс, предполагается, что имелась в виду ссылка на валюту места платежа.

CHECKABLE DEPOSITS = ДОСТУПНЫЕ ДЛЯ ЧЕКОВ ВКЛАДЫ (или ПОДДАЮЩИЕСЯ КОНТРОЛЮ ЧЕКОВЫЕ ВКЛАДЫ) – Checkable Deposits:- any demand deposit account against which checks or drafts of any kind may be written. Checkable deposit accounts include checking, savings and money market accounts. They also include any kind of negotiable draft, such as a Negotiable Order of Withdrawal (NOW) or Super Now account. The Monetary Control Act of 1980 stipulates that all checks or check-like deposits made into a checkable account are added in the same category when calculating reserve requirements. Checkable accounts are offered by banks, credit unions and other savings and loan institutions, as well as most mutual fund companies. Checkable Deposits:- bank and postal checking account balances available at any time for transfers and conversion into cash. Checkable Deposits are the funds held at a bank or any other financial institution as a means for people to quickly access their accounts by writing checks or drafts. These accounts are highly liquid in nature and thus, transferable from one person to another. Checking, savings and money market accounts are examples of a checkable deposit account.

CHECK CARD = ЧЕКОВАЯ КАРТА (или КАРТА С ФУНКЦИЕЙ ГАРАНТИИ ЧЕКА) – Check Card is a card issued by a bank for accountholders who are members of a check system, such as Eurocheque. The bank promises to cash checks up to a certain amount provided that the signature and account number on the check and on the check card are identical and that the number of the check card is noted on the back of the check. Also known as Cheque Guarantee Card.

CHECK CLEARING = РАСЧЁТ ПО ЧЕКАМ – Check Clearing is the movement of a check from the depository institution at which it was deposited back to the institution on which it was written; the movement of funds in the opposite direction and the corresponding credit and debit to the involved accounts. Check clearing also encompasses the return of a check (for insufficient funds, for example) from the bank on which it was written to the bank at which it was deposited, and the corresponding movement of funds. The Federal Reserve operates a nationwide check-clearing system. Check Clearing is a movement of a check from the bank in which it was deposited to the bank on which it was drawn, and the movement of its face amount in the opposite direction. This process (called 'Clearing Cycle') normally results in a credit to the account at the bank of deposit, and an equivalent debit to the account at the bank on which it was drawn. Also called Clearing. / Акцепт Чека:- чекодержатель получает от банка указанную в чеке сумму. Чековый Клиринг – система движения денежных фондов между банками, при которых чек, выписанный одним банком, принимается другими. В рамках Лиги Наций в Женеве, Швейцария 19 Марта 1931 были подписаны три Женевские чековые конвенции:- конвенция, устанавливающая единообразный закон о чеках; конвенция, имеющая целью разрешение некоторых коллизий законов о чеках; и конвенция о гербовом сборе в отношении чеков. Женевские чековые конвенции подписали Бельгия, Бразилия, Германия, Италия, Польша, Франция, Швейцария, Япония и ряд других государств. Женевские чековые конвенции унифицировали национальное законодательство о чеках в странах-участницах и тем самым сделали шаг в направлении достижения единообразного регулирования чекового обращения. Государства, в которых функционирует Англо-Саксонская система права, не являются участниками Женевских чековых конвенций. В них действует чековое законодательство, отличающееся от предписаний Женевских конвенций. В число таких государств входят Австралия, Великобритания, Индия, Ирландия, Канада, Новая Зеландия, Пуэрто-Рико, США и другие. Чековое законодательство этих государств ориентировано главным образом на Закон Великобритании 'О Переводных Векселях от 1882' (Bills of Exchange Act 1882), действующий в полном объёме вплоть до настоящего времени. Характерно, что в странах Англо-Саксонской системы права чек рассматривается как разновидность переводного векселя, а именно, как переводный вексель, выставленный на банк, хотя в той же Великобритании существует и самостоятельное чековое законодательство, представленное 'Актами О Чеках 1957 и 1992' (Cheques Act 1957 и Cheques Act 1992). Чек, выставленный в соответствии с требованиями Женевских чековых конвенций, получил название 'Женевский чек'. Наряду с ним действует так называемый 'Англо-Американский чек', который отвечает требованиям Англо-Саксонской правовой системы. Основные различия между этими типами чеков сводятся к следующему:- (i) Женевский чек содержит 'Чековую Метку', то есть слово 'Чек', включённое в сам текст документа и

выраженное на том языке, на котором составлен чек; Англо-Американский чек не содержит данного реквизита; (ii) Женевский чек должен быть предъявлен к платежу в сроки, чётко указанные в конвенции; Англо-Американский чек предполагает предъявление его к платежу в ‘разумный срок’; (iii) исполнение обязательства по Женевскому чеку может быть гарантировано полностью или в части чековой суммы посредством аваля – чекового поручительства; Англо-Американскому чековому праву аваль не известен; (iv) чекодатель Женевского чека отвечает за платёж, в силу чего всякое условие, по которому он слагает с себя ответственность за платёж, считается ненаписанным; чекодатель Англо-Американского чека может освободить себя от ответственности за платёж; (v) если чекодержатель получил Женевский чек в результате непрерывного ряда индоссаментов, он рассматривается как законный чекодержатель, даже если один из индоссаментов был поддельным; что же касается Англо-Американского чека, то поддельный индоссамент полностью недействителен и не способен передать другому лицу титул законного чекодержателя. Чек представляет собой ценную бумагу, удостоверяющую безусловное абстрактное денежное обязательство. Чек – ценная бумага, содержащая письменное предложение (приказ) чекодателя плательщику произвести платёж чекодержателю в размере указанной денежной суммы. Лицо, выдавшее чек, именуется чекодателем, лицо, являющееся владельцем чека, – чекодержателем. Плательщиком выступает банк или иная кредитная организация, производящая платёж по предъявленному чеку. Банк выплачивает деньги из средств, внесённых чекодателем как клиентом банка. Отношения между чекодателем и банком строятся на основе чекового договора, в соответствии с которым чекодатель распоряжается принадлежащими ему денежными средствами, выставляя чеки, а банк берёт на себя обязанность производить по ним платежи. ‘Чек включает в себя безусловное денежное обязательство’ – это означает, что предложение (приказ) чекодателя не может быть ограничено никакими условиями. Всякое ограничительное условие считается ненаписанным. ‘Чек включает в себя абстрактное денежное обязательство’ – это означает, что в тексте чека не допускаются никакие ссылки на основания его выдачи, например, внешнеторговый контракт. Предметом чекового обязательства могут быть только деньги. Чек может быть выставлен как в национальной, так и в иностранной валюте. Порядок выставления и оплаты чека в иностранной валюте регулируется нормами национального валютного законодательства соответствующего государства. Денежные обязательства, содержащиеся в чеках, могут передаваться по передаточной надписи – индоссаменту, причём число индоссаментов практически ничем не ограничено. Абстрактность денежного обязательства, его безусловный характер, возможность индоссирования позволяют формировать как чековое обращение внутри страны, так и международный чековый оборот. Не случайно Англо-Американское право использует по отношению к чеку термин ‘оборотный документ’. Кроме того, выдача чека не погашает денежного обязательства, во исполнение которого он выдан, просто в силу того обстоятельства, что чек – это расчётный документ, предназначенный для получения платежа, и его нельзя отождествлять с последним. Денежное обязательство погашается платежом, то есть уплатой денег должником кредитору. Платёж совершается в какой-либо форме, предусмотренной законодательством (например, инкассо), которая представляет собой расчётную банковскую операцию. Форма расчёта, в свою очередь, всегда предполагает использование определённого рода расчётных документов, одним из которых и выступает чек. Чек является средством расчёта, а не средством платежа, поэтому выдача чека не погашает денежного обязательства, во исполнение которого он выдан. Кроме того, чеки – неэмиссионные ценные бумаги. Их выпуск не требует разрешения или регистрации какими-либо государственными органами. Женевские чековые конвенции выделяют три разновидности чеков в зависимости от формы легитимации их держателя:- (i) именные чеки; (ii) ордерные чеки; и (iii) предъявительские чеки. Именной чек (чек, выставленный с оплатой определённому лицу с оговоркой ‘не приказу’ или с равнозначной оговоркой) может быть передан лишь с соблюдением формы и с последствиями обыкновенной цессии. Ордерный чек (чек, выставленный с оплатой определённому лицу с прямой оговоркой ‘приказу’ или без этой оговорки) может быть передан посредством индоссамента. Индоссамент может быть совершён даже в пользу чекодателя либо в пользу всякого другого обязанного лица. Эти лица могут, в свою очередь, индоссировать чек. Индоссамент должен быть простым и ничем не обусловленным. Всякое ограничивающее его условие считается ненаписанным. Частичный индоссамент недействителен. Недействительным также является индоссамент плательщика. Индоссамент на предъявителя имеет силу бланкового индоссамента. Индоссамент на плательщика имеет силу лишь расписки, кроме того случая, когда плательщик имеет несколько отделений и индоссамент совершён в пользу отделения иного, чем то, на которое был выставлен чек. Индоссамент должен быть написан на чеке или на присоединённом к нему листе (аллонже). Он должен быть подписан индоссантом. Индоссамент может не указывать лицо, в пользу которого он сделан, или может состоять только из одной подписи индоссанта (бланковый индоссамент). В последнем случае индоссамент, чтобы иметь силу, должен быть написан на обороте чека или на добавочном листе. Индоссамент переносит все права, вытекающие из чека. Если индоссамент бланковый, то держатель может:- (i) заполнить бланк либо своим именем, либо именем какого-либо другого лица; (ii) индоссировать, в свою очередь, чек посредством бланка или на имя какого-либо другого лица; или (iii) передать чек третьему лицу, не заполняя бланка и не совершая индоссамента. Индоссант, поскольку не оговорено обратное, отвечает за платёж. Он может воспретить новый индоссамент; в таком случае он не несёт ответственности перед теми лицами, которым чек был после этого индоссирован. Лицо, располагающее передаваемым по индоссаменту чеком, рассматривается как законный чекодержатель, если оно основывает своё право на непрерывном ряде индоссаментов, даже если последний индоссамент бланковый. Зачеркнутые индоссаменты считаются при этом ненаписанными. Когда за бланковым индоссаментом следует другой индоссамент, то лицо, подписавшее последний, считается приобретшим чек по бланковому индоссаменту. Индоссамент на предъявительском чеке влечёт за собой ответственность индоссанта в порядке регресса, однако, без превращения при этом документа в ордерный чек. Если индоссамент содержит оговорку ‘валюта к получению’, ‘на инкассо’, ‘как доверенному’ или всякую иную оговорку, имеющую в виду простое поручение (препоручительный индоссамент), чекодержатель может осуществлять все права, вытекающие из чека, но индоссировать его он может только в порядке препоручения. Обязанные лица могут в таком случае заявлять против чекодержателя только такие возражения, которые могли бы быть противопоставлены индоссанту. Поручение, которое содержится в препоручительном индоссаменте, не прекращается со смертью препоручителя или с наступлением его недееспособности. Индоссамент, совершённый после протеста или равнозначного ему акта или после истечения срока для предъявления, производит лишь действие обыкновенной цессии. Поскольку обратное не будет доказано, недатированный индоссамент считается сделанным до совершения протеста или равнозначного ему акта или до истечения срока для предъявления чека к платежу. Индоссамент на ордерном чеке выполняет три основные функции:- трансферабельную, гарантийную и легитимационную. Трансферабельная функция чекового индоссамента состоит в том, что индоссамент на ордерном чеке переносит от одного лица к другому права, удостоверенные чеком, а также право на сам чек. В результате чего появляется новый кредитор (индоссат) и новый должник (индоссант). Гарантийная функция индоссамента заключается в том, что индоссант, передавая чек другому лицу, принимает на себя ответственность за оплату чека перед чекодержателем и тем самым присоединяет себя к чекодателю и предыдущим индоссантам в качестве солидарного с ними чекового должника. Индоссамент является одним из способов легитимации владельца чека в качестве субъекта выраженного в чеке права, и в этом состоит легитимационная функция индоссамента. При этом законным чекодержателем является то лицо, которое основывает своё право требования на непрерывном ряде индоссаментов.

CHECKING = РАСТРЕСКИВАНИЕ (или ТРЕСКАНИЕ, или ТРЕСКАНЬЕ) – When air drying, solar drying, or kiln drying lumber, it is costly and frustrating to have high quality boards damaged by stain, warp, and checking. These defects all result from biological characteristics of wood but each may be kept at a minimum by following a few common sense recommendations. Before discussing the suggested practices, a basic understanding of these problems is needed. Checking:- Cracks that occur on the ends and surfaces of lumber during drying are known as Checks. Checking is caused by shrinkage differences between the surface and core of drying lumber. Since the ends and surfaces dry first, they tend to shrink first but are restrained by the swollen core. This results in stresses building up near the surfaces which, if they become too great, cause the lumber to check. Red and white oaks, sycamore, and beech are highly susceptible to checking. Generally, rapid drying will cause the build up of stresses that result in checking. Therefore, checking may be minimized by maintaining gentle drying conditions (lower temperatures and higher relative humidities), particularly at the beginning of the drying process. In kiln drying, the operator should follow prescribed kiln drying schedules for the species and thickness of lumber being dried. Air circulation through the lumber pile also should be monitored and kept within recommended limits. On hot, sunny days it may be necessary to open vents or partially cover the collectors of a solar kiln. This is especially important in drying oak or other check-prone species. Valuable and check-prone lumber should be sheltered from the elements during air drying. A shed or pile roof will protect lumber from excessive exposure to direct sunshine as well as rain or snow. Orienting piles parallel to prevailing winds will retard airflow through the pile and slow drying. This may or may not be an advantage depending upon species being dried and seasonal weather conditions. End checking may be greatly reduced by painting the ends of logs or freshly sawed lumber with a commercial end coating or aluminum based paint. The paint will retard drying from the ends of the lumber thus reducing the stress concentrations that cause end checks. Placing stickers as close to the ends of lumber piles as possible also reduces end checking. See also Stain, and Warp. / Смотрите также Развод, или Потёк (Stain), и Основа (Warp). Растрескивание – образование трещин в материале или изделии под влиянием внешних воздействий или внутренних напряжений. Трещины на бревне или брусе естественной влажности в деревянном доме – это неизбежная действительность. Но, к счастью, их количество и глубину можно значительно сократить. Трещины возникают из-за неравномерной сушки древесины, когда нижние слои сохнут медленнее, чем верхние. Очень важно подходить к вопросу минимизации трещин системно и основательно.

CHECKING ACCOUNT = ЧЕКОВЫЙ СЧЁТ – Check Account is a bank account from which funds deposited may be withdrawn at any time in cash or by writing a check, but which does not ordinarily earn interest, like a time deposit account. Also known as Current Account in the United Kingdom, and Demand Deposit Account.

CHECK LOSSES = УБЫТКИ ПО ЧЕКАМ – Check Losses means financial losses incurred and written off by a bank that are related to processing check payments. Losses only include the value of the check. Unless otherwise stated, all loss figures are reported before any subsequent recoveries. Check Losses means financial losses incurred by a bank related to processing check payments in which the bank was unable to recover losses from its customer. Losses reported for this survey should only include the value of the check and should only include losses incurred by the bank. Losses should be reported before recoveries associated with the checks identified. Internal check fraud (by employees) is not to be included unless it was part of an organized effort that involved parties outside the bank.

CHECK MADE OUT TO CASH = ВЫПИСАННЫЙ ДЛЯ ПОЛУЧЕНИЯ НАЛИЧНЫХ ЧЕК – Check Made Out To Cash is a check drawn by a depositor on his account in order to withdraw cash.

CHECK ROW MARKER = МАРКЁР ЧЕКОВОГО РЯДА – Check Row Marker is a manually operated (usually pulled) light tool (common in Laguna, Philippines) used to mark the soft ricefield surface in perpendicular directions to form a grid; used as guide for transplanting of rice seedlings. / Под Маркёром, от Французского слова Marquer, означающее Отмечать, понимается .

CHECK ROW PLANTING = ПОСАДКА ЧЕКОВЫМ РЯДОМ (или КВАДРАТНО–ГНЕЗДОВАЯ ПОСАДКА) – Check Row Planting is a planting pattern where each hill is aligned in rows and columns and if the row and column are equidistant, each hill has also diagonal alignments.

CHECKSUM = СВЕРОЧНАЯ СУММА – Checksum is a method used to check that no data have been lost or changed during the communication process. / Метод, используемый для сверки того, что данные не были утеряны или изменены в течение состоявшегося процесса связи. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

CHECK TRUNCATION = УПРОЩЁННАЯ ПРОЦЕДУРА ИНКАССИРОВАНИЯ ЧЕКОВ – Check Truncation is the practice of removing an original paper check from the check-clearing process and sending in its place an alternative paper or electronic version of the essential information on the check.

CHEESE = ЦИЛИНДР (или ЦИЛИНДРИЧЕСКАЯ КАТУШКА) – Cheese is a cylindrical package of yarn wound on a flangeless tube. In textile industry, cheese is a bobbin upon which yarn is wound prior to weaving. / без фланцев. В текстильной отрасли под Цилиндром или Цилиндрической Катушкой понимается разновидность бобин, на которую производится намотка пряжи, прежде чем она попадает в ткачество.

CHEESECLOTH = СЫРНОЕ ПОЛОТНО (или СУРОВАЯ МАРЛЯ) – Cheesecloth is a low-count, plain weave, soft cotton or cotton blend cloth also known as Gauze. Cheesecloth:- cotton, plainweave. Originally used as a wrapping material for pressing cheese. Loosely woven, thin, light in weight, open in construction, and soft. Carded yarns are always used. It is also called Gauze Weave. When woven in 36” widths it is called Tobacco Cloth. When an applied finish is added, it is called Buckram, Crinoline, or Bunting. In the gray cloth, it is used for covering tobacco plants, tea bags and wiping cloths. Finished cloth is used for curtains, bandages, dust cloths, cheap bunting, hat lining, surgical gauze, fly nets, food wrapping, e.g., meat and cheese, costumes and basket tops.

CHEESES = БОБИНЫ, У КОТОРЫХ ВЫСОТА МЕНЬШЕ ДИАМЕТРА (или КРЕСТОВАЯ БОБИНА, или КРЕСТОШПУЛЯ) – Cheeses refer to the spirals of pencil roving produced on the large mechanized carders. The fibers can be knit as is (the original Lopi®) or can be spun up.

CHELATE = ХЕЛАТ (или ХЕЛАТОВОЕ СОЕДИНЕНИЕ) – Chelate:- pincer-like. / похожее на клешню. Под Хелатом или Хелатовым Соединением или Комплексоном, от Греческого слова Chēlē, означающее Клешня, понимается то же, что Внутрикомплексное Соединение.

CHELATING AGENT = ХЕЛАТООБРАЗОВАТЕЛЬ (или ХЕЛАТНЫЙ АГЕНТ) – Chelating Agent is a compound that will inactivate a metallic ion by making it an integral part of an inner ring structure. The metal is attached by coordinate links to two or more nonmetal atoms in the same molecule. See also Sequestering Agent. / Хелатообразователь – вещество, способствующее образованию хелатных соединений.

CHELATOR = ХЕЛАТОР (или КОМПЛЕКСОН) – Chelators:- these form water soluble complexes with heavy metal ions in the wash water and brought in by the clothes. This helps to stabilize the bleach which is rapidly decomposed by heavy metal ions. It also helps stain removal of highly colored stains such as Tea, Coffee and red wine. / Под Хелатором, от Греческого слова Chēlē, означающее Клешня, понимается .

CHEMICAL CRIMPING = ХИМИЧЕСКАЯ ИЗВИТОСТЬ (или ХИМИЧЕСКОЕ СМЯТИЕ) – Chemical Crimping:- a crinkled or puckered effect in fabric obtained by printing sodium hydroxide onto the goods in a planned design. When the material is washed, the part to which the paste has been applied will shrink and cause untreated areas to pucker. The same effect is obtained with a caustic resist print and a sodium hydroxide bath.

CHEMICAL DECOMPOSITION = ХИМИЧЕСКОЕ РАСЩЕПЛЕНИЕ (или ХИМИЧЕСКОЕ РАЗЛОЖЕНИЕ) – Chemical Decomposition is a process where a chemical substance changes into simpler compounds or constituent elements.

CHEMICAL DRIFT = ХИМИЧЕСКИЙ ДРЕЙФ – Chemical Drift is the movement of chemical in air. / Движение химических веществ по воздуху. Под Дрейфом, от Голландского слова Drijven, означающее Гнать или Плавать, понимается смещение химиката в воздухе.

CHEMICAL FIBER = ХИМИЧЕСКОЕ ВОЛОКНО – Chemical Fibers are the fibers made from natural and synthetic organic polymers. Depending on the type of raw material, chemical fibers are divided into synthetic (from synthetic polymers) and natural (from natural polymers) categories. Fibers prepared from inorganic compounds (glass, metal, basalt, or quartz) are sometimes also regarded as chemical fibers. Chemical fibers are manufactured industrially in the form of monofilament (a single, very long fiber), staple fiber (short pieces of fine fibers), and filament threads (a packet consisting of a large number of fine and very long fibers that are twisted together). Depending on the purpose for which they are intended, filament threads are divided into textile and industrial, or cord, threads (thicker threads of greater strength and twist). History:- the possibility of making chemical fibers from various substances (glue or resins) was predicted as early as the XVII and XVIII centuries, but it was not until 1853 that the Englishman Audemars first proposed the formation of endless threads from a solution of cellulose nitrate in a mixture of ethanol and ether. In 1891 the French engineer H. de Chardonnet was the first to organize the manufacture of such threads on an industrial scale. From that time the manufacture of chemical fibers developed rapidly. In 1896 cuprammonium fiber was manufactured from cellulose dissolved in aqueous ammonia containing cupric hydroxide. In 1893 the Englishmen Cross, Bevan, and Beadle proposed a method of making viscose fibers from aqueous alkaline cellulose xanthate solutions; this was performed on an industrial scale in 1905. In 1918–20 a method for making acetate fiber from partly hydrolyzed cellulose acetate dissolved in acetone was developed, and in 1935 the production of protein fiber from milk casein was begun. Production of synthetic fibers began in 1932 with the manufacture of polyvinyl chloride fiber (Germany). In 1940 the best-known synthetic fiber, poly-amide fiber (USA), was made on an industrial scale. From 1954 to 1960 polyester, polyacrylonitrile, and polyolefin synthetic fibers were produced on an industrial scale. Properties:- chemical fibers often have high tensile strength (up to 1 200 MegaNewtons (MN) per sq.m, or 120 kilograms-force per sq.mm), high ultimate elongation, good shape retention and crease resistance, and high resistance to repeated and alternating load and to the action of light, moisture, mold, bacteria, chemicals, and heat. The physicomechanical and physicochemical properties of chemical fibers can be changed during formation, stretching, finishing, and heat treatment, as well as through modification of both the raw material (the polymer) and the actual fiber. That makes possible the creation, even from a single fiber-forming polymer, of chemical fibers with diverse textile and other properties. Chemical fibers can be used in combination with natural fibers to make new varieties of textile articles, with considerable improvement in the latter's quality and appearance. Production:- of the large number of existing polymers, only those that consist of flexible, long macromolecules that are linear or only slightly branched and that have a sufficiently high molecular weight and can melt without decomposition or dissolve in available solvents are used in the manufacture of chemical fibers. Such polymers are called Fiber-Forming Polymers. The process of producing fibers consists of the following operations:- (1) preparation of the spinning solutions or melts, (2) formation of the fiber, and (3) finishing of the formed fiber. The preparation of the spinning solutions (melts) starts with the passage of the raw polymer into a state of viscous flow (solution or melt). Then the solution (melt) is cleansed of mechanical impurities and air bubbles, and various additives are mixed in to make the fibers resistant to heat and light and to give them a dull polish. The solution (melt) thus made is fed into a spinning machine to form the fibers. The formation of the fibers involves pressing the spinning solution (melt) through the fine holes of a spinneret into a medium that causes the polymer to solidify into fine fibers. The number and diameter of the holes in a spinneret can vary depending on the intended use and thickness of the formed fiber. In forming chemical fibers from a polymer melt (for example, polyamide fibers), cold air is the medium used to solidify the polymer. If the fibers are formed from a solution of a polymer in a volatile solvent (in the case of acetate fibers), a suitable medium is hot air, in which the solvent evaporates (the so-called Dry Forming Method). When forming fibers from a polymer solution in a nonvolatile solvent (for example, viscose fiber), the threads solidify upon falling from the spinneret into a special solution – the so-called Precipitating Bath (the Wet Forming Method). The forming rate depends on the thickness and intended use of the fibers, as well as on the forming method. In the case of forming from a melt, speeds reach 600–1 200 m/min; with a solution by the dry method, 300–600 m/min; and by the wet method, 30–130 m/min. In the process of conversion of a small jet of viscous liquid into a fine fiber, the spinning solution (melt) is stretched simultaneously (spinneret stretching). In some cases the fiber undergoes additional stretching immediately after emerging from the spinning machine (plastification stretching), resulting in increased strength of the chemical fibers and an improvement in their textile properties. The finishing of chemical fibers involves treating freshly formed fibers with various reagents. The nature of the finishing operations depends on the conditions of formation and on the fiber type. During finishing, low-molecular compounds (for example, from polyamide fibers) and solvents (from polyacrylonitrile fibers) are removed, and acids, salts, and other substances drawn out of the precipitating bath by the fibers (for example, viscose fibers) are washed away. To give fibers such properties as pliability, improved sliding, and surface adhesion of separate fibers, they are given a dressing treatment or are lubricated after washing and cleaning. The fibers are then dried on drying rollers or cylinders or in drying chambers. After finishing and drying, some chemical fibers are given an additional heat treatment, called Heat Setting (usually under stress, at 100–180 °C), which results in stabilization of the thread form and a decrease in shrinkage – both of the actual fibers and of articles made from them – during dry and wet treatments at high temperatures. The world production of chemical fibers is growing rapidly; this is primarily due to reasons of economics (lower labor costs and capital investment) and to the high quality of chemical fibers relative to natural fibers. In 1968 world production of chemical fibers reached 36 percent (7 287 000 tons) of the total volume of production of all fibers. In various fields chemical fibers are displacing natural silk, flax, and even wool. It is thought that by 1980 the annual output of chemical fibers will reach 9 million tons and by 2000, 20 million tons, and that production will be comparable with that of natural fibers. In 1966 the output of the USSR was about 467 000 tons, and in 1970, 623 000 tons. See also Manufactured Fiber, and Rayon Fiber. / Одэмар (Audemars). пузырь (bubble). Химическое Волокно (Нить) – текстильное волокно (нить), полученное в результате производственного процесса из природных, синтетических полимеров или неорганических веществ. Химические Волокна – волокна, получаемые из органических природных и синтетических полимеров. В зависимости от вида исходного сырья химические волокна подразделяются на:- (i) Искусственные Волокна из природных полимеров; и (ii) Синтетические Волокна из синтетических полимеров. Иногда к химическим волокнам относятся

также волокна, получаемые из неорганических соединений (базальтовые, кварцевые, металлические, стеклянные). Химические волокна выпускают в промышленности в виде:- (i) Моноволокна – одиночное волокно большой длины; (ii) Филаментных Нитей – пучок, состоящий из большого числа тонких и очень длинных волокон, соединённых посредством крутки; и (iii) Штапельного Волокна – короткие отрезки тонких волокон. Историческая Справка:- возможность получения химических волокон из различных веществ (клей, смолы) предсказывалась ещё в XVII и XVIII веках, но только в 1853 Англичанин Одэмар (Аудемарс (Audemars)) впервые предложил формовать бесконечные тонкие нити из раствора нитроцеллюлозы в смеси спирта с эфиром, а в 1891 Французский инженер И. дё Шардонэ (H. de Chardonnet) впервые организовал выпуск подобных нитей в производственном масштабе. С этого времени началось быстрое развитие производства химических волокон. В 1896 освоено производство медноаммиачного волокна из растворов целлюлозы в смеси водного аммиака и гидроокиси меди. В 1893 Англичанами Кроссом, Бивэном и Бидлом (Cross, Bevan, and Beadle) был предложен способ получения вискозных волокон из водно-щелочных растворов ксантогената целлюлозы, осуществлённый в промышленном масштабе в 1905. В 1918–20 разработан способ производства ацетатного волокна из раствора частично омыленной ацетилцеллюлозы в ацетоне, а в 1935 организовано производство белковых волокон из молочного казеина. Производство синтетических волокон началось с выпуска в 1932 поливинилхлоридного волокна (Германия). В 1940 в промышленном масштабе выпущено наиболее известное синтетическое волокно – полиамидное (США). Производство в промышленном масштабе полиэфирных, полиакрилонитрильных и полиолефиновых синтетических волокон осуществлено в 1954–60. Свойства:- химические волокна часто обладают высокой разрывной прочностью (до 1 200 МН/м^2 (120 кгс/мм^2)), значительным разрывным удлинением, хорошей формоустойчивостью, несминаемостью, высокой устойчивостью к многократным и знакопеременным нагружениям, стойкостью к действиям света, влаги, плесени, бактерий, хемо- и термостойкостью. Физико-механические и физико-химические свойства химических волокнон можно изменять в процессах формования, вытягивания, отделки и тепловой обработки, а также путём модификации как исходного сырья (полимера), так и самого волокна. Это позволяет создавать даже из одного исходного волокнообразующего полимера химические волокна, обладающие разнообразными текстильными и другими свойствами. Химические волокна можно использовать в смесях с природными волокнами при изготовлении новых ассортиментов текстильных изделий, значительно улучшая качество и внешний вид последних. Производство:- для производства химических волокон из большого числа существующих полимеров применяют лишь те, которые состоят из гибких и длинных макромолекул, линейных или слаборазветвлённых, имеют достаточно высокую молекулярную массу и обладают способностью плавиться без разложения или растворяться в доступных растворителях. Такие полимеры принято называть волокнообразующими. Процесс складывается из следующих операций:- (i) приготовления прядильных растворов или расплавов; (ii) формования волокна; и (iii) отделки сформованного волокна. Приготовление прядильных растворов (расплавов) начинают с перевода исходного полимера в вязкотекучее состояние (раствор или расплав). Затем раствор (расплав) очищают от механических примесей и пузырьков воздуха и вводят в него различные добавки для термо- или светостабилизации волокон, их матировки и тому подобного. Подготовленный таким образом раствор или расплав подаётся на прядильную машину для формования волокон. Формование волокон заключается в продавливании прядильного раствора (расплава) через мелкие отверстия фильеры в среду, вызывающую затвердевание полимера в виде тонких волокон. В зависимости от назначения и толщины формуемого волокна количество отверстий в фильере и их диаметр могут быть различными. При формовании химических волокон из расплава полимера (например, полиамидных волокон) средой, вызывающей затвердевание полимера, служит холодный воздух. Если формование проводят из раствора полимера в летучем растворителе (например, для ацетатных волокон), такой средой является горячий воздух, в котором растворитель испаряется (так называемый ‘сухой’ способ формования). При формовании волокна из раствора полимера в нелетучем растворителе (например, вискозного волокна) нити затвердевают, попадая после фильеры в специальный раствор, содержащий различные реагенты, так называемую осадительную ванну (‘мокрый’ способ формования). Скорость формования зависит от толщины и назначения волокон, а также от метода формования. При формовании из расплава скорость достигает 600–1 200 м/мин, из раствора по сухому способу – 300–600 м/мин, по мокрому способу – 30–130 м/мин. Прядильный раствор (расплав) в процессе превращения струек вязкой жидкости в тонкие волокна одновременно вытягивается (фильерная вытяжка). В некоторых случаях волокно дополнительно вытягивается непосредственно после выхода с прядильной машины (пластификационная вытяжка), что приводит к увеличению прочности химических волокон и улучшению их текстильных свойств. Отделка химических волокон заключается в обработке свежесформованных волокон различными реагентами. Характер отделочных операций зависит от условий формования и вида волокна. При этом из волокон удаляются низкомолекулярные соединения (например, из полиамидных волокон), растворители (например, из полиакрилонитрильных волокон), отмываются кислоты, соли и другие вещества, увлекаемые волокнами из осадительной ванны (например, вискозными волокнами). Для придания волокнам таких свойств, как мягкость, повышенное скольжение, поверхностная склеиваемость одиночных волокон и других, их после промывки и очистки подвергают авиважной обработке или замасливанию. Затем волокна сушат на сушильных роликах, цилиндрах или в сушильных камерах. После отделки и сушки некоторые химические волокна подвергают дополнительной тепловой обработке – термофиксации (обычно в натянутом состоянии при 100–180 °С), в результате которой стабилизируется форма пряжи, а также снижается последующая усадка как самих волокон, так и изделий из них во время сухих и мокрых обработок при повышенных температурах. Мировое производство химических волокон развивается бурными темпами. Это объясняется, в первую очередь, экономическими причинами (меньше затраты труда и капитальных вложений) и высоким качеством химических волокон по сравнению с природными волокнами. В 1968 мировое производство химических волокон достигало 36% (7.287 миллиона тонн) от объёма производства всех видов волокон. Химические волокна в различных отраслях в значительной степени вытесняют натуральный шёлк, лён и даже шерсть. В бывшем СССР в 1966 было выпущено около 467 000 тонн, а в 1970 – 623 000 тонн химического волокна.

CHEMICAL FINISHING = ЗАКЛЮЧИТЕЛЬНАЯ ХИМИЧЕСКАЯ ОТДЕЛКА – Chemical Finishing:- processes in which additives are applied to change the aesthetic and functional properties of a material. Examples are the application of antioxidants, flameretardant, wetting agents, and stain and water repellents.

CHEMICAL FINISHING PROCESSES = ПРОЦЕССЫ ЗАКЛЮЧИТЕЛЬНОЙ ХИМИЧЕСКОЙ ОТДЕЛКИ – Chemical Finishing Processes are the treatments with alkalies, acids, bleaches, starch, resins, and the like.

CHEMICAL FIXATION = ХИМИЧЕСКАЯ ФИКСАЦИЯ – Chemical Fixation is the process by which certain nutrient elements in a soil are converted from their available form to unavailable form. Examples are potassium, ammonium, and phosphorus fixation.

CHEMICAL NAME = НАЗВАНИЕ ХИМИКАТА – Chemical Name is the systematic name of a chemical compound according to the rules of nomenclature set by the International Union of Pure and Applied Chemistry.

CHEMICAL OXYGEN DEMAND = ХИМИЧЕСКАЯ ПОТРЕБНОСТЬ В КИСЛОРОДЕ – Chemical Oxygen Demand (COD) is a measure of the oxygen-consuming capacity of inorganic and organic matter present in water or wastewater.

CHEMICAL PATCHES = ХИМИЧЕСКИЕ ЛЯПКИ – Chemical Patches:- chemical stains observed on the fabric. Finishing defect. / химические разводы (или потёки), . Порок или Дефект заключительной отделки.

CHEMICAL PRESSURE IMPREGNATION = ХИМИЧЕСКАЯ ПРОПИТКА ПОД ДАВЛЕНИЕМ – Chemical Pressure Impregnation is a treatment of wood with a chemical preservative through a process of pressure in accordance with an official technical specification. / Химическая Пропитка Под Давлением – это обработка древесины химическими защитными средствами посредством процесса нагнетания давления в соответствии с официальной технической спецификацией.

CHEMICALS = ХИМИКАЛИИ – Chemicals are securities of the chemical companies. / Ценные бумаги химических компаний на разговорном языке биржевых дельцов могут именоваться Химикалиями (Chemicals).

CHEMICALS = ХИМИКАТЫ – Chemicals are substances applied to forestlands or timber to accomplish specific management purposes and includes pesticides, insecticides, rodenticides, plant-growth regulators, fungicides, fertilizers, desiccants, fire retardants, repellents, oil, dust control agents (other than water), – salt, and other materials, natural or foreign, added to the forest environment.

CHEMICAL STABILITY = ХИМИЧЕСКАЯ СТАБИЛЬНОСТЬ (или ХИМИЧЕСКАЯ УСТОЙЧИВОСТЬ) – Chemical Stability is the tendency of a substance or mixture to resist chemical change. Chemical Stability is a degree of resistance of a material to chemicals, such as acids, bases, solvents, oils, and oxidizing agents, and to chemical reactions, including those catalyzed by light.

CHEMICAL STAIN = ХИМИЧЕСКАЯ МОРИЛКА (или ХИМИЧЕСКИЙ КРАСИТЕЛЬ, или ХИМИЧЕСКАЯ ОКРАСКА) – Chemical Stain is a solution or suspension of coloring matter in a vehicle designed to penetrate a surface and color the wood, without hiding surface characteristics and providing some protection. / Под Красителями понимаются органические соединения, применяемые для крашения текстильных материалов, кожи, меха, бумаги, пластмасс и другого. Красители получали главным образом из растений. В начале XX века природные красители почти полностью вытеснены синтетическими. Красители классифицируют как по химическому строению (азокрасители, индигоидные, нитрозокрасители, хининиминовые и другие), так и по областям и методам применения (дисперсные, кубовые, прямые, красители для меха и другие). Под Химической Окраской понимаются ненормально окрашенные равномерные по цвету участки в срубленной древесине, возникающие в результате развития химических и биохимических процессов, в большинстве случаев связанные с окислением дубильных веществ. Обычно они располагаются в поверхностных слоях древесины (1–5 мм). При высыхании древесины они часто в большей или меньшей степени выцветают. Для пилопродукции и деталей химические окраски не измеряют, учитывают наличие порока. Если это обусловлено спецификой сортимента, допускается измерять площадь зоны, занятой пороком, в процентах от площади соответствующих сторон сортимента.

CHEMICAL TANKER = ХИМИЧЕСКАЯ ЦИСТЕРНА (или ТАНКЕР ДЛЯ ПЕРЕВОЗКИ ХИМИКАТОВ) – Chemical Tanker is a specially designed for the transport of chemicals. / Специально разработанный танкер для транспортировки химикатов.

CHEMICAL TRANSPORTATION ADVISORY COMMITTEE = СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ ПО ПЕРЕВОЗКАМ ХИМИКАТОВ – Chemical Transportation Advisory Committee (CTAC), an industry advisory body to the US Coast Guard.

CHEMISE = ШЁМИЗ (или ШМИЗ, или ТЕЛЬНЯШКА, или ЖЕНСКАЯ СОРОЧКА) – Chemise is a woman's one-piece undergarment; a loose straight-hanging dress. / .

CHEMISETTE = ШМИЗЭТ (или ШЕМИЗЭТКА, или БЛУЗКА, или ТЕННИСКА, или МАНИШКА) – Chemisette is a woman's garment, especially one, as of lace, to fill the open front of a dress. / Рубашка с короткими рукавами.

CHEMODENITRIFICATION = ХЕМОДЕНИТРИФИКАЦИЯ – Chemodenitrification:- nonbiological processes leading to the production of gaseous forms of nitrogen (molecular nitrogen or an oxide of nitrogen).

CHEMOTROPISM = ХЕМОТРОПИЗМ – Chemotropism:- bending, growth or movement of a part under the influence of a concentration gradient of chemical substances. Aerotropism- special case of a response to oxygen. See also Tropism. / Смотрите также Тропизм (Tropism). Под Хемотропизмом, от слов Хемо, часть сложных слов, указывающая на отношение к химии или химическим процессам. Под Тропизмом, от Греческого слова Tróрos, означающее Направление или Поворот, понимается ростовое движение органов растений (корня, стебля, листьев), обусловленное направленным действием какого-либо раздражителя – света (фоторопизм), силы земного тяготения (геотропизм), температуры (термотропизм), прикосновения (гаптотропизм), воды (гидротропизм), кислорода (аэротропизм) и других химических веществ (хемотропизм). В основе тропизма лежит неравномерный рост, вызываемый перераспределением в растении фитогормонов.

CHEMRAWN = CHEMICAL RESEARCH APPLIED TO WORLD NEED

CHENILLE = ШЕНИЛЛОВАЯ (или ШЕНИЛЬНАЯ, или ШЕНИЛЬ) – Chenille:- a specialty yarn, characterized by a pile protruding on all sides, resembling a caterpillar. The yarn is produced by first weaving a fabric with a cotton or linen warp and a silk, wool, rayon, or cotton filling. The warp yarns are taped in groups of tightly woven filling yarns, which have been beaten in very closely. After weaving, the fabric is cut into strips between the yarn groups. Each cutting produces a continuous chenille yarn, which is then twisted, creating the chenille yarn, and giving the pile appearance on all sides of the yarn. The chenille yarn is used mainly for decorative fabrics, embroidery, tassels, and rugs. Chenille is the yarn with a fuzzy pile protruding from all sides, cut from a woven chenille weft fabric. Chenille yarns are made from all fibers, and they are used as filling in fabrics and for embroidery, fringes, and tassels. In French, the word Chenille means Caterpillar, the worm-like insect that, after a period of time in a chrysalis, becomes a butterfly. Most caterpillars are a few inches long and are covered in short hairs that give them a fuzzy look. It is this particular look that yielded the name chenille for a certain type of fabric. Chenille yarn is quite thick, soft, and fuzzy. Lengths of chenille yarn do look, in fact, like long caterpillars. Manufacturers of chenille use begin by creating a tightly wound core for the yarn. Then short lengths of fabric, which are referred to in the industry as piles of fabric, are wrapped about the core. Once the fabric is wrapped around the core, its edges stand at right angles from the center of the fabric. This gives chenille both its softness and its characteristic look. Depending on the type of fabric that is used to create chenille, as well as the tonality of the color, chenille can have a lovely iridescent look to it without actually using iridescent fabric. Fabrics like mohair and wool, are named specifically for the type of fibers that they are made of. This is not true for chenille. Rather, the distinguishing factor for this fabric is the way in which it is made. The fabric piles used to create chenille are most commonly cotton. However, chenille can also be made of rayon, acrylic, and olefin fibers. Textile historians believe that chenille has been produced since the XVIII century. However, it was not until last century that chenille developed widespread popularity. In the 1930s, chenille became a popular fabric for housewares. Very sturdy versions of the yarn were used on bedspreads and even carpets. In the 1970s, it became a commercialized in garments. But it was not until almost two decade's later, in the 1990s, when standards for production were developed for chenille. In fact, there is currently an organization dedicated to the improvement and development of chenille manufacturing processes. This organization is known as the CIMA, or Chenille International Manufacturers Association. If you currently own a chenille garment, or are considering incorporating the fabric into your wardrobe, it is important to know how to care for

it. Almost all chenille fabrics should be dry cleaned. However, if you do decide to hand-wash it, make sure that you do not hang it to dry as it will almost certainly stretch. This can ruin the form of your garment. Rather, when hand washing chenille, be sure to dry it flat. / , от Французского слова Chenille, означающее Гусеница или Гусеничное, . уточина.

CHENILLE FABRIC = ШЕНИЛЛОВАЯ ТКАНЬ (или ТКАНЬ С ВОРСОМ ИЗ ШЕНИЛИ, или ШЕНИЛЬНАЯ ТКАНЬ) – Chenille Fabric has a fur-like texture, which is created by weaving the warp thread in groups. It is made of cotton, silk or wool and is similar to velvet. The fabric has beautiful appearance and is soft. This has made it a fancy fabric and is preferred by fabric designers. The pile of the fabric is not flat, so it reflects and absorbs light in varying degrees. It is known as Shading and Mottled Effect, which is found to some extent in all items of chenille fabric. The word 'Chenille' has been taken from a French word for caterpillar because the fuzzy pile yarn looks like a caterpillar. Chenille is commercially being produced since the 1970s. Chenille was first time made by Catherine Evans in 1895 when after being inspired by a family heirloom, made her first hand-tufted chenille bedspread. Five years later, she sold hand-tufted chenille spread for USD2.50. Later with further demand, Evans Manufacturing Company was established in 1917. Making of Chenille Fabric:- (i) the pile yarns are wrapped around a shorter stem of polished meta known as Caliper; (ii) a blade passes cutting the pile yarns into short lengths; (iii) the core yarns are pressed into the shorter lengths with the help of a rotating metal wheel; (iv) next, the yarn is fed onto a traditional ring-twisting take up mechanism; (v) in this twisting process, both the ends of core yarn twist and trap the shorter ends of pile between the core yarns; (vi) the caliper size determines the resulting yarn diameter; and (vii) the size of the pile yarns and its number and quantity fed into the core determines the count of the yarn. Characteristics of Chenille Fabric:- (i) it has fur like texture; (ii) it has beautiful appearance; (iii) it is soft; (iv) it is a fancy fabric; (v) it resembles velvet; and (vi) it reflects and absorbs light in varying degree. Chenille Fabric is a fabric woven with the chenille yarn. See also Tufted Fabric, and Weave. Chenille is made by wrapping short lengths of fabric, called Piles, around a tightly wound core of yarn. The edges of these piles then stand at right angles from the yarn's core, giving chenille both its softness and its characteristic look. Chenille can appear iridescent without actually using iridescent fibers. The yarn is commonly manufactured from cotton, but can also be made using acrylic, rayon and olefin. It should be dry-cleaned only. Chenille is a fabric consisting of wool, cotton, silk or artifical fibers. It is woven from blurry yarns or tufts. Usually it is a mix from chenille and normal textile yarns. While chenille is the filling, the other yarn is the warp. Chenille is a pile yarn originally made by weaving a pile fabric and subsequently cutting it into strips. Its main use is for draperies and bedspreads. Chenille Fabric:- warp yarn of any major textile fiber. Filling of chenille yarns (has a pile protruding all around at right angles). The word is French for caterpillar and fabric looks hairy. A fuzzy yarn whose pile resembles a caterpillar. Do not confuse with tufted effects obtained without the use of true Chenille filling. Used for millinery, rugs, decorative fabrics, trimmings, upholstery. Sometimes used broadly to define a fabric woven from chenille yarns. / и крапчатый эффект. , от Французского слова Chenille, означающее Гусеница или Гусеничное, . раскрой (cutting); нарезка ткани определённой длины по требованию заказчика (cutting) . уточина. Шениль – относится к жаккардовым тканям со сложным рисунком плетения, имеет в структуре одну или несколько шенилловых нитей. Шенилловая нить (созданная переплетением простой и пушистой нитей) становится практически нерастяжимой и хорошо встаёт в общую структуру ткани. Выглядит же она, как мохнатая гусеница (по-Французски Chenille и есть Гусеница). По составу сырья шениллы могут состоять из нитей одной породы, например, из сложного полиэфира (полиэстера – синтетическое волокно) или быть смешанными. Например, полиэстер с вискозой, хлопком или акрилом. Качественный шенилл не подвержен пиллингу, то есть на поверхности ткани не образуются так называемые 'катышки'.

CHEONGSAM = ЧИОНГСЭМ (или XX) – Cheongsam is an oriental dress with a slip skirt and a mandarin collar.

CHEQUE = ЧЕК – Cheque is an instruction by an issuer to a bank to pay a certain amount for his account. A cheque is a security subject to certain formal restrictions and is by law an order instrument (order cheque). With the standard addendum 'or bearer' the cheque becomes a bearer security. Cheques require the fulfillment of certain legal conditions. Cheques are distinguished depending on the type of payment as cash cheques and crossed cheques and, depending on the type of transfer of cheque rights, as order, bearer and registered cheques. Also known as Check. / Акцепт Чека:- чекодержатель получает от банка указанную в чеке сумму.

CHEQUE DIGIT = ЧЕКОВАЯ ЦИФРА – A Check Digit is a form of redundancy check used for error detection, the decimal equivalent of a binary parity bit. It consists of a single digit computed from the other digits in the message. With a check digit, one can detect simple errors in the input of a series of digits, such as a single mistyped digit or some permutations of two successive digits. Cheque Digit is a digit or digits (character(s)) which may be used to verify the accuracy of the string through a mathematical relationship to the string. Check Digit is a decimal (or alphanumeric) digit added to a number for the purpose of detecting the sorts of errors humans typically make on data entry. When human beings use numbers – whether keying them into computers, dialing them on telephones, or reading them and telling them to others – they tend to make certain kinds of mistakes more often than others. According to Richard Hamming (Coding and Information Theory, 2e, Prentice-Hall, 1986, p. 27), the two most common human errors are:- (i) Interchanging adjacent digits of numbers:- 67 becomes 76; and (ii) Doubling the wrong one of a triple of digits, two adjacent ones of which are the same:- 667 becomes 677. J. Verhoeff (Error Detecting Decimal Codes, Mathematical Centre Tract 29, The Mathematical Centre, Amsterdam, 1969, cited in Wagner and Putter, 'Error Detecting Decimal Digits', CACM, Vol 32, No. 1 (January 1989), pp. 106-110) gives a more detailed categorization of the sorts of errors humans make in dealing with decimal numbers, based on a study of 12000 errors:- (i) single errors:- a becomes b (60% to 95% of all errors); (ii) omitting or adding a digit (10% to 20%); (iii) adjacent transpositions:- ab becomes ba (10% to 20%); (iv) twin errors:- aa becomes bb (0.5% to 1.5%); (v) jump transpositions:- acb becomes bca (0.5% to 1.5%); (vi) jump twin errors:- aca becomes bcb (below 1%) (lower for longer jumps); and (vii) phonetic errors:- a0 becomes 1a (since the two have similar pronunciations in some languages, e.g., thirty and thirteen) (0.5% to 1.5%). In the explanations above, a is not equal to b, but c can be any decimal digit.

