(2) Doff:- a set of full bobbins produced by one machine (a roving frame, a spinning frame, or a manufactured filament-yarn extrusion machine). / Экструзия или Выдавливание (Extrusion).

DOFFER = СЪЁМЩИК (или СЪЁМНЫЙ БАРАБАН, или СОБИРАТЕЛЬ ОЧЁСА) – Doffer is:- (1) the last or delivery cylinder of the card from which the sheet of fibers is removed by the doffer comb. (2) An operator who removes full bobbins, spools, containers, or other packages from a machine and replaces them with empty ones. / (1) Собиратель Очёса на гребнечёсальной машине. (2) Съёмный Барабан чёсальной машины.

DOFFER COMB = СЪЁМНАЯ ГРЕБЁНКА – Doffer Comb:- a reciprocating comb, the teeth of which oscillate close to the card clothing of the doffer to strip the web of fibers from the card. / Съёмная Гребёнка – счёсывающий гребень, совершающий колебательные движения и сбивающий прочёсанный слой волокна – прочёс или ватку – со съёмного барабана чёсальной машины.

DOFFER LOADING = ЗАГРУЗКА СЪЁМЩИКА – Doffer Loading:- fibers imbedded so deeply into the doffer wire clothing that the doffer comb cannot dislodge them to form a traveling web.

DOFFING = СЪЁМ – Doffing is the operation of removing full packages, bobbins, spools, roving cans, caps, etc, from a machine and replacing them with empty ones.

DOG COLLAR = СОБАЧИЙ ОШЕЙНИК – Dog Collar:- (slang) clerical collar; a wide flexible snug-fitting necklace. / высокий жёсткий воротник.

DOGGY = СОБАЧЬЯ – Doggy:- wools that have no character and show the results of lack of breeding. These wools are usually short, coarse, and lacking in feel.

DOH = DAYS ON HAND

DOHA DEVELOPMENT AGENDA = ДОХАВСКАЯ ПОВЕСТКА ДНЯ ПО РАЗВИТИЮ – Doha Development Agenda is the current round of multilateral trade negotiations in theWorld Trade Organisation that were initiated in November 2001, in Doha, Qatar.

THE DOHA ROUND = ДОХАВСКИЙ РАУНД – 2001 November:- WTO members meeting in Doha, Qatar, agree on the Doha Development Agenda, the nineth trade round which is intended to open negotiations on opening markets to agricultural, manufactured goods, and services. 2001 December:- China formally joins the WTO. Taiwan is admitted weeks later. 2002 August:- WTO rules in favor of the European Union (EU) in its row with Washington over tax breaks for US exporters. The EU gets the go-ahead to impose USD4bn in sanctions against the United States (US), the highest damages ever awarded by the WTO. 2002 September:- former Thai deputy prime minister Supachai Panitchpakdi begins a three-year term as director-general. He is the first WTO head to come from a developing nation. 2003 September:- WTO announces deal aimed at giving developing countries access to cheap medicines, hailing it as historic. Aid agencies express disappointment at the deal. 2003 September:- world trade talks in Cancun, Mexico collapse after four days of wrangling over farm subsidies, access to markets. Rich countries abandon plans to include so-called Singapore Issues of investment, competition policy and public procurement in trade talks. 2003 December:- WTO rules that duties imposed by the US on

imported steel are illegal. US President George Walker Bush repeals the tariffs to avoid a trade war with the EU. 2004 April:- WTO rules that US subsidies to its cotton farmers are unfair. 2004 August:- Geneva talks achieve framework agreement on opening up global trade. US and EU will reduce agricultural subsidies, while developing nations will cut tariffs on manufactured goods. 2005 March:- upholding a complaint from Brazil, WTO rules that US subsidies to its cotton farmers are illegal. 2005 May:- WTO agrees to start membership talks with Iran. 2005 September:- Frenchman Pascal Lamy takes over as WTO director-general. He was formerly the EU's trade commissioner. 2005 October:- US offers to make big cuts in agricultural subsidies if other countries, notably EU do the same. EU responds, but France opposes more concessions. 2005 November:- WTO approves membership for Saudi Arabia. 2005 December:- world trade talks in Hong Kong begin amid widespread belief that they will not succeed in making a breakthrough. 2007 January:- Vietnam becomes the 150th WTO member state. The Doha Development Round of World Trade Organization negotiations aims to lower trade barriers around the world, permitting free trade between countries of varying prosperity. As of 2006, talks have stalled over a divide between the developed nations led by the European Union, the United States and Japan and the major developing countries (represented by the G20 developing nations), led and represented mainly, however, by India, Brazil, China and South Africa. The Doha round began with a ministerial-level meeting in Doha, Qatar in 2001, with subsequent ministerials in Cancún, Mexico (2003), and Hong Kong, China (2005). Related negotiations have taken place in:- Geneva, Switzerland; Paris, France; and again Geneva. The Doha round of WTO negotiations began in November 2001. This round was to have begun at the 3rd ministerial conference in Seattle in 1999, and was to have been called The Seattle Round but severe demonstrations disrupted those meetings, and this round's beginning was put off until the meetings at the more secure and controllable Doha, Qatar. The purpose was to agree on the Doha Development Agenda, and from there negotiate opening agricultural and manufacturing markets. The intent of the round, according to its proponents, was to make trade rules fairer for developing countries. Opponents charged that the round would expand a system of trade rules that were bad for development and interfered excessively with countries' domestic 'policy space'. The 2003 Cancún talks, intended to forge concrete agreement on the Doha round objectives, collapsed after four days during which the members could not agree on farm subsidies and access to markets. Negotiations focused upon four key areas:- agriculture, industrial goods, trade in services, and updated customs codes. The North-South divide was most prominent on issues of agriculture. Rich countries' farm subsidies (both the EU's Common Agricultural Policy and the US Government agro-subsidies) became a major sticking point. The developing countries were seen as finally having the confidence to reject a deal that they viewed as unfavorable. This is reflected by the new trade bloc of developing and industrialized nations: the G20. Since its creation, the G20 has had fluctuating membership, but is spearheaded by the G4 (People's Republic of China, India, Brazil and South Africa), and overall accounts for approximately 65% of the world population, 72% of its farmers and at least 2/3 of its agricultural output. The August 2004 Geneva talks achieved a framework agreement on opening global trade. The United States, the European Union, Japan and Brazil agreed to end export subsidies, reduce agricultural subsidies and lower tariff barriers. Developing nations agreed to reduce tariffs on manufactured goods, but gain the right to specially protect key industries. The agreement also provides for simplified customs, and stricter rules for rural development aid. Trade negotiators wanted to make tangible progress before the December 2005 WTO meeting in Hong Kong, and hoped to agree to the deal before 2007 when US fast-track legislation expires. Without fast-track, it will be much harder to get a ratification from the US Senate. Paris talks were hanging over a few issues:- France protested moves to cut subsidies to farmers, while the United States, Australia, the European Union, Brazil and India failed to agree on issues relating to chicken, beef and rice. Most of the sticking points were small technical issues, making trade negotiators fear that agreement on large politically risky issues will be substantially harder. By July-August an agreement was needed in order to finalize negotiations for agreement in Hong Kong. Oxfam charged the EU with 'delaying tactics' which have threatened to spoil the round. The Sixth WTO Ministerial Conference took place in Hong Kong, December 13 to 18, 2005. Trade ministers representing most of the world's governments reached a deal that sets a deadline for eliminating subsidies of agricultural exports by 2013. The final declaration from the talks, which resolved several issues that have stood in the way of a global trade agreement, also requires industrialized countries to open their markets to goods from the world's poorest nations, a goal of the United Nations for many years. The declaration gives fresh impetus for negotiators to try to finish a comprehensive set of global free trade rules by the end of 2006. Pascal Lamy, Director General of the WTO, said, 'I now believe it is possible, which I did not a month ago'. As many as 2 000 protestors demonstrated outside the Hong Kong Convention and Exhibition Centre, the location of the talks. Clashes with the police left at least 116 people injured, including 56 officers, although there were no critical injuries according to the authorities. The July 2006 talks in Geneva failed to reach an agreement about reducing farming subsidies and lowering import taxes, and continuation of the negotiations will take months to resume. A successful outcome of the Doha round has become increasingly unlikely, because the broad trade authority granted under the Trade Act of 2002 to US President George W. Bush expires in 2007. Any trade pact will then have to be approved by the US Congress with the possibility of amendments, which creates an additional burden on the US negotiators and decreases the willingness of other countries to participate. Hong Kong offered to mediate the collapsed trade liberalisation talks. Director-General of Trade and Industry, Raymond Young, says the territory, which hosted the last round of Doha negotiations, has a 'moral high-ground' on free trade that allows it to play the role of 'honest broker'. The Doha Development Round of World Trade Organization negotiations aims to lower trade barriers around the world, permitting free trade between countries of varying prosperity. As of 2006, talks have stalled over a divide between the developed nations led by the European Union, the United States and Japan and the major developing countries (represented by the G20 developing nations), led and represented mainly, however, by India, Brazil, China and South Africa. The Doha round began with a ministerial-level meeting in Doha, Qatar in November 2001, with subsequent ministerials in Cancún, Mexico (2003), and Hong Kong, China (December 2005). Related negotiations have taken place in:- Geneva, Switzerland (August 2004); Paris, France (December 2005); and again Geneva (July 2006). / выработка (output). Паскаль Лями (Pascal Lamy). Дьжодьж Вокё Бош (George Walker Bush; 1946–).

DOING BUSINESS AS = ВЕДЕНИЕ БИЗНЕСА ПОД ИМЕНЕМ – 'Doing Business As' is a legal term for conducting business under a registered name.

DOJI = ДОДЗИ – In visual analysis, Doji is a candlestick with a body so small that the Open and Close prices are equal. A Doji occurs when the Open and Close for that day are the same, or very close to being the same. The Doji is one of the most important candlestick patterns. A doji formation is a single-candle pattern. It occurs when prices opened and closed at the same level. A doji represents equilibrium between supply and demand, a tug of war that neither the bulls nor bears are winning. Traders should not take action on the doji alone. Always wait for the next candlestick to make an appropriate trade. After a long uptrend, the appearance of a doji can be an ominous warning sign that the trend has peaked or is close to peaking. The converse holds true for a downtrend. When assessing a doji, always take careful notice of where the doji occurs. If the security you're examining is still in the early stages of an uptrend or downtrend, then it is unlikely that the doji will mark a top, but it could precede a pause in the current trend move. It can be viewed as a pivot. 'Top Marker' (right) includes an example of a successful doji pattern. As shown in the daily chart, the S&P 500 started its rally from June 25, 2013, reached a high of 1709 on August 02, and then on August 05, the index opened at 1708 and closed at 1 707.41. The open and the high were almost the same, which are the qualifications for the doji candlestick pattern. Confirmation of a new downtrend came on August 06 when the S&P 500 broke the August 05 low of 1 703 and closed at 1 697.3. A reasonable stop loss could have been placed at the August 05 high of 1 709. / Под Додзи (Doji) в техническом анализе биржевых рынков или

визуальном анализе свечных графиков изменения цены биржевого актива или инструмента понимается свеча с невероятно малым телом, которое мало настолько, что цены Открытия (Open) и Закрытия (Close) временного интервала, соответствующего данной свече, совпадают. Таким образом, Додзи появляются на графиках тогда, когда цены открытия или закрытия совпадают или отличаются друг от друга на столь малое значение, что фактически приравниваются друг к другу. При произношении Японского слова Додзи необходимо учитывать то, что буква И произносится как И, а не как Ы (как это обычно произносится большинством людей в России); а Ж звучит очень мягко. Некоторые для произношения этого слова могут применять слово Додзи, хотя и то и другое произношение будет лишь близко напоминать реальное произношение этого слова на Японском языке, поскольку в Русском языке нет букв, чтобы выразить его реальное произношение.

DOL = DAILY OFFICIAL LIST

DOLDRUMS = ШТИЛЕВЫЕ ПОЛОСЫ – Doldrums (maritime term):- the belt on each side of the Equator in which little or no wind ordinarily blows.

DOLE = DEPARTMENT OF LABOR AND EMPLOYMENT

DOLLAR COST AVERAGING = УСРЕДНЕНИЕ ДОЛЛАРОВОЙ СТОИМОСТИ – Dollar Cost Averaging is a system of buying securities at regular intervals with a fixed Dollar amount. Under this system investors buy by the Dollar's worth rather than by the number of shares. If each investment is of the same number of Dollars, payments buy more shares when the price is low and fewer when it rises. Thus temporary downswings in price benefit investors if they continue periodic purchases in both good times and bad and the price at which the shares are sold is more than their average cost. See also Formula Investing.

DOLLY = ТЕЛЕЖКА – Dolly is a set of wheels that support the front of a container; used when the automotive unit is disconnected. A detachable front axle for semi-trailer. See also Semi-Trailer.

DOLMAN SLEEVE = РУКАВ ДОЛМАНА (или ДЛИННЫЙ И ШИРОКИЙ РУКАВ) – Dolman Sleeve is a full sleeve that is very wide at the armhole and narrow at the wrist. This type of sleeve tends to draw attention to the shoulder and arm.

DOLPHIN = ПРИЧАЛЬНАЯ ТУМБА (или ШВАРТОВЫЙ ПАЛ) – Dolphin (maritime term):- a cluster of piles for mooring.

DOMAIN = ДОМЕН – Domain:- a group of computers linked to the Internet whose host names share a common suffix, such as '.com' (commercial), '.edu' (educational), or '.net' (communications network). / Под Доменом, от Французского слова Domaine, означающее Владение или Область или Сфера, понимается группа компьютеров, подключённых к Интернету, чьи названия хозяев распределены под общим суффиксом, таким как '.com' (от слова commercial – коммерческий), '.edu' (от слова образовательный – educational), или '.net' (от словосочетания сеть связи – communications network). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

DOMAIN NAME RESOLVERS = ОПРЕДЕЛИТЕЛИ ИМЁН ДОМЕНОВ – Domain Name Resolvers:- scattered across the Internet are thousands of computers – called 'Domain Name Resolvers' or just plain 'resolvers' – that routinely cache the information they receive from queries to the root servers. These resolvers are located strategically with Internet Service Providers (ISPs) or institutional networks. They are used to respond to a user's request to resolve a domain name – that is, to find the corresponding IP address. / Определители Имён Доменов – это разбросанные по всему Интернету тысячи компьютеров, называемые 'определители имён доменов' или просто 'определители', которые постоянно кэшируют данные запросов к корневым серверам. Поставщики Услуг Интернета (ПУИ) или обслуживающие сеть организации размещают эти определители в стратегически важных узлах сети Интернет. Определители используются при ответе на запросы пользователя для разрешения доменного имени, то есть для поиска соответствующего ИП-адреса.

DOMAIN NAME SYSTEM = СИСТЕМА ДОМЕННЫХ ИМЁН – Domain Name System (DNS) helps users to find their way around the Internet. Every computer on the Internet has a unique address – just like a telephone number – which is a rather complicated string of numbers. It is called its 'IP address' (IP stands for 'Internet Protocol'). IP Addresses are hard to remember. The DNS makes using the Internet easier by allowing a familiar string of letters (the 'domain name') to be used instead of the arcane IP address. So instead of typing 207.151.159.3, you can type www.internic.net. It is a 'mnemonic' device that makes addresses easier to remember. / Система Доменных Имён (СДИ) упрощает работу пользователей в Интернете. Каждому компьютеру, подключённому к Интернету, назначен уникальный адрес, точно так же, как каждому телефону назначается уникальный телефонный номер, состоящий из довольно сложной последовательности цифр. Этот адрес называется IP-адресом (сокращение IP означает 'Интернет-Протокол'). IP-адреса трудны для запоминания. Система DNS упрощает использование Интернета, позволяя вводить строку из букв (доменное имя) вместо непонятного IP-адреса. Поэтому вместо последовательности 207.151.159.3 можно ввести www.internic.net. Это 'мнемонический' способ, который позволяет легче запоминать адреса.

DOMESTIC = ВНУТРЕННЕЕ (или ОТЧЕСТВЕННОЕ, или ДОМАШНЕЕ, или ДОМЭСТИК) – In national accounting, term 'Domestic' refers to transactions which take place within a nation's borders or territories. / В национальном бюджетном процессе, Под Домэстиком. от Латинского слова Domesticus, означающее Домашний, понимается.

DOMESTIC AND COMMERCIAL WASTEWATER = ВНУТРЕННЯЯ И КОММЕРЧЕСКАЯ СТОЧНАЯ ВОДА (или ВНУТРЕННИЙ И КОММЕРЧЕСКИЙ СТОК) – Domestic And Commercial Wastewater is a wastewater (sewage) produced by domestic and commercial establishments.

DOMESTIC BILL OF LADING = ВНУТРЕННИЙ КОНОСАМЕНТ – Domestic Bill Of Lading is a bill of lading is a document or receipt issued by a carrier when it receives goods for shipment. Usually, the receipt indicates (i) the particular vessel on which the goods have been placed; (ii) destination; (iii) cargo weight; and (iv) terms of transportation. Some sales transactions involve sales and transportation contracts; therefore, a seller not only sells goods, but also arranges the transportation of the goods to the purchaser. Under such circumstances, a bill of lading serves as a link between the sales part of the transaction and the transportation portion of it. Typically, contracts governing carriage of goods by water are evidenced by charter parties or bills of lading. The term charter party is employed to describe three widely differing types of contracts relating to the use of vessels owned or controlled by others. Bills of lading, by contrast, usually fall into one of four categories inland, ocean, through, and air waybill and are independent of the vessel used. Domestic bill of lading covers domestic transportation of merchandise; further, it provides the details agreed upon for transportation. The Domestic Bill of Lading is a non-negotiable bill of lading primarily containing routing details; usually used by truckers and freight forwarders.

DOMESTIC BOND = ОБЛИГАЦИЯ ВНУТРЕННЕГО ЗАЙМА – Domestic Bond:- bond issue placed for public subscription by a borrower who is domiciled in the country where the issue is floated. The opposite Foreign Bond.

DOMESTIC CARRIAGE = ВНУТРЕННЯЯ ПЕРЕВОЗКА – Domestic Carriage is a carriage whereby the place of departure and the place of destination are situated within one country (aircargo). / В перевозках авиационных грузов, перевозка, при которой место отправления и место назначения расположены в пределах одной страны.

DOMESTIC CONSUMPTION = ВНУТРЕННЕЕ ПОТРЕБЛЕНИЕ – In the Cotton industry of the United States, Domestic Consumption is a mill raw fiber consumption plus raw fiber equivalent of imported textiles, less raw fiber equivalent of exported textiles.

DOMESTIC EXPORTS = ЭКСПОРТ ВНУТРЕННЕЙ ПРОДУКЦИИ (или ВЫВОЗЫ ОТЕЧЕСТВЕННОЙ ПРОДУКЦИИ) – Domestic Exports are the exports of domestic merchandise include commodities which are grown, produced, or manufactured in the United States, and commodities of foreign origin which have been changed in the United States, including US Foreign Trade Zones, from the form in which they were imported, or which have been enhanced in value by further manufacture in the United States.

DOMESTIC OFFSHORE TRADES = РЕЙСЫ ПО ВНУТРЕННИМ ТЕРРИТОРИАЛЬНЫМ ВОДАМ – Domestic Offshore Trades are domestic shipping routes serving Alaska and non-continental US States and territories.

DOMESTIC PAYMENTS = ВНУТРЕННИЕ ПЛАТЕЖИ (или АВТОНОМНЫЕ ПЛАТЕЖИ, или МЕСТНЫЕ ПЛАТЕЖИ) – Domestic Payments are the payments where only resident parties are involved.

DOMESTIC PRODUCTION = ОТЕЧЕСТВЕННАЯ ПРОДУКЦИЯ (или ВНУТРЕННЯЯ ПРОДУКЦИЯ, или МЕСТНАЯ ПРОДУКЦИЯ) – Domestic Production:- sum total of goods and services produced by a domestic economy, regardless of the producers' nationality.

DOMESTIC PRODUCTS = ОТЕЧЕСТВЕННЫЕ ПРОДУКТЫ (или ВНУТРЕННИЕ ПРОДУКТЫ, или МЕСТНЫЕ ПРОДУКТЫ) – Domestic Products are those plants and unprocessed or unmanufactured commodities grown or produced in the United States, its possessions, and the Commonwealth of Puerto Rico.

DOMESTIC RATE = ВНУТРЕННЯЯ СТАВКА – Domestic Rate is a rate applicable within a country, and in most cases subject to special conditions other than those of IATA (aircargo). / В перевозках авиационных грузов под Внутренней Ставкой понимается ставка, применяемая внутри страны, и в большинстве случаев она является предметом специальных условий, нежели тех, которые учитываются Международной Ассоциацией Воздушного Транспорта (МАВТ; The International Air Transport Association (IATA)).

DOMESTIC REPRESENTATIVE = ОТЕЧЕСТВЕННЫЙ ПРЕДСТАВИТЕЛЬ (или ВНУТРЕННИЙ ПРЕДСТАВИТЕЛЬ, или МЕСТНЫЙ ПРЕДСТАВИТЕЛЬ) – Domestic Representative is a person residing within the United States who is appointed by a patentee or assignee of a trademark application or registration that does not reside in or is not domiciled within the United States. A domestic representative may be served process or notice of proceedings affecting the application, patent or trademark registration, or related rights.

DOMESTICS = ДОМАШНИЙ ТЕКСТИЛЬ – Domestics:- a term used to refer to bedding (sheets, comforters, etc), towels, linens and other 'soft goods'. Term might have a different meaning company to company so always inquire definition before purchasing.

DOMESTIC SETTLEMENT = ВНУТРЕННИЙ РАСЧЁТ – Domestic Settlement is a settlement that takes place in the country where both counterparties to the trade are located. / Под Внутренним Расчётом понимается расчёт, который имеет место в стране, в которой расположены обе стороны купли-продажи.

DOMESTIC SPENDING = ОТЕЧЕСТВЕННОЕ РАСХОДОВАНИЕ (или ВНУТРЕННЕЕ РАСХОДОВАНИЕ) – In national accounting, Domestic Spending is a standard aggregate measure used in international economics representing final uses of goods and services by a country's residents. Domestic spending includes private consumption, government consumption and gross capital investment. Net domestic spending is gross domestic spending less depreciation. Gross national product is computed by adding exports of goods and services plus factor income from the rest of the world to domestic spending, after deducting imports of goods and services and factor income paid to the rest of the world. / В национальном бюджетном процессе, .

DOMESTIC SUPPORT = ОТЕЧЕСТВЕННАЯ ПОДДЕРЖКА (или ВНУТРЕННЯЯ ПОДДЕРЖКА, или МЕСТНАЯ ПОДДЕРЖКА) – A term Domestic Support refers to the annual level of support, expressed in monetary terms, provided to agricultural production. It is one of the three pillars of the Uruguay Round Agreement on Agriculture targeted for reduction.

DOMESTIC TRADE = ОТЕЧЕСТВЕННАЯ ТОРГОВЛЯ (или ВНУТРЕННЯЯ ТОРГОВЛЯ, или МЕСТНАЯ ТОРГОВЛЯ) – A term Domestic Trade refers to the exchange of goods or services within an individual country or territory. In this type of trade scenario, the market is constrained by the borders of that country, so that all products must be bought and sold by people living within the domestic market. Domestic Trade is the opposite of International Trade, where goods are sold freely between different countries. Both domestic and international trade play an important role in the modern economy, both at the local and global levels. Throughout early history, people were limited to domestic trade due to a lack of access to international markets. As transportation improved, many countries turned from a purely domestic market to an international one, which introduced new products into the region. Examples of this include the Silk Road, as well as early voyages to seek out spices, salt and gold. Today, a simple domestic market is likely to be found only in small villages or underdeveloped nations. Most larger countries rely on a mix of domestic and international trade to grow the economy and maximize product selection. For businesses, domestic trade offers a number of advantages over international trade. Transaction costs associated with making sales tend to be much lower for domestic markets due to a lack of tariffs and customs duties. Transportation costs are also much lower, and goods can be put on the market more quickly because they have a shorter distance to travel. Domestic trade also provides benefits to society as a whole. Buying local goods helps to keep money within a country, where it contributes to long- and short-term growth. It also encourages investment and development within the country, and eliminates the country's dependence on foreign lands. This means that political issues or wars will have less of an effect on the economy than they otherwise would. For example, countries with few manufacturing plants are likely to struggle during wartime, as they will have difficulty obtaining equipment and weapons from a country they may be feuding with. The biggest drawback associated with domestic trade is a limit to the selection of products available for sale. In a pure domestic trade market, countries that do not have supplies of certain resources will not be able to enjoy those resources. For example, people in northern nations like Canada would be unable to enjoy food grown in tropical regions without the presence of international trade markets. The same is true for countries that may lack the equipment or technical know-how required to make specific products. A lack of international trade also results in a limited market size for businesses. Once a company has saturated the domestic market for a product, they may have no way to increase sales in the future if international trade is prohibited. A policy allowing only domestic trade also leads to a lack of globalization, which results in limited knowledge about other people and cultures. Domestic Trade is a trade between counterparties located in the same country. Domestic Trade, also known as Internal Trade or Home Trade, is the exchange of domestic goods within the boundaries of a country. This may be sub-divided into two categories, wholesale and retail. Wholesale trade is concerned with buying goods from manufacturers or dealers in large quantities and selling them in smaller quantities to others who may retailers or even consumers. Wholesale trade is

undertaken by wholesale merchants or wholesale commission agents. Retail trade is concerned with the sale of goods in small quantities to consumers. This type of trade is taken care of by retailers. In actual practice, however, manufacturers and wholesalers may also undertake retail distribution of goods to bypass the intermediary retailer, by which they earn higher profits. The importance of domestic trade in a country is that it facilitates exchange of goods within the country. By doing this it also makes sure that factors of production reach to the right places so that the economy of the country can grow. By allowing all different types of goods and services to reach to all parts of the country it improves the standard of living of the residents of the country as well as the employment rate of the country. And it helps the growth of an industry by ensuring the availability of raw materials. It even facilitates foreign trade. Traders from outside the country will have to come in contact with internal traders, because its not easy to come directly into another country and get the required products. Wholesalers play a major role in working of domestic trade. One could even say that its the backbone of the domestic market. A wholesaler is one is directly in contact with the manufacturers but in indirect contact with the consumers. A wholesaler generally deals with one type of industry, e.g., machinery, textile, stationery. A wholesaler is not only into selling of products as its also involved in packaging, advertising, grading, and market research. They have their own go downs which saves the manufacturers from bothering about storage. They normally make cash payments from retailers and sometimes consumers themselves and give advance payments which benefits the manufacturers. They sell in smaller quantities to retailers, which refrains the retailers from requiring storage space. They do allow credit facilities to retailers at times. A retailer is normally the final seller of a product. It makes its purchases made from Wholesalers and sales are made to the customers directly. Retailers do not have particularly have to be from one industry, i.e. the can trade in a variety of products at the same time. It generally has purchases made by credit and sales made in cash. Sales as compared to wholesalers are made in small quantities. / Торговля между встречными сторонами, расположенными в одной и той же стране. Под Внутренней Торговлей понимается хозяйственная отрасль, реализующая товарную продукцию на внутреннем рынке страны.

DOMESTIC WOOL = ОТЕЧЕСТВЕННАЯ ШЕРСТЬ (или МЕСТНАЯ ШЕРСТЬ) – Domestic Wools:- all wools grown in your own country as opposed to those imported.

DOMETT FLANNEL = ФЛАНЕЛЬ ДОМЭТ – Domett Flannel:- also spelled Domet. Plain or twill weave; cotton. Generally made in white. Has a longer nap than on flannelette. Soft filling yarns of medium or light weight are used to obtain the nap. The term domett is interchangeable with ‘outing flannel’ but it is only made in a plain weave. Both are soft and fleecy and won’t irritate the skin. Any sizing or starching must be removed before using. Outing flannel is also piece-dyed and some printed and produced in a spun rayon also. Mostly used for infants wear, interlinings, polished cloths. / уточные пряжи .

DOMICILE = ДОМИЦИЛЬ – (1) Legal home or residence. Domicile is a person’s place of residence for legal and tax purposes. / Законный дом или резиденция.

(2) Domicile is the place where a draft or acceptance is made payable. / Под Домицилем, от Латинского слова Domicilium, означающее Местожительство, понимается место платежа по векселю. Место, в котором тратта или акцепт будет оплачен.

DOMICILED BILL = ДОМИЦИЛИРОВАННЫЙ ВЕКСЕЛЬ – Domestic Bill is a bill containing a domicile clause which shows where the bill is payable. In actual practice, bills are usually domiciled at the bank of the acceptor. / Домицилированный Вексель – вексель, содержащий проставляемую векселедателем оговорку, о том, что он подлежит оплате третьим лицом (домицилиатом) в месте жительства плательщика или в другом месте. Такая оговорка проставляется на векселе векселедателем. Если домицилиат в ней не указан, он может быть назван плательщиком при акцепте. Домицилированный вексель предъявляется к оплате домицилиату, который не является ответственным по векселю лицом, а лишь своевременно оплачивает вексель за счёт плательщика, предоставившего в его распоряжение необходимые средства. Обычно в качестве домицилиата указывается банк, у которого необходимо предварительно получить согласие.

DOMINANCE = ДОМИНАНТНОСТЬ (или ДОМИНИРОВАНИЕ, или ПРЕОБЛАДАНИЕ) – Dominance is an inter-allelic/intragenic interaction with complete suppression of one allele by another. / Под Доминантностью или Доминированием понимается форма взаимоотношений парных (аллельных) генов, при которой один из них – доминантный – оказывает более сильное влияние на соответствующий признак особи, чем другой – рецессивный.

DOMINANT = ДОМИНАНТ (или ДОМИНАНТА, или ДОМИНАНТНОЕ, или ПРЕОБЛАДАЮЩЕЕ) – Dominant:- form of expression of a gene, in which the phenotype of the dominant form is expressed over the recessive form. / Под Доминантом, от Латинского слова Dominans, родительный падеж Dominantis, означающее Господствующий, понимается вид растений, господствующий в определённом растительном сообществе. Под Доминантой, от Латинского слова Dominans, родительный падеж Dominantis, означающее Господствующий, понимается:- (1) главенствующая идея, основной признак или важнейшая составная часть чего-нибудь. (2) В физиологии – временно господствующий очаг возбуждения в центральной нервной системе; создаёт скрытую готовность организма к определённой деятельности при одновременном торможении других рефлекторных актов. Принцип доминанты сформулировал в 1911–23 Российский физиолог Алексей Алексеевич Ухтомский (13 (25) Июня 1875 – 31 Августа 1942). (3) Одна из гармонических функций в мажоре и миноре, обладающая интенсивным тяготением к тонике. Основа аккордов доминанты – V ступень лада, которая сама называется доминантой. Функцию доминанты выполняют и аккорды, строящиеся на VII и III ступенях.

DOMINANT ALLELE = ДОМИНАНТНЫЙ АЛЛЕЛЬ – Dominant Allele is one of a pair of alleles that is expressed and that suppresses the expression of the other member of the pair when both are present.

DOMINANT FUTURES = ДОМИНАНТНЫЙ ФЬЮЧЕРС (или ФЬЮЧЕРС ДОМИНАНТ) – Dominant Futures:- that futures having the largest amount of open interest. / Такой фьючерс, который имеет наибольшее значение по открытому интересу. Под Доминантом, от Латинского слова Dominans, родительный падеж Dominantis, означающее Господствующий, понимается .

DOMINANT GENE = ДОМИНАНТНЫЙ ГЕН – Dominant Gene is a gene that is fully expressed in a heterozygote. A dominant gene may partially or entirely suppress the expression of another allelic gene (recessive gene). / Под Доминантностью или Доминированием понимается форма взаимоотношений парных (аллельных) генов, при которой один из них – доминантный – оказывает более сильное влияние на соответствующий признак особи, чем другой – рецессивный.

DOMINANT WAVELENGTH = ДОМИНАНТНАЯ ДЛИНА ВОЛНЫ (или ДОМИНИРУЮЩАЯ ДЛИНА ВОЛНЫ, или ПРЕОБЛАДАЮЩАЯ ДЛИНА ВОЛНЫ) – Dominant Wavelength is the wavelength of a spectrally pure light that, when added to a reference achromatic (white) light, will produce a combination that matches the color of a specimen light.

DOMINATION = ДОМИНИРОВАНИЕ (или ДОМИНАНТНОСТЬ, или ПРЕОБЛАДАНИЕ, или ГОСПОДСТВО) – Domination is the unilateral and irreversible control by one economic entity over another. Domination exists at all levels of economic activity, from control over an individual or business, to control over complex entities, including conglomerates, industries, nations and regions.

DOMINO = XX (или ДОМИНО) – Domino:- a long loose hooded cloak usually worn with a half mask as a masquerade costume; a half mask worn over the eyes with a masquerade costume.

DONEGAL = ДОНИГАЛ (или ДОНИГАЛСКОЕ) – Donegal:- wool – also in rayons and cottons. Mostly plain weave but some in twill. Originally a homespun woven by the peasants in Donegal, Ireland. A rough and ready fabric that stands much hard wear. Yarns are coarse with thick slubs and colored nubs. Now made in other places as well – particularly England.

DONEGAL TWEED = ДОНИГАЛСКИЙ ТВИД – Donegal Tweed is a medium to heavy, plain or twill weave fabric in which colorful yarn slubs are woven into the fabric. The name originally applied to a hand-woven woolen tweed fabric made in Donegal, Ireland. End-uses include winter coats and suits. Donegal:- a tweed fabric with colorful slubs woven in, donegal is used for suits and coats. Donegal Tweed:- originally a thick woolen homespun fabric woven by hand by Irish peasants in County Donegal, Ireland. Today, the term is used to refer to any tweed in plain weave characterized by thick, colorful slubs woven into the fabric. See also Tweed. Donegal Tweed:- originally, a fabric woven by hand in County Donegal, Ireland. Today, the word is used to refer to any tweed with thick, usually colored slubs as part of the fabric. / Твид – пёстротканая шерстяная ткань саржевого переплетения. Твид – по названию Шотландской реки.

DONKEY JACKET = ОСЛИНЫЙ ЖАКЕТ (или ДОНКА) – Donkey Jacket:- (British) a jacket of heavy material worn especially by laborers.

DONOR = ДОНОР – Donor:- in plant breeding, a variety that serves as a source of characteristic such as insect resistance. / Под Донором, от Латинского слова Dono, означающее Дарю, понимается:- (1) человек, добровольно сдающий кровь (для использования её в лечебных целях) или ткань, орган (например, почку) для пересадки. (2) Дефект кристаллической решётки полупроводника (обычно примесный атом), способный ‘отдавать’ электроны в зону проводимости (пример донора – примесный атом Сурьмы (Sb) в кристалле Германия (Ge)).

DONOR PARENT = РОДИТЕЛЬ ДОНОР – Donor Parent is a target parent in the crossing program expected to contribute the desired characteristics, e.g., donor for resistance, quality, etc.

DON’T KNOWN = НЕ ЗНАЕТ – Don’t Known (DK) is an explanation, in industry shorthand, of a custodian’s refusal to accept a security delivery. DK means that the custodian does not know about the security and is not expecting it. Disagreement between parties on sale price, quantity, and other factors can also lead to a DK.

DOOR–TO–DOOR = ОТ ДВЕРИ ДО ДВЕРИ – Door-To-Door:- through transport of container and its lading from shipper to consignee. Through delivery of cargo from shipper to receiver. Door To Door:- said of a service or freight rate provided by a container shipping line whereby goods are loaded into a container at the shipper’s premises and not unloaded until they arrive at the consignee’s premises. Free Carrier (FCA) – New combined transport incoterms replacing FOB where CT is involved but applicable to all mode of transport. Through transportation of a container and its contents from consignor to consignee. Also known as House to House. Not necessarily a through rate.

DOOR–TO–PORT = ОТ ДВЕРИ ДО ПОРТА – Door-To-Port:- the through transport service from consignor to port of importation. / привоз (importation).

DOP = DOMINICAN PESO

DOPE = ЗАПАРКА (или ЛАК, или ПАСТА, или ПРЯДИЛЬНЫЙ РАСТВОР, или УПЛОТНИТЕЛЬНАЯ ЗАМАЗКА) – Dope is a spinning solution of fiber-forming polymer as primed for extrusion through a spinneret. A spinning solution is often referred to as Dope, a term historically associated with cellulose ethenoate (cellulose acetate) solutions as varnishes. See also Spinning Solution. Nitrate Dope is applied as the first coat on all polyester fabric. Even though nitrate dope is very flammable, it must be used initially. Butyrate dope simply will not adhere to polyester fabric. Otherwise it would be used as the first coat. So, apply nitrate dope first and then all remaining coats will be butyrate to reduce the flammability issue. The first coat of nitrate dope must bond to the fabric or all layers are in jeopardy of peeling. I am sure many of you have witnessed first hand the peeling off of fabric coatings. This is a common problem area and comprises one major reason that aircraft must be prematurely recovered. If the first coat does not bond to the fabric you can literally peel it off along with all subsequent coats. I have seen aircraft that you could take an air gun and blow the coatings off of the fabric in sheets. The problem is usually caused by one of three things:- (1) the fabric was contaminated with dirt or oil, (2) the chemical was not applied properly, or (3) the chemical was applied in temperatures that were too cold. The trick is to totally encapsulate the fabric without flooding it. Applying too much dope will cause runs to occur on the inside of the fabric that will probably show through the final coats. Years ago when Grade A Cotton fabric was used, it would actually absorb the dope. This is not true for polyester fabric. As an example, if you wipe up water using a cotton cloth you will see that it immediately absorbs the water. Try to wipe up water using polyester fabric – no absorption at all. That means you must penetrate through to the underneath side of the fabric with the dope without putting it on so heavy that it runs underneath. Only non-tautening nitrate dope should be used on your airplane. As the dopes shrink they tighten the fabric they have encapsulated. Non-tautening dopes will shrink as they age but to a lesser degree than regular dopes. When using this process you will not shrink the fabric to its maximum prior to applying the dopes. You must allow for the resulting shrinkage caused by the dopes themselves. / Экструзия или Выдавливание (Extrusion).

DOPE–DYED = КРАШЕННОЕ В МАССЕ (или КРАШЕНОЕ ЗАПАРКОЙ, или ЛАКОКРАШЕНОЕ) – Dope-Dyed:- contrived fibers, which are colored by dyeing the polymer solution before it is protruded and spun into yarn. See also Dyeing, Mass-Colored. Dope Dyed Yarn is a synthetic yarn where the polymer, before the extrusion process, is mixed with dye and and extruded fibers are then colored. This gives a yarn with excellant color fastness and light fastness characteristics. Dope-Dyed fibers have been produced starting from PET bottle wastes. Dope dyeing has been carried out both by the incorporation of pigments during drying before melt extrusion and by masterbatch addition. Fibers produced using different pigments and at different add-ons have been evaluated for color fastness properties and loss of mechanical properties due to dope addition. It has been shown that fibers having excellent fastness properties with little loss in mechanical properties could be obtained by either of these techniques. Fibers produced by recycling PET bottle wastes have been compared with those obtained by recycling polyester fiber wastes and virgin fiber grade polyesters melt spun under identical conditions. It has been demonstrated that bottle wastes yield fibers having properties equivalent to those of virgin polyester but probably cost similar as fiber wastes. Molded automotive carpets developed from recycled fibers from PET bottle wastes have shown excellent mechanical and fastness properties. It is inferred that using dope-dyed fibers based on PET bottle wastes in automotive applications may ensure a high benefit to cost ratio. / Экструзия или Выдавливание (Extrusion).

DOPE DYEING = КРАШЕНИЕ В МАССЕ (или КРАШЕНИЕ ЗАПАРКОЙ) – Dope Dyeing is a coloration of the polymer prior to manufacture of the fiber. This is really a misnomer, since the colorants are almost always pigments:- ‘mass pigmentation’ is a more accurate term. Some synthetic polymers such as polypropylene cannot be dyed after being made into fibers, and coloration by adding

pigments to the melted material is the only method available. Pigmenting prior to making fibers can also produce washfastness and lightfastness that is higher than can be obtained with any dyeing process.

DORÉ = ПОЗОЛОТА (или ДОРЕ) – Doré is an unrefined alloy of gold with variable quantities of silver and smaller quantities of base metals, which is produced at a mine before passing on to a refinery for upgrading to London Good Delivery standard. Doré is a gold-silver alloy, an intermediate product from certain gold mines. / Под Позолотой или Доре, от Французского слова Doré, означающее Золочёное или Позолоченное, понимается .

DORLASTAN® = ДОЛЭСТЭН® (или ДОРЛАСТАН®) – Dorlastan® is the embodiment of textile elasticity. It is a filament yarn which consists of segmented polyester- or polyether/polyurethane. Dorlastan® was launched on the market in 1964.The brand stands out for its exceptional stretchability, elastic recovery and wearing comfort topped by an extreme power of resistance and great durability. This combination of striking product qualities makes this elastane filament yarn an ideal component of modern yarn, fabric, and even apparel. Dorlastan® is commonly used in corsetry, waistbands, socks, medical stockings, tights, swimwear and even sportswear. Dorlastan®:- Stretching the Limits:- Dorlastan® is the embodiment of textile elasticity. Since it has been established and assumed a leading position in the world market in 1964, the brand stands out for its exceptional stretchability, elastic recovery and wear comfort topped by an extreme power of resistance and great durability. This combination of striking product qualities makes elastan filament yarns an ideal component of modern yarns, fabrics, and apparels. Bare or covered, Dorlastan® is processed in nearly all fields of textile production, together with synthetic fibers like polyamide and polyester, as well as with all natural fibers. Due to the large range of titers and its optimal economic and ecological processing properties Dorlastan® can be integrated in any production method. Product Safety:- Dorlastan® fulfils the safety requirements of Oeko-Tex standard 100 up to class 1 (products for babies). The quality and environmental management system of Asahi Kasei Spandex Europe GmbH are certified to the international ISO 9001:2000 and ISO 14001 standards. The binding standards are constantly enhanced and optimized. The Fibers Group of Bayer Polymers LLC has become a separate legal entity, changing its name to Dorlastan Fibers LLC. Dorlastan® Fibers will still be linked to its parent company, Bayer Polymers LLC. The new name embraces both the Dorlastan plants in Goose Creek, SC (Bushy Park), and Dormagen, Germany. During the past year, the Fibers Group introduced a new hosiery waistband technology that made it possible to run Dorlastan directly from the spinning supply package, virtually eliminating the rewinding process. In 1995, Bayer Corporation took the North American spandex market by storm with the opening of its first US-based spandex fiber manufacturing facility in Bushy Park. While Bayer had been producing its Dorlastan® spandex in Germany since 1964, the company identified a strong demand for an alternate spandex supplier in the United States. Bayer made an initial USD160 million investment to develop its technologically advanced facility with a 3 600-ton capacity. Two years later, Bayer Corporation is firmly established as one of the top spandex suppliers around the world and the 'smarter spandex' choice of some of the finest mills and retailers in the United States. (source:- Bayer Corporation; 1997-August-28). / филаментная (комплексная) пряжа (filament yarn). Долэстэн® (Dorlastan®). Асахи Касэй Спандэкс Юроп Ге.эм.бе.Ха. (Asahi Kasei Spandex Europe GmbH). Байа Полымёз Эл.Эл.Си. (Bayer Polymers LLC) Долэстэн Файбёз Эл.Эл.Си. (Dorlastan Fibers LLC). Байа Корпорэйшэн (Bayer Corporation).

DORMANCY = ПОКОЙ – Dormancy is a physical or physiological condition of a viable seed that suspends or prevents germination even in the presence of otherwise favorable germination conditions. Dormancy is temporary suppression of growth which may be of advantage in surviving ultimately unfavorable conditions. / У растений под Покоем понимается состояние растений, при котором снижается интенсивность жизнедеятельности (дыхание, фотосинтез и прочее). В состоянии покоя могут находиться семена, почки, клубни, споры и другие органы, а также деревья зимой после листопада. Покой у растений возник в процессе эволюции как приспособление для переживания неблагоприятных условий.

DORMANCY TEMPERATURE = ТЕМПЕРАТУРА ПОКОЯ – Dormancy Temperature:- the temperatures of cargo of vegetable origin are regulated in order to prevent loss of quality.

DORMANT = ПОКОЯЩЕЕСЯ (или НАХОДЯЩЕЕСЯ В СОСТОЯНИИ ПОКОЯ или СПЯЧКИ) – Dormant:- in a temporary state of suspended activity. Not in active growth, but protected (e.g., bud scales) from environmental stresses. / (например, почечные чешуйки) от .

DORSAL = ДОРСАЛЬНОЕ (или ДОРЗАЛЬНОЕ, или СПИННОЕ) – Dorsal:- on or relating to the back or outer surface of an organ. See also Ventral. Dorsal:- on or attached to the back of an organ. / Смотрите также Вентральное (или Брюшное (Ventral)). Под Дорсальным или Дорзальным, от позднелатинского слова Dorsalis от Латинского слова Dorsum, означающее Спина, понимается:- (i) в анатомии – спинной, расположенный на спинной стороне тела, обращённый к ней, например, дорсальный плавник; сравните с Вентральным; или (ii) у растений – дорсальной или наружной стороной листа называют сторону листа, обращённую к стеблю. Под Дорсальным или Дорзальным или Спинным, в анатомии животных и человека понимается часть тела, его поверхность, орган, расположенные на спине (дорзальный плавник Рыб), обращённые в сторону спины (дорзальный край, дорзальная поверхность, дорзальная половина органа) и так далее. Сравните Брюшное или Вентральное.

D'ORSAY = Д'ОРСЭ – D'Orsay is a type of shoe. A XIX century Frenchman created this style with a cutaway in-step that reveals the arch of the foot. / Д'Орсэ тип туфли. Женская туфля с отрезной союзкой и суженной геленочной частью подошвы.

DOS = DATE OF SEEDING

DOS = DEPTH OF SHADE

DOS = DISK OPERATING SYSTEM

DOSAGE EFFECT = ЭФФЕКТ ДОЗИРОВКИ – Dosage Effect is the effect of quantitative differential frequencies of alleles (or genes) on the phenotypic expression of the trait.

DOSE = ДОЗА – Dose:- (French:- dose – appropriate measure) quantity of a toxic substance in the body. / Под Дозой, от Греческого слова Dósis, означающее Порция или Приём, понимается точно отмеренное количество чего-либо (какого-нибудь вещества, лекарства).

DOSE MAPPING = КАРТИРОВАНИЕ ДОЗЫ – Dose Mapping is a measurement of the absorbed dose distribution within a process load through the use of dosimeters placed at specific locations within the process load.

DOSIMETER = ДОЗИМЕТР – Dosimeter is a device that, when irradiated, exhibits a quantifiable change in some property of the device which can be related to absorbed dose in a given material using appropriate analytical instrumentation and techniques. / Под Дозиметрами понимаются детекторы ядерных излучений, предназначенные для измерения дозы излучения или величин, связанных с ней.

DOSIMETRY = ДОЗИМЕТРИЯ – Dosimetry is a system used for determining absorbed dose, consisting of dosimeters, measurement instruments and their associated reference standards, and procedures for the system's use. / Под Дозиметрией, от Греческих слов Dósis, означающее Порция или Приём, и Metréō, означающее Измеряю, понимается область прикладной ядерной физики, в которой изучают физические величины, характеризующие действие ионизирующих излучений на различные объекты.

DOST = DEPARTMENT OF SCIENCE AND TECHNOLOGY

DOT = DATE OF TRANSPLANTING

DOT = DEPARTMENT OF TRANSPORTATION

DOT = DESIGNATED ORDER TURNAROUND SYSTEM

DOTM = DEEP OUT OF THE MONEY

DOT(S) = DESIGNATED ORDER TURNAROUND (SYSTEMS)

DOTTED SWISS = ШВЕЙЦАРСКАЯ С ТОЧКАМИ (или ПУНКТИРНАЯ ШВЕЙЦАРСКАЯ) – Dotted Swiss is a lightweight, sheer cotton or cotton blend fabric with a small dot flock-like pattern either printed on the surface of the fabric, or woven into the fabric. End-uses for this fabric include blouses, dresses, baby clothes, and curtains. Dotted Swiss:- plain weave cotton for ground with a swivel, lappet or flocked dot. A sheer light muslin ornamented with evenly spaced raised dots. Placed regularly or irregularly on a semi-sheer usually crisp fabric which may or may not be permanent. First made on hand looms in Switzerland. It is made generally in 32" widths. The lappet is the most permanent. When hand woven with a swivel attachment the dots are tied in by hand on the back of the cloth. The ground fabric is usually a voil or a lawn. Dots could be a single color or multicolored. Dot is a design subjugated by circular spots of any size, printed or woven into the fabric. In it small dots are often called Pin Dots, whereas medium to large dots may be referred to as Aspirin Dots, Coin Dots or Polka Dots. Dotted Swiss is a sheer cotton or cotton blend fabric embellished with small dot motif. The dots may vary in color and can be applied to the goods by swirel weaving, clip spotting, flock-dotting, lappet weaving, etc. Originated in Saint Gallen, Switzerland in about 1750. Dotted swiss is used for dress goods, curtains, eveningwear, wedding apparel, baby clothes, etc.

DOUBLE AUCTION = ДВУСТОРОННИЙ АУКЦИОН – Double Auction is a type of auction in which both sellers and buyers submit bids which are then ranked highest to lowest to generate demand and supply profiles. From the profiles, the maximum quantity exchanged can be determined by matching selling offers (starting with lowest price and moving up) with demand bids (starting with highest price and moving down). This format allows buyers to make offers and sellers to accept those offers at any particular moment. Examples are the New York Stock Exchange (NYSE®) and the American Stock Exchange® (AMEX®). / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®) и АМЭКС® (AMEX®).

DOUBLE AWN = ДВОЙНАЯ ОСТЬ – Double Awn (DA):- spikelets have awns developing on both lemma and palea. The awns may have unequal length. / Под Остью понимается:- (i) у растений (многих злаков):- тонкий, заострённый иногда колючий или перистый отросток на цветковой или (реже) колосковой чешуе. (ii) длинные и прямые волосы, тонкие у основания и утолщённые у вершины; верхний ярус волосяного покрова (шерсти) у млекопитающих животных. На уровне нижней половины ости находится подшёрсток.

DOUBLE BACK = ДВОЙНАЯ ИЗНАНКА (или ДВОЙНАЯ ОБОРОТНАЯ СТОРОНА) – Double Back:- a secondary backing glued to the back of carpet, usually to increase dimensional stability.

DOUBLE BANKING = ДВОЙНОЙ КОРПУС – Double Banking:- two vessels moored alongside each other on a certain berth. / Два судна на каком-то причале, пришвартованные друг к другу бок боком.

DOUBLE BOTTOM = ДВОЙНАЯ ВПАДИНА (или ДВОЙНОЕ ДНО) – Double Bottom:- in the analysis of market trends, a chart pattern of the price movement of a commodity that shows resistance to a falling market; the inverse of double tops. The price patterns are used by technical analysts to recognize a reversal of a price trend. It is when prices make a low and then rally, fall back to the original low price area before rallying again. Double Bottom is a reversal pattern where two prices spikes of similar magnitude are turned back lower/higher. Sometimes referred to as an W Formation. A bullish reversal pattern characterized by two lows at roughly equal value. In technical analysis, a Double Bottom occurs when the price falls to the same level twice and fails to penetrate. This signals good support. / Бычья модель разворота, характеризуемая двумя примерно одинаковыми минимальными значениями цены.

DOUBLE BOTTOM = МЕЖДУДОННОЕ (или ДВУДОННОЕ) – Double Botton is a general term for all watertight spaces contained between the outside bottom plating, the tank top and the margin plate. The double bottoms are sub-divided into a number of separate tanks, which may contain boiler feed water, drinking water, fuel oil, ballast, etc.

DOUBLE BOW = ДВОЙНОЙ ПЕРЕКОС – (1) Double Bow:- two fabric bows, arcing in the same direction, as in a flattened M or W depending on the viewing angle. See also Bow. Compare Double Reverse Bow. Fabrics defect. / Двойной Перекос рисунка и полотна – порок готовой ткани.

(2) Warp Double Bow:- warp yarns in a fabric which exhibit an approximately sinusoidal waveform for more than three-quarters of the wavelength. This defect is often caused by lack of control during warping. / Двойной Перекос Основы (double bow, warp):- порок основы; состояние текстильного полотна, в котором нити основы находятся не под прямым углом к нитям утка. Примечание:- этот порок часто вызывается отсутствием контроля во время снования.

(2) Weft Double Bow:- weft yarns in a fabric which exhibit an approximately sinusoidal waveform for more than three-quarters of the wavelength. This defect is caused by a lack of control in fabric manufacture or processing. / Перекос Утка (double bow):- порок утка; состояние текстильного полотна, в котором нити утка находятся не под прямым углом к нитям основы. Примечание:- этот порок вызван неодинаковым натяжением ткани вдоль основы при изготовлении её на ткацком станке или при отделке.

DOUBLE CLOTH = ДВОЙНОЕ ПОЛОТНО (или ДВОЙНАЯ ТКАНЬ) – Double Cloth is a fabric construction, in which two fabrics are woven on the loom at the same time, one on top of the other. In the weaving process, the two layers of woven fabric are held together using binder threads. The woven patterns in each layer of fabric can be similar or completely different.

DOUBLE–CLOTH CONSTRUCTION = КОНСТРУКЦИЯ ДВОЙНОГО ПОЛОТНА (или СТРОЕНИЕ ДВОЙНОЙ ТКАНИ) – Double-Cloth Construction:- two fabrics are woven in the loom at the same time, one fabric on top of the other, with binder threads holding the two fabrics together. The weave on the two fabrics can be different.

DOUBLE COATED = С ДВОЙНЫМ ПОКРЫТИЕМ – Double Coated:- some breeds of sheep (and other fleece-bearing animals) have two coats. Sometimes the double-coating refers to different colors; perhaps a dark outer/longer coat. Sometimes this refers to the length. Also referred to as Primitive.

DOUBLE COCOON = ДВОЙНОЙ КОКОН – Double Cocoon is a cocoon jointly built by two silkworms; it serves as protective shell for both the worms during their pupal stage of existence. Such cocoons are readily distinguished by their size and toughness.

DOUBLE CROPPING = ДВОЙНОЕ ВОЗДЕЛЫВАНИЕ (или ДВОЙНОЕ ЗЕМЛЕДЕЛИЕ) – Double Cropping:- two crops grown in sequence on the same land in a production cycle.

DOUBLE CROSS = ДВОЙНОЕ СКРЕЩИВАНИЕ – Double Cross is a cross between first generation hybrids of four separate inbred lines. / Под Скрещиванием животных понимается метод разведения в животноводстве, при котором спаривают животных разных пород. Применяют для улучшения существующих и создания новых пород.

DOUBLE DAMASK = ДВОЙНАЯ ДАМАССКАЯ (или ДВОЙНОЕ КАМЧАТОЕ ПОЛОТНО) – Double Damask is a rich traditional tablecloth, made in a heavier weight than ordinary damask.

DOUBLE DECK LOAD = ДВУХЯРУСНАЯ НАГРУЗКА – Double Deck Load is a second tier of cargo on top of the first one.

DOUBLE–DECK PALLET = ДВУХНАСТИЛЬНЫЙ ПОДДОН – Double-Deck Pallet is a flat pallet with a top deck and a bottom deck. See also Flat Pallet, and Pallet. / Двухнастильный Поддон:- плоский поддон с верхним и нижним настилами. Смотрите также Плоский Поддон (Flat Pallet), и Поддон (Pallet).

DOUBLE–DEEP STORAGE LANE = ДВОЙНОЙ ГЛУБИНЫ ПРОХОД ДЛЯ ХРАНЕНИЯ – Double-Deep Storage Lane:- a method of storing product two loads deep in an aisle.

DOUBLE DEFLATION = ДВОЙНАЯ ДЕФЛЯЦИЯ – Double Deflation is the technique used to estimate real value added of an industry. In the double deflation method, real value added is measured as the difference between real gross output and real intermediate inputs. Double deflation is the conceptually preferred method of computing real value added because it requires fewer assumptions about the relationships among gross output and intermediate inputs. Double Deflation is a method for calculating value added by industry chained volume measures which takes separate account of the differing price and volume movements of input and outputs in an industry's production process. Double Deflation is a method whereby gross value added is measured at constant prices by subtracting intermediate consumption at constant prices from output at constant prices; this method is feasible only for constant price estimates which are additive, such as those calculated using a Laspeyres' formula (either fixed-base or for estimates expressed in the previous year's prices). / выработка (output).

DOUBLED HAPLOID PLANTS = СДВОЕННЫЕ ГАПЛОИДНЫЕ РАСТЕНИЯ – Doubled Haploid Plants are homozygous diploid plants produced from anther or microspore culture. / из пыльника или микроспоры . Под Гаплоидами, от Греческих слов Haplóos, означающее Одиночный, и Éidos, означающее Вид, понимается клетка или особь с одинарным (гаплоидным) набором непарных хромосом. Гаплоидны половые клетки, некоторые грибы, водоросли.

DOUBLE DRIVE = ДВОЙНОЙ ПРИВОД – Double Drive:- both the flyer and bobbin are driven by belts from the drive wheel. The bobbin pulley (or whorl) is smaller, which determines the spinning ratio. Some double drive wheels can be converted to run with Scotch Tension. Double Drive Wheels:- this type of wheel has the flyer whorl and bobbin next to one another on the same side of the spindle. The drive band is doubled and forms a figure eight that loops onto both the bobbin and the flyer whorl. The spinner decides where the drive band is placed on the whorl depending upon the type of yarn to be spun. When spinning, both the flyer and the bobbin are rotated by the drive band. The bobbin whorl is smaller in diameter than the flyer whorl, therefore, it will spin faster than the flyer if there is no brake being used. Because of the high degree of twisting efficiency, beginners who have a problem with overtwisting the yarn, will find the double drive wheel difficult to use at first.

DOUBLE EAGLE = ДВОЙНОЙ ОРЁЛ – Double Eagle is a gold coin with a face value of USD20 issued as legal tender in the United States during the period 1850–1932. It is 900 fine with a fine gold content of 0.967 5 Troy ounces. The 1933 Gold Double Eagle was Never Officially Issued:- the US Gold Double Eagle, Saint-Gaudens type, had been issued from 1907 until 1932. Although 445 500 Double Eagles had been minted with the 1933 date, none were released into circulation because of changes made to currency laws during the Great Depression. In an effort to end the run on the banks and stabilize the economy, President Franklin Roosevelt took America off the gold standard. Not only were no more gold coins to be issued for circulation, people had to turn in the ones they had. The 1933 Double Eagles are Ordered to be Destroyed:- it became illegal for private citizens to own gold coins, unless they clearly had a collectible value. This law was enacted during desperate times to prevent the hoarding of gold currency. Since there would be no more gold currency issued in the United States, the Mint had melted down the 1933 run of Gold Double Eagles and converted them to gold bullion bars by 1937. Some of the Double Eagles Escaped the Melt Down:- two of the 1933 specimens were given by the Mint to the US National Numismatic Collection at the Smithsonian Institute. These were the only two legal specimens to ever become part of a coin collection; however, by 1952, the Secret Service had confiscated 8 more 1933 Double Eagles! How did they leave the Mint? Why weren't they melted down? Was the 1933 Double Eagle Switched for Another Coin? We may never know for certain how these coins left the Mint, but there is a general consensus among scholars that a Mint cashier by the name of George McCann exchanged about 20 1933's doomed for destruction and replaced them with earlier dated Double Eagles. This way, the accounting books would balance and nobody would realize that anything was amiss. What we do know for sure is that a Philadelphia area jeweler by the name of Israel Switt came into possession of at least 19 of the coins. The Coin of a King:- Israel Switt sold at least 9 of the 1933 Double Eagles privately to collectors, one of which found its way into the collection of King Farouk of Egypt. When the Secret Service discovered that these coins had surfaced, they confiscated them all because they were considered to be stolen property of the US Mint. However, King Farouk had legally exported his coin before the theft was discovered, and the Secret Service was unable to recover his specimen through diplomatic channels. The King's Specimen is Recovered in a Sting Operation:- After King Farouk was deposed in 1952, his 1933 Double Eagle briefly appeared on the market, but when it became clear that US authorities still wanted to confiscate it, it vanished again! More than 40 years later, British coin dealer Stephen Fenton showed up with it in New York, and the Secret Service finally seized it during a sting operation during which they purportedly negotiated to purchase the coin. The 1933 Double Eagle is Nearly Destroyed by Terrorists:- Fenton fought a several year-long legal battle in the US courts over ownership of the coin, during time which it was stored in the Treasury Vaults at the World Trade Center. A mere 2 months before the terrorist attacks of 2001-September-11, the lawsuit was settled and the Double Eagle was moved to Fort Knox. Fenton and the US Mint had come to a compromise:- the coin would be sold at auction, with the proceeds split between the Fenton and the Mint. Legal Tender at Last – and the Most Valuable Coin in the World:- The 1933 Double Eagle sold at auction on 2002-July-30, for USD6.6 million, plus the 15% buyer's fee, which brought the total cost to the buyer to USD7 590 000, plus USD20 to monetize the coin and compensate the Mint for the USD20 it believes it lost when the coin was thought to have been stolen. The buyer chose to remain anonymous, so once again we don't know where the

Farouk specimen is, or when it might suddenly show up again. One thing is for sure: the Secret Service can't confiscate it any more! Ten More Specimens Hang in Limbo:- in September of 2004, Joan Langbord, one of Israel Switt's heirs, discovered ten more specimens of the 1933 Double Eagle amongst his effects. Apparently unaware of the legal status of these coins (or perhaps just a bit too trusting of the government) she sent all ten specimens to the US Mint to have them authenticated. The Secret Service declared the coins to be seized, and now Langbord is fighting the government over ownership while the specimens languish at Fort Knox. Is the 1933 Double Eagle Still the World's Most Valuable Coin?:- It will be interesting to see, should the 10 Langbord coins ever come to market, if the 1933 Double Eagle will retain its place as the world's highest priced coin when the number of available specimens increases ten-fold. / Президент США Фрэньклын Дэлано Розэвэлт (Franklin Delano Roosevelt; 1882–1945). Своё название монета получила не вследствие изображения двух орлов или двуглавых орлов. На самом деле на ней изображён один орёл. Просто дело в том, что до выпуска данной монеты в США чеканились золотые монеты Орёл, имевшие лицевую стоимость в 10 Долларов, а эта монета была отчеканена с лицевой стоимостью в 20 Долларов, отсюда и название – Двойной Орёл.

DOUBLE END = ДВОЙНИК (или ДВОЙНАЯ ПРОДОЛЬНАЯ НИТЬ, или ПАРОЧКА, или ПОМЕХА) – Double Ends are:- (1) two warp ends drawn through the same heddle eye and reed dent or split thereby causing the ends to weave as a single end; rather common in weaving matting fabrics. (2) A defect caused by faulty drawing-in or reeding, thereby making a blemish in the cloth known as Taped Ends or Flat. (1) Double Ends:- extra ends taken on looms, at warping if extra length of end is there generates double end, wrong drawing in, wrong denting, work practices should be improved. Weaving defect. (2) Double End:- during mending repair if one extra end is not removed. Mending defect. Double End:- when two or more ends gets woven as one. This defect is characterized by a thick bar running parallel to the warp. Causes:- wrong drawing, taking more ends in heald eye. Mending:- this fault can be corrected by pulling out the extra end with help of needle. A bare patch is formed and can be filled by combing in both directions with the help of metallic comb. Double End:- two ends woven as one in a fabric. A double end may be intentional for fabric styling, or accidental, in which case a fabric defect results. Double End:- when two or more fiber ends unintentionally get woven as one, a double end type of defect is formed. This defect is characterized by the thick bar running parallel to the warp. Double end in the fabric are mostly caused due to sticky ends coming from sizing or miss drawing of ends. This can be reduced by training the weaver to correctly draw the ends. Double End:- when two or more ends unintentionally get woven as one. This defect is characterized by a thick bar running parallel to the warp. Weaving Defect. (1) Defect Name:- Double End. Defect Type:- warp lines, vertical lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Double End (face):- This defect is the result of an extra end being woven into the fabric. The extra end creates small flat distortions in the twill line. Description:- Double End (back):- This defect is the result of an extra end being woven into the fabric. The extra end creates small flat distortions in the twill line. Severity:- Minor. (2) Defect Name:- Double End. Defect Type:- warp lines, vertical lines. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- Double End:- This defect is the result of an extra end being woven double with a regular end of the fabric. Severity:- Major. (3) Defect Name:- Double End. Defect Type:- warp lines, vertical lines. Fabric Type:- Warp Knit Fabrics. Description:- Double End:- While this appears as a dark end, it actually is caused by two ends of a finer denier being knit together as one. Severity:- Major. Double End:- two ends that weave as one. This happens because of migration of a broken end to the adjacent reed space along with the neighbouring end. / Порок или дефект ткачества. две нити за одно целое в галево ремизки, две нитки за одну по основе. Порок или дефект штопки (mending defect). Парочка – две нити основы переплетаются за одну. Причиной дефекта является неправильная проборка в галево ремизок. Дефект ухудшает внешний вид ткани, имеет вид продольной утолщённой или тёмной (на просвет) полосы. Под Двойником понимается местный порок в виде двух или нескольких нитей, заработанных вместо одной.

DOUBLE FACE = ДВУХЛИЦЕВАЯ (или С ДВОЙНЫМ ЛИЦОМ) – Double Face:- a double cloth which can be used on either side. Also used to describe any fabric with two right sides.

DOUBLE–FACE PALLET = ДВУХЛИЦЕВОЙ ПОДДОН (или ДВУХСТОРОННИЙ ПОДДОН) – Double-Face Pallet is a pallet with top and bottom decks.

DOUBLE–FACED PALLET = ДВУХЛИЦЕВОЙ ПОДДОН (или ДВУХСТОРОННИЙ ПОДДОН) – (1) Double-Faced Pallet is a full deck on both sides; reversible:- very strong, good for all forms of handling and shipping.

(2) Double-Faced Pallet:- full deck on one side; non-reversible:- most rugged and durable – basic pallet for pallet exchange programs.

DOUBLE–FACED SATIN = ДВУХЛИЦЕВОЙ АТЛАС – Double-Faced Satin is a satin fabric with a satin appearance on both sides unlike ordinary satin, which has a definite right and wrong side. Double-Face Satin:- yarn woven with two warps and one filling, to simulate a double satin construction. Has satin on both sides. Cotton filling is often used in cheaper qualities. / уточина.

DOUBLE FLEECE = ДВОЙНОЕ РУНО – Double Fleece is a fleece consisting of two year's growth.

DOUBLE HEDGING = ДВОЙНОЕ ХЭДЬЖИРОВАНИЕ – Double Hedging is a hedging a position by using futures and options, thereby doubling the size of the hedge. The US Commodity Futures Trading Commission (CFTC) considers double hedging to be a situation where a trader holds a long futures position in a commodity in excess of the speculative position limit to offset a fixed price sale, even though the trader has ample supplies of the commodity to honor all sales commitments. Increasing the size of a hedge to a level that is greater than the exposure faced by a firm or individual may take it into the realm of speculation. For example, an investor with a stock portfolio of USD1 million who wishes to hedge downside risk in the broad market can do so by buying put options of a similar amount on the S&P 500. Double hedging would occur if the investor also initiates an additional short position in the S&P 500 using index futures contracts. Double Hedging is a hedging strategy that uses both a futures contract and an options contract to protect against losses caused by changes in the cash prices of the underlying instrument. See also Hedge. Double Hedging:- as used by the US Commodity Futures Trading Commission (CFTC), it implies a situation where a trader holds a long position in the futures market in excess of the speculative position limit as an offset to a fixed price sale, even though the trader has an ample supply of the commodity on hand to fill all sales commitments.

DOUBLE HOOKED BOW = ДВОЙНОЙ КРЮЧКОВАТЫЙ ПЕРЕКОС – Double Hooked Bow:- one hooked bow at each side of the fabric that arc in opposite directions. See also Hooked Bow. Fabrics defect.

DOUBLE KNIT = ФАНГОВЫЙ ТРИКОТАЖ (или ДВОЙНОЙ ТРИКОТАЖ, или ДВУСТОРОННИЙ ТРИКОТАЖ, или ДВОЙНОЕ ТРИКОТАЖНОЕ ПЕРЕПЛЕТЕНИЕ) – Double Knit is a fabric knitted on a circular knitting machine using interlocking loops and a double stitch on a double needle frame to form a fabric with double thickness. It is the same on both sides. Today, most double knits are made of 150 denier polyester, although many lightweight versions are now being made using finer denier yarns and blends of filament and spun yarns. Double Knit is a weft knit fabric in which two layers of loops are formed that cannot be separated. A double knit machine, which has two complete sets of needles, is required for this construction. Double Knit is a circular knit fabric, which has loops on both sides, front as well as back. It is made with a double set of needles to create a double thickness of fabric. Each thickness of the fabric is joined by interlocking stitches. An article of double knit is a two faced clothe. Either side can be utilized as the right side. This type of fabric originated in Milan and Florence. It is constructed on multi-feed circular knitting machines. The two layers of loops

formed is not possible to separate. The fabric is very sturdily constructed and is heavier in weight. Double knit fabric controls the shrinkage and dry-cleans well. See also Weave. Double Knit is a weft knit fabric produced in two layers which cannot be separated. Its appearance is the same on either side with a characteristic fine vertical wale. Double Knits are made from the interlock stitch and variations of that stitch. The process involves the use of two pairs of needles set at an angle to each other. A variety of attachments can be added to the knitting machine to create beautiful patterns. The development of highly sophisticated electronic controls and the use of computers in design make it possible to reproduce intricate art work or other detailed designs in minutes. The front and back surfaces of the double knits have a rib-like appearance. These fabrics are generally firm, less apt to stretch, more resilient, and heavier than single knits. They are also run resistant and do not ravel. Two fibers that are often used to make double knits are polyester and wool. / ткань, связанная на кругловязальной машине, . и двойной стежок. вертикальной бороздке (или колонке петель).

DOUBLE–KNIT FABRIC = ДВУХСТОРОННЯЯ ОСНОВОВЯЗАНАЯ ТКАНЬ – Double-Knit Fabric is a fabric produced on a circular-knitting machine equipped with two sets of latch needles situated at right angles to each other (dial and cylinder). Double Knit is a knitted fabric (cotton, wool, worsted, silk, rayon, and synthetics) made with a double set of needles to produce a double thickness of fabric with each thickness joined by interlocking stitches. An article of clothing made of double knit fabric, namely a fabric knitted to produce a double thickness. A two faced cloth, either face may be utilized as the rigth side. The fabric originated in Milan and Florence. Can be stabilized for shrinkage control and dry cleans satisfactorily.

DOUBLE PALLET JACK = ЗАЖИМ ДЛЯ ДВУХ ПОДДОНОВ – Double Pallet Jack is a mechanized device for transporting two standard pallets simultaneously. / Механизированное средство для транспортировки двух стандартных поддонов одновременно.

DOUBLE PICK = ДВОЙНАЯ ПОПЕРЕЧНАЯ НИТЬ (или ПРОЛЁТЫ, или ПРОМЁТКИ, или ДВОЙНИК) – Double Picks:- defect caused by two picks having worked into the same warp shed in the weaving of the cloth, thus making a sort of rib-effect in the filling direction. The defect is quickly seen when the goods are perched or examined. Double picks occur often when the weaver begins to weave on the loom after fixing some flaw or blemish, or changing shuttles. Carelessness on the part of the weaver causes most of the double picks found in woven goods. See also Mispick. Double Pick:- two picks of filling shot into the same shed; used in cross ribbed fabrics and heavy goods. (1) Double Picks:- faulty pick finding, improper staggering of heald shafts, play in heald shaft connections etc. Weaving defect. (2) Double Pick:- during mending repair if one extra pick is not removed. Mending defect. Double Pick:- in woven fabrics, two picks wrongly placed in the same shed. See also Mispick. Compare Jerk-In. Double Pick:- two yarns running simultaneously, mostly in the weft. Double Pick:- when two picks are mistakenly inserted instead of one. Characteristic feature of certain rapier looms. The yarn is not transferred to the receiving rapier leading to a double pick in half the width of the fabric and no pick in the remaining half. This is a major defect as it appears throughout the width of the fabric. Minor Defect Classification:- Occurring less frequently. Major Defect Classification:- Occurring more frequently. Weaving defect. / в направлении уточины. Порок или дефект ткачества. Порок или дефект штопки (mending defect). Пролёты в одну уточную прокидку. Размер порока – за каждое место. Под Двойником понимается местный порок в виде двух или нескольких нитей, заработанных вместо одной. Двойная Поперечная Нить (double pick):- порок утка в виде двух или нескольких уточных нитей, заработанных в полотно вместо одной. Примечание:- этот порок вызывается при прокладке двух текстильных нитей в один зев вместо одной.

DOUBLE PICK = ДВОЙНЫЕ ПОПЕРЕЧНЫЕ НИТИ (или ПРОЛЁТЫ, или ПРОМЁТКИ, или ДВОЙНИКИ) – Defect Name:- Double Picks. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- Double Picks:- This is the result of one filling feed on a four-feed Sulzer weaving machine picking up the end from the reserve supply package and pulling in a double filling on every fourth pick. This will continue to run until noticed by the operator. Severity:- Major.

DOUBLE RECEIPT = ДВОЙНОЕ ЗАЧИСЛЕНИЕ (или ДВОЙНОЕ ПОЛУЧЕНИЕ) – Double Receipt is a receipt which serves as confirmation of a transaction in two places. Both receipts specify that a double receipt has been issued.

DOUBLE REVERSE BOW = ДВОЙНОЙ ОБРАТНЫЙ (или ПРОТИВОПОЛОЖНЫЙ) ПЕРЕКОС – Double Reverse Bow:- two fabric bows arcing in opposite directions. See also Bow. Compare Double Bow. Fabrics defect.

DOUBLE SEAL = ДВОЙНОЕ УПЛОТНЕНИЕ – Double Seal:- two mechanical seals designed to permit a liquid or gas barrier fluid between the seals mounted back-to-back or face-to-face. See also Seal.

DOUBLE SELVAGE = ДВОЙНАЯ КРОМКА – Double Selvage:- xxxxx. See also Rolled Selvage. A Double Selvage means that the cast net has double the netting material at this particular location for maximum strength.

DOUBLE STACK CAR = ДВУХЪЯРУСНЫЙ ВАГОН – Double Stack Car is a rail car capable of carrying two containers stacked on top of each other. Double Stack Car is a rail car capable of carrying two forty-foot equivalent units (FEUs), one on top of each other. / Железнодорожный вагон, приспособленный к перевозке двух транспортных средств, эквивалентных сорока-футовому контейнеру, размещаемых друг на друге.

DOUBLE STACK TRAIN = СОСТАВ ИЗ ДВУХЪЯРУСНЫХ ВАГОНОВ – Double Stack Train:- the transport by rail between two points of a trainload of containers with two containers per chassis, one on top of the other. A number of railway wagons, usually a block train, on which containers can be stacked two-high. Double Stack Train is a train using specialized railcars that enable marine cargo containers to be stacked one atop another (2-high). There are no height restrictions for destinations served by double-stack service via the Port of Savannah. Norfolk Southern Railroad and CSX Transportation provide double-stack service via the Port of Savannah.

DOUBLET = ДУБЛЕ (или ДАБЛЭТЧ, или ЖИЛЕТ, или ДВУБОРТНЫЙ ПИДЖАК) – Doublet is a man's close-fitting jacket worn in Europe especially during the Renaissance. / Под Жилетом, от Французского слова Gilet, понимается мужская или женская верхняя одежда без рукавов. В классическом варианте надевают под пиджак. Составная часть классического костюма – 'тройки'. При комбинировании разных слоёв одежды не обойтись без жилета. Как, впрочем, и в любом другом случае – на деловой презентации, на лекции в университете, на пикнике за городом, на вечеринке в дискотеке, и даже в театре. Жилет хорош сегодня везде за счёт своей универсальности. Сохранившийся во многих коллекциях классический жилет, ведущий свою историю от мужского костюма-тройки, по-прежнему особенно хорош в деловой одежде. Сегодняшнее стремление в офисной одежде к мужскому стилю (не к унисексу, а именно к весьма женственному варианту типично мужских костюмов в стиле ИСЛ (YSL)) с увлечением блузами рубашечного стиля и мужскими галстуками естественным образом воскресило и жилетки. Жилет-Корсаж (так называемый Мида 'Mieder' (по-Немецки)) не стыдно надеть даже на светский приём в сочетании с бриллиантами и прочими друзьями девушек. Обычно такой жилет шьют из чёрного атласа или бархата, надевают поверх лёгкой широкой блузы, а спереди украшают 5–6 парами металлических крючков, которые сочетаются ещё и с металлическими цепочками в качестве декоративных застёжек. Актуальная тенденция Осенних и Весенних безрукавок – так называемые 'Рабочие Жилеты'. В модных безрукавках без труда можно увидеть отголоски рабочей формы Американских лесорубов или военной формы. Это очень функциональные жилеты в стиле 'сафари' или 'милитари', которые, конечно, вряд ли подойдут для гламурной вечеринки, однако прекрасно впишутся в любые другие обстоятельства – от загородного отдыха до работы в

офисе. Жилеты из меха (с меховой опушкой, меховой подкладкой или просто мехом наружу) сильно напоминают некогда популярные в нашей стране тёплые практичные безрукавки, которыми с десяток лет назад была завешаны все стелажи даже в захудалых сельмагах. Сегодня жилеты из меха особенно популярны. Наверняка у каждой знаменитости найдётся в шкафу пара-тройка жилетов разных стилей. В повседневной жизни дивы большого экрана предпочитают носить классические жилеты, сочетая их с различными вещами, чаще всего не классическими. Также среди звезд очень популярны дутые жилетки, которые они одевают, когда катаются на лыжах и коньках, на прогулку при холодной погоде. Выбирая себе актуальный жилет, надо помнить несколько простых правил. Во-первых, сегодня жилеты используются совершенно в разных вариантах – и как составная часть классического костюма, и как утеплённый вариант верхней одежды, и как альтернатива свитеру. Во-вторых, они могут быть в любом стиле – от гламурного до 'милитари'. В-третьих, они могут быть из любого материала, который хорошо держит форму. А всё остальное зависит только от вашей собственной фантазии.

DOUBLE TAXATION = ДВОЙНОЕ НАЛОГООБЛОЖЕНИЕ – Double Taxation is the practice of taxation the same wealth, income or property twice with different taxes or by the tax authorities of two different countries.

DOUBLE TAXATION AGREEMENT = СОГЛАШЕНИЕ О ДВОЙНОМ НАЛОГООБЛОЖЕНИИ – Double Taxation (DT) Agreement:- international treaties, generally concluded between two or more countries to prevent or reduce double taxation in cross-border capital transactions. By clearly allocating specific types of income to each country involved, DT agreements are designed to avoid the risk of a simultaneous tax liability in both, the country of residence and the source country in which income was generated. Double Taxation Agreement is an agreement or treaty signed between different nations for the purpose of eradicating or alleviating the effects of double taxation. In the United Kingdom, Double Taxation Agreement:- different countries have their own tax rules and laws. When you have income and capital gains from one country and are resident in another, you may have to pay tax in both countries under their different tax laws. To help avoid being taxed twice – 'double taxation', the UK has negotiated double taxation agreements with many countries. When you might be affected by double taxation:- (1) If you are resident in the UK and have income or gains in another country:- if you are resident in the UK and have income or capital gains in another country you usually have to pay UK tax on them. But you may also have to pay foreign tax on the same income and gains in the other country. Double taxation agreements aim to ensure that you pay tax on your income and gains once only. (2) If you are not resident in the UK and have income or gains in the UK:- if you are not resident in the UK you may have to pay UK tax on any income or capital gains you have in the UK. But you may also be charged tax on your worldwide income or gains, which will include the UK, in the country in which you are resident. Double taxation agreements aim to ensure that you pay tax on your income and gains once only. How double taxation agreements work? Double taxation agreements usually operate in one of three ways:- (i) you pay tax in your country of residence and get an exemption or relief from tax in the country where you have made your income or gain; (ii) you pay tax in the country where you have made your income or gain and get an exemption or relief from tax in the country where you are resident; and (iii) tax is deducted in the country where you make your income or gain and you declare this tax as already paid on your tax return for the country where you are resident – the tax already paid is known as 'Withholding Tax'. The agreements work in the same way for residents of both countries involved, but which system is in place depends on the individual agreement between those two countries (and can depend on the type of income involved). For example, where the relevant agreement allows UK residents to claim exemption or relief from Income Tax in Spain, Spanish residents can claim the same for their income in the UK. Income Tax and double taxation relief:- double taxation agreements normally allow some tax relief on the following kinds of income:- (i) pensions and some annuities – but not UK Government pensions; (ii) earnings from employment or professional services – but not if you're an entertainer or sportsperson; (iii) royalties; (iv) interest; (v) income distributed by real estate investment trusts (UK-REITs) and property authorised investment funds (PAIFs); and (vi) dividends. The rules for tax relief on dividend income are complicated. Section 9.1.9 of booklet HMRC6 'Residence, Domicile and the Remittance Basis' covers double taxation and dividends in more detail. Income Tax and double taxation relief – exceptions:- (1) If you receive a UK Government pension:- if you receive a pension paid by the UK for service to the UK Government or a local authority in the UK, it will usually be taxed only in the UK – but there are some exceptions to this general rule. For details of how your pension will be taxed under the double taxation agreement between the UK and the country in which you are resident, see HM Revenue & Custom's (HMRC) 'Digest of double taxation treaties'. (2) If you're an entertainer or sportsperson:- if you're not resident in the UK and you're an entertainer, sportsman or sportswoman, you won't be able to claim relief from UK tax on income you receive connected to a performance in the UK. Capital Gains Tax and double taxation relief:- under many agreements, you will pay Capital Gains Tax in the country where you are resident and you will be exempt from Capital Gains Tax in the country where the gain is made. Capital Gains Tax and double taxation relief – exceptions:- the exceptions are where either:- (i) the gain comes from an asset that cannot be taken out of the country, for example land or a house; and (ii) the gains come from assets connected with a business or trade you are running through a permanent establishment in that country. In these circumstances you will pay tax in both countries, but the country in which you are resident will give you relief for the tax paid on the gain in the other country. You should check the relevant double taxation agreement to see how your gains will be treated. Double Taxation relief if you're a student or apprentice:- under most double taxation agreements, if you are an overseas student or apprentice visiting the UK solely for full-time education or training, you will not pay tax on income payments from sources outside the UK for your maintenance, education or training. Some double taxation agreements also provide that students or apprentices coming to this country for limited periods will be exempt from UK tax on certain earnings from employment here. You'll need to check the individual agreement for details. Countries that have a double taxation agreement with the UK:- you can find a full list of the UK's double taxation agreements in HMRC publication Double Taxation Digest. If there is no double taxation agreement:- if there is no double taxation agreement between the country where you are resident and the country where you have income or capital gains, then your income or capital gains may be taxed fully in both countries. (1) If you're resident in the UK:- if you are resident in the UK then you can sometimes get credit for the tax you have paid in the other country (for instance where there is no agreement and the foreign tax is equivalent to Income Tax or Capital Gains Tax). This is called 'Unilateral Relief'. You can get more information on unilateral relief by following the link below. (2) If you're not resident in the UK:- if you're not resident in the UK and you have taxable UK income you may be eligible to receive the first part of this income (known as the 'Personal Allowance') free of tax. You can claim this tax back on form R43 Claim to personal allowances and tax repayment by an individual not resident in the UK. Dual Residence:- if you are resident in two countries in the same tax year then, if there is a double taxation agreement in place, the agreement will tell you how each country should tax any incomes or gains you may have. This will depend on the exact agreement involved and the nature of your residence in each country. It is a complicated area therefore HMRC recommends that you read the relevant section of the treaty and consider seeking professional tax advice. / Соглашение или трактат, подписанный между различными странами с целью искоренения или облегчения эффектов двойного налогообложения.

DOUBLE TOP = ДВОЙНАЯ ВЕРШИНА – In the analysis of market trends, Double Top is a chart pattern of price movements that depict a rising market which hits resistance at a certain level, retreats, rises again, but still cannot breach the previous resistance point, and falls back again. The price patterns are used by technical analysts to recognize a reversal of a price trend. It is when prices make a high and then decline or consolidate, rise back to the original high price area before declining again. Double Top is a reversal pattern where two prices spikes of similar magnitude are turned back lower/higher. Sometimes referred to as an M Formation. A reversal chart

pattern displaying two prominent peaks. The reversal is complete when the support trough is broken. The opposite of Double Bottom. In technical analysis, a Double Top occurs when a price rises to the same level twice and fails to break above it, and therefore produces a level of good resistance. A bearish reversal pattern characterized by two highs at roughly equal value. Double Tops and Bottoms:- this chart pattern is another well-known pattern that signals a trend reversal – it is considered to be one of the most reliable and is commonly used. These patterns are formed after a sustained trend and signal to chartists that the trend is about to reverse. The pattern is created when a price movement tests support or resistance levels twice and is unable to break through. This pattern is often used to signal intermediate and long-term trend reversals. Figure 3:- a double top pattern is shown on the left, while a double bottom pattern is shown on the right. In the case of the double top pattern in Figure 3, the price movement has twice tried to move above a certain price level. After two unsuccessful attempts at pushing the price higher, the trend reverses and the price heads lower. In the case of a double bottom (shown on the right), the price movement has tried to go lower twice, but has found support each time. After the second bounce off of the support, the security enters a new trend and heads upward. / В техническом анализе биржевых рынков, Двойная Вершина является разворотной фигурой тенденции на понижение, характеризующаяся двумя примерно одинаковыми максимальными значениями цены.

DOUBLE TRANSPLANTING = ДВОЙНАЯ ПЕРЕСАДКА (или ДВОЙНАЯ ВЫСАДКА (РАССАДЫ), или ДВОЙНАЯ ПИКИРОВКА) – Double Transplanting is used when seedlings once transplanted are uprooted again some 2–4 weeks after the first transplanting and planted in the final field. / Под Пикировкой, от Французского слова Piquet, означающее Колышек, понимается пересадка овощных, плодовых, декоративных и некоторых технических культур в молодом возрасте. После пикировки растения получают большую площадь питания.

DOUBLE UP = СДВАИВАТЬ – Double Up (maritime term):- to double a vessel's mooring lines.

DOUBLE WEAVE = ПЕРЕПЛЕТЕНИЕ ДВОЙНОЙ ТКАНИ (или ПЕРЕПЛЕТЕНИЕ ДВУХПОЛОТНЫХ ТКАНЕЙ) – Double Weave:- a fabric woven with two systems of warp or filling threads so combined that only one is visible on either side. Cutting the yarns that hold the two cloths together yields two separate cutpile fabrics. Double Weave:- a woven fabric construction made by interlacing two or more sets of warp yarns with two or more sets of filling yarns. The most common double weave fabrics are made using a total of either four or five sets of yarns. / переплетение. Уточные пряжи.

DOUBLE–WING PALLET = ДВУХНАСТИЛЬНЫЙ ПОДДОН С ВЫСТУПАМИ (или ПОДДОН С ВЫСТУПАМИ НА ВЕРХНЕМ И НИЖНЕМ НАСТИЛАХ) – Double-Wing Pallet is a pallet with top and bottom deckboards extending beyond the edges of the stringers or stringerboards. Double-Wing Pallet is a pallet with both top deck and bottom deck extending beyond stringers, blocks, posts or stringerboards. / Поддон С Выступами На Верхнем И Нижнем Настилах:- плоский поддон, имеющий выступы на верхнем и нижнем настилах, расположенные за продольными брусьями, шашками или продольными досками.

DOUBLE YARN AND TWIST YARN = ДВОЙНАЯ ПРЯЖА И КРУЧЁНАЯ ПРЯЖА – Double Yarn and Twist Yarn:- a two-ply yarn made from single yarns of different colors. A mottled effect is produced.

DOUBLING = ТРОЩЕНИЕ (или СУЧЕНИЕ, или СДВАИВАНИЕ) – Doubling is the process of combing by twisting together two single yarns to form a double yarn. Doubling is:- (1) a process for combining several strands of sliver, roving, or yarn in yarn manufacturing. (2) The process of twisting together two or more singles or plied yarns, i.e. plying. (3) A British term for twisting. (4) The term doubling is sometimes used in a sense opposite to singling. This is unintentional plying. (5) A yarn, considerably heavier that normal, produced by a broken end becoming attached to and twisting into another end.

DOUBLY MARKS = ОТМЕТИНЫ XX – Doubly Marks:- any fold creates doubly mark on machine. Finishing defect. / Порок или дефект заключительной отделки.

DOUBTFUL = СОМНИТЕЛЬНЫЙ – Doubtful:- a loan that has all the weaknesses of a substandard loan plus it is difficult to collect in full. / Сомнительный:- займ, которому присущи все изъяны низкокачественного займа, в дополнение к этому, взыскание всей суммы по нему сопряжено с трудностями.

DOUBTFUL DEBTS = СОМНИТЕЛЬНЫЕ ДОЛГИ – Doubtful Debts are the debts on which it is considered that it is likely that a loss will be incurred through payment not being received or not received in full. The expected loss might relate to a specific debt but usually will be a proportion of total debts outstanding which from experience it is known will not be collected. Doubtful debts are incorporated into the accounting system by means of a provision as a period-end adjustment. Contrast Bad Debts. Doubtful Debt is a debt where circumstances have rendered its ultimate recovery uncertain. Conservatism requires that doubtful debts should be treated in the same way as bad debts. They should thus be recorded as an expense in the profit and loss account and to be credited to a provision to set off against ultimate default if it occurs. Doubtful Debts:- history has shown that a certain percentage of debtors will not pay. To accurately reflect the amount owed an allowance for doubtful debts is created and recorded on the balance sheet. This reduces the debtors balance, and is an estimate of the current debtors who are likely to become uncollectible in the future. If there is already an account for doubtful debts, this account would be adjusted at each balance day. The following entry shows the creation of an allowance for doubtful debts. We debit an expense account called Doubtful debts and credit a current asset account called Allowance for doubtful debts. (i) Increasing Doubtful Debts:- if the debtors balance at the end of the last financial year is lower than the current Debtors balance, doubtful debts will be increased. Example:- doubtful debts will be debited and the allowance for doubtful debts will be credited. (ii) Decreasing Doubtful Debts:- if Debtors balance at the end of the last financial year is higher than the current Debtors balance, Doubtful Debts will be decreased. Example:- doubtful debts will be credited and the allowance for doubtful debts will be debited. (iii) Writing Off Doubtful Debts:- when you receive confirmation that doubtful debts are not going to be paid, you will debit allowance for doubtful debts and goods and services tax (GST) collected and credit debtors control and the debtors individual card. Example:- below is a sample general journal entry. Note:- this relates to sales made within a previous accounting period. / В контрасте с Безнадёжными Долгами (Bad Debts).

DOUGH STAGE = СТАДИЯ ВОСКОВОЙ СПЕЛОСТИ (или СТАДИЯ ТЕСТООБРАЗНОЙ СПЕЛОСТИ, или СТАДИЯ ТЕСТООБРАЗНОГО СОСТОЯНИЯ (ЗЕРНА)) – Dough Stage is the stage in rice development which occurs during the ripening phase when the milky caryopsis inside the developing grain turns into soft dough and later into hard dough.

DOUPION = ДВОЙНИК – Doupion:- silk that comes from the fiber formed by two silk worms who spun their cocoons together in an interlocking manner. The yarn is uneven, irregular, and larger than regular filaments. It is used to make shantung and doupioni. Also called Douppioni, Dupion, and Dupioni. Doupion is a silk-breeding term used for double cocoons. It is also used to refer to the rougher quality of silk. Doupion or Douppioni:- silk yarns made from the cocoon of two silk worms that have nested toghether. In spinning, the double strand is not separated so the yarn is uneven and irregular with a large diameter in places. Fabric is of silk made in a plain weave. The fabric is very irregular and shows many slubs; seems to be made in a hit and miss manner. It is imitated in rayon and some synthetics, and one such fabric is called 'Cupioni'. Dupion yarns also used in shantung, pongee. Tailors very well.

DOUPIONI = ДУПИОНИ (или ДВОЙНИК) – Sometimes known as Dupion or Douppioni, silk dupioni is created with the threads from two different silk worms. When two worms spin their cocoons close together, the fibers get tangled up; these naturally tangled fibers are then used together to make the silk thread. The thread is rougher than regular silk, and contains bumps and irregularities where the fibers from the two cocoons are combined. Silk dupioni takes dye well and is usually easy to sew. Silk dupioni has an advantage over some other types of silks, in that it tends to resist wrinkles, which helps to enhance the usability of the finished fabric. In addition, silk dupioni also has a tendency to take creases very well, which can give the final product a crisp and formal appearance. As an added bonus, the fabric is totally reversible, so it is perfectly acceptable for both sides of the material to be visible. At the same time, silk dupioni does have a couple of drawbacks. The material has almost no stretching ability, which means that using this fabric requires the need to be very exact in the measurements before cutting out any pattern. It is also naturally irregular in texture, and the edges may unravel. Silk dupioni can be used in a number of different fabric creations. In the way of clothing, this fabric works well for flowing jackets, blouses, skirts, dresses, and bridal gowns. For home decorating, silk dupioni can be utilized as drapery panels or other types of window treatments, table runners and cloths, and doilies for accent on tables and sofa backs and arms. While dry-cleaning is generally recommended for silk dupioni, it is possible to hand wash sections of fabric before the material is cut and used in a pattern. When washed by hand, there is the chance of some shrinkage, and the fabric will most likely lose some of the crisp texture and a portion of the shimmering effect. For finished products constructed with silk dupioni, dry cleaning is definitely the best means of freshening the material. Doupioni is a silk yarn reeled from two or more entangled cocoons and producing a coarse yarn Generally used in fabrics such as shantung or pongee. See also Reeled Silk. Douppioni (also called Doupioni, Dupion, Dupioni):- Douppioni Silk is a lustrous silk often woven from two different colors of threads, so that it shimmers or changes color in the light. Douppioni is made from an irregular, rough silk reeled from double cocoons or cocoons nested together, making it necessary to reel them together. Doupioni is also seen in man-made fibers such as polyester or acetate, and is referred to as Doupionini. An elegant woven fabric made with a tight plain weave, fine warp yarns, filling yarns that form prominent, irregular crosswise ribs. Usually brightly colored, it has a moderately crisp drape, fairly reflective luster, and a nubby texture. It is crisp to the touch; it doesn't wrinkle badly; nor does it hold a crease well. Douppioni is sturdy and substantial, but not durable. It is reversible, not particularly stretchy, and relatively easy to sew. It is commonly used to make blouses, dresses, skirts, and fine lightweight suits. Douppion Yarn:- a silk formed by two worms united to spin a single cocoon which is therefore composed of two filaments. Reeled into a coarse slubby yarn which is used in the manufacture of douppioni, pongee, shantung, and other textured silks. Douppioni is a rough or irregular yarn made of silk reeled from double or triple cocoons. Fabrics of douppioni have an irregular appearance with long, thin slubs. Douppioni-like yarns are now being spun from polyester and/or rayon staple. / уточные пряжи. DOW = ДАУ – Dow or the Dow (of the Dow Jones) Industrial Index is a stock index named after its founders. It is the 'price' of a collection of 30 blue chip industrials on the New York Stock Exchange calculated throughout the trading day. It provides a measure of how the 'blue chip' stock market is performing. See also Index. / Дау Дьжонз (Dow Jones).

THE DOW JONES–AIG COMMODITY INDEXES^{SM} = СЫРЬЕВЫЕ ИНДЕКСЫ ОТ ДАУ ДЬЖОНЗ–ЭЙ.АЙ.ДЬЖИ.^{ЗО} – The Dow Jones-AIG Commodity Index^{SM} (DJ-AIGCI^{SM}) is a broadly diversified index that allows investors to track commodity futures through a single, simple measure. The index is composed of futures contracts on physical commodities. As the index has grown in popularity since its introduction on 1998-July-14, additional versions and a full complement of sub-indexes have been introduced. Together, the family offers investors a comprehensive set of tools for measuring the commodity markets. The DJ-AIGCI^{SM} family includes both the DJ-AIGCI^{SM}, which is calculated on an excess return basis, and the DJ-AIGCITR^{SM}, a total return index based on the DJ-AIGCI^{SM}. The former reflects the return of underlying commodity futures price movements only, while the latter reflects the return on fully collateralized positions in the underlying commodity futures. The DJ-AIGCI^{SM} family includes eight sector sub-indexes that group the commodities by type, e.g., the DJ-AIG Grains Sub-Index^{SM} includes Corn, Soybeans and Wheat. The DJ-AIG Ex Energy Sub-Index^{SM} allows investors to track a diversified basket of commodity futures with-out exposure to energy futures prices. Also available are individual commodity sub-indexes on the 19 components currently included in the DJ-AIGCI^{SM}, plus cocoa, lead, platinum and tin. All DJ-AIGCI Sub-Indexes are available in excess and total return versions. The DJ-AIGCI^{SM} family includes 1-, 2-, and 3-Month Forward versions of the DJ-AIGCI^{SM} and select sub-indexes (DJ-AIGCI Forward Indexes^{SM}). Composed of longer-dated commodity futures contracts, the forward versions allow investors to measure exposure to different parts of the commodity futures curves. The Dow Jones-AIG Commodity Spot Indexes^{SM} measure price movements of the commodities included in the DJ-AIGCI^{SM} and select sub-indexes. The DJ-AIG Commodity Spot Indexes provide a general estimate of trends in commodity prices. They do not account for the effects of rolling futures contracts or the costs associated with actually holding physical commodities, and therefore are not replicable with positions in the underlying commodity futures contracts. The DJ-AIGCI^{SM} and the DJ-AIGCITR^{SM} are also available denominated in Yen, Euro, Swiss Francs and Pounds Sterling (DJ-AIGCI^{SM} Foreign Currency Versions). The Dow Jones-AIG Commodity Currency Hedged Indexes^{SM} measure the performance of commodities futures contracts that trade in a specific currency that is hedged against the US Dollar. Currently available calculated in excess return and total return are:- Australian Dollar, Euro, Pound Sterling, Yen and Swiss Franc. See also The Dow Jones Indexes. Dow Jones-AIG Commodity Indexes^{SM} (DJ-AIGCI^{SM}) is a liquid and diversified benchmark for commodities as an asset class. The index is composed of futures contracts on 19 physical commodities. The DJ-AIGCI^{SM} family includes nine subindexes that group commodities based on type, plus single commodity indexes based on the 19 individual commodities in the DJ-AIGCI^{SM}, plus Cocoa, Lead, Platinum and Tin. 'AIG' is a registered trademark of American International Group, Inc. 'Dow Jones-AIG Commodity Index' and 'DJ-AIGCI' are service marks of Dow Jones & Company, Inc and American International Group, Inc. On 2009-January-19, UBS Investment Bank has entered into an agreement to purchase the commodity index business of AIG Financial Products Corp, including AIG-FP's rights to the DJ-AIG Commodity Index^{SM}. Should the transaction close as expected by May 2009, the Dow Jones-AIG Commodity Indexes are expected to be renamed the 'Dow Jones-UBS Commodity Indexes'. Aside from the name change, all other aspects of the indexes are expected to remain the same. / Амэрикэн (American). Смотрите также Индексы от Дау Дьжонз (The Dow Jones Indexes).

THE DOW JONES AVERAGES^{SM} = УСРЕДНЕНИЯ ДАУ ДЬЖОНЗА^{ЗО} – Created more than 100 years ago, the Dow Jones Averages^{SM} were the world's first market indicators. The benchmarks currently cover the following style classifications:- convertible arbitrage, distressed securities, event driven, equity long/short, equity market neutral and merger arbitrage. See also The Dow Jones Indexes. / Смотрите также Индексы от Дау Дьжонз (The Dow Jones Indexes).

THE DOW JONES INDEXES = ИНДЕКСЫ ОТ ДАУ ДЬЖОНЗ – Dow Jones Indices:- at the end of the XIX century, publishers Dow, Jones & Company started producing indices for the New York Stock Exchange quoting the shares of 30 industrial, 20 railway and 15 power companies, respectively, as well as an overall index of all 65 stocks. The industrial index, in particular, quickly gained worldwide recognition and has become known as the Dow Jones Index. The indices issued by Standard & Poor's (500 stocks) and the New York Stock Exchange are more extensive. The Tokyo Stock Exchange publishes an index consisting of 225 Japanese company shares. The Dow Jones℠ Index is a share index showing movements on the New York Stock Exchange. Calculated regularly since 1897. Also known as The Dow Jones Averages. See also The Dow Jones Industrial Average℠ Index, The Dow Jones℠ Transportation Average Index, and The Dow Jones℠ Utilities Average Index. The Dow Jones Indexes is the name behind 'The Dow', the most quoted and recognized index in the world. Beyond this legendary measure, Dow Jones Indexes calculates a family of more than 130 000 market indicators. Among them are the Dow Jones Wilshire Global Indexes – maintained jointly by Dow Jones Indexes and Wilshire Associates – which provide the most comprehensive coverage of the world's markets. Other widely adopted index series include the Dow Jones Titans family of blue-chip indexes, the Dow Jones Islamic Market Indexes and the Dow Jones Select Dividend Indexes. Together with Deutsche Boerse AG and SWX Group, Dow Jones is co-owner of STOXX Limited, which calculates the world's leading pan-European indexes. Current Benchmark Indexes are as follows:- (i) Dow Jones Averages℠; (ii) Dow Jones STOXX® Blue-Chip Indexes; (iii) Dow Jones STOXX® Global 1800 Indexes; (iv) Dow Jones Titans Indexes℠; (v) Dow Jones STOXX® TMI Indexes; (vi) Dow Jones US Indexes℠; and (vii) Dow Jones Wilshire Global Indexes℠. Current Specialty Indexes are as follows:- (i) Dow Jones-AIG Commodity Indexes℠; (ii) Dow Jones CBOT® Treasury Index℠; (iii) Dow Jones Corporate Bond Index℠; (iv) Dow Jones Dharma Indexes℠; (v) Dow Jones Hedge Fund Strategy Benchmarks; (vi) Dow Jones Islamic Market Indexes℠; (vii) Dow Jones RBP Indexes℠; (viii) Dow Jones Relative Risk Indexes℠; (ix) Dow Jones Select Dividend Indexes℠; (x) Dow Jones Sustainability Indexes℠; (xi) Dow Jones Target Date Indexes℠; (xii) Dow Jones Transaction-Based Indexes℠; and (xiii) Dow Jones Volatility Indexes℠. Dow Jones indexes are created according to clear, unbiased and systematic methodologies that are fully integrated within index families. Rigorous procedures are employed to promote data accuracy, timeliness and consistency. Daily values of Dow Jones indexes are available through major real-time and end-of-day market-data vendors, are published worldwide in financial publications and on financial Web sites, and can be downloaded from the Dow Jones Indexes web site. Dow Jones Indexes is a unit of Dow Jones & Company, a subsidiary of News Corporation. Dow Jones is a leading provider of global business news and information services. Its Consumer Media Group publishes The Wall Street Journal, Barron's, MarketWatch and the Far Eastern Economic Review. Its Enterprise Media Group includes Dow Jones Newswires, Factiva, Dow Jones Client Solutions, Dow Jones Indexes and Dow Jones Financial Information Services. Its Local Media Group operates community-based information franchises. Dow Jones owns 50% of SmartMoney and 33% of Stoxx Ltd and provides news content to radio stations in the United States. 'Dow Jones', 'Dow Jones Indexes' and all other index names are service marks of Dow Jones & Company, Inc.. THE DOW JONES INDUSTRIAL AVERAGE℠ INDEX = УСРЕДНЁННЫЙ ПРОМЫШЛЕННЫЙ ИНДЕКС ОТ ДАУ ДЬЖОНЗ[ЗО] – Created in May 1896 by Charles Dow, one of the founders of The Wall Street Journal, the industrial average was not the first market index. That distinction belongs to an 1884 predecessor of what is today known as the Dow Jones Transportation Average, also the creation of Mr Dow. The Transportation Average originally was named the Dow Jones Railroad Average; in the late XIX century railroading was the most important industry in the United States. By 1896, industrial stocks comprised a small but growing part of the market, and Mr Dow felt compelled to create an index for this segment as well. He used the two indexes to confirm broad market trends, reasoning that because industrial companies produced goods and the railroads delivered them, a bull market was sustainable only if both sectors were participating. The new Dow Jones Industrial Average originally had 12 stocks (American Cotton Oil; American Sugar; American Tobacco; Chicago Gas; Distilling & Cattle Feeding; General Electric; Laclede Gas; National Lead; North American Utility; Tennessee Coal & Iron; US Leather (preferred); and US Rubber), including a leather maker, a steel provider and a sugar producer. First published 1896-May-26, and regularly featured in the Journal as of October of that year, The Dow waited more than 25 years to achieve prominence outside the narrow canyon of Wall Street. In 1896, investing in the stock market was considered a highly speculative activity, particularly with regards to industrial stocks. Railroad stocks were tolerable as they were the 'blue-chips' of their day, but bonds were the truly prudent investment. For more than four months in the second half of 1914, The Dow was not published. The New York Stock Exchange was closed because of World War I. It was feared that the instability caused by the war would cause the market to plummet. By the 1920s, popular attitudes had changed. Average citizens began investing in stocks, driving the industrial average from the 100 range in 1924 up to nearly 400 before the 1929 crash. It was the crash that brought The Dow's reputation to the attention of Main Street USA as it lost nearly 30% of its value over the course of two days. Before that, investors had been more focused on their individual stocks, but after the crash there was greater interest in general market conditions. Though it had come close in 1929, The Dow did not actually rise above 400 points until the end of 1954. The economic upheaval of the 1930s and the

international disruption of World War II kept it fluctuating below that mark for 25 years. No component changes were made to the Dow Jones Industrial Average during the 1940s and the 1960s. The 1950s were one of The Dow's best decades in history, climbing almost 240% to close 1959 at 679.36. However, not until the 1980s and 1990s would there again be such substantial gains in the stock market. Those two decades represent an era of unparalleled prosperity, despite the crash in 1987 and a brief bear market kicked off by the Gulf War. The Dow rose 228.25% during the 1980s to close at 2 753.20 at the end of 1989 and 317.59% during the 1990s, ending 1999 and the century at 11 497.12. In the last 10 years of the XX century, the Dow Jones Industrial Average burst through several 1 000-point milestones, crossing the 10 000 barrier for the first time on 1999-March-29. The excitement generated by this event was felt around the world. Though the number itself had no special significance, it served to highlight the spectacular performance of the index and – by extension – the US economy. Throughout most of its history, the industrial average's components have been chosen from among the stocks listed on the New York Stock Exchange, though there was never any rule in the index's methodology that said an NYSE® listing was a requirement for eligibility. It was not until 1999-November-01, that stocks from the NASDAQ® Stock Market (Intel Corp. and Microsoft Corp.) were added to The Dow. The Dow peaked at 11 722.98 on 2000-January-14, before sliding into a bear market. After weathering the 2001-September-11, terrorist attacks and hitting bottom in October 2002, the industrial average once again crossed 10 000 in December 2003. As always, in times of market turmoil – whether bull rallies or bear declines – the industrial average claims the headlines and is the language of investors as they ask, 'How did the market do?' The Dow Jones Industrial Average proved its resilience by making a comeback amid the Iraq War and a volatile energy market. In the final stretch of 2006, the Dow Jones Industrial Average gained momentum and repeatedly pummeled record after record. The succession of events began 2006-October-19 when The Dow closed at 12 011.73, simultaneously reaching a new unprecedented high and breaking the 12 000 mark on the 19th anniversary of 'Black Monday'. On November 17, the industrial average soared to 12 342.56 and continued its upward trend surpassing the 12 500 level 2006-December-27. The Dow is not called 'the Market's Measure' for nothing. Just as equity markets worldwide climbed and peaked in 2007, so did The Dow. Despite occasional small dips, it continued in an upward trajectory for most of the year, hitting highs along the way. The Dow hit its peak on 2007-October-09, when it closed at 14 164.53. That marked the end of the current (and longest ever) US bull market. With news of a rapid and harrowing meltdown of the credit markets, the DJIA started to fall throughout the rest of 2007. As the loss of faith in bond markets spread to equities – and then to Wall Street institutions themselves – the markets continued to tumble, and The Dow spiraled downward – to 11 893.69 on March 7. There was a rally in the spring that saw The Dow break 13 000 in May, but that was a brief respite. By August 01, it was back down to 11 326.32. Bank and investment company failures around the country spread to other sectors and capital started to dry up. On 2008-September-15, the Dow Jones Industrial Average fell 504.48 to 10 917.51 on news that Lehman Brothers had failed and that Merrill Lynch would be purchased (at a discount) by Bank of America. September 29 marks the largest drop in the DJIA's history:- 777.68, closing at 10 365.45. The index would have several three-digit falls in October, including a 733.08 drop (the second largest in history) on the 15th to close at 8 577.91. The Dow rallied several times in the ending months of 2008. Its second largest gain ever was on October 28, up 889.35, to close at 9 069.12. However, bear sessions after Election Day brought it below 9 000 in November for the first time since 2003-June-03; and then below 8 000 (on 2008-November-19) for the first time since 2002-October-14. The first few weeks of December 2008 had The Dow rise on news of a massive government infrastructure program in the US proposed by the incoming Obama administration, the shake-out of the markets and economy, and the idea that the bear market might have reached a bottom. It rose from 8 419.09 on December 02 to 8 934.18 on December 08, as wary investors sought stability and a few brave souls went bargain-hunting. The Dow's greatest one-day percentage gain took place 1933-March-15, well into the Depression. The index rose 15.34%, or 8.26 points, on that day. Its greatest percentage loss was on 1987-October-19 – otherwise known as 'Black Monday' – when the industrial average fell 22.61%, or 508.00 points. The Dow is calculated using very nearly the same formula now as at its inception:- Simply add the prices of the component stocks on their primary exchanges and divide this sum by the current divisor. The divisor, however, is not the number of stocks, as it originally was. In 1916, the editors of The Wall Street Journal raised the number of components in The Dow from 12 to 20. Then, in 1928, they increased the number of components again – this time to 30 – and also introduced the adjusted divisor. The adjusted divisor is designed to keep the index consistent through events such as component changes, stock splits, large dividend distributions, mergers and acquisitions and spin-offs. It ensures that the index remains at the same level immediately after one of these events as it was before. For example, in a 2-for-1 stock split the number of existing shares is doubled and the price is halved. Since the index calculation is based on price, not adjusting the divisor would cause The Dow to plunge in value as one of its components' stock prices fell by 50%, even though there was no change in the value of an investor's holding in the stock. Instead of one share worth USD10.00, for example, an investor would have two worth USD5 apiece. Over the years, there have been so many changes to the divisor, most of them downward adjustments, that it is now a fraction. The formula for calculating a divisor change is as follows:- $D_{t+1} = D_t \cdot \Sigma C^a_t / \Sigma C_t$. Where:- D_{t+1} – divisor to be effective on trading session t+1; D_t – divisor on trading session t; C^a_t – components' adjusted closing prices for stock dividends, splits, spin-offs and other applicable corporate actions on trading session t; and C_t – components' closing prices on trading session t. At any given time, The Dow's 30 components usually account for 25% to 30% of the total market value of all US stocks. The Dow doesn't literally 'represent' the entire US market. Rather, it is a blue-chip index representing the leading companies in the industries driving the US stock market. As a result, its performance is highly correlated with that of indexes containing hundreds or thousands of stocks. Component changes are rare and usually occur only when an existing company is going through a major change, such as a shift in its main line of business, acquisition by another company, or bankruptcy. There is no review schedule. Changes are made as needed at the discretion of the managing editor of The Wall Street Journal. While the responsibility rests with this individual, other senior editors may be consulted. Selected components are always US companies, are leaders in their industries, are widely held by investors, and have long records of sustained growth. The Dow is an example of the elegance of simplicity. It tracks closely with other major market indexes with more complex methodologies and yet easily can be calculated with paper and pencil. Moreover, it is the only major market index with more than 100 years of history. Today The Dow is quoted worldwide on a daily basis in news broadcasts, on Web sites, in newspapers and journals and in conversation. It also has been licensed to financial institutions around the world as the basis of investment products. The Dow Jones Industrial Average, also referred to as The Dow or the industrial average, is one of the best-known icons of American culture and among stockmarket observers around the world. It is as much a staple of news reports as traffic and weather, and its actions are reported whenever a major world event occurs. Whether The Dow rises or falls, the eyes of the world are always upon it. A price-weighted average of 30 blue chip stocks published by Dow Jones & Company, Inc. Because it is price-weighted, stocks with the highest prices will have the most influence and those with the lowest, the least influence. The Dow Jones Industrial Average℠ (DJIA℠) index is calculated by adding the closing prices of the stocks, and then dividing by a number that takes into account splits, large dividends, substitutions and mergers. THE DOW JONES SUSTAINABILITY INDEXES[SM] = ИНДЕКСЫ ПО СНАБЖАЕМОСТИ (или ПОДДЕРЖКЕ) ОТ ДАУ ДЬЖОНЗ[3O] – Based on the cooperation of Dow Jones Indexes and Zurich-based SAM, Dow Jones and Dow Jones STOXX Sustainability Indexes track the performance of the leading sustainability-driven companies. The family includes global and regional indexes, and subindexes excluding alcohol, gambling, tobacco and/or armaments and firearms. For example, the Dow Jones Sustainability World Index (DJSI World) is a worldwide sustainability index which lists the top 10% of the 2 500 largest companies that appear in the Dow Jones Global Index in terms of economic, ecological and social criteria. See also The Dow Jones Indexes. / СТАКС Лимитид (STOXX Limited). Смотрите также Индексы от Дау Дьжонз (The Dow Jones Indexes).

THE DOW JONES TARGET DATE INDEXES[SM] = ИНДЕКСЫ ПО ЗАПЛАНИРОВАННЫМ ДАТАМ ОТ ДАУ ДЬЖОНЗ[3O] – Dow Jones Target Date Indexes[SM] measure portfolios that reduce potential risk over time as investors' retirement or other 'target' dates approach. The indexes represent target dates at five-year increments through 2045. Each index is a composite of subindexes that represent stocks, bonds and cash. Indexes in the Dow Jones Real Return Target Date series are made up of subindexes for stocks, bonds, real estate, TIPS and commodities. See also The Dow Jones Indexes. / Смотрите также Индексы от Дау Дьжонз (The Dow Jones Indexes).

THE DOW JONES TITANS INDEXES[SM] = ИНДЕКСЫ ПО ТИТАНАМ ОТ ДАУ ДЬЖОНЗ[3O] – Dow Jones Titans Indexes[SM] measure the performance of the largest stocks in a country, sector or region. Each index contains between 10 and 100 stocks, selected based on size, sales/revenue, net income and/or liquidity. See also The Dow Jones Indexes. / Смотрите также Индексы от Дау Дьжонз (The Dow Jones Indexes).

THE DOW JONES TRANSACTION–BASED INDEXES[SM] = ИНДЕКСЫ, ОСНОВАННЫЕ НА ТРАНЗАКЦИЯХ, ОТ ДАУ ДЬЖОНЗ[3O] – Dow Jones Transaction-Based Indexes[SM] are based on actual transactions in the power, steel and recovered papers industries. The family includes the US Daily Electricity Price, US Hourly Electricity Price, European Power, European Gas, Recovered Papers ad Steel

Indexes. The indexes offer industry-wide benchmarks to help participants gauge price risks. See also The Dow Jones Indexes. / Смотрите также Индексы от Дау Дьжонз (The Dow Jones Indexes).

THE DOW JONES TRANSPORTATION AVERAGE INDEX = УСРЕДНЁННЫЙ ИНДЕКС ПО ТРАНСПОРТИРОВОЧНОМУ СЕКТОРУ ОТ ДАУ ДЬЖОНЗ – The Dow Jones Transportation Average Index is an index consisting of 20 stocks in the transportation business. Originally the index only included railroads; now airlines and trucking companies are included. According to the Dow Theory, a new major high in the Dow Jones Industrial Average[SM] Index should be confirmed by a new major high in this index before it is considered a reliable signal. See also The Dow Jones Indexes. / Смотрите также Индексы от Дау Дьжонз (The Dow Jones Indexes).

THE DOW JONES–UBS COMMODITY INDEX[SM] = СЫРЬЕВОЙ ИНДЕКС ОТ ДАУ ДЬЖОНЗ–Ю.БИ.ЭС.[ЗО] – The Dow Jones-UBS Commodity Index[SM] (DJ-UBSCI) is composed of futures contracts on physical commodities. Unlike equities, which typically entitle the holder to a continuing stake in a corporation, commodity futures contracts normally specify a certain date for the delivery of the underlying physical commodity. In order to avoid the delivery process and maintain a long futures position, nearby contracts must be sold and contracts that have not yet reached the delivery period must be purchased. This process is known as 'Rolling' a futures position. The DJ-UBSCI is composed of commodities traded on US exchanges, with the exception of aluminum, nickel and zinc, which trade on the London Metal Exchange (LME). Trading hours for the US commodity exchanges are between 08:00 am and 03:00 pm ET. A daily settlement price for the index is published at approximately 05:00 pm ET. Dow Jones-UBS Commodity Index[SM] and Dow Jones-UBS Commodity Index Total Return[SM]:- the DJ-UBSCI[SM] family includes both the DJ-UBSCI[SM], which is calculated on an excess return basis, and the DJ-UBSCITR[SM], a total return index based on the DJ-UBSCI[SM]. The former reflects the return of underlying commodity futures price movements only, while the latter reflects the return on fully collateralized positions in the underlying commodity futures. The information contained herein (including historical prices or values) has been obtained from sources that UBS Securities, LLC ('UBS') and Dow Jones & Company, Inc. ('Dow Jones') consider to be reliable; however, neither UBS nor Dow Jones makes any representation as to, or accepts any responsibility or liability for, the accuracy or completeness of the information contained herein. The Dow Jones-UBS Commodity Index was launched on 1998-July-14, and its subindexes, forward indexes and related indexes may have been launched at later dates. All data for any index prior to its launch date is an historical estimation using available data. Historical results should not and cannot be viewed as an indicator of future results. Dow Jones is not an advisor as to legal, taxation, accounting, regulatory or financial matters in any jurisdiction, and is not providing any investment or other advice as to any such matter. / Ю.Би.Эс. Сэкьюритиз, Эл.Эл.Си. (UBS Securities, LLC) и Дау Дьжонз Энд Кампэни, Инк. (Dow Jones & Company, Inc.). Дау Дьжонз® (Dow Jones®) и Ю.Би.Эс. А.Ге. (UBS AG) .

THE DOW JONES US INDEXES[SM] = ИНДЕКСЫ ПО США ОТ ДАУ ДЬЖОНЗ[ЗО] – The Dow Jones US Indexes[SM] are broad-based indexes that target 95% market coverage. The family includes a full complement of sector, cap-range and style indexes. See also The Dow Jones Indexes. / Смотрите также Индексы от Дау Дьжонз (The Dow Jones Indexes).

THE DOW JONES UTILITIES AVERAGE INDEX = УСРЕДНЁННЫЙ ИНДЕКС ПО СТАНЦИЯМ ОТ ДАУ ДЬЖОНЗ – The Dow Jones Utilities Average Index is an index used as a surrogate for bond prices. The Dow Jones Utilities Average (DJUA) is often a leading indicator of broad market trends since these stocks are interest-rate sensitive. Utility companies typically have large amounts of debt on which they pay interest and hold cash for capital improvements, so they are affected by interest rate changes sooner than other industries. See also The Dow Jones Indexes. / Смотрите также Индексы от Дау Дьжонз (The Dow Jones Indexes).

THE DOW JONES VOLATILITY INDEXES[SM] = ИНДЕКСЫ ПО ЛИХОРАДОЧНОСТИ ОТ ДАУ ДЬЖОНЗ[ЗО] – Dow Jones and Dow Jones STOXX[SM] Volatility indexes are based on real-time prices of options on the Dow Jones Industrial Average and the Dow Jones EURO STOXX 50. These indexes are designed to reflect investors' consensus view of the future (30-day) expected stock market volatility. See also The Dow Jones Indexes. / ЮРОУ СТАКС 50 (EURO STOXX 50). Смотрите также Индексы от Дау Дьжонз (The Dow Jones Indexes).

THE DOW JONES WILSHIRE GLOBAL INDEXES[SM] = ГЛОБАЛЬНЫЕ ИНДЕКСЫ ОТ ДАУ ДЬЖОНЗ И ВИЛШИР[ЗО] – The Dow Jones Wilshire Indexes[SM] are calculated and distributed by Dow Jones Indexes pursuant to an agreement between Dow Jones & Company, Inc., and Wilshire Associates Incorporated. Wilshire is a service mark of Wilshire Associates Incorporated. The Dow Jones Wilshire Indexes are the broadest measures of the world's equity markets. The family is anchored by the Dow Jones Wilshire 5000, which includes all US equity securities with readily available prices. The global index represents approximately 98% of the market value of countries considered open to foreign investment (currently (in 2008) 58). The family includes country, region, sector and cap-range indexes, as well as style indexes for the United States. See also The Dow Jones Indexes. / Дау Дьжонз Энд Кампэни, Инк. (Dow Jones & Company, Inc.). Вилшир Эсошиэтс Инкорпорэйтид (Wilshire Associates Incorporated). Смотрите также Индексы от Дау Дьжонз (The Dow Jones Indexes).

DOWN = ПУШОК (или ПУХ) – Down is the soft, fluffy fiber or underfeathers of ducks, geese, or other water fowl. Used primarily for insulation in outerwear garments.

DOWNDRAFT METIER = ХХ СТАНОК – Downdraft Metier is a dry-spinning machine in which the airflow within the drying cabinet is in the same direction as the yarn path (downward).

DOWN GAP = С ОТРЫВОМ ВНИЗ – In visual analysis, a Down Gap forms when a security opens below the previous period's Low, remains below the previous Low for the entire period and closes below it. Down gaps can form on daily, weekly or monthly charts and are generally considered bearish. See also Breakaway Gap, Common Gap, Continuation Gap, Exhaustion Gap, Gap, Runaway Gap, and Up Gap. / В техническом анализе биржевых рынков, графическая модель С Отрывом Вниз формируется в тех случаях, когда цена на биржевой инструмент, например, ценную бумагу или какое-то сырьё, открывается в текущем временном интервале ниже Минимума предыдущего временного интервала, продолжает находиться ниже данного предыдущего Минимума весь текущий временной интервал, и закрывается ниже его. Графические модели с отрывом вниз могут формироваться как на посуточных, так и понедельных и помесячных графиках движения цены. Такие модели рассматриваются в качестве медвежьих. Смотрите также Отрыв Прорыва (Breakaway Gap), Обыкновенный Отрыв (Common Gap), Отрыв Продолжения (Continuation Gap), Отрыв Истощения (Exhaustion Gap), Отрыв (Gap), Хxxxx (Runaway Gap), и С Отрывом Вверх (Up Gap).

DOWNGRADE = ПОНИЖЕНИЕ СОРТНОСТИ (или УСОРТИЦА) – Downgrade:- in quality control, the lowering of the grade and/or value of a product due to the presence of defects.

DOWN–LIKE FIBER = ВОЛОКНО НА ПОДОБИЕ ПУХА – Down-Like Fiber:- specialties:- (i) fine soft touch like duck down; (ii) light and preservation of warmness; (iii) excellent rising effect; (iv) easiness of surficial processing; and (v) excellent slick touch. Developed through direct spinning technology, Micro denier polyester staple fiber has a fantastic soft touch that can be applied to deluxe fabrics or stuffs as a substitute for duck down feather. Applications:- (i) interlining materials for garment; (ii) deluxe padding, non-woven; (iii) pillow (duck down – like effect); and (iv) deluxe coats, jackets, Y-shirts.

DOWNLOAD = ЗАГРУЖАТЬ – Download:- to copy digital information onto a hard drive, diskette or other electronic storage media. / Копировать цифровую информацию на жёсткий диск, дискету или иное электронное средство хранения информации.

DOWNLOADER = ЗАГРУЗЧИК – Downloader or Trojan-Downloader:- these terms usually signify malicious programs, components or functionality whose (usually sole) purpose is to download additional (usually malicious) software onto an infected system and execute it. See also Dropper.

DOWN PAYMENT = ЧАСТИЧНАЯ ПРЕДОПЛАТА (или ВЗНОС В СЧЁТ ПРЕДСТОЯЩИХ ПЛАТЕЖЕЙ, или ПЕРВЫЙ ВЗНОС ПРИ ОПЛАТЕ В РАССРОЧКУ, или АВАНС) – Down Payment is a type of payment made in cash during the onset of the purchase of an expensive good/service. The payment typically represents only a percentage of the full purchase price; in some cases it is not refundable if the deal falls through. Financing arrangements are made by the purchaser to cover the remaining amount owed to the seller. Making a down payment and then paying the rest of the price through installments is a method that makes expensive assets more affordable for the typical person. For example, because houses are extremely expensive assets, home buyers typically pay down payments that equal 5–25% of the total value of a home. The remaining 75–95% of the price will be covered by a bank or other financial institutions through a mortgage loan. Down Payment is a partial advance payment on a debt. In a commercial sale, a down payment is partial payment of total purchase price made by the buyer to the seller. A down payment differs from earnest money in that giving up the down payment does not release the purchaser from other obligations. See also Earnest Money. Down Payment (or Downpayment) is a payment used in the context of the purchase of expensive items such as a car and a house, whereby the payment is the initial upfront portion of the total amount due and it is usually given in cash at the time of finalizing the transaction. A loan or the amount in cash is then required to make the full payment. The main purposes of a down payment are to ensure that the lending institution has enough capital to create money for a loan in fractional reserve banking systems and to recover some of the balance due on the loan in the event that the borrower defaults. In real estate, the asset is used as collateral in order to secure the loan against default. If the borrower fails to repay the loan, the lender is legally entitled to sell the asset and retain a portion of the proceeds sufficient to cover the remaining balance on the loan, including fees and interest added. A down payment in this case reduces the lender's risk to less than the value of the collateral, making it more likely that the lender will recover the full amount in the event of default. The size of the down payment thus determines the extent to which the lender is protected against the various factors that might reduce the value of the collateral, as well as lost profits between the time of the last payment and the eventual sale of the collateral. Furthermore, making a down payment demonstrates that the borrower is able to raise a certain amount of money for long-term investment, which the lender may desire as evidence that the borrower's finances are sound, and that the borrower is not borrowing beyond his or her means. If the borrower is unable to pay off the loan in its entirety, he/she forfeits the down payment amount. In the United States, down payments for home purchases typically vary between 3.5% and 20% of the purchase price. The Federal Housing Administration, or FHA has advocated lower down payments since its inception in 1934, and currently, borrowers that qualify for an FHA loan pay only 3.5% for a down payment. With rising home prices in the years from 2000 to 2007, lenders were willing to accept smaller or no down payment, (either through 100% Financing, seller-assisted down payment assistance, government down payment providers, or by providing a combination of an 80% 1st and 20% second mortgages), so that more individuals could purchase homes as their primary residences. This trend has been largely reversed since that time. However, in the United States, the VA or Department of Veteran's Affairs, offers 100% financing for qualifying veterans. There are also numerous state and local municipality programs that vary in down payment amounts from zero to USD1 000 down. For car purchases the down payment could be anywhere between 3% and 13%. There is more risk for lenders when individuals purchase a home as an investment property. Therefore the lender may charge a higher interest rate and expect a higher down payment. / Частичный авансовый платёж по задолженности. В коммерческой продаже частичная предоплата служит частичной оплатой всей цены приобретения, осуществляемой покупателем продавцу. Частичная предоплата отличается от задатка (earnest money) тем, что внесение частичной предоплаты на освобождает покупающего от других обязательств. Смотрите также Задаток (Earnest Money).

DOWN ROUND = РАУНД ПРИ ЗАНИЖЕНИИ – Down Round is an investment round that is done at a valuation substantially below previous ones, often excessively diluting earlier investors.

DOWNSIDE = НИСХОДЯЩЕЕ – Downside:- pertaining to lower price potential.

DOWNSIDE TASUKI GAP = ТАСУКИ ПРИ ОТРЫВЕ ВНИЗ – Downside Tasuki Gap:- in technical analysis, a continuation pattern with a long black body followed by another black body that has gapped below the first one. The third day is white and opens within the body of the second day, then closes in the gap between the first two days, but does not close the gap. / В техническом анализе биржевых рынков, Тасуки При Отрыве Вниз является моделью продолжения, при которой вслед за длинным тёмным телом с отрывом вниз следует ещё одно тёмное тело. Третий же день характеризуется светлым телом с ценой открытия в пределах предыдущего дня и ценой закрытия в пределах произошедшего ранее разрыва, но при этом цена закрытия не покрывает этот разрыв целиком.

DOWNSTREAM = КОНЕЧНОЕ ЗВЕНО – In the United States, the Downstream Segment (Refining and Marketing) includes the nation's 141 refineries, which process more than 15 million barrels of crude oil every day. This segment also includes transporting petroleum products by tanker trucks from thousands of local terminals to the approximately 161 770 service stations across the United States, and the ownership and operation of those retail outlets. General term for that part of the industry which refines crude oil into petroleum products and markets, distributes, and retails it to customers. The refining and marketing sector of the petroleum industry. An industry term referring to commercial oil and gas operations beyond the production phase; oil refining and marketing, and natural gas transmission and distribution. Downstream is the oil industry term used to refer to all petroleum activities from the process of refining crude oil into petroleum products to the distribution, marketing, and shipping of the products. See also Midstream, and Upstream Oil And Gas Industry. / Конечные звенья нефтехозяйства, связанные с переработкой, хранением, сбытом и транспортировкой нефти и нефтепродуктов.

DOWNSTREAM DUMPING = ПОТОЧНЫЙ ДЕМПИНГ – Downstream Dumping, also known as Input Dumping, is the practice of exporting an end-product containing an input that has been purchased at less than normal value. US anti-dumping law contains provisions for monitoring downstream dumping where the input is already the subject of an anti-dumping duty order. If monitoring reveals that imports of the end-product increase as a result of the diversion of the input product into the end-product, an anti-dumping investigation of the end-product may be initiated. See also Dumping. Downstream Dumping occurs when foreign producers sell at below cost to a producer in its domestic market and the product is then further processed and shipped to another country. Downstream

Dumping is the sale of products below cost or below fair value by a producer to a another producer in its own domestic market by whom the product is then further processed and exported to another country at a price lower than would otherwise be charged and thus causing injury in that country. / Эта ситуация возникает тогда, когда зарубежные производители продают свою продукцию по ценам ниже их себестоимости на своём внутреннем рынке, и когда данная продукция обрабатывается далее и отгружается в другую страну.

DOWN TICK = СНИЖЕНИЕ НА ШАГ (или ШАГ ВНИЗ) – Down Tick is a term used to designate last transaction made at a price lower than the preceding trade. Also known as Minus Tick.

DOWN TIME = ВРЕМЯ ПРОСТОЯ (или ДЛИТЕЛЬНОСТЬ ПРОСТОЯ, или СРОК ПРОСТОЯ) – The period of time when a machine is not available for production due to a functional failure or maintenance. Down Time is the period of time during which a machine is not available due operational failure or lack of maintenance.

DOWN TRADE = ТОРГОВЛЯ НА ПОНИЖЕНИЕ – Down Trade is a trade taken in anticipation of a falling market, to 'go short'. See also Sell.

DOWN TRENDLINE = ЛИНИЯ ТЕНДЕНЦИИ НА ПОНИЖЕНИЕ – Down Trendline is a straight line drawn down and to the right above successive rally peaks. The longer the down trendline has been in effect and the more times it has been tested, the more significant it becomes. A violation of the down trendline usually signals a reversal of the downtrend.

DOWN TWIST = КРУТКА ВНИЗ – Down Twist is one of the two terms that Alden Amos uses when discussing plying. This refers to an S-Twist. Alden maintains that people get so hung up trying to remember whether an S-Twist is spun clockwise, that they lose track of process. It really doesn't matter whether your singles are spun S or Z, you just need to ply them in the opposite direction.

DOWNTWISTER = ХХ КРУТИЛЬЩИК (или ХХ КРУТИЛЬНАЯ МАШИНА) – Downtwister is a cap, ring, or flyer twisting frame.

DOWNTWISTING = КРУТКА ВНИЗ – Downtwisting is a process for inserting twist into yarn in which the yarn passes downward from the supply package (a bobbin, cheese, or cone) to the revolving spindle. The package or packages of yarn to be twisted are positioned on the creel, and the ends of yarn are led downward through individual guides and stop motions to the positively driven feed roll and from there to the revolving take-up package or bobbin, which inserts twist.

DOWN WOOL = ХХ ШЕРСТЬ – Down Wool:- also known as Hill Wool, a wool of medium fineness produced by such breeds as the Southdown and the Shropshire. These sheep are distinguished by their fine and curly wool of short staple, which is especially adapted for making loose, rough, moss-like, felted, carded yarns for the production of clothing. These wools are lofty and well suited for woolen. Much of the down wool runs 1/4 to 3/8 blood in quality. This can be a great wool for felting.

DOWSE = ОКУНУТЬ (или НАМОЧИТЬ) – Dowse (maritime term):- to take in, or lower a sail. To put out a light. To cover with water.

DOW THEORY = ТЕОРИЯ ДАУ – Dow Theory:- developed by Charles Dow and referred to as the Six Tenets of Dow Theory, it addresses market psychology, price action and marks the foundations of technical analysis. The six tenets are:- (i) the averages discount everything; (ii) there are three trends; (iii) major trends have three phases; (iv) the averages must confirm each other; (v) volume must confirm the trend; and (vi) a trend is assumed to be in effect until it gives definitive signals that it has reversed. Dow Theory is one of the oldest and most highly regarded technical theories. A Dow Theory buy signal is given when the Dow Industrial and Dow Transportation averages close above a prior rally peak. A sell signal is given when both averages close below a prior reaction low. Dow Theory is a theory of market analysis based upon the performance of the Dow Jones industrial and transportation stock price averages. The theory says that the market is in a basis upward trend if one of these averages advances above a previous important high, accompanied or followed by a similar advance in the other. When the averages both dip below previous important lows, this is regarded as confirmation of a downward trend. The Dow Jones is one type of market index. See also New York Stock Exchange (NYSE®) Composite Index. Theory of market movement developed by Charles Dow that prices move in defined trends of successive higher peaks and higher troughs in an uptrend, and lower peaks and lower troughs in a downtrend. Dow divides trends into primary, secondary and minor. Volume patterns are associated with specific points in a trend. Dow theory is the foundation of most modern technical theory. / Дау Дьжонз (Dow Jones). Сводный Индекс от Нью Йоркской Фондовой Биржи (НЙФБ® или Эн.Уай.Эс.И.® (NYSE®)). Теория развития рынка, разработанная Чарлзом Дау:- динамика цен в периоды подъёма характеризуется последовательным повышением наивысших и наинизших значений, а динамика цен в периоды спада – последовательным понижением таких значений. Дау разделяет тенденции на первичные, вторичные и несущественные. Динамика объёмов связана с отдельными точками тенденции. Теория Дау легла в основу самой современной технической теории. Теория Дау – теория анализа рынка, согласно которой крупная тенденция на фондовом рынке должна быть подтверждена аналогичным изменением Усреднением Промышленного и Усреднением Транспортного Индексов от Дау Дьжонз. Согласно теории Дау, наличие крупной тенденции не подтверждается, пока оба индекса от Дау Дьжонз не достигнут новых высоких или низких значений; если этого не происходит, рынок возвращается к своему прежнему спектру торговых котировок. Между сторонниками теории Дау часто возникают разногласия по вопросу о том, когда произошёл реальный сдвиг, и, в любом случае, они упускают значительную часть сдвига вверх или вниз, ожидая необходимых сигналов.

DOWTHERM™ = ДАУСЁМ™ – Dowtherm™ is a heat transfer fluid is a eutectic mixture of two very stable compounds, biphenyl ($C_{12}H_{10}$) and diphenyl oxide ($C_{12}H_{10}O$). The fluid is dyed clear to light yellow to aid in leak detection. Dowtherm™ is a trademark of Dow Chemical Company for a series of heat transfer media. Dowtherm jackets are used around molten polymer processing lines. / Даусём™ (Dowtherm™) Дау Кэмикэл Кампэни (Dow Chemical Company).

DP = DEEP–PLACED

DP = DEGREE OF POLYMERIZATION

D/P = DOCUMENTS AGAINST PAYMENT

DPDP = DAIRY PRODUCT DONATION PROGRAM

DPF = DENIER PER FILAMENT

DPF = DIESEL PARTICULATE FILTER

DPI = DISPOSABLE PERSONAL INCOME

DPO = DAYS PAYABLES OUTSTANDING

DPP = DIRECT PRODUCT PROFITABILITY

DPR = DISPOSAL RETURN FORM

DPS = DIVIDENDS PER SHARE

DPU = DELIVERED AT PLACE UNLOADED

DR = DEBARE

DR = DEBIT RECORD

DR = DEPOSITARY RECEIPT

DR = DOCK RECEIPT

DR = DRYER

DRAAE = DÉPARTEMENT DE RECHERCHES AGRONOMIQUE ET AGROECONOMIQUE = DEPARTMENT OF AGRONOMIC RESEARCH AND AGROECONOMY

DRAB = XX (или ТУСКЛО–КОРИЧНЕВОЕ, или ЖЕЛТОВАТО–СЕРОЕ, или ТУСКЛОЕ) – Drab:- a light olive brown. Any of various cloths of a dull brown or gray color.

DRAFT = ВЫТЯЖКА (или ЧЕРТЁЖ, или ПРОБОР, или ПРОЕКТ, или ПЕРЕХОД) – Draft:- in weaving, a pattern or plan for drawing-in. / план для проборки основных нитей в ремиз или бёрдо.

DRAFT = ОСАДКА (или УГЛУБЛЕНИЕ) – Draft is the depth of a ship in the water. The vertical distance between the waterline and the keel, in the United States expressed in feet, elsewhere in meters. The number of feet that the hull of a ship is beneath the surface of the water. The Draft of a vessel is the vertical distance between the waterline and the bottom of the keel of the vessel. Also known as Draught. Draft is the depth to which a vessel's deepest point is under water. Draft (maritime term):- the distance from the surface of the water to the ship's keel (how deep the ship is into the water). Draft (in rail) is a cut of coupled cars. / Осадка или Углубление – глубина судна в воде. Вертикальная дистанция между ватерлинией и килем, выражаемая в Соединённых Штатах Америки (США) в футах, а в других местах – в метрах. Под Осадкой судна понимается расстояние по вертикали от грузовой ватерлинии до самой нижней точки корпуса судна в средней его части. Линейная величина, характеризующая погружение судна ниже уровня воды. Значения осадок носом и кормой определяют посадку судна:- на 'ровный киль', с дифферентом (наклоном судна в продольной плоскости) на нос или на корму.

DRAFT = ТРАТТА (или ПЕРЕВОДНЫЙ ВЕКСЕЛЬ) – Draft is an unconditional order in writing, addressed by one person (the drawer) to another (the drawee), requiring the drawee to pay at a fixed or determinable future date a specified sum in lawful currency to the order of a specified person. A written order for a certain sum of money to be transferred on a certain date. Draft:- payment order in writing that directs the drawee to pay a specified sum to the payee. A draft is actually a bill of exchange drawn on a bank. A check is a bank draft, or sight draft, payable upon presentation. Drafts payable at a future date are called Time Drafts. Draft is a drawn bill that has not yet been accepted. Also known as Bill Of Exchange. Draft is a written, unconditional order for payment from one person (the drawer) to another (the drawee). It directs the drawee to pay a specified sum of money, in a given currency, at a specific date to the drawer. A Sight Draft calls for immediate payment (on sight) while a Time Draft calls for payments at a readily determined future date. See also Bill Of Exchange, and Promissory Note. Draft is a bill of exchange that has been drawn but not yet accepted by the drawee. Accordingly, it is a payment instruction containing all statutory elements of a bill of exchange. Draft is a signed, written order by one party that instructs another party to pay a third party a specific amount. It can also be called a Bill Of Exchange. / Смотрите также Переводный Вексель (Bill Of Exchange), и Простой Вексель (Promissory Note). Под Траттой, от Итальянского слова Tratta, понимается письменный приказ кредитора заёмщику (или обычно банку) об уплате последним определённой денежной суммы третьему лицу (ремитенту) или предъявителю тратты. Тратты используются главным образом в расчётах по внешней торговле. Известна также как Переводный Вексель (Bill Of Exchange). Тратта или Переводный Вексель – письменный приказ, согласно которому одна сторона – трассант (drawer) даёт указание другой стороне – трассату (drawee) выплатить указанную сумму третьей стороне – получателю (payee). Получатель и трассант, как правило, – одно и то же лицо. В зарубежных сделках переводный вексель часто носит название bill of exchange. В том случае, если переводный вексель подготавливается без сопровождающих документов, он называется чистой траттой (clear draft). Если же вексель сопровождается документами, он называется документированной траттой (documentary draft). Тратта до востребования (sight draft) подлежит оплате по предъявлении. Срочная тратта (вексель с фиксированной датой – time draft) подлежит оплате либо по наступлении определённой даты, либо по истечении фиксированного промежутка времени после предъявления или востребования.

DRAFT COLLECTION = ИНКАССО ТРАТТЫ – Draft Collection is a process for collecting payment in a sale of goods wherein a legal demand for payment from the buyer is made by a bank acting as collecting agent for the seller. Demand is made by presenting a draft. / представлением тратты.

DRAFTING = ВЫТЯГИВАНИЕ (или ПРОБОРКА ОСНОВНЫХ НИТЕЙ В РЕМИЗ И БЁРДО) – Drafting is the process of drawing out the fibers so that twist can enter the fiber. See also Drawing, 1. / протяжка или раскатка или вытяжка (drawing).

DRAFTING (or DRAWING) = ВЫТЯГИВАНИЕ (или ВЫТЯГИВАНИЕ) – Drafting (or Drawing) is the process of blending, levelling, and drawing out the fibers from your drafting hand (usually your left) to your spinning hand (usually your right) to produce a fine sliver. / волочение или протяжка или раскатка или вытяжка (drawing).

DRAFTING TRIANGLE = XX ТРЕУГОЛЬНИК – Drafting Triangle is the small triangle of fibers that are formed between your drafting hand and your fiber hand. This should never be longer than the fiber length.

DRAFT RATIO = СООТНОШЕНИЕ С ВЫТЯЖКОЙ – Draft Ratio is the ratio between the weight or length of fiber fed into various machines and that delivered from the machines in spun yarn manufacture. It represents the reduction in bulk and weight of stock, one of the most important principles in the production of yarn from staple fibers.

DRAG = ДРАГА (или ПЛАВУЧИЙ ЯКОРЬ, или ТРАЛ) – Drag (maritime term):- a sea anchor contrived to keep a vessel's head to the wind and sea.

DRAG = ЗАДЕРЖКА (или ЗАХВАТЫВАНИЕ, или ТОРМОЖЕНИЕ, или ПРИХВАТЫВАНИЕ, или СОПРОТИВЛЕНИЕ) – Drag is the resistance to movement caused by oil viscosity.

DRAG ALONG RIGHT = ПРАВО ПРИНУЖДЕНИЯ К ПРОДАЖЕ (или XX) – Drag Along Right is the right that enables a majority shareholder to force a minority shareholder to join in the sale of majority equity position. This is often required if a purchaser wants to by 100% of a company. There may be numerous small shareholders who decide not to sell, either because they are greedy or

obstreperous, and such a right allows larger shareholders to effect a sale. In some cases, for example public corporations, if more than 90% of a company's shares are being tendered (offered) to a buyer, then the other 10% get dragged along as well under the same terms (e.g., price) and conditions.

DRAGGED–IN FILLING = ЗАТЯНУТАЯ УТОЧИНА (или ЗАТАСК УТОЧИНЫ, или ПРОДЁРНУТАЯ УТОЧИНА) – Dragged-In Filling or Dragged-In Weft or Jerked-In Weft or Lashed-In Weft or Pulled-In Weft:- an extra length of weft yarn that has been inserted for a part of the fabric width, usually starting from the selvedge. This defect is often caused after a pirn (quill) change due to a loose tail being woven in with a subsequent pick because cutters or suction devices were inactive. See also Pulled-In Filling. / Drag-Ins = Затаски Уточины по кромке – пороки ткани; Уточные Петли. Затаск от печати, не более 2 см. Размер порока – до 0.5 см. Размер порока определяют по наибольшей протяжённости.

DRAGGED–IN WEFT = ЗАТЯНУТЫЙ УТОК (или ЗАТАСК УТКА, или ПРОДЁРНУТЫЙ УТОК) – Dragged-In Weft:- an extra length of weft yarn that has been inserted for a part of the fabric width, usually starting from the selvedge. This defect is often caused after a pirn (quill) change due to a loose tail being woven in with a subsequent pick because cutters or suction devices were inactive. / Затянутая Уточная Нить; Затаск Утка (dragged-in weft; jerked-in weft; lashed-in weft; pulled-in filling):- порок утка; дополнительная уточная нить, затянувшаяся в ткань во время прокладки утка со стороны кромки ткани. Примечание:- данный порок возникает в момент замены уточной паковки, имеющей свободно свисающий конец пряжи, который подхватывается предыдущим утком и затягивается в зев, а так же при условии не работающих кромочных ножниц и устройств отсоса утка.

DRAGGING END = ВОЛОЧАЩАЯСЯ ПРОДОЛЬНАЯ НИТЬ – Dragging End:- one or several wales in a warp-knitted fabric in which the laps appear shorter than those in the adjacent normal wales. Note:- this defect is caused by excessive tension in one or more warp yarns. Configuration from the adjacent normal wales. Note:- this defect is caused by a misaligned or broken needle which forms distorted stitches. Defect Name:- Dragging End. Defect Type:- warp lines, vertical lines. Fabric Type:- Warp Knit Fabrics. Description:- Dragging End:- This is the result of an end being knit under erratic and excessive tension. This quite often is caused by ends being entangled and/or trapped on the warp beam. Severity:- Major.

DRAGONFLY DOJI = ДОДЗИ СТРЕКОЗА – In technical analysis, a Doji line where the open and close price are at the high of the day. Like other Doji days, this one normally appears at market turning points. / В техническом анализе биржевых рынков, линия Додзи (Doji) проходит там, где цены открытия и закрытия находятся на максимуме дня. Как и другие Додзи дни, он обычно возникает на рынке в моменты нерешительности дальнейшего движения вверх, то есть на точках разворота рынка.

DRAINAGE FABRICS = ДРЕНАЖНЫЕ ТКАНИ (или ТКАНИ ДЛЯ ДРЕНАЖА, или ТКАНИ ДЛЯ ОСУШЕНИЯ) – Drainage Fabrics are the fabrics used as filter media or separators in subsurface drainage systems. The fabric is installed around the drainage pipe, or coarse stone in the drain; it allows water to pass freely from the soil to the drain, but prevents soil particles from migrating into the drain system. These fabrics are also used as outer coverings in prefabricated drainage composites and serve the same function as a filtering medium. See also Geotextiles.

DRAIN MARKS = ОТМЕТИНЫ ОТ СПУСКА (или ВОДООТВОДА, или ВОДОСТОКА) – (1) Drain Marks:- change in shade (looks yellowed or brown or lighter) on the fold of the Fabric. Dyeing defect. (2) Drain Marks:- color migration. Finishing defect. / Порок или дефект крашения и заключительной отделки.

DRAM = DYNAMIC RANDOM ACCESS MEMORY

DRAPE = ДРАП (или ДРАПИРОВАТЬ, или ДРАПИРУЕМОСТЬ) – Drape is a term to describe the way a fabric falls while it hangs; the suppleness and ability of a fabric to form graceful configurations. Drape:- the way a fabric hangs. Drape is affected by yarns, weave structure, and finish. / Драп, от Французского слова Drap, означающее Сукно, тяжёлая, плотная шерстяная ткань сложного переплетения из пряжи аппаратного (суконного) прядения. Драп состоит обычно из 2 слоёв, благодаря чему обладает высокими теплоизолирующими свойствами. Лицевая сторона ткани часто вырабатывается из более высококачественной шерсти, чем изнанка. В зависимости от структуры и рисунка переплетения драп может быть ворсованным и неворсованным, одно- и многоцветным, с гладким лицом и рисунчатой подкладкой. Из драпа шьют зимние и демисезонные пальто. В Русском языке название 'Драп' относится только к двойным сукнам, а более легкие ткани называются сукнами.

DRAUGHT = ОСАДКА – Draught is the depth of a vessel in the water. This will vary according to the weight of cargo on board. / Под Осадкой судна понимается расстояние по вертикали от грузовой ватерлинии до самой нижней точки корпуса судна в средней его части. Линейная величина, характеризующая погружение судна ниже уровня воды. Она изменяется в зависимости от веса груза на борту. Значения осадок носом и кормой определяют посадку судна:- на 'ровный киль', с дифферентом на нос или на корму.

DRAWBACK = ВОЗВРАТ – Drawback is a repayment by a government, in whole or in part, of customs duties assessed on imported merchandise that is subsequently manufactured into a different article or reexported in the same service, or the refund, upon the exportation of an article, or a domestic tax to which it has been subjected. A partial refund of an import fee. Refund usually results because goods are re-exported from the country that collected the fee. One of the two variants of the inward processing procedure under which the import duties are paid at release for free circulation and refunded when the processed products or the goods in the unaltered state are re-exported. Many free-trade agreements don't allow drawback if a preferential proof of origin is issued. Refund of import duties paid by an exporter who has imported goods for export. The drawback is used to encourage exports, and sometimes applies to imported raw materials that are incorporated into a finished product, then exported. Drawback is refund of 99% of all ordinary customs duties and internal revenue taxes. Drawback was initially authorized by the first tariff act of the United States in 1789. Since then it has been a part of the law, although from time to time the conditions under which it is payable have changed. For example, as a result of the Omnibus Trade And Competitiveness Act of 1988, antidumping and countervailing duties are not refundable on a drawback claim. The rationale for drawback has always been to encourage American commerce or manufacturing, or both. It permits the American manufacturer to compete in non-US markets without the handicap of including in his costs, and consequently in his sales price, the duty paid on imported merchandise. There are two types of manufacturing drawback:- (i) Direct Identification Drawback, and (ii) Substitution Drawback. See also Direct Identification Drawback, Same Condition Drawback, and Substitution Drawback. In the United States, a refund of duty and taxes which may be obtained upon the exportation or destruction of certain articles under certain conditions. Rebate of taxes or duties paid on imported goods that have been reexported. It is in effect a government subsidy designed to encourage domestic manufacturers to compete overseas. A refund or remittance, such as a discount on duties or taxes for goods destined for reexport. In law in commerce, Drawback is a paying back a duty previously paid on exporting excisable articles or on re-exporting foreign goods. The object of a drawback is to let commodities which are subject to taxation be exported and sold in a foreign country on the same terms as goods from countries where they are untaxed. It differs from a bounty in that a bounty lets commodities be sold abroad at less than their cost price; it may occur, however, under certain conditions that giving a drawback has an effect equivalent to that of a bounty, as in the case of the so-called Sugar Bounties in Germany. The earlier tariffs contained elaborate tables

of the drawbacks allowed on exporting or re-exporting commodities, but so far as the United Kingdom is concerned (as of 1911) the system of bonded warehouses practically abolished drawbacks, as commodities can be warehoused (placed in bond) until needed for exportation. 99% refund of imported, duty paid materials, which are to be exported. / обратно вывезены (или реэкспортированы; reexported) выплата (repayment) . или перечисление (remittance). вывоз (exportation). Омнибус (Omnibus).

DRAWBACK = ВОЗВРАТ (или ПОГРЕШНОСТЬ, или НЕДОСТАТОК) – Drawbacks:- caused by excessive loom tension gradually applied by some abnormal restriction. When the restriction is removed, the excess slack is woven into the fabric. Ends are usually broken. Woven fabric defect. Draw-Back is a crossed end; an end broken during warping that when repaired was not free or was tied in with an adjacent end or ends overlapping the broken end. The end draws or pulls back when unwound on the slasher. See also Sticker, 1. Draw-Back is a weave distortion characterized by tight and slack places in the same warp yarn. Synonym:- Hitch-Back. Defect Name:- Drawbacks. Defect Type:- warp lines, vertical lines. Fabric Type:- (i) Shirting and Dress Goods – Chambray, and Plain Weave; and (ii) Denim Bottomweights – Indigo Dyed. Description:- Drawbacks:- These are defects caused by excessive tension gradually applied by some abnormal restriction. When the restriction is removed, the excess slack is woven gradually into the fabric. Drawbacks may vary in length from inches to yards and often result in ruptured ends. Severity:- Major. / Порок или дефект ткачества.

DRAW BACK = ОТДЁРНУТОЕ (или ПОГРЕШНОСТЬ) – Draw Back or Tie Back or Warp Holding Place:- a warp-faced area of a fabric where the weft yarns are predominant. This defect is caused by entanglement behind the shafts or harness, putting tension on several adjacent warp threads. / Затяжка; Заклей Основы (draw back; tie back; warp holding place):- порок основы в виде стянутых нитей основы. Примечание:- этот порок вызван захлёстыванием основы ремизами, образуя натяжение на нескольких смежных нитях основы.

DRAWBACK SYSTEM = СИСТЕМА ВОЗВРАТА (или ВОЗВРАТНАЯ СИСТЕМА) – Drawback System is a customs system paying rebates of taxes, tariffs, or duties originally imposed on goods imported into a country and then later exported. The goods exported may be the original imported goods or goods manufactured from the imported goods. The 'Drawback' System covers goods in free circulation, with a reimbursement of, or rebate on, import duties payable on the goods if they are exported outside the Community's customs territory as compensating products. Drawback System is a system that provides reimbursement of customs fees to an importer, if the goods are then exported to another country for sale, or used to produce goods that will be exported. Drawback systems enable a nation to avoid penalizing importers who do not intend to compete with local markets. Drawback System is a part of US Customs' Automated Commercial System, provides the means for processing and tracking of drawback claims. / Часть Автоматизированной Коммерческой Системы Таможни США, которая обеспечивает средствами для обработки и отслеживания требований по возвратам.

DRAW BY LOT = ВЫПИСЫВАТЬ ПО ЛОТАМ (или ВЫБОРКА ПО ЛОТАМ, или РАСПИСЫВАТЬ ПО ЛОТАМ) – Draw By Lot:- lots are drawn to determine which amortization bonds are to be repaid. Lots are also drawn in stock exchange trading when demand is not covered by supply.

DRAW–CRIMPING = ВЫТЯЖНАЯ ИЗВИТОСТЬ (или ВЫТЯЖНОЕ СМЯТИЕ, или ВЫТЯЖНОЕ ОБРАЗОВАНИЕ СКЛАДОК) – Draw-Crimping of a textile strand, comprising drawing a textile strand to increased length, then directing fluid thereonto and thereby forwardly the drawn strand into the entrance of a laterally confining region having an exit for the strand therefrom and accumulating the strand in the region temporarily, the entering strand being forwarded into sufficiently forcible impact against strand already accumulated therein to buckle into crimped configuration, and diffusing the forwarding fluid laterally from the region. See also Draw-Texturing. Draw-Crimping Apparatus is provided for drawing textile strands to increased length and simultaneously imparting thereto a generally helical crimp or bulky configuration when under relatively low tension. Also so provided is apparatus for uniform heating pretreatment or aftertreatment or both.

DRAW DOWN = СПУСК (или ВЫПУСК, или ОПУСКАТЬ, или СПУСКАТЬ) – Draw Down is the amount by which manufactured filaments are stretched following extrusion. See also Drawing, 2. / Экструзия или Выдавливание (Extrusion).

DRAWEE = ТРАССАТ (или ПЛАТЕЛЬЩИК) – (1) Drawee is the person or entity in whose name a bill of exchange has been made out (persons ordered to pay under the bill). Party expected to pay a check or draft (e.g., the bank where the drawer maintains the account) when the instrument is presented for payment. Drawee means the person on whom a bill of exchange is drawn but who has not accepted it. / , например, .

(2) Drawee is the bank on which a check was drawn and which cashes the check to the debit of the drawer if the necessary cover is available.

(3) Drawee is the individual or firm on whom a draft is drawn and who owes the indicated amount. Drawee is the individual or firm that issues a draft and thus stands to receive payment. Party to whom a draft is addressed and from whom payment is demanded, or, in a documentary collection with no draft, party from whom payment is requested in exchange for delivery of documents. The drawee is the one to whom presentation is to be made in accordance with the collection instruction. / Плательщик (трассат) – это лицо, которому должно быть сделано представление в соответствии с инкассовым поручением.

DRAWER = ТРАССАНТ (или ВЕКСЕЛЕДАТЕЛЬ) – (1) Drawer is the individual or firm that issues or signs a draft and thus stands to receive payment of the indicated amount from the drawee. Drawer is the person or entity who signs a bill of exchange and orders the drawee to pay the amount. Party instructing the drawee to pay someone else by writing, or drawing, a check or draft. Also known as Maker or Writer. / трассирование (drawing).

(2) Drawer is the person who writes out the cheque, with the intention of making payment to the acceptor.

DRAWER = XX (или КАЛЬСОНЫ) – Drawer:- (plural) an article of clothing, as underwear, for the lower body. / Drawers = Кальсоны.

DRAWFRAME = ЛЕНТОЧНАЯ МАШИНА – Drawframe:- its purpose is to make the fibers uniform and parallel. There are usually four lines of drawing rollers which operate at an over-all draft of about six. There are six card slivers fed to each delivery, so that, generally speaking, the drawn sliver is about the same diameter as a single sliver fed into the frame. Thus, for example, a four-time drawing would show 6x6x6x6 for a total of 1 296 doublings. Cotton – depending on the stock used and the purpose for which it is being spun – may be run from two to six times through the same comber to increase the number of doubling and improve the ultimate product. Also known as Drawing Frame. / В прядильном производстве под Ленточной Машиной понимается машина для распрямления и параллелизации волокон в ленте, выравнивания её по линейной плотности путём сложения нескольких лент и их вытягивания. Основной рабочий орган ленточной машины – вытяжной прибор. Цилиндры и нажимные валики; втягивающие и выпускные валики; поступающие в вытяжной прибор ленты располагаются рядом друг с другом без накладок и вытягивается каждая лента самостоятельно. Из вытяжного прибора выходит мычка – тонкий слой волокон, имеющий чётко выраженную ручьистую структуру по ширине. Мычка проходит по сужающемуся лотку, где и происходит сложение вытянутых ленточек и

превращение их в ленту. Лента, сформированная из мычки и уплотнённая валиками, по каналу поступает в лентоукладчик, где происходит дополнительное уплотнение ленты воронкой и укладка её в таз. На ленточной машине после одновременного вытягивания нескольких лент осуществляется их сложение – соединение этих лент, с целью выравнивания продукта по толщине, составу и структуре. Ленточные Машины предназначены для утонения продукта в вытяжном приборе, сложения нескольких лент с целью выравнивания продукта по линейной плотности и составу, а также для формирования паковки – таза с лентой. На ленточной машине производится заключительная подготовка волокон к прядению, состоящая из двух переходов, в процессе которых осуществляется вытягивание или вытяжка (drawing) и сложение. На ленточных машинах почти полностью устраняются два недостатка чёсальной ленты:- большая неравномерность ленты и малая распрямлённость волокон. Для уменьшения неравномерности ленты по линейной плотности, то есть выравнивания продукта по толщине, составу и структуре, применяют сложение нескольких лент и автоматическое регулирование вытяжки. В процессе сложения происходит смешивание волокон. При сложении лент на ленточных машинах происходит дополнительное смешивание волокон. Для распрямления волокон и их ориентации вдоль продукта производят вытягивание лент в вытяжном приборе ленточной машины. Сущность вытягивания заключается в относительном смещении волокон вытягиваемого продукта и в распределении их на большей длине. Цель вытягивания – утонение продукта, распрямление и ориентация волокон в поступающей на машину ленте. На ленточных машинах применяется механический способ вытягивания в вытяжном приборе. Известны также пневматический и пневмомеханический способы вытягивания. Вытяжной прибор состоит из вытяжных пар. Со стороны входа продукта расположена питающая пара, на выходе – вытягивающая пара. Каждая пара представляет собой цилиндр и нажимной валик. Расстояние между питающей парой и вытягивающей называют разводкой. Это расстояние в основном определяется модальной длиной волокон. Для упрощения анализа вытягивания все волокна, поступающие в вытяжной прибор, можно условно разделить на две группы:- (i) контролируемые волокна, протяжённость которых больше или равна разводке; и (ii) неконтролируемые, протяжённость которых меньше разводки. Поступающие в вытяжной прибор ленты располагаются рядом друг с другом без накладок и вытягивается каждая лента самостоятельно. Из вытяжного прибора выходит тонкий слой волокон, имеющий чётко выраженную ручьистую структуру по ширине. Его часто называют мычкой. Из вытягивающих пар мычка подаётся в сужающий лоток, в котором происходит сложение вытянутых ленточек и превращение их в ленту. Сложение на ленточных машинах осуществляется после вытягивания лент в вытяжном приборе. Лента, сформированная из мычки и уплотнённая валиками, установленными после сужающего лотка, по каналу поступает в лентоукладчик. В лентоукладчике происходит дополнительное уплотнение ленты воронкой, после чего она подаётся на выпускные валики лентоукладчика, и затем производится её укладка в таз. Перед гребнечесанием ленты с кардочёсальных машин проходят дополнительную обработку. На этом этапе происходит предварительное распрямление волокон и их ориентация вдоль оси продукта, выравнивание продукта по линейной плотности и составу. Предварительное вытягивание обеспечивает распрямление волокон – коэффициент распрямлённости волокон повышается до 0.75, в чёсальной ленте он равен 0.5–0.6. предварительное распрямление волокон перед гребнечесанием обеспечивает меньший разрыв волокон в процессе гребнечесания. Дальнейший этап подготовки продукта к гребнечесанию состоит в формировании холстика. Холстик формируется на лентосоединительной машине из 16–24 лент. Параллельно расположенные ленты наматываются на одну катушку, образуя холстик. Линейная плотность холстиков 40–80 текс, скорость скатывания 60–100 м/мин, ширина холстика 265 мм, диаметр – 580 мм. На всех холстиках длина продукта одинакова. Автосъёмщик лентосоединительной машины автоматически укладывает по 4 холстика на тележку. На тележке холстики транспортируют к гребнечёсальной машине. Насчитывается шесть кардных или чёсальных лент. Гребенная Лента состоит из хорошо распрямлённых и разъединённых волокон, но она неравномерна по линейной плотности. Поэтому дальнейшая обработка ленты на ленточных машинах производится с целью выравнивания ленты по линейной плотности путём сложения с последующим вытягиванием (два перехода ленточных машин). Обычно число сложений 6 и вытяжка на ленточной машине 6. Пропустив ленту через две ленточные машины, имеют общее число сложений 36, что и обеспечивает хорошее выравнивание.

DRAW–FRAME BLENDS = СМЕСКИ С ЛЕНТОЧНОЙ МАШИНЫ – Draw-Frame Blends are the blends of fibers made at the draw frame by feeding in ends of appropriate card sliver. This method is used when blend uniformity is not a critical factor.

DRAWING = ВЫТЯГИВАНИЕ (или ВЫТЯЖКА) – (1) In textile industry, Drawing is the process of attenuating or increasing the length per unit weight of laps, slivers, slubbings, or rovings.

(2) Drawing is the hot or cold stretching of continuous filament yarn or tow to align and arrange the crystalline structure of the molecules to achieve improved tensile properties. / филаментная (комплексная) пряжа (filament yarn).

DRAWING = ЧЕРТЁЖ (или ОПИСАНИЕ, или ГРАФИЧЕСКИЙ МАТЕРИАЛ, или РИСУНОК) – (1) In the US patent law, patent Drawings must show every feature of the invention as specified in the claims. Omission of drawings may cause an application to be considered incomplete but are only required if drawings are necessary for the understanding of the subject matter sought to be patented.

(2) In the US trademark law, a clear depiction of the mark an applicant seeks to register. Every application must include a drawing of the mark. The United States Patent and Trademark Office (USPTO) uses drawings to file marks in the USPTO search records and to print marks in the Official Gazette and on registration certificates. For TEAS (short for the Trademark Electronic Application System) applications, if the mark is in standard character form, a separate drawing page is not required. If the mark is special form, (i.e. includes a design or stylized lettering), the applicant must attach a digitized image of the mark in jpg format to the electronic submission. / , то есть .

DRAWING–IN = ПРОБОРКА – Drawing-In:- in weaving, the process of threading warp ends through the eyes of the heddles and the dents of the reed. / Проборка основных нитей в ремиз и бёрдо (reed).

DRAWN TOW = ВЫТЯЖНОЙ (или ИЗЪЯТЫЙ) ЖГУТ – Drawn Tow:- a zero-twist bundle of continuous filaments that has been stretched to achieve molecular orientation. Tows for staple and spun yarn application are usually crimped.

DRAWN TEXTURED YARN = ТЯНУТАЯ ТЕКСТУРИРОВАННАЯ ПРЯЖА – Drawn Textured (or Texturised) Yarn (DTY) is manufactured by texturising partially oriented yarn using texturising machines. Polyester DTY yarn is a continuous filament yarn that has been processed to introduce durable crimps twists, interlaces, loops or other fine distortions along the lengths of the filament. Yarns made from thermoplastic materials can be textured by heat setting in a twisted condition, which results in polyester DTY yarn of greater bulk, higher stretch, and more pleasing aesthetics. Polyester DTY yarn can also be obtained in various colors by the dope dyed technology or by conventional dyeing. Dope dyed DTY is usually packed on paper bobbins whereas Raw White DTY which is used for dyeing is loosely packed on perforated plastic tube so that all the yarn can be easily dyed when the bobbin is dipped in color. DTY yarn can be in Semi Dull or Bright or Triloble Bright depening upon the type of sections of filaments. DTY is suitable for fabric end uses like outer/inner garments, skin-clinging garments, furnishings, upholstery, etc. This is a replacement of cotton and cotton blend yarns with very low moisture content. Luster:- (i) Semi Dull (SD); (ii) Dope Dyed Colored (DD); (iii) Bright (BR or BRT); and (iv) Melange. Quality:-

(i) Non Intermingled (NIM); (ii) Slight Intermingled (SIM); (iii) Low Intermingled (LIM); and (iv) High Intermingled (HIM). For example:- 75D (Denier) 36F (No. of Filament) SD NIM or 450D 144F SD HIM. Xxxxx. Drawn Textured Yarn (DTY) yarn is obtained when Polyester POY is simultaneously twisted and drawn. DTY yarn is mainly used in weaving and knitting of fabrics for making clothes, home furnishings, seat covers, bags and many other uses. DTY yarn can be in Semi Dull (SD) or Bright (BR) or Bright Trilobal (BR-TL) depanding upon the type of sections of filaments. Technical Properties of DTY yarn can be moulded in several ways to make the yarn suitable for its vast uses. Different heating techniques can be used to make the yarn set for specific use – 1 Heater DTY is normally woolly and more stretchable as compared to DTY with 2 Heater. Also the DTY yarn can be made with several combinations of Intermingle points – it can be Non-Intermingle (NIM) having 0–10 knots/meter or Semi-Intermingle (SIM) having 40–50 knots/meter or High-Intermingle (HIM) having 100–120 knots/meter. These knots are not actually the knots tied when two threads are broken but they are the tangle knots created by heating pressure. These intermingle yarns, also known as Interlaced Yarns, are the replacement for lightly twisted yarns. Polyester DTY yarn can also be twisted to high twists like 1 500 TPM or 4 000 TPM (twist per meter). Such twisted yarn can also be heat-set to make the yarn permanently thermo-set the twist. Catonic DTY is another variant of Polyester DTY that is mainly used in blankets. Catonic DTY is made from Catonic PET Chips. Polyester DTY yarn can also be obtained in various colors by the dope dyed technology or by conventional dyeing. Dope dyed DTY is usually packed on paper bobbins whereas Raw White DTY that will be used for dyeing is loosely packed on perforated plastic tube so that all the yarn can be easily dyed when the bobbin is dipped in color. DTY is mainly produced in large quantity in China, India, Taiwan, Indonesia and Malaysia and is exported world-wide. / высокие крутки .

DRAW RATIO = СООТНОШЕНИЕ С ВЫТЯЖКОЙ – Draw Ratio is the ratio of final to original length per unit weight of yarn, laps, slivers, slubbings, rovings, etc, resulting from drawing. See also Draw Down, and Draft Ratio.

DRAW–SIZING = ВЫТЯЖНОЕ ШЛИХТОВАНИЕ – Draw-Sizing is a system linking drawwarping and sizing in a continuous process. A typical system includes the following elements:- (1) creel, (2) eyelet board, (3) warp-draw machine, (4) intermingler, (5) tension compensator and break monitor, (6) sizing bath, (7) dryers, (8) waxing and winding units.

DRAW–TEXTURING = ВЫТЯЖНОЕ ТЕКСТУРИРОВАНИЕ – Draw-Texturing:- in the manufacture of thermoplastic fibers, the simultaneous process of drawing to increase molecular orientation and imparting crimp to increase bulk.

DRAW–TWISTING = ВЫТЯЖНОЕ КРУЧЕНИЕ (или ВЫТЯЖНОЕ ПРИСУЧИВАНИЕ) – Draw-Twisting is the operation of stretching continuous filament yarn to align and order the molecular and crystalline structure in which the yarn is taken up by means of a ring-and-traveler device that inserts a small amount of twist (usually 1/4 to 1/2 turn per inch) into the drawn yarn.

DRAW–WARPING = ВЫТЯЖНАЯ СНОВКА – Draw-Warping is a process in which a number of threadlines, usually 800 to 2 000 ends of POY (short for the partially oriented yarn) feedstock, are oriented under essentially equal mechanical and thermal conditions by a stretching stage using variable speed rolls, then directly wound onto the beam. This process gives uniform end-to-end properties.

DRAW–WINDING = ВЫТЯЖНАЯ НАМОТКА (или НАМОТКА ЛЕНТЫ) – Draw-Winding is the operation of stretching continuous filament yarn to align or order molecular and crystalline structure. The drawn yarn is taken up on a parallel tub or cheese, resulting in a zero-twist yarn.

DRAY = ПОДВОЗ (или ПОДАЧА, или ДОСТАВКА) – Dray:- the movement of trailers or containers in or out of a marshalling yard, to or from a local shipper, consignee or another carrier. / Перемещение прицепов или контейнеров в или из сборного двора, к или от местного грузоотправителя, консигнатора (получателя) или иного перевозчика.

DRAYAGE = ПОДВОЗ (или ПОДАЧА, или ДОСТАВКА) – (1) Drayage is the inland transportation from vendors to the port of shipment, and from discharge port to the point of stripping the ocean container. Drayage is hence undertaken for container yard (CY) and container freight station (CFS) cargo. Drayage:- a container or piggyback is moved from a rail yard to another location (which is most likely a Logistics Depot Distribution Center) and then returning that piggyback/container back to the initial pick-up point, is known as a Dray. It is important that these containers get unloaded quickly and returned back to the original point so not to incur detention charges. / и из порта выгрузки в пункт .

(2) Drayage is a charge made for local hauling by dray or truck. See also Drayage Charge.

DRAYAGE CHARGE = СБОР ЗА ПОДВОЗ (или ПОДАЧУ, или ДОСТАВКУ) – The charge made for hauling freight, carts, drays, or trucks. Drayage Charge is the charge of pick up and delivery by the trucker. Haulage of containers over the road via truck. Charge made for local hauling by dray or truck. Also known as Cartage. / Подвоз контейнеров.

DRD = DÉPARTEMENT DE RECHERCHE–DÉVELOPPEMENT = DEPARTMENT OF RESEARCH DEVELOPMENT

DREADNOUGHT = ДРЭДНОТ (или ТОЛСТОЕ СУКНО) – Dreadnought is the cloth used for a dreadnought garment, namely a warm garment of thick cloth. A warm garment of thick cloth.

DR (EDRP/DADRP) = DEMAND RESPONSE (EMERGENCY DEMAND RESPONSE PROGRAM/DAY–AHEAD DEMAND RESPONSE PROGRAM)

DRENCH = ПРОПИТЫВАНИЕ (или ПОЛИВ) – Drench:- to wet thoroughly by covering with water or another liquid. / Под Поливом понимается искусственное увлажнение корнеобитаемого слоя почвы для улучшения её водного и теплового режимов. Виды полива:- вегетационный, влагозарядковый, освежительный. Способы полива:- напуск по бороздам и полосам, дождевание, подпочвенное и капельное орошение, затопление.

DRENCHING = ПРОМАЧИВАНИЕ (или ВЛИВАНИЕ ЛЕКАРСТВА В РОТОВУЮ ПОЛОСТЬ ЖИВОТНОГО) – Drenching is an administering an oral medication to kill internal parasites. External parasite control may be achieved by spraying or using pour-on or backline treatments. The use of these depends on the climate, season and type of enterprise. External parasites that affect cattle include flies, lice and ticks.

DRESS = ПЛАТЬЕ – Dress is an outer garment, as for a woman or girl, usually consisting of a one-piece bodice and skirt.

DRESS = ПРОТРАВЛИВАТЬ – Dress:- to apply a chemical such as an insecticide or fungicide to seeds before planting or storage.

DRESSED LUMBER = СТРОГАНЫЙ ПИЛОМАТЕРИАЛ – Dressed Lumber is a wood from which the sapwood has been removed.

DRESSED SIZE = СТРОГАНЫЙ РАЗМЕР (или РАЗМЕР ПОСЛЕ СТРОГАНИЯ) – Dressed Size:- the dimensions of lumber after being surfaced with a planing machine. The dressed size is usually 1/2 to 3/4 inch less than the nominal or rough size. A 2x4-inch stud, for example, actually measures about 1 1/2 by 3 1/2 inches. You can infer from this glossary listing that while people buy ‘dressed’ wood (i.e. wood that has been planed down), the measurement of the wood is still given in terms of its ‘rough’ size. A good start, but we

hoped to find something that actually said this (or, at least, said something close). The cross-sectional dimensions of lumber after planing. / после строгания.

DRESSED SIZED LUMBER = СТРОГАНЫЙ МЕРНЫЙ ПИЛОМАТЕРИАЛ (или ПИЛОМАТЕРИАЛ СТРОГАНОГО РАЗМЕРА) – Dressed Sized Lumber:- the dimensions of lumber after being surfaced with a planing machine. / Размеры пиломатериала, после того, как его поверхность подверглась обработке резанием с помощью строгального станка.

DRESSING GOWN = ДОМАШНИЙ ХАЛАТ (или ХАЛАТ, или КАПОТ) – Dressing Gown is a robe worn especially while dressing or resting.

DRESSING SHIP = РАСЦВЕЧЕННОЕ СУДНО (или УКРАШЕННОЕ СУДНО) – Dressing Ship (maritime term):- a display of national colors at all mastheads and the array of signal flags from bow to stern over the masthead (for special occasions and holidays).

DRESS SHIRT = ПАРАДНАЯ СОРОЧКА (или ПАРАДНО–ВЫХОДНАЯ РУБАШКА) – Dress Shirt is a man's shirt especially for wear with evening dress; broadly, a shirt suitable for wear with a necktie.

DRESS UNIFORM = ПАРАДНАЯ ФОРМА (или ПАРАДНО–ВЫХОДНАЯ ФОРМА, или ХХ) – Dress Uniform is the uniform for formal wear.

DREX = ДРЭКС (или ДИРЭКС, или ДЕЦИРЕКС) – Drex is a unit traditionally used in the textile industry to measure the density of a single fiber of yarn. One drex equals a density of one gram per 10 kilometers (km) of length, or 1 microgram per centimeter (µg/cm). Since 1 drex equals 0.1 tex, the unit is now called the Decitex (dtex).

DRFS = DESTINATION RAIL FREIGHT STATION

DRIED = СУШЁНОЕ (или ВЫСУШЕННОЕ) – Dried:- materials from which water or other liquid has been removed.

DRIED DISTILLERS GRAINS WITH SOLUBLES = СУШЁНОЕ ОТРАБОТАННОЕ ВИНОКУРАМИ ЗЕРНО В РАСТВОРИМЫХ ВЕЩЕСТВАХ (или СУХАЯ ПОСЛЕСПИРТОВАЯ БАРДА, или ГРАНУЛИРОВАННАЯ СУХАЯ БАРДА) – DDGS (Dried Distillers Grains With Solubles), a coproduct of the ethanol production process, is a high nutrient feed valued by the livestock industry. When ethanol plants make ethanol, they use only starch from corn and grain sorghum. The remaining nutrients – protein, fiber and oil – are the by-products used to create livestock feed called Dried Distillers Grains with Solubles. A third of the grain that goes into ethanol production comes out as DDGS. Each bushel of grain used in the ethanol-making process produces 2.7 gallons of anhydrous ethanol; 18 pounds of DDGS and 18 pounds of carbon dioxide. DDGS Qualities:- (i) rich in cereal and residual yeast proteins, energy, minerals and vitamins; (ii) is an excellent digestible protein and energy source for beef cattle; (iii) can comprise 20–30% of the ration DM (dry matter); (iv) can also be used in turkey and swine applications; and (v) is a valuable feed for both feedlot and dairy cattle. In North America, over 80% of DDGS is used in ruminant diets. DDGS also is fed to poultry. Recent studies show excellent nutritional value of DDGS in swine diets, and its use is increasing in the pork industry. The production of Dried Distillers' Grains with Solubles (DDGS) has increased dramatically in the US recently (February 2009) because of the focus of the country on the production of ethanol from corn. The rise in the cost of corn for feed, which is being pushed up by the biofuels industry and its desire for more and more corn for ethanol, means that the by-product from the ethanol industry, DDGS, is becoming more readily available to integrators. Distillers Grains are a byproduct of whiskey and fuel ethanol production. They have a very long history of being fed to livestock; the first study in the United States about feeding distillers grains to cattle was published in 1907. The tremendous growth in fuel ethanol production has greatly increased the supply of distillers grains, resulting in increased interest in feeding them. Annual production of distillers grains (on a dry basis) was about 1 million tons in 1998, about 10 million tons in 2006, and is estimated to reach 16 million tons by 2010. In the United States most of the ethanol produced currently is made from corn but other grains can be used. The corn is processed and mixed with yeast that converts the starch into ethanol and carbon dioxide. The ethanol is distilled off and the remaining liquid is centrifuged to remove some water. This residue is called wet distillers grains and usually has 30 to 35% dry matter (DM) and contains most of the fiber, fat, protein, and minerals found in the original grain used to make the ethanol. The liquid removed by centrifuging is usually partially dried and becomes condensed distillers solubles. Condensed solubles are a good source of protein, energy, and vitamins but have the consistency of molasses, making feeding difficult. Most distilleries add the condensed solubles back to the wet distillers grains making wet distillers grains with solubles (WDGS). The wet products are either fed as-is or are heat-dried producing dried distillers grains with solubles (DDGS). The nutrient value of the products with and without solubles differs slightly, but only WDGS and DDGS will be discussed further. The nutrient composition of distillers grains is a function of the starting grain and the specific methods used to make the ethanol and distillers grains. Distillers grains have very low concentrations of starch because most of the starch in the starting grains was converted to ethanol. Concentrations of protein, fiber, fat, and minerals are increased depending on the concentration of starch in the grain. Corn grain is about two-thirds starch and when most of the starch is removed, concentrations of the other nutrients are increased about three-fold. With a few exceptions composition of WDGS and DDGS on a DM basis is similar. Dry distillers grains are available throughout the country but because WDGS is 65% water, transportation costs limit their availability to livestock facilities that are in close proximity to the distillery (probably less than 100 miles). A simple method to determine the breakeven price for DDGS that appears reasonably accurate is based on the price of ground corn grain and soybean meal (SBM). Breakeven price of DDGS (USD/ton) = (Corn (USD/bu) x 17.85) + (SBM (USD/ton) x 0.5). / безводное (anhydrous). Послеспиртовая Барда кукурузная Сухая (стандарт DDGS). Протеин – 26–34%, влажность – 12%, богатый аминокислотный состав. Уменьшает себестоимость кормов. Используется как белковый компонент, входящий в корм для свиней, коров, птицы и рыбы.

DRIFT = СНОС (или ДРЕЙФ) – Drift is the movement of airborne spray or dust particles outside the intended contact area. / Под Дрейфом, от Нидерландского слова Drijven, означающее Гнать или Плавать, понимается смещение .

DRIFT PATTERN = МОДЕЛЬ САМОТЁКА – Drift Pattern:- in visual analysis, a consolidation in the market after a primary trend move. The expected market direction after a breakout of the pattern is back in the original trend direction. Sometimes called a Continuation Pattern.

DRILL = ДРИЛ (или ДРЕЛЬ) – Cotton Drill is a medium weight, single cloth, weighing from 4 to 6 ounces and composed of coarse all-cotton yarns, warp and filling. It Is always made with a small uneven sided twill weave, generally (warp effect) twill weave. Drill is sometimes made from yarns in the gray and afterwards dyed in the piece, or in solid warp color effects, such as indigo blue and dark brown, white filling being used in each instance. It can be woven in any single box roller loom, and is usually drawn in and woven on cotton harness, as these are light in weight and wear better than wire heddles for this style of cotton goods. The lighter weights were used for Shirts, Safari jackets, martial art wear, cook's uniform. The warp is beamed on the slasher, the warp proper being divided into a certain number of sections, in accordance with the number of ends to 'be used in the drill warp. These sections are beamed on the warp mill, the yarn being run on to the beam from the spools in the creel rack. The several section beams, when completed in the warp mill, are assembled in the beam rack at the end of the slasher and the yarn from each beam is run through the size tub and over the drying cylinder of the slasher at the same time, on to the slasher beam, thus making a complete warp, the sizing and beaming being

done at one operation. Slasher warps do not have a lease in them, the yarn being kept nearly straight in place by the use of a slasher comb, which is, in fact, a shallow reed having one open side. The comb is pressed through the threads, while they are spread taut in the slaslher frame and a wooden cap is then fastened upon the open side of the slasher comb, thereby holding the yarn in place for the operation of drawing in. The drawing in is performed by girls, without the aid of a hander in, as is the case when pattern warps are drawn in from a lease. The drawer in for drill, uses a three-bladed hook (a blade for each harness) and the harnesses or heddles are hung upon a rack immediately in front of the beamed wary. The drawer in, if experienced, will pick out three heddles and three ends at one time, and continue to do so until the total warp ends are threaded through the harnesses or heddles. To finish colored drill, the goods are taken from the loom and run through the brusher, to remove all lint and waste threads, after which they are put through the size tubs and then dry pressed. Drill is a strong denim-like material with a diagonal 2 x 1 weave running toward the left selvage. Drill is often called Khaki when it is dyed that color. Drill is a durable cotton fabric of relatively low count, coarse yarn, and medium weight. Most of the drill made today uses a 3-harness, warp-face, left-hand twill weave; other comparable constructions, however are used. Carded cotton sheeting yarn is used and textures and weights vary considerably, depending upon the terminal use of the material. When dyed, drill may be known as Khaki, Herringbone, Silesia, Ticking, or by other names. Since the term Drill denotes the purpose for which the cloth is to be used, and not the weave, as might be supposed, some fabrics of this name are made with a small satin weave. Wide industrial drill is made on a three-leaf twill, left-hand, and in warp-effect. Finished at about 59 inches, the texture is 68 x 40, and there are about two yards to the pound. 14's warp and 20's filling are used in the fabric which serves as a basis for coated textiles. Cotton Drill Cloth is a sturdy cotton fabric known for its stength and durability. Makes great bag linings, wall coverings, banners, slipcovers, and can be used for upholstery decking. Sold by the yard. Weight:- 7 ounces (oz) per square yard. Drill is a heavy, strong, durable twilled fabric of cotton or man-made fibers, similar to denim, that has a diagonal 2 x 1 weave running up to the left selvage. When strength of fabric is essential, drill is suitable for slacks, uniforms, overalls, and work shirts. See also Twill. Drill:- a strong cotton material similar to denim which has a diagonal 2 x 1 weave running upward to the left selvage. Called Khaki when dyed that color. Used for uniforms, shirts, work clothes, ticking. Drill is a durable cotton twilled fabric. Twill. Left-hand twill. From top left to lower right. L2/1 or L3/1. Closer, flatter wales that gabardine. Medium weight and course yarns are used. Also made in some other weights. Some left in the grey but can be bleached or dyed. When dyed a khaki color it is known by that name. / основа и уточина. Каки (Khaki), Хэриньбон (Herringbone), Сайлыжа (Silesia), Тикинь (Ticking). (1) Разные сорта хлопчатобумажной саржи, выпускаемой как простынное полотно или одёжная ткань. (2) Хлопчатобумажная или льняная ткань с переплетением – трёхнитная основная саржа. Применяется на костюмы в тропических странах.

DRILLING = ВЫСЕВ – Drilling is a sowing seeds in furrows or holes by hand or machine.

DRILL MARKS = ОТМЕТИНЫ XX – Drill Marks misplaced, not perpendicular, omitted or wrong side drill used. Cutting Room Defects, and namely – Cutting Defects. / Порок или дефект раскроя.

DRILLSHIP = БУРОВОЕ СУДНО – A Drillship is a maritime vessel that has been fitted with drilling apparatus. It is most often used for exploratory offshore drilling of new oil or gas wells in deep water or for scientific drilling. The drillship can also be used as a platform to carry out well maintenance or completion work such as casing and tubing installation or subsea tree installations. It is often built to the design specification of the oil production company and/or investors, but can also be a modified tanker hull outfitted with a dynamic positioning system to maintain its position over the well. The greatest advantages these modern drillships have is their ability to drill in water depths of more than 2 500 m and the time saved sailing between oilfields worldwide. Drillships are completely independent, in contrast to semi-submersibles and jackup barges. In order to drill, a marine riser is lowered from the drillship to the seabed with a blowout preventer (BOP) at the bottom that connects to the wellhead. Drillships are just one way to perform exploratory drilling. This function can also be performed by semi-submersibles, jackup barges, barges, or platform rigs. The first drillship was the Cuss 1, and the fleet size has been growing ever since. By 2013 the worldwide fleet of drillships is expected to top 80 ships, more than double its size in 2009. Drillships are not only growing in size but also in capability with new technology assisting operations from academic research to ice drilling. US President Barack Obama's decision in late March 2010 to expand US domestic exploratory drilling seems likely to increase further developments of drillship technology. Stena drillings 'DrillMAX ICE' being constructed by Samsung Heavy Industries in South Korea is to be the most expensive drillship built to date and is to complete exploration in Arctic regions when completed in 2012. Transocean, Pride International, Seadrill, Noble Corporation and Atwood Oceanics are a few of the companies that own and operate drillships globally. Drillship is a type of drilling rig used in oil exploration at sea. In oil industry, a seadrill rig system that can extract oil at different water depths. Drillship is more mobile than a rig, which is essentially a platform. This ship can move on its own and can drill deeper than anything else in seadrill fleet. Water depth up to 2 500 meters. See also Jack-Up Rig, Semisubmersible Rig, Semitender Rig, and Tender Rig. / Президент США Борак Обама (Barack Obama). Сэмсон Хэви Индэстриз (Samsung Heavy Industries). Тчрэнсоушэн (Transocean), Прайд Интёнэшэнэл (Pride International), Сидрил (Seadrill), Нёбэл Корпорэйшэн (Noble Corporation) и Этвуд Оушиэникс (Atwood Oceanics). Смотрите также Самоподъёмная Буровая Установка или Буровая Установка На Выдвижных Сваях (Jack-Up Rig), Полупогружная Буровая Установка (Semisubmersible Rig), Полупогружная Платформа С Буровой Установкой На Сваях (Semitender Rig или Tender Rig). Буровое Судно это плавучее сооружение для морского бурения скважин. Оно оборудуется прорезью в центре корпуса, над которой устанавливается буровая вышка, и специальной системой для удержания судна над устьем скважины. Под Буровым Судном понимается плавучее средство, оборудованное буровой установкой и предназначенное для бурения на морском дне в шельфовой зоне. Оснащено системой динамической стабилизации, обеспечивающей удержание бурового судна над скважиной.

DRIP = DIVIDEND REINVESTMENT PLAN

DRIP–DRY = БЫСТРОСОХНУЩЕЕ (или НЕ ПРОПУСКАЮЩЕЕ ВОДУ) – Drip-Dry is a drip-dry garment.

DRIP LOSS = ПОТЕРЯ ВСЛЕДСТВИЕ СТЕКАНИЯ КАПЕЛЬ (или ПОТЕРЯ ВСЛЕДСТВИЕ КАПАНЬЯ) – Drip Loss is a loss of juice as the result of recrystallization of frozen meat. If the meat is frozen rapidly at low temperatures (e.g., –27 °C), small ice crystals are produced. If the meat rises to a higher temperature (e.g., –10 °C), the ice crystals grow larger, i.e. they recrystallize. As of a certain size, they can rupture the cell walls of the meat. These 'perforated' cell walls lose substantially more cell juices than cell walls which are not damaged. The result is a loss of juice, also known as 'Drip Loss'.

DRIP TIP = КАПЕЛЬНОЕ ОСТРИЁ (ЛИСТА) – Drip Tip is a sharp elongated point on which atmospheric water accumulates from dews, mists and rain until the water drop is large enough to fall off the tip, to the ground around the roots of the plant. Drip tips are common on the leaves of tropical trees in areas of high rainfall and the spines of some Cactaceae also function in this way to scavenge moisture. / корней растения. некоторых Кактусовых (Cactaceae) .

DRIVE BAND = ВЕДОМЫЙ XX (или ПРИВОДНОЙ ШНУР) – Drive Band is the cord that runs between the wheel and the flyer. A single-drive band is a circle and is used with the Scotch Tension wheels. A double-drive band is a figure-8 folded back on itself and loops over the flyer unit and the speed whorl.

DRIVE–IN BANK = АВТОБАНК (или БАНК НА КОЛЁСАХ) – Drive-In Bank is a bank that can be used without getting out of one's car. / Банк, который может быть использован, не покидая автомобиля банка.

DRIVE–IN RACK = ПРОХОДНОЙ СТЕЛЛАЖ – Drive-In Rack:- a storage racking equipment that has side rails to enable warehouse operators to stack product high in deep rows. It provides access only from aisles.

DRIVE RATIO = СООТНОШЕНИЕ С ПЕРЕДАЧЕЙ (или СООТНОШЕНИЕ С ПРИВОДОМ) – Drive Ratio is a ratio of wheel diameter to flyer whorl diameter (or bobbin whorl on a bobbin lead wheel). Governs how much twist you get in the yarn for each treadle. To measure your wheel ratios, set up your wheel, tie a bright-colored piece of yarn to your flyer arm, and adjust the treadle until it is at the bottom of its movement. Slowly rotate the wheel, while counting the flyer revolutions until the treadle returns to it's original point. The bright yarn tied to the flyer arm just makes it easier to count.

DRIVE SCREW NAIL = САМОНАРЕЗАЮЩИЙ ВИНТОВОЙ ГВОЗДЬ – Drive Screw Nail is a helically (continuous spiral) threaded pallet nail.

DRIVE–THROUGH RACK = СКВОЗНОЙ СТЕЛЛАЖ – Drive-Through Rack:- a storage racking equipment with side rails to enable warehouse operators toe stack product high in deep rows. Unlike Drive-In Rack, Drive-Through Rack allows access from either end of the row, as opposed to only being accessible from the aisle.

DRIVING WEDGES = ВЫБИВАЮЩИЕ КЛИНЬЯ – Driving Wedges:- xxxxx. See also Pallet, and Tapered Blocks.

DRK = DERRICK

DRM = DATA REFERENCE MODEL

DROOPY LEAVES = ОПУСТИВШИЕСЯ ЛИСТЬЯ (или ПОНИКШИЕ ЛИСТЬЯ) – Droopy Leaves are leaves that hang down and are not erect.

DROP = ПОДАЧА – Drop is a situation in which an equipment operator deposits a trailer or boxcar at a facility at which it is to be loaded or unloaded. / Ситуация, когда оператор оборудования размещает прицеп или фургон на площадке, на которой он должен быть загружен или выгружен.

DROP–BOTTOM BOX PALLET = ЯЩИЧНЫЙ ПОДДОН С ОТКИДНОЙ КРЫШКОЙ – Drop-Bottom Box Pallet is a box pallet with hinged deck to provide discharge of contents. / Ящичный Поддон С Откидной Крышкой – ящичный поддон с откидной шарнирной крышкой для обеспечения удобства выгрузки содержимого.

DROP NEEDLE = ОТКИДНАЯ ИГЛА (или ОТСЕЧНАЯ ИГЛА, или ПАДАЮЩАЯ ИГЛА, или ОПУСКНАЯ ИГЛА, или ПОДЪЁМНАЯ ИГЛА) – Drop Needle is a knit fabric characterized by a vertical lines within the cloth. This knit is manufactured by 'dropping' a needle from the knitting cylinder.

DROP OFF CHARGE = СБОР ЗА ПОДАЧУ – Drop Off Charge is a charge made by container owner and/or terminal operators for delivery of a leased, or pool container into depot stock. The drop off charge may be a combination of actual handling and storage charges with surcharges. / и сборы за хранение с надбавками или доплатами (surcharge).

DROPPED PICK = РАСПУЩЕННАЯ ПОПЕРЕЧНАЯ НИТЬ – Dropped Pick:- caused by the filling insertion mechanism on a shuttleless loom not holding the filling yarn, causing the filling to be woven without tension. Woven fabric defect. Defect Name:- Dropped Picks. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- Dropped Pick:- This is the result of the filling insertion mechanism on a shuttleless loom not holding, thus releasing the filling yarn too soon. This allows the yarn to snap into the body, leaving a missing pick part way across the width of the fabric. The released yarn then weaves into the fabric in a tangled mass and appears as a kinked or wild yarn. Severity:- Major. / уточную пряжу, . Порок или дефект ткачества.

DROPPED PLY = XX – Dropped Ply:- one of the plies breaks in manufacturing, producing a section of thread with one less ply than specified. Thread defects, and namely – Spinning. / Порок или дефект ниток.

DROPPED STITCHES = СПУЩЕННЫЕ ПЕТЛИ (или ЗАПАВШИЕ ПЕТЛИ) – Dropped Stitches:- a defect in knit cloth characterized by recurrent cuts in one or more wales of a length of cloth. Defect Name:- Dropped Stitches. Defect Type:- warp lines, vertical lines. Fabric Type:- Double Knit Fabrics. Description:- Dropped Stitches:- This is the result of stitches failing to form due to a malfunctioning needle or jack. Severity:- Major. Dropped Stitch:- in knitted fabrics, an unknitted stitch. Dropped Stitch is an unknitted stitch caused either by the yarn carrier not having been set properly or the stitch having been knitted too loosely. Knitted fabric defect, and namely:- stitch defect. Dropped Stitch:- a wale, within one course, in which the yarn has not been formed into a stitch. Note:- this defect is caused by a needle failing to take the yarn, or by the yarn casting off from the knitting elements prematurely.

DROPPER = ДРОПЭ (или СБРАСЫВАТЕЛЬ) – Dropper or Trojan Dropper is a type of malware that acts as a carrier, containing within itself another malicious executable. When launched, it 'drops' or installs the contained file and executes it. Historically-speaking, the term 'Dropper' was used to describe a file whose sole purpose was to introduce a computer virus into the wild and these were sometimes called 'Zero Generation' viruses by antivirus researchers, in much the same way that 'patient zero' was used by doctors and epidemiologists when discussing infectious diseases. In the case of a polymorphic computer virus, its dropper might not be encrypted but could consist solely of the decrypted computer virus code. See also Downloader, and Packer. / Троян Сбрасыватель.

DROPPING = ОТСЕВ (или ОТБРОС, или ПОДМЕТЬ, или XX) – Dropping is a category of cotton waste (lower carding waste) that has high trash content. This is obtained during manufacturing of yarn in the cotton mills. It is very much suitable and ideal for spinning yarns that has a low content. It is best suited for the same as it is low in cost and presence of less fiber content. Dropping has its another name as lower carding waste with its specification below:- length – 15–16 mm, trash – 25%, micronaire – 3.0–3.5.

DROPPING POINT = ТОЧКА КАПЛЕПАДЕНИЯ (или ТЕМПЕРАТУРА КАПЛЕПАДЕНИЯ) – Dropping Point:- in general, the dropping point is the temperature at which the grease passes from a semisolid to a liquid state. This change in state is typical of greases containing conventional soap thickeners. Greases containing thickeners other than conventional soaps may, without change in state, separate oil. / Точка Каплепадения или Температура Каплепадения.

DROP SHIPMENT = ТОЧЕЧНАЯ ОТГРУЗКА – Drop Shipment:- a request for the goods to go to the retailer directly from the manufacturer when the invoice comes from another party in the transaction, typically the distributor from whom the retailer would normally receive the goods.

DROP SPINDLE = ПОДЪЁМНОЕ ВЕРЕТЕНО (или ЗАПАДАЮЩЕЕ ВЕРЕТЕНО) – Drop Spindle is a spindle that hangs freely from the fiber source (as opposed to a Supported Spindle). Probably so named by people who haven't added enough twist. Drop Spindle is a spindle that is suspended freely from the forming yarn.

DROP STITCH = СПУСКАНИЕ ПЕТЛИ (или СПУЩЕННАЯ ПЕТЛЯ) – (1) Drop Stitch:- local column of dropped stitches. Causes:- (i) yarn guide not set properly, i.e. yarn is not fed properly during loop formation; (ii) defective latch needle; (iii) yarn tension is not sufficient; (iv) take-down is too high; and (v) wrong yarn threading. Mending:- this fault can be corrected by stitches reforming using a simple needle. Can be avoided by:- (i) precise yarn-guide setting; (ii) needle change; (iii) dial position readjustment; and (iv) use of fabric fault detector. Knitted fabric defect.

(2) Drop Stitch is a construction is generally used on Jersey and rib fabrics for either fabric design or for the separation of rib fabric pieces. Used in knit shirts and dress fabrics.

DROP STITCHES = СПУЩЕННЫЕ ПЕТЛИ (или ЗАПАВШИЕ ПЕТЛИ) – Drop Stitches:- results from malfunctioning needle or jack. Will appear as holes, or missing stitches. Knitted fabric defect. Drop Stitch is:- (1) an open design made in knitting by removing some of the needles at set intervals. (2) A defect in knit fabric. / Спускание Петли в вязаном изделии. Порок или дефект трикотажных (вязаных) тканей.

DROP WIRES = ЛАМЕЛИ (или ОСТАНОВОЧНЫЕ ИГЛЫ, или ПАДАЮЩИЕ ШПИЛЬКИ САМООСТАНОВА СНОВАЛЬНОЙ МАШИНЫ) – Drop Wires is a stop-motion device utilizing metal wires suspended from warp or creeled yarns. When a yarn breaks, the wire drops, activation the switch that stops the machine.

DROUGHT = ЗАСУХА (или ЗАСУШЛИВОСТЬ) – Drought is an insufficient supply of moisture from precipitation or soil for optimum plant growth. / Под Засухой понимается продолжительный и значительный недостаток осадков, чаще при повышенной температуре и пониженной влажности воздуха. Вызывает снижение запасов влаги в почве и, как следствие, ухудшение роста, а иногда и гибель растений. Меры борьбы:- агротехнические (специальная обработка почвы) и мелиоративные (орошение) мероприятия, полезащитное лесоразведение.

DROUGHT ESCAPE = УХОД ОТ ЗАСУХИ – Drought Escape:- that which enables the plant to complete its life cycle before serious moisture stress can cause damage to crop growth and yield.

DROUGHT RECOVERY = ВОССТАНОВЛЕНИЕ ОТ/ПОСЛЕ ЗАСУХИ – Drought Recovery is the ability of plant to resume normal growth upon alleviation of drought.

DROUGHT STRESS = СТРЕСС ОТ ЗАСУХИ – Drought Stress is a limitation on maximal plant performance imposed by water limitation.

DROUGHT TOLERANCE = ЗАСУХОУСТОЙЧИВОСТЬ (или ТОЛЕРАНТНОСТЬ К ЗАСУХЕ) – Drought Tolerance is a total expression of the plant's ability to stay alive, grow, and ultimately produce grain, with part of its life cycle under water stress.

DRP = DIVIDEND REINVESTMENT PLAN

DRR = DÉPARTEMENT DE RECHERCHES RIZICOLES = DEPARTMENT OF RICE RESEARCH

DRR = DIRECTORATE OF RICE RESEARCH

DRT = DROUGHT

DRUGGET = ДРАГИТ (или ТКАНЬ ДЛЯ ДОРОЖЕК, или ТКАНЬ ДЛЯ ПОЛОВИКОВ) – Drugget is a coarse, felted floor covering made from mixtures of such fibers as cotton, jute, and wool. Drugget is usually napped on one side and is a traditionally inexpensive floor covering used by institutions. Drugget is a wool or partly wool fabric formerly used for clothing.

DRUM = БОЧКА (или БАРАБАН) – Drum is a container with a capacity of 55 US gallons. Drum is a unit of volume sometimes used in the oil trade. The traditional standard drum of oil contains 55 US gallons or about 208.198 liters. One 55-gallon drum equals 1.309 5 barrels. In the metric world, drums of 200 liters, 205 liters, and 208 liters are in use as substitutes for the traditional size. / Бочка, старая Русская мера жидкостей, употреблявшаяся до введения метрической системы мер, равная 40 ведрам (или 491.96 литрам (л)). Бочка – транспортная тара с корпусом цилиндрической или параболической формы с обручами или зигзагами катания, с донъями. Барабан – транспортная тара с гладким или гофрированным корпусом цилиндрической формы, без обручей или зигзагов катания, с плоским дном.

DRUM CARDER = ЧЁСАЛЬНЫЙ БАРАБАН (или БАРАБАННАЯ КАРДА) – Drum Carder is a rotating drum, covered with carding cloth, used to card fibers.

DRUPE = КОСТЯНКА – Drupe is a fleshy or pulpy indehiscent fruit with a thin outer skin, containing a single central hardened stone or pit containing a seed, e.g., Almond, Cashew, Cherry, Date, Elderberry, Mango, Olive, Peach, Plum. The hard, lignified stone originates as the ovary wall of the flower. / Костянка – тип плода. мясистый (fleshy). невскрывающийся плод с . Под Костянкой понимается плод растений с твёрдой деревянистой косточкой и мясистым или кожистым наружным слоем. Однокостянка – у Вишни, Миндаля, Сливы и других, многокостянка – у Малины и других. В быту некоторые мелкие костянки неправильно называются Ягодами.

DRUSE = ДРУЗА – Druse is roughly spheroidal crystalline (e.g., calcium oxalate) or colloidal inclusions within tissues. / (например, оксалат кальция или щавелевокислый кальций) или . Под Друзой, от Немецкого слова Druse, понимается цитоплазматическое включение из сросшихся кристаллов оксалата кальция в клетках многих растений, например, в стеблях липы, листьях щавеля.

DRY = СОХНУТЬ – Dry:- to reduce or remove the moisture content.

DRYBED METHOD = МЕТОД СУХОГО ЛОЖА – Drybed Method:- raising seedlings on a dry seedbed. It is usually practiced in rainfed areas or where irrigation water is not adequate. / семенное ложе (seedbed).

DRY BOX = СУХОЙ СУНДУК – Dry Box containers are not designed to keep cargo at a certain temperature. Under certain conditions, the temperature in containers can become pretty high and cause damage to the cargo in it. A classical example of that is cocoabutter. Such circumstances can be exposured to sunlight, stowage close to fuel storage tanks on board or, to the contrary, exposure to arctic temperatures. Also known as Dry Freight Container. Dry Box Inc. is a licensed and bonded freight shipping and trucking company running freight hauling business. Dry Box sells new and used shipping containers. Dry Box offers container modifications of all types from basic modification to engineered specialty modifications. Dry Box Inc. headquartered in Chehalis, State of Washington (WA), the United States. / Известен также как Сухой Грузовой Контейнер (Dry Freight Container). Драй Бокс Инк. (Dry Box Inc.).

DRY BULK = НАСЫПЬЮ – Dry Bulk:- minerals or grains stored in loose piles moving without mark or count. Examples are potash, salts, sugar, and aggregate. / Способ перевозки сухих сыпучих грузов. Смотрите также Навалом (Bulk). Под Кюбелем, от Немецкого слова , означающее Бадья или Чан или Черпак, понимается грузозахватное устройство для перемещения сыпучих грузов. Кюбель – сосуд с механизированной выгрузкой, происходящей при его автоматическом опрокидывании либо раскрытии стенок или днища.

DRY BULK CONTAINER = КОНТЕЙНЕР ДЛЯ ТВЁРДЫХ СЫПУЧИХ ГРУЗОВ – Dry Bulk Container is a container constructed to carry grain, powder and other free-flowing solids in bulk. Used in conjunction with a tilt chassis or platform. Container consisting of a cargo-carrying structure, firmly secured within a framework, for the carriage of dry solids in bulk without packaging. Containers of this type have type codes 80 and 81. / Контейнеры этого типа имеют Типовые Коды 80 и 81.

DRY CARGO = СУХОЙ ГРУЗ – Merchandise other than liquid carried in bulk. Dry Cargo:- that is not liquid and normally does not require temperature control.

DRY CARGO SHIP = СУХОГРУЗНОЕ СУДНО – Dry Cargo Ships are used to carry solid dry goods that have a higher tolerance to heat and cold, such as metal ores, coal, steel products, forest products, and grains. These vessels are equipped with on-deck cranes and other mechanism for loading and unloading of goods. As dry cargo shipment doesn't require special types of precautions (as required for carrying liquid and gases), bulk carriers and container ships don't have onboard temperature control equipment. Today, bulk of international trade is carried out by thousands of dry cargo carriers transporting goods to ports across the world. Dry cargo vessel category mainly includes bulk carriers and container ships. Bulk carriers are used for transportation of unpackaged bulk cargo, such as metal ores, coal, cement, tin, steel, and grains in its cargo holds. Container ships are primarily used for the transportation of non-bulk cargo, generally manufactured goods, in truck-size intermodal containers. Dry Cargo Ship is a vessel which carriers all merchandise, excluding liquid in bulk. / Судно, которое перевозит все виды товарной продукции, за исключением наливной. Сухогрузное Судно – грузовое судно для перевозки сухих грузов и жидких грузов в таре. Сухогрузные суда приспосабливают для перевозки грузов (и их перегрузки) в отдельных единицах – бочках, кипах, пачках, тюках, ящиках (суда для штучных грузов), навалом или насыпью (навалочники). Сухогрузные суда для штучных грузов бывают общего назначения и специализированные по виду перевозимого груза (например, лесовозы, рефрижераторы) и по виду грузовых мест (грузовые паромы, контейнерные суда, лихтеровозы, пакетовозы, трейлерные суда). Сухогрузные суда могут быть самоходными и несамоходными.

DRY CLEANING = СУХАЯ ЧИСТКА – Dry Cleaning is a removing dirt and stains from fabrics or garments by processing in organic solvents (chlorinated hydrocarbons or mineral spirits). Dry Cleaning is a method of removing soil from certain fabrics done with organic solvents instead of water. / грязи и разводы (или потёки) с ткани или .

DRY COMBING = СУХОЕ ГРЕБНЕЧЕСАНИЕ (или ГРЕБНЕЧЕСАНИЕ В НЕЗАМАСЛОВАННОМ ВИДЕ) – Dry Combing is the preparing and combing of wool to which no oil has been added. Dry Combing is a preparing wool for worsted spinning without any oil. Also known as French Combing.

DRY DAIRY COWS = СУХИЕ КОРОВЫ МОЛОЧНОЙ ПОРОДЫ (или ХХ КОРОВЫ МОЛОЧНОЙ ПОРОДЫ) – Dry Dairy Cows:- female dairy breed Cattle that lactated previously, but are not currently producing milk for human food, i.e. dairy cows between lactations.

DRY DECATING = СУХАЯ ДЕКАТИРОВКА – Dry Decating is a process of setting the luster of a wool fabric.

DRY DOCK = СУХОЙ ДОК – A Dry Dock is a type of dock consisting of a rectangular basin dug into the shore of a body of water and provided with a removable enclosure wall or gate on the side toward the water, used for major repairs and overhaul of vessels. When a ship is to be docked, the dry dock is flooded, and the gate removed. Facility used to lay up vessels for maintenance and/or repair. Dry Dock is an enclosed basin into which a ship is taken for underwater cleaning and repairing. It is fitted with water tight entrance gates which when closed permit the dock to be pumped dry. Dry Dock (maritime term):- a basin for receiving a vessel for repairs, capable of being pumped dry (to repair vessel and scrape marine growth from bottom).

DRY FILLING = СУХОЕ НАПОЛНЕНИЕ (или СУХАЯ ЗАЛИВКА, или СУХОЕ ЗАПОЛНЕНИЕ, или СУХАЯ НАБИВКА) – Dry Filling is the application of finishing chemicals to dry fabric, usually by padding.

DRY FORMING = СУХОЕ ФОРМОВАНИЕ – Dry Forming is the production of fiber webs by methods that do not use water or other liquids, i.e. air-laying or carding.

DRY FREIGHT CONTAINER = СУХОЙ ГРУЗОВОЙ КОНТЕЙНЕР – Dry Freight Container:- manufactured from either Aluminium or steel, they are suitable for most types of cargo / general cargo. Aluminium containers have a slightly larger payload than steel, and steel containers have a slightly larger internal cube. Also known as Dry Cargo Container. Container used to carry dry cargo not requiring temperature control. / Контейнер, используемый для перевозки сухих грузов, не требующих режима температурного контроля.

DRY GAS = СУХОЙ ГАЗ (или СУХОЙ ОТБЕНЗИНЕННЫЙ ГАЗ, или СУХОЙ (БЕЗВОДНЫЙ) ГАЗ, или ОСУШЕННЫЙ ГАЗ) – Dry Gas is a natural gas from the well that is free of liquid hydrocarbons, or gas that has been treated to remove all liquids; pipeline gas. Gas that does not contain liquid hydrocarbons. / Газ, который не содержит жидких углеводородов.

DRY HOLE = СУХАЯ СКВАЖИНА (или БЕЗРЕЗУЛЬТАТНАЯ СКВАЖИНА) – Dry Hole is an exploratory or development well found to be incapable of producing either oil or gas in sufficient quantities to justify completion as an oil or gas well. / Разведочно-эксплуатационная или эксплуатационная (оценочная) скважина. Скважина – искусственная цилиндрическая горная выработка глубиной от нескольких метров до 10 километров и более и диаметром обычно 75–800 миллиметров. Скважины разделяются на взрывные, вспомогательные (вентиляционные, водоотливные и так далее), разведочные, специальные (дренажные, замораживающие и тому подобные), эксплуатационные (для добычи воды, газа, нефти и так далее). Проходка скважины осуществляется буровыми установками. Элементы скважины:- забой – дно; ствол или стенки – боковая поверхность; устье – выход на поверхность скважины. Буровая Скважина – цилиндрическая горная выработка, имеющая относительно малое поперечное сечение (обычно 75–350 миллиметров). Различают горнотехнические, исследовательские, строительные и эксплуатационные скважины.

DRYING CYLINDERS = СУШИЛЬНЫЕ БАРАБАНЫ (или ВЫСУШИВАЮЩИЕ ЦИЛИНДРЫ, или СУШИЛЬНЫЕ ЦИЛИНДРЫ) – Drying Cylinders are any of a number of heated revolving cylinders for drying fabric or yarn. They are arranged either vertically or horizontally in sets, with the number varying according to the material to be dried. They are often internally heated with steam and Tefloncoated to prevent sticking. / Тчэфлон (Teflon).

DRYING RICE = СУШКА РИСА – Drying Rice:- to remove or reduce the moisture content of Rice to a safe level (below 14%) for storage, by placing the Rice in the sun or using hot air machines.

DRY–LAID NONWOVENS = УЛОЖЕННЫЕ ПОСУХУ НЕТКАНЫЕ МАТЕРИАЛЫ – Dry-Laid Nonwovens are the nonwoven web made from dry fiber. Usually refers to fabrics from carded webs versus air-laid nonwovens which are formed from random webs.

DRYLAND = БОГАРА (или ЗАСУШЛИВАЯ ЗЕМЛЯ) – Drylands are characterized by a scarcity of water, which affects both natural and managed ecosystems and constrains the production of livestock as well as crops, wood, forage and other plants and affects the delivery of environmental services. For millennia, drylands have been shaped by a combination of low precipitation, droughts and heat waves, as well as human activities such as fire use, livestock grazing, the collection of wood and non-wood forest products (NWFPs), and soil cultivation. Dryland soils tend to be vulnerable to wind and water erosion, subject to intensive mineral weathering, and of low fertility (due to the low content of organic matter in the topsoil). The United Nations Environment Programme (UNEP) defines drylands according to an aridity index (AI), which is the ratio between average annual precipitation and potential evapotranspiration; drylands are lands with an AI of less than 0.65. Drylands are further divided, on the basis of AI, into hyper-arid lands, arid lands, semi-arid lands and dry sub-humid lands. Drylands are found in most of the world's biomes and climatic zones and constitute 41 percent of the global land area. Dryland is:- (1) pertaining to soils rarely or never flooded, or to crops grown in such soils. (2) Land that, except for limited periods, does not hold moisture in the rooting zone in excess of that held at field capacity. Drylands cover more than 40% of the Earth's total land surface and are home to more than 2 billion people. Their biodiversity plays an important role in the global fight against climate change, poverty and desertification. According to the United Nations Convention to Combat Desertification (UNCCD), drylands are defined as:- 'areas where the potential amount of water that is transferred from the land to the atmosphere is at least 1.5 times greater than the mean precipitation:- a calculation known as the Aridity Index. They are defined by water scarcity and characterized by seasonal climatic extremes and unpredictable rainfall patterns'. Despite what many think, drylands contain a great variety of biodiversity. Many species and habitats found in drylands are not present in more humid ecosystems. Their biodiversity is also central to sustainable development and to the livelihoods of their inhabitants, many of whom are poor. For this reason the importance of biodiversity to poverty reduction and economic development may be greater in drylands than in many other ecosystems. Drylands also contribute a number of high-value products of global economic importance, at least 30% of the world's cultivated plants and many livestock breeds originate in drylands. They, therefore constitute an important genetic reservoir that is becoming increasingly valuable for climate change adaptation. In 1994, the UNCCD was created to combat further desertification of land areas, and to protect the environment and develop sustainable land management in drylands. This Convention is the sole legally binding international agreement linking environment and development to sustainable land management. As of today, 61 biosphere reserves (or 9% of the World Network of Biosphere Reserves (WNBR)) include dryland ecosystems. Xxxxx. Drylands are defined by a scarcity of water. Drylands are zones where precipitation is balanced by evaporation from surfaces and transpiration by plants (evapotranspiration). The United Nations Environment Program defines Drylands as tropical and temperate areas with an aridity index of less than 0.65. The drylands can be classified into four sub-types:- dry sub-humid lands, semi-arid lands, arid lands, and hyper-arid lands. Some authorities consider Hyper-arid lands as deserts (United Nations Convention to Combat Desertification (UNCCD)) although a number of the world's deserts include both hyper arid and arid climate zones. The UNCCD excludes hyper-arid zones from its definition of drylands. Drylands cover 41.3% of the earth's land surface, including 15% of Latin America, 66% of Africa, 40% of Asia and 24% of Europe. There is a significantly greater proportion of drylands in developing countries (72%), and the proportion increases with aridity:- almost 100% of all Hyper Arid lands are in the developing world. Nevertheless, the United States, Australia and several countries in Southern Europe also contain significant dryland areas. Drylands are complex, evolving structures whose characteristics and dynamic properties depend on many interrelated links between climate, soil, and vegetation. Biodiversity:- The livelihoods of millions of people in developing countries depend highly on dryland biodiversity to ensure their food security and their well-being. Drylands, unlike more humid biomes, rely mostly on above ground water runoff for redistribution of water, and almost all their water redistribution occurs on the surface. Dryland inhabitants' lifestyle provides global environmental benefits which contribute to halt climate change, such as carbon sequestration and species conservation. Dryland biodiversity is equally of central importance as to ensuring sustainable development, along with providing significant global economic values through the provision of ecosystem services and biodiversity products. The UN Conference on Sustainable Development Rio+20, held in Brazil in June 2012, stressed the intrinsic value of biological diversity and recognized the severity of global biodiversity loss and degradation of ecosystems. / в зоне укоренения в . Под Богарой, от Персидского слова Бехар, означающее Весна, понимаются земли в зоне орошаемого земледелия, на которых сельскохозяйственные культуры возделывают без полива. Урожайность их зависит главным образом от количества и времени выпадения осадков, температуры воздуха и других условий; поэтому на богаре выращивают засухоустойчивые зерновые, кормовые и бахчевые растения. Богарное земледелие имеет большое экономическое значение, так как позволяет использовать неудобные для орошения участки. Распространено главным образом в предгорьях и на окраинах оазисов Афганистана, Ирана, Китая, Индии, Пакистана, Судана, Турции других стран:- на территории бывшего Союза Советских Социалистических Республик (СССР) – в республиках Средней Азии, на Юге Казахстана, и в Закавказье.

DRYLAND COTTON = БОГАРНЫЙ ХЛОПЧАТНИК (или ХЛОПЧАТНИК С НЕОРОШАЕМЫХ ЗЕМЕЛЬ) – The planting date for Dryland Cotton is determined by the availability of soil moisture as this ensures good germination and seedling development. In the case of late rains where planting is delayed, and the crop is only planted after the optimum planting time, a considerable reduction in yield can be expected. Obviously the main consideration for dryland production and a source of variability across regions is rainfall. Regions differ greatly in the average total amount of rainfall as well as the variability between and within seasons. Dryland Cotton is produced with minimal inputs to partially offset the physical risks and production uncertainties. Dryland Cotton yields are often limited by a lack of water. Water can be supplied from rainfall during crop growth or rainfall stored during the fallow. Dryland Cotton production is an expanding industry in Northern New South Wales and Southern Queensland, Australia. Production is expanding from areas where Cotton is high yielding and reliable to marginal areas where yields are low and variable. Dryland Cotton, or Cotton farmed on non-irrigated land. Skip row crops – a common strategy in Dryland Cotton is to miss planting every x number of rows to enable soil water to last longer. Cotton grown using mainly water provided by the natural cycle of rainfall rather than artificial irrigation. In Australia, the soil types used for Dryland Cotton have a high water holding capacity, but rainfall can be unreliable. Thus, a dryland Cotton cultivar needs to withstand extended periods of water stress and then be able to utilize rain when it occurs. See also Raingrown Cotton. / Смотрите также Хлопчатник, Выращенный За Счёт Дождевых Осадков (Raingrown Cotton).

