для Denominazione di Origine Protetta (DOP) или по-Английски – Protected Designation of Origin (PDO) или по-Русски – Защищённого Определения Происхождения (ЗОП)). Для того чтобы поистине вкусить и ‘дисфрутар’ (Испанское слово Disfrutar означает Насладиться) волшебным и эксклюзивным вкусом особенного масла, лучше не смешивать его ни с чем, а разлить в блюдце и макать кусочки свежего хлеба прямо в него. И больше ничего для счастья не надо! Ну разве что, может быть ещё бокал хорошего вина Риоха ДОК (Rioja DOC) и немного Хамона Ибэрико (Jamón Ibérico).... В Испании, как в домашней кухне, так и в ресторанах и барах, обожают всевозможные, обжаренные в огромном количестве масла продукты приготовленные во фритюрнице, в частности, такие как рыба, овощи, морепродукты и замороженные продукты. Для жарки такого типа продуктов обычно используется оливковое масло (смотрите категорию II) или масло из выжимок (второго отжима Памэйс (Pomace) (смотрите также категорию IV). I – Масло Оливковое Нерафинированное Высшего Качества (Extra Virgin Olive Oil) или по–Испански Aceite de Oliva Extra Virgen:- Это масло можно сравнить с ‘фрэш’ из оливок, со свежевыжатым фруктовым соком, без каких либо добавок или консервантов. Это масло получено при помощи отжима оливок исключительно механическим способом, то есть без применения химических и биохимических добавок. Также при процессе производства этого масла оливки не подвергались никакой обработке кроме мытья, отстаивания, центрифугирования и фильтрации. Это продукт высшего качества и способ его производства почти не поменялся со времён Древнего Эгипта. Во всем мире его называют Жидким Золотом. Этот тип оливкового масла имеет максимальную пищевую ценность и не теряет её в течении 18 месяцев, а некоторые и до двух лет. Его можно использовать, как и любое другое масло, лучше всего для приготовления соусов и заправки салатов, так как это чисто органический продукт, который имеет очень много полезных свойств для здорового образа жизни и применять его нужно таким, как он есть. Оливковое масло Экстчрэ Вёдьжин (Extra Virgin) имеет вкус оливок, в зависимости от Сорта из которых его сделали. Оно бывает различных сочетаний вкуса:- зелёных фруктов, как молодого яблока и ореха, горных трав и томатов. Но всё оно обязательно должно горчить. Если масло молодое и только что сделано, то горечь более ярко выражена, если масло находится в бутылке больше полугода, то горечь слабо выражена. Это тоже зависит от Сорта (Cultivar) и их купажа. Можно провести параллель с вином. Чтобы достичь оптимального вкуса виноделы смешивают вино разных Сортов, чтобы добиться оптимального вкуса. Оливковое масло сделанное только из Оливок Сорта Арбэкина (Oliva Arbequina) практически совсем не горчит, обладает мягким вкусом и неповторимым запахом. Но, к сожалению, масло из этого Сорта меньше всего сохраняет свои свойства с течением времени. Все масла Экстчрэ Вёдьжин (Extra Virgin) имеют максимальную кислотность 0.5–0.8% (в пересчёте на олеиновую кислоту). Оливковое масло Экстчрэ Вёдьжин (Extra Virgin) бывает также с обозначениями ЗОП (DOP) и ЗГО (IGP). Первое обозначает, что как оливки, так и производство масла из них было осуществлено в конкретном географическом месте, на определённой территории, которая входит в Европейский реестр под конкретным регистром (Reg N ...). К этому маслу применяются более жёсткие требования. Климатические условия, традиции производства, Сорта Олив, присущих этому месту, исключает его копирование других производителей. И поэтому оно очень дорогое, оно приравнивается по значимости также, как дорогое вино из Испанского региона Риоха (Rioja) или Французской Бургундии (Bourgogne). Этого масла во всех странах Средиземноморья производится очень мало. И практически всё оно остаётся в этих же странах:- Испании, Италии, Греции для собственного потребления и практически не экспортируется. Позволить себе покупать такое масло могут только очень обеспеченные люди. Также и оценить его могут только проффесионалы и опытные повара. Такое масло можно было встретить в элитных сетевых магазинах розничной торговли Гурмэ (Gourmet) во всём мире. При этом его полезные свойства для здоровья ни сколько не лучше простого серийного оливкового масла Экстчрэ Вёдьжин (Extra Virgin). Оно отличается только букетом вкуса. Остерегайтесь подделок. Спрашивайте Сертификат Происхождения продукта. Если вы встретите такое масло по низкой цене в простых магазинах – то это скорее всего искусная имитация, расчитанная на плохую осведомлённость Российских граждан в этом вопросе. ЗГО (IGP) (аббревиатура для Indication Géographique Protégée (IGP) или по-Английски – Protected Geographical Indication (PGI), или по-Русски – Защищённое Географическое Обозначение (ЗГО)) – также означает принадлежность масла к конкретному региону, входящему в Европейский Реестр Сельскохозяйственной Продукции и Пищевых Продуктов. При этом в указанном районе может быть защищена одна или несколько фаз производственного процесса (сбор сырья, переработка и классификация олив, производство масла по особой технологии, присущих только этому региону исторически). Это строгий свод правил, соблюдение которого строго контролируется специальной независимой комиссией Европейского Союза. Такое масло также очень дорогое, его мало и присутствует оно в магазинах типа бывшей сети розничной торговли Гурмэ (Gourmet). Спрашивайте Сертификат Происхождения. Биологическое или Экологически Чистое Оливковое Сасло (Bío, Eco). Это оливковое масло производится с соблюдением Регламента ЕС 834/07, который сертифицирует и контролирует все фазы производства данного продукта питания. При осуществлении всех этапов производственного процесса запрещено использование синтетических химических веществ и генетически модифицированных организмов. Также обработка почвы и самих Оливковых Деревьев и плодов осуществляется только с использованием органических веществ и натуральных природных материалов. За этим так же следит специальная независимая коммисия экспертов. Такое масло тоже очень большая редкость, оно также очень дорогое и встретить его можно всё в магазинах типа бывшей сети розничной торговли Гурмэ (Gourmet). В России можно встретить подделки оливкового масла с пометкой ‘БИО’ чаще, чем оливковое масло с пометками ‘DOP’ и ‘IGP’. Так как производители не несут никакой ответственности за небрежное нанесение слов ‘Био’, ищите на обратной стороне этикетки специальную голографическую печать и спрашивайте Сертификат Происхождения. II – Масло Оливковое Нерафинированное (Virgin Olive Oil):- Масло Оливковое Нерафинированное проходит аналогичный процесс производства как и все масла первого холодного отжима, но не достигает категорию совершенства. Это обосновывается тем, что в органолептических свойствах этого масла присутствуют какие-либо дефекты детектированные экспертами специальной комиссией дегустаторов официальной группы по-Испански Panel de Cata. Следовательно, не получая достаточное количество баллов, чтобы считаться оливковым маслом Высшего Качества. Зачастую покупатель, читая на этикетке – оливковое нерафинированное масло первого холодного отжима, не обращает внимание на то, что отсутствует описание Высшего Качества. В отличие от натурального оливкового масла первого отжима Класса Экстра (не превышает 0.8 ° кислотности), в этой отдельной категории обычного оливковое масло холодного отжима допускается кислотность до 2 °. III – Масло Оливковое Рафинированное С Добавлением Масел Оливковых Нерафинированных (Olive Oil) по-Испански Aceite de Oliva:- Это смесь рафинированного оливкового масла и оливкового масла Экстчрэ Вёдьжин (Extra Virgin) (смотрите категорию I) 85%/15%. Максимальная кислотность допускается до 1 ° в пересчёте на олеиновую кислоту. Это масло отличного качества, которое также вы можете использовать в любом блюде и рецепте. В Испании эта категория оливкового масла является самой потребляемой. Оно идеально для жарки, так как наличие в нём более стабильных жирных кислот больше, чем в других растительных маслах, делает температуру дымообразования значительно выше температуры для нормальной жарки пищи. При жарке пищи на оливковом масле не образуются канцерогены. Это масло также можно использовать для заправки салатов, приготовления соусов, оно совсем не горчит, если Вы не привыкли к горечи. Ваше блюдо будет полезным но без неповторимого аромата оливкового масла Экстчрэ Вёдьжин (Extra Virgin) (масло оливковое нерафинированное высшего качества (смотрите категорию I)), которое придаёт любому блюду неповторимый вкус. IV – Масло Оливковое Из Выжимок, Рафинированное С Добавлением Масла Оливкового Нерафинированного (Olive Pomace Oil), Памэйс (Pomace) или по-Испански Aceite de Orujo de Oliva. Это масло получается

после второго отжима плода Оливкового Дерева. Например, процесс идентичен для получения любого другого растительного масла и в нём используются органические растворители и высокая температура. После экстракции полученое масло смешивается с Экстчрэ Вёдьжин (Extra Virgin) (смотрите категорию I) для понижения кислотности и повышения качества конечного продукта. Это масло не имеет столько пищевой ценности, как другие два оливковых масла, но имеет все те витамины и минералы, которые присутствуют в натуральном масле, только в меньшем количестве. Вы можете использовать его в любом рецепте, но желательно использовать его для жарки, например, где нужно использовать большое количество масла (для фритюра, к примеру), и не так жалко использовать хорошее дорогое масло. Это масло значительно дешевле остальных. В Испании принято иметь дома два или три сорта оливкового масла и применять каждое по определённому случаю. Если пришли гости и надо заправить наш лучший салат, то используется Экстчрэ Вёдьжин (Extra Virgin) абсолютно каждый день! По праздникам оливковое масло Экстчрэ Вёдьжин ЗОП (Extra Virgin DOP), чтобы разделить со своими друзьями радость от необыкновенного вкуса. Испанцы, чтобы вкусить (у них даже глагол специальный есть – Дисфрутар) этот волшебный вкус обычно даже не смешивают ни с чем, они просто разливают его по маленьким блюдечкам и макают кусочки хлеба прямо в масло. И больше ничего для их счастья не надо; разве что, бокал хорошего вина и немного хамона. Испанцы обожают разные обжаренные в огромном количестве масла (фритюр):- рыбу, овощи, морепродукты. Для этого они используют оливковое масло или масло второго отжима Памэйс (Pomace). V – Лампадное Масло:- Лампадное масло – это масло, которое как и все масла первого отжима, получают механическим способом и напрямую из оливок, но из оливок худшего качества, собранных на земле, побитых или подзамёрзших. Название этого масла происходит от его применения как топлива для лампад и коптилок. В настоящий момент – лампадное масло используют для его последующей рафинации и получения также некоммерческого в ЕС оливкового масла – рафинированного, без запаха, цвета и вкуса. Масло, которое в свою очередь, смешивают с маслами первого холодного отжима (от 2 до 20%) и получают оливковое масло, незаменимое при жарке. Чисто рафинированное оливковое масло используют в производстве майонезов и соусов. Оливковый жмых после обрабатывают различными растворителями получают рафинированное оливковое масло из выжимок. Внимание! Будьте бдительны, читайте внимательно этикетку. Многие производители пользуются плохой осведомлённостью Российских граждан об оливковом масле и продают одну категорию масла по цене другой для извлечения своей выгоды. Любой покупатель должен различать оливковые масла по составу, как это определяется законом, масло высшей категории – это оливковое масло экстра класса (Экстчрэ Вёдьжин (Extra Virgin)) и оно идеально подходит как детям, так и взрослым с возрастной категорией от 6 месяцев до 100 лет. Полезное во всех отношениях масло и единственное из всех категорий, которое можно назвать настоящим оливковым соком. У каждой категории масла есть своё название и никак нельзя смешивать или менять переводы, чтобы не приводить в заблуждение покупателя. Название Оливковое Масло означает смесь рафинированного оливкового масла (здесь всегда имеют ввиду рафинацию масел первого отжима) и масел первого отжима . Масло Памэйс (Pomace) – это смесь рафинированного масла второго отжима и масел первого отжима. Поэтому определение на этикетки масла Памэйс (Pomace) как Оливковое Масло просто противоречит закону. Сейчас многие Российские крупные фирмы стали производить оливковое масло под своими марками, так же и многие крупные сети. И поскольку в Российском законодательстве допускаются несоответствия Европейскому Кодексу по этой категории, то такое оливковое масло часто не соответствует критериям, написанным на этикетках, самому продукту внутри. В России при сертификации делаются только физико-химические анализы для определения соответствия тому или иному качеству, а в странах происхождения согласно Кодексу производится также анализ вкуса и запаха специальной комиссией, которая в Испании называется Панэль дэ Ката (Panel de Cata). Почти такая же, как при дегустации вина. Панэль дэ Ката (Panel de Cata) состоит из 10 профессиональных дегустаторов, которые пробуют образцы масла в безымянных бокалах, и выносят своё заключение. И если мнения всех 10 членов совпадает, то такому маслу присуждается класс Экстчрэ Вёдьжин (Extra Virgin), если хоть один против, то не проходит вся партия и отправляется на доработку. Этот процесс очень долгий и ответственный. Поэтому производители стараются так приготовить своё масло, чтобы, не дай Бог, профессионалы Панэль дэ Ката (Panel de Cata), проверив это масло и не нашли бы несоответствия заявленному качеству; иначе это будет позор на всю страну, и такой производитель штрафуется и лишается санитарного регистра. Сами понимаете, что Россия к такому контролю пока не готова. Поэтому Вас легко могут ввести в заблуждение. Покупайте масло только марок производителей стран происхождения. Испания, как самый крупный производитель, славится своим жёстким контролем. И к сожалению, что нельзя в Испании, допускается в других странах. По этому поводу в Евросоюзе уже не один год идёт борьба Испанских производителей за защиту своих прав. Они добиваются установления одинаково равных методов контроля во всех странах, а также, чтобы было на этикетках написано происхождение оливкового масла. Поскольку другие страны с меньшим объёмом собственного производства покупают масло из Испании в бочках, перемешивают его, как получится, добавляют каплю своего, и продают его уже как:- Итальянское, Греческое, Турецкое, Тунисское, ... Потребление Высоко-Полифенольного Оливкового Масла Экстчрэ Вёдьжин (ОМЭВ (EVOO)) Снижает Кровяное Давление У Здоровых Взрослых:- Исследователи из Австралии показали, что употребление оливкового масла первого отжима с высоким содержанием полифенолов приводит к значительному снижению двух различных типов кровяного давления. Периферическое и центральное систолическое артериальное давление снизилось у участников исследования на 2.5 и 2.7 мм рт.ст., соответственно. Однако, никаких существенных различий в диастолическом артериальном давлении не наблюдалось. А исследование было очень простое:- добавление всего 60 миллилитров (около четырёх столовых ложек) оливкового масла первого отжима в ежедневный рацион может привести к снижению систолического давления. Всего-навсего, ведь это так легко исполнить всем, кому необходимо следить за своим давлением. Это открытие, по словам медиков, имеет значение для общественного здравоохранения, особенно в отношении профилактики сердечно-сосудистых заболеваний, потому что есть другие исследования, согласно которым снижение систолического артериального давления на 10 мм рт.ст. привело к 20% снижению сердечно-сосудистых заболеваний у населения в целом, 17% снижению ишемической болезни сердца, 27% снижению риска инсульта и 28% снижению сердечной недостаточности. Оливковое Масло Снижает Оксидативный Стресс:- Оливковое масло первого отжима является самым легкодоступным источником антиоксидантов, которые помогают уменьшить последствия окислительного стресса и, следовательно, снижают риск и прогрессирование многих заболеваний. Оксидативный или окислительный стресс – это причина всех болезней, включая рак, потому что это процесс повреждения самой клетки организма в результате окисления. Экологические, физические и психические стрессоры вызывают выработку активных форм кислорода, также известных как свободные радикалы. Выработка свободных радикалов приводит к тому, что организм человека подвергается давлению окислительного стресса. Слишком много свободных радикалов приводит к широко распространённому повреждению, потому что они ‘воруют’ электроны у других клеток, разрушая их, но стабилизируя себя. Получается дисбаланс между окислительной и антиоксидантной системами организма. Антиоксиданты стабилизируют свободные радикалы, обеспечивая поставку электронов для стабилизации клеток. Поэтому, если мы можем помочь организму, предоставляя больше антиоксидантов, имеет смысл, чтобы окислительный стресс уменьшался, а следовательно, уменьшалось бы и повреждение органов и тканей. Многие исследования показывают, что Оливковое Масло Экстчрэ Вёдьжин (ОМЭВ) обеспечивает целый ряд различных преимуществ для здоровья, но во многих случаях механизмы все ещё не полностью поняты. Тем не менее, большая часть исследований, связанных с Оливковым Маслом Экстчрэ Вёдьжин (ОМЭВ) в

отношении профилактики заболеваний или обращения риска, часто приписывает снижение окислительного стресса в качестве одного из основных механизмов. То есть это проверено и точно стоит этим пользоваться, потому что снизить окисление значит замедлить старение. Оливковое Масло И Язвенный Колит (Ulcerative Colitis):- Результаты нового исследования, опубликованного в Оксвэд Акэдэмик (Oxford Academic) – Прессе Оксфордского Университета (Oxford University Press), показали, что пациенты, страдающие воспалительными заболеваниями кишечника (ВЗК), которые употребляли в пищу оливковое масло первого отжима в течение шести месяцев ежедневно, наблюдали значительное улучшение своего состояния. У них снизился индекс массы тела, объёмы фигуры зрительно уменьшились. Также были отмечены более низкие маркеры воспаления и меньшая активность заболевания. 'Принятие правильной пищевой привычки, основанной на Средиземноморской диете (Mediterranean diet), может иметь решающее значение в клиническом лечении пациентов с воспалительными заболеваниями кишечника', сообщил агентству Ройтас (Reuters) Фабио Чикко (Fabio Cicco), ведущий автор исследования. В его исследовании пациенты оценивались на предмет клинической и патологической активности и тестировались на возможный стеатоз (жировая болезнь печени) с помощью ультразвукового исследования брюшной полости. Участники получили персональные диетические рекомендации от диетолога и всем было указано потреблять оливковое масло во время каждого приёма пищи. Всего наблюдалось 142 пациента с ВЗК, из них 84 с язвенным колитом и 58 с болезнью Крона, 73 из 142 были признаны страдающими ожирением. Через полгода в этой группе снизилось число пациентов с активным заболеванием (испытывающих симптомы) с 23.7% до 6.8% у пациентов с язвенным колитом и с 17% до 3.8% у пациентов с болезнью Крона. Было также отмечено, что употребление оливкового масла приводит к значительному уменьшению стеатоза печени, который полностью исчез у некоторых пациентов. Кстати, потребление оливкового масла было связано с профилактикой язвенного колита ещё в 2010, когда исследователи из Университета Восточной Англии пришли к выводу, что диета, богатая олеиновой кислотой (компонентом оливкового масла), значительно снижает риск развития этого заболевания. В России по данному заболеванию пациентам предоставляют III Группу Инвалидности.

OM = OMAN

OM = ORGANIC MATTER

OMA = ORDERLY MARKETING AGREEMENT

OMAN CRUDE OIL = ОМАНСКАЯ НЕФТЬ – Oman Crude Oil is a medium sour crude from Oman destined for East of Suez markets. Oman crude futures are traded at the Dubai Mercantile Exchange (DME) under ticker symbol OQD (the DME is a fully electronic exchange, and its contracts are listed on CME Globex®). Contract size is 1 000 barrels (42 000 gallons) with a contract price quoted in US Dollars and Cents per barrel. Contract settlement consists of physical delivery. Delivery dates take place every month of the year. Middle Eastern Crude Oil (average value of Dubai and Oman) is traded at the Tokyo Commodity Exchange (TOCOM) under ticker symbol 33. Contract size is 50 kl (approximately 314.5 barrels). Settlement of contract consists of cash-settled futures transaction. / ТЧОКОМ (TOCOM).

OMB = OFFICE OF MANAGEMENT AND BUDGET

OMB = ON MASS OF BATH

OMBRÉ = ОМБРЕ (или РАСТУШЁВАННОЕ, или С ПЕРЕХОДОМ ТОНОВ, или ТЕНЕВОЕ, или ТЕНИСТОЕ, или ЗАТЕНЁННАЯ) – Ombré is a color effect in which the shade is changeable from light to dark, generally produced by using warp yarns of different tones. Ombré effects may also be produced by printing. Ombré, rhymes with the Spanish word Hombre, but is actually a French word meaning 'Shade' or 'Shadow'. (Ombre without the fancy 'é' is a very old card game!) For the last couple years, Ombré dyed fashions are appearing everywhere from the cover of 'Oprah' magazine and fashion designer runways to the racks of discount department stores. Lately, we have had so many folks searching our website for the word Ombré that we decided we had better do something about it! Ombré, also known as Dip Dyeing, Color Bleeding, or Gradated Dyeing, is an effect usually achieved by hand dipping fabric in dye so that it gradually goes from light to dark, or sometimes from one color to another. On high-end garments it lends itself well to flowing silks and other fine fabrics and has even been described as 'ethereal'! On the low-end garments, we think a lot of them have perhaps been printed, airbrushed or somehow had the dye applied by direct application to simulate the more time consuming Ombré technique. Silk painters have tried blending progressive colors with brushes, but it is time consuming and never quite looks the same. Professional tie dyers have achieved somewhat of an Ombré look by pre-soaking a garment in Soda Ash and applying successively stronger solutions of color from top to bottom of the garment. But true Ombré is a laboriously hand dipped wonder with subtle gradations from top to bottom. True Ombré is not as easy as it might seem, as we found out in our attempts. Know that professional dyers have wrestled with this technique for years to get to the amazing garments you see for several hundred (or thousand?) Dollars. Keep in mind that with dyeing, it is practice that makes perfect, and sometimes lots of experimentation! We are keeping our instructions a little vague as to timing and concentrations because we know that different fiber content, weave and weight of your fabric, as well as the individuality among dye colors will vary your results. Practice will also help you get the layers straight, even and more smoothly gradated. By the way, a customer who has been doing Ombré for years just let us know that our method of securing the garment combined with our bendable wire hanger are the reasons our lines dipped rather than being straight! She recommended using PVC pipe for straighter lines. But she said our timing in our directions was perfect! / Омбр (Ombre) = Тень или Умбра.

OMC = ORGANISATION MONDIALE DU COMMERCE

OMD = ORGANISATION MONDIALE DES DOUANES

OMEGA = ОМЕГА – Omega is a measurement of the price elasticity and effective leverage of a warrant. Omega specifies the percentage by which the price of a warrant changes when the underlying experiences a price change of one percent. In contrast to simple leverage, which assumes an equivalently strong absolute price change for warrant and underlying, Omega measures the actual leverage of the warrant by taking into account the delta. For example, a warrant with a current leverage of 10 and a delta of 50% has an Omega of 5, the warrrant thus increases approximately by 5% when the underlying rises by 1%.

OMF = ON MASS OF FIBER

OMG = ON MASS OF GOODS

OMGEO (LLC) = ОМДЬЖИО (ЭЛ.ЭЛ.СИ.) – One of the first major steps we took soon after the Depository Trust & Clearing Corporation (DTCC) was formed in 1999 was to partner with Thomson Financial to create Omgeo LLC. No development illustrates our commitment to a global business strategy of forging partnerships more than Omgeo, which plays a critical role in the global securities industry as a central information management and processing hub for broker/dealers, investment managers and custodian banks. Omgeo, the leading provider of post-trade, pre-settlement institutional trade management solutions, processes over one million trades

per day and serving some 6 000 investment managers, broker/dealers and custodians in 42 countries. The company partners closely with service providers, infrastructure suppliers, industry standards organizations and its clients to increase operational efficiency and reduce risk for the world's investment management community through straight-through processing (STP) solutions. A global joint venture formed by the Depository Trust & Clearing Corporation (DTCC) and Thomson Financial ESG. Omgeo's objectives are to deliver a single, global trade management solution that will help move the industry towards global STP and T+1 settlement. Omgeo, DTCC's joint venture with Thomson Financial, is the leading provider of post-trade, pre-settlement institutional trade management solutions, processing over one million trades per day and serving 6 000 investment managers, broker/dealers and custodians in more than 42 countries. Headquartered in Boston, MA, the United States. Omgeo was formed in 2001 as a wholly owned, global joint venture between the Depository Trust & Clearing Corporation (DTCC) and Thomson Reuters. Our predecessor companies have over 30 years of experience servicing the world's capital markets; our tenure and proven track record are key differentiators in today's volatile financial markets. Omgeo is an operations expert automating trade life cycle events, including allocation, confirmation/affirmation, settlement notification, enrichment, operational analytics and counterparty risk management between trade counterparties. Our offerings address challenges mainly to do with manual, error-prone processes you may encounter throughout trade lifecycle events. Our core expertise lies in automating the communication between parties to a trade or a contract. Providing services that electronically link counterparties around the world has allowed us to create a global, efficient community of clients. We pioneered and are now the global standard for electronic trade confirmations, standard settlement instructions and confirm/affirm via automation. Omgeo set the standard for post-trade efficiency in the equities and fixed income markets and now focuses also on the credit arena and is setting a new standard in portfolio reconciliation and collateral management. This is a natural extension of our core expertise in operations. Your business may be local or global, or both. 2011:- We have over 6 000 clients representing over 2 400 financial institutions in 46 countries around the world. Omgeo associates span every major global financial center, including Boston, New York, London and Hong Kong, with a total of 16 offices around the world to support our business. You can be confident that we have on-the-ground experts who understand both the local nuances that set your business apart as well as the worldwide issues facing all within our industry today. / , от Латинского слова Affirmo, означающее Утверждаю, . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). ковка или штамповка (forging). Томсэн Файнэншл (Thomson Financial). Томсэн Ройтас (Thomson Reuters).

OMISSION OF ANY PART OF GARMENT = ПРОПУСК ЛЮБОЙ ЧАСТИ ШВЕЙНОГО ИЗДЕЛИЯ – Omission Of Any Part Of Garment:- poor work flow, inattentive operator, wrong work tickets or poor inspection. Sewing Room Defects. / Порок или дефект швейного производства.

OMNIBUS ACCOUNT = СЧЁТ ОМНИБУС (или ОБЩИЙ СЧЁТ) – Omnibus Account is a collective account holding the securities that a custodian safeguards on behalf of some or all of its customers. Omnibus Account is an account carried by one Futures Commission Merchant (FCM), the carrying FCM, for another Futures Commission Merchant, the originating FCM, in which the transactions of two or more persons who are customers of the originating FCM, are combined and carried by the carrying FCM in the name of the originating FCM rather than designated separately by the names of the individual customers. This is required if the originating broker seeks to execute or clear trades for customers at a particular exchange where it does not have trading or clearing privileges. The identity of the individual accounts is not disclosed. The opposite of Fully Disclosed. / Омнибус, от Латинского слова Omnibus, означающее Для Всех.

OMNIBUS CLAUSE = ОГОВОРКА ОМНИБУС (или ОГОВОРКА ДЛЯ ВСЕХ, или ОГОВОРКА ОБ ОХВАТЕ СТРАХОВАНИЕМ НЕСКОЛЬКИХ ЛИЦ) – Omnibus Clause is a clause in a hull policy extending liability cover to embrace, in addition to the assured's legal liability, the liability of other organizations who are connected with the ship. It usually excludes liability of shipyards, repair yards and others to whom underwriters do not wish to extend cover. / Омнибус, от Латинского слова Omnibus, означающее Для Всех.

OMNIVORE = ВСЕЯДНОЕ – Omnivore is an animal that eats both plants and animals.

OMR = OMANI RIAL

OMS = ORGANIC MATTER SOLUBLES

OMT = ORIGIN MOTOR TERMINAL

OMX (GROUP AB) = У.ЭМ.ЭКС. (ГРУП А.БЭ.) – OMX AB is a leading expert in the exchange industry. Through the Nordic Exchange, OMX offers access to approximately 80 percent of the Nordic and Baltic securities market. The Nordic Exchange is a term used for marketing purposes and is not a legal entity. It describes the common offering from the Helsinki Stock Exchange, Copenhagen Stock Exchange, Stockholmsbörsen AB (Stockholm Stock Exchange), Iceland Stock Exchange, Tallinn Stock Exchange, Riga Stock Exchange and Vilnius Stock Exchange. OMX' integrated technology solutions cross the transaction chain enabling efficient securities transactions for over 60 exchange organizations in more than 50 countries. OMX is a Nordic Large Cap company in the Financials sector on the OMX Nordic Exchange. OMX is a leading expert in the exchange industry. Through the Nordic Exchange, OMX offers access to approximately 80 percent of the Nordic and Baltic securities market. The Nordic Exchange is a term used for marketing purposes and is not a legal entity. It describes the common offering from the Helsinki Stock Exchange, Copenhagen Stock Exchange, Stockholm Stock Exchange, Iceland Stock Exchange, Tallinn Stock Exchange, Riga Stock Exchange and Vilnius Stock Exchange. OMX integrated technology solutions cross the transaction chain enabling efficient securities transactions for over 60 exchange organizations in more than 50 countries. OMX is a Nordic Large Cap company in the Financials sector on the OMX Nordic Exchange. OMX AB (Aktiebolaget Optionsmäklarna/Helsinki Stock Exchange) is a Swedish-Finnish financial services company, formed in 2003 through a merger between OM AB and HEX PLC (Helsingin Pörssi (Helsinki Stock Exchange, abbreviation – HEX)). It has two divisions, OMX Exchanges, which operates eight stock exchanges in the Nordic and Baltic countries, and OMX Technology, which develops and markets systems for financial transactions used by OMX Exchanges, as well as by other stock exchanges. The company is a world leader in financial instruments trading systems. OMX has been part of the NASDAQ OMX Group since February 2008. In December 2005 OMX started First North, an alternative exchange for smaller companies, in Denmark. The First North exchange expanded to Stockholm in June 2006, Iceland in January 2007 and Helsinki in April 2007. The Markets Technology division of Computershare was acquired in 2006. The acquisition greatly expanded its product offerings and made its client list the largest of all trading system technology providers. The group launched a virtual Nordic Stock Exchange on 2006-October-02, after merging the individual lists of shares traded at its three wholly-owned Scandinavian exchanges into a combined Nordic List. Companies listed on the Iceland Stock Exchange have also since been merged into the list. OMX also launched a pan-regional benchmark index, the OMX Nordic 40, on the same date, however the individual exchanges have also retained their own national benchmark indices. On 2007-May-25, NASDAQ® agreed to buy OMX for USD3.7 billion. In August 2007, however, Borse Dubai offered USD4 billion, prompting speculation of a bidding war. On 2007-September-20, Borse Dubai agreed to stop competing to buy OMX in return for a 20% stake and 5 percent of votes in NASDAQ® as well as NASDAQ's then 28% stake in the London Stock Exchange. In a complex transaction, Borse Dubai acquired 97.2% of OMX's outstanding shares before selling them onto NASDAQ®. The newly merged company was renamed

the NASDAQ OMX Group upon completion of the deal on 2008-February-27. OMX owns exchanges in the Nordic and Baltic region, and develops and provides technology and services to companies in the securities industry around the globe. Some history facts:- 1985 OMX starts derivatives exchange. 1987 World's first publicly listed exchange. 1991 World's first integrated derivatives trading and clearing system. 1994 First exchange in Europe to accept remote members. 1997 Creation of derivatives link network. 1998 Merger of OMX and Stockholm Stock Exchange. 1998 Joint trading platform initiative started on all the Nordic exchanges. 2001 Common member and trading rules instituted in Nordic region. 2002 Formation of EDX derivatives exchange – OMX and London Stock Exchange. 2003 Merger of OMX and HEX, including Tallinn and Riga exchanges. 2004 Acquisition of Vilnius Stock Exchange. 2004 Implementation of joint trading platform on all Nordic exchange. 2005 Merger of OMX and Copenhagen Stock Exchange. 2006 Launch of OMX Nordic Exchange. 2006 Merger of OMX and Iceland Stock Exchange. OMX was formed in 2003 through the merger of OM and HEX. The transformation of the exchange industry is inevitable as we all strive to compete effectively, form alliances, expand, generate alternative revenue sources and meet new regulations. As an expert in the exchange industry, OMX plays an important role in the fast moving financial markets. For all our customers, we aim to provide dynamic solutions and greater efficiency with today's and tomorrow's challenges in mind. Through the Nordic Exchange, OMX offers access to approximately 80 percent of the Nordic and Baltic securities market. The Nordic Exchange is a term used for marketing purposes and is not a legal entity. It describes the common offering from the Helsinki Stock Exchange, Copenhagen Stock Exchange, Stockholm Stock Exchange, Iceland Stock Exchange, Tallinn Stock Exchange, Riga Stock Exchange and Vilnius Stock Exchange, owned by OMX. OMX integrated technology solutions cross the transaction chain enabling efficient securities transactions for more than 60 exchanges, clearing organizations and securities depositories in over 50 countries. OMX is a Nordic Large Cap company in the Financial sector on the OMX Nordic Exchange. Headquartered in Stockholm, Sweden. The leading innovators in the exchange industry to create the world's premier exchange and technology company. Combination recommended by both OMX and NASDAQ® Boards and supported by key OMX and NASDAQ® shareholders. The Board of Directors of The NASDAQ® Stock Market, Inc and OMX AB have on 2007-May-25, jointly announced that they have entered into an agreement to combine the two companies. / НЭЗДЭК® (NASDAQ®) . У.Эм.Экс. (OMX). Стокгольмская Фондовая Биржа Стокгольмсбёршен А.Бэ. (Stockholmsbörsen AB). Актиэбулагет Упшунсмэкларна (Aktiebolaget Optionsmäklarna). У.Эм. А.Бэ. (OM AB). ON = OBSERVATIONAL NURSERY

ON = OVERNIGHT

ONADER = OPÉRATION NATIONALE POUR LE DÉVELOPPEMENT DE LA RIZICULTURE = NATIONAL OPERATION FOR THE DEVELOPMENT OF RICE CULTURE

ONB = OFFICE NATIONAL DES BARRAGES ET DE L'IRRIGATION

ON BALANCE VOLUME = БАЛАНСОВЫЙ ОБЪЁМ – One of the first and most popular indicators to measure positive and negative volume flow, the On Balance Volume (OBV) was introduced by Joe Granville in 1963. The concept behind the indicator is that volume precedes price. OBV is a simple indicator that adds a period's volume when the close is up and subtracts the period's volume when the close is down. A cumulative total of the volume additions and subtractions forms the OBV line. This line can then be compared with the price chart of the underlying security to look for divergences or confirmation. On Balance Volume (OBV) is a price-volume indicator developed by Joseph Granville. OBV provides a powerful measure of accumulation and distribution by comparing volume to price movements. The theory of On-Balance Volume (OBV) was developed by Joe Granville and forms the basis of his timing system. OBV is the cumulative total of advancing and declining volume. It is calculated by adding the daily volume to the cumulative total if the stock closes higher than the previous day, or subtracting it if the stock closes lower. No change days are ignored. Absolute values in OBV are meaningless, but a graph of OBV movement is very useful for spotting divergences in OBV and price. Divergences in price and OBV (also called Non-Confirmations) are important events which warn that a change of price trend is likely. An example of a negative divergence (which predicts lower prices to come) would be for the stock to hit a higher price high that is not confirmed by corresponding new high in OBV. A positive divergence (which predicts higher prices to come) occurs when a lower price low is accompanied by a higher low on the OBV chart. In these cases it can be said that volume is leading price, but this is not always the case. The divergences described above are associated with a drying up or decrease in volume commonly associated with price tops and bottoms; however, tops and bottoms can also be accompanied by high volume activity ('blow-off' tops and panic selling near bottoms). OBV is a momentum indicator relating volume to price change. If prices rise, volume is considered up-volume; if price, it is considered down-volume. Up-volume is added to the cumulative total, and down-volume is subtracted. Trading under pressure with on-balance volume. Not all volume is created equal. The On-Balance Volume (OBV) indicator recognizes this by measuring buying and selling strength separately. On-Balance Volume is a momentum indicator. In general terms, its calculation relates volume to price change, i.e. on-balance volume is a function of both price and volume. Developed by Joe Granville in the early 1960s, OBV provides a running total of market volume and shows whether this volume is flowing into or out of a given commodity, bond or stock based on changes in the market's price. OBV attempts to detect when a financial instrument is being accumulated by a large number of buyers or sold by many sellers. It is based on the concept that volume is the driving force behind the market. Therefore, OBV is designed to project when major moves in the markets would occur by measuring the positive and negative volume flow. By analyzing OBV, traders may project when major moves in the markets will occur. Often, OBV is described as an attempt to determine the actions of the 'smart money' in the market. Smart money typically is used to refer to market participants who are either large, well-capitalized traders or commercial entities with a broad understanding of the underlying commodity or 'inside' information on the market fundamentals. While it's impossible to say precisely whose positions are reflected in the OBV indicator, it's reasonable to assume that it reflects the behavior of the majority of the positions in the market. If we accept that, then we can accept the premise that OBV provides a reliable gauge of future market bias. Calculation:- on-balance volume is calculated by adding the day's volume to a cumulative total when the security or futures contract price closes up, and subtracting the day's volume to that cumulative total when the price closes down. (1) If today's close is greater than yesterday's close then:- OBV = Yesterday's OBV + Today's Volume (considered up volume). Up volume occurs when a market finishes a day of trading at a level higher than its previous close, meaning that the trading volume for the day was more bullish than bearish. (2) If today's close is less than yesterday's close then:- OBV = Yesterday's OBV – Today's Volume (considered down volume). Down volume occurs when a market finishes a day of trading at a level lower than its previous close, meaning that the trading volume for the day was more bearish than bullish. (3) If today's close is equal to yesterday's close then:- OBV = Yesterday's OBV. 'Beans on balance' (Soybeans) shows the January 2014 soybean futures contract with both volume and the OBV indicator. You can see how the OBV indicator is affected by both the volume data as well as price changes. Interpretation:- on-balance volume is a running total of volume. It tells us whether trading activity is stronger on increases or decreases in price. When the security closes higher than the previous close, all of the day's volume is considered up-volume. When the security closes lower than the previous close, all of the day's volume is considered down-volume. The basic assumption regarding OBV analysis is that OBV changes precede price changes. The theory is that the flow of the smart money can be seen by a rising OBV. Here is a key aspect to evaluating OBV:- the absolute value of it is not important. Traders should instead focus on period-to-period changes in and characteristics of the OBV

line. First, define the trend for OBV. Second, determine if the current trend matches the trend for the underlying security. Third, look for potential support or resistance levels. Once broken, the trend for OBV will change, and these breaks can be used to generate signals. Also notice that OBV is based on closing prices. Therefore, closing prices should be considered when looking for divergences or support and resistance breaks. This method of analyzing OBV is designed for trading short-term cycles. OBV is a day-to-day indicator, and investors must act quickly and decisively if they wish to profit from short-term OBV analysis. Signal Generation:- OBV can signal bearish divergence as well as bullish divergence. When prices continue to rise on negative changes in OBV, it's a warning to bulls – or a signal to bears that it could be time to establish shorts. When OBV rises during a trading range affair for price, it is a sign that the smart money is accumulating positions in anticipation of a future price rise. Bullish divergence signals can be used to anticipate a trend reversal. These signals are grounded in the theory that volume changes precede price changes. A bullish divergence forms when OBV moves higher or forms a higher low even as prices move lower. A bearish divergence forms when OBV moves lower or forms a lower low even as prices move higher. The divergence between OBV and price should alert a trader that a price reversal could be in the making. As seen in 'Forecasting crude', weekly crude oil prices are making lower low from USD93 to USD92, but a closer look at OBV suggests a higher high formation, shown with the blue line, is signaling a bullish divergence. Subsequent to the bullish divergence, crude oil jumped almost USD5 to USD97 in the following week. Bearish divergence also can occur. This is shown in 'Intraday gold'. As seen in the 15-minute chart, although gold makes a higher high from USD1 260–1 265, OBV makes a lower low, registering bearish divergence. Once prices trade below USD1 250, the bearish divergence is confirmed. Price subsequently corrects all the way down to USD1 220. OBV also helps to understand the accumulation and distribution pattern of prices and can be used to identify breakout and breakdowns in the near future. Rising OBV during a trading range indicates accumulation, which is bullish; falling OBV in a trading range indicates distribution, which is bearish. 'Sweet sugar' (Contract No. 11) includes a daily chart of sugar along with OBV. Sugar is trading in a range of 16.70–17.90¢ for almost 20 trading sessions. However, OBV has been rising while prices are trading in range. As we can see, a bullish breakout soon happened, with sugar reaching a high of 20¢. OBV also is a good confirming trend indicator. Once a trend is established, it remains in force until it is broken. OBV can be used to confirm an existing price trend, an upside breakout or a downside break. 'Gaining ground' shows how the higher price trend for Apple coincided with a rising OBV, hence confirming to traders that strength was behind the market. Simple Works:- OBV is a simple technical indicator that uses volume and price to measure buying and selling pressure. Buying pressure is evident when positive volume exceeds negative volume, and the OBV line rises. Selling pressure is present when negative volume exceeds positive volume, and the OBV line falls. Traders can use OBV to confirm the underlying trend or look for divergences that may foreshadow a price change. As with all indicators, it is important to use OBV in conjunction with other tools of technical analysis. OBV should not be used as a standalone indicator for signaling trade entries or exits. Good indicators to use in conjunction with OBV include pattern analysis and momentum oscillators. / Дьжоу Грэнвил (Joe Granville). В техническом анализе биржевых рынков, Балансовый Объём (БО) является индикатором момента, связывающим объёмы торгов с изменением цен. Если цены повышаются, значение показателя считается положительным; если цены падают – отрицательным. Положительные значения показателя прибавляются к нарастающему итогу, отрицательные – вычитаются из него.

ON BOARD = НА БОРТУ – On Board is a notation on a bill of lading that cargo has been loaded on board a vessel. Used to satisfy the requirements of a letter of credit, in the absence of an express requirement to the contrary. / На Борту:- нотация в коносаменте, указывающая на то, что груз был погружен на борт судна. Применяется для удовлетворения требований по аккредитиву, при отсутствии в обратном смысле особых требований.

ON BOARD BILL OF LADING = БОРТОВОЙ КОНОСАМЕНТ – On Board Bill Of Lading (B/L) certifies that the cargo has been placed aboard the named vessel and is signed by the master of the vessel or his representative. On letter of credit transactions, an On Board Bill of Lading is usually necessary for the shipper to obtain payment from the bank. When all bills of lading are processed a ship's manifest is prepared by the steamship line. This summarizes all cargo aboard the vessel by port of loading and discharge. B/L validated at the time of loading to transport. Onboard Air, Boxcar, Container, Rail, Truck and Vessel are the most common types. A Bill of Lading where a Carrier acknowledges that goods have been placed on board a certain vessel. Bill of lading confirmation that the goods accepted for transportation have actually been shipped on board. An Onboard Bill of Lading confirms the actual time the shipper places the cargo on the ship, train, airplane or truck to transport to its destination. Types of onboard bills of lading include rail, truck, container, air, box car and vessel. / и подписанный хозяином (или капитаном) судна или его представителем. Он суммирует весь груз на борту судна портом погрузки и разгрузки.

ON–BOARD ELECTRONIC EQUIPMENT = БОРТОВОЕ ЭЛЕКТРОННОЕ ОБОРУДОВАНИЕ – On-Board Electronic Equipment is electronic equipment, related software, antennas and accessories permanently installed in vehicles and used for communications, monitoring refrigerating or heating equipment and/or a vehicle's mileage and speed, determining the vehicle's weight, tracking the vehicle, or navigation. Note:- Permanently installed means that the equipment can be removed from housing units permanently installed in the vehicle designed to operate using electrical power from the vehicle's electrical system. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ON CALL SALES = ПРОДАЖИ С ВОСТРЕБОВАНИЕМ (ПРАВ СТОРОН) – On Call Sales are agreements to sell commodity with the price to be fixed at a later time, based on a specified quotation by the seller or the buyer. If the final price is to be fixed based on a futures market quotation:- (i) On buyer's call, the seller must fix the final price of commodity sold on call on the buyer's instructions, before the first notice day of the futures contract month. This must be done before the invoice is sent. If the buyer does not give instructions in the time agreed, the seller can fix the price when the market closes on the day before the first notice day of the futures contract month. The seller must notify the buyer about this immediately. If the parties agree that the price can be fixed after shipment, the commodity must be invoiced at a provisional price, and the difference will be paid by one of the parties based on the final price. (ii) On seller's call, the roles of the buyer and the seller are reversed. See also Basis, Call Sales, and Provisional Invoice. Xxxxx. On Call Sales (in Cotton industry):- price is usually expressed in US cents per pound (¢/lb) and is either fixed (final) or 'on call'. A fixed price is a price where both the basis (premiums and discounts 'on' or 'off' the futures month) for a certain quality and the price of the futures month are established. For example:- (i) December NY futures:- 32.50 cents per pound; (ii) Basis for a certain quality:- 5.00 cents 'on'; and (iii) Fixed price (final price):- 37.50 cents per pound. (Note:- Basis = Cash Price – Futures Price.) An 'on call' price is a price establishing only the basis (premiums or discounts to be added to or deducted from the futures month quote, as in example above, '500 cents points on December NY') for a certain grade and staple. When a sale is made 'on call', the contract (sale confirmation) specifies when the price of the futures month must be established. The sale is mostly 'buyers's call', which means that the buer sets a time or level when the price of the futures month is to be established or, as said in the trade, fixed. However, the contract frequently provides for fixing the price before shipment to avoid making provisional invoices and a price adjustment later. Invoicing Cotton at a provisional price makes it necessary to watch the fluctuations of the futures month and call for margin payments if the provisional price has been set too low because the futures month has gone up. The buyer can request the seller to transfer the basic futures month to another one instead of fixing the price when due. / В хлопковой отрасли Продажи с Востребованием:- цена обычно выражается в

центах Доллара США за фунт и является либо ‘зафиксированной’ (окончательной), либо ‘по востребованию’. Фиксированная цена – это цена, в отношении которой установлены и базис (надбавки и скидки ‘на’ или ‘от’ расценки фьючерсного контракта с соответствующим месяцем поставки) для определённого качества, и конкретная расценка фьючерсного месяца. Например:- (i) Декабрьский НЙ (Нью Йоркский) фьючерс:- 32.50 цента за фунт; (ii) Базис для определённого качества:- 5.00 центов ‘на’; и (iii) Фиксированная цена (окончательная цена):- 37.50 центов за фунт. (Примечание:- Базис = Наличная Цена – Фьючерсная Цена.) Цена ‘по востребованию’ – это цена, устанавливающая только базис (надбавки или скидки, которые должны добавляться к или вычитаться от расценки фьючерсного месяца, соответственно, как в примере выше, ‘500 центовых пунктов (cent points) на Декабрьскую НЙ расценку) для определённого сорта и штапеля волокна. Когда продажа осуществляется ‘с востребованием’, то контракт (подтверждение продажи) указывает то, когда должна быть установлена цена фьючерса с соответствующим месяцем поставки. Продажа – это в основном ‘востребование покупателей’ (‘buyers’s call’), которое означает, что покупатель устанавливает время или уровень, когда цена фьючерсного месяца должна быть установлена или, как говорят в торговле, зафиксирована. Однако контракт часто предусматривает фиксацию цены перед отгрузкой, чтобы избежать выставления условных счетов-фактур (provisional invoices) и переоценки цены (a price adjustment) позже. При выставлении счёта на хлопок по условной цене необходимо следить за колебаниями фьючерсного месяца и востребовать платежи маржи, если условная цена оказывалась установленной слишком низко из-за того, что фьючерсный месяц вырос в цене на бирже. Покупатель может попросить продавца перенести базовый фьючерсный месяц на другой вместо фиксирования цены в должное время. Продажи с Востребованием предполагают востребование сторонами сделки своих прав, заложенных в порядках и условиях контракта, например, фиксации цены на весь объём продукции или его часть, предполагаемой к поставке по данному контракту.

ONCARRIAGE = ДОСТАВКА – Oncarriage or On-Carriage:- the carriage of cargo (containers) by any mode of transport to the final place of delivery after discharge from the ocean vessel (main means of transport) at the port (place) of discharge. Carriage of goods by any mode of transport to place of delivery after discharge from ocean vessel at port of discharge. Oncarriage:- a movement of cargo by connecting carrier to ultimate destination. / после разгрузки из океанского судна .

ONCE–OVER TILLAGE = СОВМЕЩЁННАЯ ОСНОВНАЯ И ПОСЕВНАЯ ОБРАБОТКА (ПОЧВЫ) – Once-Over Tillage is an operation whereby land is tilled and planted in the same operation. / Совмещённая Основная и Посевная Обработка (почвы):- операция, посредством которой земля обрабатывается и засеивается за одну и ту же операцию. Под Боронованием (Harrowing) понимается рыхление поверхностного слоя почвы боронами и вращающимися мотыгами. Предохраняет почву от высыхания, выравнивает её поверхность, разрушает почвенную корку, уничтожает Сорняки.

ON CONSIGNMENT GRAIN = ЗЕРНО ПО КОНСИГНАЦИИ – On Consignment Grain is a grain shipped to a broker for sale in the cash market. See also Consignment. / :- зерно, отгруженное брокеру для продажи на рынке безотлагательной поставки. Смотрите также Консигнация (Consignment).

ON DECK = НА ПАЛУБЕ – On Deck is a notation on a bill of lading that the cargo has been stowed on the open deck of the ship. / Нотация на коносаменте о том, что груз был размещён на открытой палубе на судне.

ON DECK STOWAGE = ШТИВКА НА ПАЛУБЕ – On Deck Stowage:- cargo stowed on deck of vessel. / Груз, размещённый на палубе судна.

ON DEMAND = ПО ТРЕБОВАНИЮ – In the case of a claim document the notation ‘On Demand’ means that the amount specified becomes due and payable immediately upon presentation of the debt certificate or payment order by the creditor to the debtor. Also known as On Sight. On Demand:- describing a bill of exchange that is payable to the bearer immediately on presentation, such as a check.

ON–DEMAND CONTRACT BOND = КОНТРАКТНОЕ ОБЯЗАТЕЛЬСТВО ПО ТРЕБОВАНИЮ – The history of On-Demand Contract Bonds can be traced back to the oil boom of the 1970s when Middle East countries, flush with money, wanted their own airport, aluminium plant, hospital etc. Numerous contracts were put out to tender and awarded to all sorts of companies, some of whom then were unable even to start the contract, let alone finish it. Having had their fingers burnt and money wasted these countries started to require easily redeemable bonds as a condition of every contract. Some countries even passed laws making bonds mandatory in all public sector contracts. An on-demand contract bond is a payment undertaking, issued by a bank to the customer (the beneficiary) at the request of the exporter. It is a ‘primary’ undertaking of the issuing bank, and is independent of the exporter’s contractual delivery/performance obligations. The bond is ‘on-demand’ because the issuing bank undertakes to pay the beneficiary upon receiving a simple demand – a ‘call’ – for payment. Some on-demand bond wordings simply require the beneficiary to make a written demand for payment without having to give any reason for the demand (these are common in the Middle East), whilst others require the beneficiary to state that the exporter is in default of his contractual obligations and, possibly, to describe the nature of that default. On-demand bonds are ‘unconditional’ to the extent that, for the bank to pay, the beneficiary simply has to satisfy some basic conditions (e.g., relating to the validity of the bond itself and the stated procedure for making the call), without having to provide evidence to demonstrate that the exporter has not performed its contract, or even to present the original bond. The exporter cannot stop the customer getting the money if the bond is called. As soon as the bank pays the beneficiary, it will immediately take recourse against the exporter under the counter-indemnity, usually by debiting the exporters’ bank account. This means that in effect the bank is paying out the exporter’s money. It is sometimes possible to negotiate ‘conditional’ bonds (typically issued by insurance companies and called surety bonds). With these, the beneficiary has to provide evidence to the issuer – e.g., of the exporter’s failure to deliver goods in accordance with the timescale envisaged in the contract, or the exporter’s written admission of fault, or a court order or arbitration award in favour of the beneficiary – as part of the process of calling the bond. This need to produce supporting documentation makes the bond ‘conditional’. You can add words creating conditionality in a bond issued by a bank. Notwithstanding the added security of conditionality, lawyers recommend that the bond is kept as simple as possible lest the additional clauses create conflicts elsewhere in the contract. The issuing bank, also, will be keen to have absolute clarity on whether a bond call is valid. Some on-demand bonds are not issued to the customer, but to another party in connection with the export contract; the most common being to a customs authority for the purpose of deferring duty on goods imported temporarily into a country pending their re-export. The importing country’s customs authority requires a bond covering the value of the duty that will need to be paid if the goods are not re-exported within a certain time period.

ONDULÉ = ОНДЮЛЕ (или ВОЛНИСТОЕ, или ГОФРИРОВАННОЕ, или НЕРОВНОЕ) – Ondulé is a general term for plain-weave fabrics of silk, cotton, or manufactured fiber having a wavy effect produced by weaving the warp or filling, but usually the filling, in a wavy line. An ondulé reed is generally used to produce this effect, often in a leno weave to emphasize the wave. Ondulé is used for dress fabrics. / основа или уточина, . Под Ондюде в переводе с Французского понимается Волнистое или Гофрированное или Неровное. Продольная волнистость на поверхности ткани.

ONE CANCELS THE OTHER ORDER = РАСПОРЯЖЕНИЕ ‘ОДНО, ОТМЕНЯЮЩЕЕ ДРУГОЕ’ – One Cancels The Other (OCO) Order:- a pair of orders, typically limit orders, whereby if one order is filled, the other order will automatically be cancelled. For example, an One Cancels The Other (OCO) order might consist of an order to buy 10 calls with a strike price of 50 at a specified price or buy 20 calls with a strike price of 55 (with the same expiration date) at a specified price. Two orders submitted simultaneously, either of which may be filled. If one order is filled, the other is considered to be canceled. Where the execution of one order automatically cancels a previous one.

ONE–OFF = РАЗОВЫЙ (или ШТУЧНЫЙ) – In the United Kingdom, a One-Off event only happens once and will not be repeated. Also known as Non-Recurring in the United States. Something that is done, created, etc only once, and often quickly, simply, or improvisationally. A happening that occurs only once and is not repeated. As modifier, e.g., one-off job. Something that is carried out or made only once.

ONEROUS CONTRACT = КАБАЛЬНЫЙ КОНТРАКТ – Onerous Contract is a contract for which the unavoidable costs of meeting the obligations under the contract exceed the economic benefits expected to be received under it. / Кабальный Контракт – контракт, по которому неизбежные расходы по удовлетворению обязательств по данному контракту превышают ожидаемую экономическую выгоду, которую предполагается получить по нему. Кабальная Сделка совершается под влиянием крайней нужды на явно невыгодных для данной стороны условиях.

ONE–TO–MANY = ОТ ОДНОГО МНОГИМ – A term One-To-Many refers to a proprietary trading platform in which the platform operator posts bids and offers for commodities, derivatives, or other instruments and serves as a counterparty to every transaction executed on the platform. In contrast to many-to-many platforms, one-to-many platforms are not considered trading facilities under the US Commodity Exchange Act.

ONE–WAY PALLET = ПОДДОН В ОДНУ СТОРОНУ (или ПОДДОН НА ОДНУ ГРУЗОПЕРЕВОЗКУ) – One-Way Pallets are preferred if the Euro format (800 x 1 200 mm) does not provide the optimum solution for the size of the products or their packaging units, or if exchange is not viable in export. See also Disposable Pallet. One-Way Pallet:- standard sizes for one-way pallets are in stock:- 800 x 1 200, 600 x 800 and 1 000 x 1 200 mm. All one-way pallets are available used. One-way pallets are ideally used when you know there will be no return. The one-way pallet is the preferred load carrier particularly for export. Further advantage:- the one-way pallet is cheaper than the Euro-pallet. All advantages at a glance:- (i) new; (ii) used; (iii) all versions available as well as IPPC-version (short for the International Plant Protection Convention’s version); (iv) kiln-dried; (v) all versions possible; and (vi) as well as available in all sizes according to your drawing. / Поддон в Одну Сторону или Поддон на Одну Грузоперевозку:- стандартные размеры находящихся в обращении таких поддонов следующие:- 800 x 1 200, 600 x 800 and 1 000 x 1 200 миллиметров (мм). Смотрите также Одноразовый Поддон (Disposable Pallet).

ON–FARM TRIAL/ON–FARM RESEARCH = ПРОИЗВОДСТВЕННЫЙ ОПЫТ/ПРОИЗВОДСТВЕННОЕ ИССЛЕДОВАНИЕ – On-Farm Trial/On-Farm Research is an experiment conducted in farmers’ fields.

ON–HAND INVENTORY = НАЛИЧНЫЕ МАТЕРИАЛЬНЫЕ ЦЕННОСТИ (или СКЛАДСКИЕ ЗАПАСЫ В НАЛИЧИИ) – On-Hand Inventory:- the amount of product in the warehouse. The product may be designated as shippable, damaged, on hold, or pending shipment (allocated to an order).

ON HOLD = НА УДЕРЖАНИИ (или ЗАБЛОКИРОВАНО) – A term On Hold refers to product that is designated as unable to be shipped; may be product with damage, questionable quality, expired shelf life, etc.

ONION NECK ROT = ШЕЙКОВАЯ ГНИЛЬ ЛУКА – Onion Neck Rot is a rot of the neck of onions caused by the mold Botrytis allii.

ON–LINE = В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ – On-Line:- direct communication between devices with electronic capability (terminals, networks, hosts, etc). / Прямая связь между устройствами с электронными возможностями (терминалами, сетями, компьютерами, принадлежащими разным владельцам и так далее). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ONLINE BANKING = БАНКОВСКОЕ ОБСЛУЖИВАНИЕ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ – Online Banking is an access by personal computer or terminal to bank information, accounts and certain transactions via the financial institution’s web site on the Internet. Also known as Internet Banking. By means of Online Banking or Electronic Banking you have access to your accounts or deposits via Internet. Account keeping and the processing of financial services through the Internet or by phoning the bank directly. The instructions are signed using an electronic signature (for example, with a PIN (abbreviation for Personal Identification Number) or TAN (abbreviation for transaction number)).

ON–LINE COMPARISON SYSTEM = СИСТЕМА СРАВНЕНИЯ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ – On-Line Comparison System processes real-time comparison on trade data to reduce exposure to errors. / Осуществляет сравнения в режиме реального времени данных по торговле с целью снижения возникновения ошибок.

ON–LINE PERSONAL IDENTIFICATION NUMBER VERIFICATION = ВЕРИФИКАЦИЯ ПЕРСОНАЛЬНОГО (или ЛИЧНОГО) ИДЕНТИФИКАЦИОННОГО НОМЕРА В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ – On-Line Personal identification Number Verification is the process whereby the Personal Identification Number (PIN) is sent to the issuer for checking. / Процесс, посредством которого Персональный Идентификационный Номер (ПИН) направляется эмитенту для проверки.

ON–LINE PIN VERIFICATION = ON–LINE PERSONAL IDENTIFICATION NUMBER VERIFICATION

ON–LINE TRANSACTION = ТРАНЗАКЦИЯ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ (или ОПЕРАЦИЯ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ) – On-Line Transaction is a transaction that requires a real-time connection to a secure application module. / Операция, которая требует подключения к защищённому модулю приложения в режиме реального времени.

ON–PEAK = ПИКОВОЙ НАГРУЗКИ – A term On-Peak refers to hours of the business day when demand is at its peak. For example, the NYMEX® Division California-Oregon border and Palo Verde (switchyard; and Palo Verde nuclear generating station in Arizona) electricity futures contracts defined the on-peak period from the hour ending 06:00 to the hour ending 22:00 (06:00 am to 10:00 pm), prevailing local time on any day between any including Monday through Friday, excluding any day which has been designated as an off-peak day or a holiday by the North American Electric Reliability Council (NERC). In the physical market, on-peak definitions vary by North America Electric Reliability Council region. On Peak:- for the PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC) Energy Market, on-peak periods are weekdays, except NERC holidays (i.e. New Year’s Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, Christmas Day) from the hour ending at 08:00 am until the hour ending at 11:00 pm. / Относится к часам рабочего дня, когда потребление находится на своём пиковом уровне. Например, фьючерсные контракты на электричество Подразделения НАЙМЭКС® с условием поставки на границе штатов Калифорния и Орегон и Пало

Вэрдэ (открытая коммутационная подстанция; и атомная электростанция Пало Вэрдэ в Аризоне) определяли пиковый период с 06:00 до 22:00 часов (06:00 дп до 10:00 пп) по местному времени в любой день с Понедельника по Пятницу включительно, за исключением дней, принятых внепиковыми или праздничными Северо-Американским Советом по Надёжности Поставок Электричества (САСНПЭ). На рынке реальной продукции, в зависимости от региона определение понятия пиковые варьируется Северо-Американским Советом по Надёжности Поставок Электричества. Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)). Пиковая Нагрузка или Пиковая Мощность, от Французского слова Pic, означающее Остроконечная Машина или Пик, – максимальная электрическая нагрузка электроэнергетической системы в определённом интервале времени (обычно сутки). Например, в суточном графике электрической нагрузки города можно выделить утреннюю и вечернюю пиковую нагрузку. На время действия пиковой нагрузки включают резервные мощности энергосистемы или специальные пиковые электростанции.

ON REPORT = НА ДОНЕСЕНИИ (или ХХ) – On Report (maritime term):- in trouble.

ON SOUNDINGS = НА МАЛЫХ ГЛУБИНАХ – On Soundings (maritime term):- said of a vessel when the depth of water can be measured by the lead (within the 100 fathom curve). / На Малых Глубинах, доступных для измерения ручным лотом.

ON–STREAM = НА ПОТОКЕ (или ДЕЙСТВУЮЩЕЕ, или ВКЛЮЧЁННОЕ) – On-Stream is the state of having been brought into production. The term is usually used for chemical and metallurgical plants or processes.

ON–TIME PERFORMANCE = ИСПОЛНЕНИЕ В СРОК – On-Time Performance:- the proportion of time that a transit system adheres to its published schedule times within stated tolerances.

ONTOGENY = ОНТОГЕНЕЗ (или ИНДИВИДУАЛЬНОЕ РАЗВИТИЕ ОРГАНИЗМА) – Ontogeny is the sum of individual morphogenic processes and event, that describe plant development from seed germination through maturity. Ontogeny is sequential development of an individual through all its stages. / Под Онтогенезом, от Греческих слов Ón, родительный падеж Óntos, означающее Сущее, и Génesis, означающее Возникновение или Происхождение, или Индивидуальным Развитием Организма понимается совокупность преобразований, претерпеваемых организмом от зарождения до конца жизни. Термин был введён в 1866 Немецким биологом-эволюционистом Эрнстом Хайнрихём Филипом Аугустом Хэккэлем (Ernst Heinrich Philipp August Haeckel; 1834–1919).

ON TRACK = В ТРАНСПОРТНОМ СРЕДСТВЕ – (1) On Track:- a type of deferred delivery in which the price is set FOB seller's location, and the buyer agrees to pay freight costs to his destination. Also known as Track Country Station.

(2) On Track:- commodities loaded in railroad cars on tracks. / Товары, находящиеся в транспортном средстве, размещённом в железнодорожном вагоне (платформе).

ON–US CHECK = ЧЕК НА НАС – In the United States, On-Us Check means a check payable by the same bank that is also the bank of first deposit. Some banks call these 'on-us by-us' checks.

ONWARD–CARRIAGE = ВХОДЯЩАЯ ВНУТРЕННЯЯ ПЕРЕВОЗКА (или ПО СУШЕ) – The colloquial meaning is the transport of goods from the sea port/airport to the domestic port of destination. In accordance with the German Commercial Code, Onward-Carriage is the delivery of goods from the store of a receiving agent to the final recipient. During this phase of the transport chain, the freight regulations of the German Commercial Code apply.

ON WEIGHT OF BATH = ПО ВЕСУ ВАННЫ – On Weight Of Bath (OWB or O.W.B.):- usually expressed as percentage; OMB is on mass of bath – preferred modern usage. The amount of some constituent of a dyebath or other process bath based on the weight of the bath. For example, something specified as 6% owb would require 0.06 pounds of that item per pound of bath. Since the bath is invariably mostly water, which weighs 1 kilogram per liter, calculations in the metric system are much easier.

ON WEIGHT OF FIBER = ПО ВЕСУ ВОЛОКНА – On Weight Of Fiber (OWF or O.W.F.):- usually expressed as percentage; OMF is on mass of fiber – preferred modern usage. Often this is synonymous with owg but distinction may be appropriate when considering a particular fiber in a blend.

ON WEIGHT OF GOODS = ПО ВЕСУ ТОВАРОВ – On Weight Of Goods (OWG or O.W.G.):- usually specified as percentage; OMG is on mass of goods – preferred modern usage. The amount of dye or auxiliary chemicals used is often based on ratio to the weight of the goods to be dyed. For example, if a formula calls for 3% dye owg, and 400 grams of fabric are to be dyed, the required amount of dye would be 3% of 400 grams, or 12 grams. Owf may be more accurate when blended fibers are considered.

OOG CARGO = OUT OF GAUGE CARGO

OOIP = ORIGINAL OIL IN PLACE

OOPS TRADE = ТОРГОВЛЯ ОППА (или ТОРГОВЛЯ ОПЛЯ) – What is an 'Oops' Trade? 'Oops' is an expression originally coined by Larry Williams. The setup occurs when the opening price gaps outside the previous day's range. A buy (or sell) stop is placed just inside the previous day's range in case the market then closes the gap, indicating a reversal. The trade is best treated as a scalp trade and exited before the close. This pattern has no long term forecasting value. A setup developed by Larry Williams, which looks to fade gap openings. If a market opens below the previous days low, then buy at yesterday's day's low on a stop. If the market opens above the previous day's high, then sell at yesterday's high on a stop. The OOPS signal is a gap trading method that fades the direction of the opening gap. It is named thus, according to Williams, because when a broker would report to his clients that they were stopped out, he would call them and say, 'Oops, we lost'. The rules are:- (i) When a market opens lower than the previous day's low, a trader would place a buy-stop a few ticks above the previous day's low. (ii) When a market opens higher than the previous day's high, a trader will place a sell-stop a few ticks below the previous day's high. (iii) Markets open and gap overnight, due to a reaction stemming from a news announcement or event occurrence. The gap is based on the opinions that are formed by the crowd, 'savvy' traders, and active players in that market. After the open, traders could realize that the market's price had overreacted from the initial event, which caused the market to create the gap in the first place. The favorable outcome for the OOPS to work occurs as traders reevaluate the impact that the news or event had on the market's price. Prices then reverse and move back in the opposite direction of the gap. (iv) OOPS is based on an overnight gap with the open, for example, higher than the previous high. If the gap prints good volume due to short covers and the crowd is willing to follow the trend, the setup for the trap is ready. (v) Against fresh money in the direction of the trend, professionals apply techniques to fade opening gaps. Statistics say that there is a tendency to fill gaps in the markets. (vi) A deceptive move could have been orchestrated to have a high/low open. After the open, prices would swiftly change direction. Deception in the markets is always behind the corner. Entering in the opposite direction of the gap is based on a sentiment change in the market. If that does ot happen, a trend day will occur and the market would gap and run. You would have professionals to over their positions,

summing up with the crowd's fresh money in a volatile and directional nvironment:- a trend day! The OOPS signal is based on a psychological component. On the news or event, the market gaps in one direction, but there is no momentum and followthrough action, so prices reverse. If a trader gets suckered into bullish news and buys, once the market heads lower, he would sell that position. That is the force that drives prices to move lower. Consider also that most of the time the opening price will be near the high or low of the day 80% of the time. The OOPS provides, therefore, an excellent risk/reward ratio. The pattern has its validity and its statistical value. Using OOPS, you can get significant gains from fading the gap. Often, when the trade goes in your direction, you have a trend day with nice profits. results of the pattern depend at least on money management and stop-loss rules. However, it is not a mechanical system. You can have fun trying to figure out in which conditions OOPS works best. 'Oops' Trade is a term originally coined by Larry Williams which refers to a market that gaps below the previous day's low (or above the previous day's high) and then quickly reverses its direction. / Лэри Вилъйэмз (Larry Williams), .

OOTD = OUTFIT OF THE DAY

OPA = OIL POLLUTION ACT OF 1990

OPAC = ON–LINE PUBLIC ACCESS CATALOG

OPACITY = НЕПРОЗРАЧНОСТЬ (или ТУСКЛОСТЬ, или МУТНОСТЬ) – Opacity is:- (1) optical, the ability of a specimen to prevent the transmission of light; the reciprocal of the transmittance factor. (2) Paper backing, the ability of a sheet of paper to hide a surface behind and in contact with it, expressed as the ration of the reflectance factor Rb when the sheet is backed by a black surface to the reflectance factor Roo when it is backed by a pile of sheets of the same kind, and of such number that further addition of sheets does not affect the measured opacity. (3) White backing, the ability of a thin film or sheet of material, such as paint or paper, to hide a surface behind and in contact with it, expressed as the ratio of the reflectance factor Rb when the material is backed by a black surface to the reflectance factor Rw when it is backed by a white surface (usually having a reflectance factor of 0.89).

OPAQUE = НЕПРОСВЕЧИВАЮЩЕЕ (или НЕПРОЗРАЧНОЕ, или ТУСКЛОЕ, или МУТНОЕ) – Opaque:- transmitting no optical radiation, you can not see through the material.

OPAQUE = ТУСКЛОЕ (или МАТОВОЕ, или НЕПРОЗРАЧНОЕ, или НЕПРОНИЦАЕМОЕ, или МУТНОЕ) – Opaque:- impervious to the rays of visible light:- not transparent or translucent, e.g., the glutinous endosperm of the Rice grain.

OPC = SWIFT'S OPERATING CENTER

OPD = DELAYED OPENING

OPEC = ORGANIZATION OF THE PETROLEUM EXPORTING COUNTRIES

OPEC REFERENCE BASKET = СПРАВОЧНАЯ КОРЗИНА ОСЭН – The OPEC Reference Basket (ORB), also referred to as the OPEC Basket is a weighted average of prices for crude oil blends produced by OPEC countries. It is used as an important benchmark for crude oil prices. On 2005-June-15 the OPEC basket was changed to reflect the characteristics of the oil produced by OPEC members. The Reference Basket currently consists of a weighted average of the following blends of oil:- Saharan Blend (from Algeria); Minas (from Indonesia); Iran Heavy (from Islamic Republic of Iran); Basra Light (from Iraq); Kuwait Export (from Kuwait); Es Sider (from Libya); Bonny Light (from Nigeria); Qatar Marine (from Qatar); Arab Light (from Saudi Arabia); Murban (from UAE); and BCF 17 (from Venezuela). Prior to 2005-June-15, the OPEC Basket consisted of the following:- Arab Light (from Saudi Arabia); Bonny Light (from Nigeria); Fateh (from Dubai); Isthmus (from Mexico, a non-OPEC country); Minas (from Indonesia); Saharan Blend (from Algeria); and Tia Juana Light (from Venezuela). OPEC attempts to keep the price of the Opec Basket between upper and lower limits, by increasing and decreasing production. This makes the measure important for market analysts. The OPEC Basket, including a mix of light and heavy crudes, is heavier than both Brent crude oil, and West Texas Intermediate crude oil. / Организация Стран Экспортёров Нефти (ОСЭН или ОПЭК (OPEC в Англоязычном произношении)) .

(THE) OPEN = ОТКРЫТИЕ – (The) Open is the varying time period at the beginning of the trading session officially designated by the exchange during which all transactions are considered made 'at the opening'. The precise time varies with the amount of activity at the opening. See also Close. / Изменяющийся период времени в начале торговой сессии, официально обозначенный биржей, в течение которого все операции рассматриваются в качестве операций, проведённых 'по открытии'. Точное время меняется в зависимости от уровня активности по открытии.

OPEN = ПО ОТКРЫТИИ – The daily Open is the first price received at the beginning of the first trading session of the trading day. The bar open is the first price received at the beginning of each time interval. / Посуточная цена по открытии – это самая первая цена, отмеченная по открытии первой торговой сессии торгового дня. В случае со штриховым графиком цена по открытии означает самую первую цену, отмеченную по открытии каждого временного интервала.

OPEN ACCESS SAVE–TIME INFORMATION SYSTEM = ИНФОРМАЦИОННАЯ СИСТЕМА ОТКРЫТОГО ДОСТУПА ДЛЯ ЭКОНОМИИ ВРЕМЕНИ – Open Access Save-Time Information System:- in reference to electricity, an electronic information system that the Federal Energy Regulatory Commission (FERC) requires all transmission operators to create or participate in to provide transmission customers with nondiscriminatory information about available capacity, prices, and other information. / По отношению к электричеству, электронная информационная система, в которой указывается реальная информация о доступной мощности, ценах и так далее, установления и работы в которой требует Федеральная Комиссия по Надзору в Сфере Энергетики (ФКНСЭ) от всех сетевых операторов, обеспечивающих подачу электроэнергии потребителям.

OPEN ACCOUNT = ОТКРЫТЫЙ СЧЁТ (или ОТКРЫТЫЙ РАСЧЁТ) – Open Account is a trade arrangement in which goods are shipped to a foreign buyer before, and without written guarantee of, payment. The exporter submits an invoice and expects to be paid in due course as is the case with any normal domestic transaction. Because this method poses an obvious risk to the supplier, it is essential that the buyer's integrity be unquestionable. / Под Открытым Счётом понимается торговая договорённость, по которой товары отгружаются иностранному покупателю до оплаты и без письменной гарантии этой оплаты. Открытый Счёт (Open Account):- форма расчёта, при которой экспортёр направляет в адрес импортёра товар и товарные документы, оплату которых последний должен произвести в течение указанного в контракте срока, а не сразу после реализации товара.

OPEN BOLL = ОТКРЫТАЯ КОРОБОЧКА – Open Boll is a boll in which the carpel sutures have dehisced and allowed the seedcotton to dry and become exposed.

OPEN BUBBLE POINT = ТОЧКА ОТКРЫТОГО ПУЗЫРЯ – Open Bubble Point (boil point):- the differential gas pressure at which gas bubbles are profusely emitted from the entire surface of a wetted filter element under specified test conditions.

OPEN CARGO POLICY = ОТКРЫТЫЙ ПОЛИС ПО СТРАХОВАНИЮ ГРУЗОВ (или ОТКРЫТЫЙ ГРУЗОВОЙ ПОЛИС) – An Open Cargo Policy can be written to cover all cargoes shipped by the assured in foreign trade by overseas vessels, aircraft and foreign parcel post. Coverage is afforded while goods are in transit from the seller's warehouse to the buyer's warehouse in due course of transit. The contract is tailor-made to fit requirements of the individual assured's shipments and can be written to cover broad or named perils.

OPEN CHARTER = ОТКРЫТЫЙ ЧАРТЕР – Open Charter:- where the charter-party specifies neither the kind of cargo nor the ports of destination. / Под Открытым Чартером понимается фрахтование судна, при котором чартер партия не указывает ни вид груза, ни порты назначения.

OPEN CHEQUE = ОТКРЫТЫЙ ЧЕК – Open Cheque is a cheque which – unlike a crossed cheque – is paid in cash to the bearer of the cheque by the bank which is specified on the cheque and which keeps the drawer's account.

OPEN CIRCUIT VOLTAGE = НАПРЯЖЕНИЕ ХОЛОСТОГО ХОДА (или ХОЛОСТОЕ НАПРЯЖЕНИЕ, или НАПРЯЖЕНИЕ ПРИ РАЗОМКНУТОЙ ЦЕПИ) – Open Circuit Voltage is the maximum voltage produced by a power source with no load connected. / Холостое Напряжение – в источнике питания сварочной дуги при отсутствии тока. Под Напряжением Холостого Хода понимается напряжение между двумя выводами электрической цепи, когда нагрузка, подключаемая к этим выводам, отсоединена. Обычно напряжение холостого хода больше напряжения между этими выводами в нормальном рабочем режиме.

OPEN CONTRACTS = ОТКРЫТЫЕ КОНТРАКТЫ – Open Contracts are the contracts that have been bought or sold and are still outstanding, not having been delivered upon or offset. See also Open Interest. Open Contracts are the contracts that are outstanding. Futures transaction which have not been completed by an offsetting trade, or by delivery or receipt of the commodity. / Контракты, которые были куплены или проданы и всё ещё остающиеся незакрытыми, то есть по ним не была осуществлена поставка или произведён взаимозачёт. Смотрите также Открытый Интерес (Open Interest).

OPEN CORD = ОТКРЫТЫЙ КОРД – Open Cord is a steel cord in which the wires have a periodic loose association which permits 'rubber' to penetrate the cross-section.

OPEN COVER = ОТКРЫТОЕ ПОКРЫТИЕ (или ОТКРЫТЫЙ КОВЁР, или ГЕНЕРАЛЬНОЕ СОГЛАШЕНИЕ, или ОТКРЫТОЕ СОПРОВОЖДЕНИЕ) – Open Cover:- common insurance policy is the insurance policy for single shipment or one off shipment only. This policy will cover for this shipment only with specific details of:- (i) subject matter insured; (ii) voyage from one port to another port; (iii) conveyance (vessel name and voyage); (iv) insured period (on/about for the specific shipment); (v) sum insured (the insured value of the cargo); (vi) terms and conditions to be applied; (vii) payment term; and (viii) premium amount (insurance rate). You have to negotiate with the insurance company on case by case basis. In addition, as you buy for one off shipment only, so the insurer could not give the better terms and conditions for the coverage, even for the premium rate. In order to save time for both parties and to assist the insured, there is another policy – the open cover or floating policy. This policy will cover for all of your cargo shipment in the period of time. Cargo will be carried by many means of transportation (sea, river, road, rail, air, etc). All the shipments are enjoyed the same terms and conditions. Insured period:- from the date of policy inception date until the written notice of cancellation from both parties. Sum insured:- estimated of annual sending. Limit of liability:- the maximum of cargo value on any one conveyance. Payment of premium should be settled on monthly basis. Declaration of the sending:- monthly basis. The advantages of the open cover can be summarized as follows:- (i) it guarantees cover at pre-arranged rates and conditions, saving you time and effort in negotiating a separate cargo policy for each individual shipment; (ii) insurance protection starts automatically from the moment your goods are at your risk; (iii) the cargo policy remains in force unless cancelled by either party giving 30 days notice of cancellation (7 days for War Risks); (iv) the coverage is flexible and specifically tailored to meet our individual needs; (v) client can enjoy attractive premium rates; (vi) client is able to include insurance in the cost of the goods when negotiating a sale; and (vii) flexible reporting and premium payments. That is reason why insurance company encourages client to use this policy which they could benefit much from them. In addition, some insurance companies also provide the annual policy that the premium can be settled one time, that insurance company calls flat premium or pay in minimum deposit. Reinsurance contract whereby the reinsurer agrees to accept risks assigned by the insurer, at its discretion, under the terms of the contract. The transaction is optional for the insurer but mandatory for the reinsurer. Open Cover:- an agreement whereby the assured undertakes to declare every item, e.g., shipment, vessel, etc as appropriate, that comes within the scope of the cover in the order in which the risk attaches. The insurer agrees, at the time of concluding the contract, to accept all valid declarations up to the agreed limit for each declaration. An open cover may be for a fixed period or always open; subject to a cancellation clause. Open Cover:- a contract for cargo insurance to cover all shipments from time to time as declared, a policy being issued in respect of each. The arrangement is subject to cancellation on notice by either party. Open Cover is a long term contract whereby the subscribing insurers agree to accept declarations on the agreed subject matter insured as coming within the scope of the cover. It is customary for limits to be specified in the contract and for there to be a cancellation clause whereby either party may give notice to cancel the contract. Cargo contracts usually have a limit in respect of anyone shipment or vessel or sending or other, as agreed in the contract, and may incorporate a location clause. / , например, . ; (vi) порядки и условия . Открытый Ковер – форма автоматического страхования грузов на длительный период с установлением общих лимитов ответственности (то же что и Генеральный Полис).

OPEN–END CREDIT = БЕСПРЕРЫВНЫЙ КРЕДИТ – Open-End Credit is a line of credit that may be used repeatedly up to a certain limit, also called a Charge Account or Revolving Credit. / Беспрерывный кредит является кредитной линией, которая может быть использована повторно до определённого предела. Известен также как Списываемый Счёт (Charge Account) или Возобновляемый Кредит (Revolving Credit).

OPEN–END FUNDS = ОТКРЫТЫЕ (ПАЕВЫЕ) ФОНДЫ – Open-End Fund is a type of mutual fund that sells as many shares as investors want. As money comes in, the fund grows. If investors sell, the number of outstanding shares drops. Most mutual funds are Open End Funds. Also known as Unit Trust in the United Kingdom. A managed investment where there is a variable number of units on issue. Open-Ended Investment Funds issue shares (certificates) on continuous basis. The investment fund company uses the proceeds from the sale of the shares to purchase additional investment assets for the fund. The shareholder (investor) has a claim to the redemption of the shares, debiting the fund assets. The redemption price is based on the net asset value of the fund. Investment funds which are permitted to issue new shares (units) continuously and are obligated to redeem issued shares at their intrinsic value if shareholders so demand. Switzerland allows only this type of investment fund. The opposite of Closed-End Fund.

OPEN–END INVESTMENT COMPANY = ИНВЕСТИЦИОННАЯ КОМПАНИЯ ОТКРЫТОГО ТИПА – Open-End Investment Company is the investment company that sells and repurchases its capital stock continuously, selling it at book value, adding a sales charge, and redeeming it at a slight discount or at book value. Mutual funds are open-end investment companies. Also known as Open-End Investment Trust. See also Investment Company, Investment Fund, and Mutual Fund. Open-Ended Investment Company (OEIC)

is an investment vehicle very similar to an investment trust but with the open ended characteristics of a unit trust. / Инвестиционная компания, непрерывно продающая и откупающая свои .

OPEN–END LEASE = ОТКРЫТАЯ АРЕНДА – Open-End Lease is a lease that may involve a balloon payment based on the value of the property when it is returned. Also known as Finance Lease.

OPEN–END MUTUAL FUND = ОТКРЫТЫЙ ВЗАИМНЫЙ ФОНД – Open-End Mutual Funds are those where subscription and redemption of shares are allowed on continuous basis. The price at which the shares of open-end funds offered for subscription and redemption is determined by the NAV (Net Asset Value) after adjusting for any sales load or redemption fee. In Pakistan there exists only four open ended mutual funds; National Investment (Unit) Trust (NIT) in the public sector and Pakistan Stock Market Fund (PSM), Pakistan Income Fund (PIF) and Unit Trust of Pakistan (UTP) in private sector.

OPEN–END SPINNING = ПРЯДЕНИЕ СО СВОБОДНЫМ КОНЦОМ (или БЕЗВЕРЕТЁННОЕ ПРЯДЕНИЕ, или ПНЕВМОМЕХАНИЧЕСКОЕ ПРЯДЕНИЕ) – Open-End Spinning:- processing fibers directly from a fiber supply, such as a roving sliver, to the finished yarn, in contrast to ring spinning. Three basic open-end methods are electrostatic, fluid or air, and mechanical. Advantages over ring-spun yarns include increased speed, less labor, and less floor space for equipment. A process by which yarn is spun from a broken-up sliver or roving. Also known as Break Spinning. Open-End Spinning is a system of spinning based on the concept of introducing twist into the yarn without package rotation by simply rotating the yarn end at a gap or break in the flow of the fibers between the delivery system and the yarn package. Because the twisting element can be compact and the mass of material to be rotated is small, very high twisting speeds can be attained. The process, in a sense combines the traditional processes of roving and spinning in one operation. Present work is directed toward incorporating the drafting operation into the process by using card sliver as the feedstock. This can facilitate process linking. Open-End Spinning is a spinning system in which sliver feedstock is highly drafted and thus creates an open end or break in the fiber flow. The fibers are subsequently assembled on the end of a rotating yarn and twisted in. Techniques for collecting and twisting the fibers into a yarn include rotor spinning and friction spinning. / Безверетённое Прядение, известное также как Прядение с Разделённым Кручением и Наматыванием Пряжи или Прядение со Свободным Концом Волокон, – процесс выработки пряжи, включающий дискретизацию или разъединение питающего волокнистого продукта на отдельные волокна дискретизирующими органами, транспортирование потока волокон на сборную поверхность прядильной камеры, сгущение волокон в ленточку (мычку), кручение для укрепления ленточки и формирования из неё пряжи, вывод из зоны кручения и наматывание пряжи на бобину. В отличие от традиционного кольцевого способа прядения кручение производится отдельным органом, не связанным с органами наматывания. Различают аэродинамическое, пневмомеханическое, электромеханическое и другие способы безверетённого прядения. Пневмомеханическое Прядение – способ безверетённого прядения, при котором поток волокон транспортируется пневматически (воздухом) во вращающуюся прядильную камеру, скручивается и в виде кручёной пряжи наматывается на катушку. Разделение процессов кручения и наматывания позволяет по сравнению с традиционным кольцевым способом прядения увеличить скорость формирования пряжи в 3–5 раз, а массу паковки с пряжей – в 10 и более раз. В бывшем Союзе Советских Социалистических Республик (СССР) Камерный Пневмомеханический Способ Прядения, который осуществлялся на пневмомеханических прядильных машинах типа ППМ и БД-200, получил широкое распространение для выработки пряжи большой и средней линейной плотности из хлопковых, химических волокон и их смесей. Сущность этого способа заключается в преобразовании ленты в дискретный поток волокон, в образовании из этого потока клиновидной волокнистой ленточки в виде незамкнутого кольца в желобе прядильной камеры и в формировании кручением из ленточки пряжи (в результате вращения вокруг оси прядильной камеры кольцевой ленточки и пряжи), непрерывно выводимой из камеры с помощью выпускных валиков. Прядение, в котором используется однозонный вид кручения, часто для краткости называют ‘прядение со свободным концом’ и ‘разрывное прядение’ (break spinning), так как пряжа с концом волокнистой ленточки и питающая лента соединяются дискретным потоком волокон, который не может передавать крутящий момент, образуемый вращением кольцевой ленточки. Кручение пряжи и её наматывание в бобину осуществляются разными рабочими органами (прядильной камерой и мотальным валиком), то есть наматывание отделено от кручения, и эти процессы можно вести при больших скоростях. Рассматриваемый способ прядения называется камерным, так как формирование клиновидной волокнистой ленточки и кручение её осуществляются в прядильной камере. В других странах мира её часто называют ротором. Пневмомеханическая прядильная машина располагается на конечном этапе прядильного производства – непосредственно самом прядении. На этих машинах осуществляется дискретизация питающего продукта – ленты со второго перехода ленточных машин, транспортирование дискреционного потока волокон, циклическое сложение с целью формирования волокнистой ленточки, кручение с целью укрепления ленточки и превращения её в пряжу, то есть формирование пряжи, наматывание её, то есть формирование паковки. При осуществлении этих процессов используются воздушные и механические воздействия.

OPEN FACE = ВСКРЫТАЯ ЛИЦЕВАЯ ЧАСТЬ – Open Face is a fabric defect consisting of an open appearance of the fabric which permits the filling to ‘grin’ through the warp ends in the center portion of the fabric. / уточина .

OPEN GEAR = ОТКРЫТАЯ ПЕРЕДАЧА (или ОТКРЫТАЯ ЗУБЧАТАЯ ПЕРЕДАЧА, или ОТКРЫТОЕ ЗУБЧАТОЕ КОЛЕСО) – Open Gear:- a gear that is exposed to the environment, rather than being housed in a protective gear box. Open gears are generally large, heavily loaded, and slow moving. They are found in such applications as mining and construction machinery, punch presses, plastic and rubber mills, tube mills, and rotary kilns. Open gears require viscous, adhesive lubricants that bond to the metal surfaces and resist run-off. Such lubricants are often called Gear Shields. Top-quality lubricants for such applications are specially formulated to protect the gears against the effects of water and other contaminants. See also Gear. / Смотрите также (Зубчатая) Передача (Gear).

OPEN HULL = ОТКРЫТАЯ ПЛЁНКА ЗЕРНА (или ОТКРЫТАЯ ШЕЛУХА) – Open Hull is the lemma and hull cannot close after opening at blooming time.

OPENING = РАЗРЫХЛЕНИЕ – In the cotton processing, Opening covers the initial treatments given to raw cotton; the separation and opening up of the cotton to remove compression because of baling and shipping. Heavier impurities are also removed from the stock. The bale breaker and various picker machines perform the work. The action of opening machines may be revolving and tumbling, beating, air draft, and suction. Opening is concluded when the cotton lap is made ready for actual carding. The process of separating fibers from the pressed bale. Opening is:- (1) a preliminary operation in the processing of staple fiber. Opening separates the compressed masses of staple into loose tufts and removes the heavier impurities. (2) An operation in the processing of tow that substantially increases the bulk of the tow by separating the filaments and deregistering the crimp. / Процесс разборки волокон из прессованной кипы. Хлопковое волокно поступает на прядильное производство в кипах в спресованном виде. Прессование необходимо для упрощения перевозок и хранения сырья на складах фабрики. Поступающее на фабрику спресованное в кипах хлопковое волокно прежде всего нуждается в распаковывании, разрыхлении, очистке от сорных примесей и смешивании для создания однородной смеси. Сущность разрыхления заключается в уменьшении средней плотности совокупности спутанных волокон и в разделении этой совокупности на более мелкие клочки. Разрыхление осуществляется для повышения

эффективности очистки волокон от примесей, разъединения и смешивания волокон. В настоящее время применяется два способа разрыхления – расщипывание и ударное воздействие. Ведутся работы по использованию аэродинамического воздействия на материал. При разрыхлении, когда разрушается структура совокупности спутанных волокон, происходит выделение сорных примесей, то есть разрыхлению сопутствует процесс очистки. Сущность очистки заключается в выделении примесей (жёстких и мягких) и пороков волокна из волокнистых материалов. Очистка осуществляется с целью получения чистой пряжи и обеспечения стационарности технологических процессов, то есть снижение обрывности и неровноты полуфабрикатов. Известно три способа очистки:- аэродинамический, механический и электропневмомеханический. Однако практическое применение имеют всего два способа – аэродинамический и механический. С целью осуществления разрыхления на начальном этапе процесса прядения после кипоразборщиков используются кипоразрыхлители – разрыхлительно-очистительные агрегаты, основной задачей которых является создание непрерывного равномерного потока разрыхлённых волокон. Процесс подготовки волокна к прядению начинается на разрыхлительно-очистительных агрегатах. Эти машины выщипывают клочки волокна из кип с волокнистым материалом и формируют холст, а система транспортировки клочков (flocks) доставляет их в виде холста от разрыхлительных агрегатов к кардочесальной машине или иным аппаратам переработки. Следующий этап разрыхления происходит на кардочёсальных и гребнечёсальных машинах, которые разделяют поступающие с холстом клочки волокна на отдельные волокна – разрыхление до волокна. Второй этап обычно называют чесанием, и в этом случае под разрыхлением понимается только первый этап разделения волокнистого материала на клочки.

OPENING = РАСПРАВЛЕНИЕ (или РАЗРЫХЛЕНИЕ, или РЫХЛЕНИЕ, или РАСКРЫТИЕ, или ОТВЕРСТИЕ) – Opening is the second step in commercial wool processing (after sorting). The purpose is to open up the fleece in order that scouring will be more effective. Done with Dusting.

(THE) OPENING = ОТКРЫТИЕ – The Opening is a period prior to permanent trading on the exchange when orders entered during pre-opening are processed at the opening price. The period at the beginning of the trading session officially designated by the exchange during which all transactions are considered made ‘at the opening’. / Период до постоянной торговли на бирже, во время которого все те распоряжения, поступившие для исполнения в течение периода предоткрытия, исполняются по цене открытия. Период в начале торговой сессии, официально назначенный биржей, в течение которого все совершаемые операции рассматриваются в качестве осуществлённых ‘по открытии’.

OPENING AUTOMATED REPORT SERVICE = АВТОМАТИЗИРОВАННАЯ СЛУЖБА ОТЧЁТА ПО ОТКРЫТИИ – Opening Automated Report Service (OARS) provides improved accuracy and efficiency for handling certain orders sent before trading opens. Opening Automated Report Service receives, stores, and continuously tabulates market orders – up to a specified size – routed through the common message switch. It matches buy and sell interest in each stock, calculates imbalances, and reports them to specialists. Seconds after the specialist notifies OARS of an opening price, the system automatically generates and returns execution reports to originating firms, and submits the trade for automatic clearance and settlement.

OPENING HEIGHT = ВЫСОТА ПРОСВЕТА – In pallet, Opening Height is the vertical distance measured between decks, from the floor to the underside of the top deck, or from the floor to the top of the stringer notch.

OPENING PRICE = ЦЕНА ПО ОТКРЫТИИ – Opening Price is taken from the first trade of the day (or period). The public tend to place orders at the opening of the market, reacting to the previous day’s close. Closing price is taken from the last trade of the day (or period). Institutional investors normally watch developments during the day and place orders towards the close. Opening price indicates the emotional direction of the market and the closing price represents (in most cases) a more reasoned and well-researched view. Open and close are only significant for periods with a definite break before the next opening, as with days or weeks. They should be ignored in analyzing intra-day charts or markets that are open 24 hours a day. The price recorded during the period designated by the exchange as the official opening. Opening Price is the price for a given futures commodity that is generated by trading through open outcry during the opening range of trading on a commodity exchange. The price at which an asset starts to trade during the period designated by the exchange at the official opening. In securities trade, Opening Price is the price paid in the first (or opening) transaction for a given security on a given day. The opposite of Closing Price. First price fixed for a security admitted to continuous trading shortly after the trading session has begun. Opening Price is the first price occurring at the beginning of the trading day. / В торговле ценными бумагами цена, уплачиваемая в первой операции (или в операции по открытии) за данную ценную бумагу в данный день. В противовес Цене По Закрытии (Closing Price).

OPENING RANGE = ДИАПАЗОН ПО ОТКРЫТИИ (или ДИАПАЗОН ОТКРЫТИЯ) – The price range (the highest and lowest prices) recorded during the period designated by the exchange as the official opening. Opening Range is the range of prices between a high and low traded over a specified length of time (during the opening of the market) that is set by an exchange Floor Committee and posted as an official record. This zone has certain technical implications for short-term traders. / Ценовой диапазон (наивысшая и наинизшая цены) зафиксированный в течение периода времени, выбранного биржей в качестве периода официального открытия торговой сессии. Диапазон цен между максимумом и минимумом, сформировавшимися в процессе торговли за выбранный отрезок времени (в течение открытия рынка), который установлен биржевым Комитетом на Полу (Floor Committee) и разослан в качестве официальной записи. Эта зона имеет определённые технические значения для краткосрочных торговцев.

OPENING SLITS = ХХ ПРОРЕШКИ (или РАЗРЕЗЫ) – Opening Slits:- cut under, above, to the side or at incorrect angle. Not cut through entire bundle or omitted. Cutting Room Defects, and namely – Cutting Defects. / Порок или дефект раскроя.

OPENING TRANSACTION = ОТКРЫВАЮЩАЯ ТРАНЗАКЦИЯ – Opening Transaction is a trade that establishes a new position. / В биржевой торговле .

OPENING WINDOW = ОКНО ПРОСВЕТА – Opening Window is an aperture provided in the bottom deck of a double-deck pallet to allow the fork-arm wheels of a pallet truck to bear on the ground. / Просвет Поддона (Opening Window):- окно в нижнем настиле у двухнастильного поддона для размещения колёс вилочного захвата тележки, предназначенное для обеспечения их опоры на грунт.

OPEN INSURANCE POLICY = ОТКРЫТЫЙ СТРАХОВОЙ ПОЛИС – Open Insurance Policy is a marine insurance policy that applies to all shipments made by an exporter over a period of time rather than to a single shipment. Policies containing all terms and conditions, but which separately record the amount and term of each risk to be covered. Also, a term used to describe policies written with no natural expiration date, but which stay in effect until cancelled. See also Open Cover. / Открытый Страховой Полис – это полис морского страхования, который применяется не к одной единственной отгрузке, а ко всем отгрузкам, производимым экспортёром в соответствующий период времени. Полисы, содержащие все порядки и условия, но которые отдельно прописывают сумму и порядок по каждому риску, должны быть покрыты. Этот термин используется также для описания

полисов, выписанных с непривычной датой прекращения признания (экспирации), но который остаётся в силе до тех пор, пока не будет аннулирован. Смотрите также Открытое Покрытие или Открытый Ковёр или Генеральное Соглашение (Open Cover).