CHEQUE GUARANTEE CARD = КАРТА ГАРАНТИИ ЧЕКОВ – A Cheque Guarantee Card was essentially an abbreviated portable letter of credit granted by a bank to a qualified depositor in the form of a plastic card that was used in conjunction with a cheque. This allowed retailers to accept cheques and providing that the retailer wrote the card number on the back of the cheque, it was signed in the retailer's presence, and the retailer verified the signature on the cheque against the signature on the card, then the cheque could not be stopped and payment could not be refused by the bank. This arrangement worked only for cheques drawn on an account provided by the bank that issued the card and could result in an overdraft with penalty interest. After the introduction of debit cards there was a rapid decline in the use of cheque guarantee cards and these facilities were generally phased out in the countries that operated them during the 2000s. The Irish cheque guarantee scheme officially ended it on the 31 December 2011 ending the last such scheme in existence. History:- the first such scheme was introduced in the UK in 1965. During the 1980 cheque guarantee cards were often combined with ATM cards for convenience. Usage of cheque guarantee system declined significantly during the 1990s with the introduction of debit cards. In 2001, with the abolition of Eurocheques in Germany and other European countries, the cheque guarantee system also ended in those countries and many retailers stopped accepting cheques altogether. In 2011 after many years of decline, the Payments Council ended the UK cheque guarantee system, leaving Ireland as the last country to still operate a cheque guarantee card scheme. The Irish Paper Clearing Company Limited announced that the Irish system would officially end in the 31 December 2011 bringing the last such scheme to an end. Ireland:- as of 2010, there were 1.4 million valid cheque guarantee cards in Ireland; however,

just 45% of debit cards and 39% of ATM cards held the cheque guarantee function. The Irish cheque guarantee scheme covered sums of up to €130 per cheque. In 2010, the average value of a written cheque was €5 000, and only 1.5% of all cheques were used in conjunction with a guarantee card. Between 2007 and 2010, cheque usage decreased by 30%. In lights of these statistics, the Irish Paper Clearing Company announced in December 2010 that the Republic of Ireland cheque guarantee card scheme would cease on 31 December 2011 thus bringing the last such scheme in the world to an end. United Kingdom:- in the United Kingdom the scheme was first trialled in 1965 and fully introduced in 1969, with a limit of £30. The limit was increased to £50 in 1977 and then to £100 or £250, at the bank's discretion, in 1989. As of 2009 the scheme was only used to guarantee 7% of the 1.4 billion cheques issued each year, a figure which itself is declining due to the popularity of other means of payment such as debit cards. The Payments Council therefore announced a decision in September 2009 to withdraw the cheque guarantee scheme on 30 June 2011, and the scheme has now been closed. Cheque Guarantee Card is a card issued as part of a cheque guarantee system. A Cheque Guarantee Card was a plastic card that was used with a cheque as a guarantee to the recipient that the payer's bank would pay them the value of the cheque, provided that the cheque was legitimately presented by the account holder and accepted by the payee in accordance with the conditions of use of the Scheme. The card confirmed the payer's identity and guaranteed a sum up to the limit marked on the cheque card. The limit was normally £50 or £100, but 12% of cards carried a £250 guarantee limit. It was not possible to place a stop on a guaranteed cheque and once the bank received the cheque they would have had to pay it. The first cheque card was introduced in October 1965, guaranteeing payment of cheques up to £30. The UK Domestic Cheque Guarantee Card Scheme commenced in July 1969 with the objective of creating common, easily identifiable design features to simplify acceptance procedures at the point-of-sale. This was before many of us had a plastic card, and at a time when cheques were our main non-cash method of payment. The guarantee limit was increased in August 1977 to £50, and subsequently two further limits of £100 and £250 were introduced in 1989. After 01 October 1990, the common identifier on all cards with cheque guarantee functionality was William Shakespeare, and his image was used within the cheque guarantee hologram or logo on all cheque guarantee cards. In 2008 the Payments Council reviewed the viability of the Scheme – in light of the fact that the use of guaranteed cheques had dropped twelve-fold over the past 20 years – and decided to close the Scheme. At the time of taking the decision to close the Scheme, the proportion of debit cards without the guarantee had reached a quarter, and many retailers had stopped accepting guaranteed cheques. It was becoming clear that if co-ordinated action was not taken, there was an increased risk of guaranteed cheques being refused in yet more situations and banks removing the functionality in their own timescales. This would have increased the risk of confusion, processing errors and fraud. When the Scheme was first introduced the Guarantee was designed to give businesses certainty that a cheque wouldn't bounce or be returned unpaid. Times have changed; the use of debit cards has grown dramatically and the use of guaranteed cheques has been in rapid decline over the past 20 years. The decision to close the Scheme was taken by the Payments Council in June 2009 in response to the long-term decline of guaranteed cheque use. It followed consultation with Guarantee users and acceptors, and concluded that it was in all parties' interests to manage the Scheme's demise in a coordinated fashion. The UK Domestic Cheque Guarantee Card Scheme closed on 30 June 2011, meaning that it is no longer possible to guarantee a cheque under the Scheme after this date. The decision to close the Scheme was taken by the Payments Council in June 2009 as guaranteed cheque use was in terminal decline. / Вильэм .

CHERRY = ВИШНЁВОЕ (или ЧЕРЕШНЕВОЕ, или ГРАНАТОВОЕ) – Cherry:- a variable color averaging a moderate red.

CHERVONETZ = ЧЕРВОНЕЦ – Chervonetz is a Russian bullion coin, 900 fine with fine gold content of 0.248 9 Troy ounces and a face value of 10 Roubles. Issued in the 1970s. See also Gold Coin. / Под Червонцем, от Польского слова Czerwony, означающее Золотой или Красный, понимается:- (1) название иностранных золотых монет (дукатов, цехинов) в допетровской России. (2) Наименование Русской золотой монеты 3-рублёвого достоинства в XVIII–XIX веках. (3) В бывшем СССР в 1922–47 банковский билет номиналом в 10 Рублей, выпускавшийся Госбанком СССР (купюрами 1, 3, 5, 10 и 25 Червонцев). Золотое содержание червонца составляло 7.74234 г чистого золота.

CHESS = CLEARING HOUSE ELECTRONIC SUB–REGISTER SYSTEM

CHESS DEPOSITORY INTERESTS = ДЕПОЗИТАРНЫЕ ПРОЦЕНТЫ СЭСКП – CHESS (short for the Australian Clearing House Electronic Subregister System) Depository Interests (CDI's) is the general term for two products, CHESS Units of Foreign Securities (CUFS), and Depository Interests (DI's). Both types of CDI are electronic depository receipts issued over different security types and are units of beneficial ownership issued over principal securities. CUFS are the equity component of the product and apply to foreign securities only. DI's are the debt/bearer component and apply to both foreign and domestic securities.

CHESS SUBREGISTER = СУБРЕЕСТР СЭСКП – Chess Subregister:- in the Australian sharemarket, that part of an entity's register for a class of Approved Financial Products that is administered by the Australian Society for Technical Communication (ASTC) and records uncertificated holdings of Financial Products in that class. Note:- the register may be of shares, options, managed investments or other financial products that are Approved Financial Products, including CHESS (short for the Australian Clearing House Electronic Subregister System) Depository Interests (CDI's) which are units of beneficial ownership issued over Principal Financial Products. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

CHEST GIRTH = ОБХВАТ ГРУДИ – Chest Girth or Chest (for men) or Bust Girth (for women):- under the arms and across the shoulder blades with a firm and level tape. Chest Girth:- measure under the arms, at the fullest part of your chest. Make sure that the tape is level at the back. Chest Girth:- put your arms to the side, measure around your upper body right under your armpits over the fullest part of your chest. See also Bust Girth. Bust Girth:- with arms relaxed down at sides, measure around fullest part of bust, under your arms keeping tape parallel to the floor. Bust Girth:- position the tape comfortably around the fullest part of the bust making no extra allowances. Keep the tape under arms and around the shoulder blades at back. / Обхват Груди (для мужчин):- максимальный горизонтальный обхват, имеренный в сантиметрах при нормальном дыхании. Человек стоит прямо, измерительная лента проходит по лопаткам, подмышкам и груди (выступающим точкам грудных желез. Обхват Бюста (груди для женщин):- максимальный горизонтальный обхват, измеренный в сантиметрах при нормальном дыхании. Человек стоит прямо, измерительная лента проходит через лопатки, подмышки и выступающие точки грудных желез. Обхват Под Грудью (для женщин):- горизонтальный обхват тела в сантиметрах под грудью. Человек стоит прямо, измерительная лента прохоит под основанием грудных желез. Обхват Груди – сантиметровая лента проходит по наиболее выступающим точкам груди, далее – под подмышечными впадинами, на спине – немного выше. Обхват Груди – расстояние на уровне груди под проймами рукавов. Обхват Груди – это второе число, указанное на ярлыке. Размер одежды – это обхват груди, делённый на два. Например, обхват груди 88 см соответствует 44-му размеру и так далее. Если при измерении Вы получили промежуточную величину, например, 90 см, то следует выбирать одежду ближайшего размера в сторону увеличения. В данном случае 92 см, то есть 46-ой размер.

CHESTERFIELD = ЧЭСТЭФИЛД (или ЧЕСТЕРФИЛДСКИЙ, или ПАЛЬТО В ТАЛИЮ) – Chesterfield is a single-breasted or double-breasted semifitted overcoat with velvet collar. / Chesterfield = длинное пальто в талию; короткое однобортное пальто.

CHESTNUT = КАШТАНОВЫЙ (или КАШТАН) – Chestnut:- a grayish to reddish brown.

CHEVAUX = ШВО (или ЛОШАДЕЙ) – Chevaux:- this is a French unit for automobile power. The symbol ch is short for chevaux ('horses'). Some sources give it as 0.735 5 kW, but it is generally used interchangeably with the German 'PS'. Also known as Horsepower. See also Chevaux Vapeur, Horsepower, and Pferdestärke. / Французская единица мощности автомобиля. Символ 'ло' или, как это звучит на Французском, Сэ.Аш. (ch) служит сокращением для 'лошадей' или, как это звучит на Французском, 'шво' (chevaux). Некоторые источники указывают значение этой единицы, равным 0.735 5 кВт, но в более широком плане она используется в качестве взаимозаменяемого обозначения для Немецкой единицы измерения 'лошадиная сила' (лс) или, как это звучит на Немецком, Фиэдэштакэ или Пэ.Эс. (Pferdestärke или PS). Известна также как Лошадиная Сила (Horsepower). Смотрите также Шво Вапёр или Лошадиный Пар (Chevaux Vapeur), Лошадиная Сила (Horsepower), и Фиэдэштакэ или Лошадиная Сила (Pferdestärke).

CHEVAUX VAPEUR = ШВО ВАПЁР (или ЛОШАДИНЫЙ ПАР) – The capital form 'CV' is a French unit for tax horsepower, short for 'Chevaux Vapeur' ('Steam Horses') or 'Cheval-Vapeur'. CV is a non-linear rating of a motor vehicle for tax purposes. The CV rating, or fiscal power, is $((P/40)^{1.6} + (U/45))$, where P is the maximum power in kiloWatts and U is the amount of CO_2 emitted in grams per kilometer. Caution:- 'CV' has been around for a long time in France. CO_2 measurements have not. Modern quotes for CV might include a CO_2 factor, but older ones will not. The fiscal power has found its way into naming of automobile models, such as the popular 'Citroën deux-chevaux'. The cheval-vapeur unit should not be confused with the French cheval fiscal. In the XIX century the French had their own unit, which they used instead of the CV or horsepower. It was called the 'Poncelet' and was abbreviated 'p'. See also Chevaux, Horsepower, and Pferdestärke. / Обозначение двумя заглавными буквами ЛП или, как это звучит на Французском, Сэ.Вэ. (CV) является Французской единицей измерения лошадиной силы в целях налогообложения. Оно образовалось по первым буквам словосочетаний либо 'лошадиный пар' или 'шво вапёр' (chevaux vapeur, во множественном числе), либо 'лошадиный пар' или 'шёваль-вапёр' или 'шваль-вапёр' (cheval-vapeur, в единственном числе). В целях налогообложения Сэ.Вэ. служит нелинейной градацией транспортных средств, снабжённых моторами. Градация Сэ.Вэ. или мощность в фискальных целях определяется по формуле $((P/40)^{1.6} + (U/45))$, где P (Пэ.) является максимальной мощностью в килоВаттах (kiloWatts), а U (У.) является количеством выделяемого углекислого газа или диоксида углерода CO_2 в граммах на километр (grams per kilometer). Хотелось бы обратить внимание на то, что обозначение 'Сэ.Вэ.' использовалось во Франции в течение длительного времени, а замеры CO_2 стали браться относительно недавно. Современные показатели значения 'Сэ.Вэ.' могут учитывать фактор CO_2, но раньше этого не было. Мощность в фискальном смысле нашла своё отражение в обозначении автомобильных моделей, таких как популярная 'двух-лошадная Ситроэн' или, как это звучит на Французском, 'Ситроэн дё-шво' (Citroën deux-chevaux). В то же самое время единица измерения 'лошадиный пар' (шёваль-вапёр или шваль-вапёр) не должна путаться с Французской единицей мощности 'лошадей' или, как это звучит на Французском, шёваль или шваль (cheval), используемой в фискальных целях. В XIX веке во Французском языке имелась своя собственная единица, которая использовалась вместо Сэ.Вэ. или лошадиной силы. Она называлась 'понселе' или, как это звучит на Французском, 'понсэле' (poncelet) и имела обозначение 'п' или, как это звучит на Французском, 'пэ.' (p). Смотрите также Лошадиная Сила (Horsepower), Фиэдэштакэ или Лошадиная Сила (Pferdestärke), и Шво или Лошадей (Chevaux).

CHEVIOT = ШЭВЬЁ (или ШЕВИОТ, или ШЕВИОТОВАЯ) – Cheviot shirting is a narrow, all-cotton fabric, made originally from the wool of Cheviot sheep, weighing from four to five ounces per yard of 27 inches width finished and is composed of single or double ends in the warp and single filling. The effect of the double ends is entirely different from that produced by a two-ply thread, and is really meant to create a rib weave effect. This fabric is made of cotton yarns, from 1/16's to 1/22's in the warp and filling, and the cloth contains from 40 to 46 double ends per inch in warp and 36 to 40 picks per inch in the filling. Another grade is made by weaving 36 to 62 single ends per inch in the cloth, and 19 to 52 picks per inch in the filling finished. By the First Method there is 'produced a cloth that is at once stout and pliable, and having excellent wearing qualities. This cloth is used principally in the manufacture of shirts and mock shirts for the use of workmen accustomed to rough, dirty work, such as miners and railroad men, and those similarly employed. It is made in stripe pattern, usually of the darker tones of fast colors, such as dark blue, dark brown, etc, in the warp, and filling to match. In these warp stripe patterns the dark colors form 'the body or ground of the pattern andi the warp warp forms but a narrow pin stripe in the cloth. Then there are the light patterns, in which meanly all the bright colors are used, such as light blue, orange, red, light greeny etc. In this case the body or ground of the cloth la formed by the white warp, and the bright color farms the pin stripe In the cloth. Print yarns are occasionally introduced in the light colored patterns to create mixed color effects. The filling in the light patterns is always white. In making Cheviot shirting there is rather a heavy size placed upon the warp yarn. Cheviot is a rugged tweed made from uneven yarn, this fabric usually has a rather harsh hand. Cheviot:- wool originally and mostly made from wool from the Cheviot sheep but today also made of blends, spun synthetics, crossbred and reused wools. Twill weave (modern version sometimes plain). Very rugged, harsh, uneven surface that does not hold a crese and sags with wear. Resembles serge but is much more rugged and coarse and will not shine because of the rough surface. Often sold as a homespun but true homespun has a plain weave and very heavy. Also sold as a Tweed. Cheviot is a roughly textured, woolen fabric with a twill weave. The name is derived from the sheeps of the Cheviot Hills (England) of which's wool it was originally made of. / Шэвьё или Шевиот – Английская мясошерстная порода овец. уточина. Шэвьё – одно из распространённых названий шерстяных и полушерстяных камвольных и тонкосуконных костюмных тканей, вырабатываемых саржевым переплетением нитей, вследствие чего на их поверхности получаются мелкие диагональные полоски. Шэвьё изготовляют из шерстяной простой и кручёной пряжи, часто с применением хлопчатобумажной пряжи в основе или утке, а иногда из скрученных вместе шерстяной и хлопчатобумажной пряж. Шэвьё выпускают гладкокрашеным, обычно тёмных цветов; предназначается для пошива костюмов, ведомственной и школьной форм.

CHEVRON = ШЕВРОН (или ОБРАТНАЯ САРЖА, или ЛОМАНАЯ САРЖА, или НАШИВКА) – Chevron is a broad term applied to prints in zigzag stripes or to herringbone weaves. Chevron is a design that forms horizontal rows of joined Vs. Another name for chevron is Flame Stitch.

CHEWING MOUTHPARTS = ЖУЮЩИЕ РОТОВЫЕ ОРГАНЫ – Chewing Mouthparts are mouthparts with well-developed mandible for chewing.

CHF = SWISS FRANC

ChFC = CHARTERED FINANCIAL CONSULTANT

CHG = THE CHANGE BETWEEN YESTERDAY'S CLOSING PRICE AND THE PREVIOUS DAY'S CLOSE

THE CHICAGO BOARD OF TRADE = ЧИКАГСКАЯ ПАЛАТА ТОРГОВЛИ (или ЧИКАГСКОЕ ТАБЛО ТОРГОВЛИ) – The Board of Trade of the City of Chicago, Inc. or the Chicago Board of Trade or CBOT® is a commodity exchange established in 1848 that today trades in both agricultural and financial contracts. The CBOT® originally traded only agricultural commodities such as Wheat, Corn and Soybeans. Now, the CBOT® offers options and futures contracts on a wide range of products including gold, silver, US Treasury bonds

and energy. The CBOT® has added electronic trading of futures contracts in recent years, but for decades was an open auction market, where traders meet in a trading pit and primarily use hand signals to execute trades. On 2005-October-18, the Chicago Board of Trade transformed from a non-profit organization to a for-profit organization with an initial public offering on the NYSE®, listed as CBOT Holdings Inc.. Its ticker symbol is BOT. Timeline of Achievements:- 1800s:- 1848:- CBOT® creates the world's first futures exchange, based in Chicago; 1851:- CBOT® offers earliest 'forward' contract ever recorded; forward contracts begin to gain popularity among merchants and processors; 1856:- The Kansas City Board of Trade (KCBT is founded by a group of Kansas City merchants for the purposes of buying and selling); 1865:- CBOT® formalizes grain trading with the development of standardized agreements called 'Futures' Contracts, world's first such agreements CBOT® creates world's first futures clearing operation when it begins requiring performance bonds, called 'Margin', to be posted by buyers and sellers in its grain markets; 1870:- CBOT® develops first octagonal futures trading pit; 1876:- 'Grain call' trading is established under rules and guidelines approved by KCBT; 1885:- To accommodate rapid growth of futures trading, CBOT® constructs a new building at LaSalle and Jackson, Chicago's tallest building and first commercial structure with electric lights; and 1898:- Chicago Butter and Egg Board, predecessor of Chicago Mercantile Exchange, opens in Chicago. 1900s:- 1919:- Chicago Butter and Egg Board becomes Chicago Mercantile Exchange (CME®) Clearing House established; 1926:- CBOT® founds Board of Trade Clearing Corporation to guarantee its trades; 1936:- CBOT® launches soybean contract; 1961:- CME® launches first futures contract on frozen, stored meats – frozen pork bellies; 1964:- CME® launches first agricultural futures based on non-storable commodities – live cattle; 1968:- CBOT® begins trading its first non-grain-related commodity, futures on chickens; 1969:- CBOT® begins trading its first non-agricultural product, with a silver futures contract; 1972:- CME® launches first financial futures contracts, offering contracts on seven foreign currencies; 1975:- CBOT® launches first interest rate futures, offering a contract on the Government National Mortgage Association; 1981:- CME® launches first cash-settled futures contract, Eurodollar futures; 1982:- CME® launches first successful stock index futures contract, S&P 500 Index futures CBOT® launches first options on futures contract for US Treasury Bond futures; 1987:- CME® pioneers electronic futures trading with conceptualization and initiation of development of CME Globex® platform; 1992:- First electronic futures trades are made on CME Globex® electronic trading platform; 1997:- CME® develops and launches the first mini-sized, all electronic futures contract, E-mini S&P 500® futures CBOT® Dow Jones Industrial Average contract introduced; and 1999:- CME® launches first weather-based futures contracts. 2000s:- 2002:- CME® becomes first US exchange to go public; stock is listed on New York Stock Exchange; 2003:- CBOT® agrees to have CME Clearing clear its products, resulting in extensive capital efficiencies for market participants; 2005:- CBOT® demutualizes and becomes publicly traded company, listed on New York Stock Exchange; 2006:- CBOT® and CME® sign an agreement to merge into a single company pending regulatory and shareholder approval CBOT launches electronic agricultural futures trading Launch of NYMEX® products on CME Globex® CME® and Reuters agree to form first centrally cleared global FX platform for OTC market – FXMarketSpace; 2007:- CME® and CBOT® officially merge to form CME Group Inc., the world's leading and most diverse derivatives marketplace; 2008:- CME Group acquires NYMEX®, adding energy and metals to its wide array of product offerings; 2008:- CME Group and BM&FBOVESPA, Latin America's largest derivatives exchange, launch a landmark partnership that enables worldwide distribution of BM&F products on CME Globex®; 2009:- CME Group completes its New York trading floor integration, a key milestone following its 2008 acquisition of NYMEX®. The integration included the reconfiguration of the energy trading floor and combining the energy and metals futures and options trading rings onto one trading floor; 2010:- CME Group's Global Command Center opens. The 35 000 square foot facility, located at CME Group headquarters, brings the Globex Control Center, Technology Operations and all other critical support teams together in one space; 2011:- CME Group continues to make global advancements by opening its 10th global office in Seoul, South Korea; 2011:- CME Group Launches European clearing services via CME Clearing Europe; 2012:- CME Group Co-Location Services, comprised of hosting, connectivity and support services, successfully launches at its data center, allowing for the lowest latency connection possible for all CME Group Globex products; 2012:- KCBT becomes part of CME Group, bringing together the KCBT suite of hard red winter wheat products with the deep and liquid CBOT soft red winter wheat products. 2013:- KCBT Wheat is cleared on CME Clearing; 2013:- KCBT Trading Floor closes and relocates to the CBOT Trading Floor. CME Group Center for Innovation:- CME Group has continually embraced change and fostered an entrepreneurial spirit that has enabled our exchanges - as well as the futures industry – to grow and prosper. The CME Group Center for Innovation creates and sponsors thought-provoking original programming that identifies, showcases and fosters examples of significant innovation and creative thinking across multiple industries. Chicago Board of Trade (CBOT®). An exchange where grain, gold, and Treasury Bond futures and options are traded. Formed in 1848 as a centralized marketplace for the grain trade, during the last 157 years the CBOT's products line has grown to include contracts on agricultural commodities, such as Corn, Soybeans, Wheat, and rough Rice; and financial instruments such as US Treasury bonds and notes, 30-Day Federal Funds, Dow Jones stock indexes, and swaps. In 2004, the CBOT® launched 100 oz. Gold and 5 000 oz. Silver futures contracts traded exclusively through its on-line platform. In 2005, the CBOT® introduced two new contracts-South American Soybean futures and Ethanol futures-as an innovative and proactive response to shifting trends in the global agricultural economy. Intently focused on expanding the distribution of its products through a variety of global outreach efforts, the CBOT® has entered into memoranda of understandings with seven different exchanges located in the Pacific Rim and Latin America. These arrangements are intended to facilitate cooperative programs and potential joint business projects in strategic markets. The CBOT® also established a telecom hub in Gibraltar, with a second hub planned in Singapore in the latter half of 2005, to enable customers located remotely to connect directly to the CBOT®. Approximately 3 000 members trade the CBOT's products through its open auction and electronic trading platforms. The CBOT's electronic trading platform powered by LIFFE CONNECT will be further improved in 2005 with enhancements that are expected to extend its electronic trading hours to 22 hours per day for financial, equity, and metals contracts. The CBOT® has also deployed new technology to its open auction platform, creating greater efficiencies in the trading environment through the use of electronic terminals and hand-held devices. The CBOT's open auction trading platform is available Monday through Friday, 07:20 am to 02:00 pm (financial); 09:30 am to 01:15 pm (agricultural); and 07:20 am to 03:15 pm (equities). The CBOT's electronic trading platform (prior to the enhancements) is available as follows:- 06:00 pm to 04:00 pm (financial); 06:30 pm to 06:00 am (agricultural); 06:15 pm to 04:00 pm (equities); 06:16 pm to 04:00 pm (metals). The Chicago Board of Trade (CBOT®) NYSE®:- BOT, established in 1848, is the world's oldest futures and options exchange. More than 50 different options and futures contracts are traded by over 3 600 CBOT® members through open outcry and eTrading. Volumes at the exchange in 2003 were a record breaking 454 million contracts. On 2006-October-17 the CBOT® merged with the Chicago Mercantile Exchange® (CME®). History facts year by year:- On 1848-April-03, the Chicago Board of Trade (CBOT®) was officially founded by 83 merchants at 101 South Water Street as a cash market for grain. Forward or 'to-arrive' contracts begin trading at the CBOT® almost immediately. Thomas Dyer is elected the first president of the CBOT®. 1849–50:- 'To arrive' contracts come into use for future delivery of flour, timothy seed and hay. 1851:- The earliest 'forward' contract for 3 000 bushels of Corn is recorded. Forward contracts gain popularity among merchants and processors. 1852:- The Exchange moves to Clark and South Water streets. 1856:- Rising from an 1851 total of 38 members, 122 new members are admitted in 1856. The Exchange moves to South Water and LaSalle streets. 1859:- Exchange receives charter from State of Illinois. Exchange is mandated to set standards of quality, product uniformity and routine inspections of grain. 1859-February-18 – The governor of Illinois signs an act of the Illinois legislature that grants a corporate charter to the CBOT®. This charter, among other things, grants the CBOT® self-regulatory authority over its members, standardizes grades and provides for CBOT®-appointed inspectors of

grain whose decisions are binding on members. This is one of several steps in the evolution of forward contracts to modern standardized futures contracts. CFTC Annual reports published before 2004 considered 1859 to be the beginning of futures trading in CBOT® Wheat, Corn, and Oats. 1861:- The Civil War begins. CBOT® finances formation of three regiments and an artillery battery for the Union Army. CBOT® adopts gold coin as its standard of value. 1865:- CBOT® formalizes grain trading by developing standardized agreements called 'Futures Contracts'. CBOT® also begins requiring performance bonds called 'Margin' to be posted by buyers and sellers in its grain markets. CBOT® moves to its first permanent home, Chamber of Commerce Building, on corner of LaSalle and Washington streets. 1865-October-13 – Formal trading rules are instituted at the CBOT®, particularly concerning margin and delivery procedures, another step in the evolution of futures contracts. 1868:- CBOT® Board of Directors states any members engaging in a transaction to corner a market would be expelled from trading. 1868-October-13 – The CBOT® adopts a rule banning 'corners' (defined as 'making contracts for the purchase of a commodity, and then taking measures to render it impossible for the seller to fill his contract, for the purpose of extorting money from him'). This is the first known regulatory attempt to deter manipulation. 1866:- First trans-Atlantic cable laid, facilitates communication between Chicago and foreign markets; transmission of message cut from three days to three hours. 1870:- Early version of octagonal trading pit introduced; present type patented in 1878. 1871–72:- The Great Chicago Fire destroys CBOT's first building and with it all records therein. The Exchange closed October 09–10, opens two weeks after fire. A 90-ft by 90-ft, wigwam at Washington and Market streets becomes Exchange's temporary quarters. 1873:- During the Financial Panic of 1873, the CBOT® remains open despite large financial institution failures. 1875:- Chicago newspapers voice CBOT's sentiment against state grain inspection, favor Board of Trade inspection; Exchange felt that state politicians, unfamiliar with grain business and antagonistic toward grain dealers, were diverting grain from Chicago by misgrading. 1876:- First appearance of a 'bucketshop' in Chicago; such a shop was dishonest, executing orders and anticipating profit from market price changes adverse to the customer's interest. 1877:- Futures trading becomes more formalized and 'speculators' enter the picture. 1877 – The CBOT® begins publishing futures prices on a regular basis. Future CBOT® documents considered this to be the beginning of 'true' futures trading at the CBOT®. 1883:- The first clearing organization is established to clear CBOT® contracts, initially on a voluntary basis. 1885:- As a result of the explosive growth of futures, the CBOT® erects a new building at LaSalle Street and Jackson Boulevard, Chicago's tallest building at the time. It's the city's first commercial structure with electrical lighting. 1893:- The Exchange galleries are opened to the public for first time in honor of World's Columbian Exposition in Chicago. 1897:- Wheat prices rise from 60 cents a bushel to USD1.00 and William Jennings Bryan states higher prices due to crop shortages in India and Europe are not political events. 1909:- The CBOT® organizes the largest meeting ever of grain exchanges, some 20 exchanges meet at the Board of Trade in the United States. 1912:- Under auspices of the CBOT® Grain Inspection Committee, improvements are made in inspection and grading, including civil service examinations. 1914:- World War I begins. 1916:- War grinds on; corn reaches USD1.05 per bushel, highest since Civil War. 1917–20:- War makes the market unstable; Wheat trades at USD3.25 per bushel, highest ever paid for a future delivery. Grain trade and railroads nationalized during and for a period after the end of World War I on 1918-November-11. 1922:- The federal government establishes the Grain Futures Administration to regulate grain trading. 1923:- The US Supreme Court upholds the Capper-Tincher Act (Grain Futures Act), to eliminate price manipulation and other trade abuses. 1924:- The US government discusses assuming power to set daily trading limits; called by Exchange President Frank L. Carey a deplorable, unhealthy restriction of supply-demand freedom. 1925:- The CBOT® Board of Directors is given authority to declare an emergency situation and establish daily price limits. CBOT® has one of its most successful years; 26.9 billion bushels of grain traded. 1926:- Board of Trade Clearing Corporation founded to guarantee trades made on the CBOT®. 1929:- Exchange outgrows its building, temporarily relocates to quarters at Clark and Van Buren streets while new building is erected at the LaSalle and Jackson site. CBOT® seat sells for USD62 500, a record at the time. 1930:- CBOT® moves into 45-story new home at LaSalle and Jackson; building was tallest in Chicago, dominating skyline. 1936:- CBOT® launches Soybean futures contracts. 1940:- During World War II, Paris falls to the German army and open Wheat futures shrink 37 million bushels in six days of liquidation and prices decline. 1950–51:- The CBOT® completes the Soybean complex with the introduction of Soybean Oil and Soybean Meal futures. 1952:- The Exchange joins American Red Cross to obtain blood donors for American forces in Korea. 1956:- The CBOT® hires its first paid, non-member president. Robert C. Liebenow, 34. He is the youngest person to hold the post of CBOT® president. At the same time, Julius Mayer is elected the first CBOT® Chairman. CBOT® introduces the industry's first examination for commodity brokers. 1963:- CBOT® closes for funeral of President Kennedy on November 25. 1966:- CBOT® introduces the first examination in the futures industry for commission house representatives. 1967:- New, fast, automatic electronic price display boards are installed on the walls above the trading floors, replacing chalkboard markers and Morse code telegraph clicks. Price reporting time is cut to seconds. 1968:- Iced broilers, the CBOT's first non-grain related commodity, begins trading. CBOT® names its first public directors:- John Hopkins University President Milton S. Eisenhower; former Bureau of the Budget Director Charles L. Schultze; and Inland Steel Chairman Joseph I. Block. 1969:- CBOT® begins trade in first non-grain product, with a Silver futures contract. On 1969-July-29, Carol J. Ovitz, Assistant Vice President of Mitchell Hutchins & Company, becomes the first woman member of the Exchange. On 1973-April-26 members of the CBOT® launched the Chicago Board Options Exchange, Inc. (CBOE®), making it the world's first stock options exchange. The government establishes the Commodity Futures Trading Commission to regulate the futures industry. 1974:- CBOT® starts trade in 3 Kilo Gold futures on December 31. 1975:- CBOT® launches first interest rate futures contract, Government National Mortgage Association futures; sets stage for a huge increase in trading volume, a new era of growth and trading instruments for futures exchanges around the world. 1977:- CBOT® launches the US Treasury Bond futures contract; becomes most actively traded contract in the world. October 1977, The Prince of Wales visits the CBOT®. 1979:- CBOT begins trade in 100 Troy oz Gold futures on February 20. 1980:- CBOT® closes January 07–08 by the Commodity Futures Trading Commission (CFTC) order; to suspend trading after President Carter places embargo on grain shipments to Soviet Union. 1982:- CBOT® launches first options on futures contract, for US Treasury Bond futures on October 01. CBOT® completes its annex to the original 1930 building, which houses a new agricultural trading floor, then the world's largest at 32 000 sq. feet. Exchange launches 10-Year Treasury Note futures contracts on May 03. 1984:- CBOT® launches trading in Soybean futures-options. 1986:- The CBOT® saluted Vietnam war veterans during their parade down LaSalle Street. CBOT® trade volume tops 100 million contracts for the first time, sets world record. 1987:- CBOT® markets remain open throughout October stock market crash. The CBOT® is the only major exchange in the world to operate without interruption during the financial crisis. 1988:- Fed Fund futures begin trading May 03. 1991:- CBOT® welcomes President George Herbert Walker Bush; first US President to visit the Exchange. Peggy A. Ogorek is the first woman elected CBOT® Director. 1992:- CBOT® closed April 13–14, due to the Chicago River tunnel flood. Soviet President Mikhail Gorbachov visit the CBOT® on 1992-May-07. 1993:- CBOT® administers first cash SO_2 emission allowance auction for the Environmental Protection Agency. 1994:- CBOT® launches Project A, its after-hours electronic trading system for futures and futures-options. 1995:- Members approve trading of agricultural products on Project A during off-exchange hours. CBOT® launches its Internet site. 1996:- Vice President Gore is special guest at Exchange's Democratic Senatorial Campaign reception during 1996 Democratic National Convention in Chicago. 1997:- CBOT® launches the CBOT® Dow Jones Industrial Average Index® futures and options on futures contracts. CBOT® opens the world's largest trading floor, 60 000 sq ft for financial futures and futures-options on 1997-February-18. 1998:- On April 03, the CBOT® celebrates its 150th Anniversary. On September 28, the Board of Directors establishes side-by-side open outcry and electronic trading for financial contracts, providing trading opportunity for those members and firms who wished to trade on the CBOT's electronic trading

system during the day. 2001:- Chicago's four financial exchanges close on Wednesday, September 12 in recognition of the tragic events of September 11. CBOT® launches 10-Year Interest Rate Swap futures. 2003:- On November 25, the CBOT® transitions to its new electronic trading platform, powered by LIFFE Connect and its agreement with the Chicago Mercantile Exchange® (CME®) to provide clearing and related services for all CBOT® products. 2005:- On March 23, the CBOT® successfully launched its Ethanol futures contract. On April 14, the CBOT® announced that an overwhelming 99 percent of the votes were cast in favor of the CBOT's restructuring proposal, which includes the demutualization of the Exchange into a for-profit, stock-based holding company and for-profit, membership exchange subsidiary. On June 09, the CBOT® celebrated the 75th anniversary of the Exchange's landmark building; CBOT® rededicates two statues that once stood at the entrance of the original CBOT® building completed in 1885. On October 19, CBOT Holdings, Inc, has its Class A common stock listed on the New York Stock Exchange at a price of USD54.00 per share. 2006:- The CBOT® announced that the Exchange achieved the highest yearly total volume recorded in its history, with more than 674 million contracts traded in 2005. On 2006-January-06, US President George Walker Bush toured the CBOT® agricultural trading floor, becoming the second US Chief Executive to visit the Exchange. On 2006-April-26, the CBOT® announced that it will increase global access to its benchmark Agricultural products by offering trading of CBOT® full-sized, physically delivered Agricultural futures contracts on its electronic trading platform during daytime trading hours. Trading is expected to begin on 2006-August-01. 2006-August-01, marked the CBOT's historic launch of electronic agricultural futures trading side-by-side with the open auction market during daytime trading hours. On September 26, Singapore Exchange and Chicago Board of Trade commenced the first day of trade for the Joint Asian Derivatives Exchange (JADE). JADE a market division of SGX Derivatives Trading Ltd, launched its debut in commodities futures trading with TSR 20 Rubber futures contract. On 2006-October-17, the Chicago Mercantile Exchange Holdings Inc. and the CBOT Holdings, Inc announced that they signed a definative agreement to merge the two organizations to create the most extensive and diverse global derivatives exchange. On 2006-November-07, the CBOT® announced that it successfully launched open auction trading of its options on Full-sized Gold (100 oz) and Silver (5 000 oz) futures contracts. On 2006-December-18, the CBOT® announced that it has successfully launched clearing services for two new over-the-counter (OTC) Ethanol Calendar Swap contracts with the clearing of 60 contracts last week. On 2006-December-21, CBOT Holdings and CME Holdings have filed a preliminary joint proxy and registration statement on Forms S-4 with the US Securities and Exchange Commission relating to the proposed merger of the two companies. 2007:- On January 02, the CBOT® announced that it set a new record for annual trading volume, with 805 884 413 contracts. CBOT Holdings, Inc announced its best year in company history, with revenue of USD169.3 million for the fourth quarter 2006 on 2007-January-31. On 2007-February-05, the CBOT® launched the electronically-traded DJUSRE Index futures contract designed to allow market participants to capitalize on changes in the real estate sector of the stock market. On 2007-February-26, CBOT Holdings, Inc., announces that it will hold special meetings for the CME® merger vote on April 04. On 2007-March-01, CBOT Holdings, Inc filed a brief challenging CBOE's attempt to terminate Exercise Rights. On 2007-March-15, CBOT Holdings, Inc. received unsolicited, non-binding proposal letter from IntercontinentalExchange to merge with CBOT Holdings. On 2007-March-19, CBOT® Board of Directors authorized the company to begin discussions with IntercontinentialExchange, Inc, relating to ICE's announced proposal. On 2007-March-31, the CBOT® postpones the Special Meeting for the CME® merger to give Board of Directors sufficient time to complete their review of ICE's proposal. On 2007-May-01, CBOT Holdings, Inc., following its annual meeting of stockholders, announced that Charles P. Carey was re-elected as a director and reappointed to serve a third two-year term as Chairman of the Board. On 2007-May-11, Chicago Mercantile Exchange Holdings Inc. (NYSE®, NASDAQ®:- CME®) and CBOT Holdings, Inc. (NYSE®:- BOT) announced that they have revised the terms of their definitive merger agreement and recommendation that CBOT Holdings shareholders vote in favor of the merger agreement with CME®. On 2007-May-15, CBOT Holdings sets record date for July 09 meeting to vote on CME® Merger. On 2007-June-11, CME® and CBOT® received Department of Justice Clearance to proceed with merger. On 2007-June-14, CBOT Holdings, Inc. (NYSE®:- BOT) announced that its Board of Directors had carefully reviewed the revised proposal from IntercontinentalExchange, Inc. (ICE®) and concluded that it is not superior to the revised CME® merger agreement. On 2007-June-14, the CME®, CBOT® revised the merger agreement to provide increased value and delivers one-time cash dividend to all CBOT® shareholders and guarantee for holders of CBOE® exercise rights. On 2007-July-09, the Chicago Mercantile Exchange Holdings Inc. (NYSE®, NASDAQ®:- CME®) and Chicago Board of Trade Holdings, Inc. (NYSE®:- BOT) completed the merger of their companies, creating the world's largest and most diverse exchange. / СИБО® (CBOE®). Дьжодьж Хобэтч Вокё Бош (George Herbert Walker Bush; 1924–2018). THE CHICAGO BOARD OPTIONS EXCHANGE, INCORPORATED = БИРЖА ОПЦИОНОВ ПРИ ЧИКАГСКОЙ ПАЛАТЕ, ИНКОПОРЭЙТИД (или БИРЖА ОПЦИОНОВ ПРИ ЧИКАГСКОМ ТАБЛО, ИНКОПОРЭЙТИД) – Founded as a member-owned, non-stock Delaware corporation, the Chicago Board Options Exchange, Incorporated or the Chicago Board Options Exchange, Inc., or CBOE® began operating as an exchange on 1973-April-26 as the first organized marketplace for the trading of standardized, listed options on equity securities. Since the CBOE's inception, the CBOE® has grown to become one of the world's leading exchanges for the trading of derivatives and is recognized globally for its leadership role in the trading of options on individual equities and equity indexes. The Chicago Board Options Exchange (CBOE®) refers to (i) prior to the completion of the restructuring transaction, Chicago Board Options Exchange, Incorporated, a Delaware non-stock corporation, and (ii) after the completion of the restructuring transaction, the Chicago Board Options Exchange, Incorporated, a Delaware stock corporation. The CBOE® is a self-regulatory organization, or SRO, under the Securities Exchange Act of 1934, and as such are subject to regulation and oversight by the SEC. As an SRO, the CBOE® plays a critical role in the US securities markets:- it conducts market surveillance and examines members and member organizations for, and enforce, compliance with federal securities laws and its Rules. Since 2004-March-24, the CBOE® has also operated the CBOE® Futures Exchange, LLC as a designated contract market under the oversight of the Commodity Futures Trading Commission. On 2006-July-27, the CBOE® announced the creation of the CBOE® Stock Exchange, LLC, a facility of the CBOE® in which the CBOE® holds a 50% interest, which is scheduled to begin trading stocks in the first quarter of 2007. Initially, only call options were listed in the USA. Put option trading were not listed until June 1977, and, even then, only on an experimental basis. The Chicago Board of Trade launched the Chicago Board Options Exchange, Inc on 1973-April-26, making it the first exchange-traded options market in the world. At the time, only call options were listed on sixteen NYSE® common stocks. Trading begins in a small smokers' lounge overlooking the futures exchange. Between April 1973 and December 1976 four more option exchanges began making markets

in options, however, again, only calls. Puts on 25 stocks began trading in June 1977, but, even then, only on an experimental basis. The Securities and Exchange Commission (SEC) allowed each of the five stock options exchanges in the United States of America to trade puts on five stocks. Later in the year, however, the SEC declared a moratorium on option introductions while it reviewed the practices of the option exchanges and considered the economic impact of option trading. About three years later, the SEC lifted its moratorium and adopted a lottery system called the Stock Allocation Plan. According to this plan, exchanges randomly selected options from a pool of stocks and were each granted an exclusive franchise to trade options in those chosen stocks. The first options traded under the plan were listed 1980-June-02. On 1985-June-03, the first options on NASDAQ® stocks were listed. These options were exempt from the SEC's allocation plan and have always been eligible for multiple listing. On 1990-January-22, the SEC abolished its allocation plan and allowed all options to be multiple-listed. A program to 'roll out' the grandfathered option classes began in November 1992 and went quarterly through February 1995. A second set of institutional factors that may have a bearing on the empirical results are the stock option listing criteria. The CBOE®, for example, requires that the firm has (i) a minimum of seven million shares outstanding not including those held by insiders, and (ii) a minimum of 2 000 shareholders. In addition, it requires that the stock (iii) traded at least 2 400 000 shares in the last twelve months, and (iv) closed at a market price of at least USD7.50 per share for the majority of the business days during the last three months (Chicago Board Options Exchange Constitution and Rules (May 1995), Paragraph 2113). Note that the first criterion requires that the prospective stock have at least seven million shares outstanding excluding those held by insiders. This helps ensure the availability of shares to short sell the underlying stocks, which market makers may have to do to hedge an open option position. To identify candidates for listing, the CBOE® monitors the trading activity of all stocks satisfying the listing criteria. Among the factors considered in gauging the market's potential interest are the stock's trading volume and return volatility. The higher the trading volume and the greater the return volatility, the greater the projected option activity. Once the CBOE® decides to list options on a particular stock, it registers with the SEC. Trading begins a few days later. As a matter of courtesy, the exchange sends a letter informing the firm of its decision. Founded in 1973, the Chicago Board Options Exchange (CBOE®) is an exchange that focuses on options contracts for individual equities, indexes and interest rates. The CBOE® is the world's largest options market. It captures a majority of the options traded. It is also a market leader in developing new financial products and technological innovation, particularly with electronic trading. Also known as See-Bo. The world's largest options marketplace and the creator of listed options. Options traded at CBOE® include options on equity, index, ETFs, structured products, and interest rates. The CBOE® traded 911 contracts when it opened on 1973-April-26, listing call options on 16 stocks. Today it lists equity options on some 1 700 stocks and American Depositary Receipts (ADRs). The exchange launched index options in 1983 with the Standard & Poor's 100 Index (OEX). The contract is the most actively traded index option in the world. The CBOE® holds over 90% of the index options market, trading cash-settled index options on more than 40 indices. It also trades LEAPS®, FLEX options, exchange-traded funds, structured products, and interest rate options. Among the most heavily traded index options are contracts on the Dow Jones, S&P, Russell, and NASDAQ® indices. CBOE® also trades a family of options on international indices as well as industry sector indices. The CBOE® trades European-style cash-settled options on the yield of US Treasury securities. The the CBOE® Volatility Index (VIX®), known as the VIX®, is a measure of the volatility of the US Equity market, using real-time S&P 500® Index option bid/ask quotes. In 2004, CBOE® founded the CBOE® Futures Exchange, LLC (CFE®). CFE® is a wholly-owned subsidiary of CBOE® that operates as an all-electronic exchange, using CBOEdirect as its trading platform, with trades cleared through the Options Clearing Corporation. Trading hours:- Monday through Friday, from 08:30 am to 03:15 pm. (CBOE Futures Exchange (CFE®) is the home of volatility futures, featuring futures on the CBOE® Volatility Index (VIX®). CFE® is owned by CBOE® and its trades are cleared by the triple-A rated Options Clearing Corporation (OCC). CFE® is an all-electronic, open access market model with dedicated market makers and market participants providing liquidity). The Chicago Board Options Exchange, Inc. (CBOE®), located at 400 South LaSalle Street in Chicago, is one of the world's largest options exchanges with an annual trade of over 450 million options contracts, covering more than 1 200 companies, 50 stock indexes, and 50 exchange-traded funds (ETFs). The exchange was established in 1973, when it created and listed the first exchange-listed standardized stock options. The CBOE® is regulated by the Securities and Exchange Commission (SEC) and its options contracts are cleared by the Options Clearing Corporation (OCC). In 2007 it opened a Reg NMS compliant stock exchange called the Chicago Board Options Stock Exchange (CBSX) to compete with the NYSE®, NASDAQ®, and other regional exchanges. The Chicago Board Options Exchange (CBOE®) was founded in April 1973 as the first US options exchange offering standardized, listed options. CBOE, where for the first time in 2008 more than one billion contracts were traded, was at the end of 2011 the largest of the nine US options exchanges in total volume and market share. The CBOE®'s parent company, CBOE Holdings Inc., went public on June 15, 2010, at a share price of USD29. As of the end of 2011, CBOE® listed options on 2 795 equities, on 12 cash indexes, and on 275 ETFs, among other products. Chicago Board Options Exchange ranked as the world's fifth-largest derivatives exchange by contract volume in 2009, according to the annual Futures Industry Association's survey of the world's leading derivatives exchanges. CBOE® recorded its fourth straight year of volume over one billion contracts in 2011 with 1.15 billion contracts traded. The CBOE®'s S&P 500 options are its strongest performing contract. The options hit an all-time volume record of 197.5 million contracts (just under 785 000 contracts/day average) in 2011. In 2012, average daily volume in the contracts was nearly 700 000, making it the most heavily traded index product. The biggest winner at CBOE® in terms of a percentage increase during 2011 was CBOE VIX options. With 98.0 million contracts traded, contract volume was up 57 percent over 2010. Trading at CBOE® is carried out by way of the exchange's Hybrid system, which enables customers to choose whether to have their transactions handled electronically or through open outcry. About 95 percent of CBOE® orders are traded electronically, which equates to between 50 and 60 percent of the exchange's total business. The remaining transactions, traded via open outcry, typically are large or complex institutional orders that use the skills of floor brokers to 'work the order' to gain potential price improvement. The Chicago Board Options Exchange (CBOE®) was organized by the Chicago Board of Trade on 1973-April-26 for the original purpose of trading call options on sixteen New York Stock Exchange (NYSE®) common stocks. Trading began in a small smoker's lounge overlooking the futures exchange. First put options on common stocks were listed for the first time in the United States on the CBOE® and other four US exchanges on 1977-June-03. In March 1983, CBOE® began to list options on stock indexes. CBOE® History Timeline:- launched on April 26, 1973, the Chicago Board Options Exchange was created by the Chicago Board of Trade (CBOT®), which was seeking new avenues to supplement revenues from flagging futures transactions. CBOT® leaders began in the late 1960s attempting to find a market that would diversify its traditional agricultural futures product line. In 1969, the idea was born to apply the principles of the CBOT®'s commodity futures markets to securities options. Until then, securities options prices were usually obtained by word of mouth or from the newspapers. The original idea was written on the back of a napkin by then-CBOT® vice chairman Ed O'Connor during a dinner with then-Chairman Bill Mallers and President Henry Hall Wilson. It took years of research, work, and finding backing from people who could overcome exchange and government opposition. During early days of trading, volume averaged about 1 000 calls a day, and puts were not introduced for another four years. A year after launch, CBOE® trading volume had grown 40-fold, allowing the exchange to move onto its own larger trading floor directly above the CBOT® trading floor. In 1984, CBOE® moved to its current 10-story building at 400 South LaSalle in Chicago. Product Additions. One of the most noteworthy milestones in CBOE®'s history was the launch of stock index options, which began in March 1983 with the exchange's first proprietary index, the CBOE-100 Index, later renamed the S&P 100 Index (OEX). Four months later, options trading on the S&P 500 Index (SPX) was launched. Subsequent years saw creation of more new products and indexing tools, including:- (i) Long-term

Equity AnticiPation Securities (LEAPS) (1990); (ii) FLEX options (1993); (iii) CBOE Volatility Index (VIX) (1993); (iv) Dow Jones Industrial Average Index (DJX) (1997); (v) VXN Volatility Index (VXN) (2001); (vi) CBOE S&P 500 BuyWrite Index (BXM) (2002) - first major benchmark for options performance, stemming from a study by a Duke University professor; and (vii) CBOE S&P 500 PutWrite Index (PUT) (2007). CBOE Futures and Securities Exchanges:- with multi-asset-class trading/investing an increasing part of the financial world, CBOE® (now CBOE Holdings, Inc.) introduced three new affiliated exchanges:- (i) CBOE Futures Exchange (CFE) (2004) focussing on volatility and variance contracts; (ii) CBOE Stock Exchange (CBSX) (2007); and (iii) C2 Options Exchange (C2) (2010). Regulation:- CBOE® is regulated by the Securities and Exchange Commission (SEC), as is the CBOE Stock Exchange (CBSX). A wholly owned futures subsidiary of CBOE®, the CBOE Futures Exchange (CFE) is regulated by the Commodity Futures Trading Commission (CFTC). / СИБО® (CBOE®). Чикагская Палата Торговли (Чикагское Табло Торговли, если быть более точными; СИБАТ® (CBOT®)). инновация . Дау Дьжонз (Dow Jones). Стэндод энд Поз (Standard & Poor's) . Рассэл (Russell) . НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении). НЭЗДЭК® (NASDAQ®) . Биржа Опционов При Чикагской Палате или СИБО® (CBOE®) – Чикагская биржа опционов, основанная Чикагской Палатой Торговли в 1973. На СИБО были созданы котируемые опционные контракты, торгующиеся на стандартных условиях. Специализируется на опционах на акции, фондовые индексы, процентные ставки, а также на долгосрочных опционах на акции и индексы, LEAPS.