DRYLAND CROP = БОГАРНАЯ СЕЛЬСКОХОЗЯЙСТВЕННАЯ КУЛЬТУРА – Dryland Crop is a crop grown where there is free water drainage of the soil and the crop depends mainly on the rains.

DRYLAND FARMING = БОГАРНОЕ ЗЕМЛЕДЕЛИЕ (или БОГАРНОЕ ФЕРМЕРСТВО) – Dryland Farming is the practice of crop production in low-rainfall areas without irrigation.

DRYLAND PREPARATION = ПОДГОТОВКА БОГАРЫ – Dryland Preparation is a plowing and harrowing the field when the soil is dry or not saturated with water. / Подготовка Богары – вспашка и боронение поля в момент когда почва сухая или не насыщена водой.

DRYLAND RICE = БОГАРНЫЙ РИС – Dryland Rice is a direct-sown Rice grown in a manner similar to Wheat, and which depends on rainfall for moisture.

DRY LUBRICATION = СУХОЕ СМАЗЫВАНИЕ – Dry Lubrication is the situation when moving surfaces have no liquid lubricant between them. See also Lubrication.

DRY MATTER PARTITIONING = ФРАКЦИОНИРОВАНИЕ (или РАЗДЕЛЕНИЕ, или РАСЧЛЕНЕНИЕ) СУХОГО ВЕЩЕСТВА – Dry Matter Partitioning is the distribution of dry matter to various plant organs.

DRY METRIC TONNE UNIT = ЕДИНИЦА СУХОЙ МЕТРИЧЕСКОЙ ТОННЫ – A Dry Metric Tonne (Ton) Unit (dmtu) is the internationally agreed-upon unit of measure for iron ore pricing. It has the same mass value as a metric tonne, but the material has been dried to decrease the moisture level. A dry metric ton unit consists of 1% of iron (Fe) contained in a tonne of ore, excluding moisture. The price per tonne of a certain quantity of iron ore is calculated by multiplying the cents/dmtu price by the percentage of iron content. Iron ore contracts are quoted in US Cents.

DRY NATURAL GAS = СУХОЙ ПРИРОДНЫЙ ГАЗ (или ОСУШЕННЫЙ ПРИРОДНЫЙ ГАЗ) – Dry Natural Gas is a natural gas which remains after:- (i) the liquefiable hydrocarbon portion has been removed from the gas stream, i.e. gas after lease, field, and/or plant separation; and (ii) any volumes of nonhydrocarbon gases have been removed where they occur in sufficient quantity to render the gas unmarketable. In the United States, the parameters for measurement are cubic feet at 60 degrees Fahrenheit and 14.73 pounds per square inch absolute. Also known as Consumer-Grade Natural Gas in the United States. / , то есть .

DRY NATURAL GAS PRODUCTION = ПРОИЗВОДСТВО СУХОГО ПРИРОДНОГО ГАЗА (или ВЫРАБОТКА СУХОГО ПРИРОДНОГО ГАЗА) – Dry Natural Gas Production is the process of producing consumer-grade natural gas. Natural gas withdrawn from reservoirs is reduced by volumes used at the production (lease) site and by processing losses. Volumes used at the production site include (i) the volume returned to reservoirs in cycling, repressuring of oil reservoirs, and conservation operations; and (ii) gas vented and flared. Processing losses include (i) nonhydrocarbon gases (e.g., water vapor, carbon dioxide, helium, hydrogen sulfide, and nitrogen) removed from the gas stream; and (ii) gas converted to liquid form, such as lease condensate and plant liquids. Volumes of dry gas withdrawn from gas storage reservoirs are not considered part of production. Dry natural gas production equals marketed production less extraction loss. / сохранение (conservation). (i) неуглеводородные газы (например, водяной пар, диоксид углерода, гелий, сульфид водорода, и азот).

DRY REEFER = СУХОЙ ИЗОТЕРМИЧЕСКИЙ – Dry Reefer is a reefer container used to carry dry cargo not requiring temperature control. See also Reefer. / Изотермический контейнер, используемый для перевозки сухих грузов, не требующих режима температурного контроля.

DRY SEASON = СУХОЙ СЕЗОН (или ЗАСУХА) – Dry Season is the season when no rain is expected.

DRY SEEDING or DRY = СУХОЙ ВЫСЕВ или ВСУХУЮ – Dry Seeding or Dry (DSR) is a method of rice establishment where rice seeds are broadcast on dry soil (unpuddled). The technique is more popular in upland unbunded areas, where the soils are light-textured and easily drained. It can also be practiced in wetland areas, when the field is prepared at the time of early germinating rain. / Под Посевом понимается заделка семян в верхние слои почвы для их прорастания. Способы:- квадратно-гнездовой, перекрёстный, разбросной, рядовой (ленточный, узкорядный, широкорядный) и другие. Проводится сеялками, иногда с самолёта.

DRY SERVICE CONDITION = СУХОЕ СОСТОЯНИЕ ПРИГОДНОСТИ – Dry Service Condition is a service condition in which the average equilibrium moisture content over a year is 15 percent or less and does not exceed 19 percent. / Состояние пригодности, при котором усреднённое значение устойчивого содержания влаги в течение всего года составляет 15 процентов и менее и не превышает 19 процентов.

DRY SPINNING = СУХОЕ ПРЯДЕНИЕ – There are four types of spinning for polymers- wet spinning, dry spinning, melt spinning, and gel spinning. Dry Spinning:- it is also used for polymers that have to bedissolved in a solvent. However, solidification results from evaporation of the solvent. After dissolving the polymer in a volatile solvent, the solution is pumped through a spinneret. As the fibers emerge from the spinneret, air or inert gas is used to evaporate the solvent which results in solidification of the fibers that can be collected on a take-up wheel. The fibers are stretched which provides for orientation of the polymer chains along the fiber axis. This technique is used only for polymers which cannot be melt spun because of the safety and environmental concerns concerned with solvent handling. Dry spinning may be used for manufacturing acetate fiber, triacetate fiber, acrylic fiber, modacrylic fiber, PBI, spandex fiber, and vinyon. See also Spinning. Dry Spinning is the process in which a solution of the fiber-forming substance is extruded in a continuous stream into a heated chamber to remove the solvent, leaving the solid filament, as in the manufacture of acetate. Dry Spinning:- a derivative to be spun is dissolved in a solvent that can be evaporated, leaving the desired filament to be hardened by drying in warm air.

DRY–SPUN FLAX = СУХО ВЫПРЯДЕННЫЙ ЛЁН – Dry-Spun Flax:- this is a term for spinning flax and mainly is a way of differentiating it from ‘wet-spun flax’. In dry-spun flax, additional water is not added to the surface in spinning. It produces a hairier, less-attractive yarn. / При выработке пряжи из чёсаного льна применяют два способа прядения:- мокрое и сухое. Способ прядения определяет характер вытягивания в вытяжных приборах прядильных машин и их конструкцию. При мокром способе прядения пряжа формируется из элементарных волокон или из небольших их комплексов, а при сухом – из технических волокон. При мокром способе прядения ровница проходит через корыто с горячей водой (45–75 °С), установленное перед вытяжным прибором. Горячая вода способствует размягчению клеящих пектиновых веществ, которыми склеены элементарные волокна льна, и обеспечивает сдвиг элементарных волокон друг относительно друга в вытяжном приборе. Мокрый способ прядения позволяет получать более тонкую, ровную, гладкую пряжу. Сухое прядение применяют для выработки пряжи большой и средней линейной плотности.

DRY SUIT = СУХОЙ КОСТЮМ – Dry Suit is a close-fitting air-insulated waterproof suit for divers.

DRY SUMP = СУХОЙ ПОДДОН (или СУХОЙ ОТСТОЙНИК) – Dry Sump is an engine design in which oil is not retained in a pan beneath the crankshaft thus permitting splash lubrication. There may be a remote sump from which oil is recirculated, or there may be a total loss system.

DRY WEIGHT = СУХОЙ ВЕС – Dry Weight is the weight of any plant part after its water content has been removed by drying.

DS = DAYS AFTER SIGHT

D/S = DOUBLE STACK

DS = DRY SEASON

DSA = DAIRY SCIENCE ASSOCIATION

DSA = DEVELOPMENT SERVICE OF AMERICA

DSC = DEVELOPMENT STUDIES CENTER

DSI = DISEASE SEVERITY INDEX

DSO = DAYS SALES OUTSTANDING

DSR = DEMAND–SIDE RESPONSE

DSR = DIRECT SEEDED RICE

DSRO = DESIGNATED SELF–REGULATORY ORGANIZATION

DSS = DECISION SUPPORT SYSTEM

DSSAT = DECISION SUPPORT SYSTEM FOR AGROTECHNOLOGY TRANSFER

DST = DAYLIGHT SAVING TIME

DST = DOUBLE STACK TRAIN

DST = DRILL STEM TEST

DSU = DRILLING SPACING UNIT

DSU INSURANCE = DELAY IN STARTUP INSURANCE

DTB = DEUTSCHE TERMINBÖRSE

DTC = DEPOSITORY TRANSFER CHECK

DTC = THE DEPOSITORY TRUST COMPANY

DTCC = THE DEPOSITORY TRUST AND CLEARING CORPORATION

DTD = DATED

DTD = DAY–TO–DAY

DTRI = DAIRY TRAINING AND RESEARCH INSTITUTE

DTW PRICE = DEALER TANK WAGON PRICE

DTY = DRAWN TEXTURED YARN

DUAL BANKING SYSTEM = СИСТЕМА ДВОЙСТВЕННОГО БАНКОВСКОГО ОБСЛУЖИВАНИЯ (или ДВОЙСТВЕННАЯ БАНКОВСКАЯ СИСТЕМА) – Dual Banking System is the system of banking that exists in the United States in which state banks and national banks are chartered and supervised at different levels. Under the dual banking system, national banks are chartered and regulated under federal law and standards, and supervised by a federal agency. State banks are chartered and regulated under state laws and standards, which includes supervision by a state supervisor. The dual banking system allows for the co-existance of two different regulatory structures for state and national banks. This translates into differences in how credit is regulated, the legal lending limits and variations of regulations from state to state. Dual Banking System is the banking system under which lending and securities operations must be law be managed by companies legally independent of one another. Common in English-speaking countries (USA:- Glass Steagall Act) and Japan, although legislation is becoming more relaxed. Full-Service Bank.

DUAL CHIP = ДВОЙСТВЕННЫЙ МИКРОПРОЦЕССОР – Dual Chip:- a payment solution in which the banking data (especially authentication credentials) and sometimes also the payment application is located on a bank-issued second chip, independent of the Subscriber Identification Module (SIM). The second chip is semi-permanently installed in the mobile device by the end-user or a service provider.

DUAL CURRENCY BOND = ДВУХВАЛЮТНАЯ ОБЛИГАЦИЯ (или ОБЛИГАЦИЯ В ДВУХ ВАЛЮТАХ) – Dual-Currency Bond is a special type of bond issue where coupon payments are made in one currency, but the principal is redeemed at maturity in another currency. In some cases, issuers or investors can choose whether or not to take advantage of the dual currency option. Dual Currency Bond is a debt instrument in which the coupon and principal payments are made in two different currencies. The currency in which the bond is issued, which is called the Base Currency, will be the currency in which interest payments are made. The principal currency and amount are fixed when the bond is issued. Dual currency bonds are subject to exchange rate risk. If the currency in which the principal will be repaid appreciates, the bondholder will make money; if it depreciates, he or she will lose money. Investors can use dual currency swaps, which have a fixed exchange rate at issuance, to offset the exchange risk of dual currency bonds. Dual-Currency Bond is a bond issue where interest payments are not made in the same currency as the payments of the principal. In Switzerland, this type of issue is limited to foreign bonds. Today issue and interest payments are generally made in CHF (ISO code for Swiss Franc), while payments of principal are made in USD (ISO code for US Dollar). Dual-Currency Bond is a bond that pays a coupon in one currency but is redeemed for a fixed sum in another, often the Dollar. Investors usually get an above-market coupon, but run the risk

that, in this example, the Dollar could fall below the exchange rate used when the amount was fixed. Such bonds are attractive to borrowers who operate in the redemption currency because they have no long-term exchange rate risk.

DUAL CURRENCY DEPOSITS = ДВУХВАЛЮТНЫЕ ДЕПОЗИТЫ (или ДВУХВАЛЮТНЫЕ ВКЛАДЫ) – In banks' accounting, Dual Currency Deposits (DCDs) are fixed-term deposits that are repayable on the maturity date either in the original currency or at a fixed amount in a different currency at the option of the bank. Are Dual Currency Deposits Really Worth It? A chance to earn significantly higher interest rates on your deposits with the only downside being that you might be converted to a currency you could probably use anyway is pretty appealing, particularly given the paltry yields offered on cash these days. That's what dual currency deposits promise. The typical pitch for one of these products emphasizes the chance of earning higher interest rates on low-yielding deposits. Meanwhile, the potential risks (costs) of a possible currency conversion are glossed over with all the ways you could use the converted currency, such as for travel, business or education expenses. As touted on one major bank's website, with dual currency deposits you get:- (i) a higher guaranteed interest rate compared to regular deposits; (ii) a chance to diversify your currency holdings; (iii) a hedge against foreign exchange fluctuations; and (iv) an enhanced rate of return with short-term tenors of typically 3–6 months. It sounds pretty good – you get higher interest rates and there's no real downside. At least that's the marketing pitch. But is it really that simple? What Are Dual Currency Deposits? Dual currency deposits (DCDs) are foreign-currency-linked deposits that allow you to potentially earn more interest than normal-time deposits. In return for the higher interest, you give the bank the right to repay your deposit in either the base (initial) currency or the linked (new) currency at maturity depending on the foreign exchange movements between the currency pair during the deposit holding period. Conversions to the new currency by the bank are done at a predetermined FX rate, not the actual FX rate (spot rate) at the end of the holding period. What you've done in effect is 'sell' a put option to the bank for the additional interest rate (premium) you receive on the DCD compared to what you would receive on a standard-time deposit. This put gives the bank the right to convert you to the new currency at a predetermined FX rate depending on where the exchange rate between the relevant currency pair ends up at the deposit maturity. What most people don't realize is that they swapped the safety of their 'plain vanilla' deposit for the risk of a foreign-exchanged linked derivative product. The payoff they receive depends on whether the exchange rate at the beginning of the deposit finishes above or below the conversion (strike) rate specified in the contract. In effect, they've become short-term currency speculators. Why Would the Bank Want to Do This? Basically, a bank offers dual currency deposits in order to make a profit (as well as for internal hedging purposes). The bank pays you a premium (the increased interest rate) for the put (the right to convert the currency) you sold them. You could have also sold this put in the secondary options market and gotten a higher premium. The bank effectively takes the put option you've sold them and sells it on at a higher price in the secondary options market. The difference is the bank's profit. If used for internal hedging purposes, the DCD is cheaper for the bank than purchasing the put in the secondary options market. The bank's profit could be upwards of 10% of your initial deposit. For those inspired to do it yourself, the trade could easily be replicated at lower cost with a margin FX account with one of the online Forex Trading Platforms. Here's an Example from a Leading Bank's Website:- the bank is offering a 3-month AUD/USD dual currency deposit product. The base (initial) currency is the USD and the linked currency is the AUD. The interest rate (based on the USD amount) is 7% accrued daily based on a 360-day year. The conversion rate (the predetermined FX rate to exchange to the linked currency) is 0.96 (1.00 AUD = 0.96 USD). A 3-month USD time deposit at the same bank is yielding roughly 0.5% annualized. Assume you put USD50 000 on deposit. 7% looks pretty good. That's a 6.5% increase over what you could earn on the 3-month USD time deposit with the same bank. Let's look at the potential scenarios. Scenario 1:- the AUD/USD exchange rate finishes at 0.973 4 above the conversion rate of 0.96. In this case, since the AUD strengthened against the USD relative to the conversion rate, your principal and interest will be repaid in USD. The interest rate calculation would be:- USD50 000 * 7.00% * 90 / 360) = USD 875. It doesn't matter how high the AUD/USD finishes, you only ever receive USD875, which is USD813 over what you would have earned on the standard USD time deposit. Your total proceeds after 3 months are USD50 875. Scenario 2:- in this case, assume the AUD/USD exchange rate finishes at .935 0. The AUD has weakened against the USD and since the ending FX rate is less than the conversion rate of 0.96 agreed to in the contract, you will be converted to the weaker currency, which is the AUD. You still receive the interest rate payment of USD875, but your principal has been converted and returned to you in AUD at the conversion rate of 0.96. The amount you receive is USD50 000 / 0.96 = AUD52 083.33. At current exchange rates (now .935 0), your AUD52 083.33 is worth only USD48 697 (AUD52 083.33 * 0.935 0 = USD48 697.91). Adding back the USD875 in interest received, your net loss is USD428. This doesn't seem so bad, but the bank chose this relatively benign scenario for a reason. In this case, the AUD only weakened by 2.60% relative to the conversion rate, but worse outcomes occur more often than most people realize. Short-term currency movements are extremely volatile and impossible to predict. The daily volatility of the AUD/USD currency pair over the past 3 months has averaged 1.22%. This converts to a volatility of 9.68% over 3 months. What this means roughly is that two-thirds of the time the currency will end up in a range +/– 10% from the starting FX rate over the 3-month deposit period. The other one-third of the time the range will be even wider. Remember the exchange rate only has to weaken by 1.63% relative to the conversion rate (0.96) to wipe out your increased interest earnings. Based on the statistics above, it's clear there is a large chance of experiencing a significant loss. The reason DCDs can be a losing proposition is that even assuming that half the time the rate finishes above the conversion rate and half the time below, you only ever receive USD875, no matter how high the rate goes. Meanwhile, there is no limit to the loss you can bear. It's this asymmetric payoff that makes DCDs a losing bet over the long run. You can 'win' several rounds of deposits, and then have all your gains and more wiped out in just one poor round. Kind of like gambling. Here's What Many People Fail to Understand:- (i) despite retaining the word 'deposit' in the product, you have traded the safety of a deposit for the risk of a derivative product and have effectively become a short-term currency speculator. (ii) The depositor always receives the weaker currency. If your initial currency weakens beyond the pre-determined exchange rate during the deposit period, you won't get converted. If the linked currency weakens, you will be converted to the linked currency. (iii) The exchange rate used to convert the base (initial) currency to the linked (new) currency is not the spot (current) FX rate. The rate used is set in the DCD contract and will always be less than the spot rate. (iv) The depositor takes on asymmetric risk. The upside is limited to the additional interest rate received, while the downside is theoretically unlimited. During the financial crisis, currencies such as the AUD fell as much as 30% against the SGD, leaving AUD/SGD dual currency depositors with substantial losses. (v) Currencies are extremely volatile and impossible to predict, particularly in the short-run, even by Forex professionals. You may 'win' several rounds of deposits, but the asymmetric nature of the bet means that losing even one round can wipe out all previous gains leaving you with a net loss. (vi) Assuming there is no real loss on a conversion to the linked currency since you 'needed the currency anyway' makes no more sense than saying there is no loss when you travel to foreign country and get ripped off at the airport exchanging money. The next time someone offers you a dual currency deposit product, you may want to think twice.

DUAL–FIRING = ДВОЙСТВЕННОГО СЖИГАНИЯ (или СДВОЕННОГО СЖИГАНИЯ или ГОРЕНИЯ) – Dual-Firing:- where two different fuels, e.g., gas and oil, can be used to generate energy in one piece of equipment. / Когда речь идёт о двух различных видах топлива, например, газ и нефть, которые могут быть использованы для генерации энергии в одном блоке оборудования.

DUAL–LINE SYSTEM = СИСТЕМА ДВОЙСТВЕННОЙ ЛИНИИ (или ДВУХЛИНЕЙНАЯ СИСТЕМА) – Dual-Line System:- a positive displacement terminating (oil, or grease) lubrication system that employs two main lines supplied from a pump connected to a 4-way (reverser) valve. Pressure in one main line (while the other is open to tank) causes the measuring piston(s) in the dual-line valve(s) to

stroke in one direction dispensing lubricant to one group of lube points. Switching the 4-way (reverser) valve directs pump flow to the second main line and opens the first main line to tank. This allows pressure to build in the second main line causing the dual-line valve(s) measuring piston(s) to stroke back to their original position dispensing lubricant to a second group of lube points. The system is a parallel type and each dual-line valves operates independently of any other in the system.

DUAL PRICING = ДВОЙСТВЕННОЕ ЦЕНООБРАЗОВАНИЕ – Dual Pricing is the selling of identical products in different markets for different prices. This often reflects dumping practices. / Двойственное Ценообразование:- продажа аналогичных продуктов на разных рынках по разной цене. Это часто отражает демпинговую практику.

DUAL PURPOSE SHIP = СУДНО ДВОЙНОГО НАЗНАЧЕНИЯ (или СУДНО ДЛЯ ДВОЙСТВЕННЫХ ЦЕЛЕЙ) – Dual Purpose Ship is a specially constructed ship able to carry different types of cargoes such as ore and/or oil.

DUAL–RATE SYSTEM = СИСТЕМА ДВОЙСТВЕННЫХ СТАВОК – Dual-Rate System is an international water carrier pricing system in which a shipper signing an exclusive use agreement with the conference pays a rate 10 to 15 percent lower than nonsigning shippers do for an identical shipment.

DUAL SLOT PAYMENT SOLUTION = ОСУЩЕСТВЛЕНИЕ ПЛАТЕЖА ПОСРЕДСТВОМ ДВОЙСТВЕННОГО АВТОМАТА – Dual Slot Payment Solution is a payment solution in which the device is equipped with a card reader in which the customer inserts his/her payment card when paying. In this model, part of the banking application resides in the Subscriber Identification Module (SIM). In the future, the second reader may sometimes be dissociated from the mobile device, and dialogue with it using a wireless protocol, e.g., Bluetooth. / Блутюс (Bluetooth).

DUAL TRADER = ДВОЙСТВЕННЫЙ ТОРГОВЕЦ – Dual Trader is an exchange member who trades for his or her own account as well as executes customer orders. / Член биржи, торгующий как за свой собственный счёт, так и исполняя приказы клиентов.

DUAL TRADING = ДВОЙСТВЕННАЯ (или ДВУХУРОВНЕВАЯ) ТОРГОВЛЯ – Dual Trading occurs when a broker simultaneously executes customer orders and places trades in his or her own account, or one in which he or she has a beneficial interest, on the same trading day. This is also known as acting as both an agent and a dealer at the same time. Dual trading is prevalent in the futures market. Dual trading is a very controversial issue. Proponents say that when brokers are able to trade in their own accounts as well as those of their customers, they contribute to market performance and liquidity because personal broker trades make up a large portion of trading volume. On the other hand, opponents say that banning dual trading would not affect market liquidity, and would eliminate unlawful trading by removing any conflicts of interest. Dual Trading occurs when (i) a floor broker executes customer orders and, on the same day, trades for his own account or an account in which he has an interest; (ii) a Futures Commission Merchant carries customer accounts and also trades, or permits its employees to trade, in accounts in which it has a proprietary interest, also on the same trading day.

DUBAI CRUDE OIL = ДУБАЙСКАЯ НЕФТЬ – Dubai Crude Oil, also known as Fateh, is a light sour crude oil extracted from Dubai. Dubai Crude is used as a benchmark for pricing exports of Persian Gulf sour crude oil to Asia. The other two main global oil price benchmarks are the Brent Crude and West Texas Intermediate (WTI). Middle East crude oil (the average value of Dubai and Oman which acts as the benchmark price of Middle East crude oil) is traded at the Tokyo Commodity Exchange (TOCOM) under ticker symbol 33. Contract size is 50 kl (approximately 314.5 barrels). Price Increment:- JPY 10 per 1 kiloliter (kl). Settlement of contract consists of cash-settled futures transaction. Dubai Crude is a light sour crude oil extracted from Dubai. Dubai Crude is used as a price benchmark or oil marker because it is one of only a few Persian Gulf crude oils available immediately. The other two main oil markers are Brent Crude and West Texas Intermediate (WTI). Dubai Crude is generally used for pricing Persian Gulf crude oil exports to Asia. The Dubai benchmark is also known as Fateh is used in the United Arab Emirates. Forward trade of Dubai Crude is limited to one or two months. Dubai Crude is a light oil. It has a gravity of 31° API (specific gravity of 0.871) and a sulfur content of 2%/weight. / Фатэ (Fateh). ТЧОКОМ (TOCOM).

DUBAI GOLD AND COMMODITIES EXCHANGE = ДУБАЙСКАЯ БИРЖА ЗОЛОТА И СЫРЬЯ – Dubai has historically been an international hub for the physical trade of not only gold, but also many other commodities and so the establishment of the Dubai Gold & Commodities Exchange (DGCX) was the next logical step for the region and the local economy. DGCX commenced trading in November 2005 as the regions first commodity derivatives exchange and has become today, the leading derivatives exchange in the Middle East. DGCX is an initiative of the Dubai Multi Commodities Centre (DMCC), Financial Technologies (India) Limited and the Multi Commodity Exchange of India Limited (MCX). The Management team of DGCX comprises senior personnel from the commodities, securities and financial services industries bringing a wealth of experience and expertise to ensure the success of DGCX. Our range of futures contracts offers participants of the physical commodities markets, such as producers, manufacturers and end users, with a sophisticated means of hedging their price risk exposure. Such price risk management has previously been unavailable to producers in the Middle East. In addition, DGCX offers trading opportunities to financial communities and investment houses in both the Middle East and around the globe who wish to access the growing asset class of commodity and currency derivatives. Benefits of Trading on DGCX:- (i) guaranteed settlement and reduced counterparty risk provided by Dubai Commodities Clearing Corporation (DCCC), a subsidiary 100% owned by DGCX; (ii) the advantage of transacting and clearing business within the UAE and thus the local taxation and regulatory regimes; (iii) a simple fee structure - one fee for all participants. All participants also pay the same margin, whether commercial or non-commercial entities; (iv) an opening to both regional and international liquidity pools; (v) robust risk management and surveillance systems; (vi) uninterrupted trading hours from 07:00 am – 11:30 pm (GMT +4); and (vii) regulated by the Securities & Commodities Authority (SCA). The Dubai Gold and Commodities Exchange (DGCX) commenced trading in 2005. Headquartered in Dubai, UAE. Website:- http://www.dgcx.ae.

DUBAI MERCANTILE EXCHANGE (LIMITED) = ДУБАЙСКАЯ ТОВАРНАЯ БИРЖА (ЛИМИТИД) – The Dubai Mercantile Exchange Ltd (DME), scheduled to open this year (2006), is a dynamic new venture, the first energy futures exchange in the Middle East. The DME is uniquely positioned to provide price transparency and market liquidity for crude oil from the world's foremost oil producing and exporting region. The establishment of a freely traded oil futures market in Dubai will bridge the gap between business hours in the oil trading centers of London and the Far East. The establishment of the DME is also intended to strengthen Dubai's ties with the international finance and commodities trading communities. The DME is a 50/50 joint venture between the New York Mercantile Exchange, Inc. (NYMEX®) and a subsidiary of Dubai Holding is Tatweer Dubai Limited. Dubai Holding is a Dubai-based organization that manages major economic development projects. Their goal is to make Dubai the unsurpassed center of finance, trade, tourism and industry in the region. Dubai Holding currently manages USD20 billion worth of local and international investments across the real estate, media, healthcare and financial sectors. The DME will be located within the Dubai International Financial Centre (DIFC), a financial free zone designed to promote financial services within the UAE. It will be regulated by the Dubai Financial Services Authority, a regulatory body established within the DIFC and modelled after the Financial Services Authority of the United Kingdom. DME cleared by NYMEX®. 2006-April-18:- Dubai Mercantile Exchange Ltd., a venture between the Dubai government and the New York Mercantile

Exchange, Inc. (NYMEX®), said it will offer a Middle East sour crude oil futures contract in the fourth quarter to meet Asian demand. The deliverable contract will be backed by Oman's oil and gas ministry and will build on Dubai and Oman's traditional role providing benchmark pricing for Middle East crude oil, Dubai Mercantile said in a statement e-mailed today. The Financial Times (FT) reports that Oman has agreed to supply crude oil to back the planned launch of the Middle East's first oil futures exchange named the Dubai Mercantile Exchange Ltd. The decision is a significant step forward for the Dubai Mercantile Exchange Ltd. According to the FT, this new exchange gives potential users of its crude contract the option to take physical delivery or settle financially. The new electronic exchange will provide the means to manage price and credit risk in a transparent and open marketplace. The NYMEX®, the world's largest energy market, announced the formation of the Dubai Mercantile Exchange Limited in June and will provide it with clearing and settlement services. It aims to provide Asian sour crude to consumers, such as refiners and airlines, with an alternative to benchmark prices for West Texas Intermediate (WTI) and Brent crude, both of which are sweet crude oils. Headquartered in Dubai, UAE. 2006-May-24:- The Dubai Mercantile Exchange Limited (DME), a joint venture between the New York Mercantile Exchange, Inc. (NYMEX®) and Tatweer, aims to become the premier commodity and energy futures exchange in the Middle East, providing a financially secure, well-regulated and transparent trading environment. Expected to launch in the fourth quarter of 2006, the Exchange will initially develop and trade a Middle East Sour Crude Oil Futures Contract. This will address a growing market need for price discovery of Middle East Sour Crude Oil while simultaneously bridging the time zone gap between Europe and Asia by providing for the trading of energy futures, options and other products. The DME will be a fully electronic exchange. However, in a unique concept, it will also bring together a community of traders that will operate from trading hubs and individual trading stations on the Exchange's floor, which will be located within the Dubai International Financial Centre (DIFC), the region's leading financial services center. The DME will be regulated by the Dubai Financial Services Authority (DFSA), a world class, independent regulator and all trades executed on the Exchange will be cleared through, and guaranteed by, NYMEX's AA+ rated clearinghouse. On 2007-February-20 The Dubai Mercantile Exchange Limited (DME), a joint venture between Tatweer, a member of Dubai Holding, and the New York Mercantile Exchange, Inc. (NYMEX®), announced today that the Middle East's first energy futures exchange will launch officially on 2007-May-01. The Initial three contracts to be traded on the DME will be the physically delivered Oman Crude Oil Futures Contract, and two financially settled contracts, a Brent-Oman spread contract and a WTI-Oman spread contract. Trading of the contracts on DME Direct™ is expected to begin simultaneously across key energy trading centers at the following local times on May 01:- 06:00 Singapore, 02:00 Dubai, 23:00 London time (previous day), and (18:00 New York time previous day). / ДТБ в единственном роде позиционирована для . НАЙМЭКС® (NYMEX®).

DUCHESSE SATIN = ГЕРЦОГИНСКИЙ АТЛАС (или ДЮШЭС САТА) – Duchesse Satin is one of the heaviest and richest looking satins. It is important for such formal clothing as wedding gowns. Duchesse Satin is an 8–12 shaft satin. It is a dress fabric. Very fine yarns are used, particularly in the warp with more ends/inch than picks. The material is string, has a high luster, and texture, and it is firm. Usually 36" wide. Characterized by grainy twill on back. / Под Дюшэс Сата, от Французского словосочетания Duchesse Satin, означающее Атлас Герцогини, понимается . Дюшэс – очень блестящий высококачественный сатин из шёлковых или химических волокон.

DUCK = ТЕХНИЧЕСКАЯ ТКАНЬ (или ПАРУСИНА, или ГРУБОЕ ПОЛОТНО, или БРЕЗЕНТ) – Cotton Duck is a type of textile. It is used in a wide range of industries, and can be used in the manufacture of shoes, slipcovers for furniture, work clothes, sails, bags, and a variety of other things. As a general rule, the fabric is plain but very strong. The classic color is unbleached white, but many manufacturers also dye their duck to meet consumer demand for other colors. It is available by the yard (or meter) at many fabric stores. For those readers visualizing waterfowl made from textiles, the origins of the term are unfortunately more mundane. It comes from a Dutch word, Doek, which means 'Linen Canvas'. The 'Cotton' is added to distinguish it from traditional duck. Cotton duck is, however, involved with the history of duct tape, sometimes called Duck Tape. The original duct tape was in fact made from this fabric, treated with a special adhesive. There are 10 grades of cotton duck, from one, the most heavy, to ten, the most lightweight. The grades refer to the weight and thickness of the material, and are standardized across most of the textile industry. Grades are assigned on the basis of how much a piece of fabric of a specific size weighs. Individual traditional names for each grade are still used by some people, but they do not have specific grades attached. The durability of cotton duck makes it a great choice for situations in which a strong, hardy fabric is needed. Many hard laborers, for example, swear by the quality of garments made with this material, which protect them from the perils of the workplace. Popular brands of shoes are made with it, which also appears on director's chairs, tents, and pillowcases for outdoor furniture. White duck can be bleached if it is soiled, making it an excellent choice for hard wearing environments. Like other textiles made from cotton, duck is relatively easy to care for. In most cases, it can be washed and dried at any temperature. It will become more soft and flexible with time, ultimately breaking down at areas of high stress. Cotton duck also takes dye readily. When used as a garment, the fabric can be stiff and unwieldy at first, but it will settle within a few washings and wearings, and it should start to feel like a second skin. Duck is a tightly woven, heavy, plain-weave, bottom-weight fabric with a hard, durable finish. The fabric is usually made of cotton, and is widely used in men's and women's slacks, and children's play clothes. Duck is a compact, firm, heavy, plain weave fabric with a weigh of 6 to 50 ounces per square yard. Plied yarn duck has plied yarn in both warp and filling. Flat duck has a warp of two single yarns woven as one and a filling of either single or plied yarn. Duck Cloth is a heavy, plain-woven cotton fabric. It is used in a wide range of applications, from sneakers and over tents, to sandbags. There is also linen duck, which is less frequently used. The name Duck covers a wide range of fabrics. It is the most durable fabric made. A closely woven, heavy material, the most important fabrics in this group are known as Army Duck, Flat or Ounce Duck, and Number Duck. Army and number ducks are always of plain weave with medium or heavy ply yarns; army ducks are lighter. Ounce Ducks always have single warp yarns woven in pairs and single or ply filling yarns. See also Army Duck, Canvas, and Number Duck. Duck:- originally, a fabric lighter in weight than canvas. Today, the terms are synonymous. A durable plain-weave, closely woven cotton, generally made of ply yarns, in a variety of weights and thread counts. It is used for uniforms, belts, awnings, tents, and sails. See also Canvas. Duck:- generally made of Cotton; originally made in linen. Also called Canvas. Name originated in XVIII century when canvas sails from Britain bare the trademark symbol – a duck. Very closely woven and heavy, it is the most durable fabric made. There are many kinds of duck but the heavier weighs are called Canvas. It may be unbleached, white, dyed, printed or painted. Washable, many are water-proof and wind proof. Made in various weights. / уточина. Техническая ткань для спецодежды, тентов. Брезент – грубая, плотная, непромокаемая ткань, пропитанная особым составом, применяется при изготовлении непромокаемой одежды.

DUCK EYE = УТИНЫЙ ГЛАЗОК – Duck Eye:- xxxxx. See also Spinning.

DUE DATE = НАДЛЕЖАЩАЯ ДАТА (или ПРИЧИТАЮЩАЯСЯ ДАТА) – (1) Due Date is the date – agreed date between creditor and debtor – on which the beneficiary is credited (credit transfers) or when the debtor is debited (direct debits). An agreed payment date between creditor and debtor. It is also known as Date of Maturity. Some domestic banking payment standards support due date.

(2) Due Date is the date on which a debt (such as a bill of exchange or a bond) becomes payable or when an option expires. Usually, instruments not payable on demand, on sight, or on presentation are allowed three days of grace. If the debtor fails to perform payment by that date, he is said to be in default. Also known as Expiration Date, and Maturity Date.

DUE DILIGENCE = НАДЛЕЖАЩАЯ ОСМОТРИТЕЛЬНОСТЬ (или ПРИЧИТАЮЩАЯСЯ ОСМОТРИТЕЛЬНОСТЬ) – (1) Due Diligence:- this is the process of checking out a company for purposes of making an investment. It involves a thorough check on the people, the technology, the market, and the business opportunity. Think if it like doing some homework and investigating before jumping in. It is a verification and audit type of process. It can be very intense or very superficial, depending on the person interested in making the investment. Some people are content to go on 'gut feeling' whereas others may need to be totally convinced by other parties that a deal is worth investing in. Sometimes this is referred to as 'DueDili'. Detailed analysis, usually conducted by a fiduciary company, of potential takeover candidates as a basis for a purchase decision. Due Diligence:- the process whereby the directors and advisers of a company satisfy themselves that a transaction has been entered into after due and careful enquiry and that all legal and regulatory requirements have been complied with.

(2) Due Diligence refers to a thorough and objective investigation perfomed in the pre-acquisition phase prior to a company acquisition or real estate purchase. Due diligence testing includes a systematic analysis of the strengths and weaknesses of the potential investment, an analysis of risks associated with the purchase, and an in-depth valuation. Due diligence is procedures performed by underwriters in connection with the issuance of the Securities and Exchange Commission (SEC) registration statement. These procedures involve questions concerning the company and its business, products, competitive position, recent financial and other developments, and prospects. Also performed by others in connection with acquisitions and other transactions.

(3) Due Diligence is requirement found in ethical codes that the person governed by the ethical rules exercise professional care in conducting his or her activities.

DUE FROM ACCOUNT = ПРИЧИТАЮЩЕЕСЯ СО СЧЁТА – Due From Account:- general ledger asset account representing funds on deposit at another bank. In international banking, the term Nostro (Due From in Latin) is often used. See also Nostro Account.

DUE TO ACCOUNT = ПРИЧИТАЮЩЕЕСЯ НА СЧЁТ – Due To Account:- general ledger liability account representing funds payable to other banks. In international banking, the term Vostro (Due To in Latin) is often used. See also Vostro Account.

DÜFFEL CLOTH = БАЙКОВОЕ ПОЛОТНО (или ПОЛОТНО ДЮФЭЛЬ) – Düffel Cloth is a thick, heavy, napped coating fabric, usually used for düffel coats, hooded coats with wooden buttons that fasten through rope or leather thongs. Düffel cloth is traditionally tan or green, but can be any color. Düffel is a coarse heavy woolen material with a thick nap. / Немецкое слово Дюфэль (Düffel), означающее Байка.

DÜFFEL COAT = БАЙКОВОЕ ПАЛЬТО (или ПАЛЬТО, или ПИДЖАК, или КИТЕЛЬ) – Düffel Coat is a heavy usually woolen medium-length coat with toggle fasteners and a hood. / .

DULL = ТУСКЛОЕ (или МАТИРОВАННОЕ) – Dull is a term applied to manufactured fibers that have been chemically or physically modified to reduce their normal luster. Matte; opposite of Bright; low in luster. Dull:- a yarn or fiber surface lacking in lustre. / Matte = Мат (Французское слово) или Маска или Каше или Виньетка или Штейн (металлическое).

DUMB BARGE = НЕСАМОХОДНАЯ (или ТИХОХОДНАЯ) БАРЖА – Dumb Barge is a long, large, usually flatbottom vessel used for the transport of freight such as coal, finished steel, iron ore, grain, gravel, etc. It is generally designed with absence of its own means of mechanical propulsion and to be towed or pushed by other craft such as Tug Boat. Dumb Barge is a barge that has no means of propulsion.

DUMBELLS = ГАНТЕЛИ (или НЕМЫЕ КОЛОКОЛА, или ДЮМБЭЛЬ) – Dumbells or Dumb-bells:- a defect frequently seen in wet-formed nonwoven fabrics; an unusually long fiber will become entangled with groups of regular-length fibers at each end, thus producing a dumbbell-shaped clump.

DUMP = СБРАСЫВАТЬ – Dump:- to aggressively sell the market and expect lower prices. Many times the reference is to existing longs that are covering losing or unwanted positions.

DUMPING = ДЕМПИНГ (или БРОСОВЫЙ ЭКСПОРТ) – Dumping is the offer for sale of large quantities of goods in a foreign market at low prices, usually in order to gain market share, while maintaining higher prices in the home market. Dumping may be deemed to have taken place when a product is sold in a foreign market at a price which is less than the cost of production plus a normal profit margin. Dumping occurs when goods are exported at a price less than their normal value, generally meaning they are exported for less than they are sold in the domestic market or third-country markets, or at less than production cost. The sale of a commodity in a foreign market at less than fair value. Dumping is generally recognized as an unfair because the practice can disrupt markets and injure producers of competitive products in an importing country. Article VI of the GATT (short for the General Agreement on Tariffs and Trade) permits (1995) imposition imposition of antidumping duties equal to the difference between the price sought in the importing country and the normal value of the product in the exporting country. With price-price dumping, the foreign producer can use its sales in the high-priced market (usually the home market) to subsidize its sales in the low-priced export market. The price difference is often due to protection in the high-priced market. Price-cost dumping indicates that the foreign supplier has a special advantage. Sustained sales below cost are normally possible only if the sales are somehow subsidized. Attempting to import merchandise into a country at a price less than the fair market value, usually through subsidy by exporting country. Practice of selling products in a foreign market at prices which are lower than those offered domestically to gain a competitive advantage over other foreign suppliers. Dumping is a deliberate act to reduce prices of exports, and is usually practiced by a government, or with its support or encouragement. Goods may also be dumped by a cartel or group of companies, which may take advantage their monopoly position to offset losses on exports by charging higher prices at home. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)). Демпинг или или Бросовый Вывоз или Бросовый Экспорт относится к продаже товаров на внешних рынках по ценам более низким, чем на внутреннем рынке, как правило, ниже издержек производства. Демпинг является одним из средств конкурентной борьбы за внешний рынок. Разновидностью демпинга является валютный демпинг, представляющий собой вывоз (или экспорт) товаров по пониженным ценам из стран с обесцененной валютой в страны с более стабильной валютой.

DUMPING MARGIN = ПРИБЫЛЬНОСТЬ ДЕМПИНГА – Dumping Margin:- the amount by which the imported merchandise is sold in the United States below the home market or third country price or the constructed value (that is, at less than its 'fair value'). For example, if the US 'purchase price' is USD200.00 and the fair value is USD220.00, the dumping margin is USD20.00. This margin is expressed as a percentage of the United States price. In this example, the margin is 10 percent.

DUN = КОРИЧНЕВАТО–СЕРОЕ (или СЕРОВАТО–КОРИЧНЕВОЕ, или БУЛАНОЕ) – Dun:- a variable color averaging a nearly neutral slightly brownish dark gray.

DUNCE CAP = ШЛЯПКА ТУПИЦЫ – Dunce Cap is a conical cap formerly used as a punishment for slow learners at school. Also called Dunce's Cap.

DUNGAREE = ДАНГОРИ – Dungaree:- a heavy coarse durable cotton twill woven from colored yarns, specif. blue denim. Dungaree is a term describing a coarse denim-type fabric, usually dyed blue, that is used for work overalls. Dungaree fabric (used in English since 1605–15, from the Hindi Dungrī) a kind of coarse thick 2/2 twill-weave cotton cloth, often colored blue. The word is possibly derived from Dongri, a dockside village near Mumbai. In British English the term is used for all work clothes made from such fabric, and in American English for durable workmans' trousers, typically bib overalls or as part of the work uniform of soldiers. By 1891 Kipling was using the word to refer to a kind of garment (in the plural) as well as a fabric. As a fabric, it is used largely the same way as jeans cloth, to make sturdy trousers. In many non-Anglophone countries, the two words are interchangeable (British vs. American English). Dungaree is often compared to denim, but the two fabrics are colored in different ways, dungaree traditionally being woven from pre-colored yarn, while denim was made from uncolored yarn and only colored after weaving. Typically only the warp threads are pre-dyed with the traditional coloring agent indigo, the weft threads are left uncolored (white), resulting in the typical medium blue color of the fabric. Otherwise the two fabrics are identical, and dungaree is sometimes termed 'blue denim'. In America, the mill at Shady Lea, North Kingstown, Rhode Island was built in the late 1820s by Esbon Sanford to manufacture a cotton-wool blend twill fabric that visually resembles a cross between burlap and the dungaree fabric of today, called Kentucky Jean. Dungaree:- clothes made usually of blue denim. / Хинди Дангри (Hindi Dungrī). Киплинь (Kipling). Эзбэн Сэнфод (Esbon Sanford). Дангори – термин, описывающий грубую ткань типа дэним, обычно окрашенную в синий цвет, и которая используется для рабочей спецодежды. Пряжей крашеная хлопчатобумажная ткань трёхнитного основонастилочного саржевого переплетения или сатинового основонастилочного переплетения. Используется при пошиве комбинезонов.

DUNGAREES = РОБЫ – Dungarees (maritime term):- blue working overalls. / Синии рабочие одежды.

DUNNAGE = ДЕННАЖ (или ПРОКЛАДОЧНЫЙ И ПОДСТИЛОЧНЫЙ МАТЕРИАЛ) – Dunnage is the material used to protect or support freight in or on cars and vessels, e.g., bracings, false floors, meat racks, sawdust, etc. Material used around cargo to prevent breakage or shifting, normally provided by shipper. Its weight is included in the rating. The main use of Dunnage is to prevent or limit damage to cargo by breakage, chaffing, crushing, as well as to reduce damage from sweat and moisture. The use of sufficient dunnage is one of the principal precautions against damage to cargo. Wood packaging material used to secure or support a commodity but which does not remain associated with the commodity. Dunnage is used to protect the contents of the container, for instance against sweat. A distinction is drawn between top dunnage, side dunnage and floor dunnage. Paper (see paper dunnage), wood, plastic or many other materials can be used as dunnage. A term applied to loose wood or other material used in a ship's hold for the protection of cargo. The material used to protect or support freight in or on railcars or trailers. Stowage material, mainly timber or board, used to prevent damage to cargo during carriage. Materials of various types, often timber or matting, placed among the cargo for separation, and hence protection from damage, for ventilation and, in the case of certain cargoes, to provide space in which the tines of a fork lift truck may be inserted. Dunnage is the material used to protect or support freight in or on trucks. A term Dunnage refers to packing materials such as cardboard, empty pallets, air bags, air pillows, packing peanuts, or other materials utilized to protect freight. / Крепёжная Древесина – древесина, предназначенная для предохранения или крепежа товара, но не остаётся связанной с самим товаром.

DUNNAGE BAG = ДЕННАЖНЫЙ МЕШОК – Dunnage Bags are the flexible air bags constructed of various plies of kraft paper in various sizes. Also made of rubber of various sizes used for in-house movements. Inflated so that movement of cargo is restricted.

DUNNAGE MATERIAL = ДЕННАЖНЫЙ МАТЕРИАЛ – Dunnage Materials are the materials which are not fastened firmly to the means of transport or transport container and are used to protect the goods from sweat, dirt or mechanical stress, for instance, or as an aid in stowage (interlayer dunnage). Depending on its application, it is referred to as Floor Dunnage, Interlayer Dunnage, Lateral Dunnage or Top Dunnage.

DUNS = DATA UNIVERSAL NUMBERING SYSTEM

DUOPOLY = ДУОПОЛИЯ – Duopoly is a situation in which two companies own all or nearly all of the market for a given product or service. A duopoly is the most basic form of oligopoly, a market dominated by a small number of companies. A duopoly can have the same impact on the market as a monopoly if the two players collude on prices or output. Collusion results in consumers paying higher prices than they would in a truly competitive market and is illegal under US antitrust law. Boeing and Airbus have been called a Duopoly for their command of the large passenger airplane market. Similarly, Amazon and Apple have been called a Duopoly for their dominance in the e-book marketplace. A closely related concept is a monopoly, a situation in which a single company dominates the market. The United States Postal Service, which is by law the sole provider of first-class mail services, is an example of a monopoly. Market in which there are only two competing companies. Because competition between duopolists is particularly fierce and destructive, there tends to be some form of implicit or explicit agreement to share the market, e.g., on a regional basis. Duopoly is the market structure in which there are only two sellers of a good. In a duopoly, each producer's strategy must consider the other producer's reaction to changes in price or output. Duopolies are rare in practice, and are used in economic theory to study the behavior of business entities operating in imperfect competition. See also Monopoly, and Oligopoly. / выработка (output). Под Дуополией, от Латинского слова Duo, означающее Два, и Греческого слова Pōléō, означающее Продаю, или Pōlēs, означающее Продавец, понимается рыночная структура отрасли хозяйства в развитых странах, при которой существуют только два поставщика определённого товара и между ними нет монополистических соглашений о ценах, рынках сбыта, квотах производства и так далее. Понятие Дуополия отражает различные формы рыночной организации. Первая форма – рынок, где господствуют две крупные торгово-промышленные компании, между которыми имеется секретное соглашение, обеспечивающее получение максимальной прибыли посредством неэквивалентного обмена. Такое положение типично для начала XX века. Вторая форма – рынок современных отраслей массового производства, на котором также господствуют две компании. Между ними обычно существует молчаливое соглашение о монопольных ценах и ведётся неценовая конкуренция. Третья форма – рынок, на котором имеются два поставщика, но между ними полностью отсутствуют монополистические соглашения. Это возможно в двух ситуациях:- либо как временное состояние рынка в начальный период производства нового товара и 'пробы сил' двух поставщиков, либо как состояние ожесточённой конкуренции при переходе от более простых к более развитым формам монополии. Эта форма используется некоторыми экономистами в апологетических целях для доказательства возможности постоянного отсутствия монополии в условиях высококонцентрированного производства. Большинство же современных экономистов считает дуополию разновидностью монополии (что соответствует действительности). Экономико-математическое исследование дуополии было начато ещё в XIX веке Отуэн Огюста Курно (Antoine Augustin Cournot; 1801–1877), Жозэф Люи Фросуа Бертро (Joseph Louis François Bertrand; 1822–1900) (Франция) и Фрэнсис Исидро Эдьжвос (Francis Ysidro Edgeworth; 1845–1926) (Великобритания). В 1930-х Хайнрихь фон Штакэльбэрг (Heinrich von Stackelberg; 1905–1946) (Германия) дал характеристику определённых видов дуополии, зависящих от поведения дуополистов. Современная теория дуополии сложилась под влиянием теорий монополистической конкуренции Эдвода Хэйстиньза Чэймбэлина (Edward Hastings Chamberlin; 1899–1967) (США), несовершенной конкуренции Дьжоуны Вайэлэтч Робинсэн (Joan Violet Robinson; 1903–1983)

(Великобритания), работ Робэта Тчрифина (Robert Triffin; 1911–1993) (США) и стала учитывать более сложный характер реальных рыночных условий (взаимозависимость между отраслями, сдвиги в предложении и в активах, различия видов дуополии и рыночных институтов, уровень информации о рынке и других).

DUOPSONY = ДУОПСОНИЯ – Duopsony is an economic condition, similar to a duopoly, in which there are only two large buyers for a specific product or service. Members of a duopsony have great influence over sellers and can effectively lower market prices for their supplies. Also known as Buyer's Duopoly. For example, a town only has two operating restaurants. As a result there are only two employment options for waiters and chefs. The restaurant can offer lower wages because the restaurants have less competition for finding employees. The chefs and waiters have no choice but to accept the low pay, unless they choose not to work. This shows that firms that are part of a duopsony have the power not only to lower the cost of supplies, but also to lower the price of labor. Market in which there are only two purchasers of a type of goods or services, but a number of competing suppliers. Market structure characterized by imperfect competition, in which two buyers have exclusive control over demand for a particular product or service.

DUPION = ДЮПЬЁН (или ДВОЙНИК, или ДВОЙНИКОВЫЙ КОКОН) – Dupion (type of silk) has a moderately crisp drape and falls into wide cones. Decorators and designers love its quiet luster, lofty fullness and elegant feel. The Indian Dupion has a particularly luminous quality and a great deal of body. Dupioni is a type of silk fabric. It is similar to shantung, but thicker and more irregular. / от Французского слова Dupion, означающее Кокон Двойник, . Двойниковый Кокон – кокон, завитый двумя или большим числом гусениц.

DUPIONI SILK = ШЁЛК ДЮПЬЁНИ (или ДВОЙНОЙ ШЁЛК, или СДВОЕННЫЙ ШЁЛК, или ШЁЛК ШАНТУНГ) – Sometimes known as Dupion or Douppioni, Silk Dupioni is created with the threads from two different silk worms. When two worms spin their cocoons close together, the fibers get tangled up; these naturally tangled fibers are then used together to make the silk thread. The thread is rougher than regular silk, and contains bumps and irregularities where the fibers from the two cocoons are combined. Silk dupioni takes dye well and is usually easy to sew. Silk dupioni has an advantage over some other types of silks, in that it tends to resist wrinkles, which helps to enhance the usability of the finished fabric. In addition, silk dupioni also has a tendency to take creases very well, which can give the final product a crisp and formal appearance. As an added bonus, the fabric is totally reversible, so it is perfectly acceptable for both sides of the material to be visible. At the same time, silk dupioni does have a couple of drawbacks. The material has almost no stretching ability, which means that using this fabric requires the need to be very exact in the measurements before cutting out any pattern. It is also naturally irregular in texture, and the edges may unravel. Silk dupioni can be used in a number of different fabric creations. In the way of clothing, this fabric works well for flowing jackets, blouses, skirts, dresses, and bridal gowns. For home decorating, silk dupioni can be utilized as drapery panels or other types of window treatments, table runners and cloths, and doilies for accent on tables and sofa backs and arms. While dry-cleaning is generally recommended for silk dupioni, it is possible to hand wash sections of fabric before the material is cut and used in a pattern. When washed by hand, there is the chance of some shrinkage, and the fabric will most likely lose some of the crisp texture and a portion of the shimmering effect. For finished products constructed with silk dupioni, dry cleaning is definitely the best means of freshening the material. Dupioni is a type of silk fabric. It is similar to shantung, but thicker and more irregular. Dupioni Silk is a silk produced from two silkworms that spin a cocoon together, thus making a strong double-thread silk. It has an advantage over some other types of silks because it usually resists wrinkles, which assists in the usability of the finished fabric. It works well for flowing jackets, blouses, skirts, dresses and bridal gowns. For home decorating, it can be used as drapery panels or other types of window treatments, table runners and cloths, doilies for accent on tables and sofa backs and arms. Dupion (from French Doupion, from Italian Doppione = Double) is a cocoon formed jointly by two silkworms. Silk Dupion is the most widely known silk and is made in India. It is a medium weight silk. It has a slub that gives it a textured effect. The degree of texture does vary from color to color. The slubs in Silk Dupion occur when two silk worms spin cocoons close together. There are two types of Silk Dupion, handwoven Silk Dupion, which is more textured, and powerwoven Silk Dupion, which is smoother, although it still has some slub. Many of the colored Dupions are shot – making them ideal for a wide range of uses from brides' and bridesmaids' dresses, ball gowns and other formal wear. Silk Dupion is also ideal for embroidery, patchwork, quilting, mounting lace, gold work, etc. Silk Dupion, the most popular silk in the world. This beautifully textured silk is available in over 300 colors. James Hare's silk dupion is produced in India, renowned for its silk yarn production. / Дюпьён (Dupion) или Допиони (Douppioni), Дюпьёни (Dupioni). раскрой (cutting). Дьжеймз Хэа (James Hare).

DUPLEX FILTER = ДУПЛЕКСНЫЙ ФИЛЬТР (или ДВУХСТОРОННИЙ ФИЛЬТР) – Duplex Filter is an assembly of two filters with valving for selection of either or both filters. See also Filter. / Под Дуплексным, от Латинского слова Duplex, означающее Двойной.

DUPLEX PRINTING = ДУПЛЕКСНОЕ ПЕЧАТАНИЕ (или ДВУХСТОРОННЕЕ ПЕЧАТАНИЕ, или ДВУХСТОРОННЯЯ НАБИВКА) – Duplex Printing is a method of printing a pattern on the face and the back of a fabric with equal clarity. See also Printing. Duplex Printing is a method of printing the same design on both sides of the fabric to give the design additional definition and clarity of color. Also called Register Printing. / Под Дуплексным Печатанием, от Латинского слова Duplex, означающее Двойной, .

DUPLICATE BILL OF LADING = КОНОСАМЕНТ ДУБЛИКАТ (или ДУБЛИКАТНЫЙ КОНОСАМЕНТ, или ДУБЛИКАТ КОНОСАМЕНТА) – Duplicate Bill Of Lading is a second set of original B/L documents issued to replace lost or damaged original set. 'Original', 'Duplicate', 'Triplicate', etc, or similar expressions are all originals. Bills of lading need not be marked 'original' to be acceptable as an original bill of lading. Duplicate Bill Of Lading is another original Bill of Lading set if first set is lost. Also known as Reissued Bill of Lading. / Под Дубликатом, от Латинского слова Duplicatus, означающее Удвоенный, понимается второй экземпляр какого-либо документа, полностью соответствующий (идентичный) подлиннику.

DUPLICATE GENES = ДУБЛИКАТНЫЕ ГЕНЫ (или ГЕНЫ ДУБЛИКАТЫ) – Duplicate Genes are two independent genes that produce the same phenotypic effect when present individually or when present together. / , от Латинского слова Duplicatus, означающее Удвоенный, .

DUPLICATE SAMPLES = ДУБЛИКАТНЫЕ ОБРАЗЦЫ (или ОБРАЗЦЫ ДУБЛИКАТЫ) – Duplicate Samples are collected samples from different sources which belong to the same variety as indicated by name, site of collection or origin, and morpho-agronomic characters. / свойства (characters) .

DUPLICATION = ДУПЛИКАЦИЯ (или УДВОЕНИЕ) – Duplication is occurrence of a segment of a chromosome twice in the haploid set. / Под Дупликацией, от Латинского слова Duplicatio, означающее Удвоение, понимается тип хромосомной перестройки (мутации), заключающейся в удвоении какого-либо участка хромосомы. Под Дупликацией понимается изменение хромосомы, при котором один из её участков линейно представлен два и более раз. Дупликация возникает при разрыве и обмене участками хромосом и при неравном кроссинговере. Дупликации играют большую роль в возникновении новых генов.

DURABILITY = ДОЛГОВЕЧНОСТЬ (или ДОБРОТНОСТЬ) – Durability (Stability) is the ability of a material to retain its physical or chemical properties after exposure for a specified time under defined conditions such as heat, chemical agents, light or other environmental processes. Durability is the ability of a fabric to resist wear through continual use. Durability is a relative term for the

resistance of a material to loss of physical properties or appearance as a result of wear or dynamic operation. / Долговечность материала; прочность в носке; продолжительность срока службы; прочность во времени.

DURABLE FINISH = НЕСМЫВАЕМЫЙ АППРЕТ (или ДОЛГОВЕЧНАЯ ОТДЕЛКА) – Durable Finish is a rather loose term for a finish added to fabric as one of the final steps to improve the 'wearability' of the fabric.

DURABLE GOODS ORDERS = ЗАКАЗЫ НА ТОВАРЫ ДЛИТЕЛЬНОГО ПОЛЬЗОВАНИЯ – Durable Goods Orders is an economic indicator released monthly by the Bureau of Census that reflects new orders placed with domestic manufacturers for delivery of factory hard goods (durable goods) in the near term or future. Durable goods orders come in two releases per month:- the advance report on durable goods and the manufacturers' shipments, inventories and orders. Because investment prices react to economic growth, it is important for investors to be able to recognize trends in the growth of the economy. Orders for factory hard goods can provide information on how busy factories may be in the future. Orders placed in current months may provide work in factories for many months to come as they work to fill the orders. In the United States, Durable Goods Orders reflect the new orders placed with domestic manufacturers for immediate and future delivery of factory hard goods. Background:- the Advance Report on Durable Goods Manufacturer's Shipments, Inventories and Orders, or the Durable Goods Report, provides data on new orders received from more than 4 000 manufacturers of durable goods, which are generally defined as higher-priced capital goods orders with a useful life of three years or more, such as cars, semiconductor equipment and turbines. More than 85 industries are represented in the sample, which covers the entire United States. Figures are provided in current Dollars along with percentage change from prior month and prior year for new orders, total shipments, total unfilled orders (orders that have been booked but not filled as of month-end) and inventories. Revisions are also included for the prior three months if they materially affect prior-released results. The data compiled for consumer durable goods is one of the 10 components of the Conference Board's US Leading Index, as growth at this level has typically occurred in advance of general economic expansion. What it Means for Investors:- the headline figure will often leave out transportation and defense orders, as they can show higher volatility than the rest of the areas. In these industries, the ticket prices are sufficiently high that the sample error alone could swing the presented figure significantly. It is useful for investors not only in the nominal terms of order levels, but as a sign of business demand as a whole. Capital goods represent the higher-cost capital upgrades a company can make, and signals confidence in business conditions, which could lead to increased sales further up the supply chain and gains in hours worked and non-farm payrolls. Investors can play with the numbers here and look at things such as the rates of growth of inventories versus shipments; changes in the inventory/shipments ratio over time can point to either demand (falling ratio) or supply (rising ratio) imbalances in the economy. Because capital goods take longer on average to manufacture than cyclical goods, new orders are often used by investors to gauge the likelihood of sales and earnings increases by the companies who make them. For instance, a company like Boeing could make revenue adjustments on the upside based on strong new order growth, signs of which could be gleaned from the Durable Goods Report. In addition, when production and capacity at US manufacturers is rising, it helps to combat inflationary pressure, as more goods will be produced for consumer purchase. Investors should be cautious to see through the high levels of volatility found in areas of the Durable Goods Report. Month-to-month changes should be compared with year-over-year figures and year-to-date estimates, looking for the overall trends that tend to define the business cycle. Strengths:- (i) good industry breakdowns; (ii) data provided raw and with seasonal adjustments; and (iii) provides forward-looking data such as inventory levels and new business, which count toward future earnings. Weaknesses:- (i) the survey sample does not carry a statistical standard deviation to measure error; and (ii) highly volatile; moving averages should be used to identify long-term trends. The Closing Line:- the Durable Goods Report gives more insight into the supply chain than most indicators, and can be especially useful in helping investors get a feel for earnings potential in the most represented industries:- machinery, technology manufacturing and transportation. Release Date:- on or around the 20th of the month (advance release; revised release about six weeks after period end with Factory Orders). Release Time:- 08:30 am Eastern Standard Time. Coverage:- previous month. Released By US Census Bureau. Latest Release:- http://www.census.gov/indicator/www/m3/adv/. Durable Goods Orders are a measure of the new orders placed with domestic manufacturers for immediate and future delivery of factory hardgoods. Durable Goods Orders are a major indicator of manufacturing sector trends because most industrial production is done to order. / Боин (Boeing).

DURABLE MERCHANDISE = ТОВАРЫ ДЛИТЕЛЬНОГО ПОЛЬЗОВАНИЯ – Durable Merchandise:- goods that have a relatively lengthy life (television sets, radios, etc).

DURABLE PRESS = ДЛИТЕЛЬНОЕ (или ПРОЧНОЕ, или ВЫНОСЛИВОЕ) ПРЕССОВАНИЕ – Durable Press:- performance characteristics of treated textile products, mostly apparel. These features generally involve easy care:- shape retention, machine washability, tumble-dry, little or no ironing, and the like. Often referred to as Permanent Press, or Wash And Wear. Durable Press is a treatment applied to the fabric in the finishing process in which it maintains a smooth attractive appearance, resists wrinkling, and retains creases or pleats during laundering. Durable Press is a term describing a garment that has been treated so that it retains its smooth appearance, shape, and creases or pleats in laundering. In such garments no ironing is required, particularly if the garment is tumble-dried. Durable press finishing is accomplished by several methods; two of the most common are the following:- (1) a fabric that contains a thermoplastic fiber and cotton or rayon may be treated with a special resin that, when cured, imparts the permanent shape to the cotton or rayon component of the fabric. The resin-treated fabric may be precured (cured in finishing and subsequently pressed in garment form at a higher temperature to achieve the permanent shape) or postcured (not cured until the finished garment has been sewn and pressed into shape). In both cases, the thermoplastic fiber in the garment is set in the final heat treatment. This fiber, when heat-set, also contributes to the permanence of the garment shape, but the thermoplastic component of the blend is needed for strength since the cotton or rayon component is somewhat degraded by the durable-press treatment. (2) Garments of a fabric containing a sufficient amount of a thermoplastic fiber, such as polyester, nylon, or acrylic, may be pressed with sufficient pressure and time to achieve a permanent garment shape. See also Ease-Of-Care, Permanent Finish, and Wash-And-Wear. / Найлан (Nylon).

DURABLE RESISTANCE = ДЛИТЕЛЬНАЯ УСТОЙЧИВОСТЬ (или ВЫНОСЛИВАЯ УСТОЙЧИВОСТЬ) – Durable Resistance is any resistance which remains effective in a cultivar that is widely grown for a long period of time in an environment favorable to disease or insect pests. This definition emphasizes the need to observe what happens to crops when they are widely grown over a period of crop seasons.

DURABLES = DURABLE GOODS

DURABLES = ТОВАРЫ ДЛИТЕЛЬНОГО ПОЛЬЗОВАНИЯ – Durables is a category of consumer goods, durables are products that do not have to be purchased frequently. Some examples of durables are appliances, home and office furnishings, lawn and garden equipment, consumer electronics, toy makers, small tool manufacturers, sporting goods, photographic equipment, and jewelry. Also known as Durable Goods. Consumer goods are often classified as durables or non-durables. Durables are the stuff you buy to last, like a TV or a freezer. / , газонное и садовое оборудование, .

DURABLE WATER REPELLENT = ДОЛГОВЕЧНЫЙ ВОДНЫЙ РЕПЕЛЛЕНТ – Durable Water Repellent (DWR):- fabrics that retain their durability and their ability to repel water after wearing, washing, and cleaning. Typically involves a fabric with a coating.

DURATION = ДЛИТЕЛЬНОСТЬ (или ПРОДОЛЖИТЕЛЬНОСТЬ, или ДЮРАЦИЯ) – (1) Duration is a measure of the sensitivity of the price (the value of principal) of a fixed-income investment to a change in interest rates. Duration is expressed as a number of years. Rising interest rates mean falling bond prices, while declining interest rates mean rising bond prices. The duration number is a complicated calculation involving present value, yield, coupon, final maturity and call features. Fortunately for investors, this indicator is a standard data point provided in the presentation of comprehensive bond and bond mutual fund information. The bigger the duration number, the greater the interest-rate risk or reward for bond prices. It is a common misconception among non-professional investors that bonds and bond funds are risk free. They are not. Investors need to be aware of two main risks that can affect a bond's investment value:- credit risk (default) and interest rate risk (rate fluctuations). The duration indicator addresses the latter issue. Duration is the time that elapses from the date a debenture is issued until it is repaid. Duration is the average life of the present values of all future cashflows from a bond. For a given maturity, the higher the coupon, the more it (rather than the redemption payment) contributes to yield. So the higher the coupon, the shorter the duration. Although the duration of a bond increases monotonically as the maturity increases, it is non-linear (except for zero-coupon bonds), because the coupon payments are increasingly important to the yield. Duration usually refers to what technically should be described as modified duration. This measures the effect on a bond's price of a unit change in yield. So if a bond has a duration of two, a yield change of 1% will produce a price change of 2% in the other direction. The higher the modified duration, the more sensitive the bond is to interest rate changes. A measure of a bond's price sensitivity to changes in interest rates. Also known as Life, Maturity, and Term. For bonds or fixed-income assets, Duration means the average capital lockup. Duration is shorter than the residual life owing to the interest payments made on the invested capital. Only in case of zero bonds is duration equal to the residual life. It also serves as a measure for the sensitivity of the bond price to changes in market interest rates. Generally speaking, it can be said that the higher the duration, the higher the bond's interest sensitivity. Duration:- late XIV century, from Old French Duration, from Medieval Latin Durationem (nominative duratio), noun of action from past participle stem of Latin Durare 'Harden'. Old legalese phrase for the duration popularized 1916 in reference to British enlistments in World War I. / Длительность – мера чувствительности цены (стоимости принципала) вложения с фиксированным доходом от изменения процентных ставок. Длительность выражается в числе лет. Растущие процентные ставки означают падающие цены на облигации, в то время как снижающиеся процентные ставки означают растущие цены на облигации. Число длительности представляет собой сложный расчёт, включающий текущую стоимость, доходность, купон, окончательное погашение и особенности покупки. К счастью для вкладчиков, этот индикатор является стандартной точкой данных, обеспеченной при представлении исчерпывающей информации по облигациям и взаимным фондам облигаций. Чем больше число длительности, тем выше риск от процентной ставки или награда за цены облигаций. Среди непрофессиональных вкладчиков распространено заблуждение, что облигации и фонды облигаций свободны от рисков. Они в этом не правы. Вкладчикам нужно знать о двух основных рисках, которые могут воздействовать на стоимость вложений в облигации:- кредитный риск (дифолт) и риск в отношении процентных ставок (колебаний ставок). Индикатор длительность нацелен на последнюю проблему. Длительность – это время, которое проходит от даты выпуска долгового обязательства до его уплаты. Длительность – средняя жизнь настоящих стоимостей всех будущих денежных потоков по облигации. Для данного погашения (или зрелости), чем выше купон, тем больше он (а не оплата выкупа) способствует доходности. Таким образом, чем выше купон, тем короче длительность. Хотя длительность облигации монотонно увеличивается с увеличением погашения (или зрелости), она является нелинейной (за исключением бескупонных облигаций), поскольку выплаты по купонам становятся важными во всё возрастающем объёме для самой доходности. Длительность обычно относится к тому, что с технической точки зрения должно быть описано как изменённая длительность. Это измеряет влияние на цену облигации изменение единицы доходности. Так, если облигация имеет длительность два, изменение доходности в 1% приведёт к изменению цены на 2% в другом направлении. Чем выше модифицированная длительность, тем облигация более чувствительна к изменениям процентной ставки. Длительность – мера чувствительности цены облигации к изменениям процентных ставок. Известна также как Жизнь (Life), Погашение или Зрелость (Maturity), и Срок (Term). Для облигаций или активов с фиксированным доходом, Длительность означает среднее ограничение на капитал. Длительность короче, нежели остаточная жизнь, причитающаяся платежам процентов, произведённых на вложенный капитал. Только в случае с облигациями зеро длительность равняется остаточной жизни. Она также служит мерой чувствительности цены облигации к изменениям рыночных процентных ставок. В целом можно сказать, что чем выше длительность, тем выше чувствительность процентов облигации. Происхождение слова Дюрация в Английском языка:- в конце XIV века от староФранцузского слова Duration, от средневекового Латинского слова Durationem (именительный падеж Duratio), означающее Продолжительность, существительное о действии от основы – причастия прошедшего времени – Латинского слова Durare, Длиться (Harden). Старая юридическая фраза для длительности, популяризованной в 1916 в отношении Британской вербовки новобранцев на Первую Мировую Войну. Длительность:- продолжительность, протяжённость во времени, например, длительность рабочего дня. Дюрация – средневзвешенный срок до погашения актива (портфеля активов). Рассчитывается как взвешенная сумма сроков до будущих выплат по активу (портфелю активов), где в качестве весов используются доли приведённой к текущему моменту времени стоимости соответствующих выплат к общей приведённой стоимости актива (портфеля активов). Дюрация – средневзвешенная продолжительность платежей (денежных потоков по облигации), где в качестве весов выступают текущие стоимости этих денежных потоков. Дюрация служит для измерения процентного риска по облигации (чувствительности стоимости облигации к изменению процентных ставок).

(2) Duration is the time for which a loan or credit is granted. / Длительность – срок, на который был предоставлен займ или кредит.

DURUM WHEAT = ПШЕНИЦА ДУРУМ – In the United States, Durum Wheat is all Varieties of white (amber) Durum Wheat. This class is divided into the following three subclasses:- (i) Hard Amber Durum Wheat is Durum Wheat with 75 percent or more of hard and vitreous kernels of amber color; (ii) Amber Durum Wheat is Durum Wheat with 60 percent or more but less than 75 percent of hard and vitreous kernels of amber color; and (iii) Durum Wheat is Durum Wheat with less than 60 percent of hard and vitreous kernels of amber color. Durum Wheat, the hardest of all US Wheats, is seeded in the spring and contains a high amount of protein (1 216%), which is good for pasta products macaroni, spaghetti, and other noodles. Durum Wheat is grown mainly in North Dakota and has subclasses such as Hard Amber Durum, Amber Durum, and Durum Wheats. Total acreage is about 3.2 million acres. / В Соединённых Штатах Америки Пшеница Дурум подразумевает все Разновидности белой () . твёрдой и стекловидной зерновки .

DUST = ДУСТ – Dust is a powderlike formulation which may consist of (i) only toxic agents, such as sulfur, (ii) toxic agents plus an active diluent which serves as a carrier, or (iii) toxic agent plus an inert diluent which may be in the form of talc or clay.

DUST = ПЫЛЬ – (1) Dust or Fiber Dust:- non-specific terms. Can cover many types of fibrous and non fibrous species, including contaminants, usually present as mixtures of particulate matter. Recommended specific terms for airborne fibrous material are fiber fly, particulates from fibers, respirable fiber-shaped particulates (RFP). / Пыль, аэрозоль с твёрдыми частицами дисперсной фазы размером преимущественно 10^{-4}–10^{-1} миллиметров. Пыли бывают различного происхождения:- биологическая, вулканическая, космическая, производственная и другие. Некоторые виды производственной пыли взрыво- и пожароопасны,

загрязняют окружающую среду, вызывают профессиональные заболевания. Борьба с образованием пылей и их улавливание – важная техническая и санитарногигиеническая проблема.

(2) In tea industry, Dust is a fine powder, much finer than fannings, made of tea particles left over from producing higher grades of tea. Tea made by pulverizing larger pieces of leaf or the tea plant, such as Matcha, is not classified as dust. See also Fannings. / Смотрите также Высевки (Fannings).

DUST CAPACITY = ПЫЛЕЁМКОСТЬ – Dust Capacity:- the weight of a specified artificial contaminant which must be added to the influent to produce a given differential pressure across a filter at specified conditions. Used as an indication of relative service life.

DUST CLEANER = ОЧИСТИТЕЛЬ–ОБЕСПЫЛЕВАТЕЛЬ – Dust Cleaner or dust remover is a purposely-designed unit for the removal of line and micro dust found in cotton material, the unique design of new modern dust removers ensures unsurpassed cleaning efficiencies are achieved. Effective de-dusting of the material is paramount to running efficiencies in down stream machines (chute feed lines) specifically in rotor spinning applications. A good de-dusting also leads to considerably higher efficiencies (fewer yarn breaks) in the winding room, knitting and weaving mills. The Crosrol Rotary Dust Remover (CDR) is a purposely-designed unit for the removal of fine and micro dust found in cotton material, the unique design of the Crosrol rotary dust remover ensures unsurpassed cleaning efficiencies are achieved. Effective de-dusting of the material is paramount to running efficiencies in down stream machines specifically in rotor spinning applications. A good de-dusting also leads to considerably higher efficiencies (fewer yarn breaks) in the winding room, knitting and weaving mills. With the unique design of the Crosrol rotary dust remover, not only are positive pressures used to de-dust the material but also significantly high negative pressures are applied so as to obtain the ultimate in de-dusting. At the heart of the Crosrol dust removal unit is the rotating perforated disc. The tufts of fiber are blown on to the upper sector of the rotating disc's surface under positive pressure. To the rear of the disc a negative pressure is applied which holds the material on to the disc assisting in the removal of the fine dust particles. Apart from opening cleaning of rawmaterial, dedusting is the very important process in blowroom process. Normally dedusting starts with precleaning. Dedusting keeps the atmospheric air clean. Stationary dedusting condensers can be used for this purpose. It is always better to feed the material through condenser for a feeding machine of cards. Because condenser continuously removes the dust from a small quantity of fibers and the material fed to the feeding machine is opened to some extent. Cleaning system for removing dust from textile machine. Cotton dust is defined as dust present in the air during the handling or processing of cotton, which may contain a mixture of many substances including ground up plant matter, fiber, Bacteria, Fungi, soil, pesticides, non cotton plant matter and other contaminants which may have accumulated with the cotton during the growing, harvesting and subsequent processing or storage periods. Any dust present during the handling and processing of cotton through the weaving or knitting of fabrics, and dust present in other operations or manufacturing processes using raw or waste cotton fibers and cotton fiber byproducts from textile mills are considered cotton dust within this definition. In spinning process. Apart from opening cleaning of rawmaterial, dedusting is the very important process in blowroom process. Normally dedusting starts with precleaning. It is always better to have a separate machine like DUSTEX of Trutzschler for effecive dedusting. Dedusting keeps the atmospheric air clean. Dedusting in machines like Unimix, ERM of Rieter is good. Stationary dedusting condensers can be used for this purpose. In exhausts of unimix, condensers, ERM etc, positive pressure of 100 Pascal should be maintained. Exhaust fan speed and volume should be accordingly selected. DUSTEX should be installed before feeding to the cards, because better the fiber opening better the dedusting. Fine openers like ERM, CVT cleaners also help in dedusting. It is always better to feed the material through condenser for a feeding machine of cards. Because condenser continuously removes the dust from a small quantity of fibers and the material fed to the feeding machine is opened to some extent. Since material is not opened well in Unimix, the dedusting may not be very effective, eventhough dedusting concept in Unimix is very good. For rotor spinning dedusting is very important. It is better to use a machine like DUSTEX after the fine opener. / В прядильном производстве. Кросрол (Crosrol). Дастэкс (или Дустэкс (DUSTEX)) от Трутцшля (Trützschler). Анимикс (или Унимикс (Unimix)), Э.Эр.Эм. (ERM) от Рита (Rieter). Очиститель предназначен для разрыхления и очистки хлопковых волокон в свободном состоянии. В зависимости от степени интенсивности этот агрегат может начать вредное воздействие на материал. При взаимодействии рабочих органов и клочка волокна могут разрываться, могут образовываться жгутики и завитки волокон, размельчаться примеси, невыделенные из волокна. Конденсер. Пылеуловитель или Пылеотделитель, устройство для удаления (отделения) пыли и других механических примесей из воздушных и газовых потоков. Применяется в системах вытяжной вентиляции и в промышленных установках для очистки газов. Основные виды:- акустические, гравитационные, диффузионно-конденсационные, инерционные, электрические пылеуловители, пылеуловители-промыватели и другие.

DUSTER = ПЫЛЬНИК (или ТРЯПКА, или ЩЁТКА) – Duster is a lightweight overgarment to protect clothing from dust; a dress-length housecoat.

DUSTING = ОБЕСПЫЛИВАНИЕ (или ПЫЛЕВЫКОЛАЧИВАНИЕ) – Dusting is the second step in commercial wool processing (after sorting). The purpose is to remove as much dirt and sand as is possible before scouring.

DUSTING = ОПЫЛИВАНИЕ (или ОПУДРИВАНИЕ) – Dusting is the process of applying insecticide or pesticide in dust formulation. / Под Опыливанием понимается нанесение порошкообразных ядохимикатов (пестицидов) на растения или почву с помощью опыливателей (специальных машин); один из способов химической обработки для борьбы с вредителями, болезнями и сорняками сельскохозяйственных и древесно-кустарниковых растений.

DUSTING OF FINISHED GOODS = ЗАПЫЛЕНИЕ ГОТОВЫХ ИЗДЕЛИЙ – Dusting Of Finished Goods:- Fabric:- cotton-and-rayon dress goods; Construction:- (i) Count:- 60 x 56; (ii) Warp:- 30/1 combed cotton; (iii) Filling:- 24/1 70^ I 1 i-in. 1%-den. bright viscose rayon 30% IV-in. 60's Aralac; Finish:- light-blue-ground print. Defect:- converter claimed that the fabric 'dusted' excessively when the goods were being inspected on the examining machine, or even when they were shaken. Analysis:- chemical and microscopical analysis of the 'dust' accumulated from the spreader bars of the examining machine showed it to be composed chiefly of small bits of Aralac fiber. In processing fabrics containing Aralac (a casein-base fiber, production of which has been discontinued), it is essential that precautions be taken to avoid strongly alkaline solutions and to finish the goods on the slightly acid side. In this particular case, the dyer was inexperienced in handling fabrics containing such fiber and apparently subjected the goods to strong alkaline treatment, particularly because of the cotton warp, with the result that the Aralac fiber was left in an extremely brittle state. Any rough handling or rubbing of the fabric broke off small particles of the brittle fiber, causing the 'dusting'. When Aralac was eventually put into greater use and dyeing and finishing techniques were improved, this defect was overcome almost entirely. / Уточина:- 24/1 . Аралак (Aralac) – торговое название казеинового волокна.

DUST MARKS = ОТМЕТИНЫ ОТ ПЫЛИ – Dust Marks:- any type of fiber deposit on fabric. Finishing defect. / Порок или дефект заключительной отделки.

DUST–RESISTANT = ПЫЛЕНЕПРОНИЦАЕМОЕ (или ПЫЛЕСТОЙКОЕ, или ПЫЛЕПРОЧНОЕ, или ПЫЛЕСОПРОТИВЛЯЮЩЕЕСЯ) – Dust-Resistant is a term applied to a fabric that has been tightly woven so that it resists dust penetration.

DUTCH AUCTION = ГОЛЛАНДСКИЙ АУКЦИОН – A Dutch Auction is a type of auction where the auctioneer begins with a high asking price which is lowered until some participant is willing to accept the auctioneer's price, or a predetermined reserve price (the seller's minimum acceptable price) is reached. The winning participant pays the last announced price. This is also known as a Clock Auction or an open-outcry descending-price auction. This type of auction is convenient when it is important to auction goods quickly, since a sale never requires more than one bid. Theoretically, the bidding strategy and results of this auction are equivalent to those in a sealed first-price auction. The Dutch auction is named for its use in the Dutch Tulip Craze. In a Dutch auction, a seller offers up an item for bid at a very high price. The initial price is much higher than the item's value usually and no seller expects to get that price for the item. Because bidders must know the amount of the bids, bids are not sealed as they are in some types of auctions. The price is lowered in increments until a bidder chooses to accept the current price. He pays that price for the item as the winner. For example, if a business is auctioning off a used company car, the bidding may start at USD15 000. The bidders will wait as the price is lowered to USD14 000 to USD13 000 to USD12 000 to USD11 000 and to USD10 000. When the bidding reaches USD10 000, Bidder A decides to accept that price and, because he is the first bidder to do so, is considered the winner and has to pay USD10 000 for the automobile. One of the only problems with Dutch auctions has nothing to do with the auction logic itself but with a common area of confusion. The financial world and some third-party auction sites use the term 'Dutch Auction' when they refer to second price auctions. In truth, there is a huge difference between the two types of auctions. Second-price auctions are auctions in which the winners pays either the price of the lowest winning bidder or the price of the highest losing bidder. The confusion in the terms can be problematic for individuals interested in getting involved in either type of auction, so it is important to clarify which type of logic will be used before participating. Depending on what individuals have to sell and how much money they hope to earn as a result of a successful auction, Dutch auctions can be an ideal alternative to more traditionally used approaches. The descending-price structure of these auctions increases competition among bidders and makes acting fast a necessity. A second item auction can be confused with a Dutch auction or a second price auction, especially in finance. In a second item auction the seller offers two or more of an identical item for auction, so that there may be more than one winning bidder. Each bidder can bid on all of the items or only a fraction of them, and publicly indicates the price that he/she is willing to pay for each item. However, all winning bidders need to pay only the lowest qualifying (successful) bid. If there are more successful bids than items available, priority goes to the bidders who submitted their bids first. In order to beat another bidder, a bid must simply have a higher total bid price per item than the other bids, regardless on the number of items that are being bid on. Here is an example of how this might work:- (i) The seller lists a second price auction with 5 identical items:- (a) Bidder 'A' placed a bid for 2 items at USD20 each; and (b) Bidder 'B' placed a bid for 4 items at USD21 each. (ii) The outcome of this auction would be:- (a) Bidder 'B' wins 4 items at USD20 each; and (b) Bidder 'A' wins 1 item at USD20 each. The USD20 price is because the lowest successful bid was USD20 (hence the 'second price'). The total items were awarded based upon Bidder B's willingness to bid a higher Dollar amount than Bidder A. Since Bidder 'A' was only awarded '1' item, and his original bid was for '2' items, he has the right to refuse the purchase of that partial order. So, as a winning bidder, you have the right to refuse paying if you are only awarded a partial number of the items you were bidding on. The United States Department of the Treasury, through the Federal Reserve Bank of New York (FRBNY), raises funds for the US Government using a Dutch auction. The FRBNY interacts with primary dealers, including large banks and broker-dealers who submit bids on behalf of themselves and their clients using the Trading Room Automated Processing System ('TRAPS'), and are generally told of winning bids within fifteen minutes. For example, suppose the sponsor of the issuance is seeking to raise USD10 billion in ten-year notes with a 5.125% coupon and in aggregate the bids are as follows:- (i) USD1.00 billion at 5.115%; (ii) USD2.50 billion at 5.120%; (iii) USD3.50 billion at 5.125%; (iv) USD4.50 billion at 5.130%; (v) USD3.75 billion at 5.135%; (vi) USD2.75 billion at 5.140%; and (vii) USD1.50 billion at 5.145%. In this example the % at high is 66.66%, meaning only USD3 billion of the USD4.5 billion at 5.130% will get bonds. Bids will be filled from the lowest yield (highest price) until the entire USD10 billion has been raised. This auction will clear at a yield of 5.130%, and all bidders will pay the same amount. In theory, this feature of the Dutch auction format leads to more aggressive bidding as those who in this case bid 5.115% will receive the bonds at the higher yield (lower price) of 5.130%. A variation on the Dutch auction, OpenIPO, was used on the IPO for Google stock. SRECTrade.com uses a two-sided Dutch auction to trade Solar Renewable Energy Credits (SRECs). The introduction of the Dutch auction share repurchase in 1981 allows firms an alternative to the fixed price tender offer when executing a tender offer share repurchase. The first firm to utilize the Dutch auction was Todd Shipyards. A Dutch auction offer specifies a price range within which the shares will ultimately be purchased. Shareholders are invited to tender their stock, if they desire, at any price within the stated range. The firm then compiles these responses, creating a supply curve for the stock. The purchase price is the lowest price that allows the firm to buy the number of shares sought in the offer, and the firm pays that price to all investors who tendered at or below that price. If the number of shares tendered exceeds the number sought, then the company purchases less than all shares tendered at or below the purchase price on a pro rata basis to all who tendered at or below the purchase price. If too few shares are tendered, then the firm either cancels the offer (provided it had been made conditional on a minimum acceptance), or it buys back all tendered shares at the maximum price. Dutch Auction is an auction of a debt instrument (such as a Treasury Note) in which all successful bidders receive the same yield (the lowest yield that results in the sale of the entire amount to be issued). Dutch Auction is:- (1) a public offering auction structure in which the price of the offering is set after taking in all bids and determining the highest price at which the total offering can be sold. In this type of auction, investors place a bid for the amount they are willing to buy in terms of quantity and price. If a company is using a Dutch auction IPO (short for an initial public offering), potential investors enter their bids for the number of shares they want to purchase as well as the price they are willing to pay. For example, an investor may place a bid for 100 shares at USD100 while another investor offers USD95 for 500 shares. Once all the bids are submitted, the allotted placement is assigned to the bidders from the highest bids down, until all of the allotted shares are assigned. However, the price that each bidder pays is based on the lowest price of all the allotted bidders, or essentially the last successful bid. Therefore, even if you bid USD100 for your 1 000 shares, if the last successful bid is USD80, you will only have to pay USD80 for your 1 000 shares. The US Treasury (and other countries) uses a Dutch auction to sell securities. The Dutch auction also provides an alternative bidding process to IPO pricing. When Google launched its public offering, it relied on a Dutch auction to earn a fair price. (2) A type of auction in which the price on an item is lowered until it gets a bid. The first bid made is the winning bid and results in a sale, assuming that the price is above the reserve price. This is in contrast to typical options, where the price rises as bidders compete. For example, the auctioneer starts at USD2 000 for an object. If there are no bidders, the price is lowered by USD100. The object will be sold once a bidder accepts the last price announced by the auctioneer, say USD1 500. Type of auction in which the seller begins by proposing a high price and gradually begins to lower it until someone agrees to buy. A Dutch Auction is an auction where the bidders all end up paying the same price. In the context of an initial public offering (IPO), investors place orders for the number of shares they want, and at what price. The final price is the one at which there are enough investors willing to buy all the shares in the offering. Investors who bid at or above the 'clearing price' receive shares at that price, even if they'd bid higher; lower bids go unfilled. By contrast, traditional IPOs rely on an underwriter to buy the shares from the firm and allocate them to investors at the underwriter's discretion. Typically, this first round of investors tends to be hedge funds,

institutions and customers of affiliated brokerages. Why is it 'Dutch'? It isn't, actually. Academics call it a 'uniform price auction', which is about as sexy as a 'uniform price date'. The name refers to how flower auctions were run in the Netherlands. Is a Dutch auction really better than the traditional way? Some people think so. Fans of auctions say they are more democratic, because price is the only thing that determines who gets shares. A bid by Fidelity for 1 million shares would go unfilled if it fell below the clearing price; a retired teacher's bid for 100 shares would be accepted if it was above that price. Auctions are also seen as serving issuers' interests, because they award the shares to the highest bidders. Some venture capitalists and Chief Executive Officers (CEOs) have complained that the first-day jump in price for a typical IPO, the 'pop', is a sign that the company could have gotten more for its shares. Then why don't people do them more often? Defenders of the traditional process say the underwriter provides a valuable service – namely, soliciting investors for the IPO. Most IPOs are for small companies that few people have heard of; Facebook Inc.'s offering is the exception, rather than the rule. The price pop, and the traditional allocation process, can encourage investors and underwriters. / Гугэл (Google). Тод Щипъядз (Todd Shipyards). Аукцион, от Латинского слова Auctio, означающее Продажа С Публичного Торга, способ продажи некоторых товаров, например, пушнины, при котором товар (или образцы его) предварительно выставляют для осмотра. Наиболее распространён во внешней торговле. В форме аукциона производится принудительная продажа имущества неплатёжеспособных должников.

DUTY = ПОШЛИНА – Duty is a tax imposed on imports, exports and manufactured goods by a public or a customs authority of a country. Duties are generally based on the value of the goods (ad valorem duties), some other factors such as weight or quantity (specific duties), or a combination of value and other factors (compound duties). Ad Valorem Duty means an assessed amount at a certain percentage rate on the monetary value of an import. Duty Drawback means a recovery in whole or in part of duty paid on imported merchandise at the time of exportation, in the same or different form. Specific Duty means an assessment on the weight or quantity of an article without preference to its monetary value or market price. Also known as Tariff. Duties can be expressed in different ways. An Ad Valorem Tariff is a duty paid as a percentage of the import price when the good crosses the border. So, if a certain type of cheese had in the European Union (EU) an ad valorem tariff of 10%, and buyer imported EUR100.00 worth, he would have to pay a EUR10.00 import tax on it. Specific duties on the other hand are a fixed amount paid per physical unit, i.e. kilos, liters, % of alcohol content, etc. For certain types of cheese imported by the EU for processing for example, the specific tariff that has to be paid is EUR10.00 per 100 kg. Specific tariffs, together with those where specific and ad valorem duties are mixed are widely used, mainly by developed countries, but they cannot be directly compared, or summed up, or averaged as is the case for ad valorem tariffs. / , то есть . вывоз (exportation). Пошлина, денежный сбор, взимаемый государственными органами с физических и юридических лиц, за определённые виды услуг. Наиболее распространены гербовая, наследственная, почтовая, регистрационная и судебная пошлины. С провозимых через государственную границу товаров взыскиваются таможенные пошлины, позразделяемые на ввозные (или привозные или импортные), вывозные (или экспортные) и транзитные.

DUTY DRAWBACK = ВОЗВРАТ ПОШЛИНЫ – Duty Drawback is a payment returned for cargoes re-exported or trade show material returned. A Customs refund on re-exported cargo. Duty Drawback is a refund of duty paid on imported merchandise when it is exported later, whether in the same or a different form.

DUTY–FREE ZONE = БЕСПОШЛИННАЯ ЗОНА – Duty-Free Zone is an area where goods or cargo can be stored without paying import customs duties while awaiting manufacturing or future transport. / Зона, где товары или груз могут быть размещены без оплаты ввозных (или импортных) пошлин в ожидании переработки или последующего транспорта.

DUTY OF ASSURED CLAUSE = ОГОВОРКА ОБ ОБЯЗАННОСТЯХ СТРАХОВАТЕЛЯ – (1) Duty Of Assured Clause:- this appears in the Institute Cargo Clauses published for use with the MAR form of policy. It directs the attention of the Assured, his agents, etc to the duty (as required by the Marine Insurance Act (MIA) 1906) to take reasonable measures to avert or minimize any loss which is recoverable under the policy; also to ensure that all rights against carriers and others are properly preserved and exercised. Underwriters agree to reimburse the Assured for any reasonable expenditure incurred by his compliance with the clause; in practice, these expenses are termed 'sue and labor' charges. See also Sue And Labor Clause.

(2) Duty Of Assured Clause:- this appears in the Institute hull clauses published for use with the MAR form of policy. It directs the attention of the assured, etc to the duty (required by the Marine Insurance Act (MIA) 1906) to avert or minimize any loss which is recoverable under the policy and provides that underwriters will pay sue and labor charges incurred in compliance with the clause. The clause incorporates a 'waiver clause' and provisions regarding the application of underinsurance to sue & labor claims.

DUTY OF DISCLOSURE = ОБЯЗАННОСТЬ РАСКРЫТИЯ СУЩНОСТИ – Duty Of Disclosure is the duty of every person seeking insurance or reinsurance to inform the insurer/reinsurer from whom a quotation for insurance/reinsurance is sought of every material fact. The duty arises when seeking new insurance/reinsurance, when seeking a variation of cover (but only as regards a change in risk where the carrier is the same as before) and at renewal (but only as regards a change in risk where the carrier is the same as before). The scope of the duty may be modified by the terms of a proposal form. Should a person seeking insurance/reinsurance fail to disclose a material fact then this may lead to the avoidance of the relevant insurance or reinsurance by the underwriter. The consequences of non-disclosure may be modified by the terms of the relevant insurance/reinsurance. Duty Of Disclosure is an obligation placed on someone taking out insurance, to inform insurers of anything that could influence either their judgment on whether the risk is acceptable, or the terms to be offered. A common law duty on the part of a proposer for insurance to disclose to the insurer all material facts, viz., all facts that would influence a prudent insurer in deciding whether to grant the insurance and, if so, on what terms.

DUTY RATE = СТАВКА ПОШЛИНЫ – Duty Rate:- tax imposed by the US Customs on imported merchandise. There are three basic types:- (i) ad valorem – based on the entered value; (ii) specific – an amount per unit of quantity; and (iii) compound – combination of ad valorem and specific rates.

DUVETYN(E) = ДЮВЕАЙН (или ДЮВЭЙН, или ДЮВЭН, или БАРХАТООБРАЗНАЯ ТКАНЬ) – Duvetyn(e):- good quality wool. If made in cotton, is usually called Suede Cloth. Close weave, brushed, singed, and sheared to conceal the weave. Has a smooth plush appearance resembleing a compact velvet. Similar to wool broadcloth but heavier and thicker. Has a good draping quality, soft and wears well if looked after. Spots easily and care must be taken when handling it. Back is often slightly napped also. Name derived from the French word 'Duvet' meaning 'Down'. Used a great deal in the millinery trade. Duvetyn is a smooth lustrous velvety fabric. Duvetyne (also known as Molton and Rokel) is a twill fabric with a velvet-like nap on one side. It may be woven from cotton, wool, or – in rare cases, mainly in the early XX century – silk. Duvetyne has a matte finish and its high opacity makes it ideal for blocking light. Although it is most commonly used in the motion picture industry, early sources list duvetyne as a common fabric for dresses, suits, and coats. By the 1930s, however, it was widely noted for its use in constructing theatrical cycloramas and theater curtains. In modern times, fire-retardant black duvetyne is commonly used for curtains, for scenery, and to control light spill. Many commercial lighting flags are made from duvetyne. When used in film applications, especially in the eastern United States, duvetyne is also known as 'Commando Cloth'. In the first season of the original Star Trek television series, the exterior shots of 'space' were created by

gluing glitter onto black duvetyne. / Пятна . Дювэйн (в СК) или Дювэн (в США) (Duvetyn) Дювеайн (Duvetyne). Дюве (Duvet). Молтчэн (Molton) и Рокэл (Rokel). Комэндоу (Commando). Стар Трэк (Star Trek).

DV METHOD = DIMINISHING VALUE METHOD

DVC = DELIVERY VERIFICATION CERTIFICATE

DVP = DELIVERY VERSUS PAYMENT

DW = DRESSED WEIGHT

DW = DRY WEIGHT

DWARF DISEASE = КАРЛИКОВОСТЬ (или КАРЛИКОВАЯ БОЛЕЗНЬ, или БОЛЕЗНЬ КАРЛИКОВОСТИ, или БОЛЕЗНЬ НИЗКОРОСЛОСТИ) – Dwarf Disease is a disease caused by Rice dwarf virus (RDV). The disease is transmitted by leafhoppers and is characterized by pronounced stunting, reduced tillering, and irregular chlorotic specks on leaves and leaf sheaths. These specks may fuse to form broken streaks that run parallel to leaf veins. Rice dwarf disease occurs in Japan, China, Nepal, and Korea. / жилкам листьев. / Под Карликовостью понимается то же, что и Нанизм (от Греческого слова Nános, означающее Карлик) – ненормально низкий рост человека (для мужчин ниже 130 сантиметров, для женщин ниже 120 сантиметров), обусловленный обычно поражением желёз внутренней секреции.

DWARFING GENES = ГЕНЫ КАРЛИКОВОСТИ (или ГЕНЫ НИЗКОРОСЛОСТИ) – Dwarfing Genes are genes that make plants short in stature. The genes controlling the dwarf height in a plant variety.

DWARF VARIETY = КАРЛИКОВАЯ РАЗНОВИДНОСТЬ (или КОРОТКОСТЕБЕЛЬНАЯ РАЗНОВИДНОСТЬ) – Dwarf Variety is a Rice variety that is short in stature (with a plant height of 85 ± 5 cm).

DWAT = DEADWEIGHT

DWELL TIME = ВРЕМЯ ВЫДЕРЖКИ (или ВРЕМЯ ПРЕБЫВАНИЯ) – Dwell Time is the time during a process in which a particular substance remains in one location, e.g., the time during which molten polymer remains in a spinning pack.

DWELL TIME = СРОК НАХОЖДЕНИЯ (или ВРЕМЯ ПРЕБЫВАНИЯ) – Dwell Time is the length of time cargo remains in port before being loaded onto a ship or collected for domestic distribution.

DWP = DISSOLVING WOOD PULP

DWR = DEEPWATER RICE

DWS = DIRECT WET SEEDBED

DWSR = DIRECT WET SEEDED RICE

DWT = DEADWEIGHT

DYE = КРАСИТЕЛЬ – In textile terms, Dye is a soluble colorant that attaches in molecular form to the fibers, as opposed to a pigment, which exists as much large particles that are attached to the fiber with a binder. Dyes get classified by the application technique used, and by their chemical structure. A class of dye based on chemical structure may have members in several different application classes. See also Acid Dye, Azoic Dye, Basic Dye, Direct Dye, Disperse Dye, Dyes, Reactive Dye, Sulfur Dye, and Vat Dye. All commercial dyes are organic chemicals. Dyes are used for coloring the fabrics. Dyes are molecules which absorb and reflect light at specific wavelengths to give human eyes the sense of color. There are two major types of dyes – natural and synthetic dyes. The natural dyes are extracted from natural substances such as plants, animals, or minerals. Synthetic dyes are made in a laboratory. Chemicals are synthesized for making synthetic dyes. Some of the synthetic dyes contain metals too.

DYEABILITY = ОКРАШИВАЕМОСТЬ (или ПРИГОДНОСТЬ К КРАШЕНИЮ) – Dyeability is the capacity of fibers to accept dyes.

DYE ACTIVATOR = АКТИВАТОР КРАСИТЕЛЯ – Dye Activator is one dye seller's name for an alkali intended for use with reactive dyes; believed to be pure soda ash. This term is somewhat misleading:- in the case of most reactive dyes on cellulosic fibers, it is the fiber, not the dye, that is 'activated' (an exception to this is vinyl sulfone dyes). Dye Activator is the recommended pure alkali powder for use with all reactive dyes on cotton and cellulose fibers. Also used to scour fabric along with Synthrapol. / Щёлочь (Alkali). винилсульфоновый краситель (vinyl sulfone dye).

DYE BATH = КРАСИЛЬНАЯ БАНЯ (или КРАСИЛЬНАЯ ВАННА) – Dye Bath:- the solution (usually water) containing the dyes, dyeing assistants and any other ingredients necessary for dyeing.

DYE BOX or BECK (WINCH) = КРАСИЛЬНЫЙ ЯЩИК или ЧАН (БАРКА) – Dye Box or Beck (Winch) is a dyeing machine in which fabric is processed in strand or 'rope' form and which consists essentially of a large, open vat through which the cloth passes repeatedly while traveling over a large reel mounted above the vat. Dye boxes may also be of the totally enclosed type.

DYED IN THE WOOL = ШЕРСТЬЮ КРАШЕНЫЙ (ТОВАР) – Dyed In The Wool:- fabrics or yarns where the fibers were dyed prior to processing.

DYED TO MATCH = ОКРАШЕННОЕ ДЛЯ ПОДБОРА – Dyed To Match (DTM):- for example, on a spec sheet it may indicate that the buttons are DTM buttons. This means the buttons are to be dyed to match the ground color of the garment (or dyed to match another color of the garment as specified).

DYE FLECK = КРАСИЛЬНАЯ КРАПИНКА – Dye Fleck is:- (1) an imperfection in fabric caused by residual undissolved dye. (2) A defect caused by small sections of undrawn thermoplastic yarn that dye deeper that the drawn yarn.

DYE INDEX = УКАЗАТЕЛЬ ПО КРАСИТЕЛЯМ – Dye Index is an expression commonly used in the rayon industry to rate relative dyestuff absorption or dyeing rate of rayon yarns. For example, a fiber or yarn which dyes more rapidly or absorbs more dyestuff than another yarn in the same dye bath is said to have a higher 'dye index'.

DYEING = КРАШЕНИЕ – Dyeing is a method for coloring a textile material in which a dye is applied to the substrate in a uniform manner to obtain an even shade with a performance and fastness appropriate to its final use. A dyestuff is a molecule which contains a chromophoric group (conjugated system) capable of interacting with light, thus giving the impression of color. Textile dyeing involves the use of a number of different chemicals and auxiliaries to assist the dyeing process. Some of them are process-specific, while others are also used in other operations. Some auxiliaries (e.g., dispersing agents) are already contained in the dyestuff formulation, but more commonly auxiliary agents are added at a later stage to the dye liquor. Since auxiliaries in general do not remain on the substrate after

dyeing, they are ultimately found in the emissions. Various dyeing techniques exist:- (i) mass dyeing/gel dyeing, in which a dye is incorporated in the synthetic fiber during its production (this technique is the most commonly applied process for PP fibers and is of interest also for PAC, but will not be described in this document); (ii) pigment dyeing, in which an insoluble pigment, without affinity for the fiber, is deposited onto the textile substrate and then fixed with a binder; and (iii) dyeing processes which involve the diffusion of a dissolved or at least partially dissolved dye into the fiber. This last group of processes is the one that will be discussed in more detail in the following sections. From a molecular point of view, four different steps are involved:- (1) first, the dye, previously dissolved or dispersed in the dye liquor, diffuses from the liquor to the substrate; (2) the second step consists in the accumulation of the dye on the surface of the textile material. This process is controlled by the affinity (substantivity) of the colorant for the fiber; (3) the dye diffuses/migrates into the interior of the fiber until this is uniformly dyed. This step is much slower than the transport of the dissolved dye within the dye bath. The penetration of the dye into the fiber requires that the fiber itself is accessible. In the case of hydrophilic fibers the dye penetrates through the available micro-pores, while in hydrophobic fibers, whose molecular structure does not allow a continuous water phase, cavities need to be developed in order to make the penetration of the dye possible. In general, access to the fiber is enhanced by temperature. Hydrophobic fibers can only be penetrated by the dye above the glass transition temperature, which sometimes lies above 100 °C. During the diffusion into the micro-pores an electrostatic barrier, which develops on the surface of the fiber, still has to be overcome. In some cases large amounts of salt have to be added to the dyeing bath in order to reduce the electrostatic forces on the surface of the fiber and promote an even penetration of the dye; (4) the dye must be anchored (fixation) to suitable places within the substrate. Different mechanisms of fixation are known, ranging from chemical reaction of the dye with the fiber to form a covalent bond (reactive dyes) to formation of Van der Waals and other short range forces between the fiber and the dye (direct dyes). An important role is also played by hydrogen bonding responsible for long-, medium-, short-distance interactions between fiber and dyestuff, dyestuff to dyestuff, water to fiber and water to soluble substances present in the liquor, such as surfactants. Textiles can be colored at any of several stages of the manufacturing process so that the following coloring processes are possible:- (i) flock or stock dyeing; (ii) top dyeing:- fibers are shaped in lightly twisted roving before dyeing; (iii) tow dyeing:- it consists in dyeing the mono-filament material (called Tow) produced during the manufacture of synthetic fibers; (iv) yarn dyeing; (v) piece (e.g., woven, knitted and tufted cloths) dyeing; and (vi) ready-made goods (finished garments, carpet rugs, bathroom-sets, etc). Dyeing can be carried out in batch or in continuous/semi-continuous mode. The choice between the two processes depends on the type of make-up, the chosen class of dye, the equipment available and the cost involved. Both continuous and discontinuous dyeing involve the following steps:- (i) preparation of the dye; (ii) dyeing; (iii) fixation; and (iv) washing and drying. Dyeing of the yarn into solid colors before weaving or knitting. Dyeing is a method which imparts beauty to the textile by applying various colors and their shades on to a fabric. Dyeing can be done at any stage of the manufacturing of textile- fiber, yarn, fabric or a finished textile product including garments and apparels. The property of color fastness depends upon two factors- selection of proper dye according to the textile material to be dyed and selection of the method for dyeing the fiber, yarn or fabric. Dyeing Methods:- color is applied to fabric by different methods and at different stages of the textile manufacturing process. (i) Beck Dyeing; (ii) Garment Dyeing; (iii) Jet Dyeing; (iv) Jig Dyeing; (v) Package Dyeing; (vi) Pad Dyeing:- a form of dyeing whereby a dye solution is applied by means of a pad or mangle; (vii) Piece Dyeing; (viii) Pressure Dyeing:- the dyeing by means of forced circulation of dye through packages of fiber, yarn, or fabric under pressure; (ix) Skein (Hank) Dyeing:- the dyeing of yarn, fiber, or fabric in the form of skeins, or hanks; (x) Solution Pigmenting or Dope Dyeing; (xi) Space Dyeing; (xi) Stock Dyeing; (xiii) Top Dyeing; (xiv) Warp-Beam Dyeing; and (xv) Yarn Dyeing- the dyeing of yarn before the fabric is woven or knit. Dyeing is the process of applying a comparatively permanent color to fiber, yarn or fabric by immersing in a bath of dye. Dyeing is a process of coloring fibers, yarns, or fabrics with either natural or synthetic dyes. Some of the major dyeing processes are described below:- batik, chain dyeing, cross dyeing, high-temperature dyeing, ingrain, jet dyeing, mass-colored, muff dyeing, package dyeing, pad dyeing, piece dyeing, pressure dyeing, printing, reserve dyeing, short-liquor dyeing, skein dyeing, solution dyeing, solvent dyeing, space dyeing, spun-dyed, stock dyeing, thermal fixation, union dyeing, and yarn dyeing. Dyeing of the fabric into solid colors after weaving or knitting. / непрерывное крашение (continuous dyeing). Крашение – придание текстилю, коже, бумаге, пластмассам и другим материалам окраски, обладающей достаточной для практических целей устойчивостью к действию света, водным и мыльным обработкам, трению и тому подобному. В отличие от крашения, нанесение на специально подготовленную поверхность слоя жидкого лакокрасочного материала, образующего после высыхания сплошную твёрдую плёнку, называют окраской. Крашение известно с глубокой древности, особенно широкое распространение получило в связи с развитием крупного мануфактурного производства. Большое значение для развития крашения имел синтез (во 2-й половине XIX века) органических красителей, почти полностью вытеснивших дорогостоящие и менее прочные природные. Методы крашения определяются свойствами красителей и окрашиваемого материала. Для крашения бумаги (подцветки бумажной массы и крашения готовой бумаги) применяют минеральные пигменты (ультрамарин, охра и другие) и красители (основные, кислотные, прямые, сернистые, кубовые). О способах крашения этими красителями смотрите ниже. Для крашения готовой бумаги её погружают в раствор красителя (чаще кислотного) или наносят на её поверхность тонкий слой минеральных веществ (бланфикса и других) с клеящими и красящими веществами. Глубинное крашение кожи (краснодублёной, хромовой, лайки, замши) осуществляют протравными, кислотными, основными, прямыми красителями и специальными красителями для кожи. Для покрывного крашения кожи пользуются главным образом пигментами в сочетании со связующими и плёнкообразователями (казеином, нитроцеллюлозой и другими). Для крашения меха применяют окислительные, кубовые, кислотные, протравные красители и специальные красители для меха. Методы крашения пластмасс определяются технологией получения и свойствами этих материалов. Для крашения полимеризационных термопластов красители вводят в мономер до полимеризации или же в готовый полимер перед литьём и прессованием. Для получения прозрачных окрашенных продуктов применяют термостойкие жирорастворимые и основные красители. Окрашивание происходит в результате растворения этих красителей в массе полимера. Непрозрачные окрашенные продукты получаются при использовании красителей с наполнителями или нерастворимых в пластмассе пигментов. Для окрашивания конденсационных термореактивных пластмасс (фенопластов, аминопластов) красители с наполнителями и пигменты вводят при изготовлении пресс-порошков. Для крашения волокнистых материалов готовят так называемую красильную ванну, в состав которой входят краситель, вспомогательные вещества и вода. Процесс крашения заключается в самопроизвольном переходе красителя из красильной ванны в волокно до установления равновесия. Скорость достижения равновесия, а значит, и скорость крашения в целом определяются коэффициентом диффузии красителя в волокне. Этот коэффициент в тысячи и сотни тысяч раз меньше, чем коэффициент диффузии в водной среде. Увеличить скорость диффузии красителей в волокне, а следовательно, и скорость крашения можно тремя путями:- повышением температуры, введением в красильную ванну некоторых типов гидрофильных органических растворителей, созданием условий, способствующих набуханию волокна. Все эти направления широко используются для интенсификации крашения. Волокна и изделия из них красят в аппаратах периодического и непрерывного действия. Наибольшее распространение получили последние, так как они обеспечивают высокую производительность труда и оборудования. Крашение называют гладким, если материал красят сплошь в один цвет, и узорчатым или печатным, если он окрашен в несколько цветов. (1) Крашение Прямыми Красителями:- прямые красители хорошо растворимы в воде, причём в растворах наряду с анионами красящих веществ присутствуют и их агрегаты большей

или меньшей величины. К красителям этого типа относятся азокрасители. Их используют главным образом для крашения целлюлозных волокон, а также шёлка, шерсти и полиамидных волокон. Красящее вещество на волокне удерживается ван-дер-ваальсовыми силами и, по-видимому, благодаря образованию водородных связей. В зависимости от желаемой интенсивности окраски расход красителей составляет 1–4% от массы волокна. В красильную ванну вводят до 20% (от массы материала) поваренной соли или сульфата натрия для увеличения выбираемости красителя из ванны и повышения интенсивности окраски. Оптимальная температура в случае применения периодического крашения 70–90 °С. По непрерывному способу крашения окрашиваемый материал пропитывают при температуре 90–95 °С раствором красителя с концентрацией 1–20 г/л, запаривают в запарной камере при 102 °С в течение 60–90 секунд (для интенсификации проникновения красителя в волокно) и промывают. Для лучшего прокрашивания волокон и повышения равномерности окраски в красильную ванну необходимо добавлять органические растворители типа этаноламинов, так называемые выравниватели (10 г/л). Окраска прямыми красителями не обладает достаточно высокой прочностью, поэтому её упрочняют с помощью специальных препаратов. (2) Крашение Активными (Реактивными) Красителями:- активные красители используют для крашения целлюлозных, белковых и полиамидных волокон. Крашение состоит из двух стадий:- пропитки волокнистого материала раствором красителя и фиксации его в щелочной среде. На этой последней стадии краситель реагирует с волокном и образует с ним новое окрашенное соединение, например:- часть красителя (до 30%) взаимодействует с водой. Гидролизованный водой краситель необходимо полностью удалить из волокна при промывке, иначе резко снизятся показатели прочности окраски к мокрым обработкам. Крашение активными красителями проводят периодическим, полунепрерывным и непрерывным способами. Наиболее распространён однованный плюсовочно-запарной способ, при котором после пропитки окрашиваемого материала раствором красителя в присутствии бикарбоната натрия проводят (с промежуточной сушкой или без неё) запаривание волокна при температуре 100–103 °С, после чего окрашенное волокно промывают и высушивают. (3) Крашение Кубовыми и Сернистыми Красителями:- (i) кубовые красители нерастворимы в воде и поэтому для крашения их предварительно восстанавливают в щелочной среде гидросульфитом натрия, в результате чего получаются растворимые натриевые соли лейкосоединений, поглощаемые целлюлозными волокнами из водных растворов. Окислением кислородом воздуха или другими окислителями лейкосоединения переводят в исходные нерастворимые красители, которые прочно удерживаются в порах волокна. К кубовым красителям относятся полициклические красители и индигоидные красители. В зависимости от типа применяемого красителя крашение ведут при температурах от 30 до 80 °С. (ii) Аналогичным образом применяют нерастворимые сернистые красители. Отличие состоит в том, что в качестве восстановителя используют не гидросульфит, а сульфид натрия. Красящая способность сернистых красителей невелика, поэтому при крашении в тёмные цвета берут до 20% красителя от массы волокна. Крашение ведут при температуре, близкой к 100 °С. Существуют и растворимые в воде препараты сернистых красителей. При их использовании текстильный материал пропитывают водным раствором красителя, высушивают горячим воздухом и обрабатывают в растворе, содержащем сульфид натрия и едкий натр. В этом растворе при 80–90 °С в течение 30 секунд происходит проявление красителя, то есть переход его в исходную нерастворимую в воде форму. Помимо восстановительного способа крашения кубовыми красителями, широко применяется так называемый суспензионный метод. В этом случае волокнистый материал пропитывают высокодисперсной суспензией кубового красителя, высушивают, а затем обрабатывают щелочным гидросульфитным раствором. Нерастворимый краситель непосредственно на волокне переходит в растворимую натриевую соль лейкосоединения, которая сорбируется волокном и диффундирует внутрь его при последующем запаривании. Окисление лейкосоединения в исходный краситель и фиксация его на волокне происходят при обработке растворами окислителей, например, $K_2Cr_2O_7$ или H_2O_2, после чего материал тщательно промывают. Особую группу кубовых красителей составляют растворимые в воде препараты – кубозоли. Их водными растворами пропитывают волокнистые материалы и затем различными способами (нитритным, бихроматным, запарным и так далее) в кислой среде проводят гидролиз и окисление кубозолей. В результате на волокне фиксируется первоначальный кубовый краситель, из которого был получен соответствующий кубозоль. (4) Крашение Нерастворимыми Азокрасителями, образующимися в волокне (холодное крашение). В ходе такого крашения красители синтезируются непосредственно на волокне в результате сочетания азосоставляющих (азотолов) с диазония солями. При крашении волокно пропитывают щелочным раствором азотола, высушивают и обрабатывают на холоде при pH 7–9 водным раствором соли диазония. На волокне происходит реакция азосочетания, и оно окрашивается. Таким образом окрашивают целлюлозные волокна, но при известной модификации метода нерастворимые азокрасители можно синтезировать и в полиамидных, полиэфирных и полиакрилонитрильных волокнах. Кроме нерастворимых азокрасителей, на волокне можно синтезировать и другие пигменты, в частности чёрный анилин, являющийся наиболее распространённым окислительным красителем. Его получают путём окислительной конденсации анилина в среде минеральной кислоты. В качестве окислителя применяют хлорат натрия и бихромат натрия или калия; катализаторами окислительного процесса являются медный купорос, железисто- и железосинеродистый калий и другие. Для крашения волокон используют и готовые органические пигменты, для их фиксирования – различные синтетические связующие вещества, например предконденсаты мочевино- и меламиноформальдегидных смол. (5) Крашение Катионными Красителями:- катионные красители – обычно моноазокрасители и полиметиновые красители. Окрашивают полиакрилонитрильные волокна в яркие насыщенные цвета, окраски обладают довольно высокой прочностью. Краситель фиксируется на волокне межмолекулярными силами и благодаря образованию ионных связей:- , где A– – анион, например CH_3SO_4–. Крашение производят в уксуснокислой среде в присутствии глауберовой соли и выравнивающих веществ; температура ванны 95–100 °С, продолжительность крашения 60–90 мин. Расход красителя 2–5%, уксусной кислоты 1–5%, глауберовой соли 5–15% и выравнивателя 2–6% от массы окрашиваемого материала. Существуют и непрерывно-поточные методы крашения полиакрилонитрильных волокон катионными красителями. В этом случае для ускорения проникновения красителя в волокно используют резорцин, этиленкарбонат и другие вещества. Волокнистую массу пропитывают раствором красителя (5–10 г/л), содержащим названные ускорители (10–50 г/л), запаривают при 103 °С в течение 60–90 секунд и тщательно промывают. (6) Крашение Кислотными и Протравными Красителями:- кислотные красители растворимы в воде благодаря наличию групп SO_3M (реже COOM, где M – Na, K или NH_4), SO_2NH_2, SO_2CH_3 и других, к ним относятся антрахиноновые красители и азокрасители. Применяются в основном для крашения белковых и полиамидных волокон, а также кожи, меха, бумаги, древесины и других материалов. В процессе крашения краситель взаимодействует с волокном по схеме:- . В закреплении красителя на волокне участвуют также ван-дер-ваальсовы силы. Крашение осуществляют при pH 3–5 в присутствии глауберовой соли и выравнивателя, температура крашения 85–90 °С, длительность 45–60 мин. Так же красят белковые и полиамидные волокна протравными красителями, окрашивающими волокно и закрепляющимися на нём при последующей обработке некоторыми химическими веществами, называемые протравами. Важнейшие протравные красители – хромовые, которые после пропитки волокна обрабатывают раствором бихромата натрия, причём хром восстанавливается из шести- в трёхвалентное состояние с образованием на волокне нерастворимых комплексных соединений красителей:- (рисунок). Такие комплексы могут удерживаться на волокне и ван-дер-ваальсовыми силами. Хромовые красители дают окраску большой прочности к действию света и мокрых обработок. В зависимости от строения красителей крашение проводят в кислой или нейтральной среде с добавкой выравнивателей.

Наибольшее применение в качестве хромовых получили азо- и антрахиноновые красители. (7) Крашение Дисперсными Красителями:- по химическому строению дисперсные красители относятся к азокрасителям или антрахиноновым красителям. Обычно их применяют для крашения полиамидных, полиэфирных, полиакрилонитрильных и ацетатных волокон. Молекулы дисперсных красителей имеют малые размеры и легко проникают в плотные синтетические волокна. Кроме того, у них отсутствуют анионные группы, препятствующие взаимодействию красителя с волокном, имеющим в воде отрицательный заряд. Дисперсные красители плохо растворимы в горячей воде, поэтому их измельчают (диспергируют) до размера частиц меньше 2 мкм. Полиамидные и диацетатные волокна окрашивают в ванне, содержащей диспергатор. Крашение начинают при температуре 40–50 °C и затем ведут в течение 1 часа при 80 °C. Полиэфирные и полиакрилонитрильные волокна, отличающиеся повышенной плотностью, в этих условиях практически совсем не окрашиваются. Поэтому для крашения таких волокон необходимо повысить температуру до 130–140 °C или применить переносчики – вещества, разрыхляющие структуру полимера. В качестве переносчиков применяют о-оксидифенил, моно- и дихлорбензолы, бензойную и салициловую кислоты, бетанафтол, крезолы и так далее. Их оптимальная концентрация в красильной ванне 3–8 г/л. Очень эффективными для полиэфирных волокон являются непрерывно-поточные методы крашения – термозольный и вапокол-процессы. По обоим этим способам волокно сначала пропитывают слегка загущенной высокодисперсной суспензией красителя и затем после сушки прогревают в течение 60–90 секунд при температуре 200–210 °C (термозольный процесс) или подвергают воздействию паров трихлорэтилена (вапокол-процесс). После таких обработок волокно промывают и высушивают.

DYEING ABRASION = ИСТИРАНИЕ ОКРАШИВАНИЯ – Dyeing Abrasion:- white shining due to mechanical friction on the fabric, it known as Dyeing Abrasion. Dyeing defect. / Порок или дефект крашения.

DYEING AUXILLARIES = КРАСЯЩИЕ ВСПОМОГАТЕЛЬНЫЕ ВЕЩЕСТВА (или ВСПОМОГАТЕЛЬНЫЕ ВЕЩЕСТВА КРАШЕНИЯ) – Dyeing Auxillaries are the various substances that can be added to the dyebath to aid dyeing. They may necessary to transfer the dye from the bath to the fiber or they may provide improvements in leveling, penetration, etc. Also call Dyeing Assistants.

DYEING CREASES = ЗАЛОМЫ КРАШЕНИЯ – Dyeing Creases:- colored creases on the fabric. Dyeing defect. / Порок или дефект крашения. Под Заломом понимается местный порок в виде неустранимых следов складок. Размер порока – по всему куску.

DYEING PROCESS = ПРОЦЕСС КРАШЕНИЯ – Dyeing Process:- dyeing is the process of imparting colors to a textile material through a dye (color). Dyes are obtained from flowers, nuts, berries and other forms of vegetables and plants as well as from animal and mineral sources. These are known as Natural Dyes. The other class of dyes is known as Synthetic Dyes. These are based on a particular type of chemical composition. Some of these dyes are:- Acid (Anionic) dyes, Basic (Cationic) dyes, Neutral-Premetalized dyes, sulfur dyes, vat dyes, reactive dyes, pigment dyes etc. Dyeing Methods:- color is applied to fabric by different methods of dyeing for different types of fiber and at different stages of the textile production process. These methods include:- Direct dyeing; Stock dyeing; Top dyeing; Yarn dyeing; Piece dyeing; Solution pigmenting or dope dyeing; Garment dyeing etc. Of these Direct dyeing and Yarn Dyeing methods are the most popular ones. Direct Dyeing:- when a dye is applied directly to the fabric without the aid of an affixing agent, it is called Direct Dyeing. In this method the dyestuff is either fermented (for natural dye) or chemically reduced (for synthetic vat and sulfur dyes) before being applied. The direct dyes, which are largely used for dyeing cotton, are water soluble and can be applied directly to the fiber from an aqueous solution. Most other classes of synthetic dye, other than vat and sulfur dyes, are also applied in this way. Yarn Dyeing:- when dyeing is done after the fiber has been spun into yarn, it is called Yarn Dyeing. There are many forms of yarn dyeing:- Skein (Hank) Dyeing, Package Dyeing, Warp-beam Dyeing,and Space Dyeing. Skein (Hank) Dyeing:- the yarns are loosely arranged in skeins or hanks. These are then hung over a rung and immersed in a dyebath in a large container. In this method, the color penetration is the best and the yarns retain a softer, loftier feel. Package Dyeing:- the yarns are wound on spools, cones or similar units and these packages of yarn are stacked on perforated rods in a rack and then immersed in a tank. In the tank, the dye is forced outward from the rods under pressure through the spools and then back to the packages towards the center to penetrate the entire yarn as thoroughly as possible. Warp-Beam Dyeing:- it is similar to package dyeing but more economical. Here, yarn is wound on to a perforated warp beam, immersed in a tank and dyed under pressure. Space Dyeing:- in this method, the yarn is dyed at intervals along its length. For these two procedures – knit-deknit method and OPI Space-Dye Applicator – are adopted. In the first method, the yarn is knitted on either a circular or flat-bed knitting machine and the knitted cloth is then dyed and subsequently it is deknitted. Since the dye does not readily penetrate the areas of the yarn where it crosses itself, alternated dyed and undyed spaces appear. The OPI Space-Dye Applicator technique produces multi colored space-dyed yarns. (OPI (probably) = Operation Process Improvement or Optimise Process Improvement) The yarns are dyed intermittently as they run at high speeds of upto 1 000 yards (900 m) per minute through spaced dyebaths with continuous subjection to shock waves produced by compressed air assuming supersonic velocities.

DYE MARK = ОТМЕТИНА ОТ КРАСИТЕЛЯ – Dye Mark:- dye spot. Knitted fabric defect. Dye Mark; dye spot; dye stain:- in a piecedyed fabric, a discrete area of different color. Note:- this defect is often caused by contamination with concentrated dyestuff or dyeing assistants. / развод (или потёк (stain)). Порок или дефект. Цветная Отметина; Пятно Красителя; Окрашивание (dye mark; dye spot; dye stain):- порок заключительной отделки ткани; тёмное пятно по сравнению с основным фоном полотна. Примечание:- этот порок возникает в результате загрязнения красителя или вспомогательного средства для крашения.

DYE MIGRATION = МИГРАЦИЯ КРАСИТЕЛЯ (или КРАСИЛЬНАЯ МИГРАЦИЯ, или МИГРАЦИЯ ОКРАСКИ) – Dye Migration happens only on 100% polyester fabric. You can help prevent dye migration by putting blank garments through a hot dryer prior to printing them. Low-bleed plastisol will always stop dye migration. Dye Migration is also known as Bleeding or Dye Sublimation. This is a process that occurs mostly between standard plastisol inks and synthetic fibers like polyester. It is most notable with white inks on shirt colors like red, navy, maroon and even dark greens. It may appear immediately when the shirts exit the oven, when they are left to sit overnight and even two weeks later. There are two common causes of dye migration. The real cause of dye migration is simply the fact that the dyes in the polyester fabric sublimates or turns gaseous when heated to about 330 degrees Fahrenheit during the curing of the plastisol ink. Then the dye, in gaseous form, seeps into the ink layer thus tinting it the color of the shirt. This is inherent in the dyeing process of polyester and is unavoidable but not impossible to deal with. When screen printing polyester or polyester blend garments precautions must be taken to prevent this bleeding from happening. This is what we will call the ‘first’ cause; over curing. Over heating your printed polyester garments during curing is inadvisable. It is important to monitor the oven temperature to ensure consistent results. This includes flash curing. Be careful not to overheat the shirt when flash curing on press. Cure all of your polyester garments under 320 degrees Fahrenheit. It is also possible to use a catalyst like Nylobond to reduce curing temperatures of plastisol inks. Lower curing temperatures are the best defense against color bleed. Thicker layers of ink will inhibit dye migration but it will also require longer heating times and temperatures. It is best to use an ink specifically designed to be low bleed or one that is made for polyester materials. White ink is the absolute worst for bleeding problems. But don’t be surprised to see other inks discolor after being printed on navy or black. You could also use an under base to prevent bleeding and some ink manufacturers offer under base inks specifically for this application. The ‘second’ cause is basically the same problem prompted by different factors. The simple fact of the matter is that

sometimes the dyeing process for the polyester garments, which is a sublimated one, is of substandard quality and the dye will tend to migrate easily from the fabric into the ink layer. This is a problem that can only be addressed at the factory where the fabric is being dyed. Good luck. Using higher quality products may help to avoid this factor. Another part of the second cause is re-dyed shirts. This is also something that starts at the factory. Let's say Fruit of the Loom makes more yellow shirts one spring season for some reason and then they experience larger orders for shirts like black or navy and even maroon. Can you guess what they do? That's right, a re-dye job. Any re-dyed garments will have a tendency for the dyes to bleed into the ink layer. This goes for 100% cotton shirts as well as polyester or polyester blends. Printing white ink on a 100% cotton tee shirt that has been re-dyed may also result in color bleeding into the ink layer. Using a good quality, low bleed, high opacity white ink for all of your darker colored 100% cotton shirts is recommended. It is important to ensure the quality of your polyester garments before printing them. And there is a simple way of doing that in addition to buying a well known name brand garment. Take a clean piece of white cotton tee shirt fabric and tightly wrap it around your index finger. Then rub an area of the polyester fabric a few times with your finger. If there is a very slight color transfer, it should be alright. If there is a very significant color transfer, then I would be very cautious about printing those shirts. This test may also be repeated with the cotton fabric damp if you are unable to get readable results dry. Finally, there are high quality garments like Under Armour® that just have a bad problem with standard plastisol inks and bleeding. They also tend to crack or flake with standard plastisol inks as well. If you are approached with an Under Armour® print job, be wary and contact your ink manufacturer for the correct ink to use. It is always a good idea to consult your ink supplier to ensure proper ink usages in your print shop. See also Migration, 1. / Bleeding = Налёжки – порок ткани. пластизоль (plastisol). Андэр Амэ® (Under Armour®).

DYE RANGE = КРАСИЛЬНЫЙ ДИАПАЗОН – Dye Range is a broad term referring to the collection of dye and chemical baths, drying equipment, etc, in a continuous-dyeing line.

DYES = КРАСИТЕЛИ – Dyes are substances that add color to textiles. They are incorporated into the fiber by chemical reaction, absorption, or dispersion. Dyes differ in their resistance to sunlight, perspiration, washing, gas, alkalies, and other agents; their affinity for different fibers; their reaction to cleaning agents and methods; and their solubility and method of application. Various classes and types are listed below:- acid dyes, aniline dyes, anthraquinone dyes, azo dyes, azoic dyes, basic dyes, cationic dyes, developed dyes, direct dyes, disperse dyes, fiber-reactive dyes, gel dyeing, macromolecular dyes, metallized dyes, naphthol dyes, premetallized dyes, sulfur dyes, and vat dyes. See also Colour Index (CI). There are many application classes of dyes, including acid dyes, disperse dyes, reactive dyes, and natural dyes. Dyes may be generally divided into natural and synthetic types. Natural, or vegetative, dyes are obtained from berries, flowers, roots, bark and more. Synthetic dyes are chemical compounds. Dye, a substance, usually colored, which is used to impart color to other materials such as textiles, paper, and plastics. This color must be reasonably permanent (fast) to removal by rubbing, the action of water, soap, solvents, and other detergent agencies; and to chemical or physical alteration through the action of light, heat, gas fumes, or the action of chemicals to which it may normally be subjected. Dyes are usually applied for these purposes by processes of dyeing. Formerly obtained from various natural sources, dyes are now almost entirely produced by chemical synthesis. Dyeing consists essentially in dissolving a dye, or some chemical modification of a dye or chemicals that can form dyes by interaction, in water or other solvents, and treating the substance to be colored with the solutions. In general, the molecules of the dye are held between the molecules of the material being dyed by physical or by chemical forces, and this is the distinction between dyeing and other forms of coloration. Dyeing (technical) is the uniform coloration of textiles by dyes; printing (textile) is local coloration by essentially the same processes as dyeing, to form single- or multi-colored prints. Dyeing has been practised for many centuries, as evidenced by the discovery of dyed mummy cloths, etc. Until the middle of the XIX century only a few, natural dyes were available, the majority of which required a mordant for their application. The dyeing process was often laborious and the range of colors limited. Following the discovery of the first successful synthetic dye (mauve) by the English chemist William Henry Perkin in 1856, a very large number of easily applied, synthetic dyes of many chemical types, covering a much wider color range and often of improved fastness, have been introduced. The production and use of natural dyes has fallen considerably and now represents only a fraction of the total output. Dyes and dye-forming products are selective in their relations to different kinds of fibers, a given dye being absorbed from solution by some and not by others. When the dye is absorbed it is said to have an 'affinity' or to be 'substantive' to the fiber. Classification of Dyes:- dyes may be classified either according to the method by which they are applied or according to their chemical constitution. The first method of classification also takes into account the different types of textile fibers. These comprise cellulosic (cotton, flax, viscose, and rayon), cellulose derivatives (cellulose acetate), protein (wool, silk, casein, and groundnut protein), and purely synthetic fibers (nylons, Terylene, and acrylic polymers). For each class of fibers, only a limited range of dyes may be successfully applied. Dyeing Processes:- the method of dyeing depends on the material being treated and on the dye used. To meet modern industrial demands, a speedy process, known as Vat Dyeing, has been developed. The chemicals used are called Vat Dyes. The vat dyes are usually applied to a fiber or fabric when it is dry. The fiber or fabric is then put in a reducing solution, which activates the coloring matter of the dye. The dyeing process is continuous and is almost completely mechanized. Dyes that produce a fully developed color by themselves are called Direct Dyes. Other dyes require the addition of chemicals to produce the proper color. When a dye cannot attach itself strongly to a fiber or other substance, a chemical, called a Fixative, must be used. Fixatives are also used to hasten the speed at which a dye is made to adhere. Dyes may be added to synthetic fibers while the synthetic is still in liquid form. / Найлан (Nylon). Щёлочь (Alkali). Сродство (Affinity). ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate). протирание или притирка (rubbing). Английский химик Вильэм Хэнри Пёкин (William Henry Perkin) в 1856. Красители – органические соединения, применяемые для крашения текстильных материалов, кожи, меха, бумаги, пластмасс и другого. Известные с древности природные красители получали главным образом из растений. К началу XX века природные красители почти полностью вытеснены синтетическими. Красители классифицируют как по химическому строению (азокрасители, индигоидные, нитрозокрасители, хинониминовые и другие), так и по областям и методам применения (дисперсные, прямые, кубовые, красители для меха и другие).

DYE SITES = КРАСИЛЬНЫЕ УЧАСТКИ – Dye Sites are the functional groups within a fiber that provide sites for chemical bonding with the dye molecule. Dye sites may be either in the polymer chain or in chemical additives included in the fiber.

DYE SPOT = КРАСИЛЬНОЕ ПЯТНО (или ПЯТНО ОТ КРАСИТЕЛЯ) – Dye Spot or Dye Mark:- in a piece-dyed fabric, a discrete area of different color. This defect is often caused by contamination with concentrated dyestuff or dyeing assistants. See also Dyestain. Fabrics defect.

DYESTAIN = РАЗВОД КРАСИТЕЛЯ (или ПОТЁК КРАСИТЕЛЯ) – Dyestain is an area of unintended discoloration due to uneven absorption of a colorant. Fabrics defect. Dye Stain:- an area of discoloration due to un-even absorption of colorant.

DYE STREAK = ЧЕРТА ОТ КРАСИТЕЛЯ (или ЗАТАСК ОТ КРАСИТЕЛЯ) – Dye Streak is an unintended irregular stripe in a fabric due to uneven absorption of a colorant. Fabrics defect. Dye Streak in printing results from a damaged doctor blade or a blade not cleaned properly. Usually a long streak until the operator notices the problem. / Затаск – порок печатного товара в виде

параллельных цветных полос. Затаск от печати, не более 2 см. Размер порока – до 0.5 см. Размер порока определяют по наибольшей протяжённости.

DYESTUFF = КРАСЯЩЕЕ ВЕЩЕСТВО – Dyestuff is a substance that can be used as a dye or from which a dye can be obtained. Dyestuff is one of the most important group of substances used in the clothing industry. Dyestuff is any soluble pigment used for dyeing the hair, fabric etc. See also Dyes.

DYE TRANSFER INHIBITOR = ИНГИБИТОР ПЕРЕНОСА КРАСИТЕЛЯ (или ЗАМЕДЛИТЕЛЬ ПЕРЕНОСА КРАСИТЕЛЯ) – Dye Transfer Inhibitors (DTIs):- Poly(N-vinylpyrrolidone) and Poly(vinylpyridine N-oxide). Shorthand notations:- (i) Dye transfer inhibitor = DTI; (ii) Poly(N-vinylpyrrolidone) = PVP; and (iii) Poly(vinylpyridine N-oxide) = PVP-NO<. A DTI is pretty much what the name suggests:- a substance that prevents the transfer of dyes from one garment to another in the wash. Today's multicolored (often brightly colored) fabric loads put high demands on the laundry detergent. It would not be practical to do laundry in batches of similar colors. We are willing to separate out our whites and our 'hot' loads, but as for the colors we want to put them all together! In the wash, dye molecules leach out of the garments – this is also called Bleeding – and the extent to which this happens depends on newness of the garment, type of fabric, type of dye and wash conditions. The surfactants in the wash often contribute to this 'bleeding' phenomenon. If such free dye molecules were to redeposit themselves randomly on other garments, pretty soon our brights would no longer be so bright. Bleach cannot offer a solution in this case, because it would attack the dye molecules in solution as well as the dye molecules on the fabric, causing 'bleach stains'. This is where DTIs come in:- they act as dye scavengers! How do DTIs work and how are they used? DTIs bind irreversibly to free dye molecules in the wash water and form water-soluble macromolecules. This way, the dyes are prevented from redepositing onto garments and are removed with the spent wash water. DTIs may be added up to 0.5% (w/w) to powder specialty detergents for delicate and colored fabrics. Such products are usually marketed as 'color care' detergents; typically these do not contain bleach nor optical brighteners (fluorescent whitening agents or FWAs); they were first introduced on European markets in 1991. Not all DTIs work for all dyes. Certain combinations work better than others, depending on the chemical structures of the dye and the DTI. The most commonly used DTIs in laundry detergents are PVP and PVP-NO. / осаждение (redeposition). Оптический Блескообразователь или Оптический Отбеливатель (Optical Brightener).

DYNAMIC ADHESION = ДИНАМИЧЕСКАЯ АДГЕЗИЯ – Dynamic Adhesion is the ability of a cord-to-rubber bond to resist degradation resulting from flexure.

DYNAMIC MODEL = ДИНАМИЧЕСКАЯ МОДЕЛЬ (или ДИНАМИЧНАЯ МОДЕЛЬ) – Dynamic Model is a collection of regression models that together represent an entire dynamic system.

DYNAMIC RANDOM ACCESS MEMORY = ДИНАМИЧЕСКАЯ ПАМЯТЬ С ПРОИЗВОЛЬНЫМ ДОСТУПОМ – Dynamic Random Access Memory (DRAM) is a type of memory component. 'Dynamic' means the device's memory cells must be recharged periodically. Information stored in the memory cells is accessed randomly. Memory is a key component of most electronic products.

DYNAMIC SEAL = ДИНАМИЧЕСКОЕ УПЛОТНЕНИЕ – Dynamic Seal is a seal that moves due to axial or radial movement of the unit. See also Seal.

DYNAMIC SYSTEM = ДИНАМИЧЕСКАЯ СИСТЕМА (или ДИНАМИЧНАЯ СИСТЕМА) – Dynamic System is a part of the real world that can be quantified with state and rate variables and parameters. The environment affects the system through rate variables. System behavior is the dynamic pattern of all state variables of a system. / Под Динамической Системой понимается механическая система с конечным числом степеней свободы. Например, система конечного числа материальных точек, движущаяся по законам классической механики; обычно закон движения таких систем описывается системами обыкновенных дифференциальных уравнений.

DYNAMIC VISCOSITY = ДИНАМИЧЕСКАЯ ВЯЗКОСТЬ – Dynamic Viscosity or Absolute Viscosity – coefficient of absolute viscosity – is a measure of internal resistance. Dynamic (absolute) viscosity is the tangential force per unit area required to move one horizontal plane with respect to an other plane – at an unit velocity – when maintaining an unit distance apart in the fluid. Dynamic viscosity is known by the Greek symbol η (Eta). It is sometimes also referred to as Shear Viscosity. Dynamic viscosity is obtained by reformulating Newton's Law. The SI unit is Pascal-second (Pa·s) or milliPascal-second (mPa·s):- (i) 1 Pa·s = 1 000 mPa·s; and (ii) the SI unit is named after Blaise Pascal. Other commonly used units are Poise (P) or centiPoise (cP):- (i) 1 P = 100 cP; and (ii) this unit is named after Jean Poiseuille. Relation between units:- 1 cP = 1 mPa·s. Dynamic viscosity is rather used in life science and research applications. See also Viscosity. / Сдвиговая Вязкость (Shear Viscosity). Динамическая Вязкость, то же, что и Вязкость. Смотрите также Вязкость (Viscosity). Динамическая Вязкость (Dynamic Viscosity) η (входит в виде коэффициента пропорциональности в формулу Закона Ньютона), единицей которой в Международной Системе Единиц, так называемой системе СИ (или SI по первым буквам первых двух слов полного Франкоязычного наименования Système International d'Unités; введена в действие в бывшем Союзе Советских Социалистических Республик (СССР) с 01 Января 1963 для предпочтительного применения) является Паскаль-секунда (Па·с), в Англоязычных странах для обозначения динамической вязкости и в Системах Единиц СГС (системы единиц физических величин lmt (где l – длина, m – масса, t – время), в которых приняты три основные единицы:- сантиметр (см) – единица длины, грамм (г) – единица массы и секунда (с) – единица времени; отсюда и название системы по первым буквам названий этих трёх единиц) использовалась устаревшая и более не подлежащая применению единица измерения Пуаз (П (P); на Французском Poise, от имени Французского физика и физиолога Жона Луи Мари Пуазёйя (или Пуазёйля; Jean Louis Marie Poiseuille; 1799–1869)). 1 П = 0.1 Па·с. Чаще использовалась дольная единица – сантиПуаз (сП); 1 сП = 1 мПа·с. Чем гуще жидкость, тем выше её вязкость. Международные производители смазочных масел до сих пор используют в основном единицу измерения Пауз (П), несмотря на то, что в настоящее время все страны мира официально перешли на использование единиц измерений системы СИ.

DYNAPOINT PROCESS = ПРОЦЕСС ДАЙНЭПОИНТЧ – Dynapoint Process is a continuous computer-controlled process for manufacturing tufted carpets with intricate patterns from undyed yarn. The carpet is dyed as it is tufted and the colors and pattern are clearly visible through the primary backing of the carpet.

DZ = ALGERIA

DZD = ALGERIAN DINAR

- E -

E = И. – E is fifth letter of a NASDAQ® stock symbol specifying that an issue has not met the reporting date for the company's SEC (short for the US Securities and Exchange Commission) regulatory filing requirements. / И. (E) – пятая буква фондового индекса НЭЗДЭК® (NASDAQ®), указывающая на то, что выпуск .

E = DECLARED OR PAID IN THE PRECEDING 12 MONTHS

E = ECHO

E = EXA = 10^{18}

E&O = ERRORS AND OMISSIONS

E & OE = ERRORS AND OMISSIONS EXCEPTED

E&P = EARNINGS AND PROFIT

E&P = EXPLORATION AND PRODUCTION

E4/E6 = E4/E6 – E4/E6 Ratio of light absorption at wavelengths 465/665 nm.

E15 = 15 MEMBER STATES THAT JOINED THE EUROPEAN UNION BEFORE 2004

E28 = 28 MEMBER STATES OF THE EUROPEAN UNION

E85 = BLENDS OF BIOFUEL IN TRANSPORT FUEL THAT REPRESENT 85% OF THE FUEL VOLUME

EA = ENROLLED AGENT

EA = ENTERPRISE ARCHITECTURE

EAC = EUROPEAN ADVISORY COMMITTEE

EACA = E–AMINO–CARPOIC ACID

EADI = EUROPEAN ASSOCIATION OF DEVELOPMENT RESEARCH AND TRAINING INSTITUTES

EAFE INDEX = EUROPEAN AUSTRALIAN AND FAR EAST INDEX

EAG = ELECTROANTENNOGRAM

EAGLE = ОРЁЛ – Authorized by the Bullion Coin Act of 1985, American Eagle Gold Bullion Coins quickly became one of the world's leading gold bullion investment coins. Produced from gold mined in the United States, American Eagles are imprinted with their gold content and legal tender 'face' value. An American Eagle's value is based on the market price of its metal content, plus a small premium to cover coinage and distribution. American Eagles use the durable 22 karat standard established for gold circulating coinage over 350 years ago. They contain their stated amount of pure gold, plus small amounts of alloy. This creates harder coins that resist scratching and marring, which can diminish resale value. Minted to exacting standards, the obverse (front) design is inspired by what's often considered one of America's most beautiful coins:- Augustus Saint-Gaudens' celebrated USD20 gold piece, minted from 1907-1933. The reverse design, by sculptor Miley Busiek, features a male eagle carrying an olive branch flying above a nest containing a female eagle and her hatchlings. Government Guarantee:- what truly sets American Eagles apart is that they are the only bullion coins whose weight, content and purity are guaranteed by the United States Government. Investors can buy them with confidence, knowing the coins contain their stated amount of gold. In addition, long-term savers can include American Eagles in their Individual Retirement Accounts (IRAs). See also Double Eagle. Eagle is the earliest legal tender US gold coin first minted in 1795. It is 900 fine. / Огюстюс Са-Годас (Augustus Saint-Gaudens). Майли Бизиэк (Miley Busiek). Золотая монета, чеканившаяся в США и имевшая лицевую стоимость в 10 Долларов.

EAGLE FLIES = ОРЁЛ ЛЕТАЕТ (или ДЕНЬГИ ДАЮТ!) – Eagle Flies (maritime term):- pay day. / День выдачи денежного довольствия.

EAI = ENTERPRISE APPLICATION INTEGRATION

EAN = EUROPEAN ARTICLE NUMBER

EAN–8 = ЕНИ–8 (или 8–ЗНАЧНЫЙ ЕВРОПЕЙСКИЙ НОМЕР ИЗДЕЛИЯ) – The European Article Number (EAN) is a barcoding standard. EAN barcodes are used when the country origin needs to be known. There are 8 digits in EAN-8 where the first two characters are used to define the country of origin, the next 5 are data, followed by the checksum. Both 2 and 5 digit supplementals are also supported. EAN International is now (from 18 February 2005) called GS1 (short for the Global Standards One).

EAN–8 BAR CODES = EUROPEAN ARTICLE NUMBER BAR CODES

EAN–13 = ЕНИ–13 (или 13–ЗНАЧНЫЙ ЕВРОПЕЙСКИЙ НОМЕР ИЗДЕЛИЯ) – The European Article Number (EAN) is a barcoding standard. EAN barcodes are used when the country origin needs to be known. There are 13 digits in EAN-13 where the first two characters are used to define the country of origin, the next ten are data, followed by the checksum. Both 2 and 5 digit supplementals are also supported. EAN International is now (from 18 February 2005) called GS1 (short for the Global Standards One).

EAP = ECOREGIONAL ACTION PLAN

EAR = КОЛОС – Ear is a common name for the panicle of Rice. / Под Колосом понимается соцветие, в котором на удлинённой главной оси расположены сидячие цветки (простой колос – у Вербены, Подорожника) или колоски (сложный колос – у Пшеницы, Ржи).

EARFLAP = НАУШНИК (или УХО ШАПКИ) – Earflap:- a warm covering for the ears, especially an extension on the lower edge of a cap that may be folded up or down.

EARLINESS = РАННЕСПЕЛОСТЬ (или СКОРОСПЕЛОСТЬ, или ХХ) – Earliness is an imprecise term used to represent the rapid development or maturation of the harvestable Cotton crop relative to the available growing season.

EARLY–GENERATION MATERIALS = МАТЕРИАЛЫ РАННИХ ПОКОЛЕНИЙ (или МАТЕРИАЛЫ РАННЕЙ ГЕНЕРАЦИИ) – Early-Generation Materials are the Rice plants derived from hybridization that are in early filial generations such as F_2 and F_3.

EARLY–MATURING VARIETY = СКОРОСПЕЛАЯ (или РАННЕСОЗРЕВАЮЩАЯ) РАЗНОВИДНОСТЬ – Early-Maturing Variety is a variety that matures early; variety that matures at least 10 days earlier than common types. In rice, varieties that mature in 100 days are called Very Early.

EARLY STAGE FINANCING = ФИНАНСИРОВАНИЕ НА РАННЕЙ СТАДИИ – Early Stage Financing is a venture capital financing instrument. Financing is provided in the early development stage of a company, i.e. as seed and start-up capital. It is used to finance anything from a business concept, the production of initial prototypes, through to the start of production and marketing. The potential for commercial success is difficult to assess in this phase. Owing to the risk involved, financing takes the form of capital provided by venture capital companies or wealthy individuals (business angels).

EARLY SUPPRESSION, FAST RESPONSE = БЫСТРО ОТВЕЧАЮЩЕЕ, С РАННИМ ГАШЕНИЕМ – Early Suppression, Fast Response (ESFR):- ceiling-mounted sprinkler systems that started being used in warehouses around 1990 as an alternative to rack-mounted sprinkler systems. ESFR heads detect fire faster and are reported to start spraying with more speed than conventional sprinkler heads. They also output water at higher volumes (approximately 100 gallons per minute). Droplet size is typically bigger which delivers more water, with greater speed, to the fire source. ESFR systems reportedly extinguish fires faster and more effectively with less damage to product than in-rack systems.

EARLY TERMINATION OPTION = ОПЦИОН С РАННИМ ПРЕКРАЩЕНИЕМ – Early Termination Option is a contract provision granting either counterparty the option to terminate a contract before its maturity date, sometimes upon payment of a fee.

EARLY YIELD TESTING = ТЕСТИРОВАНИЕ ХХ (или АПРОБАЦИЯ ХХ) – Early Yield Testing is a testing of breeding lines at early filial generations which may have some amount of segregation. / на ранних дочерних поколениях, которые могут иметь некоторое количество расхождений. Сегрегация или Выделение или Зейгерование или Разделение По Крупности (Segregation).

EARMARKING = АССИГНОВАНИЕ (или ВЫДЕЛЕННИЕ СРЕДСТВ, или НАЧИСЛЕНИЕ) – Earmarking:- allocation of certain resources to specific uses. While this is a normal process in management, by establishing the relationship between sources and uses of funds, especially between revenues and expenses, ahead of time, resources can be set aside in advance for specific future uses. / между доходами и расходами, .

EARMUFF = УШНАЯ МУФТА (или ХХ) – Earmuff:- one of a pair of ear coverings connected by a flexible band and worn as protection against cold or noises.

EARNED INCOME = ЗАРАБОТАННЫЙ ДОХОД – Earned Income is wages, salaries, professional fees, and other amounts received as compensation for services rendered.

EARNED PREMIUM = ЗАРАБОТАННАЯ ПРЕМИЯ – The proportion of premium that relates to a used period of cover. That portion of a premium for which the policy protection has already been given during the now-expired portion of the policy term. Earned Premium is:- (i) that part of the premium applicable to the expired part of the policy period, including the short-rate premium on cancellation, the entire premium on the amount of loss paid under some contracts, and the entire premium on the contract on the expiration of the policy. (ii) That portion of the reinsurance premium calculated on a monthly, quarterly or annual basis which is to be retained by the reinsurer should there cession be canceled. (iii) When a premium is paid in advance for a certain time, the company is said to 'earn' the premium as the time advances. For example, a policy written for three years and paid for in advance would be one-third 'earned' at the end of the first year. / Та часть премии, которая относится к истёкшему периоду покрытия. Та часть премии, в отношении которой защита, предлагаемая на условиях полиса, была уже предоставлена к текущему моменту, и эта часть больше не распространяется на дальнейшее покрытие по данному полису.

EARNEST MONEY = ЗАДАТОК – Earnest Money is a money paid by a purchaser to a seller when entering into a contract to indicate the buyer's intention to buy. The money is applied to the purchase price and is forfeited if the purchaser defaults on the contract. See also Advance, and Down Payment. / Смотрите также Аванс (Advance) и Первый Взнос При Оплате В Рассрочку (Down Payment). Под Задатком понимается денежная сумма, выдаваемая одной стороной контракта (договора) другой стороне в счёт причитающихся платежей. Задаток служит доказательством заключения контракта и средством обеспечения его исполнения.

EARNINGS = ЗАРАБОТКИ – (1) In the United States, Earnings are an income of an entity. May be expressed as gross or net. Income after a company's taxes and all other expenses have been paid. Also known as Net Income. Earnings:- this is the 'bottom line', or net after-tax profit, reported by a company in its financial statements (monthly, quarterly, or yearly). A company's earnings (or losses) are usually reported in total as well as on a per share basis. This allows investors to easily see how the company is performing with respect to their investment. Earnings is net income of a business. Also known as Profit in the United Kingdom. Earnings are the operating profit less interest and tax. Thus it represents the 'profits' earned by the company for its stockholders in the current year. Earnings:- net income attributable to Chevron Corporation as presented on the Consolidated Statement of Income. / Шеврон Корпорэйшэн (Chevron Corporation).

(2) Return, monetary or otherwise, for human effort. Broadly earnings may be defined as wages plus any bonuses, e.g., for overtime worked. In the United States, Earnings are defined as the sum of wage or salary income and net income from self-employment. 'Earnings' represent the amount of income received regularly for people 16 years old and over before deductions for personal income taxes, social security, bond purchases, union dues, medicare deductions, etc.

EARNINGS BEFORE INTEREST AND TAX = ЗАРАБОТКИ ДО ИСЧИСЛЕНИЯ И УПЛАТЫ ПРОЦЕНТОВ И НАЛОГОВ – Earnings Before Interest And Taxes (EBIT) is a profit ratio that measures a company's profit prior to deduction of interest and taxes. It reflects the earning power of a company from its ongoing operations, irrespective of its capital structure. This measure makes it possible to compare the profit results of companies with different debt leverage ratios. A key measure of the financial performance of a company. It is similar to net profit, except that the effects of tax benefits, deductions and loans are factored out, providing a better measure of companies underlying performance. Earnings Before Interest and Tax (EBIT) is a measure of a company's earning power from ongoing operations, equal to earnings before deduction of interest payments and income taxes. EBIT excludes income and expenditure from unusual, non-recurring or discontinued activities. In the case of a company with minimal depreciation and amortization activities, EBIT is watched closely by creditors since it represents the amount of cash that such a company will be able to use to pay off creditors. Also known as Operating Income, or Operating Profit. EBIT corresponds to income from operations. / И.Би.Ай.Ти. или ИБИТ.

EARNINGS BEFORE INTEREST, TAXATION, DEPRECIATION, AMORTIZATION = ЗАРАБОТКИ ДО ИСЧИСЛЕНИЯ И УПЛАТЫ ПРОЦЕНТОВ, НАЛОГООБЛОЖЕНИЯ, ОБЕСЦЕНЕНИЯ (ИЗНОСА), АМОРТИЗАЦИИ – Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA):- the earnings generated by a business's fundamental operating performance, frequently used in accounting ratios for comparison with other companies. Interest on borrowings, tax payable on those profits, depreciation, and amortization are excluded on the basis that they can distort the underlying performance. Example:- It is calculated as follows:- Revenue

Expenses (excluding tax and interest, depreciation, etc) = EBITDA. It is important to note that EBITDA ignores many factors that impact on true cash flow, such as working capital, debt payments, and other fixed expenses. Even so, it may be useful for evaluating firms in the same industry with widely different capital structures, tax rates, and depreciation policies. EBITDA represents revenue before interest, taxes, depreciation, and amortization have been subtracted and after other expenses (except dividends) have been. EBITDA is one of those terms that is increasingly used, but usually for the wrong reason. This paper will define it and discuss how it can be useful, but also misleading. EBITDA is an acronym for 'Earnings before interest, taxes, depreciation and amortization'. It is calculated by taking operating income and adding back to it depreciation and amortization expenses. EBITDA is used to analyze a company's operating profitability before non-operating expenses (such as interest and 'Other' non-core expenses) and non-cash charges (depreciation and amortization). Earnings before interest, taxation, depreciation, goodwill amortization/impairment (EBITDA) and special items. See also Special Items. EBITDA (Earnings Before Interest, Taxes, Depreciation and Amortization):- This measure of profitability is being increasingly used to try to show a company's performance by not counting those items which might be seen as being beyond management's direct control, e.g., taxes and interest. The idea is to show earnings generated from the operations of the company (i.e. its real business) without the 'excess baggage' imposed by the excluded items. It is also a better measure of cash flow from operations since Depreciation and Amortization are non-cash items. No, it does not mean 'Earnings Before I Tricked the Damn Auditor!', which in recent times might not be so far from the truth! EBITDA corresponds to income from operations before depreciation and amortization. Earnings before Interest, Taxes, Depreciation and Amortization (EBITDA):- this measure of profitability is being increasingly used to try to show a company's performance by not counting those items which might be seen as being beyond management's direct control, e.g., taxes and interest. The idea is to show earnings generated from the operations of the company (i.e. its real business) without the 'excess baggage' imposed by the excluded items. It is also a better measure of cash flow from operations since Depreciation and Amortization are non-cash items. No, it does not mean 'Earnings Before I Tricked the Damn Auditor!', which in recent times might not be so far from the truth! Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) is a profit ratio that measures a company's profit before deduction of interest, taxes and depreciation. It reflects the company's earning power from its ongoing operations, irrespective of its capital structure and propensity to invest. / И.Би.Ай.Ти.Ди.Эй. или ИБИТДА. строка баланса (item).

EARNINGS PER SHARE = ЗАРАБОТКИ, ПРИХОДЯЩИЕСЯ НА ОДНУ АКЦИЮ (или ЗАРАБОТКИ НА АКЦИЮ) – IAS 33 (short for International Accounting Standard No. 33) Earnings per Share – The objective of this Standard is to prescribe principles for the determination and presentation of earnings per share, so as to improve performance comparisons between different entities in the same reporting period and between different reporting periods for the same entity. The focus of this Standard is on the denominator of the earnings per share calculation. This Standard shall be applied by entities whose ordinary shares or potential ordinary shares are publicly traded and by entities that are in the process of issuing ordinary shares or potential ordinary shares in public markets. An entity that discloses earnings per share shall calculate and disclose earnings per share in accordance with this Standard. An ordinary share is an equity instrument that is subordinate to all other classes of equity instruments. A potential ordinary share is a financial instrument or other contract that may entitle its holder to ordinary shares. An entity shall present on the face of the income statement basic and diluted earnings per share for profit or loss from continuing operations attributable to the ordinary equity holders of the parent entity and for profit or loss attributable to the ordinary equity holders of the parent entity for the period for each class of ordinary shares that has a different right to share in profit for the period. An entity shall present basic and diluted earnings per share with equal prominence for all periods presented. An entity that reports a discontinued operation shall disclose the basic and diluted amounts per share for the discontinued operation either on the face of the income statement or in the notes. Basic earnings per share:- Basic earnings per share shall be calculated by dividing profit or loss attributable to ordinary equity holders of the parent entity (the numerator) by the weighted average number of ordinary shares outstanding (the denominator) during the period. For the purpose of calculating basic earnings per share, the amounts attributable to ordinary equity holders of the parent entity in respect of:- (a) profit or loss from continuing operations attributable to the parent entity; and (b) profit or loss attributable to the parent entity shall be the amounts in (a) and (b) adjusted for the after-tax amounts of preference dividends, differences arising on the settlement of preference shares, and other similar effects of preference shares classified as equity. For the purpose of calculating basic earnings per share, the number of ordinary shares shall be the weighted average number of ordinary shares outstanding during the period (Paragraph 19). The weighted average number of ordinary shares outstanding during the period and for all periods presented shall be adjusted for events, other than the conversion of potential ordinary shares, that have changed the number of ordinary shares outstanding without a corresponding change in resources (Paragraph 26). Diluted earnings per share:- For the purpose of calculating diluted earnings per share, an entity shall adjust profit or loss attributable to ordinary equity holders of the parent entity, and the weighted average number of shares outstanding, for the effects of all dilutive potential ordinary shares. Dilution is a reduction in earnings per share or an increase in loss per share resulting from the assumption that convertible instruments are converted, that options or warrants are exercised, or that ordinary shares are issued upon the satisfaction of specified conditions. For the purpose of calculating diluted earnings per share, the number of ordinary shares shall be the weighted average number of ordinary shares calculated in accordance with paragraphs 19 and 26, plus the weighted average number of ordinary shares that would be issued on the conversion of all the dilutive potential ordinary shares into ordinary shares. Potential ordinary shares shall be treated as dilutive when, and only when, their conversion to ordinary shares would decrease earnings per share or increase loss per share from continuing operations. An entity uses profit or loss from continuing operations attributable to the parent entity as the control number to establish whether potential ordinary shares are dilutive or antidilutive. In determining whether potential ordinary shares are dilutive or antidilutive, each issue or series of potential ordinary shares is considered separately rather than in aggregate. Retrospective adjustments:- If the number of ordinary or potential ordinary shares outstanding increases as a result of a capitalization, bonus issue or share split, or decreases as a result of a reverse share split, the calculation of basic and diluted earnings per share for all periods presented shall be adjusted retrospectively. A company's net earnings divided by the average number of shares in issue. Earnings Per Share (EPS) is a ratio that is widely used by financial analysts, investors and others to gauge a company's profitability and to value its shares. EPS is normally calculated in the context of common shares of the entity. Earnings attributable to common shareholders is, therefore, determined by deducting from net income the earnings attributable to holders of more senior equity instruments. EPS, when presented on the face of the income statement, assists the ordinary shareholders to gauge the company's current net earnings and changes in its net earnings from period to period. All entities whose ordinary shares or potential ordinary shares are publicly traded, or that are in the process of issuing such shares or potential shares in public markets, are required to disclose with equal prominence on the face of the income statement both basic and diluted EPS. Basic EPS is calculated by dividing the profit or loss for the period attributable to the equity holders of the parent by the weighted average number of ordinary shares outstanding (including adjustments for bonus and rights issues). Diluted EPS is calculated by adjusting the profit or loss and the weighted average number of ordinary shares by taking into account the conversion of any dilutive potential ordinary shares. Potential ordinary shares are those financial instruments or contracts that may result in issuing ordinary shares such as convertible bonds and options (including employee stock options). Basic and diluted EPS for both continuing and total operations are presented on the face of the income statement with equal prominence, for each class of ordinary shares. Separate EPS figures for discontinued operations are disclosed either on the face of the income statement or in the notes. Earnings Per Share (EPS) measures

the earnings that are attributed to each equivalent ordinary share over a twelve month period. It is calculated by dividing the company's earnings by the number of shares on issue. In the balance sheet, basic Earnings/(Loss) Per Share are calculated by dividing the net profit/(loss) attributable to the shareholders by the weighted average shares outstanding during the period. Diluted earnings/(loss) per share are calculated by dividing the net profit/(loss) attributable to the shareholders by the weighted average shares outstanding during the period adjusted for potential dilution that could occur if dilutive securities, such as stock options and convertible debt, were exercised or converted into common stock or resulted in the issuance of common stock that then shared in the earnings of the company. Earnings Per Share is a corporation's profit divided by the number of shares outstanding. The basic Earnings Per Share from total operations is the bottom line income after all expenses, divided by the weighted average number of common shares outstanding. For example, if a company has USD10 million in net income and USD10 million in outstanding shares, then its earnings per share is USD1.00. Ratio Earnings Per Share = Profit Attributable to Shareholders / Weighted Average Number of Shares (by Days) in Issue for the Year. Earnings Per Share (EPS) is a key figure for assessing a company's earning power. It expresses how much of a company's net income is attributable to each individual share. This figure is needed to work out the price-earnings ratio (PER) of a share. Also:- Profit Per Share. / МСБУ 33 (сокращение для Международного Стандарта Бухгалтерского Учёта № 33) – .

EARNINGS RATE = СТАВКА ЗАРАБОТКОВ – An I Bond's Earnings Rate is a combination of two rates:- a fixed rate of return and a semiannual inflation rate. Each May and November, Treasury announces a fixed rate of return for I Bonds issued during the six-month period starting with the effective date of the announcement. An I Bond's fixed rate when it's purchased is the bond's fixed rate throughout the bond's 30-year life. A semiannual inflation rate announced in May is a measure of inflation from October through March. The rate announced in November is a measure of inflation from April through September. Twice a year – on the anniversary and 6 months later on the semiannual anniversary of an I Bond's issue date – the earnings rate can change because the bond's fixed rate is newly combined with a semiannual inflation rate that can vary.

EARNINGS REPORT = ОТЧЁТ О ЗАРАБОТКАХ (или ОТЧЁТ О ПРИБЫЛЯХ И УБЫТКАХ) – Earnings Report is a statement issued by a company showing its earnings or losses over a given period. The earnings report lists the income earned, expenses and the net result. Also known as Income Statement. See also Balance Sheet. See also Income Statement. Earnings Report is an official quarterly or annual financial document published by a public company, showing earnings, expenses, and net profit. Also known as Income Statement or Profit and Loss Statement. Earnings Report is a 'report card' of sorts for a public companies. It is through these reports that companies let shareholders know how well they have performed over the past time period. Most often the key metrics – net income and earnings per share (EPS) – are weighed against the previous years' numbers.

EARNINGS/STOCKHOLDERS' EQUITY = ЗАРАБОТКИ/СОБСТВЕННЫЕ СРЕДСТВА УЧАСТНИКОВ (%) – Earnings/Stockholders' Equity (%) is the earnings expressed as a percentage of the stockholders' equity. Thus it measures the return earned by the stockholders. (But it measures this return based on the balance sheet value rather than the stock market value of the stockholders' equity.) It should comfortably exceed interest rates or inflation (whichever is greater).

EARTH PELLETS = КОМОЧКИ ЗЕМЛИ (или ЗЕМЛЯНЫЕ ГРАНУЛЫ) – Earth Pellets are a type of foreign material found in grains. Soft earth pellets include soft fertilizer pellets, except in domestic mustard seed, and any non-toxic material of a similar consistency. Earth pellets remaining in cleaned samples are handpicked and, up to specified tolerances, their percentage by weight is added to the percentage by weight of dockage in domestic shipments to terminals. Export shipments must be practically free from earth pellets. Hard earth pellets are stones.

EARTH TONE = ЗЕМЛЯНОЙ (или ЗЕМЕЛЬНЫЙ) ТОН – Earth Tone:- any of various rich colors containing some brown.

EARTHY = ЗЕМЛИСТОЕ – Earthy:- suggestive of the earth as in color.

EAR–TO–ROW SELECTION = СЕЛЕКЦИЯ КОЛОС К РЯДУ – Ear-To-Row Selection is a method in which selection is carried out on progenies derived from individual ears.

EASD = EUROPEAN ASSOCIATION OF SECURITIES DEALERS

EASE–OF–CARE = ЛЁГКОСТЬ УХОДА (или УДОБСТВО УХОДА) – Ease-Of-Care is a term used to characterize fabrics that, after laundering, can be restored to their original appearance with a minimum of ironing or other treatment. An ease-of-care fabric generally wrinkles only slightly upon laundering. See also Durable Press, Easy-Care, and Wash-And-Wear.

EASE OFF = ОТКАТ (или ОТХОД, или ОСЛАБЛЕНИЕ, или СНИЖЕНИЕ) – Ease Off:- a minor and/or slow decline in the price of a market.

EASILY REALIZABLE ASSETS = ЛЕГКО РЕАЛИЗУЕМЫЕ АКТИВЫ – Easily Realizable Assets are the asstes for which a market exists at all times. Defined by Article 16 of Switzerland's Ordinance to the Banking Law as those assets of a bank which must be reported in the liquidity statement, such as bills eligible for discount with the National Bank or bonds qualifying as collateral.

EASING = ОСЛАБЛЕНИЕ – In the United States, Easing is the Federal Reserve action to lower the federal funds rate. The action is undertaken when economic activity needs to be stimulated. Compare Tightening. / В Соединённых Штатах Америки действие Федерального Резерва по снижению уровня процентных ставок. Предпринимается такое действие в момент, когда необходимо стимулировать экономическую активность. Сравните с Укреплением (Tightening).

EAST = EXAMINER AUTOMATED SEARCH TOOLS

EASTERN ON–PEAK = ПИКОВАЯ НАГРУЗКА НА ВОСТОКЕ – Eastern On-Peak:- in reference to electricity, the load during a specific period of time. Refers to the hours of the business day when demand is at its peak. The eastern markets trade a 16-hour (5 by 16), on-peak day Monday through Friday. / В Соединённых Штатах Америки по отношению к электричеству под пиковой нагрузкой на востоке понимается нагрузка в течение определённого периода времени. Она относится к часам рабочего дня, когда спрос на электроэнергию наиболее высок. Торговля на восточных рынках предполагает 16-часовой пиковый период потребления в сутки с Понедельника по Пятницу (5 дней по 16 часов). Пиковая Нагрузка или Пиковая Мощность, от Французского слова Pic, означающее Остроконечная Машина или Пик, – максимальная электрическая нагрузка электроэнергетической системы в определённом интервале времени (обычно сутки). Например, в суточном графике электрической нагрузки города можно выделить утреннюю и вечернюю пиковую нагрузку. На время действия пиковой нагрузки включают резервные мощности энергосистемы или специальные пиковые электростанции.

EASTERN PREVAILING TIME = ВОСТОЧНОЕ ПРЕВАЛИРУЮЩЕЕ ВРЕМЯ – In the United States, Eastern Prevailing Time (EPT) is equivalent to Eastern Standard Time (EST) or Eastern Daylight Time (EDT) as is in effect from time to time. See also Eastern Standard Time.

EASTERN PULLED WOOL = ВОСТОЧНАЯ ЗАВОДСКАЯ (ОВЕЧЬЯ) ШЕРСТЬ (или ПОДПАР) – Eastern Pulled Wool:- a wool is pulled from the skins after it has been loosened, usually be a depilatory. Pulled wool should not be confused with dead wool.

EASTERN STANDARD TIME = ВОСТОЧНОЕ СТАНДАРТНОЕ ВРЕМЯ – The Eastern Standard Time (EST) is the standard time in the fifth time zone west of Greenwich, England, reckoned at 75° west and used, for example, in the eastern part of North America. Also known as Eastern Time. See also Eastern Prevailing Time. The time used on the east coast of Northern America, which is five hours behind GMT. Eastern Time Zone is the Eastern Time Zone of the United States of America (USA) and Canada. Eastern Standard Time (EST) is 5 hours behind Greenwich Mean Time (GMT –5). In most states in the USA and in most provinces in Canada, Daylight-Saving Time (DST) is observed. During DST the time is shifted forward by 1 hour to EDT; which is 4 hours behind Greenwich Mean Time (GMT –4). After the Summer months Eastern Time is shifted back by 1 hour to US Eastern Standard Time (EST) or (GMT –5). The schedule for the states of the United States that adopt daylight saving time are:- (i) 02 am on the Second Sunday in March to (ii) 02 am on the First Sunday of November.

EAST–WEST MARKET = РЫНОК ВОСТОК–ЗАПАД – East-West Market (in air transport):- for the purposes of this forecast, we define east-west markets as the bidirectional cargo flows connecting Asia and North America, Europe and Asia, and Europe and North America.

EASY = ЛЕГЧЕ – Easy (maritime term):- carefully (watch what you're doing).

EASY–CARE = ЛЁГКОСТЬ УХОДА (или УДОБСТВО УХОДА) – A term Easy Care refers to fabrics which are restored to their original appearance after laundering with little or no ironing. Generally such fabrics can be machine washed and tumble dried. Easy-Care (clothing & fashion) (esp. of a fabric or garment) hardwearing, practical, and requiring no special treatment during washing, cleaning, etc. See also Ease-Of-Care. Easy Care is an extremely loose term implying that a limited amount of ironing will be necessary after the item is washed. Easy care fabrics seem to be most successful when they are made of at least 65% polyester, or have had a special finish applied to them. Durable press is a more reliable indication that garments or other items require little or no ironing.

EAT = EFFECTIVE ACCUMULATED TEMPERATURE

EATING RIPENESS = СПЕЛОСТЬ ДЛЯ ПОЕДАНИЯ – Eating Ripeness:- ready-to-eat or ripe for consumption (climacteric). Ideal degree of ripeness for consumption. / *Идеальная степень спелости для потребления.*

EBA = EUROPEAN BANKING ASSOCIATION

EBA INITIATIVE = EVERYTHING–BUT–ARMS INITIATIVE

EBA CLEARING BANKS = КЛИРИНГОВЫЕ БАНКИ ЕБА – EBA Clearing Banks:- the Euro Banking Association (EBA) was founded in Paris in 1985 by 18 commercial banks and the European Investment Bank. The European Commission as well as the Bank for International Settlements (BIS) supported the founding of the EBA. Since then, the number of members has risen to almost 200. The institutions come from all member states of the European Union and from Norway, Switzerland, Australia, China, Japan, the United Arab Emirates and the USA. In its early years, the agenda of the EBA included the promotion of the European Monetary Union (EMU) and the development and management of a private industry ECU clearing system stretching across Europe. EBA Clearing Banks are the settlement banks for the EBA's Euro1 system. EURO1 is a real-time net clearing and settlement system for individual financial and commercial payments and is owned and operated by EBA Clearing Company (was founded in June 1998 by 52 major European and international banks with the mission to own and operate the EURO1 large-value payment system; today, EBA Clearing counts 64 shareholder banks and, through its EURO1, STEP1 and STEP2 systems, offers both high-value and low-value clearing and settlement services to a wide community of banks in the European Union; based in Paris; it has representative offices in Brussels, Frankfurt and Milan). It is open to banks that have a registered address or branch in the European Union and fulfill a number of additional requirements. On average, EURO1 processes more than 230 000 payments per day, with an overall value of almost €245 billion. Today, the service counts 66 participants and 60 sub-participants. EURO1 is subject to German law (Transactional account principle/Single Obligation Structure) and is based on a messaging and IT infrastructure provided by SWIFT. / Клиринговые Банки ЕБА – расчётные банки в системе 'Евро 1' Европейской Банковской Ассоциации (ЕБА).

EBA EURO1 = ЕБА ЕВРО1 – EBA EURO1 is a same-day payment system run by the Euro Banking Association (EBA). Launched in 1998, EBA EURO1 was developed in order to provide an efcient, secure, and cost-efective net settlement infrastructure, but with immediate fnality for all Euro high-value payments processed. Similar to the CHIPS system for USD, EBA EURO performs rolling multilateral netting and settlement throughout the day among its 51 participant banks. Each EBA EURO1 participant only has one single obligation/claim toward the system as a whole. EBA EURO1 is a private-sector-owned system used for domestic and cross-border single payments in Euro between banks operating in the European Union. There are 22 203 BICs reachable via the EURO1/STEP1 participants as listed in the EURO1/STEP1 directory. EBA EURO1 is an alternative to TARGET2 similar to TARGET2, it is a SWIFT-based system with banks identifed via SWIFT BICs. Although it is a netting system, payments processed via EBA EURO1 are irrevocable and processed with immediate fnality. EURO1 opens at 07:30 CET and closes at 16:00 CET for payment processing. During the final settlement window, members' final positions are sent by EBA Clearing to each member. A member with an end-of-day obligation is to pay to EBA EURO1 for its obligation via TARGET2 and a member with an end-of-day claim receives the claim via TARGET2 from EBA EURO1. The service provides a unique RTGS-equivalent multilateral net settlement arrangement, duly approved by the European Central Bank (ECB). See also TARGET2.

E–BANKING = ELECTRONIC BANKING

EBC = ELECTRONIC BUSINESS CENTER

EBIAT = EARNINGS BEFORE INTEREST AFTER TAXES

EBIT = EARNINGS BEFORE INTEREST AND TAX

EBITD = EARNINGS BEFORE INTEREST, TAXES AND DEPRECIATION

EBITDA = EARNINGS BEFORE INTEREST, TAXATION, DEPRECIATION, AMORTIZATION

EBITDA MARGIN = МАРЖА И.БИ.АЙ.ТИ.ДИ.ЭЙ. (или МАРЖА ИБИТДА) – EBITDA stands for Earnings Before Interest, Taxes, Depreciation and Amortization. The EBITDA Margin measures the number of cents of EBITDA generated per Dollar of sales. It is one way to measure the cash flow of a company's operations. This is particularly important for a start-up company because it needs to ensure it has enough cash to cover its costs. For example, a company might have a number of capital expenditures that are depreciated over five years or more, so it might be generating a profit on paper but still be short on cash. Step 1:- add the cost of goods sold, research and development, and sales, general and administrative expenses (SG&A for short) to calculate the total cash

expenditures of the company for the year. SG&A include wages and benefits for employees, rent for company property, utilities and related costs. If the company does not have certain expenses, such as research and development, plug in USD0. For example, if the company has USD150 000 in costs of goods sold, USD0 in R&D (short for the Research and Development), and USD100 000 in SG&A (short for the Selling, General and Administrative) expenses, the company's total cash expenses for the year equal USD250 000. Step 2:- subtract the company's total cash expenditures from its sales for the year to find the company's EBITDA. In this example, if the small business has USD350 000 of sales, subtract USD250 000 from USD350 000 to find the company's EBITDA equals USD100 000. Step 3:- divide the company's EBITDA by its sales to calculate the EBITDA margin. In this example, divide USD100 000 by USD350 000 to get 0.285 7. Step 4:- multiple the EBITDA margin by 100 to convert it to a percentage. This percentage represents how many cents out of every Dollar of sales that count towards the business's EBITDA. In this example, multiply 0.285 7 by 100 to find the small business's EBITDA equals 28.57 percent. EBITDA as a percentage of turnover. EBITDA Margin is a measurement of a company's operating profitability. It is equal to earnings before interest, tax, depreciation and amortization (EBITDA) divided by total revenue. Because EBITDA excludes depreciation and amortization, EBITDA margin can provide an investor with a cleaner view of a company's core profitability. A firm with revenue totalling USD125 000 and EBITDA of USD15 000 would have an EBITDA margin of USD15 000 / USD125 000 = 12%. The higher the EBITDA margin, the less operating expenses eat into a company's bottom line, leading to a more profitable operation. The EBITDA Margin is the margin that we earn on sales from our operating activities before depreciation and amortization. It is calculated as income from operations before depreciation and amortization as a percentage of sales. / И.Би.Ай.Ти.Ди.Эй. или ИБИТДА как процент от оборота.

EBON = ЭБЭН (или ХХ) – Ebon:- dark brown or black; ebony. / тёмно-коричневое или чёрное; эбэни (ebony).

EBONY = ЭБЕНОВОЕ (или ЧЁРНОЕ, или ЭБЭНИ) – Ebony:- black, dark.

EBRD = EUROPEAN BANK FOR RECONSTRUCTION AND DEVELOPMENT

EBT = EARNINGS BEFORE TAXES

EBXML = И.БИ.ЭКС.ЭМ.ЭЛЬ (или ХХ) – ebXML:- transaction based XML language which assists e-commerce.

EC = ECUADOR

EC = ELECTRICAL CONDUCTIVITY

EC = EMULSIFIABLE CONCENTRATE

EC = EUROCHEQUE

EC = EUROPEAN COMMUNITY

ECA = ECONOMIC COMMISSION FOR LATIN AMERICA

ECAR = EAST CENTRAL AREA RELIABILITY COUNCIL

ECART = EUROPEAN CONSORTIUM FOR AGRICULTURAL RESEARCH IN THE TROPICS

ECASH = ЭНАЛИЧНОСТЬ – ECash or Electronic Cash is a computer generated Internet based system which allows funds to be transferred and items to be purchased by credit card, check or by money order, providing secure on-line transaction processing. ECash is an electronic payment system for purchasing goods and services on the Internet. Electronic Cash (ECash) is an anonymous electronic cash system; equivalent to 'cash' or 'printed bank notes' except that it is transferred through networks with bits of information, in essence it is just another representation of monetary value; anonymity is preserved through public key cryptography, digital signatures, and blind signatures. How it is used? ECash is used over the Internet, email, or personal computer to other workstations in the form of secured payments of 'cash' that is virtually untraceable to the user. It is backed by real currency from real banks. The way ecash works is similar to that of electronic fund transfers done between banks. The user first must have an ecash software program and an ecash bank account from which ecash can be withdrawn or deposited. The user withdraws the ecash from the account onto her computer and spends it in the Internet without being traced or having personal information available to other parties that are involved in the process. The recipients of the ecash send the money to their bank account as with depositing 'real' cash. Other than making purchases on the Internet, ecash can also be found used in entertainment sites – on 'gambling tables' in Internet casinos such as PAF Casino and Internet Casino. Ecash allows the exchange of money to be conducted in the same way as in real casinos. Relevance to business and electronic commerce:- even though there are more than 25 000 companies conducting business on the Internet, consumers are still not that confident with having transaction done over the Internet. This is mostly due to a lack of a readily available and secure payment system. With credit cards, consumers are concerned with the security of their information and thus deterring them from directly making purchases from the Internet. With ecash, hopefully consumers will be more comfortable with transactions over the Internet as it is a one-time transaction that cannot be traced back to the user, whereas with credit cards, hackers can obtain information of the card holder and commit frauds. With the appearance of ecash, the need for commercial banks to be involved in electronic banking and to back the electronic currencies becomes more apparent. However, there remains a skeptical view about having monetary transactions done over the Internet as it is a fairly public domain where there is easy access. Thus increasing and promoting commercial bank's interest in the Internet and conducting business over the Internet is necessary in order to further the development of ecash and commerce in the Internet, as well as improving cryptography and security features of the systems. While it is a grand idea to mimic the real world transactions with cash on the Internet through the use of an anonymous transaction system, at this moment it still poses a lot of logistics and legal problems and possible security hazards. There are still questions of the regulation of electronic money, how will the ecash be backed and redeemed, determining how much of money in the economy are circulated in ecash since the Internet covers such a vast area internationally. Moreover, with Internet business companies, how will taxes be applied to them when they conduct business all over the world? Ecash is not completely anonymous as with hard cash since there is always the computer and the network, which can be traced. But do people really care about anonymity? Some people may want to track expenses if they're conducting businesses through the Internet. Also, there is the issue of possible criminal activity within the system by allowing criminals to spend illegal money easier if ecash is untraceable. The US Department of Treasury's Financial Crimes Enforcement Network provides some information on how it is addressing these issues. Some Ecash providers:- (i) eCash Technologies; (ii) CyberCash; (iii) Mondex; (iv) Magex; etc.

ECB = THE EUROPEAN CENTRAL BANK

THE ECB PAYMENT MECHANISM = МЕХАНИЗМ ПЛАТЕЖЕЙ ЕЦБ (или ПЛАТЁЖНЫЙ МЕХАНИЗМ ЕЦБ) – The ECB Payment Mechanism (EPM):- the ECB operates its own payment-processing tool, the ECB payment mechanism (EPM). EPM is an integral part of TARGET and connected to the 15 national systems in exactly the same way as they are connected to one another. EPM Customers:- besides processing the ECB's own payments, the EPM offers its services only to three categories of customers:- (i) non-

EU central banks; (ii) European and international institutions; and (iii) clearing and settlement organisations (for example, CLS and EBA). Features and Functioning:- the EPM provides all features for the real-time processing of payments. It contains the necessary Central Accounting System (CAS) for the settlement of payments between customers. It can also send them the required confirmation and/or payment messages. The normal communication channel with the EPM is the SWIFT network. Customers send their payments (and inquiries) via the SWIFT FIN service and also receive debit or credit advices and end-of-day statements via SWIFT. Account holders without a SWIFT connection can deliver their payment orders via other pre-agreed means. In a similar way, they can receive information on the status of their account(s) and transactions. The ECB Payment Mechanism (EPM), although this is not an Real-Time Gross Settlement (RTGS) system, it is a participant in Trans-European Automated Real-time Gross settlement Express Transfer (TARGET) system. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Механизм Платежей ЕЦБ (МПЕ; под сокращением ЕЦБ понимается Европейский Центральный Банк) хотя и не является системой Валовых Расчётов в Режиме Реального Времени (ВРРРВ), он всё равно является участником Трансевропейской Автоматизированной Системы Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам (ТАСВРРУП) или Трансевропейской Автоматизированной Системы Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам (ТАСВРРЭП).

ECC = EMPLOYEE COMPENSATION COMMISSION

ECC = EUROPEAN CONTRACT FOR COFFEE

EC CARD = КАРТА ЕЧ – EC Card or Eurocheque Card is a payment instrument employed in connection with the international Eurocheque system. Uses of card:- (i) as a guarantee card when paying with eurocheque; (ii) as a debit card for withdrawing cash from bancomats; (iii) as a means of cashless payment in shops/businesses displaying the 'ec-direct' sign (EFTPOS, POS); (iv) as a means of cashless payment for transactions involving small amounts in shops/businesses/petrol stations displaying the 'CASH' sign. An Ec-Card is not a credit card.

ECCN = EXPORT CONTROL CLASSIFICATION NUMBER

ECD = EMPTY CONTAINER DEPOT

ECE = ECONOMIC COMMISSION FOR EUROPE

ECF = EUROPEAN COFFEE FEDERATION

ECGD = EXPORT CREDITS GUARANTEE DEPARTMENT

ECHINATE = ШИПОВАТОЕ (или ИМЕЮЩЕЕ ШИПЫ, или КОЛЮЧЕЕ, или ИГЛИСТОЕ) – Echinate:- bearing prickles or spines.

ECHINOCARPA = ЭХИНОКАРПА (или ЭХИНОПЛОДНОЕ, или ШИПОГЛАВОЕ, или ШИПОПЛОДНОЕ) – Echinocarpa:- with spiny fruit. Also Acanthocarpa. / Колючеплодное (Acanthocarpa).

ECHO = ЭКО – Echo (pronunciation:- ECK-oh) or E is international nautical signal flag meaning:- I am directing my course to starboard. Meaning:- I am altering my course to starboard.

ECJ = EUROPEAN COURT OF JUSTICE

ECL = ENHANCED CHEMILUMINESCENCE

ECM = EMERGING COMPANY MARKETPLACE

ECM = EUROPEAN COMMON MARKET

E–CMR = ELECTRONIC CMR

ECN = ELECTRONIC COMMUNICATIONS NETWORK

ECO = ЭКО – Eco:- of or relating to habitat or household, mostly used as a prefix related to ecology. Eco comes from the ancient Greek word 'oikos' (house), e.g., eco-label, eco-friendly, eco-shopping. Within the textile industry, 'eco' refers to fibers/fabrics that are sustainable or friendly to the environment.

ECOAREA = ЭКОАРЕАЛ – Ecoarea is an area with similar fauna, flora and climate and hence similar concerns about the introduction of biological control agents.

ECO–FRIENDLY = ЭКОЛОГИЧНОЕ (или НЕ ОКАЗЫВАЮЩЕЕ НЕБЛАГОПРИЯТНОГО ВОЗДЕЙСТВИЯ НА ОКРУЖАЮЩУЮ СРЕДУ) – Eco-Friendly is a term used to describe services and goods that cause very little, if any, harm to the environment.

ECOLOGY = ЭКОЛОГИЯ – Ecology is the science concerning the relationship between organisms and environment. Ernst Haeckel in full Ernst Heinrich Philipp August Haeckel (born on 1834-February-16, Potsdam, Germany, and died on 1919-August-09, Jena, Germany). Ecology is the study of the interactions of organisms with their physical environment and with one another. / Под Экологией, от Греческих слов Óikos, означающее Дом или Жилище или Местопребывание, и Lógos, означающее Слово или Учение, понимается наука об отношениях растительных и животных организмов и образуемых ими сообществ между собой и окружающей средой. Термин Экология предложен в 1866 Немецким зоологом и эволюционистом Эрнстом Хэккэлем (Ernst Haeckel; родился 16 Февраля 1834 в Потсдаме, Германия, и умер 09 Августа 1919, в Йэне, Германия). Объектами экологии могут быть популяции организмов, виды, сообщества, экосистемы и биосфера в целом. В XX веке в связи с усилившимся воздействием человека на природу экология приобрела особое значение как научная основа рационального природопользования и охраны живых организмов. С 1970-х складывается экология человека, или социальная экология, изучающая закономерности взаимодействия общества и окружающей среды, а также практические проблемы её охраны; включает различные философские, социологические, экономические, географические и другие аспекты, например, экология города, техническая экология, экологическая этика и другие. В этом смысле говорят об 'экологизации' современной науки. Экологические проблемы, порождённые современным общественным развитием, вызвали на Западе ряд общественно-политических движений, выступающих против загрязнения окружающей среды и других отрицательных последствий научно-технического прогресса. Под Экологией понимается наука о взаимоотношениях организмов со средой их обитания. Под организмом в данном случае понимается всё живое на Земле, обладающее способностью обменивать вещества и воспроизводить себе подобное, а средой обитания – всё то, что окружает эти организмы, всё, с чем они соприкасаются и взаимодействуют. Термин Экология впервые употребил в 1858 Американский философ-идеалист и писатель Хэнри Дэйвид Торо (Henry David Thoreau; 1817–62). Однако научное содержание этому понятию придал в 1866 Немецкий зоолог и эволюционист Эрнст Хайнрихь Филип Аугуст Хэккэль (Ernst Heinrich Philipp August Haeckel; 1834–1919), определив экологию

как науку об ‘экономии природы’. Интенсивное развитие экология получила в XX веке, перестав уже быть только биологической дисциплиной. Её объектами стали популяции организмов, виды, сообщества, экосистемы, человек и биосфера в целом. В результате возник ряд тесно связанных между собой самостоятельных научных дисциплин и направлений:- общая экология, глобальная экология, эволюционная экология, экология животных, экология растений, космическая, медицинская, сельскохозяйственная и тому подобная экология. В последние годы идёт активный процесс становления социальной экологии. Экология – взаимоотношение человека с окружающей его природной средой, включая экономическое использование природных ресурсов, их охрану и восстановление.

ECOMM = ELECTRONIC COMMERCE PORTAL

E–COMMERCE = ELECTRONIC COMMERCE

E–COMMERCE = Э–КОММЕРЦИЯ – E-Commerce:- transaction of goods or services that takes place electronically using the Internet.

ECONOMETRICS = ЭКОНОМЕТРИЯ – Econometrics is a branch of economics in which economic theories are expressed in mathematical terms. Econometrics as we know it today is directly related to economic forecasting and planning. Econometrists use statistical methods to measure relationships among economic variables and their impacts to predict future events or make economic policy recommendations. The application of statistical and mathematical methods in the field of economics to test and quantify economic theories and the solutions to economic problems. Branch of statistics that uses mathematical models to test economic hypotheses, describe economic relationships, and forecast economic trends. Econometrics is employed to produce correlated quantitative data rather than to prove economic causation. / Под Эконометрией понимается наука, изучающая конкретные количественные взаимосвязи экономических объектов и процессов с помощью математических и статистических методов и моделей. Эконометрия – часть экономической науки, занимающаяся разработкой и применением математических и прежде всего экономико-статистических методов анализа экономических процессов, обработки статистической экономической информации.

ECONOMICALLY DELIVERABLE SUPPLY = ПРЕДЛОЖЕНИЕ ПО ФАКТИЧЕСКОЙ ПОСТАВКЕ (ПО ФЬЮЧЕРСУ) – Economically Deliverable Supply:- that portion of the deliverable supply of a commodity that is in position for delivery against a futures contract, and is not otherwise unavailable for delivery. For example, Treasury Bonds held by long-term investment funds are not considered part of the economically deliverable supply of a Treasury Bond futures contract.

ECONOMICALLY SIGNIFICANT PRICES = ЭКОНОМИЧЕСКИ ЗНАЧИМЫЕ ЦЕНЫ – Economically Significant Prices are the prices whose level significantly affects the supply of the good or service concerned. Market output consists mainly of goods and services sold at ‘economically significant’ prices while non-market output comprises those provided free or at prices that are not economically significant. / выработка (output).

ECONOMIC ANALYSIS = ЭКОНОМИЧЕСКИЙ АНАЛИЗ – Economic Analysis:- it primarily uses monetary values as a measure to allow policy makers to compare costs and benefits from different types of goods and services. It encompasses more than the study of market goods and services. Economic analysis does not prevent the use of other measures that do not use a monetary value; for example, qualitative or environmental analysis. / Экономический Анализ – выведение экономических закономерностей из соответствующих фактов экономической действительности, разложение экономики на отдельные части, именуемые экономическими категориями, и их анализ.

ECONOMIC AND FINANCIAL COMMITTEE = ЭКОНОМИЧЕСКИЙ И ФИНАНСОВЫЙ КОМИТЕТ (или КОМИТЕТ ПО ЭКОНОМИКЕ И ФИНАНСАМ) – Economic And Financial Committee (EFC) is a consultative Community body set up at the start of Stage Three of Economic and Monetary Union (EMU). The Member States, the European Commission and the European Central Bank (ECB) each appoint no more than two members of the Committee. Each Member State selects one member from among the senior officials of its national administration, and the second member from among the senior officials of its national central bank (NCB). However, the NCB members only participate in EFC meetings when issues of their institution’s particular expertise or competence are being discussed. Article 114(2) of the EC Treaty lists the EFC’s tasks.

ECONOMIC AND MONETARY UNION = ЭКОНОМИЧЕСКИЙ И МОНЕТАРНЫЙ СОЮЗ – Economic and Monetary Union (EMU): was realized in three stages according to the procedures and timetable set out in the EC Treaty. Stage One of EMU started in July 1990 and ended on 31 December 1993. It was mainly characterized by the dismantling of all internal barriers to the free movement of capital within the EU. Stage Two of EMU began on 01 January 1994. It provided for, among other things, the establishment of the European Monetary Institute (EMI), the prohibition of financing of the public sector by the central banks, the prohibition of privileged access to financial institutions by the public sector and the avoidance of excessive government deficits. Stage Three started on 01 January 1999 with the transfer of monetary competence to the ECB and the introduction of the Euro. The cash changeover on 01 January 2002 completed the set-up of EMU. Economic And Monetary Union (EMU):- the process which leads EU Member States to harmonise their economic and monetary policies and to create a single currency. The Treaty on European Union (Maastricht Treaty; signed on 1992-February-07) provided for EMU to be achieved in three stages:- in the first stage (1990-July-01 to 1993-December-31), Member States established the free movement of capital between their respective territories, with closer coordination of economic policies and closer cooperation between central banks; the second stage (1994-January-01 to 1998-December-31) started with the creation of the European Monetary Institute, and was dedicated to technical preparations for the creation of the single currency, the avoidance of excessive deficits, and enhanced convergence of the economic and monetary policies of the Member States (to ensure stability of prices and sound public finances); and the third stage (from 1999-January-01) began with the irrevocable fixing of exchange rates, the transfer of monetary policy competence to the ECB and the introduction of the Euro as the single currency. Economic and Monetary Union (EMU):- the idea that Europe should have a single, unified and stable monetary system has its roots far back in history. After one unsuccessful attempt in the early 1970s, a decisive impetus to the integration process came about in June 1988, when the European Council reconfirmed the objective to gradually achieve economic and monetary union. A committee chaired by Jacques Delors, the then President of the European Commission, was set up to study and propose concrete stages leading to this union. The committee’s report (the so-called ‘Delors Report’), presented in April 1989, proposed the introduction of an Economic and Monetary Union (EMU) in three discrete but evolutionary steps. Stage One of EMU:- following the Delors Report, the European Council, in June 1989, decided that the first stage of EMU should be launched on 01 July 1990. At the same time, the Committee of Governors of the central banks of the Member States of the European Economic Community, which had played an increasingly important role in monetary cooperation since it was established in May 1964, was given additional responsibilities. In order for Stages Two and Three to take place, the Treaty establishing the European Community (the so-called ‘Treaty of Rome’) had to be revised so that the required institutional structure could be established. For this purpose, an Intergovernmental Conference on EMU was held in 1991 in parallel with the Intergovernmental Conference on political union. The Committee of Governors submitted the draft Statute of the ESCB and of the ECB to the Intergovernmental Conference. The negotiations resulted in the Treaty on European Union, which was

agreed in December 1991 and signed in Maastricht on 07 February 1992. However, owing to delays in the ratification process, it did not come into force until 01 November 1993. Stage Two of EMU:- the establishment of the EMI and the ECB. The establishment of the European Monetary Institute (EMI) on 01 January 1994 marked the start of the second stage of EMU. Henceforth, the Committee of Governors ceased to exist.The EMI's transitory existence also mirrored the state of monetary integration within the Community:- the EMI had no responsibility for the conduct of monetary policy in the European Union (this remained the responsibility of the national authorities) nor did it have any competence for carrying out foreign exchange intervention. The two main tasks of the EMI were first to strengthen central bank cooperation and monetary policy coordination; and second to make the preparations required for the establishment of the ESCB, for the conduct of the single monetary policy and for the creation of a single currency in the third stage. In December 1995 the European Council meeting in Madrid agreed on the name of the European currency unit to be introduced at the start of Stage Three, the 'Euro', and confirmed that Stage Three of EMU would start on 01 January 1999. A chronological sequence of events was preannounced for the changeover to the Euro. This scenario was based mainly on detailed proposals drawn up by the EMI. At the same time, the EMI was given the task of carrying out preparatory work on the future monetary and exchange rate relationships between the Euro area and other EU countries. In December 1996 the EMI presented a report to the European Council which formed the basis of a Resolution of the European Council on the principles and fundamental elements of the new exchange rate mechanism (ERM II), which was adopted in June 1997. In December 1996 the EMI also presented to the European Council, and subsequently to the public, the selected design series for the Euro banknotes to be put into circulation on 01 January 2002. In order to both complement and clarify the Treaty's provisions on EMU, in June 1997 the European Council adopted the Stability and Growth Pact to ensure budgetary discipline in respect of EMU. The Pact was supplemented and the respective commitments enhanced by a Declaration of the Council in May 1998. On 02 May 1998 the Council of the European Union – in its composition of Heads of State or Government – decided that 11 Member States (Belgium, Germany, Spain, France, Ireland, Italy, Luxembourg, the Netherlands, Austria, Portugal and Finland) had fulfilled the conditions necessary for the adoption of the single currency on 01 January 1999. At the same time, the finance ministers of the Member States adopting the single currency agreed, together with the governors of the NCBs, the European Commission and the EMI, that the ERM central rates of the currencies of the participating Member States would be used to determine the irrevocable conversion rates for the Euro. On 25 May 1998 the governments of the 11 participating Member States officially appointed the President, the Vice-President and the four other members of the Executive Board of the ECB. Their appointment came into effect on 01 June 1998 and marked the establishment of the ECB. With this, the EMI had completed its tasks. In accordance with Article 123 of the Treaty establishing the European Community, the EMI went into liquidation. All the preparatory work entrusted to the EMI was concluded in good time and the ECB spent the rest of 1998 carrying out final tests of systems and procedures. Stage Three of EMU:- the irrevocable fixing of exchange rates. On 01 January 1999 the third and final stage of EMU began with the irrevocable fixing of the exchange rates of the currencies of the 11 Member States which had initially participated in monetary union and with the conduct of a single monetary policy under the responsibility of the ECB. The number of participating Member States increased to 12 on 01 January 2001, when Greece joined the third stage of EMU. This followed on from a decision taken on 19 June 2000 by the EU Council, in which it was acknowledged that Greece fulfilled the convergence criteria. In January 2007 the number of participating countries changed again to 13 with the entry of Slovenia into the euro area. Following the decision of the EU Council on the abrogation of the derogation status of Cyprus and Malta, taken on 10 July 2007, Cyprus and Malta joined the Eurosystem on 01 January 2008. On 01 January 2009 Slovakia became the 16th EU Member State to join the Euro area. This followed the decision of the EU Council on 08 July 2008 which acknowledged that Slovakia had fulfilled the convergence criteria. On 01 January 2011 Estonia joined the Euro area and became the 17th Member State to join, after a decision by the EU Council of 13 July 2010 that Estonia fulfilled the convergence criteria. / Жакь Дэлёр (Jacques Delors), тогдашний Президент Европейской Комиссии. Маастрихт – город в Нидерландах, административный центр провинции Лимбург. Маастрихтский Трактат .

ECONOMIC AND SOCIAL COUNCIL = ЭКОНОМИЧЕСКИЙ И СОЦИАЛЬНЫЙ СОВЕТ – Designed to be the UN's main venue for the discussion of international economic and social issues, the Economic and Social Council (ECOSOC) directs and coordinates the economic, social, humanitarian, and cultural activities of the UN and its specialized agencies. Established by the UN Charter, ECOSOC is empowered to recommend international action on economic and social issues; promote universal respect for human rights; and work for global cooperation on health, education, and cultural and related areas. ECOSOC conducts studies; formulates resolutions, recommendations, and conventions for consideration by the General Assembly; and coordinates the activities of various UN programs and specialized agencies. Most of ECOSOC's work is performed in functional commissions on topics such as human rights, narcotics, population, social development, statistics, the status of women, and science and technology; the council also oversees regional commissions for Europe, Asia and the Pacific, Western Asia, Latin America, and Africa. The UN Charter authorizes ECOSOC to grant consultative status to nongovernmental organizations (NGOs). Three categories of consultative status are recognized:- General Category NGOs (formerly category I) include organizations with multiple goals and activities; Special Category NGOs (formerly category II) specialize in certain areas of ECOSOC activities; and Roster NGOs have only an occasional interest in the UN's activities. Consultative status enables NGOs to attend ECOSOC meetings, issue reports, and occasionally testify at meetings. Since the mid-1990s, measures have been adopted to increase the scope of NGO participation in ECOSOC, in the ad hoc global conferences, and in other UN activities. ECOSOC has granted consultative status to more than 1 500 NGOs. Originally, ECOSOC consisted of representatives from 18 countries, but the Charter was amended in 1965 and in 1974 to increase the number of members to 54. Members are elected for three-year terms by the General Assembly. Four of the five permanent members of the Security Council – the United States, United Kingdom, Soviet Union (Russia), and France – have been reelected continually because they provide funding for most of ECOSOC's budget, which is the largest of any UN subsidiary body. Decisions are taken by simple majority vote. / для данного случая (ad hoc). С целью создания условий стабильности и благополучия, необходимых для мирных и дружественных отношений между нациями, основанных на уважении принципа равноправия и самоопределения народов, Организация Объединённых Наций (ООН) содействует:- (i) повышению уровня жизни, полной занятости населения и условиям экономического и социального прогресса и развития; (ii) разрешению международных проблем в области экономической, социальной, здравоохранения и подобных проблем; международному сотрудничеству в области культуры и образования; и (iii) всеобщему уважению и соблюдению прав человека и основных свобод для всех, без различия расы, пола, языка и религии. Все члены ООН обязаны предпринимать совместные и самостоятельные действия в сотрудничестве с Организацией Объединённых Наций для достижения этих целей. Ответственность за выполнение данных функций ООН возлагается на Генеральную Ассамблею ООН и, под руководством Генеральной Ассамблеи, на Экономический и Социальный Совет (ЭКОСОВ; the Economic and Social Council, сокращённо – ECOSOC), являющийся одним из главных органов ООН. Экономический и Социальный Совет состоит из пятидесяти четырёх членов ООН, избираемых Генеральной Ассамблеей. Восемнадцать членов Экономического и Социального Совета избираются ежегодно сроком на три года. Выбывающий член Совета может быть переизбран немедленно. При первых выборах после увеличения числа Экономического и Социального Совета с двадцати семи до пятидесяти четырёх, в дополнение к членам, избираемым вместо десяти членов, срок полномочий которых истекает в конце данного года, избираются двадцать семь дополнительных членов. Срок полномочий девяти из двадцати семи дополнительных членов, избранных таким образом, истекает в конце первого года, а срок полномочий девяти

других членов – в конце второго года, в соответствии с постановлением Генеральной Ассамблеи ООН. Каждый член Экономического и Социального Совета имеет одного представителя. Экономический и Социальный Совет уполномочивается:- (i) предпринимать исследования и составлять доклады по международным вопросам в области экономической, социальной, культуры, образования, здравоохранения и подобным вопросам или побуждать к этому других, а также делать по любому из этих вопросов рекомендации Генеральной Ассамблее, членам ООН и заинтересованным специализированным учреждениям; (ii) делать рекомендации в целях поощрения уважения и соблюдения прав человека и основных свобод для всех; (iii) подготавливать для представления Генеральной Ассамблее проекты конвенций по вопросам, входящим в его компетенцию; (iv) созывать, в соответствии с правилами, предписанными ООН, международные конференции по вопросам, входящим в его компетенцию; и (v) представлять Совету Безопасности информацию и, по предложению Совета Безопасности, обязан ему помогать. Экономический и Социальный Совет осуществляет такие функции, какие входят в его компетенцию, в связи с выполнением рекомендаций Генеральной Ассамблеи. Совет, с одобрения Генеральной Ассамблеи, уполномочивается выполнять работы по просьбе членов ООН и по просьбе специализированных учреждений, связанных с ООН. Совет должен выполнять такие другие функции, какие перечислены в других частях Устава ООН или какие могут быть возложены на него Генеральной Ассамблеей. Экономический и Социальный Совет устанавливает свои собственные Правила и процедуры, включая порядок избрания своего Председателя. Он созывается, по мере надобности, в соответствии со своими Правилами, которые должны включать положения о созыве заседаний по требованию большинства членов. Каждый член Экономического и Социального Совета имеет один голос. Решения Совета принимаются большинством голосов членов Совета, присутствующих и участвующих в голосовании. Экономический и Социальный Совет создаёт комиссии в экономической и социальной областях и по поощрению прав человека, а также такие другие комиссии, которые могут потребоваться для выполнения его функций. Совет приглашает любого члена ООН участвовать без права голоса в обсуждении им любого вопроса, представляющего особый интерес для данного члена ООН. Экономический и Социальный Совет Экономический и Социальный Совет ООН уполномочивается проводить надлежащие мероприятия для консультации с неправительственными организациями, заинтересованными в вопросах, входящих в его компетенцию. Такие мероприятия могут быть условлены с международными организациями, а в случае надобности, с национальными организациями после консультации с заинтересованным членом ООН.

ECONOMIC COMMUNITY OF CENTRAL AFRICAN STATES = ЭКОНОМИЧЕСКОЕ СООБЩЕСТВО ГОСУДАРСТВ ЦЕНТРАЛЬНОЙ АФРИКИ – At a summit meeting in December 1981, the leaders of the Central African Customs and Economic Union (CACEU; l'Union Douanière et Économique de l'Afrique Centrale (UDEAC)) agreed in principle to form a wider la Communauté Économique des États de l'Afrique Centrale (CEEAC; in English – Economic Community of Central African States (ECCAS)). ECCAS was established on 1983-October-18 by the UDEAC members and the members of the Economic Community of the Great Lakes States (CEPGL) (Burundi, Rwanda and the then Zaire (now The Democratic Republic of Congo)) as well as Sao Tomé and Principe. Angola remained an observer until 1999-January-21, when it became a full member. ECCAS began functioning in 1985, but was inactive for several years because of financial difficulties (non-payment of membership fees) and the conflict in the Great Lakes area. The war in the DRC was particularly divisive, as Rwanda and Angola fought on opposing sides. ECCAS has been designated a pillar of the African Economic Community (AEC), but formal contact between the AEC and ECCAS was only established in October 1999 due to the inactivity of ECCAS since 1992 (ECCAS signed the Protocol on Relations between the AEC and the RECs in October 1999). The AEC again confirmed the importance of ECCAS as the major economic community in Central Africa at the third preparatory meeting of its Economic and Social Council (ECOSOC) in June 1999. In June 2002 Rwanda was officially welcomed upon its return as a full member of ECCAS. ECCAS aims to achieve collective autonomy, raise the standard of living of its populations and maintain economic stability through harmonious cooperation. Its ultimate goal is to establish a Central African Common Market. At the Malabo Heads of State and Government Conference in 1999, four priority fields for the organization were identified:- (i) to develop capacities to maintain peace, security and stability, which are essential prerequisites for economic and social development; (ii) to develop physical, economic and monetary integration; (iii) to develop a culture of human integration; and (iv) to establish an autonomous financing mechanism for ECCAS. At the moment CEEAC-ECCAS consists of:- Angola, Burundi, Cameroon, Central African Republic, Chad, Congo, Congo (Democratic Republic of), Equatorial Guinea, Gabon, Rwanda, and Sao Tome and Principe. Headquartered in Libreville, Gabon. Economic Community of Central African States (CEEAC-ECCAS), established in October, 1983, consists of 10 member states and 1 observer state with the goal of promoting economic cooperation and establishing a Central African Common Market. / Во время встречи в верхах, состоявшейся в Декабре 1981, лидеры Таможенного и Экономического Союза Центральной Африки или, как это звучит на Французском языке по месту его регистрации, л'Юньён Дуаньер э Економик' дё л'Яфрик' Сантраль (У.Дэ.Ё.А.Сэ.; l'Union Douanière et Économique de l'Afrique Centrale (UDEAC)) согласились в принципе сформировать более широкое Экономическое Сообщество Государств Центральной Африки (ЭСГЦА) или, как это звучит на Французском языке по месту расположения, Коммюноте Економик' дэз Ета дё л'Яфрик' Сантраль (Сэ.Ё.Ё.А.Сэ; la Communauté Économique des États de l'Afrique Centrale (CEEAC)). основанное в Октябре 1983, состоит из 10 стран членов и 1 страны наблюдателя. Целью данного сообщества является содействие экономическому сотрудничеству и создание Центрально-Африканского Общего Рынка (Central African Common Market).

ECONOMIC COMMUNITY OF THE GREAT LAKES COUNTRIES = ЭКОНОМИЧЕСКОЕ СООБЩЕСТВО БЕРЕГОВЫХ СТРАН ВЕЛИКИХ ОЗЁР – La Communauté Économique des Pays des Grands Lacs (CEPGL; French for The Economic Community of the Great Lakes Countries (CEPGL)) is a sub-regional organization with multiple vocation created by the signing of the Convention of Gisenyi in Rwanda on 1976-September-20, aiming at insuring the safety of member states, at favoring the creation and the development of activities of public interest, at promoting the trades and the traffic of the persons and the possessions, at establishing the cooperation in a narrow way in all the domains of the political, economic and social life. It has three members:- Burundi, The Democratic Republic of Congo (former Zaire), and Rwanda. Its purpose is to promote regional economic cooperation and integration. The CEPGL controls the following institutions:- (i) the Bank of Development of the States of the Great Lakes (BDEGL); (ii) the Comité Permanent Inter-Compagnies (COPIC); (iii) the Institute of the Agronomic Researches and Zootechniques (IRAZ); (iv) the Economic Community of the Great Lakes Countries Organization for Energy (EGL); (v) the International Society for Electricity in the Great Lakes Region (SINELAC); and (vi) the Research Center for the Development of the Mining Resources in Central Africa (CRDRMAC). Economic Community of the Great Lakes Countries (La Communauté Économique des Pays des Grands Lacs (CEPGL)), established in September, 1976, consists of Burundi, Rwanda and Zaire (The Republic of Zaire was the name of the present Democratic Republic of the Congo between 27 October 1971 and 17 May 1997). The President of the Republic of Burundi, the President of the Rwandese Republic, the President of the Republic of Zaire, Considering the historical, geographical and cultural links between their States, their similar development problems, their common interests and their common aspirations for peace, security and progress, in accordance with the principles embodied in the Charter of the United Nations, and in loyalty to the Charter of the Organization of African Unity, resolved to consolidate and increase co-operation and trade, and to join forces in economic, cultural and social development endeavours, guided by their common desire to increase understanding between their peoples and co-operation between their States in

order to consolidate their fraternity and integrated solidarity as part of a greater unity transcending national characteristics, convinced that the establishment of regional economic groups constitutes an objective approach and a realistic basis for African unity, desiring to promote mutual understanding and solidarity between the member States so as to foster in perpetuity a climate propitious to economic co-operation and the maintenance of friendly and peaceful relations between them, decide to establish the Economic Community of the Great Lakes Countries (CEPGL). The aims of the Community shall be:- (i) to ensure, first and foremost, the security of the States and their people in such a way that nothing disturbs peace and order along their respective frontiers; (ii) to devise, plan and encourage the organization and development of activities of common interest; (iii) to promote and intensify trade and the movement of persons and goods; and (iv) to co-operate closely in the social, economic, commercial, scientific, cultural, political, military, financial, technical and tourist fields, and more particularly in legal, customs, public health, energy, transport and telecommunications matters. In order to attain these objectives, the member States solemnly undertake to initiate appropriate action on the problems involved, in particular, through the establishment of common agencies and services, and by the signing of understandings, agreements or conventions. Any member State which is or becomes a member of other organizations promoting economic co-operation shall inform the Community and communicate to it those provisions of the constituent instruments which may relate to the Community's aims. In order to achieve their aim, the High Contracting Parties have agreed to establish the following organs:- (i) The Conference of Heads of State; (ii) The Council of Ministers and the State Commissioner; (iii) The Permanent Executive Secretariat; and (iv) The Arbitration Commission. This Convention shall enter into force upon its ratification by the signatory States in accordance with their constitutional procedures. The Convention came into force on 17 April 1978, the date by which the instruments of ratification of the signatory States had been deposited with the Government of Rwanda, in accordance with article 35. The deposit of the instruments of ratification was effected as follows:- Burundi – on 1977-January-07, Rwanda – on 1977-January-13, and Zaire – on 1978-April-17. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Экономическое Сообщество Береговых Стран Великих Озёр (ЭСБСВО) или, как это звучит на Французском языке по месту создания, Коммюноте Экономик' дэ Пэйи дэ Гран Ляк (Сэ.Ё.Пэ.Жэ.Эл.; La Communauté Économique des Pays des Grands Lacs (CEPGL)). ; (ii) Постоянный Межкомпанийный Комитет или, как это звучит на Французском, Комитэ Пэрманэн Интэр-Компани (КОПИК; Comité Permanent Inter-Compagnies (COPIC)); (iii) . , транспорта и вопросов дальней связи.

ECONOMIC COMMUNITY OF WEST AFRICAN STATES = ЭКОНОМИЧЕСКОЕ СООБЩЕСТВО ЗАПАДНО–АФРИКАНСКИХ ГОСУДАРСТВ – The Economic Community of West African States (ECOWAS; in French:- Communauté Économique des États de l'Afrique de l'Ouest (CEDEAO)) is a regional group of fifteen West African countries. Founded on 28 May 1975, with the signing of the Treaty of Lagos, its mission is to promote economic integration across the region. Considered one of the pillars of the African Economic Community, the organization was founded in order to achieve 'collective self-sufficiency' for its member states by creating a single large trading bloc through an economic and trading union. It also serves as a peacekeeping force in the region. The organization operates officially in three co-equal languages – French, English, and Portuguese. The ECOWAS consists of two institutions to implement policies – the ECOWAS Commission and the ECOWAS Bank for Investment and Development, formerly known as the Fund for Cooperation until it was renamed in 2001. A few members of the organization have come and gone over the years. In 1976 Cape Verde joined ECOWAS, and in December 2000 Mauritania withdrew, having announced its intention to do so in December 1999. Regional Security Cooperation:- the ECOWAS nation assigned a non-aggression protocol in 1990 along with two earlier agreements in 1978 and 1981. They also signed a Protocol on Mutual Defence Assistance in Freetown, Sierra Leone, on 29 May 1981, that provided for the establishment of an Allied Armed Force of the Community. The Community Court of Justice:- the ECOWAS Community Court of Justice was created by a protocol signed in 1991 and was later included in Article 6 of the Revised Treaty of the Community in 1993. However, the Court didn't officially begin operations until the 1991 protocol came into effect on 05 November 1996. The jurisdiction of the court is outlined in Article 9 and Article 76 of the Revised Treaty and allows rulings on disputes between states over interpretations of the Revised Treaty. It also provides the ECOWAS Council with advisory opinions on legal issues (Article 10). Like its companion courts the European Court of Human Rights and the East African Court of Justice, it has jurisdiction to rule on fundamental human rights breaches. Transport:- a Trans-ECOWAS project, established in 2007, plans to upgrade railways in this zone, led by Ghana. Sporting and Cultural Exchange:- ECOWAS nations organize a broad array of cultural and sports event under the auspices of the body, including the CEDEAO Cup in football, the 2012 ECOWAS Games and the Miss CEDEAO beauty pageant. Economic Community Of West African States (ECOWAS), established in 1975 by the Treaty of Lagos, brought together 16 West African countries in an economic association aimed at creating a full customs union (not yet achieved). Members include:- Benin, Burkina Faso, Cape Verde, Cote d'Ivoire, Gambia, Ghana, Guinea, Guinea-Bissau, Liberia, Mali, Mauritania, Niger, Nigeria, Senegal, Sierra Leone and Togo. The Economic Community Of West African States (ECOWAS) or in French – Communauté Économique Des États de l'Afrique de l'Ouest (CEDEAO) is a regional group of fifteen countries, founded in 1975. Its mission is to promote economic integration in 'all fields of economic activity, particularly industry, transport, telecommunications, energy, agriculture, natural resources, commerce, monetary and financial questions, social and cultural matters ...'. The Institutions of the Economic Community of West African States (ECOWAS) are as follows:- (i) The Commission; (ii) The Community Parliament; (iii) The Community Court of Justice; and (iv) ECOWAS Bank for Investment and Development (EBID). The ECOWAS Commission and the ECOWAS Bank for Investment and Development, more often called The Fund are its two main institutions designed to implement policies, pursue a number of programmes and carry out development projects in Member States. Such projects include intra-community road construction and telecommunications; and agricultural, energy and water resources development. Headquartered in Abuja, Nigeria. The fifteen (15) West African States that constitute ECOWAS in 2013:- Benin, Burkina Faso, Cabo Verde, Côte d'Ivoire, Gambia, Ghana, Guinea, Guinea-Bissau, Liberia, Mali, Niger, Nigeria, Senegal, Sierra Leone, and Togo. Economic Community Of West African States (ECOWAS) is an African organization established by the Treaty of Lagos in May 1975 to promote economic trade, cooperation, and self-reliance. The organization seeks to harmonize agricultural policies and to facilitate the free movement of peoples, services, and capital between members. The original 15 members were Benin, Côte d'Ivoire, Gambia, Ghana, Guinea, Guinea-Bissau, Liberia, Mali, Mauritania, Niger, Nigeria, Senegal, Sierra Leone, Togo, and Upper Volta (now Burkina Faso). Cape Verde joined in 1977. ECOWAS contains four specialized commissions:- (i) trading, customs, immigration, and monetary payments; (ii) industry, agriculture, and natural resources; (iii) transportation, telecommunications, and energy; and (iv) social and cultural affairs. / Коммюноте Экономикь Дэ зЕта дё л'Яфрикь дё л'Юэст (Сэ.Э.Дэ.Э.А.О. или СЭДЭАО; Communauté Économique Des États de l'Afrique de l'Ouest (CEDEAO)) . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Экономическое Сообщество Западно-Африканских Государств (ЭСЗАГ), образованное в 1975 Лагосским Трактатом (Treaty of Lagos), собрало вместе 16 Западно-Африканских стран в экономическую ассоциацию, стремившуюся к созданию таможенного союза (так до сих пор и не созданного). Членами сообщества являются:- Бенин, Буркина Фасо (бывшая Верхняя Вольта), Гамбия, Гана, Гвинея, Гвинея-Бисау, Кабо Верде, Кот дИвуар, Либерия, Мали, Мавритания, Нигер, Нигерия, Сенегал, Сьерра Леоне и Того.

ECONOMIC COST BREAKEVEN SELLING PRICE = XX ЦЕНА – Economic Cost Breakeven Selling Price is the price needed to recover all costs including the opportunity costs (cost for using the producer's labor and capital) associated with producing the commodity. See also Accounting Cost Breakeven Selling Price; Breakeven Selling Price; and Cash Flow Breakeven Selling Price.