OPEN INTEREST = ОТКРЫТЫЙ ИНТЕРЕС – Open Interest is the total number of futures contracts for a commodity that have not yet been offset or fulfilled by delivery of the commodity. Open Interest (OI) is a number of contracts that have not been closed out after a trading session. Open Interest is the sum of futures contracts in one delivery month or one market that has been entered into and not yet liquidated by an offsetting transaction or fulfilled by delivery. The number of unclosed or unfilled contracts, on one side of the market. In any one delivery month, the short interest always equals the long interest, since the total number of contracts sold must equal the total number bought. Open Interest:- the number of options or futures contracts that are still unliquidated at the end of a trading day. A rise or fall in open interest shows that money is flowing into or out of a futures contract or option, respectively. In futures markets, rising open interest is considered good for the current trend. Open interest also measures liquidity. The total number of futures contracts long or short in a delivery month or market that has been entered into and not yet liquidated by an offsetting transaction or fulfilled by delivery. Also known as Open Commitments, and Open Contracts. The number of open or outstanding contracts for which an individual or entity is obligated to the exchange because that individual or entity has not yet made an offsetting sale or purchase, an actual contract delivery, or, in the case of options, exercised the option. Also known as Commitment. In options trading, the number of outstanding option contracts, at a given point in time, which have not been exercised and have not yet reached expiration. The total number of futures or options contracts of a given asset in one delivery month or one market that have not yet been offset by an opposite futures or option transaction nor fulfilled by delivery of the asset or option exercise. Each open transaction has a buyer and a seller, but for calculation of open interest, only one side of the contract is counted. Open interest increases as new buyers and sellers take positions, and decreases as the positions are covered. On a futures exchange, Open Interest is the daily statistic that indicates the number of open contracts, i.e. those which have not been fulfilled or closed out. Open Interest is the total number of futures contracts outstanding that have not yet been settled financially or through physical delivery. One futures contract represents 1 000 barrels of crude oil. Open Interest is the number of outstanding futures contracts for a commodity that have not been offset by opposite future transactions or fulfilled by delivery of the commodity. / Открытый Интерес (ОИ) – число контрактов, которые не были закрыты после окончания биржевой торговой сессии. Число незакрытых или неисполненных контрактов с одной стороны рынка, например, со стороны покупателей. Почему только с одной стороны? Дело в том, что покупатель купил предположим один контракт, а продавец продал соответственно один контракт. И у одного и у другого по одной открытой позиции, а задействованных в них контрактах всего один, который и формирует открытый интерес. По любому отельно взятому месяцу поставки интерес продавцов всегда равен интересу покупателей, поскольку итоговое число проданных контрактов должно равняться итоговому числу приобретённых контрактов. Число опционных или фьючерсных контрактов, остающихся неликвидированными к концу торгового дня. Рост или падение открытого интереса отображает соответственно приток или отток денежных средств из таких контрактов. На рынках фьючерсов возрастающий открытый интерес рассматривается хорошим знаком в отношении существующей текущей тенденции. Открытый интерес измеряет также ликвидность данного рынка. Итоговое число купленных или проданных фьючерсных контрактов по конкретному месяцу поставки или по всему рынку (всем месяцам поставки), которое было открыто и пока что не ликвидировано зачётной (противоположной) сделкой или по которому не была произведена поставка. Известно также как Открытые Контракты (Open Contracts), и Открытые Обязательства (Open Commitments). Число открытых или остающихся неисполненными контрактов, по которым физическое или юридическое лицо продолжает нести финансовую ответственность перед биржей вследствие того, что данное физическое или юридическое лицо пока что не произвело соответствующей зачитывающей продажи или приобретения, реальной поставки по контракту, или, в случае с опционами, пока что не исполнило опцион. Известно также как Обязательство (Commitment). В торговле опционами, число остающихся задействованных в данный момент времени опционных контрактов, которые не были исполнены и по которые пока что не прекратили признания или, другими словами, для которых ещё не наступила экспирация. Общее количество фьючерсных или опционных контрактов на данный актив для одного месяца поставки или одного рынка, которое пока что не было зачтено противоположной сделкой с этим фьючерсным или опционным контрактом и по которому не производилась поставка актива или не исполнялся опцион. Каждая открытая сделка имеет своего покупателя и продавца, но подсчёт открытого интереса осуществляется только по одной стороне данного контракта (открытой позиции). Открытый интерес возрастает, когда новые покупатели и продавцы открывают свои позиции, и уменьшается, когда эти открытые позиции закрываются.

OPEN MARKET = ОТКРЫТЫЙ РЫНОК – With the 'Official' and 'Regulated Markets', the Open Market is the third legally regulated market segment in Germany. However, it is not subject to public but private law and was officially called the 'Regulated Unofficial Market' until October 2005. Trading in the open market segment on the Frankfurt Stock Exchange (FWB) includes not only German shares, but primarily foreign shares, bonds of German and foreign issuers, certificates and warrants. It was first created on 1987-May-01, through the merger of the 'regulated unofficial market' and the 'unregulated unofficial market'. The open market is not an organized market as defined by the German Securities Trading Act (Wertpapierhandelsgesetz (WpHG)). The basis for the inclusion of securities in the open market is provided by the conditions for the regulated unofficial market of Deutsche Börse AG. There are only a few formal application requirements and no follow-up obligations. Anti-insider trading rules apply, but the regulation on ad hoc disclosures does not. Freely competitive market. / Вэртпапиахандэльзгэзэтц (Вэ.пе.Ха.Ге.; Wertpapierhandelsgesetz (WpHG). Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG). для данного случая (ad hoc). Рынок со свободной конкуренцией.

OPEN MARKET OPERATIONS = ОПЕРАЦИИ НА ОТКРЫТОМ РЫНКЕ – (1) Open Market Operations are sales or purchases of government debt instruments (treasury bonds, treasury bills, treasury notes) on the open financial markets by a country's central bank (in the United States, the Federal Reserve or Fed) as part of its efforts to influence the size of the money supply and the levels of interest rates. Central bank decisions to buy up government debt instruments make for an expansionary monetary policy, while sales of government debt instruments by the central bank represent a contractionary monetary policy. When the Fed enters the financial markets and buys US government securities, it pays for them by checks drawn on the Federal Reserve Bank's own account with itself, which the sellers of the securities then deposit in their own private bank accounts. The private banks in turn deposit the Fed's checks in their own accounts at the Fed – which means that the private banks now have extra reserves on which they can extend additional loans to their customers, thus tending to expand the size of the money stock and (in the short run, at least) to lower interest rates. (For example, if the reserve requirement is 20%, banks can legally create five times the amount of these new reserves by simply crediting the checking accounts of new borrowers.) Conversely, when the Fed enters the financial markets and sells government securities it owns, the buyers pay for them with checks drawn on their accounts at their own banks and the Fed presents the checks for collection. When these checks clear and the private banks pay over the funds to the Fed, the private banks' deposits at the regional Federal Reserve banks decline by the amounts of these checks, reducing the private banks' reserves and thus reducing the amount of the loans that the banks may legally have outstanding. This tends to decrease the size of the money stock and (in the short term, at least) to raise interest rates. For example, if the reserve requirement is 20% and a particular bank is operating right at the legal minimum of reserves, it will have to reduce quickly the amount of the loans outstanding to its customers by five times the amount of the reduction in

the bank's reserves in order to maintain the legally required reserve percentage. Following World War I, Benjamin Strong, head of the New York Fed from 1914 to his death in 1928, recognized that gold no longer served as the central factor in controlling credit. Strong's aggressive action to stem a recession in 1923 through a large purchase of government securities gave strong evidence of the power of open market operations to influence the availability of credit in the banking system. During the 1920s the Fed began using open market operations as a monetary policy tool. During his tenure, Strong also elevated the stature of the Fed by promoting relations with other central banks, especially the Bank of England. Open Market Operations involve the buying and selling of US government securities (federal agency and mortgage-backed). The term 'Open Market' means that the Fed doesnt decide on its own which securities dealers it will do business with on a particular day. Rather, the choice emerges from an 'open market' in which the various securities dealers that the Fed does business with – the primary dealers – compete on the basis of price. Open market operations are flexible and thus, the most frequently used tool of monetary policy. Open market operations are the primary tool used to regulate the supply of bank reserves. This tool consists of Federal Reserve purchases and sales of financial instruments, usually securities issued by the US Treasury, Federal agencies and government-sponsored enterprises. Open market operations are carried out by the Domestic Trading Desk of the Federal Reserve Bank of New York under direction from the Federal Open Market Committee (FOMC). The transactions are undertaken with primary dealers. The Feds goal in trading the securities is to affect the federal funds rate, the rate at which banks borrow reserves from each other. When the Fed wants to increase reserves, it buys securities and pays for them by making a deposit to the account maintained at the Fed by the primary dealers bank. When the Fed wants to reduce reserves, it sells securities and collects from those accounts. Most days, the Fed does not want to increase or decrease reserves permanently so it usually engages in transactions reversed within a day or two. That means that a reserve injection today could be withdrawn tomorrow morning, only to be renewed at some level several hours later. These short-term transactions are called Repurchase Agreements (Repos) the dealer sells the Fed a security and agrees to buy it back at a later date. Why does the Fed typically conduct open market operations several times a week? The vast majority of open market operations are not intended to carry out changes in monetary policy. Instead open market operations are conducted on a daily basis to prevent technical, temporary forces from pushing money and credit conditions in an undesired direction. For example, the amount of cash in peoples possession varies depending upon the season of the year, the day of the month, and even the day of the week. When people hold more cash, the reserves that banks have available to lend to the banking system go down. That could push the fed funds rate up, if the Fed didnt intervene by adding reserves using open market purchases of securities. How does the Fed conduct open market operations? Before conducting open market operations, the staff at the Federal Reserve Bank of New York collect and analyze data and talk to banks and others to estimate the amount of bank reserves to be added or drained that day. They then confer with Fed officials in Washington who do their own daily analysis and reach a consensus about the size and terms of the operation. Then a New York Fed official sends a message to over twenty securities dealers to detail the Feds intention to buy or sell securities. Fed officials expect these dealers to respond within minutes. Then they take another few minutes to accept or reject a dealers offer. In the United States, the Open Market Operations are purchases and sales of government securities (typically US Treasury securities) and certain other securities in the open market, through the Domestic Trading Desk at the Federal Reserve Bank of New York as directed by the Federal Open Market Committee (FOMC), to influence the volume of money and credit in the economy. Purchases inject reserves into the banking system and stimulate growth of money and credit; sales do the opposite. Intervention by a central bank to control the amount of money in circulation or to stabilize interest rates, e.g., by the large-scale purchase of securities. Buying and selling the US government securities on the open market by a central bank to implement monetary policy. The buying and selling of government securities, Treasury bills, notes, and bonds by the US Federal Reserve. See also Federal Reserve System. / Покупка и продажа Федеральным Резервом США государственных ценных бумаг, Казначейских векселей, нот и облигаций. Эти краткосрочные операции именуются соглашениями об откупе (рипо; repurchase agreements (repos)). Операции на Открытом Рынке:- этот метод заключается в том, что центральный банк (ЦБ) осуществляет операции купли-продажи ценных бумаг в банковской системе. Покупая ценные бумаги на открытом рынке, центральный банк увеличивает резервы коммерческих банков и способствует росту денежного предложения. Продажа ценных бумаг ЦБ приводит к обратным последствиям. Центральный банк периодически вносит изменения в указанный метод кредитного регулирования, изменяя интенсивность своих операций, их частоту. Операции на открытом рынке – наиболее действенный и гибкий рыночный инструмент денежно-кредитной политики ЦБ, обеспечивающий эффективное воздействие на денежный рынок и банковский кредит, а следовательно, и на всю экономику. Механизм операций на открытом рынке не сложен, что делает его привлекательным для использования.

(2) In the European Union, Open Market Operations can be divided into:- (i) main refinancing operations; these are regular liquidity-providing transactions with a frequency and maturity of one week; (ii) longer-term refinancing operations; these are liquidity-providing transactions with a monthly frequency and a maturity of three months; (iii) fine-tuning operations; these can be executed on an ad hoc basis to manage the liquidity situation in the market and to steer interest rates. In particular, they aim to smooth the effects on interest rates of unexpected liquidity imbalances; and (iv) structural operations can be carried out by the Eurosystem through reverse transactions, outright transactions and issuance of debt certificates. Open Market Operation is an operation executed on the initiative of the central bank in the financial markets involving one of the following transactions:- (i) buying or selling assets outright (spot or forward); (ii) buying or selling assets under a repurchase agreement; (iii) lending or borrowing against underlying assets as collateral; (iv) issuing central bank debt certificates; (v) accepting fixed-term deposits; or (vi) conducting foreign exchange swaps between domestic and foreign currencies. / , неотложные операции и выдача долговых сертификатов. для данного случая (ad hoc).

OPEN MARKET POLICY = ПОЛИТИКА ОТКРЫТОГО РЫНКА – The Open Market Policies are the most important monetary policy instruments the central bank has to influence the creation of money. The central bank offers commercial banks specific fixed-income securities (open market securities) to buy, or it buys such securities itself from the commercial banks. If the commercial banks buy the securities, the money invested is no longer available for lending, i.e. the money created sinks. If the commercial banks sell the securities, they can use the money they receive to grant loans. Influence exerted on the money supply and interest levels by the central bank through buying and selling short-, medium- and long-term debt instruments (such as Treasury bills, bonds and notes) on the money market or capital market for its own account. See also Central Bank Powers.

OPEN ORDER = ОТКРЫТОЕ РАСПОРЯЖЕНИЕ – Open Order is an order that remains in force until it is canceled or until the futures contracts expire. A resting order that is good until canceled. Also known as Good 'Till Canceled Order. See also Good This Week Order. / Распоряжение, которое остаётся в силе до тех пор пока оно не будет отменено или пока не истечёт срок действия фьючерсного контракта. Остающееся в силе распоряжение, которое действительно пока не будет отменено. Известно также как Распоряжение, Действительное До Отмены (Good 'Till Canceled Order). Смотрите также Распоряжение, Действительное В Течение Этой Недели (Good This Week Order).

OPEN OUTCRY = ОТКРЫТОЕ ОГЛАШЕНИЕ (или ОТКРЫТОЕ ВЫКРИКИВАНИЕ) – The Open Outcry method consists of floor traders standing in a trading pit to call out orders, prices, and quantities of a particular commodity. Different colored jackets are worn by the traders to indicate their function on the floor (traders, runners, CME® employees, etc). In addition, complex hand signals (called

Arb) are used. These hand signals were first used in the 1970s. The pits are areas of the floor that are lowered to facilitate communication, sort of like a miniature amphitheater. The pits can be raised and lowered depending on trading volume. To an onlooker, the open outcry system can look chaotic and confusing, but in reality the system is a tried and true method of accurate and efficient trading. With Open Outcry, all market participants are afforded the opportunity to buy or sell at the best available current price. A method of public auction, common to most US commodity exchanges, where trading occurs on a trading floor and traders may bid and offer simultaneously either for their own accounts or for the accounts of customers. Transactions may take place simultaneously at different places in the trading pit or ring. At most exchanges outside the United States, open outcry has been replaced by Electronic Trading Platforms. See also Specialist System. A method of public auction for making verbal bids and offers for contracts in the trading pits or rings of commodity exchanges. Open Outcry is the name of a method of communication between professionals on a stock exchange or futures exchange which involves shouting and the use of hand signals to transfer information primarily about buy and sell orders. An example of a stock exchange which uses this system is the New York Stock Exchange, an example of a futures exchange is the Chicago Board of Trade. The open outcry system is being replaced by electronic exchanges (e.g., CATS), the supporters of which claim that they are faster, cheaper and more efficient for users, and less prone to manipulation by stock specialists and broker/dealers. Method of public auction in which verbal bids and offers are made in the trading rings or pits. Used on the futures and options exchanges. Also known as Outcry, and A La Criee in French. At the Board of Trade, orders were still carried to the pits on pieces of paper by runners and clerks, and then shouted out by traders or 'flashed' to others in the pit using the hand signal language known as 'Arb' – an abbreviation for arbitrage, the exploitation of discrepancies in prices. But at the turn of the millennium the digital age was already poised to radically transform the way that modern traders conduct business. Chicago's open-outcry trading, a way of life stretching back to the grain futures pits of the XIX century, was on the brink of disappearing when I visited the Board of Trade in 1999 and 2000. There were already signs that technology was encroaching:- headsets were increasingly used instead of runners to communicate between the pits and the booths where customer orders arrived, and a few traders carried hand-held computers. Since 2000, Chicago's pits have emptied, and those who still stand in them focus less on the people around them than they do on their computers, which are no longer an adjunct to trading but essential to it. Chicago remains central to the world's financial markets – its recent merger with the Chicago Mercantile Exchange® (CME®) has made the Board of Trade part of the world's largest exchange – but as the hub of electronic networks, not as a set of huge rooms crowded with bodies. Open Outcry:- a style of trading conducted on a futures exchange in a ring or a pit where dealers face each other, calling out the price, contract, month and number of contracts. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). В биржевой торговле сырьём, метод Открытого Оглашения заключается в том, что торговцы на полу, находящиеся в яме для торговли, оглашают распоряжения, цены и количества конкретного сырья. Эти торговцы одеты в жакеты разного цвета, что указывает на их функции на полу (торговцы, посыльные, служащие биржи и так далее). В дополнение к выкрикам они используют комплексные сигналы руками (называемые сокращённо Арб (Arb) от Арбитража (Arbitrage)). Эти сигналы руками впервые были использованы в 1970-е. является Чикагская Палата Торговли (Чикагское Табло Торговли, если быть более точными) . , например, . Открытое Выкрикивание:- метод ведения торгов в торговом зале биржи. Термин происходит от того факта, что торговцы должны выкрикивать свои предложения о покупке или продаже. Когда торговец выкрикивает, что желает продать по какой-либо цене, а кто-то другой выкрикивает, что желает сделать покупку по этой цене, два торговца заключают в результате между собой контракт, который затем будет зафиксирован.

OPEN PIT = ОТКРЫТЫЙ КАРЬЕР (или ОТКРЫТЫЙ РАЗРЕЗ) – The definition of a Open Pit Mine is 'an excavation or cut made at the surface of the ground for the purpose of extracting ore and which is open to the surface for the duration of the mine's life'. To expose and mine the ore, it is generally necessary to excavate and relocate large quantities of waste rock. The main objective in any commercial mining operation is the exploitation of the mineral deposit at the lowest possible cost with a view of maximizing profits. The selection of physical design parameters and the scheduling of the ore and waste extraction program are complex engineering decisions of enormous economic significance. The planning of an open pit mine is, therefore, basically an exercise in economics, constrained by certain geologic and mining engineering aspects. A bench may be defined as a ledge that forms a single level of operation above which mineral or waste materials are mined back to a bench face. The mineral or waste is removed in successive layers, each of which is a bench. Several benches may be in operation simultaneously in different parts of, and at different elevations in the open pit mine. Open pit mines can be used in coal mining, and they are used extensively in 'hard rock' mining for ores such as metal ores, copper, gold, iron, aluminum, and many minerals. In a open pit coal mine, the pit bottom would be the bottom mined coal seam elevation, since it is usually feasible to extract multiple seams when surface mining coal. In a hard rock mine, the bottom of the pit would be the lowest level (elevation) that mining would be conducted on the ore being mined. Planning must account for both environmental protection, beginning as early as the initial exploration, and for reclamation. It is critical that planning alleviate or mitigate potential impacts of mining for two key reasons:- (i) the cost of environmental protection is minimized by incorporating it into the initial design, rather than performing remedial measures to compensate for design deficiencies; and (ii) negative publicity or poor public relations may have severe economic consequences. From the start of the planning process, adequate consideration must be given to regulatory affairs. The cost of compliance may be significantly reduced when taken into account in the design or planning process, in a proactive manner, rather than being addressed on an ad hoc basis as problems develop or enforcement actions occur. From the beginning of the mine design planning stage, data gathering and permitting, environmental considerations are important, although benefits from a strictly economic sense may be intangible. From exploration, where core holes must be sealed and the site reclaimed, through plan development, the impacts on the environment must be considered. These impacts include aesthetics, noise, air quality (dust and pollutants), vibration, water discharge and runoff, subsidence, and process wastes; sources include the underground and surface mine infrastructure, mineral processing plant, access or haul roads, remote facilities, etc. If mining will cause quality deterioration of either surface water or groundwater, remedial and treatment measures must be developed to meet discharge standards. The mine plan must include all the technical measures necessary to handle all the environmental problems from initial data gathering to the mine closure and reclamation of the disturbed surface area. Reclamation plans include many of the following concerns:- drainage control, preservation of top soil, segregation of waste material, erosion and sediment control, solid waste disposal, control of fugitive dust, regrading, and restoration of waste and mine areas. The plan must also consider the effects of mine subsidence, vibration (induced by mining, processing, transport, or subsidence), and impact on surface water and groundwater. These environmental items often dictate the economics of a planned mining operation and determine its viability. Open Pit is a mine based on extraction from a surface excavation, which remains open to the surface for the life of the mine. / для данного случая (ad hoc). Сегрегация или Выделение или Зейгерование или Разделение По Крупности (Segregation). Горное предприятие, осуществляющее разработку месторождения полезных ископаемых открытым способом, носит название Карьер. В угольной промышленности вместо термина Карьер используют термин Разрез. В результате производства открытых горных работ на поверхности горного отвода образуется выемка, которая и в угольной промышленности называется Карьером. Карьер снизу ограничен подошвой, а сбоков – бортами. Вскрытием карьерного поля называются горные работы по созданию комплекса капитальных и временных выработок (траншей и съездов), обеспечивающих грузотранспортную связь между рабочими горизонтами в карьере и приёмными пунктами на поверхности. Схемой Вскрытия называют совокупность всех вскрывающих выработок. При открытом

способе добычи, в зависимости от условий залегания полезного ископаемого, извлекают не только полезное ископаемое, но и вмещающие породы в значительных объёмах. Эти породы называют Вскрышными Породами или Вскрышей. В целях безопасности условий работы бортам карьера придают определённый угол наклона, который делает борта устойчивыми. Линейные размеры карьера постоянно меняются в процессе добычи полезного ископаемого. Полезные ископаемые и вскрышу вывозят из карьера автомобильным или железнодорожным транспортом, а наиболее перспективным с определённой глубины разработки является конвейерный транспорт. Иногда вскрыша вывозится на внешний отвал, а иногда – на внутренний. При отработке карьеров с использованием внутреннего отвала себестоимость добычи ниже, но такая эксплуатация возможна при соответствующих горно-геологических условиях. Разработка массы горных пород в границах карьера ведется горизонтальными или слабонаклонными слоями. Слои отрабатываются параллельно с некоторым отставанием работ в пространстве и времени. Таким образом, боковая поверхность карьера приобретает ступенчатую форму. По виду применяемого оборудования различают Экскаваторный и Гидравлический способы производства открытых горных работ. Экскаваторный способ является универсальным. При экскаваторном способе применяются взрывные работы для рыхления пород. При гидравлическом способе основные производственные процессы осуществляются энергией движущейся воды. Для этой цели применяется специальное оборудование – гидромониторы. Рельеф поверхности оказывает влияние на выбор направления развития горных работ, типа применяемого выемочно-погрузочного и транспортного оборудования, способа вскрытия, места складирования вскрышных пород и другое. В зависимости от положения полезного ископаемого горные работы могут быть поверхностными – при мощности наносов или покрывающих пород 20–30 м, глубинными – при мощности покрывающих пород более 40 метров (м), высотными – при расположении залежи выше уровня местности. Открытая разработка полезных ископаемых ведется непосредственно с земной поверхности, имеет свои особенности и технологию. Технология открытого способа предполагает применение мощной вскрышной и добычной техники. По этой причине открытый способ длительное время не имел подавляющего преимущества перед подземной добычей. Только с развитием техники в 1950-х открытый способ начал стремительно развиваться во всем мире. Так, если в 1950 доля добычи угля открытым способом составила 11%, то к 1980 объём увеличился до 38%, а объём добычи железной руды возрос с 44 до 88%. В бывшем Союзе Советских Социалистических Республик (СССР) в 1960 доля добычи угля составляла 20%, а в 1988 – 44.4%. При открытом способе добычи, при соответствующих условиях залегания полезного ископаемого, извлекают не только полезное ископаемое, но и, как правило, довольно большое количество пустых пород. Линейные размеры карьера в процессе добычи изменяются как по глубине, так и в плане. При этом, если залегание полезного ископаемого горизонтальное или пологое, то изменения размеров в плане более значительные, чем по глубине и наоборот, если залегание крутое, то большие изменения происходят по глубине. Вскрышные Работы заключаются в удалении вмещающих пород для обнажения полезного ископаемого. Добычные Работы – это работы по выемке полезного ископаемого. Вскрышные и добычные работы ведутся параллельно, причем вскрышные всегда опережают добычные. Коэффициентом Вскрыши называют количество вскрыши, которое необходимо переместить для добычи единицы полезного ископаемого. Он измеряется в т/т, $м^3/м^3$, $м^3/т$. Наибольшее распространение в угольной промышленности получила размерность $м^3/т$, то есть сколько $м^3$ вскрыши необходимо переместить для добычи 1 тонны (т) полезного ископаемого. Коэффициент вскрыши изменяется в широком диапазоне от 0.9 до 15 $м^3/т$ и более. При разработке угольных месторождений этот показатель не превышает 10 $м^3/м^3$. Подошвой Карьера называют воображаемую плоскость, которая ограничивает карьер по глубине. Бортами карьера называют плоскости, ограничивающие карьер с боков. Уступом называют часть толщи пород, имеющую рабочую поверхность в форме ступени и разрабатываемую самостоятельными средствами выемки, погрузки и транспорта. Высота уступа зависит от устойчивости пород и применяемой техники. Она колеблется от 10–40 м. Различают рабочие и не рабочие уступы. На рабочих уступах производится выемка пород или добыча полезного ископаемого. Уступ имеет нижнюю и верхнюю площадки, откос и бровки. Откосом уступа называется наклонная поверхность, ограничивающая уступ со стороны выработанного пространства. Уступ представляет собой один из основных технологических элементов карьера. От правильности определения высоты уступа зависит эффективность производственных процессов. Каждый уступ имеет один транспортный горизонт. При расположении транспортного горизонта в середине уступа последний разделяется на два Подуступа – верхний и нижний. Площадка уступа, на которой располагается основное оборудование для его отработки, называется рабочей площадкой. Ширина рабочей площадки должна быть такой, которая обеспечивает расположение, разминовку оборудования и движение транспорта. Бермой называется площадка небольшой ширины, на которой не производятся технологические работы. По назначению их делят на транспортные и предохранительные. Угол наклона уступа α к горизонтальной плоскости называется Углом Откоса уступа. Угол откоса рабочих уступов обычно равен 65–80°, нерабочих уступов 45–60°. Капитальная Траншея – открытая наклонная горная выработка, имеющая поперечное сечение в виде обратной трапеции или неправильного четырехугольника (треугольника). Капитальная траншея предназначена для вскрытия полезного ископаемого с поверхности. Основными элементами капитальной траншеи являются:- ширина основания $В_{к.т}$, глубина $Н_{к.т}$, продольный угол $i_{к.т}$, угол откоса бортов $\alpha_{к.т}$, длина в плане $L_{к.т}$ и её строительный объём $V_{к.т}$. Разрезная Траншея – горизонтальная открытая горная выработка, пройденная в крест капитальной траншеи. Разрезная траншея предназначена для создания фронта работ при осуществлении вскрыши полезного ископаемого капитальной траншеей. В ходе подготовки к эксплуатации карьеров выделяют четыре периода:- подготовительный, строительный, эксплуатационный и заключительный. Указанные периоды имеют место и при подземной добыче с той лишь разницей, что при открытой добыче заключительный период подразумевает окончание огромного объёма работ по рекультивации (восстановлению) земель. При подземной добыче эти работы связаны с консервацией горных работ и в гораздо меньших объёмах – с рекультивацией земель. Рекультивация – восстановление нарушенных горными работами земель с целью их дальнейшего использования. В результате рекультивации могут восстанавливаться земли, пригодные для сельского, лесного хозяйства, под строительство и организацию отдыха. В состав работ по рекультивации входит:- перемещение земляных масс, планировка отводов, выполаживание откосов, перемещение и засыпка плодородным слоем спланированных площадей, водоотводные, водопонижающие работы и другое. Выработанное пространство карьера, являясь нарушенной поверхностью земли, также требует рекультивации. Эти огромные ёмкости могут быть использованы под хранилища других полезных ископаемых или веществ, организацию водоёмов для разведения рыб или для других нужд региона. Уступ (bench) – часть толщи горных пород в виде ступени, подготовленная для разработки самостоятельными выемочными и транспортными средствами. При открытой разработке месторождений уступ – часть борта карьера. Уступы разделяются на рабочие, которыми производится отработка массива полезных ископаемых и вмещающих горных пород, включённых в контуры карьера, и нерабочие (погашенные), достигшие при разработке месторождения своего предельного положения. Элементы уступа:- откос, площадки, бровки. (i) Откос – наклонная поверхность, ограничивающая уступ со стороны выработанного пространства. Угол его наклона зависит от физико-механических свойств породы, высоты и срока службы уступа. Угол откоса нерабочих уступ обычно выполаживают. (ii) Площадки – поверхности, ограничивающие уступ по высоте. Площадки, на которых располагается буровое, выемочное или транспортное оборудование, называется рабочими. Ширина последних (до 40–70 метров (м)) зависит от величины развала взорванных горных пород, а также ширины заходки, транспортных коммуникаций и берм безопасности. Нерабочие уступы разделяют транспортными,

предохранительными и площадками очистки. Транспортные (10–15 м) служат для обеспечения грузотранспортной связи между рабочими площадками в карьере и поверхностью; предохранительные (3–5 м) – для задержания осыпающейся с откосов породы (через 3–4 уступа их расширяют до 7–10 м, и они служат для периодической очистки борта карьера специальным оборудованием). От ширины площадок существенно зависят результирующий угол наклона борта карьера и объём выемки, поэтому обычно стремятся к их уменьшению. (iii) Бровки – линии пересечения откоса уступа с его верхней и нижней площадкой. Угол наклона линии, соединяющей верхнюю бровку верхнего и нижнего уступа, характеризует наклон борта карьера. Уступ может разделяться на два и больше подуступов, их разработка в этом случае осуществляется общим экскавационным оборудованием.

OPEN PLACE = ВСКРЫТОЕ (или ОТКРЫТОЕ) МЕСТО (или УЧАСТОК) (или ПЛЕШИНА) – Open Place:- xxxxx. See also Crack Mark. Fabrics defect.

OPEN POLICY = ОТКРЫТЫЙ ПОЛИС – Open Policy:- policies containing all terms and conditions, but which separately record the amount and term of each risk to be covered. Also, a term used to describe policies written with no natural expiration date, but which stay in effect until cancelled. See also Open Cover. / В страховании под Открытым Полисом понимаются полисы, содержащие все порядки и условия, но которые отдельно прописывают сумму и порядок по каждому риску, по которым предоставляется покрытие. Этот термин используется также для обозначения полисов, выписанных с необычными датами прекращения признания, но которые остаются в силе до той поры, пока не будут отменены. Смотрите также Открытое Покрытие или Открытый Ковёр (Open Cover).

OPEN POLLINATED = ОТКРЫТО ОПЫЛЁННОЕ (или СВОБОДНО ОПЫЛЁННОЕ, или ПЕРЕКРЁСТНО ОПЫЛЁННОЕ) – Open Pollinated:- seed produced as the result of natural pollination as opposed to hybrid seed produced as a result of controlled pollination.

OPEN POLLINATION = СВОБОДНОЕ ОПЫЛЕНИЕ (или ОТКРЫТОЕ ОПЫЛЕНИЕ) – Open Pollination is the natural process of pollinating grains in a plant (not controlled). / Под Опылением понимается перенос пыльцы из пыльника на рыльце пестика у цветковых растений или на семязачаток у голосеменных. Предшествует оплодотворению. Опыление в пределах одного цветка или одного растения называется самоопылением, при переносе пыльцы на цветки других растений – перекрёстным опылением.

OPEN POSITION = ОТКРЫТАЯ ПОЗИЦИЯ – Open Position is a position taken by the purchase or sale of a contract but not yet closed by an opposite position. A deal that has not been settled by being reversed by an opposite deal. Also known as Going Long, or Going Short. Open Position is a market position which has not been closed out. / В биржевой торговле фьючерсами позиция, занятая приобретением или продажей контракта и временно остающаяся незакрытой противоположной позицией.

OPEN RATES = ОТКРЫТЫЕ СТАВКИ – In the United States, Open Rates are the rates established for each individual carrier. These rates are although listed in the same tariff list but may differ according to carrier. Pricing systems that are flexible and not subject to conference approval. Usually applied to products in which tramps are substituted for liners.

OPEN REED = ОТКРЫТОЕ БЁРДО – Open Reed:- results from a bent reed wire causing warp ends to be held apart, exposing the filling yarn. Will be conspicuous on fabrics that use different colored yarns on warp and shuttle. Woven fabric defect. (1) Defect Name:- Open Reed. Defect Type:- warp lines, vertical lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Open Reed:- This is the result of a bent reed wire leaving a crack in the fabric. Severity:- Major. (2) Defect Name:- Open Reed. Defect Type:- warp lines, vertical lines. Fabric Type:- Denim Bottomweights – Indigo Dyed. Description:- Open Reed:- This defect is the result of a bent reed wire holding the warp ends apart exposing the filling. Severity:- Major. (3) Defect Name:- Open Reed. Defect Type:- warp lines, vertical lines. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- Open Reed:- This defect is the result of a bent reed wire holding the warp ends apart exposing the filling. Severity:- Major. / уточная пряжа. Порок или дефект ткачества.

OPEN REGISTRY = ОТКРЫТАЯ РЕГИСТРАЦИЯ (или ОТКРЫТОЕ КЛАССИФИКАЦИОННОЕ СВИДЕТЕЛЬСТВО) – Open Registry is a term used in place of ‘flag of convenience’ or ‘flag of necessity’ to denote registry in a country which offers favorable tax, regulatory, and other incentives to ship owners from other nations.

OPEN SAFEKEEPING ACCOUNT = ОТКРЫТЫЙ СЧЁТ ОТВЕТСТВЕННОГО ХРАНЕНИЯ – Open Safekeeping Account is a safekeeping account for the depositing and administration of valuables (especially securities). Also known as Custody Account. The opposite of Sealed Safekeeping Account. / Счёт Ответственного Хранения, который используется для депонирования и администрирования ценностей (особенно ценных бумаг). Известен также как Счёт Депо или Счёт Доверительного Управления (Custody Account). В противовес Опечатанному Счёту Ответственного Хранения (Sealed Safekeeping Account).

OPEN SEAMS = ОТКРЫТЫЕ ШВЫ – Open Seams:- incorrect folder or poor operator technique. Sometime results from poor selection of type of seam for fabric used or purpose of seam in garment. Sewing Room Defects. / Порок или дефект раскроя.

OPEN–SHOULDER CONSTRUCTION = КОНСТРУКЦИЯ С ОТКРЫТЫМИ ПЛЕЧАМИ – Open-Shoulder Construction:- a method used on better coats that is characterized by hand-sewn lining shoulder seams.

OPEN SIDE CONTAINER = ОТКРЫТЫЙ СБОКУ КОНТЕЙНЕР – Open Side Container is a container with sides which can be opened, usually closed with tarpaulin and bows. Container with frames with mesh at the sides covered by a tarpaulin which can be pulled away to give unrestricted sideways access to the container for stuffing or stripping. Shipping container with frames with wire-mesh at the sides covered by means of a tarpaulin which can be dropped down to give unrestricted access to the sides of the container for loading or discharging. Also known as Open-Sided Container.

OPEN TOP CONTAINER = КОНТЕЙНЕР С ОТКРЫТЫМ ВЕРХОМ (или ОТКРЫТЫЙ СВЕРХУ КОНТЕЙНЕР) – Open Top Container:- allowing cargo to be loaded from the top, open top containers are particularly suitable for bulky cargo such as machinery. They are fitted with a PVC tarpaulin cover and attachable bows with cable sealing devices. The container doors can be removed to make the stuffing of cargo more convenient. Manufactured from steel. Container having a removable tarpaulin top to facilitate the overhead loading and unloading of cargo. Open Top Container is a container open at the top (enables the container to be loaded by crane). A dry freight container with a tarpaulin roof normally supported on movable or removable roof bows. A container fitted with a solid removable roof, or with a tarpaulin roof so the container can be loaded or unloaded from the top. An Open Top is a container with sides but no roof. Open Top Containers have an open top covered by a tarpaulin instead of a solid roof. This enables oversized cargo such as timber and scrap metal to be loaded from the top. Open top containers normally have end doors to give flexibility to loading and discharging operations. Specific dimensions and capacity of open top containers may vary depending on the container manufacturer, the age of the container and the container owner.

OPEN TRADE EQUITY = СОБСТВЕННЫЕ СРЕДСТВА (или ДОЛЯ), ДОСТУПНЫЕ ДЛЯ ТОРГОВЛИ – A term Open Trade Equity means, with respect to any account, any net unrealized gain or loss on open positions carried in such account. / В биржевой торговле

в отношении любого счёта этот термин означает то, что любые чистые нереализованные прибыль или убыток по открытым позициям занесены на такой счёт.

OPEN TRANSACTIONS = ОТКРЫТЫЕ ТРАНЗАКЦИИ (или ОТКРЫТЫЕ ОПЕРАЦИИ) – Open Transactions are the transactions having no fixed maturity date. / Операции, не имеющие зафиксированной даты погашения.

OPEN WOOL = ОТКРЫТАЯ ШЕРСТЬ – Open Wool is a wool that is not dense on the sheep and shows a distinct part down the ridge or middle of the back. Usually found in the coarser wool breeds.

OPEN YEAR OF ACCOUNT = ОТКРЫТЫЙ ГОД УЧЁТА (или ОТКРЫТЫЙ ГОД РАСЧЁТА) – Open Year Of Account:- a year of account of a syndicate which has not been closed by reinsurance to close. There are two types of open year of account; naturally open years of account and run-off accounts. Syndicates are required to keep each year of account open for a minimum of three years before it may be closed by reinsurance to close. In normal circumstances a syndicate will therefore have three naturally open years of account at any point in time:- the third year of one year of account, the second year of the following year of account; and the first year of the next year of account. Thus in 2005 the 2003 year of account is in its third year, the 2004 year of account is in its second year and the 2005 year of account is in its first year. Where the liabilities attaching to a particular year of account of a syndicate (including any prior year of account closed into that year) cannot be quantified after three years then that year of account will be left open until such time as a reinsurance to close may be effected or all the liabilities attaching to that year of account are extinguished. See also Year Of Account.

OPERA = ОПЕРНАЯ (или ВЫХОДНАЯ, или НАРЯДНАЯ) – Opera:- hat a man's collapsible top hat.

OPERABLE NUCLEAR UNIT = ЯДЕРНАЯ УСТАНОВКА, СПОСОБНАЯ ДЕЙСТВОВАТЬ – Operable Nuclear Unit:- a nuclear unit is 'operable' after it completes low power testing and is granted authorization to operate at full power. This occurs when it receives its full power amendment to its operating license from the Nuclear Regulatory Commission.

OPERATE AIRCRAFT AND OPERATION OF AIRCRAFT = ЭКСПЛУАТИРОВАТЬ ВОЗДУШНОЕ СУДНО И ЭКСПЛУАТАЦИЯ ВОЗДУШНОГО СУДНА – Operate Aircraft and Operation Of Aircraft mean using aircraft for the purposes of air navigation, including:- (i) the navigation of aircraft; and (ii) causing or authorizing the operation of aircraft with or without the right of legal control of the aircraft.

OPERATING ACTIVITIES = ВИДЫ ОПЕРАЦИОННОЙ ДЕЯТЕЛЬНОСТИ (или ОПЕРАЦИОННАЯ ДЕЯТЕЛЬНОСТЬ ПО ВИДАМ) – Operating Activities are the principal revenue-producing activities of the entity and other activities that are not investing or financing activities. Cash flows from operating activities are primarily derived from the principal revenue-producing activities of the entity. Therefore, they generally result from the transactions and other events that enter into the determination of profit or loss. The amount of cash flows arising from operating activities is a key indicator of the extent to which the operations of the entity have generated sufficient cash flows to repay loans, maintain the operating capability of the entity, pay dividends and make new investments without recourse to external sources of financing. An entity shall report cash flows from operating activities using either:- (a) the direct method, whereby major classes of gross cash receipts and gross cash payments are disclosed; or (b) the indirect method, whereby profit or loss is adjusted for the effects of transactions of a non-cash nature, any deferrals or accruals of past or future operating cash receipts or payments, and items of income or expense associated with investing or financing cash flows.

OPERATING ASSETS = ОПЕРАЦИОННЫЕ АКТИВЫ – Operating Assets:- a difference between the replacement value and the book value of operating assets can arise as a result of accretion in value, obsolescence of assets, and depreciation. Accretion in value most commonly occurs with real estate, mineral reserves, and intangible assets such as research and development, patents, and managerial capabilities. Assets that can become obsolete include production lines and employee talent in high-tech industries. Depreciation occurs as the asset's value declines from use. Thus, it is appropriate to adjust the book value of operating assets to a replacement value to reflect the changes in valuation which can occur over time. The replacement value represents an opportunity cost of the invested funds, because one could conceivably liquidate the assets in place and reinvest the funds in another company or project, and earn a similar return on that investment. Also known as Working Capital. Assets of a company which enable it to produce its goods or services. They include administrative buildings, plant facilities, liquid assets, etc. The opposite of Non-Operating Assets.

OPERATING CAPACITY = ОПЕРАЦИОННАЯ МОЩНОСТЬ (или УСТАНОВЛЕННАЯ МОЩНОСТЬ, или ПРОИЗВОДСТВЕННАЯ МОЩНОСТЬ, или ЭКСПЛУАТАЦИОННАЯ МОЩНОСТЬ) – Operating Capacity:- the amount of capacity that is available for immediate use (including spare capacity and capacity under active repair). / Объём мощности, который доступен для немедленного использования (включая резервные мощности и мощности, находящиеся в ремонте (нагрузку под действующим ремонтом)). Под Установленной Мощностью понимается сумма номинальных мощностей электрических машин одного вида, например, генераторов, входящих в состав промышленного предприятия или электрической установки. Под Установленной Мощностью энергетической системы понимают суммарную номинальную активнуюмощность генераторов электростанций, входящих в состав системы. Под Производственной Мощностью предприятия или его подразделения понимается расчётный максимально возможный объём выпуска продукции в единицу времени при наиболее полном использовании производственного оборудования и площадей по прогрессивным нормам, передовой технологии и организации производства. Рабочая Мощность Электроэнергетической Системы – располагаемая мощность электроэнергетической системы за вычетом мощности агрегатов, выведенных в ремонт. Располагаемая Мощность Электроэнергетической Системы – установленная мощность электроэнергетической системы за вычетом неиспользуемой мощности, обусловленной ограничениями по режимам работы оборудования электростанций и пропускной способности электрической сети. Установленная Мощность Электроэнергетической Системы – суммарная номинальная активная электрическая мощность агрегатов всех электростанций электроэнергетической системы в целом.

OPERATING CAPITAL = ОПЕРАЦИОННЫЙ КАПИТАЛ (или ОБОРОТНЫЙ КАПИТАЛ) – Operating Capital is a capital available for the operations of a firm (e.g., manufacturing or transportation) as distinct from financial transactions and long-term improvements. Capital assets, excluding land and buildings, used in production. / Под Оборотным Капиталом понимается часть производительного капитала (затраты на сырьё, материалы, рабочую силу), которая переносит свою стоимость на вновь созданный продукт полностью и возвращается к предприятию в денежной форме в конце каждого кругооборота капитала.

OPERATING DATES AND TIMES = ОПЕРАЦИОННЫЕ ДАТЫ И ВРЕМЯ – Operating Dates And Times:- information exchanged in the end-of-day messages between the European Central Bank (ECB) and the other participants, in order to confirm the operational involvement of each TARGET participant for the next three business days. The times refer to the moments at which the participants will be ready to start accepting Interlinking payments (start of day) and the final cut-off for sending Interlinking payments (end of day). / ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

OPERATING DIFFERENTIAL SUBSIDY = ЭКСПЛУАТАЦИОННАЯ ДИФФЕРЕНЦИАЛЬНАЯ СУБСИДИЯ – Operating-Differential Subsidy (ODS) was established by the Merchant Marine Act of 1936, it was a direct subsidy paid to US-flag operators to offset the high operating cost of US-flag ships when compared to foreign-flag counterparts. Contracts between US-flag vessel operators and the Maritime Administration have expired. The ODS program has been replaced by the Maritime Security Program. A payment to an American-flag carrier by the US Government to offset the difference in operating costs between US and foreign vessels. An amount of money the US Government paid US shipping companies that qualify for this subsidy. The intent was to help offset the higher subsidy. The intent was to help ofset the higher cost of operating a US-flag vessel. The operating differential subsidy program (ODS program) is administered by the US Maritime Administration and is being phased out.

OPERATING EXPENSES = ОПЕРАЦИОННЫЕ РАСХОДЫ – Operating Expenses (including pension and other staff costs) have been charged to the syndicates in accordance with the policies adopted by the managing agents. The cost incident to the actual handling of traffic. Costs related to the operation of the enterprise for the current accounting period, including amortization, depletion, depreciation and provisions, and excluding those which do not apply to the current period. / Затраты, связанные с деятельностью предприятия за текущий отчётный период, включая .

OPERATING INCOME = ОПЕРАЦИОННЫЙ ДОХОД – Operating Income is the amount of profit realized from a business's operations after taking out operating expenses – such as cost of goods sold (COGS) or wages – and depreciation. Operating income takes the gross income (revenue minus COGS) and subtracts other operating expenses and then removes depreciation. These operating expenses are costs which are incurred from operating activities and include things such as office supplies and heat and power. Operating Income is typically a synonym for earnings before interest and taxes (EBIT) and is also commonly referred to as 'Operating Profit' or 'Recurring Profit'. Calculated as:- Operating Income = Gross Income – Operating Expenses – Depreciation & Amortization. Operating income would not include items such as investments in other firms, taxes or interest expenses. In addition, nonrecurring items such as cash paid for a lawsuit settlement are often not included. Operating income is required to calculate operating margin, which describes a company's operating efficiency. Operating Income:- the operating revenue less cost of sales, operating expense, SC&A expense, and research and development and depreciation. Also known as Earnings Before Interest And Taxes (EBIT), or Operating Profit. Operating Income is a company's income from the goods and services it provides, less its operating expenses and depreciation. The operating income does not include losses from interest payments or income tax. For example, a widget manufacturer earns USD1 000 000 in gross revenue from the sale of widgets. The widgets cost USD200 000 to make and his administrative and payroll expenses total USD250 000. He also must subtract USD50 000 in depreciation on his widget manufacturing equipment. His operating income is stated as:- USD1 000 000 – USD200 000 – USD250 000 – USD50 000 = USD 500 000. Operating income is closely related to earnings before interest and taxes (EBIT), but EBIT includes nonoperating income, which is usually (but not always) significantly less than operating income. See also Net Income, and Operating Profit. Operating Income:- the excess of revenues over expenses derived from normal business operations. Operating income, representing income from ordinary business activities, excludes expenses, such as interest and taxes. Unusual nonrecurring items, such as gains from selling a subsidiary or losses from closing a plant, are not included in the calculation of operating income. Also called Earnings Before Interest and Taxes, and Operating Profit. Compare Operating Loss. See also Operating Revenue. Operating Income, or Operating Profit as it is sometimes called, is the total pre-tax profit a business generated from its operations. It is what is available to the owners before a few other items need to be paid such as preferred stock dividends and income taxes (don't worry – we'll cover all of those other things later in this lesson). Operating income can be used to gauge the general health of a company's core business or businesses. All else being equal, it is one of the most important figures you will ever need to know. The reason is straightforward and intuitive:- Unless a firm has a lot of assets that it can sell, any money that will flow to shareholders is going to have to be generated from selling something such as a product or service. If a company is experiencing declining operating income, there will be less money for owners, expansion, debt reduction, or anything else management hopes to achieve. This is one of the reasons that it is so closely watched by lenders and shareholders. In fact, operating income is used to calculate the interest coverage ratio and operating margin. Calculating Operating Income:- Operating Income = Gross Profit – Operating Expenses. Operating Income is a measure of a company's earning power from ongoing operations, equal to earnings before deduction of interest payments and income taxes.

OPERATING INCOME BEFORE DEPRECIATION AND AMORTIZATION = ОПЕРАЦИОННЫЙ ДОХОД ДО ВЫЧЕТА ОБЕСЦЕНЕНИЯ (ИЗНОСА) И АМОРТИЗАЦИИ – Operating Income Before Depreciation and Amortization (OIBDA) represents operating income before depreciation and amortization. OIBDA margin is defined as OIBDA as a percentage of our net revenues. OIBDA may not be similar to OIBDA measures of other companies, is not a measurement under accounting principles generally accepted in the United States and should be considered in addition to, but not as a substitute for, the information contained in our consolidated statement of operations. We believe that OIBDA provides useful information to investors because it is an indicator of the strength and performance of our ongoing business operations, including our ability to fund discretionary spending such as capital expenditures, acquisitions of mobile operators and other investments and our ability to incur and service debt. While depreciation and amortization are considered operating costs under generally accepted accounting principles, these expenses primarily represent the non-cash current period allocation of costs associated with long-lived assets acquired or constructed in prior periods. / Операционный Доход до Вычета Обесценения (Износа) основных средств и Амортизации нематериальных активов (ОДВОА). Маржа ОДВОА – это показатель ОДВОА, выраженный как процент от выручки. Расчёт ОДВОА может отличаться от величин ОДВОА других компаний. Показатель ОДВОА не является величиной, принятой согласно Американским стандартам GAAP (Generally Accepted Accounting Principles; ОПВБУ (Общепринятые Принципы Ведения Бухгалтерского Учёта)) и должен рассматриваться в дополнение, а не как альтернатива информации, содержащейся в отчётности компании. Мы считаем, что показатель ОДВОА даёт важную информацию инвесторам, поскольку отражает состояние бизнеса компании, включая её способность финансировать капитальные расходы, приобретения операторов сотовой связи и другие инвестиции, а также возможность брать займы и обслуживать долг. В то время как износ основных средств и амортизация нематериальных активов рассматриваются как операционные затраты в отчётности ОПВБУ США, эти расходы главным образом показывают не связанные с расходом наличности затраты, относящиеся к долгосрочным активам, приобретенным или созданным в предыдущие периоды.

OPERATING LEASING = ОПЕРАЦИОННАЯ АРЕНДА (или ОПЕРАЦИОННЫЙ ЛИЗИНГ) – Operating Leasing is the conventional form of leasing, in which the lessee makes use of the leased asset for a period in return for a rental while the asset remains on the balance sheet of the lessor. The leasing payments are part of the output of the lessor, and the intermediate consumption of the lessee. See also Financial Leasing.

OPERATING LOSS = ОПЕРАЦИОННЫЕ УБЫТКИ – Operating Loss is the loss for the relevant period resulting from the operations of the entity or group during the period of a kind carried on regularly to achieve the objectives of the entity or group. It is usually shown before tax and is also called 'Loss From Continuing Ordinary Activities'. / Убыток за относимый период времени, возникший вследствие операций лица или группы в течение данного периода .

OPERATING PROFIT = ПРИБЫЛЬ ОТ ОСНОВНОЙ ДЕЯТЕЛЬНОСТИ (или ПРИБЫЛЬ ОТ ОПЕРАЦИОННОЙ ДЕЯТЕЛЬНОСТИ) – Operating Profit is a business management figure showing the profit from a company's operating business. Operating profit usually designates earnings before the result of financial operations, extraordinary profit and taxes. Similar to EBIT, which stands for earnings before interest and taxes. In the United Kingdom, earnings from normal business transactions. It does not include interest on loans or return on other investments. Operating Profit is the profit for the relevant period resulting from the operations of the entity or group during the period of a kind carried on regularly to achieve the objectives of the entity or group. It is usually shown before tax and is also called 'Profit From Continuing Ordinary Activities'. A measure of a company's earning power from ongoing operations, equal to earnings before deduction of interest payments and income taxes. Operating Profit is calculated by subtracting from Sales the Cost of Goods Sold, Distribution and Administration and Other Costs. Since it does not include interest charges (which are influenced by the mix of funding between stockholders and bankers) it provides a measure of the trading success of the core business. It is synonymous with Net Operating Profit, Operating Income and Net Operating Income. The operating position of an organization after all trading expenses have been subtracted from sales revenue. In accounting, revenues from sales less the cost of sales. See also Earnings Before Interest And Taxes, and Operating Income. Also known as Net Operating Income in the United States.

OPERATING PROFIT/EMPLOYEE = ПРИБЫЛЬ ОТ ОСНОВНОЙ ДЕЯТЕЛЬНОСТИ НА РАБОТНИКА (или ПРИБЫЛЬ ОТ ОПЕРАЦИОННОЙ ДЕЯТЕЛЬНОСТИ/РАБОТНИК) – Operating Profit/Employee is the operating profit divided by the number of employees. It provides a measure of the effectiveness of the company's human resources.

OPERATING PROFIT/SALES (%) = ПРИБЫЛЬ ОТ ОСНОВНОЙ ДЕЯТЕЛЬНОСТИ К ПРОДАЖАМ (%) (или ПРИБЫЛЬ ОТ ОПЕРАЦИОННОЙ ДЕЯТЕЛЬНОСТИ/ПРОДАЖИ (%)) – Operating Profit/Sales (%) is the operating profit expressed as a percentage of the value of sales. Therefore it measures how efficient the company is at gaining sales. It normally ranges from 3% to 20% depending on the industry, degrees of competition and risk, the efficiency of the business and the value added.

OPERATING PROFIT/TOTAL ASSETS = ПРИБЫЛЬ ОТ ОСНОВНОЙ ДЕЯТЕЛЬНОСТИ К ИТОГОВЫМ АКТИВАМ (%) (или ПРИБЫЛЬ ОТ ОПЕРАЦИОННОЙ ДЕЯТЕЛЬНОСТИ/ИТОГОВЫЕ АКТИВЫ) – Operating Profit/Total Assets is the operating profit expressed as a percentage of the total assets. Thus it measures the profitability of the business from the viewpoint of managerial efficiency. It normally ranges between 9% and 17% depending on the industry, degrees of competition and risk, and the efficiency of the business.

OPERATING RATIO = ОПЕРАЦИОННОЕ СООТНОШЕНИЕ (или КОЭФФИЦИЕНТ ЭКСПЛУАТАЦИИ, или КОЭФФИЦИЕНТ ИСПОЛЬЗОВАНИЯ) – Operating Ratio is the relation of operating expenses to gross receipts. A comparison of a carrier's operating expense with its net sales. The most general measure of operating efficiency. A measure of operating efficiency defined as Operating Expenses divided by the Operating Revenues x 100.

OPERATING RESERVE MARGIN = ЗАПАС ЭКСПЛУАТАЦИОННОГО РЕЗЕРВА (или ЗАПАС ОПЕРАТИВНОГО РЕЗЕРВА) – Operating Reserve Margin is the amount of unused available capability that can be applied to the system within ten minutes at peakload for a utility system, expressed as a percentage of total capability. / Количество неиспользуемых пригодных к эксплуатации мощностей, которые могут быть подключены к энергетической системе в течение десяти минут при возникновении пиковой нагрузки; выражается в процентах от совокупного производственного потенциала.

OPERATING REVENUES = ОПЕРАЦИОННАЯ ВЫРУЧКА – Operating Revenue:- income derived from sources related to a company's everyday business operations. For example, in the case of a retail business, inventory sales generate operating revenue, whereas the sale of a warehouse does not. Instead, the latter sale is considered to be an unexpected, or 'one-time', event. Also referred to as 'Regular Revenue'. By examining a company's operating, or 'regular', revenue an investor can often gain meaningful insights into the health of a business, especially since fading companies often sell underperforming stores and/or assets, making the income statement look more attractive than it might otherwise be. Operating revenue is not the same as operating profit, which is the more commonly used metric in financial statement analysis. Premiums earned plus net investment income plus other revenues. Operating Revenue is the revenue a company receives in the course of its normal operations. Examples include sales and commissions, as well as other things that may vary according to the time of business. Importantly, operating revenue on a balance sheet reflects only ordinary revenue rather than unexpected, one-time income. One subtracts the operating expense from operating revenue to determine the operating profit. Operating Revenue is a revenue from any regular source. Revenue from sales is adjusted for discounts and returns when calculating operating revenue. Compare Other Revenue. Operating Revenue is any type of income that is generated as a result of the day to day operations of a business. Revenue of this type usually includes all income that is derived from sales efforts, or the lease of assets owned by the business. The goal of any business is to establish a steady flow of operating revenue and thus ensure that the business operation is able to continue functioning at a profit. In order to calculate operating revenue, it is necessary to determine what constitutes the normal business operations of the company. This often involves direct sales to steady customers, as well as any rental or leasing activity that is associated with properties or equipment that is owned by the business. All these forms of revenue are then adjusted to allow for any discounts or returns that take place during the time frame that is under consideration. After making those adjustments, it is possible to determine the net operating revenue for the period, and compare that figure to the cost of operations. Assuming that the revenue exceeds the costs, the company is operating at a profit and has an excellent chance of continuing to remain a viable operation. Businesses actively look for ways to boost their operating revenue. This may come in the form of offering ancillary products that are intended to work with or otherwise support other products offered, or to actively cultivate a presence with a broader range of consumers. The idea is often to make the most efficient use of production efforts, so that the highest volume of products is produced using the same amount of resource. In the event that more products can be sold, this will in turn increase gross sales and have a positive effect on the amount of net sales for any given period. Some companies do experience situations where the operating revenue for a given period does not exceed operating costs. This is particularly true in industries where consumer demand is highly affected by seasonal factors. When this is the case, businesses seek to generate high volumes of operating revenue during the times of year when demand is high, and utilize those proceeds to continue operation during off-season periods. For companies that are not affected by seasonal changes in consumer demand, undergoing a period where the operating revenue does not cover operational expenses can be a strong indicator of impending financial issues that could undermine the entire operation. In this scenario, steps should be taken to isolate the causes for the disparity, and correct them as soon as possible. Operating Revenue:- net sales plus other regular income sources related to the normal business operations of the entity, e.g., lease income if a major activity. / Заработанные премии плюс чистый доход от инвестиций плюс прочая выручка.

OPERATING SEGMENTS = ОПЕРАЦИОННЫЕ СЕГМЕНТЫ – Current version of the International Financial Reporting Standards (IFRS), IFRS 8 was issued in November 2006 and is effective for annual financial statements for periods beginning on or after 2009-January-01. It replaces IAS 14 (short for the International Accounting Standard No. 14) Segment Reporting. Once IFRS 8 is effective, segment reporting under IFRSs and US Generally Accepted Accounting Principles will be converged except for some minor

differences. IFRS 8 requires an entity to report financial and descriptive information about its reportable segments, which are operating segments or aggregations of operating segments that meet specified criteria. Operating segments are components of an entity about which separate financial information is available that is evaluated regularly by the chief operating decision maker in deciding how to allocate resources and in assessing performance. Upon adoption of IFRS 8, the identification of an entity's segments may or may not change. IAS 14 required an entity to identify two sets of segments (business and geographical), using a risks and rewards approach, with the entity's 'system of internal financial reporting to key management personnel' serving only as the starting point for the identification of such segments. One set of segments was regarded as primary and the other as secondary. If under IAS 14 an entity identified its primary segments on the basis of the reports provided to the person whom IFRS 8 regards as the chief operating decision maker, those might become the 'operating segments' for the purposes of IFRS 8. IFRS 8 states that a component of an entity that sells primarily or exclusively to other operating segments of the entity will meet the definition of an operating segment if the entity is managed in that manner. IAS 14 limited reportable segments to those that earn a majority of their revenue from sales to external parties and did not require the different stages of a vertically integrated entity to be identified as separate segments. The new Standard requires the amount reported for each segment item to be the measure reported to the chief operating decision maker for the purposes of allocating resources to that segment and assessing its performance. In contrast to IAS 14, IFRS 8 does not define segment revenue, segment expense, segment result, segment assets and segment liabilities, nor does it require segment information to be prepared in conformity with the accounting policies adopted for the entity's financial statements. As a consequence, entities will have more discretion in determining what is included in segment profit or loss under IFRS 8, limited only by their internal reporting practices. Under IFRS 8, additional entity-wide disclosures are prescribed that are required even when an entity has only one reportable segment. These include information about each product and service or groups of products and services. Analyses of revenues and certain non-current assets by geographical area are required – with an expanded requirement to disclose revenues/assets by individual foreign country (if material), irrespective of the identification of operating segments. IFRS 8 also introduces a requirement to disclose information about transactions with major customers. If revenues from transactions with a single external customer amount to 10 per cent or more of the entity's revenues, the total amount of revenue from each such customer and the segment or segments in which those revenues are reported must be disclosed. See also Segment Reporting. The International Accounting Standards Board issued IFRS 8, 'Operating Segments' in November 2006. The standard replaces IAS 14 (short for International Accounting Standard No. 14), 'Segment reporting'. It applies to annual reporting periods beginning on or after 2009-January-01. Early adoption is permitted. The key implementation issues are as follows:- (i) The IASB did not intend to change the range of entities required to present segment information, but we believe IFRS 8 has a wider scope than IAS 14. It applies to entities whose equity or debt securities are publicly traded or that issue, or are in the process of issuing, any class of instrument in a public market. The scope also includes entities that file financial statements with a regulatory organisation for purpose of issuing any instruments in a public market. We believe this means that some entities whose equity and debt securities are not traded publicly and were not within the scope of IAS 14 will have to provide segment disclosures. (ii) The standard introduces a 'management approach' to identifying and measuring the financial performance of an entity's operating segments. Reported segment information will be based on the information used internally by management. This means that:- (a) the way entities identify segments and measure and present segment information could change; (b) there will be more diversity in reported segment information; (c) segment information may not be measured in accordance with IFRS – entities are required to reconcile segment financial information to the consolidated financial statements; and (d) entities will no longer need to prepare two sets of information for internal and external reporting. (iii) Reportable segments are no longer limited to those that earn a majority of revenue from sales to external parties, so entities may now be required to report the different stages of vertically integrated operations as separate segments. IFRS 8 applies to entities that prepare financial statements, and:- (i) whose equity or debt securities are traded in a public market, or (ii) that file, or are in the process of filing, financial statements with a securities commission or other regulatory organisation for the purposes of issuing any class of instruments in a public market. IFRS 8 applies to annual reporting periods beginning on or after 2009-January-01. It may be early adopted, as long as that fact is disclosed in the notes to the financial statements. IFRS 8 requires disclosures that enable users to evaluate the nature and financial effects of the business activities in which it engages and the economic environment in which it operates. An operating segment is a component of an entity:- (i) that engages in business activities from which it may earn revenues and incur expenses; (ii) whose operating results are regularly reviewed by the entity's chief operating decision maker (CODM) to make decisions about resources to be allocated to the segment and assess its performance; and (iii) for which discrete financial information is available. / МСБУ 14 (сокращение для Международного Стандарта Бухгалтерского Учёта № 14) – .

OPERATING STATEMENT = ОПЕРАЦИОННЫЙ ОТЧЁТ (или ОТЧЁТ ОБ ОПЕРАЦИЯХ) – Operating Statement often used as the equivalent of the income statement. Technically, the operating statement reports only earnings from the operations of a firm, and excludes other types of income and expenses (such as investment income and interest expense). Also known as Flow Of Funds Statement. See also Income Statement.

OPERATING SURPLUS = ОПЕРАЦИОННЫЙ ПРОФИЦИТ (или ОПЕРАЦИОННЫЙ ИЗЛИШЕК) – Operating Surplus:- the balance on the generation of income account. Households also have a mixed income balance. It may be seen as the surplus arising from the production of goods and services before taking into account flows of property income.

OPERATIONAL GEARING = ОПЕРАЦИОННОЕ ПЛЕЧО – Operational Gearing:- companies with high fixed costs and low marginal costs are said to have high operational gearing. A small change in sales gives a big change in profits for such companies.

OPERATIONAL RISK = ОПЕРАЦИОННЫЙ РИСК – Operational Risk is the risk of direct or indirect loss resulting from inadequate or failed internal procedures, people, and systems, or from external events. For the purposes of this paper, we adopt this definition of operational risk put forth by the Bank for International Settlements. However, while reputational risk is not considered part of operational risk for Basel capital purposes, the importance of reputational risk in foreign exchange is reflected in the best practices outlined in this document. Operational risk for foreign exchange in particular involves problems with processing, product pricing, and valuation. These problems can result from a variety of causes, including natural disasters, which can cause the loss of a primary trading site, or a change in the financial details of the trade or settlement instructions on a FX transaction. Operational risk may also emanate from poor planning and procedures, inadequate systems, failure to properly supervise staff, defective controls, fraud, and human error. Failure to adequately manage operational risk, in turn, can decrease a firm's profitability. Incorrect settlement of FX transactions, for example, can have direct costs in improper payments and receipts. In addition, trade processing and settlement errors can lead to indirect costs, such as compensation payments to counterparts for failed settlements or the development of large losses in a firm's portfolio as a result of managing the wrong position. Furthermore, investigating problems and negotiating a resolution with a counterparty may carry additional costs. Failure to manage operational risk may also harm a firm's reputation and contribute to a loss of business. Operational risk has another distinctive quality. Unlike credit and market risk, operational risk is very difficult to quantify. Clearly, an institution can measure some of the losses associated with operational errors or losses that result from the failure of the operational process to catch errors made by sales and trading areas. Determining expected losses, however, given the uncertainty

surrounding those losses, is much more complicated for operational risks than for other risk categories. Operational Risk is the risk that deficiencies in information systems or internal controls could result in unexpected losses. Operational Risk is defined as the risk of a loss as the result of weaknesses or errors in processes, controls or projects through technology, personnel, organization or external factors. The risk of financial losses, damage to the bank's reputation, or both, caused by people, failed or inadequate processes or systems, or external events. Operational Risk is defined by the bank as the risk of financial loss, or damage to the bank's reputation, or both, resulting from one or more of the following:- (i) human error or fraud, e.g., insufficient personnel, lack of requisite knowledge, inadequate training, inadequate supervision, loss of key personnel, inadequate succession planning or lack of integrity or ethical standards; (ii) failed or inadequate processes, e.g., an internal policy or process is inadequate, poorly designed or unsuitable, or is not properly documented, understood, implemented, followed or enforced; (iii) failed or inadequate systems, e.g., hardware, software applications, operating systems or infrastructure necessary to support the activities of the bank are poorly designed, unsuitable, inadequate, unavailable, fail, or do not operate as intended; and (iv) external events, i.e. the occurrence of an event having an adverse impact on the bank but outside its control. The bank manages operational risk through internal controls, including policies, procedures, practices and organizational structures, designed to reduce the likelihood of an operational risk event occurring or that mitigate the adverse consequences of such an event if it does occur. The bank allocates economic capital for operational risk on the basis of a statistical model that incorporates the bank's experience of operational losses as well as external loss data. Operational Risk is the risk of loss due to fraud or mismanagement within the fund management organisation itself. / Операционный Риск – риск возникновения убытков в результате несоответствия характеру и масштабам деятельности кредитной организации и (или) требованиям действующего законодательства внутренних порядков и процедур проведения банковских операций и других сделок, их нарушения служащими кредитной организации и (или) иными лицами (вследствие некомпетентности, непреднамеренных или умышленных действий или бездействия), несоразмерности (недостаточности) функциональных возможностей (характеристик) применяемых кредитной организацией информационных, технологических и других систем и (или) их отказов (нарушений функционирования), а также в результате воздействия внешних событий.

OPERATION EXODUS = ОПЕРАЦИЯ ИСХОД – Operation Exodus is a US Customs Service export enforcement program that was developed in 1981 to help stem the flow of the illegal export of US-sourced arms technology to the Soviet bloc and other prohibited destinations. / Операция Исход – название программы принудительного характера в отношении вывоза (или экспорта), разработанная Таможенной Службой США в 1981 с целью помощи в поимке незаконного вывоза (или экспорта) военных технологий Американского происхождения в Советский Союз и его союзникам, а также в другие запрещённые пункты назначения.

OPERATIONS STEERING COMMITTEE = КОМИТЕТ ПО НАПРАВЛЕНИЮ ОПЕРАЦИЙ – The Operations Steering Committee (OSC) coordinates, recommends and reviews changes to certain operational activities of the Generic Names Supporting Organization (GNSO) and its constituencies with a view to efficient outcomes. These operational activity areas cover GNSO operations, Stakeholder Group and Constituency operations, and communications with GNSO and between GNSO and other the Internet Corporation for Assigned Names and Numbers (ICANN) structures. / Комитет по Направлению Операций (КНО) отвечает за координацию, рекомендацию и анализ изменений определённых видов деятельности ОПРИ и её постоянных групп с точки зрения эффективности результатов. К этим сферам деятельности относятся операции ОПРИ, деятельность групп заинтересованных лиц и постоянных групп, их связь с ОПРИ, а также связь между ОПРИ и прочими структурами Корпорации Интернета по Распределению Имён и Номеров (КИРИН).

OPERATOR = ОПЕРАТОР – (1) Operator means a person who contracts to provide services that comprise in whole or part the nominee and custody service.

(2) Operator is the company or individual responsible for managing an exploration, development or production operation. / Компания или физическое лицо, ответственное за управление исследованием, развитием или осуществлением производственного цикла.

OPERON = ОПЕРОН – Operon is a cluster of functionally related genes regulated and transcribed as a unit. / Под Опероном понимается участок генетического материала, состоящий из 1, 2 и более сцепленных структурных генов, которые кодируют белки (ферменты), осуществляющие последовательные этапы биосинтеза какого-либо метаболита. В оперон эукариот входит, как правило, 1 структурный ген. Оперон содержит регуляторные элементы.

OPF = OFFICIAL PERSONNEL FILE

OPIC = OVERSEAS PRIVATE INVESTMENT CORPORATION

OPINION = ПОЯСНИТЕЛЬНАЯ ЗАПИСКА (или ЗАКЛЮЧЕНИЕ, или МНЕНИЕ, или СУЖДЕНИЕ) – Opinion is a statement by an actuary that, in the actuary's professional judgement, one or more aspects of a financial statement, such as a liability (or asset), have been valued, assessed, or analyzed in accordance with recognized actuarial practice. An opinion will be relied upon by the actuary's principal or other intended user and may involve estimates or financial information other than a liability (or asset).

OPL = OBLIGATION PEAK LOAD

OPL = OVERALL PREMIUM LIMIT

OPLA = OFFICE OF PATENT LEGAL ADMINISTRATION

OPM = OFFICE OF PERSONNEL MANAGEMENT

OPM = OPTIONS PRICING MODEL

OPM = OTHER PEOPLE'S MONEY

OPPONENT–COLOR SCALES = ШКАЛЫ ЦВЕТОВ–ОППОНЕНТОВ – Opponent-Color Scales are the scales that denote one color by positive scale values, the neutral axis by zero value, and an approximately complementary color by negative scale values. Common examples include scales that are positive in the red direction and negative in the green direction (CIE a*, Hunter a) and scales that are positive in the yellow direction and negative in the blue direction (CIE b*, Hunter b). Commission Internationale de l'Eclairage (CIE) is the French title of the International Commission on Illumination. / Комисьо Этэрнасьёналь дё л'Эклераж (Сэ.И.Е.; Commission Internationale de l'Eclairage (CIE)).

OPPORTUNITY COST = АЛЬТЕРНАТИВНЫЙ РАСХОД (или ВМЕНЁННАЯ ЗАТРАТА) – Opportunity Cost, that is, the highest valued alternative that must be sacrificed to attain something or otherwise satisfy a want. For example, the opportunity cost of a spur-of-the-moment decision to go to the movies Tuesday afternoon instead of going in to work is not just the six Dollars for the ticket plus the gasoline and wear and tear on the car to get there. It also includes (at least) the four hours' wages not earned, diminished

prospects for being promoted at work, and possibly such additional consequences as future hostility from co-workers who had to take up the slack, unpleasant feelings of guilt or shame, and so on. In a more extreme vein, the opportunity cost of committing suicide is not simply the money outlay for the necessary equipment, but rather the value of the total range of future satisfactions one might otherwise be able to achieve. Opportunity Cost is the economic cost of using a resource for a specific activity is equal to the income foregone by not using it for an alternative activity. For example, the opportunity cost of using an acre of land in your farming operation is the income foregone by not renting it to a neighboring farmer.

OPPOSITE = СУПРОТИВНОЕ – Opposite:- two leaves per node, facing opposite sides of the stem. Opposite:- parts of a plant, such as leaves, arranged in pairs on opposite sides of the stem. See also Leaf. Leaves may be arranged on the stem in a variety of ways. The place on the stem from where the leaves grow is called a Node and the part between the nodes is the Internode. If only one leaf arises at a node the leaves are said to be Alternate, if there are two leaves they are Opposite and if there are more than two they are Whorled. / Супротивные:- органы растения, такие как листья, расположенные парами на противоположных сторонах стебля. Смотрите также Лист (Leaf). Листорасположение – расположение листьев на стебле. По мере роста стебля, листья располагаются на нём в определённом порядке, который обусловливает оптимальный доступ к свету. В сущности, листья появляются на стебле по спирали, по либо против часовой стрелки, под определённым углом расхождения. Супротивным называется расположение листьев парами, друг против друга. Встречается у таких деревьев как Клён либо Сирень и так далее. Супротивное – листья располагаются по два на каждом узле и обычно перекрёстно-попарно, то есть каждый последующий узел на стебле поворачивается под углом в 90°; либо двумя рядами, если не поворачивается, но имеется несколько узлов. Супротивное листорасположение у Клёна, Бузины, Калины. Листорасположение у примитивных форм – супротивное, у более продвинутых – очередное, что связано с редукцией одного листа в каждой паре супротивных листьев.

OPPOSITION PROCEEDING = ПРОИЗВОДСТВО ПО ВОЗРАЖЕНИЯМ (или ПРОИЗВОДСТВО ПО ПРОТЕСТАМ) – Opposition Proceeding is a proceeding before the Trademark Trial and Appeal Board in which the plaintiff seeks to prevent the issuance of a registration of a mark. An opposition is similar to a proceeding in a federal court, but is held before the Trademark Trial and Appeal Board, a USPTO (short for the United States Patent and Trademark Office) administrative tribunal. Any person who believes that he or she will be damaged by the registration of a mark may file an opposition, but the opposition may only be filed in response to the publication of the mark in the Official Gazette.

OPR = OFFICE OF PUBLIC RECORDS

OPR = OUTWARD PROCESSING RELIEF

OPTICAL BRIGHTENER = ОПТИЧЕСКИЙ БЛЕСКООБРАЗОВАТЕЛЬ (или ОПТИЧЕСКИЙ ОТБЕЛИВАТЕЛЬ) – Optical Brightener is a fluorescent dye used to make white textiles appear brighter; often called just ‘Optical’ in dye industry; also called Fluorescent Brighteners or Fluorescent Brightening Agents (FBA). Optical brighteners are colorless dyes that work by emitting visible light, typically in bluish hue, when exposed to invisible ultraviolet light. This bluish tint helps mask the residual yellowish cast of bleached cellulosic fibers and wool, making the fabric appear a more neutral white. Most fully-bleached commercial white fabrics have been treated with these brighteners. Fabrics and garments that are truly prepared for dyeing should not contain brighteners. Optical brighteners can interfere with some dyes by competing for the ‘dye sites’ on the fibers. It is almost impossible to remove brighteners once they are applied. Most commercial laundry detergents contain optical brighteners, which is primarily the reason that they are not the best choice for scouring fabric prior to dyeing. When detergent containing optical brighteners is used to wash brightener-free fabric that has been dyed to pale shades, noticeable shade change may occur. Optical Brightener is:- (1) a colorless compound that, when applied to fabric, absorbs the ultraviolet radiation in light but emits radiation in the visible spectrum. (2) Fluorescent materials added to polymer in manufactured fiber production that emit light in the visible spectrum, usually with a blue cast. / Оптический Блескообразователь или Оптический Отбеливатель (Optical Brightener).

OPTICAL PROPERTIES = ОПТИЧЕСКИЕ СВОЙСТВА – Optical Properties is a general term used to refer to the relations of yarn or fibers with light. It includes such parameters as birefringence, refractive index, reflectance, optical density, etc.

OPTIMAL INFLATION RATE = ОПТИМАЛЬНАЯ СТАВКА ИНФЛЯЦИИ – Many central banks target specific rates of inflation; ideally, according to Roberto M. Billi and George A. Kahn (in a recent article in the Federal Reserve Bank of Kansas City’s Economic Review), the goal is to attain the level of inflation that maximizes the public’s economic well-being. Inflation can be harmful to the economy because it generally hurts creditors, discourages saving, and increases tax burdens. It can also distort prices because most companies change prices infrequently. Nevertheless, there are reasons to keep inflation above zero. First, maintaining some inflation decreases the possibility of deflation, which is generally considered by policymakers to be a more serious problem than inflation because it increases the real value of the money owed by debtors. Second, low inflation leads to low interest rates. When nominal interest rates reach zero – a phenomenon known as hitting the zero lower bound – conventional monetary policy no longer works. These two reasons constitute policymakers’ primary rationale for targeting an inflation rate above zero. A third possible reason to aim for a positive inflation rate is that Billi and Kahn, among other economists, believe that most measures of inflation tend to overstate it. Economists David Reifschneider and John C. Williams have found in econometric analyses that when zero percent inflation is targeted, the Federal funds rate is expected to reach the zero bound 14 percent of the time; when the inflation target is 4 percent, the funds rate is expected to hit zero less than 1 percent of the time. Billi has simulated a New-Keynesian model in order to take the next step and estimate the optimal inflation rate. The model attempts to keep inflation as low as possible while still hitting the zero bound infrequently and remaining there for only a short period of time. If his model is completely accurate and its underlying assumptions are correct, the optimal inflation rate is 0.7 percent per year. However, one must take ‘model uncertainty’ into account, because greater uncertainty regarding the model leads to greater uncertainty about the economy’s response to shocks. Bearing in mind varying degrees of model certainty, Billi estimates an optimal inflation rate between 0.7 percent (no model uncertainty) and 1.4 percent (extreme model uncertainty). Under this policy, the Federal funds rate is expected to reach the zero bound between 3.5 percent and 7.5 percent of the time and stay there for about two consecutive quarters. / Робэрто Эм. Билли (Roberto M. Billi) и Дьжодьж Эй. Кан (George A. Kahn). Билли (Billi) и Кан (Kahn). Экономисты Дэйвид Райфшнайда (David Reifschneider) и Дьжон Си. Вилъйэмз (John C. Williams). Под Оптимальным, от Латинского слова Optimus, означающее Наилучший, понимается наилучший, наиболее соответствующий определённым условиям и задачам.

OPTIMIZE = ОПТИМИЗАЦИЯ – Optimize:- the process of finding the indicators and methods best used to predict price in historical data. A system that is too highly optimized using historical data generally performs poorly at predicting future prices. Optimize:- a technique used by technical analysts to decide on which measures work best in their specific markets. For instance, the 40-day moving average might generate good signals for oil and commodity markets, but not foreign exchange markets. By using optimization software, traders hope to work out which measures work well for their specific instruments. / Методика, используемая специалистами по техническому анализу для определения того, какие меры являются наиболее эффективными на обслуживаемых ими рынках. Например, скользящая средняя величина, рассчитываемая за 40 суток, может оказаться информативным для рынков нефти и

прочих товаров сырьевой группы, но не для валютных рынков. Используя оптимизированное программное обеспечение, торговцы стараются определить меры, наиболее эффективные в отношении рыночных инструментов, с которыми они работают. Оптимизация:- (i) процесс выбора наилучшего варианта из возможных; или (ii) процесс приведения системы в наилучшее (оптимальное) состояние.

OPTIMUM = ОПТИМАЛЬНЫЙ – Optimum is the very 'best' possible situation or state of affairs according to some explicit objective that provides a precise standard of evaluation. For example, if a business firm's objective is to make the biggest profits possible (as economists generally assume it is), then the firm's optimal level of output at any given level of sales prices and production costs is that at which its profits will be the highest possible. Most of economics is concerned with analyzing how individuals or groups of people or even whole societies may achieve optimal use of available resources, and it is normally assumed that the maximum satisfaction of people's individual wants or desires is the objective of the economy that provides the relevant standard of evaluation. Social critics, moral philosophers, religious thinkers, and political power-seekers in their various ways have often disputed the validity of this individualistic standard of evaluation, of course. / Под Оптимальным, от Латинского слова Optimus, означающее Наилучший, понимается наилучший, наиболее соответствующий определённым условиям и задачам.

OPTIMUM PHOTOPERIOD = ОПТИМАЛЬНЫЙ ФОТОПЕРИОД – Optimum Photoperiod is the day length at which growth duration is at a minimum. / Под Оптимальным, от Латинского слова Optimus, означающее Наилучший, понимается наилучший, наиболее соответствующий определённым условиям и задачам.

OPTIMUM SAMPLE PORTION = ОПТИМАЛЬНАЯ МАССА ПРОБЫ – The Optimum Sample Portion should be analyzed for those factors that would determine the grade when concentrations appear to be within the range of statutory grade specifications, if it appears that the concentration could result in downgrading of the grain. If the concentration of a factor is only marginally in excess or less than a tolerance, the inspector should exercise judgment and pick a larger sample portion.

OPTIMUM TILLAGE = ОПТИМАЛЬНАЯ ОБРАБОТКА (ПОЧВЫ) – Optimum Tillage is the combination of tillage operations which maximizes growth of crop plants. / Под Оптимальным, от Латинского слова Optimus, означающее Наилучший, понимается наилучший, наиболее соответствующий определённым условиям и задачам. Под Боронованием (Harrowing) понимается рыхление поверхностного слоя почвы боронами и вращающимися мотыгами. Предохраняет почву от высыхания, выравнивает её поверхность, разрушает почвенную корку, уничтожает сорняки.

OPTIMUM TWIST = ОПТИМАЛЬНАЯ КРУТКА – Optimum Twist:- in spun yarns, a term to describe the amount of twist that gives the maximum breaking strength or the maximum bulk at strength levels acceptable for weaving or knitting.

OPTING OUT = ВЫБЫВАНИЕ (или ВЫБОРКА) – (1) Opting Out:- to the knowledge of the company, the parties have undertaken in the agreement not to attempt to take over the company in any direct or indirect way and to each remain a minority shareholder until the termination of the agreement. In this respect, to the knowledge of the Company, the shareholders' agreement furthermore provides that the parties will not vote for an amendment of the articles of incorporation (Articles) to the effect of ruling out the obligation of an acquirer of shares exceeding the threshold of 33.33% of the voting rights to proceed with a public purchase offer (opting-out) or of increasing the threshold triggering the obligation to proceed with a public purchase offer from 33.33% up to 49% (opting-up) under article 22 para. 2, 3 and article 32 para. 1 of the Swiss Federal Act on Stock Exchanges and Securities Trading (SESTA). To choose not to participate in something. Also known as Public Bid, and Public Offer. SESTA allows a Swiss target company to opt out of the mandatory offer rules by adopting an article to this effect in its articles of incorporation. A selective opting-out, which relates to specific persons only, is impermissible, and the Takeover Board has also refused to consent to deal-specific opt-outs and proposed a 5 year cooling period for such opt-out to take full effect. Furthermore, target companies may opt up the threshold triggering a mandatory offer requirement in their articles of incorporation from 33-1/3 to 49 per cent. See also Opting Up.

(2) Opting Out:- the decision by an employee to leave or not join an occupational pension scheme provided by his/her employer.

OPTING UP = ВЫБЫВАНИЕ (или ВЫБОРКА) – Opting Up:- xxxxx. Also known as Public Bid, and Public Offer. See also Opting Out.

OPTION = ОПЦИОН – Option:- a commodity option is a unilateral contract which gives the buyer the right to buy or sell a specified quantity of a commodity at a specific price within a specified period of time, regardless of the market price of that commodity. See also Call Option, and Put Option. An Option is a contractually agreed right that the buyer has the right, and the seller (option writer) the oblication, to buy or to sell the underlying at the strike price within a certain period (option period) until the option's expiry date. The buyer pays the option writer a certain amount of money for this right, the option premium. Option is a contract that gives the purchaser the right, but not the obligation, to buy or sell an underlying at a certain price (the exercise, or strike price) on or before an agreed date (the exercise period). For this right, the purchaser pays a premium to the seller. The seller (writer) of an option has a duty to buy or sell at the strike price, should the purchaser exercise his right. With European-style options, purchasers may take delivery of the underlying only at the end of the option's life. American-style options may be exercised, for immediate delivery, at any time over the life of the option. Holders of semi-American-style or Bermudan options may be exercised on specified dates – typically on a monthly or quarterly basis. Options can be bought on commodities, stocks, stock indexes, interest rates, bonds, currencies, etc. The trading terminology, though, may change according to the product. In most cases, the right to buy the underlying is known as a Call, and the right to sell, a put. Options are traded on formal exchanges and in over-the-counter (OTC) markets. The exchanges, such as the Chicago Board Options Exchange, the London International Financial Futures and Options Exchange and the Philadelphia Stock Exchange, provide primarily standardized options; the OTC markets are able to provide tailored products to fit specific requirements. The choice between OTC and exchange-traded options will depend on the degree of tailoring required, the relative liquidity of both markets (this varies greatly according to the underlying) and credit concerns. Such credit concerns increase with the option's maturity, since the likelihood that a counterparty will default increases with the length of time that passes between the option being bought and being exercised. Several derivatives exchanges have tried to bridge the gap between OTC and exchange-traded options by introducing flexible options that can be customized by the purchaser. Pricing models for simple or vanilla options have five major inputs: the option's exercise or strike price; the time to expiration; the price of the underlying instrument; the risk-free interest rate on the underlying instrument, and the volatility of the underlying instrument (See also Historical Volatility, and Implied Volatility). European-style options are usually priced off a closed-form analytical model first published by Fischer Black and Myron Samuel Scholes in 1973, which has subsequently been modified to fit different underlyings (see also Black-Scholes Model). At maturity, an option's value will depend on the value of the right to buy or sell a product. If an option is purchased giving the right to buy gold at USD375 an ounce and at expiration the price is USD400, the option is worth USD25. The extent to which an option is in-the-money (how far the strike price is below/above the current forward market price) is called its intrinsic value. Where the strike price is less favorable than the market price, the option is said to be out-of-the-money, and where the two prices are the same it is at-the-money. At any time before maturity, an option's price will be a combination of its intrinsic value (which is always either greater than, or equal to, zero) and its time value. The latter includes the cost

of carry and the probability that the price of the underlying will move into or remain in the money. Options can broadly be used in two ways – for speculation, or for insurance. Their usefulness, both from a buyer's and a seller's point of view, derives from their pay-outs. In contrast to other types of hedge, options provide insurance against unfavorable moves in a product's price and the opportunity to take advantage of favorable moves. Forwards and futures, for example, require buyers and sellers to lock into one rate. In return for assuming this risk, sellers of options receive a premium, effectively a risk-taking fee. The pay-off of a purchased option means that the price risk of an option is limited to its premium – it is not as exposed to adverse movements as a position in the underlying. For speculators selling (writing) options, this often means taking a naked option position and therefore being exposed to adverse movements in the underlying. Hedgers may sell options to garner premium to offset any expected slight downturn in a market. Since option premiums are only a fraction of the cost of the underlying product, it is possible to achieve a much greater exposure to price changes of the underlying compared with a similar investment directly in the product – this is called Leverage. Option contracts confer either the right or the obligation, depending upon whether the reporting institution is the purchaser or the writer, respectively, to buy or sell a financial instrument or commodity at a specified price up to a specified future date. Option is a contract giving the owner the right to buy or sell a stock at a fixed price before a certain expiration date. Option contracts are typically called Calls, Puts or LEAPS (short for Long-Term Equity Anticipation Securities). An options contract allows you to control 100 shares of the underlying financial security. Option is a right to buy or sell something at a specified price during a specified time period. Options provide many opportunities to balance risk vs. reward to your liking. Unfortunately, there's only so much you can do with vanilla calls or puts. Here are five strategies to take your trading to the next level. The ability to manage risk vs. reward precisely is one of the reasons traders continue to flock to options. While an understanding of simple calls and puts is enough to get started, adding simple strategies such as spreads, butterflies, condors, straddles and strangles can help you better define risk and even open up trading opportunities you didn't have access to previously. Although it may seem daunting at first to put on these strategies, it's important to remember most are just a combination of calls and puts, says Marty Kearney, senior instructor at CBOE® Options Institute. 'These names came about so that people who were phoning in orders to trading desks could convey very quickly what they wanted to do. These are all pretty basic strategies, just taking things up a notch'. A call gives the buyer the right, but not the obligation, to buy the underlying asset at the purchased strike price. A put gives the buyer the right, but not the obligation to sell the underlying asset at the purchased strike price. There are 5 Basic Options Strategies:- (i) Vertical Spreads; (ii) Butterflies; (iii) Condor; (iv) Straddle; and (v) Strangle. The right (but not the obligation), in return for a premium, to purchase or sell futures for a specified month at an agreed price, generally at any time between when the option is taken and the expiry date. An Option is an agreement that gives the buyer, who pays a fee (premium), the right – but not the obligation – to buy or sell a specified amount of an underlying asset at an agreed upon price (strike or exercise price) on or until the expiration of the contract (expiry). A call option is an option to buy, and a put option is an option to sell. Options differ from swaps and forwards. In a forward or swap, the parties lock in a price (e.g., a forward price or a fixed swap rate) and are subject to symmetric and offsetting payment obligations. In an option, the buyer purchases protection from changes in a price or rate in one direction while retaining the ability to benefit from movement of the price or rate in the other direction. In other words, the option involves asymmetric cash flow obligations. For a buyer of an option, the amount at risk is generally the value (premium) of the option at default. For the seller of an option, there is no credit exposure. Options differ from insurance in that options do not require one party to suffer an actual loss for payment to occur. In addition, the owner of an option need not have an insurable interest – such as ownership in the underlying asset – in the option. Option is a financial instrument which gives the buyer the right to buy or sell an underlying (for example a share) within a certain period of time and at a price determined in advance. A contract or transaction whereby one party grants to another the right, but not the obligation, to buy or to sell the underlying asset at a fixed price by a fixed future date in time in exchange for a one-time premium payment. If the right is not exercised the option expires and the buyer forfeits the money. The option to buy is a call option while the option to sell is a put option. Certain options may be exercised at any time before the expiration date, while others may be exercised only on the specified date. Option is the unilateral contract which gives the buyer the right but not the obligation to buy or sell a futures contract or a specified quantity of a commodity or other instrument at a specific price (strike price) within a specified period of time, regardless of the current market price of the that instrument. The contract price is not dependent on the current market price for the contract item. The buyer is under no obligation to fulfill the contract. The seller of the option has the obligation to sell the asset or futures contract or buy it from the option buyer at the exercise price if the option is exercised. The option is exercised only if and when the option holder so decides. There are two separate and distinct types of options:- Calls and Puts. An Option is the right but not the obligation to buy and sell a pre-determined quantity of an underlying asset at a pre-determined price by or on a defined date. The buyer pays a premium to the seller for this option, by other words each option has a price paid by the buyer to the seller and determined in the marketplace. There are no margin calls for purchases of options. An option contract has the same standardization of quality, quantity and location as a futures contract. Options are flexible price risk management tool, and options have become an important hedging tool. One of the largest advantages to buyers of commodity futures options is that the buyer can enjoy the price protection afforded by the futures market in the event of unfavorable price moves, while sharing the economic benefits of favorable price changes. Options can be liquidated by an offsetting transaction. Options buyers enjoy limited risk with unlimited profit potential. They can never lose more than the premium they paid. Option is the right (but not the obligation) to buy or sell a particular futures contract at a specific price during the life of the option. Under the terms of an option contract, a buyer has the right to buy or sell a futures (or other) contract, at a specific price within a set period of time. The contract price is not dependent on the current market price for the contract item. The buyer is under no obligation to fulfill the contract. / , например, . Майрон Сэмьюэл Сколз (Myron Samuel Scholes). Мати Кони (Marty Kearney), Старший Инструктор (Senior Instructor) в Институте Опционов СИБО® (CBOE® Options Institute). Покупатель уплачивает продавцу премию за этот опцион, другими словами каждый опцион имеет цену, уплачиваемую покупателем продавцу и определяему на рыночной площадке. При приобретении опционов отсутствуют маржинальные требования (или требования к марже). Опционный контракт имеет точно такую же стандартизацию качества, количества и пунктов поставки что и у фьючерсного контракта. Опционы являются гибким инструментом управления риском изменения цены, и опционы также стали важным инструментом хэдьжирования. Одним из самых крупных преимуществ для покупателей опционов на фьючерсный контракт на сырьё является то, что покупатель может воспользоваться защитой цены, предоставляемой рынком фьючерсов в случае, когда цена движется в неблагоприятном направлении, и при этом разделяя экономические выгоды от её изменений в благоприятном направлении. Опционы могут быть ликвидированы зачётной сделкой. Покупатели опционов обладают ограниченным риском с неограниченным потенциалом прибыли. Они никогда не могут потерять больше, чем премия, которую они заплатили при покупке опциона. В соответствии с порядками опционного контракта покупатель имеет право купить или продать фьючерсный (или иной) контракт по определённой цене в течение установленного периода времени. Контрактная цена не зависит от текущей рыночной цены для контрактного актива. При этом у покупателя отсутствует обязательство исполнять данный контракт. Под Опционом, от Латинского слова Optio, от Optionis, означающее Выбор или Желание или Усмотрение, понимается:- (1) в Гражданском Праве – возможность выбора (обычно должником) способа выполнения альтернативного обязательства, а также предварительное соглашение о заключении договора в будущем (в сроки, обусловленные сторонами). (2) В Авторском Праве Опцион применяется при заключении договоров об издании произведений авторов одного государства в другом. (3) В Международном Праве – выбор лицом гражданства в случаях,

предусмотренных международными договорами, при территориальных изменениях, образовании новых государств или в целях устранения двойного гражданства.

(1) In the case of a share or bond issue, Option is the right of an underwriting bank to increase its original allotment or quota of shares, participation certificates or bonds. / В случае с выпуском акций или облигаций, под Опционом понимается право расписывающего банка увеличивать своё первоначальное размещение или квоту на акции, свидетельства о долевом участии или облигации.

(2) In the case of a warrant issue, Option is the right conferred by the warrant (certificate) to purchase securities, precious metals (e.g., gold) or other assets. / В случае с выдачей варранта, под Опционом понимается право, присуждаемое данным варрантом (сертификатом) на приобретение ценных бумаг, благородных металлов (например, золота) или иных активов.

(3) Short for the non-tradable option contract between a bank and a customer which gives the buyer the right to buy (call option) or sell (put option) a specified number of securities, currency units or commodities at an agreed exercise (strike) price on the exercise day. / Краткое обозначение для неперепродаваемого опционного контракта между банком и заказчиком (клиентом), предоставляющего покупателю право купить (опцион на покупку (call option)) или продать (опцион на продажу (put option)) определённое количество ценных бумаг, валютных единиц или сырья по оговорённой цене исполнения (сходной цене (strike price)) на дату исполнения данного опциона.

OPTIONAL ANALYSIS = ФАКУЛЬТАТИВНЫЙ АНАЛИЗ – Optional Analysis:- where a shipper requests special cleaning of a carlot of grain at a terminal or transfer elevator, and the elevator manager agrees, dockage material will be analysed for the presence of grain. The percentage and grade of any grain contained in the dockage will be reported and elevator stocks will be adjusted on the basis of the analysis. Agreement between the shipper and unload elevator must be conveyed to the Canadian Grain Commission (CGC) in writing prior to the analysis being performed.

OPTIONAL CARGO = ФАКУЛЬТАТИВНЫЙ ГРУЗ – Cargo for which the final destination will be declared during transport. Optional Cargo is a cargo of which the final destination is not known at the moment of booking but will be indicated during the transport.

OPTIONAL CONVERSIONS = ФАКУЛЬТАТИВНЫЕ КОНВЕРСИИ – Optional Conversions are the conversions in which the customer has the option of converting a security into more than one other security, i.e. bonds, stock, warrants. / Конверсии, при которых заказчик имеет опцион или возможность конвертации ценной бумаги более, чем в одну другую ценную бумагу, то есть в облигации, акции, варранты.

OPTIONAL DISCHARGE BILL OF LADING = КОНОСАМЕНТ С (ФАКУЛЬТАТИВНОЙ) РАЗГРУЗКОЙ (или ПО ВЫБОРУ) – Optional Discharge Bill Of Lading is a bill of lading (B/L) covering cargo with more than one discharge point option possibility. / Коносамент, обеспечивающий перевозку груза с возможностью выбора более чем одного пункта разгрузки.

OPTIONAL PORT = ФАКУЛЬТАТИВНЫЙ ПОРТ – Optional Port is a port of which it is not known whether or not it will be called by a vessel during a voyage. Optional Port is a port which may or may not be called by a vessel during a voyage, depending on available cargo volumes.

OPTIONAL REDEMPTION DATE = ФАКУЛЬТАТИВНАЯ ДАТА ПОГАШЕНИЯ (или XX) – Optional Redemption Date:- where the stock/security may not be paid back on a fixed date but where there may be a choice of possible redemption dates. The issuer of the stock (e.g., the British Government in the case of British Government Stocks) will choose the redemption date on which to repay.

OPTION BUYER = ПОКУПАТЕЛЬ ОПЦИОНА – Option Buyer is the person who buys calls, puts, or any combination of calls and puts. A market participant who takes a long futures position or buys an option. Option Buyer or Holder is a person who buys an option. In option trading, a market participant who takes a long futures position or buys an option. Option buyers receive the right, but not the obligation, to assume a futures position. Also known as Holder, Owner, or Taker. / В торговле опционами, участник рынка, который занимает длинную позицию по фьючерсу или покупает опцион. Покупатели опционов получают право, но не обязательство, взять позицию по фьючерсу. Известен также как Держатель (Holder), Владелец (Owner) или Приёмщик (Taker).

OPTION CLASS = КЛАСС ОПЦИОНА (или КАТЕГОРИЯ ОПЦИОНА) – Option Class:- all options of the same type, i.e. all calls or all puts, on the same underlying instrument with the same expiration date. / Все опционы одного и того же типа, то есть все опционы на покупку или все опционы на продажу, по одному и тому же соответствующему инструменту с одной и той же датой прекращения признания.

OPTION CONTRACT = ОПЦИОННЫЙ КОНТРАКТ – Option Contract is a contract that gives the buyer the right, but not the obligation, to buy or sell an underlying asset by (or on) a specific date for a specific price. For this right the purchaser pays a premium.

OPTION EXPIRATION = ПРЕКРАЩЕНИЕ ПРИЗНАНИЯ ОПЦИОНА – Option Expiration:- the final day on which an option may be exercised. / Последний день, когда опцион может быть исполнен.

OPTION GRANTOR = ПРЕДОСТАВИВШИЙ ОПЦИОН – Option Grantor is the person who originates an option contract by promising to perform a certain obligation in return for the price of the option. Also known as Option Writer. / Лицо, которое инициирует опционный контракт, предоставляя обещание исполнить определённое обязательство в обмен на стоимость данного опциона. Известен также как Выписавший Опцион (Option Writer).

OPTION MARGIN = МАРЖА ПО ОПЦИОНУ – In options trading, 'Margin' also refers to the cash or securities required to be deposited by an option writer with his brokerage firm as collateral for the writer's obligation to buy or sell the underlying security, or in the case of cash-settled options to pay the cash settlement amount, in the event that the option gets assigned. Margin requirements for option writers are complicated and not the same for each type of underlying security. They are subject to change and can vary from brokerage firm to brokerage firm. As they have significant impact to the risk/reward profiles of each trade, writers of options (whether they be calls or puts alone or as part of multiple position strategies such as spreads, straddles or strangles) should determine the applicable margin requirements from their brokerage firms and be sure that they are able to meet those requirements in case the market turns against them. A term Option Margin means the amount of money, securities or other property required as security for the performance of options carried in a customer account as provided in the rules of the exchange. Option Margin is the cash or securities an investor must deposit in his account as collateral before writing – or selling – options. Margin requirements are established by the Federal Reserve Board in Regulation T and varies based on the type of option. Option margin requirements are very complex and differ quite a bit from stocks or futures margin requirements. In the case of stocks and futures, margin is used as leverage to increase buying power, whereas option margin is used as collateral to secure a position. Minimum margin requirements for various types of underlying securities are established by FINRA (short for the Financial Industry Regulatory Authority) and the options exchanges. Brokers may have very different margin requirements since they can add to the minimum requirements set by regulators.