CHICAGO MERCANTILE EXCHANGE® INC. = ЧИКАГСКАЯ ТОВАРНАЯ БИРЖА® ИНК. – 1970:- Production Seasonal:- during the last half of the XIX century, a fast-growing nation was at the mercy of alternating periods of scarcity and plenty. Cold storage facilities were primitive, markets were disorganized, and major production was seasonal. Futures Trading in Livestock:- in the case of butter, for example, a Chicago Product Exchange was formed in 1874 which established grades and rules of trading. Kegs of butter were individually smelled and tasted on the spot, and a price was agreed on. Some butter produced in the warm months was heavily salted and stored in basements for later use. The Chicago Butter and Egg Board was organized in 1898, and by 1915 the Board had developed 28 rules governing butter grading. CME Founded:- Chicago Mercantile Exchange records show that after World War I, the industry leaders banded together to form an organization to permit public participation under carefully supervised commodity trading regulations. In 1919, early planners including S.E. Davis, O.W. Olson, W.S. Moore and C.E. McNeil established the Chicago Mercantile Exchange. The initial day of trading was on December 01. During the first 45-minute session, 3 cars were traded; a total of 8 cars were traded during that first week. Early trading was in an old building at LaSalle and Lake streets. After 5 years, the Exchange governors decided that North Franklin Street would be a valuable property in the years ahead, and property was secured at the northwest corner of Franklin and Washington. On September 16, 1926, Exchange officials quickly vetoed architects' proposals that the new building's elevator shafts be located in the central part of the trading floor. On November 02, members were told 'it has definitely been decided that the new home of the Chicago Mercantile Exchange at Washington and Franklin will be 17 stories high. The first nine floors will be built with a steel frame and the remaining eight floors of concrete'. The idea of using concrete was to limit construction costs. Those wishing to make the entire building concrete were defeated because heavy pillars would have been required throughout the trading floor in order to support the building's weight. Something New!:- while members traded butter, eggs, and ideas in their old stand, construction got under way when USD2 600 000 in bonds were subscribed. The plans specified that, 'The Exchange trading floor should occupy the second floor. It was to be reached by a marble stairway and six elevators. The area provided was approximately 75 by 125 feet; a high ceiling and no pillars or posts intervened to obstruct vision of the entire trading floor. The third floor included a studio for radio; it was anticipated that we would do our own broadcasting from the building'. Plans for the trading floor anticipated a form of pit trading similar to that being used on the Chicago Board of Trade. The blackboard system was not entirely satisfactory because it was difficult to install boards which would expedite trade during hectic periods when trades assumed tidal proportions. Shortly after construction ended, the new building was dedicated with an impressive ceremony and banquet held on April 25, 1928, at which humorist Will Rogers was an honored guest and speaker. For a number of years, business was conducted in a relatively unhurried fashion. Most desks had a single phone; clerks and runners were almost unheard of, and members gathered in front of blackboards on standards. The world grew more complex, and so did life at the Chicago Mercantile Exchange. Post-depression years saw the Exchange building sold to its present owners, the Material Service Corporation; later to Henry Crown & Co. The trading floor was 'turned around' to face doubledecked boards covering the East wall and much of the South and North walls. A new ceiling with built-in lighting and air conditioning was formed to cover the ornate ceiling and chandeliers originally installed. In the early 1960's, new desks and chairs were provided, and a new floor encased the complicated wiring necessary as leads to hundreds of telephones, to time clocks, and to sending and receiving machines. Prior to World War II, the Chicago Mercantile Exchange was synonymous with butter and eggs, and virtually all futures trading was dormant during the war. Principal butter and egg traders of the roaring twenties began to disappear and were virtually nonexistent in the fabulous forties. Technological changes had transformed the production and distribution of butter and storage eggs from seasonally produced commodities with classical production and price cycles to basically new and different products in their production, price and distribution patterns. The economic necessity of hedging markets provided by a futures market had greatly diminished. Futures trading in storage butter had almost disappeared and trading in eggs became tenuous. Partially successful efforts were made by members to modify rules relative to egg futures trading by shifting from refrigerator to shell eggs. That is, trading in fresh eggs began. Trading in storage eggs continued, but at a discount. This discount continually increased from year to year until presently hedgers and speculators are trading very heavily in strictly fresh eggs with storage eggs nondeliverable. Thus, the Exchange tried to keep abreast of changing times in the egg industry. Members are proud that the highly efficient, mechanized, and modernized egg industry uses the updated egg futures contract as a helpful pricing tool. It is used by producers and handlers both for long and short hedging, for forward pricing, and for price information. So much for eggs. It became apparent that members could not continue to subsist economically on eggs alone. Necessity is the mother of invention. Beginning in the early fifties and until the present time, Exchange members have vigorously researched, tested, and promoted many new contracts for futures trading. Most have been agricultural commodities but some nonagricultural commodities were also formulated. Some have succeeded and some have failed, but fear of failure has not impeded progress. The commodities which have fallen by the wayside in futures trading include onions, scrap iron, frozen shrimp, frozen broilers, hides, and apples. Successful markets have been established in frozen pork bellies, Idaho potatoes, live hogs, strictly fresh eggs, and the most exciting current futures – live beef cattle. The Chicago Mercantile Exchange is the second largest and fastest growing market in the world today. For the first time in history, August, 1969, saw the Chicago Mercantile Exchange the leader in volume among the major US Commodity Exchanges. True, the Chicago Mercantile Exchange has grown, adapted, and changed with the times. But in many ways it has not changed since its founding fathers laid out its goals, purposes, and standards as shown below:- 'The proposed business and objects for which said corporation is formed is to make for the benefit of its members daily quotations of market prices on butter, eggs and produce, and to furnish general information to its members regarding the markets for such commodities, and to furnish a convenient place where its members may buy and sell such commodities, and to facilitate the speedy adjustment of business disputes'. Today, because of the modern promotion methods aggressively used by the Chicago Mercantile Exchange and by its members, we can say 'Business is 'show business' but it must be done with integrity'. With leadership goes responsibility, and increasingly higher and higher standards have been set and met. Yet, as the French say 'the more things change, the more they remain the same'. In 1926, Florence Sherman, secretary at the Exchange, wrote a poem for the

'Exchange News' which read in part as follows:- How It Looks At The Door (стихотворение):- 'One by one, they trickle in, some just quiet, some with din, some with lightly tripping toe, some with faces filled with woe. And now approaches eleven o'clock, The markets cease to roll and rock, Hundreds of cars are bought and sold, The record of which the world is told. The bell has rung the close at last, The sound of conflict is ebbing fast, The settlement price is posted too, It cannot suit each one of you. Now one by one they trickle out, Some are sure, some are in doubt, Some will gain, and some will pay, Ah, well, tomorrow's another day'. And so the story goes in 1969 – the Golden Anniversary of the Chicago Mercantile Exchange. The Chicago Mercantile Exchange Inc. (CME® or, simply, The Merc):- in 1898, the butter and egg dealers withdrew to form their own market, the Chicago Butter and Egg Board (CBEB). In 1919, it was reorganized to trade other commodity futures and was renamed the Chicago Mercantile Exchange. The Chicago Mercantile Exchange Inc. (CME® or, simply, The Merc) is an American financial exchange based in Chicago. The CME® was founded in 1898 as the Chicago Butter and Egg Board. Originally, the exchange was a not-for-profit organization. The exchange demutualized in November 2000, and went public in December 2002. The Chief Executive Officer of the Merc is Craig S. Donohue. CME® trades several types of financial instruments:- interest rates, equities, currencies, and commodities. It also offers trading in exotic instruments such as weather and real estate derivatives. CME® has the largest options and futures contracts open interest (number of contracts outstanding) of any futures exchange in the world. Trading is conducted in two methods; an open outcry format and the CME Globex® electronic trading platform. Approximately 70 percent of total volume at the exchange occurs on CME Globex®. On 2006-October-17, the Chicago Mercantile Exchange announced the purchase of the Chicago Board of Trade for USD8 billion in stock, rejoining the two financial institutions as CME Group, Inc. CBOT® currently uses outsourced technology platforms, but will move to CME's Globex® trading system. This will provide much of the merger's anticipated savings. The merger will also strengthen the combined group's position in the global derivatives market. The world's second-largest exchange for futures and options on futures and the largest in the United States. Trading involves mostly futures on interest rates, currency, equities, stock indices and a small amount on agricultural products. Founded in 1898 as a not-for-profit corporation, the CME® was called the Chicago Butter and Egg Board until 1919. In November 2000, CME® became the first US financial exchange to demutualize and become a shareholder-owned corporation. The trading of futures and options on futures provides a way to protect against and profit from price changes in financial instruments and physical commodities. US derivatives exchange founded in 1898 as the Chicago Butter and Egg Board, evolving into Chicago Mercantile Exchange® Inc. in 1919. The exchange is a major global marketplace for trading futures and options on interest rates, equities, foreign exchange, commodities, and alternative investment products nearly 24 hours a day via the CME Globex® electronic trading platform and on its Open Outcry trading floors. CME® became a for-profit, shareholder-owned corporation in November 2000, the first US Financial exchange to demutualize by converting its membership interests into shares of common stock that can be traded separately from exchange trading privileges. In December 2002, CME® became the first publicly traded US Financial exchange when shares of the parent company, Chicago Mercantile Exchange Holdings, Inc. Began trading on the New York Stock Exchange. CME® has greatly expanded its international presence through strategic alliances with exchanges and clearing organizations. As a result of its transaction processing agreement with the Chicago Board of Trade, CME's Clearing House now clears approximately 90% of all US Futures trading. CME® has an agreement with Reuters to bring direct foreign exchange futures trading to the interbank foreign exchange market. The CME® has a mutual offset system with Singapore Exchange Derivatives Trading Ltd (SGX). The exchange has entered into memoranda of understanding with the Shanghai Stock Exchange, the Shanghai Futures Exchange, and the China Foreign Exchange Trading System. CME® is a partner in One Chicago LLC, a joint venture created to trade single-stock futures and narrow-based stock indices. Xxxxx. The Chicago Mercantile Exchange (CME®) (often called 'the Chicago Merc', or 'the Merc') is an American financial and commodity derivative exchange based in Chicago and located at 20 S. Wacker Drive. The CME was founded in 1898 as the Chicago Butter and Egg Board, an agricultural commodities exchange. Originally, the exchange was a non-profit organization. The Merc demutualized in November 2000, went public in December 2002, and merged with the Chicago Board of Trade in July 2007 to become a designated contract market of the CME Group Inc., which operates both markets. The chief executive officer of CME Group is Phupinder Gill, Terrence A. Duffy is the president and executive chairman of the board, and Leo Melamed is chairman emeritus. On August 18, 2008, shareholders approved a merger with the New York Mercantile Exchange (NYMEX®) and COMEX®. The Merc, CBOT®, NYMEX® and COMEX® are now markets owned by the CME Group. Today, the Merc trades several types of financial instruments: interest rates, equities, currencies, and commodities. It also offers trading in alternative investments, such as weather and real estate derivatives, and has the largest options and futures contracts open interest (number of contracts outstanding) of any futures exchange in the world. As a Designated Self-Regulatory Organization (DSRO), the CME® had primary regulatory-audit authority over firms such as MF Global. CME® also pioneered the CME SPAN software that is used around the world as the official performance bond (margin) mechanism of 50 registered exchanges, clearing organizations, service bureaus and regulatory agencies throughout the world. Trading Platforms:- trading is conducted in two methods; an open outcry format and the CME Globex electronic trading platform. Approximately 80 percent of total volume at the exchange occurs electronically on CME Globex. Open Outcry:- operating during regular trading hours (RTH), the open outcry method consists of floor traders standing in a trading pit to call out orders, prices, and quantities of a particular commodity. Different colored jackets are worn by the traders to indicate their function on the floor (traders, runners, CME employees, etc). In addition, complex hand signals (called Arb) are used. These hand signals were first used in the 1970s. The pits are areas of the floor that are lowered to facilitate communication, sort of like a miniature amphitheater. The pits can be raised and lowered depending on trading volume. To an onlooker, the open outcry system can look chaotic and confusing, but in reality the system is a tried and true method of accurate and efficient trading. An illustrated project to record the hand signal language used in CME's trading pits has been compiled. Electronic Trading:- operating virtually around the clock, today the CME Globex trading system is at the heart of CME. Proposed in 1987, it was introduced in 1992 as the first global electronic trading platform for futures contracts. This fully electronic trading system allows market participants to trade from booths at the exchange or while sitting in a home or office thousands of miles away. On 19 October 2004, the one billionth (1 000 000 000) transaction was recorded. When Globex® was first launched, it used Reuters' technology and network. September 1998 saw the launch of the second generation of Globex® using a modified version of the NSC trading system, developed by Paris Bourse for the MATIF (now Euronext). To connect to Globex®, traders connect via Market Data Protocol (MDP) and iLink 2.0 for order routing. Mergers and Acquisitions:- in 2006, CME® purchased 'Swapstream', an interest rate swaps electronic trading platform, based in London. On October 17, 2006, the Chicago Mercantile Exchange announced the purchase of the Chicago Board of Trade for USD8 billion in stock, rejoining the two financial institutions as CME Group, Inc. CBOT formerly used outsourced technology platforms but has moved over to CME's Globex trading system. This will provide much of the merger's anticipated savings. The merger will also strengthen the combined group's position in the global derivatives market. The merger agreement was modified on December 20, 2006, May 11, 2007, June 14, 2007, and on July 6, 2007. The merger agreement was passed by shareholders of both CME and the Chicago Board of Trade on July 9, 2007. The merger officially closed on July 12, 2007, after which the Chicago Board of Trade shares (old symbol: BOT) stopped trading and were converted into CME shares as agreed, and the overarching holding company began life as CME Group, a CME/Chicago Board of Trade Company. On January 13, 2008 electronic trading at the Chicago Board of Trade shifted onto the Mercantile Exchange's computer system. On March 17, 2008, the New York Mercantile Exchange (NYMEX®) accepted an offer from CME Group, the parent of the Chicago Mercantile Exchange, to purchase NYMEX® for USD8.9 billion in cash and CME Group Stock. The acquisition was

formally completed on August 22, 2008, and the NYMEX® systems were fully integrated by September 30, 2009. Commodity Futures and Options:- Agricultural Commodity Contracts include:- Live Cattle, Lean Hogs, Feeder Cattle, Class IV Milk, Class III Milk, Frozen Pork Bellies, International Skimmed Milk Powder (ISM), Nonfat Dry Milk, Deliverable Nonfat Dry Milk, Dry Whey, Cash-Settled Butter, Butter, Random Length Lumber, Softwood Pulp, Hardwood Pulp. / Чикагская Палата по Маслу и Яицам (Чикагское Табло Масла и Яиц, если быть более точными). Чикагская Товарная Биржа® (Chicago Mercantile Exchange®; Си.Эм.И.® (СМЕ®) или, попросту, За Мёрк (The Merc)). НЭЗДЭК® (NASDAQ®). Ройтас (Reuters). СИБАТ® (СВОТ®). Чикагская Товарная Биржа® (ЧТБ®) является одной из крупнейших и наиболее диверсифицированных товарно-сырьевых бирж мира. Штабквартира расположена в Чикаго, США. Факты из истории биржи:- 1874 – год основания биржи. Первоначально называлась Чикагская Палата по Маслу и Яицам (The Chicago Butter and Egg Board). Её члены торговали фьючерсными контрактами на сельскохозяйственные продукты, такие как яйца и масло. 1960-е – впервые в мире здесь стали торговать фьючерсами на замороженую свинину и живой крупный рогатый скот. 1970-е – на бирже начала функционировать торговля фьючерсами на мировые валюты. 1982 – успешно была введена торговля фьючерсом на наиболее известный Американский фондовый индекс S&P 500. 1992 – на ЧТБ® создали первую глобальную электронную торговую платформу – Глобэкс® (Globex®), торги на которой проходят круглосуточно с часовым перерывом, 5 дней в неделю. На Глобэксе представлены наиболее популярные контракты, торгуемые на ЧТБ®. По многим товарам введены электронные мини контракты (e-mini) – по сути то же самое, что и обычные, но с меньшим номиналом. Это дало возможность торговать на бирже с гораздо меньшими первоначальными инвестициями. Сегодня объём торгов на ЧТБ® составляет 524.2 миллиона контрактов и 326.7 миллионов на Глобэксе®. К наиболее известным инструментам, торгуемым на ЧТБ®, относятся:- (i) фьючерсы на валюты – Евро, Мини-Евро, Британский Фунт, Японскую Иену; (ii) индексы – S&P 500, НЭЗДЭК® 100 (NASDAQ® 100) и мини-контракты на них; (iii) процентные ставки; и (iv) товарные фьючерсы на свинину, крупный рогатый скот, древесину. Чикагская Товарная Биржа® (ЧТБ®) – срочная товарная биржа США, основанная в 1898. Одна из ведущих Американских бирж, на которой ведётся торговля фьючерсными контрактами и опционами на фьючерсные контракты. Специализируется на срочных сделках с процентными ставками, фондовыми индексами, иностранной валютой, сырьевыми и сельскохозяйственными товарами. В Декабре 2002 ЧТБ® стала первой публично торгуемой биржей США. Акции Chicago Mercantile Exchange Holdings Inc. торгуются на Нью Йоркской Фондовой Бирже под тикером CME. В 2003 количество сделок на ЧТБ® достигло рекордного уровня 640.2 миллионов, а объем операций составил USD333.7 триллиона.

CHICAGO RICE AND COTTON EXCHANGE = ЧИКАГСКАЯ БИРЖА РИСА И ХЛОПКА – Chicago Rice and Cotton Exchange (CRCE):- originally designated as the New Orleans Commodity Exchange on February 12, 1981. The exchange moved to Chicago in 1983 and became the Chicago Rice and Cotton Exchange. The CRCE was subsequently acquired by the MidAmerica Commodity Exchange, which in turn was acquired by the Chicago Board of Trade in 1986. In 1991, the CRCE designation was vacated and its rough Rice contract was transferred to the MidAm.

CHIEF ENGINEER = СТАРШИЙ МЕХАНИК (или ГЛАВНЫЙ ИНЖЕНЕР) – Chief Engineer is a head of engineer department. Keeps records of all engine parts and repairs. Generally tends to the functioning of all mechanical equipment on ship. Calculates fuel and water consumption and requirements. Coordinates operations with shoreside port engineer. Chief Engineer is the senior engineer officer responsible for the satisfactory working and upkeep of the main and auxiliary machinery and boiler plant on board ship. Chief Engineer is a head of engineer department (licensed). Keeps records of all engine parts and repairs. Generally tends to the functioning of all mechanical equipment on ship. Calculates fuel and water consumption and requirements. Coordinates operations with shoreside port engineer. Chief is the crew's term for the chief engineer. / В Англоязычном жаргоне моряков для обозначения термина Главный Инженер используется термин Чиф или Шеф (Chief). Начальник Инженерной Службы.

CHIEF EXECUTIVE OFFICER = СТАРШЕЕ ИСПОЛНИТЕЛЬНОЕ ДОЛЖНОСТНОЕ ЛИЦО (или СТАРШИЙ ИСПОЛНИТЕЛЬНЫЙ УПРАВЛЕНЕЦ) – Chief Executive Officer (CEO) is the highest ranking executive in a company whose main responsibilities include developing and implementing high-level strategies, making major corporate decisions, managing the overall operations and resources of a company, and acting as the main point of communication between the board of directors and the corporate operations. The CEO will often have a position on the board, and in some cases is even the chair. There are various other titles for the position of CEO including president and executive or managing director. The role of the CEO will vary from one company to another depending on its size and organization. In smaller companies, the CEO will often have a much more hands-on role in the company, making a lot of the business decisions, even lower-level ones such as the hiring of staff. However, in larger companies, the CEO will often deal with only the higher-level strategy of the company and directing its overall growth, with most other tasks deligated to managers and departments. Chief Executive Officer (CEO) is the title often given to the top ranking management official in a company, one step from being the Board Chairman. CEO is one of the most coveted, and least understood, jobs in a company. Everyone believes that CEOs can do whatever they want, are all powerful, and are magically competent. Of course, nothing could be further from the truth. By its very nature, the job description of a CEO means meeting the needs of employees, customers, investors, communities, and the law. Some of a CEO's job can be delegated. But several elements of the job must be done by the CEO. Read on for the details of what makes a CEO. What is the CEO's main duty? Setting strategy and vision. The senior management team can help develop strategy. Investors can approve a business plan. But the CEO ultimately sets the direction. Which markets will the company enter? Against which competitors? With what product lines? How will the company differentiate itself? The CEO decides, sets budgets, forms partnerships, and hires a team to steer the company accordingly. The CEO's second duty is building culture. Work gets done through people, and people are profoundly affected by culture. A lousy place to work can drive away high performers. After all, they have their pick of places to work. And a great place to work can attract and retain the very best. Culture is built in dozens of ways, and the CEO sets the tone. Her every action – or inaction – sends cultural messages. Clothes send signals about how formal the workplace is. Who she talks to signals who is and isn't important. How she treats mistakes (feedback or failure?) sends signals about risk-taking. Who she fires, what she puts up with, and what she rewards shape the culture powerfully. A project team worked weekends launching a multimedia web site on a tight deadline. Their CEO was on holiday when the site launched. She didn't call to congratulate the team. To her, it was a matter of keeping her personal life sacred. To the team, it was a message that her personal life was more important than the weekends and evenings they had put in to meet the deadline. Next time, they may not work quite so hard. The emotion and effect on the culture was real, even if it wasn't what the CEO intended. Congratulations from the CEO on a job well done can motivate a team like nothing else. Silence can demotivate just as quickly. Team-building is the CEO's #3 duty. The CEO hires, fires, and leads the senior management team. They, in turn, hire, fire, and lead the rest of the organization. The CEO must be able to hire and fire non-performers. She must resolve differences between senior team members, and keep them working together in a common direction. She sets direction by communicating the strategy and vision of where the company is going. Strategy sets a direction. With clear direction, the team can rally together and make it happen. Don't underestimate the power of setting direction. In 1991, at Intuit's new employee orientation, CEO Scott Cook presented his vision of Intuit as the center of computerized personal finance. Intuit had just 120 employees and one product. Ten years later, it's a billion-Dollar company with thousands of employees and dozens of products. Worldwide, it is the winner in personal finance, bar none. The success is due in no small part to every Intuit employee knowing and sharing the company's vision and strategy. If vision is where the company is going, values tell how the

company gets there. Values outline acceptable behavior. The CEO conveys values through actions and reactions to others. Slipping a ship schedule to meet quality levels sends a message of valuing quality. Not over-celebrating a team's heroic recovery when they could have avoided a problem altogether sends a message about prevention versus damage control. People take their cues about interpersonal values – trust, honesty, openness – from CEO's actions as well. Capital allocation is the CEO's #4 duty. The CEO sets budgets within the firm. She funds projects which support the strategy, and ramps down projects which lose money or don't support the strategy. She considers carefully the company's major expenditures, and manages the firm's capital. If the company can't use each dollar raised from investors to produce at least USD1 of shareholder value, she decides when to return money to the investors. Some CEOs don't consider themselves financial people, but at the end of the day, it is their decisions that determine the company's financial fate. Chief Executive Officer (CEO) is the title often given to the top ranking management official in a company, one step from being the Board Chairman. Cynically, some have come to call this the Chief Embezzlement Officer, in the wake of various top level corporate scandals! / наём сотрудников (hiring of staff). Старшее Исполнительное Должностное Лицо (СИДЛ) – должностное лицо, несущее в компании основную ответственность за её текущую деятельность. Часто совмещает также пост Председателя Правления (Chairman of the Board), Президента или иного старшего руководящего работника – Вице Председателя Правления или Исполнительного Вице Президента.

CHIEF MATE = СТАРШИЙ ПОМОЩНИК – Chief Mate is the officer in the deck department next in rank to the master; second in command of a ship. He is next to the master, most especially in the navigation and as far as the deck department is concerned. The chief mate assumes the position of the Master in his absence. Chief Mate is another term for first mate. First Mate or Chief Mate:- In charge of four to eight watch. Directly responsible for all deck operations (cargo storage and handling, deck maintenance deck supplies). Assigns and checks deck department overtime. Ship's medical officer. There are also Second Mate and Third Mate. / исполняет обязанности хозяина (или капитана) в его отсутствие. В Русскоязычном жаргоне моряков для обозначения термина Старший Помощник используется термин Чиф.

CHIEF STEWARD = СТАРШИЙ СТЮАРД (или СТАРШИЙ БОРТПРОВОДНИК, или БУФЕТЧИК, или ШЕФ СТЮАРД) – Chief Steward (steward department):- orders food. Prepares menus. Assists chief cook in food preparation. Chief Steward orders food, prepares menus, and assists chief cook in food preparation. / Старший Стюард заказывает продукты, составляет меню, и помогает шеф-повару в приготовлении пищи.

CHIENGORA = ШЬЕНГОРА – Chiengora is a yarn or wool spun from dog hair. The word is a portmanteau of 'chien', the French word for dog, and 'Angora'. It is up to 80% warmer than wool (1) and is not elastic. Often chiengora is blended with wool during the carding process. This blend has some give to it, which is preferable when knitting. It is also often blended with wool in order to create a yarn with less heat insulation. / (портманто) от Французского слова Chien (Шьен), означающее Собака, и слова Ангора.

CHIFFON = ШИФОН – Chiffon is a lightweight, balanced, plain-woven, sheer fabric woven of alternate S- and Z-twist crêpe (high-twist) yarns. The twist in the crêpe yarns puckers the fabric slightly in both directions after weaving, giving it some stretch and a slightly rough feel. Chiffon can be made from cotton, silk or synthetic fibers, but is usually associated with silk or nylon. Chiffon can be dyed to almost any shade desired, however, if made from polyester, it is difficult to dye. Chiffon is most commonly used in evening wear, especially as an overlay, giving an elegant and floating appearance to the gown. It is also a popular fabric used in blouses, ribbons, scarves and lingerie. Like other crêpe fabrics, chiffon can be difficult to work with because of its light and slippery textures. It should only be hand-washed. Chiffon is a plain woven lightweight, extremely sheer, airy, and soft silk fabric, containing highly twisted filament yarns. The fabric, used mainly in evening dresses and scarves, can also be made from rayon and other manufactured fibers. Chiffon literally means 'Rag' in French. This elegant, sheer fabric is quite limp, with a beautiful drape. It has a soft, supple, thin hand and a flat, crêpe-like texture. A very light, diaphanous fabric, Chiffon is made with a loose, plain weave and tightly twisted single crêpe yarns in both warp and weft. Unlike in crêpe de Chine, the weft yarn is either S or Z twist. The characteristic wrinkles in the finished fabric are created by the weft yarns being pulled in one direction. Chiffon is elegant and sheer, with a slightly rough feel to it. Sometimes called Crêpe Chiffon, this fabric is highly suited for special occasion dresses, Scarves, nightgowns, and linings. Chiffon is softer and thinner than Georgette. Georgette is made like chiffon, but with a two or three ply yarn. Because of its slippery quality, chiffon is difficult to cut and sew. Chiffon is a plain weave, lightweight, sheer, transparent fabric made from fine, highly twisted yarns. It is usually a square fabric, i.e. having approximately the same number of ends and picks and the same count in both warp and filling. Chiffon:- French for 'Rag'. Silk, rayon, cotton, synthetics. Plain weave. Lightweight, sheer, transparent. Made with very fine, tightly twisted yarns. The tightly twisted yarns could be either in the filling or the warp or both. It is very strong, despite filmy look. Wears very well. It is very difficult to handle when sewing and it is best to baste the pieces over tissue to make it easier. It has slightly bumpy look. It is best suited to shirring, draping, gathering, tucking, etc, because it is so limp. If made in a straight sheath style, it should be underlined with very firm fabric, e.g., faille taffeta. Chiffon is an extraordinary lightweight and thin crêpe fabric. Originally, chiffon was made of silk, but today also wool, rayon, nylon and other fibers are used for the production of chiffon. It is an open weave with slightly twisted yarns and can have both, a soft or stiff finish. Chiffon is often used for dresses and scarves. / Найлан (Nylon). филаментная (комплексная) пряжа (filament yarn). чем Жоржэт (Georgette). уточина. Под Шифоном, от Французского слова Chiffon, означающее буквально Тряпка, понимается тонкая шелковистая хлопчатобумажная ткань повышенной плотности. Применяют для пошива белья, блузок, платьев, а также в химической промышленности. Шифон – очень тонкая, нежная, струящаяся ткань из пряжи креповой крутки шёлковых или химических волокон, с неровной поверхностью, на ощупь напоминающей песчаную.

CHIFFON VELVET = БАРХАТ ШИФОН – Chiffon Velvet is a lightweight, soft, usually silk fabric with a dense pile.

CHILD ENTITY = ДОЧЕРНЕЕ (ЮРИДИЧЕСКОЕ) ЛИЦО – An entity is a Child Entity of another entity if the other entity is its holding company or has control over it. Compare parent entity.

CHILLED BANANAS = ОХЛАЖДЁННЫЕ БАНАНЫ (или ЗАМОРОЖЕННЫЕ БАНАНЫ, или ПРИХВАЧЕННЫЕ МОРОЗОМ БАНАНЫ, или ОХЛАЖДЁННЫЕ БАНАНЫ) – Chilled Bananas:- bananas are chilled when the temperature has dropped below the acceptable limit. This process means that the fruit suffers irreparable metabolic damage which renders it incapable of ripening.

CHILLED MEAT = ОХЛАЖДЁННОЕ МЯСО (или ЗАМОРОЖЕННОЕ МЯСО) – Chilled Meat:- fresh meat is transported chilled.

CHILLED OPERATION/CHILLED MODE = ОПЕРАЦИЯ ПО ОХЛАЖДЕНИЮ/РЕЖИМ ОХЛАЖДЕНИЯ – Chilled Operation/Chilled Mode is operating mode of a refrigerated container. During chilled operation the circulating fans run at maximum rpm and the intake air temperature is regulated constantly.

CHILL HAZE = ОХЛАЖДЁННАЯ ДЫМКА (или ОХЛАЖДЁННЫЙ ЛЁГКИЙ ТУМАН, или ОХЛАЖДЁННАЯ МГЛА, или ОХЛАЖДЁННОЕ ПОМУТНЕНИЕ) – Chill Haze:- change in consistency due to the deposition of dissolved components as a result of the cooling of aqueous solutions.

CHILLING = ОХЛАЖДЕНИЕ – Chilling:- chill damage is caused when the storage temperature goods of vegetable origin drops below the specified limits. This process means that fruit suffers irreparable metabolic damage which renders it incapable of ripening.

CHILLING DAMAGE = ПОВРЕЖДЕНИЕ ОХЛАЖДЕНИЕМ – Chilling Damage occurs when the load is subject to temperatures below the acceptable limits. This process means that fruit suffers irreparable metabolic damage which renders it incapable of ripening.

CHIMERA = ХИМЕРА (или ХИМЕРОВОЕ) – Chimera is the combination of tissues of different genetic origin in the same part of a plant. Examples of chimeras include some variegated cultivars of Sansevierias, although there can be many reasons for variegation. A Chimera is a genetic fault that causes white or variegated areas on leaves. Chimeras usually develop on one branch or one side of the plant. Also known as Chimaera. Chimera is an individual, organ, or part consisting of tissues of diverse genetic constitution. / Под Химерой понимается:- (1) в биологии, организм, состоящий из наследственно различных клеток или тканей; частный случай мозаицизма. Возникает в результате мутаций, рекомбинаций, нарушений клеточного деления. Могут быть получены искусственно при пересадках тканей у животных или при прививках у растений. (2) Химеры или Химерообразные, отряд морских рыб подкласса цельноголовых. Длиной от 60 сантиметров до 2 метров. 3 семейства, около 30 видов. Широко распространены от шельфа до больших глубин Мирового океана. 1 вид изредка заходит в Баренцево Море. В ряде стран химеры – объект промысла. (3) В Греческой мифологии Химера – чудовище с головой и шеей льва, туловищем козы и хвостом дракона; порождение Тифона и Ехидны. (4) В средневековом Европейском искусстве скульптурное изображение фантастических чудовищ. (5) В переносном смысле – фантазия, неосуществимая мечта.

CHIMERE = СИМАРА (или КИМЭРЭ) – Chimere is a loose sleeveless robe worn by Anglican bishops over the rochet.

CHINA GRASS = КИТАЙСКАЯ ТРАВА – The China Grass is an alternative name for Ramie, a bast fiber. / Китайская Трава – альтернативное название Растения Рами, лубяного волокна. Растение Рами (Boehmeria Nivea), Белое Рами (нижняя сторона листьев белая от густо покрывающего их пуха).

CHINA SILK = КИТАЙСКИЙ ШЁЛК – China Silk is a lightweight and soft fabric. This plain-weave silk fabric is used for lingerie and soft suits. Nowadays, China silk has been replaced almost completly with lining fabrics of man-made fibers. China Silk:- originally hand woven in China of silk from the Bonabyx mori. Very soft and extremely lightweight but fairly strong. Irregularities of threads caused by the extreme lightness and softness are characteristic of the fabric. Mostly for linings and underlinings, and could be used for blouses. / Лёгкая ткань полотняного переплетения с утком из шёлка-сырца.

CHINCHILLA = ШИНШИЛЛА – Chinchilla:- cotton or wool, and some manmade and synthetics. Sateen or twill construction with extra fillings for long floats. Does not resemble true Chinchilla fur. Has small nubs on the surface of the fabric which are made by the chinchilla machine. It attacks the face and causes the long floats to be worked into nubs and balls. Cotton warp is often used because it cannot show from either side. Made in medium and heavy weights. Very warm and cozy fabrics. Takes its name from Chinchilla Spain where it was invented. In cotton, used for baby's blankets and bunting bags. / уточина. Шиншиллы (Chinchilla), млекопитающие Рода (или Отряда) Грызунов Семейства Шиншилловых (Chinchillidae). Длина тела 22–38 сантиметров (см), хвоста 7–15 см. Голова крупная, глаза большие, уши округлые (5–6 см), усы длинные. Задние конечности четырёхпалые, вдвое длиннее передних пятипалых. Зубов 20, в том числе 16 коренных, растущих в течение всей жизни. Мех густой, ровный, до 3 см длины, очень мягкий, на спине и боках голубовато-серый с тёмной вуалью, на брюшке белый. Сезонный и половой диморфизм отсутствует. Два Вида:- Длиннохвостая Шиншилла и Короткохвостая Шиншилла. Распространены в Южной Америке в пустынном высокогорье Анд в Чили, Перу, Боливии и Аргентине. Живут колониями в расщелинах скал. Деятельны ночью в течение всего года. Питаются Травами, Кустарниками и Кактусами. Самка рождает 1–3 раза в год, в среднем по 2 детёныша (от 1 до 6). В начале XX века из-за высокой ценности меха Шиншиллы были почти истреблены; охраняются законом. Шиншилл разводят в небольшом количестве на фермах во многих странах. В бывшем Союзе Советских Социалистических Республик (СССР) – с 1960 на опытной ферме ВНИИ Охотничьего Хозяйства и Звероводства под Кировом; имелись у любителей в 40 областях страны. Начаты опыты по акклиматизации Шиншилл на Памире и в Закавказье.

CHINCHILLA CLOTH = ШИНШИЛЛОВОЕ ПОЛОТНО – Chinchilla Cloth is a heavy, twill weave, filling-pile fabric with a napped surface that is rolled into little tufts or nubs. The material is frequently double faced with a knitted or woven, plain or fancy back. Chinchilla cloth is used primarily in coats. The term is also used to refer to a knitted woolen fabric having a napped surface. / уточина.

CHINE = ОБОД (или ОБОДОК, или ОБРУЧ, или РЁБРА ЖЁСТКОСТИ, или КОЛЬЦА ЖЁСТКОСТИ, или ОКАЙМОВКА) – Chine is the extended or extruded rim at each end of a cask, barrel or drum. / Выпуклый или вогнутый край на каждом торце бочонка, бочки или барабана. Рёбра жёсткости служат для обеспечения устойчивости оболочки бочки или цистерны при воздействии избыточного наружного давления.

CHINE = ШИНЕ – Chine:- this French word, meaning speckled, is used for fabrics in which the warp threads are printed before weaving whereas the filling threads are left plain, giving a shadowy effect to the finished fabric. / Ткань с набивной основой. Уточные нити.

THE CHINESE GOLD AND SILVER EXCHANGE SOCIETY = КИТАЙСКОЕ ОБЩЕСТВО БИРЖИ ЗОЛОТА И СЕРЕБРА – The Chinese Gold and Silver Exchange Society operates in Hong Kong as a registered society. At present, we have 171 member firms which are sole proprietorships, partnerships or limited companies. Among these 171 firms, 30 are bullion group members. Bullion group members who want to manufacture good delivery bars may apply for the qualification of accredited refineries. Upon accreditation, these member firms may produce 99% fineness 5-tael gold bullions and 999.9% 1-kg gold bullions for delivery on the Exchange. The bullions they produce also circulate widely in the open market. To encourage more industry players to participate in spot gold market, we accept settlement accreditation applications from non members. The Members General Meeting is the highest authority of the Exchange. Twenty one members of the Executive & Supervisory Committees are elected once every two years in June. In this biannual election, each member firm has one vote. When the Members General Meeting is adjourned, the Executive & Supervisory Committees are the highest decision-making authority. They are responsible for implementing policies, effecting development plans and monitoring their effectiveness. To ensure effective performance of the many tasks of the Executive & Supervisory Committees, there are several subordinate groups. Administration work of the Exchange is carried out by the General Manager. Mission:- (i) to develop business related to gold, silver and precious metals; (ii) to explore new products related to gold, silver and precious metals; (iii) to maintain and to strengthen the relationship and cooperation with international gold markets; (iv) to help its members in business development, and to safeguard the rights and interests of its members and practitioners; and (v) to foster knowledge and professional standards of its members and practitioners, to benefit the public. Functions:- (i) to provide a trading place, facilities and related services to its members for gold, silver and precious metals transactions; (ii) to set up and implement rules and regulations, and to normalize the transactions; (iii) to supervise transaction process, settlements and delivery arrangement; (iv) to design trading contracts and regulations, and to monitor the fulfillment and completion of the contract; (v) to set up and implement the risk management system as to control the risk in the market; (vi) to set the settlement price, to announce and disseminate market

information; (vii) to supervise all transactions, to examine and execute punishment if any members' act violates CGSE rules and regulations; and (viii) other functions stipulated by its members and the Executive and Supervisory Committees. Headquartered in Hong Kong. Hong Kong's exchange first opened in 1910 and became the Chinese Gold and Silver Exchange Society in 1918. Website:- http://www.cgse.com.hk. History:- inception of the Chinese Gold and Silver Exchange Society dates back to 1910 when we began operation as the 'Gold and Silver Exchange Company'. In 1918, the Exchange formally registered in the name of the Chinese Gold and Silver Exchange Society. About a century ago, there were only a lot of gold and silver trading in the territory. Small scale banking counters appeared later, which gradually led to the emergence of bank houses and modern banks. The Exchange was established in wake of the thriving development of Hong Kong's banking industry. Members of the post-war management were founders of leading Chinese banks in Hong Kong. Since its establishment, the Exchange has adhered to a stringent and effective set of rules. Although constantly tested, the integrity of industry members is always upheld. Moreover, it plays a vital role in Hong Kong's gold market. The Exchange provides local and international investors with a gold market of continuity, liquidity and depth, in which they can exploit gold as a vehicle of investment, speculation, hedging and arbitrage. The Exchange, except for the Pacific War years of 1941 to 1945, provides services to investors on every trading day. In January 1980 when the Soviet army invaded Afghanistan, the price of gold soared to a record high of HKD4 855.00 per tael on 18 January, before plunging down to a low of HKD3 590.00 on 23 January, marking a sharp volatility of HKD1 200.00 in only a few days. Unable to cope with this severe fluctuation, all major gold markets suspended trading. Thanks to great versatility and a sound market system, the Exchange was the only market in the world where trading continued as usual. In early February 1983, plummeting oil prices, tightening of the US Federal Reserve's monetary policy and rising rates brought great volatility to the price of gold again. Gold markets in the US and Singapore suspended trading but the Exchange remained open. The above incidents fully demonstrate the Exchange's ability to ensure trading continuity. As for liquidity, investors have realized their gold bullion and closed out gold positions smoothly and swiftly over the past decades. Not one complaint has been reported. One significant example is that on 15 January 1970, the Exchange abandoned the then prevailing 945 fineness and adopted 99 fineness as the standard for pure gold. It was a step to meet demand of the gold jewelry industry. At that time, the people of Hong Kong had more than 100 000 taels of 945 fineness gold between them, and the Exchange bought all 945 gold by paying a price based on the 99 fineness standards. Consumers got the full value of their gold investments, and there were no disputes. This piece of history illustrates our members' integrity and the high liquidity of the Exchange. Note:- 945 fineness is a 94.5% gold bullion; 99 fineness is a 99% gold bullion. Depth is best used to describe our strength. While the Exchange is subject to varying market situations due to fluctuation in gold prices, the strength we display in market strong runs is impressive. In the early 1980's when the gold market staged stellar performance, more than 2 million taels of gold were traded on the Exchange daily. History shows that our member firms are establishments of great strengths. They can cope well with large trade volumes in a bullish market. Hong Kong has secured a key position in the international gold market. This important role is attributed to a number of factors. They include political stability, free trade, a respect for private ownership, a sound and established legal system, good communications networks, sophisticated telecommunications facilities, a strong financial system and a stringent regulatory system. Yet another important factor worth noting is that Hong Kong spans across the Asia time zone and it provides pricing information for the gold market after the close of New York market and before the opening of the London market. Because of this connection, international investors can continue their trading, hedging or arbitrage activities in Hong Kong. Effectively, the emerging of Hong Kong gold market turns the trading of gold around-the-clock. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

CHINESE MAIN PORT = ОСНОВНОЙ КИТАЙСКИЙ ПОРТ – Most petrochemical trade in China is carried out basis China Main Port, rather than a specific port. Chinese Main Ports are:- Foshan, Guangzhou, Hongkong, Ningbo, Shanghai, Shenzhen, Tianjin, Xiamen, Zhongshan and any other ports. / Большинство сделок с Китаем по продукции нефтехимической промышленности осуществляются на условиях Основной Китайский Порт без увязки к какому-либо определённому порту.

CHINESE WALLS = КИТАЙСКИЕ СТЕНЫ – Investment services firms are obliged to set up confidentiality areas separated by so-called 'Chinese Walls'. These Chinese walls are intended to ensure that unpublicized and possibly price-relevant information cannot circulate freely from one division, department or group to other divisions, departments or groups (separation of, for example, proprietary trading in securities, order trading, research, origination and syndicate business). The aim is to avoid conflicts of interest. Chinese Wall is a barrier to the flow of information between two different parts of a firm's business. Chinese Walls is a term describing the separation of lending business from securities business in order to prevent a conflict of interests which would be detrimental to the client. Under a dual banking system Chinese Walls are institutionalized.

CHINO = ЧИНО (или КИТАЙСКАЯ) – Chino is a Spanish word translating as China or Chinese. The term Chinos, synonymous with Khakis (when the terms describe pants) migrated to the English language, when pants made of strong cotton fabric were used as part of military uniforms in both the United Kingdom (UK) and the United States (US). Chinos, in their simplest definition, are merely pants for men made of cotton fabric imported from China. They also picked up the name khakis because the military standard in the UK was to dye these pants to a tan khaki color. The modern chino may be dyed any color, though tan, black, blue, and olive drab are the usual choices. Chinos as military uniform were simple slacks with straight waists, no pleats, and a tapered leg. The fabric was durable, yet light, and suitable for wear in warm conditions, while providing adequate coverage. The khaki color became popular in the UK in the mid XIX century, particularly for blending into the landscape of India during the British occupation. In the late XIX century, American soldiers started wearing khakis as part of standard military wear. The term Khakis came first, and is a Hindi name for the word dust. Chinos came later after the Spanish American War, where US occupation of the Philippines resulted in a high number of Spanish terms entering the English language, since so many residents of the Philippines spoke Spanish. Again, the American style of military chino was much like the British, a very simple pant with no pleats, a zip and button front, and straight legs. By the early XX century, the American public began to wear chinos, especially to semi-informal gatherings. Boys might wear them to school or young men might wear them in college. They quickly became associated by the 1940s with the preppy look, and the young men wearing chinos after WWII only reinforced this. The 1950s perhaps can be viewed as the highpoint for chino popularity. Most schoolboys and college men wore chinos, as it was not always acceptable to wear jeans, especially to school. Popularity of khakis as everyday pants declined with upsurge in trends toward wearing more casual clothing. Jeans have been, since the mid 1960s, the standard wear for attending school. Yet you'll still see chinos worn for informal events, and most boys in private schools wear them. Design styles in khakis have changed too. First off, both men and women may wear today's chino styles. Second, you're likely to see dressier styles of the pants with pleated fronts, larger pockets, cuffs, and a variety of other small details. Chino styles for women can be full length or come in pedal pusher or low waist styles. Further, khakis aren't necessarily always made of 100% cotton twill, and the fabric does not always come from China, as it used to for military issue uniforms. They may have some polyester or other stain resistant fabric blended with cotton. Instead of referring to the fabric, they more refer to a style imitative of military issued pants. Chino is a classic all-cotton 'Army twill' fabric made of combed two-ply yarns. Usually vat dyed, mercerized, and given a compressive shrinkage finish. Used traditionally for army uniforms, chino is now finding popularity sportswear and work clothes. Chino is a twill-weave cotton originally used for slacks, sport shirts, and summer military uniforms. It is made of two-ply cotton combed yarns, vat-dyed, and is mercerized and Sanforized. Today, the name is given to any medium-weight, sturdy fabric with a slight sheen. Khaki green and military tan are common chino colors, but the fabric is

also made in other colors. Chino is a cotton or cotton blend twill used by armies throughout the world for summer-weight uniforms. Chino is frequently dyed khaki. Chino:- cotton, twill (left hand) weave. Combined two-ply warp and filling. Has a sheen that remains. Fabric was purchased in China (thus the name) by the US Army for uniforms. Originally used for army cloth in England many years before and dyed olive-drab. Fabric is mercerized and sanforized. Washs and wears extremely well with a minimum of care. Army uniforms, summer suits and dresses, sportswear. / Ткань саржа армейская мерсеризованная, безусадочная, цвета хаки. уточина.

CHINOS = КИТАЙСКИЕ (или ЧИНОЗ, или СЛАКСЫ) – Chinos:- casual men's trousers made from chino fabric (British), called 'Khakis' in America.

CHINOSOL = ХИНОЗОЛ – Chinosol is 8-hydroxyquinoline sulphate, used as a fungicide and soil sterilant. This compound may inhibit seed germination and show some toxicity to seedlings. / Хинозол – это 8-гидроксихинолин сульфат, используемый в качестве фунгицида и стерилизатора почвы. Это соединение может .

CHINTZ = ЧИНЦ (или ВОЩЁНЫЙ СИТЕЦ, или ЛОЩЁНЫЙ СИТЕЦ, или СИТЕЦ С ГЛЯНЦЕВОЙ ОТДЕЛКОЙ) – Chintz, a Hindi word, referring to a printed cotton used for furnishings. Chintz is a glazed plain weave cotton fabric with a tioghtly spun fine warp and a coarser slack twist filling, often printed with brightly colored flowers or stripes. Named from Hindu word meaning Spotted. Several types of glazes are used in the finishing process. Some glazes wash out in laundering, but others such as resin finishes are permanent. Unglazed chintz is called Cretonne. Chintz end-uses include draperies, slipcovers, skirts, and summer dresses, and shirts. Chintz is a plain-weave fabric, which has been glazed to produce a polished look. Usually made of cotton, this fabric is most commonly used in blouses, dresses, draperies, and slipcovers. Chintz is any closely woven, plain-weave, glazed cotton and blends of polyestercotton fabric, often printed in bright designs, which are most often floral. It is used for draperies, slipcovers, bedspreads, upholstery, and now mens' and boys' shirts, and ladies' and girls' dresses. Chintz is a glazed fabric produced by friction calendering. Unglazed chintz is called Cretonne. See also Cretonne. Chintz:- cotton cloth, usually printed with flowery patterns, that has a slightly shiny appearance. Cotton plain weave. Has bright printed gay figures, large flower designs, birds and other designs. Also comes in plain colors. Several types of glaze. The wax and starch glaze produced by friction or glazing calendars will wash out. The resin glaze finish will not wash out and withstand drycleaning. Also comes semi-glazed. Unglazed chintz is called Cretonne. Named from the Indian word 'Chint' meaning 'broad, gaudily printed fabric'. Used in draperies, slipcovers, dresses, sportswear. / называется Крэтон (Cretonne). уточина. (1) Цвет (на Индийском языке). (2) Яркая набивная хлопчатобумажная ткань с лощёной отделкой. (3) Всякая хлопчатобумажная набивная ткань. Чинц – лощёная хлопчатобумажная ткань, поверхность которой производит впечатление натёртой воском. Благодаря импрегнированию не пачкается и не смачивается водой.

CHIP = КРОШКА – (1) Chip is the form of polymer feedstock used in fiber production. See also Flake.

(2) Chip is the feedstock for a pulp digestor. / для автоклава или варочного котла.

(3) Chip is a defect in a nonwoven fabric. / Порок или дефект нетканого материала.

CHIP = МИКРОПРОЦЕССОР – Chip is an individual integrated circuit built in a tiny, layered rectangle or square on a silicon wafer.

CHIP CARD = КАРТА С МИКРОПРОЦЕССОРОМ – Chip Card:- description of a card with an integrated storage chip, for example, for holding the private code, the digital signature or to store a monetary amount for cashless payment. The data of credit card sized chip cards (smart cards) can be read by chip card readers.