ECONOMIC CRISIS = ЭКОНОМИЧЕСКИЙ КРИЗИС – Economic Crisis:- disequilibrium between supply and demand of goods and services that triggers an economic downturn. By extension, state of depression affecting an economy, an industry or a region. In the strict sense, a crisis is a sudden downturn in a business cycle, after a phase of expansion, which triggers a recession or depression. Most economic theories attempt to explain the causes of economic crises. Governments began to look for ways to minimize the impacts of crises, and later to prevent them, after the economic crises of the late XIX and early XX centuries. The analysis of changes in Western economies over the past 20 years shows that policies of rapid expansion result in the use of inflation to make periodic adjustments, and that expansion through monetary stability leads to 'stop and go' effects and very slow growth. Economic Crisis is a situation in which the economy of a country experiences a sudden downturn brought on by a financial crisis. An economy facing an economic crisis will most likely experience a falling GDP, a drying up of liquidity and rising/falling prices due to inflation/deflation. An economic crisis can take the form of a recession or a depression. Also called Real Economic Crisis. See also Collapse, Depression, and Recession. The current (in 2013) Financial Crisis is the worst the world has seen since the Great Depression of the 1930s. For younger generations, accustomed to mild recessions of the new phase of globalization, the misery of the Great Depression is hitherto nothing more than a distant legend. However, the collapse of two Bear Stearns Hedge funds in summer of 2007 exposed what came to be known as the subprime mortgage crisis, reintroducing the world to an era of bank failures, a credit crunch, private defaults and massive layoffs. In the new, globalized world of closely interdependent economies, the crisis affected almost every part of the world, receiving extensive coverage in the international media. Global Economic Crisis may refer to:- (i) economic events of the late 2000s:- (a) financial crisis of 2007–08; or (b) Great Recession; (ii) a global recession; and (iii) earlier global economic events, such as:- (a) the Great Depression, a global economic downturn from the late 1920s until World War II, and (b) the Long Depression, an international depression that began in 1873. / Бэа Стёнз Хэдьж (Bear Stearns Hedge). Под Экономическим Кризисом понимается фаза экономического цикла, во время которой происходит насильственное восстановление нарушенных в ходе развития экономики пропорций воспроизводства. Он проявляется в абсолютном падении производства, недогрузке производственных мощностей, росте безработицы, нарушениях в денежно-кредитной и валютно-финансовой сферах и другом. Первый в истории капитализма промышленный кризис разразился в 1825. На домонополистической стадии капитализма экономические кризисы повторялись каждые 8–12 лет, на стадии империализма, особенно после Второй Мировой Войны (1939–45), через 5–6 лет. Наиболее острым был экономический кризис 1929–33. На мировой экономический кризис 1974–75 большое влияние оказал сырьевой кризис начала 1970-х. Экономический Кризис – резкое ухудшение экономического состояния страны, проявляющееся в значительном спаде производства, нарушении сложившихся производственных связей, банкротстве предприятий, росте безработицы, и в итоге – в снижении жизненного уровня, благосостояния населения.

ECONOMIC EFFECTS = ЭКОНОМИЧЕСКИЕ ЭФФЕКТЫ – Economic Effects:- this includes market effects as well as non-market effects, such as environmental and social considerations. Measurement of the economic value of environmental effects or social effects may be difficult to establish. For example, the survival and well being of another species or the value of the aesthetics of a forest or a jungle. Both qualitative and quantitative worth may be considered in measuring economic effects.

ECONOMIC ENTITY = ХОЗЯЙСТВЕННОЕ ЛИЦО (или ЭКОНОМИЧЕСКОЕ ЛИЦО, или ХОЗЯЙСТВУЮЩИЙ СУБЪЕКТ) – Economic Entity is an organization or unit within society, such as a company or agency. In business accounting, the economic entity assumption holds that the entity's activities need to be separated from activities of its owner and those of other economic entities. Economic Entity is a group of entities comprising the parent entity and each of its subsidiaries. In accounting, an Economic Entity is one of the assumptions made in generally accepted accounting principles. Basically, any organization or unit in society can be an economic entity. Examples of economic entities are hospitals, companies, municipalities, and federal agencies. The 'Economic Entity Assumption' says that the activities of the entity are to be kept separate from the activities of its owner and all other economic entities. The business is accounted for separately from other business entities, including its owner. The reason for this is that separate information about each business is necessary for good decisions. Economic entity can be any organization or unit in society. / Группа юридических лиц, состоящая из материнского юридического лица и каждого из его дочерних предприятий.

ECONOMIC GROWTH = ЭКОНОМИЧЕСКИЙ РОСТ (или РОСТ ЭКОНОМИКИ) – Growth theory is the part of economic theory that seeks to explain (and hopes to predict) the rate at which a country's economy will grow over time. Economic Growth is usually measured as the annual percentage rate of growth in one or another of the country's major national income accounting aggregates, such as Gross National Product or Gross Domestic Product (almost always with appropriate statistical adjustments to discount the potentially misleading effects of price inflation). Just about any country's economy will show sizable year-to-year and quarter-to-quarter fluctuations in its economic growth rate, but economic growth theorists tend to concentrate their efforts on analyzing and explaining the smaller variations in the longer-term trend or average rate of economic growth over periods of a decade or more. They leave explanation of the shorter-term fluctuations around the longer-term trend to specialists in business cycle theory because investigation has shown that the predominant influences on short-term growth rates seem to differ in important ways from the determinants of an economy's long term average growth performance. It might also be added that the political effects of variations in long range economic growth rates tend to be substantially different from the political effects of the booms and busts of the business cycle. The short term ups and downs of the business cycle have dramatic effects on popular perceptions of the country's economic well-being. In a recession, hundreds of thousands or even millions of people may become unemployed and suffer dramatic declines in their incomes for the duration of the crisis – usually for a period of somewhere between six months and one-and-a-half years before more normal economic conditions return again. Yet over the long haul, even rather small increases or decreases in the trend rate of economic growth will have much more profound and enduring effects on economic production and hence on the material living standards of the population. As an illustration, consider the following:- During the period since the end of World War II (1946 to 1999-I), the growth rate of GDP for the United States (corrected for inflation) has averaged about 3.3% per year. Assuming that the typical undergraduate student reading this text was born in 1979, the growth rate of the US economy over his or her lifetime has averaged a slightly lower 2.7% per year – a difference of 'only' 0.6 percentage points per year. But if the US had been able to maintain the same average growth rate from 1979 to 1999 that it had enjoyed during 1946 to 1978 (about 3.6%), 1998 GDP would have reached 9.152 trillion 1992 Dollars worth of goods and services instead of the 7.552 trillion Dollars of production actually achieved. That means that the income of the average American household in 1998 (and every single year thereafter) could have been more than 20% higher than it actually turned out to be if only a way could have been found to prevent this seemingly slight decline in the trend rate of economic growth. And if the US economy had somehow managed to average the slightly higher growth rate of an even 4% for the whole postwar period, the income of the average American household from 1998 on could have been about half again as much over what was (and will later be) at their disposal. Explaining differences between countries in their long term economic growth rates is a complex matter, and the scientific literature on the subject is filled with controversies both technical and ideological in nature. Many of the theoretical determinants of long term growth rates are difficult to measure very adequately and many of the least imperfect measurements available for testing the various theories have been systematically collected in much of the world only for a relatively recent historical period – roughly the last 20 to 30 years. Nevertheless one eminent scholar's recent survey of the published professional literature came up with over sixty different variables that have been put forward by theorists as enhancing or retarding long term economic

growth and that also actually showed significant evidence of real explanatory power in one or more systematic statistical tests using a broad range of XX century historical data. There is broad support in virtually all empirical studies for a strong positive impact on economic growth by the investment rate (especially the rate of investment in plant and equipment) and by various measures of human capital (such as the literacy rate, school enrollment ratios, and average life expectancy). Although it is difficult to measure separately from investment and improvement of human capital, there is also substantial support for the positive contribution of continuing technological innovation and improvement in sustaining the process of economic growth by improving productivity. A majority of the other variables that have been brought into economic growth theory are conceived of as influencing growth rates mainly in an indirect fashion by affecting either the volume or the efficiency in utilization of investment and/or of human capital and/or technological progress. There is also substantial and robust support in the empirical literature for the hypothesis of 'conditional convergence' – that is, because of diminishing returns to capital, the lower a country's level of real GDP per capital at the beginning of a given historical period, the faster the country's subsequent growth rate tends to be (an initial advantage of less developed countries that in practice has been all too often offset by counterproductive governmental policies and by disruptive conditions such as frequent coups, lawlessness, warfare and civil strife that tend to retard savings and investment rates and to destroy or drive out a lot of human capital). Various kinds of public policy variables also seem to make a difference in growth rates. Countries with relatively 'open' economies (that is, those which allow relatively free movement of goods and capital in and out of the country without high tariffs, protectionist import quotas, foreign exchange controls or major restrictions on foreign investment) have tended to maintain higher growth rates than countries with more restrictive policies. Countries that allow extremely rapid expansion of their money stocks and thus bring on high rates of inflation (about 20% per year seems to be a critical threshold) have tended to experience sharply lower economic growth rates than countries with low or moderate rates of inflation. Countries whose legal systems provide relatively reliable enforcement of private contracts and relatively secure protection for private property rights have tended to grow more rapidly than countries whose legal systems are bogged down by corruption, arbitrary judicial decision-making, frequent radical changes in basic legal principles, ex post facto legislation and/or just plain lack of prompt and effective enforcement of the law. Some of the most emotion-laden and ideologically-tinged debates on economic growth theory deal with two questions on which no broad consensus seems likely in the near future:- What sort of mixture of government planning and control versus the free market is most conducive to economic growth? And what are the effects of different cultures (especially differences in religious and ethical values) on promoting or retarding economic growth? Taking the second question first, it should be noted that many of the earliest theories about what causes economic growth were largely cultural in nature. Adam Smith, David Ricardo, Thomas Malthus and many others (even Karl Marx) laid great stress on the importance to economic growth of such culturally conditioned values or attitudes as thrift, the value of diligence and hard work, ambition for a better material standard of living, respect for other people's property rights, the sense of obligation to honor agreements and contracts, inventiveness, willingness to adopt new ways of doing things and so on. Many of these values are fostered and reinforced (or possibly denigrated and condemned) in different measure within different cultural traditions, and an especially important role in this is played by organized religion. It is not surprising then that nowadays we still see a lot of more or less informed speculation about the role of this religion or that in fostering or inhibiting economic growth, especially in less developed regions of the world. (Max Weber's classic essay on 'The Protestant Ethic and the Spirit of Capitalism' is one of the best known and most closely reasoned classic examples of this tradition in the social sciences.) Two or three decades ago, the prevalence of Roman Catholicism in southern Europe and Latin America and its alleged anti-commercial social and economic values were often invoked as a part of the explanation for the relative economic backwardness of these regions compared to mainly Protestant northern Europe and North America. In much more recent times, the influence of Islam in fostering fatalistic attitudes and anti-commercial or anti-materialist values (such as the condemnation of all lending at interest) is often invoked as part of the explanation for the relative economic backwardness of the Moslem countries, despite the huge advantages many of them enjoy in the form of rich endowments of natural resources like petroleum. The conservative anti-materialist and fatalistic elements of Hinduism are often put forward as an explanation for India's backwardness. Weber believed that Confucianism greatly hindered China's economic development over the centuries, but ironically the same Confucian heritage is today more often invoked as an explanation for the rapid commercial development of such places as Hong Kong, Taiwan, and Singapore. The problem with such explanations is that all major religious traditions contain some elements that can encourage economic activity along with other elements that inhibit it, and determining which influences will predominate in any particular place and time is a game that tends to be played with far too many wild cards, with the theorist opportunistically seizing upon whichever elements of the local religious tradition best seem to fit with what he already knows has been happening lately. It is hard to deny that cultural values matter for economic development and that religion plays an important role in fostering the people's values, but correlating changes in people's values with changes in economic growth performance requires much better measurement than is possible by simplistic references to which particular religious faith has predominated in the particular country for centuries. A more promising approach is for researchers to go out periodically and directly sample the distributions of particular 'pro-growth' and 'anti-growth' attitudes among the populations of various countries (perhaps by survey research polling methods) rather than simply assuming the presence of these values and attitudes on the basis of formal religious doctrines. Only then does it make sense to begin gingerly pronouncing upon how the prevalence or lack of particular values correlate with actual long-term economic growth performance in subsequent years. As to the first question, socialist and communist economists used to argue that a totally government controlled and planned economy would enjoy more rapid economic growth than a capitalist economy, primarily basing their case on the idea that a planned economy would maintain a steadier and higher rate of investment, free of the periodic slowdowns of investment caused by periodic financial crises in the capitalist business cycle. It was also assumed that a more egalitarian socialist educational policy would be much more successful in promoting widespread education for the masses, greatly enhancing the supply of what we would today call human capital. Economists more favorably inclined toward the free market system acknowledged that the total amount of investment in both non-human and human capital was indeed very important to rapid economic growth but cautioned that the efficiency with which these resources were allocated was also of extreme importance. A capitalist economy, they argued, has a much better system of incentives for encouraging the most efficient allocation of economic resources, whereas the socialist economy would tend to get bogged down in bureaucratic waste and misallocation of resources that would lead to even more waste than the 'anarchy of the market'. It is now reasonably clear from the historical record of the last thirty years or so that the closer to capitalist the economy has been, other things being equal, the more successful it has been in achieving higher long term rates of economic growth. During that same period, countries at the extreme socialist end of the scale, especially the countries of the Communist bloc and their third world client states, have seen their initially fairly high rates of economic growth dwindle away gradually to zero and then plunged rapidly into full-scale economic collapse in the late 1980s. Since then, only those relatively few former Communist countries that moved most rapidly and radically to adopt capitalistic institutions and practices have resumed respectable rates of economic growth (such as Poland, Hungary, the Czech Republic, Estonia), while the vast majority of them have stagnated for about a decade in a kind of Never-never land where government bureaucrats have largely lost their power to plan, finance and administer state-owned enterprises but most of the legislation necessary to legalize and unleash private business still remain on hold. Many of the non-Communist countries of the world that formerly had relatively large public sectors and extensive government controls over the economy have enacted reforms to privatize some of their state-owned enterprises and to open up their economies to more foreign trade and outside investment – and most (but not all) of them

have since experienced at least modest improvements in their economic growth rates (although it is still too soon to tell whether these improvements represent changes in the long term trend or only temporary cyclical upswings). Clearly the advocates of the free market have been scoring a lot of points in the debates over the past decade or two and have won over some of the skeptics, but their remaining opponents have by no means lost all of their intellectual ammunition. Die-hard advocates of full-scale socialism can (and do) still argue that socialism has not failed economically because 'true' socialism has never been fully implemented (the Soviets and their former comrades in Eastern Europe and the Far East went ideologically wrong somewhere in the beginning) – and if it were really to be tried in the future, surely it would painlessly combine social justice, perfect democracy and the most rapid possible economic progress. Less fanciful socialists can argue that there have actually been at least a few relatively successful growth stories in countries that retain many of the trappings of old fashioned state socialism (mainland China being the most telling example, since about one-third of the human species lives and works there). Some elements of the political left (including the economists among them) reluctantly accept the idea that more government control of the economy might lead to somewhat slower economic growth but then go on to say that low (or no) growth in GDP would be worth it if it was required in order to promote greater social justice. Still others on the left, especially the 'Greens', believe that an end to economic growth would be a positive good because people should reject excessively materialistic consumerist values and because it seems to them to be necessary in order to save the planet from environmental catastrophe. More conventional moderate socialists and social democrats more often take the line that they now accept the importance of retaining many elements of the market economy but still insist that a 'middle way' with considerably larger amounts of government ownership, regulation and control than now exist in the United States or much of Western Europe could maintain or even improve upon present economic growth rates if done carefully and in the right way. Only a few of these arguments are susceptible to proof or disproof by reference to numbers in the historical record since they contain value judgments as well as empirical assumptions. And it must be acknowledged that the limited amount of data we have amassed over just the past few decades is still a very long way from what one would like to have for decisively resolving even the more tractable empirical disputes over just how economic growth rates get determined. Economic Growth is an increase in the nation's capacity to produce goods and services. / Эдэм Смис (Adam Smith), Дэйвид Рикадо (David Ricardo), Томэс Малфис (Thomas Malthus) и многие другие (даже Каль Макс (Karl Marx)). Макс Веба (Max Weber). виды (species). Под Экономическим Ростом понимается увеличение способности нации к производству товаров и оказанию ею услуг. Экономический Рост:- (1) увеличение масштабов совокупного производства и потребления в стране, характеризуемое прежде всего такими макроэкономическими показателями, как валовой национальный продукт, валовой внутренний продукт, национальный доход. Экономический рост измеряется темпами роста или прироста этих показателей за определённый период времени (отношение показателей в конце и в начале периода или отношение прироста показателя к его начальному значению). (2) Показанное на графике (кривой) увеличение производственных возможностей в результате увеличения количества используемых факторов производства или совершенствования техники и технологии.

ECONOMIC IMPACTS OF PLANT PESTS = ЭКОНОМИЧЕСКИЕ ВОЗДЕЙСТВИЯ ВРЕДИТЕЛЕЙ РАСТЕНИЙ (или ЭКОНОМИЧЕСКИ НЕБЛАГОПРИЯТНЫЕ ВОЗДЕЙСТВИЯ ВРЕДИТЕЛЕЙ РАСТЕНИЙ) – Economic Impacts Of Plant Pests:- this includes both market measures as well as those consequences that may not be easy to measure in direct economic terms, but which represent a loss or damage to cultivated plants, uncultivated plants or plant products.

ECONOMIC INDICATOR = ЭКОНОМИЧЕСКИЙ ИНДИКАТОР – Economic Indicator is a simple or composite index that serves as a tool to analyze changes in economic or business conditions. Economic indicators have thresholds, above or below which the attainment of certain objectives could be compromised. Economic indicators provide a snapshot of business conditions and warning signs of future trends. Analysis of economic indicators enables governments to measure economic performance in comparison with economic plans. Also known as Economic Barometer. A key statistic in the overall economy that experts use as a yardstick to predict the performance of the stock market. / Простой или сводный индекс, который служит в качестве инструмента для анализа изменений в экономических и деловых условиях. Экономические индикаторы имеют пороги, выше или ниже которых .

ECONOMIC INJURY = ЭКОНОМИЧЕСКОЕ ПОВРЕЖДЕНИЕ – Economic Injury or Threshold Level is the pest population density at which the loss caused by the pest is greater than the cost of controlling the pest. The pest density at which artificial control measures are economically justified. See also Threshold Level. / Смотрите также Пороговый Уровень (Threshold Level).

ECONOMIC LIFE = ЭКОНОМИЧЕСКИЙ СРОК СЛУЖБЫ – Economic Life:- output from the Pallet Design System© (PDS©) program which identifies the number of trips the pallet will make, provided it is properly repaired, which maximizes a return on investment.

ECONOMIC OFFICERS = СОТРУДНИКИ ЭКОНОМИЧЕСКОГО ОТДЕЛА – Economic Officers:- in the United States, the embassy officials who analyze and report on macroeconomic trends and trade policies and their implications for US policies and programs. Economic Officers represent US interest and arrange and participate in economic and commercial negotiations.

ECONOMIC PARTNERSHIP AGREEMENTS = СОГЛАШЕНИЯ ОБ ЭКОНОМИЧЕСКОМ ПАРТНЁРСТВЕ – Economic Partnership Agreements (EPAs) are the free trade agreements currently being negotiated between the EU and the African, Caribbean Pacific (ACP) group of developing countries to replace the Cotonou Agreement which expired in 2007.

ECONOMIC POLICY COMMITTEE = КОМИТЕТ ПО ЭКОНОМИЧЕСКОЙ ПОЛИТИКЕ – Economic Policy Committee (EPC):- a consultative Community body set up by a Council Decision 74/122/EEC of 18 February 1974, composed of two representatives and two alternates from each of the Member States, the European Commission and the ECB. Its main tasks are to contribute to the Economic and Financial Affairs (ECOFIN) Council's preparatory work in coordinating the economic policies of the Member States and the European Community and advise the European Commission and the EU Council. It cooperates closely with the Economic and Financial Committee (EFC) and focuses mainly on structural policies aimed at improving growth potential and employment in the Community.

ECONOMIC RECOVERY = ВОССТАНОВЛЕНИЕ ЭКОНОМИКИ – Economic Recovery is a period of increasing business activity signaling the end of a recession. Much like a recession, an economic recovery is not always easy to recognize until at least several months after it has begun. Economists use a variety of indicators, including gross domestic product (GDP), inflation, financial markets and unemployment to analyze the state of the economy and determine whether a recovery is in progress. Some confusion commonly results from the use of both leading and lagging indicators in analyzing whether an economic recovery is in progress. Leading indicators, such as the stock market, often rise ahead of economic recovery. This is because stocks are priced based on future expectations. On the other hand, employment is typically a lagging indicator. Unemployment often remains high even as the economy begins to recover because many employers will not hire additional personnel until they are confident there is a long-term need for new hiring. Economic Recovery is a return of the economy to a period of growth. Phase in the business cycle following an economic crisis, which may be either a depression or recession. An Economic Recovery is the phase of the business cycle following a recession, during which an economy regains and exceeds peak employment and output levels achieved prior to downturn. A recovery period is typically characterized by abnormally high levels of growth in real gross domestic product, employment, corporate profits, and other indicators. / наём (hiring).

ECONOMIC RENT = ЭКОНОМИЧЕСКАЯ РЕНТА – Economic Rent is the amount of money an owner of a factor of production must receive in order for that owner to rent out that factor of production. Factors of production include labor, capital and land. Economic rent is the minimum amount of money that some owner must receive in order to use an asset for a given purpose. In labor terms, it is the reservation wage of the individual, which is the minimum amount of wages that the person must receive in order to work. In capital and land terms, economic rent is the amount of money needed to breakeven when either land or capital is used for any given purpose. Economic Rent is an excess income derived from a factor of production. Economic Rent is any excess payment for a service, good, or property above and beyond the minimum amount at which the person receiving payment would still have agreed to the deal. Although the term originated in terms of land, it can apply to any good, service or property which can be hired. It is both an indicator of market imperfections and a guide to the effects of taxation. One example of economic rent would be an employee who is hired for 50 000 US Dollars (USD) but would have still taken the job at USD40 000. In this situation, the excess payment is USD10 000. The figure can also be referred to as Unearned Income. Although, in this example, the employee does work for the money, the extra USD10 000 is said to be 'unearned' because it is above and beyond the value the employee placed on his or her labor when deciding he or she would have done the work for less. The term refers to Rent, since it was first developed to solve an apparent problem with determining the flow of money in the production process. At most processes that bring together raw materials, labor, and manufacturing equipment costs, the numbers added up in line with the value each step added to the process. Two stores selling the same final product, however, might pay very different rents on identical properties if one was in a better location for attracting customers. In this case, the landowner of the property with the higher rent is able to get extra income thanks to circumstances beyond his direct responsibility or control, such as other shops in the same area creating a busy location for shoppers. This income is explained as economic rent. In theory, the free market would eliminate this additional money. In the example of the employee, the higher salary should mean more people would be attracted to working for the firm, dropping the salary down until people are working for the lowest amount they would accept. In reality, this might not happen, as there may not be enough people with the necessary skills to fill the posts, or those with the skills may be unwilling to relocate. Such issues are known as Market Barriers. The extent of economic rent may indicate how strong those barriers are. Economic rent can also be a guide to taxation. In theory, the government could tax the employee in the above example and take some or even all of their income above USD40 000 without affecting their willingness to continue working in the job. In reality, the added tax may cause resentment and thus political repercussions. Some economists use the term in the everyday meaning of rent: the flat amount of money paid in return for use of land or property, regardless of any other factors. This runs the risk of confusion, and it is best for people to avoid using the phrase for this meaning if this is a concern. Fortunately, the context usually makes it clear enough which definition is being used. Economic Rent is defined as the payment to labor in excess of their transfer earnings. The area of economic rent is shown by the area above the labour supply curve and below the market wage rate. The breakdown between transfer earnings and rent is determined by the elasticity of supply of labor. In the short run, the supply of labour may be inelastic and therefore a large proportion of total factor earnings will be economic rent. This is shown in the diagram above. The minimum wage rate that will attract labor into the market is GBP200. The ruling equilibrium wage is GBP400, the factor earnings above the labor supply curve and below the market wage shows the economic rent accruing to labor in the market. The remainder of the factor earnings is transfer earnings. As labor supply becomes more elastic more of the earnings of labor are transfer earnings. In economics, Economic Rent is an analytic term for the portion of income paid to a factor of production in excess of that which is needed to keep it employed in its current use. Economic rent is unrelated to and should not be confused with the more common term rent; a payment for the temporary use of a good or property. Economic rent (which in production analysis is always seen as a cost of inputs) is affected by any production only minimally, if at all. Economic rent is a fact of natural or contrived exclusivity. For labor, economic rent could be created by the existence of guilds or labor unions (e.g., higher pay for workers, where political action creates a scarcity of such workers); for a produced commodity, economic rent may also be due to the legal ownership of a patent (a politically enforced right to the use of a process or ingredient); for operating licenses, it is the cost of permits and licenses that are politically controlled as to their number of licenses regardless of competence and willingness of those who wish to compete in the area being licensed; for most other production including agriculture, economic rent is due to natural scarcity. When economic rent is privatized, the recipient of economic rent is referred to as a Rentier. By contrast, if there is no exclusivity and there is perfect competition, there are no economic rents, as competition drives prices down to their floor. Economic rent is different from other unearned and passive income, including contract rent. This distinction has important implications for public revenue and tax policy. As long as there is sufficient accounting profit, governments can collect a portion of economic rent for the purpose of public finance. For example, economic rent can be collected by a government as royalties or extraction fees in the case of resources such as minerals and oil and gas. Historically, theories of rent have always applied to rent received by different factor owners within a single economy. Hossein Mahdavy was the first to introduce the concept of 'External Rent' whereby one economy received rent from other economies. According to Robert Tollison (1982), economic rents are 'excess returns' above 'normal levels' that take place in competitive markets. More specifically, it is 'a return in excess of the resource owner's opportunity cost'. Henry George, best known for his proposal for a single tax on land, defined rent as 'the part of the produce that accrues to the owners of land (or other natural capabilities) by virtue of ownership' and as 'the share of wealth given to landowners because they have an exclusive right to the use of those natural capabilities'. Professors of law Lucian Bebchuk and Jesse Fried define the term 'to refer to extra returns that firms or individuals obtain due to their positional advantages'. Classical factor rent is primarily concerned with the fee paid for the use of fixed (e.g., natural) resources. The classical definition is expressed as any excess payment above that required to induce or provide for production:- (i) 'a payment for the services of an economic resource which is not necessary as an incentive for its production'; (ii) 'any payment that does not affect the supply of the input'; and (iii) 'a payment to any factor in perfectly inelastic supply'. / Хосэйн Мадэви (Hossein Mahdavy). Робэтч Тчолисэн (Robert Tollison) (1982). Хэнри Дьжодьж (Henry George). Люсиэн Бибщюк (Lucian Bebchuk) и Дьжеси Фрайд (Jesse Fried). Экономическая Рента – это разница между платой за ресурс и минимальной платой, необходимой для того, чтобы этот ресурс был предложен. Ресурс, дающий экономическую ренту, приносит сумму, превышающую альтернативную стоимость его использования. Экономическая рента может быть изъята посредством налогообложения, не затрагивая предложения ресурса. Экономическая рента является одним из ключевых понятий теории общественного выбора. В обыденном понимании под рентой имеют в виду просто плату за пользование чем-либо, например жилищем, автомобилем. Теория общественного выбора использует это понятие в специфическом смысле, то есть платежи собственнику ресурса, превосходящие его альтернативную стоимость. Минимальная сумма, требуемая собственником ресурса для того, чтобы он согласился продать некоторое количество его услуг, есть предельные издержки этих услуг. В таком случае экономическая рента выступает в форме выигрыша излишка в сравнении с альтернативной стоимостью предложения ресурса и аналогична понятию 'выигрыша производителя' на рынке продукции. Экономическая Рента – это разница между платой за услуги ресурсов и тем минимальным количеством средств, которые необходимо затратить, чтобы побудить владельцев ресурсов предложить их услуги на рынке. Современное неоклассическое направление исследует проблемы ренты на основе теорий предельного продукта, предельной отдачи. Предполагается, что именно размеры предельных продуктов определяют вклад и долю каждого из продуктов производства. Минимальная сумма, требуемая обладателю ресурсов для того, чтобы он согласился продать некоторое количество услуг, есть предельные издержки этих услуг. Экономическая рента – это выигрыш (излишек) по сравнению с альтернативной стоимостью

предложения ресурсов. Она аналогична понятию ‘выигрыш производителя’ на рынке продукции. В этой связи экономическая рента трактуется как любой доход, относимый к производственным затратам ресурса, который превосходит его альтернативную стоимость. Этот доход возможен лишь при фиксированном предложении ресурсов. Ресурсы производства всегда имеют определённое ограничение в коротком периоде. Единственным ресурсом, предложение которого неэластично с точки зрения общества, является земля. Доход, получаемый от использования, называют чистой экономической рентой. Экономическая Рента – разница между той ценой, которую фирмы или иные экономические субъекты готовы заплатить за необходимый им фактор производства на конкурентном рынке, и минимальной существующей ценой этого производственного фактора. Экономическая рента обычно не равна нулю.

ECONOMICS = ЭКОНОМИКА (или ЭКОНОМИЧЕСКИЕ НАУКИ) – Economics is the branch of the social sciences concerned primarily with analyzing and explaining human behavior in making decisions about the allocation of scarce resources. Economists study the complex ways in which the following are determined within a society:- (i) What goods and services are to be produced (and in what amounts)? (ii) By what means are these goods and services to be produced (using what combinations of the various substitutable factors of production)? (iii)How are the goods and services that are produced to be distributed among the individual members and groups in the society’s population? Study of the production, distribution, exchange and consumption of goods and services. Economics is a social science insofar as it deals with the uncertainties of human nature. Economic theories and forecasts can never be totally accurate. / Под Экономикой, от Греческого слова Oikonomiké, означающее Искусство Ведения Домашнего Хозяйства, понимается:- (1) исторически определённая совокупность производственных отношений, экономический базис общества; (2) хозяйство страны, области, района, отрасли, например, экономика транспорта; (3) экономикой называют некоторые экономические науки, например, экономика промышленности. Экономические Науки являются составной частью общественных наук. Они включают историю развития, историю экономической мысли, планирование хозяйством, управление общественным производством, экономическую статистику, финансы и кредит, экономику труда, экономику отраслей хозяйства. Под Экономикой, от Греческих слов Oikos, означающее Дом или Хозяйство, и Homes, означающее Закон или Правило, понимается в совокупности – правила ведения хозяйства:- (1) хозяйство, совокупность средств, объектов, процессов, используемых людьми для обеспечения жизни, удовлетворения потребностей путём создания необходимых человеку благ, условий и средств существования с применением труда; (2) наука о хозяйстве, способах его ведения людьми, отношениях между людьми в процессе производства и обмена товаров, закономерностях протекания хозяйственных процессов. Экономика как наука – классическая экономика, уделяющая главное внимание изучению того, каким образом спрос и предложение влияют на распределение ограниченных ресурсов для производства товаров и услуг. Макроэкономика (macroeconomics) изучает национальную или мировую экономику в целом, используя данные об инфляции, безработице и промышленном производстве для объяснения прошлого и прогнозирования будущего. Микроэкономика изучает поведение отдельных секторов экономики, компаний, отраслей и семей. В разные годы ведущее положение занимали различные экономические школы, среди которых можно назвать Кейнсианство (Keynesian economics), монетаризм (monetarism) и ‘экономика предложения’ (supply-side economics). Икэномикс:- экономическая теория, часть экономической науки, изучающая теоретические основы экономических процессов. Термин Икэномикс (в Англии) или Экэномикс (в США) введён в широкое обращение Британским учёным-экономистом Алфридом Машэлом (Alfred Marshall; 1842–1924) и в известном смысле заменил ранее использовавшееся понятие Политическая Экономия, придав ему большую практическую направленность. Основой предмета Икэномикс служит теория спроса и предложения, установление рыночного равновесия, рыночная конкуренция, поведение производителей и потребителей на рынке. В Русском языке корректнее употреблять вместо Английского слова Экэномикс или Икэномикс (Economics) адекватные ему Русские слова Экономика, Экономическая Теория.

ECONOMIC SHOCK = ЭКОНОМИЧЕСКИЙ ШОК – Economic Shock is an event that produces a significant change within an economy, despite occurring outside of it. Economic shocks are unpredictable and typically impact supply or demand throughout the markets. An economic shock may come in a variety of forms. A shock in the supply of staple commodities, such as oil, can cause prices to skyrocket, making it expensive to use for business purposes. The rapid devaluation of a currency would produce a shock for the import/export industry because a nation would have difficulty bringing in foreign products. Economic Shocks are the events that impact the economy, come from outside it, and are unexpected and unpredictable, e.g., Hurricane Andrew in 1991, the rise in oil prices by OPEC. / К Экономическим Шокам относятся события, которые оказывают воздействие на экономику, источником которых не является сама эта экономика, и которые являются неожиданными и непредсказуемыми, например, Ураган Эндрю (Hurricane Andrew) в 1991 привёл к подъёму цен на нефть ОСЭН или ОПЭК (OPEC) в Англоязычном произношении.

ECONOMIC SYSTEM = ЭКОНОМИЧЕСКАЯ СИСТЕМА – Economic System is a group of legal and social institutions within which certain technical resources, organized as a function of dominant motives, are used to achieve economic equilibrium. / Экономическая Система – исторически возникшая или установленная, действующая в стране совокупность принципов, правил, законодательно закреплённых норм, определяющих форму и содержание основных экономических отношений, возникающих в процессе производства, распределения, обмена и потребления экономического продукта.

ECONOMIC THRESHOLD = ЭКОНОМИЧЕСКИЙ ПОРОГ – (1) Economic Threshold is a level of expenditure above which it is no longer financially beneficial to continue an activity. / Уровень издержек, выше которых нет больше выгоды в финансовом плане продолжать деятельность.

(2) Economic Threshold is:- (i) the pest population level at which control measures should be started to prevent the pest population from reaching economic-injury level; or (ii) the density of pest population at which a control action becomes profitable. Economic Thresholds of Insect Pests:- keeping insect infestations below significant levels through preventative measures is the core of long-term integrated pest management. More immediate control is reactive and warranted only when the insects affect the producer financially. A common problem for most producers is deciding whether or not to treat a crop for a specific insect pest. The question to ask is how many insects are too many? The initial response may be to spray as soon as insects are found in the crop. But implementing control measures is costly and can require significant inputs/amounts/quantity of insecticides and fuel. In addition, the labour involved in control operations is significant. Many insecticides have broad-spectrum activity affecting target and non-target (including beneficial) organisms. Therefore, unnecessary applications can have undesirable environmental effects. When does an infestation become economically viable to control? Ultimately, the decision is made by the producer. Economic thresholds help with these management decisions by providing guidance as to whether insect control will have an economic benefit. An economic threshold is the insect’s population level or extent of crop damage at which the value of the crop destroyed exceeds the cost of controlling the pest. Economic thresholds can be expressed in a variety of ways including the number of insects per plant or per square meter, the amount of leaf surface damage, etc. In many cases, thresholds have been established through scientific research. Unfortunately, not all combinations of pests and crops have been studied, and some reported thresholds are educated estimates. It is important to note that just the presence of insects in a crop does not suggest that there is the potential for damage and subsequent crop loss. It is important to identify the insect and to determine if it is really a pest, a beneficial species or is inconsequential to the crop. The majority of the

economically important insects have been studied. However, the growing diversity of crops in Saskatchewan leaves some gaps in knowledge as to how insects will affect some of the newer crops. Economic thresholds can fluctuate depending on a combination of factors including the pest, the crop type, growth stage, expected market value and cost of control. The economic threshold may also vary with growing conditions. A vigorously growing crop may be able to withstand higher insect pest populations with little yield loss, depending on the stage of the plant. Conversely, relatively few insects may significantly damage reproductive or yield components (pods, bolls and heads) or a stressed crop. Furthermore, researchers have suggested that with some sucking insects, such as aphids on flax, a higher yielding crop will suffer a greater percentage yield loss than a crop already under stress. Economic thresholds serve as a guideline to the producer. To be effective, the plant's growth stage and growing conditions must also be considered. On Wheat, the Wheat midge provides an excellent example of how the damage potential of an insect is related to plant growth stage. Spring Wheat is highly susceptible to Wheat midge damage from the time the boot swells and splits and any part of the head is visible until flowering (anthesis). Control measures are not recommended for Wheat midge if the Wheat is not in this susceptible stage. Grasshoppers do not do serious damage to lentil foliage, but preferentially feed on developing pods, having a greater impact on yield and consequently a lower economic threshold than recommended in other crops. Other examples can be found in the comprehensive economic threshold charts for the Bertha Armyworm and Lygus Bug. These charts illustrate a range of economic thresholds in relation to other variables – spray costs, varying commodity prices and canola plant growth stages. If an economic threshold is not available for a specific insect in a crop, control decisions should be made objectively. First, there should be evidence of damage. Second, an estimate of potential crop damage should be made and then compared to the cost of applying an insecticide. If crop damage is widespread, control measures may be required for the whole field. However, if damage appears to be more isolated, a spot spray concentrating on the infected area(s) may suffice. Thorough monitoring and insect identification are essential elements in helping reduce input costs and crop loss even if an economic threshold is unknown. The extent to which cultural practices can help to control or suppress insect infestations is also worthy of consideration. Certain pest species, by virtue of their life cycles, can be greatly affected by agronomic practices, sometimes without the use of chemicals. In some cases, cultural control of insect pests can coincidentally be achieved by implementing agronomic practices that are already recommended for other reasons. For example, effective weed control will help conserve soil moisture and, at the same time, destroy an alternative food source for insects. Other practices, such as crop rotation, adjusting seeding depth and soil packing will help to manage certain insect species, as well as reduce the levels of some disease organisms. This fact sheet provides a quick reference to the currently accepted economic thresholds of the major insect pests in Saskatchewan. Also included is information regarding recommended monitoring procedures, and for certain pests, alternatives to chemical control. Crop Monitoring Techniques:- every field should be monitored on a regular basis to detect specific insect pests and to determine densities within the crop (e.g., Pattern 1). With an adequate monitoring program to establish presence of pest species and to monitor changes in population densities, producers are more likely to be aware of potential problems. The first step is to determine the potential insect pests. Producers unfamiliar with the possible insect pests of a crop should acquire a production guide for the crop. The second step is to identify the insects, their life stages and to detect their presence by the effect they have on the crop. Know the signs of a potential problem. The most obvious sign of a problem is physical damage to the crop. Stands that show patches of thinning, stunting, or dying off may be the first indication of an infestation, as they are usually visible from a distance. If the problem is due to insect damage, examine individual plants to determine chewing or sucking damage to leaves, stems, flowers and buds, and possibly, the insects themselves. Being able to recognize the symptoms of damage within the crop and on individual plants can help to indicate the presence of an insect pest and its identification. Symptoms of insect damage will vary, depending on the type of mouthparts of the insect pest. Damage caused by insects with chewing mouthparts is often easy to identify, even when the insects are not readily visible. These insects may remove material from leaves, stems, or other plant parts giving it a ragged or chewed look. Injured roots will often show sign of bored holes or lesions, while above ground the plant may appear wilted or stunted. Examples of insects with chewing mouthparts are grasshoppers, larval and adult beetles, larvae of moths and butterflies (caterpillars) and larvae of flies (maggots). It is more difficult to discern damage caused by insects with sucking mouthparts as the symptoms are often not readily visible. Insects with sucking mouthparts pierce the plant and feed on sap and juices. Damage may appear as tiny dots where the mouthparts have pierced the plant tissues. Eventually symptoms may include dead plant tissue in leaf tips, heads, etc. Since these insects inject a chemical to prevent the sap from coagulating while feeding, plant juices will continue to flow after the insect has moved on. Therefore, evidence of sucking insects may be seen as glistening sap extruded on pods and stems. More advanced symptoms of severe injury include shrivelled stems and seeds and a reduction in number of seeds set. Extreme cases in canaryseed have been observed where aphid feeding has resulted in empty, whitened tips of heads. Examples of insects with sucking mouthparts are Leafhoppers, Plant Bugs (e.g., Lygus) and Aphids. There are many other signs of insect infestations:- lodged plants; silken webs; discoloration of plant tissue; cocoons or pupae found on leaves; insect frass (faeces) on and around plants; and of course direct observation of insect adults and/or larvae. These signs should arouse suspicion of a potential problem and help determine what insect(s) could be causing the damage. Scouting:- insects are rarely uniformly distributed throughout a field. They are simply too dependent on local environmental conditions and, often, terrain is variable even within a single field. Hills and depressions within a field dictate the local pattern of soil moisture, and insects sensitive to soil moisture conditions will distribute themselves accordingly. Cutworms, for example, can be found first on the tops of hills, because of the warmer, drier soil, and may not be noticed in low-lying areas until the insects become larger and more numerous. Conversely, wireworms will be less abundant on hilltops, preferring the more moist soils found in low-lying areas. Many insects tend to be edge feeders because of migration from ditches and adjacent fields with damage more prevalent around the margins. Therefore, field scouting can be most effective using Pattern 2. Concentrating control in affected areas can reduce input costs while keeping insect populations below the economic threshold. Scouting for signs of infestation where they are most likely to occur will lead to early detection. The life stage of an insect is an important factor to determine the best timing for control measures. For example, egg and pupal stages are usually difficult to control. These are non-feeding life stages and are not considered a threat to the crop. Because they are immobile in these stages they are often in locations that are more difficult to access by predators and control measures (e.g., Bertha Army worm pupae or Wheat Midge cocoons in the soil). Even larvae, which are more susceptible to insecticides, can be difficult, or not economically feasible to manage when they are below the soil surface. In a few cases, Insects (e.g., Blister Beetles) may exhibit both destructive and beneficial behaviour depending on life stage. As adults, Blister Beetles can cause serious damage to portions of Canola fields. However, the larval Blister Beetle is predatory on Grasshopper eggs. Once the presence of a pest has been confirmed, its identification must be verified. Correct identification may require consulting a reference guide or an agronomist. To facilitate this process, collect samples of the damage and a few specimens of the pest, including as many life stages as possible. The insect and associated damage should be compared with good reference material. If uncertainties remain, contact the Agriculture Knowledge Centre at 1-866-457-2377, or contact the Crop Protection Laboratory. These resources will help to ensure a proper identification. Sampling:- once the pest has been identified, the level of infestation in the crop must be established. There are several important points to consider while sampling. First – it is important to utilize a sampling technique that is appropriate for the type of insect being monitored. The monitoring method is largely related to specific Insect behaviour. Highly mobile insects like Flea Beetles and Grasshoppers provide two different examples of monitoring techniques. Rather than attempt to count flea beetles, a per cent plant damage threshold is used. For grasshoppers, the economic threshold is measured in Insects per square meter. However, sampling

such mobile insects by counting the number within a measured area is difficult. The following procedure for estimating grasshopper densities is relatively easy and reliable:- (1) before counting grasshoppers in a field or roadside, measure a distance of 50 meters on a reasonably level surface. Usually, this will be adjacent to the actual area to be sampled, such as a road. Flag both ends using markers or specific fence posts on the field margin. These points should be easily visible for the observer because they will be used as starting and end points. (2) To begin the count, start in the area to be sampled, aligned with one of the markers. Walking parallel to the measured distance, move through the crop toward the other marker making some disturbance with your feet to encourage any grasshoppers to jump. Any grasshoppers that jump through a one meter field of view in front of the observer are counted. A meter stick can be carried as a visual guide to give perspective for a one meter width. After doing this a few times, one can often visualize the required width and a meter stick may not be required. (3) At the end of the 50 meters, the total number of Grasshoppers counted is divided by 50 to give an average per square meter. A hand-held counter can be useful to count the number of Insects while the observer measures off the required distance. This tool may not be practical under high insect populations. Second – it is important to sample randomly and gather numerous samples. The samples must represent, as much as possible, the entire field being monitored. Random sampling reduces the risk of biased estimates that could result from uneven distribution of insect populations. Collecting numerous samples will also increase the accuracy of an overall field estimate. Areas of a field may have insect numbers that are in excess of economic thresholds. However, other areas may be very low in pest densities. In these situations, a decision could be made to either not spray, due to the overall average density being below economic threshold, or to concentrate control measures on the more highly infested areas. Either choice would actually benefit the producer financially while reducing environmental impacts. Third – keep in mind the edge-effect. In situations where insects migrate into a field from an adjacent field or ditch, the population density is likely to be highest at field margins. Some pest species prefer the edges of a field because of light, temperature or moisture factors. Edge effects can also be important for other reasons. Although they may distort true population estimates, they may indicate a potential problem before it becomes serious. Be sure to sample throughout the field, not only the field margin, to avoid overestimating population densities. Sampling methods can vary according to the particular pest. Consult the economic threshold tables within this document to determine the preferred sampling method. If the chart says:- (1) % damage to leaves, plants, foliage, or (2) # of plants showing damage; or (3) # adults or larvae/stem / plant. Walk through the crop to obtain or observe the required sample units (i.e. leaves, stems, whole plants or insect counts) every few steps. To get an accurate population estimate, sample randomly at reasonably spaced intervals. As previously discussed, the best estimate of a population or damage will be achieved with adequate, representative samples taken over a well-distributed pattern. A zigzag route through the field sampling approximately every 10 meters is a commonly used pattern. If the chart says:- (1) # adult Insects or larvae/m^2 – use a meter-stick or pre-measured piece of string to mark off a square meter of the crop. Examine this area, counting the numbers of pests seen. Do this at several randomly chosen and widely-spaced sites. Average your results. If the chart says:- (1) # adult Insects or larvae/sweep – obtain or make a sweep net (Figure 1), a tool used by entomologists to sample insects. It consists of a muslin bag or some similar material held open by a hoop attached to a long handle. An angler's net lined with a pillowcase will work as well. The size of the net opening is important, however, as this will affect the number of insects caught. The standard net size is 38 centimeters (15 inches) in diameter. Walk through the crop sweeping the net, from side to side, in front of you, through the crop canopy. Generally, the arc of the sweep will cover approximately 180 degrees. However, some economic thresholds specify 90 degree sweeps. The main point is to keep the sweeps consistent. Ideally, the entire open end or mouth of the net should pass through the crop. In some crop stages, such as the pod stage in canola, this can be difficult. As a general rule, try to keep as much of the net as possible within the crop canopy. Flying Insects and those on the plants will be knocked into the bag. Do not sweep through the same pass more than once. Keep track of the number of sweeps and count the number of pests in each sweep, or take an average of the number of insects divided by the number of sweeps. Caution:- a sweep net catches all Insects, including wasps, bees, and other stinging and biting Insects. Therefore, be careful when examining the contents of the sweep net. Cultural or Non-Chemical Control of Insect Pest:- cultural practices can be used to manage insect populations. The Pest Species affected to some degree by cultural practices and the steps that can be taken are listed below:- (i) Alfalfa plant bug:- crop damage can be minimized by burning Alfalfa stubble in spring; (ii) Alfalfa Weevil:- in Alfalfa grown for hay, reduce populations of new adults by harvesting the first cut early; (iii) Aphids:- early seeding can help to avoid infestations because the crops mature before the pest levels exceed economic thresholds. As plants mature they are less attractive to aphids. (iv) Beet Webworm:- Weeds in and around susceptible crops should be removed to reduce the attractiveness of the field to egg-laying females; (v) Cutworms:- ensure fallow (conventional or chemical) fields are kept free of weeds that can be attractive for egg-laying females and the soil is allowed to form a crust between mid-August and mid-September, making it difficult for moths to lay eggs. This should only be done under threat of serious infestation, however, since this type of practice may encourage soil erosion. In the case of army cutworms, check for damage on volunteer cereals and weeds before seeding. Delay seeding until late May if damage is evident. (vi) Grasshoppers:- control of annual weeds before grasshopper emergence will help reduce grasshopper populations by eliminating alternative food sources for young grasshoppers. Disturbed soil is less attractive to egg-laying female grasshoppers. In areas where they have emerged before weed control is carried out, or in forage used for animal feed, trap strips can be maintained in which grasshoppers will be concentrated before application of insecticide. Research has shown that barrier strips of less preferred crops, such as oats or peas, around the perimeter will help reduce damage to the main crop. (vii) Wheat Midge:- in areas where wheat midge is expected to be abundant, one should consider not seeding spring wheat or at least avoid planting it in or near fields that were infested the previous year. If planting in infested areas, increase seeding rate from 1.5 to 2.0 bushels of viable seed per acre. This encourages a more uniform stand that may complete flowering before midge levels increase to harmful levels. Susceptibility to wheat midge damage decreases dramatically after flowering (anthesis). Consider growing early-maturing Varieties. Hard red spring wheat varieties may benefit from early seeding (late April to early May) in most years. However, Durum and CPS Varieties do not reflect this same trend. Midge tolerant hard red spring Wheat Varieties are available. These are composed of a 90:10 per cent blend of midge tolerant and conventional Wheat. Midge tolerant Wheat contains a gene that results in significantly less damage from feeding by midge larvae, and consistently grade better under midge infestations. It may still be necessary to apply an insecticide to these Varieties if there is very high midge pressure. (viii) Red Turnip Beetle:- damage can be minimized by destroying volunteer mustards and other cruciferous weeds in the spring before seeding, and by not seeding to Canola in, or adjacent to fields that were infested the previous year. (ix) Root Maggots:- (Canola) increase seeding rates. Napus Canola Varieties tend to compensate for root maggot feeding better than rapa Varieties; (x) Sunflower Beetle:- crop damage in the year following infestation can be minimized with late fall cultivation to expose beetles to the elements and increase winter mortality; (xi) Sweet Clover Weevil:- infestations can be reduced by establishing new stands of sweet clover as far as possible from second-year stands using high-quality scarified seed, planted no deeper than 2.5 cm to ensure rapid germination. Cultivating second-year sweet clover immediately after it has been cut for hay or silage will help destroy larval and pupal stages. (xii) Wheat Stem Sawfly:- there are no established economic thresholds for wheat stem sawfly. There are no insecticides registered for wheat stem sawfly and research trials have not shown any insecticides to be cost effective. The best option to manage wheat stem sawfly, if spring wheat is to be grown as part of a rotation, is to seed a solid-stemmed wheat variety. Early swathing of infested fields once the crop drops below 40 per cent moisture content. Producers are recommended to implement management strategies if 10 to 15 per cent of wheat stems were cut the previous year. In conditions conducive to successful over-wintering, a field with this level of

damage could produce enough adults to increase cutting levels to 70 per cent or greater in the following year. (xiii) Wireworms:- crop damage can be minimized by including less preferred crops such as flax or canola in rotation with cereals, cultivating summerfallow fields as shallow as possible, seeding cereal crops shallow to induce quick germination and using seed treated with an insecticide component (e.g., Cruiser – active ingredient – thiamethoxam). Remember:- it is critical to know the insect pest you are dealing with. Have it properly identified to determine best management options. / Растительноядные Клопы (например, Лигус) .

ECONOMIC VALUE = ЭКОНОМИЧЕСКАЯ ЦЕННОСТЬ – Economic Value is the basis for measuring the cost of the effect of changes (e.g., in biodiversity, ecosystems, managed resources or natural resources) on human welfare. Goods and services not sold in commercial markets can have economic value. Determining economic value does not prevent ethical or altruistic concerns for the survival and well-being of other species based on cooperative behavior.

ECONOMIC VALUE ADDED = ЭКОНОМИЧЕСКАЯ ДОБАВЛЕННАЯ СТОИМОСТЬ – The Economic Value Added (EVA®):- Stern Stewart & Co. has actually trademarked an old concept that has been known by academic literature for the past 100 years. The company (Stern Stewart) has done such a fine job in promoting the whole Shareholder value -approach. Without them the whole world would be years behind this development. The term Economic Value Added (EVA®) is used all over the world in thousands of companies, universities etc. Therefore it is however a bit shame that the company is so jealous about other consultants using this currently very generic name EVA®. Stern Stewart has already lost one law suite against KPMG with this issue (the court has stated that 'Stern Stewart had done such a fine job of spreading the EVA® gospel that it was tough to prove that EVA® is a proprietary concept'. – quoted from Fortune magazine). Economic Value Added (EVA®) is the accounting and finance concept. Measuring Shareholder value as a company's operating profits after tax, less a charge for the capital used in creating the profits. EVA® is a registered trademark of Stern Stewart & Co. in the United States. The Economic Value Added (EVA®) concept is a registered trademark (1990) of the US firm Stern Stewart & Co. and it is viewed as a measure of financial performance and also as potential main part of an integrated financial management system, leading to decentralized decision making and to maximize the shareholders' wealth. Our paper provides a synoptic survey of the use of EVA® indicator and also gives the opinions of two main groups of EVA® researchers:- proponents of EVA® and opponents to EVA®. Furthermore, we develop a practical model for EVA® calculation and try to make a parallel between Net Income as a measure of accounting profit and EVA® as a measure of real economic profit. We also present a relevant example regarding the EVA® calculation and give a special attention of the way of calculation of the three main components of EVA®:- net operating profit after taxes, weighted average cost of capital and economic asset (or invested capital). Also our articles emphasis some of the most important adjustments against accounting rules involved in the way of EVA® calculation, in order to improve the correctitude of real economic profit calculation as a measure of value creation. Economic Value Added (EVA®) is a measure of the shareholder value as a company's operating profits after tax, less a charge for the capital used in creating the profits. EVA® is a registered trademark of Stern & Co. in the USA. Economic Value Added (EVA®) is a financial performance measure used to evaluate a company's true profit. EVA® is actually a trademark of Stern Stewart & Co. There is a website dedicated to so-called EVAnomics at http://www.evanomics.com. EVA® is often called Economic Profit (EP) in order to avoid problems caused by trademarking. EP has been defined as total net gains less the interest on invested capital at the current rate, i.e. the idea behind it is that shareholders must earn a return that compensates for the risk taken. Equity capital has to earn at least same return as similarly risky investments in equity markets. / Стён Стюэт Энд Ко. (Stern Stewart & Co). Кей.Пи.Эм.Дьжи. (KPMG).

ECONOMY = ЭКОНОМИЯ – Economy is the careful or thrifty use or management of resources, such as income, materials or labor. / Под Экономией понимается осмотрительное или бережливое использование или управление ресурсами, такими как доход, материальные ценности или рабочая сила. Экономия – бережливое ведение хозяйства, в основе которого лежит уменьшение издержек, расходов, затрат экономических ресурсов:- материалов, энергии, оборудования, труда, рабочего времени. Экономия достигается снижением потерь, использованием ресурсосберегающих технологий, рачительным ведением хозяйства, высокой организацией труда.

ECONOMY ENERGY = УСЛОВНАЯ ЭНЕРГИЯ (или НЕПОТРЕБЛЁННАЯ ЭЛЕКТРОЭНЕРГИЯ) – Economy Energy is the energy sold on a non-firm basis and subject to recall at the discretion of the selling party. / Энергия, которая продается условно и может быть исключена из объемов поставок по усмотрению продавца.

eCOPS = ELECTRONIC COMMODITY OPERATIONS PROCESSING SYSTEM

ECO–STRAINS = ЭКО–ЛИНИИ (или ЭКО–ШТАММЫ) – Eco-Strains are such strains within a variety that have developed physiological differences in response to long-time growth, repeated planting, and selection in distinct environments.

ECOSYSTEM = ЭКОСИСТЕМА – Ecosystem is a complex of organisms and their environment, interacting as a defined ecological unit (natural or modified by human activity, e.g., agroecosystem), irrespective of political boundaries. Ecosystem is the complex of living organisms, their physical environment, and all their interrelationships in a particular unit of space. The principles underlying the study of ecosystems are based on the view that all the elements of a life-supporting environment of any size, whether natural or man-made, are parts of an integral network in which each element interacts directly or indirectly with all others and affects the function of the whole. All ecosystems are contained within the largest of them, the ecosphere, which encompasses the entire physical Earth (geosphere) and all of its biological components (biosphere). An ecosystem can be categorized into its abiotic constituents, including minerals, climate, soil, water, sunlight, and all other nonliving elements, and its biotic constituents, consisting of all its living members. Linking these constituents together are two major forces:- the flow of energy through the ecosystem, and the cycling of nutrients within the ecosystem. The fundamental source of energy in almost all ecosystems is radiant energy from the sun. The energy of sunlight is used by the ecosystem's autotrophic, or self-sustaining, organisms. Consisting largely of green vegetation, these organisms are capable of photosynthesis, i.e. they can use the energy of sunlight to convert carbon dioxide and water into simple, energy-rich carbohydrates. The autotrophs use the energy stored within the simple carbohydrates to produce the more complex organic compounds, such as proteins, lipids, and starches, that maintain the organisms' life processes. The autotrophic segment of the ecosystem is commonly referred to as the Producer Level. Organic matter generated by autotrophs directly or indirectly sustains heterotrophic organisms. Heterotrophs are the consumers of the ecosystem; they cannot make their own food. They use, rearrange, and ultimately decompose the complex organic materials built up by the autotrophs. All animals and fungi are heterotrophs, as are most bacteria and many other microorganisms. Together, the autotrophs and heterotrophs form various trophic (feeding) levels in the ecosystem: the producer level, composed of those organisms that make their own food; the primary-consumer level, composed of those organisms that feed on producers; the secondary-consumer level, composed of those organisms that feed on primary consumers; and so on. The movement of organic matter and energy from the producer level through various consumer levels makes up a food chain. For example, a typical food chain in a grassland might be grass (producer) → mouse (primary consumer) → snake (secondary consumer) → hawk (tertiary consumer). Actually, in many cases the food chains of the ecosystem overlap and interconnect, forming what ecologists call a food web. The final link in all food chains is made up of decomposers, those heterotrophs that break down dead organisms and organic wastes. A food chain in which the primary consumer feeds on living plants is called a Grazing Pathway; that in which the primary

consumer feeds on dead plant matter is known as a Detritus Pathway. Both pathways are important in accounting for the energy budget of the ecosystem. As energy moves through the ecosystem, much of it is lost at each trophic level. For example, only about 10 percent of the energy stored in grass is incorporated into the body of a mouse that eats the grass. The remaining 90 percent is stored in compounds that cannot be broken down by the mouse or is lost as heat during the mouse's metabolic processes. Energy losses of similar magnitude occur at every level of the food chain; consequently, few food chains extend beyond five members (from producer through decomposer), because the energy available at higher trophic levels is too small to support further consumers. The flow of energy through the ecosystem drives the movement of nutrients within the ecosystem. Nutrients are chemical elements and compounds necessary to living organisms. Unlike energy, which is continuously lost from the ecosystem, nutrients are cycled through the ecosystem, oscillating between the biotic and abiotic components in what are called Biogeochemical Cycles. Major biogeochemical cycles include the water cycle, carbon cycle, oxygen cycle, nitrogen cycle, phosphorus cycle, sulfur cycle, and calcium cycle. Decomposers play a key role in many of these cycles, returning nutrients to the soil, water, or air, where they can again be used by the biotic constituents of the ecosystem. The orderly replacement of one ecosystem by another is a process known as Ecosystem Development, or Ecological Succession. Succession occurs when a sterile area, such as barren rock or a lava flow, is first colonized by living things or when an existing ecosystem is disrupted, as when a forest is destroyed by a fire. The succession of ecosystems generally occurs in two phases. The early, or growth, phase is characterized by ecosystems that have few species and short food chains. These ecosystems are relatively unstable but highly productive, in the sense that they build up organic matter faster than they break it down. The ecosystems of the later, or mature, phase are more complex, more diversified, and more stable. The final, or climax, ecosystem is characterized by a great diversity of species, complex food webs, and high stability. The major energy flow has shifted from production to maintenance. Human interference in the development of ecosystems is widespread. Farming, for example, is the deliberate maintenance of an immature ecosystem – one that is highly productive but relatively unstable. Sound management of ecosystems for optimal food production should seek a compromise between the characteristics of young and mature ecosystems, and should consider factors that affect the interaction of natural cycles. Short-term production can be maximized by adding energy to the ecosystem in the form of cultivation and fertilization. Such efforts, however, can hinder efficient energy use in the long run by producing an imbalance of nutrients, an increase in pollutants, or a heightened susceptibility to plant diseases as a consequence of intensive inbreeding of crops. Although an awareness of the interdependence between human society and its environment was already prominent in ancient philosophy and religion, the formulation of the basic principles of systems ecology as a scientific discipline began in the late XIX century. During the second half of the XX century, the study of ecosystems has become increasingly sophisticated and is now instrumental in the assessment and control of the effects of agricultural development and industrialization on the environment. On farms, for instance, it has shown that optimal long-term production of pasturage requires a moderate grazing schedule in order to ensure a steady renewal of the moisture and nutrient content of the soil and has emphasized the need for multiple-use strategies in the cultivation of arable lands. Systems ecology has been concerned with the consequences of accumulated insecticides and has provided a way of monitoring the climatic effects of atmospheric dust and carbon dioxide released by the burning of fossil fuels, e.g., coal, oil, and natural gas. It has helped to determine regional population capacities and has furthered the development of recycling techniques that may become essential in humanity's future interaction with the environment. Ecosystem is a dynamic complex of plant, animal and micro-organism communities and their abiotic environment interacting as a functional unit. The term Ecosystem was coined by the British ecologist Arthur George Tansley in 1935. He used it to define a unit that covers all organisms of a given area as well as their relationship to the inorganic environment. The organisms within an ecosystem form a biocenosis, their inanimate environment is called a Habitat. The totality of all ecosystems on earth is called the Biosphere. Ecosystem is an operational term, since it describes units that are less easily captured than, for example, a molecule, a cell or a species. What is defined as an ecosystem is within the discretion of the person dealing with the ecosystem. A lake, for example, a reed belt, a wood, or a cornfield can be defined and described as ecosystems. Each system can consist of a number of partial systems as can be deduced from the system theory. Which level of complexity is studied is therefore mainly dependent on practical considerations. It is distinguished between simple and complex, between aquatic and terrestrial, between natural and human-influenced ecosystems. Among the astonishingly complex systems, i.e. those systems that are especially rich in species are tropical rain forests and coral reefs. Systems are more than just the sum of the system elements' performances. Between their elements exist numerous, often specific and usually always regulated connections. Controlled systems, in contrast, are characterized by feedbacks and thus by a high degree of stability. They are largely independent against disruptions. The higher the number of system elements and the amount of interactions with each other, the more effective fluctuations can be balanced out. But still each system has only a limited capacity. When the limit of this capacity is exceeded, then the system will not return to its original situation or will even be destroyed. Ecosystems with only a few system elements are extremely liable to break down. Just think of a spruce monoculture or a corn field. They can only be kept in balance with the use of stabilizing, energy-consuming measures like the use of insecticides. They can, on the other hand, easily be rebuilt after complete destruction. Complex systems are very resilient, they have a large buffer capacity, but their destruction is an irreversible act. A destroyed tropical rain forest or a destroyed coral reef is lost forever. Natural or almost natural ecosystems were able to absorb human influences for centuries, but it becomes clear that the limits of the strains on them are reached or even exceeded. Ecology has therefore during the last decades been in the public eye. Environmental protection has become a major issue of the domestic policy of many industrial nations. Many students of biology study this subject only, because they are interested in environmental issues. Ecology cannot solve political problems, it is especially unable to offer a fast aid to decision-making in order to answer short-term questions. Changes in a human society require a knowledge about its structure, its functions, its decision-makers, the chances to alter something, and the most effective ways to initiate changes. Successes that can be achieved by organizations like Greenpeace helped considerably to create an environmental awareness among general public and politicians. Ecology is a holistic science. In ecological work, long-term experience, a detailed insight into plants, animals or microorganisms, a sound knowledge and/or mastery of physical and chemical measuring are more important than spontaneous political activity. A co-operation between scientists of different disciplines is therefore the best way to approach the aim. A solid scientific management is necessary in order to co-ordinate the activities of all scientists participating in the project. Ecosystems change permanently. Changes and disruptions are not only caused by human activities. The evolution of organisms and their adaptation to variable environmental conditions are the main reason of the changes and thus also of the evolution of ecosystems. A sequence of differently structured systems under constant abiotic conditions is called Succession. In Central Europe, for example, certain types of forests are the most stable systems. Such a system is called a Climax Association. Such final links of developments exist only as long as the environmental conditions are stable. In the history of the earth, several drastic climatic changes occurred that caused the extinction of whole groups of plants and thus also to the replacement of once stable ecosystems by others. The pre-Ice Age vegetation of Central and Northern Europe, for example, or the carboniferous swamp forests became irreversibly extinct. After the ice had gone, the landscape was inhabited again beginning in the south and slowly advancing towards the northern part of Europe. A comparison of today's Central and North European flora with that of North America shows that the European flora is far poorer in species. The variety of species of North America that was only to a small extend covered by ice the variety of species that existed before the Ice Age in Europe, too, remained. The transformation of the natural landscape into a cultivated landscape had a serious impact on all ecosystems. Often, new ecosystems possibly worth protecting developed that could not exist under natural

conditions. The Calluna vularis areas of the Lüneburg Heath in Germany are impressive examples. Without regular grazing by a species of German moorland sheep called Heidschnucken, these areas would soon be replaced by birch-pine-forests. Ecosystem is a biotic system maintained by the balance of organic life with its environment. Ecosystem is:- (1) a major interacting system that involves both living organisms and their physical environment. (2) A system of ecological relationships in a local environment, including relationships between organisms and the environment itself. / луг или пастбище (grassland). Хайдшнукэн (Heidschnucken). Под Экосистемой, от Греческих слов Óikos, означающее Жилище или Местопребывание, и Sýstēma, означающее Составленное Из Частей или Целое, понимается единый природный комплекс, образованный живыми организмами и средой их обитания (атмосфера, водоём, почва и тому подобное), в котором живые и косные компоненты связаны между собой обменом вещества и энергии. Понятие экосистема применяется к природным объектам различной сложности и размеров:- весь океан или небольшой пруд, тайга или участок берёзовой рощи. Термин Экосистема в 1935 ввёл Английский фитоценолог Асо Дьходьж Тэнзли (Arthur George Tansley; 15 Августа 1871 – 25 Ноября 1955). Часто термины Экосистема и Биогеоценоз употребляют как синонимы. Экосистема, природный комплекс (биокосная система), образованный живыми организмами (биоценоз) и средой их обитания (косной, например, атмосфера, или биокосной – почва, водоём и тому подобное), связанными между собой обменом веществ и энергии. Одно из основных понятий экологии, приложимое к объектам разной сложности и размеров. Примеры экосистем – пруд с обитающими в нём растениями, рыбами, беспозвоночными животными, микроорганизмами, донными отложениями, с характерными для него изменениями температуры, количества растворённого в воде кислорода, состава воды и тому подобного, с определённой биологической продуктивностью; лес с лесной подстилкой, почвой, микроорганизмами, с населяющими его птицами, травоядными и хищными млекопитающими, с характерным для него распределением температуры и влажности воздуха, света, почвенных вод и других факторов среды, с присущим ему обменом веществ и энергии. Гниющий пень в лесу, с живущими на нём и в нём организмами и условиями обитания, тоже можно рассматривать как экосистему. В идеальном случае экосистема со сбалансированной жизнедеятельностью автотрофных организмов и гетеротрофных организмов могут приближаться к замкнутой системе, обменивающейся с окружающей средой только энергией (смотрите Закрытая Экологическая Система). Однако в естественных условиях длительное существование экосистемы возможно только при притоке из окружающей среды не только энергии, но и большего или меньшего количества вещества. Все реальные экосистемы, в совокупности слагающие биосферу Земли, принадлежат к открытым системам, обменивающимся с окружающей их средой веществом и энергией. Термин ‘Экосистема’ приложим как к природным, так и к искусственным экосистемам, таким, например, как сельскохозяйственные угодья, сады, парки. В процессе всестороннего изучения природных комплексов взаимодействующих между собой растений, животных и микроорганизмов учёные давали этим надорганизменным единицам разные названия. Большая часть из предложенных терминов не получили распространения, некоторые используются лишь в определённых случаях (например, термином ‘Биом’ в США обозначают такие макроэкосистемы, как зона хвойных лесов, степная зона и другие). Термин ‘Экосистема’, вытеснивший многие другие термины сходного содержания, предложил в 1935 Английский ботаник Асо Дьходьж Тэнзли (Arthur George Tansley; 15 Августа 1871 – 25 Ноября 1955). В 1944 Советский учёный Владимир Николаевич Сукачёв (1880–1967) стал пользоваться применительно к наземным живым системам термином ‘Биогеоценоз’, не считая, однако, его тождественным экосистеме. Действительно, даже аквариум или пчелиный улей несомненно представляют собой экосистему, но не могут быть названы Биогеоценозами. Кроме того, общая особенность биогеоценоза – меньшая суммарная биомасса животных по сравнению с биомассой растений, в то время как в водной экосистеме господствует обратное их соотношение. Экосистемы характеризуются видовым составом, численностью особей отдельных видов, их биомассой, распределением и сезонной динамикой. Начиная с 1940–50-х развернулись исследования, позволяющие количественно характеризовать функциональные особенности экосистем, прежде всего цепи питания, через которые осуществляется биологическая трансформация вещества и энергии. Количественное выражение интенсивности и эффективности этих процессов с помощью современных методов, в частности математического моделирования экологических систем, – необходимая основа решения актуальных вопросов рационального использования биологических ресурсов природы и сохранения среды обитания человека. Экосистема:- динамичный комплекс сообществ растений, животных и микроорганизмов, а также окружающей их абиотической среды, взаимодействующих как функциональная единица.

ECOTYPE = ЭКОТИП – Ecotype is a population within a species that has developed distinct physiological characteristics (e.g., herbicide resistance) in response to a specific environment which persist even if individuals are moved to a different environment. / Под Экотипом, от Греческих слов Oikos, означающее Жилище или Местопребывание, и Týpos, означающее Образец или Отпечаток или Форма, понимается группа однородных популяций в пределах одного и того же вида растений, у которых в процессе приспособления к условиям местообитания выработались наследственно закреплённые биохимические, морфологические, физиологические и другие особенности. Чем обширнее ареал вида и разнообразнее экологические условия, тем больше у него число экотипа, например, у Сосны Обыкновенной выделяют 36 экотипов. Экотип или Экологический Тип или Экологическая Раса, совокупность однородных популяций в пределах одного и того же вида растений, которые приспособились к определённым климатическим, эдафическим или ценотическим условиям и у которых выработались в этих условиях наследственные морфологические, физиологические, биохимические и другие особенности. Таким образом, экотип – обособленное по распространению и генотипическое внутривидовое подразделение, что отличает его от Биотипа. Термин ‘Экотип’ ввёл в 1922 Шведский учёный Йотэ Вильхэльм Тюресон (Göte Wilhelm Turesson; 1892–1970). У различных видов растений выявлено различное число экотипов. Чем обширнее ареал вида и шире его экологическая амплитуда, тем разнообразнее экотипический состав вида. Так, у Сосны (Pinus Silvestris) выделено 36 экотипов, у Ели (Picea Abies) – 27 и так далее. Экотипический полиморфизм наиболее ярко выражается в центре видо- и морфообразования. У Люцерны (Medicago Falcata), например, множество экотипов на Кавказе и лишь несколько на Севере страны (в России). У многих видов наблюдается параллелизм экотипического расчленения. Так, у Полыни Полевой (Artemisia Campestris), Щавелька (Rumex Acetosella), Смолёвки Одноцветной (Silene Uniflora) и других в сильно освещённых, сухих местообитаниях с сильными ветрами образуются экотипы с распростёртыми стеблями. Различают 3 основные группы экотипов:- (1) Климатические, или Географические, Экотипы занимают обособленную часть ареала вида и сформировались под воздействием определённых климатических условий (у Костра Безостого – Bromus Inermis, например, Южный Экотип отличается от Северного низкорослостью, более короткими, узкими и жёсткими листьями и восковым налётом на них). (2) Эдафические Экотипы возникают под влиянием почвенно-грунтовых условий (пример:- экотипы Сосны на меловых обнажениях Реки Дона, который описан даже как самостоятельный вид Pinus Cretacea). (3) Биотические, или Ценотические, Экотипы возникают и развиваются главным образом под воздействием определённых растений, вместе с которыми данный вид образует растительные сообщества (например, Луговой и Лесной Экотипы Ежи Сборной – Dactylis Glomerata, лесной и дюнный экотипы Ястребинки Зонтичной – Hieracium Umbellatum). Возникновение экотипа – длительный исторический процесс. Если экотип имеет прогрессивные признаки, позволяющие расширять ареал вида, то он может дать начало новому виду, то есть экотип – одна из стадий процесса видообразования.

ECOWAS = ECONOMIC COMMUNITY OF WEST AFRICAN STATES

ECP = ELECTRONIC CHECK PRESENTMENT

ECP = EUROCOMMERCIAL PAPER

ECR = EFFICIENT CONSUMER RESPONSE

ECR = EXPORT CERTIFICATION RECORD

ECRU = XX (или НАБЕЛЁНОЕ, или СЕРОВАТО–БЕЖЕВОЕ) – Ecru:- the color of fibers, yarns or fabrics that have not been subjected to processes affecting their natural color.

ECS = ECUADORIAN SUCRE

ECS = EXCHANGE COVER SCHEME

ECS = EXPORT CERTIFICATION SPECIALIST

ECSA = EASTERN, CENTRAL, AND SOUTHERN AFRICA

ECSDA = EUROPEAN CENTRAL SECURITIES DEPOSITORIES ASSOCIATION

ECSC = EUROPEAN COAL AND STEEL COMMUNITY

ECSSID = EUROPEAN COOPERATION IN SOCIAL SCIENCE INFORMATION AND DOCUMENTATION

ECT = ESTIMATED COMPLETION TIME

ECTOPARASITE = ЭКТОПАРАЗИТ – Ectoparasite is a parasite feeding on the host from the exterior. / снаружи. Под Эктопаразитом, от Греческих слов Ektós, означающее Вне или Снаружи, и Parásitos, означающее Нахлебник или Тунеядец, понимается паразит, обитающий на поверхности животного или растительного организма (называемого Хозяином); например, мучнисто-росяные грибы – экопаразиты растений.

ECTOTROPHIC MYCORRHIZA/ECTOMYCORRHIZA = ЭКТОТРОФНАЯ МИКОРИЗА/ЭКТОМИКОРИЗА – Ectotrophic Mycorrhiza/Ectomycorrhiza is a mycorrhizal association in which the fungal hyphae form a compact mantle on the surface of the roots. Mycelial strands extend inward between cortical cells and outward from the mantle to the surrounding soil. / на поверхности корней.

ECU = EUROPEAN CURRENCY UNIT

ED = EXPIRATION DATE

EDAN = ELECTRONIC DESKTOP APPLICATION NAVIGATOR

EDAPHIC = ЭДАФИЧЕСКОЕ – Edaphic:- influenced by the soil rather than by climate.

EDAPHIC FACTORS = ЭДАФИЧЕСКИЕ ФАКТОРЫ – Edaphic Factors are soil conditions such as alkalinity, extreme acidity, iron toxicity, salinity, and zinc deficiency, which adversely affect plant growth. / Щёлочность (Alkalinity).

EDAPHOLOGY = ЭДАФОЛОГИЯ (или ПОЧВОВЕДЕНИЕ) – Edaphology is the science that deals with the influence of soils on living things, particularly plants, including people's use of land for plant growth.

EDC = ELECTRICITY DISTRIBUTION COMPANY

EDC = EXPORT DEVELOPMENT CANADA

EDD = ESTIMATED DELIVERY DATE

EDGAR = ELECTRONIC DATA GATHERING, ANALYSIS AND RETRIEVAL SYSTEM

EDGE = КРАЙ (или КРОМКА, или ЗАКРАЙКА, или РЕБРО, или БОРТ, или КАНТ, или ГРАНЬ, или ОПОРНАЯ ПРИЗМА) – Edge is the front margin of the garment that extends from front corner to front corner.

EDGE ACT CORPORATION = КОРПОРАЦИЯ ПО АКТУ ЭДЬЖА – Edge Act Corporation is a banking corporation financing international commerce, chartered by the Federal Reserve Board under a 1919 amendment to the Federal Reserve Act. These corporations, owned by state chartered or national banks, may operate interstate branches, accept deposits outside the United States, and invest in non-US Firms. A nonbanking Edge Act corporation makes equity investments under Federal Reserve Regulation K in foreign corporations, such as merchant banks or finance companies. A banking Edge corporation buys and sells notes, drafts, and bills of exchange, and basically complements the international banking activities of its parent bank. The International Banking Act of 1978 approved ownership of Edge corporations by foreign banks. In the United States, Edge Act Corporation (EAC) is the corporation chartered by the Federal Reserve to engage in international banking. Also known as Edge Corporation. The Board of Governors acts on applications to establish Edge Act corporations and also examines the corporations and their subsidiaries. Typically organized as a subsidiary of a bank, an Edge Act corporation may conduct activities abroad that are permissible to foreign banks abroad but that may not otherwise be permissible to US banks. Named after Senator Walter Edge of New Jersey, who sponsored the original legislation to permit formation of such organizations. See also Agreement Corporation. The Edge Act is a 1919 amendment to the United States Federal Reserve Act of 1913, codified at 12 USC §§ 611–631, which allows National Banks to engage in international banking through federally chartered subsidiaries. The Act is named after Walter Evans Edge, a US Senator from New Jersey who sponsored the original legislation for these types of subsidiaries. The impetus for the act was to give US firms more flexibility to compete with foreign firms. An Edge Act Corporation (EAC) is a subsidiary of a Bank or Bank Holding Company or Financial Holding Company, that is chartered by the Federal Reserve under Section 25A of the Federal Reserve Act, as amended in 1916 and 1919, to engage in foreign banking activities. The Federal Reserve Board authorizes US and foreign banking and financial organizations to establish Edge Act Corporations. It also regulates and examines the foreign activities of Edge Act Corporations and their subsidiaries. Foreign banks operating in the United States are permitted to organize and own an Edge Act Corporation. An Edge Act Corporation is useful because, among other things, it separates the risks of domestic operations from those of international. Prior to 1919, US institutions were not permitted to own foreign banks. An EAC can own branches in the US, but may only conduct transactions directly linked to international trade. By virtue of historical developments and funding considerations, an Edge Act Corporation is a domestic subsidiary that is generally held by a US Member Bank; however, it may also be held directly by the Bank Holding Company or Financial Holding Company. As of the International Banking Act of 1978 (IBA), an Edge Act Corporation may also be held by a Foreign Bank. Types:- (i) banking Edge or Agreement Corporation, which is directly under control of a US Member Bank or Bank Holding Company, can receive

deposits (without Federal Deposit Insurance Corporation coverage) from, and make loans to, companies engaging in international business. This structure allows foreign branches of US Banks. (ii) Investment Edge or Agreement Corporation functions as an investment company, taking equity positions in foreign commercial and industrial organizations. An Agreement Corporation is chartered by a state to engage in international banking (essentially a state-chartered EAC, so named because the corporation enters into an 'agreement' with the Fed's Board of Governors to limit its activities to those of an Edge Act Corporation, as if organized under Section 25A of the Federal Reserve Act. In reality, state supervision is superfluous, so Edge Act Corporations (rather than Agreement Corporations) are the vehicles of choice for international banking and financing operations. Investment Edges expand the types of companies in which their parent banks may invest. By law, US banks may invest abroad only in other banking organizations. However an Edge Act Corporation may invest in any type of foreign company, as long as it does not engage in business in the United States, including making any domestic loans. Banking Edges extend the geographic reach of their parents because an Edge was not considered a bank and hence was not subject to the same interstate banking prohibitions. Thus in the 1960s, the trend was for banks from outside the state of New York to form Banking Edges and locate them in New York City for conducting international banking and for trading in foreign exchange. In the 1970s and 1980s, the trend was toward expansion into regional financial centers, such as Miami, Chicago, and San Francisco. Legislation in the mid-1990s, providing for the removal of Federal Interstate Branching, restrictions undermined the appeal of Banking Edges, and their relative importance in international banking has therefore declined. Major disadvantages of a Banking Edge, compared with an agency, are the smaller size of its loans (due to its smaller capital base, compared with that of the agency's parent bank) and the limitation of domestic lending ability to international or foreign business transactions. Of the 82 Edge and Agreement Corporations in operation at year-end 1999, 27 were Banking Edges located mostly in New York City and Miami with total assets of USD18 billion. Largest Edges:- as of 1999, the three largest Edges were all holding companies under the Federal Reserve Regulatory District of New York:- (i) HSBC International Finance Corporation, a Financial Edge (Wilmington, Delaware); (ii) HSBC Holdings PLC (London); (iii) Citibank International, a Banking Edge (Miami); (iv) Citigroup Inc. (New York); (v) Banco Santander International, a Banking Edge (Miami); and (vi) Banco Santander Central Hispano, SA (Madrid). In 1999, these institutions accounted for 81.6 percent of all assets (source:- Board of Governors, Federal Reserve System). In official documents, reference to an Edge Act Corporation typically mentions the state or city where it is domiciled. These are banks that are subsidiaries either to bank holding companies or other banks established to engage in foreign business transactions. Edge Act Corporation is a banking institution with a special charter from the US Federal Reserve to conduct international banking operations and certain other forms of business without complying with state-by-state banking laws. By setting up or investing in Edge Act corporations, US banks are able to gain portfolio exposure to financial investing operations not available under standard banking laws. Edge Act corporations have gone through structural changes since they were first implemented in 1919. Economies, and therefore financial institutions, are much more international today, and many of the restrictions once in place limiting foreign banking activity have since been relaxed. Edge Act revisions in 1984 allowed companies engaged in international business, such as trading and shipping firms, and international airlines, to provide full banking services, including taking deposits and granting loans. The Federal Reserve retains the right to monitor ownership of these corporations and their future investment and business activities. / Волтё Эвэнз Эдьж (Walter Evans Edge), Сенатор от Нью Джерси. (i) Эйч.Эс.Би.Си. Интёнэшэнэл Файнэнс Корпорэйшэн (HSBC International Finance Corporation, Файнэншэл Эдьж (Financial Edge) (Вилмингтон, Делавэр, США); (ii) Эйч.Эс.Би.Си. Холдиньз Пи.Эл.Си. (HSBC Holdings PLC; Лондон, Соединённое Королевство); (iii) Сытибэньк Интёнэшэнэл (Citibank International, Банковский Эдьж (Banking Edge) (Майами, США); (iv) Сытигруп Инк. (Citigroup Inc.; Нью Йорк, США); (v) Банко Сантандэр Интёнэшэнэл (Banco Santander International, Бэнькинь Эдьж (Banking Edge) (Майами, США); и (vi) Банко Сантандэр Сэнтраль Испано, Эсэ.А. (Banco Santander Central Hispano, SA; Мадрид, Испания). Существуют банки, являющиеся дочерними предприятиями либо банковских холдиньговых компаний, либо иных банков, которые созданы для проведения внешнеэкономических операций. Акт Эдьжа от 1919 – закон о банковской деятельности, принятый в 1919, который позволил банкам США предоставлять международные займы через филиалы, зарегистрированные на федеральном уровне или на уровне штатов, названные 'корпорациями Эдьжа', созданными в рамках закона о деятельности за рубежом. Подобные корпорации могли быть зарегистрированы в других штатах и, в отличие от отечественных банков, могли владеть банками в зарубежных странах и вкладывать средства в зарубежные коммерческие и промышленные компании. Закон также позволял Федеральной Резервной Системе (Federal Reserve System) налагать на иностранные банки, ведущие деятельность в США, требования о внесении резерва. Корпорации, созданные в рамках Акта Эдьжа, получили дальнейшие преимущества после принятия в 1978 Акта о Международном Банковском Обслуживании (International Banking Act), который требовал от Федеральной Резервной Системы отмены любых законов, ставящих Американские банки в невыгодное положение по сравнению с иностранными банками, действующими в США.

EDGE CRIMPED YARN = ПРЯЖА С ЗАВИТОЙ КАЙМОЙ (или КРОМКОЙ) – Edge Crimped Yarn is a textured filament yarn obtained by drawing heated filament yarn over an edge of small radius of curvature. / филаментная (комплексная) пряжа (filament yarn).

EDGE CRIMPING METHOD = МЕТОД ЗАВИВАНИЯ КАЙМЫ (или СКЛАДЫВАНИЯ КРАЯ) – Edge Crimping Method:- in this method of texturing, thermoplastic yarns in a heated and stretched condition are drawn over a crimping edge and cooled. Edge-crimping machines are used to make Agilon yarns. See also Coil Yarn, Textured Yarn, and Texturing.

EDGE DISTANCE = РАССТОЯНИЕ ДО КАЙМЫ (или РАССТОЯНИЕ ДО КРАЯ) – Edge Distance is the distance from the edge of a member to the center of the nearest fastening. / .

EDGE PROTECTOR = ОКАЙМЛЯЙЩИЙ (или РЕБРОВОЙ, или ОБРАМЛЯЮЩИЙ) ПРОТЕКТОР – Edge Protector:- an angle piece fitted over the edge of boxes, crates, bundles and other packages to prevent the pressure from metal bands or other types from cutting into the package.

EDGE ROLL = СВОРАЧИВАНИЕ КАЙМЫ – Edge Roll is the curl that develops on the edge of a single-knit fabric preventing it from lying flat.

EDGE TAPE = ОКАЯМЛЯЮЩАЯ ЛЕНТА – Edge Tape is a tape sewn along the front edge of a coat from top of the lapel to bottom of the facing. On less expensive coats, this tape starts at the bottom of the lapel (called the Breakline). The tape is usually sewn with an edge-knife machine.

EDI = ECONOMIC DEVELOPMENT INSTITUTE

EDI = ELECTRONIC DATA INTERCHANGE

EDIFACT = ELECTRONIC DATA INTERCHANGE FOR ADMINISTRATION, COMMERCE AND TRANSPORT

EDIS = ELECTRONIC DOCUMENT INFORMATION SYSTEM

EDK = EX DOCK

EDP = ELECTRONIC DATA PROCESSING

EDPITAF = EDUCATIONAL DEVELOPMENT PROJECTS IMPLEMENTING TASK FORCE

EDR = EQUIPMENT DAMAGE REPORT

EDS = ENTERPRISE DIRECTORY SERVICES

EDT = EASTERN DAYLIGHT TIME

EDTA = ETHYLENEDIAMINETETRAACETIC ACID

EDUCATION FEATURE = ОБРАЗОВАТЕЛЬНАЯ ЧЕРТА – In the United States, Education Feature:- interest earned on EE bonds with 1990-January-01 and later issue dates may qualify for exclusion from income for Federal income tax purposes if the owner pays his or her tuition and required fees or those of his or her spouse or legally dependent children at colleges, universities, and qualified technical schools during the year eligible bonds are redeemed. Costs of room, board, and books are excluded. To be eligible, bonds must have been issued to a person 24 years old or older on the first day of the bonds' issue months. The bonds have to be in the name of the taxpayer who will claim the exclusion. The taxpayer's spouse can be a co-owner. Qualifying expenses are tuition and required fees at an eligible institution incurred by the taxpayer, his or her spouse, or children who are his or her legal dependents. The 'Taxpayer Relief Act of 1997', enacted 1997-August-05, included contributions to qualified State tuition programs in the definition of qualified higher education expenses. Excludable interest cannot be greater than eligible education expenses and is proportionately reduced when total redemption value of qualifying bonds is more than the total of such expenses. For example, 80% of interest is excludable if qualifying expenses total USD8 000, bond redemption proceeds are equal to USD10 000, and all other relevant conditions of the tax regulations are met. Married taxpayers filing separately aren't allowed to claim the exclusion. Bond owners claiming the exclusion must keep complete records concerning bonds on which excluded interest was earned. The tax benefits of the interest exclusion are based on the modified adjusted gross income (MAGI) of the taxpayer. For taxpayers filing a joint Federal income tax return, the exclusion is gradually reduced for taxpayers with modified adjusted gross incomes between certain limits (originally set at USD60 000 and USD90 000 for joint return filers and at USD40 000 and USD55 000 for single filers and heads of households) and not available above the high ends of current ranges. Since 1990, these income limits have been adjusted annually.

EDW = ENTERPRISE DATA WAREHOUSE

EE/E SAVINGS BONDS = СБЕРЕГАТЕЛЬНЫЕ ОБЛИГАЦИИ СЕРИИ И.И./И. – In the United States, series EE Savings Bonds are safe, low-risk savings products that pay interest based on current market rates for up to 30 years for bonds purchased May 1997 through April 30, 2005. You may purchase EE Bonds via TreasuryDirect or at almost any financial institution or through your employer's payroll deduction plan, if available. As a TreasuryDirect account holder, you can purchase, manage, and redeem EE Bonds directly from your Web browser. EE/E Savings Bonds are a secure savings product that pay interest based on current market rates for up to 30 years. Electronic EE Savings Bonds are sold at face value in TreasuryDirect. Paper EE Savings Bonds are sold at 1/2 face value. EE Bonds are reliable, low-risk government-backed savings products that you can use toward financing education, supplemental retirement income, birthday and graduation gifts, and other special events. Series EE Bonds purchased on or after May 01, 2005, earn a fixed rate of return, letting you know what the bonds are worth at all times. See our press release for more information. EE Bonds purchased between May 1997 and April 30, 2005, are based on 5-year Treasury security yields and earn a variable market-based rate of return. E Bonds are the predecessor to EE Bonds and are no longer issued by the US Treasury. A Series EE US Savings Bond is an appreciation-type (or accrual-type) savings security issued after 1979 that is a contract between the owner or co-owners and the United States. Under the contract, the owner or co-owners lend money to the United States, and the US must repay that money with interest when the bond is redeemed. You can cash Series EE bonds anytime after 12 months. Interest stops accruing 30 years after issue, and the interest rate is subject to change at the beginning of each extended maturity period. Regulations for these securities are in Title 31 Code of Federal Regulations Parts 351 and 353, also published as Department of the Treasury Circulars, Public Debt Series Nos. 1-80 and 3-80. Purchase Limitation:- series EE bonds are limited to an investment of USD5 000 per person, per calendar year. For Series I Bonds, the purchase limit is USD5 000 (par value) in the name and taxpayer identifying number (usually, Social Security Account Number) of any one person in an individual capacity. Bonds the purchaser obtained in earlier years don't affect the current year's limitation. Bonds purchased and redeemed in the same calendar year are also excluded from the computation. For Co-owners – Series EE bonds registered in the names of two persons as co-owners are attributed to the first-named co-owner. For Beneficiaries – purchases are attributable to the owner, not the beneficiary. For Fiduciary Estates – bonds held by persons serving as guardian or in another fiduciary capacity are computed separately from personal purchases that list them as owner or first-named co-owner. Penalty:- a loss consisting of the most recent 3 months' interest for EE bonds with May 1997 or later issue dates, and I Bonds, if the bonds are redeemed in the first 5 years after issue. In other words, if you redeem a May 1997 or later EE bond, or an I Bond, before it's 5 years old, you give up the last 3 months' worth of interest. For example, if you buy an EE bond in May 1997 and redeem it 2 years (24 months) later, you get your original investment back plus 21 months of interest. The value of the bond would be based on the announced rates applied over the 21-month period from May 1997 to February 1999. / ТчрэжэриДирэкт (TreasuryDirect).

EEK = ESTONIAN KROON

EELQMS = EUROPEAN ENGINE LUBRICANT QUALITY MANAGEMENT SYSTEM

EEOC = EQUAL EMPLOYMENT OPPORTUNITY COMMISSION

EEP = EUROPEAN ELECTRONIC PURSE

EER = EFFECTIVE EXCHANGE RATE

EEZ = EXCLUSIVE ECONOMIC ZONE

EF = ELEMENTARY FILE

EFC = ECONOMIC AND FINANCIAL COMMITTEE

EFFECT = ЭФФЕКТ – Effect is the influence of an external factor on the plant, e.g., drought, fertilizer, flooding. In statistics, that which is measured and analyzed as in treatment effect. / Под Эффектом, от Латинского слова Effectus, означающее Действие или Исполнение, от Efficio, означающее Действую или Исполняю, понимается:- (1) результат, следствие каких-либо причин, действий, например, эффект лечения. (2) Сильное впечатление, произведённое кем-либо, чем-либо; средство, приём (в том числе в искусстве), цель которых произвести впечатление, удивить или создать иллюзию чего-либо, например, световые, шумовые эффекты в театре. (3) Физическое явление, например, фотоэффект.

EFFECTIVE ACCUMULATED TEMPERATURE = ЭФФЕКТИВНАЯ АККУМУЛИРОВАННАЯ ТЕМПЕРАТУРА (или СУММА АКТИВНЫХ ТЕМПЕРАТУР) – Effective Accumulated Temperature (EAT) is the total effective temperature in °C received by the plant in a certain growth period (stage). It is used to predict flowering. EAT = mean daily temp °C – temp higher than 27 °C – temp of the lower limit (12 °C).

EFFECTIVE DATE = ДАТА ВСТУПЛЕНИЯ В СИЛУ (или ЭФФЕКТИВНАЯ ДАТА) – (1) Effective Date is a date on which a contract becomes effective. / Дата, с которой контракт или договор становится действительным.

(2) Effective Date is the date on which an insurance policy or bond goes into effect, and from which protection is furnished. / Дата, с которой страховой полис или гарантия вступает в силу, и с которой предоставляется защита.

(3) The Effective Date is the date on which the parties begin calculating accrued obligations, such as fixed and floating interest payment obligations on an interest rate swap. See also Trade Date. / Под Датой Начала Расчёта понимается дата, с которой стороны начинают осуществлять расчёт начисляемых обязательств, таких как обязательства оплаты по зафиксированной и плавающей процентной ставке в сделке со свопом на процентную ставку. Смотрите также Дата Сделки (Trade Date).

EFFECTIVE EXCHANGE RATE = ЭФФЕКТИВНЫЙ ОБМЕННЫЙ КУРС – The nominal Effective Exchange Rate (EER) of the Euro is a summary measure of its external value vis-à-vis the currencies of the most important trading partners of the Euro area. The real EER – obtained by deflating the nominal EER with appropriate price or cost indices – is the most commonly used indicator of international price and cost competitiveness. The European Central Bank (ECB) calculates daily nominal EERs, which are defined as geometric weighted averages of the bilateral exchange rates of the Euro against the currencies of trading partners. Since price and cost data are not available at higher frequency, real EERs are calculated monthly or quarterly. The weights assigned to trading partners are derived from their shares in Euro area trade in manufactured goods, excluding trade within the Euro area, over two three-year periods (namely 1995–97 and 1999–2001). The former weights are used for the series up to 1999 and the latter for the series from 1999 onwards. The weights use information on both exports and imports. The import weights are the simple shares of each partner country in total Euro area imports from all the partner countries. The weights for exports are determined in such a way that they capture both the importance of those individual markets for Euro area exports and the competition faced by euro area exporters in other foreign markets from both domestic producers and exporters from third countries. EERs are calculated vis-à-vis three groups of trading partners:- the EER–12, consisting of the 12 main trading partners of the Euro area; the EER–22, comprising the 12 EU Member States outside the Euro area and ten main trading partners outside the European Union; and the EER–42, comprising the EER–22 and another 20 relevant countries. Nominal EERs are computed daily for the EER–12 and EER–22, and monthly for all three groups. Real EER indices using consumer prices are available monthly for all three groups. For the EER–12 and EER–22, real EER indices based on producer prices are also calculated monthly, and based on GDP deflators and unit labor costs, quarterly. The ECB also publishes monthly harmonized competitiveness indicators based on consumer prices for individual Euro area countries. These indicators are constructed using the same methodology and data sources employed in the calculation of the real EER for the Euro and allow for consumer price developments in the other Euro area countries as well as for price and exchange rate developments outside the Euro area.

EFFECTIVE FRUITING PERIOD = ЭФФЕКТИВНЫЙ ПЕРИОД ПЛОДОНОШЕНИЯ – Effective Fruiting Period is the time between first square and flowering date of the last effective boll population, i.e. cutout with cutout defined by nodes above white flower (NAWF) = 5. Flowering will continue beyond this point, but the resulting bolls are not economical to manage, i.e. not of acceptable size or quality. See also Last Effective Boll Population.

EFFECTIVE INTEREST METHOD = МЕТОД ЭФФЕКТИВНОГО ПРОЦЕНТА – Effective Interest Method is a method of calculating the amortized cost of a financial asset or financial liability (or group of financial assets or financial liabilities) and of allocating the interest income or interest expense over the relevant period.

EFFECTIVE INTEREST RATE = ЭФФЕКТИВНАЯ ПРОЦЕНТНАЯ СТАВКА – Effective Interest Rate:- Net interest return designates the actual interest rate earned by an investment in any given year. It takes into account buying and sellings fees, prices valid at time of purchase or sale, as well as any discounts or premiums. A security's maturity and repayment conditions also influence the net interest return. Opposite:- Nominal Interest Rate. The rate that exactly discounts estimated future cash payments or receipts through the expected life of the financial instrument or, when appropriate, a shorter period to the net carrying amount of the financial asset or liability.

EFFECTIVE PRECIPITATION = ЭФФЕКТИВНЫЕ АТМОСФЕРНЫЕ ОСАДКИ – Effective Precipitation is that portion of total precipitation that becomes available for plant growth. / Эффективные Осадки – осадки, используемые растениями.

EFFECTIVE PRICE = ЭФФЕКТИВНАЯ ЦЕНА – The Effective Price is the price at which a commodity is sold or bought after the hedge has been lifted (liquidated). It can be calculated either by adding/substracting the basis change to the original cash price, or by adding/substracting the hedge of the futures (the original futures price at the time the hedge was placed minus the futures price at the time the hedged was lifted) to the final cash price. If a short hedger has made a profit, the effective cash price will be higher than the original cash price being hedged. If a long hedger has made a profit, the effective cash price will be lower than the original cash price being hedged.

EFFECTIVE RAINFALL = ЭФФЕКТИВНЫЕ ДОЖДЕВЫЕ ОСАДКИ – Effective Rainfall is that portion of rainfall that can be stored within the rooting depth of the crop and on the paddy surface and can be subsequently utilized by the plants. / в пределах глубины укоренения . Эффективные Осадки – осадки, используемые растениями.

EFFECTIVE YIELD = ЭФФЕКТИВНАЯ ДОХОДНОСТЬ – Effective Yield is the yield of a bond, assuming that you reinvest the coupon (interest payments) once you have received payment. Effective yield is the total yield an investor receives in relation to the nominal yield or coupon of a bond. Effective yield takes into account the power of compounding on investment returns, while nominal yield does not. For example, if an investor holds a bond that pays a 5% coupon semi-annually, he will actually receive two coupon payments per

annum. If the investor reinvests each coupon payment then his effective yield will be greater than the stated coupon rate or nominal yield. Reinvesting the coupon will produce a higher yield, because interest is earned on the interest payments. Effective Yield is the yield calculated as a percentage of the price of an investment. See also Yield (2). Effective Yield is the yield or return on a short-term investment after adjustment for the change in exchange rates over the period of concern. Effective Yield:- a calculation of the return on an investment that considers the price paid,the time held,and the interest received. / Смотрите также Доходность (Yield) (2).

THE EFFECTS OF CHANGES IN FOREIGN EXCHANGE RATES = ЭФФЕКТЫ ИЗМЕНЕНИЙ ОБМЕННЫХ КУРСОВ ИНОСТРАННОЙ ВАЛЮТЫ – IAS 21 (short for International Accounting Standard No. 21) – The Effects of Changes in Foreign Exchange Rates – An entity may carry on foreign activities in two ways. It may have transactions in foreign currencies or it may have foreign operations. In addition, an entity may present its financial statements in a foreign currency. The objective of this Standard is to prescribe how to include foreign currency transactions and foreign operations in the financial statements of an entity and how to translate financial statements into a presentation currency. The principal issues are which exchange rate(s) to use and how to report the effects of changes in exchange rates in the financial statements. This Standard does not apply to hedge accounting for foreign currency items, including the hedging of a net investment in a foreign operation. IAS 39 applies to hedge accounting. This Standard does not apply to the presentation in a cash flow statement of cash flows arising from transactions in a foreign currency, or to the translation of cash flows of a foreign operation (see IAS 7 Cash Flow Statements). Functional currency:- functional currency is the currency of the primary economic environment in which the entity operates. The primary economic environment in which an entity operates is normally the one in which it primarily generates and expends cash. An entity considers the following factors in determining its functional currency:- (a) the currency:- (i) that mainly influences sales prices for goods and services (this will often be the currency in which sales prices for its goods and services are denominated and settled); and (ii) of the country whose competitive forces and regulations mainly determine the sales prices of its goods and services. (b) the currency that mainly influences labor, material and other costs of providing goods or services (this will often be the currency in which such costs are denominated and settled). Reporting foreign currency transactions in the functional currency:- foreign currency is a currency other than the functional currency of the entity. Spot exchange rate is the exchange rate for immediate delivery. Exchange difference is the difference resulting from translating a given number of units of one currency into another currency at different exchange rates. Net investment in a foreign operation is the amount of the reporting entity's interest in the net assets of that operation. A foreign currency transaction shall be recorded, on initial recognition in the functional currency, by applying to the foreign currency amount the spot exchange rate between the functional currency and the foreign currency at the date of the transaction. At each balance sheet date:- (a) foreign currency monetary items shall be translated using the closing rate; (b) non-monetary items that are measured in terms of historical cost in a foreign currency shall be translated using the exchange rate at the date of the transaction; and (c) non-monetary items that are measured at fair value in a foreign currency shall be translated using the exchange rates at the date when the fair value was determined. Exchange differences arising on the settlement of monetary items or on translating monetary items at rates different from those at which they were translated on initial recognition during the period or in previous financial statements shall be recognised in profit or loss in the period in which they arise. However, exchange differences arising on a monetary item that forms part of a reporting entity's net investment in a foreign operation shall be recognised in profit or loss in the separate financial statements of the reporting entity or the individual financial statements of the foreign operation, as appropriate. In the financial statements that include the foreign operation and the reporting entity (e.g., consolidated financial statements when the foreign operation is a subsidiary), such exchange differences shall be recognized initially in a separate component of equity and recognised in profit or loss on disposal of the net investment. Furthermore, when a gain or loss on a non-monetary item is recognised directly in equity, any exchange component of that gain or loss shall be recognised directly in equity. Conversely, when a gain or loss on a non-monetary item is recognised in profit or loss, any exchange component of that gain or loss shall be recognised in profit or loss. Translation to the presentation currency/Translation of a foreign operation:- The Standard permits an entity to present its financial statements in any currency (or currencies). For this purpose, an entity could be a standalone entity, a parent preparing consolidated financial statements or a parent, an investor or a venturer preparing separate financial statements in accordance with IAS 27 Consolidated and Separate Financial Statements. If the presentation currency differs from the entity's functional currency, it translates its results and financial position into the presentation currency. For example, when a group contains individual entities with different functional currencies, the results and financial position of each entity are expressed in a common currency so that consolidated financial statements may be presented. An entity is required to translate its results and financial position from its functional currency into a presentation currency (or currencies) using the method required for translating a foreign operation for inclusion in the reporting entity's financial statements. The results and financial position of an entity whose functional currency is not the currency of a hyperinflationary economy shall be translated into a different presentation currency using the following procedures:- (a) assets and liabilities for each balance sheet presented (ie including comparatives) shall be translated at the closing rate at the date of that balance sheet; (b) income and expenses for each income statement (i.e. including comparatives) shall be translated at exchange rates at the dates of the transactions; and (c) all resulting exchange differences shall be recognised as a separate component of equity. Any goodwill arising on the acquisition of a foreign operation and any fair value adjustments to the carrying amounts of assets and liabilities arising on the acquisition of that foreign operation shall be treated as assets and liabilities of the foreign operation. Foreign operation is an entity that is a subsidiary, associate, joint venture or branch of a reporting entity, the activities of which are based or conducted in a country or currency other than those of the reporting entity. On the disposal of a foreign operation, the cumulative amount of the exchange differences deferred in the separate component of equity relating to that foreign operation shall be recognised in profit or loss when the gain or loss on disposal is recognised. When there is a change in an entity's functional currency, the entity shall apply the translation procedures applicable to the new functional currency prospectively from the date of the change. If the functional currency is the currency of a hyperinflationary economy, the entity's financial statements are restated in accordance with IAS 29 Financial Reporting in Hyperinflationary Economies. The results and financial position of an entity whose functional currency is the currency of a hyperinflationary economy shall be translated into a different presentation currency using the following procedures:- (a) all amounts (i.e. assets, liabilities, equity items, income and expenses, including comparatives) shall be translated at the closing rate at the date of the most recent balance sheet, except that (b) when amounts are translated into the currency of a non-hyperinflationary economy, comparative amounts shall be those that were presented as current year amounts in the relevant prior year financial statements (i.e. not adjusted for subsequent changes in the price level or subsequent changes in exchange rates). / МСБУ 21 (сокращение для Международного Стандарта Бухгалтерского Учёта № 21) – .

EFFICACY = ЭФФЕКТИВНОСТЬ – Efficacy (treatment) is a defined, measurable, and reproducible effect by a prescribed treatment. Efficacy is the degree of which a herbicide controls a weed. / Эффективность (обработки):- определённый, измеряемый и воспроизводимый результат, достигаемый в результате предписанной обработки. В отношении к гербицидам под Эффективностью понимается та степень, с которой гербицид борется с сорняками.

EFFICIENCY = ЭФФЕКТИВНОСТЬ (или ПРОИЗВОДИТЕЛЬНОСТЬ) – Efficiency:- in an economic sense, the ratio or proportionality between the value of the human end achieved ('benefits' or 'satisfactions') and the value of the scarce resources expended to achieve it (opportunity costs). When an economist calls a situation or a practice 'inefficient', he is claiming that we could

achieve exactly the same desired goals with the expenditure of fewer scarce resources, or, put another way, that the amount of resources being employed could potentially produce even more of the beneficial results intended than they do. Efficiency simply means making the most we can of the limited resources we have. Notice that 'efficiency' in the economist's sense is an inherently evaluative term, not a matter of mere technical or scientific measurement of objective physical quantities, as the term might be used in an engineering context (as for example, the 'efficiency' of various kinds of steam engine in transforming heat energy to useful kinetic energy). 'Value of' always requires some sort of answer to the question 'value to whom'. When we assess the efficiency of any process or social institution or practice, just whose evaluations of the means and the ends are we using? In a well-developed market economy, assessment of economic efficiency makes heavy use of the monetary values placed on the various inputs and the resulting outputs in the open marketplace. The valuations that count are thus the valuations of those who are willing and able to support their preferences by spending their money in the ways that seem to them most likely to maximize their own satisfactions or 'utility' based on their own individual tastes and preferences. The evidence that any particular economic resource is being used efficiently is, in the end, the fact that no one finds it 'worth his while' to bid up the price and pay more in order to divert it to some other use. The logical and philosophical elaboration of the idea that competitive market systems are highly efficient in a much broader sense even than this is the primary content of Adam Smith's classic work The Wealth of Nations (1776). Indeed the entire subdivision of today's economic science known as 'Welfare Economics' specializes primarily in identifying and analyzing the necessary preconditions for voluntary market interactions to generate socially efficient outcomes (and in examining the possibilities for remedies by deliberate state economic policies where those necessary preconditions may not be fully met). / Эдэм Смис (Adam Smith).

EFFICIENT CONSUMER RESPONSE = ЭФФЕКТИВНАЯ РЕАКЦИЯ ЗАКАЗЧИКА – Efficient Consumer Response (ECR) is a customer-driven system where distributors and suppliers work together as business allies to maximize consumer satisfaction and minimize cost. A consumer-driven system of replenishment in which high-quality products and accurate information flow through a paperless electronic data interchange (EDI) system between all distribution points from the manufacturing line to the retail checkout counter.

EFFICIENT FRONTIER = ЭФФЕКТИВНАЯ ГРАНИЦА – Efficient Frontier:- an efficient portfolio is one for which it is not possible to increase the expected return without accepting more risk and not possible to reduce the risk without accepting a lower return. The efficient frontier is the line joining all efficient portfolios in risk-return space. In portfolio theory risk is defined as variance or standard deviation of return.

EFFICIENT MARKET = ЭФФЕКТИВНЫЙ РЫНОК – Efficient Market is a market in which new information is immediately available to all investors and potential investors. A market in which all information is instantaneously assimilated and therefore has no distortions. In economic theory, an Efficient Market is one in which market prices adjust rapidly to reflect new information. The degree to which the market is efficient depends on the quality of information reflected in market prices. In an efficient market, profitable arbitrage opportunities do not exist and traders cannot expect to consistently outperform the market unless they have lower-cost access to information that is reflected in market prices or unless they have access to information before it is reflected in market prices. See also Random Walk.

EFFLUENT = СТОК (или ИСТОК, или ВЫТЕКАЮЩИЙ ПОТОК, или ЭФФЛЮЕНТ) – Effluent is the fluid leaving a component.

EFORD = EQUIVALENT DEMAND FORCED OUTAGE RATE

EFP = ELECTRONIC FILING PARTNERSHIP

EFP = EXCHANGE FOR PHYSICAL

EFRAG = THE EUROPEAN FINANCIAL REPORTING ADVISORY GROUP

EFS = ELECTRONIC FILING SYSTEM

EFS = EXCHANGE OF FUTURES FOR SWAP

EFS–ABX = ХХ–СЭП – EFS-ABX is short for the Electronic Filing System – Application Body eXtensible Markup Language authoring tool (for patent applications); superceded by EFS-Web. / Система Электронной Подачи .

EFS–WEB = ВЭБ–СЭП – EFS-Web is short for the Electronic Filing System – web-based filing using PDF files. / Система Электронной Подачи .

EFT = ELECTRONIC FUNDS TRANSFER

EFTA = EUROPEAN FREE TRADE ASSOCIATION

EFTD = ESTIMATED FIRST TRADING DATE

EFTPOS = ELECTRONIC FUNDS TRANSFER AT THE POINT OF SALE

EFTS = ELECTRONIC FUNDS TRANSFER SYSTEMS

EG = EGYPT

EGG = ЯЙЦО (или ЯЙЦЕКЛЕТКА) – Egg is a single cell or ovum from an ovary; the first stage of an insect or mite; may be deposited singly (e.g., bollworm) or in a mass (e.g., European corn borer). Egg is:- (1) in insects, the reproductive body in which the embryo develops and from which the nymph or larva hatches. (2) In plants, the female ovum, pertaining to reproductive cells. / Под Яйцом или Яйцеклеткой понимается женская половая клетка животных и растений, из которой может развиваться новый организм в результате оплодотворения или путём партеногенеза. Содержит гаплоидный (одинарный) набор хромосом.

EGG MASS = МАССА ЯИЦ – Egg Mass is a group of eggs deposited by the female insect which are adjacent to each other (as in rice bug) or overlapping (as in the yellow stem borer) as opposed to eggs laid singly.

EGGPLANT = ХХ – Eggplant:- a dark grayish or blackish purple.

EGG PLUG = ЯИЧНАЯ ПРОБКА – Egg Plug is a gelatinous fluid which the rice weevil places over the egg, located in the egg cavity in the plant.

EGGSHELL = ЯИЧНАЯ СКОРЛУПА (или ХХ) – Eggshell:- semi-matte, having a texture resembling that of the outer surface of the shell of a chicken egg. Usually used in describing a type of paint finish. / полуматовая, имеющая текстуру .

EGGSHELL = ХХ – Eggshell:- yellowish white. / :- желтовато-белое.

E–GLASS FIBER = И–СТЕКЛОВОЛОКНО – Physical Properties of E-glass Fiber:- (1) Approximate Chemistry*:- (i) SiO_2 – 52–60%; (ii) CaO – 16–25%; (iii) Al_2O_3 – 12–16%; (iv) BaO – 8–13%; (v) MgO – 0–6%; (vi) NaO_2 – 0–1%; and (vii) KO_2 – 0–1%. (2) Physical Properties*:- (i) Density – 2.54–2.60 g/cc; and (ii) Refractive Index – 1.558 to 1.562. (3) Mechanical Properties*:- (i) UTS (room temp) – 3.4–3.5 GPa; (ii) Breaking Strain – 4.5–5.0%; (iii) Young's Modulus – 65–75 GPa; (iv) Shear Modulus – 28–32 GPa; and (v) Poisson's Ratio – 0.200. (4) Thermal Properties*:- (i) CTE (20 °C) – 4.0–5.0 µm/m-°C; (ii) CTE (30 °C to 250 °C) – 4.5–5.5 µm/m-°C; (iii) Specific Heat Capacity – 0.78–0.82 J/g-°C; (iv) Thermal Conductivity – 1.28–1.32 W/m-K; and (v) Softening Point – ≤ 845°C. (5) Electrical Properties*:- (i) Dk @ 1 MHz – 6.3–6.6; (ii) Df @ 1 MHz – 0.002 3–0.002 7; (iii) Electrical Resistivity – 3.5–4.0e+12Ω-cm; and (iv) Dielectric Strength – 10.3kV/mm. Note:- *All values approximate. Actual values may vary, for further info contact JPSCM (short for the JPS Composite Materials is a wholly owned subsidiary of JPS Industries Inc. – the world's leading manufacturer of high strength fiberglass, Astroquartz®, and aramid fabrics and reinforcements; headquartered in Anderson, State of South Carolina (SC), the United States). See also S-Glass Fiber. / Дьжей.Пи.Эс. Индэстриз Инк. (JPS Industries Inc.). Эстроквотц® (или Астрокварц®; Astroquartz®).

E–GOV = ELECTRONIC GOVERNMENT

EGP = EGYPTIAN POUND

EGR = EXHAUST GAS RECIRCULATION

EGYPTIAN COTTON = ЕГИПЕТСКИЙ ХЛОПЧАТНИК – Egyptian Cotton is a fine, long, staple Cotton generally grown in Egypt along the Nile Delta. Egyptian Cotton fibers average more than 1-1/2 inches in length and produce a strong, lustrous yarn. See also Cotton. Egyptian Cotton:- Egypt is the world's largest producer of high grade, long staple Cotton. The majority of it is grown in the Nile Delta and all requires irrigation. The staple length commonly runs from 1-1/8 to 1-1/2 inches, the fibers are quite fine and they have a distinct color – varying from light cream to dark tan. One troublesome problem with these Cottons has been to maintain the quality of the better varieties. Egyptian Cotton is grown exclusively in Egypt and has the longest fiber of all types of Cotton. It average 1-3/8" to 2-1/4" inches in length of fibers. Egyptian Cotton has become wildly popular in recent years. Why exactly? Does it really matter? It was thought for ages that Cotton was Cotton and thread count was king when choosing quality fabrics. That is no longer true. Consumer guidelines for buying fabric suggest that Cotton from Egypt is superior to other Cotton. Is this true and, if so, what is the big difference? The varieties of Egyptian Cotton are used to create fabric of all types from sheets to pillowcases to comforters to shirts. The long staple or long fiber of Egyptian-grown Cotton means that there is more continuous fiber to use when creating threads or yarns. This yarn is smaller in diameter yet stronger than other Cottons. Smaller yarn means that more threads per square inch can be used to create stronger fabric which is light in weight yet breathes well. More threads per inch means that the thread count on the fabric label will be higher. Many buyers think that choosing high thread count sheets is the only gauge of quality. This is not true, but in the case of Cotton grown in Egypt, the higher thread count means the fabric will be incredibly strong and will last for years and years. If cared for properly, Egyptian produced cotton fabric can last for decades. The texture of the fabric created from Egyptian grown Cotton is a bit harder than other cottons when the fabric is new. However, with every single laundering, the cotton fabric from Egyptian fibers becomes softer and softer. Like a fine perfume, age improves the Egyptian fiber cotton fabric. Unlike many products, fabric made from Egyptian Cotton will become softer with each washing. Cotton grown in Egyptian fields also produce less lint and therefore will not pill after repeated washings like other materials. At one time, the only way to obtain Egyptian fiber cotton fabrics was to shop in high-end expensive stores. This is no longer true and most department stores and online stores carry a selection of Egyptian produced cotton sheets,shirts and other items for abuyer seeking a high quality product. Processability:- Egyptian Cotton is distinct for many reasons; one of them being the supermacyof cellulose distribution in its fibers. Each cotton fiber is composed of concentric layers. The cuticle layer on the fiber which consists of wax and pectin materials is separated from other fibers. The primary wall, the most peripheral layer of the fiber, is composed of cellulose crystalline fibrils. The secondary wall of the fiber consists of three distinct layers. All three layers of the secondary wall include closely packed parallel fibrils with spiral winding of 25–35° and represent the majority of cellulose within the fiber. The innermost part of cotton fiber the lumen, is composed cell content remains. Before boll opening, the lumen is filled with liquid containing the cell nucleus and protoplasm. The twists and convolutions of the dried fiber are due to the removal of this liquid. The cross section of the fiber is bean-shaped, swelling almost round when moisture absorption takes place. The overall contents are broken down into the following components:- (i) 80–90% cellulose; (ii) 6–8% water; (iii) 0.5–1% waxes and fats; (iv) 0–1.5% proteins; (v) 4–6% hemicellulose and pectins; and (vi) 1–1.8% ash. During scouring, treatment of the fiber with caustic soda, natural waxes and fats in the fiber are saponified and pectins and other non-cellulosic materials are released, so that the impurities can be removed by just rinsing away. After scouring, a bleaching solution (consisting of a stabilized oxidizing agent) interacts with the fiber and the natural colors removed. Bleaching takes place at an elevated temperature for a fixed period of time. Mercerization is another process of improving absorption properties of cotton. Cotton fiber is immersed into 18–25% solution of sodium hydroxide often under tension. The fiber obtains better luster and absorption during mercerization. After scouring and bleaching, the fiber is 99% cellulose. Cellulose is a polymer consisting of anhydroglucose units connected with 1,4 oxygen bridges in the beta position. The hydroxyl groups on the cellulose units enable hydrogen bonding between two adjacent polymer chains. Fiber Properties:- the following table shows the quality properties of different varieties of Egyptian Cotton:- Giza 85, 86, 88 and 87 verses Upland Greek Cotton, Acala Sudanese Cotton, Southern Indian Cotton, Aegean and GAP Turkish Cotton. Naturally, the fiber quality of Egyptian Cotton variety is higher than all other Cotton varieties even if they are comparable in fiber length. The main differences shown include:- fiber strength, fiber length, length uniformity, fiber fineness, fiber elongation and short fiber index. In some samples of Greek and Acala Cottons the short fiber index reached 18.0 accompanied by the lowest length uniformity of 79. Conclusion:- (i) Egyptian Cotton is of superior quality to most of the cotton varieties known in the world concerning all mechanical and technological characteristics. (ii) Egyptian Cotton uniformity is higher than Turkish Cotton uniformity including comparable micronaire and staple length values. Due to cellulose uniformity in fibers, Egyptian Cotton is superior for comfort performance products, such as shirting, bedding and even towels. (iii) Egyptian Cotton strength is almost 50% higher than Greek and Turkish Cotton and double that of Indian Cotton. (iv) Egyptian Cotton varieties can offer micronaire as low as 3.05 (Giza 45) and 3.24 (Giza 87) introducing maximum fineness which is not available in other varieties. (v) Due to superior uniformity and cellulose distribution, Egyptian Cotton introduces more comfort products, better absorption for dye material, better fabric breath while usage and durable appearance, which cannot be introduced with other varieties for lack of similar mechanical properties of Egyptian Cotton. Egyptian Cotton is a long staple variety from Egypt with fiber length averaging 1-3/8". / Гиза (Giza).

EH = WESTERN SAHARA

EHA = EQUIPMENT HANDOVER AGREEMENT

EHV = EXTRA HIGH VOLTAGE

EIA = ENERGY INFORMATION ADMINISTRATION

EIA = ENVIRONMENTAL IMPACT ASSESSMENT

EIB = EUROPEAN INVESTMENT BANK

EIC = EQUIPMENT IMBALANCE CHARGE

EIDERDOWN = АЙДЁДАУН (или XX) – Eiderdown is a soft lightweight clothing fabric knitted or woven and napped on one or both sides.

EIGHT–HARNESS SATIN WEAVE = ВОСЬМИРЕМИЗНОЕ АТЛАСНОЕ ПЕРЕПЛЕТЕНИЕ – The Eight-Harness Satin Weave is similar to the four-harness satin weave except than one filling yarn floats over seven warp yarns and under one. This is a very pliable weave and is used for forming curved surfaces. / уточная пряжа .

EIN = EMPLOYER IDENTIFICATION NUMBER

EIN = EXPORT IDENTIFICATION NUMBER

EIR = EQUIPMENT INTERCHANGE RECEIPT

EISA = ENERGY INDEPENDENCE AND SECURITY ACT

ELAIN = ELECTRONIC LICENSE APPLICATION AND INFORMATION NETWORK

ELAN = EXPORT LEGAL ASSISTANCE NETWORK

ELASTANE = ЭЛАСТАН – Elastane or Elasthane or Spandex is a synthetic fiber that can be stretched by between 500 and 800%. It is stronger and considerably more robust than fibers made of rubber or natural caoutchouc, the primary plant-based 'alternative' material. In chemical terms, elastane is a long-chain polymer containing at least 85% polyurethane. It's tradenames are Dorlastan and Lycra®. Compared to rubber, elastane has both greater tear resistance and durability and a tension capacity two or three times greater, at a third of the weight. There are two principal methods used in processing elastane. One is to wrap the elastane fiber in a non-elastic thread – either natural or man-made. The resulting yarn has the appearance and feel of the outer fiber used. The second method involves using pure elastane threads, which are worked or woven into fabrics made from other fibers. The added elasticity makes such fabrics more comfortable to wear. Blends with elastane depend on the type of fabric and the end use. Elastane is used in all areas where a high degree of permanent elasticity is required, as, for example, in tights, sportswear, swimwear, corsetry, and in woven and knitted fabrics. When stretched, it always reverts to its original form. On care labels elastane is often designated as 'EL'. Elastane is a synthetic fiber composed of at least 85% by mass of a segmented polyurethane and which, if stretched to three times its unstretched length, rapidly reverts substantially to the unstretched length when the tension is removed. Alphabetic code – EL; and relevant commercial allowance – 1.30. European Union Directives on Textile Labelling indicate 1.50. / Эластан (Elastane или Elasthane). Доэлэстэн (Dorlastan) и Лайкра® (Lycra®).

ELASTERELL–P = ЭЛАСТЕРЭЛ–ПИ. – The US fiber producer Invista Inc., Wilmington, DE, USA, has been producing the meltspun elastic polyester fiber T-400 in its plant in Chattanooga, TN, USA since 2001. In the United States, Invista was given the generic name 'Elasterell-P' for its product by the Federal Trade Commission (FTC). In European Union, this fiber received the generic name 'Elastomultiester'. With the introduction of this new generic name, apparel producers now had to relabel clothing and materials that contained T-400. / Американский производитель волокна – компания Инвиста Инк. (Invista Inc.), Вилмингтон, Штат Дэлавэр, США, .

ELASTIC = ЭЛАСТИК (или ЭЛАСТИЧНОЕ, или УПРУГОЕ, или РЕЗИНКА) – Elastic is an elastic fabric usually made of yarns containing rubber.

ELASTIC AIR COVERED YARN = ЭЛАСТИЧНАЯ (или ЭЛАСТИЧЕСКАЯ) ПОКРЫТАЯ ПРЯЖА С ВОЗДУШНОЙ ПРОСЛОЙКОЙ – Elastic Air Covered Yarn is the elastic yarn with bare and twistless elastane core and one or more relatively inelastic cover yarns air-mingled together with the core entwined by the filaments with randomly distributed interlace points.

ELASTIC CORE SPUN YARN = ЭЛАСТИЧНАЯ (или ЭЛАСТИЧЕСКАЯ), С ВПРЯДЕННЫМ СЕРДЕЧНИКОМ ПРЯЖА – Elastic Core Spun Yarn is the elastic yarn with bare elastane core and relatively inelastic staple fibers from a sliver twisted around the core with continuous turns in one direction.

ELASTIC CORE TWISTED YARN = ЭЛАСТИЧНАЯ (или ЭЛАСТИЧЕСКАЯ), КРУЧЁНАЯ С СЕРДЕЧНИКОМ ПРЯЖА – Elastic Core Twisted Yarn is the elastic yarn with bare elastane core and one or more relatively inelastic cover yarns twisted with continuous turns in one direction.

ELASTIC COVERED YARN = ЭЛАСТИЧНАЯ (или ЭЛАСТИЧЕСКАЯ) ПОКРЫТАЯ ПРЯЖА – Elastic Covered Yarn is a General term for elastic yarn with bare elastane core covered by one or more relatively inelastic textile components. Several processes are in use to combine elastane with other fibers to produce elastic yarns for textile applications. The main yarn constructions of such fiber combinations are:- (i) single or double covered yarn; (ii) elastic core spun yarns; (iii) elastic core twisted yarns; (iv) elastic air covered yarns; and (v) core textured yarn.

ELASTIC CURRENCY = ЭЛАСТИЧНАЯ ВАЛЮТА – Elastic Currency is a currency that can, by the actions of the central monetary authority, expand or contract in amount warranted by economic conditions. The ability of currency to expand and contract to meet the needs of the economy.

ELASTICITY = ЭЛАСТИЧНОСТЬ (или УПРУГОСТЬ) – (1) In economics, Elasticity is a measure of responsiveness, i.e. how a variable reacts to a change in one of the factors influencing it. Price elasticity of supply, for instance, shows the extent to which supply for an economic asset changes in response to a rise or fall in the price of that asset.

(2) Elasticity is the ability to return to its original length after being stretched or compressed. Wool has more elasticity than cotton, with finer wools stretching up to 30% of their original length. Elasticity is the ability of a fiber or fabric to return to its original length, shape, or size immediately after the removal of stress. Elasticity:- that property of a material by virtue of which it tends to recover its original size and shape immediately after removal of a deforming force. Elasticity is the ability of a strained material to recover its original size and shape immediately after removal of the stress that causes deformation. Elasticity of a thread of fabric may be defined as the power of a thread or fabric to recover its original length when the tension or stretching force is removed. A number of factors affect elasticity and among them are:- length of fiber, fineness of fiber, twist of fiber, wax content of the fiber, hygroscopicity (ability to absorb moisture) of the fiber, count of yarn, twist, and moisture content of the yarn while under test. / Под Эластичностью понимается способность материала или изделия испытывать значительные упругие деформации без разрушения при сравнительно небольшой действующей силе. К эластичным материалам относится, например, резина.

ELASTICIZED FABRIC = ЭЛАСТИЧНАЯ (или УПРУГАЯ) ТКАНЬ – Elasticized Fabric is a fabric that contains elastic threads. Such fabrics are used for girdles, garters, and similar items.

ELASTIC LIMIT = ЭЛАСТИЧНЫЙ ЛИМИТ (или ПРЕДЕЛ УПРУГОСТИ) – Elastic Limit:- in strength and stretch testing, the load below which the specimen shows elasticity and above which it shows permanent deformation. See also Yield Point.

ELASTIC RECOVERY = ЭЛАСТИЧНОЕ ВОССТАНОВЛЕНИЕ (или УПРУГОЕ ВОССТАНОВЛЕНИЕ, или УПРУГОЕ ПОСЛЕДЕЙСТВИЕ) – Elastic Recovery is the degree to which fibers, yarn, or cord returns to its original size and shape after deformation from stress.

ELASTODIENE = ЭЛАСТОДИЕН (или ЭЛАСТОДИЕНОВОЕ (ВОЛОКНО)) – Elastodiene is a synthetic fiber composed of natural or synthetic polyisoprene, or of one or more dienes polymerized with or without one or more vinyl monomers, and which, if stretched to three times its unstretched length, rapidly reverts substantially to the unstretched length when the tension is removed. Alphabetic code – ED; and relevant commercial allowance – 1.00 (refers to European Union Directives on Textile Labelling). / Эластодиеновое Волокно – волокно из натурального или синтетического полиизопрена или сополимеров одного или более диенов, с одним или более виниловым мономером.

ELASTOHYDRODYNAMIC LUBRICATION = ЭЛАСТОГИДРОДИНАМИЧЕСКОЕ СМАЗЫВАНИЕ – Elastohydrodynamic Lubrication:- in rolling element bearings, the elastic deformation of the bearing (flattening) as it rolls, under load, in the bearing race. This momentary flattening improves the hydrodynamic lubrication properties by converting point or line contact to surface-to-surface contact. See also Lubrication.

ELASTOLEFIN = ЭЛАСТОЛЕФИН – In the beginning of 2000s, the European Union Commission has introduced a new generic name Elastolefin for elastic polyolefin fibers. Until now, these synthetic fibers have only been produced since 2004 by Dow Fiber Solutions at their site in Tarragona, Spain under the name of Dow XLA, and is distinguished through high elasticity as well as resistance to chlorine, and generally against aggressive chemicals and UV light. It also has a high temperature resistance (up to 220 °C). In the United States, the Federal Trade Commission (FTC) had already introduced the generic name Lastol a few years ago. Elastolefin is a synthetic fiber composed of at least 95% (by mass) of macromolecules partially cross-linked, made up from ethylene and at least one other olefin and which, when stretched to one and a half its original length and released, recovers rapidly and substantially to its original length. Alphabetic code – EOL; and relevant commercial allowance – 1.50 (refers to European Union Directives on Textile Labelling). / ультрафиолетового (УФ (UV)) излучения.

ELASTOMER = ЭЛАСТОМЕР – Elastomer is a rubber or rubber-like material, both natural and synthetic, used in making a wide variety of products, such as seals and hoses. In oil seals, an elastomer's chemical composition is a factor in determining its compatibility with a lubricant. Elastomers are the synthetic polymers having properties of natural rubber such as high stretchability and recovery. / Под Эластомерами понимаются полимеры и материалы на их основе, обладающие высокоэластичными свойствами в широком интервале температур, охватывающем практически всю область температур их эксплуатации. Типичные эластомеры – натуральный каучук, синтетические каучуки, резина. Под Эластомерами понимаются полимеры, способные к большим обратимым, так называемым высокоэластическим, деформациям в широком диапазоне температур (для большинства эластомеров – от –60 до 200 °C). Типичные представители эластомеров – каучуки и резины на их основе. Смотрите также Высокоэластическое Состояние, Натуральный Каучук, Резина, Синтетические Каучуки.

ELASTOMULTIESTER = ЭЛАСТОМУЛЬТИЭСТЕР – Elastomultiester is a synthetic fiber formed by interaction of two or more chemically distinct linear macromolecules in two or more distinct phases (of which none exceeds 85% by mass) which contains ester groups as dominant functional unit (at least 85%) and which after suitable treatment when stretched to one and half times its original length and released recovers rapidly and substantially to its initial length. Alphabetic code – EME; and relevant commercial allowance – 1.50 (refers to European Union Directives on Textile Labelling).

ELECTED OFFICE = ВЫБОРНОЕ УПРАВЛЕНИЕ – In the US patent law, Elected Office (EO) is the national office or intergovernmental organization of or acting for the Contracting State elected by the applicant under Chapter II of the Patent Cooperation Treaty.

ELECTION = ВЫБОР – In the US patent law, Election is an indication made by applicant, in the Demand for an International Application filed under the Patent Cooperation Treaty, as to the Contracting States in which applicant intends to use the results of the international preliminary examination.

ELECTRICAL CIRCUIT = ЭЛЕКТРИЧЕСКАЯ ЦЕПЬ – An Electrical Circuit is a network that has a closed loop, giving a return path for the current. A network is a connection of two or more components, and may not necessarily be a circuit. / Под Электрической Цепью понимается совокупность различных устройств и соединяющих их проводников или элементов электропроводящей среды, образующих путь для электрического тока, в которой электромагнитные процессы могут быть описаны с помощью понятий об эдс, силе тока и напряжении. По назначению отдельных частей электрической цепи в ней можно выделить участки, содержащие источники энергии или сигналов, участки, содержащие приёмники энергии, и участки, служащие для соединения других частей электрической цепи. По конфигурации различают электрические цепи параллельного, последовательного и смешанного типа. Понятие 'электрическая цепь' применяется в бионике, радиотехнике, электротехнике и другом. Под Электрической Схемой понимается:- (i) монтажная электрическая схема – чертёж, показывающий наряду с порядком соединения элементов их взаимное расположение, а также место в данной конструкции соединительных проводов; и (ii) принципиальная электрическая схема – схема электрической цепи, на которой условными обозначениями показывается, из каких элементов (аппаратов, конденсаторов, резисторов и так далее) состоит данная электрическая цепь и каков порядок соединения этих элементов между собой.

ELECTRICAL CONDUCTIVITY = ЭЛЕКТРОПРОВОДНОСТЬ (или (ЭЛЕКТРИЧЕСКАЯ) ПРОВОДИМОСТЬ) – Electrical Conductivity is a measure of the amount of salts in a solution expressed as deciSiemen per meter (dS/m). Electrical Conductivity is:- (1) a measure of the ease of transporting electric charge from one point to another in an electric field; (2) the reciprocal of resistivity. / Под Электропроводностью или Проводимостью понимается способность веществ проводить электрический ток, обусловленная наличием в них подвижных заряженных частиц (носителей тока) – электронов, ионов и других, а также физическая величина (σ), количественно характеризующая эту способность. Величина 1/σ называется удельным электрическим сопротивлением.

ELECTRICAL DERANGEMENT = ЭЛЕКТРИЧЕСКАЯ НЕИСПРАВНОСТЬ – Mechanical and/or Electrical Derangement is an insurance industry term to describe malfunction, or non-function, of an appliance for reasons other than obvious external damage. From time to time, an electronic or mechanically operated item will prove to be inoperable upon arriving at its destination.

ELECTRICAL FINISH = ЭЛЕКТРИЧЕСКАЯ ОТДЕЛКА – Electrical Finish is a finish designed to increase or maintain electrical resistivity of a textile material.

ELECTRICAL INSULATING OIL = ЭЛЕКТРОИЗОЛЯЦИОННОЕ МАСЛО – Electrical Insulating Oil is a high-quality oxidation-resistant oil refined to give long service as a dielectric and coolant for electrical equipment, most commonly transformers. An insulating oil must resist the effects of elevated temperatures, electrical stress, and contact with air, which can lead to sludge formation and loss of insulation properties. It must be kept dry, as water is detrimental to dielectric strength – the minimum voltage required to produce an electric arc through an oil sample, as measured by test method ASTM D 877. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Изоляционное Масло – техническое масло для электроизоляции. Электроизоляционные Масла, высокоочищенные нефтяные масла, реже синтетические и растительные масла, используемые для изоляции и охлаждения электрических аппаратов и устройств:- трансформаторов (смотрите Трансформаторные Масла), конденсаторов, кабелей и других. Электроизоляционные масла отличаются высокой электрической прочностью (до 25 МВ/м) и имеют электрическое сопротивление порядка 10^{10}–10^{12} Ом·см. В 1970-е мировое производство нефтяных электроизоляционных масел составляло около 1 миллиона тонн (т), а синтетических – около 50 000 т в год. Электроизоляционное Масло – жидкий диэлектрик, предназначенный для обеспечения надёжной электрической изоляции и охлаждения активной части маслонаполненного электрооборудования.

ELECTRICAL NETWORK = ЭЛЕКТРИЧЕСКАЯ СЕТЬ – An Electrical Network is an interconnection of electrical elements such as capacitors, inductors, resistors, switches, transmission lines and voltage sources. Electrical Networks that consist only of sources (voltage or current), linear lumped elements (resistors, capacitors, inductors), and linear distributed elements (transmission lines) can be analyzed by algebraic and transform methods to determine AC (alternating current) response, DC (direct current) response and transient response. / Под Электрической Сетью понимается совокупность электрических подстанций (преобразовательных – для преобразования электрического тока по частоте, трансформаторных – по напряжению и распределительных пунктов – для распределения электроэнергии) и линий электропередачи (ЛЭП), связывающих электростанции (источники электроэнергии) с потребителями. По размерам охватываемой территории различают местные электрические сети, районные электрические сети и электрические сети энергосистем; по характеру потребителей – городские, сельские, промышленные, тяговые электрические сети и тому подобные; по конструктивному выполнению ЛЭП – воздушные и кабельные электрические сети; по схеме электрических соединений – замкнутые сети и разомкнутые сети (магистральные сети, радиальные сети и тому подобные); по значению номинального напряжения – аналогично делению линий электропередачи. Под Электрической Сетью понимается совокупность устройств для соединения источников электроэнергии (обычно электростанций) с приёмниками (потребителями). Электрическая сеть состоит из линии электропередачи (ЛЭП), трансформаторных и преобразовательных подстанций, соединительных проводов (кабелей) и другого.

ELECTRICAL RESISTIVITY = ЭЛЕКТРИЧЕСКАЯ СОПРОТИВЛЯЕМОСТЬ (или УДЕЛЬНОЕ ЭЛЕКТРОСОПРОТИВЛЕНИЕ) – Electrical Resistivity is the resistance of longitudinal electrical flow through a uniform rod of unit length and unit cross-sectional area.

ELECTRICALS = SECURITIES OF THE ELECTRICAL COMPANIES

ELECTRICAL SYSTEM ENERGY LOSSES = ЭНЕРГЕТИЧЕСКИЕ ПОТЕРИ ЭЛЕКТРИЧЕСКИХ СИСТЕМ – Electrical System Energy Losses:- the amount of energy lost during generation, transmission, and distribution of electricity, including plant and unaccounted-for uses. / Количество энергии, утерянной в процессе генерации, передачи, и распределения электричества, включая те, которые уходят на внутренние нужды станции и неучтённые цели. Потери Электроэнергии – электрическая энергия, расходуемая в элементах электрической системы на нагрев токопроводящих частей, коронный разряд в линиях электропередачи (ЛЭП), на намагничивание и нагрев сердечников трансформаторов, статоров и роторов электрических машин, а также поглощаемая в диэлектриках кабелей и конденсаторов.

ELECTRIC CURRENT = ЭЛЕКТРИЧЕСКИЙ ТОК – Electric Current is a flow of electrons in an electrical conductor. The strength or rate of movement of the electricity is measured in Amperes. The flow of electricity commonly measured in Amperes. Electric Current is any movement of electric charge carriers, such as subatomic charged particles (e.g., electrons having negative charge, protons having positive charge), ions (atoms that have lost or gained one or more electrons), or holes (electron deficiencies that may be thought of as positive particles). Electric current in a wire, where the charge carriers are electrons, is a measure of the quantity of charge passing any point of the wire per unit of time. In alternating current (AC) the motion of the electric charges is periodically reversed; in direct current (DC) it is not. In many contexts the direction of the current in electric circuits is taken as the direction of positive charge flow, the direction opposite to the actual electron drift. When so defined the current is called Conventional Current. Current in gases and liquids generally consists of a flow of positive ions in one direction together with a flow of negative ions in the opposite direction. To treat the overall effect of the current, its direction is usually taken to be that of the positive charge carrier. A current of negative charge moving in the opposite direction is equivalent to a positive charge of the same magnitude moving in the conventional direction and must be included as a contribution to the total current. Current in semiconductors consists of the motion of holes in the conventional direction and electrons in the opposite direction. Currents of many other kinds exist, such as beams of protons, positrons, or charged pions and muons in particle accelerators. Electric current generates an accompanying magnetic field, as in electromagnets. When an electric current flows in an external magnetic field, it experiences a magnetic force, as in electric motors. The heat loss, or energy dissipated, by electric current in a conductor is proportional to the square of the current. A common unit of electric current is the Ampere (abbreviation:- A), a flow of one Coulomb of charge per second, or $6.2 \cdot 10^{18}$ electrons per second. The centimetre–gram–second units of current are either the electrostatic unit of charge (esu) per second or the absolute electromagnetic unit (abamp). One abamp equals 10 Amperes; one Ampere equals $3 \cdot 10^{9}$ esu per second. / Кулон . Сила Тока равна электрическому заряду, проходящему через поперечное сечение проводника в 1 секунду. Под Электрическим Током понимается всякое упорядоченное движение электрических зарядов (заряженных частиц и тел). По физической природе различают:- (i) конвекционный электрический ток – движение заряженных частиц и тел в вакууме или в среде, не обладающей электрической проводимостью; (ii) электрический ток поляризации – движение связанных заряженных частиц в диэлектрике при изменении поляризации диэлектрика; и (iii) электрический ток проводимости – упорядоченное движение носителей тока, возникающее в проводнике или полупроводнике под действием электрического поля. Мерой электрического тока служит сила тока и плотность тока. Сила Тока – скалярная характеристика I электрического тока, равная отношению абсолютного значения dq электрического заряда, который проходит за малый интервал времени dt через рассматриваемую поверхность, например, через площадь поперечного сечения проводника, к этому интервалу:- $I = dq/dt$. Единица силы тока в системе единиц СИ – Ампер (обозначение:- А). Плотность Тока – векторная характеристика I электрического тока, численно равная отношению силы тока dI сквозь малый элемент поверхности, нормальный к направлению движения заряженных частиц, образующих ток, к площади dS этого элемента:- $I = dI/dS$. Направление I совпадает с направлением движения положительно заряженных частиц и противоположно направлению движения отрицательно заряженных частиц. Электрический ток является источником магнитного поля. При рассмотрении источников магнитного поля различают:- (i) макроскопические токи – электрические токи проводимости и конвекционные; и (ii) молекулярные токи – микротоки, соответствующие движению электронов в атомах, молекулах и ионах, образующих среду; ток смещения. Переменный Ток (AC или alternating current) – электрический ток, периодически изменяющийся по силе и

направлению. В широком смысле слова переменный ток – всякий ток, изменяющийся во времени; периодический ток, среднее за период значение которого равно нулю. Наиболее часто применяется синусоидальный переменный ток. С использованием переменного тока связан основной способ передачи электроэнергии вследствие относительной простоты его преобразования (трансформации, выпрямления, изменения частоты). В электроэнергетике бывшего СССР используют одно- и трёхфазный синусоидальный переменный ток стандартной частоты 50 Герц (Гц), в США – 60 Гц. Переменный ток более высокой частоты применяется в радиотехнике, электроавтоматике и другом. Постоянный Ток (DC или direct current), электрический ток, не изменяющийся во времени ни по силе, ни по направлению. Постоянный ток используется в различных отраслях промышленности, например, в электрометаллургии, на транспорте (тяговые электродвигатели), для питания устройств связи, автоматики и телемеханики, сигнализации и так далее.

ELECTRIC FUSE = ЭЛЕКТРИЧЕСКИЙ ПЛАВКИЙ ПРЕДОХРАНИТЕЛЬ (или ЭЛЕКТРИЧЕСКАЯ ПЛАВКАЯ ВСТАВКА, или ЭЛЕКТРИЧЕСКАЯ ПРОБКА, или ЭЛЕКТРОДЕТОНАТОР) – Electric Fuse is a safety device used to protect an electric circuit against an excessive current. A fuse consists essentially of a strip of low-melting alloy enclosed in a suitable housing. It is connected in series with the circuit it is to protect. / Под Плавким Предохранителем понимается защитное устройство, содержащее плавкий элемент, который при силе тока, превосходящей допустимое значение, плавится и отключает электрическую цепь от источника питания. Плавкий предохранитель включают последовательно в электрическую цепь. Плавкий элемент представляет собой проволоку, стержень или пластину из легкоплавкого металла (например, из цинка), которая под действием тока разогревается и плавится. С увеличением силы тока время срабатывания плавкого предохранителя уменьшается. При низком напряжении (до 1 кВ) плавкие предохранители выпускаются на номинальную силу тока до 1 кА и предельную силу тока 17 кА, при высоком напряжении (до 110 кВ) – на номинальную силу тока до 400 А.

ELECTRICITY = ЭЛЕКТРИЧЕСТВО – Electricity is a form of energy characterized by the presence and motion of elementary charged particles generated by friction, induction, or chemical change. / Форма энергии, характеризуемая наличием и движением заряженных элементарных частиц, полученных посредством трения, индукции или химической реакции. Под Электричеством, от новолатинского слова Electricus, означающее Электрический или, буквально, Похожий На Янтарь, от Греческого слова Ēlektron, означающее Янтарь (в связи с тем, что янтарь при трении электризуется), понимается вся совокупность электромагнитных явлений, то есть явлений, в которых обнаруживается существование, движение и взаимодействие (посредством электро-магнитного поля) заряженных частиц. Учение об электричестве – один из основных разделов физики. Часто под словом электричество понимают электрическую энергию, например, когда говорят об использовании электричества в народном хозяйстве. Значение термина Электричество менялось в процессе развития физики и техники.

ELECTRICITY GENERATION = ГЕНЕРАЦИЯ ЭЛЕКТРИЧЕСТВА – Electricity Generation is the process of producing electric energy, or the amount of electric energy produced by transforming other forms of energy, commonly expressed in kiloWatthours (kWh) or MegaWatthours (mWh). / Процесс производства электроэнергии, или количество электроэнергии, полученное посредством преобразования иных форм энергии, выраженное, как правило, в килоВаттах (кВт) или МегаВаттах (МВт).

ELECTRIC PLANT = ЭЛЕКТРИЧЕСКАЯ СТАНЦИЯ (или ЭЛЕКТРОСТАНЦИЯ) – Electric Plant (physical) is a facility containing prime movers, electric generators, and auxiliary equipment for converting mechanical, chemical, and/or fission energy into electric energy. See also Electric Power Plant. / Под Электрической Станцией или Электростанцией понимается предприятие или электроустановка, вырабатывающая электрическую, а в некоторых случаях и тепловую (теплоэлектроцентраль или ТЭЦ) энергию путём преобразования других видов энергии. В зависимости от источника энергии различают:- атомные, ветровые или ветроэлектрические, геотермальные, ГЭС (гидроэлектростанции), солнечные, ТЭС (тепловые электростанции:- газотурбинные, паротурбинные и другие) и так далее. К разновидностям ТЭС относят и Атомные Электростанции (АЭС). Наибольшей мощности достигли к концу 1970-х ГЭС (свыше 6 ГВт).

ELECTRIC POWER = ЭЛЕКТРИЧЕСКАЯ ЭНЕРГИЯ (или ЭЛЕКТРОЭНЕРГИЯ) – Electric Power is the rate of energy consumption in an electrical circuit. The electric power is measured in units of Watts (W). Electric Power definition:- The electric power P is equal to the energy consumption E divided by the consumption time t:- $P = E/t$, where P is the electric power in Watt (W), E is the energy consumption in Joule (J), and t is the time in seconds (s). Example:- Find the electric power of an electrical circuit that consumes 120 Joules for 20 seconds. Solution:- E = 120J, t = 20s, P = E / t = 120J / 20s = 6W. Electric Power Calculation:- $P = V \cdot I$ or $P = I^2 \cdot R$ or $P = V^2/R$, where P is the electric power in Watt (W), V is the Voltage in Volts (V), I is the current in Amperes (A), and R is the resistance in Ohms (Ω). Power of AC Circuits:- The formulas are for single phase AC power. For 3 phase AC power:- When line to line Voltage (V_{L-L}) is used in the formula, multiply the single phase power by square root of 3 ($\sqrt{3}$=1.73). When line to zero Voltage (V_{L-0}) is used in the formula, multiply the single phase power by 3. Real Power:- Real or true power is the power that is used to do the work on the load. $P = V_{rms} I_{rms} \cos \varphi$, where P is the real power in Watts (W), V_{rms} is the rms Voltage = $V_{peak}/\sqrt{2}$ in Volts (V), I_{rms} is the rms current = $I_{peak}/\sqrt{2}$ in Amperes (A), and φ is the impedance phase angle = phase difference between Voltage and current. Reactive Power:- Reactive power is the power that is wasted and not used to do work on the load. $Q = V_{rms} I_{rms} \sin \varphi$, where Q is the reactive power in Volt-Ampere-reactive (VAR), Vrms is the rms Voltage = $V_{peak}/\sqrt{2}$ in Volts (V), I_{rms} is the rms current = $I_{peak}/\sqrt{2}$ in Amperes (A), and φ is the impedance phase angle = phase difference between Voltage and current. Apparent Power:- The apparent power is the power that is supplied to the circuit. $S = V_{rms} I_{rms}$, where S is the apparent power in Volt-Amper (VA), V_{rms} is the rms Voltage = $V_{peak}/\sqrt{2}$ in Volts (V), and I_{rms} is the rms current = $I_{peak}/\sqrt{2}$ in Amperes (A). Real / Reactive / Apparent Powers Relation:- The real power P and reactive power Q give together the apparent power S:- $P^2 + Q^2 = S^2$, where P is the real power in Watts (W), Q is the reactive power in Volt-Ampere-reactive (VAR), and S is the apparent power in Volt-Amper (VA). Electric Power is the rate at which electric energy is transferred. Electric power is measured by capacity and is commonly expressed in MegaWatts (MW). A MegaWatt (MW) is one million Watts. Electric Power:- The rate at which the work is being done in an electrical circuit is called an electric power. In other words, the electric power is defined as the rate of the transferred of energy. The electric power is produced by the generator and can also be supplied by the electrical batteries. It gives a low entropy form of energy which is carried over long distance and also it is converted into various other forms of energy like motion, heat energy, etc. The electric power is divided into two types, i.e. the AC power and the DC power. The classification of the electric power depends on the nature of the current. The electric power is sold regarding Joule which is the product of the power in kiloWatts and the running time of the machinery in hours. The utility of power is measured by the electric meter which records the total energy consumed by the powered devices. The electric power is given by the equation shown below. Electric Power = Work Done In An Electrical Current / time, $P = VIt / t = VI = IR^2 = V^2 / R$, where V is the Voltage in Volts, I is the current in Amperes, R is the resistance offered by the powered devices, T is the time in seconds and the P is the power measured in Watts. Unit Of Electric Power:- The unit of electrical power is Watt. V = 1 Volt and I = 1 Ampere, if, P = 1 Watt. Thus, the power consumed in an electrical circuit is said to one Watt if one Ampere current flows through the circuit when a potential difference of 1 Volt is applied across it.The bigger unit of electrical power is the kiloWatt (kW), it is usually used in the power system 1 kW = 1 000 W. Types Of An Electric Power:- The electrical power is mainly classified into two types. They are the DC power and the AC power. (1) DC Power:- The DC power is defined as the product of the Voltage and current. It is produced by the fuel cell, battery and generator. Where P – Power

in Watt, V – Voltage in Volts, and I – current in Amps. (2) AC Power:- The AC power is mainly classified into three types. They are the apparent power, active power and real power. (1) Apparent Power – The apparent power is the useless power or idle power. It is represented by the symbol S, and their SI unit is Volt-Amp. $S = V_{rms}I_{rms}$, where S – apparent power, V_{rms} – RMS Voltage = $V_{peak}\sqrt{2}$ in Volt, and I_{rms} – RMS current = $I_{peak}\sqrt{2}$ in the Amp. (2) Active Power – The active power (P) is the real power which is dissipated in the circuit resistance. $P = V_{max}I_{max}Cos\text{Ø}$, where, P – the real power in Watts, V_{rms} – RMS Voltage = $V_{peak}\sqrt{2}$ in Volts, I_{rms} – RMS current = $I_{peak}\sqrt{2}$ in the Amperes, and Ø – impedance phase angle between Voltage and current. (3) Reactive Power – The power developed in the circuit reactance is called Reactive Power (Q). It is measured in Volt-Ampere reactive. $Q = V_{rms}I_{rms}Sin\text{Ø}$, where, Q – the reactive power in Watts, V_{rms} – RMS Voltage = $V_{peak}\sqrt{2}$ in Volt, I_{rms} – RMS current = $I_{peak}\sqrt{2}$ in the Amperes, and Ø – impedance phase angle between Voltage and current. The relation between the apparent, active and reactive power is shown below. $S^2 = Q^2 + P^2$. The ratio of the real to the apparent power is called Power Factor, and their value lies between 0 and 1. Electric Power is defined as the rate at which electrical energy is consumed in an electrical circuit. The SI unit of power is the Watt, which is one Joule per second. Although sources such as electric batteries can supply electric power, it is mostly produced by electric generators. With the help of an electric grid, electric power is supplied by the energy industry to homes and other industries. Electric power (P) can be calculated as energy consumption (E) divided by the time consumed (t):- P = E/t, with P in Watts, E in Joules and t in seconds. In the case of electric power consumption by homes and businesses, it is mostly sold by the kiloWatthour, which is running time in hours multiplied by the power in kiloWatts. An electricity meter is used to measure the amount of power consumption. Electric power is considered as a low-entropy form of energy. Electric power generation is considered clean, as there are no byproducts produced. As it is a necessity for businesses and customers to operate commercial and domestic appliances, the electric power generation industry is considered as part of the public utility infrastructure. / Электроэнергия, термин, широко распространённый в технике и в быту для определения количества энергии, отдаваемой электростанцией в электрическую сеть или получаемой из сети потребителем. Мера электроэнергии – килоВатт-час. Качество Электроэнергии, совокупность свойств энергии электрического тока, определяющих режим работы электроприёмников (электродвигателей, нагревательных установок, осветительных приборов, радиоэлектронных устройств и других). Показателями качества электроэнергии являются:- для сетей однофазного переменного тока – отклонение частоты и напряжения, колебания частоты и напряжения, несинусоидальность формы кривой напряжения; для сетей трёхфазного переменного тока – то же, что и для сетей однофазного тока, а также несимметрия фазных напряжений основной частоты (фазные напряжения не равны между собой и сдвиг по фазе отличен от 120°); для сетей постоянного тока – отклонение напряжения, колебания напряжения и коэффициент пульсации напряжения (отношение амплитуды переменной составляющей к выпрямленному напряжению). Отклонение Частоты – разность между номинальным и фактическим значениями основной частоты, усреднённая за 10 минут (мин); в нормальном режиме допускается отклонение частоты в пределах ±0.1 Герц (Гц), иногда разрешается временное отклонение частоты до ±0.2 Гц. Колебания Частоты – разность между наибольшим и наименьшим значениями основной частоты при скорости изменения её не менее 0.2 Герц в секунду (Гц/сек); в нормальных условиях колебания частоты не должны превышать 0.2 Гц сверх указанных выше допустимых отклонений. Отклонение Напряжения – разность между номинальным и фактическим (для данной сети) значениями напряжения, возникающая при сравнительно медленном изменении режима работы, когда скорость изменения напряжения менее 1% в сек. Колебания Напряжения – разность между наибольшим и наименьшим действующими значениями напряжения в сети, возникающая при достаточно быстром изменении режима работы, когда скорость изменения не менее 1% в сек. Несинусоидальность формы кривой напряжения (несоответствие форме кривой гармонического колебания) длительно допускается на зажимах электроприёмника при условии, что действующее значение всех высших гармоник не превышает 5% действующего значения напряжения основной частоты. Качество электроэнергии может меняться в зависимости от времени суток, погодных и климатических условий, изменения нагрузки энергосистемы, возникновения аварийных режимов в сети и так далее. Снижение качества электроэнергии может привести к заметным изменениям режимов работы электроприёмников и в результате – к уменьшению производительности рабочих механизмов, ухудшению качества продукции, сокращению срока службы электрооборудования, повышению вероятности аварий и так далее. В реальных условиях поддержание показателей качества электроэнергии в заданных пределах наиболее эффективно обеспечивается автоматическим регулированием напряжения и автоматическим регулированием частоты.

ELECTRIC POWER PLANT = ЭЛЕКТРИЧЕСКАЯ СТАНЦИЯ (или ЭЛЕКТРОСТАНЦИЯ) – Electric Power Plant is a station containing prime movers, electric generators, and auxiliary equipment for converting chemical, mechanical, and/or fission energy into electric energy. See also Electric Plant, and Electric Utility. / Станция, состоящая из турбин, электрических генераторов и вспомогательного оборудования для преобразования химической, механической и/или энергии трения в электроэнергию. Под Электростанцией или Электрической Станцией понимается предприятие или электроустановка, вырабатывающая электрическую, а в некоторых случаях и тепловую энергию (энергия ТЭЦ (теплоэлектроцентраль)) путём преобразования других видов энергии. В зависимости от источника энергии различают ветровые или ветроэлектрические станции, геотермальные, гидроэлектрические станции или гидроэлектростанции или ГЭС, солнечные электростанции, тепловые электростанции или ТЭС (газотурбинные, паротурбинные и другие) и так далее. К разновидностям ТЭС относят атомные электростанции (АЭС). В конце 1970-х наибольшей мощности достигали ГЭС (свыше 6 ГВт). Под Электростанцией или Электрической Станцией понимается совокупность установок, оборудования и аппаратуры, используемых непосредственно для производства электрической энергии, а также необходимые для этого сооружения и здания, расположенные на определённой территории. В зависимости от источника энергии различают Тепловые Электростанции, Гидроэлектрические Станции, Гидроаккумулирующие Электростанции, Атомные Электростанции, а также Приливные Электростанции, Ветроэлектростанции, Геотермические Электростанции и Электростанции С Магнитогидродинамическим Генератором. Тепловые Электростанция (ТЭС) являются основой электроэнергетики; они вырабатывают электроэнергию в результате преобразования тепловой энергии, выделяющейся при сжигании органического топлива. По виду энергетического оборудования ТЭС подразделяют на Паротурбинные, Газотурбинные и Дизельные Электростанции. Основное энергетическое оборудование современных тепловых паротурбинных электростанций составляют котлоагрегаты, паровые турбины, турбогенераторы, а также пароперегреватели, питательные, конденсатные и циркуляционные насосы, конденсаторы, воздухоподогреватели, электрические распределительные устройства. Паротурбинные Электростанции подразделяются на Конденсационные Электростанции и Теплоэлектроцентрали (Теплофикационные Электростанции). На Конденсационных Электростанциях (КЭС) тепло, полученное при сжигании топлива, передаётся в парогенераторе водяному пару, который поступает в конденсационную турбину, внутренняя энергия пара преобразуется в турбине в механическую энергию и затем электрическим генератором в Электрический Ток. Отработанный пар отводится в конденсатор, откуда конденсат пара перекачивается насосами обратно в парогенератор. КЭС, работающие в энергосистемах бывшего СССР, называются также ГРЭС (Государственная Районная Электростанция). В отличие от КЭС на Теплоэлектроцентралях (ТЭЦ) перегретый пар не полностью используется в турбинах, а частично отбирается для нужд теплофикации. Комбинированное использование тепла значительно повышает экономичность тепловых электростанций и существенно снижает стоимость 1 кВт·ч вырабатываемой ими электроэнергии. В 1950–70-х в электроэнергетике появились электроэнергетические установки с газовыми турбинами.

Газотурбинные установки в 25–100 МВт используются в качестве резервных источников энергии для покрытия нагрузок в часы ‘пик’ или в случае возникновения в энергосистемах аварийных ситуаций. Перспективно применение комбинированных Парогазовых Установок (ПГУ), в которых продукты сгорания и нагретый воздух поступают в газовую турбину, а тепло отработанных газов используется для подогрева воды или выработки пара для паровой турбины низкого давления. Дизельной Электростанцией называется энергетическая установка, оборудованная одним или несколькими электрическими генераторами с приводом от дизелей. На стационарных дизельных электростанциях устанавливаются 4-тактные дизель-агрегаты мощностью от 110 до 750 МВт; стационарные дизельные электростанции и энергопоезда (по эксплуатационным характеристикам они относятся к стационарным электростанциям) оснащаются несколькими дизель-агрегатами и имеют мощность до 10 МВт. Передвижные дизельные электростанции мощностью 25–150 кВт размещаются обычно в кузове автомобиля (полуприцепа) или на отдельных шасси либо на железно-дорожной платформе, в вагоне. Дизельные электростанции используются в сельском хозяйстве, в лесной промышленности, в поисковых партиях и тому подобном в качестве основного, резервного или аварийного источника электропитания силовых и осветительных сетей. На транспорте дизельные электростанции применяются как основные энергетические установки (дизель-электровозы, дизель-электроходы). Гидроэлектрическая Станция (ГЭС) вырабатывает электроэнергию в результате преобразования энергии потока воды. В состав ГЭС входят гидротехнические сооружения (плотина, водоводы, водозаборы и прочие), обеспечивающие необходимую концентрацию потока воды и создание напора, и энергетическое оборудование (гидротурбины, гидрогенераторы, распределительные устройства и тому подобное). Сконцентрированный, направленный поток воды вращает гидротурбину и соединённый с ней электрический генератор. По схеме использования водных ресурсов и концентрации напоров ГЭС обычно подразделяют на Русловые, Приплотинные, Деривационные, Гидроаккумулирующие и Приливные ГЭС. Русловые и Приплотинные ГЭС сооружают как на равнинных многоводных реках, так и на горных реках, в узких долинах. Напор воды создаётся плотиной, перегораживающей реку и поднимающей уровень воды верхнего бьефа. В Русловых ГЭС здание электростанции с размещенными в нём гидроагрегатами является частью плотины. В Деривационных ГЭС вода реки отводится из речного русла по водоводу (деривации), имеющему уклон, меньший, чем средний уклон реки на используемом участке; деривация подводится к зданию ГЭС, где вода поступает на гидротурбины. Отработавшая вода либо возвращается в реку, либо подводится к следующей деривационной ГЭС. Деривационные ГЭС сооружают главным образом на реках с большим уклоном русла и, как правило, по совмещённой схеме концентрации потока (плотина и деривация совместно). Гидроаккумулирующая Электростанция (ГАЭС) работает в двух режимах:- аккумулирования (энергия, получаемая от других электростанций, главным образом в ночные часы, используется для перекачки воды из нижнего водоёма в верхний) и генерирования (вода из верхнего водоёма по трубопроводу направляется к гидроагрегатам; вырабатываемая электроэнергия отдаётся в энергосистему). Наиболее экономичны мощные ГАЭС, сооружаемые вблизи крупных центров потребления электроэнергии; их основное назначение – покрывать пики нагрузки, когда мощности энергосистемы использованы полностью, и потреблять излишки электроэнергии в то время суток, когда другие электростанции оказываются недогруженными. Приливные Электростанции (ПЭС) вырабатывают электроэнергию в результате преобразования энергии морских приливов. Электроэнергия ПЭС из-за периодического характера приливов и отливов может быть использована лишь совместно с энергией другой электростанции энергосистемы, которые восполняют дефицит мощности ПЭС в пределах суток и месяца. Источником энергии на Атомной Электростанции (АЭС) служит ядерный реактор, где энергия выделяется (в виде тепла) вследствие цепной реакции деления ядер тяжёлых элементов. Выделившееся в ядерном реакторе тепло переносится теплоносителем, который поступает в теплообменник (парогенератор); образующийся пар используется так же, как на обычных паротурбинных электростанциях. Существующие способы и методы дозиметрического контроля полностью исключают опасность радиоактивного облучения персонала АЭС. Ветроэлектростанция вырабатывает электроэнергию в результате преобразования энергии ветра. Основное оборудование станции – ветродвигатель и электрический генератор. Ветровые электростанции сооружают преимущественно в районах с устойчивым ветровым режимом. Геотермическая Электростанция – паротурбинная электростанция, использующая глубинное тепло Земли. В вулканических районах термальные глубинные воды нагреваются до температуры свыше 100 °С на сравнительно небольшой глубине, откуда они по трещинам в земной коре выходят на поверхность. На геотермических электростанциях пароводяная смесь выводится по буровым скважинам и направляется в сепаратор, где пар отделяется от воды; пар поступает в турбины, а горячая вода после химической очистки используется для нужд теплофикации. Отсутствие на геотермических электростанциях котлоагрегатов, топливоподачи, золоуловителей и тому подобного снижает затраты на строительство такой электростанции и упрощает её эксплуатацию. Электростанция С Магнитогидродинамическим Генератором (МГД-Генератор) – установка для выработки электроэнергии прямым преобразованием внутренней энергии электропроводящей среды (жидкости или газа).

ELECTRIC POWER SECTOR = СЕКТОР ЭЛЕКТРОСТАНЦИЙ – Electric Power Sector:- in some US energy reports, an energy-consuming sector that consists of electricity-only and combined-heat-and-power (CHP) plants whose primary business is to sell electricity, or electricity and heat, to the public. / В некоторых отчётах США по энергетике, энергопотребляющий сектор, который состоит из чисто электрических или комбинированных теплоэлектрических станций, который занимается продажами электричества или электричества и тепла населению.

ELECTRIC RATE SCHEDULE = РАСПИСАНИЕ (или ГРАФИК) ЕЛЕКТРИЧЕСКОЙ СТАВКИ – Electric Rate Schedule is a statement of the electric rate and the terms and conditions governing its application, including attendant contract terms and conditions that have been accepted by a regulatory body with appropriate oversight authority.

ELECTRIC UTILITY = ЭЛЕКТРОСНАБЖАЮЩЕЕ ПРЕДПРИЯТИЕ – In the United States, Electric Utility is an enterprise that is engaged in the generation, transmission, and/or distribution of electric energy primarily for use by the public and is the major power supplier within a designated service area. Also, corporation, person, agency, authority, or other legal entity or instrumentality aligned with distribution facilities for delivery of electric energy for use primarily by the public. Included are investor-owned and publicly owned electric utilities, municipal and State utilities, Federal electric utilities, and rural electric cooperatives. A few entities that are tariff based and corporately aligned with companies that own distribution facilities are also included. Due to the issuance of the US Federal Energy Regulatory Commission Order 888 that required traditional electric utilities to functionally unbundled their generation, transmission, and distribution operations, electric utility currently has inconsistent interpretations from State to State. See also Electric Plant, and Electric Power Plant. Electric Utility is a corporation, person, agency, authority, or other legal entity or instrumentality that owns and/or operates facilities within the United States, its territories, or Puerto Rico for the generation, transmission, distribution, or sale of electric energy primarily for use by the public and files forms listed in the Code of Federal Regulations, Title 18, Part 141. Facilities that qualify as cogenerators or small power producers under the Public Utility Regulatory Policies Act (PURPA) are not considered electric utilities. / В Соединённых Штатах Америки под Электроснабжающим Предприятием понимается предприятие, генерирующее, передающее и/или распределяющее электроэнергию, в первую очередь, для населения и являющееся основным поставщиком энергии в зоне обслуживания. Также, корпорация, частное лицо, агентство, государственный орган, или иное юридическое лицо или предприятие, чьей задачей является распределение мощностей по доставке электроэнергии в первую

очередь населению. Включают в себя электростанции, принадлежащие инвесторам, или имеющие статус открытого акционерного общества, муниципальные и региональные электростанции, Федеральные электростанции и электростанции, принадлежащие сельскохозяйственным кооперативам. В этот состав могут также входить некоторые тарифицируемые предприятия, связанные с компаниями-владельцами распределительных мощностей. Благодаря Распоряжению 888 Федеральной Комиссии США по Энергонадзору, потребовавшему от традиционных производителей электроэнергии разделения операций по генерации, передаче и распределению электроэнергии, в настоящее время в разных штатах США имеется своё определение энергопредприятия.

ELECTRIC WHEEL = ЭЛЕКТРИЧЕСКОЕ КОЛЕСО – Electric 'Wheel' is a flyer on bearings driven by a small motor. Very compact, can be useful for people with limited use of legs. Very portable, can be battery powered. / маховик на подшипниках, .

ELECTROLYTE = ЭЛЕКТРОЛИТ – Electrolyte is a substance that makes an electrically conductive solution when it is dissolved in water. Electrolytes dissociate to form ions in solution. Fibers immersed in water develop a negative electrical charge at their surface. Most dyes are anionic, so the fiber tends to repel the dye. The presence of electrolytes in the dye bath helps to overcome this repulsion so that the dye can gain access to the surface of the fiber. The most common electrolyte in dyeing is sodium chloride (common salt). Sodium sulfate is used sometimes. The acids used with acid dyes also behave as electrolytes. Electrolyte is a nonmetallic conductor of electricity usually consisting of a liquid or paste in which the flow of electricity is by ions. / Под Электролитами, от новолатинского слова Electricus, означающее Электрический, буквально – Похожий на Янтарь, от Греческого слова Ēlektron, означающее Янтарь, и Греческого слова Lytós, означающее Разлагаемый или Растворимый, понимаются жидкие или твёрдые химические вещества и системы, в которых в сколько-нибудь заметных концентрациях присутствуют ионы, способные перемещаться и проводить электрический ток. В узком смысле – соли, растворы которых проводят электрический ток ионами, образующимися в результате электролитической диссоциации. Содержатся во всех жидких системах живых организмов, служат средой для проведения многих химических синтезов. Важный класс электролитов – полиэлектролиты. Электролиты – жидкие или твёрдые химические вещества, обладающие преимущественно ионной проводимостью. Растворы электроитов часто также называют электролитами. Сильными электролитами называют вещества, почти нацело диссоциирующие на ионы в растворе. Электролиты твёрдые (сверхионные проводники) имеют высокую электрическую проводимость за счёт движения ионов только одного типа, например, у PbF_2 – ионов F.

ELECTROLYTIC REFINING = ЭЛЕКТРОЛИТИЧЕСКОЕ РАФИНИРОВАНИЕ (или ЭЛЕКТРОЛИТИЧЕСКИЙ АФФИНАЖ) – Electrolytic Refining:- most of the metals such as copper, silver, gold, zinc, nickel, and chromium are refined electrolytically. The impure metal is made the anode and a thin sheet of the pure metal the cathode in a suitable electrolytic bath. On passing current the metal from the anode passes in the solution and pure metal from the electrolyte is deposited on the cathode. / или Электролитический Аффинаж благородных металлов. Электролитическое Рафинирование, представляющее собой электролиз водных растворов или солевых расплавов, позволяет получать металлы высокой чистоты. Применяется для глубокой очистки большинства цветных металлов. Электролитическое рафинирование с растворимыми состоит в анодном растворении очищаемых металлов и осаждении на катоде чистых металлов в результате приобретения ионами основного металла электронов внешней цепи. Разделение металлов под действием электролиза возможно вследствие различия электрохимических потенциалов примесей и основного металла. Например, нормальный электродный потенциал Cu относительно водородного электрода сравнения, принятого за ноль, +0.346, у Au и Ag эта величина имеет большее положительное значение, а у Ni, Fe, Zn, Mn, Pb, Sn, Co нормальный электродный потенциал отрицателен. При электролизе медь осаждается на катоде, благородные металлы, не растворяясь, оседают на дно электролитной ванны в виде шлама, а металлы, обладающие отрицательным электродным потенциалом, накапливаются в электролите, который периодически очищают. Иногда (например, в гидрометаллургии Zn) используют электролитическое афинирование с нерастворимыми анодами. Основной металл находится в растворе, предварительно тщательно очищенном от примесей, и в результате электролиза осаждается в компактном виде на катоде.

ELECTRONIC AGENT DESIGNATION = XX – Electronic Agent Designation is an electronic record that:- (1) Designates the entity authorized by a producer to redeem all of the cotton pledged as collateral for a specific loan (Loan:- the provision of funds by the agency directly to an applicant in exchange for repayment with interest and collateral to secure repayment); (2) Is maintained by providers of electronic warehouse receipts; and (3) A producer may authorize the Commodity Credit Corporation of the US Department of Agriculture (CCC) to use as the basis for the redemption and release of loan collateral.

ELECTRONIC BANK = ЭЛЕКТРОННЫЙ БАНК – Electronic Bank is a bank offering electronic self-service facilities which customers can avail themselves of regardless of bank opening hours. / Банк, предлагающий электронные системы или установки по самообслуживанию, которыми клиенты могут воспользоваться сами по себе, невзирая на часы работы самого банка.

ELECTRONIC BANKING = ЭЛЕКТРОННОЕ БАНКОВСКОЕ ОБСЛУЖИВАНИЕ – Electronic Banking:- provision of banking services from a bank to a customer using a customer-supplied device (e.g., personal computers, small and medium-sized enterprise, or corporate customer) using a customer device connected to a network. Electronic Banking is conducted by automated teller machines (ATMs), telephones (not via the Internet) or debit cards. Bank services provided direct to the customer electronically, e.g., automatic teller machines (bancomat), telebanking, or voucherless data carrier exchange. Banking activities accessed by using a computer, employing modems and telephones. Electronic Banking (E-Banking) includes familiar and relatively mature electronically-based products in developing markets, such as telephone banking, credit cards, ATMs, and direct deposit. It also includes electronic bill payments and products mostly in the developing stage, including stored-value cards (e.g., smart cards/smart money) and Internetbased stored value products. E-banking in developing countries is in the early stages of development. Most banking in developing countries is still done the conventional way. However, there is an increasing growth of online banking, indicating a promising future for online banking in these countries. Electronic Banking is a paperless execution of banking transactions by means of electronic data processing. / , например, , дистанционное банковское обслуживание или банковское обслуживание на отдалении (telebanking), или .

ELECTRONIC BANKING STANDARD = СТАНДАРТ НА ЭЛЕКТРОННОЕ БАНКОВСКОЕ ОБСЛУЖИВАНИЕ – Electronic Banking Standard:- specification covering formats, protocols, and interfaces to meet a particular set of business requirements.

ELECTRONIC BUSINESS CENTER = ЭЛЕКТРОННЫЙ ДЕЛОВОЙ ЦЕНТР (или ЭЛЕКТРОННЫЙ БИЗНЕС ЦЕНТР) – In the US patent and trademark laws, Electronic Business Center (EBC):- includes links to Patents EBC and Trademarks EBC. A web page containing hyperlinks to all online systems for conducting electronic commerce with the United States Patent and Trademark Office (USPTO).

ELECTRONIC CASH = ЭЛЕКТРОННАЯ НАЛИЧНОСТЬ – Electronic Cash is a German cashless retail electronic payment system in which customers use their bank customer card and Personal Identification Number (PIN). The amount due is debited in voucherless form to the customer's personal account.

ELECTRONIC CHECK CONVERSION = ЭЛЕКТРОННАЯ КОНВЕРСИЯ ЧЕКА – Sometimes, when you write a check to buy something at a store or to pay a bill, your check is used as a source of information to make a one-time electronic payment from your account. In this procedure, called 'Electronic Check Conversion', your paper check will not be processed as a check. Instead, the payment will be debited from your account as an electronic fund transfer. You must receive a notice if a merchant or anyone else you are paying plans to use your check for electronic check conversion. For example, if you are at a store, you may see the notice on a sign, or you may be asked to sign a written notice. If you mail a check to pay a bill, you may see the notice on an insert with your monthly bill, or the notice may be on the bill itself. You will probably experience the following if your check is used for electronic check conversion:- If you write a check at a store, your check may be stamped 'void' and handed back to you with a receipt. If you mail a check to pay a utility bill, the utility company will keep a copy of your check as a record but will destroy the original so that you won't be charged more than once for the same bill. Your check will not be returned to you. When you receive your account statement, both of these electronic check conversions should be listed. As you do in other electronic fund transfers, you have certain rights when your check is processed as an electronic check-conversion transaction.These rights include the right to have your bank investigate errors (called 'Error Resolution'). If you mailed a check to pay a bill and need a copy of the check to resolve a dispute or to prove you made a payment, you may contact the company you paid. Your bank can also help you to get a copy of a check. Xxxxx. In the United States, Electronic Check Conversion is a process in which your check is used as a source of information – for the check number, your account number, and the number that identifies your financial institution. The information is then used to make a one-time electronic payment from your account – an electronic fund transfer. The check itself is not the method of payment. When you provide your check, you must be given notice that information from your check may be used to make an electronic payment from your account. The notice is required by the federal law that applies to electronic fund transfers, the Electronic Fund Transfer Act, and by the Federal Reserve Board's Regulation E. You may receive notice in different ways. For example, a utility or credit card company might put a notice in your bill stating that if you pay by check, your check may be used to make an electronic fund transfer from your account. If you pay with a check at a store or other place of business, you will receive notice in two different ways. First, a merchant must post a sign – typically at the register – notifying you that if you pay by check, you are agreeing to let the merchant make an electronic fund transfer from your account. Second, you will be given a copy of the posted notice (or a similar notice) that you can keep for your records. This notice usually appears on your sales receipt. What are some of the differences between electronic check conversion and using my check as payment? (1) Your electronic transaction may be processed faster than a check. Be sure you have enough money in your account at the time you make a purchase. (2) Your financial institution will not return any checks that are converted, even if you normally receive your original checks or images of those checks with your statement. (3) You have different consumer rights in an electronic check conversion transaction than you do when you use your check as payment. For example, in an electronic check conversion, you have the right to an investigation by your financial institution when an error occurs. What are my rights in electronic check conversion transactions? (1) You have the right to receive notice that if you provide a check as payment, information from the check may be used to make an electronic payment from your account. (2) When you provide your check, you have the right to receive notice of any fee that the merchant will collect from your account electronically. For example, if you do not have enough money in your account to cover the transaction, your check may be returned to the merchant for nonsufficient funds (NSF), and the merchant may charge you a fee. This fee is similar to a bounced-check fee. (3) You have the right to receive a receipt when you make a purchase at a store. The receipt will contain information about the transaction, including the:- Date, Amount, Location, and Name of the merchant. (4) You have the right to have this same transaction information included as part of the regular account statement from your financial institution. (5) You have the right to ask your financial institution to investigate any electronic fund transfers from your account that you believe are unauthorized or incorrect. What should I do if I have a problem with an electronic check conversion transaction? Always review your regular account statement from your financial institution. You should immediately contact your financial institution if you see a problem. Were you charged the wrong amount? Were you charged twice for the same transaction? You have only 60 days (from the date your statement was sent) to tell the financial institution about a problem. Depending on the circumstances, the financial institution may take up to 45 days from the time you notify it to complete its investigation.

ELECTRONIC CHECK PRESENTMENT = ПРЕДСТАВЛЕНИЕ ЧЕКА ЭЛЕКТРОННЫМ ОБРАЗОМ – Electronic Check Presentment (ECP) means the presentment of checks electronically to the paying bank when the delivery of paper checks to the paying bank is not necessary for legal presentment.

ELECTRONIC CMR = ЭЛЕКТРОННАЯ СЭ.ЭМ.ЭР. (или ЭЛЕКТРОННАЯ ДПГ) – The Electronic CMR consignment note is issued through electronic communication by the carrier, the sender or any other party interested in the performance of a CMR carriage contract (Article 1 of the Additional Protocol to CMR). It contains the same data as the CMR paper consignment note (Article 4). For its authentication the parties are required to use a 'reliable electronic signature' (Article 3). The use of the electronic CMR consignment note requests the consent of all 'parties interested in the performance of the contract' (Article 5). The phrase 'parties interested in the performance of the contract' comprises not only the sender and carrier who concluded the carrier contract, but also the consignee and subsequent carriers, if any (Martius, European Transport Law, 2007, at p 307). Thus, the electronic CMR consignment note might first become popular with parties who have close regular contacts (of course, many parties to advanced carriage and logistics contracts already use electronic means to manage their goods movements). Apart from the CMR consignment note, any demand, declaration, instruction, request, reservation or other communication relating to the performance of a CMR carriage contract may be made out by electronic communication (Article 2). Martius (at pp 311–312) states that, in contrast to the use of the electronic consignment note (Article 5), a party can use electronic means without the consent of the other 'interested parties' for other communication such as notification of loss or damage under Article 30 CMR. See also CMR Consignment Note and CMR Convention. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Смотрите также Товарно-Транспортная Накладная ДПГ (CMR Consignment Note) и Сэ.Эм.Эр. Конвэнсьён или Конвенция ДПГ (CMR Convention).

ELECTRONIC COMMERCE = ЭЛЕКТРОННАЯ КОММЕРЦИЯ (или ЭЛЕКТРОННАЯ ТОРГОВЛЯ) – Electronic Commerce (e-commerce) is the exchange of business information, goods or services using the Internet. This leads to cost savings (as a result of automation), improved services (24-hour availability) and worldwide competition. E-commerce takes place between suppliers and consumers (Business-to-Consumer or B2C) and between companies (Business-to-Business or B2B). Transactions relating to commercial activities that are based upon the processing and transmission of digitised data. / Операции, касающиеся тех видов коммерческой деятельности, которые основываются на обработке и передаче данных в цифровом виде.

ELECTRONIC DATA GATHERING, ANALYSIS AND RETRIEVAL SYSTEM = СИСТЕМА СБОРА, АНАЛИЗА И ОБРАБОТКИ ЭЛЕКТРОННЫХ ДАННЫХ – Electronic Data Gathering, Analysis And Retrieval System (EDGAR) is the Securities and Exchange Commission's system for the electronic submission by direct transmission, magnetic tape or diskette, of most filing and related

correspondence. EDGAR is a web site for US corporate filings, similar to the System for Electronic Document Analysis and Retrieval (SEDAR) in Canada. Website:- http://www.edgar.com. Electronic Data Gathering, Analysis and Retrieval System (EDGAR) is the system through which companies electronically file reports and registration statements with the US Securities and Exchange Commission (SEC). This requires converting the paper or word-processing document to be filed into a universal ASCII format (short for the American Standard Code for Information Interchange format), a process known as EDGAR-izing the document. The filings can then be accessed by the public through the SEC's Web site on the Internet. / ЭДГО (EDGAR). СЭДАР (SEDAR). Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении).

ELECTRONIC DATA INTERCHANGE = ЭЛЕКТРОННЫЙ ВЗАИМООБМЕН ДАННЫМИ – Electronic Date Interchange (EDI) is the exchange of information computer-to-computer by means of telecommunications or the Internet. This is used to transmit and receive purchase orders, acknowledgements, invoices, shipping confirmations, payments and other transactions without the need to send or reenter the information. A series of standards for exchanging information between businesses' computer systems. A term Electronic Data Interchange (EDI) refers to a computerized exchange of information with the client through the warehouse management system. It is a method of exchanging orders, invoices, shipping forms and other documents over the computer. By eliminating the clerical, mailing and other costs associated with paper-based information, EDI reduces costs, time delays and errors. Generic term for transmission of transactional data between computer systems. EDI is typically via a batched transmission, usually conforming to consistent standards. The transfer of structured data, by agreed standards from applications on the computer of one party to the applications on the computer of another party by electronic means. Document transfer by computer to computer from one company to another. Under the conditions and in the manner which they determine, the customs authorities may provide that customs formalities are carried out by exchanging EDI standard messages; this includes the replacement of the handwritten signature by other means and a waiver from presenting written documents when the declaration is lodged. The automated exchange of any predefined and structured data for business among information systems of two or more organizations. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ELECTRONIC DATA INTERCHANGE FOR ADMINISTRATION, COMMERCE AND TRANSPORT = ЭЛЕКТРОННЫЙ ВЗАИМООБМЕН ДАННЫМИ В СФЕРАХ УПРАВЛЕНИЯ, ТОРГОВЛИ И ТРАНСПОРТА – Electronic Data Interchange for Administration, Commerce and Transport (EDIFACT) is an international syntax used in the interchange of electronic data. Customs uses EDIFACT to interchange data with the importing trade community. International data interchange standards sponsored by the United Nations. A comprehensive standard for the coding and transmission of different business documents. EDIFACT or UN/EDIFACT is supported by the United Nations; EDI (short for the Electronic Date Interchange) is the US standard. The standard is multi-facetted, but the technical equipment and interventions into the data processing are also expensive. The ISO application level syntax rules for the structuring of user data and of the associated service data in the interchange of messages in an open environment. / Электронный Взаимообмен Данными в Сферах Управления, Торговли и Транспорта (ЭВДСУТТ (EDIFACT)) – универсальные правила обмена информацией с использованием электронной техники в управлении, торговле, на транспорте.

ELECTRONIC DATA INTERCHANGE MESSAGE = СООБЩЕНИЕ ЭЛЕКТРОННОГО ВЗАИМООБМЕНА ДАННЫМИ – Electronic Date Interchange (EDI) Message:- an approved, published and maintained formal description of how to structure the data required to perform a specific business function in such a way as to allow for the transfer and handling of this data by electronic means.

ELECTRONIC DATA PROCESSING = ЭЛЕКТРОННАЯ ОБРАБОТКА ДАННЫХ – Electronic Data Processing is a collection, interpretation and transmission of data by electronic means. Most electronic data processing is performed by computers, which receive information inputs from their own keyboards or from other computers, interpret it using computer programs and transmit it electronically via cables (on-line) or telephone lines (using a modem). The computerised handling of information or data, e.g., business data. / Компьютеризированная обработка информации или данных, например, бизнес-данных.

ELECTRONIC DOCUMENT INFORMATION SYSTEM = ИНФОРМАЦИОННАЯ СИСТЕМА ЭЛЕКТРОННЫХ ДОКУМЕНТОВ – In the United States, an Electronic Document Information System (EDIS) is the repository for all documents filed in relation to an investigation conducted by the United States International Trade Commission (USITC). EDIS provides the capability to file documents for an investigation as well as search for documents which have been submitted to the USITC.

ELECTRONIC FILE WRAPPER = ЭЛЕКТРОННАЯ ОБЁРТКА ФАЙЛА – Electronic File Wrapper is a system that provides a way to access electronic copies of the correspondence, documents and other pertinent records used in considering a particular case.

ELECTRONIC FILING SYSTEM = ЭЛЕКТРОННАЯ СИСТЕМА УЧЁТА – For patent applications, the Electronic Filing System (EFS):- supports secure electronic filing of patent application documents via the Internet.

ELECTRONIC FUNDS TRANSFER = ЭЛЕКТРОННЫЙ ПЕРЕВОД ДЕНЕЖНЫХ СРЕДСТВ – Electronic Funds Transfer (EFT) is a transfer of funds electronically rather than by check or cash. The Federal Reserve's Fedwire and automated clearinghouse services are EFT systems. EFTs subject to the Electronic Funds Transfer Act are more narrowly defined. Payment for goods or services via exchanges of electronic authorizations against bank accounts. Authorization is sent to an automated clearing house (usually a bank), which verifies the source of the transaction as having control over the accounts, and performs the fund transfer. Electronic Funds Transfer (EFT) is a transfer of funds from one account to another utilizing electronic means, instead of by check or cash. Examples of EFT systems include The Federal Reserves Fedwire and Automated Clearinghouse (ACH) services. Movement of money between two entities by electronic means. Also known as ACH, and EFT. EFT refers to the automatic electronic deposit or withdrawal of funds from an account. Many shareholders have their dividend payments made through EFT directly into their personal accounts. / Фэдвайэ (Fedwire).

ELECTRONIC FUNDS TRANSFER SYSTEMS = СИСТЕМЫ ЭЛЕКТРОННОГО ПЕРЕВОДА ДЕНЕЖНЫХ СРЕДСТВ – Electronic Funds Transfer System (EFTS) is a variety of systems and technologies for transferring funds (money) electronically rather than by check. Includes Fedwire, automated clearinghouses (ACHs) and other automated systems.

ELECTRONIC HOLDING STATEMENT = ЭЛЕКТРОННАЯ ВЫПИСКА О ВЛАДЕНИИ – Electronic Holding Statement:- you will receive from a company in which you own shares it is evidence of your ownership in the form of a holding statement. Share certificates have now been phased out and all share holdings on the Australian Securities Exchange (ASX) are registered electronically. Shareholders receive an initial statement when the holding is established, and then receive subsequent statements when the holding changes. The statement will show the number of shares you own at the beginning and end of the period by detailing all transactions.

THE ELECTRONIC LARGE–VALUE INTERBANK PAYMENT SYSTEM = ЭЛЕКТРОННАЯ СИСТЕМА МЕЖБАНКОВСКИХ ПЛАТЕЖЕЙ КРУПНЫХ СУММ – The Electronic Large-value Interbank Payment System (ELLIPS) is a non-profit-making association which has its registered office in the NBB (short for the Nationale Bank van België) in Brussels. Its operating rules were established by

its General Assembly. The system has been operational since 1996-September-24. Direct participants must hold an account with the NBB and meet several conditions as described in the terms and conditions regarding operational capacity, solvency, legal guarantees and volume. The direct participants can provide a representation service for other credit institutions (indirect participants). The payment orders of an indirect participant are processed in ELLIPS through its direct participant, who will also be responsible for the settlement of the operations. ELLIPS is also the Belgian component of the European RTGS system in Euros (TARGET). Thus participating in ELLIPS implies access to the TARGET system. There are three payment systems in Belgium. The Electronic Large-value Interbank Payment System (ELLIPS) is Belgium's TARGET-linked RTGS system. UVC/CEC (Center for Exchange and Clearing – Centre d'Echange et de Compensation (CEC)/Uitwisselingscentrum en Verrekening (UCV)) is an automated netting system, which processes most of the low-value payments. The third system, CHB (The Clearing House of Belgium), processes the very small number of paper-based payments which cannot be processed by the other systems. ELLIPS was launched on 1996-September-24 and is responsible for processing transfers that are usually for large amounts and many of which relate to transactions on the financial markets. The Nationale Bank van België (NBB; central bank of Belgium) runs the system and assumes the daily management on a contractual basis with ELLIPS while the banks own the software for the application. ELLIPS only processes credits in Euro. To enable large real-time cross-border payments, ELLIPS is linked to TARGET. The NBB is closely involved in the Belgian interbank clearing mechanisms:- it runs and assumes the daily management of the CEC and of ELLIPS. The CEC is an ACH and is designed for retail payments; ELLIPS is an RTGS system and is part of the TARGET system. Furthermore, the NBB also operates the Securities Settlement System (SSS) for dematerialized government securities. There are three domestic interbank payment systems in Belgium:- ELLIPS, the CEC and the Clearing House of Belgium. ELLIPS is an RTGS system designed to process large-value credit transfers. The CEC (Center for Exchange and Clearing) is the Belgian ACH for retail payments; it handles both credit and debit orders. Recently work has been carried out to introduce the third generation of the CEC, namely CEC III. These automated systems are the two pillars of the interbank payment system in Belgium. Together they process more than 99.5% of all interbank payments in both number and value. The remaining interbank payments are processed by the Clearing House of Belgium, a paper-based system which only handles non-truncated cheques of more than EUR10 000.00. Since 1999-January-01 all these systems have operated solely in Euros. / В Бельгии функционируют три платёжные системы. взаиморасчёт или сведение (netting) . Центр по Обмену и Клирингу или Сантр дЭшанж э дё Компасасьён (Сэ.Ё.Сэ. или СЭС) (Centre d'Echange et de Compensation (CEC))/ или Айтвиссэлингсэнтрум эин Флекэнын (У.Сэй.Вэй.; Uitwisselingscentrum en Verrekening (UCV)). порядки и условия . Нашьёналэ Банк фон Болхие (Эн.Бе.Бе.; Nationale Bank van België (NBB). ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

ELECTRONIC LICENSE APPLICATION AND INFORMATION NETWORK = ЭЛЕКТРОННАЯ СЕТЬ ПОДАЧИ ЗАЯВОК НА ЛИЦЕНЗИИ И ПОЛУЧЕНИЯ ИНФОРМАЦИИ – The US Electronic License Application and Information Network (ELAIN) is a Bureau of Export Administration (BXA) 24-hour on-line service which allows exporters to submit license applications. Electronic License Application and Information Network (ELAIN) is a system that allows electronic submission of license applications through private vendors.

ELECTRONIC MONEY = ЭЛЕКТРОННЫЕ ДЕНЬГИ – Electronic Money is a record of the funds or 'value' available to a consumer stored on an electronic device in his or her possession, either on a prepaid card or on a personal computer for use over a computer network such as the Internet. The potential attraction of electronic money for consumers is convenience while the benefits for issuers include the revenue from fees (if any) and from the investment of the outstanding balances and, for some issuers, cost savings from reduced cash handling. While there are some security risks, a range of safeguards are available which should allow these risks to be controlled (for more detail, see the report on the Security of Electronic Money published by the BIS (short for the Bank for International Settlements) in August 1996). With respect to monetary policy, the effect of most practical significance is likely to be on the measurement of monetary aggregates, as the implementation of monetary policy should be largely unaffected unless there is a very large scale substitution of electronic money for cash. Also, except in this extreme case, the seigniorage effects are likely to be modest. In its discussion of regulatory issues, the report emphasises that, at this stage, the development of electronic money and the associated policy assessments are subject to considerable uncertainty that is likely to influence the nature and timing of any regulatory response. Designing an appropriate regulatory framework for electronic money involves balancing different objectives including the stability and financial integrity of the issuers, protection of consumers and the promotion of competition and innovation. Global cash flows circulating independently of the central banks. Very high volumes can affect money supply policy. / инновация. Глобальные потоки наличных денег, находящиеся в обращении независимо от центральных банков. Очень крупные объёмы таких денег могут оказывать влияние на политику центральных банков в отношении к денежной массе, находящейся в обращении. Электронные Деньги:- безналичные расчёты между продавцами и покупателями, банками и их клиентами, осуществляемые посредством компьютерной сети, систем связи с применением средств кодирования информации и её автоматической обработки.

ELECTRONIC MONEY INSTRUMENT = ЭЛЕКТРОННЫЙ ДЕНЕЖНЫЙ ИНСТРУМЕНТ – Electronic Money Instrument means a reloadable payment instrument, whether a stored-value card or a computer memory, on which value units are stored electronically.

ELECTRONIC ORDER = ЭЛЕКТРОННОЕ РАСПОРЯЖЕНИЕ – Electronic Order is an order placed electronically (without the use of a broker) either via the Internet or an electronic trading system. / Распоряжение, размещённое либо с применением электронной техники (без использования брокера), либо посредством Интернета или системы электронной торговли.

ELECTRONIC PAYMENT INITIATOR = ИНИЦИАТОР ЭЛЕКТРОННОГО ПЛАТЕЖА (или ИНИЦИАТОР ПЛАТЕЖА В ЭЛЕКТРОННОЙ ФОРМЕ) – Electronic Payment Initiator or E-Payment Initiator or ePI is a standard data container made available electronically to the ordering customer by the beneficiary. The ePI is not a product but part of a process developed in co-operation with SWIFT. / в сотрудничестве с Сообществом по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ELECTRONIC PAYMENT INSTRUMENT = ЭЛЕКТРОННЫЙ ИНСТРУМЕНТ ОПЛАТЫ – Electronic Payment Instrument means a remote access payment instrument and electronic money instrument that enables its holder to effect one or more electronic payment transactions.

ELECTRONIC PAYMENT SYSTEM = ЭЛЕКТРОННАЯ ПЛАТЁЖНАЯ СИСТЕМА – An Electronic Payment System (EPS) is a system of financial exchange between buyers and sellers in the online environment that is facilitated by a digital financial instrument (such as encrypted credit card numbers, electronic checks, or digital cash) backed by a bank, an intermediary, or by legal tender. EPS plays an important role in e-commerce because it closes the e-commerce loop. In developing countries, the underdeveloped electronic payments system is a serious impediment to the growth of e-commerce. In these countries, entrepreneurs are not able to accept credit

card payments over the Internet due to legal and business concerns. The primary issue is transaction security. The absence or inadequacy of legal infrastructures governing the operation of epayments is also a concern. Hence, banks with e-banking operations employ service agreements between themselves and their clients. The relatively undeveloped credit card industry in many developing countries is also a barrier to e-commerce. Only a small segment of the population can buy goods and services over the Internet due to the small credit card market base. There is also the problem of the requirement of 'explicit consent' (i.e. a signature) by a card owner before a transaction is considered valid-a requirement that does not exist in the US and in other developed countries. What is the confidence level of consumers in the use of an EPS? Many developing countries are still cash-based economies. Cash is the preferred mode of payment not only on account of security but also because of anonymity, which is useful for tax evasion purposes or keeping secret what one's money is being spent on. For other countries, security concerns have a lot to do with a lack of a legal framework for adjudicating fraud and the uncertainty of the legal limit on the liability associated with a lost or stolen credit card. In sum, among the relevant issues that need to be resolved with respect to EPS are:- consumer protection from fraud through efficiency in record-keeping; transaction privacy and safety, competitive payment services to ensure equal access to all consumers, and the right to choice of institutions and payment methods. Legal frameworks in developing countries should also begin to recognize electronic transactions and payment schemes.

ELECTRONIC PURSE = ЭЛЕКТРОННЫЙ КОШЕЛЁК – Electronic Purse is an application able to store and process electronic value.

ELECTRONIC RETAILING = ЭЛЕКТРОННАЯ РОЗНИЧНАЯ ПРОДАЖА – Electronic Retailing (E-Tailing) is the selling of retail goods on the Internet. It is the most common form of business-to-consumer (B2C) transaction. The year 1997 is considered the first big year for e-tailing. This was when Dell Computer recorded multimillion Dollar orders taken at its Web site. Also, the success of Amazon.com (which opened its virtual doors in 1996) encouraged Barnes & Noble to open an e-tail site. Security concerns over taking purchase orders over the Internet gradually receded. In the same year, Auto-by-Tel sold its millionth car over the Web, and CommerceNet/Nielsen Media recorded that 10 million people had made purchases on the Web. Jupiter projects that e-tailing will grow to USD37 billion by 2002. Another estimate is that the online market will grow 45% in 2001, reaching USD65 billion. Profitability will vary sharply between Web-based, catalog-based and store-based retailers. There was also a marked reduction in customer acquisition costs for all online retailers from an average of USD38 in 1999 to USD29 in 2000. An e-retail study conducted by Retail Forward showed that eight of its top 10 e-retailers were multi-channel-that is, they do not rely on online selling alone. / Дэл Компьютё (Dell Computer). Эмэзон.дат.кам (Amazon.com (которая открыла свои виртуальные двери в 1996) Барнз Энд Нобэл (Barnes & Noble). (Auto-by-Tel) продала свой миллионный автомобиль через Вэб (Web), и (CommerceNet/Nielsen Media) написала о том, что 10 миллионов человек осуществили приобретения по Вэб (Web). Дьжупитё (Jupiter). Ритэйл Форвэрд (Retail Forward).

ELECTRONIC SERVICES = ЭЛЕКТРОННЫЕ УСЛУГИ – Electronic Services are the services offered by banks to their customers via electronic means.

ELECTRONIC SIGNATURE = ЭЛЕКТРОННАЯ ПОДПИСЬ – Electronic Signature:- data in electronic form which are attached to or logically associated with other data and which serve as a method of authentication. An electronic signature concept makes use of a 'digital signature' mechanism but may involve additional data or procedural requirements. See also Digital Signature. / Смотрите также Цифровая Подпись (Digital Signature).

ELECTRONIC TRADE CONFIRMATION = ЭЛЕКТРОННОЕ ПОДТВЕРЖДЕНИЕ СДЕЛОК – Electronic Trade Confirmation is a process providing an efficient bridge between pre-trade messaging and settlement processing. The industry views the role of ETC as crucial to achieving straight-through processing. Providers of ETC systems include DTC's ID system, Thomson Financial's OASYS, Financial Management Corporation's FMCNET, and ISMA's TRAX system. / ОЭЙСИС от Томсэн Файнэншэл (Thomson Financial's OASYS), Эф.Эм.Си.НЭТ от Файнэншэл Мэнэдьжмент Корпорэйшэн (Financial Management Corporation's FMCNET).

ELECTRONIC TRADEMARK EXAMINATION APPLICATION SYSTEM = ЭЛЕКТРОННАЯ СИСТЕМА ЭКЗАМЕНАЦИИ ЗАЯВЛЕНИЙ ПО ТОВАРНЫМ ЗНАКАМ – In the US trademark law, the Electronic Trademark Examination Application System (eTEAS) is the electronic trademark filing system. It allows the public to complete various trademark filings and transactions on-line. For example, eTEAS allows you to complete trademark applications, preliminary amendments, amendments to allege use/statements of use, responses to Office actions, and post registration filings online, and then submit them directly over the Internet, paying by credit card, electronic funds transfer or an existing the United States Patent and Trademark Office (USPTO) deposit account.

ELECTRONIC TRADER = ЭЛЕКТРОННЫЙ ТОРГОВЕЦ – Electronic Trader is a person who is authorized to enter orders for his own account and/or for customers' accounts on the NYMEX ACCESS® electronic trading system. / НАЙМЭКС ЭКСЭС® (NYMEX ACCESS®).

ELECTRONIC TRADING FACILITY = ЭЛЕКТРОННАЯ ТОРГОВАЯ СИСТЕМА – Electronic Trading Facility is a trading facility that operates by an electronic or telecommunications network instead of a trading floor and maintains an automated audit trail of transactions. / Система торговли, которая функционирует посредством элекронной сети или сети дальней связи вместо торгового пола и поддерживает автоматизированное аудиторское отслеживание операций. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ELECTRONIC TRADING SYSTEM = ЭЛЕКТРОННАЯ ТОРГОВАЯ СИСТЕМА – Electronic Trading System is the trading system where stock exchange transactions are carried out via a computer system, e.g., Swiss Exchange. Systems that allow participation exchanges to list their products for trading after the close of the exchange's open outcry trading hours, i.e. Chicago Board of Trade's Project A, Chicago Mercantile Exchange's GLOBEX® and New York Mercantile Exchange's ACCESS®. Also known as Electronic Bourse, and Screen-Based Trading. / , например, . , то есть Проект А Чикагской Палаты Торговли (Chicago Board of Trade's Project A; Проект А Чикагского Табло Торговли, если быть более точными)), . ГЛОБЭКС® (GLOBEX®) и ЭКСЭС® (ACCESS®). Известна также как Электронная Биржа (Electronic Bourse) и Торговля На Основе Данных С Экрана (Screen-Based Trading).

ELECTRONIC VALUE = ЭЛЕКТРОННАЯ СТОИМОСТЬ – Electronic Value:- the counterpart of a bank deposit. It is value stored and exchanged in an electronic purse scheme and has no legal tender status.

ELECTRONIC WAREHOUSE RECEIPT = ЭЛЕКТРОННАЯ СКЛАДСКАЯ РАСПИСКА – In the United States, beginning with the 1995 Cotton crop ownership and/or legal interest was transferrable by Electronic Warehouse Receipt (EWR) records. Effective with the December 1997 contract only EWR's are permitted for delivery on the No. 2 Cotton contract. An electronic receipt is a group of information (i.e. record) stored in a secure computer system. The receipt record contains all of the same information that was on a paper receipt. In order to participate in the delivery process a clearing member should have EWR software and New York Clearing Corporation's software set up to their computer. In US Cotton exchange trading, the term Electronic Warehouse Receipt (EWR) means the electronic warehouse receipt record created by a warehouse operator with respect to cotton stored in one of its warehouses, which record is reflected in the data base maintained by a Cotton EWR Provider designated as such by the USDA. / В биржевой торговле

хлопковым волокном, термин Электронная Складская Расписка (ЭСР) означает официальный документ в форме электронной складской расписки, созданный оператором складов (warehouse operator) в отношении хлопкового волокна, размещённого на хранение в одном из его складов. Этот документ отражается в базе данных, поддерживаемой Обеспечивающим ЭСР на Хлопковое Волокно (Cotton EWR Provider), назначенным таковым Департаментом Сельского Хозяйства США.

ELECTROPHORESIS = ЭЛЕКТРОФОРЕЗ – Electrophoresis is a method used to separate protein or nucleic acid molecules in an electric field extending across a physical medium such as agarose gel or polyacrylamide. / Под Электрофорезом, от Греческих слов Ēlektron, означающее Янтарь, и Phórēsis, означающее Несение или Перенесение, или Катафорезом понимается:- (1) движение частиц, находящихся во взвешенном состоянии в жидкой или газообразной среде, под действием внешнего электрического поля. Одно из электрокинетических явлений, на котором основано, например, улавливание частиц дыма и пыли. Явление, обратное электрофорезу, – возникновение так называемого потенциала осаждения, то есть разности электрических потенциалов при оседании содержащихся в среде заряженных дисперсионных частиц. (2) Лекарственный электрофорез (гальваноионотерапия), лечащий метод воздействия на организм постоянным током и лекарственными веществами, вводимыми при его помощи через кожу или слизистые оболочки. Сочетание электрофореза с индуктотермией называется Индуктоэлектрофорезом.

ELECTROPORATION = ЭЛЕКТРОПОРАЦИЯ – Electroporation is an introduction of DNA or RNA into plant cells or protoplasts by the disruption of the cell membrane through exposure to an intense electric field.

ELECTROSTATIC SEPARATOR = ЭЛЕКТРОСТАТИЧЕСКИЙ СЕПАРАТОР – Electrostatic Separator is a separator that removes contaminant from dielectric fluids by applying an electrical charge to the contaminant that is then attracted to a collection device of different electrical charge.

ELEMENT = ЭЛЕМЕНТ – In patent law, Element is a discretely claimed component of a patent claim. / Под Элементом, от Латинского слова Elementum, означающее Первоначальное Вещество или Стихия, понимается понятие объекта, входящего в состав определённой системы и рассматриваемого в её пределах как неделимый (например, атом в системе ‘молекула’, электрон в системе ‘атом’ и так далее). Однако ‘неделимое’ в одной системе оказывается делимым в другой.

ELEMENTARY FILE = ЭЛЕМЕНТАРНЫЙ ФАЙЛ – Elementary File is a set of data records which share the same file identifier. It cannot be the parent of another file.

ELEVATING = ПЛАТА ЗА ПЕРЕВАЛКУ (ЗЕРНА) (или ЭЛЕВАЦИЯ) – (1) Elevating is a charge for services performed in connection with floating elevators. / Под Элевацией, от Французского слова Élévation, означающее Возвышение или Подъём, понимается .

(2) Elevating:- charges assessed for the handling of grain through grain elevators.

ELEVATOR = ЭЛЕВАТОР – (1) Elevator is an equipment used to discharge some bulk cargoes such as grain which is removed from the hold by a continuous line of buckets or by suction and carried on a conveyor belt to store. / Оборудование, используемое для выгрузки некоторых навалочных грузов, таких как зерно, которое удаляет его из трюма . Под Элеватором, от Латинского слова Elevator, означающее буквально Поднимающий, от Elevo, означающее Поднимаю, понимается устройство или машина непрерывного действия, транспортирующая грузы в вертикальном или наклонном направлениях. Различают:- (i) Ковшовые Элеваторы (наиболее распространённые), (ii) Люлечные Элеваторы и (iii) Полочные Элеваторы. Ковшовые элеваторы предназначены для подъёма по вертикали или крутому наклону (более 60°) насыпных грузов (зернистых, кусковых, пылевидных). Такие элеваторы используются в машиностроении, металлургии, химических и пищевых производствах, на обогатительных фабриках и зернохранилищах. Люлечные и полочные элеваторы предназначены для вертикального подъёма штучных грузов (деталей, мешков, ящиков и тому подобного) с промежуточной погрузкой-разгрузкой. Такие элеваторы используются на предприятиях различных отраслей промышленности, базах, в магазинах, а также на складах, в том числе в виде подвижных стеллажей для хранения и выдачи изделий. (i) Ковшовый Элеватор представляет собой замкнутое полотно с тяговым органом, огибающим приводной и натяжной барабаны (звёздочки), и прикрепленными к нему ковшами. Несущей и ограждающей частью элеватора является сварной стальной кожух с загрузочным и разгрузочным патрубками. Привод имеет электродвигатель, редуктор, муфты и останов, предотвращающий обратное движение полотна. На элеваторе применяется винтовое или грузовое натяжное устройство. Скорость движения полотна тихоходных элеваторов до 1 метра в секунду (м/сек), быстроходных до 4 м/сек. Подача ковшовых элеваторов 5–500 кубических метров в час ($м^3$/ч). Высота подъёма H не превышает 60 м. Основными параметрами ковшовых элеваторов являются ширина $B_к$, высота h, вылет A, полезная (до кромки передней стенки) вместимость ковша и расстояние (шаг) между ковшами $a_к$. Быстроходные элеваторы имеют расставленные глубокие и мелкие ковши, для которых $a_к$ = (2.5 – 3) h, а в качестве тягового органа – конвейерную резинотканевую ленту или короткозвенную цепь. На тихоходных элеваторах применяют сомкнутые ($a_к$ = h) с бортовыми направляющими остроугольные и со скруглённым днищем ковши, прикреплённые боковыми стенками к двум тяговым цепям. (ii) Люлечный Элеватор отличается от полочного элеватора способом крепления рабочего органа – люльки, которая благодаря шарнирному подвесу на всех участках трассы сохраняет горизонтальное положение днища. Загрузка люлечных элеваторов производится на восходящей, а разгрузка – на нисходящей ветви. Скорость движения полотна 0.2–0.3 м/сек. (iii) Полочный Элеватор имеет две вертикальные пластинчатые втулочные цепи, огибающие верхние тяговые и нижние натяжные звёздочки. К цепям жёстко прикреплены захваты-полки, соответствующие форме и размерам груза. Загрузка полок производится вручную или автоматически с гребенчатого стола, а разгрузка в верхней части нисходящей ветви – при опрокидывании полок. Скорость движения цепей полочного элеватора 0.2–0.3 м/сек. Элеватор, конвейер для перемещения грузов вертикально или под большим углом к горизонту. Под Элеватором понимается сооружение для приёма, хранения, взвешивания и выдачи сыпучих грузов, чаще всего зерна и цемента. Элеватор имеет несколько бункеров с загрузочными и разгрузочными устройствами. Приёмка материалов, их разгрузка, взвешивание, переработка (сушка, очистка) механизированы, для чего используют механические лопаты, конвейеры, нории, сепараторы, автовесы, аспираторы и так далее.

(2) In Canada, licensed grain Elevators are of four types:- primary, process, transfer and terminal. / В Канаде существуют четыре типа лицензированных зерновых Элеваторов:- заготовительные (или первичные), производственные, перевалочные и терминальные или портовые. Элеватор, сооружение для хранения больших масс зерна, оборудованное устройствами для приёма, взвешивания, сушки, очистки и отгрузки зерна. Под зерновым Элеватором понимается сооружение для хранения больших партий зерна и доведения его до кондиционного состояния; высокомеханизированное зернохранилище силосного типа. В зависимости от назначения элеваторы подразделяют на:- (i) Хлебоприёмные или Заготовительные Элеваторы, которые принимают зерно от хозяйств, очищают от примесей, сушат и отгружают потребителю; ёмкость 15–100 тысяч тонн. (ii) Производственные Элеваторы, которые сооружают при мельницах, крупяных, комбикормовых, крахмало-паточных заводах и тому подобном; ёмкость 10–150 тысяч тонн. (iii) Базисные Элеваторы, которые предназначены для длительного хранения зерна, принимаемого с железнодорожного транспорта и отгружаемого в железнодорожные вагоны; ёмкость 100–150 тысяч

тонн. (iv) Перевалочные и Портовые Элеваторы, которые строят в местах перевалок зерна с одного вида транспорта на другой – на крупных железнодорожных станциях, в морских портах; ёмкость 50–100 тысяч тонн. Элеватор – это соединённые в корпуса силосы (ёмкости) из монолитного или сборного железобетона (высотой обычно 30 метров (м), круглые в плане, диаметром 6–7 м), сблокированные с рабочим зданием, где размещено основное технологическое и транспортное оборудование. Зерно из приёмных бункеров поднимают транспортёрами на верх рабочего здания, взвешивают, очищают от примесей, сушат в зерносушилках и направляют по верхнему конвейеру на надсилосные транспортёры, которые сбрасывают его в силосы. Выгружают зерно на нижние конвейеры (их устанавливают в подсилосном этаже) через отверстия с воронками в днищах силосов. Часть силосов оборудуют установками для дезинфекции зерна и активного вентилирования. Температуру зерна измеряют термоподвесками, устанавливаемыми на разных уровнях. На современных элеваторах управление машинами и механизмами автоматизировано. На крупных элеваторах применяют телевидение. Первый силосный элеватор построен в городе Дулут, США в 1845; в России – в Нижнем Новгороде в 1887. За рубежом распространены также элеваторы с силосами из металла (сталь, алюминий), большого размера (до 30 м) и высоты (до 60 м), прямоугольными в плане.

ELEVATOR CASH CONTRACT = ЭЛЕВАТОРНЫЙ НАЛИЧНЫЙ КОНТРАКТ – Elevator Cash Contracts are the contracts for the purchase of grain, usually from producers. See also Basis Contract; Delayed Payment Contract; Forward Contract; Hedge-To-Arrive Contract; Minimum Price Contract; Offer Contract; and Price-Later (Delayed Price) Contract.

ELICITORS = ВЫЯВИТЕЛИ (или ИЗВЛЕКАТЕЛИ) – Elicitors are molecules produced by the host (or pathogen) that induce a response from the pathogen (or host).

ELIGIBILITY AS COLLATERAL = ПРИЕМЛЕМОСТЬ В КАЧЕСТВЕ ОБЕСПЕЧЕНИЯ – Eligibility As Collateral is a characteristic of securities necessary for them to be accepted as a means of collateral for lombard loans.

ELIGIBLE COMMERCIAL ENTITY = ПРИЕМЛЕМОЕ КОММЕРЧЕСКОЕ ЮРИДИЧЕСКОЕ ЛИЦО – Eligible Commercial Entity:- an eligible contract participant or other entity approved by the US Commodity Futures Trading Commission that has a demonstrable ability to make or take delivery of an underlying commodity of a contract; incurs risks related to the commodity; or is a dealer that regularly provides risk management, hedging services, or market-making activities to entities trading commodities or derivative agreements, contracts, or transactions in commodities.

ELIGIBLE CONTRACT PARTICIPANT = ПРИЕМЛЕМЫЙ УЧАСТНИК КОНТРАКТА – Eligible Contract Participant is an entity, such as a financial institution, insurance company, or commodity pool, that is classified by the US Commodity Exchange Act as an eligible contract participant based upon its regulated status or amount of assets. This classification permits these persons to engage in transactions (such as trading on a Derivatives Transaction Execution Facility) not generally available to non-eligible contract participants, i.e. retail customers. / , то есть розничные заказчики.

ELIGIBLE FOREIGN CUSTODIAN = ПРИЕМЛЕМЫЙ ИНОСТРАННЫЙ ДОВЕРИТЕЛЬНЫЙ УПРАВЛЯЮЩИЙ – In the United States, Eligible Foreign Custodian means an entity that is incorporated or organized under the laws of a country other than the United States and that is a Qualified Foreign Bank or a majority-owned direct or indirect subsidiary of a US Bank or bank-holding company.

ELIGIBLE FOR INVESTMENT OF WARD MONEY = ПРИЕМЛЕМЫЙ ДЛЯ ИНВЕСТИРОВАНИЯ ДЕНЕЖНЫХ СРЕДСТВ ПОД ОПЕКОЙ – Eligible For Investment Of Ward Money:- a ward is understood to be a minor under the care of a guardian. The ward's capital assets must be invested, puruant to § 1806 ff. German Civil Code (BGB), in an especially secure manner ('eligible for investment of ward money'). The investment is usually in fixed-income securities that have been expressly declared as eligible for the investment of ward money by the lawmakers.

ELIMINATION PERIOD = ПЕРИОД ЭЛИМИНАЦИИ – Elimination Period is a loosely-used term sometimes designating the waiting period and sometimes the probationary period. / Под Элиминацией, от Латинского слова Elimino, означающее Выношу За Порог или Удаляю, понимается исключение, удаление. В биологии элиминация – гибель отдельных особей или целых групп организмов (видов, популяций) в результате различных естественных причин. Различают элиминацию избирательную (в результате естественного отбора) и неизбирательную (общая элиминация).

ELISA = ENZYME–LINKED IMMUNO–SORBENT ASSAY

ELITE = ЭЛИТА – (1) Elite (seeds):- foundation stock of pure selected seed of a certain crop variety. See also Seed Classification, Strain, and Super-Elite. / Под Элитой, от Французского слова Élite, означающее Самое Лучшее или Отборное, понимаются лучшие, отборные семена, растения или животные, полученные в результате селекции и используемые для дальнейшего размножения или разведения. В селекции растений под Элитой понимают лучшие растения, отбираемые из популяции для выведения новых сортов; в семеноводстве – потомство лучших отобранных растений возделываемого сорта. Элитные семена наиболее полно передают наследственные признаки и свойства сорта, имеют наивысшую по сравнению с другими репродукциями сортовую чистоту (типичность), свободны от заболеваний, имеют высокие физические качества и посевные качества не ниже I класса стандарта. Элитные семена выращивают научно-исследовательские учреждения, учхозы сельскохозяйственных ВУЗов для проведения сортосмены и сортообновления. В животноводстве к классам Элиты и Элиты-Рекорд относят наиболее ценных по экстерьеру, конституции, наследственным качествам и продуктивности сельскохозяйственных животных, превышающих требования к I бонитировочному классу. Элита, (1) в растениеводстве высококачественные семена сельскохозяйственных культур, получаемые от урожая суперэлиты и являющиеся исходными при размножении районированных сортов. (2) В животноводстве наиболее ценные по экстерьеру, конституции, наследственным качествам и продуктивности сельскохозяйственные животные, типичные для данной породы. Смотрите также Классность Животных, и Семеноводство.

(2) In political and sociological theory, the Elite (French Élite, from Latin Eligere) are a small group of powerful people that control a disproportionate amount of wealth, privilege or political power in a society. / Термин Элита в буржуазной социологии часто употребляется для обозначения классового неравенства ('избранный' слой общества, 'избранный' круг людей). Элита – наиболее видные представители какой-либо части, слоя общества, например, финансовая элита, творческая элита.

ELITE GERMPLASM = ЭЛИТНАЯ ГЕРМОПЛАЗМА – Elite Germplasm:- Plant materials of proven genetic superiority. Material in this advanced stage of development is a candidate for variety release. Elite Germplasm is a germplasm that is agronomically acceptable or has the preferred traits.

ELITE LINES = ЭЛИТНЫЕ ЛИНИИ – Elite Lines are the breeding lines that possess most of the characteristics being sought for a particular environment or plant. See also Elite. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и

воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

ELITE SEED = ЭЛИТНОЕ СЕМЯ – Elite Seed is foundation stock of pure selected seed of a certain crop variety.

ELKINS ACT = АКТ ЭЛКИНЗА – The Elkins Act is a 1903 United States federal law that amended the Interstate Commerce Act of 1887. The Elkins Act authorized the Interstate Commerce Commission of 1887 to impose heavy fines on railroads that offered rebates, and upon the shippers that accepted these rebates. The railroad companies were not permitted to offer rebates. Prior to the Elkins Act, the livestock and petroleum industries paid standard rail shipping rates, but then would demand that the railroad company give them rebates. The railroad companies resented being extorted by the railroad trusts and therefore welcomed passage of the Elkins Act. The law was sponsored by President Theodore Roosevelt as a part of his 'Square Deal' domestic program, and greatly boosted his popularity. Elkins Act is an act of the US Congress (1903-February-19) prohibiting rebates, concession, misbilling, etc, and providing specific penalties for such violations. The Elkins Act ended the common practice of the railroads granting rebates to their most valued customers. The great oil and livestock companies of the day paid the rates stated by the railroads, but demanded rebates on those payments. The giants paid significantly less for rail service than farmers and other small operators. The railroads had long resented being extorted by the trusts and welcomed the Elkins legislation. The law provided further that rates had to be published and that violations of the law would find both the railroad and the shipper liable for prosecution. This measure brought some improvement, but other abuses needed to be addressed. Stephen Benton Elkins (1841–1911), American statesman. As Senator from West Virginia (1895–1911), Elkins, who had extensive railroad holdings, was author of the Elkins Act of 1903 against the system of the rebate, and coauthor of the 1910 Mann-Elkins Act, extending the power of the Interstate Commerce Commission although he did not support the more drastic Hepburn Act of 1906. / Президент Сиодор Розэвэлт (Theodore Roosevelt). домогательство (abuse). Стивэн Бэнтэн Элкинз (Stephen Benton Elkins; 1841–1911). Акт Мэна-Элкинза (Mann-Elkins Act), Акт Хэпбёна от 1906 (Hepburn Act of 1906).