Some option strategies, such as covered calls and covered puts, have no margin requirement since the underlying stock is used as collateral. Traders must request options trading authorization when opening a new account. Often times, brokers will classify options trading clearance levels depending on the type of strategies employed. Buying options is typically a Level I clearance since it doesn't require margin, but selling naked puts may require Level II clearances and a margin account. Level III and IV accounts often have lower margin requirements. Option margin requirements can have a significant impact on the profitability of a trade since it ties up capital. Complex strategies, such as strangles and straddles, may involve computing multiple margin requirements. Traders should determine the margin requirements for a trade before entering into it and make sure that they can meet those requirements if the market turns against them. How to Avoid Option Margin Requirements:- There are several different strategies that can be used to avoid option margin requirements. (i) Covered Calls and Covered Puts:- covered calls and covered puts involve owning the underlying stock, which is used as collateral in the option position. For example, if you own 500 shares of QQQ, you can sell to open five contracts of QQQ call options without any margin. (ii) Debit Spreads:- debit spreads involve buying in-the-money options and selling out-of-the-money options. In this case, the right to exercise the long option at a more favorable strike price offsets the obligation to sell at the less favorable strike price, which means that no margin is required. Calculating Option Margin Requirements:- The easiest way to calculate option margin requirements is using the Chicago Board of Options Exchange (CBOE) Margin Calculator that provides exact margin requirements for specific trades. Traders can also see the minimum requirements in the CBOE's Margin Manual. Brokerage accounts may have similar tools available to provide an idea of the cost before entering into a trade. Agriculture Trade Options (in the United States):- agricultural trade options are tools for managing agricultural price risk exposure. They are referred to as 'Trade Options' because, unlike exchange-traded options, which are bought and sold on a designated contract market, agricultural trade options are bought and sold off-exchange directly between commercial market participants for business-related purposes. Apart from their 'Over-The-Counter' (OTC) feature, agricultural trade options are similar in most respects to exchange-traded options. They permit the purchaser to buy or sell an agricultural commodity at a pre-specified price called the 'Strike Price' on or before a given 'Expiration Date'. An option to buy is referred to as a 'Call' and an option to sell is known as a 'Put'. The purchaser of an agricultural trade option pays a 'Premium' for the right (without the obligation) to buy or sell the underlying commodity at the strike price and this premium represents the maximum loss that can be incurred by the option buyer. In return for this premium, the option seller, or 'Writer', is exposed to potentially unlimited losses. An agricultural trade option may be 'Exercised' by the purchaser by making (in the case of a put) or taking (in the case of a call) delivery of the underlying commodity or by means of a cash payment. In general, options are only exercised when they are 'In-The-Money' – this occurs for a call when the strike price is below the current market price and for a put when the strike price is above the current market price. For exercise to be profitable, the amount by which an option is in-the-money must exceed the premium paid for the option. When an option's strike price is equal to the current market price, the option is said to be 'At-The-Money'. When a call (put) option's strike price is above (below) the current market price, the option is said to be 'Out-Of-The-Money'. Part 32 of the CFTC's regulations, 17 CFR 32, governs the sale of commodity options in the cash market. CFTC Regulation 32.4 largely exempts from Commission oversight 'Trade Options', that is, cash market options entered into by commercials for business-related purposes. The exemption applies to all commodities other than the 'Enumerated' agricultural commodities. (The Enumerated Commodities are listed in Section 1a(4) of the Commodity Exchange Act, 7 USC 1a(4), and CFTC Regulation 32.2. They include Wheat, Cotton, Rice, Corn, Oats, Barley, Rye, flaxseed, grain sorghums, mill feeds, butter, eggs, solanum tuberosum (Irish potatoes), wool, wool tops, fats and oils (including lard, tallow, cottonseed oil, peanut oil, soybean oil, and all other fats and oils), cottonseed meal, cottonseed, peanuts, soybeans, soybean meal, livestock, livestock products, and frozen concentrated orange juice.) Options in the soft commodities (Coffee, sugar, and Cocoa), dairy products, and lumber qualify for the trade option exemption. The trade option exemption applies to all commercial entities, regardless of size. Trade options in the enumerated agricultural commodities are subject to a separate exemption under CFTC Regulation 32.13. Under this exemption, options may only be offered or purchased through a registered agricultural trade options merchant (ATOM), and may only be transacted between commercial firms for business-related purposes. However, commercial firms with a net worth of USD10 million or greater are exempt from the agricultural trade options regulations, and are treated essentially the same as if they fell under the more general trade options exemption. How to Become an Agricultural Trade Option Merchant:- In June 1998, the CFTC began a program to permit the purchase and sale of agricultural trade options in the enumerated commodities. In December 1999, the Commission amended the program to streamline the registration process and to provide greater flexibility in option contract design by allowing cash settlement of contracts. An entity that plans on offering or selling agricultural trade options as part of its agricultural business, may do so only in compliance with the program rules. Before offering or selling agricultural trade option contracts, an entity is required to register as an agricultural trade option merchant (ATOM). The regulatory structure for agricultural trade options is found in Part 3 and Part 32 of the CFTC's regulations and involves four areas:- (i) registration of ATOMs; (ii) financial requirements; (iii) conditions on contracts and on their offer and sale; and (iv) disclosure and reporting requirements. An entity is only eligible to solicit, offer, or sell agricultural trade options if it operates in commercial agricultural markets and if it has registered with the Commission as an ATOM. In addition, its sales representatives and their supervisors, as well as its principals, must register as associated persons (APs). To apply for registration as an ATOM, an entity must contact the National Futures Association (NFA) which processes registrations on behalf of the CFTC. Registration forms for ATOMs, their principals, and their APs are available by telephone from the NFA at +1-800-6213570. Completed registration forms should be returned to the NFA, Office of the Secretary, PO Box 98383, Chicago, IL 60693-0001. For further information, or to download a registration form, you may go to the NFA's website. Registration lasts for an indefinite period. Applicants for ATOM registration must maintain a net worth of USD50 000 at all times. The registration application must include the ATOM's most recent annual financial statement audited by a certified public accountant (CPA) during the previous 12 months. A number of grounds exist that disqualify ATOMs, their principals or their APs from registering. For example, a potential registrant must not have had a prior registration revoked or been convicted of or enjoined from violating laws as specified in the program rules. APs may not have had a prior registration revoked or been convicted of violating laws relating to futures or securities trading, embezzlement, theft, fraud, or similar types of wrongdoing. All agricultural trade option contracts must be in writing or, if verbal, must be confirmed in writing. If an entity decides to offer or sell an agricultural trade option, it must give its customer a signed copy of the written contract. The option contract confirmation must include all terms and conditions of the contract. Before entering into an agricultural trade option, the CFTC requires that an ATOM disclose to its customer information about the general risks of agricultural trade options. Disclosures can be printed or electronic. An ATOM must also provide its customers with:- (i) a written confirmation of each agricultural trade option contract; (ii) information that the customer requests about commodity prices, or the customer's positions or funds; and (iii) notice that an option will expire within the coming month. In addition to the requirement to maintain at least USD50 000 in net worth, an ATOM must also segregate funds that its customer pays up front (the option premium), in a separate bank account. However, it may use its customer's funds to hedge or cover the trade option with an exchange-traded option on a designated futures exchange. In addition, the ATOM must have a written policy governing internal trading and supervisory controls as well as an annual financial audit. An ATOM must keep full and complete books and records for five years, and during the first two years, they must be readily accessible for inspection. ATOMs are also required to report to the Commission annually on volume, open interest, and the total amount of commodities underlying the options they sell. If a dispute should arise regarding the terms of an option contract and an ATOM and its customer are unable to resolve it, the customer

may file a reparations claim with the CFTC. To file such a claim, the customer must show that one or more of the provisions of the Commodity Exchange Act or the CFTC's rules was violated, thereby causing the customer to suffer a loss on the agricultural trade option. The ATOM and its customer can also agree to any other dispute resolution forum provided in the contract, such as arbitration, and either party may also be able to bring the dispute to court. However, an ATOM's contract may not impose a binding pre-dispute arbitration requirement on a customer. A dispute arising solely out of a cash market transaction would not be eligible for the CFTC Reparations program. / СИБО® (CBOE®). Этот термин означает некую сумму денежных средств, ценных бумаг или иного имущества на счёте клиента, требуемого правилами биржи в качестве гарантийного обеспечения исполнения обязательств по выписанным опционам.

OPTION MONTH = МЕСЯЦ ИСПОЛНЕНИЯ ОПЦИОНА – A term Option Month means, with respect to any option, the delivery month of the underlying asset. / В отношении любого опциона, этот термин означает, месяц поставки соответствующего актива.

OPTION PREMIUM = ПРЕМИЯ ЗА ОПЦИОН – Option Premium:- the premium is the price for an option that is to be paid to acquire an option or a warrant. The option premium or price is comprised of the intrinsic value and time value, and is determined by several factors including the following:- exercise (strike) price, the development of the price of the underlying and its volatility, the period of the option, the risk-free interest rate and the dividends of the underlying during the period of the option. The amount quoted on an exchange for a call and put options on the underlying assets. Also known as Option Price. Option Premium is the price of an option, which is paid by the buyer and received by the seller. Option premiums are determined by open outcry of competitive bids and offers in a trading pit. Option Premium is the price paid for an option. Received by the writer of the option. Option Premium is the price of an option. The amount the option buyer pays to an option seller (writer) for the right to buy or sell a futures contract at a specific price during the life of the option. Premiums are determined through trading on an organized and regulated exchange. See also Delta Factor, Extrinsic Value, and Intrinsic Value. / Премия За Опцион – сумма, котируемая на бирже за опционы на покупку и продажу по соответствующим активам. Известна также как Цена Опциона (Option Price).

OPTION PRICING MODEL = МОДЕЛЬ ЦЕНООБРАЗОВАНИЯ ОПЦИОНА – Option Pricing Model is a mathematical model used to calculate the theoretical value of an option. Inputs to option pricing models typically include the price of the underlying instrument, the option strike price, the time remaining till the expiration date, the volatility of the underlying instrument, and the risk-free interest rate, e.g., the Treasury bill interest rate. Examples of option pricing models include Black-Scholes and Cox-Ross-Rubinstein. / , например, . Модель Блэка-Скулза (Black-Scholes Model) и Модель Кокса-Роса-Рубинштайна (Cox-Ross-Rubinstein Model).

OPTION RISK = РИСК ПО ОПЦИОНУ – Option Risk results when a financial instrument's cash flow timing or amount can change as a result of market interest rate changes. This can adversely affect earnings or EVE (short for the Economic Value of Equity) by reducing asset yields, increasing funding costs, or reducing the net present value of expected cash flows. For example, assume that a bank purchased a callable bond, issued when market interest rates were 10 percent, that pays a 10 percent coupon and matures in 30 years. If market rates decline to eight percent, the bond's issuer will call the bond (new debt will be less costly). At call, the issuer effectively repurchases the bond from the bank. As a result, the bank will not receive the cash flows that it originally expected (10 percent for 30 years). Instead, the bank must invest that principal at the new, lower market rate. In addition, many loan and deposit products contain option risk. For example, many borrowers can prepay part or all of their loan principal at any time. Also, savings account depositors may withdraw their funds at any time.

OPTIONS AND WARRANTS = ОПЦИОНЫ И ВАРРАНТЫ – Options And Warrants:- these corporate actions come in two forms, convertible at any time during their life, or convertible on a set date. / Опционы и Варранты:- эти корпоративные действия предпринимаются в двух формах, обратимые в любое время в течение их срока действия, или обратимые в установленную дату.

THE OPTIONS CLEARING CORPORATION = КЛИРИНГОВАЯ КОРПОРАЦИЯ ПО ОПЦИОНАМ (или КОРПОРАЦИЯ ПО КЛИРИНГУ ОПЦИОНОВ) – The New York Stock Exchange affiliated organization The Options Clearing Corporation clears options transactions. Partly owned by the New York Stock Exchange. Founded in 1973, The Options Clearing Corporation (OCC) is the largest clearing organization in the world for financial derivatives instruments. Operating under the jurisdiction of the Securities and Exchange Commission, OCC is the issuer and registered clearing facility for all United States exchange-listed securities options. OCC issues put and call options on several types of underlying assets including common stocks and other equity issues, stock indexes, foreign currencies and interest rate composites. OCC has one of the largest securities industry membership bases, with over 135 Clearing Members consisting of US registered broker dealers and non-US securities firms, representing both professional traders and public customers. The American Stock Exchange® (AMEX®), the Chicago Board Options Exchange, the Pacific Exchange and the Philadelphia Stock Exchange share equal ownership of OCC. This ownership, along with OCC's Clearing Member dominated Board of Directors, ensures continuing service and support to options market participants. Committed to providing unparalleled service, OCC has the systems and capacity to clear new options products and enhance operational and ancillary services. With its sophisticated disaster recovery plan, OCC can provide uninterrupted critical clearing and settlement functions. OCC is dedicated to promoting stability and financial integrity in the options markets by focusing on effective risk management. In its role as guarantor, OCC ensures that the obligations of options contracts are fulfilled for the selling and purchasing clearing firms, regardless of the financial condition of the contra party. OCC provides substantial credit risk protection, even in times of significant market volatility. In 1993, OCC sought a credit rating from the Standard & Poor's Corporation (S&P) to establish a third party recognition of its 'AAA' rating. After reviewing OCC's operational capabilities and three-tiered backup system of financial safeguards, S&P awarded OCC with its highest 'AAA' rating. OCC's three-tiered backup system includes rigorous initial and ongoing membership standards, prudent margin requirements and its substantial clearing fund. S&P reviews its ratings annually, and continues to consistently award OCC a 'AAA' rating. OCC uses its risk-based margin methodology, Theoretical Intermarket Margin System (TIMS), to measure market risk exposure and set margin requirements accordingly. Using advanced portfolio theory and a sophisticated options pricing model, TIMS measures the inherent risk in portfolios containing options, futures, options on futures and stock positions. The TIMS methodology has been implemented by various clearing organizations worldwide. OCC receives most of its revenue from clearing fees charged to its members. Operating like a not for profit corporation, OCC rebates and discounts a substantial portion of these fees back to the clearing firms. Continued strong profitability has allowed OCC to refund over USD165 million in excess clearing fees to date. OCC's wholly-owned subsidiary, The Intermarket Clearing Corporation (ICC), was formed in 1984 to support participant exchanges that were establishing futures markets and to meet the need for a cross-margining mechanism between options and futures. OCC's cross-margin program, which has expanded to several clearing organizations. OCC has a solid commitment on continuing the state of the art computer system environment already established. OCC develops on 3-tiered, Object Oriented architectures which includes advance technologies in Internet and Client/Server platforms. Because of the dynamics of our position in the financial industry, OCC will continue to offer career and technical advancement for all of their employees. The Options Clearing Corporation (OCC), founded in 1973, is (as of 2006) the world's largest equity derivatives clearing organization, as well as a clearing firm in commodity futures, commodity options, and security

futures. By acting as guarantor, they ensure that the obligations of the contracts they clear are fulfilled. OCC operates under the jurisdiction of both the Securities and Exchange Commission (SEC) and the Commodities Futures Trading Commission (CFTC). Under its SEC jurisdiction, OCC clears transactions for put and call options on common stock and other equity issues, stock indexes, foreign currencies, interest rate composites and single-stock futures. As a registered Derivatives Clearing Organization (DCO) under CFTC jurisdiction, OCC offer clearing and settlement services for transactions in futures and options on futures contracts. Overseeing OCC is a clearing member dominated board of directors. OCC operates as an industry utility and receives most of its revenue from clearing fees charged to its members. OCC's participant exchanges include:- American Stock Exchange® (AMEX®), Chicago Board Options Exchange, International Securities Exchange, NYSE® Arca, Philadelphia Stock Exchange, and the Boston Stock Exchange. Clearing members serve both professional traders and public customers and comprise approximately 130 of the largest US broker-dealers, futures commission merchants and non-US securities firms. OCC also clears commodity contracts traded on CBOE® Futures Exchange and Philadelphia Board of Trade, as well as security futures contracts traded on OneChicago. OCC is also a sponsor of the Options Industry Council. The Options Clearing Corporation (OCC), founded in 1973, is the world's largest equity derivatives clearing organization. We are dedicated to promoting stability and financial integrity in the marketplaces that we serve by focusing on sound risk management principles. By acting as guarantor, we ensure that the obligations of the contracts we clear are fulfilled. As the marketplace evolves, so do our clearing capabilities. Although we began as a clearinghouse for listed equity options, we have grown into a globally recognized entity that clears a multitude of diverse and sophisticated products. OCC operates under the jurisdiction of both the Securities and Exchange Commission (SEC) and the Commodities Futures Trading Commission (CFTC). Under its SEC jurisdiction, OCC clears transactions for put and call options on common stocks and other equity issues, stock indexes, foreign currencies, interest rate composites and single-stock futures. As a registered Derivatives Clearing Organization (DCO) under CFTC jurisdiction, we offer clearing and settlement services for transactions in futures and options on futures. Overseeing OCC is a clearing member dominated board of directors. OCC operates as an industry utility and receives most of its revenue from clearing fees charged to its members. We offer volume discounts on fees and, as applicable, refund excess fees to our clearing members. OCC's participant exchanges include:- American Stock Exchange® (AMEX®), Chicago Board Options Exchange, International Securities Exchange, NASDAQ®, NYSE Arca, Philadelphia Stock Exchange, and the Boston Stock Exchange. Our clearing members serve both professional traders and public customers and comprise approximately 130 of the largest US broker-dealers, futures commission merchants and non-US securities firms. OCC's goal is to service clearing members and the exchanges through an operating plan that emphasizes timely, reliable and cost-efficient clearing operations. OCC also serves other markets, including those trading commodity futures, commodity options, and security futures. We clear commodity contracts traded on CBOE® Futures Exchange and Philadelphia Board of Trade, respectively, as well as security futures contracts traded on OneChicago. Headquartered in Chicago, IL, the United States. 2011:- OCC's participant exchanges include:- BATS Options Exchange, C2 Options Exchange, Inc., Chicago Board Options Exchange, Inc, International Securities Exchange, NASDAQ OMX BX, Inc., NASDAQ OMX PHLX, NASDAQ® Stock Market, NYSE® Amex® Options, and NYSE® Arca Options. Our clearing members serve both professional traders and public customers and comprise approximately 120 of the largest US broker-dealers, futures commission merchants and non-US securities firms. OCC's goal is to service clearing members and the exchanges through an operating plan that emphasizes timely, reliable and cost-efficient clearing operations. OCC also serves other markets, including those trading commodity futures, commodity options, and security futures. We clear futures contracts traded on CBOE® Futures Exchange, NYSE Liffe, NASDAQ OMX Futures Exchange and ELX Futures, as well as security futures contracts traded on OneChicago and options on futures contracts traded at NYSE Liffe US. In addition, OCC provides central counterparty services for two securities lending market structures, OCC's OTC Stock Loan Program and AQS, an automated marketplace for securities lending and borrowing. / АМЭКС® (AMEX®). и Филадельфийской Палате Торговли (Филадельфийском Табло Торговли, если быть более точными) . Стэндод энд Поз Корпорэйшэн (Standard & Poor's Corporation) . НЭЗДЭК® (NASDAQ®) . НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении). НЭЗДЭК У.Эм.Экс. Би.Экс., Инк. (NASDAQ OMX BX, Inc.). ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE). СИБО® (CBOE®). Клиринговая Корпорация по Опционам (ККО) – организация США, обеспечивающая расчёты по сделкам с производными инструментами на фондовые активы. Основана в 1973. Считается крупнейшей в мире корпорацией, занимающейся клирингом в сфере опционов на акции и индексы. Клиринговая Корпорация по Опционам является гарантом по всем опционным контрактам, торгуемым на Американских биржах, и осуществляет контроль над соблюдением правил исполнения опционов. По состоянию на 2004, членами корпорации являются около 140 крупнейших Американских брокеров-дилеров по ценным бумагам, комиссионных торговцев фьючерсами и зарубежных компаний, совершающих операции с ценными бумагами. Действуя под юрисдикцией Комиссии по Ценным Бумагам и Биржам (Securities and Exchange Commission, SEC) и Комиссии по Торговле Фьючерсами на Сырьё (Commodity Futures Trading Commission, CFTC), Клиринговая Корпорация по Опционам находится в совместном владении пяти бирж США, на которых ведётся торговля опционами, – Американской Фондовой Биржи (АМЭКС® или АФБ) (American Stock Exchange (AMEX® or ASE)), Международной Биржи Ценных Бумаг (International Securities Exchange), Биржи Опционов Чикагской Палаты (СИБО®) (Chicago Board Options Exchange (CBOE®)), Тихоокеанской Фондовой Биржи (ТОФБ) (Pacific Stock Exchange (PSE)) и Филаделфийской Фондовой Биржи (ФФБ) (Philadelphia Stock Exchange (PHLX)).

OPTIONS EXCHANGE = БИРЖА ОПЦИОНОВ – Options Exchange is an exchange specialized in trading in options. See also SOFFEX. / Биржа Опционов – биржа, специализирующаяся на торговле опционами. Смотрите также СОФФЭКС (SOFFEX).

OPTIONS ON FUTURES SPREADS = ОПЦИОНЫ НА КУРСОВЫЕ РАЗНИЦЫ ФЬЮЧЕРСОВ – In early 2005, the New York Board of Trade (NYBOT®) has developed a new instrument to serve its traditional 'soft' commodity markets – Options On Futures Spreads (OFS). This specialized contract, which has been in the planning stages for several years, will be rolled out early in 2005, starting with sugar No. 11, NYBOT's largest market, and continuing with Cotton and Coffee later in the year. In order to clear this product, NYBOT® has been working with the Chicago Mercantile Exchange® (CME®) on an innovative application of the SPAN® margining system. NYBOT® developed the OFS contract in response to the rapid growth in options trading at the exchange and the demand for more complex option-based products. Options are particularly attractive during periods of high volatility. On 2005-November-15, for example, the price of the Coffee 'C' contract at NYBOT® jumped nearly 14%. A few days later the margin levels for the contract were adjusted upward by almost 34%. Margin calls of that magnitude can explain to some degree why hedgers and speculators find options on futures very useful. Options on futures have a single premium and no margin requirement for the buyer, whereas a futures position can generate considerable cash-flow demands. Options on sugar futures, the most active commodity options contract at NYBOT®, are having a very bullish year, with open interest hitting a record level of 418 874 contracts on 2005-December-01. Open interest at that level is an indicator of hedging activity and highlights the importance of options as a means to reduce risk exposure in these volatile markets. Options help traders manage their risk, as well as presenting them with opportunities created by that same volatility. The rapid growth in options usage is also driven by the increasing sophistication of the participants in these markets. Hedgers and investors often use options to structure and implement trading strategies that may call for the use of combinations of futures and options. Spread strategies represent one kind of combination trade. Since different futures contracts trade at different prices (the outer months often

reflecting 'carrying charges'), market participants may hold spread positions, namely buy/sell contracts in two different contract months. In developing options on spreads, NYBOT® also observed the development of options on spreads in the over-the-counter markets. Often a practice that appears in the over-the-counter (OTC) market will migrate to the exchange as use of the practice matures and market participants feel the need to move their transactions into the security and transparency of an exchange environment. The introduction of OFS is certainly not the first time at NYBOT® that an OTC product has moved onto the exchange. Exchange for Swaps, whereby users can exchange their swaps agreements for futures contracts, have been available at NYBOT® since 2001. The addition of other specialized contracts such as serial and flexible options has continuously been in evidence at NYBOT® as market conditions demand. Pricing OFS Options:- traders who write options on the floor of the exchange have joined with sophisticated hedgers/investors in supporting the introduction of the OFS contracts at NYBOT®. Essentially the OFS allows traders to manage a single position instead of two and pay only one premium for that single instrument, making this a less expensive and more efficient way to take a position on the volatility of the underlying futures contracts. Where a regular option contract gives the buyer the right, but not the obligation, to establish a futures position at a pre-determined price level, an OFS gives the buyer the right, but not the obligation, to establish a spread position at a pre-determined spread price between two futures contract months. An OFS call option contract would give the buyer the right to establish a spread position of long one futures contract/short a second futures contract. Similarly, an OFS put option would give the buyer the right to establish a spread position of short one futures contract/long a second futures contract. The spread price in an OFS is the result of subtracting the price of the second delivery month of the underlying futures contract from the price of the first delivery month. Since the spread relationship between any two months can be in contango (nearby month less than back month price) or backwardation (nearby month more than back month price), the strike prices for OFS contracts can be positive, negative or zero. Some clearing firms therefore may need to modify their systems so that negative prices can be processed. A positive strike price means the spread is in backwardation and a negative strike price means the spread is in contango. For example, the exercise of a –2 cent Jul 05/Dec 05 Cotton OFS call option would result in the buyer receiving a spread position of long a July 2005 cotton futures/short a December 2005 Cotton future at prices such that the Jul 05 price is 2 cents below the Dec 05 price. To settle the price, the exchange will set the price of the first month of the spread pair equal to the settlement price of that futures contract on the day of exercise; the futures price on the second month in the pair will be set at the settlement price of the first month in the pair minus the OFS strike price (in this case –2 cents). The exchange/clearing systems now have the capability to list negative prices. Premiums on the OFS will be quoted in the same manner as the regular option on the relevant commodity. Clearing OFS Options:- clearing firms will face several technical issues as they prepare to clear options on spreads. Three stand out as particularly important:- data symbol methodology, negative numbers and a different approach to margining this particular contract. Regarding the symbols, the current four field data symbol methodology needed expansion to handle the symbols required for spreads. The systems enhancement added a third digit within the contract field for in-house as well as outside clearing firms and data vendors. For example, SB1 K5 would designate a Sugar No. 11 May/July 2005 spread; the K5 represents the first month in the pair (May 2005), SB is the standard sugar No. 11 commodity code and the '1' (the new third digit in the contract field) represents the number of listed months forward from the named K5 month and therefore designates the second month of the pair as one listed month past K5. This symbol field is particularly important given the fact that the contract will trade in four monthly series, matching different pair combinations, e.g., first listed month/second month, second/third, first/third, second/fourth, and so on. Regarding margins, the New York Clearing Corporation (NYCC®), NYBOT's clearinghouse, has created a unique SPAN® environment with CME's assistance. By using the 'super inter-commodity spread' feature of SPAN®, the NYCC® will provides traders with the appropriate spread offsets for OFS positions. Super inter-commodity spread margining treats an OFS in a similar manner as regular options; it analyzes the risk of the option as compared to the futures price. Two other methodologies now in use for margining options – delta split allocation and split allocation – do not provide an arena for capturing the risk of options where one is trying to ascertain vega and gamma risk. Super inter-commodity spread margining, while available in SPAN® for years, had not been modified for the use of OFS until now. Considerable latitude exists in the margining of these products to accommodate a full range of inter-commodity and intra-commodity spreads. Options on Futures Spreads (OFS) contracts are a relatively new type of option contract. Where a regular option contract gives the buyer the right, but not the obligation, to establish a futures position at a pre-determined price level, on OFS gives the buyer the right, but not the obligation, to establish a spread position at a pre-determined spread price between the two futures contract months. An OFS call option contract would give the buyer the right to establish a spread position of long the first futures contract/short the second futures contract. The strike price of the call option is the difference between the prices of the two futures contracts. Similarly, an OFS put option would give the buyer the right to establish a spread position of short the first futures contract/long the second futures contract. Just as with the call option, the strike price of the put option is the difference between the prices of the two futures contracts. / НАЙБЭТ® (NYBOT®).

OPTION SPREAD = КУРСОВАЯ РАЗНИЦА ОПЦИОНОВ (или СПРЭД ОПЦИОНОВ) – Option Spread involves the purchase and sale of two options of the same type (call or put). It is used to take advantage of a bullish or bearish market while restricting risk to a predefined level. See also Horizontal Option Spread, and Vertical Option Spread.

OPTION STRADDLE = СТРЭДЛ ОПЦИОНОВ – Option Straddle:- it involves the purchase or sale of both a put and a call option.

OPTION STRADDLE PURCHASE = ПРИОБРЕТЕНИЕ СТРЭДЛА ОПЦИОНОВ – Option Straddle Purchase:- it involves the purchase of a put and a call option. It is designed to take advantage of a volatile market.

OPTION STRADDLE SALE = ПРОДАЖА СТРЭДЛА ОПЦИОНОВ – Option Straddle Sale:- it involves the sale of a put and a call option. It is designed to take advantage of a stable market.

OPTION STYLES = СТИЛИ ОПЦИОНОВ – Option Styles:- the purchaser of a European-style option has the right to exercise it on a predetermined expiry date. In contrast, the holder of an American-style option has the right to exercise it at any time during its lifetime, up to and including its expiry date. This flexibility means there is a greater probability of an American-style option being exercised than the corresponding European-style option with the same strike. Hence the early exercise feature of an American option adds value and makes it the more expensive of the two. Most exchange-traded options are American-style. Further variations on these styles also exist. A Bermudan option, so called because it falls between American- and European-style options, has more than one possible exercise date. For example, the holder of a Bermudan option with a two-year maturity might have the right to exercise it every quarter or half year during the life of the contract. Bermudans are also known as Limited Exercise or Semi-American-Style Options. Another twist is the deferred pay-out option, a variation on American-style options in which the option can be exercised at any time during the option's life, but the pay-out is delayed until the expiry date. With the similar shout option, the purchaser can lock in a profit at any time, but retains the right to profit from further favorable moves. / Стили Опционов:- приобретатель опциона в Европейском стиле (European-style option) имеет право исполнить его в предопределённую дату прекращения признания. В контрасте с ним держатель опциона в Американском стиле (American-style option) имеет право исполнить его в любое время в течение его срока действия вплоть до даты и в дату прекращения его признания. Эта гибкость означает то, что .

OPTION TYPE = ТИП ОПЦИОНА – Option Type is the designation of an option as either a call or a put. / Определение опциона, что он либо на покупку, либо на продажу.

OPTION WRITER = ВЫПИСАВШИЙ ОПЦИОН – Option Writer is the person who originates an option contract by promising to perform a certain obligation in return for the price or premium of the option. See also Writer. In option trading, an individual who sells or grants or writes any exchange option, establishing a short position. He is obligated to deliver the underlying asset if the option is exercised. Also known as Grantor or Seller. In option trades, there is an option buyer and a so-called option writer, the option seller. The buyer acquires the right to request delivery of a specific underlying asset (call option) or request the writer to purchase the underlying asset (put option) at the price fixed on the contract date. For this right, the option writer receives a so-called Premium, the option price, from the buyer. Option Writer is the seller of an option. Option Writer is the person who sells the option to the buyer. Option Writer or Grantor is a person selling an option. / В торговле опционами, частное лицо, продающее или предоставляющее, или выписывающее любой биржевой опцион, и устанавливающее тем самым короткую позицию или позицию продажи. Он обязан поставить соответствующий актив в случае исполнения опциона. Известен также как Предоставивший (Grantor) или Продавец (Seller).

O/R = OPERATING RATE

ORANGE = ОРАНЖЕВОЕ (или АПЕЛЬСИНОВОЕ) – Orange:- any of a group of colors that lie midway between red and yellow in hue and are of medium lightness and moderate to high saturation.

ORANGE LEAF = ОРАНЖЕВЫЙ ЛИСТ – Orange Leaf is a disease caused by a mycoplasmalike organism. The causal agent is restricted in the cells of the phloem sieve tubes and is vectored by Leafhoppers. The disease is characterized by short, malformed leaves, the edges of leaves are serrated and chlorotic, and the leaf tips are twisted. At the later stage, the leaves turn yellow-orange beginning at the tip. Leaves may become entirely orange, roll inward and dry out.

ORANGE PEEL = НОЗДРЕВАТОСТЬ (или АПЕЛЬСИНОВАЯ КОРКА, или МЕЛКИЕ НАПЛЫВЫ КАК У АПЕЛЬСИНА, или 'ШАГРЕНЕВАЯ КОЖА', или КРАСНО–ЖЁЛТЫЙ ЦВЕТ) – Orange Peel:- the appearance of irregularity of a surface resembling the skin of an orange, usually on painted surfaces. / Ноздреватость – дефект лакокрасочного покрытия.

ORANGE WHEAT BLOSSOM MIDGE = ОРАНЖЕВЫЙ ПШЕНИЧНЫЙ КОМАРИК – The Orange Wheat Blossom Midge causes a distinct form of damage. Grade tolerances for midge have existed for many years based primarily on the shrivelling and distortion of midge-damaged kernels. The tiny midge larvae feed directly on the developing kernels in the heads of Wheat. The extent of damage largely depends on the number of larvae feeding on each kernel The orange wheat blossom midge causes a distinct form of damage. Grade tolerances for midge have existed for many years based primarily on the shrivelling and distortion of midge-damaged kernels. The tiny midge larvae feed directly on the developing kernels in the heads of Wheat. The extent of damage largely depends on the number of larvae feeding on each kernel. Only recently have the full effects of midge damage on Canadian red spring bread Wheat quality been studied, revealing the seriousness of midge damage to quality. The shrunken distorted grains reduce flour yields and produce dark flours with increased flour ash. Severely midge-damaged Wheat exhibits weak, sticky dough properties, low baking absorption and poor bread quality. Protein content is abnormally high, but gluten protein quality is distinctly inferior. / повреждённая Комариком зерновка (повреждённые Комариком ядра).

ORANGISH = ОРАНЖЕВАТОЕ – Orangish:- somewhat orange.

ORANGY = ОРАНЖЕВЕНЬКОЕ – Orangy:- resembling or suggestive of an orange as in color.

ORB = OPEC REFERENCE BASKET

ORBICULAR = КРУГООБРАЗНОЕ (или ОКРУГЛОЕ, или СФЕРИЧЕСКОЕ, или ОРБИКУЛЯРНОЕ) – Orbicular:- round and flat or spheroidal. Orbicular:- almost circular.

ORBICULATE LEAF = ОКРУГЛЫЙ ЛИСТ – Orbiculate Leaf is a circular or nearly circular leaf.

ORCHID = ОРХИДЕЙНЫЙ (или ОРХИДЕЯ) – Orchid:- a light purple. / Орхидейный:- светло-пурпурный.

ORCHIDS = ОРХИДНЫЕ (или ОРХИДЕИ) – Orchids, as relates to the US/Canada Greenhouse Certification Program, Orchids are a special group of flowering plants comprising approximately 25 000 Species. Orchids are best recognized by their bilaterally symmetrical flowers. Some of the most popular greenhouse Genera include Cattleya, Cymbidium, Dendrobium, Odontoglossum, Oncidium, Paphiopedilum, and Phalaenopsis. / Самые популярные парниковые (greenhouse) Рода включают Кэтлея (Cattleya), Сымбидиум (Cymbidium), Дэндробиум (Dendrobium), Одонтоглоссум (Odontoglossum), и Онсидиум (Oncidium), Пафиопэлилум (Paphiopedilum), и Фалэнопсис (Phalaenopsis). Под Орхидными (Orchidaceae) или Ятрышниковыми понимается Семейство однодольных многолетних трав. Свыше 20 000 Видов (по другим данным, 35 000), в обоих полушариях. На территории бывшего Союза Советских Социалистических Республик (СССР) насчитывалось свыше 120 Видов. Некоторые Орхидные используют в промышленности (Ваниль) и медицине (Ятрышник); многие выращивают в оранжереях. 35 Видов, в том числе из Родов Башмачок, Любка, Ятрышник и другие, были внесены в Красную Книгу СССР.

ORDER = ЗАКАЗ – Order is a request made to a supplier for a particular quantity of a certain product or for his or her services. / Заказ – запрос, сделанный поставщику на конкретное количество определённого продукта или на его или её услуги. Заказ – некоторое количество продукции, материала или услуги, заказанное в одно время у одного изготовителя. Примечание:- заказ может состоять из одной или нескольких поставок.

ORDER = ПОРЯДОК – Order or Ordo is a taxonomic grouping below Class and above Family. A taxonomic Order contains one or more Families. See also Class, Division, Family, Genus, Kingdom, Phylum, Specie, Tribe, and Type. / Порядок – таксономическое группирование ниже Класса, но выше Семейства. Таксономический Порядок содержит одно или более Семейств. Смотрите также Вид (Specie), Класс (Class), Отдел (Division), Отряд (Phylum), Род (Genus), Семейство (Family), Тип (Type), Триба или Колено (Tribe), и Царство (Kingdom). В биологии под Порядком понимается таксономическая категория (ранг) в систематике Растений. В порядок (иногда сначала в Подпорядок) объединяют родственные Семейства. Близкие Порядки образуют Класс (иногда сначала Надпорядок). В систематике Животных Порядку соответствует Отряд. Порядок (Ordo), одна из основных категорий систематики, объединяющая родственные Семейства Растений. Например, Семейства Вязовые, Тутовые, Коноплёвые и Крапивные образуют Порядок Крапивоцветных (Urticales). Латинское название Порядок обычно образуют, прибавляя окончание -ales к основе названия Семейства. Порядок часто объединяет 2–3 и более (до 20) Семейств, иногда включает всего 1 Семейство (например, Порядок Ивоцветных Salicales с единственным Семейством Salicaceae). Крупные Порядки иногда разделяют на Подпорядки (Subordo). Число Порядков в различных филогенетических системах неодинаково (по одной системе, все Семейства Цветковых Растений объединяют в 94 Порядка, по другой – в 78 Порядков). Родственные

Порядки объединяют в Классы; при этом промежуточными категориями могут быть Надпорядок и Подкласс. В систематике Животных Порядку соответствует Отряд.

ORDER = РАСПОРЯЖЕНИЕ (или ПОРУЧЕНИЕ) – (1) Order is a directive, sent by the owner of the goods, to ship product out of the warehouse. An order specifies product, quantity, shipping date, and destination and may contain special instructions.

(2) Order is a specific instruction to a broker/dealer to buy, sell, deliver, or receive assets that commits the issuer of the order to the terms specified. This may refer to:- (i) the communication by a broker to an underwriter of a client's acceptance of his quotation; or (ii) the amount of the sum insured that is covered by a particular slip where more than one slip is used to arrange cover. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). В праве под Распоряжением понимается:- (i) акт управления, изданный в пределах компетенции должностного лица, государственного органа и имеющий обязательную силу; или (ii) одно из правомочий собственника. Поручение – гражданско-правовой договор, в силу которого одна сторона (Поверенный) обязуется совершить от имени и за счёт другой стороны (Доверителя) определённые юридические действия (приобретение имущества, производство платежей и тому подобное). В бывшем СССР поручение служило одним из правовых средств, обеспечивавших участие граждан и организаций в гражданском обороте (заключение сделок и тому подобное) при содействии других лиц. Совершение поверенным юридических действий в отношении третьих лиц основывается на выданной ему доверенности. Доверитель обязан уплатить поверенному вознаграждение, если это предусмотрено законом или договором.

ORDER BACKLOG = ЗАКАЗЫ НА ИСПОЛНЕНИИ – In the official statistics of US Census Bureau, Order Backlog (Unfilled Orders):- generally, unfilled orders at the end of an accounting period are equal to unfilled orders at the beginning of the period, plus new orders net of cancellations received during the period, less net sales. This includes orders that have not yet passed through the sales account and funded orders (or portions of orders) for which the value of work done has not been reported as sales.

ORDER BILL OF LADING = ОРДЕРНЫЙ КОНОСАМЕНТ (или КОНОСАМЕНТ ПРИКАЗУ ОТПРАВИТЕЛЯ ИЛИ ПОЛУЧАТЕЛЯ) – An Order Bill Of Lading:- this type of bill of lading states that the goods are consigned to the order of any person named in the bill. An order bill of lading is negotiable and cannot be made non-negotiable unless the shipper agrees in writing by endorsing the bill. Id., at 2-93. The term 'Order' alone is defined as an 'order by endorsement on a bill of landing'. 49 USC §80101(5) (2005; 49 USC is short for the United States Code:- Title 49). An 'order bill of lading' is basically the equivalent to a 'negotiable bill of lading'. A negotiable document by which a transportation line acknowledges receipt of freight and contracts for its movement. The surrender of the original Order Bill of Lading, properly endorsed, is required by transportation lines upon delivery of the freight, in accordance with the terms of the Bill of Lading. An Order Bill of Lading is one in which the goods are consigned to the order of a named party. This distinction is important in determining whether a bill of lading is negotiable (capable of transferring title to the goods covered under it by its delivery or endorsement). If its terms provide that the freight is to be delivered to the bearer (or possessor) of the bill, to the order of a named party, or, as recognized in overseas trade, to a named person or assigns, a bill, as a document of title, is negotiable. In contrast, a straight bill is not negotiable. Negotiable bill of lading that can be negotiated like any other Negotiable Instrument, so that the shipper can sell it to anyone, not just the intended recipient of the goods. The bill requires the carrier to release the goods only when the bill of lading is given him by the recipient. This bill uses express words to make the bill negotiable, e.g., it states that delivery is to be made to the further order of the consignee using words such as 'delivery to ABC Ltd or to order or assigns'. Consequently, it can be endorsed by ABC Ltd or the right to take delivery can be transferred by physical delivery of the bill accompanied by adequate evidence of ABC Ltd's intention to transfer. Also known as Negotiable Bill Of Lading. / , например, .

ORDER BOOK = КНИГА ПОРУЧЕНИЙ (или КНИГА УЧЁТА РАСПОРЯЖЕНИЙ, или ОРДЕРНАЯ КНИГА) – Order Book:- electronic memory device maintained by the Swiss Exchange. It contains all current buy and sell orders in price-time sequence for a specific security at a given moment. / Электронное запоминающее устройство, поддерживаемое Швейцарской Биржей. Оно содержит в себе все текущие распоряжения на покупку и продажу во временной ценовой последовательности для конкретной ценной бумаги на данный момент времени.

ORDER CHECK = ОРДЕРНЫЙ ЧЕК (или ИМЕННОЙ ЧЕК) – Order Check or Order Cheque is a type of order paper, ownership of an order cheque is transferred through endorsement. Order cheques are only payable to the legitmate presenter. As the order cheque is inherently an order paper, the customary 'to the order of' clause can be legally waived. The bank that cashes the cheque has an obligation to check the endorsement and identification. An Order Check – the most common form in the United States – is payable only to the named payee or his or her endorsee, as it usually contains the language 'Pay to the order of (name)'.

ORDER COST = СТОИМОСТЬ ВЫПОЛНЕНИЯ ЗАКАЗА (или ЗАТРАТА НА ЗАКАЗ) – Order Cost is the cost of labor, time, and other activities needed in an instance that a product is ordered.

ORDER CYCLE = ЦИКЛ ЗАКАЗА – Order Cycle:- this includes the time and the process involved from the placement of the order to the receipt of the shipment. It includes the following processes:- communicating the order, order processing, transporting the shipment. Based on demand and frequency for orders of specific product, the Order Cycle is a replenishment cycle that determines how often a product needs to sent as an inbound to the warehouse in order to keep up with demand.

ORDER–DRIVEN TRADING = ТОРГОВЛЯ, ПРИВОДИМАЯ В ДВИЖЕНИЕ РАСПОРЯЖЕНИЯМИ – Order-Driven Trading:- bilateral market on which members can enter buy and sell orders at their discretion. System used on the Swiss Exchange. / Двусторонний рынок, на котором участники могут выставлять распоряжения на покупку и продажу по их собственному усмотрению. Данная система используется Швейцарской Биржей.

ORDERING CUSTOMER = КЛИЕНТ РАСПОРЯДИТЕЛЬ (или ИНСТРУКТИРУЮЩИЙ ЗАКАЗЧИК) – It is a field name in a SWIFT message:- the customer ordering the transaction. Ordering Customer is the initiator of a funds transfer instruction. The term Ordering Customer is used as a synonym for the ECBS (European Committee for Banking Standards) term Originator. / Это название поля в сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ORDERING CUSTOMER'S FINANCIAL INSTITUTION = ФИНАНСОВОЕ УЧРЕЖДЕНИЕ КЛИЕНТА РАСПОРЯДИТЕЛЯ (или ИНСТРУКТИРУЮЩЕГО ЗАКАЗЧИКА) – In banking, Ordering Customer's Financial Institution (OFI) holds the account of the ordering customer and executes an initiated payment on behalf of the ordering customer.

ORDERING INSTITUTION = УЧРЕЖДЕНИЕ РАСПОРЯДИТЕЛЬ (или ИНСТРУКТИРУЮЩИЙ ИНСТИТУТ) – Ordering Institution:- it is a field name in a SWIFT message:- if 'Received From' the financial institution (or branch) initiating the transfer; if the 'Sending Bank' has more than 1 account in same currency with correspondent bank (SCOTIABANK, Canada), message will not be a straight through, unless each account has a unique SWIFT TID (short for the transaction identifier). / Когда в сообщении Сообщества по

Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) указано 'Получено От' ('Received From'), то имеется в виду финансовое учреждение (или его филиал), инициировавший данный перевод. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

ORDER INSTRUMENT = ОРДЕРНЫЙ ИНСТРУМЕНТ – Order Instrument is a paper which can be transferred by endorsement (negotiable). Legal order instruments (bills of exchange, checks, drafts, registered shares) are always order instruments, even if they do not bear the 'to the order of' notation. Bills of lading, bill-like orders, etc become negotiable only with such a notation. Also known as Order Paper. Ownership of these papers can be transferred to another person after endorsement. They are made out 'to the order of' a named beneficiary. Ownership of the order instruments is transferred by delivery of the endorsed deed. Examples of these instruments are registered shares, bills of lading, bills of exchange and cheques.

ORDERLY MARKETING AGREEMENT = ОРГАНИЗОВАННОЕ СОГЛАШЕНИЕ О МАРКЕТИНГЕ – Orderly Marketing Agreement is a bilateral agreement between governments by which one government limits exports to the other. Similar to a voluntary export restriction agreement or a voluntary restraint agreement. Used to address injury to a domestic industry. Contracts negotiated between two or more governments, in which the exporting nation undertakes to ensure that international trade in specified 'sensitive' products will not disrupt, threaten or impair competitive industries or workers in importing countries.

ORDER–NOTIFY = УВЕДОМИТЬ РАСПОРЯДИТЕЛЯ – Order-Notify is a bill of lading term to provide surrender of the original bill of lading before freight is released; usually associated with a shipment covered under a letter of credit.

ORDER OF PRIORITY = ПОРЯДОК ОЧЕРЁДНОСТИ – Order Of Priority is the order of claim established by senior and junior mortgages to the underlying real estate serving as collateral for the mortgage. The mortgages are entered in the Land Register in the order of their priority (first mortgage, second mortgage, etc). The claim is generally realized (the mortgage foreclosed) by an action or proceedings brought by the creditor against the debtor after the latter has defaulted or as a consequence of the debtor's bankruptcy.

ORDER PAPERS = ОРДЕРНЫЕ БУМАГИ – Order Papers:- ownership of these papers can be transferred to another person after endorsement. They are made out 'to the order of' a named beneficiary. Ownership of the order instruments is transferred by delivery of the endorsed deed. Examples of these instruments are registered shares, bills of lading, bills of exchange and cheques.

ORDER SELECTOR = ОТБОРЩИК ЗАКАЗА (или СЕЛЕКТОР ЗАКАЗА) – Order Selector:- also known as an Order Picker, an order selector is a specialized lift truck that allows a person to ride on it with the pallet in order to pick from various locations and levels.

ORDER SPLITTING = ДРОБЛЕНИЕ РАСПОРЯЖЕНИЙ – Order Splitting:- breaking up orders so that they can be processed as small orders for execution by Small Order Execution System (SOES). Prohibited by NASD.

ORDER TICKET = КАРТОЧКА РАСПОРЯЖЕНИЯ (или ФОРМУЛЯР ПОРУЧЕНИЯ, или ОРДЕРНЫЙ ФОРМУЛЯР) – Order Ticket is a form detailing an order instruction that a customer gives an account executive. / Форма, детализирующая инструкцию распоряжения, которое заказчик направляет исполнителю по счёту.

ORDINARIES = ORDINARY SHARES

ORDINARY BREAKAGE = ЕСТЕСТВЕННЫЙ БОЙ (или БОЙ В ПРЕДЕЛАХ НОРМЫ) – Ordinary Breakage is a breakage of fragile cargo which by its regularity has become accepted as inevitable loss during transit. It is not mentioned in the general exclusion clauses in the ICC (1982; short for the Institute Cargo Clauses 1982), but is one of the Statutory exclusions in the Marine Insurance Act (MIA) 1906. / Бой хрупкого груза, .

ORDINARY LEAKAGE = ЕСТЕСТВЕННАЯ УТЕЧКА (или УТЕЧКА В ПРЕДЕЛАХ НОРМЫ) – Ordinary Leakage is a natural loss of liquid in a cargo, e.g., evaporation of water in grain, evaporation of oil, contraction of oil, etc during transit.

ORDINARY OR REGULARY LAY = ОРДИНАРНАЯ ИЛИ РЕГУЛЯРНАЯ СВИВКА – Ordinary Or Regular Lay:- cord in which the direction of lay in the stranding is opposite to the direction of lay in cabling the cord.

ORDINARY PARTNERSHIP = ОБЫКНОВЕННОЕ ПАРТНЁРСТВО (или ОБЫКНОВЕННОЕ ТОВАРИЩЕСТВО) – Ordinary Partnership:- contractual relationship between two or more legal persons or corporate entities for the attainment of a common purpose (such as earning a profit or placing a bond issue) by contributing their property, skill, experience and labor. / Контрактные (договорные) взаимоотношения между двумя или более правовыми лицами или корпоративными образованиями для достижения общей цели (такой как зарабатывание прибыли или размещение выпуска облигаций) посредством внесения их имущества, навыков, опыта и труда.

ORDINARY SEAMAN = МЛАДШИЙ МАТРОС (или МАТРОС 2–ГО КЛАССА) – Ordinary Seaman (OS) (deck department (unlicensed)):- an apprentice able-bodied (AB) seaman, assists AB's, bosun, and officers, keeps facilities clean. Ordinary Seaman is a deck crewmember who is subordinate to the Able Bodied Seaman. Ordinary Seaman (maritime term):- the beginning grade for members of the deck department. The next step is able bodied seaman. / Младший Матрос или Матрос 2-го Класса является членом палубной команды, который подчиняется Матросу с Хорошей Морской Выучкой или Матросу 1-го Класса (Able Bodied Seaman).

ORDINARY SHARE CAPITAL = КАПИТАЛ В ОБЫКНОВЕННЫХ АКЦИЯХ – Ordinary Share Capital are the resources supplied to the company (equity capital) through the issuance of ordinary shares. Ordinary shares refer to certificates/securities enabling owners to possess a portion of the company through contributing to the equity capital of the company in the primary stock exchange market, i.e. first-hand trading of shares. Ordinary Share Capital also contribute to a part of the shareholders' funds. Shareholders' Funds = Ordinary Share Capital + Preference Share Capital + Reserves.

ORDINARY SHARES = ОБЫКНОВЕННЫЕ АКЦИИ – Ordinary Shares or Equities:- investments in companies like BP, Shell etc where the shareholder is entitled to share in the profits of the company but where the future dividends depend on the future success of the company and there is no fixed rate of interest or fixed payment of capital on a specified redemption date. Ordinary Shares are stocks bought by investors in the United States in foreign companies that are traded on their home markets, as opposed to stocks that trade in the United States. Ordinary stocks are equivalent to common stock traded on US markets. Ordinary Shares are the most common type of shares and the full name is fully paid ordinary share or FPO. You may see this abbreviation after the name of the share when you search on your broker's website. Generally, when investors talk about shares, you can assume that they mean ordinary shares. With some company's there can be two classes of share and usually they are called A and B. Generally, the different classes come with different voting rights. As an investor it is important to know what class of shares you are buying when you make an investment in a stock. The most important class of shares. The ordinary shareholders (or equity shareholders) are effectively the owners of the company and will bear the greatest risk. In the United Kingdom, Ordinary Shares are standard shares with no special

rights or restrictions. They have the potential to give the highest financial gains, but also have the highest risk. Ordinary shareholders are the last to be paid if the company is wound up. See also Cumulative Preference Shares, Preference Shares, Redeemable Shares, and Shares. The most common type of share in the ownership of a corporation. Holders of ordinary shares receive dividends. In the United Kingdom, shares whose holders are the owners of a company. They are entitled to a dividend after other preferential payments have been made, although payment of the dividend is at the discretion of the directors. Ordinary shares are sometimes classed as voting or non-voting shares. A regular share, without any special features such as those pertaining to a preference (preferred) share. In Australia, the most commonly traded security. Holders of ordinary shares are part-owners of a company and may receive payments in cash, called Dividends, if the company trades profitably. A class of shares which have no preferential rights as to either dividends out of profits or capital on a winding up. Also known as Equities in the United Kingdom; and as Common Stock in the United States. Share entitling the holder to all rights specified in the German Stock Corporation Act. In particular, holders of ordinary shares are entitled to a share in profits, to attend the General Meeting, vote at the General Meeting, request information from management, acquire new shares (subscription right) and receive a share of liquidation proceeds. Ordinary shares are the most common class of shares in Germany. The opposite of ordinary shares are Preference Shares. Ordinary Share is a share in the equity capital of a company. Ordinary shareholders have the right to receive all distributable profits of the company after debt holders and preference shareholders have been paid. They also have the right to attend and vote at general meetings of the company. / Би.Пи. (BP), Щел (Shell). В Соединённом Королевстве под Обыкновенными Акциями понимаются акции, держатели которых являются владельцами компании. Известна также как Обыкновенный Уставный Капитал (Common Stock) в Соединённых Штатах Америки. Под Обыкновенной Акцией понимается акция, дающая право её владельцу на получение дохода (дивиденда) в зависимости от величины прибыли акционерного общества.

ORE = РУДА – Ore:- originally from the Old English for crude or unwrought metal. It refers to any economic mineral deposit of precious or other metals. Ore is a rock from which metal or minerals can be extracted at a financial profit. In mining industry, Ore is a rock from which metals or minerals can be extracted. / В горной (горнодобывающей) промышленности, рудой считается горная порода, из которой могут быть экстрагированы металлы или минералы. Под Рудой понимается природное минеральное образование, содержащее какой-либо металл или несколько металлов в концентрациях, при которых экономически целесообразно их извлечение. Термин Руда иногда применяется и к ряду неметаллических полезных ископаемых. В зависимости от минерального состава, а также относительного содержания ценных компонентов, текстуры, структуры и тому подобного руды разделяются на отдельные технологические сорта. Под Рудой понимаются минеральные образования с таким содержанием и такими формами нахождения (крупность, характер соединений и другие) металлов или полезных минералов, которые обеспечивают технологическую возможность и экономическую целесообразность их извлечения. Скопление руды называют рудным телом. Сближенные и генетически связанные рудные тела образуют рудное месторождение или рудное поле. Различают руды металлические (железные, медные, свинцовые, цинковые и так далее) и неметаллические (мышьяковые, баритовые, асбестовые, флюоритовые, апатитовые, тальковые и так далее). Термин ‘руда’ часто применяется также к рудным минералам – основным компонентам металлических руд, например, халькопирит – руда меди, или медная руда.

ORE–BULK–OIL CARRIER = РУДОНЕФТЕНАВАЛОЧНИК (или БАЛКТАНКЕР–РУДОВОЗ) – Ore-Bulk-Oil Carriers (OBO Carriers) are the tankers and bulk carriers almost invariably carry cargoes one way only, and the return voyage to the loading port is made in ballast, earning no money. These ships are also vulnerable in times of a recession in their particular trade, as they are not flexible enough to carry other types of cargo. The combination ore-bulk-oil (or OBO) carrier was developed in answer to both these problems. The OBO has gas-tight holds which can load either bulk cargoes such as ore and coal or crude oil. These ships can be recognised because on deck they carry a row of hatches to load and discharge the bulk cargo and also have smaller hatches and the associated pipe work to load oil. Equipping a ship for two types of cargo inevitably means that OBOs are more expensive to build and maintain than pure bulk carriers or tankers, and a compromise cannot be as efficient as a dedicated design. In addition, flows of ore or coal and oil are rarely complimentary to each other, so OBOs tend to specialise in one or the other. Being able to switch to whichever trade is more profitable is useful, but the availability of many OBOs means that ships switching rapidly depressed freight rates in the alternative trade. For these reasons, building OBOs has become less popular of late. Ore-Bulk-Oil (OBO) Carrier is a large multi-purpose ship designed to carry cargoes wither of ore or other bulk commodities or oil so as to reduce the time the ship would be in ballast if restricted to one type of commodity. This type of ship is sometimes called Bulk-Oil Carrier.

ORE CARRIER = РУДОВОЗ – Ore Carrier is a large ship designed to be used for the carnage of ore. Because of the high density of ore, ore carriers have a relatively high center of gravity to prevent them being still when at sea, that is, rolling heavily with possible stress to the hull. / Под Рудовозом понимается грузовое судно для перевозки навалом тяжёлых руд; один из типов навалочников. Рудовоз имеет две продольные переборки между которыми располагаются грузовые трюмы сравнительно небольшого объёма (удельная грузовместимость современных рудовозов 0.5–0.8 $м^3$/т), грузовые люки больших размеров и обычно высокое двойное дно. На некоторых рудовозах можно перевозить поочерёдно руду и нефть (нефтенавалочники или нефтерудовозы).

ORE MINERAL = РУДНЫЙ МИНЕРАЛ – Ore Mineral is a mineral which contains a metal or metals which can be extracted at a financial profit.

ORE–OIL CARRIER = НЕФТЕРУДОВОЗ – Ore-Oil Carrier is a ship designed to carry either ore or oil in bulk. Ore/Oil Carrier is a ship capable of transporting dry, high-density cargoes, such as iron ore, as well as crude petroleum products. Abbreviated O/O Carrier.

ORE RESERVES = РУДНЫЕ РЕЗЕРВЫ – In mining industry, Ore Reserves are a part of ore resources for which appropriate assessments have been carried out to demonstrate at a given date extraction could be reasonably justified and which include consideration of and modification by realistically assumed mining, metallurgical, economic, marketing, legal, environmental, social and government factors. Resources are stated inclusive of reserves. / В горной (горнодобывающей) промышленности, .

ORE RESOURCES = РУДНЫЕ РЕСУРСЫ – In mining industry, Ore Resources are the material of intrinsic economic interest occurring in such form and quantity that there are reasonable prospects for eventual economic extraction. / В горной (горнодобывающей) промышленности, .

ORGAN = ОРГАН – Organ is a functionally distinct part of an organism consisting of several kinds of tissues such as leaf, root, flower, seed, etc. Organ is a distinct and visibly differentiated part of a plant such as a leaf. / таких как лист, корень, цветок, семя и так далее. Под Органом, от Греческого слова Órganon, означающее Инструмент или Орудие, понимается часть животного или растительного организма, выполняющая определённую функцию, например, сердце или печень у животных, корень или стебель у растений.

ORGANDY = ОРГАНДИ (или ТЮЛЬ ЖЁСТКОЙ ВЫДЕЛКИ) – Organdy is a very thin, transparent, stiff, wiry, muslin fabric used for dresses, neckwear, trimmings, and curtains. Swiss organdy is chemically treated and keeps its crisp, transparent finish through many

launderings. Organdy without chemical treatment loses its crispness in laundering and has to be restarched. Organdy crushes or musses but is easily pressed. Shadow organdy has a faint printed design in self-color. Organdy is a stiffened, sheer, lightweight plain weave fabric, with a medium to high yarn count. End-uses include blouses, dresses, and curtains/draperies. Organdy is a very fine transparent muslin with a stiff finish. Some has lappet, swivel, or flocked designs. Made with tightly twisted yarns. Crispness is due to a finish with starch and calendering which washes out, or a permanent crispness obtained with chemicals (Heberlein process). Wrinkles badly unless given a wrinkle-free finish (bellmanizing). May be bleached, dyed, printed, frosted, flocked, embroidered, or plisse. Used for fussy children's wear, trims, collars and cuffs, baby's wear, bonnets, artificial flowers, dolls clothes, millinery, summer formals, blouses, curtains, bedspreads, aprons. Organdy is a balanced, plain weave that is sheer, crisp, stiff and prone to wrinkling. It comes in three types of finishes, one commonly used finish is 'Stiff', but 'Semi-stiff' and 'Soft' finishes are also available. The latter two finishes are more popular for summer wear and draping apparels, whereas the first one is more popular for loose-fitting apparels, curtains or other home textiles. It can be made of silk, rayon, nylon or polyester. / Найлан[T3] (Nylon[TM]). Органди – кисея жёсткой отделки. Под Органди, от Французского слова Organdi, понимается очень тонкая жёсткая прозрачная матовая шёлковая ткань, выработанная мелкоузорчатым переплетением. Применяют для отделки платьев, изготовления воротничков, жабо и другого. Органди – тонкая, очень прозрачная, довольно жёсткая ткань из хлопка или искусственного шёлка, первоначально изготавливалась в Индии. В современной моде используется для вечерних блузонов и жакетов, одеваемых поверх бюстье или топа. Особенно была популярна в 1930-х и выпускалась, как гладкокрашеная светлых тонов, так и набивная.

ORGANELLE = ОРГАНЕЛЛА (или ОРГАНОИД) – Organelle is a distinct sub-cellular structure, usually with a specific function and compartmentalized within its own membrane. Organelle is the membrane-bound cellular compartment, e.g., nucleus, chloroplast, mitochondrion, Golgi apparatus. / Под Органеллами понимаются 'органы' простейших, выполняющие различные функции:- двигательные и сократительные, рецепторные, нападения и защиты, пищеварительные, экскреторные и секреторные. Часто термин Органеллы употребляют как синоним Органоидов.

ORGANIC = ОРГАНИЧЕСКОЕ – (1) Organic:- (i) of a mainly carbon-based molecule or chemical or chemistry; (ii) a style of agriculture where synthetic pesticides and fertilizers are not used; (iii) of food produced by organic farming methods; and (iv) a marketing ploy to sell sub-standard fruit with wormholes at an inflated price. See also Inorganic. Organic:- of, relating to, or derived from living organisms. Being composed of or containing matter of plant and animal origin. Organic agriculture, also known as Biological or Ecological, agriculture or protected equivalent forms of these words (in other languages) is a whole system approach based upon a set of processes resulting in a sustainable ecosystem, safe food, good nutrition, animal welfare and social justice. Organic production therefore is more than a system of production that includes or excludes certain inputs. Organic:- this term carries the chemist's meaning:- a chemical that is derived from carbon and hydrogen. It does not imply that the chemical had a biological origin, or that it is not dangerous. / субстандартный плод с червоточинами по . В химии под Органическими считаются соединения углерода с другими элементами. В сельском хозяйстве под Органическими понимаются удобрения, содержащие элементы питания растений в форме органических соединений – гуано, компосты, навоз, зелёные удобрения и другие. Улучшают физические и химические свойства почвы, активизируют жизнедеятельность полезных микроорганизмов. В бывшем СССР с 1973 на поля ежегодно вносили более 500 миллионов тонн органических удобрений.

(2) Organic – these fibers for these fabrics are grown using a production system that replenishes the soil and maintains its fertility. The growing methods also reduce the use of toxic pesticides and fertilizers, while at the same time they contribute to biologically diverse agriculture. Fields must be free from synthetic chemicals for three years to achieve organic certification. Our organic and natural fabrics are based on bamboo, organic cotton and seacell fibers.

ORGANIC COTTON = ОРГАНИЧЕСКИЙ ХЛОПЧАТНИК – The term 'Organic' prohibits the use of genetic engineering. By other words, cotton products labeled as organic should never have come into contact with genetic engineering. All organic standards exclude even the smallest traces of genetic modifications, i.e. the so-called Zero Tolerance is still valid. The problem of unavoidable contamination but also adulteration can not be ignored and will probably increase. Almost half of the global cotton cultivation area is already genetically modified. 40% of the textiles produced worldwide are made of cotton (Gossypium spec.). It is still the most important natural fiber. In the beginning of a new millennium, the global cultivation of genetically modified cotton has increased enormously. At the same time, a growing demand for organic cotton can be observed. The proportion of cotton produced according to biological criteria (organic, kBA, bio, green cotton etc) is still very low, worldwide approximate 1%, but there is a strong increase. Examples for organic criteria are the renunciation of synthetic pesticides, insecticides and fertilizer. Manual harvesting of cotton is obligatory, i.e. the use of defoliants is prohibited. The fertility of the arable farmland should be maintained or improved. Between 2001 and 2005 global sales of organic cotton products increased 35% yearly, i.e. sales increased by USD338 million to USD583 million. The overall global increase in production of organic cotton fibers was around 400% – a dramatic increase in only 4 years. During the harvest period 2004/05 organic cotton was produced in 22 countries, primarily in Turkey (40%), India (25%), the United States (7.7%) and China (7.3%). It is very difficult if not impossible to avoid unintended mixture of organic cotton and genetically modified cotton. But adulteration can also not be excluded because of the increasing demand for organic cotton, its higher price and the very restricted availability. Certification programs and standards that guarantee the organic status still rely on documents and do not yet use analytical testing. This is the reason why Impetus Bioscience GmbH (Bremerhaven, Germany) has developed a reliable and sensitive molecular genetic detection system to identify genetic modifications in cotton fibers. Organically grown cotton uses crop rotation, beneficial insects, compost and other farming methods in place of chemical fertilizers and intensive farming techniques. The Organic Cotton sector continues to grow, albeit more slowly in the global economic slowdown, reaching over 180 000 metric tons of lint in 2008/09. Organic Cotton is one option to meet the challenges of land use, food security and water scarcity. Small growers exposed to variable rainfall and problems from debt produce most organic Cotton in India. Many farmers view organic Cotton as a risk reduction tool, but the use of fewer purchased inputs involves a tradeoff with productivity. Often the smallest and most resource poor farmers come to organic, and in fact organic works better in marginal or tribal areas. Certification of organic Cotton is expensive and in some states of India the government is supporting certification costs. In September 2009, speakers of the 68th Plenary Meeting of the International Cotton Advisory Committee (ICAC) conveyed a collective message that organic Cotton requires technological knowledge. An essential element of organic Cotton production is to have more planning and certainty through partnerships to ensure long-term viability. Organic Cotton production, processing, spinning and marketing at the retail level involve a long and complex chain requiring traceability and communication links between producers and consumers. The future of organic Cotton production may involve contract farming with direct links to retailers. Cotton grown without synthetic chemicals. As the environmental and social consciousness grows, the use of organic products is also on the rise. One such is Organic Cotton which has been gaining popularity for the last few years. Some of the facts about organic Cotton are given below:- (i) Organic Cotton is grown using methods and materials that have a low impact on the environment. Organic production systems replenish and maintain soil fertility, reduce the use of toxic and persistent pesticides and fertilisers and build biologically diverse agriculture. Existing regulations prohibit the use of genetically modified seed for organic farming. (ii) Production of organic Cotton registered a 20 per cent growth in 2007/08 when 1,75,113 tonnes were produced from 2.53 lakh

hectares. About 22 countries grow organic Cotton led by India and followed by countries like Turkey, Syria, Tanzania, China, United States, Uganda, Peru and Burkina Faso. Approximately 2.2 lakh farmers grow organic cotton. (iii) The year 2008/09 was challenging one for organic Cotton because of over production without corresponding increase in demand. This resulted in sizable unsold stocks. However, leading brands and retailers are said to retain their commitment to use organic cotton and are taking steps to utilise the stocks. (iv) As a result of consumer interest, organic Cotton fiber is used in several textile products such as personal care items (sanitary products, make-up removal pads, cotton puffs and ear swabs) home furnishings (towels, bathrobes, sheets, blankets, bedding), Children's products (toys, diapers), clothes of all kinds and styles whether for lounging, sports or the workplace. In addition, organic cottonseed is used for animal feed and organic cottonseed oil is used in a variety of food products including cookies and chips. Bolstered by strong sustained manufacturer demand, organic Cotton has continued to grow. In the season 2009/10, the production of organic Cotton rose 15% to about 242 000 tons. This amount represents a 1.1% share of global Cotton production compared with 0.9% in the season 2008/09. India has remained the top producing nation with 196 000 tons. The production quantity increased 539% over the last 5 years from 38 000 tons in the season 2005/06. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Примерами для попадания под критерий Органического, являются отказ от искусственных пестицидов, инсектицидов и удобрений. Удобрение обрабатываемых сельскохозяйственных угодий должно быть продолжительным и улучшенным. Но примешивание также не может быть исключено из-за усиливающегося спроса на органический хлопок, его высокой цены и крайне ограниченной доступности. . Хлопок, выращенный без использования синтетических химикатов. Импетос Байосайэнс Ге.эм.бе.Ха. (Impetus Bioscience GmbH) Брэмэрхафэн (Bremerhaven), Германия. Puff = Буф или Вставка или Клин.

ORGANIC FERTILIZERS = ОРГАНИЧЕСКИЕ УДОБРЕНИЯ – Organic Fertilizers are fertilizer materials derived from plant and animal parts or residues. / Под Органическими Удобрениями понимаются удобрения, содержащие элементы питания растений в форме органических соединений – гуано, зелёные удобрения, компосты, навоз и другие. Улучшают физические и химические свойства почвы, активизируют жизнедеятельность полезных микроорганизмов. В бывшем СССР ежегодно на поля вносили (с 1973) более 500 миллионов тонн органических удобрений.

ORGANIC GROWTH = ОРГАНИЧНЫЙ РОСТ – In finance, Organic Growth is the process of business expansion due to increased output, sales, or both, as opposed to mergers, acquisitions, or take-overs. Typically, the organic growth rate also excludes the impact of foreign exchange. Growth including foreign exchange, but excluding divestitures and acquisitions is often referred to as core growth. Organic growth is growth that comes from a company's existing businesses, as opposed to growth that comes from buying new businesses. It may be negative. Organic growth figures are adjusted for the effects of acquisitions and disposals of businesses. Organic growth does include growth over a period that results from investment in businesses the company owned at the beginning of the period. What it excludes is the boost to growth from acquisitions, and the decline from sales and closures of whole businesses. When a company does not disclose organic growth numbers, it is usually possible to estimate them by estimating the numbers for acquisitions made in the period being looked at and in the previous year. It is useful to break down organic sales growth into that coming from market growth and that coming from gains in market share:- this makes it easier to see how sustainable growth is. Relating to organic input in an organisation, it can also relate to the act of closing down cost centres through established organic methods instead of waiting for a Finance list. The mechanisms and rate of growth of firms experiencing organic growth was extensively studied by Edith Penrose in her 1958 book 'The Theory of the Growth of the Firm'. Non-acquisition growth. Part of the growth (of a company) resulting from internal forces and not from acquisitions. / выработка (output).

ORGANIC IMPURITIES = ОРГАНИЧЕСКИЕ ПРИМЕСИ (или РАСТИТЕЛЬНЫЕ ПРИМЕСИ) – Organic Impurities:- organic, a broad term, applied to substances obtained from living organisms, or any substances which consist largely of hydrogen, oxygen, and carbon. Also known as Shives. The other general class of substance is the mineral or inorganic group. / Примеси из частиц Хлопчатника (листка, прицветника, цветка, створок коробочек, стебля, засохших, гнилых и ломких долек хлопка-сырца, волокно которых не имеет прочности) и сорных растений.

ORGANIC MATTER = ОРГАНИЧЕСКОЕ ВЕЩЕСТВО (или ОРГАНИЧЕСКАЯ МАТЕРИЯ) – Organic Matter is the fraction of the soil that includes plant and animal residues at various stages of decomposition and substances synthesized by the soil populations of various organisms. / Под Органическим Веществом понимается:- (1) в химии – то же, что органическое соединение (соединение углерода с другими элементами). (2) В геологии – сложная смесь природных органических соединений, являющаяся малым компонентом почв, морских и озёрных почв, осадочных горных пород, а также поверхностных и подземных вод. Первоисточник органического вещества – в основном растения. Различают гумусовое, сапропелевое и липтобиолитовое органическое вещество. Среднее содержание в осадочных породах около 15–20 кг/м^3. Составляют основную массу углей и горючих сланцев и предположительно являются источником нефти и горючих газов.

ORGANIC PHOSPHORUS = ОРГАНИЧЕСКИЙ ФОСФОР – Organic Phosphorus:- phosphorus present as a constituent of an organic compound, or a group of organic compounds such as glycerophosphoric acid, inositol phosphoric acid, cytidylic acid, etc.

ORGANIC RICE = ОРГАНИЧЕСКИЙ РИС – The number of acres planted to Organic Rice in the United States is very small, but growing. For Rice to be certified organic by organizations such as California Certified Organic Farmers (CCOF), the field used must have gone for three years without use of pesticides, herbicides, fertilizers, or any chemicals. Then the crop must be grown, harvested, stored, and milled under organic conditions. The field yields for organic Rice are unpredictable and average about half of conventional Rice. Much of the Rice is removed in the milling process because of damages due to insects and weeds. It is very difficult to store organic Rice and avoid insect problems. The final cost of milled organic Rice is about three times that of conventional Rice. Today in the United States there is no federal standard for organic Rice. This may change soon. There are several non profit and private organizations who certify Rice as organic. They have strict requirements and the public has learned to trust and respect many of their logos on organic products. Sage V Foods is certified by CCOF and other organizations.

ORGANIC SOIL = ОРГАНОГЕННАЯ ПОЧВА (или ОРГАНИЧЕСКАЯ ПОЧВА) – Organic Soil is a soil which contains a high percentage (> 15 or 20%) of organic matter.

ORGANIC SOLVENT = ОРГАНИЧЕСКИЙ РАСТВОРИТЕЛЬ – Organic Solvent is a chemical compound (usually liquid) containing carbon to dissolve another substance (the solute).

ORGANISATION FOR CO–OPERATION BETWEEN RAILWAYS = ОРГАНИЗАЦИЯ СОТРУДНИЧЕСТВА ЖЕЛЕЗНЫХ ДОРОГ – The Organization for Co-operation between Railways (OSJD) is an international organization established at the Railway Ministers Conference in Sofia, Republic of Bulgaria, by the ministers, responsible for the railway transport, on 1956-June-28. The OSJD activities are undertaken according to the OSJD Statute, which is of an international treaty nature. Among the OSJD members there are transport ministries and central transport bodies, responsible for the railway transport, from 27 countries. Major OSJD activities comprise:- (i) development and improvement of international railway transportation with the traffic between Europe and Asia in the first

place, to include combined transportation; (ii) development of consentaneous transport policy in the field of international railway traffic, elaboration of railway transport and OSJD activity strategies; (iii) improvement of international transport law, administration of the Agreement concerning International Passenger Traffic by Rail (SMPS), Agreement concerning International Goods Traffic by Rail (SMGS) and other legal documents connected with the international railway traffic; (iv) co-operation on the solution of the problems connected with the economic, information, scientific, technological and ecological aspects of railway transport; (v) development of measures aimed at the increase of railway transport competitiveness in comparison with other modes of transportation; (vi) co-operation in the field of railway operation and technical matters connected with further development of international railway traffic; (vii) collaboration with other international organizations, engaged in railway transportation matters, including those of combined transport. The OSJD Committee is the executive body of the Organization. It exercises control over OSJD activities in the period between the sessions of the Ministers Conference and General Directors Conference meetings. The Committee functions as a depository for the agreements and contracts, concluded within the OSJD framework. The Committee is manned by the experts, appointed to the OSJD by its member countries. The Committee is headed by the Chairman, with two Deputy Chairmen and a Committee Secretary complementing the Committee's directorate. The Committee headquartered in Warszawa, Poland. / Организация Сотрудничества Железных Дорог (ОСЖД) является международной организацией, созданной на Совещании Министров Железнодорожного Транспорта 28 Июня 1956 в Софии, Республика Болгария, министрами, ведающими железнодорожным транспортом. Основой существования и работы ОСЖД является 'Положение об ОСЖД', которое имеет характер международного договора. Членами ОСЖД являются транспортные министерства и центральные государственные органы, ведающие железнодорожным транспортом, 27 стран. Основными направлениями деятельности ОСЖД являются:- (i) развитие и совершенствование международных железнодорожных перевозок, прежде всего в сообщении между Европой и Азией, включая комбинированные перевозки; (ii) формирование согласованной транспортной политики в области международных железнодорожных перевозок, разработка стратегии деятельности железнодорожного транспорта и стратегии деятельности ОСЖД; (iii) совершенствование международного транспортного права, ведение дел по Соглашению, касающемуся Международного Железнодорожного Пассажирского Сообщения (СМПС), Соглашению, касающемуся Международного Железнодорожного Грузового Сообщения (СМГС) и по другим правовым документам, связанным с международными железнодорожными перевозками; (iv) сотрудничество по решению проблем, связанных с экономическими, информационными, научно-техническими и экологическими аспектами железнодорожного транспорта; (v) разработка мероприятий по повышению конкурентоспособности железнодорожного транспорта по отношению к другим видам транспорта; (vi) сотрудничество в области эксплуатации железных дорог и технических вопросов, связанных с дальнейшим развитием международных железнодорожных перевозок; и (vii) сотрудничество с международными организациями, занимающимися вопросами железнодорожного транспорта, включая комбинированные перевозки. Исполнительным органом ОСЖД является Комитет. Комитет обеспечивает деятельность ОСЖД в период между сессиями Совещаний Министров и заседаниями Конференций Генеральных Директоров. Комитет выполняет функции депозитария соглашений и договоров, заключенных в рамках ОСЖД. В состав Комитета входят специалисты, направленные странами членами ОСЖД. Комитет возглавляет Председатель Комитета. В состав руководства входят два Заместителя Председателя и Секретарь Комитета. Штабквартира Комитета расположена в Варшаве, Польша.

ORGANISATION FOR ECONOMIC CO–OPERATION AND DEVELOPMENT = ОРГАНИЗАЦИЯ ЭКОНОМИЧЕСКОГО СОТРУДНИЧЕСТВА И РАЗВИТИЯ – (2004) Pursuant to Article 1 of the Convention signed in Paris on 1960-December-14, and which came into force on 1961-September-30, the Organisation for Economic Co-operation and Development (OECD) shall promote policies designed:- (i) to achieve the highest sustainable economic growth and employment and a rising standard of living in Member countries, while maintaining financial stability, and thus to contribute to the development of the world economy; (ii) to contribute to sound economic expansion in Member as well as non-member countries in the process of economic development; and (iii) to contribute to the expansion of world trade on a multilateral, non-discriminatory basis in accordance with international obligations. The original Member countries of the OECD are:- Austria, Belgium, Canada, Denmark, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom and the United States. The following countries became Members subsequently through accession at the dates indicated hereafter:- Japan (1964-April-28), Finland (1969-January-28), Australia (1971-June-07), New Zealand (1973-May-29), Mexico (1994-May-18), the Czech Republic (1995-December-21), Hungary (1996-May-07), Poland (1996-November-22), the Republic of Korea (1996-December-12) and Slovakia (2000-September-28), Chile (2010-May-07), Slovenia (2010-July-21), Israel (2010-September-07), and Estonia (2010-December-09). The Commission of the European Communities takes part in the work of the OECD (Article 13 of the OECD Convention). Headquartered in Paris, France. Twenty-four member international organization created on 1961-October-01 to promote economic cooperation and policies leading to optimum economic growth, employment and living standards in member nations; to maintain financial stability and contribute to the development of the world economy; and to expand world trade. It is the successor of the Organisation For European Economic Cooperation (OEEC), which was created to implement the Marshall Plan. The OECD's members include 18 European countries (Austria, Belgium, Denmark, France, Germany, Greece, Ireland, Iceland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom), and Australia, Canada, Japan, New Zealand, and the United States and its territories (Guam, Puerto Rico, and the Virgin Islands). In addition, Czech Republic, Hungary, Poland, and South Korea joined the OECD in 1996. The former Yugoslavia also participated in some of its activities. Also was known as Group Of 24. The Organisation for Economic Co-operation and Development (OECD) is the primary forum for the discussion of common economic and social issues confronting the United States, Canada, Western Europe, Japan, Australia and New Zealand. It was founded in 1960 as the successor to the Organisation for European Economic Cooperation which oversaw European participation in the Marshall Plan. The OECD's fundamental objective is 'to achieve the highest sustainable economic growth and employment and a rising standard of living in member countries while maintaining financial stability and thus contribute to the world economy'. The Organisation for Economic Co-operation and Development (OECD) is comprised of 34 countries (in 2011):- Australia, Austria, Belgium, Canada, Chile, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Korea, Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, the Slovak Republic, Slovenia, Spain, Sweden, Switzerland, Turkey, the United Kingdom and the United States. See also The International Energy Agency. The Maritime Transport Committee (MTC) is a part of this organization. The mission of the Organisation for Economic Co-operation and Development (OECD) is to promote policies that will improve the economic and social well-being of people around the world. The OECD provides a forum in which governments can work together to share experiences and seek solutions to common problems. We work with governments to understand what drives economic, social and environmental change. We measure productivity and global flows of trade and investment. We analyse and compare data to predict future trends. We set international standards on all sorts of things, from the safety of chemicals and nuclear power plants to the quality of cucumbers. We look, too, at issues that directly affect the lives of ordinary people, like how much they pay in taxes and social security, and how much leisure time they can take. We compare how different countries' school systems are readying their young people for modern life, and how different countries' pension systems will look after their citizens in old age. Drawing on facts and real-life experience, we recommend policies designed to make the lives of ordinary people better. We work with business, through the Business and Industry Advisory Committee to the OECD, and with labor, through the Trade Union Advisory

Committee. We have active contacts as well with other civil society organisations. The common thread of our work is a shared commitment to market economies backed by democratic institutions and focused on the wellbeing of all citizens. Along the way, we also set out to make life harder for the terrorists, tax dodgers, crooked businessmen and others whose actions undermine a fair and open society. 2011:- The Organisation for Economic Co-operation and Development (OECD) is celebrating its 50th anniversary, but its roots go back to the rubble of Europe after World War II. Determined to avoid the mistakes of their predecessors in the wake of World War I, European leaders realised that the best way to ensure lasting peace was to encourage co-operation and reconstruction, rather than punish the defeated. The Organisation for European Economic Cooperation (OEEC) was established in 1947 to run the US-financed Marshall Plan for reconstruction of a continent ravaged by war. By making individual governments recognise the interdependence of their economies, it paved the way for a new era of cooperation that was to change the face of Europe. Encouraged by its success and the prospect of carrying its work forward on a global stage, Canada and the US joined OEEC members in signing the new OECD Convention on 1960-December-14. The Organisation for Economic Co-operation and Development (OECD) was officially born on 1961-September-30, when the Convention entered into force. Other countries joined in, starting with Japan in 1964. Today, 34 OECD member countries worldwide regularly turn to one another to identify problems, discuss and analyse them, and promote policies to solve them. The track record is striking. The US has seen its national wealth almost triple in the five decades since the OECD was created, calculated in terms of gross domestic product per head of population. Other OECD countries have seen similar, and in some cases even more spectacular, progress. So, too, have countries that a few decades ago were still only minor players on the world stage. China, India and Brazil have emerged as new economic giants. Most of the countries that formed part of the former Soviet bloc have either joined the OECD or adopted its standards and principles to achieve our common goals. Russia is negotiating to become a member of the OECD, and we now have close relations with Brazil, China, India, Indonesia and South Africa through our 'enhanced engagement' programme. Together with them, the OECD brings around its table 40 countries that account for 80% of world trade and investment, giving it a pivotal role in addressing the challenges facing the world economy. The Council:- decision-making power is vested in the OECD Council. It is made up of one representative per member country, plus a representative of the European Commission. The Council meets regularly at the level of permanent representatives to OECD and decisions are taken by consensus. The Council meets at ministerial level once a year to discuss key issues and set priorities for OECD work. The work mandated by the Council is carried out by the OECD Secretariat. Committees:- representatives of the 34 OECD member countries meet in specialised committees to advance ideas and review progress in specific policy areas, such as economics, trade, science, employment, education or financial markets. There are about 250 committees, working groups and expert groups. Some 40 000 senior officials from national administrations go to OECD committee meetings each year to request, review and contribute to work undertaken by the OECD Secretariat. Once they return home, they have online access to documents and can exchange information through a special network. OECD Secretariat:- Angel Gurría heads the OECD Secretariat and is assisted by one or more Deputy Secretaries-General. Mr Gurría also chairs the Council, providing the link between national delegations and the Secretariat. The Secretariat in Paris is made up of some 2 500 staff who support the activities of committees, and carry out the work in response to priorities decided by the OECD Council. The staff includes economists, lawyers, scientists and other professionals. Most staff members are based in Paris but some work at OECD centres in other countries. OECD uses its wealth of information on a broad range of topics to help governments foster prosperity and fight poverty through economic growth and financial stability. We help ensure the environmental implications of economic and social development are taken into account. OECD's work is based on continued monitoring of events in member countries as well as outside OECD area, and includes regular projections of short and medium-term economic developments. The OECD Secretariat collects and analyses data, after which committees discuss policy regarding this information, the Council makes decisions, and then governments implement recommendations. Mutual examination by governments, multilateral surveillance and a peer review process through which the performance of individual countries is monitored by their peers, all carried out at committee-level, are at the heart of our effectiveness. An example of the peer review process at work is to be found in the Working Group on Bribery, which monitors the implementation by signatory countries of the OECD Convention on Combating Bribery of Foreign Officials in International Business Transactions. Discussions at OECD committee-level sometimes evolve into negotiations where OECD countries agree on rules of the game for international co-operation. They can culminate in formal agreements by countries, for example on combating bribery, on arrangements for export credits, or on the treatment of capital movements. They may produce standards and models, for example in the application of bilateral treaties on taxation, or recommendations, for example on cross-border co-operation in enforcing laws against spam. They may also result in guidelines, for example on corporate governance or environmental practices. Organisation for Economic Co-operation and Development (OECD) is an intergovernmental organization, established in 1950 and based in Paris. It currently has 30 member countries and links with 70 others. It provides a forum for its members to consult each other, to compare experiences and to cooperate in order to achieve the highest possible sustainable growth and improve economic and social well-being in line with the principles of a market economy. The OECD is a unique forum where the governments of thirty democracies work together to address the economic, social and environmental challenges of globalisation. The OECD is also at the forefront of efforts to understand and to help governments respond to new developments and concerns, such as corporate governance, the information economy and the challenges of an ageing population. The Organisation provides a setting where governments can compare policy experiences, seek answers to common problems, identify good practice and work to co-ordinate domestic and international policies. The OECD member countries are (in August 2008):- Australia, Austria, Belgium, Canada, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Japan, Republic of Korea, Luxembourg, Mexico, Netherlands, New Zealand, Norway, Poland, Portugal, Slovak Republic, Spain, Sweden, Switzerland, Turkey, United Kingdom and United States. The European Commission takes part in the work of the OECD. / вывозной (или экспортный) кредит (export credit). Организация Экономического Сотрудничества и Развития (ОЭСР) является межгосударственной экономической организацией, созданной 01 Октября 1961. Основными целями ОЭСР являются координация экономической политики и согласование программ помощи развивающимся странам. Штабквартира расположена в Париже, Франция. 25 Мая 2011 организация праздновала своё 50-летие.

ORGANISATION FOR EUROPEAN ECONOMIC COOPERATION = ОРГАНИЗАЦИЯ ЕВРОПЕЙСКОГО ЭКОНОМИЧЕСКОГО СОТРУДНИЧЕСТВА – The Organisation for European Economic Co-operation; (OEEC) came into being on 1948-April-16. It emerged from the Marshall Plan and the Conference of Sixteen (Conference for European Economic Co-operation), which sought to establish a permanent organisation to continue work on a joint recovery programme and in particular to supervise the distribution of aid. The headquarters of the Organisation was in the Chateau de la Muette in Paris, France. The European organisation adopted was a permanent organisation for economic co-operation, functioning in accordance with the following principles:- (i) promote co-operation between participating countries and their national production programmes for the reconstruction of Europe; (ii) develop intra-European trade by reducing tariffs and other barriers to the expansion of trade; (iii) study the feasibility of creating a customs union or free trade area; (iv) study multi-lateralisation of payments; and (v) achieve conditions for better utilisation of labor. The OEEC originally had 18 participants:- Austria, Belgium, Denmark, France, Greece, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Portugal, Sweden, Switzerland, Turkey, United Kingdom, and Western Germany (originally represented by both the combined American and British occupation zones (The Bizone) and the French occupation zone). The Anglo-American zone of the Free Territory of Trieste was

also a participant in the OEEC until it returned to Italian sovereignty. Representatives of these countries and territories sat on the Council of the Organisation, chaired by well-known figures of the era (Paul-Henri Spaak, Paul van Zeeland, Dirk Strikker, Anthony Eden, Richard Heathcoat Amory). Decisions required unanimity. Coucil appointed an executive committee of seven members, with partial delegation of powers between full Council meetings. The business structure of the subordinate bodies of OEEC Council consisted of approximately fifteen vertical and five horizontal technical committees responsible for handling particular areas:- food and agriculture, coal, electricity, oil, iron and steel, raw materials, machinery, non-ferrous metals, chemical products, timber, pulp and paper, textiles, maritime and inland transport, programmes, balance of payments, trade, intra-European payments and manpower. The Secretary-General (Robert Marjolin until 1955 and then René Sergent) derived his authority from the Council. Work in the Seretartiat was carried out in directorates, roughly aligned with member country ministries and with the technical committees. The OEEC's first objective in 1948–49 was to prepare the European Recovery Programme which justified the American effort. Severe difficulties arose with some beneficiary countries proving incapable of reaching agreement on prior harmonisation of their long-term programmes. The OEEC was also involved in the allocation of Marshall Aid Dollars. This problem, partly solved thanks to arbitration by a 'Committee of Wise Men' (G. Guindey, E.P. Roll, G. Malagodi, D. Spierenburg) in August 1949, flared up again at the second aid share-out. It was overshadowed by the British currency crisis and devaluation in September 1949. Baron Snoy d'Oppuers, Deputy Chairman of the OEEC Council, and Secretary General Robert Marjolin acted as arbitrators. They drew up a scale for sharing out the aid, which Britain accepted. Participants received 11 800 000 000 Dollars between 1948-April-03 and 1950-June-31 (Britain 24%, France 20%, Italy 11.1%, FRG 11%). A crisis hit the Marshall Plan in autumn 1949. The Americans were changing their policy regarding aid, which they considered insufficiently directed towards economic integration. Formerly, Marshall Plan credit had been used mainly to make up the European countries' Dollar balance deficit. The United States was now prepared to provide credits, for the final two years of aid, on the basis of an intra-European action programme. In October-November 1949 the head of the ECA, Paul Hoffman, complained to the OEEC that it was not making enough proposals for freeing trade. Under this pressure, the Europeans arrived at an agreement to free 50% of private import trade in foodstuffs, manufactured products and raw materials. These were measures of limited scope, since the liberation related only to a joint list of products, and a large part of the trade remained State trade. Nonetheless, by the end of 1950, 60% of private intra-European trade had been freed thanks to OEEC action, a percentage that rose to 84% in 1955 and 89% in 1959. Another outstanding act of co-operation was the creation of the European Payments Union under OEEC auspices in September 1950. It had three objectives:- (i) remove the obstacle of inconvertibility of European currencies; (ii) remove quantity restrictions; and (iii) suppress bilateral commercial practices. Organisation of the EPU led to the creation of the necessary compensation fund to balance intra-European deficits by determining a quota for each country. The quota would act as a reference for automatic settlement of surpluses. An EPU common fund was also established to which each member would contribute up to 60% of its quota. The EPU was dissolved on 1958-December-27 when the currencies were declared convertible with Dollars. EPU negotiations had been accompanied by consideration of methods of freeing trade. In June 1950 Stikker, Chairman of the OEEC Council, put forward an action plan for the economic integration of Europe through specialization of activities, division of labor and the creation of a single European market. Countries with heavy state trade were asked to issue long-term purchase contracts at reasonable prices, and a joint list of objects for freeing was proposed. A European fund was to be set up to alleviate the consequences of increased competition for firms. Other proposals were made to accelerate the freeing of trade, and also to give the OEEC power to organize the European economies or rationalise them. Consequently, the French and Italian ministers, Petsche and Pella, amended the Stikker Plan. Central to these projects was a European Investment Bank (EIB), which came into being with the Common Market. The OEEC declined after 1952 due to the unexpected end of the Marshall Plan and a subsequent shift in favor of NATO. The mutual security policy that blended economic aid and military assistance – the OEEC being replaced for some purposes on 1952-January-01 by the Mutual Security Agency (MSA) – almost dealt the organisation a fatal blow. The debate on using NATO in lieu of the OEEC as the preferred vehicle for economic aid began. The military threat had given Atlanticists the idea of utilising the OEEC and its committees, teams of experts and statistical output, with a view to promoting the alliance's rearmament while controlling the difficult problems of inflation and allocation of raw materials. In the name of efficient rearmament, the British took a position in favor of a NATO economic committee, with the hope of dispossessing the OEEC. A compromise was reached:- the September 1951 NATO conference in Ottawa set up a special committee (Monnet, Harriman, Plowden) charged with studying the question of the economic development of NATO countries in relation to the economic possibilities of each of the members. It was decided that the OEEC would deal with European economic questions, including those relating to the functioning of NATO, on its own. Other autonomous agencies developed to fill out the sphere of OEEC's activities. The Marshall Plan had been a vehicle for the 'cult of productivity' in the firm. A productivity programme was resumed in 1952 by a European Productivity Agency set up under OEEC auspices and largely financed by the United States. Over 3 000 specialists and hundreds of farmers, organised into more than 500 teams from 15 different countries, visited American factories and farms. In late 1957, a European Nuclear Energy Agency was set up under the OEEC. Its first act was to sign a convention establishing security controls on nuclear energy. The same year the OEEC provided the framework for negotiations aimed at determining conditions for setting up a European Free Trade Area, to bring together the Common Market of the Six and the other OEEC members on a multilateral basis. Peter Thorneycroft was responsible for coordination. Following signature of the Rome Treaties on 25 March 1958, an intergovernmental ministerial committee was set up in October by the Council of the Organisation, chaired by Reginald Maudling, to pursue the negotiations. In September 1961 the OEEC was superceded by the Organisation for Economic Co-operation and Development (OECD), a worldwide body. In 1961, the OECD consisted of the European founder countries of the OEEC plus the United States and Canada. The list of member countries has expanded over the years, with 34 countries today. International organization created to promote economic cooperation, recovery and development, which operated from 1948 until 1960 and was superseded by the Organisation for Economic Cooperation and Development (OECD). The Organisation for European Economic Cooperation (OEEC) was created on 1948-April-16. Its members included 18 European countries, two associate members (Canada and the United States) and one observer (former Yugoslavia). The two major functions of the OEEC were to establish a common economic program to distribute aid allocated under the Marshall Plan and, beginning in 1949, to foster and promote freedom of international trade and an international system of payments to bring an end to the bilateral trade system that existed until the post-war era. / Пол-Хори Шпак (Paul-Henri Spaak), Пол фан Зэлянд (Paul van Zeeland), Дирк Страйка (Dirk Strikker), Энтэни Идэн (Anthony Eden), Ричад Хискоут Эмори (Richard Heathcoat Amory). Робэт Мардьжолин (Robert Marjolin) до 1955 и затем Ронэ Сержо (René Sergent). Дьжи. Гинди (G. Guindey), И.Пи. Рол (E.P. Roll), Дьжи. Малагоди (G. Malagodi), Ди. Спиренбурх (D. Spierenburg). ORGANISATION MONDIALE DES DOUANES = ОРГАНИЗАСЬЁН МОНДЬЯЛЬ ДЭ ДУАН (или ВСЕМИРНАЯ ОРГАНИЗАЦИЯ ТАМОЖЕН) – Organisation Mondiale Des Douanes (OMD) in French:- is the World Customs Organization (WCO) in English. See also World Customs Organization. / Смотрите также Всемирная Организация Таможен (World Customs Organization).

ORGANISATION MONDIALE DU COMMERCE = ОРГАНИЗАСЬЁН МОНДЬЯЛЬ ДЮ КОМЭРС (или ВСЕМИРНАЯ ОРГАНИЗАЦИЯ ТОРГОВЛИ) – Organisation Mondiale Du Commerce (OMC) in French:- is the World Trade Organization (WTO) in English. See also World Trade Organization. / Смотрите также Всемирная Организация Торговли (World Trade Organization).

ORGANISATION OF EASTERN CARIBBEAN STATES = ОРГАНИЗАЦИЯ ВОСТОЧНО–КАРИБСКИХ ГОСУДАРСТВ – The Organisation of Eastern Caribbean States (OECS) came into being on 1981-June-18, when seven Eastern Caribbean countries signed a treaty agreeing to cooperate with each other and promote unity and solidarity among the Members. The Treaty became known as the Treaty of Basseterre, so named in honour of the capital city of St. Kitts and Nevis where it was signed. Following the collapse of the West Indies Federation, and prior to the signing of the Treaty of Basseterre, two caretaker bodies were created:- the West Indies Associated States Council of Ministers (WISA) in 1966 and the Eastern Caribbean Common Market (ECCM) in 1968. As the islands gained their independence from Britain it became evident that there was need for a more formal arrangement to assist with their development efforts. So it was that the OECS was established. The WISA Secretariat became the central secretariat of the OECS and the ECCM, the Economic Affairs Secretariat. In mid 1997, as a result of restructuring of the organisation the Economic Affairs Secretariat was merged into and became a Division of the OECS Secretariat in St Lucia. The OECS is now a nine member grouping comprising Antigua and Barbuda, Commonwealth of Dominica, Grenada, Montserrat, St Kitts and Nevis, St Lucia and St Vincent and the Grenadines. Anguilla and the British Virgin Islands are associate members of the OECS. The Mission of the Organisation of Eastern Caribbean States is to be a Center of Excellence contributing to the sustainable development of OECS Member States by supporting their strategic insertion into the global economy while maximizing the benefits accruing from their collective space. The organization's objectives:- as set out in the Treaty of Basseterre:- (i) to promote co-operation among the member states and the regional and international level; (ii) to promote unity and solidarity among the member states and to defend their sovereignty, territorial integrity an independence; (iii) to assist the member states in the realization of their obligations and responsibilities to the international community with due regard to the role of international law as a standard of conduct in their relationships; (iv) to seek to achieve the fullest possible level of harmonization of foreign policy among the member states; to seek to adopt, as far as possible, common positions on international issues and to establish and to maintain wherever possible, arrangements for joint overseas representation and/or common services; (v) to promote economic integration among the member states; and (vi) to pursue these purposes through its respective institutions by discussion of questions of common concern and by agreement and common action. The OECS Authority is the highest decision-making body of the organization. The Authority comprises the Heads of Government (Prime Ministers of the independent countries as well as the Chief Ministers and Premier of the non-independent countries) whose policy decisions direct the work of the organization as required. The chairmanship of the authority changes every year, rotating alphabetically by country. The OECS Authority meets twice yearly, and from time to time in Special Session as and when required. The functions of the organization are set out in the Treaty establishing the Organisation of Eastern Caribbean States, which was signed on 1981-June-18 in Basseterre, and are coordinated by the Secretariat under the direction and management of the Director General. A new treaty, The Treaty of Basseterre to establish the OECS Economic Union, will be ratified on 2010-June-18. The OECS functions in a rapidly changing international economic environment, characterised by globalization and trade liberalization, which are posing serious challenges to the economic and social stability of these small island developing states. It is the purpose of the organization to assist its Members to respond to these multi-faceted challenges by identifying scope for joint or coordinated action towards the economic and social advancement of their countries. The work of the Secretariat is constantly informed by considerations of cost effectiveness in the context of the need to respond to the increasing challenges placed on it, taking into account the limited fiscal capacities of its members. The Secretariat consists of four main Divisions namely:- Division of the Office of the Director General, Social and Sustainable Development Division, Corporate Services Division and Economic Affairs Division. These four Divisions oversee the strategic direction of the organization, as well as the work of a number of specialized institutions, work units or projects located in six countries – Commonwealth of Dominica, Saint Lucia, Belgium, Switzerland, Canada, and the United States of America. A Central Secretariat located on Morne Fortune, Castries, Saint Lucia. Organisation of Eastern Caribbean States (OECS) is made up of 8 members (Antigua and Barbuda, British Virgin Islands, Dominica, Grenada, Montserrat, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines) with the goal of promoting political, economic and defense cooperation. / Организация Восточно-Карибских Государств (ОВКГ) была создана 18 Июня 1981 восьмью государствами участниками (Антигуа и Барбуда, Британские Виргинские Острова, Доминика, Гренада, Монсэра или Монтсеррат, Сент Китс и Невис, Сент Люсия, Сент Винсент и Гренадины) с целью обеспечения политического, экономического сотрудничества и сотрудничества в сфере обороны.