CHIP CONTROL (GRIT CONTROL, LAST–CHANCE) FILTER = ФИЛЬТР КОНТРОЛЯ СТРУЖКИ (КОНТРОЛЯ КРУПНЫХ ЧАСТИЦ, ПОСЛЕДНИЙ ШАНС) – Chip Control (Grit Control, Last-Chance) Filter is a filter intended to prevent only large particles from entering a component immediately downstream. See also Filter.

CHIPPING = СКАЛЫВАНИЕ (или ВЫБОИНА, или ИЗЛОМ) – Chipping is a mechanical defect of enamel goods.

CHIPS = CLEARING HOUSE INTERBANK PAYMENTS SYSTEM

CHISEL = РЕЗЕЦ – Chisel is a very sharp hand tool used to cut and shape wooden objects and tools. / Под Резцом понимается инструмент, обычно стальной брусок прямоугольного, квадратного или круглого сечения; режущая часть выполняется из материала значительно более твёрдого, чем обрабатывающий материал. Различают по технологическим группам станков (долбёжные, строгальные, токарные), выполняемым работам (подрезные, проходные, расточные, резьбовые и другие), видам подач (левые и правые, продольные, радиальные, тангенциальные), обрабатываемому материалу (для металла, пластмасс и другого), конструкции (сварные, составные, цельные), материалу режущей части (из инструментальной стали, твёрдого сплава, минералокерамического или композиционного материала) и другим признакам.

CHISEL = ЧИЗЕЛЬ – Chisel is a narrow tool that is used to break up soil.

CHI SQUARE = ХИ КВАДРАТ – The Chi Square (X^2) is a statistical test commonly used for attribute or categorical data (i.e. to test for a fixed ratio, for independence in a contingency table, or for homogeneity of a ratio), for homogeneity of variance test, and for goodness of fit. Chi-square is a nonsymmetric, continuous probability distribution which is the null distribution, or asymptotic null distribution, of many test statistics including Bartlett's test for homogeneity of variance and the so called Chi-Square Tests Of Goodness-Of-Fit and independence in contingency tables.

CHITIN = ХИТИН – Chitin may be the second most abundant polysaccharide in nature, after cellulose to which it is structurally related, but see also lignin. At least 109 tons of chitin are thought to be synthesized each year. Chitin is found in the cell walls of many lowerplants such as yeast, mushrooms and other fungi. It also forms a substantial part of the exoskeleton shells of crustaceans, such as crabs shrimps and lobsters, as well as in the exoskeletons of marine zoo-plankton, including coepods, and in corals and jellyfish. Insects, such as butterflies and ladybird beetles, have chitin in their wings. Chitin mainly consists of the amino-sugar N-acetyl-D-glucosamine linked together with beta-1,4' linkages, which may be partially deacetylated to a form of chitin called Chitosan. Chitin is usually found complexed with other polysaccharides and proteins. / Под Хитином понимается полисахарид, образованный остатками аминосахара ацетилглюкозамина. Основной компонент наружного скелета (кутикулы) насекомых, ракообразных и других членистоногих. У грибов заменяет целлюлозу, с которой сходен по химическим и физическим свойствам и биологической роли.

CHITON = ХИТОН (или ТУНИКА, или ХХ) – Chiton is the basic garment of ancient Greece worn usually knee-length by men and full-length by women.

CHLAMYDOSPORES = ХЛАМИДОСПОРЫ – Chlamydospores:- thick-walled, single-celled, asexual spores produced by some fungi to aid survival in the soil and/or between seasons. Chlamydospore is a thick-walled asexual spore of a fungus formed by modification of a hyphal cell. / Хламидоспора спора . Хламидоспоры, от Греческих слов Chlamys, Chlamydos, означающее Верхняя Одежда

или Плащ, и Spora, означающее Посев или Семя или Сеяние, – образования, возникающие при бесполом размножении некоторых грибов (в том числе паразитических); представляют собой крупные клетки, окружённые толстой оболочкой. Хламидоспоры, споры головнёвых и некоторых других грибов, образующиеся из специализированных либо обычных неспециализированных клеток гиф, которые округляются, обычно увеличиваются в размерах и приобретают утолщённую, часто пигментированную оболочку. В зависимости от количества трансформированных клеток хламидоспоры могут быть одиночными или в цепочках. Содержат значительные запасы питательных веществ. С помощью хламидоспоры гриб может в состоянии покоя переносить неблагоприятные условия среды.

CHLAMYS = ХЛАМИДЫ (или КЛЭМИС) – Chlamys is a short oblong mantle worn by young men of ancient Greece Chlamys. Chlamys is the short Greek mantle draped around the upper shoulders, pinned on the right shoulder with a brooch.

CHLORANTHUS = ХЛОРАНТОВОЕ (или ЗЕЛЕНОЦВЕТКОВОЕ) – Chloranthus:- with green flowers.

CHLORINA = ХЛОРИНА – Chlorina:- yellowish green appearance as a result of chlorophyll deficiency. Plants are often smaller than normal.

CHLORINATED WAX = ХЛОРИРОВАННЫЙ ПАРАФИН (или ХЛОРПАРАФИН) – Chlorinated Wax:- certain solid hydrocarbons treated with chlorine gas to form straight-chain hydrocarbons with a relatively high chlorine component. Chlorinated waxes are used primarily as polyvinyl chloride plasticizers, extreme-pressure additives for lubricants, and formulation components for many cutting fluids. / присадки для сверхвысокого давления для смазок, и .

CHLORINATED WOOL = ХЛОРИРОВАННАЯ ШЕРСТЬ (или БЕЗУСАДОЧНАЯ ШЕРСТЬ) – Chlorinated Wool is a wool in the fiber, yarn, or fabric form which are treated chemically to decrease felting shrinkage and increase ability to take dyes. Chlorinated Wool:- woolens chemically treated to decrease shrinkage and to increase affinity for dyes. / Безусадочная Шерсть – шерсть, получаемая надлежащей обработкой хлором или хлорными препаратами.

CHLORINATION OF WOOL = ХЛОРИРОВАНИЕ ШЕРСТИ – Chlorination Of Wool is a treatment of wool with chlorine compounds to alter the surface to make the wool less prone to shrinkage in washing and to improve dye uptake. Chlorination, sometimes alone and sometime with subsequent application of special polymers, alters the surface of wool so that the scales are largely prevented from causing the 'ratcheting' action that makes the motion of one strand of wool 'one way' with respect to others whose scales point in the opposite direction. By preventing this ratcheting, wool fabric is much less likely to shrink when laundered. Chlorination also improves dye uptake in printing processes, but at the expense of washfastness. Chlorination is typically done using organic chlorine compounds, sometimes the same as those used for chlorination of small swimming pools.

CHLORINE BLEACH = ХЛОРНЫЙ ОТБЕЛИВАТЕЛЬ – Chlorine Bleach is a solution of sodium hypochlorite in water; an oxidizing bleach. Household chlorine bleach, about 5% sodium hypochlorite, suitably diluted, can be used for whitening cellulose fabrics prior to dyeing. It is also used in some art discharge processes (this author knows of no industrial use of chlorine bleach for discharge). Chlorine bleach can damage cellulose fibers, but is safe if strength and exposure time are limited, and the bath pH is maintained at about 9.5. Goods must be thoroughly scoured prior to chlorine bleaching, otherwise impurities may form compounds that are yellow and very difficult to remove. An antichlor should usually be used to assure complete neutralization of the bleach. Do not mix chlorine bleach with acids – chlorine gas will be liberated. Do not use chlorine bleach on wool, silk or spandex – fiber damage will result. Industrially, chlorine dioxide is sometimes used for bleaching. Although it is less likely to cause cellulose fiber damage, it is not suitable for home use because the bath is very corrosive to metals, and there is significant risk of chlorine gas production. In general, chlorine bleaching is obsolescent for industrial textile preparation. / хлорный отбеливатель.

CHLORINE RETENTION = УДЕРЖИВАНИЕ ХЛОРА – Chlorine Retention is a characteristic of several resins and textile finishes whereby they retain some of the chlorine from bleach. On heating of the goods, the chlorine forms hydrochloric acid, causing tendering of the cloth. This is especially true of certain wrinkle resistant finishes for cotton and rayon.

CHLORO = ХЛОРО (или ЗЕЛЕНОВАТОЕ) – Chloro (Greek:- Chloros = Yellowish-Green) is green, as a prefix. / Приставка Хлоро, от Греческого слова Chlōrós, означающее Зелёный, .

CHLOROFIBER = ХЛОРОВОЛОКНО – Chlorofiber is a synthetic fiber composed of linear macromolecules having in the chain more than 50% by mass of vinyl chloride or vinylidene chloride units (more then 65% in the case in which the rest of the chains is made up of acrylonitrile, the modacrylic fibers being thus excluded). Alphabetic code – CLF; and relevant commercial allowance – 2.00 (refers to European Union Directives on Textile Labelling). / Хлороволокна:- эти волокна очень крепкие и впитывают очень мало или вообще не впитывают воды. Они исключительно чувствительны к высокой температуре:- могут размягчаться и сжиматься даже при температуре 70 °C. Несмотря на это хлороволокна являются замедлителями горения. Ткани, выделанные из хпороволокон, являются хорошим теплоизоляционным материалом, и поэтому их часто применяют при производстве тёплого нижнего белья.

CHLOROFLUOROCARBON = ХЛОРОФТОРНЫЙУГЛЕРОД – Chlorofluorocarbon (CFC) is any of several gaseous compounds that are derivatives of methane, contain carbon chlorine and fluorine, and are used especially as aerosol propellants and refrigerants; suspected to be a major cause of ozone depletion.

CHLORO FLUORO CARBONS = ХЛОРО ФТОРНЫЕ УГЛЕРОДЫ – Chloro Fluoro Carbons (CFCs) are artificially produced gases or liquids. They are used as coolants, propellants or detergents. CFCs can remain in the atmosphere for decades before being broken down. They are a source of chlorine radicals, which react with ozone and contribute significantly toward the destruction of the ozone layer. CFCs are now banned in Switzerland and a number of other countries.

CHLOROPHYLL = ХЛОРОФИЛЛ – Chlorophyll (Greek:- Chloros = Yellowish-Green) is the green metallo-pigment in plants concerned with harvesting energy from light and transmitting the energy to an ordered chain of enzymes, ultimately responsible for the production of sugars. Each chlorophyll molecule contains a central magnesium atom chelated by four nitrogens from a large porphyrin ring and the two forms may be distinguished by substitution of a methyl group in chlorophyll a for an aldehyde in chlorophyll b. Structure of chlorophyll. Chlorophyll is the green pigment found in all green plants. It is essential for photosynthesis. In canola, seeds lose their chlorophyll as they ripen. However, canola seeds do not all ripen at once. Therefore in harvested canola, some seeds may still contain some chlorophyll. / Под Хлорофиллом, от Греческих слов Chlōrós, означающее Зелёный, и Phýllon, означающее Лист, понимается зелёный пигмент растений, содержащийся в хлоропластах. В процессе фотосинтеза поглощает световую энергию и превращает её в энергию химических связей органических соединений. По химическому строению сложное циклическое соединение – порфирин, содержащий атом Mg. Существуют различные, близкие по структуре, типы хлорофилла. Хлорофилл:- зелёный пигмент растений, позволяющий им синтезировать органические вещества на свету (фотосинтез).

CHLOROPLAST = ХЛОРОПЛАСТ – Chloroplast is a specialized cytoplasmic organelle containing chlorophyll, characteristic of plants, and responsible for using energy captured from visible light to fix carbon from carbon-dioxide and synthesise carbohydrates as energy storage molecules. Like mitochondria, chloroplasts contain a small amount of DNA which encodes genes for a few chloroplast proteins. See also Plastid. Chloroplast is a plastid containing chlorophyll; seat of photosynthesis in eukaryotes. / Смотрите также Пластид (Plastid). Под Хлоропластами, от Греческих слов Chlõrós, означающее Зелёный, и Plastós, означающее Вылепленный или Образованный, понимаются внутриклеточные органоиды растительной клетки, в которых осуществляется фотосинтез. Окрашены в зелёный цвет (в них присутствует хлорофилл). Имеют собственный генетический аппарат и белоксинтезирующую систему, обусловливающие хлоропластам относительную автономию. В клетке высших растений от 10 до 70 хлоропластов.

CHLOROPLAST STRUCTURES = ХЛОРОПЛАСТОВЫЕ СТРУКТУРЫ (или СТРУКТУРЫ ХЛОРОПЛАСТА) – Chloroplast Structures located in the leaves and serve as small photosynthetic factories within the leaf.

CHLOROSIS = ХЛОРОЗ (или ЖЕЛТУХА) – Chlorosis is yellowing of plant tissue caused by many factors, often nutritional imbalance or poor illumination. Chlorosis is yellowing or discoloration of the normally green parts of chlorophyll-bearing plants due to diseases or nutritional/physiological disorders. / У растений под Хлорозом, от Греческого слова Chlõrós, означающее Бледно-Зелёный, понимается болезнь, вызываемая патогенными микроорганизмами, недостатком железа в почве, избыточной влажностью. Чаще поражает плод и декоративные культуры. Нарушается образование хлорофилла, листья желтеют и белеют, растения отстают в росте и развитии. Хлороз:- нездоровое пожелтение листьев, обычно вызванное недостатком железа или других микроэлементов. Часто появляется у растений бедных, щелочных почв.

CHO = CARBOHYDRATE

CHOCK = ЧАК (или КЛИН) – (1) Chock:- to use a wood or metal wedge to block the wheels of a truck while it is being loaded or unloaded. Chock is a wedge used to prevent motion/movement of cargo. Chock is a piece of wood or other material placed at the side of cargo to prevent rolling or moving sideways. / прокатка (rolling). Клин, используемый для предотвращения смещения груза. Предмет из дерева или иного материала, размещаемый сбоку какого-либо груза с целью предотвращения перекатывания или движения из стороны в сторону.

(2) Chock is a heavy wooden or metal fitting secured on a deck or on a dock, with jaws, used for the lead or to guide lines or cables.

CHOCOLATE = ШОКОЛАДНЫЙ – Chocolate:- a brownish gray.

CHOKED = ЗАГЛУШЕНО (или ЗАЖАТО, или ХХ) – Choked (maritime term):- the falls foul in a block. The falls may be chocked or jammed intentionally for a temporary securing (holding).

CHOKED COILER = ЗАКУПОРЕННЫЙ ЛЕНТОУКЛАДЧИК – Choked Coiler:- a condition in carding or drawing in which sliver is either puffy, badly condensed, or very uneven, leading to overloading of the coiler trumpets and causing work stoppage.

CHOKED FLYERS = ЗАКУПОРЕННЫЕ РОГУЛЬКИ – Choked Flyers:- a situation in which roving will not pass through the flyer channels because of heavy or cockled conditions caused by such factors as uneven drafting, waste, overcut fibers, and improper finish. / когда ровница не проходит через каналы рогульки (flyer channels) из-за .

CHOKER = УДАВКА (или КОЛЬЕ, или КОРОТКОЕ ОЖЕРЕЛЬЕ, или ГОРЖЕТКА) – Choker:- something, as a collar or a necklace, worn closely about the throat or neck.

CHOLI = ЧОЛИ – Choli is a short blouse usually worn with a saree or a lengha. You can vary the collar, sleeve and length as you choose. A traditional garment worn in India.

CHOLLA = ЧОЛЬЯ (или ХОЛЛА, или ЧОЙА) – Cholla is any member of the genus Opuntia with short cylindrical-stems. The Cholla plant is common in the American Southwest. The genus name for chollas, Cylindropuntia, bears witness to this similarity. / любой член рода (genus).

CHOOSER OPTION = ОПЦИОН С ПРАВОМ ВЫБОРА – Chooser Option is an option which is transacted in the present but which at some prespecified future date is chosen to be either a put or a call option. Chooser Option is an option contract that allows the holder to decide whether it is a call or put prior to the expiration date. Chooser options usually have the same exercise price and expiration date regardless of what decision the holder ultimately makes. Because they don't specify that the movement in the underlying asset be positive or negative, chooser options provide investors a great deal of flexibility when evaluating volatile issues. Like most options, chooser options fare best when the underlying asset experiences large price fluctuations and is especially useful to investors in instances where emotions figure to play a part in the process. For example, one might be wise to select a chooser option on a biotech company awaiting the FDA's (short for the US Food and Drug Administration) reaction to its latest wonder drug or any company facing litigation. Unfortunately, chooser options are somewhat rare and tend to be issued on more stable items. An exotic option that is transacted in the present, but that at some specified future date is chosen to be either a put or a call option. In finance, a Chooser Option is a special type of option contract. It gives the purchaser a fixed period of time to decide whether the derivative will be a European call or put option. In more detail, a chooser option has a specified decision time t_1, where the buyer has to make the decision described above. Finally, at the expiration time t_2 the option expires. If the buyer has chosen that it should be a call option, the payout is max (S – K,0). For the choice of a put option, the payout is max (K – S,0). Here K is the strike price of the option and S is the stock price at expiry. Replication:- for stocks without dividend the chooser option can be replicated using one call option with strike price K and expiration time t_2, and one put option with strike price $Ke^{-r(t2\ -\ t1)}$ and expiration time t_1. / Необычный (экзотический) опцион, сделка по которому проводится в настоящий момент, но право выбора типа опциона (на продажу или на покупку) отложено до заранее оговорённой даты в будущем.

CHOP = МЕТКА (или ЧОП) – Chop is the assay mark of Chinese origin. The term is now widely applied to a manufacturer's mark on bullion bars. Chopmarked coins, unlike most coins that tell us nothing of where they've been, can speak volumes. All of those marks tell us where the coin has been and what it was used for, and are strongly tided to events of the day. Chopmarks differ from countermarks (or counterstamps) in that a countermark was a monogram added by a government making the coin acceptable for use in that country. One of the most well known countermarked examples is the oval bust of George III on various Spanish Colonial coins of the late XVIII century (shown at the left). Chopmarks are basically countermarks used by Chinese bankers and merchants stamped on coins as a defense against debased counterfeit coins. Chopmarks also signified that a coin's composition had been verified and that it was acceptable for use in trade. Chopmarks can take a variety of forms as shown in the table below. Chopmark Varieties:- (i) Test Marks:- the most common usually made with a punch. Its purpose was to test the coin to see if it was silver-plated base metal or hollowed out. (ii) Edge Cuts:- common, aimed at determining if the coin was a plated fake. (iii) Small Chops:- common, can consist of abstract symbols such as circles, stars, and crescents etc or Chinese characters. Most commonly found on Mexican Cap and Rays 8 Reales. (iv) Large Chops:- common, usually consisting of Chinese characters, pseudo characters or abstract symbols. (v) Chops in

Relief:- small relief chops are scarce while large relief chops are rare. (vi) Assay Chops:- a rare special relief chop made by a banker, usually rectangular containing two or more characters. (vii) Letter Chops:- scarce, consisting of the Latin alphabet. The most common letter used was the letter 'S'. (viii) Number Chops:- moderately scarce, consisting of large chops, the number 8 being the most common followed by the number 5. (ix) Manchu Chops:- extremely rare, consisting of Manchu script. (x) Banker's Ink Chops:- these come in red, blue, purple and black ink, and can be difficult to find high grade. (xi) Paper Chops:- the usual paper chop is called the 'Happy Wedding'. (xii) Presentation Chops:- elaborately drawn in India ink comprised of letters surrounded by fancy borders, dragons and flowers often covering the entire coin. To understand why the Chinese felt it necessary to 'chop' all silver (and a few gold and even fewer copper) coins, it is helpful to understand what was going on in China economically at that time. Prior to 1842 Canton was the only Chinese port open to foreign trade so it stands to reason that the practice of chopping coins probably began in Canton. References in the 'Chronicles of the East Indian Trading Company' indicate that chopmarked coins were in use in 1776. Over time local Chinese officials developed a consortium of merchants known in the west as the Cohong system, to conduct foreign trade. During the 1600's and 1700's foreign traders wanted commodities such as tea, silk, porcelain and lacquer ware, but the only commodity China wanted in return was silver. Ships from England, Spain, Portugal, The Netherlands, France, Germany, Denmark and America carried to China tons of silver – most of it produced in the mines of Spanish America. Tao Kuang, Emperor of China from 1820 to 1840, issued an Imperial Edict, ordering that the only form of payment Chinese merchants could lawfully accept for the goods they sold to foreigners was silver coins. This attempt to stop barter caused the English to seek a commodity that Chinese merchants wanted badly enough to risk Imperial wrath to pay for it with silver. Otherwise China would soon have all the world's silver and the East India Company would run out of profits from China trade. That commodity was opium. England had opium, grown in India, and could sell all they could deliver to the Chinese who were willing to pay in silver coins. The Imperial government blamed the English for the terrible increase in opium addiction in China, which ultimately led to war. Thus came the Opium War, Part 1 was fought between 1838 and 1842, and Part 2 ran from 1850 to 1860. This also triggered the Tai-Ping rebellion, 1850–65, which was suppressed by the government and went underground to resurface as the Boxer Rebellion. This too was suppressed by the government, but not finished. It turned into two things, the Revolution of 1911, which overthrew the Ching Dynasty; and the Triads, which became secret criminal organizations similar to the Mafia. China produced very few dollar sized silver coins before 1890 using instead the circulating silver dollar coinage of other countries. The most widely traded coins of the time were the Spain's and Mexico's 8 Reales coins, but other countries not wanting these to become the world-trading standard started producing their own dollar-sized silver trade coins. One thing thing to keep in mind:- the Chinese people accepted the coins above by weight, as '7 Mace and 2 Candareens' of standard silver, but not as a 'Dollar' which did not become legal tender until 1889. But, with all of the types of dollars and variations of silver content, it was becoming difficult to determine which coins to accept and which to avoid. Compounding the problem was the influx of counterfeit coins. Researchers have uncovered records describing the production of counterfeit coins for the Chinese market. One was by a Mr. Pablo Bordeauz, 'Made in Birmingham in 1792, Counterfeit Spanish Pieces of Eight, Countermarked in China', where he documented manufacturing methods of copper coins plated with silver and specified a production scale amounting to 25 000 pounds of counterfeit coins weekly during 1792. Another report is that the British established a mint in Canton at the end of the XVIII century in order to strike forged pieces of eight dated 1778 and that by 1790 several million forged coins were circulating in China. It turns out that the East India Company made a big mistake, and that was to leave the mint in the hands of the natives. They were producing forged Mexico Carolus Dollars, but Chinese workers anxious to make money for themselves too, began increasing the copper content of the alloy and keeping the silver. Coins put into circulation were .600 fine instead of the correct .902.7. The flamboyant mint of the East India Company went bankrupt and closed its doors. Between the coins not of Chinese origin and the large number of forgeries, some form of silver content guarantee was needed. To solve this problem, the native bank or moneychanger added their 'chop' to each dollar that passed through their hands. This 'chop' was normally a single symbol or letter or sometimes a secret symbol known only to that particular money changer that:- (i) showed the coin was given out by them; (ii) certified the silver content was standard; and (iii) that they agreed to accept the coin back without argument. 'Chop' is said to be a word imported by the English from India where the word was 'Chappa' or 'Choppa', meaning seal or official stamp. Deciphering the meaning of these little 'chops' can be an exercise in frustration. First, they are over 100 years old and many of the characters are no longer comparable to modern-day characters. Therefore it is difficult to translate them into a modern English-Chinese dictionary and necessitates locating someone who can read the old characters. Secondly, research has shown that many of the 'chops' turned into personal marks of identity like a monogram, some even using an assemblage of characters similar to a cattle brand. Chinese characters are made up of meanings, which may describe the person's physical appearance, title or other unique feature. This 'chop' change may have been caused when local businessmen took up the practice of chopmarking. Unfortunately, the practice of counterfeiting coins, even those bearing chopmarks, continues in China today so great care should be exercised when selecting coins for your collection. For some collectors chopmarked coins will always be damaged goods, but for others they represent a moment in history. And, just like in other facets of this hobby, you should always collect what you like, not what someone else tells you too.

CHOPINE = ШОПИН (или КОТУРН) – Chopine is a shoe with a very high sole designed to increase stature and protect the feet from mud and dirt worn by women in the XVI and XVII centuries. / обувь на пробковой или деревянной подошве.

CHOPPED FILLING = МЕЧЕНАЯ (или ПРЕРЫВИСТАЯ, или РЕЗАНАЯ, или РУБЛЕНАЯ) УТОЧИНА – Chopped Filling (fragmentation weft):- this defect is produced by the weft direction imbalances, characterized by the existence of a manifest or neat pattern, and the pattern by drawing roller caused by the eccentric behavior. Fabric Printing Defect. (1) Defect Name:- Chopped Filling. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Oxford or Basket. Description:- Chopped Filling:- This defect is the result of alternately light and heavy filling caused by the eccentric behavior of a drafting roll, most likely the front roll of the drawframe. This defect occurs in isolated instances and generally is of one package duration. Severity:- Major. (2) Defect Name:- Chopped Filling. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Chopped Filling:- This effect is the result of light and heavy filling caused by the eccentric behavior of a drafting roll, most likely the front roll of a drawframe. It has been accentuated in this warp-face fabric by having been sueded. This defect generally appears in isolated instances of one-bobbin duration. Severity:- Major. / Порок или дефект набивки тканей. Разрезанная Уточная Нить (chopped weft):- порок утка в виде оборванной уточной нити на очень коротком участке по ширине ткани. Примечание:- этот порок часто возникает вследствие разреза бёрдом во время заправки уточной нити.

CHOPT = CHARTERERS OPTION

CHORD MODULUS = МОДУЛЬ ХОРДЫ (или ХОРДОВЫЙ МОДУЛЬ, или ХОРДА МОДУЛЬ) – Chord Modulus:- in a tenacity-strain curve, the ratio of the change in tenacity to the change in strain between two specified points on the curve. See also Modulus.

CHP = COMBINED HEAT AND POWER

CHP PLANT = COMBINED HEAT AND POWER PLANT

CHRISOM = АНАВОЛИЙ (или КРЕСТИЛЬНАЯ РУБАХА) – Chrisom:- a white cloth or robe put on a person at baptism as a symbol of innocence. / .

CHROMA = ХРОМА – Chroma:- (1) attribute of color used to indicate the degree of departure of the color from a gray of the same lightness. (2) C*, (in the CIE 1976 L*, a*, b* or L*, u*, v* system) the quantity C*ab = (a*2 + b*2)1/2 or C*uv = (u*2 + v*2)1/2. (3) attribute of a visual perception, produced by an object color that permits a judgment to be made of the amount of pure chromatic color present, irrespective of the amount of achromatic color. Commission Internationale de l'Eclairage (CIE) is the French title of the International Commission on Illumination. / Комисьо Этэрнасьёналь дё л'Эклераж (Сэ.И.Е.; Commission Internationale de l'Eclairage (CIE)). Хрома – концентрация или степень насыщенности цвета. Под Хромо, от Греческого слова Chrōma, родительный падеж Chrómatos, означающее Краска или Цвет, понимается часть сложных слов, указывающая на отношение к цвету, например, хромоскоп; на отношение к хрому, например, хромомагнезит.

CHROMATED COPPER ARSENATE = ХРОМАТИРОВАННЫЙ АРСЕНАТ МЕДИ – Chromated Copper Arsenate (CCA) is a water-borne, combined fungicide and insecticide that includes arsenic for the treatment of wood. It was developed in 1933 and has been used widely in the United Kingdom and around the world. The arsenic is carried off in flue gases during combustion if treated wood is burned, and can be volatilized, making it difficult to trap with conventional filters so CCA treated timber must not be burned except in suitable equipment. Modern, less toxic alternatives are now widely available.

CHROMATIC = ХРОМАТИЧЕСКОЕ – Chromatic:- perceived as having a hue; not white, gray, or black. The opposite of Achromatic.

CHROMATICITY = ЦВЕТНОСТЬ (или ХРОМАТИЧНОСТЬ) – Chromaticity:- dimensions of a color stimulus expressed in terms of hue and saturation, or redness-greenness and yellowness-blueness, excluding the luminous intensity; generally expressed as a point in a plane of constant luminance. Syn:- Chromaticness. Chromaticity is the quality of color expressed as a function of wavelength and purity.

CHROMATICITY COORDINATES = КООРДИНАТЫ ЦВЕТНОСТИ (или КООРДИНАТЫ ХРОМАТИЧНОСТИ) – Chromaticity Coordinates:- the ratios of each of the three tristimulus values X, Y and Z in relation to the sum of the three; designated as x, y and z, respectively. They are sometimes referred to as the Trichromatic Coefficients. When written without subscripts, they are assumed to have been calculated for illuminant C and the 2° (1931) Standard Observer unless specified otherwise. If they have been obtained for other illuminants or observers, a subscript describing the observer or illuminant should be used. For example, x10 and y10 are chromaticity coordinates for the 10° observer and illuminant C.

CHROMATICITY DIAGRAM = ДИАГРАММА ЦВЕТНОСТИ (или ДИАГРАММА ХРОМАТИЧНОСТИ) – Chromaticity Diagram:- a two-dimensional graph of the chromaticity coordinates, x as the abscissa and y as the ordinate, which shows the spectrum locus (chromaticity coordinates of monochromatic light, 380–770 nm). It has many useful properties for comparing colors of both luminous (light emitting) and nonluminous (reflective) materials.

CHROMATID = ХРОМАТИДА (или ХРОМАТИДНОЕ) – Chromatid:- threadlike structures formed by the longitudinal division of a chromosome during mitotic prophase and known as a Daughter Chromosome During Anaphase. / Под Хроматидой, от Греческих слов Chrōma, родительный падеж Chrómatos, означающее Краска или Цвет, и Éidos, означающее Вид, понимается одна из двух нуклеопротеидных нитей, которые образуются при удвоении хромосом в процессе клеточного деления. После разделения хроматиду называют дочерними хромосомами.

CHROMATIN = ХРОМАТИН (или ХРОМАТИНОВОЕ) – Chromatin is:- (1) complex form of eukaryotic nuclear material at the times between cellular divisions (cf., euchromatin, heterochromatin). (2) The substance of chromosomes, now known to include DNA, chromosomal proteins, and chromosomal RNA. / Под Хроматином понимается вещество (нуклеопротеид) клеточного ядра, составляющее основу хромосом; окрашивается основными красителями. В процессе клеточного деления конденсируется, образуя компактные структуры в хромосомах, видимые в микроскоп. Различают гетерохроматин и эухроматин.

CHROMATOGRAPHY = ХРОМАТОГРАФИЯ – Chromatography is an analytical technique whereby a complex substance is adsorbed on a solid or liquid substrate and progressively eluted by a flow of a substance (the eluant) in which the components of the substance under investigation are differentially soluble. The eluant can be a liquid or a gas. When the substrate is filter paper and the eluant a liquid, a chromatogram of colored bands can be developed by use of indicators. For gas chromatography, electronic detectors are normally used to indicate passage of the various components from the system. Chromatography is the generic name of a group of processes for separating and analyzing mixtures of chemical compounds. The separation depends on the redistribution of molecules of the mixture between phases, one of which is thin, often reaching molecular dimensions. For this reason, molecular size and shape are important in the separation, and extremely subtle separations are possible. / Под Хроматографией, от Греческих слов Chrōma, родительный падеж Chrómatos, означающее Краска или Цвет, и Gráphō, означающее Пишу, понимается метод разделения, анализа и исследования смесей, основных на различном распределении их компонентов между двумя фазами – неподвижной и подвижной (элюентом). Хроматография может быть основной на различной способности компонентов к абсорбции (распределительная хроматография), адсорбции (адсорбционная хроматография), ионному обмену (ионообменная хроматография) или другому. В зависимости от агрегатного состояния элюента различают газовую и жидкостную хроматографию. Хроматографическое разделение проводят в трубках, заполненных сорбентом (колоночная хроматография); в капиллярах длиной несколько десятков метров, на стенки которых нанесён сорбент (капиллярная хроматография); на пластинках, покрытых слоем адсорбента (тонкослойная хроматография); на бумаге (бумажная хроматография). Хроматографию широко используют в лабораториях и в промышленности для контроля производства и выделения индивидуальных веществ. Под Хроматографией понимается метод разделения, анализа и исследования веществ. Основана на различии в скоростях движения отдельных компонентов смеси, распределённой в потоке подвижной фазы (газ или жидкость), вдоль слоя неподвижной фазы (сорбент с развитой поверхностью). По агрегатному состоянию подвижной фазы хроматография делится на газовую и жидкостную; по геометрии неподвижной фазы – на колоночную (в том числе капиллярную) и плоскослойную (в том числе хроматографию на бумаге и тонкослойную хроматографию). По механизму разделения различают:- (i) Ионообменную Хроматографию, основанную на различной способности разделяемых ионов в растворе к ионному обмену с ионитом; (ii) Эксклюзионную Хроматографию, основанную на различной способности молекул разного размера проникать в поры неионогенного геля; (iii) Осадочную Хроматографию, основанную на различной растворимости осадков, образуемых компонентами смеси со специальными реактивами, нанесёнными на высокодисперсное вещество; (iv) Аффинную Хроматографию, основанную на специфическом взаимодействии биологически активных веществ с лигандами (ингибиторы, кофакторы, субстраты), ковалентно свясанными с нерастворимыми носителями (силикаты, целлюлоза и другие); (v) Адсорбционную Хроматографию, основанную на избирательной адсорбции отдельных компонентов смеси; и (vi) Распределительную Хроматографию, основанную на различной сорбции компонентов смеси двумя несмешивающимися жидкостями, одна из которых (неподвижная) находится в порах твёрдого носителя. Хроматография

применяется для разделения и анализа близких по свойствам веществ. Хроматография, физико-химический метод разделения и анализа смесей, основанный на распределении их компонентов между двумя фазами – неподвижной и подвижной (Элюент), протекающей через неподвижную. Историческая Справка:- метод разработан в 1903 Русским ботаником-физиологом и биохимиком Михаилом Семёновичем Цветом (1872–1919), который показал, что при пропускании смеси растительных пигментов через слой бесцветного сорбента индивидуальные вещества располагаются в виде отдельных окрашенных зон. Полученный таким образом послойно окрашенный столбик сорбента Цвет назвал хроматограммой, а метод – Хроматографией. Впоследствии термин 'Хроматограмма' стали относить к разным способам фиксации результатов многих видов хроматографии. Однако вплоть до 1940-х хроматография не получила должного развития. Лишь в 1941 Британцы биохимик и физико-химик Ачё Дьжон Потё Матин (Archer John Porter Martin; 1910–2002) и биохимик Ричад Лорэнц Милиньгтэн Сынь (Richard Laurence Millington Synge; 1914–1994) открыли метод распределительной хроматографии и показали его широкие возможности для исследования белков и углеводов. В 1950-е Ачё Матин в паре с другим Британским биохимиком – Энтэни Тчрэфод Дьжеймз (Anthony Trafford James; 1922–2006) разработали метод газо-жидкостной хроматографии. Основные Виды Хроматографии:- в зависимости от природы взаимодействия, обусловливающего распределение компонентов между элюентом и неподвижной фазой, различают следующие основные виды хроматографии – адсорбционную, распределительную, ионообменную, эксклюзионную (молекулярно-ситовую) и осадочную. (i) Адсорбционная Хроматография основана на различии сорбируемости разделяемых веществ адсорбентом (твёрдое тело с развитой поверхностью). (ii) Распределительная Хроматография основана на разной растворимости компонентов смеси в неподвижной фазе (высококипящая жидкость, нанесённая на твёрдый макропористый носитель) и элюенте (следует иметь в виду, что при распределительном механизме разделения на перемещение зон компонентов частичное влияние оказывает и адсорбционное взаимодействие анализируемых компонентов с твёрдым сорбентом). (iii) Ионообменная Хроматография основана на различии констант ионообменного равновесия между неподвижной фазой (Ионитом) и компонентами разделяемой смеси. (iv) Эксклюзионная (Молекулярно-Ситовая) Хроматография основана на разной проницаемости молекул компонентов в неподвижную фазу (высокопористый неионогенный гель). Эксклюзионная хроматография подразделяется на:- (a) Гель-Проникающую Хроматографию (ГПХ), в которой элюент – неводный растворитель; и (b) Гель-Фильтрацию, где элюент – вода. (v) Осадочная Хроматография основана на различной способности разделяемых компонентов выпадать в осадок на твёрдой неподвижной фазе. В соответствии с агрегатным состоянием элюента различают Газовую и Жидкостную Хроматографии. В зависимости от агрегатного состояния неподвижной фазы газовая хроматография бывает Газо-Адсорбционной (неподвижная фаза – твёрдый адсорбент) и Газожидкостной (неподвижная фаза – жидкость), а жидкостная хроматография – Жидкостно-Адсорбционной (или Твёрдо-Жидкостной) и Жидкостно-Жидкостной. Последняя, как и газо-жидкостная, является распределительной хроматографией. К твёрдо-жидкостной хроматографии относятся Тонкослойная и Бумажная Хроматографии. Различают Колоночную и Плоскостную Хроматографии. В колоночной сорбентом заполняют специальные трубки – колонки, а подвижная фаза движется внутри колонки благодаря перепаду давления. Разновидность колоночной хроматографии – Капиллярная Хроматография, когда тонкий слой сорбента наносится на внутренние стенки капиллярной трубки. Плоскостная хроматография подразделяется на Тонкослойную и Бумажную Хроматографии. В тонкослойной хроматографии тонкий слой гранулированного сорбента или пористая плёнка наносится на стеклянную или металлическую пластинки; в случае бумажной хроматографии используют специальную хроматографическую бумагу. В плоскостной хроматографии перемещение подвижной фазы происходит благодаря капиллярным силам. При хроматографировании возможно изменение по заданной программе температуры, состава элюента, скорости его протекания и других параметров. В зависимости от способа перемещения разделяемой смеси вдоль слоя сорбента различают следующие варианты хроматографии:- фронтальный, проявительный и вытеснительный. При Фронтальном Варианте в слой сорбента непрерывно вводится разделяемая смесь, состоящая из газа-носителя и разделяемых компонентов, например 1, 2, 3, 4, которая сама является подвижной фазой. Через некоторое время после начала процесса наименее сорбируемый компонент (например, 1) опережает остальные и выходит в виде зоны чистого вещества раньше всех, а за ним в порядке сорбируемости последовательно располагаются зоны смесей компонентов:- 1 + 2, 1 + 2 + 3, 1 + 2 + 3 + 4. При Проявительном Варианте через слой сорбента непрерывно проходит поток элюента и периодически в слой сорбента вводится разделяемая смесь веществ. Через определённое время происходит деление исходной смеси на чистые вещества, располагающиеся отдельными зонами на сорбенте, между которыми находятся зоны элюента. При Вытеснительном Варианте в сорбент вводится разделяемая смесь, а затем поток газа-носителя, содержащего вытеснитель (элюент), при движении которого смесь через некоторый период времени разделится на зоны чистых веществ, между которыми окажутся зоны их смеси. Ряд видов хроматографии осуществляется с помощью приборов, называемых Хроматографами, в большинстве из которых реализуется проявительный вариант хроматографии. Хроматографы используют для анализа и для препаративного (в том числе промышленного) разделения смесей веществ. При анализе разделённые в колонке хроматографа вещества вместе с элюентом попадают через различные промежутки времени в установленное на выходе из хроматографической колонки детектирующее устройство, регистрирующее их концентрации во времени. Полученную в результате этого выходную кривую называют Хроматограммой. Для качественного хроматографического анализа определяют время от момента ввода пробы до выхода каждого компонента из колонки при данной температуре и при использовании определённого элюента. Для количественного анализа определяют высоты или площади хроматографических пиков с учётом коэффициентов чувствительности используемого детектирующего устройства к анализируемым веществам. Для анализа и разделения веществ, переходящих без разложения в парообразное состояние, наибольшее применение получила Газовая Хроматография, где в качестве элюента (газа-носителя) используются гелий, азот, аргон и другие газы. Для Газо-Адсорбционного Варианта Хроматографии в качестве сорбента (частицы диаметром 0.1–0.5 миллиметров (мм)) используют силикагели, алюмогели, молекулярные сита, пористые полимеры и другие сорбенты с удельной поверхностью 5–500 квадратных метров на грамм ($м^2/г$). Для Газо-Жидкостной Хроматографии сорбент готовят нанесением жидкости в виде плёнки (высококипящие углеводороды, сложные эфиры, силоксаны и другие) толщиной несколько микрометров (мкм) на твёрдый носитель с удельной поверхностью 0.5–5 $м^2/г$ и более. Рабочие температурные пределы для Газо-Адсорбционного Варианта Хроматографии от –70 до 600 °C, для Газо-Жидкостного от –20 до 400 °C. Газовой хроматографией можно разделить несколько кубических сантиметров ($см^3$) газа или миллиграммов (мг) жидких (твёрдых) веществ; время анализа от нескольких секунд (сек) до нескольких часов. В Жидкостной Колоночной Хроматографии в качестве элюента применяют легколетучие растворители (например, углеводороды, эфиры, спирты), а в качестве неподвижной фазы – силикагели (в том числе силикагели с химически привитыми к поверхности различными функциональными группами – эфирными, спиртовыми и другими), алюмогели, пористые стекла; размер частиц всех этих сорбентов несколько мкм. Подавая элюент под давлением до 50 МегаНьютонов на квадратный метр ($МН/м^2$) (500 килограммов силы на квадратный сантиметр ($кгс/см^2$)), удаётся сократить время анализа от 2–3 часов (ч) до нескольких минут (мин). Для повышения эффективности разделения сложных смесей используют программируемое во времени изменение свойств элюента путём смешения растворителей разной полярности (Градиентное Элюирование). Жидкостная Молекулярно-Ситовая Хроматография отличается использованием сорбентов, имеющих поры строго определённого размера (пористые

стекла, молекулярные сита, в том числе декстрановые и другие гели). В тонкослойной и бумажной хроматографии исследуемую смесь в жидком виде наносят на стартовую линию (начало пластинки или полоски бумаги), а затем разделяют на компоненты восходящим или нисходящим потоком элюента. Последующее обнаружение (проявление) разделённых веществ на хроматограмме (так в этих случаях называют пластину с нанесённым на неё сорбентом или хроматографическую бумагу, на которых произошло разделение исследуемой смеси на компоненты) осуществляют при помощи ультрафиолетовой (УФ) спектроскопии, инфракрасной (ИК) спектроскопии или обработкой реактивами, образующими с анализируемыми веществами окрашенные соединения. Качественно состав смесей с помощью этих видов хроматографии характеризуют определённой скоростью перемещения пятен веществ относительно скорости движения растворителя в данных условиях. Количественный анализ осуществляют измерением интенсивности окраски вещества на хроматограмме. Хроматография широко применяется в лабораториях и в промышленности для качественного и количественного анализа многокомпонентных систем, контроля производства, особенно в связи с автоматизацией многих процессов, а также для препаративного (в том числе промышленного) выделения индивидуальных веществ (например, благородных металлов), разделения редких и рассеянных элементов. Газовая Хроматография применяется для разделения газов, определения примесей вредных веществ в воздухе, воде, почве, промышленных продуктах; определения состава продуктов основного органического и нефтехимического синтеза, выхлопных газов, лекарственных препаратов, а также в криминалистике и так далее. Разработаны аппаратура и методики анализа газов в космических кораблях, анализа атмосферы Марса, идентификации органических веществ в лунных породах и тому подобном. Газовая хроматография применяется также для определения физико-химических характеристик индивидуальных соединений:- теплоты адсорбции и растворения, энтальпии, энтропии, констант равновесия и комплексообразования; для твёрдых веществ этот метод позволяет измерить удельную поверхность, пористость, каталитическую активность. Жидкостная Хроматография используется для анализа, разделения и очистки синтетических полимеров, лекарственных препаратов, детергентов, белков, гормонов и других биологически важных соединений. Использование высокочувствительных детекторов позволяет работать с очень малыми количествами веществ (10^{-11}–10^{-9} грамма (г)), что исключительно важно в биологических исследованиях. Часто применяется Молекулярно-Ситовая Хроматография и Хроматография По Сродству; последняя основана на способности молекул биологических веществ избирательно связываться друг с другом. Тонкослойная и Бумажная Хроматографии используются для анализа жиров, углеводов, белков и других природных веществ и неорганических соединений. В некоторых случаях для идентификации веществ используется хроматография в сочетании с другими физико-химическими и физическими методами, например, с масс-спектрометрией, ИК-, УФ-спектроскопией и другими. Для расшифровки хроматограмм и выбора условий опыта применяют электронно-вычислительные машины (ЭВМ).

CHROME DYES = ХРОМИРОВОЧНЫЕ КРАСИТЕЛИ (или ХРОМОВЫЕ КРАСИТЕЛИ) – Chrome Dyes:- a number of techniques have been developed for the application of chrome dyes. The Chrome mordant process relies on chroming the fiber prior to dyeing with a chromable dye; the Metachrome process applies both dye and chromium salt simultaneously. Both processes have been largely superseded by the Afterchrome process in which the dye is applied first and the fiber is then chromed in a separate step, utilising the exhausted dye bath and thus conserving water. Application of the dyestuff takes place from a moderately acid dye bath (1% acetic acid) often with an addition of formic acid towards the end of the boiling period to promote exhaustion of the dye. The dye bath is then cooled back from the boil to approximately 80 °C, the pH is lowered to approximately 3.5 with formic acid and the pre-dissolved chromium salt added. The dye bath is then returned to the boil and boiling continued for 20–30 minutes. Chromium is added to the dye bath as either sodium or potassium dichromate. In solution the chroming species present vary according to pH, with the dichromate anion $Cr_2O_7^{2-}$ predominating at pH between 3 and 7. Although it is the chromium (VI) anion which is initially adsorbed by the wool, the dye complex is formed with chromium (III), formed by the action of reducing groups in the fiber itself. Strong acids have an activating effect on this process; organic acids (tartaric, lactic, formic acid) or thiosulphate can also be used to enhance the degree of conversion of Cr VI. Chrome Dyes are the dyes for wool that use chromium compounds as mordants. These dyes are part of the broader category of mordant dyes for wool. / бихромат калия или двухромокислый калий (potassium dichromate). муравьиная кислота (formic acid).

CHROMIUM = ХРОМ (или ХРОМОВОЕ ПОКРЫТИЕ) – Chromium is the metallic element that forms the basis of a number of compounds often used as mordants, or as part of the molecular structure of pre-metallized dyes. Potassium dichromate is a common mordant chemical. Chromium compounds are toxic and some are carcinogenic. They must be handled with care and understanding of the risks involved. / Бихромат калия или двухромокислый калий (potassium dichromate).

CHROMOMERE = ХРОМОМЕР – Chromomere is one of the visible enlargements of the chromonema at which nucleoproteins appear to be concentrated. Some regard these to be the physical seat of the genes, commonly regarded as actual carrier of genes. Others consider these as optical artifacts due to the coiled state of the chromonema.

CHROMOPHORE = ХРОМОФОР – Chromophore is a color-bearing compound, typically meaning the part of a larger organic molecule that makes it appear colored. Dyes typically have a chromophore chemically bonded to other structures that impart desired characteristics such as affinity for the fiber and solubility in water. A particular chromophore structure may be found in a variety of dye classes and in pigments. / Сродство (Affinity).

CHROMOPLAST = ХРОМОПЛАСТ – Chromoplast is a specialized cytoplasmic organelle containing pigments other than chlorophyll including yellow or orange carotenoid pigments. See also Plastid. / Смотрите также Пластид (Plastid). Под Хромопластами, от Греческих слов Chrōma, означающее Краска или Цвет, и Plastós, означающее Вылепленный, понимаются органоиды растительных клеток; содержат пигменты, преимущественно каротиноиды, придающие красную, жёлтую или оранжевую окраску осенним листьям, многим сочным плодам, корням моркови.

CHROMOSOME = ХРОМОСОМА – Chromosome is tiny condensed X or Y-shaped sub-cellular bodies seen at the time of cell division, containing the genetic material (DNA) in the cell nucleus in association with packaging proteins such as histones. The number of chromosomes is usually constant for a particular species and species with different numbers of chromosomes may have difficulty hybridising. Chromosome is a structural unit of the cell nucleus which carries in linear order the genes responsible for the determination and transmission of hereditary characteristics. The term is applicable not only to the nuclear chromosomes but more loosely to the DNA of viruses, bacteria, and the chloroplast and mitochondria of eukaryotes. / виды (species). Под Хромосомами, от Греческих слов Chrōma, означающее Краска или Цвет, и Sōma, означающее Тело, понимаются структурные элементы ядра клетки, содержащие ДНК, в которой заключена наследственная информация организма. В хромосомах в линейном порядке расположены гены. Самоудвоение и закономерное распределение хромосом по дочерним клеткам при клеточном делении обеспечивает передачу наследственных свойств организма от поколения к поколению. В виде чётких структур хромосомы различимы (при микроскопии) только во время деления клеток. Каждая хромосома имеет специфическую форму, размер. В клетках организмов с недифференцированным ядром (бактерии) имеется одиночная двухспиральная молекула ДНК, нередко называемая хромосомой.

CHROMOSOME CYTOLOGY = ХРОМОСОМНАЯ ЦИТОЛОГИЯ – Chromosome Cytology is a study of chromosome sets of organisms.

CHROMOSOME WALKING = ПРОГУЛКА ВДОЛЬ ХРОМОСОМЫ – Chromosome Walking is a chromosome analysis in which cloned chromosomal segments are used to isolate the neighboring DNA fragments. / Прогулка Вдоль Хромосомы – метод скрининга аллельных локусов гена.

CHRONIC RODENTICIDES = ХРОНИЧЕСКИЕ РОДЕНТИЦИДЫ (или ДЛИТЕЛЬНЫЕ РОДЕНТИЦИДЫ) – Chronic Rodenticides are slow-acting rodent poisons or anticoagulants. Their principal action is to prevent blood from clotting, thereby causing slow and painless death to the animal through continuous internal bleeding and external bleeding.

CHRYSANTHA = ХРИЗАНТА (или ЗОЛОТИСТОЕ) – Chrysantha (-us,-um):- golden.

CHRYSOCENTRUS = ХРИЗОСЭНТРУС (или С ЗОЛОТИСТЫМ ЦЕНТРОМ) – Chrysocentrus:- with a golden center.

CHUKKA = ЧАКА – Chukka is a usually ankle-length leather boot with two or three pairs of eyelets or a buckle and strap. / ботинок кроя ‘конверт’ с закруглённым верхним кантом.