ELLIOT WAVE THEORY = ТЕОРИЯ ВОЛН ЭЛИЭТА – Ralph Nelson Elliott (28 July 1871 in the small community of Marysville, Marshall County, located by the Big Blue River, in northeastern Kansas – 15 January 1948 in King's Park, New York) was an American accountant and author, whose study of stock market data led him to develop the Wave Principle, a form of technical analysis that identifies trends in the financial markets. He proposed that market prices unfold in specific patterns, which practitioners today call Elliott waves. In the early 1930s Elliott began his systematic study of 75 years of stock market data, including index charts from yearly to half-hourly. In August 1938 he detailed the results of his studies by publishing his third book (written in collaboration with Charles J. Collins), called The Wave Principle. Elliott said that while stock market prices may appear random and unpredictable, they actually follow predictable, natural laws and can be measured and forecast using Fibonacci numbers. Soon after the publication of The Wave Principle, Financial World magazine commissioned Elliott to write 12 articles (under the same title as his book) describing his new method of market forecasting. In the early 1940s Elliott expanded his theory to apply to all collective human behaviors. His final major work was his most comprehensive:- Nature's Law – The Secret of the Universe published in June 1946, two years before his death. In the years after Elliott's death, other practitioners continued to use the wave principle and provide forecasts to investors, including Charles Collins, Hamilton Bolton, Richard Russell and A.J. Frost. Frost co-authored Elliott Wave Principle with Robert Prechter in 1978. Prechter came across Elliott's works while working as a market technician at Merrill Lynch. His prominence as a forecaster during the bull market of the 1980s helped bring the greatest exposure to date to Elliott's wave principle. Elliott Wave Theory is a theory named after Ralph Elliot, who contended that the stock market tends to move in discernible and predictable patterns reflecting the basic harmony of nature. Elliott Wave Theory is a theory developed in the early part of the XX century by Ralph N. Elliot, who contended that the stock market tends to move in discernible and predictable patterns reflecting the basic harmony of nature and extended by other technical analysts to futures markets. The theory promotes the idea that investments moves in series of 5 waves and then correct in the opposite direction with 3 waves. In technical analysis, a charting method based on the belief that all prices act as waves, rising and falling rhythmically. A market theory of identifying price movements that come as repetitive waves of five moves higher in the direction of the main trend, and three moves lower in a corrective manner. An approach to market analysis that is based on repetitive wave patterns and the Fibonacci number sequence. An ideal Elliot wave pattern shows a five wave advance followed by a three wave decline. In technical analysis, a charting method based on the belief that all prices act as wavers, rising and falling rhythmically. For his significant contributions to the field of technical analysis, the Market Technicians Association awarded Ralph Nelson Elliott the 1996 Annual Award. The Elliott Wave Principle, the legacy of Ralph Nelson Elliott, is practiced globally – 62 years after Elliott's discovery, and 50 years (now 72 and 60 years, respectively) after his last work was published. Within its sophistication, as Paul Tudor Jones has pointed out, 'Elliott Wave theory allows one to create incredibly favorable risk/reward opportunities'. We focus on a pioneer's work and its variations, and when awed by a theory, we wish we knew more about the person. American essayist Ralph Waldo Emerson put it best:- 'There is properly no history, only biography'. Ralph N. Elliott's Wall Street career is known. During the last 13 years of his life, he advanced a unique theory of stock market action. The Elliott Wave Principle was first revealed privately, in December, 1934, to Charles J. Collins, an investment counselor. In August, 1938, a monograph written with Collins' assistance – The Wave Principle – was published. A year later, Elliott wrote the now-famous twelve articles for the magazine Financial World, where Elliott's theories were presented to a larger audience. Between November 1938 and August 1945, Elliott issued interpretive letters and educational bulletins. In June 1946, his last work – Nature's Law:- The Secret of the Universe – was published. Elliott Wave Theory:- developed by Ralph Nelson Elliott, the approach defines markets as moving in a predetermined number of waves. Markets move in a sequence of five waves in the direction of the underlying trend and correct in a sequence of three waves. The trend movement or impulse is labeled 1-2-3-4-5 and a correction is labeled A-B-C. His sharp and energetic mind would not rest. His stock market studies began. He read Robert Rhea's book, Dow Theory, and was one of the first subscribers to Rhea's stock market service. Elliott's observations led not only to the discovery of the Elliott Wave Principle but, at age 64, to a career in Wall Street, to what he later referred to as 'Wave number five of my own life'. The Elliott Wave Principle was first revealed privately, in December, 1934, to Charles J. Collins, an investment counselor. In August, 1938, a monograph written with Collins' assistance – The Wave Principle – was published. A year later, Elliott wrote the now-famous 12 articles for the magazine Financial World, where Elliott's theories were presentedto a broader investment community than his 1938 monograph had reached. Between 1938 and 1945, Elliott issued interpretive letters and educational bulletins. In 1946, his last work – Nature's Law:- The Secret of the Universe – was published. / Ралф Нэлсэн Элиэт (Ralph Nelson Elliot). Чарлз Калынз (Charles Collins), Хэмилтчэн Болтчэн (Hamilton Bolton), Ричад Рассэл (Richard Russell) и Эй.Дьжей. Фрост (A.J. Frost). Робэтч Прэктё (Robert Prechter) в 1978. Мёрл Лынч (Merrill Lynch). Теория, разработанная в начале XX века Ралфом Нэлсэном Элиэтом (Ralph Nelson Elliot), Американским бухгалтером. Фибоначчи (Fibonacci). Он прочитал книгу Робёрта Риэ (Robert Rhea), Теория Дау (Dow Theory), и был одним из первых подписчиков . Чарлз Дьжей. Калынз (Charles J. Collins).

ELLIPS = THE ELECTRONIC LARGE–VALUE INTERBANK PAYMENT SYSTEM

ELLIPSOID = ЭЛЛИПСОИД – Ellipsoid is a compressed or flattened sphere. Ellipsoid is an elliptical solid. / Под Эллипсоидом понимается замкнутая поверхность (2-го порядка). Эллипсоид можно получить из поверхности шара, если шар сжать (растянуть) в произвольных отношениях в трёх взаимно перпендикулярных направлениях. Если эллипс вращать вокруг одной

из его осей, то описываемая им поверхность будет эллипсоид вращения. Под Эллипсоидом, от Греческих слов Elleipsis, означающее Выпадение или Нехватка или Опущение, и Eidos, означающее Вид, понимается замкнутая центральная поверхность второго порядка. Эллипсоид имеет центр симметрии O и три оси симметрии, которые называются осями эллипсоида. Точки пересечения координатных осей с эллипсоидом называются его вершинами. Сечения эллипсоида плоскостями являются эллипсами (в частности, всегда можно указать круговые сечения эллипсоида). В надлежащей системе координат уравнение эллипсоида имеет вид:- $x^2/a^2 + y^2/b^2 + z^2/c^2 = 1$.

ELLIPTIC = ЭЛЛИПТИЧЕСКОЕ – Elliptic:- oval in outline, having narrowed to rounded ends and being widest at or near the middle. Elliptic or Elliptical:- oblong with regular flattened ends. / овальное с . , от Греческого слова Élleipsis, означающее Выпадение или Опущение, .

ELLIPTICAL = ЭЛЛИПТИЧНОЕ – Elliptical:- oval-shaped. / овальной формы.

ELLIPTICAL LEAF = ЭЛЛИПТИЧЕСКИЙ ЛИСТ – Elliptical Leaf:- ellipse-shaped, narrow at each end, widest at the middle, e.g., Cotoneaster dammeri or Nyssa sylvatica. Elliptic Leaf:- remembering to an ellipse; 2 or 3 times longer than wide.

ELMENDORF TEAR TESTER = ТЕСТЕР ЭЛМЕНДОРФА ДЛЯ ОПРЕДЕЛЕНИЯ ОТРЫВА (или ТЕСТЕР ЭЛМЕНДОРФА ДЛЯ ОПРЕДЕЛЕНИЯ РАЗДИРА) – Elmendorf Tear Tester is a tester designer to determine the tearing strength of paper. It is also used to measure the tearing strength of very lightweight fabrics and resin-finished apparel fabrics. A trapezoidal fabric sample is employed. Elmendorf Tearing Tester:- to determine the ballistic tearing strength of textiles, paper or board. Range from 8 000 to 64 000 milliNewtons with suitable pendulum. Elmendorf Tear Tester is internationally recognized as a basic instrument for performing one of the most important tests in quality evaluation. It is used to measure tear resistance of many sheet materials, including: paper, board, textiles, non-wovens, films, foils, and coated materials. The instrument provides reading accuracy of ±1% of the indicated reading when used with the standard 1 600 g pendulum. Applications:- paper, foil, film, textiles, and nonwovens. The Elmendorf Tear Test exerts a shearing force perpendicular to the surface of the paper, simulating an actual tearing action. The Elmendorf Tester, named after Armin Elmendorf, the American mechanical engineer that invented the instrument, was originally created with assistance from Dr. Charles B. Thwing to test the tearing strength of paper. Over time, this test has evolved to include many additional testing standards to quickly and accurately measure the tear resistance of sheet materials including paper, textiles, roofing products, film, foils, and more. Armin Elmendorf was the inventor of the Elmendorf method. / Армин Элмендорф (Armin Elmendorf). Доктор Чарлз Би. Свин (Dr. Charles B. Thwing).

EL NIÑO = ЭЛЬ НИНЬО – A term El Niño is used to indicate a broader term of quasi-periodic ocean climate conditions including La Niña, Southern Oscillation, or ENSO, which are characterised by anomalies in the temperature of the surface of Eastern coast of Latin America (centred on Peru) – warming or cooling known as El Niño and La Niña respectivelyand air surface pressure in the tropical Western Pacific (the Southern Oscillation), often around Christmas time. The abnormal warm ocean climate conditions are accompanied by dramatic changes in species abundance and distribution, higher local rainfall and flooding, massive deaths of fish and their predators (including birds). El Niño is climatic condition associated with the temperature of major sea currents. / Эль Ниньо (El Niño) и Ла Ниньа (La Niña).

EL NIÑO–SOUTHERN OSCILLATION = ЭЛЬ НИНЬО–ЮЖНАЯ ОСЦИЛЛЯЦИЯ – El Niño-Southern Oscillation (ENSO) refers to periodic but irregular variations in wind and sea surface temperatures in the tropical Eastern Pacific Ocean. ENSO consists of a warming phase known as El Niño and a cooling phase known as La Niña, and occurs typically at intervals of two to seven years. The abnormal warm ocean climate conditions of El Niño are accompanied by higher local rainfall and flooding, and massive deaths of fish and their predators (including birds).

E–LOCAL = Э–МЕСТНЫЙ – E-Local is a person with trading privileges at an exchange with an electronic trading facility who trades electronically (rather than in a pit or ring) for his or her own account, often at a Trading Arcade.

ELON = ELONGATION

ELONGATION = ЭЛОНГАЦИЯ (или УДЛИНЕНИЕ, или РАСТЯЖИМОСТЬ) – Elongation is the deformation in the direction of load caused by a tensile force. Elongation is measured in units of length (inches, millimeters) or calculated as a percentage of the original specimen length. Elongation may be measured at a specific load, or at the breaking point (or breaking load). The fractional increase in length of a material stressed in tension. Elongation is the ratio of the extension of a test specimen to its initial length, expressed as a percentage. The increase in length of a specimen during a tensile test, expressed in units of length. / Под Элонгацией, от позднелатинского слова Elongatio, означающее Удаление, понимается . Под Удлинением понимается характеристика деформативности материала, оцениваемая по увеличению длины образца из этого материала при растяжении. На практике обычно определяют относительное удлинение – отношение (в %) прироста длины образца до разрыва к начальной длине образца; характеризует пластичность материала.

ELONGATION ABILITY = СПОСОБНОСТЬ К УДЛИНЕНИЮ (или СПОСОБНОСТЬ К ВЫТЯГИВАНИЮ) – Elongation Ability is:- (1) Deepwater Rice:- the ability of the internodes, leaves, and leaf sheath to elongate during the vegetative growth phase, thereby escaping submergence by rapidly rising floodwater. Floating Rice can elongate as fast as 20 cm per day. (2) Grain:- the ability of the Rice kernel to stretch lengthwise upon cooking to sometimes twice its original length or more in some high quality Basmati Rice varieties.

ELONGATION AT BREAK = УДЛИНЕНИЕ ПРИ РАЗРЫВЕ – Elongation At Break is the elongation of a test specimen produced by the breaking force. Elonagtion At Break is the increase in length when the last component of the specimen breaks. Usually expressed as %. / Удлинение волокна к моменту его разрыва на динамометре, выраженное в процентах.

ELONGATION AT RUPTURE = УДЛИНЕНИЕ ПРИ ПРОРЫВЕ (или УДЛИНЕНИЕ ПРИ РАЗРЫВЕ) – Elongation At Rupture is the elongation of a test specimen corresponding to rupture.

ELONGATION AT SPECIFIED FORCE = УДЛИНЕНИЕ ПРИ СПЕЦИФИЦИРОВАННОЙ СИЛЕ – Elongation At Specified Force is the elongation of a test specimen produced by a specified force.

ELONGATION AT SPECIFIED TENACITY = УДЛИНЕНИЕ ПРИ СПЕЦИФИЦИРОВАННОЙ ТЯГУЧЕСТИ (или (УДЕЛЬНОЙ) ПРОЧНОСТИ, или ВЯЗКОСТИ) – Elongation At Specified Tenacity is the elongation of a test specimen produced by a specified tenacity.

ELONGATION BETWEEN DEFINED FORCES = УДЛИНЕНИЕ МЕЖДУ ОПРЕДЕЛЁННЫМИ СИЛАМИ – Elongation Between Defined Forces is the increase in length of a test specimen which results from subjecting it to two specified forces.

ELONGATION GENES = ГЕНЫ УДЛИНЕНИЯ – Elongation Genes are the genes controlling the elongation of the plant parts, especially the stem and leaf sheath.

ELONGATION RATIO = СООТНОШЕНИЕ С УДЛИНЕНИЕМ – Elongation Ratio is a ratio of grain length of 10 cooked Rice grains to that of raw Rice grains, preferably presoaked in water 30 min before cooking for 10 min.

ELTD = ESTIMATED LAST TRADING DATE

ELUVIUM = ЭЛЮВИЙ – Eluvium:- (1) rock debris produced by the weathering and disintegration of rock in situ. Compare Alluvium. (2) Fine soil or sand deposited by wind (as in dunes). In geology, Eluvium or Eluvial Deposits are those geological deposits and soils that are derived by in situ weathering or weathering plus gravitational movement or accumulation. The process of removal of materials from geological or soil horizons is called Eluviation or Leaching. There is a difference in the usage of this term in geology and soil science. In soil science, eluviation is the transport of soil material from upper layers of soil to lower levels by downward percolation of water across soil horizons, and accumulation of this material (illuvial deposit) in lower levels is called Illuviation. In geology, the removed material is irrelevant, and the deposit (eluvial deposit) is the remaining material. Eluviation occurs when precipitation exceeds evaporation. A soil horizon formed due to eluviation is an Eluvial Zone or Eluvial Horizon. In a typical soil profile, the eluvial horizon refers to a light-colored zone located (depending on context and literature) either at the lower part of the A horizon (symbol:- Ae) or within a distinct horizon (E horizon) below the A, where the process is most intense and rapid. Yet some sources consider the eluvial zone to be the A horizon plus the (distinct) E horizon, as eluviation technically occurs in both. The strict eluvial horizon (E horizon) is typically light gray, clay-depleted, contains little organic matter and has a high concentration of silt and sand particles composed of quartz and other resistant minerals. Eluvial ore deposits are those such as tungsten and gold placer deposits formed by settling and enriched by the winnowing or removal of lower density materials. Diamonds within yellow ground (weathered portions of kimberlites) may be considered to be eluvial deposits. Cassiterite and columbite-tantalite deposits also occur as residual or eluvial concentrations. The Pitinga tin deposit in Brazil, an eluvial deposit, is one of the largest tin mines in the world. Weathering supergene enrichment of an apatite rich carbonatite in Ontario has produced a significant eluvial phosphate ore deposit. Под Элювием, от Латинского слова Eluo, означающее Вымываю, понимаются рыхлые отложения, возникающие при выветривании исходных (материнских) горных пород на месте их залегания. Элювий слагает коры выветривания и почвы. Различают ортоэлювий кристаллических (магматических и метаморфических) горных пород, метаэлювий уплотнённых осадочных пород и неоэлювий молодых рыхлых отложений (в двух последних исходные породы в значительной мере состоят из переотложенных и слабо изменённых продуктов выветривания). Наиболее типичен ортоэлювий, состав которого изменяется от щебнисто-глыбового в холодном климате до глинистого во влажном и жарком. По степени разложения различают грубый сиаллитный элювий, в котором сохраняются первичные алюмосиликаты, кислый сиаллитный элювий, сложенный главным образом из новообразованных водных алюмосиликатов группы глинистых минералов, и аллитный, или ферраллитный элювий, в котором значительная часть силикатов разложена и представлена свободными гидроокислами алюминия и железа.

ELVIS = EXPORT LICENSE VOICE INFORMATION SYSTEM

EM = EFFECTIVE MARGIN

EM = ELECTROMAGNETIC MAPPING

EMA = EXPONENTIAL MOVING AVERAGE

E–MAIL = ELECTRONIC MAIL

EMAPA = EMPRESA MARANHENSE DE PESQUISA AGROPECUÁRIA

EMARGINATE = ВЫЕМЧАТОЕ (или НАДРЕЗАННОЕ У ВЕРХУШКИ) – Emarginate:- having a shallow notch at the extremity. Emarginate:- with notched ends or tips. / О листе.

EMASAR = ECOLOGICAL MANAGEMENT OF SEMI–ARID RANGELANDS IN AFRICA, THE NEAR EAST, AND MIDDLE EAST

EMASCULATION = ЭМАСКУЛЯЦИЯ (или КАСТРАЦИЯ) – Emasculation is the systemic removal of all of the male sex organ from an organism; in Rice, the removal of the stamen of the floret. / тычинки (stamen) . Эмаскуляция – удаление несозревших пестиков у цветков. Под Кастрацией, от Латинского слова Castratio, означающее Оскопление, понимается:- (1) у человека – удаление половых желёз (яичек, яичников) хирургическим путём или подавлением их функции другими методами (гормоны, облучение) преимущественно при опухолях. (2) У животных – удаление половых желёз у самцов и самок с хозяйственными и реже лечебными целями. Кастрированные сельскохозяйственные животные более спокойны, лучше откармливаются, их мясо вкуснее, питательнее.

EMBARGO = ЭМБАРГО – Embargo is an order prohibiting the acceptance and/or handling of freight at certain points or via certain routes due to emergencies, congestion, strikes, acts of God, etc. Prohibition of the import or export of specified goods from or to a particular country or block, generally for political reasons. Embargo:- order to restrict the hauling of freight. A government order prohibiting the entry or departure of commercial vessels or merchandise at its ports. Embargo is an edict or order of the government prohibiting the departure of ships of commerce from some or all of the ports within its dominions; a prohibition to sail. Note:- if the embargo is laid on an enemy's ships, it is called a Hostile Embargo; if on the ships belonging to citizens of the embargoing state, it is called a Civil Embargo. An order to restrict the hauling of freight. Embargo is a temporary arrest or injunction laid on ships or cargo to prevent their arrival or departure. Normally used by the likes of the New Zealand Ministry of Agricultural and Forestry when inspecting incoming cargo if there is a likelihood of foreign pests being imported. Embargo is a government prohibition against the shipment of certain products to a particular country for economic or political reasons. Embargo is a government ordered prohibition of trade with another country restricting all trade on only that of selected goods and services. / Под Эмбарго, от Испанского слова Embargo, означающее Наложение Ареста, понимается наложение государством запрета (ареста) на ввоз другими странами или вывоз золота или иностранной валюты, отдельных видов товаров, например, оружия. Под Эмбарго понимается запрещение ввоза из какой-либо страны или вывоза в какую-либо страну товаров, валюты, а также задержание судов, грузов и другого имущества, принадлежащих иностранному государству. В военное время эмбарго используется для экономических санкций против вражеских государств. В мирное время применяется империалистическими государствами для экономического и финансового давления на различные страны. Эмбарго, в международном праве первоначально запрещение государственной властью выхода из портов своей страны судов других стран или своих собственных. Впоследствии термин Эмбарго стал применяться в смысле запрещения ввоза в страну или вывоза из этой страны товаров или валюты. Эмбарго может быть введено как в военное, так и в мирное время. Эмбарго в военное время по существу становится формой блокады экономической. В мирное время эмбарго применяется как мера воздействия, репрессалии или средство экономического и финансового давления на другие страны. Устав Организации Объединённых Наций (ООН) предусматривает возможность установления эмбарго в

качестве коллективной репрессивной меры в отношении государства, действия которого представляют угрозу международной безопасности. Эмбарго – государственный запрет на вывоз (или экспорт) или привоз (или импорт) определённых товаров из/в какую-либо страну. Эмбарго чаще всего применяется во время войны, но иногда налагается также и по экономическим причинам. Например, Организация Стран Экспортёров Нефти (Organization of Petroleum Exporting Countries (OPEC)) наложила эмбарго на поставку нефти в западные страны в начале 1970-х как протест против политики Израиля и повышения цены на нефть. Эмбарго:- (1) государственное запрещение на ввоз или вывоз из страны определённого вида товаров, ценностей, золота, ценных бумаг, валюты; (2) блокирование торговли с определёнными странами по решению Организации Объединённых Наций в качестве репрессивной меры по отношению к данной стране за нарушение Устава ООН или другие неблаговидные действия. Эмбарго – запрещение органами государственной власти ввоза из какой-либо страны золота, товаров, ценных бумаг. Первоначально эмбарго применялось как запрещение органами государственной власти выхода из портов своей страны судов других стран (или своих собственных судов).

EMBEDDED DERIVATIVE = ВСТРОЕННЫЙ ПРОИЗВОДНЫЙ ИНСТРУМЕНТ (или ВСТРОЕННЫЙ ДЕРИВАТИВ) – Embedded Derivative is a component of a hybrid (combined) instrument that also includes a non-derivative host contract – with the effect that some of the cash flows of the combined instrument vary in a way similar to a stand-alone derivative. It causes some or all of the cash flows that otherwise would be required by the contract to be modified according to a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates or other variable. A derivative that is attached to a financial instrument but is contractually transferable independently of that instrument, or has a different counterparty from that instrument, is not an embedded derivative, but a separate financial instrument.

EMBEDDED DERIVATIVE CASH FLOW = ДВИЖЕНИЕ ДЕНЕЖНЫХ СРЕДСТВ ПО ВСТРОЕННЫМ ПРОИЗВОДНЫМ ИНСТРУМЕНТАМ (или ДВИЖЕНИЕ ДЕНЕЖНЫХ СРЕДСТВ ПО ВСТРОЕННЫМ ДЕРИВАТИВАМ) – Embedded Derivative Cash Flow is an embedded cash flow of a contract that varies in a similar way to a cash flow of a derivative. It does not need to consist of the cash flow of the whole contract but could be only part of it.

EMBEDDED ENERGY = ВСТРОЕННАЯ ЭНЕРГИЯ – Embedded Energy is the total amount of energy used in the production of a fuel or product. For woodfuel this may include contributions from land preparation, planting, fertilizer and pesticide inputs, thinning, harvesting, comminution, processing, and transport.

EMBEDDED VALUE = ВМЕНЁННАЯ СТОИМОСТЬ (или ПРИВЕДЁННАЯ СТОИМОСТЬ, или СОСТАВНАЯ СТОИМОСТЬ) – Embedded Value equals the net asset value of the company, plus the present value of the projected stream of future after-tax profits on in-force insurance contracts, less the cost of capital at risk. Actuarially determined estimate of the economic value of the in-force life and health insurance operations of an insurance company, excluding any value attributable to future new business.

EMBEDDED VALUE EARNINGS = ЗАРАБОТКИ ПО ВМЕНЁННОЙ СТОИМОСТИ – Embedded Value Earnings, defined as the change in the embedded value over the year (after adjustment for any capital movements such as dividends and capital injections), provide a measure of the performance of the life and health insurance operations of an insurance company.

EMBODIMENT = ВОПЛОЩЕНИЕ (или ОСУЩЕСТВЛЕНИЕ) – Embodiment:- a manner in which an invention can be made, used, practiced or expressed.

EMBOSSING = ТИСНЕНИЕ (или НАСЕЧКА, или ЧЕКАНКА) – Embossing is a calendering process for producing raised or projected figures or designs in relief on fabric surfaces. Embossed surfaces are usually produced on fabrics by engraved, heated rollers that give a raised effect. Embossed velvet or plush is made by shearing the pile to different levels or by pressing part of the pile flat. Embossing is the impressing of a pattern on a fabric by subjecting it to the pressure of an engraved roll. Embossing is a calendering process in which fabrics are engraved with the use of heated rollers under pressure to produce a raised design on the fabric surface. / Тиснёный бархат (embossed velvet) или плюш изотавливается .

EMBOSS MARK = ОТМЕТИНА ОТ НАСЕЧКИ (или ШТАМПОВАНИЯ, или ЧЕКАНКИ, или ТИСНЕНИЯ) – Emboss Mark:- a small area of the fabric standing out in relief. Note:- this defect is often caused by the relief print-off of defects, such as slubs, or of seams used to join lengths of fabric, under excessive rolling tension, or contraction on the roll during wet processing. / Вдавливание; След От Шва (emboss mark; impression mark; seam mark):- порок ткани; небольшая часть ткани, отличающаяся рельефом. Примечание:- этот порок в форме вдавленного шва, соединяющего ткань по длине, возникающий на поверхности полотна в результате чрезмерного натяжения при намотке или усадки на валу во время влажной обработки.

EMBRAPA = EMPRESA BRASILEIRA DE PESQUISA AGROPECUÁRIA

EMBROIDERY = ВЫШИВАНИЕ (или ВЫШИВКА) – Embroidery is an embellishment of a fabric or garment in which colored threads are sewn on to the fabric to create a design. Embroidery may be done either by hand or machine. Embroidery:- ornamental needlework on fabric either by hand or by machine. Embroidery is the term for a group of decorative, usually ornamental and nonfunctional needlework done with thread or yarn on fabric. Most machine embroidery is done by the Schiffli machine which can imitate many different hand embroidery stitches. (The origins of this machine date to 1863, when Isaak Gröbli (1822–1917) from St. Gallen, Switzerland, developed what became known as the Schiffli Machine. His machine was based on the principles introduced by the newly invented sewing machines, which used two sets of threads, one on the obverse and one on the reverse side of the cloth. Gröbli's machine, however, used the combination of a continuously threaded needle on the obverse and, more significantly, a shuttle containing a bobbin of thread underneath. The shuttle itself looks like the hull of a sailboat, hence its nickname, Schiffli, meaning 'Little Boat' in Swiss German (the term is still in use at the beginning of the XXI century).) Although embroidery is usually thaught of as being done in several colors, white work (white embroidery on white fabric) and black work (black embroidery on white fabric) are fairly common. Embroidery terms are tremendously variable, with different words being given to the same stitches in different countries, and even different sections of the same countries. Some of the most common embroidery stitches are beading, buttonhole stitch, chain stitch, chevron stitch, satin stitch, stem stitch, back stitch, and straight stitch. Embroidery is ornamental designs worked on a fabric with threads. Embroidery may be done either by hand or by machine. Embroidery is the art or handicraft of decorating fabric or other materials with designs stitched in strands of thread or yarn using a needle. Embroidery may also use other materials such as metal strips, pearls, beads, quills and sequins. Sewing machines can be used to create machine embroidery. / Машина Шифли (Schiffli Machine). Изаак Гробли (Isaak Gröbli; 1822–1917). бисеринки или бусинки (beads). узкая вышивка (beading), петельный шов (buttonhole stitch), цепной стежок (chain stitch), шевронный стежок (chevron stitch), гладь (satin stitch), оплётка с жилкой или оплётка с сердечником (stem stitch), сплошной или непрерывный шов (back stitch), и прямой шов (straight stitch).

EMBROIDERY DEFECTS = ПОРОКИ ВЫШИВАНИЯ (или ДЕФЕКТЫ ВЫШИВКИ) – Embroidery Defects:- defective or absence of embroidery. The defects which are caused during the process of embroidery.

EMBROIDERY LINEN = ВЫШИВАЛЬНЫЙ ЛЁН – Embroidery Linen is another name for art linen. See also Art Linen.

EMBROIDERY THREAD = ВЫШИВАЛЬНАЯ НИТЬ – Emroidery Thread:- polyester threads are ideal for almost any application in commercial and home machines. Its superior tensile strength makes it durable and smooth running. Polyester Sewing Thread is mainly used in sewing all kinds of fabric used for making clothes, bags, dresses, curtains and much more. Polyester Embroidery Thread is used for doing embroidery in clothes to fulfill the demands for cheap embroidery work as polyester embroidery thread is priced much lower than viscose embroidery thread which is mainly used in Embroidery works. Kayavlon Impex Pvt Ltd (India) has been exporting world class quality polyester embroidery threads to various Asian, European, African and American countries. Polyester threads are high performance fibers that have found uses in a vast array of applications. Though they are comparatively less lustrous than silk and rayon threads, their applications are extremely varied. This is precisely because of the properties that they employ such as highly durable, high resistant to chlorine and bleach, resistant to shrinkage and fading, wrinkle free, highly absorbent, dyes easily. Polyester Sewing Thread is made from polyester spun yarn and is available in counts like 40/2, 42/2, 45/2 and so on. Whereas Polyester Embroidery Thread is made from Polyester Fully Drawn Yarn (FDY) available in various colors and twists like 120/2D, 150/2D and so on. Since these are strong fibers, they are resistant to any kind fraying or breaking. They have founded uses for applications like children wear, linens used for commercial purposes in hotels and restaurants, for manufacturing carry bags, kitchen linens, throw rugs and blankets. Embroidery thread is commonly available in two ply. Polyester embroidery thread is available in various colors known as Dyed/Colored Embroidery Threads. We can supply you best quality Polyester Embroidery Threads from manufacturers and suppliers in India, China, Taiwan, Indonesia, Vietnam, Malaysia and South Korea. We can offer you Polyester Thread on paper bobbins as well as plastic cones. It is mainly available in packing like 5 000 yards (or meters) per cone, 1 kg/cone, etc. Thread on plastic cones can be used to dye the thread conventionally. / Кайэвлон Импэкс Пи.ви.ти. Эл.ти.ди. (Kayavlon Impex Pvt Ltd; Индия).

EMBRYO = ЭМБРИОН (или ЗАРОДЫШ) – Embryo is the generative part of a seed that develops from the fertilized (diploid) egg called Zygote, which upon germination gives rise to a young seedling. It is located on the ventral side of the seed. It is easily detached and removed in the milling process as part of the bran. Embryo is the new plant developing from the fertilized egg cell (zygote) in the fertilized seed. See also Germ. Embryo (syn. Eye, and Germ). The miniature plant developed from the fertilized (diploid) egg, the zygote, which upon germination gives rise to a young seedling. The basic parts of a mature embryo are the embryonic axis and the scutellum. The embryo is appressed to the endosperm by the scutellum. The embryo lies on the ventral side of the caryopsis next to the lemma. It is easily detached and removed in the milling process as pert of the bran. / Смотрите также Зародыш (Germ). Под Эмбрионом, от Греческого слова Émbryon, понимается то же, что Зародыш животных и человека. Под Зародышем понимается:- (i) у животных и человека Зародыш, или Эмбрион, – организм на ранних стадиях развития. Заключён в яйцевые и зародышевые оболочки. Развивается обычно из оплодотворённого яйца, питается за счёт имеющихся в нём запасов питательных веществ или за счёт материнского организма. (ii) Зачаток папоротникообразных и семенных растений; развивается обычно из оплодотворённой яйцеклетки. Зародыш:- (1) у животных и человека Зародыш, или Эмбрион, – организм в раннем периоде развития – от оплодотворённого яйца (зиготы) до появления способности к самостоятельному питанию и активному передвижению. Развитие зародыша происходит, как правило, в яйцевых оболочках или специальных органах материнского организма. Смотрите Зародышевое Развитие, Зародышевые Оболочки. (2) У растений Зародыш, или Эмбрио, – зачаток новой особи, развивающийся из зиготы, которая возникает в результате оплодотворения яйцеклетки зародышевого мешка или из клеток нуцеллуса или интегумента (в случае апомиксиса). Наиболее простой тип эмбрионального развития у зелёных Водорослей, например, у Спирогиры, зигота которой не образует спорофитной нити, а сразу приступает к мейозу. У бурых Водорослей, например, у Фукуса, зигота прикрепляется к субстрату, делится, после чего образует эмбриональное тело с точкой роста таллома. У мохообразных зародыш прорастает на материнском организме – гаметофите, за счёт которого он питается, затем образует спорогенную ткань, где формируются споры. Такой тип зародыша не встречается среди других групп высших растений. У древнейших высших растений – Псилотовых – развитие зародыша протекает в ткани гаметофита, где происходит ряд последовательных делений зиготы. Из клеток нижней части формируется ножка, внедряющаяся в ткань гаметофита, в верхней – закладывается точка роста побега с двумя меристематическими бугорками (смотрите Меристема). Зародыш здесь – поляризованная структура, один конец которой образует наземный побег, другой – корневище. У плауновидных зародыш имеет два симметричных бугорка будущих зародышевых листочков, между которыми находится точка роста в виде верхушечной клетки. Развитие зародыша у хвощей характеризуется правильным планом сегментации в виде 4 зон, дающих начало побегу, корню, первому листу и ножке. У папоротниковидных в первых 4 клетках, возникших в результате двух первых делении зиготы, определено место закладки верхушки побега, первого листа, корня и ножки. У голосеменных начальный цикл развития зародыша характеризуется свободноядерной, или ценоцитной, стадией (у саговников, например, свободных ядер 1 024), которая сменяется образованием клеток; затем в формирующемся зародыше происходит закладка точек роста побега, корня и семядольных бугорков (у некоторых видов сосны – до 18). У большинства покрытосеменных зигота делится на две клетки:- апикальную, дающую начало собственно зародышу, п базальную – подвеску, или суспензору. В эмбриогенезе различают 2 фазы развития:- предзародышевую (от зиготы до образования эмбриодермы) и зародышевую (закладка основных структур:- точки роста побега, семядоли, гипокотиля и центрального зародышевого корешка). На основе первых этапов деления предзародыша были созданы классификации эмбриональных типов, используемые систематиками при решении вопросов эволюции и филогении растений. Предзародышевая стадия развития двудольных и однодольных одинакова. На более поздних стадиях у однодольных апикальная зона проэмбрио даёт начало только 1 семядольному бугорку; у двудольных таких бугорков может возникнуть 2, а у некоторых видов 3 и даже больше, что приводит к образованию многосемядольности. У покрытосеменных растений развитие зародыша, в отличие от голосеменных, сопровождается образованием клеточных перегородок. Лишь у пионов обнаружен новый тип эмбриогенеза, при котором в зиготе вначале возникают свободные ядра, а затем такая многоядерная структура становится клеточной и на её периферии возникают проэмбриональные бугорки; из них в собственно зародыше развивается только один. По наличию или отсутствию у зародыша покрытосеменных зелёного пигмента – хлорофилла – они делятся на 2 группы:- хлороэмбриофиты (Бобовые, Крестоцветные и другие) и лейкоэмбриофиты (Лютиковые, Злаковые и другие). В процессе эволюции среди некоторых групп Покрытосеменных, например, у растений паразитов (заразиховые) и сапрофитов (орхидные), наблюдается редукция зародыша. Источником питания зародыша служит эндосперм, который у одних видов (Бобовые) поглощается целиком растущим зародышем, у других (злаки) – сохраняется. Иногда зародыш в семени окружён не только эндоспермом, но и другой запасной тканью – перисперм, развивающимся из клеток нуцеллуса (Свёкла, Чёрный Перец и другие).

EMBRYOGENIC CALLUS = ЭМБРИОГЕННЫЙ КАЛЛЮС (или ЭМБРИОГЕННЫЙ КАЛЛУС, или ЭМБРИОГЕННЫЙ НАПЛЫВ) – Embryogenic Callus is an undifferentiated cell mass that produces somatic embryos. / Под Эмбриогенным Каллюсом, от Греческих слов Émbryon, означающее Зародыш, и Genēs, означающее Рождающий или Рождённый, и Латинского слова Callus, означающее Мозоль, или Каллюсом в Зародышевом Развитии понимается ткань, образующаяся у растений в местах повреждений в виде наплыва и способствующая их заживлению.

EMBRYONIC = ЭМБРИОННОЕ – Embryonic:- rudimentary, in an early stage. / Рудиментарный. , от Греческого слова Émbryon, означающее Зародыш, .

EMBRYONIC AXIS = ЭМБРИОННАЯ ОСЬ – Embryonic Axis:- the plumule enclosed by the coleoptile and the radicle ensheathed by the coleorhiza form the embryonic axis in the embryo.

EMBRYONIC ROOT = ЭМБРИОННЫЙ КОРЕНЬ (или КОРЕНЬ ЗАРОДЫША) – Embryonic Root (in botany):- the Radicle is the first part of a seedling (a growing plant embryo) to emerge from the seed during the process of germination. The radicle is the Embryonic Root of the plant, and grows downward in the soil (the shoot emerges from the plumule). Above the radicle is the Embryonic Stem or Hypocotyl, supporting the cotyledon(s). See also Embrio Stem, and Hypocotyl.

EMBRYONIC SHOOT = ЭМБРИОННЫЙ ПОБЕГ – Embryonic Shoot is the early leaves coming from the seed or the plumule. / , от Греческого слова Émbryon, означающее Зародыш, понимаются ранние листочки, появляющиеся из семени или .

EMBRYONIC STEM = ЭМБРИОННЫЙ СТЕБЕЛЁК (или СТЕБЕЛЁК ЗАРОДЫША) – Embryonic Stem or Hypocotyl:- above the radicle is the Embryonic Stem or Hypocotyl, supporting the cotyledon(s). See also Embryonic Root, and Radicle.

EMBRYO RESCUE = СПАСЕНИЕ ЭМБРИОНА – Embryo Rescue is an in vitro technique used to culture the hybrid embryos which otherwise abort in vivo. / , от Греческого слова Émbryon, означающее Зародыш, .

EMC = EQUILIBRIUM MOISTURE CONTENT

EMCF = EUROPEAN MONETARY COOPERATION FUND

EMERALD = ИЗУМРУДНОЕ – Emerald:- brightly or richly green.

EMERALD GREEN = ИЗУМРУДНО–ЗЕЛЁНОЕ – Emerald Green:- any of various strong greens.

EMERGENCE = ПОЯВЛЕНИЕ (или ВОЗНИКНОВЕНИЕ, или ВСХОЖЕСТЬ) – Emergence is coming out or rising of seedlings from the ground; coming out of panicles from the boot (panicle exsertion); coming out of adult insect from cocoon or pupa. The event in seedling establishment when a shoot becomes visible by pushing through the soil surface. / Всхожесть – способность семян образовывать нормально развитые проростки за определённый срок проращивания, предусмотренный ГОСТом для каждой культуры. Лабораторную всхожесть определяют в процентах как отношение нормально проросших семян (за определённый срок при определённых условиях) к общему их количеству, взятому при проращивании в лаборатории. Полевую всхожесть семян выражают в процентах взошедших на поле растений от числа всех высеянных семян. Полевая всхожесть всегда ниже лабораторной (иногда на 20–30%). Это объясняется тем, что часть прорастающих в почве семян погибает от вредителей и болезней, часть их не всходит в результате образования после дождей корки, глубокой или мелкой заделки. Всхожесть семян – способность семян образовывать нормально развитые проростки. Для определения всхожести семян Хлопчатника используют две пробы по 100 семян.

EMERGENCE SURCHARGE = ВРЕМЕННАЯ НАДБАВКА (или ВРЕМЕННАЯ ДОПЛАТА, или ЭМЕРДЖЕНТНАЯ НАДБАВКА) – Emergence Surcharge:- The Rhode Island General Assembly passed Senate Bill 01-0978, as amended, which was enacted on 2001-July-13 as Public Law Chapter 307. This law amends R.I.G.L. 39-12-13 (short for the Rhode Island General Laws Title 39, Chapter 39-12 of Property Chapter 39-12-13) and requires the Administrator of the Division of Public Utilities and Carriers to implement a gasoline price emergency surcharge program allowing taxi companies and towing companies to assess a surcharge, per fare or towing job, in an amount to be determined by the Administrator, during periods when it is determined that the average price of gasoline in this state exceeds one Dollar and fifty Cents (USD1.50) per gallon. Additionally, the bill required the Administrator of the Division of Public Utilities and Carriers to implement a similar diesel emergency surcharge program for ferry companies operating within Rhode Island. Freight surcharges are no longer updated by conferences. Please refer to shipping line agents or freight forwarders for their values. / надбавка или доплата (surcharge). Под Эмерджентной, от Латинского слова Emergere, означающее Возникать или Появляться, понимается .

EMERGENCY = ЧРЕЗВЫЧАЙНОЕ ПОЛОЖЕНИЕ (или ЧРЕЗВЫЧАЙНОЕ, или ЭКСТРЕННОЕ) – Emergency is a term describing a state. It is a managerial term, demanding decision and follow-up in terms of extra-ordinary measures. A ‘State of Emergency’ demands to ‘be declared’ or imposed by somebody in authority, who, at a certain moment, will also lift it. Thus, it is usually defined in time and space, it requires threshold values to be recognized, and it implies rules of engagement and an exit strategy. Conceptually, it relates best to Response. Emergency Preparedness:- Actions taken in anticipation of an emergency to facilitate rapid, effective and appropriate response to the situation. Emergency Threshold:- mortality rate above which an emergency is said to be occurring. Usually taken as a crude mortality rate of 1 per 10 000 per day, or as an under-five mortality rate of 2 per 10 000 per day. A National Emergency (in US) is a situation in which a government is empowered to perform actions not normally permitted. The 1976 National Emergencies Act implemented various legal requirements regarding emergencies declared by the President of the United States. Between the enactment of the National Emergencies Act in 1976 through March 13, 2020, 61 emergencies have been declared; 27 have expired while 34 are currently in effect, each having been renewed annually by the president. For example, Declaring a National Emergency Concerning the Novel Coronavirus Disease (COVID-19) Outbreak (Proclamation 9994) – on March 13, 2020, President Donald Trump declared that he would give the states and territories access to up to 50 billion Dollars in federal funds to fight the coronavirus pandemic. This includes the ability to waive laws to enable tele-health. Stated by President Trump:- ‘It gives remote doctor’s visits and hospital check ins. The power to waive certain federal license requirements so the doctors from other states can provide services in states with the greatest need’. / Президент США Данэлд Тчрамп (Donald Trump).

EMERGENCY ACTION = ЭКСТРЕННОЕ ДЕЙСТВИЕ – Emergency Action is a prompt phytosanitary action undertaken in a new or unexpected phytosanitary situation. / Под Экстренным Действием понимается немедленное фитосанитарное действие, предпринятое в новой или неожиданной фитосанитарной ситуации.

EMERGENCY MEASURE = ЭКСТРЕННАЯ МЕРА – Emergency Measure is a phytosanitary measure established as a matter of urgency in a new or unexpected phytosanitary situation. An emergency measure may or may not be a provisional measure. / Экстренная Мера – фитосанитарная мера, установленная в чрезвычайном (экстренном) порядке в новой или неожиданной фитосанитарной ситуации. Экстренная мера может быть, а может не быть временной мерой. Под Экстренной Мерой понимается фитосанитарная мера, установленная в порядке срочности в новой или неожиданной фитосанитарной ситуации. Экстренная мера может быть, а может не быть временной мерой.

EMERGENCY ORDER = ЭКСТРЕННЫЙ ЗАКАЗ – Emergency Order:- also known as an Expedited Order, this order is placed and processed to be picked and shipped in an expedited manner.

EMERGENT = ПОЛУПОГРУЖЁННОЕ – Emergent (plant) is a plant growing in standing water with the terminal part above the water.

EMERGING MARKETS = РАЗВИВАЮЩИЕСЯ РЫНКИ – Emerging Markets comprise the region Asia Pacific (excluding Japan, Australia and New Zealand), South and Central America, Eastern Europe, the Middle East and Africa. Newly industrializing countries or markets with above-average growth potential and developing financial markets. Emerging Market is a stock market in a developing country such as China, Mexico, Singapore etc. They offer high expected returns due to rapid industrialization. They are also very risky markets.

EMERY CUTS = ПОРЕЗЫ НАЖДАЧКОЙ – Emery Cuts:- fabric cuts (holes) due to emery. Weaving defect. Emery Cuts:- bad or worn out emery roller edges or surfaces, faulty winding width at every roller. Higher pressure or tension weaving generates emery cuts. / порезы (дыры) вследствие наждака. Порок или дефект ткачества.

EMFF = EUROPEAN MARITIME AND FISHERIES FUND

EMI = EUROPEAN MONETARY INSTITUTE

EMINENT DOMAIN = (ПРАВО ГОСУДАРСТВА НА) ПРИНУДИТЕЛЬНОЕ ОТЧУЖДЕНИЕ СОБСТВЕННОСТИ (или ЭМИНЭНТ ДОМЭЙН) – Eminent Domain is the sovereign power to take property for a necessary public use, with reasonable compensation. Eminent Domain:- the property is taken either for government use or by delegation to third parties who will devote it to public or civic use or, in some cases, economic development. The most common uses of property taken by eminent domain are for government buildings and other facilities, public utilities, highways, and railroads; however, it may also be taken for reasons of public safety, as in the case of Centralia, Pennsylvania. Some jurisdictions require that the government body offer to purchase the property before resorting to the use of eminent domain. The term 'Eminent Domain' was taken from the legal treatise De Jure Belli et Pacis, written by the Dutch jurist Hugo Grotius in 1625, which used the term Dominium Eminens (Latin for Supreme Lordship) and described the power as follows:- '... The property of subjects is under the eminent domain of the state, so that the state or he who acts for it may use and even alienate and destroy such property, not only in the case of extreme necessity, in which even private persons have a right over the property of others, but for ends of public utility, to which ends those who founded civil society must be supposed to have intended that private ends should give way. But it is to be added that when this is done the state is bound to make good the loss to those who lose their property'. Some US states, use the term Appropriation (New York) or Expropriation (Louisiana) as synonyms for the exercising of eminent domain powers. / Суверенная (самостоятельная) . Дэ Юрэ Бэлли Эт Пачис (De Jure Belli et Pacis), написанное Датских юристом Юхо Хротиусом (Hugo Grotius) в 1625, который использовал термин Доминиум Эминэнс (Dominium Eminens) (в переводе с Латинского – (Supreme Lordship)).

EMIP = EXCHANGE MARKET INFORMATION PROGRAM

EMISSION SPECTROMETER = ЭМИССИОННЫЙ СПЕКТРОМЕТР – Emission Spectrometer works on the basis that atoms of metallic and other particular elements emit light at characteristic wavelengths when they are excited in a flame, arc, or spark. Excited light is directed through an entrance slit in the spectrometer. This light penetrates the slit, falls on a grate, and is dispersed and reflected. The spectrometer is calibrated by a series of standard samples containing known amounts of the elements of interest. By exciting these standard samples, an analytical curve can be established which gives the relationship between the light intensity and its concentration in the fluid. / Под Спектрометром, от Латинского слова Spectrum, означающее Образ или Представление, и Греческого слова Métron, означающее Мера, от Metréo, означающее Измеряю, в широком смысле понимается устройство для измерений функции распределения некоторой физической величины f по параметру x. Функция f(x) может определять распределение электронов по скоростям (Бета-Спектрометр), атомов по массам (Масс-Спектрометр), Гамма-квантов по энергиям (Гамма-Спектрометр), энергии световых потоков по длинам волн l (Оптический Спектрометр) и тому подобного. В узком смысле спектрометрами называют спектральные приборы для измерений оптических спектров f(l) с помощью фотоэлектрических приёмников излучения. Под Оптическим Спектрометром понимается прибор для измерения спектров с помощью фотоэлектрических приёмников излучения.

EMP = END–OF–MONTH PAYMENT

EMPIRE WAIST = ТАЛИЯ АМПИР (или ТАЛИЯ В СТИЛЕ АМПИР, или ХХ КУШАК, или ХХ ПОЯС) – Empire Waist is a waist which begins immediately below the bust.

EMPLOYEE BENEFITS = ВЫПЛАТЫ РАБОТНИКУ – IAS 19 (International Accounting Standard No. 19) – Employee Benefits – Employee benefits are all forms of consideration given by an entity in exchange for service rendered by employees. The objective of this Standard is to prescribe the accounting and disclosure for employee benefits. The Standard requires an entity to recognise:- (a) a liability when an employee has provided service in exchange for employee benefits to be paid in the future; and (b) an expense when the entity consumes the economic benefit arising from service provided by an employee in exchange for employee benefits. This Standard shall be applied by an employer in accounting for all employee benefits, except those to which IFRS 2 Share-based Payment applies. Short-term employee benefits:- short-term employee benefits are employee benefits (other than termination benefits) which fall due wholly within twelve months after the end of the period in which the employees render the related service. When an employee has rendered service to an entity during an accounting period, the entity shall recognise the undiscounted amount of short-term employee benefits expected to be paid in exchange for that service:- (a) as a liability (accrued expense), after deducting any amount already paid. If the amount already paid exceeds the undiscounted amount of the benefits, an entity shall recognise that excess as an asset (prepaid expense) to the extent that the prepayment will lead to, for example, a reduction in future payments or a cash refund; and (b) as an expense, unless another Standard requires or permits the inclusion of the benefits in the cost of an asset (see, for example, IAS 2 Inventories and IAS 16 Property, Plant and Equipment). Post-employment benefits:- post-employment benefits are employee benefits (other than termination benefits) which are payable after the completion of employment. Post-employment benefit plans are formal or informal arrangements under which an entity provides post-employment benefits for one or more employees. Post-employment benefit plans are classified as either defined contribution plans or defined benefit plans, depending on the economic substance of the plan as derived from its principal terms and conditions. (i) Post-employment benefits:- defined contribution plans:- Defined contribution plans are post-employment benefit plans under which an entity pays fixed contributions into a separate entity (a fund) and will have no legal or constructive obligation to pay further contributions if the fund does not hold sufficient assets to pay all employee benefits relating to employee service in the current and prior periods. Under defined contribution plans:- (a) the entity's legal or constructive obligation is limited to the amount that it agrees to contribute to the fund. Thus, the amount of the post-employment benefits received by the employee is determined by the amount of contributions paid by an entity (and perhaps also the employee) to a post-employment benefit plan or to an insurance company, together with investment returns arising from the contributions; and (b) in consequence, actuarial risk (that benefits will be less than expected) and investment risk (that assets invested will be insufficient to meet expected benefits) fall on the employee. When an employee has rendered service to an entity during a period, the entity shall recognise the contribution payable to a defined contribution plan in exchange for that service:- (a) as a liability (accrued expense), after deducting any contribution already paid. If the contribution already paid exceeds the contribution due for service before the balance sheet date, an

entity shall recognise that excess as an asset (prepaid expense) to the extent that the prepayment will lead to, for example, a reduction in future payments or a cash refund; and (b) as an expense, unless another Standard requires or permits the inclusion of the contribution in the cost of an asset (see, for example, IAS 2 Inventories and IAS 16 Property, Plant and Equipment). (ii) Post-employment benefits:- defined benefit plans:- defined benefit plans are post-employment benefit plans other than defined contribution plans. Under defined benefit plans:- (a) the entity's obligation is to provide the agreed benefits to current and former employees; and (b) actuarial risk (that benefits will cost more than expected) and investment risk fall, in substance, on the entity. If actuarial or investment experience are worse than expected, the entity's obligation may be increased. Accounting by an entity for defined benefit plans involves the following steps:- (a) using actuarial techniques to make a reliable estimate of the amount of benefit that employees have earned in return for their service in the current and prior periods. This requires an entity to determine how much benefit is attributable to the current and prior periods (see paragraphs 67–71) and to make estimates (actuarial assumptions) about demographic variables (such as employee turnover and mortality) and financial variables (such as future increases in salaries and medical costs) that will influence the cost of the benefit (see paragraphs 72–91); (b) discounting that benefit using the Projected Unit Credit Method in order to determine the present value of the defined benefit obligation and the current service cost (see paragraphs 64–66); (c) determining the fair value of any plan assets (see paragraphs 102–104); (d) determining the total amount of actuarial gains and losses and the amount of those actuarial gains and losses to be recognised (see paragraphs 92–95); (e) where a plan has been introduced or changed, determining the resulting past service cost (see paragraphs 96–101); and (f) where a plan has been curtailed or settled, determining the resulting gain or loss (see paragraphs 109–115). Where an entity has more than one defined benefit plan, the entity applies these procedures for each material plan separately. Other long-term employee benefits:- other long-term employee benefits are employee benefits (other than post-employment benefits and termination benefits) which do not fall due wholly within twelve months after the end of the period in which the employees render the related service. The Standard requires a simpler method of accounting for other long-term employee benefits than for post-employment benefits:- actuarial gains and losses and past service cost are recognised immediately. Termination Benefits are employee benefits payable as a result of either:- (a) an entity's decision to terminate an employee's employment before the normal retirement date; or (b) an employee's decision to accept voluntary redundancy in exchange for those benefits. An entity shall recognise termination benefits as a liability and an expense when, and only when, the entity is demonstrably committed to either:- (a) terminate the employment of an employee or group of employees before the normal retirement date; or (b) provide termination benefits as a result of an offer made in order to encourage voluntary redundancy. Where termination benefits fall due more than 12 months after the balance sheet date, they shall be discounted. In the case of an offer made to encourage voluntary redundancy, the measurement of termination benefits shall be based on the number of employees expected to accept the offer. / МСБУ 19 (сокращение для Международного Стандарта Бухгалтерского Учёта № 19) – . порядки и условия .

EMPLOYEE INCENTIVE SCHEME = СХЕМА СТИМУЛИРОВАНИЯ РАБОТНИКОВ – (1) Employee Incentive Scheme is a scheme for the issue or acquisition of equity securities in the entity to be held by, or for the benefit of, participating employees or non-executive directors of the entity or a related entity.

(2) Employee Incentive Scheme is a scheme which, in the Australian Securities Exchange's (ASX's) opinion, is an employee incentive scheme.

EMPLOYEE RETIREMENT INCOME SECURITY ACT = АКТ О ЗАЩИТЕ ПЕНСИОННЫХ ДОХОДОВ РАБОТНИКА – The Employee Retirement Income Security Act of 1974 (ERISA) is a federal law that sets minimum standards for pension plans in private industry. ERISA does not require any employer to establish a pension plan. It only requires that those who establish plans must meet certain minimum standards. The law generally does not specify how much money a participant must be paid as a benefit. ERISA requires plans to regularly provide participants with information about the plan including information about plan features and funding; sets minimum standards for participation, vesting, benefit accrual and funding; requires accountability of plan fiduciaries; and gives participants the right to sue for benefits and breaches of fiduciary duty. ERISA also guarantees payment of certain benefits through the Pension Benefit Guaranty Corporation, a federally chartered corporation, if a defined plan is terminated. The Department of Labor's (DOL) Employee Benefits Security Administration (EBSA) enforces ERISA. In the United States, an Employee Retirement Income Security Act (ERISA) is a 1974 federal law governing most private pension and benefit plans. Employee Retirement Income Security Act (ERISA) was designed to curb abuses by pension fund managers and sets standards for pension funds, including standards on:- eligibility, performance, investment selection, funding, and vesting. / ОРИЗА (ERISA) домогательство (abuse).

EMPLOYEES = РАБОТНИКИ – Employees are persons, which receive income from their employers.

EMPLOYEE SAVINGS ALLOWANCE = ОТЧИСЛЕНИЕ НА СБЕРЕЖЕНИЯ РАБОТНИКА – Employee Savings Allowance:- in Germany, the formation of wealth by wage and salary earners is supported by an employee savings allowance. It is a state subsidy for cash payments which the employer invests for the employee (wealth formation payment).

EMPLOYEE SHARE OWNERSHIP PLAN = ПЛАН ВЛАДЕНИЯ РАБОТНИКАМИ АКЦИЙ – Employee Share Ownership Plan (ESOP):- designed to encourage employee investment in a company.

EMPLOYERS = РАБОТОДАТЕЛИ – The Employers are self-employed persons with paid employees.

EMPLOYER'S LIABILITY = ОТВЕТСТВЕННОСТЬ РАБОТОДАТЕЛЯ – Employers' Liability:- coverage against common law liability of an employer for accidents to employees, as distinguished from liability imposed by workers compensation law. / перед работниками .

EMPLOYERS' LIABILITY INSURANCE = СТРАХОВАНИЕ ОТВЕТСТВЕННОСТИ РАБОТОДАТЕЛЕЙ – Insurance taken out by employers covering employees against injuries arising out of their employment. Employers' Liability Insurance is an insurance for employers in respect of their liability to employees for injury or disease arising out of and in the course of their employment. With some exemptions this insurance is compulsory in England, Scotland, Wales and Northern Ireland and can only be provided by an authorized insurer.

EMPLOYER'S NON–OWNERSHIP AUTO LIABILITY = ОТВЕТСТВЕННОСТЬ РАБОТОДАТЕЛЯ, НЕ ЯВЛЯЮЩЕГОСЯ ВЛАДЕЛЬЦЕМ АВТОТРАНСПОРТНОГО СРЕДСТВА – (1) Employer's Non-Ownership Auto Liability is a liability arising out of the operation of an automobile not owned by the insured. This frequently results when an employee uses his own personal car in the business activities of the insured.

(2) Employer's Non-Ownership Auto Liability:- insurance coverage for the liability exposure mentioned above.

EMPLOYMENT = ЗАНЯТОСТЬ – Employment:- engagement in an occupation or economic activity, such as a profession, trade, business or job. By extension, number of persons actually employed compared to the total work force, which consists of all persons who are currently working or actively seeking work. In all modern economies, whether developed or underdeveloped, employment and

unemployment levels are of fundamental concern. One of the chief goals of economic policy is to maximize employment, a prerequisite to growth. / Под Занятостью населения понимается степень участия трудоспособного населения в общественном труде.

EMPLOYMENT COST INDEX = ИНДЕКС ПО РАСХОДАМ НА ЗАНЯТОСТЬ – Employment Cost Index is a measure of total employee compensation costs, including wages, salaries and benefits. This is the broadest measure of labor costs.

EMPLOYMENT RATE = УРОВЕНЬ ЗАНЯТОСТИ – Employment Rate is the percentage of the labor force that is employed. The employment rate is one of the economic indicators that economists examine to help understand the state of the economy. See also unemployment rate.

EMPLOYMENT STANDARDS ACT = АКТ О СТАНДАРТАХ ЗАНЯТОСТИ – Employment Standards Act (ESA) or Employment Standards Act of the Province of British Columbia (BC) is the provincial legislation which 'protects' workers from abuse by employers. The high tech industry recently got some amendments to this act in order to accommodate the unorthodox nature of high tech employees who like to work late nights and weekends, for example – without penalizing the employer.

EMPTY–CELL PROCESS PRESSURE–TREATING = СПОСОБ РЮПИНГА ПО ПРОПИТКЕ ПОД ДАВЛЕНИЕМ – Empty-Cell Process Pressure-Treating is the pressure treating process in which back pressure from air drives out part of the injected preservative or chemical to leave the cell walls coated but the cell cavity mostly devoid of chemical. See also Full-Cell Process Pressure-Treating, and Pressure-Treating. / , но полости клеток . Способ ограниченного поглощения применяют в тех случаях, когда необходимо получить более глубокое проникновение антисептика при относительно низком конечном его поглощении. Существуют две основные модификации этого способа:- (i) давление-давление-вакуум (ДДВ), известный как Способ Рюпинга; и (ii) давление-вакуум (ДВ).

EMPTY GLUMES = ПУСТЫЕ КОЛОСКОВЫЕ ЧЕШУЙКИ – Empty Glumes are the sterile rudimentary lemmas at the lowest section of the spikelet.

EMPTY REPO = РИПО ПОРОЖНЯКА – Empty Repo:- contraction for Empty Repositioning. The movement of empty containers.

EMPTY SPIKELET = ПУСТОЙ КОЛОСОК – Empty Spikelet is a spikelet that is not filled at maturity.

EMS = EUROPEAN MONETARY SYSTEM

EMT = ENTITLEMENT MANAGEMENT TOOL

EMTN = EUROPEAN MEDIUM TERM NOTE

EMU = ECONOMIC AND MONETARY UNION

EMULSIBILITY = ЭМУЛЬГИРУЕМОСТЬ – Emulsibility is the ability of a non-water-soluble fluid to form an emulsion with water.

EMULSIFIABLE CONCENTRATE = ЭМУЛЬГИРУЕМЫЙ КОНЦЕНТРАТ – Emulsifiable Concentrates (EC):- where the active ingredient is dissolved in an organic solvent to which an emulsifier has been added to make the solution mix readily with water. Emulsifiable Concentrate (EC) is a concentrated solution and an emulsifying agent in an organic solvent which will form an emulsion when added to water. / Под Концентратом, от новолатинского слова Concentratus, означающее Концентрированный или Сосредоточенный, понимается:- (1) в пищевой промышленности – обезвоженные прессованные пищевые продукты и полуфабрикаты, удобные для хранения и быстрого приготовления пищи. (2) В сельском хозяйстве – корма (концентрированные корма) – жмых, зерновые, комбикорм, отруби, шрот и другие с высоким содержанием питательных веществ. Входят в состав рационов всех видов сельскохозяйственных животных. (3) В горном деле – продукт обогащения полезных ископаемых, в котором содержание ценных минералов выше, чем в исходном сырье.

EMULSIFIER = ЭМУЛЬСОЛ (или ЭМУЛЬГАТОР, или ЭМУЛЬСОР) – Emulsifier is the additive that promotes the formation of a stable mixture, or emulsion, of oil and water. Common emulsifiers are:- metallic soaps, certain animal and vegetable oils, and various polar compounds. Emulsifier is a substance that promotes the suspension of one liquid in another. / Эмульгатор – вещество, способствующее образованию эмульсий (эмульгированию). Под Эмульгатором понимается вещество, облегчающее получение эмульсий. Эмульгаторами служат мыла, белки (казеин, альбумин и другие), желатины, углеводы (декстрин) и многие синтетические поверхностно-активные вещества (ПАВ). Под Эмульсолами понимаются смеси индустриальных масел с водой, поверхностно-активными веществами (ПАВ), противоизносными и защитными присадками, служащие в качестве смазочно-охлаждающих жидкостей. Эмульсолы, многокомпонентные составы на основе минеральных масел и поверхностно-активных веществ. При смешении с водой эмульсолы образуют устойчивые коллоидно-дисперсные системы типа лиофильных эмульсий или мицеллярных растворов, содержащих водонерастворимые компоненты в солюбилизованном состоянии (смотрите Солюбилизация). На 40–80% эмульсолы чаще всего состоят из нефтяных масел, на 10–30% – из мыл или мылоподобных поверхностно-активных веществ (сульфонатов, оксиэтилированных алкилфенолов, алифатических кислот и других), играющих роль эмульгаторов и солюбилизаторов. Кроме того, эмульсолы могут содержать спирты и полиэтиленгликоли, различного рода присадки, бактерициды, воду, иногда высокодисперсные твёрдые тела. Эмульсолы разных марок выпускаются промышленностью в виде концентратов, разбавлением которых водой получают смазочно-охлаждающие жидкости (СОЖ). Эмульгаторы, стабилизаторы эмульсий; вещества, облегчающие эмульгирование и придающие эмульсиям устойчивость. Действие эмульгаторов обусловлено их способностью скапливаться на границе двух жидких фаз, снижая межфазное натяжение, и создавать вокруг капель защитный слой, препятствующий коагуляции и коалесценции. Основные типы эмульгаторов:- мыла и мылоподобные поверхностно-активные вещества, растворимые высокомолекулярные соединения, высокодисперсные твёрдые тела. При выборе различных веществ в качестве эмульгаторов руководствуются общим правилом:- эмульгаторы всегда лучше растворяются в дисперсионной среде, чем в дисперсной фазе, а в случае твёрдых нерастворимых эмульгаторов – лучше смачиваются ею. Поэтому для получения эмульсий типа 'масло в воде' пригодны, например, олеат натрия, поливиниловый спирт, гидрофильные глинистые минералы (например, бентониты, каолин), а для эмульсий типа 'вода в масле' – металлические мыла, асфальто-смолистые вещества, сажа (смотрите Гидрофильность и Гидрофобность). Смеси веществ обычно более эффективны как эмульгаторы, чем индивидуальные вещества, и чаще последних используются в составе эмульсий различного назначения. Под Эмульсором понимается аппарат для приготовления молочных эмульсий. В эмульсоре жидкие, нерастворимые один в другом компоненты подвергаются механическому воздействию, в результате которого происходит раздробление одного из них и распределение в другом. Наиболее распространены центробежно-распылительные эмульсоры, в которых жидкость распыляется через вращающийся в камере диск. Несколько дисков могут быть объединены в блок.

EMULSION = ЭМУЛЬСИЯ – Emulsion is the intimate mixture of oil and water, generally of a milky or cloudy appearance. Emulsions may be of two types:- oil-in water (where water is the continuous phase) and water-in-oil (where water is the discontinuous phase).

Emulsion:- one liquid suspended as minute globules in another liquid, e.g., oil dispersed in water. Emulsion is a suspension of finely divided liquid droplets in a second liquid, i.e. oil in water or vice versa. / Под Эмульсией, от новолатинского слова Emulsio, от Латинского слова Emulgeo, означающее Выдаиваю или Дою, понимается дисперсная система, состоящая из двух не растворяющихся друг в друге жидкостей, одна из которых (дисперсная фаза) распределена в другой (дисперсионной среде). Молоко было одной из первых изученных эмульсий. Эмульсии с водной дисперсионной средой называются Прямыми Эмульсиями, а с водной дисперсной фазой – Обратными Эмульсиями. Примерами могут служить:- (i) Дорожная Эмульсия – смесь битума или дёгтя с водой – применяется для поверхностной обработки щебёночных или гравийных дорожных покрытий. (ii) Фотографическая Эмульсия – традиционное название суспензии светочувствительных монокристаллов галогенидов серебра в коллоидном растворе, главным образом желатины; наносится тонким слоем на подложку – стекло, плёнку или бумагу, образуя после высыхания светочувствительный слой фотоматериала. Под Эмульсией, от Латинского слова Emulsus, означающее Выдоенный, понимаются дисперсные системы, состоящие из мелких капель жидкости (дисперсной фазы), распределённых в другой жидкости (дисперсионной среде). Эмульсии с водной дисперсионной средой называются прямыми (например, водоэмульсионные краски), с водной дисперсной фазой – обратными (нефтяные эмульсии). Эмульсии:- одной из первых изученных эмульсий было молоко, дисперсные системы, состоящие из мелких капель жидкости (дисперсной фазы), распределённых в другой жидкости (дисперсионной среде). Различают эмульсии Прямые, типа ‘масло в воде’, с каплями неполярной жидкости, например, минерального масла, в полярной (обычно водной) среде, и Обратные, типа ‘вода в масле’, с каплями полярной жидкости в неполярной среде. Встречаются также ‘Множественные’ Эмульсии, в которых капли дисперсной фазы являются в то же время и дисперсной средой для более мелких капелек. Кроме того, эмульсии делят на Лиофильные и Лиофобные. Лиофильные Эмульсии, образующиеся самопроизвольно при температурах, близких к критической температуре смешения жидких фаз, термодинамически устойчивые обратимые системы (смотрите Лиофильные и Лиофобные Коллоиды). Лиофобные Эмульсии, возникающие при механическом, акустическом или электрическом диспергировании одной жидкости в другой либо вследствие выделения новой капельножидкой фазы из пересыщенных растворов или расплавов, термодинамически неустойчивы. Они могут длительно существовать только в присутствии эмульгаторов. Лиофильные Эмульсии – высокодисперсные (коллоидные) системы, размер их капель не превышает 10–5 сантиметра (см). Лиофобные Эмульсии – грубодисперсные системы (размер капель обычно лежит в пределах 10–5–10–2 см). При достаточно большой разнице в плотностях дисперсной фазы и дисперсионной среды они седиментационно (кинетически) неустойчивы. Седиментация капель эмульсий, хорошо защищённых от коалесценции, приводит к концентрированию капель и образованию сливок или осадка без расслаивания эмульсии на две сплошные жидкие фазы. Тип и свойства эмульсий зависят от состава и соотношения жидких фаз, количества и химической природы эмульгатора, способа и температуры эмульгирования и других факторов. Изменение состава эмульсии или внешнего воздействия могут вызвать так называемое Обращение Фаз – превращение прямой эмульсии в обратную или, наоборот, обратной в прямую. Низкоконцентрированные эмульсии с каплями, перемещающимися свободно и независимо друг от друга в легкоподвижной среде, – типичные жидкости. При повышении концентрации дисперсной фазы свыше 74% по объёму (для эмульсий с одинаковым размером капель) вязкость системы резко возрастает, эмульсии желатинируются и приобретают свойства геля. При этом капли, имеющие первоначально сферическую форму, сильно деформируются и приобретают конфигурацию, близкую к многограннику. Содержание дисперсной фазы в высококонцентрированных эмульсиях можно довести до 99% по объёму; при этом дисперсионная среда сохранится между каплями лишь в виде тонких прослоек, подобных жидким плёнкам между пузырьками в пенах. Разнообразные по составу и свойствам, эмульсии широко используют в промышленности, сельском хозяйстве, медицине, быту и других областях. Многокомпонентными эмульсиями являются многие пищевые продукты (например, молоко, яичный желток), а кроме того, млечные соки растений, сырая нефть. В виде эмульсий применяют смазочно-охлаждающие жидкости (СОЖ), некоторые пестициды, косметические средства, лекарства, связующие для эмульсионных красок. В строительстве широко применяют битумные эмульсии.

EMULSION POLYMERIZATION = ЭМУЛЬСИОННАЯ ПОЛИМЕРИЗАЦИЯ – Emulsion Polymerization:- a three-phase reaction system consisting of monomer, an aqueous phase containing the initiator, and colloidal particles of polymer. Polymerization takes place in the colloidal phase. The process enables the production of very high molecular weights at increased polymerization rates. Only applicable to addition polymers.

EMULSION SPINNING = ПРЯДЕНИЕ ИЗ ЭМУЛЬСИИ (или ФОРМОВАНИЕ ИЗ ЭМУЛЬСИИ) – Emulsion Spinning is the process of spinning synthetic polymers in dispersion form, then heating to coalesce the dispersed particles. Normally a matrix polymer provides support until coalescence is completed.

ENABLEMENTS = ВОЗМОЖНОСТИ – Enablements control the services that are available on each system. They include system defaults, exchanges, optional services, and screen allocation information. The enablements for each system are determined by the agreements made with marketing representative of vendor. / Контроль возможностей показывает какие услуги доступны по каждой системе. Они включают системные настройки по умолчанию, биржевые и дополнительные возможные настройки и предоставленную на экране информацию. Возможности каждой системы определяются соглашениями с маркетинговыми представителями разработчика.

ENABLING CLAUSE = ОГОВОРКА О ВОЗМОЖНОСТИ – Enabling Clause:- Part I of the General Agreement on Tariffs and Trade (GATT) framework which permits developed country members to give more favorable treatment to developing countries and special treatment to the least developed countries, notwithstanding the most-favored-nation provisions of the GATT. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)).

ENAMEL PAINT = ЭМАЛЕВАЯ КРАСКА – Enamel Paint is a coating product characterized by ability to form a uniform hard film used for flooring and other high wear applications. Enamels may be obtained in a full range of colors and usually in gloss or semi-gloss. / Под Краской понимается однородная суспензия пигментов в плёнкообразующих веществах (связующих). Краски могут содержать наполнители, матирующие вещества, пластификаторы, растворители и другие добавки. В зависимости от основы подразделяется на:- клеевые краски на основе водных растворов некоторых органических полимеров, масляные краски на основе олифы, силикатные краски на основе жидкого стекла, эмалевые краски на основе лаков и эмульсионные краски на основе дисперсий полимеров. Тонкие слои краски образуют при высыхании непрозрачные (укрывистые) прочные покрытия в виде плёнки, защищающие поверхность от воздействия агрессивных агентов и придающие ей красивый внешний вид. Краски широко используются в быту, живописи, народном хозяйстве. Под Эмалевой Краской понимается краска на основе лаков. Она образует твёрдые блестящие покрытия, напоминающие по внешнему виду эмаль. Применяют для окраски автомобилей и многого другого. Под Эмалевыми Красками понимаются суспензии пигментов в лаках. При высыхании образуют твёрдую блестящую плёнку, напоминающую по внешнему виду эмаль. В зависимости от типа плёнкообразующего вещества различают эмалевые краски:- алкидные, масляные, эфироцеллюлозные и тому подобные; по условиям сушки покрытий – горячей и холодной сушки. Эмалевые краски горячей сушки образуют более прочные, твёрдые и атмосферостойкие плёнки.

ENATION = ЭНАЦИЙ (или ВЫРОСТ) – Enation is the tissue malformation or overgrowth induced by certain virus infections. / Под Энациями, от Латинского слова Enatus, означающее Выросший, понимаются выросты на осевом органе некоторых высших растений (папоротников). Листовидные энации на теломах (гладких веточках) примитивных предковых групп наземных растений дали начало микрофиллам.

ENCAPSULATION = ИНКАПСУЛЯЦИЯ (или ГЕРМЕТИЗАЦИЯ, или ЗАКУПОРИВАНИЕ) – Encapsulation is a process in which the fibers of a fabric are coated with a filmy substance to create certain high performance qualities, such as breathability.

ENCRYPTION = ШИФРОВКА – Encryption is the encoding of information in such a fashion that it is enciphered and cannot be read without first being decrypted. The cryptographic transformation of data to produce ciphertext. Also known as Encipherment. See also Cryptography. Encryption is a process whereby the characters which constitute a readable message are encoded using a cipher so as to render that message unintelligible to other parties.

END = КОНЕЦ (или XX) – (1) End is an individual sliver, slubbing, roving, yarn, thread, or cord.

(2) End is a short length or remnant of fabric.

END = ПРОДОЛЬНАЯ НИТЬ – In a weaving, End is a warp yarn or thread that runs lengthwise or vertically in the fabric. Ends interlace at right angles with filling yarn (picks) to make a woven fabric. See also Filling, Pick, Warp, and Weft. End is an individual yarn used in or part of a specific textile assembly such as yarn sheets, warps, yarns on beam. End is an individual warp yarn. A warp is composed of a number of ends. End is a warp yarn. Ends:- the individual yarns which, when taken collectively, make up the warp. Ends are the yarns running in the warp wise direction, or 'warp threads'. / с уточной пряжей (поперечными нитями) . Продольная Нить (End) или Основа (Warp). Основные признаки определения нити основы в ткани:- (i) основа всегда идёт вдоль кромки ткани; (ii) начёсный ворс располагается в направлении основы; (iii) при рассмотрении малоплотной ткани на просвет можно заметить, что основа расположена более равномерно и прямолинейно, чем уток; (iv) в полушерстяных и полульняных тканях основа обычно хлопчатобумажная; (v) в полушёлковых тканях основа шёлковая, направление основы в костюмных тканях совпадает с направлением полос и просновок (нити основы, отличающиеся по толщине или цвету); (vi) в шерстяных и хлопчатобумажных тканях, имеющих одну систему кручёную, а другую – однониточную, основа обычно кручёная; (vii) в шёлковых тканях, выработанных из шёлка-сырца и шёлка-крепа, в основе всегда шёлк-сырец; и (viii) плотность по основе в большинстве тканей большая, чем плотность по утку.

END = ТОРЕЦ (или ТОРЦЕВАЯ СТЕНКА, или КОНЕЦ) – End is a vertical face of the pallet which corresponds to the width. See also Pallet. / Торцевая Стенка (End):- вертикальная поверхность поддона, расположенная по ширине поддона. Смотрите также Поддон (Pallet).

ENDANGERED = ПОДВЕРГШЕЕСЯ ОПАСНОСТИ – The Endangered Species Act of 1973 defines Endangered as any species which is in danger of extinction throughout all or a significant portion of its range. Why do species become endangered? In many cases, declines in populations of plants and animals are caused by more than one event. Habitat degradation and destruction by humans are the most serious threats to wildlife and plants worldwide. Destruction occurs through development activities; environmental pollution; introduction of invasive, nonnative species; overharvesting of wild species; and conversion of habitat to other uses. See also Endangered Species Act.

ENDANGERED AREA = УЯЗВИМЫЙ АРЕАЛ (или АРЕАЛ, ПОДВЕРЖЕННЫЙ ОПАСНОСТИ) – Endangered Area is an area where ecological factors favor the establishment of a pest whose presence in the area will result in economically important loss. / Уязвимым Ареалом или Ареалом, Подверженным Опасности, является ареал (область), в котором экологические факторы благоприятствуют обоснованию (акклиматизации) вредителя, присутствие которого в данном ареале приведёт к существенному экономическому ущербу.

ENDANGERED SPECIES ACT = АКТ ОБ УЯЗВИМЫХ ВИДАХ – The Endangered Species Act (ESA) of 1973 is enabling legislation that provides for the protection of listed species in two categories. These categories, listed in order of their restrictiveness, are as follows:- (i) endangered – any species, subspecies, or variety that is in danger of extinction throughout all or a significant portion of its range; and (ii) threatened – any species, subspecies, or variety that is likely to become endangered within the foreseeable future throughout all or a significant portion of its range.

END CAP = ТОРЦЕВАЯ ПРОБКА (или ТОРЦЕВАЯ ЗАГЛУШКА, или ТОРЦЕВАЯ КРЫШКА) – End Cap is a ported or closed cover for the end of a filter element.

END COUNT = ЧИСЛО ПРОДОЛЬНЫХ НИТЕЙ (или ЧИСЛО НИТЕЙ ПО ОСНОВЕ) – End Count:- an exact number of ends supplied on a ball of roving.

END DISTANCE = РАССТОЯНИЕ ДО ТОРЦА – End Distance is the distance measured parallel to the axis of a piece from the center of a fastening to the square-cut end of the member (if the end of the member is not square-cut, a formula is used to calculate the end distance). / .

ENDEMIC = ЭНДЕМИК (или ЭНДЕМ, или ЭНДЕМИЧЕСКОЕ) – Endemic:- originating from and confined to a specific, usually small, geographic area. Endemic is native to a country, geographical region, or area. / Под Эндемиками, от Греческого слова Éndēmos, означающее Местный, понимаются виды (роды, семейства и так далее) растений и животных, свойственные относительно небольшой территории, например, Европейский Протей обитает в подземных водоёмах Югославии, Русская Выхухоль – только в бассейнах рек Волга и Дон, Микробиота – в хвойных лесах и на гольцах Сихоте-Алиня. Сравните с Космополитом.

ENDFOLD = XX – Endfold (Label):- finishing is ideal for labels which will be sewn on two sides or four sides. This label type secures the cut ends of the label to prevent fray and is highly recommended for exterior applications or uses where the label will be subjected to harsh treatment. Endfold finishing has the added characteristic of adding body to a label and in so doing enhances its general appearance at a nominal extra charge.

END–FOR–END = КОНЕЦ С КОНЦОМ (или ВСТЫК) – End-For-End (maritime term):- reversing the position of an object or line.

ENDING = ОКАНТОВКА (или ОКОНЧАНИЕ, или XX) – Ending:- a difference in color between the bulk and one end of a piece of fabric. Note:- this defect is caused by the premature exhaustion of the dye bath in continuous dyeing. / Неравномерная Окраска (ending):- порок заключительной отделки ткани; различие в цвете между основной частью и одной частью куска полотна. Примечание:- этот порок возникает в результате преждевременного расходования краски в красильной ванне при непрерывном крашении.

ENDING INVENTORY = КОНЕЧНЫЕ МАТЕРИАЛЬНЫЕ ЦЕННОСТИ (или КОНЕЧНЫЕ СКЛАДСКИЕ ЗАПАСЫ, или КОНЕЧНАЯ ИНВЕНТАРИЗАЦИЯ) – Ending Inventory is an inventory levels at the end of a specified period.

ENDING STOCKS = ЗАПАСЫ НА КОНЕЦ СЕЗОНА (или ПЕРЕХОДЯЩИЕ ЗАПАСЫ) – In the Cotton industry, the Ending Stocks of Cotton reflect supply less disappearance, adjusted for any unaccounted Cotton, for the marketing year or crop year ending July 31. See also Beginning Stocks. / В хлопковой отрасли, под термином Запасы На Конец Сезона или Переходящие Запасы понимаются остатки хлопкового волокна текущего сезона на конец этого же сезона, то есть на 31 Июля (даты окончания хлопкового сезона). Они отражают оставшееся предложение за вычетом .

ENDING STOCKS = ПЕРЕХОДЯЩИЕ ЗАПАСЫ – Ending Stocks are primary stocks of crude oil and petroleum products held in storage as of 12 midnight on the last day of the month. Primary stocks include crude oil or petroleum products held in storage at (or in) leases, refineries, natural gas processing plants, pipelines, tank farms, and bulk terminals that can store at least 50 000 barrels of petroleum products or that can receive petroleum products by tanker, barge, or pipeline. Crude oil that is in-transit by water from Alaska or that is stored on Federal leases or in the Strategic Petroleum Reserve is included. Primary Stocks exclude stocks of foreign origin that are held in bonded warehouse storage.

END JOINT = ТОРЦЕВОЕ СОЕДИНЕНИЕ – End Joint is a joint made by bonding two pieces of wood together end to end, usually by finger or scarf joint. / Соединение, формируемое сцеплением двух изделий из древесины вместе концом к концу, обычно с помощью штифта или соединением внапуск.

END MARKS = КОНЦЕВЫЕ ОТМЕТИНЫ – (1) End Marks:- the change in the shade on the end of the full length is called End Mark. Dyeing defect. (2) End Marks:- mark of fabric joint. Finishing defect. / Порок или дефект крашения и заключительной отделки.

END MIDDLE BLOCK = ТОРЦЕВАЯ СРЕДИННАЯ ШАШКА (или БОКОВАЯ СРЕДНЯЯ ШАШКА) – End Middle Block is a middle block on the end of the pallet. See also Pallet. / Боковая Средняя Шашка (End Middle Block):- средняя крайняя шашка, расположенная на боковой стороне поддона. Смотрите также Поддон (Pallet).

END OF DAY TRADING = ТОРГОВЛЯ В КОНЦЕ ДНЯ – End Of Day Trading:- usually involves the use of daily and/or weekly price data and charts to analyze for potential trades.

END OF PERIOD CLOSING = ЗАКРЫТИЕ В КОНЦЕ ПЕРИОДА – (1) End Of Period Closing:- generally end of the month (last business day of the month). In this case, more usually known as Month-End Closing.

(2) Time when forward transactions are closed (liquidated, squared).

ENDOPARASITE = ЭНДОПАРАЗИТ – Endoparasite is a parasite that enters the host and feeds from within. / Под Эндопаразитами, от Греческих слов Éndon, означающее Внутри, и Parásitos, означающее Нахлебник или Тунеядец, понимаются вирусы, бактерии, многие грибы, простейшие и гельминты, паразитирующие в различных органах и тканях растений и животных. Некоторые эндопаразиты проходят отдельные стадии развития вне организма хозяина.

ENDOPHYTE = ЭНДОФИТ – Endophyte is a plant growing within a plant. The association may be symbiotic or parasitic. / Под Эндофитом, от Греческих слов Éndon, означающее Внутри, и Phytón, означающее Растение, понимается .

ENDORSEE = ИНДОССАТ – Endorsee is a person or entity to whom the title to and rights of a negotiable instrument, e.g., a check, are transferred by the endorser by means of the latter's signature.

ENDORSEMENT = ИНДОССАМЕНТ – (1) An Endorsement transfers property rights of a negotiable instrument made payable to order (such as a cheque or bill of exchange), including all ensuing claims. An endorsement is written on the instrument itself. With his endorsement the beneficiary declares that the debitor has to pay to a new creditor (endorsee) on maturity. A legal signature usually placed on the reverse of a draft; signifies transfer of rights from the holder to another party. The transfer of the right to obtain delivery of the goods from the carrier by means of the consignee's signature on the reverse side of a bill of lading. The transfer of title or rights to a negotiable instrument by writing one's name on the back of said instrument. See also Assignment. Endorsement:- signature of the payee on the back of a negotiable instrument, which transfers the instrument to a party other than the payee. Registered securities (unlike bearer bonds, which can be cashed by anyone), and checks written to an individual or entity must be endorsed before they can be transferred to a third party or cashed. / передаточная надпись , индоссировавшие ценную бумагу . Смотрите также Уступка Требования (Assignment). Термин Индоссамент, от Немецкого слова Indossament, относится к передаточной надписи на векселях, коносаментах, чеках и некоторых других ценных бумагах, посредством которой оформляется передача прав по этим документам от одного лица (индоссанта) другому (индоссату). Индоссамент:- вексельный или чековый; именной или бланковый; инкассовый или залоговый. Индоссамент – передаточная надпись на документе (векселе, чеке или другом), которой оформляется передача прав по нему от одного лица (индоссанта) в пользу другого лица (индоссата), с обязательной подписью индоссанта. Индоссамент – передаточная надпись на векселях, чеках, коносаментах, страховых полисах и прочих оборотных документах. Инструмент переуступки права требования, удостоверяет передачу прав по индоссируемому документу другому лицу. Индоссамент – передаточная надпись на страховом полисе, коносаменте и других товарораспорядительных и денежных документах.

(2) Endorsement is a document that is attached to a slip, cover note or policy which evidences one or more changes in the terms of the insurance or reinsurance contract to which it refers. A form attached to the policy bearing the language necessary to change the terms of the policy to fit special circumstances. Endorsement is an amendment or alteration to a policy, which becomes an integral part of that policy.

ENDORSEMENT IN BLANK = ИНДОССАМЕНТ НА БЛАНКЕ – Endorsement In Blank:- although consisting simply of the endorser's signature, it fulfils all the functions of an endorsement. Besides the endorsement in blank, there is also the endorsement in full, which includes, besides the endorser's signature, the name of the endorsee (the new entitled party).

ENDORSEMENT MECHANISM = МЕХАНИЗМ ИНДОССАМЕНТА – Endorsement Mechanism is a mechanism through which the EU will judge the suitability of the International Accounting Standards (IAS) for adoption in Europe and whether an amendment to the EU Accounting Directives is recommended in the light of international accounting developments. See also Accounting Regulatory Committee (ARC), The European Financial Reporting Advisory Group (EFRAG), and Technical Expert Group (TEG).

ENDORSER = ИНДОССАНТ – Endorser is a person or entity who has title to a negotiable instrument and writes his name on it in order to transfer said title or rights to another person or persons. / Индоссант – лицо, учиняющее передаточную надпись (индоссамент) на документе, право требования по которому подлежит передаче.

ENDOSPERM = ЭНДОСПЕРМ – The Endosperm is the germ's food supply, which provides essential energy to the young plant so it can send roots down for water and nutrients, and send sprouts up for sunlight's photosynthesizing power. The endosperm is by far the largest portion of the kernel. It contains starchy carbohydrates, proteins and small amounts of vitamins and minerals. Endosperm is a mass of nutrient tissue formed within the embryo sac. Endosperm:- nutritive tissues of the ripened ovary, consisting of the aleurone layer and the starchy endosperm. The endosperm is triploid, derived from the fertilization of two polar nuclei in the embryo sac by one sperm nucleus from the pollen tube. Endosperm is the nutritive tissues of the ripened ovary, consisting of the aleurone layer and the starchy endosperm. It serves as food for the germinating embryo; triploid in chromosome number. / Под Эндоспермом, от Греческих слов Éndon, означающее Внутри, и Spérma, означающее Семя, понимается запасающая ткань семени растений, в которой откладываются питательные вещества, необходимые для развития зародыша. Эндосперм хорошо развит у Злаков, Зонтичных, Паслёновых и некоторых других растений.

ENDOTROPHIC = ЭНДОТРОФИЧЕСКОЕ (или ЭНДОТРОФНОЕ) – Endotrophic:- nourished or receiving nourishment from within, e.g., Fungi or their hyphae receiving nourishment from plant roots in a mycorrhizal association. / корни растения в . , от Греческих слов Éndon, означающее Внутри, и Trophē, означающее Питание, понимается .

END OUT = ЗАКОНЧИЛАСЬ ПРОДОЛЬНАЯ НИТЬ (или ОТСУТСТВИЕ ПРОДОЛЬНОЙ НИТИ) – (1) Defect Name:- End Out. Defect Type:- warp lines, vertical lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- End Out:- The end out leaves a thin dark line on the face of the fabric with short filling floats on the back. The ladder-like effect of the filling floats is a quick and easy way to identify this defect. Severity:- Major. (2) Defect Name:- End Out. Defect Type:- warp lines, vertical lines. Fabric Type:- Bottomweights – Twill Derivatives. Description:- End Out:- This end out also takes place in the plain weave area of the fabric and appears as a thin place and a double end. When one end in a plain wave is missing, the adjacent ends fall together and weave as one. Severity:- Major. (3) Defect Name:- End Out. Defect Type:- warp lines, vertical lines. Fabric Type:- Bottomweights – Plain Weave Derivatives. Description:- End Out:- The cord effect of this fabric is attained by two red ends weaving plain between each end of 2/ply white. The 2/ply white end also weaves plain with adjoining red ends. The defect is the result of one red end missing. Severity:- Major. (4) Defect Name:- End Out. Defect Type:- warp lines, vertical lines. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- End Out:- The end out appearance results with two ends on either side coming together and weaving as one giving the appearance of an end out. Severity:- Major. (5) Defect Name:- End Out. Defect Type:- warp lines, vertical lines. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- End Out:- This defect is the result of a loom continuing to run after an end is broken. Severity:- Major. (6) Defect Name:- End Out. Defect Type:- warp lines, vertical lines. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- End Out:- The end out appearance results with two ends on either side coming together and weaving as one giving the appearance of an end out. Severity:- Major. (7) Defect Name:- End Out. Defect Type:- warp lines, vertical lines. Fabric Type:- Warp Knit Fabrics. Description:- End Out:- This defect is the result of the knitting machine continuing to run with an end missing. The back of the fabric is shown, since the defect is clearly seen on the back and not the face. Severity:- Major. End Out is a void caused by a missing warp yarn. (1) End Out:- caused by yarn breaking and loom continuing to run. The defect will appear as a thin line. Woven fabric defect. (2) End Out occurs in warp knit. Results from knitting machine continuing to run with missing end. Knitted fabric defect. End Out:- a warpways steak in a warp-knitted fabric in which some of the laps are missing. Note:- this defect is caused by a warp yarn breaking or running out. End Out is a void caused by a missing warp yarn. Synonym:- Missing End. End Out:- a warp yarn that was broken or missing during weaving. / Порок или дефект ткачества.

END OUT and STRAYING END = XX ПРОДОЛЬНАЯ НИТЬ и XX ПРОДОЛЬНАЯ НИТЬ – Defect Name:- End Out and Straying End. Defect Type:- warp lines, vertical lines. Fabric Type:- Warp Knit Fabrics. Description:- End Out and Straying End:- This is the result of a broken end straying over and being knit irregularly into another area of the fabric. Severity:- Major.

ENDOWMENT CAPITAL = ДАРСТВЕННЫЙ (или БЕЗВОЗМЕЗДНЫЙ, или ПОЖЕРТВОВАННЫЙ) КАПИТАЛ (или НА БЛАГОТВОРИТЕЛЬНОСТЬ) – (1) Endowment Capital is a capital stock placed at the disposal of a public sector company (e.g., a cantonal bank) by a country or state or municipality. / , например, .

(2) Capital stock made available by a company to its dependent branch or branches.

ENDOWMENT EFFECT = ЭФФЕКТ НАКОПЛЕНИЯ (или ЭФФЕКТ НАКАПЛИВАНИЯ) – The Endowment Effect refers to a change in interest margin which occurs when market interest rates change and the assets and liabilities reprice in different ways. In both the up and down interest rate cycles, assets re-price more than liabilities, therefore margins compress in a downward cycle and opens in an upward cycle.

ENDOWMENT WARRANT = ВАРРАНТ НА ДАРЕНИЕ – Endowment Warrants are long term warrants typically with a 10 year life. They are generally over an Autralian Securities Exchange (ASX) listed security or basket of securities and have either a European or an American exercise style. The structure of an endowment warrant provides for the investor to pay between 30–65 percent of the market value of the underlying security at the time of issue. The exercise price (called the Outstanding Amount) is initially the remaining sum plus other costs and is specified when the warrant is issued. The outstanding amount varies over the life of the warrant. The outstanding amount is reduced by any dividends that are paid in relation to the underlying security. However, an interest amount is also applied and the outstanding amount is increased by these interest amounts. An investor in endowment warrants is taking a long term view on the underlying company's dividend policy versus interest rates with the hope that the dividends will outweigh the interest payments and the outstanding amount will reduce over time.

END POINT ROYALTY = XX – End Point Royalty (EPR):- the Cotton Choices™ program includes Cotton Choices™ 3:- End Point Royalty (EPR). You are able to make the choice to pay your Cotton technology fees as your Cotton is ginned, via a set EPR per bale. Visit the website for full terms and conditions.

ENDS = КОНЦЫ (или ЭНДЗ, или ДИЛЕНЫ, или КОРОТКОМЕРНЫЕ ПИЛОПРОДУКТЫ, или ОБРЕЗКИ, или ХВОСТЫ) – Ends are pieces of battens, deals and planks under 8 feet (243.84 centimeters) long are called Ends. / Изделия или куски реек, лаг/дильсов и половых/обшивных досок длиной до 243.84 сантиметров (8 футов) называются остатками/эндсами. Под Диленами (Дилены) или Эндсами (Эндз), от Английских слов Deal-Ends, понимаются короткие доски, так называемые Концы, длиной меньше 2.7 метра (м), предназначенные на вывоз (или экспорт). Деловые Концы.

END SEIZING = КОНЦЕВОЙ БЕНЗЕЛЬ – End Seizing (maritime term):- a round seizing at the end of a rope. / круглый (прямой) бензель на конце троса.

END–TO–END ENCRYPTION = ШИФРОВКА НА ВСЕОБЪЕМЛЕМОЙ ОСНОВЕ (или ШИФРОВКА НА УРОВНЕ ПОЛЬЗОВАТЕЛЯ, или ШИФРОВКА НА КОНЕЧНОМ УРОВНЕ) – End-To-End Encryption is a method used to ensure the confidentiality of data at the application level; the encryption algorithms are implemented together with the application.

END USE = КОНЕЧНОЕ ПОТРЕБЛЕНИЕ – End Use:- in the textile industry, the final product form in which fibers are consumed, including apparel, household products, and industrial items.

END–USE CERTIFICATE = СЕРТИФИКАТ О КОНЕЧНОМ ИСПОЛЬЗОВАНИИ (или СВИДЕТЕЛЬСТВО О КОНЕЧНОМ ИСПОЛЬЗОВАНИИ) – End-Use Certificates are issued upon request for grain imported into Canada as prescribed under the Canada Grain Act.

END–USE CUTOMER = ПОТРЕБИТЕЛЬ КОНЕЧНОГО ИСПОЛЬЗОВАНИЯ – End-Use Customer is any customer purchasing electricity at retail in the United States.

END USER = КОНЕЧНЫЙ ПОТРЕБИТЕЛЬ – (1) End User is the final buyer of the product who purchases the product for immediate use. / Конечный покупатель продукта, который приобретает этот продукт для непосредственного использования.

(2) End User is the ultimate consumer of petroleum products or natural gas; most commonly refers to large commercial, industrial, or utility consumer. / Конечный Потребитель нефтепродуктов или природного газа. Обычно ими являются крупные коммерческие, промышленные потребители или электростанции.

(3) In reference to electricity in wholesale markets, the End Users are the industrial sector which is comprised of agriculture, construction, fisheries, forestry, manufacturing, and mining. / По отношению к электричеству, на оптовых рынках конечными потребителями являются промышленный сектор, состоящий из предприятий сельского хозяйства, строительства, рыболовства, лесоводства, производства и добычи природных ископаемых.

(4) End User is an individual or organization that accesses digital information for their own use. / Лицо или организация, имеющая доступ к цифровой информации для личного использования.

(5) End-User is an entity that takes derivatives positions for investment or hedging purposes. An end-user often deals only on one side of the market. End-users include banks, insurance companies, pension funds, other financial institutions, non-financial corporations, governments, supranational entities (for example, the World Bank) and high net worth individuals. See also Dealer.

END USER LICENSE AGREEMENT = ЛИЦЕНЗИОННОЕ СОГЛАШЕНИЕ ДЛЯ КОНЕЧНОГО ПОЛЬЗОВАТЕЛЯ – End User License Agreement (EULA) is an agreement between a producer and a user of computer software that specifies the terms of use putatively agreed to by the user. The software producer specifies the parameters and limitations on use, which comprise a legally binding contract. Some companies use the EULA as the sole means of disclosure of a program's behavior, including Bundling, use of the user's data, etc.

END USER PRICES = ЦЕНЫ ДЛЯ КОНЕЧНЫХ ПОТРЕБИТЕЛЕЙ – End User Prices:- the price net of any rebates paid for an oil product by the consumer including taxes which have to be paid by the consumer as part of the transaction and which are not refundable.

END–USE SECTORS = СЕКТОРЫ КОНЕЧНОГО ПОТРЕБЛЕНИЯ – End-Use Sectors:- in some US energy reports, the commercial, industrial, residential, and transportation sectors of the economy.

ENERGY = ЭНЕРГИЯ – Energy:- the capacity for doing work as measured by the capability of doing work (potential energy) or the conversion of this capability to motion (kinetic energy). Energy has several forms, some of which are easily convertible and can be changed to another form useful for work. Most of the world's convertible energy comes from fossil fuels that are burned to produce heat that is then used as a transfer medium to mechanical or other means in order to accomplish tasks. Electrical energy is usually measured in kiloWatt-hours, while heat energy is usually measured in British thermal units. Energy is the capacity for, or the ability to do, mechanical work. Electrical energy is measured in kiloWatt-hours for billing purposes. / Под Энергией, от Греческого слова Enérgeia, означающее Действие или Деятельность, понимается общая количественная мера различных форм движения материи. Термин Энергия был введён Английским учёным Томэсом Яном (или Юнгом; Thomas Young, 1773–1829) в 1807 и понимался им как произведение массы движущегося тела на квадрат его скорости. Качественно различные физические формы движения материи способны превращаться друг в друга, и этот процесс превращения контролируется строго определёнными количественными эквивалентами, что позволяет выделить общую меру движения – энергию как таковую. В физике для количественной характеристики качественно различных форм движения и соответствующих им взаимодействий вводят различные виды энергии:- внутреннюю, гравитационную, механическую, тепловую, электромагнитную, ядерную и так далее. В свою очередь, в механике энергия подразделяется на потенциальную и кинетическую, в термодинамике – на связанную и свободную, в определённых задачах осуществляется подразделение на внешнюю и внутреннюю энергию системы. Каждый из видов энергии существенно характеризует соответствующую физическую форму движения со стороны возможности её превращения в любую другую форму движения при количественном сохранении самого движения. В замкнутой системе выполняется закон сохранения энергии. Вследствие существования закона сохранения энергии понятие энергия связывает воедино все явления природы. В теории относительности установлена следующая универсальная связь между полной энергией E тела и его массой m:- $E = mc^2$, где c – скорость света в вакууме. Единица энергии (в СИ) – Джоуль (Дж).

ENERGY ABSORPTION = АБСОРБЦИЯ ЭНЕРГИИ (или ПОГЛОЩЕНИЕ ЭНЕРГИИ) – Energy Absorption is the energy required to break or elongate a fiber to a certain point.

ENERGY CHARGE = СБОР ЗА ЭНЕРГИЮ – Energy Charge is that portion of the charge for electric service based upon the electric energy (kWh) consumed or billed.

ENERGY COMMODITIES = ЭНЕРГОНОСИТЕЛИ – Energy Commodities are energy-generating products. Those include electricity, crude oil, ethanol, natural gas, crude oil distillates (gasoline, gasoil, kerosene, diesel, heating oil) and coal.

ENERGY COMMODITIES INDEX = ИНДЕКС ПО ЭНЕРГОНОСИТЕЛЯМ (или СЫРЬЕВОЙ ИНДЕКС ПО ЭНЕРГОНОСИТЕЛЯМ) – The Energy Commodities Index charted by StockCharts.com is published by Goldman Sachs. The energy products listed include crude oil, heating oil, and natural gas. / Сырьевой Индекс По Энергоносителям, графики которого предлагаются компанией СтакЧартсДат.Кам (StockCharts.com) на их одноимённом сайте StockCharts.com, публикуется компанией Голдмэн Сэкс (Goldman Sachs). К числу учитываемых в расчёте индекса энергоносителей относятся нефть, печное бытовое топливо (heating oil) и природный газ.

ENERGY DELIVERIES = ПОСТАВКИ ЭНЕРГИИ – Energy Deliveries:- energy generated by one electric utility system and delivered to another system through one or more transmission lines.

ENERGY DENSITY = ЭНЕРГЕТИЧЕСКАЯ ПЛОТНОСТЬ (или ПЛОТНОСТЬ ЭНЕРГИИ) – Energy Density is the amount of energy stored per unit volume (volume energy density) or mass (mass energy density) of a fuel. A high energy density generally make storage and transport of a fuel more convenient. Fossil fuels typically have higher energy density than solid or wet biomass fuels, though converted liquid biofuels and biogas are similar to those of their fossil counterparts.

ENERGY EFFECTS = ЭНЕРГЕТИЧЕСКИЕ ЭФФЕКТЫ – Energy Effects are the changes in aggregate electricity use (measured in MegaWatthours) for customers that participate in a utility Demand-Side Management (DSM) program. Energy Effects should represent changes at the consumer meter (i.e. exclude transmission and distribution effects) and reflect only activities that are undertaken specifically in response to utility-administered programs, including those activities implemented by third parties under contract to the utility. To the extent possible, Energy Effects should exclude non-program related effects such as changes in energy usage attributable to nonparticipants, government-mandated energy efficiency standards that legislate improvements in building and appliance energy usage, changes in consumer behavior that result in greater energy use after initiation in a DSM program, the natural operations of the marketplace, and weather and business cycle adjustments.

ENERGY EFFICIENCY = ЭНЕРГЕТИЧЕСКАЯ ОТДАЧА (или ЭНЕРГЕТИЧЕСКАЯ ЭФФЕКТИВНОСТЬ, или ЭФФЕКТИВНОСТЬ ЭНЕРГИИ) – Energy Efficiency:- refers to programs that are aimed at reducing the energy used by specific end-use devices and systems, typically without affecting the services provided. These programs reduce overall electricity consumption (reported in MegaWatthours), often without explicit consideration for the timing of program-induced savings. Such savings are generally achieved by substituting technically more advanced equipment to produce the same level of end-use services (e.g., lighting, heating, motor drive) with less electricity. Examples include high-efficiency appliances, efficient lighting programs, high-efficiency heating, ventilating and air conditioning (HVAC) systems or control modifications, efficient building design, advanced electric motor drives, and heat recovery systems.

ENERGY INDEPENDENCE AND SECURITY ACT = АКТ ОБ ЭНЕРГЕТИЧЕСКОЙ НЕЗАВИСИМОСТИ И БЕЗОПАСНОСТИ – Energy Independence and Security Act (EISA) of 2007 is the US legislation passed in December 2007 that is designed to increase US energy security by lessening dependence on imported oil, to improve energy conservation and efficiency, expand the production of renewable fuels, and to make America's air cleaner for future generations.

ENERGY INFORMATION ADMINISTRATION = АДМИНИСТРАЦИЯ ПО ИНФОРМАЦИИ В СФЕРЕ ЭНЕРГЕТИКИ – The Energy Information Administration (EIA) is the statistical agency of the Department of Energy. It provides policy-independent data, forecasts, and analyses to promote sound policy making, efficient markets, and public understanding regarding energy, and its interaction with the economy and the environment. Featured Publications & Reports:- (i) This Week in Petroleum:- a weekly report which provides data and analysis of the latest weekly US petroleum supply and price. Other fuels of interest to the consumer are also noted, especially natural gas and propane. (ii) Gasoline and Diesel Prices:- weekly price data by US regions of regular gasoline and on-highway diesel fuel, with week ago and year ago comparisons. (iii) Short-Term Energy Outlook:- this 18-month forecast includes information on oil and gasoline prices and supply. (iv) Historical Energy Data:- the US energy history from 1949–2004 recorded in data tables and figures. All major forms of energy (fossil fuels, nuclear, electricity, and renewable energy) and total energy by key activity (e.g., production, consumption, trade, stocks, and prices) are covered. Key long-term trends are summarized in 'Energy Perspectives'. (v) Primer on Gasoline Prices:- this brochure uses laymen terms to discuss how gasoline prices are established, why they fluctuate, and why they differ according to region. And other publications. The Energy Information Administration (EIA) created by the US Congress in 1977, is a statistical agency of the US Department of Energy (DOE). The EIA provides policy-independent data, forecasts and analyses to promote sound policy making, efficient markets and public understanding regarding energy and its interaction with the economy and the environment. Headquartered in Washington, DC, the United States. The US Energy Information Administration (EIA) is the statistical and analytical agency within the US Department of Energy. EIA collects, analyzes, and disseminates independent and impartial energy information to promote sound policymaking, efficient markets, and public understanding of energy and its interaction with the economy and the environment. EIA is the Nation's premier source of energy information and, by law, its data, analyses, and forecasts are independent of approval by any other officer or employee of the US Government. EIA conducts a comprehensive data collection program that covers the full spectrum of energy sources, end uses, and energy flows. EIA also prepares informative energy analyses, monthly short-term forecasts of energy market trends, and long-term US and international energy outlooks. EIA disseminates its data, analyses, and other products primarily through its website and customer contact center. The Department of Energy Organization Act of 1977 established EIA as the primary Federal Government authority on energy statistics and analysis, building upon systems and organizations first established in 1974 following the oil market disruption of 1973. Located in Washington, DC, EIA is an organization of about 370 Federal employees, with an annual budget in Fiscal Year 2010 of USD111 million. EIA has lots of energy information, just as our name says. The information is disseminated in different ways, including reports, web products, press releases, databases, and maps. Our information is issued weekly, monthly, annually, and periodically as needed or requested. Some of our products deal with specific energy industries or fuels. Some products contain mostly data; some also have analysis and forecasts. Other products present an integrated view over different fuels or energy uses. EIA's data and analyses are widely used by Federal and state agencies, industry, media, researchers, consumers, and educators. All of EIA's products can be accessed through its Web site, http://www.eia.gov, which averages approximately 2.1 million visits per month. EIA also distributes information and data on specific topics through 40 email subscription lists and 10 RSS feeds. RSS (short for the Really Simple Syndication) is a technology used to distribute a website's content to users in real time, similar to using a 'bookmark' in your web browser. The Nation's leaders rely on EIA for timely and comprehensive information to formulate energy policy and programs. Industry looks to EIA for official estimates on energy demand, supply, prices, markets and financial indicators. Media and the general public rely on EIA for the most comprehensive source of current and historical data and information on all aspects of US energy. The international community relies on EIA's products for timely information on world energy supply and demand. Primary and secondary school educators and students turn to the EIA Kid's Page (http://www.eia.gov/kids/) for a wealth of energy-related information and activities. The US Energy Information Administration (EIA) was created in response to the need for additional Federal initiatives to collect and disseminate energy-related information, and to evaluate and analyze this information. These needs were revealed as the United States sought to respond to the energy crises of the 1970s. The first law to address these needs was the Federal Energy Administration Act of 1974 and, over the years, many subsequent laws have contributed to EIA's evolution and growth. 1974:- Federal Energy Administration (FEA) Act created the FEA and mandated it to collect, assemble, evaluate, and analyze energy information; provide energy information and projections to the Federal Government, State Governments, and the public; and provide Congress with an annual report summarizing these activities. It also provided FEA with data collection enforcement authority for gathering data from energy producing and consuming firms. 1976:- Energy Conservation and Production Act established within the FEA, the Office of Energy Information and Analysis (which later became the Energy Information Administration (EIA)). This office was to (i) operate a comprehensive National Energy Information System, (ii) possess expertise in energy analysis and forecasting, (iii) be subject to performance audits by a Professional Audit Review Team, (iv) coordinate energy information activities with Federal agencies, (v) promptly provide upon request any energy information to any duly established

committee of Congress, and (vi) make periodic reports on the energy situation and trends to the Congress and the public. 1977:- Department of Energy (DOE) Organization Act established EIA as the single Federal Government authority for energy information. Gave EIA independence from the rest of DOE with respect to data collection, and from the whole Government with respect to the content of EIA reports. Incorporated all the provisions of the Office of Energy Information and Analysis. Established an annual survey to gather and report detailed energy industry financial data. 1992:- Energy Policy Act of 1992 required EIA to expand its data gathering and analysis in several areas, including energy consumption, alternative fuels and alternatively-fueled vehicles, greenhouse gas emissions, fossil fuel transportation rates and distribution patterns, electricity production from renewable energy sources, and foreign purchases and imports of uranium. 2005:- Energy Policy Act of 2005 required EIA to undertake several new activities in the renewable fuels area, including:- an inventory of renewable fuels available for consumers and a projection of future inventories; a study of renewable fuel blending; and a monthly survey on renewable fuels production, blending, importation, demand, and prices. 2007:- Energy Independence and Security Act required EIA to prepare a 5-year plan to enhance the quality and scope of its data collection program, and also to prepare an assessment of State-level data needs and a plan to address those needs. Authorized funds to carry out both plans. Required EIA to prepare a semi-annual analysis of planned refinery outages and their impact on petroleum product supply and price. The US Energy Information Administration (EIA) collects, analyzes, and disseminates independent and impartial energy information to promote sound policymaking, efficient markets, and public understanding of energy and its interaction with the economy and the environment. EIA provides a wide range of information and data products covering energy production, stocks, demand, imports, exports, and prices; and prepares analyses and special reports on topics of current interest. EIA has four Assistant Administrators directing program functions for energy statistics, energy analysis, communications, and resource and technology management. EIA receives funding for its activities with an annual appropriation from the Congress. Find out about our current and requested budgets, how we measure performance, how to do business with us, and the changes we are planning for the next five years. / привоз (importation). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). сохранение (conservation).

ENERGY RECEIPTS = ПРИХОДЫ (или ПОЛУЧЕНИЯ) ЭНЕРГИИ – Energy Receipts:- energy generated by one electric utility system and received by another system through one or more transmission lines.

ENERGY SOURCE = ИСТОЧНИК ЭНЕРГИИ – Energy Source is the primary source that provides the power that is converted to electricity through chemical, mechanical, or other means. Energy sources include coal, petroleum and petroleum products, gas, water, uranium, wind, sunlight, geothermal, and other sources.

ENERGY SUPPLY COMPANY = КОМПАНИЯ ПО ЭНЕРГОСНАБЖЕНИЮ – Energy Supply Company (ESCO) sells heat to the customer instead of a boiler and/or fuel. May install, own and maintain the boiler, or may sub-contract some or all of that. Heat used by the customer is metered, usually as hot water flow rate and temperature difference between outflow and return. Fully responsible for ensuring continuous operation and suitable quality fuel supply. Particularly well suited to district, site or large or multiple building heating systems.

ENERGY–TO–BREAK = ЭНЕРГИЯ НА РАЗРЫВ – Energy-To-Break is the total energy required to rupture a yarn or cord.

ENERGY–USE SECTORS = СЕКТОРЫ ЭНЕРГОПОТРЕБЛЕНИЯ – Energy-Use Sectors:- a group of major energy-consuming components of US society developed to measure and analyze energy use. The sectors most commonly referred to in US Energy Information Administration are:- commercial, electric power, industrial, residential, and transportation.

ENFORCEABILITY OF PATENT = ВОЗМОЖНОСТЬ ПРАВОВОЙ ОХРАНЫ ПАТЕНТА (или ПРИНУЖДАЕМОСТЬ ПАТЕНТА, или ИСКОВАЯ СИЛА ПАТЕНТА, или ПРАВОВАЯ ОБЕСПЕЧИВАЕМОСТЬ ПАТЕНТА) – Enforceability Of Patent is the right of the patent owner to bring an infringement suit against a party who, without permission, makes, uses or sells the claimed invention. The period of enforceability of a patent is the length of the term of the patent plus the six years under the statute of limitations for bringing an infringement action.

ENGINE DEPOSITS = ОТЛОЖЕНИЯ В ДВИГАТЕЛЕ – Engine Deposits:- hard or persistent accumulation of sludge, varnish and carbonaceous residues due to blow-by of unburned and partially burned fuel, or the partial breakdown of the crankcase lubricant. Water from the condensation of combustion products, carbon, residues from fuel or lubricating oil additives, dust and metal particles also contribute.

ENGINEERING ECONOMICS = ИНЖЕНЕРНАЯ ЭКОНОМИКА – Engineering Economics:- the analysis of various financial alternatives, usually based on time-value-of-money concepts and formulas, to determine the most effective solution from an economical, i.e. lowest cost, perspective. Many larger-scale engineering projects, e.g., power generation, that require large investments in equipment and other assets require this type of analysis in order to ultimately determine how cost-effective they are.

ENGINEERING INSURANCE = СТРАХОВАНИЕ ТЕХНИЧЕСКИХ РИСКОВ (или ИНЖЕНЕРНОЕ СТРАХОВАНИЕ, или СТРАХОВАНИЕ ИНЖЕНЕРИИ) – Engineering Insurance:- in the United Kingdom, a policy that provides boiler and machinery (BM) inspection services as well as coverage for the pressure vessel and any internal accidents. Outside the United States, particularly in the United Kingdom, a property policy provides coverage for property damage (PD) resulting from a boiler explosion but not for damage to the object itself. Coverage for the boiler and inspection services must be separately arranged under an engineering insurance policy. Engineering Insurance is an insurance covering the construction and erection of objects, and the insurance of machinery in operating plants. / Страхование, покрывающее строительство и возведение объектов, а также страхование машинного (станочного) парка на действующих заводах.

ENGLISH COMBS = АНГЛИЙСКИЕ ГРЕБНИ – English Combs are the multi-pitch (commonly 4-pitch) hand combs used in preparing top.

ENGLISH COTTON COUNT = АНГЛИЙСКАЯ НУМЕРАЦИЯ ХЛОПКА – English Cotton Count is an indirect system measuring length per unit of mass, i.e. the number of hanks (840 yards) per pound weight. / Английская Нумерация Хлопка – вторичная (или косвенная) система, измеряющая длину на единицу массы, то есть число мотков (длиной 840 ярдов) на фунт веса.

ENGLISH JURISDICTION CLAUSE = ОГОВОРКА ОБ АНГЛИЙСКОЙ ЮРИСДИКЦИИ – English Jurisdiction Clause:- this clause appears in the London market MAR policy form, and applies to all claims except where a foreign jurisdiction clause is attached, by agreement with the underwriters, to the policy. The clause provides that claims under the policy are subject to English jurisdiction in the event that action is taken in a court of law against the underwriters. A condition, printed in the MAR form of policy, whereby Underwriters agree to recognize judgments only from courts convened within English jurisdiction. Subscribing Underwriters may agree to replace this clause with a foreign jurisdiction clause. Please note this is not applicable to business emanating from the United States of America which is subject to the Service of Suit Clause (USA) appearing in the Standard Conditions.

ENGLISH LAW AND PRACTICE CLAUSE = ОГОВОРКА ОБ АНГЛИЙСКОМ ЗАКОНЕ И ПРАКТИКЕ (или ОГОВОРКА ОБ АНГЛИЙСКОМ ПРАВЕ И ПРАКТИКЕ) – English Law And Practice Clause:- this clause appears in all Institute clauses published for attachment to the MAR form of policy (the MAR Form is simply a general statement of insurance). It provides that when one applies law and practice to the interpretation of the policy conditions decisions must be based on English law and practice, and applies irrespective of the country of jurisdiction. This clause appears in Institute clauses published for use with the MAR form or policy. It applies where a foreign jurisdiction clause attaches to the policy and requires that the foreign court shall base its decisions on English law and practice.

ENGULFING PATTERN = МОДЕЛЬ ПОГЛОЩЕНИЕ – In visual analysis, Engulfing Pattern is a reversal pattern that can be bearish or bullish depending upon whether it is in an uptrend or downtrend. The first day is characterized by a small body, followed by a day whose body completely engulfs the previous day's body. Engulfing Pattern:- the bullish engulfing pattern is most significant when it occurs after a prolonged downtrend. The stock or index has been selling off sharply. On the day of the bullish engulfing pattern, prices will often start the day by falling. However, strong buying interest comes in and turns the market around. The bullish engulfing pattern is so named because the open-close range of this candle surrounds or engulfs the open-close range of the previous one. The bullish engulfing represents a reversal of supply and demand. Whereas supply has previously far outstripped demand, now the buyers are more eager than the sellers. Perhaps at a market bottom, this is just short covering at first, but it is the catalyst that ultimately creates a buying stampede. When analyzing the bullish engulfing pattern, always be aware of its size. The larger the candle, the more significant the possible reversal. A bullish engulfing candle that consumes several of the previous candles speaks of a powerful shift in the market. Apple Inc. provided a good example of this pattern last summer. Apple had been on a downtrend from June 01 until June 20. Then, on June 23, Apple formed a bullish engulfing pattern where that day's candle engulfed the previous day's candle completely and suggested that the market would embark on a new bullish rally. As seen in 'Expanding opportunity' (above), the trader would not buy exactly on June 23 when the bullish engulfing pattern was formed, however. The trader would wait for the June 23 high of USD331.69 to be broken and sustained for a subsequent trading session. Confirmation came on June 28, when prudent traders might have initiated long positions. A reasonable level for a stop loss would be the June 23 low of USD318. The bearish engulfing pattern is the opposite of the bullish engulfing pattern. Like its companion, it is most significant when it occurs after a prolonged, steady trend. On the day of the bearish engulfing pattern, prices often begin by rising. However, strong selling comes in and turns the market around. 'Downturn' (left) provides an example in Caterpillar Inc. (CAT). On March 12, 2013, Caterpillar formed a bearish engulfing pattern that engulfed the previous day's candle completely and gave an indication of a subsequent correction – in this case, one that continued until April 18. As for entry strategy, the trader should not short sell on March 12 but wait for that day's low to be broken and sustained for a subsequent trading session. Entry confirmation came on March 13, and a short sell could be initiated on that day. A reasonable stop loss could have been placed at the March 12 high, or USD91.16. / Эпэл Инк. (Apple Inc.). Кэтёпилар Инк. (Caterpillar Inc.; Си.Эй.Ти. (CAT)). В визуальном анализе ситуации на биржевых рынках, под Моделью Поглощения понимается модель разворота, которая в зависимости от восходящей или нисходящей тенденции может быть соответственно как медвежьей, так и бычьей. Предыдущий день отображается малым телом, за которым следует большое тело текущего дня, полностью поглощающее предыдущее.

ENHANCED OIL RECOVERY = ПОВЫШЕННАЯ ОТДАЧА НЕФТИ (или ПОВЫШЕННАЯ НЕФТЕОТДАЧА) – Enhanced Oil Recovery (EOR) is any process whereby oil is produced other than by natural reservoir pressure. Enhanced Oil Recovery is any method that increases oil production by using techniques or materials that are not part of normal pressure maintenance or water flooding operations. For example, natural gas can be injected into a reservoir to 'enhance' or increase oil production. / операций по поддержанию нормального давления или по заводнению (water flooding) нефтяных месторождений. Заводнение это метод поддержания и восстановления пластового давления для вытеснения нефти из этого пласта путём закачки воды. Применяют внутриконтурное, законтурное, площадное и другие виды заводнений, посредством которых достигаются высокие темпы отбора жидкости из пластов и повышенная нефтеотдача. Под Нефтеотдачей понимается показатель извлечения нефти из пласта; отношение количества извлечённой нефти к первоначально содержащейся в пласте, выраженное в долях единицы или в процентах, называемых коэффициентом нефтеотдачи. Под Нефтеотдачей понимается степень полноты вытеснения нефти из продуктивного горизонта в скважины или в шахту с водой или газом под влиянием пластовой энергии. Нефтеотдача оценивается коэффициентом нефтеотдачи – отношением количества извлечённой нефти к первоначально содержащейся в пласте, выраженным в долях единицы или в %. При современных способах нефтедобычи нефтеотдача редко превышает 50%. Для повышения нефтеотдачи применяются многочисленные методы воздействия на залежь – вытесняют нефть из пласта растворами поверхностно-активных веществ (ПАВ), диоксида углерода, водорастворимых полимеров, мицеллярными растворами, горячей водой и паром, а также продуктами горения нефти при частичном её сжигании в пласте.

ENHANCED RECOVERY = ПОВЫШЕННАЯ ОТДАЧА – Enhanced Recovery:- techniques used to increase or prolong production from crude oil and natural gas reservoirs.

EN NOM PARTICIPATION = УЧАСТИЕ А НО (или УЧАСТИЕ АН НОМ, или УЧАСТИЕ ИМЕНЕМ) – En Nom Participation:- from the French, participation in an underwriting syndicate by being named in the issue prospectus. An 'En Nom' (meaning 'in the name of') participant in underwriting activities is listed like a syndicate member but is strictly speaking only a sub-participant because he has signed neither the loan agreement nor the syndicate agreement. See also Sub-participation. / Смотрите также Субучастие (Sub-participation).

ENQUIRY = ЗАПРОС – Enquiry is a document issued by a party interested in the purchase of goods specified therein and indicating particular, desirable conditions regarding delivery terms, etc, addressed to a prospective supplier with a view to obtaining an offer. Also known as Inquiry.

ENRICHED RICE = ОБОГАЩЁННЫЙ РИС – Enriched Rice is the blend containing ordinary milled Rice and a small percentage of milled Rice heavily fortified with thiamin, niacin, and iron phosphate to raise the vitamin and iron content slightly above the level present in brown Rice. When the yellow-colored riboflavin is added to the enriching agents, white pigments such as calcium oxide, talc, and titanium dioxide are also included to make the finished product appear white.

ENRICHMENT CULTURE = ОБОГАЩАЮЩАЯ КУЛЬТУРА (или УЛУЧШАЮЩАЯ КУЛЬТУРА) – Enrichment Culture is a technique in which environmental (including nutritional) conditions are controlled to favor the development of a specific organism or group of organisms.

ENROUTE = В ПУТИ – Enroute is a term used for goods in transit or on the way to a destination. / Термин, используемый для товаров, находящихся в транзите или в пути к месту назначения.

ENSIGN = ФЛАГ (или ЭНСЫН) – Ensign (maritime term):- the national flag.

ENSIGN = ЭНСЫН – Ensign (maritime term):- a junior officer. / Энсын – первичное офицерское звание в военно-морском флоте Соединённых Штатов Америки.

EN STANDARD = СТАНДАРТ ЕН – EN Standard:- European Norm/Normes standards. A Standard (French:- Norme, German:- Norm) is a technical publication that is used as a rule, guideline or definition. Essentially, it is a repeatable way of doing something, developed through consensus. Standards are created by bringing together all interested parties including manufacturers, consumers and regulators of a particular material, product, process or service. Everyone benefits from standardization through increased product safety and quality as well as lower transactions costs and prices. A European Standard (EN) is a document that has been adopted by one of the three recognized European Standardization Organizations:- CEN (short for the Comité Européen de Normalisation or European Committee for Standardization), CENELEC (short for the Comité Européen de Normalisation Electrotechnique or the European Committee for Electrotechnical Standardization) or ETSI (short for The European Telecommunications Standards Institute). An EN is available, in principle, in the three official languages of CEN (English, French and German). European Standards are a key component of the Single European Market. Perhaps rather technical and 'hidden' from the public and media, but they represent one of the most important issues for business. These technical documents – perceived as irrelevant to some organizations – are crucial for facilitating trade and hence have high visibility among manufacturers inside and outside Europe. A standard represents a model specification, a technical solution against which a market can trade. It codifies best practice and is usually state of the art. In essence, standards relate to products, services or systems. Today standards are no longer created solely for technical reasons but have also become platforms to enable greater social inclusiveness and engagement with technology, as well as convergence and interoperability within a growing market across industries. Developing a European Standard:- in CEN, the development of an EN is governed by the principles of consensus, openness and transparency. Consensus reflects the economic and social interests of 31 CEN Member countries channeled through their National Standards Bodies. The development of the standards is driven by business and each one is drafted by experts in the field. In building European consensus, industry, trade federations, public authorities, academia and NGO representatives are invited to contribute to the standardization process. It is this open participation which accounts for the strength of European standardization. The standardization process includes the following steps:- (i) Proposal; (ii) Acceptance; (iii) Drafting; (iv) CEN Enquiry; (v) Adoption by weighted vote; (vi) Publication of the EN; and (vii) Review of the EN. Proposal – Starting the work:- in principle, any interested party is able to introduce a proposal for new work in CEN. Most standardization work is proposed through the National Standards Bodies. Acceptance:- the appropriate CEN Technical Committee makes a decision on the adoption of the proposal. An accepted standardization project is allocated to one of its working groups for the drafting of a standard. If the proposal is for a new field of standardization activity, a decision is made by the CEN Technical Board first. The participants in the Technical Board include all National Standards Bodies and all standardization partners such as consumers, trade unions, European industry and the counselors namely the European Commission (EC) and European Free Trade Association Secretariat (EFTA). One of the principles of standardization in CEN is that, once a project to develop a standard has been accepted, the National Standards Bodies put all national activity within the scope of the project on hold. This means that they do not initiate new projects, nor revise existing standards at national level. This obligation is called 'Standstill' and allows efforts to be focused on the development of European Standards. Drafting:- the EN is then developed by experts appointed in a working group of the Technical Committee. CEN Enquiry – public comment at national level:- once the draft of a European Standard is prepared, it is released for public comment, a process known in CEN as the 'CEN Enquiry'. During the public commenting stage, everyone who has an interest (e.g., manufacturers, public authorities, consumers, etc) may comment on the draft. These views are collated by the 31 National Standards Bodies and analyzed by the CEN Technical Committee. Adoption by weighted vote:- taking into account the comments resulting from the CEN Enquiry, a final version is drafted which is then submitted to the 31 CEN Members for a weighted Formal Vote. Publication of the European Standard (EN):- after its adoption, each of the 31 National Standards Bodies publishes the new EN as an identical national standard and withdraws any national standards that conflict with it. Hence, one EN becomes a national standard in the 31 member countries of CEN. This is unique in the world and guarantees that a manufacturer, for example, has easier access to the market of all these European countries when applying European Standards. For example, the EN on toy safety, EN 71, has been adopted as NF EN 71 by AFNOR in France and as EVS EN 71 by EVS in Estonia. These standards are made available by the National Standards Body in each country. Review of the EN:- to ensure that a European Standard is still current, it is reviewed at least once every five years. A review is initiated by the Secretary of the Technical Committee (TC) after 4 years. It may be carried out earlier at the request of the TC, the Technical Bureau (BT), a CEN National Member, the European Commission, the European Free Trade Association Secretariat or the CEN Management Centre (CMC). If no TC exists, it is the responsibility of the BT to decide, after close examination, on the proposal prepared by the CMC. As a result, the EN may be confirmed, withdrawn, amended of revised. Harmonized Standards:- Harmonized Standards are European Standards that are produced by CEN, CENELEC, or ETSI under a mandate given by the European Commission. In general, these standards support the essential requirements of a New Approach Directive. A list of Harmonized Standards is available here. Please click on 'Subject (short title of directive)' to view the list of titles and references of harmonized standards under the directive. Beyond Europe:- European Standards are drafted in a global perspective. CEN has signed the 'Vienna Agreement' with the International Organization for Standardization (ISO) through which common European and international standards can be developed in parallel. More than 30% of the whole collection of the European Standards adopted by CEN are identical to the international standards. These EN/ISO standards have the dual benefits of automatic and identical implementation in 31 CEN Member countries, and global applicability .... / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ENT = ENTOMOLOGY

ENTANGLED YARN = СПУТАННАЯ (или БЕСПОРЯДОЧНАЯ) ПРЯЖА – Entangled Yarn is the textured yarn of one variant that develops bulk by the air-jet texturing method. See also Compacted Yarn.

ENTANGLING = СПЛЕТЕНИЕ – Entangling is:- (1) a method of forming a fabric by wrapping and knotting fibers in a web about each other, by mechanical means, or by the use of jets of pressurized water, so as to bond the fibers. See also Hydroentangling, and Spunlaced Fabric. (2) See also Intermingling.

ENTERING = ПРОБОРКА – Entering is the process of threading each warp yarn on a loom beam through a separate drop wire, heddle, and reed space in preparation for weaving. This process may be done by hand or by a semiautomatic machine. The Entering operation prepares warp yarn for weaving. In this process, the warp yarns are threaded from the loom beam through the headle eyes on the proper harnesses to achieve the desired pattern in the fabric. The warp yarn is then drawn through a reed to establish the warp thread count. The reed is also used to place the filling yarns in their proper position. / Проборка основных нитей в ремиз. Уточные пряжи .

ENTERING INWARDS = ОФОРМЛЕНИЕ ПО ПРИБЫТИИ – Entering Inwards:- the reporting of the vessel's arrival in port by the master at the Custom House. Permission to commence discharging is obtained. / Отчитывание хозяина (или капитана) в Таможенном Посту по прибытии судна в порт, посредством чего достигается разрешение на начало выгрузки.

ENTERPRISE = ПРЕДПРИЯТИЕ – Enterprise is an institutional unit producing market output. Enterprises are found mainly in the non-financial and financial corporations sectors but exist in all sectors. Each enterprise consists of one or more kind-of-activity units. / выработка (output). Предприятие – этот термин часто употребляется по отношению к новым, только что созданным компаниям.

ENTERPRISE RESOURCE PLANNING = ПЛАНИРОВАНИЕ РЕСУРСОВ ПРЕДПРИЯТИЯ – A term Enterprise Resource Planning (ERP) refers to a wide range of activities supported by software with multiple modules (accounting, purchasing, inventory, manufacturing, etc). Manufacturers and other businesses utilize ERP systems to manage various aspects of their businesses, including:- product planning, parts purchasing, inventory management, supplier management, customer service management, and order tracking. A relational database system may be a necessary component for the effective use of an ERP system. Implementation of an ERP system can involve considerable business process analysis, user training, and a significant financial investment. Enterprise Resource Planning (ERP) is a cross-functional/regional planning process supporting regional forecasting, distribution planning, operations centers planning, and other planning activities. ERP provides the means to plan, analyze, and monitor the flow of demand/supply alignment and to allocate critical resources to support the business plan. A term Enterprise Resources Planning (ERP) means a business strategy that helpsan apparel company manage their key sectors of activity, namely, purchasing, inventorymanagement, suppliers, customer service, and order tracking. ERP can also be applied to finance and human resources. An ERP system is typically based upon a number of software modules integrated with a relational database.

ENTIRE = ЦЕЛЬНОЕ – Entire:- with a continuous margin without teeth, lobes or indentations. / Цельнокрайный (Margin Entire) лист.

ENTIRE LEAF = ЦЕЛЬНЫЙ ЛИСТ – Entire Leaf has a smooth margin.

ENTITLEMENT MANAGEMENT TOOL = ИНСТРУМЕНТ УПРАВЛЕНИЯ ПРАВАМИ – Entitlement Management Tool:- basis of network security. Allows user access to specific services delivered through the Integrated Network.

ENTITY = ЮРИДИЧЕСКОЕ ЛИЦО – Entity is a corporation, organization or person that exists as a separately identifiable unit. ‘Separately Identifiable’ may be demonstrated by legal existence or the existence of a complete set of financial accounts, or by the ability to compile a meaningful and complete set of accounts if they were to be required. An Entity is any legal, administrative or fiduciary arrangement, organizational structure or other party (including a person) having the capacity to deploy scarce resources in order to achieve objectives. Entity is an incorporated company or organization which is legally permitted to enter into a contract, and be sued if it fails to meet its contractual obligations. Also known as Legal Entity. The opposite of Person. / В противовес Физическому Лицу (Person). Под Юридическим Лицом понимается учреждение, предприятие или организация, имеющие по закону право заключать имущественные сделки, брать на себя определённые обязательства, по которым они несут ответственность. В гражданском праве под Юридическим Лицом понимается компания, предприятие или организация, являющаяся по закону субъектом (носителем) гражданских прав и обязанностей. Юридическое лицо обладает обособленным имуществом. Оно может от своего имени приобретать имущественные и личные неимущественные права и нести обязанности, быть истцом и ответчиком в суде, арбитраже или третейском суде. Правоспособность юридического лица определяется целями, предусмотренными его уставом. Юридическое Лицо – организация (объединение лиц, предприятие, учреждение), являющаяся субъектом гражданских прав и обязанностей. Юридическое лицо – социальное (коллективное) образование, выступающее в гражданских правоотношениях как самостоятельная целостная единица. Юридическое лицо на основе устава выступает в гражданских правоотношениях от своего имени и несёт самостоятельную имущественную ответственность за свои долги. В бывшем Союзе Советских Социалистических Республик (СССР) права юридического лица принадлежат организациям, которые обладали обособленным имуществом, могли от своего имени приобретать имущественные и личные неимущественные права, нести обязанности, быть истцами и ответчиками в суде, арбитраже или третейском суде. Юридическими лицами являлись:- государственные предприятия и иные государственные организации, состоящие на хозяйственном расчёте, имеющие закреплённые за ними основные и оборотные средства и самостоятельный баланс; учреждения и иные государственные организации, состоящие на государственном бюджете с самостоятельной сметой, если их руководители пользуются правом распорядителей кредитов; государственные организации, финансируемые за счёт иных источников и имеющие самостоятельную смету и самостоятельный баланс (например, почта, телеграф); колхозы, межколхозные и другие кооперативные и общественные организации и их объединения, а в случаях, предусмотренных законом, – их отдельные предприятия и учреждения с обособленным имуществом и самостоятельным балансом. За юридическими лицами – государственными организациями закреплялись государственное имущество, которым они владели, пользовались и распоряжались на праве оперативного управления. В том же порядке владели, пользовались и распоряжались закреплённым за ними имуществом юридические лица межколхозные организации и предприятия (учреждения) колхозов, иных кооперативных и общественный организаций:- имущество этих юридических лиц являлось собственностью создавших их колхозов, кооперативных и общественных организаций. Юридические лица образовывались в порядке, установленном общесоюзным и республиканским законодательством, некоторые общественные организации – в порядке, предусмотренном их уставами (например, для профсоюзов – Уставом Профессиональных Союзов СССР). Государственные организации возникали в силу распорядительных актов компетентных государственных органов. Общественные организации (добровольные общества, некоторые кооперативные организации) создавались по инициативе их учредителей – граждан или других юридических лиц, но с разрешения компетентного государственного органа либо уполномоченного высшего органа кооперативной системы или общественной организации. Колхозы возникали в явочно-нормативном порядке, то есть в силу самого факта объединения группы лиц в колхоз с последующей регистрацией устава в Исполкоме Районного Совета Депутатов Трудящихся. Межколхозные, государственно-колхозные и иные государственно-кооперативные организации возникали в силу договора о совместной хозяйственной деятельности, заключаемого заинтересованными организациями. Каждое юридическое лицо имело своё наименование. Правоспособность юридического лица определялась целями его деятельности (так называемая специальная правоспособность), она возникалат с момента утверждения устава (положения) юридического лица, а если устав подлежал регистрации – с момента регистрации. Гражданские права и обязанности юридическое лицо принимало на себя через свои органы, компетенция которых была определена в уставе. Государство не отвечало за долги государственных организаций, являвшихся юридическими лицами, а эти организации в свою очередь не отвечали за долги государства. Государственная организация не отвечала также за долги подчинённого ей предприятия, являвшегося самостоятельным юридическим лицом. На тех же началах строились отношения между кооперативом или общественной организацией, с одной стороны, и созданными ими предприятиями, являющимися юридическими лицами, с другой. Юридическое лицо отвечало за свои долги всем принадлежащим ему или закреплённым за ним имуществом, на которое по закону могло быть обращено взыскание. Юридическое лицо прекращалось путём ликвидации всей его деятельности и имущества. В этом случае после удовлетворения обоснованных претензий кредиторов остаток имущества юридического лица обращался на указанные в уставе цели или передавался соответственным органам в порядке, предусмотренном уставом или законом. Другая форма прекращения юридического лица – реорганизация (слияние двух или более юридических лиц, разделение одного юридического лица на два или более, присоединение одного или нескольких

юридических лиц к другому). Советское государство (Союз ССР, Союзная республика) также могли выступать как субъект гражданских правовых отношений (например, государство было вправе наследовать имущество как по закону, так и по завещанию). Правом юридического лица обладали торговые представительства СССР за рубежом. Значение института юридического лица особенно возросло в связи с осуществлёнными в 1960–70-е в бывшем СССР и в других социалистических странах хозяйственными реформами, в результате которых были значительно расширены права социалистических государственных предприятий. В буржуазных государствах институт юридического лица используется как правовая форма централизации и концентрации капитала, организации хозяйственной деятельности капиталистических предприятий. Существуют различного рода корпорации (союзы лиц), выступающие в форме признанных законом юридических лиц – товариществ, преследующих цели извлечения прибыли. Наиболее распространённым видом юридического лица является акционерное общество. В форме юридического лица создаются также различного рода благотворительные, социально-культурные и иные, не преследующие цели извлечения прибыли учреждения. Во многих странах в результате длительной борьбы рабочего класса, всех трудящихся и демократических кругов в 1940–70-х права юридических лиц были признаны законом за профессиональными союзами и некоторыми другими общественными организациями, что облегчало решение задач, стоявших перед этими организациями в их борьбе против капиталистической эксплуатации, создавало материальную основу для защиты завоёванных трудящимися демократических прав и свобод. Юридическое Лицо – организация, учреждение, предприятие, фирма, выступающая в качестве единого, самостоятельного носителя прав и обязанностей, имеющая основные признаки юридического лица:- (1) независимость его существования от входящих в его состав отдельных лиц; (2) наличие имущества, обособленного от имущества участников; (3) право приобретать, пользоваться и распоряжаться собственностью; (4) право осуществлять от своего имени экономические операции; (5) право выступать от своего имени в суде в качестве истца или ответчика; (6) самостоятельная имущественная ответственность. Юридическое лицо имеет свое фирменное наименование, устав (юридический адрес), а также печать и расчётный счёт в банке. Юридическое лицо проходит государственную регистрацию и заносится в государственный реестр. Юридическое Лицо – организация, имеющая в собственности, полном хозяйственном ведении или оперативном управлении обособленное имущество, отвечающая по своим обязательствам этим имущество, а также выступающая в суде, арбитражном суде и третейском суде от своего имени. Признаками юридического лица являются:- (i) организационное единство, обеспечивающее деятельность организации как самостоятельной единицы, закреплённое в уставе; (ii) обособленность имущества и наличие самостоятельной имущественной ответственности; (iii) законность образования и способность участия в гражданско-правовых отношениях от своего имени. Юридическое лицо, являющееся коммерческой организацией, должно иметь самостоятельный баланс. Учредителями юридического лица могут быть собственники имущества либо уполномоченные ими органы или лица. Юридическое лицо действует на основании устава, учредительного договора, либо только учредительного договора.

ENTITY AUTHENTICATION = АУТЕНТИФИКАЦИЯ ЮРИДИЧЕСКОГО ЛИЦА (или УДОСТОВЕРЕНИЕ ПОДЛИННОСТИ ЮРИДИЧЕСКОГО ЛИЦА) – Entity Authentication is the corroboration that an entity is who it claims to be.

ENTOMOPHAGOUS = ЭНТОМОФАГИ – Entomophagous are organisms that eat insects. See also Insectivorous. / Смотрите также Насекомоядное (Insectivorous). Под Энтомофагами, от Греческих слов Éntoma, означающее Насекомые, и Phágos, означающее Пожиратели, или Насекомоядными Растениями понимаются многолетние травянистые (наземные и водные) растения, использующие мелких насекомых как дополнительный источник питания. Около 500 видов, во всех частях света; в бывшем СССР насчитывалось 18 видов из семейства Росянковых и Пузырчатковых. Ловчие органы – листья с липкими железистыми волосками, закрывающиеся при попадании насекомых, или в форме специальных ловушек. Переваривают добычу с помощью протеолитических ферментов и органических кислот. Наиболее известны Жирянка, Венерина Мухоловка, Непентес, Росянка. Под Насекомоядными понимается отряд Млекопитающих. Длина тела от 3 до 45 сантиметров. 7 семейств; около 300 видов. Распространены широко. В бывшем СССР насчитывалось 35 видов из 3 семейств:- Ежи, Землеройки и Кроты. Некоторые Насекомоядные – объект пушного промысла.

ENTRAINED AIR = ВОВЛЕЧЁННЫЙ ВОЗДУХ (или УВЛЕЧЁННЫЙ ВОЗДУХ) – Entrained Air is a mechanical mixture of air bubbles having a tendency to separate from the liquid phase.

ENTREPÔT = АНТРЁПО (или СКЛАД, или ПОГРУЗОЧНАЯ ПЛОЩАДКА) – Entrepôt is a trading center or port at a geographically convenient location where goods are imported and re-exported without directly entering the local economy. According to the strict definition, oods are imported into and re-exported from an entrepôt without incurring liability for duties. / Под Антрёпо, от Французского слова Entrepôt, означающее Склад или Погрузочная Площадка, понимается .

ENTREPRENEUR = АНТРЭПРЭНЁР (или ПРЕДПРИНИМАТЕЛЬ) – Entrepreneur is a French term (taken over into English) for ‘Enterpriser’ or ‘One Who Undertakes’. An entrepreneur is a person who detects a previously untapped opportunity to make substantial profits (either by lowering the costs of producing existing good/services or by creating brand new ways for people to satisfy their wants through new products) – and then takes the initiative in bringing together the necessary factors of production to exploit this opportunity, typically by organizing a new business firm (or perhaps a new subdivision of an existing firm) for the purpose. The new opportunity which the entrepreneur has detected may involve the introduction of a new good or service only recently invented or improved. It might involve introducing some existing good or service into a new market area where it is presently unavailable or deepening the original market by finding and publicizing new ways for new groups of customers to use it. It might involve recognizing the potential of some new production technology for dramatically lowering the costs of production of an existing good or service, making it possible to garner huge sales increases at the expense of much higher cost substitutes that are thereby rendered obsolete and no longer competitive. Entrepreneurs thus serve an important role in enabling the economy to adapt to changing conditions and new possibilities for material improvements by creating new production organizations, and even whole new industries. Because of its essential role in initiating the process of production, entrepreneurship is identified by some economists as a ‘fourth factor of production’, alongside land, labor and capital. In its essence, entrepreneurship involves looking ahead to foresee future conditions of supply and/or demand that will be quite substantially different from present conditions. Having arrived at a vision of the future based on observation of previously unnoticed trends, tentative theories, recent discoveries and inventions, and a large dose of creative imagination, the entrepreneur differentiates himself from the prophet, the social scientist and the idle dreamer by taking practical action to reallocate costly resources in the present so as to prepare for meeting an expected future demand. However, if the entrepreneur’s vision of the future proves to be incorrect, all or part of the resources mobilized to prepare for that future may prove to have been wasted, so there are risks of large losses. The prospect of far above average profitability is normally necessary to attract the necessary resources into an undertaking with such a high possibility of loss. Being the first in the field with an exceptionally good idea may well yield far above average profits because of the possibilities for explosive sales growth and because of especially favorable pricing conditions enjoyed due to the temporary monopoly the firm enjoys until imitators can gear up to enter the marketplace. The entrepreneur may personally bear all or most of the risk of the new enterprise by using only his own resources and thus becoming the sole owner of the business. Frequently, however, the entrepreneur will organize the business in such a way as to share the risks with others, either by borrowing part of the initial financing

from banks or from wealthy passive investors or by selling bonds. The entrepreneur may even give up part of the ownership of the enterprise (and thus part of the claims on future profits) to other partners or share-holders willing to buy their way in after the entrepreneur has developed and explained the basic concepts of the new undertaking. However, such risk-sharing arrangements will normally be structured by the entrepreneur in such a way that the entrepreneur retains an ownership interest larger than his original share of the resources put at risk. In other words, there are financial returns to entrepreneurial creativity above and beyond the returns demanded for pure risk-bearing. Entrepreneurship is something above and beyond risk-bearing or even ownership of the enterprise, even though any or all of these functions may happen to be performed by the same person in individual instances. Because the entrepreneur originated the idea of the business venture and took the lead in mobilizing the human and non-human resources to make it a reality, the entrepreneur often takes on the role of operational management of the new enterprise as well, especially during the lean early years before the basic assumptions of the undertaking have been proved valid in practice. However this need not always be the case, and many highly gifted entrepreneurs in history seem to have been quite remarkably lacking in ordinary managerial ambitions and basic skills. Once the core entrepreneurial function of discerning the new profit opportunity and mobilizing resources to exploit it has been fulfilled, the task of exerting day to day control so that these resources are efficiently employed to meet the owners' planned objectives can well be delegated to professional managers who need not be either entrepreneurs or even share-holders. Even though entrepreneurs frequently become managers, and even though professionally trained managers sometimes become entrepreneurs, the function of entrepreneurship is as separate and distinct from management as it is from ownership and risk-bearing. It is good to keep this in mind, because the term 'Entrepreneur' is sometimes applied incorrectly and indiscriminately in ordinary speech to any business owner or high-ranking manager. / Под Антрэпрэнёром, от Французского слова Entrepreneur, означающее Предприниматель, понимается владелец, арендатор, содержатель частного зрелищного предприятия (театра, цирка и другого) – антрэпризы. Предприниматель – лицо, принимающее на себя риск при создании нового предприятия. Многие предприниматели обладают техническими знаниями, позволяющими им производить годные к продаже изделия или оказывать необходимые новые услуги. Для начального финансирования их деятельности используется часто рисковый капитал (venture capital) в обмен на часть акционерного капитала. После создания предприятия акции его могут быть проданы на открытом рынке в рамках первоначального публичного предложения акций (initial public offering) при наличии благоприятных условий на рынке.

ENTRY = ВВОЗ – (1) Entry is a movement of a consignments into a country through a point of entry, such as airport, land border point or seaport officially designated for the importation of consignments. Entry (of a consignment) is a movement through a point of entry into an area. / привоз (importation).

(2) Entry (of a pest) is a movement of a pest into an area where it is not yet present, or present but not widely distributed and being officially controlled.

ENTRY = ДОКУМЕНТЫ НА ВВОЗ – Entry:- Customs documents required to clear an import shipment for entry into the general commerce of a country. Entry is a customs form used for the clearance of ships or merchandise. A statement of kinds, quantities and values of goods imported together with duties due, if any, and declared before a Customs Officer or other designated officer. / Документы, требуемые таможней, для очистки привезённого (или импортного) груза при ввозе в страну для общего использования.

ENTRY = ПРОВОДКА – In accounting, Entry is any debit or credit item posted to an account. / В бухгалтерском учёте, любая строка баланса (item) по дебиту или кредиту, занесённая в счёт.

ENTRY = ПРОЁМ – Entry is a side aperture provided to permit the passage of the lifting devices of handling equipment. See also Pallet. / Проём (Entry):- боковое отверстие, предназначенное для захода рабочего органа погрузочного оборудования. Смотрите также Поддон (Pallet).

ENTRY = XX – Entry is a test variety or a breeding line under evaluation.

ENTRY DATE = ДАТА ПРОВОДКИ – In accounting, Entry Date is a date on which entries are made in the records of an account. / В бухгалтерском учёте, дата на которую в записях по счёту были сделаны проводки.

ENTRY FEE = ВОЗНАГРАЖДЕНИЕ ЗА ВХОД (В РЫНОК, ВЗИМАЕМОЕ ИЗ ПЕРЕВЕДЁННОЙ СУММЫ) – Entry Fee is the fee set by the fund manager for buying units in a managed investment expressed as a percentage of the amount invested. The fee is deducted from the amount invested by the fund manager.

ENTRY FORM = ФОРМА ДОКУМЕНТА НА ВВОЗ – (1) Entry Form is the document that must be filed with Customs to obtain the release of imported goods and to allow collection of duties and statistics. Also known as Customs Entry Form, or Entry.

(2) Generic term for any form for which input is needed.

ENTRY OUTWARDS = ОФОРМЛЕНИЕ ПО ОТХОДУ – Entry Outwards:- the reporting of the intention to commence a new voyage by the master at the Custom House. Permission to commence loading is obtained. / хозяином (или капитаном) на Таможенном Посту.

ENTRY POINT FINANCIAL INSTITUTION = ФИНАНСОВОЕ УЧРЕЖДЕНИЕ, ЯВЛЯЮЩЕЕСЯ ПУНКТОМ ВХОДА – Entry Point Financial Institution is the first financial institution or Automated Clearing House (ACH) that receives a cross-border transaction in the receiving country.

ENTRY STANDARD = СТАНДАРТ ВХОДА – Entry Standard:- capital market access provided by Deutsche Börse within the Open Market (formerly:- Regulated Unofficial Market) for small and medium-sized companies as an alternative to EU-regulated segments. The Entry Standard is primarily aimed at qualified investors who are able to assess and accept the potential risks related to the investment in shares of the respective company. Investors must be aware that shares of the company are not admitted to trading at an EU-regulated market and that this part of the Open Market is not subject to the uniform transparency standards and the strict provisions for investor protection on organized markets in the EU. / Дойчэ Бёрзэ (Deutsche Börse).

ENTRY SUMMARY SELECTIVITY SYSTEM = СВОДНАЯ СЕЛЕКТИВНАЯ СИСТЕМА ВВОЗА – The Entry Summary Selectivity System, a part of Customs' Automated Commercial System, provides an automated review of entry data to determine whether team or routine review is required. Selectivity criteria include an assessment of risk by importer, tariff number, country of origin, manufacturer, and value. Summaries with Census warnings, as well as quota, antidumping and countervailing duty entry summaries are selected for team review. A random sample of routine review summaries is also automatically selected for team review.

ENTRY SUMMARY SYSTEM = СВОДНАЯ СИСТЕМА ВВОЗА – Entry Summary System:- an entry is the minimum amount of documentation needed to secure the release of imported merchandise. The Entry Summary System, a part of Customs' Automated Commercial System, contains data on release, summary, rejection, collection, liquidation, and extension or suspension.

ENTRY VALUE = ВВОЗНАЯ СТОИМОСТЬ – US Customs Service defines Entry Value (or Entered Value) as the value reflected on the enry documentation submitted by the importer. / Таможенная Служба США определяет ввозную стоимость (или ввозимую стоимость) как стоимость, указанную в документации на ввоз, представленной импортёром.

ENUMERATED AGRICULTURAL COMMODITIES = ПЕРЕЧИСЛЕННЫЕ СЕЛЬСКОХОЗЯЙСТВЕННЫЕ РОДА СЫРЬЯ – Enumerated Agricultural Commodities are the commodities specifically listed in Section 1a(3) of the Commodity Exchange Act:- Barley, butter, Corn, Cotton, cottonseed, cottonseed meal, eggs, fats and oils (including cottonseed oil, lard, peanut oil, soybean oil, tallow, and all other fats and oils), flaxseed, frozen concentrated orange juice, grain sorghums, livestock, livestock products, mill feeds, Oats, Peanuts, Rice, Rye, Solanum Tuberosum (Irish Potatoes), soybean meal, Soybeans, Wheat, wool, wool tops.

ENVELOPE = ОБОЛОЧКА – Envelope:- in technical analysis, lines that are placed at fixed percentages above and below a moving average line. Envelopes help determine when a market has traveled too far from its moving average and is overextended. / В техническом анализе биржевых рынков, линии, которые размещаются в зафиксированном процентном отдалении сверху или снизу линии скользящей средней величины. Оболочки помогают определить насколько далеко продвинулся рынок от значения скользящей средней величины, двигаясь в каком-то выбранном направлении, и насколько перерасширился.

ENVELOPE = СЛУЖЕБНЫЙ КОНВЕРТ – Envelope:- the header and trailer parts of a SWIFT message. / Заголовок и концовка составляют (электронное) сообщение в системе Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ENVIRONMENT = ОКРУЖАЮЩАЯ СРЕДА – Environment:- combination of things and elements surrounding and affecting the existence of human beings and other living organisms. The effect of industrial development on the environment has become a major concern. Society produces pollution, which is altering the environment. Environmental protection is in competition with the development of personal consumption desires in industrialized nations. Environment is the total external conditions and surrounding organisms, physical and biological factors which affect the growth and development of an organism.

ENVIRONMENTAL ACCOUNTS = СЧЕТА ПО ОКРУЖАЮЩЕЙ СРЕДЕ – Environmental Accounts:- a satellite account describing the relationship between the environment and the economy.

ENVIRONMENTAL CONTAMINANT = ЗАГРЯЗНИТЕЛЬ ОКРУЖАЮЩЕЙ СРЕДЫ (или ЗАГРЯЗНЯЮЩЕЕ ОКРУЖАЮЩУЮ СРЕДУ ВЕЩЕСТВО) – Environmental Contaminant:- all material and energy present in and around an operating system, such as dust, air moisture, chemicals, and thermal energy.

ENVIRONMENTAL IMPACT STUDY = ИЗУЧЕНИЕ ВОЗДЕЙСТВИЯ НА ОКРУЖАЮЩУЮ СРЕДУ – Environmental Impact Study (EIS) is a written report, compiled prior to a production decision, which examines the effects proposed mining activities will have on the natural surroundings of an exploration property. Abbreviation:- EIS. / Письменный отчёт, составляемый до принятия решения о начале добычи, в котором рассматриваются последствия воздействия предполагаемого бурения на естественное окружение разведанного объекта. Используется в виде обозначения ОВОС.

ENVIRONMENTAL POLLUTION = ЗАГРЯЗНЕНИЕ ОКРУЖАЮЩЕЙ СРЕДЫ – Environmental Pollution:- undesirable effects on the environment arising primarily from industrial activities and urbanization.

ENZYME = ЭНЗИМ (или ФЕРМЕНТ) – Enzymes:- (Greek:- Enzymos – Fermented) these are catalytic systems which break down nutrients. Why using Enzymes in detergents? Enzymes are used in cleaning products as cleaning and fabric care agents. Most of the used enzyme types breakdown large, water-insoluble soils and stains which are attached to, e.g., fabrics, into smaller, more water-soluble pieces. Subsequently, the smaller molecules are removed, e.g., from the fabric/chinaware, by the mechanical action of the (dish) washing machine or by the interaction of other detergent ingredients. The enzyme does not loose its functionality after having worked on one stain and continues to work on the next one. Some enzymes also deliver fabric care benefits by, e.g., better maintaining whiteness or keeping colors bright. The most important reasons to use enzymes in detergents are (i) that a very small quantity of these inexhaustible bio-catalysts can replace very large quantity of man made chemicals and (ii) enzymes can work at very low temperature at which traditional chemistry quite often is no longer effective (iii) they are fully biodegradable. All these characteristics make enzymes – on top of their high efficiency – environmentally friendly ingredients. Several enzymes can be used in products; each one having its own very well defined target. Some enzymes are specialized to attack fat stains, others to attack food stains. What is an enzyme? Enzymes are proteins, composed of hundred of amino-acids, which are produced by living organisms. They are responsible for a number of reactions and biological activities in plants, animals, human beings and micro-organisms. They are found in the human digestive system to break down carbohydrates (sugars), fats or proteins present in food. The smaller pieces can be absorbed into the blood stream. Each enzyme is a made of a sequence of amino acids (like pearl on a string) folded into a unique three-dimensional structure that determines the function of the enzyme. Even the slightest change in the sequence of the amino acids can alter the shape and function of the enzyme. Only a small part of the enzyme participates in the catalysis of biochemical reactions:- the active site. Enzymes are therefore very specific, e.g., a cellulose can only degrade cellulose. Enzymes are essential for all metabolic processes, but are not themselves living materials. They are distinguishable from other proteins because they are known as Biological Catalysts (substances which speed up reactions but which do not get used up themselves). Types of enzymes that can be used in cleaning products:- many classes of enzymes are known to improve the laundry process:- (i) Proteases act on soils and stains containing proteins. Examples are collar & cuff soil-lines, grass, blood. Proteases are enzymes that break down a long protein into smaller chains called peptides (a peptide is simply a short amino acid chain). (ii) Amylases remove starch-based soils and stains, e.g., sauces, ice-creams, gravy. Amylases break down starch chains into smaller sugar molecules. (iii) Lipases are effective in removing oil / greasy body and food stains. (iv) Cellulases provide general cleaning benefits, especially on dust and mud, and also work on garments made from cellulosic fibers, minimizing pilling to restore color and softness. By far the most commonly used classes of enzymes in detergents are proteases and amylases. Our brands are based on a cocktail of different enzyme classes to increase efficiency on a wide range of stains. The innovation thus lies in the specificity of a given enzyme as well as in the synergistic effects stemming from the combination of different enzyme classes. The approach that guarantees the best cleaning action of a detergent uses an active biological component that is:- (i) active at very low levels (1 to 2 ppm, and sometime even below 1 ppm); (ii) highly specific; (iii) active at low temperatures; and (iv) highly biodegradable. Production of enzymes:- enzyme molecules are far too complex to synthesize by purely chemical means, and so the only way to make them is to use living organisms. The problem is that enzymes produced by micro-organisms in the wild are often expressed in tiny amounts and mixed up with many other enzymes and proteins. These micro-organisms can also be very difficult to cultivate under industrial conditions, and they may create undesirable by-products. Modern industrial cultivation of enzymes begins with fermentation of a vial of dried or frozen micro-organisms called a Production Strain. This production strain is selected to produce large amounts of the enzymes of interest. The production strain is first cultivated in a small flask containing nutrients and agar. The flask is placed in an incubator which provides the optimal temperature for the previously frozen or dried cells to germinate. Once

the flask is ready, the cells are transferred to a seed fermenter, which is a large tank containing previously sterilized raw materials and water, known as the Medium. Seed fermentation allows the cells to reproduce and adapt to the environment and nutrients that they will encounter later on. The cells are then transferred to a larger tank, the main fermenter, where temperature, pH and dissolved oxygen are carefully controlled to optimize enzyme production. Additional nutrients may be added to enhance productivity. When main fermentation is complete, the mixture of cells, nutrients and enzymes, referred to as the Broth, is ready for filtration and purification. Benefits of enzymes:- the past decades with a growing number of enzyme applications in consumer detergents have led to major improvements in terms of benefits for consumers. (i) Low temperature efficiency:- enzymes catalyze the breakdown of soils and stain materials at lower temperatures. This allowed washing at lower temperatures and using less water throughout Europe whilst washing performance has improved. The energy-saving in the home from the temperature reduction and consequent reduction in environmental emissions (such as carbon dioxide) is considerable as a washing machine operated at 40 °C consumes only one third of the energy it would use at 95 °C. (ii) Weight-efficiency:- because enzymes act as catalysts (which can be used repeatedly to speed up chemical reactions without themselves being depleted) they are very weight efficient and cost effective. In other words, they can potentially replace a larger usage of conventional chemicals in the detergent. From an eco-toxicological viewpoint, enzymes can be considered as highly optimized laundry products ingredients which contribute positively to the overall environmental profile of detergents. (iii) Other:- technical and consumer research has demonstrated that the formulation of Procter & Gamble (P&G) detergents with enzyme has led to significant consumer benefits in terms of performance. The benefits of enzymes are related to both the laundry process and the wash results, and include the abilities to:- (a) wash at varying pH levels, from mild to high alkalinity; (b) use different wash temperatures, from 60 °C to as low as the '30–40 °C range'; (c) retain laundering performance in the presence of chemicals such as bleach; builder, surfactant, etc; (d) soften fabrics; (e) brighten their colors; (f) improve whiteness; and (g) remove fatty stains at low wash temperatures. Enzyme is any of the numerous proteins or conjugated proteins produced by living organisms that function as biochemical catalysts within the organism's body. Some RNA enzymes were recently discovered. See also Ferment, and Ribozyme. Enzyme is a protein that acts as a catalyst in a biochemical reaction. Enzymes are now extensively used in textile processing. Amylase enzymes are used for desizing, and cellulase enzymes are used for modification of cellulosic fabrics such as de-pilling or permanent softening. Enzymes have recently found application is wash-off of fabric dyed with reactive dyes, to conserve energy and water. Most enzymes used in textile processing are produced by fungi or bacteria grown in culture. None are readily available to textile artists. / Щёлочность (Alkalinity). Под Энзимами, от Греческих слов En, означающее В или Внутри, и Zýmē, означающее Закваска, понимаются ферменты. Под Ферментами, от Латинского слова Fermentum, означающее Закваска, или Энзимами понимаются биологические катализаторы, присутствующие во всех живых клетках. Осуществляют превращения веществ в организме, направляя и регулируя тем самым его обмен веществ. По химической природе – белки. Ферменты обладают оптимальной активностью при определённом водородном показателе (pH), наличии необходимых коферментов и кофакторов, отсутствии ингибиторов. Каждый вид ферментов катализирует превращение определённых веществ (субстратов), иногда лишь единственного вещества в единственном направлении. Поэтому многочисленные биохимические реакции в клетках осуществляет огромное число различных ферментов. Все ферменты подразделяются на 6 классов:- гидролазы, изомеразы, лиазы, лигазы, оксидоредуктазы и трансферазы. Многие ферменты выделены из живых клеток и получены в кристаллическом виде (впервые в 1926). Ферментные препараты применяют в медицине, в пищевой и лёгкой промышленности.

ENZYME–LINKED IMMUNOSORBENT ASSAY = СВЯЗАННАЯ С ЭНЗИМОМ (или ФЕРМЕНТОМ) ИММУНОСОРБЕНТНАЯ ПРОБА (или ФЕРМЕНТНАЯ ИММУНОСОРБЕНТНАЯ ПРОБА, или ТВЁРДОФАЗНАЯ ИММУНОСОРБЕНТНАЯ ПРОБА, или ИММУНОСОРБЕНТНАЯ ПРОБА, МЕЧЕНАЯ ФЕРМЕНТОМ) – Enzyme-Linked Immunosorbent Assay (ELISA) is a serological test in which one antibody carried within an enzyme releases a colored compound.

ENZYME WASHING = ПРОМЫВКА (или ОТМУЧИВАНИЕ, или ДЕКАПИРОВАНИЕ, или РАЗМЫВАНИЕ) ЭНЗИМА (или ФЕРМЕНТА) – Enzyme Washing is a process used to treat dyed fabric or garments to give it a worn or aged appearance. Cellulase enzymes are used, often on finished garments of cotton denim, to make the garment appear like it has been worn and washed repeatedly. Prior to the use of enzymes, similar effects were produced with acids and/or sand or stone washing where the garments were tumbled with pumice stones.

EO = ELECTED OFFICE

EOA = EFFECTIVE ON OR ABOUT

EOD = EVERY OTHER DAY

EOE = EUROPEAN OPTIONS EXCHANGE

EOM = END OF MONTH

EONIA = EURO OVERNIGHT INDEX AVERAGE

EOQ = ECONOMIC ORDER QUANTITY

EOR = ENHANCED OIL RECOVERY

EOTC = EUROPEAN ORGANIZATION FOR TESTING AND CERTIFICATION

EP = EUROPEAN PARLIAMENT

EP = EXTREME PRESSURE

EPA = ECONOMIC PARTNERSHIP AGREEMENT

EPA = ENVIRONMENTAL PROTECTION AGENCY

EP ADDITIVE = ПРИСАДКА ДЛЯ СВД (или ПРОТИВОЗАДИРНАЯ ПРИСАДКА) – EP (Extreme Pressure) Additive is the lubricant additive that prevents the seizing of the sliding surfaces under extreme pressure conditions. See also Additive. / Присадка Для Сверхвысокого Давления .

EPAL = THE EUROPEAN PALLET ASSOCIATION

EPAMIG = EMPRESA DE PESQUISA AGROPECUÁRIA DE MINAS GERAIS

EPAN = XX – Epan:- Class A pan evaporation.

EPAS = ELECTRONIC PATENT ASSIGNMENT SYSTEM

EPAULET = ЭПОЛЕ(Т) – Epaulet:- something that ornaments or protects the shoulder. An epaulet is an ornamental fringed shoulder pad formerly worn as part of a military uniform. An epaulet can also be an ornamental strip or loop sewn across the shoulder of a dress or coat. / .

EPC = ECONOMIC POLICY COMMITTEE

EPC = ENGINEERED PEST CONTROL

EPFI = ENTRY POINT FINANCIAL INSTITUTION

EPHEMERAL = ЭФЕМЕРНОЕ (или ОДНОДНЕВНОЕ) – Ephemeral is a plant that completes its life-cycle in a very short time. / Под Эфемерами, от Греческого слова Ephemeros, означающее Однодневный, понимаются однолетние растения, всё развитие которых происходит в очень короткий срок (несколько недель). Характерны для степей, полупустынь и пустынь, например, лебеда диморфная.

EPHOD = ЭФЕД (или ЭФОД) – Ephod is a linen apron worn in ancient Hebrew rites, especially a vestment for the high priest.

EPI = ELECTRONIC PAYMENT INITIATOR

EPIBLAST = ЭПИБЛАСТ – Epiblast:- a small structure opposite the scutellum in the embryo. Sometimes considered to be a rudimentary cotyledon. It has no vascular tissue. / Под Эпибластом, от Греческого слова Epi, означающее На или Над или Возле или После или При или Сверх, и Blastós, означающее Зародыш или Росток, понимается наружный слой клеточной стенки дискобластулы у высших позвоночных.

EPICALYX = ЭПИКАЛИКС (или ПОДЧАШИЕ, или НАРУЖНАЯ ЧАШЕЧКА) – Epicalyx is a group of bracts below the calyx, resembling a (second) calyx. / Подчашие – группа прицветников ниже чашечки, схожее со (второй) чашечкой. , от Греческих слов Epi, означающее На или Над или После или При или Сверх, и . В цветках растений под Подчашием понимается нижний, наружный ряд обычно мелких листочков чашечки, чередующихся с чашелистиками. По происхождению это прилистники чашелистиков. Подчашие хорошо развито у семейства Мальвовых (Мальва, Хлопчатник), Розоцветных (Земляника, Лапчатка).

EPICARP = ЭПИКАРПИЙ (или ВНЕПЛОДНИК) – Epicarp is the outermost layer of the pericarp of a fruit. / Эпикарпий – это внешний слой или поверхность перикарпия плода. Под Эпикарпием, от Греческих слов Epi, означающее На или Над или После или При или Сверх, и Karpós, означающее Плод, понимается .

EPICOTYL = ЭПИКОТИЛЬ (или НАДСЕМЯДОЛЬНОЕ КОЛЕНО) – Epicotyl is the main axis of the seed embryo just above the cotyledons and continuing into the developing stem of the seedling. Epicotyl is the part of the stem of a seedling or embryo just above the cotyledons. / Под Эпикотилем, от Греческих слов Epi, означающее На или Над или После или При или Сверх, и Kotýlē, означающее Углубление, или Надсемядольным Коленом понимается часть стебля у проростков растений между семядолями и первыми настоящими листьями (первое междоузлие).

EPIDEMIC = ЭПИДЕМИЧЕСКОЕ – Epidemic:- The occurrence in a community or region of cases of an illness, specific health-related behaviour, or other health-related events clearly in excess of normal expectancy. The community or region and the period in which the cases occur are specified precisely. The number of cases indicating the presence of an epidemic varies according to the agent, size, and type of population exposed, previous experience or lack of exposure to the disease, and time and place of occurrence. Epidemic Threshold:- Is the critical number or density of susceptible hosts required for an epidemic to occur. The epidemic threshold is used to confirm the emergence of an epidemic so as to step-up appropriate control measures. Epidemic:- an extensive development of a pest or disease in a geographical area or community, in a given time and space. / Под Эпидемическим, от Греческого слова Epidēmia, .

EPIDERMIS = ЭПИДЕРМИС – Epidermis is the thin outermost protective cell layer, usually taken to include the waxy water-impermeable material (cuticle) overlying the living cells. The outermost, single-celled layer of tissue (‘a skin’) covering all plant parts. Epidermis is the outer layer of cells. A layer of primary tissue in higher plants that is commonly one cell thick, often cutinized on its outer surface, and continuous in young plants except over the stomata. The epidermis provides protection to the underlying parts against mechanical injury and desiccation and is largely replaced in older plants except on leaves and herbaceous stems. / Под Эпидермисом, от Греческих слов Epi, означающее На или Над или После или При или Сверх, и Dérma, означающее Кожа, понимается:- (i) у животных и человека – поверхностный слой кожи, состоящий из многослойного плоского эпителия. поверхностная однослойная ткань; и (ii) у растений эпидермис (кожица) – поверхностный слой клеток листьев, стеблей, корней. Поверхностный слой кожицы, состоящий из многослойного плоского эпителия, покрывающий все части растения.

EPIGEAL = ЭПИГЕАЛЬНОЕ (или НАДЗЕМНОЕ) – Epigeal:- growing with one or more leaves above the ground. Germinating with cotyledons above the ground. / с котиледонами (семядолями). , от Греческих слов Epi, означающее На или Над или После или При или Сверх, и .

EPIGENOUS = НАЗЕМНОЕ – Epigenous:- on or developing or growing on the upper surface of a part such as a leaf. / такой как лист. , от Греческих слов Epi, означающее На или Над или После или При или Сверх, и . Наземный:- растущий и укореняющийся в почве.

EPIPHYTES = ЭПИФИТЫ – Epiphyte is a plant (or other organism) that grows on another for support, without drawing any nutrients from it. Hence:- Adj. Epiphytic. Non-parasitic or parasitic organisms such as bacteria, fungi, yeasts and algae that live and multiply on plant surfaces. Epiphyte is a plant attached usually to another plant solely for support; not a parasite. / Непаразитирующие или паразитирующие организмы, такие как, бактерии, грибки, дрожжи и морские водоросли, которые живут и размножаются на поверхности растений. Под Эпифитом, от Греческих слов Epi, означающее На или Над или После или При или Сверх, и Phytón, означающее Растение, понимается автотрофное растение, не имеющее связи с почвой. Селятся на стволах и ветвях других растений. Используют влагу и минеральные вещества осадков и пыли. Распространены повсеместно в тропических (Орхидеи) и Северных (Лишайники, Мхи) лесах. Эпифит:- растение, которое растёт выше уровня земли, обычно на деревьях. Эпифиты не паразитируют на хозяине, а лишь используют его как физическую опору. Эпифитное:- растение, которое растёт на других растениях, не паразитируя.

EPIPHYTOTIC = ЭПИФИТОТИЧЕСКОЕ – Epiphytotic:- an unarrested spread of plant disease, an old term which means epidemic. / Под Эпифитотическим, от Греческих слов Epi, означающее На или Над или После или При или Сверх, и Phytón, означающее Растение, понимается широко распространённая (инфекционная болезнь растений, охватывающая район, область или страну).

EPISTASIS = ЭПИСТАЗ – Epistasis is the interaction between genes in which one gene suppresses the action of another gene located at a different locus. / Эпистаз:- (1) подавление действия аллельной пары генов геном не аллельной им пары; (2)

подавление секреции или выделения. В генетике под Эпистазом, от Греческого слова Epistasis, означающее Препятствие, понимается взаимодействие между доминантными генами из разных пар аллелей, при котором один ген, называемый эпистатическим, подавляет проявление другого. Сравните с Гипостазом.

EPITHET = ЭПИТЕТ – Epithet is a descriptive adjective used as a noun forming part of the binomial botanical name of a species, e.g., gracilis = slender. See also Specie. / Смотрите также Вид (Specie). Под Эпитетом, от Греческого слова Epithetón, означающее буквально Приложенное, понимается .

EPITROPIC FIBERS = ЭПИТРОПИЧЕСКИЕ ВОЛОКНА – Epitropic Fibers are the fibers with an altered surface property, e.g., electrically conducting, abrasive, etc. Epitropic Fibres Ltd (Vale Mill, Oakworth, Keighley, West Yorkshire, the United Kingdom) is the only manufacturer of branded Epitropic fibers for use in antistatic applications. Physical Properties:- (i) Decitex – 3.3; (ii) Length – 75 mm; (iii) Color – Black; (iv) Cross Section – Circular; (v) Tenacity – 35 cN/tex; (vi) Extension – 40%; (vii) Crimp – Flat; and (viii) Density – 1.42 g/cm^3. Shrinkage Properties:- (i) Hot Air 150 °C – 1.0%; (ii) Boiling Water – 1.5%; and (iii) Autoclave 140°C – 0.5%. Effect of Moisture:- Moisture Regain – 0.3%. Effect of Temperature:- (i) Continuous Operation Temperature:- (a) Dry – 100 °C, and (b) Wet – 80 °C; and (ii) Maximum (Short Term) End Use – 145 °C. Operating Temperature:- (i) Melting Point – Sheath – 220 °C; (ii) Melting Point – Core – 255 °C; and (iii) Flash Point – 485 °C. Electrical Properties:- (i) electrical resistance of Epitropic fiber is 10–100 MegOhms/cm; (ii) approximately 1% Epitropic fiber prevents discomfort from static in everyday clothing and carpets; (iii) 2–5% Epitropic fiber is necessary in fabrics for industrial filters and safety workwear; and (iv) resistivity is approximately 1–100 MegOhms/sq but is dependent on the fabric and its construction. Resistance of Epitropic Fiber to Chemical Agents:- (i) Acids:- except under the most extreme conditions the rate of acid hydrolysis is very slow and good resistance to the majority of mineral and organic acids can be expected. (ii) Alkalis:- aqueous alkalis except ammonia and its derivatives cause progressive solution of the fiber. Ammonia, quaternary bases, Amines etc degrade the fibre without dissolving it. Maximum level recommended is pH 10. (iii) Oxidising Agents:- Epitropic fiber has excellent resistance to oxidising agents and withstands bleaching processes; (iv) Reducing Agents:- Epitropic fiber has excellent resistance to reducing agents; (v) Water/Steam:- good; and (vi) Long Term Exposure to Dry Heat:- excellent. / влагопоглощательная способность (moisture regain).

EP LUBRICANTS = СМАЗКИ ДЛЯ СВД (или ПРОТИВОЗАДИРНЫЕ СМАЗКИ) – EP (Extreme Pressure) Lubricants are the lubricants that impart to rubbing surfaces the ability to carry appreciably greater loads than would be possible with ordinary lubricants without excessive wear or damage. See also Lubricant. / Смазки Для Сверхвысокого давления . без чрезмерного износа или повреждения.

EPM = THE ECB PAYMENT MECHANISM

EPO = EUROPEAN PATENT OFFICE

EPONGE = ЭПОНЖ (или ГУБКА, или МАХРОВАЯ ТКАНЬ) – Eponge (Souffle):- wool, also rayon and silk. Derived from the French term eponge for ‘spongy’. Very soft and spongelike in a variety of novelty effects with loose weave of about 20 x 20. Also known as Ratine in cotton. Rayon and silk is soft, loose, and spongy, something like terry cloth. Does not have surface loops. Many stores now call eponge ‘Boucle’. / Эпонж – ткань губчатой фактуры.

EPOXY RESIN = ЭПОКСИДНАЯ СМОЛА (или ЭПОКСИДНЫЙ ПОЛИМЕР) – Epoxy Resin:- in textiles, a compound used in durable-press applications for white fabrics. It provides chlorine resistance but causes loss of tensile strength.

EPPD = ENTOMOLOGY AND PLANT PATHOLOGY DIVISION

EPR = EARNINGS PRICE RATIO

EPR = END POINT ROYALTY

EPS = EARNINGS PER SHARE

EPS = ELECTRONIC PAYMENT SYSTEM

EPS = EXPORT PROMOTING SERVICES

EPSA = EXPLORATION AND PRODUCTION SHARING AGREEMENT

EPT = EASTERN PREVAILING TIME

EPZ = EXPORT PROCESSING ZONE

EQUAL CREDIT OPPORTUNITY ACT = АКТ О РАВНОМ ДОСТУПЕ К КРЕДИТАМ – The Equal Credit Opportunity Act (ECOA) is a United States law (codified at 15 USC § 1691 et seq.), enacted in 1974, that makes it unlawful for any creditor to discriminate against any applicant, with respect to any aspect of a credit transaction, on the basis of race, color, religion, national origin, sex, marital status, or age (provided the applicant has the capacity to contract); to the fact that all or part of the applicant’s income derives from a public assistance program; or to the fact that the applicant has in good faith exercised any right under the Consumer Credit Protection Act. The law applies to any person who, in the ordinary course of business, regularly participates in a credit decision, including banks, retailers, bankcard companies, finance companies, and credit unions. Failure to comply with the Equal Credit Opportunity Act’s Regulation B can subject a financial institution to civil liability for actual and punitive damages in individual or class actions. Liability for punitive damages can be as much as USD10 000 in individual actions and the lesser of USD500 000 or 1% of the creditor’s net worth in class actions. Enacted in the United States in 1974, the Equal Credit Opportunity Act (ECOA) seeks to ensure that non-credit-related factors, such as a person’s race, national origin, or sex, do not enter into a decision to deny a person’s request for credit. Equal Credit Opportunity Act (ECOA) is a regulation created by the US government that aims to give all legal individuals an equal opportunity to apply for loans from financial institutions and other loan granting organizations. Individuals cannot be discriminated upon via factors that are not directly related to their creditworthiness. For example, individuals cannot be discriminated on the grounds of their racial background, religious background, sex and/or marital status. The only accepted factors that can be used to determine whether or not an individual is acceptable for a loan are relevant financially related information such as one’s credit score, income and existing debt load. Organizations found in violation of this act could potentially face class-action suits. If found guilty, the offending organization could have to pay out punitive damages totaling up the lesser of USD500 000 or 1% of the organization’s net worth.

EQUALISATION = СТАБИЛИЗАЦИЯ (или ВЫРАВНИВАНИЕ) – (1) Equalisation:- return on capital invested in a unit trust. All investors in a trust receive an equal sum per unit held, although some may only have invested in the period since the last distribution. The distribution paid on the latter’s stock therefore comprises the dividend and an equalization that brings the return up to par.

(2) Equalisation:- monetary allowance to a customer for picking up or delivering cargo to or from a point which is not the origin/destination shown on the bill of lading (B/L). A monetary allowance to the customer for picking up or delivering at a point other than the destination shown on the bill of lading. This provision is covered by tariff publication. Compensation for additional charges incurred by the shipper for delivering cargo to port designated by the carrier other than the closest port to the supplier.

EQUALISATION RESERVES = СТАБИЛИЗАЦИОННЫЕ РЕЗЕРВЫ – Equalisation Reserves are the reserves prescribed by local regulatory authorities for future claim fluctuations and for large and catastrophic losses which are established and included in the unpaid claims and claim adjustment expenses liabilities. / флуктуации (колебания) .

EQUILIBRIUM = РАВНОВЕСИЕ (или СБАЛАНСИРОВАННОСТЬ) – Equilibrium is a situation in which the quantities demanded and supplied in a market are equal. Equilibrium exists when forces that cause changes in the market are in balance so that there is no tendency for the market price to change. In economics, Equilibrium is a condition of perfect balance in which opposing forces of equal weight counter tendencies to change in any direction. An economic system is considered to be in equilibrium when all significant variables show no change over time. When a market is in equilibrium, buyers are willing to purchase the entire supply of goods which sellers are willing to offer at a certain price, or the equilibrium price. Equilibrium is not mathematical equality between one or more variables; it is a state of a balance among economic forces and factors, or the lack of a severe imbalance, which enables the socio-economic system to function to the satisfaction of its agents and tends to protect them from economic crisis.

EQUILIBRIUM MOISTURE CONTENT = РАВНОВЕСНАЯ ВЛАЖНОСТЬ (или РАВНОВЕСНОЕ ВЛАГОСОДЕРЖАНИЕ, или РАВНОВЕСНОЕ СОДЕРЖАНИЕ ВЛАГИ, или СОДЕРЖАНИЕ РАВНОВЕСНОЙ ВЛАГИ) – Equilibrium Moisture Content is the moisture content at which wood neither gains nor loses moisture when surrounded by air at a specified relative humidity and temperature. Equilibrium Moisture Content is the condition wherein the moisture-retaining tendency of the grain is the same as the moisture-withdrawing tendency of the air. Equilibrium Moisture Content is the water content of the goods is in equilibrium with the quantity of water vapor in the ambient air (relative humidity). / Содержание влаги, при котором древесина больше не увеличивает и не снижает уровень влажности за счёт воздействия окружающего воздуха при определённой относительной влажности и температуре.

EQUILIBRIUM PRICE = СБАЛАНСИРОВАННАЯ ЦЕНА – Equilibrium Price is the market price at which the quantity supplied of a commodity equals the quantity demanded. / Рыночная цена при которой количество предлагаемого сырья эквивалентно количеству требуемого сырья.

EQUIP = ENVIRONMENTAL QUALITY INCENTIVES PROGRAM

EQUIPMENT = ОБОРУДОВАНИЕ – In reference to electricity, Equipment is all apparatus, conductors, machines, etc used as part of, or in connection with, an electrical installation. / По отношению к электричеству, все аппараты, проводники, машины и так далее, используемые как часть или в связи с элетроустановкой.

EQUIPMENT = СНАРЯЖЕНИЕ (или ОБОРУДОВАНИЕ, или ОСНАЩЕНИЕ) – Equipment:- the rolling stock carriers use to facilitate the transportation services that they provide, including containers, trucks, chassis, vessels, and airplanes, among others. / Устройства на колёсах, используемые грузоперевозчиками для облегчения оказания услуг по транспортировке, включая транспортировку контейнеров, грузовиков, шасси, судов и самолётов.

EQUIPMENT DAMAGE REPORT = АКТ О ПОВРЕЖДЕНИИ ОБОРУДОВАНИЯ – Equipment Damage Report is a document that describes and establishes a value for damage to a shipping container aboard a shipping vessel. Equipment Damage Report is a written statement concerning damage to equipment, based on a physical inspection. / Заключение в письменной форме, касающееся повреждения оборудования, и основанное на проведённой инспекции.

EQUIPMENT HANDOVER AGREEMENT = ДОГОВОР ПЕРЕДАЧИ ОБОРУДОВАНИЯ – Equipment Handover Agreement is an agreement acknowledging the condition of the carrier's equipment when handed over and returned, which includes the terms of contract under which the equipment was taken over.

EQUIPMENT ID = ИДЕНТИФИКАЦИОННЫЙ НОМЕР ОБОРУДОВАНИЯ – Equipment ID is an identifier assigned by the carrier to a piece of equipment.

EQUIPMENT IMBALANCE CHARGE = СБОР ЗА ДИСБАЛАНС С ОСНАЩЕНИЕМ – Equipment Imbalance Charge (EIC):- this charges apply due to shortage of equipment (and namely:- containers). Shortages of containers is produced by commercial imbalance situations. When exports outgrow imports in a geographic region, you may face equipment shortages, as was the case in Asia. When you add imbalance by type of equipment to the situation, the situation worsens. While at present leasing containers are available to meet the demand in Asia, container pricing has reached levels of USD2 500.00 for a dry, due largely, to the increase of commodities costs and deterioration of the US exchange rate. Naturally, under these conditions, shipping lines are relying primarily on empty repositioning to Asia rather than use of fresh equipment. The shortage of equipment in the United States today is due to two primary factors. First, exports are growing at high rates, mainly because of devaluation of the US Dollar. Additionally imports are pretty much staggered causing, again, a commercial imbalance. Secondly, last year many nonprofitable international intermodal lanes were eliminated. This reduced the stock of containers at some inland locations available for exports. Location specific equipment shortages have created the need for increasing empty container repositioning. That is one of the reasons export freight rates have gone up. The rolling stock carriers use term equipment to facilitate the transportation services that they provide, including containers, trucks, chassis, vessels, and airplanes, among others. Container imbalance has always been a major challenge for container shipping carriers and all companies who were interviewed expressed serious concern at the gravity of the situation. The downturn caused by the global economic crisis (lower volumes, increased competition and consequent rate decreases) has made the cost of repositioning empty containers to attend to export demands an even more critical issue. The research revealed that ocean carriers use a combination of factors such as tracking systems (equipment stocks), experience (past performance) and manual work to manage empty repositioning. A small minority have systems to forecast demand and allow planning but none of them have the visibility to potential bottle necks with the necessary advance notice for timely corrections to planning. / Правильнее было бы даже называть Контейнерный Дисбаланс, поскольку под Англоязычным термином Equipment грузоперевозчики подразумевают Контейнеры.

EQUIPMENT INTERCHANGE RECEIPT = РАСПИСКА О ВЗАИМООБМЕНЕ ОБОРУДОВАНИЯ – Equipment Interchange Receipt (EIR) is a document used to receive or deliver a full or empty container/chassis at any terminal or inland container pool/depot. Physical inspection and transfer receipt of a container. Equipment Interchange Receipt (EIR) is a document transferring a container from one carrier to another, or to/from a terminal.

EQUIPMENTMAN = ХХ ПО ОБОРУДОВАНИЮ – Equipmentman (liners) (engine department (unlicensed); maritime term):- maintains and repairs cargo handling equipment and also cargo with special handling characteristics.

EQUIPMENT POSITIONING = УСТАНОВКА ОБОРУДОВАНИЯ – Equipment Positioning is the process of placing equipment at a selected location. / Процесс размещения или установки оборудования в выбранном месте.

EQUIPMENT TRUST CERTIFICATE = ТРАСТОВЫЙ СЕРТИФИКАТ НА ОБОРУДОВАНИЕ – Equipment Trust Certificate is a type of security, generally issued by a railroad, to pay for new equipment. Title to the equipment, such as a locomotive, is held by a trustee until the notes are paid off. An equipment trust certificate is usually secured by a first claim on the equipment.

EQUITAS REINSURANCE LTD = ЭКВИТЭС РИИНШУРЭНС ЭЛ.ТИ.ДИ. – Equitas Reinsurance Limited (ERL):- on 1996-September-03 the Council of Lloyd's finalized the terms of a 'Reinsurance and Run-off Contract' that documented the powers vested in Equitas and its duties to settle pre-1993 claims. Curiously, Lloyd's created two 'Equitas' entities to handle the claims, Equitas Reinsurance Limited and Equitas Limited. Equitas Reinsurance Limited (ERL) was organized to reinsure 'all liabilities under contracts of insurance underwritten at Lloyd's and allocated to the 1992 year or account of any prior year' other than life business. In simplified terms, ERL agreed to reinsure the liabilities of Names under policies issued prior to 1993 in return for ERL's receipt of the assets held in Names underwriting accounts, and of the Names' obligations to pay the premiums levied as a part of the settlement of their accounts (among other things). Concurrent with the effective date of the contract, ERL delegated its duties and retroceded its insurance obligations to Equitas Limited (EL). As consideration for this retrocession, ERL agreed to pay EL all of the assets and premiums it received from Names under its reinsurance agreement with Underwriters, less £710 000 000.00 (USD1.136 billion). There is no plausible explanation as to how the Names benefited from ERL's retrocession to EL, or, given the laying off of liabilities, why ERL needed to keep over USD1.1 billion. There is no justification for this arrangement in the original Equitas documentation nor in the cryptic Annual Reports sent to the Names. Regulators should know if this money is available to settle claims and if so, in what way. The financial statements published by Equitas are of no help; no accounting of these held-back funds has been provided. On 1996-September-04 Equitas began its administration of the run off of Lloyd's syndicates' 1992 and prior liabilities. According to its Report & Accounts for the period ended 1996-September-04, Equitas reinsured 740 syndicate years of account for more than 34 000 Names with gross claims reserves of £14.757 billion (USD22.136 billion @ USD1.50). Anticipated recoveries from over 248 500 reinsurance policies issued by approximately 2 900 reinsurers reduced the reserves to a net of £10.5 billion (USD15.75 billion). Headquartered in London, the United Kingdom. Equitas Reinsurance Ltd is a reinsurance company that was formed by the Society of Lloyd's for the purpose of accepting reinsurances to close of non-life syndicates for the 1992 and prior years of account in 1996. The company is not a subsidiary of the Society of Lloyd's and operates independently of it. / Эквитэс Рииншурэнс Эл.ти.ди. (Equitas Reinsurance Ltd). Лойдз (Lloyd's). Эквитэс Лимитид (Equitas Limited).

EQUITIES = ПАИ (или ДОЛИ, или ДОЛЕВЫЕ (ЦЕННЫЕ) БУМАГИ) – In sharemarket terms, Equities is a synonym for shares and represent part-ownership of a company, as distinct from debt securities such as bonds and debentures. Securities embodying the right to a dividend. In actual practice this includes dividend-right certificates, participation certificates, and shares. The opposite of Fixed-Interest Securities. / В терминологии рынка акций под Паями или Долями предполагается синоним акциям и понимается частичное владение компанией, в отличие от долговых ценных бумаг, таких как облигации (bonds) и долговые обязательства (debentures). Ценные бумаги воплощают право на дивиденд. На деле они предполагают под собой свидетельства на право на дивиденды (dividend-right certificates), свидетельства участия (participation certificates), и акции (shares). В противоположность Ценным Бумагам С Фиксированным Процентом (Fixed-Interest Securities).

EQUITY = ПАЙ (или ДОЛЯ, или ДОЛЕВАЯ (ЦЕННАЯ) БУМАГА) – In the United Kingdom, Equity is ownership or potential ownership of a company. An entity's equity in a company will be evidenced by ordinary shares. They differ from other financial instruments in that they confer ownership of something more than a financial claim. Shareholders are owners of the company whereas bond holders are merely outside creditors. Stock or any other security representing an ownership interest. Equity is the value of your investment in a venture. If you have a 12% equity stake in a company, it means that you own 12% of that company. It is often used synonymously with 'Shareholding' or 'Stakeholding'. Sometimes it is also used to refer to the value of an asset that you hold free and clear. For example, I have a CAD500 000 (market value) home. My equity in that home is CAD200 000 (i.e. I have a mortgage for CAD300 000 and my real ownership, or equity, is really just CAD200K, not CAD500K). The term Equity is sometimes used synonymously with 'Security', i.e. as in equities – meaning shares of companies. The ownership interest of common and preferred stockholders in a company. / Под Паем понимается часть, доля участия в каком-либо акционерном обществе, товариществе.

EQUITY = СОБСТВЕННЫЕ СРЕДСТВА (или АКЦИОНЕРНЫЙ КАПИТАЛ) – (1) Equity is a term whose meaning depends very much on the context. In general, you can think of equity as ownership in any asset after all debts associated with that asset are paid off. For example, a car or house with no outstanding debt is considered the owner's equity since he or she can readily sell the items for cash. Stocks are equity because they represent ownership of a company, whereas bonds are classified as debt because they represent an obligation to pay and not ownership of assets. In a balance sheet (International Financial Reporting Standards (IFRS®)), Equity consist of:- Subscribed Capital; Capital Surplus; Retained Earning; Other Comprehensive Income; Minority Interests. Equity is the difference between the original purchase or sales price and the current market price of a commodity futures contract or option premium. / Собственные Средства являются термином, понимание которого очень сильно зависит от контекста. В большинстве случаев под ним понимаются собственные средства как владение любым активом после того, как все долги, связанные с данным активом, оплачены. Например, автомобиль или дом с отсутствием неоплаченных долгов по ним, считаются собственными средствами владельца с тех пор, как он или она становятся способными продавать их за наличные. Акции являются собственными средствами, поскольку они представляют владение компанией; в то время как облигации классифицируются в качестве долга, поскольку они представляют обязательство оплаты, а не владения активами. В бухгалтерском балансе предприятия в соответствии с Международными Стандартами Финансовой Отчётности (МСФО) (International Financial Reporting Standards (IFRS®)), Собственные Средства состоят из:- xxxxx (Subscribed Capital); xxxxx (Capital Surplus); xxxxx (Retained Earning); xxxxx (Other Comprehensive Income); и xxxxx (Minority Interests).

(2) Equity is an ownership interest in an asset after liabilities are deducted. In general, net worth of a company, calculated as the excess of assets over liabilities. The opposite of Debt, and Liabilities. In the United Kingdom, an equity is the risk-sharing part of a company's capital, usually made up of ordinary shares. Equity is ownership interest in a corporation in the form of common stock or preferred stock. Equity is an ownership interest in a corporation in the form of common stock or preferred stock. It also refers to total assets minus total liabilities, in which case it is also referred to as Shareholder's Equity or Net Worth or Book Value. In real estate, it is the difference between what a property is worth and what the owner owes against that property, i.e. the difference between the house value and the remaining mortgage or loan payments on a house. In the context of a futures trading account, it is the value of the securities in the account, assuming that the account is liquidated at the going price. In the context of a brokerage account, it is the net value of the account, i.e. the value of securities in the account less any margin requirements. Equity is the portion of a company's assets that the shareholders own, as opposed to what they've borrowed:- equal to total assets minus liabilities. Also known as Owners' Equity or Shareholders' Equity. Equity is detailed on the balance sheet. Equity is also used as an adjective, to describe mutual funds

that invest in stocks, rather than bonds. / Собственные Средства подразделяются на Основные Средства и Оборотные Средства.

(3) In banking, Equity is a core capital (paid-in, capital, declared reserves and profit brought forward) as well as the supplementary capital eligible for inclusion in tier one (undisclosed reserves and subordinated issues). Equity must satisfy the requirements set out in the banking law, but in most cases it goes beyond these prescribed limits. Equity is an important measure of how solid a bank is. / В банковском обслуживании, базовый капитал (оплаченная собственная часть капитала .

(4) On the balance sheet, Equity is the amount of the funds contributed by the owners (the stockholders) plus the retained earnings (or losses). Also known as Shareholder's Equity. Equity is residual interest in the assets of an entity that remains after deducting its liabilities. Also, the amount of a business' total assets less total liabilities. Also, the third section of a balance sheet, the other two being assets and liabilities. Equity is total assets minus total liabilities; here also called Shareholder's Equity or Net Worth or Book Value. In accounting, equity is the total of capital, reserves and undistributed profit. That means the amount contributed by share holders plus accumulated profits of the company. Equity, therefore, represents the total of shareholders fund in the company. / В бухгалтерском отчёте под Собственными Средствами понимается сумма денежных средств, .

(5) Equity:- it is the residual value of common stock over the debit balance of a margin account. It is the residual value of the variation margins and initial margins of a liquidated future. In the context of margin trading, the value of securities in a margin account minus what has been borrowed from the brokerage. The residual Dollar value of a futures, option, or leverage trading account, assuming it was liquidated at current prices. As used on a trading account statement, refers to the residual Dollar value of a futures or options trading account, assuming it was liquidated at current prices. See also Available Equity, Net Liquidating Value, Open Trade Equity, and Total Equity. The value of a futures trading account if all open positions were offset at the current market price. Sometimes used to refer to a stock. The investor's equity in a margin account.

(6) Equity is the difference between the fair market value of the home and the outstanding balance on your mortgage plus any outstanding home equity loans. It is the difference between the market value of a property and the outstanding mortgage on it. In the context of real estate, the difference between the current market value of the property and the amount the owner still owes on the mortgage. Thus, it is the amount, if any, the owner would receive after selling a property and paying off the mortgage. Equity is the value of a property minus the owner's outstanding mortgage balance. / В контексте с недвижимостью под этим термином понимается разница между справедливой рыночной стоимостью дома (или имущества) и неоплаченным остатком по вашей закладной плюс любые неоплаченные долевые займы по этому дому (или имуществу).

(7) Equity:- the money value of an insurance company that is over and above it's liabilities. Liabilities include almost all of it's reserves.

(8) Equity is fairness in law.

(9) Equity:- individual derivatives over-the-counter (OTC) transactions were categorized (in 1996, now plus credit default swaps) into four market classes:- (i) commodity, (ii) equity, (iii) foreign exchange, and (iv) single-currency interest rate. With the exception of contracts with a joint exposure to commodities and equities, which were to be reported as commodities, all derivatives transactions with a link to the performance of equities or equity indices were to be reported in the equity category. That is, equity deals with exposure to foreign exchange or interest rates had to be included in this category. Quanto-type instruments are an example of deals with joint equity and foreign currency exposures which were to be reported in the equity category. Equities are the contracts that have a return, or a portion of their return, linked to the price of a particular equity or to an index of equity prices. With the exception of contracts with a joint exposure to commodities and equities, which are to be reported as commodities, all derivatives transactions with a link to the performance of equities or equity indices should be reported in this category. This includes equity deals with exposure to foreign exchange or interest rates. Quanto-type instruments are an example of deals with joint equity and foreign currency exposures that would be reported in this category.

EQUITY ACCOUNTING = УЧЁТ ПАЁВ (или УЧЁТ ФИКТИВНОГО КАПИТАЛА) – Equity Accounting is the method of accounting by which an equity investment in an associated company or joint venture entity is adjusted to reflect the investing company's proportionate share of the retained earnings and reserves (or net assets) in an associated company.

EQUITY AND ENTITLEMENT VOLUMES OF OIL AND GAS = ДОЛЕВЫЕ И ПОЛАГАЮЩИЕСЯ ОБЪЁМЫ НЕФТИ И ГАЗА – Equity And Entitlement Volumes Of Oil And Gas:- equity volumes represent volumes produced under a Production Sharing Agreement (PSA) that correspond to company's percentage ownership in a particular field. Entitlement volumes, on the other hand, represent company's share of the volumes distributed to the partners in the field, which are subject to deductions for, among other things, royalties and the host government's share of profit oil. Under the terms of a PSA, the amount of profit oil deducted from equity volumes will normally increase with the cumulative return on investment to the partners and/or production from the licence. The distinction between equity and entitlement is relevant to most PSA regimes, whereas it is not applicable in most concessionary regimes such as those in Brazil, Canada, Norway and the United Kingdom. The overview of equity production provides additional information for readers, as certain costs described in the profit and loss analysis were directly associated with equity volumes produced during the reported years. / Соглашение о Разделе Продукции (СРП).

EQUITY CAPITAL = ПАЕВОЙ КАПИТАЛ (или ФОНДОВЫЙ КАПИТАЛ, или ФИКТИВНЫЙ КАПИТАЛ) – Equity Capital is a capital of a company that belongs to the owners of the company (in many cases, holders of ordinary shares), rather than capital provided by owners of fixed-interest securities. Capital raised by a company through issuing shares. Also known as Equity Funding. An alternative to Debt Funding. Equity Capital is the sum of capital from retained earnings and the issuance of stocks. / Под Фиктивным Капиталом или Фондовым Капиталом понимается капитал в виде ценных бумаг, приносящих доход их владельцам. В отличие от капитала, вложенного в различные сферы и отрасли общественного производства (на покупку средств производства и рабочей силы), не является реальным богатством и не имеет действительной стоимости. С развитием капитализма масса фиктивного капитала растёт. Фиктивный Капитал, капитал, вложенный в ценные бумаги (акции, облигации), дающие право их владельцам регулярно присваивать часть прибыли в виде дивиденда или процента. Будучи бумажным двойником реального капитала, фиктивный капитал имеет особое движение вне кругооборота действительного капитала. Как специфический товар, он обращается на особом рынке – фондовой бирже и приобретает цену. Но так как ценные бумаги не обладают стоимостью, то движение их рыночной цены может не совпадать (и часто не совпадает) с изменениями реального капитала. Цена фиктивного капитала представляет собой капитализированный доход по ценным бумагам. Она прямо пропорциональна величине дохода от ценных бумаг и обратно пропорциональна уровню нормы банковского процента в стране. Например, если годовой доход от ценной бумаги 20 Долларов США, а норма банковского процента 5, то курс (цена) этой бумаги будет (20 x 100) / 5 = 400 Долларов США. Разница между размерами фиктивного и действительного капитала составляет Учредительскую Прибыль. Один из способов её получения – Разводнение Капитала – выпуск акций на сумму, значительно превышающую капитал, реально вложенный в предприятие. В эпоху империализма в огромных масштабах растёт эмиссия ценных бумаг,

причём рост фиктивного капитала обгоняет увеличение действительного капитала. Это обусловлено всеобщим распространением акционерной формы организации предприятий, ростом государственного долга в связи с увеличением непроизводительных расходов буржуазного государства на милитаризацию и войны, усилением инфляции и другим. В ходе экономического цикла разбухание фиктивного капитала происходит в период промышленного подъёма, а сокращение – во время кризиса. Фиктивный капитал отличается также от Ссудного Капитала. Ценные бумаги – это одна из сфер размещения ссудного капитала. Количественно фиктивный капитал превышает ссудный, а их движение не совпадает. В категории фиктивного капитала отражается дальнейшее развитие фетишизма и паразитизма капиталистических производственных отношений. Источник доходов по фиктивному капиталу полностью скрыт. В представлении владельцев ценных бумаг последние обладают способностью приносить доход сами по себе. Паразитизм фиктивного капитала особенно проявляется в облигациях государственных займов, когда государство непроизводительно растрачивает привлечённые средства. Эта особая форма фиктивного капитала не только не имеет стоимости, но часто и не представляет никакого реального капитала. Проценты по облигациям государственных займов выплачиваются в основном за счёт налогов. В эпоху общего кризиса капитализма происходят изменения в структуре фиктивного капитала. В связи с расширением государственного сектора в экономике и увеличением государственного долга рынок ценных бумаг всё больше заполняется государственными ценными бумагами. Сращивание монополий и государства проявляется в их совместных операциях с фиктивным капиталом государство всё чаще выступает на рынке ценных бумаг как должник, кредитор и гарант, причём, в отличие от частных предприятий, занимает привилегированное положение, так как имеет свободный доступ к эмиссии ценных бумаг, предоставляет подписчикам на государственные облигации налоговые льготы и гарантии против риска обесценения денег. Связь фиктивного капитала с государственным кредитом и правительственными гарантиями способствует усилению инфляции. Государственно-монополистический контроль над операциями с фиктивным капиталом позволяет использовать последний для покрытия нужд казначейства в дополнительной эмиссии ценных бумаг, увеличивая тем самым размеры контролируемого финансовой олигархией капитала.

EQUITY FINANCING = ПАЕВОЕ ФИНАНСИРОВАНИЕ (или ДОЛЕВОЕ ФИНАНСИРОВАНИЕ, или ФИНАНСИРОВАНИЕ ЗА СЧЁТ ВЫПУСКА АКЦИЙ, или ФИНАНСИРОВАНИЕ ЗА СЧЁТ СОБСТВЕННЫХ СРЕДСТВ) – Loan in the form of an equity share in a business entity, with interest indexed to profits. Equity Financing is the act of raising money for company activities by selling common or preferred stock to individual or institutional investors. In return for the money paid, shareholders receive ownership interests in the corporation. Also known as Share Capital. This is when a company raises money by issuing stock. The other way to raise money is through debt financing, which is when the company borrows money. Equity Financing is a method of raising capital in which a corporation sells shares of stock.

EQUITY FORWARD = ПАЕВОЙ ФОРВАРД (или ФОРВАРДНЫЙ КОНТРАКТ НА ПАЙ) – Equity Forward is a contract to exchange an equity or equity basket at a set price at a future date. / Контракт на обмен пая или паевой корзины по заранее утверждённой цене в ближайшем будущем.

EQUITY FUND = ПАЕВОЙ ФОНД – A Equity Fund or Stock Fund is a fund that invests in stocks, also called Equity Securities. Stock funds can be contrasted with bond funds and money funds. Fund assets are typically mainly in stock, with some amount of cash, which is generally quite small, as opposed to bonds, notes, or other securities. This may be a mutual fund or exchange-traded fund. The objective of an equity fund is long-term growth through capital gains, although historically dividends have also been an important source of total return. Specific equity funds may focus on a certain sector of the market or may be geared toward a certain level of risk. Stock funds can be distinguished by several properties. Funds may have a specific style, for example, value or growth. Funds may invest in solely the securities from one country, or from many countries. Funds may focus on some size of company, that is, small-cap, large-cap, et cetera. Funds which involve some component of stock picking are said to be actively managed, whereas index funds try as well as possible to mirror specific stock market indices. Equity Fund is an investment fund that invests in shares as stipulated in its regulations. Equity Fund is a mutual fund that invests principally in stocks. It can be actively or passively (index fund) managed. Also known as a Stock Fund. Stock mutual funds are principally categorized according to company size, the investment style of the holdings in the portfolio and geography:- size is determined by a company's market capitalization, while the investment style, reflected in the fund's stock holdings, is also used to categorize equity mutual funds. Stock funds are also categorized by whether they are domestic (US) or international. These can be broad market, regional or single-country funds. There are so-called 'Specialty' Stock Funds that target business sectors such as healthcare, commodities and real estate. / Инвестиционный фонд, который, как это предопрелено в его предписаниях, вкладывает средства в акции.

EQUITY FUNDING = ПАЕВОЕ ФОНДИРОВАНИЕ (или ДОЛЕВОЕ ФОНДИРОВАНИЕ) – (1) Equity Funding is a funding achieved through issuing new shares. Also known as Equity Capital. Alternative to Debt Funding. When seeking money for a business, an entreprenuer should consider the company's debt-to-equity ratio. That is, the relation between Dollars borrowed and Dollars invested in the business. The more money owners have invested in their business, the easier it is to attract financing. New or small businesses may find it difficult to get debt financing so they turn to equity funding. Equity financing often comes from non-professional investors such as family, friends, or employees. It can also come from professional investors known as Venture Capitalists. Equity Financing, or Equity Funding, is trading a percentage of a business for a specific amount of money. This form of financing enables a business to receive the capital needed without taking on additional debt. Outside investors will want to see an owner also investing their own money to show they are willing to share the risks. While it is possible to attract investors, the main source of equity financing is still family and friends.

(2) Equity Funding is:- (1) an insurance policy paid for by a mutual fund. That is, the value of the shares of the mutual fund pays the premiums of the insurance policy. Equity funding can be useful because it provides the risk reduction of an insurance policy while allowing the policyholder to keep any returns from the mutual fund over and above what is owed for the premium. It is most common with life insurance. However, the practice is controversial, as it has been associated with the Equity Funding Corporation of America, which offered this investment vehicle. This company perpetrated massive accounting fraud in the 1960s and 1970s. Perhaps because of this, equity funding is not very popular with investors. (2) See also Equity Financing. Equity Funding is an investment consisting of a life insurance policy and a mutual fund. The insurance policy is paid by the collateral value of fund shares, giving the investor the advantages of insurance protection with the growth potential of a mutual fund.

EQUITY INDEX OPTION = ОПЦИОН НА ПАЕВОЙ ИНДЕКС – Equity Index Option:- a transaction in which one party grants to the other party (in consideration for a premium payment) the right to receive a payment equal to the amount by which an equity index either exceeds (in the case of a call) or is less than (in the case of a put) a specified strike price.

EQUITY INDEX SWAP = СВОП НА ПАЕВОЙ ИНДЕКС – Equity Index Swap:- a transaction in which one party pays periodic amounts of a given currency based on a fixed price or a fixed rate and the other party pays periodic amounts of the same currency or a different currency based on the performance of an equity index, such as the Standard & Poor's 500 Index. Equity (Index) Swap is a swap in

which the total or price return on an equity index, equity basket or single equity is exchanged for a stream of cashflows based on a short-term interest rate index (or another index). Equity swaps are a convenient structure for switching into or out of equity markets, particularly for those that prefer to avoid, or are not allowed to use stock index futures. Like futures, the price of the swap is directly related to the cost of carry, although there may also be tax considerations. / Стэндод энд Поз (Standard & Poor's 500 Index).

EQUITY INTEREST = ПАЕВОЙ ПРОЦЕНТ (или ДОЛЕВОЙ ПРОЦЕНТ) – Equity Interest:- the sum of paid up capital, reserves, and accumulated profits or losses, disregarding redeemable preference share capital and outside equity interests, as shown in the consolidated financial statements. Equity Interest is an ownership interest; the interest of a shareholder as distinguished from that of a creditor. Investment that represents total or partial ownership in a company or enterprise, or entitles the investor to a share of its profits or a say in its management.

EQUITY INVESTMENT = ВЛОЖЕНИЕ В ДОЛЕВОЕ УЧАСТИЕ – In the United States, Equity Investment is the money that is invested in a firm by its owner(s) or holder(s) of common stock (ordinary shares) but which is not returned in the normal course of the business. Investors recover it only when they sell their shareholdings to other investors, or when the assets of the firm are liquidated and proceeds distributed among them after satisfying the firm's obligations. Also known as Joint Venture in the United Kingdom.

EQUITY–LINKED ISSUE = ВЫПУСК С УВЯЗКОЙ К ПАЮ – Equity-Linked Issue is a bond issue with conversion right or option on shares (or participation certificates).

EQUITY MARKET = ФОНДОВЫЙ РЫНОК (или ПАЕВОЙ РЫНОК, или РЫНОК ДОЛЕВЫХ ЦЕННЫХ БУМАГ) – Equity Market is the market for shares in companies listed on a stock exchange. Equities are normally considered more risky investments than bonds, since the holders of equities are entitled to receive a dividend from the issuing companies, while bond holders are entitled to an interest payment independent of the companies' profits.

EQUITY METHOD = ПАЕВОЙ МЕТОД (или МЕТОД УЧЁТА ПО ДОЛЕВОМУ УЧАСТИЮ) – Equity Method:- this financial term has different meanings:- (i) The equity method of accounting is used in consolidated financial reporting to determine income derived from a company X's investment in another company Y over which it exerts a significant influence, but which is not a subsidiary or joint venture of X's Group. (ii) A method of determining shareholder value, i.e. the market value of a company's equity. It is a variation of the Discounted Cash Flow (DCF) method where the value of a business is calculated by discounting future cash flows attributable to equity capital providers at the company's cost of equity. Shareholder value is defined as the aggregate total of these discounted amounts (cash value). By contrast, the entity approach discounts the future cash surpluses available to providers of equity and debt capital using the total cost of capital. This is used to calculate the market value of the entire company, i.e. including both equity and debt capital. Method of evaluating and reporting associated companies in the group balance sheet. Investments are booked proportionately to the percentage of a company's net asset value held. The Equity Method is an accounting technique used in the Consolidated Financial Statements to include BASF's investments in companies over which it has significant influence. The book value of the investment changes depending on the equity of the company in question. / Бе.А.Эс.Эф. (BASF).

EQUITY OPTION = ОПЦИОН НА ПАЙ – Equity Option is an over-the-counter (OTC) option, provision to deliver or receive a specific equity or equity basket at an agreed price at an agreed time in the future. Option contract that gives the right to deliver or receive a specific equity or equity basket at an agreed price at an agreed time in the future. Equity Option:- a transaction in which one party grants to the other party (in consideration for a premium payment) the right, but not the obligation, to purchase (in the case of a call) or sell (in the case of a put) shares of an issuer or a basket of shares of several issuers at a specified strike price. The option may be settled by physical delivery of the shares in exchange for the strike price or may be cash settled based on the difference between the market price of the shares on the exercise date and the strike price.

EQUITY RATIO = СООТНОШЕНИЕ С СОБСТВЕННЫМИ СРЕДСТВАМИ – Equity Ratio is a financial ratio that measures the level of leverage used by a company, the equity ratio quantifies the proportion of the total assets that are financed by stockholders, and not creditors (or debt). The equity ratio only requires two inputs, owner's equity and total assets; both of which are found on a company's balance sheet. Calculation:- Equity Ratio = Total Owner's Equity / Total Assets. Explanation:- also known as the Shareholder's Equity Ratio, there are two distinct schools of thought as to how to interpret the results of this metric. Optimistic Outlook:- a low equity ratio will produce good results for stockholders, as long as the company earns a rate of return on assets that is greater than the interest rate paid to creditors. Pessimistic Outlook:- a high equity ratio provides security to shareholders in the event a company is liquidated, since most of the assets are financed by equity and not by debt. (Remember, debt holders are paid first during bankruptcy proceedings.) Example:- company A's balance sheet indicates total stockholder equity of USD15 420 000 and total assets of USD31 616 000. The equity ratio for Company A would be:- Equity Ratio = USD15 420 000 / USD31 616 000, or 0.49. Equity Ratio is a ratio of a company's equity to its total capital stock. The Equity Ratio is a financial ratio indicating the relative proportion of equity used to finance a company's assets. The two components are often taken from the firm's balance sheet or statement of financial position (so-called Book Value), but the ratio may also be calculated using market values for both, if the company's equities are publicly traded. The equity ratio is especially in Central Europe a very common financial ratio while in the US the debt to equity ratio is more often used in financial (research) reports. Formula:- Equity Ratio = Total Shareholder's Equity / Total Assets. Example:- Equity Ratio = 12% <=> (Shareholder's Equity / Total Assets) <=> (USD79 180 000 / USD647 483 000). 'The Equity Ratio is a good indicator of the level of leverage used by a company. The Equity ratio measures the proportion of the total assets that are financed by stockholders and not creditors. The calculation of equity ratio is:- a low equity ratio will produce good results for stockholders as long as the company earns a rate of return on assets that is greater than the interest rate paid to creditors'.

EQUITY SECURITIES = ПАЕВЫЕ ЦЕННЫЕ БУМАГИ (или ЦЕННЫЕ БУМАГИ ДОЛЕВОГО УЧАСТИЯ) – (1) Equity Securities are the shares in a body corporate or an unincorporated body other than redeemable preference shares which are Loan Securities in accordance with paragraph.

(2) Equity Securities:- prescribed interests except Loan Securities.

(3) Equity Securities:- renounceable and non-renounceable rights to subscribe for securities other than Loan Securities.

(4) Equity Securities:- options over unissued securities other than Loan Securities.

(5) Equity Securities:- convertible notes. / Обратимые ноты (конвертируемые ноты).

(6) Equity Securities:- any securities which are determined by the exchange to be Equity Securities, but does not include option contracts or securities determined to be Loan Securities by the exchange.

EQUITY SHARE = ПАЕВАЯ ДОЛЯ (или ДОЛЯ ПАЯ) – Equity Share:- certificate of part-ownership in the capital stock of a company issued in exchange for capital. Also known as Equity Position.

EQUITY SHAREHOLDERS' FUNDS = ФОНДЫ ИЗ ПАЁВ АКЦИОНЕРОВ (или ФОНДЫ ИЗ СОБСТВЕННЫХ СРЕДСТВ АКЦИОНЕРОВ) – In the United Kingdom, . Assets minus Liabilities = Net Assets = Shareholders' Funds, i.e. the 'Net Worth' of the group. Shareholders' Funds is strictly a UK generally accepted accounting principles (GAAP) term. Under UK GAAP, the total shareholders' funds figure would be split between those attributable to equity shareholders and those attributable to non-equity (generally preferred) shareholders. Under the International Financial Reporting Standards (IFRS), the term Shareholders' Funds is replaced by 'Equity' and the definition of equity under IFRS excludes most shares which were regarded as 'non-equity' under UK GAAP – they are instead classified as liabilities. Shareholders' Funds is the balance sheet value of the shareholders' interest in a company. For company (as opposed to group) accounts it is simply all assets less all liabilities. For consolidated group accounts the value of minority interests should also be excluded. The addition of minority interests gives us 'shareholders' fund including minority interests'. Further adjustments gives us total equity. The balance sheet value of assets does have some significance for valuation. However, changes in shareholders' funds are also important. The most obvious reason for shareholders' funds to change is that profits have been made and retained, however changes can also be caused by gains or losses that do not go through the profit and loss account (P&L), such as revaluations. This is why both the statement of total recognized gains and losses (STRGL) and the note to the accounts reconciling beginning and ending shareholders' funds are important, the more so because looking at changes that have not gone through the P&L can alert investors to some manipulations of the accounts. For example, a consistent accumulation of unrealized losses on investments may be a cause for concern. The items within shareholders' funds (share capital, reserves and retained profit) are usually of little importance, although the amount of distributable reserves might matter to shareholders if it is too low, and (even more rarely) to creditors if it is too high. Also known as Shareholders' Equity in the United States. Equity Shareholders are the owners of the company, sharing its risks, profits, and losses. They have a residual claim on the earnings and assets of a company. They are paid their share of the company's profits after all other claims are met, and in the event of the liquidation of the company they share whatever is left of the company after all its creditors have been paid. They enjoy limited liability, i.e. liability only to the extent of their shareholding. Only equity shareholders are entitled to vote at the company's meetings, thus controlling the management. If the company prospers, it is the equity shareholders who is the greatest gainer.

EQUITY SWAP = ПАЕВОЙ СВОП – Equity Swap is a contract in which one or both payments are linked to the performance of equities or an equity index, e.g., S&P 500. It involves the exchange of one equity or equity index return for another, or the exchange of an equity or equity index return for a floating or fixed interest rate. Equity Swap is a transaction in which one party pays periodic amounts of a given currency based on a fixed price or a fixed rate and the other party pays periodic amounts of the same currency or a different currency based on the performance of a share of an issuer, a basket of shares of several issuers. / , например, .

EQUITY WARRANT = ПАЕВОЙ ВАРРАНТ – Equity Warrant is a warrant in which the underlying security is a stock. That is, an equity warrant is a certificate issued with a security giving the holder the option of buying a stock at a certain strike price for a certain period of time. Equity warrants are the most common warrants. Unlike options, warrants are issued by companies during a round of financing as an added incentive to buy a security; they are not issued by individual investors or brokerages. Warrants also usually have a longer maturity. Equity Call and Put Warrants are issued over securities, for example, shares in companies. Equity Warrant is an over-the-counter (OTC) option; long-dated (over one year) equity option. See also Bond With Warrant, and Warrant.

EQUIVALENCE = ЭКВИВАЛЕНТНОСТЬ (или РАВНОЦЕННОСТЬ) – Equivalence (of phytosanitary measures):- the situation where, for a specified pest risk, different phytosanitary measures achieve a contracting party's appropriate level of protection. Equivalence is the situation of phytosanitary measures which are not identical but have the same effect. / Под Эквивалентностью, от Латинского слова Aequivalens, означающее Равнозначный или Равносильный, понимается отношение типа равенства. Эквивалентность (фитосанитарных мер):- ситуация, при которой для определённого фитосанитарного риска различные фитосанитарные меры позволяют достигать уровня защиты, необходимого для договаривающейся стороны.

EQUIVALENT SINGLE YARN NUMBER = НОМЕР, ЭКВИВАЛЕНТНЫЙ НОМЕРУ ПРЯЖИ В ОДНУ НИТЬ – Equivalent Single Yarn Number is the number of a plied yarn or cord determined by the standard methods used for singles yarns. See also Yarn Number.

ER = ERITREA

ERADICATION = ИСТРЕБЛЕНИЕ (или УНИЧТОЖЕНИЕ) – Eradication is an application of phytosanitary measures to eliminate a pest from an area.

ERDA = ENERGY RESEARCH AND DEVELOPMENT ADMINISTRATION

ERECT GROWTH HABIT = ГАБИТУС ПРЯМОСТОЯЧЕГО РОСТА – Erect Growth Habit is a tendency of the plant to grow upright without spreading. The culms are erect and closely grouped. Erect growth is recessive to the spreading or procumbent habit. / Под Габитусом, от Латинского слова Habitus, означающее наружный вид, облик растения или животного; внешний облик человека, его телосложение, конституция, осанка.