ORGANISATION OF THE ISLAMIC CONFERENCE = ОРГАНИЗАЦИЯ ИСЛАМСКОЙ КОНФЕРЕНЦИИ – The Organisation of the Islamic Conference (OIC) is the second largest inter-governmental organization after the United Nations which has membership of 57 states (in 2011) spread over four continents. The organization is the collective voice of the Muslim world and ensuring to safeguard and protect the interests of the Muslim world in the spirit of promoting international peace and harmony among various people of the world. The organization was established upon a decision of the historical summit which took place in Rabat, Kingdom of Morocco on 12th Rajab 1389 Hijra (25 September 1969) as a result of criminal arson of Al-Aqsa Mosque in occupied Jerusalem. In 1970 the first ever meeting of Islamic Conference of Foreign Minister (ICFM) was held in Jeddah which decided to establish a permanent secretariat in Jeddah headed by the organization's secretary general. Prof Ekmeleddin Ihsanoglu is the 9th Secretary General who assumed the office in January 2005 after being elected by the 31st ICFM. The present Charter of the organization was adopted by the Eleventh Islamic Summit held in Dakar on 13–14 March 2008 which laid down the objectives and principles of the organization and fundamental purposes to strengthen the solidarity and cooperation among the Member States. Over the last 40 years, the membership has grown from its founding members of 25 to 57 states. The organization has the singular honor to galvanize the Ummah into a unified body and have actively represented the Muslims by espousing all causes close to the hearts of over 1.5 billion Muslims of the world. The organization has consultative and cooperative relations with the UN and other inter-governmental organizations to protect the vital interests of the Muslims and to work for the settlement of conflicts and disputes involving Member States. In safeguarding the true values of Islam and the Muslims, the organization has taken various steps to remove misperceptions and have strongly advocated elimination of discrimination against the Muslims in all forms and manifestations. The Member States of the OIC face many challenges in the XXI century and to address those challenges, the third extraordinary session of the Islamic Summit held in Makkah in December 2005, laid down the blue print called the Ten-Year Program of Action which envisages joint action of Member States, promotion of tolerance and moderation, modernization, extensive reforms in all spheres of activities including science and technology, education, trade enhancement, and emphasizes good governance and promotion of human rights in the Muslim world, especially with regard to rights of children, women and elderly and the family values enshrined by Islam. Under the Charter, the Organization aims, inter alia, to:- (i) enhance and consolidate the bonds of fraternity and solidarity among the Member States; (ii) safeguard and protect the common interests and support the legitimate causes of the Member States and coordinate and unify the efforts of the Member States in view of the challenges faced by the Islamic world in particular and the international community in general; (iii) respect the right of self-determination and non-interference in the domestic affairs and to respect sovereignty, independence and territorial integrity of each Member State; (iv) ensure active participation of the Member States in the global political, economic and social decision-making processes to secure their common interests; (v) reaffirm its support for the rights of peoples as stipulated in the UN Charter and international law; (vi) strengthen intra-Islamic economic and trade cooperation; in order to achieve economic integration leading to the establishment of an Islamic Common Market; (vii) exert efforts to achieve sustainable and comprehensive human development and economic well-being in Member States; (viii) protect and defend the true image of Islam, to combat defamation of Islam and encourage

dialogue among civilizations and religions; and (ix) enhance and develop science and technology and encourage research and cooperation among Member States in these fields. In order to realize these objectives, Member States shall act, inter alia, in accordance with the following principles:- (i) all Member States commit themselves to the purposes and principles of the United Nations Charter; (ii) Member States are sovereign, independent and equal in rights and obligations; (iii) all Member States shall settle their disputes through peaceful means and refrain from use or threat of use of force in their relations; (iv) all Member States undertake to respect national sovereignty, independence and territorial integrity of other Member States and shall refrain from interfering in the internal affairs of others; and (v) Member States shall uphold and promote, at the national and international levels, good governance, democracy, human rights and fundamental freedoms, and the rule of law. The organization is composed of the following main bodies:- (1) The Islamic Summit, composed of Kings and Heads of State and Government of Member States, is the supreme authority of the organization. It convenes once every three years to deliberate, take policy decisions and provide guidance on all issues pertaining to the realization of the objectives and consider other issues of concern to the Member States and the Ummah. (2) The Council of Foreign Ministers, which meets once a year, considers the means for the implementation of the general policy of the organization by, inter alia:- (a) adopting decisions and resolutions on matters of common interest in the implementation of the objectives and the general policy of the organization; and (b) reviewing progress of the implementation of the decisions and resolutions adopted at the previous Summits and Councils of Foreign Ministers. (3) The General Secretariat, which is the executive organ of the organization, entrusted with the implementation of the decisions of the two preceding bodies. So far eleven Islamic Summit Conferences and 37 Councils of Foreign Ministers (CFM) have been held. The Eleventh Islamic Summit Conference held in Dakar on 13–14 March 2008 elected Senegal as the current Chairman of the Organization. The Secretary General of the Organisation of the Islamic Conference, Professor Ekmeleddin Ihsanoglu, was re-elected for a new term of office at the closing meeting of the 11th Session of the Islamic Summit Conference. The new OIC Charter was adopted at the Dakar Summit. The Summit also witnessed the setting up of the Special Programme for the Development of Africa (SPDA). An agreement between H.E. President Omar Hassan Al Bashir and H.E. President Idriss Déby, President of the Republic of Chad, under the auspices of H.E. Maitre Abdoulaye Wade, President of the Republic of Senegal, was signed on the sidelines of the 11th Islamic Summit Conference, on 13 March 2008. Before the Summit Conference, at His Excellency President Abdoulaye Wade's initiative, the first conference of humanitarian and charity organizations was held in Saly Portudal from 07 to 09 March 2008. In order to coordinate and boost its action, align its view points and stands, and be credited with concrete results in various fields of cooperation -political, economic, cultural, social, spiritual and scientific- among Member States, the organization has created different committees, nearly all, at ministerial level, a number of which are chaired by Heads of State. The Al-Quds Committee, the Standing Committee for Information and Cultural Affairs (COMIAC), the Standing Committee for Economic and Trade Cooperation (COMCEC), and the Standing Committee for Scientific and Technological Cooperation (COMSTECH) are the ones Chaired by Heads of State. The number and types of secondary organs and institutions, working toward the achievement of the OIC objectives, have been steadily increasing, and cover various areas of cultural, scientific, economic, legal, financial, sports, technological, educational, media, as well as vocational, social and humanitarian. Depending on their degree of autonomy vis-à-vis the parent organization, they are classified as subsidiary organs and specialized or affiliated institutions. Headquartered in Jeddah, Kingdom of Saudi Arabia. The Organisation of the Islamic Conference (OIC), established in 1969, promotes cooperation in cultural, economics, scientific and social areas among Islamic nations. Headquarters are located in Jeddah, Saudi Arabia. Members include:- Afghanistan, Algeria, Bahrain, Bangladesh, Benin, Brunei, Burkina Faso, Cameroon, Chad, the Comoros, Cyprus, Djibouti, Egypt, Gabon, the Gambia, Guinea, Guinea-Bissau, Indonesia, Iran, Iraq, Jordan, Kuwait, Lebanon, Libya, Malaysia, Maldives, Mali, Mauritania, Morocco, Niger, Nigeria, Oman, Pakistan, Qatar, Saudi Arabia, Senegal, Sierra Leone, Somalia, Sudan, Syria, Tunisia, Turkey, Uganda, the United Arab Emirates and Yemen. / , от Латинского слова Affirmo, означающее Утверждаю, . Профессор Экмэледин Исаноглю (Prof Ekmeleddin Ihsanoglu). Соглашение между Его Превосходительством Президентом Омаром Хэссэном Аль Баширом (H.E. President Omar Hassan Al Bashir) и Президентом Идрисом Дэби (H.E. President Idriss Déby), Президентом Республики Чад, при содействии Мэтра Абдулаи Вадэ (H.E. Maitre Abdoulaye Wade), Президента Республики Сенегал, было подписано . Организация Исламская Конференция (ОИК), основанная 25 Сентября 1969, обеспечивает сотрудничество между Исламскими государствами в области культуры, науки, экономики и в социальной сфере. Штабквартира организации расположена в Джидде, Королевство Саудовская Аравия. В состав участников организации входят:- Алжир, Афганистан, Бангладеш, Бахрейн, Бенин, Бруней, Буркина Фасо, Габон, Гамбия, Гвинея, Гвинея-Бисау, Джибути, Египт, Индонезия, Иордания, Ирак, Иран, Йемен, Камерун, Катар, Кипр, Коморские Острова, Кувейт, Ливан, Ливия, Мавритания, Малайзия, Мали, Мальдивские Острова, Марокко, Нигер, Нигерия, Объединённые Арабские Эмираты, Оман, Пакистан, Саудовская Аравия, Сенегал, Сирия, Сомали, Судан, Сьерра Леоне, Тунис, Турция, Уганда и Чад. Организация Исламская Конференция или Организация Исламской Конференции (ОИК) была основана 25 Сентября 1969. Она объединяет под своим началом большее число мусульманских государств и Организацию Освобождения Палестины (ООП). В 1984 в составе организации состояли 45 членов. По Уставу деятельность ОИК направлена на укрепление мусульманской солидарности и сотрудничества между государствами членами.

ORGANISM = ОРГАНИЗМ – Organism is any biotic entity capable of reproduction or replication in its naturally occurring state. Organism is a biotic entity capable of reproduction or replication, vertebrate or invertebrate animals, plants and micro-organisms. Organism is a complete, living individual member of a species. / Под Организмом, от позднелатинского слова Organizo, означающее Сообщаю Стройный Вид или Устраиваю Стройный Вид, понимается:- (1) живое существо, обладающее совокупностью свойств, отличающих его от неживой материи. Большинство организмов имеет клеточное строение. Формирование целостного организма – процесс, состоящий из дифференцировки структур (клеток, тканей, органов) и функций и их интеграции как в онто-, так и в филогенезе. (2) Методологический принцип, требующий целостного подхода к изучению объектов органической природы; один из компонентов системного подхода. Под Организмом понимается любое живое существо. Одноклеточные и многоклеточные организмы обладают совокупностью основных жизненных свойств, отличающих их от неживой материи:- клеточной организацией (смотрите Клетка); обменом веществ, в котором ведущая роль принадлежит биополимерам – белкам и нуклеиновым кислотам, обеспечивающим самообновление и поддержание постоянства внутренней среды организма (смотрите Гомеостаз); движением с его специфическими формами – мышечным, плазматичным, ресничным и жгутиковым; раздражимостью; ростом и развитием; размножением; изменчивостью и наследственностью; приспособляемостью к условиям существования (смотрите Адаптация). Существуют также организмы, не обладающие типичным клеточным ядром и хромосомным аппаратом, это так называемые Прокариоты, к которым относятся Бактерии, Синезелёные Водоросли, Риккетсии, Микоплазмы и другие. Они проще по строению, меньше по размерам самых маленьких клеточных организмов (диаметр животной клетки более 30 мкм, бактериальной – обычно менее 3 мкм; одна из мельчайших Бактерий при удалении из неё воды состоит всего из $5 \cdot 10^7$ атомов). Взаимодействуя со средой обитания, организм выступает как целостная система; при этом уровни организации живого, как и уровни целостности организма (цитоплазматический, клеточный, тканевый, органный, организменный), неодинаковы. Формирование целостного организма – исторический процесс, состоящий из дифференцировки структур (клеток, тканей, органов) и функций и их интеграции. У одноклеточных организмов жизненные функции осуществляются специальными органеллами. Возникновение в процессе эволюции многоклеточности способствовало прогрессивному морфофизиологическому усложнению организма, его дифференциации, которая невозможна

без структурной и функциональной координации клеток, тканей и органов, осуществляемой нервным и гуморальным путём. Взаимозависимость органов в процессе эволюции организма у животных обстоятельно исследована Алексеем Николаевичем Северцовым (1866–1936) и его школой; эволюция и дифференциация тканевых структур, возникших в филогенезе из клеток, объединённых общей функцией, строением и развитием, – Алексеем Алексеевичем Заварзиным (1886–1945), Николаем Григорьевичем Хлопиным (1897–1961), Алексеем Всеволодовичем Румянцевым (1889–1947) и их учениками. Проблемы дифференцировки и интеграции органов и функций изучались также многими другими отечественными (Илья Ильич Мечников (1845–1916), Иван Петрович Павлов (1849–1936), Иван Иванович Шмальгаузен (1884–1963), Валентин Александрович Догель (1882–1955) и другие) и зарубежными (Эрнст Хайнрихь Филип Аугуст Хэккэль (Ernst Heinrich Philipp August Haeckel; 1834–1919), Феликс Антон Дон (Felix Anton Dohrn; 1840–1909), Сэр Гявин Райлэндз дэ Бээ (Sir Gavin Rylands de Beer; 1899–1972) и другие) учёными. Достижения современной биологии, главным образом генетики, позволили выявить материальный механизм наследственной связи поколений организма, связи между историческим и индивидуальным развитием целостного организма на всех уровнях его организации. Смотрите также Гистогенез, Морфогенез, Онтогенез, Органогенез, и Филогенез.

ORGANIZACIÓN LATINOAMERICANA DE ENERGÍA = ОРГАНИСАСЬОН ЛАТИНОАМЭРИКАНА ДЭ ЭНЭРХИА (или ЛАТИНОАМЕРИКАНСКАЯ ОРГАНИЗАЦИЯ ПО ЭНЕРГЕТИКЕ) – The Latin American Energy Organization (Organización Latinoamericana de Energía (OLADE)) was created within the context of the international energy crisis of the early seventies, whose scope and impact was analyzed by the Latin America and the Caribbean countries, which lacked energy policies and facing the need to adequately address this crisis began a intense political mobilization process that came to an end on 1973-November-02 with the signing of the Lima Agreement, the constituent instrument of the organization, ratified by 26 countries in Latin America and the Caribbean. While promoting the creation of OLADE, the need for establishing a cooperation mechanism for the countries of the Region arose in order to develop their energy resources and jointly attend issues regarding their efficient and rational use attempting to contribute in the economic and social development of Latin America and the Caribbean. OLADE is the political and technical-support organization by means of which its Member States undertake common efforts to achieve integration and development in the regional energy market. Mission:- to promote agreements between its Member Countries and carry out actions to satisfy their energy needs by means of the sustainable development obtained from the different sources of energy; and to contribute to the regions integration, sustainable development and energy security, advising and promoting cooperation and coordination among its member countries. OLADE is a public governmental organization working for energy development in Latin America and the Caribbean, thus contributing to economic and social development of its 27 member countries and participating country, Algeria. OLADE was created within the context of the international energy crisis of the early seventies, whose scope and impact was analyzed by the Latin America and the Caribbean countries, which lacked energy policies and facing the need to adequately address this crisis began a intense political mobilization process that came to an end on 1973-November-02 with the signing of the Lima Agreement, the constituent instrument of the Organization, ratified by 27 countries in Latin America and the Caribbean:- (i) South America:- Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Paraguay, Peru, Uruguay and Venezuela; (ii) The Caribbean:- Barbados, Cuba, Dominican Republic, Grenada, Guyana, Haiti, Jamaica, Suriname and Trinidad & Tobago; (iii) Central and Mexico:- Belize, Costa Rica, El Salvador, Guatemala, Honduras, Mexico, Nicaragua and Panama; and Participating Country:- Algeria While promoting the creation of OLADE, the need for establishing a cooperation mechanism for the countries of the Region arose in order to develop their energy resources and jointly attend issues regarding their efficient and rational use attempting to contribute in the economic and social development of Latin America and the Caribbean Mission:- to contribute to the regions integration, sustainable development and energy security, advising and promoting cooperation and coordination among its member countries. Vision:- OLADE is the political and technical-support organization by means of which its Member States undertake common efforts to achieve integration and development in the regional energy market. The Latin-American Energy Organisation (Organización Latinoamericana de Energía (OLADE)) is an international public entity of cooperation, coordination and advising. Its fundamental purpose is integration, protection, conservation, defense and rational use of energy resources of the region. The fundamental objectives of the organization are as follows:- (i) politic and technical tool for prompting better regional energy integration; (ii) manage official statistics, products and services and regional energy planning; (iii) encourage training inside the Energy Ministries of the member countries; and (iv) promote regional energy cooperation among countries. Member countries:- Argentina, Barbados, Bolivia, Brazil, Colombia, Costa Rica, Cuba, Chile, Ecuador, El Salvador, Grenada, Guatemala, Guyana, Haiti, Honduras, Jamaica, México, Nicaragua, Panama, Paraguay, Peru, Dominican Republic, Surinam, Trinidad & Tobago, Uruguay and Venezuela. Headquartered in Quito, Ecuador. / сохранение (conservation). Латиноамериканская Организация по Энергетике (ЛАОПЭ) или, как это звучит на Испанском языке по месту расположения штабквартиры, Организасьон Латиноамэрикана дэ Энэрхиа (О.Эль.А.Дэ.Э. или ОЛАДЭ; Organización Latinoamericana de Energía (OLADE)) является публичной межправительственной организацией по сотрудничеству, координации и советованию по вопросам развития энергетики в странах Латинской Америки и Карибского Бассейна. Она была создана 02 Ноября 1973 в ответ на международный энергетический кризис, произошедший в начале 1970-х. Членами организации являются 26 стран, а именно:- Аргентина, Барбадос, Боливия, Бразилия, Венесуэлла, Гаити, Гайана, Гватемала, Гондурас, Гренада, Доминиканская Республика, Колумбия, Коста Рика, Куба, Мексика, Никарагуа, Панама, Парагвай, Перу, Суринам, Тринидад и Тобаго, Уругвай, Чили, Эквадор, Эль Сальвадор, и Ямайка. Кроме этих стран в организацию в качестве участвующей страны входит также Алжир. Итого 27 стран. Штабквартира расположена в Кито, Эквадор.

ORGANIZATIONAL MEETING = ОРГАНИЗАЦИОННОЕ СОБРАНИЕ – Organizational Meetings are meetings of incorporators or initial directors that are held after the filing of the articles of incorporation to complete the organization of the corporation. / Организационные Собрания – собрания учредителей или первоначальных директоров, которые проводятся после заполнения положения об ассоциации (или устава) с целью завершения процесса организации корпорации.

ORGANIZATION COSTS = ОРГАНИЗАЦИОННЫЕ ИЗДЕРЖКИ (или ОРГАНИЗАЦИОННЫЕ ЗАТРАТЫ) – Organization Costs are the expenditures incurred in planning and establishing a business, including attorney fees, registration fees paid to state governments and other start-up costs. Organization costs are considered to be an intangible asset and must be amortized, usually over a 5 to 10 year period. Also known as Formation Expenses in the United Kingdom.

ORGANIZATION OF AFRICAN UNITY = ОРГАНИЗАЦИЯ АФРИКАНСКОГО ЕДИНСТВА – The Organization of African Unity (OAU) was established in 1963 in Addis Ababa, Ethiopia. From 32 independent Member States in 1963, the independent Member States of Africa are now 53. The OAU is entering from political liberalization to phase two by focusing on the economic integration. It has therefore a new mandate and new responsibilities which will by no means make it abandon its political character and its resolve to sustain peace and security in the continent which are crucial for the socio-economic development process. The following purposes and principles are stated in OAU charter adopted in 1963 in Addis Ababa, Ethiopia. The OAU objectives are stated in Article II of the CHARTER as follows:- (i) to promote the unity and solidarity of the African States; (ii) to co-ordinate and intensify their cooperation and efforts to achieve a better life for the peoples of Africa; (iii) to defend their sovereignty, their territorial integrity and independence; (iv) to eradicate all forms of colonialism from Africa; and (v) to promote international cooperation, having due regard to the Charter of the

United Nations and the Universal Declaration of Human Rights. To achieve these goals Member States pledged themselves to harmonize their policies in the foolowing fields:- (i) political and diplomatic cooperation; (ii) economic cooperation, including transport and communication; (iii) educational and cultural cooperation; (iv) health, sanitation, and nutritional cooperation; (v) scientific and technical cooperation; and (vi) cooperation for defence and security. The OAU principles are stated in Article II of the Charter as follows:- (i) the sovereign equality of all Mernber States; (ii) non-interference in the internal affairs of States; (iii) respect for the sovereignty and territorial integrity of each State and for its inalienable right to independent existence; (iv) peaceful settlement of disputes by negotiation, mediation, conciliation or arbitration; (v) unreserved condemnation in all its forms, of political assassination as well as of subversive activities on the part of neighbouring States or any other States; (vi) absolute dedication to the total emancipation of the African territories which are still dependent; and (vii) affirmation of a policy of non-alignment with regard to ail blocs. In proclaiming OAU principles and objectives, the Founding Fathers of the Organization envisaged clearly a unity 'that transcends ethnics and national differences'. OAU action has been particularly significant in the following fields:- (i) Decolonization:- in this field, the OAU Co-ordinating Committee for the Liberation of Africa, has organized diplomatic support and channelled financial, military and logistical aid to liberation movements. Though much remains to be done before final victory is obtained, the struggle for liberation has gained considerable momentum. It is commanding every day increasing support from world opinion. At the United Nations, the liberation struggle is recognized as legitimate. Liberation movements representatives will soon be seated as observers at UN meetings. Through an OAU fund, international support is being channelled to liberated areas in Guinea Bissau, in Angola and Mozambique. OAU has initiated action with the International Court of Justice which has just declared that South Africa had no right to stay in Namibia. Consequently, UN action is being considered for the International territory of Namibia (former South West Africa) to accede to Independence. Likewise, a UN boycott is enacted against Rhodesia's racist minority regime until majority rule is obtained. Every pressure is brought to bear on Great Britain, which, as a colonial power at the time of Smith's Unilateral Declaration of Independence (1965), has to live by its constitutional and moral responsibility towards African majority in Rhodesia. Thus, Portugal, South Africa, Rhodesia and their NATO allies are periodically harassed and condemned for their colonialist and racist policy in Africa, particularly at the United Nations where' the African group commands a near 'blocking third' vote. (ii) Boundary conflicts:- in the ten years of its existence, OAU has been confronted with a number of boundary conflicts in North, East and Central Africa. Thanks to OAU machinery and efforts, these conflicts were settled in a true spirit of African Solidarity without outside intervention or interference. On such occasions, OAU made a name for itself as peacekeeper no. 1 in the continent. The UN General Assembly has paid tribute to OAU for the role played in the maintenance of international peace and security. (iii) Defence of Member States' sovereignty and territorial integrity:- action undertaken by OAU in this concern will remain one of its greatest achievements ever:- (a) In the Congo:- where imperialism threatened in its supply lines of strategic raw materials (uranium, and copper) vied for disintegration to set up a puppet state. (b) In Nigeria:- where a civil war flared up and threatened the Federal Republic of Nigeria to its very foundation. By throwing its weight on the side of unity, and providing for appropriate machinery (an ad hoc Consultative Committee) OAU helped to prevent secession while maintaining the cohesion of its membership. (c) In Republic of Egypt:- which was aggressed and occupied in parts by Israeli forces in 1967. OAU has strongly condemned this Israeli aggression and demanded the withdrawal of Israeli troops from all occupied Arab territories. Egypt is one of the founding Member States of the Organization of African Unity. (d) In Guinea:- where Portugal's last ditch attempt at colonial reconquest failed. In the wake of this aggression OAU's offer of financial and military aid to Guinea, along with its declared war on mercenaries in Africa and the successful information campaign it waged to alert international opinion were all evidence of the usefulness OAU has in facing outside aggression and the outside world. (e) In Equatorial Guinea:- where OAU support enabled the Young Republic to reinforce its newly won independence. (iv) The struggle against Apartheid:- through action of the African group at the United Nations and appropriate information campaigns Apartheid, the abhorred system of stateimposed racial discrimination in South Africa, Rhodesia and the International territory of Namibia (South West Africa), has been universally condemned as 'a crime against humanity' (Teheran Conference in 1968). As a result of increasing pressure from all quarters, Apartheid South Africa has been forced out of the Commonwealth and a number of specialized institutions of the United Nations family. In world sports, Apartheid South Africa has been barred from the Olympic Games and from International Tennis Tournaments. (v) Promotion of African Culture:- OAU staged both the 1st All African Cultural Festival (Algiers August 1969) and the First Workshop on African Folklore, Dance and Music (Mogadiscio Somalia) October 1970. The first momentous panafrican Festival took place in Algiers, Algeria in August 1969. Never before, had African culture and arts given such a brilliant display of their richness, variety and genius. Above cultural and artistic achievements, this First Festival was the triumph of African solidarity and sense of purpose, the triumph of AFRICANITY. In Mogadiscio, the workshop on African folklore, dance and music was attended by many scholars and artists of international repute from OAU Member States. The quality of the various contributions is likely to influence any future development of African culture. (vi) Fields of economic and social development, transport and telecommunication:- thanks to OAU efforts, African countries have harmonized their policies with regard to UNCTAD, IBRD, IMF, UNIDO, ILO. Consequently, their claims for better terms of trade, full participation in a new international monetary system and more multilateral aid carry more weight. Through OAU, African countries have proclaimed their permanent sovereignty over their natural resources, just as they are pressing for a modification of International Law with regard to the continental shelf and territorial waters. In the social field, progress has been achieved towards the Unification of African Trade Unions and Youth Organizations, In cooperation with ECA, blueprints for a rational continental telecommunications network and efficient air and road transport have been laid. To fly across Africa from east to west or to make a phone call one need no longer go through Paris or London. A trans-saharan highway from Algiers (Algeria) to Mali and Niger is being built. Another one from Mombasa, Kenya to Lagos, Nigeria, is under active consideration. An all african Trade fair, took place in Nairobi, Kenya, (February 1972). (vii) Fields of Education, Science, Health:- in these fields, OAU action may be credited with:- (a) pre-investment studies:- fishery projects; an anti-rinder pest campaign that has vaccinated so far a billion Dollars worth of cattle, a number of scientific investigations on plant protection, soils, animal health, all of which may be obtained from the OAU/STRC office in Lagos, Nigeria. And (b) pilot projects in the field of earth science:- geology, geophysics, the idea being to supply Africa with the most up-to-date know-how and limit the 'brain-drain'. In the field of Education, African college graduate should soon be able to move from one African University to another, a scheme of degree equivalence being now devised. In the field of health, preventive medicine and public health measures are being applied all over Africa. (viii) Action in favor of African Refugees:- a bureau for placement and education of African refugees has been in operation at OAU headquarters since 1968. Great many African refugees ever since have been provided with educational and job opportunities. A convention governing aspects of refugee problems in Africa has been adopted by OAU Heads of State in September 1969. To the terms of this convention, a refugee status and right of asylum are recognized to refugees by all independent African countries. 'No longer are refugees subjected to rejection at the frontier, return or expulsion, which would compel them to return to or remain in a territory where their life or freedom would be threatened' (Article 11 of OAU convention on refugees). To achieve its aims with much efficiency, OAU is composed of following institutions:- (i) The Assembly of Heads of State and Government (it meets in Ordinary Session first Monday of June every year). (ii) The Council of Ministers, i.e. Foreign Affairs Ministers (it meets twice a year, in February mainly on budgetary matters and in May/June prior to Summit.) Other Ministerial Sectoral Meetings are held every two years in different domains such as Labor, Information, Trade, Health, Culture, etc. (iii) The General Secretariat (based in Addis Ababa, Ethiopia) The General Secretariat is headed by a Secretary General, who is elected by the Assembly of Heads

of State and Government for a term of four years. He has five Assistant Secretary Generals, each elected from a geographical region by the Assembly for a term of four years. The six may be re-elected. The General Secretariat is constituted of:- (a) Office of the Secretary General under which operates his Cabinet, Protocol, Information, Security, Legal Affairs, Inspectorate, Budget Control and Afro-Arab Co-operation; (b) Political Department; (c) Economic Co-operation and Development Department (EDECO); (d) Education, Science, Culture and Social Affairs Department (ESCAS); (e) Finance Department; (f) Administration and Conferences Department; and (g) Regional and sub-regional Offices exist in New York, Geneva, Cairo, Brussels, Lagos, Niamey. Dar es Salam (hosts to the OAU liberation Committee). (iv) Specialized Commissions established are:- (a) Economic and Social Commission; (b) Educational, Scientific, Cultural and Health Commission; (c) Commission of Fifteen on Refugees; (d) Defence Commission; and (e) Mediation, Conciliation and Arbitration Commission. (v) Autonomous Specialized Agencies working under the auspices of the OAU are:- (a) Pan-African Telecommunications Union (PATU); (b) Pan-African Postal Union (PAPU); (c) Pan-African News Agency (PANA); (d) Union of African Natioral Television and Radio Organizations (URTNA); (e) Union of African Railways (UAR); (f) Organization of African Trade Union Unity (OATUU); and (g) Supreme Council for Sports in Africa. Following the introduction of the Treaty Establishing the African Economic Community, the General Secretariat is to serve as the Secretariat for the African Economic Community (AEC). Over 600 staff members of whom 152 of the professional category, recruited from over 40 Member States are in the service of the Organization at the Headquarters and Regional and sub-Regional Offices. The General Secretariat is the Permanent organ whose task is to service various OAU Meetings, implement decisions and resolutions adopted by the Summit and Council. It keeps documents and archives and generally speaking conduct the daily work of coordination among Member States in all fields stated in the Charter. The annual budget of the Organization (1st June to 31st May) is provided by contributions from Member States in accordance with the scale of assessment which is calculated on the basis of area, population and per capita income. However, no Member States shall be assessed on an amount exceeding 20% of the yearly regular budget of the Organization. The budget is in the range of USD27–30 million. The official languages are:- Arabic, English, French, and Portuguese. The Organization of African Unity (OAU) was founded in 1963 with 32 African countries as original members; it had 51 members in 1990. The Organization aims to further African unity and solidarity, to coordinate political, economic, cultural, scientific and defense policies; and to eliminate colonialism in Africa. Members include (2011):- Algeria, Angola, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Cape Verde, Central Africa Republic, Chad, the Comoros, Congo, Cote d'Ivoire, Democratic Republic of Congo (former Zaire), Djibouti, Egypt, Equatorial Guinea, Eritrea, Ethiopia, Gabon, the Gambia, Ghana, Guinea, Guinea-Bissau, Kenya, Lesotho, Liberia, Libya, Madagascar, Malawi, Mali, Mauritania, Mauritius, Mozambique, Namibia, Niger, Nigeria, Republic Arab Saharawi Democratic, Rwanda, Sao Tome and Principe, Senegal, the Seychelles, Sierra Leone, Somalia, South Africa, Sudan, Swaziland, Tanzania, Togo, Tunisia, Uganda, Zambia, and Zimbabwe. Organization of African Unity (OAU), former international organization, established 1963 at Addis Ababa, Ethiopia, by 37 independent African nations to promote unity and development; defend the sovereignty and territorial integrity of members; eradicate all forms of colonialism; promote international cooperation; and coordinate members' economic, diplomatic, educational, health, welfare, scientific, and defense policies. The OAU was, at the time, the most significant result of Pan-Africanism. The organization mediated several border and internal disputes and was instrumental in bringing about majority rule and the end of apartheid in South Africa, which in 1994 became the 53rd nation to be admitted to the organization. In 1997, OAU members established the African Economic Community (AEC), envisioned as an African common market; the AEC signed an agreement with regional African economic groupings that was intended to lead to harmonization of policies of those common markets. A more radical expansion and transformation of the OAU was adopted at Lomé, Togo, in 2000, in the form of the Constitutive Act of the African Union, which replaced the OAU in 2002. The African Union has with greater powers to promote African economic, social, and political integration, and a stronger commmitment to democratic principles. Headquartered in Addis Ababa, Ethiopia. The advent of the African Union (AU) can be described as an event of great magnitude in the institutional evolution of the continent. On 1999-September-09, the Heads of State and Government of the Organisation of African Unity issued a Declaration (the Sirte Declaration) calling for the establishment of an African Union, with a view, inter alia, to accelerating the process of integration in the continent to enable it play its rightful role in the global economy while addressing multifaceted social, economic and political problems compounded as they are by certain negative aspects of globalization. The main objectives of the OAU were, inter alia, to rid the continent of the remaining vestiges of colonization and apartheid; to promote unity and solidarity among African States; to coordinate and intensify cooperation for development; to safeguard the sovereignty and territorial integrity of Member States and to promote international cooperation within the framework of the United Nations. Indeed, as a continental organization the OAU provided an effective forum that enabled all Member States to adopt coordinated positions on matters of common concern to the continent in international fora and defend the interests of Africa effectively. Through the OAU Coordinating Committee for the Liberation of Africa, the Continent worked and spoke as one with undivided determination in forging an international consensus in support of the liberation struggle and the fight against apartheid. / для данного случая (ad hoc). , от Латинского слова Affirmo, означающее Утверждаю, . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). ковка или штамповка (forging). Организация Африканского Единства (ОАЕ) является объединением Африканских государств, созданным в Мае 1963 на конференции в Аддис Абебе, Эфиопия. Там же в Аддис Абебе расположена и штабквартира организации. Первоначальными членами ОАЕ были 32 Африканские страны, хотя в 1990 она насчитывала уже 51 государство. Основными целями ОАЕ являются:- дальнейшее укрепление Африканского единства и солидарности, координация действий Африканских стран в сфере политической, экономической, культурной, научной и оборонной политики, борьба за искоренение колониализма и неоколониализма в Африке. Главными органами ОАЕ являются:- Ассамблея Глав Государств и Правительств, и Совет Министров. Членами организации являются (на 2011):- Алжир, Ангола, Бенин, Ботсвана, Буркина Фасо, Бурунди, Габон, Гамбия, Гана, Гвинея, Гвинея-Бисау, Демократическая Республика Конго (бывший Заир), Джибути, Египет, Замбия, Зимбабве, Кабо Верде, Камерун, Кения, Коморы (Коморские Острова), Конго, Кот Дивуар, Лесото, Либерия, Ливия, Маврикий, Мавритания, Мадагаскар, Малави, Мали, Марокко, Мозамбик, Намибия, Нигер, Нигерия, Руанда, Сан Томе и Принсипи, Сахарская Арабская Демократическая Республика, Свазиленд, Сенегал, Сейшеллы (Сейшельские Острова), Сомали, Судан, Сьерра Леоне, Танзания, Того, Тунис, Уганда, Центральноафриканская Республика, Чад, Экваториальная Гвинея, Эритрея, Эфиопия и Южная Африка.

ORGANIZATION OF AMERICAN STATES = ОРГАНИЗАЦИЯ АМЕРИКАНСКИХ ГОСУДАРСТВ – The Organization of American States (OAS) is the world's oldest regional organization, dating back to the First International Conference of American States, which was held in Washington, DC from October 1889 to April 1890. At that conference, the establishment of the International Union of American Republics was approved and the stage was set for the weaving together of a web of provisions and institutions that came to be known as the Inter-American System, the oldest of the international institutional systems. The OAS came into being in 1948 with the signing, in Bogotá, Colombia, of the Charter of the OAS (The Ninth International Conference of American States, meeting in Bogotá, Colombia, in 1948, with the participation of 21 States, adopted the Charter of the Organization of American States, the American Treaty on Pacific Settlement ('Pact of Bogotá'), and the American Declaration on the Rights and Duties of Man. The same Conference also adopted the Economic Agreement of Bogotá, which sought to advance economic cooperation among the American States. However, it never entered into force). The Charter entered into force in December 1951 and was subsequently amended by the Protocol of Buenos Aires, which was signed in 1967 and which entered into force in February 1970; by the Protocol of Cartagena de Indias, which was

signed in 1985 and which entered into force in November 1988; by the Protocol of Managua, which was signed in 1993 and which entered into force on 1996-January-29; and by the Protocol of Washington, which was signed in 1992 and which entered into force on 1997-September-25. The OAS was established to achieve among its member states, as stated in Article 1 of its Charter, 'an order of peace and justice, to promote their solidarity, to strengthen their collaboration, and to defend their sovereignty, their territorial integrity, and their independence'. Today it comprises the 35 independent states of the Americas and has granted permanent observer status to 63 states, as well as to the European Union. The Organization of American States constitutes the principal political, juridical, and social governmental forum in the Hemisphere. The OAS uses a four-pronged approach to effectively implement its essential purposes, based on its pillars:- democracy, human rights, security, and development. The OAS uses a four-pronged approach to effectively implement its essential purposes. The Organization's four main pillars – democracy, human rights, security, and development – support each other and are intertwined through political dialogue, inclusiveness, cooperation, and legal and follow-up instruments that provide the OAS with the tools to maximize its work in the Hemisphere. Headquartered in Washington, DC, the United States. The Organization of American States (OAS) is a regional organization established in 1948 which promotes Latin American economic and social development. Members include the United States, Mexico and most Central American, South American and Caribbean nations. Members include:- Antigua and Barbuda, Argentina, the Bahamas, Barbados, Belize, Bolivia, Brazil, Canada, Chile, Colombia, Costa Rica, Cuba (participation suspended), Dominica, Dominican Republic, Ecuador, El Salvador, Grenada, Guatemala, Guyana, Haiti, Honduras, Jamaica, Mexico, Nicaragua, Panama, Paraguay, Peru, Saint Christopher and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Suriname, Trinidad and Tobago, the United States, Uruguay and Venezuela. / Организация Американских Государств (ОАГ), региональная организация, основанная в 1948 на 9-й Международной Американской Конференции в Боготе, Колумбия. Основной целью ОАГ является экономическое и социальное развитие стран, входящих в Латино-Американский регион, хотя членами организации являются также Мексика, США, большинство стран Центральной и Южной Америки, а также стран Карибского Бассейна. В 1984 в составе ОАГ числилось 31 Латино-Американское государство. Под нажимом США в 1962 из ОАГ была незаконно исключена Республика Куба. Высшим органом ОАГ является ежегодная Генеральная Ассамблея Министерств Иностранных Дел; исполнительный орган – Постоянный Совет ОАГ, штабквартира которого располагается в Вашингтоне, Округ Колумбия, США. Членами организации являются:- Антигуа и Барбуда, Аргентина, Багамы (Багамские Острова), Барбадос, Белиз, Боливия, Бразилия, Венесуэла, Гаити, Гайана, Гватемала, Гондурас, Гренада, Доминика, Доминиканская Республика, Канада, Колумбия, Коста Рика, Куба (участие приостановлено), Мексика, Никарагуа, Панама, Парагвай, Перу, Сент Винсент и Гренадины, Сент Кристофер и Невис, Сент Люсия, Соединённые Штаты Америки, Суринам, Тринидад и Тобаго, Уругвай, Чили, Эквадор, Эль Сальвадор и Ямайка.

ORGANIZATION OF THE PETROLEUM EXPORTING COUNTRIES = ОРГАНИЗАЦИЯ СТРАН, ВЫВОЗЯЩИХ НЕФТЬ (или ОРГАНИЗАЦИЯ СТРАН ЭКСПОРТЁРОВ НЕФТИ, или ОРГАНИЗАЦИЯ СТРАН, ЭКСПОРТИРУЮЩИХ НЕФТЬ) – The Organization of the Petroleum Exporting Countries (OPEC) is an intergovernmental organization currently made up of twelve oil exporting countries that work together to coordinate their petroleum policies. The Organization was formed in response to the activities and practices of seven large international oil companies (IOCs) known as the 'Seven Sisters'. The activities of these IOCs were often detrimental to the growth and development of the oilproducing host countries, whose natural resources they exploited. The first move towards the establishment of OPEC can be traced back to 1949, when Venezuela approached four other oilproducing developing countries – Iran, Iraq, Kuwait and Saudi Arabia – to suggest that they explore avenues for regular and closer cooperation on oil matters. But the main impetus for OPEC's birth came a decade later, after the IOCs had decided to reduce the price of oil without first asking the governments. In response, several oil-producing countries decided to hold a meeting in Cairo, Egypt, in 1959. This was the First Arab Petroleum Congress. Iran and Venezuela were invited as observers. The meeting adopted a resolution asking IOCs to consult the governments of oil-producing countries before changing the posted price of oil. But the IOCs ignored the oil-producing countries. And in August 1960, they once again lowered the price of oil. OPEC's mission is to coordinate oil policies in its Member Countries and help stabilize oil markets. It also includes working together – to make sure there is always a regular supply of oil available to consumers, and to make sure a steady income is generated for producers. All this is formally stated in the OPEC Statute. The birth of OPEC:- In response to this, five of the largest oil-producing countries held another conference on September 10–14, 1960. This time the venue chosen was Baghdad, the capital of Iraq. The countries that attended the conference were:- Iran, Iraq, Kuwait, Saudi Arabia and Venezuela. These are the Organization's Founder Members. That was when OPEC was born. Each country sent a delegate:- Fuad Rouhani from Iran, Dr. Tala'at al-Shaibani from Iraq, Ahmed Sayed Omar from Kuwait, Abdullah Al-Tariki from Saudi Arabia and Dr. Juan Pablo Pйrez Alfonzo from Venezuela. At this Baghdad Conference, the delegates discussed the role of the IOCs and changes in crude oil prices. The oilproducing countries saw an urgent need to create an organization for the defence of their most important non-renewable natural resource, oil. Thus, OPEC was established as a permanent intergovernmental organization. Its first headquarters were located in Geneva, Switzerland. In April 1965, OPEC decided to move the Secretariat to Vienna, the capital of Austria. A Host Agreement was signed with the Austrian government and OPEC moved to Vienna on September 01, 1965. After OPEC was created, the governments of OPEC's Member Countries began to have more control over their own natural resources. And in the years that followed, OPEC became increasingly aware of the important role it could play in the global oil markets. The OPEC logo is the recognizable symbol of the Organization. It is the result of an international design competition held in 1969. An Austrian designer, Gertrude Svoboda, won the competition with her design, which combined the different letters of the Organization's name in a rounded design. This logo is still in use by OPEC. Who are the members of OPEC? There are three categories of membership:- (i) Founder Members, (ii) Full Members and (iii) Associate Members. Founder Members of the Organization are those countries which attended the Baghdad Conference in 1960, and which signed the original agreement establishing OPEC. Full Members are all Founder Members, plus those countries whose applications for membership have been accepted by the Ministerial Conference. Associate Members are countries which do not qualify for full membership, but which are nevertheless admitted under special conditions. OPEC is made up of twelve sovereign nations:- six in the Middle East, four in Africa and two in South America. The oil producing capacity of each Member Country is different. But when it comes to making decisions as an Organization, every country is equal. Decisions must be made unanimously with the agreement of all Member Countries. Who can be a Member? OPEC membership is open to any country that exports crude oil and which shares the ideals of the Organization. A country may become a Full Member if its request to join OPEC is accepted by a three-fourths majority of Full Members (including all Founder Members). If most of the oil a country produces is consumed internally – to meet domestic demand – then it may not be able to join OPEC. Nevertheless, that country may still be admitted as an Associate Member. An Associate Member may be invited to attend any of the Organization's meetings. While an Associate Member may participate in these meetings, it does not have the right to vote. In addition, other oil-producing countries that are not members of OPEC may also be invited to attend Meetings as Observers. Keeping the market supplied:- Throughout its 50-year history, OPEC has seen periods of both extremely high and low oil prices. Each time OPEC has tried to respond in an appropriate manner. OPEC does this by coordinating the oil policies of its Member Countries. If demand suddenly grows and supplies fall short, OPEC can increase its oil production in order to keep the market well supplied. On the other hand, if demand suddenly falls and supplies grow, OPEC can slow down production in order to help maintain a balance in the market. OPEC's actions at critical times have demonstrated the Organization's ability to keep the oil market well-supplied during different kinds of unexpected events, such as

wars or natural disasters. Stabilizing oil markets:- One of the most important parts of OPEC's mission is making sure that the oil markets remain stable. One way that OPEC tries to do this is by working to avoid price extremes (when oil prices are too low or too high). Avoiding price extremes – and sudden changes in prices – is important for producers and consumers. When oil prices are too high or too low, problems can be generated for the global economy. For example, with extremely high oil prices, it costs more to do things – like run a car, operate a machine or make products like plastics. But extremely low oil prices also cause problems. If the price of crude oil is too low, then it doesn't make sense to spend money trying to find more oil. Investments in projects may then fall. Organizational Structure:- (1) The Conference is OPEC's supreme authority. It consists of Heads of Delegations from each Member Country. It is responsible for the formulation of the Organization's general policies. The Conference meets twice a year to look at market conditions. These are 'Ordinary Meetings'. In addition, the Conference holds 'Extraordinary' Meetings when required. (2) OPEC's Board of Governors is composed of representatives nominated by Member Countries and confirmed by the Conference. The Board manages the Secretariat, implements the resolutions of the Conference, prepares the Secretariat's annual budget and submits it to the Conference for approval. The Board makes decisions based on reports submitted by the Secretary General. The Board also submits its own reports and recommendations on the activities of the Organization to the Conference. (3) The Economic Commission Board (ECB) is a special research body within the Secretariat. It considers current market conditions, the situation of the global economy and forecasts the future direction of market fundamentals. The ECB is composed of National Representatives from Member Countries, a Commission Coordinator (who is also the Director of the Secretariat's Research Division) and the Secretary General. (4) The OPEC Secretariat is responsible for carrying out the executive functions of the Organization, according to the OPEC Statute and under the direction of the Board of Governors. The Secretary General is the Chief Executive of the Secretariat, as well as the legally authorised representative of the Organization. He is assisted directly by the Office of the Secretary General, a Legal Office and an Internal Auditor. OPEC's first Secretary General was HE Dr. Fuad Rouhani of Iran. The Secretariat consists of a Research Division, which monitors, forecasts and analyzes developments in the global energy industry. The Research Division consists of the Departments of Data Services, Energy Studies and Petroleum Studies. The Secretariat is also made up of a Support Services Division, which includes the Departments of Administration and Information Technology, Finance and Human Resources, and Public Relations and Information. The Secretariat is a multicultural working environment. It has employees drawn from more than 30 different countries. About a quarter of them are from Member Countries. Others are international employees. The official language of the Organization is English. (5) The Secretariat has an Information Centre with over 20 000 volumes – including books, reports, maps and conference proceedings – related to petroleum, energy and the oil market. It keeps journals in Arabic, English, French, German and Spanish. The Information Centre is open to the public and is often used by researchers and students. (6) Though not a formal organ of the Organization, the OPEC Summit brings together Heads of State of OPEC Member Countries to discuss issues of global importance and make policy recommendations to guide the Organization. The OPEC Summit has proved to be a very effective way to make group decisions and provide opportunities for leaders to review the role of the Organization in world affairs. Building bridges:- global events in recent years have demonstrated the interconnected nature of today's world. It is thus more important than ever to coordinate actions and work together with others when tackling these global challenges. This is especially true for the oil industry, which reaches all corners of the Earth. There are several issues that OPEC considers priorities for all global energy stakeholders. One of these is improving communications – through dialogue and cooperation – between oil producers and consumers. This is especially important in order to avoid market instability. OPEC has always said that avoiding instability and preserving market stability can only be achieved by cooperating with other non-OPEC oil producers. OPEC regularly meets with these other major oil producers such as Russia to improve the understanding of the oil industry and seek appropriate policy actions. Since it is an organization of oilproducing countries, OPEC also meets regularly with large oil consumers. In fact, OPEC has an on-going dialogue with the European Union. OPEC also holds meetings and workshops with China. In addition, OPEC holds dialogues with other international organizations – such as the International Energy Agency (IEA) – and participates in ongoing dialogue with other energy stakeholders under the framework of the International Energy Forum (IEF). Another issue that OPEC considers important for all global energy stakeholders is the role that governments and people everywhere have in environmental protection efforts. OPEC Member Countries are continually looking for ways to work with others on this. The Organization has participated in environmental conferences and seminars, and has undertaken extensive studies of the relationship between the energy sector and global warming. At the same time, OPEC also supports the efforts of its individual Member Countries to do what they can at the national level – such as develop new technologies that enhance the environmental credentials of oil and reduce the environmental impact of activities in the energy sector. To emphasize their overall commitment to the environment, the leaders of OPEC Member Countries agreed to several principles set forth in the 'Riyadh Declaration' issued at the conclusion of the Third OPEC Summit of Heads of State held in Saudi Arabia in 2007. In it, the Heads of State of OPEC Member Countries agreed that the themes of stability, sustainable development and the environment should guide all Member Country initiatives. How does OPEC help other countries? For decades, OPEC and its Member Countries have found different ways to help poor countries. Much of this has been through individual Member Country national funds which have made donations and aid available to poor countries, through bilateral and multilateral arrangements. Another way that OPEC helps is through the OPEC Fund for International Development (OFID), which helps finance projects with lowinterest loans. During the First OPEC Summit in Algiers, Algeria, held in 1975, OPEC Member Countries asked the international community – especially developed countries – to work together to help respond to the challenges facing developing countries. Following this Summit, in January 1976, OPEC's Member Countries decided to establish the OPEC Special Fund. This later became known as the OPEC Fund for International Development (OFID). The OPEC Fund for International Development (OFID) is an institution that provides funding and other support to developing countries around the world. According to the agreement establishing OFID, all developing countries (with the exception of OPEC Member Countries) are eligible for OFID assistance. OFID is active in many regions of the world. So far, people in 122 countries in Africa, Asia, Latin America, the Caribbean, the Middle East and Europe have benefited from OFID's programmes. These programmes have included clean water and energy projects; building schools, hospitals and roads; and developing industry and expanding trade opportunities. These programmes have been financed by low-interest loans that OFID provides to the public sector in recipient countries. OFID also provides financing for private sector projects in developing countries, and provides grants to social and humanitarian projects. OFID's financial resources come from its investments, loans and the voluntary contributions made by OPEC Member Countries. By the end of June 2013, OFID's total approved commitments stood at USD15.7 billion (of which USD10.1 billion has been disbursed). Organization of the Petroleum Exporting Countries (OPEC) is an association of the world's oil-producing countries, formed in 1960. The chief purpose of OPEC is to coordinate the petroleum policies of its members:- Algeria, Ecuador, Gabon, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates and Venezuela (1995). The oil market before 1960 had two forms of cartel arrangements that controlled price, production volume or both at different periods. The first was a group of vertically and horizontally integrated International Oil Companies (IOCs). They included the Seven Sisters (they were Jersey (Exxon), Socony-Vacuum (Mobil), Standard of California (Chevron), Texaco, Gulf, Royal Dutch/Shell and BP) and French company – Compagnie Francaise des Petroles (CFP). The second cartel arrangement was formed within the US by individual state governments to ration production quotas. Although domestic, their influence and impact had consequences in the international oil market. These two groups set the background-reasoning and structure upon which OPEC was formed. In September 1960, Iran, Iraq,

Kuwait, Saudi Arabia and Venezuela formed OPEC to restore oil prices back to their precut level, i.e. to defend crude oil price. OPEC's primary mission, among others, is to achieve oil price stability at a reasonable level and in fairness to both producers and consumers. It, however, gives priority 'at all times to the interest of oil-producing nations and to the necessity of securing a steady income for them…'. Over the period from 1960 to 1973, OPEC:- (i) coordinated the restructuring of Fiscal Systems to ensure host governments got more despite decreasing oil prices; (ii) embarked on production control for both political and price control purposes; (iii) through the 1968 Resolution/Declaration, set the stage for reviewing concessions drastically to give host governments higher percentage in oil operations. On various occasions, from 1973 to 1981, OPEC members acted unilaterally. OPEC intermittently embarked on price increases and production cutbacks, e.g., OPEC embargo of 1973–74. They increased royalties, profit and income tax rates. The foreign oil companies were nationalized and consequently became crude oil buyers and service contractors. In line with its price stabilization goals, OPEC fixed prices for twelve years after 1973. Subsequently it has managed crude oil supplies for the same and other purposes. The nature of the oil market has ensured OPEC's ability to regulate and influence oil prices. Historically, in the late 1970's there were few spot market transactions and price was based rigidly on OPEC's announced prices. These prices also formed the basis for long-term contracts. The integrated nature of the industry at that time enabled OPEC to have firm control. In the early 1980s, however, more new companies entered the market and nationalization distorted the structure of traditional IOCs. Gradually the market became more transparent as arms-length transactions increased. The spot market expanded and more liquidity was created to manage trading risk. Term contracts were then indexed to spot prices. Hence, OPEC's grip became weak and it attempted to regain control after the second oil shock. Thereafter, in 1983, OPEC introduced the quota system for rationing production volumes. Its price-fixing powers were greatly destabilized after the introduction, in March 1983, of NYMEX® futures contract. Together with the IPE Brent Futures, the futures contracts served as instruments for price-risk management. These derivatives are more sophisticated now and are used to mobilize funds for oil projects. Despite the effect of Saudi Arabia's policy change on the market (1986 oil price crash) OPEC still uses the quota system. In April 2000, OPEC nations signed a 'gentlemen's agreement' to maintain a range of prices within USD22–28 per barrel. The 2004 oil-price upsurge has raised new questions on OPEC's ability to manage Oil prices. Currently, oil prices depend on the interaction of OPEC supply manipulation and market forces at the various oil exchanges (these were the New York Mercantile Exchange (NYMEX®), the International Petroleum Exchange in London (IPE) and the Singapore International Monetary Exchange (SIMEX)). Organization of the Petroleum Exporting Countries (OPEC), emerged as the major petroleum pricing power in 1973, when the ownership of oil production in the Middle East transferred from the operating companies to the governments of the producing countries or to their national oil. Members are:- Algeria, Ecuador, Gabon, Indonesia, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela. An organization founded in Baghdad, Iraq, in September 1960, to unify and coordinate members' petroleum policies. The Organization of Petroleum Exporting Countries (OPEC) members' national oil ministers, meet regularly to discuss prices and, since 1982, to set crude oil production quotas. Original OPEC members include Iran, Iraq, Kuwait, Saudi Arabia, and Venezuela. Between 1960 and 1975, the organization expanded to include Qatar (1961), Indonesia (1962), Libya (1962), the United Arab Emirates (1967), Algeria (1969), Nigeria (1971), Ecuador (1973), and Gabon (1975). Ecuador is deemed to have left the cartel in December 1992, and Gabon in January 1995. Although Iraq remains a member of OPEC, Iraqi production has not been a part of any OPEC quota agreements since March 1998. For several decades, OPEC has effectively controlled the price of world crude oil by means of agreeing upon member country crude oil production levels. The Organization of Petroleum Exporting Countries, OPEC is the organization that coordinates and unifies the petroleum policies of the eleven developing oil producing nations that make up its membership. It seeks to ensure the stabilization of oil prices in international oil markets, with a view to eliminating harmful and unnecessary fluctuations, due regards being given at all times, to the interests of oil producing nations, and to the necessity of securing a steady income for them. OPEC was formed on 1960-September-14, at a meeting in Baghdad, the Iraqi capital by five countries that became the founder members. It was registered with the United Nations Secretariat on 1962-November-06, following UN Resolution No. 6363. Also in attendance at the Baghdad meeting were – Islamic Republic of Iran, Iraq, Kuwait, Saudi Arabia and Venezuela**.** They signed the original agreement establishing OPEC. Today, the organization has eleven members namely, Algeria, Indonesia, Nigeria, Qatar, Saudi Arabia, United Arab Emirates, Islamic Republic of Iran, Iraq, Kuwait, SP Libyan AJ and Venezuela. The principal aims of the organization as outlined in Article 2 of its statute are:- (i) the co-ordination and unification of the petroleum policies of Member Countries and the determination of the best means for safeguarding their interests, individually and collectively; (ii) devising ways and means of ensuring the stabilization of prices in international oil markets with a view to eliminating harmful and unnecessary fluctuations, while; and (iii) giving due regard at all times, to the interests of the producing nations and to the necessity of securing a steady income to the producing countries; an efficient, economic and regular supply of petroleum to consuming nations; and a fair return on their capital to those investing in the petroleum industry. Headquartered in Vienna, Austria. The official suspension on 2009-January-01 of Indonesia's membership of OPEC. The Organization of Petroleum Exporting Countries (OPEC) is an intergovernmental organization 'dedicated to the stability and prosperity of the petroleum market'. OPEC membership is open to any country that is a substantial net exporter of oil and that shares the ideals of the organization. OPEC's 11 member countries supply more than 40 percent of the world's oil and possess about 78 percent of the world's total proven crude oil reserves. The government of Congo said in January that it wanted to join OPEC as it moves ahead with new projects that could help it become sub-Saharan Africa's third-largest oil producer with a target of 350 000 barrels per day this year. Republic of Congo, one of Africa's major oil producers, has joined the Organization of the Petroleum Exporting Countries (OPEC), OPEC said in a statement on 22 June 2018. Congo's membership was approved during a meeting in Vienna. 'The Conference considered Congo's request to join the Organization and decided to approve its admission with immediate effect', OPEC said in statement. 2018-December-03 (Monday):- Qatar will withdraw from the Organization of the Petroleum Exporting Countries (OPEC), the Gulf nation's Energy Minister Saad Sherida al-Kaabi announced. Speaking at a news conference in the capital Doha, al-Kaabi said:- 'The withdrawal decision reflects Qatar's desire to focus its efforts on plans to develop and increase its natural gas production from 77 million tonnes per year to 110 million tonnes in the coming years'. The decision to quit the bloc of 15 oil-producing countries that account for a significant percentage of the world's oil production was confirmed by Qatar Petroleum, the state oil company, on Monday (Qatar announces it was withdrawing from the Organization of Petroleum Exporting Countries (OPEC) effective 01 January 2019). Since 2013, the amount of oil Qatar produced has steadily declined from about 728 000 barrels per day in 2013 to about 607 000 barrels per day in 2017, or just under two percent of OPEC's total output. Sheikh Hamad bin Jassim Al Thani, Qatar's former Prime Minister, called the withdrawal a 'wise decision'. 'This organization has become useless and adds nothing to us', Sheikh Hamad wrote on Twitter. 'They are used only for purposes that are detrimental to our national interest'. Meanwhile, total production during the same period increased from 30.7 million barrels per day to 32.4 million barrels per day. Qatar joined OPEC in 1961, one year after the organisation's establishment. / Организация Стран, Вывозящих Нефть (ОСВН):- . Они состояли из Семи Сестёр (Seven Sisters), среди которых были Дьжози (Эксан) (Jersey (Exxon)), Сокэни-Вакъюм Оил Кампэни (Мобл) (Socony-Vacuum Oil Company (Mobil)), Стандарт Калифорнии (Шеврон) (Standard of California (Chevron)), Тэксэко (Техасо), Галф (Gulf), Ройэл Датч/Шел (Royal Dutch/Shell) и Би.Пи. (BP) и Французская компания – Компани Фронсэз дэ Пэтроле (Сэ.Эф.Пе.; Compagnie Française des Petroles (CFP)). Щел (Shell). ЭКСАН (Эксан Мобл Корпорэйшэн; EXXON (Exxon Mobil Corporation)). Организация Стран Экспортёров Нефти или Организация Стран, Экспортирующих Нефть (ОСЭН или ОПЭК (OPEC), в Англоязычном произношении) была сформирована на встрече в Багдаде,

Ирак 14 Сентября 1960. Первоначально ОСЭН устанавливала единые продажные цены на нефть. Штабквартира расположена в Вене, Австрия. и нежелательные флуктуации (колебания), . Организация Стран Экспортёров Нефти (ОСЭН) – межправительственная организация, координирующая и унифицирующая нефтяную политику стран-членов и разрабатывающая пути и методы защиты их интересов как на индивидуальной, так и на коллективной основе. Основана в 1960 Ираном, Ираком, Кувейтом, Саудовской Аравией, Венесуэлой. Впоследствии к ОСЭН присоединились Катар (1961), Индонезия и Ливия (1962), Эмират Абу-Даби (1967), Алжир (1969), Нигерия (1971), Эквадор (1973) и Габон (на правах ассоциированного члена с 1973, полное членство с 1975). 06 Сентября 1962 ОСЭН зарегистрирована в Секретариате ООН как полноправная межправительственная организация. В 1965 установила официальные отношения с Экономическим и Социальным Советом ООН, стала участником Конференции ООН по Торговле и Развитию. Высший орган ОСЭН – Конференция стран-участниц, созываемая, как правило, 2 раза в год. Конференция решает вопросы приёма новых членов, утверждает состав Совета Управляющих, бюджет и финансовый отчёт, назначает Председателя Совета Управляющих, Генерального Секретаря, его заместителей и ревизора. Совет Управляющих подготавливает вопросы для Конференции, руководит работой Секретариата, являющегося постоянно действующим органом. Секретариат проводит исследования и готовит предложения для Совета Управляющих и Конференции, осуществляет контроль за исполнением принятых решений, составляет проекты ежегодных бюджетов ОСЭН. В его состав входят административный, экономический, юридический, информационный и технический отделы. Цель ОСЭН – обеспечение участия государства в эксплуатации своих нефтяных ресурсов, обеспечение стабильности цен на мировом рынке нефти и устойчивых доходов участников, регулярных поставок нефти в страны-потребители. Членом ОСЭН может стать страна, являющаяся крупным нетто-экспортёром нефти и признающая цели и задачи организации. В первые годы существования ОСЭН главной задачей было повышение доходов от нефти, в последующие годы – изменение принципа расчёта платежей роялти, осуществление единой программы регулирования добычи нефти и установления единого уровня справочных цен, изменение условий концессионных соглашений и условий эксплуатации нефтяных ресурсов, создание национального нефтяного хозяйства в нефтедобывающих странах, а также вопросы сбыта нефти национальными компаниями. В общей мировой добыче нефти (без социалистических стран) доля ОСЭН составляла около 42%, в достоверных запасах – 77%, в вывозе (или экспорте) – 64% (1985). В Мае 1968 Саудовская Аравия, Кувейт, Ливия, Алжир, Бахрейн, Ирак, Катар, Сирия, Эмират Абу-Даби подписали соглашение об образовании Организации Арабских Стран-Экспортёров Нефти (Organization of Arab Petroleum Exporting Countries (ОАСЭН), основная цель которой определять пути и средства защиты интересов стран-участниц по обеспечению поставок нефти на равноправных и справедливых условиях. В отличие от ОСЭН, ОАСЭН не занимается установлением цен на нефть, а осуществляет сотрудничество стран-участниц в различных сферах экономической деятельности в области нефтяной промышленности.

ORGANIZER = ОРГАНИЗАТОР (или УЧРЕДИТЕЛЬ) – Organizer is the person(s) who perform the act of forming a limited liability company. / В плане организации предприятия под Организатором или Учредителем понимается лицо(а), которые осуществляют все необходимые действия по формированию компании с ограниченной ответственностью.

ORGANOGENESIS = ОРГАНОГЕНЕЗ (или ОРГАНОГЕНЕЗИС) – Organogenesis is a development of individual plant organs such as leaves, tillers, floral organs, or roots. / или корни. Под Органогенезом, от слова Орган (в биологии), означающее часть тела животного или растительного организма, выполняющая одну или чаще несколько специфичных для него функций, и части сложного слова ...генез, от Греческого слова Genésis, означающее Возникновение или Происхождение, понимается:- (1) у животных – образование и развитие органов. Различают онтогенетический органогенез, изучаемый эмбриологией и биологией развития, и филогенетический органогенез, исследуемый сравнительной анатомией. Кроме описания и анализа течения процессов органогенеза, в задачу указанных дисциплин входят раскрытие и причинное объяснение этих процессов в филогенезе и онтогенезе. Сравнительная анатомия рассматривает возникновение новых органов, их преобразование, разделение, прогрессивное развитие и редукцию, процессы рудиментации и тому подобное. Изучение развития формы органов в связи с их функцией привело к открытию основных закономерностей филогенетического органогенеза. Таковы принципы дифференциации и интеграции, а также смены функций как руководящего начала в филогенетическом преобразовании органов. Онтогенетический органогенез до известной степени повторяет филогенетический органогенез (смотрите Биогенетический Закон). В ходе первого осуществляется последовательная дифференцировка и интеграция органов, а также неравномерный рост и активное перемещение клеточного материала. Причинное исследование онтогенетического органогенеза доступно точному изучению, особенно благодаря возможности применения экспериментального метода (смотрите Экспериментальная Эмбриология). О начальных и некоторых последующих этапах органогенеза смотрите Детерминация, Дробление, Зародышевое Развитие, Зародышевые Листки, Индукторы, Индукция, Организатор. (2) У растений термином Органогенез обычно обозначают формирование и развитие основных органов (корня, стебля, листьев, цветков) в процессе онтогенеза из участка недифференцированной ткани – меристемы.

ORGANOLEPTIC INSPECTION = ОРГАНОЛЕПТИЧЕСКАЯ ИНСПЕКЦИЯ – Organoleptic Inspection:- organoleptic testing involves inspection through visual examination, feeling and smelling of products. Organoleptic refers to any sensory properties of a product, involving taste, color, odor and feel. Organoleptic quality – product characteristics such as flavour, texture, appearance and aroma. Organoleptic Inspection:- using organoleptic methods, that is, relying on sight, touch and smell, the inspectors examine the head, viscera, and exterior of each carcass for signs of adulteration, such as tumors, inflammation, parasites, and other diseases. / Контроль, при котором первичная информация воспринимается и оценивается с помощью органов чувств, например, вкус или запах. Под Органолептическим Анализом понимается исследование свойств продуктов или материалов, главным образом пищевых, при помощи органов чувств. Применяется, когда нет более объективных научно обоснованных методов анализа. Под Органолептическим Анализом, от слова Орган (в биологии), означающее часть тела животного или растительного организма, выполняющая одну или чаще несколько специфичных для него функций, и Греческого слова Lēptikós, означающее Склонный Брать или Склонный Принимать), исследование свойств продуктов и материалов, главным образом пищевых, при помощи органов чувств. Органолептический анализ обычно осуществляется дегустаторами (смотрите Дегустация). Широко применяется для оценки качества вин, коньяков, чая, табака, сыров, сливочного масла и консервов. Метод органолептического анализа в известной мере субъективен, что обусловлено изменчивостью ощущений как у разных людей, так и у одного и того же человека (в зависимости от состояния организма). Применяется в тех случаях, когда нет более объективных научно обоснованных методов анализа.

ORGANOPHOSPHATES = ОРГАНОФОСФАТЫ – Organophosphates is a class of organic, phosphorus-containing insecticides that inhibit cholinesterase, causing excess nerve activation, paralysis, and eventual death; some insecticides in this class with a high phosphorus content (e.g., methyl parathion) may delay cotton crop maturity if applied at an early stage. Abbreviation:- OP.

ORGANOSOLV PULPING = XX – Organosolv Pulping:- in industrial paper-making processes, organosolv is a pulping technique that uses an organic solvent to solubilise lignin and hemicellulose.

ORGANZA = ОРГАНЗА – Organza:- while there are some great ways to infuse the home and wardrobe with a sense of luxury, few of them can equal the use of Organza. As a sheer fabric that provides a look and feel that is similar to silk, many forms of organza are actually made with silk filaments. Here is some background on the production of organza, as well as some of the ways that organza is commonly used. Originally a lightweight silk fabric, organza is a plain weave that is created using nylon, polyester, and silk or a blend of any of the three. The loose weave of the filaments allows the production of organza to result in sections of cloth that are translucent in nature. A slightly looser variation on the weave will result in sheer looking fabric. Chinese organza is still often made completely from silk filaments. Italian and French organza is generally sturdier and often includes nylon filaments as a blend with the silk. Organza produced in India and the United States often uses a mixture of nylon and polyester to create usable organza that is both cost effective and smooth to the touch. Organza has a number of uses around the house. One of the more common applications is organza fabric that has been left either a natural white or given a tea rinse and used as sheer curtains for windows. The window treatment can either be simple flowing panels or include ruffles with a valance and tiebacks to add a frilly touch to the space. Another application has to do with creating painted screens that can add enhance a corner or be used as an airy way to divide the space in a larger room. Organza holds paints well and can result in some beautifully appointed designs for the screen panels. Along with window treatments and screens, organza can also add a romantic touch to the bedroom. Suspended as netting over the bed, silk organza panels will soften the lines of just about any style of furniture, and create a romantic getaway. Organza scarves can also be draped over lampshades to diffuse the light. Just make sure the bulbs in the lamps are low heat types. When it comes to attire, organza is a staple of formal dresses and other feminine wardrobe items. As a way to create full skirts on evening gowns, nothing beats organza for a graceful fall that produces attractive lines. Wraps that are overlaid with organza can produce a sophisticated look that will draw many admiring eyes. One of the main uses of organza is in the creation of wedding dresses that help to make the big day all the more special. Between wedding attire and uptown evening fashions, organza has a secure future in the world of fashion. Organza is a crisp, sheer, lightweight plain weave fabric, with a medium to high yarn count, made of silk, rayon, nylon, or polyester. The fabric is used primarily in evening and wedding apparel for women. Silk Organza is a sheer, thin open-weave fabric that is heavier and crisper than silk gauze. It has a smooth, flat finish, is strong and durable, and gets its stiffness from tightly twisted yarns. Often used as the base fabric for embellished fabrics. This plain weave sheer silk is made with a loose plain weave and tightly twisted yarns that have 10 to 20 turns per inch (tpi). Organza is similar to cotton organdy except it is made with silk and is transparent. Organza has a crisp drape, which requires special sewing techniques for seams, facings, and hems because they can be seen from the outside of the garment. It is mostly used for interfacing, veils, and undergowns. Organza is a stiff, thin, plain weave fabric made of silk, nylon, acrylic, or polyester. Organza is used primarily in evening and wedding attire for women. Organza is a sheer dress fabric resembling organdy and usually made of silk, rayon, or nylon. Fine, sheer, lightweight, crisp fabric. It has a very wiry feel. It crushes or musses fairly easily, but it is easily pressed. Dressy type of fabric, sometimes has a silvery sheen. Used in trimming, neckwear, millinery, and underlinings for delicate, sheer materials, as well as an underlining for other fabrics that require a bit of stiffness without weight. Organza is a thin, plain-weave, sheer fabric is traditionally made from silk, the continuous filament of silkworms. Nowadays, though many organzas are woven with synthetic filament fibers such as polyester or nylon, the most luxurious organzas are still woven in silk. / Найлан[ТЗ] (Nylon[TM]). Органза – плательная прозрачная жёсткая ткань из шёлка или вискозы.

ORGANZINE YARN = ТРОЩЁНАЯ ПРЯЖА – Organize (Organzine) Yarn:- two or more threads twisted in the singles and then plied in the reverse direction. The number of turns per inch in the singles and in the ply is usually in the range of 10 to 20 turns. Organzine yarn is generally used in the warp. To make into organzine:- to twist threads of silk so as to form organzine. Organzine:- a very strong yarn from high-quality silk. Two or more strands are each twisted and the compound thread then twisted in the opposite direction. Organzine is used as warp in a woven fabric. Organzine is a raw silk yarn used for warp thread in fine fabrics.

ORIENTATION = ОРИЕНТАЦИЯ (или ОРИЕНТИРОВАНИЕ, или ОРИЕНТИРОВКА) – Orientation:- in linear polymeric structures, the degree of parallelism of the chain molecules.

ORIENTED STRANDBOARD = ОРИЕНТИРОВАННО–СТРУЖЕЧНАЯ ПЛИТА (или ПЛИТА С ОРИЕНТИРОВАННЫМИ ЛИСТАМИ ЛУЩЁНОГО ШПОНА, или ПЛИТА С ОРИЕНТИРОВАННОЙ СТРОЖКОЙ, или ПЛИТА С ОРИЕНТИРОВАННЫМИ ВОЛОКНАМИ, или ПЛИТА С ОРИЕНТИРОВАННЫМ НАПРАВЛЕНИЕМ СТРУЖКИ (или ПРОЖИЛОК)) – Oriented Strandboard is a panel product, used for sheathing, made from strands with the face wafers oriented in the long direction of the panel to provide additional strength in that direction. Also known as Wafer Board. / Панельный продукт, используемый для обшивки/настила/опалубки, производимый из листов лущёного шпона (строжки/жил/пучков/стренгов/скруток/прядей/прожилок) с лицевыми стружками, ориентированными по направлению длины. Известна также как Древесностружечная Плита (Wafer Board). Под Древесными Слоистыми Пластиками (ДСП) понимаются материалы, изготовленные из листов лущёного шпона, уложенных в определённом порядке (по направлению волокон) и склеенных синтетическими клеями в процессе термической обработки под большим давлением. Древесные слоистые пластики отличаются высокой плотностью (1 230–1 330 кг/м^3). Они применяются в машиностроении, электротехнике, авиа- и судостроении. Древесностружечная Плита (ДСП) с ориентированными древесными частицами – древесностружечная плита, у которой в одном или нескольких слоях специальные крупноразмерные древесные частицы расположены преимущественно в заданном направлении. Ориентированные Стружечные Плиты (ОСП) существенно отличаются от плит ДСП, прежде всего размером и порядком укладки стружки (щепы) в стружечном ковре перед прессованием. Диапазоны размеров стружки (щепы) для ОСП составляют:- длина 75–150 миллиметров (мм), ширина 10–25 мм, толщина 0.50–0.75 мм. Осмолённая щепа с указанными параметрами при помощи специальных шнековых укладчиков раскладывается так, что в верхнем слое щепа располагается вдоль длины плиты, в среднем слое – поперёк и в нижнем слое снова вдоль длины плиты. Набранный таким образом ковёр подвергается горячему прессованию при температурах 165–175 °C в многоэтажных прессах. Принцип укладки щепы в плитах ОСП полностью аналогичен принципу укладки фанеры, однако производительность процесса значительно выше в технологии, а также значительно больший выбор исходного древесного сырья. Прочность при изгибе плит ОСП со средней плотностью 685 килограммов на кубический метр (кг/куб.м.) составляет около 45 МегаПаскалей (Мпа) (прочность фанеры аналогичной плотности составляет в среднем 57 МПа). Начало производства плит относится к 1978 (США), а к 2000 в США производство плит ОСП по объёму сравнялось с производством фанеры. В последние годы процесс производства плит ОСП значительно усовершенствовали, и производительность труда ещё больше увеличилась за счёт замены периодического процесса горячего прессования на непрерывный процесс с использованием ленточных процессов. Современная технология производства плит ОСП:- В качестве основного сырья для изготовления плит ОСП используется круглый лес сосны. Окорка круглого леса осуществляется вне производственных цехов при помощи окорочного барабана, в котором можно обрабатывать стволы длиной до 2.5 метров (м). Окорённые стволы направляются в цех на стружечные станки с ножевыми кольцами. Стружка для наружного слоя изготавливается длиной 100 мм, толщиной 0.6 мм и шириной 20 мм. И для внутреннего слоя – шириной 15 мм. По ленточному транспортёру длиной 250 м стружка направляется к бункеру сырой стружки для промежуточного хранения. Барабанная сушилка нагревается прямым нагревом при помощи горячего воздуха, который вырабатывается на газомасляной горелке. Испарительная мощность сушилки составляет 28 тонн в час (т/час). Два параллельных сита барабанного типа

отделяют полезное сырьё от мелких фракций. На выходе из сепаратора более широкая стружка для наружного слоя отделяется от более узкой стружки для внутреннего слоя при помощи простого двухходового распределителя. Затем в одном смесителе для внутреннего слоя и двух смесителях для наружного слоя происходит нанесение клея. При изготовлении плит ОСП-2 процентное содержание клея составляет 11% (относительно абсолютно сухого веса стружки) для стружки наружного слоя и 2% для стружки внутреннего слоя. Причём для наружного слоя используется клеевая смесь на основе карбамидной или меламиновой смолы, а для стружки внутреннего слоя – фенол-дифенил-метан-диизоцианатный клей PM01. Для соблюдения требований норм для плит ОСП-3 для стружки наружного слоя используется смесительный конденсат МУРР (13–14%), а для внутреннего слоя – клей (4%). Формирующая станция имеет две насыпные головки с дисковыми вальцами для наружного слоя и одну насыпную головку с камерными вальцами для внутреннего слоя. Максимальная ширина насыпки составляет 2.93 м. Прибор-металлоискатель соединён с управляющей заслонкой ошибочной насыпки. Первый в Европе пресс непрерывного действия Немецкой фирмы Диффэнбахэр (Dieffenbacher) для производства плит ОСП, имеет длину 34 м с возможностью удлинения на 10 м, ширина стальной ленты – 3 м, толщина – 3 мм. Стальные ленты нагреваются котлом мощностью 8 МегаВатт (МВт) при помощи термомасла до температуры 220 °C. В передней зоне уплотнения давление прессования достигает 5 Ньютонов на миллиметр (Н/мм). Расчётное время отвердения составляет 9 секунд на каждый миллиметр толщины плиты. Плиты изготавливаются толщиной от 6 до 40 мм. Пыль и отработанный пар после пресса удаляются вентилятором влажным способом. Участок транспортировки ‘сырых’ плит начинается на установке раскроя на базовый размер плиты (от 3 м до 6.3 м). После прохождения устройства распознавания расслоений плиты направляются на два веерных охладителя, установленных последовательно друг за другом, После охлаждения плиты укладываются в штабели. Поперечные транспортёры направляют плиты на участок разборки штабелей. Затем 5-пильными агрегатами осуществляется продольный и поперечный раскрой плит на 4 плиты необходимой длины и ширины. За последние три года (2011) в рекламно-технических публикациях, посвящённых плитам ОСП, участилось упоминание так называемых водостойких ОСП, к которым относятся ОСП-3 и ОСП-4, обладающих большей прочностью и водостойкостью по сравнению с плитами ОСП, ОСП-1 и ОСП-2. Авторы многих публикаций наибольшее внимание уделяют ОСП-3, которые сочетают высокую прочность, водостойкость (% разбухания в воде за 24 часа) и приемлемую цену. Некоторые авторы прогнозируют бурное развитие производства ОСП-3.

ORIFICE = ОТВЕРСТИЕ (или УСТЬЕ, или ПРОХОД, или ЖИКЛЁР, или СОПЛО, или НАСАДКА, или НАКОНЕЧНИК, или ШТУЦЕР) – Orifice:- generally, an opening. Used specifically to refer to the small holes in spinnerets through which the polymer flows in the manufacture of fibers. Orifice is a hole in end of flyer, directing the yarn to the bobbin, may also be a hook or pig’s tail. / Под Жиклёром, от Французского слова Gicleur, от Gicler, означающее Брызнуть, понимается калиброванное отверстие для дозирования подачи жидкого топлива или воздуха. В технической литературе жиклёрами называют детали карбюратора (пробки, форсунки) с калиброванными отверстиями. По выполняемым функциям и в зависимости от того, в какой системе карбюратора он установлен, различают жиклёр топливный, воздушный, главный, компенсационный, холостого хода и другие. Жиклёры оценивают их пропускной способностью (производительностью), то есть количеством жидкости (обычно воды), которое может пройти через калиброванное отверстие в единицу времени; пропускная способность жиклёров выражается в кубических сантиметров в минуту ($см^3$/мин)). Штуцер, деталь трубопровода или его соединительного узла, представляющая собой втулку, один из концов которой имеет внутреннюю или наружную резьбу для крепления к различным ёмкостям или трубопроводам. Форма другого конца штуцера зависит от способа присоединения к последующим деталям. Штуцером называют также отрезок трубы небольшого диаметра (10–20 миллиметров (мм)) для выпуска воды или воздуха, отбора жидкости из трубопровода с целью измерения её давления.

ORIGIN = ПРОИСХОЖДЕНИЕ – Origin:- in referring to accessions in the germplasm collection, the site where the accession was collected.

ORIGINAL APPLICATION = ПЕРВИЧНАЯ ЗАЯВКА (или ПЕРВОНАЧАЛЬНАЯ ЗАЯВКА) – Original Application:- a term ‘Original’ is used in the patent statute and rules to refer to an application which is not a reissue application. An original application may be a first filing or a continuing application. See also Nonprovisional Patent Application, and Provisional Patent Application.

ORIGINAL BILL OF LADING = ОРИГИНАЛ КОНОСАМЕНТА (или ПОДЛИННЫЙ КОНОСАМЕНТ) – Original Bill Of Lading (OBL) is a document which requires proper signatures for consummating carriage of contract. Must be marked as ‘original’ by the issuing carrier. Also known as Original Bill. The part of the B/L set that has value, especially when negotiable; rest of set are only informational file copies. Abbreviated as OBL. Original Bill Of Lading (OBL):- if a credit requires presentation of a bill of lading (‘marine’, ‘ocean’ or ‘port-to-port’ or similar) covering sea shipment only, UCP 600 article 20 is applicable. To comply with UCP 600 article 20, a bill of lading must appear to cover a port-to-port shipment but need not be titled ‘marine bill of lading’, ‘ocean bill of lading’, ‘port-to-port bill of lading’ or similar. A UCP 600 article 20 transport document must indicate the number of originals that have been issued. Transport documents marked ‘First Original’, ‘Second Original’, ‘Third Original’, ‘Original’, ‘Duplicate’, ‘Triplicate’, etc, or similar expressions are all originals. Bills of lading need not be marked ‘original’ to be acceptable as an original bill of lading. In addition to UCP 600 article 17, the ICC Banking Commission Policy Statement, document 470/871 (Rev), titled ‘The Determination of an ‘Original’ Document in the Context of UCP 500 sub-Article 20 (b)’ is recommended for further guidance on originals and copies and remains valid under UCP 600. The content of the Policy Statement appears in the Appendix of this publication, for reference purposes. Original bills of lading must be signed in the form described in UCP 600 sub-article 20(a)(i) and indicate the name of the carrier, identified as the carrier. If an agent signs a bill of lading on behalf of the carrier, the agent must be identified as agent and must identify on whose behalf it is signing, unless the carrier has been identified elsewhere on the bill of lading. (a) If the master (captain) signs the bill of lading, the signature of the master (captain) must be identified as ‘master’ (‘captain’). In this event, the name of the master (captain) need not be stated. (b) If an agent signs the bill of lading on behalf of the master (captain), the agent must be identified as agent. In this event, the name of the master (captain) need not be stated. (c) If a credit states ‘Freight Forwarder’s Bill of Lading is acceptable’ or uses a similar phrase, then the bill of lading may be signed by a freight forwarder in the capacity of a freight forwarder, without the need to identify itself as carrier or agent for the named carrier. In this event, it is not necessary to show the name of the carrier. / хозяин (или капитан). Оригинал Коносамента – коносамент, обозначенный как оригинал.

ORIGINAL EQUIPMENT MANUFACTURER = ИЗГОТОВИТЕЛЬ С ПОДЛИННЫМ ОБОРУДОВАНИЕМ (или ИЗГОТОВИТЕЛЬ ПЕРВОНАЧАЛЬНОГО ОБОРУДОВАНИЯ) – Original Equipment Manufacturer (OEM):- companies which manufacture and market their own products under their own trademarks are often referred to as OEMs by other companies who supply components or systems to these companies. / Производство, при котором ‘безымянный’ производитель изготавливает то или иное изделие по заказу и по спецификации владельца ‘чужой’ торговой марки, и в дальнейшем этот заказчик использует это изделие под собственной маркой в качестве ‘фирменного изделия’; Самостоятельный сторонний изготовитель оборудования:- при изготовлении тех или иных продуктов, например, компьютеров, изготовители обычно приобретают компоненты у сторонних изготовителей оригинального оборудования и интегрируют их в собственные.

ORIGINAL FILING BASIS = БАЗИС ПЕРВОНАЧАЛЬНОЙ ПОДАЧИ (или ОСНОВАНИЕ ДЛЯ ПЕРВОНАЧАЛЬНОЙ ПОДАЧИ) – Original Filing Basis is the basis set forth in the application as initially filed. See also Filing Basis.

ORIGINAL ISSUE = ПЕРВОНАЧАЛЬНАЯ ЭМИССИЯ – Original Issue:- shares of stock newly issued through a public offering, an exercise of a stock option, a merger, or a special reserve set up for a special purpose.

ORIGINAL ISSUE DISCOUNT = ДИСКОНТ ПРИ ПЕРВОНАЧАЛЬНОЙ ЭМИССИИ – In the United States, a long-term debt instrument generally has Original Issue Discount (OID) when it is issued for a price less than its stated redemption price at maturity (principal amount). The OID is the difference between the stated redemption price at maturity and the issue price. OID is considered to be a form of interest. All debt instruments that pay no interest prior to maturity (zero coupon bonds) are presumed to be issued at a discount. The majority of OID bonds are zero coupon bonds. However, it is possible for a bond making periodic coupon payments to also have OID. Formula:- OID = The stated redemption price at maturity – The issue price. The IRS allows bond issuers to disregard OID (treat it as zero) if it is less than USD0.0025 times the stated redemption price times the number of full years from the date of original issue to maturity. For example, a bond is issued on 1990-January-01 for USD950.00. The bond matures on 1995-January-01, has a face value of USD1 000.00 and pays interest at an annual rate of 10% on June 1st and January 1st. Redemption Price:- The interest is based on a fixed rate and payable unconditionally at fixed periodic intervals. Therefore, the redemption price is USD1 000.00. De minimis test:- (USD0.0025)(USD1 000.00)(5 years) = USD12.50. Therefore, OID for this issue is reportable if issue price is less than USD987.50. OID = USD1 000.00 – USD950.00 = USD50.00. Nonqualified Stated Interest. Assume the same facts as above but the 10% coupon begins accruing on 1992-January-01 with the first payment on 1992-June-01. Since the bond does not make interest payments at fixed periodic intervals of less than one year the interest is nonqualified stated interest (NQSI). NQSI payments are added to the maturity value of an instrument to determine the stated redemption price. The stated redemption price therefore is USD1 000.00 plus the nonqualified stated interest. Stated Redemption Price = USD1 000.00 + (3 years x USD100.00) = USD1 300.00. OID = USD1 300.00 – USD950.00 = USD350.00.

ORIGINAL MARGIN = ПЕРВОНАЧАЛЬНАЯ МАРЖА – Original Margin is a term applied to the initial deposit of margin money each clearing member firm is required to make according to clearing organization rules based upon positions carried, determined separately for customer and proprietary positions; similar in concept to the initial margin or security deposit required of customers by exchange rules. The amount of money, securities or other property required as security for the performance of futures contracts carried in a customer account, as provided in the rules of the exchange. Original Margin is the deposit the clearinghouse requires of clearing members when futures contracts are presented for clearance; parallel to the initial margin (total amount of margin per contract) required of customers by exchanges and collected by Futures Commission Merchants (FCMs) when futures positions are originated. The margin needed to cover a new position. Also known as Initial Margin, and Initial Performance Bond. The amount a futures market participant must deposit into his margin account at the time he placed an order to buy or sell a futures contract in order to guarantee fulfillment of its obligations. Original Margin is the total amount of margin per contract required by the broker when a futures position is opened.

ORIGINAL MATURITY = ПЕРВОНАЧАЛЬНОЕ ПОГАШЕНИЕ – In the United States, Original Maturity:- the original (or initial) term fixed for a bond. During this original term (or period), the bond increases in value and becomes worth at least its face amount. Original Maturity is a maturity at issue. For example, a 5-year note has an original maturity at issue of 5 years; one year later it has a current maturity of 4 years. The Original Maturity is the length of time from the opening agreement to the final repayment date.

ORIGINAL ORDERED AMOUNT = ПЕРВОНАЧАЛЬНАЯ ЗАЯВЛЕННАЯ СУММА – In banking, Original Ordered Amount is the transaction amount instructed by the debtor. / В банковской сфере сумма операции в соответствии с заявленной инструкцией дебитора.

ORIGINAL SLIP = ПОДЛИННЫЙ СЛИП (или ОРИГИНАЛЬНАЯ КВИТАНЦИЯ) – Original Slip is the broker's placing slip.

ORIGINATING BENEFICIARY INFORMATION = ИНФОРМАЦИЯ ОБ ИНИЦИИРУЮЩЕМ ВЫГОДОПРИОБРЕТАТЕЛЕ – Originating Beneficiary Information (OBI) is the informational portion of a wire (electronic) transfer of funds. It is a necessary and important element, providing the United States Patent and Trademark Office (USPTO) information as to why the 'wire' was sent, by whom, and how to apply the payment.

ORIGINATOR = ИНИЦИАТОР – In banking, Originator is the initiator of a funds transfer instruction. / В банковской сфере, инициатор инструкции по переводу денежных средств.

ORIGIN MOTOR TERMINAL = АВТОМОБИЛЬНЫЙ ТЕРМИНАЛ ПО МЕСТУ ОТГРУЗКИ – Origin Motor Terminal (OMT) is a location designated by a motor carrier at origin points where, the motor carrier or his authorized agent assembles, holds or stores an ocean carrier's containers and chassis; where loaded containers are received from shippers or their agents; where empty containers are delivered to shippers or their agents. See also Destination Motor Terminal and Origin Rail Terminal.

ORIGIN OF GOODS = ПРОИСХОЖДЕНИЕ ТОВАРОВ – Origin Of Goods:- origin is the 'economic' nationality of goods in international trade. It is necessary to determine the origin of goods as any duties and/or equivalent charges or any customs restrictions or obligations applicable to them will depend on their origin. / Под Происхождением Товаров в международной торговле понимается их 'экономическая' принадлежность.

ORIGIN RAIL TERMINAL = ЖЕЛЕЗНОДОРОЖНЫЙ ТЕРМИНАЛ ПО МЕСТУ ОТГРУЗКИ – Origin Rail Terminal (ORT) is a location designated by a rail carrier at origin points where, the motor carrier or his authorized agent assembles, holds or stores an ocean carrier's containers and chassis; where loaded containers are received from shippers or their agents; where empty containers are delivered to shippers or their agents. See also Destination Motor Terminal and Origin Motor Terminal.

ORIMULSION = ОРИМУЛЬСИЯ – Orimulsion is a trade name for a heavy fuel oil made of an aqueous emulsion of tar sand bitumen from the Orinoco region of Venezuela that can be transported by pipeline, oil tanker or truck.

ORLON = ОЛАН (или ОЛОН, или ОРЛОН, или ОРЛОНОВОЕ) – Orlon is a trademark for an acrylic fiber available in filaments (long single strands) or staples (bundles of short fibers). Orlon is resistant to sunlight and atmospheric gases, which makes it ideal for awnings and other outdoor uses. It is also characterized by stability, resistance to shrinkage, a soft, warm feel, and good drapability. The filaments have a high tensile strength that is almost as good when wet as dry. The fibers have good elasticity and low moisture absorption. Orlon is resistant to chemicals, chiefly acids, and it has the ability to withstand high temperatures, which makes it suitable for various industrial uses. Other uses for the filament include evening wear, sports fabrics, and rainwear. The staple fiber is used in bulky suiting fabric, overcoatings and topcoatings, dress fabrics, knitted wear, and washable woven sportswear. Orlon is a trademark used for an acrylic fiber. Orlon is an acrylic fiber or the lightweight crease-resistant fabric made with Orlon yarns. First use:- 1948. Origin:- proprietary name (DuPont) of synthetic textile fiber, an invented word (compare Nylon). Origin:- Orl- (perhaps after Orleans) + -

on (compare nylon, rayon, developed by the same company). / Найлан^{T3} (Nylon^{TM}). Орлон – торговое название полиакрило-нитрильного волокна, выпускаемого в Соединённых Штатах Америки (США). Орлон – это разновидность химического волокна, которое относится к полиакрилонитрилам и производится в Америке. В России можно купить отечественный аналог орлона, с похожим составом и свойствами, но с названием Нитрон. Орлон используется для выработки всевозможных нетканых полотен и тканей, благодаря таким качествам как лёгкость, упругость, стойкость к воздействию растворителей и кислот, микроорганизмам и плесени. Например, орлон используется для выработки ворса, входит в состав грунта для искусственного меха. В состав смесового сырья для штор плиссе входят штапельные волокна орлана, они обеспечивают тканям нужную светостойкость. Внешний вид орлона напоминает шерстяное волокно, чуть более мягкое и шелковистое, однако сохраняющее тепло даже лучше, чем сама шерсть. Что касается истирания, то тут орлон уступает шерсти и даже хлопку, он плохо окрашивается, имеет низкую гигроскопичность. Стоимость орлона доступна всем слоям населения, также этот материал любят использовать дизайнеры для декорирования банкетных залов отелей, кафе и ресторанов. Кроме предварительной обработки, которую проходит сырьё, в процессе изготовления орлона нужно приготовить раствор для формовки и прядения нитей. Исходные полимеры из твёрдого состояния переводятся в размягчённое до нужной вязкости или концентрации, затем происходит фильтрация и сырьё освобождается от лишнего воздуха. Далее подготовленный полимер превращается в нити – его продавливают сквозь тончайшие отверстия. В зависимости от вида формовочных отверстий, производители получают волокна с различными свойствами, которые могут быть как профилированными, так и полыми внутри. Как правило, волокно встречается круглым, а профилированное может быть и трёхгранным, и плоским. Полученные тонкие нити промывают, сушат и соединяют в пучки, далее их вытягивают и скручивают. Чтобы фиксировать крутку нитей орлана, волокна нагревают, перематывают и сортируют, при необходимости отбеливают и окрашивают. Получается жгут волокон, которые соединены в пучки и разрезаны на отрезки необходимой длины. Производители могут использовать волокна для пряжи или выработки нетканых материалов (ковров, теплоизоляционных полотен). Чтобы улучшить свойства (придать пластичности, лучшей окрашиваемости, способностей противостоять истиранию) нередко исходный состав полимера видоизменяется.

ORLOP = ОРЛОП (или САМАЯ НИЖНЯЯ ПАЛУБА) – Orlop is a lowest deck of a ship. / Орлоп – самая нижняя палуба на судне.

ORP = OPERATIONAL RESEARCH PROJECT

ORPHREY = ОРФЭРИ (или ВЫШИВКА ЗОЛОТОМ) – Orphrey is an ornamental border or band especially on an ecclesiastical vestment. / .

ORRI = OVERRIDING ROYALTY INTEREST

ORSTOM = INSTITUT FRANÇAIS DE RECHERCHE SCIENTIFIQUE POUR LE DÉVELOPPEMENT EN COOPÉRATION = FRENCH INSTITUTE OF SCIENTIFIC RESEARCH FOR DEVELOPMENT

ORT = ORIGIN RAIL TERMINAL

ORTHO = OPTO – Ortho is a chemical prefix, usually abbreviated o, signifying that two substituents appear in adjacent positions on a benzene ring. / Под Орто, от Греческого слова Orthós, означающее Прямой, понимается приставка к .

ORYZA GLABERRIMA = ОРИЗА ГЛАБЭРРИМА (или РИС ГОЛЫЙ) – Oryza Glaberrima is a cultivated Rice Species in West Africa. Oryza Glaberrima, commonly known as African Rice, is one of the two domesticated Rice Species. It was first domesticated and grown in West Africa, and was brought to the Americas by enslaved West African Rice farmers. It is now largely a subsistence crop, rarely sold in markets even in West Africa. See also Rice.

ORYZA NIVARA = ОРИЗА НИВАРА (или РИС ДИКОРАСТУЩИЙ) – Oryza Nivara is an annual wild Species of Rice from South and Southeast Asia which is the only known source of resistance for the grassy stunt virus biotype one. See also Rice. / Рис Ориза Нивара (Oryza Nivara) – дикий прародитель культурного Риса; растёт на мелководье, в сезонно сухих и открытых местах обитания. Травянистый однолетник менее 2 метров (м) высотой. Метёлки обычно компактные, редко открытые, с крупными колосками до 1 сантиметра (см) длиной и до 0.34 см шириной, с крепкими остями до 10 см длиной.