CHUNNI = ЧУННИ – Chunni or Dupatta is a scarf or wrap worn with most Indian garments. The item can be plain or embellished with embroidery. Traditional garment from India. / Чунни (Chunni) или Дупатта (Dupatta).

CHURIDHAR = ЧУРИДХАР – Churidhar:- fitted pants with deliberate snugness around the calf and ankle with gatherings and hooks for fastening. Traditional garment from India.

CHURN = ПЕРЕСМОТР (СПИСКА ПАРТНЁРОВ) – Churn:- the relentless cycle of acquiring new customers and losing others that characterizes consumer e-commerce and reduces lifetime customer value because switching is so easy.

CHURNING = РАСКРУТКА (или СДЕЛКИ С ЗАИНТЕРЕСОВАННОСТЬЮ) – Churning:- excessive trading of a discretionary account by a person with control of the account for the purpose of generating more commissions while disregarding the interests of the customer. Excessive trading that results in the broker deriving a profit from commissions while disregarding the best interests of the customers. / Излишние операции, в результате которых брокер получает доход от комиссий, игнорируя интересы заказчиков.

CHUTE FEEDER = БУНКЕРНЫЙ ПИТАТЕЛЬ – Chute Feeder:- this machine is a connecting unit between cards and blow-room whose function is to make fiber (after being opened and mixed) feed to card in even batt ensure continuous and even cotton supply for card. Continuous pressure monitoring of the batt formation chamber for previously supplied Crosrol chute feed systems, which currently utilize the on-off photo-eye monitoring system. The newly introduced system uses an highly sensitive digital pressure monitoring transducer for constant monitoring of the material fill level of the batt formation chamber. The newly designed system working in conjunction with the card controller continually adjusts the feed roll speed (via inverter) so as to ensure a constant feed of material from the upper chamber to the lower batt formation chamber. This new principle of constant feeding leads to significant benefits in short term irregularities of card sliver been seen. Working trials have shown that the card’s short-term CV% (5M CV) to be reduced from typically 2.5% (when utilizing the photo-eye system) to less than 1.5% when using the new control method. In spinning process, pneumatic fiber transport system used in linking textile processing equipment or operations, especially opening, blending, and carding. This invention relates to the creation of a different styled batt from tufts of fiber for delivery to textile machinery. In particular, the batt formed in the style of this invention is particularly suited for delivery to a carding machine. Carding machines are able to more fully utilize fiber processing capacity with lower risk of becoming overloaded because the tufts are less able to be pulled out of the batt intact but are held back allowing for the lickerin roll or other feed arrangement to pull fiber out of the batt in a more continuous and uniform manner. / Питание чёсальной машины может осуществляться холстом с трёпальной машины или равномерным слоем, поступающим из бункера при агрегировании чёсальной машины с разрыхлительно-очистительным агрегатом. Бункерное питание позволило увеличить коэффициент полезного времени машины, в результате чего повысилась производительность труда (исключены операции по транспортированию холстов, их перегрузке на стойки чёсальных машин и заправке на чёсальной машине). При холстовом питании чёсальной машины его равномерность зависит от равномерности холстов, контролируемой на трёпальной машине путём взвешивания каждого холста. При бункерном питании поток волокон должен равномерно распределяться по бункерам чёсальных машин. Возникла необходимость автоматических регуляторов питания чёсальных машин. При бункерном питании затрудняется перезаправка чёсальных машин, когда на предприятии перерабатывается большое число сортировок при малом их объёме. Однако, несмотря на эти трудности, бункерное питание является прогрессивной технологией прядильного производства, которая непрерывно совершенствуется. В прядильном производстве, дозирующий бункер предназначен для выравнивания по массе потока волокон от кипоразрыхлителей, смешивания, разрыхления и частичной очистки волокна от сорных примесей. От дозирующих бункеров быстроходный конденсер подаёт волокно в камеру головного питателя. В этом агрегате происходит перемешивание волокон, разрыхление и частичная их очистка. Питатели-смесители предварительно разрыхляют волокна, частично очищают их от сорных примесей и перемешивают. Около каждого питателя-смесителя устанавливается 10–12 кип хлопкового волокна, и работник загружает машины, равномерно отбирая волокно от всех кип. У батареи питателей-смесителей одновременно находится 40–48 кип, что обеспечивает стабильность состава смеси волокон. Для выравнивания потока волокон после питающей решётки устанавливается головной питатель, обеспечивающий предварительное перемешивание волокон и равномерную подачу их к шестибарабанному наклонному очистителю, откуда конденсером волокно подаётся в горизонтальный разрыхлитель. В горизонтальном разрыхлителе, как и в наклонном очистителе, разрыхление клочков волокон осуществляется при ударном воздействии ножей барабанов по волокну. Из горизонтального разрыхлителя волокно пневматическим распределителем распределяется по трёпальнам машинам.

CHUTE–FEED SYSTEM = СИСТЕМА СПУСКНЫХ И ПОДАЮЩИХ ТРУБ (или КОРОБОВ) – Chute-Feed System is a pneumatic fiber transport system used in linking textile processing equipment or operations, especially opening, blending, and carding.

CIBACRON® F = ЦИБАКРОН® ЭФ. (или СИБЭКРОН® ЭФ.) – Cibacron® F and FN dye is a family of reactive dyes developed and manufactured by Ciba Specialty Chemicals (part of the merger agreement of 1997 between Ciba Geigy and Sandoz was that the former's industrial chemicals business would be spun off as a separate business, leading to the formation of Ciba Specialty Chemicals PLC, Manchester, the United Kingdom). This family of dyes is less reactive than the MX family, and is intended for application typically between 50 °C and 60 °C. Industrially, they have some definite merits over the MX family, and there are still new family members being introduced. Unfortunately, they are generally less available to the textile artist, partly due to Ciba's corporate policies. / Цибакрон® Эф. – активный краситель.

CICADELLOIDEA = ЦИКАДЭЛЛОИДЭ (или ЦИКАДОВЫЕ) – Cicadelloidea is a Superfamily within the Auchenorrhyncha (Hemiptera) having long hind tibia lined with numerous spines, transverse platelike hind coxae, 2 or no ocelli, but no tegulae. / Подотряд Цикадовые – Auchenorrhyncha. В мировой фауне около 25 тысяч Видов, в бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось свыше 2 000 Видов. Среднего размера или мелкие насекомые с удлинённым, реже овальным телом. Окраска преимущественно бурых или зеленоватых тонов, реже беловатая, чёрная, оранжевая, красноватая. Для Цикадовых характерны неподвижно сочленённая с переднегрудью голова, сосущего типа ротовой аппарат в виде хоботка, отходящего от нижнезадней части головы, относительно короткие усики, вершинный третий членик которых имеет вид щетинки. Передние крылья перепончатые или уплотнённые, разделены косым швом на кориум и клавус, иногда укороченные с продольными и поперечными жилками. Задние крылья перепончатые, иногда рудиментарные. Ноги с трехчлениковой лапкой. Передние и средние обычно бегательные, задние – прыгательного типа. Генитальный аппарат самцов характеризуется большим разнообразием и служит диагностическим признаком при установлении видовой принадлежности. Большинство Цикадовых – вредители различных сельскохозяйственных культур, древесных насаждений, сенокосных угодий и пастбищ. Считались особенно вредоносными в Южных районах бывшего СССР. Характер повреждений, причиняемых растениям, разнообразен. Наиболее опасно высасывание соков из флоэмы, ксилемы и паренхимы листа, что лишает растепия необходимых для построения тканей азотистых веществ и влаги и приводит к замедлению роста, а иногда и гибели их. Многие Виды причиняют заметный ущерб луговодству, увеличивая количество сухотравья, не поедаемого скотом, и снижая питательную ценность кормовых трав путём разрушения провитамина А. Особенно опасны повреждения для молодых растений – всходов, саженцев, что связано с выделением со слюной фитотоксинов. угнетающих рост и развитие растительных тканей. Личинки младших возрастов и цикадки Подсемейства Typhlocybinae питаются клеточным соком листьев, вызывая разрушение хлорофилла. Вследствие этого в местах сосания на поверхности листьев появляются своеобразные желтоватые, беловатые или красноватые пятна. Некоторые Виды, помимо непосредственного вреда, способны заражать растения фитопатогенными вирусами. Описано около 130 Видов Цикадовых – переносчиков вирусных болезней растений, в том числе в бывшем СССР таких видов было известно 10, но эта цифра не отражает истинного числа переносчиков, так как этот вопрос пока ещё недостаточно изучен. Некоторые виды цикадовых являются специфическими переносчиками определённых вирусов (Hyalesthes Obsoletus Sign. – столбура Пасленовых, Laodelphax Striatella Fall. – закукливания злаков, Psammotettix Strlatus L. – мозаики озимой Пшеницы). Значительный вред плодовым культурам причиняют Цикадовые Семейств Cicadidae, Membracidae при откладке яиц под кору или в древесину молодых побегов и веточек. Делая поперечные надпилы, они рассекают v проводящие сосуды и нарушают сокодвижение. В местах повреждения ветки истончаются, становятся хрупкими и часто обламываются или засыхают. На образовавшихся ранках и наплывах камеди поселяются паразитные Грибы и Бактерии. В годы массового размножения певчих Цикад и горбатки буйвола в Молдавии и на Украине сильно повреждаются плодовые и многие лесные породы, особенно молодые неокрепшие растения. Меры борьбы со всеми Видами вредных Цикадовых, кроме горбатки буйвола, сходны и приведены в конце обзора Подотряда. (1) Носатка Европейская – Dictyphara Europaea L. В бывшем СССР:- Средняя Азия, Украина (степная и лесостепная зоны). Средиземноморье и средняя Европа. Развитие личинок и питание взрослых проходит обычно на дикорастущей растительности. В Ферганской Долине отмечена на Люцерне, Свёкле, Моркови, хлебных и кормовых злаках. В году одно поколение. Лет взрослых с Июля до Сентября. (2) Минд Мозаичный – Myndus Musivus Germ. В бывшем СССР:- Юг Европейской части, Кавказ, Украина (локально по всех зонах). Средняя и Южная часть Западной Европы, Турция. На Ивах местами в массе. Одно поколение в году. Взрослые встречаются с конца Июня до конца Августа. (3) Циксий Жилковатый – Cixius Nervosus L. В бывшем СССР:- Европейская часть, Кавказ, Сибирь, Средняя Азия, Украина (чаще в лесостепи и полесье). Европа, Северная Африка, Япония, Китай. На широколиственных породах. В Ленинградской Области отмечен на Яблоне. В году одно поколение. Зимуют яйца, личинки живут в земле на корнях различных растений. Взрослые – со средины Июня до Сентября. (4) Корневая Цикада – Pentastiridius Leporinus L. Палеарктика. В бывшем СССР:- Европейская часть, Сибирь, Закавказье, Средняя Азия. Повреждает Свёклу, Картофель, Капусту, Кукурузу, хлебные злаки, Горох, Горчицу. Личинки вредят корнеплодам Свёклы. Взрослые переносят вирус мозаики сахарной Свёклы. В естественных условиях живёт обычно в тростнике. Описание:- тело дорсовентрально уплощённое с перепончатыми почти плоско сложенными крыльями. Длина 5–9 мм. Голова короткая, посредине вогнутая с закруглённым передним краем. Переднеспинка беловатая, очень короткая и широкая с прямоугольно вырезанным посредине задним краем. Щиток чёрный, по длине превышает темя и переднеспинку вместе взятые, с 5 продольными килями. Передние крылья беловатосерого оттенка, значительно длиннее брюшка. Жилки слегка затемнены в вершинной части крыла. Брюшко короткое, уплощённое, просвечивает сквозь прозрачные крылья. Окраска личинок от кремовой до светлобурой, передняя часть тела несколько темнее окрашена. На трёх последних сегментах брюшка расположены восковые железы, выделяющие плотную длинную кисть белых шелковистых нитей, имеющих защитное значение. Наличие кисти восковых нитей характерно для личинок всех возрастов. Яйца блестящебелые, продолговатоовальные (длина 0.6 мм, ширина 0.3 мм). Яйцекладки в верхнем сухом слое почвы на плантациях сахарной Свёклы и Кукурузы. Образ Жизни:- генерация одногодичная. На Юге зимуют личинки II возраста (в Киевской Области III–IV возрастов) в почве на глубине 5–20 см. С наступлением тепла (обычно в Апреле) личинки возобновляют питание на сохранившихся в почве корнеплодах сахарной Свёклы, позднее переходят на корни культур, посеянных после Свёклы, среди которых предпочитают Кукурузу, Горох, Ячмень. Питание перезимовавших личинок продолжается до начала Июня. Личинки, достигшие V возраста, переходят в трещины почвы, где и превращаются во

взрослых насекомых. Лет начинается в первых числах Июня и продолжается до начала Августа, максимум его приходится на середину Июля. Взрослые Цикадки – полифаги, питаются на листьях Кукурузы, сахарной Свёклы и многих других растений. Повреждения на листьях имеют вид беловатых точек, сливающихся в мелкие неправильной формы пятнышки. К концу Июня появляются половозрелые самки, отличающиеся наличием белоснежной кисточки восковых выделений на конце брюшка. Откладка яиц происходит с начала Июля до середины Августа. Основную массу яиц откладывают на свекловичных и кукурузных плантациях вблизи растений в трещины почвы на глубину 4–10 см. Каждая яйцекладка содержит от 40 до 100, чаще 60–70 яиц, покрытых восковым пушком с брюшка самок. Плодовитость одной самки около 170 яиц. На 14–16-й день из отложенных яиц выходят личинки, которые свободно передвигаются в почве в направлении к корням и поселяются на них колониями по 5–17 особей. Питание личинок продолжается до холодов. На корнях Свёклы к зиме они достигают III–IV возраста, на корнях Кукурузы – II, реже III. Корневая Цикадка предпочитает среднесуглинистые почвы, богатые растительными остатками, с трещинами и ходами дождевых червей, облегчающими передвижение личинок. Промерзание почвы ниже 5° вызывает гибель личинок. Откладывающих яйца самок и личинок в почве уничтожают Тарантулы и другие пауки. (5) Рептал Панцера – Reptalus Panzeri P. Low. В бывшем СССР:- Юг Европейской части, Кавказ, Казахстан, Юг Украины (на Свёкле, Кукурузе и хлебных злаках). Западная Европа, Северная Африка, Турция. (6) Вьюнковая Цикадка – Hyalesthes Obsoletus Sign. В бывшем СССР:- Юг и средняя полоса Европейской части, Кавказ, Средняя Азия, Украина (повсеместно, но чаще в Южных областях, включая Крым). Средиземноморье и центральная часть Западной Европы, Передняя Азия. Многоядный вредитель. Является переносчиком столбура Пасленовых, поражающего в Крыму и Южных областях Томаты, Баклажаны, Картофель, Перец, а также болезни Табака, известной под названием мокрый монтарь. Кроме того, в Молдавии отмечена как вредитель Укропа, семенников Моркови и других зонтичных, Кукурузы, в плодовых питомниках на различных породах. Описание:- среднего размера (4.5–5.5 мм) чёрные Цикадки с длинными прозрачными плоско складывающимися крыльями. Голова короткая, впереди широко закруглена. Лоб с тремя продольными килями, боковые края темени и лба белые. Передиеспинка белая, широкая и короткая, задний край её тупоугольно вырезан. Щиток большой, превышает по длине переднеспинку и голову вместе взятые, с пятью чёткими продольными килями. Надкрылья значительно длиннее брюшка, жилки их светлые, стигмы затемнены. Образ Жизни:- личинки развиваются главным образом в прикорневой части Вьюнка (Convolvulus). Зимуют личинки III–IV возрастов в почве, весной развитие их заканчивается. Окрыление происходит в поверхностных слоях почвы в конце Мая – начале Июня. Взрослые Цикадки мигрируют, при этом переносят вирус с дикорастущих растений на культурные. Для откладки яиц самки возвращаются на Вьюнок. В тёплое время года личинки живут на глубине 7–12 см, а к зиме уходят на большую глубину. Взрослые Цикадки летают до конца Августа. В течение года развивается одно поколение. (7) Тёмная Цикадка – Laodelphax Striatella Fall. (= Calligypona Striatella Fall., Delphax s., Liburnia s.). В бывшем СССР:- повсеместно на Украине во всех зонах, предит чаще в степи. Европа, Северная Африка, внетропическая Азия. Многоядный вид, предпочитающий злаки. В Украине повреждает Пшеницу, Рожь, Овёс, Ячмень, Кукурузу, Горох, Морковь, Огурцы, Капусту, Свёклу, Картофель, Клубнику, кормовые травы. Сильно повреждённые растения отстают в росте, хуже развиваются, листья нередко увядают, подсыхают с верхушки и постепенно отмирают. Однако наибольший вред причиняет, распространяя ряд вирусных болезней (закукливание Овса и других злаков, карликовость Овса, рыжую карликовость Кукурузы, карликовую и полосатую болезни Риса). Описание:- мелкая (1.7–4.0 мм) стройная Цикадка с прозрачными крыльями. Темя квадратное, слабо выступающее вперёд. Передиеспинка беловатая или местами буроватая, затемнённая позади глаз, боковые кили её плавно расходятся в стороны. Щиток почти вдвое длиннее переднеспинки, чёрный, блестящий с тремя продольными килями. Вершина щитка желтоватобелая. Верхние крылья вдвое длиннее брюшка, кровлеобразно сложены, стекловиднопрозрачные, с тёмнобурыми мелко пунктированными жилками. Вершина клавуса с тёмнобурым пятном. Брюшко и передняя часть тела снизу тёмнобурые до чёрного. Образ Жизни:- в Украине развивается в двух поколениях, в Ферганской Долине – в пяти. В Японии даёт 4–7 поколений в год, в Израиле отмечена круглогодичная активность. Зимуют личинки III–IV возрастов на посевах злаковых культур, на межах и обочинах. Весной они появляются значительно раньше Цикадок других видов. Окрыление начинается в первой половине Мая. Взрослые Цикадки перелетают на поля и в конце Мая приступают к откладке яиц. Размещают их самки небольшими кучками по нескольку штук в прикорневую часть, ткани листьев и листовых влагалищ злаков. Развитие яиц длится 10–12 дней. Отрождение личинок второй генерации происходит в середине Июля, окрыление с конца Июня.

CIRCUIT = ЦЕПЬ (или СХЕМА) – An electrical Circuit is a complete route which an electric current can flow around. Electric Circuit, unbroken path along which an electric current exists or is intended or able to flow. A simple circuit might consist of an electric cell (the power source), two conducting wires (one end of each being attached to each terminal of the cell), and a small lamp (the load) to which the free ends of the wires leading from the cell are attached. When the connections are made properly, current flows, the circuit is said to be ‘closed’, and the lamp will light. The current flows from the cell along one wire to the lamp, through the lamp, and along the other wire back to the cell. When the wires are disconnected, the circuit is said to be ‘open’ or ‘broken’. In practice, circuits are opened by such devices as switches, fuses, and circuit breakers. Two general circuit classifications are series and parallel. The elements of a series circuit are connected end to end; the same current flows through its parts one after another. The elements of a parallel circuit are connected so that each component has the same voltage across its terminals; the current flow is divided among its parts. When two circuit elements are connected in series, their effective resistance (impedance if the circuit is being fed alternating current) is equal to the sum of the separate resistances; the current is the same in each component throughout the circuit. When circuit elements are connected in parallel, the total resistance is less than that of the element having the least resistance, and the total current is equal to the sum of the currents in the individual branches. A battery-powered circuit is an example of a direct-current circuit; the voltages and currents are constant in magnitude and do not vary with time. In alternating-current circuits, the voltage and current periodically reverse direction with time. A standard electrical outlet supplies alternating current. Lighting circuits and electrical machinery use alternating current circuits. Many other devices, including computers, stereo systems, and television sets, must first convert the alternating current to direct current. That is done by a special internal circuit usually called a Power Supply. A digital circuit is a special kind of electronic circuit used in computers and many other devices. Magnetic circuits are analogous to electric circuits, where magnetic materials are regarded as conductors of magnetic flux. Magnetic circuits can be part of an electric circuit; a transformer is an example. Equivalent circuits are used in circuit analysis as a modeling tool; a simple circuit made up of a resistor, and an inductor might be used to electrically represent a loudspeaker. Electrical circuits can also be used in other fields of studies. In the study of heat flow, for example, a resistor is used to represent thermal insulation. Operating electric circuits can be used for general problem solving (as in an analog computer). Circuit is a conductor or a system of conductors through which electric current flows. / Проводник или система проводников, через которые проходит электричество. Под Электрической Цепью понимается совокупность различных

устройств и соединяющих их проводников или элементов электропроводящей среды, по которым может протекать электрический ток. Под Электрической Схемой понимается схема электро- или радиотехнического устройства, сети. Она отображает их структуру и межэлементные электрические связи.

CIRCUIT BREAKER = АВТОМАТИЧЕСКИЙ ВЫКЛЮЧАТЕЛЬ НАГРУЗКИ (или СЕТЕВОЙ РАЗЪЕДИНИТЕЛЬ) – Circuit Breaker is an electric device that, like a fuse, interrupts an electric current in a circuit when the current becomes too high. The advantage of a circuit breaker is that it can be reset after it has been tripped; a fuse must be replaced after it has been used. In reference to electricity, Circuit Breaker is a device designed to open a circuit either by manual action or by automatic action when current exceeds a value longer than permitted. A circuit breaker can provide overcurrent protection. / По отношению к электричеству, устройство, разработанное для размыкания цепи вручную или автоматически, когда сила тока превышает определённое значение дольше, чем разрешено.

CIRCUIT BREAKER = СЕТЕВОЙ ВЫКЛЮЧАТЕЛЬ (или СЕТЕВОЙ РАЗЪЕДИНИТЕЛЬ) – Circuit Breaker:- though its specifics depend on statutory provisions prescribing it in the particular State, a 'Circuit Breaker' generally is a law that activates, for qualifying property owners (or renters), a State financed credit or rebate of specified amounts of property taxes incurred (or rent equivalents) whenever such taxes (or rent equivalents) exceed specified amounts of household income. Circuit Breakers are mechanisms used by management to control activity in capacity-constrained systems. The term Circuit Breaker originates in electrical engineering to describe a pre-set switch that shuts down electrical activity in excess of a system's design capacity. The activation level of the breaker reflects an ex ante decision on the capability of the system. Circuit breaker activation is inherently costly. The system engineer designing a circuit breaker makes an ex ante choice between temporary loss of the use of the system and reductions in the likelihood of permanent damage to system integrity. Activation of a circuit breaker intentionally imposes costs that are expected to be less than losses realized by exceeding the system's capacity. Cost considerations naturally focus on the value the intended users can expect to obtain through their use of the system. Activation of circuit breakers can also have unintentional costs. These have two sources. First, activation of circuit breakers can lead to unanticipated convenience losses. For example, system engineers may undervalue some activities lost when a circuit breaker is activated. Therefore, system users with a financial stake in its operation have incentives to increase system capacity by allowing increases in the activation levels of circuit breakers. It is these incentives that produce pressure to re-allocate financial resources toward increased investment in the system. Thus, when private interests are involved, the ability to re-allocate resources insures that unanticipated convenience losses will be infrequent and temporary. Second, costs are also incurred when unplanned uses of the system are disrupted. System engineers focusing on anticipated uses will not incorporate the value of unanticipated uses into their circuit-breaker decisions. These value losses are recognized only when service interruption motivates increased investment by such users. When value losses fail to attract investment, system engineers are not motivated to include these losses in the circuitbreaker decision. I (James T. Moser is a senior economist at the Federal Reserve Bank of Chicago) refer to these interests as public, to distinguish them from private interests that do lead to increased investment in the system. In financial markets, the intended effect of circuit breakers is to halt trading when activity levels threaten market viability. Earlier circuit breaker policy was determined within the affected market by parties having private rather than public interests in the activation of circuit breakers. Exchanges, responding to these interests, developed three separate circuit breaker mechanisms. Order-imbalance circuit breakers are intended to protect the interests of market makers in specialist markets. Volume-induced circuit breakers are intended to protect the viability of back-office operations. Price-change circuit breakers are intended to bring excessive volatility under control. Recent developments in financial markets have elevated the importance of public interests. Markets are increasingly characterized as inter-related. This inter-relatedness increases the importance of price information flowing between markets. This is particularly true between the stock markets and the markets for financial derivatives – options and futures. Futures exchanges have developed standardized contracts for a variety of financial assets. Value changes in these contracts are closely linked to developments in their related asset markets. Thus, asset prices serve the public purpose of determining gains and losses in futures contracts. Futures exchanges and their customers have benefitted from the price information generated by asset markets. Activation of circuit breakers interrupts this information flow, decreasing the public value of the services rendered by asset markets. Futures markets offer a distinct set of services including opportunities to manage risks and additional routes to price discovery. Circuit breakers activated in these markets similarly disrupt these services, lessening their value. The stock-index futures contract illustrates this. Prices for these futures contracts are for hypothetical baskets of stocks. Thus, a single quote determines the price of the futures basket, whereas in the asset market cash prices must be aggregated to produce a cash index. In addition, daily settlement in the futures market is in cash, greatly simplifying order processing. The simplicity of stock-index futures contracts produces an ideal instrument for institutions to manage systematic risk levels through simultaneous trading in asset markets and futures. Circuit breakers disrupt the normal synchronization of price changes between futures contracts and asset prices. This disruption amplifies the risk that gains realizable in one market may be unavailable to offset losses in the other market. The current proliferation of derivativeasset markets with differing capacity constraints, combined with intensive intermarket trading, raises coordination issues that were less crucial in the past. Circuit breakers activated in one market now can affect several markets, not only the market in which they were activated. Thus, circuit breakers in financial markets can influence public interests. These public costs are realized in two ways. First, circuit breaker interruption of private markets serves to shift trading into markets that remain open. Such interruptions initiate a chain of events that ultimately generates demand for a lender of last-resort to supply liquidity to the financial system. Second, pricechange circuit breakers shift credit risk to gaining positions that implicitly extend credit to loss positions. Their creditworthiness may decrease the quality of exchange guarantees of performance. The next section describes the three types of circuit breakers. Then, I examine the history of circuit breaker activity. An analysis of the unintended result of price limits on liquidity demands and the quality of nonperformance guarantees follows. Classification Of Circuit Breakers:- circuit breakers are of three types. Each addresses a different design-capability issue. The first, the order-imbalance circuit breaker, occurs in specialist markets. Inequalities in the number of buy and sell orders are balanced by specialists trading for their own accounts. These trades maintain orderly markets by smoothing short-run order imbalances. Substantial order imbalances increase the risk born by specialists. This, in turn, jeopardizes orderly markets. The second type, volumeinduced, occurs when order processing becomes uneconomic. At low volume, order processing does not meet costs. High volume impedes the ability of the exchange to effectively process orders. Markets close when either volume effect pushes trading costs to uneconomic levels. The third type, the pricetriggered circuit breaker, closes markets when a given price level is reached. This last type originated in the futures markets. Such circuit breakers are called 'Price Limits'. Justifications of price limits are couched in terms of controlling 'excessive' volatility. Order-Imbalance Circuit Breakers:- stock markets activate order-imbalance circuit breakers at the request of a specialist. The specialist asks for a suspension of trade in an individual stock when an order imbalance occurs. In these cases, suspension gives the specialist time to determine a market-clearing price based upon information obtained off the exchange floor. Following the price determination period, the market re-opens with the specialist taking a position at the newly determined price. The purpose of this circuit breaker is to protect the specialist from large losses. Order imbalances were a problem in both the 1987 and 1989 breaks. In 1987, selling pressure at the October 19 opening prevented trading in 140 of the NYSE-listed stocks in the S&P 500 during the first half hour. In 1989, openings on October 16, 1989 were similarly delayed. (Most stocks were reported not opened during the first fifteen minutes of trading. Beginning

08:45 CT, stocks began opening and trading was reported at 09:15.) In both cases, the intended effect of the order-imbalance circuit breakers was to protect specialists from losses incurred by purchases in declining markets. Activation of these circuit breakers have unintentional effects. Trading halts in individual stocks create uncertainty about the correct level of the aggregate indexes. This, in turn, tends to be reflected in the futures contract. As a result, the futures contract becomes more likely to encounter a price limit. (On October 16, 1989, it did hit the open limit-5 points down.) When a price limit is reached futures trading stops, shifting some trades to the stock exchange. These trades tend to aggravate any existing order-imbalance problems. Volume-Induced Circuit Breakers:- the cost-effectiveness of order processing depends on the level of trading volume. At low trading levels, breakeven costs are not met. The determination of exchange trading hours recognizes that the fixed costs of operations must be covered by revenues generated from trading activities. Exchanges schedule closings based on expectations that additions to these fixed costs will not be adequately compensated. Thus, daily closes can be construed as activation of a circuit breaker. Trading volume can surpass the ability of exchange back offices to process the paperwork required to document executed trades. When this happens, the effectiveness of order processing is reduced, producing additional costs as the need for correcting orders rises. These costs are expected to rise with trading volume. With these additional costs, exchange operations can become uneconomic and the exchange closes. In 1968, the stock exchanges instituted a temporary four-day week during the last half of the year, closing on Wednesdays to increase the time available to process paperwork. Heavy volume in the period prior to the fourday week had led to increases in errors executing orders. These midweek closings insured that each five-trading-day delivery period included at least one nontrading day, allowing the back offices to catch up. More recently, heavy volume appears to have complicated the order-matching activity of the specialists. Stock trading volume during the 1987 price break surpassed the ability of specialists to match orders. As a result, executions were not timely and the ticker lagged current trades. Changes instituted after 1987 substantially increased the capacity of the exchange to process orders to an estimated one billion shares daily. However, the trading suspensions that resulted from the volume on October 13, 1989, suggest a lower capacity. At the rate of trading in the last hour of October 13, daily volume would have been just over 703 million shares. Volume on October 16, 1989, the heaviest day of trading since October 1987, was 416 million shares. After processing the overhang from the previous Friday (most stocks were trading by 10:15), stock trading proceeded smoothly all day. Price-Limit Circuit Breakers:- in futures markets, price limits restrict trading to a band of prices generally symmetrical above and below the previous trading day's settlement price. (A notable exception to price-limit symmetry is found in the stock-index contracts. These are discussed in the next section.) The stated goals of circuit breaker policies have historically been to control volatility. More recently, price limits on stock index contracts have been set to coordinate price movements in the cash and futures markets. Price limits serve as market-closing rules because:- (1) short trades (sales of futures contracts) are not offered on up-limit days – the market clearing price is higher; and (2) long trades (buying futures contracts) are not offered on down-limit days – the market clearing price is lower. Historically, the rules committees of the futures exchanges incorporated price limits into trading rules in response to threatened regulatory intervention. That pattern suggests that price-triggered circuit breakers would not exist without potential regulatory intervention. Past Circuit Breaker Experience:- this history of the price-limit form of circuit breaker demonstrates that price limits appear to resolve 'political' volatility. (This term is from Joseph A. Grundfest, Commissioner of the Securities and Exchange Commission.) The imposition of price limits, an apparent impediment to the price discovery purpose of futures exchanges, coincides with threats to the independence of the exchanges. Rather than face increased regulatory oversight and lose their ability to resolve disputes internally, the exchanges accommodated pressures for regulation by self-imposing price limits. Early History Of Price Limits:- the earliest occurrence of a price limit in futures trading was at the Dojima exchange in Japan during the early XVIII century. Settlement in the Koku 'Small Futures' contract for Rice was determined by the average of the previous three days' forward-closing prices. If this price deviated by more than a fixed amount from the cash price for Rice, all contracts were either reversed out or delivered. This effectively discontinued trading in the contract by eliminating all futures positions. Also, the futures price was tied to the cash market, avoiding the potential criticism that futures trading caused problems in cash markets. Imposition of the rule came during a time when rice markets were described as 'deteriorating'. Deteriorating markets are often characterized by price volatility. The first instance of a price limit rule in the United States came during the First World War. On February 01, 1917, Germany announced that its submarines would sink all ships found in the major Atlantic shipping lanes. Cotton prices for May delivery on the New York Cotton Exchange closed down by a record of over five cents a pound. By the following Monday, however, the market had recovered to within one and one-half cents of the earlier price. In subsequent weeks, futures prices continued to be extremely volatile. The threat of attacks on shipping continued to run down prices as traders feared lost access to the European markets. Cotton prices rose as markets responded to news of potentially large purchases of cotton for military uniforms. Congress responded by supplying flat-rate three percent war loss insurance – a substantial discount from the then-current Lloyd's of London quote of ten percent. Cotton prices reached an all-time high following the introduction of this subsidized insurance. The futures exchanges trading cotton responded to this volatility in two ways. On June 20, 1917, the British Board of Trade closed down cotton futures trading and the New York Cotton Exchange increased margin requirements. Separately, the US Government requested a price limit on the cotton contract. On August 22, 1917, a three-cent price limit was imposed. This limit remained in effect for the duration of the war. Interestingly, there is no record of a limit day during this period. Also during the First World War, the Food Administration froze prices on wheat to prevent profiteering in that commodity. This action closed down trading in wheat futures at the Chicago Board of Trade. However, other grain prices were not frozen and their corresponding futures contracts traded freely. Since these grains are partially substitutable for Wheat, government policy regarding Wheat induced volatility in other grains. Futures prices for these commodities reflected this volatility, attracting the attention of the Food Administration. As a result of this scrutiny, the Board of Trade instituted a two-cent per day price limit on the oat contract and the New York Mercantile Exchange introduced a three-cent per day price limit on soy bean oil contracts. These price limits were removed once trading in wheat futures resumed after the war. Price limits were formalized in 1925 at the Chicago Board of Trade. The 1925 Annual Report reported a modification to all contracts allowing the Board of Directors to set price-change limits of five percent of the preceding day's average closing price, following a ten-hour notice period. (For comparison, a five percent limit on Wheat in today's Wheat contract comes to 18.9 cents per bushel. The present limit is twenty cents per bushel.) Determination of an emergency was left to the Board. Nevertheless, price limits retained their temporary character, to be used only in emergency situations. Direct federal intervention in agricultural markets during peace time began in the early 1930s under the authority of the Agricultural Adjustment Act. The Federal Farm Board, attempting to maintain prices in spite of large supplies of wheat, opened long futures contracts in May 1931 and 1932 wheat. Uncertainty about government policy (including complaints that officials were manipulating prices in their own interests) increased the frequency of emergency use of price limits. (A recent proposal by Robert Heller makes similar use of futures markets. He argues the current policy of supplying liquidity during a market break disrupts monetary policy. Instead he suggests the Fed supply liquidity directly by taking long futures positions. His use of futures contracts is reasoned from the same basis as the Federal Farm Board policy of six decades ago – both approaches avoid the problem of the federal government holding and disposing of assets. The experience of the 1930s suggests that careful consideration should be given to the problem of contract expiration.) (The Heller proposal is in Heller, R., 'Have the Fed Support Stock Market, Too', Wall Street Journal, October 27, 1989, p. A14. An analysis of the 1930s experience is in Moser, James T., 'Public Policy Intervention Through Futures Market Operations', forthcoming in the Journal of Futures Markets.) Passage of the National Industrial Recovery Act in July 1933 opened the way for trade associations to enforce price stabilization agreements, with the federal government acting both

as architect and enforcing partner. Application for these partnerships was made through the National Recovery Administration (NRA) with the agreements chartered through Executive Orders by President Franklin Roosevelt. The agreements came in the form of codes for fair competition. Grain price volatility continued to be high after the Farm Board ceased its price manipulations. The drought of the period and uncertainty about government policy were contributing factors. This high volatility led to Department of Agriculture pressure in July 1933 for a fair-trade agreement among the grain exchanges. Pressure on the exchanges to comply came in the form of a proposal by the Agricultural Adjustment Administration and the Grain Futures Administration that would have empowered the Secretary of Agriculture to modify and enforce trading rules at the futures exchanges. The proposed authority included limits on individual trading, limits on daily price changes, and margin setting. The futures exchanges complied with the request and Executive Order No. 6648, entitled 'Code of Fair Competition for Grain Exchanges and Members Thereof', was signed by President Roosevelt on March 20, 1934. The agreement, implemented the next day, included price limits which could not be exceeded, but did permit exchanges to set limits below the prescribed maximums. The Supreme Court ruling in the Schechter Poultry Corporation case on May 27, 1935, declared the NRA codes unconstitutional. Following the Schechter decision, Congressional hearings began on the Commodity Exchange Act to broaden the scope of federal regulatory powers over the futures exchanges. These powers had previously been lodged within the Grain Futures Administration. Congressional discussion indicated the proposed Act would institutionalize the defunct NRA codes. To thwart increased regulation, the Chicago Board of Trade incorporated permanent price limits on all its contracts. (At the same time, the Board of Trade also eliminated trading of options on futures, then called 'Priviledges [sic]'. These were also targeted in Congressional hearings.) The action began the use of price limits as a standard contract feature. The Commodity Exchange Act later passed specifying only regulatory review, rather than expanded powers, over contract details – including price limits. Circuit Breakers In The 1980s:- in 1982, futures contracts on stock indexes were introduced. The initial contracts, keeping with standard practice, were introduced with price limits. However, for the first time since the 1930s, these limits were dropped on objections from New York stock trading interests. In late 1984, price limits were dropped on all International Monetary Market contracts for foreign exchange. The movement away from price limits continued until the market break of October 1987, when price limits were instituted on the S&P 500 contract. Three of the six commissions studying issues of the market break recommended significant regulatory changes. With regard to price limits the recommendations differ substantially. The Brady Commission recommended coordinated trading halts. While no specific method was proposed, the Commission indicated that price limits should be considered among the possible mechanisms. The NYSE 'Katzenbach' study group said that price limits will not resolve market break issues. Their proposals focused on increasing the cost of trading to prevent speculation. They specifically proposed requiring delivery of stocks on stock-index futures contracts – increasing the cost of trading futures. The SEC study recommended against price limits on stock-index contracts. The SEC proposal suggested optional delivery of stock on index contracts, again increasing the cost of trading futures. After the 1987 break, price limits were imposed on stock-index futures. The stated reason for these limits was to synchronize futures and cash prices. In 1988, the S&P 500 contract traded with a level-determined price limit. At levels below 275, the limit was 15 index points (USD7 500 per contract); between 275.05 and 325, the limit was 20 index points (USD10 000 per contract); and, above 325, the limit was 25 index points (USD12 500 per contract). Initial margins on these contracts were USD15 000, twice the pre-break amount. In addition, a five-point limit was established at market opening. On reaching an opening limit, trading is suspended for two minutes and reopened at a new opening level. The opening limit rule holds only for the first ten minutes of trading. The 1987 market break also led to introduction of price-triggered circuit breakers on the New York Stock Exchange. After a fall of 25 points in the Dow Jones Industrial Average (DJIA), the Sidecar program re-prioritized orders, giving priority to small (less that one million Dollars) orders. After a decline of 250 points in the DJIA, the stock market would be closed for one hour. After a 400-point decline in the DJIA, the stock market would be closed for two hours. In addition, the DOT (Designated Order Turnaround) program would be shut down after a 50-point decline in the DJIA. The Mini-Crash Of October 1989:- recalling that the intent of these circuit breakers is to synchronize cash and futures markets, the events of October 13, 1989, provide a gauge for the usefulness of circuit breaker mechanisms. The evidence suggests that price limits did not synchronize these markets and may have routed dynamic-hedge trades into the stock market. At 01:43 (CDT) negotiators announced the failure of financing for the proposed UAL buyout. The announcement sent the stock and index-futures markets into a steep decline. At 02:00 the DJIA was down 55 points. This corresponds to a 7.3 point drop in the S&P. Seven minutes later, the S&P futures contract hit its limit-12 points down. With futures trading suspended, the DJIA at 02:30 was down 114.76 points or roughly 15.3 S&P points. At 02:30, the futures contract reopened, but closed again fifteen minutes later – down 30 points. At the close of trading (03:00), the DJIA was down 190 points, or 25.3 S&P points. Quotes from the stock market clearly lagged behind those from the futures market. The circuit breakers do not appear to have kept prices in line. Trading volume was affected by the circuit breakers. Figure 1 shows NYSE volume for half-hour intervals for 10/13/1989 and 10/16/1989. Volume at 01:30 on 10/13 was 125.52 million shares for the day, or 12.55 million shares per half-hour interval. The market response to the UAL announcement in the 01:30–02:00 interval increased volume to 17.48 million shares, or 39 percent above the average prior to 01:30 but still less than two of the previous half-hour intervals. At 02:07 CDT futures trading was suspended for the remainder of the half-hour period. Minutes later Chicago Board Options Exchange (CBOE®) closed without re-opening. Volume during that period was 45.86 million shares, 265 percent above the average and more than twice the busiest previous period. During the last half-hour of trading, volume was 396 percent above the average – nearly four times the busiest period before 01:30. This trading might be explained as a response to new information and, therefore, independent of the incidence of circuit breakers but evidence in the Index futures pit suggests more was involved. After limits were hit in the S&P 500 pit for the second time, a limited number of sell orders were executed at the limit price despite the disadvantageous price obtained there. Further, at the official 03:15 close of index trading, 2 000 sell orders worth USD330 million were said to be outstanding. The pattern of selling in the Index pit indicates that traders were searching for reliable executions. The closest available substitute to selling stock-index futures is the sale of stock holdings. Thus, the substantial increase in stock volume can be related to the incidence of the CME circuit breaker. The consequence of the volume increase may have been an increased difficulty in keeping up with the flow of orders. Heavy selling after 01:30 CDT produced suspensions in ten stocks with seven not re-opening. This suggests that stock markets were unable to handle the increased volume. Finally, the evidence from the 1989 price break reveals three weaknesses. First, volume increases after price limits were encountered suggest these circuit breakers routed trades from the futures markets to the stock markets. This is a serious concern. There is good evidence from the 1987 break that order imbalances are positively correlated with price changes. Policies tending to exacerbate the order-imbalance problem are likely to increase price volatility during price swings encountered in the future. Second, both the price lags reflected in the DJIA and the suspensions in stock trading indicate that the circuit breakers did not keep prices in line. Third, taking the USD330 million overhang in the futures market to be intended to cover stock positions of institutional traders, at least one-third of a billion Dollars went unhedged. New Circuit Breakers In Place:- after the 1989 market break, price limits were revised. The following describes current limit procedures for the S&P contract. The five-point opening limit is retained. After the opening interval and at all levels of the index, current levels are:- On a 12-point drop in the index prior to 02:30 pm (Central Time), trading is suspended for thirty minutes; on a 20-point drop in the index prior to 01:30 pm, trading is suspended for one hour; on a 30-point change (up or down), trading is suspended until 50 percent of S&P stocks (by capitalized value) are open for trading. The NYSE also revised its circuit breakers to restrain program trading. After a 30-point drop in the DJIA, incoming orders are routed into the Sidecar for fifteen minutes. After a 75-point drop trading orders are Sidecard for thirty minutes. In addition,

the CME rejects incoming S&P 500 contract orders after a 12-point drop in the S&P. The emphasis on drops clarifies the purpose of recent price-linked, circuit-breaker policies. They do not resolve cash flow problems for the futures exchanges – else limits would be imposed on the upside as well. Nor do they control volatility – for the same reason. They do shield the futures exchanges from the criticism that futures trading pulls down stock prices. Circuit Breakers And The Market For Liquidity:- liquidity is the relative ease of matching buy and sell orders at recently observed prices. Sellers can always obtain liquidity by lowering offers to sell. The difference between the price they obtain and the previously observed prices they expected can be construed as the cost of liquidity. Buyers recognize that for some assets these costs may be high. Thus, their offers to buy incorporate the risk of encountering a high liquidity cost on the eventual sale of the asset. Buyers respond by adjusting bids downward. Markets respond by organizing to keep liquidity costs low. They accomplish this through efficient matching of buy and sell orders backed up by methods to handle any order imbalances that may arise. The Market-Making Activity:- market making refers to the activity of matching buy and sell orders. In specialist markets such as the stock exchanges, orders to buy or sell arrive at a central post, are matched up by a specialist, and are posted as transactions. The specialist's order book is unbalanced when the number of buy and sell orders at the most recent price are unequal. When these order imbalances occur, exchange rules require the specialist to trade for his own position – buying in a declining market or selling in a rising market. Since these trades are aimed at re-balancing the order book, they may be loss trades for the specialist; that is, buying above the correct market price in a declining market or selling below in a rising market. These trades produce a balance of buy and sell orders and fulfill the specialist's responsibility of maintaining an orderly market. To facilitate this role, dealers have exchange-required capitalization and minimum inventories for their stock listings. Under an interest-rate targeting policy, the Fed acts as a marketmaker in markets directly linked to reserve assets. Reserve policy effects credit levels so that a stable monetary policy depends on a stable market for reserves. To maintain this stability, the Fed acts as a specialist in reserves – both buying and selling to prevent order imbalances. Links Between Financial Markets:- The Federal Reserve is affected by circuit breakers because markets for stocks, bonds, and futures contracts are fundamentally linked through the payments system and the market for reserves. To see this, consider the problem faced by the specialist after a steep decline in stock prices. In the process of buying stock to maintain an orderly market, losses have been encountered. In addition, inventories of stock, generally purchased on margin, have been marked down and require additional financing. Summing the financing needs of many specialists after declines of the magnitude experienced during the breaks of 1987 and 1989, one will generally observe a large increase in the demand for loanable funds. Institutions supplying funds to specialists respond by selling short-term Treasury securities to meet reserve requirements. Thus, the demand shock in the loanable funds market tends to destabilize markets for Treasury securities – orders to sell Treasury securities exceed buy orders. Shocks to the loanable funds market are also felt as the margin accounts of mark-tomarket assets are adjusted. Dynamic hedge trades in a declining market increase demand for Treasury securities placed in the initial margin accounts of long and short futures positions. Long and short positions marked to market add further shocks as losing positions sell Treasuries to generate funds required to cover calls for variation margin and winning positions invest cash balances in Treasuries. Over a period of time these shocks will net out. Nevertheless, lack of synchronicity induces short-term swings in the supply of liquidity. Combining with these separate effects, stock-market specialists encountering losses from their market-making activities are seeking funds in a market subjected to volatile levels of liquidity. In its capacity as reserve specialist, the Federal Reserve supports liquidity by maintaining a balance between buy and sell orders for reserves and Treasury securities. This activity prevents short-run order imbalances from wringing liquidity from the system. The credit-demand shock from specialists' needs for funds are supported as the Fed adds reserves to the system. Importantly, Fed policy must first distinguish between the real and monetary components of these shocks in the market for reserves. Facilitating the liquidity demands of a financial shock need not have real effects. Liquidity can be increased through purchases of Treasuries. Once the short-term credit needs of the payments system subside, reserve levels can then be reduced. These financial shocks can be identified by sharp market declines accompanied by volume and orderbalancing problems. The timing of this credit accommodation requires consideration. Circuit breakers interfere with trades needed to generate liquidity. The appropriate time for the Fed to begin the supply of liquidity is at the point when trading halts create an imbalance of buy and sell orders for reserves and Treasury securities. Policy considerations for mixed realmonetary shocks differ. In these events, the Fed must consider both the need for credit accommodation through its order-matching activity and its monetary policy which is implemented through reserve-level choices. For example, liquidity operations after the 1987 break produced significant decreases in shortterm rates. Reserves were left in the system after October 1987, giving permanence to the October liquidity operations. The 1989 break was followed by reports that the Fed would supply liquidity as in 1987. These reports were later disavowed. However, open market operations on October 16, 1989, did effect a modest temporary increase in the reserve base. In terms of the effect on credit markets, the expectation of increased credit availability is key. Interest rates fell on October 16, evidencing market anticipation of increased purchases of Treasuries. Interest rates rose shortly afterwards as the Fed's response and its disclaimers became known. Identification of a real component to a shock suggests consideration of a less temporary adjustment to the reserve level. Accommodation of temporary liquidity needs facilitates the allocation of capital. Failure to accommodate liquidity tends to hinder the reallocation of capital, delaying recovery from the real shock. Once temporary liquidity needs are met, reserve policy should then focus on real, relatively permanent aspects. Effect Of Circuit Breakers:- circuit breakers alter the effect of a market move on credit markets by altering cash flows. Trading halts have three effects on the flow of funds. First, amounts marked to market based on prices recorded when trading was halted do not reflect market values – short positions record less gain in a price decline, long positions record less loss. Provided trading halts are synchronized across markets, amounts marked to market for related securities are similar causing no excess demand for loanable funds. Unsynchronized trading halts, on the other hand, tend to produce asymmetry in that losses and gains on related assets are unequal. The liquidity needs produced by losses incurred in one market cannot be covered by recognition of gains in related markets. Thus, nonsynchronized trading halts increase the demand for loanable funds and shift liquidity trades into those markets which remain open. This places greater stress on these markets. Consider, for example, a specialist hedging his equity position with a short futures position in an index contract. A trading halt in the index futures contract can result in equity losses exceeding gains on futures. In an unrestricted market, the futures position, in this example, would generate needed cash to cover the financing needs of the stock position. A halt in futures trading reduces the flow of funds to the specialist, increasing dependence on borrowed funds. Inventory financing needs that cannot be met with gains from the futures contract must be covered by increased borrowing. Second, positions not marked to market are affected like marked-to-market accounts. The difference is one of form, not result. Gains and losses on stocks or options are realized by unwinding the position. Circuit breakers halt trading and prevent unwinding of contracts. This restricts access to invested balances required to cover losses, realized elsewhere, increasing the demand for credit. For example, traders holding UAL on 10/13 attempted to sell out after the 1:43 announcement. The halt in trading of that stock initiated a search for close substitutes for UAL stock. The nearest substitutes were other takeover stocks and transportations, particularly airlines. Order books for these stocks quickly became unbalanced. Three Big Board stocks halted trading temporarily: USAir Group, Delta Air Lines, and Philips Industries. Seven Big Board stocks halted and remained closed for the day:- UAL, AMR, BankAmerica, Walt Disney, Capital Cities/ABC, Philip Morris, and Pacific Telesis. Sales again shifted; first to index futures, then to a broad range of stocks after the 15-point limit halted futures trading. These first two effects of price limits derive from restrictions on investor access to liquidity. During market breaks when liquidity is most valuable, circuit breakers reduce the number of routes available for private resolution of liquidity needs. This tends to increase demand