ERECT LEAVES = ПРЯМОСТОЯЧИЕ ЛИСТЬЯ – Erect Leaves:- upright leaves.

ERECTOCENTRUS = ЭРЕКТОСЕНТРУС (или ПРЯМОСТОЯЧЕЕ) – Erectocentrus:- with an erect central spine. / Centro – Колюче- или Колючко- или Колючковато- .

ERGONOMICS = ЭРГОНОМИКА – Ergonomics is an applied science which considers human characteristics in designing machinery and arranging things for effective interaction, comfort, and safety; also called Human Engineering. Ergonomics is the study of improving a garment design by enhancing the wearers' comfort, performance, or health. / Под Эргономикой, от Греческих слов Érgon, означающее Работа, и Nómos, означающее Закон, понимается научная дисциплина, изучающая человека (или группу людей) и его (их) деятельность в условиях современного производства с целью оптимизации орудий, условий и процесса труда. Основной объект исследования эргономики – системы 'человек–машина', в том числе и так называемые эргатические системы; метод исследования – системный подход. Под Эргономикой, от Греческих слов Ergon, означающее Работа, и Nomos, означающее Закон, понимается наука, изучающая поведение человека, движение органов его тела во время выполнения работы с целью создания условий на рабочем месте, обеспечивающих удобство и комфорт, повышающих производительность, снижающих затраты энергии..

ERGONOMIC SEAMING = ЭРГОНОМИЧЕСКОЕ СШИВАНИЕ – Ergonomic Seaming:- this apparel construction technology is aimed at maximizing comfort and ease of movement. The key feature of this seaming technology is that the seams are constructed ergonomically. Therefore, the seams flow according to the body's natural movements, regardless of the type of activity engaged in by the wearer. The seams are placed away from potential pressure points, in order to maximize comfort and movement.

ERGOT = СПОРЫНЬЯ – Ergot is a fungal disease which occurs on cereals and grasses. It is most prevalent on Rye, Triticale, Wheat, and Barley, in decreasing order of occurrence. It is rarely found on Oats. The disease produces hard dense fungus bodies, called

Sclerotia, having a purplish black exterior, a purplish white to off-white interior, and a relatively smooth surface texture. Sclerotia (sclerotium, sing.) of the fungus, Claviceps species, which are associated with some seeds other than Canola where the fungal organism has replaced the seed. Ergot or Ergot Fungi refers to a group of fungi of the Genus Claviceps. The most prominent member of this group is Claviceps purpurea. This fungus grows on rye and related plants, and produces alkaloids that can cause ergotism in humans and other mammals who consume grains contaminated with its fruiting structure (called Ergot Sclerotium). Claviceps includes about 50 known species, mostly in the tropical regions. Economically significant species include Claviceps Purpurea (parasitic on grasses and cereals), Claviceps Fusiformis (on pearl millet, buffel grass), Claviceps Paspali (on dallis grass), and Claviceps Africana (on sorghum). Claviceps Purpurea most commonly affects outcrossing species such as rye (its most common host), as well as triticale, wheat and barley. It affects oats only rarely. Claviceps Purpurea has at least three races or varieties, which differ in their host specificity:- (i) G1 – land grasses of open meadows and fields; (ii) G2 – grasses from moist, forest, and mountain habitats; and (iii) G3 (Claviceps Purpurea var. spartinae) – salt marsh grasses (Spartina, Distichlis). Ergot is a resting body (sclerotium) of the ergot fungus. Meal contaminated by ergot causes poisoning; ergot alkaloids produce uterine contractions. / тритикале (пшенично-ржаные амфидиплоиды или ржано-пшеничные гибриды, формы пшеницы, полученные при скрещивании её с рожью). виды (species). Под Спорыньёй, от Французского слова Ergot, понимается Род Сумчатых Грибов. Паразиты растений; вызывают болезнь злаков (чаще Ржи) того же названия. Развиваются в завязи растения-хозяина. Около 30 видов. Наиболее распространённый и важный в хозяйственном отношении вид – Спорынья Пурпурная. В колосьях поражённых злаков вместо зёрен образуются склероции Гриба (чёрно-фиолетовые рожки), содержащие эрготамин и другие алкалоиды, используемые в медицине. Их выращивают, искусственно заражая посевы Ржи.

ERGOTY WHEAT = ПОРАЖЁННАЯ СПОРЫНЬЁЙ ПШЕНИЦА – Ergoty Wheat is a Wheat that contains more than 0.05 percent of ergot.

ERIC = EDUCATIONAL RESOURCES INFORMATION CENTER

ERINACEAE = ИГЛОКОЖИЕ (или ЕЖЁВЫЕ, или ЕЖЕВИДНЫЕ) – Erinaceae:- with a hedgehog-like appearance.

ERISA = EMPLOYEE RETIREMENT INCOME SECURITY ACT OF 1974

ERLC = EXPORT REVOLVING LINE OF CREDIT

ERLENMEYER FLASK = КОЛБА ЭРЛЕНМАЙА (или КОЛБА ЭРЛЕНМЕЙЕРА) – An Erlenmeyer Flask, also known as a Conical Flask, is a widely used type of laboratory flask which features a flat bottom, a conical body, and a cylindrical neck. It is named after the German chemist Richard August Carl Emil Erlenmeyer or Emil Erlenmeyer (28 June 1825 – 22 January 1909), who created it in 1861. Erlenmeyer Flask is a thin glass flask, flat-bottomed and cone-shaped allowing its contents to be shaken laterally without danger of spilling. An Erlenmeyer Flask is a cone-shaped container with neck, so you can hold the flask or attach a clamp or use a stopper. Erlenmeyer flasks are used to measure, mix, and store liquids. The shape makes this flask very stable. They are one of the most common and useful pieces of chemistry lab glassware. Most Erlenmeyer flasks are made of borosilicate glass so that they can be heated over a flame or autoclaved. The most common sizes of Erlenmeyer flasks probably are 250 ml and 500 ml. They can be found in 50, 125, 250, 500, 1 000 ml. You can seal them with a cork or stopper or place plastic or paraffin film or a watch glass on top of them. / в честь Немецкого химика Рихяда Аугуста Карля Эмиля Эрленмайа (Richard August Carl Emil Erlenmeyer).

ERM = EXCHANGE RATE MECHANISM

ERM II = EXCHANGE RATE MECHANISM II

EROSE = С НЕПРАВИЛЬНО ЗАЗУБРЕННЫМ КРАЕМ (или С НЕРОВНО ЗАЗУБРЕННЫМ КРАЕМ) – Erose:- ragged, with irregular random indentations.

EROSION = ЭРОЗИЯ – (1) Erosion is the progressive removal of a machine surface by cavitation or by particle impingement at high velocities. / Под Эрозией, от Латинского слова Erosio, означающее Разъедание, от Erodo, означающее Разъедаю, понимается:- разрушение поверхностных слоёв металлических изделий в результате механического воздействия потока газа, жидкости, твёрдых частиц, а также при кавитационных явлениях или под влиянием электрических разрядов (электроэрозия). Некоторые виды эрозии используются для обработки материалов (электроэрозионная обработка). Под Эрозией металлов понимается постепенное разрушение поверхности металлических изделий в потоке газа или жидкости, а также под давлением механических воздействий или электрических разрядов. Эрозия металлов – комплексный физический и физико-химический процесс, протекающий в результате влияния окружающей среды, окисления, наклёпа, остаточных напряжений, хрупкого и усталостного разрушения. На явлении эрозии металлов основан ряд технологических процессов (пескоструйная, электроэрозионная и ультразвуковая (УЗ) обработка); она же приводит к разрушению в условиях службы (при кавитации, трении). Повышение сопротивления металлов эрозии – важная задача для многих областей техники – решается подбором высокотвёрдых, тугоплавких и достаточно пластичных материалов, иногда армированием и другими способами. Под Эрозией, от Латинского слова Erosio, означающее Разъедание, понимается разрушение поверхностных слоёв металлических изделий в результате механического воздействия потока газа, жидкости, твёрдых частиц, а также при кавитационных явлениях или под влиянием электрических разрядов (электроэрозия). Некоторые виды эрозии используются для обработки материалов (электроэрозионная обработка). Эрозия металлов, постепенное послойное разрушение поверхности металлических материалов под влиянием механического воздействий или электрических разрядов (электроэрозия). Эрозия металлов возникает при трении поверхностей, износе, кавитации, а также при воздействии на поверхность сильных потоков – струй (газовых, жидкостных), особенно при высоких температурах. Эрозионному разрушению подвергаются, в частности, некоторые детали реактивных двигателей, ядерных реакторов, паровых турбин и котлов. Повышение эрозионной стойкости деталей обеспечивается совершенствованием технологии процесса и конструкции агрегата, а также выбором материала и его термической обработки. Созданы конструкционные материалы, обеспечивающие длительную работу деталей в условиях эрозионного изнашивания (например, некоторые сплавы на основе Nb или Mo). Эрозионные процессы лежат в основе многих видов обработки металлов (пескоструйная, дробеструйная, ультразвуковая, электроэрозионная; смотрите Электрофизические и Электрохимические Методы Обработки).

(2) Erosion:- xxxxx. / Под Эрозией, от Латинского слова Erosio, означающее Разъедание, понимается процесс разрушения горных пород и почв водным потоком. Различают поверхностную (сглаживание неровностей рельефа), линейную (расчленение рельефа), боковую (подмыв берегов рек) и глубинную (врезание русла потока в глубину). Эрозия (в геологии, географии), процесс разрушения горных пород и почв водным потоком. Проявляется в виде:- непосредственного механического воздействия течения, вызывающего взвешивание (и унос) твёрдых частиц или их перемещение по поверхности ложа водным потоком; растворения пород водой (коррозия); истирания и обтачивания ложа потока переносимыми водой частицами (коррозия); возбуждения электрических зарядов противоположного знака в системе ‘вода – твёрдые тела’, что

способствует суспензированию мелких частиц. Размывающая способность потока тем значительнее, чем больше скорость течения, и зависит от характера подстилающей поверхности (ложа). Эрозия – один из главных факторов формирования рельефа земной поверхности. Различают Поверхностную Эрозию (смыв со склонов), способствующую сглаживанию неровностей рельефа, и Линейную Эрозию (образование оврагов, балок, долин), приводящую к расчленению рельефа земной поверхности. Линейная эрозия разделяется на Глубинную (в том числе регрессивную или пятящуюся, которая, распространяясь от низовьев водотока вверх по течению, приводит к формированию продольного профиля равновесия) и Боковую, приводящую к расширению дна долины путём меандрирования или смещения русла под воздействием отклоняющего влияния вращения Земли. Везде, где имеется сток, происходит естественная нормальная эрозия. С нерациональной хозяйственной деятельностью человека связана ускоренная (антропогенная) эрозия. В зарубежной литературе под термином ‘Эрозия’ понимается непосредственная деструктивная деятельность моря, ветра, ледников и другого. Отсюда происхождение таких терминов, как ‘Ветровая Эрозия’, ‘Ледниковая Эрозия’, ‘Морская Эрозия’ и тому подобные. К этой же группе относится и термин Эрозия Почвы.

(3) Erosion is the loss of soil particles and nutrients when the surface soil is carried away by wind, water, or other agents. / Под Эрозией, от Латинского слова Erosio, означающее Разъедание, понимается разрушение водой и ветром верхнего слоя почвы, смыв или развеивание его частиц и осаждение в новых местах. Водная и ветровая (дефляция) эрозия почвы уменьшает площадь пашни, снижает плодородие почвы, затрудняет обработку полей, разрушает дороги и другие сооружения, заиливает каналы и водохранилища. Меры борьбы:- почвозащитные севообороты, правильная обработка почвы, снегозадержание, защитные насаждения, террасирование склонов, оврагоукрепительные работы и другое. Эрозия почвы, разрушение почвы водой и ветром, перемещение продуктов разрушения и их переотложение. Водная эрозия проявляется на склонах, где стекает дождевая или талая вода; подразделяется на Плоскостную (сравнительно равномерный смыв почвы под влиянием стока воды, не успевающей впитаться), Струйчатую (образование неглубоких промоин, устраняемых обычной обработкой) и Глубинную (размыв потоками воды почв и горных пород). Ветровая Эрозия, или Дефляция, развивается на любых типах рельефа, в том числе на равнинах; бывает Повседневной (ветры малой скорости поднимают в воздух почвенные частицы и относят их на другие участки) и Периодической – пыльные бури (сильные ветры поднимают в воздух верхний слой почвы, иногда вместе с посевами, и переносят почвенные массы на большие расстояния). По степени разрушения эрозию почвы подразделяют на Нормальную (Естественную) и Ускоренную (Антропогенную). Нормальная эрозия почвы протекает медленно, плодородие почвы не снижается. Ускоренная эрозия связана с хозяйственной деятельностью человека – с неправильной обработкой почвы и орошением, нарушением растительного покрова при выпасе скота, сведением лесов, стремительными работами. При сильном развитии эрозии почвы снижается плодородие земель, повреждаются посевы, овраги превращают сельскохозяйственные угодья в неудобные земли и затрудняют обработку полей, происходит заиление рек и водоёмов. Эрозия почвы разрушает дороги, линии связи, электропередач и другие коммуникации. Эрозия почвы наносит огромный ущерб сельскому хозяйству. Особо опасные размеры она приняла в Соединённых Штатах Америки (США) и Канаде, где длительное время практиковалось использование земли ‘на истощение’, а также в странах Средиземноморья, Ближнего Востока, в Индии, Пакистане, Китае, Южной Африке и Австралии. Вследствие эрозии почвы к 1975 на земном шаре выбыло из сельскохозяйственного оборота свыше 50 миллионов гектаров (га) пахотных земель. В бывшем Союзе Советских Социалистических Республик (СССР), по данным государственного учёта земель (1975), в защите от водной эрозии нуждалось около 200 миллионов га (Центрально-черноземные области, районы по правобережью Днепра, в Поволжье, на Дону и другие, на Северном Кавказе, в горных районах Закавказья и Средней Азии); ветровая эрозия угрожает более 100 миллионов га земель (Северный Казахстан, Южная Сибирь, Юг Украины, Заволжье), проявляется чаще на почвах лёгкого гранулометрического состава. В СССР борьба с эрозией почвы считалась одной из важнейших государственных задач развития сельского хозяйства. Для её решения были разработаны зональные комплексы взаимодополняющих агротехнических, лесомелиоративных, гидротехнических и организационно-хозяйственных противоэрозионных мероприятий. Агротехнические мероприятия (обработка участков и посев поперёк склонов, глубокая, более 22 сантиметров (см), вспашка, чередуемая через 2–3 года с обычной вспашкой, плоскорезная и безотвальная обработка почвы, весеннее рыхление зяби полосами, щелевание, залужение склонов) способствовали регулированию стока талых и дождевых вод и значительно уменьшали смыв почвы. В районах распространения ветровой эрозии вместо вспашки применяют плоскорезную обработку почвы культиваторами – плоскорезами и другим с сохранением стерни на поверхности (почвозащитная технология обработки почвы), что уменьшает распыление и способствует большему накоплению почвенной влаги. Во всех районах, подверженных эрозии почвы, большое значение имеют почвозащитные севообороты, а также посевы сельскохозяйственных культур между кулис из высокостебельных растений. Из лесомелиоративных мероприятий эффективны защитные лесные насаждения (полезащитные, приовражные и прибалочные лесные полосы). Из гидротехнических мер применяют террасирование на крутых склонах, сооружают водозадерживающие валы и водоотводящие канавы, быстротоки и перепады в руслах оврагов и ложбин. Противоэрозионные организационно-хозяйственные мероприятия обычно разрабатывают при землеустройстве.

(4) Erosion is a discontinuity of the skin exhibiting incomplete loss of the epidermis, a lesion that is moist, circumscribed, and usually depressed. Skin erosion is a loss of some or all of the epidermis (the outer layer) leaving a denuded surface. Erosion is an eating away of a surface. The word ‘Erosion’ comes from the Latin ‘Erodere’ meaning to eat out. / Эрозия (в медицине), поверхностное повреждение эпителия кожи или слизистой оболочки. Причинами эрозии могут быть механическое воздействие (ссадины кожи), дистрофические и воспалительные процессы в слизистой оболочке (например, эрозия желудка), раздражающее действие патологических выделений (смотрите Эрозия Шейки Матки) и другие. Важное клиническое значение имеют эрозии слизистой оболочки желудка; их образование характерно для так называемого Эрозивного Гастрита; нередко они бывают множественными и осложняются желудочными кровотечениями. В отличие от язвы, эрозия заживает без образования рубца.

EROSION CONTROL FABRICS = ТКАНИ ДЛЯ КОНТРОЛЯ ЭРОЗИИ (или ТКАНИ ДЛЯ БОРЬБЫ С ЭРОЗИЕЙ) – Erosion Control Fabrics are the fabrics used in the stabilization of embankments and the containment of silt run-off from erodible slopes. In embankment stabilization, the fabric functions as a filter medium behind stabilizing rip-rap revetments. In siltation control, the fabric acts as a filter to contain silt while allowing excess water to drain freely. In turf reinforcement, the mat is used to retain soil while allowing roots and stems to grow through. In fabric-forming systems for the construction of revetments, a double-layer, water-permeable fabricis positioned, then pumped full of structural grout. These systems are alternatives to rip-rap. See also Geotextile.

EROSION INDEX = ИНДЕКС ПО ЭРОЗИИ – The Erosion Index (EI, also called the Erodibility Index) is created by dividing potential erosion (from all sources except gully erosion) by the T value, which is the rate of soil erosion above which long term productivity may be adversely affected. The erodibility index is used in conjunction with conservation compliance and the Conservation Reserve Program (CRP). For example, one of the eligibility requirements for the CRP is that land have an EI greater than 8. Erosion Index is a measure of the erosive potential of a specific rainfall event. / сохранение (conservation).

ERP = ENTERPRISE RESOURCE PLANNING

ERROR CONTROL = КОНТРОЛЬ ОШИБКИ (или КОНТРОЛЬ ПОГРЕШНОСТИ) – Error Control is the procedures such as blocking, proper selection of experimental design, measurement techniques, and field plot techniques applied to reduce experimental error.

ERROR LIST = СПИСОК ОШИБОК – Error List is a report showing discrepancies (errors) in data input. / Отчёт, отражающий расхождения (ошибки) во входящем потоке данных.

ERRORS AND OMISSIONS CLAUSE = ОГОВОРКА ОБ ОШИБКАХ И УПУЩЕНИЯХ – Errors And Omissions (E&O) Clause is a provision, usually in an obligatory reinsurance treaty, stating that an error or omission in reporting a risk that falls within the automatic reinsurance coverage under such treaty shall not invalidate the liability of the reinsurer on such omitted risk. Errors and Omissions Clause is a provision in reinsurance agreements which is intended to neutralize any change in liability or benefits as a result of an inadvertent error by either party. Errors And Omissions (E&O) Clause is a clause in a reinsurance treaty that stipulates that errors or omissions made do not nullify the reinsurer's liability. A statement that a reinsurer's liability is not nullified due to textual errors or omissions. Errors And Omissions Clause is a clause in a reinsurance treaty that stipulates that in the event of inadvertent error or omission, the reinsurer shall not be prejudiced in the fulfillment of the agreement, provided that any error or omission shall be corrected as soon as discovered.

ERRORS AND OMISSIONS EXCEPTED = ОШИБКИ И УПУЩЕНИЯ ИСКЛЮЧЕНЫ – Errors and Omissions Excepted (E&OE) is an expression included at the end of an invoice or total as a disclaimer against clerical error. It is used in an attempt to reduce legal liability for incorrect or incomplete information supplied in a contractually related document such as a price list, quotation or specification. It is often applied as a disclaimer and seeks to make a statement that information cannot be relied upon or may have changed by the time of use. It is most commonly used in the United Kingdom and Ireland, and is less frequently used in other English speaking countries. Errors and Omissions Excepted (E&OE):- denial of responsibility for clerical errors and omissions, often included in invoices as a safeguard.

ERROR VARIANCE= ДИСПЕРСИЯ ОШИБКИ (или ВАРИАНСА ПОГРЕШНОСТИ) – Error Variance is a measure of experimental error. Variance arising from unrecognized or uncontrolled factors in an experiment with which the variance of unrecognized factors is compared in tests of significance. / Под Вариантом, от Латинского слова Varians, родительный падеж Variantis, означающее Изменяющийся, понимается видоизменение, разновидность; одна из возможных реализаций, например, одна из нескольких редакций какого-либо произведения. Под Дисперсией, от Латинского слова Dispersio, означающее Рассеяние, понимается мера рассеивания (отклонения от среднего).

ERS = ECONOMIC RESEARCH SERVICE

ERTA = ECONOMIC RECOVERY TAX ACT OF 1981

ERYTHEMA METER = СЧЁТЧИК ЭРИТЕМЫ – Erythema Meter (erythema ultraviolet intensity meter) is an indicator of the sunburning effect of radiation with wavelengths as short as 270 nm. / Под Эритемой, от Греческого слова Erýthēma, означающее Краснота, понимается ограниченное или разлитое покраснение кожи при воздействии различных факторов (инфекционных, физических (например, облучение), химических и других).

ES = SPAIN

ESA = ENDANGERED SPECIES ACT

ESA = EUROPEAN SPACE AGENCY

ESA = EUROPEAN SYSTEM OF NATIONAL AND REGIONAL ACCOUNTS

ESCALATOR CLAUSE = ОГОВОРКА О СКОЛЬЗЯЩЕЙ ШКАЛЕ – Escalator Clause is a stipulation contained in a union contract stating that wages will be raised or lowered, based upon an external standard such as the cost of living index. A term, ordinarily in a contract or lease, that provides for an increase in the money to be paid under certain conditions. Escalator clauses frequently appear in business contracts to raise prices if the individual providing a particular service or type of merchandise is forced to pay more for labor or materials. Such clauses are also often part of contracts or leases executed subject to price-control regulations. When this type of provision is in a lease, a landlord has the power to collect the maximum amount of rent allowed under rent regulations that are in effect at the time of the lease. The escalator clause provides that if the rent regulations are altered during the time of the lease, the tenant must pay the new rental fee computed pursuant to the revised regulations. Escalator Clause is a clause allowing for adjustment of the insured value in certain non-marine material damage insurances. A similar clause can be found in builders risks policies covering ships under construction. Escalator Clause is a contract provision allowing for one to pass an increase in costs to another party. Escalator clauses are usually related to influences beyond both parties control, such as inflation. Also known as an Escalation Clause. Escalation clauses allow people to enter large or long-term contracts, while accounting for changes in the market or economy. For example, let's examine a possible arrangement for someone to rent an apartment. If housing prices are increasing rapidly, a landlord may be hesitant to sign a longer term rental agreement or lease, since he or she could lose out on the property's appreciation. By including an escalator clause, where rent can increase by a specified amount each period, the landlord can still benefit from current market conditions, while the renter can secure a long-term living arrangement. Escalator Clause is a provision in a lease or other agreement in which rent, installment payments or alimony, for example, will increase from time to time when the cost of living index (or a similar gauge) goes up. Often there is a maximum amount of increase ('cap') and seldom is there a provision for reduction if the cost of living goes down or for deflation instead of inflation.

ESCAP = ECONOMIC AND SOCIAL COMMISSION FOR ASIA AND THE PACIFIC

ESCAPE = ИЗБАВЛЕНИЕ (или УХОД, или ИСХОД) – Escape:- to avoid undesirable growing conditions, environmental factors, pests or diseases, e.g., through early or late sowing, to avoid grain losses is a drought escape mechanism.

ESCAPE = ПРОСАЧИВАЮЩЕЕСЯ (или ОДИЧАВШЕЕ, или УСТОЙЧИВОЕ) – Escape:- an exotic species spreading from cultivation and becoming established in natural habitats.

ESCAPE CLAUSE = ОГОВОРКА ОБ ВЫХОДЕ (или ОГОВОРКА ОБ ИЗБЕЖАНИИ ОТВЕТСТВЕННОСТИ, или ОГОВОРКА О СНЯТИИ ОТВЕТСТВЕННОСТИ, или ОГОВОРКА ОБ УХОДЕ ОТ ОТВЕТСТВЕННОСТИ, или ОГОВОРКА О ВОЗМОЖНОСТИ ОТКАЗА) – (1) An Escape Clause is any clause, term or condition in a contract that allows a party to that contract to avoid having to perform the contract. If an agreement was drawn up for the sale of a house, for example, the purchaser could include some kind of escape clause in the contract, which will allow him to 'escape' from the contract without being liable for breach of contract. In a contract, Escape Clause is a clause that allows one or other party to withdraw from the contract should certain events take place, e.g., in a lease, it is possible to have a clause that allows the lessee to withdraw should the lessor increase the rent.

(2) The Escape Clause, which can be invoked under GATT (short for the General Agreement on Tariffs and Trade) Article XIX, allows countries to temporarily violate their GATT obligations to the degree and time necessary to protect a domestic industry from serious injury. Countries taking such actions, however, must consult with affected contracting parties to determine appropriate compensation for the violation of GATT rights, or be subject to retaliatory trade actions. Section 201 of the US Trade Act of 1974 requires the US International Trade Commission to investigate complaints filed by domestic industries or workers claiming that they are injured or threatened by rapidly rising imports. Section 203 of the Act provides that if the ensuing investigation establishes that the complaint is valid, relief may be granted in the form of adjustment assistance, which may be training, technical and financial assistance, or temporary import restrictions in the form of tariffs, quotas, tariff rate quotas and/or orderly marketing agreements. Import restrictions imposed under the escape clause authority are limited in duration. They may last no longer than five years but can be extended by the President for a tree-year period. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)).

ESCB = EUROPEAN SYSTEM OF CENTRAL BANKS

ESCHERICHIA COLI = ЭСХЭРИХИА КОЛИ – Escherichia Coli (E. Coli) is a common gut bacterium used as a model genetic organism. Escherichia Coli has about 3 000 genes and a genome of around 4 million basepairs.

ESCO = ENERGY SUPPLY COMPANY

ESCROW ACCOUNT = СЧЁТ УСЛОВНОГО ДЕПОНИРОВАНИЯ (или ЭСКРОУ СЧЁТ, или НОМИНАЛЬНЫЙ СЧЁТ) – (1) Written agreement authorizing funds to be held by a custodian, usually a bank or trust company. Banks typically hold escrow accounts for real estate taxes and property insurance due on mortgaged property. Escrow Account is special bank account into which earnings from sales (e.g., convertible currency proceeds from exports) are accumulated. These revenues are set aside for subsequent acquisition of goods and services from a foreign supplier. The escrowed money, usually interest-bearing, is disbursed by the bank to the foreign supplier under payment terms and against documents specified in the supplier's sale contract. / Счёт Эскроу – специальный условный счёт, на котором учитываются имущество, документы или денежные средства до наступления определённых обстоятельств или выполнения определённых обязательств. Услуги по открытию эскроу счетов в мировой практике могут оказывать банки, юридические компании, специализированные фирмы или другие эскроу агенты. Чаще всего такие счета применяются в торговых операциях. В США, например, эскроу счета широко используются в сделках с недвижимостью. В такой сделке участвуют три стороны:- покупатель, продавец и эскроу агент. Последний следит за ходом сделки купли-продажи недвижимости и выдаёт деньги с эскроу счёта продавцу в момент подписания всех необходимых документов. Сущность расчётов через такие счета заключается в том, что все ценности с него передаются эскроу агентом в пользу одной из сторон сделки только в том случае, если она выполнила свои обязательства по сделке перед другой стороной. В мировой практике эскроу счета используются наравне с такими инструментами, как инкассо, аккредитив, вексель. Использование счёта эскроу позволяет продавцу и покупателю обеспечить исполнение обязательств и минимизировать свои риски по срыву сделки или возможности мошенничества одной из её сторон. В России в 2012 был разработан проект Федерального Закона 'О внесении изменений в части первую, вторую, третью и четвертую Гражданского Кодекса РФ, а также в отдельные законодательные акты РФ'. В этом документе был прописан новый вид соглашения – договор условного депонирования (эскроу), а также новая разновидность банковского счёта – Счёт Эскроу. С 01 Июля 2014 новые положения ГК РФ, предусматривающие возможность осуществления расчётов посредством заключения договора счёта эскроу, вступили в силу. Счёту эскроу посвящены следующие статьи ГК РФ:- 860.7, 860.8, 860.9 и 860.10. В частности Статья 860.7. Договор Счёта Эскроу:- (1) По Договору Счёта Эскроу банк (эскроу агент) открывает специальный Счёт Эскроу для учёта и блокирования денежных средств, полученных им от владельца счёта (депонента) в целях их передачи другому лицу (бенефициару) при возникновении оснований, предусмотренных договором между банком, депонентом и бенефициаром. (2) Обязательства по договору счёта эскроу могут содержаться наряду с договором счёта эскроу в ином договоре, по которому эскроу агентом является банк. (3) Вознаграждение банка как эскроу агента не может взиматься из денежных средств, находящихся на счёте эскроу, если иное не предусмотрено договором. (4) К отношениям сторон в связи с открытием, обслуживанием и закрытием счёта эскроу применяются общие положения о банковском счёте, если иное не предусмотрено настоящей статьей и статьями 860.8–860.10 настоящего Кодекса или не вытекает из существа отношений сторон. Значительная часть выгодных сделок не заключается (либо их структура серьёзно усложняется) из-за неуверенности в том, что партнер по сделке выполнит все условия. Так, при купле-продаже продавец не уверен в том, что получит деньги за своё имущество, а покупатель не уверен в получении приобретаемого товара. Актуально это как при сделках между гражданами (например, при продаже автомобиля, квартиры), так и при масштабных сделках между юридическими лицами (продажа предприятий, объектов недвижимости и так далее). Стороны в таких случаях, даже желая осуществить безналичный расчёт, вынуждены использовать банковскую ячейку. Другой вариант – регистрация сделки за рубежом, используя иностранное право и специально созданные компании. Что уж говорить про расчёты по сложным соглашениям, включающим в себя элементы нескольких видов договоров. Между тем за рубежом (США, страны ЕС и другие страны с развитой экономикой) разработан, законодательно урегулирован и успешно применяется механизм защиты сторон от неисполнения обязательств – Эскроу (Escrow). Его можно трактовать как условное депонирование. Это одновременно и способ осуществления расчётов, и обеспечение оговорённых обязательств, что позволяет сторонам гарантировать исполнение сделки и минимизировать возможные риски. Конечно, Российское законодательство предусматривает меры, которые должны гарантировать исполнение обязательств. К ним относятся неустойка, залог, банковская гарантия и так далее. Но ни один из таких способов не защищает от ситуации, когда лицо просто скрывается с деньгами или же уходит от ответственности, скрывая имущество от взыскания. В иностранном праве эскроу – это трёхсторонняя сделка между эскроу агентом и, условно говоря, продавцом и покупателем. По этому соглашению одна сторона передаёт (депонирует) имущество (деньги, документы, иные ценности) лицензированному эскроу агенту до того момента, когда другая сторона исполнит свои обязательства. Эскроу Агент – поверенный для каждой стороны, независимое лицо, не имеющее своего интереса в сделке. Он должен действовать в строгих рамках договора, так как контроль над исполнением всех оговорённых условий – главная обязанность поверенного. При депонировании денежных средств или ценных бумаг используется специальный Счёт Эскроу. Он открывается эскроу агентом или банком, который может выступать в той же роли. Если все договорённости соблюдены, то агент передаёт имущество, деньги или ценные бумаги стороне, исполнившей обязательства. В противном случае имущество возвращается собственнику. Данный инструмент применяется за рубежом очень широко:- от купли-продажи жилой недвижимости до сделок слияния и поглощения, от сделок с ценными бумагами до реализации продуктов интеллектуальной деятельности. Удобство и рентабельность использования такой схемы расчётов сложно переоценить. Важно отметить, что за рубежом эскроу агент не только является независимой стороной, но и должен иметь обязательную лицензию (аккредитацию). При этом риск потери репутации и применения санкций (аннулирование лицензии, штрафы и тому подобное) также является гарантией надёжности и эффективности деятельности эскроу агента. В России были попытки законодательно закрепить популярный за рубежом инструмент, но они не были доведены до конца. Новый проект изменений в Гражданский Кодекс России предполагает

введение ‘Института Эскроу’, однако сегодня (2012-Октябрь-22) он вызывает много вопросов. Например, Российский вариант договора эскроу также является соглашением между двумя сторонами сделки и эскроу агентом, который получает от одной стороны имущество и передаёт его второй стороне в случае исполнения всех обязательств. В случае депонирования денежных средств или ценных бумаг эскроу агент также обязан открыть отдельный банковский счёт, но каковы гарантии его добросовестности, непонятно. Кроме того, в законопроекте остались неурегулированными следующие важные моменты:- общие требования к субъектам, которые могут действовать в качестве эскроу агентов; механизм и контроль их деятельности; режим распоряжения средствами на счетах, открытых эскроу агентом (который не является банком); переход обязанностей эскроу агента в случае прекращения его деятельности или смерти. Также стоит отметить, что должны быть внесены необходимые изменения в законодательство, регулирующее исполнительное производство, банкротство и налоговые правоотношения. Эскроу – это новый этап для отечественного контрактного права, призванный развивать бизнес и привлекать иностранные инвестиции. И нововведения, предлагаемые проектом изменений ГК, являются первым и очень значимым шагом в формировании цивилизованного эскроу сервиса в России. Данный институт может серьёзно повысить степень доверия к Российскому гражданскому обороту и, надеемся, вывести часть сделок с Российскими активами из зарубежных юрисдикций.

(2) Escrow Account:- money, securities or other property held by a third party until the conditions of a contract are met. / Денежные средства, ценные бумаги или иное имущество, удерживаемое третьей стороной до тех пор, пока не будут соблюдены условия контракта (договора). Эскроу – депонирование у третьего лица денежной суммы на имя другого лица с тем, чтобы она была выдана ему лишь после выполнения некоторого условия.

ESD = EXAMINATION SUPPORT DOCUMENT

ESFR = EARLY SUPPRESSION, FAST RESPONSE

ESOP = EMPLOYEE SHARE OWNERSHIP PLAN

ESP = EXCHANGEABLE SODIUM PERCENTAGE

ESP = EXCHANGE STOCK PORTFOLIO

ESP = EXPORTER’S SALE PRICE

ESP = SPANISH PESETA

ESPADRILLE = ЭСПАДРИЛЬ (или ХОЛЩОВАЯ ТУФЛЯ) – Espadrille:- a sandal usually having a fabric upper and a flexible sole. / сандалия, имеющая, как правило, тканевый верх и гибкую подошву. Холщовая туфля на верёвочной подошве.

ESPARTO = ЭСПАРТО (или ТРАВА АЛЬФА, или СОЛОМА) – Esparto or Stipa Tenacissima, a coarse grass grown in Southern Spain and Northern Africa, containing short fibers which are usually extracted by alkaline pulping processes. Esparto pulp is most often used in the production of book papers. Esparto is also known as Alfa, Esparto Grass and Spanish Grass. / .

ESPRIT = EUROPEAN STRATEGIC PROGRAM FOR RESEARCH AND DEVELOPMENT IN INFORMATION TECHNOLOGIES

ESS = EUROPEAN STATISTICAL SYSTEM

ESSENTIAL AMINO ACIDS = НЕЗАМЕНИМЫЕ АМИНОКИСЛОТЫ – Essential Amino Acids are those amino acids that are not made by the human body but must be taken in as part of the diet. Examples are lysine, tryptophan, and valine. / лизин (lysine). Под Незаменимыми Аминоксилотами понимаются аминокислоты, которые не синтезируются клетками животных и человека и поступают в организм в составе белков пищи. Для человека незаменимые аминокислоты:- валин, изолейцин, лейцин, лизин, метионин, треонин, триптофан, фенилаланин и в некоторых случаях аргинин (arginine). Для разных животных набор незаменимых аминокислот неодинаков. Отсутствие или недостаток незаменимых аминокислот приводит к остановке роста, падению массы, нарушениям обмена веществ, при острой недостаточности – к гибели организма. Под Аминокислотами понимается класс органических соединений, содержащих карбоксильные (–COOH) и аминогруппы ($–NH_2$); обладают свойствами и кислот, и оснований. Участвуют в обмене азотистых веществ всех организмов (исходные соединения при биосинтезе гормонов, витаминов, медиаторов, пигментов, пуриновых и пиримидиновых оснований, алкалоидов и других). Природных аминокислот свыше 150. Около 20 важнейших аминокислот служат мономерными звеньями, из которых построены все белки (порядок исключения аминокислот в них определяется генетическим кодом). Большинство микроорганизмов и растения синтезируют необходимые им аминокислоты; животные и человек не способны к образованию так называемых незаменимых аминокислот, получаемых с пищей. Освоен промышленный синтез (химический и микробиологический) ряда аминокислот, используемых для обогащения пищи, кормов, как исходные продукты для производства полиамидов, красителей и лекарственных препаратов.

ESSENTIAL ELEMENTS = НЕЗАМЕНИМЫЕ ЭЛЕМЕНТЫ – Essential Elements are those elements such as N, P, and, K that are required for plant growth.

ESSENTIAL OIL = ЭФИРНОЕ МАСЛО (или НЕЗАМЕНИМОЕ МАСЛО) – Essential Oil is a constituent part of spices that have a strong seasoning action and odor. / Под Эфирными Маслами понимаются летучие жидкости сложного состава; вырабатываются растениями и обусловливают их запах. Главные компоненты эфирных масел – терпены. Получают главным образом перегонкой с водяным паром богатых эфирными маслами частей растений. Применяют в парфюмерии (розовое, жасминное), пищевой промышленности (например, анисовое, укропное), медицине (мятное, эвкалиптовое). Биологическая роль эфирных масел в растениях окончательно не установлена. Эфирные Масла – общее название летучих жидких смесей органических соединений (главным образом терпенов и их производных), которые вырабатываются растениями и обусловливают их запах. Выделяют из растений перегонкой в водяным паром или экстрагированием. В наиболее крупных масштабах вырабатывают апельсиновое, гвоздичное, кориандровое, лимонное и некоторые другие эфирные масла. Применяются как душистые вещества в парфюмерии, производстве косметических средств, пищевой промышленности, как компоненты лекарственных препаратов и сырьё для получения индивидуальных душистых веществ.

EST = EASTERN STANDARD TIME

EST = ESTERASE

EST = ESTIMATE

ESTABLISH = ОБОСНОВЫВАТЬСЯ (или ОСНОВЫВАТЬСЯ, или УКОРЕНЯТЬСЯ) – Establish:- to begin; to become embedded and grow in the soil; to plant the crop; to be a part of a certain practice, functioning group, society, or organization.

ESTABLISHMENT = ОБОСНОВАНИЕ (или УКОРЕНЕНИЕ, или ЗАКРЕПЛЕНИЕ) – (1) Establishment is a perpetuation, for the foreseeable future, of a pest within an area after entry. / Обоснование (акклиматизация) вредителя это приживаемость на длительный период времени в обозримом будущем вредителя в ареале после его проникновения в этот ареал.

(2) Establishment (of a biological control agent) is the perpetuation, for the foreseeable future, of a biological control agent within an area after entry.

ESTER = СЛОЖНЫЙ ЭФИР – Ester is an organic compound with the general formula $R–C–O–R^2$ analogous to an inorganic salt. Esters are formed by reacting an acid with an alcohol, or by the exchange of a replaceable hydrogen atom of an acid for an organic alkyl radical. Esters of any monofunctional alcohols and organic acids are oily, fruity-smelling liquids, forming important families of solvents and plasticizers. When the alcohol selected is polyfunctional, that is, contains two or more –OH groups, and the acid is di- or polybasic, long chains of repeating units can be formed by their reaction. These are polyesters.

ESTERIFICATION = ЭСТЕРИФИКАЦИЯ (или ОБРАЗОВАНИЕ СЛОЖНОГО ЭФИРА) – Esterification is the chemical process of combining an acid and an alcohol to form an ester. Cellulose acetate is an ester formed by the reaction of acetic acid and the hydroxyl groups of cellulose. Polyethylene terephthalate, the most common fiber-forming polyester, is a product of esterification of teraphthalic acid with ethylene glycol. / Эстерификация – получение сложных эфиров при взаимодействии карбоновых кислот со спиртами.

ESTER INTERCHANGE = ВЗАИМООБМЕН СЛОЖНОГО ЭФИРА – Ester Interchange (ester exchange) is a reaction between an ester and another compound in which occurs an exchange of alkoxy or acyl groups, resulting in the formation of a different ester. When an ester is reacted with an alcohol, the process is called Alcoholysis; reaction between an ester and an acid is called Acidolysis. Tester interchanges are used in producing plasticizers, polyvinyl alcohol, acrylics, polyesters, and polycarbonates. See also Transesterification.

ESTHETICS = ЭСТЕТИКА – Esthetics or Aesthetics (also spelled æsthetics) is a branch of philosophy dealing with the nature of art, beauty, and taste, with the creation and appreciation of beauty. It is more scientifically defined as the study of sensory or sensori-emotional values, sometimes called judgments of sentiment and taste. More broadly, scholars in the field define aesthetics as 'critical reflection on art, culture and nature'. More specific aesthetic theory, often with practical implications, relating to a particular branch of the arts is divided into areas of aesthetics such as art theory, literary theory, film theory and music theory. The word Aesthetic is derived from the Greek αἰσθητικός (Aisthetikos, meaning 'Esthetic, Sensitive, Sentient'), which in turn was derived from αἰσθάνομαι (Aisthanomai, meaning 'I Perceive, Feel, Sense'). The term 'Aesthetics' was appropriated and coined with new meaning in the German form Æsthetik (modern spelling Ästhetik) by Alexander Baumgarten in 1734. From the late XVII to the early XX century Western aesthetics underwent a slow revolution into what is often called Modernism. German and British thinkers emphasised beauty as the key component of art and of the aesthetic experience, and saw art as necessarily aiming at absolute beauty. For Alexander Gottlieb Baumgarten aesthetics is the science of the sense experiences, a younger sister of logic, and beauty is thus the most perfect kind of knowledge that sense experience can have. For Immanuel Kant the aesthetic experience of beauty is a judgment of a subjective but similar human truth, since all people should agree that 'this rose is beautiful' if it in fact is. However, beauty cannot be reduced to any more basic set of features. For Friedrich Schiller aesthetic appreciation of beauty is the most perfect reconciliation of the sensual and rational parts of human nature. For Friedrich Wilhelm Joseph Schelling, the philosophy of art is the 'organon' of philosophy concerning the relation between man and nature. So aesthetics began now to be the name for the philosophy of art. Friedrich von Schlegel, August Wilhelm Schlegel, Friedrich Schleiermacher and Georg Wilhelm Friedrich Hegel have also given lectures on aesthetics as philosophy of art after 1800. For Hegel all culture is a matter of 'absolute spirit' coming to be manifest to itself, stage by stage, changing to a perfection that only philosophy can approach. Art is the first stage in which the absolute spirit is manifest immediately to sense-perception, and is thus an objective rather than subjective revelation of beauty. For Arthur Schopenhauer aesthetic contemplation of beauty is the most free that the pure intellect can be from the dictates of will; here we contemplate perfection of form without any kind of worldly agenda, and thus any intrusion of utility or politics would ruin the point of the beauty. It is thus for Schopenhauer one way to fight the suffering. The British were largely divided into intuitionist and analytic camps. The intuitionists believed that aesthetic experience was disclosed by a single mental faculty of some kind. For Anthony Ashley-Cooper, 3rd Earl of Shaftesbury this was identical to the moral sense, beauty just is the sensory version of moral goodness. For Ludwig Wittgenstein aesthetics consisted in the description of a whole culture which is a linguistic impossibility. That which constitutes aesthetics lies out side the realm of the language game. For Oscar Wilde the contemplation of beauty for beauty's sake, augmented by John Ruskin's search for moral grounding, was not only the foundation for much of his literary career but was quoted as saying 'Aestheticism is a search after the signs of the beautiful. It is the science of the beautiful through which men seek the correlation of the arts. It is, to speak more exactly, the search after the secret of life'. Wilde famously toured the United States in 1882. He travelled across the United States spreading the idea of Aesthetics in a speech called 'The English Renaissance'. In his speech he proposed that Beauty and Aesthetics was 'not languid but energetic. By beautifying the outward aspects of life, one would beautify the inner ones'. The English Renaissance was, he said, 'like the Italian Renaissance before it, a sort of rebirth of the spirit of man'. For Francis Hutcheson beauty is disclosed by an inner mental sense, but is a subjective fact rather than an objective one. Analytic theorists like Henry Home, Lord Kames, William Hogarth, and Edmund Burke hoped to reduce beauty to some list of attributes. Hogarth, for example, thinks that beauty consists of:- (1) fitness of the parts to some design; (2) variety in as many ways as possible; (3) uniformity, regularity or symmetry, which is only beautiful when it helps to preserve the character of fitness; (4) simplicity or distinctness, which gives pleasure not in itself, but through its enabling the eye to enjoy variety with ease; (5) intricacy, which provides employment for our active energies, leading the eye on 'a wanton kind of chase'; and (6) quantity or magnitude, which draws our attention and produces admiration and awe. Later analytic aestheticians strove to link beauty to some scientific theory of psychology (such as James Mill) or biology (such as Herbert Spencer). Post-Modern Aesthetics and Psychoanalysis:- early-XX-century artists, poets and composers challenged existing notions of beauty, broadening the scope of art and aesthetics. In 1941, Eli Siegel, American philosopher and poet, founded Aesthetic Realism, the philosophy that reality itself is aesthetic, and that 'The world, art, and self explain each other:- each is the aesthetic oneness of opposites'. Various attempts have been made to define Post-modern aesthetics. The challenge to the assumption that beauty was central to art and aesthetics, thought to be original, is actually continuous with older aesthetic theory; Aristotle was the first in the Western tradition to classify 'beauty' into types as in his theory of drama, and Kant made a distinction between beauty and the sublime. What was new was a refusal to credit the higher status of certain types, where the taxonomy implied a preference for tragedy and the sublime to comedy and the Rococo. Croce suggested that 'expression' is central in the way that beauty was once thought to be central. George Dickie suggested that the sociological institutions of the art world were the glue binding art and sensibility into unities. Marshall McLuhan suggested that art always functions as a 'counter-environment' designed to make visible what is usually invisible about a society. Theodor Adorno felt that aesthetics could not proceed without confronting the role of the culture industry in the commodification of art and aesthetic experience. Hal Foster attempted to portray the reaction against beauty and Modernist art in The Anti-Aesthetic:- Essays on Postmodern Culture. Arthur Danto has described this reaction as 'Kalliphobia' (after the Greek word for beauty – 'Kalos'). André Malraux explains that the notion of beauty was connected to a particular conception of art that arose with the Renaissance and was still

dominant in the XVIII century (but was supplanted later). The discipline of aesthetics, which originated in the XVIII century, mistook this transient state of affairs for a revelation of the permanent nature of art. Brian Massumi suggests to reconsider beauty following the aesthetical thought in the philosophy of Deleuze and Guattari. Daniel Berlyne created the field of experimental aesthetics in the 1970s, for which he is still the most cited individual decades after his death. Pneumaist aestheticism is a theory of art and a highly experimental approach to art negating historical preconceptions of the aesthetic. Jean-François Lyotard re-invokes the Kantian distinction between taste and the sublime. Sublime painting, unlike kitsch realism, '... will enable us to see only by making it impossible to see; it will please only by causing pain'. Sigmund Freud inaugurated aesthetical thinking in Psychoanalysis mainly via the 'Uncanny' as aesthetical affect. Following Freud and Merleau-Ponty, Jacques Lacan theorized aesthetics in terms of sublimation and the Thing. Guy Sircello pioneered efforts in analytic philosophy to develop a rigorous theory of aesthetics, focusing on the concepts of beauty, love and sublimity. In contrast to romantic theorists Sircello argued for the objectivity of beauty and formulated a theory of love on that basis. See also Aesthetics. / Вильэм . Андре Мальро (André Malraux). Дьжеймз (James). Смотрите также Эстетика (Aesthetics). Под Эстетикой понимается наука, изучающая прекрасное в действительности, особенности эстетического осознания человеком мира и общие принципы творчества по законам красоты, в том числе законы развития искусства как особой формы эстетического отражения действительности. Под Эстетикой, от Греческого слова Aisthētikós, означающее Чувственно Воспринимаемый или Чувственный или Чувствующий, понимается наука о закономерностях эстетического освоения человеком мира, о сущности и формах творчества по законам красоты. Эстетика родилась около 2.5 тысяч лет назад, в эпоху рабовладельческого общества – в Египте, Вавилоне, Индии и Китае. Большое развитие получила в античной Греции и в Древнем Риме. Материалистическую тенденцию проводили в своих трудах древнегреческий философ-материалист Демокрит (Democritus; около 460–около 370 до Нашей Эры), древнегреческий философ и энциклопедический учёный Аристотель (Aristotle; 384–322 до Нашей Эры), Греческий философ-материалист и атеист эпохи эллинизма Эпикур (Epicurus; 341–270 до Нашей Эры), Римский поэт и философ-материалист Тит Лукреций Кар (Titus Lucretius Carus; около 99–55 до Нашей Эры) и другие, утверждавшие объективную основу прекрасного, которую они находили в вещественных свойствах, связях, отношениях, закономерностях реальной действительности, вопреки идеалистическому учению древнегреческого философа-идеалиста Платона (Plato или Plátōn; 428/427–348/347 до Нашей Эры), согласно которому прекрасное есть абсолютная, вечная и неизменная, надчувственная идея, а воспроизводимые искусством чувственные вещи являются лишь отблеском этой идеи. В борьбе с мистическими учениями Западного средневековья о 'божественной красоте' (Епископ Гиппонский (в Северной Африке), христианский богослов и философ-мистик, Блаженный Аурэлиус Аугустинус Санктус (или Аврелий Августин Санктус; Aurelius Augustinus Sanctus; 354–430); Итальянский средневековый католический теолог, монах-Доминиканец Фома Аквинский (St Thomas Aquinas; 1225 или 1226–74)) развивались гуманистические реалистические тенденции в трудах мыслителей, писателей, художников Эпохи Возрождения (Итальянский поэт Франчэско Пэтрарка (Francesco Petrarca; 1304–74); Итальянский учёный, архитектор, теоретик Леон Баттиста Альбэрти (Leon Battista Alberti; 1404–72); Итальянский живописец, скульптор, архитектор, учёный, инженер Леонардо да Винчи (Leonardo da Vinci; 1452–1519); Немецкий живописец и график Альбрэхьт Дюра (Albrecht Dürer; 1471–1528); Итальянский философ-пантеист и поэт Дьжордано Бруно (Giordano Bruno; 1548–1600); Французский философ Мишэль Экем дё Монтэньэ (Michel Eyquem de Montaigne; 1533–92) и другие). Преодолевая идеи аристократической эстетики, устверждают связь искусства с реальной жизнью теоретики Просвещения (Французский философ, просветитель Дёни Дидро (Denis Diderot; 1713–84); Французский философ, социолог и эстетик Жо-Жакь Русу (или Руссо; Jean-Jacques Rousseau; 1712–78); Немецкий просветитель, историк и теоретик искусства Йохан Йоахим Винкельман (Johann Joachim Winckelmann; 1717–68); Немецкий просветитель, философ, публицист, драматург, критик и теоретик искусства Готхольд Эфраим Лессин (Gotthold Ephraim Lessing; 1729–81); и Немецкий философ-просветитель, писатель, литературовед Йохан Готфрид Хэрда (или Гердер; Johann Gottfried Herder; 1744–1803)), а также продолжатели их традиций Немецкий поэт, философ и эстетик Фридрихь Шиля (Friedrich Schiller; 1759–1805) и Немецкий поэт, естествоиспытатель и мыслитель Йохан Вольфганг фон Гётэ (Johann Wolfgang von Goethe; 1749–1832). Немецкий философ и учёный Иммануэль Кант (Immanuel Kant; 1724–1804) выдвигает положение о полной 'незаинтересованности' эстетического суждения. Противопоставив красоту пользе, совершенство художественной формы – идейному содержанию, он оказал влияние на развитие формалистической эстетики. В основу объяснения эстетической деятельности Немецкий философ, объективный идеалист Георг Вильхэльм Фридрихь Хегель (Georg Wilhelm Friedrich Hegel; 1770–1831) кладёт принципы историзма и противоречия, что позволяет ему сопоставить эстетическую деятельность с противоречивым характером капиталистического производства, выявить значение труда для понимания сущности эстетического. Однако, будучи объективным идеалистом, Гегель определяет искусство как первую и несовершенную форму абсолютного духа. Немецкий философ-материалист Людвихь Фойэбах (или Феербах; Ludwig Feuerbach; 1804–72) пытался вывести красоту непосредственно из физических свойств предметов и явлений, а эстетические чувства и вкусы – из биологических закономерностей, из 'природы' человека. Своё высшее развитие домарксовская эстетика получила в трудах Русских революционных демократов Виссариона Григорьевича Белинского (1811–48), Николая Гавриловича Чернышевского (1828–89), Николая Александровича Добролюбова (1836–61) (разработка закономерностей реалистического искусства, принципов идейности и народности искусства и так далее). Проблематика и задачи Марксистско-Ленинской эстетики определяются главным образом тем, что её специфический предмет – эстетическое освоение человеком мира – состоит из трёх неразрывно связанных между собой сторон:- (1) эстетического в объективной действительности; (2) субъективно-эстетического (эстетическое сознание); и (3) искусства (как своеобразного единства субъективно- и объективно-эстетического). Эстетика изучает сущность, закономерности и конкретные проявления всех этих сторон в их диалектическом единстве. Основные эстетические категории – прекрасное и безобразное, возвышенное и низменное, драматизм, трагическое и комическое, героическое – раскрываются как своеобразное проявление эстетического освоения мира в каждой из областей общественного бытия, человеческой жизни – в производственно-трудовой и общественно-политической деятельности, в отношении к природе, в культуре и быту и так далее. Субъективная сторона эстетического освоения – эстетические чувства, вкусы, оценки, переживания, идеи, идеалы рассматриваются Марксистско-Ленинской эстетикой как специфическая форма отражения и воплощения объективных жизненных процессов и отношений. Являясь, как и философия, мировоззренческой наукой, эстетика ставит во главу угла своей проблематики решение вопроса об отношении эстетического сознания и искусства к общественному бытию, к человеческой жизни.

ESTIMATED DELIVERY DATE = РАСЧЁТНАЯ ДАТА ПОСТАВКИ – Estimated Delivery Date is the date and time a package or shipment is expected to be delivered to a given destination. / Под Расчётной Датой Поставки понимается дата и время, в которые пакет или груз ожидаются прибытием в место назначения.

ESTIMATED LAST TRADING DATE = РАСЧЁТНЫЙ ПОСЛЕДНИЙ ДЕНЬ ТОРГОВЛИ – Estimated Last Trading Date is a day on which trading ceases for the maturing (current) delivery month. / День, в который заканчивается торговля погашающимся (текущим) месяцем поставки.

ESTIMATED TIME OF AVAILABILITY = РАСЧЁТНОЕ ВРЕМЯ ГОТОВНОСТИ – Estimated Time Of Availability:- that time when a tractor/partner carrier is available for dispatch. / То время, когда тягач/тягач в сцепке готовы к отправке.

ESTIMATED VALUE = РАСЧЁТНАЯ СТОИМОСТЬ – Estimated Value is a value of a real estate property or other asset estimated on the basis of an expert analysis. Also known as Appraised Value.

ESTTA = ELECTRONIC SYSTEM FOR TRADEMARK TRIALS AND APPEALS

ESTUARINE = ЭСТУАРНОЕ (или ЭСТУАРИЙНОЕ) – Estuarine:- associated with estuaries or river mouths, usually in brackish conditions. / Эстуарийное:- ассоциируемое с эстуариями или устьями рек, обычно в солоноватых условиях. Под Эстуарием, от Латинского слова Aestuarium, означающее Затопляемое Устье Реки, понимается однорукавное воронкообразное устье реки, расширяющееся в сторону моря.

ESTUARY = ЭСТУАРИЙ – Estuary is the mouth of a river where the salty ocean tide meets the current of a stream. / Под Эстуарием, от Латинского слова Aestuarium, означающее Затопляемое Устье Реки, понимается однорукавное воронкообразное устье реки, расширяющееся в сторону моря.

E–TALLING = ELECTRONIC RETAILING

ÉTAMINE = ЕТАМИН (или КИСЕЯ) – An Étamine is a thin, slightly glossy fabric used principally for women's dress goods. Being a very popular material for summer wear, it is usually made in what is commonly known as a Piece Dyed Fabric that is, woven with undyed yarn. A good reason for making it a piece dyed fabric is that it is much cheaper than, if the yarn is dyed previous to the weaving. Étamines are dyed in almost any color. Blue, black, red and various shades of drabs seem, to be very popular. The interlacing of the warp and weft is on the one and one order, or plain weave. The openness or transparency of the fabric is due partly to the smooth, hard-twisted yarn and partly to the weave. Étamines were originally made with worsted yarns, which, of course, are much more expensive; however, if a good quality of cotton is used there is little difference in appearance between worsted and cotton étamines. The difference would be chiefly in the wearing quality, worsted of course being more durable. The principal feature of an étamine is to have it a crisp glossy and an open fabric. Analysis of Fabric:- width of warp in reed, 27% inches; width of fabric finished, 26 inches. Heed, 500 – 2 ends per dent. Total ends in warp 740, including selvedge. Take-up of warp during weaving, 12 per cent. Weight of fabric from loom, 3 ounces per yard; weight of fabric, finished, 3 ounces per yard. No shrinkage during the finishing process. Generally, however, the mill of the second division is used. The cotton used would be peeler of about Xhi inches length of staple. A number of bales (enough for a mixing) should be brought from the cotton shed and placed in the picker room. The overseer should sample each of the bales and those not up to staple should be placed to one side. Several of the other bales should be placed around the bale breaker and a little fed to the breaker from each bale alternately This will help to produce a more even mixing, which will help to give a more evenly finished yarn. Loom required:- this character of fabric could be woven on any roller or dobby loom, a roller loom being preferable, principally on account of the comparatively low rate of expense the latter could be operated at. Finish:- étamines, as before mentioned, are usually woven with undyed yarns, or in the gray. The cloth, after reaching the dyehouse, is first subjected to a scouring process, then dyed, after which it is given a medium sizing; then it is calendered, which in a great measure accentuates the gloss upon the fabric and also imparts to it the crisp feeling which characterizes an étamine. It is then measured rolled and papered, after which it is ready for the merchant. Cotton étamine sells from 12 cents to 20 cents per yard. Carding and Spinning Particulars. The cloth of which the weaving particulars have been given is sometimes made of all cotton yarn or a combination of cotton and wool or cotton and linen, or a combination of wool, silk linen and cotton fibers. For the carding and spinning particulars of this lesson we will consider that the fabric is made up of cotton yarns in both the warp and filling. Étamine is a light cotton or worsted fabric with an open mesh. / Этамин (Étamine). В основе и уточине.

ETAS = ELECTRONIC TRADEMARK ASSIGNMENT SYSTEM

ETB = ETHIOPEAN BIRR

ETC = ELECTRONIC TRADE CONFIRMATION

ETC = EMERGING TECHNOLOGY CENTER

ETC = EQUIPMENT TRANSFER CHARGES

ETC = ET CETERA

ETC = EXPORT TRADING COMPANY

ET CAETERA = ЭТ КАЭТЭРА – Et Caetera:- in Latin, And The Rest; And So Forth. / Выражение 'Эт Каэтэра' на Латинском языке означает 'И Так Далее'.

ET CETERA = ЭТ КЭТЭРА – Et Cetera, often abbreviated to Etc, &c or &/c especially in older texts, is Latin for And The Others. It is often used to represent the logical continuation of some sort of series of descriptions. For example, it is important to avoid the phrase 'and etc' because then you are saying 'and and the others'. / Выражение 'Эт Кэтэра' или 'Эт Сэтэра', часто используемое в виде сокращений Etc, &c или &/c, особенно в старинных текстах, в переводе с Латинского языка означает 'И Прочее' или 'И Тому Подобное'. Оно часто используется при предоставлении логического продолжения какого-то сорта серий описаний, В частности, важно избегать фразу 'И Эт Кэтэра', поскольку таким образом было бы сказано 'И И Прочие'.

ETCHANT = ТРАВИТЕЛЬ (или ТРАВИЛЬНЫЙ РАСТВОР) – In textile terms, Etchant is a chemical that is used to break down fibers so that they can be removed for purposes of patterning; often called 'Burn-Out' Solution or Paste. A velvet that has rayon pile and silk base fabric may be etched to remove patterns of pile in a technique called Devoré. This would require an acid etchant that would attack the rayon, but not the silk. Etchants for cellulose fibers are often based on sulfuric acid or sodium bisulfate, with a thickener added to improve control in application. Etchants for protein fibers are made from strong bases such as sodium hydroxide. All fiber etchants are likely to be quite caustic, and should be handled carefully. / Devoré:- (1) Дэворе; (2) Пожирать; (3) Съедать. сильное основание (strong base).

ETCHING = ВЫТРАВКА (или ТРАВЛЕНИЕ) – Etching is the process of using strong acid or mordant to cut into the unprotected parts of a metal surface to create a design in intaglio in the metal (the original process – in modern manufacturing other chemicals may be used on other types of material). As an intaglio method of printmaking, it is, along with engraving, the most important technique for old master prints, and remains in wide use today. In pure etching, a metal (usually copper, zinc or steel) plate is covered with a waxy ground which is resistant to acid. The artist then scratches off the ground with a pointed etching needle where he or she wants a line to appear in the finished piece, so exposing the bare metal. The échoppe, a tool with a slanted oval section, is also used for 'swelling' lines. The plate is then dipped in a bath of acid, technically called the Mordant (French for 'Biting') or Etchant, or has acid washed over it. The acid 'bites' into the metal, where it is exposed, leaving behind lines sunk into the plate. The remaining ground is then cleaned off the plate. The plate is inked all over, and then the ink wiped off the surface, leaving only the ink in the etched lines. The plate is then put through a high-pressure printing press together with a sheet of paper (often moistened to soften it). The paper picks up the ink from the etched lines, making a print. The process can be repeated many times; typically several hundred impressions (copies) could be printed before the plate shows much sign of wear. The work on the plate can also be added to by repeating the whole process; this creates an etching which exists in more than one state. Etching has often been combined with other intaglio techniques such as engraving (e.g., Rembrandt) or aquatint (e.g., Goya). Origin:- etching by goldsmiths and other metal-workers in order to decorate metal items such as guns, armour, cups and plates has been known in Europe since the Middle Ages at least, and may go back to antiquity. The elaborate decoration of armour, in Germany anyway, was an art probably imported from Italy around the end of the XV century – little earlier than the birth of etching as a printmaking technique. The process as applied to printmaking is believed to have been invented by Daniel Hopfer (circa 1470–1536) of Augsburg, Germany. Hopfer was a craftsman who decorated armour in this way, and applied the method to printmaking, using iron plates (many of which still exist). Apart from his prints, there are two proven examples of his work on armour:- a shield from 1536 now in the Real Armeria of Madrid and a sword in the Germanisches Nationalmuseum of Nuremberg. An Augsburg horse armour in the German Historical Museum, Berlin, dating to between 1512 and 1515, is decorated with motifs from Hopfer's etchings and woodcuts, but this is no evidence that Hopfer himself worked on it, as his decorative prints were largely produced as patterns for other craftsmen in various media. The switch to copper plates was probably made in Italy, and thereafter etching soon came to challenge engraving as the most popular medium for artists in printmaking. Its great advantage was that, unlike engraving which requires special skill in metalworking, etching is relatively easy to learn for an artist trained in drawing. Callot's innovations:- échoppe, hard ground, stopping-out:- Jacques Callot (1592–1635) from Nancy in Lorraine (now part of France) made important technical advances in etching technique. He developed the échoppe, a type of etching-needle with a slanting oval section at the end, which enabled etchers to create a swelling line, as engravers were able to do. Callot also appears to have been responsible for an improved, harder, recipe for the etching ground, using lute-makers' varnish rather than a wax-based formula. This enabled lines to be more deeply bitten, prolonging the life of the plate in printing, and also greatly reducing the risk of 'foul-biting', where acid gets through the ground to the plate where it is not intended to, producing spots or blotches on the image. Previously the risk of foul-biting had always been at the back of an etcher's mind, preventing him from investing too much time on a single plate that risked being ruined in the biting process. Now etchers could do the highly detailed work that was previously the monopoly of engravers, and Callot made full use of the new possibilities. Callot also made more extensive and sophisticated use of multiple 'stoppings-out' than previous etchers had done. This is the technique of letting the acid bite lightly over the whole plate, then stopping-out those parts of the work which the artist wishes to keep light in tone by covering them with ground before bathing the plate in acid again. He achieved unprecedented subtlety in effects of distance and light and shade by careful control of this process. Most of his prints were relatively small – up to about six inches or 15 cm on their longest dimension, but packed with detail. One of his followers, the Parisian Abraham Bosse, spread Callot's innovations all over Europe with the first published manual of etching, which was translated into Italian, Dutch, German and English. The XVII century was the great age of etching, with Rembrandt, Giovanni Benedetto Castiglione and many other masters. In the XVIII century, Piranesi, Tiepolo and Daniel Chodowiecki were the best of a smaller number of fine etchers. In the XIX and early-XX century the Etching revival produced a host of lesser artists, but no really major figures. Etching is still widely practiced today. Variants:- (i) Aquatint Etching:- Aquatint uses acid-resistant resin to achieve tonal effects. (ii) Soft-Ground Etching:- uses a special softer ground. The artist places a piece of paper (or cloth etc in modern uses) over the ground and draws on it. The print resembles a drawing. (iii) Relief Etching:- was invented by William Blake in about 1788, and he has been almost the only artist to use it in its original form. However from 1880–1950 a photo-mechanical ('line-block') variant was the dominant form of commercial printing for images. A similar process to etching, but printed as a relief print, so it is the 'white' background areas which are exposed to the acid, and the areas to print 'black' which are covered with ground. Blake's exact technique remains controversial. He used the technique to print texts and images together, writing the text and drawing lines with an acid-resistant medium. (iv) Nontoxic Etching:- growing concerns about the health effects of acids and solvents led to the development of less toxic etching methods in the late XX century. An early innovation was the use of floor wax as a hard ground for coating the plate. Others, such as printmakers Mark Zaffron and Keith Howard, developed systems using acrylic polymers as a ground and ferric chloride for etching. The polymers are removed with sodium carbonate (washing soda) solution, rather than solvents. When used for etching, ferric chloride does not produce a corrosive gas, as acids do, thus eliminating another danger of traditional etching. The traditional aquatint, which uses either powdered rosin or enamel spray paint, is replaced with an airbrush application of the acrylic polymer hard ground. Again, no solvents are needed beyond the soda ash solution, though a ventilation hood is needed due to acrylic particulates from the air brush spray. The traditional soft ground, requiring solvents for removal from the plate, is replaced with water-based relief printing ink. The ink receives impressions like traditional soft ground, resists the ferric chloride etchant, yet can be cleaned up with warm water and either soda ash solution or ammonia. Anodic etching has been used in industrial processes for over a century. The etching power is a source of direct current. The item to be etched (anode) is connected to its positive pole. A receiver plate (cathode) is connected to its negative pole. Both, spaced slightly apart, are immersed in a suitable aqueous solution of a suitable electrolyte. The current pushes the metal out from the anode into solution and deposits it as metal on the cathode. Shortly before 1990, two groups working independently developed different ways of applying it to creating intaglio printing plates. In the patented Electroetch system, invented by Marion and Omri Behr, in contrast to certain nontoxic etching methods, an etched plate can be reworked as often as the artist desires. The system uses Voltages below 2 Volts which exposes the uneven metal crystals in the etched areas resulting in superior ink retention and printed image appearance of quality equivalent to traditional acid methods. With polarity reversed the low voltage provides a simpler method of making mezzotint plates as well as the 'steel facing' copper plates. Some of the earliest printmaking workshops experimenting with, developing and promoting nontoxic techniques include Grafisk Eksperimentarium, in Copenhagen, Denmark, Edinburgh Printmakers, in Scotland, and

New Grounds Print Workshop, in Albuquerque, New Mexico. (v) Photo-Etching:- light sensitive polymer plates allow for photorealistic etchings. A photo-sensitive coating is applied to the plate by either the plate supplier or the artist. Light is projected onto the plate as a negative image to expose it. Photopolymer plates are either washed in hot water or under other chemicals according to the plate manufacturers' instructions. Areas of the photo-etch image may be stopped-out before etching to exclude them from the final image on the plate, or removed or lightened by scraping and burnishing once the plate has been etched. Once the photo-etching process is complete, the plate can be worked further as a normal intaglio plate, using drypoint, further etching, engraving, etc. The final result is an intaglio plate which is printed like any other. Etching is also used in the manufacturing of printed circuit boards and semiconductor devices, on glass, and in the preparation of metallic specimens for microscopic observation. See also Burn-Out Printing, and Printing. / эмаль (enamel). обработка металла (metalworking). эшоп (échoppe = Ларёк или Лавочка или Мастерская или Хибарка или Домишко или Домик). ETH = EIDGENÖSSISCHE TECHNISCHE HOCHSCHULE

ETHANE = ЭТАН – Ethane is a chemical compound with chemical formula C_2H_6. At standard temperature and pressure, ethane is a colorless, odorless gas. Ethane is isolated on an industrial scale from natural gas, and as a byproduct of petroleum refining. Its chief use is as petrochemical feedstock for ethylene production. Ethane was first synthetically created in 1834 by Michael Faraday, applying electrolysis of a potassium acetate solution. He mistook the hydrocarbon product of this reaction for methane, and did not investigate it further. During the period 1847–49, in an effort to vindicate the radical theory of organic chemistry, Hermann Kolbe and Edward Frankland produced ethane by the reductions of propionitrile (ethyl cyanide) and ethyl iodide with potassium metal, and, as did Faraday, by the electrolysis of aqueous acetates. They, however, mistook the product of these reactions for methyl radical, rather than the dimer of methyl, ethane. This error was corrected in 1864 by Carl Schorlemmer, who showed that the product of all these reactions was in fact ethane. The name Ethane is derived from the IUPAC (short for the International Union of Pure and Applied Chemistry) nomenclature of organic chemistry. 'Eth-' refers to the presence of 2 carbon atoms, and '-ane' refers to the presence of a single bond between them. After methane, ethane is the second-largest component of natural gas. Natural gas from different gas fields varies in ethane content from less than 1% to over 6% by volume. Prior to the 1960s, ethane and larger molecules were typically not separated from the methane component of natural gas, but simply burnt along with the methane as a fuel. Today, however, ethane is an important petrochemical feedstock, and it is separated from the other components of natural gas in most well-developed gas fields. Ethane can also be separated from petroleum gas, a mixture of gaseous hydrocarbons that arises as a byproduct of petroleum refining. Economics of building and running processing plants can change, however. If the relative value of sending the unprocessed natural gas to a consumer exceeds the value of extracting ethane, then the plant may not be run. This can cause operational issues managing the changing quality of the gas in downstream systems. Ethane is most efficiently separated from methane by liquefying it at cryogenic temperatures. Various refrigeration strategies exist: the most economical process presently in wide use employs turboexpansion, and can recover over 90% of the ethane in natural gas. In this process, chilled gas expands through a turbine; as it expands, its temperature drops to about –100 °C. At this low temperature, gaseous methane can be separated from the liquefied ethane and heavier hydrocarbons by distillation. Further distillation then separates ethane from the propane and heavier hydrocarbons. The chief use of ethane is in the chemical industry in the production of ethene (ethylene) by steam cracking. When diluted with steam and briefly heated to very high temperatures (900 °C or more), heavy hydrocarbons break down into lighter hydrocarbons, and saturated hydrocarbons become unsaturated. Ethane is favored for ethene production because the steam cracking of ethane is fairly selective for ethene, while the steam cracking of heavier hydrocarbons yields a product mixture poorer in ethene, and richer in heavier alkenes (olefins) such as propene (propylene) and butadiene, and in aromatic hydrocarbons. Experimentally, ethane is under investigation as a feedstock for other commodity chemicals. Oxidative chlorination of ethane has long appeared to be a potentially more economical route to vinyl chloride than ethene chlorination. Many processes for carrying out this reaction have been patented, but poor selectivity for vinyl chloride and corrosive reaction conditions (specifically, a hydrochloric acid-containing reaction mixture at temperatures greater than 500 °C) have discouraged the commercialization of most of them. Presently, INEOS (INEOS Group Limited is a privately owned multinational chemicals company consisting of 15 standalone business units, headquartered in Rolle, Switzerland and with its registered office in Lyndhurst, the United Kingdom) operates a 1 000 t/a (tons per annum) ethane-to-vinyl chloride pilot plant at Wilhelmshaven in Germany. Similarly, the Saudi Arabian firm SABIC (short for the Saudi Basic Industries Corporation) has announced construction of a 30 000 tons per annum plant to produce acetic acid by ethane oxidation at Yanbu. This economic viability of this process may rely on the low cost of ethane near Saudi oil fields, and it may not be competitive with methanol carbonylation elsewhere in the world. Ethane can be used as a refrigerant in cryogenic refrigeration systems. On a much smaller scale, in scientific research, liquid ethane is used to vitrify water-rich samples for electron microscopy (cryo-electron microscopy). A thin film of water, quickly immersed in liquid ethane at –150 °C or colder, freezes too quickly for water to crystallize. This rapid freezing does not disrupt the structure of soft objects present in the liquid state, as the formation of ice crystals can do. At room temperature, ethane is a flammable gas. When mixed with air at 3.0–12.5% by volume, it forms an explosive mixture. Some additional precautions are necessary where ethane is stored as a cryogenic liquid. Direct contact with liquid ethane can result in severe frostbite. In addition, the vapors evaporating from liquid ethane are, until they warm to room temperature, heavier than air and can creep along the ground or gather in low places, and if they encounter an ignition source, can flash back to the body of ethane from which they evaporated. Containers recently emptied of ethane may contain insufficient oxygen to support life. Beyond this asphyxiation hazard, ethane poses no known acute or chronic toxicological risk. It is not known or suspected to be a carcinogen. Ethane is a component of natural gas consisting of two carbon atoms and six hydrogen atoms, condenses into a liquid at relatively low temperature and pressure. Ethane, is a colorless, odorless, gaseous hydrocarbon (compound of hydrogen and carbon), belonging to the paraffin series; its chemical formula is C_2H_6. Ethane is structurally the simplest hydrocarbon that contains a single carbon-carbon bond. The second most important constituent of natural gas,

it also occurs dissolved in petroleum oils and as a by-product of oil refinery operations and of the carbonization of coal. The industrial importance of ethane is based upon the ease with which it may be converted to ethylene (C_2H_4) and hydrogen by pyrolysis, or cracking, when passed through hot tubes. Like propane and, to a lesser extent, butane, ethane is a major raw material for the huge ethylene petrochemical industry, which produces such important products as polyethylene plastic, ethylene glycol, and ethyl alcohol. More than 90 percent of the ethane produced in the 1960s was burned as fuel without separation from natural gas. Ethane gas can be liquefied under pressure or at reduced temperatures and thus be separated from natural gas. Unlike propane, liquid ethane is not in common use as an industrial or domestic fuel. / Английский учёный Майкэл Фэрэдэй (Michael Faraday; 1791–1867). Немецкий химик Хэрман Кольбэ (Hermann Kolbe; 1818–1884) и Британский химик Сэр Эдвод Фрэньклэнд (Sir Edward Frankland; 1825–1899). Эта ошибка была исправлена в 1864 Немецким химиком Карлем Шорлема (Carl Schorlemmer; 1834–1892). Инеос Груп Лимитид (INEOS Group Limited). САБИК (SABIC; Сауди Бэйсик Индэстриз Корпорэйшэн (Saudi Basic Industries Corporation)). Компонент природного газа, состоящий из двух атомов углерода и шести атомов водорода, который превращается в жидкость при относительно низких температуре и давлении. Этан, $CH_3–CH_3$ или H_3CCH_3, бесцветный газ, $t_{кип}$ –88.6 °C. Содержится в нефти, природном горючем газе и газах нефтепереработки. Сырьё в промышленном органическом синтезе.

ETHANOL = ЭТАНОЛ (или ЭТИЛОВЫЙ СПИРТ) – Ethanol is a flammable, colorless, slightly toxic chemical compound with a distinctive perfume-like odor, and is the alcohol found in alcoholic beverages. In common usage, it is often referred to simply as Alcohol. There are two types of ethanol:- (i) Absolute Ethanol (1% воды) and (ii) Denatured Alcohol. The largest single use of ethanol is as a motor fuel and fuel additive. The largest national fuel ethanol industries exist in Brazil (gasoline sold in Brazil contains at least 20% ethanol and hydrous ethanol is also used as fuel). One method of production is through fermentation of sugar. Ethanol creates very little pollution when burned. Millions more acres of land are needed if ethanol is to be used to replace gasoline. Pure ethanol has a lower energy content than gasoline (about 30% less energy per unit volume). At gas stations, ethanol is contained in a mix of ethanol and gasoline, otherwise known as Gasohol. In the United States, the color yellow (symbolizing the color of corn) has become associated with the fuel and is commonly used on fuel pumps and labels. Growth in fuel ethanol in the United States is largely being driven by financial incentives that naturally exist when oil prices are over a certain level, as ethanol typically costs under USD1.50 per gallon to manufacture (of course this is sensitive to corn prices) and is exempt from the USD0.52 per gallon federal gasoline tax. However, the United States RFS (renewable fuel standard) requires that 4 billion gallons of 'renewable fuel' be used in 2006 and this requirement will grow to 7.5 billion gallons per annum by 2012. Also known as Ethyl Alcohol, and Grain Alcohol. Ethanol is a biofuel that can be used as a fuel substitute (hydrous ethanol) or a fuel extender (anhydrous ethanol) in mixes with petroleum, and which is produced from agricultural feed-stocks such as Sugar Cane and Maize. With so many variables at work in the pricing of Ethanol, the presence of a price benchmark is critical to the growth and economic stability of the ethanol industry. The New York Board of Trade® (NYBOT®) has created a world ethanol futures and options marketplace to bring some order to this unpredictable pricing picture. The global importance of the sugar trade provides a critical basis for the establishment of the ethanol futures market. The size of the new ethanol contract (7 750 gallons) represents a close approximation of the amount of ethanol that can be produced from 112 000 pounds of raw sugar (the size of the Sugar No. 11 futures contract traded on the NYBOT® exchanges). The ethanol (anhydrous, undenatured alcohol) deliverable against the contract does not specify sugar-based ethanol. The contract treats all ethanol as ethanol and makes no distinction, very much in the same way that the world Sugar No. 11 contract makes no distinction between sugar produced from beets or cane The global importance of the sugar trade provides a critical basis for the establishment of the ethanol futures market. The size of the new ethanol contract (7 750 gallons) represents a close approximation of the amount of ethanol that can be produced from 112 000 pounds of raw sugar (the size of the Sugar No. 11 futures contract). The ethanol (anhydrous, undenatured alcohol) deliverable against the contract does not specify sugar-based ethanol. The contract treats all ethanol as ethanol and makes no distinction, very much in the same way that the world Sugar No. 11 contract makes no distinction between sugar produced from beets or cane. Ethanol, known also as Ethyl Alcohol, is a bio-fuel produced from either Sugar Cane (Brazil) or Corn (United States). It is produced by a process of fermentation. Ethanol uses are wide. It is used as solvent, as an alcoholic beverage, as an antiseptic and ultimately as a motor fuel and fuel additive. Brazil is the world's largest producer of ethanol. Ethanol futures are traded at the CBOT® and at the NYMEX®. Ethanol is a clean-burning, high-octane fuel that is produced from renewable sources. At its most basic, ethanol is grain alcohol, produced from crops such as Corn. Because it is domestically produced, ethanol helps reduce America's dependence upon foreign sources of energy. Pure, 100% ethanol is not generally used as a motor fuel; instead, a percentage of ethanol is combined with unleaded gasoline. This is beneficial because the ethanol:- (i) decreases the fuel's cost, (ii) increases the fuel's octane rating, and (iii) decreases gasoline's harmful emissions. Any amount of ethanol can be combined with gasoline, but the most common blends are:- (i) E10 – 10% ethanol and 90% unleaded gasoline. E10 is approved for use in any make or model of vehicle sold in the United States. Many automakers recommend its use because of its high performance, clean-burning characteristics. In 2004, about one-third of America's gasoline was blended with ethanol, most in this 10% variety; and (ii) E85 – 85% ethanol and 15% unleaded gasoline. E85 is an alternative fuel for use in flexible fuel vehicles (FFVs). There are currently more than 4 million FFVs on America's roads today, and automakers are rolling out more each year. In conjunction with more flexible fuel vehicles, more E85 pumps are being installed across the country. When E85 is not avaialble, these FFVs can operate on straight gasoline or any ethanol blend up to 85%. It is important to note that it does not take a special vehicle to run on Ethanol. All vehicles can use E10 with no modifications to the engine. E85 is for use in a flexible fuel vehicle, so some people confuse 'ethanol' with the blend of 85% ethanol and 15% gasoline. Ethanol is a biofuel that can be used as a fuel substitute (hydrous ethanol) or a fuel extender (anhydrous ethanol) in mixes with petroleum, and which is produced from agricultural feed-stocks such as Sugar Cane and Maize. Anhydrous alcohol is free of water and at least 99% pure. Hydrous alcohol contains water and usually has a purity of 96%. In Brazil, this ethanol is being used as a gasohol substitute in flex-fuel vehicles. / безводное (anhydrous). НАЙБЭТ® (NYBOT®). СИБАТ® (CBOT®). Этанол или Этиловый Спирт или Винный Спирт, C_2H_5OH, бесцветная подвижная жидкость жгучего вкуса с характерным запахом. Получается сбраживанием пищевого сырья (например, картофеля, зерновых культур), гидролизом растительных материалов (например, древесины) и синтетически (гидратацией этилена). Очищается ректификацией (пищевой спирт-сырец – от сивушного масла). Спирт-ректификат ($t_{кип}$ 78.39 °C) содержит 95.57% этилового спирта и 4.43% воды; может быть превращён в абсолютный спирт посредством обезвоживания путём отгонки воды с бензолом или другими способами. Применяется для получения ацетальдегида, диэтилового эфира, синтетического каучука, уксусной кислоты, этилацетата, и другого, используется как антисептик, моторное топливо, растворитель лакокрасочных материалов и лекарственных средств, для приготовления спиртных напитков. Этиловый Эфир или Диэтиловый Эфир, или Серный Эфир (устаревшее название), или эфир, $(C_2H_5)_2O$ или $H_5C_2OC_2H_5$, бесцветная подвижная легколетучая жидкость, $t_{кип}$ 34.48 °C. Растворитель нитратов целлюлозы (нитроцеллюлозы), жиров, природных и синтетических смол (в промышленности применяется ограниченно из-за огне- и взрывоопасности); экстрагент (например, при извлечении урана из руд); наркотическое средство в медицине, так называемый наркозный эфир (применяется для наркоза). Нью Йоркская Палата Торговли (Нью Йоркское Табло Торговли, если быть более точными). (NYBOT®).

ETHICS = ЭТИКА – Ethics, also known as Moral Philosophy, is a branch of philosophy that involves systematizing, defending, and recommending concepts of right and wrong conduct. The term comes from the Greek word Ethos, which means Character. Ethics is a

complement to Aesthetics in the philosophy field of Axiology. In philosophy, ethics studies the moral behavior in humans, and how one should act. Ethics may be divided into four major areas of study:- (i) Meta-Ethics, about the theoretical meaning and reference of moral propositions and how their truth values (if any) may be determined; (ii) Normative Ethics, about the practical means of determining a moral course of action; (iii) Applied Ethics, about how moral outcomes can be achieved in specific situations; and (iv) Descriptive Ethics, also known as Comparative Ethics, is the study of people's beliefs about morality. Ethics seeks to resolve questions dealing with human morality – concepts such as good and evil, right and wrong, virtue and vice, justice and crime. Ethics is the process of determining how one should hold the interests of various stakeholders, taking into account moral values/principles. Spinoza or Baruch Spinoza (Hebrew:- Baruch Shpinoza; Portuguese:- Bento de Espinosa, Latin:- Benedictus de Spinoza) (November 24, 1632 – February 21, 1677) was a Jewish Philosopher of Dutch origin. / Барух Спиноза (Baruch Shpinoza), Бэнэдиктус дэ Спиноза (Benedictus de Spinoza) был Еврейским философом-материалистом, пантеистом Нидерландского происхождения. Под Этикой, от Греческого слова Ēthiká, от Ēthos, означающее Нрав или Обычай или Характер, понимается философская дисциплина, изучающая мораль, нравственность. Как обозначение любой области исследования термин впервые употребляется древнегреческим философом и учёным Аристотелем (384–322 до Нашей Эры). От стоиков идёт традиционное деление философии на логику, физику и этику, которая часто понималась как наука о природе человека, то есть совпадала с антропологией; Этика Еврейского философа-материалиста, пантеиста Нидерландского происхождения Бэнэдиктуса (или Баруха (Baruch)) дэ Спинозы (Benedictus de Spinoza или Бэнто д'Эспиноза (Bento d'Espinosa); родился 24 Ноября 1632 в Астердаме, Нидерланды (Amsterdam, North Holland, The Netherlands) – умер 21 Февраля 1677 в Гааге, Ниерланды (The Hague, South Holland, The Netherlands)) – учение о субстанции и её модусах. Этика – наука о должном в системе Немецкого философа Иммануэля Канта (Immanuel Kant; родился 22 Апреля 1724 в Кёнигсберге, Пруссия, Германия – умер 12 Февраля 1804 в Кёнигсберг, Пруссия, Германия), который развил идеи так называемой автономной этики, как основанной на внутренних самоочевидных нравственных принципах, противопоставляя её этикой гетерономной, исходящей из каких-либо внешних по отношению нравственности условий, интересов и целей. Под Этикой понимается:- (1) наука о морали (нравственности), о её природе и сущности, структуре и функциях, происхождении и развитии. Домарксистская и современная буржуазная этика, трактуя природу морали, усматривает в ней либо проявление естественных, врождённых качеств человека, либо изобретение человеческого разума, либо нечто полученное людьми 'свыше' от Бога или богов, либо, наконец, явление необъяснимое. Подлинную природу и сущность морали, закономерности её функционирования и развития установил марксизм-ленинизм, показав, что мораль, как и другие формы идеологии, носит классовый характер, что она относится к надстройке и проявляется в поведении людей по-разному в разных исторических условиях, соответственно тому, интересы каких классов и иных социальных слоёв выражают те или иные лица. (2) Этикой иногда называют также нормы поведения в обществе и в отношениях с другими людьми, предписываемые особым общественным или профессиональным статусом человека, например, этика педагога, этика офицера, этика врача.

ETHIDIUM BROMIDE = БРОМИСТЫЙ ЭТИДИЙ (или БРОМИД ЭТИДИЙ) – Ethidium Bromide is a chemical used to visualize DNA by fluorescence. It interposes itself into the DNA groove and alters buoyancy. / жёлоб или паз (groove).

ETHNOBOTANY = ЭТНОБОТАНИКА – Ethnobotany is the study of the uses of plants by various human cultures. / Под Этноботаникой, от Греческих слов Éthnos, означающее Народ или Племя, и Botánē, означающее Растение или Трава, понимается .

ETHYLENE = ЭТИЛЕН – Ethylene is a petroleum derivative (C_2H_4) that is the raw material for polyethylene. / Под Этиленом, $H_2C{=}CH_2$, понимается бесцветный газ, $t_{кип}$ 103.8 °C. В больших количествах (до 20%) содержится в газах нефтепереработки; входит в состав коксового газа. Один из основных продуктов нефтехимической промышленности. Применяется для синтеза винилхлорида, окиси этилена, этилового спирта, полиэтилена и другого.

ETHYLENEDIAMINETETRAACETIC ACID = ЭТИЛЕНДИАМИНТЕТРАУКСУСНАЯ КИСЛОТА – Ethylenediaminetetraacetic Acid (EDTA; $(CH_2)_2N_2(CH_2COOH)_4$):- read as 'ethylene diamine tetra-acetic acid'. EDTA as the acid form or as various sodium salts, is a powerful sequestering or chelating agent used primarily where metals such as iron or copper are present in water and may interfere with preparation or dyeing processes. It is sometimes used to sequester hardness ions such as calcium and magnesium. EDTA may not be suitable for use with premetallized dyes, since it may be capable of removing the metal from the dye. / хелатообразователь (chelating agent). твёрдость (hardness).

ETHYLENE GLYCOL = ЭТИЛЕН ГЛИКОЛЬ – Ethylene Glycol (the International Union of Pure and Applied Chemistry (IUPAC) name:- ethane-1,2-diol) is an organic compound widely used as an automotive antifreeze and a precursor to polymers. In its pure form, it is an odorless, colorless, syrupy, sweet-tasting liquid. Ethylene glycol is toxic, and ingestion can result in death. Ethylene glycol breaks down in air in about ten days, and in water or soil in a few weeks. It enters the environment through the disposal of ethylene glycol-containing products, especially at airports where it is used in deicing agents for runways and airplanes. Although almost all sources state that French chemist Charles-Adolphe Wurtz (1817–1884) first prepared ethylene glycol in 1859, he actually first prepared it in 1856. He first treated 'ethylene iodide' ($C_2H_4I_2$) with silver acetate and then hydrolyzed the resultant 'ethylene diacetate' with potassium hydroxide. Wurtz named his new compound 'glycol' because it was intermediate to ethyl alcohol (with one hydroxyl group) and glycerin (with three hydroxyl groups). In 1860, Wurtz prepared ethylene glycol from the hydration of ethylene oxide. There appears to have been no commercial manufacture or application of ethylene glycol prior to World War I, when it was synthesized from ethylene dichloride in Germany and used as a substitute for glycerol in the explosives industry. In the United States, semicommercial production of ethylene glycol via ethylene chlorohydrin started in 1917. The first large-scale commercial glycol plant was erected in 1925 at South Charleston, West Virginia, by Carbide and Carbon Chemicals Co. (now Union Carbide Corp.). By 1929, ethylene glycol was being used by almost all dynamite manufacturers. In 1937, Carbide started up the first plant based on Lefort's process for vapor-phase oxidation of ethylene to ethylene oxide. Carbide maintained a monopoly on the direct oxidation process until 1953, when the Scientific Design process was commercialized and offered for licenses. This molecule has been observed in outer space. Current Methods:- ethylene glycol is produced from ethylene (ethene), via the intermediate ethylene oxide. Ethylene oxide reacts with water to produce ethylene glycol according to the chemical equation:- $C_2H_4O + H_2O \rightarrow HO{-}CH_2CH_2{-}OH$. This reaction can be catalyzed by either acids or bases, or can occur at neutral pH under elevated temperatures. The highest yields of ethylene glycol occur at acidic or neutral pH with a large excess of water. Under these conditions, ethylene glycol yields of 90% can be achieved. The major byproducts are the ethylene glycol oligomers diethylene glycol, triethylene glycol, and tetraethylene glycol. About 6.7 billion kilograms are produced annually. A higher selectivity is achieved by use of the Shell's OMEGA process. In the OMEGA process, the ethylene oxide is first converted with carbon dioxide (CO_2) to ethylene carbonate to then react with water in a second step to selectively produce mono-ethylene glycol. The carbon dioxide is released in this step again and can be fed back into the process circuit. The carbon dioxide comes in part from the ethylene oxide production, where a part of the ethylene is completely oxidized. Uses:- the major end uses of ethylene glycol are as an antifreeze, which accounts for over 50% of ethylene glycol's commercial uses, and as raw material in the production of polyester fibers, mainly PET, which accounts for 40% of total ethylene glycol consumption. Because this material is cheaply available, it finds many

niche applications. Ethylene Glycol is a synthetic liquid substance that absorbs water. It is odorless, but has a sweet taste. Ethylene glycol is used to make antifreeze and de-icing solutions for cars, airplanes, and boats. It is also used in hydraulic brake fluids and inks used in stamp pads, ballpoint pens, and print shops. Ethylene Glycol has many uses, including as antifreeze in cooling and heating systems, in hydraulic brake fluids, and as a solvent. Acute (short-term) exposure of humans to ethylene glycol by ingesting large quantities causes three stages of health effects:- central nervous system (CNS) depression, followed by cardiopulmonary effects, and later renal damage. The only effects noted in one study of individuals exposed to low levels of ethylene glycol by inhalation for about a month were throat and upper respiratory tract irritation. Rats and mice chronically (long-term) exposed to ethylene glycol in their diet exhibited signs of kidney toxicity and liver effects. Several studies of rodents exposed orally or by inhalation showed ethylene glycol to be fetotoxic. An epidemiologic study on renal cancer mortality did not find an increased risk for workers exposed to ethylene glycol. The US Environmental Protection Agency (EPA) has not classified ethylene glycol for carcinogenicity. Ethylene Glycol is a viscous, sweet, colorless liquid, (CH_2OHCH_2OH). Principal uses are as an intermediate in the manufacture of polyester fibers and as automobile antifreeze. Ethylene Glycol intoxication:- ethylene glycol is a colorless, odorless, sweet-tasting chemical found in many household products, including antifreeze, deicing products, detergents, paints, and cosmetics. It is poisonous if swallowed. Causes:- ethylene glycol may be swallowed accidentally, or it may be taken deliberately in a suicide attempt or as a substitute for drinking alcohol (ethanol). Symptoms:- The first symptom of ethylene glycol ingestion is similar to the feeling caused by drinking alcohol (ethanol). Within a few hours, more toxic effects become apparent. Symptoms may include nausea, vomiting, convulsions, stupor, or even coma. An overdose of ethylene glycol can damage the brain, lungs, liver, kidneys, and lungs. The poisoning causes disturbances in the body's chemistry, including metabolic acidosis. The disturbances may be severe enough to cause profound shock, organ failure, and death. As little as 120 milliliters (approximately 4 fluid ounces) of ethylene glycol may be enough to kill an average-sized man. Exams and Tests:- ethylene glycol toxicity should be suspected in anyone who is severely ill after drinking an unknown substance, especially if they at first appear drunk and you cannot smell alcohol on their breath. Diagnosis of ethylene glycol toxicity is usually made through a combination of blood, urine, and other tests such as:- arterial blood gas analysis; CHEM-7; chest x-ray (shows fluids in the lungs); complete blood count (CBC); CT scan (shows brain swelling); EKG; ethylene glycol test; ketones – blood; osmolality; toxicology screen; and urinalysis. Tests will show increased levels of ethylene glycol, blood chemical disturbances, and possible signs of kidney failure and muscle or liver damage. Treatment:- most people with ethylene glycol poisoning need to be admitted to a hospital's intensive care unit (ICU) for close monitoring. A breathing machine (respirator) may be needed. Those who recently swallowed the ethylene glycol may have their stomach pumped (suctioned). This can help remove some of the poison. Other treatments may include:- activated charcoal; sodium bicarbonate solution given through a vein (IV) to reverse severe acidosis; and antidotes that slow the formation of the poisonous by-products in the body. In severe cases, dialysis may be used to directly remove the ethylene glycol and other poisonous substances from the blood. Dialysis reduces the time needed for the body to remove the toxins. Dialysis is also needed by patients who develop severe kidney failure as a result of poisoning. It may be needed for many months afterwards. Outlook (Prognosis):- how well a person does depends on how quickly treatment is received, among other things. When treatment is delayed, this type of poisoning can be deadly. Possible Complications:- coma; death; Kidney failure; and shock. / Французский химик Шарле-Адольф Вюртц (Charles-Adolphe Wurtz; 1817–1884). Карбайд энд Карбэн Кемикэлз Ко. (Carbide and Carbon Chemicals Co.) (ныне Юниэн Карбайд Корп. (Union Carbide Corp.)). Щел (Shell) процесс ОМИГЭ (OMEGA process). Кидни (Kidney). Под Этиленгликолем, $HOCH_2CH_2OH$, понимается вязкая бесцветная жидкость. $t_{кип}$ 197.6 °C. Применяется в производстве полиэтилентерефталата, полиуретанов, взрывчатых и душистых веществ, как компонент антифризов.

ETIOLATE = ЭТИОЛАТ (или ЭТИОЛИРОВАТЬ, или БЛЕДНЕТЬ, или ХИРЕТЬ, или ЧАХНУТЬ) – Etiolate is leaves and/or stems that are unnaturally long, often with a change of color from the natural shade of green to yellow or white, due to insufficient light. / Этиолировать – лишать растение хлорофилла или выращивать при недостатке света.

ETIOLATION = ЭТИОЛЯЦИЯ (или ЭТИОЛИРОВАНИЕ) – Etiolation is a growth of plants from seeds in darkness. A yellowing condition of the plants due to light deficiency characterized by an elongated stem, small leaves, and lack of chlorophyll. / Под Этиолированными Растениями, от Французского слова Étioler, означающее Делать Блёклым или Делать Хилым, понимаются растения, выросшие в темноте или при недостатке света; светло-зелёные, иногда белые (из-за отсутствия хлорофилла) растения. Этиолированные органы овощных растений (внутренние листья Капусты, подземные побеги Спаржи и другие) используют в пищу.

ETIOLOGY = ЭТИОЛОГИЯ – Etiology is the science dealing with the causes of diseases. / Под Этиологией, от Греческих слов Aitia, означающее Причина, и Lógos, означающее Слово или Учение, понимается учение о причинах болезней. Профессиональное (медицинское) употребление термина – как синонима 'Причины', например, грипп – заболевание вирусной этиологии.

ETL = ECONOMIC THRESHOLD LEVEL

ETLT = EQUAL TO OR LESS THAN

ETON COLLAR = ИТЧЭНСКИЙ ВОРОТНИК – Named for the prestigious Eton College, English public school. The broad Eton Collar has been a part of the school's uniform since the 1800s. Eton Collar is a large stiff turnover collar. Eton Collar is a broad, stiff white collar worn outside the coat collar, especially with an Eton jacket.

ETON JACKET = ИТЧЭНСКИЙ ЖАКЕТ – Eton Jacket is a short black jacket with long sleeves, wide lapels, and an open front. / .

ETS = EXPECTED TIME OF SAILING

ETS = EXPRESSED TAGGED SITE

ETSI = EUROPEAN TELECOMMUNICATIONS STANDARDS INSTITUTE

ET WARRANT = EURO–TREASURY WARRANT

EU = EUROPEAN UNION

EUA = EUROPEAN UNIT OF ACCOUNT

EUCHROMATIN = ЭУХРОМАТИН – Euchromatin is the portion of genomic DNA that remains relatively unstained and is transcriptionally active. / Под Эухроматином понимается вещество хромосомы, сохраняющее деспирализованное (диффузное) состояние в покоящемся ядре и спирализующееся при делении клеток. Содержит большинство структурных генов организма.

EUCLID = EUROPEAN COOPERATION FOR THE LONG–TERM IN DEFENSE

EUKARYOTE = ЭУКАРИОТ (или ЭВКАРИОТ) – Eukaryote is an organism characterized by the presence of a nucleus. Also other organelles such as mitochondria and/or chloroplasts may be present in eukaryotes. Includes all plants, animals, green algae, and fungi.

/ Под Эукариотами или Эвкариотами, от Греческих слов Éu, означающее Полностью или Хорошо, и Káryon, означающее Ядро, понимаются организмы (все, кроме бактерий, включая цианобактерий), обладающие, в отличие от прокариот, оформленным клеточным ядром, отграниченным от цитоплазмы ядерной оболочкой. Генетический материал заключён в хромосомах. Клетки эукариот имеют митохондрии, пластиды и другие органоиды. Характерен половой процесс.

EULA = END USER LICENSE AGREEMENT

EUPHORBUS = ЭВФОРБ (или ЭУФОРБУС) – Euphorbus:- physician to King Juba II (ca. 50 BC – 19 AD) of Mauretania. King Juba was said, by Pliny the Elder (23–79 AD), to have named a plant (probably Euphorbia resinifera) that he discovered on Mount Atlas in Morocco as 'Euphorbea' after his physician. This is generally considered to be the origin of the name of the genus Euphorbia. A variety E. regis-jubae of Euphorbia obtusifolia commemorates King Juba himself. / Молочай смолоносный (Euphorbia resinifera). происхождение названия рода Молочаев (genus Euphorbia). Под Эвфорбом понимается троянец, сын Панфоя, ранивший Патрокла, а затем убитый Менелаем (Пифагор утверждал, что этот Эвфорб был одним из его прошлых перевоплощений).

EUPLOID = ЭУПЛОИД (или ЭУПЛОИДНОЕ) – Euploid:- having a chromosome number that is a whole multiple of the monoploid number. See also Polyploid.

EUR = EURO

EUR 1 FORM = ФОРМА ЕВР 1 – EUR 1 Form is the name for a form, which is used in international commodity traffic. The application of this form is based on application of various bi- and multilateral agreements within the Pan-European preference system (the European Union Association Agreement). In the free trade agreements goods are defined, which apply to cheaper rates of duty or to be completely duty-free introduced, on the condition that they were completely manufactured in a member country or in such were so far worked on that they become on an equal footing in accordance with the agreements of the origin of the products. In order to profit from the preferential rate during a customs clearance, a EUR.1 movement certificate, in short EUR.1, must be handed over to the competent authority (usually a customs administration), in which the manufacturer certifies the origin of the goods. The EUR.1 is recognized also as a certificate of origin in the external trade in legal sense. In place of a movement certificate also a declaration of origin on the invoice can be provided by the manufacturer or sender of the goods, if the amount of items with EU preferential origin of a single shipment does not exceed €6 000. If it concerns an approved exporter, the delimitation of 6 000 Euro does not apply. The creator of such a movement certificate or declaration of origin must be able to prove the origin characteristics of the goods with a possible check on supplier declarations. The exporter fills in the form and then hands it over or sends it in to the competent authorities, usually customs, who stamp it and send it back to the exporter. List of countries with which the EU has a Free Trade Agreement where the EUR.1 is used:- Africa:- Algeria, Egypt, Morocco, South Africa, and Tunisia; America:- Chile and Mexico; Europe:- Bosnia and Herzegovina, Croatia, Georgia, Iceland, Liechtenstein, Macedonia, Norway, Serbia, Switzerland, Moldova (Republic of); Middle East:- Israel, Jordan, Lebanon, Syria, and Turkey; ACP (short for the African, Caribbean and Pacific Group of States) countries:- regulated through the Cotonou-agreement, which is not a traditional free-trade agreement (FTA), but rather a non-reciprocal agreement. With the introduction of the Pan Euro Med Free Trade Area, which is partially in place, the EUR.1 certificate will be replaced by the EUR-MED certificate for countries that are part of this Free Trade Area. This process is however as of May 2007 not complete. Furthermore, the European Commission has presented a draft in which certificates will be replaced by declarations of origin instead. These declarations will not have to be stamped by the competent authority and can also be submitted electronically to the importer. Also known as Movement Certificate. See also ATR Certificate. 'EUR.1 Movement Certificate' means the proof of origin issued properly by the customs authorities or made out by institutions authorized by those authorities and then endorsed by the customs authorities in order to be able to benefit the products originating in the Republic of Turkey from the provisions of cumulation for the purposes of the Generalized System of Preferences. / Известен также как Сертификат о Перемещении (Movement Certificate). Смотрите также A.Тэ.Эр. Сэртификат или Свидетельство о ВДА (ATR Certificate).

EURATOM = EUROPEAN ATOMIC ENERGY COMMUNITY

EUREKA = EUROPEAN RESEARCH COORDINATION AGENCY

EUREP = EURO–RETAILER PRODUCE WORKING GROUP

EUREPGAP = EUREP GOOD AGRICULTURAL PRACTICE = EURO–RETAILER PRODUCE GOOD AGRICULTURAL PRACTICE

EUREPO = ЕВРИПО (или ЮРИПО) – EUREPO is the rate at which one prime bank offers funds in Euro to another prime bank in exchange for collateral consisting exclusively of government bonds and bills issued by Euro area countries. The EUREPO's calculation methodology is similar to that of the EURIBOR, but it is representative of rates in the secured markets (repo markets). The panel of banks is also different. / Юрибо или Юрайбо (Euribor).

EUREX® = EUROPEAN EXCHANGE

EUREX CLEARING AG = ОЙРЭКС КЛИРИН А.ГЕ. (или ЮРЭКС КЛЫЭРЫНЬ А.ГЕ.) – Eurex Clearing:- guaranteeing a secure financial market. Eurex Clearing AG was founded in 1998 as a 100 percent subsidiary of Eurex Frankfurt AG. As a central counterparty, the European clearing house is responsible for clearing transactions in the cash and derivatives market. In 2010, Eurex® made clearing orders worth an average of EUR8.3 billion per month. What exactly is a central counterparty? When a transaction is agreed, Eurex Clearing automatically acts as a buyer for every seller and as a seller for every buyer – thus serving as a central counterparty. This means that the clearing house assumes the risk should one of the trading parties default. More security for all trading participants Eurex Clearing guarantees that all contracts traded are settled, and has established a multi-level collateral system for this purpose. It calculates the total risk (margin) for every clearing member and guarantees it by depositing collateral in the form of cash or securities. The system thus covers not only potential losses calculated on the basis of current prices, but also potential future price risks. Every clearing member provides collateral at least once a day so that none of the orders are guaranteed under and in addition to this, pays into a clearing fund. The clearing house thus has a sufficient security cushion, should one of the clearing members become insolvent. Eurex Clearing AG is a clearing-house and central counterparty for on-exchange trades executed on the Frankfurt Stock Exchange (Xetra® or floor trades) in German equities that are subject to collective safe custody, denomoinated in Euro and listed on Xetra®. In its role as central counterparty, it additionally assures the fulfillment and clearing of trades on the Eurex® derivatives exchange, Eurex® Bonds and Eurex® Repo. Headquartered in Frankfurt am Main, Germany. Eurex Clearing is one of the world's leading Clearing Houses. We offer fully automated and straight-through post trade services for derivatives, equities, repo, energy and fixed income transactions. As a central counterparty, our focus is to increase market integrity. Eurex Clearing acts as a buyer to all sellers and as a seller to all buyers thereby minimizing counterparty risk and maximizing operational efficiency. Our offering comprises flexible trade management functions, advanced risk management services, efficient collateral and delivery management tools. With our high-quality, cost-efficient and comprehensive value chain of clearing services delivered via a state-of-the-art clearing system, our customers are clear to trade. Eurex Clearing acts as the central counterparty for Eurex®, Eurex® Bonds, Eurex® Repo,

European Energy Exchange (EEX) the FWB® Frankfurter Wertpapierbörse (the Frankfurt Stock Exchange) – both Xetra® and floor – and the Irish Stock Exchange. Eurex Clearing is a wholly owned subsidiary of Eurex Frankfurt AG. Eurex Clearing serves more than 114 clearing members located in 10 European countries and manages a collateral pool of approximately EUR45 billion. In 2008, Eurex Clearing processed more than 2.3 billion transactions, ranking it the largest CCP in Europe. Eurex Clearing is a company incorporated in Germany and licensed as a credit institution under supervision of the Bundesanstalt für Finanzdienstleistungsaufsicht (BaFin) pursuant to the Banking Act (Gesetz für das Kreditwesen). The Financial Services Authority (FSA) has granted Eurex Clearing status as a Recognised Overseas Clearing House (ROCH) in the United Kingdom. / Ойрэкс Клирин А.Ге. (Eurex Clearing AG). Ойрэкс® или Юрэкс®. Эф.Ве.Бе.® (FWB®; Франкфота Вертпапиабёрзэ (Frankfurter Wertpapierbörse) или Франкфуртская Фондовая Биржа (Frankfurt Stock Exchange)):- Ксэтра® (Xetra®). Гэзэтц фюа дас Крэдитвезэн (Gesetz für das Kreditwesen). Ойрэкс Клирин А.Ге. является одной из ведущих клиринговых организаций мира. Мы предлагаем полностью автоматизированные и 'straight-through' услуги в сфере 'post-trade' для деривативов, акций, рипо и облигаций. Наша задача как Центрального контрагента заключается в повышении интеграции рынков. Ойрэкс выполняет функцию покупателя для всех продавцов и функцию продавца для всех покупателей, минимизируя при этом риск контрагента по сделке и максимизируя операционную эффективность. Ойрэкс Клирин А.Ге. – 100% дочерняя компания Ойрэкс Франкфот А.Ге. (Eurex Frankfurt AG), оператором которого является Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG) и SIX Swiss Exchange. Ойрэкс Клирин А.Ге. выполняет функции Центрального контрагента для Eurex®, Eurex® Bonds, Eurex® Repo, European Energy Exchange (EEX), FWB® Франкфуртской Фондовой Биржи (Frankfurt Stock Exchange) – для Ксэтра® (Xetra®) и торгового зала (паркет) – и для Ирландской Фондовой Биржи (Irish Stock Exchange). Ойрэкс Клирин А.Ге. обслуживает 114 клиринговых члена из 10 Европейских стран, а также управляет пулом обеспечения, денежная стоимость которого достигает примерно 45 миллиардов Евро. В 2008 Ойрэкс Клирин А.Ге. осуществил более 2.3 миллиардов операций и имеет рэйтиньг самого крупного Центрального контрагента в Европе.

EURIBOR = EUROPEAN INTERBANK OFFERED RATE

EURO = EBPO – The Euro (€; ISO 4217 code:- EUR) is the currency of twelve European Union member states:- Austria, Belgium, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, the Netherlands, Portugal, and Spain. Monaco, San Marino, and Vatican City which formerly used the French Franc or the Italian Lira as their currency, mint their own Euro coins in small amounts. The Euro is also the currency of Montenegro and Kosovo and is used in Andorra as well. Euro is the name of the European single currency adopted by the European Council at its meeting in Madrid on 15 and 16 December 1995. Europe's single currency – the Euro – came into being on 01 January 1999. But it remained a 'virtual' currency, mainly used by banks and the financial markets – for three years thereafter. For most people, it did not become a 'real' currency, visible and tangible, until 01 January 2002. That was the starting date for the introduction of Euro banknotes and coins. They are now an everyday fact of life for more than 300 million people in Europe. The introduction of the new cash in 12 European countries – like the launch of the currency itself – was a historic event, involving years of meticulous planning and preparation. There were numerous challenges – as well as difficulties and risks – to be overcome by the European Central Bank (ECB), the central banks and governments of the Euro area countries, the European Commission, banknote printing works, mints as well as by people in many other fields, especially banks and shops. The logistical preparations for the banknotes and coins go back to 1992, when nobody knew what they would look like, and when the new currency did not even have a definitive name. The design issue was resolved in 1996 when the ECB's predecessor, the European Monetary Institute, chose the final banknote designs after holding a competition. By 1998, the pilot print run was launched. Delivery of the cash to banks and shops started four months before €-day, 01 January 2002. During this period, millions of cash dispensers and vending machines in the Euro area were modified. Communications too formed an essential part of the preparations. Everyone had to know what the Euro would look like and how they would exchange their old currencies for the new one. The message was spread as broadly as possible via TV commercials, print adverts, the internet and other channels, and a pivotal role here was played by the Euro 2002 Information Campaign, conducted by the ECB and the 12 national central banks in the Euro area. Governments, public institutions as well as commercial and voluntary organizations also worked closely together to ensure the information was received by all. In the end, the launch went smoothly, and the new banknotes and coins have become an integral part of our lives, at home and abroad. Single currency for European Monetary Union launched on 1999-January-01. Euro banknotes and coins were put into circulation in 2002, but the planning and preparation of their introduction goes back to the early 1990s. On 1992-February-07, the Treaty on European Union was signed in Maastricht. It describes the competencies of the European Central Bank (ECB) and of the governments and central banks of the 12 Euro area countries with regard to the issuing of Euro cash. It stipulates that the ECB has the exclusive right to authorise the issuance of banknotes within the Euro area, but both the ECB and the national central banks (NCBs) may issue them. However, since the ECB is not involved in any cash operations, it is the NCBs that actually put the banknotes into circulation and withdraw, process and store them. The banknotes in circulation are reflected in the balance sheets of the ECB and the NCBs according to a fixed key, regardless of the country in which they are actually circulating. In fact, the number of banknotes circulating in any one country can no longer be determined because of unrecorded cross-border cash flows in the Euro area due, for example, to tourism. Responsibility for Euro coins lies with the national governments, coordinated by the European Commission in Brussels. Euro area governments are the legal issuers of Euro coins and, as such, are responsible for the designs and technical characteristics of the coins and for their minting. The ECB, however, is responsible for approving annually the volume of Euro coins to be issued; it also acts as an independent assessor of the quality of the minted coins. At the meeting of the European Council in Madrid in December 1995, Europe's leaders decided on the currency's new name:- the Euro. Other suggestions were rejected because of their national connotations. These included the 'Ducat', 'Ecu', 'Florin', 'Franken', or using the Euro as a prefix to existing currency names – 'Euromark', for example. They agreed that the name should be the same in all official languages of the European Union (EU), taking account of different alphabets, and easy to pronounce. Above all, it had to be simple and representative of Europe. The currency also needed to have a symbol. Like the name, the symbol had to be clearly associated with Europe, easy to write and attractive. A list of thirty possibilities drawn up by European Commission staff was reduced to ten and these became the subject of a public survey. From this shortlist, two possible symbols emerged and the final choice was made by the then President of the Commission, Jacques Santer, and Yves-Thibault de Silguy, the Commissioner in charge of Economic and Financial Affairs at that time. The Euro symbol was inspired by the Greek letter epsilon, reflecting the cradle of European civilisation. E is of course the first letter of the word Europe. The two strong parallel horizontal lines are intended to symbolise the stability of the currency. The official abbreviation of the Euro, EUR, has been registered with the International Organization for Standardization (ISO). In November 1994, the Council of the European Monetary Institute (EMI), the ECB's predecessor, decided on a sequence of 1:2:5 for the seven Euro banknote denominations:- €10 and €100; €20 and €200; and €5, €50 and €500. This sequence is in line with the common denominational split of most of the world's currencies and also corresponds to the sequence of the Euro coins:- 1 cent, 10 cent and €1; 2 cent, 20 cent and €2; 5 cent and 50 cent, as agreed by the EU's Economic and Financial Affairs Council (ECOFIN). The decision to have a very high-value banknote – €500 – was made after careful evaluation. Prior to the changeover to Euro cash, six of the Euro area countries – Austria, Belgium, Germany, Italy, Luxembourg, and the Netherlands – had national banknotes worth between €200 and €500, and were using them increasingly. In

2000, for example, the demand for DM1 000.00 banknotes (equivalent to €511.00) was 15 times higher than in 1975 and represented 34% of the total value of Deutsche Mark banknotes in circulation. Moreover, in countries outside the European Union with relatively unstable monetary regimes, where inflation is high and/or there is little trust in the banking system, people often hold the cash of lowinflation currencies as a store of value. Before the introduction of Euro banknotes, high-value notes such as the DM1 000.00 were held. Three EU countries – Greece, Italy and Austria – used very low-value banknotes (below €2) prior to the Euro cash changeover. But the issuance of both very high and very low denominations would have created a banknote series with too many denominations. It would also have made the notes less user-friendly and complicated their handling and storage. Therefore, €2 was chosen as the highest-value coin and €5 as the lowest-value banknote. At the Madrid European Council, the heads of state and government agreed that Euro banknotes and coins would start to circulate alongside the national currencies at the latest by 2002-January-01. The precise date, sometime between 1999-January-01 and 2002-January-01, was left open in order to take account of the different preferences of various cash users and the long lead times for printing banknotes and minting coins. The date of 2002-January-01 had both advantages and disadvantages. The peak period for banknote use is at the end of the year:- circulation is around 10% higher than average because of the Christmas season and the first few days of January are traditionally a sales and stocktaking period for retailers. A number of other dates were considered but, in the end, 2002-January-01 was agreed to be the most convenient date, marking the start of the calendar year and being the date expected by national public administrations. The Madrid European Council also decided that the Euro should circulate alongside the national currencies for a maximum of six months, although subsequently, the pros and cons of shortening this period were discussed. A shorter period would reduce the costs of handling two currencies simultaneously for banks, retailers and the public, while a longer period would make it easier to adapt vending machines. A compromise was reached and it was decided to shorten the transition period. In November 1999, ECOFIN agreed that the period of dual circulation should last between four weeks and two months. Banks would continue to change national currencies into Euro after that period but those currencies would no longer be legal tender. Euro is the name of the European single currency, the world's second most important currency after the US Dollar. It is under the control of the European Central Bank in Frankfurt am Main and is the official currency in 13 of the 27 EU member states and six other countries. In addition, seven other EU countries have fixed exchange rates against the Euro. Euro banknotes were put into circulation on 2002-January-01. There are seven denominations:- €5, €10, €20, €50, €100, €200 and €500. The higher the denomination, the larger the banknote. The banknotes depict the architectural styles of seven periods in Europe's cultural history – classical, Romanesque, Gothic, Renaissance, baroque and rococo, the age of iron and glass architecture, and modern XX century architecture – and show three main architectural elements:- windows, gateways and bridges. None of the designs depicts actual buildings or monuments. The windows and gateways on the front of each banknote symbolize the spirit of openness and cooperation in Europe. The reverse of each banknote features a bridge. These bridges are used as a metaphor for communication between the nations of Europe and between Europe and the rest of the world. A number of security features, such as a watermark, a hologram, a security thread and color-changing ink, have been incorporated into the banknote designs to protect them against counterfeiting and enable people to recognize genuine banknotes. Special design features, e.g., raised print and large numerals, have also been included to help blind and partially sighted people. Strict quality controls ensure that all banknotes produced are identical in quality and appearance. The banknotes do not have individual national designs. The planning of a new series of Euro banknotes is under way. It will incorporate new security features but in other respects it will represent a continuation of the current series: the banknotes will have the same denominations – from €5 to €500 – and they will be based on the current designs, making them immediately recognisable as Euro banknotes. One Euro is divided into 100 cent. There are eight Euro coins:- 1, 2, 5, 10, 20 and 50 cent, €1 and €2. Each one has a 'European' side and a national side. Of course, all Euro coins can be used in all Euro area countries, irrespective of their national side. The eight Euro coins vary in size, weight, material, color and thickness. Some additional innovative features have also been included to help users, particularly blind and partially sighted people, to recognise the different denominations. For instance, each consecutive coin in the series has a different edge. A detailed quality management system ensures that all Euro coins are interchangeable throughout the Euro area and conform to the standards necessary for their use in vending machines. Particular care has been taken in the production of the higher-value Euro coins (€1 and €2) to protect them against counterfeiting. Their sophisticated two-color design makes them difficult to counterfeit, as do the embossed characters around the edge of the €2 coin. On 2007-January-01, Slovenia joined the Eurozone. On 2008-January-01, Malta and Cyprus joined the Eurozone. The Euro is the sole currency in Austria, Belgium, France, Finland, Germany, Greece, Ireland, Italy, Luxembourg, the Netherlands, Portugal and Spain. These 12 countries together are frequently referred to as the Eurozone or the Euro Area, or more informally 'Euroland' or the 'Eurogroup'. The Euro is also legal currency in the Eurozone overseas territories of French Guiana, Réunion, Saint-Pierre et Miquelon, Guadeloupe, Martinique and Mayotte. 2008-January-01 for Cyprus and Malta. 2009-January-01 for Slovakia. 2010-January-01 for Bulgaria and the Czech Republic. 2011 or later for Hungary, Poland and Romania. Andorra, Montenegro and Kosovo adopted the foreign Euro as their legal currency for movement of capital and payments without participation in the European System of Central Banks (ESCB) or the right to mint coins. Andorra is in the process of entering a monetary agreement similar to Monaco, San Marino, and Vatican City. The Euro is divided into 100 cents (sometimes referred to as Eurocents). Euro banknotes and coins were introduced on 2002-January-01 in 12 of the then 15 Member States of the European Union (EU). Since then, five more countries have adopted the Euro:- Slovenia on 2007-January-01, Cyprus and Malta on 2008-January-01, Slovakia on 2009-January-01. Estonia became the 17th Member State to join the Euro area on 2011-January-01. Common currency of the European Community nations. The Euro was officially adopted on 1999-January-01 by 11 European nations-Austria, Belgium, Finland, France, Germany, Ireland, Italy, Luxembourg, the Netherlands, Portugal and Spain, followed by Greece in 2001. On its debut as the common currency in the European Monetary Union (EMU) group of nations, the Euro replaced the European Currency Unit (ECU) and the initial value of the Euro was fixed at a one-to-one equivalence with the ECU. Euro-denominated currency and coins went into circulation on 2002-January-01, replacing all national currencies. The common currency was adopted by the Treaty on European Union, signed in Maastricht, the Netherlands, on 07 February 1992 and ratified in 1993 by the parliaments of the member nations. Public referendums approved the treaty in some countries. The economic rationale behind the Euro was that a single currency would promote cross-border trade within Europe and international trade with the rest of the world. Converting to a single currency also helps companies cut costs and promotes a more efficient banking system because businesses would no longer have to conduct business in several different currencies. On 2011-January-01, the Euro became legal tender in Estonia; and Latvia adopted the Euro as its currency as of 01 January 2014. The Road To The Single Currency, The Euro:- 1962 The European Commission makes its first proposal (Marjolin-Memorandum) for economic and monetary union. May 1964:- a Committee of Governors of central banks of the Member States of the European Economic Community (EEC) is formed to institutionalise cooperation among EEC central banks. 1970:- the Werner Report sets out a plan to realise an economic and monetary union in the Community by 1980. April 1972:- a system (the 'snake') for the progressive narrowing of the margins of fluctuation between the currencies of the Member States of the European Economic Community is established. April 1973:- the European Monetary Cooperation Fund (EMCF) is set up to ensure the proper operation of the snake. March 1979:- the European Monetary System (EMS) is created. February 1986:- the Single European Act (SEA) is signed. June 1988:- the European Council mandates a committee of experts under the chairmanship of Jacques Delors (the 'Delors Committee') to make proposals for the realisation of EMU. May 1989:- the 'Delors Report' is submitted to the European Council. June The European Council agrees on the

realisation of EMU in three stages. July 1990:- Stage One of EMU begins. December An Intergovernmental Conference to prepare for Stages Two and Three of EMU is launched. 07 February 1992:- The Treaty on European Union (the 'Maastricht Treaty') is signed. October 1993:- Frankfurt am Main is chosen as the seat of the European Monetary Institute (EMI) and of the ECB, and a President of the EMI is nominated. November 1993:- The Treaty on European Union enters into force. December 1993:- Alexandre Lamfalussy is appointed President of the EMI, to be established on 01 January 1994. January 1994:- Stage Two of EMU begins and the EMI is established. December 1995:- The Madrid European Council decides on the name of the single currency and sets out the scenario for its adoption and the cash changeover. December 1996:- The EMI presents specimen banknotes to the European Council. June 1997:- The European Council agrees on the 'Stability and Growth Pact'. May 1998:- Belgium, Germany, Spain, France, Ireland, Italy, Luxembourg, the Netherlands, Austria, Portugal and Finland are considered to fulfil the necessary conditions for the adoption of the Euro as their single currency; the Members of the Executive Board of the ECB are appointed. June1998:- The ECB and the ESCB are established. October 1998:- The ECB announces the strategy and the operational framework for the single monetary policy it will conduct from January 1999. Janury 1999:- Stage Three of EMU begins; the Euro becomes the single currency of the Euro area; conversion rates are fixed irrevocably for the former national currencies of the participating Member States; a single monetary policy is conducted for the Euro area. January 2001:- Greece becomes the 12th Member State to join the Euro area. January 01, 2002:- The Euro cash changeover:- Euro banknotes and coins are introduced and become sole legal tender in the Euro area by the end of February 2002. May 2004:- The NCBs of the ten new EU Member States join the European System of Central Banks (ESCB). January 2007:- Bulgaria and Romania bring the total number of EU Member States to 27 and join the ESCB at the same time. January 01, 2007:- Slovenia becomes the 13th Member State to join the Euro area. January 01, 2008:- Cyprus and Malta join the Euro area, thereby increasing the number of Member States to 15. January 01, 2009:- Slovakia joins the Euro area, bringing the number of Member States to 16. January 01, 2011:- Estonia joins the Euro area, increasing the number of Member States to 17. January 01, 2014:- Latvia joins the Euro area, increasing the number of Member States to 18. January 01, 2015:- Lithuania joins the Euro area increasing the number of Member States to 19; Lietuvos Bankas (central bank of Lithuania) becomes a member of the Eurosystem. See also Euro Area. 1999-January-01 – exchange rates fixed and Euros launched. Electronic and paper transfer of money can be done in Euros. Euro notes become legal tender on 2002-January-01. National currencies will be taken out of circulation by 2002-June-30 and EU countries will only be able to do business in Euros. Euro notes will be issued in denominations of 5, 10, 20, 50, 100, 200 and 500 Euro. There will be eight different coins ranging from 1, 2, 5, 10, 20, 50 cent to 1, and 2 Euro. The introduction of Euro banknotes and coins on 2002-January-01 has made travelling simpler within the Euro area. Prices for goods and services can be compared at a glance and payments can be made with the same money in all the countries. With the birth of the Euro, foreign exchange transaction costs and foreign exchange risks were eliminated within the Euro area. In the past, these costs and risks hindered competition across borders. Increased competition makes it more likely that available resources will be used in the most efficient way. With a single currency, investment decisions are much easier, as fluctuations in the exchange rate can no longer influence the return on investment across national borders within the Euro area. Before the introduction of the Euro, financial markets were, as a rule, national in character. Financial instruments, such as government bonds and shares were denominated in national currencies. The launch of the Euro was a major step towards the integration of the financial markets in the Euro area. It will continue to influence the structure of the Euro area economy. Evidence of integration can be found, to varying degrees, in all parts of the financial structure:- (i) the Euro area's interbank money market is fully integrated; (ii) the Euro-denominated bond market is well integrated, deep and liquid, and provides a wide choice of investments and funding; (iii) the Euro area equity market is increasingly viewed as a single market; and (iv) domestic and cross-border mergers and acquisitions have increased among banks in the Euro area. The depth and quality of an integrated financial market facilitate the financing of economic growth and thereby the creation of jobs. People have a broader range of choices for their decisions on savings and investments. Companies can tap a very large capital market to finance their business and use new financial instruments to protect themselves against various financial risks and to enhance the management of their investments. / Александрэ Лёмфалюси (Alexandre Lamfalussy). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). и окончательный выбор был сделан тогдашним Президентом Комиссии, Жаком Сантэ (the then President of the Commission, Jacques Santer), и Ивом-Тибо дё Сильгюи, Комиссаром по вопросам Экономических и Финансовых Дел (Yves-Thibault de Silguy, the Commissioner in charge of Economic and Financial Affairs), находившимся на этом посту в то же самое время. колебания обменного курса. + С 01 Января 2007 в Словении, с 01 Января 2008 в Кипре и Мальте, с 01 Января 2009 в Словакии, с 01 Января 2011 в Эстонии, с 01 Января 2014 в Латвии, с 01 Января 2015 в Литве, и того будет 19 стран внутри ЕС. EURO AREA = ОБЛАСТЬ ЕВРО (или АРЕАЛ ЕВРО) – Euro Area is the area that is made up of those Member States of the European Union in which the Euro has been adoped as the single currency. See also Euro. Euro Area is the area encompassing those Member States in which the Euro has been adopted as the single currency in accordance with the Treaty and in which a single monetary policy is conducted under the responsibility of the European Central Bank (ECB). The Euro area currently comprises Belgium, Germany, Greece, Spain, France, Ireland, Italy, Luxembourg, the Netherlands, Austria, Portugal and Finland. The Euro Area is the geographical area covered by those European Union countries which have adopted the Euro as their currency. Key characteristics of the Euro Area:- the individual countries that now comprise the Euro area were relatively open economies before they joined the Euro area. However, they are now part of a larger, much more self-contained economy. The size of the Euro area makes it comparable with major economies such as the United States and Japan. The Euro area is one of the largest economies in the world, with a population of 318 million in 2006.The European Union as a whole has 27 Member States and a population of 493 million. By comparison, the United States and Japan have 299 and 128 million inhabitants respectively. In terms of gross domestic product (GDP) expressed in purchasing power parities, the United States was the largest economy in 2006, with 19.7% of world GDP, followed by the Euro area with 14.3%. Japan's share was 6.3%.The shares of the individual Euro area countries are significantly smaller:- the largest accounted for 3.9% of world GDP in 2006. Although the Euro area can be significantly affected by developments in the global economy, the fact that the Euro area has a less open economy means that movements in prices of foreign goods have only a limited impact on domestic prices. However, it is more open than either the United States or Japan. Euro area exports of goods and services as a share of GDP were significantly higher in 2006 (21.6%) than the corresponding figures for the United States (11%) and Japan (16.8%).

EURO BANKING ASSOCIATION = АССОЦИАЦИЯ БАНКОВСКОГО ОБСЛУЖИВАНИЯ В ЕВРО – Euro Banking Association (EBA) is an organisation which provides a forum for exploring and debating all banking issues of interest to its members and, in particular, matters related to the use of the Euro and the settlement of transactions in Euro. At the end of 1998, the EBA established a clearing company (ABE Clearing S.A.S., Société par Actions Simplifiée à Capital Variable) to manage the new Euro Clearing System (EURO1) from 01 January 1999; EURO1 is the successor to the ECU Clearing and Settlement System. Headquartered in Paris, France. In 1985, 18 commercial banks and the European Investment Bank formed the Euro Banking Association (EBA) with the support of the European Commission and the Bank for International Settlements. The EBA's original mission was to promote the ECU and to facilitate its use by developing and managing the ECU Clearing System. Over the years, the EBA made a substantial

contribution to improving the infrastructure of ECU financial markets and continually enhanced the ECU Clearing System in close co-operation with the European Monetary Institute, central banks, the Bank for International Settlements and SWIFT. In particular, the EBA provided a useful forum for payment-industry practitioners to exchange their experience on EMU (short for the Economic and Monetary Union) preparations. The views of the EBA were sought after by European authorities as valuable input into the planning for a smooth transition to the Euro. At the same time, the EBA developed a new payment system (EURO1), relying on the technical platform for the ECU Clearing System which was enhanced to deal with the expected volumes of cross-border payments in Euro. At the end of 1998, the EBA handed over EURO1 to EBA CLEARING. To complement the EURO1 system, the EBA developed a solution for handling low value payments entitled STEP1 as part of the Straight Through Euro Payment System (STEPS) program designed to offer a full range of Euro payments in a pan-European environment. At the end of 2000, the EBA handed over STEP1 to EBA CLEARING. The STEPS program continued with the development of STEP2 as a pan-European automated clearing house (PE-ACH) for cross-border and domestic mass payments in Euro. The system has been designed to become an important pillar for the creation of the Single Euro Payments Area (SEPA). At the beginning of 2003, the EBA handed over STEP2 to EBA CLEARING. / А.Бе.Э. Клыэринь Эс.А.Эс. (ABE Clearing S.A.S.), Сосьетэ пар Аксьё Саплифье а Кяпиталь Варъябль (Société par Actions Simplifiée à Capital Variable). Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

EUROBOND = ЕВРООБЛИГАЦИЯ – Eurobonds:- the name Eurobonds can be misleading because from the word, you'd think either Eurobonds were about the European bond markets, or about the European currency, Euros. Eurobonds are actually bonds that are denominated in a currency other than that of the country in which they are issued. They are usually issued in more than one country of issue and traded across international financial centers. Supranational organisations and corporations are major issuers in the Eurobond market. Supranational organisations (such as the World Bank or the European Bank for Reconstruction and Development) use such bond issues for financing the development of emerging markets or to support developing countries. Corporations, including banks and multinational entities issue Eurobonds for many purposes including financing for capital and other projects. Eurobonds are not regulated by the country of the currency in which they are denominated. Eurobonds are so-called Bearer Bonds, they are not registered anywhere centrally, so whomever holds or bears the bond is considered the owner. Their 'bearer' status also enables Eurobonds to be held anonymously. The Eurobond market is largely a wholesale, institutional market with bonds held by large institutions. There are few individual investors in the Eurobond market, in general – fewer in the UK than on the continent. Since many investors hold Eurobonds for a long time, these bond issues may not be frequently traded which will make it more difficult for an investor who wants to buy or sell a Eurobond to assess the market price. Types of Eurobonds:- (i) Conventional or Straight Eurobonds:- have a fixed coupon (usually paid on an annual basis) and maturity date when all the principal is repaid. (ii) Floating Rate Bond Notes (FRN):- are usually short to medium term bond issues, with a coupon interest rate that 'floats', i.e. goes up or down in relation to a benchmark rate plus some additional 'spread' of basis points (each basis point being one hundredth of one percent). The reference benchmark rate is usually LIBOR (London interbank offered rate) or EURIBOR (Euro interbank offered rate). The 'spread' added to that reference rate is a function of the credit quality of the issuer. (iii) Zero-Coupon Bonds:- do not have interest payments. The investor in this type of Eurobond may be looking for some kind of tax advantage. (iv) Convertible Bonds:- can be exchanged for another instrument, usually an ordinary share or shares (fixed ahead of time with a predetermined price) of the issuing organisation. The bondholder decides whether to convert the bond. In convertible bonds, the coupon payable is usually lower than it otherwise would be. Because convertible bonds can be viewed more as equity shares than bonds, the credit and interest rate risks for investors are higher than with conventional bonds. (v) High-Yield Bonds are also part of the Eurobond markets, a class of bonds (rather than a type of bond) which individual investors may encounter. High-yield bonds are those that are rated to be 'below investment grade' by credit rating agencies (i.e. issuer has a credit rating below BBB). Eurobonds – Buying and Selling:- banks and brokers can help investors buy and sell Eurobonds but most market professionals advise potential individual investors to take advice and be sure any broker or bank you use has expertise in the type of Eurobond that you are interested in. Eurobond issuers price Eurobonds related to LIBOR, EURIBOR or the US Treasury Bond Market Yield curve, adjusted to indicate the credit quality of the issuer. Some investors considering investing in Eurobonds, especially ones denominated in a currency other than the US Dollar, may see mention of a swap curve related to pricing. An interest rate swap has to do with how corporations and banks think interest rates will go, whether a rate will go up or go down or stay the same and is effectively the fixed rate banks will pay to convert a floating rate bond to fixed for the various maturities. There are advantages to Eurobond investments but there are complexities and risks attached. Individual investors may consider individual Eurobond issuers or Eurobond funds. On individual Eurobond issuers, the credit quality and credit rating of the issuer are very important for an investor to understand. Investors have credit risk in investing in a Eurobond, and need to be able to judge whether the yield on the bond is worth the risk. The credit quality of some sectors of Eurobond issuers may generally be higher than others but each investment must be considered on the basis of the issuer and the research and documentation provided, not on some overall sense of what kinds of organisations are good or bad. If the Eurobond issuer is a corporation, there may also be significant 'event risk' as well, since credit ratings can change over time as corporations change. Also, as noted above, many investors hold Eurobonds for a long time so Eurobond issues may not be frequently traded which will make it more difficult for an investor who wants to buy or sell a Eurobond to assess the market price. Consult a financial advisor. Eurobond is the medium- to long-term bond issued on the Euromarket (Eurocapital market) in a Eurocurrency (Eurodollar, Euro-DM, etc). Eurobonds are bonds underwritten by an international syndicate (of banks) and simultaneously placed in a number of countries. Generally denominated in one of the major currencies US Dollars, Euro, Yen or Pounds Sterling. Eurobonds can be issued by government entities, international institutions and major companies. Corporate or government bond in a currency other than the national currency of the issuer and floated outside the issuer's own country. Eurobonds may be issued in a single currency or in multiple currencies. Eurobond is a bond issued in a currency other than the currency of the country or market in which it is issued. Usually, a Eurobond is issued by an international syndicate and categorized according to the currency in which it is denominated. A Eurodollar bond that is denominated in US Dollars and issued in Japan by an Australian company would be an example of a Eurobond. The Australian company in this example could issue the Eurodollar bond in any country other than the United States. Eurobonds are attractive financing tools as they give issuers the flexibility to choose the country in which to offer their bond according to the country's regulatory constraints. They may also denominate their eurobond in their preferred currency. Eurobonds are attractive to investors as they have small par values and high liquidity. Medium- or long-term bearer bond denominated in a Eurocurrency. Eurobonds are issued by governments or multinational companies. The Eurobond market developed in the 1960s and is independent of the stock market. Eurobond is an international bond issued by a company or government, often in a currency other than the currency of the borrower. The bonds are traded internationally through banks, and not in the traditional bond markets. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)), ЮРИБО или ЮРАЙБО (EURIBOR). Еврооблигация – облигация, деноминированная в Долларах США или других валютах; продаётся инвесторам за пределами страны, в которой используется эта валюта. Облигации обычно выпускаются группами распространителей, включающими банки и инвестиционные дома из многих стран. Примером сделки с Еврооблигациями могут служить деноминированные в Долларах США долговые обязательства, выпущенные Бельгийской корпорацией через

группу распространителей, включающую зарубежный филиал Нью Йоркского инвестиционного банковского дома, Голландский банк и консорциум Британских коммерческих банков; часть выпуска была реализована Французским инвесторам через инвестиционные счета в Швейцарии. Рынок Еврооблигаций является важным источником капитала для многонациональных компаний и иностранных правительств, включая правительства стран третьего мира.

EUROCAPITAL MARKET = РЫНОК ЕВРОКАПИТАЛОВ – Eurocapital Market is the segment of the Euromarket where instruments with medium- to long-term maturities (i.e. maturities of longer than 18 months) are issued and traded. / Сегмент Еврорынка, в котором выпускаются в обращение и торгуются инструменты со средне- и долгосрочными периодами погашения (то есть сроками погашения большими, чем 18 месяцев).

EUROCARD/MASTERCARD = ЭРОКЯР/МАСТЁРКЯР (или ЮРОКАРД/МЭСТЧЁКАРД) – Eurocard/Mastercard is a credit card issued by the international credit card organization Eurocard International SA in Brussels, Belgium, which is represented in some countries by national Eurocard companies. / Кредитная карта, эмитированная международной организацией по кредитным картам Юрокард Интёнэшэнэл Эс.Ай. (Eurocard International SA), расположенной в Брюсселе, Бельгия, и которая представлена в некоторых странах национальными компаниями Эрокяр (или Юрокард; Eurocard). Юрокард/МэстчёКард Интёнэшэнэл Инк. (Eurocard/MasterCard International Inc.).

EURO–CD = EURODOLLAR CERTIFICATE OF DEPOSIT

EURO CENTRAL RATE = ЦЕНТРАЛЬНАЯ СТАВКА ЕВРО – Euro Central Rate is the official exchange rate of exchange rate mechanism II (ERM II) member currencies vis-à-vis the Euro, around which the ERM II fluctuation margins are defined. / виз-а-ви (vis-à-vis).

EUROCHEQUE = ЕВРОЧЕК – The Eurocheque is a first cross-border payment system launched by European banks in the 1960's. Encashment was assured by a cheque guarantee card known as the Eurocheque Card (or EC Card for short). The guarantee function was discontinued in early 2002. Since then banks have adopted debit cards (bank customer cards), which can be used for cashless payment or to withdraw cash from ATMs. Unlike credit cards, the cardholder's current account is debited immediately after making a purchase. German banks generally combine their debit cards with ec/Maestro cards. Today 'ec' no longer stands for Eurocheque but for the German electronic cash system. A payment option used widely in Europe. A Eurocheque can be written in most European currencies on a bank that is part of the system. The Eurocheque was a type of cheque used in Europe that was accepted across national borders and which could be written in a variety of currencies. Eurocheques were originally introduced in 1969 as an alternative to the traveler's cheque and for international payments for goods and services. They were rapidly adopted for domestic use in a number of countries, to the extent that their use for international payment rarely accounted for more than 5% of total Eurocheque transactions. The charges for clearing Eurocheques were substantially lower than those for cross-border use of domestic cheques. Although still accepted as payment by a few bodies, the practice of issuing Eurocheques ceased on 2002-January-01, following the decision to withdraw the Eurocheque guarantee. This was, coincidentally, the same date that the Euro currency was introduced. Despite the similarity of name, the Eurocheque had no connection with the currency. Eurocheques were particularly popular in German-speaking countries, where they were often issued as standard domestic cheques. They usually had to be accompanied by a cheque guarantee card in order to be accepted in payment at a point of sale. The Eurocheque guarantee card also had the functionality of an ATM card. In some countries, such as Austria and Germany, virtually all Eurocheque cards were co-branded with the logo of the respective domestic debit card system and were actually debit cards. After its phase-out, virtually all of these Eurocheque cards were replaced by Maestro® cards. Therefore, Maestro® is very often considered to be the successor to the Eurocheque system. The decision to end the issuing of Eurocheques was taken as increasing numbers of retailers and banks started to decline payment by Eurocheque, and as the use of cash machines and credit cards by international travellers grew within Europe. The relatively high cost of processing Eurocheques, together with the costs resulting from fraud, were also among the factors. In advance of the move, the European Commission expressed concern that 'the benefits of the existing Eurocheque system, in particular its standardised cheque format and its clearing facilities in all European countries should not be lost'. International check system presently in use in more than 40 countries. The uniformly designed check cards and check forms can be used either for cashless payments or to withdraw cash. The Eurocheque was launched in 1969 with the participation of banks in 14 countries – Belgium, France, United Kingdom, the Netherlands, Austria, Switzerland and West Germany (which issued and accepted Eurocheques) together with Denmark, Italy, Ireland, Luxembourg, Norway, Spain and Sweden (which only accepted Eurocheques). In 1972 the 'Uniform Eurocheque' and 'Uniform Eurocheque Guarantee Card' were introduced, providing single designs that could be used by all banks within the system. Previously all Eurocheques had carried the Eurocheque symbol, but differed in their designs. Eurocheque International CV was formed in 1974 to process payments made using Eurocheques. In 1983 the British banks withdrew the Eurocheque symbol from their credit cards. On 1988-February-03, Eurocheque International became a cooperative society established under Belgian law, having previously been a de facto association, rather than a legal entity. The shareholders were the Association of Swedish Banks, Associazione Bancaria Italiana, Groupement des Cartes Bancaires 'CB' (France), Comunidade Portuguesa Eurocheque, Bank of Cyprus, Caisse d'épargne de l'État du grand-duché de Luxembourg, Agrupació Andorrana Eurocheque, PBS-Pengeinstitutternes BetalingsSystemer (Denmark), Apacs (United Kingdom), Telekurs (Switzerland), Suomen Pankkiyhdistys (Finland), Association of Norwegian Banks, Stichting Bevordering Chequeverkeer (Netherlands), Irish Clearing House, Jugobanka United Bank (Yugoslavia), Association of Austrian Banks and Bankers, Eurocheque Belgique SC, GZS-Gesellschaft für Zahlungssysteme GmbH (Germany). According to an estimate by Eurocheque International, in 1989 around 32 million Eurocheque cards had been issued by some 9 000 banks in 20 European Union countries. By the end of 1998 there were 46 participating countries, 22 of them both issuing and accepting the cheques:- Belgium, Denmark, Germany, Finland, France, United Kingdom, Ireland, Israel, Italy, Croatia, Luxembourg, Malta, Netherlands, Poland, Portugal, Switzerland, Slovenia, Spain, the Czech Republic, Hungary, Cyprus, and 24 accepting cheques:- Egypt, Albania, Algeria, Andorra, Armenia, Azerbaijan, Bosnia-Herzegovina, Bulgaria, Georgia, Gibraltar, Greece, Iceland, Lebanon, Lithuania, Latvia, Morocco, Macedonia, Romania, Russia, Slovakia, Tunisia, Turkey, Ukraine, Belarus. In 1989 the French banks withdrew the Eurocheque symbol from their credit cards. In the same year the use of the Uniform Eurocheque format became universal. On 1992-September-01, Eurocheque International CV and Eurocheque International Holding NV merged together with EUROCARD International NV into a single company, Europay International SA, incorporated under Belgian law. Europay relocated to Waterloo, Belgium, where they shared the same address as the Europe, Middle East and Africa region of MasterCard® International, and the headquarters of the Eurocard-MasterCard joint-venture, Maestro® International. The decision to end the Eurocheque guarantee from the end of 2002 was taken by Europay's board on 2001-April-22. A cheque drawn on European bank which can be cashed at any bank displaying an EC sign. Multicurrency European payment system giving check cashing privileges in 39 countries. Eurocheque (EC) is a debit card system managed by Eurocheque International in Brussels, Belgium enabling cardholders to buy merchandise or to cash checks by presenting the Eurocheque card. / карты Маэстро® (Maestro®). МэстчёКард® (MasterCard®). представлением Еврочековой карты. (Eurocheque Belgique SC), Ге.Цэт.Эс.-Гэзэльшафт фюр Цалунгссыстэмэ Ге.эм.бе.Ха. (GZS-Gesellschaft für Zahlungssysteme GmbH; Германия). 01 Сентября 1992, Эрошэйкь Энтэрнасьёналь Сэ.Ве. (Eurocheque International CV) и Эрошэйкь Энтэрнасьёналь Ольдинь Эн.Фэй. (Eurocheque International Holding NV) объединились вместе с ЭроКяр Энтэрнасьёналь Эн.Фэй. (EUROCARD International NV) в одну единственную компанию, Юропэй Интёнэшэнэл Эс.Эй. (Europay International SA), инкорпорированную по Бельгийскому законодательству.

EUROCLEAR = ЮРОКЛЫЭ – Euroclear is an international central securities depository operated by the Brussels branch of Morgan Guaranty Trust Company of New York through the Euroclear Operations Center. Euroclear is owned by its participants. One of the Eurobond market's two clearing systems. It is provided by Morgan Guaranty for over 100 banks and is based in Brussels. Clearing system (Clearing), set up in 1968 by the Morgan Guaranty Trust Co. in Brussels, for international securities transactions. With over 2 700 associates in 70 counties and more than 60 000 listed securities (in 1995), Euroclear is the largest clearing system in the world for international securities. A clearing system for Eurobond based in Brussels. An international clearing organization located in Brussels, responsible for holding, clearing and settling international securities transactions. It is expected to merge with the French, Belgian, and Dutch clearing centers. Euroclear is a clearing house for Eurobonds, set up in Brussels, Belgium in 1968. International securities clearing system formed by banks and securities dealers for the collective custody and book-entry transfer of securities (primarily Eurobonds). In 1986, the custody service was extended to include stocks traded internationally. See also CEDEL. Euroclear System, which is operated by Euroclear Bank SA/NV. Euroclear is a clearing system for international securities transactions set up in 1968 by the Morgan Guaranty Trust Co. in Brussels, Belgium. Today, Euroclear operates the central securities depositories in France, the Netherlands, Belgium, the UK and Ireland, as well as Euroclear Bank, the international central securities depository in Brussels. / Система Юроклыэ управляется банком Юроклыэ Банк Эс.Эй./Эн.Фэй (Euroclear Bank SA/NV). Моргэн Гэрэнти Тчраст Кампэни (Morgan Guaranty Trust Company).

EUROCOMMERCIAL PAPER = ЕВРОКОММЕРЧЕСКАЯ БУМАГА – Euro Commercial Paper is a commercial paper traded on international money markets (Euromoney markets) and issued primarily by prime addresses to cover short-term borrowing requirements. Maturities are generally under one year. Euro Commercial Paper (ECP) is the shortterm, unsecured discount debt securities with maturities ranging from 1 to 360 days issued by companies in the Euromarkets. A syndicate of dealers places ECP on a bestefforts basis; unlike US Commercial Paper, ECP issues may be unrated and need not be backed by swinglines. See also Eurobond, Euro Medium Term Note, and Euronote. Short-term money market paper issued by major first-class companies on the Euromarket without any underwriting commitment on the part of a bank or banking consortium. Very similar to the commercial paper issued in the United States. Eurocommercial Paper:- an unsecured, short-term loan issued by a bank or corporation in the international money market, denominated in a currency that differs from the corporation's domestic currency. For example, if a US corporation issues a short-term bond denominated in Canadian Dollars to finance its inventory through the international money market, it has issued Eurocommercial paper. / Краткосрочная бумага денежного рынка, выпускаемая крупными первоклассными компаниями на Еврорынке без каких-либо обязательств расписывания со стороны банка или банковского консорциума. Слишком мала для коммерческой бумаги, выпускаемой в Соединённых Штатах Америки.

EURO–CP = EUROCOMMERCIAL PAPER

EUROCREDIT = ЕВРОКРЕДИТ – Eurocredit is the international bank credit denominated in a Eurocurrency. / Международный банковский кредит, деноминированный в Евровалюте.

EUROCURRENCY = ЕВРОВАЛЮТА – Eurocurrency:- foreign currency deposit held by banks outside the country issuing the currency. Contrary to the name, Eurocurrency deposits are not limited to Europe, and European currencies are not the only ones involved:- 75% of Eurocurrency deposits consists of Eurodollars. Moreover, depositors are not just Europeans:- US multinational corporations and oil-producing countries are some of the largest depositors. In the absence of a truly international currency, international transactions can be settled only through the intermediary of domestic currencies. Economic agents engaged in foreign trade must have a certain amount of foreign currency. Banks are restricted in their use of local currency by the domestic monetary authorities, while they have more freedom in foreign currency transactions, especially in relationships with non-residents. In general, the combination of credit and exchange policies usually favors foreign currency transactions by non-residents through resident banks. The Eurocurrency market is real international capital market, bringing together borrowers and lenders of all nationalities, dealing in all currencies, through a special banking system – the Eurobanks. Although banks of any size may participate in the Eurocurrency market, the world's largest banks and their branches control most of the activity. Bonds, Certificates of Deposit (CDs), deposits, or any capital market instrument issued outside of the national boundaries of the currency in which the instrument is denominated (for example, Eurodollars, Euro-Swiss Francs, or Euroyen). Eurocurrency is the currency employed for the balances and liabilities on the Euromarket. Among the principal Eurocurrencies are the Eurodollar, the ECU or Euro, the Euro-CHF, the Euro-DEM, the Euro-FRF, the Euro-GBP, the Euro-NLG, etc. / Евровалюта – денежные средства, депонированные корпорациями и правительствами различных стран в банки за пределами их собственных стран, называемые Евробанками (Eurobanks). Термины Евровалюта и Евробанк не обязательно означают, что валюты или банки являются Европейскими, хотя в большинстве случаев это именно так. Например, Доллары, депонированные в банке в Великобритании, или Итальянские Лиры, депонированные в Японском банке, считаются Евровалютами. ЕвроДоллары (Eurodollars) являются только одним из видов Евровалют, хотя и наиболее распространённым. Также известны как Евроденьги (Euromoney).

EUROCURRENCY LIABILITIES = ЕВРОВАЛЮТНЫЕ ОБЯЗАТЕЛЬСТВА – Eurocurrency Liabilities is a generic term referring to liabilities in a bank located in a country other than the one that issues the currency in which the liability is denominated. Despite its name, Eurocurrency need not be a liability of a European banking office nor denominated in European currency. Not to be confused with the Euro, the name of the common currency of twelve (as of 2004) European Union countries.

EURODOLLAR BOND = ЕВРОДОЛЛАРОВАЯ ОБЛИГАЦИЯ – Eurodollar Bond is a US-Dollar denominated bond issued by an overseas company and held in a foreign institution outside both the US and the issuer's home nation. Eurodollar bonds are an important source of capital for multinational companies and foreign governments. A Eurodollar bond is a type of Eurobond. Don't let the name confuse you! Although the Eurodollar originated in London, the name today refers only to the history, not the currency. For example, if a Chinese bank held Dollar-denominated bonds issued by a Japanese company, this would be considered a Eurodollar

bond. Eurodollar bonds are advantageous because they are subject to fewer regulatory restrictions. They are not registered with the United States' Securities and Exchange Commission and can be sold at lower interest rates than in the US. Eurodollar Bond is a bond issued in Europe by corporate or government interests outside the boundary of the national capital market, denominated in the US Dollars. Eurodollar Bond is a bond denominated in US Dollars issued by a non-American company outside of the United States and the issuer's home country. It is important to note that these are traded worldwide, not just in Europe. Like other Eurocurrency securities, Eurodollar bonds are subject to fewer regulatory restrictions because the central bank that issued the currency (in this case, the US Federal Reserve System) does not have any jurisdiction over the Dollars because the bonds are issued and traded outside the United States. For example, a Japanese company may issue a Eurodollar bond to attract foreign investors for its financing needs. Eurodollar bonds are one of the more common Eurocurrency bonds because of the international importance of the Dollar. See also Eurobond, and Eurodollar. Bond that pays interest and principal in Dollars held on deposit outside of the US. Bonds can be issued in other Eurocurrencies besides the Eurodollar, such as Euroyen bonds, which are sold in Japan and elsewhere by non-Japanese issuers and pay out in Yen held outside of Japan. / ЕвроДолларовая Облигация – облигация, проценты и основная сумма по которой выплачиваются в ЕвроДолларах, то есть в Долларах США, хранящихся в банках за пределами США, главным образом в Европе. Подобные облигации не регистрируются в Комиссии по Ценным Бумагам и Биржам (Securities and Exchange Commission), и поскольку на Европейском рынке гораздо меньше регуляторных отсрочек и расходов, облигации в ЕвроДолларах обычно продаются с более низкой процентной ставкой, чем ставкой в США.

EURODOLLAR CERTIFICATE OF DEPOSIT = ЕВРОДОЛЛАРОВЫЙ ДЕПОЗИТНЫЙ СЕРТИФИКАТ – Eurodollar Certificate Of Deposit is a negotiable certificate of deposit in US Dollars issued outside the United States either by a branch of a US bank or by a foreign bank. Eurodollar Certificates of Deposit (Euro-CDs) with a face value of USD1 million are traded in the money market. Nearly all Euro-CDs are issued in London, at rates tied to the London Interbank Offered Rate (LIBOR). Eurodollar Certificate of Deposit is a certificate of deposit paying interest and principal in Dollars, but issued by a bank outside the United States, usually in Europe. Eurodollar Certificate Of Deposit is a variation on the Eurodollar Time Deposit. A Eurodollar CD is basically the same as a domestic CD, except that it's the liability of a non-US bank. Because eurodollar CDs are typically less liquid, they tend to offer higher yields. The eurodollar market is obviously out of reach for all but the largest institutions. The only way for individuals to invest in this market is indirectly through a money market fund. Eurodollar CD is a certificate of deposit denominated in US Dollars, but issued and held outside the United States. Almost all Eurodollar certificates of deposit are issued by banks in London. Eurodollar Certificate of Deposit, or just Eurodollar CD, is a negotiable dollar-denominated time deposit issued by a US bank located outside the US or by a foreign bank located abroad. It's the same thing as a domestic CD expect that it's the liability of a non-US bank. Eurodollars also include dollars deposited in international banking facilities in the United States. Characteristics:- (i) Eurodollar CDs are not insured by FDIC, and are also free from US regulations and reserve requirements. They also don't attract any fees imposed by The Federal Deposit Insurance Corporation (FDIC). (ii) Eurodollar CDs are generally issued in denominations above USD1 million, however the stipulated minimum is USD100 000. (iii) They are denominated in US Dollars (not in the foreign currency). (iv) They have a maturity of minumum 7 days, but are mostly issued for 3 to 6 months. (v) Issuing banks are not allowed to purchase their owm CDs. (vi) Eurodollar CDs sold at face value either directly to investors or depositors or through dealers/brokers. (vii) Settlement is on a two-day basis. Uses:- (i) issuers have the benefit of lower cost of funds due to no regulatory costs and reserve requirements; (ii) buyers receive slightly higher yields while maintaining reasonable liquidity; and (iii) issuers can use the funds received for various purposes such as invest, improve reserves, maintain liquidity, or even lend to others outside the US. Marketplace:- London is the center of the he Eurodollar CD, however, activity also happens in offshore branches. The market is mostly accessible to large institutions. The small investors may access these through money market funds. Pricing:- Eurodollar CDs are priced based on LIBOR. Since they are issued in a foreign country, they are considered slightly riskier compared to the docestic CDs, and therefore offer a higher yield. Eurodollar CDs are quoted on an actual/360-day basis. The bid/offer quotes are in 16ths (for example, 12 7/16). A bid/offer rates of 10 7/16 and 10 3/16 would roughly translate to a bid interest rate of 10.437 5% and an offer rate of 10.187 5% percent, respectively, giving the dealer a spread of 25 basis points. Risks:- the key risks include credit risk, sovereign risk, and liquidity risk. The Eurodollar CDs are not rates, however most issuers issuers are rated by either Thompson Bankwatch (for domestic banks) or IBCA, Ltd. (for foreign banks). / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)). ЕвроДолларовые Депозитные Сертификаты – депозитные сертификаты, выпущенные банками за пределами США, главным образом в Европе, проценты и основная сумма по которым выплачиваются в Долларах. Подобные депозитные сертификаты обычно имеют минимальную деноминацию в 100 000 Долларов, краткосрочные депозитные сертификаты имеют срок погашения менее двух лет. Процентные ставки по этим депозитным сертификатам обычно привязаны к процентной ставке, предлагаемой Лондонской Межбанковской Ставкой Предложения (London Interbank Offered Rate), более известной в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR).

EURODOLLAR DEPOSITS = ЕВРОДОЛЛАРОВЫЕ ДЕПОЗИТЫ (или ЕВРОДОЛЛАРОВЫЕ ВКЛАДЫ) – Eurodollar Deposits are the Dollar-denominated deposits in banks and other financial institutions outside the United States; includes deposits at banks not only in Europe, but in all parts of the world.

EURODOLLARS = ЕВРОДОЛЛАРЫ – Eurodollars:- deposits denominated in US Dollars at banks and other financial institutions outside the United States. Although this name originated because of the large amounts of such deposits held at banks in Western Europe, similar deposits in other parts of the world are also called Eurodollars. US Dollar-denominated deposits in banks and other financial institutions outside of the United States. Ordinating from, but not limited to, the large quantity of US Dollar deposits held in Western Europe. Eurodollars are Dollar balances and Dollar liabilities beyond the borders of the United States. These transactions collectively form the Eurodollar market. See also Euromarket. US Dollars on deposit with a bank outside of the United States, even if this bank is a subsidiary of a US bank. Consequently this deposit is outside the jurisdiction of the United States. The bank could be either a foreign bank or a subsidiary of a US bank. US Dollar deposits held outside the United States, usually as deposits in commercial banks abroad. The creation and rapid expansion of the Eurodollar market is one of the biggest events in the history of international monetary relations since the end of World War II. Eurodollars were at first held by a few banks in a few European financial centers but are now the largest component of the broader Eurocurrency market. Dollar balances and Dollar liabilities, including certificates of deposit, bonds, deposits, or any capital market instrument placed outside the borders of the United States. These transactions collectively form the Eurodollar market. Holders may include individuals, companies, banks and central banks. / Долларовые остатки и Долларовые обязательства, включая сертификаты депозитов, облигации, депозиты или иные инструменты рынка капиталов, размещённые за пределами границ Соединённых Штатов Америки. Эти сделки в общей массе формируют рынок ЕвроДолларов. Владельцами могут быть частные лица, компании, банки и центральные банки. ЕвроДоллары или Европейские Доллары представляют собой временно свободные денежные ресурсы в Долларах США, помещённые юридическими и физическими лицами в Европейских банках и используемые этими банками для предоставления кредитов. Рынок ЕвроДолларов возник в конце 1950-х. В 1960 его объём составлял порядка двух миллиардов Долларов, а в 1980 – уже 735 миллиардов Долларов, что ни могло не сказаться и проявилось в виде усиления инфляции в странах Западной Европы. Это также послужило одной из главных причин обострения валютного кризиса 1960-х – середины 1980-х.

ЕвроДоллары – Доллары США, хранящиеся в банках за пределами Соединённых Штатов Америки, главным образом в Европе. Обычно используются для краткосрочного финансирования международных торговых операций. Некоторые ценные бумаги выпускаются в ЕвроДолларах, то есть проценты выплачиваются в Долларах, депонированных на счетах в иностранных банках.

EUROGAS = ЮРОГЭС (или ЕВРОГАЗ) – Eurogas is a non profit organization governed by the Belgian law. The offices are located in Brussels, Belgium. The organization is composed of 49 members from 28 countries amongst which 35 natural gas companies, 12 federations of natural gas companies, and 2 international organizations. The objectives of the organization are:- (i) to promote the interests of its membership, companies, national federations and associations involved in the supply, trading and distribution of natural gas and related activities such as storage and liquefied natural gas; (ii) to promote the development of natural gas in Europe particularly in the legal economic technical and scientific areas to prepare studies and to promote cooperation within the gas industry; and (iii) to promote the smooth functioning of the European internal gas market and to take stance on issues of interest to the European natural gas industry with respect to international and supra-national organizations including but not limited to the European Institutions and to public opinion. The General Assembly convenes twice a year. The Governing Board chaired by the President, with an elected Board composed of representatives of its member companies and federations (Presidency is composed of one President, one Senior Vice-President, three Vice-Presidents and past President). Groups/Task Forces consisting of industry executives and specialists from the member organisations, deal with selected policy areas and issues of concern. The Secretariat General is in charge of the daily management, and co-ordinates the work of Groups/Task Forces and other activities on behalf of Eurogas. The General Secretariat is in charge of representation and of the daily management. The Eurogas staff co-ordinates the work of Groups/Task Forces and other activities on behalf of Eurogas. Main areas for Eurogas action:- (i) energy policy and EU policies in general; (ii) the structure and regulation of the internal energy market; (iii) security of supply; (iv) competitiveness; (v) storage, LNG and other supply instruments; (vi) energy statistics and economic forecasts; (vii) energy taxation; (viii) environmental protection and climate change policies; (ix) energy efficiency; (x) legal matters; (xi) gas networks use; and (xii) external relations – EU Russia Dialogue. See also International Gas Union.

EUROGROUP = ЕВРОГРУППА – Eurogroup is an informal gathering of the ministers of economics and finance of the Euro area member countries. The ministers discuss issues connected with their shared responsibilities in respect of the single currency. The European Commission and the European Central Bank (ECB) are invited to take part in the meetings. The Eurogroup usually meets immediately before an Economic and Financial Affairs (ECOFIN) meeting. Eurogroup is the informal grouping bringing together those members of the ECOFIN Council who represent the Euro area countries. It meets on a regular basis (usually prior to meetings of the ECOFIN Council) to discuss issues connected with the Euro area countries' shared responsibilities for the single currency. The European Commission and, when appropriate, the ECB are invited to take part in these meetings.

EURO INTERBANK OFFERED RATE = МЕЖБАНКОВСКАЯ ПРЕДЛОЖЕННАЯ СТАВКА ЕВРО – Euro Interbank Offered Rate (EURIBOR) is the rate at which a prime bank is willing to lend funds in Euro to another prime bank, computed daily for interbank deposits with a maturity of up to 12 months. Unlike the EUREPO, the EURIBOR reflects conditions in the unsecured market. / ЮРИПО (EUREPO), Юрибо или Юрайбо (Euribor).

EUROMARKET = ЕВРОРЫНОК – Euromarket is the international financial market consisting of several specialized markets on which bank loans and bond and equity issues are transacted in Eurocurrencies such as EuroDollars, Euro-DEM and Euro-FRF. Despite its name, the Euromarket is by no means confined to Europe geographically and today is organized at the global level. See also Eurocapital Market, and Euromoney Market.

EUROMONEY MARKET = РЫНОК ЕВРОВАЛЮТ – Euromoney Market (Eurodollar market) is a market for limited-term Dollar loans, generally with short repayment periods, established in 1957. Trading is conducted in US Dollars and other convertible currencies between banks outside the USA (primarily in Europe, Canada and Japan, including foreign subsidiaries of US banks). The principal market is London. Additionally, there is the eurocapital market, the market for eurobonds, public-sector debentures and German mortgage bonds (Pfandbriefe). The segment of the Euromarket which specializes in settling short- to medium-term deposits (with maturities not exceeding 18 months). / Сегмент Еврорынка, который специализируется на расчётах по кратко- и среднесрочным депозитам (со сроками погашениями, не превышающими 18 месяцев).

EURONEXT (NV) = ЮРОНЭКСТ (ЭН.ФЭЙ.) (или ЮРОНЭКСТ (ЭН.ВИ.)) – Euronext NV is part of the NYSE Euronext Group. Headquartered in Amsterdam, The Netherlands. Euronext refers to its combined stock exchange operations, comprising:- (i) Amsterdam:- Euronext Amsterdam Stock Market, which is a regulated market under Dutch Law; (ii) Brussels:- Euronext Brussels Stock Market, which is a regulated market under Belgian Law; (iii) Lisbon:- Euronext Lisbon Stock Market, which is a regulated market under Portuguese Law; (iv) Paris:- Euronext Paris Stock Market, which is a regulated market under French Law. All are regulated markets under the European Union's Investment Services Directive. NYSE Liffe is the brand name of the derivatives business of NYSE Euronext, comprising the derivatives markets in Amsterdam, Brussels, Lisbon, London and Paris; and the futures markets in the United States. NYSE Liffe's European derivatives markets are as follows:- (i) Amsterdam:- Euronext Amsterdam Derivative Markets, which is a regulated market under Dutch Law; (ii) Brussels:- Euronext Brussels Derivatives Market, which is a regulated market under Belgian Law; (iii) Lisbon:- Euronext Lisbon Futures and Options Market, which is a regulated market under Portuguese Law; (iv) London:- LIFFE Administration and Management, which is a Recognised Investment Exchange under English Law; and (v) Paris:- MATIF and MONEP, which are regulated markets under French Law. All are regulated markets under the European Union's Investment Services Directive. On 2000-September-22 the exchanges of Paris (Bourse de Paris), Amsterdam Exchanges (AEX, Euronext Amsterdam) and Brussels Exchanges (BXS, Euronext Brussels) merged, becoming fully owned subsidiaries of Euronext NV, a Dutch-incorporated structuur regime holding company. The Euronext merger has created a single organization with one line of command for the three exchanges. Euronext NV has a two-tier board structure consisting of a Managing Board and a Supervisory Board. The three members of the Managing Board are appointed by the Supervisory Board. The Managing Board is responsible for the company's general policy and for making decisions on the principles for the organization of the markets and the clearing and settlement of transactions. Since mid-2001, Euronext NV has itself been listed on the Euronext Paris exchange. Euronext is creating a fully integrated cross-border stock and derivatives trading market, with one trading system, one central order book and a single set of trading rules. Since November 2001 cash market transactions have been conducted on a single trading platform, the Nouveau Système de Cotation (NSC), which was already being used in Paris. Furthermore, derivatives trading and clearing and settlement will be integrated. From a regulatory point of view, the three exchanges will still be regulated markets recognised in their national jurisdictions, but national rules (eg listing requirements, membership, enforcement trading and surveillance) will be harmonized. As far as Belgium is concerned, the main legislation for the stock exchange markets is stipulated in the Law of 1995-April-06 relating to secondary markets. The Euronext Brussels Rule book has been formally established by the Euronext Brussels Managing Board and has to be approved by the Belgian Minister of Finance, on the advice of the BFC. It comprises both harmonized rules, e.g., the membership rules, and, in a transition

period, local Euronext Brussels rules. The BFC has since 2002 acted as the market authority for Euronext Brussels. It concluded a memorandum of understanding with the market authorities of the French and Dutch Euronext markets regarding the regulation and supervision of Euronext. Euronext NV is a Dutch public company with limited liability (naamloze vennootschap (NV) is the Dutch equivalent of the British public limited company (PLC)) which has its registered office in Amsterdam, the Netherlands. Euronext NV has subsidiaries in Belgium, France, the Netherlands, Portugal and the United Kingdom (together, Euronext). Euronext NV, a holding company incorporated under Dutch law that operates through local subsidiaries, was formed on 2000-September-22 when the exchanges of Amsterdam, Brussels and Paris merged. The Euronext group expanded at the beginning of 2002 with the acquisition of LIFFE (London International Financial Futures and Options Exchange) and the merger with the Portuguese exchange BVLP (Bolsa de Valores de Lisboa e Porto). Today, Euronext is Europe's leading cross-border exchange, integrating trading and clearing operations on regulated and non-regulated markets for cash products and derivatives. Euronext was formed in 2000 in response to the globalisation of capital markets and to create a pan-European exchange offering its participants increased liquidity and lower transaction costs. On 2006-June-01, NYSE Group, Inc. and Euronext NV announced an agreement to combine the leading US and pan-European securities trading exchanges in a merger of equals. This new group, to be named NYSE Euronext, will globally redefine the marketplace for trading cash and derivatives securities, producing significant benefits for shareholders, issuers and users. NYSE Euronext, the holding company created by the combination of NYSE Group, Inc. and Euronext NV, was launched on 2007-April-04. NYSE Euronext operates the world's largest and most liquid exchange group and offers the most diverse array of financial products and services. NYSE Euronext, which brings togethersix cash equities exchanges in five countries and six derivatives exchanges, is a world leader for listings, trading in cash equities, equity and interest rate derivatives, bonds and the distribution of market data. With a leading USD28.5 trillion/EUR21.5 trillion total market capitalization of listed companies and average daily trading value of its combined markets of approximately USD102 billion/EUR77 billion (as of 2007-February-28), NYSE Euronext seeks to provide the highest standards of market quality and integrity, innovative products and services to investors, issuers, and all users of its markets. Euronext NV, a wholly owned subsidiary of NYSE Euronext, has successfully integrated local markets across Europe to provide users with a unified market that is broad, liquid and cost effective. Euronext is the largest central order book cash market in Europe and the second largest derivatives exchange in the world, by value of business traded. Following the initial three-way merger of the local exchanges of Amsterdam, Brussels and Paris, Euronext acquired the London-based derivatives market LIFFE and merged with the Portuguese exchange in 2002. Euronext's unique business model incorporates the individual strengths and assets of each local market and has been implemented on all of Euronext's markets, covers technological integration, the harmonisation of market rules and the regulatory framework. The implementation of Euronext's horizontal model designed to generate synergies has proved that the most successful way to merge European exchanges is to apply global vision at a local level. Euronext's IT integration was completed in 2004, when a four-year migration plan resulted in harmonised IT platforms for cash trading (NSC®) and derivatives (LIFFE CONNECT®). As a result, every market participant now has a single point of access to trading. Euronext's IT structure was rationalized in 2005 with the creation of Atos Euronext Market Solutions (AEMS), an IT services-related vehicle between Euronext and Atos Origin which is now a leading global provider of technology services to Euronext and other global capital markets. / Юронэкст Эн.Фэй. или Юронэкст Эн.Ви. (Euronext NV). Парижская Биржа или, как это звучит на Французском языке по месту расположения, Бурс дё Пари (Bourse de Paris). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). (LIFFE)). двухъярусное (two-tier).

EURONOTE FACILITIES = ЕВРОНОТНЫЕ ВОЗМОЖНОСТИ – Euronote Facilities are financial agreements which enable the issuer to procure liquid funds, up to a certain limit, during a fixed programme period of five to ten years through the revolving placement of euronotes. It is essential for this construction that the banks involved (underwriters) undertake to purchase the euronotes at a contractually agreed rate of interest, or to alternatively provide book credits (backup or standby facilities), if the borrower does not succeed in selling his euronotes on the market. Since the euronotes themselves only have a duration of several months, the borrower may have to make a renewed offer once this period has expired (= Revolving Underwriting Facilities, RUFs, or Note Issuance Facilities, NIFs).

EURONOTE = ЕВРОНОТА – Euronote is a short-dated money market paper issued on the euromarket by non-banks. Euronote interest rates are linked to a money-market reference rate. In contrast to Euro Commercial Paper, that results in standard maturities of one, three or six to twelve months. Medium-term notes issued on the Euromoney market. Short-term unsecured promissory notes in US Dollars or in Euro, issued by high-quality corporate, financial or government borrowers. Euronotes or Euro-Notes are ordinarily issued in bearer form and sold at a discount.

EURO OVERNIGHT INDEX AVERAGE = УСРЕДНЕНИЕ ИНДЕКСА ПО ЕВРО ОВЕРНАЙТ – The Euro Overnight Index Average (EONIA) is a measure of the effective interest rate prevailing in the Euro overnight market. EONIA is calculated, with the help of the European Central Bank (ECB), as a weighted average of the interest rates on unsecured overnight lending transactions on the interbank market in the Euro area. The necessary data is reported by a representative panel of EURIBOR prime banks. Euro Overnight Index Average (EONIA) is a measure of the effective interest rate prevailing in the Euro interbank overnight market, based on transactions. The Euro OverNight Index Average (EONIA):- the Eonia rate is the 1-day interbank interest rate for the Euro zone. In other words, it is the rate at which banks provide loans to each other with a duration of 1 day. Therefore Eonia can be considered as the 1 day Euribor rate. / ОНИА (EONIA). ЮРИБО или ЮРАЙБО (EURIBOR).

EUROPAY (INTERNATIONAL SA) = ЮРОПЭЙ (ИНТЁНЭШЭНЭЛ ЭС.ЭЙ.) – Europay International SA was formed in 1992 with the merger of Eurocard International and Eurocheque International. As the leading financial services provider in Europe, Europay International provides personal payment services to the European banking community. Headquartered in Waterloo, Belgium, Europay International also offers payment products to banks worldwide through its alliance with MasterCard International. Europay International SA and MasterCard International announced on 1993-October-02 that they will merge their technologies to build a single, global transaction-processing network. The move represents the next step in strategic alliance between the two companies aimed at increasing brand awareness and market strength. MasterCard International, based in New York, the United States, is a payment services company. In 2002 Europay International merged with MasterCard International to form MasterCard, Inc.. Today the company is known as MasterCard Worldwide. / Компания Юропэй Интёнэшэнэл Эс.Эй. (Europay International SA) была создана в 1992 в результате слияния Юрокард Интёнэшэнэл (Eurocard International) и Юрочек Интёнэшэнэл (Eurocheque International). МэстчёКард, Инк. (MasterCard, Inc.).

EUROPEAN ADVISORY COMMITTEE = ЕВРОПЕЙСКИЙ СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ (или ЕВРОПЕЙСКИЙ КОНСУЛЬТАТИВНЫЙ КОМИТЕТ) – European Advisory Committee provides views and attitudes of the European corporate community regarding the New York Stock Exchange's (NYSE®) role in international matters. The committee consists of active or former

chief executive officers of European-based companies or financial institutions. They provide views on strengthening NYSE® policies and programs on internationalization, facilitating multinational corporate securities offerings, and strengthening communication with European corporations. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

EUROPEAN AGREEMENT CONCERNING THE INTERNATIONAL CARRIAGE OF DANGEROUS GOODS BY ROAD = ЕВРОПЕЙСКОЕ СОГЛАШЕНИЕ, КАСАЮЩЕЕСЯ МЕЖДУНАРОДНОЙ ПЕРЕВОЗКИ ОПАСНЫХ ТОВАРОВ ПО АВТОДОРОГАМ – The European Agreement Concerning the International Carriage of Dangerous Goods by Road (or in French:- Accord Européen Relatif au Transport International des Marchandises Dangereuses par Route (ADR)) applicable as from 2001-January-01. The European Agreement concerning the International Carriage of Dangerous Goods by Road (ADR) was done at Geneva on 1957-September-30 under the auspices of the United Nations Economic Commission for Europe, and it entered into force on 1968-January-29. The Agreement itself was amended by the Protocol amending article 14 (3) done at New York on 1975-August-21 1975, which entered into force on 1985-April-19. The Agreement itself is short and simple. The key article is the second, which say that apart from some excessively dangerous goods, other dangerous goods may be carried internationally in road vehicles subject to compliance with:- (i) the conditions laid down in Annex A for the goods in question, in particular as regards their packaging and labelling; and (ii) the conditions laid down in Annex B, in particular as regards the construction, equipment and operation of the vehicle carrying the goods in question. Annexes A and B have been regularly amended and updated since the entry into force of ADR. Consequently to the amendments for entry into force on 2011-January-01, a revised consolidated version has been published as document ECE/TRANS/215, Vol. I and II ('ADR 2011'). The structure is consistent with that of the United Nations Recommendations on the Transport of Dangerous Goods, Model Regulations, the International Maritime Dangerous Goods Code (of the International Maritime Organization), the Technical Instructions for the Safe Transport of Dangerous Goods by Air (of the International Civil Aviation Organization) and the Regulations concerning the International Carriage of Dangerous Goods by Rail (of the Intergovernmental Organisation for International Carriage by Rail). / Акорд Эропеэнн Рэлятиф о Транспор Этэрнасьёналь дэ Маршандиз Данжёрёз пар Рут (А.Дэ.Эр.; Accord Européen Relatif au Transport International des Marchandises Dangereuses par Route (ADR)).

EUROPEAN ARTICLE NUMBER BARCODES = ШТРИХОВЫЕ КОДЫ ЕВРОПЕЙСКИХ НОМЕРОВ ИЗДЕЛИЙ (или ПРОДУКЦИИ) – The European Article Number (EAN) is a barcoding standard. EAN Barcodes are used when the country origin needs to be known. There are 8 digits in EAN 8, where the first two characters are used to define the country of origin, the next 5 are data, followed by the checksum. Both 2 and 5 digit supplementals are also supported. There are 13 digits in EAN 13 where the first two characters are used to define the country of origin, the next ten are data, followed by the checksum. Both 2 and 5 digit supplementals are also supported. See also Bar Code, EAN-8, and EAN-13.

EUROPEAN AUTOMOBILE MANUFACTURERS ASSOCIATION = АССОЦИАЦИЯ ЕВРОПЕЙСКИХ ИЗГОТОВИТЕЛЕЙ АВТОМОБИЛЕЙ – European Automobile Manufacturers Association or Association des Constructeurs Europeens D'Automobiles (ACEA):- represents Europe's car, van, truck and bus manufacturers, and works with a variety of institutional, non-governmental, research and civil society partners – as well as with a number of industry associations to ensure the economic environmental and social sustainability of the automobile industry. Who We Are:- ACEA represents Europe's car, van, truck and bus manufacturers. The European Automobile Manufacturers' Association (ACEA) represents the 15 Europe-based car, van, truck and bus makers. ACEA works with a variety of institutional, non-governmental, research and civil society partners – as well as with a number of industry associations with related interests. ACEA has permanent cooperation with the European Council for Automotive R&D (EUCAR), which is the industry body for collaborative research and development. ACEA has close relations with the 29 national automobile manufacturers' associations in Europe, and maintains a dialogue on international issues with automobile associations around the world. What We Do:- ACEA is an advocate for the automobile industry in Europe, representing manufacturers of passenger cars, vans, trucks and buses with production sites in the EU. ACEA's mission is to:- (i) define and advocate the common interests, policies and positions of the European automobile industry; (ii) engage in dialogue with the European institutions and other stakeholders in order to advance understanding of industry-related issues, and to contribute to effective policy and legislation at both European and global levels; (iii) act as a portal for expert knowledge on vehicle-related regulation; (iv) communicate the role and importance of the industry, using reliable data and information; (v) monitor activities that affect the automobile industry, cooperating with the other stakeholders involved; and (vi) undertake strategic reflection on the increasingly global challenges of mobility, sustainability and competitiveness. The automotive industry is one of the most regulated sectors in Europe. This regulatory framework consists of around 80 EU Directives and over 70 international UNECE (short for the United Nations Economic Commission for Europe organized in 1947) regulatory agreements, mostly covering technical issues and standardisation. Through its member companies, ACEA taps into a wealth of technical, regulatory and practical expertise in the following priority fields:- (i) Competitiveness, Market and Economy; (ii) Environment and Sustainability; (iii) International Trade; (iv) Research and Innovation; (v) Safety; and (vi) Transport Policy. Headquartered in Brussels, Belgium. See also Association des Constructeurs Européens D'Automobiles (ACEA). European Automobile Manufacturers' Association (ACEA) represents the 14 Europe-based car, van, truck and bus manufacturers: BMW Group, DAF Trucks, Daimler, Fiat Chrysler Automobiles, Ford of Europe, Hyundai Motor Europe, Iveco, Jaguar Land Rover, PSA Group, Renault Group, Toyota Motor Europe, Volkswagen Group, Volvo Cars, and Volvo Group. Association des Constructeurs Européens D'Automobiles (ACEA) represents Europe's car, van, truck and bus manufacturers. The European Automobile Manufacturers' Association (ACEA) represents the 15 Europe-based car, van, truck and bus makers. EUROPEAN BANK FOR RECONSTRUCTION AND DEVELOPMENT = ЕВРОПЕЙСКИЙ БАНК РЕКОНСТРУКЦИИ И РАЗВИТИЯ – The European Bank for Reconstruction and Development (or EBRD for short) was established in 1991. The EBRD uses the tools of investment to help build market economies and nurture the transformation to private enterprise in countries from central Europe to central Asia. The EBRD is owned by 61 countries and two intergovernmental institutions, the European Commission and the European Investment Bank. The European Bank for Reconstruction and Development (EBRD) provides assistance through direct loans. The loans are designed to facilitate the development of market-oriented economies and to promote private and entrepreneurial initiatives. We work together with the private sector financing projects in 29 countries from central Europe to central Asia. EBRD began financing operations in 1991. EBRD headquarters are in London, the United Kingdom. The EBRD is an international financial institution that supports projects from central Europe to central Asia. Investing primarily in private sector clients whose needs cannot be fully met by the market, the Bank fosters transition towards open and democratic market economies. In all our operations we follow the highest standards of corporate governance and sustainable development. We aim to promote market economies that function well – where businesses are competitive, innovation is encouraged, household incomes reflect rising employment and productivity, and where environmental and social conditions reflect peoples' needs. The EBRD is composed of a multinational staff and in-house Board of Directors representing shareholders (61 countries plus the European Union and European Investment Bank). Our shareholders include countries from both the region and the rest of the world, plus the EU and the European Investment Bank. Our governance:- the powers of the EBRD are vested in the Board of Governors that delegates most of its authority to the Board of Directors. Our management:- the President chairs the meetings of the Board of Directors and conducts the current business of the Bank. The Executive Committee advises the President together with Senior Management. The overall structure of the Bank is organised along seven lines based on shared operational priorities. We work in 29 countries across central and eastern Europe and central Asia. Our staff:- we are more than 1 500 talented individuals from all over the world. We provide project financing for banks, industries and businesses, both new ventures and investments in existing companies. We also work with publicly owned companies. Each of our projects is tailored to the needs of the client and to the specific situation of the country, region and sector. Direct investments generally range from €5 million to €230 million. We provide loan and equity finance, guarantees, leasing facilities and trade finance. Typically we fund up to 35 per cent of the total project cost. The Bank invests only in projects that could not otherwise attract financing on similar terms. For each project we finance, we assign a dedicated team of specialists with specific sectoral, regional, legal and environmental skills. Through donor funds we mobilise investment capital and expertise by giving local business access to consultant experts. Donor programmes are funded by governments and international institutions, and are managed by the EBRD. We also manage six nuclear safety and decommissioning funds. The biggest of these is for the transformation of the destroyed reactor in Chernobyl into an environmentally safe state. Since our establishment in 1991 we have become the largest financial investor in our region of operations which stretches from central Europe and the Western Balkans to central Asia. With the ability and willingness to bear risk on behalf of our clients, we help their countries in the region to become open, market economies. We are owned by 61 countries, the European Union and the European Investment Bank. The European Bank for Reconstruction and Development (EBRD) is the first international financial institution of the post Cold War period. It was established in 1991 in response to major changes in the political and economic climate in central and eastern Europe. Inaugurated less than two years after the fall of the Berlin Wall, the Bank was created to support the development of market economies in the region following the widespread collapse of communist regimes. A bank for Europe:- the idea of the European Bank, put forward by President François Mitterrand of France at the European Parliament in Strasbourg on 25 October 1989, came to fruition on 29 May 1990 with the signature of its agreement by 40 countries, the Commission of the European Communities and the European Investment Bank. With Headquarters in London, the EBRD began operations in April 1991. The EBRD is the world's only transition bank. Today it works in 29 countries from central Europe to central Asia financing projects, primarily in the private sector, that serve the transition to market economies and pluralistic democratic societies. In its capacity as a development bank, the EBRD seeks to finance operations that are both commercially viable and assist development, including in the environmental field. The Bank serves the interests of all its members, not just those which will benefit from financing, because the integration of central and eastern Europe into Europe and into the global market provides new opportunities for trade and investment in all parts of the world. The original idea for the EBRD came from President Mitterrand's special adviser Dr Jacques Attali who also chaired the international conference for the creation of the EBRD. The perceived urgency of the project was demonstrated by the fact that it took just 18 months for founding members to complete the negotiations and launch the Bank. The Treaty was signed in April 1990. London was chosen as the Headquarters of the Bank and Dr Attali was elected as its founding and first President. The EBRD was inaugurated in May 1991. The sudden and total collapse of the Soviet Union convinced the founding countries of the urgency to provide support to a region emerging from decades of political and economic dictatorship. It became clear that boosting the role of the private sector as the linchpin for free and open market economies was crucial in the democratic transition process. The EBRD's early activities included establishing contacts with all interested parties, conducting preparatory missions to central and eastern Europe agreeing on procedures, and forging a strategy for the institution. Why a transition bank? The process of transition from command economies to open market economies requires an enormous range of structural transformation. From very early on the EBRD became heavily involved in areas such as banking systems reform, the liberalisation of prices, privatisation (legalisation and policy dialogue) and the creation of appropriate legal frameworks for property rights. The expertise of the Bank became well-known in fostering competition throughout the economy, the necessary changes in managerial behaviour and the establishment of commercial codes and accounting systems. These reforms were supported by sound advice, training and technical expertise, and supplemented by major investments in the private and public sectors to ensure an effective supply response. Since domestic capital alone would not have been sufficient, the Bank helped to bring in external capital from both private and public sources. The role conceived for the EBRD was unique for an international financial institution (IFI). It included fostering transition through project financing, primarily in the private sector, through the careful identification of projects that would expand and improve markets. Focus includes building the institutions necessary for underpinning the market economy, and demonstrating and promoting market-oriented skills and sound business practices. A unique mandate:- the uniqueness of the EBRD's mission is remarkable for its political underpinning. Differing from other development banks, the EBRD operates under a mandate that has political aspects, in that it seeks to assist only those countries that are 'committed to and applying the principles of multi-party democracy (and) pluralism' (Article 1 of the Agreement Establishing the Bank). Protection of the environment is also a core component of the Bank's mandate. Years of ecologically destructive practices left the countries of central and eastern Europe and the Commonwealth of Independent States (CIS) with a chronic environmental legacy. The Bank promotes environmentally sustainable development in all its activities, making it the only IFI with such a determined approach to the environment. The Bank believes that sustainable development is fundamental to sound business practice and to ensure this, all of the Bank's investment projects are screened in compliance with the it's Environmental and Social Policy. / особый советник Президента Фросуа Митеро Доктор Жакь Атали (President François Mitterrand's special adviser Dr Jacques Attali). ковка или штамповка (forging).

EUROPEAN BANKING COMMITTEE = ЕВРОПЕЙСКИЙ КОМИТЕТ ПО БАНКОВСКОМУ ОСБЛУЖИВАНИЮ – European Banking Committee (EBC):- established in 2003 by Commission Decision 2004/10/EC of 05 November 2003 as a level 2 committee to advise the European Commission on policy issues relating to banking activities; it superseded the Banking Advisory Committee. The ECB is represented in the field of banking and supervision in the Committee of European Banking Supervisors, which is a level 3 committee.

THE EUROPEAN CENTRAL BANK = ЕВРОПЕЙСКИЙ ЦЕНТРАЛЬНЫЙ БАНК – The European Central Bank (ECB) was established on 1998-June-01 in Frankfurt am Main, Germany, taking over from its predecessor, the European Monetary Institute (EMI). It is a supra-national institution with its own legal personality. The ECB is based in three buildings in the heart of Frankfurt but will move to its new headquarters, currently under construction in the Eastern part of the city, in 2011. The ECB must influence conditions in the money market, and thereby the level of short-term interest rates, in order to achieve price stability. The ECB has adopted a strategy to ensure that a consistent and systematic approach is applied to monetary policy decisions. Consistency helps to stabilize inflation expectations and enhance the credibility of the ECB. A main element of the ECB Governing Council's monetary policy strategy is its quantitative definition of price stability:- 'a year-on-year increase in the Harmonized Index of Consumer Prices (HICP) for the Euro area of below 2%'. Price stability must be maintained over the medium term, which reflects the need for monetary policy to be forward-looking. In the pursuit of price stability, the ECB aims to maintain inflation rates below but close to 2% over the medium term. This underlines its commitment to provide a sufficient safety margin to guard against the risks of deflation. Monetary policy needs to be forward-looking since there are significant lags in the transmission mechanism (see next section). In addition, monetary policy should anchor inflation expectations and help to reduce volatility in economic developments. In addition to the definition of price stability, the monetary policy strategy consists of a comprehensive assessment of the risks to price stability consisting of an economic analysis and a monetary analysis. Every decision on monetary policy is preceded by a thorough cross-checking of the information coming from the two analyses. The ECB compiles and publishes financial and monetary statistics in close cooperation with the National Central Banks (NCBs). This statistical information supports the monetary policy of the Euro area and the decision-making of the ECB. The NCBs (and, in some cases, other national authorities) collect data from financial institutions and other sources in their respective countries and calculate aggregates at the national level, which they send to the ECB. The ECB then compiles the aggregates for the Euro area. The legal basis for the development, collection, compilation and dissemination of statistics by the ECB is laid down in the Statute of the European System of Central Banks and of the European Central Bank annexed to the Treaty. While ensuring that its statistical requirements are met, the ECB seeks to minimise the burden which statistical reporting places on financial institutions and other reporting agents. Responsibility for statistics at the European level is shared between the ECB and the European Commission (through Eurostat, the Statistical Office of the European Communities). The ECB is primarily or jointly responsible for Euro area monetary, financial institutions and financial markets statistics, external statistics (including the balance of payments), financial accounts and the development of quarterly non-financial accounts for institutional sectors (households, corporations and government). Responsibility for the statistical infrastructure (including seasonal adjustment, the design of a quality framework and data transmission standards) at the European level is also shared between both institutions. Wherever possible, ESCB statistics conform to international standards. European Central Bank (ECB) was established on 1998-June-01 and based in Frankfurt am Main, the ECB, together with the national central banks of the Euro area, defines and implements the monetary policy of the countries participating in the Euro area. The European Central Bank (ECB) is a central bank of the European Monetary Union (EMU) and executive body of the European System of Central Banks (ESCB) whose remit is to define monetary policy within the EMU. The authority to grant licenses to issue Euro banknotes rests solely with the ECB. Planned central bank of the European Community (EC), mandated at the Maastricht Summit in December 1991. Scheduled to become operational in 1999 if the Maastricht Treaty is ratified. The European Central Bank (ECB), domiciled in Frankfurt am Main, is the joint monetary authority of the Member States of the European Monetary Union and together with the national central banks forms the European System of Central Banks (ESCB). Its primary objective is to maintain stability of the price level in the Euro area. A further objective is to support economic policies to achieve a high level of employment and sustainable and non-inflationary growth. The ECB has two decision-making bodies: the Governing Council, and the General Council; the Executive Board is its executive body. The central bank for the new European Monetary Union. European Central Bank (ECB):- the ECB lies at the centre of the European System of Central Banks (ESCB) and the Eurosystem and has legal personality under Community law. It ensures that the tasks conferred upon the Eurosystem and the ESCB are implemented either through its own activities or through those of the NCBs, in line with the Statute of the European System of Central Banks and of the European Central Bank. The ECB is governed by the Governing Council and Executive Board, and, as a third and temporary decision-making body, by the General Council. The ECB is at the heart of the Eurosystem. / Маастрихтский Трактат .

EUROPEAN CENTRAL SECURITIES DEPOSITORIES ASSOCIATION = ЕВРОПЕЙСКАЯ АССОЦИАЦИЯ ЦЕНТРАЛЬНЫХ ДЕПОЗИТАРИЕВ ЦЕННЫХ БУМАГ – The European Central Securities Depositories Association (ECSDA) is an association of Central Securities Depositories and International Central Securities Depositories, or (I)CSDs, in Europe, founded in 1997. The association aims to build up a common European infrastructure to support European central banks' interbank lending operations involving securities as collateral. There are also plans to build up mutual accounts among CSDs to facilitate the cross-border settlement of securities transactions. European Central Securities Depositories Association (ECSDA) is an association of central securities depositories formed in 1997 to facilitate the exchange of ideas and collaboration on projects of mutual interest. ECSDA is the European Central Securities Depositories Association, gathering 41 (I)CSDs across Europe. Its objective is to offer solutions and provide advice at European and international level on technical, economic, financial and regulatory matters to reduce risk and increase efficiency in custody, pre-settlement and settlement arrangements for securities and related payments across Europe for the benefit of issuers, investors and market participants. The Association is without any purpose of gain or commercial interest. Its main missions are:- (i) to study technical, economic, financial, and regulatory issues affecting European central securities depositories, to offer solutions and provide advice on these topics; (ii) to facilitate cooperation between central secuirities depositories at the European and international level, including by providing a forum for the exchange of information, not only among members, but also between interested parties in the field of securities pre-settlement, settlement and custody; (iii) to promote the unique role of central securities depositories in financial markets, and especially their contribution to reducing risks and increasing efficiency in relation to cross-border securities processing, for the benefit of issuers, investors and market participants; and (iv) to represent and defend the common interests of European central securities depositories, especially by supporting a coordinated approach towards relevant European and international regulatory and decision-making bodies with competence in the field of securities pre-settlement, settlement and custody. ECSDA generally promotes:- (i) a process flow that ensures highest efficiency with a low risk profile; (ii) a level playing field with the highest standards for entities providing custody, pre-settlement and settlement services; (iii) common standards to reduce/remove barriers to cross border settlement; (iv) exchange of information on legal, tax, regulatory framework and market practices to foster the process of harmonisation across Europe; and (v) international cooperation. The European Central Securities Depositories Association (ECSDA) was formed in 1997 in Madrid in order to provide a forum for CSDs to exchange views and take forward projects of mutual interest. At the beginning of its activity, the work programme of ECSDA was focused on technical aspects of secure and efficient cross border settlement, through the introduction of the Eurolinks network. ECSDA has developed complete standards for cross-border settlement (free of/against payment) of securities transactions and for automated support of corporate actions, ranging from cash dividends to more complex events such as rights. In support, a model agreement was drafted to provide legal guidelines for establishing links between (I)CSDs. In the light of the strong increase of cross border activity, the deeper awareness of risks in the settlement process, the integration process of the European capital market and the higher attention paid to high efficiency of cross border settlement, ECSDA has decided to enhance the role of the Association:- ECSDA now focuses on conducting joint work on

common interest issues in European clearing and settlement and on promoting the removal of obstacles on cross border settlement. This task has to be done in close cooperation with the market participants (such as operators of exchanges and trading platforms, issuers, intermediaries) and the institutional authorities. ECSDA also aims at giving advice on legal, regulatory and fiscal matters to the European Authorities and to contributing to the decision making process which will shape clearing and settlement in Europe in the near future. European Central Securities Depositories Association's (ECSDA) objective is to offer solutions and provide advice at international level on technical, economical, financial and legal and regulatory matters to reduce risk and increase efficiency in custody, pre-settlement and settlement arrangements for securities and related payments across Europe for the benefit of issuers, investors and market participants. Headquartered in Brussels, Belgium. / Европейская Ассоциация Центральных Депозитариев Ценных Бумаг (ЕАЦДЦБ) – ассоциация центральных депозитариев ценных бумаг, сформированная в 1997 для содействия обмену идеями и сотрудничества по проектам взаимного интереса.

EUROPEAN COAL AND STEEL COMMUNITY = ЕВРОПЕЙСКОЕ ОБЪЕДИНЕНИЕ УГЛЯ И СТАЛИ – European Coal and Steel Community (ECSC) is one of the European Communities, the ECSC was created in 1951 in Paris, and established a common market for coal and steel between the six founder Member States (Belgium, France, Germany, Italy, Luxembourg and the Netherlands). / Европейское Объединение Угля и Стали (ЕОУС) – одно из Европейских Сообществ. ЕОУС было основано в 1951 в Париже, Франция с целью создания общего рынка угля и стали между шестью государствами членами (Бельгия, Германия, Италия, Люксембург, Нидерланды и Франция). К 1985 оно насчитывало уже 12 стран участниц и контролировало свыше 85% производства чугуна, около 80% выплавки стали, почти всю добычу каменного угля и примерно 50% добычи железной руды в странах Западной Европы. Европейское Объединение Угля И Стали (ЕОУС), международная государственно-монополистическая организация, объединяющая каменноугольную, железорудную и металлургическую промышленность Франции, ФРГ, Италии, Бельгии, Нидерландов и Люксембурга (эти страны с 1958 образуют Европейское Экономическое Сообщество). Объединение было создано в 1951 сроком на 50 лет и провозгласило целью содействовать экономическому развитию стран-членов путём образования общего рынка для продукции угольной и металлургической промышленности. Создание ЕОУС явилось результатом структурных сдвигов, происходящих в экономике капитализма после II Мировой Войны 1939–45, и роста межимпериалистических противоречий, что оказало непосредственное влияние на характер объединения. Наряду с экономическими факторами большую роль в образовании ЕОУС сыграли политические планы империалистических государств, стремившихся к организации военно-политического блока в Западной Европе. В задачи ЕОУС официально входило:- обеспечение рационального распределения производства, высокой производительности труда в угольно-металлургической промышленности Западной Европы; содействие постоянному расширению производства и его модернизации; поддержание условий 'свободной' и 'нормальной' конкуренции в ' Общем Рынке' и другое. Образование ЕОУС отвечает интересам металлургических монополий, которые видят в нём одно из средств укрепления господства монополистического капитала в металлургической промышленности стран-участниц. Создание общего рынка угля и стали осуществлялось постепенно в течение подготовительного и 'переходного' периодов (1952–57). В Феврале 1953 были введены в действие положения об общем рынке угля, железной руды, железного лома и отменены все пошлины и количественные ограничения в торговле этой продукцией. В Мае 1953 открыт общий рынок для чугуна и стали, а в Августе 1954 – для специальных сталей. В Мае 1956 начали действовать единые транспортные тарифы для перевозок угля и руды, а в Мае 1957 – для перевозок железного лома и продукции металлургической промышленности. ЕОУС контролирует около 2/3 выплавки стали, 1/2 добычи каменного угля и железной руды в Западной Европе. Руководящие органы ЕОУС:- Верховный орган, при котором существуют Консультативный Комитет, Специальный Совет Министров, Ассамблея и Суд. Печатный орган – Journal Officiel de la Communaute Europeenne du Charbon et de l'Acier, выходящий с Декабря 1952. Штаб-квартира ЕОУС – в Люксембурге; имеются информационные бюро в Вашингтоне, Лондоне, Париже, Риме и Бонне. Летом 1967 произошло слияние исполнительных органов ЕОУС и Евратома.

EUROPEAN COMMISSION = ЕВРОПЕЙСКАЯ КОМИССИЯ – European Commission is the institution of the European Community which ensures the application of the provisions of the Treaty. The Commission develops Community policies, proposes Community legislation and exercises powers in specific areas. In the area of economic policy, the Commission recommends Broad Economic Policy Guidelines (BEPGs) and reports to the EU Council on economic developments and policies. It monitors public finances within the framework of multilateral surveillance and submits reports to the EU Council. Until 01 May 2004 it consisted of 20 members:- two nationals each from Germany, Spain, France, Italy and the United Kingdom, and one from each of the other Member States. Following a transition period after EU enlargement, the Commission will consist of 25 members (in 2006), one national for each of the 25 Member States. Brussels – the Commission's buildings are mainly located in what has become known as the EU Quarter (Quartier Schuman) situated around the Schuman roundabout. The European Commission plays a crucial role in enabling the EU to deliver on its promises. Its powers and responsibilities have increased over the years as the Union has expanded and moved into new areas of activity. The Commission has three distinct, and equally important, functions. The first is to draft new laws and regulations. The Commission draws up proposals which are submitted to the Council and the European Parliament for debate and decision. It is they who, in the end, formally adopt – or reject – the Commission's proposals. The second is to take charge of the day-to-day management of the wide range of EU activities from farming and food safety to protecting consumers from being ripped off by unscrupulous firms. The Commission can, for instance, impose fines of hundreds of millions of Euro on the worst offenders who manipulate markets to keep prices – and profits – high. The Commission's third area of responsibility is to make sure that the laws adopted by the Council and the European Parliament are applied correctly and even-handedly in all member states. In the European Union, with its single market and freedom of movement, it is essential that all citizens are equal before EU law, whatever their country of residence. Because of this function, the Commission is sometimes called the 'Guardian Of The EU Treaties'. Most Commission staff work in Brussels, although more than 2 500 are based in Luxembourg and there are Commission offices in all 27 EU countries. In addition, the Commission runs more than 100 delegations located around the globe, dealing with matters like trade, development and humanitarian assistance. Because its staff come from every member state, the Commission has native speakers of all official languages (and others) in its ranks. However, no one can be expected to cope with more than a few foreign languages, so for its internal working purposes the Commission often uses just three languages – English, French and German. Draft legislation generally sees the first light of day in one of these languages. (2010) The European Commission is the EU's executive body. It represents and upholds the interests of Europe as a whole. It drafts proposals for new European laws. It manages the day-to-day business of implementing EU policies and spending EU funds. The Commission also makes sure that everyone abides by the European treaties and laws. The term 'European Commission' refers in the first instance to the 27 Commissioners appointed by the EU Member States after approval by the European Parliament. However, the 'Commission' also refers to the institution and its approximately 38 000 staff. The Commission has four distinct, and equally important functions:- (i) to draft new laws and regulations, which are then submitted to the European Parliament and the Council for debate and decision; (ii) to take charge of the day-to-day management of EU policies and activities (from farming and food safety to protecting consumers from being ripped-off by unscrupulous firms); (iii) to make sure that the laws adopted by the Council and the Parliament are applied correctly and even-handedly in all EU countries (jointly with the Court of Justice); and (iv) to represent the

European Union on the international stage, for example by negotiating agreements between the EU and other countries. In short, we are involved in everything the EU does in one way or another. When the EU was first created in the 1950s, EU countries focused on cooperating mostly on trade and economic issues. But now, the EU also deals with many other subjects of direct importance for our everyday lives, such as citizens' rights, ensuring freedom, security and justice, job creation, regional development, environmental protection and making globalisation work for everyone. Civil servants work within operational departments, called Directorates-General (DGs). Each DG is in charge of a specific policy area:- agriculture, competition, economic and financial affairs, and so on. Every DG comes under the responsibility of one of the Commissioners, who is assisted by his/her private office or 'cabinet'. Proposals for new EU laws are drafted by the Commission civil service in collaboration with their Commissioner and his/her cabinet. The 'college' of Commissioners meets once a week. These meetings usually take place in Brussels on Wednesdays. Each item on the agenda is presented by the Commissioner responsible for that policy area, and the college takes a collective decision on it. Although European civil servants have been based in Brussels for many decades it was only in 1997 (Treaty of Amsterdam) that it was officially stated that the Commission should have its seat in Brussels. In short, most Commission staff work in Brussels, although more than 2 000 are based in Luxembourg and other locations in Europe. There are Commission representative offices in all 27 countries of the European Union. There are also over 120 delegations located around the globe – from Peru to Papua New Guinea, dealing with such matters as trade, development and humanitarian aid. Major institution of the European Union, established in 1967, responsible for implementing the Treaty of Rome. It introduces EU legislation and reconciles disagreements between members. European Commission is one of the five European institutions, the European Commission was created in 1967 for the three European Communities. It drafts proposals for new European laws, which it presents to the European Parliament and the Council. The Commission makes sure that EU decisions are properly implemented and supervises the way EU funds are spent. It also monitors compliance with the European treaties and Community law. As the guardian of the Treaties, it ensures, together with the Court of Justice of the European Communities, that the legislation applying to all EU Member States is properly implemented. At the moment, the Commission consists of a president and 27 commissioners. Its departments, called Directorates General, are responsible for the implementation of common policies and general administration in a specific area. It represents the general interest of the EU and is independent of the Member States. The Commission is appointed for a five-year term, but it can be dismissed by Parliament. One of the five major institutions of the European Community, the Commission is responsible for ensuring the implementation of the Treaty of Rome and Community rules and obligations; submission of proposals to the Council of Ministers; execution of the Council's decisions; reconciliation of disagreements among Council members; administration of EC policies, such as the Common Agricultural Policy and coal and steel policies; taking necessary legal action against firms or member governments; and representing the Community in trade negotiations with non-member countries. European Community (EC) institution that proposes policies and legislation, is responsible for the administration of the EC and ensures that provisions of EC treaties and decisions of the other EC institutions are properly implemented. The Commission consists of 17 members:- 2 each from France, Germany, Italy, Spain and the United Kingdom, and 1 from each of the remaining seven countries. The commissioners are nominated by the national governments and appointed by the European Council for a renewable four-year term. Each commissioner is in charge of a specific area of EC activity, and decisions are made by simple majority vote. The Commission is expected to represent, protect and further the EC's interests, and its members are not supposed to represent or take orders from their national governments or from the Council. The Council does not have the right to remove the Commissioners. Only the European Parliament has the power to force the Commission to resign as a body. The Commission elects its own president for a two-year renewable term. Jacques Delors of France became president of the Commission in 1985 and was reelected in 1987, 1989 and 1991. Also known as Commission Of The European Communities. / Римского Трактата . Европейская Комиссия была создана в 1958 вместе с созданием Европейского Экономического Сообщества. Комиссия является политически независимым учреждением, которое представляет и проявляет заботу об интересах всего ЕС. Комиссия имеет три главных полномочия:- контролирующие, инициативные и исполнительные. К задачам Комиссии принадлежит:- (i) контроль за выполнением трактата и решений, принятых на его основе органами Сообщества (контроль, который касается законодательства Сообщества); и (ii) формирование рекомендаций, которые обусловлены трактатом, если трактат чётко это предусматривает, а Сообщество признаёт это необходимым.

EUROPEAN COMMITTEE FOR ELECTROTECHNICAL STANDARDIZATION = ЕВРОПЕЙСКИЙ КОМИТЕТ ПО СТАНДАРТИЗАЦИИ В СФЕРЕ ЭЛЕКТРОТЕХНИКИ – European Committee For Electrotechnical Standardization is the English name of the Comité Européen de Normalisation Electrotechnique. See also Comité Européen de Normalisation Electrotechnique. / Смотрите также Комите Эропеэнн дё Нормализасьё Электротэкникь (Comité Européen de Normalisation Electrotechnique).

EUROPEAN COMMITTEE FOR STANDARDIZATION = ЕВРОПЕЙСКИЙ КОМИТЕТ ПО СТАНДАРТИЗАЦИИ – European Committee For Standardization is the English name of the Comité Européen de Normalisation. See also Comité Européen de Normalisation. / Смотрите также Комите Эропеэнн дё Нормализасьё (Comité Européen de Normalisation).

EUROPEAN COMMUNITY = ЕВРОПЕЙСКОЕ СООБЩЕСТВО – The European Community (EC) is the intergovernmental organization of twelve Western European nations with its own institutional structures and decision-making framework. The aim of the European Community's founders was to build a united Europe through peaceful means, to create conditions for economic growth and social cohesion among the European peoples and to promote greater political integration and cooperation among governments. The EC initially consisted of six member nations:- Belgium, France, Germany, Italy, Luxembourg and the Netherlands. The EC was extended in 1973 with the admission of Denmark, Ireland and the United Kingdom. Greece became a member in 1981, and Spain and Portugal joined in 1985. Three organizations laid the foundation for the EC:- (i) The European Coal and Steel Community (ECSC), established in 1952 to pool resources and harmonize industrial policies in the coal, iron ore and steel industries of Belgium, France, Italy, Luxembourg, the Netherlands and West Germany; (ii) The European Atomic Energy Community (EURATOM) created in 1958 and pledged to the joint development of Europe's nuclear resources; and (iii) The European Economic Community (EEC). These three European organizations merged in 1965 to form the EC. Four common institutions were established for the three organizations by the Merger Treaty, which was signed on 1965-April-08 and became effective on 1967-July-19:- The European Parliament, The European Council of Ministers, The European Commission, and The European Court of Justice. The Single European Act, which was adopted in 1985 and became effective on 1987-July-01, launched the integration process full force. It increased the powers of the European Parliament and set the stage for the 1992 Program, a plan designed to eliminate all remaining legal, fiscal and technical barriers to a single European market, where people, goods, services, capital and information would move freely among the member states. The member nations have established common policies in agriculture, foreign trade, fisheries, transportation, and fiscal and monetary activities. Current plans call for the elimination of all trade barriers, the harmonization of standards and the standardization of value-added taxes by 1993-January-01. Programs are under development in the areas of energy, environmental protection education and training, research and development, technology and currency. The Maastricht Summit meeting held in December 1991 calls for the creation of a single currency and a central bank by 1999, but the Maastricht Treaty was vetoed by Denmark in July 1992 and had not been ratified as of the date of this publication. EC membership is expected to grow in the coming decade, and the organization may well merge with the European Free Trade Association to create a European Economic Area. Now known as the European Union (EU).

The European 'Community':- the Treaty of Rome signed on 1957-March-25 created the 'common market' (the European Economic Community) and its roots were laid down in the ECSC (the European Coal and Steel Community) established on April 18 1951, based on the Schuman Plan of 1950-May-09 (Vaughan 1976, Milward 1984). It is not implausible to suggest that the route from the one to the other in fact passed through the first five Bilderberg conferences, May 1954 at Oosterbeek (Netherlands), March 1955 at Barbizon (France), September the same year at Garmisch (Germany), May 1956 at Fredensborg (Denmark) and finally in February 1957 at St. Simon's Island (Georgia, USA); and that these secret meetings played a decisive role in overcoming the opposing, centrifugal tendencies symbolised by the collapse of the European Defence Community in 1954, the Hungarian revolution and its suppression and the fiasco of the Anglo-French adventure at Suez in 1956 – the last gasp of independent European imperialism. Even more important the 'protectionism' implicit in the European unification project was successfully subordinated to the 'liberalising' hegemony of the Americans, through the close involvement of the key US players at every stage. The evidence for this is entirely circumstantial, and this hypothesis must remain speculative, but I believe there is a prima facie case to launch an investigation. It should be clear from the details recounted earlier that not all the possible roads led to the Rome Treaty, and that there is far more to the politics of European 'integration' than the legislative enactments already known about. The Treaty establishing the European Community (EC Treaty) was signed in Rome, Italy on 1957-March-25 (therefore often referred to as the 'Treaty of Rome') and entered into force on 1958-January-01. It established the European Economic Community (EEC), which is now the European Community. The Treaty on European Union (EU Treaty), which is often referred to as the 'Maastricht Treaty' (signed on 07 February 1992), amended the EEC Treaty with a view to establishing the European Community. A regional organization created in 1958 providing for gradual elimination of intraregional customs duties and other trade barriers, applying a common external tariff against other countries, and providing for gradual adoption of other integrating measures, including a Common Agricultural Policy (CAP) and guarantees of free movement of labor and capital. The original 6 members were Belgium, France, West Germany, Italy, Luxembourg and the Netherlands. Denmark, Ireland and the United Kingdom became members in 1973, Greece acceded in 1981, Spain and Portugal in 1986 (January-01), Austria, Finland and Sweden join the EU on 1995-January-01; on 2004-May-01 – Eight countries of central and eastern Europe – the Czech Republic, Estonia, Latvia, Lithuania, Hungary, Poland, Slovenia and Slovakia – join the EU, finally ending the division of Europe decided by the Great Powers 60 years earlier at Yalta. Cyprus and Malta also become members; 2007-January-01 – Two more countries from eastern Europe, Bulgaria and Romania, now join the EU, brining the number of member states to 27 countries. Croatia, the Former Yugoslav Republic of Macedonia and Turkey are also candidates for future membership. The term European Community is used to refer to three separate regional organizations consisting of the European Coal and Steel Community (ECSC), the European Atomic Energy Community (EURATOM) and the European Economic Community. These have been served since 1967 by common institutions – the EC Commission, the EC Council, the European Parliament and the Court of Justice of the European Communities. The present 12 (1990s) member states of the EC are also members of the ECSC and EURATOM. The three European Communities operate under separate treaties:- the European Coal and Steel Community (ECSC), the European Atomic Energy Community (EURATOM) and the European Economic Community (EEC). Due to the existence of three separate entities, the expression 'European Communities' (EC) is used to refer to the three Communities in legal documents and official designations, i.e. the Commission of the European Communities. However, since the three Communities function as a single political institution, use of the expression 'European Community' (EC) has become common usage except for legal texts. European Community is the supranational organisation which was established by the EEC Treaty in 1958 as the European Economic Community (EEC). The EU Treaty extended the tasks of the EEC which was accordingly renamed the European Community in 1993. The main tasks of the European Community are to promote the harmonious, balanced and sustainable development of economic activity, a high level of employment and social protection, equality between men and women, sustainable and non-inflationary growth, a high degree of competitiveness and convergence of economic performance, a high level of protection and improvement of the quality of the environment, a high standard of living and quality of life, and social cohesion and solidarity among Member States. It fulfils these tasks, among other things, through the single market and Economic and Monetary Union (EMU). / сразу или на первый взгляд (prima facie). , то есть . но Маастрихтский Трактат . на первых пяти Билдэрбэрьхских конференциях . План Шумана (Schuman Plan). Европейское Сообщество (ЕС):- в Ноябре 1993 при ратификации Трактата по Европейскому Союзу (Treaty on European Union; или так называемого Маастрихтского Трактата, подписанного в Маастрихте 07 Февраля 1992) было упразднено его старое название – Европейское Экономическое Сообщество. ЕС является частью Европейского Союза (European Union). Это экономический, но в большей степени – политический альянс, заключённый в 1957 между Германией, Францией, Бельгией, Люксембургом, Нидерландами и Италией с целью развития торговли и сотрудничества между его членами и 'ещё более тесного союза между народами Европы'. Впоследствии членами ЕС стали Великобритания, Ирландия и Дания (1973), Греция (1981), Испания и Португалия (1986) и в 1995 Австрия, Финляндия и Швеция. Норвегия отказалась от вступления в ЕС в Ноябре 1994. Между членами ЕС были упразднены тарифные барьеры и стандартизированы ввозные (или привозные или импортные) пошлины на товары стран – не членов ЕС. Многие бывшие колонии Европейских государств в Африке, Карибском бассейне и Тихоокеанском регионе с заключением Римской Конвенции (Rome Convention) получили преференциальные условия торговли со странами – членами ЕС. Штабквартира ЕС находится в Брюсселе и подчиняется Европейской Комиссии (European Commission), которая является исполнительным органом Европейского Союза. К Декабрю 1992 была упразднена большая часть оставшихся между странами – членами ЕС нетарифных торговых барьеров и приняты общие стандарты для многих отраслей производства. ЕС также ошибочно отождествляют с Общим Рынком (Common Market) и Европейским Союзом (European Union), хотя оно является лишь частью Европейского Союза.

EUROPEAN COOPERATION FOR THE LONG–TERM IN DEFENSE = ДОЛГОСРОЧНОЕ ЕВРОПЕЙСКОЕ СОТРУДНИЧЕСТВО В ОБОРОННОЙ СФЕРЕ – The European Cooperation for the Long-term in Defense (EUCLID) is a coordinated defense Research and Development (R&D) initiative which was approved in a 1989 meeting of the Independent European Program Group (IEPG). EUCLID was designed to overcome deficiencies in European defense R&D (short for the Research And Development) spending, minimize individual nation's duplicative efforts, improve planning and overcome legal and administrative obstacles. EUCLID is divided into 11 technological categories:- (a) modern radar technology, (b) microelectronics, (c) composite structures, (d) modular avionics, (e) electric gun, (f) artificial intelligence, (g) signature manipulation, (h) opto-electronic devices, (i) satellite surveillance technologies (including verification), (j) underwater acoustics, and (k) 'human factors', including technology for training and simulation. Each of the 11 categories is assigned a lead coordinating nation.

EUROPEAN CORN BORER = ЕВРОПЕЙСКИЙ КУКУРУЗНЫЙ ТОЧИЛЬЩИК (или ЕВРОПЕЙСКИЙ КУКУРУЗНЫЙ МОТЫЛЁК) – European Corn Borer (Ostrinia nubilalis) is a recent Pest of Cotton in the Southeast where Corn is planted, this boring caterpillar passes its initial two generations on Corn, Potatoes, Wheat, and various Weed Species in North Carolina; the third and a partial fourth generation can be damaging to Cotton, primarily because the Pest bores into medium to large bolls and to a lesser extent into stems; female moths deposit small, fish scale-like egg masses deep within the plant canopy and on the underside of cotton leaves. Egg masses are difficult to find.