ORYZA SATIVA L. = ОРИЗА САТИВА Л. (или РИС ПОСЕВНОЙ) – Oryza Sativa L. (L. = Linnaeus) is the most important cultivated Rice Species, indigenous to Asia. The population structure of domesticated Species is influenced by the natural history of the populations of predomesticated ancestors, as well as by the breeding system and complexity of the breeding practices exercised by humans. Within Oryza Sativa, there is an ancient and well-established divergence between the two major Subspecies, Indica and Japonica, but finer levels of genetic structure are suggested by the breeding history. In this study, a sample of 234 accessions of Rice was genotyped at 169 nuclear SSRs and two chloroplast loci. The data were analyzed to resolve the genetic structure and to interpret the evolutionary relationships between groups. Five distinct groups were detected, corresponding to Indica, Aus, Aromatic, Temperate Japonica, and Tropical Japonica Rices. Nuclear and chloroplast data support a closer evolutionary relationship between the Indica and the Aus and among the Tropical Japonica, Temperate Japonica, and Aromatic groups. Group differences can be explained through contrasting demographic histories. With the availability of rice genome sequence, coupled with a large collection of publicly available genetic resources, it is of interest to develop a population-based framework for the molecular analysis of diversity in Oryza Sativa. Asian cultivated Rice (Oryza Sativa L.) holds a unique position among domesticated crop Species in that it is both a critical food staple and the first fully sequenced crop genome. Rice is consumed as a grain almost exclusively by humans, supplying 20% of daily calories for the world population (World Rice Statistics, http://www.irri.org; FAOSTAT, http://apps.fao.org). As a model organism with a fully sequenced genome, rice affords unique opportunities to use genomic approaches to study its domestication, adaptive diversity, and the history of crop improvement. Archeological evidence supports a similar time of domestication for Rice, Wheat (Triticum Aestivum), and Maize (Zea Mays Ssp. Mays), 5–10 000 years ago, but the evolutionary histories of these Cereals differ in several significant ways. Recent studies tracing the molecular evolution of Maize offer several points of comparison that help illuminate the genetic history of Rice. Unlike maize, Rice is predominantly autogamous and, hence, gene flow is restricted. As a result, geographically or ecologically distinct groups of Rice are expected to show greater genetic differentiation than would be the case in an outcrossing Species. Because of fewer opportunities for cross-pollination, the structure of landraces in Rice and Maize is also predicted to be fundamentally different. A greater proportion of diversity is expected to reside in differences between homozygous lines within a heterogenous landrace in Rice compared to the distribution of diversity among heterozygous individuals within a landrace of Maize. In addition, evidence suggests that the two primary Subspecies of Rice, Indica and Japonica, are the products of separate domestication events from the ancestral Species, Oryza Rufipogon, a hypothesis initially based on studies of biochemical traits and hybrid sterility and subsequently supported by molecular analyses. This is in contrast to the single domestication event that led to the evolution of modern Maize. At all levels of analysis, the differences between the Indica and Japonica Subspecies are very apparent. Differences between nonsticky (Indica) and sticky (Japonica) Rices are documented in Chinese literature as early as 100 AD. In ecogeographical terms, Indica are primarily known as lowland Rices that are grown throughout tropical Asia, while Japonica are typically found in temperate East Asia, upland areas of Southeast Asia, and high elevations in South Asia. The traits that have been used to classify Indica and Japonica have included grain

shape, phenol reaction, sensitivity to potassium chlorate, leaf color, and apiculus hair length, although the spectra of variation for any of these individual traits overlap in the two Subspecies. Using restriction fragment length polymorphisms (RFLPs), the Indica-Japonica division was very clear but additional population structure consisting of the six Varietal Groups Indica, Japonica, Aus, Aromatic, Rayada, and Ashina was discerned using 15 isozyme loci. The Aus, Rayada, and Ashina are minor Groups that have generally been considered to be Ssp. Indica ecotypes, and all have a comparatively small geographic distribution along the Himalayan foothills. The drought-tolerant, early maturing Aus Rices are grown in Bangladesh during the summer season from March to June. Rayada and Ashina are floating Rices of Bangladesh and India, respectively. Aromatic Rices such as Basmati from Pakistan, Nepal, and India and Sadri from Iran have a distinctive popcorn-like aroma and are highly prized for their quality. Because there has been no reliable way to distinguish ecotypes on the basis of phenotypic evaluation and because information about the varietal groupings is rarely available from genetic resource collections, a genetically based identification of groups is required to fully utilize these resources. The purpose of this study is (1) to establish a population genetics framework for the evaluation of Rice by characterizing the intraspecific divergence within a set of 234 Rice accessions using simple sequence repeats (SSRs) and chloroplast sequence and (2) to address the evolutionary relationships among groups within the Species. Intraspecific classification of Rice has been of importance to Rice geneticists and breeders, but with the advent of population genetics approaches, it is now feasible to examine the genetic basis of domestication, adaptation, plant development, and agricultural performance. SSR loci are particularly useful for the study of population structure and demographic history of domesticated species because their high level of allelic diversity facilitates the detection of the fine structure of diversity more efficiently than an equal number of restriction fragment length polymorphism (RFLP), amplified fragment length polymorphism (AFLP), or single nucleotide polymorphism (SNP) loci. The specific goals of this study are to characterize population structure within Oryza Sativa, to examine the differences between and relationships among genetically defined groups, and to analyze aspects of demographic history that may explain them. The resulting framework will be used to pose questions about the origin and diversity of gene pools that exist within cultivated Asian Rice and to lay the foundation for characterizing the genes that distinguish them. See also Rice. Asian Rice in English. / Классификация:- Царство:- Plantae; Тип/Отдел:- Tracheophyta; Класс:- Liliopsida; Порядок:- Poales; Семейство:- Poaceae; Род:- Oryza. OS&D = OVER, SHORT AND DAMAGE

OS = OPERATING SYSTEM

OS = OUT OF STOCK

OSB = ORIENTED STRANDBOARD

OSC = OPERATIONS STEERING COMMITTEE

OSCAR = ОСКАР – Oscar (pronunciation:- OSS-kur) or O is international nautical signal flag meaning:- Man overboard.

OSCILLATOR = ОСЦИЛЛЯТОР – In technical analysis, Oscillator is an indicator that determines when a market is in a overbought or oversold condition. When the oscillator line reaches an upper extreme, the market is overbought. When the oscillator line reaches a lower extreme, the market is oversold. Oscillator is an indicator that moves up and down, wavelike, within a price range. This type of indicator is supposed to de-trend prices. A momentum-based technical indicator that is used to determine extreme overbought and oversold conditions as a trading tool. These can be very effective tools in a trading range environment, and disastrous in a strong trend. Most oscillators range in value between 0 and 100. When the indicator is between 0 and 20, the asset is deemed to be oversold. When the indicator is between 80 and 100, the asset is deemed to be overbought. In a trending type of market, prices may stay overbought or oversold for extended periods of time. / В техническом анализе биржевых рынков под Осциллятором, от Латинского слова Oscillo, означающее Качаюсь, понимается . технический индикатор, основанный на моменте, .

OSE = OSAKA SECURITIES EXCHANGE

OSHA = OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION

OSIRIS = ОСИРИС (или ОЗИРИС) – Osiris is ancient Egyptian god of vegetation, credited with introducing the skills of agriculture to the Egyptians. He became the god of the dead and the underworld, following his slaying by his brother Set and restoration to life by his wife and sister Isis. Osiris is sometimes depicted with green skin in paintings or in statues made from green stone, reflecting his aspects of agriculture, vegetation, fertility and resurrection. He was recorded as the first to make mankind give up cannibalism and credited with introducing culture of the vine and fermentation of its fruit to produce wine. This may be the oldest account of a biochemical process. The legend of Osiris and Isis dates back to at least 2400 BC, as recounted by the Greek historian Plutarch (AD 46–120). The historian Diodorus Siculus (I century BC) included Osiris among those who had been men, immortalized by virtue of their sagacity and good works. By this account, the legend of Osiris dates back to between 25 000 and 12 000 years ago. The story may be derived from the Sumerian goddess of fertility, Ishtar who could grant crops and children to her devotees. Ishtar's son Tammuz rose from the dead each year, after the hot summer months, to make the land green again. / Под Осирисом или Озирисом в древнеегипетской мифологии понимался бог умирающей и воскресающей природы, брат и супруг Исиды, отец Гора; покровитель и судья мёртвых.

OSJD = ORGANISATION FOR CO–OPERATION BETWEEN RAILWAYS

OSMIUM = ОСМИЙ – Osmium; chemical symbol Os. Its specific gravity is 22.50 and its melting point is 2 700 °C. / Под Осмием, от Греческого слова Osmē, означающее Запах, Латинское название Osmium (Os), понимается химический элемент VIII группы Периодической Системы Менделеева. Атомный номер 76, атомная масса 190.2, относится к платиновым металлам. Осмий – белый с серо-голубым оттенком металл; плотность 22 500–22 610 кг/м^3, $t_{пл}$ около 3 030–3 050 °C. В природе встречается в виде минералов группы осмистого Иридия, иногда вместе с самородной Платиной, как изоморфная примесь в сульфидах

меди и никеля. Добывается совместно с Платиной и другими платиновыми металлами. Осмий, а также его природные и искусственные сплавы с другими платиновыми металлами, благодаря их высокой твёрдости, коррозионной стойкости и износостойкости, используются для изготовления изнашивающихся деталей точных измерительных приборов, наконечников перьев в авторучках и так далее. Осмий и его соединения – хорошие катализаторы различных процессов, например, синтеза аммиака, гидрогенизации. Оксид осмия OsO_4 имеет резкий запах, отсюда название элемента.

OSMOSIS = ОСМОС – Osmosis is the movement of water through a selectively permeable membrane from a place of low solute concentration to a place of higher solute concentration. Osmosis is the passage of water or another solvent through a semipermeable membrane from a region of low solute concentration to a region of high solute concentration. / Под Осмосом, от Греческого слова Ōsmós, означающее Давление или Толчок, понимается односторонняя диффузия (обычно растворителя) через полупроницаемую перегородку (мембрану), отделяющую раствор от чистого растворителя или раствора меньшей концентрации и проницаемую только для растворителя. Обусловлен стремлением системы к термодинамическому равновесию и выравниванию концентраций раствора по обе стороны мембраны. Характеризуется осмотическим давлением; оно равно избыточному внешнему давлению, которое следует приложить со стороны раствора, чтобы прекратить осмос, и зависит от концентрации раствора и природы растворённого вещества. Играет важную роль в физиологических процессах растительных и животных организмов; его используют при исследовании полимеров, биологических структур. В технике применяют Обратный Осмос.

OSNABURG = ОЗНАБУРЖСКАЯ (или ОЗНАБУРГСКАЯ) – Osnaburg is a tough medium to heavyweight coarsely woven plain weave fabric, usually made of a cotton or cotton/poly blend. Lower grades of the unfinished fabric are used for such industrial purposes as bags, sacks, pipe coverings. Higher grades of finished osnaburg can be found in mattress ticking, slipcovers, workwear, and apparel. Osnaburg is a coarse type of plain textile fabric used for quilting, home decor, apparel projects and more! Made of 100% cotton. 45 inches wide. Osnaburg was a coarse type of plain textile fabric, named for the city of Osnabrück (a city in Lower Saxony, Germany; from which it may have been first imported into English-speaking countries). Originally made from flax yarns, it has been made from either flax, tow or jute yarns, sometimes flax or tow warp with mixed or jute weft, and often entirely of jute. The finer and better qualities form a kind of common sheeting, and the various kinds may contain from 20 to 36 threads per inch and 10 to 15 picks per inch. It began to be woven in Scotland as an imitation from a German import of a coarse lint or tow-based linen cloth in the later 1730s. It quickly became the most important variety in East-Central Scotland. Sales quadrupled, from 0.5 million yards in 1747 to 2.2 million yards in 1758. It was exported mainly to England, the Netherlands and Britain's colonies in America, and some rough fabrics were called 'Osnaburg' as late as the mid-XX century. In the Atlantic plantation complex, prior to the abolition of slavery, osnaburg was the fabric most often used for slave garments. Osnaburg is a medium to heavyweight coarsely woven cotton. Osnaburg can be made of 100% cotton or a cotton and polyester blend. Higher grades of finished osnaburg are known for their durability and can be used for mattress ticking, slipcovers, work wear and apparel. Osnaburg can also be used for industrial purposes as sack or bag material. It can also serve as a less expensive drapery or upholstery fabric. Osnaburg is most often used in its natural color, but it can also be dyed or printed. Osnaburg is a coarse type of plain-textile fabric. Originally made from flax yarns, it has been made from either flax, tow or jute yarns, sometimes flax or tow warp with mixed or jute weft, and often entirely of jute. It can be used for mattress ticking, slipcovers, work wear, apparel or even less expensive drapery or upholstery. Osnaburg is a coarse cotton or polyester/cotton fabric, often partly of waste fiber, in a plain weave, medium to heavy in weight, that looks like crash. Unbleached osnaburg is used for grain and cement sacks, and higher grades are used as apparel and household fabrics. / (1) Грубая мешочная ткань. (2) Хлопчатобумажная ткань в полоску или в клетку из коротковолокнистого хлопка низких номеров.

ÖSTERREICHISCHE TERMIN UND OPTIONENBÖRSE (AG) = ЁСТЭРАЙХИШЭ ТЭМИН УНД ОПЦИОНЭНБЁРЗЭ (А.ГЕ.) (или АВСТРИЙСКАЯ БИРЖА ФЬЮЧЕРСОВ И ОПЦИОНОВ (АГ)) – The Vienna Stock Exchange's ÖTOB (Österreichische Termin und Optionenbörse) market provides clearing for all standardised derivative products in the three market segments, i.e. the stock market, the index market and the bond market. All contracts are cleared according to the different product specifications. These specifications naturally require different systems, settlement procedures and handling. This allows for a flexible treatment of the different trading periods in these market segments. The product range traded on the Vienna Stock Exchange's ÖTOB market includes:- (a) Austrian derivatives:- futures and options on the ATX, ATX stock options. (b) CECE derivatives (CECE index family):- futures and options traded on the CTX, HTX, PTX, STX, RTX and RDX. The CECE index family comprises traded indices of the major blue chips in the Czech Republic (Czech Traded Index, CTX), Hungary (Hungarian Traded Index, HTX), Poland (Polish Traded Index, PTX), Slovakia (Slovak Traded Index, STX), Russia (Russian Traded Index, RTX, and the Russian Depository Receipts Index, RDX) and a benchmark index for the whole region (CECE Index). The indices have served as the basis for futures and options trading on the Vienna Stock Exchange since spring 1997. They have been published since July 1996. One of the main targets for the establishment of the CECE indices is the opportunity to trade different markets on a single trading platform in a single currency. All indices are calculated in US Dollars, which is the predominant currency for the valuation of international portfolios. The HTX, CTX, PTX and STX are also available on a local currency basis. Trading in futures and options on the Vienna Stock Exchange is conducted via a fully electronic trading system developed by OM which permits the immediate and SWIFT execution of transactions. For each listed derivative instrument, at least three market participants have committed themselves to acting as market-makers and to quoting binding bid and offer prices. Permanent quotes are entered for all major futures maturities and options series; bid and offer quotes are entered for the remainder upon a quote request. The orders entered into the trading system are ranked according to time and price and are executed if matched. The OM AB (Optionsmäklarna AB) in operation at the Vienna Stock Exchange is a real-time clearing system which is fully integrated with the exchange system. The transaction transport mechanism enabling the integration is the OMnet network. OMnet is also the external network used for members to access the exchange and clearing house via the respective user devices. Information on accepted and matched trades is received over OMnet in real time on a transaction basis from the market-place system. The clearing system consists of several subsystems, e.g., the SE system, which is the bookkeeping system of the derivatives market. All payment transactions within a market are booked on a daily basis in the SE sub-system. On the settlement day a file with all relevant booking instructions is sent to the custodian bank electronically, which subsequently processes the booking instruction automatically. All derivatives of the ÖTOB market are traded via the fully electronic trading system by OM systems. The Austrian futures and options exchange was founded in Vienna in 1991 and today, it is operated under derivatives market.at as an important market segment of Wiener Börse. Since 1991, investors have been able to trade in futures and options on Austrian securities as well as Austrian and CEE indices. Among other advantages, derivatives permit investors to hedge their investments against price losses. Moreover, derivative financial instruments enable investors to exploit market opportunities in any market situation. These contracts can be binding for both parties (futures) or just document the right of the buyer to buy or sell a specific instrument (options). Headquartered in Vienna, Austria. / Ё.Тэ.О.Бэ. А.Ге. (ÖTOB AG) Ёстэрайхишэ Тэмин унд Опционэнбёрзэ А.Ге. (Österreichische Termin und Optionenbörse). (Примечание:- в Русском языке нет точного соответствия звуку при произношении буквы Ö Немецкого алфавита. Разные источники по-разному интерпретируют его. Буквосочетание ЫО может более менее точно передавать произношение буквы Ö лишь при быстром и кратком их произношении, напоминая в отдалении произношение буквы Ё Русского алфавита.) . У.Эм.

А.Бэ. (ОМ АВ; сокращённо для Упшунсмэкларна А.Бэ. (Optionsmäklarna AB)). Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Вина Бёрзэ А.Ге. (Wiener Börse AG).

OSU = OHIO STATE UNIVERSITY

OSU = OKLAHOMA STATE UNIVERSITY

OSU = OREGON STATE UNIVERSITY

O/T = OVERTIME

OTA = OCHRATOXIN A

OTC = OVER THE COUNTER

OTHER ASSETS = ПРОЧИЕ АКТИВЫ – In accounting, Other Assets comprise, among other things, items to be cashed in, payments on account, tax rebates, receivables due from the sale of participations, commission receivables, inventory and option premiums paid. Other Assets includes all miscellaneous assets such as capitalized research and development costs and patent rights. / строка баланса (item).

OTHER CEREAL GRAINS = ПРОЧИЕ ЗЛАКОВЫЕ ЗЕРНОВЫЕ – Other Cereal Grains:- a cereal grain mixed into another type of cereal grain is considered foreign material. The presence of other cereal grains affects the processing quality of the main grain. For example:- (i) in Barley other cereal grains are:- Oats, Rye, Triticale, and Wheat; (ii) in Oats other cereal grains are:- Barley, Rye, Triticale, and Wheat; (iii) in Rye other cereal grains are:- Barley, Oats, Triticale, and Wheat; (iv) in Triticale other cereal grains are:- Barley, Oats, Rye, and Wheat; and (v) in Wheat other cereal grains are:- Barley, Oats, Rye, and Triticale. / Тритикале (пшенично-ржаные амфидиплоиды или ржано-пшеничные гибриды, формы Пшеницы, полученные при скрещивании её с Рожью).

OTHER CHEMICAL SUBSTANCES = ПРОЧИЕ ХИМИЧЕСКИЕ ВЕЩЕСТВА (или ПРОЧИЕ ХИМИЧЕСКИЕ СУБСТАНЦИИ) – In grain industry, Other Chemical Substances refers to any chemical residues either adhering to the kernel or remaining in the sample and to samples having a chemical odor of any kind. / В зерновой индустрии, под Прочими Химическими Веществами понимаются любые остатки химикатов, либо прилипшие к зерновке (ядру), либо остающиеся в пробе, а также в отношении проб, имеющих запахи химикатов любого типа.

OTHER COARSE GRAINS = ПРОЧИЕ КОРМОВЫЕ ЗЕРНОВЫЕ (или ПРОЧИЕ ФУРАЖНЫЕ ЗЕРНОВЫЕ, или ПРОЧИЕ ХХ ЗЕРНОВЫЕ) – Other Coarse Grains:- defined as Barley, Oats, Sorghum and other coarse grains in all countries except Australia where it includes Triticale, and in the European Union where it includes Rye and other mixed grains.

OTHER COSTS = ПРОЧИЕ ЗАТРАТЫ (или ПРОЧИЕ ИЗДЕРЖКИ) – Other Costs includes marketing and research & development expenses.

OTHER COSTS/SALES = ПРОЧИЕ ЗАТРАТЫ К ПРОДАЖАМ (или ПРОЧИЕ ИЗДЕРЖКИ/ПРОДАЖИ) – Other Costs/Sales is other costs expressed as a percentage of the value of sales.

OTHER DSM PROGRAMS = ПРОЧИЕ ПРОГРАММЫ УПРАВЛЕНИЯ СО СТОРОНЫ ПОТРЕБЛЕНИЯ (или СПРОСА) – Other DSM Programs:- a residual category to capture the effects of Demand-Side Management (DSM) programs that cannot be meaningfully included in any of the program categories listed and defined herein. The energy effects attributable to this category should be the net effects of all the residual programs. Programs that promote consumer's substitution of electricity by other energy types should be included in Other DSM Programs. Also, self-generation should be included in Other DSM Programs to the extent that it is not accounted for as backup generation in Other Load Management or Interruptible Load categories.

OTHER FIXED ASSETS = ПРОЧИЕ НЕДВИЖИМЫЕ АКТИВЫ (или ПРОЧИЕ ОСНОВНЫЕ СРЕДСТВА) – Other Fixed Assets is the current value of other long term fixed assets.

OTHER FOREIGN EXCHANGE DERIVATIVES = ПРОЧИЕ ПРОИЗВОДНЫЕ ИНСТРУМЕНТЫ НА ОБМЕННЫЙ КУРС ПО ИНОСТРАННОЙ ВАЛЮТЕ (или ПРОЧИЕ ДЕРИВАТИВЫ НА ОБМЕННЫЙ КУРС ПО ИНОСТРАННОЙ ВАЛЮТЕ) – Other Foreign Exchange Derivative products:- this category comprised in principle over-the-counter (OTC) foreign exchange derivative instruments which involve several features and where a breakdown into individual plain vanilla components is impractical or impossible, such as swaps with underlying notional principal in one currency and fixed or floating interest rate payments based on interest rates in currencies other than the notional (differential swaps or diff swaps).

OTHER GRAINS = ПРОЧИЕ ЗЕРНОВЫЕ – In the Wheat industry, Other Grains are Barley, Corn, cultivated Buckwheat, Einkorn, Emmer, Flaxseed, Guar, hull-less Barley, nongrain Sorghum, Oats, Polish Wheat, popcorn, poulard Wheat, Rice, Rye, Safflower, Sorghum, Soybeans, Spelt, Sunflower seed, sweet Corn, Triticale, and wild Oats. / тритикале (пшенично-ржаные амфидиплоиды или ржано-пшеничные гибриды, формы Пшеницы, полученные при скрещивании её с Рожью).

OTHER INCENTIVES = ПРОЧИЕ ДОПЛАТЫ (или ПООЩРЕНИЯ, или СТИМУЛЫ) – Other Incentives:- Energy Efficiency programs that offer cash or noncash awards to electric energy efficiency deliverers, such as appliance and equipment dealers, building contractors, and architectural and engineering firms, that encourage consumer participation in a Demand-Side Management (DSM) program and adoption of recommended measures.

OTHER INTEREST RATE DERIVATIVES = ПРОЧИЕ ПРОИЗВОДНЫЕ ИНСТРУМЕНТЫ НА ПРОЦЕНТНУЮ СТАВКУ (или ПРОЧИЕ ДЕРИВАТИВЫ НА ПРОЦЕНТНУЮ СТАВКУ) – Other Interest Rate Derivative products is a category that mainly comprises over-the-counter (OTC) interest rate derivative instruments with leveraged payoffs and/or those whose notional principal varies as a function of interest rates. For example, swaps based on LIBOR squared as well as index amortising rate swaps fall into this category. / окупаемость (payoff). (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)).

OTHER KEROSENE = ПРОЧИЙ КЕРОСИН – Other Kerosene:- kerosene comprises refined petroleum distillate and is used in sectors other than aircraft transport. It distils between 150 °C and 300 °C. Lower quality specification kerosene (other kerosene) or a dual purpose grade is used in some regions as domestic heating oil, especially in Asia, notably in Japan and Korea. See also Jet Kerosine. Other Kerosene is a light hydrocarbon distillates in the 150 to 280 °C distillation range and used as a heating fuel and as fuel for certain types of internal combustion engines.

OTHER LIABILITIES = ПРОЧИЕ ПАССИВЫ – In accounting, Other Liabilities are the major items include tax on interest at source retained from customers, outstanding invoices, salary deductions still to be passed on and option premiums received. Other Liabilities includes taxes owed (other than current corporation tax), the value of unpaid leases on fixed assets etc. / строка баланса (item).

OTHER LOAD MANAGEMENT = ПРОЧЕЕ УПРАВЛЕНИЕ НАГРУЗКОЙ – Other Load Management:- refers to programs other than Direct Load Control and Interruptible Load that limit or shift peak load from on-peak to off-peak time periods. It includes technologies that primarily shift all or part of a load from one time-of-day to another and secondarily may have an impact on energy consumption. Examples include space heating and water heating storage systems, cool storage systems, and load limiting devices in energy management systems. This category also includes programs that aggressively promote time-of-use (TOU) rates and other innovative rates such as real time pricing. These rates are intended to reduce consumer bills and shift hours of operation of equipment from on-peak to off-peak periods through the application of time differentiated rates.

OTHER MATTER = ПРОЧАЯ ПРИМЕСЬ (или СОРНАЯ ПРИМЕСЬ) – In grain industry, Other Matter refers to inseparable material excluding cereal grains, large seeds, wild oats, stones, mineral matter, ergot and sclerotinia. / У Ячменя к Сорной Примеси относят:- (i) весь проход, полученный при просеивании навески зерна через сито с отверстиями диаметром 1.5 мм (полотно № 1 – 15); (ii) в остатке на сите с отверстиями диаметром 1.5 мм; (iii) минеральную примесь – гальку, комочки земли, частицы шлака, руды и тому подобное; (iv) органическую примесь – части стеблей и стержней колоса, ости, плёнки и тому подобное; (v) семена дикорастущих Растений; (vi) семена культурных Растений, не отнесённые к зерновой примеси; (vii) испорченные зёрна Ячменя, Пшеницы, полбы, Ржи и Овса:- загнившие, заплесневевшие, поджаренные, обуглившиеся – все с испорченным эндоспермом от коричневого до чёрного цвета, а также со светлым, но рыхлым, легко рассыпающимся эндоспермом; (viii) зёрна Ячменя, Пшеницы, полбы, Ржи и Овса с полностью выеденным эндоспермом; и (ix) вредную примесь – спорынью, головню, зёрна, поражённые нематодой, плевел опьяняющий, горчак ползучий, софору лисохвостную, термопсис ланцетный (мышатник), вязель разноцветный, гелиотроп опушённоплодный, триходесму седую.

OTHER OILSEEDS = ПРОЧИЕ МАСЛИЧНЫЕ СЕМЕНА – Other Oilseeds:- defined as rapeseed (canola), sunflower seed, and groundnuts (peanuts).

OTHER PROVISIONS = ПРОЧИЕ XX (или ПРОЧИЕ РЕЗЕРВЫ) – In BASF's Balance Sheet, Other Provisions consist of:- Restoration Obligations (restoration obligations primarily relate to the estimated costs for the filling of wells, the removal of production equipment after the end of production and the removal of natural gas pipelines. The decline in long-term provisions for restoration obligations resulted in particular from the reclassification of provisions into the natural gas trading disposal group); Environmental Protection and Remediation Costs (provisions for environmental protection and remediation costs cover expected costs for rehabilitating contaminated sites, recultivating landfills, removal of environmental contamination at existing production or storage sites and similar measures. In addition, provisions are recognized in connection with the allocation of emission certificates from the German Emissions Trading Authority or other similar bodies in the European Union. The decrease in short-term provisions for environmental protection measures and remediation costs is largely due to the return of emission certificates used in Germany and Belgium and the utilization for ongoing remediation work at various sites); Employee Obligations (provisions for employee obligations include obligations for the granting of long-service bonuses, anniversary payments, variable compensation including the associated social security contributions, and other accruals as well as provisions for early retirement programs for employees nearing retirement); Sales and Purchase Risks (the sales and purchase risks provisions include warranties, product liability, customer rebates and other price reductions, sales commissions and provisions for expected losses on committed purchases as well as provisions for onerous contracts. The decline was due to the reclassification of provisions into the natural gas trading disposal group); Restructuring Measures (the restructuring measures provisions include severance payments to employees as well as expected costs for site closures, including the costs for demolition and similar measures); Litigation, Damage Claims, Guarantees and Similar Commitments (provisions for litigation, damage claims, guarantees and similar commitments include the expected costs of litigation, obligations under damage claims, and other guarantees); Other (other includes long-term tax provisions as well as further present obligations and accruals. The decline is due to the reversal of long-term tax provisions and a reclassification of accruals for outstanding invoices into trade accounts payable). / Бе.А.Эс.Эф. (BASF).

OTHER PUBLISHED DATA = ПРОЧИЕ ОПУБЛИКОВАННЫЕ ДАННЫЕ – Other Published Data:- additional data published as part of a typical company's Final Accounts are as follows:- Staff Costs; Number of Employees; Depreciation; Stock Market Price; and Number of Issued Stocks.

OTHER TYPES OF KERNELS = ПРОЧИЕ ТИПЫ ЗЕРНОВКИ (или ПРОЧИЕ ТИПЫ ЯДЕР) – In the Rice industry of the United States, Other Types Of Kernels are:- (1) whole kernels of:- (i) long grain Rice in medium or short grain Rice, (ii) medium grain Rice in long or short grain Rice, (iii) short grain Rice in long or medium grain Rice; and (2) broken kernels of long grain Rice in medium or short grain Rice and broken kernels of medium or short grain Rice in long grain Rice, except in US No. 5 and US No. 6 milled Rice. In US No. 5 and US No. 6 milled Rice, only whole kernels will apply. Broken kernels of medium grain Rice in short grain Rice and broken kernels of short grain Rice in medium grain Rice shall not be considered other types. / (1) целиковая зерновка (целые ядра):- . Битая зерновка (битые ядра) среднезёрного Риса в короткозёрном Рисе и .

OTM = OLD–TO–MARKET

OTM OPTION = OUT–OF–THE–MONEY OPTION

ÖTOB (AG) = ÖSTERREICHISCHE TERMIN UND OPTIONENBÖRSE (AG)

OTPP = OFFICE OF TECHNICAL PLANS AND POLICY

OTS = OFFICE OF THRIFT SUPERVISION

OTTOMAN = ОТТОМАНСКАЯ (или ОСМАНСКАЯ) – Ottoman:- a tightly woven plain weave ribbed fabric with a hard slightly lustered surface. The ribbed effect is created by weaving a finer silk or manufactured warp yarn with a heavier filler yarn, usually made of cotton, wool, or waste yarn. In the construction, the heavier filler yarn is completely covered by the warp yarn, thus creating the ribbed effect. End uses for this fabric include coats, suits, dresses, upholstery, and draperies. Ottoman:- heavy, large, filling rib yarns, often of cotton, wool, or waste yarn, covered in their entirety by silk or manufactured fiber warp yarns, characterized this fabric used for women's wear and coats. Ottoman:- heavy in weight – larger rib than both faille and bengaline. Very pronounced flat ribs in the filling direction. Ribs are made by a cotton, worsted, silk, or rayon filling which does not show on either the face or the back, because the warp covers the filling entirely. Is called Ottoman Cord or Ottoman Rib when a warp rib is employed. Fabric is stiff and connot be gathered or shirred. Like other ribbed fabrics, it has a tendency to slip at the seams and crack, so it cannot be fitted too tightly. / уточина. Оттоманская или Османская:- торговое название репсовой плательной ткани из сильно кручёной шерстяной пряжи.

OUAT = ORISSA UNIVERSITY OF AGRICULTURE AND TECHNOLOGY

OUNCE = УНЦИЯ – (1) Ounce is a unit of weight used for precious metals. See also Troy Ounce. Ounce (weight, avoirdupois):- approximately 28.35 grams. / Единица измерения веса благородных металлов. Смотрите также Тройская Унция (Troy Ounce).

Под Унцией, от Латинского слова Uncia, понимается:- (i) единица массы в Британской Имперальной Системе, 1 унция = 16 драхмам = 437.5 грана = 28.349 5 граммов; (ii) единица вышедшего из употребления аптекарского веса, Английская аптекарская и Тройская (мера массы благородных металлов) унция равнялась 31.103 5 граммам, Российская унция равнялась 29.86 граммам; (iii) жидкостная унция – мера объёма и вместимости, равная в США 1/128 галлона или 29.573 5 кубических сантиметров ($см^3$), а в Великобритании – 28.413 $см^3$; и (iv) старая Русская единица массы, равная 29.86 граммам. Унция:- (1) мера массы в Древнем Риме, составлявшая 1/12 основной тогда меры массы либры, равнялась 27.166 граммов (г). Получила широкое распространение во всех странах до введения Метрической Системы Мер. (2) Старинная Римская монета, чеканилась из сплава меди, олова и свинца, равнялась 1/12 асса (27.28 г). Унцией называли также Испанский золотой дублон и Китайский таэль. В Сицилии унция была монетной единицей до 1865. (3) Единица массы в системе Английских мер, 1 у. = 16 драхмам = 437.5 грана = 28.349 5 г. (4) Единица вышедшего из употребления аптекарского веса, аптекарская унция составляла 8 драхм, или 24 скрупула, Русская аптекарская унция равнялась 29.860 г, в системе Английских мер аптекарская унция, а также монетная, или Тройская, унция (мера массы благородных металлов) = 31.103 5 г.

(2) Ounce (fluid) is a volume equal to approximately 29.57 milliliters in the United States, or 28.41 milliliters in Canada and Britain. / Жидкостная Унция – мера вместимости, равная 8 жидкостным драхмам, что соответствует 29.57 кубическим сантиметрам ($см^3$) (США) или 28.41 $см^3$ (Великобритания).

OUTAGE = ПРОСТОЙ (или БЕЗДЕЙСТВИЕ) – A planned Outage is the shutdown of a generating unit, transmission line, or other facility for inspection and maintenance, in accordance with an advance schedule. A forced outage is the unplanned loss of service of a generating unit, transmission line, or other facility for purposes other than inspection and maintenance. Usually, forced outages occur when utilities are unable to generate. Reasons for forced outages include damage to equipment due to weather or unforeseen system malfunction. Outage is the period during which a generating unit, transmission line, or other facility is out of service. / Запланированным Простоем считается отключение генерирующего устройства, линии электропередачи или иной установки для проведения инспекции и обслуживания в соответствии с ранее утверждённым графиком. Вынужденным Простоем считается незапланированная отключение генерирующего устройства, линии электропередачи или иной установки с целью иной, нежели проведение инспекции и обслуживания. Обычно, вынужденные простои происходят тогда, когда электростанции не в состоянии генерировать электроэнергию. Причинами этого служат поломка оборудования из-за воздействия неблагоприятных погодных условий или непредвиденный сбой системы. Под производственным Простоем понимается временная приостановка работы по вине работника или по не зависящим от него причинам, например, из-за отсутствия сырья.

OUTBOARD = ЗАБОРТНОЕ (или НАРУЖНОЕ) – Outboard (maritime term):- towards the sides of the vessel (with reference to the centerline).

OUTBOUND = ИСХОДЯЩИЕ – Outbound:- export shipments. / Исходящие:- вывозные (или экспортные) отгрузки.

OUTBREAK = НАШЕСТВИЕ (или ВСПЫШКА) – Outbreak is a recently detected pest population, including an incursion, or a sudden significant increase of an established pest population in an area. Outbreak is a sudden increase in pest population resulting in economic damage to the Rice crop. / , включающее , налёт, или скоротечное значительное возрастание . внезапное увеличение .

OUTBREEDING = НЕРОДСТВЕННОЕ СПАРИВАНИЕ (или АУТБРИДИНГ) – Outbreeding is a system of breeding that involves crossing unrelated parents. / Под Аутбридингом понимается скрещивание неродственных организмов разных пород, сортов, видов. Используют в животноводстве и растениеводстве для предотвращения вредных последствий близкородственного скрещивания (инбридинга) и другого.

OUTCROSSING = ХХ (или АУТКРОССИНГ, или НЕПРЕДНАМЕРЕННОЕ СКРЕЩИВАНИЕ) – Outcrossing is a cross of different genotypes usually under natural conditions. This may also refer to cross-pollination. / Аутскроссинг – скрещивание особей из разных линий.

OUTERCOAT = ВЕРХНЕЕ ПАЛЬТО – Outercoat:- coat.

OUTERWEAR = ВЕРХНЯЯ ОДЕЖДА – Outerwear:- clothing for outdoor wear.

OUTFIT = ОБМУНДИРОВАНИЕ (или СНАРЯЖЕНИЕ, или ОДЕЖДА) – Outfit is the wearing apparel with accessories usually for a special occasion or activity.

OUTFLOW QUENCH = ВЫХОД (или ИСТЕЧЕНИЕ, или СМЕШЕНИЕ, или ВЫТЕКАНИЕ, или ОТТОК, или ОТЛИВ, или СТОК, или ИСТЕКАТЬ) ТУШИТЬ (или ТУШЕНИЕ, или ГАШЕНИЕ, или ЗАКАЛКА, или ГАСИТЬ, или ОСЛАБЕВАТЬ, или РЕЗКОЕ ОХЛАЖДЕНИЕ, или ПОДАВЛЕНИЕ) – Outflow Quench:- air for cooling extruded polymer that is directed radially outward from a central dispersion device around which the filaments descend. See also Inflow Quench.

OUTING FLANNEL = ПОХОДНАЯ (или ПИКНИКОВАЯ) ФЛАНЕЛЬ – Outing Flannel is a flannelette sometimes having an admixture of wool.

OUTLAYS = НАКЛАДНЫЕ (или ИЗДЕРЖКИ, или ЗАТРАТЫ) – Outlays or expenditures represent charges made to the project or program. They may be reported on a cash or accrual basis. For reports which are prepared on a cash basis, outlays are the sum of actual cash disbursements for direct charges for goods and services, the amount of indirect expense charged, the value of in-kind contributions applied, and the amount of cash advances and payments made to subrecipients. For reports prepared on an accrual basis, outlays are the sum of actual cash disbursements for direct charges for goods and services, the amount of indirect expense incurred, the value of in-kind contributions applied, and the net increase (or decrease) in the amounts owed by the recipient for goods and other property received, for services performed by employees, contractors, subrecipients and other payees and other amounts becoming owed under programs for which no current services or performances are required. See also In-Kind Contributions.

OUT OF CONDITION = В ПЛОХОМ СОСТОЯНИИ (или НЕ В КОНДИЦИИ) – Grain which is Out Of Condition has deterioriated in storage. Grain that is damp, heating or spoiling in storage requires special treatment such as drying or aeration to preserve its quality or to prevent further deterioration. In Canada, the Canada Grain Act specifies that operators of licensed terminal or transfer elevator must inform the Canadian Grain Commission (CGC) if they find grain that is or is likely to go out of condition. The CGC may inspect the grain. The CGC tells the operator how to treat or dispose of the grain. If the grain has been special binned, the elevator operator may recover the costs of treating or disposing of the grain from the owner of the grain.

OUT OF GAUGE CARGO = НЕГАБАРИТНЫЙ ГРУЗ – Out Of Gauge Cargo is a cargo which exceeds the internal dimensions of the container in width, length or height. Out Of Gauge Cargo is a cargo which dimensions exceed the normal dimensions of a container, whether in length, width, height, or a combination of same. Cargo which dimensions are exceeding the normal dimensions of a 20 or 40

feet container, e.g., overlength, overwidth, overheight, or combinations thereof. / Груз, размеры которого превышают обычные размеры 20 или 40-футового контейнера, например, .

OUT OF POSITION = НЕПРАВИЛЬНО УСТАНОВЛЕННОЕ (или СДВИНУТОЕ С МЕСТА, или СМЕЩЁННОЕ, или ВНЕ ГОТОВНОСТИ) – Out Of Position:- position is the most important factor in poker, that is my experience too. If you are in position, you can better play the player and not your cards, it doesnt really matter, what cards you really have. While without position you aren't comfortable even with big hands. You have to play check-raise with those hands, cause of lack of information, and that can cost you a lot, if you dont have the nuts or one of the really big hands. Out of Position you may be even in a bad spot when you've got queens oder kings. When u raise them, and someone just calls, what do u know about his hand? Nothing. And if he reraises, you have to invest a lot of money more without being secure that you have the best hand, a simple ace on the flop might kill your playing strategy. When you're out of position, you're often playing in the dark. In short, it loses you money. When you are in an early position and must act in front of your opponents. See also In Position.

OUT OF POSITION = НЕТ В НАЛИЧИИ – Out Of Position:- commodities not so situated are Out of Position for delivery. The opposite of In Position.

OUT–OF–REGISTER = XX – Defect Name:- Out-Of-Register. Defect Type:- Printing Defects. Fabric Type:- Print Goods. Description:- Out-Of-Register:- This is the result of print rolls not being synchronized to bring all parts of the design into proper position. Severity:- Major.

OUT OF THE MONEY OPTION = УБЫТОЧНЫЙ ОПЦИОН – Out Of The Money Option:- options and warrants with no intrinsic value. In the case of call options, the current market price of the underlying asset is below the strike price. In the case of put options, the strike price is below the current market price of the underlying asset. Out-Of-The-Money (OTM) is a term used to describe an option contract that would produce a negative cash flow for the holder if it were exercised now. An option is said to be 'out of the money' when its strike price is at a level in relation to the current price for the underlying asset such that it would not be profitable to exercise the option. A call option with a strike price higher or a put option with a strike price lower than the current market price of the underlying asset, i.e. an option that does not have any intrinsic value. For example, a call with a strike price of USD400.00 on gold trading at USD390.00 is out-of-the-money 10.00 US Dollars. Out Of The Money:- refers to options with only time value, i.e. no intrinsic value, e.g., calls where the strike price is greater than the underlying asset price or puts where the strike price is less than the underlying price. A term 'Out-Of-The-Money (OTM) Option' describes an option for which the currency forward market price of the underlying is below the strike price in the case of a call, or above it in the case of a put. The more the option is out-of-the-money, the cheaper it is (since the chances of it being exercised get slimmer). Its Delta also declines and it becomes less sensitive to movements in the underlying. Out-Of-The-Money (OTM) Option is a call option whose exercise (strike) price is above the current market price of the underlying security or futures contract. Out of the Money:- this term is usually used when referring to an option. An out of the money option is worthless if it were to expire today. It means that the exercise price (for a call option) is more than the current price of the underlying stock. Out-Of-The-Money:- an option with no intrinsic value is described as being out-of-the-money. Out-Of-The-Money Option is a call (or put) option in which the strike price exceeds (is less than) the current market price of the underlying futures contract. Out-Of-The-Money Option is an option (call or put) which has no intrinsic value. Out-Of-The-Money refers to an option that has no intrinsic value. For a put option, this occurs when the strike price is below the current futures price. For a call option, this occurs when the strike price is above the current futures price. Out-Of-The-Money:- an option which has no intrinsic (exercise) value. A put option with the current price of the underlying contract above the strike price. A call option with the current price of the underlying futures contract below the strike price. / Об опционе говорят, что он Убыточный, когда его сходная цена находится на уровне (по отношению к текущей цене соответствующего актива), который не смог бы принести прибыли в случае исполнения этого опциона. Опцион на покупку со сходной ценой выше или опцион на продажу со сходной ценой ниже текущей рыночной цены соответствующего актива, то есть опцион, не имеющий никакой внутренней ценности. Например, при текущей цене золота в USD390.00 опцион на покупку фьючерса на золото со сходной ценой в USD400.00 будет убыточным на 10.00 Долларов США. Убыточный Опцион, буквально Опцион Без Денег:- термин, использующийся для описания опциона, в котором сходная цена (strike price) за акцию либо выше существующей рыночной цены в случае опциона на покупку (call), либо ниже в случае опциона на продажу (put). Например, при сходной цене в 60 Долларов Декабрьский опцион на покупку акции компании XYZ будет считаться убыточным ('без денег'), если акция XYZ продаётся по 55 Долларов. Аналогично, при сходной цене в 60 Долларов Декабрьский опцион на продажу акции компании XYZ будет считаться убыточным ('без денег'), если акция компании XYZ продаётся за 65 Долларов. Лицо, приобретающее убыточные опционы, надеется, что они станут прибыльными опционами (или опционами 'с деньгами' (in the money option)) или, по крайней мере, сместятся в этом направлении. Покупатель вышеупомянутого опциона на покупку со сходной ценой в 60 Долларов за акцию XYZ желал бы, чтобы курс акции вырос выше 60 Долларов, тогда как продавец хотел бы, чтобы курс акции упал ниже 60 Долларов.

OUT OF THE MONEY STRIKE = УБЫТОЧНАЯ СХОДНАЯ ЦЕНА – Out Of The Money Strike is a strike that has currently has no intrinsic value. For calls, that would include strikes greater than the current value of the underlying asset. For puts, it would include all strikes less than the current value of the underlying asset. / Убыточная Сходная Цена – сходная цена опциона, не имеющая в данный момент времени внутренней ценности. Для опционов на покупку, это могло бы означать, что сходные цены выше текущей стоимости соответствующего актива. Для опционов на продажу, это могло бы означать, что сходные цены ниже текущей стоимости соответствующего актива.

OUT OF TRIM = НЕУДИФФЕРЕНТОВАННЫЙ – Out Of Trim (maritime term):- not properly trimmed or ballasted (not on even keel; listing).

OUTPERFORMER = СВЕРХРЕЗУЛЬТАТИВНЫЙ (или СВЕРХПЛОДОТВОРНЫЙ, или СВЕРХЭФФЕКТИВНЫЙ) – 'Outperformer' is an evaluation of the expectations for a stock's future trading. It means that the development of the share's price, according to analysts, will be better than that of the overall market. The share will prospectively perform better than, for example, the DAX®. / ДАКС® (DAX®).

OUTPORT = ВТОРОСТЕПЕННЫЙ ПОРТ – Outport is the destination port, other than a base port, to which rates apply but which may be subject to additional outport arbitraries.

OUTPUT FOR OWN FINAL USE = ВЫРАБОТКА ДЛЯ СОБСТВЕННОГО КОНЕЧНОГО ИСПОЛЬЗОВАНИЯ (или ВЫПУСК ДЛЯ СОБСТВЕННОГО КОНЕЧНОГО ИСПОЛЬЗОВАНИЯ) – Output For Own Final Use:- production of output for final consumption or gross fixed capital formation by the producer. Also known as Own-Account Production. / Продукция выработки для конечного потребления или для формирования валового основного капитала самим производителем. Известна также как Производство За Собственный Счёт (Own-Account Production).

OUTRIGHT FOREIGN EXCHANGE CONTRACT = НЕОТЛОЖНЫЙ (или НЕПРЕЛОЖНЫЙ, или НЕПРЕМЕННЫЙ, или НЕПОСРЕДСТВЕННЫЙ, или ЯВНЫЙ, или БЕЗОГОВОРОЧНЫЙ, или БЕЗУСЛОВНЫЙ, или БЕЗОТЛАГАТЕЛЬНЫЙ, или ПРЯМОЙ) КОНТРАКТ НА ИНОСТРАННУЮ ВАЛЮТУ – An Outright Foreign Exchange Forward is a currency trade to settle at some time in the future (usually more than two business days). / Неотложный Контракт На Иностранную Валюту это валютная сделка с расчётом в какое-то время в будущем (обычно более, чем через два дня).

OUTRIGHT FORWARD = НЕОТЛОЖНЫЙ (или НЕПРЕЛОЖНЫЙ, или НЕПРЕМЕННЫЙ, или НЕПОСРЕДСТВЕННЫЙ, или ЯВНЫЙ, или БЕЗОГОВОРОЧНЫЙ, или БЕЗУСЛОВНЫЙ, или БЕЗОТЛАГАТЕЛЬНЫЙ, или ПРЯМОЙ) ФОРВАРД (или НЕОТЛОЖНЫЙ ФОРВАРДНЫЙ КОНТРАКТ) – (1) Outright Forward transactions are defined as the exchange of two currencies for settlement more than two business days after the conclusion of the deal. Outright forward deals are structurally similar to spot transactions in that once the exchange rate for a forward deal has been agreed, the confirmation and settlement procedures are the same as in the cash market. However, the longer the forward period, the greater the risk that the creditworthiness of the counterparty could deteriorate. Non-standard amounts or maturities may leave the market-maker with exposure that is difficult to unwind immediately, and the smaller number of participants and lower volumes in this sector imply somewhat less competitive pricing. In most centers, the amount of business in this sector remains comparatively small. A relatively large share of business in the market as a whole is conducted with non-financial customers (37%), and another 29% involves transactions with non-reporting financial institutions. Much higher shares of business with non-financial customers are seen in countries without major foreign exchange markets. This focus on customer business is also related to the domestic orientation of outright forward trading, with local business accounting for more than half (52%) of total turnover. Outright forward deals also tend to involve the domestic currency more than other types of business. These factors are consistent with the use of this market segment for hedging the financial and trade risks of commercial customers. On average, outright forward transactions with a maturity of less than one week and above one week each account for roughly half of the deals. Outright forward transactions with a maturity of more than one year are comparatively rare (except in Finland and Sweden), accounting for only 2% of turnover on average. Short-term transactions with a maturity of seven days or less tend to dominate business in the major centers except Germany and France. In most of the smaller markets, where business reflects to a greater extent the foreign exchange needs of trading in real and financial goods, outright forward transactions tend to mature beyond one week. Outright Forward is similar to spot deals except that they are for value, i.e. delivered for cash settlement, more than two business days after the conclusion of the transaction. Transaction involving the exchange of two currencies at a rate agreed on the date of the contract for value or delivery (cash settlement) at some time in the future (more than two business days later). This category also includes forward foreign exchange agreement transactions (FXA), non-deliverable forwards and other forward contracts for differences. / Неотложный Форвард или, как это произносится на Английском языке, Аутрайт Фовод (Outright Forward).

(2) Outright Forward refers to a simple purchase or sale of metal for settlement on a value date further into the future than spot. The way in which a dealer covers an outright forward deal in an OTC market provides a useful illustration of how the forward market works. When dealing forward with a counterpart, dealers generally cover the spot exposure first and then adjust the trade to the required forward date. In the case of the counterpart wishing to make a forward purchase, the dealer will purchase spot metal in the market, generally financing the purchase by borrowing US Dollars. The forward sale to the counterpart is then made on the basis of the cost of financing the transaction, less any benefit accruing to the dealer as a result of the metal liquidity created for the period as a result of the spot purchase. The net effect is that the dealer will have purchased metal in the market on a spot basis and sold metal to his counterpart for the forward date. In other words, the dealer will have created metal liquidity for the period on his book; in market parlance, he will have ‘borrowed’ it. While a forward sale creates metal liquidity on the dealer’s book for the period, a forward purchase by a dealer will drain liquidity from his metal book (and create liquidity in his USD book) until the maturity date. / На Внеучётном Рынке благородных металлов в Лондоне, СК, под Свопом понимается .

OUTRIGHT ORDER = НЕОТЛОЖНОЕ (или НЕПРЕЛОЖНОЕ, или НЕПРЕМЕННОЕ, или НЕПОСРЕДСТВЕННОЕ, или ЯВНОЕ, или БЕЗОГОВОРОЧНОЕ, или БЕЗУСЛОВНОЕ, или БЕЗОТЛАГАТЕЛЬНОЕ, или ПРЯМОЕ) РАСПОРЯЖЕНИЕ – Outright Order is an order to buy or sell only one specific type of futures contract. An order that is not a spread order. / Неотложное Распоряжение или Поручение – распоряжение купить или продать один специфический тип фьючерсного контракта. Распоряжение, не являющееся распоряжением на курсовую разницу (распоряжением на спрэд).

OUTRIGHT OPTION = НЕОТЛОЖНЫЙ (или НЕПРЕЛОЖНЫЙ, или НЕПРЕМЕННЫЙ, или НЕПОСРЕДСТВЕННЫЙ, или ЯВНЫЙ, или БЕЗОГОВОРОЧНЫЙ, или БЕЗУСЛОВНЫЙ, или БЕЗОТЛАГАТЕЛЬНЫЙ, или ПРЯМОЙ) ОПЦИОН – Outright Option is an option that is bought or sold by itself; in other words, the option position is not hedged by another offsetting position. An outright option can be either a call or a put. Most option trades involve outright options. The opposite strategy to purchasing outright options is a spread trade strategy, which involves purchasing one option and selling another option of the same class but of a different series.

OUTRIGHT TRANSACTION = НЕОТЛОЖНАЯ (или НЕПРЕЛОЖНАЯ, или НЕПРЕМЕННАЯ, или НЕПОСРЕДСТВЕННАЯ, или ЯВНАЯ, или БЕЗОГОВОРОЧНАЯ, или БЕЗУСЛОВНАЯ, или БЕЗОТЛАГАТЕЛЬНАЯ, или ПРЯМАЯ) ТРАНЗАКЦИЯ (или НЕОТЛОЖНАЯ ОПЕРАЦИЯ) – Outright Transaction:- forward market purchase or sale of foreign exchange without a corresponding spot market purchase or sale. Outright Transaction:- in the United States, ‘permanent’ purchase or sale of securities in the open market, or the redemption of securities, by the Federal Reserve to adjust the supply of balances at the Federal Reserve Banks over the long term. Contrasts with transactions intended to adjust the supply of balances only temporarily. See also Repurchase Agreement and Reverse Repurchase Agreement. / Смотрите также Соглашение Об Откупе (Repurchase Agreement) и Обратное Соглашение Об Откупе (Reverse Repurchase Agreement).

OUTSEAM = БОКОВОЙ ШОВ (или НАРУЖНЫЙ ШОВ, или ХХ) – Outseam:- the distance from the bottom of the trouser leg to the top of the pant at the waist. The measurement is taken along the outside leg seam that joins the front and back leg panels, and includes the width of the waistband.

OUTSEAM = ДЛИНА НОГИ ПО ВНЕШНЕЙ ПОВЕРХНОСТИ – Outseam:- length measurement over the surface of the lower body, from the side-center waist to the standing surface at the side of the foot. / Длина Ноги По Внешней Поверхности:- расстояние в сантиметрах от линии талии до пола. Измерение проводят по контуру бедра далее вертикально вниз до пола.

OUTSIDE DAY = ВЫХОДЯЩИЙ ЗА ПРЕДЕЛЫ ПРЕДЫДУЩЕГО ДНЯ – Outside Day:- the day’s trading range is outside that of the previous day i.e. a higher high and a lower low. The market often ‘uses up’ its energy, and on the following morning, any extreme move may be faded for a short-term trade. / В техническом анализе биржевых рынков, то есть .

OUTSIDE–MOUNTED SEAL = СНАРУЖИ (или ВНЕШНЕЕ) УСТАНОВЛЕННОЕ УПЛОТНЕНИЕ – Outside-Mounted Seal is a mechanical seal with its seal head mounted outside the seal chamber that holds the fluid to be sealed. Outside seals have the pumped fluid’s pressure at their ID. See also Seal.

OUTSIDER = СТОРОННИЙ (или АУТСАЙДЕР) – Outsider is a carrier which operates in a trade route served by a Liner Conference but which is not a member of that Conference. / Перевозчик, который действует на торговом пути (маршруте), обслуживаемом Линейной Конференцией, но который не является участником данной конференции.

OUTSIDE RANGE BAR = ШТРИХ С ПРЕВЫШЕНИЕМ ПРЕДЫДУЩЕГО ДИАПАЗОНА – Outside Range Bar:- an increase in market volatility where the high of the bar is higher than the previous bar and the low is lower than the previous low. This can be a one-bar reversal pattern if a trend has been in place and the closing price is above/below the previous close in the opposite direction. It is especially noteworthy when the close is outside the entire range of the previous bar.

OUTSIZE CARGO = НЕГАБАРИТНЫЙ ГРУЗ (или ХХ) – Outsize Cargo:- freight that is larger than can be accommodated on standard pallets. It is often carried by a nose door–equipped Boeing 747 or a purpose-built Russian freighter.

OUTSOURCE = ПОДРЯДИТЬ (или ОТДАВАТЬ В ПОДРЯД) – Outsource:- to hire a third-party provider to assume tasks previously performed in-house.

OUTSOURCING = ИСПОЛЬЗОВАНИЕ ПОДРЯДА (или АУТСОРСИНГ) – (1) A term Outsourcing refers to a company buying services from another firm. For example, if company X is outsourcing its e-commerce services, it means that it is relying on another company to do this job rather than doing it internally with its own employees and resources. Many companies, like IBM, outsource much of their production to Taiwanese firms. Purchasing a logistics service from an outside firm, as opposed to performing it in-house. The concept of taking internal company functions and paying an outside firm to handle them. Outsourcing is done to save money, improve quality, or free company resources for other activities. Outsourcing was first done in the data-processing industry and has spread to areas, including telemessaging and call centers. Outsourcing is the wave of the future. In computing, outsourcing can take many forms. A company, for instance, may outsource its whole IT operation, so that another outsourcing firm provides the hosting and maintenance of its servers and ensures that the system runs smoothly and runs its application development. This would be a total outsourcing solution, although many companies will often just pick elements of such a package. Outsourcing (or contracting out) is often defined as the delegation of non-core operations or jobs from internal production to an external entity (such as a subcontractor) that specializes in that operation. Outsourcing is a business decision that can be made for quality or financial reasons. A subset of the term (offshoring) also implies transfering jobs to another country, either by hiring local subcontractors or building a facility in an area where labor is cheap. / наём (hiring) локальных субподрядчиков или .

(2) Outsourcing:- to hire a third-party provider to assume tasks previously performed in-house. Performance of a production activity that was previously done inside a firm or plant outside that firm or plant. / нанимать .

(3) Outsourcing:- manufacture of inputs to a production process, or a part of a process, in another location, especially in another country.

(4) Outsourcing is another term for Fragmentation. / Ещё один термин для Фрагментации (Fragmentation).

OUTSTANDING CREDIT = НЕПОГАШЕННЫЙ КРЕДИТ – The item Outstanding Credit includes outstanding Euro denominated credit and outstanding foreign currency denominated credit. Euro denominated credit includes Euro denominated loans and advances, loans granted from central government funds, as well as bonds and debentures classified as investments. Foreign currency denominated credit includes foreign currency denominated loans and advances, as well as foreign currency denominated bonds classified as investments. The item ‘outstanding loans’, both Euro and foreign currency denominated, includes overdrafts, bills of exchange, promissory notes and other loans. The item ‘bonds classified as investments’ includes bonds and debentures that are recorded as investment assets. In the case of credit institutions, the item includes transferable bonds and debentures. In the case of insurance companies, the item includes bonds and debentures classified as investments. Three different concepts of outstanding credit are used for statistical purposes:- (1) Total Lending:- this item includes all loans granted by a sector, i.e.:- (i) loans to the public; (ii) loans to foreign borrowers; and (iii) loans between financial institutions, central government and social security funds. Loans granted from central government funds are included twice in total lending:- (a) first as central government credit to the banking sector, and a second time as loans from the banking sector to the public, and (b) first as central government credit to the municipal sector, and a second time as loans to the public. (2) Loans To The Public:- loans to the public equals total lending minus loans to foreign borrowers and overlapping credit (loans between financial institutions, central government and social security funds as well as loans intermediated from central government funds). (3) Loans To Enterprises And Entrepreneur Households:- this item includes loans to sectors 1 (enterprises) and 51 (households of employers and own-account workers). The item appears as a sum total in tables where loans are classified by the borrower’s economic activity. Loans to sectors 1 and 51 include housing loans granted to these sectors. See also Liabilities. Credit Outstanding means any loan, extension of credit, issuance of a guarantee, acceptance, or letter of credit, including an endorsement or standby letter of credit, or other transaction that extends financing to a person or group of persons. / Смотрите также Пассивы или Обязательства (Liabilities).

OUTSTANDING INSURANCE CLAIMS = НЕПОГАШЕННЫЕ СТРАХОВЫЕ ПРЕТЕНЗИИ – Outstanding Insurance Claims:- these are reserves that insurance enterprises hold in order to cover the amounts they expect to pay out in respect of claims that are not yet settled or claims that may be disputed. Reserves against outstanding claims are therefore considered being assets of the beneficiaries and liabilities of the insurance enterprises. Therefore, claims on insurance companies not yet settled are assets of corporations and should be reported under this category.

OUT TRADE = ОТКЛОНЁННАЯ ТОРГОВЛЯ (или ОТКЛОНЁННАЯ СДЕЛКА, или АУТ ТРЭЙД) – Out Trade:- a trade that cannot be cleared by a clearing organization because the trade data submitted by the two clearing members involved in the trade differs in some respect, e.g., price and/or quantity. In such cases, the two clearing members or brokers involved must reconcile the discrepancy, if possible, and resubmit the trade for clearing. If an agreement cannot be reached by the two clearing members or brokers involved, the dispute would be settled by an appropriate exchange committee. All out trades must be resolved before the market opens the next day. / , например, .

OUTTURN = ОБЪЁМ ВЫГРУЗКИ (или АУТТЁРН, или ИСХОДЯЩЕЕ) – The quantity of cargo discharged from a ship. Outturn:- the quantity of oil unloaded from a vessel at its discharge point. Outturn pricing allows the buyer to pay only for the oil measured into receiving tanks. The amount of oil loaded on the tanker becomes irrelevant. / Количество разгруженного из судна груза. Количество нефти, выгруженной с судна в пункте назначения. При расчёте цены по объёму выгрузки покупатель имеет возможность заплатить только за нефть, загруженную в приёмные резервуары. Количество нефти, погруженной на танкер, не принимается к расчёту.

OUTTURN REPORT = АКТ ВЫГРУЗКИ – Outturn Report is a written statement by a stevedoring company in which the condition of cargo discharged from a vessel is noted along with any discrepancies in the quantity compared with the vessel’s manifest. Outturn Reports:- (1) When cargo is unloaded from an aircraft at an airport, the depot operator whose particulars have been communicated to

the Department by the operator of the aircraft under section 64AAC must communicate electronically to the Department an outturn report in respect of the cargo. (2) When a container is unloaded from a ship at a port, the stevedore whose particulars have been communicated to the Department by the operator of the ship under section 64AAC must communicate electronically to the Department an outturn report in respect of the container. (3) When cargo that is not in a container is unloaded from a ship, the stevedore whose particulars have been communicated to the Department by the operator of the ship under section 64AAC must communicate electronically to the Department an outturn report in respect of the cargo. (4) When cargo unloaded from an aircraft or ship has been moved, under a permission given under section 71E, to a Customs place other than a warehouse, the person in charge of the Customs place must communicate electronically to the Department an outturn report in respect of the cargo. (5) An outturn report must:- (a) if it is made under subsection (1), (3) or (4):- (i) specify any goods included in the cargo report that have not been unloaded or, if there are no such goods, contain a statement to that effect; and (ii) specify any goods not included in the cargo report that have been unloaded or, if there are no such goods, contain a statement to that effect; and (b) if it is made under subsection (2) – set out a list of the containers that have been unloaded; and (c) in any case:- (i) be in accordance with an approved statement; and (ii) state any times required by section 64ABAB; and (iii) be made within the period or at the time required by that section. (6) The Comptroller-General of Customs may approve different statements for the outturn reports to be made by stevedores, depot operators, or persons in charge of Customs places. (7) An officer may disclose a cargo report to a stevedore, a depot operator or a person in charge of a Customs place (other than a warehouse) for the purpose of enabling the stevedore, operator or person to communicate to the Department an outturn report in respect of the cargo. (8) A person who intentionally contravenes this section commits an offence punishable, on conviction, by a penalty not exceeding 120 penalty units. (9) A person who contravenes this section commits an offence punishable, on conviction, by a penalty not exceeding 60 penalty units. (10) An offence against subsection (9) is an offence of strict liability. (11) In this section:- 'Customs Place' has the meaning given by subsection 183UA(1). / в котором отмечается состояние разгруженного из судна груза . Ауттёрн Рипот (Outturn Report):- документ, которым в портах ряда стран фиксируется количество доставленного и сданного судном груза и выявленные при этом потери. В некоторых портах этот документ называется сертификатом, но независимо от названия и формы он содержит сведения о результатах сдачи груза по каждой коносаментной партии. Ауттёрн Рипот обычно оформляется тальманом, принимающим груз от имени грузополучателей, либо самим получателем груза, а иногда и стивидором. В портах некоторых стран выгружаемые из судна грузы поступают на склады портовой администрации или таможни, и официальный их подсчёт производится при выдаче с этих складов получателям. Только после этого судну (или его агенту) выдаётся документ, подтверждающий результат сдачи груза. В некоторых портах, где действует указанный порядок сдачи-приёмки груза, судну по окончании выгрузки выдаётся предварительный Ауттёрн Рипот, который, однако, юридической силы не имеет. При предъявлении претензий на несохранную перевозку Ауттёрн Рипот служит подтверждающим документом.

OUTWARD HANDLING = ОБСЛУЖИВАНИЕ ВЫВОЗА – Outward Handling:- the operations to be performed on outgoing goods from a production unit, both administrative and physical, starting at the moment forwarding orders can be executed to the moment of actual departure of the goods.

OUTWARD PROCESSING = ПЕРЕРАБОТКА ЗА РУБЕЖОМ – In the European Union, Outward Processing is a customs procedure allowing the export of Community goods for processing abroad and the re-import of the processed products under total or partial duty relief. Outward Processing is a procedure whereby a company based in one country exports material to another country for additional processing, and then reimports the processed products for further treatment, for domestic distribution, or for re-export. The most common form of outward processing involves the exporting of fabric from a high cost country to a low cost country for assembly or part-assembly into garments.

OUTWARD PROCESSING RELIEF = ОСВОБОЖДЕНИЕ ОТ ОПЛАТЫ ПОШЛИН ПРИ ПЕРЕРАБОТКЕ ЗА РУБЕЖОМ – Outward Processing Relief (OPR) is a system of duty relief that gives full or partial relief from import duty when EC goods are exported outside the Community for process or repair and are sunsequently reimported. See also Inward Processing Relief.

OUTWARD REMITTANCE = ИСХОДЯЩЕЕ ПЕРЕЧИСЛЕНИЕ – Outward Remittance:- it refers to the service that the bank of importer authorize, entrusted by the remitter, an overseas affiliated bank or a correspondent bank to pay a certain amount of money to the specified remittee in the agreed method of remittance. The service is used for international settlement of fund transfer and remittance. Methods of remittance include telegraphic transfer, mail transfer and demand draft, among which telegraphic transfer and demand draft are frequently used. Features:- (i) Low Cost:- compared with L/C and collection, remittance is characterized by simple procedures and low cost; (ii) Fast Processing:- telegraphic transfer is faster and enables exporters to collect payments timely and accelerate capital turnover; and (iii) Simple Operation:- remittance features simple operation and wide scope of application. Target Customers:- (i) importers with sufficient working capital, whose current aim is to control financial expenses other than convenient financing; (ii) exporters accept terms of Cash on Delivery but require a rapid collection under trade settlement business; (iii) importers are willing to pay in advance to exporters based on their good business relationship and complete trust; (iv) outward remittance shall be adopted when it refers to information cost, technology cost and trade incidental cost (including freight charges and premium); and (v) final payment under trade shall be fulfilled by outward remittance. Required Documents:- (i) in order to make outward remittance, importer (you) shall present documents as following to the bank of importer:- application form for outward remittance, pay order for foreign exchange account as well as RMB cheque (Renminbi cheque) for foreign exchange purchase; and (ii) handling outward remittance shall be in accordance with the provisions of the foreign exchange control regulations of China, and present valid certificates required by the regulations, such as approval document to use foreign exchange, declaration form of international balance of payment (if required), verification certificate of import trade payment in foreign exchange (if required). Application Qualifications:- (i) the applicant shall be approved and registered in accordance with the law, and hold a business license that has passed the annual inspection or other valid certificates which fully prove its legal operation and scope of business; (ii) the applicant shall have a loan card; (iii) the applicant shall have an account opening permit and open a settlement account with the bank of applicant; (iv) the applicant shall have the qualification to engage in import and export trade; and (v) the applicant shall have a credit line at the bank of applicant. Process (solid line for telegraphic transfer and mail transfer, and dotted line for demand draft):- (i) the remitter submits the application form for outward remittance as well as pay order for foreign exchange account or RMB cheque for foreign exchange purchase; (ii) after verifying such documents, the bank of applicant (importer) sends the remittance instruction via telegraph (under telegraphic transfer) or instruction letter (under mail transfer) to the overseas affiliated bank or correspondent bank, or issue demand draft (under demand draft) to the remitter; (iii) under telegraphic transfer or mail transfer, the overseas affiliated bank or correspondent bank pays the remittance to the remittee following the instruction from the bank of exporter; and (iv) under demand draft, the remitter delivers demand draft to the remittee by himself, and the remittee presents the demand draft to the paying bank noted on the draft, and the paying bank pays the remittance to the remittee. Our Advantages:- (i) with advanced clearing network and rich experience, the bank of importer leads in rolling out 'Global Foreign Exchange Daypass' service and 'Han Hui Tong' service handling remittance to Korea in USD, which can provide customers with the most convenient remittance access; (ii) the bank of importer has opened a multi-currency current

account with major clearing banks, enabling various remittance services with convertible currencies; and (iii) for large-amount remittance, the bank of importer offers follow-up service to ensure the fund safety, relying on sophisticated technology and good relationships with correspondent bank.

OUTWARDS REINSURANCE = ИСХОДЯЩЕЕ ПЕРЕСТРАХОВАНИЕ – Outwards Reinsurance is the reinsurance of a syndicate or of an insurance company as distinct from inwards reinsurance.

OVAL = ОВАЛЬНОЕ – Oval:- broadly elliptical. / Под Овалом, от Латинского слова Ovum, означающее Яйцо, понимается выпуклая замкнутая плоская кривая без угловых точек, например, эллипс.

OVARY = ЗАВЯЗЬ – Ovary is the female reproductive part of the plant, below the style, containing the egg cells (ovules) that after fertilization enlarge and become seeds. Ovary:- the bulbous, basal portion of the pistil which contains one ovule. Ovary is the bulbous, basal portion of the pistil containing one ovule. / Завязь – это женский репродуктивный орган растения, расположенный внизу пестика (или стиля, или столбика), содержащего яйцеклетки (семяпочки), которые после оплодотворения увеличиваются и становятся семенами. луковичная, . В ботанике под Завязью понимается нижняя расширенная полая часть пестика, заключающая одну или несколько семяпочек, из которых после оплодотворения образуются семена. Сама завязь превращается в плод.

OVARY = ЯИЧНИК – The Ovaries are homologous with the testes in the male. They are two nodular bodies, situated one on either side of the uterus in relation to the lateral wall of the pelvis, and attached to the back of the broad ligament of the uterus, behind and below the uterine tubes. The ovaries are of a grayish-pink color, and present either a smooth or a puckered uneven surface. They are each about 4 cm in length, 2 cm in width, and about 8 mm in thickness, and weigh from 2 to 3.5 gm. Each ovary presents a lateral and a medial surface, an upper or tubal and a lower or uterine extremity, and an anterior or mesovarion and a posterior free border. It lies in a shallow depression, named the ovarian fossa, on the lateral wall of the pelvis; this fossa is bounded above by the external iliac vessels, in front by the obliterated umbilical artery, and behind by the ureter. The exact position of the ovary has been the subject of considerable difference of opinion, and the description here given applies to the ovary of the nulliparous woman. The ovary becomes displaced during the first pregnancy, and probably never again returns to its original position. In the erect posture the long axis of the ovary is vertical. The tubal extremity is near the external iliac vein; to it are attached the ovarian fimbria of the uterine tube and a fold of peritoneum, the suspensory ligament of the ovary, which is directed upward over the iliac vessels and contains the ovarian vessels. The uterine end is directed downward toward the pelvic floor, it is usually narrower than the tubal, and is attached to the lateral angle of the uterus, immediately behind the uterine tube, by a rounded cord termed the ligament of the ovary, which lies within the broad ligament and contains some non-striped, muscular fibers. The lateral surface is in contact with the parietal peritoneum, which lines the ovarian fossa; the medial surface is to a large extent covered by the fimbriated extremity of the uterine tube. The mesovarian border is straight and is directed toward the obliterated umbilical artery, and is attached to the back of the broad ligament by a short fold named the mesovarium. Between the two layers of this fold the bloodvessels and nerves pass to reach the hilum of the ovary. The free border is convex, and is directed toward the ureter. The uterine tube arches over the ovary, running upward in relation to its mesovarian border, then curving over its tubal pole, and finally passing downward on its free border and medial surface. Xxxxx. The Ovary consists of two fused median carpels. At the top it bears the style and the stigma. The stigma may be inconspicuous (with a small area of stigmatic papillae at the style tip), distinctly capitate (head-shaped), stomatomorphic (mouth-shaped, with short upper and lower lip) or bilobed. Under the latter term quite a number of different types must be distinguished. The position of the lobes may be median or lateral, with both or only the anterior carpel forming the two lobes. A style is always present, though it may be short in some cases. It may be straight or gently curved. In flowers with a distinct tube it is usually held immediately below the corolla roof. In some species of Chirita and others it is held in a stable position between two flaps of the corolla roof. Position may be central or, in the case of enantiostyly, lateral. The outer shape of the ovary varies from (rarely) disc-like through globose, ovoid, elongated to long-cylindrical. In the long forms sometimes a narrow, tapering ‘stipe’ (basal ovary part with sterile placentae) is present (species of Didymocarpus and Aeschynanthus). Usually the two carpels are developed equally, but there are exceptions in some E Asian taxa, in which the anterior carpel is much reduced and sterile:- Hemiboea, Briggsiopsis, Metabriggsia, Deinostigma, and some species of Chirita. Ovary position may be roughly classified into superior, semi-inferior and inferior. Distinctly semi-inferior and completely inferior ovaries (including many transitional forms) occur only in the neotropical Gesneriaceae; slight sinkage into the receptacle is found in the other groups as well. Genera with superior, semi-inferior and inferior ovaries are found side by side in the Gloxinieae and in the Sinningieae, almost superior to fully inferior ovaries even in a single genus (Sinningia). Position and shape of placentae (the tissue supporting the ovules) is of great taxonomic importance. The form of the individual placentae (in cross section) can be roughly classified into two types. In the Didymocarpoid Gesneriaceae they are rather thin, of equal thickness throughout their length (lamelliform), and curved back in the distal part. Especially in Aeschynanthus and allies, lamellae are long and markedly revolute. The production of ovules is usually confined to the distal, reflexed parts, sometimes even to the very ends. The second type, occurring in the rest of the family, is that of a (roughly) right-angled triangle, with ovules mostly being produced on all sides. Variation relates to the shape of the placenta (e.g., more rounded) and to the restriction of ovule production to the inner (e.g., species of Columnea, Chrysothemis) or outer (e.g., Achimenes candida) surface of the placentae. / заращён/сплюснут (obliterated). В анатомии под Яичником понимается женская половая железа (обычно парная), в которой образуются и созревают яйца. У позвоночных животных и человека расположена в брюшной полости. Вырабатывает гормоны – эстрогены и прогестерон.

OVATE = ЯЙЦЕВОЙ (или ЯЙЦЕВИДНОЕ, или ПРОДОЛГОВАТОЕ) – Ovate:- a flattened structure (e.g., leaf) having an outline in the shape of an egg, with the stalk or point of attachment at the large end. Ovate:- egg-shaped, widest toward the base. / Под Овалом, от Латинского слова Ovum, означающее Яйцо, понимается выпуклая замкнутая плоская кривая без угловых точек, например, эллипс.

OVATE LEAF = ЯЙЦЕВИДНЫЙ ЛИСТ – Ovate Leaf:- more or less rounded at both ends and broadest below the middle, egg-shaped, e.g., Cornus florida. Ovate Leaf:- egg-shaped; wider at the base than the apex.

OVB = OUTER VASCULAR BUNDLE

OVEN = ПЕЧЬ (или ДУХОВОЙ ШКАФ) – Oven:- enclosed heating equipment used by garment manufacturers to apply heat for the purpose of applying heat to a garment to set, or cure (bake), a durable press finish on the article.

OVEN–DRY MASS = МАССА ПОСЛЕ СУШКИ В ПЕЧИ – Oven-Dry Mass is the mass obtained by drying the fiber, usually after removal of added products such as finish or oil and of extractable matters. See also Mass.

OVEN–DRY WEIGHT = ВЕС ПОСЛЕ СУШКИ В ПЕЧИ – Oven-Dry Weight is the constant weight of a specimen obtained by drying in an oven under prescribed conditions of temperature and humidity. / неизменный вес образца, полученный в результате сушки в печи при предписанных условиях температуры и влажности.

OVERAGE = ПРЕВЫШЕНИЕ – (1) Overage is the additional premium payable on a marine insurance open cover or policy when the insured goods are carried on a vessel which does not come within the scope of the Institute Classification Clause, usually because it is too old. Overage is a term used to define the addition premium paid under a cargo open cover in regard to the 'held covered' provision in the Institute classification clause. Overage is an additional premium charged on a cargo open cover declaration because the carrying vessel is outside the scope of the classification clause.

(2) Overage:- when more has shipped on a load than was intended or was indicated on the Bill of Lading (BOL).

OVER–ALL = НАИБОЛЬШЕЕ (или ГАБАРИТНОЕ, или ОБЩЕЕ, или ПОЛНОЕ) – Over-All (maritime term):- the extreme deck fore and aft measurement of a vessel.

OVERALL = XX (или СПЕЦОДЕЖДА, или КОМБИНЕЗОН) – Overall:- (archaic) loose protective trousers worn over regular clothes; (plural) trousers of strong material usually with a bib and shoulder straps; (chiefly British) a loose-fitting protective smock worn over regular clothes.

OVERALL HEIGHT = ГАБАРИТНАЯ ВЫСОТА (или ПРЕДЕЛЬНАЯ ВЫСОТА) – In pallet, Overall Height is the vertical distance measured from the floor to the top side of the top deck. / У поддона .

OVERALLOTMENT = ПРЕВЫШЕНИЕ – Overallotment:- more shares (or other instrument) has been allotted to buyers or investors (of an IPO (short for the Initial Public Offering), for example) than what is available.

OVERALL PREMIUM LIMIT = ПРЕДЕЛЬНЫЙ ЛИМИТ ПРЕМИИ – In relation to a member of the Corporation of Lloyd's, Overall Premium Limit is the limit for the time being prescribed on the amount of insurance business which is to be underwritten on his behalf from time to time, such limit being expressed as the maximum permissible amount of his premium income allocable to any year of account. Also known as Overall Premium Income Limit.

OVER BASIS = XX – Over Basis is a condition that exists when the local cash price is higher than the futures price. See also Under Basis.

OVERBLOUSE = XX (или БЛУЗКА, ОДЕВАЕМАЯ ПОВЕРХ ЮБКИ) – Overblouse:- a usually fitted or belted blouse worn un-tucked.

OVERBOARD = ЗА БОРТОМ (или ЗА БОРТ) – Overboard:- over the side or out of ship. / За бортом или вне судна.

OVER–BOOKED VESSEL = СУДНО С ПРЕВЫШЕННЫМ ПРЕДЕЛОМ БРОНИРОВАНИЯ – Over-Booked Vessel:- a condition in which all available container spaces aboard a given vessel are reserved and more containers have been booked to the vessel that it can carry.

OVERBOUGHT = ПЕРЕКУПЛЕННОСТЬ (или КУЛЬМИНАЦИЯ ПОКУПОК) – Overbought:- a technical condition that occurs when prices are considered too high and susceptible to a decline. Overbought conditions can be classified by analyzing the chart pattern or with indicators such as the Relative Strength Index (RSI) and Stochastic Oscillator. For example, a sharp advance from USD15.00 to USD30.00 in 2 weeks might lead a technician to believe that a security is overbought; or, a security is sometimes considered overbought when the RSI exceeds 70 and when the Stochastic Oscillator exceeds 80. It is important to keep in mind that overbought is not necessarily the same as being bearish. It merely infers that the stock has risen too far too fast and might be due for a pullback. A technical opinion that the market price has risen too steeply and too fast in relation to underlying fundamental factors. Rank and file traders who were bullish and long have turned bearish. Overbought is a technical opinion about the level of prices. May refer to an asset that has had a sharp rise or to the market as a whole after a period of vigorous buying which, it may be argued, has left prices 'too high'. Some indicators will signal when prices are thought to be overbought. A technical opinion that the market price or an asset price that has risen too steeply and too fast in relation to underlying fundamental factors. A market that has had a sharp decline. Rank-and-file traders who were bullish and long earlier have turned bearish. Overbought is an opinion about the market that recent price action has carried too far in one direction, and that a minor reversal or retracement is necessary to get the market back into a technical equilibrium state. Overbought:- a market in which the price, under excessive buying pressure, has risen too high and too fast without genuine fundamental support to maintain the new level. Overbought is a condition in which prices are thought to have increased too much or too rapidly. Can be measured by the Relative Strength Index. / В техническом анализе биржевых рынков под Перекупленностью или Кульминацией Покупок понимается состояние рынка в предверии резкого снижения цен после их слишком длительного и значительного роста. Рядовые торговцы, бывшие до сей поры быками или покупателями, переходят соответственно в разряд медведей или продавцов.

OVERCARRIER = ПЕРЕВОЗЧИК, РАБОТАЮЩИЙ СВЕРХ КВОТЫ – Overcarrier is a carrier within a consortium who carries cargo beyond his allotted share.

OVERCHARGE = ПЕРЕНАЧИСЛЕНИЕ (или ЗАВЫШЕННАЯ ПЛАТА) – Overcharge:- to charge more than the proper amount according to the published rates.

OVERCHECK = ВЫПУКЛАЯ КЛЕТКА – Overcheck is a design in which one check is woven or printed over another of a different size. Glen checks are overchecks. / Ткань в выпуклую клетку. Glen Check = пёстротканая Шотландка.

OVERCOAT = ТУЛУП (или ПАЛЬТО, или ШИНЕЛЬ) – Overcoat is a warm coat worn over indoor clothing.

OVERCURRENT = СВЕРХТОК – Overcurrent is any current beyond the continuous rated current of the conductor or equipment. This may be value slightly above the rating as in the case of an overload, or may be far above the rating as in the case of a short circuit.

OVERCUT = XX – Overcut:- a staple fiber that is longer than nominal length. Usually, the length is a multiple of 2, 3, or more times the nominal length. An overcut is caused by the failure of filaments to be cut to the desired length during staple manufacture.

OVERDOMINANCE = СВЕРХДОМИНАНТНОСТЬ (или СВЕРХДОМИНИРОВАНИЕ) – Overdominance is an effect in the heterozygote, A/a, which is greater than that in the homozygous dominant, A/A.

OVERDRAFT = ПЕРЕРАСХОД (или ПЛАТЁЖНАЯ ССУДА, или ОВЕРДРАФТ) – Overdraft:- when a bank customer withdraws money from a bank account than is actually deposited with the bank, the excess is known as a Bank Overdraft. An overdraft facility must normally be agreed with the bank in question and interest on the overdraft is charged on a day-to-day basis. It attracts high rates of interest and ideally is used only for short-term borrowing. Overdraft is a line of credit, contractually repayable on demand unless a fixed-term has been agreed, established through a customer's current account. Overdraft:- a deficiency caused by drawing on funds, e.g., in a bank account, causing a default condition. If you write a cheque on your bank account that exceeds the cash in the account, your account will be in an overdraft position if your bank has honored the cheque. Many bank customers have overdraft privileges. Without such privileges, banks will not allow deficit positions and will return the cheques to the payee marked, Not Sufficient Funds

(NSF) (a nice way of saying that they 'bounced' the cheque). Situation where a bank customer withdraws funds exceeding his credit balance without a formal loan agreement (overdraft limit). Given the risk entailed, interest on an overdraft is higher than on a loan within a pre-agreed limit. / Овердрафтное Кредитование. Под Платёжной Ссудой или так называемым Овердрафтом понимается оплата банком претензий к клиенту сверх остатков на его текущем счёте в пределах согласованных лимитов. Овердрафтом предусмотрено поддержание определённого оборота (5:1) по расчётному счёту. Обеспечение в виде залога не требуется. Лимит овердрафта устанавливается из расчёта 15–30% от месячных кредитовых поступлений на расчётный счёт заёмщика. При получении овердрафта устанавливаются жёсткие сроки пользования траншем, как правило, не превышающие 30 дней. Срок действия договора по возобновляемой кредитной линии не может превышать 3–6 месяцев. Все кредитовые поступления автоматически списываются с расчётного счёта в погашение овердрафта и процентов по нему. Овердрафт возвращается банку заёмщиком, и предусматривает переход заёмщика на расчётно-кассовое обслуживание в данный банк. Под Кассовым Дефицитом понимается недостаток денежной наличности для текущих платежей.

OVERDRAFT & SHORT–TERM LOANS = ПЕРЕРАСХОД И КРАТКОСРОЧНЫЕ ЗАЙМЫ (или ПЛАТЁЖНАЯ ССУДА И КРАТКОСРОЧНЫЕ ЗАЙМЫ, или ОВЕРДРАФТ И КРАТКОСРОЧНЫЕ ЗАЙМЫ) – Overdraft & Short-Term Loans is the total of all the borrowings that are due to be repaid during the next twelve months. May also be shown as Short-Term Borrowings, Short-Term Debt or Short-Term Liabilities.

OVERDRAFT CHECKING ACCOUNT = ЧЕКОВЫЙ СЧЁТ С ПЕРЕРАСХОДОМ (или ЧЕКОВЫЙ СЧЁТ С ПЛАТЁЖНОЙ ССУДОЙ, или ЧЕКОВЫЙ СЧЁТ С ПОКРЫТИЕМ КАССОВЫХ РАЗРЫВОВ) – Overdraft Checking Account is a checking account associated with a line of credit that allows a person to write checks for more than the actual balance in the account, with a finance charge on the overdraft.

OVERDRAFT FACILITY = ВОЗМОЖНОТЬ ПЕРЕРАСХОДА (или ВОЗМОЖНОСТЬ ПЛАТЁЖНОЙ ССУДЫ, или ВОЗМОЖНОСТЬ ОВЕРДРАФТА) – Overdraft Facility is an arrangement whereby customers can overdraw their current account up to a specific amount. For salary accounts, the overdraft facility frequently corresponds to two to three net monthly salaries. Also referred to as Personal Credit Line. / Овердрафтное Кредитование.

OVERDRAFT INTEREST = ПРОЦЕНТ ЗА ПЕРЕРАСХОД (или ПРОЦЕНТ ПО ПЛАТЁЖНОЙ ССУДЕ, или ПРОЦЕНТ ПО ОВЕРДРАФТУ, или ОВЕРДРАФТНЫЙ ПРОЦЕНТ) – Overdraft Interest is an interest payable at a variable rate on the debit balance of a personal credit line or overdraft facility.

OVERDRAFT LIMIT = ЛИМИТ ПЕРЕРАСХОДА (или ЛИМИТ ПЛАТЁЖНОЙ ССУДЫ, или ЛИМИТ ПО ОВЕРДРАФТУ, или ОВЕРДРАФТНЫЙ ЛИМИТ) – Overdraft Limit is the individually agreed limit to bridge temporary financial bottlenecks. Overdraft limits on a personal account are usually roughly equivalent to one month's salary.

OVERDRAFT PROTECTION = ЗАЩИТА ПЛАТЁЖНОЙ ССУДОЙ (или ЗАЩИТА ОТ/ПО ОВЕРДРАФТУ) – Overdraft Protection:- granting of credit by a bank to cover insufficient funds in a customer's checking account.

OVERDRAW = ПЕРЕРАСХОДОВАТЬ – Overdraw:- to draw in excess of the deposit balance or credit limit.

OVERDUE BILL = ПРОСРОЧЕННЫЙ ВЕКСЕЛЬ – Overdue Bill is a bill of exchange which was not paid at maturity (due date). Also known as Dishonoured Bill. / Вексель, который не был оплачен по погашении, то есть в надлежащую (причитающуюся) дату. Известен также как Не Оплаченный В Срок Вексель (Dishonoured Bill).

OVERGARMENT = ВЕРХНЯЯ ОДЕЖДА – Overgarment is an outer garment.

OVERHANG = НАВЕС (или ВЫСТУП) – (1) A term Overhang refers to stock options. It is calculated as to stock options granted plus remaining options yet to be granted divided by the total number of shares issued and outstanding. A high percentage implies excessive dilution.

(2) Overhang is the distance the deck extends from the outer edge of the stringer or stringerboard; wing; lip; distance the unit load extends beyond the deck.

OVERHANG = СВЕС – Overhang (maritime term):- the projection of the stern beyond the sternpost and of the bow beyond the stem. / Свес кормы.

OVERHAUL = РЕМОНТИРОВАТЬ (или ПЕРЕБИРАТЬ, или ПРОИЗВОДИТЬ ПЕРЕБОРКУ) – Overhaul (maritime term):- get gear in condition for use; to separate the blocks of a tackle to lengthen the fall (ready for use again).

OVERHEAD = НАКЛАДНЫЕ РАСХОДЫ – Overhead:- costs incurred in the everyday running of a business and not variable according to output. Overhead include energy, heating and lighting costs, administration, insurance, rent and rates. Also known as Fixed Costs, Indirect Costs, and Supplementary Costs; and as Overheads in the United Kingdom. Overhead is an accounting term that refers to all costs not relating to direct labor and materials. Another term for this is 'indirect' cost. There can be manufacturing overhead or general overhead. The term is ambiguous unless it is described accordingly. / Затраты, понесённые выработке (output).

OVERHEAD CRANE = КРАН–БАЛКА – Overhead Crane:- also known as Suspended Crane. This type of crane works in the same way as a gantry crane but without uprights. The hoist is on a trolley which moves in one direction along one or two beams, which move at right angles to that direction along elevated tracks, often mounted along the side walls of an assembly area in a factory. Some of them can lift very heavy loads. The Overhead Traveling Crane, a type of bridge crane, is used inside buildings or in outdoor storage yards. Two or more parallel girders span its working area. Another girder, called the Bridge, stretches between them and rolls along them on wheels; this girder, in turn, supports a carriage from which a lifting attachment is lowered by pulleys. Overhead Crane is a crane mounted on wheels; esp., an overhead crane consisting of a crab or other hoisting apparatus crane consisting of a crab or other hoisting apparatus traveling on rails or beams fixed overhead, as in a machine shop or foundry. Also known as Traveler Crane, Traveling Crane, and Traversing Crane. / но без мачт (uprights). балка или ферма (girder) . Кран-Балка, разновидность подъёмного крана мостового типа, у которого тельфер передвигается по ездовой балке. Балка опирается ходовыми колёсами на рельсы, которые обычно уложены на верхних полках подкрановых балок, расположенных под потолком обслуживаемого помещения, крытой площадки или участка. В некоторых конструкциях ходовые колёса опираются на нижние полки подкрановых двутавровых балок; краны-балки такой конструкции называются Подвесными, или Катучими. Краны-балки бывают Однопролётные (ширина пролёта 6–15 метров (м)) и Многопролётные (до 100 м). Механизмы крана-балки приводятся в действие электродвигателем, питающимся от сети (через контактный провод или кабель). Управление механизмами осуществляет машинист из кабины, подвешенной к ездовой балке, или с пола помещения при помощи кнопочного пульта, соединённого с механизмами крана-балки кабелем. Грузоподъёмность крана-балки обычно 1–5 тонн (т). Кран-балка, или Катабалка, на судах – простейший подъёмный поворотный кран для подъёма и спуска становых (носовых) якорей. Имеет вид

изогнутой балки с блоком на конце или стрелы с укосиной. Подъём якоря осуществляют вручную или от брашпиля. Устанавливают 1 кран-балку на баке или 2 по бортам бака. На парусных деревянных судах роль крана-балки выполняют 2 деревянных неподвижных кронштейна (балки на скулах бака), так называемые Крамболы. Под Краном-Балкой, от Голландского слова Kraanbalk, понимается разновидность подъёмного крана мостового типа, у которого таль с ручным или электрическим приводом передвигается по ездовой балке с колёсами. Грузоподъёмность крана-балки может доходить до 5 тонн. Кран-балка на судах, так называемая катабалка, является простейшим поворотным краном для подъёма становых (носовых) якорей. Под Мостовым Краном понимается подъёмный кран, выполненный в виде опорного или подвесного моста с грузовой тележкой (талью). Мост перемещается по подкрановым рельсам, например, вдоль пролёта цеха, а тележка (таль) – по мосту поперёк пролёта. Грузоподъёмность мостовых кранов может находиться в весьма широком диапазоне – от 5 до 450 тонн.

OVERHEIGHT CARGO = СВЕРХВЫСОКИЙ ГРУЗ (или КРУПНОГАБАРИТНЫЙ ПО ВЫСОТЕ ГРУЗ, или НЕГАБАРИТНЫЙ ПО ВЫСОТЕ ГРУЗ) – Overheight Cargo is a cargo more than eight feet high which thus cannot fit into a standard container. Cargo exceeding the standard height (of an open-top container/flatrack).

OVERLAND COMMON PORT = ОБЫЧНЫЙ ПОРТ СУХОПУТНОЙ ДОСТАВКИ – Movement of a trailer to or from an inland location to a port at the shipper's or consignee's expense. Overland Common Port (OCP):- a special rate concession made by shipping lines, rail carriers and truckers serving the US West Coast for export and import traffic, intended to benefit midwest shippers and importers by equalizing rates to and from other coastal areas, and offering these midwest companies a comparable alternative. The steamship companies lower their rates and the inland carriers pick up the terminal charges, which consist of handling charges, wharfage charges and car loading or unloading charges. Overland Common Port (OCP) rates apply to cargo shipped from or consigned to the states of:- North Dakota, South Dakota, Nebraska, Colorado, New Mexico and all states east thereof. OCP rates in Canada apply to the provinces of:- Manitoba, Ontario and Quebec.

OVERLAND COMMON PORT SHIPMENT = ОТПРАВКА ЧЕРЕЗ ОБЫЧНЫЙ ПОРТ ДОСТАВКИ – Overland Common Port Shipment is a shipment to/from an inland location from/to a port.

OVER LANDED = ДОСТАВЛЕННЫЙ – (1) Over Landed:- cargo volume count more than originally shipped.

(2) Over Landed:- cargo taken beyond original port of discharge. / Груз, принятый после первоначального порта разгрузки.

OVERLAP = НАХЛЁСТКА (или ПЕРЕКРЫШКА, или ПЕРЕКРЫТИЕ) – Overlap:- that thread portion in a warp-knitted fabric that is placed over the needle during loop formation. Printing defect. Overlap is a portion of a shingle, shake, or tile that is covered by the succeeding course and that is not exposed to weathering. Overlap:- part of a garment construction that is designed to extend over another part to hide a fastening. Overlap of a single-breasted jacket. Overlap or Overprinting:- alteration patterns at Sullivan are complicated by a postore overprinting by an albite-chlorite-pyrite alteration that is most extensively developed in the hanging wall of the deposit. Complex, irregular ore and alteration patterns are due, in part, to the superposition or overlap of mineral and alteration zones of different ages. / Частично покрывать; заходить один за другой; перекрывать.

OVERLAP PALLET = УПРОЧНЁННЫЙ ПОДДОН – Overlap Pallet is a flat pallet with bottom deck components layered one on top of another. / Упрочнённый Поддон:- плоский поддон, детали нижнего настила которого накладывают сверху на другие детали поддона для обеспечения дополнительной прочности.

OVERLAPPING OF COLORS IN A PRINT = НАХЛЁСТКА (или ПЕРЕКРЫТИЕ, или НАКЛАД, или ПЕРЕКРЫША, или ЗАХОЖДЕНИЕ ОДИН ЗА ДРУГОЙ) ЦВЕТОВ В НАБИВНОМ РИСУНКЕ – Overlapping Of Colors In A Print:- Possible Cause:- poor registration of screens. In this case the defect is minor as the character is recognizable and when viewed from a distance the registration problem doesn't seem too obvious. However, depending on the severity and end use the defect can be major or minor. Printing defect.

OVERLAY = ВЕРХНИЙ СЛОЙ (или НАРУЖНЫЙ СЛОЙ) – Overlay is a thin layer of paper, plastic, film, metal foil, or other material bonded to one or both faces of panel products, or to lumber, to provide a protective or decorative face, or a base for painting. / Тонкий слой бумаги, пластика, плёнки, металлической фольги или иного материала, .

OVERLENGTH = ПРИПУСК (ПО ДЛИНЕ) – Overlength (adjective):- longer than is standard or (context: transportation legal of a vehicle) longer than is allowed. See also Overcut. Overlength (noun):- an excessiveness of length.

OVERLENGTH CARGO = ДЛИННОМЕРНЫЙ ГРУЗ – Overlength Cargo is a cargo exceeding the standard length (of a flatrack/ATD).

OVERLOAD = ПЕРЕГРУЗКА – Overload:- operation of electrical equipment above its normal full-load rating or of a conductor above its rated ampacity. An overload condition will eventually cause dangerous overheating and damage.

OVERNIGHT = ОДНОДНЕВНЫЙ РАСЧЁТ (или ОВЕРНАЙТ) – Overnight:- foreign exchange swap from the contract day to the following working day, i.e. for one day (weekends for 3 days). / , то есть .

OVERNIGHT MONEY = ОДНОДНЕВНЫЕ ДЕНЬГИ (или ОДНОДНЕВНЫЙ РАСЧЁТНЫЙ КРЕДИТ, или КРЕДИТ ОВЕРНАЙТ) – Overnight Money:- interbank credit repayable on the following day. / Межбанковский кредит, погашаемый на следующий день.

OVERNIGHT OVERDRAFT = ОДНОДНЕВНЫЙ ОВЕРДРАФТ – Overnight Overdraft:- daylight overdrafts that have not been extinguished prior to the close of the business day.

OVERNIGHT REPURCHASE AGREEMENT RATE = СТАВКА ПО ОДНОДНЕВНЫМ СОГЛАШЕНИЯМ ОБ ОТКУПЕ (или СТАВКА ПРЯМОГО РИПО НА ДЕНЬ) – The Overnight Rate is the interest rate at which financial institutions borrow and lend one-day funds to each other. Overnight Repurchase Agreement Rate means the interest rate calculated by the Federal Reserve Bank of New York from the volume-weighted average overnight rate paid to finance general collateral securities compiled by the Federal Reserve Bank of New York and published weekly by the Board of Governors of the Federal Reserve System. See also Treasury Tax And Loan Rate. / Ставка Выкупа Овернайт со сроком до начала следующего рабочего дня – ставка финансирования дилера для продажи и откупа ценных бумаг со сроком исполнения поручения до начала следующего рабочего дня.

OVERNIGHT TRADE = ТОРГОВЛЯ ОВЕРНАЙТ (или СДЕЛКА С ПЕРЕНОСОМ НА СЛЕДУЮЩИЙ ДЕНЬ) – Overnight Trade is a trade which is not liquidated during the same trading session during which it was established. Overnight Trade is the buying or selling of currencies between 9 pm and 8 am local time. This type of financial transaction occurs when an investor takes a position at the end of the trading day in a foreign market that will be open while the local market is closed. The trade will be executed sometime that evening or early morning.

OVERPACK = ПЕРЕУПАКОВЫВАНИЕ – Overpack:- a unit used by a single shipper to contain one or more packages and to form one handling unit for convenience of handling and stowage. Dangerous goods packages contained in the overpack must be properly packed, marked, labelled and in proper condition as required by the Regulations regarding dangerous goods (aircargo). / В перевозках авиационных грузов .

OVERPLAID = ХХ – Overplaid is a fabric with an over-plaid design, namely a textile design consisting of a plaid pattern superimposed on another plaid or on a textured ground.

OVER PROFILE = ПЕРЕБОР – Over Profile:- a stowage condition in which more containers are aboard vessel than the vessel was designed to carry.