for a source of last resort to supply liquidity – a role many expect to be taken up by the Fed. A third effect derives from responses to price uncertainty as clearinghouses re-consider prudential margin levels. The trade halt produced by a circuit breaker creates uncertainty about the market's actual volatility. Since margin levels are determined in response to estimates of price volatility, risk-averse clearinghouses are forced to estimate margin needs on a worst-case basis. This will tend to increase the margin levels required by prudent clearinghouses. Recognizing that further losses to customer accounts may be substantial, initial and variation margin levels are increased to prevent losses from spilling over from customer accounts into clearing-member accounts. This effect tends to decrease the supply of loanable funds by increasing use of Treasury securities to meet margin obligations. Credit Risk Due To Loss Financing:- the previous comments on circuit breakers emphasize problems induced by disruption to the flow of funds. Circuit breakers can also be viewed as shifting credit risk. Failure to record the full loss amount in a marked-to-market account implicitly extends an interest-free loan for a portion of the loss amount to the losing position. The amount of this loan is the difference between the amount marked to the settlement price and the amount marked to the true market price. The loan is extended to losing positions from gaining positions. The amount of credit extended by these loans can be considerable. To illustrate, I will use the October 1989 market break. Taking the true futures price to be roughly the 10/16/89 opening, the true settlement price for the 117, 202 December contracts outstanding should have been 323.85. The difference between the actual settlement of 328.85 and the estimate of the true settlement is 5 S&P points. The amount of credit implicitly extended to short positions over the weekend of 10/14–10/15 was, therefore, USD58.6 million or 3.3 percent of the value marked to market on 10/13. (The 10/16 open price is probably too high. Opening contract prices on that date encountered the CME open limit of five points, preventing realization of a lower price on the S&P contract. Thus, our estimate may significantly underestimate the amount of credit extended.) To gauge the risk to the financial system, we need to recall that futures clearinghouses provide performance guarantees for contracts trading on their affiliated exchanges. The quality of these guarantees depends on the amount of potential loss relative to equity. As potential losses increase relative to a fixed level of equity, the possibility of default rises, diminishing the quality of any guarantees. Book equity balances for the CME at the end of 1988 were USD79.3 million. The USD58.6 million implicitly lent to short positions is 73.9 percent of book equity. The full implication for contract performance guarantees is not known. Threats to these guarantees will tend to shift trading away from the futures markets as the perceived quality of the guarantees declines. This tends to increase the credit needs of specialists operating in stock markets, requiring increases in reserves to meet these demands. Thus, the significance of the credit balance implied by price limits bears investigation. The policy issue is the viability of contract performance guarantees provided by the futures exchanges. Conclusion:- this article examines the effects of circuit breakers on the stability of the financial markets. Circuit breakers are classified into three types based on capacity issues:- volume-triggered circuit breakers halt trading when volume exceeds order-processing capacity; orderimbalance circuit breakers halt trading when orders to buy or sell threaten the viability of the specialist; and price-limit circuit breakers halt trading when price changes are regarded as excessive. The history of price limits suggests they are introduced when futures exchanges are threatened with greater regulatory oversight. This paper argues that circuit breakers reduce access to markets. This reduces the ability of markets to resolve needs for liquidity. Second, price limits extend credit to loss positions in futures and options markets. Since clearinghouses guarantee contract performance, these guarantees may be threatened by large credit balances. On several recent occasions, circuit breakers have proved of some value in market crises. But it must be remembered that their value is not costless, nor their benefits without limit. A term Circuit Breaker refers to any of the measures used by stock exchanges during large sell-offs to avert panic selling. Sometimes called a Collar. After an index has fallen a certain percentage, the exchange might activate trading halts or restrictions on program trading. For example, if the Dow Jones Industrial Average falls by 10%, the NYSE® might halt market trading for one hour. There are other circuit breakers for 20% and 30% falls. In response to the market breaks in October 1987 and October 1989 the New York Stock Exchange instituted circuit breakers to reduce volatility and promote investor confidence. By implementing a pause in trading, investors are given time to assimilate incoming information and the ability to make informed choices during periods of high market volatility. Effective April 15, 1998 the SEC approved amendments to Rule 80B (Trading Halts Due to Extraordinary Market Volatility) which revised the halt provisions and the circuit-breaker levels. The trigger levels for a market-wide trading halt were set at 10%, 20% and 30% of the DJIA, calculated at the beginning of each calendar quarter, using the average closing value of the DJIA for the prior month, thereby establishing specific point values for the quarter. Each trigger value is rounded to the nearest 50 points. The circuit-breaker halt for a 10% decline would be one hour if it occurred before 02 pm, and for 30 minutes if it occurred between 02 and 02:30, but would not halt trading at all after 02:30. The halt for a 20% decline would be two hours if it occurred before 01 pm, and between 01 pm and 02 pm for one hour, and close the market for the rest of the day after 02 pm. If the market declined by 30%, at any time, trading would be halted for the remainder of the day. Under the previous Rule 80B trigger points (in effect since October 19, 1988) for a market-wide trading halt, a decline of 350 points in the DJIA would halt trading for 30 minutes and a drop of 550 points one hour. These circuit-breaker trigger points were hit only once on October 27, 1997, when the DJIA was down 350 at 02:35 pm and 550 at 03:30, shutting the market for the remainder of the day. Circuit Breaker is a system of coordinated trading halts and/or price limits on equity markets and equity derivative markets designed to provide a cooling-off period during large, intraday market declines. The first known use of the term circuit breaker in this context was in the Report of the Presidential Task Force on Market Mechanisms (January 1988), which recommended that circuit breakers be adopted following the market break of October 1987. Also known as Stop Trading. NYSE® Announces Fourth-Quarter 2012 Circuit-Breaker Levels:- New York, September 28, 2012 – The New York Stock Exchange will implement new circuit-breaker collar trigger levels for fourth-quarter 2012 effective Monday, October 01, 2012. Circuit-breaker points represent the thresholds at which trading is halted marketwide for single-day declines in the Dow Jones Industrial Average (DJIA). Circuit-breaker levels are set quarterly as 10, 20 and 30 percent of the DJIA average closing values of the previous month, rounded to the nearest 50 points. In fourth-quarter 2012, the 10-, 20- and 30-percent decline levels, respectively, in the DJIA will be as follows:- (i) Level 1 Halt:- a 1 350-point drop in the DJIA before 02 pm will halt trading for one hour; for 30 minutes if between 02 pm and 02:30 pm; and have no effect if at 02:30 pm or later unless there is a level 2 halt. (ii) Level 2 Halt:- a 2 700-point drop in the DJIA before 01:00 pm will halt trading for two hours; for one hour if between 01:00 pm and 02:00 pm; and for the remainder of the day if at 02:00 pm or later. (iii) Level 3 Halt:- a 4 050-point drop will halt trading for the remainder of the day regardless of when the decline occurs. Background:- circuit-breakers are calculated quarterly. The percentage levels were first implemented in April 1998 and the point levels are adjusted on the first trading day of each quarter. In 2012, those dates are January 03, April 02, July 02 and October 01. Xxxxx. Circuit Breakers (at CME GROUP) are a series of price limits that, when reached, pause a market for a particular period of time for markets to reset. There are two kinds of circuit breakers in CME Group markets:- Traditional Circuit Breakers:- Traditional circuit breakers are a series of price limits above and below a reference price (usually settlement) for certain CME Group products. Once a circuit breaker is triggered, the next level of circuit breaker comes into effect. Products with traditional circuit breakers, like equity markets, are divided into primary contracts and associated contracts. Primary Contracts:- The CME Global Command Center (GCC) designates the lead month for the primary contract. Associated Contracts:- When primary contracts trigger a circuit breaker event, all associated contracts follow the behavior of the primary contract. Associated contracts can also have their own circuit breaker events, but those events do not influence other contracts like primary contracts do. Dynamic Circuit Breakers:- Dynamic circuit breakers (DCBs) are similar to traditional circuit breakers but move with the market throughout the day. Within a specific time interval, DCBs define an upper and lower limit of how far an instrument is allowed to move in a specific time interval, usually an hour. Each product has its own assigned value used to calculate

the circuit breaker level, typically a percentage of its previous settlement price. Dynamic Circuit Breakers (DCB) monitor for significant price movements during a trading session. DCBs define an upper and lower limit of how far an instrument is allowed to move in a configured time interval. Each product has its own assigned percentage used to calculate its DCB variant, which is a percentage value of its previous settlement price. This calculated variant is used through the course of the trading session. Formula:- Previous Days Settle * DCB Percentage Value = DCB Variant (Rounded Down To Nearest Tradable Tick). Upon market open, a rolling 60-minute look-back window calculates the upper and lower limits used by DCBs. The high and low prices within the window plus or minus the variant determine the DCB high bid and low ask limits during the open market state. For example:- DCB Variant:- 1 187.8 * 5% = 59.39; rounded down to nearest tick 59.3; and Prior 60 minute's Highest Bid/Lowest Ask (1 196.0/1 187.0). Lookback Window Lowest Price + DCB Variant = DCB High Trade/Bid Limit; e.g., 1 187.0 + 59.3 = 1 246.3. Lookback Window Highest Price – DCB Variant = DCB Low Trade/Ask Limit; e.g., 1 196.0 – 59.3 = 1 136.7. If triggered in the primary contract market (lead month), all associated contract markets immediately transition into a pre-open state. There is no monitoring period. The GCC designates the lead month for the primary contract. When a DCB is triggered in a primary month, CME Globex will send a Security Status message (35=f) within market data which will show tags 327=2 (Halt Reason – Market Event) and a 326=21 (Security Trading Status – Pre Open). If triggered in a non-primary month, only the triggering contract will reserve. CME Globex will send a Security Status message (35=f) within market data which will show tags 327=2 (Halt Reason – Market Event) and a 326=21 (Security Trading Status – Reserve). FAQ:- What Are Dynamic Circuit Breakers? Dynamic Circuit Breakers monitor for significant price movements during a trading session. DCBs define an upper and lower limit of how far an instrument is allowed to move in a configured time interval. What Is Changing? Some products using traditional Circuit Breakers, which have a static daily fixed value pinned to settlement, are implementing DCBs. The market data Security Definition (tag 35-MsgType=d) message for these products will not publish the price limit values in tag 1049-HighLimitPrice and tag 1048-LowLimitPrice. What Happens If A DCB Is Triggered? If triggered in the primary contract market (lead month), all associated contract markets immediately transition into a two minute pre-open state. There is no monitoring period. The GCC designates the lead month for the primary contract. If triggered in a non-primary month, only the triggering contract will reserve. How Is The DCB Variant Calculated? Each product has its own assigned percentage used to calculate its DCB variant, which is a percentage value of its previous settlement price. This calculated variant is used through the course of the trading session. Formula:- Previous Days Settle * DCB Percentage Value = DCB Variant (Rounded Down To Nearest Tradable Tick). How Are The Upper And Lower Limits Calculated? Upon market open, a rolling look-back window calculates the upper and lower limits used by DCBs. The high and low prices within the window plus or minus the variant determine the DCB high bid and low ask limits during the open market state. What Happens To The Look-Back Window After A DCB Triggers? When trading resumes, the 60-minute look-back window restarts and DCBs begin to calculate accordingly. What Happens To The DCB Look-Back Window If A Velocity Logic (Narrow/Wide) Is Triggered? When trading resumes, the 60-minute look-back window restarts and DCBs begin to calculate accordingly. Where Can I Find The Pertinent Information Of The Levels For DCB, And Velocity Logic Thresholds? You can find Velocity Logic values within the Special Price Fluctuations and Limits guide and the DCB values on the Price Limits page. What Happens If A DCB Triggers On The Close? On the market close, the halt time will reduce to 5 seconds from 2 minutes in the last five minutes of trading. What Happens If DCB Triggers During The Final Settlement Window? In the five minutes preceding daily settlement the halt time will reduce to 5 seconds from 2 minutes. After the settlement window, the reserve will revert to 2 minutes. What Is Disseminated Over Market Data When A DCB Is Triggered? When a DCB is triggered in a primary month, we will send a Security Status message (35=f) within market data which will show tags 327=2 (Halt Reason – Market Event) and a 326=21 (Security Trading Status – Pre Open). When a DCB is triggered in a non-primary month, we will send a Security Status message (35=f) within market data which will show tags 327=2 (Halt Reason – Market Event) and a 326=21 (Security Trading Status – Reserve). How Can I Be Notified Of Product DCB Product Updates? When DCBs are added or changed to products it will be announced in the CME Globex Notice. You can sign up for the CME Globex Notice via our subscription center. See also Price Banding, Price Limits, and Velocity Logic. / СИБО® (СВОЕ®). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Xxxxx (Robert Heller). Xxxxx Корпорэйшэн (Schechter Poultry Corporation). Xxxxx ('Katzenbach'). Дьжеймз Ти. Xxxxx (James T. Moser). Дау Дьжонз (Dow Jones). Президент США Фрэньклын Дэлано Розэвэлт (Franklin Delano Roosevelt; 1882–1945). Система согласованных остановов торговли и/или ценовых лимитов на фондовых рынках и производных от них рынках, разработанная для обеспечения периодов охлаждения пыла биржевых игроков, возникающих при крупных внутрисуточных обвалах рынка. В данном контексте термин предохранитель впервые был использован в Отчёте Президентской Комиссии по Рыночным Механизмам (Январь 1988), которая рекомендовала применение этих предохранителей после обвала рынка в Октябре 1987. Известен также как Останов Торговли (Stop Trading).

CIRCUITOUS PATTERN = СХЕМАТИЧЕСКИЙ УЗОР (или КОЛЬЦЕВОЙ УЗОР) – Circuitous Pattern is a plowing pattern or technique where the operator first moves clockwise around the field, then counterclockwise toward the center. It is commonly used in small rectangular fields.

CIRCULAR KNIT = ТРИКОТАЖНОЕ ПОЛОТНО С КРУГЛОВЯЗАЛЬНЫХ МАШИН – Circular Knit:- weft knit fabric made on a circular needle-bed knitting machine, which produces fabric in tubular form. Common types include single or double knits. Seamless hosiery are also made on a circular knitting machine. Although allowances are made on the machine for knitting the welt and foot. See also Knitting (Circular). Circular-Knit Fabric is a tubular weft-knit fabric made of a circular-knitting machine. / Общие типы включают одинарный или двойной трикотаж. Бесшовные чулочно-носочные изделия (seamless hosiery) также производятся на кругловязальных машинах.

CIRCULAR KNITTING = КРУГЛОВЯЗАЛЬНЫЙ (или ТРИКОТАЖНОЕ ПОЛОТНО С КРУГЛОВЯЗАЛЬНЫХ МАШИН) – Circular Knitting:- the fabric is produced on the knitting machine in the form of a tube, the threads running continuously around the fabric. See also Knitting. Circular Knitting or Knitting In The Round is a form of knitting that creates a seamless tube. Originally, circular knitting was done using a set of four or five double pointed needles. Later a circular needle was invented; the circular needle looks like two standard knitting needles connected by a cable between them. Machines also do circular knitting; these use individual latch-hook needles to make each stitch in a round frame.

CIRCULAR KNITTING MACHINE = КРУГЛОВЯЗАЛЬНАЯ МАШИНА – Circular Knitting Machine is a type of knitting machine which forms a knitted fabric in a cylindrical fashion. Most fabrics formed from circular knitting machines are weft knit structures.

CIRCULATING HEADER SYSTEM = ЦИРКУЛЯЦИОННАЯ СИСТЕМА СБОРНИКА (или КОЛЛЕКТОРА) – Circulating Header System is a lubrication system having isolated lube zones wherein the lube pump runs continuously and circulates oil through the header, a return filter and back to tank during the idle period. When lubrication is required, a normal open solenoid valve in the return loop is actuated, allowing pump pressure to build. The zone valves are then sequentially opened to provide lubricant to the individual zones. Oil dispensed to the friction points is not reused, therefore, the system is a terminating type. / клапан (solenoid valve).

CIRCULATING OIL = ЦИРКУЛИРУЮЩЕЕ МАСЛО – Circulating Oil:- a lubrication system wherein the oil pump runs continuously and circulates oil to the friction points on a continuous basis. The oil is drained back to tank, filtered, cooled as required and reused.

CIRCULATING SYSTEM = ЦИРКУЛИРУЮЩАЯ СИСТЕМА (или ЦИРКУЛЯЦИОННАЯ СИСТЕМА) – Circulating System is a lubricating system in which oil is recirculated from a central sump to the parts requiring lubrication and then returned to the sump.

CIRCULATION BYPASS = ОБХОД ЦИРКУЛЯЦИЕЙ – Circulation Bypass occurs when air in a space does not circulate throughout the entire space, but rather seeks the path of least resistance in parts of the space.

CIRÉ = СИРЕ (или НАВОЩЁНОЕ, или ВОЩЁНОЕ, или ЛОЩЁНОЕ) – Ciré is a fabric with a ciré finish, namely a highly glazed finish usually achieved by applying wax to the fabric. A garment with a ciré finish, namely a highly glazed finish usually achieved by applying wax to the fabric. Ciré:- a brilliant patent leather effect produced by application of wax, heat, and pressure. Ciré is an extremely shiny, glossy surface given to fabrics as part of the finishing process. Ciré fabrics have a much higher shine than glazed fabrics and are usually somewhat slippery. / покрытое воском.

CIRED = CENTRE INTERNATIONAL DE RECHERCHE SUR L'ENVIRONNEMENT ET LE DÉVELOPPEMENT

CIS = CARD–ISSUING SCHEME

CIS = COMMONWEALTH OF INDEPENDENT STATES

CIS = CUSTOMER INFORMATION SYSTEM

CISELE VELVET = СИЗЭЛЬ БАРХАТ (или БАРХАТ С РАЗРЕЗНЫМ И БУЛАВОЧНЫМ ВОРСОМ) – Cisele Velvet is a satin weave fabric. A velvet pattern is woven in. Cisele Velvet is a velvet with a pattern formed by contrast in cut and uncut loops. / Под Сизэль, от Французского слова Cisele, означающее Гравированный или Прореженный или Чеканенный, понимается .

CISG = CONVENTION ON CONTRACTS FOR THE INTERNATIONAL SALE OF GOODS

CIT = COMITÉ INTERNATIONAL DES TRANSPORTS FERROVIAIRES

CIT = COURT OF INTERNATIONAL TRADE

CITES = CONVENTION ON INTERNATIONAL TRADE IN ENDANGERED SPECIES OF WILD FAUNA AND FLORA

CITIZEN OF THE UNITED STATES = ГРАЖДАНИН СОЕДИНЁННЫХ ШТАТОВ – Citizen Of The United States means:- (i) an individual who is a citizen of the United States; (ii) a partnership each of whose partners is an individual who is a citizen of the United States; or (iii) a corporation or association organized under the laws of the United States or a State, the District of Columbia, or a territory or possession of the United States, of which the president and at least two-thirds of the board of directors and other managing officers are citizens of the United States, which is under the actual control of citizens of the United States, and in which at least 75 percent of the voting interest is owned or controlled by persons that are citizens of the United States.

CITRIC ACID = ЛИМОННАЯ КИСЛОТА – Citric Acid is a a solid organic acid; $HOCCOOH(CH_2COOH)_2$ or $C_6H_8O_7$); 2-hydroxy-1,2,3-propanetricarboxilic acid. Citric acid is sometimes used in dyeing as an alternative to other chemicals such as acetic acid. It is convenient to store and handle, but may be more expensive. It is a weak acid but can produce pH in the range of 2 to 3. It can act as a sequestering agent for some metals, so it may be inappropriate for some metal-containing dyes such as premetallized dyes. It is used as a resist in some printing processes with reactive dyes on cellulosic fibers, acting by maintaining a pH that prevents the dye from fixing to the fiber. / Под Лимонной Кислотой $(HOOCCH_2)_2{\cdot}COH–COOH$ понимаются бесцветные кристаллы. $t_{пл}$ = 153 °C. Получают лимонную кислоту из махорки и брожением углеводов (сахар, патока); применяют в фармацевтической и пищевой промышленности. Соли лимонной кислоты (цитраты) используют в медицине для консервирования крови.

CITRIC ACID CRYSTALS = КРИСТАЛЛЫ ЛИМОННОЙ КИСЛОТЫ – Citric Acid Crystals:- substitute for acetic acid 56%. Use 1 teaspoon to replace 1 teaspoon acetic acid 56%. / уксусной кислоты.

CITRINA = ЛИМОННОЕ (или ЛИМОННО–ЖЁЛТОЕ, или СИТРИНА) – Citrina:- yellow. / жёлтое.

CITRUS CERTIFICATION/REGISTRATION PROGRAM = ПРОГРАММА СЕРТИФИКАЦИИ/РЕГИСТРАЦИИ ЦИТРУСОВЫХ – Citrus Certification/Registration Program is an officially approved program for the production of citrus propagative material according to the applicable National Plant Protection Organization (NPPO) standards.

CITRUS PROPAGATIVE MATERIAL = РАЗВОДИМЫЙ ЦИТРУСОВЫЙ МАТЕРИАЛ (или ПОСАДОЧНЫЙ ЦИТРУСОВЫЙ МАТЕРИАЛ) – Citrus Propagative Material is a plant parts (budwood, seeds or cuttings) for sexual or asexual reproduction.

CITY GATE = ГОРОДСКИЕ ВОРОТА (или ГОРОДСКАЯ РАСПРЕДЕЛИТЕЛЬНАЯ СТАНЦИЯ, или ГОРОДСКАЯ ГАЗОРАСПРЕДЕЛИТЕЛЬНАЯ СТАНЦИЯ) – City Gate is a point at which a local distribution company takes delivery of gas; physical interface between transmission and local distribution systems. The point at which the Local Gas Distribution Company takes delivery of natural gas from an interstate pipeline. The point or measuring station at which a gas distribution utility receives natural gas from the pipeline transmission company. City Gate is a point or measuring station at which a distribution gas utility receives gas from a natural gas pipeline company or transmission system. Generally refers to the location at which gas changes ownership or transportation responsibility from a pipeline to a local distribution company or gas utility. Slang in energy industries. The 'City Gate' is the place where a company that sells natural gas receives the natural gas from the pipeline company. The 'city gate price' is the sales price of the natural gas at this point. / из магистрального газопровода. Под Газораспределительной Станцией понимается оборудованная станция для понижения давления газа до уровня, необходимого для его использования. В России по назначению различают:- (i) газораспределительные станции на ответвлении магистрального газопровода (на конечном участке его ответвления к населённому пункту или объекту); (ii) промысловые газораспределительные станции для обработки газа, добытого на промысле (осушки, обеспыливания и так далее), а также для снабжения газом близлежащего к промыслу населённого пункта; (iii) контрольно-распределительные пункты, размещаемые на ответвлениях от магистральных газопроводов к промышленным или сельскохозяйственным объектам, а также для питания кольцевой системы газопроводов вокруг города; (iv) автоматические газораспределительные станции для снабжения газом небольших населённых пунктов, ферм на ответвлениях от магистральных газопроводов; (v) газорегуляторные пункты. Производительность газораспределительной станции достигает 500 000 $м^3$/ч.

CIVIL AIRCRAFT = ГРАЖДАНСКОЕ ВОЗДУШНОЕ СУДНО – Civil Aircraft means an aircraft except a public aircraft.

CIVIL AIRCRAFT OF THE UNITED STATES = ГРАЖДАНСКОЕ ВОЗДУШНОЕ СУДНО СОЕДИНЁННЫХ ШТАТОВ – Civil Aircraft Of The United States means an aircraft registered under chapter 441 of this title.

CK = CHECK

CK = COOK ISLANDS

CKD = COMPLETELY KNOCKED DOWN

CKD CARS = COMPLETELY KNOCKED DOWN CARS

CL = CARLOAD

CL = CHILE

CL = CONTAINERLOAD

CL4 = CONFINEMENT LEVEL 4 (GREENHOUSES AND GROUNDS)

CLADE = ВЕТВЬ – Clade is a group of organisms with common ancestors, therefore sharing similar characteristics. / группа организмов с общими предками, .

CLADISTICS = КЛАДИСТИКА – Cladistics is a method of classification of organisms based on their common ancestry and exploring their relationships within the branching evolutionary family tree or cladogram. / Кладистика – метод классификации организмов, основанный на их общем происхождении и . , от Греческого слова Kládos, означающее Ветвь, понимается .

CLADISTIC ANALYSIS = КЛАДИСТИЧЕСКИЙ АНАЛИЗ – Cladistic Analysis is phylogenetic analysis of taxa.

CLADOGRAM = КЛАДОГРАММА – Cladogram is a graphical representations of the evolutionary divergence of species or related groups of species (clades) from common ancestors. / , от Греческого слова Kládos, означающее Ветвь, понимается .

CLADOPHYLL = КЛАДОФИЛЛ (или КЛАДОДИЙ) – Cladophyll or Cladode is a leaf-like flattened photosynthetic stem or branch that resembles and functions as a leaf. Typical of epiphytic cacti, e.g., Epiphyllum, Zygocactus. / Под Кладофиллом, от Греческих слов Kládos, означающее Ветвь, и Phýllon, означающее Лист, или Кладодием, от Греческого слова Kládos, означающее Ветвь, понимается уплощённый листовидный стебель растений, выполняющий функции листа. Характерен для растений засушливых областей. Приспособление к уменьшению испарения, например, у Кактусов, Смилакса, Спаржи. Кладодий:- модифицированный побег, который принял вид и функции листа. Среди знакомых растений с кладодиями можно назвать Ruscus aculeatus (Иглицу колючую) и Asparagus densiflorus (Аспарагус густоцветковый).

CLAIM = ПРЕТЕНЗИЯ (или ТРЕБОВАНИЕ, или ИСК, или РЕКЛАМАЦИЯ) – (1) In general law, a claim is:- (1) to make a demand for money, for property, or for enforcement of a right provided by law. (2) The making of a demand (asserting a claim) for money due, for property, from damages or for enforcement of a right. If such a demand is not honored, it may result in a lawsuit. In order to enforce a right against a government agency (ranging for damages from a negligent bus driver to a shortage in payroll) a claim must be filed first. If rejected or ignored by the government, a lawsuit may be filed. Claim:- any right to payment whether or not any such right is reduced to judgment, liquidated, unliquidated, fixed, contingent, matured, unmatured, disputed or secured. Right to a specific payment. A demand by one person or another under asserted legal or judicial rights. In the case of a nominal claim, the demand is exclusively for a certain sum of money. In bank balance sheets a distinction is drawn between claims on banks and claims on clients. / Претензионное Заявление, Исковое Заявление, Иск – требование истца к ответчику. Под Иском понимается исковое заявление в суд, арбитраж или третейский суд за защитой своего нарушенного, оспариваемого права или охраняемого законом интереса. В гражданском праве под Претензией, от позднелатинского слова Praetensio, означающее Притязание или Требование, понимается требование кредитора к должнику об уплате долга, возмещения убытков, уплате шрафа, устранении недостатков поставленной продукции, проданной вещи или выполненной работы. В гражданском праве под Рекламацией, от Латинского слова Reclamatio, означающее Громкое Возражение или Неодобрение, понимается:- (i) претензия покупателя (заказчика) к продавцу (подрядчику, поставщику) по поводу ненадлежащего качества вещи; (ii) требование об устранении недостатков, снижении цены, возмещении убытков. Рекламация – оформленное в установленном порядке заявление получателя или потребителя поставщику или подрядчику на обнаруженное в период действия гарантийных обязательств несоответствие качества или комплектности продукции или проведённых работ установленным требованиям.

(2) Claim is a demand made upon a transportation line for payment on account of a loss sustained through its alleged negligence. A request for payment by a customer due to shortage or damage to cargo.

(3) Claim is injury or loss to a claimant against the insured arising so as to cause liability under an arrangement policy. Depending on the context this term may refer to:- (i) a demand made by a policyholder on his insurer(s) for payment or some other contractual benefit under an insurance policy; (ii) a demand made by an insurer on its reinsurer(s) to be paid under a reinsurance contract; or (iii) a demand made by a third party on a policyholder to be compensated for some injury, damage or loss for which the third party blames the policyholder. A claim is payable under an insurance or reinsurance contract if it is caused by an insured peril and it is not excluded under the terms of that contract. A formal request for payment of a loss under an insurance contract or bond. In health care, Claim is an itemized statement of healthcare services and their costs provided by a hospital, physician's office, or other provider facility. Claims are submitted to the insurer or managed care plan by either the plan member or the provider for payment of the costs incurred. / Формальное требование по возмещению или оплате убытков по договору страхования или обязательству.

(4) The actual amount of the final settlement. Demand by an insured for indemnity under an insurance contract.

(5) In the US patent law, Claims define the invention and are what aspects are legally enforceable. The specification must conclude with a claim particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention or discovery. The claim or claims must conform to the invention as set forth in the remainder of the specification and the terms and phrases used in the claims must find clear support or antecedent basis in the description so that the meaning of the terms in the claims may be ascertainable (clearly understood) by reference to the description (See 37 CFR § 1.58(a)).

CLAIMANT = ПРЕТЕНДАТЕЛЬ (или РЕКЛАМАНТ, или ВЗЫСКАТЕЛЬ, или ЗАЯВИТЕЛЬ, или ПОТЕРПЕВШИЙ, или ИСТЕЦ) – (1) Claimant is the person making a claim. A person who has either filed a Claim Notice or a Notice of Arbitration. / В гражданском процессе под Истцом понимается физическое или юридическое лицо, обращающееся с иском в суд, арбитраж или третейский суд.

(2) One who seeks reimbursement for loss under the terms and conditions of the insurance contract. According to Lisbon Rules, Claimant means any person, corporate body or legal entity to whom damages are due in respect of loss or damage (excluding death and personal injury) as a result of a collision. / порядки и условия . возмещение (damages).

CLAIMING BANK = ВЗЫСКИВАЮЩИЙ БАНК (или ТРЕБУЮЩИЙ ВОЗМЕЩЕНИЯ БАНК, или БАНК ЗАЯВИТЕЛЬ) – Claiming Bank is the bank demanded payment of the loan. / Банк, запрашивающий оплату займа.

CLAIM NOTICE = УВЕДОМЛЕНИЕ О ТРЕБОВАНИИ (или ПРЕТЕНЗИОННОЕ УВЕДОМЛЕНИЕ) – Claim Notice is a notice of claim against the proceeds of sale of a membership as provided in the rules of the exchange. / Уведомление о требовании (претензионное уведомление) на вырученные суммы от продажи членства в соответствии с правилами биржи.

CLAIMS AGENT = АГЕНТ ПО ПРЕТЕНЗИЯМ – Claims Agent is a representative of the insuring underwriters, usually located overseas, who has been authorized to accept the papers and documents required to prove a claim. While the claims agent does not have authority to make settlement with the claimant, he/she performs a valuable service in expediting the processing of a claim.

CLAIMS HANDLING = УРЕГУЛИРОВАНИЕ ПРЕТЕНЗИЙ – Claims Handling is the work in connection with the investigation, settlement and payment of claims from the time of their occurrence until settlement.

CLAIMS INCURRED AND CLAIM ADJUSTMENT EXPENSES = РАСХОДЫ ПО ВЫДВИНУТЫМ ПРЕТЕНЗИЯМ И ПЕРЕОЦЕНКЕ ПРЕТЕНЗИЙ – Claims Incurred And Claim Adjustment Expenses:- all claims payments plus the adjustment in the outstanding claims provision of a business year and claim adjustment expenses.

CLAIMS–MADE BASIS = БАЗИС ПО ВЫДВИНУТЫМ ПРЕТЕНЗИЯМ – In reinsurance, Claims-Made Basis is a form of reinsurance under which the date of the claim report is deemed to be the date of the loss event. Claims reported during the term of the reinsurance agreement are therefore covered, regardless of when they occurred. A claims made agreement is said to 'cut off the tail' on liability business by not covering claims reported after the term of the reinsurance agreement – unless extended by special agreement.

CLAIMS MADE COVERAGE = ПОКРЫТИЕ ПО ВЫДВИНУТЫМ ПРЕТЕНЗИЯМ – Claims Made Coverage:- a policy providing liability coverage only if a written claim is made during the policy period or any applicable extended reporting period. For example, a claim made in the current reporting year could be charged against the current policy even if the injury or loss occurred many years in the past. If the policy has a retroactive date, an occurrence prior to that date is not covered. Contrast this with Occurrence Coverage.

CLAIMS MADE POLICY = ПОЛИС ПО ВЫДВИНУТЫМ ПРЕТЕНЗИЯМ – Claims Made Policy is a policy which only pays claims that are notified to the insurer during a specified period.

CLAIMS NOTIFICATION CLAUSE = ОГОВОРКА О НОТИФИКАЦИИ ПРЕТЕНЗИЙ – Claims Notification Clause is a clause in an insurance or reinsurance contract which sets out the procedure that the insured or reassured must follow in order to make a claim under the contract. Such clauses frequently provide for prompt notification of claims and events which may gives to claims in the future.

CLAIMS RATIO = СООТНОШЕНИЕ С ПРЕТЕНЗИЯМИ – Claims Ratio:- sum of claims paid, change in the provisions for unpaid claims and claim adjustment expenses in relation to premiums earned.

CLAIM TRACER = ОТСЛЕЖИВАНИЕ ПРЕТЕНЗИИ – Claim Tracer:- request for advice concerning the status of a claim.

CLAMPS = ЗАЖИМЫ (или ЗАКРЕПКИ) – Clamps are the parts of a testing device which are used to grip the test specimen by means of suitable jaw faces. Clamps are the parts of a testing machine that are used to hold a specimen while it is subjected to force. Also known as Jaws.

CLAMPS = ЛАПЫ – Clamps:- used on forklifts to lift bulk cargoes such as paper and pulp. Clamp is an attachment to a forklift that allows it to encircle and grasp product.

CLARET = КЛАРЕТ (или БОРДО, или БОРДОВОЕ) – Claret:- a dark purplish red.

CLARITY = ЧИСТОТА (или ПРОЗРАЧНОСТЬ, или ЧЁТКОСТЬ, или ЯСНОСТЬ) – Clarity is the characteristic of a transparent body whereby distinct high-contrast images or high-contrast objects (separated by some distance from the body) are observable through the body.

CLARITY = ЯСНОСТЬ – Clarity:- (1) in general, the optical property of being clear. (2) In acetate manufacture, a measure of the appearance of dope solutions, indicating the quality of the acetylation mixture. (3) In printing, the sharpness or definition of a print pattern.

CLASPING = ОБВИВАЮЩЕЕ (или ОХВАТЫВАЮЩЕЕ, или ОКРУЖАЮЩЕЕ) – Clasping:- partly wholly surrounding.

CLASS = КЛАСС – (1) Class or Classis is a taxonomic group containing one or more Orders, ranking below Phylum or in botany, Division. See also Division, Family, Genus, Kingdom, Order, Phylum, Specie, Tribe, and Type. / Смотрите также Вид (Specie), Отдел (Division), Отряд (Phylum), Порядок (Order), Род (Genus), Семейство (Family), Тип (Type), Триба или Колено (Tribe), и Царство (Kingdom). Под Классом, от Латинского слова Classis, означающее Группа или Разряд, понимается одна из высших таксономических категорий (рангов) в систематике животных и растений. В классы, иногда – сначала в Подклассы, объединяют родственные Отряды животных или Порядки растений. Например, Отряды Грызунов, Насекомоядных, Хищных и так далее составляют Класс Млекопитающих. Классы, имеющие общий план строения и общих предков, образуют Типы животных или Отделы растений. Под Классом, от Латинского слова Classis, означающее Группа или Разряд, в биологии понимается одна из высших таксономических (систематических) категорий Животных и Растений. Класс объединяет родственные Отряды (Животных) или Порядки (Растений). Например, Отряды Грызунов, Насекомоядных, Хищных и другие объединяют в Класс Млекопитающих. В свою очередь, Классы, представители которых сходны по общему плану строения и происходят от общих предков, объединяют в Типы (Животных) или Отделы (Растений). Например, Классы Рыб, Земноводных, Пресмыкающихся, Млекопитающих и других составляют Тип Хордовых Животных; Классы Однодольных и Двудольных Растений – Отдел Покрытосеменных (Цветковых) Растений. Понятие Класс введено в систематику Французским ботаником Жозефом Питтоном де Турнефором (1656-Июнь-05–1708-Декабрь-28) и впоследствии принято Шведским естествоиспытателем и медиком Карлом Линнеем (Carl Linné; 1707-Май-23–1778-Январь-10) в его 'Системе Природы' (1735).

(2) Class, in respect of Grain, means any Variety or Varieties of grain designated by order of the Canadian Grain Commission (CGC) as a class.

(3) Class, as relates to Potatoes, class is a seed-quality level as relates to compliance with the specified tolerances for diseases and varietal purity.

(4) In sharemarket, Class of security on issue. Securities are in the same class only if the same rights and obligations attach to them. Differences arising from the requirements of the listing rules relating to restricted securities are to be ignored. Example:- Partly paid securities are in a different class to fully paid securities. Fully paid securities that rank equally except for the next dividend or distribution are in the same class (but may be traded separately until they merge with the other shares in the class). Fully paid ordinary securities classified as restricted securities are in the same class as fully paid ordinary securities that are not classified as restricted securities.

CLASS ACTION SUIT = ХХ (или КОЛЛЕКТИВНЫЙ ИСК) – Class Action Suit or Class Action Lawsuits are law suits launched by lawyers on behalf of a 'class' of litigants, i.e. a group which is adversely affected. Lawyers generally do this by charging exorbitant contingency fees (like 30–50% of any settlements) and they only need one legitimate complainant to proceed. Now you know why they are so popular!

CLASS AUCTION = РАСЧЁТНЫЙ АУКЦИОН (или КЛАССОВЫЙ АУКЦИОН, или КЛАССНЫЙ АУКЦИОН) – Class Auction:- technically not corporate action but managed in a similar manner. A class action is a court action filed on behalf of a group of shareholders. In a class action, shareholders who purchased or sold the company's securities during a specific period of time, known as the Class Period, usually allege that the company and its officers and directors violated federal and state securities laws.

CLASSES OF BUSINESS = КЛАССЫ БИЗНЕСА (или КАТЕГОРИИ БИЗНЕСА) – Classes Of Business:- the Lloyd's market underwrites five main classes of insurance and reinsurance business:- marine, non-marine, motor, aviation and term life insurance. The market rules that previously prevented marine underwriters writing more than one class of business have been abolished. However, the premiums and claims relating to term life insurance must be kept separate from those relating to other classes of business and the rules of the Financial Services Authority (FSA) prohibit a syndicate writing both general insurance and long term insurance as defined by the FSA. Term life may constitute long term insurance.

CLASS–FOUR WOOL = ШЕРСТЬ ЧЕТВЁРТОГО КЛАССА – Class-Four Wool:- these fibers are from 25–400 mm long, are coarse and hair like, have relatively few 'scales' and little crimp, and therefore, more smoother and more lustrous. This wool is less desirable, with the least elasticity and strength.

CLASSIC BIOLOGICAL CONTROL = КЛАССИЧЕСКАЯ БИОЛОГИЧЕСКАЯ БОРЬБА (или КЛАССИЧЕСКИЙ БИОЛОГИЧЕСКИЙ КОНТРОЛЬ) – Classical Biological Control is the intentional introduction and permanent establishment of an exotic biological agent for long-term pest control.

CLASSIFICATION = КЛАССИФИКАЦИЯ – (1) Classification is a publication, such as Uniform Freight Classification (railroad) or the National Motor Freight Classification (motor carrier), that assigns ratings to various articles and provides bill of lading descriptions and rules. / Под Классификацией, от Латинских слов Classis, означающее Группа или Разряд, и Facere, означающее Делать, понимается особый случай применения логической операции деления объёма понятия, представляющий собой некоторую совокупность делений (деление некоторого класса на виды, деление этих видов и так далее). Классификация предназначена для постоянного использования в какой-либо науке или области практической деятельности (например, животных и растений, общественно-экономических формаций или классификация книг в книгохранилище). Обычно в качестве оснований деления в классификациях выбирают признаки, существенные для данных предметов. В этом случае классификация (называется естественной) выявляет существенные сходства и различия между предметами и имеет познавательное значение. В других случаях, когда цель классификации состоит лишь в систематизации предметов, в качестве основания выбираются признаки, удобные для этой цели, но, возможно, несущественные для самих предметов, например, алфавитные каталоги. Такие классификации называются искусственными. Наиболее ценными являются классификации, основанные на познании законов связи между видами, перехода от одного вида к другому в процессе развития (такова, например, классификация химических элементов, созданная в 1869 Русским химиком Дмитрием Ивановичем Менделеевым (1834–1907)). Классификация по существенным признакам называется типологией; она основывается на понятии типа как единицы расчленения изучаемой реальности, конкретной идеальной модели исторически развивающихся объектов (биологические, языковые, культурологические и тому подобные типологии). Классификация является обычно результатом некоторого огрубления действительных граней между видами, ибо они всегда условны и относительны. С развитием знаний происходит уточнение и изменение классификаций. В логике под Классификацией понимается система соподчинённых понятий (классов объектов) какой-либо области знания или деятельности человека, используемая как средство для установления связей между этими понятиями или классами объектов. Научная классификация выражает систему законов, присущих отображённой в ней области действительности. Различают:- (i) естественные классификации, основания которых – существенные признаки объектов, например, периодическая система химических элементов; и (ii) искусственные классификации, в которых используются несущественные признаки; к искусственным классификациям относятся, так называемые вспомогательные классификации (алфавитно-предметные указатели, именные каталоги в библиотеках).

(2) In the US patent law, patents are classified (organized) by a system using a 3 digit class and a subclass to describe every similar grouping of patent art. A single invention may be described by multiple classification codes. Classification:- patents are classified (organized) in the United States by a system using a 3 digit class and a 3 digit subclass to describe every similar grouping of patent art. A single invention may be described by multiple classification codes.

(3) In the United States, a Classification means the measurement results provided by the Agricultural Marketing Service (AMS) of color grade, leaf, staple, strength, extraneous matter and micronaire, and for Upland Cotton, length uniformity.

(4) Classification is the systematic grouping of Plants based on natural relationships or botanical classification.

CLASSIFICATION BY FLEECE = КЛАССИФИКАЦИЯ ПО РУНУ – Classification By Fleece:- wool shorn from young lambs differs in quality from that of older sheep. Also, fleeces differ according to whether they come from live or dead sheep, which necessitates standards for the classification of fleeces.

CLASSIFICATION CARGO CLAUSE = ОГОВОРКА О КЛАССИФИКАЦИИ ГРУЗА – Classification Cargo Clause is a clause in a cargo insurance open cover which details the minimum classification for an overseas carrying vessel that is acceptable to the insurers for carriage of the insured goods at the premium rate/s agreed in the contract. Goods carried by lower class vessels are accepted under the open cover, subject to payment of an additional premium.

CLASSIFICATION CLAUSE = ОГОВОРКА О КЛАССИФИКАЦИИ – Classification Clause is a clause in a marine cargo policy specifying the minimum standard of the vessels to be used in the carriage if additional premium is to be avoided. Vessels must be fully classed by a recognised classification society but additional premium may be required if a vessel is over a specified age.

CLASSIFICATION CLAUSE – CARGO = ОГОВОРКА О КЛАССИФИКАЦИИ В ОТНОШЕНИИ ГРУЗА – Classification Clause – Cargo:- an Institute clause used in cargo open cover contracts to indicate the age and class of overseas carrying vessels acceptable at the premium rates specified in the contract. Basically, the ship must be iron or steel and mechanically self-propelled. She must be fully classed with any of the classification societies. She must be no more than 15 years of age. The age limit is raised to 25 years for liners. Goods carried by ships not attaining the required standard are held covered subject to payment of an additional premium. The 1992 version of this clause reduces the age limit for bulk and/or combination carriers and mineral oil carriers under 50 000 grt to 10 years.

CLASSIFICATION CLAUSE – HULLS = ОГОВОРКА О КЛАССИФИКАЦИИ В ОТНОШЕНИИ КОРПУСА – Classification Clause – Hulls:- a set of London market clauses available for attachment to hull and machinery policies. They incorporate an 'existing class maintained' warranty and various restrictive conditions relating to the ship's classification. / ручательство (warranty).

CLASSIFICATION OF GOODS AND SERVICES = КЛАССИФИКАЦИЯ ТОВАРОВ И УСЛУГ – Classification Of Goods And Services:- in the US trademark law, goods and services are classified by an international system, according to international treaties to which the United States is a signatory. All goods and services included in trademark applications are classified by the Office of the United States Patent and Trademark Office (USPTO) according to this system.

CLASSIFICATION OF INDIVIDUAL CONSUMPTION BY PURPOSE = КЛАССИФИКАЦИЯ КОНКРЕТНОГО ПОТРЕБЛЕНИЯ ПО НАЗНАЧЕНИЮ (или ЦЕЛЕВОМУ ИСПОЛЬЗОВАНИЮ) – Classification Of Individual Consumption By Purpose is an international classification which groups consumption according to its function or purpose. Thus the heading clothing, for example, includes expenditure on garments, clothing materials, laundry and repairs.

CLASSIFICATION RATING = КЛАССИФИКАЦИОННЫЙ РЭЙТИНЬГ – Classification Rating:- the designation provided in a classification by which a class rate is determined.

CLASSIFICATION SOCIETY = КЛАССИФИКАЦИОННОЕ ОБЩЕСТВО – Classification Society is a society formed to inspect ships and to describe and grade them for the information of insurers, e.g., Lloyd's Register of Shipping. An approved ship is said to be fully classed. An organization whose main function is to carry out surveys of vessels, with the purpose of setting and maintaining standards of construction and maintenance of vessels, engines, and safety equipment. A classification society also inspects and approves the construction standards for containers. Worldwide experienced and reputable societies. which undertake to arrange inspections and advise on the hull and machinery of a ship. A private organization that supervises vessels during their construction and afterward, in respect to their seaworthiness, and the placing of vessels in grades or classes according to the society's rules for each particular type. It is not compulsory by law that a shipowner have his vessel built according to the rules of any classification society; but in practice, the difficulty in securing satisfactory insurance rates for an unclassed vessel makes it a commercial obligation. / Под Классификационным Обществом понимается орган технического надзора в судостроении и мореплавании. Оно устанавливает технические требования, обеспечивающие безопасность плавания, присваивает судам класс, анализирует аварии судов и так далее. В своё время в СССР было всего два классификационных общества:- (i) Регистр Союза ССР для морских судов и (ii) Речной Регистр РСФСР для речных судов. Классификационное Общество, орган технического надзора в судостроении и мореплавании. Классификационное общество устанавливает технические требования в отношении обеспечения безопасности плавания гражданских судов, надёжности перевозки грузов и охраны человеческой жизни; рассматривает проектную и техническую документацию на суда, их оборудование и материалы; ведёт надзор за постройкой судов, изготовлением судовых механизмов, оборудования и материалов и за их эксплуатацией; производит обмер судов (смотрите Регистровая Вместимость), классифицирует суда, присваивает им класс или снимает его, изучает аварии судов; ведёт учёт поднадзорных судов; сотрудничает с иностранными классификационными обществами. Присвоение судну класса классификационным обществом, удостоверяемое свидетельством, означает гарантию технической надёжности судна и обеспечивает судовладельцу более выгодные условия страхования судна и груза и другие льготы. Первое классификационное общество (Англия, 1760) возникло как придаток судового страхового общества Лойда и носило название Регистр Судоходства Лойда. Классификационные общества учреждены и действуют во Франции (Бюро Веритас, 1828), Италии (Итальянский Морской Регистр, 1861), США (Американское Бюро Судоходства, 1862), Норвегии (Норвежский Веритас, 1864), ФРГ (Германский Лойд, 1867), Японии (Ниппон Кайдзи Кёкай, 1899), а также в ПНР (Польский Регистр Судов), ГДР (Немецкая Судоревизионная И Классификационная Организация), НРБ (Болгарский Судовой Регистр), КНР (Регистр Судов КНР), ЧССР (Чехословацкий Судовой Регистр), СФРЮ (Югорегистр). В России классификационное общество основано в 1899, в 1913 получило название Русский Регистр. В бывшем Союзе Советских Социалистических Республик (СССР) было два классификационных общества:- Регистр Союза ССР (для морских судов) и Речной Регистр РСФСР (для речных судов).

CLASSIFICATION YARD = КЛАССИФИКАЦИОННЫЙ ДВОР – Classification Yard is a railroad yard with many tracks used for assembling freight trains.

CLASSIFIED ASSET = КЛАССИФИЦИРОВАННЫЙ АКТИВ – Classified Asset is an asset of a kind referred to in paragraph (a) of the definition of restricted securities in the Australian Securities Exchange (ASX) Listing Rules.

CLASSING = КЛАССИРОВКА (или КЛАССИФИКАЦИЯ) – In the Cotton industry, Classing or Classification is the process of describing the quality of Cotton in terms of grade, staple length and micronaire. In the past, this classing has been done with the hand and the eye. Micronaire determinations are performed with an airflow measurement which indicates fiber fineness. Classification is essential to the Cotton pricing systems, but additional testing is required for high level quality control in textile production. Therefore, an instrument was developed to measure most fiber properties. This instrument is referred to as the High Volume Instrument (HVI) and is manufactured by Zellweger Uster, Inc.. Its classification system currently consists of instrument measurements for fiber length, strength, length uniformity, micronaire, trash and color. Since 1991, 100 percent of the US crop is graded by the HVI. The process of describing Cotton quality so that its value can be determined. / Высокопроизводительный Инструмент (ВПИ; High Volume Instrument (HVI). Уштэр Тчэкнолодьжиз А.Ге. (Цельвига Уштэр) (Uster Technologies AG (Zellweger Uster)), Уштэр (или Устер), Швейцария. Процесс описания качества хлопка с тем, чтобы можно было определить его ценность.

CLASS OF OPTIONS = КЛАСС ОПЦИОНОВ (или КАТЕГОРИЯ ОПЦИОНОВ) – Class Of Options:- this term means, with respect to any option, a put option or call option covering the same underlying asset. All call options, or all put options, exercisable for the same underlying futures contract and which expire on the same expiration date. Options of the same type (i.e. either puts or calls, but not both) covering the same underlying futures contract or other asset (e.g., a March call with a strike price of 54 and a May call with a strike price of 52). Option contracts of the same type, either call options or put options, covering the same underlying security. / Опционы или опционные контракты одного и того же типа (то есть либо опционы на продажу, либо опционы на покупку, но не те и другие одновременно), покрывающие один и тот же соответствующий фьючерсный контракт или иной актив (включая ценные бумаги), например, Мартовский опцион на покупку со сходной ценой в 54 и Майский опцион на покупку со сходной ценой в 52.