EUROPEAN COUNCIL = ЕВРОПЕЙСКИЙ СОВЕТ – The European Council refers to the regular meetings of the heads of state or of government in the European Union, (EU) responsible for defining the general political direction and priorities of the Union. It comprises the heads of state or government of EU member states, along with its President and the President of the Commission. The High Representative takes part in its meetings, which are chaired by its President:- currently (2011) Herman Van Rompuy. While the European Council has no formal legislative power, it is an institution that deals with major issues and any decisions made are 'a major impetus in defining the general political guidelines of the European Union'. The Council meets at least twice every six months; usually in the Justus Lipsius building, the headquarters of the Council of the European Union in Brussels. The first Councils were held in February and July 1961 (in Paris and Bonn respectively). They were informal summits of the leaders of the European Community and were started due to then-French President Charles de Gaulle's resentment at the domination of supranational institutions (e.g., the European Commission) over the integration process. The first influential summit was held in 1969 after a series of irregular summits. The Hague summit of 1969 reached an agreement on the admittance of the United Kingdom into the Community and initiated foreign policy cooperation (the European Political Cooperation) taking integration beyond economics. The summits were only formalised in the period between 1974 and 1988. At the December summit in Paris in 1974, following a proposal from then-French President Valéry Giscard d'Estaing, it was agreed that more intergovernmental, political input was needed following the 'empty chair crisis' and economic problems. The inaugural European Council, as it had become, was held in Dublin on 03 October and 03 November 1975 during Ireland's first Presidency of the Council of the European Union. In 1987, it was included in the treaties for the first time (the Single European Act) and had a defined role for the first time in the Maastricht Treaty. At first only two meetings per year were required, now there are on average four European Councils each year (two per presidency). The seat of the Council was formalised in 2002, basing it in Brussels. In addition to usual councils, there are the occasional extraordinary councils as for example in 2001 when the European Council gathered to lead the EU's response to the 11 September attacks. The meetings of the Council are seen by some as turning points in the history of the European Union. For example:- 1969, The Hague:- foreign policy and enlargement; 1974, Paris:- creation of the Council; 1985, Milan:- initiate IGC leading to the Single European Act; 1991, Maastricht:- agreement on the Maastricht Treaty; 1993, Copenhagen:- leading to the definition of the Copenhagen Criteria; 1997, Amsterdam:- agreement on the Amsterdam Treaty; 1998, Brussels:- selected member states to adopt the Euro; 1999; Cologne:- declaration on military forces; 1999, Tampere:- institutional reform; 2000, Lisbon:- Lisbon Strategy; 2002, Copenhagen:- agreement for May 2004 enlargement; 2007, Lisbon:- agreement on the Lisbon Treaty; and 2009, Brussels:- appointment of first President and merged High Representative. As such, the European Council had already existed before it gained the status as an institution of the European Union with the entering into force of the Treaty of Lisbon. Indeed, Article 214(2) of the Treaty establishing the European Community provided (before it was amended by the Treaty of Lisbon) that 'the Council, meeting in the composition of Heads of State or Government and acting by a qualified majority, shall nominate the person it intends to appoint as President of the Commission' (emphasis added); this may be seen as an early codification of the European Council in the Treaties. In the event, Article 2 of the Treaty of Lisbon officially introduces the term European Council as a substitute for the phrase 'Council (of the European Union) meeting in the composition of the Heads of State or Government', which was previously used in the treaties to refer to this body. The Treaty of Lisbon made the European Council a formal institution distinct from the Council of the EU, and created the present permanent presidency. As an outgrowth of the Council of the EU, the European Council followed the same Presidency by rotating between each member state. While the Council of the EU retains that system, the European Council established, with no change in powers, a system of appointing an individual (without them being a national leader) for two-and-a-half-years. Following the ratification of the treaty in December 2009, the European Council elected the then-Prime Minister of Belgium Herman Van Rompuy as its first permanent President (resigning from Belgian Prime Minister). The European Council is an official institution of the EU, mentioned by the Lisbon Treaty as a body which 'shall provide the Union with the necessary impetus for its development'. Essentially it defines the EU's policy agenda and has thus been considered to be the motor of European integration. It does this without any formal powers, only the influence it has being composed of national leaders. Beyond the need to provide 'impetus', the Council has developed further roles; to 'settle issues outstanding from discussions at a lower level', to lead in foreign policy – acting externally as a 'collective Head of State', 'formal ratification of important documents' and 'involvement in the negotiation of the treaty changes'. Since the institution is composed of national leaders, it gathers the executive power of the member states and has thus a great influence outside established areas as for example foreign policy. It also exercises some executive powers such as the appointment of its own President, the President of the European Commission, and the High Representative. Moreover, the European Council influences police and justice planning, the composition of the Commission, matters relating to the rotating presidency, the suspension of membership rights, and changing the voting systems through the Passerelle Clause. Although the European Council has no direct legislative power, under the 'emergency brake' procedure, a state outvoted in the Council of Ministers may refer contentious legislation to the European Council. However, the state may still be outvoted in the European Council. Hence with powers over the supranational executive of the EU, in addition to its other powers, the European Council has been described by some as the Union's 'supreme political authority'. The European Council consist of the heads of state or government of the member states, alongside its own President and the Commission President (non-voting). The meetings used to be regularly attended by the national foreign minister as well, and the Commission President likewise accompanied by another member of the Commission. However, since the Treaty of Lisbon reclassified inter-member state relations as domestic rather than international politics, foreign ministers are no longer regular attendees. When present though, these are the attendants seen in the 'family photo' taken at each Council. Meetings can also include other leading national positions (e.g., the French Prime Minister), as required. The Secretary-General of the Council is also a regular attendee as is his or her deputy; the position had become highly important due to its regular role in organising the meetings while also (before the Lisbon treaty took effect) acting as the High Representative. The President of the European Parliament usually attends to give an opening speech outlining the European Parliament's position before talks begin, European Council provides the European Union with the necessary impetus for its development and defines the general political guidelines thereof. It brings together the Heads of State or Government of the Member States and the President of the European Commission. European Council provides the European Union with the necessary impetus for its development and defines the general political guidelines thereof. It brings together the Heads of State or Government of the Member States and the President of the European Commission. Французский Президент Шарль дё Голь (Charles de Gaulle). Французский Президент Валери Жискар д'Эста (Valéry Giscard d'Estaing). Европейский Совет является консультативной политической организацией. Его Устав был подписан в Лондоне, Соединённое Королевство 05 Мая 1949, а вступил в силу 03 Августа 1949. Штабквартира Европейского Совета расположена в Страсбурге, Франция. В 2011 в состав совета входили 27 Европейская страна. Европейский Совет – учреждение, которое продолжило начатую в 1962 в Париже конференцию руководителей правительств и государств тогдашних Европейских Сообществ. Совет, с правовой точки зрения, не является органом ЕС, лишь формально играет главную роль в сотрудничестве между государствами-участницами. В состав Европейского Совета входят руководители государств и правительств государств-участников и глава Европейской Комиссии.

EUROPEAN COURT OF HUMAN RIGHTS = ЕВРОПЕЙСКИЙ СУД ПО ПРАВАМ ЧЕЛОВЕКА – The European Court Of Human Rights (ECtHR), often referred to informally as the Strasbourg Court, was created to systematise the hearing of human rights complaints against States Parties to the Convention for the Protection of Human Rights and Fundamental Freedoms, adopted by the Council of Europe in 1950 (at present, all member states of the Council of Europe are also parties to the Convention, but there is no necessary connection between the two). The Court's mission is to enforce the Convention for the Protection of Human Rights and Fundamental Freedoms, by ruling over complaints against human rights violations committed by States Parties, and brought to the Court either by other States Parties or by individuals subject to the jurisdiction of a State Party. The current incarnation of the court was instituted on 1998-November-01, replacing the then existing enforcement mechanisms, which included the European Commission of Human Rights (created in 1954) and the previous, limited Court of Human Rights, which was created in 1950. The new court was the result of the ratification of Protocol 11, an amendment to the Convention, which was ratified in November 1998. Judges were subsequently elected by the Council of Europe, and the court was opened approximately one year later. The court consists of a number of judges equal to the number of States Parties, which currently stand at forty-six. Each judge is elected in respect of a State Party; despite this correspondence, however, there are no requirements that each state be represented on the court, nor are there limits to the number of judges belonging to any nationality, e.g., Mr Caflish is a Swiss national elected in respect of Liechtenstein. Judges are assumed to be impartial arbiters, rather than representatives of any nation. The court is divided into five Sections, each of which consists of a geographic and gender-balanced selection of justices. The entire court elects a President and five Section Presidents, two of whom also serve as Vice-Presidents of the court. All terms last for three years. Each section selects a Chamber, which consists of the Section President and a rotating selection of six other justices. The court also maintains a 17-member Grand Chamber, which consists of the President, Vice-Presidents, and Section Presidents, in addition to a rotating selection of justices from one of two balanced groups. The selection of judges alternates between the groups every nine months. Complaints of violations by member states are filed in Strasbourg, and are assigned to a Section. Each complaint is first heard by a committee of three judges, which may unanimously vote to strike any complaint without further examination. Once past committee, the complaint is heard and decided by a full Chamber. Decisions of great importance may be appealed to the Grand Chamber. Any decisions of the court are binding on the member states. It is the role of the Committee of Ministers to supervise the execution of court judgements, though they have no formal means of forcing member countries to comply. However, the ultimate sanction of non-compliance is expulsion from the Council of Europe and thus becoming a 'pariah' state within Europe. Furthermore, the European Union takes a keen interest in the Convention and Court (and its jurisprudence) so would not look kindly upon any EU member state that did not fulfill its Convention obligations. In French, Cour Européenne Des Droits De L'Homme. The Convention for the Protection of Human Rights and Fundamental Freedoms was drawn up within the Council of Europe. It was opened for signature in Rome on 4 November 1950 and entered into force in September 1953. Taking as their starting point the 1948 Universal Declaration of Human Rights, the framers of the Convention sought to pursue the aims of the Council of Europe through the maintenance and further realisation of human rights and fundamental freedoms. The Convention was to represent the first steps for the collective enforcement of certain of the rights set out in the Universal Declaration. In addition to laying down a catalogue of civil and political rights and freedoms, the Convention set up a mechanism for the enforcement of the obligations entered into by Contracting States. Three institutions were entrusted with this responsibility:- the European Commission of Human Rights (set up in 1954), the European Court of Human Rights (set up in 1959) and the Committee of Ministers of the Council of Europe, the latter organ being composed of the Ministers of Foreign Affairs of the member States or their representatives. Under the Convention in its original version, complaints could be brought against Contracting States either by other Contracting States or by individual applicants (individuals, groups of individuals or non-governmental organizations). Recognition of the right of individual application was, however, optional and it could therefore be exercised only against those States which had accepted it (Protocol No. 11 to the Convention was subsequently to make its acceptance compulsory, see paragraph 6 below). The complaints were first the subject of a preliminary examination by the Commission, which determined their admissibility. Where an application was declared admissible, the Commission placed itself at the parties' disposal with a view to brokering a friendly settlement. If no settlement was forthcoming, it drew up a report establishing the facts and expressing an opinion on the merits of the case. The report was transmitted to the Committee of Ministers. Where the respondent State had accepted the compulsory jurisdiction of the Court, the Commission and/or any Contracting State concerned had a period of three months following the transmission of the report to the Committee of Ministers within which to bring the case before the Court for a final, binding adjudication. Individuals were not entitled to bring their cases before the Court. Headquartered in Strasbourg, France. Also known as Strasbourg Court. If a case was not referred to the Court, the Committee of Ministers decided whether there had been a violation of the Convention and, if appropriate, awarded 'just satisfaction' to the victim. The Committee of Ministers also had responsibility for supervising the execution of the Court's judgments. Since the Convention's entry into force thirteen Protocols have been adopted. Protocols Nos. 1, 4, 6, 7, 12 and 13 added further rights and liberties to those guaranteed by the Convention, while Protocol No. 2 conferred on the Court the power to give advisory opinions. Protocol No. 9 enabled individual applicants to bring their cases before the Court subject to ratification by the respondent State and acceptance by a screening panel. Protocol No. 11 restructured the enforcement machinery. The remaining Protocols concerned the organization of and procedure before the Convention institutions. Protocol No. 11, which came into force on 1998-November-01, replaced the existing, part-time Court and Commission by a single, full-time Court. For a transitional period of one year (until 1999-October-31) the Commission continued to deal with the cases which it had previously declared admissible. During the three years which followed the entry into force of Protocol No. 11 the Court's case-load grew at an unprecedented rate. The number of applications registered rose from 5 979 in 1998 to 13 858 in 2001, an increase of approximately 130%. Concerns about the Court's capacity to deal with the growing volume of cases led to requests for additional resources and speculation about the need for further reform. / Господин Кафлиш (Caflish). Европейский Суд по Правам Человека или, как это звучит на Французском языке по месту регистрации, Кур Эропеэнн Дэ Друа Дё Ль'Ом (Cour Européenne Des Droits De L'Homme). В течение переходного периода сроком в один год (до 1999-Октябрь-31) Комиссия .

EUROPEAN COURT OF JUSTICE = ЕВРОПЕЙСКИЙ СУД СПРАВЕДЛИВОСТИ – European Court of Justice (ECJ) is a European Community institution, based in Luxembourg, which:- (i) ensures that the treaties are interpreted and applied correctly; and (ii) decides on the validity and the meaning of Community law. The acts and omissions of the European Central Bank (ECB) are subject to review by the ECJ.

EUROPEAN CURRENCY SNAKE = ЕВРОПЕЙСКАЯ ВАЛЮТНАЯ ЗМЕЯ – European Currency Snake:- in April 1972, a system (the 'snake') for the progressive narrowing of the margins of fluctuation between the currencies of the Member States of the European Economic Community is established. The mechanism by which the central banks of the European Community member countries agreed to limit the fluctuation in the bilateral exchange rates of their currencies. Originally, the 'Snake' became an exchange rate mechanism among the Deutsche Mark, the Benelux currencies and the Danish Krone (for a while two non-Community currencies – the Swedish Krona and Norwegian Krone – were also part of the system). The other Community currencies remained outside the system for all or most of its existence. The pound sterling and the Irish pound participated in the system from April to June 1972 and the Italian Lira from April 1972 to February 1973. The French Franc, which had joined the system at the outset, was withdrawn in February 1974;

it entered the snake again in July 1975 and left the mechanism definitively in November 1976. The snake was superseded in 1979 by the European Monetary System. / флуктуации (колебания) между валютами Государств Членов . Механизм, посредством которого центральные банки стран участниц Европейского Сообщества согласились ограничить двусторонние колебания ставок других валют по отношению к своей валюте. Змея была заменена в 1979 Европейской Монетарной (или Платёжной) Системой. Европейское Валютное Соглашение, соглашение о валютном сотрудничестве Европейских капиталистических стран – членов Европейского Платёжного Союза (ЕПС). Заключено 05 Августа 1955. Вступило в силу после ликвидации ЕПС и введения обратимости валют большинства его членов (Декабрь 1958). Европейское Валютное Соглашение ставило задачи содействовать развитию международных экономических связей путём расширения многосторонних расчётов и либерализации торговли и движения капиталов. Соглашением стимулировалось преимущественное использование для расчётов между его членами открытого валютного рынка, а не механизма многосторонних клиринговых зачётов. Был создан Европейский Фонд в сумме 607.5 миллионов расчётных единиц (приравненных по золотому содержанию к Доллару США), из которых 271.6 остались после ликвидации ЕПС и 335.9 подлежали взносу участниками. Управление Европейским Фондом было возложено на Правление Директоров, назначаемых Советом Организации Экономического Сотрудничества и Развития (ОЭСР). Техническим агентом по операциям Европейского Валютного Соглашения является Банк Международных Расчётов в Базеле, Швейцария. В отличие от ЕПС, сальдо многосторонних расчётов в рамках Европейского Валютного Соглашения погашается каждой страной в золоте или Долларах США. Кредиты Европейского Фонда предоставляются по решениям Совета ОЭСР на срок до 3 лет, по решениям Правления Европейского Валютного Соглашения на срок до года в суммах не выше 50 миллионов Долларов США. Задолженность стран по кредитам Европейского Фонда за всё время его существования не превышала 100 с небольшим миллионов Долларов США, поэтому необходимости востребовать взносы участников для пополнения фонда не возникало. Роль Европейского Валютного Соглашения в определении валютной политики стран-участниц крайне незначительна, так как в этом качестве он дублирует Международный Валютный Фонд.

EUROPEAN CURRENCY UNIT = ЕВРОПЕЙСКАЯ ЕДИНИЦА ВАЛЮТЫ (или ЕВРОПЕЙСКАЯ ВАЛЮТНАЯ ЕДИНИЦА) – European Currency Unit (ECU):- prior to Stage Three of EMU, the ECU was a basket currency made up of the sum of fixed amounts of 12 of the 15 currencies of the EU Member States. The value of the ECU was calculated as a weighted average of the value of its component currencies. The ECU was replaced by the Euro on a one-for-one basis on 01 January 1999 (1 Euro = 13.760 3 Austrian Schillings; = 40.339 9 Belgian Francs; = 1.955 83 Deutsche Mark; = 2.203 71 Dutch Guilders; = 5.945 73 Finnish Markkas; = 6.559 57 French Francs; = 340.750 Greek Drachmas; = 0.787 564 Irish Pounds; = 1 936.27 Italian Lire; = 40.339 9 Luxembourg Francs; = 200.482 Portuguese Escudos; = 166.386 Spanish Pesetas). The European Currency Unit (ECU) is a 'basket' of specified amounts of each EC currency. Amounts are determined according to the economic size of EC member and are revised every five years. The value of the ECU is determined by using the current exchange rate of each member currency. All the member states' currencies participate in the ECU basket. The ECU is the Community's accounting unit and is a popular private financial instrument. European Currency Unit (ECU or Ecu, for short). Official currency unit of the EU since 1979. It is equal to the sum of the values of the European Community currencies making up the ECU currency basket. Not only serves many European organizations and central banks as a unit of account but is also of considerable importance in private business (bank accounts, bond issues, checks, options, etc). The ECU will be replaced by the Euro when European Monetary Union comes into force. The official unit of account of the European Monetary System. It is a combination or basket of the currencies from the twelve European Community countries:- the Austrian Schilling, Deutsche Mark, French Franc, Irish Pound, Italian Lira, Belgian Franc, Dutch Guilder, Luxembourg Franc, Spanish Peseta, Portuguese Escudo, Danish Krona, and Finnish Markka. Monetary unit created in 1979 by nine European nations to promote currency stability in the European Community. The European Currency Unit (ECU; ISO 4217 Code:- XEU/954) consists of a currency basket of the national currencies of members of the European Monetary System. The ECU was a hypothetical, rather than a real, currency, since no ECU bills or coins exist and the ECU cannot be privately held. It is a weighted average of member country currencies, with the specific weights reflecting the relative size and share of trade of each member nation's economy. It was replaced by the Euro from 1999-January-01. / Европейская Единица Валюты (сокращённо, ЭКЮ или Экю по первым буквам Англоязычного названия). Официальная валютная единица ЕС с 1979. Австрийский Шиллинг, Немецкая Марка, Французский Франк, Ирландский Фунт, Итальянская Лира, Бельгийский Франк, Нидерландский Гульден, Люксембургский Франк, Испанская Песета, Португальский Эскудо и Финляндская Марка. Европейская Единица Валюты или Европейская Валютная Единица, так называемая ЭКЮ, – одна из двух искусственных денежных единиц, используемых в международных расчётах наряду со Специальными Правами Заимствования (СПЗ; Special Drawing Rights (SDRs)) Международного Валютного Фонда (МВФ; International Monetary Fund (IMF)). Как и в случае с SDR, в основе ЭКЮ лежит корзина различных валют. В корзину, используемую для расчёта SDR, входит пять валют, корзина для расчёта ЭКЮ включает валюты всех стран Европейского Сообщества (ЕС), за исключением Испанской Песеты и Португальского Эскудо. В отличие от национальных валют курс этих заменителей денег подвержен меньшим колебаниям, и следует ожидать, что с развитием Европейского Союза их использование в коммерческих целях будет расширяться. ЭКЮ:- (1) денежная единица, лежавшая в основе Европейской валютной системы, введённая в обращение в 1979. Стоимость этой денежной единицы, её курс по отношению к другим валютам определялась по 'корзине валют' стран, входивших в Европейское Сообщество, то есть как некоторая средняя (средневзвешенная) величина, зависевшая от стоимости и удельной доли валют, представленных в 'корзине'. Курс ЭКЮ по отношению к Немецкой Марке примерно равнялся двум Маркам. В соответствии с решением Маастрихтского Договора ЭКЮ будет в дальнейшем полностью самостоятельной валютой. (2) Старинная золотая и серебряная Французская монета, чеканившаяся с XIII века. Изъята из обращения в 1834, но её название сохранилось на пятифранковых монетах. ЭКЮ – региональная международная валютная единица, используемая странами-участницами Европейской Валютной Системы (ЕВС) посредством зачисления выраженных в ней (в ЭКЮ) сумм на специальные счета. Так же как и СДР (Специальные Права Заимствования), ЭКЮ не имеет материальной формы в виде банкнот и монет, то есть является записанной валютой. Базируется на корзине (наборе) валют стран-членов Европейского Союза. Квоты национальных валют-компонентов ЭКЮ определяются экономическим потенциалом стран (их долями в совокупном ВНП и товарообороте сообщества) и подлежат пересмотру раз в пять лет. При температуре состава корзины все активы и пассивы в ЭКЮ переоцениваются по новому курсу. Последний раз структура ЭКЮ была зафиксирована 21 Сентября 1989. Один миллион ЭКЮ составляет:- Бельгийские Франки – 3 301 000; Голландские Гульдены – 219 800; Греческие Драхмы – 1 440 000; Датские Кроны – 197 600; Испанские Песеты – 6 885 000; Люксембургские Франки – 130 000; Немецкие Марки – 624 200; Португальские Эскудо – 1 393 000; Французские Франки – 1 332 000; Фунты Стерлингов – 87 840, Итальянские Лиры – 151 800 000. В отличие от количественного содержания, определённого на пять лет, удельный вес каждой валюты может постоянно колебаться в зависимости от курса на мировом валютном рынке. Если удельный вес какой-либо из валют корзины меняется более чем на 25 процентов, структура ЭКЮ может быть пересмотрена досрочно. Удельный вес валют на 21 Сентября 1989 (в %):- Немецкая Марка – 30.1; Французский Франк – 19.0; Фунт Стерлингов – 13.0; Итальянская Лира – 10.5; Голландский Гульден – 9.4; Бельгийский Франк – 7.6; Испанская Песета – 5.3; прочие – 5.45. Помимо своего официального содержания, ЭКЮ имеет рыночный курс, то есть тот курс, по которому заключаются сделки на рынке. ЭКЮ выполняет расчётные и кредитные функции, используется как база выравнивания валютных паритетов стран-участниц,

как регулятор отклонений рыночных валютных курсов. К частным владельцам ЭКЮ не попадает и, соответственно, не участвует в обычных коммерческих расчётах за товары и услуги.

EUROPEAN ECONOMIC AREA = ЕВРОПЕЙСКАЯ ЭКОНОМИЧЕСКАЯ ОБЛАСТЬ – The member states of the European Union plus Norway, Iceland and Liechtenstein. The European Economic Area (EEA) joins the member nations of the European Community (EC) and the European Free Trade Association (EFTA). (1995) The EEA would comprise 19 nations, nearly 380 million people and approximately 40 percent of world trade. The EEA is considered a major step towards eventually encompassing all 19 countries in the European Community. / Европейская Ассоциация Свободной Торговли (ЕАСТ).

EUROPEAN ECONOMIC COMMUNITY = ЕВРОПЕЙСКОЕ ЭКОНОМИЧЕСКОЕ СООБЩЕСТВО – European Economic Community (EEC) was established in 1957 by the Treaty of Rome, the EEC was a step towards economic integration, i.e. the free movement of persons, goods, capital and services between EU Member States. The European Economic Community (EEC) was created by the Treaty of Rome, which was ratified on 1957-March-25, and began operating on 1958-January-01. It was originally a customs union of Belgium, France, Italy, Luxembourg, the Netherlands and West Germany. Membership in the EEC has grown to 12 countries. The EEC is the result of post-World War II efforts to unify Western Europe, spurred by the creation of Benelux in 1948, the European Coal and Steel Community (ECSC) in 1951–52 and the aborted European Defense Community in 1954. The idea of a united Europe was brought back to life in 1955 in a Benelux memorandum referred to as the Spaak Report, which served as the basis of the Brussels talks and the Treaty of Rome. The latter specified two general and complementary goals:- the creation of a customs union, and the organization of an economic union. The Treaty identified specific actions for the creation of the customs union, and established time limits for extending or shortening those actions. Ultimately, the schedule was shortened, and internal customs barriers among the six original members were eliminated within 10 years. Tariffs were first reduced on 1959-January-01, and completely eliminated on 1968-July-01, at which time the members also adopted uniform tariffs for non-member nations. Under the 1965 Merger Treaty, the EEC merged with the ECSC and the European Atomic Energy Community (EURATOM) to form the European Community (EC). Also was originally known as Common Market. See also European Community. / Римским Трактатом в 1957. Европейское Объединение Угля и Стали (ЕОУС) в 1951–52 Европейское Оборонительное Сообщество в 1954. Европейское Сообщество по Атомной Энергии (ЕВРАТОМ). Отчёт Спака (Spaak Report). Известен также как Общий Рынок (Common Market). Смотрите также Европейское Сообщество (European Community). Европейское Экономическое Сообщество (ЕЭС) было создано в соответствии с, так называемым Римским Трактатом, подписанным и ратифицированным 25 Марта 1957 и вступившим в силу с 01 Января 1958. Данный договор, предусматривавший создание нового политического и экономического субъекта, в качестве основополагающих провозгласил следующие цели:- постепенное устранение всех ограничений в торговле между странами участницами; введение общего таможенного тарифа в торговле с третьими странами; ликвидация препятствий для свободного перемещения ‘лиц, капиталов и услуг’; общая политика в области транспорта и сельского хозяйства; создание валютного союза; унификация налоговых систем; сближение законодательств стран участниц; и разработка принципов согласованной экономической политики. Поначалу в ЕЭС насчитывалось всего несколько государств, среди которых были Бельгия, Германия (Федеративная Республика), Италия, Люксембург, Нидерланды и Франция. Однако, в 1973 в его состав вошли Великобритания, Дания и Ирландия, в 1981 – Греция, и в 1985 – Испания и Португалия. Таким образом, в 1986 в составе ЕЭС принимали участие 12 стран Западной Европы. Европейское Экономическое Сообщество (ЕЭС) или Общий Рынок, государственно-монополистическая организация 6 Западно-Европейских стран:- Франции, Федеративной Республики Германии (ФРГ), Италии, Бельгии, Нидерландов и Люксембурга, созданная в целях объединения национальных хозяйств стран-участниц в единый Общий Рынок. Договор об учреждении ЕЭС был подписан в Марте 1957 в Риме, Италия и вступил в силу 01 Января 1958. Образование ЕЭС представляет собой новое явление, возникшее в условиях современного этапа общего кризиса капитализма, и отражает присущую монополистической стадии капитализма объективную тенденцию к интернационализации хозяйственных отношений и капитала, к ликвидации узких национальных границ, на что в своё время указывал Владимир Ильич Ленин. Он подчёркивал, что капитализм ‘... связывает все страны мира в единое хозяйственное целое’, ибо ‘... капиталистическое предприятие неизбежно перерастает границы ... местного рынка, области, а затем и государства’ (Полное Собрание Сочинений, 5 Издание, Том 3, Стр. 57). В основе учреждения ЕЭС лежит попытка финансовой олигархии 6 Западно-Европейских стран, опираясь на эту объективную тенденцию, расширить рынки сбыта и территориальную сферу своей деятельности с целью создания благоприятных условий для быстрого и бескризисного развития производительных сил стран-участниц. Возникновение ЕЭС знаменует собой дальнейшее углубление конфликта между современным уровнем развития производительных сил и производственных отношениями капитализма и стремление правящих кругов стран-участниц разрешить его с помощью межгосударственного объединения. Создание ЕЭС, помимо экономических, преследует и политические цели – объединение сил Западно-Европейского капитализма против мирового коммунистического движения, социалистических государств, а также национально-освободительной борьбы колониальных и зависимых стран. В учреждении ЕЭС нашло также отражение стремление определённых монополистических кругов ‘шестёрки’ консолидировать свои силы в конкурентной борьбе с монополиями других стран, в первую очередь Соединённых Штатов Америки (США), за передел рынков сбыта. Официальной целью создания ЕЭС было объявлено достижение ‘всестороннего развития экономической деятельности’ в масштабах всего сообщества, ‘постоянного и равномерного развития, возрастающей стабильности, скорейшего повышения уровня жизни и более тесных связей между государствами, которые оно объединяет’, путём создания ‘Общего Рынка’. Под ‘Общим Рынком’ мыслится такое объединение (интеграция) национальных рынков стран-участниц, в котором предусматривается:- постепенное устранение всех ограничений в торговле между ними; введение общего таможенного тарифа в торговле с третьими странами; устранение препятствий для свободного передвижения ‘лиц, капиталов и услуг’; проведение общей политики в области транспорта и хозяйства; разработка принципов согласования экономической политики стран-участниц; установление единообразных правил конкуренции, сближение законодательств стран-участниц. Реализация этих мероприятий должна осуществляться постепенно, в течение так называемого переходного периода в 12 лет. Помимо ‘шестёрки’, в ЕЭС на правах присоединившихся (‘ассоциированных’) членов участвуют Греция и Турция, условия присоединения которых предусматривают более длительные сроки снижения таможенных пошлин между ними и ‘шестёркой’ (до 22 лет). ЕЭС заключило также ряд конвенций об ассоциации в общей сложности с 24 странами Африки, в основном бывшими колониальными владениями Франции и Бельгии. Присоединение к сообществу менее развитых в экономическом отношении стран создаёт предпосылки для их экономического подчинения более сильным европейскими партнёрам. Руководящими органами ЕЭС являются Совет, Комиссия (Комиссия Европейских Сообществ), Ассамблея (Европейский Парламент), Суд. В состав высшего органа ЕЭС – Совета – входят по одному представителю от каждой страны-участницы (обычно министры экономики, финансов или торговли). Главный исполнительный орган – Комиссия – состоит из 9 членов, назначаемых на 4-летний срок правительствами стран, входящих в сообщество. В рамках сообщества функционирует также ряд кредитных учреждений, в задачи которых входит финансирование отдельных мероприятий, связанных с проведением общей экономической и социальной политики, – Европейский Инвестиционный Банк, Европейский Фонд Развития и другие. ЕЭС является важнейшей составной частью системы Европейских сообществ, объединяющих 6 стран Западной Европы,

которая, помимо ЕЭС, включает также Европейское Объединение Угля И Стали и Европейское Сообщество По Атомной Энергии. Последние выступают по существу в качестве отраслевых объединений ‘шестёрки’ и управляются с Июля 1967 теми же органами, что и ЕЭС. Создание ЕЭС отвечало интересам монополий 6 Западно-Европейских стран, так как способствовало укреплению их позиций в рамках сообщества и расширению сбыта их товаров. К началу 1970 торговля внутри сообщества возросла более чем в 6.3 раза по сравнению с 1958. За тот же период торговля ЕЭС с третьими странами увеличилась только в 2.8 раза. 01 Июля 1968 проведено последнее (20%-ное) снижение таможенных пошлин во взаимной торговле стран-участниц, положившее начало функционированию в рамках ЕЭС таможенного союза. В других областях задачи, поставленные перед ЕЭС Римским Договором, к концу 1969 оказались выполненными лишь частично вследствие постоянных разногласий между странами-партнёрами, особенно между Францией и ФРГ, стремящейся к установлению гегемонии в объединении (например, введение свободного передвижения капиталов между 6 странами, проведение общей политики в области транспорта и так далее). Состоявшаяся в Декабре 1969 в Гааге конференция глав правительств стран-участниц приняла решение о необходимости дальнейшего экономического сближения 6 стран (Гаагская Декларация), в соответствии с которым группой экспертов был подготовлен доклад, предусматривавший создание в течение 1971–80 экономического и валютного союза ‘шестёрки’ (так называемый План Вернера). Реализация этого плана с самого начала натолкнулась на большие трудности, одной из причин которых послужило обострение кризиса международной валютной системы капитализма в 1969–71. Очагом непрекращающихся конфликтов в ЕЭС является создание общего рынка сельскохозяйственной продукции, функционирование которого связано с дополнительными бюджетными и валютными расходами стран-участниц. Торгово-политические мероприятия ЕЭС вызывают обострение межимпериалистических противоречий не только в рамках самой ‘шестёрки’, но и между этой группировкой и остальным капиталистическим миром. Непосредственным результатом создания ЕЭС явилось возникновение в Западной Европе другого торгово-экономической блока – Европейской Ассоциации Свободной Торговли (ЕАСТ). Однако с самого начала существования ЕАСТ его участники во главе с Великобританией выражали желание вступить в ЕЭС. 22 Января 1972 после длительных, неоднократно прерывавшихся переговоров было подписано соглашение о вступлении Великобритании, Дании, Ирландии и Норвегии в Общий Рынок с 01 Января 1973. Правящие круги США поддерживали создание ЕЭС, рассчитывая с его помощью усилить экономическую базу НАТО и сплотить силы Западно-Европейского империализма в борьбе против мирового коммунистического движения. Однако сообщество превратилось в сильного конкурента США, теснящего их на мировых рынках. Не оправдались тогда надежды и на укрепление НАТО. Будучи по своему существу государственно-монополистическим объединением, ЕЭС оказалось не в состоянии обеспечить бескризисное равномерное развитие и смягчить классовые противоречия в странах-участницах. Трудящиеся массы шести стран открыто выступают против антидемократического характера ЕЭС, требуют придать ему новое, глубоко отличное от нынешнего, экономическое и социальное содержание, которое отвечало бы интересам широких народных масс. EUROPEAN ELECTRONIC BANKING STANDARDS FRAMEWORK = СТРУКТУРА ЕВРОПЕЙСКИХ СТАНДАРТОВ ЭЛЕКТРОННОГО БАНКОВСКОГО ОБСЛУЖИВАНИЯ – European Electronic Banking Standards Framework:- compilation of mandatory and optional European electronic banking business requirements. The standards framework applies to all electronic distribution channels and covers the requirements of personal, Small and Medium Enterprises (SME) and corporate markets.

EUROPEAN ELECTRONIC PURSE = ЕВРОПЕЙСКИЙ ЭЛЕКТРОННЫЙ КОШЕЛЁК – European Electronic Purse is an integrated circuit card (ICC) application as described in the European Committee for Banking Standards (ECBS).

EUROPEAN ELECTRONIC PURSE ID = ИДЕНТИФИКАЦИЯ ЕВРОПЕЙСКОГО ЭЛЕКТРОННОГО КОШЕЛЬКА (или АЙ.ДИ. ЕВРОПЕЙСКОГО ЭЛЕКТРОННОГО КОШЕЛЬКА) – European Electronic Purse ID is the unique identification (ID) of an European Electronic Purse (EEP). It consists of the Purse Provider ID and the Purse ID.

EUROPEAN ELECTRONIC PURSE MESSAGE = СООБЩЕНИЕ ЕВРОПЕЙСКОГО ЭЛЕКТРОННОГО КОШЕЛЬКА – European Electronic Purse Message is a string of bytes transmitted by the terminal to the card or vice-versa, excluding transmission control characters.

EUROPEAN ELECTRONIC PURSE SCHEME = СХЕМА ЕВРОПЕЙСКОГО ЭЛЕКТРОННОГО КОШЕЛЬКА – European Electronic Purse Scheme is a purse scheme that conforms to the European Committee for Banking Standards (ECBS).

EUROPEAN ENGINE LUBRICANT QUALITY MANAGEMENT SYSTEM = ЕВРОПЕЙСКАЯ СИСТЕМА УПРАВЛЕНИЯ КАЧЕСТВОМ МОТОРНЫХ СМАЗОЧНЫХ МАТЕРИАЛОВ – The European Engine Lubricant Quality Management System (EELQMS) was developed jointly by ACEA (The European Automobile Manufacturers’ Association), ATC (The Technical Committee of Petroleum Additive Manufacturers in Europe) and ATIEL (The Technical Association of the European Lubricants Industry). EELQMS headquartered in Auderghem/Oudergem, Belgium. It is designed to promote the development of improved, fit-for-purpose engine lubricants that meet the increasing technical requirements of the automotive industry, and to assist lubricant marketers in assuring the quality of their lubricants and the performance claims being made for them in the marketplace. Although voluntary, the EELQMS is the only system that can be used to support claims against the ACEA Oil Sequences, which set the minimum performance specifications for lubricants used in different European automotive engine categories, and so enable lubricant marketers to include those performance claims on their product labelling. Marketers are required by ACEA to sign the EELQMS Marketers’ Letter of Conformance (LoC) if they make an ACEA claim for their products. The signing of an LoC by the lubricant marketer, who is wholly responsible for the quality of the lubricant reaching the consumer together with any performance claims being made for it, is the final stage in the process to demonstrate commitment to the EELQMS. Signed LoCs are submitted to ATIEL, which administers the EELQMS on behalf of the other stakeholders. The EELQMS embraces various European, North American and global quality standards, test methods and procedures, together with industry Codes of Practice and the requirements of the ACEA European Oil Sequences. Each element of the EELQMS specifies detailed requirements that should be followed in the course of designing, developing, manufacturing or marketing engine lubricants. By incorporating all of these elements, the EELQMS provides comprehensive guidelines for developing high quality lubricants for which a valid ACEA performance claim can be made. Meeting the requirements of each of the constituent elements of EELQMS is the responsibility of the lubricant marketer.

EUROPEAN EXCHANGE = ЕВРОПЕЙСКАЯ БИРЖА – The European Exchange (Eurex®) is a public company and is owned in equal parts by Deutsche Börse AG and SWX Swiss Exchange. Eurex® operates the Eurex Exchanges ((i) Eurex Zürich AG and (ii) Eurex Frankfurt AG), Eurex Clearing AG and the ECNs (Electronic Communication Networks) Eurex® Bonds (launched in October 2000, Eurex® Bonds was conceived as an Electronic Communication Network (ECN) and provides participants with an electronic platform for off-exchange, ‘wholesale’ trading in fixed income securities and Treasury discount papers. By having networked the Eurex® Bonds trading platform into the Eurex Clearing AG settlement system, the Eurex Clearing House acts as the central counterparty for all bond trades leading to a risk and cost reduction for all connected participants. Additionally, a direct link between spot and futures markets is available for the first time to enable electronic basis trading of bonds and futures via an integrated central order book. Market Makers

provide the necessary liquidity in the bond and basis instruments. The current product range includes different instruments available for trading:- German government bonds including inflation-linked bonds and T-bills, basis instruments, Agencies and German Jumbo Pfandbriefe, German federal state bonds, European covered bonds France, Great Britain, Ireland, the Netherlands and Spain, selected European corporate bonds as well as European government bonds from Austria, Belgium, Finland, France, Greece, Ireland, Italy, the Netherlands, Portugal and Spain) and Eurex® Repo (The Eurex® Repo trading platform was launched in June 1999 to initiate electronic repo trading in Switzerland. Eurex® Repo is based on the latest Internet technology and, within a short period of time, has become the standard bearer in the Swiss Franc repo market. Today, the Swiss National Bank (SNB) carries out its open market operations exclusively via repo transactions executed via the Eurex® Repo electronic platform. The Euro repo market of Eurex® Repo was launched in July 2001 in Germany. Eurex® Repo is among the forerunners in providing an integrated trading and clearing platform for repo transactions. Eurex® Repo offers the entire value chain from trading through clearing and settlement). European Exchange (Eurex®) is an umbrella organization founded jointly in the second half of 1998 by the Swiss Exchange and Deutsche Börse AG to operate the first ever cross-border futures market. The merger of SOFFEX and Deutsche Terminboerse (DTB®) produced a common platform for the fully electronic trading and clearing of derivatives instruments. One of the world's largest derivatives exchanges. Eurex® is one of the world's leading derivatives exchanges and is jointly operated by Deutsche Börse AG and SWX Swiss Exchange. Eurex® offers a broad range of international benchmark products and operates the most liquid fixed income markets in the world, featuring open and low-cost electronic access. With market participants connected from 700 locations worldwide, trading volume at Eurex® exceeds 1.5 billion contracts a year. Therefore, Eurex® is the market place of choice for the derivatives community worldwide. On 2007-December-20, Eurex® completed the acquisition of International Securities Exchange, Inc (ISE). Hence, ISE is a wholly owned subsidiary of Eurex®. The new member of the Eurex® group operates a variety of fully electronic trading platforms, its markets portfolio consists of an options exchange and a stock exchange. On a combined basis, Eurex® and ISE are the global market leader in individual equity and equity index derivatives. Currently, they distribute their products to approximately 560 direct exchange members. Aside from operating a fully electronic trading platform, Eurex® provides an automated and integrated joint Clearing House. Eurex Clearing AG offers central counterparty services for instruments traded on the Eurex® exchanges, Eurex® Bonds and Eurex® Repo as well as the FWB® Frankfurter Wertpapierbörse (the Frankfurt Stock Exchange:- Xetra® and floor) and the Irish Stock Exchange, eliminating the individual counterparty risk. With this structure, Eurex® participants benefit from a high-quality, cost-efficient and comprehensive value chain of trading and clearing services via a single electronic system. Together with leading international financial institutions, Eurex® operates the electronic trading platform Eurex® Bonds, an ECN (electronic communication network) for off-exchange, wholesale trading in fixed income securities and treasury discount papers (Bubills). Through the basis trading Eurex® Bonds offers a direct link between the cash market and the futures market, this enables electronic basis trading via a central order book. Eurex® Repo, which is a separate segment, is the electronic trading solution for repos (sale and repurchase agreements). This Eurex® segment is one of the leading electronic repo market providers, and operates the Swiss Franc and Euro Repo Markets. Eurex® Repo offers the entire value chain from trading through clearing and settlement. Operating as a lean, entrepreneurial organization Eurex® strives to fulfill customer demand. Its team of dedicated professionals does its utmost to offer every class of investor the advantages of having spot and futures markets as well as related clearing and settlement activities all fully integrated under one roof. European Exchange (Eurex®) is one of the world's biggest futures and options exchanges, formed by an amalgamation of DTB® (Deutsche Terminbörse) and SWX Swiss Exchange member SOFFEX (Swiss Options and Financial Futures Exchange). Besides its futures and options exchange, Eurex® offers an OTC trading platform for fixed-income securities (Eurex® Bonds), the electronic settlement of repo business (Eurex® Repo) and serves as central counterparty (Eurex Clearing AG). Eurex® is one of the world's leading market organisers for futures contracts. Eurex®, the futures and options exchange, is a subsidiary of Deutsche Börse and the Swiss Exchange. In 2010, around 2.0 billion contracts were traded on Eurex®, making it one of the world's largest international market organisers for the trading and settlement of futures and options on shares and share indices, as well as of interest rate derivatives. In individual products – such as the futures on long- and medium-term German government bonds – Eurex® now enjoys a market share of over 90 percent in Europe. What makes Eurex® so successful? Eurex® focused on electronic trading combined with an international network right from the start. Today, over 400 market participants in 27 countries are connected to the Eurex® trading system, which was developed by Deutsche Börse IT. It remains extremely stable even at peak times, and processes orders in milliseconds. At the end of 2007, Eurex® merged with the New York based options exchange – the International Securities Exchange (ISE) – creating one of the largest transatlantic marketplaces for derivatives. The European Exchange (Eurex®) is the European derivatives exchange formed in 1998 by a merger of the Deutsche Terminbörse (DTB) and the Swiss Options and Financial Futures Exchange (SOFFEX). / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). (((i) Ойрэкс Цюрихь А.Ге. (Eurex Zürich AG) и Ойрэкс Франкфот А.Ге. (ii) Eurex Frankfurt AG)). Ойрэкс Клирин А.Ге. (Eurex Clearing AG). Юмбо Фандбрифэ (Jumbo Pfandbriefe). Эф.Ве.Бе.® (FWB®; Франкфота Вертпапиабёрзэ (Frankfurter Wertpapierbörse) или Франкфуртская Фондовая Биржа (Frankfurt Stock Exchange)):- Ксэтра® (Xetra®). Бубилз (Bubills). СОФЭКС (SOFFEX). Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG) СОФЭКС (SOFFEX) и Дойчэ Хxxxxбёрзэ (Deutsche Terminboerse) (или Дэ.Тэ.Бе.® (DTB®)). (Примечание:- в Русском языке нет точного соответствия звуку при произношении буквы Ö Немецкого алфавита. Разные источники по-разному интерпретируют его. Буквосочетание ЫО может более менее точно передавать произношение буквы Ö лишь при быстром и кратком их произношении, напоминая в отдалении произношение буквы Ё Русского алфавита.) . Ксэтра® (Xetra®). (соглашения о продаже и откупе). Европейская Биржа – одна из крупнейших мировых бирж по торговле производными (деривативами). Немецко-Швейцарское Предприятие, Ойрэкс® или Юрэкс® (Eurex®) контролируется Немецкой Биржей (или Дойчэ Бёрзэ А.Ге.; Deutsche Börse AG), владельцем Франкфуртской Фондовой Биржи. В Феврале 2004 в Чикаго открылось Американское подразделение Eurex® – электронная биржа Eurex US, – которое вышло на рынок производных на Казначейские Облигации США.

EUROPEAN FINANCIAL REPORTING ADVISORY GROUP = ЕВРОПЕЙСКАЯ СОВЕЩАТЕЛЬНАЯ ГРУППА ПО ФИНАНСОВОЙ ОТЧЁТНОСТИ (или ЕВРОПЕЙСКАЯ КОНСУЛЬТАТИВНАЯ ГРУППА ПО ФИНАНСОВОЙ ОТЧЁТНОСТИ) – The European Financial Reporting Advisory Group (EFRAG), created in 2001 by the main actors interested in financial reporting, namely the users, the preparers, and the accountancy profession, (supported by the national standard setters). This private sector initiative was warmly welcomed by the European Commission and supports the adoption in Europe of IAS by 2005. EFRAG has as its main aim to give a pro-active contribution to the work of IASB (International Accounting Standards Board). It also advises on the technical assessment of the IASB standards and interpretations for application in Europe. The technical work is carried out by the Technical Expert Group (TEG). Chairman of the EFRAG Supervisory Board is FEE President Göran Tidström (Sweden). / Гёран Тидстрём (Göran Tidström).

EUROPEAN FREE TRADE ASSOCIATION = ЕВРОПЕЙСКАЯ АССОЦИАЦИЯ СВОБОДНОЙ ТОРГОВЛИ – The Association is responsible for the management of:- (i) the EFTA Convention, which forms the legal basis of the organisation and governs free trade relations between the EFTA States; (ii) EFTA's worldwide network of free trade and partnership agreements; and (iii) the European Economic Area (EEA) Agreement, which enables three of the four EFTA Member States (Iceland, Liechtenstein and Norway) to participate in the EU's Internal Market. The European Free Trade Association (EFTA) was founded in 1960 on the premise of free trade

as a means of achieving growth and prosperity amongst its Member States as well as promoting closer economic cooperation between the western European countries. Furthermore, the EFTA countries wished to contribute to the expansion of trade in the world at large. Based on these overall goals, EFTA today maintains the management of the EFTA Convention (intra-EFTA trade), the EEA Agreement (EFTA-EU relations), and the EFTA Free Trade Agreements (third country relations). The EFTA Convention and the EFTA free trade agreements are managed from the Geneva office, the EEA Agreement from the Brussels office. EFTA was founded by the Stockholm Convention in 1960. The immediate aim of the Association was to provide a framework for the liberalisation of trade in goods amongst its Member States. At the same time EFTA was established as an economic counterbalance to the more politically driven EEC. Relations with the EEC, later the EC and the EU, have been at the core of EFTA activities from the beginning. In the 1970s the EFTA States concluded free trade agreements with the EC; in 1994 the EEA Agreement entered into force. Since the beginning of the 1990s EFTA has actively pursued trade relations with third countries in and beyond Europe. The first partners were the central and eastern European countries, followed by the countries in the Mediterranean area. In recent years EFTA's network of free trade agreements has reached across the Atlantic as well as into Asia. EFTA was founded by the following seven countries:- Austria, Denmark, Norway, Portugal, Sweden, Switzerland and the United Kingdom. Finland joined in 1961, Iceland in 1970 and Liechtenstein in 1991. In 1973, the United Kingdom and Denmark left EFTA to join the EC. They were followed by Portugal in 1986 and by Austria, Finland and Sweden in 1995. Today the EFTA members are Iceland, Liechtenstein, Norway and Switzerland. The European Free Trade Association (EFTA) is an intergovernmental organisation set up for the promotion of free trade and economic integration to the benefit of its four Member States:- Iceland, Liechtenstein, Norway and Switzerland. The Association manages the EFTA Convention; EFTA's worldwide network of free trade and partnership agreements, and the European Economic Area (EEA) Agreement. The European Free Trade Association (EFTA) was established in 1960 by the Stockholm Convention (EFTA Convention). The original signatories were Denmark, Great Britain, Norway, Austria, Portugal, Sweden and Switzerland. Later, Iceland (1970), Finland (1986) and Liechtenstein (1991) joined. Denmark, Great Britain, Austria, Portugal, Sweden and Finland are no longer members of EFTA as they have since joined the European Union (EU). EFTA's current membership consists of Iceland, Liechtenstein, Norway and Switzerland. The Stockholm Convention establishes a free trade area for the movement of goods among the EFTA States under the terms of Article XXIV of the General Agreement on Tariffs and Trade (GATT). Contractual relations between the EFTA States were for a long time limited to trade in industrial products. The Convention was later supplemented by an economic integration agreement for the services sector according to Article V of the General Agreement on Trade in Services (GATS). On 2001-June-21 in Vaduz, the EFTA member States Iceland, Liechtenstein, Norway and Switzerland signed an agreement on the revision of the EFTA Convention. The sectorial agreements between Switzerland and the EU from 1999 ('Bilaterals I') served as a point of reference for the revision of the EFTA Convention. As a result, the EFTA founding provisions of 1960 were completely revised. The revised EFTA Convention establishes legal relations between Switzerland and the other EFTA States comparable to those contained in the seven bilateral agreements concluded between Switzerland and the EU in 1999. New provisions include, for example, the free movement of persons between Switzerland and the other EFTA States (with specific arrangements for the movement of persons between Switzerland and Liechtenstein). The Vaduz Agreement also added provisions regarding trade in services, movement of capital and protection of intellectual property. The Agreement amending the EFTA Convention came into force on 2002-June-01, at the same time as the seven sectorial agreements between Switzerland and the EU, signed in 1999. The EFTA Convention has been regularly amended since then, in particular in order to take into account the development in the bilateral relations between Switzerland and the EU (amendment of the bilateral sectorial agreements of 1999, conclusion of new agreements). The objective is to ensure, wherever possible, the parallel development of contractual relations among EFTA States and between EFTA States and the EU (bilateral agreements between Switzerland and the EU, EFTA Convention, European Economic Area). A regional organization established in 1959 by the Stockholm Convention as an alternative to the Common Market, European Free Trade Association (EFTA) was designed to provide a free trade area for industrial products among member countries. Unlike the EC however, EFTA members did not set up a common external tariff and did not include agricultural trade. The original members were Austria, Denmark, Norway, Portugal, Sweden, Switzerland, and the United Kingdom. Denmark, Portugal, and the United Kingdom left EFTA when they joined the EC. EFTA currently (1994) has seven members:- Austria, Finland, Iceland, Liechtenstein, Norway, Sweden, and Switzerland; but Austria and Sweden have applied for EC membership. The European Free Trade Association (EFTA) was established in 1960 by the Stockholm Convention. The original purpose of this intergovernmental organisation was to remove customs duties on industrial products in trade among its Member States. The current (2011) members of EFTA are Iceland, Liechtenstein, Norway and Switzerland. In contrast to the European Union (EU), EFTA is not a customs union. Individual EFTA States are basically free to set their own customs tariffs and arrange other foreign trade measures vis-à-vis non-EFTA States (so-called Third Countries). hree of the four EFTA States, Iceland, Liechtenstein and Norway, are parties to the Agreement on the European Economic Area (EEA). An EFTA Surveillance Authority and an EEA Court were set up in order to implement those countries' obligations under the EEA Agreement. EFTA States have been using EFTA as a platform for the joint negotiation of free trade agreements with third countries outside the EU. 22 such agreements are currently in force and a number of agreements are being negotiated. / Европейская Ассоциация Свободной Торговли (ЕАСТ) была создана в 1960 Австрией, Великобританией, Данией, Норвегией, Португалией, Швейцарией и Швецией в качестве альтернативы Европейскому Экономическому Сообществу (ЕЭС), так называемому Общему Рынку. Соглашение предусматривало постепенную отмену таможенных пошлин и количественных ограничений в торговле между странами членами. В 1970 в состав ЕАСТ вошла Исландия, а в 1986 – Финляндия. Однако, сначала в 1973 Великобритания и Дания, а потом, в 1985, – Португалия, вступая в Еропейское Сообщество (ЕС), официально вышли из состава ЕАСТ. Европейская Ассоциация Свободной Торговли (ЕАСТ), замкнутая торгово-экономическая группировка, образованная в 1960 Австрией, Великобританией, Данией, Норвегией, Португалией, Швейцарией и Швецией. Конвенция о ЕАСТ распространяется также на Лихтенштейн, который связан со Швейцарией таможенной унией. Ассоциация создана по инициативе Великобритании в результате обострения межимпериалистических противоречий как противовес Европейскому Экономическому Сообществу (ЕЭС). Соглашение о создании ЕАСТ предусматривало в 1960–70 отмену таможенных пошлин и количественных ограничений в торговле между членами ассоциации, в отношении же третьих стран страны-участницы сохраняют самостоятельные таможенные тарифы. В 1961 в ЕАСТ в качестве ассоциированного члена вступила Финляндия, а в 1970 членом стала Исландия. Штаб-квартира ЕАСТ – в Женеве, Швейцария, руководящий орган – Совет Министров, исполнительный орган – Секретариат. К 1967 участники ассоциации отменили таможенные пошлины и количественные ограничения в торговле, исключение составила Португалия, которой было разрешено продлить защиту своей промышленности таможенными пошлинами до конца 1979. Создание свободного внутризонального рынка способствовало росту товарооборота между странами-участницами:- за период с 1959 по 1968 он возрос на 145%, тогда как общий объём торговли этих стран увеличился на 85%. Тем не менее, ЕАСТ осталась непрочным объединением, более слабым по сравнению с Общим Рынком (или Европейским Экономическим Сообществом (ЕЭС)), в который стремятся вступить сами члены ЕАСТ. 22 Января 1972 было подписано соглашение о вступлении в ЕЭС с 01 Января 1973 ведущего члена ЕАСТ – Великобритании, а также Дании и Норвегии. Общий торговый баланс стран ЕАСТ пассивен, причём более половины дефицита получается от торговли со странами Общего Рынка. Фактически наибольший вес в объединении имеют Великобритания и отчасти Швеция, обладающие наибольшим экономическим потенциалом. Внутри

ассоциации растут как экономические, так и политические противоречия, грозящие привести к её распаду. Во внешней торговле ЕАСТ доля социалистических стран в 1970 составляла примерно 5%; она достигала 16.1 в импорте и 15.7 в экспорте Финляндии, 9.4 в импорте и 12.9 в экспорте Австрии, 10.7 в импорте и 10.1% в экспорте Исландии. В 1970 по сравнению с 1969 общий импорт из социалистических стран возрос на 16.7%, а экспорт на 13.5%, при этом наибольший рост импорта имели Финляндия (29.6%) и Австрия (22.1%), а также Швейцария и Швеция; наибольший рост экспорта – Швеция, Швейцария и Исландия. Потребности стран ЕАСТ диктуют необходимость дальнейшего расширения их торговли с социалистическими странами.

EUROPEAN GASOIL = ЕВРОПЕЙСКИЙ ГАЗОЙЛЬ – European Gasoil is a definition for No 2 Heating Oil and No 2 Diesel fuel. It is used as the pricing reference for all distillate trading in Europe and beyond. The underlying physical market is heating oil barges delivered in ARA (Antwerp, Rotterdam, Amsterdam). European gasoil futures are traded at the NYMEX® under ticker symbol 7F. Contract size is 100 metric tons quoted in US Dollars and Cents per metric ton. Contract is settled financially. European gasoil futures are also traded at the ICE Europe under ticker symbol G. Contract size 100 metric tons quoted in US Dollars and Cents per metric ton. Contract settled with physical delivery, to barge or by in-tank or inter-tank transfer, within the within the ARA (Antwerp, Rotterdam, Amsterdam) area. Delivery by volume is 118.35 cubic meters per lot being the equivalent of 100 tons of gasoil at a density of 0.845 kg/liter in vacuum at 15 °C.

EUROPEAN INTERBANK OFFERED RATE = ЕВРОПЕЙСКАЯ МЕЖБАНКОВСКАЯ СТАВКА ПРЕДЛОЖЕНИЯ – The Euro Interbank Offered Rate (Euribor) is short for Euro Interbank Offered Rate. The Euribor rates are based on the interest rates at which a panel of 57 European banks borrow funds from one another. In the calculation, the highest and lowest 15% of all the quotes collected are eliminated. The remaining rates will be averaged and rounded to three decimal places. Euribor is determined and published at about 11:00 am each day, Central European Time. When Euribor is being mentioned it is often referred to as THE Euribor, like there's only 1 Euribor interest rate. This is not correct, since there are in fact 15 different Euribor rates, all with different maturities. The maturities range from 1, 2, or 3 weeks to 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 and 12 months. Euribor was first published on 1998-December-30 (value 1999-January-04). 1999-January-01 was the day that the Euro as a currency was introduced. In the years before, a lot of domestic reference rates like PIBOR (France) and Fibor (Germany) existed. Since the Euribor rates are based upon agreements between many European banks, the level of the rates is determined by supply and demand in the first place. However there are some external factors, like economic growth and inflation which do influence the level of the rates as well. The Euribor rates are important because these rates provide the basis for the price or interest rate of all kinds of financial products, like interest rate swaps, interest rate futures, saving accounts and mortgages. The panel banks are the banks with the highest volume of business in the euro zone money markets. The panel consists of banks with a first class credit standing, high ethical standards and an excellent reputation. Euribor and LIBOR are comparable base rates. Euribor is the average interbank interest rate at which European banks are prepared to lend to one another. LIBOR is the average interbank interest rate at which a selection of banks on the London money market are prepared to lend to one another. Just like Euribor, LIBOR comes in 15 different maturities. The main difference is that LIBOR rates come in 10 different currencies. The European Interbank Offered Rate (Euribor) is the benchmark rate at which Euro interbank term deposits within the eurozone are offered by one prime bank to another. The Euro Interbank Offered Rate (Euribor) is a daily reference rate based on the averaged interest rates at which banks offer to lend unsecured funds to other banks in the euro wholesale money market (or interbank market). Euribors are used as a reference rate for euro-denominated forward rate agreements, short term interest rate futures contracts and interest rate swaps, in very much the same way as LIBORs are commonly used for Sterling and US Dollar-denominated instruments. They thus provide the basis for some of the world's most liquid and active interest rate markets. Domestic reference rates, like Paris' PIBOR, Frankfurt's FIBOR, and Helsinki's Helibor merged into Euribor on EMU day on 1999-January-01. A representative panel of banks provide daily quotes of the rate, rounded to two decimal places, that each panel bank believes one prime bank is quoting to another prime bank for interbank term deposits within the Euro zone, for maturity ranging from one week to one year. Every Panel Bank is required to directly input its data no later than 10:45 am (CET) on each day that the Trans-European Automated Real-Time Gross-Settlement Express Transfer system (TARGET) is open. At 11:00 am (CET), Reuters will process the Euribor calculation and instantaneously publish the reference rate on Reuters pages 248–249, which will be made available to all its subscribers and to other data vendors. The published rate is a rounded, truncated mean of the quoted rates:- the highest and lowest 15% of quotes are eliminated, the remainder are averaged and the result is rounded to 3 decimal places. Euribor rates are spot rates, i.e. for a start two working days after measurement day. Like US money-market rates, they are Actual/360, i.e. calculated with an exact daycount over a 360-day year. Euribor was first published on 30 December 1998 for value 1999-January-04. / ПИБОР (PIBOR) (Франция) и Фибо или Фибор (Fibor) (Германия). Ройтас (Reuters). ЮРИБО или ЮРАЙБО (EURIBOR). (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)). Европейская Межбанковская Ставка Предложения, более известная как Юрибо или Юрайбо (Euribor) – процентная ставка по которой производится размещение срочных депозитов в Евро между первоклассными банками, находящимися в зоне Евро. Ставки Юрибо определяются в системе Bridge-Telerate (система межбанковских котировок) ежедневно около 11 часов по Центрально-Европейскому Времени (ЦЕВ) как усреднённые ставки предложения группы банков, наиболее крупных участников рынка. Ставки Юрибо устанавливаются на сроки 1 (1W), 2 (2W) и 3 (3W) недели, 1 (1M), 2 (2M), 3 (3M), 4 (4M), 5 (5M), 6 (6M), 7 (7M), 8 (8M), 9 (9M), 10 (10M), 11 (11M) и 12 (12M) месяцев. Юрибо или Юрайбо – средневзвешенная процентная ставка по межбанковским кредитам, предоставляемым в Евро. Определяется при поддержке Европейской Банковской Федерации, представляющей интересы кредитных учреждений в странах членах Евросоюза, а также Исландии, Норвегии, Швейцарии и Ассоциации Финансовых Рынков. Расчёт и публикация ставки выполняется ежедневно в 11:00 по Центрально-Европейскому Времени на основании данных, предоставляемых несколькими десятками банков с первоклассным рэйтиньгом. Перечень котируемых банков регулярно пересматривается на соответствие высоким рэйтиньговым требованиям.

EUROPEAN INVESTMENT BANK = ЕВРОПЕЙСКИЙ ИНВЕСТИЦИОННЫЙ БАНК – The European Investment Bank (EIB) is a bank established in 1958 with headquarters in Luxembourg, Luxembourg, administered by the Finance Ministers of its member countries. The European Investment Bank (EIB) is an independent public institution set up the Treaty of Rome to contribute to balanced and steady development in the European Community. The EIB provides loans and guarantees to companies and public institutions to finance regional development, structural development and achieve cross-border objectives. The EIB has emphasized regional development and energy, with Greece, Ireland and Italy receiving major support. This was set up to assist economic development within the European Union. Its members are the member states of the European Union. The European Investment Bank (EIB), domiciled in Luxembourg, Luxembourg, was set up in 1958 by the Treaty of Rome establishing the European Economic Community. The main aim of the EIB, the European Union's financing institution, is to contribute to the integration, balanced development and economic and social cohesion of the Member Countries. The EIB raisies substantial volumes of funds on the capital markets and makes them available at the most favorable terms for financing investment projects according to the objectives of the Union. Outside the EU, the EIB implements the financial components of agreements concluded under European development aid and cooperation policies. Established under the treaty of Rome in 1957 and created in 1958, the European Investment Bank (EIB) is the

European Union's long-term lending institution. As a policy-driven Bank, the EIB supports EU priority objectives, notably European integration and social cohesion, through its financing operations. The EIB is governed by the:- (i) Board of Governors – usually the Finance Ministers of the Member States; (ii) Board of Directors – 28 members representing each Member State and the European Commission. There are 16 Alternates, meaning that some of these positions will be shared by groupings of States. The Board also has the right to co-opt a maximum of 6 experts (3 Directors and 3 Alternates), who will participate in the Board meetings in an advisory capacity, without voting rights. (iii) Management Committee – the President of the EIB and 8 Vice Presidents. (iv) Audit Committee – 3 members and 3 observers appointed by the Board of Governors. The European Investment Bank (EIB) is the European Union's financing institution. Its shareholders are the 27 Member States of the Union, which have jointly subscribed its capital. The EIB's Board of Governors is composed of the Finance Ministers of these States. The EIB's role is to provide long-term finance in support of investment projects. Inside the European Union the EIB supports the EU's policy objectives in the following areas:- (i) small and medium-sized enterprises:- stimulating investment by small businesses; (ii) cohesion and convergence:- addressing economic and social imbalances in disadvantaged regions; (iii) the fight against climate change:- mitigating and adapting to the effects of global warming; (iv) environmental protection and sustainable communities:- investing in a cleaner natural and urban environment; (v) sustainable, competitive and secure energy:- producing alternative energy and reducing dependence on imports; (vi) the knowledge economy:- promoting an economy that stimulates knowledge and creativity through investment in information and communication technologies, and human and social capital; and (vii) trans-European networks:- constructing cross-border networks in transport, energy and communications. In 2010, some 88% of the total EIB financing of EUR72 billion went to projects in the EU. Outside the EU, the EIB is active in over 150 countries (the pre-accession countries of South-East Europe, the Mediterranean partner countries, the African, Caribbean and Pacific countries, Asia and Latin America, and Russia and other neighbours to the East), working to implement the financial pillar of EU external cooperation and development policies (private sector development, infrastructure development, security of energy supply, and environmental sustainability). The EIB, the largest international non-sovereign lender and borrower, raises the resources it needs to finance its lending activities by borrowing on the capital markets, mainly through public bond issues. Its AAA credit rating enables it to obtain the best terms on the market. As a not-for-profit institution, the EIB passes on this advantage in the terms it offers to the beneficiaries of its loans in both the public and private sectors. The EIB works closely with the other EU institutions, especially the European Parliament, the European Council and the European Commission. The European Investment Fund is a subsidiary of the EIB. Our Mission is to further the objectives of the European Union by making long-term finance available for sound investment. We are at the service of the Union. We were created by the Treaty of Rome; our shareholders are the Member States; and our Board of Governors is composed of the Finance Ministers of these States. We provide service and value-added:- (i) through our appraisal and follow-up of investment projects and programmes:- to receive our support, projects and programmes must be viable in four fundamental areas:- economic, technical, environmental and financial. We appraise each investment project thoroughly and follow it through to completion. And (ii) through our financing:- through our own lending operations and our ability to attract other financing, we widen the range of funding possibilities. Through our borrowing activities, we contribute to the development of capital markets throughout the Union. We offer first-class terms and conditions. Our financial soundness derives from the strength and commitment of our shareholders, the independence of our professional judgements and our record of achievement. It enables us to borrow at the finest terms, which we pass on in our lending conditions. We work in partnership with others. Our policies are established in close coordination with the Member States and the other Institutions of the European Union. We also cooperate closely with the business and banking sectors and the main international organisations in our field. We attract qualified and multi-lingual staff from all the Member States. We are motivated by our direct participation in the construction of Europe. / Римским Трактатом . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Европейский Инвестиционный Банк, инвестиционный банк 6 стран – участниц Общего Рынка (или Европейского Экономического Сообщества (ЕЭС)) (Франции, Федеративная Республика Германия (ФРГ), Италии, Бельгии, Нидерландов, Люксембурга). Учреждён в 1958 в соответствии с Римским Договором о создании Общего Рынка (1957). Во главе банка стоит Совет Управляющих, в который входят министры финансов стран-членов. Правление банка – в Брюсселе, Бельгия. Разрешённый и выпущенный акционерный капитал – 1 миллиард Долларов США, оплаченный капитал – 250 миллионов Долларов США (в том числе 25% золотом и 75% в национальной валюте). Остальные 750 миллионов Долларов США служат фондом, гарантирующим займы, заключаемые банком. С Мая 1971 разрешенный капитал увеличен до 1.5 миллиардов Долларов США, а оплаченный – до 300 миллионов Долларов США. Франция и ФРГ подписались каждая на 450 миллионов Долларов США, Италия – на 360 миллионов Долларов США, Бельгия – на 130 миллионов Долларов США, Нидерланды – на 107 миллионов Долларов США, Люксембург – на 3 миллиона Долларов США. Банк выпускает облигации. К началу 1971 было выпущено облигаций на сумму 1 020 миллионов Долларов США, из них 2/3 было размещено в странах Общего Рынка и 1/3 в США. Банк предоставляет займы из 7.5% годовых государственным и частным предприятиям 'шестёрки', а также Греции и Африканскими государствам, входящим в Еврафрику. Право инвестиций в последние банк получил с 1963. На 01 Января 1971 открытые банком кредиты составили 1 393 миллионов Долларов США. Кроме того, банк принял участие в проектах инвестиций на общую сумму 4.5 миллиарда Долларов США. Выданные кредиты составили 1 060 миллионов Долларов США. Из открытых кредитов 91% приходится на 'шестёрку' (57% – Италия, 19% – Франция, 9% – ФРГ, 6% – Бенилюкс), 5% на Грецию и лишь 4% на развивающиеся страны, главным образом Африканские. Основная масса кредитов предоставлена на создание и улучшение инфраструктуры (строительство железных и автомобильных дорог, гаваней, предприятий связи) и на развитие сельского хозяйства.

EUROPEAN MEDIUM TERM NOTE = ЕВРОПЕЙСКАЯ СРЕДНЕСРОЧНАЯ НОТА – Euro Medium Term Note (EMTN) is a flexible medium-term debt instrument that is issued and traded outside of Canada and the United States and requires fixed dollar payments. EMTNs are issued directly to the market with maturities of less than five years and are offered continuously rather than all at once like a bond issue. EMTNs make it easier for issuers to enter into foreign markets for capital. With EMTNs, the issuer maintains a standardized document (known as a Program) that can be transferred across all issues and has a great proportion of sales through a syndication of pre-selected buyers. European Medium Term Note (EMTN) is a vehicle for raising funds by borrowing from the capital markets or from private investors. The European Medium Term Note (EMTN) programme itself is effectively a platform, under a standard documentation framework, from which to launch such issues on an ongoing basis.

EUROPEAN MONETARY COOPERATION FUND = ЕВРОПЕЙСКИЙ ФОНД СОТРУДНИЧЕСТВА В МОНЕТАРНОЙ СФЕРЕ – European Monetary Cooperation Fund (EMCF):- central banks of member states of the European Monetary System deposit 20 per cent of their gold and foreign exchange reserves on a short-term basis with the European Monetary Cooperation Fund in exchange for ECUs. The Fund is the clearing house for central banks in the European Monetary System (EMS). A European Monetary Cooperation Fund was set up in 1973 to support the operation of the 'Snake' mechanism and the Bank for International Settlements (BIS) was appointed Agent for it. The European Monetary Cooperation Fund (EMCF) is an institution and a fund established in 1973 by members of the European Exchange Rate Mechanism (ERM) of the European Union (EU) to stabilise exchange rates. It was succeeded by the European Monetary Institute which is now part of the European Central Bank. In the early 1970s, when the Bretton Woods system was breaking down, the Committee of Governors agreed to put limits on exchange rate fluctuations between participating European

currencies as a first step towards closer integration (the so-called 'Snake'). The European Monetary Cooperation Fund (EMCF) is the fund organized by the European Monetary System in which members of the European Union deposited reserves to provide a pool of resources to stabilize exchange rates and to finance balance of payments support. In return for depositing 20% of their gold and gross dollar reserves, member states were given access to a wide variety of credit facilities, denominated in ECU, from the fund. It ceased operations with the introduction of the Euro in 1999. European Monetary Cooperation Fund (EMCF) is a former Community body established under Regulation (EEC) No 907/73 of the Council of 03 April 1973. At the start of Stage Two of the Economic and Monetary Union (EMU), the EMCF was dissolved and its tasks taken over by the European Monetary Institute (EMI).

EUROPEAN MONETARY INSTITUTE = ЕВРОПЕЙСКИЙ МОНЕТАРНЫЙ ИНСТИТУТ – Forerunner of the European Central Bank. The European Monetary Institute's (EMI) main remit is to prepare the third stage of European Monetary Union and the introduction of the single currency (Euro) by coordinating the monetary and economic policies of future European Monetary Union countries. European Monetary Institute (EMI) is a temporary institution established at the start of Stage Two of Economic and Monetary Union (EMU) on 01 January 1994. The two main tasks of the EMI were to strengthen central bank cooperation and monetary policy coordination and to make the preparations required for the establishment of the European System of Central Banks (ESCB), for the conduct of the single monetary policy and for the creation of a single currency in Stage Three of EMU. It went into liquidation when the ECB was established on 01 June 1998. European Monetary Institute (EMI) is a European body responsible for preparing the final stage of Economic and Monetary Union. It was created on 1994-January-01 and was replaced by the ECB on 1998-June-01. The European Monetary Institute (EMI) was the forerunner of the European Central Bank (ECB), operating between 1994 and 1997. Headquartered in Frankfurt am Main (Frankfurt on the Main), Germany. The EMI was created 01 January 1994 to oversee the second stage in the creation of monetary union. The EMI itself took over from the earlier European Monetary Cooperation Fund (EMCF). The EMI met for the first time on 12 January under its first President, Alexandre Lamfalussy. On 01 July 1997 Lamfalussy was replaced by Wim Duisenberg who would then go on to serve as the ECB's President. The institute was dissolved on 01 June 1998 with the creation of the ECB and the European System of Central Banks (ESCB) which took over its expanded responsibilities as the Euro was launched. The EMI and was the key monetary institution of the second phase of the Economic and Monetary Union of the European Union. The EMU encouraged cooperation between the national banks of the member states of the European Union (EU) and laid the foundation for the Euro. It had less than 250 staff, mostly seconded from national central banks, and was based in the Eurotower, Frankfurt (Germany), where the ECB is now based. / Европейский Монетарный Институт (ЕМИ). Александрэ Лёмфалюси (Alexandre Lamfalussy). Вим Дайшэнбэрх (Wim Duisenberg).

EUROPEAN MONETARY SYSTEM = ЕВРОПЕЙСКАЯ МОНЕТАРНАЯ СИСТЕМА (или ЕВРОПЕЙСКАЯ ДЕНЕЖНО-КРЕДИТНАЯ СИСТЕМА) – The European Monetary System And The Single European Act:- in March 1979 the process of monetary integration was relaunched with the creation of the European Monetary System (EMS). The EMS was established by a Resolution of the European Council (Resolution of the European Council on the establishment of the European Monetary System (EMS) and related matters of 05 December 1978), and its operating procedures were laid down in an Agreement between the participating central banks (Agreement of 13 March 1979 between the central banks of the Member States of the European Economic Community laying down the operating procedures for the European Monetary System). The EMS proved to be instrumental in furthering European monetary integration. Unlike the 'snake', the EMS managed to keep most Community currencies in a single exchange rate system. (The main exception was the pound sterling which participated for less than a year.) Some features of the EMS were similar to the 'snake', for example the EMS was also built around a grid of fixed but adjustable central rates among the participating Community currencies. A new feature, however, was the introduction of the European Currency Unit (ECU), which was defined as a 'basket' of fixed quantities of the currencies of the Member States. (The value of the ECU vis-à-vis the US Dollar was the weighted average of the US Dollar exchange rates of the component currencies. Its value in each of the component currencies was determined by multiplying its US Dollar value with the US Dollar exchange rate of the respective component currency) The ECU was to serve as the numéraire (The function of numéraire implied that the central rates of the participating currencies were expressed in terms of the ECU. The ECU central rates were then used to determine the bilateral ERM central rates around which the bilateral intervention rates were fixed.) of the exchange rate mechanism (ERM), as a unit of account to denominate operations in the intervention and credit mechanisms and as a reserve asset and means of settlement among the participating central banks. However, the EMS was not just an exchange rate mechanism. In line with its objective to promote internal and external monetary stability, the EMS also covered the adjustment of monetary and economic policies as tools for achieving exchange rate stability. Its participants were able to create a zone in which monetary stability increased and capital controls were gradually relaxed. The exchange rate constraint greatly helped those participating countries with relatively high rates of inflation to pursue disinflation policies, in particular through monetary policy. It thus fostered a downward convergence of inflation rates and brought about a high degree of exchange rate stability. This in turn helped to moderate cost increases in many countries and led to an improvement in overall economic performance. Moreover, reduced uncertainty about exchange rate developments and a perception that the parities of the participating currencies were not allowed to depart significantly from the economic fundamentals protected intra-European trade from excessive exchange rate volatility. Although the EMS became the focal point of improved monetary policy coordination, its success in bringing about greater convergence of economic policies was rather limited. The lack of sufficient convergence in fiscal policy also remained a source of tension:- some countries had persistently large budget deficits (leading to several exchange rate crises at the beginning of the 1990s), which put a disproportionate burden on monetary policy. The European Council Resolution of 1978 stated that the ECU should be at the centre of the EMS; but, in practice, the ECU played only a limited role in the functioning of the system. In the financial markets, however, it gained some popularity as a means of portfolio diversification and as a hedge against currency risks. The expansion of financial market activity in ECU was driven by a growing volume of ECU-denominated debt instruments that were issued by Community bodies and the public-sector authorities of some member countries. However, in the absence of an anchor for the ECU, the further prospects of the ECU market remained limited. A further impetus for economic and monetary union was provided by the adoption of the Single European Act (SEA), which was signed in February 1986 and entered into force on 01 July 1987. The main purpose of this Act was to introduce the Single Market as a further objective of the Community, to make the necessary decision-making changes to complete the Single Market and to reaffirm the need for the Community's monetary capacity for achieving economic and monetary union. There was growing consensus among policy-makers that a market without internal borders would link the national economies much more closely together and increase significantly the degree of economic integration within the Community. This in turn would reduce the room for manoeuvre of national policies and thus oblige the Member States to step up convergence of their economic policies. If greater convergence did not occur, full freedom of capital movements and integrated financial markets was expected to put an undue burden on monetary policy. The integration process would therefore require more intensive and effective policy coordination for which the prevailing institutional framework was perceived to be insufficient. In addition, the Single Market was not expected to be able to exploit its full potential without a single currency. A single currency would ensure greater price transparency for consumers and investors, eliminate exchange rate risks within the Single Market, reduce transaction costs and, as a result, significantly increase economic welfare in the Community. Taking all these considerations into account, the then 12 Member States of the European Economic

Community decided in 1988 to relaunch the EMU project. Where the Werner Plan of the early 1970s had failed, the second attempt at EMU would prove to be a success, finally turning the single currency dream into reality. European Monetary System (EMS) before the Euro was introduced a number of currencies of EU Member States were linked together in the EMS, which existed from 1979 until 1999. It had three main components:- (i) the ECU, which was a basket of the currencies of the Member States; (ii) the exchange-rate and intervention mechanisms, which gave each currency a central exchange rate linked to the ECU (bilateral exchange rate); and (iii) the credit mechanisms, which allowed central banks to intervene if bilateral exchange rates exceeded a threshold. On 1999-January-01 the EMS was replaced by the Exchange Rate Mechanism II. International currency union established by vote of the European Economic Community (EEC) Council of Europe on 1978-December-05 in Brussels, Belgium and operable since March 1979. The central element of the European Monetary System (EMS) is the European Currency Unit (ECU), which is decisive for fixing the central rates and the width of the bands within which rates can fluctuate. With the exception of the UK (situation 1998) all EU currencies participate in the Monetary System's exchange rate mechanism (ERM). Since August 1993, currencies have been allowed to fluctuate up to ±15% of the average rate (DEM/NLG:- ±2.25%) without any intervention. When monetary union comes into force, a special succession arrangement will govern the fixing of exchange rates between the Euro and the currencies of those EU countries not taking part in the single currency (EMS-2). System created in 1979 by agreement among member nations of the European Economic Community to promote greater exchange rate stability and economic cooperation, and to encourage intra-European Economic Community trade and development. The European Monetary System (EMS) created a common unit of account, the European Currency Unit, along with a reserve fund containing 20% of each member's gold and US Dollar reserves, from which a central bank may borrow to make purchases in the open market in order to stabilize its currency. European Monetary System (EMS) is an exchange rate regime created in 1979 by a Resolution of the European Council of 05 December 1978. Its operating procedures were laid down in the Agreement of 13 March 1979 between the central banks of the Member States of the European Economic Community. The EMS provided a framework for close monetary and exchange rate policy cooperation between the Member States of the European Community. Its main components were the European Currency Unit (ECU), the exchange rate and intervention mechanism (ERM), very short-term financing mechanisms and short and medium-term credit mechanisms. At the start of Stage Three of the Economic and Monetary Union (EMU), the EMS was superseded by the exchange rate mechanism II (ERM II). European Monetary System is a monetary system intended to move Europe toward closer economic integration and avoid the disruptions in trade that can result from fluctuations in currency exchange rates. The EMS member countries deposit gold and Dollar reserves with the European Monetary Cooperation Fund in exchange for the issuance of European currency units. Established in 1979; all EC members except Greece and the United Kingdom participate in the exchange rate mechanism of the EMS. / флуктуаций (колебаний) обменных курсов валют.

EUROPEAN MONETARY UNION = ЕВРОПЕЙСКИЙ МОНЕТАРНЫЙ СОЮЗ – European Monetary Union (EMU) was established under the Treaty on European Union (or Maastricht Treaty signed on 07 February 1992). In the broader sense an economic and monetary union. Participating countries are obligated to pursue a common economic policy and use a single currency (Euro). Scheduled by European Union decree to enter into force on 1999-January-01. The Road To EMU And The Euro:- So how did it all start? One possible starting point for this chronology of economic and monetary union in Europe might be the Treaties of Rome, which entered into force on 01 January 1958. (The Treaty establishing the European Economic Community (EEC) and the Treaty establishing the European Atomic Energy Community (Euratom). The Treaties entered into force on 01 January 1958. The two new Communities were added to the European Coal and Steel Community (ECSC), which had been established in 1952 for a period of 50 years.) After all, the realisation of EMU is one of the achievements of European integration; indeed probably the most important one so far. However, a single currency was not yet in the mind of the authors of the Treaties of Rome; the aims and objectives of the original treaties were much more limited. Another starting point might be 1989, when the European Council decided to initiate the realisation of EMU by the end of the century. However, it would be historically incorrect to discard the first steps towards European monetary integration, which had started in the mid-1960s. The early attempts at monetary integration were characterised by varying degrees of success, and progress alternated with setbacks. Nevertheless, the achievements of this period, and some of the lessons learned, were indispensable in shaping the process of monetary integration that finally took off in the 1990s. Taking all this into account, the most appropriate starting point would therefore seem to be the year 1962 and a European Commission document known as the Marjolin Memorandum. This memorandum initiated the first discussion on monetary integration at the Community level and prompted the first, albeit very limited, measures in the field of monetary cooperation. First Steps Towards European Monetary Integration:- Europe's 'founding fathers', who negotiated the Treaties of Rome in the 1950s, did not dwell on the idea of a common currency. To start with, the initial aims of the European Economic Community (EEC) were largely limited to realising a customs union and a common agricultural market, which was not perceived to require integration in the monetary field. Moreover, at the time, all the EEC countries were part of a reasonably well-functioning international monetary system (the Bretton Woods system). Within this system, exchange rates were fixed but adjustable and remained relatively stable until the mid-1960s, both within the EEC and globally. The idea of a common currency for the EEC Member States was first launched in the European Commission's Memorandum of 24 October 1962 (the Marjolin Memorandum). In its Memorandum, the Commission called for the customs union to lead on to an economic union by the end of the 1960s with irrevocably fixed exchange rates between the Member States' currencies. However, since the Bretton Woods system was ensuring widespread exchange rate stability, the Member States considered that intra-EEC exchange rate stability could be secured without the need for new institutional arrangements at the Community level. Thus, no follow-up action was taken on the Memorandum, except that a Committee of Governors of the central banks of the Member States of the EEC (the Committee of Governors) was established in 1964. The Committee of Governors complemented the Monetary Committee provided for by Article 105(2) of the EEC Treaty. Initially the Committee of Governors had a very limited mandate, but over the years it gradually gained in importance to become the focus of monetary cooperation among the Community central banks. In this capacity, the Committee developed and managed the framework for monetary cooperation that was subsequently established at the Community level. The Committee's work would also prove instrumental in the final move to EMU. By the end of the 1960s, the international environment had changed significantly. The Bretton Woods system was showing signs of increasing strain as a result of US balance of payments policy. The EEC Member States increasingly differed on economic policy priorities. Greater price and cost divergences between them led to several exchange rate and balance of payments crises, which in turn threatened to disrupt the customs union and the common agricultural market, which had been functioning quite successfully up to then. In 1969 the European Commission submitted a plan (the Barre Plan) to create a distinct monetary identity in the Community. On the basis of this plan, the Heads of State or Government, meeting in The Hague, called on the Council of Ministers to draw up a plan for the realisation in stages of an economic and monetary union. This work was done by a group of experts, chaired by Pierre Werner, the Prime Minister of Luxembourg. The resulting Werner Report (report by the Working Group chaired by Pierre Werner on economic and monetary union, 08 October 1970), which was published in 1970, proposed to create economic and monetary union in several stages by 1980. In parallel to these developments, the first mechanisms for intra-Community monetary and financial assistance were established in 1970 and 1971. (The Agreement of 09 February 1970 among the EEC central banks on the establishment of a short-term monetary support mechanism; and the Decision of the Council of Ministers of 22 March 1971 on the creation of a machinery for medium-term financial assistance among the EEC Member States.) In March 1971 the Member States agreed to realise an economic and monetary Union (Resolution of the Council and of the Representatives of the Governments

of the Member States of 22 March 1971 on the attainment by stages of economic and monetary union in the Community). As part of the first stage, they established a Community system for the progressive narrowing of the fluctuation margins of the members' currencies. This system, which became known as the 'Snake' (Under the snake, the spot exchange rates of the participating currencies were to be kept within a band of 2.25%, compared with a theoretically possible spread of 4.5% resulting from each currency's fluctuation margin of ±2.25% around its central rate vis-à-vis the US Dollar (snake in the tunnel). The respective maximum limits of fluctuation were to be defended by intervention in US dollars and Community currencies. On 19 March 1973 the fluctuation margins vis-à-vis the US Dollar were suspended and the snake fluctuated freely), was put into operation in April 1972. In 1973 the European Monetary Cooperation Fund (EMCF; The EMCF was set up under Regulation (EEC) No 907/73 of the Council of 03 April 1973 establishing a European Monetary Cooperation Fund. Under Article 2 of this Regulation, the EMCF was required to promote:- (i) the proper functioning of the progressive narrowing of the fluctuation margins of the Community currencies, (ii) intervention on the exchange markets, and (iii) settlements between central banks leading to a concerted policy on reserves. The EMCF was superseded by the EMI on 01 January 1994) was set up as the nucleus of a future Community organisation of central banks. And in 1974, with a view to enhancing coordination of economic policies, the Council adopted a Decision on the attainment of a high degree of convergence in the Community (Council Decision 74/120/EEC of 18 February 1974 on the attainment of a high degree of convergence of the economic policies of the Member States of the European Economic Community) and a Directive on stability, growth and full employment (Council Directive 74/121/EEC of 18 February 1974 on stability, growth and full employment in the Community). Yet, by the mid-1970s the process of integration had lost momentum under the pressure of divergent policy responses to the economic shocks of the period. The 'snake' became an exchange rate mechanism among the Deutsche Mark, the Benelux currencies and the Danish Krone (for a while two non-Community currencies – the Swedish Krona and Norwegian Krone – were also part of the system). The other Community currencies remained outside the system for all or most of its existence. (The Pound Sterling and the Irish Pound participated in the system from April to June 1972 and the Italian Lira from April 1972 to February 1973. The French Franc, which had joined the system at the outset, was withdrawn in February 1974; it entered the snake again in July 1975 and left the mechanism definitively in November 1976) The EMCF turned out to be an empty shell with limited 'bookkeeping' tasks:- because the legal basis of the EMCF brought it under the control of the Community institutions, the Member States and their central banks were reluctant to assign it policy functions. The Realisation Of EMU And The Changeover To The Euro:- Stage One of EMU:- on the basis of the Delors Report, the European Council decided in June 1989 that the first stage of the realisation of economic and monetary union should begin on 01 July 1990. This was the date on which, in principle, all restrictions on the movement of capital between Member States were to be abolished. At this time, the Committee of Governors of the central banks of the Member States of the European Economic Community was given additional responsibilities, which were set out in a Council Decision of 12 March 1990 (Council Decision 90/142/EEC of 12 March 1990 amending Council Decision 64/300/EEC on cooperation between the central banks of the Member States of the European Economic Community). They included holding consultations on, and promoting the coordination of, the monetary policies of the Member States, with the aim of achieving price stability. In view of the relatively short time available and the complexity of the tasks involved, the Committee of Governors initiated the preparatory work for Stage Three of EMU as soon as the Maastricht Treaty had been signed. The first step was to identify all the issues that should be examined at an early stage and establish a work programme by the end of 1993. Then it was necessary to define appropriate mandates for the existing sub-committees (The Monetary Policy Sub-Committee, the Foreign Exchange Policy Sub-Committee and the Banking Supervisory Sub-Committee) and the new working groups which had been set up to look into specific issues (Working Groups on Accounting Issues, Banknotes, Information Systems, Payment Systems and Statistics; a Working Group of Legal Experts was set up in 1996). Stage Two Of EMU:- the establishment of the EMI on 01 January 1994 marked the start of Stage Two of EMU. It was created as a transitory body to undertake the preparatory work for Stage Three of EMU, while the conduct of monetary and exchange rate policy in the European Union remained the preserve of national authorities. The Committee of Governors ceased to exist but was effectively reconstituted as the Council (governing body) of the EMI. The two main tasks of the EMI were:- (i) to strengthen central bank cooperation and monetary policy coordination; (ii) to make the necessary preparations for establishing the ESCB, for the conduct of the single monetary policy and for creating a single currency in the third stage of EMU. In December 1995 the Madrid European Council confirmed that Stage Three of EMU would start on 01 January 1999. It also named the single currency to be introduced at the start of Stage Three the 'Euro' and announced the sequence of events leading up to its introduction. (Madrid European Council (1995), 'The scenario for the changeover to the single currency'.) This scenario was mainly based on detailed proposals developed by the EMI (EMI (1995), 'The changeover to the single currency'), which had also used the term 'Changeover to the Euro' instead of 'introduction of the Euro' (European Commission (1995), 'One Currency for Europe, Green Paper on Practical Arrangements for the Introduction of the Single Currency') to reflect the nature of the transition to the single currency. The EMI's changeover scenario recommended a transitional period of three years starting from 01 January 1999 to accommodate differences in the pace with which the various groups of economic agents (e.g., the financial sector, the non-financial corporate sector, the public sector, the general public) would be able to adapt to the single currency. Also in December 1995, the EMI was given the task of carrying out preparatory work on the future monetary and exchange rate relationships between the Euro and the currencies of the non-Euro area EU countries. One year later, in December 1996, the EMI presented a report to the European Council, which subsequently formed the basis of a European Council Resolution on the principles and fundamental elements of the new exchange rate mechanism (ERM II; Resolution of the European Council on the establishment of an exchange rate mechanism in the third stage of economic and monetary union, Amsterdam, 16 June 1997), which was adopted in June 1997. In December 1996 the EMI presented to the European Council, and to the public, the design series that had won the Euro banknote design competition and that would therefore feature on the banknotes to be put into circulation by the ESCB on 01 January 2002. The design of the Euro coins which were to be issued by the EU Member States was endorsed by the European Council in 1997. In June 1997 the European Council adopted the Stability and Growth Pact, which complements the Treaty provisions and aims to ensure budgetary discipline within EMU. The Pact consists of three instruments:- a European Council Resolution (Resolution of the European Council on the Stability and Growth Pact, Amsterdam, 17 June 1997) and two Council Regulations (Council Regulation (EC) No 1466/97 of 07 July 1997 on the strengthening of the surveillance of budgetary positions and the surveillance and coordination of economic policies, and Council Regulation (EC) No 1467/97 of 07 July 1997 on speeding up and clarifying the implementation of the excessive deficit procedure). It was supplemented and the respective commitments enhanced by a Declaration of the Council in May 1998. The Member States implemented policies to fulfil the economic 'convergence criteria' (Article 121 of the EC Treaty) and revised extensively their national legislation to bring it into line with the requirements of legal convergence (Article 109 of the EC Treaty). The adaptations concerned in particular the legal and statutory provisions for their central banks with a view to their integration into the Eurosystem. The final decisions on EMU were taken starting in May 1998. On 02 May 1998 the EU Council, meeting in the composition of the Heads of State or Government, decided unanimously that 11 Member States had fulfilled the conditions necessary to adopt the single currency on 01 January 1999. These countries (Belgium, Germany, Spain, France, Ireland, Italy, Luxembourg, the Netherlands, Austria, Portugal and Finland) would therefore participate in Stage Three of EMU. (Council Decision (98/317/EC) of 03 May 1998 in accordance with Article 109(4) of the Treaty.) Given their special status, Denmark and the United Kingdom 'opted out' of Stage Three of EMU, and Greece and Sweden were not deemed to have met the conditions for adopting

the single currency. The Heads of State or Government also reached a political understanding on who to appoint as members of the future ECB's Executive Board. At the same time, the ministers of finance of the Member States adopting the single currency and the governors of the national central banks of these Member States agreed, together with the European Commission and the EMI, that the current ERM bilateral central rates of the currencies of the participating Member States would be used to determine the irrevocable conversion rates for the Euro. (Joint Communiqué of 02 May 1998 on the determination of the irrevocable conversion rates for the Euro.) On 25 May 1998 the President, Vice-President and the four other members of the ECB's Executive Board were formally appointed by common accord of the governments of the then 11 participating Member States at the level of the Heads of State or Government. In line with Article 50 of the Statute of the ESCB, their appointment was made on the basis of a recommendation from the ECOFIN Council and opinions from the European Parliament and the Council of the EMI (which acted instead of the Governing Council of the ECB not yet in place). The six members of the Executive Board were appointed with effect from 01 June 1998 when the ECB was established. The EMI had completed its tasks and went into liquidation in line with Article 123(2) of the EC Treaty. The ECB, as liquidator of the EMI, inherited not only an extensive body of preparatory work but also the whole EMI infrastructure, including a body of staff which had been prepared to undertake its duties at the ECB. This greatly helped the ECB to make the Eurosystem operational within only seven months, i.e. in time for the start of Stage Three, and to complete the preparations for the Euro cash changeover by 01 January 2002. Stage Three of EMU:- the third and final stage of EMU began on 01 January 1999. The conversion rates of the currencies of the 11 Member States initially participating in Monetary Union were irrevocably fixed and the ECB took over responsibility for conducting the single monetary policy in the Euro area. In line with the legal framework established in secondary Community legislation by the EU Council, the Euro replaced the national currencies immediately, making them non-decimal sub-divisions of the Euro during the transitional period from 01 January 1999 to 31 December 2001. For the first three years, all agents were free to use either the Euro or its national sub-divisions for denominating claims and liabilities and for cashless payments (principle of 'no compulsion no prohibition'). However, Member States were entitled to oblige entities to use the Euro for the redenomination of tradable outstanding debt instruments, for trading in regulated markets and the working of payment systems. This scope was used extensively by the Member States in the run-up to Stage Three of EMU. Furthermore, the EMI announced that the Eurosystem would conduct its monetary policy operations exclusively in Euro and that the Euro would be the single denominator for the functioning of the TARGET system. Against this background, the financial sector made extensive preparations for operating in the integrated financial markets as from the start of Stage Three. The financial industry was itself interested in a rapid and comprehensive changeover of financial markets to the Euro and no group of market participants wished to be left behind by its competitors. With the assistance of the EMI, financial market associations agreed on conventions for unifying market practices, and leading interest rate indicators (e.g., the EURIBOR and the EONIA) were developed. (A further leading interest rate indicator, the EUREPO, was established in early 2002.) Thanks to these preparations, the financial markets were able to convert to the Euro at once as from the start of Stage Three of EMU. Trading in financial markets was exclusively in Euro and the bulk of outstanding tradable debt instruments was converted to Euro. All large-value cross-border payment systems functioned in Euro. Not only was the changeover of the financial market immediate, but it also went very smoothly. Whereas the corporate sector gradually converted to the Euro during the transitional period, individuals – in the absence of Euro-denominated cash – did not at first use the Euro much for transactions. That would all change of course with the introduction of Euro banknotes and coins on 01 January 2002. On 01 January 2001 Greece joined the Euro area – bringing the number of participating countries to 12 – and the Bank of Greece became part of the Eurosystem. Under the procedure laid down in Article 122(2) of the EC Treaty, the EU Council had decided on 19 June 2000 that Greece fulfilled the conditions for adopting the Euro. (Council Decision 2000/427/EC of 19 June 2000 in accordance with Article 122(2) of the Treaty on the adoption by Greece of the Single Currency in 2001.) The conversion rate between the Euro and the Greek Drachma had been pre-announced in a Council Regulation (Council Regulation (EC) No 1478/2000 of 19 June 2000) on the same day. The introduction of the Euro was completed with the cash changeover on 01 January 2002:- Euro banknotes and coins were put into circulation and the residual function of the national currencies as non-decimal sub-divisions of the Euro became obsolete. Cash denominated in the legacy currencies ceased to be legal tender by the end of February 2002 and, from that date, the Euro banknotes and coins became the sole legal tender in the countries of the Euro area. EMU was created within the framework of the European Communities, which itself has increased significantly since its inception in 1952. The European Union now numbers 25 Member States, with the most recent addition of ten central and eastern European and Mediterranean countries on 01 May 2004. Two other eastern European countries, Bulgaria and Romania, signed the Accession Treaty in April 2005 and are set to join the EU in 2007. Negotiations with two further candidates, Croatia and Turkey, started in autumn 2005. Since participation in the euro area requires an EU Member State to fulfil the necessary conditions for adopting the Euro, new EU Member States do not immediately join the Euro area. However, they are committed to the objectives of EMU and their respective NCBs become ex officio members of the ESCB on the date of accession and prepare themselves for their eventual integration into the Eurosystem. Slovenia will be the first of the ten new EU Member States to participate in the Euro area, as from 01 January 2007. Under the procedure laid down in Article 122(2) of the EC Treaty, the EU Council decided on 11 July 2006 that Slovenia fulfilled the conditions for adopting the Euro. (Council Decision 2006/495/EC of 11 July 2006 in accordance with Article 122(2) of the Treaty on the adoption by Slovenia of the single currency on 01 January 2007.) The conversion rate, which will take effect on 01 January 2007, has been set at 239.640 Slovenian Tolars to one Euro. (Council Regulation (EC) No 1086/2006 of 11 July 2006 amending Regulation (EC) No 2866/98 on the conversion rates between the euro and the currencies of the Member States adopting the Euro.) The Monetary And Economic Aspects Of EMU:- The monetary and economic aspects of EMU have been organised differently. Whereas monetary and exchange rate policies have been denationalised and centralised at the Community level, the responsibility for economic policy has remained with the Member States although national economic policies are to be conducted within a Community framework for cooperation in macroeconomic policies. The differences in organisation respect the principle of subsidiarity (Article 5 of the EC Treaty), i.e. the allocation of policy responsibilities to the Community level is only justified:- (i) if the Member States cannot sufficiently achieve the given objectives by themselves; or (ii) if the Community, by reason of the scale or effects of the proposed action, is better placed to achieve the objectives. As explained below, centralisation at the Community level is justified for monetary and exchange rate policy because a single currency and national monetary and exchange rate policies are mutually exclusive. The situation is different for economic policies. To the extent that the Community framework ensures that national economic policies are actually in line with the aforementioned objectives of EMU, the conduct of such policies is best located at the national level. Thus, even a fully integrated economic zone like the Euro area does not provide a compelling argument for a full transfer of economic policy responsibilities to the Community. Differentiated Integration:- EU membership does not automatically imply participation in the Euro area. Besides the aforementioned special status of Denmark and the United Kingdom, participation in the Euro area requires a Member State to fulfil the conditions necessary for the adoption of the single currency. The conditions necessary for the adoption of the single currency are a high degree of sustainable convergence (economic convergence) and the compatibility of national legislation with the Treaty provisions on EMU (legal convergence). Under Article 121(1) of the EC Treaty, the achievement of a high degree of sustainable economic convergence is assessed by reference to the following criteria:- (i) a high degree of price stability; (ii) the sustainability of the government's financial position; (iii) the observance of the normal fluctuation margins provided for by the exchange rate mechanism of the European Monetary System for at least two years; (iv) the durability of convergence achieved by the Member

State and of its participation in the exchange rate mechanism of the European Monetary System, as reflected in the long-term interest rate levels. Before a Member State can join the Euro area, it must prove that it has fulfilled these criteria in a lasting manner. This provision ensures that EMU remains in line with its fundamental objectives and guiding principles, in particular stable prices, sound public finances and monetary conditions, and a sustainable balance of payments. The requirement of legal convergence obliges each Member State to adapt national legislation to ensure the independence of the respective NCB and to integrate it into the ESCB. The European Commission and the ECB (in 1998, the EMI) independently assess both economic and legal convergence and report their findings to the EU Council (meeting in both the Economic and Financial Affairs (ECOFIN) composition and the composition of the Heads of State or Government), which takes the final decision. In the broader sense an economic and monetary union. Participating countries are obligated to pursue a common economic policy and use a single currency (Euro). Scheduled by EU decree to enter into force on 1999-January-01. The European Monetary Union (EMU) is a failed experiment and should be put to rest. It was a good idea in principle, but not in practice. Like the saying goes, the road to Hell is paved with good intentions. I (Michael P. Gardner, Jacksonville, State of Florida (FL), the United States) understand this proverb, what I do not understand is, why some nations want to go down this road, and join this disastrous endeavor. Let's look at some of the current economic conditions in the EU according to Eurostat. GDP growth rate in 2013 is 0.1%, compared to 2007 3.2%. Retail sales have steadily declined since 2000 despite a near zero European Central bank benchmark interest rate. Unemployment is currently at 12%, the highest since EU statistics were compiled. Consumer spending in 2012 is at 2007 levels. By almost every measure, the people of the EU are worse off than before unification. Greece (27% unemployment) and Spain (26% Unemployment) are much worse off. In the case of Bulgaria, just being pegged to the Euro has required them to enact severe austerity measures. This has brought down the Bulgarian government. According to Danish economist Lars Christensen, 'The Bulgarian Government has been heroic. But the fact is there hasn't been any real growth for five years. They have lost their policy levers and are importing a monetary crunch from the ECB's tight policies and a credit crunch due to links to Greece. They now face years of deflation'. This is merely the latest casualty in a series of EMU countries like Greece, Portugal, and Spain. These countries have given up their economic sovereignty for what? They have an economic union that has been devastating to their countries. It is one thing to have a dire economic situation in your country and be able to make adjustments and control your own destiny. It is quite another to have a foreign authority tell you what you must do, and when you comply, it not only does not correct the problem, but actually makes it worse. I don't want to blame all of the economic problems in Europe on the EMU. Some of it is cyclical and some of it because of demographics. Europe is getting older and there are less young people to stimulate economic growth and create jobs. But as Lars Christensen, states 'Turkey is doing much better. So is Ukraine. So is Moldova'. How can these economies be doing better when they are operating under the same conditions and demographics as the rest of Europe. He answers that question by saying 'In fact, the lesson is that if you want to prosper as a developing economy on Europe's fringes, keep well-clear of the EMU Project'. Ambrose Evans-Pritchard, financial writer for the UK Telegraph, reports what the European commission said in its annual report. 'A string of countries on the periphery (either in EMU or pegged) seem trapped in a downward spiral of falling output, fast rising unemployment and eroding disposable incomes'. Evans-Pritchard states 'the wave of austerity policies raise important questions about the viability of Europe's welfare states'. The current economic situation in Europe requires each country to make adjustments based on what is best for them. Unfortunately, that impossible if your country is pegged to the Euro, or you are in the EMU. You must do what Brussels tell you to do, like it or not. In this atmosphere, I cannot understand why countries like the Turkey, Serbia, and Macedonia want to be a part of this disaster. There is no evidence to suggest that it improves a countries economic situation, and, may in fact, make it worse. The reality is that this economic union (pegged or EMU) has not worked and will, in all probability, collapse in the future. New EU candidate countries need to ask themselves if they want to be part of this debacle, or safely sit it out. / Европейский Монетарный Союз (EMC). в соответствии с Маастрихтским Трактатом о Европейском Союзе. EUROPEAN OPTION = ЕВРОПЕЙСКИЙ ОПЦИОН – European Option (European Style Option) is a buy or sell option which can be exercised only at maturity. Opposite:- American Option, or American Style Option. A type of option which allows the holder to exercise only on the expiry date. European Option is an option that may only be exercised on the date of expiry. Predominant in the London bullion market. Option which can only be exercised on the last day of trading, i.e. on maturity. The opposite of American-Style Option. An option that may be exercised only at the option's expiration date. European Option is an option that can only be exercised at the end of its life, at its maturity. European options tend to sometimes trade at a discount to its comparable American option. This is because American options allow investors more opportunities to exercise the contract. European options normally trade over the counter, while American options usually trade on standardized exchanges. A buyer of an European option that does not want to wait for maturity to exercise it can sell the option to close the position. European Option is an option that can only be exercised at expiry. / Европейский Опцион или Опцион Европейского Стиля (European Style Option) это опцион на покупку или продажу, который может быть исполнен только по его погашении. В противовес Американскому Опциону (American Option) или Опциону В Американском Стиле (American Style Option). Тип опциона, который позволяет его владельцу исполнить опцион только в дату прекращения признания. Опцион, который может быть исполнен только в дату прекращения признания. Доминирующий тип опционов на Лондонском рынке слитков. Опцион, который может быть исполнен только в последний день торговли, то есть по погашении. В противовес Опциону В Американском Стиле (American-Style Option). Опцион, который может быть исполнен только в момент своего прекращения признания (окончания срока действия).

EUROPEAN ORGANIZATION FOR TESTING AND CERTIFICATION = ЕВРОПЕЙСКАЯ ОРГАНИЗАЦИЯ ПО ИСПЫТАНИЯМ И СЕРТИФИКАЦИИ – The European Organization For Testing And Certification (EOTC) was created in April 1990 by the European Comminity Commission under a memorandum of agreement with CEN/CENELEC and the European Free Trade Association countries. EOTC promotes mutual recognition of test, test and certification procedures and quality systems within the European private sector for product areas or characteristics not covered by EC legislative requirements. The EOTC promotes mutual recognition of tests, test and certification procedures, and quality systems within the European private sector for product areas or characteristics not covered by EC legislative requirements. EOTC headquarters are in Brussels, Belgium.

THE EUROPEAN PALLET ASSOCIATION = ЕВРОПЕЙСКАЯ АССОЦИАЦИЯ ПО ПОДДОНАМ – The European Pallet Association (EPAL):- global economic structural changes always pose new challenges for the logistics industry. In view of both the automation of material flows and globalisation of commodity flows, all means of transportation, such as the EPAL-pallet, must meet ever-increasing expectations. This in turn requires stricter quality controls. EPAL (the European Pallet Association) guarantees the highest quality standard for EPAL-pallets throughout the world. EPAL was founded in 1991 to work with the European Railways to maintain a European-wide quality assurance and inspection standard for the EURO pallet. The EPAL is a European organization gathering the manufacturers, traders, repairers, users, conveyors of pallets known as EURO or EPAL of certified quality. This association does not have a lucrative goal. Its goal is to implement insurance-quality in the whole world according to homogeneous criteria's, including the

exchange of exchangeable EURO EPAL pallets. Its mission is to impose in an effective way the standard UIC 435.2/435.4 on the EURO EPAL pallets, to fix homogeneous criteria of exchange on the basis of standard UIC (short for the French:- Union Internationale des Chemins de fer, or International Union of Railways, is an international rail transport industry body) and finally to promote the interchangeability for ecological and economic reasons and also to set up circles of work for these tasks. The association is headquartered in Hagen, Germany. Xxxxx. The Euro-pallet goes back to the wooden pallets used in railway transport. In 1961 the European railways commissioned the standardization of a common pallet type under the auspices of the UIC. The actual inventor is unknown, but there are historic records of the effect – using the Euro-pallet it was possible to load railroad cars in just 10% of the time of earlier loading processes. In 1968 the association also specified a standard lattice box along with a standard lattice box pallet. Broken pallets are not swappable – they must be repaired or removed from the pool. Following the standardization most of the European industry switched over to use Euro-pallets with trucks, forklifts and high-rack warehouses optimized for their size. National associations developed framework agreements for pallet exchange in that freight would be delivered on Euro-pallets and be given the same number of Euro-pallets in return ('pallet for pallet'). The Euro-pallets are controlled by the association and the association takes care of repairing or removing old pallets from the pool. With the ongoing European integration, the European Pallet Pool allowed for pallet exchange even in cross-border dealings. With the success of the Euro-pallets, a number of replicas entered the market that used low-quality wood which splintered easily and were prone to mould. So the European railways, which own the trademarks for EUR/EPAL, created a separate standardization body. The European Pallet Association was founded in 1991, and the EUR and EPAL logo may only used by licensees of that organization. Globalization has made for a decline of the EUR/EPAL system since the EUR-pallets do not fit well into ISO containers. It is still the most widespread pallet type in the world, with an estimate of 350 to 500 million EUR-pallets being in circulation. One of the advantages is that the 800 mm width fits through normal doors (the most common DIN (short for the German:- Deutsches Institut für Normung e.V.; in English, the German Institute for Standardization) door type is 850 mm by 2 000 mm). Derivatives of the EUR-pallet have been developed for specific uses. The EUR-pallet – also EUR-1-pallet – was followed by the EUR-2-pallet and EUR-3-pallet, which are both 1 200 x 1 000 mm, which is close to the standard American pallet type of 40 x 48 inches. For use in retail stores, the EUR-6-pallet is half the size of the EUR-pallet, 600 x 800 mm. ISO standards have also been published for these Euro-pallet types. To accommodate EUR-pallets, there are derivative intermodal containers that are about 2 inches (5 cm) wider – these are commonly known as 'Pallet-Wide' Containers. These containers feature an internal width of 2 440 mm for easy loading of two 1 200 mm long pallets side by side – many sea shipping providers in Europe allow these, as overhangs on standard containers are sufficient to fit them in the usual interlock spaces. Especially the 45ft pallet-wide high-cube shortsea container has gained wide acceptance, as these containers can replace the 13.6 m swap bodies that are common for truck transport in Europe. The EU has started a standardization for pallet-wide containerization in the EILU (short for the European Intermodal Loading Unit) initiative. / Немецкий Институт по Стандартизации или, как это звучит на Немецком, Дойчэс Институт фюр Нормун Э.Фау. (Дэ.И.Эн.; Deutsches Institut für Normung EV (DIN)). Глобальные структурные изменения в экономике всегда преподносят новые вызовы индустрии логистики. Вследствие как автоматизации материальных потоков, так и глобализации сырьевых потоков, все средства транспортировки, в том числе и такие как поддон ЕАП (EPAL-pallet), должны удовлетворять опережающим ожиданиям. Это, в свою очередь, требует ужесточения контроля за качеством. ЕАП (Европейская Ассоциация по Поддонам) гарантирует стандарт высочайшего качества для поддонов ЕАП по всему миру. ЕАП была основана в 1991 для работы с Европейскими Железными Дорогами с целью поддержания гарантии качества и стандарта инспекции ЕВРО поддонов (EURO pallets) по всей Европе. ЕАП является Европейской организацией, объединяющей изготовителей, торговцев, ремонтников, пользователей, перевозчиков поддонов, известных под сертифицированным качеством, а проще говоря, под марками качества ЕВРО (EURO) или ЕАП (EPAL). Эта ассоциация не ставит перед собой задачи получения прибыли. Она лишь преследует цель претворения в жизнь гарантируемого качества во всём мире в соответствии с однородными критериями, включающими и обмен обмениваемыми ЕВРО поддонами ЕАП. Основной миссией ассоциации является навязывание эффективными методами стандарта UIC 435.2/435.4 на ЕВРО поддоны ЕАП, утверждение однообразного критерия обмена на основе стандарта UIC, и, в конце концов, продвижение взаимозаменяемости из соображений экологичности и экономичности, а также установление круга работ для решения этих задач. UIC (Union Internationale des Chemins de Fer) в переводе с Французского языка означает Международный Союз Железных Дорог (МСЖД) или, как это звучит на Французском языке по месту регистрации союза, Юньён Этэрнасьёналь дэ Шмэн дё Фэр (Ю.И.Сэ.). Штабквартира ассоциации расположена в Хагене (Hagen), Германия.

EUROPEAN PALLET POOL = ЕВРОПЕЙСКИЙ ПУЛ ПО ПОДДОНАМ (или ЕВРОПЕЙСКОЕ ОБЪЕДИНЕНИЕ ПО ПОДДОНАМ) – The European Pallet Pool is a pool of Euro pallets, railway pool pallets, which are exchanged by 19 different European railway companies. These are handled under unified terms and exchanged under transient ownership. The EUR-pallet – also Euro-pallet or EPAL-pallet – is the standard European pallet as specified by the European Pallet Association (EPAL). Pallets conforming to the standardization are eligible for the European Pallet Pool (EPP) – the EPAL pallet system allows for an exchange as 'pallet for pallet'. The EUR/EPAL-pallet is 1 200 x 800 x 144 mm; it is a four-way pallet made of wood that is nailed with 78 special nails in a prescribed pattern. Only EPAL-licensed makers may produce EUR/EPAL-pallets. Pool for the exchange of standard size pallets (the so-called Europallets) in European cargo traffic, formed in 1961 by a number of European rail administrators. Harry F. Jacobi, EPAL's CEO, said that despite considerable growth, the European Pallet Pool and its 800 x 1 200 mm design has encountered resistance in some markets. Jacobi explained, 'In Great Britain, France and the Netherlands people favor the pallet 1 000 x 1 200 mm whereas the most popular pallet size in the United States is 1 219 x 1 016 mm (48 x 40 inch) and 1 100 x 1 100 mm in Asia'. / Хари Эф. Дьжакоби (Harry F. Jacobi). Группа по взаимообмену поддонов стандартных размеров (так называемых Европоддонов), используемых в грузоперевозках в Европе, созданная в 1961 руководством ряда Европейских железных дорог.

EUROPEAN PARLIAMENT = ЕВРОПЕЙСКИЙ ПАРЛАМЕНТ – The European Parliament is the only directly-elected body of the European Union. The 736 Members of the European Parliament are there to represent you, the citizen. They are elected once every five years by voters right across the 27 Member States of the European Union on behalf of its 500 million citizens. The work of the European Parliament is important because in many policy areas, decisions on new European laws are made jointly by Parliament and the Council of Ministers, which represents Member States. Parliament plays an active role in drafting legislation which has an impact on the daily lives of its citizens:- For example, on environmental protection, consumer rights, equal opportunities, transport, and the free movement of workers, capital, services and goods. Parliament also has joint power with the Council over the annual budget of the European Union. European Parliament, the European institution consists of 785 directly elected representatives of the citizens of the EU Member States. Although it mainly has consultative powers, it also shares budgetary powers with the EU Council in voting on the annual budget. It is also associated with the EU Council in the making of European laws and controls the European Commission. European Parliament is a Community institution that comprises 732 representatives of the citizens of the Member States as of the parliamentary term 2004–09. It contributes to the legislative process, although with different prerogatives according to the procedures through which EU law is to be enacted. In the framework of Economic and Monetary Union (EMU), Parliament has mainly consultative powers. However, the Treaty establishes certain procedures for the democratic accountability of the European Central Bank (ECB) to

Parliament (presentation of the Annual Report, general debate on monetary policy, testimonies before the competent parliamentary committees). / Европейский Парламент является консультативным органом Европейского Экономического Сообщества (ЕЭС). С 1979 он избирается прямыми всеобщими выборами населением стран участниц ЕЭС сроком на 5 лет. Европейский Парламент начал своё существование в 1950-х. С 1979 депутаты парламента избираются на основе прямых непосредственных выборов. Выборы в парламент происходят каждые 5 лет, а право голоса имеет каждый гражданин ЕС, который зарегистрирован как избиратель. Парламент имеет абсолютно консультационный характер. Выполняет три главные функции:- (i) разделяет с Советом законодательную власть; (ii) осуществляет демократический надзор над всеми учреждениями ЕС, а особенно над Комиссией; и (iii) делит с Советом компетенции в сфере принятия бюджета ЕС и может в связи с этим влиять на расходы, осуществляемые ЕС.

THE EUROPEAN PATENT CONVENTION = ЕВРОПЕЙСКАЯ КОНВЕНЦИЯ О ПАТЕНТАХ – The Convention on the Grant of European Patents of 1973-October-05, commonly known as the European Patent Convention (EPC), is a multilateral treaty instituting the European Patent Organisation and providing an autonomous legal system according to which European patents are granted. The term European patent is used to refer to patents granted under the European Patent Convention. However, after grant a European patent is not a unitary right, but a group of essentially independent nationally-enforceable, nationally-revocable patents, subject to central revocation or narrowing as a group pursuant to two types of unified, post-grant procedures:- a time-limited opposition procedure, which can be initiated by any person except the patent proprietor, and limitation and revocation procedures, which can be initiated by the patent proprietor only. The EPC provides a legal framework for the granting of European patents, via a single, harmonized procedure before the European Patent Office. A single patent application, in one language, may be filed at the European Patent Office at Munich, at its branches at The Hague or Berlin or at a national patent office of a Contracting State, if the national law of the State so permits. There is currently no single, centrally enforceable, European Union-wide patent. Since the 1970s, there has been concurrent discussion towards the creation of a Community patent in the European Union. In May 2004 however, this has led to a stalemate. The European Patent Convention (EPC) is an agreement between European nations to centralize and standardize patent law and procedure. The EPC, which took effect in 1977, established a single 'European patent' through application to the European Patent Office in Munich, Germany. Once granted, the patent matures into a bundle of individual patents – one in each member country. The European Patent Convention (Munich Convention), signed in Munich in October 1973, establishes a uniform patenting system for all countries signatory to the Convention. The European patenting procedure consists of two parts; firstly, the search followed by publication of the application, and secondly, the examination which is only conducted after a formal request by the applicant. The applicant can designate as many contracting states as he wants at the moment of filing the application or at the moment the Euro-PCT enters the regional (European) phase. A granted European patent is protected under national law in each of the countries designated in the application. Twenty-one countries attended the Munich Diplomatic Conference in 1973 on which the Convention is based. Up to 1997, eighteen countries were Member States of the European Patent Convention:- Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Liechtenstein, Luxembourg, Monaco, Portugal, The Netherlands, Spain, Sweden, Switzerland, and The United Kingdom. In December 1997, the Cypriot parliament approved the country's accession to the EPC and since April 1998 Cyprus has been the nineteenth country of the organisation. Norway has signed the Convention but not yet ratified it. On November 1997 the former Yugoslav Republic of Macedonia became the sixth country to join the extension system after Albania, Latvia, Lithuania, Romania and Slovenia. The European Patent Convention (EPC) created the European Patent Office (EPO), which is based in Germany. The convention currently applies to most European Economic Community member states and to several other European countries. The EPC provides for a single application in English, French or German, on which a central search and examination is carried out. Once the patent is accepted for grant, and the appropriate fees and translations are submitted, the single application is converted into a bundle of individual national patents. The system also allows an opposition to the grant to be lodged at the EPO within nine months from patent grant. Subsequent issues of validity, however, must be dealt with on a country-by-country basis by individual national courts. See also The Berne Convention, The Madrid Agreement, The Madrid Protocol, The Paris Convention, The Patent Cooperation Treaty, and Trade-Related Aspects of Intellectual Property Rights. / Трактат о Сотрудничестве в Патентной Сфере (The Patent Cooperation Treaty), и .

EUROPEAN PRIVATE EQUITY & VENTURE CAPITAL ASSOCIATION = ЕВРОПЕЙСКАЯ АССОЦИАЦИЯ ЧАСТНЫХ СОБСТВЕННЫХ СРЕДСТВ И ВЕНЧУРНОГО КАПИТАЛА – The European Private Equity and Venture Capital Association (EVCA) is a member-based, non-profit trade association and was established in 1983 and is based in Brussels. EVCA was very provisionally set up on 1983-August-31 – without officers, secretarial support, premises or a printed constitution, but with a lot of enthusiasm. EVCA's inaugural general meeting was held on 1983-November-09, with 36 full members and 7 associate members. EVCA represents, promotes and protects the interests of the European private equity and venture capital industry. With over 1 200 members in Europe, EVCA's role includes representing the interests of the industry to regulators and standard setters; developing professional standards; providing industry research; professional development and forums, facilitating interaction between its members and key industry participants including institutional investors, entrepreneurs, policymakers and academics. EVCA's activities cover the whole range of private equity, from venture capital (seed, start-up and development capital), to buyouts and buyins. Representing the European private equity and venture capital industry towards a variety of stakeholders:- (i) on behalf of its members, EVCA undertakes public policy activities and maintains a dialogue with policy institutions and regulatory bodies at European, international and national levels, often in coordination with national trade associations; and (ii) it promotes and increases the understanding of the key roles that private equity and venture capital and entrepreneurship play in creating and protecting jobs and enriching the European economy. Raising professional standards:- EVCA is at the forefront of developing guidelines for professional standards and best practice, contributing to harmonisation across the industry. EVCA has produced a range of widely-used guidelines for the professional conduct of private equity and venture capital fund managers, both in respect of the management of their activities and in their relationships with investors and portfolio companies. Networking opportunities:- (i) EVCA provides opportunities for members from across Europe to meet together, exchange information and ideas, and discuss the latest industry trends and issues; and (ii) throughout the year EVCA holds regular networking events with leading practitioners and industry participants from all over Europe, including the Investors' Forum, the CFO-COO Summit (Chief Financial Officer–Chief Operating Officer Summit), the Venture Capital Forum and Buyout Forum as well as workshops on ICT, life sciences, buyouts and corporate venturing topics. Enhancing Professional Development:- since its foundation in 1987, the EVCA Institute has built a reputation as Europe's premier provider of courses for private equity practitioners. The Institute's comprehensive range of private equity management training courses is designed to enhance the professional skills and expertise of a private equity practitioner at all stages of his or her career. The group-based courses provide an opportunity to network with peers from across Europe and to profit from the experience of instructors drawn from leading senior industry professionals and academics. Conducting and publicising industry research:- EVCA conducts and commissions a wide variety of private equity and venture capital research. Through its partnerships with PEREP Analytics™ (former Pan-European statistics platform is no longer active) and Thomson Reuters, it collects and publishes quarterly and annual statistics, based on rigorous and transparent methodologies, covering industry activity and performance. EVCA members have the EVCA Library and Research Helpdesk at their disposal, with access to industry

data and information at no extra cost. The European Private Equity & Venture Capital Association (EVCA) is an association based in Brussels, Belgium which represents and promotes the interests of the European private equity and venture capital industry. Its role includes arranging contacts for companies seeking private equity providers. / Томсэн Ройтас (Thomson Reuters).

EUROPEAN RESEARCH COORDINATION AGENCY = ЕВРОПЕЙСКОЕ АГЕНТСТВО ПО КООРДИНАЦИИ ИССЛЕДОВАНИЙ – The European Research Coordination Agency (EUREKA) coordinated advanced technology projects being carried out by European industry. Created on 1985-July-17, EUREKA includes the European Community countries, plus Austria, Finland, Iceland, Norway, Sweden, Switzerland, and Turkey. Headquartered in Brussels, Belgium. Its objectives are the strengthening of collaborations betweet enterprises and universities in high-end technology, in order to strengthen the productivity and competitivity of Europe's economy on world markets. EUREKA supports the competitiveness of European companies through international collaboration and in creating links and networks for innovation. The objective is to bring high quality research and development efforts to the market and to use the multiplying effects of cooperation. The wider objective is to advance and improve the quality of life. Launched in 1985, EUREKA is a framework through which industry and research institutes from European countries and the European Commission develop and exploit the technologies crucial to global competitiveness and a better quality of life. EUREKA currently (in 2018) has 34 full members:- Austria, Belgium, Croatia, Cyprus, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Latvia, Lithuania, Luxembourg, the Netherlands, Norway, Poland, Portugal, Romania, the Russian Federation, Serbia and Montenegro, Slovak Republic, Slovenia, Spain, Sweden, Switzerland, Turkey, the United Kingdom and the European Union. In addition, three countries (Albania, Bulgaria and Ukraine) participate in EUREKA projects through a network of National Information Points (NIPs). Morocco gained the Associate Country status in 2003. Compared to the pre-competitive projects supported under the EU Framework Programmes for research and technology development, EUREKA projects concentrate on the development of marketable products and services. Projects are generated on a 'bottom-up' basis with the participants deciding the objectives of the project, who is involved, who runs the project, the contribution of each of the partners, and how the results are used. EUREKA does not provide direct financial support for projects – this is the responsibility of the EUREKA member. Subdivision:- Projects are currently being carried out under the 12 technological areas covered by EUREKA:- Biotechnology; Telecom; ICT; Energy; Environment; Advanced materials; Robotics; Transport; Aeronautics; Automotive; Security; and Multimedia. Implementation:- EUREKA is a decentralised cooperation structure with National Project Coordinators (NPCs) located in each of the member countries. From project conception to completion, the NPCs are the primary source of contact and assistance for project developers. NPCs can also help companies or research organisations who wish to participate in on-going EUREKA projects. To receive the EUREKA label, a project proposal must:- (a) Demonstrate innovation and be aimed at developing a new product, process or service with market potential; (b) Involve partners (independent organisations) from at least two EUREKA member countries; (c) Aim to develop a significant technological advance in its sector and a marketable product, process or service for civilian use; (d) The participants must be technically and managerially qualified to conduct the project with access to necessary financial resources. Interested organisations can join already existing projects or submit new ones. The steps to be followed when establishing a new EUREKA project include:- (i) Drafting a project proposal and identification of partners:- the National Project Coordinator assists with the completion of a 'Project Suggestion Form' and helps to locate potential partners in other EUREKA countries. (ii) Developing and proposing the project:- once a project consortium is established, the scope, objectives and structure of the project have to be defined. An application for EUREKA status must then be made by filling in what is known as the '18-Point Sheet'. The NPCs can provide assistance with this. (iii) Approval of the proposal by the NPC:- completed project proposals are evaluated by the different NPCs of each of the partners participating in the consortium and a decision is taken on whether to grant the EUREKA label. This takes on average 2–3 months. (iv) Circulation of the project proposal throughout NPC network:- during a 45-day circulation period, the project is sent to all NPCs who may bring it to the attention of other potential participants (although the decision to expand the consortium rests with the original members). During this period, many of the involved governments will begin taking the 'EUREKA nature' of the project into account when considering the possibility of public funding. All project proposals are officially endorsed by the EUREKA High Level Group (HLG), which consists of one representative per member country. They are also announced at the annual EUREKA ministerial conference. The Ministerial conference is responsible for presenting new initiatives and deciding on applications for membership. EUREKA does not provide direct financial support for projects. However, the granting of a EUREKA label enhances the likelihood of a project receiving financial support from national governments or other sources. The type of support granted by member countries differs from country to country and from project to project and may take the form of grants or loans. Many financial institutions take the EUREKA status of a project into account when considering loan applications. A small EUREKA secretariat is based in Brussels which acts as a clearing house for project information, maintains the EUREKA database, and provides support for contacts within the EUREKA network and for the EUREKA chairmanship (which rotates between the EUREKA member governments). Close cooperation between European Union research and technology development activities and EUREKA was assured under the Fourth and Fifth Framework Programmes by specific measures implemented under the International Cooperation programme (INCO). Several of the specific programmes also contained provisions for coordination with EUREKA. The cooperation continues under the Sixth RTD Framework Programme (2002–06). 2011:- EUREKA brings now together 40 members including the European Union. EUREKA is an intergovernmental network launched in 1985, to support market-oriented R&D (short for the Research And Development) and innovation projects by industry, research centres and universities across all technological sectors. It is composed of 39 members, including the European Community. With its flexible and decentralised network, EUREKA offers project partners rapid access to skills and expertise across Europe and national public and private funding schemes. EUREKA currently counts 39 members including European Communities. Several European countries participate in EUREKA cooperation through a network of National Information Points (NIPs). The affiliation known as Associated Country Status was initiated as part of EUREKA's proactive strategy to enhance cooperation with countries outside of Europe judged to have scientific and research potential. EUREKA members (since):- Austria (1985), Belgium (1985), Croatia (2000), Cyprus (2002), Czech Republic (1995), Denmark (1985), Estonia (2001), Finland (1985), former Yugoslav Republic of Macedonia (2008), France (1985), Germany (1985), Greece (1985), Hungary (1992), Iceland (1985), Ireland (1985), Israel (2000), Italy (1985), Latvia (2000), Lithuania (1999), Luxembourg (1985), Malta (2006), Monaco (2005), the Netherlands (1985), Norway (1985), Poland (1995), Portugal (1985), Romania (1997), Russian Federation (1993), San Marino (2005), Serbia (2002), Slovak Republic (2001), Slovenia (1994), Spain (1985), Sweden (1985), Switzerland(1985), Turkey (1985), Ukraine (2006), United Kingdom (1985), European Commission (1985). EUREKA NIPs:- Albania, Bosnia and Herzegovina,Bulgaria. EUREKA Associated country:- South Korea. 1985:- launch of EUREKA initiative on 17 July 1985. EU and 18 countries sign Hannover Declaration on 06 November 1985. First 10 projects annoinced. EUREKA was established by a Conference of Ministers of 17 countries and Members of the Commission of the European Communities, meeting in Paris on 17 July 1985. Since its inception in 1985, substantial public and private funding has been mobilised to support the research and development carried out within the EUREKA framework.

EUROPEAN SPACE AGENCY = ЕВРОПЕЙСКОЕ КОСМИЧЕСКОЕ АГЕНТСТВО – The European Space Agency (ESA) is Europe's gateway to space. Its mission is to shape the development of Europe's space capability and ensure that investment in space continues to deliver benefits to the citizens of Europe and the world. ESA is an international organisation with 18 Member States. By coordinating

the financial and intellectual resources of its members, it can undertake programmes and activities far beyond the scope of any single European country. ESA's job is to draw up the European space programme and carry it through. ESA's programmes are designed to find out more about Earth, its immediate space environment, our Solar System and the Universe, as well as to develop satellite-based technologies and services, and to promote European industries. ESA also works closely with space organisations outside Europe. Who belongs to ESA? Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and the United Kingdom. Canada takes part in some projects under a Cooperation agreement. Hungary, Romania, Poland, Estonia and Slovenia are 'European Cooperating States'. Other countries have signed cooperation agreements with ESA. ESA's headquarters are in Paris which is where policies and programmes are decided. ESA also has sites in a number of European countries, each of which has different responsibilities:- (i) EAC, the European Astronauts Centre in Cologne, Germany; (ii) ESAC, the European Space Astronomy Centre, in Villanueva de la Canada, Madrid, Spain; (iii) ESOC, the European Space Operations Centre in Darmstadt, Germany; (iv) ESRIN, the ESA centre for Earth Observation, in Frascati, near Rome, Italy; and (v) ESTEC, the European Space Research and Technology Centre, Noordwijk, the Netherlands. A new ESA centre has opened in the United Kingdom, at Harwell, Oxfordshire. ESA also has liaison offices in Belgium, USA and Russia; a launch base in French Guiana and ground/tracking stations in various parts of the world. How many people work for ESA? There are around 2000 staff working for ESA, from all the Member States and include scientists, engineers, information technology specialists and administrative personnel. Where do ESA's funds come from? ESA's mandatory activities (space science programmes and the general budget) are funded by a financial contribution from all the Agency's Member States, calculated in accordance with each country's gross national product. In addition, ESA conducts a number of optional programmes. Each Member State decides in which optional programme they wish to participate and the amount they wish to contribute. How big is ESA's budget? ESA's budget for 2010 is €3 745 million. ESA operates on the basis of geographical return, i.e. it invests in each Member State, through industrial contracts for space programmes, an amount more or less equivalent to each country's contribution. How much does each European spend on ESA? European per capita investment in space is very little. On average, every citizen of an ESA Member State pays, in taxes for expenditure on space, about the same as the price of a cinema ticket (in USA, investment in civilian space activities is almost four times as much). How does ESA operate? The Council is ESA's governing body and provides the basic policy guidelines within which ESA develops the European space programme. Each Member State is represented on the Council and has one vote, regardless of its size or financial contribution. ESA is headed by a Director General who is elected by the Council every four years. Each individual research sector has its own Directorate and reports directly to the Director General. The present Director General of ESA is Jean-Jacques Dordain. The European Space Agency (ESA) consists of 13 member states and one associate member, with the goal of promoting peaceful cooperation in space research and technology. / Европейское Космическое Агентство (ЕКА) состоит из 13 стран участниц и одного ассоциативного члена и функционирует с целью обеспечения мирного сотрудничества в исследовании космоса и космических технологий. Европейское Космическое Агентство (ЕКА) было создано в 1975 десятью странами Западной Европы. Оно занимается разработкой космических аппаратов коммерческого и хозяйственно-прикладного назначения. ЕКА имеет сеть станций слежения за полётом космических аппаратов с центром управления в Дармштадте, Германия.

EUROPEAN STATISTICAL SYSTEM = ЕВРОПЕЙСКАЯ СТАТИСТИЧЕСКАЯ СИСТЕМА – European Statistical System (ESS) includes the national statistical institutes (NSIs), member state government departments and agencies engaged in statistical activities, central banks, international bodies active in EU (European Option) statistics, etc.

EUROPEAN–STYLE OPTION = ОПЦИОН В ЕВРОПЕЙСКОМ СТИЛЕ – The European-Style Option is an option that can only be exercised on the expiry date. European-Style Option is an option which can only be exercised for a short, specified period of time just prior to its expiration, usually a single day. See also European Option.

THE EUROPEAN SYSTEM OF CENTRAL BANKS = ЕВРОПЕЙСКАЯ СИСТЕМА ЦЕНТРАЛЬНЫХ БАНКОВ – The European System of Central Banks (ESCB) is made up of the European Central Bank (ECB) and the national central banks (NCBs) of all EU Member States, regardless of whether or not they have adopted the Euro. The system is coordinated by two decision-making bodies:- the ECB Governing Council and the Executive Board. The primary objective is to maintain price stability. The basic tasks of the ESCB are to define and implement the monetary policy of the Community, to hold and manage the official foreign reserves of the Member States, to conduct foreign exchange operations, to promote the smooth operation of payment systems in the Euro area, and to help execute banking supervision rules and stability measures for financial systems taken by the responsible authorities. The ESCB has a number of monetary policy instruments at its disposal to steer money supply and liquidity in line with stability requirements. European System of Central Banks (ESCB) composed of the European Central Bank (ECB) and the national central banks (NCBs) of all 25 Member States, i.e. it includes, in addition to the members of the Eurosystem, the NCBs of the Member States that have not yet adopted the Euro. The ESCB is governed by the Governing Council and the Executive Board of the ECB, and, as a third and temporary decision-making body of the ECB, by the General Council. The core tasks of the ESCB are carried out by the Eurosystem. The European System of Central Banks:- the European Central Bank (ECB) was established on 01 June 1998 and is one of the world's youngest central banks. However, it has inherited the credibility and expertise of all Euro area NCBs, which together with the ECB implement the monetary policy for the Euro area. The legal basis for the ECB and the ESCB is the Treaty establishing the European Community. According to this Treaty, the ESCB is composed of the ECB and the NCBs of all EU Member States (27 since 01 January 2007).The Statute of the ESCB and of the ECB is attached to the Treaty as a protocol. Mandate of the ESCB:- the Treaty states that 'the primary objective of the ESCB shall be to maintain price stability' and that 'without prejudice to the objective of price stability, the ESCB shall support the general economic policies in the Community with a view to contributing to the achievement of the objectives of the Community as laid down in Article 2'. Article 2 of the Treaty mentions as objectives of the Community, interalia, 'a high level of employment (…), sustainable and non-inflationary growth, a high degree of competitiveness and convergence of economic performance'. The Treaty thus establishes a clear hierarchy of objectives and assigns overriding importance to price stability. By focusing the monetary policy of the ECB on this primary objective, the Treaty makes it clear that ensuring price stability is the most important contribution that monetary policy can make to achieving a favourable economic environment and a high level of employment. European System of Central Banks (ESCB) consists of the European Central Bank and the national central banks (NCBs) of all 27 EU Member States. The European System of Central Banks (ESCB) was established in accordance with the Maastricht Treaty (signed on 07 February 1992) and the Statute of the European System of Central Banks and of the European Central Bank. It comprises the European Central Bank (ECB) and the national central banks (NCBs) of all EU Member States. The decision-making bodies of the ECB are supported by ESCB Committees. These Committees are also important for intra-ESCB cooperation. They consist of members from the ECB and the national central banks (NCBs) of the Eurosystem, as well as from other competent bodies, such as national supervisory authorities in the case of the Banking Supervision Committee. The NCBs of the non-Euro area countries have each appointed experts to take part in ESCB Committee meetings whenever a Committee is dealing with matters which fall within the field of competence of the General Council. The mandates of the Committees are laid down by the Governing Council, to which the Committees report via the Executive Board. The direct responsibility for banking supervision and financial stability remains with the

competent authorities in each EU Member State, but the Treaty has assigned to the ESCB the task of 'contributing to the smooth conduct of policies pursued by the competent authorities relating to the prudential supervision of credit institutions and the stability of the financial system'. This task is mainly carried out in three ways. First, the ESCB monitors and assesses the financial stability at the Euro area/EU level. This activity complements and supports the corresponding activity at the national level, carried out by the national central banks and supervisory authorities in order to maintain financial stability in their respective country. Second, the ESCB gives advice on the design and review of regulatory and supervisory requirements for financial institutions. Much of this advice is provided through the ECB's participation in the relevant international and European regulatory and supervisory bodies, such as the Basel Committee on Banking Supervision, the European Banking Committee and the Committee of European Banking Supervisors. Third, the ECB promotes cooperation between central banks and supervisory authorities on issues of common interest, e.g., payment system oversight, financial crisis management. These activities are carried out with the assistance of the Banking Supervision Committee (one of the ESCB committees), which brings together experts from the EU central banks and supervisory authorities. / в соответствии с Маастрихтским Трактатом .

EUROPEAN SYSTEM OF NATIONAL AND REGIONAL ACCOUNTS = ЕВРОПЕЙСКАЯ СИСТЕМА НАЦИОНАЛЬНЫХ И РЕГИОНАЛЬНЫХ СЧЕТОВ – The European System Of National And Regional Accounts:- 1996-June:- o achieve the objectives set by the Treaty on European Union, and more specifically Economic and Monetary Union, we need high-quality statistical instruments which provide the Community institutions, governments and economic and social operators with a set of harmonised and reliable statistics on which to base their decisions. The new European System of National and Regional Accounts (ESA 95) is a major improvement on the previous version, which dates from 1979. Progress has been achieved in the harmonisation of methodology and in the precision and accuracy of the concepts, definitions, classifications and accounting rules which have to be applied in order to arrive at a consistent, reliable and comparable quantitative description of the economies of the Member States. The new system will provide its users with a more comprehensive and more detailed knowledge of the economic and financial structures of the Member States and their regions. ESA 95 is the fruit of several years' work. It draws on the experience acquired by the European statistical system during its work on harmonising gross national product (GNP). The European Commission is deeply grateful to the specialists from the National Statistical Institutes for the perseverance and the expertise with which they helped Eurostat to accomplish this task. The 1995 ESA is broadly consistent with the System of National Accounts of the United Nations (1993 SNA) as regards the definitions, accounting rules and classifications. It nevertheless incorporates certain differences, particularly in its presentation, which is more in line with its use within the European Union. This specific use in fact requires greater accuracy in the definitions and the accounting rules. To ensure that the methodological provisions set out in this volume are strictly applied, the Council of the European Union has decided, following a proposal from the Commission, to give it a solid legal basis. ESA 95 was thus adopted in the form of a Council Regulation dated 25 June 1996. The results of this joint effort by the European statistical system will be an essential tool for formulating and implementing the entire range of European Community policies, whether economic, agricultural, regional, social, commercial or environmental. ESA 95 will also be a crucial aid to the training of those concerned with running, understanding and analysing the European economy. Similar efforts will be made to ensure that the data compiled at European Union level are disseminated in the form and with the frequency required by their users. In this way the Commission hopes to give all those engaged in building Europe – institutions, businesses and members of the public alike – the means to base their decisions on a genuine understanding of the issues involved. European System of National and Regional Accounts (ESA) is an integrated system of economic accounts which is the European version of the System of National Accounts (SNA). / Европейская Система Национальных и Региональных Счетов (ECC) является интегрированной системой экономических счетов, служащей Европейской версией Системы Национальных Счетов (СНС).

EUROPEAN TELECOMMUNICATIONS STANDARDS INSTITUTE = ЕВРОПЕЙСКИЙ ИНСТИТУТ СТАНДАРТОВ В СФЕРЕ ДАЛЬНЕЙ СВЯЗИ – The European Telecommunications Standards Institute (ETSI) was established in 1988 in response to the inability of the Council of European Post and Telecommunications Administration (CEPT) to keep up with the schedule of work on common European standards and specifications agreed to in the 1984 Memorandum of Understanding between CEPT and the EC. ETSI has a contractual relationship with the EC to pursue standards development for telecommunications equipment and services, and it cooperates with other European standards bodies such as CEN/CENELEC. ETSI membership includes the telecommunications administrations that constitute the CEPT as well as manufacturers, service providers and users. Headquartered in Sophia-Antipolis, France. The European Telecommunications Standards Institute (ETSI) produces globally-applicable standards for Information and Communications Technologies (ICT), including fixed, mobile, radio, converged, broadcast and internet technologies. We are officially recognized by the European Union as a European Standards Organization. The high quality of our work and our open approach to standardization has helped us evolve into a European roots – global branches operation with a solid reputation for technical excellence. ETSI is a not-for-profit organization with more than 700 ETSI member organizations drawn from 62 countries across 5 continents world-wide. ETSI produces globally-applicable standards for ICT (Information and Communications Technologies), including fixed, mobile, radio, converged, broadcast and internet technologies. An independent, not-for-profit organization based in the technical park of Sophia Antipolis in the south of France, we are committed to serving our members and assisting in the development of their market potential. ETSI is officially recognized by the European Union (EU) as a European Standards Organization. However, the high quality of our work and our open approach to standardization has helped us evolve into a 'European roots – global branches' operation with a solid reputation for technical excellence. ETSI brings together more than 700 member organizations drawn from 62 countries worldwide. Thanks to globalization, our members operate in an increasingly international and competitive environment. We are also active in vital areas related to standardization such as interoperability, including protocol testing and methodology and we also offer forum-hosting services. ETSI unites:- manufacturers, network operators, national Administrations, service providers, research bodies, user groups, and consultancies. This cooperation has resulted in a steady stream of highly successful ICT standards in mobile, fixed, and radio communications and a range of other standards that cross these boundaries, including:- security, satellite, broadcast, Human Factors, Testing & Protocols, intelligent transport, power-line telecoms, eHealth, Smart Cards, emergency communications, GRID & Clouds, aeronautical and many more. ETSI is consensus-based and conducts its work through Technical Committees, which produce our standards and specifications, with the ETSI General Assembly and Board guiding the Secretariat towards its Vision and Mission. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

EUROPEAN TERMS = ЕВРОПЕЙСКИЕ ПОРЯДКИ – European Terms is a foreign exchange quoting convention where the domestic currency is quoted in terms of a foreign currency. In other words, it is the amount of foreign currency that one unit of the domestic currency can buy. For example, assume there is a bid quote of EUR 1.3446/USD, and an ask quote of EUR 1.3448/USD. From the United States perspective, these quotes are given in European terms. Although the bid and ask quotes given here are in European terms, the bid and ask quotes in American terms will be reversed. European Terms is a method of quoting exchange rates, which measures the amount of foreign currency needed to buy one US Dollar, i.e. foreign currency unit per Dollar. See also Reciprocal of European Terms. In quoting foreign exchange rates, European terms refers to how many US Dollars equals one foreign currency. For example in January 2000, one Euro equaled USD1.0210. This exchange rate is quoted in European terms. In Dollar terms, the same exchange rate would be 0.9794 Euro, where one Dollar is worth 0.9794 Euro. / Метод котирования обменного курса, который

измеряет сумму иностранной валюты, необходимую для покупки одного Доллара США, то есть единица иностранной валюты за Доллар.

EUROPEAN UNION = ЕВРОПЕЙСКИЙ СОЮЗ – European Union (EU) established by the Treaty on European Union (EU Treaty), often referred to as the 'Maastricht Treaty', which was signed on February 1992 and entered into force on 01 November 1993. This Treaty has subsequently been amended by the 'Treaty of Amsterdam', which was signed in Amsterdam on 02 October 1997 and entered into force on 01 May 1999, and most recently by the 'Treaty of Nice', which was signed on 26 February 2001 and entered into force on 01 February 2003. The European Union (EU) rests on several organisations and arrangements with different legal natures that constitute the three supporting pillars. The first pillar comprises the European Community and the European Atomic Energy Community (Euratom), which both possess legal personality and are governed by separate Treaties. The second and third pillars are essentially intergovernmental arrangements on the common foreign and security policy, and police and judicial cooperation in criminal matters. The European Union is made up of 27 Member States:- Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden and the United Kingdom. The idea of establishing an economic and monetary union in Europe goes back more than half a century. It was a vision of the political leaders who, in 1952, founded the European Coal and Steel Community (ECSC), which consisted of six countries – Belgium, Germany, France, Italy, Luxembourg and the Netherlands. Further steps were taken towards European integration in the 1950s and thereafter. The same six countries established the European Economic Community (EEC) and the European Atomic Energy Community (EURATOM) in 1958. This network of relationships strengthened and deepened over the years, becoming the European Communities (EC) and then, with the adoption of the Maastricht Treaty in 1993, the European Union (EU).The number of member countries increased too. Denmark, Ireland and the United Kingdom joined in 1973, followed by Greece eight years later. Portugal and Spain became members in 1986; Austria, Finland and Sweden joined in 1995. This expansion continued on 2004-May-01 2004, when the Czech Republic, Estonia, Cyprus, Latvia, Lithuania, Hungary, Malta, Poland, Slovenia and Slovakia acceded to the European Union. Bulgaria and Romania are the latest members, having joined on 2007-January-01. The conditions to be fulfilled before entering the EU are the Copenhagen criteria. These require the prospective members (i) to have stable institutions guaranteeing democracy, the rule of law, human rights and the respect for and protection of minorities, and (ii) to have a functioning market economy as well as the capacity to cope with competitive pressure, in order to be able to take on the obligations of membership, including the aims of political, economic and monetary union (EMU). The first attempt to create an economic and monetary union was described in the Werner Report of 1970 (named after Pierre Werner, then Prime Minister of Luxembourg), which envisaged three stages to be completed by 1980. However, these first plans for an economic and monetary union were never realized amid the considerable international currency unrest after the collapse of the Bretton Woods system in the early 1970s, and the international recession in the wake of the first oil crisis in 1973. To counter this instability, the then nine Member States of the EEC created the European Monetary System (EMS) in 1979. Its main feature was the exchange rate mechanism (ERM), which introduced fixed but adjustable exchange rates among the currencies of the nine countries. In the second half of the 1980s the idea of an economic and monetary union was revived in the Single European Act of 1986, which created a single market. But it was realized that the full benefits of a single market could only be reaped with the introduction of a single currency for the participating countries. In 1988 the European Council instructed the Delors Committee to examine ways of realizing Economic and Monetary Union (EMU). The 1989 Delors Report led to the negotiations for the Treaty on European Union, which established the European Union (EU) and amended the Treaty establishing the European Community. It was signed in Maastricht on 1992-February-07 (so it is sometimes called the Maastricht Treaty) and entered into force on 1993-November-01. Progress towards EMU in Europe took place in three stages. Stage One (1990–93) was characterized mainly by the full achievement of a single European market through the dismantling of all internal barriers to the free movement of persons, goods, capital and services within Europe. Stage Two (1994–98) started with the creation of the European Monetary Institute, and was dedicated to the technical preparations for the single currency, the avoidance of excessive deficits, and enhanced convergence of the economic and monetary policies of the Member States (to ensure stability of prices and sound public finances). Stage Three began on 1999-January-01 with the irrevocable fixing of exchange rates, the transfer of monetary policy competence to the ECB and the introduction of the Euro as the single currency. On 2002-January-01 Euro banknotes and coins became legal tender in the participating countries and by the end of February 2002 national banknotes and coins ceased to be legal tender. 1981 – Greece joins the European Communities. The European Union (EU) is a mutually beneficial association of the following member States (countries):- Austria, Belgium, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Monaco, Netherlands, Poland, Portugal, San Marino, Slovakia, Slovenia, Spain, Sweden, United Kingdom, and Vatican City State. An economic association of European countries founded by the Treaty of Rome in 1957 as a common market for six nations. It was known as the European Community until 1994-January-01 and currently comprises 27 European member countries. Its goals are a single market for goods and services without any economic barriers, and a common currency with one monetary authority. The European Union (EU) was originally created by six founding states in 1958 (following the earlier establishment by the same six states of the European Coal and Steel Community (ECSC) in 1952; founding members were the Benelux countries (Belgium, the Netherlands, and Luxembourg), France, Italy, and West Germany), but has grown to its current size of 27 member countries. There were five successive enlargements during this period, with the largest occurring on 2004-May-01, when 10 new member states joined. The EU will have 27 member states when further enlargement takes place in 2007 with the addition of Romania and Bulgaria. Negotiations are also underway with other states. The process of enlargement is sometimes referred to as European Integration. However, this term is also used to refer to the intensification of cooperation between EU member states as national governments allow for the gradual centralising of power within European institutions. WTO members (28):- Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, European Union (formerly EC), Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovak Republic, Slovenia, Spain, Sweden, United Kingdom. Some history facts:- 1958 – the ECSC members establish the European Economic Community, which later becomes the European Community (EC). 1973-January-01 (First Enlargement) – Denmark, Ireland, and the United Kingdom accede to the EC (Norway signed the treaty but failed to ratify due to a negative opinion in a national referendum on accession). 1981-January-01 (Second Enlargement) – Greece accedes to the EC. 1985 – granted home rule by Denmark six years earlier, Greenland decides to leave the EC following a referendum. 1986-January-01 (Third Enlargement) – Portugal and Spain accede to the EC. 1990-October-03 – East Germany and West Germany reunify, automatically adding the former East Germany to the EC; reunification adds to the EC's area and population, but not the number of member states. 1993-November-01 – the Maastricht Treaty takes effect, formally establishing the European Union. 1995-January-01 (Fourth Enlargement) – Austria, Finland, and Sweden, accede to the EU (Norway signed the treaty but failed to ratify due to a negative opinion in a national referendum on accession). 2004-May-01 (Fifth Enlargement, part I) – comprising the largest number of countries ever admitted at one time, Cyprus, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Slovakia, and Slovenia accede to the EU. 2007-January-01 (Fifth Enlargement, part II) Bulgaria and Romania. 2007-July-01 – the Caribbean islands of Bonaire, Saba and Sint Eustatius will become part of the Netherlands as the Kingdom Islands, and will thereby also become part of the European Union. This mini-enlargement will be the first enlargement that happens entirely outside Europe. Formerly known as European

Community and European Economic Community. Since 1993, the name of the former EC. The Treaty on European Union (which is often referred to as the 'Maastricht Treaty') was signed on 1992-February-07 and entered into force on 1993-November-01. The Treaty on European Union amended the Treaty establishing the European Community and established the European Union. The 'Treaty of Amsterdam', which was signed in Amsterdam on 1997-October-02 and entered into force on 1999-May-01, amended both the Treaty establishing the European Community and the Treaty on European Union. Equally, the 'Treaty of Nice', which concluded the 2000 Intergovernmental Conference and was signed on 2001-February-26 and entered into force on 2003-February-01, amended both the Treaty establishing the European Community and the Treaty on European Union. / Пьер Вэрна (Pierre Werner). Маастрихтского Трактата в 1993. С 01 Января 2007 в составе ЕС – 27 государств. 23 Июня 2016 в Великобритании состоялся всенародный референдум, в результате которого с небольшим перевесом (52% против 48%) было принято решение о выходе страны из Европеского Союза. Европейский Союз (ЕС) – это семья демократических Европейских стран, обязанных работать вместе, ради мира и процветания. Это – не государство, что должно заменить существующие страны, это – больше, чем любая международная организация. ЕС – действительно уникальное явление. Страны-участницы Европейского Союза создали общие институты, которым делегировали часть своих полномочий, чтобы решения, касающиеся конкретных вопросов, можно было принимать на Европейском уровне. Это и есть Европейская интеграция. Главные цели ЕС:- (i) обеспечить своим гражданам защиту; (ii) способствовать быстрому развитию экономики; (iii) обеспечить занятость на территории ЕС; и (iv) хранить свободу и права граждан ЕС. Эти цели были разделены на три направления деятельности ЕС:- экономическое и валютное направление; общая заграничная политика и безопасность; и сотрудничество в сфере внутренней безопасности и защиты справедливости. У ЕС нет своей столицы, но главным административным центром ЕС является Брюссель – столица Бельгии, так как в этом городе находятся штабквартиры многих Европейских институтов, в том числе Европейской Комиссии. Флагом ЕС являются 12 звёзд, образующих круг на синем фоне. Гимном ЕС является IX симфония Людвига Ван Бетховена 'Ода Радости'. Валютой ЕС является Евро. Европейский Союз (ЕС) – термин, употребляемый в отношении планируемого конфедеративного объединения Европейского Союза – Европейского Сообщества (European Community, EC), стоящего на 'трёх китах' и ещё на двух недавно выдвинутых столпах – Общей Внешней Политике и Политике в Сфере Безопасности (включая вопросы обороны) (Common Foreign and Security Policy), сотрудничестве в области Правосудия и Внутренних Дел (Justice and Home Affairs). Институциональную систему ЕС составляют пять органов:- Европейская Комиссия (European Commission), Совет Министров ЕС (EU Council of Ministers), Европейский Парламент (European Parliament), Европейский Суд (European Court of Justice) и Суд Аудиторов (Court of Auditors), которые осуществляют текущий контроль за расходной частью бюджета ЕС. По Маастрихтскому Трактату по Европейскому Союзу, заключённому 01 Ноября 1993, парламент, выбранный прямым голосованием, получил право принимать решения совместно с Советом Министров и Европейской Комиссией.

EUROPEAN UNION COUNCIL = СОВЕТ ЕВРОПЕЙСКОГО СОЮЗА – European Union Council (Council of Ministers) is an institution of the European Community made up of representatives of the governments of the Member States, normally the ministers responsible for the matters under consideration (therefore often referred to as the Council of Ministers).The EU Council meeting in the composition of the ministers of economy and finance is often referred to as the Economic and Financial Affairs (ECOFIN) Council. In addition, for decisions of particular importance, the EU Council meets in the composition of the Heads of State or Government. This should not be confused with the European Council, which also brings together the Heads of State or Government but which provides the Union with the necessary impetus for its development and defines the general political guidelines. / Совет Европейского Союза – главный законодательный и принимающий решения орган ЕС. Подобно, как Европейский Парламент, Совет был создан в 1950-х на основе учредительских трактатов. Совет представляет интересы стран-участниц и реализовывает общую политику, в каждой сфере, которая подлежит законодательной деятельности Совета. Задача Совета вытекает прежде всего из её законодательных полномочий, но также и из инициативных (Совет может выступить к Комиссии о подготовке законодательного акта, хотя Комиссия не обязана этого выполнять) а также номинативных (например, право назначения членов Экономически-Социального Комитета). В состав Совета входят – по одному представителю из каждой страны-участницы – на уровне министерств.

EUROPEAN UNION/EUROPEAN ECONOMIC AREA RISK = РИСК В ОТНОШЕНИИ ВСЕГО ЕВРОПЕЙСКОГО СОЮЗА/ЕВРОПЕЙСКОЙ ЭКОНОМИЧЕСКОЙ ОБЛАСТИ – European Union/European Economic Area Risk:- in insurance, a risk is deemed to be located in an European Union or European Economic Area member state if it is:- (i) a building (and its contents issued under the same policy) situated in that state; (ii) a motor vehicle, ship, yacht or aircraft registered in that state; and (iii) a travel policy for four months or less taken out in that state. For any other type of insurance (including a life insurance) it is an individual if the policyholder is habitually resident in the member state or a business or an organization if the establishment to which the contract relates is situated in that state.

EUROPEAN UNIT OF ACCOUNT = ЕВРОПЕЙСКАЯ ЕДИНИЦА РАСЧЁТА (или ЕВРОПЕЙСКАЯ РАСЧЁТНАЯ ЕДИНИЦА) – European Unit Of Account (EUA) is the unit of account used by the European Community (EC). The EUA was originally equal to 0.888 670 88 mg of fine gold, and, until 1971, its value was equal to that of the US Dollar. After the second Dollar devaluation in 1974, the EUA was roughly equal to USD1.20. Beginning in 1975, a new unit of account was gradually adopted; it was defined as a basket of member country currencies, with the weight of each currency based on each nation's gross national product and its position in the European market place. See also European Currency Unit. Official unit of account for the European Payments Union (EPU) from 1961 to 1972, and from 1973 to 1979 of the European Community. Originally same gold parity as the US Dollar. Subsequently defined as EC currency basket.

EUROPEAN ZONE CHARGE = СБОР ЕВРОПЕЙСКОЙ ЗОНЫ – European Zone Charge (EZC):- tariff as basis for shipowners to calculate containers's haulage when Carrier's Haulage has been agreed. European Zone Charge (EZC) is a charge for inland haulage transport in case of carrier haulage in Europe. / Сбор за подвоз сухопутным транспортом .

EUROPICA = EUROPEAN PROGRAM IN CHEMISTRY OF THE ATMOSPHERE

EUROSAL SERVICE = СЛУЖБА ЮРОЗЭЛ (или СЛУЖБА ОЙРОЗАЛЬ) – EUROSAL Service is a container line running between the West coast of South America, the Caribbean and Europe. Members of the EUROSAL service include CMA CGM, Hapag-Lloyd, Hamburg-Süd and CSAV (Compañia Sud Americana de Vapores SA; Chilean shipping company). Line Strengths:- (i) service providing optimum coverage of Chile from/to North Europe with direct call in Valparaiso and seamless relay to Iquique, San Vicente and San Antonio via Callao; (ii) extensive coverage of whole Scandinavian, Baltic and Russian area via Rotterdam and Hamburg, using CMA CGM operated feeders; and (iii) fast and direct service from Chile to North Europe, perfect for fresh fruits and seafood in reefer containers. Main Connections:- (i) in Callao:- to Iquique, San Vicente and San Antonio; (ii) in Rotterdam and Hamburg:- to whole Scandinavian, Baltic and Russian area; and (iii) in Manzanillo:- to US East Coast (Miami, New-York, Halifax). Port Rotation:- Rotterdam, Hamburg, Tilbury, Antwerp, Caucedo, Cartagena, Manzanillo (Pan), Callao, Valparaiso, Callao, Manzanillo (Pan), Cartagena (Col), Caucedo, Rotterdam. The original Eurosal service was launched in 1980. The current Eurosal/EuroAndes service was

launched in June 2006 by Hapag-Lloyd and Hamburg Süd, succeeding to the existing Eurosal services (6511/6512). CMA CGM and CSAV have slot allocations. Ships used at launch:- VALPARAISO EXPRESS, CALLAO EXPRESS, SANTIAGO EXPRESS, HUMBOLDT EXPRESS, EMS TRADER, CAP TRAFALGAR, CAP NELSON, TEVAL, from July 2010:- JUIST TRADER. February 2008 – Buenaventura skipped due to congestion. January 2009 – CSAV left. / Си.Эм.А. Си.Жи.Эм. (CMA CGM; Французская транспортная и судоходная компания), Хапаг-Лёйд А.Ге. (Hapag-Lloyd AG; многонациональная транспортная компания со штабквартирой в Германии), Хамбург-Зюд (Hamburg-Süd или Хамбург Зюдамэриканишэ Дампфшиватс-Гезэльшафт А.пе.Эс. Унд Ко Ка.Ге. (Hamburg Südamerikanische Dampfschifffahrts-Gesellschaft ApS & Co KG); крупная судоходная компания со штабквартирой в Германии) и Сэ.Эсэ.А.Увэ. (CSAV; Компаниа Суд Амэрикана дэ Вапорес Эсэ.А. (Compañia Sud Americana de Vapores SA); Чилийская судоходная компания).

EUROSTAT = ЕВРОСТАТ – Eurostat is the Statistical Office of the European Communities. Eurostat is part of the European Commission and is responsible for the production of Community statistics. Eurostat is the statistical service of the European Commission. Its mission is to provide the European Union with a high-quality statistical information service. Eurostat's mission:- to be the leading provider of high quality statistics on Europe. Eurostat is the statistical office of the European Union situated in Luxembourg. Its task is to provide the European Union with statistics at European level that enable comparisons between countries and regions. This is a key task. Democratic societies do not function properly without a solid basis of reliable and objective statistics. On one hand, decision-makers at EU level, in Member States, in local government and in business need statistics to make those decisions. On the other hand, the public and media need statistics for an accurate picture of contemporary society and to evaluate the performance of politicians and others. Of course, national statistics are still important for national purposes in Member States whereas EU statistics are essential for decisions and evaluation at European level. Statistics can answer many questions. Is society heading in the direction promised by politicians? Is unemployment up or down? Are there more CO_2 emissions compared to ten years ago? How many women go to work? How is your country's economy performing compared to other EU Member States? International statistics are a way of getting to know your neighbours in Member States and countries outside the EU. They are an important, objective and down-to-earth way of measuring how we all live. Changing Role of Eurostat:- Eurostat was established in 1953 to meet the requirements of the Coal and Steel Community. Over the years its task has broadened and when the European Community was founded in 1958 it became a Directorate-General (DG) of the European Commission. Eurostat's key role is to supply statistics to other DGs and supply the Commission and other European Institutions with data so they can define, implement and analyse Community policies. The result:- Eurostat offers a whole range of important and interesting data that governments, businesses, the education sector, journalists and the public can use for their work and daily life. With the development of Community policies, Eurostat's role has changed. Today, collecting data for the Economic and Monetary Union (EMU) and developing statistical systems in candidate countries for EU membership are more important than ten years ago.

EUROSYSTEM = ЕВРОСИСТЕМА – Eurosystem comprises the European Central Bank (ECB) and the national central banks (NCBs) of those Member States that have already adopted the Euro. It defines and implements the monetary policy of the Euro area. Eurosystem comprises the ECB and the NCBs of the Member States that have adopted the Euro in Stage Three of Economic and Monetary Union (see also Euro Area). There are currently 12 NCBs in the Eurosystem. The Eurosystem is governed by the Governing Council and the Executive Board of the ECB. / В банковской сфере Евросоюза Евросистема состоит из Европейского Центрального Банка (the European Central Bank) и национальных центральных банков (НЦБ) государств участников, которые уже приняли у себя Евро в качестве собственной валюты. Она определяет и подразумевает монетарную политику области Евро.

EUROSYSTEM STAFF PROJECTIONS = ПРОЕКЦИИ ПЕРСОНАЛА ЕВРОСИСТЕМЫ – Eurosystem Staff Projections:- the results of exercises conducted by Eurosystem staff to project possible future macroeconomic developments in the Euro area as part of the economic analysis.

EURO TRAVELLER'S CHEQUE = ДОРОЖНЫЙ ЧЕК В ЕВРО – Euro Traveller's Cheque is the internationally acceptable traveller's check denominated in a currency other than US Dollar. / Принимаемые в разных странах мира дорожные чеки, деноминированные в иной валюте, нежели в Долларах США, и в частности в Евро.

EURO–TREASURY WARRANT = КАЗНАЧЕЙСКИЙ ВАРРАНТ В ЕВРО – Euro-Treasury Warrant is a warrant issued on the Euromarket entitling its holder to subscribe to US Treasury bonds.

EUSC = EFFECTIVE UNITED STATES CONTROL

EUSIDIC = EUROPEAN ASSOCIATION OF SCIENTIFIC INFORMATION DISSEMINATION CENTRES

EUTECTIC POINT = ЭВТЕКТИЧЕСКАЯ ТОЧКА – Eutectic Point (EP) is a temperature (approximately –62 °C) at which all the water in the cells of the product is completely frozen, preventing microbial biotic activity and therefore preventing any loss of quality to the product. The product has an infinite storage life. Water and dissolved substances crystallize out together. / , от Греческого слова Éutēktos, означающее Легко Плавящийся, понимается .

EUTROPHIC = ЭВТРОФНОЕ – Eutrophic:- having optimal concentrations of nutrients (or nearly so) for plant or animal growth. / О водоёме. Под Эвтрофными растениями, от Греческого слова Eutrophia, означающее Хорошее Питание, понимаются растения, которые способны произрастать только на почвах (или другом субстрате), богатых питательными веществами, например, Дуб, Ясень и многие другие.

EUTROPHICATION = ЭВТРОФИКАЦИЯ – Eutrophication is the process of becoming rich in nutrients. / Под Эвтрофикацией понимается обогащение рек и озёр биогенными элементами, сопровождающееся повышением продуктивности вод. Эвтрофикация может быть результатом естественного старения водоёма, внесения удобрений или загрязнения сточными (в том числе с полей) водами. Для эвтрофных водоёмов характерна богатая литоральная и сублиторальная растительность, обильный планктон. Искусственная несбалансированная эвтрофикация может приводить к бурному развитию водорослей ('цветению' вод), дефициту кислорода и замору рыб и других животных.

EV = ELECTRONIC VALUE

EVA® = ECONOMIC VALUE ADDED

EVALUATE = ВЫЧИСЛЯТЬ – Evaluate:- to examine and estimate the amount and degree of a character and to express it numerically. / свойство (character).

EVALUATION = ВАЛЬВАЦИЯ (или ОЦЕНКА, или ВЫЧИСЛЕНИЕ) – Evaluation has several distinguishing characteristics relating to focus, methodology, and function. Evaluation (i) assesses the effectiveness of an ongoing program in achieving its objectives, (ii) relies on the standards of project design to distinguish a program's effects from those of other forces, and (iii) aims at program

improvement through a modification of current operations. Evaluation is a process of quantification or qualitative grading of agronomic traits of interest in cultivars.

EVAPORATION = ЭВАПОРАЦИЯ (или ИСПАРЕНИЕ, или ВЫПАРИВАНИЕ, или ПАРООБРАЗОВАНИЕ) – Evaporation, in Rice cultivation, the moisture lost in vapor form from the free water surface. It is one of the important factors that determine the effectivity of rainfall, particularly in arid or semiarid areas. Evaporation is the process of conversion of a liquid into a vapor or gaseous form. This change of state absorbs energy – the latent heat of vaporization. / Под Эвапорацией, от Латинского слова Evaporo, означающее Испаряю, понимается .

EVAPORITES = ЭВАПОРИТЫ – Evaporites are the class of materials including gypsum and all more soluble species, precipitated by evaporation. / осадок (precipitate).

EVAPOTRANSPIRATION = ЭВАПОТРАНСПИРАЦИЯ (или СУММАРНОЕ ИСПАРЕНИЕ) – Evapotranspiration:- water that passes from the leaves of plants to the air plus water evaporated from the surface of the plants and soil. The loss of water from the soil by the combination of evaporation from the soil surface and withdrawal or transpiration by the plant. Evapotranspiration is the loss of water from a given area and during a specified period of time by evaporation from the soil surface and by transpiration from plants. / Под Эвапотранспирацией, от Латинских слов Evaporo, означающее Испаряю, Trans, означающее За или Сквозь или Через, и Spiro, означающее Выдыхаю или Дышу, понимается . Потеря почвой влаги вследствие сочетания её испарения с поверхности почвы и водозабора растениями или транспирации (выделениями через кожицу) этими растениями.

EVCA = EUROPEAN PRIVATE EQUITY & VENTURE CAPITAL ASSOCIATION

EVEN BASIS = XX – Even Basis is a condition that exists when the local cash price is equal to the futures price. See also Over Basis; and Under Basis.

EVENING DOJI STAR = ВЕЧЕРНЯЯ ЗВЕЗДА ДОДЗИ – Evening Doji Star:- in technical analysis, a three day bearish reversal pattern similar to the Evening Star. The uptrend continues with a large white body. The next day opens higher, trades in a small range, then closes at its open (Doji). The next day closes below the midpoint of the body of the first day. / В техническом анализе биржевых рынков, трёхдневная медвежья модель разворота, похожая на Вечернюю Звезду. Тенденция на повышение отображается большим светлым телом. Следующий день открывается выше, затем торгуется в очень малом диапазоне и закрывается на уровне открытия; это тело и есть Додзи (Doji). Следующий (третий) день закрывается ниже среднего значения тела первого дня.

EVENING STAR = ВЕЧЕРНЯЯ ЗВЕЗДА – Evening Star:- in technical analysis, a three day bearish reversal pattern that continues an uptrend with a long white body day followed by a gapped up small body day (Evening Star), then a down close with the close below the midpoint of the first day. / В техническом анализе биржевых рынков трёхдневная медвежья модель разворота, которая, продолжая тенденцию на повышение, отображается большим светлым телом первого дня. Далее с отрывом следует малое тело второго дня, собственно Вечерняя Звезда. Завершает модель тёмное тело третьего дня с ценой закрытия ниже среднего уровня цен первого дня.

EVENING UP = УРАВНИВАНИЕ – Evening Up:- buying or selling to offset an existing market position. See also Liquidation. / Покупка или продажа для зачёта существующей позиции на рынке. Смотрите также Ликвидация (Liquidation).

EVEN KEEL = РОВНЫЙ КИЛЬ – Even Keel:- when the draft of a ship fore and aft are the same. Even Keel (maritime term):- floating level (no list). Said of a vessel which is balanced in such a way that the draft forward and aft is the same as the draft in the midship of the vessel on both sides. / Ровный Киль – о посадке корабля. Под Килем, от Голландского слова Kiel, понимается балка, служащая основным продольным креплением и связью днища судна, располагаемая в диаметральной плоскости. Различают брусковый, вертикальный, горизонтальный, коробчатый, туннельный кили.

EVEN LOT = ПОЛНАЯ (или РОВНАЯ, или ЦЕЛИКОВАЯ) ПАРТИЯ – Even Lot is the unit of trading in a commodity established by an exchange to which official price quotations apply. See also Round Lot.

EVENNESS = РАВНОМЕРНОСТЬ (или ГЛАДКОСТЬ) – Evenness is the degree of evenness of raw silk panels with approximately the same length as the sizing skein, determined on the basis of incidence of evenness defects by using official standard photographs for evenness and official standard variation photographs. Evenness defects are those portions of raw silk which show stripes caused by the variations in the size of the raw silk to such a degree as is easily noticeable by visual inspection. Evenness is expressed as percentage. Evenness:- this term refers to the uniformity of the fiber throughout the fleece. / Порок или дефект.

EVENNESS TESTING = ТЕСТИРОВАНИЕ НА РАВНОМЕРНОСТЬ – Evenness Testing is a determination of the variation in weight per unit length and thickness of yarns or fibers aggregates such as roving, sliver, or top.

EVENT DRIVEN = ПО ОБСТОЯТЕЛЬСТВАМ – Event Driven:- in the context of hedge funds, a style of management that combines many different types of hedge fund investing such as merger arbitrage, distressed securities and high yield investing, in conjunction with an important event that is supposed to unlock firm value (like a merger announcement, earnings announcement, or a regulator decision). / В контексте с хэдьж фондами, стиль управления, который комбинирует многочисленные различные типы инвестирования хэдьж фондов, такие как .

EVENT OF DEFAULT = СЛУЧАЙ НЕСОСТОЯТЕЛЬНОСТИ (или СЛУЧАЙ ДИФОЛТА) – Event Of Default is an event stipulated in an agreement as constituting a default. Generally, the occurrence of a failure to pay or deliver on the due date, breach of agreement and insolvency are events of default. / или поставить в надлежащую (причитающуюся) дату .

EVENTS AFTER THE BALANCE SHEET DATE = СОБЫТИЯ ПОСЛЕ ДАТЫ СДАЧИ БАЛАНСОВОГО ОТЧЁТА – IAS 10 (short for International Accounting Standard No. 10) Events After the Balance Sheet Date – the objective of this Standard is to prescribe:- (a) when an entity should adjust its financial statements for events after the balance sheet date; and (b) the disclosures that an entity should give about the date when the financial statements were authorised for issue and about events after the balance sheet date. The Standard also requires that an entity should not prepare its financial statements on a going concern basis if events after the balance sheet date indicate that the going concern assumption is not appropriate. Events after the balance sheet date are those events, favorable and unfavorable, that occur between the balance sheet date and the date when the financial statements are authorised for issue. Two types of events can be identified:- (a) those that provide evidence of conditions that existed at the balance sheet date (adjusting events after the balance sheet date); and (b) those that are indicative of conditions that arose after the balance sheet date (non-adjusting events after the balance sheet date). An entity shall adjust the amounts recognised in its financial statements to reflect adjusting events after the balance sheet date. An entity shall not adjust the amounts recognised in its financial statements to reflect non-adjusting events after the balance sheet date. If non-adjusting events after the balance sheet date are material, non-disclosure

could influence the economic decisions of users taken on the basis of the financial statements. Accordingly, an entity shall disclose the following for each material category of non-adjusting event after the balance sheet date:- (a) the nature of the event; and (b) an estimate of its financial effect, or a statement that such an estimate cannot be made. If an entity receives information after the balance sheet date about conditions that existed at the balance sheet date, it shall update disclosures that relate to those conditions, in the light of the new information. / МСБУ 10 (сокращение для Международного Стандарта Бухгалтерского Учёта № 10) – .

EVERGREEN = ВЕЧНОЗЕЛЁНОЕ – Evergreen:- remaining green and leafy throughout the winter or resting season. / Вечнозелёное растение, растение, остающееся зелёным и облиственным в зимнее время или в период покоя.

EVERGREEN LETTER OF CREDIT = ВЕЧНОЗЕЛЁНЫЙ АККРЕДИТИВ (или ОСТАЮЩИЙСЯ В СИЛЕ АККРЕДИТИВ) – Evergreen Letter Of Credit is a letter of credit with an initial expiration date but containing a clause that states that it will be automatically extended for additional periods unless the issuing bank provides notice to the beneficiary stating otherwise.

EVERYTHING–BUT–ARMS = ВСЁ–НО НЕ–ОРУЖИЕ – The Everything-But-Arms (EBA) Initiative eliminates EU import tariffs for numerous goods, including agricultural products, from the least developed countries. The tariff elimination is scheduled in four steps from 2006/07 to 2009/10.

EVIDENCE ACCOUNT = СВИДЕТЕЛЬСКИЙ СЧЁТ – Evidence Account:- umbrella agreement contracted between a Western supplier and a government agency in a developing country (e.g., an industrial ministry, or a provincial or state authority), which is designed to facilitate reciprocal trade flows. The agreement stipulates trade conditions between the Western firm, other independent firms designated by it, and commercial organizations under the jurisdiction of the developing country signatory. It also requires that the cumulative payment turnovers for the traded goods, not payments of individual transactions, be balanced in an agreed-upon proportion within a specified period of time (typically 1 to 3 years). Trade flows are monitored and financial settlements occur through banks designated by the agreement's signatories.

EVIDENCE OF INSURABILITY = ДОКАЗАТЕЛЬСТВО СТРАХОВОЙ ПРИЕМЛЕМОСТИ – Evidence Of Insurability:- any statement of a person's physical condition, occupation, etc, affecting his acceptance for insurance.

EVIDENCE OF RIGHT TO MAKE ENTRY AND POWER OF ATTORNEY = ДОКАЗАТЕЛЬСТВО ПРАВА ОСУЩЕСТВИТЬ ВВОЗ И ДОВЕРЕННОСТИ АТТОРНЕЯ – Evidence Of Right To Make Entry And Power Of Attorney:- since goods can be entered in the United States only by the buyer or a licensed customhouse broker, a power of attorney from is required to give customhouse brokers permission to present their clients in matters pertaining to Customs.

EVOLUTION = ЭВОЛЮЦИЯ – Evolution is a process of selection originally described by Charles Robert Darwin in 'The Origin of Species', whereby organisms possessing one or more characteristics conferring increased fitness, tend to survive and proliferate more successfully than similar organisms without these features. Natural selection therefore occurs for organisms possessing these desirable characteristics, and their numbers increase disproportionately within the population. Evolution generally proceeds very slowly, by selection for very small differences in characteristics. However, occasional introduction of large beneficial (in terms of fitness) changes into the gene pool leads to punctuated evolution where major changes occur over relatively short times compared with the geological record. The Cactaceae appear to be a group of plants which have diversified relatively recently, with few, if any, authentic fossils. Compare with Creation. / Чарлз Робёт Давин (или Дарвин; Charles Robert Darwin; 1809–1882), Английский естествоиспытатель в своём основном труде 'Происхождение Видов Путём Естественного Отбора' (1859; The Origin of Species). В широком смысле слова под Эволюцией, от Латинского слова Evolutio, означающее Развёртывание, понимается представление об изменениях в обществе и природе, их направленности, порядке, закономерностях; определённое состояние какой-либо системы рассматривается как результат более или менее длительных изменений её предшествовавшего состояния. В более узком смысле слова под эволюцией понимается представление о медленных, постепенных количественных изменениях в отличие от революции. Диалектический материализм рассматривает эволюцию и революцию как взаимообусловливающие стороны развития, выступая против абсолютизации какой-либо одной из них. Под Эволюцией понимается одна из форм движения в природе и обществе; медленное, постепенное количественное изменение, приводящее при определённых условиях к переходу к новому качеству путём скачка, перерыву постепенности, революции. Эволюция и Революция – две неразрывно связанные между собой формы движения, развития природы и общества.

EWR = ELECTRONIC WAREHOUSE RECEIPT

EWS = EARLY WET SEASON

EX = ЭКС (или ФРАНКО) – When used in pricing terms such as Ex Warehouse or Ex Dock, it signifies that the price quoted applies only at the point of origin indicated; in the two examples, at the seller's factory or a dock at the import point. In practice, this kind of quotation indicates that the seller agrees to place the goods at the disposal of the buyer at the specified place within a fixed period of time. Also known as From. From Latin:- Ex (Out Of). / Экс, от Латинского слова Ex, означающее Из или От. В сделках купли-продажи (поставки) товара под Франко, от Итальянского слова Franco, означающее Свободный, понимается термин, обозначающий распределение транспортных расходов между продавцом и покупателем до места, указанного в договоре, например, Франко-Борт, Франко-Вагон, Франко-Склад Покупателя и тому подобное.

EXAMINATION COPY = ЭКЗЕМПЛЯР ОБСЛЕДОВАНИЯ (или КОПИЯ ОБСЛЕДОВАНИЯ) – In the US patent law, Examination Copy is a copy of an international application filed under the Patent Cooperation Treaty maintained by the International Preliminary Examining Authority.

EXAMINATION OF DOCUMENTS AND NEGOTIATION UNDER LETTERS OF CREDIT = ОБСЛЕДОВАНИЕ ДОКУМЕНТОВ И НЕГОЦИАЦИЯ ПО АККРЕДИТИВАМ – Examination of Documents and Negotiation under Letters of Credit (L/Cs):- examination of documents under L/Cs refers to comprehensive services with integration of document examination, document mailing, and reimbursement claiming provided by the bank for exporters under L/C. Functions:- the product is for the needs of exporters for settlement and collection of payments under L/Cs. Features:- (i) the product is for the needs of exporters for settlement and collection of payments under L/Cs; (ii) low risks:- the issuing bank's bank credit substitutes the commercial credit of importers and provides a conditional payment undertaking for exporters; (iii) high initiative:- so long as the document quality is ensured, the unconditional payment undertaking will be granted by the issuing bank, while the document quality is under the full control of exporters; and (iv) passing on costs:- banking fees related to issuance of the L/C may be borne by importers, which is advantageous for exporters. Target Customers:- (i) exporters who are not familiar or confident with the credit standing of importers, thus requiring additional commitment from the bank of importers; and (ii) exporters need to apply for packing loan from a local bank to finance the goods to be exported. Application Qualifications:- (i) the applicant shall be approved and registered in accordance with the law, and hold a business license that has passed the annual inspection or other valid certificates which fully prove its legal operation and scope of business; and (ii) the applicant shall have the qualification to engage in import and export trade. Process:- (i) the exporter (beneficiary) presents export

documents to the bank after the preparation and shipment of the goods under the L/C terms; (ii) after examining the documents, the bank mails the documents to the foreign issuing bank or the nominated bank to claim reimbursement; (iii) the foreign issuing bank presents the received documents to the applicant under the L/C; and (iv) the foreign issuing bank makes due payment to the bank and the bank will pay the exporter. Our Advantages:- (i) high quality of document examination and experienced in handling complicated articles, most professional among the peers; (ii) highly skilled negotiation skills and effective response to and disposal of disputes such as unjustified payment rejection; skillful application of international practices to protect your interests to the maximum extent; and (iii) fast collection of payment:- with a global network of correspondent banks, advanced technical means and rigorous system on expediting collection and appraisal, we guarantee timely collection of your export payments.

EXAMINATION OF GOODS = ДОСМОТР ТОВАРОВ (или ОБСЛЕДОВАНИЕ ТОВАРОВ) – Examination Of Goods is the physical inspection of goods by the Customs to satisfy themselves that the nature, origin, condition, quality and value of the goods are in accordance with the particulars furnished in the goods declaration. / Под Досмотром Товаров понимается физическая инспекция товаров сотрудниками таможни с тем чтобы убедиться в том, что сущность, происхождение, положение, качество и стоимость товаров соответствуют тем параметрам, которые были предоставлены в грузовой декларации.

EXAMINE = ЭКЗАМЕНОВАТЬ (или ОБСЛЕДОВАТЬ, или ДОСМАТРИВАТЬ) – Examine:- to test the state or condition of; inspect or analyze carefully. / Проверять состояние или положение чего-либо; инспектировать или анализировать более тщательно.

EXAMINER AUTOMATED SEARCH TOOLS = ИНСТРУМЕНТЫ (или СРЕДСТВА) АВТОМАТИЗИРОВАННОГО ПОИСКА ЭКЗАМЕНАТОРА (или СРЕДСТВА АВТОМАТИЗИРОВАННОГО ПОИСКА ОБСЛЕДОВАТЕЛЯ, или СРЕДСТВА АВТОМАТИЗИРОВАННОГО ПОИСКА ДОСМОТРЩИКА) – Examiner Automated Search Tools (EAST) is a system used by patent examiners within the United States Patent and Trademark Office (USPTO). / система, используемая патентными экспертами в .

EXAMINER'S AMENDMENT = ПОПРАВКА ОБСЛЕДОВАТЕЛЯ (или ПОПРАВКА ДОСМОТРЩИКА) – In the US patent law, Examiner's Amendment is a written confirmation of an amendment made to a trademark application. The trademark examining attorney assigned to the application will make the amendment after consultation with an applicant or the applicant's attorney. The examiner's amendment is merely a written confirmation of the agreement between the examining attorney and the applicant as to the amendment, and it is also a notice that the amendment will be made. The applicant need not respond to the examiner's amendment unless the applicant wishes to make further changes to the application.

EXAMINING ATTORNEY = ЭКЗАМЕНУЮЩИЙ АТТОРНЕЙ (или ОБСЛЕДУЮЩИЙ АТТОРНЕЙ, или ДОСМАТРИВАЮЩИЙ ПОВЕРЕННЫЙ) – In the US patent law, Examining Attorney is a USPTO (short for the United States Patent and Trademark Office) employee who examines (reviews and determines compliance with the legal and regulatory requirements of) an application for registration of a federally registered trademark.

EX BONUS DATE = ДАТА БЕЗ БОНУСА – Ex Bonus Date:- shares sold ex bonus entitle the seller to retain the bonus shares being issued. The ex bonus date occurs seven business days prior to and including the Record Date. The share price may fall on the ex bonus date to reflect the dilution effect as the company's assets are spread over a greater number of shares on issue. From Latin:- Ex (Out Of).

EXCEL = EXPORT CREDIT ENHANCED LEVERAGE

EXCEPTION = РАСХОЖДЕНИЕ – Exception:- notations made when the cargo is received at the carrier's terminal or loaded aboard a vessel. They show any irregularities in packaging or actual or suspected damage to the cargo. Exceptions are then noted on the bill of lading. / нотации, произведённые в тех случаях, когда груз, получен на терминале перевозчика или погружен на борт судна. Они отражают любые .

EXCEPTION CLAUSE = ОГОВОРКА О РАСХОЖДЕНИИ (или УСЛОВИЕ ОБ ОСВОБОЖДЕНИИ ОТ ОТВЕТСТВЕННОСТИ) – (1) Exception Clause:- contract wordings detailing how variations from a specified parameter will be handled. Exception Clause is a provision in an agreement, ruling, or statute, that grants which is otherwise not granted, or prevents which is otherwise not prevented.

(2) Exceptions Clause is a clause in the US Constitution that grants Congress the power to make exceptions to the constitutionally defined appellate jurisdiction of the Supreme Court. This clause refers to USCS Const. Art. III, § 2, Cl 2 of the US Constitution. This provision reads:- 'In all Cases affecting Ambassadors, other public Ministers and Consuls, and those in which a State shall be Party, the supreme Court shall have original Jurisdiction. In all the other Cases before mentioned, the Supreme Court shall have appellate Jurisdiction, both as to Law and Fact, with such Exceptions, and under such Regulations as the Congress shall make'.

EXCEPTION HOLDS = УДЕРЖИВАНИЯ ВСЛЕДСТВИЕ РАСХОЖДЕНИЯ – In the United States, Exception Holds means the safeguard provisions that allow a bank to extend the time to make funds available beyond two business days for local checks and five business days for nonlocal checks under Regulation CC. The safeguard exceptions are for new accounts, accounts with repeated overdrafts, aggregate deposits exceeding USD5 000.00, reasonable cause to doubt collectibility, and emergency conditions.

EXCEPTION RATE = УРОВЕНЬ РАСХОЖДЕНИЯ (или СТАВКА РАСХОЖДЕНИЯ) – Exception Rate:- a deviation from the class rate; changes (exceptions) made to the classification.

EXCERPT = EXPORT CERTIFICATION PROJECT

EXCESS = ЭКСЦЕСС (или ПРЕВЫШЕНИЕ, или ИЗБЫТОЧНОСТЬ) – (1) Excess:- from Latin, Excessus. Going over the prescribed amount or degree, e.g., excess luggage is luggage of which the weight is over the weight for free carriage. / Отступление в виде завышения от предусмотренных суммы или уровня, например, превышенный багаж, когда его вес превышает вес, допустимый к бесплатной перевозке. Под Эксцессом, от Латинского слова Эксцессус (Excessus), означающее Выход или Отступление, понимается:- (i) острое столкновение, нарушающее нормальный ход чего-либо, например, общественного порядка; или (ii) крайнее проявление чего-либо, невоздержанность, излишество. Эксцесс – крайнее проявление, редко встречающийся характер протекания процесса.

(2) In reference to the UK insurance, an Excess is specified initial amount of a claim that the insured has to contribute. If a claim is less than the excess stated in the policy, no payment is made by the insurers. Excesses do not apply to Employers' Liability Compulsory Insurance, as the insurer is responsible for any payments due to the employee. Also known as Deductible. The amount or proportion of some or all losses arising under an insurance or reinsurance contract that is the insured or reassured must bear. If the loss is less than the amount of the excess then the insured/reassured must meet the cost of it (unless there is other insurance in place to cover the excess). Compare deductible and retention. Excesses may either be compulsory or voluntary. An insured which accepts an increased excess in the form of a voluntary excess will receive a reduction in premium. In English insurance terminology, a deductible or franchise, after which losses will be paid. The term 'Excess' was used for many years in the marine market to denote an amount that

had to be exceeded before a partial loss claim attached to the policy. Once the excess was passed the amount of the claim above the amount of the excess was paid. The term has gradually disappeared in the marine market, to be replaced by the term 'Deductible', which has the same effect on partial loss claims. / Эксцедент, от Латинского слова Exess, максимальная сумма собственного участия страховщика в покрытии какого-либо риска. Термин связан с перестрахованием, суть которого сводится к распределению страховщиком (цедентом) своих рисков, которое осуществляется путём передачи цедентом части своих рисков другой (перестраховочной) компании – цессионеру. Выделяются Эксцедент Убытка и Эксцедент Убыточности. При использовании системы эксцедента убытка по наступлении страхового случая и установления размера страховой суммы цедент выплачивает определённый в договоре перестрахования приоритет (то есть максимальную сумму своих обязательств при несении страхователем убытка), а перестраховщик выплачивает сумму превышения. Во втором случае (эксцедент убыточности) подсчитывается максимальная сумма ответственности страховщика за определённый период. Общая убыточность соответствующего периода. превышающая этот уровень, автоматически покрывается перестраховщиками (цессионерами). Эксцедент:- в страховом деле, система перестрахования, согласно которой страховая организация передаёт в перестрахование часть рисков, принятых на страхование. Различают следующие виды эксцедентов:- (i) Эксцедент Риска – договорённость о перестраховании убытка по данной категории риска; (ii) Эксцедент Суммы – перестрахование, при котором перестраховочное возмещение выплачивается лишь при превышении определённого лимита, причём в отличие от безусловной франшизы показывается только это превышение; и (iii) Эксцедент Убытка – часть страховой суммы, превышающая определённый размер по одной категории риска. Эксцедент – сумма риска, подлежащая перестрахованию сверх суммы собственного удержания страховой компанией, которая приняла этот риск. Эксцедент обычно составляет умноженную в определённое число раз сумму собственного удержания передающей компании. Если сумма такого эксцедента является недостаточной для полного перестрахования риска, за первым эксцедентом может следовать второй эксцедент, третий эксцедент и так далее до полного перестрахования перестраховываемого риска.

EXCESSIVE CLEARER WASTE = ИЗЛИШНИЙ (или ЧРЕЗМЕРНЫЙ) ОТХОД ЧИСТИТЕЛЯ (или БЕГУНА) – Excessive Clearer Waste:- a higher that normal amount of short and regular fibers that become attached to the drafting rolls and are transferred to the clearer brushes to accumulate in abnormal amounts until they are removed manually.

EXCESSIVE DEFICIT PROCEDURE = ПРОЦЕДУРА ЧРЕЗМЕРНОГО ДЕФИЦИТА – Excessive Deficit Procedure:- the provision defined in Article 104 of the EC Treaty and specified in Protocol No 20 (on the excessive deficit procedure) requires EU Member States to maintain budgetary discipline, defines criteria for a budgetary position to be considered an excessive deficit and sets out the steps to be taken following the observation that the criteria for the budget balance or government debt have not been fulfilled. This is supplemented by Council Regulation (EC) No 1467/97 of 07 July 1997 on speeding up and clarifying the implementation of the excessive deficit procedure, which is an element of the Stability and Growth Pact.

EXCESSIVE FINISH = ИЗЛИШНЯЯ ОТДЕЛКА (или ЧРЕЗМЕРНАЯ ОТДЕЛКА) – Excessive Finish:- excess comes off on needle, reducing sewing ability. Thread defects, and namely – Finish. / Порок или дефект ниток.

EXCESSIVE FULLNESS = ИЗЛИШНЯЯ ПОЛНОТА (или ЧРЕЗМЕРНАЯ ПОЛНОТА) – Excessive Fullness:- caused where piece surface not smoothed prior to stitching. Sewing Room Defects. / втачивание (stitching). Порок или дефект швейного производства.

EXCESSIVE WEAR = ЧРЕЗМЕРНЫЙ ИЗНОС (или ИЗЛИШНЯЯ НОСКА) – Excessive Wear:- Garments:- men's gabardine shirts; Fabric Construction:- (i) Count:- 98 x 50; (ii) Warp:- 20/1 75% 2-in. 3-den. dull viscose rayon 25% 2-in. IV2-den. dull viscose rayon; (iii) Filling:- same as warp. Complaint:- several shirts were returned because of excessive wear at the collars and cuffs. Analysis:- analysis of fabric construction and tensile-strength tests on cuttings of the fabric taken from the garments, as well as on finished file head ends, disclosed no significant difference. However, laboratory abrasion tests made on both new and worn shirts and the same file head ends showed the latter to be very much superior when subjected to the same number of abrasion cycles. Further analysis revealed that the reference head ends as well as the fabric in the shirts had approximately the same content of urea formaldehyde resin. The poor resistance to abrasion in wear was, therefore, attributed to some faulty operation in application of the resin. Resin finishes are commonly used on rayon fabrics of this type to impart stability in laundering, and it should not be inferred that such finishes are normally detrimental to the wearing qualities of the fabrics to which they are applied. It must be noted, however, that the slightest lack of control during finishing – such as inadequate curing and polymerization, incomplete scouring, or overdrying – may contribute to the tendering or embrittlement of the fibers, with attendant loss of abrasion resistance. / Уточина:- такая же как и основа.

EXCESS OF LOSS = ПРЕВЫШЕНИЕ УБЫТКА (или ЭКСЦЕСС УБЫТКА, или ЭКСЦЕДЕНТ УБЫТКА) – In reinsurance, Excess Of Loss is a form of reinsurance under which recoveries are available when a given loss exceeds the cedant's retention defined in the agreement. In reference to the UK insurance, Excess of Loss is a type of reinsurance that covers specified losses incurred by the reassured in excess of a stated amount (the excess) up to a higher amount, for example £5 million excess of £1 million. An excess of loss reinsurance is a form of non-proportional reinsurance. / который покрывает спецификационные убытки .

EXCESS POINT = ТОЧКА ПРЕВЫШЕНИЯ (или ТОЧКА ЭКСЦЕССА) – Excess Point is a term used in excess of loss reinsurance to determine the point at which the reinsurer comes on risk.

EXCESS RESERVES = СВЕРХНОРМАТИВНЫЕ РЕЗЕРВЫ (или ИЗЛИШНИЕ РЕЗЕРВЫ, или ИЗБЫТОЧНЫЕ РЕЗЕРВЫ) – In the United States, Excess Reserves are an amount of funds held by an institution in its account at a Federal Reserve Bank in excess of its required reserve balance and its contractual clearing balance. Amount of reserves held by an institution in excess of its reserve requirement and required clearing balance. See also Reserves.

EXCESS VALUE INSURANCE = СТРАХОВАНИЕ ПРЕВЫШАЕМОЙ СТОИМОСТИ – Excess Value Insurance:- this term was commonly used in the marine market in reference to insurances effected additionally to the policy covering the hull and machinery of a ship. These could apply to insurable interest in respect of ship-owners' liabilities, or additional insurances covering hull interests, e.g., disbursements. Today, the term 'Excess Liabilities' is used for the former, and 'Increased Value' for the latter.

EXCHANGE = БИРЖА – The Exchange does not set prices. The exchange provides a neutral, orderly, and transparent trading forum where buyers and sellers can come together and publishes the prices that result from those transactions. The prices that emerge from trading are determined by supply and demand. If there are more buyers than sellers, the price goes up. If there are more sellers than buyers, it goes down. A market held regularly and organized in accordance with fixed customs and practices, e.g., bond, commodity, forex, option, stock exchanges. The regulated exchange environment provides for transparent price discovery, with visibility of the bid and offer prices shown in the central order book. It also provides for certainty of outcome, as trades are processed through exchange-operated or closely related after-trade service providers, very often with central party clearinghouse guarantees. The transaction and counterparty risk is then transferred to the exchange or clearer. The robustness of this model has proven its worth by providing liquidity to users of capital markets, including on days when OTC and interbank market segments have seized up. Since August 2007, exchanges have remained the major providers of liquidity to the markets, along with central banks. A central marketplace with

established rules and regulations where buyers and sellers meet to trade futures and options contracts or securities. Exchanges include designated contract markets and derivatives transaction execution facilities. See also Contract Market. / , например, . Под Биржей, от Голландского слова Бёрс (Beurs), от Немецкого слова Бёрзэ (Börse), от Французского слова Бурс (Bourse), от Итальянского слова Борса (Bórsa), от Испанского слова Больса (Bolsa), от Английского слова Эксчейндьж (Exchange)) понимается современная наиболее развитая форма регулярно функционирующего оптового рынка массовых заменимых товаров, продающихся по стандартам (установленным сортам), а иногда и по образцам (зерно, сахар, шерсть, хлопок, кофе, каучук, металлы), а также рынка заменимых ценных бумаг (акций, облигаций) и иностранной валюты. Существуют товарные, фондовые и валютные биржи. Зачатки товарной и вексельной (валютной) бирж (торговля векселями) появились в XV–XVI веках в Итальянских городах Средиземноморья (Венеции, Генуе и Флоренции), где возникли мануфактуры и на этой почве развилась широкая внешняя торговля, и в городе Брюгге (Нидерланды). В Брюгге на площади возле дома знатного менялы и маклера ван дер Бурсе (герб которого состоял из трёх кошельков, откуда слово Биржа – от позднелатинского слова Бурса (Bursa), означающее Кошелёк) собирались купцы из разных стран для покупки иностранных векселей и обмена торговой информацией. В начале XVII века была создана Амстердамская Биржа (1608), на которой котировались главным образом облигации королевских займов и акции Голландской и Британской Ост-Индских торговых компаний, а также зародилась биржевая торговля колониальными товарами. В Лондоне ещё в XVI веке (1566) возникла Королевская Биржа (товарная и вексельная), а в конце XVII века – Лондонская Фондовая Биржа. В Нью Йорке Фондовая Биржа была создана неофициально в конце XVIII века и официально в начале XIX века. В Париже, Берлине и Вене биржи были организованы в XVIII веке. Расцвет бирж относится ко 2-й половине XIX века и связан с развитием капиталистического производства и ростом объёма торговли, транспорта и связи (товарная биржа), широким развитием акционерных обществ (фондовая биржа). Фондовая Биржа выполняет важную экономическую функцию в капиталистических странах. Через неё мобилизуются средства для вложений в основной капитал промышленности и происходит огромная централизация капитала. На биржах осуществляется купля-продажа акций и облигаций акционерных обществ, а также облигаций государственных займов. Последнее даёт государству средства, за счёт которых оно покрывает бюджетные дефициты. В эпоху общего кризиса капитализма растёт удельный вес облигаций внутренних государственных займов в общей сумме ценных бумаг, котирующихся на бирже. На биржах складываются курсы (уровни цен) ценных бумаг. Эти курсы – чуткий барометр любых изменений в экономической и политической жизни той или иной капиталистической страны. Курсы резко падают в годы кризисов и неблагоприятной конъюнктуры и, наоборот, повышаются в периоды оживления и подъёма производства. Всеобщее падение курсов акций называется Биржевым Крахом. Магнаты финансового капитала всегда выигрывают на биржах, а мелкие и средние капиталисты проигрывают. Заправилы монополий, контролирующие производство, раньше других узнают о намечающемся падении или росте производства, сокращении или увеличении дивидендов и падении или росте курсов бумаг. Покупая ценные бумаги по низкому курсу и продавая их по высокому курсу, монополисты получают крупную биржевую прибыль. До середины 1860-х фондовая биржа не играла большой роли. Основную массу ценных бумаг составляли облигации государственных займов, акций предприятий было мало. С 1870-х акционерные общества быстро растут и становятся главной формой капиталистических предприятий, а акции – главным видом ценных бумаг, котирующихся на фондовых биржах. После 1-й Мировой Войны 1914–18 США заняли ведущее место в мировой капиталистической экономике и главную роль стала играть Нью Йоркская Фондовая Биржа. Курсовая стоимость акций, котирующихся на этой бирже, к концу 1967 превысила 600 миллиардов Долларов, в то время как на 2-й по размеру Лондонской бирже она составила около 200 миллиардов Долларов. На Нью Йоркской и Лондонской биржах котируются акции самых крупных акционерных обществ, предприятия которых дают более 3/4 продукции промышленности этих стран. Крупные фондовые биржи функционируют в Париже (1967 – свыше 20 миллиардов Долларов), Франкфурте-на-Майне (1967 – около 18 миллиардов Долларов), Базеле и других. Организация бирж разнообразна, но в основном она сводится к 2 типам:- (i) биржа как открытый, свободный для доступа всех торгующих рынок, находящийся под наблюдением государства (Австрия, Франция и другие); и (ii) биржа как замкнутая корпорация торгующих, доступная лишь для её членов и свободная от вмешательства государства (Великобритания, США). Доступ в последнюю обусловлен известным имущественным цензом, рекомендациями нескольких старых членов биржи и баллотировкой. Из среды биржевой корпорации выбирается руководящий орган биржи – Биржевой Комитет (в США – Совет Управляющих). При нём существует так называемая Допускающая Комиссия, которая решает вопрос о допуске новых ценных бумаг. Она принимает меры к тому, чтобы не допустить на официальную биржу ценные бумаги мелких и средних акционерных обществ. Во многих странах существуют неофициальные, иногда называемые чёрными, биржи, где котируются любые ценные бумаги. Хозяева монополий являются, как правило, членами биржи, а биржевой комитет состоит из их ставленников. Вот почему чинятся препятствия желающим стать членами биржи. Членство на Нью Йоркской Фондовой Бирже стоит 200 000 Долларов. Кроме того, необходимо представить несколько рекомендаций старых членов биржи. В США к 1968 насчитывалось менее 1 400 членов биржи. Члены биржи подразделяются на Биржевых Посредников (Маклеров и Брокеров) и Дельцов (или Дилеров), которые спекулируют бумагами за свой счёт. Широкая публика участвует в биржевых операциях через посредство маклеров. Крупнейшие капиталистические банки имеют своих маклеров. Для публикации данных о количестве проданных ценных бумаг и их курсов при биржевых комитетах существуют котировальные комиссии, публикующие ежедневно курсовые бюллетени. Несмотря на рост операций, объём которых колоссально вырос, самостоятельная роль биржи в эпоху империализма падает. Операции с ценными бумагами сосредоточиваются в крупных банках, которые размещают эти бумаги среди своих клиентов. В условиях домонополистического капитализма при фондовых биржах организовывались валютные биржи, где продавалась и покупалась иностранная валюта. При империализме сделки с иностранной валютой и золотом почти целиком переходят в руки банковских монополий. Товарная Биржа представляет собой оптовый рынок, где происходит торговля заменимыми сырьевыми и продовольственными товарами по образцам или стандартам, в которых указан перечень необходимых признаков (качество, сортность). В США в качестве мировых торговых рынков выступают Нью Йоркские и Чикагские, в Великобритании – Лондонские и Ливерпулские товарные биржи. В Нью Йорке существуют специализированные Биржа Хлопка, Кофе, Сахара, Какао и другие, в Чикаго – Зерновая Биржа. На товарных биржах осуществляется купля-продажа не только реально существующих товаров, но и товаров, которые ещё будут произведены (например, Пшеница будущего урожая), что ведёт к разбуханию биржевого оборота. В условиях государственно-монополистического капитализма правительство, особенно в США, использует свои средства для создания запасов биржевых товаров (в частности, стратегического сырья) и воздействия на цены, например, для снижения цен на сырьё, производимое развивающимися странами. При этом лица, связанные с правительством, зная о мерах, предпринимаемых им, играют через подставных лиц на биржах и наживают огромные прибыли. При господстве монопольных цен роль товарных бирж падает, так как биржа может действовать лишь в условиях свободно колеблющихся цен. Биржевые сделки с ценными бумагами (а также с товарами и иностранной валютой), заключаемые на биржах, подразделяются на:- (i) кассовые, при которых сразу или в ближайшие 2–3 дня уплачиваются деньги; и (ii) срочные, при которых передача акций (или товара) и уплата денег совершаются через определённый срок, обычно в пределах месяца. Срочные сделки носят наиболее спекулятивный характер, так как в результате разницы в курсах или ценах на момент заключения сделки и на момент осуществления расчётов по ней один

участник сделки обогащается за счёт другого. Если проигравший уплачивает только проигранную разницу без передачи акций, то сделка называется 'Игрой На Разницу'. Крупные продавцы акций, играющие на понижении курса акций, называются Понижателями ('Медведями'), а покупатели, играющие на их повышении, называются Повышателями ('Быками'). Капиталистические банки не только кредитуют биржевую спекуляцию путём выдачи биржевым дельцам ссуд под залог акций, но и сами активно участвуют в этой спекуляции, покупая ценные бумаги и перепродавая их по более высокому курсу. В дореволюционной России первая товарная и вексельная биржа была официально открыта в 1703 в Петербурге. Большинство бирж было организовано во 2-й половине XIX века (в 1914 их было 115). Главной была Петербургская Биржа, которая имела товарный и фондовый отделы. На ней котировались 312 различных видов акций на 2 миллиарда Рублей, а также облигации государственных и гарантированных государством займов. Главную роль на бирже играли крупнейшие Петербургские банки. В начале 1-й Мировой Войны 1914–18 официальные биржи были закрыты, но чёрные биржи продолжали функционировать (смотрите также Биржевые Комитеты в России). В бывшем СССР сделки с ценными бумагами были запрещены в Декабре 1917, а в Январе 1918 были аннулированы облигации царских займов. Биржи существовали в 1921–30 и являлись органами государственного регулирования рынка в условиях многоукладной экономики. Подавляющее большинство членов бирж составляли социалистические предприятия и учреждения. В 1923 были организованы фондовые отделы товарных бирж, осуществлявшие операции с иностранной валютой, государственными ценными бумагами и с акциями и паями акционерных и других обществ, допускавшихся законом. Число бирж в СССР достигло 100. В 1930 в результате ликвидации многоукладности в экономике страны и усиления планового начала необходимость в биржах отпала и они были закрыты. Биржа – место, предназначенное для заключения сделок с ценными бумагами и фьючерсами. Например, наиболее крупные биржи, осуществляющие торговлю акциями в США:- Нью Йоркская Фондовая Биржа (New York Stock Exchange) и Американская Фондовая Биржа (American Stock Exchange®). Торговля фьючерсами осуществляется на биржах в Чикаго, Канзас Сити, Нью Йорке и других городах, где продаются фьючерсные контракты. Под Биржей, от Немецкого слова Burse, от Латинского слова Bursa, означающее Кошелёк, понимается регулярно функционирующий, организационно определённый оптовый рынок однородных товаров, на котором заключаются сделки купли-продажи крупных партий товара. Биржа, играя роль посредника в торговых операциях, способствует установлению контактов между продавцами и покупателями товара и формированию оптовых рыночных цен посредством биржевых торгов. В зависимости от вида представленных на бирже товаров различают:- (i) товарные биржи, торгующие материальными ценностями; (ii) фондовые биржи, торгующие ценными бумагами; (iii) валютные биржи, торгующие валютой; (iv) универсальные биржи, торгующие разнообразными товарами; (v) биржи труда, способствующие трудоустройству безработных и лиц, желающих сменить место работы.

EXCHANGE = ВЗАИМОБМЕН – (1) Exchange:- it is to give one thing and take an equivalent in return. / Обмен:- (1) Бартер:- торговля товарами и услугами, ведущаяся частными лицами или компаниями в обмен на товары и услуги, имеющие такую же стоимость. (2) Финансы корпорации:- предложение корпорации обменять один вид ценных бумаг на другой. Например, компания может потребовать, чтобы держатели её конвертируемых облигаций обменяли их на обыкновенные акции. Другой пример:- компания, испытывающая финансовые затруднения, может попросить держателей облигаций обменять их на акции, чтобы уменьшить или ликвидировать свою задолженность. Смотрите также Swap (Своп). (3) Валюта:- обмен одной валюты на другую. Также называется как Foreign Exchange (Иностранная Валюта). (4) Взаимные фонды:- 'переброска' инвестиций из одного взаимного фонда в другой внутри одной 'семьи' фондов либо между 'семьями' фондов в случае, если операция осуществляется посредством брокерской фирмы, предлагающей средства нескольких компаний. Часто управляющие компании не требуют дополнительных комиссионных (load), если активы остаются в том же фонде. Если один фонд продаётся с целью приобретения другого, возникает необходимость уплаты налогов, предполагающая, что происходит реализация доходов или убытков от прироста капитала, если только сделка не проходит по счетам с отсроченным налогообложением, таким, как Индивидуальный Пенсионный Счёт (Individual Retirement Account (IRA)) и счёт Кео (Keogh account).

(2) In the United States, 'Exchange' and 'Redemption-Exchange' are interchangeable terms referring to the authorized redemption (payment) of eligible securities presented and surrendered for the purpose of applying the proceeds (what they're worth) for other securities according to Treasury regulations. The current exchange offering (see Title 31 Code of Federal Regulations part 352, also available as Department of the Treasury Circular, Public Debt Series 2-80) permits owners of Series E and EE savings bonds as well as savings notes (but not Series I Bonds) to exchange a minimum of USD500 worth of such securities for current income savings bonds of Series HH and continue to postpone reporting interest (for Federal income tax purposes) on the securities surrendered until the HH bonds are cashed, reach final maturity (20 years after issue), or some other taxable transaction occurs, whichever happens first. The deadline for exchanging E and EE bonds, as well as savings notes, is one year following the month those securities reach final maturity and stop earning interest. Please note:- August 2004 will be the last issue month for HH/H bonds. After 2004-August-31, you will no longer be able to exchange your EE/E bonds for HH bonds.

EXCHANGEABLE ION = ОБМЕНИВАЕМЫЙ ИОН – Exchangeable Ion is the electrically charged form of an element that is adsorbed by soil particles.

EXCHANGEABLE SODIUM FRACTION = ОБМЕНИВАЕМАЯ ФРАКЦИЯ НАТРИЯ – Exchangeable Sodium Fraction is the ratio of exchangeable sodium to the remaining exchangeable cations in soil.

EXCHANGE ARBITRAGE = ВАЛЮТНОЕ АРБИТРАЖИРОВАНИЕ – Exchange Arbitrage:- buying and selling currency for a profit. In international finance, exchanging a note denominated in one currency and subject to certain conditions for one denominated in another currency and subject to certain other conditions. See also Arbitrage.

EXCHANGE BILL OF LADING = ОБМЕННЫЙ КОНОСАМЕНТ – Exchange Bill Of Lading is a bill of lading issued in exchange for another bill of lading.

EXCHANGE CAPACITY = ОБМЕННАЯ СПОСОБНОСТЬ – Exchange Capacity is the total charge of the adsorption complex active in the adsorption of ions.

EXCHANGE CERTIFIED STOCKS = СЕРТИФИЦИРОВАННЫЕ БИРЖЕЙ ЗАПАСЫ – Exchange Certified Stocks are the stocks of commodities held in depositories or warehouses certified by an exchange-approved inspection authority as constituting good delivery against a futures contract position. Current total certified stocks are reported in the press for many important commodities. / должным образом осуществлённая поставка.

EXCHANGE COVER SCHEME = СХЕМА ПОКРЫТИЯ ВАЛЮТЫ – In the United Kingdom (UK), the Exchange Cover Scheme (ECS) is a scheme first introduced in 1969 whereby UK public bodies raise foreign currency from overseas residents, either directly or through UK banks, and surrender it to the Exchange Equalisation Account (EEA) in exchange for sterling for use to finance expenditure in the United Kingdom. HM Treasury sells the borrower foreign currency to service and repay the loan at the exchange rate that applied when the loan was taken out.

EXCHANGE EQUALISATION ACCOUNT = СЧЁТ УРАВНИВАНИЯ ВАЛЮТЫ – In the United Kingdom, Exchange Equalisation Account (EEA) is an account of central government held by the Bank of England in which transactions in the official reserves are recorded. It is the means by which the government, through the Bank of England, influences exchange rates.

EXCHANGE FOR PHYSICAL = ОБМЕН НА ФИЗИЧЕСКОЕ – Exchange For Physical (EFP) is a facility allowed by futures exchanges that enables clients to swap their futures positions to a physical market such as London or vice versa while avoiding outright price exposure. Normal transactions on a futures exchange are conducted by open outcry on the floor of the exchange – thereby leading to uncertainty as to the realised price of the futures contract. They are then registered with the exchange. With an EFP, the price of the exchange contract is determined by the differential to the spot physical leg, and this exchange facility allows the contract to be registered without the trade passing over the floor. There are two types of EFP transactions, the swap and the outright. The EFP Swap is purely a buy futures and sell loco London transaction, or vice-versa, where the futures position is exchanged for a spot physical. The price reflects the difference between the spot and futures value dates as well as the different locality and contract terms of the futures contract. The EFP swap is quoted as spot-to-futures swap in terms of the differential in dollars. For example, in April, a September EFP swap may be quoted USD1.45 – USD1.65 per ounce. This means the dealer will sell spot loco London and buy the futures at a premium of USD1.45 per ounce or sell the futures at a premium of USD1.65 per ounce. An EFP Outright is a mechanism through which a client may trade out of or into a futures position when the exchange is closed via a physical transaction. It is a two-step process. First, there is an outright spot physical transaction. Second, an EFP swap is done using the same spot price basis as the first transaction, thereby unwinding the loco London exposure. The client is therefore left with an outright futures contract. It is important when conducting off-exchange transactions in this way that they are transacted and documented in accordance with the rules and regulations of the particular futures exchange. Exchange For Physical (EFP) is a mechanism that allows a client to open or close a futures contract through the physical market when the futures market in question is closed. A dealer will deal for the client in the London market and then replace the position with a futures market position when the exchange opens. The differential in the price between the spot and the futures contract is often itself referred to as the EFP. A transaction in which the buyer of a cash commodity transfers to the seller a corresponding amount of long futures contracts, or receives from the seller a corresponding amount of short futures, at a price difference mutually agreed upon. By other words, a transaction generally used by two hedgers who want to exchange futures for cash positions. In this way, the opposite hedges in futures of both parties are closed out simultaneously. Also known as Against Actuals (AA), Exchange of Futures For Cash, Ex-Pit Transactions, or Versus Cash. See also Exchange Of Futures For Cash. Exchange For Physical (EFP) is an actual exchange between an OTC contract and a futures contract which takes place off exchange between parties.

EXCHANGE HOLIDAY = ПРАЗДНИЧНЫЙ ДЕНЬ ДЛЯ БИРЖИ – Exchange Holiday:- this term means any day which the board of directors of the exchange may designate as an exchange holiday and on which the exchange shall be closed.

EXCHANGE LICENSE = ВАЛЮТНАЯ ЛИЦЕНЗИЯ – Exchange Licenses serve a similar purpose as import licenses but protect, instead, a country's foreign exchange reserves or allocate such reserves so they may be used advantageously.

EXCHANGE MARKET INFORMATION PROGRAM = ИНФОРМАЦИОННАЯ ПРОГРАММА БИРЖЕВОГО РЫНКА – Exchange Market Information Program seeks to promote constituent confidence in and support for the New York Stock Exchange (NYSE®) trading mechanism, and to strengthen the mutuality of purpose between the NYSE® and member firm listed company and institutional investor. Teams of NYSE® staff members, floor brokers, and specialists present programs tailored to constituent audiences in cities nationwide. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®).

EXCHANGE OFFICE = ОБМЕННЫЙ ПУНКТ – Exchange Office:- banking department/teller area that handles currency exchange and related business, such as coin dealing, traveller's checks and letters of credit.

EXCHANGE OF FUTURES FOR CASH = ОБМЕН ФЬЮЧЕРСОВ НА РЕАЛЬНОЕ СЫРЬЁ – Exchange Of Futures For Cash is a transaction in which the buyer of a cash commodity transfers to the seller a corresponding amount of long futures contracts, or receives from the seller a corresponding amount of short futures, at a price difference mutually agreed upon. By other words, a transaction generally used by two hedgers who want to exchange futures for cash positions. In this way, the opposite hedges in futures of both parties are closed out simultaneously. Also known as Against Actuals (AA), Exchange of Futures For Cash, Ex-Pit Transactions, or Versus Cash. See also Exchange For Physicals.

EXCHANGE OF FUTURES FOR PHYSICALS = ОБМЕН ФЬЮЧЕРСОВ НА РЕАЛЬНОЕ СЫРЬЁ – Exchange Of Futures For Physicals:- a futures contract provision involving an agreement for delivery of physical product that does not necessarily conform to contract specifications in all terms from one market participant to another and a concomitant assumption of equal and opposite futures positions by the same participants at the time of the agreement. A transaction in which one party buys the physical commodity and simultaneously sells futures and the other party does the opposite-sells the physical commodity and simultaneously obtains a long futures position. Also known as Against Actual (AA) Transaction. This type of trade fixes the price of a physical trade deal in the futures market.

EXCHANGE OF FUTURES FOR SWAPS = ОБМЕН ФЬЮЧЕРСОВ НА СВОПЫ – Exchange Of Futures For Swaps:- a privately negotiated transaction in which a position in a physical delivery futures contract is exchanged for a cash-settled swap position in the same or a related commodity, pursuant to the rules of a futures exchange. See also Exchange For Physicals.

EXCHANGE PALLET = ОБМЕННЫЙ ПОДДОН – Exchange Pallet is a pallet intended for use among a designated group of shippers and receivers where ownership of the pallet is transferred with the ownership of the unit load; common pool pallet. See also Pallet. Exchange Pallet is a pallet which can be replaced by a pallet of the same type on the basis of mutual agreement. / Обменный Поддон (Exchange Pallet):- поддон, подлежащий обмену на идентичный поддон на основе взаимной договорённости. Смотрите также Поддон (Pallet).

EXCHANGE PRICE = БИРЖЕВАЯ ЦЕНА – Exchange Price is the price for securities and other fungible goods traded on an exchange. The exchange price is expressed as a percentage of the nominal value or in Euro per unit. The official exchange price is determined by exchange brokers.

EXCHANGE RATE = ОБМЕННЫЙ КУРС – Exchange Rate is a rate of exchange between two currencies. Fixed exchange rates involve restrictions of capital imports and exports. Floating exchange rates, by contrast, are driven by supply and demand on foreign exchange markets. Exchange rates refer to cashless payments, while the banknote rate is the exchange rate for notes and coins. Rate used to convert an amount from one currency into another. Exchange Rate is the price of a country's currency in terms of another country's currency. The rate at which one currency can be exchanged for another, usually expressed as the value of the one in terms of the other. Exchange Rate is the price of one currency expressed in terms of another, i.e. the number of units of one currency that may be exchanged for one unit of another currency. Influences on exchange rates include differences between interest rates and other

asset yields between countries; investor expectations about future changes in a currency's value; investors' views on the overall the overall quantity of Dollar-denominated assets in circulation; arbitrage; and central bank exchange rate support. Conversion price for exchanging one currency for another. The Exchange Rate is the ratio at which the currency of one country can be exchanged for the currency of another country. The rate at which one currency is exchanged for another. The average of the bid and asked prices is taken as the mean rate. Exchange Rate is the number of units of one currency that can be exchanged for one unit of another currency. The exchange rate affects the price of grain to foreign buyers. For example, a decline (increase) in the value of the US Dollar reduces (increases) the price of US commodities for foreign buyers. Exchange Rate is the value of one currency expressed in terms of another. For example, if EUR/USD is 1.0754, 1 Euro is worth USD1.0754. / Ставка, по которой одна валюта обменивается на другую. Средний арифметический показатель курсов предлагаемой к продаже или покупке валюты и составляет усреднённый курс. Конверсионная стоимость. , то есть . Обменный Курс – цена, по которой валюта одной страны может быть куплена (конвертирована) в обмен на валюту другой страны. Например, обменный курс Доллара США (USD) на Великобританский Фунт (GBP; именуемый также как Кабель (Cable) или Стерлинг (Sterling)) отличается от обменного курса Доллара США на Евро (EUR). На обменные курсы влияет широкий спектр макроэкономических и политических факторов. За один торговый день обменнные курсы обычно изменяются незначительно. Некоторые обменные курсы устанавливаются по соглашению.

EXCHANGE RATE MECHANISM = МЕХАНИЗМ ОБМЕННОГО КУРСА – Exchange Rate Mechanism (ERM):- the exchange rate and intervention mechanism of the European Monetary System (EMS) provided for central rates of participating currencies against the ECU. These central rates were used to establish a grid of bilateral central rates between the participating currencies. Exchange rates were allowed to fluctuate within a band around the bilateral central rates. The central rates could be adjusted, subject to mutual agreement between all countries participating in the ERM. In 1999, at the start of Stage Three of Economic and Monetary Union (EMU), the ERM was superseded by ERM II.

EXCHANGE RATE MECHANISM II = II МЕХАНИЗМ ОБМЕННОГО КУРСА – Exchange Rate Mechanism II (ERM II) is the framework for exchange rate policy cooperation between the Euro area countries and those outside the Euro area. Membership of the mechanism is voluntary. Nevertheless, Member States with a derogation are expected to join the mechanism, thereby establishing a central parity of their currency against the Euro and a fluctuation band around the central parity. The standard fluctuation band is ±15%. In the case of countries with a very high level of convergence with the Euro area, a narrower band can be agreed on at the request of the non-euro area Member State concerned. Exchange Rate Mechanism II (ERM II):- the exchange rate arrangement which provides a framework for exchange rate policy cooperation between the Euro area countries and the EU Member States not participating in Stage Three of the Economic and Monetary Union (EMU). / и полоса флуктуации (колебания) вокруг центрального паритета.

EXCHANGE RATE PARITY = ПАРИТЕТ ОБМЕННОГО КУРСА – Exchange Rate Parity:- the officially fixed ratio of the value of one currency against another, i.e. the equivalence between the market or declared values of two different currencies. Dollar parity, for example, is the ratio of a currency against the US Dollar. See also Gold Parity. / , то есть .