OVER–RAISED = ПЕРЕВОРСОВАННОЕ – Over-Raised:- excessive surface nap that may or may not be accompanied by damage to the ground structure. Note:- this defect is caused by the incorrect setting of the raising machine or irregular feed of the fabric. / Избыточное Ворсование (over-raised):- порок ткани; чрезмерный поверхностный ворс, который может сопровождаться повреждением структуры основания. Примечание:- этот порок вызван неправильной регулировкой ворсовальной машины или неправильной подачей ткани.

OVERRIDING COMMISSION = СУПЕРКОМИССИЯ (или ОСНОВНАЯ КОМИССИЯ, или ПЕРВОСТЕПЕННАЯ КОМИССИЯ) – Overriding Commission is a commission that is paid by a reinsurer to the reassured to cover the latter's overheads in administering the reinsurance.

OVERSEAS BUSINESS REPORTS = ОТЧЁТЫ О ЗАРУБЕЖНОМ БИЗНЕСЕ – In the United States, Overseas Business Reports are marketing studies of America's major trading partners which provide updated export and economic outlooks, industrial trends, trade regulations, distribution and sales channels, transportation, and credit situation in individual countries.

OVERSEAS PRIVATE INVESTMENT CORPORATION = КОРПОРАЦИЯ ЗАРУБЕЖНЫХ ЧАСТНЫХ КАПИТАЛОВЛОЖЕНИЙ (или КОРПОРАЦИЯ ЗАРУБЕЖНЫХ ЧАСТНЫХ ИНВЕСТИЦИЙ) – The Overseas Private Investment Corporation (OPIC) is America's development finance institution, solving critical world challenges by delivering finance innovations that help ambitious US businesses successfully enter, grow and compete in emerging markets. Established as an agency of the US Government in 1971, OPIC enables US businesses to create revenues, jobs and growth opportunities at home and abroad. OPIC helps secure America's competitive foothold in pivotal developing economies, brings stability to unstable regions, and paves the way for US private capital to help solve our world's most urgent challenges. It does so by providing innovative financial solutions, including debt financing, political risk insurance, and by supporting private equity investment funds. OPIC operates on a self-sustaining basis at no net cost to American taxpayers. In fact, in fiscal year 2010, OPIC generated a positive net contribution to the federal budget of USD352 million. This represented the 33rd consecutive year that OPIC has made a contribution to the budget. Mobilizing the US private sector to advance US foreign policy and development initiatives, OPIC services are available for new and expanding business enterprises in more than 150 countries worldwide. OPIC also promotes US best practices by requiring projects to adhere to international standards on the environment and worker and human rights. The Overseas Private Investment Corporation's (OPIC) mission is to solve critical world challenges by catalyzing markets in developing nations. OPIC accomplishes its mission by delivering finance innovations that help ambitious US businesses successfully enter, grow and compete in emerging markets. In accomplishing its mission, OPIC will promote positive US effects and host country developmental effects. OPIC will assure that the projects it supports are consistent with sound environmental and worker rights standards. In conducting its programs, OPIC will also take into account guidance from the Administration and Congress on a country's observance of, and respect for, human rights. In accomplishing its mission, OPIC will operate on a self-sustaining basis. OPIC supports US investment in emerging markets worldwide, fostering development & the growth of free markets. Overseas Private Investment Corporation (OPIC) is a government corporation which assists US private investments in less developed nations. These investments may include distributorships owned by US manufacturers which are consistent with the economic interests of both the United States and the developing country involved. Headquartered in Washington, DC, the United States.

OVERSHIRT = ВЕРХНЯЯ СОРОЧКА–БЛУЗОН – Overshirt is a shirt usually worn over another shirt without being tucked in.

OVERSHOE = БОТ (или БОТИК, или ГАЛОША) – Overshoe:- an outer shoe, especially a galosh.

OVER, SHORT AND DAMAGED = В ИЗЛИШКЕ, С НЕДОСТАЧЕЙ И ПОВРЕЖДЕНО – Over, Short and Damaged (OS & D) is a term used to describe a shipment that has been damaged or lost in transit or that arrives with more containers than originally shipped. A term Over, Short and Damage (OS & D) refers to the condition of a load of product which arrives in a defective condition, or whose quantity does not match the bill of lading (cases over or short).

OVERSHOT = ПОДНЫРОК – Overshot is a pattern or weave featuring filling floats which pass two or more warp yarns before reentering the fabric. See also Float. Fabrics defect. Defect Name:- Overshot. Defect Type:- weft lines, horizontal lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Overshot:- This is the result of a shuttle being deflected from its normal path of flight so that it breaks completely from the shed, leaving the filling floating on the surface of the fabric. This is caused by incorrect settings of those parts of the loom that influence the path and launching of the shuttle. Severity:- Major. / уточина. Поднырки – порок ткани. Поднырки не более 5 сантиметров (см). Размер порока – до 1 см. Под Поднырками понимается дефект суровой ткани, когда уточные нити на коротких участках не переплетаются с основными, а выступают в виде скобочек или петель сверху или снизу полотна; причины – нечистый зев, несвоевременный ввод уточной нити в зев, провисание нитей основы, излишне высокое или низкое расположение шпаруток и другое.

OVERSKIRT = ВЕРХНЯЯ ЮБКА (или ТЮНИК) – Overskirt is a skirt worn over another skirt.

OVERSOLD = ПЕРЕПРОДАННОСТЬ (или КУЛЬМИНАЦИЯ ПРОДАЖ) – Oversold:- a market which has fallen too far and too fast under excessive selling pressure and is expected to move back to a higher, more neutral level. A technical opinion that the market price has declined too steeply and too fast in relation to underlying fundamental factors. Rank and file traders who were bearish and short have turned bullish. Oversold:- a technical condition that occurs when prices are considered too low and ripe for a rally. Oversold conditions can be classified by analyzing the chart pattern or with indicators such as the Relative Strength Index (RSI) and Stochastic Oscillator. For example, a sharp decline from 30 to 15 in 2 weeks might lead a technician to believe that a security is oversold; or, a security is sometimes considered oversold when the RSI is less than 30 and when the Stochastic Oscillator is less than 20. It is important to keep in mind that oversold is not necessarily the same as being bullish. It merely infers that the security has fallen to far too fast and may be due for a reaction rally. A single asset or a market which, it is believed, has declined to an unreasonable level. A technical opinion about the level of prices. Some indicators will signal when prices are thought to be oversold. A technical opinion that the market price or an asset price has declined too steeply and too fast in relation to underlying fundamental factors. A technical opinion about the market that recent price action has carried too far in one direction, and that a minor reversal or retracement is

necessary to get the market back into a technical equilibrium state. A market that has had a sharp upturn. Rank-and-file traders who were bearish and short earlier have turned bullish. Oversold is a condition in which prices are believed to have declined too far or too rapidly. Can be measured by the Relative Strength Index. / Состояние рынка в предверии резкого повышения цен. Рядовые торговцы, бывшие до сей поры медведями и продавцами, становятся быками и покупателями.

OVERSPRAYING = ЧРЕЗМЕРНОЕ ОПРЫСКИВАНИЕ (или ХХ) – Overspraying is a term sometimes used to describe the application, by spraying, of a fiber lubricant to staple fibers during opening and blending. / – термин, используемый иногда для описания внесения, опрыскиванием (или разбрызгиванием), волокновой смазки в штапельные волокна в процессе вскрытия и смешивания.

OVERSPUN = СПРЯДЕННАЯ ОЧЕНЬ ВЫСОКИМ НОМЕРОМ – Overspun:- xxxxx. See also Collapse. Overspun Yarn is the yard which has received too much twist in places, thereby causes thin lengths in it. It is usually caused by spinning to counts too high for the quality of the raw material. Sometimes called Twitty Yarn. / Пряжа, спряденная очень высоким номером, не соответствующим качества волокна.

OVER–STOW = ПЕРЕГРУЗ – Over-Stow:- to increase the profile of a vessel from normal carrying capacity.

OVERSUBSCRIBED ISSUE = ВЫПУСК С ПРЕВЫШЕНИЕМ ЛИМИТА ПОДПИСКИ (или ЭМИССИЯ С ЧРЕЗМЕРНЫМ СПРОСОМ НА ПОДПИСКУ) – Oversubscribed Issue:- investors are not able to buy all the shares or bonds they want, so underwriters must allocate the shares or bonds among investors. This occurs when a new issue is underpriced or in great demand because of growth prospects. Oversubscribed Issue is an issue is said to be oversubscribed if orders to acquire newly issued securities exceed the number of securities offered for subscription (for purchase). In this case the underwriting banks must adjust (= scale down) customer demand accordingly.

OVERSUBSCRIPTION = ПРЕВЫШЕНИЕ ЛИМИТА ПОДПИСКИ (или ЧРЕЗМЕРНЫЙ СПРОС НА ПОДПИСКУ) – Oversubscription is a situation in which investors show so much interest in a new issue of a security that demand exceeds supply. Before a new issue, underwriters canvass potential investors, who may or may not book an order to buy a portion the new issue. If investors order more shares than there are shares being issued, the security is said to be oversubscribed. This may affect the price when the security is actually issued. Oversubscription:- an oversubscription of shares on an IPO means that there was much more demand than supply of shares on an initial offering. Oversubscription:- when a new issue of securities is made and the demand for the securities exceeds the number on offer, the issue is said to be oversubscribed. The situation is often remedies by a ballot. See also Allocation, Ballot, and Stagging. / В тех случаях, когда новая эмиссия ценных бумаг произведена, а спрос на данные ценные бумаги превышает количество предложенных офертой, об этой эмиссии говорят, что она превысила лимит подписки или что у неё чрезмерный спрос на подписку. Такая ситуация часто исправляется жеребьёвкой. Смотрите также Размещение (Allocation), Жеребьёвка (Ballot), и Раскрутка (Stagging).

OVERTAKING = ПОПУТНОЕ (или ОБГОНЯЮЩЕЕ) – Overtaking (maritime term):- said of a vessel when she is passing or overtaking another vessel.

OVER–THE–COUNTER = ВНЕУЧЁТНОЕ – (1) Over-The-Counter (OTC) is a figurative term for the means of trading securities that are not listed on an organized stock exchange such as the New York Stock Exchange (NYSE®), as in OTC margin bonds. Over-the-counter trading is done by broker-dealers who communicate by telephone and computer networks. Something that is legal, above board. Securities trading outside the regular exchange session. At the Swiss Exchange, trades not executed via the exchange system matcher. Off-exchange trades also have to be reported. Also known as Off-Exchange. Over-the-counter trading is done by broker-dealers who communicate by telephone and computer networks. Over The Counter (OTC), also known as Off-Exchange trading, is trading financial instruments such as stocks, bonds, or commodities directly between two parties. OTC contracts are bilateral contracts in which two parties agree on how a particular trade or agreement is to be settled in the future as opposed to exchange traded contracts, which take place in a location established for the purpose of trading such as commodity futures exchanges or stock exchanges. Forwards and swaps are main examples of such contracts. Products traded by this method include iron ore swaps at the NYMEX®; natural gas, electricity, crude oil and refined products, and iron ore at the ICE. Over-The-Counter (OTC) is a method of trading that does not involve an exchange. In over-the-counter markets, participants trade directly with each other, typically by telephone or computer links. Transactions that are quoted and conducted between parties on a principal-to-principal basis as opposed to being traded via a broker on an exchange. Over-The-Counter (OTC):- describes security dealings outside a recognised stock exchange for example the purchase of a derivative from a bank. / Известен также как Внебиржевой (Off-Exchange). / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). НАЙМЭКС® (NYMEX®). Внеучётный:- (1) Ценные бумаги, не котирующиеся на бирже, торговля которыми ведётся на внебиржевом рынке. (2) Рынок, на котором операции с ценными бумагами осуществляются по телефону и через компьютерную сеть, соединяющую дилеров, ведущих операции с акциями и облигациями не в торговом зале биржи. Внеучётными акциями традиционно являются акции более мелких компаний, которые не удовлетворяют требованиям котировки на бирже (listing requirements) Нью Йоркской и Американской фондовых бирж (New York Stock Exchange, American Stock Exchange). В последние годы, однако, многие компании, удовлетворяющие требованиям котировки на бирже, предпочли остаться в рамках внеучётной торговли, поскольку они считают, что многократные торговые операции, производимые большим числом дилеров, являются более предпочтительными, чем централизованный подход в отношении торгов, характерных для Нью Йоркской Фондовой Биржи, когда все торговые операции с некоторой акцией должны проходить через ‘специалиста’ (specialist) по этим акциям. Правила внебиржевых торговых операций с акциями введены в действие Национальной Ассоциацией Дилеров по Ценным Бумагам (National Association of Securities Dealers (NASD)) – саморегулируемой организацией. Цены на внеучётные акции публикуются в ежедневных газетах, где акции Системы Национального Рынка (National Market System) даются отдельно от других акций внебиржевого рынка. Остальная часть внеучётного рынка включает рынок государственных и муниципальных облигаций.

(2) Over-The-Counter (OTC) is a term that usually refers to direct sales to a retail customer in a store, as opposed to wholesale marketing.

OVER–THE–COUNTER DERIVATIVES = ВНЕУЧЁТНЫЕ ПРОИЗВОДНЫЕ ИНСТРУМЕНТЫ (или ВНЕУЧЁТНЫЕ ДЕРИВАТИВЫ) – Over-The-Counter Derivatives are privately negotiated contracts that are traded directly between two parties, rather than on a centralized exchange. Some of the most common derivatives to be traded in the OTC market include swaps, forward rate agreements, and exotic options. The self-regulatory trade organization that oversees the over-the-counter derivatives market is the International Swaps and Derivatives Association (ISDA). Over-The-Counter (OTC) Derivatives:- these financial instruments (derivatives) are non-standardized and are not traded on an exchange, but are traded directly between market participants (over the counter).

OVER–THE–COUNTER MARGIN BOND = ВНЕУЧЁТНАЯ МАРЖИНАЛЬНАЯ ОБЛИГАЦИЯ – In the United States, Over-The-Counter (OTC) Margin Bond is a debt security not traded on the national securities exchange, which meets certain Regulation T requirements as to size of original offering, available information and status of interest payments.

OVER–THE–COUNTER MARKET = ВНЕУЧЁТНЫЙ РЫНОК – The Over-The-Counter Market (OTC Market) is a non-exchange trading market or unofficial market for equities and bonds. It is not based in specific location and does not have fixed trading hours. Negotiations usually take place using computer or telephone systems at the international level. The price for a security is negotiated between banks and brokage firms or securities services providers and institutional investors. In this context, the transactions are subject to the applicable statutory provisions for trading in securities. In the United Kingdom, Over-The-Counter Transactions are conducted between two private parties and specifications can be customized, although they generally reflect industry standards. The exchange has eliminated one of the key concerns over doing business in the over-the-counter (OTC) market – counterparty credit risk – by offering its clearing services for deals transacted off-exchange. This allows buyers and sellers to negotiate the price with trading partners of their choice with the full security of the exchange clearinghouse behind them. Additionally, margin requirements for cleared OTC transactions are netted against other cleared positions on the exchange, including futures and short options positions, reducing costs and improving cash flow. The Over-The-Counter Market (OTC Market) is a common term utilized to describe the market for shares that are not traded on any of the US Exchanges. Regulated by the NASD, the OTC market is comprised of a network of broker/dealers who complete transactions via telephone or computer rather than in a centralized marketplace. The OTC brokers are usually referred to as 'Market-Makers' for the particular security they are transacting. A number of OTC issuers are listed in the 'pink sheets' (a weekly NASD publication covering OTC securities and their market-makers) and/or the 'Electronic Bulletin Board', an on-line version of the pink sheets for companies registered under the 1934 Exchange Act. A securities market that is not geographically centralized like the trading floor of the New York Stock Exchange. Over The Counter (OTC) securities are traded through a telephone and computer network. The Over-The-Counter Market (OTC Market) is a market for securities that are not traded on any organized stock exchange, and for some listed securities traded off the exchange. These include most corporate, municipal and government bonds; almost all new stock issues; shares in mutual funds; and the securities traded on the nationwide electronic National Association Of Securities Dealers Automated Quotations (NASDAQ®) system. The Over-The-Counter (OTC) market has no physical location, and securities are quoted and sold by telephone on computer by market makers, rather than being sold by public auction on the exchanges. The trading of commodities, contracts, or other instruments not listed on any exchange. OTC transactions can occur electronically or over the telephone. Also known as Off-Exchange Market. The Over-The-Counter Market (OTC Market) is a market for securities made up of dealers who may or may not be members of a securities exchange. The Over-The-Counter (OTC) market is conducted over the telephone and deals mainly with stocks of companies without sufficient shares, stockholders or earnings to warrant listing on an exchange. OTC firms may act either as principals or dealers (buying or selling stock from either own inventory and charging a markup) or as a broker or agent and charging a commission. A market where products such as securities, foreign currencies, custom-tailored contracts and other cash items are bought and sold by telephone and other electronic means of communication rather than on a designated futures exchange. / Внеучётный Рынок. Он потому и называется так, поскольку не учитывается никакими надзорными органами. в системе (НЭЗДЭК® (NASDAQ®)). Внеучётный рынок не имеет физического местоположения, а ценные бумаги котируются и продаются с помощью телефонной связи на компьютерах у создателей рынка, а не посредством публичного аукциона, как это происходит на биржах. Торговля различными родами сырья, контрактами или иными инструментами, не котируемыми на каких-либо биржах. Внеучётные операции могут проводиться как электронным образом, так и при помощи телефонной связи. Известен также как Внебиржевой Рынок (Off-Exchange Market). Рынок ценных бумаг, формируемый дилерами, которые могут или не могут быть членами фондовой биржи. Внеучётный рынок или, так называемый О.Ти.Си. (OTC) по общепринятому Англоязычному сокращению от самого названия на Английском языке, держится на телефонной связи, а сделки главным образом с акциями компаний без подходящих акций, дольщиков или заработков, которые используются в виде гарантий при котировании на бирже. Фирмы внеучётного рынка могут действовать либо как принципалы, либо как дилеры (покупающие или продающие акции либо из каких-то собственных запасов и взимая накидку к цене) или как брокеры или агенты, взимающие за свои услуги комиссию. Рынок, на котором инструменты, такие как ценные бумаги, иностранные валюты, спецификационные контракты и иные наличные изделия покупаются и продаются посредством телефонного и иного электронного средства связи нежели как на определённой бирже фьючерсов. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

OVER–THE–COUNTER OPTION = ВНЕУЧЁТНЫЙ ОПЦИОН – Over The Counter (OTC) Options are not traded on recognized future exchanges but between organizations acting as principals, or between a bank and its client.

OVER–THE–COUNTER STOCKS = ВНЕУЧЁТНЫЕ АКЦИИ – Over the Counter (OTC) Stocks are the stocks which do not trade on a recognized stock exchange, trade in one of several so-called over-the-counter markets. It is a somewhat less formal, more risky way to trade stocks. There are no 'listing' rules. OTC markets can be highly manipulated. But, they do serve a purpose, i.e. allowing investors to trade and get liquidity. In the USA, the common OTC market is called the OTC-BB (BB = Bulletin Board, see http://www.otcbb.com), and in Canada it is called the CDN. Note the OTC-BB market has nothing to do with the NASDAQ® market, although many people incorrectly make that association. The OTC markets are usually on-line electronic markets which investment dealers (brokers) can access for purposes of posting buy or sell orders. / НЭЗДЭК® (NASDAQ®) .

OVER–THE–COUNTER TRADING = ВНЕУЧЁТНАЯ ТОРГОВЛЯ – Over-The-Counter (OTC) Trading:- direct conclusion of a securities transaction between two parties without the intermediation of a stock exchange. The reasons for such trading may be the stock exchange's hours of business (pre-market trading and after-hours trading) or the fact that a security is not admitted to trading on an official or regulated market or to regulated unofficial trading.

OVER THE ROAD CARRIER = АВТОДОРОЖНЫЙ ПЕРЕВОЗЧИК (или НАЗЕМНЫЙ ПЕРЕВОЗЧИК) – Over The Road Carrier is a truck or trailer used in hauling freight by road to destinations outside a 70 mile radius of the logistics depot facility.

OVER THE ROAD LIMITATIONS = ОГРАНИЧЕНИЯ ДЛЯ ТРАНСПОРТИРОВКИ ПО АВТОДОРОГАМ – Over The Road Limitations:- state or country regulations for weight limits allowed per container/truckload.

OVER–THE–TOP APPLICATION = НАДВЕРХУШЕЧНОЕ ПРИМЕНЕНИЕ – Over-the-Top Application is a broadcast or banded application applied over the canopy of crops.

OVERTIME = ПЕРЕРАБОТКА (или СВЕРХУРОЧНАЯ РАБОТА) – Overtime:- work extending beyond normal established working hours usually compensated by a premium to be paid to the employees concerned. / Работа, выполнение которой выходит за рамки нормальных утверждённых часов работы (рабочего времени) и компенсируемая обычно премией, которая должна быть выплачена соответствующим работникам.

OVERTONNAGING = ИЗОБИЛИЕ ТОННАЖА (или ИЗБЫТОЧНЫЙ ТОННАЖ) – Overtonnaging is a situation where there are too many ships generally or in a particular trade for the level of available cargoes.

OVERWIDTH CARGO = СВЕРХШИРОКИЙ ГРУЗ – Overwidth Cargo is a cargo exceeding the standard width (of a flatrack/ATD). / Груз, превышающий стандартную ширину (контейнера на базе платформы (flatrack)/искусственного твиндека (artificial tween deck, сокращённо – ATD)).

OVERWRITE = ПЕРЕБРАТЬ С ВЫПИСКОЙ – Overwrite:- the writing of more options than one expects to have exercised. Call options are overwritten because the writer considers the underlying overvalued. Put options are overwritten because the underlying is considered undervalued.

OVERWRITING = ПЕРЕБОР С ВЫПИСКОЙ – Overwriting:- where a syndicate exceeds its allocated capacity. Depending on the scale of the problem the managing agent of the syndicate may be required to cease underwriting some or all new business and the members may be required to make available additional funds at Lloyd's to cover the overwriting.

OVERWRITING VIRUSES = ПЕРЕПИСЫВАЮЩИЕ ВИРУСЫ – Overwriting Viruses are the simplest forms of infection. The original code is deleted and replaced by new, malicious code. When the substituted file is executed the virus can try to replicate again. Because overwriting viruses delete the original file either in whole or in part, it is not possible to disinfect them. They must be restored from a backup, instead. While overwriting viruses of this type were mostly restricted to the MS-DOS era, we do see malware nowadays that replaces system files (and may include some of the original file's functionality) but also runs undesirable processes. See also Virus.

OVICIDE = ОВИЦИД – Ovicide is a material that kills the egg stage of an organism. / Под Овицидом, от Латинских слов Ovum, означающее Яйцо, и Caedo, означающее Убиваю, понимается химическое вещество, убивающее яйца насекомых и клещей.

OVIPOSIT = ОТКЛАДЫВАТЬ ЯЙЦА (или КЛАСТЬ ЯЙЦА) – Oviposit:- in insects, to lay or deposit eggs.

OVIPOSITION = ЯЙЦЕКЛАДКА (или КЛАДКА ЯИЦ) – Oviposition is the way in which an insect deposits eggs.

OVIPOSITION CAGE = КЛЕТКА ДЛЯ ЯЙЦЕКЛАДКИ (или КЛЕТКА ДЛЯ КЛАДКИ ЯИЦ) – Oviposition Cage is a cage where an insect lays eggs on plants or other materials.

OVOID = ОВОИДНОЕ (или ЯЙЦЕВИДНОЕ) – Ovoid:- a structure with a circular cross section (i.e. not flattened as in ovate) having an outline in the shape of an egg, with the stalk or point of attachment at the large end. Ovoid:- ovate or oval solid. / яйцевое или овальное твёрдое тело. В ботанике под Овоидным, от Латинского слова Ovum, означающее Яйцо, или Яйцевидным понимается .

OVULE = СЕМЯПОЧКА (или СЕМЯЗАЧАТОК) – Ovule:- the outgrowth in a seed- plant's ovary that develops into a seed following fertilization of the egg cell within it. The fertilized egg cell forms a group of cells that becomes an embryo consisting of an axis, (root and stem, or hypocotyl and epicotyl) and in Cactaceae two cotyledons, with its associated protective and nutritive structures capable of developing into a plant. Ovule is a minute structure which, after fertilization, becomes a plant seed. The immature seeds before fertilization. / и в Кактусовых (Cactaceae) два котиледона (две семядоли). ось (axis), (корень и стебель, или гипокотиль (подсемядольное колено). Семяпочка или Семязачаток – многоклеточное образование у семенных растений, из которого развивается семя. Основные части семяпочки – нуцеллус, интегумент (или интегументы) и семяножка. Нуцеллус возникает в типичных случаях в виде бугорка из клеток плаценты мегаспорофилла (плодолистика). Интегумент закладывается в виде кольцевого валика в основании нуцеллуса и обрастает развивающийся нуцеллус, оставляя над его вершиной узкий канал – Микропиле, или Пыльцевход, под которым у большинства голосеменных находится пыльцевая камера. Семяножка (фуникулус) соединяет семяпочку с плацентой. Базальную часть семяпочки, от которой отходит семяножка, называют Халазой. Согласно наиболее распространённой так называемой синангиальной гипотезе, интегумент возник в результате срастания стерилизовавшихся мегаспорангиев, окружавших нуцеллус; следовательно, семяпочка – это мегасинангий (группа сросшихся спорангиев), в котором фертилен лишь центральный спорангий. Эту гипотезу подтверждает строение примитивных семяпочек многих ныне вымерших семенных Папоротников, имевших сегментированные интегументы с проводящим пучком в каждом сегменте и свободными концами сегментов в области пыльцевой камеры; типичного микропиле здесь ещё не было. Обычно одна из клеток нуцеллуса, разрастаясь, становится археспориальной, образующей после мейоза линейную тетраду мегаспор; как правило, 3 микропилярные споры отмирают, а халазальная даёт начало женскому гаметофиту – первичному эндосперму голосеменных или зародышевому мешку покрытосеменных, остающемуся внутри нуцеллуса. После опыления, то есть попадания мужских гаметофитов (пыльцевых зёрен) в пыльцевход семяпочки у голосеменных или на рыльце пестика у покрытосеменных, становятся возможными оплодотворение, развитие из зиготы зародыша и превращение семяпочки в семя. При этом семяпочка голосеменных обеспечивают завершение развития находящихся в пыльцевых камерах мужских гаметофитов (образование гамет), снабжая их питательными веществами через гаустории, внедряющиеся в нуцеллус. У хвойных и оболочкосеменных по гаусториям, дорастающим до женских заростков (таким образом представляющим собой пыльцевые трубки), проходят мужские гаметы (спермии). У покрытосеменных пыльцевые трубки через рыльце и столбик проникают в полость завязи и затем (обычно через микропиле) в семяпочку, доставляя туда спермии, которые образовались в пыльцевых зёрнах либо ещё до опыления (у растений с так называемой трёхклеточной пыльцой), либо после него, при делении спермиогенных клеток в пыльцевых трубках (если пыльца двухклеточная). Для голосеменных характерны прямые (атропные) и обращённые (анатропные) семяпочки, а также промежуточные их формы. Самые примитивные семяпочки обнаружены у семенных Папоротников (карбон). У некоторых из них, например, у калимматотеки, семяпочка снаружи защищена чашеобразной купулой, возникшей, вероятно, из сегментов спорофилла. Зародыши в семяпочках этих растений не найдены, так как, по-видимому, семяпочки опадали вскоре после опыления, а зародыши развивались без периода покоя, который характерен для семян настоящих семенных растений; следовательно, семенным Папоротникам была свойственна лишь 'семязачатковость'. Семязачатковыми можно считать и кордаитовые, а из ныне живущих – некоторые Хвойные (например, Подокарп), отчасти Саговники, зародыши которых завершают развитие в уже опавших семяпочек, и Гинкго, у которого зародыш может дозревать как на материнском растении, так и после опадения семяпочки. Наружный слой трёхслойного интегумента саговников, возможно, гомологичен купуле семенных Папоротников. Купулу имели и семяпочки некоторых Беннеттитовых. У некоторых Хвойных семяпочки погружены в ткани семенных чешуй и срастаются с ними (араукария), у других они срастаются с видоизменёнными семенными чешуями – так называемыми эпиматиями (подокарп, цефалотаксус) или кровельками (некоторые Тиссовые). У покрытосеменных семяпочки мельче, чем у голосеменных, и имеют относительно тонкие интегументы, так как семяпочки развиваются внутри завязи под защитой сросшихся мегаспорофиллов (плодолистиков). Они имеют либо 2 интегумента (большинство однодольных и свободнолепестных двудольных), либо 1 (большинство спайнолепестных двудольных); у некоторых растений семяпочки интегументов не имеют. При морфологической классификации семяпочек учитывают положение микропиле и продольной оси нуцеллуса по отношению к фуникулусу и

устанавливают 5 основных типов семяпочек и ряд производных. Наиболее обычны для покрытосеменных анатропные семяпочки, у которых микропиле обращено к плаценте, что благоприятно для проникновения внутрь семяпочки пыльцевой трубки. В так называемых крассинуцеллятных семяпочках археспориальная клетка отделена несколькими слоями клеток нуцеллуса от его эпидермиса, в тенуинуцеллятных она обычно прилежит к нему; у некоторых (например, у представителей сложноцветных, Грушанковых, Орхидных) и этот эпидермальный слой нуцеллуса недолговечен. У немногих Ремнецветниковых и Баланофоровых семяпочки морфологически не выражены – мегаспоры и женские гаметофиты развиваются в клетках плаценты. Под Семяпочкой или Семязачатком у семенных растений понимается образование, из которого (обычно после оплодотворения) развивается семя. У покрытосеменных растений семяпочка расположена в полости завязи, у голосеменных – на поверхности семенных чешуек в шишках. В центральной части семяпочки (нуцеллусе, или мегаспорангии) формируются мегаспоры. Снаружи семяпочка прикреплена семяножкой к плаценте. Под Овуляцией, от позднелатинского слова Ovulum, означающее Яичко, понимается выход ооцита (яйца) из яичника в полость тела. У самок большинства позвоночных, а также у женщин овуляция происходит периодически; у некоторых млекопитающих, например, кошки, кролика, хорька – только в результате спаривания. Регулируется в основном гормонами гипофиза. Прекращается с наступлением беременности.

OVUM = ЯЙЦО – Ovum is a female reproductive cell. / Под Яйцом понимается то же, что яйцеклетка – женская половая клетка животных и растений, из которой может развиваться новый организм в результате оплодотворения или путём партеногенеза. Содержит гаплоидный (одинарный) набор хромосом. Яйцо – женская половая клетка человека, животных и растений (яйцеклетка), из которой развивается новый организм в результате оплодотворения или путём Партеногенеза. Яйцо человека и животных – высокоспециализированная клетка, содержащая запасы питательных веществ, необходимых для развития зародыша. Яйцо бывает, как правило, одето яйцевыми оболочками. Формирование яйца (Оогенез) обычно происходит в яичниках. У большинства животных яйцо имеет округлую или овальную форму, реже, например, у Насекомых, Головоногих Моллюсков, – удлинённую. У наиболее примитивных многоклеточных животных (Губки, некоторые Кишечнополостные) яйцо не имеет определённой формы и способно к амёбоидным движениям. Размеры яйца варьируют в зависимости от количества желтка в цитоплазме. Так, бедные желтком яйца плацентарных млекопитающих имеют диаметр (без оболочек) от 50 мкм (Полёвка) или 70 мкм (Крыса, Мышь) до 140–150 мкм (Летучая Мышь, Морская Свинка, Корова, Собака), максимально – 180 мкм (овца); диаметр яйца человека – 89–91 мкм. Сходные размеры имеют яйца многих беспозвоночных – Кишечнополостных, Червей, Иглокожих, Моллюсков. При накоплении больших запасов желтка яйца могут достигать крупных, иногда гигантских размеров:- яйца некоторых беспозвоночных имеют диаметр около 1.4 миллиметра (мм) (некоторые Моллюски, Иглокожие, Ракообразные), Утконоса – 4.3 мм, лососёвых рыб – 7–9 мм, акулообразных – 50–70 мм; очень велики также яйца некоторых птиц:- диаметр собственно яйца Курицы (без окружающей его белковой оболочки) свыше 30 мм, яйца Страуса – 80 мм (при общей длине яйца в скорлупе 155 мм). Между величиной яйца и размерами тела взрослого организма нет чёткой зависимости; яйца человека и кролика имеют одинаковые размеры, у аквариумной рыбки Гуппи, при длине самки 5–6 мм, яйцо вдвое крупнее, чем у полутораметрового голубого тунца (диаметр яйца соответственно 2–2.1 и 1–1.1 мм). Обычно наблюдается обратная корреляция между числом яиц и их размерами. В частности, животные, охраняющие своё потомство, производят, как правило, немного крупных яиц, например, птицы откладывают от 1 (Пингвины, некоторые хищники) до 22 (Куропатка) яиц большого размера, Морские Сомики из Семейства Ariidae, вынашивающие яйца в ротовой полости, производят по 20–40 яиц диаметром 17–21 мм (самые крупные яйца, известные у костистых рыб). В то же время у рыб, вымётывающих икру в воду и не проявляющих заботы о потомстве, плодовитость очень велика:- многие Карповые, например, Вобла, Лещ, Карась, вымётывают до 300 тысяч, Сазан – до 1.5 миллионов и Треска – до 10 миллионов яиц диаметром менее 2 мм. У некоторых животных наблюдается полиморфизм яйца. В частности, у животных со сложным циклом размножения – Коловраток, Ветвистоусых Рачков, Тлей – наблюдается сезонный полиморфизм яйца, например у Дафний летом сменяется несколько поколений самок, производящих ‘летние’ яйца с малым количеством желтка и тонкой оболочкой, которые развиваются без оплодотворения; при наступлении неблагоприятных условий самки откладывают богатые желтком оплодотворённые ‘зимние’ яйца, заключённые в защитную оболочку, которые продолжают развиваться только после длительного периода покоя. У Коловраток известны 3 типа яиц:- диплоидные, дающие партеногенетическим путём самок; мелкие гаплоидные, развивающиеся в самцов; покоящиеся, или ‘зимние’, яйца, развивающиеся в самок после оплодотворения. Существует также половой диморфизм яйца:- у Бабочек, Ручейников, Пресмыкающихся, Птиц. Яйца, развивающиеся в самца и самку, различаются по половым хромосомам (женская гетерогаметия); при внешне различимом половом диморфизме (димегалии) у Коловраток, некоторых Червей крупные яйца дают самок, а мелкие – самцов. Зрелое яйцо обладает определённой организацией, которая проявляется в первую очередь в его полярности:- часто ядро располагается вблизи от бедного желтком (анимального) полюса, тогда как желточные включения концентрируются ближе к противоположному (вегетативному) полюсу. Кроме того, в яйцах многих животных обнаруживаются локальные различия, ярко выраженные у Моллюсков, Червей и Асцидий. У этих животных судьба разных областей яйца уже определена и при его разделении на части из них развиваются уродливые зародыши, у которых отсутствуют те или иные органы (мозаичные яйца). У других животных, в частности у иглокожих, организация яйца более лабильна:- при его разделении на части могут развиться несколько маленьких, но полноценных зародышей (регуляционные яйца). Раньше мозаичные и регуляционные яйца противопоставляли друг другу, однако различия между ними непринципиальные и обусловлены более или менее ранней дифференцировкой цитоплазмы. Поверхность яйца одета полупроницаемой эластичной плазматической мембраной, обладающей сократимостью. Поверхностный (кортикальный) слой цитоплазмы образует многочисленные выросты – микроворсинки. В этом слое у многих животных заключены особые тельца, содержимое которых богато мукополисахаридами; такие тельца диаметром от десятых долей мкм (кортикальные гранулы двустворчатых Моллюсков, Иглокожих, Млекопитающих) до 5–40 мкм (кортикальные альвеолы костистых рыб) располагаются в один или несколько рядов вблизи плазматической мембраны. При активации яйца их содержимое выделяется из цитоплазмы под оболочку. Недалеко от поверхности обычно лежат и пигментные гранулы. Постоянными компонентами цитоплазмы яйца, так же как и других клеток, являются митохондрии, комплексы Гольджи (которые у многих животных концентрируются на периферии яйца), эндоплазматическая сеть и рибосомы. Клеточный центр в яйцах большинства животных к концу оогенеза исчезает и лишь изредка (например, у некоторых Пиявок, Планарий и других) сохраняется, обнаруживаясь во время делений созревания. В остальных случаях после оплодотворения в яйце формируется новый клеточный центр – за счёт центриолей, вносимых сперматозоидом или, редко, путём новообразования. Специфическим компонентом цитоплазмы яйца являются желточные включения; различия в количестве желтка и его распределении у разных животных обусловливают разные типы дробления яйца. В цитоплазме содержится большой запас макромолекул (вся белок-синтезирующая система, включая информационную РНК и необходимые ферменты, а также ДНК-и РНК-полимеразы, негистоновые ядерные белки – тубулин и другие), которые используются только после активации яйца и на ранних стадиях развития зародыша. О Яйце растений смотрите в статье Яйцеклетка.

OW = OFFER WANTED

OWB = ON WEIGHT OF BATH

OWF = ON WEIGHT OF FIBER

OWG = ON WEIGHT OF GOODS

OWN–ACCOUNT PRODUCTION = ПРОИЗВОДСТВО ЗА СОБСТВЕННЫЙ СЧЁТ – Own-Account Production is a production of output for final consumption or gross fixed capital formation by the producer. Also known as Output For Own Final Use. / Известно также как Выработка Для Собственного Конечного Использования или Выпуск Для Собственного Конечного Использования (Output For Own Final Use).

OWN–ACCOUNT TRADING = ТОРГОВЛЯ ЗА СВОЙ СЧЁТ – Own-Account Trading:- all trades in securities, financial instruments, derivatives, foreign exchange and precious metals conducted by the bank in its own name and for its own account.

OWNER = СОБСТВЕННИК (или ХОЗЯИН) – (1) Owner is the legal owner of cargo, equipment or means of transport. The legal owner of cargo, equipment or vessels, trucks, etc. See also Holder. / Законный собственник (или хозяин) груза, оборудования или средств перевозки. Законный собственник (владелец) груза, оборудования, судов, грузовиков и тому подобного. Смотрите также Владелец или Держатель (Holder).

(2) Owner is a person in whose name a security is registered on the books of the Registrar or Depositary. Also referred to as a Registered Owner or Holder. / Лицо, на чьё имя ценная бумага зарегистрирована в книгах Регистратора или Депозитария. Относится также к Зарегистрированному Владельцу (Registered Owner) или Держателю (Holder).

(3) In cotton futures trading, Owner is a primary deliverer or receiver who holds ownership and control of the duplicate samples of bales that have been tendered or retendered on contract. / В торговле фьючерсами на хлопок Первичный Поставщик (Primary Deliverer) или Получатель (Receiver), который удерживает во владении и под контролем дубликатные образцы, взятые из кип, которые были поданы для участия в конкурсе первично или повторно по данным контрактам.

OWNER OPERATOR = ОПЕРАТОР СОБСТВЕННИК – Owner Operator is the independent trucker, usually moving trailers under the authority of a motor carrier. / Независимый дальнобойщик, перевозящий обычно прицепы по поручению автомобильного перевозчика.

OWNER'S BILL = КОНОСАМЕНТ СОБСТВЕННИКА (или КОНОСАМЕНТ СУДОВЛАДЕЛЬЦА) – Owner's Bill is a bill of lading by virtue of which the owner of a vessel is the contractual carrier. / Коносамент Собственника или Коносамент Судовладельца – коносамент, на основании которого владелец судна приходится перевозчиком по контракту (контрактным перевозчиком).

OWNERS' EQUITY = СРЕДСТВА СОБСТВЕННИКОВ (или ДОЛЯ СОБСТВЕННИКОВ, или КАПИТАЛ СОБСТВЕННИКОВ) – Owners' Equity:- the interest of shareholders or other owners in the assets of an entity. At any time, it is the cumulative net result of past transactions and other events and circumstances affecting the entity. In financial statements, owners' equity is shown as the recorded accountability of an entity to its owners. The characteristics of owner's equity are:- (i) it is a general interest in an entity's assets, not a claim to specific assets; (ii) its amount is affected by the entity's operations and other events as well as by owners' investments in the entity and the entity's distributions to owners; and (iii) it is the interest that, perhaps in varying degrees, bears the ultimate risks of entity failure and reaps the ultimate rewards of entity success.

OWNERSHIP = ВЛАДЕНИЕ – Ownership is ultimate and exclusive right (conferred by a lawful claim or title, and subject to certain restrictions) to enjoy, occupy, possess, rent, sell (fully or partially), use, give away, or even destroy an item of property. Ownership may be 'corporeal' (title to a tangible object such as a house) or 'incorporeal' (title to an intangible something, such as a copyright, or a right to recover debt). Possession (as in tenancy) does not necessarily mean ownership because it does not automatically transfer title. Ownership is the state or fact of exclusive rights and control over property, which may be an object, land/real estate or intellectual property. Ownership involves multiple rights, collectively referred to as title, which may be separated and held by different parties. The process and mechanics of ownership are fairly complex:- one can gain, transfer, and lose ownership of property in a number of ways. To acquire property one can purchase it with money, trade it for other property, win it in a bet, receive it as a gift, inherit it, find it, receive it as damages, earn it by doing work or performing services, make it, or homestead it. One can transfer or lose ownership of property by selling it for money, exchanging it for other property, giving it as a gift, misplacing it, or having it stripped from one's ownership through legal means such as eviction, foreclosure, seizure, or taking. Ownership is self-propagating in that the owner of any property will also own the economic benefits of that property. History:- Over the millennia and across cultures, notions regarding what constitutes 'property' and how it is treated culturally have varied widely. Ownership is the basis for many other concepts that form the foundations of ancient and modern societies such as money, trade, debt, bankruptcy, the criminality of theft, and private vs. public property. Ownership is the key building block in the development of the capitalist socio-economic system. Scottish economist, philosopher and author Adam Smith (1723–1790) stated that one of the sacred laws of justice was to guard a person's property and possessions. Types Of Owners:- In person:- Individuals may own property directly. In some societies only adult men may own property; in other societies (such as the Haudenosaunee), property is matrilinear and passed on from mother to the offspring. In most societies both men and women can own property with no restrictions and limitations at all. Structured Ownership Entities:- Throughout history, nations (or governments) and religious organizations have owned property. These entities exist primarily for other purposes than to own or operate property; hence, they may have no clear rules regarding the disposition of their property. To own and operate property, structures (often known today as legal entities) have been created in many societies throughout history. The differences in how they deal with members' rights is a key factor in determining their type. Each type has advantages and disadvantages derived from their means of recognizing or disregarding (rewarding or not) contributions of financial capital or personal effort. Cooperatives, corporations, trusts, partnerships, and condominium associations are only some of the many varied types of structured ownership; each type has many subtypes. Legal advantages or restrictions on various types of structured ownership have existed in many societies past and present. To govern how assets are to be used, shared, or treated, rules and regulations may be legally imposed or internally adopted or decreed. Liability For The Group Or For Others In The Group:- Ownership by definition does not necessarily imply a responsibility to others for actions regarding the property. A 'legal shield' is said to exist if the entity's legal liabilities do not get redistributed among the entity's owners or members. An application of this, to limit ownership risks, is to form a new entity to purchase, own and operate each property. Since the entity is separate and distinct from others, if a problem occurs which leads to a massive liability, the individual is protected from losing more than the value of that one property. Many other properties are protected, when owned by other distinct entities. In the loosest sense of group ownership, a lack of legal framework, rules and regulations may mean that group ownership of property places every member in a position of responsibility (liability) for the actions of each other member. A structured group duly constituted as an entity under law may still not protect members from being personally liable for each other's actions. Court decisions against the entity itself may give rise to unlimited personal liability for each and every member. An example of this situation is a

professional partnership (e.g., law practice) in some jurisdictions. Thus, being a partner or owner in a group may give little advantage in terms of share ownership while producing a lot of risk to the partner, owner or participant. Sharing Gains:- At the end of each financial year, accounting rules determine a surplus or profit, which may be retained inside the entity or distributed among owners according to the initial setup intent when the entity was created. For public corporations, common shareholders have no right to receive any of the profit. Entities with a member focus will give financial surplus back to members according to the volume of financial activity that the participating member generated for the entity. Examples of this are producer cooperatives, buyer cooperatives and participating whole life policyholders in both mutual and share-capital insurance companies. Entities with share voting rights that depend on financial capital distribute surplus among shareholders without regard to any other contribution to the entity. Depending on internal rules and regulations, certain classes of shares have the right to receive increases in financial 'dividends' while other classes do not. After many years the increase over time is substantial if the business is profitable. Examples of this are common shares and preferred shares in private or publicly listed share capital corporations. Entities with a focus on providing service in perpetuam do not distribute financial surplus; they must retain it. It will then serve as a cushion against losses or as a means to finance growth activities. Examples of this are not-for-profit entities:- they are allowed to make profits, but are not permitted to give any of it back to members except by way of discounts in the future on new transactions. Depending on the charter at the foundation of the entity, and depending on the legal framework under which the entity was created, the form of ownership is determined once and for all time. To change it requires significant work in terms of communicating with stakeholders (member-owners, governments, etc) and acquiring their approval. Whatever structural constraints or disadvantages exist at the creation thus remain an integral part of the entity. Common in for instance New York City, Hamburg and Berlin in Germany is a form of real estate ownership known as a cooperative (also co-operative or co-op, in German Wohnungsgenossenschaft – apartment co-operative, also 'Wohnbaugenossenschaft' or simply 'Baugenossenschaft') which relies heavily on internal rules of operation instead of the legal framework governing condominium associations. These 'co-ops', owning the building for the mutual benefit of its members, can ultimately perform most of the functions of a legally constituted condominium, i.e. restricting use appropriately and containing financial liabilities to within tolerable levels. To change their structure now that they are up and operating would require significant effort to achieve acceptance among members and various levels of government. Sharing Use:- The owning entity makes rules governing use of property; each property may comprise areas that are made available to any and every member of the group to use. When the group is the entire nation, the same principle is in effect whether the property is small (e.g., picnic rest stops along highways) or large such as national parks, highways, ports, and publicly owned buildings. Smaller examples of shared use include common areas such as lobbies, entrance hallways and passages to adjacent buildings. One disadvantage of communal ownership, known as the Tragedy of the Commons, occurs where unlimited unrestricted and unregulated access to a resource (e.g., pasture land) destroys the resource because of over-exploitation. The benefits of exploitation accrue to individuals immediately, while the costs of policing or enforcing appropriate use, and the losses dues to over exploitation, are distributed among many, and are only visible to these gradually. In a communist nation the means of production of goods would be owned communally by all people of that nation; the original thinkers did not specify rules and regulations. Ownership Models:- (i) State Ownership:- ownership of an industry, asset, or enterprise by the state or a public body representing a community as opposed to an individual or private party. (a) Public Ownership:- ownership and operation of an enterprise by a central government; also an ambiguous term that could refer to either social, partial state, or full state ownership. (ii) Private Ownership:- ownership of property by non-governmental legal entities. (a) Fractional Ownership:- ownership held in percentage shares of an expensive asset, sold to individual owners, who are charged fees for the asset's management and variable use. (iii) Collective Ownership:- either joint ownership of an economic entity (e.g., a cooperative) or public ownership. (a) Cooperative Ownership:- ownership by the people who together operate and trade with an enterprise. (b) Common Ownership is both a concept in political philosophy, and a specific legal form existing at least in the United Kingdom (UK) law whereby employees own a business in which they work collectively 'in common') rather than in individual shares. (iv) Property is also distinguished by whether it is movable (personal property) or immovable (immovable property and real property). (v) Concerning ownership of means of production and delineating which groups receive the direct profits, capitalism's private ownership is distinguished from socialism's social ownership. (vi) Ownership of resources can be distinguished as either as individual or communal, analogous to private or public in delineating who has rights of use. Types Of Property:- (1) Personal Property is a type of property. In the common law systems personal property may also be called chattels. It is distinguished from real property, or real estate. In the civil law systems personal property is often called Movable Property or Movables – any property that can be moved from one location or another. This term is used to distinguish property that different from immovable property or immovables, such as land and buildings. This also means the direct owner of the item(s) is in full control of them/it until either stolen, confiscated by law enforcement, or destroyed. Personal property may be classified in a variety of ways, such as goods, money, negotiable instruments, securities, and intangible assets including choses in action. (2) Land Ownership:- Real Estate or Immovable Property is a legal term (in some jurisdictions) that encompasses land along with anything permanently affixed to the land, such as buildings. Real estate (immovable property) is often considered synonymous with real property, in contrast from personal property (also sometimes called Chattel or Personalty). However, for technical purposes, some people prefer to distinguish real estate, referring to the land and fixtures themselves, from real property, referring to ownership rights over real estate. The terms Real Estate and Real Property are used primarily in common law, while civil law jurisdictions refer instead to immovable property. In law, the word Real means relating to a thing (from Latin Reālis, Ultimately from Rēs, 'Matter' or 'Thing'), as distinguished from a person. Thus the law broadly distinguishes between Real Property (land and anything affixed to it) and Personal Property (everything else, e.g., clothing, furniture, money). The conceptual difference is between immovable property, which would transfer title along with the land, and movable property, which a person would retain title to. Incidentally, the word real in real estate is not derived from the notion of land having historically been 'royal' property. The word Royal – and its Spanish Cognate, Real – come from the unrelated Latin word Rēgālis 'Kingly', which is a derivative of Rēx, meaning 'King'. With the development of private property ownership, real estate has become a major area of business. (3) Corporations And Legal Entities:- An individual or group of individuals can own shares in corporations and other legal entities, but do not necessarily own the entities themselves. A Legal Entity is a legal construct through which the law allows a group of natural persons to act as if it were an individual for certain purposes. Some duly incorporated entities may not be owned by individuals nor by other entities; they exist without being owned once they are created. Not being owned, they cannot be bought and sold. Mutual life insurance companies, credit unions, foundations and cooperatives, not for profit organizations, and public corporations are examples of this. No person can purchase the company, as their ownership is not legally available for sale, neither as shares nor as a single whole. (4) Intellectual Property:- Intellectual Property (IP) refers to a legal entitlement which sometimes attaches to the expressed form of an idea, or to some other intangible subject matter. This legal entitlement generally enables its holder to exercise exclusive rights of use in relation to the subject matter of the IP. The term Intellectual Property reflects the idea that this subject matter is the product of the mind or the intellect, and that IP rights may be protected at law in the same way as any other form of property. Intellectual property laws confer a bundle of exclusive rights in relation to the particular form or manner in which ideas or information are expressed or manifested, and not in relation to the ideas or concepts themselves (see Idea-Expression Divide). It is therefore important to note that the term 'Intellectual Property' denotes the specific legal rights which authors, inventors and other IP holders may hold and exercise, and not the intellectual work itself. Intellectual property laws are designed to protect different forms of intangible subject matter,

although in some cases there is a degree of overlap. (i) Copyright may subsist in creative and artistic works (e.g., books, movies, music, paintings, photographs and software), giving a copyright holder the exclusive right to control reproduction or adaptation of such works for a certain period of time. (ii) A Patent may be granted in relation to an invention that is new, useful and not simply an obvious advancement over what existed when the application was filed. A patent gives the holder an exclusive right to commercially exploit the invention for a certain period of time (typically 20 years from the filing date of a patent application). (iii) A Trademark is a distinctive sign which is used to distinguish the products or services of one business from those of another business. (iv) An Industrial Design Right protects the form of appearance, style or design of an industrial object (e.g., spare parts, furniture or textiles). (v) A Trade Secret (also known as 'Confidential Information') is an item of confidential information concerning the commercial practices or proprietary knowledge of a business. Patents, trademarks and designs fall into a particular subset of intellectual property known as Industrial Property. Like other forms of property, intellectual property (or rather the exclusive rights which subsist in the IP) can be transferred (with or without consideration) or licensed to third parties. In some jurisdictions it may also be possible to use intellectual property as security for a loan. The basic public policy rationale for the protection of intellectual property is that IP laws facilitate and encourage disclosure of innovation into the public domain for the common good, by granting authors and inventors exclusive rights to exploit their works and invention for a limited period. However, various schools of thought are critical of the very concept of intellectual property, and some characterise IP as intellectual protectionism. There is ongoing debate as to whether IP laws truly operate to confer the stated public benefits, and whether the protection they are said to provide is appropriate in the context of innovation derived from such things as traditional knowledge and folklore, and patents for software and business methods. Manifestations of this controversy can be seen in the way different jurisdictions decide whether to grant intellectual property protection in relation to subject matter of this kind, and the North-South divide on issues of the role and scope of intellectual property laws. (5) Chattel Slavery:- The living human body is, in most modern societies, considered something which cannot be the property of anyone but the person whose body it is. This is in contrast to chattel slavery. Chattel slavery is a type of slavery defined as the absolute legal ownership of a person or persons, including the legal right to buy and sell them. Persons who are enslaved do not have the freedom to direct their own actions, and their legal rights may be either severely limited or nonexistent. In most countries, chattel slaves were considered as movable property. Slavery is currently illegal in every country around the world. However, up until the XIX century slavery and ownership of people had existed in one form or another in nearly every society on earth. Notwithstanding the illegality according to codes of law, slavery still exists in various forms today. Critical Views:- The question of ownership reaches back to the ancient philosophers, Plato and Aristotle, who held different opinions on the subject. Plato (428/427 BC – 348/347 BC) thought private property created divisive inequalities, while Aristotle (384 BC – 322 BC) thought private property enabled people to receive the full benefit of their labor. Private property can circumvent what is now referred to as the 'Tragedy Of The Commons' problem, where people tend to degrade common property more than they do private property. Given a short-sighted owner, however, a private property system can make these tragedies worse – for example, a private owner of a piece of oil-rich property, depending on his worldview, might be more interested in short-term financial gain than incremental use with an eye toward other's concerns (e.g., those of future generations, the disenfranchised, etc). While Aristotle justified the existence of private ownership, he left open questions of (1) how to allocate property between what is private and common and (2) how to allocate the private property within society. Modern Western Views:- In modern Western popular culture some people believe that exclusive ownership of property underlies much social injustice, and facilitates tyranny and oppression on an individual and societal scale. Others consider the striving to achieve greater ownership of wealth as the driving factor behind human technological advancement and increasing standards of living. Right-libertarians not only believe that ownership is the driving factor behind human technological advancement and increasing standards of living, but is also necessary for liberty itself. Ownership Society:- Ownership society was a political slogan used by United States President George Walker Bush to promote a series of policies aimed to increase the control of individual citizens over health care and social security payments and policies. Critics have claimed that slogan hid an agenda that sought to implement tax cuts and curtail the government's role in health care and retirement saving. Basic right to possess something. It should not be confused with possession, for whereas a person may own something, he or she may still lose possession of it, e.g., to a bailee or to a thief. Ownership is the legal right to the possession of a thing. The object of ownership can be tangible such as personal property and land or it can be intangible such as intellectual property rights over musical, literary or scientific creations of the mind. Ownership also includes rights allowing a person to use and enjoy certain property (physical or intellectual). It includes the right to convey it to others. It can also be the state or fact of being an owner. Example of a state statute on ownership (Annotated Statutes Of New Mexico (NM); Chapter 47; Property Law Article 7. Building Unit Ownership; (NM Stat. Ann. § 47-7-2) defines a unit owner as follows:- 'Unit Owner' means the person or persons owning a unit in fee simple absolute and undivided interest in the fee simple or leasehold estate of the common areas and facilities in the percentage established by the declaration. Right by which a thing is owned by an individual or legal entity. Ownership is the state of owning something. Anything that people own or possess gives them the quality of ownership. Wars are often fought over the ownership of land. When you buy a book, you own it. Add the suffix ship to owner, and now you have ownership of that lovely book. If you buy a house, you have ownership of it. Politicians like to talk about the 'American dream of home ownership'. If you buy a lottery ticket, you have ownership of that, too. If you win big, you'll have ownership of lots of cash and then you, too can realize that American dream. / Шотландский экономист, философ и автор Эдэм Смис (Adam Smith; 1723–1790). Президент США Дьжодьж Вокё Бош (George Walker Bush; 1946–). Право, посредством которого вещь принадлежит физическому или юридическому лицу. В гражданском праве под Владением понимается фактическое обладание вещью, одно из правомочий собственника. Владение в гражданском праве, фактическое обладание вещью. Различаются владение собственника и владение несобственника. Владение собственника – одно из правомочий (наряду с пользованием и распоряжением), входящих в содержание права собственности, оно всегда охраняется законом. Владение несобственника может быть законным и незаконным. В основе законного владения лежит всегда какое-либо правовое основание (правовой титул). Это означает, что владение возникло на основании закона, договора, административного акта. При законном владении лица, не являющегося собственником данной вещи, она передаётся ему добровольно самим собственником (например, по договорам хранения, найма, ссуды и так далее). Незаконным является владение лица, похитившего вещь или присвоившего находку. В гражданском праве незаконное владение, в свою очередь, подразделяется на добросовестное и недобросовестное. Добросовестным владельцем считается тот, кто не знал и по обстоятельствам дела не мог знать о неправомерности своего владения; недобросовестный же владелец знал или должен был знать о неправомерности своего владения (знал, что приобретает вещь от лица, неуправомоченного на её продажу). Разграничение добросовестного и недобросовестного владения имеет существенное значение при разрешении спора об истребовании вещи из чужого владения (смотрите Виндикация) по иску собственника. В Советском праве нет самостоятельного правового института Владения, оно является элементом других правовых институтов:- права собственности, залога, найма, комиссии и других. Такое титульное владение подлежит самостоятельной охране; владелец, подобно собственнику, может предъявить иск об истребовании вещей либо об устранении всяких нарушений его права. Закон предусматривает в определённых случаях защиту добросовестного владения даже против собственника. Например, если добросовестный владелец приобрёл вещь по сделке купли-продажи или мены (то есть возмездно) от лица, неуправомоченного на её отчуждение, но получившего вещь от самого собственника по договору найма, хранения и прочего,

собственник не вправе истребовать вещь в порядке виндикации владения. В гражданском праве буржуазных государств существует самостоятельный институт Владения. Установлено несколько способов защиты владения (в частности, судебные способы – иски о возврате владения и внесудебные – право на самопомощь, дающее владельцу возможность самостоятельно защищать владение). По-разному регулируется и защищается владение движимостью и недвижимостью в праве Великобритании и Соединённых Штатов Америки (США). Большинство буржуазных систем права рассматривает длительное владение в качестве основания приобретения права собственности (так называемая Приобретательная Давность). Советское право приобретения права собственности по давности владения не предусматривает.

OWNERSHIP RIGHTS = ПРАВА ВЛАДЕНИЯ – Ownership Rights:- ownership means a person has a right over a property, and owns it. An owner will have the right of possession, right to its use, right of way, right to transfer it and the right to earn rent from the property. An owner can transfer his property by gifting or selling it. A sale deed, or any document through which the ownership rights are transferred, is a document that gives evidence of an individual's ownership of a property. Rights in property can be transferred only on execution and registration of a sale deed in favor of the buyer. A conveyance deed is executed to transfer title from one person to another. Generally, an owner can transfer his property unless there is a legal restriction barring such transfer. Under the law, any person who owns a property and is competent to contract can transfer it in favor of another. If the owner gives another individual a Power of Attorney (POA), that person can sell it under this authority. A POA gives another person the power to act on behalf of the owner. However, if the POA only grants a person the authority to manage the property, he cannot sell it. Agreement to sell precedes execution of a sale deed. The subsequent sale deed is based on the agreement to sell. The agreement is signed and executed by the seller and buyer on a non-judicial stamp paper. As such, it has legal value and can be produced as evidence. Agreement to sell is the base document on which the conveyance deed is drafted. Every document of transfer of property by way of sale would be preceded by an agreement to sell. The agreement to sell is also in writing. Any instrument indicating transfer of property must be registered. The sale deed and other relevant documents have to be stamped and registered at the subregistrar's office having jurisdiction over the property. The purpose of registration is to prevent fraud and provide security. It also ensures that every person dealing with property, where such dealings require registration, may rely with confidence on the statements contained in the registered document as a complete account of all transactions by which his title may be affected. A transfer of title in real estate is not valid if the sale deed is not registered. Registration in the name of the seller by the person transferring property is crucial for the transfer of clear title in favor of the new owner. Registration is to be done after payment of appropriate stamp duty, as prevalent in the State. Once purchased, the property should be mutated in the name of the purchaser. Mutation is not a legal title given to the new owner. It basically means rectification in the records of the municipal authorities (in case of urban properties) and local revenue officers (in case of other properties), replacing the name of the owner with that of the new owner. The new owner, in whose favor the title and other rights pass on, must apply to the local municipal authorities for mutation. Mutation of property is recorded on the presentation of registered documents showing evidence of transfer of property. Mutation of property in the municipal or revenue records is mainly for the purpose of payment of property taxes. See also Deed, and Ownership.

OWN ISSUE = СОБСТВЕННЫЙ ВЫПУСК (или СОБСТВЕННАЯ ЭМИССИЯ) – Own Issue:- securities placed with investors directly by the issuer, without the involvement of an intermediary, e.g., bank. Issuers must have very strong placement capabilities for this to function, i.e. issuers must be able to reach a large number of investors directly. As a rule, only banks with an extensive branch network and/or good relationships with institutional investor groups will have such considerable placement strength. The vast majority of own issues are therefore handled by banks. The risk that the entire issue cannot be sold to (placed with) investors is borne by the issuer. The advantage of direct issuing lies in the lower costs, since no fees are involved for an underwriting syndicate.

OXBLOOD = ХХ (или КРОВАВОЕ) – Oxblood:- a moderate reddish brown.

OXFORD = ОКСФОРДСКАЯ – As a durable option, Oxford cloth has been a staple of clothing that is now making its way into other types of applications. Here is some background into the creation of Oxford cloth, as well as examples of how the cloth can be used. Originally made of only cotton, Oxford cloth utilizes a warp that that combines two fine filaments that are woven together to create a basket weave pattern that is sturdy but still allows the fabric to breathe. In fact, the material gets its name from the term that defines the process, which is referred to as the Oxford Weave. The spin of the filaments results in a feel that is smooth to the touch without being silky. Today, Oxford fabric is not only produced from cotton. Polyester and rayon may be introduced to make a synthetic blend that is ideal for casual shirts, the traditional button down Oxford shirts that are the ideal middle ground between casual and dressy, walking shorts, and a number of other casual wear items. Along with long and short sleeved shirts, Oxford cloth has begun to make an impact around the home as well. As a sturdy solution, Oxford cloth is an ideal fabric to use for window treatments in children's rooms, as well as duvet covers, pillow shams, and wall hangings. Oxford cloth can also be an inexpensive material to use in the construction of screen panels that will fit over a wooden frame. Machine washable, Oxford cloth is an easy fabric to maintain, and tends to hold its shape. The result is household items that require little or no ironing after going through the laundry process. One innovative use of Oxford cloth today is for wall coverings. The light weave of the fabric makes it ideal for absorbing liquid starch. Using sections of the Oxford cloth that have been soaked in the starch, apply the sections to the clean wall and smooth with a wallpaper brush. What makes the use of oxford cloth so attractive is that the material can be purchased in bulk and easily removed when a change is desired. Persons who are renting or leasing a living space can use Oxford cloth as a solution to introducing color into a room that is not permanent. The material will simply pull off the walls easily, and a quick wash will remove all traces of the starch residue. As a fabric that is comfortable to wear for casual and business casual solutions, as well as an inexpensive way to create a statement in your living space, oxford cloth is a great choice. As Oxford cloth makes further inroads into home décor, creative people will come up with even more uses for this versatile material. Oxford is a fine, soft, lightweight woven cotton or blended with manufactured fibers in a 2 x 1 basket weave variation of the plain weave construction. The fabric is used primarily in shirtings. Oxford is a rather soft, porous cotton fabric made from fine count of warp and a coarse, soft-spun weft yarn; warp and weft are usually combed but lower qualities may be made of carded yarn. In the warp two ends are made to weave as one and they alternate in plain-weave formation with each pick. Fabric usually has twice as many ends as picks, and it is all-white, although striped warp-effect is not uncommon. This material will soil easily. Oxford Cloth is a soft but stout shirting fabric in a modified basket weave with a large filling yarn having no twist woven under and over two single, twisted warp yarns. The fabric is usually made from cotton or polyester/cotton blends and is frequently given a silk like luster finish. Oxford:- a low shoe laced or tied over the instep. A soft durable cotton or synthetic fabric with a silky luster made in plain or basket weaves; also called Oxford Cloth. Warp has two fine yarns which travel as one and one heavier softly-spun bulky filling which gives it a basket-weave look. Better qualities are mercerized. rather heavy. Usually is all white but some has a spaced stripe in the warp direction. Launders very well but soils easily. When made with yarn dyed warp and white weft, it is called Oxford Chambray. The one remaining commercial shirting material made originally by a Scotch mill which bore the names of four Universities – Oxford, Cambridge, Harvard, and Yale. / уточная пряжа . Оксфордская ткань – хлопчатобумажная набивная рубашечная ткань.

OXFORD WEAVE = ОКСФОРДСКОЕ ПЕРЕПЛЕТЕНИЕ – Oxford Weave fabric consists of two, thin warp yarns woven to every soft, thicker yarn in the filling direction. The unbalanced construction of the fabric causes the thin yarns to break and leave tiny holes. It is

fine, soft and lightweight. Oxford weave is commonly found in cotton shirting but is also available in a wide variety of fibers and weights. It is mainly used in apparel. Manufacturers make use of a high twist in the yarn to stop or minimise the development of holes, but oxford weave do develope tiny pinholes. All the yarns in shirts made of oxford weave receive the same care, but the constant abrasion in the wear causes the thin yarns to weaken and tear. Characteristics of Oxford Weave:- (i) it is fine; (ii) it is soft; and (iii) it is lightweight. See also Weave. / в направлении уточины. , но постоянное истирание . высокой крутки в пряже для останова или минимизации развития .

OXICLEAN® = АКСИКЛЫН® (или ОКСИКЛИН®) – OxiClean® is the brand name for a line of household cleaners, including 'OxiClean® Versatile Stain Remover', which is a laundry additive, spot stain remover, and household cleaner marketed by Church & Dwight. It was originally marketed through infomercials in the United States and Canada with Billy Mays, as a 'miracle cleanser'. Church and Dwight acquired the OxiClean® brand through its acquisition of Orange Glo International in 2006. Endorsed by Mays until his death in 2009, the product is now seen endorsed by Billy's friend and co-worker Anthony Sullivan. Both Billy and Anthony were featured on the show Pitchmen on the Discovery Channel in which the product was feature on multiple occasions. OxiClean® was developed by OCI Company Ltd, in South Korea. One of the active ingredients in OxiClean® is sodium percarbonate ($Na_2CO_3 \cdot H_2O_2$), an adduct of sodium carbonate (Na_2CO_3) and hydrogen peroxide (H_2O_2). Related products include OxiClean® Free Versatile Stain Remover, OxiClean® Laundry Stain Remover, OxiClean® MaxForce Spray, OxiClean® Power Paks, OxiClean® Triple Power Stain Fighter, and OxiClean® Baby Stain Soaker. OxiClean® is a proprietary product, so full details are unknown to this author. The label reveals that it contains sodium percarbonate and sodium carbonate. It probably also contains special activators that make the percarbonate more effective at low temperature. Church & Dwight Co., Inc. headquartered in Princeton, State of New Jersey (NJ), the United States. / пятно- разводо- (или потёко-) удалитель, . АксиКлын® (или ОксиКлин® (OxiClean®)). перкарбонат натрия (sodium percarbonate). Били Мэйз (Billy Mays). Орэндьж Гло Интёнэшэнэл (Orange Glo International). Чёч Энд Двайт Ко., Инк. (Church & Dwight Co., Inc.). Энтэни Саливэн (Anthony Sullivan). Пичмен (Pitchmen) Дискавэри Чэнэл (Discovery Channel). Оу.Си.Ай. Кампэни Эл.ти.ди. (OCI Company Ltd).

OXIDATION = ОКСИДИРОВАНИЕ (или ОКИСЛЕНИЕ) – Oxidation occurs when the petroleum product reacts with oxygen. The process is accelerated by heat, light, metallic catalysts, water, acids or the presence of solid contaminants. / Под Оксидированием, от Немецкого слова Oxydieren, означающее Окислять, от Греческого слова Οξύς, означающее Кислый, понимается преднамеренное окисление поверхностного слоя металлических изделий. Образующиеся в результате оксидирования окисные плёнки (смотрите Окалина) предохраняют изделия от коррозии, имеют декоративное значение (смотрите Воронение, Патина), служат в качестве электроизоляции, являются основой для нанесения на них защитных покрытий – лака, краски, жировой смазки и так далее. Оксидирование осуществляется химически (в воздухе или жидкой среде – щёлочах, кислотах) или электрохимически (анодирование) методами. В зависимости от режима оксидирования и состава сплава получают окисные плёнки толщиной от долей микрона до 500–600 мкм. Оксидированию подвергают изделия из стали, чугуна, алюминиевых, медных, цинковых и других сплавов. Под Окислением понимается окислительный процесс, в узком смысле слова – реакция соединения какого-либо вещества с кислородом. В более широком смысле – всякая химическая реакция, сущность которой состоит в отнятии электронов от атомов или ионов (смотрите Окисление-Восстановление). Из обычных окислителей к числу важнейших относятся:- кислород O_2, озон O_3, перекись водорода H_2O_2, хлор Cl_2, фтор F_2, перманганат калия $KMnO_4$, хлорная кислота $HClO_{24}$, азотная кислота HNO_3 и другие. Смотрите также Электролиз.

OXIDATION INHIBITOR = ИНГИБИТОР ОКСИДИРОВАНИЯ (или ИНГИБИТОР ОКИСЛЕНИЯ, или ЗАМЕДЛИТЕЛЬ ОКИСЛЕНИЯ) – Oxidation Inhibitor is a substance added in small quantities to a petroleum product to increase its oxidation resistance, thereby lengthening its service or storage life; also called Anti-Oxidant. An oxidation inhibitor may work in one of these ways:- (1) by combining with and modifying peroxides (initial oxidation products) to render them harmless, (2) by decomposing the peroxides, or (3) by rendering an oxidation catalyst inert. See also Inhibitor, and Oxidation.

OXIDATION MARKS = ОТМЕТИНЫ ОТ ОКИСЛЕНИЯ – Oxidation Marks:- it is a type of stain observed in the vat dyed fabric. Dyeing defect. / развод (или потёк (stain)). Порок или дефект крашения.

OXIDATION STABILITY = ОКИСЛИТЕЛЬНАЯ СТАБИЛЬНОСТЬ (или СТАБИЛЬНОСТЬ ОКСИДИРОВАНИЯ, или УСТОЙЧИВОСТЬ ПРОТИВ ОКИСЛЕНИЯ) – Oxidation Stability is an ability of a lubricant to resist natural degradation upon contact with oxygen. See also Oxidation. Oxidation Stability:- a petroleum product's resistance against oxidation. Affects product life both in storage and in use.

OXIDATIVE FAT CLEAVAGE = ОКИСЛИТЕЛЬНОЕ РАСЩЕПЛЕНИЕ ЖИРА – Oxidative Fat Cleavage is a fat cleavage produced by atmospheric oxygen.

OXIDE AND SULPHIDE ORE = ОКСИДНАЯ И СУЛЬФИДНАЯ РУДА – In mining industry, Oxide And Sulphide are different kinds of copper contained ore. Oxide ore processing generates cathode copper as the finished product. Sulphide ore processing normally generates concentrate. / В горной промышленности Оксиды И Сульфиды являются отличающимися друг от друга видами руды, в которой содержится медь. Переработкой оксидной руды производят катодную медь как конечный продукт. Переработкой сульфидной руды обычно производят концентрат. Оксиды (Окислы) являются соединениями химических элементов с кислородом. Делятся на солеобразующие и несолеобразующие (например, NO). Солеобразующие оксиды бывают:- (i) аморфными (ZnO), гидраты которых являются соответственно кислотами, основаниями или проявляют амфотерность; (ii) кислотными (SO_3); и (iii) основными (CaO). Сульфидные Руды, минеральные образования, состоящие из сернистых (сульфидов или колчеданов), а также селенистых, теллуристых, мышьяковистых и сурьмянистых соединений металлов. Месторождения главным образом гидротермальные. Основные руды Bi, Co, Cu, Hg, Mo, Ni, Pb, Sb, Zn. Содержание металлов в руде от десятых долей до первых десятков процента. Сульфидные Руды – минеральные агрегаты, состоящие из сульфидов (сернистых соединений) железа и цветных металлов, содержащие последние в количествах и концентрациях, достаточных для экономически выгодного их извлечения. Сульфидные руды добываются главным образом из гидротермальных, отчасти из магматических (медно-никелевые пирротиновые руды) месторождений. Сульфидные руды – сырьё для получения большинства тяжёлых цветных металлов (кроме олова и вольфрама), серебра и частично платины и золота, а также для производства серной кислоты. Сульфиды, от Латинского слова Sulphur, Sulfur, означающее Сера, являются химическими соединениями серы с металлами и некоторыми неметаллами. Многие сульфиды являются природными минералами, например, молибденит, пирит, сфалерит. Природные сульфиды – сырьё для получения металлов, а также серной кислоты. Сульфиды металлов это соли сероводородной кислоты H_2S, они подразделяются на:- (i) кислые или гидросульфиды, например, NaHS; (ii) средние, например, Na_2S. Обжигом природных сульфидов получают цветные металлы и SO_2. Сульфиды щелочно-земельных металлов, а также CdS и ZnS служат основой люминофоров. Сульфиды многих металлов являются полупроводниками. Сульфиды молибдена, титана и тория являются твёрдыми смазочными материалами. Сульфиды фосфора применяют в производстве флотационных реагентов, фосфорорганических инсектицидов.

OXIDIZING AGENT = ОКИСЛЯЮЩИЙ АГЕНТ (или ОКИСЛИТЕЛЬ) – Oxidizing Agent is a chemist's term for any chemical that causes loss of electrons from another chemical with which it reacts; the oxidizing agent is itself reduced (see Reducing Agent) in the process. Oxygen is the oxidizing agent whence the name comes. Chlorine is another strong oxidizing agent. As an example, when sodium reacts with chlorine, sodium chloride (common salt) is formed. Sodium loses an electron in the process (going from Na to Na^{+}), and chlorine gains an electron (going from Cl to Cl^{-}). Strong oxidizing agents must be handled with care, since contact with substances that burn may cause fire.

OXIDIZING BLEACH = ОКИСЛЯЮЩИЙ ОТБЕЛИВАТЕЛЬ – Oxidizing Bleach is a bleach based on an oxidizing agent, such as hydrogen peroxide or sodium hypochlorite. Most general-purpose household bleaches belong to this class.

OXTER PLATE = ЛИСТ ОБШИВКИ КОРМОВОГО ПОДЗОРА – Oxter Plate is a plate fitted to the top of a rudder post. / Лист обшивки, закреплённый к верху рудерпоста.

OXYCELLULOSE = ОКСИЦЕЛЛЮЛОЗА – Oxycellulose is the degraded cellulose products formed by the oxidation of the cellulose as the result of attack by chemical oxidizing agents. / Оксицеллюлоза – продукт окисления целлюлозы кислотами, обладающими окислительным действием, – азотной, хромовой, марганцевой и других. Сырая оксицеллюлоза состоит из разных степеней окисления целлюлозы, неизменяющейся целлюлозы и продуктов её распада. Обладает сильными восстановительными свойствами.

OXYGENATED MOTOR GASOLINE = ОКСИГЕНИРОВАННЫЙ АВТОМОБИЛЬНЫЙ БЕНЗИН (или АВТОМОБИЛЬНЫЙ БЕНЗИН С КИСЛОРОДСОДЕРЖАЩИМИ ДОБАВКАМИ) – Oxygenated Motor Gasoline is the finished motor gasoline, other than reformulated gasoline, having an oxygen content of 2.7 percent or higher by weight and required by the US Environmental Protection Agency (EPA) to be sold in areas designated by EPA as carbon monoxide (CO) nonattainment areas. Oxygenated gasoline excludes Oxygenated Fuels Program Reformulated Gasoline (OPRG) and Reformulated Gasoline Blendstock for Oxygenate Blending (RBOB). Data on gasohol that has at least 2.7 percent oxygen, by weight, and is intended for sale inside CO nonattainment areas are included in data on oxygenated gasoline. Other data on gasohol are included in data on conventional gasoline.

OXYGEN BLEACH = КИСЛОРОДСОДЕРЖАЩИЙ ОТБЕЛИВАТЕЛЬ (или КИСЛОРОДНЫЙ ОТБЕЛИВАТЕЛЬ) – Oxigen Bleach is a bleach based on hydrogen peroxide or a chemical derivative of hydrogen peroxide. Oxygen bleaches typically are less damaging to fibers than chlorine-based bleaches. Most 'color safe' bleaches are of this type. Dry powder bleaches and detergents of this class usually use a 'peroxygen' compound such as sodium perborate, sodium percarbonate or potassium monopersulfate. / перборат натрия (sodium perborate), перкарбонат натрия (sodium percarbonate) или моноперсульфат калия (potassium monopersulfate).

OYSTER = УСТРИЧНОЕ (или УСТРИЦА) – Oyster:- a grayish-white color. / Устричный:- серовато-белый цвет.

OYT = OBSERVATIONAL YIELD TRIAL/TEST

OYWR = OUTSTANDING YOUNG WOMEN IN RICE SCIENCE

OZONE DEPLETION = ИСТОЩЕНИЕ ОЗОНА – Ozone Depletion is also a very important ecological problem. The ozone layer is thinning. For the last 20–25 years as it was announced by experts it became 2% thinner. First ozone depletion war found out over Antarctic in 1978. It increased from 5 up to 20 million square kilometers. The international researches show that ozone depletion is still increasing in size. Besides new ozone 'holes' appeared over Europe and the USA. The ozone layer is being damaged by gases which are called CFCs (short for the Ozone Hole-Chlorofluorocarbons). Unfortunately emissions of these gases especially freon grow every year because they are used in refrigerators, air conditioners, plastic foam and other things. Spaceships and planes also influence the ozone layer. One of the effects of the ozone depletion may be genetic mutation. According to the papers of the ecological conference the number of children and adults with diseases of blood and skin is growing. Different countries began to unite their efforts to stop the ozone layer from disappearing and we care about the environment and we are concerned about ozone depletion too. Ozone Depletion is a reduction of the ozone layer in the atmosphere. Influenced by aerosols and other gaseous pollutants. / разрушение озонового слоя атмосферы под влиянием чего-либо.

OZONE FADING = ОБЕСЦВЕЧИВАНИЕ ОЗОНОМ (или ВЫЦВЕТАНИЕ ОЗОНОМ) – Ozone Fading is the fading of a dyed textile material, especially those in blue shades, caused by atmospheric ozone (O_3). / Обесцвечивание (или Выцветание) Озоном – обесцвечивание крашеного текстильного материала, особенно тех, которые имеют голубые оттенки, вызванное атмосферным озоном (O_3).

- P -

P = ПИ. – (1) P is fifth letter of a NASDAQ® stock symbol specifying issue is the company's first class of preferred shares. / Пи. (P) – пятая буква фондового символа НЭЗДЭК® (NASDAQ®), указывающая на то, что .

(2) P is the parents of a cross. Used also to designate phosphorus.

(3) P:- pressure – psi.

P = PAID THIS YEAR, DIVIDEND OMITTED, DEFERRED OR NO ACTION TAKEN AT LAST MEETING

P = PAPA

P = PETA = 10^{15}

P = PHOSPHORUS

p = PICO = 10^{-12}

P = PRIMARY TILLERS

P = PUT

P1 = PROVEN

P2 = PROBABLE

P2P = PATH TO PROFITABILITY

P3 = POSSIBLE

P+H = PLOW AND HARROW

P&C = PRIVATE AND CONFIDENTIAL

P&F CHART = POINT AND FIGURE CHART

P&I = PRINCIPAL AND INTEREST

P&I = PROTECTION AND INDEMNITY

P&L = PROFIT AND LOSS

P&NG = PETROLEUM AND NATURAL GAS

P&S STATEMENT = PURCHASE AND SALE STATEMENT

PA = PANAMA

PA = PER ANNUM

PA = PERSONAL ACCOUNT

PA = POWER OF ATTORNEY

PA = PRUNE AGAR

PA = PUBLIC ACCOUNTANT

PA = PURCHASING AGENT

PAASCHE PRICE INDEX = ПАШЭВСКИЙ ИНДЕКС ПО ЦЕНАМ – The Paasche Price Index (PPI) is an index formula used in price statistics for measuring the price development of the basket of goods and services that is consumed in the current period. The question it answers is how much a basket that consumers buy in the current period would have cost in the base period. So it is also defined as a fixed-weight, or fixed-basket, index, because it uses the basket of goods and services and their weights from the current period. It is therefore also known as a 'Current Weighted Index. Other formulas (Laspeyres Price Index, Fisher Price Index) may be chosen for calculating price indices; the choice in a particular case is partly determined by the data requirements of the formulas which are different. Paasche Price Index is defined as a methodology to calculate Inflation by measuring the Price change in a Commodity as compared to the base year. It was invented by Hermann Paasche, an Economist from Germany to understand the Actual Inflation in the Basket of Goods compared to the base year value. The Index generally uses a base year of 100 to analyze the Index. An index greater than 100 signifies the Inflation impact and an Index less than 100 implies Deflation. Year 0 will be termed as Base Year while Calculating Year will be termed as Observation Year. It is commonly used by Economist to analyze the Economic Growth of the Country taking into consideration the Inflation in the Goods and Services. Paasche Price Index Formula:- Paasche Price Index = Sum (Observation Price * Observation Qty) / (Base Price * Observation Qty); where:- Observation Price refers to the Price at the Current Levels for which the Index needs to be calculated; Observation Qty refers to the Qty at the Current Levels for which the Index needs to be calculated; and Base Price refers to the price at Year 0 which is known as the Base Year for calculating the Index. Advantages:- Paasche Price Index is one of the most important tools to observe the Inflation in the basket of Goods and Services by comparing the Current Levels and Quantity available with the Base year prices. Below mentioned are some of the major advantages of its Ratio :- (i) It focuses more on the Consumption patterns in the Economy by taking into account the Current level of Quantities available for the same; (ii) It takes into account the Entire Basket of Goods and Services which includes Goods at a lower cost and higher Cost both; (iii) It gives a reflection of the governmental policies on daily goods and services since the same is been consumed by the common public every day and that what matters them the most; (iv) It gives a trigger or a warning signal to the government about rising prices and increased cost of living which may hamper growth for a certain class of people; and (v) Is a good parameter to frame the Future Policies that will control Inflation. Disadvantages:- Following are the disadvantages of Paasche Index:- (i) It does not take into account the changing taste and Preferences of the people; (ii) It ignores the Growing Economy; (iii) Data for the Current Quantities available is very much difficult to extract from multiple Websites; and (iv) A Costlier Process to execute. Limitations of Paasche Price Index:- (i) It gives more weight age to the Current Quantity of the Goods; (ii) It ignores the Economical growth since the Goods and Services form part of the GDP and lowering their prices about a certain level can have an impact on the Country's GDP; (iii) Prices Tend to rise on a yearly basis keeping in mind the Consuming patterns and Rising Standard of Living among the people; and (iv) Deciding the Base Year is a challenge since its value will be 100. So which year to be Selected for the Year 0 itself is a debatable issue. Points to Note:- A significant Change in the Paasche Price Index will give a Warning Signal to the government Authorities that some action needs to be taken for its Sudden increase or sudden fall. A very high increase in the Index may turn detrimental to the Interest of the Common people to buy the Essential Commodities at high prices. Conclusion:- Paasche Price Index is one of the key ratios in order to determine the velocity of Inflation in the Basket of Goods and Services. It is calculated on a monthly basis to understand the Trend whether it is going in the upward or the downward direction along with the necessary steps or actions to be taken to maintain the same. This index is been widely used in the Economical Work and the Finance Ministry in order to be aware of the Inflation trends so that the Future Plans and policies would be drafted keeping in mind the Paasche Price Index Ratio worked out and analyzing its impact on the Economy and on the Common people. See also Fisher Price Index, and Laspeyres Price Index. / Немецкие экономисты Эрнэст Люи Этен Ляспэр (Ernst Louis Étienne Laspeyres; 1834–1913) и Хэрман Пашэ (Hermann Paasche; 1851–1925), а также Американский экономист Овинь Фищё (Irving Fisher; 1867–1947). Смотрите также Фищёвский Индекс по Ценам (Fisher Price Index), и Ляспэровский Индекс по Ценам (Laspeyres Price Index).

PAB = PANAMANIAN BALBOA

PAB = PHOTOSYNTHETIC AQUATIC BIOMASS

PAC = PATENT ASSISTANCE CENTER

PAC = PLANNED AMORTIZATION CLASS

PAC = PREAUTHORIZED CHECKS

PAC = PUBLIC ADVISORY COMMITTEE

PAC = PUT AND CALL

PAC BOND = PLANNED AMORTIZATION CLASS BOND

PACE = PHILADELPHIA AUTOMATED COMMUNICATIONS AND EXECUTIONS SYSTEM

PACHYCAUL = ТОЛСТОТРАВЯНИСТЫЙ СТЕБЕЛЬ (или МОЩНОЕ) – Pachycaul:- of massive construction. Plants with a thick or swollen stem. / Растения с толстым или разбухшим стеблем.

PACIFIC BEEF/PIGMEAT MARKET = ТИХООКЕАНСКИЙ РЫНОК ГОВЯДИНЫ/СВИНИНЫ – Pacific Beef/Pigmeat Market is the Pacific meat market consists of countries or zones within countries that produce and trade livestock free from/of, Foot and Mouth Disease (FMD) without vaccination. FMD status is given by the OIE (short for the French former l'Office International Des Épizooties or current Organisation Mondiale De La Santé Animale or in English World Organisation For Animal Health) according to strict guidelines (www.oie.int/en/animal-health-in-theworld/official-disease-status/fmd/) and include, inter alia, Australia, New Zealand, Japan, Korea, North America and the vast majority of Western Europe. The name 'Pacific' refers to the fact that most of them are located around the Pacific Rim. See also Atlantic Beef/Pigmeat Market.

PACIFIC RIM = ТИХООКЕАНСКИЙ РЕГИОН – The Pacific Rim, referring to countries and economies bordering the Pacific ocean, is an informal, flexible term which generally has been regarded as a reference to East Asia, Canada, and the United States. At a minimum, the Pacific Rim includes Canada, Japan, the People's Republic of China, Taiwan and the United States. It may also include Australia, Brunei, Cambodia, Hong Kong, Indonesia, Laos, Macau, North Korea, South Korea, Malaysia, New Zealand, the Pacific Islands, the Philippines, Russia (or the Commonwealth of Independent States), Singapore, Thailand and Vietnam. As an evolutionary term, usage sometimes includes Mexico, the countries of Central America, and the Pacific coast countries of South America. Pacific Rim:- for the purposes of this document, the major Asia-Oceania economies: Australia, Indonesia, Japan, South Korea, Malaysia, New Zealand, China (including Hong Kong and Macau), the Philippines, Singapore, Taiwan, and Thailand.

PACK = СВЯЗКА (или НАБИВКА, или УПЛОТНЕНИЕ, или ЗАПОЛНЕНИЕ, или XX) – Pack is:- (1) the complete assembly of filters and spinneret through which polymer flows during extrusion. (2) A unit of weight for wool, 240 pounds. Pack is a bundle arranged for convenience in carrying especially on the back. / Экструзия или Выдавливание (Extrusion). Мера веса – 240 фунтов, для шерсти и шерстяной ленты.

PACKAGE = ПАКОВКА – Package:- the intended use of a yarn usually determines the packaging method employed. Bobbins are wood, cardboard, or plastic cores on which yarns are wound as they are spun, and have holes in their centers allowing them to fit on spindles or other holding devices. Spools are cylindrical, with end flanges. Cones, having a conical-shaped core, produce a package of conical shape; tubes, with cylindrical-shaped cores, produce cylindrical packages. Cheeses are cylindrical yarn packages wound on a tube, and, unlike most other packages, they have greater diameter than height. Skeins are coils of yarn wound with no supporting core. Pirns are large barrel-shaped packages used to hold the weft, or filling, yarn supply for the shuttle in weaving; quills are small tapered tubes holding the weft yarns for weaving. Beams are wood or metal cylinders, about five feet long and up to 10 inches in diameter, on which yarns used as warp in weaving are wound. General term implying any wound arrangement of yarn such as found on a cheese or cone. Packages:- a large selection of forms for winding yarn is available to meet the requirements of existing machinery and a variety of package builds is used to ensure suitable unwinding in later stages of manufacturing. Since a package with flanges cannot be unwound easily and quickly by pulling the yarn off overend, most packages are flangeless with self-supporting edges. Some can be unwound at speeds up to 1 500 yd/min. The accompanying diagram shows six common types of yarn packages. Six yarn packages in common use:- (i) Cheese:- taper (1/2 angle) – 0°; (ii) Cone:- taper (1/2 angle) – 3°30'; (iii) Cone:- taper (1/2 angle) – 4°20'; (iv) Hosiery Cone:- taper (1/2 angle) – 9°15'; (v) Warp-Wind Package:- taper (1/2 angle) – 3°30'; and (vi) Pineapple Package:- taper (1/2 angle) – 0°. Packages:- a large selection of forms for winding yarn onto. Examples include a cone, cheese, and pineapple package. A Package consists of yarn or cord with its winding support, if used. Packages may be of various shapes and winding patterns, e.g., beams, bobbins, cakes, cheeses, cones, cops, hanks, pirns, tubes. Yarn length for a package may be controlled by means of the pre-set digital counters at the drive end of the machine. / уток, или уточина, . Паковки могут быть различной формы и иметь разные рисунки намотки, например, навои (beams), бобины (bobbins), куличи (cakes), цилиндры или цилиндрические катушки (cheeses), конуса или конусные катушки (cones), шпули (cops), мотки/петинки (hanks), шпули/цевки/патроны (pirns), валики/катушки/патроны/гильзы/тубы (tubes). Длина пряжи в каждой паковке может контролироваться с помощью счётчиков, установленных на приводе (drive end) машины. Пряжа, поступающая на ткацкую фабрику, должна иметь определённую влажность, так как в зависимости от влажности изменяются её масса, линейная плотность и некоторые физические свойства. Форма и размер паковок, применяемых на ткацком станке, влияют на его производительность. Паковки должны иметь такую форму, при которой обеспечивается свободное сматывание нитей в процессе ткачества. Размер паковки определяет массу и длину нити в ней, а следовательно, продолжительность работы с одной паковкой. Расположение витков нити на поверхности паковки зависит от шага винтовой линии и угла подъёма витка. В зависимости от угла подъёма винтовой линии различают параллельную и крестовую намотку. Параллельная намотка получается при небольшом угле подъёма витков пряжи. При этой намотке шаг винтовой линии находится в пределах (1…4) $d_н$, где $d_н$ – диаметр наматываемой нити. Параллельная намотка получается при относительно небольшой скорости нитеводителя. При данном способе наматывания витки пряжи и нитей не могут прочно удерживаться на поверхности паковки, особенно в её торцах, и при незначительных воздействиях паковка может разрушиться. Поэтому пряжа и нити наматываются на катушки с фланцами, которые удерживают крайние витки от сползания и придают паковке соответствующую форму. Параллельная паковка подразделяется на два вида:- разомкнутая и сомкнутая. При разомкнутой намотке смежные витки пряжи и нитей укладываются на паковке с некоторыми промежутками. При сомкнутой намотке шаг витков нити, наматываемой на паковку, равен её диаметру и витки укладываются на поверхности паковки один возле другого. С уменьшением угла подъёма витков плотность намотки увеличивается. При сомкнутой намотке достигается наибольшая удельная плотность. Крестовая намотка получается при угле подъёма витков наматываемой нити 10–15° и более. Угол, образованный витками последующего слоя, называют углом скрещивания. Вследствие значительного угла скрещивания витки пряжи сжимают нижележащие и удерживают их от сползания, что позволяет наматывать пряжу на патроны без фланцев. Крестовая намотка по сравнению с параллельной имеет ряд преимуществ:- (i) возможность сматывания нити с неподвижной бобины при большой скорости; (ii) ячейкообразная структура паковки, позволяющая окрашивать нити в бобинах; (iii) большая длина нити в бобине, чем на катушке; и (iv) возможность выявления таких дефектов, как намотка нитей разного оттенка и различной линейной плотности. на катушке или конусе. Под Паковкой, от Немецкого слова Packen, означающее Укладывать, понимается форма расположения текстильного материала (продукта или полуфабриката) после законченного перехода технологического процесса. Основными видами паковки в зависимости от материала являются:- (i) для волокна – кипа; (ii) для полуфабрикатов и готовых отдельных нитей – бобина, катушка, початок и шпуля; (iii) для основы – валик, навой; (iv) для ткани – кусок, рулон, штука.

PACKAGE = УПАКОВКА – (1) Package is any physical piece of cargo in relation to transport consisting of the contents and its packing for the purpose of ease of handling by manual or mechanical means. / В контексте грузоперевозки, любая физическая единица груза, состоящая из содержимого и его упаковки, для целей обращения с ней при перевалке вручную или механическими средствами.

(2) Package:- the final product of the packing operation consisting of the packing and its contents to facilitate manual or mechanical handling. / Конечный продукт операции по упаковыванию, состоящий из самой упаковки (например, бумаги, полиэтилена или картона) и его содержимого с целью обеспечения должного обращения с ним при перевалке вручную или механическими средствами.

PACKAGE BUILD = СТРОЕНИЕ ПАКОВКИ – Package Build is a general term that applies to the shape, angles, tension, etc, of a yarn package during winding. Package build affects performance during subsequent processing.

PACKAGE DYEING = КРАШЕНИЕ В ПАКОВКАХ – Package Dyeing occurs after the wool has been spun into yarn. See also Dyeing, and Yarn Dyeing. Package Dyeing:- the yarns are wound on spools, cones or similar units and these packages of yarn are stacked on perforated rods in a rack and then immersed in a tank. In the tank, the dye is forced outward from the rods under pressure through the spools and then back to the packages towards the center to penetrate the entire yarn as thoroughly as possible. Mostly, the carded and combed cotton which are used for knitted outerwear is dyed through this method.

PACKAGE INSERT = УПАКОВОЧНЫЙ ВКЛАДЫШ – Package Insert is a leaflet that, by order of the Food and Drug Administration, must be placed inside the package of every prescription drug. The leaflet must include the trademark for the drug, its generic name, and its mechanism of action; state its indications, contraindications, warnings, precautions, adverse effects, and dosage forms; and include instructions for the recommended dose, time, and route of administration. A Package Insert (formally prescribing information in the United States; in Europe, Patient Information Leaflet for human medicines or Package Leaflet for veterinary medicines) is a document provided along with a prescription or over-the-counter medication to provide additional information about that drug. Package Insert:- printed materials available in the legal pharmacologic description of a drug, subject to detailed regulatory specifications, including approved chemical and proprietary names, description and classification, clinical pharmacology, approved indications and usage, contraindications, warnings, precautions, adverse reactions, drug abuse and dependence information, overdosage discussion, dosage and administration, formulations, and appropriate references; in the United States, such materials are negotiated between the drug's manufacturer(s) and the US Food and Drug Administration. / Вкладыши – это разновидность этикеток, отличающаяся направленностью товарной информации и предназначенная для сообщения кратких сведений о наименовании товара, изготовителе. Иногда вкладыши могут содержать краткую характеристику потребительских свойств товара, в первую очередь функционального назначения. Наиболее часто применяются вкладыши для кондитерских изделий – конфет, печенья, пряников в коробках; для парфюмерно-косметических и лекарственных средств, товаров бытовой химии.

PACKAGE POLICY = ПАКЕТНЫЙ ПОЛИС – Package Policy is an insurance policy including two or more lines or types of coverages in the same contract. / Страховой полис, включающий в себя две или более линии или типов покрытий по одному и тому же контракту.

PACKAGING = УПАКОВКА (или УПАКОВОЧНЫЙ МАТЕРИАЛ) – Packaging:- materials used for the containment, protection, handling, delivery and presentation of goods and the activities of placing and securing goods in those materials. Packaging is a material used in supporting, protecting or carrying a commodity. / Материалы, используемые для удерживания, защиты, обработки, поставки и презентации товаров, и виды деятельности, связанные с размещением и сохранением товаров в таких материалах.

PACKER = УПАКОВЩИК – Packer or Crypter or Protector:- packers are the 'outer shells' of some trojan horses, the purpose of which is to make detection and analysis by anti-virus software and malware analysts (respectively) more difficult by hiding the payload they contain, making it first necessary to unpack them so as to ascertain their purpose. To make the tasks even more challenging, packers often employ various anti-debugging, anti-emulation (anti-VM) techniques and code obfuscation. Packers also usually make the resulting executable smaller in size, and are therefore also used by legitimate software, not only malware. They serve several purposes, mainly compressing the executable and protecting applications against software piracy.

PACKING = УПАКОВКА – Packing is any container or other covering in which goods are packed. / Любой контейнер или иная форма покрытия, в которой упакованы товары. Упаковка:- тара, материалы, обеспечивающие защиту товара, продукции от повреждения или потерь при транспортировке, складировании и тому подобном.

PACKING INSTRUCTION = ИНСТРУКЦИЯ ПО УПАКОВКЕ – Packing Instruction is a document issued within an enterprise giving instructions on how goods are to be packed. / Документ, выдаваемый предприятием, представляющий инструкции о том, как должны быть упакованы товары.