CLASS OF SERVICE = КЛАСС ОБСЛУЖИВАНИЯ (или КАТЕГОРИЯ ОБСЛУЖИВАНИЯ) – Class Of Service:- the utility's sales categories such as residential, commercial, industrial, other, and sales for resale. / Категории осуществляемых поставщиками электроэнергии продаж, к числу которых относятся население, коммерческий сектор, промышленность и другие, в том числе и продажи для дальнейшей перепродажи.

CLASS–ONE WOOL = ШЕРСТЬ ПЕРВОГО КЛАССА – Class-One Wool:- merino sheep produce the best wool which is relatively short, but the fiber is strong, fine, and elastic and has good working properties. Merino fiber has the greatest amount of crimp of all

wool fibers and has a maximum number of 'scales':- two factors which contribute to its superior warmth and spinning properties. These sheep produce class one wool.

CLASS OR KIND OF MERCHANDISE = КАТЕГОРИЯ ИЛИ РАЗНОВИДНОСТЬ (или РОД) ТОВАРА – Class Or Kind Of Merchandise is a term used in defining the scope of an antidumping investigation. Included in the 'class or kind' of merchandise is merchandise sold in the home market which is 'such or similar' to the petitioned product. 'Such or similar' merchandise is that merchandise which is identical to or like the petitioned product in physical characteristics.

CLASS RATE = СТАВКА ПО КЛАССУ (или СТАВКА ПО КАТЕГОРИИ) – Class Rate is a rate applicable to a class rating to which articles are assigned in a classification. A grouping of goods or commodities under one general heading. All the items in the group make up a class. The freight rates that apply to all items in the class are called Class Rates.

CLASS TARIFF = ТАРИФ ПО КЛАССУ (или ТАРИФ ПО КАТЕГОРИИ) – Class Tariff is a tariff containing only class rates. / Тариф, содержащий только лишь ставки по классу или по категории.

CLASS–THREE WOOL = ШЕРСТЬ ТРЕТЬЕГО КЛАССА – Class-Three Wool:- these fibers are about 100–455 mm long, are coarser, and have fewer 'scales' and less crimp than Merino and Class-two wools. As a result, they are smoother, and therefore, they have more lustre. These wools are less elastic and resilient. They are nevertheless of good quality to be used for clothing. This class of sheep originated in the United Kingdom.

CLASS–TWO WOOL = ШЕРСТЬ ВТОРОГО КЛАССА – Class-Two Wools are not quite as good as the Merino wool, but this variety is nevertheless a very good quality wool. It is 50–200 mm in length, has a large number of 'scales', and has good working properties. This class of sheep originated in England, Scotland, Ireland and Wales.

CLAUSE = ОГОВОРКА (или СТАТЬЯ) – Clause is a term used to identify a particular part of a policy or endorsement. A section or paragraph in an insurance policy that explains, defines or clarifies the conditions of coverage. / Раздел или параграф в страховом полисе, который оговаривает, устанавливает или разъясняет условия покрытия.

CLAUSED BILL = КОНОСАМЕНТ С ОГОВОРКОЙ – Claused Bill is a bill of lading that contains a positive notation of a defective condition or shortage either of the cargo covered or, where material, of its packaging. The usual qualifications such as 'said to contain' and 'condition, weight, etc unknown' contain no positive notation of any defect or shortage and thus do not render a bill of lading 'claused'.

CLAVATE = БУЛАВОВИДНОЕ – Clavate:- club shaped. Elongated, with a gradual increase in diameter or increasing abruptly near the top. / .

CLAW–SHAPED SPIKELETS = КОЛОСКИ В ФОРМЕ НОГОТКОВ (или ЛАПЫ С КОГТЯМИ) – Claw-Shaped Spikelets (clw) are spikelets with undersized paleas that are overlapped by recurved lemmas; synonymous to 'parrot's beak'.

CLAY FILTRATION = ФИЛЬТРАЦИЯ ЧЕРЕЗ СЛОЙ ГЛИНЫ (или ФИЛЬТРОВАНИЕ ЧЕРЕЗ СЛОЙ ГЛИНЫ) – Clay Filtration is a refining process using fuller's earth (activated clay), bauxite or other mineral to absorb minute solids from lubricating oil, as well as remove traces of water, acids, and polar compounds. See also Filtration.

CLAYTON ACT = АКТ КЛЭЙТЭНА – The Clayton Act included a declaration that labor unions, as such, were not to be construed as conspiracies in restraint of trade in violation of the antitrust laws; but what organized labor wanted, and did not get, was immunity from prosecution for such measures as the sympathetic strike and the secondary boycott, which the courts had proscribed as violations of the Sherman Act. An anti-trust act of the US Congress making price discrimination unlawful. The Clayton Act of 1914 was one of the major pieces of legislation of the Progressive Era in American history. It prohibited four specific types of monopolistic practices:- (i) price discrimination; (ii) exclusive-dealing contracts and tying agreements; (iii) the acquisition of competing companies through stock purchases; and (iv) interlocking directorates among companies with a market value of at least USD1 million, and in the same industry. Its main objective was to prevent business practices that may tend 'to substantially lessen competition or tend to create a monopoly'. It underwent several amendments in subsequent years partly because of lax judicial interpretations. The most important ones include the Robison-Patman Act of 1936, which strengthened price discrimination prohibition, and the Celler-Kefauver Act of 1950, which prohibited corporate mergers that would tend to reduce competition or promote monopolies. Clayton became a representative in the US House of Representatives in 1897 and served until 1914. From 1911 to 1914 he was the presiding officer of the Judiciary Committee. During his last year in the House, Clayton drafted the Clayton Antitrust Act, which simplified and added provisions to the Sherman Anti-Trust Act of 1890 (15 USCA § 1 et seq. (15 USCA is short for the United States Code Annotated:- Title 15)), a law that was enacted to prevent the combination of businesses for the purpose of unreasonably restricting free competition. Clayton, Henry De Lamar – 1857–1929, US congressman, Democrat, he was a member of the House of Representatives from 1897 to 1915 and later a federal district judge. He is chiefly remembered as the author of the Clayton Antitrust Act. / Антитрестовский Акт Конгресса США, признающий ценовую дискриминацию незаконной. Акт Клэйтона, по имени автора законопроекта – Американского Конгрессмена Энри Дэ Ламар Клэйтэна (Henry De Lamar Clayton – 1857–1929), является антитрестовским законом, принятым в США в 1914. Этот акт ограничивал деятельность монополий и формально освобождал рабочие и фермерские организации от преследований, которым они подвергались в соответствии с Актом Шермана (Sherman Act), принятым 02 Июля 1890.

CLD = CALLED

CLEAN = ЧИСТОЕ – Clean:- 100 particles > 10 micron per milliliter – in regards to an oil sample bottle cleanliness.

CLEANABLE FILTER = ОЧИЩАЕМЫЙ ФИЛЬТР – Cleanable Filter is a filter element which, when loaded, can be restored by a suitable process, to an acceptable percentage of its original dirt capacity. See also Filter.

CLEAN BILL OF LADING = ЧИСТЫЙ КОНОСАМЕНТ – Clean Bill is a bill of lading that contains no positive notation of a defective condition or shortage either of the cargo covered or, where material, of its packaging. A bill of lading can be 'clean' although it contains no positive statement that the cargo covered was shipped 'clean'. However, such positive notation is commonly placed on the face of bills of lading. One in which there is nothing to qualify the admission that the goods are shipped in good order and condition. A Clean Bill of Lading is issued when the shipment is received in good order. If damaged or a shortage is noted, a clean bill of lading will not be issued. A B/L which bears no superimposed clause or notation which declares a defective condition of the goods and/or the packaging. A receipt for goods issued by a carrier with an indication that the goods were received in 'apparent good order and condition', without damage or other irregularities. If no notation or exception is made, the B/L is assumed to be cleaned. A Bill of Lading which does not take exception from the apparent order and condition of the goods to be transported. A Clean Bill of Lading is a bill of lading that contains no language qualifying the acknowledgment of the apparent good order and condition of the cargo is known as a 'Clean Bill Of Lading'. A 'clean bill of lading' creates a rebutta-ble presumption that all of the cargo listed in the document was loaded in the condi-tion

described in the bill. Bill of lading without any reservations as to the condition of the goods or packaging. The seller must deliver the goods in seaworthy packaging. A Clean Bill Of Lading is received by carrier for merchandise in good condition which does not bear such notation/remarks as 'Shipper Load and Count' etc. / Чистый Коносамент – документ, отражающий ответственность владельца груза за качество товара и его упаковку. Чистый Коносамент – коносамент, который не содержит каких-либо оговорок или пометок, констатирующих дефектное состояние груза или его упаковки.

CLEAN CARGO = СВЕТЛЫЕ НЕФТЕПРОДУКТЫ (или ОЧИЩЕННЫЕ НЕФТЕПРОДУКТЫ) – Clean Cargo:- refined products such as kerosene, gasoline, home heating oil, and jet fuel carried by tankers, barges, and tank cars. All refined products except bunker fuels, residual fuel oil, asphalt, and coke. / печное бытовое топливо (heating oil) .

CLEAN COLLECTION = ЧИСТОЕ ИНКАССО – Clean Collection is a method by which an exporter finances a sale by submitting a draft to the bank and instructing it to collect payment from the importer. Clean Collection means the collection business of financial documents without any commercial documents as entrusted by the customer of bank. Functions:- it is used for international trade settlement in two forms: documents against payment (D/P) and documents against acceptance (D/A). Features:- (i) Low Costs:- the banking fee is relatively lower for clean collection service; (ii) Safe and Secure:- collecting money using the international banking network is a safer collection method as compared with direct mailing of the draft to the drawee; and (iii) Fast Service:- the collection time can be largely reduced if an 'immediate credit' agreement is made between the remitting bank and the paying/collecting bank. Target Customers:- (i) small payments under trading or non-trading items; (ii) foreign currency notes (including worn notes) non-exchangeable in the country; (iii) collection service for valued certificates including foreign exchange cheques, promissory note, foreign bonds, and deposit receipts; and (iv) transactions where commercial documents are unable or inconvenient to be provided such as mailing samples, high tech products (software) trading, seasonal goods trading, and intangible trading such as services and technical transfers. Application Qualifications:- the applicant shall be approved and registered in accordance with the law, and hold a business license that has passed the annual inspection or other valid certificates which fully prove its legal operation and scope of business. Process:- (i) the payee presents the collection documents to the bank; (ii) the bank will mail the collection documents to the foreign collecting bank to collect payments; (iii) the foreign collecting bank presents documents to the payer and the payer pays the face amount; and (iv) the foreign collecting bank pays the collection to the bank and the bank pays it to the payee. Kind Reminder:- (i) clean collection is used for collection of documents and valued certificates under trading and non-trading items; (ii) the currency denominated in the collection documents should generally be exchangeable currency; (iii) documents marked with limitation of circulation areas are difficult to be collected; (iv) documents endorsed with transfer have the risks of fraud of being faked or altered so you should exercise due precautions; (v) fraud usually lies in documents that are strange, of huge amount, or issued by an issuing bank which with questionable credit; and (vi) the large-amount documents used for investment, loans and mortgage bear more risks of fraud. Clean Collection means collection of financial documents not accompanied by commercial documents. See also Documentary Collection. Clean Collection is a documentary collection whereby only the financial document (draft or bill of exchange) is sent through the banks without a bill of lading and/or other shipping documents (which are sent separately by the consignor to the consignee). Used usually in open account arrangements, clean collection allows a consignee to take delivery of the shipment without paying and without making a firm commitment to pay on a fixed date. Also called Clean Credit. / Чистое Инкассо означает инкассо финансовых документов, не сопровождаемых коммерческими документами. Смотрите также Документарное Инкассо (Documentary Collection).

CLEAN CONTENT = ВЫХОД (ШЕРСТИ) НА ФАБРИЧНУЮ МОЙКУ – Clean Content is the amount of clean, scoured wool remaining after removal of all vegetable and other foreign material.

CLEAN DRAFT = ЧИСТАЯ ТРАТТА (или ТРАТТА БЕЗО ВСЕГО) – Clean Draft is a draft to which no documents have been attached. / Тратта, к которой не были приложены никакие документы.

CLEANED CARD STRIPS = ОЧИЩЕННЫЕ КАРДНЫЕ ОЧЁСЫ (или ОЧИЩЕННЫЕ КАРДНЫЕ СДИРЫ) – Cleaned Card Strips is the waste fiber removed by the revolving flats of a card during the carding process.

CLEANING = ЧИСТКА – Cleaning is a hand operation in which the basting threads are removed from the garment; usually done prior to the final pressing. / Под Чисткой понимается процесс, в результате которого с гигиенической точки зрения одежде возвращается пригодность к эксплуатации путём удаления загрязнения. Примечание:- циклом чистки обычно считается стирка с последующей сушкой, сухая чистка с глажением или другой обработкой при необходимости.

CLEANING IN TRANSIT = ЧИСТКА В ТРАНЗИТЕ – Cleaning In Transit:- rhe stopping of articles, such as peanuts, etc, for cleaning at a point between the point of origin and destination.

CLEANLINESS LEVEL = СТЕПЕНЬ ЧИСТОТЫ (или УРОВЕНЬ ЧИСТОТЫ) – Cleanliness Level is a measure of relative freedom from contaminants.

CLEAN ON BOARD = ЧИСТЫЙ БОРТОВОЙ – Clean On Board:- a clause inserted in the bill of lading by some shipping/transportation companies, stating that they have not noted or are not familiar with any irregularities or discrepancies in the packing or in the general condition of any part of the goods or its description. Mention specifying that the bill of lading is issued without exceptions. When goods are loaded on board and the document issued in respect to these goods is clean.

CLEAN PRICE = ЧИСТАЯ ЦЕНА – Clean Price:- the dirty price less the accrued interest. The clean price is continuous across xd dates. The prices quoted in the Financial Times are clean prices and you have to add on the accrued interest to get the price you actually pay. See also Dirty Price.

CLEAN ROOM = ЧИСТАЯ КОМНАТА – Clean Room is a facility or enclosure in which air content and other conditions (such as temperature, humidity, and pressure) are controlled and maintained at a specific level by special facilities and operating processes and by trained personnel.

CLEAN SHIP = ЧИСТОЕ СУДНО – A term Clean Ship refers to tankers which have their cargo tanks free of traces of dark persistent oils which remain after carrying crudes and heavy fuel oils.

CLEAN TANKER = ТАНКЕР ДЛЯ СВЕТЛЫХ НЕФТЕПРОДУКТОВ – Clean Tankers carry lighter products such as diesel, gasoline, No. 2 heating oil, and jet fuel, while dirty tankers carry loads of crude oil and residual fuels. Light products cannot be carried in dirty tankers because they will become contaminated and no longer meet product specifications. Generally, smaller tankers carry clean cargoes of refined products, while the larger tankers carry crude oil and other dirty products. Increased demand coupled with decreased flexibility in the fleet have led to very tight capacity in both clean and dirty tankers, with the effect being felt most keenly in clean tankers. See also Dirty Tanker. / печное бытовое топливо № 2 (No. 2 heating oil). Смотрите также Танкер Для Тёмных Нефтепродуктов (Dirty Tanker).

CLEAN TILLAGE (CLEAN CULTURE, CLEAN CULTIVATION) = ЧИСТАЯ ВСПАШКА (или ОЧИСТИТЕЛЬНАЯ ОБРАБОТКА ПОЧВЫ) (ЧИСТАЯ КУЛЬТУРА, ЧИСТАЯ КУЛЬТИВАЦИЯ (или ПАРОВАНИЕ)) – Clean Tillage (Clean Culture, Clean Cultivation) is a process of frequent cultivation or plowing to prevent growth of all vegetation except the particular crop desired during the growing season. / Под Боронованием (Harrowing) понимается рыхление поверхностного слоя почвы боронами и вращающимися мотыгами. Предохраняет почву от высыхания, выравнивает её поверхность, разрушает почвенную корку, уничтожает сорняки.

CLEAN WOOL = ЧИСТАЯ ШЕРСТЬ – Clean Wool:- usually refers to scoured wool but occasionally it describes grease wool that has a minimum amount of vegetable matter.

CLEAR = РАСЧЁТ – Clear:- the process by which a clearing house maintains records of all trades and settles margin flow on a daily mark-to-market basis for its clearing members. To be verified and guaranteed. / Должно быть проверено и гарантировано.

CLEARANCE = ВЗАИМОРАСЧЁТ – Clearance is the process of calculating the mutual obligations of the participants, usually on a net basis, for the exchange of funds and securities. Clearance may also refer to the process of transferring securities on the settlement date (a clearing system), also known as a Securities Settlement System. / процесс расчёта взаимных обязательств участников, как правило на чистом базисе, для обмена фондов и ценных бумаг.

CLEARANCE = КЛИРЕНС (или ДОРОЖНЫЙ ПРОСВЕТ) – Clearance is the size beyond which cars or loads cannot use limits bridges, tunnels, etc. / Под Клиренсом может пониматься:- (i) нерекомендуемое название дорожного просвета; или (ii) просвет между водной поверхностью и днищем судна на подводных крыльях.

CLEARANCE = ОЧИСТКА (или ВВОЗ или ВЫПУСК РАЗРЕШЁН) – Clearance is a document stating that a shipment is free to be imported into the country after all legal requirements have been met. / Документ, указывающий на то, что отгруженные товары могут быть свободно ввезены в страну, поскольку все требования законодательства в отношении ввоза были удовлетворены.

CLEARANCE = ОЧИСТКА (или ЗАЧИСТКА) – Clearance (of a consignment) is a verification of compliance with phytosanitary regulations.

CLEARANCE BEARING = ЗАЗОРНЫЙ ПОДШИПНИК (или ПОДШИПНИК С ЗАЗОРОМ) – Clearance Bearing is a journal bearing in which the radius of the bearing surface is greater than the radius of the journal surface. See also Bearing. / радиальный подшипник (journal bearing). Смотрите также Подшипник (Bearing).

CLEARANCE LABEL = БИРКА ОБ ОЧИСТКЕ (или БИРКА О ТАМОЖЕННОМ ОФОРМЛЕНИИ) – Clearance Label denotes that a vessel has complied with all the regulations for clearance outward. It is attached to the Victualling Bill by the Customs officer who clears the vessel, and is then known as the Outward Clearance.

CLEARANCE TERMINAL = ТЕРМИНАЛ ДЛЯ ТАМОЖЕННОГО ОФОРМЛЕНИЯ (или ТЕРМИНАЛ ДЛЯ ТАМОЖЕННОЙ ОЧИСТКИ) – Clearance Terminal is a terminal where Customs facilities for the clearance of goods are available.

CLEARED WITHOUT EXAMINATION = РАСТАМОЖЕНО БЕЗ ДОСМОТРА – Cleared Without Examination:- cleared by customs without inspection. / Прошедший таможенную очистку или растаможку без проведения осмотра.

CLEAR FINISHING = ОБЕЗВОРСИВАНИЕ (или ГЛАДКАЯ ОТДЕЛКА) – Clear Finishing:- usually, worsteds are not brushed, but closely sheared to give the fabric a clean face and crisp feel. This is called Clear Finishing. See also Unfinished Worsteds. / Гладкая Отделка:- переплетение на поверхности ткани ясно выражено.

CLEAR HEIGHT = ВЫСОТА В СВЕТУ (или ПОЛЕЗНАЯ ВЫСОТА) – Clear Height is the height pallets can be stacked while leaving clearance for product movement or for lights, sprinklers, etc, hanging from a ceiling.

CLEARING = КЛИРИНГ (или РАСЧЁТ, или ВЗАИМОРАСЧЁТ) – Clearing is a centralized offsetting of amounts receivable and amounts payable with the result that only the balance(s) in favor or to the debit of each participant are credited or debited respectively. As a rule, the clearing work is handled by a central institution, the so-called 'Clearing House'. In the case of futures trades, it states the size of margin payments that have to be made. General term that may refer to check clearing or to the process of matching trades between the sellers and buyers of securities and other financial instruments and contracts. Clearing is the process of exchanging payment orders or security transfer instructions prior to settlement, including netting of instructions and the establishment of final positions for settlement. Cashless payment through the netting between members of the same group of participants (in particular banks). Internationally frequently also in different currencies. Clearing is the procedure through which the clearing house or association becomes the buyer to each seller of a futures contract, and the seller to each buyer, and assumes responsibility for protecting buyers and sellers from financial loss by assuring performance on each contract. A system used to settle mutual indebtedness between a number of organizations (banks, brokers, etc). All claims are set against one another, a balance is struck at agreed intervals and only the differences are settled. Used frequently in securities clearing. Clearing is an accounting procedure between two or more parties to simultaneously settle the claims of the parties among themselves. Claims are reduced to a net balance that a party must pay or be paid. If two parties, A and B, engage in ongoing business transactions, their accounts payable and accounts receivable may offset each other to some extent during a given period. For example:- A owes B 500 + 100 + 800 + 200; B owes A 300 + 150 + 450. Through the clearing process, these seven payments are replaced by a single payment representing the net balance of these relationships, while the other payments are cleared by making offsetting bookkeeping entries. In the example, A owes B a total of 1 600, while B owes A a total 900. A therefore owes B the net sum of 700, and will settle this debt by making a single payment. Clearing is the process of registering and guaranteeing the financial settlement of futures and options transactions and the settling of differences between clearing members. Clearing is the procedure through which the clearing house becomes the buyer to each seller of a futures contract, and the seller to each buyer and assumes responsibility for the financial integrity of each open contract for clearing members. / Процедура, посредством которой клиринговая палата становится покупателем для каждого продавца фьючерсного контракта и продавцом для каждого покупателя и принимает ответственность за финансовое обеспечение любого открытого контракта для клиринговых членов. взаиморасчёт или сведение (netting) . Под Клирингом понимается система безналичных расчётов, основанная на зачёте взаимных требований и обязательств. Клиринг используется во внутренних и международных расчётах и производится через банки или специальные расчётные палаты. Первая расчётная палата была учреждена в 1775 в Лондоне, Соединённое Королевство.

CLEARING = ОЧИСТКА – Clearing is the treatment of printed fabrics with a chemical solution to improve the appearance of the whites. In many cases the treatment also brightens the printed areas. See also Reduction Clearing.

CLEARING ACCOUNT = КЛИРИНГОВЫЙ СЧЁТ – (1) Clearing Account is a bank account used by a mortgage servicing company for the temporary, short-term deposit of mortgage payments that have been collected and are either awaiting transmittal to investors who bought the mortgages or awaiting deposit in escrow accounts. Account where the transactions carried out by its holder and

positions which are opened through those transactions are registered. Clearing Accounts serve as control accounts for certain areas of the accounting system. Therefore, they must be supported by receipt and disbursement entries in the general ledger and subsidiary ledgers or other supporting records. The accounts are defined within each classification dependent on the purpose they serve. These purposes are detailed herein and include Petty Cash, Central Stores, Prepaid Insurance, Investments, Loans and Payroll Deductions. A Clearing Account is either an accumulation account (a holder record maintained in CHESS by a broker to facilitate settlement of CHESS approved securities with clients who are not participants) or a settlement account (a holder record maintained in CHESS by a participant non-broker to facilitate settlement of CHESS approved securities with other participants).

(2) Clearing Account is a form of countertrade. In a clearing-account arrangement, two parties agree in a single contract to exchange a specified value (in hard currency) of goods from each other over a stated period of time. Goods to be exchanged are generally those products not readily sold on the open market through normal marketing channels. This form is widely used in state trading between governments. This form normally occurs between Eastern European countries and the LDC's (less developed countries). The LDC ships products to one East European nation, creating an accounts payable entry on that country's trade books (country A owes USD for this product). Country A can then satisfy the entry with either its own products or it can be satisfied by another country that comes along and buys country A's debt. For example, we may sell product to Brazil and receive payment from one of Brazil's trading partners. Sometimes it is part cash and part products from that country. A clearing agreement is a Clearing Account barter with no currency transaction required. With a line of credit being established in the central banks of the two countries, the trade in this case is continuous, and the exchange of products between two governments is designed to achieve an agreed-on value or volume of trade tabulated or calculated in nonconvertible 'clearing account units'.

CLEARING AGENCY = КЛИРИНГОВОЕ АГЕНТСТВО – In the United States, section 3(a)(23)(A) of the Securities Exchange Act of 1934 defines a Clearing Agency as 'any person who acts as an intermediary in making payments or deliveries or both in connection with transactions in securities or who provides facilities for comparison of data respecting terms of settlement of securities transactions, to reduce the number of settlements of securities transactions, or for the allocation of securities settlement responsibilities'. 15 USC 78c(a)(23)(A); 15 USC is short for the United States Code:- Title 15.

CLEARING AGREEMENTS = КЛИРИНГОВЫЕ СОГЛАШЕНИЯ – Clearing Agreements are the agreements whereby international payments for imports and exports among nations are settled by means of each member country's trading surplus or deficit via a clearing union, or a kind of international clearing house. Western Europe abandoned bilateral clearing agreements in 1945 and set up multilateral clearing agreements through the Organization For European Economic Cooperation (OEEC) and the European Payments Union (EPU). This gradually restored the convertibility of the member states' currencies, at least for purposes of international trade.

CLEARING ASSOCIATION = КЛИРИНГОВАЯ АССОЦИАЦИЯ (или РАСЧЁТНАЯ АССОЦИАЦИЯ) – The Clearing Association in futures markets:- guarantor and regulator. One of the least understood institutions in futures markets is the Clearing Association, or the Clearing House Corporation. Ironically, it is a key institution in futures markets; the functions it performs transform what would otherwise be forward contracts into highly liquid futures contracts. Through its rules and regulations and credit-monitoring activities the Clearing Association also plays a major role in maintaining the financial integrity of the entire futures industry. It, along with Organized Exchanges, forms the institutional bedrock foundation upon which futures markets are organized. Clearing associations are not well understood for two reasons. They are complex institutions, and information about what they do and how they do it is not easy to come by. The little that has been written about them does not describe them in sufficient detail to illuminate their contribution to futures markets. In addition, there are, as we shall see, many different clearing associations in futures markets, and they do not all function the same way. These differences clearly create confusion. See also Clearing Organization. / Смотрите также Клиринговая Организация или Расчётная Организация (Clearing Organization).

CLEARING CYCLE = РАСЧЁТНЫЙ ЦИКЛ – Clearing Cycle is the length of time in banking business days or hours between the input of payments to the clearing system and the availability of funds to the beneficiary's financial institution. There may be different cycles for different types of transactions.

CLEARING HOUSE = КЛИРИНГОВАЯ ПАЛАТА (или РАСЧЁТНАЯ ПАЛАТА) – Clearinghouse is an institution where mutual claims are settled between accounts of member depository institutions. Clearinghouses among banks have traditionally been organized for check-clearing purposes, but more recently have cleared other types of settlements, including electronic fund transfers. Clearing House is an agency or separate corporation of a futures exchange responsible for settling trading accounts, clearing trades, collecting and maintaining margin monies, regulating delivery and reporting trading data. Clearing houses act as third parties to all futures and options contracts – as a buyer to every clearing member seller and a seller to every clearing member buyer. Each futures exchange has its own clearing house. All members of an exchange are required to clear their trades through the clearing house at the end of each trading session and to deposit with the clearing house a sum of money (based on clearinghouse margin requirements) sufficient to cover the member's debit balance. For example, if a member broker reports to the clearing house at the end of the day total purchase of 100 000 bushels of May Wheat and total sales of 50 000 bushels of May Wheat, he would be net long 50 000 bushels of May Wheat. Assuming that this is the broker's only position in futures and that the clearing house margin is six cents per bushel, this would mean the broker would be required to have USD3 000 on deposit with the clearing house. Because all members are required to clear their trades through the clearing house and must maintain sufficient funds to cover their debit balances, the clearing house is responsible to all members for the fulfillment of the contracts. Institutions undertaking the settlement of indebtedness between members. Used to rationalize securities trading and bank transfers. Local clearing houses exist in all major banking centers, often augmented by other organizations working on a national or international basis. Clearing House is an agency or separate corporation of a futures exchange that is responsible for settling trading accounts, collecting and maintaining margin monies, regulating delivery and reporting trade data. The clearing house act as third parties to all futures and options contracts acting as a buyer to each clearing member seller (and the seller to each clearing member buyer) and assumes responsibility for protecting buyers and sellers from financial loss by assuring performance on each contract. In futures trading, an agency affiliated with a commodities exchange, through which transactions are settled, by delivery of the commodity or purchases of offsetting futures positions. An adjunct to a futures exchange through which transactions executed on the floor of the exchange are matched, settled and guaranteed. Charged with assuring the adequate financial protection of trading through collection and payment of margin and the proper conduct of the exchange's delivery procedures. Also charged with assuring the proper conduct of delivery procedures and the adequate financing of the trading. Clearing House is an institution through which all futures contracts are made, and are either 'closed out' or are fulfilled by physical delivery of the commodity after matching purchases with sales. It operates a system of margin payments to ensure the integrity of futures and option contracts. An exchange-associated body charged with the function of insuring the financial integrity of each trade. Orders are 'cleared' by means of the clearing house acting as the buyer to all sellers and the seller to all buyers. See also Clearing Organization, and Securities Clearing. Clearing House is a department of an exchange or a separate legal entity that provides a range of services related to the clearance and settlement of trades and the management of risks associated with the resulting

contracts. A clearing house is often central counterparty to all trades, that is, the buyer to every seller and the seller to every buyer. A Clearinghouse is an entity separated from an exchange, but associated with it. It acts as guarantor for sellers and buyers of futures contracts. The clearinghouse acts as seller to all buyers and as buyer to all sellers. The clearinghouse is responsible for the margin. The clearinghouse guarantees financial transparency, but does not guarantee the physical delivery of the commodity. Clearing House process trades and use pooled capital from members plus a fund to guarantee deals even if one side defaults. With regulators pushing more complex derivatives into clearing, it is not known whether a clearer could survive multiple member defaults amid volatile conditions. Clearing House is an adjunct to a commodity exchange through which transactions executed on the floor of the exchange are settled. Also charged with assuring the proper conduct of the exchange's delivery procedures and the adequate financing of the trading. Clearing House is the agency of the futures exchange responsible for matching purchases and sales, ensuring proper delivery procedures, and maintaining adequate financing by member firms. Clearing House is a separate agency for the collection and dispersion of margin money and the financial settlement of futures contracts.

(2) In banking, Clearing House is the central collection facility through which banks exchange checks, drafts and other items drawn on each other, rather than presenting checks directly to paying banks. Participants maintain a single clearing account, against which debits or credits are posted. See also Bank Clearing. Clearing House shall mean an entity responsible for the calculation of the net positions of institutions, a possible central counterparty and/or a possible settlement agent.

THE CLEARING HOUSE AUTOMATED PAYMENT SYSTEM = АВТОМАТИЗИРОВАННАЯ СИСТЕМА ПЛАТЕЖЕЙ КЛИРИНГОВОЙ ПАЛАТЫ – Clearing House Automated Payment System (CHAPS) started operating in 1984 as a nationwide, electronic interbank system for sending irrevocable, guaranteed and unconditional sterling credit transfers. Final settlement took place on an end-of-day multilateral net basis. In April 1996, CHAPS was developed into an RTGS system and now handles nearly all large-value same-day sterling payments between banks. CHAPS Clearing Company Ltd is responsible for the large-value Real-Time Gross Settlement (RTGS) clearings. CHAPS remains the main vehicle for transferring high-value automated credits that need to be settled on a same-day basis. Settlement accounts held at the Bank of England are operated in real time. In the case of CHAPS Sterling and CHAPS Euro, individual credits and debits are applied to settlement accounts on a gross basis. The Clearing House Automated Payment System (CHAPS) is the United Kingdom's electronic transfer system for sending same-day value payments from bank to bank. It was introduced in 1984, and has operated as a real-time gross settlement system since April 1996. In 1999, CHAPS began offering payment services in Euro as well as Sterling. Every CHAPS payment is unconditional, irrevocable, and guaranteed. Most high-value wholesale payments go through the CHAPS (Clearing House Automated Payment System) RTGS system. There is, however, no lower limit on transaction values, and the system can be used for low-value (retail) payments when same-day finality is required. The system offers two separate clearings – one denominated in Sterling, the other in Euros. CHAPS Sterling moved to RTGS in April 1996, having previously settled on an end-of-day net basis. On 1999-January-04, CHAPS Euro began operations, and connects to the pan-EU TARGET system. Member banks can thus route both domestic and cross-border payments through CHAPS Euro. Since August 2001, with the completion of the NewCHAPS project, CHAPS Sterling and CHAPS Euro have operated on a common (SWIFTbased) technical platform. See also The Clearing House Automated Payment System Euro. / для крупных взаиморасчётов по Валовым Расчётам в Режиме Реального Времени (ВРРРВ). Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

THE CLEARING HOUSE AUTOMATED PAYMENT SYSTEM EURO = АВТОМАТИЗИРОВАННАЯ СИСТЕМА КЛИРИНГОВОЙ ПАЛАТЫ ПО ПЛАТЕЖАМ В ЕВРО – In January 1999, a second Clearing House Automated Payment System (CHAPS) system – for euro-denominated payments – was launched. CHAPS Euro connects to the TARGET system, which links together the RTGS systems of the 15 EU states and the European Central Bank. This provides member banks with the ability to make and receive cross-border as well as domestic payments in Euros. With the introduction of an enhanced Real-Time Gross Settlement (RTGS) service called NewCHAPS in August 2001, CHAPS Sterling and CHAPS Euro now operate on a common technical platform. The new platform, which is based on the SWIFT FIN Copy Financial Application service, enables member banks to manage their outgoing payments using a central scheduler and also to obtain real-time payment flow information via the 'Enquiry Link' facility. The Clearing House Automated Payment System (CHAPS) Euro is the United Kingdom's Euro Real-Time Gross Settlement (RTGS) system. On 1999-January-04, CHAPS Euro began operations, and connects to the pan-EU TARGET system. Member banks can thus route both domestic and cross-border payments through CHAPS Euro. CHAPS Euro is currently the second largest cross-border component of the Trans-European Automated Real-time Gross settlement Express Transfer (TARGET) system by both volume and value. / службы Валовых Расчётов в Режиме Реального Времени (ВРРРВ). Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

CLEARING HOUSE ELECTRONIC SUB–REGISTER SYSTEM = СУБРЕЕСТРОВАЯ ЭЛЕКТРОННАЯ СИСТЕМА КЛИРИНГОВОЙ ПАЛАТЫ – The Australian Securities Exchage's (ASX's) Clearing House Electronic Sub-Register System which provides the central register for electronic transfer of share ownership.

CLEARING HOUSE INTERBANK PAYMENTS SYSTEM = СИСТЕМА КЛИРИНГОВОЙ ПАЛАТЫ ПО МЕЖБАНКОВСКИМ ПЛАТЕЖАМ – Clearing House Interbank Payments System (CHIPS). An on-line, real-time, large-value fund transfer network. A same-day settlement multilateral netting system, it is the central US clearing system for international transactions. All transactions settle in US Dollars. Originated in 1970, CHIPS is a private funds transfer network managed by the Clearing House Interbank Payments Company LLC (CHIPCo). CHIPCo is owned by CHIPS participants. CHIPS was established in 1970 by the New York Clearing House Association (now The Clearing House) and operates a realtime, private sector payment system owned by banks. CHIPS maximizes processing efciencies, minimizes risk, and allows participant banks to respond efectively to the ever-changing nature of domestic and international (cross-border) payments. Wells Fargo is one of the early members of CHIPS. CHIPS is a real-time net settlement (RTNS) system that uses a patented multilateral netting process to settle payments with minimal use of liquidity. The system continually scans its payment database looking for ofsetting payments between two or more banks. This process ensures that payments are made efciently and rapidly. Payments are considered fnal and settled when released by CHIPS. Neither daylight nor overnight overdrafts are allowed, eliminating any fnancial risk to CHIPS or its participants. Each CHIPS participant is assigned a four-digit CHIPS Participant Number (often referred to as the CHIPS ABA number (ABA is short for the American Bankers Association)), which serves as a bank identifer within CHIPS and in SWIFT messages. In addition, CHIPS participants have the ability to assign a unique Universal Identifcation Number (UID) for accounts on their books. This six-digit UID is a valuable tool in promoting straight-through processing (STP), since it

can be used to uniquely identify bank and corporate customers without the need to provide sensitive account information. In the United States, Clearinghouse Interbank Payments System (CHIPS) is an automated clearing system used primarily for international payments. This system is owned and operated by the New York Clearinghouse banks and engages Fedwire for settlement. The US wholesale payment infrastructure comprises two systems, which are of a systemic importance and settle in central bank money. The Fed Banks' Fedwire Funds Services (Fedwire) is a real time gross settlement system (RTGS) operated by the Fed, while the Clearing House Interbank Payments System (CHIPS) is a private sector system combining net and gross real time settlement. In addition to these domestic systems, payments services are offered by Continuous Linked Settlement Bank International (CLS Bank), which operates payment versus payment settlement services in 17 currencies mainly for foreign exchange (FX) related transactions. The settlement model implemented by CHIPS since 2001, though partly on a bilateral or multilateral net basis, allows for immediate finality of payments, thanks to a pre-funding arrangement in central bank money. This reflects the trend observed in many countries for the past decade, to combine the benefits of RTGS settlement to provide real time finality with the liquidity saving features of net settlement systems. To facilitate the settlement process, CHIPS maintains an account at the Federal Reserve Bank of New York on behalf of its participants. Each CHIPS participant must prefund the account each day in the amount of an opening primary position requirement, which, once funded via Fedwire funds transfer to the CHIPS account, is used to settle payment orders throughout the day. The amount of the initial prefunding is calculated weekly by CHIPS based on the size and number of transactions by the participant and cannot be removed by participants during the day. During the operating day, participants submit payment orders to a centralized queue maintained by CHIPS. Each payment is settled immediately if the transaction does not result in either a negative primary position for the sender or a position for the receiver that is greater than twice its initial primary position (half of the value and more than 90 percent of payments are settled on this gross basis). If a payment cannot be settled using the funds in the CHIPS account, an optimization algorithm attempts to match the payment order with other payments in the queue against which it can be bi- or multilaterally offset and released with finality at the time of release from the queue. Debits and credits to the current primary position are reflected only in CHIPS's records and are not recorded on the books of the Federal Reserve Bank of New York. Payments remain in the queue until they can be settled by the funds in the participant's position, offset against another payment, or deleted by the participant. The sender can also intervene to release queued payments by transferring more funds from its Fedwire account to feed a CHIPS balance, called the Supplemental Position, that is separate from the primary position. Supplemental prefunding can be withdrawn by the participant from CHIPS, subject to the constraint that the amount withdrawn must be the lesser of their current supplemental position and the total supplemental prefunding paid-in by the participant. The sender can also earmark payments with 'urgent' or 'preferred' priorities to be released immediately from the queue by tying funds from the supplemental position to these payments ahead of time. At 17:00 ET, CHIPS attempts to match, net, set off, and release as many of the remaining payment orders in the queue as possible without putting any participant in a negative position. A multilateral net position for the residual payments pending in the queue is provisionally added to each participant's current combined position (which is the aggregation of the participant's primary position and supplemental position) to calculate the final net position. Each participant with a negative final position has 30 minutes to transfer that amount, called Final Prefunding, to the CHIPS account through Fedwire. Once all of the final prefunding transfers have been received, CHIPS uses this liquidity to release and settle all remaining payment orders in the queue. CHIPS then transfers the remaining positive balances to the participants through Fedwire. If any participant fails to make its final prefunding payment (which happened only once since 2001), CHIPS attempts to settle as many payments as possible using the available funds in the system. The CHIPS settlement model greatly minimizes the settlement risk at stake in traditional deferred net settlement systems, which are exposed to the settlement failure of participants in a debit position. A failure in these systems has the effect of deferring or impeding final settlement of all balances stemming from the system, and ultimately of unwinding the operations of the defaulter(s). This may lead to unexpected changes in positions of non defaulting participants, late in the day with associated liquidity pressures that may cause second round defaults and systemic risk propagation. / взаиморасчёт или сведение (netting) . распространение или продвижение (propagation).

CLEARING MARGIN = КЛИРИНГОВАЯ МАРЖА – Clearing Margin:- financial safeguards to ensure that clearing members (usually companies or corporations) perform on their customer's open futures and options contracts. Clearing margins are distinct from customer margins that individual buyers and sellers of futures and options contracts are required to deposit with brokers. See also Customer Margin.

CLEARING MEMBER = КЛИРИНГОВЫЙ ЧЛЕН – (1) Clearing Members of the New York Mercantile Exchange accept responsibility for all trades cleared through them, and share secondary responsibility for the liquidity of the exchange's clearing operation. They earn commissions for clearing their customers' trades, and enjoy special margin privileges. Origin margin requirements for clearing members are lower than for non-clearing members and customers, and clearing members may use letters of credit posted with the clearing house as original margin for customer accounts as well as for their own trades. Clearing members must meet a minimum capital requirement. A member of the Clearing House or Association. All trades of a non-clearing member must be registered and eventually settled through a clearing member. Memberships in clearing organizations are usually held by companies. Clearing members are responsible for the financial commitments of customers that clear through their firm. Any person who is a member of an exchange clearing organization. The clearing member is responsible for the financial commitments of its customers. All trades of a non-clearing member must be processed and eventually settled through a clearing member. / Любое лицо, являющееся членом клиринговой организации. Клиринговый член несёт ответственность по финансовым обязательствам своих заказчиков. Все сделки не членов клиринговой палаты должны осуществляться и окончательно просчитываться через клирингового члена.

(2) In the cotton futures trading, Clearing Member is a commission merchant who carries futures contracts for customers. Either members or non-members of the New York Cotton Exchange. Every Clearing Member must be a member of the New York Clearing Corporation.

CLEARING ORGANIZATION = КЛИРИНГОВАЯ ОРГАНИЗАЦИЯ (или РАСЧЁТНАЯ ОРГАНИЗАЦИЯ) – Clearing Organization is an entity through which futures and other derivative transactions are cleared and settled. It is also charged with assuring the proper conduct of each contract's delivery procedures and adequate financing of trading. A clearing organization may be a division of a particular exchange, an adjunct or affiliate thereof, or a freestanding entity. Also known as Clearing Association, Clearing House, or Multilateral Clearing Organization. See also Derivatives Clearing Organization.

CLEARING PRICE = РАСЧЁТНАЯ ЦЕНА – Clearing Price is the specified monetary value assigned to a security or asset. This price is determined by the bid and ask process of buyers and sellers interested in trading the security. In any exchange, sellers prefer to part with their assets for the highest price possible while investors interested in buying the same asset desire the lowest purchase price possible. At some point, a mutually agreeable price is reached between buyers and sellers. It is at this point that economists say the market has 'cleared' and transactions take place. Thus, the clearing price of an asset is the price at which it was most recently traded. In securities trading, Clearing Price is the fictional price which approximates the listed price of a security on the day it is sold, and at which a buyer buying short sells its short position, then immediately buys it back to sell it again at a higher price. Also known as

Settlement Price. Clearing Price is the price assigned to an asset after buyers have completed the bid and ask process. The clearing price represents the highest negotiated price that the buyer is willing to pay and the lowest price that the seller is willing to take.

CLEARING SYSTEM = РАСЧЁТНАЯ СИСТЕМА – Clearing System is a system established to settle payments among banks or, in relation to the markets, to facilitate transactions such as the transfer of ownership of securities. In the markets, the clearing process is performed by a clearing house. In the banking sector, a bank is described as a clearing bank if it is a member bank of a national cheque clearing system, which ensures that a payee receives the full value of a cheque or standing order. The clearing house interbank payment system (CHIPS) is a computerised payment system for funds transfers between US banks and the New York branches of foreign banks. The clearing house automated payment system (CHAPS) is a similar system, based in the UK, for clearing payments involving European banks. Clearing System:- the banking systems and procedures for the clearing of payments between banks. / Системы банковского обслуживания и процедуры для расчётов при проведении платежей между банками.

CLEAR SPAN = ПРОЛЁТ В СВЕТУ – Clear Span is the horizontal distance between interior edges of supports. / .

CLEARSTREAM INTERNATIONAL = КЛЫЭСТРИМ ИНТЁНЭШЭНЭЛ – Clearstream International:- the world's entire financial system is built on trust. When assets are traded, both parties must be sure they will receive their part of the transaction. Given the complexity, speed and quantity of assets involved, a fast, secure and trusted third-party is absolutely essential for settling transactions. Clearstream is a leading European supplier of post-trading services. The wholly owned subsidiary of Deutsche Börse ensures that cash and securities are promptly and effectively delivered between trading parties. It also manages, safekeeps and administers the securities that it holds on behalf of its customers. Over 300 000 domestic and internationally traded bonds, equities and investment funds are currently deposited with Clearstream. Clearstream maintains relationships with around 2 500 customers in over 110 countries. Its global network extends across 50 markets. Backed by flexible securities lending and collateral management services, Clearstream offers one of the most comprehensive international securities services available, settling more than 250 000 transactions daily. Clearstream International was formed in January 2000 through the merger of Cedel International and Deutsche Börse Clearing. The full integration of Clearstream was completed in July 2002. Headquartered in Luxembourg, Luxembourg. Clearstream is an electronic clearinghouse that allows financial institutions to settle securities transactions. Along with Euroclear, it is the principal clearinghouse for Euromarket transactions. Clearstream International – a 100 percent subsidiary of Deutsche Börse – is Europe's leading provider of these posttrade services for shares and bonds in domestic and international markets. Clearstream ensures that cash and securities are promptly and effectively delivered between trading parties. It is also responsible for custody and administration of securities deposited. With its international network of depositories, Clearstream covers 50 markets worldwide. Apart from its main business centres in Luxembourg, Frankfurt/Main and Prague, Clearstream has representative offices in Dubai, Hong Kong, London, New York and Tokyo, as well as a branch in Singapore. Clearstream processes more than 9 million transactions per month, involving over 850 000 securities. All in all, close to €11 trillion worth of shares, bonds and funds are in the company's custody deposits – this is around four times the German gross national product. Clearstream International is a settlement organization offering comprehensive service for bonds and equities both domestic and cross-border. The company was formed from the merger of Cedel International and Deutsche Börse Clearing. Its shareholders consist of the world's major financial institutions. Clearstream International has six subsidiaries:- (i) Clearstream Banking Frankfurt (Frankfurt am Main, Germany); (ii) Clearstream Banking Luxembourg (Luxembourg, Luxembourg); (iii) Clearstream Services (Luxembourg, Luxembourg); (iv) Clearstream Nominees London (London, the United Kingdom); (v) Clearstream International UK Branch (London, the United Kingdom); and (vi) Clearstream Operations Prague (Prague, Czech Republic). / Юроклыэ (Euroclear). Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG). (Примечание:- в Русском языке нет точного соответствия звуку при произношении буквы Ö Немецкого алфавита. Разные источники по-разному интерпретируют его. Буквосочетание ЫО может более менее точно передавать произношение буквы Ö лишь при быстром и кратком их произношении, напоминая в отдалении произношение буквы Ё Русского алфавита.) .

CLEAT = ПЛАНКА – Cleat is a fitting of wood or metal, with horns, used for securing lines (tying up). A strip of wood or metal used to afford additional strength, to prevent warping, or to hold in place. Cleat is a piece of wood or metal secured to the floor of a container for providing additional support or strength to cargo restraining device.

CLEISTOGAMOUS = КЛЕЙСТОГАМНОЕ – Cleistogamous:- of flowers that do not open, but nevertheless set seed by self-pollination. / Под Клейстогамией, от Греческих слов Kleistós, означающее Запертый, и Gámos, означающее Брак, понимается самоопыление и самооплодотворение в нераскрывающихся цветках. Например, у Арахиса, Недотроги, многих Фиалок бутон сразу превращается в плод.

CLEISTOGAMY = КЛЕЙСТОГАМИЯ (или САМООПЫЛЕНИЕ) – Cleistogamy is a fertilization taking place in an unopened flower. / Под Клейстогамией, от Греческих слов Kleistós, означающее Запертый, и Gámos, означающее Брак, понимается самоопыление и самооплодотворение в нераскрывающихся цветках. Например, у Арахиса, Недотроги, многих Фиалок бутон сразу превращается в плод.

CLERICAL COLLAR = ПАСТОРСКИЙ ВОРОТНИК – Clerical Collar is a narrow upright white collar worn buttoned at the back of the neck by members of the clergy.

CLERK = КЛЕРК – (1) In the United Kingdom, Clerk is a person who deals with records of some kind, usually in an office. / В Соединённом Королевстве это лицо, которое ведёт дела с записями определённого вида, обычно в конторе. В некоторых странах под Клерком, от Французского слова Clerc и позднелатинского слова Clericus, означавших Духовное Лицо, понимается конторский служащий.

(2) In the United States, Clerk is an anyone dealing with customers, e.g., a salesperson in a retail store. / В Соединённых Штатах Америки это некое лицо, ведущее дела с заказчиками, например, продавец в магазине розничной торговле.

(3) Clerk is a member's employee who has been registered to work on the trading floor as a phone person or runner. / Сотрудник члена биржи, зарегистрированный для работы на торговом полу в качестве лица по связям с клиентами по телефону, или посыльного.

CLEVELAND OPEN CUP = ОТКРЫТЫЙ ТИГЕЛЬ КЛИВЛЭНДА (или ОТКРЫТАЯ ЧАШКА КЛИВЛЭНДА) – Cleveland Open Cup is a flash point test in which the surface of the sample is completely open to the atmosphere, and which is therefore relatively insensitive to small traces of volatile contaminants. / Испытание на Точку Вспышки или Температуру Вспышки, при котором поверхность испытуемого образца полностью открыта для атмосферы, и которое . Сущность метода Кливлэнда заключается в нагревании пробы нефтепродукта в Открытом Тигле Кливлэнда с установленной скоростью до тех пор, пока не произойдёт вспышка паров (точка вспышки или температура вспышки) нефтепродукта над его поверхностью от зажигательного устройства и пока при дальнейшем нагревании не произойдёт загорание продукта (точка воспламенения или температура воспламенения) с продолжительностью горения не менее 5 секунд (с). Под Тиглем, от Немецкого слова Tiegel, понимается

сосуд для плавки, варки или нагрева различных материалов. Тигель применяют, например, для плавки металлов и сплавов, термической обработки металлических изделий в атмосфере контролируемого состава или жидких средах (смотрите Ванная Печь), варки стекла (смотрите Стекловаренная Печь), плавки и прокаливания веществ в лабораториях (смотрите Химическая Лабораторная Посуда). В зависимости от температуры обработки и химических свойств обрабатываемых материалов тигли изготовляют из металлов (чугуна, жароупорных сталей и сплавов, платины и другого), графита, фарфора или огнеупорных материалов. Форма тигля преимущественно круглая в поперечном сечении, с сужением книзу. Промышленные печи, в которых проводят обработку материалов в тиглях, часто называют Тигельными (или Горшковыми) Печами (или Горнами). Смотрите также Тигельная Плавка металлов.