EXCHANGE RISK = ВАЛЮТНЫЙ РИСК – Exchange Risk:- exposure incurred by a business entity or bank doing business abroad on the future value of its cash flow due to uncertainties concerning future prices of currency and fluctuations in foreign exchange rates. Businesses can protect themselves from such risk by hedging. Exchange Risk is the effect that unanticipated exchange rate changes have on the value of the firm. This chapter explores the impact of currency fluctuations on cash flows, on assets and liabilities, and on the real business of the firm. Three questions must be asked. First, what exchange risk does the firm face, and what methods are available to measure currency exposure? Second, based on the nature of the exposure and the firm's ability to forecast currencies, what hedging or exchange risk management strategy should the firm employ? And finally, which of the various tools and techniques of the foreign exchange market should be employed: debt and assets; forwards and futures; and options. The chapter concludes by suggesting a framework that can be used to match the instrument to the problem. What is exchange risk? Exchange risk is simple in concept:- a potential gain or loss that occurs as a result of an exchange rate change. For example, if an individual owns a share in Hitachi, the Japanese company, he or she will lose if the value of the yen drops. Yet from this simple question several more arise. First, whose gain or loss? Clearly not just those of a subsidiary, for they may be offset by positions taken elsewhere in the firm. And not just gains or losses on current transactions, for the firm's value consists of anticipated future cash flows as well as currently contracted ones. What counts, modern finance tells us, is shareholder value; yet the impact of any given currency change on shareholder value is difficult to assess, so proxies have to be used. The academic evidence linking exchange rate changes to stock prices is weak. Moreover the shareholder who has a diversified portfolio may find that the negative effect of exchange rate changes on one firm is offset by gains in other firms; in other words, that exchange risk is diversifiable. If it is, than perhaps it's a non-risk. Finally, risk is not risk if it is anticipated. In most currencies there are futures or forward exchange contracts whose prices give firms an indication of where the market expects currencies to go. And these contracts offer the ability to lock in the anticipated change. So perhaps a better concept of exchange risk is unanticipated exchange rate changes. These and other issues justify a closer look at this area of international financial management. Exchange Risk is the variability of a firm's value that results from unexpected exchange rate changes, or the extent to which the present value of a firm is expected to change as a result of a given currency's appreciation or depreciation. Foreign Exchange Risk is the risk that the return on an investment may be reduced or eliminated because of a change in the exchange rate of two currencies. For example, if an American has a Certificate of Deposit (CD) in the United Kingdom worth 1 million British pounds and the exchange rate is 2 USD: 1 GBP, then the American effectively has USD2 million in the CD. However, if the exchange rate changes significantly to, say, 1 USD: 1 GBP, then the American only has USD1 million in the CD, even though he/she still has 1 million Pounds. Foreign exchange risk is also called Exchange Rate Risk. / Хитаци (Hitachi). и флуктуации (колебания) обменных курсов валют. Валютный Риск, риск, связанный со ставкой обменного курса:- вероятность того, что колебания стоимости местной валюты относительно иностранных валют могут ослабить способность должника своевременно исполнять его финансовые обязательства. Такой риск может возникнуть в результате резкого падения или повышения стоимости местной валюты по отношению к иностранным валютам и проявиться даже при отсутствии каких-либо изменений в оценке риска, связанного с переводом средств. Риск, связанный со ставкой обменного курса, учитывается во всех рэйтиньгах, как международных, так и национальных, в отношении задолженностей как в местной, так и в иностранной валюте. Тест на устойчивость, применяемый в отношении риска, связанного со ставкой обменного курса, должен выявлять потенциальные пределы и вероятность значительного падения или повышения стоимости местной валюты относительно основных свободно конвертируемых валют (например, Доллар США, Японская Йена и Марка ФРГ) и валют, применяемых основными торговыми партнёрами. Риск, связанный со ставкой обменного курса, может повлиять на глобальные или национальные рэйтиньги за счёт того, что он влияет на стоимость обслуживания долга для должника, доступность и стоимость средств для погашения основной суммы долга, а также на спрос на результаты деятельности. Рэйтиньги кредитных рисков не учитывают риск того, что колебания ставок обменного курса могут изменить стоимость конкретных обязательств в местной валюте инвестора.

EXCHANGE RISK FACTOR = ФАКТОР БИРЖЕВОГО РИСКА – Exchange Risk Factor:- the Delta of an option as computed daily by the exchange on which it is traded. / Дельта опциона ежедневно вычисляется компьютером биржи, на которой этот опцион торгуется.

EXCHANGE RULES = БИРЖЕВЫЕ ПРАВИЛА (или РЕГЛАМЕНТ БИРЖИ) – Exchange Rules:- law requires each stock exchange to have exchange rules. The exchange rules are issued by the stock exchange council in agreement with the entity responsible for the stock exchange. They ensure that the stock exchange can perform its tasks and that the interests of customers and traders are protected. Specifically, the exchange rules regulate the organization of the stock exchange, the tasks of the stock exchange council, the stock exchange management and the trading surveillance office, the publication of all prices and trading volumes. They also regulate admission to stock exchange membership and participation in stock exchange trading.

EXCHANGE SUPERVISORY AUTHORITY = УПРАВЛЕНИЕ ПО НАДЗОРУ ЗА ДЕЯТЕЛЬНОСТЬЮ БИРЖ – The Exchange Supervisory Authority is usually the regional Ministry for Economic Affairs. The authority has the power to oversee stock exchange trading activities directly and comprehensively and also has emergency competence for the pursuit of breaches of insider law. In the fulfilment of its supervisory and control tasks, the exchange supervisory authority is entitled to use the services and resources of the trading surveillance office of the stock exchange and to issue directions to the office. The trading surveillance office has functional competence for the comprehensive monitoring of day-to-day trading activities. It records systematically and in full chronological order all stock exchange trading data and evaluates it. As an independent stock exchange body, the trading surveillance office is not subordinated to the stock exchange management.

EXCHANGE–TRADED COMMODITY = ТОРГУЕМОЕ НА БИРЖЕ СЫРЬЁ (или СЫРЬЁ, ТОРГУЕМОЕ НА БИРЖАХ) – A Exchange-Traded Commodity (ETC) is a commodity for which spot (cash) and futures markets are established and where official or settlement prices can be determined. Exchange-traded commodities include:- Wheat, Corn, Soybeans, Oats, live cattle, Cocoa, frozen orange juice, Sugar, gold, silver, coal, electricity, gasoline, crude oil, diesel, ethanol, etc. Conversely, a non-exchange-traded commodity is a commodity for which spot and futures markets do not exist and the only price information available comes from data provided by producers, consumers and traders. Non-exchange-traded commodities include:- fresh flowers, Melons, Lemons, Tomatoes, grapes, eggs, Potatoes, asphalt, arsenic, borax, gypsum, asbestos, cement, carbon dioxide, rare earth metals, magnesium, manganese, silicon, rhodium, etc. In fact, most commodities are not traded in exchanges. Only major ones are. Exchange Traded Commodities (ETC) are open-ended, listed securities which are arbitrageable with the underlying markets. ETCs trade on stock exchanges and have multiple market makers. ETCs are either backed by the physical commodity where possible (e.g., gold, silver, platinum, palladium) or are priced off commodity futures markets, thereby providing retail and institutional equity investors with the opportunity to gain exposure to major commodities through existing equity accounts.

EXCHANGE–TRADED DERIVATIVE = ПРОИЗВОДНЫЙ ИНСТРУМЕНТ, ТОРГУЕМЫЙ НА БИРЖАХ (или ДЕРИВАТИВ, ТОРГУЕМЫЙ НА БИРЖАХ) – Exchange-Traded Derivative is a derivative which is listed and traded at an organized market-place. Derivatives exchanges generally provide standardised contracts and central clearing facilities for participants.

EXCHANGE–TRADED FUND = ТОРГУЕМЫЙ НА БИРЖЕ ФОНД (или ПАЙ) (или ФОНД (или ПАЙ), ТОРГУЕМЫЙ НА БИРЖЕ) – Exchange Traded Funds (ETFs):- challenge to traditional mutual funds:- using baskets of stocks, Exchange Traded Funds offer diversification and a cost-effective alternative to equity mutual funds. They may be a creative answer to your investing questions. Exchange Traded Funds (ETFs) have become one of the most successful financial innovations of modem times. Index-linked exchange-traded funds are baskets of stocks in a form that is cost effective and convenient for many investors. As of May 2001, ETFs had accumulated approximately USD88 billion in assets, and had gained the support of some of the largest, most respected firms on Wall Street. ETFs are formed through the deposit of securities in the fund, in return for creation units, which represent a fixed amount of fund shares. These shares are then traded on an exchange. ETFs can represent:- (i) a sector or an industry, such as financial services or telecommunications; (ii) a broad market, such as the NASDAQ 100 or the S&P 500; and (iii) a style of investing, such as growth or value. ETFs trade throughout the day as ordinary stocks on major US exchanges, allowing investors to use the same strategies used with other investments, including market and limit orders, buying on margin and short selling. ETFs originated in the early 1980s as a result of program trading. Program trading and futures allow institutional investors to buy and manage large 'baskets' of stocks. The following is a brief history of the development of the ETFs. During 1989, the Toronto Stock Exchange (TSE) created TSE Index Participations (TIPs), which were based on an instrument designed to track the TSE-35 index. These proved to be too expensive for the exchanges. Leland, O'Brian, Rubinstein Associates (LOR) created SuperShares, a product that used both a trust and a mutual fund structure. These were also high cost and complex products. During 1993, the American Stock Exchange launched Standard & Poor's Depository Receipt (SPDRs). These became the first US- based ETFs. Morgan Stanley introduced World equity benchmark shares (WEBs), which were the first instruments to use the mutual fund structure. These were subsequently rebranded as iShares. Mid-Cap SPDRs, DIAMONDs, QQQs, and the Select Sector SPDRs, were all formed around 1998. There are three main structures of ETFs:- (i) Exchange-Traded Open-End Index Mutual Fund; (ii) Exchange-Traded Unit Investment Trust; and (iii) Exchange-Traded Grantor. Characteristics of ETFs:- ETFs structure their operations to qualify as Regulated Investment Companies under the US Tax Code. Thus, the ETF does not have to pay taxes related to the buying, holding and selling of securities. Investors can redeem ETF shares for shares of the underlying portfolio, and vice versa. This enables large investors to take advantage of any disparity between the market price and the underlying Net Asset Value (NAV), which in turn keeps the two trading close to one another. Passive management reduces taxes, operating cost and volatility. Index-linked ETFs are designed to closely mirror their respective benchmarks, so portfolio changes are made infrequently. Low turnover means lower realized gains and, thus, a lower tax burden. Also, because they're not actively managed portfolios, indexed-linked ETFs tend to have lower annual operating expense ratios and lower management fees than most actively managed funds. Index-linked ETFs offer a shortcut to asset allocation. They enable investors to make investments in a variety of markets, sectors, and countries. Index-linked ETFs are generally diversified portfolios, so they are usually less volatile and tend to have a lower overall risk profile. Advantages to Investors:- (1) Investors trade Exchange Traded Funds for many reasons. For some institutional investors, ETFs provide broad market exposures from which custom portfolios of sector funds and/or individual stocks can be built. Index-linked ETFs also offer an efficient way to add specific sectors or international diversification, in order to weight a portfolio toward those specific sectors, styles, countries or regions. (2) Index-linked ETFs can be sold short to hedge a portfolio of stocks, closed-end funds or open-end mutual funds. This allows investors to keep a portfolio intact while protecting it from overall market losses. In a market decline, profits on an index-linked fund's short position could offset some of the Losses incurred by the portfolio. Listed options are available on certain ETFs, and can be used for income producing, risk-reducing and speculative strategies. (3) Investors can purchase index-linked ETFs to equalize cash inflows that eventually could be invested in stocks. They offer an alternative to futures and, in some situations, advantages over futures. ETFs can be bought in smaller sizes than futures. These do not require any special documentation or accounts, and investors do not have to deal with roll costs and margin requirements. In addition, ETFs track many indexes that do not have futures. (4) Index-linked ETFs can be highly tax efficient. They tend to pay out fewer taxable capital gains distributions than actively managed funds. From a tax standpoint, each separate ETF series

is a different stock, so they are not subject to wash-sale rules, which disallow a loss on a stock if the same stock is repurchased within 30 days. Instead, an ETF investor under these rules could take a loss on one sector fund and immediately reestablish a position in another ETF fund in the same sector. Finally, ETFs may be used to hedge and defer income. Some Popular ETFs:- (1) Standard & Poor's 500 Depository Receipts (SPDRs), pronounced 'spiders', were introduced in 1993. They were created as a trust that holds all 500 stocks included in the S&P 500 index. The trust, managed by State Street Global Advisors, has about USD17 billion in assets. Warehouse receipts are issued against the trust. Each receipt represents a SPDR, and gives its holder a pro rata interest in the securities that are held by the trust This enables the investor to transact a single security as though he were trading the entire S&P 500 index. SPDRs trade on the American Stock Exchange and can be expected to track the S&P 500 very closely. The dividends paid by the underlying stocks are aggregated and paid quarterly to the SPDRs holders. In 1998, the American Stock Exchange began trading subsets of SPDRs. Each subset represents an industry sector consisting of stocks belonging to an industry that are included in the S&P 500. (2) DIAMONDS are designed to provide investment results that correspond generally to the performance of the DowJones Industrial Average (DJIA), and provide investors with an instantly diversified portfolio of the blue-chip DJIA component stocks. However, there is no assurance that the performance of the DJIA can be fully matched. Among the advantages of DIAMONDS are tradability, the opportunity to receive monthly cash dividends, and the absence of high management or sponsor fees. (3) Holding Company Depository Receipts (HOLDRs), pronounced 'Holders', are defined as trust-issued receipts that represent the investor's beneficial ownership of a specified group of stocks. HOLDRs allow the investor to benefit from the ownership of a specified group of stocks. They automatically provide diversified exposure to an industry, a sector, or a group of stocks in a single investment HOLDRs also allow the investor to tax losses in any stocks that decline, and to defer gains indefinitely on the best-performing stocks. Shareholders retain the voting and dividend rights on the underlying stocks. (4) iShares represent a uniquely flexible mechanism for getting an investor exposure at precisely the level wanted and at exactly the moment needed. The most significant advantages are their tradability, lack of sales loads, low management and/or sponsor fees, tax efficiency, diversification and precise market tracking. iShares are advised and marketed by Barclays Global Investors. They are structured as open-end mutual funds. iShares include more than 50 different index funds. Each fund represents a portfolio of stocks designed to closely track a specific index. Applications of ETFs:- investors with idle cash in their portfolios may want to invest in a product tied to the fund's benchmark or to their favorite sectors. Investment managers who see regular inflows and outflows of cash may be attracted to the ETFs because of their liquidity and their ability to represent a 'slice' of the portfolio. If the investor is not sure about which particular stock to buy but likes the overall sector, investing in ETFs provide an efficient method to gain diversified exposure to a volatile sector, at lower management fees. ETFs can be used as a hedging tool. Long/short (market-neutral) strategies can be implemented easily. An investor with a concentrated portfolio can diversify more efficiently. This can be a quick way to gain exposure to foreign markets. Investors can fill gaps by taking active views on sectors, and the style of exposure can be modified very easily. ETFs are starting to have an impact:- according to the American Stock Exchange, SPDRs had USD14 billion in assets as of May 2001. By comparison, the Vanguard 500 Index Fund, the biggest of the S&P 500 index funds, had USD89 billion in assets. The Vanguard fund has existed since 1976, while the SPDRs have been offered only since 1993. SPDRs would already rank amongst the 20 largest domestic stock mutual funds. Conclusion:- Exchange Traded Funds have advantages and characteristics that make them a very useful tool for an investor. Using baskets of stocks, they offer diversification and a cost-effective alternative to equity mutual funds. ETFs not only offer low turnover and tax efficiency similar to an index mutual fund, hut they also allow constant trading during the day. ETFs offer many creative solutions to investing. Open ended listed investment fund, that combines some of the characteristics of shares and managed funds. An Exchange-Traded Fund, or ETF, is a type of mutual fund, usually a passively managed index fund, whose investment objective is to achieve the same return as a particular market index. Xetra® Funds is the market segment of Deutsche Börse AG in which exchange-traded index funds (XTF Exchange Traded Funds segment) and actively managed funds (Xetra® Active Funds segment) are electronically traded via Xetra®. These funds are traded just like shares, though the price is not fixed once a day, but variable throughout the day on the basis of supply and demand. There is no front-end load, but investors must pay a spread, i.e. the difference between the buying and the selling price, as well as the customary fees for stock exchange transactions. Collections of stocks that are bought and sold as a package on an exchange, principally the American Stock Exchange® (AMEX®), but also the CBOE®, NASDAQ®, and NYSE®. If an ETF's underlying futures contracts are experiencing contango, the ETF can lose value. ETF traders and investors need to understand this relationship and what it means for their bottom lines. Exchange-Traded Funds (ETFs) are investment funds that trade on a stock exchange. Like a stock, an ETF's price changes throughout the trading session as shares are bought and sold, and they can be sold short and bought on margin. In addition, ETFs typically are low-cost compared to other investment vehicles, and are considered a relatively simple way to add diversity to a portfolio. Because of their attractiveness to institutional and individual investors alike, ETFs have grown into a USD1 trillion industry since the SPDR fund – the first ETF – was launched 20 years ago (information of 2013 March). Today, traders and investors can gain exposure to a variety of investment products through ETFs, including bonds, currencies, indexes and commodities. However, even the relatively simple arena of ETF trading has special considerations that must be acknowledged. In futures-based commodity ETF trading, if the futures contract in which the ETF invests is experiencing contango, the ETF can lose value, resulting in potentially significant – and often unexpected – losses for investors. Here, we will introduce contango and its effect on the futuresbased commodity ETF markets, and how traders and investors can mitigate the potentially damaging consequences. Contango Defined:- when the forward price of a futures contract is above the expected future spot price, the market is said to be in contango. This is a fairly common situation because under normal circumstances investors and traders are willing to pay a premium to avoid the inconvenience and costs associated with transporting, storing and insuring a commodity. Further out contracts often are priced higher than current ones. The price of a futures contract will converge to the spot price as its expiration date approaches as a function of arbitrage, supply and demand. If a contract is priced above the spot price, as is the case with a market that is trading in contango, price eventually must move down to be in line with the spot price. Because contango implies that price must fall, long positions in contangoed markets can lose value. Although individual investors can participate in the commodity cash market, buying and taking delivery of physical commodities, most prefer the convenience of exploiting price moves by trading an exchange-traded derivative, such as a futures contract or an ETF. ETFs are a popular alternative with the general public because not only do they provide individual investors with direct exposure to a variety of commodities without the limitations of holding the physical assets, but they can be traded in any equity account, just like a stock. Investors can trade ETFs based on various commodity categories, including agriculture (grains and softs), energy and metals. Some commodity ETFs physically hold the commodity. For example, the SPDR Gold Shares ETF buys physical gold bars and stores them in London vaults. Not all commodity ETFs, however, are structured this way. ETF managers also can replicate the commodity markets by investing in futures contracts. The ETFs United States Oil Fund (USO) and United States Natural Gas Fund (UNG) attempt to replicate the underlying commodity by buying and rolling over futures contracts. Roll Process:- futures trade at multiple maturities with different prices. As time goes by, longterm investors must perform a regular roll process in which contracts nearing expiration are sold and longer-dated contracts are purchased (assuming a long position; the reverse is true for short positions). For example, if an investor is long the current Henry Hub natural gas futures contract, he simultaneously can sell that month and buy the next-furthest-out contract to maintain the position. Because the next contract probably does not cost the same as the current one, the roll process can be expensive if the market is in contango. Sometimes, the profit or loss resulting from the roll process

can be the most decisive factor in commodity returns, even more so than the spot price. If the market is in contango, it will cost the investor to roll from one contract to the next. Conversely, if the market is in backwardation, where the forward price of a futures contract is below the expected futures spot price, the roll process may be favorable. 'Time values' (right) shows prices for natural gas contracts; at this point, the market is in contango through February 2014, with each successive contract more expensive than the previous. Managing expectations:- contango can create strong headwinds and surprise investors who hold long positions in commodity ETFs. If a futures contract in which an ETF invests is experiencing contango, a fund may be forced to sell low and buy high each time it rolls over to the next contract. This may not be significant if it were to occur only once or twice; however, the serial process of rolling from cheap contracts to more expensive ones may cause an ETF's returns to diverge significantly from those of the commodity itself. The UNG is an oft-cited example of the trouble contango can cause. UNG invests primarily in near-month natural gas futures contracts. When natural gas futures are trading in persistent contango, as they are frequently, the fund has to sell the expiring contract for a lower price than it must pay for the next contract, resulting in a loss each time the contract is rolled over. Meanwhile, if spot prices are rising, ETF investors may assume incorrectly that the value of the ETF will increase as well. As a result, ETF investors can be blindsided by losses and not even understand how or why they happened. 'Slip slide' compares the natural gas futures contract with the UNG fund. Investors who saw rising prices in the natural gas contract most certainly were hoping for positive returns through the ETF; because of the impact of contango, many were sorely disappointed. Trading Ahead:- if a futures contract is in contango, any ETF that invests in that contract could perform worse than if it had invested in the commodity itself. Another challenge faced by futures-based commodity ETFs is the possibility that investors might trade ahead of the fund before the roll process. For example, a large fund may hold billions of dollars in futures contracts. Some investors safely may assume that the fund will not plan on taking delivery of the commodity, and that it must therefore roll over its contracts, selling and subsequently buying billions of Dollars worth. When the fund purchases so many shares of the next contract, prices can be driven up, providing an opportunity for savvy investors to purchase ahead of time at the lower price, and later sell at the higher price. This is good news for the investors who traded the futures contracts ahead of the ETF, but bad for those who are holding the ETF. Dealing With Contango:- this does not mean that investors and traders should steer clear of futuresbased commodity ETFs. Here are a few strategies for limiting the potentially negative effects of contango:- (1) Recognize contango. Understand that it can impact ETF returns negatively – even when the related futures contracts are performing well. (2) Know your ETF. Understand an ETF's structure before investing. Look at a fund's prospectus to determine if it invests in futures contracts or buys and sells spot prices. In general, futures funds will perform worse when there is contango (and better when there is normal backwardation). Be aware of contango in the associated futures markets and plan accordingly. (3) Consider other investors. Be aware that other investors may seek profits by trading ahead of large funds, thereby hurting potential profits for the ETF itself. Consider investing in funds that are not as large to limit this possibility. (4) Look for funds that hold various length contracts. Because contango and normal backwardation market states can and do fluctuate, a fund that invests in one-month, threemonth, six-month and 12-month contracts may be better able to weather contango than one that invests only in the near-month. Exchange-Traded Fund (ETF) is a security that tracks an index and represents a basket of securities like an index fund. However, it trades like a stock on an exchange, thus experiencing price changes throughout the day as it gets bought and sold. Exchange-traded funds (ETFs) generally have lower expense ratios and experience greater tax efficiency. By owning an ETF, you get the diversification of an index fund as well as the right to sell short, buy on margin, and purchase as little as one share. Some common ETFs are the Dow Jones Diamonds (DIA), which tracks the Dow Jones Industrial Average; the NASDAQ-100 Index Tracking Stock (QQQ), which tracks the NASDAQ-100; and the S&P Depositary Receipts (SPY), which tracks the S&P 500. How to trade ETF volatility:- investors can diversify into different markets through options on exchange-traded funds. Volatility analysis can point the way. Since the first option on an exchange-traded fund (ETF) was launched on the American Stock Exchange in 1998, followed by the Chicago Board Options Exchange in 2000, the market segment has grown steadily in popularity. Investors now benefit from a wide range of ETF underlyings, from US equity indexes to all kinds of stock-, bond- and commodity-based ETFs. However, quite a few ETF options still exhibit low trading volume. Many ETFs are quite specialized and, therefore, cover specific market segments that interest only a few investors. In contrast to more popular options in broad-based equity indexes, these ETF options also are American style; they are physically settled and are subject to early exercise. A proper understanding of the products combined with an analysis of correlation, skew and volatility levels – both implied and realized – uncover opportunities that can supplement any trading plan. Assessing opportunity:- there are many liquid ETF and index options that give investors numerous investment choices. To get a feeling for the option underlyings, 'Correlation matrix' (right) lists correlation values for some selected ETFs and equity indexes based on three-month implied volatilities and spot price changes (reported in Dollars) based on weekly data for the last three years. Obviously, the implied volatilities and spot correlation tables look alike because of the relationship between volatility and spot movements. Although those correlations are not stable over time and appear high for this sample, the figures indicate opportunities for investors to diversify their portfolios. Especially interesting is how correlations between commodity-based ETFs and those based on emerging markets are, on average, lower than their correlations with US and European equities. In 'Volatility view' (right), we list some average at-the-money volatility, implied-to-realized spreads and skew figures for some ETFs and equity indexes. Although the three years between March 2009 and November 2012 represent only a short time period, the numbers display some general trends that are observable for longer time series and in other markets, as well: Most notably, on average positive implied-to-realized volatility spreads and high skew levels for equity indexes or equity ETFs. The positive implied-to-realized spread is a supporting argument for short volatility investments such as, for example, selling short-dated out-of-themoney put options. Because these positions contain delta-positive exposure, they are intended for those investors who expect a neutral to positive performance of the ETF underlying. With a spot price of around USD42 for the iShares Emerging Markets Index, selling a one-month put option with a strike of USD38 currently would generate income of around 30¢. However, people should be aware of the downside risks if markets crash. One way to reduce this risk is to take the premium and purchase a put option on an underlying that is positively correlated to the iShares ETF. Investors with a more positive view on emerging markets compared to the S&P 500 – and who identify S&P 500 volatility as cheap compared to emerging market ETF volatility – may want to take the iShares Emerging Market ETF put premium and buy S&P 500 put options. With a high skew on the S&P 500, investors should select put options that are closer to at-the-money. In this case, the number of long S&P 500 put options should be adjusted to reflect the higher delta of at-the-money options. Another way to reduce the risk of a short put exposure is a put ratio spread. Investors can profit from a positive skew by adding at-the-money put options on the same underlying to the existing short out-of-the-money option position. The analysis in this case turns from one implied volatility number to the pair of at- vs. out-of-the-money volatilities. The ratio of long at-the-money options vs. short out-of-the-money options can be adjusted to obtain a premium-neutral or delta-hedged position. In those cases, the number of puts to be shorted is, of course, higher than the long at-the-money put position, as both the premium and the delta are lower for out-of-the-money options. Taking trades:- the following trades illustrate a putratio spread on the S&P 500 that, at the time of the trade, exhibits a high skew. Set up as a premium-neutral trade with three months until expiration, the resulting position has a slightly positive delta at initiation. The example is based on a current spot price of 1 400 for the S&P 500. (1) Buy 100 put contracts with strike 1 400 and expiry in three months. (2) Sell 280 put contracts with strike 1 275 and expiry in three months. As the black line in 'Valuing the trade' (below) indicates, the profit and loss at expiration would be flat for prices above 1 400 and would increase for falling spot prices until 1 275 where the short puts expire worthless. Losses would be expected for prices around 1 205 and lower. For those investors who believe

that the skew is not high enough, the reverse position in the form of short at-the-money options and long out-of-the-money options is an alternative. Because the out-of-the-money options would outnumber the at-the-money options, the position gains if we see a huge downturn in the market. An analysis of a long put spread before maturity is important for understanding the trade. If the position is set up with a low positive delta and theta at initiation, the trade profits from a positive performance of the S&P 500 and time decay. The 'Greeks', however, change during the term of the trade. For example, closer to expiration, the delta can turn negative (positive) if the spot stays above (far below) 1 275. The Theta, although usually positive, can turn negative for high S&P 500 values close to expiration. That's because at initiation the investor doesn't want the S&P 500 to drop too quickly, which would result in trade losses. On the other hand, getting closer to maturity, the spot should move to where the trade becomes most profitable, which in this example would be 1 275. Note that this position is not a pure skew position. Like the changes in the Greeks, the spot movements lead to movements on the volatility surface. The trade does not necessarily profit directly from a change of it. That is, if the spot moves from 1 400 to 1 275, the at-the-money and out-of-the-money options change into in-the-money and at-the-money options. Without any adjustments, the skew analysis is no longer properly applicable. Still, because of the long and short positioning in those options, a high skew at initiation is beneficial:- The higher the skew, the lower the number of out-of- the-money put options necessary to reach a delta- or premium-neutral position at initiation. Exchange Traded Funds (ETFs):- collections of stocks that are bought and sold as a package on an exchange. / Стэндод Энд Поз 500 (Standard & Poor's 500 Depository Receipts (SPDRs)), произносимые на Английском языке как 'Спайдёз' ('spiders'), были представлены в 1993. EXCHANGE TRADED INDEX FUND = ТОРГУЕМЫЙ НА БИРЖЕ ИНДЕКСНЫЙ ФОНД (или ТОРГУЕМЫЙ НА БИРЖЕ ИНДЕКСНЫЙ ПАЙ) – Exchange Traded Index Fund:- see also Index Fund. Exchange-Traded Funds (ETFs) are index-based products that allow investors to buy or sell shares of entire portfolios of stock in a single security. Moreover, an ETF is a type of investment vehicle whose objective is to achieve the same return as a particular market, and is similar to an index fund in that it will primarily invest in the securities of companies that are included in a selected market index. Exchange-Traded Fund (ETF) is a security that tracks an index, a commodity or a basket of assets like an index fund, but trades like a stock on an exchange. ETFs experience price changes throughout the day as they are bought and sold. Because it trades like a stock, an ETF does not have its net asset value (NAV) calculated every day like a mutual fund does. By owning an ETF, you get the diversification of an index fund as well as the ability to sell short, buy on margin and purchase as little as one share. Another advantage is that the expense ratios for most ETFs are lower than those of the average mutual fund. When buying and selling ETFs, you have to pay the same commission to your broker that you'd pay on any regular order. One of the most widely known ETFs is called the Spider (SPDR), which tracks the S&P 500 index and trades under the symbol SPY.

EXCHANGE–TRADED NOTE = ТОРГУЕМАЯ НА БИРЖЕ НОТА (или НОТА, ТОРГУЕМАЯ НА БИРЖЕ) – Exchange-Traded Notes (ETNs) are made for spreads. Exchange-traded notes are a good product to use to execute commodity spreads that eliminate most of futures-based spreads' price discrepancies. Here, we explore this concept. Spread trades between futures contracts present problems with equalizing the underlying prices. This is true with gold and silver because of the large differences in their cash and futures prices (see 'Grain & cattle spreads:- Finding an edge' (Futures:- November 2011) and 'Gold & silver:- Always good options' (May 2011)). However, they also present opportunities. Consider a recent trading day in September 2012. The cash prices for these commodities were gold, USD1 755; silver, USD33.98; wheat, USD8.34 and corn, USD7.36. Wheat and corn futures almost are interchangeable and frequently shift the lead in price size. On the other hand, gold and silver are spread trade partners that require some effort to put their prices on an equal level. This equalizing is not necessarily an insurmountable burden; however, it can create uncertainty in trades where the slightest mismatch can mean the difference between profit and loss. A trading alternative that eliminates most price discrepancy by design is the exchange-traded note (ETN). Because the companies issuing ETNs design the securities to be based on underlying commodities in a format that is easily traded on stock exchanges, the prices are set such that they are a convenient size for most traders. These new securities also have percentage price changes approximating those of the commodities or futures contracts on which their prices are based. In the case of gold and silver ETNs, the traditional ratio between the metals (51.6 in the current market) has been eliminated so that their ETNs may be traded with comparable prices. The ETN prices on September 21, 2012 for these ETNs were gold, USD46.72; silver, USD48.72; wheat, USD22.77 and corn, USD19.88. Comparing markets:- 'Futures and ETNs' (right) shows how closely the ETNs follow the price changes of a single futures contract for both corn and wheat, and gold and silver. December futures are used in this study for each of those markets. Keep in mind that most ETN index prices are based on a mix of cash commodities and futures, as well as Treasury securities and other variables. Thus, December futures are used simply to show the relatively close correlation between ETNs and as a dependable benchmark price. The charts indicate that for the period of April to mid-September 2012, the spread between gold and silver was much wider and potentially more profitable than the distance at any time between wheat and corn. In the previous study of the gold-silver spread, gold was stable and silver was the more volatile member of the pair. The current chart confirms this relationship to a surprising extent. Starting in early April, by the end of June silver had a cumulative percent price decline of almost 20%, while gold was stable with almost zero price change. Silver rebounded by 25% to become equal to gold later in September. Silver futures and the silver ETN move together. A spread or hedge trade of silver vs. gold could have used either the ETN or December futures with approximately equal results. With the tight relationship between each ETN and its associated futures contract, a spread between the ETN and December futures would be difficult for all four commodities. This differs from the potential ETN-futures spread noted for the livestock ETN, COW, which is based on a combination of live cattle and lean hog futures ('Trading cattle, hogs and ETNs', November 2012). The potential of an ETN-futures spread is better in that case because the ETN is based on more than one underlying commodity, which at times allows larger differences for spread trading. Dollar by Dollar:- spreads valued in terms of Dollars are depicted in 'Wheat ETN – corn ETN' (right) and 'Gold ETN – silver ETN' (page 52). The maximum difference for wheat and corn is between USD4 and USD1; otherwise the price difference is approximately USD2 to USD2.50. These small price spreads reflect the close connection between wheat and corn futures, carried into the ETN formulation. The chart for the gold ETN minus silver ETN has a USD7 maximum difference, between +USD5 and –USD2. Between these extremes, as shown on the chart, gold futures were stable while silver futures declined until a reversal occurred near the end of June 2012. Volatilities of gold, silver, wheat and corn futures and ETNs are shown on 'December call options' (right). Silver and wheat have the highest option price curves on September 21, 2012. These are followed closely by calls on December corn futures and much less closely by December gold futures. Having viewed these charts, which clearly show the relatively high volatility of silver, wheat and corn, it is not surprising that these three – with cumulative percentage price changes of up to 50% – leave gold behind with lower volatility. The call price curves are regression equations that produce predicted prices that match options market prices at each strike price. Each symbol on the 'December call options' chart represents a separate strike price. As shown, all call option prices occur along

curves that are determined by the market's assessment of the relative price volatility of underlying futures contracts. The result is a market forecast at each instant during the trading day of upper and lower breakeven prices at the expiration date. Breakeven prices are those that result in no gain or loss from a Delta trade:- Long call options and short the underlying futures. Market match:- ETNs based on commodity futures tend to move in price at the same pace as their associated futures contracts. The result is that the percentage price spread forecast for the underlying at expiration also indicates the span of higher and lower prices expected for the ETN between the current time and expiration. In this way, the options market is forecasting a continuous stream of future price spreads for ETNs. As the underlying contracts expire and are replaced by new farther-out expirations, the forecast can be extended throughout the life or planned holding period of the ETN. At this time, there are many ETNs and exchange-traded funds (ETFs) available with ETNs based on indexes of commodity and futures prices representing unsecured debt of the issuing institution. ETFs differ from ETNs in that they represent ownership of shares in real assets instead of index prices. To illustrate the depth of securities now available for trading on stock exchanges, website goldetf.net lists four long gold ETNs, including the ETN used in this study, E-TRACS UBS Bloomberg CMCI Gold ETN. There also are double-long gold ETNs and double-short gold ETNs, each seeking to double the investment returns of the Deutsche Bank Liquid Commodity Index:- Optimum Yield Gold. (Leveraged funds require extra care particularly in gold, but options and futures traders understand the risk in leverage.) The seventh security listed by goldetf.net is the Power Shares DB Gold Short ETN. The silver ETN used here is E-TRACS UBS Bloomberg CMCI Silver ETN. Wheat and corn ETN data are listed by Bloomberg for WHEU and CONU. Along with gold, silver, wheat and corn ETN prices from Bloomberg, futures prices are found at Barchart.com. Analytical methods described should be applicable to any ETN or ETF whose price index is based on a single underlying asset. / Дойчэ Банк А.Ге. (Deutsche Bank AG). Ю.Би.Эс. Блумбёг (UBS Bloomberg).

EXCHANGE TRADED OPTIONS = ТОРГУЕМЫЕ НА БИРЖЕ ОПЦИОНЫ (или ОПЦИОНЫ, ТОРГУЕМЫЕ НА БИРЖЕ) – Exchange Traded Options are the options on future contracts offered by a recognized futures exchange, such as NYMEX®. Option contracts which are bought and sold on the options market operated by the exchange. / НАЙМЭКС® (NYMEX®). Опционные контракты, которые покупаются и продаются на рынке опционов, поддерживаемом той или иной биржей.

EXCHANGE TRADERS ADVISORY COMMITTEE = СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ БИРЖЕВЫХ ТОРГОВЦЕВ (или КОНСУЛЬТАТИВНЫЙ КОМИТЕТ БИРЖЕВЫХ ТОРГОВЦЕВ) – Exchange Traders Advisory Committee advises on ways to strengthen the efficiency and expand the use of the New York Stock Exchange (NYSE®) markets, and reviews policy issues affecting NYSE® traders. The members, representatives of major NYSE® member organizations, also advise the NYSE® staff on the prospective impact of proposed trading rules on NYSE® traders, their needs and interests, and ways to strengthen communication with them. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

EXCHANGE TRANSACTIONS = ОБМЕННЫЕ ТРАНЗАКЦИИ (или ОБМЕННЫЕ ОПЕРАЦИИ) – In reference to electricity, Exchange Transactions are the transactions between different regions and/or parties that are not priced. / По отношению к электричеству, операции между различными регионами и/или сторонами, осуществляемые на бесплатной основе взаимообмена.

EXCISE = АКЦИЗ – (1) Excise is an internal tax or duty on certain commodities, as liquor or tobacco, levied on their manufacture, sale, or consumption within the country. An Excise Tax is a special tax levied on specific products sold within a country. To excise something can also mean to get rid of it. Say, wouldn't it be nice if they would excise the excise taxes? An excise tax is simply an extra tax put on various products. Perhaps the most common examples are the taxes levied on tobacco and liquor, often called Sin Taxes because drinking and smoking are considered vices. There is also an excise tax on gasoline. To cover the tax, the seller will usually raise the price of the item. Interestingly, the word Excise (ek-SIZE) used as a verb means to remove something by cutting it out. / Под Акцизом, от Французского слова Accise, от Латинского слова Accido, означающее Обрезаю) понимается один из видов косвенного налога преимущественно на предметы массового потребления (соль, сахар, спички и другие), а также коммунальные, транспортные и другие распространённые услуги. Включается в цену товаров или тариф за услуги и тем самым фактически перелагается на потребителя, главным образом на трудящихся. В дореволюционной России акциз вместе с винной монополией давали (в 1904) 47.5% общей суммы бюджетных доходов. Акциз служит важным источником доходов государственного бюджета современных капиталистических стран. В Англии и Соединённых Штатах Америки (США), например, за период 1929–58 акцизы дали от 14 до 30% всех налоговых поступлений. В США за период 1928–59 сумма акцизных сборов возросла с 0.5 до 12.4 миллиардов Долларов в год. Размер акциза по многим товарам достигает половины, а иногда 2/3 их цены. В бывшем Союзе Советских Социалистических Республик (СССР) система акцизов была отменена налоговой реформой 1930; в других социалистических странах – налоговыми реформами 1948–49. Смотрите также Налоги.

(2) Excise is a tax levied for a license to carry on certain employments, pursue certain sports, etc. Excise is any of various taxes on privileges often assessed in the form of a license or fee.

EXCISE = ОТДЕЛЯТЬ – Excise:- to remove by cutting. / Отделять:- удалять отрезанием.

EX–CLEARING HOUSE = БЕЗ КЛИРИНГОВОЙ ПАЛАТЫ – Ex-Clearing House is a term used to describe a transaction processed without benefit of clearing corporation facilities. / Минуя Клиринговую Палату:- любая сделка между брокерами-дилерами, совершаемая вне обычных расчётных учреждений.

EXCLUDED COMMODITY = ИСКЛЮЧЁННОЕ СЫРЬЁ (или НЕДОПУЩЕННОЕ СЫРЬЁ) – In general, the US Commodity Exchange Act defines an Excluded Commodity as:- any financial instrument such as a security, currency, interest rate, debt instrument, or credit rating; any economic or commercial index other than a narrow-based commodity index; or any other value that is out of the control of participants and is associated with an economic consequence, for example, the average temperature in Chicago in January which can affect the demand for heating fuel. Under the Commodity Exchange Act (CEA) as amended by the Commodity Futures Modernization Act of 2000 (CFMA), an Excluded Commodities are a variety of financial derivatives, including interest rate, currency, equity, debt, credit, weather, economic index, and other derivatives based on one or more commodities for which there is no cash market or whose price levels are not within the control of any party to the transaction.

EXCLUSIONS = ИСКЛЮЧЕНИЯ – (1) In reference to taxation, Exclusions are income item which is excluded from a taxpayer's gross income by the internal revenue code or an administrative action. Common exclusions include gifts, inheritances, and death proceeds paid under a life insurance contract. Also known as Excluded Income. / строка баланса (item).

(2) Exclusions are specified hazards for which a policy will not provide benefit payments. Also known as Exceptions. Exclusion is an event or circumstances specifically excluded from the terms of a policy. A term in an insurance or reinsurance contract that excludes the insurer or reinsurer from liability for specified types of loss. An exclusion may apply throughout a policy or it may be limited to specific sections of it. In certain circumstances an exclusion may be limited or removed altogether following the payment of an

additional premium. / Особые виды опасности, по которым полис не будет обеспечивать компенсационных выплат. Известны также как Исключения (Exceptions). Спецификационные типы убытков.

EXCLUSIVE ECONOMIC ZONE = ИСКЛЮЧИТЕЛЬНАЯ ЭКОНОМИЧЕСКАЯ ЗОНА – The Exclusive Economic Zone (EEZ) refers to the rights of coastal states to control the living and nonliving resources of the sea for 200 miles off their coasts while allowing freedom of navigation to other states beyond 12 miles, as agreed at the sixth session of the Third UN Conference on the Law of the Sea (UNCLOS). The EEZ also gives the coastal states the responsibility for managing the conservation of all natural resources within the 200-mile limit. / Исключительная Экономическая Зона (ИЭЗ) относится к правам прибрежных государств контролировать живые и неживые ресурсы моря в пределах 200 мильного отдаления от берега, в то время как свобода навигации для других государств допускается лишь на отдалении свыше 12 миль, как это оговорено шестой сессией третьей Конференции ООН по Законам о Море (КООНЗОМ; UN Conference on the Law of the Sea (UNCLOS)). ИЭЗ накладывает также на прибрежные государства ответственность за управление сохранением всех природных ресурсов в пределах 200-мильного ограничения. Исключительная Экономическая Зона (ИЭЗ) Российской Федерации – морской район, находящийся за пределами территориального моря Российской Федерации и прилегающий к нему, с особым правовым режимом, установленным Федеральным законом, международными договорами Российской Федерации и нормами международного права. Определение исключительной экономической зоны применяется также ко всем островам Российской Федерации, за исключением скал, которые не пригодны для поддержания жизни человека или для осуществления самостоятельной хозяйственной деятельности. Внутренней границей исключительной экономической зоны является внешняя граница территориального моря. Внешняя граница исключительной экономической зоны находится на расстоянии 200 морских миль от исходных линий, от которых отмеряется ширина территориального моря, если иное не предусмотрено международными договорами Российской Федерации. Природные Ресурсы Исключительной Экономической Зоны – живые и неживые ресурсы, находящиеся в водах, покрывающих морское дно, на морском дне и в его недрах. Живые ресурсы исключительной экономической зоны – все виды рыб, морских млекопитающих, моллюсков, ракообразных, а также другие водные биологические ресурсы, за исключением живых организмов ‘сидячих видов’ морского дна и его недр, использование которых регулируется Федеральным законом ‘О Континентальном Шельфе Российской Федерации’. Неживые ресурсы исключительной экономической зоны – минеральные ресурсы вод, покрывающих морское дно, включая содержащиеся в морской воде химические элементы и их соединения, энергия приливов, течений и ветра, другие возможные виды неживых ресурсов.

EXCLUSIVE PATRONAGE AGREEMENT = СОГЛАШЕНИЕ ОБ ИСКЛЮЧИТЕЛЬНОМ ПАТРОНАЖЕ – Exclusive Patronage Agreement:- a shipper agrees to use only a conference’s member liner firms in return for a 10 to 15 percent rate reduction. / Грузоотправитель соглашается использовать только линейные фирмы, являющиеся членами конференции, в обмен на 10–15 процентное снижение ставки.

EXCRESCENCE = КАП (или НАПЛЫВ, или НАРОСТ, или ОПУХОЛЬ) – Excrescence is an outgrowth or protrusion from the surface. / Под Капом понимается наплыв на стволах, ветвях и корнях деревьев, возникающий в местах обильного развития побегов и разрастания тесно сидящих придаточных и спящих почек. Материал для столярных, резных и токарных изделий.

EXCRETA = ЭКСКРЕТА – Excreta is the grading factor term used for excrement from any animal including mammals, birds and insects. Usually excreta are removed as dockage. Any that remains may become a grading factor. / экскремент . Под Экскретой, от Латинского слова Excretum, означающее Выделенное, понимается конечные продукты обмена веществ, выделяемые организмом (кал, моча и другие). Под Экскрецией, от позднелатинского слова Excretio, понимается выделение.

EX–DATE = ДАТА БЕЗ ДИВИДЕНДА – Ex-Date is the date on which shares change from being quoted ‘cum’ to ‘ex’. It is usually the fourth business day prior to the record date. From Latin:- Ex (Out Of). The first day after a stock dividend has become due. Also known as Ex Dividend Date.

EX–DEC = EXPORT DECLARATION

EX–DISTRIBUTION = БЕЗ РАСПРЕДЕЛЕНИЯ – Ex-Distribution (X-Dis):- the security is trading so that the buyer will not be entitled to a distribution that is to be made to holders. Ex Distribution (X-Dis):- in stock kistings of newspapers. / Без Распределения прибыли в приводимых в газетах перечнях акций. Без Распределения:- данный термин означает отсутствие права у покупателя данной ценной бумаги на распределение дивиденда на акцию.

EX–DIVIDEND = БЕЗ ДИВИДЕНДА (или ИСКЛЮЧАЯ ДИВИДЕНД) – Ex Dividend (X or XD or X Div.):- in stock listings of newspapers. xd:- stands for Ex-Dividend (i.e. without dividend) and means that the investor who buys the stock xd will not receive the coupon/dividend which is due to be paid in a few days time on the next coupon date as this coupon will go to the seller. British Government Stocks normally go xd 7 days before the next coupon date (i.e. the xd date is 7 days before the coupon date). In respect of ordinary shares/equities it means the investor who buys the stock xd will not receive the dividend due to be paid in a few days time as it will go to the seller. Shares normally go xd some days before the date when the next dividend is to be paid. If the buyer is entitled to the dividend payable in a few days time then the stock has not yet gone xd and is still cum dividend (i.e. with dividend). Shares sold Ex-Dividend entitle the seller to retain the current dividend. Shares are usually quoted ex-dividend four business days before company’s book close. The interval between the announcement of a dividend and the dividend’s payment. An investor purchasing a security while it is ex-dividend is not entitled to the dividend. From Latin:- Ex (Out Of). Ex-Dividend is the interval between the announcement and the payment of the next dividend. Shareholders must own the stock prior to the ex-dividend date, the date on which the stock goes ‘ex-dividend’, in order to be paid the dividend for the prior period. On the ex-dividend date the price of the stock is reduced by the amount of the dividend. Because of this, the amount of change from the prior day shown in the newspaper listings may not be the same as the difference between today’s close and yesterday’s close. For example, lets assume that stock XYZ closed yesterday at 50.00. Today the stock went ex-dividend with a dividend of USD1.00 and closed at 49.50. The amount of change in the newspaper will be shown as +0.50, because the prior day’s price has been corrected to 49.00 to reflect the USD1.00 dividend. See also xd. A share is quoted ex dividend when the amount of the dividend just paid has been deducted from the price. When a stock is dealt ex dividend, the seller retains the dividend. A synonym for ‘Without Dividend’. The buyer of a stock selling ex-dividend does not receive the recently declared dividend. Every dividend is payable on a fixed date to all shareholders recorded on the books of the company as of a previous date of record. For example, a dividend may be declared as payable to holders of record on the books of the company on a given Friday. Since three business days are allowed for delivery of stock in a ‘regular way’ transaction on the New York Stock Exchange, the exchange would declare the stock ‘ex-dividend’ as of the opening of the market on the preceding Wednesday. That means anyone who bought it on or after that Wednesday would not be entitled to that dividend. When stocks go ex-dividend, the stock tables include the symbol ‘X’ following the name. See also Cash Sale, Net Change and Transfer. Symbol indicating that a stock is trading ex-dividend, with no dividend attached. Ex Dividend (X):- that is any dividend payable on the stock is payable to the seller, not the buyer. / Символ, указывающий на то, что акция продаётся без дивиденда, то есть без прилагаемого дивиденда. Без Дивиденда или Исключая Дивиденд – период времени между объявлением и выплатой следующих дивидендов. Инвестор,

приобретающий акции в течение этого периода времени, не имеет права на получение дивидендов. Как правило, цена на акции повышается на сумму, равную сумме дивидендов, по мере приближения даты. После наступления даты объявления дивидендов цена снижается на величину дивиденда. Акции, которые продаются без дивидендов, отмечены в газете символом X.

EX–DIVIDEND DATE = ДАТА БЕЗ ДИВИДЕНДА – Ex-Dividend Date (EDD):- shares are quoted 'ex dividend' four business days before the company's Record Date. To be entitled to a dividend a shareholder must have purchased shares before the ex dividend date. The share price may fall on the ex dividend date, with the fall in price being related to the amount of dividend being paid, on the basis that the buyer will not, in the ordinary course of events, receive the dividend because they will not be registered by the Record Date. The first day of trading when the seller, rather than the buyer, of a stock will be entitled to the most recently announced dividend payment. This date set by the NYSE® (and generally followed on other US exchanges) is currently two business days before the record date. A stock that has gone ex-dividend is marked with an x in newspaper listings on that date. The first day of the ex-dividend period. If an investor does not own the stock before the ex-dividend date, they will be ineligible for the dividend payout. The exchanges automatically reduced the price of the stock by the amount of the dividend for all pending transactions that have not been completed by the ex-dividend date. From Latin:- Ex (Out Of). Ex-Dividend Date is the date when the sale of shares as ex-dividend ones starts, that is the seller preserves the right for dividends, while the buyer doesn't have that right yet. The EDD usually comes four working days before closing the register; the date of shareholder's register for receiving the dividends. Ex-Dividend Date (in ExxonMobil balance sheet) is the 2nd business day prior to the record date. Dividends are paid to shareholders of record on the record date. Shares must be purchased before the ex-dividend date to settle by the record date and be entitled to receive the dividend. Ex-Dividend Date (EDD) is the day on which shares are distributed to shareholders; buyers who purchase shares on or after this date are not entitled to receive the current dividend. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). ЭКСАН (Эксан Мобл Корпорэйшэн; EXXON (Exxon Mobil Corporation)). Дата Исключая Дивиденд – дата, после которой акции будут продаваться без дивидендов (ex-dividend) как правило, примерно за три недели до даты выплаты дивидендов зарегистрированным владельцам акций. Акции, котирующиеся на Нью Йоркской Фондовой Бирже (New York Stock Exchange), продаются Без Дивидендов за четыре дня до наступления последней даты регистрации (record date). Этому правилу Нью Йоркской Фондовой Биржи обычно следуют и другие биржи.

EXECUTIVE = ИСПОЛНИТЕЛЬНОЕ – Executive is a person or group having administrative or managerial authority in an organization. / Лицо или группа, имеющая административные или управленческие полномочия в организации.

EXECUTIVE BOARD = ИСПОЛНИТЕЛЬНЫЙ СОВЕТ – Executive Board is one of the decision-making bodies of the European Central Bank (ECB). It comprises the President and the Vice-President of the ECB and four other members appointed by common accord by the Heads of State or Government of the countries that have adopted the Euro.

EXECUTIVE OFFICER = ИСПОЛНИТЕЛЬНОЕ ДОЛЖНОСТНОЕ ЛИЦО (или ИСПОЛНИТЕЛЬНЫЙ СОТРУДНИК) – (1) An Executive Officer is generally a person responsible for running an organization, although the exact nature of the role varies depending on the organization. In business, the executive officers are the top officers of a corporation, the chief executive officer (CEO) being the best-known type. The definition varies; for instance, the California Corporate Disclosure Act defines 'executive officers' as the five most highly-compensated officers not also sitting on the board of directors. In many insurance policies, executive officer means, in the case of a corporation, any chairman, chief executive officer, chief financial officer, chief operating officer, president, or general counsel. In the case of a sole proprietorship, an executive officer is the sole proprietor. In the case of a partnership, an executive officer is a managing partner, senior partner, or administrative partner. In the case of a limited liability company, an executive officer is any member, manager, or officer.

(3) In the airline industry, the Executive Officer, more commonly known as the First Officer, is the second in command of the aircraft. In a fixed wing aircraft the first officer sits in the right-hand seat but a rotary wing aircraft they sit on the left.

(2) Executive Officer (abbreviation:- XO) is the second in command of a unit. See also Chief Executive Officer (CEO). Executive Officer is:- (i) (military) the second-in-command of any of certain military units. Abbreviation (US):- XO; (ii) (military) a specialist seaman officer, responsible under the captain for the routine efficient running of the ship in the US, British (formerly), and certain other navies.

EXECUTOR = ИСПОЛНИТЕЛЬ – Executor is the person designated in a decedent's will to carry out the directions and requests in the will and to dispose of the property according to the testamentary provisions.

EXEMPT BOARD OF TRADE = ОСВОБОЖДЁННАЯ ПАЛАТА ТОРГОВЛИ (или ОСВОБОЖДЁННОЕ ТАБЛО ТОРГОВЛИ) – Exempt Board Of Trade is a trading facility that trades commodities (other than securities or securities indexes) having a nearly inexhaustible deliverable supply and either no cash market or a cash market so liquid that any contract traded on the commodity is highly unlikely to be susceptible to manipulation. An exempt board of trade's contracts must be entered into by parties that are eligible contract participants.

EXEMPT CARRIER = ОСВОБОЖДЁННЫЙ ПЕРЕВОЗЧИК – Exempt Carrier is a for-hire carrier that is exempt from economic regulations.

EXEMPT COMMERCIAL MARKET = ОСВОБОЖДЁННЫЙ КОММЕРЧЕСКИЙ РЫНОК – Exempt Commercial Market is an electric trading facility that trades exempt commodities on a principal-to-principal basis solely between persons that are eligible commercial entities.

EXEMPT COMMODITY = ОСВОБОЖДЁННОЕ СЫРЬЁ – Exempt Commodity is any commodity other than an excluded or agricultural commodity. Transactions in an exempt commodity may only be between eligible contract participants or commercial entities, and cannot be executed on a trading facility. This serves as a residual term for any of the commodities not specified in the Commodities Exchange Act (CEA). These commodities are exempt from the rules outlined in the CEA; however, these transactions are still subject to the prohibitions against fraud and price manipulation. Exempt commodities include energy and metals. Exempt Commodity:- under the Commodity Exchange Act (CEA) as amended by the Commodity Futures Modernization Act of 2000 (CFMA), an Exempt Commodity is any commodity other than an excluded commodity or an agricultural commodity. This category includes, for example, metals and energy products.

EXEMPTED SECURITY = ОСВОБОЖДЁННАЯ ЦЕННАЯ БУМАГА (или ПРИВИЛЕГИРОВАННАЯ ЦЕННАЯ БУМАГА) – In the United States, Exempted Security is a security that is exempted from most provisions of the securities laws, including the margin rules. Such securities include US government and agency securities, and municipal securities designated by the US Securities and Exchange Commission (SEC). Under financial regulations in the United States, Exempt Securities are securities which do not need to be registered and reported under the Securities Act of 1933. There are several different criteria which can qualify a security for exemption from registration and reporting rules. People who are not clear about whether or not a specific security is exempt can consult a financial adviser or broker, who should be able to provide information and advice. The Securities and Exchange Commission (SEC) oversees

securities in the United States. Under the Securities Act of 1933, the SEC can take a number of steps to protect investors. The Securities Act is designed to prevent fraud, to make sure that information disseminated about securities is truthful, and to provide investors with information about the securities they buy. This is where registration and reporting requirements come in, with securities for sale needing to be registered with information about the parent company, a description of the securities, and the financial status of the company offering them. Exempt securities do not need to fulfill this registration requirement. A classic example of an exempt security is a Treasury security. Likewise, municipal bonds and commercial paper are exempt securities. Small security offerings and intrastate offerings are also exempted from needing to comply with the Securities Act. Another example of exempt securities is securities which are only offered to accredited investors, investors who are authorized to be involved in high risk investments. The assumption is that such investors are able to protect themselves. These exempt securities may be subject to other regulations which are designed to protect consumers. Securities which are not offered by a dealer, issuer, or underwriter are exempt as well. This caveat was put in place so that individual traders were not subject to reporting rules. Otherwise, every time someone wanted to sell securities, they would need to be registered and reported. This would be cumbersome, and could inhibit the free market in addition to generating a rather substantial amount of paperwork for SEC personnel and traders. The SEC takes its regulatory responsibilities seriously. Protecting investors is of key importance for financial health, and investors as well as the general public rely on the SEC to discharge its legal duties. Misrepresentation of securities as exempt or failure to comply with reporting rules can be grounds for legal penalties, including penalties which bar people from being involved in the financial industry in the future. / Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении).

EXEMPT FOREIGN FIRM = ОСВОБОЖДЁННАЯ ИНОСТРАННАЯ ФИРМА – Exempt Foreign Firm is a foreign firm that does business with US customers only on foreign exchanges and is exempt from registration under Commodity Futures Trading Commission (CFTC) regulations based upon compliance with its home country's regulatory framework, also known as a 'Rule 30.10 Firm'.

EXEMPTION = ОСВОБОЖДЕНИЕ – A term Exemption refers to a company obtaining an 'exemption' from the requirement to issue a prospectus and meeting registration requirements (to sell securities) when raising capital. Exemptions vary among Securities Regulators. An example of an exemption is the 'family, friends and relatives exemption', i.e. it is not necessary to issue a prospectus to a family member when selling shares in ones' company.

EXEMPTION CLAUSE = ОГОВОРКА ОБ ОСВОБОЖДЕНИИ – Exemption Clause is a provision in a contract under which one party (usually the one which drafted the agreement) is protected from being sued by the other party for damages, loss, negligence, non-performance, etc, or its liabilities are severely restricted. Banks, for example, use exemption clauses in documents of foreign trade where they accept no liability for any injury to the customer unless it can be proven to have been the direct result of their negligence or mistake. The courts, however, look at this clause with disfavor and often interpret it narrowly to see if it is reasonable in the circumstances. See also Exclusion Clause, Exculpatory Clause, and Indemnity Clause. A clause in a contract, which relieves the carrier's responsibility for certain events. An Exemption Clause is a contractual term by which one party attempts to cut down either the scope of his contractual duties or regulate the other parties right to damages or other possible remedies for breach of contract. It means that the exemption clause is a phrase in an agreement that give a limitation towards contracting parties. The exemption clause generally is called as Exclusion Clauses as well. There are three types of exemption clauses which are incorporation by signature, incorporation by notice and incorporation by previous course of dealings. In incorporation by signature, it includes a clause written on a document that all the parties have signed. Besides that, in incorporation by notice, it includes an exclusion clause if the person relying on a contract took a rational measure to draw notice in order to attract other parties' attention. In incorporation by previous course of dealings, it is practically use words. It means that, this incorporation involve a course of dealings between the parties were depends on the facts incorporated by a contract. The interpretation of exemption clause also includes a Contra Preferendum Rule (CPR), which means if the exemption clause is not clearly worded, the courts will appeal to CPR to the party relying on the exemption clause to explain on the not clearly worded exemption clause failing which the party relying must accept the entire responsibility. Based on the case of study, the situation of exemption clause can be seen in a notice board that stated 'The management shall not be liable for any damage to the car parked in the car park'. John who own a car in the parking lots was very disbelief that his car being knocked by some unknown vehicle which had costs his car damaged during the time he left his car at the time of appointment. John has approach the car park attendant for explanation but the car park attendant told John to read the car park ticket as well as the notice boards. John argued that the exclusion clause is not clearly worded which applied the Contra Preferendum Rule (CPR). He want to sue the car park due to the exclusion clause is not clearly worded. Contractual Liability:- (i) Exemption clause excludes liability:- sometimes, a party to a contract will include exemption clause to exclude or limit his liability in the event of a breach of contract. For example, the management of a company may include exemption clause such as 'The management shall not be liable for any death or personal injuries caused by any act, negligence, careless, reckless of omission by the employee, servants, agents whomsoever' in a contract. (ii) Exemption clause doesn't give a freedom of contract:- this is because there is a term or condition attached to the contract which restricts the rights of the parties to the contract. Exemption clause allow the benefit to the buyer to be limited or even completely excluded, by agreement between the parties. In practice, this allow an economically stronger seller to get an economically weaker buyer to agree to a term or terms implied for the benefit of the buyer. (iii) Exemption clause doesn't give inequality of bargain:- this might be a problem if one party is, for example, a big company, and the other is an ordinary customer. The parties have unequal bargaining power, so the stronger party might be able to take advantage of the weaker party. (iv) Exemption clause only protects the defendants:- sometimes it is unfair as defendants companies only rely on exemption clauses to limit its liability in the event of something going wrong. For example when a party to a contract wishes to limit their liability in the event that they breach the contract they will usually include an exclusion clause, limiting the amount that the other side can claimed to a specified total. They operate for the benefit of one party to an agreement, usually the defendant even though the incident happened due to the negligence of the defendant. (v) Exemption clause evades liability on contract and tort (civil wrong). Case Law (sample) – Thornton v Shoe Lane Parking (1971):- this case (Thornton v Shoe Lane Parking (1971) 1 All ER 686) demonstrates that for an Exclusion clause to be incorporated into a contract, other than by explicit agreement, the affected party must be given adequate warning. Mr Thornton parked his car in a commercial car park. The car park did display a sign to the effect that cars were parked at the owner's risk. As it happens it was Mr Thornton that was injured, not the car. The car park's terms of business were printed on the back of the ticket issued from the ticket dispenser but, it was ruled, this did not form part of the contract as the contract was concluded before the ticket was issued. The notice on the building was deemed insufficiently precise to allow a disclaimer of liability for injury. This case was one of many in which Lord Justice 'I-hate-exclusion-clauses' Denning used the rules of incorporation to defeat exclusion clauses that mitigated against consumers. These days such technical manoeuvres would be unncessary, as a contract term disclaiming liability for personal injury would be deemed void under the Unfair Contract Terms Act 1977. Conclusion:- in exemption clauses, it is generally having a few limitations. Firstly, exemption clause should be clearly worded for example not absurd and must not be ridiculous. Secondly, exemption clause must come before the formation of a contract or agreement. Besides that, the exemption clause also needs to be legible. Next, exemption clause must be placed in places which can be seen easily by people. After that, exemption clause also cannot be applied for children as well as unfortunate for example handicap. In the limitations of exemption clause, the courts will look into the policy consideration, the types of contract and also floodgate of

litigation before deciding on application of exemption clause. In addition, exemption clause is ineffective when situation is attempt to exempt liability for death or personal injuries, situation of attempt to exempt liability in respect of seller's implied undertaking as to title and also situation of attempt to exempt liability in respect of seller's obligations in respect of quality. So, exemption clause operates as to exclude or restrict the rights of a party in a contract. Exemption Clause is a clause in a contract relieving the carrier from responsibility for certain events. / Дьжон (John). Сонтэн против Щу Лэйн Пакинь (Thornton v Shoe Lane Parking) (1971):- . Дэнинь (Denning).

EXEMPT PROPERTY = ОСВОБОЖДЁННАЯ СОБСТВЕННОСТЬ – Exempt Property means tangible personal property which is acquired in whole or in part with Federal funds, and title to which is vested in the recipient without further obligation to the Federal Government except as provided in 4d below. Such unconditional vesting of title will be pursuant to any Federal legislation which provides the Federal sponsoring agency with adequate authority.

EXERCISE = ИСПОЛНЕНИЕ – Exercise:- notification by the buyer (taker) of their decision to buy or sell the underlying securities or receive a cash payment pertaining to an option contract, or warrant. Options and warrants may be either American Style or European Style exercise. Exercise:- to elect to buy or sell, taking advantage of the right (but not the obligation) conferred by an option contract. Exercise:- the action taken by the holder of an option contract to exercise his right to buy or sell one or more underlyings at the terms specified in the option contract. The process of converting an options contract into a futures position. Action taken by an option holder that requires the writer to perform the terms of the contract. Exercise is the initiation of the right to buy (call) or sell (put) an asset by the option holder at the agreed strike price. Exercise:- the process by which the owner (holder) of the option takes advantage of the right (but not the obligation) and notifies the seller of his intention to take/make delivery of the underlying contract at the option's strike (exercise) price. The Put Option's owner sells or the Call Option's owner buys the underlying asset. The Exercise by an option holder of his right to buy (call) or sell (put) an asset at the agreed strike price. Exercise:- to put into effect the right specified in a contract. In options trading, the option holder has the right, but not the obligation, to buy or sell the underlying instrument at a specified price on or before a specified date in the future. If the holder decides to buy or sell the underlying instrument (rather than allowing the contract to expire worthless or closing out the position), he or she will exercise the option, and make use of the right available in the contract. In options trading, the buyer (or holder) of a call contract may exercise his or her right to buy the underlying shares at the specified price (the strike price); the buyer of a put contract may exercise his or her right to sell the underlying shares at the agreed-upon price. If the buyer chooses to exercise the option, he or she must inform the option seller (the writer of the option contract). This is achieved through an exercise notice, the broker's notification that a client wishes to exercise his or her right to buy or sell the underlying security. The exercise notice is forwarded to the option seller via the Options Clearing Corporation. Even though the buyer has the right but not the obligation to exercise the option, the seller is obligated to fulfill the terms of the contract if the buyer decides to exercise the option. The majority of options contracts are not exercised, but instead are allowed to expire worthless or are closed by opposing positions. For example, an option holder can close out a long call or put prior to expiration by selling it (assuming the contract has market value). If an option expires unexercised, the holder no longer has any of the rights granted in the contract. In addition, the holder loses the premium that was paid for the option, along with any commissions and fees related to its purchase. Exercise is an action taken when the buyer of a call (put) option converts the option to the purchase (sale) of the underlying futures contract. / на условиях, спецификационных в опционном контракте. Опционная Клиринговая Корпорация (ОКК; Options Clearing Corporation (OCC)). Процесс, посредством которого хозяин (владелец) опциона, пользуясь преимуществом права (но не обязательства), извещает продавца о своём желании принять/осуществить поставку соответствующего контракта по сходной цене (цене исполнения) опциона. Хозяин опциона на продажу продаёт, а хозяин опциона на покупку покупает соответствующий актив. Исполнение:- пользоваться правом, предоставленным в контракте. Покупатель опциона на покупку может осуществить своё право на покупку соответствующих финансовых инструментов (акций) по фиксированной цене, проинформировав продавца опциона. Право покупателя опциона на продажу осуществляется, когда соответствующие акции продаются по оговорённой цене.

EXERCISE DAY = ДЕНЬ ИСПОЛНЕНИЯ – Exercise Day is the day on which the owner of an option exercises his option right. In the case of European-style options, the exercise day can only be the expiration day at the end of the maturity. With American-style options, the option holder can exercise at any time during the maturity.

EXERCISE NOTICE = УВЕДОМЛЕНИЕ ОБ ИСПОЛНЕНИИ – Exercise Notice:- this term means a notice, in the form prescribed by the clearing organization, issued to the clearing organization by a clearing member that is, or that carries accounts for other persons who are, holding long positions in options that are to be exercised. Exercise Notice is a notice sent by an option holder to the Options Clearing Corporation (OCC), calling for fulfillment of the option's terms. The OCC will then assign fulfillment to someone short the same option. Exercise Notice is the written notice of the holder of an option contract of his/her intent to exercise the option. Exercise notice may occur on or before the expiration date, depending on the type of option contract. The exercise notice is sent to the Options Clearing Corporation, which is responsible for settling the transaction by finding an investor with an opposite position on the same contract. Exercise Notice:- a notification by a broker that a client wants to exercise a right to buy the underlying stock in an option contract. Such notice is transmitted to the option seller through the Options Clearing Corporation, which ensures that stock is delivered as agreed upon. / Уведомление об Исполнении – уведомление брокера о том, что его клиент желает воспользоваться своим правом на покупку соответствующих акций по опционному контракту. Подобное уведомление передаётся продавцу опциона через Опционную Клиринговую Корпорацию (ОКК; Options Clearing Corporation (OCC)), которая обеспечивает поставку акций в соответствии с контрактами.

EXERCISE PERIOD = ПЕРИОД ИСПОЛНЕНИЯ – Exercise Period is a period during which an option can be exercised (only American-style). When the option period ends, the option right expires and the option lapses.

EXERCISE PRICE = ЦЕНА ИСПОЛНЕНИЯ – Exercise Price is a price at which an option buyer can buy (in the case of a call) or sell (in the case of a put) the underlying commodity futures, currencies, securities, etc. The price, specified in the option contract, at which the underlying futures contract, security, or commodity will move from seller to buyer. Exercise Price is the specified price on an option contract at which the contract may be exercised, whereby a call option buyer can buy the underlier or a put option buyer can sell the underlier. The buyer's profit from exercising the option is the amount by which the spot price exceeds the exercise price (in the case of a call), or the amount by which the exercise price exceeds the spot price (in the case of a put). In general, the smaller the difference between spot and exercise price, the higher the option premium. The price, specified in the option contract, at which an option holder may buy or sell the underlying futures contract upon exercise of this option. Exercise Price is the price at which the underlying security can be purchased (call option) or sold (put option). The exercise price is determined at the time the option contract is formed. Also known as the Strike Price. The exercise price is the key to profiting from options. A difference between the fixed exercise price and the market price at the time the option is exercised is what gives it value. Generally, the greater the difference between the exercise and market price at the time an option contract is written, the higher the premium required to purchase the option. Exercise Price or Strike Price is the value of the underlying futures contract determined at the time of purchasing an option. Hence the price achieved if the

option is exercised. Exercise Price is the price, specified in the option contract, at which the buyer of a call can purchase the underlying asset during the life of the option; and the price, specified in the option contract, at which the buyer of a put can sell the underlying asset during the life of the option. Exercise Price is the price (strike price) at which an option can be exercised. Exercise Price or Strike Price is the price at which an underlying security can be sold to (for a put) or purchased from (for a call) the writer or issuer of an option (or option feature on a security). / Цена Исполнения – цена, спецификационная в опционном контракте, по которой покупатель, в случае исполнения опциона на покупку, может приобрести соответствующий актив в течение срока действия этого опциона; или цена, спецификационная в опционном контракте, по которой покупатель, в случае исполнения опциона на продажу, может продать соответствующий актив в течение срока действия этого опциона. В качестве актива может выступать фьючерсный контракт на соответствующее сырьё, различные валюты, ценные бумаги и так далее. Известна также как Сходная Цена (Strike Price). Цена Исполнения – фиксированная цена, по которой могут быть куплены по опционному контракту на покупку или проданы по опционному контракту на продажу ценные бумаги или товары в течение определённого периода времени. Например, опцион на покупку может позволить покупателю приобрести 100 акций компании Экс.Уай.Зэд. (XYZ) в любой момент времени в течение следующих 3 месяцев по заранее установленной сходной цене (strike price), равной 63 Долларам.

EXERCISING OPTIONS = ИСПОЛНЕНИЕ ОПЦИОНОВ – Exercising Options is initiated by the buyer of an option. The buyer takes ownership of the underlying futures contract at the specified option strike price. The seller is obligated to take the offsetting transaction.

EX GRATIA PAYMENT = ПЛАТЁЖ ЭКС ГРАЦИА (или ДОБРОВОЛЬНЫЙ ПЛАТЁЖ) – Ex Gratia Payment is a payment made by underwriters 'as a favor' or 'out of kindness' without an admission of liability so as to maintain goodwill. Ex Gratia Payment is the payment made 'as a favor' by an insurer, when there is no obligation under the policy terms. Ex Gratia (sometimes Ex-Gratia) is Latin (literally:- By Favor); new Latin, literally:- Out Of Kindness. From Latin:- Ex (Out Of) + Gratia (Favor, Kindness). In reinsurance, Ex Gratia Payment is a payment made for which the company is not liable under the terms of its policy. Usually made in lieu of incurring greater legal expenses in defending a claim. Rarely encountered in reinsurance as the reinsurer by custom and for practical reasons follows the fortunes of the ceding company. When they say they are making a payment ex gratia, it is more often than not, not ex gratia, but because of their culpability. / Ex Gratia (иногда Ex-Gratia) – Латинское выражение (буквально – Из Милости или По Милости или Добровольно).

EXHAUST DYEING = КРАШЕНИЕ ИСТОЩЕНИЕМ – Exhaust Dyeing:- generally meaning the use of a dye bath of moderately large liquor to goods ratio, in which the fiber is immersed for some time, allowing the dye molecules to leave the bath and attach to the fibers. Exhaust dyeing is the typical process for most commercial fabric dyeing. It depends of dye substantivity. See padding for a different method. / Субстантивность (Substantivity). Крашение Истощением красильной ванны.

EXHAUST GAS RECIRCULATION = ИСТОЩАЮЩАЯСЯ ГАЗОВАЯ РЕЦИРКУЛЯЦИЯ – Exhaust Gas Recirculation (EGR):- a system designed to reduce the NOx emission. It recirculates the exhaust gas back into the intake manifold thus diluting the fuel/air mixture and reducing the temperature and NOx formation. / Эксгаустер.

EXHAUSTION = ВЫТЯЖКА (или ВЫБИРАНИЕ) – Exhaustion is the leaving of a dye from the dye bath and attachment to the fiber being dyed. The ideal dye would exhaust totally – all the dye in the dye bath would end up on the fiber. Exhaustion is sometimes specified as a percentage. For example, 60% exhaustion would mean that 60% of the total amount of dye has attached to the fiber, and 40% is still in solution. Reactive dyes generally show moderate exhaustion while many acid dyes exhaust to the point that the dye liquor becomes nearly colorless. Dye that has exhausted onto the fiber is not necessarily 'permanently' bonded to the fiber. See also Affinity, Fixation, and Substantivity. / Смотрите также Сродство (Affinity), (), и Субстантивность (Substantivity).

EXHAUSTION = ИСТОЩЕНИЕ – (1) Exhaustion is the end of a strong trend in prices where an acceleration phase is taking place. Usually thought of as when the last buyer of an uptrend or seller of a downtrend has been satisfied. A precursor to a trend reversal.

(2) During wet processing, the ratio at any time between the amount of dye or substance taken up by the substrate and the amount originally available. Exhaustion is the amount of dye taken from the dye bath by the fiber, yarn or fabric being dyed. Also, the condition of the dyer at the end of the day.

(3) Exhaustion:- in intellectual property protection, the principle that once a product has been sold on a market, the intellectual property owner no longer has any rights over it. (A debate among WTO member governments is whether this applies to products put on the market under compulsory licences.) Countries' laws vary as to whether the right continues to be exhausted if the product is imported from one market into another, which affects the owner's rights over trade in the protected product. See also Parallel Imports.

EXHAUSTION GAP = ОТРЫВ ИСТОЩЕНИЯ (или РАСХОЖДЕНИЕ ИСТОЩЕНИЯ, или РАЗРЫВ ИСТОЩЕНИЯ, или ПРОМЕЖУТОК ИСТОЩЕНИЯ, или ЗАЗОР ИСТОЩЕНИЯ) – After an extended or long move, a gap in the direction of the current move is called an Exhaustion Gap. For an exhaustion gap to be considered valid, prices should reverse soon after the gap and close the gap. After an extended decline, a gap down could signal that the downtrend is about to exhaust itself. An exhaustion gap is confirmed when prices reverse soon afterwards and move above (or 'close') the gap. After an extended advance, an exhaustion gap would be confirmed when prices reverse soon afterwards and move below the gap. See also Breakaway Gap, Common Gap, Continuation Gap, Down Gap, Gap, Runaway Gap, and Up Gap. A price gap that occurs at the end of an important trend, and signals that the trend is concluding. Exhaustion Gap signals end of a move. These gaps are associated with a rapid, straight-line advance or decline. A reversal day can easily help to differentiate between the Measuring gap and the Exhaustion gap. When it is formed at the top with heavy volume, there is significant chance that the market is exhausted and prevailing trend is at halt which is ordinarily followed by some other area pattern development. An Exhaustion gap should not be read as a major reversal. A price gap during a blow-off stage that signals the end to a trend. Many times followed by a reversal pattern. Exhaustion Gaps occur at the end of a trend. In the case of an uptrend, price makes one last attempt to move higher; however, the trend is exhausted, and the higher price cannot be sustained. Similarly, in downtrends, prices make one last attempt to form a new low. As the trend gets exhausted, lower prices are not sustained and value buying emerges, pushing stock prices higher. As seen in 'Cat Back' (right – this exhaustion gap marked the last gasp of this trend in CAT before the stock's price broke down hard), Caterpillar Inc. (CAT) formed an exhaustion gap on 2013-February-01, when the stock opened at USD99.00 per share compared to the previous trading day's close of USD98.39. CAT made one last attempt to make a new high of USD99.70, but the next day it gave up all the gains and started a fresh downtrend. While an exhaustion gap is better used as a signal to liquidate existing positions, it also can be used to establish new trades. This should be done with care, though, because of the ease of mistaking continuation gaps for exhaustion gaps. You'll want significant confirmation from price or other indicator readings before taking a new trade against the previous trend. / Инк. (Caterpillar Inc.; Си.Эй.Ти. (CAT)). В техническом анализе биржевых рынков, Разрыв Истощения наблюдается после значительного движения цен, и за ним вскоре следует разворот тенденции. Разрыв истощения может показаться особенно полезным техническим сигналом, пока не поймёшь, что различие между ним и разрывом ускорения можно обнаружить только задним числом. Однако в некоторых случаях разрыв истощения можно распознать на очень ранней стадии разворота тенденции.

EXIMBANK = EXPORT–IMPORT BANK

EXIMBANK = ЭКСИМБЭНЬК – Eximbank is a short for the Export-Import Bank of the United States. The US Government agency responsible for assisting in the export of US goods and services through a variety of programs. See also Export-Import Bank of the United States.

EXINE = ЭКЗИНА – Exine is the outer layer of the pollen grain wall largely composed of the polysaccharide sporopollenin and resistant to attack by chemicals. / Экзина – наружная оболочка (стенка) зрелого пыльцевого мешка, зерна или споры.

EX–INTEREST = БЕЗ ПРОЦЕНТА – Ex-Interest (.X or X Int.):- in bond listing of newspapers. / Без Процентов в приводимых в газетах перечнях акций.

EXIT = ВЫХОД – (1) An Exit is the means by which a financial investor is able to realize its investment in a company. Generally speaking four exit routes are available:- (i) the former proprietors buy back the stake held by a financial investor (buy-back); (ii) the stake is sold to another company, usually in the same industry (trade sale); (iii) a third-party, often another financial investor, takes over the stake from the financial investor's portfolio (secondary purchase); or (iv) the stake in a company is listed on the stock exchange (going public).

(2) Exit:- to cover a market position and move to the sidelines. / Покрыть ранее занятую позицию на рынке и уйти в сторону.

EXIT FEE = ВОЗНАГРАЖДЕНИЕ ЗА ВЫХОД – Exit Fee is the fee set by the fund manager for selling units in a managed investment expressed as a percentage of the amount invested. The fee is deducted from the amount invested by the fund manager. / Вознаграждение За Выход – плата за выход из рынка, взимаемая из переведённой суммы.

EXIT FEE = ВОЗНАГРАЖДЕНИЕ ЗА ВЫХОД (или ПЛАТА ЗА ОТКАЗ ОТ ОБСЛУЖИВАНИЯ) – Exit Fee is a fee that is paid by a customer leaving a utility network intended to compensate the utility in whole or part for the loss of fixed cost contribution from the exiting customer. / Плата, которую потребитель, отказывающийся от услуг сети энергопредприятия, должен оплатить с целью полной или частичной компенсации за потерю доли возмещения постоянных издержек, которую ранее вносил отказавшийся от её услуг потребитель.

EXIT STRATEGY = СТРАТЕГИЯ ВЫХОДА – A term Exit Strategy refers to the way in which investors and founders can 'exit', i.e. leave their company, with a cash return on their investment, e.g., by going public or being acquired or being bought out by other shareholders.

EXON = ЭКЗОН – Exon:- expressed region of a gene. Transcribed and translated.

EXOTIC = ЭКЗОТИЧЕСКОЕ (или ЭКЗОТЫ, или ЧУЖЕЗЕМНОЕ, НЕ МЕСТНОЕ, или ИНОЗЕМНОЕ) – Exotic:- not native to a particular country, ecosystem or ecoarea (applied to organisms intentionally or accidentally introduced as a result of human activities). As the code is directed at the introduction of biological control agents from one country to another, the term 'Exotic' is used for organisms not native to a country. Exotic:- introduced from another climate, country or region. Exotic is an organism or a plant introduced from one country to another. / Экзоты – растения, ввезённые из стран с климатом, резко отличающимся от климата данной страны. Под Экзотикой, от Греческого слова Exōtikós, означающее Иноземный или Чужой, понимаются причудливые, необычайные особенности (природы, обычаев, искусства и прочего) отдалённых стран. Экзотический:- не местный для данной страны, экосистемы или экозоны (применяется к организмам, целенаправленно или случайно интродуцированным в результате человеческой деятельности). Поскольку Код рассматривает интродукцию агентов биологической борьбы из одной страны в другую, термин Экзотический используется в нём для организмов, не местных для данной страны. Иноземный Вид – особь или популяция на любой стадии развития, или жизнеспособная часть организма, который является не местным для зоны, и проник в эту зону путём человеческого вмешательства. Термин Иноземный относится только к местности и распространению организма в сравнении с его естественным распространением. Это не означает, что организм является вредным. Данное определение делает акцент на физическом присутствии особей вида в определённый отрезок времени, тогда как другие формулировки о присутствии относятся к географическому распределению таксона в целом. Согласно данной формулировке иноземный вид уже проник в рассматриваемую зону. Дригих формулировок больше волнуют организмы, которые ещё не присутствуют в рассматриваемой зоне (то есть карантинные вредные организмы). Термин Иноземный не подходит к ним, и в ряде формулировок использовались такие термины, как Экзотический, Не Местный или Не Родной. Во избежание путаницы, было бы предпочтительно использовать только один из этих терминов, в данном случае термин Не Местный будет самым подходящим, тем более что он может употребляться в противовес термину Местный. Термин Экзотический не является подходящим, так как представляет проблемы для перевода. Вид, который является не местным, и проник в зону естественными путями, не является иноземным видом. Он просто расширяет свой природный ареал распространения. Согласно же целям других формулировок такой вид всё ещё можно рассматривать в качестве потенциального карантинного вредного организма. Иноземный Вид – вид, подвид или более низкий таксон, интродуцированный за границы зоны его естественного прошлого или настоящего распространения; включает любую часть, гаметы, семена, яйца, или отпрыски таких видов, которые могут выживать и впоследствии воспроизводиться. Слово 'прошлое' в данном определении предположительно подразумевает повторную интродукцию вида в зону, из которой он недавно исчез, таким образом, повторно интродуцированные виды, вероятно, не будут рассматриваться как чужеродные виды.

EXOTIC GERMPLASM = ЭКЗОТИЧЕСКАЯ ГЕРМОПЛАЗМА – Exotic Germplasm:- plant material of unknown genetic value often comprised of plant introductions, accessions, or germplasm of diverse geographic origin. See also Raw Germplasm.

EXOTIC INSTRUMENTS = ЭКЗОТИЧЕСКИЕ ИНСТРУМЕНТЫ – Exotic Instruments are any uncommon securities. This may include certain derivatives, structured or synthetic securities. / Любые необычные ценные бумаги. К ним могут относиться некоторые производные (деривативы), структурированные или синтетические ценные бумаги.

EXOTIC OPTIONS = ЭКЗОТИЧЕСКИЕ ОПЦИОНЫ – Exotic Options are engineered financial products, relating to warrants and other leverage products, with a strongly speculative character. Issuers are constantly creating and launching products with innovative new names to meet fast-changing investor demand. Though exotic options offer the chance of quick and sizeable price gains, there is also the risk of equally quick losses, right up to a complete loss of the investment. Any of a wide variety of options with non-standard payout structures or other features, including Asian Options and Lookback Options. Exotic options are mostly traded in the over-the-counter market. Compared with the types already described above, options of this nature involve additional conditions or agreements. They therefore feature structures which cannot be created by any combinations of standard options alone or together with underlying instruments. Exotic options occur both as over-the-counter (OTC) options and also in the form of warrants. The virtually unlimited possibilities for structuring exotic options mean that the risks arising in individual instances cannot be described within the scope of this brochure. Investors should therefore seek detailed information about the risks involved before purchasing or selling instruments of this

nature. Exotic Options is the generic term for the more sophisticated option strategies which have features over and above basic option contracts. Exotic Option is any option with a more complicated pay-out structure than a plain vanilla put or call option. The pay-out of a plain vanilla option is simply the difference between the strike price of the option and the spot price of the underlying at the time of exercise. For a European-style option, the exercise time is always the expiry date; other option styles offer greater flexibility. There are a number of ways in which an option pay-out can differ from that of a plain vanilla. The pay-out could also be a function of:- (i) the difference between a strike and an average rate for the underlying (average options); (ii) the difference between prices for two different underlyings (difference options, exchange options), the same underlying at different times (high-low options); (iii) the correlation between two or more underlyings (outperformance options, outside barrier options); (iv) the difference between a strike and the spot rate at some time other than expiry (deferred pay-out options, shout options, lookback options, cliquet options, ladder options – see diagram; and (v) a fixed amount (binary options). Alternatively, or additionally, a pay-out may be conditional on certain trigger conditions being met. For example, barrier options are activated or nullified if a spot rate falls or rises through a predetermined trigger level. Multiple trigger conditions are possible (as the in case of corridor or mini-premium options).

EXPANDED TRADING HOURS = РАСШИРЕННЫЕ ЧАСЫ ТОРГОВЛИ – Expanded Trading Hours are the additional trading hours of specific futures and options contracts at the Chicago Board of Trade that overlap with business hours in other time zones. / В Чикагской Палате Торговли (Чикагском Табло Торговли, если быть более точными) .

EXPANSION = ЭКСПАНСИЯ – Expansion:- period characterized by growth of economic output and demand. Expansion is a primary goal of economic policy. It attenuates or even eliminates fluctuations in the business cycle, promotes stable growth and, in some cases, maximizes an economy's development potential. The opposite of Recession, or Stagnation. See also Business Cycle, and Growth. / выработка (output). флуктуации (колебания) . Под Экспансией, от Латинского слова Expansio, означающее Распространение или Расширение, понимается расширение сферы господства монополистических объединений, групп, государств, осуществляемое как экономическими (например, вывоз капитала, кабальные займы), так и внеэкономическими методами (вооружённые захваты, дипломатическое давление). Империалистическая экспансия выражается в захватнических войнах, в лишении народов политической независимости. Под Экспансией понимается политика капиталистического государства, направленная к расширению сферы своего влияния на другие страны и осуществляемая дипломатическими, экономическими и военными методами. Империалистическая Экспансия преследует цели закабаления других народов, захвата новых территорий, рынков сбыта товаров и сфер приложения капиталов, источников сырья.

EXPANSIVE GROWTH = ЭКСПАНСИВНЫЙ РОСТ – Expansive Growth is an increase in height, length, or area of cells or tissues. / Под Экспансивным Ростом, от Французского слова Expansif, означающее Несдержанный или Порывистый, от Латинского слова Expansio, означающее Распространение, понимается .

EX PARTE REEXAMINATION = ОДНОСТОРОННЯЯ ПОВТОРНАЯ ЭКЗАМЕНАЦИЯ (или ОДНОСТОРОННЯЯ ПОВТОРНАЯ ЭКСПЕРТИЗА) – Ex Parte Reexamination:- if the request for ex parte reexamination is filed by a third party and not the patent owner, the third party may not participate in the ex parte proceedings beyond the filing of a reply to the patent owner's statement under 37 CFR § 1.530 (CFR:- short for the US Code of Federal Regulations), if the patent owner files a statement. No other reply or submission by a third party will be considered in ex parte reexamination.

EXPECTATION = ОЖИДАНИЕ – Expectation is a belief concerning a future event. The expectations of economic agents are the optimistic or pessimistic assumptions on which they base their financial plans. Consumer and business expectations often influence future events and are an important element in economic forecasting.

EXPECTED RATE OF INFLATION = ОЖИДАЕМЫЙ УРОВЕНЬ ИНФЛЯЦИИ – In the United States, Expected Rate Of Inflation is the public's expectations for inflation. These expectations determine how large an effect a given policy action by the Fed will have on economic activity.

EXPEDITING = ЭКСПЕДИРОВАНИЕ (или ЭКСПЕДИЦИЯ) – Expediting:- determining where an in-transit shipment is and attempting to speed up its delivery.

EXPENDABLE PALLET = РАСХОДНЫЙ (или СПИСЫВАЕМЫЙ, или РАСХОДУЕМЫЙ) ПОДДОН – Expendable Pallet is a pallet intended for a series of handlings during a single trip from shipper to receiver; it is then disposed. See also Shipping Pallet. Expendable Pallets are frequently used all over the world. To ensure that the packaging conforms to phytosanitary regulations, treated wood or other material is used. Expendable Pallets are the perfect solution when you need to ship large loads to recipients who do not plan on reusing the pallets. Expendable pallets are used all over the world, and to meet industry standards, they are normally made with treated wood or other materials. Expendable Pallet is a pallet utilized for a single transaction and is not expected to be returned. Also known as Disposable Pallet. Expendable Pallet is a pallet is an essential packaging in the modern logistics. No matter in the warehouse, on the road, or with the customer, pallet facilitates the storing, handling, loading, unloading, effectively save the time and labor cost. Both Expendable and Returnable pallets are frequently used all over the world. / Известен также как Одноразовый Поддон (Disposable Pallet).

EXPENDITURE = ТРАТА (или ИЗДЕРЖКИ) – Expenditure is the incurrence of a liability to obtain an asset or service. Expenditure is a payment, either in cash, by assuming a liability, or by surrendering asset. Payment – in cash or property, or by incurring a liability – to acquire a good or obtain a service. / Трата или Издержки – несение обязательства для получения актива или услуги. Трата или Издержки – платёж наличными или имуществом, или несением или принятием ответственности для поступления товара или получения услуги, или уступкой актива.

EXPENSE RATIO = СООТНОШЕНИЕ С РАСХОДОМ (или УРОВЕНЬ РАСХОДОВ, или СООТНОШЕНИЕ РАСХОДОВ К ДОХОДАМ) – Expense Ratio is the percentage of premium used to pay all the costs of acquiring, writing and servicing insurance and reinsurance. Sum of acquisition costs and other operating costs and expenses in relation to premiums earned. Expense Ratio is the percentage of assets that are used to operate a fund. These include expenses such as management fees, advisory fees, and overhead costs. The expense ratio does not include brokerage costs for trading the portfolio.

EXPENSES = РАСХОДЫ – Expenses:- as a verb, to write off a past or current expenditure in the current period. As a noun, a sacrifice involved in carrying out the earning process of an entity during a period resulting in a decrease in proprietorship; an outflow or other using up of assets or incurring of a liability (or a combination of both) during a period from delivering or producing goods, rendering services, or carrying out other activities that constitute the entity's ongoing operations. Expenses are investments made, typically measured monthly, to support the generation of sales and profits. Examples of expenses are advertising, payroll, rent and other purchases. In general, any business cost incurred in operating an enterprise. In accounting, any operating cost related to a particular accounting period rather than to a given product or service, or to be charged as past or current expenditure to the accounting period to

which it applies. An expense is a cost with expired benefits. See also Direct Expenses, Fixed Expenses, Indirect Expenses, Operating Expenses, and Variable Expenses.

EXPERIENCE = ОПЫТ (ПРАКТИКА, или СТАЖ, или КВАЛИФИКАЦИЯ) – In insurance, Experience is the loss record of an insured, class of coverage, or of an insurance company. Experience is:- (i) the loss record of an insured or of a class of coverage; (ii) classified statistics of events connected with insurance, of outgo, or of income, actual or estimated; and (iii) what figures show to have happened in the past. Experience may be compiled on different bases to provide various means of appraisal, viz. Accident Year, Calendar Year, or Policy Year, but, for underwriting purposes, should always compare earned premium with incurred losses after the latter have been modified by an allowance for loss development and incurred but not reported (IBNR) losses.

EXPERIENCE RATING = ОПЫТНАЯ ОЦЕНКА (СТРАХОВОЙ ПРЕМИИ) – Experience Rating:- determination of the premium rate for an individual risk, made partially or wholly on the basis of that risk's own past claim experience.

EXPERIMENT = ЭКСПЕРИМЕНТ – Experiment is a planned inquiry to obtain new facts or to confirm or refute results of previous work. Such an inquiry will aid in decisionmaking, recommending of new processes, procedures, plant varieties, and so on. This type of research sets the circumstances and is controlled by the researcher. / Под Экспериментом, от Латинского слова Experimentum, означающее Опыт или Проба, понимается чувственно-предметная деятельность в науке; в более узком смысле – опыт, воспроизведение объекта познания, проверка гипотез и тому подобного. Под Экспериментом понимается исследование каких-либо явлений путём активного воздействия на них при помощи создания новых условий, соответствующих целям исследования, или же через изменение течения процесса в нужном направлении. Эксперимент – изучение, исследование экономических явлений и процессов путём их воспроизведения, моделирования в искусственных или естественных условиях. Возможности экономических экспериментов весьма ограничены, так как очень сложно воспроизвести реальные условия, многократно повторять эксперимент, к тому же приходится экспериментировать на людях, субъектах хозяйства, что способно вызывать неблагоприятные социальные последствия.

EXPERIMENTAL DESIGN = ЭКСПЕРИМЕНТАЛЬНЫЙ ДИЗАЙН – Experimental Design is the plan of an experiment. It involves the assignment of treatments to the experimental units.

EXPERIMENTAL ERROR = ЭКСПЕРИМЕНТАЛЬНАЯ ОШИБКА (или ЭКСПЕРИМЕНТАЛЬНАЯ ПОГРЕШНОСТЬ) – Experimental Error is the deviation of a randomly occurring observation from its true or expected value. The difference between experimental plots or experimental units receiving the same treatments. This error comes from the inherent variability which exists in the experimental materials and the variation resulting from any nonuniformity in the physical conduct of the experiment. Experimental error is always present. A good experiment is one in which experimental error is kept at the minimum level. Its measurement is essential for use in detecting real differences between treatments. Experimental Error is the difference in results between experimental plots treated alike; uncontrollable random error.

EXPERIMENTAL FARMS = ЭКСПЕРИМЕНТАЛЬНЫЕ ФЕРМЫ – Experimental Farms are the government or institute-controlled farms where experiments are conducted.

EXPERIMENTAL GRADES = ЭКСПЕРИМЕНТАЛЬНЫЕ СОРТА – Experimental Grades are established to provide the Canadian Wheat Board a way to market new varieties of Wheat and Barley to assess their acceptability in world markets.

EXPERIMENTAL PLOT = ЭКСПЕРИМЕНТАЛЬНАЯ ДЕЛЯНКА – Experimental Plot is the area used in a field experiments.

EXPERIMENTAL SITE = ЭКСПЕРИМЕНТАЛЬНЫЙ УЧАСТОК – Experimental Site is a specific location where field experiments are conducted.

EXPERIMENTAL STATION = ЭКСПЕРИМЕНТАЛЬНАЯ СТАНЦИЯ – Experimental Station is a place with land and buildings where various facilities and trained staff are available for scientific experiments on rice and other agricultural products.

EXPERIMENTAL UNITS = ЭКСПЕРИМЕНТАЛЬНЫЕ ЕДИНИЦЫ (или ОПЫТНЫЕ ХОЗЯЙСТВА) – Experimental Units:- a unit to which one treatment is assigned or applied.

EXPIRATION = ПРЕКРАЩЕНИЕ ПРИЗНАНИЯ (или ЭКСПИРАЦИЯ) – Expiration:- when an option can no longer be exercised. Expiration is a termination of a certain period. The final date and time after which an option may no longer be exercised. / Под Экспирацией, от Латинского слова Expiratio, означающее Выдох или Выдыхание, понимается прекращение определённого периода. В отношении опционных контрактов это относится к окончательным дате и времени, после которых опцион больше не может быть исполнен. Экспирация:- (1) наступление даты завершения сделки; (2) наступление даты истечения срока действия опциона; последний день для реализации опциона.

EXPIRATION DATE = ДАТА ПРЕКРАЩЕНИЯ ПРИЗНАНИЯ (или ДАТА ЭКСПИРАЦИИ) – (1) Expiration Date is the date past which a product, such as food or medicine, must be sold or removed from availability because it is no longer expected to be fresh or effective. The dates on food labels can be confusing. The truth is, they often have nothing to do with food safety. Here's what you really need to know. You've assembled everything you need for the perfect deli sandwich:- Genoa salami, prosciutto, some thinly sliced provolone and a crusty baguette. To top it all off, you reach into the fridge for your favorite spicy mustard. And then you notice it. The 'Best By' date on the mustard bottle was 4 months ago! You might think you've got to ditch the mustard and settle for a ho-hum sandwich. But that's not the case. Here's what you need to know about food expiration dates:- Use-By, Best if Used By, Best By, Best Before. These 'use by' and 'best' dates are generally found on shelf-stable products such as mustard, mayonnaise, and peanut butter. The date, which is provided voluntarily by the manufacturer, tells you how long the product is likely to remain at its absolute best quality when unopened. But, as the US Department of Agriculture's Food Safety and Inspection Service points out, it is not a safety date. After the 'use by' or 'best' date has passed, you may start to notice gradual changes in the unopened product's texture, color, or flavor. But as long as you've been storing the unopened item properly, you can generally consume it beyond this date. Your best bet for gauging whether an unopened shelf-stable product with this type of date is still of satisfactory quality is to simply smell and examine it first. Always discard foods that have developed an off odor, flavor or appearance. You can also consult the Keep It or Toss It database for optimal food storage times, for both unopened and opened items. Sell-By:- most sell-by dates are found on perishables like meat, seafood, poultry and milk. The date is a guide for stores to know how long they can display a particular product. You should buy the product before the sell-by date expires. But you can still store it at home for some time beyond that date, as long as you follow safe storage procedures (check the Keep It or Toss It database for specific foods). For instance, milk that has been continuously refrigerated will usually remain drinkable for about one week after the 'sell by' date on the package. Likewise, you can store ground beef in your refrigerator for 1 to 2 days after purchasing it, even if the sell-by date expires during that time. Expires On:- the only place you're likely to encounter this type of date is on infant formula and some baby foods, which are the only food products the federal government regulates with regard to dating. You should always use the product before this date has passed. Packing Codes:- these

codes, which appear as a series of letters and/or numbers on the package, sometimes indicate the date or time of manufacture. Often, though, they simply appear as a meaningless jumble. Either way, packing codes help manufacturers and grocers rotate their stock and quickly locate products in the event of a recall. But they are not meant to be interpreted as an indicator of either food safety or quality.

(2) Expiration Date is the date on which something, such as a warranty or license, is no longer valid or in effect.

(3) Expiration Date:- it is not uncommon for an option to expire on a specified date during the month prior to the delivery month for the underlying futures contracts. The last date on which an offer can be accepted. Expiration dates are generally associated with tender offers, subscriptions, rights, offerings, warrants, options, etc. Expiration Date is the date on which an option contract automatically expires; the last day an option can be exercised. The date and time after which trading in an options contracts terminates, and after which all contract rights or obligations become null and void. Options on futures generally expire on a specific date during the month preceding the futures contract delivery month. For example, an option on a March futures contract expires in February but is referred to as a March option because its exercise would result in a March futures contract position. The date on which an option contract in any option month automatically expires or is no longer traded; generally the last day on which an option may be exercised. Expiration Date is the last day that an options or futures contract is valid. When an investor buys an option, the contract gives them the right but not the obligation to buy or sell an asset at a predetermined price, called a Strike Price, within a given time period, which is on or before the expiration date. If the investor chooses not to exercise that right, the option expires and becomes worthless and the investor loses the money paid to buy the option. The expiration date for all listed stock options in the United States is normally the third Friday of the contract month, which is the month when the contract expires. However, when that Friday falls on a holiday, the expiration date is on the Thursday immediately before the third Friday. Once an options or futures contract passes its expiration date, the contract is invalid. Expiration Date is a day on which an option right expires; for American-style options the last day of the exercise period, for European-style options the exercise date. Expiration Date is the day when the holder of the option loses the right to exercise the option. / на спецификационную дату в течение месяца, предшествующего месяцу поставки по соответствующим фьючерсным контрактам. Дата, на которую опционный контракт по любому месяцу опциона автоматически прекращает своё признание или более не торгуется; в общем толковании последний день, в который опцион может быть исполнен. Дата Прекращения Признания или Дата Экспирации – день, после которого опцион не может быть куплен, продан или исполнен. Для опционов на акции это Суббота, следующая за третьей Пятницей месяца. Права держателей опционов могут быть реализованы в последний рабочий день – в Пятницу. Если на Пятницу выпадает праздничный день, и биржа не работает, то последним торговым днём для опциона будет предшествующий ей Четверг. Если опцион не исполнен и не продан другому покупателю до истечения срока действия, он теряет свою ценность (истекает без последствий), а его владелец – сумму, уплаченную при его приобретении (премию за опцион).

(4) Expiration Date is the date when merchandise is no longer able to be shipped.

EXPIRED = С ИСТЕЧЁННЫМ СРОКОМ – Expired:- trademark registration is no longer active. The registrant failed to renew the trademark registration at the end of the registration period.

EXPIRY = ИСТЕЧЕНИЕ СРОКА – (1) Expiry:- a date on which a debt (e.g., bond) falls due or an option lapses. Borrowers who fail to meet their obligations by the expiry date are liable to payment of default interest. / Дата, на которую долг или задолженность (например, по облигации) .

(2) Expiry:- the final day on which futures trading in a particular month is allowable. Any contracts left open following this day must be settled by delivery or cash settlement.

EXPIRY DATE = ДАТА ИСТЕЧЕНИЯ СРОКА – Expiry Date:- issued in connection with documents such as letters of credit, tariffs, etc, to advise that stated provisions will expire at a certain time. Expiry Date is the last date on which an option can be exercised.

EXPIRY MONTH = МЕСЯЦ ИСТЕЧЕНИЯ СРОКА – Expiry Month:- options terminology for delivery month. / Опционная терминология для месяца поставки.

EX–PIT(S) = СДЕЛКА(И) ЗА ПРЕДЕЛАМИ ЯМЫ – Ex-Pit(s):- trades executed, for certain technical purposes, in a location other than the regular exchange trading pit. Trade is referred to as a Transfer Trade. This ex-pit transaction transfers an open position from one clearing member to another clearing member. Ex-Pit transactions are transactions not required to be made by open outcry in the trading ring. See also Exchange For Physicals and Transfer Trades. From Latin:- Ex (Out Of).

EXPLANT = ЭКСПЛАНТАТ – Explant, as relates to Potatoes, an in vitro Potato plant or plantlet produced by rooting an excised tip of a tuber sprout or an auxiliary bud from a growing plant, which shall serve as a parent for a whole clone or accession of micro-propagated plants or plantlets. Explant is living tissue removed from a plant and placed in an artificial medium for tissue culture. / побегов клубня или пазушной почки из растущего растения, микроразмножаемых растений или ростков. В переводе с Латинского In Vitro, означает В Лабораторных Условиях или В Пробирке. Эксплантат, участок органа или ткани, культивируемый вне организма. Под Эксплантантом, от Латинских слов Ex, означающее Из или От, и Planto, означающее Сажаю, понимается .

EXPLORATION = РАЗВЕДКА (или ИССЛЕДОВАНИЕ) – (1) Exploration refers to the exploration and investigation of an area in the search for mineral resources such as crude oil or natural gas. The exploration process involves using suitable geophysical processes to find structures that may contain oil and gas then proving a possible find by means of exploratory drilling. Exploration:- searching for crude oil and/or natural gas by utilizing geological and topographical studies, geophysical and seismic surveys, and drilling of wells.

(2) Exploration is the plant-collecting expeditions.

EXPLORATION FOR AND EVALUATION OF MINERAL RESOURCES = РАЗВЕДКА И ОЦЕНКА МИНЕРАЛЬНЫХ РЕСУРСОВ – IFRS 6 (short for the International Financial Reporting Standards No. 6) Exploration for and Evaluation of Mineral Resources – The objective of this IFRS is to specify the financial reporting for the exploration for and evaluation of mineral resources. Exploration and evaluation expenditures are expenditures incurred by an entity in connection with the exploration for and evaluation of mineral resources before the technical feasibility and commercial viability of extracting a mineral resource are demonstrable. Exploration for and evaluation of mineral resources is the search for mineral resources, including minerals, oil, natural gas and similar non-regenerative resources after the entity has obtained legal rights to explore in a specific area, as well as the determination of the technical feasibility and commercial viability of extracting the mineral resource. Exploration and evaluation assets are exploration and evaluation expenditures recognised as assets in accordance with the entity's accounting policy. The IFRS:- (a) permits an entity to develop an accounting policy for exploration and evaluation assets without specifically considering the requirements of paragraphs 11 and 12 of IAS 8 (International Accounting Standard 8). Thus, an entity adopting IFRS 6 may continue to use the accounting policies applied immediately before adopting the IFRS. This includes continuing to use recognition and measurement practices that are part of

those accounting policies. (b) requires entities recognising exploration and evaluation assets to perform an impairment test on those assets when facts and circumstances suggest that the carrying amount of the assets may exceed their recoverable amount. (c) varies the recognition of impairment from that in IAS 36 but measures the impairment in accordance with that Standard once the impairment is identified. An entity shall determine an accounting policy for allocating exploration and evaluation assets to cash-generating units or groups of cash-generating units for the purpose of assessing such assets for impairment. Each cash-generating unit or group of units to which an exploration and evaluation asset is allocated shall not be larger than an operating segment determined in accordance with IFRS 8 Operating Segments. Exploration and evaluation assets shall be assessed for impairment when facts and circumstances suggest that the carrying amount of an exploration and evaluation asset may exceed its recoverable amount. When facts and circumstances suggest that the carrying amount exceeds the recoverable amount, an entity shall measure, present and disclose any resulting impairment loss in accordance with IAS 36. One or more of the following facts and circumstances indicate that an entity should test exploration and evaluation assets for impairment (the list is not exhaustive):- (a) the period for which the entity has the right to explore in the specific area has expired during the period or will expire in the near future, and is not expected to be renewed. (b) substantive expenditure on further exploration for and evaluation of mineral resources in the specific area is neither budgeted nor planned. (c) exploration for and evaluation of mineral resources in the specific area have not led to the discovery of commercially viable quantities of mineral resources and the entity has decided to discontinue such activities in the specific area. (d) sufficient data exist to indicate that, although a development in the specific area is likely to proceed, the carrying amount of the exploration and evaluation asset is unlikely to be recovered in full from successful development or by sale. An entity shall disclose information that identifies and explains the amounts recognised in its financial statements arising from the exploration for and evaluation of mineral resources. / МСБУ 8 (сокращение для Международного Стандарта Бухгалтерского Учёта № 8) – . Под Разведкой Месторождений полезных ископаемых понимается комплекс работ, проводимых с целью выявления геологического строения месторождения, количества, качества и распределения запасов минерального сырья в недрах, горно-технических условий эксплуатации, а также разработки схемы обогащения руд и химико-металлургического передела концентратов. Эти геолого-промышленные параметры необходимы для промышленной оценки объекта, проектирования и строительства горнообогатительного комбината. Разведка месторождений подразделяется на предварительную, детальную и эксплуатационную разведку, а также доразведку.

EXPLORATORY WELL = РАЗВЕДОЧНАЯ СКВАЖИНА – Exploratory Well is a well drilled to find and produce oil or gas in an area previously considered an un productive area, to find a new reservoir in a known field (i.e. one previously found to be producing oil or gas in another reservoir), or to extend the limit of a known oil or gas reservoir. See also Wildcat Well. / Скважина, пробуренная с целью поиска и добычи нефти или газа в районе, рассматриваемом ранее в качестве малопродуктивного, с тем, чтобы обнаружить новую залежь в известном месторождении (то есть однажды уже найденном для добычи нефти или газа в другой залеже) или с целью расширения предела известного нефтяного или газового залежа. Смотрите также Скважина Дикая Кошка (Wildcat Well). Под Скважиной понимается искусственная цилиндрическая горная выработка глубиной от нескольких метров до 10 километров и более и диаметром обычно 75–800 миллиметров. Скважины разделяются на взрывные, вспомогательные (вентиляционные, водоотливные и так далее), разведочные, специальные (дренажные, замораживающие и тому подобные), эксплуатационные (для добычи воды, газа, нефти и так далее). Проходка скважины осуществляется буровыми установками. Элементы скважины:- забой – дно; ствол или стенки – боковая поверхность; устье – выход на поверхность скважины. Под Разведочным Бурением понимается проведение разведочных скважин для составления по кернам геологических разрезов (картировочное разведочное бурение), построения структурных карт тектонического рельефа (структурное разведочное бурение), исследования геологического разреза новой территории (опорное разведочное бурение), доразведки и оконтуривания залежи (промышленное разведочное бурение). Под Буровой Скважиной понимается цилиндрическая горная выработка, имеющая относительно малое поперечное сечение (обычно 75–350 миллиметров). Различают горнотехнические, исследовательские, строительные и эксплуатационные скважины.

EXPLOSION CLAUSE = ОГОВОРКА О ВЗРЫВЕ – Explosion Clause:- this insurance includes the risk of explosion, howsoever or wheresoever occurring during the currency of this insurance, unless excluded by the Free of Capture and Seizure (FC&S) Warranty or the Strikes, Riots, and Civil Commotions (SR&CC) Warranty set forth herein. Explosion Clause:- broadens coverage to include loss or damage due to explosion from any cause, other than a cause associated with a war risk. / Оговорка О Взрыве расширяет покрытие, включая убыток или повреждение вследствие взрыва любого происхождения, за исключением того, который ассоциируется с военным риском или риском войны.

EXPONENTIAL = ЭКСПОНЕНЦИАЛЬНАЯ (или ПОКАЗАТЕЛЬНАЯ) – Exponential:- characteristic of a quantity which varies by a constant percentage over a given period of time, as opposed to linear variations. The classical example of exponential growth is that of compound interest earned on money:- If a principal amount of USD100.00 is invested at 10% and the yearly interest is not withdrawn from the account, the principal will grow to USD4 526.00 at the end of 40 years. With simple interest, or linear growth, the investment would be worth only USD500.00 at the end of the same period. Numerous economic and social factors are exponential in nature:- growth in urban areas, industrial expansion, pollution, population growth, and uses of natural resources.

EXPONENTIAL MOVING AVERAGE = ЭКСПОНЕНЦИАЛЬНАЯ СКОЛЬЗЯЩАЯ СРЕДНЯЯ ВЕЛИЧИНА (или ЭКСПОНЕНЦИАЛЬНОЕ СКОЛЬЗЯЩЕЕ СРЕДНЕАРИФМЕТИЧЕСКОЕ) – In technical analysis, Moving Average is a key trend line that is plotted on a bar chart, reflecting the progress of prices over a given period of time. To calculate an Exponential Moving Average (EMA):- Take today's price multiplied by an EMA%. Add this to yesterday's EMA multiplied by (1 – EMA%). If we recalculate the earlier table we see that the exponential moving average presents a far smoother trend:- (i) Day 1, 2, 3, 4, 5, 6, 7, 8, 9; (ii) Price (USD) 16, 17, 17, 10, 17, 18, 17, 17, 17; and (iii) EMA(1/3) no, 16.3, 16.5, 14.4, 15.2, 16.2, 16.4, 16.6, 16.8. How to calculate an EMA% for a selected time period (the indicator panelperforms this calculation automatically):- EMA% = 2 / (n + 1) where n is the number of days. Example:- the EMA% for 5 days is 2 / (5 days +1) = 33.3%. A moving average that gives greater weight to more recent data in an attempt to reduce the lag of (or 'smooth') the moving average. Exponential Moving Average (EMA) is a moving average, similar to a Simple Moving Average, that gives more weight to more recent prices relative to older prices in an attempt to reduce the lag of the simple moving average. EMA's reflect recent price changes sooner than simple moving averages. Also known as Exponentially Weighted Moving Average. See also Moving Average, Moving Averages, and Simple Moving Average. Exponential Moving Averages (EMAs) apply more weight to more recent prices. Simple moving averages weight all prices within the lookback period equally. Here, we also can see how longer-term moving averages are smoother and less reactive than shorter-term ones. The Moving Average is one of the classic and most-reliable tools for technical analysis. A moving average simply shows the average value of a security's price over a defined period of time. The direction of the average reflects the general trend of the security. Although the moving average is one of the simplest technical indicators, there are variations in its calculation. For example, the moving average calculation can be based on a security's open, high, low, close, volume or even another indicator. In addition, it can be calculated over different time periods. The longer the time period, the smoother the average. The shorter the time period, the more reactive the average. There also are variations

in the process used to calculate the average. Two of the most popular methods are the simple moving average (SMA) and the exponential moving average (EMA). The only significant difference between the EMA and SMA is the weight assigned to the most recent data. The SMA applies equal weight to all prices in the range; the EMA applies more weight to recent prices. 'Two averages' (above) shows a 20-day SMA in red and the equivalent of a 50-day EMA in blue applied to daily data of the Market Vectors Gold Miner (GDX) exchangetraded fund (ETF). An SMA is calculated by adding the security's price for the desired lookback period (say, five days) and dividing by the same number (in this case, five). Each day, we add the new day and drop the oldest. For example, assume these seven daily closing prices: 101, 102, 103, 104, 105, 106, 107. On the fifth day of this sequence, the average would be (101 + 102 + 103 + 104 + 105) / 5 = 103. On the second day of this sequence, the average would be (102 + 103 + 104 + 105 + 106) / 5 = 104. On the third day of this sequence, the average would be (103 + 104 + 105 + 106 + 107) / 5 = 105. Such an average is probably too sensitive to price changes because small changes in price quickly are reflected in changes in the average. This is where EMAs are helpful. Because EMAs emphasize more recent prices in their calculation, we can achieve a smoother average line with nearly the same level of reactivity. EMAs are based on the most recent value of the average, the most recent raw price and a weighting multiplier. The weighting multiplier can be changed to mimic a comparable length SMA. For the initial EMA calculation, an SMA of the target length is substituted for the previous-period EMA. First, we calculate the value of the multiplier. Multiplier = (2 / (Time periods + 1)) = (2 / (5 + 1)) = 0.33 Then, we insert the multiplier value into the following EMA formula:- EMA = [Close – EMA(previous day)] x multiplier + EMA(previous day) 'Average comparison' (right) shows the values of a five-day SMA and EMA for Apple. The exponential moving average starts with the simple moving average value of 449.61 in the first calculation. After the first calculation, the EMA formula takes over. The chart of the EMA is shown in 'Apple smoothie' (below right). Because the EMA gives more weight to recent price action, whipsaws are less frequent. As seen in the chart, Apple closing prices stay above the stock's five-period EMA throughout most of the uptrend that started in January 2012. Reading Averages:- the most popular method of interpreting a moving average is to compare the relationship between a moving average of the security's price with the security's price itself. A buy signal is generated when the security's price rises above its moving average and a sell signal is generated when the security's price falls below its moving average. While such basic trading rules may be appealing, moving averages may be better used in a less-rigid sense. For example, they can be used to find support and resistance and trend identification. 'Look at me, MA' (page 45) shows an example of the S&P 500 bouncing off its 50-day SMA. The green arrows identify points of bullish reaction. The red arrows identify periods when the average provided resistance. Trend identification generally is done with long-term averages. Perhaps the most popular application is the 200-day moving average. In general, the market is considered bullish when it is above the 200-day moving average, and bearish when it is below the 200-day moving average. As seen in 'Look at me, MA', Microsoft broke its 200-day moving average on September 29, 2012, at USD30. It corrected until it reached USD26, and then consolidated and started forming its base. On April 09, 2013, eight months later, Microsoft was able to close above its 200-day moving average at USD29.60, initiating a big rally that hit USD36 by June 05, a 20% rally in just two months. Crossovers:- two moving averages can be used together to generate crossover signals. Crossovers involve one relatively short moving average and one relatively long one. As with all moving averages, the general length of the lookback period determines the indicator's sensitivity. A system using a five-day EMA and a 20-day EMA would be deemed short-term. A system using a 50-day SMA and a 200-day SMA would be long-term. A bullish crossover occurs when the shorter moving average crosses above the longer moving average. A bearish crossover occurs when the shorter moving average crosses below the longer moving average. As seen in 'Look at me, MA', when the five-period EMA (red) of Caterpillar Inc. (CAT) crossed below the 20-period EMA (blue), the stock began a downtrend correction from USD95 to USD83. Moving average crossovers produce relatively late signals. After all, the strategy depends on two lagging indicators. The longer the moving average periods, the greater the lag in the signals. These signals work great when a good trend takes hold. However, a moving average crossover system will produce lots of false signals in the absence of a strong trend. As lagging indicators, all moving average-based strategies are not intended to get you in at the exact bottom nor out at the exact top. Rather, they keep you in line with the security's price trend by being on the right side of the bulk of the move. / В техническом анализе биржевых рынков, . Эс.ЭндПи. 500 (S&P 500). Майкрософт (Microsoft). Кэтёпилар Инк. (Caterpillar Inc.; Си.Эй.Ти. (CAT)).

EXPORT = ВЫВОЗ (или ЭКСПОРТ) – Exports are merchandise sent to one place or country from another. Collectively, imports and exports are referred to as Trade. Trade may be denominated in volume, financial value, or both. Goods shipped outside a country. / Товары, отгруженные за пределы страны. Под Экспортом, от Латинского слова Exporto, означающее Вывожу, или Exportare, означающее Вывозить, или Вывозом понимается вывоз товаров или капиталов за границу. Под Экспортом или Вывозом понимается вывоз из данной страны товаров, услуг, ценных бумаг и тому подобного и их реализация на внешнем рынке. Реэкспорт – вывоз за границу иностранных товаров, не подвергавшихся переработке в стране. Экспорт – вывоз за границу товаров, проданных иностранным покупателям, предназначенных для продажи на иностранных рынках или для переработки в другой стране. К экспорту относят также перевозку товаров транзитом через другую страну и вывоз привезённых из другой страны товаров для продажи их в третьей стране (реэкспорт).

EXPORT = ВЫВОЗИТЬ (или ЭКСПОРТИРОВАТЬ) – Export:- to ship goods out of one country for sale in another country. To sell goods and services outside the country of origin. / Отгружать товары из одной страны для продажи в другой стране. Продавать товары и услуги за пределы страны происхождения.

EXPORT BAN = ЗАПРЕТ НА ВЫВОЗ (или ЗАПРЕТ ЭКСПОРТА) – Export Ban is a prohibition on the export of a good or service. / Запрет на экспорт товаров или услуг.

EXPORT BROKER = ВЫВОЗНОЙ БРОКЕР (или ЭКСПОРТНЫЙ БРОКЕР) – Export Broker is an individual or firm that brings together buyers and sellers for a fee but does not take part in actual sales transactions. The individual who brings together buyer and seller for a fee, eventually withdrawing from any transaction. / Лицо или фирма, которая за вознаграждение сводит вместе покупателя и продавца.

EXPORT CERTIFICATE = ВЫВОЗНОЕ СВИДЕТЕЛЬСТВО (или ЭКСПОРТНЫЙ СЕРТИФИКАТ) – In the United States, Export Certificate is any one of three accountable certificates, including PPQ Form 577, 578, or 579 (short for the Plant Protection and Quarantine Form 577, 578, or 579) used for exporting commodities.

EXPORT CERTIFICATION PROJECT = ПРОЕКТ ВЫВОЗНОЙ СЕРТИФИКАЦИИ (или ПРОЕКТ ЭКСПОРТНОЙ СЕРТИФИКАЦИИ) – Export Certification Project is an electronic database known as EXCERPT, which provides current information on the plant import requirements of foreign countries. Also includes other related reference lists such as processed products, ineligible products, endangered species, Export Certification Specialists, designated the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) ports, recent summary changes, phytosanitary notes, messages and alerts.

EXPORT CERTIFICATION RECORD = УЧЁТНАЯ КАРТОЧКА ВЫВОЗНОЙ СЕРТИФИКАЦИИ (или УЧЁТНАЯ КАРТОЧКА ЭКСПОРТНОЙ СЕРТИФИКАЦИИ) – Export Certification Record is an official form, APHIS Form 80-R (short for the Animal and Plant Health Inspection Service Form 80-R), used by the Authorized Certification Officials (ACOs) to track and monitor accountable export certificates (prepaid and those issued upon request). See also Collecting User Fees.

EXPORT CERTIFICATION SPECIALIST = СПЕЦИАЛИСТ ПО ВЫВОЗНОЙ СЕРТИФИКАЦИИ (или СПЕЦИАЛИСТ ПО ЭКСПОРТНОЙ СЕРТИФИКАЦИИ) – Export Certification Specialist is the Plant Protection and Quarantine (PPQ) employee who is responsible for maintaining the quality and credibility of the export program. See the Export Certification Project (EXCERPT) for a list of the Export Certification Specialists along with a description of their jurisdiction. See also Responsibilities.

EXPORT CONTROL AUTOMATED SUPPORT SYSTEM = СИСТЕМА АВТОМАТИЗИРОВАННОЙ ПОДДЕРЖКИ ПО ВЫВОЗНОМУ КОНТРОЛЮ (или СИСТЕМА АВТОМАТИЗИРОВАННОЙ ПОДДЕРЖКИ ПО ЭКСПОРТНОМУ КОНТРОЛЮ) – In the United States, Export Control Automated Support System (ECASS) was implemented by the Commerce Department in 1985 to automate a paper-based system. The system currently provides:- (i) electronic submission of application forms directly by exporters; (ii) optical character recognition of applications submitted on paper; (iii) paperless workstations for all licensing officers to review the application, route it to other officers, branches, or external agencies and to enter their final action along with riders and conditions; (iv) automated audit of all licenses issued; and (v) real time management reporting on Licensing Officer workloads, average processing times, counts and times by license type, destination country, commodity code and other data. Commerce's Bureau of Export Administration is expanding ECASS to include export enforcement activities.

EXPORT CONTROL CLASSIFICATION NUMBER = КЛАССИФИКАЦИОННЫЙ НОМЕР ПО ВЫВОЗНОМУ КОНТРОЛЮ (или КЛАССИФИКАЦИОННЫЙ НОМЕР ПО ЭКСПОРТНОМУ КОНТРОЛЮ) – Every product has an Export Control Classification Number (ECCN; formerly:- Export Commodity Classification Number) within the Commerce Control List. The ECCN consists of a five character number that identifies categories, product groups, strategic level of control and country groups.

EXPORT CONTROL DOCUMENT = ДОКУМЕНТ ВЫВОЗНОГО КОНТРОЛЯ (или ДОКУМЕНТ ЭКСПОРТНОГО КОНТРОЛЯ) – Export Control Document:- a license; application for license; any and all documents submitted in accordance with the requirements of the Export Administration Regulations (EAR) in support of, or in relation to, a license application; application for International Import Certificate; Delivery Verification Certificate or similar evidence of delivery; Shipper's Export Declaration (SED) or Automated Export System (AES) record presented in connection with shipments to any country; a Dock Receipt or bill of lading issued by any carrier in connection with any export subject to the EAR and any and all documents prepared and submitted by exporters and agents pursuant to the export clearance requirements of part 758 of the EAR; a US exporter's report of request received for information, certification, or other action indicating a restrictive trade practice or boycott imposed by a foreign country against a country friendly to the United States, submitted to the US Department of Commerce in accordance with the provisions of part 760 of the EAR; Customs Form 7512, Transportation Entry and Manifest of Goods, Subject to Customs Inspection and Permit, when used for Transportation and Exportation (T&E) or Immediate Exportation (IE); and any other document issued by a US Government agency as evidence of the existence of a license for the purpose of loading onto an exporting carrier or otherwise facilitating or effecting an export from the United States or any reexport of any item requiring a license. / вывоз (exportation). обратный вывоз (или реэкспорт; reexport).

EXPORT CREDIT = ВЫВОЗНОЙ КРЕДИТ (или ЭКСПОРТНЫЙ КРЕДИТ) – Export Credit:- medium- to long-term credit granted for the purpose of financing export shipments. There are two main forms of export credits:- supplier credit (trade credit), i.e. credit granted by the supplier to the buyers; and customer or buyer's credit granted directly to the foreign buyer or his bank. Large credits of this kind are generally furnished by a syndicate of banks (in Switzerland, syndicated credit). An export credit granted jointly by a commercial bank and the government is referred to as a Mixed Loan or Credit. This type of loan is commonly granted to developing economies. / Среднесрочный и долгосрочный кредит, предоставленный с целью финансирования отгрузок на вывоз (или экспорт). Вывозные (или экспортные) кредиты бывают в двух формах:- кредит поставщика (торговый кредит), то есть кредит, предоставленный поставщиком покупателям; и кредит заказчика или покупателя, предоставленный напрямую иностранному покупателю или его банку. Крупные кредиты такого рода обычно предоставляются синдикатом банков (в Швейцарии, синдикатный кредит). Вывозной (или экспортный) кредит, предоставленный совместно коммерческим банком и государством рассматривается как Смешанный Заём или Кредит. Этот тип займа предоставляется, главным образом, импортёрам из стран с развивающейся экономикой. Под Вывозным Кредитом или Экспортным Кредитом понимается кредит, предоставляемый экспортёром товаров их импортёру. Выдаются преимущественно в форме акцепта импортёрами тратт экспортёров. В современных условиях предоставление среднесрочных и долгосрочных экспортных кредитов осуществляют экспортные банки, специализирующиеся на операциях, связанных с внешней торговлей. Вывозной (или Экспортный) Кредит – кредит, предоставляемый покупателям или их банку с целью финансирования продаж, как средство поощрения вывоза (или экспорта). Фирменный вывозной (или экспортный) кредит предоставляется от лица экспортёра, но не финансируется банком. Банковский вывозной (или экспортный) кредит предоставляется иностранным покупателям непосредственно банками. Известны и комбинированные варианты, когда государственный кредит сочетается с кредитами частных банков и международных организаций.

EXPORT CREDIT ENHANCED LEVERAGE = ПОВЫШЕНИЕ ПРИВЛЕКАТЕЛЬНОСТИ ВЫВОЗНЫХ КРЕДИТОВ (или ПОВЫШЕНИЕ ПРИВЛЕКАТЕЛЬНОСТИ ЭКСПОРТНЫХ КРЕДИТОВ) – The Export Credit Enhanced Leverage (EXCEL) program was developed in 1990 by the World Bank in conjunction with a working group of the International Union of Credit and Investment Insurers (the Berne Union). The objective of EXCEL is to provide export credits at consensus rates for private sector borrowers in highly indebted countries, which would previously have been too great a risk for most agencies to cover. / экспортный кредит (export credit).

EXPORT CREDITS GUARANTEE DEPARTMENT = ДЕПАРТАМЕНТ ПО ГАРАНТИЯМ ВЫВОЗНЫХ КРЕДИТОВ (или ДЕПАРТАМЕНТ ПО ГАРАНТИЯМ ЭКСПОРТНЫХ КРЕДИТОВ) – UK Export Finance is the operating name of the Export Credits Guarantee Department (ECGD), the United Kingdom's export credit agency. It was created in 1919 and was the world's first export credit agency. We work closely with exporters, banks, buyers and project sponsors and have 90 years' experience of supporting exports to, and investments in, markets across the world. We do this by providing guarantees, insurance and reinsurance against loss, taking into account the government's international policies. Mission and Principles:- Who UK Export Finance is? UK Export Finance is the export credit agency of the United Kingdom and is a Government Department that operates under an Act of Parliament. What UK Export Finance does? UK Export Finance complements the private market by providing assistance to exporters and investors, principally in the form of insurance and guarantees to banks. How UK Export Finance operates? UK Export Finance is governed by its statute pursuant to which certain financial objectives are set by HM Treasury. It is UK Export Finance's policy to comply with all International Agreements which apply to the operations of Export Credit Agencies. The principles UK Export Finance applies:- on individual cases, UK Export Finance aims to:- (i) provide a quality of service that is proactive, flexible and efficient, with a focus on solution and innovation; (ii) take account of factors beyond the purely financial, and of relevant government policies, in respect of environmental, social and human rights impacts; debt sustainability and bribery and corruption; and (iii) publish, for the benefit of applicants, guidance on processes and factors taken into account by it in considering applications. Generally, UK Export Finance aims to:- (i) disseminate information about its products and services; (ii) achieve fairer competition by seeking to establish a level playing

field internationally, through obtaining multilateral improvements in export credit policies and practices; (iii) recover the maximum amount of debt in respect of claims paid taking account of the Government's policy on debt forgiveness; (iv) abide by such codes of practice and guidelines on consultation as may be published by the Government from time to time; and (v) employ good management practice to recruit, develop and retain the people needed to achieve UK Export Finance's business goals and objectives. Go to our annual report to parliament, which you can find on the right hand side of this page, to see reviews of our performance against these objectives, and other strategic goals. Legislation:- the Export Credits Guarantee Department's statutory powers are set out in the Export and Investment Guarantees Act 1991 (as amended by the Industry and Exports (Financial Support) Act 2009). Go to the Office of Public Sector Information website, which you can find on the right hand side of this page, to read the Acts in full. Export Credits Guarantee Department (ECGD) is the UK government department whose main function is to provide insurance cover for export credit transactions. Headquartered in London, the United Kingdom. We provide services such as:- (i) insuring UK exporters against non-payment by their overseas buyers; (ii) helping overseas buyers to purchase goods and/or services from UK exporters by guaranteeing bank loans to finance those purchases; (iii) sharing credit risks with banks in order to assist exporters in the raising of tender and contract bonds, in accessing pre- and post-shipment working capital finance and in securing confirmations of letters of credit; and (iv) insuring UK investors in overseas markets against political risks. / вывозной (или экспортный) кредит (export credit).

EXPORT CREDIT INSURANCE = СТРАХОВАНИЕ ВЫВОЗНОГО КРЕДИТА (или СТРАХОВАНИЕ ЭКСПОРТНОГО КРЕДИТА) – Why you need Export Credit Insurance? Cash-in-advance and letters of credit are no longer always competitive terms in the international marketplace. Facing limited access to capital in their own countries, foreign companies are seeking more than ever before to buy on credit terms. You need to extend competitive open-account terms to grow your international business, but what happens if you don't get paid? Your foreign customers could go out of business or file bankruptcy, face currency devaluations or foreign exchange problems, run short on cash, take you for a ride, or fail to pay you for any number of other reasons. You can protect your foreign receivables against non-payment risks with an export credit insurance policy. What export credit risks are covered? Export credit insurance protects your foreign receivables against virtually all commercial and political risks that could result in non-payment of your export invoices. Commercial risks include bankruptcy, receivership, and other kinds of insolvencies, as well as protracted defaults caused by cash flow problems, balance sheet issues, bad faith, market demand, currency fluctuations, natural disasters, or general economic conditions in your customer's country or abroad. Political risks include currency inconvertibility, foreign exchange controls, transfer risks, war, strikes, riots, revolution, confiscation, expropriation, nationalization, embargoes, trade sanctions, and changes in import or export regulations. How much does export credit insurance cost? Premium rates for export credit insurance are based on the terms you extend, the spread of your buyer and country risks, and your previous exporting experience. The cost of foreign receivables insurance is low, typically a fraction of one percent based on sales volume, in most cases much less than the fees charged for letters of credit. Whether or not you pass this incremental expense to your overseas customers, the price of export credit insurance coverage is insignificant compared to the additional business you can obtain by extending competitive international credit terms. Insurance as a sales and financing tool:- increase your international sales and profits by using export credit insurance to extend payment terms that make it more economical for your foreign customers to purchase larger quantities. Shipping bigger orders can help you negotiate better pricing from your suppliers, make longer manufacturing runs, and transfer inventory overseas. Negotiate stronger overseas representation by using foreign receivables insurance to offer competitive credit terms to your international distributors. Provide incentives to keep more of your products in their country's supply chain, increasing your market share and local brand recognition. Open new markets which your company might otherwise perceive as too risky for extending international credit terms without accounts receivable insurance. The opportunity to establish market share in emerging economies has never been greater. Enhance your borrowing capacity and obtain more favorable financing by including your insured export receivables in your collateral base. Foreign credit insurance makes your international A/R more attractive to banks and other asset-based lenders. You can assign export receivables insurance policy proceeds to the lender of your choice. Strengthen your balance sheet and keep your company's financial position secure with foreign credit insurance, despite exposure to unforeseen events, concentrations of export receivables risks, and changing international market conditions. Covering your foreign receivables with international credit insurance may also enable you to reduce your bad debt reserves. International receivables insurance can help facilitate the 'true sale' of your export receivables per FASB 140 (Financial Accounting Standards Board), on a case-by-case basis or in the context of a formal asset securitization. Export Credit Insurance:- usually government-sponsored (but in some cases self-financed) scheme to provide a hedge against the specific risks associated with the granting of export credits. Also known as Export Risk Guarantee in Switzerland. With the global marketplace becoming smaller by the day, it gets more and more difficult for businesses to remain local. In fact, it is not in a business's best interest to remain local if it wants to survive. It needs to expand globally, and that is where export credit insurance comes in. It is an absolutely vital necessity in the exporting of goods and services to foreign markets. It helps to keep the assets of a company safe. Here is a brief explanation of this most important necessity. Definition:- Export Credit Insurance is a policy that is taken out by a company that wants to sell to an overseas company. If a company wanted to ship goods to a foreign company, it might demand payment for those goods upfront or it may take payment after delivery. The latter option is a risky one. This insurance guarantees that a business will get paid for its goods after delivery should the receiving business be unable to pay. Advantages:- the advantages of export credit insurance to the insured are great. If the receiving company were to go bankrupt or for some reason find themselves unable to pay, then the insured company would be covered for the goods that they were exporting. It allows a company to extend goods without demanding upfront payments from a receiving company which may limit the amount of companies it would be able to do business with. This is a huge advantage of carrying this insurance. Disadvantages:- there are very few disadvantages to export credit insurance. There are premiums to consider, but these are negligible when weighed against the cost of losing an entire shipment of goods should a company refuse to pay. It is better to have this insurance than to extend credit to a company on faith that the payment will be made after receiving the shipment. Having this insurance allows a company to remain competitive in a global marketplace by giving them the ability to trade safely with foreign buyers. Future:- as the world gets smaller, the need for a company with global reach will continue to be important. Companies will have to compete on a global scale in order to compete at all. This is where export credit insurance will become absolutely vital to the global economy. It is too risky to do business in a global economic structure without the safety net of this insurance. Therefore, the future of this insurance is a bright one indeed. If a business is looking to go global, then investing in export credit insurance is almost mandatory. There are precious few ways to ensure that a shipment of goods will be paid for after delivery and asking for upfront payments is often a limiting business practice. Export credit insurance allows for easy foreign trade between businesses. This allows local businesses to thrive as it expands its market into unforeseen territory and allows it to bring more money into the local economy. Xxxxx. Export Credit Insurance:- Increase Your Export Sales While Minimizing Risks:- Ex-Im Bank's export credit insurance allows you to increase your export sales by limiting your international risk, offering credit to your international buyers, and enabling you to access working capital funds. Benefits:- (i) reduces nonpayment risk; (ii) enables you to extend competitive credit terms to buyers; (iii) helps you export to new markets with more confidence; and (iv) increases cash flow. Limit Your Risk:- Ex-Im Bank's insurance covers the risk of buyer nonpayment for commercial risks (e.g., bankruptcy) and certain political risks (e.g., war or the inconvertibility of currency). This product can replace cash-in-advance, letters of credit, and other documentary sales. By limiting your risk, you can sell to more international buyers and compete vigorously in international markets. Extend Credit to Your Buyers:- these

policies also allow you to provide qualifying international buyers with advantageous terms of credit. In today's competitive global marketplace, you may be able to increase sales by providing this 'open account' financing feature. Access Working Capital:- Ex-Im Bank's insurance enhances the quality of your balance sheet by transforming export-related accounts receivable into receivables insured by the US government. With our insurance in place, lenders are more likely to advance against these receivables to increase your working capital cash flow. Get Assistance:- Ex-Im Bank regional offices and insurance brokers can provide assistance with our export credit insurance applications. Insurance brokers can provide the required information to Ex-Im Bank and assist with the documentation. Eligibility:- Ex-Im Bank can do business in most markets. However, we may be limited or unable to offer financing in certain countries and under certain circumstances. Military or defense items are generally not eligible nor are sales to military buyers (with certain exceptions). Short-Term Insurance – products must be shipped from the United States and have at least 50% US content (excluding mark-up). Medium-Term Insurance – we will insure up to 85% of the net US contract value. (If the foreign content is more than 15%, we will support only the US portion.) Enhanced Support for Environmentally Beneficial Exports:- Ex-Im Bank has an Environmental Exports Program that provides enhanced support for a broad range of environmentally beneficial exports, including exports related to renewable energy sources. These enhancements apply to both short-term and medium-term policies. Credit Standards:- all applications for short-term and medium-term insurance are subject to objective credit criteria. To ensure consistent and transparent credit analysis, Ex-Im Bank has developed credit standards to facilitate timely application processing. Exporter Policies (Short-Term):- Ex-Im Bank's short-term insurance covers a wide range of goods, raw materials, spare parts, components, and most services on terms up to 180 days. We also cover capital goods, consumer durables (e.g., refrigerators) and bulk agricultural commodities. In exceptional cases, these exports may be covered on terms up to 360 days. Multi-Buyer Policy:- this policy allows exporters to insure all sales to eligible international buyers on 'open account' credit terms. Features include:- (i) provides 90–95% commercial, 95–100% political coverage against buyer payment defaults; (ii) allows for assignment of exporter's receivables to a lender for immediate funding; (iii) premium rates are paid only on actual shipments. The premium rates are a composite rate based on tenor, type of buyer, and country of buyer. (iv) Exporters with international credit management experience may receive 'discretionary' credit limits under the policy to qualify and approve buyers for coverage without Ex-Im Bank review based on good payment experience or favorable credit information. Small Business Multi-Buyer Policy:- for qualifying small businesses, we offer enhanced coverage. To qualify as a small business, the US exporter (together with affiliates) must meet the US Small Business Administration's definition of a small business and have export credit sales of less than USD5 million. Features include:- (i) no first-loss deductible; (ii) simplified premium-rate schedule; and (iii) enhanced assignment (for qualified exporters), an attractive financing feature that allows your lender to advance on the insured receivables with limited risk. Single-Buyer Policy:- this policy provides credit protection for short-term credit sales made by an exporter to a single international buyer during a 12-month policy period. Premium rates are based on tenor, type of buyer, and the buyer's country. Features include:- (i) supports single or multiple shipments to a single international buyer; (ii) provides 90% coverage against buyer payment defaults with no first-loss deductible; (iii) contains a 'lock-in' feature to commit Ex-Im Bank coverage over a 90-day period (useful to present to a buyer while a sale is being negotiated); and (iv) increases borrowing base by allowing for assignment of an exporter's receivables to a lender. Lender Policies (Short-Term):- lenders may request assignment of proceeds of multi-buyer policies (described above) by exporters. Enhanced assignment to lenders is available with our small business multi-buyer policy. In addition to exporter insurance policies, Ex-Im Bank also offers several policies for financial institutions. Bank Letter of Credit Policy:- this policy protects US-based banks against losses (i.e. the failure of a foreign issuing bank to make payments or reimbursements) on irrevocable letters of credit opened to finance US exports. Benefits to Lender:- (i) provides authority to selectively insure letters of credit; (ii) discretionary credit limit coverage available; (iii) coverage available for refinancing payments by issuing bank under a sight irrevocable letter of credit policy; and (iv) pre-presentation agreement available. Features include:- (i) coverage is 95% for private sector, 100% for sovereign banks, and 98% for bulk agricultural goods; (ii) premium rates are based on a fixed-fee schedule based on the tenor of the letter of credit, type of buyer, and country of the buyer; and (iii) interest is covered up to prime rate minus 0.5%. Financial Institution Buyer Credit Policy:- this policy protects lenders that finance purchases by international buyers of US goods and services, generally on terms up to 180 days (exceptionally up to 360 days for bulk agricultural products and capital goods). Benefits to Lender:- (i) may be used for a one-time sale or for a series of shipments from one or more exporters to the same buyer; and (ii) no first-loss deductible. Features include:- (i) coverage is 90% for private sector buyers, 100% for sovereign obligors, and 98% on bulk agricultural products; (ii) premium rates are based on a fixed-fee schedule based on the tenor of the letter of credit, type of buyer, and country of the buyer; and (iii) interest is covered up to prime rate minus 0.5%. Medium-Term Insurance (Exporters and Lenders):- Ex-Im Bank's medium-term insurance protects longer-term financing to international buyers of capital equipment or services, covering one or a series of shipments. Benefits:- (i) medium-term financing; (ii) no first-loss deductible; and (iii) documentary policy protection available for lenders. Financing under these policies can generally extend up to five years (up to seven years in exceptional cases) and for amounts up to USD10 million. Ex-Im Bank requires the buyer to make cash payment to the exporter equal to at least 15% of the net US contract value. The insured portion is the lesser of 85% of the net US contract value or the US content of the exporter's supply contract. Frequently, a financial institution is the insured and will disburse funds to the exporter when the insurance cover is approved. Ex-Im Bank reviews the documentation only after a claim is presented. A claim will be paid only if the relevant documents are submitted in complete form and are presented within the time allowed. Premium rates are on a fixed-fee schedule based on the tenor of the credit, type of buyer, and country of the buyer. Xxxxx. In the United States, Export Credit Insurance (ECI) protects an exporter of products and services against the risk of non-payment by a foreign buyer. In other words, ECI significantly reduces the payment risks associated with doing business internationally by giving the exporter conditional assurance that payment will be made if the foreign buyer is unable to pay. Simply put, exporters can protect their foreign receivables against a variety of risks that could result in non-payment by foreign buyers. ECI generally covers commercial risks (such as insolvency of the buyer, bankruptcy, or protracted defaults/slow payment), and certain political risks (such as war, terrorism, riots, and revolution) that could result in non-payment. ECI also covers currency inconvertibility, expropriation, and changes in import or export regulations. ECI is offered either on a single-buyer basis or on a portfolio multi-buyer basis for short-term (up to one year) and medium-term (one to five years) repayment periods. Key Points:- (i) ECI allows exporters to offer competitive open account terms to foreign buyers while minimizing the risk of non-payment; (ii) even creditworthy buyers could default on payment due to circumstances beyond their control; (iii) with reduced non-payment risk, exporters can increase export sales, establish market share in emerging and developing countries, and compete more vigorously in the global market; (iv) when foreign accounts receivable are insured, lenders are more willing to increase the exporter's borrowing capacity and offer more attractive financing terms; and (v) ECI does not cover physical loss or damage to the goods shipped to the buyer, or any of the risks for which coverage is available through marine, fire, casualty or other forms of insurance. Coverage:- short-term ECI, which provides 90 to 95 percent coverage against commercial and political risks that result in buyer payment defaults, typically covers (a) consumer goods, materials, and services up to 180 days, and (b) small capital goods, consumer durables, and bulk commodities up to 360 days. Medium-term ECI, which provides 85 percent coverage of the net contract value, usually covers large capital equipment up to five years. ECI, the cost of which is often incorporated into the selling price by exporters, should be a proactive purchase, in that exporters should obtain coverage before a customer becomes a problem. Where Can I Get Export Credit Insurance? ECI policies are offered by many private commercial risk insurance companies as well as the Export-Import Bank of the United States

(Ex-Im Bank), the government agency that assists in financing the export of US goods and services to international markets. US exporters are strongly encouraged to shop for a specialty insurance broker who can help them select the most cost-effective solution for their needs. Reputable, well-established companies that sell commercial ECI policies can be easily found on the Internet. You may also buy ECI policies directly from Ex-Im Bank. In addition, a list of active insurance brokers registered with Ex-Im Bank is available at www.exim.gov or you can call +1-800-565-EXIM (3946) for more information. Private-Sector Export Credit Insurance:- (i) premiums are individually determined on the basis of risk factors and may be reduced for established and experienced exporters; (ii) most multi-buyer policies cost less than 1 percent of insured sales, whereas the prices of single-buyer policies vary widely due to presumed higher risk; (iii) the cost in most cases is significantly less than the fees charged for letters of credit; (iv) there are no restrictions regarding foreign content or military sales; and (v) commercial insurance companies can usually offer flexible and discretionary credit limits. Ex-Im Bank's Export Credit Insurance:- (i) Ex-Im Bank customers are advised to refer to the Exposure Fee Information & Fee Calculators section (which are posted on the Bank's Web site http://www.exim.gov under the 'Apply' section) to determine exposure fees (premiums); (ii) coverage is available in riskier emerging foreign markets where private insurers may not operate; (iii) exporters electing an Ex-Im Bank working capital guarantee may receive a 25 percent premium discount on multi-buyer insurance policies; (iv) enhanced support is offered for environmentally beneficial exports; (v) the products must be shipped from the United States and have at least 50 percent US content; (vi) Ex-Im Bank is unable to support military products or purchases made by foreign military entities; and (vii) support for exports may be closed or restricted in certain countries for US government policy reasons (for more information, see the Country Limitation Schedule posted on the Bank's Web site under the 'Apply' section). / вывозной (или экспортный) кредит (export credit).

EXPORT CREDITS (WITH OFFICIAL SUPPORT) = ВЫВОЗНЫЕ КРЕДИТЫ (С ОФИЦИАЛЬНОЙ ПОДДЕРЖКОЙ) (или ЭКСПОРТНЫЕ КРЕДИТЫ (С ОФИЦИАЛЬНОЙ ПОДДЕРЖКОЙ)) – Export Credits (With Official Support):- Government financial support, direct financing, guarantees, insurance or interest rate support provided to foreign buyers to assist in the financing of the purchase of goods from national exporters.

EXPORT CUSTOMER CREDIT = ВЫВОЗНОЙ КРЕДИТ ЗАКАЗЧИКУ (или ЭКСПОРТНЫЙ КРЕДИТ ЗАКАЗЧИКУ) – Export Customer Credit is the special export credit system in which credit is granted by a bank or other institution in the exporting country to the foreign purchaser directly, rather than to the exporter, who would otherwise finance the purchase by offering credit terms. Form of supplier credit whereby the exporter secures credit from the banking system in its own country and uses this credit to finance its client's purchases. / вывозной (или экспортный) кредит (export credit).

EXPORT DECLARATION = ВЫВОЗНАЯ ДЕКЛАРАЦИЯ (или ЭКСПОРТНАЯ ДЕКЛАРАЦИЯ) – In the United States (US), Export Declaration is a Government document permitting designated goods to leave the country. Issued by the US Department of Commerce. Includes complete particulars on the shipment. Although customers can submit their declarations themselves to US Customs, the carrier is still responsible for penalities if the documentation is not available by the time a vessel is 'cleared' by Customs for sailing. Also known as Ex-Dec or SED (Shipper's Export Declaration). Shippers need to obtain a Bureau of Census document which spells out shipment details for entry into a government statistical system. Documents for export shipping, declaring the value of the cargo to the US Customs. In the United States, this form includes complete particulars on an individual shipment and is required by Commerce to control exports and act as a source document for export statistics. Export Declaration is a form completed by the exporter or its authorized agent and filed in triplicate by a carrier with the US Collector of Customs at the point of exit. It serves a twofold purpose:- (1) Primarily, it is used by the US Bureau of Census for the compilation of export statistics on US foreign trade. For this reason, an export declaration is required for practically all shipments from the USA to foreign countries and the US possessions, except for mail shipments of small value or for those of a non-commercial character. (2) The declaration also serves as an export control document because it must be presented, together with the export license, to the US Customs at the port of export. If the goods may be exported under general export license, this fact must be stated on the export declaration. A government document declaring designated goods to be shipped out of the country. To be completed by the exporter and filed with the US Government. Export Declaration (Shippers) Bureau of Census document which spells out shipment details for entry to government statistical system. Documents for export shipping declaring value of cargo to US Customs. Also known as Shipper's Export Declaration. / Коллектор Таможни США.

EXPORT DEVELOPMENT CANADA = КАНАДСКОЕ АГЕНТСТВО ПО РАЗВИТИЮ ВЫВОЗА (или КАНАДСКОЕ АГЕНТСТВО ПО РАЗВИТИЮ ЭКСПОРТА) – Export Development Canada (EDC) is Canada's export credit agency, offering innovative financing, insurance and risk management solutions to help Canadian exporters and investors expand their international business. Every year, EDC's knowledge and partnerships are used by more than 8 300 Canadian companies and their global customers in up to 200 markets worldwide. Approximately 80 per cent of EDC's customers are small and medium-sized businesses. EDC is a Crown corporation wholly owned by the Government of Canada. The corporation is financially self-sustaining and operates on commercial principles. EDC is a recognized leader in financial reporting, economic analysis and has been named one of Canada's Top 100 Employers for nine consecutive years. EDC operates as a commercial institution that collects interest on its loans and premiums on its insurance products. Unlike other ECAs that rely on government subsidies, EDC is financially self sufficient. EDC is committed to Corporate Social Responsibility (CSR) practices and is working alongside other leading organizations that share the same commitment to the principles of ethical business, social and environmental improvement, public accountability and community involvement. EDC does not receive annual parliamentary appropriations and EDC does not provide subsidies to Canadian companies. Why we do what we do?:- (i) in Canada, one in three jobs relies on exports; (ii) due to the size of Canada's population, the domestic market remains limited for small businesses; as a result, businesses have to think globally to compete; and (iii) the majority of our customers are small business; it can be particularly difficult for them to access the financing they need. Products:- EDC provides insurance and financial services, bonding products, and small business solutions to Canadian exporters and investors, EDC also provides online credit risk management tools. Export Development Canada (EDC) is Canada's official export credit agency, responsible for providing export credit insurance, loans, guarantees and other financial services to promote Canadian export trade. Headquartered in Ottawa, Ontario (ON), Canada. / Канадская Корпорация по Развитию Экспорта (ККРЭ) является официальным агентством Канады по предоставлению вывозных (или экспортных) кредитов, которое несёт ответственность за обеспечение страхования вывозных (или экспортных) кредитов, займами, гарантиями и другими финансовыми услугами, направленными на продвижение торговли, связанной с вывозом (или экспортом) из Канады.

EXPORT DUTY = ВЫВОЗНАЯ ПОШЛИНА (или ЭКСПОРТНАЯ ПОШЛИНА) – Export Duties consist of general or specific taxes on goods or services that become payable when the goods leave the economic territory or when the services are delivered to non-residents; profits of export monopolies and taxes resulting from multiple exchange rates are excluded. Export Duty is a government tax paid on goods exported from a country. Export Duty is a tax levied on exports of basic commodities entering into world trade, such as rubber, copper, palm oil, sisal, tea, cocoa and coffee. Export Duty is a tax imposed on exports of some nations. See also Duty; and Tariff.

EXPORTER = ЭКСПОРТЁР – Exporter is the person on whose behalf the export declaration is made and who is the owner of the goods or has a similar right of disposal over them (Art. 788 CCIP). Under other Regulations it is the person who is partner of the export contract, the holder of an export licence or who is entitled to export refunds. The party responsible for the export of goods. Exporter is the person in the United States who has the authority of a principal party in interest to determine and control the sending of items out of the United States. Note that the Foreign Trade Statistics Regulations have a different definition for the term 'Exporter'. Under the Foreign Trade Statistics Regulations (FTSR), the 'Exporter' is the US principal party in interest (see Foreign Trade Statistics Regulations 15 CFR part 30). / Сторона, ответственная за вывоз (или экспорт) товаров. Экспортёр – страна, физическое или юридическое лицо, занимающееся вывозом (или экспортом).

EXPORTERS SALES PRICE = ЦЕНА ПРОДАЖ ЭКСПОРТЁРОВ – Exporters Sales Price is a statutory term used to refer to the United States sales prices of merchandise which is sold or likely to be sold in the United States, before or after the time of importation, by or for the account of the exporter. Certain statutory adjustments are made to permit a meaningful comparison with the foreign market value of such or similar merchandise, e.g., import duties, United States selling and administrative expenses and freight are deducted from the United States price. / привоз (importation). , например, .

EXPORT FINANCE = ВЫВОЗНОЕ ФИНАНСИРОВАНИЕ (или ЭКСПОРТНОЕ ФИНАНСИРОВАНИЕ, или ФИНАНСИРОВАНИЕ ЭКСПОРТА) – Export Finance:- providing exporters with the required capital for the shipment abroad of merchandise, or for the rendering of services such as construction, engineering and development operations in a different country. Export finance generally takes the form of bank credits granted to the supplier or credit given to the foreign purchaser of the goods. The documentary credit plays an important role in short-term export finance. Medium- to long-term export credits furnished by the banks are the most usual form of export financing in Switzerland. Special types of export finance are barter transactions, factoring, and non-recourse financing. In Switzerland, export financing is frequently provided in combination with an export risk guarantee from the Federal Government. / экспортный кредит (export credit).

EXPORT FINANCE CREDIT = КРЕДИТ ПОД ФИНАНСИРОВАНИЕ ВЫВОЗА (или КРЕДИТ ПОД ФИНАНСИРОВАНИЕ ЭКСПОРТА) – Export Finance Credit is one of the instruments in export finance. In Switzerland, export financing credits are granted by Swiss banks to finance export shipments not covered by the official export risk guarantee program, to finance downpayments, intermediate payments and local costs related to the installation of plant or equipment delivered by the Swiss producer.

EXPORT IDENTIFICATION NUMBER = ИДЕНТИФИКАЦИОННЫЙ НОМЕР ВЫВОЗНОЙ ОПЕРАЦИИ (или ИДЕНТИФИКАЦИОННЫЙ НОМЕР ЭКСПОРТНОЙ ОПЕРАЦИИ) – Export Identification Number is a number required for the US exporter on the Shipper's Export Declaration. A corporation may use their Federal Employer Identification Number as issued by the IRS; individuals can use their Social Security Numbers.

EXPORT–IMPORT BANK OF JAPAN = ЭКСПОРТНО–ИМПОРТНЫЙ БАНК ЯПОНИИ (или БАНК ВЫВОЗА-ПРИВОЗА ЯПОНИИ) – Export-Import Bank of Japan, Japanese Nihon Yushutsunyū Ginkō, originally Japan Export Bank, one of the principal government-funded Japanese financial institutions, which provides a wide range of services to support and encourage Japanese trade and overseas investment. Headquarters are in Tokyo. The Japan Export Bank was established in 1950; its name was changed in 1952, when its activities expanded to include import financing. The bank's principal activity is the provision of low-cost loans to support corporate growth; these activities include, for example, credits for exports of heavy industrial products and imports of raw materials in bulk. The bank also provided loans to developing countries to allow them to import Japanese products. The bank came under increasing pressure from other countries, particularly from the United States, to change its one-sided trade policies and growing trade surpluses. Therefore, the bank began to develop some programs to assist in management of the global economy. In 1986 it began to work in cooperation with the World Bank and the Asian Development Bank to cofinance loans to less developed countries. The Export-Import Bank of Japan (JEXIM) is Japan's official provider of export credits. About 10 percent of JEXIM's business is providing export credits. The bank's main role is to disburse about half the funds available under the trade surplus recycling program (the Nakasone facility). / Нихон Ющюцуню Гинко (Nihon Yushutsunyū Ginkō). вывозной (или экспортный) кредит (export credit). Накасонэ (Nakasone).

EXPORT–IMPORT BANK OF THE UNITED STATES = ЭКСПОРТНО–ИМПОРТНЫЙ БАНК СОЕДИНЁННЫХ ШТАТОВ (или БАНК ВЫВОЗА–ПРИВОЗА СОЕДИНЁННЫХ ШТАТОВ) – The Export-Import Bank of the United States (EXIMBANK) was chartered in 1934 as an independent agency to finance the export of US goods and services. Eximbank offers four major export finance support programs:- loans, guarantees, working capital guarantees and insurance. Eximbank undertakes some of the risk associated with financing the production and sale of American-made goods; provides financing to overseas customers for American goods when lenders are not prepared to finance the transactions; and enhances a US exporter's ability to match foreign government subsidies by helping lenders meet lower rates, or by giving financing incentives directly to foreign buyers. Export-Import Bank (Eximbank) is a Federal agency that aids in financing exports of US goods and services through direct loans, loan guarantees, and insurance. Headquartered in Washington, DC, the United States. The Export-Import Bank of the United States (Ex-Im Bank) is the official export credit agency of the United States. Ex-Im Bank's mission is to assist in financing the export of US goods and services to international markets. Ex-Im Bank enables US companies – large and small – to turn export opportunities into real sales that help to maintain and create US jobs and contribute to a stronger national economy. Ex-Im Bank does not compete with private sector lenders but provides export financing products that fill gaps in trade financing. We assume credit and country risks that the private sector is unable or unwilling to accept. We also help to level the playing field for US exporters by matching the financing that other governments provide to their exporters. Ex-Im Bank provides working capital guarantees (pre-export financing); export credit insurance; and loan guarantees and direct loans (buyer financing). No transaction is too large or too small. On average, 85% of our transactions directly benefit US small businesses. With more than 75 years of experience (2009), Ex-Im Bank has supported more than USD400 billion of US exports, primarily to developing markets worldwide. Since its creation by President Franklin Delano Roosevelt, the Export-Import Bank has been a strong advocate for American exporters, filling the gap when private financing is unavailable. This vital institution creates American jobs, strengthens our economy, and helps our businesses succeed in increasingly competitive global markets. Franklin Delano Roosevelt:- Now, Therefore, under and by virtue of the authority vested in me by the National Industrial Recovery Act of June 16, 1933, it is hereby declared that an agency, to wit:- a banking corporation, be created pursuant to Title 5, Chapter 9, 261 of the Code of the District of Columbia, under the name of Export-Import Bank of Washington. 18-Executive Order 6581:- creating the Export-Import Bank of Washington; February 02, 1934. 1968:- Congress changes name to Export-Import Bank of the United States. 1934:- The Export-Import Bank of Washington is established to lend to the Soviet Union, but doesn't because of unpaid war debts. The Export-Import Bank was established by President Franklin D. Roosevelt, in 1934, as a New Deal program and to support his foreign policy. Today, Ex-Im Bank provides working capital guarantees (pre-export financing); export credit insurance; loan guarantees and direct loans (buyer financing). On average, 85% of the transactions directly benefit US small businesses providing export financing for products that fill gaps in trade financing. Ex-Im Bank has supported more than USD400 billion of US exports, primarily to developing

markets worldwide. / вывозной (или экспортный) кредит (export credit). Президент США Фрэньклын Дэлано Розэвэлт (Franklin Delano Roosevelt; 1882–1945). Экспортно-Импортный Банк Соединённых Штатов является государственным банком поддержки и содействия вывозу (или экспорту) и привозу (или импорту) США. Он предоставляет кредиты и гарантии преимущественно на срок от 5 лет и более. Банк был основан 02 Февраля 1934. Капитал 1 миллиард Долларов США, основные источники ресурсов – средства денежного рынка США и долгосрочные займы Казначейства. Ежегодный объём кредитов и гарантий устанавливается Конгрессом США (кредиты:- 1983 – 4.4, 1984 – 3.9, 1985 – 3.8 миллиардов Долларов США; гарантии в 1983, 1984, 1985 – 10 миллиардов Долларов США). Экспортно-Импортный Банк Соединённых Штатов Америки (Экс-Им Бэньк) – банк, созданный по решению Конгресса США в 1934 с целью развития торговли между США и иностранными государствами. Экс-Им Бэньк является независимой организацией, которая занимает средства у Казначейства США (US Treasury) с целью:- (i) финансирования вывоза (или экспорта) и привоза (или импорта); (ii) предоставления прямого кредита займополучателям за пределами США; (iii) предоставления экспортных гарантий, страхования против коммерческих и политических рисков и (iv) предоставления займов на льготных условиях (со скидкой).

EXPORTING = ВЫВОЗ (или ЭКСПОРТИРОВАНИЕ) – Exporting is a sale of goods and services to a foreign country. While exporting was long considered a secondary activity, it is widely recognized as an absolute necessity in the modern world. The traditional reasons for exporting still apply today and are an essential component of developing economies, which seek foreign markets where they can sell permanent or temporary commodity surpluses, or from which they can import commodities that are in short supply. Industrial nations view exporting not just as a means of reaching balance of payments equilibrium, but as a means of fueling expansion. This explains the growing importance ascribed to exports by government and business alike.

THE EXPORT LEGAL ASSISTANCE NETWORK = СЕТЬ ЮРИДИЧЕСКОЙ ПОДДЕРЖКИ ВЫВОЗА (или СЕТЬ ЮРИДИЧЕСКОЙ ПОДДЕРЖКИ ЭКСПОРТА) – In the United States, The Export Legal Assistance Network (ELAN) sponsored by the Small Business Administration (SBA), is a nationwide group of attorneys with experience in international trade who provide free initial consultations to small businesses on export-related matters. Headquartered in Washington, DC, the United States. The Export Legal Assistance Network (ELAN) is a cooperative program among the Federal Bar Association, US Department of Commerce, and US Small Business Administration (SBA). Important Advice:- to maximize the value of your one free consultation with a lawyer, you must be well prepared. ELAN lawyers may refuse to meet with callers who begin their request with a question such as:- 'I want to export, can you help me'? Before contacting an ELAN lawyer, you should have done considerable homework, have a business plan or strategy and have made use of the services of your local USEAC (short for the United States Export Assistance Center) or SBA. Otherwise, you may be wasting not only the time of our lawyers, but also your own. What is the Export Legal Assistance Network? With a presence in 70 US cities and with the participation of more than 250 attorneys, the Export Legal Assistance Network (ELAN) program is a nationwide group of attorneys in private law firms that volunteer to provide an initial legal consultation free of charge to companies just beginning to export. Under ELAN, knowledgeable lawyers help new export companies learn the legal aspects of international trade, issues relating to export licensing, domestic and foreign taxation, tariffs, and intellectual property rights are just some of the topics covered. What are the services that an ELAN lawyer will provide? In your first meeting, the volunteer ELAN lawyer will help you identify the key legal issues facing your company in exporting. The volunteer will explain basic contractual requirements, taxes and regulations and give you introductory information on other necessary resources, such as banks, freight forwarders, insurance companies, and state and federal programs to expand exports. Your consultation will last long enough to identify the legal issues facing your product or service. This free consultation is meant to provide a reasonably detailed overview of the legal issues involved in exporting. You are then free to handle the next steps yourself, or to hire an attorney to complete them for you. What can I expect to get out of my meeting with a volunteer lawyer from ELAN? An indication of the key legal issues which your business needs to address in making its first export sales. The lawyer should be able to help you to understand basic contractual, tax and regulatory requirements, provide an indication of priorities among them, and provide some basic information on programs of other institutions which might be helpful in getting export operations started, e.g., international department of a near-by bank, freight forwarders, insurance companies with international experience, and other helpful government programs. The lawyers will work closely with the district offices of the US Commerce Department and Small Business Administration. How long will my consultation be? Long enough to allow you to identify the export-related legal issues related to your product or service and to demonstrate that, like other business problems, they are divisible into manageable pieces which can be resolved within a reasonable time at a foreseeable level of cost. ELAN wants you to feel comfortable with the legal aspects of exporting. What won't the lawyer do for me? This free consultation is not intended to have the lawyer draft contracts or enter into deep analyses of specific pending issues. It is intended to provide an overview and a reasonably detailed discussion of the legal problems involved in entering the export market. Do I have any obligation, financial or otherwise, to the volunteer attorney? Absolutely not. If the free consultation has achieved its purpose, you will have an idea of the next steps required. You are entirely free to handle them yourself, to hire another lawyer, or to use the volunteer attorney. The choice is entirely yours. Why are these attorneys involved in the program? As professionals and as Americans, ELAN attorneys are interested in improving the US balance of payments and securing the future of our country in international trade.

EXPORT LICENSE = ЛИЦЕНЗИЯ НА ВЫВОЗ (или ЭКСПОРТНАЯ ЛИЦЕНЗИЯ, или ЛИЦЕНЗИЯ НА ЭКСПОРТ) – Export License is a government document authorizing exports of specific goods in specific quantities to a particular destination. This document may be required in some countries for most or all exports and in other countries only under special circumstances. Government-issued permit to export a given item under specified conditions. Export License is a government document which permits the licensee to engage in the export of designated goods to certain destinations. Export License is a government document authorizing exports of special goods in specific quantities to a particular destination. / Выдаваемое Правительством разрешение для вывоза (или экспорта) данного изделия на спецификационных условиях. Экспортная Лицензия – право вывоза (или экспорта) определённых товаров, предоставляемое уполномоченным государственным органом предприятиям, фирмам, другим экспортёрам.

EXPORT LICENSE VOICE INFORMATION SYSTEM = СИСТЕМА УСТНОЙ ИНФОРМАЦИИ О ЛИЦЕНЗИЯХ НА ВЫВОЗ (или СИСТЕМА УСТНОЙ ИНФОРМАЦИИ ОБ ЭКСПОРТНЫХ ЛИЦЕНЗИЯХ) – In the United States, Export License Voice Information System (ELVIS) is a Bureau of Export Administration (BXA) 24-hour on-line service which allows exporters to obtain recorded information on such topics as commodity classifications, emergency handling procedures and seminars as well as to order information.

EXPORT MANAGEMENT COMPANY = КОМПАНИЯ ПО УПРАВЛЕНИЮ ВЫВОЗОМ (или КОМПАНИЯ ПО УПРАВЛЕНИЮ ЭКСПОРТОМ) – In the United States, Export Management Company is a private firm that serves as the export department for several manufacturers, soliciting and transacting export business on behalf of its clients in return for a commission, salary, or retainer plus commission.

EXPORT MERCHANT = ВЫВОЗЯЩИЙ КОММЕРСАНТ (или ЭКСПОРТИРУЮЩИЙ КОММЕРСАНТ) – In the United States, Export Merchant is a company that buys products directly from manufacturers, then packages and markets the merchandise for resale under its own name.

EXPORT PREMIUMS = ВЫВОЗНЫЕ ПРЕМИИ (или ЭКСПОРТНЫЕ ПРЕМИИ) –Export Premiums:- Financial benefits granted in capitalist countries to exporters by state bodies or monopolistic associations for the purpose of expanding the export abroad of certain goods. They were first systematically introduced at the end of the XIX century and are applied on an extensive scale in capitalist countries today. Export premiums take the form either of payments to national exporting companies of money subsidies for the export of goods (Direct Export Premiums) or of the granting to such companies of exemptions from internal taxes and dues (Concealed Export Premiums). Direct export premiums enable ex-port firms to reduce their prices while maintaining their profits at a high level. Such subsidies are used in the United States for the export of agricultural products, such as Cotton. Japan and the countries of Western Europe use such subsidies in the export of many kinds of finished articles, including textiles and automobiles. The volume of the export premium may amount to as much as 60 or 70 percent of the price of the article, thus enabling monopolies to engage in dumping. Concealed (indirect) export premiums are accorded by a government to a domestic exporting firm in the form of advantageous conditions for the payment of domestic taxes, excise and customs duties, and other dues. In Western Europe, the United States, and Japan, a system of tax benefits exists for the expansion of exports:- exporting monopolies are exempted from tax payments or pay only a reduced rate. The system of indirect export premiums exempts export firms from the payment of import duties (or provides for their subsequent refunding) if the export firms are using imported raw materials for the manufacturing of goods for export (the so-called Conditional Duty-Exempt Importation, or Return Of Duties). Export premiums are one of the ways in which monopolies use the state machinery in the struggle for foreign markets. They impose a heavy burden on the shoulders of the working masses of capitalist countries, representing as they do a method of redistribution in the interests of monopolistic capital of the share of the taxes and duties accruing to the state budget. / Вывозные Премии или Экспортные Премии, льготы финансового характера, предоставляемые в капиталистических странах экспортёрам государственными органами или монополистическими объединениями для расширения вывоза определённых товаров за границу. Начали систематически применяться с конца XIX века. Широко используются современными капиталистическими странами. Выступают либо в форме выплаты национальным фирмам-экспортёрам денежных субсидий при экспорте товаров (Прямые Вывозные Премии), либо в форме освобождения этих фирм от уплаты внутренних налогов и сборов (Скрытые Вывозные Премии). Прямые вывозные премии позволяют фирмам-экспортёрам снижать цены, сохраняя на высоком уровне получаемые прибыли. Они применяются в Соединённых Штатах Америки (США) при вывозе сельскохозяйственных товаров (Хлопка и других). Япония и страны Западной Европы используют их при экспорте многих видов готовых изделий (текстиля, автомобилей и других). Размеры вывозных премий достигают 60–70% цены товаров, что позволяет монополиям осуществлять демпинг товаров. Скрытые (косвенные) вывозные премии заключаются в создании правительством для национальных фирм-экспортёров льготных условий в отношении уплаты внутренних налогов, акцизов, таможенных пошлин и других сборов. В странах Западной Европы, США и Японии существует система налоговых льгот для расширения экспорта:- монополии-экспортёры не платят налогов или платят их по уменьшенным ставкам. Форма косвенных вывозны премий – система освобождения от уплаты импортных пошлин (или последующий возврат их) фирм-экспортёров, применяющих импортное сырьё для изготовления товаров на экспорт (так называемый Условно Беспошлинный Ввоз, или Возврат Пошлин). Вывозные премии являются одной из форм использования монополиями государственного аппарата в борьбе за внешние рынки. Тяжёлым бременем ложатся они на плечи трудящихся капиталистических стран, представляя собой метод перераспределения части поступающих в государственный бюджет налогов и сборов в интересах монополистического капитала.

EXPORT PROCESSING ZONE = ЗОНА ОБРАБОТКИ ВЫВОЗА (или ЗОНА ОБРАБОТКИ ЭКСПОРТА) – Export Processing Zones are industrial parks designated by a government to provide tax and other incentives to export firms.

EXPORT QUOTAS = КВОТЫ НА ВЫВОЗ (или ЭКСПОРТНЫЕ КВОТЫ, или КВОТЫ НА ЭКСПОРТ) – Export Quotas are the specific restrictions or target objectives on the value or volume of exports of specified goods imposed by the government of the exporting country. These restraints may be intended to protect domestic producers and consumers from temporary shortages of certain materials, or as a means to moderate world prices of specified commodities. Commodity agreements sometimes contain explicit provisions to indicate when export quotas should go into effect among producers. Export quotas are also used in connection with orderly marketing agreements and voluntary restraint agreements. Export Quota:- controls applied by an exporting country to limit the amount of goods leaving the country. / вывоза (или экспорта) спецификационных товаров . Экспортная Квота – количество товара, которое государственные органы разрешают вывозить (или экспортировать) предприятиям, фирмам в условиях, когда вывоз (или экспорт) ограничен.

EXPORT RATE = ВЫВОЗНАЯ СТАВКА (или ЭКСПОРТНАЯ СТАВКА) – Export Rate is a rate published on traffic moving from an interior point to a port for transshipment to a foreign country.

EXPORT READY = ГОТОВОЕ К ВЫВОЗУ (или ГОТОВОЕ К ЭКСПОРТУ) – Export Ready refers to carlots which meet the following criteria:- (i) the lot must meet the commercially clean specifications for the grade; (ii) Wheat of other classes and contrasting classes must meet the export specifications for the grade; and (iii) total foreign material must meet the export specification for the grade. Carlots, which are commercially clean but do not meet the export specifications for either Wheat of other classes or total foreign material, will be designated as Not Ready For Export.

EXPORT RESTITUTIONS (REFUNDS) = ВЫВОЗНЫЕ ВОЗМЕЩЕНИЯ (ВОЗВРАТЫ) (или ЭКСПОРТНЫЕ РЕСТИТУЦИИ (ВОЗВРАТЫ)) – Export Restitutions (Refunds) are the EU export subsidies provided to cover the difference between internal prices and world market prices for particular commodities.

EXPORT REVOLVING LINE OF CREDIT = ВОЗОБНОВЛЯЕМАЯ КРЕДИТНАЯ ЛИНИЯ ПО ВЫВОЗУ (или ВОЗОБНОВЛЯЕМАЯ КРЕДИТНАЯ ЛИНИЯ ПО ЭКСПОРТУ) – In the United States, the Export Revolving Line of Credit (ERLC) is a form of financial assistance provided by the Small Business Administration (SBA). The ERLC guarantees loans to US firms to help bridge the working capital gap between the time inventory and production costs are disbursed until payment is received from a foreign buyer. SBA guarantees 85 percent of the ERLC subject to a USD750 000.00 guarantee limit. The ERLC is granted on the likelihood of a company satisfactorily completing its export transaction. The guarantee covers default by the exporter, but does not cover default by a foreign buyer; failure on the buyer's side is expected to be covered by letters of credit or export credit insurance. Under SBA's ERLC program, any number of withdrawals and repayments can be made as long as the Dollar limit on the line of credit is not exceeded and disbursements are made within the stated maturity period (not more than 18 months). Proceeds can be used only to finance labor and materials needed for manufacturing, to purchase inventory to meet an export order and to penetrate or develop foreign markets. Examples of eligible expenses for developing foreign markets include professional export marketing advice or services, foreign

business travel and trade show participation. Under the ERLC program, funds may not be used to purchase fixed assets. / выплата (repayment) . вывозной (или экспортный) кредит (export credit).

EXPORT RISK GUARANTEE = ГАРАНТИЯ РИСКА ЭКСПОРТЁРА – Export Risk Guarantee is a guarantee safeguarding claims arising from export operations. The Swiss Federal Government's export risk guarantee (ERG) scheme has been in place since 1934. The guarantee cover includes not only the actual merchandise exports but also certain other business services rendered by the exporter, such as the construction, engineering and development work, leasing of goods, licensing and scientific, technical and economic consulting. The following four principal risks are currently covered by the ERG:- (i) the currency, transfer and premium risk; (ii) the credit risk of the state buyer, guarantor, or certain private banks; (iii) the political risk, e.g., wars, revolutions, etc; and (iv) the risk prior to delivery (manufacturing risk). / , например, .

EXPORTS = ВЫВОЗЫ (или ЭКСПОРТ) – Exports are the domestically produced commodities that are sold abroad.

EXPORT SAMPLE PORTION = ПОРЦИЯ ВЫВОЗНОЙ ПРОБЫ (или НАВЕСКА ЭКСПОРТНОЙ ПРОБЫ) – The Export Sample Portions are the minimum sample portions to be picked for specific factors when analyzing export samples. These standards do not prevent the inspector from analyzing larger portions when appropriate. / К порции вывозной (или экспортной) пробы относятся минимальные навески проб, которые должны быть отобраны для последующего определения специфических характеристик при анализе вывозных (или экспортных) проб. Эти стандарты не препятствуют для отбора инспектором более крупных порций в случае необходимости.

EXPORT SERVICES = ВЫВОЗНЫЕ СЛУЖБЫ (или ЭКСПОРТНЫЕ СЛУЖБЫ) – Export Services (ES):- headquarters unit within USDA-APHIS-PPQ (short for the United States Department of Agriculture – Animal and Plant Health Inspection Service – Plant Protection and Quarantine) that maintains a phytosanitary certification system for exported US agricultural commodities. USDA-APHIS-PPQ, Export Services, 4700 River Road, Unit 140, Riverdale, State of Maryland 20737, the United States; Phone:- +1-301-7348537; Fax:- +1-301-7347639.

EXPORT STANDARD SAMPLES = СТАНДАРТНЫЕ ВЫВОЗНЫЕ ПРОБЫ (или СТАНДАРТНЫЕ ЭКСПОРТНЫЕ ПРОБЫ) – Export Standard Samples are created only for Canada Western grains. They are prepared for most grades of Wheat and general purpose grades of Barley and govern grading of shipments out of terminal, transfer, and process elevators. They are intended to ensure that the buyer receives grain that is reasonably close in quality to the average of the grade. Minimum test weights, maximum limits of admixtures and grading factors in general are demonstrated in the export standard samples. However, overall quality is always considered. An export shipment may be assigned a certain grade although the shipment is slightly below the requirements in one factor, provided that in the judgment of the inspector it is sufficiently superior in other factors to be equal in overall quality to the export standard sample. Final decisions on the grade of such shipments are made only by senior officials of CGC's (short for the Canadian Grain Commission's) Inspection Services.

EXPORT STATISTICS = СТАТИСТИКА ПО ВЫВОЗУ (или СТАТИСТИКА ПО ЭКСПОРТУ) – In the United States, Export Statistics measure the total physical quantity or value of merchandise (except for shipments to US military forces overseas) moving out of the United States to foreign countries, whether such merchandise is exported from within the US Customs territory or from a US Customs bonded warehouse or a US Foreign Trade Zone.

EXPORT SUBSIDIES = ВЫВОЗНЫЕ СУБСИДИИ (или ЭКСПОРТНЫЕ СУБСИДИИ) – Generally, Export Subsidies are the direct government payments or other economic inducements given to domestic producers of goods that are sold in foreign markets. The General Agreement on Tariffs and Trade (GATT) recognizes the export subsidies may distort trade, unduly disturb normal commercial competition and hinder the achievement of GATT fair trade objectives; but it does not clearly define what practices constitute export subsidies. Export Subsidies are the subsidies given to traders to cover the difference between internal market prices and world market prices, such as for example the EU export restitutions. Export subsidies are now subject to value and volume restrictions under the Uruguay Round Agreement on Agriculture. Export Subsidies are the subsidies given to traders to cover the difference between internal market prices and world market prices, such as the EU export restitutions. The elimination of agricultural export subsidies is part of the Nairobi Package adopted at the WTO's Tenth Ministerial Conference in December 2015. Export Subsidies are the special incentives such as cash payments, tax exemptions, preferential exchange rates, and contracts extended by governments to encourage increased foreign sales. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)). Вывозная (или Экспортная) Субсидия – один из способов государственного стимулирования вывоза (или экспорта) за счёт бюджета. Такое субсидирование возможно в форме прямого финансирования научно-исследовательских, опытно-конструкторских работ и вывозного (или экспортного) производства, а также путём предоставления на те же цели благоприятных кредитов.

EXPORT SUMMARY = ВЫВОЗНАЯ СВОДКА (или СВОДКА ПО ЭКСПОРТУ, или ЭКСПОРТНАЯ СВОДКА) – Export Summary is an interpretation of the plant quarantine import requirements of a foreign country. Export summaries provide guidance to Authorized Certification Officials (ACOs), Export Certification Specialists, other officials, and interested parties concerned with the export of agricultural commodities. Export summaries are not to be considered legally authoritative; they are written from translated plant quarantine regulations, official instructions, and other information provided by officials in foreign countries. Export summaries are housed in the Export Certification Project (EXCERPT).

EXPORT TAX = ВЫВОЗНОЙ НАЛОГ (или ЭКСПОРТНЫЙ НАЛОГ, или НАЛОГ НА ВЫВОЗ) – Export Tax is a fee charged on exports that is paid to the government of the originating country.

EXPORT TRADE CERTIFICATE OF REVIEW = СВИДЕТЕЛЬСТВО О ПЕРЕСМОТРЕ ТОРГОВЛИ НА ВЫВОЗ (или СЕРТИФИКАТ ПЕРЕСМОТРА ПО ТОРГОВЛЕ НА ЭКСПОРТ) – Export Trade Certificate Of Review:- in the United States (US), a certification of partial immunity from US antitrust laws that can be granted based on the Export Trading Company Act legislation by the Department of Commerce with Department of Justice concurrence. Any prospective or present US-based exporter with antitrust concerns may apply for certification.

EXPORT TRADING COMPANY = ВЫВОЗНАЯ ТОРГОВАЯ КОМПАНИЯ (или ЭКСПОРТНАЯ ТОРГОВАЯ КОМПАНИЯ) – In the United States, Export Trading Company (ETC) a firm that purchases foreign goods for resale in its own local market. An ETC is a company doing business in the United States (US) principally to export goods or services produced in the US or to facilitate such exports by unaffiliated persons. The ETC can be owned by foreigners and can import, barter and arrange sales between third countries, as well as export.

EXPORT TRADING COMPANY ACT = АКТ О ВЫВОЗНЫХ ТОРГОВЫХ КОМПАНИЯХ (или АКТ ОБ ЭКСПОРТНЫХ ТОРГОВЫХ КОМПАНИЯХ) – Export Trading Company Act (ETCA):- the globalized economy presents increasingly intense competition from foreign suppliers in the export market. Moreover, US companies currently face competitive pressures on an unprecedented scale. The ETCA was created by Congress to enable US firms to collaborate with each other to reduce their exports

costs, become more efficient at exporting, and, in turn, compete more effectively in the export market. The US Department of Commerce's Office of Competition and Economic Analysis administers the Export Trade Certificate of Review. Thousands of US companies have already benefitted from these programs. If you or your company are interested in gaining a competitive edge in the global economy, please explore the following:- The Export Trade Certificate of Review. The Export Trade Certificate of Review provides substantive federal antitrust protection and procedural benefits to US firms interested in collaborating on export activities. By coordinating with one another under the legal protection of this program, US firms can reduce their shipping costs, boost their negotiating power, fill large export orders, and develop long-term export business. In the United States, the Export Trading Company Act (ETCA) of 1982 initiates the Export Trade Certificate of Review program that provides antitrust preclearance for export activities; permits bankers' banks and bank holding companies to invest in ETCs; establishes a Contact Facilitation Service within the Commerce Department designed to facilitate contact between firms that produce exportable goods and services and firms that provide export trade services. On October 08, 1982, President Reagan signed into law the Export Trading Company Act of 1982 (ETCA). Designed to create jobs and to reduce US balance-of-payments deficits by encouraging new export ventures, ETCA was the product of nearly four years of congressional consideration. Although the Administration's expectation that this legislation will create at least USD11 billion in increased sales and more than 300 000 new jobs over the next five years may be overly optimistic, ETCA is nonetheless potentially significant to US and foreign businesses for at least two reasons. First, US businesses and US banking organizations will enjoy new export opportunities created by a clarification of applicable antitrust restrictions and by a relaxation of the general prohibition against banking organizations participating in the ownership and management of non-banking commercial ventures. Second, foreign companies and their counsel will need to understand the applicable legal standards in order to determine under what circumstances a challenge might be brought against practices contravening ETCA. Although ETCA may have modified US antitrust standards, foreign competitors of US export trading companies (ETCs) still may be able to challenge ETC activities in their own countries by invoking their own domestic antitrust provisions, and thus will need to understand the nature of these potential entrants into international markets. ETCA consists of four titles. Title I provides a series of definitions which, curiously, applies only to that title and to none other. Title II contains banking law amendments permitting greater banking involvement, including ownership ... / Президент США Ранэлд Вилсэн Рэйген (Ronald Wilson Reagan; 1911–2004) 08 Октября 1982 .

EXPOSED CORD = ВЫСТУПАЮЩИЙ КОРД – Exposed Cord:- not readily visible. Results from legs of teeth not completely covering or clamping around the cord. Except for what appears in slight degree, exposed cord tends to cause hard operation and weakness of the zipper under strain. Closure defects, and namely – Zippers:- Chain or Teeth Defects. / Порок или дефект застёжки.

EXPOSURE = УЯЗВИМОСТЬ – Exposure:- the monetary risk involved in holding a futures position if it were closed out with a loss. / Финансовый риск, сопровождающий удержание позиции по фьючерсу, если бы она была закрыта с убытком.

(1) In securities trade, Exposure is an obligation arising from new purchases of securities. Also a designation for the entire securities portfolio of an investor or group of buyers. / В торговле ценными бумагами, обязательство, возникающее при новой покупке ценных бумаг. Также определениея для целого портфеля ценных бумаг инвестора или группы покупателей.

(2) In lending business, Exposure is the credit liability which a bank has assumed in regard to a customer or borrowing country.

(3) In insurance, Exposure is a state of being subject to the possibility of loss; or extent of risk as measured by payroll, gate receipts, area, or otherwise; or possibility of loss to a risk being caused by its surroundings.

EXPRESS = ЭКСПРЕСС – Express (in air transport):- cargo with a guaranteed or time-definite service component. Express carriers usually are characterized as integrated because, in addition to carrying mostly airport-to-airport, time-definite cargo, they also offer many other services, such as door-to-door pickup and delivery.

EXPRESS ABANDONMENT = УСКОРЕННЫЙ (или ВЫРАЖЕННЫЙ) ОТКАЗ – Express Abandonment:- a patent application may be expressly abandoned by filing a written declaration of abandonment identifying the application in the United States Patent and Trademark Office. Express abandonment becomes effective when an appropriate official of the office (the United States Patent and Trademark Office (USPTO)) takes action thereon. Express abandonment of the application may not be recognized by the United States Patent and Trademark Office (USPTO) before the date of issue or publication unless it is actually received by appropriate officials in time to act. Abandonment may be either of the invention or of an application. An abandoned application, in accordance with 37 CFR 1.135 and 1.138 (CFR:- short for the US Code of Federal Regulations), is one which is removed from the USPTO docket of pending applications.

EXPRESS BILL OF LADING = ЭКСПРЕСС КОНОСАМЕНТ – Express Bill Of Lading is a non-negotiable bill of lading (B/L) where there are no hard copies of originals printed.

EXPRESSED WARRANTY = ВЫРАЖЕННОЕ РУЧАТЕЛЬСТВО – Expressed Warranty:- an agreement written in a marine underwriter's insurance policy which must be strictly and literally complied with. A violation voids the insurance, e.g., trading warranties.

EXPRESSIVITY = ЭКСПРЕССИВНОСТЬ – Expressivity is the degree of manifestation of a certain character in the offspring. The degree of expression of a given gene. Genes that always produce the same phenotype have 100 percent expressivity. / свойство (character) . Под Экспрессивностью понимается степень выраженности признака, определяемого данным геном. Может меняться в зависимости от генотипа, в который входит данный ген, и от условий внешней среды.

EXPRESS MAIL MAILING LABEL = ПОСЫЛОЧНАЯ ЭТИКЕТКА ЭКСПРЕСС ПОЧТЫ – (1) Express Mail Mailing Label:- patent correspondence delivered to the United States Patent and Trademark Office (USPTO) via the 'Express Mail Post Office to Addressee' service of the United States Postal Service (USPS) which is considered filed in the office (the United States Patent and Trademark Office (USPTO)) on the date of deposit with the USPS, shown by the 'date-in' on the 'Express Mail' mailing label.

(2) Express Mail Mailing Label:- the filing date for Trademark documents is not the same as for patent documents.

EXPRESS WARRANTY = ЭКСПРЕСС РУЧАТЕЛЬСТВО – Express Warranty is a warranty that is specified in the policy document, or is attached thereto. A warranty that applies to the policy, but is not expressed therein (e.g., warranty of legality), is termed an 'implied warranty'. / специфицировано в полисном документе.

EX QUAY = ЭКС ПРИЧАЛ (или ФРАНКО ПРИЧАЛ, или ФРАНКО НАБЕРЕЖНАЯ) – Ex Quay means that the seller makes the goods available to the buyer on the quay (wharf) at the destination named in the sales contract. The seller has to bear the full cost and risk involved in bringing the goods there. There are two Ex Quay contracts in use:- (i) Ex Quay 'Duty Paid', and (ii) Ex Quay 'Duties on Buyer's Account' in which the liability to clear goods for import is to be met by the buyer instead of by the seller. From Latin:- Ex (Out Of). Ex Quay (EXQ) means from the dock at the import point. The term goes one step beyond CIF to include the seller's responsibility for placing goods on the dock at the named overseas port with the appropriate duty paid. / Экс, от Латинского слова Ex, означающее Из или От. В сделках купли-продажи (поставки) товара под Франко, от Итальянского слова Franco, означающее Свободный,

понимается термин, обозначающий распределение транспортных расходов между продавцом и покупателем до места, указанного в договоре, например, Франко-Борт, Франко-Вагон, Франко-Склад Покупателя и тому подобное.

EX RIGHT = БЕЗ ПРАВА – Ex Right:- securities quoted ex-rights entitle the seller to retain the right to participate in a New Issue then current. From Latin:- Ex (Out Of). Ex Right (XR):- without the rights (in stock listing of newspapers). Corporations raising additional money may do so by offering their stockholders the right to subscribe to new or additional stock, usually at a discount from the prevailing market price. The buyer of a stock selling ex-rights is not entitled to the rights. See also Ex Dividend and Rights. Symbol indicating that a stock is trading ex-rights, with no rights attached. Designation of a share which is traded without its subscription rights (usually in the form of coupons). The rights are traded separately on the stock exchange where they have been listed for a stipulated period. / Символ, указывающий на то, что акция продаётся без прав, то есть без прилагаемых прав.

EXSERTED = ВЫДАЮЩЕЕСЯ (или ВЫПИРАЮЩЕЕ, или ВЫСТУПАЮЩЕЕ) – Exserted:- of stamens or pistils exceeding the length of the tepals. / Выдающееся или Выступающее наружу, о тычинках (stamens) или , длину листочков околоцветника (tepals).

EXSERTED PANICLE = ВЫСТУПАЮЩАЯ МЕТЁЛКА – Exserted Panicle is a panicle that emerges fully from the flag leaf sheath. / В ботанике под Метёлкой понимается ложное соцветие, многократно ветвящееся и несущее на концах ветвей простые соцветия – кисти (Сирень), колоски (у злаков), корзинки (у сложноцветных).

EXSERTION = ВЫСТУПАНИЕ (или ВЫПИРАНИЕ) – Exsertion:- (1) when the spikelets of the Rice plant become distinguishable and the panicle extends upward inside the flag leaf sheath. (2) Degree of emergence of the panicle from the flag leaf sheath; maybe positive or negative depending on whether the neck node is above or below the collar of the flag leaf. (3) Ability of the panicles to arise from the boot.

EX SHIP = ЭКС СУДНО (или ФРАНКО СУДНО) – Ex Ship means that the seller will make the goods available to the buyer on board the ship at the destination named in the sales contract. The seller bears all costs and risks involved in bringing the goods to the destination. From Latin:- Ex (Out Of). / Экс, от Латинского слова Ex, означающее Из или От. В сделках купли-продажи (поставки) товара под Франко, от Итальянского слова Franco, означающее Свободный, понимается термин, обозначающий распределение транспортных расходов между продавцом и покупателем до места, указанного в договоре, например, Франко-Борт, Франко-Вагон, Франко-Склад Покупателя и тому подобное.

EX SITU = ЭКС СИТУ (или ВНЕ МЕСТА НАХОЖДЕНИЯ) – Ex Situ (in Latin):- outside, off site, or away from the natural location. For example, biological material which is in a laboratory, collection, botanical garden, zoo, or aquarium. Also known as off-site. Contrast In Situ. Ex Situ:- away from the natural or original position/place; off-site. Ex Situ:- literally 'Out Of Place' and the opposite of In Situ ('In Place'). The term sometimes refers to excavated soil or pumped out groundwater, both of which have been moved from their original place. Ex Situ conservation is the practice of protecting rare plants outside of their native habitat, typically through the collection and storage of germplasm in a seedbank (or genebank). See also In Situ. / сохранение (conservation).

EXTENDED 3 OF 9 = РАСШИРЕННЫЙ 3 ИЗ 9 – Extended 3 Of 9:- similar to Code 3 of 9 except that it allows the full 128 ASCII (short for the American Standard Code for Information Interchange) character set to be encoded by printing two barcode characters for each text character.

EXTENDED CODE 93 = РАСШИРЕННЫЙ КОД 93 – Extended Code 93:- similar to Code 93 except that it allows the full 128 character ASCII (short for the American Standard Code for Information Interchange) character set to be encoded.

EXTENDED FAMILY = РАСПРОСТРАНЁННОЕ СЕМЕЙСТВО – Extended Family:- several generation of basic family units, related by descent, marriage or adoption and living together; a household group which includes kin outside of the nuclear family.

EXTENDED (IN PRICE) = РАСШИРЕННАЯ (В ЦЕНЕ) – Extended (In Price) is a term describing a stock that has risen past its Pivot Point. Such a stock is considered a risky investment because it has already begun its advance and is more likely to reverse.

EXTENDED LENGTH = ВЫТЯНУТАЯ ДЛИНА (или РАСТЯНУТАЯ ДЛИНА) – Extended Length is the length of a face pile yarn required to produce one inch of tufted carpet.

EXTENDED MATURITY PERIOD = РАСШИРЕННЫЙ ПЕРИОД ПОГАШЕНИЯ – In the United States, Extended Maturity Period is a period (typically 10 years long for pre-May 1995 bonds) after the original maturity date during which a bond continues to earn interest according to applicable regulations, e.g., Department of the Treasury Circular, Public Debt Series, No. 1-80, as revised and amended, for Series EE bonds. It is also sometimes referred to as an Extension Period.

EXTENDED PROTEST = РАЗВЁРНУТЫЙ ПРОТЕСТ – Extended Protest is the detailed statement made by the master of a vessel concerning an accident which has become the subject of a court case. / Детальный отчёт, выполненный хозяином (или капитаном) судна, касающийся несчастного случая, который стал предметом судебного дела.

EXTENDED REPORTING PERIOD = РАСШИРЕННЫЙ ПЕРИОД ЗАЯВЛЕНИЯ (ПРЕТЕНЗИИ) – Extended Reporting Period is the period after the expiry of a claims made policy in which claims under that policy must be made if they are to be covered. It may be possible for an insured to extend this period on payment of an additional premium. A period allowed for making claims after expiration of a claims made liability policy. Also known as Tail.

EXTENDER = РАЗБАВИТЕЛЬ – Extender is a substance added to an adhesive to reduce the amount of primary binder required per unit area. / .

EXTENDER PIGMENT = ПИГМЕНТ РАЗБАВИТЕЛЬ – Extender Pigment is a coating additive which imparts special properties, for example, to give exterior varnish protection from ultra-violet light degradation. / придать наружную защиту лаком/олифой . Под Пигментом, от Латинского слова Pigmentum, означающее Краска, понимается окрашенное химическое соединение, применяемое в виде тонких (высокодисперсных) порошков для крашения древесины, пластмасс, резины, химических волокон и изготовления красок. Важнейшие характеристики пигментов – яркость и насыщенность цвета, укрывистость (способность перекрывать цвет окрашиваемой поверхности), светостойкость, устойчивость к действию химических реагентов, размер частиц (дисперсность). Пигменты подразделяют на органические и неорганические. Из органических наиболее важны азопигменты, полициклические и фталоцианиновые пигменты, которые используют в текстильной и полиграфической промышленности, при крашении пластмасс, резины и тому подобного. К пигментам относят также органические лаки. Неорганические пигменты делятся на природные и искусственные (свинцовые и цинковые белила, диоксид титана, охра, сажа, сурик, ультрамарин и другие). Они особенно широко применяются в лакокрасочной промышленности.

EXTENSIBILITY = РАСТЯЖИМОСТЬ (или ТЯГУЧЕСТЬ) – Extensibility is the ability of a materiel to undergo elongation on the application of force. See also Elongation.

EXTENSION = ВНЕДРЕНИЕ (или РАСПРОСТРАНЕНИЕ, или РАСШИРЕНИЕ) – Extension is a dissemination of agricultural technology from scientific research organization to the farming community to improve their farming practices.

EXTENSION = РАСШИРЕНИЕ – (1) Extension:- by expressing the strain as a percentage we obtain the 'Extension'. Extension = (Elongation / Initial Length) x 100 per cent. The extension is sometimes referred to as the 'Strain Percent'. Extension is the increase in length of a test specimen produced by a force, expressed in units of length.

(2) In reference to insurance, an Extension is an addition to an existing policy to provide cover not previously considered or included, either temporarily or permanently.

EXTERIOR PANEL = НАРУЖНАЯ ПАНЕЛЬ – Exterior Panel is a general term for plywood or OSB/waferboard (oriented strandboard/waferboard), bonded with a type of adhesive that by systematic tests and service records has proved highly resistant to weather. See also Interior Panel. / Плита с Ориентированными Волокнами (ПОВ)/стружечная плита или древесностружечная плита (ДСП). Смотрите также Внутренняя Панель (Interior Panel). Под Панелью, от Немецкого слова Paneel, понимается плоский крупноразмерный элемент (конструкция) заводского изготовления, широко применяемый в современном строительстве зданий и сооружений различного назначения (например, панель покрытия, стеновая панель и другие).

EXTERNALLY PRESSURIZED SEAL = ВНЕШНЕ ЗАПРЕССОВАННОЕ УПЛОТНЕНИЕ – Externally Pressurized Seal is a seal that has pressure acting on the seal parts from an external independent source of supply.

EXTERNAL RESOURCE = ВНЕШНИЙ РЕСУРС – External Resource (in electricity) is a resource located outside metered PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC) boundaries in the United States. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

EXTERNAL VALUE = ВНЕШНЯЯ ОЦЕНКА (или ПОСТОРОННЯЯ ОЦЕНКА) – The External Value of a currency is mirrored in exchange rate movements. It is indexed against a number of currencies, i.e. the geometric mean of foreign currency indices weighted to reflect the export or foreign trade quota of the respective countries. A comparison of index levels on different reference dates shows the extent of any change in the external value of a given currency vis-à-vis the other currencies in its group. The change in real external value can be determined by adjusting exchange rates for the corresponding consumer or producer price indices. / , то есть . виз-а-ви (vis-à-vis).

EXTINCT = ВЫМЕРШЕЕ (или ИСЧЕЗНУВШЕЕ, или ЭКСТИНКТ) – Extinct:- of a species which has completely died out. Species can also become 'extinct in the wild' but persist in botanical or other collections. / Под Экстинкцией, от Латинского слова Exstinctio, означающее Гашение, понимается .

EXTINCTION = ЭКСТИНКЦИЯ (или ВЫМИРАНИЕ) – Extinction is the process leading to complete loss of a species. / Под Экстинкцией, от Латинского слова Exstinctio, означающее Гашение, понимается видов (species).

EXTRA = ЭКСТРА – The short form of Extra Dividend. A dividend in the form of stock or cash in addition to the regular or usual dividend the company has been paying. / Под Экстра, от Латинского слова Extra, означающее Вне или Сверх, понимается часть сложных слов, означающая:- вне, дополнительно, сверх. В индустрии ценных бумаг под этим словом понимается сокращение или краткая форма для термина 'Экстра Дивиденд' или 'Дополнительный Дивиденд' (Extra Dividend). Дивиденд в форме акций или денежных средств, выплачиваемый компанией в дополнение к регулярному или обычному дивиденду.

EXTRA CHARGES = ЭКСТРА СБОРЫ (или СВЕРХСБОРЫ) – Extra Charges are the expenses incurred in connection with a claim under a policy.

EXTRACHROMOSOMAL INHERITANCE = ВНЕХРОМОСОМНАЯ НАСЛЕДСТВЕННОСТЬ (или ЭКСТРАХРОМОСОМНАЯ НАСЛЕДСТВЕННОСТЬ) – Extrachromosomal Inheritance is the transmission of hereditary characters through components in the cytoplasm rather than by chromosomes. Known as Extrachromosomal Inheritance, plastid inheritance and non-Mendelian inheritance. / свойства (characters) .

EXTRA CONTRACTUAL OBLIGATIONS = СВЕРХ КОНТРАКТНЫЕ ОБЯЗАТЕЛЬСТВА – In reinsurance, Extra Contractual Obligations (ECOs) is a generic term that, when used in reinsurance agreements, refers to damages awarded by a court against an insurer which are outside the provisions of the insurance policy, due to the insurer's bad faith, fraud, or gross negligence in the handling of a claim. Examples are punitive damages and losses in excess of policy limits.

EXTRACTABLES = ЭКСТРАГИРУЕМЫЕ – Extractables:- the materials that can be removed from textiles by means of a solvent (in many cases, water).

EXTRACTION = ЭКСТРАКЦИЯ – Extraction is a removal of one substance from another, often accomplished by means of a solvent. / Под Экстракцией, от Латинского слова Extraho, означающее Вытягиваю или Извлекаю, понимается извлечение одного или нескольких компонентов раствора путём перевода их в не смешивающуюся с этим раствором другую жидкость (экстрагент). Обратный процесс – реэкстракция. Разделение фаз после экстракции производят отстаиванием, центрифугированием, кристаллизацией и так далее. Применяется в гидрометаллургии, при получении фармацевтических препаратов, пищевых и химических продуктов.

EXTRACTION LOSS = ПОТЕРИ ПРИ ЭКСТРАКЦИИ (или ПОТЕРИ ПРИ ИЗВЛЕЧЕНИИ, или ЗА ВЫЧЕТОМ ПРОДУКТОВ ЭКСТРАКЦИИ) – Extraction Loss is the reduction in the volume of natural gas available for disposition resulting from the removal of natural gas liquid constituents at natural gas processing plants. It represents that portion of the 'raw' gas stream that is transferred from the natural gas supply chain to the petroleum and natural gas liquids supply chain. Extraction loss does not include the reduction in volume resulting from the removal of nonhydrocarbon constituents or gas used as fuel, vented, flared, or otherwise disposed of within natural gas processing plants. Extraction loss also results in a reduction in the total heat (Btu) content of the natural gas stream equal to the heat content of the liquids extracted. The reduction in volume of natural gas due to the removal of natural gas liquid constituents, such as butane, ethane, and propane, at natural gas processing plants. / Снижение объёма природного газа в связи с извлечением или отбором из него жидких фракций, таких как бутан, пропан и этан на газоперерабатывающих заводах.

EXTRACTIVE METALLURGY = ЭКСТРАКТИВНАЯ МЕТАЛЛУРГИЯ (или МЕТАЛЛУРГИЧЕСКОЕ ИЗВЛЕЧЕНИЕ) – Extractive Metallurgy:- following separation and concentration by mineral processing, metallic minerals are subjected to extractive metallurgy, in which their metallic elements are extracted from chemical compound form and refined of impurities. Metallic compounds are frequently

rather complex mixtures (those treated commercially are for the most part sulfides, oxides, carbonates, arsenides, or silicates), and they are not often types that permit extraction of the metal by simple, economical processes. Consequently, before extractive metallurgy can effect the separation of metallic elements from the other constituents of a compound, it must often convert the compound into a type that can be more readily treated. Common practice is to convert metallic sulfides to oxides, sulfates, or chlorides; oxides to sulfates or chlorides; and carbonates to oxides. The processes that accomplish all this can be categorized as either pyrometallurgy or hydrometallurgy. Pyrometallurgy involves heating operations such as roasting, in which compounds are converted at temperatures just below their melting points, and smelting, in which all the constituents of an ore or concentrate are completely melted and separated into two liquid layers, one containing the valuable metals and the other the waste rock. Hydrometallurgy consists of such operations as leaching, in which metallic compounds are selectively dissolved from an ore by an aqueous solvent, and electrowinning, in which metallic ions are deposited onto an electrode by an electric current passed through the solution. Extraction is often followed by refining, in which the level of impurities is brought lower or controlled by pyrometallurgical, electrolytic, or chemical means. Pyrometallurgical refining usually consists of the oxidizing of impurities in a high-temperature liquid bath. Electrolysis is the dissolving of metal from one electrode of an electrolytic cell and its deposition in a purer form onto the other electrode. Chemical refining involves either the condensation of metal from a vapour or the selective precipitation of metal from an aqueous solution. The processes to be used in extraction and refining are selected to fit into an overall pattern, with the product from the first process becoming the feed material of the second process, and so on. It is quite common for hydrometallurgical, pyrometallurgical, and electrolytic processes to be used one after another in the treatment of a single metal. The choices depend on several conditions. One of these is that certain types of metallic compounds lend themselves to easiest extraction by certain methods; for example, oxides and sulfates are readily dissolved in leach solutions, while sulfides are only slightly soluble. Another condition is the degree of purity, which can vary from one type of extraction to another. Zinc production illustrates this, in that zinc metal produced by pyrometallurgical retort or blast-furnace operations is 98 percent pure, with traces of lead, iron, and cadmium. This is adequate for galvanizing, but the preferred purity for die-casting (99.99 percent) must be obtained hydrometallurgically, from the electrolysis of a zinc sulfate solution. Also to be considered in choosing a processing method is the recovery of particular impurities that may have value themselves as by-products. One example is copper refining:- the pyrometallurgical refining of blister copper removes many impurities, but it does not recover or remove silver or gold; the precious metals are recovered, however, by subsequent electrolytic refining. / металлургическое извлечение (extractive metallurgy) металлов из руд. пирометаллургия (pyrometallurgy) или гидрометаллургия (hydrometallurgy). Электролитическое рафинирование (electrolytic refining). Плавка или Выплавка или Плавление (Smelting). литьё или отливка (casting). Литьё Под Давлением или Кокильное Литьё или Кокильная Отливка (Die-Casting). Металлургическое Извлечение металлов из руд.

EXTRACTOR = ЭКСТРАКТОР – In the cotton gin, Extractor is an equipment for removing large trash pieces (sticks, stems, burs, and leaves). The equipment may include one or more devices, including a stick machine, bur machine, green-leaf machine, and a combination machine. / Оборудование на хлопкоочистительном предприятии для удаления крупных частиц сора (черешков (sticks), стеблей (stems), створок коробочек (burs или burrs) и листьев (leaves)). Под Экстрактором понимается аппарат для проведения экстракции, промывки экстракта и реэкстракции. Основными типами экстракторов являются:- смеситель-отстойник, колонный экстрактор (пульсационного или вибрационного типа), центробежный экстрактор.

EXTRACTOR–FEEDER = ЭКСТРАКТОР–ПИТАТЕЛЬ – In the cotton gin, Extractor-Feeder is a device that gives seed cotton a final light extraction/cleaning and then feeds it at a controlled rate to the gin stand.

EXTRACT PRINTING = ПЕЧАТАНИЕ ЭКСТРАКТОМ – Extract Printing or Discharge Printing:- used to obtain medium-to-dark colored fabrics with white or colored motifs. The cloth is first piece dyed and color is then discharged or bleached out in certain areas leaving them white. The cloth is then direct-printed and some or all of the white areas are colored to provide the finished effect. Piece dyed is mentioned above .... Piece dyeing is the dyeing of fabric in the cut, bolt or piece form. It follows the weaving of the goods and provides a single color for the material. See also Discharge Printing, Printing, Resist Printing, and Roller Printing. Discharge Printing, also called Extract Printing, is a method of applying a design to dyed fabric by printing a color-destroying agent, such as chlorine or hydrosulfite, to bleach out a white or light pattern on the darker colored ground. In color-discharge printing, a dye impervious to the bleaching agent is combined with it, producing a colored design instead of white on the dyed ground.

EXTRA DIVIDEND = ЭКСТРА ДИВИДЕНД (или ДОПОЛНИТЕЛЬНЫЙ ДИВИДЕНД) – Extra Dividend is a special dividend distribution made by a company in addition to its regular dividend. / Экстра Дивиденд – дивиденд, выплачиваемый наличными или акциями в дополнение к основному дивиденду.

EXTRA LEMMA = ЭКСТРА (НИЖНЯЯ) ЦВЕТКОВАЯ ЧЕШУЯ – Extra Lemma (lmx):- spikelets have an extra glume between the fertile lemma and the sterile lemma; synonymous with polyhusk.

EXTRA LOADER = ДОПОЛНИТЕЛЬНЫЙ ЗАГРУЗЧИК – Extra Loader is an additional vessel brought into schedule to cope with exceptionally strong market conditions. Additional vessel brought into schedule to cater for, e.g., seasonal fluctuations. / , например, сезонные флуктуации (колебания).

EXTRA LONG STAPLE COTTON = ЭСТРА ДЛИННОВОЛОКНИСТЫЙ ХЛОПЧАТНИК (или ЭКСТРА ДЛИННОШТАПЕЛЬКОВЫЙ ХЛОПЧАТНИК, или ХЛОПЧАТНИК СО СВЕРХДЛИННЫМ ШТАПЕЛЬКОМ) – Extra Long Staple (ELS) Cotton means any of the following Varieties of Cotton which is produced in the United States and is ginned on a roller gin:- (1) American-Pima; (2) All other Varieties of the Barbadense Species of Cotton, and any hybrid thereof; and (3) Any other Variety of Cotton in which one or more of these Varieties predominate. Extra Long Staple (ELS) Cottons having a staple length of 1-3/8 inches or more, according to the classification used by the International Cotton Advisory Committee. Also characterized by fineness and high fiber strength, contributing to finer and stronger yarns, needed for certain and-uses such as thread and high-valued fabrics. American growths include American Pima and, formerly, Sea Island Cotton. Extra-Long Staple (ELS) Cotton (in 1958/59):- Cottons having a staple length of 1-3/8 inches (35 mm) or over are defined as Extra-Long Staples according to the classification used by the International Cotton Advisory Committee (ICAC). These Cottons comprise only about 6.5 percent of the production of Cotton in the non-communist world, but are highly important in the economies of the limited number of areas in which they are produced. The Extra-Long Staple Cottons also are an important raw material in the textile industries of several countries where they are made into cotton goods of the highest quality. Production Of Cotton In Non-Communist World By Staple Lengths, 1958/59 (Staple Length – Production):- (i) Extra-Long, 1-3/8” and longer – 1.9 million bales (or 6.5 percent); (ii) Long, 1-1/8” and longer but less than 1-3/8” – 2.8 million bales (or 9.6 percent); (iii) Medium, 3/ 4” and longer but less than 1-1/8” – 23.6 million bales (or 80.5 percent); and (iv) Short, Under 3/4” – 1.0 million bales (or 3.4 percent); Total:- 29.3 million bales (or 100.0 percent). Characteristics:- Extra-Long Staple Cottons are characterized not only by their length of fiber but also by fineness and high fiber strength which makes possible finer and stronger yarns that can be spun from shorter staples Cottons, although the advantage in strength diminishes as the yarn becomes coarser. The inherent fiber strength of as high as 50 tons per square inch is higher than for any other Cotton, which is im portant if strength is needed in the end product. The long staple length also makes possible textiles of smoother finish than can be made of other Cottons. It

will be noted that some Cotton of the Lambert variety in the Sudan may fall below the lower limit for extra-long staples but is included in this group for convenience. Growing Conditions:- ELS varieties, with the exception of Sea Island, are grown under irrigation. All require a relatively long growing season and, except in the USSR, are usually roller ginned, a much slower process that saw ginning which is used widely for medium staples. Extra-Long Staple Cotton is highly important commodity to the economies of Egypt and Sudan, is a specialized product. They produce ninety per cent of all the world supply of this variety. In a lesser degree this is also true of Peru. These three countries export most of their Cotton crops. Only the United States, the smallest in production among the four extra-long staple growing nations, consumes the bulk of its own domestic crop and imports more foreign cotton of this variety than grown at home. Extra-long staple cotton is a minor product in the United States compared to the production of the other countries growing this variety. End Uses Of Extra-Long Staple Cotton:- Belgium:- principal uses are sewing thread, poplins, voile, bed sheets, covering for electric cables, and sometimes knitted goods and hosiety. The yarn count range is 36s to 80s. France:- principal uses are fine woven and knitted goods, undergarments, lingerie, voiles, lace, sewing thread, knitting yarn, plain velvets, trimmings and elastic fabrics. Yarn counts are mostly above 60s but for some uses above 50s. Germany:- generally speacing, extra-long staples are spun into yarns varying from 40s to 250s with the bulk centered around 85s, 100s and above. Such yarns are manufactured into high quality goods, expecially fine woven fabrics, fine knitted fabrics, sewing thread and fishing nets. India:- extra-long staples are spun into yarns of 60s and above. Principal end-uses are superfine cloths such as voiles, mulls, dhoties, sarees, handkerchiefs, superior poplins, fancy leno cloth, lawns, cambric, etc. Italy:- principal uses are sewing threads, laces, gloves, quality fabrics for shirts and dresses. Yarn counts are mainly from 30s to 120s. Japan:- yarn counts are generally used for 65s count and higher. Principal end-uses are high grade broadcloth, lawn, high grade sewing thread, voile (including organdy), lacing thread, embroidery yarn, and women's gloves. Spain:- principal uses are sewing thread, umbrella fabrics, certain types of velvets and ribbons, organdies, veils, batistes and poplins of high quality, for mixing with reworked wool, and certain industrial textiles. Switzerland:- 60s to 80s are normally spun from extra-long staples and the principal uses are mousselines, voiles, poplins, marquesettes (for shirts, blouses, printed cloth for ladies' dresses, handkerchiefs, curtains and embroideries). United Arab Republic Egypt:- extra-long staples are spun mainly into combed yarns of 80s to 100s count used in fine poplins, shirts, organdy, muslin, ladies frocks, fine handkerchiefs, sewing thread, fine hosiery and rain coats. United Kingdom:- among principal end-uses are lace, muslin, organdy, two-fold poplins, 'air-proof and water-proof' cloths, umbrella cloth, typewriter ribbons, fine lisle stockings, gabardines, gloves, insulation for fine wiring, sewing threads, men's and women's underwear and embroidery yarns. The finest yarn, very rarely produced now, is used for lace (300s–400s) and the coarsest, also rarely produced, for embroidery (3s, 5s, 9s). The coarsest yarn produced in any quantity is 30s probably for hosiery, but the bulk is probably between 50s and 100s. United States:- generally, extra-long staple cotton is spun into yarns of 60s and finer unless some particular use, such as sewing thread yarns, requires unusual strength or appearance in which case coarser numbers may be spun. Probably the largest single end-use is sewing thread including thread for use on high speed machines used in shoe making, manufacture of leather goods, etc. A large part of the extra-long staple cotton is made into sales yarn, which is made into shoe laces, broadcloths, lawns, organdies, voiles, twills, sateens, handkerchief fabrics, balloon fabrics, airplane fabrics, and typewriter ribbons. Also, specialty yarns for lace, tricot knitting, parachute webbing and insulation for fine electrical wiring. Union of Soviet Socialist Republics:- extra-long staple cotton is used for spinning yarn counts of 50s and up and principally in the manufacture of fine cotton cloth, sewing thread, hosiery and knitted fabrics. This type of Cotton also is used for spinning medium counts used for manufacture of technical textiles of extra strength. See also American-Egyptian Cotton, Extra Long Staple Cotton, Pima Cotton, Supima®, and Upland Cotton. Extra-Long Staple (ELS) Cotton has been grown in the Southwest United States since the early-1900's, but it wasn't until mid-century that much attention was given to the new Cotton. The real breakthrough came in 1951 when a seed was developed and introduced that produced an ELS Cotton with superior fiber properties, luster and silkiness ... as well as an unusually high yield. Subsequent Variety releases in the 1970's, 80s and 90's included Pima S-5, S-6 and S-7, all of which boasted higher yields and better spinning characteristics. The name 'Pima' was applied to ELS Cotton (previously called American-Egyptian) being developed in the US desert southwest in the early 1900's. The name was given in honor of the Pima Indians who were helping to raise the ELS Cotton on the USDA experimental farm in Sacaton, Arizona. Although South America is the center of origin of the species Gossypium barbadense, to which ELS Cottons belong, these cottons were photoperiodic, and the fiber was medium staple in length and coarse, as typified by the current Tanguis Cottons of Peru. The origin of true extra-long staple (ELS) Cottons can be traced to the introduction of Sea Island to the US in 1786 from seed received from the Bahama Islands, an area from which Columbus is reputed to have taken Sea Island samples to Europe in 1492. The Gossypium Barbadense Cotton that first appeared in the US in 1786, where it became known as Sea Island, had strikingly different fiber properties from the native Gossypium Barbadense of South America. The exact origin of Sea Island Cotton is unknown, but geneticists suggest that the most logical hypothesis to explain the ELS type was that it developed by transgressive inheritance through the introgression of length genes from outside the species, possibly from Gossypium Hirsutum. The first successful crop of Sea Island was produced by William Elliott on Hilton Head Island, South Carolina in 1790. Although production of this ELS cotton later expanded into the interior regions of Georgia and Florida, the best Sea Island cottons were grown on the Sea Islands; James, Edisto, John and Wadmalaw. The crop continued until 1920, when a severe boll weevil infestation had made it unprofitable. Attempts to revive the Sea Island industry in the US in the 1930's failed. The evolution of ELS Cottons began in 1825 when Sea Island Cotton was brought into Egypt and crossed with a tree cotton named Jumel. The crossing of Jumel and Sea Island resulted in the development of Ashmouni in about 1860. The next several Egyptian cultivars were derived either by selecting within Ashmouni or from crosses of Ashmouni and Sea Island. The successful utilization of inbreeding between the years 1910 and 1940 led to the gradual development of Egyptian cottons that could compete with the quality of Sea Island. viii (It's important to note here that during the development of these later Cottons, no germplasm from outside Egypt was used.) The first ELS cultivar released by the USDA was 'Yuma' in 1908. It was selected from Mitafifi, an Egyptian cultivar developed in 1887 from a cross of Ashmouni and Sea Island, and was introduced into the southwestern US in about 1900. The first commercial ELS crop in the US was produced in 1912 – 375 bales. Between 1908 and 1949, four additional Pima varieties were developed from the Egyptian germplasm base and released:- 'Pima', 'SXP', 'Amsak' and 'Pima 32'. At about the same time 'Yuma' was being developed, the Egyptian variety Mitafifi was introduced into Peru. The same source traces the arrival of American Pima Cotton seed into Peru to 1923. However, a Peruvian Cotton information sheet distributed by the Junta Nacional Del Algodon (National Cotton Association) says Peruvian Pima originated from the 'Yuma' Cotton developed in Sacaton, Arizona, and was first grown in Peru in 1918. Dr. Carl V. Feaster, a longtime Pima breeder and geneticist, and known around the world as the father of modern-day Pima Cottons, says he doubts the first Peruvian Pimas were actually Yuma, but more than likely were Pima, which was grown in the US from 1918–41. He said Pima was a selection from 'Yuma' and its fiber characteristics more closely match those of Peruvian Pima's at the time. By 1930, Pima production had reached 28 307 bales in Peru, while the production of Mitafifi was quickly diminishing, soon to be all but extinct. Gossypium Hirsutum – or Upland Cotton – can be classified into four major types; Acala, Delta, Plains and Eastern. Acala types in the United States are confined to irrigated regions in the South-West and far west. These Varieties produce the longest staple cotton among the domestic upland styles, and their growing seasons most closely resemble that of American Pima varieties. Yields in these areas are higher than those generated from upland cotton produced in southern, mid-south and eastern states because of the longer growing season, greater number of hot days and close control of irrigation. Because of the longer growing season and higher yields, however, these crops are more expensive to produce. Cotton

varieties are developed to suit specific growing regions and their respective environmental and cultural conditions, with the objective of maximizing yield potential and improving fiber characteristics. The same applies somewhat more loosely to the individual cotton species, which are limited to Pima (Gossypium Barbadense) and upland (Gossypium Hirsutum). The only other native cotton species – Asiatic (Gossypium Arboreum) – is grown almost exclusively in Southeast Asia. SuPima® was formed in 1954 in El Paso, Texas. In its early years SuPima® was primarily concerned with promotion, government regulations and agricultural research. In an effort to keep pace with the expanding interest worldwide in ELS Cotton, SuPima® broadened its responsibilities in 1978 when it merged with the Arizona Cotton Planting Seed Distributors, essentially overseeing the production and distribution of all certified American Pima planting seed. However, the division was sold to Delta and Pine Land Company in 1993 when commercial seed companies had entered the business. The sale also marked the end of Supima's 30-year-old partnership with the USDA in its Arizona-based Pima Improvement Program. SuPima® had provided funding for the program designed to develop new and improved seed varieties. Revenues from the seed division also was used to help finance ginning research and improved production practices. SuPima® is represented by a board of directors composed of 11 Pima Cotton producers:- seven from California, two from Texas and one each from Arizona and New Mexico. Directors are elected by the general membership to three-year terms and are eligible for re-election. Board officers are elected to two-year terms by the directors as follows; chairman, vice-chairman and secretary-treasurer. The offices of president and executive vice president are full-time staff positions. / Вилъйэм Элыэт (William Elliott). Дьжеймз (James), Эдисто (Edisto), Дьжон (John) и Водмэло (Wadmalaw). Дьжумэл (Jumel). Ашмуни (Ashmouni). Эс.Экс.Пи. ('SXP'), Эмсэк ('Amsak'). Доктор Карл Ви. Фистё (Dr. Carl V. Feaster). Акала (или Экала; Acala), Дэлтэ (Delta), Плэйнз (Plains). Пима (Pima). Дэлтэ Энд Пайн Лэнд Кампэни (Delta and Pine Land Company). СуПима® (SuPima®). Под Хлопчатником со Сверхдлинным Штапельком, согласно классификации, используемой Международным Совещательным Комитетом по Хлопку (МСКХ (ICAC)), понимается Хлопчатник, имеющий штапельную длину волокна в 1-3/8 дюймов и более. Он также характеризуется повышенными значениями тонины и прочности волокна, идёт на производство более тонких и прочных пряж, необходимых для определённых конечных продуктов, таких как швейные нитки или дорогостоящие ткани. К Американским разновидностям такого Хлопчатника относятся селекционные сорта Американского Пима (Pima), известного ранее как Хлопчатник с Морских Островов (Sea Island Cotton).