PACKING LIST = УПАКОВОЧНЫЙ ЛИСТ (или УПАКОВОЧНЫЙ ПЕРЕЧЕНЬ) – Packing List is a detailed specification as to goods packed. The Packing List is created in the Distribution Center. The packing list identifies the quantity and weight of each product on the order and each individual item # (unit ID, serial number, etc) if applicable. It is a comprehensive list identifying exactly what is being shipped on the order. List of packages for each shipment, showing individual breakdown in weights/measure and quantity. A list showing the number and kinds of items being shipped, as well as other information needed for transportation purposes. Itemized list of commodities with marks/numbers but no cost values indicated. Packing List (also known as a Bill of Parcel, Unpacking Note, Packaging Slip, (Delivery) Docket, Delivery List, Manifest or Customer Receipt, Shipping List) is a document which details the contents, and often dimensions and weight, of each package or container. It serves to inform all parties involved with shipping, including transport agencies, government authorities, and customers, about the contents of the package. It helps them deal with the package accordingly. / Отгрузка товара сопровождается выпиской Упаковочных Листов. Упаковочный Лист или Упаковочный Перечень – один из видов товаросопроводительной документации. Это документ, который содержит перечень всех видов и сортов товара, находящихся в каждом товарном месте (ящике, коробке, контейнере) и необходим, обычно когда в одной упаковке содержатся разные по ассортименту товары. Он используется в качестве дополнения к счёту-фактуре, когда отправляется большое количество наименований товаров, или когда количество, вес или содержимое каждого индивидуального места различны. Упаковочный лист может иметь форму комплектовочной ведомости, которая содержит перечень деталей, узлов, агрегатов целой машины, упакованных в нескольких товарных местах, с описанием содержания каждого места. Комплектовочная ведомость имеет обозначение в виде дроби, в числителе которой указывается номер отгрузочной партии, а в знаменателе – число мест в данной партии. Её составляет предприятие изготовитель до отгрузки всей партии товара. Упаковочный Лист:- документ с перечнем предметов входящих в одно товарное/грузовое место.

PACK LIFE = СРОК ПАКОВКИ – Pack Life is the time during which a pack assembly can remain in use and produce goodquality yarn.

PACKSACK = XX – Packsack is a case, as of canvas, held on the back by shoulder straps and used to carry gear when traveling on foot.

PACK SIZE = РАЗМЕР ПАКОВКИ – A term Pack Size describes how a product is packaged such as '20 cartons per pallet' or '6 units per carton'.

PAD = PETROLEUM ADMINISTRATION FOR DEFENSE DISTRICT

PAD = PREAUTHORIZED ELECTRONIC DEBITS

PAD = ПЛЮСОВКА (или ПЛЮСОВАНИЕ) – Pad (Padder) is a dyeing machine consisting essentially of a shallow trough and a pair of squeeze rolls, between which the fabric passes and becomes impregnated with the dyestuff or other processing solution which is being applied.

PADAG = PLEASE AUTHORIZE DELIVERY AGAINST GUARANTEE

PADD = PETROLEUM ADMINISTRATION FOR DEFENSE DISTRICT

PADDING = ПЛЮСОВАНИЕ (или ПРОТРАВКА) – Padding is a dyeing method with very low liquor to goods ratio, where typically only enough strong dye solution is used to saturate the fabric. Padding can have the advantage of high dye yield. Padded goods are usually 'batched' – wrapped in plastic and left for some period of time for the dye to attach to the fiber, or steamed to fix the dye quickly. Padding methods are sometimes used for other textile processes such as bleaching. Padding is the application of a liquor or paste to textiles either by passing the material through a bath and subsequently through squeeze rollers, or by passing it between squeeze rollers, the bottom one of which carries the liquor or paste.

PADDLE DYEING MACHINE = МАШИНА ДЛЯ КРАШЕНИЯ ЛОПАСТНЫМ ПЕРЕМЕШИВАНИЕМ – Paddle Dyeing Machine is a machine used for dyeing garments, hosiery, and other small pieces that are packaged loosely in mesh bags. The unit consists of an open tank and revolving paddles that circulate the bags in the dyebath.

PADDY = ПАДДИ (или ПЭДИ) – Paddy is:- (1) Wetland Rice. (2) Bunded and leveled field used for cultivation of Rice. The original meaning of paddy (Malay padis) is threshed, unhulled Rice. / нешелушеный Рис.

PAD DYEING = КРАШЕНИЕ ПЛЮСОВАНИЕМ – Pad Dyeing is a process of dyeing fabrics by passing the fabrics between rollers that apply the dyestuff. See also Dyeing. Pad Dyeing is a process in which fabrics are dyed by passing them between rollers. Pad Dyeing:- padding is also done while holding the fabric at full width. The fabric is passed through a trough having dye in it. Then it is passed between two heavy rollers which force the dye into the cloth and squeeze out the excess dye. Then it is passed through a heat chamber for letting the dye to set. After that it is passed through washer, rinser and dryer for completing the process. Pad Dyeing is a form of dyeing whereby a dye solution is applied by means of a padder or mangle.

PADDY KERNELS = ОБМОЛОЧЕННАЯ ЗЕРНОВКА (или НЕШЕЛУШЕНАЯ ЗЕРНОВКА, или ОБМОЛОЧЕННЫЕ ЯДРА, или НЕШЕЛУШЕНЫЕ ЯДРА) – Paddy Kernels are whole or broken unhulled kernels and whole or broken kernels of Rice having a portion or portions of the hull remaining which cover one-half (1/2) or more of the whole or broken kernel. Paddy Kernels are whole or broken unhulled kernels of Rice; whole or broken kernels of brown Rice, and whole or broken kernels of milled Rice having a portion or portions of the hull remaining which cover one-eighth (1/8) or more of the whole or broken kernel.

PADDY RICE = ОБМОЛОЧЕННЫЙ РИС (или НЕШЕЛУШЕНЫЙ РИС) – Paddy Rice:- in Australia, heads of Rice form as tiny clusters of flowers in the base of the Rice plant during early January (sowing commences in September of each year and harvest commences in March of the following year). These develop as they travel up through the center of the plant to emerge in early February. The small green shell that is the flower opens and under the right conditions all flowers are successfully pollinated within a week. The fertilized flower then closes to become a protective hull which the Rice plant fills with liquid starch and protein. Over the following forty days the liquid consolidates to form a starchy inner grain attached to a seed embryo, all encased in nutrient, enzyme and oil rich layers. This complete grain, encased in its hull, is called 'Paddy'. Rough brown Rice (caryopsis) is called Paddy. Paddy means Rice that is not yet dehashed. Paddy Rice is Rice that in its as-harvested state. See also Moisture. In most of the world and in California, the United States, the term Paddy Rice is used to describe the Rice as it comes from the field after harvest. The Rice has been threshed and each grain is separate. The grain of Rice has a hard husk protecting the kernel inside. The husk (or hull) that covers Rice is much thicker and tougher than most cereal grain husks. Primarily in the southern growing area of the United States Paddy Rice is also called Rough Rice. By weight, the composition of Paddy Rice is approximately:- 22% husk (including about 2% trash), 10% bran, and 68% Rice (2% of the Rice are very small pieces, brewers Rice, and fines). The Rice portion can have varying percentages of broken kernels. A typical milling yield in California for medium grain would be described as 54/68. 54% brokens and 68% total. (14% brokens) In the southern growing area, a typical yield for long grain would be 58/68. In Japan where harvest and drying conditions are ideal a typical yield would be 67/70. Paddy Rice is not as dense as milled Rice and usually weighs about 37 lb per cubic ft. Brown Rice, milled Rice, and brokens weigh about 52 lb per cubic ft. Most Paddy Rice is milled in the United States. Some is exported to countries like Brazil, Mexico, and Turkey for milling. The export of Paddy harms the milling industry and eventually the farmer. The United States is about the only country in the world that allows the export of Paddy Rice. It does not make sense from an economic standpoint (the unnecessary freight cost of hulls and bran). It only occurs when the importing country has some sort of duty advantage for Paddy Rice that allows it to occur. Also known as Rough Rice. / дроблёнка или сечка (brokens).

PAD EYE = КЛЮЗ (или ПЛАНКА С ОБУХОМ, или РЫМ ИЗ ПЛАСТИНЫ) – Pad Eye (maritime term):- a metal eye permanently secured to a deck or bulkhead (for mooring any blocks and tackle).

PADUASOY = ПАДЮАСУА (или ХХ) – Paduasoy is a corded silk fabric. A garment made of paduasoy fabric, namely a corded silk fabric. / Суа = Шёлк.

PAG = POLYALKALINE GLYCOL

PAGASA = PHILIPPINE ATMOSPHERIC, GEOPHYSICAL, AND ASTRONOMICAL ASRVICES ADMINISTRATION

PAGE = POLYACRYLAMIDE GEL ELECTROPHORESIS

PAG SYNTHETIC FLUID = СИНТЕТИЧЕСКАЯ ЖИДКОСТЬ ПАГ – PAG Synthetic Fluid:- polyalkaline glycol (PAG) have excellent oxidative and thermal stability, very high viscosity index (VI), excellent film strength and an extremely low tendency to leave deposits on machine surfaces. The low deposit-forming tendency is really due to two properties – the oil's ability to dissolve deposits and the fact that the oil burns clean. So when they are exposed to a very hot surface or subjected to micro-dieseling by entrained air, PAGs are less likely to leave residue that will form deposits. PAGs may also be the only type of base oil with significantly lower fluid friction, which may allow for energy savings. The other unique property of PAGs is the ability to absorb a great deal of water and maintain lubricity. There are actually two different types of PAGs – one demulisifies and the other absorbs water. The most common applications for

PAGs are compressors and critical gearing applications. The negatives of PAGs are their very high cost and the potential to be somewhat hydrolytically unstable. / гликоль .

PAID–IN CAPITAL = ОПЛАЧИВАЕМЫЙ КАПИТАЛ – Paid-In Capital is a capital received from investors in exchange for stock. This is recorded as an entry on the balance sheet. This term is sometimes also referred to as Contributed Capital or Share Capital. Capital, in the form of money or property, such as contributions in kind, contributed by shareholders in a corporation. Paid-in capital includes stock issued by a corporation, premiums or discounts from the sale of stock, stock received from donations, and the resale of treasury stock. / Оплачиваемый Капитал – капитал, полученный от вкладчиков в обмен на акции. В балансовом отчёте предприятия он проходит как Приход или Поступления (Entry). Этот термин иногда относится к Распределяемому или Контрибуционному Капиталу (Contributed Capital) или Акционерному Капиталу (Share Capital). Оплачиваемый Капитал – капитал в денежной форме или в форме собственности, такой как контрибуции в натуре (contributions in kind), распределённый держателями акций корпорации. Оплачиваемый капитал включает акции, выпущенные корпорацией, премии и скидки от продажи акций, акции, полученные от пожертвований, и перепродажу казначейских акций.

PAID–IN SURPLUS = ОПЛАЧИВАЕМЫЙ ИЗЛИШЕК – Paid in Surplus represents the difference on the sale of a new issue of stocks to stockholders between the actual price obtained and the nominal stock price.

PAID–IN SURPLUS (NOT DISTRIBUTABLE) = ОПЛАЧИВАЕМЫЙ ИЗЛИШЕК (НЕ РАСПРЕДЕЛЯЕМЫЙ) – In the United States, Paid-In Surplus is the price paid by investors per share at issue minus the par value per share, times the number of shares issued. Also known as Additional Paid-in Capital in the United States. Paid-In Surplus is the amount received by a corporation for its stock in excess of the par or stated value. Paid-In Surplus represents the difference on the sale of a new issue of stocks to stockholders between the actual price obtained and the nominal stock price. Also known as Share Premium Account in the United Kingdom.

PAID LAND DIVERSION = ОПЛАЧЕННЫЙ ОТВОД ЗЕМЛИ (или ОПЛАЧЕННОЕ СОКРАЩЕНИЕ ПОСЕВНЫХ ПЛОЩАДЕЙ) – Paid Land Diversion:- the US program that offers payments to producers for reduction of planted acreage of a program crop if the Secretary of Agriculture determines that acreage planted for a program crop should be further reduced. Farmers are given a specific payment per acre to idle a percentage of their crop acreage base. The idled acreage is in addition to an acreage reduction program.

PAID–UP CAPITAL = ОПЛАЧЕННЫЙ КАПИТАЛ – Paid-Up Capital (PUC):- conceptually, this refers to the total amount of investment capital actually received by a company for each (and all) classes of shares. Tax definitions for Paid-up Capital (PUC) vary depending on jurisdiction and this may be an important factor when determining taxes on stock dispositions (especially in private companies). PUC applies to the company while ACB (adjusted cost base) applies to the investor. If they are different, tax issues may arise, i.e. see a tax expert. Paid-Up Capital is a capital obtained by a share issue in which the shares are fully paid. Paid-Up Capital:- the amount paid by shareholders or recorded as paid on issued shares. It is calculated by deducting from the balance in the authorised capital account, the totals for unallotted shares, uncalled capital, and calls in arrears. Payment by all shareholders in a corporation of all or part of the contribution they have agreed to make at the time of a capital subscription or new issue.

PAIL = ВЕДРО (или БОЧОНОК, или БАК, или ЧАН, или БАДЬЯ) – A Pail is a watertight, vertical cylinder or truncated cone, with an open top and a flat bottom, usually attached to a semicircular carrying handle called the Bail. A bucket is distinguished from other containers by being unlidded. Their main purpose is the carrying of water, but they may also have other purposes. Elaborate ceremonial or ritual buckets in bronze, ivory or other materials are found in several ancient or medieval cultures and are known by the Latin for bucket, Situla. Other buckets include those attached to loader (equipment) and telehandler for agricultural and earthmoving purposes. They can also be used to transport items other than water such as sand, rocks, gumbo, and blood. The first buckets were used by the Assyrians as mentioned in the book of the prophet Ezekiel. Also known as Bucket. A container made from plastic or steel with a firmly closed lid, for transportation of liquids, in particular paints and oils. / использовались Ассирийцами, как это упомянуто в книге Еврейского пророка Йэхезкэля (prophet Ezekiel; 621 BC–569 BC). Ведро – контейнер, сделанный из пластика или стали, способный без какого-либо просачивания удерживать жидкости при их транспортировке и хранении. В качестве таких жидкостей могут выступать краски или масла. Ведро – сосуд, обычно цилиндрической формы, с ручкой в виде дужки для жидкостей, сыпучего. А также старая Русская мера жидкостей, равная 1/40 бочки или 12 литров. Бочонок – маленькая бочка. Бак – большой сосуд для жидкостей. Чан – большая деревянная или металлическая кадка (цилиндрической формы вместилище со стенками из деревянных клёпок, обтянутое обручами), а также (специальный) железобетонный или кирпичный резервуар прямоугольной формы. Бадья – широкое низкое ведро.

PAIN RELIEF = СНЯТИЕ БОЛИ – Pain Relief:- the administration of drugs that reduce the intensity and duration of a pain response.

PAINT = КРАСКА – Paint is a coating containing enough pigment to create an opaque solid film after application as a thin layer. / Под Краской понимается однородная суспензия пигментов в плёнкообразующих веществах. В зависимости от основы подразделяется на:- клеевые краски на основе водных растворов некоторых органических полимеров, масляные краски на основе олифы, силикатные краски на основе жидкого стекла, эмалевые краски на основе лаков и эмульсионные краски на основе дисперсий полимеров. Тонкие слои краски образуют при высыхании непрозрачные покрытия, защищающие поверхность от воздействия агрессивных агентов и придающие ей красивый внешний вид. Краски широко используются в быту, живописи, народном хозяйстве.

PAINTER = ФАЛИНЬ – Painter (maritime term):- a short piece of rope secured in the bow of a small boat used for making her fast.

PAIR = PATENT APPLICATION INFORMATION RETRIEVAL

PAIRED PORTS = СПАРЕННЫЕ ПОРТЫ (или ПАРНЫЕ ПОРТЫ) – Paired Ports:- the US Customs program wherein at least two designated Customs ports will enter cargo that arrives at either port without the necessity of an in-bound document.

PAIRED WEFT = СПАРЕННЫЙ УТОК – Paired Weft:- regroupment of weft yarns in pairs, apparent as weftway ribs. Note:- this defect is often caused by healds raised to different heights, allowing weft yarns to be beaten up alternately more and less tightly. / Скрутка Уточных Нитей Парами (paired weft):- порок утка; перегруппировка уточной пряжи в пары, создающие эффект ластичного переплетения уточной крутки. Примечание:- этот порок вызывается сбоем в работе ремизоподъёмного механизма ткацкого станка.

PAIRS TRADING = ТОРГОВЛЯ ПАРАМИ – Pairs Trading:- taking a long position and a short position on two stocks in the same sector, creating a hedge.

PAIR TRADING = ТОРГОВЛЯ ПАРОЙ – Pair Trading is another term for Spread Trading but more specifically to securities (stocks in particular) rather than commodities. Commonly refers to buying one stock and selling another related stock against it. An example would be spreading Coke Single-Stock Futures (SSF) against Pepsi SSF. See also Spread Trade.

PAISLEY = ПЭЙЗЛИ (или ПЕЙСЛИ) – Paisley is a tear-drop shaped, fancy printed pattern, used in dresses, blouses, and men's ties. Paisley is a fabric made typically of soft wool and woven or printed with colorful curved abstract figures. Paisley is a drop-shaped pattern that is extremely popular for men's ties and womenswear. Paisley is a droplet-shaped vegetable motif of Persian and Indian origin, similar to half of the yin and yang symbol. The name comes from Paisley, Scotland, which was one of the primary makers of paisley in the XVIII century. Resembling a large comma or twisted teardrop, the kidney-shaped paisley is usually decorated with involved designs and is commonly found on drapery and quilts. / Набивные и тканые рисунки, имитирующие узоры кашмировых шалей. Пэйзли или Пейсли – город в Шотландии.

PAJAMAS = ПИЖАМА (или XX) – Pajamas:- loose lightweight trousers formerly much worn in the Near East; a loose usually two-piece lightweight suit designed for sleeping or lounging. / .

PAL = PASSIVE ACTIVITY LOSS

PALATINE = ПАЛАТИН (или ПАЛАНТИН) – Palatine is a fur cape or stole covering the neck and shoulders. / .

PALEA = ЧЕШУЯ (или ПЛЁНКА, или ВЕРХНЯЯ ЦВЕТКОВАЯ ЧЕШУЯ) – Palea is:- (1) the inner of the two bracts enclosing the floret in grasses. (2) The hardened 3-nerved bract of the floret, which fits closely to the lemma. It is narrower than the lemma. (3) The upper bract that, with the lemma, encloses the flower in grasses. Palea is a scale. Palea (syn. Palet, Pale, Upper Palea, Palea Superior, Inner Glume, Glume, Flowering Glume, and Valvule):- the indurate, 3-nerved bract of the floret which fits closely to the lemma. It is similar to the lemma but narrower, keeled, with a median bundle but with no strong midnerve on the back. The two other nerves are close to the margins. / чешуйка или чешуя (scale). Под Чешуйками понимаются:- (1) мелкие хитиновые пластинки на теле членистоногих, главным образом насекомых. Часто окрашены, например, у чешуекрылых, комаров, некоторых перепончатокрылых. (2) Выросты кожицы (эпидермиса) у растений, например, на листьях Облепихи, или видоизменённые листья, например, чешуйки в цветках. Выполняют защитную функцию.

PALEATE = ЧЕШУЙЧАТОЕ (или ПЛЁНЧАТОЕ) – Paleate:- clothed with scales.

PALEOBOTANY = ПАЛЕОБОТАНИКА – Paleobotany is the study ofplants that existed in former geological periods, mainly known from their fossils or pollen. / Под Палеоботаникой, от Греческих слов Palaiós, означающее Древний, и Botánē, означающее Растение или Трава, понимается раздел палеонтологии, изучающий ископаемые растения.

PALETOT = ПАЛЬТО – Paletot is a man's overcoat; a loose jacket worn by women and children. / .

PALETTE = ПАЛЕТ (или ЛОПАТКА, или НАЛОПАТНИК) – Palette is one of the plates at the armpits of a suit of armor. / .

PALL = МАНТИЯ (или ОБЛАЧЕНИЕ) – Pall:- pallium.

PALLADIUM = ПАЛЛАДИЙ – Palladium is a chemical element with symbol Pd and atomic number 46. It is a rare silver-white transition metal of the platinum group, resembling platinum chemically. It was discovered in platinum ores in 1803, and named after the asteroid Pallas (which was discovered two years earlier) by William Hyde Wollaston. Palladium is usually found as a free metal, alloyed with others in the platinum group. It is commercially extracted from copper-nickel ores. Palladium has a great affinity for hydrogen, being able to absorb 900 times its own volume of the gas. Palladium metal and its complexes are often used in catalysis such as in catalytic converters on cars, palladium on carbon used in organic chemistry, and other coupling reactions. As a precious metal, it is sometimes used in jewelry. Palladium:- chemical symbol Pd. Its specific gravity is 12.00 and its melting point is 1 555 °C. Palladium, a platinum group metal, is used extensively as an industrial catalyst and is a key component in the manufacturing of automotive catalytic converters. Palladium bullion is also essential in the jewelry industry; White Gold is actually a palladium/gold alloy. Recently, one of the Big Three mints introduced palladium coinage to American investors. Although palladium coins have been minted on a small scale from time to time since 1967, none of the major coin Mints, which are located in the United States, Canada and Austria, have struck palladium coin issues. On 2005-November-01, Canada launched its first ever coin made from palladium. The Royal Canadian Mint will issue its one Troy ounce 2005 Palladium Maple Leaf, its first year of issue, with a strictly limited quantity of 40 000. However, future mintages will be unlimited and the RCM expects to mint several times that number annually. Those estimates seem very plausible, considering the popularity of palladium investing and the need for a popular, high-quality investment-grade coin. Palladium Bullion, available in units of 10 ounces in .999 fine bullion bars. Each bar is hallmarked to certify weight and purity. Coins:- Canadian Palladium Maple Leafs, available in units of 10 one-ounce coins for personal delivery only. Struck beginning 2005 in .9995 fine palladium at the Royal Canadian Mint. Legal tender coin of Canada with a CAD50.00 face value. The reverse has the well known maple leaf image while the obverse features an updated portrait of Her Majesty Queen Elizabeth II by artist Susanna Blunt. / Сродство (Affinity). Вильэм Хайд Волэстэн (William Hyde Wollaston). Сюзана Блант (Susanna Blunt). Палладий, на Латинском языке Палладиум (Palladium), символ Pd, является химическим элементом VIII группы Периодической Системы Менделеева. Серовато-белый металл, мягкий и ковкий. Атомный номер 46, атомная масса 106.42, плотность 12 020 кг/м^3, $t_{пл}$ 1 552 °C. Палладий относится к группе платиновых металлов. Палладий был открыт в 1803 и назван в честь малой планеты Паллады, открытой в 1802. В природе встречается вместе с другими платиновыми металлами. Добывается вместе с платиной главным образом из сульфидных медно-никелевых руд. Палладий, наряду с платиной, благодаря своей пластичности и сравнительной дешевизне, применяется в технике гораздо чаще, чем другие платиновые металлы. Чистый палладий используют для очистки водорода, изготовления электрических контактов (для АТС и другого), сплавы с золотом, платиной, родием – в терморегуляторах и термопарах, сплавы с золотом, серебром, никелем и другими элементами – в зубопротезировании (не имеют привкуса и не темнеют), ювелирном деле при изготовлении ювелирных изделий и для производства химической аппаратуры. Палладий и его соединения широко применяют как катализаторы многих химических реакций, в том числе гидрогенизации, дегидрогенизации, дожигания выпускных газов автомобилей. Пасты палладия используют в производстве интегральных схем.

PALLADIUM FIXING = ФИКСИРОВАНИЕ ЦЕНЫ ПАЛЛАДИЯ (или УСТАНОВЛЕНИЕ ЦЕНЫ ПАЛЛАДИЯ) – The Platinum and Palladium Fixing is held twice each working day at 09:45 am and 02:00 pm in the City of London, the United Kingdom. See also Platinum and Palladium Fixings.

PALLET = ПОДДОН – A Pallet is a platform of wood, metal or other material on which cargo is stacked and secured in order to be moved by forklift or other handling devices. Although it can be adapted and designed for specific purposes, its major advantage is to follow standard dimensions, so it is interoperable and its transportation can be optimised. Pallets utilised for air transport are significantly different from those used for surface transport and are not treated here. Pallet Class defines the basic pallet design class:- (i) Block-Class Pallets utilize rectangular blocks (or cylindrical posts), which separate the top deck from bottom deck (is double-face). Block-class pallets with lumber decks have top stringerboards, which run the full length of the pallet and are fastened to the blocks; and (ii) Stringer-Class Pallets utilize rectangular stringers (or runners) – wood components that run the full length of the pallet. The top deck is fastened to the top edge of the stringers. For double-face pallets, the bottom deck is fastened to the bottom edge of the stringers. The Pallet Use Category for wood pallets:- (i) Limited-Use Pallets are intended for use with a single unit load. Limited-use pallets are

also referred to as Shipping Pallets; and (ii) Multiple-Use Pallets are intended for repeated uses for more than one unit load. Multiple-use pallets are also referred to as Returnable Pallets. Pallet Style defines the basic construction style of the pallet:- (i) Double-Face Non-Reversible Pallets have a specific top face and a specific bottom face, which are not interchangeable; (ii) Double-Face Reversible Pallets have a top and bottom deck which are identical, so the pallet can be used 'reversibly'; and (iii) Single-Face Pallets have only one deck and are also referred to as Skids. Entry Type further defines the pallet design and indicates how the pallet may be entered by forklift and pallet jack equipment:- (i) 2-Way Pallet designs are stringer-class pallets without stringer notches. They can be entered and lifted by forklift and pallet jack from only the two ends, thus the term 2-Way Entry; (ii) Full 4-Way Pallet designs are single-face block-class pallets or double-face non-reversible block-class pallets with a panel base, perimeter base, or unidirectional base. The single layer bottom deck (if present) and potentially large openings between blocks (or posts) allows entry of forklifts or pallet jacks from all pallet sides and ends, thus the term Full 4-Way Entry; (iii) Partial 4-Way Pallet designs also include block-class pallets with an overlap base. The overlapped bottom strinerboards and bottom deckboards typically prevents the entry of pallet jack wheels over the bottom stringerboards (without damaging the pallet), but pallet jacks can enter the pallet over the bottom deckboards. Only forklifts can enter and lift the pallet from all 4 directions, thus the term Partial 4-Way Entry; and (iv) Partial 4-Way Pallet designs include stringer-class pallets with stringers notched for fork tine entry. These notches are rarely sized to accommodate pallet jacks, which can only enter the pallet from the ends. Only forklifts can enter and lift the pallet from the sides as well as ends, thus the term Partial 4-Way Entry. Top Deck Constructions for each pallet class:- (i) Stringer-Class:- (a) deckboard, and (b) panel; and (ii) Block-Class:- (a) deckboard/stringerboard, (b) panel, and (c) panel/stringerboard. Bottom Deck Constructions for each pallet class:- (i) Stringer-Class:- (a) deckboard, and (b) panel base; and (ii) Block-Class:- (a) panel base, (b) perimeter base, (c) overlap base, and (d) unidirectional base. Deck Style further defines construction style of pallet decks:- (i) Double-Wing:- ends of top and bottom deckboards and edges of top and bottom panels overhang stringer or stringerboard edge. Bottom winf must be ≤ top wing; (ii) Flush:- ends of deckboards and edges of panel are flush with stringer or stringerboard edge. For panel deck block-class pallets without stringerboards, panel edges are flush with block edges; and (iii) Single-Wing:- ends of top deckboards and edges of top panels overhang stringer or stringerboard edge. Bottom deck, if present, is Flush. Stringerboard Style further defines construction style of block-class pallets with stringerboards:- (i) Double-Cantilever:- overlap base block-class pallets only. Ends of top and bottom stringerboards overhang ends of blocks. Top and bottom stringerboards must be parallel, and bottom cantilever must be ≤ top cantilever; (ii) Flush:- ends of stringerboards are flush with ends of blocks; and (iii) Single-Cantilever:- ends of top stringerboards overhang ends of blocks. Ends of bottom stringerboards, if present, are flush with ends of blocks. Bottom Deck Orientation may be specified for block-class pallets:- (i) Overlap Base or Unidirectional Base:- bottom deckboards may be parallel or perpendicular to pallet length; and (ii) Perimeter Base:- butted boards may be parallel or perpendicular to pallet length. Outer boards will be oriented opposite direction. Pallet ID is your own name or identification for this pallet design (maximum 60 characters). It will be displayed on all printouts and drawings for this pallet. Pallet Size is the overall pallet dimensions expressed as Pallet Length x Pallet Width. Pallet Length is the length of the stringers (stringer-class pallets) or top stringerboards (block-class pallets). For panel-deck block-class pallets without stringerboards, pallet length is typically the pallet dimension parallel to the top panel deck strong axis. Pallet Width is the length of the top deckboards. For panel-deck pallets, pallet width is the top panel deck dimension perpendicular to pallet length. Pallet is a low, portable platform, usually double faced, on which cargo is stacked for storage or transportation. Pallet is a flat tray, generally made of wood but occasionally of steel, on which goods particularly those in boxes, cartons or bags, can be stacked. Its purpose is to facilitate the movement of such goods, mainly by the use of forklift trucks. A platform, usually made of wood, on which merchandise can be stacked in order to facilitate the handling by a forklift or sling. Pallet is a device on the deck of which a quantity of goods can be assembled to form a unit load for the purpose of transporting it, or of handling or stacking it with the assistance of mechanical appliances. This device is made up of two decks separated by bearers, or of a single deck supported by feet; its overall height is reduced to the minimum compatible with handling by fork lift trucks and pallet trucks; it may or may not have a superstructure. Wooden structure used to support cargo and ease movement by forklifts. Pallet:- a flat tray, generally made of wood but occasionally of steel, on which goods particularly those in boxes, cartons or bags, can be stacked. Its purpose is to facilitate the movement of such goods, mainly by the use of forklift trucks. Note that were goods are presented for shipment packed onto a pallet, then the number of packages = 1, not the number of packages on the pallet. Pallet is a platform with or without sides, on which a number of packages or pieces may be loaded to facilitate handling by a lift truck. Pallet is a wooden or plastic base upon which layers of product are stacked for storage and transporting with a forklift or pallet jack. Pallet is a wood or plastic base for securing large quantities of merchandise during shipping. Pallet:- rigid horizontal platform of minimum height, compatible with handling by pallet trucks and/or forklift trucks and other appropriate handling equipment, used as a base for assembling, loading, storing, handling, stacking, transporting, or displaying goods and loads. Note:- the pallet can be constructed with, or fitted with, a superstructure. Pallet is a portable, horizontal, rigid platform used as a base for assembling, storing, stacking, handling and transporting goods as a unit load, often equipped with a superstructure. Pallets were conceived for easy handling of all types of stackable items such as small cases, cartons or bags; they consist of wooden boards as a floor on which goods are placed, a wooden top, and the whole being securely strapped to constitute a compact unit. The floor itself is nailed onto wood blocks which allows for passage of the prongs of a forklift. Standard Europallets have the following dimensions:- 120 x 80 cm and US pallets 120 x 100 cm. Pallets are ideal for loading into containers and facilitate easy handling by forklift. It is highly recommended that each carton, case or unit of goods loaded on pallets be clearly marked to facilitate identification, in case a pallet is lost in transit. For instance, a consignment should be described as 'three pallets of each 40 cartons', instead of just 'three pallets'. Endless difficulties, loss of time and loss of supplies can occur at destination when the number of parcels on the bill of lading (B/L) and invoices does not agree with the quantity actually received because the pallet wrapping has broken. Pallet is a robust, wooden floor, on wood blocks, allowing handling by fork-lift trucks, on which goods, presented in standard packs, can be easily transported. / Под Поддоном понимается средство пакетирования, имеющее один настил или два настила и, при необходимости, настройку для размещения и крепления груза или грузов. Состоит из:- (i) Доска Настила (deckboard; крайняя, средняя и промежуточная); (ii) Доска Основная (stringerboard; крайняя и средняя); (iii) Поперечная Доска (stringer); и (iv) Шашка (block; малая и большая). У досок на внутренней поверхности могут быть сделаны заходные фаски, облегчающие заезд вилочных захватов грузоподъёмника или полозьев гидравлической тележки. Типы поддонов:- (i) однонастильный двухзаходный; (ii) однонастильный четырёхзаходный; (iii) двухнастильный четырёхзаходный; (iv) двухнастильный четырёхзаходный с окнами в нижнем настиле; и (v) двухнастильный двухзаходный с выступами. Поддон:- горизонтальная площадка минимальной высоты, соответствующая способу погрузки с помощью вилочной тележки, или автопогрузчика, или другого аналогичного оборудования, используемого для укладывания на стеллажи, перегрузки и транспортирования грузов. Примечание:- поддон может быть оборудован надстройками.

PALLET BOX = СУНДУК С ПОДДОНАМИ – Pallet Box is a transport container/box with integrated pallet. See also Pallet.

PALLET CONVERTER = УСТРОЙСТВО–ПРЕОБРАЗОВАТЕЛЬ ПОДДОНА – Pallet Converter or Portable Pallet or Rack Stacking Frame is a superstructure, with or without infill, which can be applied to a pallet to convert it into either a box or a post pallet, or for stacking. See also Pallet. / Устройство-Преобразователь Поддона – конструкция, которая может быть использована для трансформации плоского поддона в ящичный или стоечный поддон.

PALLET DESIGN SYSTEM© = СИСТЕМА ДИЗАЙНА ПОДДОНОВ© – Pallet Design System© (PDS©):- reliability-based computer-aided design (CAD) program, for determining the safe load carrying capacity, performance, life and economy of wooden pallets. See also Pallet.

PALLET DIMENSIONS = ИЗМЕРЕНИЯ ПОДДОНА – Pallet Dimensions:- when specifying pallet size, the stringer or stringerboard (block pallet) length is always expressed first; for example, a 48” x 40” pallet has a 48” stringer or stringerboard and 40” deckboards. See also Pallet.

PALLET ID = ИН ПОДДОНА – Pallet ID:- the bar code tag that is placed on a pallet for tracking purposes. See also Pallet.

PALLET INVERTER = КАНТОВАТЕЛЬ ПОДДОНОВ (или ИНВЕРТОР ПОДДОНОВ, или ОПРОКИДЫВАТЕЛЬ ПОДДОНОВ) – Pallet Inverter is a machine that aids in the transfer of product from one pallet to another. The pallet inverter flips over the pallets and product in order to put the product on the new pallet and take off the old. See also Pallet.

PALLETIZATION = УКЛАДКА НА ПОДДОНЫ (или ПАКЕТИРОВАНИЕ НА ПОДДОНАХ) – Palletization is a loading of uniform packages onto pallets in accordance with a predefined packing plan. For reasons of stability this should be done in such a way that the load items interlock. See also Pallet. / Погрузка однообразных упаковок на поддоны в соответствии с предопределённым планом упаковки. По соображениям устойчивости это должно быть выполнено таким образом, чтобы погруженные изделия или продукция находились бы в плотной укладке по отношению друг к другу.

PALLETIZE = ПАКЕТИРОВАТЬ ПОДДОНЫ (или ФОРМИРОВАТЬ ПОДДОНЫ, или УКЛАДЫВАТЬ НА ПОДДОНЫ) – Palletize:- to put materials and product onto a pallet. See also Pallet.

PALLETIZED = УЛОЖЕННЫЙ НА ПОДДОН (или ПАКЕТИРОВАННЫЙ НА ПОДДОНЕ) – Palletized:- cargo which has been grouped into a single cargo unit. Better rates are generally available for packing containers with palletized loads in the case of LCL (Less than Container Load), as a pallet load can be better handled with ground conveyors than individual items. See also Pallet. / Груз, который был сгруппирован в одно грузовое место. В целом же, более выгодные ставки за использование контейнеров могут быть предоставлены даже в случае так называемой ‘Меньше Полной Загрузки Контейнера’ (Less than Container Load (LCL)), поскольку груз, размещённый на поддонах, намного легче в обслуживании наземным транспортными средствами, нежели какие-то штучные изделия или грузы.

PALLET JACK = РОХЛА (или РОХЛЯ, или ДОМКРАТ ДЛЯ ПОДДОНОВ) – Pallet Jack:- material handling equipment consisting of pallet forks on small wheels that is used in the warehouse to move cases of product. It may be a motorized unit guided by an operator who stands on a platform; or it may be a motorized or manual unit guided by an operator who is walking behind or beside it. Pallet Jack is hand-propelled wheeled platform, equipped with a lifting device for moving palletized unit loads. Pallet Jack is a hand-operated machine that lifts heavy pallets, allowing delivery drivers to pull skids of fuel over flat, hard surfaces (such as a garage floor). Because of their maneuverability and small size, pallet jacks give you greater flexibility than forklifts to place pallets exactly where you need them. See also Pallet. / Рохля – жаргонное название вилочной тележки. Название происходит от наименования Финской компании-производителя Rocla, тележки которой одними из первых появились в бывшем Союзе Советских Социалистических Республик (СССР).

PALLET LIFE = СРОК СЛУЖБЫ ПОДДОНА – Pallet Life is the period during which the pallet remains useful, expressed in units of time or in the number of one-way trips. See also Pallet.

PALLET RIVER = ХХ (или ЗАКЛЁПКА ПОДДОНА) – Pallet Rivet is a hollow tube rivet with large head which can be pressure-peened to make a bell-shaped end. Note:- a pallet rivet is particularly useful for composite pallets where the ‘blocks’ are tubular or sheet metal. See also Pallet. / Заклёпка Поддона (Pallet Rivet):- пустотелая трубчатая заклёпка с большой головкой, которая от давления молотка приобретает колоколообразный конец. Примечание:- заклёпку поддона часто применяют для сложных поддонов, где ‘шашки’ (или ‘блоки’) трубчатые или из листовой стали. Смотрите также Поддон (Pallet).

PALLET SIZE = РАЗМЕР ПОДДОНА – Pallet Size is a nominal plan view dimensions of pallet length and pallet width. Note:- the dimensions are commonly given in mm. See also Pallet. / Размер Поддона (Pallet Size):- номинальный размер поддона, определяющий длину, ширину и высоту поддона. Примечания:- при указании размеров поддона приводят длину, ширину и высоту (l x w x h); и размеры поддонов указывают в миллиметрах (мм). Смотрите также Поддон (Pallet).

PALLET SKID = ПОЛОЗ ПОДДОНА – Pallet Skid is an assembly unit of one bottom deckboard and two or more blocks, or metal profiles with rectangular upturned ends and possibly a centre block. See also Pallet, and Skid.

PALLET TAG = ЯРЛЫК ПОДДОНА (или БИРКА ПОДДОНА) – A term Pallet Tag refers to the bar code sticker placed on a pallet of product. See also Pallet.

PALLIUM = ПАЛЛИЙ (или ПЛАЩ, или МАНТИЯ) – Pallium is a white woolen band with pendants in front and back worn over the chasuble by a pope or archbishop as a symbol of full Episcopal authority; a rectangular cloth worn as a cloak by men of ancient Greece and Rome.

PALM = PATENT APPLICATION LOCATING AND MONITORING

PALM = ПАЛЬМА – Palm is a monocotyledon of the Family Palmae with an an unbranched trunk or stem crowned with large pinnate (fan-shaped) leaves. Most Species are tropical or sub-tropical and some are economically important. / Пальма – это однодольное растение Семейства Пальмовых с неветвящимся стволом или стеблем с кроной в виде крупных перистых (веерообразных) листьев. Большинство Видов тропические и субтропические и некоторые являются значимыми с экономической точки зрения. Под Пальмами или Арековыми понимается семейство древовидных растений, большей частью неветвящимся стволом и кроной листьев на вершине. Около 3 400 видов (около 250 родов), преимущественно в тропиках. Введены в культуру Кокосовая, Масличная, Финиковая пальмы.

PALM AND NEEDLE = ПАЛЬМА И ИГЛА – Palm And Needle (maritime term):- a seaman’s sewing outfit for heavy work.

PALMATE = ПАЛЬЧАТОЕ (или ЛАПЧАТОЕ, или ДЛАНЕВОЕ) – Palmate:- divided with radial lobes like the fingers of a hand. Palmate leaves:- the nerves diverge from the main point such as the fingers do in the palm of the hand. / Среди двудольных широко распространены листья с так называемым пальчатым или длановидным жилкованием. Это пальчатожилковатые, или пальчатонервные, листья. Первичные жилки отходят радиалыно от одной точки, или у самого основания пластинки (базально), или несколько выше основания (супрабазально). Примером такого жилкования могут служить листья многих видов Клёна. В пальчатом жилковании повторяются те же основные типы, как и у перистого жилкования. Это пальчатокраевое, или пальчатокраспедодромное, жилкование (например, у Ликвидамбара, Платана, Клёна, Стеркулии, Фатсии, Винограда),

пальчатопетлевидное, или пальчатоброхидодромное, жилкование (например, у Церцидифиллума), пальчатосетчатое, или пальчатодиктиодромное, жилкование (например, у Тетрацентрона, Луносемянника и Иудина Дерева). В широком смысле слова к пальчатому типу можно отнести жилкование ряда щитовидных листьев (например, Лотоса, Клещевины, Настурции и других.

PALMATE LEAF = ПАЛЬЧАТЫЙ ЛИСТ – Palmate Leaf:- the nerves diverge from the main point such as the fingers do in the palm of the hand.

PALMATELY COMPOUND LEAF = ПАЛЬЧАТОСЛОЖНЫЙ ЛИСТ – Palmately Compound:- three or more leaflets radiating fan-like from a common basal point of attachment, e.g., Aesculus hipocastanum. A Palmately Compound Leaf is one in which all the leaflets arise from a common point at the tip of the petiole. Depending upon the number of leaflets present, the palmately compound leaves can be distinguished into the following types:- (i) Bifoliolate (when two leaflets arise from the tip of the petiole, it is said to be bifoliolate, e.g., Balanites; (ii) Multifoliolate or Digitate (when five or more leaflets arise from the tip of the petiole, it is said to be multifoliolate or digitate, e.g., Silk Cotton; (iii) Tetrafoliolate or Quadrifoliolate (when a palmately compound leaf ends in four leaflets, it is said to be tetrafoliolate or quadrifoliolate, e.g., Oxalis; (iv) Trifoliate (a trifoliolate leaf is one in which three leaflets arise from the tip of the petiole, e.g., Feronia; and (v) Unifoliolate (here only one leaflet arises from the tip of the petiole, e.g., Lemon.

PALMATELY LOBED LEAF = ПАЛЬЧАТОЛОПАСТНЫЙ ЛИСТ – Palmately Lobed Leaf:- three or more lobes radiating fan-like from a common base, e.g., Acer saccharum.

PAN = PRIMARY ACCOUNT NUMBER

PANAMA = ПАНАМА – Panama is a lightweight hat of natural-colored straw hand-plaited of narrow strips from the young leaves of the Jipijapa palm, a palm tree.

PANAMAX VESSEL = СУДНО ПЭНЭМЭКС (или СУДНО ПАНАМАКС) – Panamax:- the maximum dimensions of a vessel capable to transit the Panama Canal. Maximum size for transiting the Panama Canal. Panamax is a vessel designed to be just small enough to transit the Panama Canal. The maximum dimensions of a vessel capable to transit the Panama Canal. Panamax Vessels between 60 000 dwt and 80 000 dwt. Panamax vessels, defined as those with the maximum beam (width) of 32.2 meters permitted to transit the Panama Canal, carry coal, grain and, to a lesser extent, minor bulks, including steel products, forest products and fertilizers. / Максимальные размеры судна, способного перевозить грузы через Панамский Канал. 60 000 т грп и 80 000 т грп.

PANDA = ПАНДА – China issued its first gold coins picturing an adorable Panda design in 1982, in sizes of 1, 1/2, 1/4, and 1/10 Troy oz of 999 fine gold. Beginning in 1983 another size was added – 1/20 oz. Larger Panda coins were issued in some years, weighing 5 and 12 oz. These popular coins were issued in Prooflike Brilliant Uncirculated quality with a different design each year, through 2000. A freeze of the design was announced with the 2001 issues … and thus the 2002 Pandas were identical to 2001. But collectors spoke up in behalf of annual changes, and China has responded by reversing their policy, and announcing new designs for the 2003 Pandas. In addition, from 1986–1995 gold Panda Proof Sets were issued. Panda is the Chinese gold coin of 999.9 quality, first made in 1982. The Chinese Gold Panda is a series of gold bullion coins issued by the People's Republic of China. The official mint of the People's Republic of China introduced the Panda gold bullion coins in 1982. The panda design changes every year (with a single exception) and the gold Panda coins come in different sizes and denominations, ranging from 1/20 Troy oz to 1 Troy oz (and larger ones as well). There is also a Silver Panda series issued with the same designs as the gold Panda coins. China issued its first gold coins picturing an Panda design in 1982, in sizes of 1, 1/2, 1/4, and 1/10 Troy oz of 999 fine gold. Beginning in 1983 another size was added – 1/20 oz. Larger Panda coins were issued in some years, weighing 5 and 12 oz. These popular coins are issued in Prooflike Brilliant Uncirculated quality with a different design each year. A freeze of the design was announced with the 2001 issues – and thus the 2002 Pandas were identical to 2001. But collectors spoke up in behalf of annual changes, and China reverted to their original policy. There are several mints that produce these coins, including but not limited to:- Beijing, Shenzhen, Shanghai and Shenyang. Unlike coins made by US mints that carry mintmarks to distinguish their origin, Chinese mints usually do not employ mintmarks. In certain years there are minor variations – in the size of the date, style of the temple, etc – in the coin design that allow the originating mint to be determined. Obverse:- Depiction of the Temple of Heaven in the center with Chinese characters on top saying 'Zhonghua Renmin Gongheguo' meaning People's Republic of China and the bottom the year of issue. If the issue is a commemorative issue, the theme will be marked here also. Reverse:- different portraits of panda that changes every year (except for 2001 and 2002, which share the same design). The official distributor for the gold and silver Panda coins in China is the China Gold Coin Corporation (CGCC); in the United States, Panda America has been an official distributor since 1982. The gold pandas are legal tender in the People's Republic of China, and are currently issued in face value denominations of 500, 200, 100, 50 and 25 Yuan; from 1982 through 2000 they were issued in denominations of 100, 50, 25, and 10 Yuan with the 5 Yuan added in 1983. These correspond with 1, 1/2, 1/4, 1/10 and 1/20 Troy ounces of gold, respectively. An exception is 1991, when 1 gram gold pandas were minted, issued in the denomination of 3 Yuan. / Панда или Бамбуковый Медведь – вид млекопитающих семейства Енотовых, обитает в горах на Юго-Западе Китая, на Севере Бирмы и Непала.

PANDEMIC = ПАНДЕМИЯ (или ПАНДЕМИЧЕСКОЕ, или ПАНДЕМИЧНОЕ) – A Pandemic is defined as 'an epidemic occurring worldwide, or over a very wide area, crossing international boundaries and usually affecting a large number of people'. The classical definition includes nothing about population immunity, virology or disease severity. By this definition, pandemics can be said to occur annually in each of the temperate southern and northern hemispheres, given that seasonal epidemics cross international boundaries and affect a large number of people. However, seasonal epidemics are not considered pandemics. A Pandemic is the worldwide spread of a new disease. A Pandemic is a disease epidemic that has spread to a large group of people across a sprawling region, or across multiple nations or continents. An epidemic is a sudden disease outbreak that affects a large number of people – larger than what is normally expected – in a particular region, community, or population. A pandemic occurs when an epidemic spreads to a larger region, or across multiple nations or continents. An epidemic, and later pandemic, of an infectious disease can happen if the virus, bacteria, or other cause of the disease has recently grown stronger, is introduced somewhere it has never been before, is newly transmitted to a place where more people are exposed to it, or finds new ways to enter the bodies of those it is affecting. It also can happen if people somehow grow more susceptible to the cause of the disease or have greater exposure to it. Pandemics often are caused by viruses that start in animals and later infect humans. In the early 1800s, a cholera epidemic turned into a pandemic. The epidemic began in Bengal, India and grew into a pandemic as it travelled across India and over to China and other Asian countries. An influenza epidemic turned into a deadly pandemic in 1918, when it spread around the globe. The close quarters and moving troops of World War I helped fuel its expansion. Of the five hundred million who were infected, at least fifty million died. One of the worst pandemics in recorded history was the plague, or Black Death, in the XIV century Europe was hardest hit, with as much as half of the continent's population, or about twenty-five million, dying of the disease within four years. It was known as the Black Death because of the black skin spots that accompanied it. HIV/AIDS is an ongoing pandemic. Human Immunodeficiency Virus is the agent that causes Acquired Immune Deficiency Syndrome, which is the most advanced stage of an HIV infection. HIV attacks and weakens a

person's immune system. AIDS was first recognized as a new disease in 1981, as young homosexual men died as a result of unusual infections and cancers. HIV/AIDS mainly spreads through sexual contact, but can be transmitted through body fluids like blood, semen, vaginal fluids, and breast milk. Since the pandemic began, between 59.9 and 100 million people have been infected with HIV, and between 25 and 49.9 million people have died from AIDS-related diseases. As of 2017, between 31.1 and 43.9 million people living around the world were infected with HIV. While medical advances have helped to better treat HIV and reduce the number of AIDS-related deaths, not all countries have access to these treatments. Developing countries have the highest rates of infection and AIDS-related deaths, with the highest rates in sub-Saharan Africa. During the international 1918 influenza pandemic, in America, medical teams such as the nurses of the St. Louis Red Cross Motor Corps were dispatched en-masse to respond to the growing health crisis, often protected from infection by nothing more than face masks. Pandemic:- occurring over a wide geographic area and affecting an exceptionally high proportion of the population. / Под Пандемическим, от позднелатинского слова Pandēmus, от Греческого слова Pándēmos, означающее Общий (Common) или Публичный (Public), от Pan-, означающее Все, и Dêm(os), означающее Народ, . Под Пандемией, от Греческого слова Pandēmia, означающее Весь Народ, понимается эпидемия, охватывающая значительную часть населения страны, группы стран, континента.

PANEL DECK PALLET = ПОДДОН С ПАНЕЛЬНЫМ НАСТИЛОМ – Panel Deck Pallet is a pallet constructed with composite or structural panel top deck.

PANEL POINT = УЗЕЛ ФЕРМЫ (или ПАНЕЛЬНАЯ ТОЧКА) – Panel Point is the point of intersection where the web or webs of a truss meet a chord. / Точка пересечения, в которой раскос или раскосы фермы стыкуются с поясом.

PANELS (HOSIERY) = ПАГОЛЁНКИ (или ПАНЕЛИ, или ФИЛЁНКИ) (НОСОЧНО–ЧУЛОЧНОЕ ИЗДЕЛИЕ) – Panels (Hosiery) are knitted panels used for testing purposes. / Паголёнок чулка.

PANICLE = МЕТЁЛКА – Panicle is a branched flower cluster, a compound raceme with pedicellate flowers. A loosely-branching pyramid-shaped cluster of flowers. Panicle:- (1) An inflorescence with a main axis and at least primary and secondary branching. (2) The terminal shoot of a rice plant that produces grain. Panicle (syn. Inflorescence, Head, and Ear) is the determinate inflorescence of Rice with a racemose mode of branching, bearing pediceled spikelets and flowering from the apex downward. / ветвистая цветковая гроздь (рацемозное, или ботрическое, соцветие), сложная кисть со стебельковыми цветками (расположенными на стебельке). гроздь из цветков. Метёлка – тип соцветия. В ботанике под Метёлкой понимается ложное соцветие, многократно ветвящееся и несущее на концах ветвей простые соцветия – кисти (Сирень), колоски (у злаков), корзинки (у сложноцветных). Под Паникой, от Греческого слова Panikón, означающее Безотчётный Ужас, .

PANICLE AXIS = ОСЬ МЕТЁЛКИ – Panicle Axis (syn. Rachis, and Rhachis) is the distinctly grooved, main axis of the panicle, extending from the base to the apex. The axis is hollow except at the regions (nodes) where the primary panicle branches are borne. Panicle Axis is the main axis of the panicle from the base to the apex.

PANICLE BASE = ОСНОВАНИЕ МЕТЁЛКИ – Panicle Base:- the nearly solid node between the uppermost internode of the culm and the main axis of the panicle. This node gives rise to the first primary branches of the panicle (1–4) and usually bears no leaf or dormant bud. Panicle Base is the solid node between the uppermost internode of the culm and the panicle.

PANICLE DEVELOPMENT = РАЗВИТИЕ МЕТЁЛКИ – Panicle Development is the growth stage of the rice plant in which the spikelets become distinguishable and the panicle extends upward inside the flag leaf sheath.

PANICLE EXSERTION = ВЫБРОС МЕТЁЛКИ – Panicle Exsertion:- (1) degree of emergence of the panicle from the flag leaf sheath. (2) Growth stage of the Rice plant marked by the emergence of the panicle from the boot. / В ботанике под Метёлкой понимается ложное соцветие, многократно ветвящееся и несущее на концах ветвей простые соцветия – кисти (Сирень), колоски (у злаков), корзинки (у сложноцветных).

PANICLE INITIATION = ЗАЛОЖЕНИЕ МЕТЁЛКИ – Panicle Initiation is the growth stage of the rice plant which starts when the primordium of the panicle has differentiated and becomes visible, changing from the vegetative primordium to a reproductive primordium. Used to predict the flowering date of the rice plant.

PANICLE LENGTH = ДЛИНА МЕТЁЛКИ – Panicle Length is the length of the panicle from its base to the apex.

PANICLE PRIMORDIUM = ПРИМОРДИЙ МЕТЁЛКИ (или ЗАВЯЗЬ МЕТЁЛКИ, или ЗАЧАТОК МЕТЁЛКИ) – Panicle Primordium is the panicle at its rudimentary (earliest) stage of development.

PANICLE PULVINI = ПОДУШЕЧКА МЕТЁЛКИ – Panicle Pulvini:- the swellings in the axis of the primary panicle branches. / В ботанике под Метёлкой понимается ложное соцветие, многократно ветвящееся и несущее на концах ветвей простые соцветия – кисти (Сирень), колоски (у Злаков), корзинки (у Сложноцветных).

PANICLE PULVINUS = ЛИСТОВАЯ ПОДУШЕЧКА МЕТЁЛКИ – Panicle Pulvinus:- a swelling in the axils of the primary panicle branches, more noticeable during panicle emergence.

PANICLE SHATTERING = ОСЫПАНИЕ МЕТЁЛКИ (или ВЫМОЛАЧИВАНИЕ МЕТЁЛКИ) – Panicle Shattering:- when the Rice grains fall from the panicle before harvesting.

PANICLE THRESHABILITY = ОБМОЛАЧИВАЕМОСТЬ МЕТЁЛКИ – Panicle Threshability is a descriptive term for how easily the grain is removed from the panicle during threshing. These qualities vary with different varieties.

PANICLE TYPE = ТИП МЕТЁЛКИ – Panicle Type is a term used to classify the angle of the primary branches and spikelet density of the rice panicle, as compact, intermediate, or lax.

PANNÉ = ПАННЕ – Panné is a silk or rayon velvet with lustrous pile flattened in one direction – called also Panné Velvet; a heavy silk or rayon satin with high luster and waxy smoothness.

PANNÉ SATIN = ПАННЕ АТЛАС – Panné Satin is a satin fabric with an unusually high luster because of the application of very heavy roll pressure in finishing. Panné satin is made of silk or one of the manufactured fibers. / , от Французского слова Panné, означающее Не Имеюший или Сукно Типа Плюш, . Панне Атлас – атлас с исключительно высоким блеском.

PANNÉ VELVET = ПАННЕ БАРХАТ – Panné Velvet is a velvet of silk or a manufactured fiber, with a finish in which the pile is flattened and laid in one direction. Panné velvet is a lustrous, lightweight fabric. Panné Velvet is a type of lustrous, lightweight velvet fabric, usually made of silk or a manufactured fiber, in which the pile has been flattened in one direction. Panné Velvet is a lightweight, glossy, velvet fabric in which the pile has been flattened in a single direction. Panné velvet has a nice stretch across the grain and is used for apparel such as tops and dresses. Panné Velvet is a velvet with the pile flattened in one direction. See also Mirror Velvet.

Panné Velvet has a longer or higher pile than velvet, but shorter than plush. It is pressed flat and has a high lustre made possible by a tremendous roller-press treatment given the material in finishing. Now often made as knit fabric. / Смотрите также Зеркальный Бархат (Mirror Velvet). Панне Бархат – ткань с исключительно высоким блеском, у которой ворс приглажен в одну сторону.

PANNIER = ПАНЬЕ (или КОРЗИНКА) – Pannier is an overskirt draped at the sides of a skirt for an effect of fullness. / .

PANNING = ПРОМЫВКА – Panning is the classic and simple method of mining alluvial gold. / Классический и простой метод добычи аллювиального золота с помощью лотка.

PANOPLY = ПАНОПЛИЯ (или ДОСПЕХИ) – Panoply is a full suit of armor; ceremonial attire.

PANT = ХХ (или УНТЫ) – Pant is an outer garment covering each leg separately and usually extending from the waist to the ankle. Usually used in plural; (chiefly British) men's underpants; (plural) pantie. / panties = трусики.

PANTALETS = ПАНТАЛЕ (или ПАНТАЛОНЫ) – Pantalets are the long loose drawers frilled at the ankle and showing beneath the skirt worn by mid-XIX century women. / .

PANTALOONS = ПАНТАЛОНЫ – Pantaloons are the wide breeches worn especially in England during the reign of Charles II; close-fitting trousers usually having straps passing under the instep and worn especially in the XIX century; loose-fitting usually shorter than ankle-length trousers. / Чарлз II (Charles II).

PANTDRESS = ЮБКА–БРЮКИ – Pantdress is a dress having a divided skirt. / Платье, состоящее из лифа и юбки-брюк.

PANTIE = ТРУСИКИ – Pantie is a woman's or child's undergarment covering the lower trunk with a closed crotch. Usually used in plural.

PANTIE GIRDLE = ТРУСИКИ КОРСЕТ – Pantie Girdle is a woman's girdle having a sewed-in or detachable crotch and made with or without garters and bones.

PANTOFLE = ПАНТУФЛЬ (или ДОМАШНЯЯ ТУФЛЯ, или ТАПОЧЕК) – Pantofle is a slipper. / .

PANTONE® = ПЭНТОН® – Pantone® is a registered trademark of Pantone, Inc.. The Pantone company produces a wide range of color guides useful in almost any industry dealing with color. The colors in the guide are widely accepted as standards. Colors are sometime seen described as a Pantone number:- Pantone applies a unique number to each color. Pantone Inc. is a corporation headquartered in Carlstadt, State of New Jersey (NJ), the United States. The company is best known for its Pantone Matching System (PMS), a proprietary color space used in a variety of industries, primarily printing, though sometimes in the manufacture of colored paint, fabric, and plastics. In October 2007, X-Rite Inc., a supplier of color measurement instruments and software, purchased Pantone Inc. for USD180 million. / Экс-Райт Инк. (X-Rite Inc.) Пэнтон Инк. (Pantone Inc.).

PANTONE® MATCHING SYSTEM® = СИСТЕМА ПОДБОРА® ОТ ПЭНТОН® – The Pantone® Matching System® (PMS) is a standardized color matching system, utilizing the Pantone® numbering system for identifying colors. By standardizing the colors, different manufacturers in different locations can all reference a Pantone® numbered color, making sure colors match without direct contact with one another. The most commonly referenced colors are in the Pantone® solids palette. The Pantone® Solid palette consists of 1 114 colors, identified by three or four digit numbers, followed by a C, U, Or M suffix. Originally designed for the graphics industry, the pantone solids palette is now used by a wide range of industries, and is the most commonly used palette. For example, Pantone® 199 Red can be identified as Pantone 199C (C = Coated Paper), Pantone® 199U (U = Uncoated Paper) or Pantone® 199M (M = Matte Paper). Pantone® also has a Process palette, which consists of more than 3 000 color variations digitally created with CMYK process printing. Process printing requires the use of Cyan, Magenta, Yellow, and Black ink. Work printed using CMYK is also referred to as 4 Color Process Printing. All colors in this palette start with DS and contain hypenated numbers, from DS-1-1 thru DS-334-9 and may be followed by a C (coated) or U (uncoated). These guides are only suitable for four-color process printing, and are used to design color build using CMYK, in various combinations. The Pantone® Color Bridge can be used to convert Solid Colors into CMYK percentages. Pantone also has a Textile palette, which consists of 1 925 Pantone® for Fashion and Home colors, identified by two digits, followed by a hyphen, four digits, and then a suffix. They also have a name, as a secondary identifier.The Fashion and Home colors are used by fashion, textile, and apparel designers and manufacturers worldwide. For example Pantone® 19-2430 could be identified as Pantone® 19-2430 TPX Purple Potion (Printed on Paper) or 19-2430 TC Purple Potion (Dyed on Cotton). Pantone also has a Plastics palette, which consists of 735 transparent and 1 005 opaque plastic color chips. The plastics palette is used primarily by industrial designers and manfacturers worldwide to specify colors for molded and fabricated plastics. These chips are conveniently arranged in three ring binders, and each chip has three levels of thickness, to display different levels of transparency. Plastic selectors are offered in either opaque (Q) or transparent (T). An example of an opaque color would be Q200-2-4. The transparent colors begin with a T. Finally, Pantone® has the Goe Palette, which contains 2 058 chromatically-arranged solid colors, and should not be confused with the Pantone® Solids Palette. This system is relatively new. History:- Pantone® developed the first color matching system in 1963, which consisted of a large number of small cardboard sheets, printed on one side with a series of related color swatches and then bound into a small 'fan deck'. This system was referred to as the Pantone® Matching System®, or the PMS system. It's goal was to allow designers to 'color match' specific colors when a design enters production. This system was widely adopted by graphic designers and reproduction and printing houses and is still used today to specify colors for a wide range of industries. The Pantone® Solid Colors Palette, with over 1 100 unique, numbered colors, was originally devised to help printers and designers specify and control colors for print projects. This is the most widely used Pantone palette, with colors sometimes referred to as PMS (short for the Pantone® Matching System®) or 'spot colors', and is used in the graphics, print, and publishing, industries. Pantone LLC has World Headquarters in Carlstadt, State of New Jersey (NJ), the United States. Pantone LLC, a wholly owned subsidiary of X-Rite, Incorporated, is the world-renowned authority on color and provider of color systems and leading technology for the selection and accurate communication of color across a variety of industries. The Pantone® name is known worldwide as the standard language for color communication from designer to manufacturer to retailer to customer. Pantone LLC, a wholly owned subsidiary of X-Rite, Incorporated, is the world-renowned authority on color. For 50 years, Pantone® has been inspiring design professionals with products, services and leading technology for the colorful exploration and expression of creativity. History:- In 1963, Lawrence Herbert, Pantone's founder, created an innovative system for identifying, matching and communicating colors to solve the problems associated with producing accurate color matches in the graphic arts community. His insight that the spectrum is seen and interpreted differently by each individual led to the innovation of the PANTONE® MATCHING SYSTEM®, a book of standardized color in fan format. Pantone has since expanded its color matching system concept to other color-critical industries, including digital technology, fashion, home, plastics, architecture and contract interiors, and paint. Today, the PANTONE® Name is known worldwide as the standard language for accurate color communication, from designer to manufacturer to retailer to customer, across a variety of industries. Pantone continues to develop color communication and inspirational tools, and aggressively adopts new digital technology to address the color needs of the creative community (design and production professionals) everywhere. Pantone was acquired by X-Rite, Incorporated in October 2007. Markets

and Products:- each year, innumerable products and services are sold by Pantone and its hundreds of licensees in over 100 countries in the graphic arts, fashion, home, interior, plastics, architectural, paint, industrial design and consumer markets. Graphic Arts – Printing, Publishing & Packaging:- The PANTONE® PLUS SERIES for multimedia graphics – today's version of the PANTONE® MATCHING SYSTEM – is the definitive international reference for selecting, specifying, matching and controlling ink colors. The PANTONE® FORMULA GUIDE, a two-guide set consisting of 1 677 solid PANTONE® Colors on coated and uncoated stock, shows corresponding printing ink formulas for each color, and the two-book set of SOLID CHIPS provides coated and uncoated perforated tear-out chips that can be used for quality control. The digitally created PANTONE® CMYK Guides provide a comprehensive palette of 2 868 colors achievable in four-color process printing. The PANTONE® COLOR BRIDGE® GUIDES coated and uncoated compare solid PANTONE® Colors to their closest possible match in CMYK four-color process that can be achieved on a computer monitor, output device or printing press. Other PANTONE® Color Reference Guides for the graphic arts include METALLICS, PREMIUM METALLICS, PASTELS and NEONS. Fashion & Home:- The PANTONE® FASHION + HOME Color System is a vital tool for designers in the apparel, home furnishings and interior design industries for selecting and specifying color used in the manufacture of textiles and fashion. The System – consisting of 2 100 colors in cotton or paper format – is ideal for assembling creative palettes and conceptual color schemes, and for providing color communication and control in the manufacturing process. Through a partnership with Clariant International, one of the world's largest textile colorant and chemical producers, the PANTONE® SMART Color Swatch Card System enables designers and manufacturers to expedite the color development cycle efficiently and accurately, dramatically increasing speed-to-market and reducing costs. The PANTONE® VIEW Colour Planner is a biannual trend forecasting tool that offers seasonal color direction and inspiration 24 months in advance for multiple usages, including menswear, women's wear, activewear, cosmetics and industrial design. Introduced in 2004, PANTONE® VIEW Home is a comprehensive forecasting tool for the home furnishings industry. Paint:- In 2006, Pantone partnered with Fine Paints of Europe to create PANTONE® PAINTS, a line of premium-quality Dutch paint, empowering designers and consumers with the ability to match over 3 000 PANTONE® Colors in paint. Plastics:- The PANTONE® PLASTICS Color System™ allows designers, manufacturers and suppliers who work with plastics to select, specify, control and manufacture hundreds of colors through opaque and transparent plastic color chips in the system. It offers a comprehensive color range that is reproducible in plastics. Pantone Universe:- PANTONE® UNIVERSE is a collection of lifestyle products based on fashion color trends for the consumer. The collection, consisting of tabletop, stationery items, travel gear, accessories and rainwear, combines timeless designs and modern materials with current trend colors. Color Management:- in 2001, Pantone began marketing affordable digital color control solutions to graphic artists, designers, photographers and printers. Lights and Scales:- PANTONE Color Viewing Lights allow the user to preview color choices in different lighting conditions. PANTONE® formula scales are pre-programmed with formulas for all PANTONE® Colors, including PASTELS and METALLICS, and are available in various sizes for small, medium and large print shops. RESEARCH & DEVELOPMENT LABS:- Pantone supports its color communication systems with industry-specific research and testing labs:- (i) Ink Lab scientists develop new formulas to update PANTONE Color palettes and test licensee samples for quality control; (ii) Textile Lab technicians verify formulas for color reproduction, and dye and prepare fabric for the PANTONE® FASHION + HOME swatch books. They also provide custom color dying services to textile clients. (iii) Advanced Color Technology experts develop core technology and digital solutions for the accurate viewing and printing of PANTONE® Colors. The department provides licensed technology to software and color output device manufacturers such as Adobe, Hewlett-Packard, Xerox, Quark and Microsoft to ensure the best possible representation of PANTONE® Colors. PANTONE® Custom Color Services provide custom color standards for corporate managers and art directors in fashion, home, contract design, paint, beauty, automotive, sports and pharmaceutical – any industry requiring color accuracy. PANTONE® Custom Color Services also provides products to specify corporate identity, product color and packaging standards, including color standards showing one or more PANTONE® Colors or custom colors on paper, cotton or custom substrates, as well as the corresponding CMYK, HTML and RGB values. The Pantone Color Institute® is a color research and information center that shares its color expertise with professionals in a variety of industries including fashion, commercial/industrial, contract and interior design, graphic arts, advertising, film and education. Recognized throughout the world as the leading source of color information, the Institute is used as a resource by the world's most influential media. Through the Pantone Color Institute, Pantone continues to study how color influences human thought processes, emotions and physical reactions, furthering its commitment to providing professionals with a greater understanding of color and to help them utilize color more effectively. Leatrice Eiseman, America's leading color expert, is the executive director of the Pantone Color Institute®. On September 05, 2007 Pantone introduced the Goe System. Goe consists of over 2 000 new colors in a new matching and numbering system. In addition to the standard swatch books (now called the GoeGuide), the new system also includes adhesive-backed GoeSticks, interactive software, tools, and an online community where users are able to share color swatches and information. The Goe system is streamlined to use fewer base colors (10 + Clear coating for reflections) and accommodates many technical challenges in reproducing colors on a press. / Цветовая Система Пэнтон (Pantone) для текстильной промышленности и дизайна одежды развивается с 1980-х и в настоящее время насчитывает 2 100 цветов. В отличие от Pantone Plus, системы цветов Pantone для полиграфии и графического дизайна, система Fashion + Home разработана специально для тканей, с учётом всех особенностей текстиля и текстильных красителей. В частности, в системе присутствует богатая палитра светлых и белых оттенков, отсутствующая в полиграфической системе, где роль белого цвета выполняет бумага. В справочниках цвета системы имеют индексы TPX и TCX. До 2006 эти индексы имели вид TP и TC. Индекс TPX используется в справочниках на бумажном носителе, где краситель нанесён на бумажную подложку. Цветовые плашки в справочниках на бумаге матовые. TCX – индекс для справочников с носителем из 100% хлопка. В этих справочниках образцы цвета сделаны в виде лоскутов ткани. Различают две разновидности текстильных образцов Pantone:- образцы ткани наклеены на бумажную подложку, и образцы ткани свободно закреплены в виде двуслойной 'петли' (такие образцы называются Образчик (Swatch)). Все справочники Pantone содержат одинаковое количество цветов:- 2 100 – всю библиотеку Pantone Fashion + Home. Различные справочники отличаются друг от друга только типом носителя:- бумага или хлопок – и размером образца, а также ценой. Большая часть ассортимента цветовых справочников Pantone для текстиля и дизайна одежды постоянно в наличии на складе в Москве. Отдельные позиции поставляются под заказ. Также под заказ доступны отдельные страницы для справочника Pantone Fashion + Home с отрывными образцами (Color Specifier) и отдельные цвета на хлопоквых лоскутах большого размера (SMART Swatch Card).

PANTSUIT = БРЮЧНЫЙ КОСТЮМ – Pantsuit is a woman's ensemble consisting usually of a long jacket and tailored pants of the same material.

PANTYHOSE = КОЛГОТКИ – Pantyhose or Panty Hose [pntee hoz] or Pan'ti Hose (plural noun). Clothing for covering the legs. A one-piece undergarment consisting of hosiery combined with panties. Called 'Trunk Hose' in medieval times.

PANTY WAIST = XX – Panty Waist is the originally a child's two-piece undergarment that buttoned together at the waist.

PAO = POLYALPHAOLEFIN

PAO SYNTHETIC FLUID = СИНТЕТИЧЕСКАЯ ЖИДКОСТЬ ПАО – PAO Synthetic Fluid:- polyalphaolefins, often called Synthetic Hydrocarbons, are probably the most common type of synthetic base oil used today. They are moderately priced, provide excellent performance and have few negative attributes. PAO base oil is similar to mineral oil. The advantage comes from the fact that it is built, rather than extracted and modified, making it more pure. Practically all of the oil molecules are the same shape and size and are completely saturated. The potential benefits of PAOs are improved oxidative and thermal stability, excellent demulsibility and hydrolytic stability, a high viscosity index (VI), and very low pour point. Most of the properties make PAOs a good selection for temperature extremes – both high operating temperatures and low start-up temperatures. Typical applications for PAOs are engine oils, gear oils and compressor oils. The negative attributes of PAOs are the price and poor solubility. The low inherent solubility of PAOs creates problems for formulators when it comes to dissolving additives. Likewise, PAOs cannot suspend potential varnish-forming degradation by-products, although they are less prone to create such material. / Синтетическая Жидкость ПАО:- полиальфаолефины, часто называемые Синтетическими Углеводородами, являются вероятно наиболее общим типом синтетического базового масла, используемого сегодня. Они . являются двигательные масла, передаточные масла и компрессорные масла.

PAP = PROCESSED ANIMAL PROTEIN

PAPA = ПАПА – Papa (pronunciation:- pah-PAH) or P is international nautical signal flag meaning:- All personnel return to ship; proceeding to sea (Inport). Meaning:- all aboard, vessel is about to proceed sea. (At sea) your lights are out or burning badly. Inport:- All personnel return to ship; proceeding to sea. Underway, when used by a fishing vessel:- 'My nets have come fast upon an obstruction'.

PAPER = БУМАГА – Paper:- in business, any instrument evidencing a claim or ownership right, which is widely negotiable in financial markets. Term commonly used in banking and commerce to denote instruments of exchange that are traded on financial markets, such as marketable securities, on money markets, such as bills of exchange, Treasury bills and Treasury notes, or on mortgage markets. See also Commercial Paper. General term for short-term debt instruments such as commercial paper. / Бумага – обобщённый термин для обозначения краткосрочных долговых инструментов, таких как коммерческие бумаги.

PAPER BARREL = БУМАЖНЫЙ БАРРЕЛЬ – Paper Barrel is a term used to denote trade in non-physical oil (futures, forwards, swaps, etc) markets which give a buyer or seller the right to a certain quantity and quality of crude oil or refined products at a future date, but not to any specific physical lot. / Бумажный Баррель – термин, используемый для обозначения торговли на рынке нефизической нефти (посредством фьючерсов, форвардов, свопов и тому подобного), который предоставляет покупателю или продавцу право на определённое количество и качество нефти или очищенных нефтепродуктов на какую-то дату в будущем, но не на какую-то конкретную партию физической продукции.

PAPER CHROMATOGRAPHY = БУМАЖНАЯ ХРОМАТОГРАФИЯ – Paper Chromatography is a method which involves placing a drop of fluid on a permeable piece of paper and noting the development and nature of the halos, or rings, surrounding the drop through time. The roots of this test can be traced to the 1940s, when railroads used the 'blotter spot' tests. See also Chromatography.

PAPER DUNNAGE = БУМАЖНЫЙ ДЕННАЖ (или ДЕННАЖ БУМАГОЙ) – Paper Dunnage:- covering the floor, sides and cargo surface with paper dunnage provides protection against dripping sweat. / Буммажный Деннах:- покрытие поверхности пола, сторон и груза бумажным деннажем обеспечивает защиту от образования каплевидной испарины.

PAPER GOLD = БУМАЖНОЕ ЗОЛОТО – Paper Gold is a term used to describe gold contracts such as loco London deals and futures contracts which do not necessarily involve the delivery of physical gold.

PAPER LOSS = ДОКУМЕНТАРНЫЙ УБЫТОК (или ДОКУМЕНТАЛЬНЫЙ УБЫТОК) – Paper Loss:- non-realized book losses on securities. Difference between current price and original purchase price. The loss that would be realized if open contracts were liquidated as of a certain time or a certain price. An unrealized loss on a security still held. Paper losses become realized only when the security is sold. The opposite of Paper Profit.

PAPERMAKER'S FELT = ВОЙЛОК ДЛЯ ПРОИЗВОДИТЕЛЕЙ БУМАГИ – Papermaker's Felt:- formerly, a heavy, wide, coarse, worsted or woolen fabric that was threaded between the rolls of the papermaking machine to form an endless conveyer belt for pulp or wet paper in its passage through the machine. These products are now also made of various constructions, woven and nonwoven, of manufactured fibers and monofilaments. / мононить (monofilament).

PAPER PROFIT = ДОКУМЕНТАРНАЯ ПРИБЫЛЬ (или ДОКУМЕНТАЛЬНАЯ ПРИБЫЛЬ, или НЕРЕАЛИЗОВАННАЯ ПРИБЫЛЬ) – Paper Profit:- non-realized capital gains on securities. Difference between current price and original purchase price. Paper Profit is the profit that would be realized if open contracts were liquidated as of a certain time or a certain price. An unrealized profit on a security still held. Paper profits become realized only when the security is sold. The opposite of Paper Loss. See also Profit-Taking.

PAPER–ROLL CLAMP = ЗАЖИМ (или ЛАПЫ) ДЛЯ БУМАЖНЫХ РУЛОНОВ – Paper-Roll Clamp:- designed specifically for the handling of large paper rolls, the paper roll clamp is a lift truck attachment that clamps around the roll and also allows for a full 360 degree rotation.

PAPER TAFFETA = БУМАЖНАЯ ТАФТА – Paper Taffeta is a lightweight, crisp taffeta used for evening clothes. Paper Taffeta:- plain weave, very light in weight and treated to give a crisp, paper-like finish.

PAPER TRADE = ДОКУМЕНТАРНАЯ ТОРГОВЛЯ (или ТОРГОВЛЯ НА БУМАГЕ, или ИМИТАЦИОННАЯ ТОРГОВЛЯ) – Paper Trade is a hypothetical trade that does not involve any monetary transactions. Paper trading is a risk-free way to learn the ropes of the market. / Гипотетическая торговля, которая не предполагает под собой никаких монетарных операций. Документарная торговля является безопасным способом обучения всем тонкостям рынка.

PAPILLA = ПАПИЛЛА (или БУГОРОК, или СОСОЧЕК) – Papilla is small, rounded protruberance from any plant surface. Hence:- Adj. papillose – of or relating to or resembling papilla. / Под Папиллой, от Латинского слова Papilla, означающее Сосок, понимается.

PAPILLATE = ПАПИЛЛЯРНОЕ (или НЕСУЩЕЕ ПАПИЛЛЫ, или ПОКРЫТОЕ ПАПИЛЛАМИ, или СОСОЧКОВИДНОЕ, или В ВИДЕ ПАПИЛЛ) – Papillate:- covered with many tiny projections (papilla). / , от Латинского слова Papilla, означающее Сосок, .

PAPILLOSE = ПАПИЛЛОЗНОЕ (или СОСОЧКОВОЕ, или СОСОЧКОВИДНОЕ) – Papillose:- bearing minute, nipple-shaped projections. / , от Латинского слова Papilla, означающее Сосок, .

PAPPUS = ХОХОЛОК (или ЛЕТУЧКА, или СЕМЯНКА–ЛЕТУЧКА) – Pappus is a ring of hairs or scales around the top of the fruit of the composites. / Под Летучкой понимается крыловидный вырост или крупный волосок у семян или плодов многих растений (Ваточника, Кипрея и других). Способствует их распространению ветром.

PAPR = PARTIALLY ACIDULATED PHOSPHATE ROCK

PAPYRACANTHA = ПАПИРАКАНТА (или С БУМАЖИСТЫМИ ШИПАМИ) – Papyracantha:- with papery spines. / с бумажно-пергаментными шипами.

PAR = PERFORMANCE AND ACCOUNTABILITY REPORT

PAR = PHOTOSYNTHETIC AQUATIC BIOMASS

PAR = БАЗА (или НОМИНАЛ) – A term Par refers to the standard delivery point(s) and/or quality of a commodity that is deliverable on a futures contract at contract price. Serves as a benchmark upon which to base discounts or premiums for varying quality and delivery locations. Also known as Basis Grade.

PAR = НОМИНАЛ (или КУПЮРА) – (1) Par means the price of a security corresponds to its nominal (face) value. If a security is issued at a price above (below) its face value, it is 'above par' ('below par'). The difference is the agio (disagio). A security lists at par when it is trading at 100 percent of its nominal (face) value. Equal to the face value or current rate. Par is the nominal value of a security. This Par Value will bear no relation to the market value of the security which will rise and fall in relation with supply and demand in the market. In bond markets, an index (usually 100) representing the face value of a bond. Par:- the face value of a stock, assigned by a corporation at the time the stock is issued. The par value is often printed on the stock certificate, but the market value of the stock may be much more or much less than par. In securities market, the face value of a security or bond. For example, a bond selling at par is worth the same Dollar amount it was issued for or at which it will be redeemed at maturity. Par:- redeemable at par means £1 nominal of the stock/security is paid out as £1 cash. Issued at par means that £1 nominal of stock/security costs £1 to purchase when the stock/security is first issued. / На рынке ценных бумаг, номинальная стоимость ценной бумаги или облигации. Например, облигация, продающаяся по номиналу, оценивается в ту же Долларовую сумму, по которой она была выпущена или по которой она будет выкуплена при погашении. Под Купюрой, от Французского слова Coupure от Couper, означающее Отрезать или Резать, понимается наименование нарицательной стоимости бумажных денег, банкнот или ценных бумаг. Под Номиналом, от Латинского слова Nominalis, означающее Именной, понимается нарицательная стоимость ценных бумаг, бумажных денег, банкнот и монет.

(2) Par:- ratio defining the value of a currency relative to the standard or nominal value on which it is based. / Соотношение, определяющее стоимость валюты со стандартной или номинальной ценой, на которой она базируется.

PARA = ПАРА – Para is a chemical prefix, usually abbreviated p, indicating that two substituents on a benzene ring are separated by two carbon atoms.

PARABOLIC = ПАРАБОЛИК (или ПАРАБОЛИЧЕСКИЙ) – In technical analysis, a type of indicator that is often used as a trailing stop. / В техническом анализе биржевых рынков, тип индикатора, часто используемый в качестве ползущего стопа или ползущего уровня фиксации.

PARABOLIC SAR = ПАРАБОЛИЧЕСКИЕ ОИР (или ОСТАНОВКА И РАЗВОРОТ ПАРАБОЛИКА) – In technical analysis, an indicator that sets trailing price stops for long or short positions. Parabolic SAR (Stop-And-Reversal) Indicator is more popular for setting stops than for establishing direction or trend. If the trend is up, buy when the indicator moves below the price. If the trend is down, sell when the indicator moves above the price. Also known as Stop-And-Reversal Indicator. Parabolic SAR was developed by J. Welles Wilder. The Parabolic SAR indicator provides excellent entry and exit points in trending markets. / В техническом анализе биржевых рынков, . Дьжей. Вэлз Вайлдё Младший (J. Welles Wilder Jr) является одним из крупнейших разработчиков индикаторов технического анализа. Начинал он с ремонта автомобилей, затем служил в армии и работал торговцем недвижимости, прежде чем ввязался в биржевой рынок, вложив средства во фьючерс на серебро, и занялся углублённым изучением технической стороны биржевой торговли. Результатом этой деятельности стали многочисленные статьи в специализированных журналах для биржевых торговцев и инвесторов, а также книги, и частности, книга Новые Концепции в Технических Системах Торговли (New Concepts in Technical Trading Systems). Вайлдё разработал систему Delta Plus, технические индикаторы ADX, ART, DMI, RSI, параболическую систему SAR, и другие. В 1980-е он основал общество Delta Society International, помогающее биржевым торговцам и инвесторам со всего света обмениваться информацией и опытом торговли.

PARACHUTE FABRIC = ПАРАШЮТНАЯ ТКАНЬ – Parachute Fabric is a compactly woven, lightweight fabric comparable with airplane cloth. It is made of silk, nylon, rayon, cotton, or polyester. / Найлан^{TЗ} (Nylon^{TM}).

PARAFFIN = ПАРАФИН – Paraffin is any hydrocarbon identified by saturated straight (normal) or branched (iso) carbon chains; also called an Alkane. The generalized paraffinic molecule can be symbolized by the formula C_nH_{2n+2}. Paraffins are relatively non-reactive and have excellent oxidation stability. In contrast to naphthenic oils, paraffinic lubricating oils have relatively high wax content and pour point, and generally have a high viscosity index (VI). Paraffinic solvents are generally lower in solvency than naphthenic or aromatic solvents. Paraffin is a wax extracted from crude (petroleum) oil (North American usage; in Britain, paraffin means kerosene). Paraffin wax (actually a number of waxes with somewhat different characteristics) is used, by itself or in mixtures with other waxes such as beeswax, as a dye resist in batik. It quite brittle and cracks easily. 'Canning wax', sold in North America (and elsewhere, presumably) for sealing home-made jam and jelly and the like, is paraffin. Most candle wax, other than beeswax, is paraffin. / Под Парафином, от Латинских слов Parum, означающее Мало, и Affinis, означающее Сродный, понимается бесцветная воскоподобная смесь твёрдых насыщенных углеводородов состава $C_{18}H_{38}$–$C_{35}H_{72}$; $t_{пл}$ 40–65 °C; плотность 0.88–0.915 г/см^3 (15 °C). Название парафина связано с его нейтральностью по отношению к реактивам. Выделяют из нефтяных фракций при их депарафинизации. Электроизоляционный материал, компонент пластичных смазок, присадка к смазочным маслам, сырьё в производстве синтетических жирных кислот и высших жирных спиртов. Используется также для аппретирования тканей, пропитки упаковочной бумаги для пищевых продуктов, парафинирования древесины, в медицинской практике (парафинолечене) и так далее. Под Парафином понимается воскоподобное вещество, смесь предельных углеводородов состава $C_{18}H_{38}$–$C_{35}H_{72}$; $t_{пл}$ 40–65 °C; плотность 0.88–0.915 г/см^3 (15 °C). Получают главным образом из нефти. Применяют для приготовления парафинистой бумаги, пропитки древесины в спичечном и карандашном производствах, для аппретирования тканей, как изоляционный материал, химическое сырьё и так далее. В медицине используется для парафинолечения. Парафин, от Немецкого слова Paraffin, от Латинских слов Parum, означающее Мало, и athnis, означающее Сродный:- назван так из-за нейтральности к большинству химических реагентов), нефтепродукт, смесь алкановых углеводородов преимущественно нормального строения с числом атомов углерода от 9 до 40. В парафине присутствуют также

изопарафиновые, циклопарафиновые (нафтеновые) и нафтено-ароматические углеводороды. Твёрдый парафин ($t_{пл}$ 45–70 °C) получается в основном из масляных дистиллятов парафинистых нефтей при обезмасливании гача (смеси парафина с маслом), выделившегося в процессе депарафинизации методом кристаллизации. Выделяют парафин из нефтяных фракций также путём избирательной адсорбции нормальных алканов цеолитами. Жидкий парафин, выкипающий в пределах 180–360 °C, получают при карбамидной депарафинизации некоторых нефтепродуктов (смотрите Очистка Нефтепродуктов). Товарные парафины проходят предварительную обработку адсорбентами и подвергаются очистке другими методами. Вследствие химической индифферентности и ряда других свойств парафин используют в пищевой промышленности, в медицине, косметике, парфюмерии и других, а также в электротехнической промышленности как изоляционный материал. Парафин служит сырьём для нефтехимической промышленности (из него получают высшие жирные кислоты и спирты, моющие вещества и другое). Промышленностью выпускается несколько марок парафина:- технический высокоочищенный, технический очищенный, медицинский и другие. Парафины – то же, что Насыщенные Углеводороды (Алканы).

PARAFFINIC = ПАРАФИНОВОЕ – Paraffinic is a type of petroleum fluid derived from paraffinic crude oil and containing a high proportion of straight chain saturated hydrocarbons. Often susceptible to cold flow problems.

PARAFFIN WAXES = ПАРАФИНЫ (или ПАРАФИНОВЫЙ ВОСК, или ПАРАФИНОВЫЕ ВАКСЫ) – Paraffin Waxes:- these are saturated aliphatic hydrocarbons. These waxes are residues extracted when dewaxing lubricant oils. They have a crystalline structure which is more-or-less fine according to the grade. Their main characteristics are as follows:- they are colorless, odorless and translucent, with a melting point above 45 °C. / Это насыщенные алифатические (или ациклические) углеводороды, известные также как Алканы. Эти воскоподобные вещества являются остатком, экстрагируемым в процессе депарафинизации смазочных масел. Они имеют кристаллическую структуру, которая более менее тонкая соответственно данному сорту. Их основными характеристиками являются:- отсутствие цвета, запаха и просвечиваемости; температура плавления выше 45 °C.

PARALLEL IMPORTS = ПАРАЛЛЕЛЬНЫЕ ПРИВОЗЫ (или ПАРАЛЛЕЛЬНЫЙ ИМПОРТ) – Parallel Imports:- when a product made legally (i.e. not pirated) abroad is imported without the permission of the intellectual property right-holder (e.g., the trademark or patent owner). Some countries allow this, others do not.

PARALLELING = ПАРАЛЛЕЛИЗАЦИЯ – Paralleling is the process of aligning fibers to produce a more uniform, smoother, stronger yarn. / Параллелизация – процесс параллельного расположения волокон.

PARALLEL STRAND LUMBER = ДРЕВЕСНЫЙ СЛОИСТЫЙ ПЛАСТИК (или ПИЛОМАТЕРИАЛ С ПАРАЛЛЕЛИЗОВАННЫМИ ПРОЖИЛКАМИ) – Parallel Strand Lumber is a structural wood product made by gluing together long strands of wood which have been cut from softwood veneer. / Под Древесными Слоистыми Пластиками (ДСП) понимаются материалы, изготовленные из листов лущёного шпона, уложенных в определённом порядке (по направлению волокон) и склеенных синтетическими клеями в процессе термической обработки под большим давлением. Древесные слоистые пластики отличаются высокой плотностью (1 230–1 330 кг/м^3). Они применяются в машиностроении, электротехнике, авиа- и судостроении.

PARALLEL SYSTEMS = ПАРАЛЛЕЛЬНЫЕ СИСТЕМЫ – Parallel Systems are the lubrication systems where the dispensing devices are connected to the main line in parallel. Each dispensing device operates independent of any other in the system.

PARALLEL–VEINED LEAF = ЛИСТ С ПАРАЛЛЕЛЬНЫМ ЖИЛКОВАНИЕМ (или ЛИСТ С ПАРАЛЛЕЛЬНОБЕЖНЫМ ЖИЛКОВАНИЕМ, или ЛИСТ С ПАРАЛЛЕЛОДРОМНЫМ ЖИЛКОВАНИЕМ) – Parallel-Veined Leaf:- the veins run at the same distance to each other, like in canes.

PARAMETER = ПАРАМЕТР – Parameter is the true value of an attribute or characteristic of a population. / Под Параметром, от Греческого слова Parametrōn, означающее Отмеривающий, понимается величина, характеризующая какое-либо основное свойство процесса, явления или системы, машины, прибора (например, электрическое сопротивление, теплоёмкость, быстродействие, масса, коэффициент трения и другие). Параметры могут быть сосредоточенными (например, ёмкость электрического конденсатора, масса подвешенного к балке груза) и распределёнными в пространстве (например, индуктивность линии электропередачи).

PARAMOUNT CLAUSE = ПЕРВОСТЕПЕННАЯ ОГОВОРКА – Paramount Clause is essentially a clause that incorporates a cargo liability regime, usually the Hague or Hague-Visby Rules (the Rules), into the subject charter. Such clauses are necessary as, under English law at least, the Rules are not compulsorily applicable to charterparties. So, where the Rules do not apply compulsorily, sufficiently clear words of incorporation are needed. See, for example, Clause 24 of the NYPE 1946 form (short for the New York Produce Exchange 1946 time charterparty form), which reads as follows:- 'It is further subject to the following clauses… the Carriage of Goods by Sea Act of the United States, approved April 16, 1936, which shall be deemed to be incorporated herein…'. What is the effect of a clause paramount? Defence of claims outside of cargo loss or damage:- Where the Rules are successfully incorporated and apply to a charterparty, their application will not be limited to cargo claims alone. An owner may also benefit from the defences provided for by the Rules in respect of other claims. For example, the leading treatise 'Time Charters' suggests that the effect of the incorporation of United States COGSA, in Clause 24 of the NYPE form, is that the 'absolute' obligation of seaworthiness at the beginning of the charter period is reduced to an obligation to exercise due diligence to make the ship seaworthy before and at the beginning of each voyage under the subject time charter. This was demonstrated in The Saxon Star (Adamastos Shipping v Anglo-Saxon Petroleum (The Saxon Star) [1958] 1 Lloyd's Rep. 73 (H.L.)) where there was a consecutive voyage charter which included a clause paramount. Delays occurred on the voyages, including ballast, due to breakdowns of machinery caused by the incompetence of the engine room staff, making the ship unseaworthy. They were incompetent despite the fact that the owner had exercised due diligence in their selection. It was held by the House of Lords that the Rules applied to all voyages, whether these were in ballast or with cargo, and the immunity given in respect of 'loss or damage' extended beyond physical loss or damage to cargo and also covered the financial loss to the charterer from the reduction in the number of voyages performed. Time limit The incorporation of the Rules will also give an owner the benefit of the one-year time limit in respect of claims in relation to goods loaded or to be loaded under the charter. This covers proceedings by a charterer against an owner. It does not, however, cover proceedings by the owner against the charterer. The words 'loss or damage' in the Rules are not necessarily restricted to physical loss of or damage to goods, but can be extended to loss or damage related to goods – such as extra tank cleaning costs, pumping costs, standby lifting equipment and/or substitute cargo costs. The question of whether there is a sufficiently close relationship between 'loss or damage' claimed and the 'goods' in question to enable the owner to invoke the one-year time limit is one of fact in each case and upon construction of the particular clause paramount in the subject charter. For example, there is a difference between the NYPE form compared with the Shelltime standard form. The English courts have typically held that the former contains wider and more expansive incorporation of clauses than the latter. This should be of no real surprise given that the Shelltime forms are generally more 'charterer friendly'. Some of the differences between the Hague and the Hague-Visby Rules, such as the applicable time limit for bringing indemnity actions and package limitation, can often make it important to distinguish whether precisely the Hague or the Hague-Visby Rules will apply to the

relevant contract of carriage. Words of incorporation Charterparties may contain a clause paramount, but it does not necessarily mean that the Rules are incorporated. For instance, wordings such as 'The following clause shall be included in all bills of lading issued pursuant to this Charter' (Clause 37 of the ShellVoy 6 Form) or 'Charterers shall procure that all bills of lading issued under this charter shall contain the following' (Clause 38 of the Shelltime 4 Form) are not sufficient to incorporate the clause paramount into the subject charter. However, the following wording is sufficient to incorporate the clause paramount into the subject charter:- 'This Charter Party is subject to the following clauses all of which are also to be included in all bills of lading or waybills issued hereunder' (Clause 31 of the NYPE 1993 Form). Once incorporated, the clause paramount may conflict with other clauses in the contract and, in these circumstances, it is especially important that attention be paid to the precise wording of the clauses at issue. As a general principle of construction, the preamble of the clause will usually identify which clause overrides another. For instance, if the incorporation commences with the words 'Notwithstanding anything which may otherwise be stated in the charter…', the clause paramount is likely to prevail over the other clause. The converse is true if it is the other clause that has such a preamble wording. The effect of incorporation If the clause paramount is successfully incorporated into the subject charter, it will often override any other conflicting clause by virtue of Article III Rule 8 of the Rules. For example, clause 2 of the standard GENCON charterparty holds the owner liable for loss, damage or delay caused only by the personal want of due diligence and excludes the owner's liability for (mere) negligence of the master or crew. Such a clause would be null and void if a paramount clause were incorporated into this charter. However, Article III Rule 8 doesn't prevent the parties to a charterparty from transferring obligations and liabilities for, say, loading, stowage and/or discharge of cargo from an owner to a charterer. Which rules are incorporated? It has historically been held by the English courts that a general reference to a clause paramount will give effect to the Hague Rules (not the HagueVisby Rules). However, in The Superior Pescadores, the bill of lading provided for 'The Hague Rules contained in the International Convention of the Unification of certain rules relating to Bills of Lading, dated Brussels 25 August 1924 as enacted in the country of shipment' and the Court of Appeal held that this wording in the clause paramount contractually incorporated the Hague-Visby Rules. The Court of Appeal dismissed the argument that if the parties wanted the Hague-Visby Rules to apply they would have made an express reference to it, going against earlier decisions on the point given that the relevant bill of lading did not make specific reference to the HagueVisby Rules (only the Hague Rules). The main differences between the Hague and the Hague-Visby Rules There are two significant differences between the Hague and the HagueVisby Rules that an owner and charterer should consider when deciding which clause paramount to agree to:- (1) Indemnity Claims:- Where the Hague Rules apply and a party has settled a cargo claim under the bill of lading, the time limit to bring an indemnity claim remains 12 months from the cargo delivery. Therefore, by the time the indemnity action arises, it may well already be timebarred. However, where the Hague-Visby Rules apply, the time limit is three months after the claim has been settled or the person has been served with process in the action, provided that English law applies. This is particularly important where there is a charterparty chain and claims are to be passed up or down the line. (2) Package Limitation:- Another difference is package limitation. The Hague Rules contain a limitation of '£100 per package or unit', regardless of whether the bulk cargo is dry or wet. Conversely, the Hague-Visby Rules provide for 'the equivalent of 666.67 units of account per package or unit or 2 units of account per kilo of gross weight of the goods lost or damaged, whichever is the higher'. Conclusion Whether or not a clause paramount is included in a charterparty is a matter of commercial risk and negotiation. Furthermore, whilst it is not a prerequisite for P&I (short for Protection and Indemnity) cover that all charterparties are to contain a clause paramount (and thus incorporate the Rules), there could be P&I cover implications if, as a result, an owner member is held liable for a cargo claim liability over and above that which would have been incurred had the contract of carriage been subject to the Rules. It is nearly always beneficial for an owner to have a clause paramount incorporated into a charterparty. If such a clause is not to be included then the owner should consider the implications carefully and weigh up the 'pros and cons'. Parties should then know exactly the nature of the bargain they are entering into. Generally, the Paramount Clause will be used by parties to incorporate the terms and conditions of The Hague or Hague-Visby Rules into the contract of carriage of goods by sea, usually into the bills of lading or the charterparty. The Paramount Clause also incorporate particular legislation, such as the Carriage of Goods by Sea Act of a specific state which may have already incorporated The Hague or Hague-Visby Rules into its domestic law. To avoid doubt and clarify specifically whether The Hague or Hague-Visby Rules apply The Paramount Clause can be used to achieve this. Limits of Liability provided by The Hague and Hague-Visby Rules create an invaluable shield for shipowners, especially in cargo damage claims. When the Paramount Clause is used to incorporate the Rules it must be clear which Rules are being incorporated. Whether The Hague or Hague-Visby Rules apply plays an important role when limits of liability are being calculated for cargo damage claims. Clearly, from this case the differences can be significant; without limits of liability, the claims would be in excess of USD3.6 million, with The Hague Rules it would be about USD600 000 and in this instance with The Hague-Visby Rules the lesser of USD400 000. Thus, knowing which Rules apply would reduce uncertainty with respect to the limits of liability for cargo damage claims. This case established that the expression in a Paramount Clause, 'the Hague Rules as enacted in the country of shipment', will in the eyes of the Courts mean the Hague-Visby Rules. Thus it is important that the clause is drafted in such a way to avoid ambiguity or uncertainty when incorporating the Paramount Clause into the bills of lading. A Clause Paramount may be inserted in both a charterparty and in any bill of lading issued under that charterparty. The original purpose of a clause paramount was to make sure that the Hague Rules, which were intended to apply to certain bills of lading, did indeed apply to bills of lading. Although the Rules do not apply to charterparties, many charterparties also contain a clause paramount requiring any bill of lading issued under the charterparty to contain such a clause and applying the clause to the charterparty as well, so that the obligations under the charterparty and the bill of lading are therefore back-to-back. The clause paramount was relatively straightforward when the only international convention was the Hague Rules which had been widely adopted by maritime nations. However, the clause paramount has become much more complex owing to the proliferation of potential rules that could be mandatorily applicable to the bill of lading, such as the Hague-Visby or Hamburg Rules. After discussing the current lack of international harmony around the world as to which rules may apply to the bill of lading, and when the Hague-Visby Rules apply mandatorily under English law to a bill of lading, we will turn to the charterparty, and consider whether the clause paramount in the charterparty is effective to incorporate a set of rules and, if so, which rules. It will be argued that in order to determine which rules apply to the charterparty, it is nowadays necessary to determine first which rules apply to the bill of lading and then to apply those rules to the charterparty. The application of the rules to a charterparty is a matter of major significance in international trade both in terms of the impact of those rules on the obligations under the charterparty, the exceptions, the amount which may be recovered and the time bar. This chapter will focus on the impact on the obligation of seaworthiness, the exceptions and the time bar. / Зэ Сэксэн Ста (The Saxon Star) (Адэмэстос Щипинь против Энглоу-Сэксэн Питчроулиэм (Зэ Сэксэн Ста) [1958] 1 Лойд'з Рэп. 73 (Эйч.Эл.)) (Adamastos Shipping v Anglo-Saxon Petroleum (The Saxon Star) [1958] 1 Lloyd's Rep. 73 (H.L.)). стандартная форма Щелтайм (Shelltime standard form). Форма 6 ЩелВой (ShellVoy 6 Form). Супэриор Пэскадорес (Superior Pescadores).