CLF = CHILEAN UNIDAD DE FOMENTO

CLG = CHEMILUMINIGRAM

CLICK–ON LICENSE = ЛИЦЕНЗИЯ ПО ЩЕЛЧКУ – Click-On License:- In the course of their official duties, University faculty and staff may be presented with so-called 'Click-On' Licenses before they can access certain online resources. In these cases, acceptance of the information providers' terms is indicated by clicking on a button labeled 'I agree' (or similar language). There are two types of click-on licenses. One type commits the individual user to terms that govern which uses of the resources are permitted by an underlying license. Behind these agreements, invisible to the user, is a much more extensive license executed by the University, including many additional terms, and legally committing the University to those terms. Formal acceptance of such licenses occurs only after thorough review by the appropriate University unit and the University's General Counsel, almost always resulting in modifications to the license to protect our legal and business interests. In the second type of click-on license, a complete institutional license may be presented in clickable form. This creates the potential for any member of the faculty and staff unwittingly to commit the University to the binding terms of the license without the protections provided by a review process. With the promise of immediate access, you will be asked for your name, position, and institution, and you will be asked to commit the institution to the terms of the license. Because a license is a contract, only persons authorized to sign contracts for the University can commit the University to click-on institutional license agreements. Also known as Click-Through License. See also Shrinkwrap Agreement.

CLICK–THROUGH LICENSE = ЛИЦЕНЗИЯ ЧЕРЕЗ ЩЕЛЧОК – Click-Through License:- when you install a new piece of software either from the Internet or from a network drive within your organisation, you will have come across the click-through licensing concept. The click-through license is usually in the installer or set-up process when installing new software or even during software updates. The license usually presents itself in a small box with the options of 'agree' and 'disagree' at the bottom. If you click disagree you are unable to continue with the install/use of the application. What Does This Mean? By clicking 'agree' you are legally saying that you will abide by the terms and conditions set out in the license agreement. If you haven't read it, then that is your own risk as the license holds the same legal standing as any other license contract or documentation. The term 'Click-Through' comes from the fact that you must 'click-through' the license before accessing the software. The agreement can also present itself as a 'pop up' box before you first use the software once it has been installed. If you disagree with the license agreement at this point then the software will remain installed on your machine, but you will be unable to use any of its features. This is basically a 'take it or leave it' contract. The click through license may also present itself as a link to a webpage that contains the license agreement. This still counts as you agreeing to the license, as the agreement will say something along the lines of:- 'To continue to use this product you must agree to the license agreement/terms and conditions highlighted at ...' It is important to remember that if the license agreement or terms and conditions for using the software are lacking in anyway then the licensee can argue that the information was not readily available and therefore they had nothing to highlight what improper use would be. This is important for the end user should there be any non-compliance or legal challenges. What's In A Click-Through License? Everything. The click-through license holds all license agreement information and terms and conditions for using the software you are installing. When installing new software or entering into a new agreement you should always read the license agreement/EULA (End User License Agreement)/Terms of Use before installing the software to ensure that you are remaining compliant throughout the software's use. Click-Through licenses are the same. If installing a piece of software for the first time you should read the license agreement before clicking agree. As I'll mention later, there are methods for you so you don't need to read the license every time you go through the install process. It's important to make sure that the SAM (short for the (Software Asset Management)) or License Manager keeps up-to-date with the license agreement as this may change. Any changes should be stated at the top or bottom of the click-through license with either a date or a license version number. Issues With This Type Of License:- due to the ease in which you can by-pass a click-though license end users can legally agree to things that they do not understand or haven't read. The nature in which the license presents itself proves difficult and an inconvenience to the end user. During installation isn't an ideal time to provide the user with a legally binding document, as they just want to install the software, either for themselves or for one of their users. It may also be the case that the user installing the software has no licensing or SAM expertise or knowledge, which results in the license being completely dismissed. So along with timing, there is also the fact that the license presents itself in a tiny box with small font. The majority of them are quite frankly unreadable, as they have been compressed into a tiny box that can only show the first few sentences. The end user will instantly dismiss the license agreement as just text that they haven't the time or understanding for reading. Finally, it's all legal jargon that quite frankly isn't digestible to the user. Only SAM/Licensing practitioners along with those with a legal background can realistically fully understand what is in a EULA or license agreement. A lot of the quick-through license agreements are quite lengthy too, which puts end users off. The license agreement should be summarised with the key legal aspects that an end user needs to know at the top of the license agreement. This way they have some understanding of what they are agreeing to. Tips For Click-Through licensing:- (i) take time out to read the content; (ii) helpdesk staff are likely to be installing the software, so have the SAM/Licensing Manager look through the EULA before giving the 'ok' for future installs; (iii) it's just another software license agreement; treat it as you would other EULA's or terms of use; (iv) be wary of accepting the conditions set out by the license when installing free software from the Internet; (v) once you've read the license agreement, if you do disagree with its contents then don't install the software without talking to the developer/vendor; (vi) ensure only those authorized to install software have the administrator rights to install the software; and (vii) have a pre-approved software list. All of the EULA's, Terms and Conditions of the approved software must be read and understood before the software is 'approved'. Finally, Be Careful!:- We've all clicked 'agree' or 'yes' on a click through license both in our professional lives and in our private life. We have to, to be able to access software. There is no getting away from the click-through license aspect. Should you not read the contents that you are at risk of not adhering to the terms and conditions set out. It's a similar set-up with the cloud-based licensing so it's an important you read the contents! Legally a click-through license is as powerful as a normal contract or EULA, so it shouldn't be treated differently. Sure it takes time to read it, but would you rather spend 30 minutes or so reading the terms and conditions of the license, or click-through and run the risk of being non-compliant? Either take it, or leave it! Also known as Click-On License. See also Shrinkwrap Agreement. Clickthrough Agreement is an agreement made by a computer user through clicking on a particular button onscreen. Clickwrap Agreement:- Also known as a Clickthrough Agreement and Clickwrap License. A form of agreement used for software licensing, websites, and other electronic media. It requires the user to agree to terms and conditions before using a website or completing an installation or online purchase process. These

agreements typically present the terms and conditions followed by a check box with the words 'I agree' or 'I accept' that the user must click. Some examples of transactions that would require the user's assent to a clickwrap agreement are:- (i) Downloading or installing software; (ii) Purchasing an airline ticket or online music; (iii) Registering an account on a social media website; and (iv) Using a website. Clickwrap agreements must still meet the criteria for enforceability for unilateral form contracts and not all of their terms may be enforceable.

CLIENT = КЛИЕНТ – (1) Client:- the stock that arrives at our Distribution Centers is owned by the client, the companies that have made arrangements with Logistics Depot to store and distribute their products.

(2) Client is a party with which a company has a commercial relationship concerning the transport of, e.g., cargo or concerning certain services of the company concerned, either directly or through an agent. / В современном понимании термин Клиент, от Латинского слова Cliens, относится к постоянному покупателю или заказчику; лицу, пользующемуся услугами адвоката, нотариуса и тому подобных.

CLIENT CONTRACT = КОНТРАКТ С КЛИЕНТОМ (или ДОГОВОР С КЛИЕНТОМ) – Client Contract is a contract between a broker member and its customer.

CLIMACTERIC = КЛИМАКТЕРИЧЕСКОЕ – Climacteric:- (Latin:- climactericus – turning point, critical time) Ready-to-eat or ripe for consumption.

CLIMACTERIC FRUITS = КЛИМАКТЕРИЧЕСКИЕ ПЛОДЫ – Climacteric Fruits (from the Latin climactericus – turning point, critical time):- for bananas the 'climacteric' is the point at which the fruits turn from green to yellow. Starch breaks down to form sugar. Fruits that reach the climacteric are ready-to-eat or ripe for consumption.

CLIMACTERIC RISE = КЛИМАКТЕРИЧЕСКИЙ ПОДЪЁМ – Climacteric Rise (from the Latin climactericus – turning point, critical time):- the final increase in carbon dioxide excretion which marks the beginning of maturation of a fruit. After the climacteric rise, fruits are ready-to-eat.

CLIMATIC ANALYSIS = КЛИМАТИЧЕСКИЙ АНАЛИЗ – Climatic Analysis is an analysis of data over an extended period of time, including precipitation, maximum and minimum temperature, relative humidity, wind, and radiation.

CLIMAX = КУЛЬМИНАЦИЯ (или КЛИМАКС) – (1) Climax is an aggressive range-expansion day on high volume that characterizes the end of a strong trend within a blow-off stage. Many times this will end up being a reversal pattern, or lead to a breakaway gap in the opposite direction. / Под Кульминацией понимается момент наивысшего напряжения в развитии какого-то действия или процесса. Под Климаксом, от Греческого слова Klimax, означающее Лестница, понимается:- (1) период в жизни человека, характеризующийся инволюцией, угасанием функции половой системы, происходящими на фоне общих возрастных изменений организма. (2) В ботанике, устойчивое состояние растительного сообщества, находящегося в равновесии с окружающей средой; состав его более или менее постоянен в течение длительного времени.

(2) Climax is a plant community of the most advanced type capable of development under, and in dynamic equilibrium with, the prevailing environment. / Климакс или климаксовое растительное сообщество .

CLINCH NAIL = XX (или ЗАКЛЁПОЧНЫЙ ГВОЗДЬ) – Clinch Nail is a nail specially designed to embed its point when driven and clinched. See also Pallet. / Заклёпочный Гвоздь (Clinch Nail):- гвоздь, специально предназначенный для того, чтобы его можно было вставить остриём, вбить и расклепать. Смотрите также Поддон (Pallet).

CLIP = НАСТРИГ – Clip:- with angora goats, refers to the amount of hair removed from a single animal.

CLIP MARK = ОТМЕТИНА ОТ КЛУПОВ – Defect Name:- Clip Mark. Defect Type:- Finishing Defects. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Clip Mark:- This mark is the result of a metal clip having been used to prevent or correct a selvage turndown. Severity:- Major. Clip Mark is a visual deformation near the edge of a fabric parallel with the lengthwise direction caused by pressure exerted by a clasping device on a clip tenter frame. See also Pin Mark. Clip Mark (hole defect):- this defect is not infected with colored fabrics where the production of this defect is due to clip the edge of the metal in the fabric caused by a small clip, small clip of these amendments in order to avoid or in dyeing fabric selvage turnover and use. Clipmark is a visible deformation of selvage due to pressure from a tenter clip. Clip Mark:- a rectangular area of fabric adjacent to the selvedge, which is characterized by tiruising, lustre, surface disturbance, or a difference in color from the normal fabric. Note:- this defect is caused by a maladjusted stenter-clip. Fabric Printing Defect. / Отметина От Клупов цепной ширилки. Порок или дефект набивки тканей. Отметки Клуппа (clip mark):- порок заключительной отделки ткани в виде прямоугольного участка ткани, который характеризуется повреждением, блеском, искажением поверхности или отличием в цвете от смежной обычной ткани. Примечание:- этот порок вызван плохой регулировкой зажимов сушильно-ширильной машины.

CLIP–ON–UNITS = ЗВЕНЬЯ НА ЗАЖИМАХ – Clip-On-Units:- refrigeration units used to cool porthole containers on deck, in port or during road/rail transportation.

CLIPPER BOW = КЛИПЕРСКИЙ НОС – Clipper Bow (maritime term):- a stem curving up and forward in graceful line.

CLIPPING = ОБРЕЗКА – Clipping:- (i) to cut leaves with scissors or shears; and/or (ii) to cut off briskly the margins, ends, or a small portion of an object or plant.

CLK = CHALKINESS

CLO = КЛО – Clo is a unit of thermal insulation used for clothing. One clo is intended to represent the insulation required to keep a resting person warm in an indoor room at 70 °F (21.1 °C). The rate of a person's heat loss is measured in Watts per square meter of skin area per Kelvin of temperature difference across the clothing; the value of insulation is measured by the reciprocal of this rate, in square meter Kelvins per Watt (m^2K/W). One clo is equal to 0.155 m^2K/W or 1.550 togs. Togs, now a slang word in English, is derived from an old Dutch/North German word Tuig or Tög meaning 'the clothes you're wearing'. Tog is the European unit of thermal insulation. 1 tog = 0.645 clo. See also Clo Value. Clo is the unit of thermal resistance. The insulation required to produce the necessary heat to keep an individual comfortable at 21 degrees Centigrade with air movement at 1 m/s. One clo is about equal to the insulation value of typical indoor clothing. Thermal comfort:- Clothing Insulation is measured in Clo units (I_{cl}):- (i) One clo is the amount of thermal resistance which 'is necessary to maintain thermal comfort for a sitting-resting subject in a normally ventilated room (air movement 20 ft/min or 10 cm/sec) at a temperature of 70 °F (21.1 °C) and a RH < 50%. (ii) 1 clo = 0.155 m^2 °C/W. (iii) Lowest clo value is 0 (naked body). (iv) Highest practical clo value = 4 clo (Eskimo clothing, fur pants, coat, hood, gloves etc). (v) Summer clothing ~0.6 clo. (vi) Winter clothing ~1 clo. (vi) I_{cl} passive ~0.15 x weight of clothes (lbs) (10 lbs clothing ~1.5 clo). (vii) I_{cl} active = I_{cl} X (0.6 + 0.4/M) 1.2 Met<M<2.0 Met. Clo is the unit of thermal resistance. The insulation needed to keep an individual producing heat at the rate of 58 W/m^2

comfortable of 21 °C air temperature with air movement of 0.1 m/s. One clo is roughly equal to the insulation value of typical indoor clothing. / Xxxxx (Tuig) или Xxxxx (Tög). Число Кло – единица теплоизоляции одежды.

CLOAK = ПЛАЩ (или МАНТИЯ, или НАКИДКА) – Cloak is a loose outer garment.

CLOCHE = КЛЁШ (или ШЛЯПКА, или КОЛПАК, или КОЛОКОЛ, или ЧАШКА, или МУФТА) – Cloche is a woman's small close-fitting hat usually with deep rounded crown and very narrow brim. / .

CLOCHE = УКРЫТИЕ – Cloche is a glazed structure used to protect delicate plants from rain, wind and cold.

CLOCK REEL = XX МОТОВИЛО – Clock Reel is a device for winding hanks of yarn. Some come with various kinds of counters. An image of a clock reel can be found at the Illinois State Museum site.

CLOD = КОМ (или КОМОК, или СГУСТОК) – Clod is a compact coherent mass of soil, varying in size. Usually produced by breaking up soil by plowing, especially when performed on clayey or fine-textured soils that are either too wet or too dry. Seldom occurs in sandy soil.

CLODHOPPER = БАХИЛЫ (или БОЛВАН) – Clodhopper:- a large heavy work shoe or boot.

CLOG = КЛАГ (или БАШМАК НА ДЕРЕВЯННОЙ ПОДОШВЕ) – Clog:- a shoe, sandal, or overshoe having a thick typically wooden sole. / тяжёлая обувь на деревянной подошве.

CLONE = КЛОН – Clone is a plant which is genetically identical to its parent, produced vegetatively by offsetting, bulbils, cuttings or by in vitro propagation from meristem tissue. Clone, as relates to potatoes, clone is all of the progeny of a single explant and/or plantlets. Clone is:- (1) a group of cells, tissues, or plants which are in principle genetically identical. (2) Progenies resulting from sexual or vegetative propagation. A group of plants vegetatively produced from the same original stock. / потомства единственного эксплантата (кусочка ткани, культивируемого вне организма) и/или проростков (или ростков или всходов). разведение или распространение (propagation). Под Клоном, от Греческого слова Klōn, означающее Ветвь или Отпрыск, понимается популяция клеток или организмов, происшедших от общего предка путём бесполого размножения. Клон – основная единица учёта в генетике микроорганизмов. Клонирование клеток применяют в онкологии, генетике соматических клеток и другом. Новый метод получения клонов растений – выращивание их из одной клетки с применением клеточной культуры.

CLONED DNA = КЛОНИРОВАННАЯ ДНК – Cloned DNA (Passenger) is the DNA segment that is spliced into a vector and that subsequently replicates along with the vector in a host cell in the cloning stage of recombinant DNA technology. / (ДНК Пассажир – чужеродная ДНК в клонирующем векторе) технологии рекомбинантных ДНК.

CLONE LIBRARY = БИБЛИОТЕКА КЛОНОВ – Clone Library is a large collection of bacterial or viral recombinant DNA clones that contain many of the DNA sequences from a single organism. Two general kinds of clone libraries are gene libraries and cDNA libraries. / рекомбинантная ДНК .

CLOQUÉ = КЛЁКЕ – Cloqué is a term used to describe a fabric with a raised effect Jacquard, usually knitted from two colors, and often used interchangeably with matelasse and blister. Cotton cloqué is frequently popular for summer dress and jacket or coat costumes. Cloqué is a fabric with an embossed design; a fabric especially of pique with small woven figures. Additional definition for te word Cloqué provided by an Apparel Search viewer September 2007 is as follows... Cloqué – from the French word for 'Blister', a finishing technique applied to a Jacquard or double cloth of mixed fibers in order to shrink the cellulose content and bubble up the design. The longer the Jacquard float or the larger the embossed design the more exaggerated the effect. / Жакяр (Jacquard). Клёке – натуральный или искусственный шёлк либо шерстяная ткань с характерной рельефной поверхностью. Вырабатывается на жаккардовых станках, рельефность достигается применением двух основных нитей. Верхняя основа креповой крутки слабая, нижняя натянута. Эффект клёке получают и на хлопчатобумажных тканях в результате обработки на соответствующем каландре.

CLOQUÉ FABRIC = ТКАНЬ КЛЁКЕ – Cloqué Fabric:- from the French term for blistered, it refers to any fabric whose surface exhibits an irregularly raises blister effect. / Под Тканью Клёке, от Французского слова Cloqué, означающее Вздувшееся, понимается гофрированная ткань. Клёке – натуральный или искусственный шёлк либо шерстяная ткань с характерной рельефной поверхностью. Вырабатывается на жаккардовых станках, рельефность достигается применением двух основных нитей. Верхняя основа креповой крутки слабая, нижняя натянута. Эффект клёке получают и на хлопчатобумажных тканях в результате обработки на соответствующем каландре.

(THE) CLOSE = ЗАКРЫТИЕ – The Close is the exchange-designated period at the end of the trading session during which all transactions are considered made 'at the close'. See also Call. The settlement price of a trading day. Sometimes loosely referred to as 'On The Close' which implies the last few minutes of trading in a day when orders can still be executed. The Close is a short period at the end of the trading session during which the closing price range is established. Sometimes used to refer to the closing price. See also Open. Close is the period during which all trades on a given day are offi cially declared as having been executed at the close. The closing range is the range of prices during this designated period. / Короткий период в конце торговой сессии, в течение которого формируется уровень цены по закрытии. Иногда используется в отношении цены по закрытии. Смотрите также Открытие (Open).

CLOSE ACCOUNT = ЗАКРЫТЫЙ СЧЁТ (или ЗАКРЫТЫЙ РАСЧЁТ) – Close Account:- a formal request made to terminate an accounting balance. For example, a close account request might be used by the finance department of a business to close down an account held at a bank, credit card company or securities broker, or to reset an income or expense account to zero ahead of a fresh accounting period. See also Open Account. A Closed Account is any account that has been deactivated or otherwise terminated, either by the customer, custodian or counterparty. The term is often applied to a checking or savings account, or derivative trading, credit card, auto loan or brokerage account.

CLOSE CORPORATION = ЗАКРЫТАЯ КОРПОРАЦИЯ – In the United States a Close Corporation is a corporation that elects in its articles of incorporation to be registered under the close corporation statutes of their state of incorporation. Some state close corporation statutes provide for a maximum number of shareholders. In addition, close corporation statutes may eliminate or limit the powers of the board of directors, prescribe preemptive rights to the shareholders or relax the corporate formalities. Exact specifications vary by jurisdiction. Not all state statutes provide for a close corporation provision.

CLOSED DISTRIBUTION SYSTEM = ЗАКРЫТАЯ СИСТЕМА РАСПРЕДЕЛЕНИЯ – Closed Distribution System is a shipping system restricted to moving goods between specified plants and facilities.

CLOSED–END CREDIT = ЗАКРЫТЫЙ КРЕДИТ (или УПАКОВАННЫЙ КРЕДИТ, или КРЕДИТ НА СРОК) – Closed-End Credit is an agreement in which advanced credit plus any finance charges are expected to be repaid in full over a definite time. Most real estate and automobile loans are closed-end agreements.

CLOSED–END FUND = ЗАКРЫТЫЙ ПАЕВОЙ ФОНД – Closed-End Fund is a fund whose investment company issues a fixed number of shares in a portfolio of securities. The shares are traded in the market just like common stock. A fund that has a fixed number of shares or units on issue. Investment fund which operates with a limited number of units outstanding. It is not obligated to redeem units on demand. This type of investment fund is not legal in some countries. The opposite of Open-End Fund. Closed-End Fund is a type of mutual fund that raises money only once and offers a fixed number of shares that are traded on an exchange. Closed end funds fluctuate in response to investor demand as well as to changes in the value of the fund's holdings. Also known as Investment Trust.

CLOSED–END INVESTMENT COMPANY = ИНВЕСТИЦИОННАЯ КОМПАНИЯ ЗАКРЫТОГО ТИПА – Closed-End Investment Company is an investment company created with a fixed number of shares which are then traded as listed securities on a stock exchange. After the initial offering, existing shares can only be bought from existing shareholders. A company which uses its capital to invest in other companies. Shares in closed-end investment companies are readily transferable in the open market and are bought and sold like shares. Closed-end funds can trade at a discount to the market value of the investments they hold. Normally closed-end funds only issue shares at startup then they reinvest the initial investment and sometimes borrowings in a portfolio of securities to produce income and capital gains. A fund with a fixed number of shares outstanding, and one which does not redeem shares the way a typical mutual fund does. Closed-end investment companies behave more like stock than open-end funds:- closed-end investment companies issue a fixed number of shares to the public in an initial public offering, after which time shares in the fund are bought and sold on a stock exchange, and they are not obligated to issue new shares or redeem outstanding shares as open-end funds are. The price of a share in a closed-end investment company is determined entirely by market demand, so shares can either trade below their net asset value ('at a discount') or above it ('at a premium'). Also known as Closed-End Fund, or Publicly-Traded Fund. See also Investment Company.

CLOSED–END MUTUAL FUND = ЗАКРЫТЫЙ ВЗАИМНЫЙ ФОНД – A Closed-End Mutual Fund has a fixed number of shares and is usually listed on a major stock exchange. Whereas open-ended mutual funds are valued strictly on the basis of their NAV (Net Asset Value), which is the market value of all the stocks held by the fund, the shares of closed-end funds trade like stock and usually sell at a discount or premium to NAV, because the shares are subject to the pressures of supply and demand on the open market. A simple example of how a closed-end fund works:- (i) the fund management begins with a finite amount of cash; (ii) they buy stocks based on the fund objectives using all the money they have; (iii) they issue stock in the fund; (iv) the stock is traded just like any other stock on an exchange. There is a bid and ask, and the shares can be traded intraday; and (v) closed-end fund prices are listed in the stock listings rather than in the mutual fund listings. ASA, Ltd. (ASA) and Central Fund of Canada (CEF) are both closed-end funds. Barron's lists all closed-end funds each week in a separate listing showing the amount of premium or discount to NAV for each fund. Closed-End Mutual Funds are those where the shares are initially offered to the public and are then traded in the secondary market. The trading usually occurs at a slight discount to the NAV (Net Asset Value). Over a period of time, the mutual fund managers have developed a variety of investment products to cater for the requirement of investors, having different needs. These include:- (i) growth funds; (ii) balanced funds; and (iii) income funds. / Эй.Эс.Эй. Эл.ти.ди. (ASA, Ltd.).

CLOSED VENTILATED CONTAINER = ЗАКРЫТЫЙ ВЕНТИЛИРУЕМЫЙ КОНТЕЙНЕР – Closed Ventilated Conatiner is a container of a closed type, similar to a general purpose container, but specially designed for carriage of cargo where ventilation, either natural or mechanical (forced), is necessary. / Контейнер закрытого типа, аналогичный контейнеру общего назначения, но разработанный специально для перевозки грузов, требующих наличия вентиляции, будь-то естественной или приводимой в действие с помощью дополнительного оборудования.

CLOSED YEAR = ЗАКРЫТЫЙ ГОД – (1) Closed Year is the Year in which a limit or law expires. In taxation, for example, after a certain number of years a taxpayer cannot claim a refund and the authorities cannot levy penalties for non filing. Closed Year is a tax year for which the statute of limitations has expired. The taxpayer can't claim a refund and the US Internal Revenue Service (IRS) can't collect additional taxes (with certain exceptions).

(2) Closed Year is a year of account that has been closed into another year of account by means of a reinsurance to close contract. Historically most Lloyd's syndicates have operated a three year underwriting account according to which the profit or loss of an underwriting account is determined by the managing agent 36 months after the beginning of that account which is always the start of a calendar year. According to this system the normal closure date of the 2000 year of account (which commenced on 2000-January-01) was 2003-December-31 2003 with the calculation of the reinsurance to close as at that date being finalized in or about February/March 2004.

CLOSE MEMBERS OF THE FAMILY OF AN INDIVIDUAL = БЛИЗКИЕ ЧЛЕНЫ СЕМЬИ ИНДИВИДУУМА – Close Members of The Family of an Individual are those family members who may be expected to influence, or be influenced by, that individual in their dealings with the entity. They may include:- (i) the individual's domestic partner and children; (ii) children of the individual's domestic partner; and (iii) dependants of the individual or the individual's domestic partner.

CLOSEOUT = ЛИКВИДАЦИЯ (или РАСПРОДАЖА) – Closeout:- merchandise that is being sold below original wholesale cost. Can be Overstock, Shelf Pull or Discontinued merchandise.

CLOSE–OUT = ЗАКРЫТИЕ (или ЛИКВИДАЦИЯ) – Close-Out is acceleration and termination of a contract prior to its maturity. Close Out:- to undertake an opposite position, i.e. if the initial transaction was a purchase, the closing out activity is to sell the same tonnage for the same prompt date.

CLOSE–OUT AMOUNT = СУММА ПО ЗАКРЫТИИ – Close-Out Amount is the amount of losses or costs, or gains (as the case may be) under then-prevailing circumstances in replacing or providing for the economic equivalent of the material terms of the terminated over-the-counter (OTC) transactions and any option rights. In determining the close-out amount, the determining party (i.e. the party determining the close-out amount, which is generally the non-defaulting party) is charged with acting in good faith and using commercially reasonable procedures to produce a commercially reasonable result.

CLOSE–OUT NETTING = ВЗАИМОРАСЧЁТ ПО ЗАКРЫТИИ (или СВЕДЕНИЕ ПО ЗАКРЫТИИ, или ПОДВЕДЕНИЕ ИТОГОВ ПРИ ЛИКВИДАЦИИ) – Close-Out Netting is an arrangement to settle all contracted but not yet due obligations to and claims on a counterparty by one single payment, immediately upon the occurrence of one of the defined events of default. If an event of default occurs and the relevant notices are given, all covered transactions under the master agreement are closed out (accelerated and terminated) automatically (these transactions are deemed to be terminated as of the point in time immediately prior to the default; and

the parties must specify whether they want automatic termination to apply) or at the option of the non-defaulting party. A 'termination (close-out) amount' is calculated for each transaction or group of transactions. This termination amount would be either the mark-to-market value of the transaction ('market quotation method') or would represent the amount of the loss incurred by the non-defaulting party ('loss method') for terminating the transaction. The termination amounts for all transactions are then netted into a single net amount ('net termination amount'), which could be either positive (the non-defaulting party is owed that amount) or negative (the non-defaulting party owes that amount). See also Netting, and Payment Netting. If a counterparty to an International Swap and Derivatives Association, Inc. (ISDA®) Master Agreement defaults, the close-out netting provisions of the ISDA® Master Agreement provide that offsetting credit exposures between the two parties will be combined into a single net payment from one party to the other. / взаиморасчёт или сведение (netting) . Международная Ассоциация по Свопам и Деривативам, Инк. (МАСД®; The International Swaps And Derivatives Association, Inc. (ISDA®)). в соответствии с головным соглашением .

CLOSING–OUT = ЗАКРЫТИЕ (или ЛИКВИДАЦИЯ) – Closing-Out is a transaction in which a party who has a bought (sold) option or futures position, exits the position by selling (buying) an option or futures contract in the same series. Liquidating an existing long or short futures or option position with an equal and opposite transaction. Also known as Offset. / Ликвидация существующей длинной или короткой позиции по фьючерсным контрактам или опционам посредством эквивалентной противоположной сделки. Известно также как Офсет или Зачёт (Offset).

CLOSING PRICE = ЦЕНА ПО ЗАКРЫТИИ – Closing Price is the final price at which a security is traded on a given trading day. The closing price represents the most up-to-date valuation of a security until trading commences again on the next trading day. Most financial instruments are traded after hours (although with markedly smaller volume and liquidity levels), so the closing price of a security may not match its after-hours price. Still, closing prices provide a useful marker for investors to assess changes in stock prices over time – the closing price of one day can be compared to the previous closing price in order to measure market sentiment for a given security over a trading day. Closing Price is the price at which an asset finishes a particular period of time, usually a day. See also Settlement Price. Opening Price is taken from the first trade of the day (or period). The public tend to place orders at the opening of the market, reacting to the previous day's close. Closing price is taken from the last trade of the day (or period). Institutional investors normally watch developments during the day and place orders towards the close. Opening price indicates the emotional direction of the market and the closing price represents (in most cases) a more reasoned and well-researched view. Open and close are only significant for periods with a definite break before the next opening, as with days or weeks. They should be ignored in analyzing intra-day charts or markets that are open 24 hours a day. The price recorded during trading that takes place in the final period of a trading session's activity that is officially designated as the 'Close'. Closing Prices for DAX® shares are fixed on the Frankfurt trading floor at 07:55 pm for the other shares at 07:30 pm; variable price fixing is no longer allowed after these times. In electronic Xetra® trading, closing prices are fixed at 05:30 pm in a closing auction. / Ксэтра® (Xetra®). Цена По Закрытии – цена, по которой биржевой актив заканчивает конкретный период времени, обычно сутки. Смотрите также Расчётная Цена (Settlement Price).

CLOSING PURCHASE = ЗАКРЫВАЮЩЕЕ ПРИОБРЕТЕНИЕ – Closing Purchases are transactions in which the investor will change his or her written position by purchasing an option with terms that are like those of a recently sold option. The main benefit to this type of action is that the investor can reduce or possibly even eliminate a short position associated with the options involved. This action will tend to have a positive effect on the value of the investment portfolio, and provide the investor with the opportunity to work with an option that carries a longer position. In order to effect a closing purchase, the seller will work with a broker to manage the proper sequence in the combination. Together, the broker and the investor will evaluate the current short positions that are part of the portfolio. An option with a short position will be selected for sale. The broker will then manage the sale of the selected option. At the same time, the broker will identify a purchase of the same option with a longer position, and make arrangements to execute an order to purchase. Once the option with the short position is sold, the investor has fulfilled his or her obligation as a writer for that option. This leaves the investor free to purchase the similar option and enjoy the longer position associated with the new purchase. As a result of this two step closing purchase, the investor is able to continue enjoying the benefits of owning the option, since the close date is now no longer pending in the short term. While the actual process is very simple, both the investor and the broker often have to put a great deal of thought into creating a closing purchase strategy. Selecting the right option for the method is important, since the idea is to continue enjoying a good return on the purchased option. If the option begins to decrease in value after a longer position is purchased, the closing purchase will not create the desired result. A close out approach of this type is a common investment tool. Close outs by their very nature make it possible for an investor to minimize losses while simultaneously making it possible to maximize return. Few transaction types can accomplish this with the ease of a closing purchase. Closing Purchase is a trade that liquidates an investor's open position. / Сделка, которая ликвидирует ранее открытую биржевым дельцом позицию продажи.

CLOSING RANGE = ДИАПАЗОН ЗАКРЫТИЯ – Closing Range is the band of prices that a security trades at in a specified period, shortly before market close. In the futures market, it refers to the trading range or the minimum and maximum prices that a contract traded at, during the official closing period specified by the exchange. The closing range for a specific security will generally not be very wide, in the case of an orderly market, but may be quite significant during periods of volatility and turmoil. A pattern of consistently higher closing ranges for a stock, in comparison to its prices over the rest of the day, may indicate that it is being subjected to a form of market manipulation known as 'High Close'. The Closing Range is the last two minutes of trading except on the last day, when it's the last half-hour. Closing Range is a price range at which transactions took place at the closing of the market; buying and selling orders during the closing period might have been filled at any point within such a range. A range of prices recorded during the period designated as the official close. See also Settlement Price. / Диапазон цен, установившийся в течение периода, обозначенного в качестве официального закрытия. Смотрите также Расчётная Цена (Settlement Price).

CLOSING TRANSACTION = ЗАКРЫВАЮЩАЯ ТРАНЗАКЦИЯ (или ОПЕРАЦИЯ ПО ЗАКРЫТИЮ) – (1) Closing Transactions are the final transactions that complete the terms of a contract. Generally, each detail of the contract must be met in order for the closing transaction to take place, and thus complete the business deal. Depending on the circumstances, a closing transaction could be a purchase or a sale. In either case, this final action on the part of the investor will bring an existing contract on a given investment to an end and clear the way for the initiation of a new contract. In situations where the contract involves a long position, the sale of the investment would be considered the closing transaction. For circumstances that involve a short position, the closing transaction would be for a short position. With either scenario, the investor would consider the transaction to be fulfilled and complete, and would be free to address other investment options. The importance of properly executing a closing transaction cannot be underestimated. In order for contracts to be considered completed, the final transaction must be conducted in exactly the terms outlined in the body of the contract. This means that the buyer must meet all the qualifications, payment must be received in the form specified in the contract, and that the seller delivers the shares in a timely manner. Without each point of the agreement being met in full, the closing transaction cannot take place. This will mean the contract cannot truly be considered complete. With the execution of the closing transaction, both the buyer and the seller agree to the terms and conditions associated with the investment option. This includes the sale price, the number of units

that are being traded, and the terms of payment that are agreed upon between the two parties. With the rendering of the payment, the closing transaction is considered complete and the contract is fulfilled.

(2) Closing Transaction:- this term means any transaction in which a person (i) grants a call option or put option which is in the same series as a call option or put option, respectively, which had been purchased by such person; or (ii) purchases a call option or put option which is in the same series as a call option or put option, respectively, which had been granted by such person.

CLOSURE DAMAGE = ПОВРЕЖДЕНИЕ ЗАСТЁЖКИ – Closure Damage:- closed pressure of press too great, insufficient press padding. Machinery defects, and namely – Pressing Equipment. / Порок или дефект от машинного оборудования.

CLOSURES = ЗАСТЁЖКИ – Closures are the items used to close openings in apparel and other consumer textile products, i.e. buttons, buckles, hook and eye, snaps and zippers.

CLOSURES MISPLACED = НЕПРАВИЛЬНО РАЗМЕЩЁННЫЕ ЗАСТЁЖКИ – Closures Misplaced:- inattention or inexperience by operating personnel, or improper alignment with gauges. Sewing Room Defects. / Порок или дефект швейного производства.

CLOSURES OMITTED = ПРОПУЩЕННЫЕ ЗАСТЁЖКИ – Closures Omitted:- normally an oversight by operators or failure by inspectors. Sewing Room Defects. / Порок или дефект швейного производства.

CLOTH = ПОЛОТНО (или ТКАНЬ) – Cloth:- the word cloth is sometimes used as a generic term for 'Fabric'. The word Cloth also considered a unit of length for measuring cloth. Cloth is a textile product obtained by bonding, braiding, felting, fusing, knitting, or weaving of fibers. Cloth is synonymous with Fabric. See also Fabric. Cloth is a generic term embracing all textile fabrics and felts. Cloth may be formed of any textile fiber, wire, or other material, and it includes any pliant fabric woven, knit, felted, needled, sewn, or otherwise formed. Fabric or Cloth:- warp and filling yarns combined and interlaced together. / Ткань – это текстильный продукт, полученный скреплением, . основные и уточные пряжи. Текстильное Полотно – в широком смысле слова – ткани, трикотаж, гардинно-тюлевые и другие изделия. Различают полотна по виду сырья (льняные, хлопчатобумажные, шёлковые и тому подобные), массе 1 квадратного метра (в бывшем Союзе Советских Социалистических Республик (СССР)), строению (переплетению нитей).

CLOTHES = ОДЕЖДА (или БЕЛЬЁ, или ОДЕЯНИЯ) – Clothes:- clothing; all the cloth articles of personal and household use that can be washed.

CLOTHES–HORSE = XX (или ЩЕГОЛИХА, или ПИЖОНКА, или ФРАНТИХА, или МОДИСТКА, или МОДНИЦА, или СТОЙКА ДЛЯ СУШКИ БЕЛЬЯ) – Clothes-Horse is:- (1) a frame on which to hang clothes; (2) a conspicuously dressy person. / складная рама для сушки белья.

CLOTHES–LINE = БЕЛЬЕВАЯ ВЕРЁВКА (или ОДЁЖНАЯ ВЕРЁВКА) – Clothes-Line is a line (as of cord or rope) on which clothes may be hung to dry. / Верёвка для развешивания и сушки белья.

CLOTHES MOTH = ОДЁЖНАЯ МОЛЬ – Clothes Moth is the larvae of this moth eats wool and other protein fibers. Clothes Moths are major pests of fabric and other items made of natural fibers. Clothes Moth larvae commonly feed on wool, feathers, fur, hair, upholstered furniture, animal and fish meals, milk powders, and most animal products, such as bristles, dried hair, and leather. Larvae will also infest or feed on lint, dust, paper, and materials soiled with oil. Clothes Moths can feed on mixtures of natural and synthetic fabrics. However, they cannot feed on materials made of synthetic fibers. In nature, clothes moths have been found infesting pollen, hair, dead insects, and dried animal remains. The most common clothes moths are the webbing clothes moth and the case-making clothes moth. Adult Moths do not feed on fabrics, only the caterpillars damage fabrics. Fabrics injured by clothes moths have holes eaten through them by the tiny white caterpillars. Damaged fabrics often have silken cases or silken threads on the surface. Adult moths may be found running over the surface of infested garments or materials. Unlike many other moths, clothes moths are not attracted to light and avoid lighted areas. Description:- clothes moths are small yellowish or brownish moths from 1/4" to 1/2" in length, depending on species. The head and front wings of the webbing clothes moth are golden or yellowish in color; the wings do not have spots. The case-making clothes moth has a dusty, brownish head and front wings with three dark spots, which may be rubbed off with wear. The larvae spin a silken tube or case to protect them from the environment and natural enemies. The tubes created by the webbing clothes moth are attached to and are often located in dark protected areas such as seams or hems. Therefore, the larvae of the webbing clothes moth are stationary and feed in one area. The case made by the case-making clothes moth is not attached to the fabric. The larvae drag the case along and are relatively mobile. The Life Cycle of the clothes moth can last from two months to 2 years. The adults lay eggs on products that the larvae will consume. Each female moth can lay from 100 to 150 eggs, which hatch in about five days. The small white caterpillars vary in size from 1/16 inch newly hatched to 1/3 inch fully grown. The larval stage varies greatly according to conditions and food supply. The larvae live in cases that are enlarged as they grow. When the larvae pupate, the case is transformed into a tough cocoon. The adult moth emerges in one to four weeks. Control:- (i) Prevention and Inspection:- the most important method of clothes moth control is good housekeeping. All susceptible articles should be brushed and cleaned periodically, especially items that will be stored for any length of time. Dry clean items such as woolen sweaters, before they are stored. Sweep or vacuum regularly to remove woolen lint or hair from floors, shelves, and drawers. Also inspect areas for the presence of clothes moths, such as attics, ventilation ducts, and other areas where insects and dust accumulate. Clothing bags, cedar closets, and cedar chests only provide protection when stored materials are free from infestation. (ii) Chemical Control:- some woolen fabrics and carpets can be mothproofed by the manufacturer; however, very few of susceptible products are mothproofed today. Crack and crevice or spot treatment with insecticides may be necessary when clothes moths become established in the home. Apply sprays according to label directions and do not apply directly to clothing. Sprays are effective when properly applied to surfaces as spot treatments. Sprays should be directed to all known or suspected breeding places. Clothing should be removed from closets and drawers before spraying interior surfaces. For severe infestations it may be necessary for a Pest Control Company to fumigate the structure. Tight closets, trunks, or chests can be mothproofed by application of moth balls at the rate of 1 pound per 50 cubic feet of space. Clothes Moth:- any of several small yellowish or buff-colored Moths (esp. Tinea Pellionella and Tineola Bisselliella of the Family Tineidae) whose larvae eat wool, fur or feathers.

CLOTHES–PIN = ПРИЩЕПКА (или ЗАЩИПКА, или ЗАЖИМКА, или ОДЁЖНАЯ БУЛАВКА) – Clothes-Pin is a forked piece of wood or plastic or a small spring clamp used for fastening clothes on a clothesline.

CLOTH FALL–OUT = СБРОС ПОЛОТНА – Cloth Fall-Out:- it is an area consisting of drop stitches lying side by side. Here the yarn is not stitched by several needles laying near to each other. Causes:- (i) yarn breakage; and (ii) it can also occur after a drop stitch especially when an empty needle with closed latch runs into yarn feeder and removes the yarn out of the hooks of following needles. Mending:- non mendable. Knitted fabric defect.

CLOTHIER = ПОРТНОЙ (или ХХ) – Clothier is the one who makes or sells clothing. For example, if the Apparel Search Company sells clothing, they would be considered a clothier. / .

CLOTHING = ОДЕЖДА (или ОБМУНДИРОВАНИЕ, или ОДЕЯНИЕ) – Clothing:- garments, in general; covering.

CLOTHING HORSE = ЛОШАДКА ДЛЯ ОДЕЖДЫ – Clothing Horse:- xxxxx. Clothes Horse is a person who is passionate about new clothes. A big shopper and consequently, a big spender. Clothes Horse is a a frame on which wet clothes can be hung to dry, usually used inside the house. Clothes Horse is a a person, especially a woman, who is employed to wear expensive and fashionable clothes.

CLOTHING WOOL = СУКОННАЯ ШЕРСТЬ – Clothing Wool (industry term) is a wool under 1.5 inch in length and distinguished from combing wools by their shorter length. Principal properties include softness, crimpiness, and felting ability. See also Carding Wool.

CLOTH ROLLER = ТОВАРНЫЙ ВАЛИК (или ВАЛИК ДЛЯ ТКАНИ) – Cloth Roller or Cloth Roll is a roller across the front of the loom, below the breast beam, onto which the newly woven material is wound. Each piece, bolt or cut of cloth is taken from the cloth rollers when the correct cloth yardage has been woven. Cut lengths of cloth will vary considerably dependent upon local conditions. Sixty to eighty yards seems to be the length desired for woolen and worsted goods; forty to fifty yards for rayon and cotton goods. There is no cut-and-dried rule as to what a cut-length should be in actual yardage. See also Loom.

CLOTH YARD = ЯРД ПОЛОТНА – Cloth Yard is a yard esp. for measuring cloth; specific:- a unit of 37 inches equal to the Scottish ell and used also as a length for arrows.

CLOUD POINT = ТОЧКА ПОМУТНЕНИЯ (или ТЕМПЕРАТУРА ПОМУТНЕНИЯ) – A Cloud Point is the temperature at and above which a component will precipitate from solution. Most water soluble compounds become more soluble as temperature is increased, but some, such as non-ionic surfactants become less soluble with rising temperature. The solution will go from clear to cloudy at the cloud point temperature, and the surfactants effectiveness will drop. Cloud Point is the temperature at which waxy crystals in an oil or fuel form a cloudy appearance. Cloud Point is the term which is related to the wax formation in the oil. Cloud point indicates the temperature at which waxes begin to form in the oil. Gradually, the wax formed crystallizes and clogs the filters. The cloud point helps in finding out the tendency of the oil to form wax. A Cloud Point is the temperature at which a fuel, when cooled, begins to congeal and take on a cloudy appearance caused by the bonding of paraffins. / осадок (precipitate). Точка Помутнения или Температура Помутнения – температура, при которой топливо, при его охлаждении, начинает застывать и становится мутным на вид из-за связывания парафинов.

CLOUD YARN = ПРЯЖА ДВУХ СЛОЖЕНИЙ ФАСОННОЙ КРУТКИ ИЗ ОДИНОЧНОЙ ПРЯЖИ РАЗНЫХ ЦВЕТОВ – Cloud Yarn is a term given to yarns of irregular twist obtained by alternately holding one of the component threads while the other, being delivered quickly, is twisted around it, and then reversing the position of the two threads; thus producing alternate clouds of the two colors.

CLOUDY WEB = НЕРОВНАЯ ВАТКА (или НЕРОВНЫЙ ПРОЧЁС) – Cloudy Web is an uneven or irregular web from the doffer of a card.

CLOUDY WOOL = СОМНИТЕЛЬНАЯ ШЕРСТЬ (или МУТНОВАТАЯ ШЕРСТЬ) – Cloudy Wool is a wool that is off-color. It may be due to wool becoming wet while poorly stored in a pile.

CLO VALUE = ЧИСЛО КЛО – Clo is a unit of thermal insulation used for clothing. One clo is intended to represent the insulation required to keep a resting person warm in an indoor room at 70 °F (21.1 °C). The rate of a person's heat loss is measured in Watts per square meter of skin area per Kelvin of temperature difference across the clothing; the value of insulation is measured by the reciprocal of this rate, in square meter Kelvins per Watt (m^2K/W). One clo is equal to 0.155 m^2K/W or 1.550 togs. Togs, now a slang word in English, is derived from an old Dutch/North German word Tuig or Tög meaning 'the clothes you're wearing'. Tog is the European unit of thermal insulation. 1 tog = 0.645 clo. See also Clo. Clo is the unit of thermal resistance. The insulation required to produce the necessary heat to keep an individual comfortable at 21 degrees Centigrade with air movement at 0.1 m/s. One clo is about equal to the insulation value of typical indoor clothing. Thermal comfort:- Clothing Insulation is measured in Clo units (I_{cl}):- (i) One clo is the amount of thermal resistance which 'is necessary to maintain thermal comfort for a sitting-resting subject in a normally ventilated room (air movement 20 ft/min or 10 cm/sec) at a temperature of 70 °F (21.1 °C) and a RH < 50%. (ii) 1 clo = 0.155 m^2 °C/W. (iii) Lowest clo value is 0 (naked body). (iv) Highest practical clo value = 4 clo (Eskimo clothing, fur pants, coat, hood, gloves etc). (v) Summer clothing ~0.6 clo. (vi) Winter clothing ~1 clo. (vi) I_{cl} passive ~0.15 x weight of clothes (lbs) (10 lbs clothing ~ 1.5 clo). (vii) I_{cl} active = I_{cl} X (0.6 + 0.4/M) 1.2 Met < M < 2.0 Met. Clo is the unit of thermal resistance. The insulation needed to keep an individual producing heat at the rate of 58 W/m^2 comfortable of 21 °C air temperature with air movement of 0.1 m/s. One clo is roughly equal to the insulation value of typical indoor clothing. / Число Кло – единица теплоизоляции одежды.

CLP = CHILEAN PESO

CLP = CONTAINER LOAN PLAN

CLRRI = CUU LONG DELTA RICE RESEARCH INSTITUTE

CLS = CONTINUOUS LINKED SETTLEMENT

CLS BANK = СИ.ЭЛ.ЭС. БЭНЬК (или БАНК ПСР) – CLS Bank is a bank set up by leading trading banks, with the support of central banks and the BIS (Bank for International Settlements), to settle foreign exchange transactions on a global basis. CLS, or Continuous Linked Settlement, is designed to remove the Herstatt Risk of default by one party in a foreign exchange deal. CLS Bank is based in New York, USA and is an Edge Corporation bank supervised by the Federal Reserve. CLS Bank is a multi-currency bank, holding an account for each Settlement Member and an account at each eligible currency's Central Bank, through which funds are received and paid. Technical and operational support is provided by CLS Services, an affiliate of CLS Bank. CLS Bank observes the Core Principles for Systemically Important Payment Systems published by the Committee on Payment and Settlement Systems (CPSS) of the central banks of the G10 countries. The Core Principles serve as guidelines for the design and operation of safer and more efficient systemically important payment systems by suggesting the key characteristics that these systems should have. / или Банк Постоянно Связанных Расчётов (ПСР). банк в форме Корпорации по Акту Эдьжа.

CLSU = CENTRAL LUZON STATE UNIVERSITY

CLU = CHARTERED LIFE UNDERWRITER

CLUB OF TEN = КЛУБ ИЗ ДЕСЯТИ (или КЛУБ ДЕСЯТИ) – Club Of Ten:- this is one of the names of Group Of Ten (G10). See also Group Of Ten, or Paris Club. / Смотрите также Группа Из Десяти (Group Of Ten), или Парижский Клуб (Paris Club).

CLUMPS = КОМКИ (или ГЛЫБЫ, или КУЧКИ) – Clumps:- in nonwoven fabrics, an irregularly shaped grouping of fibers caused by insufficient fiber separation.

CLUNY LACE = КЛЮНИНСКОЕ КРУЖЕВО – Cluny Lace is a heavy lace, often made of thick cotton or man-made fibers using the bobbin method. It is the traditional lace for doilies and place mats, but is also used in apparel. See also Bobbin Lace. / Французский город Клюни (Cluny).

CLUSTER = СКОПЛЕНИЕ (или ГРОЗДЬ) – Cluster:- things grouped together because of similar characteristics or physical proximity. Closely crowded inflorescence.