EXTRANEOUS MATERIAL = ПОСТОРОННИЕ ПРИМЕСИ (или ПОСТОРОННИЙ МАТЕРИАЛ) – Extraneous Material:- in the Canadian grain industry, can be defined as glass, metal, plastic, wood or any other material not already defined in the Canadian Official Grain Grading Guide. / В Канадской зерновой индустрии, к ней могут относиться частицы дерева, металла, пластика, стекла или иного материала, не определённого на данный момент в Канадском Официальном Справочнике по Сортировке Зерна (Canadian Official Grain Grading Guide).

EXTRAORDINARY ITEMS = РЕЗУЛЬТАТЫ ЧРЕЗВЫЧАЙНЫХ ОБСТОЯТЕЛЬСТВ (или ЭКСТРАОРДИНАРНЫЕ СТРОКИ БАЛАНСА, или СВЕРХНЕОБЫЧНЫЕ ИЗДЕЛИЯ, или ЧРЕЗВЫЧАЙНЫЙ ВОПРОС) – Extraordinary Items:- in accounting in the United States, one that is both unusual in nature and infrequent in occurrence. Extraordinary gains and losses are presented Net of Tax separately in the income statement. They appear between Income from Discontinued Operations and cumulative effect of a Change in Accounting Principle. Examples of extraordinary items are casualty losses, losses from expropriation of assets by a foreign government, gain on life insurance, gain or loss on the early extinguishment of debt, gain on troubled debt restructuring, and write-off of an intangible asset. Write-down and write-off of receivables and inventory are not extraordinary because they relate to normal business operational activities. They would be considered extraordinary, however, if they resulted from an Act of God (e.g., casualty loss arising from an earthquake) or governmental expropriation. Gains or losses included in a company's financial statements, which are infrequent and unusual in nature. These are usually explained further in the 'notes to the financial statements'. These are the result of unforeseen and atypical events. They are usually accounted for separately so they don't skew the company's regular earnings. An example would be a snowstorm in Hawaii creating extraordinary losses to banana crops. These losses might be written down as a one-time charge due to an extraordinary item. Items derived from very rare events or transactions that are distinct from the ordinary activities of the business and which are not expected to recur frequently or regularly. They are shown separately in the Statement of Financial Performance. / Доходы и расходы, являющиеся результатом очень редких событий или операций, чётко отличимых от обычной деятельности предприятия, частого или повторяющегося появления которых в этой связи не ожидается. Они указываются отдельно в Отчёте о Финансовой Деятельности. Под Экстраординароными, от Латинского слова Extraordinarius, от Extra, означающее Вне, и Ordo, означающее Порядок или Ряд, понимается чрезвычайный, исключительный, из ряда вон выходящий.

EXTRAPOLATION = ЭКСТРАПОЛЯЦИЯ – Extrapolation:- in statistics, estimating a law, a function or a value beyond the calculated or observed range. Extrapolation is used in economic forecasting to estimate the direction and magnitude of changes in certain events which cannot be directly estimated by a chain of events. Extrapolation is relatively inaccurate insofar as it relies on estimates derived from trend projections, and is used only in the absence of a more reliable technique. / В статистике под Экстраполяцией, от Латинских слов Extra, означающее Вне, и Polio, означающее Выправляю или Изменяю или Приглаживаю, понимается распространение установленных в прошлом тенденций на будущий период (экстраполяция во времени применяется для перспективных расчётов населения); распространение выборочных данных на другую часть совокупности, не подвергнутую наблюдению (экстраполяция в пространстве). Методы экстраполяции во многих случаях сходны с методами интерполяции. Экстраполяция – определение будущих, ожидаемых значений экономических величин, показателей на основе имеющихся данных об их изменении в прошлые периоды; перенесение прошлого в будущее, исходя из выявленных в прошлом тенденций изменения. Математически экстраполяция сводится к продолжению кривой, характеризующей предыдущее изменение экономического показателя.

EXTRAPOLATION AREA = АРЕАЛ ЭКСТРАПОЛЯЦИИ – Extrapolation Area is the domain of possible adaptation of a cropping pattern. It is composed of land types and other physical factors, to which the cropping pattern is adapted. / Под Экстраполяцией, от Латинских слов Extra, означающее Вне или Сверх, и Polio, означающее Выправляю или Изменяю или Приглаживаю, понимается:- распространение выводов, полученных из наблюдения над одной частью явления на другую его часть.

EXTREME PRESSURE ADDITIVE = ПРИСАДКА ДЛЯ СВЕРХВЫСОКОГО ДАВЛЕНИЯ – Extreme Pressure (EP) Additive is a lubricant additive that prevents sliding metal surfaces from seizing under conditions of extreme pressure. At the high local temperatures associated with metal-to-metal contact, an EP additive combines chemically with the metal to form a surface film that prevents the welding of opposing asperities, and the consequent scoring that is destructive to sliding surfaces under high loads. Reactive compounds of sulfur, chlorine, or phosphorus are used to form these inorganic films. See also Additive. Extreme Pressure (EP) refers to the additive used in gear oils. This additive is designed to stop metal-to-metal contact taking place between transmission components. The EP additives are usually based on sulphur and phosphorous. These elements bond to the metal surfaces where there are points of extreme pressure and temperature, forming a sacrificial chemical layer. The sulphur gives gear oils their characteristic smell. / относится к присадке, используемой в передаточных маслах.

EXTREME VARIATIONS IN THICKNESS = ЭКСТРЕМАЛЬНЫЕ ВАРИАЦИИ ПО ТОЛЩИНЕ – Extreme Variations In Thickness:- button functionally satisfactory but will probably cause a problem if automatic button feed is used. Closure defects, and namely – Pearl and Plastic Buttons. / Порок или дефект застёжки.

EXTRINSIC VALUE = ВНЕШНЯЯ ЦЕННОСТЬ – Extrinsic Value is that portion of an option's premium that exceeds its intrinsic value. The extrinsic value of an option reflects the probability that the option will move into-the-money. By other words, the extrinsic value of an option reflects the probability that the price of the underlying futures contract will change to a level at which it is profitable for the holder to exercise the option. Therefore, the longer the time remaining until expiration of the option, the greater its extrinsic value. Also known as Time Value. See also Intrinsic Value. Extrinsic Value is an amount by which an option premium exceeds the option's intrinsic value. If an option has no intrinsic value, its premium is entirely extrinsic value. / Внешняя Ценность:- та часть премии за опцион, на которую она превышает свою внутреннюю ценность. Внешняя ценность опциона отражает вероятность того, что опцион будет двигаться в сторону своей прибыльности для держателя данного опциона. Другими словами, внешняя ценность опциона отражает вероятность того, что цена соответствующего фьючерсному контракту инструмента будет изменяться до уровня, при котором она станет прибыльной для исполнения данного опциона его держателем. Исходя из этого, чем больше времени остаётся до прекращения признания опциона, тем выше его внешняя ценность. Известна также как Временная Ценность (Time Value). Смотрите также Внутреннюю Ценность (Intrinsic Value).

EXTRUDED = ВЫДАВЛИВАЕМОЕ (или ВЫДАВЛЕННОЕ) – Extruded:- a process by which feed has been pressed, pushed, or protruded through orifices under pressure.

EXTRUDER = ЭКСТРУДЕР – (1) Extruder:- generally a machine in which molten or semisoft materials are forced under pressure through a die to form continuous tubes, sheets, or fibers. It may consist of a barrel, heating elements, a screw, ram or plunger, and a die through which the material is pushed to give it shape. / Под Экструдером, от Латинского слова Extrudo, означающее Выталкиваю, понимается машина, предназначенная для размягчения (плавления, пластикации) полимерных материалов и придания им нужной формы путём продавливания через головку с профилирующим каналом (в резиновой промышленности экструдер часто называют Шприц-Машиной). Наиболее распространён червячный экструдер, рабочим органом которого служит вращающийся червяк (шнек). С помощью экструдера могут быть осуществлены многие операции:- гранулирование; получение плёнок и их дублирование; изготовление листовых и рулонных материалов, например, материалов для покрытий полов; производство труб, шлангов, прутков и других профильных изделий; наложение изоляции на металлические провода и кабели; нанесение тонкослойных покрытий на бумагу, картон, ткани, фольгу; смешение полимеров с ингредиентами. Процесс переработки полимерных материалов в экструдере называется Экструзией. Под Экструдером, понимается машина для размягчения (пластикации) материалов и придания им формы путём продавливания через профилирующий инструмент (так называемую Экструзионную Головку), сечение которого соответствует конфигурации изделия. Процесс переработки материалов в экструдере называется Экструзией. В экструдере получают главным образом изделия из термопластичных полимерных материалов (смотрите Пластические Массы), используют их также для переработки резиновых смесей (в этом случае экструдер часто называют Шприц-Машиной). С помощью экструдера изготовляют плёнки, листы, трубы, шланги, изделия сложного профиля и другое, наносят тонкослойные покрытия на бумагу, картон, ткань, фольгу, а также изоляцию на провода и кабели. Экструдеры применяют, кроме того, для получения гранул, подготовки композиций для каландрирования, формования металлических изделий (об этом процессе смотрите в статье Прессование Металлов, Порошковая Металлургия) и других целей. Экструдер состоит из нескольких основных узлов:- корпуса, оснащённого нагревательными элементами; рабочего органа (шнека, диска, поршня), размещённого в корпусе; узла загрузки перерабатываемого материала; силового привода; системы задания и поддержания температурного режима, других контрольно-измерительных и регулирующих устройств. По типу основного рабочего органа (органов) экструдеры подразделяют на одно- или многошнековые (червячные), дисковые, поршневые (плунжерные) и другие. Первые экструдеры были созданы в XIX веке в Великобритании, Германии и США для нанесения гуттаперчевой изоляции на электрические провода. В начале XX века было освоено серийное производство экструдеров. Примерно с 1930 экструдеры стали применять для переработки пластмасс; в 1935–37 паровой обогрев корпуса заменили электрическим; в 1937–39 появились экструдеры с увеличенной длиной шнека (прототип современного экструдера), был сконструирован первый двухшнековый экструдер. В начале 1960-х были созданы первые дисковые экструдеры. Наибольшее распространение в промышленности получили шнековые (червячные) экструдеры. Захватывая исходный материал (гранулы, порошок, ленту и другой) из загрузочного устройства, шнек перемещает его вдоль корпуса. При этом материал сжимается (давление в экструдере достигает 15–50 МегаНьютонов на квадратный метр (МН/м^2) (150–500 килограмм-силы на квадратный сантиметр (кгс/см^2)), разогревается, пластицируется и гомогенизируется. По частоте вращения шнека экструдеры подразделяются на нормальные (окружная скорость до 0.5 метров в минуту (м/мин)) и быстроходные (до 7 м/мин); по конструктивному исполнению – на стационарные и с вращающимся корпусом, с горизонтальным или вертикальным расположением шнека. Существуют экструдеры со шнеками, осуществляющими не только вращательное, но и возвратно-поступательное движение. Для эффективной гомогенизации материала на шнеках устанавливают дополнительные устройства (зубья, шлицы, диски, кулачки и так далее). Получают распространение планетарно-вальцевые экструдеры, у которых вокруг центрального рабочего органа (шпинделя) вращается несколько (4–12) дополнительных шнеков. Принцип действия дискового экструдера основан на использовании возникающих в упруго-вязком материале напряжений, нормальных к сдвиговым. Основу конструкции такого экструдера составляют 2 плоско-параллельных диска, один из которых вращается, создавая сдвиговые и нормальные напряжения, а другой неподвижен. В центре неподвижного диска имеется отверстие, через которое выдавливается размягчённый материал. Дисковые экструдеры обладают более высокой пластицирующей и гомогенизирующей способностью, чем шнековые, но развиваемое ими давление формования ниже. Поэтому используют их главным образом как смесители-грануляторы или для подготовки материала перед загрузкой в шнековый экструдер. Преимуществами дискового и шнекового экструдеров обладает комбинированный экструдер с независимыми приводами шнека и диска. Поршневой экструдер из-за низкой производительности используют ограниченно, в основном для изготовления труб и профилей из реактопластов (смотрите Штранг-Прессование Пластмасс). Экструзионная головка состоит из обогреваемого корпуса, который крепится к экструдеру, и формующего инструмента с отверстием, например, в виде сужающейся к центру щели (при получении листов, плёнок) или кольцевого канала (при изготовлении труб или других изделий круглого сечения). Современные экструдеры – автоматизированные установки, производительность которых достигает 3–3.5 тонны в час (т/ч). Доля термопластичных полимерных материалов, перерабатываемых в экструдерах, колеблется в разных странах в пределах 30–50%.

(2) In fiber manufacture, Extruder is the machine that feeds molten polymer to an extrusion manifold or that first melts the polymer in a uniform manner then feeds it to a manifold and associated equipment for extrusion. See also Screw Melter. / Экструзия или Выдавливание (Extrusion).

(3) The Extruder converts agricultural commodities, usually in a granular or powdered form, into fully cooked and formed, near finished, products through the action of shearing friction generated between the extruder screws and extruder barrel. Agricultural materials are processed at relatively low moisture contents and are easily dried to their final forms by frying, baking, gun-puffing, or drying. Extruder consists mainly of a preconditioner, a main drive unit, a barrel, one or two screws, and dies. Extruders are typically classified into two categories:- single-screw extruder and twin-screw extruder. Historically, single-screw extruders have been used extensively in the food industry. But, twin-screw extruders have gained popularity because of their versatility and other advantages over single-screw extruders. / В сельском хозяйстве под Экструдером понимается устройство для приготовления гранулированного корма для скота – карбамидного концентрата – из смеси дроблёного зерна, карбамида и бентонита натрия. Экструдер состоит из шнекового пресса, бункера с дозатором и электропривода. Исходная смесь загружается в бункер и поступает в пресс, в котором она перемешивается, уплотняется и нагревается. При этом происходит запаривание зерна, плавление карбамида и внедрение его в крахмал зерна. Производительность применявшихся в бывшем Союзе Советских Социалистических Республик (СССР) экструдеров КМЗ-2М до 500 килограммов в час (кг/ч).

EXTRUSION = ЭКСТРУЗИЯ (или ВЫДАВЛИВАНИЕ, или ВЫТАЛКИВАНИЕ) – Extrusion:- materials such as polystyrene, nylon, polypropylene and polythene can be used in a process called Extrusion. These are thermoplastics – this means when they are heated and then pressured in a mould they can be formed into different shapes and sections. A machine used to extrude materials is very similar to the injection moulding machine. A motor turns a thread which feeds granules of plastic through a heater. The granules melt into a liquid which is forced through a die, forming a long 'tube like' shape. The extrusion is then cooled and forms a solid shape. The shape of the die determines the shape of the tube. See also Extruder, and Spinning. / Найлан (Nylon). Экструзия или Выдавливание (Extrusion). Под Экструзией полимерных материалов, от позднеЛатинского слова Extrusio, означающее Выталкивание, понимается метод получения изделий из пластмасс и резиновых смесей в экструдере.

EXW = EX WORKS

EX WARRANTS = БЕЗ ВАРРАНТОВ – Ex Warrants (X-Warr or XW or X-W):- symbol indicating that a stock is trading ex-warrants, with no warrants attached. From Latin:- Ex (Out Of). Ex Warrants:- in bond and stock listings of newspapers. / Символ, указывающий на то, что акция торгуется без варрантов, то есть варранты к ней не приложены.

EX WORKS = ЭКС ЗАВОД (или ФРАНКО ЗАВОД) – 'Ex Works' (EXW), a term of INCOTERMS® 2000, means that the seller delivers when he places the goods at the disposal of the buyer at the seller's premises or another named place, i.e. factory, mill, works, warehouse, etc, not cleared for export and not loaded on any collecting vehicle. This term thus represents the minimum obligation for the seller, and the buyer has to bear all costs and risks involved in taking the goods from the seller's premises. However, if the parties wish the seller to be responsible for the loading of the goods on departure and to bear the risks and all the costs of such loading, this should be made clear by adding explicit wording to this effect in the contract of sale. This term should not be used when the buyer cannot carry out the export formalities directly or indirectly. In such circumstances, the FCA term should be used, provided the seller agrees that he will load at his cost and risk. Ex Works (EXW) at a named place or point of origin (examples are:- Ex Factory, Ex Mill, or Ex Warehouse). Under this term, the price quoted applies only at the point of origin and the seller agrees to place the goods at the disposal of the buyer at a specified place on the date or within the period fixed. All other charges are for the account of the buyer. EXW (insert named place of delivery) Incoterms® 2010:- this rule may be used irrespective of the mode of transport selected and may also be used where more than one mode of transport is employed. It is suitable for domestic trade, while FCA is usually more appropriate for international trade. 'Ex Works' means that the seller delivers when it places the goods at the disposal of the buyer at the seller's premises or at another named place, i.e. works, factory, warehouse, etc. The seller does not need to load the goods on any collecting vehicle, nor does it need to clear the goods for export, where such clearance is applicable. The parties are well advised to specify as clearly as possible the point within the named place of delivery, as the costs and risks to that point are for the account of the seller. The buyer bears all costs and risks involved in taking the goods from the agreed point, if any, at the named place of delivery. EXW represents the minimum obligation for the seller. The rule should be used with care as:- (a) The seller has no obligation to the buyer to load the goods, even though in practice the seller may be in a better position to do so. If the seller does load the goods, it does so at the buyer's risk and expense. In cases where the seller is in a better position to load the goods, FCA, which obliges the seller to do so at its own risk and expense, is usually more appropriate. (b) A buyer who buys from a seller on an EXW basis for export needs to be aware that the seller has an obligation to provide only such assistance as the buyer may require to effect that export: the seller is not bound to organize the export clearance. Buyers are therefore well advised not to use EXW if they cannot directly or indirectly obtain export clearance. (c) The buyer has limited obligations to provide to the seller any information regarding the export of the goods. However, the seller may need this information for, e.g., taxation or reporting purposes. From Latin:- Ex (Out Of). Ex Works (EXW) means that the price quoted applies to the point of origin, and the goods are made available to a buyer at a specific place, usually at a seller's place of business or warehouse. The buyer receives the cargo directly from the factory and thereafter arranges shipment, insurance and other related services themselves. / спецификационном месте . Экс, от Латинского слова Ex, означающее Из или От. В сделках купли-продажи (поставки) товара под Франко, от Итальянского слова Franco, означающее Свободный, понимается термин, обозначающий распределение транспортных расходов между продавцом и покупателем до места, указанного в договоре, например, Франко-Борт, Франко-Вагон, Франко-Склад Покупателя и тому подобное. ИНКОТЁРМЗ® 2000. Франко-Завод (EXW или Ex Works):- базисные условия поставки, при которых товар переходит в распоряжение покупателя уже на предприятии или складе поставщика. Ответственность за погрузку и далее вплоть до доставки товара в пункт назначения несёт покупатель.

EYELASH = РЕСНИЦА – Eyelash is a term used to describe clipped yarns that lie on the surface of a fabric, giving the effect of eyelashes.

EYELET = ГЛАЗОК (или ТКАНЬ ГЛАЗКОВОГО ПЕРЕПЛЕТЕНИЯ, или УШКО, или ПЕТЕЛЬКА, или ПРОУШИНА, или КНОПКА, или ЛЮВЕРС) – Eyelet is a type of fabric which contains patterned cut-outs, around which stitching or embroidery may be applied in order to prevent the fabric from raveling. Eyelet is a lightweight fabric perforated by small holes finished with stitching or embroidery around the edges to prevent unraveling, usually created in flowerlike designs. Eyelet is:- (1) a series of small holes made to receive a string or tape. A buttonhole stitch is worked around the holes. (2) A type of yarn guide used on a creel. (3) A fabric style with areas of cut-outs surrounded by stitching. / втачивание (stitching).

EYESHADE = ГЛАЗНАЯ ТЕНЬ (или ТЕНЬ ДЛЯ ВЕК) – Eyeshade is a visor that shields the eyes from strong light and is fastened on with a headband.

EZC = EUROPEAN ZONE CHARGE

- F -

F = ЭФ. – (1) F is fifth letter of a NASDAQ® stock symbol specifying that the issue is a foreign company. / Эф. (F) – пятая буква фондового символа НЭЗДЭК® (NASDAQ®), указывающая на то, что .

(2) The letter 'F' some times stands for Filament. Filament affects the handfeel of fabric. The higher number of filament the more expensive for fabric.

f = FEMTO = 10^{-15}

F = FERTILE

F = FILAMENT

F = FOXTROT

F&F = FURNITURE AND FIXTURES

F_1 = ЭФ.$_1$ (или ПЕРВОЕ ПОКОЛЕНИЕ) – F_1:- of progeny derived from a first generation cross between distinct individuals. F_1 – first filial generation. F_1 is an abbreviation for the first filial generation, usually the hybrid between two homozygous types. / Эф.$_1$:- о потомстве, полученном от первого поколения, скрещённого между различными особями на основании Закона Георга Менделя О Единообразии Гибридов Первого Поколения.

F_1 HYBRID = ГИБРИД ЭФ.$_1$ (или ГЕТЕРОЗИСНЫЙ ГИБРИД, или ГИБРИД ПЕРВОГО ПОКОЛЕНИЯ) – F_1 Hybrid denotes the first generation offspring from the mating of two parents.

F_2 = ЭФ.$_2$ (или ВТОРОЕ ПОКОЛЕНИЕ) – F_2:- of progeny from self fertile F_1 hybrids. F_2 – first filial generation. F_2 is the second filial generation obtained by self-fertilization of F_1 individuals. / Эф.$_2$:- о потомстве от самооплодотворяющихся гибридов Эф.$_1$ (F_1) на основании Закона Георга Менделя О Расщеплении Гибридов Второго Поколения.

F_2 POPULATION = ПОПУЛЯЦИЯ ЭФ.$_2$ – F_2 Population is the population of individuals present in the F_2 generation of a cross.

F_2 RATIO = СООТНОШЕНИЕ С ЭФ.$_2$ – F_2 Ratio is the segregation pattern of a character or characters in F_2 generation. / Сегрегация или Выделение или Зейгерование или Разделение По Крупности (Segregation) свойства (characters) .

F_2 SEED = СЕМЯ ЭФ.$_2$ – F_2 Seed is the second generation progeny from the mating of two parents.

F_3 = ЭФ$_3$ (или ТРЕТЬЕ ПОКОЛЕНИЕ) – F_3 is a progeny obtained by self-fertilizing F_2 individuals.

FA = FULVIC ACID

FAAS = FOREIGN AFFAIRS ADMINISTRATIVE SUPPORT

FAB = FEATURES, ADVANTAGES, BENEFITS

FABRIC = ТКАНЬ (или ПОЛОТНО) – Fabric is a planar textile structure produces by interlacing yarns, fibers, or filaments. See also Cloth, and Technical Cloth. Fabric is any cloth woven or knitted from fibers. Fabric is a textile product obtained by bonding, braiding, felting, fusing, knitting, or weaving of fibers. Fabric is synonymous with Cloth. Fabric is a cloth; material that resembles cloth. Fabric is a collective term applied to cloth no matter how constructed or manufactured and regardless of the kind of fiber from which made. / Текстильная Ткань – изделие, образованное в процессе ткацкого производства переплетением взаимно перпендикулярных нитей – продольных (основных) и поперечных (уточных). В некоторых случаях применяются дополнительные системы нитей, служащие для образования ворса, узоров и тому подобного. Наиболее распространённое текстильное изделие. Вырабатывается в виде полотен или штучных вещей (платки, скатерти и тому подобное). Текстильные ткани имеют малую толщину (обычно до 5 миллиметров (мм)), значительную ширину (как правило, до 1.5 метра (м), но иногда до 12 м), различную длину. Отрезки ткани, поступающие в торговлю и называемые Кусками, обычно имеют длину 20–40 м. Узкие ткани (шириной менее 0.4 м) называют Лентами. Классификация текстильных тканей может быть выполнена по следующим признакам:- волокнистому составу, назначению, а также способам выработки, отделки и расцветки. Текстильные ткани вырабатывают почти из всех видов текстильных волокон и текстильных нитей. В зависимости от отраслей текстильной промышленности и преобладающего волокнистого состава их подразделяют на хлопчатобумажные, льняные, шерстяные, шёлковые и другие. К шёлковым относят текстильные ткани из химических волокон и натурального шёлка. Выделяют текстильные ткани:- (i) однородные (из одного типа волокон или нитей либо с примесью не более 10% других видов); (ii) смешанные – из нитей, полученных из нескольких видов волокон; и (iii) неоднородные – в которых чередуются различные нити. По назначению текстильные ткани классифицируют на бытовые и технические. Примерно две трети от общего количества текстильных тканей составляют Бытовые; они подразделяются на одёжные (бельевые, платьевые, костюмные, платки и так далее), Декоративные (мебельные, портьерные и так далее) и Влаговпитывающие (полотенечные и салфеточные). В торговле, кроме того, в отдельные группы выделяют текстильные ткани, вырабатываемые в больших количествах, например, Бязь, Ситец, Сатин. Основную массу бытовых текстильных тканей составляют хлопчатобумажные ткани. Следующими по объёму производства являются шёлковые и льняные. Шерстяные текстильные ткани подразделяются на:- (i) камвольные (вырабатываются из тонкой и гладкой, так называемой гребенной пряжи) для пошива платьев, костюмов, пальто и тому подобного; (ii) тонкосуконные (из более толстой, так называемой аппаратной пряжи) – для пальто и костюмов; и (iii) грубосуконные (из самой грубой, толстой аппаратной пряжи) – для пальто, одеял и другого. Неотделанные Ткани (снимаемые с ткацкого станка) называются Суровьём. Из разноцветных нитей вырабатывают Пёстротканые Ткани; из пряжи, полученной из смеси волокон разных цветов, – Меланжевые Ткани. Помимо гладкой поверхности, ткани могут иметь пушистый наружный слой (Ворс). К Ворсовым Тканям относят ткани с петельным или разрезным (получается при разрезании петель) ворсом, который образуется дополнительной системой нитей, а к Ворсованным Тканям – ткани, у которых ворс начёсывается из уточных нитей. Сукна отличаются войлокообразным застилом, закрывающим переплетение нитей. На поверхности ткани могут образовываться рубчики (с помощью утолщённых нитей), рельефные тканые рисунки. Многослойные текстильные ткани вырабатываются из нескольких наложенных друг на друга основ, скреплённых общими уточными нитями. До поступления к потребителю ткани подвергаются, как правило, отбеливанию, крашению или печатанию, а также различным видам заключительных отделок тканей. Гладкокрашеными называются ткани, окрашенные в один цвет; Набивными – имеющие на лицевой поверхности печатный узор. Отдельные виды тканей, отличающиеся от других хотя бы одним показателем заправочных данных (толщина нитей, число их на единицу длины и ширины, переплетение и так далее), обозначаются условными номерами и называются артикулами. Общее число артикулов, вырабатывавшихся фабриками бывшего Союза Советских Социалистических Республик

(СССР), составляло около 4 000. Основные характеристики и свойства текстильных тканей:- строение текстильных тканей характеризуют толщиной нитей (оценивается линейной плотностью, то есть массой (г) 1 км нити), видом переплетения нитей, плотностью ткани, соотношением изогнутости нитей основы и утка (так называемая Фаза Строения), структурой поверхности (гладкая, ворсовая) и тому подобным. Свойства и внешний вид текстильных тканей обусловливаются их строением, свойствами нитей и отделкой. В бывшем СССР текстильные ткани аттестовали по 3 категориям качества:- высшей, первой и второй. Текстильные ткани, которым присвоен Государственный знак качества, относили к высшей категории, а ткани, аттестованные второй категорией, подлежали снятию с производства. При аттестации учитывали оформление, структуру и заключительную отделку ткани. Кроме того, категория качества текстильных тканей определяется показателями качества:- поверхностной плотностью (массой 1 $м^2$), усадкой, устойчивостью окраски, степенью белизны, износостойкостью, пиллингуемостью, несминаемостью, механическими свойствами. Поверхностная плотность характеризует материалоёмкость и косвенно толщину текстильных тканей. Она колеблется от 30 $г/м^2$ (шёлковый крэп-шифон) до 1 000 $г/м^2$ (брезент, бельтинг и другие); плотность наиболее распространённых платьевых тканей (ситец, сатин и другие) 90–150 $г/м^2$, а костюмных шерстяных – 250–400 $г/м^2$. Усадка текстильных тканей показывает уменьшение размеров (выражается в % от их начального значения) после стирки, сушки, химчистки, хранения. Величина усадки по основе допускается в пределах 1.5–5%, по утку – 1.5–3.5%. Устойчивость окраски текстильных тканей проверяют к действию света, светопогоды (совместное действие света и атмосферных условий), стирки, трения и так далее. Её оценивают визуально сравнением испытанных образцов с эталонными. Высший балл оценки устойчивости окраски к действию света и светопогоды – 8, а к другим воздействиям – 5. Степень белизны текстильных тканей измеряют на специальном приборе (фотометре). Износостойкость текстильных тканей к истиранию, стирке, химчистке, светопогоде и другим воздействиям определяют после опытной носки сшитой из тканей одежды, а также на приборах, имитирующих изнашивание при эксплуатации текстильных тканей; характеризуется уменьшением прочности, выносливости, массы, изменением вязкости раствора, полученного растворением вещества ткани (например, в щёлочи, кислоте), а также другими критериями. Стойкость к истиранию характеризуют Числом Циклов, вызывающих разрушение текстильных тканей. При истирании на поверхности текстильных тканей могут образовываться из закатанных кончиков волокон мелкие шарики – Пилли. Это свойство (так называемая Пиллингуемость) особенно резко проявляется у текстильных тканей, содержащих синтетические волокна. Коэффициент Несминаемости определяют углом восстановления согнутого на 180° образца или по изменению размеров искусственно запрессованной складки. Для оценки механических свойств текстильных тканей обычно измеряют прочность и удлинение при растяжении до разрыва, усталостные и другие характеристики. Разрывные нагрузки колеблются от 50 Н (марля) до 3 500 Н на 50 мм (брезент, бельтинг); ситец имеет разрывные нагрузки 250–400 Н, костюмные шерстяные ткани – 350–600 Н. Удлинение выражается разницей между конечной и первоначальной длиной в %. При оценке гигиеничности текстильных тканей определяют их способность поглощать водяные пары и воду, капиллярность, воздухо-, водо- и паропроницаемость, теплопроводность и реже электризуемость. Техническая Ткань – текстильная ткань, используемая для изготовления деталей машин, установок, сооружений, а также различных технических изделий. Вырабатывается почти из всех видов волокон текстильных и нитей текстильных. В качестве технических тканей могут использоваться и некоторые бытовые ткани (например, марля, миткаль, саржа) для изготовления кальки, прокладок, чехлов и тому подобного. К техническим тканям обычно предъявляются повышенные требования по сравнению с бытовыми. Большинство технических тканей вырабатывают полотняным переплетением нитей (одно- и многослойным), так как оно обеспечивает наиболее прочную связь между основой и утком. В некоторых отраслях промышленности технические ткани заменяются синтетическими плёнками. Наибольшее распространение получили:- (i) Кордные, (ii) Ремнёвые, (iii) Транспортёрные, (iv) Рукавные, (v) Прессовые и (vi) Фильтровальные Ткани. (i) Кордная Прорезиненная Ткань используется для каркасов покрышек шин. Основные нити изготавливают из вискозных, полиамидных и полиэфирных комплексных нитей двойной крутки, в качестве утка применяется хлопчатобумажная пряжа. Плотность нитей по основе значительно больше (до 94 нитей на 100 миллиметров (мм)), чем по утку (до 30 на 100 мм). Разрывная нагрузка от 120 до 250 Ньютонов (Н) на 1 нить. Для защиты бортов покрышек от повреждения о закраины обода и для придания им жёсткости и прочности применяются ткани из хлопчатобумажной пряжи или мононитей. (ii и iii) Ремнёвые и Транспортёрные Ткани используются для изготовления конвейерных лент и приводных ремней. Плотность этих тканей по основе значительно больше, чем по утку (смотрите Бельтинг). (iv) Рукавные Ткани применяют для передаточных устройств, работающих под давлением или разрежением (пожарные рукава и другие). Вырабатываются из льняных, хлопчатобумажных, комбинированных и синтетических нитей. Рукавные ткани образуют каркас рукава и обеспечивают прочность и стабильность размеров изделия. Изготавливаются на специальных круглых или плоских станках. Основные требование к рукавным тканям – равенство разрывных прочностей и удлинений по основе и по утку. Разрывная нагрузка этих тканей по основе и утку составляет от 1 250 до 5 000 Н на 50 мм. Иногда для изготовления рукавов используют так называемые Равнопрочные или Кордные Ткани. (v) Прессовые Ткани применяют для обтяжки отжимных валов на машинах полиграфической, текстильной и других отраслей промышленности, для прокладок прессов в маслобойной промышленности, для брошюровочно-переплётного производства и так далее. Изготавливают главным образом из шерстяной (технические сукна) или хлопчатобумажной пряжи. Имеют высокую прочность на истирание, гладкую поверхность и нормированную водопроницаемость. (vi) Фильтровальные Ткани служат для улавливания твёрдых частиц из жидкостей, газов и воздуха в химической, угольной, пищевой, целлюлозобумажной, медицинской и других отраслях промышленности. Изготовляются в основном из хлопка, шерсти, льна, асбеста, синтетических волокон и так далее. Разрывная нагрузка тканей должна соответствовать давлению фильтруемой жидкости или газа и поэтому колеблется в широких пределах (от 3 до 15 кН на 50 мм). Большое распространение получили фильтровальные ткани из синтетических волокон, которые обладают исключительной стойкостью к химическим реагентам (щелочам, кислотам, солям) и имеют большую разрывную нагрузку по сравнению с натуральными волокнами. Помимо перечисленных областей применения, технические ткани используют также для парашютов, оболочек надувных сооружений, тентов (смотрите Брезент), для гибких ограждений агрегатов на воздушной подушке, в качестве заменителей кожи (смотрите Кирза), для изготовления сит и тому подобного. Художественные Ткани – ткацкие изделия (ручные или машинные), отличающиеся художественностью орнаментации, красотой расцветки, высоким искусством выработки, являющиеся произведениями декоративно-прикладного искусства. Орнаментация художественных тканей, строящаяся обычно по принципу ритмичных повторов (смотрите Раппорт), достигается либо путём переплетения нитей, либо набивным способом (смотрите Набойка), а также вышивкой. Все 3 способа орнаментации применялись с глубокой древности и были известны почти всем народам. Художественное оформление тканей обусловливается их назначением и техническими возможностями производства; узоры художественных тканей отражают стилистическое своеобразие различных эпох в развитии искусства и национальных художественных школ (смотрите также Ковёр). Художественные ткани Древнего Востока и античного мира известны по памятникам изобразительного искусства и литературы, а также по отдельным образцам тканей, найденным в раскопках (например, фрагменты древнеегипетских льняных узорных тканей 2-го тысячелетия до Нашей Эры, фрагменты античных тканей из городов Северного Причерноморья). Высокой художественностью с древних времен славились Китайские, главным образом шёлковые и ‘золотные’ (с металлической нитью), ткани, известные с конца 2-го тысячелетия до Нашей Эры (сохранились фрагменты узорчатых тканей

V–III веков до Нашей Эры из раскопок в Чанша, богатых по расцветке тканей эпохи Хань (206 до Нашей Эры – 220 Нашей Эры) и другие). Широкое распространение получили изготовлявшиеся в XVI и особенно в XVII веках в Китае шёлковая ‘камка-Китайка’ (Русское название), различные виды бархата (шёлковые Основа и Уток) и так далее. Орнамент Китайских тканей – геометрические узоры, стилизованные мотивы растительного и звериного мира, символические изображения (круг, дракон, облака), иероглифы. К Китайским художественным тканям близки (по материалу, выработке, орнаменту) Японские ткани. На протяжении веков (известны с 3-го тысячелетия до Нашей Эры) славились Индийские хлопчатобумажные (реже полушёлковые) ткани с набивным узором, шерстяные узорные и тонкие льняные ткани, орнамент которых состоял главным образом из растительных мотивов (часто с обилием деталей), а также из повторяющихся сюжетных сцен. Иран с древних времён вырабатывал изысканные по мастерству шерстяные и шёлковые ткани; сохранились фрагменты шёлковых тканей эпохи Сасанидов (III–VII века); их узор состоял обычно из медальонов (кругов, овалов и так далее) с изображениями апофеоза царской власти, сцен охоты, фантастических животных. В XV–XVII веках высоко ценились Иранские шёлковые и ‘золотные’ ткани – так называемые Объярь, Атлас, Бархат (основа бумажная); для их орнаментов характерны стилизованные мотивы растительного и животного мира, сцены из эпоса и так далее. Сохранилось много образцов тканей коптского Египта (IV–VII веков) с изображением различных религиозных сцен. Орнаментация Византийских художественных тканей испытала значительное воздействие позднеантичного и сасанидского искусства. Для узоров Византийских тканей типичны круги с орлами, колесницами, библейскими сценами и так далее. В Арабских странах выделывались шёлковые и ‘золотные’ художественные ткани, узорные и гладкие (атлас). Своеобразны Турецкие атласы и бархаты (имеющие бумажную основу) XV–XVIII веков, обычно с крупным узором из ‘опахал’, полумесяцев, цветов гвоздики и других. С Ближним Востоком связано художественное ткачество Испании (период расцвета – XVI век):- шёлковые ткани, бархат (шёлковые основа и уток) с геометрическим орнаментом в сочетании с мелким растительным узором (мавританское влияние), разнообразные ‘золотные’ ткани (особенно известна шёлковая ткань с тончайшими нитями золочёного серебра в утке, в России называвшаяся Алтабас). Итальянские художественные ткани приобрели известность с XIV века:- расцвет их производства приходится на XVI–XVII века. Наиболее известны:- Венецианская камка с ‘чешуйчатым’ и мелким растительным (‘мелкотравчатым’) узором, различные бархаты (шёлковые основа и уток) – орнамент геральдический и растительный, реже – изображения зверей. Из ‘золотных’ Итальянских тканей наиболее ценилась ткань сложной техники в несколько основ и утков (Русское название – Аксамит). С XVII века с Итальянскими тканями соперничали Французские, производство которых достигло расцвета в XVIII веке. Выделялись шёлковые ткани Лиона:- бархат (шёлковые основа и уток), атлас, камка. Среди орнаментов Французских тканей – реалистически трактованные цветы, букеты, архитектурные мотивы, жанровые сцены. Замечательные по художественным достоинствам ткани создавались народами, населявшими современную территорию бывшего СССР. Древними традициями художественного ткачества обладают народы Средней Азии и Закавказья (шёлковые, шерстяные, хлопчатобумажные ткани, ковры). В Древней Руси художественное ткачество было известно издавна. Об этом свидетельствуют литературные источники и сохранившиеся фрагменты шерстяных тканей Северных Славян X–XI веков (узор крупный, геометрический, набивной), Кривичей XII века (узор – переплетение с мережкой). Наряду с набойкой, распространённой почти повсеместно, ценные художественные ткани (покрывала, полотенца, скатерти, плахты, ткани для одежды) создавало народное узорное ткачество Русских, Украинцев, Белорусов, народов Прибалтики и других. В XVI–XVII веках возникло Русское шёлкоткацкое производство, получившее особое развитие в XVIII веке:- выпускались штофы, парча, гризеты и другие (узор крупный и мелкий – букеты роз и других цветов, трактованных реалистически). В начале XIX века развивалось производство шалей, а также выделка шёлковых художественных тканей, особенно парчи. В XX веке с развитием фабричного текстильного производства и совершенствованием техники нанесения рисунка на ткань повышается и художественное качество массовых бытовых тканей. Рисунки для тканей создаются специалистами-художниками. В 1920-е в бывшем СССР осуществлялись отдельные опыты по внедрению ситца, лаконичных по цвету и строгих по ритму рисунков. В 1930-е усилилось стремление сделать, опираясь на изучение классического и народного наследия, художественные ткани не только удобными, но и многообразно декоративными по рисунку и цвету. В тканях этого периода (создаваемых по рисункам Н.В. Кирсановой, В.К. Склярова, М.В. Хвостенко, Е.Я. Шумяцкой и других) всё большее место занимал цветочный орнамент (иногда – с элементами Советской эмблематики). К середине 1930-х возникли художественные лаборатории на крупнейших текстильных предприятиях. С середины 1950-х мастера Советских художественных тканей (Н.М. Жовтис, С.А. Заславская, С.А. Каусов и другие) интенсивно работают над созданием тканей новых структур, а также более разнообразных по ритмическому построению видов орнамента. Под текстильной Тканью понимается изделие, образованное на ткацком станке переплетением продольных (основа) и поперечных (уток) нитей. Иногда применяются дополнительные системы нитей, служащие для образования ворса, узоров и тому подобного. Текстильная ткань имеет сравнительно малую толщину 0.1–5 миллиметров (мм), значительную ширину обычно до 1.5 метров (м) (иногда до 12 метров), различную длину. В зависимости от волокна, из которого выработана пряжа, текстильные ткани подразделяются на:- льняные, хлопчатобумажные (хлопковые), шерстяные, шёлковые и из химических волокон. Бывают однородные (льняные, хлопчатобумажные, шерстяные, шёлковые и так далее), смешанные (из однотипных нитей, выработанных из смеси различных волокон, например, льнолавсановой пряжи) и неоднородные (например, с хлопчатобумажной основой и шерстяным утком). Текстильные ткани, снятые с ткацких станков, называют суровыми или суровьём. Они в дальнейшем подвергаются отделке. Текстильные ткани выпускаются белёные, гладкокрашеные и набивные. По назначению текстильные ткани делятся на бытовые и технические. Строение текстильных тканей характеризуется линейной плотностью или толщиной нитей, характером поверхности, плотностью, видом переплетения и так далее. Поверхностная плотность от 30 граммов на квадратный метр (г/м^2) (креп-шифон и другие) до 1 килограмма на квадратный метр (кг/м^2) (бельтинг, брезент и другие). Тканью называется текстильное изделие, образуемое на ткацком станке переплетением двух взаимно перпендикулярных систем нитей:- (i) основных, идущих вдоль ткани, и (ii) уточных, идущих поперёк неё. Ширина готовой ткани в зависимости от её назначения может быть различной (обычно от 60 до 300 сантиметров (см)). Тканые изделия уже 30 см называют Лентами или Тесьмой. Ширина ткани определяется рабочей шириной ткацкого станка. Ткань имеет фон и кромки. Кромки формируют края ткани. Ширина кромки тканей из льна составляет примерно 0.25%, из хлопка – 0.5–1% ширины ткани, шерстяных и шёлковых тканей – примерно 1%. Кромки предохраняют ткань от чрезмерного сужения в процессе её формирования и отделки, в результате чего они испытывают большее напряжение, чем фон ткани. Поэтому кромки должны быть достаточно прочными. При отделке ткани кромки воспринимают значительную нагрузку и способствуют улучшению раскроя ткани. Текстильное Полотно – в широком смысле слова – ткани, трикотаж, гардинно-тюлевые и другие изделия. Различают полотна по виду сырья (льняные, хлопчатобумажные, шёлковые и тому подобные), массе 1 квадратного метра (в бывшем СССР), строению (переплетению нитей). Подготовка волокон к прядению начинается с разрыхления и очистки от примесей. Затем обрабатываемый материал подвергается чесанию, в результате которого волокна разъединяются и окончательно очищаются от мелких и цепких примесей. В результате получают продукт – ленту. Этап подготовки волокон завершается на ленточных машинах вытягиванием ленты до заданной толщины и плотности. При вытягивании лента в результате смещения волокон становится тоньше, волокна при этом распрямляются, разъединяются и ориентируются. Для получения эффективного распрямления и

смешения волокон процессы вытягивания повторяются несколько раз. Далее лента поступает на ровничные машины, где она вытягивается и скручивается, образуя ровницу, которая наматывается на специальные катушки. Кручение придаёт ровнице необходимую прочность. На последнем этапе ровница вытягивается до толщины пряжи и скручивается, то есть превращается в пряжу. Крученая пряжа предназначена для утка и сразу поступает на ткацкие станки. Пряжа для основы перематывается на мотальных машинах в конические бобины и поступает для последующего технологического процесса на сновальную машину. На сновальной машине происходит перематывание пряжи с большого числа мотальных бобин на одну большую паковку – сновальный валик. Чтобы придать пряже большую гладкость, повысить прочность, её подвергают специальной обработке – шлихтованию. Кроме того, на шлихтовальных машинах из нескольких сновальных валиков с основной пряжей путём перематывания формируется ткацкий навой. Из основной пряжи на ткацком навое и уточной на ткацком станке путём переплетения получается суровая ткань. Из ткацкого цеха суровая ткань поступает в приёмно-контрольный цех, где происходит учёт ткани и её разбраковка на браковочно – учётных машинах. В отделочное производство ткани поступают в суровом виде. Задача отделочной фабрики – улучшить качество ткани:- её эстетический вид и прочностные характеристики, добавить с помощью различных отделок (водоотталкивающей, термостойкой) защитные свойства. После приёмки ткань обрабатывают на стригальных агрегатах для очистки её поверхности от выступающих кончиков волокон, нитей, узелков. Ткань обрабатывается на мерсиризационных машинах с целью повышения её гигроскопичности, увеличения прочности, способности окрашиваться. Далее суровая ткань окрашивается, на неё наносится рисунок на печатных машинах. После нанесения рисунка и сушки ткань подвергают высокотемпературной обработке для более прочного закрепления красителя. Завершающий этап в производстве ткани – придание дополнительных специальных свойств путём нанесения водоотталкивающей и жаростойкой пропиток. Готовые ткани поступают в складальный цех, где определяется их сорт также с применением системы штрих-кодирования. Из складального цеха готовая ткань поступает в швейную фабрику и на склад готовой продукции. Ткань – текстильное изделие получаемое на ткацком станке в результате переплетения двух систем нитей расположенных перпендикулярно друг другу в одной плоскости и связанных друг с другом путём ткацкого переплетения. Ткань – полотно, изготовленное из нитей (пряжи) с помощью ткачества. Ткань – текстильное изделие получаемое на ткацком станке в результате переплетения двух систем нитей расположенных перпендикулярно друг другу в одной плоскости и связанных друг с другом путём ткацкого переплетения. Нити идущие вдоль ткани называются основными, а вся система продольных нитей называется основой. Нити, идущие поперёк ткани называются уточными (одна нить – уточина), а вся система поперечных нитей называется утком. Пряжа применяемая в ткачестве должна удовлетворять след основным требованиям:- (i) иметь определённую линейную плотность (Текс) и быть равномерной по линейной плотности; (ii) обладать достаточной прочностью на разрыв и быть равномерной по прочности; (iii) иметь заданную крутку и быть равномерной по крутке; (iv) быть чистой, не иметь внешних дефектов (узлов, шишек, непропрядов, посторонних включений); и (v) паковки, поступающие в ткацкое производство должны быть правильно намотаны. Во время работы основа на ткацком станке подвергается многократному растяжению при зевообразовании и прибое уточной нити. Кроме того, на нити основы действуют изгибающие силы и силы трения. Трение возникает при прохождении основы по скалу, через ламели, через галево ремизок, через зубья бёрда и при взаимодействии основы и утка во время прибоя. Так как основа на ткацком станке имеет небольшую скорость перемещения в горизонтальном направлении, то большинство из перечисленных воздействий воздействуют на нить многократно. Чтобы противостоять этим разрушающим силам к основным нитям предъявляются повышенные требования по прочности, стойкости к истиранию, стойкости к многократным переменным растягивающим нагрузкам, к гладкости и равномерности нити. Уточная нить при переработке на ткацком станке испытывает значительно меньшее напряжение, чем основная (трение при выходе из челнока и трение при прибивании к опушке. Это однократное воздействие.) Поэтому уточные нити могут иметь значительно худшие, чем основа физико-механические характеристики. Ткань является одним из видов текстильных изделий, главные из которых:- тканевые, плетёные, тюлевые, вязаные. Эти изделия отличаются между собой видом пряжи (нитей), из которой они изготовлены, строением, способом изготовления, внешним видом, назначением и так далее. Тканью называют текстильное изделие, образуемое переплетением двух взаимно перпендикулярных систем нитей. Нити, расположенные вдоль ткани, называются основными, а вся их совокупность – основой. Нити, расположенные поперёк ткани, называются уточными, или утком. По краям ткани имеют кромки. Нити основы, идущие на образование кромок, называют кромочными. Кромки в тканях с бесчелночных ткацких станков СТБ отличаются от кромок тканей с челночных станков своей структурой. Это объясняется особенностями процессов прокладывания утка и кромкообразования. На станках СТБ установлены кромкообразующие механизмы закладного типа, в связи с чем ткани вырабатываются с закладными кромками, имеющими плотность по утку, вдвое большую, чем плотность фона. Закладные кромки толще обычных (разница достигает 30–100%), в зависимости от применяемого в них переплетения могут иметь эффекты стянутости или гофристости, требуют большего расхода уточных нитей. Для устранения перечисленных недостатков необходимо максимально приближать степень заполнения нитями ткани в кромках к степени заполнения фона ткани. Для этого рекомендуются следующие методы:- разуплотнение кромок по основе (по сравнению с фоном); применение кромочных нитей более низкой, чем в фоне, линейной плотности; использование более рыхлого, чем в фоне, переплетения. Основные признаки определения лицевой и изнаночной сторон ткани:- (i) печатные рисунки в тканях, имеющих одностороннюю отделку, на лицевой стороне яркие и чёткие; (ii) ткацкие дефекты – узелки и петельки выводятся на изнаночную сторону, поэтому с лицевой стороны дефектов меньше; (iii) в тканях саржевых и диагоналевых переплетений рубчик на лицевой стороне идёт снизу вверх слева направо (исключение составляют так называемые обратные саржи); (iv) наиболее дорогие нити выводят на лицевую сторону:- в полушерстяных тканях на лицевой стороне преобладает шерстяная пряжа, в полушёлковых тканях – шёлковые нити; (v) если ткацкое переплетение с двух сторон одинаковое, то на лицевой стороне рисунок переплетения более чёткий; (vi) в ворсово-начёсных шерстяных тканях на лицевой стороне ворс располагается более упорядочено, изнаночная сторона обычно имеет войлокообразный настил; и (vii) при рассмотрении гладких тканей на уровне глаза можно заметить, что лицевая сторона менее пушистая, так как в процессе отделки она опаливается. Ткань – текстильное изделие получаемое на ткацком станке в результате переплетения двух систем нитей расположенных перпендикулярно друг другу в одной плоскости и связанных друг с другом путём ткацкого переплетения.

FABRICATION = ФАБРИКАЦИЯ (или ИЗГОТОВЛЕНИЕ) – Fabrication or Fabricating is the manufacture of products from molded parts, rods, tubes, sheeting, extrusions, or other form by appropriate operations, such as punching, cutting, drilling, and tapping. Fabrication is a term used to distinguish manufacturing operations for components as opposed to assembly operations. / Под Изготовлением или Фабрикацией, от Латинского слова Fabricatus, означающее Изготовленный, от Fabrica, означающее Мастерская, от Faber, означающее Мастер, понимается .

FABRICATION INTEGRITY POINT = ТОЧКА ЦЕЛОСТИ ВЫРАБОТКИ – Fabrication Integrity Point:- the differential gas pressure at which the first stream of gas bubbles are emitted from a wetted filter element under standard test conditions.

FABRICATOR = ФАБРИКАНТ (или МАСТЕРОВОЙ) – (1) Fabricator is a company that processes refined (cathodes, ingots, billet etc) or semi-fabricated (extrusions, sheet metal etc) metal to produce products for sale to end consumers. Fabricator is one who fabricates; one who constructs or makes. Fabricator is a company that makes industrial products, such as computers, cars, or machine

parts. (2) Fabricator is an individual or group who, usually without genuine resources, invents or inflates information for personal or political gain or political purposes. Fabricator is someone who tells lies. Also known as Fibber, and Storyteller. / Экструзия или Выдавливание (Extrusion). Мастеровой (устаревший термин):- (1) относящийся к ремесленникам, мастерам, к рабочим людям, например, мастеровой человек или мастеровой люд; (2) фабрично-заводской работник, а также ремесленник.

FABRIC CONSTRUCTION = СТРОЕНИЕ ТКАНИ (или КОНСТРУКЦИЯ ТКАНИ) – Fabric Construction:- textiles are important for everyone. It is used for covering body, for warmth or coolness, personality enhancement and sometimes to display one's status in the society. From the wholesale textile manufacturer and merchant to the retailer and the end-user, the customer, everyone consumes textile. Not only those who are in this direct trade are related to this product but there are certain industries which are indirectly associated with textile. Automobile industry is a good example of this type of industry which uses textile in various forms. Others who use textile in one or the other form may include designers, interior decorators, craftspersons, advertisers using hoardings and banners, painters etc. Weaving:- What is it? Weaving is a major process of making fabric or cloth. In it, two distinct sets of yarns called the Warp and the Filling or Weft are interlaced with each other to form a fabric. Yarn is a long continuous length of interlocked fibers. The lengthwise yarns which run from the back to the front of the loom are called the Warp. The crosswise yarns are the filling or weft. A loom is a device for holding the warp threads in place while the filling threads are woven through them. Yarns made from natural fibers like cotton, silk, and wool and synthetic fibers such as Nylon and Orlon are commonly used for weaving textile. But other fibers can also be used for weaving. Yarn intended for the warp goes through operations such as spooling, warping and slashing to prepare them to withstand the strain of the weaving process. Weaving Operations:- four major operations are involved in weaving:- Shedding, Picking, Beating Up (Battening) and Taking Up and Letting Off. Shedding:- each alternate warp yarn is raised to insert the filling yarn into the warp to form a shed. Picking:- as the warp is raised, the filling yarn is inserted through the shed by a carrier device. Different types of looms are used for carrying the filling yarn through the shed:- Shuttle Loom, Shuttle Less Looms, Circular Looms etc. Beating Up (Battening):- with each picking operation, the reed pushes or beats each filling yarn against the portion of the fabric that has already been formed. Reed is a comb like structure attached to the looms. It gives the fabric a firm, compact construction. Taking Up and Letting Off:- with each shedding, Picking, Battening operation, the new fabric must be wound on the cloth beam which is called 'Taking Up'. At the same time, the warp yarns must be released from the warp beam which is called l 'Letting Off'. As the shuttle moves back and forth across the width of the shed, a self edge is woven which is called Selvage or Selvedge. The selvage prevents the fabric from muddling. It is usually more compact and strong than the rest of the fabric. There are different kinds of selvages depending upon the expected use of the fabric:- Plain Selvages, Tape Selvages, Split Selvages, Fused Selvages, Leno Selvages and Tucked Selvages. Knitting:- after weaving, the most prevalent method of fabric construction is knitting. Its popularity has grown tremendously over the recent years. Today, knitting is a very big industry which has two main divisions. One division manufactures knitted goods for apparel production, sewing centers, consumers and others. The other division manufactures finished apparel such as hosiery, sweaters and underwear. The knitted fabric has the advantage of stretchability which provides fit and comfort. It also gives warmth. At the same time, they are porous and provide breathing comfort. It is light in weight and wrinkle-resistant. However, certain specialized techniques like Pak-nit or Permasized have to be used so that it may not shrink too much. Also, care should be taken so that not a single loop breaks. If even one loop breaks, a hole is made and it starts running. This disadvantage can be eliminated by variation in the stitch that protects the fabric from raveling. The kind and quality of the needle also affect the quality of the knitted fabric. Different kinds of needles are used in knitting latch needle, spring- beard needle, compound needle etc. Weft and Warp Knitting:- there are two major varieties of knitting:- weft knitting and warp knitting. In weft knitting, one continuous yarn forms courses across the fabric. In warp knitting, a series of yarns form wales in the lengthwise direction of the fabric. The knitting machine also called Knitting Frame, Knitting Loom, or Hand Knitting Machine, is used to manufacture knit fabrics. These fabrics are produced on a fixed bed of hooked needles. The knitting machines can be hand driven or motor powered. The machines come in domestic and industrial models, with either flat or circular beds that produce rectangular or tubular fabrics. The fabric produced by a knitting machine has a more fine texture than hand-knitted fabric. Fabric Construction:- the details of structure of fabric. Includes such information as style, width, type of knit of weave, threads per inch in warp and fill, and weight of goods. In selecting a woven fabric for industrial applications, a number of design parameters may be considered, these are broken down into four basic variables:- Yarn Weight, Thread Count, Weave Pattern, and Fabric Finish. The wide range of yarn weights and counts available provide the base for fabric design. Yarn weight, combined with thread count (the number of warp ends (lengthwise) and filling picks (width wise) per inch) determines the strength, weight and thickness of the fabric. / Основа Уточина или Уток. Найлан (Nylon). Сведения о структуре ткани, включающие такую информацию как стиль, ширина, тип вязания или переплетения, количество нитей на дюйм по основе и утку, и вес ткани.

FABRIC CRIMP = ПЕРЕПЛЕТЕНИЕ ТКАНИ (или ХХ, или СВИВКА ТКАНИ, или ГОФРИРОВКА ТКАНИ) – Fabric Crimp is the angulation induced between a yarn and woven fabric via the weaving or braiding process.

FABRIC CRIMP ANGLE = УГОЛ ПЕРЕПЛЕТЕНИЯ ТКАНИ (или УГОЛ СВИВКИ ТКАНИ, или УГОЛ ГОФРИРОВКИ ТКАНИ) – Fabric Crimp Angle is the maximum acute angle of a single weaving yarn's direction measured from a plane parallel to the surface of the fabric.

FABRIC DAMAGED = ПОВРЕЖДЁННАЯ ТКАНЬ – Fabric Damaged:- any type of damaged, for example, holes, component damage, selvedge damage etc. Dyeing defect. / Порок или дефект крашения.

FABRIC DEFECT = ПОРОК ТКАНИ (или ДЕФЕКТ ТКАНИ) – Fabric Defect is nothing but an undesirable fault in the fabric which deteriorates the quality of fabric and makes it inferior. In textile industry, woven fabrics are produced by interlacing warp and weft yarn. Faulty woven fabrics hampers the total quality of woven garments such as shirt, pant, trouser, jacket etc. As a textile engineer you should know about the major woven fabric faults which produced during woven fabric manufacturing. As its importance this article has shown those woven fabric faults with their images. Defects in woven fabric can be a result of yarn imperfections, incorrect weaving process or errors in the finishing process. They can be categorized into 3 groups:- yarn related defects, defects occurring in warp direction and defects in the filling direction. Yarn Related Defects:- (1) Mixed End / Thick End; (2) Slub Or Slug. Warp Direction Defects:- (1) Reedy Fabric Marks; (2) Warp Streaks; (3) Misdraws/Wrong Draw; (4) Broken/Missing End. Weft Direction Defects:- (1) Starting Marks; (2) Filling/Weft Bars; (3) Broken Pick; (4) Broken Pattern; (5) Double Pick; (6) Gout; (7) Sloughing Off; (8) Snarl. As you might have read our first post on fabric defects causes and remedies – (Read) Warp Way Defect. This is our another related post on fabric defects causes and remedies – Weft Way Defects (fabric defects with images). Major Defects Found in Woven Fabric:- Various types of faults found in woven fabric has mentioned in the below:- bad selvedge, ball, broken ends or warp, broken picks or weft, double end, double pick, float of warp, hole, loose warp, loose weft or snarl, miss pick, oil spot, reed mark, slub, tails out, temple mark, thick and thin place, tight end, weft bar, wrong end color. / в направлении уточины.

FABRIC FILL FACE = УТОЧНОНАСТИЛОЧНАЯ ТКАНЬ (или УТОЧНОЛИЦЕВАЯ ТКАНЬ) – Fabric Fill Face is the side of the woven fabric where the greatest number of the yarns are perpendicular to the selvage.

FABRIC FUSED IN CUTTING = ТКАНЬ, РАСПЛАВЛЕННАЯ (или СКЛЕЕННАЯ) ПРИ РАСКРОЕ – Fabric Fused In Cutting:- Complaint:- a manufacturer of men's clothing returned cellulose acetate lining fabrics to the converter, claiming that the goods were defective because the edges became stuck together when a number of layers of fabric were being cut for suit linings. Analysis:- physical and chemical tests proved that the fabric and finish in the lining materials returned were normal in all respects. Apparently the garment manufacturer was not familiar with the characteristic low melting temperature of cellulose acetate materials and had allowed his cutting blade to get too hot, fusing the edges of the cut pieces. This condition can usually be corrected by not attempting to cut too large a lay of fabrics or by applying a small amount of paraffin to the cutting blade as a lubricant.

FABRIC PERFORMANCE = ИСПОЛНЕНИЕ ТКАНИ (или ВЫПОЛНЕНИЕ ТКАНИ, или ЭКСПЛОАТАЦИОННЫЕ КАЧЕСТВА ТКАНИ) – Fabric Performance:- this includes appearance, texture, feel etc. That are different from the approved fabric or with discrepancies between garment.

FABRIC SETT = ЗАПРАВОЧНЫЙ РАСЧЁТ ТКАНИ – Fabric Sett is the number of warp threads per inch, or other convenient unit.

FABRIC SOFTENERS = МЯГЧИТЕЛИ ТКАНЕЙ (или УМЯГЧИТЕЛИ ТКАНЕЙ) – Fabric Softeners are the chemical solutions added to the final rinse to improve the hand of terry cloths and infants' fabrics.

FABRIC STABILIZER = СТАБИЛИЗАТОР ТКАНИ – Fabric Stabilizer is a resin or latex treatment for scrims used in coated fabric manufacture to stabilize the scrim for further processing.

FABRIC TEXTURE = ТЕКСТУРА ТКАНИ – Fabric Texture is the feel of the fabric. It is smooth, rough, soft, velvety, silky, lustrous, and so on. The different textures of the fabric depend upon the types of weaves used. Textures are given to all types of fabrics, cotton, silk, wool, leather, and also to linen. Few of the famous fabric textures are flannel, velvet, organdy, chintz, crepe, damask, challis, venise, suede and embossed leather. Different types of fabric textures are cotton fabric textures, silk fabric textures, wool fabric textures, linen fabric and leather fabric.

FABRIC WARP FACE = ОСНОВОНАСТИЛОЧНАЯ ТКАНЬ (или ОСНОВОЛИЦЕВАЯ ТКАНЬ) – Fabric Warp Face is the side of the woven fabric where the greatest number of the yarns are parallel to the fabric.

FABRIC WHITENING AGENTS = ВЕЩЕСТВА, ОТБЕЛИВАЮЩИЕ ТКАНЬ (или ОТБЕЛИВАЮЩИЕ АГЕНТЫ ДЛЯ ТКАНЕЙ) – Fabric Whitening Agents:- also known as Optical Brighteners, work by depositing on fabrics during laundering to enhance the brightness of light colored fabrics. Their effectiveness varies with the type of fabric and concentration in the wash water. Their effect is cumulative so new fabrics exhibit increased fluorescence after several washes. Optical brighteners/fabric whiteners are not bleach and cannot remove color from a garment. In unusual instances they may create a stain that has the appearance of color loss. / известны также как Оптический Блескообразователь или Оптический Отбеливатель (Optical Brightener). развод (или потёк (stain)).

FAB SPREAD = FIVE AGAINST BOND SPREAD

FAC = FEDERAL ADVISORY COUNCIL

FAC = FORWARDING AGENTS COMMISSION

FACE = ЛИЦЕВАЯ СТОРОНА – In the textile industry, Face is the side of a fabric which, by reason of weave, finish, or other characteristic, presents a better appearance than the other side, or back. Face is the correct or better-looking side of a fabric. / В текстильной промышленности, та сторона ткани, которая по причинам ткацкого переплетения, отделки или иных характеристик выглядит более приглядно, нежели другая сторона или оборотная.

FACE FINISHED FABRICS = ТКАНИ С ОТДЕЛАННОЙ ЛИЦЕВОЙ СТОРОНОЙ – Face Finished Fabrics are fabrics which have surface treatments that provide a variety of looks and effects on the fabric surface. These include brushing, sanding, sueding, etc. The warp knit industry is specially innovative with face finishing techniques.

FACE LOOP = ЛИЦЕВАЯ ПЕТЛЯ – Face Loop is a knitted loop formed on the cylinder needles on a knitted machine.

FACE SEAL = ТОРЦЕВОЕ УПЛОТНЕНИЕ (или ЛИЦЕВОЕ УПЛОТНЕНИЕ) – Face Seal is a device that prevents leakage of fluids along rotating shafts. Sealing is accomplished by a stationary primary seal ring bearing against the face of a mating ring mounted on a shaft. Axial pressure maintains the contact between the seal ring and the mating ring. See also Seal.

FACE VALUE = ЛИЦЕВАЯ СТОИМОСТЬ – Face Value is the principal amount of a bond, which will be paid off at maturity. The nominal value given to legal tender coin or currency, for example, a 1-oz Gold American Eagle coin has a face value of USD50.00. The value of a bond that appears on the face of the bond, unless the value is otherwise specified by the issuing company. Face value is ordinarily the amount the issuing company promises to pay at maturity. Face value is not an indication of market value. Sometimes referred to as Par Value. See also Par. The amount of money printed on the face of the certificate of a security; the original Dollar amount of indebtedness incurred. Face Value is the nominal value given to legal tender coin or currency. / специфицировано выпускающей компанией. Лицевая Стоимость:- стоимость облигации, векселя, ипотечного сертификата или иной ценной бумаги, указанная на сертификате или финансовом документе. Корпоративные облигации обычно выпускаются лицевой стоимостью в 1 000 Долларов США, муниципальные – 5 000 Долларов США, а федеральные государственные облигации – 10 000 Долларов США. Хотя в период времени между выпуском и погашением облигаций цены на них колеблются, по наступлении срока погашения они погашаются по лицевой стоимости, за исключением случаев банкротства эмитента. Если облигации погашаются до наступления срока погашения, владельцы облигаций, как правило, получают небольшую премию сверх номинальной стоимости. Именно на лицевую стоимость начисляются проценты. Таким образом, по 10%-ной облигации лицевой стоимостью 1 000 Долларов США её владельцу выплачивается 100 Долларов в год. Также может называться Нарицательная Стоимость (Par Value), или Номинальная Стоимость (Nominal Value).

FACILITIES = УСТАНОВКИ – Facility is an existing or planned location or site at which prime movers, electric generators, and/or equipment for converting mechanical, chemical, and/or nuclear energy into electric energy are situated, or will be situated. A facility may contain more than one generator of either the same or different prime mover type. For a cogenerator, the facility includes the industrial or commercial process. In reference to electricity, Facilities are a generic term describing the apparatus, buildings, equipment and necessary supporting resources for the generation, transmission, supply, sale, ancillary support, and consumption of electricity. / Установки:- по отношению к электричеству, общий термин, описывающий аппараты, здания, оборудование и необходимые вспомогательные ресурсы для генерации, передачи, поставки, продажи, дополнительной поддержки и потребления электричества.

FACILITY = ОБЕСПЕЧЕНИЕ (или ПОДДЕРЖКА, или МАКСИМАЛЬНЫЙ ЛИМИТ КРЕДИТОВАНИЯ) – Facility:- maximum credit granted by a bank to a customer. See also Credit Line. / Максимальный кредит, предоставляемый банком заказчику. Смотрите также Кредитная Линия (Credit Line).

FACILITY = СООРУЖЕНИЕ – Facility is the physical warehouse or plant where storage takes place.

FACILITY GUARANTEE = ГАРАНТИЯ ОБЕСПЕЧЕНИЯ (или ГАРАНТИЯ ПОДДЕРЖКИ) – Facility Guarantee enables an applicant to secure banking facilities for a subsidiary/associate company, or personal account, in other countries. For example, the US Commodity Credit Corporation's (CCC) Facility Guarantee Program (FGP) provides payment guarantees to facilitate the financing of manufactured goods and services exported from the United States to improve or establish agriculture-related facilities in emerging markets. By supporting such facilities, the FGP is designed to enhance sales of US agricultural commodities and products to emerging markets where the demand for such commodities and products may be constricted due to inadequate storage, processing, or handling capabilities for such products.

FACING = ОБЛИЦОВКА (или БЕЙКА, или ФАСКА, или СКОС, или НАРУЖНАЯ ОТДЕЛКА, или ПЕРЕДНЯЯ СТОРОНА, или ПЛАНКА, или ПОДБОРТ, или ОБТАЧКА, или ПОДШИВКА, или НАКЛАДЫВАНИЕ ПОЛОС УСИЛЕНИЯ, или ЛИЦЕВАЯ ОТДЕЛКА) – Facing is a lining or trim that protects the edges of a garment especially at collars, cuffs, and front closings. Facing is a piece of fabric that is sewn to the collar, front opening, cuffs, or arms eye of a garment to create a finished look. / Обтачка – отдельно выкраиваемая деталь для обработки срезов, всегда повторяющая форму среза. Поэтому для обтачки не даётся, как правило, отдельная выкройка – она переснимается с конструктивной детали выкройки как отдельная деталь. Направление долевой нити обтачки и основной нити обычно совпадают. Цельнокроенная обтачка – если подлежащий обработке срез прямой, обтачку можно выкроить вместе с основной деталью и отвернуть на изнаночную сторону.

FAC/OBLIG = FACULTATIVE OBLIGATORY

FAÇONNÉ = ФАСОННЕ (или УЗОРЧАТАЯ, или ФАСОННАЯ, или САРПИНКА) – Façonné is a broad term for fabrics with a fancy-type weave made on a Jacquard or dobby loom. Façonné:- silk or rayon. Figured weave or 'burnt-out' finish. Façonné in French, means fancy weave. Has small designs all over the fabric. Fairly light in weight, and could be slightly creped. Background is much more sheer than the designs, therefore the designs seem to stand out. Very effective when worn over a different color. Drapes, handle, and wears well. / Жакяр (Jacquard). Под Французским словом Фасонне понимается Узорчатое или Фасонное.

FAÇONNÉ VELVET = БАРХАТ ФАСОННЕ (или ФАСОННЫЙ БАРХАТ) – Façonné Velvet is a cut velvet made by the burnout method of printing. See also Burn-Out Printing, Cut Velvet, and Printing.

FACT = FACTOR ANALYSIS CHART TECHNIQUE

FACTOR = ФАКТОР – (1) Factor is a third party that buys a firm's accounts receivable. If a firm is not confident in its ability to collect on its credit sales, it may sell the right to receive payment to the factor at a discount. The factor then assumes the credit risk associated with the accounts receivable. This provides the firm immediate access to working capital, which is important, especially if the firm has a cash flow problem. The price of factoring is determined by the creditworthiness of the firm's customer, not of the firm itself. It is also known as Accounts Receivable Financing. An agent employed to sell in his own name (at the agreed commission) goods or merchandise belonging to his principal; his acts being binding in the principal at the instance of third parties. Compare with Broker. Company that undertakes factoring. A Factor is an agent who will, at a discount (usually 5 to 8% of the gross), buy receivables. Factor is an agent holding goods belonging to a principal for the purpose of eventual sale. The agent has implied authority to sell them in his/her own name. Also known as Mercantile Agent. / Под Фактором, от Латинского слова Factor, означающее Делающий или Производящий, понимается .

(2) In Scotland, Factor is the manager of an estate of land. / В Шотландии, управляющий земельным поместьем.

(3) Factor is the ratio of the outstanding principal amount of a pass-through pool or collateralized mortgage obligation (CMO) tranche to its original principal amount. See also Z Factor.

FACTORAGE = ФАКТОРАЖ (или ХХ) – Factorage, or Commission, the allowance given to factors by the merchants and manufacturers, etc who employ them:- it is a percentage on the goods they purchase or sell on account of their principals; and varies in different countries, and as it refers to different articles. It is customary for factors, as observed in the previous article, to insure the debts due to those for whom they sell for an additional, or del credere, commission, generally averaging from 1-1/2 to 2 per cent. Factorage or commission is also frequently charged at a certain rate per cask, or other package, measure, or weight, especially when the factor is only employed to receive or deliver:- this commission is usually fixed by special agreement between the merchant and factor. See also Commission.

FACTORED LOAD = РАСЧЁТНАЯ НАГРУЗКА – Factored Load:- the product of a specified load and its applicable load factor as used in Limit States Design. / Продукт спецификационной нагрузки и его . В строительной механике под Нагрузками понимаются силовые воздействия, вызывающие изменения напряжённо-деформированного состояния конструкций зданий и сооружений. По характеру изменений во времени различают:- (i) динамические нагрузки; и (ii) статические нагрузки. Статические нагрузки подразделяются на:- (a) временные нагрузки, в свою очередь делящиеся на неподвижные нагрузки (например, вес стеллажей и бункеров в складских помещениях) и подвижные нагрузки; и (b) постоянные нагрузки. По характеру приложения к телу, на которое они воздействуют, различают:- (i) распределённые нагрузки, прилагаемые ко всей поверхности (линии) или части её; и (ii) сосредоточенные нагрузки, прилагаемые к весьма малой площадке (точке). Распределённую нагрузку постоянной интенсивности называют равномерно-распределённой нагрузкой, а нагрузку, точки приложения которой непрерывно заполняют всю данную площадь (или отрезок), – сплошной нагрузкой. При расчёте строительных конструкций нагрузки подразделяют на:- (i) нормативные, отвечающие нормальным условиям эксплуатации; и (ii) расчётные – максимальные, определяемые умножением нормативных нагрузок на коэффициент надёжности по нагрузкам. При действии нескольких нагрузок в расчёте учитывают наименее выгодные их сочетания. Нормативные Нагрузки – наибольшие нагрузки, отвечающие нормальным условиям эксплуатации зданий и сооружений. Они используются при расчёте конструкций по предельным состояниям. Расчётная Нагрузка – наибольшая нагрузка на здание, сооружение или конструкцию, определяемая с учётом возможных отклонений от заданных условий их нормальной эксплуатации. Расчётную нагрузку вычисляют умножением нормативных нагрузок на соответствующие коэффициенты надёжности по нагрузкам, зависящие от вида нагрузки, параметров проектируемого объекта и прочего. Нормативные нагрузки и коэффициенты надёжности для расчёта строительных конструкций устанавливаются Строительными Нормами и Правилами.

FACTORED RESISTANCE = РАСЧЁТНОЕ СОПРОТИВЛЕНИЕ – Factored Resistance:- the product of resistance and its applicable resistance factor as applied in Limit States Design. / .

FACTORIAL = ФАКТОРИАЛ (или ФАКТОРИАЛЬНЫЙ) – Factorial:- where two or more treatments of an experiment produce different interactions. / Под Факториалом понимается произведение натуральных чисел от единицы до какого-либо данного натурального числа n, то есть 1·2·3·…·n; обозначается n!, например, 5! = 1·2·3·4·5 = 120.

FACTORIAL EXPERIMENT = ФАКТОРИАЛЬНЫЙ ЭКСПЕРИМЕНТ – Factorial Experiment is an experiment where treatments are combinations of two or more factors. The treatments can be either complete factorial combinations or incomplete factorial combinations.

FACTORING = ФАКТОРИНГ (или ФИНАНСИРОВАНИЕ ПОД УСТУПКУ ДЕНЕЖНОГО ТРЕБОВАНИЯ) – Factoring:- the selling, on a regular basis, by a firm of its short-term accounts receivable arising from supplies and services to a factoring company. Factoring is a form of financing which enables companies to procure liquidity. Othr significant aspects are the assumption of default risk by the factoring company as well as its responsibility for related debt collection and dunning procedures. Service of assuming the credit risk of another party's sales, generally including collecting payment when due. Factors often provide or arrange limited-recourse financing against the accounts receivable they are guaranteeing, referred to as Purchasing Receivables. Factoring is the discounting of a foreign account receivable that does not involve a draft. The exporter transfers title to its foreign accounts receivable to a factoring house (an organization that specializes in the financing of accounts receivable) for cash at a discount from the face value. Factoring is often done without recourse to the exporter. Factoring of foreign accounts receivable is less common than with domestic receivables. Sale of accounts receivable to a financial organization (the factor) at a discount or fee, in exchange for which the factor assumes the risk and responsibility of collecting payment from customers. Factoring has been practiced in the US for over a century. It provides working capital for businesses and relieves them of burdensome billing procedures and collection problems. A form of sales financing similar in nature to an assignment credit in which the factor or factoring company (often the subsidiary of a bank) purchases the trade debts of its clients and collects them on its own behalf. The claims purchased are usually for 30–90 days, the purchase price representing a certain percentage of the face value of the debts. The remaining balance is returned to the client after deduction of a service charge once the debt is collected. The purchase price paid by the factor is credited to the client after deduction of the factoring fee and the financing charges (contingent on the amount of credit drawn). As a rule, the factor also assumes the del credere (or credit) risk, i.e. assignment without guarantee for collection. Activity of managing the trade debts of another firm. Commonly, a company sells due debts to a factor at a discount. The factor then makes a profit by recovering the debts at a price nearer the face value. Factoring relieves companies of the burden of administering debts and gives them access to ready cash before payment is due. Factoring is a complete financial package that combines export working capital financing, credit protection, foreign accounts receivable bookkeeping, and collection services. A factoring house, or factor, is a bank or specialized financial firm that performs financing through the purchase of invoices or accounts receivable. A form of factoring, export factoring, is offered under an agreement between the factor and exporter, in which the factor purchases the exporter's short-term foreign accounts receivable for cash at a discount from the face value, normally without recourse. The factor also assumes the risk on the ability of the foreign buyer to pay, and handles collections on the receivables. Thus, by virtually eliminating the risk of non-payment by foreign buyers, factoring allows the exporter to offer open accounts, improves liquidity positions, and boosts competitiveness in the global marketplace. Factoring is recommended for continuous short-term export sales of consumer goods on open accounts:- (i) it offers 100% protection against the foreign buyer's inability to pay – with no deductible or risk sharing; and (ii) it is an attractive option for small and medium-sized exporters, particularly during periods of rapid growth, because cash flow is preserved and risk is virtually eliminated. How it works? The exporter signs an agreement with the export factor who selects an import factor through an international correspondent factor network, who then investigates the foreign buyer's credit standing. Once credit is approved locally, the foreign buyer places orders for goods on open account. The exporter then ships the goods and submits the invoice to the export factor who then passes it to the import factor. The import factor handles the local collection and payment of the accounts receivable. During all stages of the transaction, records are kept for the exporter's bookkeeping. There are some limitations of factoring that must be taken into account. Factoring exists in countries with laws that support the buying and selling of receivables. It generally does not work with foreign account receivables that have more than 180-day terms. It is also not well suited to a new-to-export company as factors generally (a) do not take on a client for a one-time deal, and (b) require access to a certain volume of the exporter's yearly sales. Lastly, it may be cost prohibitive for exporters with tight profit margins. / , то есть . дэль крэдэрэ (del credere). Факторинг предполагает под собой комплекс финансовых услуг, оказываемых специализированными компаниями оптовым торговцам и поставщикам услуг. Эти услуги носят бессрочный характер и имеют стратегический интерес, как для компании заёмщика, так и для финансирующей компании. Целью факторинга является стимулирование роста объёма продаж за счёт предоставления заёмщикам необходимых денежных средств, управления дебиторской задолженностью, покрытия ряда рисков, имеющих место в торговых операциях заёмщика, а также информационно-аналитического и консультационного обслуживания заёмщика. Схема работы факторинга выглядит следующим образом:- отгрузив свой товар покупателю (дебитору) продавец (заёмщик) предоставляет в свой банк документы по отгрузке (накладная и другие) и после их проверки банком получает от последнего в форме аванса значительную часть (до 90% от суммы отгруженных товаров), не дожидаясь осуществления платежа от своего покупателя. Остаток денежных средств, за вычетом комиссии банка, зачисляется на счёт продавца по мере фактического прихода денежных средств покупателя на факторинговый счёт банка. В данном случае банк выступает в качестве лица, авансирующего товарный кредит, предоставляемый продавцом покупателю с последующим возмещением продавцу остатка суммы поставки. Таким образом, за счёт заключённого соглашения с банком о безусловном предоставлении денежных средств против акцептованных банком товарно-транспортных документов по отгрузкам с отсрочками платежа продавец получает возможность планирования своих финансовых потоков вне зависимости от платёжной дисциплины своих покупателей. Достаточно часто торговый оборот продавца ограничивается тем, что покупатель не в состоянии оплатить больший объём закупки из-за отсутствия для этого достаточных оборотных средств, и продавец, соответственно, не имеет оборотных средств, необходимых для увеличения товарного кредита покупателю. Факторинг в этом случае позволяет продавцу товаров предложить своим покупателям товарный кредит, ограниченный лишь сбытовыми возможностями покупателя. Иногда факторинг пытаются сравнивать с банковским кредитом, хотя они имеют различную природу и направлены на удовлетворение разных потребностей заёмщиков. Банковский кредит характеризуется срочностью, что предполагает его погашение через определённый срок; и в этом плане он абсолютно неприемлим для финансирования поставок товаров с отсрочкой платежа. Факторинговое финансирование выплачивается в день поставки товара на срок фактической отсрочки платежа (до 90 календарных дней). Размер фактического финансирования не ограничен и может безгранично увеличиваться по мере роста объёма продаж клиента. Для факторингового финансирования никакого обеспечения не требуется. Факторинговое финансирование погашается из денег, поступающих от дебиторов клиента. Факторинговое финансирование погашается в день фактической оплаты дебитором поставленного товара. При факторинге переход компании на расчётно-кассовое обслуживание в банк не требуется. В банковском секторе России Факторинг представляет собой финансирование продавца в обмен на уступку денежного требования к покупателю за отгруженные товары или оказанные услуги в пользу Банка. По договору факторинга, продавец, отгрузив товары или оказав услуги на условиях отсрочки платежа, получает денежные средства от Банка до наступления

срока платежа от покупателя. Факторинг является идеальной формой краткосрочного финансирования, ориентированного на широкий спектр как производственных и торговых компаний, так и компаний, занятых в сфере услуг независимо от их формы собственности. Использование факторинга наиболее эффективно для небольших, и средних предприятий, расширяющих объёмы продаж или выходящих на новые рынки, испытывающих недостаток денежных средств из-за несвоевременности поступления платежей от дебиторов, наличия чрезмерных запасов, трудностей в организации производственного процесса. За счёт использования факторинга у продавца отпадает необходимости мобилизации крупных денежных ресурсов к определённой дате для погашения задолженности перед банком – погашение задолженности происходит при поступлении денежных средств банку от третьего лица – покупателя товаров. Также нет необходимости представлять банку материальное обеспечение (в виде недвижимости, товаров, ценных бумаг и прочих материальных активов), поскольку у банка уже есть переданное продавцом товара право на получение денежных средств с должника. В целях минимизации своих рисков Банк оставляет за собой право востребовать задолженность со своего клиента в случае нарушений условий оплаты денежных требований должниками. Используя факторинг, продавец получает следующие выгоды:- (i) возможность получения денежных средств сразу после поставки товара (до 90%); (ii) ускорение оборачиваемости оборотных средств; (iii) возможность значительно увеличить товарный оборот за счёт покупателей, не готовых работать на условиях оплаты по факту; (iv) оперативно менять условия поставок, имея в наличии достаточное количество оборотных средств; (v) обеспечение конкурентоспособности в связи с возможностью увеличения объёма закупок и поддержания достаточности ассортимента товаров; (vi) увеличение количества покупателей; (vii) финансирование производится без залога; (viii) погашение осуществляется покупателем (нет необходимости в срочной мобилизации ресурсов, кроме того, деньги не отвлекаются на погашение кредитов, а идут на оплату поставщикам); (ix) улучшение показателей публичной финансовой отчётности (оборачиваемость дебиторской задолженности, оборачиваемость кредиторской задолженности, финансовая независимость, текущая ликвидность); и (x) получение льготных условий на покупку товаров у своих поставщиков за счёт улучшения финансовой дисциплины и тем самым повышение конкурентоспособности в занимаемом сегменте рынка. За счёт использования факторинга продавец может предоставить своему покупателю следующие возможности:- (i) предоставление товарного кредита (отсрочка платежа); (ii) увеличение объёма закупок в связи с получением более льготных условий оплаты; и (iii) эффективное использование оборотных средств в связи с предоставлением отсрочки оплаты товаров (работ, услуг). Схема классического Факторинга:- (i) поставка товара на условиях отсрочки платежа; (ii) уступка права требования долга по поставке банку, передача товарораспорядительных документов в банк; (iii) выплата досрочного платежа сразу после поставки; (iv) оплата за поставленный товар; и (v) выплата остатка средств за минусом комиссии. Отличительные особенности факторинга:- (i) не требуется оформление залога и не производятся связанные с этим затраты (на оформление залога, страхование и так далее); (ii) рост объёма финансирования происходит вместе с ростом объёма продаж; (iii) не отвлекаются средства из оборота для погашения финансирования (погашение осуществляется денежными средствами, поступающими от дебиторов); (iv) для получения финансирования достаточно предоставить в банк товарораспорядительные документы; (v) обслуживание производится бессрочно; (vi) финансирование происходит независимо от объёмов полученных кредитов; и (vii) предъявляются менее жёсткие требования к финансовому состоянию поставщика. Плюсы факторинга:- обычно поставщики обращаются к факторинговым компаниям по трём вопросам:- (i) нехватка денежных средств; (ii) построение продаж в кредит; и (iii) страхование рисков. С точки зрения денежных средств факторинг решает такие проблемы, как:- (1) расширение доли компании на рынке. У поставщика появляется возможность привлечь новых клиентов, увеличить ассортимент товара на складе и, как следствие, увеличить оборот и прибыль. (2) Повышение ликвидности дебиторской задолженности. Поставщик получает деньги сразу же после отгрузки товаров с отсрочкой платежа. Выплачиваемое финансирование автоматически увеличивается по мере роста продаж. (3) Ликвидация кассовых разрывов. Чёткое планирование поступления денежных средств и погашение собственной задолженности. Поставщик может построить план выплаты факторингового финансирования ‘под свою компанию’, то есть получать деньги именно в тот день, когда ему необходимо и именно в том объёме, какой требуется на данный момент. (4) Своевременная уплата налогов. В соответствии с 25 главой Налогового Кодекса РФ уплата налогов должна осуществляться по факту отгрузки товаров и услуг. Получая финансирование в рамках факторингового обслуживания в день отгрузки товара, поставщика не будут беспокоить ‘расчёты’ с государством. Компания-поставщик получает гарантию защиты от штрафных санкций со стороны кредиторов (в том числе государственных органов) при несвоевременных расчётах с ними, вызванных кассовым разрывом. Дополнительной возможностью является получение финансирования к дате налоговых платежей. (5) Своевременная оплата контрактов. Сокращение сроков отсрочки платежа при закупках товаров ведёт к лучшим ценовым условиям на закупаемый товар и увеличению размеров товарных кредитов, получаемых от собственных поставщиков. В коммерческом аспекте эффективность факторинга выражается в том, что банк оказывает содействие в плане кредитного менеджмента. Банк контролирует своевременность оплаты поставок покупателями, проверяет платёжную дисциплину и деловую репутацию покупателей, эффективно управляет дебиторской задолженностью. Банк в рамках факторинга позволяет клиенту управлять своими рисками, избегать отгрузок недобросовестным покупателям, грамотно строить лимитную и тарифную политику при осуществлении товарного кредитования. Кроме того, при факторинговом обслуживании поставщик защищён от массы рисков. Речь идёт, прежде всего,:- (i) о кредитном риске, то есть неоплате поставки покупателем вовсе; (ii) о риске нарушения ликвидности, то есть риске несвоевременной оплаты; и (iii) о валютном риске (риск изменения курса, допустим, Доллара в период отсрочки платежа по поставке). Кому нужен факторинг? Несмотря на все выгоды факторинговых операций, далеко не везде они могут применяться с равной эффективностью. Ведь факторинг может использоваться лишь как инструмент краткосрочного привлечения ресурсов. По нашим данным, в 44 случаях из 100 факторинговое финансирование по одной сделке в 2004 году предоставлялось на срок 31–60 дней. На срок до 90 дней было заключено 90% всех сделок. В то же время сам договор факторинга между поставщиком и фактором обычно носит бессрочный характер, в его рамках поставщик, в тех случаях, когда ему необходимо получить финансирование сразу после отгрузки товара, уступает фактору права денежных требований к своим покупателям. Факторинг подходит предприятиям, осуществляющим регулярные поставки товаров, потому что в этом случае услуги фактора по управлению дебиторской задолженностью наиболее ценны. ‘Если предприятие поставляет ёлочные игрушки, которые пользуются спросом раз в год, или турбины для атомных ледоколов, которые покупают ещё реже, то факторинг ему не нужен’, – мнение одного эксперта. Идеальная среда для использования факторинга – торговля потребительскими товарами, причём воспользоваться этими услугами могут как непосредственные производители, так и оптовые компании или розничные торговцы. По данным исследования одного из Российских банков, 81% принятой на обслуживание дебиторской задолженности принадлежит производственным компаниям и лишь 19% – торговым. По его оценке, в действительности доля торговых компаний среди клиентов выше:- дело в том, что в составе промышленных холдингов часто присутствуют собственные торговые компании. Среди промышленных компаний более трети потребителей факториньга – это производители пищевой продукции, чуть менее половины из них – производители алкогольной продукции. Две трети сделок заключены с производителями продуктов питания и потребительских товаров:- пищевой промышленности (33%), бытовой техники и электроники (16%), химии и нефтехемии (в основном средств бытовой химии, 12%), лёгкой промышленности (5%). Такая же структура характерна для факторинговых

сделок с оптовиками и розничными торговцами. Для них привлекательность факторинга обусловлена тем, что даже довольно крупные компании часто не располагают имуществом, которое могло бы быть передано в залог под кредит. Одна из причин того, что факторинг особенно востребован в пищевой отрасли, заключается в том, что там наиболее сильны позиции зарубежного бизнеса – как производителей, так и торговых компаний. Эти компании оценивают стоимость отсрочки платежа на Российском рынке довольно высоко, поскольку вообще считают Российский рынок высокорисковым. В такой ситуации обращение к факторинговой компании становится для Западного поставщика спасением. Российская факторинговая компания на месте имеет больше возможностей для оценки подобных рисков и обычно оценивает их значительно ниже, поэтому такие сделки очень выгодны и для Западных поставщиков, и для Российских факторинговых компаний. При том, что отраслевая структура предприятий – клиентов факторинговых компаний довольно специфична и чётко обозначена, размер предприятия-клиента не оказывает существенного влияния на привлекательность для него факторинга. ‘Приблизительно пятнадцать процентов нашего факторингового портфеля приходится на сделки с малыми предприятиями, тридцать пять процентов – со средними и пятьдесят процентов – с крупными’, – говорит один из экспертов. По словам другого эксперта, доля сделок с малыми и средними компаниями в факторинговом портфеле его банка составляет 80–90%. У некоторых банков – прямо противоположная ситуация. ‘На данный момент среди наших клиентов очень высока доля крупных предприятий, – говорит эксперт из такого банка. – Сейчас мы активно работаем над тем, чтобы увеличить долю малых и средних компаний’. Таким образом, факторинг привлекателен для большинства компаний, независимо от масштабов их бизнеса. Малым компаниям он позволяет получать финансирование без залога. Средние предприятия в факторинге привлекает страхование рисков и административное управление дебиторской задолженностью. Крупным предприятиям факторинг позволяет ‘расчистить’ баланс – уменьшить дебиторскую задолженность без увеличения кредиторской. Это особенно важно, если предприятие намерено привлечь инвесторов. Кроме того, для крупных предприятий всегда актуален вопрос избавления от дебиторской задолженности. Доля сделок с региональными клиентами составляет в портфелях факторов немногим меньше половины. Большая часть факторинговых сделок заключается в Москве (58%), далее идут Приволжский и Уральский регионы. Такое региональное распределение сделок говорит скорее о существующей структуре спроса, нежели о нежелании факторов работать с клиентами из регионов. Для сделок Российских лизинговых компаний характерно почти такое же региональное распределение, хотя рынок лизинга более зрелый, а лизинговых компаний в регионах существенно больше, чем факторинговых. Стать клиентом факторинговой компании или банка легко:- большинство факторов не имеет строгих критериев выбора клиентов. Например, руководство одной из Российских факторинговых компаний на заседании специального комитета два раза в неделю принимает решения о новых сделках. Прежде всего, во внимание принимаются платёжеспособность дебиторов, а также долгосрочность отношений с клиентом, поскольку факторинг наиболее эффективен при регулярных сделках. В некоторых банках основное требование к клиенту заключается в том, что дебиторская задолженность одного дебитора не должна превышать 15% от всей дебиторской задолженности. В других же банках принимаются денежные требования от клиента на сумму не менее 2 миллионов Рублей, кроме того, на факторинговое обслуживание должны передаваться платежи не менее трёх дебиторов одного поставщика; и так далее. Факторинг – это комплекс услуг для поставщиков товаров или услуг, предоставляющих отсрочку платежа. По своей сути он является разновидностью посреднической деятельности, при которой факторинговая компания (банк) за определённую плату получает от предприятия право взыскивать и зачислять на его счёт причитающиеся ему от покупателей суммы денег. Одновременно с этим посредник кредитует оборотный капитал клиента и принимает на себя его кредитный и валютный риски. Схема реализации факторинга:- (1) С компанией (фирма–фактор, как правило банк) продавец заключает договор о факторинговом обслуживании и согласовывает перечень покупателей для проведения факторинговых операций. (2) Продавец осуществляет поставку товара (услуг, работ) покупателю на условиях отсрочки платежа. (3) Покупатель подтверждает поставку предоставлением соответствующих документов. (4) Продавец передаёт полученные документы (подтверждающие дебиторскую задолженность) компании – фактору. (5) Продавец отправляет сообщение покупателю-дебитору о новых реквизитах для оплаты и подтверждение о вручении покупателю передаёт компании-фактору. (6) Компания-фактор перечисляет на счёт продавца авансовый платёж в размере до 80% от суммы, указанной в документах. (7) Дебитор-покупатель оплачивает сумму поставки на счёт компании-фактора. (8) Компания-фактор перечисляет остаток суммы по документам за вычетом своего дохода по факторингу продавцу. Функции факторинга:- (1) Финансирование:- основная функция факторинга – предоставление финансовых средств поставщику продукции после её отгрузки или в определённый договором факторинга день. Таким образом, поставщик имеет возможность поставлять продукцию своим покупателям с отсрочкой платежа, при этом получать значительную часть от суммы поставки сразу же после поставки или по удобному для него графику, не дожидаясь платежа от своего покупателя. Если компания нацелена на увеличение объёма продаж, то она имеет возможность постоянно пускать деньги в оборот и при этом конкурировать с другими поставщиками за клиентов, предоставляя отсрочку платежа. Также поставщик, заключив договор факторинга, заранее знает, в какой день деньги поступят на его счёт. (2) Управление дебиторской задолженностью:- факторинг позволяет клиенту также избавиться от рутинной работы, связанной с отслеживанием состояния дебиторской задолженности, напоминанием дебиторам о задержках платежей. Обычно факторинговая компания по первому требованию поставщика предоставляет ему отчёт о состоянии дебиторской задолженности, включающий в себя информацию обо всех поставках поставщика и платежах его покупателей. Также в случае безрегрессного факторинга фактор берёт на себя заботу о взыскании долгов с дебиторов, что особенно актуально для небольших компаний, не располагающих собственными ресурсами для инкассации. Это позволяет им экономить трудовые и финансовые ресурсы. (3) Покрытие финансовых рисков:- фактор может покрывать риски связанные с поставкой товаров с отсрочкой платежа, в том числе неполучения платежа от покупателя в связи с его неплатёжеспособностью. (4) Оценка платёжеспособности покупателей поставщика:- в странах, где кредитные бюро и рэйтиньговые агентства развиты, эта функция факторинговых компаний является не самой востребованной. В странах же с переходной экономикой факторинговые компании могут играть роль кредитных бюро и рэйтиньговых агентств, аккумулируя информацию о платёжной дисциплине компаний. Помимо этого, факторинговые компании могут использовать различные методы оценки платёжеспособности потенциальных покупателей поставщика. Основные преимущества факторинга для продавца:- (i) получение беззалогового финансирования для пополнения оборотных средств в объёме до 90% от суммы отгруженного и неоплаченного дебитором товара (предоставленных услуг, выполненных работ); (ii) предоставление дебиторам отсрочки платежа, которая не повлияет на краткосрочную ликвидность баланса клиента и состояние его расчётов с кредиторами; (iii) увеличение объёмов поставок дебиторам на условиях товарного кредита; (iv) увеличение количества потенциальных покупателей; (v) покрытие финансовых рисков, связанных с отсрочкой платежа:- (a) риска несвоевременной оплаты поставок покупателями, (b) риска неуплаты поставок покупателями (в случае факторинга без регресса), (c) риска изменения валютного курса на протяжении периода отсрочки платежа по поставке, и (d) риска резкого изменения рыночной стоимости денежных ресурсов; (vi) улучшение платёжеспособности поставщика товара (работ, услуг) для проведения своевременных расчётов с кредиторами, что способствует укреплению финансовой позиции и делового имиджа. Основные преимущества факторинга для покупателя:- (i) получение от поставщика продукции (услуг, работ) с отсрочкой платежа (товарный кредит); (ii) снижение затрат по

финансированию оплаты поставки (факторинговые услуги оплачивает поставщик); и (iii) увеличение объёмов закупок без привлечения дополнительного капитала. Отличие финансирования при факторинге от других банковских продуктов:- иногда факторинг пытаются сравнивать с кредитом, хотя факторинг и банковский кредит имеют различную природу и направлены на удовлетворение разных потребностей поставщиков. Кредит характеризуется срочностью, что предполагает его погашение через определённый срок. Таким образом, банковский кредит абсолютно неприемлем для финансирования поставок с отсрочкой платежа. Сегодня в России большинство кредитов выдаются на срок до года. Факторинг же на сегодняшний день является единственным бессрочным пассивом в Российской экономике и позволяет планировать программу развития на многие годы вперед. Другой особенностью кредита является необходимость предоставления залога для его получения. Принципиальное отличие факторинга и кредита заключается в том, что кредит ориентирован на успехи компании в прошлом, на те активы, которые были заработаны вчера, факторинг же ориентирован на будущие успехи в продажах, и даже если продажи вырастут в 5 раз, это не будет ограничением для финансирования в рамках факторинга. Факторинг – приобретение права на взыскание долгов, на перепродажу товаров и услуг с последующим получением платежей по ним. При этом речь идёт, как правило, о краткосрочных требованиях. Другими словами, факторинг является разновидностью посреднической деятельности, при которой фирма-посредник (факторинговая компания) за определённую плату получает от предприятия право взыскивать и зачислять на его счёт причитающиеся ему от покупателей денежные суммы (право инкассировать дебиторскую задолженность). Одновременно с этим посредник кредитует оборотный капитал клиента и принимает на себя его кредитный и валютный риски. В Российском законодательстве под факторингом понимают договор финансирования под уступку денежного требования. Договор, по которому одна сторона (финансовый агент) передаёт или обязуется передать другой стороне (клиенту) денежные средства в счёт денежного требования клиента (кредитора) к третьему лицу (должнику), вытекающего из предоставления клиентом товаров, выполнения им работ или оказания услуг третьему лицу, а клиент уступает или обязуется уступить финансовому агенту это денежное требование. Денежное требование к должнику может быть уступлено предприятием-клиентом финансовому агенту также в целях обеспечения исполнения обязательства клиента перед финансовым агентом. Обязательства финансового агента по договору финансирования под уступку денежного требования могут включать ведение для клиента бухгалтерского учёта, а также предоставление клиенту иных финансовых услуг, связанных с денежными требованиями, являющимися предметом уступки. В качестве финансового агента договор финансирования под уступку денежного требования могут заключать банки и иные кредитные организации, а также другие коммерческие организации, имеющие разрешение (лицензию) на осуществление деятельности такого вида. Предметом уступки, под которую предоставляется финансирование, может быть как денежное требование, срок платежа по которому уже наступил (существующее требование), так и право на получение денежных средств, которое возникнет в будущем (будущее требование). Денежное требование, являющееся предметом уступки, должно быть определено в договоре клиента с финансовым агентом таким образом, чтобы позволять идентифицировать существующее требование в момент заключения договора, а будущее требование – не позднее чем в момент его возникновения. Этот тип договора широко применяемый в международной практике под названием ‘Факторинг’ в России впервые получил закрепление во второй части нового Гражданского Кодекса Российской Федерации (ГК РФ). Факторинговые операции возникли на основе коммерческого кредита, который предоставляется продавцами покупателям в виде отсрочки платежа за проданные товары. Изменение требований к расчётам с точки зрения ускорения оборота средств вызвали необходимость для поставщиков искать пути решения проблемы дебиторской задолженности. Факторинг является сравнительно новой эффективной системой улучшения ликвидности и уменьшения финансового риска при организации платежей. Коммерческие банки, развивая эти операции, дополняют их элементами бухгалтерского, информационного, рекламного, сбытового, юридического, страхового и другого обслуживания клиентов. Это позволяет расширять круг клиентов банка, усиливать связь с ними, увеличивать прибыль банка за счёт расширения операций. В соответствии с Конвенцией о международном факторинге, принятой в 1988 Международным институтом унификации частного права, операция считается факторингом в том случае, если она удовлетворяет как минимум двум из четырёх признаков:- (1) наличие кредитования в форме предварительной оплаты долговых требований; (2) ведение бухгалтерского учёта поставщика, прежде всего учёта реализации; (3) инкассирование его задолженности; и (4) страхование поставщика от кредитного риска. Вместе с тем в ряде стран к факторингу по-прежнему относят и учёт счетов-фактур – операцию, удовлетворяющую лишь одному, первому из указанных признаков. Финансовые институты, которые предоставляют факторинговые услуги называются фактор-фирмами. Они создаются крупнейшими банками (или сами банки выполняют функции фактор-фирм), что обеспечивает высокую надёжность факторинговых сделок и минимальные издержки для клиентов. Разветвлённая сеть специализированных филиалов для факторингового обслуживания предприятий в различных странах создана крупными транснациональными корпорациями. На международном уровне действует ассоциация Фэкторз Чэйн Интёнэшл, членами которой являются 95% факторинговых компаний из 40 стран мира. В операции факторинга обычно участвуют три лица:- фактор (банк) – покупатель требования, первоначальный кредитор (клиент) и должник, получивший от клиента товары с отсрочкой платежа. Операция факторинга заключается в том, что факторинговый отдел банка покупает долговые требования (счета-фактуры) клиента на условиях немедленной оплаты до 80% стоимости отфактурованных поставок и уплаты остальной части, за вычетом процента за кредит и комиссионных платежей, в строго обусловленные сроки независимо от поступления выручки от дебиторов. Если должник не оплачивает в срок счета факторинга, то выплаты вместо него осуществляет факторинговый отдел. Факторинговое обслуживание наиболее эффективно для малых и средних предприятий, которые традиционно испытывают финансовые затруднения из-за несвоевременного погашения долгов дебиторами и ограниченности доступных для них источников кредитования. Вместе с тем не всякое предприятие, относящееся к категории малого или среднего, может воспользоваться услугами факторинговой компании. Так, факторинговому обслуживанию не подлежат:- (i) предприятия с большим количеством дебиторов, задолженность каждого из которых выражается небольшой суммой; (ii) предприятия, занимающиеся производством нестандартной или узко специализированной продукции; (iii) строительные и другие фирмы, работающие с субподрядчиками; (iv) предприятия, реализующие свою продукцию на условиях послепродажного обслуживания, практикующие компенсационные (бартерные) сделки; и (v) предприятия, заключающие со своими клиентами долгосрочные контракты и выставляющие счета по завершении определённых этапов работ или до осуществления поставок (авансовые платежи). Факторинговые операции также не производятся по долговым обязательствам физических лиц, филиалов или отделений предприятия. Подобные ограничения обусловлены тем, что в указанных случаях факторинговой компании достаточно трудно оценить кредитный риск или невыгодно брать на себя повышенный объём работ, а также дополнительный риск, возникающий при переуступке таких требований, оплата которых может быть не произведена в срок по причине невыполнения поставщиком каких-либо своих договорных обязательств. Помимо этого, поставщик должен производить товары или оказывать услуги высокого качества, иметь перспективы быстрого расширения производства и увеличения прибыли (только в этом случае предприятию будет выгодно оплачивать достаточно высокую стоимость услуг факторинговой компании) и сугубо временные причины нехватки денежных средств — из-за несвоевременного погашения долгов дебиторами, а также недостаточного уровня прибыли, чрезмерных товарных запасов и трудностей, связанных с производственным процессом.

FACTORING HOUSES = ФАКТОРИНГОВЫЕ ДОМА – A Factoring House, or Factor, is a bank or specialized financial firm that performs financing through the purchase of invoices or accounts receivable. A form of factoring, export factoring, is offered under an agreement between the factor and exporter, in which the factor purchases the exporter's short-term foreign accounts receivable for cash at a discount from the face value, normally without recourse. The factor also assumes the risk on the ability of the foreign buyer to pay, and handles collections on the receivables. Factoring Houses are the certain companies which purchase export receivables, e.g., the invoices to foreign buyers, at a discounted price, usually about two to four percent less than their face value. / Во внешнеэкономической сфере к Факторинговым Домам относятся компании, которые приобретают денежные поступления, причитаемые за экпорт товаров или услуг, например, такие компании покупают по сниженной цене выставляемые экпортёром (продавцом) счета-фактуры. Скидка от цены в таких случаях составляет обычно от двух до четырёх процентов от цены, указанной в данных счетах-фактурах.

FACTORS = ФАКТОРЫ – (1) Factors of production are the scarce resources that are useful not so much for direct and immediate satisfaction of human wants as for producing other goods or services. Economists often find it useful for purposes of theoretical simplification to group the millions of different sorts of factors of production into several very broad categories and then discuss them as though all the items within each category were perfectly substitutable for each other and therefore traded on a single market. The simplest such conventional categorization of the factors of production divides them into land, labor, capital, and sometimes also entrepreneurship and/or human capital. In economics, Factors of production are the resources required to produce a commodity. There are three main factors of production:- labor; land, which includes natural resources; and capital, which consists of goods that have been produced by the last two factors and are used for further production of goods and services. / Под Фактором, от Латинского слова Factor, означающее Делающий или Производящий, понимается .

(2) Growth Factors are fundamental components of economic growth, mainly foreign trade, innovation, investment, and population. / К Факторам роста относятся фундаментальные компоненты экономического роста, главными из которых являются международная торговля, инновация, инвестиции и население.

FACTORY DELIVERY = ВНУТРИФАБРИЧНАЯ ПОСТАВКА – Factory Delivery is the delivery of goods by a factory whereby the goods are put at the disposal of another (internal) party such as a commercial department. / Поставка товаров фабрикой, посредством которой товары оказываются в распоряжении другой (внутренней) стороны, такой как коммерческий отдел.

FACTS = FINANCIAL ANALYSIS AUDITING COMPLIANCE TRACKING SYSTEM

FACULTATIVE/OBLIGATORY TREATY = ФАКУЛЬТАТИВНЫЙ/ОБЯЗАТЕЛЬНЫЙ ТРАКТАТ – Facultative/Obligatory Treaty is a reinsurance contract which allows the reassured to select which risks of a given type are to be ceded to the reinsurer. The reinsurer is obliged to accept all the cessions made by the reassured provided they fall within the scope of the treaty. When applied to a reinsurance contract this term allows the reassured to cede under the contract only those risks he does not wish to retain; but the reinsurer remains under obligation to accept all cessions that come within the scope of the contract. In direct insurance the term is used in relation to open covers and similar contracts (usually operated by brokers) where the broker is not obliged to declare every item that comes within the scope of the contract, but the insurer is obliged to accept all valid items declared by the broker. / Под Факультативным, от Латинского слова Facultas, означающее Возможность, понимается необязательное.

FACULTATIVE REINSURANCE = ФАКУЛЬТАТИВНОЕ ПЕРЕСТРАХОВАНИЕ – Facultative Reinsurance means reinsurance of individual risks by offer and acceptance wherein the reinsurer retains the 'faculty' to accept or reject each risk offered. Reinsurance of the insurer's risks on an individual basis. The reinsurance company looks at each individual risk and determines whether to accept or decline coverage. / Перестрахование рисков страховщика на индивидуальной основе. Перестраховочная компания рассматривает каждый отдельный риск и определяет для себя и клиента акцептовать или снижать объём покрытия.

FACULTATIVE RISK = ФАКУЛЬТАТИВНЫЙ РИСК – Facultative Risk:- a reinsurance risk that is placed by means of separately negotiated contract as opposed to one that is ceded under a reinsurance treaty.

FACULTATIVE SAPROPHYTE = ФАКУЛЬТАТИВНЫЙ САПРОФИТ – Facultative Saprophyte is an organism living on another living organism during part of its life cycle or living on the dead tissues of its host. / Под Сапрофитами, от Греческих слов Saprós, означающее Гнилой, и Phytón, означающее Растение, понимаются Бактерии, Грибы и Растения, питающиеся органическим веществом отмерших организмов. Таким образом, они разлагают выделения и трупы Животных, а также растительные остатки.

FADAMA = ФЭДЭМА (или ФАДАМА) – Fadama:- naturally flooded plains in Nigeria where Rice grows.

FADE = ПРОТИВОСТОЯТЬ – Fade:- to take an opposite position in the market than the prevailing opinion. Selling into rallies and buying breaks. Also, to disregard a technical indicator's message.

FADE DAY = ДЕНЬ ПРОТИВОСТОЯНИЯ – Fade Day:- look to fade a morning move. Rallies can be sold, dips can be bought. These often follow big range, trend days. / В техническом анализе биржевых рынков, .

FADE–OMETER® = ФЕДОМЕТР® – Fade-Ometer®:- laboratory device used to determine the fastness of a colored fabric to exposure to light. The test pieces are rotated around a light source simulating the sun's rays at 45° N latitude in July between the hours of 09 am and 03 pm. Fabrics are rated by visual comparison with a gray scale according to degree of fading. / Федометр® – прибор для определения светопрочности.

FADINAP = FERTILIZER ADVISORY, DEVELOPMENT AND INFORMATION NETWORK FOR ASIA AND THE PACIFIC

FADING = ФЭДИНЬГ (или ВЫЦВЕТАНИЕ, или ЛИНЯНИЕ, или ЗАТУХАНИЕ, или УВЯДАНИЕ, или УГАСАНИЕ) – Fading is a change in color, usually to a lighter and less-saturated color, normally over time caused by the effects of light and other environmental effects on the colorants in a material. / Под Фэдингом или Федингом понимается то же, что Замирание.

FAF = FUEL ADJUSTMENT FACTOR

FAHRENHEIT TEMPERATURE SCALE = ТЕМПЕРАТУРНАЯ ШКАЛА ФАРЭНХАЙТА (или ТЕМПЕРАТУРНАЯ ШКАЛА ФАРЕНГЕЙТА) – Fahrenheit Temperature Scale is a scale based on 32° for the freezing point of water and 212° for the boiling point of water, the interval between the two being divided into 180 equal parts. The XVIII century German physicist Daniel Gabriel Fahrenheit (born on 1686-May-24 in Gdańsk, Poland and died on 1736-September-16, in The Hague, Dutch Republic (now in The Netherlands)) originally took as the zero of his scale the temperature of an equal ice-salt mixture and selected the values of 30° and 90° for the freezing point of water and normal body temperature, respectively; these later were revised to 32° and 96°, but the final scale required an adjustment to 98.6° for the latter value. The Fahrenheit temperature scale is used in the United States; the Celsius, or centigrade, scale is employed in most other countries and for scientific purposes worldwide. The conversion formula for a temperature that is

expressed on the Celsius (°C) scale to its Fahrenheit (°F) representation is:- °F = (9/5 x °C) + 32. See also Celsius Temperature Scale. Fahrenheit Temperature Scale is a temperature scale in which the freezing point of water is taken as 32 °F and the boiling point of water as 212 °F (or 100 °C) under standard atmospheric pressure. Daniel Gabriel Fahrenheit is a German physicist and maker of scientific instruments. He is best known for inventing the alcohol thermometer (1709) and mercury thermometer (1714) and for developing the Fahrenheit temperature scale; this scale is still commonly used in the United States. Fahrenheit spent most of his life in the Netherlands, where he devoted himself to the study of physics and the manufacture of precision meteorological instruments. He discovered, among other things, that water can remain liquid below its freezing point and that the boiling point of liquids varies with atmospheric pressure. / В XVIII веке Немецкий физик Даниэль Габриэль Фарэнхайт (1686–1736) предложил температурную шкалу, названную его именем. В 1709 изготовил спиртовой, а в 1714 – ртутный термометры. Под Температурной Шкалой Фаренгейта понимается температурная шкала, 1 градус которой (1 °F) равен 1/180 разности температур кипения воды и таяния льда при атмосферном давлении, а точка таяния льда имеет температуру +32 °F. Температура по Шкале Фаренгейта связана с температурой по Шкале Цельсия (t °C) соотношением:- t °C = 5/9 x (t °F – 32), или 1 °F = 5/9 °C. Была предложена Немецким физиком Даниэлем Габриэлем Фарэнхайтом (Daniel Gabriel Fahrenheit; 1686–1736) в 1724.

FAILED TRANSACTION = НЕСОСТОЯВШАЯСЯ (или НАРУШЕННАЯ) ТРАНЗАКЦИЯ (или НЕСОСТОЯВШАЯСЯ (или НАРУШЕННАЯ) ОПЕРАЦИЯ) – Failed Transaction is a securities transaction that fails to settle on the contractual settlement date because one of the counterparties fails to perform. The trade, which usually fails because of technical or temporary difficulties, often settles at a later date.

FAILLE = ФАЙ – Faille is a type of fabric which is woven with a faintly ribbed pattern, creating a distinctive textured feel. This fabric is often used on formal dresses and gowns, and it can also be used to make jackets, vests, skirts and other garments. Drapes and upholstery may utilize faille as well, typically a heavier grade of this fabric which is designed to stand up to hard use. Many fabric stores sell faille in a rainbow of colors for people who want to work with it, and the fabric also appears in garments in department stores, for people who want ready to wear garments. Cotton, rayon, and silk can all be used to create faille, which is also called Bengaline in some regions of the world. In all cases, the texture of the fabric is like that of grosgrain; it is ribbed and slightly stiff. The stiffness makes faille incredibly useful for clothing, as it tends not to deform or wrinkle, and it can be used to create supportive garments or snug-fitting bodies which will look good after hours of wear. This fabric is primarily worn by women. It has an excellent drape, which is why it often appears in wedding gowns, and it was historically popular during the 1940s and 1950s for gowns and dresses. This fabric is also durable and often quite rugged; it is often very resistant to stains and tearing, for example. When the woven fabric is made with heavier materials, it can sometimes withstand quite intensive and varied uses. Like other ribbed fabrics, faille has to be cut carefully. When you are assembling a pattern, think about how the pieces will fit together, as you want to avoid creating strange patterns with the ribbing of the faille. Ideally, the ribbing of two connecting pieces should match up for a smooth look; avoid perpendicular angles unless you are going for a very specific desired look. It is also important to make strong hems and seams, so that the fabric will not ravel. In addition to stocking faille in a variety of colors, many fabric supply stores carry undyed or white fabric which you can dye to your own specifications. Since ribbed fabrics can be challenging to dye at times, it is a good idea to consult someone who is experienced with textiles about dyeing faille, to ensure that you get a smooth, even look. Faille is a glossy, soft, finely-ribbed silk-like woven fabric made from cotton, silk, or manufactured fibers. Faille is a soft, slightly glossy woven fabric made of silk, rayon, cotton, wool, or manufactured fibers or combinations of these fibers and having a light, flat crossgrain rib or cord made by using heavier yarns in the filling than in the warp. Faille is a glossy, ribbed, woven fabric of silk, rayon, cotton or polyester; it is soft and lightweight. Faille is a soft, slightly glossy silk, rayon, acetate, cotton, wool, or a mixture of these, in a rib weave, that has a light, flat, narrow crosswise rib or cord. It is made by using heavier yarns in the filling than in the warp, and has more ribs to the inch than bengaline. Ottoman is similar to faille but has a wider rib. Faille is considered a dressy fabric, and is used for evening clothes, tailored dresses, coats, suits, ties, handbags, shoes, and draperies. See also Ottoman. Faille:- a somewhat shiny/lustrous closely woven silk, rayon, or cotton fabric characterized by slight ribs in the weft. Finer than gros grain but in that family – ribs are also flatter than in grosgrain. Some belongs to the crepe family. It is rather difficult to launder. Will give good wear if handled properly. / уточина. развод (или потёк (stain)). Бэнгалин (Bengaline). Под Фаем, от Французского слова Faille, означающее Фай или Сдвиг или Сброс или Разлом или Перелом или Шёлковая Ткань, понимается плотная ткань с мелкими поперечными рубчиками, образующимися из-за разницы в толщине и плотности основы и утка. Шёлковый фай (файдешин) применяют для пошива платьев, знамён; шерстяной фай – для пошива костюмов, платьев.

FAILLE CRÊPE = ФАЙ КРЭП – Faille Crêpe is a silk, rayon, acetate, or other man-made fiber dress fabric with a decided wavy (crêpe) cord fillingwise. It is used for negligees, blouses, daytime and evening dresses, handbags, and trims. See also Crêpe, and Faille. / по уточине. Смотрите также Крэп (Crêpe), и Фай (Faille).

FAILLE TAFFETA = ФАЙ ТАФТА – Faille Taffeta is a taffeta made with a prominent crosswise rib as in faille. See also Faille, and Taffeta. Faille Taffeta:- made with a crosswise rib weave. Has a distinct rib effect and is usually quite heavy and firm. / Смотрите также Фай (Faille), и Тафта (Taffeta).

FAIR = FEDERATION OF AFRO–ASIAN INSURERS ANS REINSURERS

FAIR AVERAGE QUALITY = СНОСНОЕ СРЕДНЕЕ КАЧЕСТВО (или ДОСТАТОЧНО ХОРОШЕЕ СРЕДНЕЕ КАЧЕСТВО) – Fair Average Quality (FAQ) is a term used in grain marketing in some countries to describe the current year's grain quality on the basis of an average sample. The FAQ is a class of grain which is said to represent the quality of a commodity produced in a given year. FAQ standards of quality may change from year to year.

FAIR ISLE = ОСТРОВ ФЭА (или ПРЕКРАСНЫЙ ОСТРОВ) – Fair Isle is an article of clothing knitted in Fair Isle style, namely a style of knitting originating in the Shetland Islands that is characterized by bands of multicolored geometric patterns.

FAIR MARKET PRICE = СПРАВЕДЛИВАЯ РЫНОЧНАЯ ЦЕНА – Fair Market Price is a reasonable price for assets based on supply and demand. / Приемлемая цена для активов, основанная на балансе спроса и предложения.

FAIR MARKET VALUE = СПРАВЕДЛИВАЯ РЫНОЧНАЯ СТОИМОСТЬ – (1) Fair Market Value is a price at which property would change hands between a buyer and a seller without any compulsion to buy or sell, and both having reasonable knowledge of the relevant facts. Fair Market Value is the price a willing buyer will pay and a willing seller will accept for real or personal property. / Под Справедливой Рыночной Ценой предусматривается цена по которой покупатель, желающий купить, будет покупать, а продавец, желающий продать, будет получать оплату за реальное или персональное имущество или собственность.

(2) In insurance, Fair Market Value is a value on open market of goods of similar age and condition. / В страховании, стоимость товаров аналогичного срока выпуска и в аналогичном состоянии на открытом рынке.

FAIR RETURN = СПРАВЕДЛИВАЯ ОТДАЧА (или УДОВЛЕТВОРИТЕЛЬНАЯ НОРМА ПРИБЫЛИ, или УДОВЛЕТВОРИТЕЛЬНАЯ РЕНТАБЕЛЬНОСТЬ) – Fair Return is a profit level that enables a carrier to realize a rate of return on

investment or property value that the regulatory agencies deem acceptable for that level of risk. / Уровень прибыли, который позволяет перевозчику реализовать ставку отдачи по инвестициям или от стоимости собственности, которые регулирующие агентства рассматривают в качестве приемлемых для данного уровня риска.

FAIR TRADE = СПРАВЕДЛИВАЯ ТОРГОВЛЯ (или ДОБРОСОВЕСТНАЯ ТОРГОВЛЯ) – Fair Trade:- furthermore, concerning the latter criticism, as a result of unregulated competition in global commodity markets since the 1970s, prices for many agricultural developing country exports, including Cocoa, Coffee, Cotton, and sugar, have fallen by 30 to 60 percent. Fair trade advocates do not believe that current market prices for many agricultural commodities. The modern fair trade movement evolved in Europe during the 1960s as an outgrowth of leftist student organizations protesting multinational corporations' 'exploitative' trade relationships with producers in economically vulnerable developing countries. In 1968 the United Nations Conference on Trade and Development adopted 'Trade not Aid' as its mantra, and focused its transnational organizational efforts on establishing a commercial fair trade framework between multinational corporations ('importers') and economically developing nations ('exporters'). Since 1994 the European Union (EU) has been on record supporting fair trade, with the European Parliament passing the Resolution on Fair Trade in 1998, and the European Commission in 1999 adopting the Communication from the Commission to the Council on Fair Trade. On 2006-July-06, the European Parliament unanimously passed 'Fair Trade and Development', a resolution suggesting the development of an EU wide policy on fair trade. Fair trade advocates argue that there is both a market failure associated with the present international trade system and a long term commodity crisis adversely affecting developing country producers. Addressing the former criticism, Oxford University professor Alex Nicholls and Charlotte Opal, director of product development, Transfair USA, argue that reflect the actual costs of production, including environmental and social costs absorbed by producers, and therefore recommend a stable minimum price system remedy. According to a definition developed in December 2001 by an informal group of four major international fair trade import federations, which include the Fairtrade Labelling Organizations International, International Fair Trade Association, Network of European Workshops, and the European Fair Trade Association, popularly referred to by the acronym FINE. Fair Trade is a trading partnership, based on dialogue, transparency and respect that seek greater equity in international trade. It contributes to sustainable development by offering better trading conditions to, and securing the rights of, marginalized producers and workers especially in the South. Fair Trade Organizations, backed by consumers, are engaged actively in supporting producers, awareness raising and in campaigning for changes in the rules and practice of conventional international trade. The fair trade principles referred to in the above FINE definition include the following guidelines:- (i) Fair Price:- farm and handcraft cooperatives are guaranteed a 'floor' price from importers (referred to as a 'Fair Trade Minimum'); in addition to this minimum guaranteed price, a premium price (referred to as a 'Fair Trade Premium') is added by importers for the sale of certified organic farm products, for example. (ii) Fair Labor:- agricultural and handcraft workers are entitled, when they deem necessary, to the freedom to associate (i.e. the opportunity to join a labor union), equal employment opportunities, safe working conditions, and to receive living wages. Also, no forced labor or exploitative child labor is employed in the production process. (iii) Market Access and Sustainable Trading Relationships:- importers will make every effort to develop long term, direct purchasing relationships with agricultural and handcraft cooperatives, thereby eliminating so called Middlemen in the supply chain; increasing profit margins for producers; and further developing farmers and crafts peoples' knowledge base and business skills, thus allowing them to effectively compete in the global marketplace. (iv) Democratic Cooperative Organizations and Community Development:- in free association, farmers and craft workers democratically, and transparently, decide how to invest fair trade revenue in sustainable business operations and, with their Fair Trade Premium revenue, community social, economic, and environmental development projects. (v) Environmental Sustainability:- farmers utilize environmentally safe and sustainable agricultural production methods that protect owner/employee health and preserve the ecosystem for future cultivation. (vi) Consumer Awareness:- by informing consumers of the need for social justice and trade opportunities, fair trade organizations advocate for developing country producers to acquire consumer support for reform of international trade rules, leading to an equitable international trade system (as the current system of international trade is 'unfair'). When discussing fair trade, there are generally two complementary approaches to trading/marketing agricultural and craft products to consumers:- (i) Integrated Supply Chain:- fair trade organizations, also referred to as Alternative Trading Organizations, employ their marketing expertise (including public awareness campaigns) to import and/or distribute their clientele's products to consumers. (ii) Product Certification:- products complying with established fair trade international standards are formally certified, utilizing a consumer friendly labeling 'mark', to have been produced, traded, processed, and packaged according to the applicable specifications listed in the international standards. Fair trade products are, whenever possible, verified by a credible, independent assurance system. The fair trade product certification system is designed to allow consumers to identify a product (generally, although not exclusively, agricultural in nature) by a 'mark' that informs him/her that it meets certain environmental, labor, and development standards (based upon the fair trade principles described above) in all aspects of production and distribution in the supply chain. In 1997 the Fairtrade Labelling Organization (FLO) was formed as a centralized 'umbrella' organization of 12 fair trade labeling organizations (now consisting of 23 member organizations, traders, and external experts), and in 2002, FLO initiated its International Fairtrade Certification Mark (or the Fair Trade Certified Mark in the United States and Canada), which is granted for a product inspected and certified by its independent certification body, FLO CERT (which itself follows the ISO 65 standard for product certification). FLO CERT, created in 2004 (along with FLO International, the standard setting entity), operates with a network of 72 independent inspectors who regularly audit producer and trade organizations to verify and report on organizational (producer and trader) fair trade practices. As of 2007 the International Fairtrade Certification is used by 632 organizations in 58 developing countries on a range of products, including bananas, cocoa, coffee, cotton, footballs, fruit juices, herbs, honey, nuts, spices, sugar, and wine, among others. In 2007 fair trade-certified product sales were USD3.62 billion globally, with the 2005 Just Food Global Market Review forecasting fair trade-certified sales of USD9 billion in 2012, and USD20–25 billion by 2020. Criticisms of Fair Trade:- opponents of fair trade argue that this concept is similar in application to a farm subsidy. As such, they posit that establishing a Fair Trade Minimum price for a product, which in many cases exceeds the market price, encourages existing producers to expand production while signaling new producers to enter the market the result being excess supply leading to lower prices in the non-fair trade market. While the fair trade market may benefit such producers in the short run, there are potential long term effects on country development and economic growth. For instance, economic theory suggests that when low prices result from surplus production, in this case when artificially raising prices, it will only encourage expanded supply and the misappropriation of human capital into less productive economic activities. Other critics of fair trade argue that the present fair trade standards (as they pertain to product certification) are not strict enough or call for the establishment of a fairer, autonomous trading system not beholden to major retailers and multinational corporations. Proponents of fair trade respond to critics, especially those employing the above mentioned market price distorting argument, by claiming that fair trade pricing does not 'fix' prices, but establishes a product price floor to ensure that farmers and craft workers can meet their cost of sustainable production should market prices fall below this minimum sustainable level. They further argue that the Fair Trade Minimum price is not a 'fixed' price, but only represents an initial starting point for business negotiation, as many fair trade producers who deal in differentiated products, such as coffee bean growers, routinely earn above this price floor for their higher quality, blends, packaging, and social responsibility features associated with their products. Moreover, fair trade proponents argue that, beyond the direct market benefits, there are other nonmarket benefits associated in the fair trade value chain, including increased technical assistance, democratization of markets, and crop diversification programs. Fair Trade is alternative

approach to conventional international trade. It is a trading partnership which aims at sustainable development for excluded and disadvantaged producers. It seeks to do this by providing better trading conditions, by awareness raising and positive marketing. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

FAIR USE = ДОБРОСОВЕСТНОЕ ИСПОЛЬЗОВАНИЕ – Fair Use:- the right set forth in Section 107 of the United States Copyright Act, to use copyrighted materials for certain purposes, such as criticism, comment, news reporting, teaching, scholarship, and research. Section 107 sets out four factors to be considered in determining whether or not a particular use is fair:- (i) the purpose and character of the use, including whether such use is of commercial nature or is for nonprofit educational purposes; (ii) the nature of the copyrighted work; (iii) the amount and substantiality of the portion used in relation to the copyrighted work as a whole; and (iv) the effect of the use upon the potential market for or value of the copyrighted work.

FAIR VALUE = СПРАВЕДЛИВАЯ СТОИМОСТЬ – Fair Value is the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's length transaction. The amount of revenue arising on a transaction is usually determined by agreement between the entity and the buyer or user of the asset. It is measured at the fair value of the consideration received or receivable taking into account the amount of any trade discounts and volume rebates allowed by the entity. Fair Value is the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's length transaction. Fair Value of a stock index futures contract is the current value of the underlying shares or index, plus an amount referred to as the 'Cost Of Carry'. This amount reflects the cost of the money required to buy and hold the basket of stocks which make up the index, less the value of the dividends paid on those shares during the term of the futures contract. The value of the carrier's property; the calculation basis has included original cost minus depreciation, replacement cost, and market value. The reference against which US purchase prices of imported merchandise are compared during an antidumping investigation. Generally expressed as the weighted average of the exporter's domestic market prices, or prices of export to third countries during the period of investigation. In some cases fair value is the constructed value. Constructed value is used if there are no, or virtually no, home market or third country sales or if the number of such sales made at prices below the cost of production is so great that remaining sales above the cost of production provide an inadequate basis for comparison. Theoretical value. Fair Value is a rational estimate of the reasonable price of a security or derivative, i.e. the price at which the financial instrument is neither overvalued nor underrated. In other words it is a hypothetical market price under idealized conditions. If an instrument is not fairly priced, price differentials can be leveraged without any risk, leading to the realization of so-called Arbitrage Profits. Fair Value is the theoretical price at which a futures contract would be expected to trade. Fair Value:- subject of a 2001 EU Directive. This amends the 4th Directive on Annual Accounts, the 7th Directive on consolidated accounts and the Bank Accounts Directive to enable the valuation of certain financial instruments at fair value. The fair value of financial instruments is defined as the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's length transaction. The fair value is determined by reference to the published price quotation in an active market, or generally accepted valuation models if there is no active market. Changes in fair value, even though not realised, generally need to be shown in the company's profit and loss account. Fair value provides a more accurate view of a company's financial position and performance. The main objective of the Directive is to enable companies to fully apply the International Accounting Standards (IAS), including IAS 39 on the valuation of financial instruments. / Теоретическая стоимость.

FAIR VALUE MEASUREMENT = ВЕЛИЧИНА СПРАВЕДЛИВОЙ СТОИМОСТИ – On May 12, 2011, the International Accounting Standards Board (IASB) issued IFRS 13 Fair Value Measurement (IFRS 13). This was the culmination of a convergence project undertaken with the US Financial Accounting Standards Board (FASB), which spanned a number of years and entailed significant consultation with interested parties. The FASB and the IASB (together, the 'Boards') have achieved the goal of establishing a single set of global accounting standards to measure fair value; this means that IFRS 13 is virtually identical to the revised Accounting Standards Codification (ASC) Topic 820 Fair Value Measurement (formerly known as FAS 157). IFRS 13 becomes effective for annual reporting periods beginning on or after January 01, 2013, although early adoption is permitted. IFRS 13 provides a single source of guidance for all fair value measurements, clarifying the definition of fair value and enhancing disclosures about reported fair value estimates. Historically, fair value guidance was spread across various standards and it was incomplete in certain places, while silent in other situations. This created the potential for inconsistency and differences in interpretation when arriving at an estimate of fair value. In providing a single source of guidance and a precise definition of fair value, the standard will (i) assist in improving consistency and comparability, (ii) help preparers and auditors in fulfilling their role, and (iii) contribute to users' understanding of what fair value represents. A key point to highlight is that the standard addresses how to measure fair value, not when to measure it. In practice, this means we do not expect an increase in items reported at fair value, but the newly introduced framework may result in changes to how fair value has been historically measured and disclosed. The Fair Value Framework:- the new fair value definition emphasizes that it is a market based measurement. IFRS 13 provides a new framework to estimate fair value in a consistent manner across standards. This framework highlights areas where attention is to be focused and where determinations need to be made. Some of these key elements are highlighted in the diagram below. Diagram:- The Asset or Liability – Unit of Account; at The Price – Exit Price; in the Principal (or Most Advantageous) Market – Market where market participant would orderly transact the asset or liability; between Market Participants – Independent, knowledgeable, able and willing; at the Highest and Best Use (for Non-Financial Assets) – Current or alternative use? As a 'group' or on a 'standalone basis'?; based on Valuation Techniques – Market, Income, Cost Approach; using Fair Value Hierarchy – Level 1, 2 and 3 Inputs. Some of these elements are discussed in more detail on the following pages. Definition and Measurement Framework:- Definition:- Fair Value is defined as 'the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date'. The exit price notion embodies expectations about the future cash flows associated with the asset or liability from the perspective of market participants at the measurement date, under current market conditions. Entry vs. Exit Price:- When is Fair Value Different from Transaction Price? In the context of an actual exchange transaction, the assumption will often be that the price at transaction date (i.e. the 'entry price') represents the fair value (i.e. the 'exit price') at initial recognition of the asset or liability. However, an assessment of the specific transaction should be made to determine whether this is appropriate. Situations in which the transaction price may not represent fair value include:- (i) the transaction is between related parties; (ii) the transaction takes place under duress or under circumstances where the seller is forced to accept a price; (iii) the unit of account of the transaction differs from the unit of account for the asset or liability being measured; or (iv) the market where the transaction takes place is different from the principal market (or most advantageous market). The Asset or Liability:- a fair value measurement is for a particular asset or liability. Therefore, characteristics such as the condition and location of the asset, as well as restrictions on the sale or use of that asset should be considered, if a market participant would take these characteristics into account. In accordance with the standard, the asset or liability measured at fair value might be either of the following:- (a) a stand-alone asset or liability; or (b) a group of assets, a group of liabilities, or a group of assets and liabilities. For measurement purposes, whether the asset or liability is viewed as stand-alone or as a group depends on its unit of account. The unit of account is determined in accordance with the IFRS that requires or permits the fair value measurement in the first place. For example, when valuing the equity interest in a publicly-traded company, the unit of account may be the individual share (e.g., under IAS 39 Financial Instruments:- Recognition and Measurement) or the entire equity interest (e.g., under IFRS 3 Business Combinations). The Price:- in determining the

price of an asset or liability in the principal market, transaction costs are not included as a component of the price. Transaction costs are considered to be entity specific and will therefore differ depending on how a transaction is structured. However, transport costs are not considered to be entity specific. If the principal (or most advantageous) market requires the asset to be transported from its current location, then the associated transport costs should be considered as component of the price. The Reference Market:- the transaction is assumed to take place in the principal market, being the market with the greatest volume and level of activity for the asset or liability, or (if no principal market exists) in the most advantageous market where the amount received to sell the asset is maximised or the amount paid to transfer the liability is minimised. In determining which market has the greatest volume and level of activity, it is irrelevant that the entity never transacted in a certain market, provided it has access to such market at the measurement date. If there is no evidence to the contrary, it is assumed that the principal (or most advantageous) market is the same as the market in which the entity normally transacts. An exhaustive search of all possible markets is not required, but consideration should be given to all reasonably available information. Market Participants:- IFRS 13 formalizes the definition of market participants, which was lacking in other previously issued standards. Market participants are buyers and sellers in the principal (or most advantageous) market who are (i) independent of each other; (ii) knowledgeable about the asset or liability; and (iii) able and willing to enter into a transaction for the asset or liability. Fair value is determined using market participant assumptions, not entity-specific assumptions. An entity's own intentions (for example, to hold an asset, or to settle a liability) are not relevant when estimating fair value. IFRS 13 emphasizes that when measuring fair value it should be assumed that market participants act in their economic best interest, i.e. a value maximizing concept. Application to Assets and Liabilities:- Fair Value of Assets:- the measurement of a non-financial asset should consider a market participant's ability to generate an economic benefit by using the asset in its highest and best use, or by selling it to another market participant who will then use the asset in its highest and best use. The highest and best use is determined from the perspective of market participants, who are assumed to maximise the value of the asset or the group of assets (and potentially liabilities) within which the asset would be used. When determining the highest and best use of a non-financial asset, the entity must take into account the use of an asset that is:- (i) Physically possible:- any physical attributes that a market participant would consider should be taken into account, for example, size and location; (ii) Legally permissible:- if market participants would consider any legal restrictions preventing the use of the asset, then these restrictions should also be taken into account by the entity; (iii) Financially feasible:- when assessing if a use is financially feasible, the entity must consider that market participants should earn a reasonable return on investment from the use of the asset, after taking into account any costs of converting the asset to that use. The highest and best use of a non-financial asset establishes its valuation premise; in other words, it determines whether the asset should be valued on a stand-alone basis or as a group in combination with other assets (or with other assets and liabilities). If the asset's highest and best use is determined to be in combination with of other assets (and potentially liabilities), it is assumed that the complementary assets (and potentially associated liabilities) would be available to market participants. IFRS 13 clarifies that the concepts of highest and best use and valuation premise do not apply when measuring the fair value of financial assets or of liabilities. An exception is afforded in IFRS 13 by allowing a group of financial assets and financial liabilities to be measured as a group, provided that certain market risk or counterparty credit risk exposures are managed by the entity on a net basis (subject to specific requirements). Fair Value of Liabilities:- the definition of the fair value of a liability is based on a transfer, rather than a settlement, concept. In other words, the standard requires the assumption that the liability will be transferred to a market participant and that such liability will not be cancelled, or otherwise settled, at the measurement date. The fair value of a liability reflects nonperformance risk, the risk that an entity will not fulfil an obligation, including (but not limited to) the entity's own credit risk. A key notion when measuring the fair value of a liability is the assumption that nonperformance risk is the same before and after the transfer. In other words, an implicit assumption is made that a market participant transferee has the same credit standing as the reporting entity. As with the valuation of assets, the use of observable inputs should be maximized when measuring the fair value of liabilities. However, it is often the case that observable markets do not exist where liabilities are transferred. Nonetheless, if there is a quoted price for an identical item which is traded as an asset in an active market, then the fair value of the liability shall be measured from the perspective of the market participants who hold the identical item as an asset. In this case, if there are factors specific to the asset (e.g., third-party credit enhancements) that are not applicable to the liability being measured, then the quoted price should be adjusted. If quoted prices in an active market for the identical asset are not available, then the liability is valued using other observable inputs (e.g., prices in an inactive market for the asset), or through a valuation technique. Where there are restrictions relating to the transfer of a liability, the effects of these restrictions should not be included as a separate input or adjustment. The standard indicates that when entering into a transaction, market participants already included, either implicitly or explicitly, the effects of the restriction on the transaction price. Fair Value Hierarchy:- the standard introduces the concept of a fair value hierarchy based on the observability of the inputs used to measure fair value (similar to concepts firstly introduced by IFRS 7 Financial Instruments:- Disclosures). Inputs to fair value measurements should be used in the following order of priority:- Level 1:- Level 1 inputs are quoted prices (unadjusted) in active markets for identical assets or liabilities. When a Level 1 input is being used in the fair value measurement, the fair value of the asset or liability is the product of the quoted price and the quantity held. This remains the case even where a significant quantity of the asset or liability is held and normal trading activity is not sufficient to absorb the block held. Level 2:- Level 2 inputs are inputs (other than quoted prices included in Level 1) that are observable either directly (prices) or indirectly (derived from prices). Level 2 inputs include:- (i) quoted prices for identical assets or liabilities in inactive markets; (ii) quoted prices for similar assets or liabilities in active or inactive markets; (iii) observable inputs other than quoted prices (interest rates and yield curves, for example); or (iv) inputs that are corroborated by market data. Level 3:- Level 3 inputs are unobservable inputs for the asset or liability. Unobservable inputs should be developed using market participant assumptions, although these assumptions may originally be based on the entity's own data. When inputs categorized in more than one level are used, the entire fair value measurement is classified in the same hierarchy level as the lowest level input that is significant to the entire measurement. This concept is intended to help increase consistency and comparability in fair value measurements and related disclosures. Other Guidance:- Premiums and Discounts:- blockage discounts are typically viewed as an adjustment to the quoted price of an asset or a liability because the market's normal daily trading volume is insufficient to absorb the quantity (the size of the block) held by the entity. To address the ongoing debate on blockage discounts, the Boards decided that blockage factors are strictly prohibited from consideration for inputs in all hierarchy levels. The Boards' rationale is that adjustments based on the size of the holding reflect entity-specific decisions around how to transact, rather than a characteristic of the asset or liability. IFRS 13 clarifies that other premiums or discounts may be appropriate for Levels 2 and 3 to the extent that (i) they reflect a characteristic of the asset/liability, and (ii) are consistent with the corresponding unit of account. Assuming discounts are appropriate, some practical challenges may arise when trying to ascertain if empirical studies on discounts for lack of marketability also include, to some extent, a size (or blockage) effect. Inactive Markets and Transactions That Are Not Orderly:- IFRS 13 formalizes the guidance to determine when a market may be inactive or a transaction is not considered orderly. Of note, the standard indicates that even if a market is not active, it would not be appropriate to automatically conclude that all transactions in that market are not orderly, i.e. are forced or distress sales; a careful examination of the facts should be conducted to arrive at a conclusion. Disclosures:- IFRS 13 enhances the disclosures about fair value measurements, including disclosure around the valuation method and inputs used, as well as the information used to develop those inputs. Additional quantitative and descriptive disclosures are required where Level 3 unobservable inputs are used, with the

intent of helping financial statement readers understand the sensitivity of the analysis to key significant inputs. Closing Thoughts:- concurrent with the release of IFRS 13, the FASB issued Accounting Standards Update (ASU) 2011-04 amending ASC Topic 820. With the release of the new standards, the FASB and the IASB have achieved the goal of a single set of global accounting standards applicable to measuring fair value. Neither IFRS 13 nor ASC 820 prescribes when and which assets and/or liabilities are required to be reported at fair value – this is determined by other accounting standards. Rather, both IFRS 13 and ASC 820 provide a framework of how fair value is to be measured and which information is required to be disclosed about fair value measurements. There are a few remaining differences between the converged standards, including:- (i) ASC Topic 820 includes guidance for valuing interests in investment company entities. For example, ASC Topic 820 includes a practical expedient for measuring selected alternative investments at net asset value. IFRS 13 does not currently provide investment company accounting guidance. (ii) Some disclosure differences remain. IFRS goes further than US GAAP by requiring a quantitative sensitivity analysis for Level 3 financial instruments that are measured at fair value (this was based on disclosures already required by IFRS 7 Financial Instruments:- Disclosures). (iii) Minor wording and style differences exist. The IASB and FASB have taken a major step forward in issuing converged accounting standards for measuring fair value. As additional accounting standards are converged, many of which may require fair value measurements, the global investor community will be well served by the Boards' first convergence success.

FAIR VALUE HEDGE = ХЭДЬЖ СПРАВЕДЛИВОЙ СТОИМОСТИ – Fair Value Hedge is a hedge of the exposure to changes in fair value of an asset, liability or unrecognized firm commitment.

FAIRWAY = ФАРВАТЕР (или СУДОВОЙ ХОД) – Fairway is a navigable channel for vessels, often the prescribed route a vessel will follow to avoid danger. A navigable channel for vessels, often the regular or prescribed track a vessel will follow in order to avoid dangerous circumstances. / Под Фарватером или Судовым Ходом, от Голландского слова Vaarwater, от Varen, означающее Двигаться или Плавать, и Water, означающее Вода, понимается безопасный в навигационном отношении проход по водному пространству (морю, озеру, проливу, реке, фиорду и другому), характеризующийся достаточными глубинами и отсутствием препятствий для судоходства. Фарватер обозначают средствами навигационного оборудования – бакенами, буями, створными знаками и прочим. Створный знак, ориентир (башня, мачта, щит), расположенный на одной прямой (в створе), для указания направления движения судна, самолёта или обозначения какого-либо рубежа.

FAK = FREIGHT ALL KINDS

FAKE = БУХТА (или ШЛАГ) – Fake (maritime term):- a single turn of rope when a rope is coiled down. / Бухта троса.

FAKE DOWN = УКЛАДЫВАТЬ В БУХТУ – Fake Down (maritime term):- to fake line back and forth on deck.

FAKE FUR = ПОДДЕЛЬНЫЙ (или ФАЛЬШИВЫЙ) МЕХ (или ПОДДЕЛКА ПОД МЕХ) – Fake Fur is a slang term for pile fabrics and garments that imitate animal pelts. The most popular fake furs are probably those made from modacrylic fiber. See also Modacrylic, and Pile.

FAKEOUT = ПЛУТОВСТВО – In exchange trading, Fakeout is one of trading traps. The Fakeout is false breaks (tricks of the trade). If a market professional sits with a large sell order and the stock is consolidating (a sign that the market is in equilibrium) he knows that he cannot merely dump his orders on the market. That would upset that equilibrium and he would be selling into a weak market, chasing prices down. The golden rule is:- sell into strength, so our trader bides his time and waits for the market to test resistance at the top of the range. If impatient, he may even help to nudge prices across the line with a few well-timed buy orders. Trading Breakouts:- trading breakouts from a consolidation pattern is one of the most popular and (in the past) most profitable trades that a trader can make. The problem is that everyone knows this. It is fairly easy to identify a consolidation pattern and to identify the resistance level that everyone is watching. If not a round number there will be at least one, if not many, highs at the same level. As soon as price crosses the line there is a tremor of excitement. Conditional buy orders placed in anticipation of a breakout are triggered. Traders watching their screens notice the activity and send in a flood of new buy orders; everyone hopes to get on board before price rallies too far above the former resistance levels. And who is standing in the face of the rally, happy to accommodate them? Our market professional releases a steady stream of sell-orders into the market, careful not to saturate the market until he has offloaded most of his stock. Other professionals pick up on what is happening and start shorting the stock. The rally fizzles and the punters are left high and dry. Price retreats back below the new support level (formerly resistance) and triggers their stops. A fresh round of selling ensues as the punters struggle to clear their positions. The professionals cover their short positions and go home having made a tidy profit for a few hours work. It's a hard game – you have to live by your wits – but the rewards are big. Our market professional reports back to his clients that he has offloaded the large parcel of stock at well above the average price traded over the past few days. They congratulate themselves and are happy to pay his fat commission – he has earned it. For example, Westpac Banking Corporation on the ASX had started to rally in early 2003 after a broad double-bottom and a shakeout below AUD13.00. The stock entered a narrow consolidation, with low volume for the three days. A shakeout follows at:- (i) a break through resistance; (ii) the rally meets with strong selling; (iii) price is driven back below the resistance level; and (iv) all in the same day. Punters are more cautious the second time, with a narrow price range and lower volumes. Then we have a real breakout, with a gap above the resistance line and a strong blue bar on average volume. The rally meets further selling before it continues on its' way. Variations:- most false breaks expire on the same day but you do get larger patterns that occur over a week or more. These false breaks occur in a larger time frame. Broad patterns, encompassing a false break above a primary resistance level, are the most powerful and often forewarn of a primary trend reversal. / Вэстпэк Бэнькинь Корпорэйшэн (Westpac Banking Corporation).

FALCATE = СЕРПОВИДНОЕ – Falcate:- strongly curved or sickle-like.

FALL = НИСПАДАЮЩИЙ (или ОТЛЕТ) – Fall is a very wide turned-down collar worn in the XVII century.

FALL ARMYWORM = ОСЕННИЙ РАТНЫЙ ЧЕРВЬ (или ОСЕННИЙ ПОХОДНЫЙ ЧЕРВЬ, или ОСЕННИЙ ТРАВЯНАЯ СОВКА, или ОСЕННИЙ АРМЕЙСКИЙ ЧЕРВЬ) – Fall Armyworm (Spodoptera Frugiperda) is a migratory Species that does not overwinter in the Carolinas; larvae hatch from egg masses often deposited in the upper third of the Cotton Plant, often on the underside of leaves but also in the terminal area; small larvae typically etch the bracts of medium and large bolls before penetrating the carpel walls, often at the base of the boll. Fall armyworm larvae are also often associated with blooms. Medium to large established larvae are difficult to kill with insecticides. The Armyworm gets its name from its habit of 'marching' in large numbers from grasslands into crops.

FALLBACK = ОТКАТ (или ВОССТАНОВЛЕНИЕ) – Fallback is the process of returning to the mode of operation, or of network connection, previously used, in the event of a serious problem.

FALLING NUMBER = ЧИСЛО ПАДЕНИЯ – The Falling Number is a measurement used by plant breeders and grain quality specialists to determine the soundness of Wheat, which is primarily influenced by the degree of sprouting in a grain sample. Hagberg Falling Number is the full name of this international standard of sprout measurement. The term Falling Numbers refers to the amount of time it takes for the Hagberg steel ball in this sprout analysis tool to fall through a flour/water slurry that has been heated to release the

starch from water. In sprouted grain, enzymes are produced which break down the starch. If there is less starch, the slurry is less viscous (or thick) and the ball falls more quickly. The result is a lower falling number reading. The faster the ball falls through this slurry, the less time it takes, the lower the falling number. Sprouting in grain can occur once the kernel has reached maturity; therefore, when mature kernel is subjected to proper moisture, temperature and time it begins to sprout. The physiological changes needed to produce a new plant require energy and nutrients, which is why the Wheat kernel produces enzymes to breakdown starch (amylases), oil (lipases) and protein (proteases). This process is exploited in the production of barley malt, which is an enzyme and nutrient 'package' vital to the brewing of beer. When moisture levels in the Wheat decrease prior to threshing, the sprouting process stops, and if it stops before there are visible signs of sprouted kernels it is called Incipient Sprouting. The impact of sprouting on foods produced from Wheat depends on the amount of enzymes present and breakdown of the kernel. Sprouting lowers test weight and flour yield, lowering the grade and value to the processor. The impact on baking quality is observed by lower absorption (water added in baking, which reduces bread yield), reduced mixing strength and tolerance, and sticky dough. It can also affect loaf volume, crust strength and crumb texture, whereas a wet and gummy crumb causes problems with slicing and shelf life. The starch degradation and enzyme activity also reduce the quality of Asian noodles. The effects on durum are lower test weight, reduced semolina yield and color. In the processing of semolina and pasta, sprouting increases semolina speck counts, reduces shelf life of dried pasta (due to checking or cracking), increases cooking loss, and produces softer cooked pasta. The level and impact of sprout damage is not fully realized until it is processed into bread or pasta. The Falling number test does not directly measure amylase enzyme activity, but measures changes in the physical properties of the starch portion of the Wheat kernel caused by these enzymes during the test. There are actually no standards for falling number, as it is not an official grading factor in FGIS (short for the Federal Grain Inspection Service) grain inspection and grading process. Generally speaking for Wheat, a falling number value of 350 seconds or longer indicates low enzyme activity and very sound Wheat. As the amount of enzyme activity increases, the falling number decreases. Values below 200 seconds indicate high levels of enzyme activity. In the past, grain buyers have discounted Wheat for falling number values below 300 seconds. Falling number values are also important overseas, as many of the buyers from export markets have written minimum tolerances of 300 to 350 seconds into their purchase contracts. The Falling Number is a measure of enzyme activity as a result of sprouting. It is a measure of how many seconds it takes for a plunger to sink through a paste made of ground grain and water. The test works on the principle that the presence of alpha-amylase causes the gelatinized starch to be reduced to sugars, with a loss of viscosity. The loss in viscosity results in a lower falling number. Samples of grain with high amounts of alpha-amylase will have a falling number of around 70 seconds. Grain which is sound and has low levels of enzyme will have a high falling number, for example, 350 seconds. See also Hagberg Falling Number. / Это мера того, сколько секунд потребуется плунжеру для . Смотрите также Число Падения Хагбэрья (Hagberg Falling Number). Число Падения это показатель деятельности ферментов, приводящей к прорастанию. Зерно, которое является доброкачественным и имеет низкие уровни .

FALLING THREE METHOD = СНИЖЕНИЕ ПО МЕТОДУ ТРЁХ – Falling Three Method:- in technical analysis, a five day bearish continuation pattern. A long black body is followed by three small body days, each fully contained within the range of the High and Low of the first day. The fifth day closes at a new Low. / В техническом анализе биржевых рынков под снижением по методу трёх понимается пятидневная медвежья модель продолжения. Выглядит она следующим образом:- за длинным тёмным телом первого дня следуют три малых тела последующих дней, которые располагаются по возрастающей, но полностью внутри диапазона первого дня. Пятый день отображается длинным тёмным телом и закрывается на новом минимуме.

FALL MULCH TILLAGE = ОСЕННЯЯ ЗЯБЛЕВАЯ ОБРАБОТКА ПОЧВЫ (или БРАБОТКА ПОЧВЫ С ОБРАЗОВАНИЕМ МУЛЬЧИРУЮЩЕГО СЛОЯ, или ОСЕННЯЯ ВСПАШКА С МУЛЬЧИРОВАНИЕМ, или ОСЕННЯЯ ЗЯБЛЕВАЯ ВСПАШКА) – Fall Mulch Tillage:- The chisel plow, disc-ripper and discs (either tandem or offset) are the most widely adopted fall primary tillage tools in Ontario, Canada. These tools usually leave more residue on the soil surface while leaving the surface level in the fall, so that single-pass planting (no secondary tillage) becomes a viable option in the spring. / Зяблевая Обработка Почвы или Зябь или Зяблевая Вспашка, летне-осенняя обработка почвы под посев яровых культур весной следующего года. В Восточной Европе применялась ещё в Киевской Руси. В мелком крестьянском хозяйстве дореволюционной России, а также в первые годы Советской власти господствовала весновспашка. В Западной Европе получила распространение с начала XIX века. Широкое применение зяблевой обработки почвы в бывшем Союзе Советских Социалистических Республик (СССР) началось в крупном социалистическом сельском хозяйстве – совхозах и колхозах. Вспаханная на зиму почва хорошо впитывает осенние осадки, лучше поглощает талые воды; в ней накапливаются доступные для растений питательные вещества, образующиеся в результате жизнедеятельности аэробных бактерий. Зяблевая обработка почвы позволяет успешно бороться со многими Сорняками и засорённостью почвы, вредителями, зимующими в растительных остатках и верхних слоях почвы, и болезнями сельскохозяйственных культур; способствует раннему проведению весенних полевых работ, уменьшая их напряжённость. Зяблевую обработку почвы проводят после уборки предшествующей культуры; после зерновых и других культур сплошного посева почву сначала лущат, затем через 15–20 суток, когда появятся всходы Сорняков, пашут. Под вспашку вносят органические и минеральные удобрения, а на кислых почвах и известь. Основной приём зяблевой обработки почвы – вспашка плугом с предплужником, при которой почва лучше крошится и создаётся более выровненная поверхность. На подзолистых почвах пашут на глубине не менее 22–23 сантиметров (см), применяя различные способы углубления пахотного слоя. На плодородных (чернозёмных, каштановых, орошаемых серозёмных и других) почвах глубина вспашки нередко достигает 35 см. Значительно повышает урожай сельскохозяйственных культур, особенно в засушливых районах и в нечернозёмной полосе, ранняя зябь, поднимаемая в Августе. На полях из-под многолетних трав проводят вспашку на полную глубину, минуя лущение; из-под пропашных культур при тщательном уходе за ними и отсутствии многолетних сорняков применяют более мелкую обработку почвы (на 12–16 см) лемешными лущильниками; в районах, подверженных ветровой эрозии (Северный Казахстан, Западная Сибирь и другие), хороший эффект даёт безотвальная обработка почвы. Вспаханное под зябь поле обычно оставляют на зиму неборонованным. Исключение составляют некоторые районы Восточной Сибири и Дальнего Востока (почва при бесснежной зиме и ветрах сильно высыхает) и отдельные степные районы, особенно на Юге Украины и Северном Кавказе, где иногда применяют осеннее боронование и культивацию зяби для борьбы с Сорняками.

FALLOW = БЛЁКЛОЕ (или XX) – Fallow:- of a light yellowish brown color.

FALLOW = ПАР – Fallow, Fallows, Fallow Land:- (i) the period of time between crops; or (ii) area of land set aside from a cropping regime – can be summer, winter or longer. Fallow is a land that is ordinarily used for crops but allowed to lie idle between crops. / Пар, пары, земля под паром или парующая земля:- (i) ; или (ii) . В сельском хозяйстве под Паром понимается поле севооборота, не занимаемое посевами в течение всего вегетационного периода или части его и содержащееся в рыхлом и чистом от Сорняков состоянии; средство повышения плодородия почвы и накопления в ней влаги. Чистый пар и занятой – посевы растений, убираемых в первую половину лета. Пар или Паровое Поле, поле севооборота, не занимаемое посевами в течение всего вегетационного периода или части его и содержащееся в рыхлом и чистом от Сорняков состоянии. Эффективное агротехническое средство повышения плодородия почвы, накопления влаги в ней, увеличения урожайности всех культур

севооборота, улучшения качества сельскохозяйственной продукции; основной элемент научно обоснованной системы земледелия. Пары подразделяют на:- (i) чистые – чёрный пар (обработку его начинают летом или осенью после уборки предшествующей культуры), (ii) ранний (почву пашут весной следующего года), (iii) кулисный (с кулисами из рядов Кукурузы, Подсолнечника, Горчицы и других высокостебельных растений, высеваемых на парах для задержания снега) и (iv) занятые – первую половину лета в паровом поле выращивают растения с коротким периодом вегетации (смотрите Парозанимающие Культуры). Один из видов занятого пара – сидеральный, в котором выращивают сидераты (Люпин, Сераделла и другие) и запахивают их на зелёное удобрение. Появление чистого пара связано с развитием переложной системы, существовавшей в Европе до XV–XVI веков, а на Юге и Юго-Востоке России – до конца XIX века. По мере уменьшения фонда нераспаханных земель продолжительность ‘отдыха’ постепенно сократилась до 1 года, то есть многолетний перелог превратился в чистый пар. Весной на нём выпасали скот, в Июне вносили навоз и распахивали под озимые культуры. В таком виде чистый пар применялся в Западно-Европейских странах до XIX века, а в России – до так называемой Великой Октябрьской Социалистической Революции 1917. В бывшем Союзе Советских Социалистических Республик (СССР) чистый пар (занимал 16% площади пашни в 1940, 18% – в 1950, 8% – в 1960, 6% – в 1973) был распространён на Юге Украины, в Поволжье, на Северном Кавказе, в Молдавии – здесь он лучший предшественник для озимых Пшеницы и Ржи; в Северном Казахстане, Западной и Восточной Сибири по нему сеют яровую Пшеницу. Чистый чёрный пар под озимые культуры поднимают осенью по системе зяблевой обработки почвы, внося перед вспашкой навоз и минеральные удобрения, рано весной его боронуют для сохранения влаги, а летом культивируют на разную глубину и прикатывают. При правильном уходе чёрный пар к посеву озимых накапливает в метровом слое почвы 100–200 миллиметров (мм) влаги, обогащается питательными элементами (N, P, K и другие) в усвояемых для растений формах, что создаёт благоприятные условия для развития всходов озимых и получения высоких и устойчивых урожаев зерна. Эффективность чёрного пара повышается посевом кулис. Обработка чёрного пара под яровую Пшеницу начинается с осеннего или весеннего лущения, несколько раз повторяемого в течение лета для подавления Сорняков и накопления влаги, после чего в конце Августа проводится основная вспашка. Чистый ранний пар пашут весной, а летом обрабатывают так же, как чёрный пар. В районах, подверженных ветровой эрозии (смотрите Эрозия Почвы), на чистых парах применяют противоэрозионную систему обработки глубокорыхлителями и культиваторами-плоскорезами с оставлением стерни на поверхности почвы (смотрите Безотвальная Обработка Почвы). В XX веке чистый пар занимал большие площади в засушливых областях многих стран мира, особенно в бывшем СССР, Соединённых Штатах Америки (США), Канаде, Аргентине, Австралии, где он составлял агротехническую основу зерновых севооборотов и являлся основным средством борьбы с засухой в неорошаемом земледелии. Занятой Пар возник в XVIII веке в связи с развитием животноводства и введением в севооборот технических культур (сахарная Свёкла, Картофель). На паровом поле стали выращивать кормовые растения, которые убирали за 3–4 недели до посева озимых. Сначала он широко распространился в Великобритании и Франции, затем в Германии и других странах; в России занятой пар применялся в отдельных помещичьих хозяйствах. Занятой пар в бывшем СССР был распространён в условиях достаточного увлажнения:- в нечернозёмной зоне, Северной лесостепи Европейской части страны, в орошаемых районах, где его используют под посевы озимых и яровых зерновых культур. В менее увлажнённой Южной лесостепи занятой пар сочетают с чистым. Осенью занятой пар обрабатывают по системе зяблевой обработки, летом после уборки парозанимающей культуры – пашут или культивируют. Занятой пар широко применяют в Западной Европе. Выводное Поле или Выводной Клин, поле севооборота, временно находящееся вне чередования культур. Выделяют для возделывания на нём в течение ряда лет многолетних, обычно кормовых растений. После окончания срока пользования это поле снова включают в ротацию севооборота, а вместо него выводят из общего чередования другое поле и так далее. Необходимость выделения выводного поля и целесообразность посева на нём тех или иных сельскохозяйственных культур обусловливаются конкретными почвенно-климатическими и экономическими условиями хозяйства.

FALL STRIP–TILLAGE = ОСЕННЯЯ ПОЛОСНАЯ ОБРАБОТКА ПОЧВЫ (или ОСЕННЯЯ ПОЛОСНАЯ ВСПАШКА) – Fall Strip-Tillage:- Performing fall tillage, confined to narrow zones that correspond to next year’s Corn rows, has received considerable attention in the past few years. The strips of soil are loosened, cleared of residue and often elevated, while leaving the rest of the field covered with protective crop residue. The following spring, the strips are drier, less dense and more suited to ‘no-till’ planting. Strip-tillage systems also provide an opportunity to band fertilizers that must be broadcast in a no-till system. Applying fertilizer using the strip-tillage system may also replace the need to apply banded starter fertilizers through the planter. Fall banding of phosphorus and potassium in strip-tillage systems, with adequate fertility levels, can produce higher yields than when similar rates of fertilizer are broadcast in no-till systems.

FALL WOOL = ШЕРСТЬ С ПАЛЫХ ОВЕЦ (или ШЕРСТЬ ОТ ЛИНЯНИЯ ОВЕЦ) – Fall Wool is a wool shorn in the fall following 5–6 months of growth.

FALSE BILLING = ЛОЖНОЕ ВЫСТАВЛЕНИЕ (или ЛОЖНАЯ ОТМЕТКА В СОПРОВОДИТЕЛЬНЫХ ДОКУМЕНТАХ НА ГРУЗ, или ОПИСКА В СОПРОВОДИТЕЛЬНЫХ ДОКУМЕНТАХ НА ГРУЗ) – False Billing:- describing freight or shipping documents so as to mis-represent the actual contents or weight of shipment. Misrepresenting freight or weight on shipping documents.

FALSE BREAKOUT = ЛОЖНЫЙ ПРОБОЙ – False Breakout:- in technical analysis, a quick reversal in prices after a penetration of key support or resistance. Sometimes called a Head Fake or Bull/Bear Trap. / В техническом анализе биржевых рынков, быстрый разворот цен после пробоя ключевого уровня поддержки или сопротивления. Иногда называется Подделка Под Голову (Head Fake) или Бычья/Медвежья Ловушка (Bull/Bear Trap).

FALSE BRINELLING = ЛОЖНОЕ БРИНЕЛЛИРОВАНИЕ – False Brinelling of needle roller bearings is actually a fretting corrosion of the surface since the rollers are the ID of the bearing. Although its appearance is similar to that of brinelling, false brinelling is characterized by attrition of the steel, and the load on the bearing is less than that required to produce the resulting impression. It is the result of a combination of mechanical and chemical action that is not completely understood, and occurs when a small relative motion or vibration is accompanied by some loading, in the presence of oxygen. See also Brinelling. / подшипников с игольчатыми роликами (needle roller bearings).

FALSE PACKED COTTON = ПРЕДНАМЕРЕННО СМЕШАННЫЙ ХЛОПОК (или ЛОЖНЫЙ УПАКОВАННЫЙ ХЛОПОК) – False Packed Cotton means cotton in a bale containing substances entirely foreign to cotton; containing damaged cotton in the interior with or without any indiction of the damage on the exterior; composed of good cotton on the exterior and decidedly inferior cotton in the interior, but not detectable by customary examination; or, containing pickings or linters worked into the bale. False packed cotton means cotton in a bale containing substances. Also known as Mixed Packed Cotton. False Packed Cotton means cotton in a bale containing substances entirely foreign to cotton; containing damaged cotton in the interior with or without any indication of the damage on the exterior; composed of good cotton on the exterior and decidedly inferior cotton in the interior, but not detectable by customary

examination; or, containing pickings or linters worked into the bale. / Порок хлопка, вызванный преднамеренным смешиванием хлопка разного качества, подбрасыванием в него отходов и инородных примесей перед кипованием.

FALSE SMUT = ЛОЖНАЯ ГОЛОВНЯ – False Smut is a disease caused by Ustilaginoidea Virens. The Fungus transforms individual grains of the panicle into greenish spore balls that have a velvety appearance. The spore balls are small at first and enclose the floral parts. They are covered with a membrane which bursts as a result of further growth and the color of the ball becomes orange and later yellowish green or greenish black. Also known as Grain Smut. / в зеленоватые споровые шарики . Под Головнёй понимается болезнь Растений, вызываемая Головнёвыми Грибами. Несколько видов:- пузырчатая, пыльная, стеблевая, твёрдая. Наиболее вредоносна для Злаков (Кукуруза, Пшеница, Рожь и другие). Колосья, метёлки, початки, стебли и листья превращаются в тёмную споровую массу.

FALSE–TWISTING = ЛОЖНОЕ КРУЧЕНИЕ (или ВРЕМЕННОЕ КРУЧЕНИЕ или ЛОЖНОЕ ПРИСУЧИВАНИЕ) – False-Twisting, i.e. spinning tension, can be increased by:- (i) a larger nozzle surface diameter; (ii) additional notches, grooves, ridges, etc, arranged radially, axially or helically on the surface of the draw-off nozzle; (iii) a tighter bend in the thread draw-off tube; and (iv) additional twist accumulating elements in the bend of the thread draw-off tube. One popular texturizing process is False-Twisting. In this technique, twist is inserted into a heated multifilament yarn running at high speed. The yarn is cooled in a highly twisted state, so that the twist geometry is set, and then the yarn is untwisted. Untwisting leaves filaments that are still highly convoluted, allowing the production of a textured yarn of much greater volume than the yarn would be in an untextured state. False-twist texture is usually combined with drawing. Partially Oriented (POY) nylon and polyester, which have been spun at extremely high rates and are already partially crystalline, are both drawn and textured in this way. See also Texturing, False-Twist Method. / Найлан (Nylon). жёлоб или паз (groove).

FALSE–TWIST METHOD = МЕТОД ЛОЖНОЙ КРУТКИ – False-Twist Method is a continuous method for producing textured yarns utilizes simultaneous twisting, heat-setting, and untwisting. The yarn is taken from the supply package and fed at controlled tension through the heating unit, through a false-twist spindle or over a friction surface that is typically a stack of rotating discs called an Aggregate, through a set of take-up rolls, and onto a take-up package. The twist is set into the yarn by the action of the heater tube and subsequently is removed above the spindle or aggregate resulting in a group of filaments with the potential to form helical springs. Much higher processing speeds can be achieved with friction false twisting than with conventional spindle false twisting. Both stretch and bulked yarns can be produced by either process. Examples of false-twist textured yarns are Superloft®, Flufflon®, and Helanca®. See also Coil Yarn, and Textured Yarn.

FALSE TWIST STRETCH YARN = НАТЯНУТАЯ ПРЯЖА ЛОЖНОЙ (или ВРЕМЕННОЙ) КРУТКИ – False Twist Stretch Yarn is a false twist yarn which has a high crimp elongation or high crimp contraction.

FALSE–TWIST TEXTURED SYNTHETIC FILAMENT YARN = ТЕКСТУРИРОВАННАЯ СИНТЕТИЧЕСКАЯ ФИЛАМЕНТНАЯ ПРЯЖА ЛОЖНОЙ КРУТКИ – False-Twist Textured Synthetic Filament Yarn is manufactured with a false-twist texturing machine which heats finish-applied synthetic filament yarn with its heating device, and then processes the yarn in simultaneous twisting and drawing with its false-twisting device. False-twist texturing machines fall into two types; a non-contact heating type which heats synthetic filament yarn with radiation heat from a high temperature heater (hereinafter referred to as a non-contact type false-twist texturing machine), and a contact heating type which heats synthetic filament yarn being contacted on a heater (hereinafter referred to as a contact type false-twist texturing machine). A non-contact type false-twist texturing machine is apt to result in broken filaments and ends down due to its high-speed false-twist texturing operation. The major cause of the broken filaments and ends down in a process with a non-contact type false-twist texturing machine is the load given to synthetic filament yarn in high-speed drawing and false-twist texturing, because such load increases breakage of monofilaments. On the other hand, a contact type false-twist texturing machine has been increasingly employed for processing various yarns along with the recent diversification in false-twist textured yarns represented by fine-denier yarns, full-dull polymer yarns, yarns of modified cross sections, and yarns spun of multicomponent polymer, all of which are applied with higher amount of finishes or apt to generate fiber waste in texturing so as to increase broken filaments and ends down. Those yarns also shorten the cleaning intervals for heaters of texturing machines to hinder high-speed texturing operation. Broken filaments and ends down in texturing with a contact type false-twist texturing machine are also caused by the load given to synthetic filament yarn of low monofilament tenacity that accelerates breakage of monofilaments. One of the causes of the load given to synthetic filament in texturing process is stain on heater surface resulted from finishes and fiber waste. For solving these problems, several methods (for example, those in Patent References 1 to 4) have been suggested. Those methods provide finishes applicable to yarns to be textured with both contact and non-contact type false-twist texturing machines, and the finishes contain fluorine compounds which function to decrease the surface tension of the finishes in a specified temperature range so as to prevent broken filaments and ends down. Another method for solving the problems (for example, the method in Patent Reference 5) provides a finish which is formulated by combining a polyether and ether ester each having a M.W. in a specified range and attains stable false-twist texturing to decrease broken filaments. Furthermore, finishes containing polyether compounds and specific polyorganosiloxanes (for example, those in Patent References 6 and 7), and a finish containing a secondary alcohol or its derivative (for example, that in Patent Reference 8) have been suggested for texturing with a contact type false-twist texturing machine. The fluorine compounds in finishes disclosed in Patent References 1 to 4, however, excessively decrease the surface tension of finishes to cause finish emulsion to be thrown off from yarn and result in insufficient amount of finish on yarn so as to fail to sufficiently prevent broken filaments and ends down. In addition, the fluorine compounds increased the cost of the finishes to disturb their practical use. Furthermore, the finishes containing the fluorine compounds could not sufficiently prevent broken filaments and ends down in texturing with a contact type false-twist texturing machine, because the fluorine compounds in finishes evaporated on the heater plate of a contact type heater before the compounds exert their effect. The method in Patent Reference 5 failed to uniformly coat filament surface, and resulted in insufficient filament cohesion which leads to varied yarn tension in false-twist texturing, broken filaments, and ends down. Finishes represented by those disclosed in Patent References 6 and 7 could not decrease stain on heater surface which was caused from finishes thrown off from filament yarn in false-twist operation to be stuck on heater surface, and resulted in broken filaments and ends down due to the stain. A finish represented by that disclosed in Patent Reference 8 formed weak finish film on filament surface to attain poor filament cohesion, and could not sufficiently prevent broken filaments and ends down. Those finishes seriously decreased their flowability at the initial stage of heating yarn on heater surface (for example, the finishes in Patent References 1 to 5 and 8), or left hard finish residue on heater surface due to the increased amount of finish accumulated on heater surface for a long term of texturing (for example, the finishes in Patent References 6 and 7) so as to fail to sufficiently prevent broken filaments and ends down. Some finishes exhibiting good flowability at the initial stage of heating left high amount of finish residue on heater surface and failed to sufficiently prevent stain on heater surface. / развод (или потёк (stain)). филаментная (комплексная) пряжа (filament yarn). мононить (monofilament).

FALSE TWIST YARN = ПРЯЖА ЛОЖНОЙ (или ВРЕМЕННОЙ) КРУТКИ – False Twist Yarn is a torsion textured yarn obtained by a continuous process applying high twist, heat setting and untwisting. / скрученная текстурированная пряжа, . высокая крутка .

FALSIFICATION = ФАЛЬСИФИКАЦИЯ – Falsification is the act of producing something that lacks authenticity with the intent to commit fraud or deception. Also known as Forgery. See also Contrafaction, and Forgery. / Известна также как Подлог или Подделка (Forgery). Под Фальсификацией, от позднелатинского слова Falsificatio, от Латинского слова Falsifico, означающее Подделываю, от Falsus, означающее Ложный, и Facio, означающее Делать, понимается:- (i) злостное, преднамеренное искажение каких-либо данных, заведомо неверное истолкование чего-либо; или (ii) изменение с корыстной целью вида или свойства предметов; подделка.

FAME = FATTY ACID METHYL ESTERS

FAMILY = СЕМЕЙСТВО – Family or Familia of taxonomy, is a category level below an 'Order' but above a 'Genus'. One uniting Genera assessed as having been derived from a common ancestral stock, or from a single Genus, when no other Genera are believed related. Family is a taxonomic grouping of related Genera with a similar floral pattern and other common characteristics, contained within an Order. See also Class, Division, Genus, Kingdom, Order, Phylum, Specie, Tribe, and Type. / Смотрите также Вид (Specie), Класс (Class), Отдел (Division), Отряд (Phylum), Порядок (Order), Род (Genus), Тип (Type), Триба или Колено (Tribe), и Царство (Kingdom). Под Семейством (Family или Familia) понимается таксономическая категория (ранг) в биологической систематике. В Семейства (иногда сначала в Подсемейства) объединяют близкие Рода. Например, Семейство Беличьих включает Рода:- Белки, Сурки, Суслики и другие. Семейство Сосновых образуют Рода:- Сосна, Ель, Пихта и другие. В одних Семействах до 1 000 Родов, в других – немного или только один Род. Семейства объединяют в Отряд (в систематике Животных) или в Порядок (в систематике Растений), иногда сначала в Надсемейства. Семейство, систематическая категория в ботанике и зоологии. Семейство объединяет близкие Рода, имеющие общее происхождение. Например, Семейство Буковых образуют Рода:- Бук, Дуб, Каштан и другие; Семейство Беличьих составляют Рода:- Белки, Сурки, Бурундуки, Суслики, Тонкопалые Суслики и некоторые другие. Наряду с Семействами с большим числом Родов (Сложноцветные – около 1 000 Родов, Бобовые и Мареновые – примерно по 500 Родов; Хомяки и Полорогие – по 50–100 Родов) имеются Семейства, включающие очень малое количество Родов, некоторые даже 1 Род (например, Гранатовые, Утконосы, Бобры, Серые Киты). Крупные Семейства иногда разбивают на Подсемейства. Близкие Семейства объединяют в Отряды у Животных, в Порядки у Растений, в некоторых случаях в промежуточные группы – Надсемейства, Подотряды.

FAM TOUR = ОЗНАКОМИТЕЛЬНЫЙ ТУР – Familiarization Tour (FAM Tour) for travel agents or journalists planned and executed by a destination or region, usually in cooperation with an international airline. / Ознакомительный Тур для агентов туриндустрии или журналистов, спланированный и осуществлённый властями соответствующего пункта назначения или региона, как правило, при сотрудничестве с международной авиалинией.

FANCIFUL MARKS = ПРИЧУДЛИВЫЕ ЗНАКИ – Fanciful Marks:- comprise terms that have been invented for the sole purpose of functioning as a trademark or service mark. Such marks comprise words that are either unknown in the language, e.g., EXXON (Exxon Mobil Corporation), KODAK (Eastman Kodak Company), PEPSI (PepsiCo, Inc.) or are completely out of common usage, e.g., FLIVVER (an old, cheap, or battered car; older slang:- an automobile, especially one that is small, inexpensive, and old; Ford Flivver or Sky Flivver is a single seat aircraft that did not go in production; Air Flivver is a light aircraft of the 1930s). A Fanciful Mark is a 'coined' word or symbol invented or selected for the sole purpose of functioning as a mark. Examples of fanciful marks include EXXON (Exxon Mobil Corporation) for gasoline, KODAK (Eastman Kodak Company) for photographic supplies, XEROX (Xerox Corporation) for photocopying equipment, and CLOROX (The Clorox Company) for bleach. Fanciful marks are traditionally afforded the greatest scope of protection. The most distinctive marks are fanciful marks. / , например, . Фод Флэвё (Ford Flivver). Причудливый Знак – это 'отчеканенное' слово или символ, изобретённое или выбранное исключительно для того, чтобы функционировать в качестве товарного знака. Примерами причудливых знаков служат ЭКСАН (Эксан Мобл Корпорэйшэн) (EXXON (Exxon Mobil Corporation)) для бензина, КОДЭК (Истмэн Кодэк Кампэни) (KODAK (Eastman Kodak Company)) для фотоматериалов, ЗИРОКС (Зирокс Корпорэйшэн) (XEROX (Xerox Corporation)) для фотокопировального оборудования и ПЭПСИ (ПэпсиКо, Инк.) (PEPSI (PepsiCo, Inc.)) для безалкогольных напитков. Причудливым знакам традиционно предоставляется наибольший объём охраны.

FANCY YARN = ФАСОННАЯ ПРЯЖА (или ПРЯЖА ФАСОННОЙ КРУТКИ) – Fancy Yarn or Novelty Yarn is the yarn that has been specially manufactured so that its appearance differs significantly from that of conventional yarn in order to give it a decorative effect. For several years (в начале 2000-х) fancy yarns have been essential components of modern fashion and have been gaining more importance in the clothing sector, especially denim, and in furnishing and draperies. Demand for complex fabrics with distinguishing characteristics is increasing, conquering larger shares of the textile market. See also Novelty Yarn. Fancy Yarn is the yarn produced for a special effect. Novelty yarn are usually uneven in size, varied in color, or modified in appearance by the presence of the irregularities deliberately produced during their formation. / Фасонная Пряжа – текстильная нить, имеющая периодически повторяющиеся местные изменения структуры и окраски.

FANNIE MAE = ФЭНИ МЭЙ – Fannie Mae is a federally chartered and stockholder-owned corporation organized and existing under the Federal National Mortgage Association Charter Act. It was established in 1938 as a United States government agency to provide supplemental liquidity to the mortgage market and were transformed into a stockholder-owned and privately managed corporation by legislation enacted in 1968. Our business operates within the US residential mortgage market. We operate an integrated business that contributes to providing liquidity to the US residential mortgage market and increasing the availability and affordability of housing in the United States. Our principal customers are lenders that operate within the primary mortgage market by originating mortgage loans for homebuyers and for current homeowners refinancing their existing mortgage loans. Lenders originating mortgages in the primary market often sell them in the secondary market in the form of loans or mortgage-related securities. We operate in the secondary market, where we securitize mortgage loans originated by lenders into Fannie Mae mortgage-backed securities ('Fannie Mae MBS') and other mortgage-related securities and purchase mortgage loans (often referred to as 'Whole Loans') and mortgage-related securities for our mortgage portfolio. By selling loans and mortgage-related securities to us, lenders replenish their funds and, consequently, are able to make additional loans. Pursuant to the Charter Act, we do not lend money directly to consumers in the primary mortgage market. Headquartered in Washington, DC, the United States of America. In the United States, a corporation (government-sponsored enterprise) created by Congress to support the secondary mortgage market; it purchases and sells residential mortgages insured by the Federal Home Administration (FHA) or guaranteed by the Veteran's Administration (VA). Formerly the Federal National Mortgage Association. See also Freddie Mac. Fannie Mae is GSE (Government-sponsored enterprise) that buys and sells home mortgages, either as whole mortgages or mortgagebacked securities. Originally part of a federal program, Fannie Mae converted into a privately-owned corporation in 1968. In September 2008, Treasury placed Fannie Mae and its 'brother' corporation, Freddie Mac, into conservatorship that continues through the date of publication. / В бывшем – Федеральная Национальная Ассоциация по Закладным (Federal National Mortgage Association). Смотрите также Фрэди Мэк (Freddie Mac). Фэни Мэй от Федеральная Национальная Ассоциация по Закладным (Fannie Mae – жаргонное название в виде сокращения от Federal National Mortgage Association) – акционерное общество, поддерживаемое правительством, организовано в 1938 для

приобретения ипотек и ценных бумаг с ипотечным обеспечением. Цель ассоциации – сделать доступными жилищные ипотечные фонды для низко- и среднеоплачиваемых категорий покупателей домов. Фэни Мэй – акционерная компания, которую поддерживает федеральное правительство, это – крупнейший источник средств для ипотечных фондов в США. Федеральная Национальная Ассоциация по Закладным – одна из крупнейших корпораций, выпускающих ценные бумаги для финансирования своей деятельности. Обыкновенные акции Фэни Мэй котируются на Нью Йоркской Фондовой Бирже (New York Stock Exchange (NYSE®)). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®).

FANNINGS = ВЫСЕВКИ – In tea industry, Fannings are finely-broken pieces of tea leaf that still have a recognizable coarse texture; they are the grade of tea used in most tea bags. See also Dust. Fannings are small pieces of tea that are left over after higher grades of teas are gathered to be sold. Traditionally these were treated as the rejects of the manufacturing process in making high-quality leaf tea like the orange pekoe. Fannings with extremely small particles are sometimes called Dusts. Fannings and dusts are considered the lowest grades of tea, separated from broken-leaf teas which have larger pieces of the leaves. However, the fannings of expensive teas can still be more expensive and more flavourful than whole leaves of cheaper teas. This traditionally low-quality tea has, however, experienced a huge demand in the developing world in the last century as the practice of tea drinking became popular. Tea stalls in India and the South Asian sub-continent, and Africa prefer dust tea because it is cheap and also produces a very strong brew; consequently, more cups are obtained per measure of tea dust. Because of the small size of the particles, a tea infuser is typically used to brew fannings. Fannings are also typically used in most tea bags, although some companies sell tea bags containing whole-leaf tea. Some exporters focus primarily on broken-leaf teas, fannings, and dusts. / Смотрите также Пыль (Dust).

FANNY PACK = ЗАДАСТАЯ СУМКА (или ПОЯСНАЯ СУМКА) – A Fanny Pack or Belt Bag or Belly Bag (American English), Bum Bag (British English) or Ket Bag (Hiberno-English) is a small fabric pouch worn by use of a strap above the hips around the waist that is secured usually with some sort of buckle. The straps sometimes have tri-glide slides, making them able to be adjusted to fit. The American and British names derive from the fact that they are often worn with the pouch above the buttocks, for which 'Fanny' and 'Bum' are the slang terms in each country respectively, although they may also be worn with the pouch at the front. The British usage of 'Fanny' is vulgar slang for the labia, so the name 'Fanny Pack' is rarely used in Britain. History:- Historically, the bag was positioned in front of the body, so people could protect themselves from bandits. The fanny pack relates back to the stone age in Ireland. Bags attached to belts have been in use since antiquity in many cultures. One origin was the Native American buffalo pouch which was used instead of sewing pockets into clothing. Buffalo pouches may also be worn on the wrist or carried on the front of the chest via a neck strap or lanyard. Ötzi had a belt pouch 5000 years ago. The European medieval belt-pouch is another antecedent which was superseded as clothing came to have pockets. The Scottish Sporran is a similar belted pouch that survived because of the impracticality of pockets in a kilt. The modern version made from synthetic materials came into use in the 1980s and they were especially in vogue in the 1990s, but are now often considered old-fashioned. Their use was satirised by the American humorist 'Weird Al' Yankovic in his song White & Nerdy. In 2012, calling them 'Belted Satchels' or 'Hands-Free Bags', several designer labels sought to bring the accessory back by offering stylish and expensive designs selling for as much as USD1 995. Fanny packs designed for concealed carry of a weapon are available. In other cultures they are known as Banana Bags (in France), and Kidney Bags (in Spain), while in Italy is called the Marsupio, from the Marsupium. Variations include the Wristpack, which is essentially a fanny pack for the wrist. Resurgence:- In July 2018, The Boston Globe reported that fanny packs are back in vogue with new packs introduced by fashion designers Gucci, Prada, and Louis Vuitton. The designer packs retail for up to USD1 500 and are being worn by celebrities such as Kim Kardashian, Rihanna, Jaden Smith, and Russell Westbrook. This time around, the packs can be worn around the waist or worn cross-body. Vogue magazine reported on the trend by writing 'Alas, due to our odd fascination with ugly throwback clothing, the fanny pack has been vindicated'. Fanny Pack is a pack for carrying personal articles that straps to the waist. Fanny Packs are back, and they are not going anywhere anytime soon. Straight from the 1980's these small but essential bum bags are now the accessory that every wardrobe needs. Cinch in your waist and style one as belt or opt for an athletic approach and swing yours over the shoulder or across your chest. The best part about these fanny packs is that they're a trend that will instantly elevate any look. Want to upgrade your jeans and a top combo? Throw a black fanny pack across your chest. Need to add a fierce twist to a feminine dress? Go for a faux leather style waist bag. Whether worn cross-body, over the shoulder or slung around your hips, fanny packs for women are now a season essential. / Отци (Ötzi). FAN SPREAD = FIVE AGAINST NOTE SPREAD

FANTAIL = ПОДЗОР (или СВЕС) – Fantail (maritime term):- after deck over counter. The part of a rounded stern which extends past the rearmost perpendicular.

FANTAINER = ЗАКРЫТЫЙ ВЕНТИЛИРУЕМЫЙ КОНТЕЙНЕР – Fantainer:- identical to a GP (General Purpose) container but is fitted with an electric extraction fan for carriage of cargoes prone to condensation. 20' only. / Идентичен контейнеру ОН (Общего Назначения), за исключением того, что . Изготавливаются только в 20-футовом исполнении.

FAO = FOOD AND AGRICULTURE ORGANIZATION (OF THE UNITED NATIONS)

FAQ = FAIR AVERAGE QUALITY

FAQ = FREQUENTLY ASKED QUESTIONS

FARAD = ФАРАД – Farad (symbol:- F) is the SI derived unit of capacitance. One Coulomb of charge will produce a potential difference of one Volt across a capacitance of one Farad. Named for the British physicist and chemist Michael Faraday (22 September 1791 – 25 August 1867; best known for his discoveries of electromagnetic induction and of the laws of electrolysis) 1867. A Farad is the charge in Coulombs which a capacitor will accept for the potential across it to change 1 Volt. A Coulomb is 1 Ampere second. Example:- the voltage across a capacitor with capacitance of 47 nF will increase by 1 Volt per second with a 47 nA input current. For electronics, one Farad is a fairly large amount of capacitance. The most commonly used submultiples in electrical and electronic usage are:- (i) 1 microFarad (μF) = one millionth (10^{-6}) of a Farad, or 1 000 000 pF, or 1 000 nF; (ii) 1 nanoFarad (nF) = one billionth (10^{-9}) of a Farad, or 1 000 pF; and (iii) 1 picoFarad (pF) = one trillionth (10^{-12}) of a Farad. / Один Кулон . Под Фарадом понимается единица электрической ёмкости в СИ. Обозначение:- Ф. Названа в честь Английского физика и химика, основоположника учения об электромагнитном поле Майкэла Фарадэя (Michael Faraday; 1791–1867). 1 Фарад равен электрической ёмкости конденсатора, при которой заряд 1 Кулон (Кл) создаёт на нём напряжение 1 Вольт (В). 1 Ф = $8.99 \cdot 10^{11}$ см (единица СГСЭ) = 10^{-9} единиц СГСМ. Чаще применяются дольные единицы:- микроФарад (мкФ), равный 10^{-6} Ф, и пикоФарад (пФ), равный 10^{-12} Ф.

FARINA = (ЦВЕТОЧНАЯ) ПЫЛЬ (или БЕЛЫЙ МУЧНИСТЫЙ НАЛЁТ) – Farina is a whitish mealy or flour-like covering. Hence:- Adj. farinose, farinaceus. / мучнистое (), приготовленные из муки (farinaceus).

FARM BILL = ФЕРМЕРСКИЙ БИЛЛЬ (или XX) – In the United States, the Farm Bill is the primary agricultural and food policy tool of the Federal Government. The comprehensive omnibus bill is renewed every 5 years or so and deals with both agriculture and all other affairs under the purview of the United States Department of Agriculture. In the United States the Farm Bill connects the food on our plates, the farmers and ranchers who produce that food, and the natural resources – our soil, air and water – that make growing food possible. The Farm Bill is a package of legislation passed roughly once every five years that has a tremendous impact on farming livelihoods, how food is grown, and what kinds of foods are grown. Covering programs ranging from crop insurance for farmers to healthy food access for low-income families, from beginning farmer training to support for sustainable farming practices, the farm bill sets the stage for our food and farm systems. As a leading advocate for family farmers and sustainable agriculture, it's our job to make sure that this important bill is good for farmers, consumers, and for the natural environment. Every five years, the farm bill expires and is updated:- it goes through an extensive process where it is proposed, debated, and passed by Congress and is then signed into law by the President. Each farm bill has a unique title, and the current farm bill is called the Agriculture Improvement Act of 2018. It was enacted into law on 20 December 2018 and expires in 2023. The original farm bill(s) were enacted in three stages during the 1930s as part of President Franklin Delano Roosevelt's New Deal legislation. Its three original goals – to keep food prices fair for farmers and consumers, ensure an adequate food supply, and protect and sustain the country's vital natural resources – responded to the economic and environmental crises of the Great Depression and the Dust Bowl. While the farm bill has changed in the last 70 years, its primary goals are the same. Our food and farming system confronts new challenges today, but through citizen and stakeholder action for a fair farm bill, we can ensure the vibrancy and productivity of our agriculture, economy, and communities for generations to come. (1) What Does The Farm Bill Cover? The farm bill's chapters are called Titles. The numbers and the substance matter of the titles can change over time. The 2018 Farm Bill, for instance, has twelve titles. Here's what they're called (and what they cover):- Title 1:- Commodities:- The Commodities title covers price and income support for the farmers who raise widely-produced and traded non-perishable crops, like Corn, Soybeans, Wheat, and Rice – as well as dairy and sugar. The title also includes agricultural disaster assistance. Title 2:- Conservation:- The Conservation title covers programs that help farmers implement natural resource conservation efforts on working lands like pasture and cropland as well as land retirement and easement programs. Title 3:- Trade:- The Trade title covers food export subsidy programs and international food aid programs. Title 4:- Nutrition:- The Nutrition title covers the Supplemental Nutrition Assistance Program (SNAP) (formerly known as Food Stamps) as well as a variety of smaller nutrition programs to help low-income Americans afford food for their families. Title 5:- Credit:- The Credit title covers federal loan programs designed to help farmers access the financial credit (via direct loans as well as loan guarantees and other tools) they need to grow and sustain their farming operations. Title 6:- Rural Development:- The Rural Development title covers programs that help foster rural economic growth through rural business and community development (including farm businesses) as well as rural housing, and infrastructure. Title 7:- Research, Extension, and Related Matters:- The Research title covers farm and food research, education, and extension programs designed to support innovation, from federal labs and state university-affiliated research to vital training for the next generation of farmers and ranchers. Title 8:- Forestry:- The Forestry title covers forest-specific conservation programs that help farmers and rural communities to be stewards of forest resources. Title 9:- Energy:- The Energy title covers programs that encourage growing and processing crops for biofuel, help farmers, ranchers and business owners install renewable energy systems, and support research related to energy. Title 10:- Horticulture:- The Horticulture title covers farmers market and local food programs, funding for research and infrastructure for fruits, vegetables and other horticultural crops, and organic farming and certification programs. Title 11:- Crop Insurance:- The Crop Insurance title provides premium subsidies to farmers and subsidies to the private crop insurance companies who provide federal crop insurance to farmers to protect against losses in yield, crop revenue, or whole farm revenue. The title also provides USDA's Risk Management Agency (RMA) with the authority to research, develop, and modify insurance policies. Title 12:- Miscellaneous:- The Miscellaneous title is a bit of a catch-all. The current title brings together six advocacy and outreach areas, including beginning, socially disadvantaged, and veteran farmers and ranchers, agricultural labor safety and workforce development, and livestock health. (2) Who In Congress Writes The Farm Bill? Members of Congress who sit on the Senate and House Committees on Agriculture, Nutrition, and Forestry hold the primary responsibility of drafting farm bills:- (i) The Senate Committee on Agriculture, Nutrition, and Forestry; and (ii) The House Committee on Agriculture. (3) What Is Not Included In The Farm Bill? While the Farm Bill covers a swath of key agricultural policy topics, there are some policy areas that are not included, such as:- (i) Farm and food worker rights and protections; (ii) Public land grazing rights; (iii) Irrigation water rights; (iv) Food and Drug Administration (FDA) food safety; (v) Renewable fuels standards; (vi) Tax issues; (vii) School meals; (viii) The Women, Infants, and Children (WIC) program; (ix) Some pesticide Laws; (x) Clean Water Act; and (xi) Clean Air Act. While these issues are directly related to agriculture, they are not included in the farm bill because they fall outside of the jurisdiction of the Agriculture Committees and are instead considered under the jurisdiction of other committees. For example, Farmworker Rights and Protections fall under the jurisdiction of the House Education and Labor Committee and Senate Health, Education, Labor and Pensions Committee. (4) How Much Does The Farm Bill Cost? The 2018 Farm Bill is projected to cost about USD428 billion over the five years of the bill's life, according to the estimates from the Congressional Budget Office. While all of the farm bill funding numbers are projections, some are more firm projections than others. The costs of the bill's three major groups of entitlement programs – the commodity, crop insurance, and SNAP programs – depend on what happens in the commodity markets and the general economy over the coming five years. Therefore, actual costs could be higher or lower than the projections. Less than five billion of the USD428 billion projected for the 2018 farm bill is allocated for programs that fit under the 'Other' category, which includes many vital programs such as the Local Agriculture Market Program (LAMP), the Farming Opportunities Training and Outreach (FOTO) program, Organic Agriculture Research and Extension Initiative (OREI), and the Specialty Crop Block Grant Program (SCBGP). (5) How Does The Farm Bill Process Work? There are four main phases of the farm bill process, from drafting the new legislation to putting the programs into effect on the ground. Here's how it works:- Reauthorization:- (i) First:- The Reauthorization phase, in which a new farm bill is written and passed into law approximately every five years. Hearings:- Legislatively, it all begins with hearings (in Washington, DC and across the country) – these are listening sessions where members of Congress take input from the public about what they want to see in a new bill. (ii) Agricultural Committees:- House and Senate Agriculture Committees each draft, debate, 'mark up' (amend and change), and eventually pass a bill; the two committees work on separate bills that can have substantial differences. (iii) Full Congress / 'The Floor':- Each committee bill goes next to 'the floor' – the full House of Representatives or Senate. Each bill is debated, amended, and voted on again by its respective body (House or Senate). (iv) Conference Committee:- After both the full House and Senate have passed a farm bill – which can take a while, and may require a bill being sent back to committee for more work before passage! – the two bills (House and Senate) go to a smaller group of Senators and Representatives called a 'Conference Committee', which combines the two separate bills into one compromise package. Conferees are typically chosen mostly from House and Senate Agriculture Committee members. (v) Full Congress / 'The Floor':- The combined version of the conference committee's farm bill then goes back to the House and Senate floors to be debated – and potentially passed. (vi) Last Step:- The White House:- Once the House and Senate approve a final farm bill, the bill goes to the President, who can veto it (and send it back to Congress) or sign it into law! Appropriations:- Once the farm bill is signed into law, it's time for the Appropriations phase:- setting money aside in the yearly federal budget to fund the programs in the farm bill. Rather than a calendar year, the federal government operates on a fiscal year from October 1st to September 30th. Some farm bill programs – called

Entitlements – are written in such a way that their funding is guaranteed with 'mandatory money' that will automatically support the program every year. An example of an entitlement program is the Supplemental Nutrition Access Program (SNAP). Other programs are authorized but funded through discretionary spending – meaning agriculture appropriators must decide each year how much funding (if any) to award a program. Because of budgetary constraints, not every program can be structured as an entitlement and generally it is much easier to include new programs in the farm bill if they are subject to appropriations. Though the farm bill expires and is reauthorized every 5 years or so, the appropriations process takes place each year. The farm bill includes language that authorizes programs and sets the maximum funding levels for each program for the years covered by the farm bill. However, authorized funding isn't the same as appropriated funding and appropriators may choose to provide funding well below the maximum amount that was authorized. The Sustainable Agriculture Research and Education (SARE) Program, for example, has been authorized at USD60 million per year since it was first introduced in 1985, but has not yet been funded above USD37 million per year. (1) First, the president's budget proposing how funding should be allocated to various federal programs is sent to Congress for their consideration. The House and Senate budget committees then draft and negotiate a concurrent budget resolution. The concurrent budget resolution provides appropriations committees with a framework for making funding decisions and sets a ceiling on how much funding is available to the appropriations committees for determining which programs receive discretionary funding. (2) Next, the process moves to the House and Senate Appropriations Committees, responsible for determining program-by-program funding levels across all areas of the US Government. Oftentimes, appropriators use the President's budget as a starting point for negotiations and decisions, but very rarely do they simply accept the president's recommendations. (3) Within the House and Senate Appropriations Committees are Agricultural Appropriations Subcommittees – the people responsible for designating farm, food, and rural development program funding. The Subcommittees get input for their funding decisions in a few ways:- (i) by holding public hearings and inviting testimony from experts and agencies; (ii) by requesting and considering funding requests from all legislators and staff (both on and off committee); and (iii) And by meeting with constituents and advocates of programs to discuss funding priorities. (4) From this input, the subcommittee staff puts together a proposed agriculture appropriations bill that the subcommittee will review and make changes (aka amendments), and approve the bill through a process called 'Markup'. Once passed by the subcommittee, these bills are submitted to the full Appropriations Committees, where they go through another round of review and changes – 'full committee markup'. (5) Once a bill has been marked up by the full Appropriations Committee, following subcommittee markup, the bill is brought to the full floor of the respected chamber of Congress for consideration. During the full floor passage, members of Congress can also make further changes to the bill, via amendments, prior to final passage. (6) Much like with the farm bill, differences in House and Senate appropriations bills get sorted out via a small group of legislators called the conference committee. Legislators have until the end of the fiscal year (11:59 pm September 30th) to reconcile their chamber's respective bills, write a single compromise bill, and pass it on the full floor of both the House and the Senate. After Congressional passage, the bill is sent to the White House and is signed into law by the President. Because the appropriations process is such a contentious process, this deadline is not often met, and lawmakers must then pass a 'continuing resolution', which maintains existing funding levels from the previous fiscal year so as to prevent a government shutdown. Rulemaking:- Happening concurrently with the annual appropriations process is rulemaking. After Congress passes a farm bill, the US Department of Agriculture (USDA) is responsible for writing the actual rules for how these programs will be implemented on the ground. This phase is called Administration (or Rulemaking). Wins for sustainable agriculture in the farm bill require vigilant attention during this phase to ensure the rules implement programs in a way that reflects the intent of Congress – and of the farmers and advocates who helped shape the bill! (i) Advocates and experts check in with agency staff at USDA, track the status of particular programs, and share their input. (ii) Grassroots individuals have a major role to play during this stage, by commenting on USDA's proposed rules for farm bill programs. (iii) Proposed agency rules are published in the Federal Register and are usually open for public comment from 30–90 days. When rules are posted, the National Sustainable Agriculture Coalition (NSAC) and its member groups will provide example comments that grassroots individuals can use in formulating their own responses. Outreach And Evaluation:- And always, when program funding is appropriated and rules are set in place for implementation, it's time for outreach and evaluation! Here is the true test of program success:- do farmers, ranchers, and grassroots organizations use the program? Does the program accomplish its goals and reach the people it is meant to reach on the ground? Is it having an impact? At this phase, grassroots organizations and USDA both promote funding opportunities, requests for grant proposals, and sign-ups for programs. Spreading the word is important to make sure everyone hears about programs and can access the information needed to participate. And following up on the successes and challenges of specific farm bill programs is another key step in improving our food and farming system. By sharing evaluation and feedback on farm bill programs, farmers and constituents give lawmakers and agencies the information they need to fix any problems in the bill, and to work towards building a better farm bill for everyone. (6) Farm Bill 101 Webinars:- In 2017, NSAC co-hosted several webinars in partnership with the Southern Sustainable Agriculture Working Group to take a deeper look at some of the programmatic areas of the farm bill and identify ways one can become involved in 'agvocacy'!

FARMING SYSTEM = СИСТЕМА ФЕРМЕРСТВА (или СИСТЕМА ЗЕМЛЕДЕЛИЯ) – Farming System is:- (1) the manner in which a particular set of farm resources is assembled within its environment, by means of technology, for the production of primary agricultural products. (2) A collection of distinct functional units, where crops, livestock, and marketing activities interact because of the joint inputs received from the environment and management personnel. (3) A unique and reasonably stable arrangement of farming enterprises that a household manages according to well-defined practices in response to the physical, biological, and socioeconomic environment and resources. These factors combine to influence output and production methods. / Под Системой Земледелия (Cropping System) понимается комплекс взаимосвязанных агротехнических, мелиоративных и организационных мероприятий для восстановления и повышения плодородия почвы. Отражает различные фазы интенсификации земледелия. Примитивные системы земледелия (подсечно-огневая и лесопольная, переложная и залежная) применялись в дофеодальный период. При феодализме из заменили экстенсивные системы; восстановление плодородия почвы стало направляться человеком (введение пара и другое). При переходных системах земледелия, например, травопольной, воздействие человека на почвенное плодородие возросло (посевы трав, улучшенная обработка и тому подобное). Для современных интенсивных систем земледелия (плодосменная, пропашная, вольная и другие) характерно повышение плодородия почвы путём использования удобрений, чередования сельскохозяйственных культур и другого.

FARMI–VISCA = FARM AND RESOURCE MANAGEMENT INSTITUTE–VISAYAS STATE COLLEGE OF AGRICULTURE

FARM OPERATOR = ОПЕРАТОР ФЕРМЫ – In the United States, Farm Operator is the person who is in general control of the farming operation on the farm during the program year. / Под Фермерским Хозяйством понимается сельскохозяйственное предприятие предпринимательского типа на собственной или арндованной земле. Фермерские хозяйства ведутся с применением наёмного труда, семейные – преимущественно силами владельца (фермера) и членов его семьи.

FARM–OUT = СУБАРЕНДА – Farm-Out:- an interest in an oil or gas lease that is granted by the lease holder to a third party. / Доля в праве аренды нефтеносного или газоносного месторождения или объекта, переданная арендатором третьей стороне.

FARM PRICE = ФЕРМЕРСКАЯ ЦЕНА – Farm Price:- in the Cotton industry of the United States, the season-average price received by farmers for Cotton is a sales-weighted average of prices received by farmers during the marketing season at the point of first sale, usually on the farm or at a local delivery point. This USDA series is available for both upland cotton by months and by State and for Extra Long Staple (ELS) Cotton by marketing year and by State and is reported in Agricultural Prices, published by USDA's National Agricultural Statistics Service. An important use of upland cotton farm prices on a calendar year basis is to determine Government deficiency payments. Farm Price or Average Price Received by Farmers represent the price paid to grower by cotton buyers. Average Price Received is reported by the National Agricultural Statistics Service of USDA.

FARM SERVICE AGENCY = АГЕНТСТВО ПО ОБСЛУЖИВАНИЮ ФЕРМ – The Farm Service Agency (FSA) is an agency of the United States Department of Agriculture (USDA) responsible for administration of federal farm programs. This agency, for example, administers the Government Loan Programs. Cotton responsibilities include the loan program and price support programs. The address is:- Kansas City Commodity Office, Cotton and Rice Division, PO Box 419205, Kansas City, MO 64141. The Commodity Credit Corporation (CCC) is a division of this agency. Farm Service Agency is the Federal agency that among other duties, is involved with certifying Title II (PL 480) commodities, such as corn soya milk, corn soya blend, wheat protein concentrate, and vegetable oil. These types of commodities are ineligible for export certificates. The Farm Service Agency (FSA) is the USDA agency into which were merged several predecessor agencies, including the Agricultural Stabilization and Conservation Service (ASCS). The ASCS was, as the FSA is now, primarily tasked with the implementation of farm conservation and regulation laws around the country. The Administrator of FSA reports to the Under Secretary of Agriculture for Farm and Foreign Agricultural Services. The current administrator is Jonathan Coppess, who was appointed in 2009. The FSA (ASCS) of each state is led by a politically appointed State Executive Director (SED). FSA was set up when the department was reorganized in 1994, incorporating programs from several agencies, including the Agricultural Stabilization and Conservation Service, the Federal Crop Insurance Corporation (now a separate Risk Management Agency), and the Farmers Home Administration. Although its name has changed over the years, the agency's relationship with farmers goes back to the 1930s. Earlier USDA agencies that evolved into FSA include the Agricultural Adjustment Administration, War Food Administration, Production and Marketing Administration, and Commodity Stabilization Service as well as ASCS. At that time, Congress set up a unique system under which federal farm programs are administered locally. Farmers who are eligible to participate in these programs elect a three- to five-person county committee, which reviews county office operations and makes decisions on how to apply the programs. County committees are panels of three to five farmers, elected by other farmers, to oversee the local operation of commodity programs, credit, and other programs of the Farm Service Agency. County committees, established by the Soil Conservation and Domestic Allotment Act of 1935 (PL 74-46), are so named because they have overseen USDA field offices for farmers that once existed in most rural farm counties throughout the United States. Today, the committees often oversee activities in multi-county areas, due to USDA reorganization and consolidation of its field office structure into a network of about 2 500 field service centers. The committees are responsible for hiring and supervising the County Executive Director (CED), who manages the day-to-day activities of the field service center and its employees. The director and most county office staff legally are employees of the farmer-elected committees rather than the federal government, although their salaries come from federal funds. / сохранение (conservation). Служба Стабилизации и Сохранения Сельского Хозяйства (Agricultural Stabilization and Conservation Service). наём (hiring).

FAS = FOREIGN AGRICULTURAL SERVICE

FAS = FREE ALONGSIDE SHIP

FAS 133 = FINANCIAL ACCOUNTING STANDARDS BOARD STATEMENT 133

FASAB = FEDERAL ACCOUNTING STANDARDS ADVISORY BOARD

FASB = FINANCIAL ACCOUNTING STANDARDS BOARD

FASCIATED YARN = ОПОЯСАННАЯ ПРЯЖА – Fasciated Yarn:- yarns consisting of a core of discontinuous fibers with little or no twist and surface fibers wrapped around the core bundle.

FASCIATION = ФАСЦИАЦИЯ (или ОБРАЗОВАНИЕ ПУЧКОВ) – Fasciation is a malformation of a stem or other part usually with lateral flattening, cresting. / опухоль. Под Фасциацией, от Латинского слова Fascia, означающее Повязка или Полоса, понимается уродливая деформация побегов растений, при которой они становятся плоскими, лентовидными, ребристыми и так далее. Причины фасциации:- заражение растения специфическими вирусами, микоплазмами, бактериями, микроскопическими грибами, фитогельминтами; поражение клещами, насекомыми; воздействие ионизирующего излучения, химических мутагенов, стимуляторов роста, пестицидов, удобрений; механическое травмирование; нарушение режима влажности, освещения, температуры и другое. Возникновение фасциации связывают со срастанием стеблей друг с другом, боковых ветвей с главным побегом, срастанием нескольких точек роста и с разрастанием одной точки роста. В результате фасциации у растений наблюдаются – искривление и перекручивание стебля, ненормальное разветвление его апикальной части, изменение сроков формирования и взаимного расположения листьев, цветков и соцветий, чрезмерная разветвлённость соцветий и увеличение количества цветков в них, деформация цветка с увеличением количества образующих его органов, возникновение многогнёздного гинецея, разрастание плодов и соплодий, смещение ритма деления и дифференциации клеток и так далее. Физиологическо-биохимические закономерности, происходящие при фасциации, не установлены. Фасциация, затрагивающая цветки, соцветия, плоды и соплодия, во многих случаях полезна, так как используется при селекции некоторых сельскохозяйственных растений (например, при выведении крупнозёрных диплоидных сортов Гречихи). Исследование природы фасциации представляет значительный интерес для познания структурных и гормональных закономерностей морфогенеза растений. Смотрите также Уродства. Под Фасциацией понимается деформация побегов растений. Возникает вследствие срастания стеблей друг с другом, ветвей с главным побегом, нескольких точек роста, разрастания одной точки роста, смещения ритма деления и дифференцировки клеток. Причина фасциации – поражение растений возбудителями болезней и вредителями (насекомыми, клещами и другими), травмирование, воздействие различными мутагенами, нарушение режима влажности, освещения, температуры и так далее. Фасциацию цветков, соцветия, плодов, соплодий и прочего иногда используют в селекции растений, например, при выведении крупноплодных сортов Гречихи, махровых цветков декоративных растений.

FASCICLE = ПУЧОК (или ГРОЗДЬ) – Fascicle (Latin:- Fasciculus = Small Bundle) is a small cluster or bundle of, e.g., branches, flowers, leaves, or stems, or a bundle of vascular tissue. Of an inflorescence, a cluster of flowers in a leaf axil lacking an axis or cymose morphology. Hence:- Adj. fasciculate:- bundled or clustered. / маленькая гроздь (cluster) или пучок, например, ветвей, цветков, листьев или стеблей, или пучок васкулярной ткани. О соцветии, грозди цветков в пазухе листа, недостающей оси или . Пучок Проводящий у растений, совокупность элементов проводящих тканей. В побеге проводящий пучок возникает из меристемы его конуса нарастания, точнее из прокамбия. Проводящий пучок включает флоэму (луб) и ксилему (древесину),

механические ткани и клетки живой паренхимы. Проводящие пучки бывают полными или неполными, то есть состоят из одной флоэмы или ксилемы; открытыми – часть прокамбия не дифференцируется в проводящие ткани и сохраняется в виде камбия (у двудольных), или закрытыми – без камбия (у однодольных). Различают:- (i) Коллатеральные Пучки – флоэма располагается по одну сторону – кнаружи от ксилемы; (ii) Биколлатеральные Пучки – флоэма располагается по обе стороны от ксилемы; (iii) Концентрические Пучки – амфивазальные (ксилема окружает флоэму) и амфикрибральные (флоэма окружает ксилему). Структура проводящих пучков на разных уровнях стебля может меняться. В корнях растений формируются Радиальные Пучки, состоящие из отдельных чередующихся участков ксилемы и флоэмы, расположенных по радиусам проводящего цилиндра.

FASCINATOR = ПОВЯЗКА (или ОЧАРОВЫВАЮЩИЙ) – Fascinator is a woman's lightweight head scarf usually of crochet or lace. / :- женский лёгкий головной шарф, как правило, вязаный крючком или из кружева.

FASCISM = ФАШИЗМ – Fascism is a class of political ideologies (and historical political regimes) that takes its name from the movement led by Benito Mussolini that took power in Italy in 1922. Mussolini's ideas and practices directly and indirectly influenced political movements in Germany (especially the Nazi Party), Spain (Franco's Falange Party), France, Argentina, and many other European and non-European countries right up to the present day. The different 'fascist' movements and regimes have varied considerably in their specific goals and practices, but they are usually said to be characterized by several common features:- (i) militant nationalism, proclaiming the racial and cultural superiority of the dominant ethnic group and asserting that group's inherent right to a special dominant position over other peoples in both the domestic and the international order; (ii) the adulation of a single charismatic national leader said to possess near superhuman abilities and to be the truest representation of the ideals of the national culture, whose will should therefore literally be law; (iii) emphasis on the absolute necessity of complete national unity, which is said to require a very powerful and disciplined state organization (especially an extensive secret police and censorship apparatus), unlimited by constitutional restrictions or legal requirements and under the absolute domination of the leader and his political movement or party; (iv) militant anti-Communism coupled with the belief in an extreme and imminent threat to national security from powerful and determined Communist forces both inside and outside the country; (v) contempt for democratic socialism, democratic capitalism, liberalism, and all forms of individualism as weak, degenerate, divisive and ineffective ideologies leading only to mediocrity or national suicide; (vi) glorification of physical strength, fanatical personal loyalty to the leader, and general combat-readiness as the ultimate personal virtues; (vii) a sophisticated apparatus for systematically propagandizing the population into accepting these values and ideas through skilled manipulation of the mass media, which are totally monopolized by the regime once the movement comes to power; (viii) a propensity toward pursuing a militaristic and aggressive foreign policy; and (ix) strict regulation and control of the economy by the regime through some form of corporatist economic planning in which the legal forms of private ownership of industry are nominally preserved but in which both workers and capitalists are obliged to submit their plans and objectives to the most detailed state regulation and extensive wage and price controls, which are designed to insure the priority of the political leadership's objectives over the private economic interests of the citizenry. Therefore under fascism most of the more important markets are allowed to operate only in a non-competitive, cartelized, and governmentally 'rigged' fashion. / Под Фашизмом, от Итальянского слова Fascismo, от Fascio, означающее Объединение или Пучок или Связка, понимается политическое течение, возникшее в капиталистических странах в период общего кризиса капитализма и выражающее интересы наиболее реакционных и агрессивных кругов империалистической буржуазии. Фашизм у власти – открыто террористическая диктатура наиболее реакционных сил монополистического капитала. Важнейшие черты фашизма – применение крайних форм насилия против собственного народа, воинствующий антикоммунизм, шовинизм, расизм, широкое использование государственно-монополистических методов регулирования экономики, политическая демагогия с целью создания массовой базы (главным образом за счёт мелкой буржуазии) для фашистских партий и организаций. Внешняя политика фашизма – политика империалистических захватов. К концу 1930-х фашистские режимы утвердились в Германии, Испании, Италии, Португалии и ряде стран Восточной Европы. Фашистская Германия во главе с Адольфом Гитлером (у власти в 1933–45), заключив союз с фашистской Италией во главе с Бэнито Муссолини (у власти в 1922–43) и милитаристской Японией, развязала Вторую Мировую Войну 1939–45. В соответствии с решениями Берлинской Конференции 1945 были уничтожены фашистская национал-социалистическая партия и подконтрольные ей организации. Решения предусматривали предупреждение возрождения фашизма в любой форме. В 1970-е ликвидированы фашистские режимы в Греции, Испании, Португалии. Однако в ряде капиталистических стран отмечалась и отмечается активность неофашистских элементов. Фашистские методы правления характерны для военных диктатур в Парагвае, Чили, для южноафриканских расистов. Под Фашизмом понимается открытая террористическая диктатура наиболее реакционных, наиболее шовинистических элементов финансового капитала. Установление фашизма выражает неспособность господствующей буржуазии удерживать свою власть обычными, 'демократическими' средствами. Фашизм выступает во главе сил антикоммунизма, его основной удар направлен против коммунистических и рабочих партий и других прогрессивных организаций. Впервые фашистский строй был установлен в Италии (1922), а затем в Германии (1933) и в ряде других стран. В Германии фашизм выступал под маской национал-социализма. Фашизм явился ударной силой международной реакции; фашистские государства, в первую очередь Гитлеровская Германия, развязали Вторую Мировую Войну, в ходе которой был разгромлен Германский фашизм. В некоторых странах в настоящее время реакционные элементы пытаются возродить фашизм. В идеологии фашизм – это антикоммунизм, иррационализм, крайний национализм и расизм (идея 'высшей расы', якобы призванной господствовать над 'низшими', 'неполноценными' расами) и антигуманизм, культ силы и личной власти, пропаганда войны как естественного состояния человечества.

FASHION = МОДА – Fashion is a popular style or practice, especially in clothing, footwear, accessories, makeup, body piercing, or furniture. Fashion is a distinctive and often habitual trend in the style in which a person dresses. It is the prevailing styles in behaviour and the newest creations of textile designers. The more technical term costume has become so linked to the term 'Fashion' that the use of the former has been relegated to special senses like fancy dress or masquerade wear, while 'fashion' means clothing more generally, including the study of it. Although aspects of fashion can be feminine or masculine, some trends are androgynous. / Под Модой, от Французского слова Mode, от Латинского слова Modus, означающее Мера или Образ или Правило или Предписание или Способ, понимается непродолжительное господство определённого вкуса в какой-либо сфере жизни или культуры. В отличие от понятия стиля, мода характеризует более кратковременные и поверхностные изменения внешних форм бытовых предметов и художественных произведений. В более узком смысле модой называют смену форм и образцов одежды, которая происходит в течение сравнительно коротких промежутков времени. Это словоупотребление (быть одетым 'по моде' или а ля мод (à la mode)) восходит к XVII веку, когда Французская придворная мода стала образцом для всех Европейских стран. Слово Мода употребляется также для обозначения непрочной, быстропреходящей популярности. Перспективное Направление Моды:- конечно, нельзя сказать, что в моде начала XXI века вообще нет никаких правил и перемен. Нет тотальных, кардинальных изменений. Но существуют чёткие тенденции развития моды, и с ними надо считаться, чтобы не 'выпасть из времени'. Это, однако, не мешает придерживаться своего собственного стиля, соответствующего личной философии и образу жизни. Силуэт всегда был главной характеристикой модной одежды. Сегодня он изменился до неузнаваемости – вытянулся,