PARAPHYLETIC = ПАРАФИЛЕТИЧЕСКОЕ – Paraphyletic:- of a group of organisms sharing and including a common ancestor, but not including all the descendents of that common ancestor. See also Monophyletic, and Polyphyletic. / общего предка, но . Под Парафилетическим, от Греческих слов Pará, означающее Вне или Возле или Мимо, и и Phýlon, означающее Племя или Род, понимается .

PARAPHYSIS = ПАРАФИЗА (или ПАРАФИЗ) – Paraphysis is a sterile hypha present in some fruiting bodies of Fungi. / Под Парафизами, от Греческих слов Pará, означающее Вне или Возле или Мимо, и Phýsis, означающее Возникновение или Вырастание), многоклеточные нити или одиночные клетки, развивающиеся среди половых или спороносных органов у некоторых Бурых Водорослей, у большинства Базидиальных и Сумчатых Грибов, а также у Мхов. Парафизы предохраняют эти органы от механических повреждений и высыхания.

PARASITE = ПАРАЗИТ – Parasite is an organism that lives wholly off and often feeds within another organism (called a Host); with most insect species, insect parasites usually kill their hosts and are referred to as Parasitoids. An insect that spends its immature stages in the body of a host which dies just before the parasite pupates – some parasites attack stages of major pests. Parasite is an organism that grows on or within another, drawing its nutrients from it, e.g., mistletoe. See also Commensal, and Symbiosis. Parasite is an organism which lives on or in a larger organism, feeding upon it. Parasite is an organism living in or on another living organism, obtaining from it part or all of its organic nutrients, and commonly exhibiting some degree of adaptive structural modification. / виды (species). , например, Омела белая (mistletoe). Насекомое, которое проводит свои недоразвитые (промежуточные) стадии на теле жертвы, гибнущей непосредственно перед окукливанием паразита – некоторые паразиты нападают на промежуточных фазах развития основных вредителей. Под Паразитом, от Греческого слова Parásitos, означающее Нахлебник или Тунеядец, понимается организм, питающийся за счёт других организмов, называемых хозяевами, и большей частью наносящие им вред. Паразиты разделяют на:- (i) зоопаразитов (простейшие, гельминты и другие) и фитопаразитов (бактерии, грибы и другие); (ii) эктопаразитов, живущих на теле хозяина, и эндопаразитов, живущих в теле хозяина. К внутриклеточным паразитам относят вирусы. Под Паразитами, от Греческого слова Parásitos, означающее Нахлебник или Тунеядец, понимаются организмы, питающиеся за счёт других организмов (называемых хозяевами) и большей частью вредящие им. Паразитов разделяют на зоопаразитов (Простейшие, Гельминты, Паукообразные, Насекомые и другие) и фитопаразитов (Бактерии, Грибы, некоторые Высшие Растения и другие); к паразитам относят и вирусы. Паразиты принадлежат к разным систематическим Группам животных (исключая Иглокожих, Плеченогих, большинство Хордовых) и растений (их нет только среди Мохообразных, Папоротникообразных и Голосеменных). Хозяевами паразитов могут быть Бактерии, Актиномицеты, Растения и Животные всех систематических Групп. Паразиты вызывают ослабление и истощение организма хозяина, а нередко и его гибель. Для прохождения цикла развития паразита иногда требуется смена 2–3 хозяев. Паразиты возникли в процессе исторического развития организмов из свободно живущих форм. Приспособление паразитов к определённым условиям жизни повлекло упрощение их организации, развитие специальных органов фиксации, усиленное развитие половых органов, аноксибиотическое дыхание, дающее возможность существовать в бескислородной среде, и другие. Многие паразиты – возбудители ряда заболеваний человека, животных и растений. Смотрите также Паразитология, и Паразитизм.

PARASITISM = ПАРАЗИТИЗМ (или ПАРАЗИТИРОВАНИЕ) – Parasitism is a relationship wherein an organism of one kind lives in, on, or in intimate association with an organism of another kind at the expense of which it obtains food and usually other benefits, causing some degree of overt damage but not usually killing directly and immediately. / Под Паразитизмом, от Греческого слова Parásitos, означающее Нахлебник или Тунеядец, понимается:- (1) форма взаимоотношений между организмами различных видов, из которых один (паразит) использует другого (хозяина) в качестве среды обитания и источника питания, нанося ему вред. (2) В переносном смысле – жизнь на чужие средства, за счёт чужого труда, тунеядство. Паразитизм (в биологии), форма взаимоотношений между организмами (Растениями, Животными, Микроорганизмами), относящимися к разным Видам, из которых один (Паразит) использует другого (Хозяина) в качестве среды обитания и источника пищи, возлагая при этом (частично или полностью) на хозяина регуляцию своих отношений с внешней средой. Паразитизм – преимущественно экологическое понятие, аналогичное понятиям планктонного, бентосного, почвенного и им подобного образа жизни организмов. Качественная особенность паразитизма, по сравнению с другими формами существования организмов, определяется своеобразием среды обитания, которой для паразита является другой живой организм (хозяин), активно реагирующий на присутствие паразита. Внешняя среда паразита, как это показали Российский зоолог и паразитолог Евгений Никанорович Павловский (1884–1965) и Российский зоолог Валентин Александрович Догель (1882–1955), имеет двойственный характер. Различают Среду 1-го Порядка – окружающие паразита органы и ткани хозяина – и Среду 2-го Порядка, окружающую хозяина. Взаимоотношения паразита со средою 2-го порядка в основном регулируются через хозяина, хотя имеет место (в различной степени для разных форм паразитизма) и прямое воздействие факторов внешней среды (например, температуры) на паразита. Между паразитом и хозяином устанавливаются более или менее глубокие метаболические связи. Многие паразиты являются антигенами, вызывая образование в организме хозяина антител, что, в свою очередь, приводит к реакциям иммунитета. Различают Внешний (Наружный) Паразитизм, или Эктопаразитизм (паразит живёт на поверхности тела хозяина), и Внутренний Паразитизм, или Эндопаразитизм (паразит живёт в теле хозяина). В зависимости от продолжительности паразитирования различают Временный Паразитизм и Стационарный Паразитизм, включающий Периодический и Постоянный Паразитизмы. Пути возникновения паразитизма в эволюции разнообразны. Источником его может быть квартирантство, хищничество, комменсализм, симбиоз, случайное поселение одного организма на теле другого, заглатывание и другое. Паразиты часто (но не всегда) приносят более или менее существенный вред хозяину и вызывают различные заболевания человека, животных и растений. Изучением паразитизма и разработкой мер борьбы с паразитами занимаются паразитология, микробиология, вирусология и фитопатология.

(2) Parasitism:- Xxxxx. / Паразитизм Животных:- Паразитические Виды встречаются среди большинства Групп животных, за исключением Иглокожих и Плеченогих. Среди Хордовых полупаразитический образ жизни ведут Миноги и Миксины, а также некоторые Летучие Мыши – кровососы. Имеются Отряды и Классы, представленные только паразитами (из Простейших – Споровики; из Плоских Червей – Трематоды, Моногенеи, Ленточные Черви; из Круглых Червей – Скребни; из Насекомых – Блохи, Вши и другие). Степень вредоносности паразита для хозяина различна. Обычно паразитизм ведёт к заболеванию хозяина; иногда присутствие в теле хозяина патогенного паразита не приводит к заболеванию, но хозяин становится источником распространения паразита (такой паразитизм называется Паразитоносительством). Хозяевами паразитов могут быть различные Виды Животных и Растений. Нередко хозяин бывает заражен одновременно несколькими Видами паразитов, которые вступают в определённые взаимодействия не только с хозяином, но и между собой. Вся совокупность паразитов одного хозяина составляет паразитоценоз. При эктопаразитизме паразиты поселяются на поверхности тела хозяев:- Животных и Растений (Вши, Блохи, Власоеды, Перьевые Клещи, Тли и другие Сосущие Насекомые). Переходом к внутреннему паразитизму являются случаи поселения паразитов в коже и открывающихся наружу полостях тела. При эндопаразитизме различают Полостной Паразитизм (паразиты обитают в полостях органов, например в полости кишечника) и Тканевой Паразитизм (паразиты обитают в тканях тела, например, Саркоспоридии и личинки Трихинелл – в толще скелетных мышц; Нематоды, живущие в тканях Картофеля, Томатов, Табака и других Растений). При тканевом паразитизме паразиты могут проникать внутрь отдельных клеток (возбудители малярии – в эритроциты крови человека, кокцидии – в клетки эпителия кишечника). Продолжительность паразитирования временных паразитов варьирует от десятков секунд (сосание крови Человека самкой Комара) до нескольких дней или месяцев (Иксодовые Клещи, личинки Оводов). У некоторых эндопаразитов

развитие во внешней среде сменяется развитием в теле хозяина (например, личинки Круглых Червей Анкилостомид развиваются в почве, а половозрелыми становятся в теле Животного или Человека); у других паразитов во внешней среде ‘созревают’ попавшие в неё из хозяина яйца, под оболочкой которых развиваются личинки, после чего яйца могут заражать хозяина и вскрываются только в его пищеварительном канале (Власоглавы, Аскариды, Эхинококк и другие). Паразитизм характеризуется разной степенью специфичности – приспособленности паразитов к определённому Виду или Группе Видов хозяев. Часто паразитизм характеризуется тем, что для прохождения жизненного цикла паразиту необходимы 2 или даже 3 хозяина, порой далёкие друг от друга в систематическом отношении. Так, хозяева возбудителя малярии – Человек и Комар из Рода Анофелес; Плоских Червей:- Цепня Вооружённого – Свинья и Человек, Цепня Невооружённого – крупный рогатый скот и Человек (смотрите Цепни), Эхинококка – Человек и Собака; Печёночной Двуустки – Моллюски и крупный рогатый скот; Лентеца Широкого – Веслоногий Рачок (например, Циклоп), Рыбы и Хищные Млекопитающие (или Человек). Смена хозяев связана с чередованием поколений паразитов. Хозяин, в котором паразит становится половозрелым и размножается половым путём, называют Окончательным Хозяином; хозяева, в которых протекают личиночные стадии, называется Промежуточными Хозяевами. Очень разнообразны пути проникновения паразитов в тело хозяев. Они могут попадать в пищеварительный тракт с пищей, активно вбуравливаться через покровы, проникать при посредстве переносчиков – Кровососущих Насекомых и Клещей, и тому подобных. Географическое распространение паразитов связано с распространением их хозяев и с особенностями физико-географической среды данного района. Поэтому в пределах своего ареала паразиты распространены не повсеместно, а лишь в определённых местообитаниях. На распространение паразитов существенное влияние оказывает образ жизни хозяев (способ питания, миграции, спячка), размеры ареала, особенности ландшафтно-климатического фактора, доместикация и другие факторы. Изучение различных особенностей паразитизма (жизненного цикла паразитов, путей заражения ими хозяев, экологии хозяев и переносчиков) чрезвычайно важно для борьбы с паразитами – возбудителями болезней Человека, домашних и промысловых Животных, а особенно – для профилактики этих болезней. При этом, кроме действия лекарств, веществами, убивающими паразитов, особое значение имеет проведение системы мероприятий, направленных на разрыв жизненного цикла, на уничтожение промежуточных хозяев и переносчиков. Для борьбы с паразитами (вредителями) растений широко используются паразиты этих вредителей (например, Перепончатокрылые Насекомые – Наездники и другие) – биологический метод борьбы.

(3) Parasitism:- Xxxxx. / Паразитизм Растений:- Известны многочисленные паразитические Грибы, Бактерии, Вирусы, Микоплазмы, паразитические Цветковые Растения, немногие Водоросли. Неизвестны паразиты среди Мхов, Папоротникообразных и Голосеменных Растений. Хозяевами растений-паразитов могут быть не только Растения, но и Животные и Человек (на последних паразитируют главным образом Бактерии и некоторые Грибы). У Человека паразитические Бактерии вызывают туберкулёз, дифтерию, ангину, дизентерию, чуму, холеру, общий сепсис и другие; Грибы поражают главным образом наружные покровы (кожу, волосы), возможно также – лёгкие, глаза и другие органы. На Насекомых паразитируют так называемые Энтомофторовые Грибы, вызывающие нередко массовую гибель Насекомых, например, Комнатных Мух в конце лета; заболевание Птиц вызывают Мукоровые Грибы и Аспергиллы, вызывающие микозы дыхательных путей, и так далее. Растения, паразитирующие на других растениях, делят на имеющих хлорофилл и не имеющих его. Первые – зелёные паразиты – сами вырабатывают органические вещества в процессе фотосинтеза, а от хозяина получают главным образом воду и минеральные вещества. Вторые – полные паразиты, или голопаразиты, – получают от хозяина и органическое, и неорганическое питание. Среди растений-паразитов различают более или менее случайных, необязательных, так называемых Факультативных, и Обязательных (Облигатных) Паразитов. Эти биологические Группы паразитов понимаются как ступени эволюции, достигнутые в приспособлении к паразитизму. У эктопаразитов (Мучнисторосяные Грибы, Повилика, Петров Крест и другие) большая часть тела находится вне хозяина, и лишь органы чужеядного питания (гаустории, или присоски) внедряются внутрь и вступают в непосредственный контакт с живыми клетками хозяина. У эндопаразитов (многие паразитические Бактерии и Грибы, из Цветковых – Раффлезиевые и другие) всё или почти всё тело паразита, исключая большей частью высовывающиеся наружу органы размножения, погружено в живую ткань хозяина. Это лучше обеспечивает питание паразита, которое как у эндо-, так и у эктопаразитов осуществляется, вероятно, осмотическим путём. Большинство паразитических Грибов живёт в межклетниках, погружая в клетки лишь гаустории. Низшие Грибы, Бактерии, Вирусы и Микоплазмы – внутриклеточные паразиты. У многих паразитов наблюдаются закономерные изменения организации в связи с эволюцией их паразитизма. Основное из них – упрощение, или редукция, некоторых функций и соответствующих органов. Так, в связи с утратой функции фотосинтеза у паразитов происходит редукция листьев, которые развиваются только в виде небольших бесцветных чешуек (например, у Петрова Креста, Повилики), или редуцируются и листья, и стебли (например, у представителей Семейства Раффлезиевых, некоторых Заразиховых и Ремнецветниковых). У некоторых паразитов снаружи образуются лишь отдельные цветки, иногда очень большие (например, у Раффлезий диаметром до 1 метра (м)), а вегетативное тело представлено клеточными нитями, подобными гифам Гриба, и полностью погружено в ткани питающего Растения. У паразитических Водорослей, как и у цветковых паразитов, наблюдается морфологическая редукция, хотя и менее выраженная. У Грибов морфологическая редукция выражена иногда как недоразвитие плодовых тел (например, у некоторых Сумчатых Грибов). По мере усиления паразитических свойств сокращается ферментный аппарат паразитов; в конце концов остаются лишь специализированные ферменты, позволяющие паразитировать на узком круге Растений. Некоторые физиологи Растений считают отношения так называемых Сапрофитных Цветковых Растений с их Микоризным Грибом взаимным паразитизмом. Влияние Паразита На Хозяина:- Факультативные паразиты поражают часто лишь ослабленные Растения или их части, находящиеся в недеятельном состоянии (например, плоды и овощи при хранении), и вызывают быстрое отмирание поражённых частей. Так, Грибы – вредители Овощей в хранилищах – проникают в субстрат через поверхностные ранки. Мицелий Гриба поселяется сначала на мёртвых тканях, где и разрастается; затем гифы его выделяют токсины и ферменты. Токсины убивают живые клетки, а ферменты (пектиназы) мацерируют ткани. Таким образом гифы Гриба не соприкасаются с живыми клетками питающего Растения, растут только среди мёртвых клеток, питаясь их веществами. Такое питание формально можно назвать сапрофитным, но так как Гриб сам подготавливает для себя мёртвый субстрат из живых тканей, то в этом есть существенные черты паразитизма. Облигатные и близкие к ним паразиты, например, Ржавчинные, Головнёвые, Мучнисторосяные Грибы, поражают преимущественно хорошо развитые Растения и оказывают на них более медленное воздействие; при этом иногда наблюдается даже известная стимуляция клеток хозяина – они часто богаче хлорофиллом и лучше растут. Такое состояние стимуляции продолжается несколько дней, недель, иногда целый вегетационный период и больше, но затем ‘мирное’ сожительство паразита и хозяина нарушается:- фотосинтез прекращается, дыхание усиливается, клетки хозяина начинают отмирать, а мицелий Гриба приступает к спорообразованию и вскоре сам отмирает. Смотрите также Бактериальные Болезни Растений, Вирусные Болезни Растений, Грибные Болезни Растений, и Грибы Паразитические.

PARASITOID = ПАРАЗИТИРУЮЩЕЕ – Parasitoid is an insect parasitic only in its immature stages, killing its host in the process of its development, and free living as an adult. Also known as Parasite. / Известно также как Паразит (Parasite).

PARASITOSES = ПАРАЗИТОЗЫ (или ПАРАЗИТАРНЫЕ БОЛЕЗНИ) – Parasitoses are diseases caused by parasites. / Паразитарные Болезни, заболевания, вызываемые паразитами. К паразитарным болезням относят гельминтозы, миазы, протозойные (то есть вызванные простейшими) болезни (малярия, амёбная дизентерия, лейшманиозы, сонная болезнь и прочие), заболевания, вызванные Клещами (например, чесотка). В некоторых тропических странах обитает Песчаная Блоха (Саркопсилла), проникновение которой в кожу вызывает сыпь, зуд, нагноение. Лечение и профилактику паразитарных болезней смотрите в статьях об отдельных заболеваниях.

PARASTICHY = ПАРАСТИХА (или ВТОРИЧНАЯ СПИРАЛЬ, или ПОБОЧНАЯ СПИРАЛЬ) – Parastichy:- reference to the virtual spirals in plants, joining elements (tubercle, leaf, scale, floret) to their nearest neighbors. Parastichies usually come in two families winding in opposite directions. Parastichy numbers denoted by a pair (n,m) classify spiral and whorl phyllotaxes. / в отношении к виртуальным спиралям у растений, соединяющих элементы (, лист, чешуйка, цветочек) с их ближайшими соседями. в противоположных направлениях. Под Парастихой, от Греческих слов Pará, означающее Вне или Возле или Мимо, и Stíchos, означающее Линия или Ряд, понимается косой, спирально закручивающийся ряд тесно соприкасающихся друг с другом листьев, чешуй, цветков и тому подобного. Наблюдается при спиральном листорасположении на сильно укороченных побегах:- в шишках Хвойных, в соцветиях – корзинках Сложноцветных – обычно в виде системы перекрещивающихся парастих, идущих по часовой стрелке и против неё. Сравните с Ортостиха.

PARATYPE = ПАРАТИП – Paratype is additional specimens, other the holotype, cited at the same time as the original description. / , прочий голотип, . Под Паратипом, от Греческих слов Pará, означающее Вне или Возле или Мимо, и Týpos, означающее Образец или Отпечаток или Форма, понимается .

PARBOILED BROWN RICE FOR PROCESSING = ПРОПАРЕННЫЙ БУРЫЙ РИС ДЛЯ ПЕРЕРАБОТКИ – In the Rice industry of the United States, the Parboiled Brown Rice For Processing shall be Rice in which the starch has been gelatinized by soaking, steaming, and drying. Grades US Nos. 1 to 5, inclusive, shall contain not more than 10.0 percent of ungelatinized kernels. Grades US No. 1 and US No. 2 shall contain not more than 0.1 percent, grades US No. 3 and US No. 4 not more than 0.2 percent, and grade US No. 5 not more than 0.5 percent of nonparboiled Rice. The maximum limits for 'chalky kernels', 'Heat-damaged kernels', and 'Kernels damaged by heat' shown in §868.261 are not applicable to the special grade 'Parboiled Brown Rice For Processing'. / В рисовой индустрии Соединённых Штатов Америки под Пропаренным Бурым Рисом Для Переработки понимается Рис, в котором крахмал был желатинизирован замачиванием, пропариванием и сушкой. Американские сорта с 1 по 5 номер включительно должны содержать не более 10.0 процентов нежелатинизированной зерновки (ядер). Американские сорта № 1 и 2 должны содержать не более 0.1 процента, сорта № 3 и 4 – не более 0.2 процента, и сорт № 5 – не более 0.5 процента непропаренного Риса. Максимальные лимиты содержания .

PARBOILED MILLED RICE = ПРОПАРЕННЫЙ ОБРУШЕННЫЙ РИС – In the Rice industry of the United States, Parboiled Milled Rice shall be milled Rice in which the starch has been gelatinized by soaking, steaming, and drying. Grades US No. 1 to US No. 6, inclusive, shall contain not more than 10.0 percent of ungelatinized kernels. Grades US No. 1 and US No. 2 shall contain not more than 0.1 percent, grades US No. 3 and US No. 4 not more than 0.2 percent, and grades US No. 5 and US No. 6 not more than 0.5 percent of nonparboiled Rice. If the Rice is:- (i) not distinctly colored by the parboiling process, it shall be considered 'Parboiled Light'; (ii) distinctly but not materially colored by the parboiling process, it shall be considered 'Parboiled'; and (iii) materially colored by the parboiling process, it shall be considered 'Parboiled Dark'. The color levels for 'Parboiled Light', 'Parboiled', and 'Parboiled Dark' shall be in accordance with the interpretive line samples for parboiled Rice. / В рисовой индустрии Соединённых Штатов Америки под Пропаренным Обрушенным Рисом понимается Рис, в котором крахмал был желатинизирован замачиванием, пропариванием и сушкой. зерновки (ядер).

PARBOILED RICE = ПРОПАРЕННЫЙ РИС – Parboiled Rice has been through a special cooking process, called Parboiling, prior to milling. While in the paddy form, the Rice is soaked and then steam cooked. This process does not allow the kernel to swell during the cooking and the moisture level does not exceed 40%, versus cooked table Rice, which is most often cooked to a moisture level of 64%. The starch granule is cooked (technically gelatinized), but not allowed to swell. The Rice is then dried while still in the paddy form and then passed through a standard milling process to remove the hull and bran. This process has been going on for centuries in many countries and is believed to have started in ancient India. Researchers learned in the early 1900's that parboiled Rice retained some of the vitamins that exist in bran, but are lost in the milling of milled Rice. The incidence of beriberi was reduced when diets were changed from white Rice to parboiled Rice because of increased levels of thiamin in parboiled Rice. Uncle Ben made the process famous in the United States with its converted (same as parboiled) Rice. The process may have originated to sterilize the Rice and allow longer storage conditions. (All Rice comes from the field with insect eggs in the germ of the Rice. These eggs hatch when the temperature is warm and moisture is available.) The high temperatures occurring during parboiling kill any insect eggs in the Rice and essentially sterilize it. Parboiling also mends the cracks in the Rice (glues broken Rice back together) and dramatically improves the milling yield of whole kernels in the Rice. This improvement in milling yield, especially for poor quality paddy, can justify the cost of the process. Parboiling changes the texture of the Rice. It becomes firmer and less sticky. It is a much more durable kernel. It takes just as long to cook (actually a little longer) as white Rice, but is much easier to cook. It is almost fool proof. It can be overcooked without being mushy or losing its grain shape. It does not have to be steamed. It can be cooked by blanching only. It has a long steam table life, which is important for restaurants. For these reasons, parboiled Rice was adopted as the preferred Rice of the restaurant industry long ago and so many consumers have become accustomed to the taste and texture parboiled Rice. It is the only type of Rice that can withstand the harsh treatment of most industrial processes that involve cooking and then freezing, canning, or drying. Most Rice that is sold in the supermarket in some sort of cooked or partially cooked form has been parboiled. In the United States, some parboiled Rice is sold into the consumer market, but most is sold into the food service (for use in restaurants) and industrial markets (for use in prepared meals). A great deal is exported to Saudi Arabia, South Africa, Europe and other countries. Parboiled Rice is a rough Rice which has been subjected to a steam or hot water treatment prior to milling; parboiling increases the percentage of head Rice and the vitamin content of milled Rice. This procedure gelatinizes the starch in the grain, and results in firmer more separate grains. It also takes a few minutes longer to cook. Parboiled Rice – unmilled Rice is soaked, steams and dried before milling. Nutrients stay within the grain and surface starch is reduced, producing a cooked Rice that is somewhat more firm in texture and very separate when cooked. It cooked perfectly in approximately 20 minutes. Parboiled Rice means non-glutinous Rice that has passed through the parboiling process and has its bran removed. Rough Rice soaked overnight or longer in water at ambient temperature, followed by boiling or steaming the steeped Rice at 100 °C to gelatinize the starch. The Rice is then cooled and dried before storage or milling. In this way part of the vitamins and minerals of the bran permeate the endosperm and are thus retained in the polished Rice. Parboiled Rice is the rough Rice that has gone through a steam-pressure process before milling. This procedure gelatinizes the starch in the grain, and ensures a firmer, more separate grain. Parboiled Rice is favored by consumers and chefs who desire an extra fluffy and separate cooked Rice. Parboiled White Rice characteristics:- (i) firm, separate texture; (ii) withstands processing; and (iii) ideal for steam table use, canning and other retort applications. Applications:- (i) frozen/prepared meals; (ii) specialty side dishes; (iii) packaged rice mixes; (iv) canned soups; (v)

foodservice products; and (vi) prepared salads. / эндосперм (endosperm). Пропаривание зерна – влажнотепловая обработка зерна в производстве некоторых видов круп (из гречихи, овса, проса) с целью разрушения клеящих веществ (пектина) в плёнках и оболочках. Облегчает последующую обработку зерна, способствует увеличению выхода готового продукта. При пропаривании частично клейстеризуется крахмал и разрушаются ферменты. основное зерно Риса (head rice).

PARBOILED ROUGH RICE = ПРОПАРЕННЫЙ РИС–СЫРЕЦ – In the Rice industry of the United States, Parboiled Rough Rice shall be rough Rice in which the starch has been gelatinized by soaking, steaming, and drying. Grades US No. 1 to US No. 6 inclusive, shall contain not more than 10.0 percent of ungelatinized kernels. Grades US No. 1 and US No. 2 shall contain not more than 0.1 percent, grades US No. 3 and US No. 4 not more than 0.2 percent, and grades US No. 5 and US No. 6 not more than 0.5 percent of nonparboiled Rice. If the Rice is:- (1) not distinctly colored by the parboiling process, it shall be considered 'Parboiled Light'; (2) distinctly but not materially colored by the parboiling process, it shall be considered 'Parboiled'; (3) materially colored by the parboiling process, it shall be considered 'Parboiled Dark'. The color levels for 'Parboiled Light', 'Parboiled', and 'Parboiled Dark' Rice shall be in accordance with the interpretive line samples for parboiled Rice. The maximum limits for 'Chalky kernels', 'Heat-damaged kernels', 'Kernels damaged by heat', and the 'Color requirements' shown in §868.210 are not applicable to the special grade 'Parboiled rough Rice'. / В рисовой индустрии Соединённых Штатов Америки под Пропаренным Рисом-Сырцом понимается Рис, в котором крахмал был желатинизирован замачиванием, пропариванием и сушкой. зерновки (ядер).

PARC = PAKISTAN AGRICULTURAL RESEARCH COUNCIL

PARCEL POST RECEIPT = ПОЧТОВАЯ КВИТАНЦИЯ НА ПОСЫЛКУ – Parcel Post Receipt:- the postal authorities' signed acknowledgement of delivery to them of a shipment made by parcel post.

PARCEL RECEIPT = КВИТАНЦИЯ НА ПОСЫЛКУ (или КВИТАНЦИЯ НА МЕЛКУЮ ПАРТИЮ, или КВИТАНЦИЯ НА ПАКЕТ) – A Parcel Receipt shipment is an arrangement whereby a steamship company will, under rules and regulations established in the freight tariff of a given trade, accept small packages at rates below the minimum bill of lading, issuing a parcel receipt instead of a bill of lading.

PARENCHYMA = ПАРЕНХИМА – Parenchyma:- living undifferentiated cellular tissue with thin cell walls, which may differentiate to form other types of cell. Parenchyma cells are the most common plant cells, make and store food substances and form the pith at the centre of stems of dicotyledons. Parenchyma is a tissue of higher plants consisting of thin-walled living cells that remain capable of cell division even when mature. These cells are agents of photosynthesis and storage and make up much of the substance of leaves and roots and the pulp of fruits as well as parts of stems and supporting structures. / на листьях и корнях и . Под Паренхимой, от Греческого слова Parénchyma, означающее буквально Налитое Рядом, понимается:- (i) У растений – основная ткань из клеток более или менее одинакового размера; осуществляет ассимиляцию, выделение и другие функции. Разновидности паренхимы:- ассимиляционная (хлоренхима), воздухоносная (аэренхима), запасающая и поглощающая. (ii) У животных паренхимой называется главная функциональная ткань лёгкого, печени, селезёнки и некоторых других органов. Под Паренхимой, от Греческого слова Parénchyma, означающее буквально – Налитое Рядом, понимается:- (1) основная ткань растений, состоит из клеток более или менее одинакового размера по всем направлениям. Клетки паренхимы образуют однородные скопления в теле растения, заполняют пространства между другими тканями, входят в состав проводящих и механических тканей. Вследствие функциональной специализации протопластов клетки паренхимы могут выполнять ассимиляционную, выделительную и другие функции. Присутствие в паренхиме (особенно рыхлой) межклетников определяет её участие в газообмене. Паренхимные клетки, выполняющие опорную функцию, могут быть удлинёнными, ветвистыми, звёздчатыми (склереиды), они имеют толстые, часто одревеснevшие стенки. Живые паренхимные клетки способны к делению; в паренхиме закладывается Феллоген (пробковый камбий), а у растений с атипичным приростом в толщину – Камбий (корнеплоды Свёклы, некоторые Лианы). (2) У животных Паренхима – филогенетический предшественник настоящей ткани. Различают:- Первичную Паренхиму – соединение большого числа однородных клеток, расположенных без определённой системы, не слитых в Синцитий и не разделённых межуточным веществом (например, у зародышей некоторых гидроидов на стадии морулы), и Смешанную Паренхиму – соединение разнородных клеток, расположенных без определённого порядка (например, в теле бескишечных турбеллярий). Иногда Паренхимой называют главную функциональную ткань печени, селезёнки, лёгкого, железы или поперечнополосатой мышцы.

PARENT APPLICATION = РОДОВАЯ ЗАЯВКА (или ИСХОДНАЯ ЗАЯВКА) – Parent Application:- the term 'Parent' is applied to an earlier application of the inventor disclosing a given invention. / Родовая Заявка – первичная заявка, являющаяся основной для продолжающих заявок.

PARENT COMPANY = МАТЕРИНСКАЯ КОМПАНИЯ (или ГОЛОВНАЯ КОМПАНИЯ) – Parent Company is a company which either:- (i) is the holding company of another company; or (ii) controls another company by holding more than half the voting stock and majority of shares of another company. Company that owns more than 50% of the capital in another company or subsidiary. See also Branch, Representation, and Subsidiary. / Компания, которая владеет более чем 50% капитала другой компании или дочернего предприятия. Смотрите также Дочернее Предприятие (Subsidiary), Представительский Офис или Представительство (Representative Office), Филиал (Branch).

PARENT CORPORATION = МАТЕРИНСКАЯ КОРПОРАЦИЯ (или ГОЛОВНАЯ КОРПОРАЦИЯ) – In the United States, a Parent Corporation is the corporation that owns a controlling interest in another corporation. / В Соединённых Штатах Америки под Материнской Корпорацией или Головной Корпорацией понимается корпорация, владеющая контрольным пакетом в другой корпорации.

PARENT MATERIAL = РОДИТЕЛЬСКИЙ МАТЕРИАЛ – Parent Material:- in vitro, pathogen-free propagules used to increase a clone of potatoes for production of commercial quantities of microplantlets, microtubers, or minitubers. / В переводе с Латинского In Vitro, означает В Лабораторных Условиях или В Пробирке.

PAREU = ПАРЭО (или ПАРЭУ) – Pareu is a wraparound skirt usually made from a rectangular piece of printed cloth and worn by men and women throughout Polynesia; the Tahitian equivalent of the Samoan Lavalava.

PARFLECHE = ХХ (или ИЗ КОЖИ БУЙВОЛА) – Parfleche is a case or robe made of parfleche, namely rawhide with hair removed by soaking in water and lye.

PARIETAL = ПАРИЕТАЛЬНОЕ (или ПРИСТЕНОЧНОЕ) – Parietal:- borne on or pertaining to the wall or inner surface of a capsule or other hollow structure. Of ovules arising from the outer wall of the ovary and pointing inwards. / Под Париетальным, от Латинского слова Parietalis, означающее Стенной, понимается пристеночный, тесно связанный со стенкой тела, например, париетальный листок плевры. Под Париетальным, от Латинского слова Parietalis, означающее Стенной, от Paries, означающее Стена, или Пристеночным, понимается анатомический термин, обозначающий у Животных, в противоположность понятию висцеральный,

тесную связь какого-либо анатомического образования со стенкой полости тела. Например, париетальный листок брюшины. У Растений париетальными семяпочками называются семяпочки, расположенные по стенкам завязи, а не в её центре.

PARI PASSU CLAUSE = ОГОВОРКА ПАРИ ПАССУ – Pari Passu Clause:- it means that the designated share will rank equally for dividends with comparable existing shares. Latin for 'With Equal Step' or 'By The Same Step'. Clause in a loan agreement precluding subordination of the loan to other debt. In the issue of new shares, a pari passu clause states that the new shares will have the same dividend rights as existing similar shares. On an equal footing, or proportionately. A term frequently used with respect to share issues to indicate that the new shares being issued will rank equally in all respects with previously issued shares either immediately or at some specified time in the near future. / Оговорка Пари Пассу – условие в страховых, фрахтовых, торговых сделках, в соответствии с которым регулируются взаимоотношения сторон при наступлении какого-либо обстоятельства или в случае изменения в будущем обстоятельств, имевших место во время заключения сделки. Латинское словосочетание Пари Пассу означает В Равной Пропорции.

PARIS CLUB = ПАРИЖСКИЙ КЛУБ – Paris Club:- under the International Monetary Fund's General Agreements to Borrow (GAB), established in 1962, 10 of the wealthiest industrial members of the International Monetary Fund (IMF) agreed to lend funds to the IMF, up to specified amounts when supplementary resources are needed. The finance ministers of these countries comprise the Paris Club. The Paris Club has become a popular designation for meetings between representatives of a developing country that wishes to renegotiate its 'official' debt (normally excluding debts owed by and to the private sector without official guarantees) and representatives of the relevant creditor governments and international institutions. These meetings usually occur at the request of a debtor country that wishes to consolidate all or part of its debt service payments falling due over a specified period. Meetings are traditionally chaired by a senior official of the French Treasury Department. Comparable meetings occasionally take place in London, the United Kingdom and in New York, the United States for countries that wish to renegotiate repayment terms for their debts to private banks. These meetings are sometimes called 'Creditor Clubs'. International forum which convenes to negotiate rescheduling the debt of heavily indebted countries. The negotiations are held between the delegates of the various creditor and debtor countries. Paris Club is a group of the ten nations with the largest share of international trade since the 1960s, formed for research and reform of the international monetary system and to coordinate monetary and fiscal policies. The ten countries are all members of the International Monetary Fund (IMF). They are:- Belgium, Canada, France, Germany, Italy, Japan, the Netherlands, Sweden, the United Kingdom and the United States of America. Switzerland, an associate member of the IMF, has announced its intention to join as a full-fledged member. Also known as Group Of Ten. / выплата (repayment) . Известен также как Группа из Десяти (Group of Ten). Парижский Клуб – неинституциализированное объединение стран-кредиторов (Австралия, Австрия, Бельгия, Великобритания, Германия, Дания, Ирландия, Испания, Италия, Канада, Нидерланды, Норвегия, Россия, США, Финляндия, Франция, Швейцария, Швеция, Япония), созданное в 1956 для обсуждения и урегулирования проблем задолженности суверенных государств; Россия – член Парижского клуба с 1997.

THE PARIS CONVENTION = ПАРИЖСКАЯ КОНВЕНЦИЯ – The Paris Convention for the Protection of Industrial Property, signed in Paris, France, on 1883-March-20, was one of the first intellectual property treaties. As a result of this treaty, intellectual property, including patents, of any contracting state are accessible to the nationals of other states party to the Convention. The 'Convention priority right', also called 'Paris Convention Priority Right' or 'Union Priority Right', was also established by this treaty. It provides that an applicant from one contracting State shall be able to use its first filing date (in one of the contracting State) as the effective filing date in another contracting State, provided that the applicant files another application within 6 months (for industrial designs and trademarks) or 12 months (for patents and utility models) from the first filing. The Paris Convention for the Protection of Industrial Property, first adopted in 1883, is the major international agreement providing basic rights for protecting industrial property. It covers patents, industrial designs, service marks, trade names, indications of source, and unfair competition. The United States ratified this treaty in 1903. The treaty provides two fundamental rights:- (1) The principle of national treatment provides that nationals of any signatory nation shall enjoy in all other countries of the union the advantages that each nation's laws grant to its own nationals. (2) The right of priority enables any resident or national of a member country to, first, file a patent application in any member country and, thereafter, to file a patent application for the same invention in any of the other member countries within 12 months of the original filing and receive benefit of the original filing date. The International Convention for the Protection of Intellectual Property is probably the single most important multilateral treaty on intellectual property, and is better known as the Paris Convention. Most industrialized nations and many developing countries are parties to this convention and are referred to collectively as the Paris Union. To date (1995), 56 countries have ratified the latest revision of the text, which covers a wide range of intellectual property rights including patents, industrial designs, trademarks, trade names, service marks, collective marks and unfair competition. The Paris Convention grants foreign nationals the same protection and benefits accorded to nationals of any other member country, without discrimination. One of the most important provisions of the Paris Convention relates to 'Convention Priority'. An applicant's priority date is the date on which an application is first filed in the applicant's home country. The convention allows the applicant to claim this date as the effective date on which an application for the same patent, industrial design, utility mark or trademark was filed in any other member country, provided that the application is filed within 12 months (for patents and utility marks) or six months (for industrial design and trademarks) from the claimed priority date. This removes the need and cost to file all the separate country applications at the same time to obtain effective protection. Under the convention priority filing system, intervening third party applications cannot act as bars to the owner's application if the owner files within the prescribed time. See also The Berne Convention, The European Patent Convention, The Madrid Agreement, The Madrid Protocol, The Patent Cooperation Treaty, and Trade-Related Aspects of Intellectual Property Rights. After a diplomatic conference in Paris in 1880, the Convention was signed in 1883 by 11 countries:- Belgium, Brazil, France, Guatemala, Italy, the Netherlands, Portugal, El Salvador, Serbia, Spain and Switzerland. The Treaty was revised at Brussels, Belgium, on 1900-December-14, at Washington, United States, on 1911-June-02, at The Hague, Netherlands, on 1925-November-06, at London, United Kingdom, on 1934-June-02, at Lisbon, Portugal, on 1958-October-31, and at Stockholm, Sweden, on 1967-July-14, and was amended on 1979-September-28. The Convention now has 173 contracting member countries, which makes it one of the most widely adopted treaties worldwide. Notably, Taiwan and Kuwait are not parties to the Convention. However, according to Article 27 of its Patent Act, Taiwan recognizes priority claims from contracting members. The Paris Convention entered into force in Thailand on 2008-August-02, bringing the total number of Nation States party to the Convention to 173. Contracting members include:- Albania; Algeria; Andorra; Angola; Antigua and Barbuda; Argentina; Armenia; Australia; Austria; Azerbaijan; Bahamas; Bahrain; Bangladesh; Barbados; Belarus; Belgium; Belize; Benin; Bhutan; Bolivia; Bosnia and Herzegovina; Botswana; Brazil; Bulgaria; Burkina Faso; Burundi; Cambodia; Cameroon; Canada; Central African Republic; Chad; Chile; China; Colombia; Comoros; Congo; Costa Rica; Croatia; Cuba; Cyprus; Czech Republic; Côte d'Ivoire; Democratic People's Republic of Korea; Democratic Republic of the Congo; Denmark; Djibouti; Dominica; Dominican Republic; Ecuador; Egypt; El Salvador; Equatorial Guinea; Estonia; Finland; France; Gabon; Gambia; Georgia; Germany; Ghana; Greece; Grenada; Guatemala; Guinea; Guinea-Bissau; Guyana; Haiti; Holy See; Honduras; Hungary; Iceland; India; Indonesia; Iran (Islamic Republic of); Iraq; Ireland; Israel; Italy; Jamaica; Japan; Jordan; Kazakhstan; Kenya; Kyrgyzstan; Laos; Latvia; Lebanon; Lesotho; Liberia; Libya; Liechtenstein; Lithuania; Luxembourg; Macedonia; Madagascar; Malawi; Malaysia; Mali; Malta; Mauritania;

Mauritius; Mexico; Moldova; Monaco; Mongolia; Morocco; Mozambique; Namibia; Nepal; Netherlands; New Zealand; Nicaragua; Niger; Nigeria; Norway; Oman; Pakistan; Panama; Papua New Guinea; Paraguay; Peru; Philippines; Poland; Portugal; Qatar; Republic of Korea; Romania; Russian Federation; Rwanda; Saint Kitts and Nevis; Saint Lucia; Saint Vincent and the Grenadines; San Marino; Sao Tome and Principe; Saudi Arabia; Senegal; Serbia; Seychelles; Sierra Leone; Singapore; Slovakia; Slovenia; South Africa; Spain; Sri Lanka; Sudan; Suriname; Swaziland; Sweden; Switzerland; Syrian Arab Republic; Tajikistan; Thailand; Togo; Tonga; Trinidad and Tobago; Tunisia; Turkey; Turkmenistan; Uganda; Ukraine; United Arab Emirates; United Kingdom; United Republic of Tanzania; United States of America; Uruguay; Uzbekistan; Venezuela; Vietnam; Yemen; Zambia; and Zimbabwe. / Парижская Конвенция По Охране Промышленной Собственности от 20 Марта 1883 пересматривалась в Брюсселе 14 Декабря 1900, в Вашингтоне 02 Июня 1911, в Гааге 06 Ноября 1925, в Лондоне 02 Июня 1934, в Лиссабоне 31 Октября 1958 и в Стокгольме 14 Июля 1967. Парижская Конвенция Об Охране Промышленной Собственности, смотрите в статье Промышленная Собственность.

PARIS GREEN = ПАРИЖСКОЕ ЗЕЛЁНОЕ – Paris Green:- a brilliant yellowish green.

PARITY = ПАРИТЕТ – (1) Par Rate. Parity:- equality in amount, character, status or value. / Под Паритетом (юридическое), от Немецкого слова Parität, от Латинского слова Paritas, означающее Равенство или Равноценность, понимается принцип равного представительства сторон. На паритетных началах образуются, например, комиссии для рассмотрения пограничных конфликтов. Наиболее распространён принцип паритета при согласительном рассмотрении трудовых споров и трудовых конфликтов. Например, в бывшем Союзе Советских Социалистических Республик (СССР) комиссии по трудовым спорам образуются из равного числа представителей работающих и администрации. Под Паритетом понимается равенство двух или более сторон взаимоотношений по каким-либо параметрам. Может означать состояние относительного равновесия сил, равноценности целей, эквивалентности платёжных средств, равенства прав и обязанностей и так далее. Слово является частью терминов:- Паритет Покупательной Способности – формулировка закона единой цены на международных рынках; и Ядерный Паритет – геополитическое состояние, при котором стороны обладают сравнимыми потенциалами ядерного оружия.

(2) In general, Parity is the exchange rate between two currencies is called Parity. On stock exchanges, parity is the price used for a foreign security as a result of converting the listing on its home exchange into the domestic currency. Exchange rate parity. / Паритет валютной ставки. Под Валютным Паритетом, от Немецкого слова Parität от Латинского слова Paritas, означающее Равенство или Равноценность, понимается соотношение между валютами разных стран. В эпоху обращения золота (серебра) в качестве денег и при свободном размене бумажных денег на золото (до Первой Мировой Войны 1914–18) применялся монетный паритет, по количеству содержащегося в денежных единицах чистого золота. В условиях обращения неразменных на золото бумажных денег – валютный паритет, по количеству золота, официально устанавливаемого правительством в национальной денежной единице. Валютный паритет, изменяемый государством в зависимости от движения цен внутри страны и покупательской силы иностранной валюты, называют паритетом покупательской силы валют. Паритет в экономике, соотношение между денежными единицами различных стран. В эпоху обращения золота (серебра) в качестве денег и при свободном размене бумажных денег на золото (до 1-й Мировой Войны 1914–18) соотношение между иностранными валютами по количеству чистого золота (серебра), содержащегося в сравниваемых денежных единицах различных стран, выступало как Монетный Паритет. После 1-й Мировой Войны в условиях обращения неразменных на золото бумажных денег монетный паритет был заменён Валютным Паритетом, который отражает соотношение валют по количеству золота, официально устанавливаемому правительством в национальных денежных единицах (смотрите Валютный Курс). Однако если в условиях золотого стандарта валютный (монетный) паритет и масштаб внутренних цен изменялись с изменением золотого содержания национальной денежной единицы, то с отменой золотого стандарта (середина 1930-х), наоборот, государства вынуждены изменять валютный паритет и золотое содержание национальной денежной единицы в соответствии с движением внутренних цен. Изменение валютного паритета осуществляется с целью сближения покупательной способности национальной валюты с покупательной способностью других валют. Соотношение между валютами различных стран, основанное на равенстве их покупательной силы к товарам, выражает паритет покупательной силы валют. На валютных рынках обмен валют осуществляется не по их официальному валютному паритету, а по валютному курсу, который отклоняется от паритета в зависимости от рыночного спроса и предложения на ту или иную валюту. В периоды валютных кризисов эти колебания резко обостряются. В условиях социалистической экономики валютный паритет устанавливается государством на плановой основе, исходя из золотого содержания валют и сопоставления покупательной способности национальной валюты на внутреннем и мировом рынках. Валютные курсы национальных валют социалистических стран колеблются только по отношению к капиталистическим валютам в зависимости от рыночных отклонений курсов последних.

(3) In futures trading, Parity is the situation in which cash and futures contracts are selling at equivalent yields. / Ситуация в торговле фьючерсами, при которой фьючерсные и реальные контракты продаются с одинаковой доходностью.

PARITY PRICE = ПАРИТЕТНАЯ ЦЕНА – (1) Parity Price:- prices quoted for all US equities traded on the Swiss Exchange. Equal to equity prices on New York Stock Exchange translated at current exchange rates.

(2) In the United States, Parity Price is the price which will give agricultural commodities the same relative purchasing power in terms of goods and services farmers buy that prevailed in a specified base period. This concept was first defined by the Agricultural Adjustment Act of 1933. The parity price formula is not a comprehensive measure of the economic well-being of farmers, nor does it measure cost of production, standards of living, or income parity. The parity price formula is based on price relationships, and reflects only one component of cost of production and income.

PARKA = ПАРКА – Parka is a hooded fur pullover garment for arctic wear; a usually lined fabric outerwear pullover or jacket. / Парка (у Ненцев; у Хантов и Манси – Порхы, у Селькупов – Порга), название различных местных типов верхней зимней одежды в Северной Сибири России, сшитой большей части из оленьих шкур мехом наружу. В низовьях Реки Обь (у Хантов и Манси) парка – одежда глухого покроя с капюшоном. На нижней и средней Оби (у Хантов и Манси), на территории Тазе и Турухане (у Селькупов), на Севере Красноярского Края и в Якутии (у Долган, Эвенков, Якутов) парка имеет вид шубы. Некоторые Эвенки Восточной Сибири называют Паркой свой обычный открытый кафтан. В XVIII веке Русские на Камчатке называли парками длинные меховые рубахи (Кухлянки).

PART = РАЗРЫВАТЬ (или ОТДЕЛЯТЬ) – Part (maritime term):- to break.

PARTHENOCARPY = ПАРТЕНОКАРПИЯ – Parthenocarpy is the development of fruit without seeds or fertilization. / Под Партенокарпией, от Греческих слов Parthénos, означающее Девственница, и Karpós, означающее Плод, понимается образование плодов Растений, обычно бессемянных, без оплодотворения. У некоторых Сортов Банана, Винограда, Крыжовника, Мандарина, Огурца, Хурмы и других. Такие плоды часто вкуснее плодов с семенами и имеют преимущества при технологической обработке. Партенокарпия, образование на Растении плодов без оплодотворения. Такие плоды обычно бессеменные или содержат семена без зародышей. Партенокарпия известна у многих культурных Растений:- Винограда,

Яблони, Груши, Тыквы, Огурца, Томата, Мандарина, Банана и многих других. В ряде случаев партенокарпия – прочно закреплённый сортовой признак (Сорта Винограда с ягодами без семян). Растения, образующие только бессеменные плоды, могут размножаться лишь вегетативным путём (отводками, черенками, почками и тому подобным). Различают Партенокарпию Вегетативную (или Автономную) и Стимулятивную. В первом случае плоды образуются без опыления; во втором – для образования плода требуется раздражение рыльца чужеродной пыльцой. Так, пыльца некоторых Сортов Яблони способна вызвать партенокарпию у некоторых Сортов Груши, пыльца Картофеля – у Томата, пыльца Томата – у Баклажана и так далее. Иногда партенокарпию вызывают механическими, химическими, тепловыми раздражениями рылец цветков. Искусственно вызываемая партенокарпия приобрела хозяйственное значение в культуре Томатов и Огурцов. Разработаны методы опрыскивания Растений слабыми растворами некоторых химических веществ, стимулирующих обильное образование бессеменных плодов, отличающихся мясистостью, сочностью и хорошими вкусовыми качествами.

PARTIAL = ЧАСТИЧНОЕ (или НЕПОЛНОЕ) – Partial:- less than a full pallet of product.

PARTIAL ACCEPTANCE = ЧАСТИЧНЫЙ АКЦЕПТ – Partial Acceptance is an acceptance which varies from the terms of the bill itself, e.g., one calling for payment of only part of the amount, or at a different time. / Акцепт, который отличается от порядка, прописанного в самом векселе, например, лицо, обращающееся за оплатой только части суммы или в отношении различного срока.

PARTIAL CONTAINERSHIP = ЧАСТИЧНЫЙ КОНТЕЙНЕРОВОЗ – Partial Containership:- multipurpose containerships where one or more but not all compartments are fitted with permanent container cells. Remaining compartments are used for other types of cargo.

PARTIAL DEBENTURE = ЧАСТИЧНОЕ ДОЛГОВОЕ ОБЯЗАТЕЛЬСТВО – Partial Debenture is a term referring to the division of the total amount of a debt instrument (bond) into separate parts. The total amount of the required loan is divided into separate amounts, securitized in standardized certificates (partial debentures) and sold to investors.

PARTIAL DIVIDEND = ЧАСТИЧНЫЙ ДИВИДЕНД – Partial Dividend:- breakdown of the annual dividend into interim dividend(s) and final dividend at the end of the financial year. Normal practice in the United Kingdom and the United States, but not permissible in Switzerland.

PARTIAL DOMINANCE = ЧАСТИЧНАЯ ДОМИНАНТНОСТЬ (или ЧАСТИЧНОЕ ДОМИНИРОВАНИЕ) – Partial Dominance is the incomplete dominance. / Частичная Доминантность – неполная доминантность.

PARTIAL EXECUTION = ЧАСТИЧНОЕ ИСПОЛНЕНИЕ – Partial Execution is an order execution where, due to the market situation, an order is executed in several steps, or not fully executed, during its validity.

PARTIAL FACTOR PRODUCTIVITY = ПРОДУКТИВНОСТЬ ЧАСТИЧНОГО ФАКТОРА – Partial Factor Productivity (PFP) is the average productivity of a single factor, measured by grain output divided by the quantity of the factor applied. This measure is sometimes referred to as Input Use Efficiency.

PARTIAL FOUR–WAY PALLET = ЧАСТИЧНО ЧЕТЫРЁХЗАХОДНЫЙ ПОДДОН – Partial Four-Way Pallet or Partial Four-Way Entry Pallet is a flat pallet permitting four-way entry of the fork arms of forklift trucks and two-way entry of the fork arms of pallet trucks. / Поддон Частично Четырёхзаходный Поддон:- плоский поддон, конструкция которого обеспечивает возможность ввода вилочного захвата с четырёх и с двух сторон.

PARTIAL FOUR–WAY STRINGER PALLET = ЧАСТИЧНО ЧЕТЫРЁХЗАХОДНЫЙ ХХ ПОДДОН – Partial Four-Way Stringer Pallet is a pallet with notched stringers.

PARTIAL LOSS = ЧАСТИЧНЫЙ УБЫТОК – Partial Loss is a loss under an insurance policy which does not either (i) completely destroy or render worthless the insured property; or (ii) exhaust the insurance applying thereto.

PARTIALLY ORIENTED STAPLE = ЧАСТИЧНО ОРИЕНТИРОВАННЫЙ ШТАПЕЛЬ – Partially Oriented Staple:- staple fibers cut from tow that has been drawn less than normal so that only partial longitudinal orientation of the polymer molecules exists.

PARTIALLY ORIENTED YARN = ЧАСТИЧНО ОРИЕНТИРОВАННАЯ ПРЯЖА – Partially Oriented Yarns (POYs) are the filament yarns with a significant degree of residual drawability. Such yarns are designed to be submitted to a further orientation process. Partially Oriented Yarns (POYs) are the filament yarns in which the draw ratio is less than normal resulting in only partial longitudinal orientation of the polymer molecules. Polyester Partially Oriented Yarn, commonly known as Polyester POY is the primary form of Polyester yarn. It is also known as Polyester Pre-Oriented Yarn. It is the first form of yarn made directly from PTA & MEG or by spinning Polyester PET Chips. POY is mainly used in texturizing to make textured yarn, also known as Polyester Drawn Textured Yarn (DTY). POY can also be used in draw warping for weaving and warp knitting of fabrics. POY is a substitute for cotton and other synthetic yarns and has a number of advantages over its substitutes, as a result of which, POY demand increased at a Compounded Annual Growth Rate (CAGR) of around 16% during the period 1991–92 to 2000–01. The advantages include:- POY is more durable, does not fade on exposure to sunlight or soap, has better abrasion resistance, drape and crease recovery properties, and is wrinkle resistant. POY yarn is available in different lustre like Full Dull (FD) POY, Semi-Dull (SD) POY, Bright (BR or BRT) POY, Bright Triloble (BR-TL) POY, and Black Dope Dyed (BK) POY. The Bright POY has the shine in it due to the cross-sections in the filaments. The fabric made from Bright POY also has the bright lustre. Polyester POY yarn is mainly available in Raw White color and is also available in various different colors. POY is usually colored by the Dope Dyed technology as it is more efficient and the yarn gets evenly colored at each and every part. Color master-batch is mixed with the raw material to make the dope dyed POY. Dope dyed POY yarn can be used to make the Dope Dyed DTY yarn. POY yarn is mainly available in packing of 15 kg per cheese and is usually packed in pallets. POY made on Barmag machines from Germany and TMT machines from Japan have the highest quality. POY from China and India is being exported in large quantities in countries like Egypt, Syria, Argentina, Iran and several other countries. For example:- 126D (Denier) 48F (No. of Filament) SD or 530D 68F SD. / филаментная (комплексная) пряжа (filament yarn).

PARTIAL PRESSURE DIFFERENCE = ЧАСТИЧНАЯ РАЗНОСТЬ В ДАВЛЕНИИ – Partial Pressure Difference:- in a mixture of gases, each component has a partial pressure. The sum total of all partial pressures is the absolute pressure. The partial pressure difference is the difference between the partial pressures of the gases either side of a gas separation membrane.

PARTIAL RESISTANCE = ЧАСТИЧНАЯ РЕЗИСТЕНТНОСТЬ (или ЧАСТИЧНАЯ СОПРОТИВЛЯЕМОСТЬ, или ЧАСТИЧНАЯ УСТОЙЧИВОСТЬ) – Partial Resistance is an incomplete resistance in the plant type that has some ability to grow when attacked by disease or pests.

PARTIAL RESTORER = ЧАСТИЧНЫЙ ВОССТАНОВИТЕЛЬ – Partial Restorer is a pollinator variety used to pollinate a male sterile line to produce F_1 male fertile progenies which produce partial seed set upon selfing. / Selfing = самоопыление; – сэлфинг (или сельфинг) – коньюгация в пределах одного клона инфузорий.

PARTIAL SHIPMENTS = ЧАСТИЧНЫЕ ОТГРУЗКИ (или ОТГРУЗКИ ЧАСТЯМИ) – Partial Shipments:- under letters of credit, one or more shipments are allowed by the phrase 'partial shipments permitted'. / По условиям выставленного аккредитива допускаются одна или более отгрузок посредством фразы 'частичные отгрузки разрешены'.

PARTIAL STERILIZATION = ЧАСТИЧНАЯ СТЕРИЛИЗАЦИЯ – Partial Sterilization is the elimination of a portion of a population of microorganisms, usually by treatment with heat or chemicals. / Частичная Стерилизация – устранение части популяции микроорганизмов, как правило, посредством обработки теплом или химикатами.

PARTICIPANT = УЧАСТНИК – Participant means any person or enterprise involved in the carriage of dangerous goods by road including any person involved in the activity of loading, unloading, packing and filling, and includes consignor, carrier, consignee, driver, vehicle crew, dangerous goods safety adviser (DGSA) or any person with a duty under the regulations.

PARTICIPATING BOND = ОБЛИГАЦИЯ УЧАСТИЯ – Participating Bonds are the bonds which not only confer on the holder the right to receive interest at a fixed rate but also embody the claim to a share in the net profit of the issuing company. / Облигации Участия – облигации, дающие владельцу право не только получать процент по фиксированной ставке, но и на участие в распределяемой чистой прибыли компании эмитента.

PARTICIPATING CERTIFICATE = СЕРТИФИКАТ ДОЛЕВОГО УЧАСТИЯ (или СВИДЕТЕЛЬСТВО О ДОЛЕВОМ УЧАСТИИ) – Participating Certificate is a security incorporating the right to participate in the ownership (equity) of a corporation, but without some of the rights granted to shareholders, e.g., the right to vote at shareholders' meetings. In Switzerland, participation certificates serve a similar function to dividend-right certificates and are issued for the purpose of raising capital. As is the case with capital stock, participation certificates form part of the equity capital of a company. Participation Certificate is a security issued by Swiss stock corporations that is equipped with equity rights, but in contrast to shares does not certify shareholder's rights, in particular voting rights. The company thus protects itself from unwanted influences and an excessive level of third-party ownership with the simultaneous addition of new risk-weighted captial. From a legal perspective, participation certificates are comparable to participatory rights. / , например, право на голосование на собраниях учредителей. В Швейцарии .

PARTICIPATING OR PRO RATA REINSURANCE = ПЕРЕСТРАХОВАНИЕ С УЧАСТИЕМ ИЛИ ПРОПОРЦИОНАЛЬНО – Participating Or Pro Rata Reinsurance:- includes Quota Share, First Surplus, Second Surplus, and all other sharing forms of reinsurance whereunder the reinsurer participates pro rata in all losses and in all premiums.

PARTICIPATING PREFERRED STOCK = ПРИВИЛЕГИРОВАННАЯ АКЦИЯ (С ПРАВОМ) УЧАСТИЯ – Participating Preferred Stock is a preferred stock, that is entitled to its stated dividend, and, also, to additional dividends on a specific basis upon payment of dividends on the common stock. Preferred stock that entitle the shareholder to additional dividends or bonuses from the remaining profits of a company if the dividend on ordinary shares exceeds a specified amount. Also known as Participating Preference Shares in the United Kingdom. / Привилегированная Акция, акция, по которой уплачивается твёрдый, фиксированный доход, независимо от величины прибыли акционерного общества. Иногда привилегированными акциями называют акции, дающие несколько голосов на собрании акционеров.

PARTICIPATION CERTIFICATE = СВИДЕТЕЛЬСТВО О (ДОЛЕВОМ) УЧАСТИИ (или СЕРТИФИКАТ (ДОЛЕВОГО) УЧАСТИЯ) – (1) Participation Certificate:- these securities guarantee a share in the profit generated by the issuer, but they do not come with voting rights. For participation certificates, no general standards apply, neither stipulated by law nor by the rules of the stock exchanges themselves. Each feature can be adapted to the individual financing needs of the issuer. The profit entitlement is securitized by means of a certificate (participation certificate). Participation certificates are negotiable, but are not considered as shares. / Сертификат Участия – сертификат, представляющий долевое участие в пуле (pool) фондов или иных финансовых инструментах, например, в пуле закладных (mortgage pool). Следующие полугосударственные агентства выпускают и/или гарантируют подобные сертификаты (называемые также Ценными Бумагами на Базе Пула Закладных или Пропускающими Ценными Бумагами (Pass-Through Securities)):- Федеральная Корпорация Жилищного Ипотечного Кредита (Federal Home Loan Mortgage Corporation (FHLMC)), Федеральная Национальная Ипотечная Ассоциация (Federal National Mortgage Association (FNMA)), Государственная Национальная Ипотечная Ассоциация (Government National Mortgage Association (GNMA)); Ассоциация Маркетинга Студенческих Кредитов (Sallie Mae).

(2) Participation Certificate is a security issued by Swiss stock corporations that is equipped with equity rights, but in contrast to shares does not certify shareholder's rights, in particular voting rights. The company thus protects itself from unwanted influences and an excessive level of third-party ownership with the simultaneous addition of new risk-weighted captial. From a legal perspective, participation certificates are comparable to participatory rights.

PARTICIPATION INDEX = ИНДЕКС ПО УЧАСТИЮ – The Participation Index (PI) measures short-term price trends and tracks the percentage of stocks pushing the upper and lower edge of the short-term trend envelope. Specifically we track participation of each stock in a given index. We can see how UP participation, the number of stocks actually driving the up move expands as the market moves higher, then contracts prior to ST market tops. A similar thing can happen with DOWN participation as the market is about to bottom. Bottom Line:- a trend needs a strong plurality of participation to be maintained. / В техническом анализе биржевых рынков, .

PARTICIPATORY RIGHT = КОЛЛЕГИАЛЬНОЕ ПРАВО – Participatory Right is the right to participate in voting. See also Pre-emptive Right.

PARTICLE COUNT = ПОДСЧЁТ (или СЧЁТ) ЧАСТИЦ – Particle Count is the number of particles present greater than a particular micron size per unit volume of fluid often stated as particles > 10 microns per milliliter.

PARTICLE COUNTER = СЧЁТЧИК ЧАСТИЦ – Particle Counter is an instrument that detects and counts particles found in a fluid such as oil.

PARTICLE COUNTING = ПОДСЧЁТ ЧАСТИЦ – Particle Counting is a microscopic technique that enables the visual counting of particles in a known quantity of fliud. The count identifies the number of particles present greater than a particular micron size per unit volume of fluid often stated as particles > 10 microns per milliliter.

PARTICLE DENSITY = ПЛОТНОСТЬ ЧАСТИЦ – Particle Density is an important parameter in establishing an entrained particle's potential to impinge on control surfaces and cause erosion. Particle Density is dry weight per unit volume of soil solids, normally expressed in grams per cubic centimeter or Megagram per cubic meter.

PARTICLE EROSION = ЭРОЗИЯ ЧАСТИЦ – Particle Erosion occurs when fluid-entrained particles moving at high velocity pass through orifices or impinge on metering surfaces or sharp angle turns.

PARTICLE GUN = ПУШКА (или ПИСТОЛЕТ, или РУЖЬЁ) ДЛЯ ЧАСТИЦ – Particle Gun is the apparatus to accelerate DNA-coated particles in order to introduce the DNA into the target cells.

PARTICLE IMPINGEMENT EROSION = ЭРОЗИЯ СТОЛКНОВЕНИЯ ЧАСТИЦ – Particle Impingement Erosion is a particulate wear process where high velocity, fluid-entrained particles are directed at target surfaces. / процесс износа, где высокая скорость, .

PARTICULAR AVERAGE = ЧАСТНАЯ АВАРИЯ – Particular Average is a partial loss of a ship or cargo which is caused by an insured peril and which is not a general average loss. The term Partial Loss may be used instead. A fortuitous partial loss to the subject matter insured, proximately caused by an insured peril but which is not a general average loss. In a freight at risk policy the term may be applied to a claim for loss of freight following a particular average loss of goods. Accidental partial loss of the subject matter insured proximately caused by an insured peril. In a freight at risk policy the term may be applied to a claim for loss of freight following particular average loss of goods. A fortuitous partial loss of insured property proximately caused by an insured peril, but which is not a general average loss. Particular Average:- a fortuitous partial loss to the subject matter insured, proximately caused by an insured peril but which is not a general average loss. Particular average only relates to damage and/or expenses which are exclusively borne by the owners of a vessel which has sustained damage as a result of, e.g., heavy weather or by the owners of the cargo, which has been damaged in transit. See also General Average. Partial loss sustained by goods insured. In marine insurance, partial loss of or damage to the subject-matter of insurance. / Частичный убыток, нанесённый застрахованным товарам. , например, . Частная Авария – ненамеренный ущерб, причинённый судну или грузу или связанный с их повреждением; убытки по частной аварии несёт тот, кто их потерпел, или тот, на кого падает ответственность за их причинение. Смотрите также Общая Авария (General Average). В морском праве под Частной Аварией подразумеваются убытки, причинённые судну или грузу при отсутствии общей для них опасности. При Частной Аварии убытки не подлежат распределению, и их несёт тот, кто их потерпел. При этом потерпевшему принадлежит право взыскать убытки с лица, виновного в их причинении. Частная Авария – по законодательству Российской Федерации (РФ) о торговом мореплавании убытки, не подпадающие под признаки общей аварии, установленные Пункте 1 Статьи 284 КТМ РФ, а также:- (а) стоимость выброшенного за борт груза, перевозившегося на судне с нарушением правил и обычаев торгового мореплавания; (б) убытки, причинённые в связи с тушением пожара на судне вследствие воздействия дыма или нагревания; (в) убытки, причинённые обрубанием обломков или частей судна, ранее снесённых или фактически утраченных вследствие морской опасности; (г) убытки, причинённые форсированием работы двигателей либо иной работой двигателей, других машин или котлов судна, находившегося на плаву; (д) любые убытки или потери, понесённые судном или грузом вследствие увеличения продолжительности рейса (убытки от простоя, изменения цен и другого). Перечисленные убытки не признаются общей аварией даже при наличии её признаков. Такие убытки не подлежат распределению между судном, грузом и фрахтом, и их несёт тот, кто их потерпел, или тот, кто отвечает за их причинение. Частная Авария:- убытки, причинённые судну или перевозимому грузу во время фрахта при отсутствии общей опасности, которые несут исключительно владельцы судна, потерпевшего аварию во время шторма, или владельцы груза, которому был нанесён ущерб. Убытки по частной аварии несёт тот, кто их потерпел, или тот, на кого падает ответственность за их причинение. При этом выбрасывание груза за борт рассматривается как частная авария, при потере груза, расположенного на палубе, убытки за который несут владельцы груза. Если судно село на мель, но затем снялось своими собственными средствами, то убытки относятся к частной аварии. Если судно снялось с мели при помощи буксира и/или морских спасателей, то есть были произведены дополнительные расходы в общих интересах судна, груза, фрахта, то имеет место авария общая. Частная Авария – термин морского права, означающий убытки, вызванные морским происшествием, которые не подлежат распределению между владельцами судна, фрахта и груза, как в общей аварии, – их несёт только потерпевший. К частной аварии относится ущерб, причинённый судну без груза, а при его наличии – случайный урон, когда причина возникает мгновенно и является абсолютно непредвиденной и непредотвратимой, например, падение метеорита на судно. Частные аварии могут быть вызваны действием непреодолимой силы, а также являться следствием неправильных действий экипажа потерпевшего или другого судна, приведшим к посадке на мель, столкновению, повреждению причальных сооружений и прочему. К частным авариям приравнивается стоимость повреждений, причинённых частям судна, и груза, пострадавшего от огня, а также выброшенного за борт самовозгоревшегося груза или груза, перевозившегося не по правилам, принятым в торговом мореплавании. Убытки могут быть также вызваны неоправданным увеличением продолжительности рейса, простоя в связи с выполнением экипажем судна ремонтно-восстановительных работ после шторма, форсирования двигателей, машин и котлов судна на плаву при возникновении какой-либо опасности.

PARTICULAR AVERAGE INSURANCE = СТРАХОВАНИЕ ОТ ЧАСТНОЙ АВАРИИ – Particular Average Insurance is a marine insurance term to refer to partial loss on an individual shipment from one of the perils insured against, regardless of the balance of the cargo. Particular-average insurance can usually be obtained, but the loss must be in excess of a certain percentage of the insured value of the shipment, usually three to five percent, before a claim will be allowed by the company.

PARTICULAR CHARGE = ОСОБЫЙ СБОР – Particular Charge is an expense incurred by an assured in relation to an insured loss. This can be a means of preventing further loss in transit (e.g., sue and labor charges), of assessing loss (e.g., a survey fee) or making good a loss at destination (e.g., repacking); the latter being sometimes referred to as an 'Extra Charge' when connected with a claim on the policy.

PARTICULATE AIR CONTAMINANTS = ЧАСТИЦЫ КОНТАМИНАНТЫ ВОЗДУХА (или ЧАСТИЦЫ ЗАГРЯЗНИТЕЛИ ВОЗДУХА) – Particulate Air Contaminants:- air pollution caused by dust.

PARTICULATES = (МАКРО) ЧАСТИЦЫ – Particulates are the particles made up of a wide range of natural materials (e.g., pollen, dust, resins), combined with man-made pollutant (e.g., smoke particles, metallic ash); in sufficient concentrations, particulates can be a respiratory irritant.

PARTICULATES FROM FIBERS = ЧАСТИЧКИ ИЗ ВОЛОКОН – Particulates From Fibers are the airborne particles, not visible as fibers to the naked eye. May or may not be of the polymer material of the fiber or have fiber shape under microscopic view.

PARTIES = СТОРОНЫ – In the US Open Access Transmission Tariff, Parties are the Transmission Provider and the Transmission Customer receiving service under the tariff. Transmission Provider is the public utility (or its designated agent) that owns, controls, or operates facilities used for the transmission of electric energy in interstate commerce and provides transmission service under the Tariff. Transmission Customer is any eligible customer (or its designated agent) that (i) executes a ServiceAgreement, or (ii) requests in writing that the Transmission Provider file with the Commission, a proposed unexecuted Service Agreement to receive transmission service under Part II of the Tariff. This term is used in the Part I Common Service Provisions to include customers receiving transmission service under Part II and Part III of this Tariff.

PARTLET = ПАРТЛЭТ (или ПАРТЛЕ, или ВОРОТНИК С РЮШЕМ) – Partlet is a XVI century chemisette with a band or collar. Partlet (now historical or archaic) is a covering for the neck and upper chest, originally worn by both sexes, but later especially by women to cover a low neckline (from XVI century). / .

PARTLOW™ CHART = ГРАФИК НИЗКИХ ТЕМПЕРАТУР (или ГРАФИК ПАРТЛОУ™) – Partlow™ – is a respected US leader in rugged and reliable circle chart process recorders and state-of-the-art single loop and multi-loop temperature recorder units and controllers servicing industry and machine builders in their process automation applications for over 80 years (since 1920). From quality validation to trend analysis and product safety applications, Partlow™ brand basic to high end controller and recorder products offer excellent value. Partlow™ circle chart recorder products, furthermore, provide the additional benefit of a paper document record of process control results for traceability. Partlow™ has been a division of Danaher Industrial Controls Group since 1993. Partlow Chart is a chart that indicates the temperature reading in a reefer container. Partlow™ offers the world's broadest range of reputable brand name mechanical, analog and digital micro-based electronic temperature recorder, process controller and circle chart recorder products to satisfy a full range of temperature and process control validation industry applications involving temperature, pressure, level and flow. Over the last 80 years, Partlow™ has been supplying customers with temperature controller and circle chart recorder system solutions the world over – with 3 day or less fast delivery time for customer peace of mind. Partlow™ digital temperature chart recorders are available with 10" and 12" circular charts. There are one and two pen analog recorders with optional control capability. We have one and two pen microcontroller based recorders with optional temperature controller, profiling, relative humidity calculations, or open channel flow and totalization capabilities. Partlow™ has the world's first four pen, color annotating, full-featured circular chart recorder, and it's now available with four control loops. / Партлоу™ (Partlow™) Дэнэхё Индэстриэл Контчролз Груп (Danaher Industrial Controls Group). График, который указывает показатели значений температуры в изотермическом контейнере.

PARTLY BLACK KERNELS = ЧАСТИЧНО (или ОТЧАСТИ) ЧЁРНАЯ ЗЕРНОВКА (или ЧАСТИЧНО (или ОТЧАСТИ) ЧЁРНЫЕ ЯДРА) – Partly Black Kernels mean parboiled Rice kernels that have black or dark brown area on the kernels as from 2.5 parts onward but not reaching the whole kernels.

PARTNERSHIP = АКЦИОНЕРНОЕ ОБЩЕСТВО (или ТОВАРИЩЕСТВО, или ПАРТНЁРСТВО) – Partnership is a relationship between two or more persons based on a written, oral, or implied agreement whereby they agree to carry on a trade or business for profit and share the resulting profits. Unlike a corporation's shareholders, the partnership's general partners are liable for the debts of the partnership. See also General Partnership, Limited Liability Partnership, Limited Partnership. In the United Kingdom, a business association normally formed by between two to twenty partners. The partners are jointly liable to the debts of the partnership, so that if one partner dies or decamps, the remainder are responsible for any debts. Association of two or more persons to conduct an enterprise. Partnerships differ from corporations in that the partners' liability is unlimited and in that profits and losses flow through to the partners, who pay taxes as individuals. See also Joint Venture, and Limited Partnership. A business relationship in which two or more people agree to share the risks and profits of running a business. Two or more persons (or organizations) who join their resources in business, sharing both rights and obligations. Partnership is a business organization in which two or more persons agree to do business together. / Акционерное Общество является основной организационной формой предприятия. Под его началами объединяются индивидуальные капиталы путём выпуска и продажи акций. Акционерное общество признаётся юридическим лицом, отвечающим по своим обязательствам в пределах принадлежащего ему имущества. Ответственность каждого акционера ограничена стоимостью его акций. Партнершип, от Английского слова Partnership, означающее Компания или Товарищество или Участие), в Соединённых Штатах Америки (США), Великобритании и некоторых других буржуазных государствах, воспринявших Англо-Саксонскую систему права, организационно-правовая форма капиталистических предприятий. Законодательством Партнершип определяется как отношение, существующее между лицами, совместно ведущими предприятие с целью извлечения прибыли; взаимоотношения между участниками партнершип регулируются договором. Партнершип не признаётся юридическим лицом:- имущество его принадлежит на праве совместной собственности всем участникам. При отсутствии специального соглашения каждый из участников имеет право на ведение дел и представительство партнершип. По договорным обязательствам участники партнершип несут совместно ответственность перед кредиторами. Партнёрство или Товарищество (Partnership):- контракт между двумя или более лицами, являющимися участниками совместного предприятия, согласившимися объединить свои средства и возможности и разделить прибыли и убытки этого предприятия. Лицо, несущее ответственность за ежедневное управление деятельностью товарищества, чьи решения являются обязательными для других партнеров, и которые несут личную ответственность по всем обязательствам товарищества, называются полными (генеральными) партнёрами (general partners). Те, кто лишь вносит деньги и не участвует в принятии управленческих решений, называются участниками с ограниченной ответственностью (limited partners); их ответственность ограничивается размерами инвестиций. Товарищества являются распространённым видом предприятий, где объединяются профессионалы и оказываются различные услуги. Это могут быть, например, бухгалтеры и юристы. Каждый бухгалтер или юрист, получивший статус партнёра, получает определённую долю прибыли компании. Права на участие в товариществах с ограниченной ответственностью продаются инвесторам брокерскими фирмами, консультантами по финансовому планированию и другими зарегистрированными посредниками. Эти товарищества могут быть либо публичными, то есть в них участвует большое число инвесторов и планы относительно создания товарищества должны быть представлены в Комиссию по Ценным Бумагам и Биржам (КЦББ; Securities and Exchange Commissions (SEC)), либо частными, то есть только ограниченное число инвесторов может участвовать в товариществе, их планы не должны представляться в Комиссию по Ценным Бумагам и Биржам. Как публичные, так и частные товарищества с ограниченной ответственностью вкладывают средства в недвижимость, нефть и газ, исследования и развитие, а также сдачу в аренду оборудования. Некоторые из этих товариществ ориентированы на предоставление участникам с ограниченной ответственностью налоговых льгот и возможностей получения прироста капитала, в то время как другие ориентированы преимущественно на получение дохода и некоторый прирост капитала. Смотрите также (General Partner), (Limited Partnership), (Oil And Gas Limited Partnership), (Private Limited Partnership), и (Public Limited Partnership). Акционерное Общество:- (1) объединение нескольких граждан, предприятие, объединение нескольких предприятий, формирующее свой капитал посредством выпуска и продажи акций; (2) организационно-правовая форма существования и функционирования предприятий, компаний, привлекающих акционерный капитал. Например, Акционерное Общество Закрытого Типа (АОЗТ) распространяет свои акции в форме закрытой подписки по решению учредителей; или Акционерное Общество Открытого Типа (АООТ) распространяет свои акции посредством открытой продажи.

(2) Partnership is one of the types of corporations in Switzerland, comparatively few business entities in Switzerland are organized as partnerships. At the end of 2001, approximately 10 000 general Partnerships (Kollektivgesellschaften) and 1 600 Limited Partnerships (Kommanditgesellschaften) were recorded in the commercial register. See also Corporation, Limited Liability Corporation, and Limited Partnership. / Одна из разновидностей корпораций в Швейцарии, В конце 2001 в коммерческом реестре были вписаны приблизительно 10 000 общих Товариществ или, как это звучит на Немецком языке по месту регистрации,

Колективгезэльшафтэн (Kollektivgesellschaften) и 1 600 Коммандитных Товариществ или, как это звучит на Немецком языке по месту регистрации, Командитгезэльшафтан (Kommanditgesellschaften).

PARTNERSHIPS AND ALLIANCES = ПАРТНЁРСТВА И АЛЬЯНСЫ – Partnerships And Alliances:- shippers and providers who enter into agreements designed to benefit both parties.

PARTNERS' PERMANENT CAPITAL CONTRIBUTION = КОНТРИБУЦИЯ ПОСТОЯННОГО КАПИТАЛА ПАРТНЁРОВ – Partners' Permanent Capital Contribution, this balance represents proceeds from the sale of partnership interests and any other partners' contributions of cash or other consideration to the partnership, less any returns of capital or other deductions.

PART PER MILLION = ЧАСТЕЙ НА МИЛЛИОН – Part Per Million (ppm):- 1/ppm = 0.000 001. Generally by weight. 100 ppm = 0.01%; 10,000 ppm = 1%. Part Per Million (ppm) is a unit of proportion equal to 10^{-6}.

PART RUN = ЧАСТИЧНЫЙ СБЕГ – Part Run is a partially filled bobbin that occurs when an end breaks before the completion of a doff cycle. The total weight of yarn normally wound during a cycle is not obtained on the bobbin at the break position. The number of part runs is used as a measure of spinning performance.

PART SET = ЧАСТИЧНЫЙ КОМПЛЕКТ (или ЧАСТИЧНЫЙ НАБОР) – Part Set is a term that indicates that all guide eyes in a guide bar do not have a yarn from the warp.

PARTS OF RICE KERNELS = ЧАСТИ РИСОВОЙ ЗЕРНОВКИ (или ЧАСТИ РИСОВЫХ ЯДЕР) – Parts Of Rice Kernels mean each part of the whole kernel that is divided lengthwise into 10 equal parts. / Под Частями Рисовой Зерновки (ядер) подразумевается каждая часть целиковой зерновки (целого ядра), которая поделена в длину на 10 равных частей.

PARTY COUNTRY = СТРАНА СТОРОНА – Party Country is a country, including its territories, that is a party to the Convention on International Trade in Endangered Species of Wild Fauna and Flora, by virtue of ratification or accession.

PAR VALUE = НАРИЦАТЕЛЬНАЯ СТОИМОСТЬ – Par Value is the value of the security as printed on its face. Thus also called the Full Face or Nominal Value of a security or financial instrument, such as a common stock, bond, bank note or other instrument. The par value of common stock is the nominal value assigned by corporate charter, and has no special relevance after the issue date. However, the par value of a bond is the price that will be paid to the bondholder at maturity. Par value is unrelated to market price. Securities can be issued at a premium or discount to par. Ordinarily not identical with the market value. Swiss law prescribes a minimum par value of the CHF10.00 per share, whereas in the United States and Canada shares may be issued without par value. Par Value is a minimum price of a share below which the share cannot be issued, as designated in the articles of incorporation. Par Value is the stated face value of a bond or, in the case of stock, an amount assigned by the company and expressed as a Dollar amount per share. Par value of common stock usually has no relationship to the current market value and so no par value stock is issued. Par value of preferred stock is significant, however, as it indicates the Dollar amount of assets each preferred share would be entitled to in the event of liquidation of the company. See also Denomination.

PAR VALUE PRICE = ЦЕНА ПО НАРИЦАТЕЛЬНОЙ СТОИМОСТИ – Par Value Price is a price of a security which is equal to its nominal or face value. / Цена ценной бумаги, равная её номинальной или лицевой стоимости.

PAR VALUE STOCK = АКЦИЯ ПО НАРИЦАТЕЛЬНОЙ СТОИМОСТИ – Par Value Stock is capital stock that has been assigned a value per share in the corporate charter.

PARVIFLORA = МЕЛКОЦВЕТКОВОЕ (или МЕЛКОЦВЕТЬЕ) – Parviflora – Parviflorum – Parviflorus – with small flowers. / Мелкоцветковое.

PARVIFOLIA = МЕЛКОЛИСТОВОЕ (или МЕЛКОЛИСТЬЕ) – Parvifolia – Parvifolium – Parvifolius – with small leaves.

PAR YIELD CURVE = КРИВАЯ НАРИЦАТЕЛЬНОЙ ДОХОДНОСТИ – Par Yield Curve:- a plot of coupon value on the y-axis against term to redemption on the x-axis. For each term, the coupon that would be required for a fixed interest bond of that term to be issued at par is plotted.

PASCAL = ПАСКАЛЬ – Pascal is a unit of pressure in the metric (SI) system. Pascal (Pa) is the SI unit of pressure. The Pascal is the standard pressure unit in the MKS metric system, equal to one Newton per square meter or one 'kilogram per meter per second per second'. Sounds impressive, but in traditional English terms a Pascal is only 0.000 145 pounds per square inch (0.020 885 lbf/ft^2 or 0.007 50 mmHg). Thus pressure is more commonly measured in kiloPascals (kPa), with 1 kPa = 0.145 lbf/in^2. Air pressure is also measured in hectoPascals (hPa), with 1 hPa = 1 millibar. The unit is named for Blaise Pascal (1623–1662), French philosopher and mathematician, who was the first person to use a barometer to measure differences in altitude. / Данная единица измерения была названа по имени Французского Католического теолога, писателя, математика и физика Блеза Паскаля (Blaise Pascal; 1623–1662), который был первым человеком, который стал использовать барометр для измерения разниц в высоте. Паскаль – наименование единицы давления и механического напряжения в Международной Системе Единиц СИ. Названа в честь Французского учёного Блеза Паскаля. Паскаль – давление, вызываемое силой 1 Ньютон (Н), равномерно распределённое по поверхности площадью 1 квадратный метр (м^2). Обозначения:- Русское Па, международное Ра. 1 Па = 1 Н/м^2 = 10 дин/см^2 = 0.102 кгс/м^2 = 10^{-5} бар = $7.50 \cdot 10^{-3}$ мм рт.ст. = 0.102 мм вод.ст.

PASCAL'S LAW = ЗАКОН ПАСКАЛЯ – Pascal's Law:- a pressure applied to a confined fluid at rest is transmitted with equal intensity throughout the liquid and that pressure is considered to act at right angles to each surface contacted by the fluid. / Закон Паскаля – закон гидростатики, согласно которому давление на поверхность жидкости, произведённое внешними силами, передаётся жидкостью одинаково во всех направлениях. Установлен Французским Католическим теологом, писателем, математиком и физиком Блезом Паскалем (Blaise Pascal; 1623–1662) (опубликован в 1663). Закон Паскаля имеет большое значение для техники, например, он используется в гидравлическом прессе.

PASHMINA = ПЯШМИНА – Pashmina refers to a type of fine cashmere wool and the textiles made from it. The name comes from Pashmineh, made from Persian Pashm ('Wool').The wool comes from changthangi or pashmina goat, which is a special breed of goat indigenous to high altitudes of the Himalayas. Pashmina shawls are hand spun, woven and embroidered in Kashmir, and made from fine cashmere fiber. Pashmina is the Persian name for the softest, warmest, and most delicate type of wool is popularly known as Cashmere in the west. Actually Cashmere is the modern interpretation of pashmina wool. Pashmina comes from the goat Capre Hircus which thrive best in the heights of 14 000 16 000 to of Himalayan ranges of the Himalayan kingdom of Nepal, Tibet and Mongolia. Majority of the pashmina shawls are made in the Kathmandu valley the capital city of Nepal. This goat hair is blessed with extreme softness and insulation capacity. It is only 12–14 microns thick and is spun and then blended with the silk to give it a versatile look and strength. Hand woven Pashmina shawls blended with the silk has become the darling of the western fashion for its finest touch and elegance. This elegant blend of goat hair and silk is an unmatched fabric all over the world. Pashmina is a luxurious mix of soft

Pashmina wool which is first spun and then hand woven over silk and is transformed into various end uses such as fabrics, shawls, stoles etc shawls is generally 36 inches wide and 80 inches in length. The smaller one is called Stole which is 28 inches to 80 inches. After being taken out of the looms according to the sizes required these fabrics are washed and are finally fringed with twisted silk tassels to make them into shawls, stoles, scarves. The most common blend contains 70% pashmina and 30% silk. There are also 60:40, 80:20 quality and 100% ones. Pashmina is the perfect accessory for any outfit and for any occasion.

PASS A LINE = ПРОВЕДИ ЛИНИЮ (или ПОДАТЬ КОНЕЦ) – Pass A Line (maritime term):- to reeve and secure a line.

PASS A STOPPER = ПРОВЕДИ СТОПОРА (или НАЛОЖИТЬ СТОПОРА) – Pass A Stopper (maritime term):- to reeve and secure a stopper (hold a strain on a line while transferring it).

PASS BOOK = СБЕРКНИЖКА – Pass Book is a book issued by a bank or building society which details transactions of a customer's account. The account holder present it when making deposits or withdrawals, unless he or she has a plastic card for use in an automated teller machine (ATM). The pass book is then brought up to date the next time the account holder visits the bank or society. Booklet issued by banks to depositors in which deposits, withdrawals and interest are recorded. Generally issued for savings accounts, which are also called Passbook Accounts. / Сберегательная Книжка или Сберкнижка – выданная чеком книжка, в которой отмечаются внесение средств на сберегательный счёт, изъятие средств со счёта и начисленные проценты; обычно называется Книжкой Сберегательного Счёта. В ней содержатся имя клиента и номер его счёта, а также регистрируются все операции, произведённые по счёту. Сберегательные счета, по которым ведутся подобные расчётные книжки, обычно имеют низкую доходность, но являются сберегательными, поскольку депонированная на них сумма (в пределах 100 000 Долларов) страхуется Федеральной Корпорацией Страхования Вкладов (Federal Deposit Insurance Corporation (FDIQ)). В настоящее время существует множество вложений, альтернативных такому сберегательному вкладу, в том числе счета, обслуживаемые по телефону с помощью автоматических кассовых машин, и счета с неограниченным объёмом операций.

PASS DOWN THE LINE = ПЕРЕДАТЬ ВНИЗ ПО ЛИНИИ (или ПЕРЕДАВАТЬ ПО КОМАНДЕ) – Pass Down The Line (maritime term):- relay to all others in order (a signal repeated from one ship to the next astern in column).

PASSED DIVIDEND = ПРОПУЩЕННЫЙ ДИВИДЕНД – Passed Dividend:- omission of a regular or scheduled dividend. / Пропуск регулярного или предусмотренного графиком дивиденда.

PASSENGER BOARDINGS = ПАСАДКИ ПАССАЖИРОВ – Passenger Boardings:- (i) means, unless the context indicates otherwise, revenue passenger boardings in the United States in the prior calendar year on an aircraft in service in air commerce, as the Secretary determines under regulations the Secretary prescribes; and (ii) includes passengers who continue on an aircraft in international flight that stops at an airport in the 48 contiguous States, Alaska, or Hawaii for a nontraffic purpose.

PASSENGER IN TRANSIT = ПАССАЖИР В ТРАНЗИТЕ – Passenger In Transit is a passenger who arrives by ship from a foreign country for the purposes of continuing his journey by ship or some other means of transport to a foreign country.

PASSENGERS' ACCOMPANIED BAGGAGE = СОПРОВОЖДАЕМЫЙ ПАССАЖИРОВ БАГАЖ – Passenger's Accompanied Baggage:- property, which may include currency, carried for a passenger on the same ship as the passenger, whether in his personal possession or not, so long as it is not carried under a contract of carriage or other similar agreement.

PASSENGER SHIP = ПАССАЖИРСКОЕ СУДНО – A Passenger Ship that its authorized to carry over twelve passengers. / Пассажирское судно, имеющее разрещение от соответствующих органов на перевозку более двенадцати пассажиров.

PASSIVE BEHAVIOR = ПАССИВНОЕ ПОВЕДЕНИЕ (или ПАССИВНОЕ ОТНОШЕНИЕ) – Passive Behavior defines the sensitivity of cargo to other cargo and to its environment, e.g., sensitivity to foreign odors.

PASSIVE MANAGEMENT = ПАССИВНОЕ УПРАВЛЕНИЕ – Passive Management is an investment strategy that mirrors a market index and does not attempt to beat the index. Also known as Passive Investing, or Passive Strategy.

PASS–ON SLIP = ПЕРЕДАВАЕМАЯ КВИТАНЦИЯ (или ПЕРЕДАВАЕМЫЙ СЛИП) – A Pass-On Slip is a document given to the captain or mate of a vessel by the Canadian Grain Commission (CGC) inspector when grain is loaded into the vessel from a terminal elevator. The information on the slip includes the vessel name, exact storage of all grades of grain loaded, a diagram of the stowage plan, the date, and the loading terminal. This slip is collected by the inspector in charge of the next loading elevator.

PASSOUT = ОТКАЗ (или ПЕРЕДАЧА) – Passout:- a contract executed by one broker for the client of another broker that the client orders to be turned over to the second broker. Also known as Give Up. / Контракт, исполненный одним брокером для клиента другого брокера, по которому приказы клиента должны быть переданы второму брокеру. Известен также как Отказ или Передача (Give Up).

(2) Passout:- an order that, at the request of the customer, is credited to a brokerage house that has not performed the execution service.

PASS THE WORD = ПЕРЕДАТЬ ДРУГОМУ (или ПЕРЕДАТЬ СЛОВО) – Pass The Word (maritime term):- to repeat an order for information to the crew.

PASS–THROUGH DIGITAL DOLLAR WALLETS = ПРОДЕТЫЕ (или СКВОЗНЫЕ) БУМАЖНИКИ ПОД ЦИФРОВЫЕ ДОЛЛАРЫ – The term Pass-Through Digital Dollar Wallet means a digital wallet or account, maintained by a member bank on behalf of any person, entitling that person to a pro rata share of a pooled reserve balance that the member bank maintains at any Federal Reserve bank. Pass-through digital Dollar wallets:- (i) shall not be subject to any account fees, minimum balances, or maximum balances and shall pay interest at a rate not below the greater of the rate of interest on required reserves and the rate of interest on excess reserves; (ii) shall provide functionality and service levels no less favorable than those that the member bank offers for its existing transaction accounts, including with respect to debit cards, automated teller machines, online account access, automatic bill-pay, mobile banking, customer service and such other services as the Board of Governors of the Federal Reserve System determines appropriate in the public interest, provided that digital Dollar wallets shall not include overdraft coverage; (iii) shall be prominently branded in all account statements, marketing materials, and other communications as 'Pass-Through FedAccounts' maintained by the member bank on behalf of the Federal Reserve; (iv) may not be closed or restricted by the bank on the basis of profitability considerations; and (v) shall provide account holders with reasonable protection against losses caused by fraud or security breaches.

PASTICHE = ПАСТИШ (или ПАСТИЧЧО, или ПОДРАЖАНИЕ, или ПАРОДИЯ) – Pastiche:- wig, especially toupee. / .

PATCH TEST = ИСПЫТАНИЕ НА ЗАПЯТНЫВАНИИ (или ЗАПЯТНАНИЕ) – Patch Test:- a method by which a specified volume of fluid is filtered through a membrane filter of known pore structure. All particulate matter in excess of an 'average size', determined by the membrane characteristics, is retained on its surface. Thus, the membrane is discolored by an amount proportional to the particulate

level of the fluid sample. Visually comparing the test filter with standard patches of known contamination levels determines acceptability for a given fluid.

PATCHY DYEING = НЕСПЛОШНОЕ КРАШЕНИЕ – Patchy Dyeing:- when the shade of the fabric found uneven, lighter darker called patchy dyeing. Examples – big stain due to dyestuffs, chemicals, water, etc. Dyeing defect. / развод (или потёк (stain)). Порок или дефект крашения.

PATENT = ПАТЕНТ – (1) A Patent is an exclusive right granted for an invention, which is a product or a process that provides, in general, a new way of doing something, or offers a new technical solution to a problem. In order to be patentable, the invention must fulfill certain conditions. A patent provides protection for the invention to the owner of the patent. The protection is granted for a limited period, generally 20 years. Patent protection means that the invention cannot be commercially made, used, distributed or sold without the patent owner's consent. These patent rights are usually enforced in a court, which, in most systems, holds the authority to stop patent infringement. Conversely, a court can also declare a patent invalid upon a successful challenge by a third party. A patent owner has the right to decide who may – or may not – use the patented invention for the period in which the invention is protected. The patent owner may give permission to, or license, other parties to use the invention on mutually agreed terms. The owner may also sell the right to the invention to someone else, who will then become the new owner of the patent. Once a patent expires, the protection ends, and an invention enters the public domain, that is, the owner no longer holds exclusive rights to the invention, which becomes available to commercial exploitation by others. Patents provide incentives to individuals by offering them recognition for their creativity and material reward for their marketable inventions. These incentives encourage innovation, which assures that the quality of human life is continuously enhanced. Patented inventions have, in fact, pervaded every aspect of human life, from electric lighting (patents held by Edison and Swan) and plastic (patents held by Baekeland), to ballpoint pens (patents held by Biro) and microprocessors (patents held by Intel, for example). All patent owners are obliged, in return for patent protection, to publicly disclose information on their invention in order to enrich the total body of technical knowledge in the world. Such an ever-increasing body of public knowledge promotes further creativity and innovation in others. In this way, patents provide not only protection for the owner but valuable information and inspiration for future generations of researchers and inventors. The first step in securing a patent is the filing of a patent application. The patent application generally contains the title of the invention, as well as an indication of its technical field; it must include the background and a description of the invention, in clear language and enough detail that an individual with an average understanding of the field could use or reproduce the invention. Such descriptions are usually accompanied by visual materials such as drawings, plans, or diagrams to better describe the invention. The application also contains various 'claims', that is, information which determines the extent of protection granted by the patent. An invention must, in general, fulfill the following conditions to be protected by a patent. It must be of practical use; it must show an element of novelty, that is, some new characteristic which is not known in the body of existing knowledge in its technical field. This body of existing knowledge is called 'Prior Art'. The invention must show an inventive step which could not be deduced by a person with average knowledge of the technical field. Finally, its subject matter must be accepted as 'patentable' under law. In many countries, scientific theories, mathematical methods, plant or animal varieties, discoveries of natural substances, commercial methods, or methods for medical treatment (as opposed to medical products) are generally not patentable. A patent is granted by a national patent office or by a regional office that does the work for a number of countries, such as the European Patent Office and the African Regional Intellectual Property Organization. Under such regional systems, an applicant requests protection for the invention in one or more countries, and each country decides as to whether to offer patent protection within its borders. The WIPO-administered (short for the World Intellectual Property Organization) Patent Cooperation Treaty (PCT) provides for the filing of a single international patent application which has the same effect as national applications filed in the designated countries. An applicant seeking protection may file one application and request protection in as many signatory states as needed. At present, no 'world patents' or 'international patents' exist. In general, an application for a patent must be filed, and a patent shall be granted and enforced, in each country in which you seek patent protection for your invention, in accordance with the law of that country. In some regions, a regional patent office, for example, the European Patent Office (EPO) and the African Regional Intellectual Property Organization (ARIPO), accepts regional patent applications, or grants patents, which have the same effect as applications filed, or patents granted, in the member States of that region. Further, any resident or national of a Contracting State of the Patent Cooperation Treaty (PCT) may file an international application under the PCT. A single international patent application has the same effect as national applications filed in each designated Contracting State of the PCT. However, under the PCT system, in order to obtain patent protection in the designated States, a patent shall be granted by each designated State to the claimed invention contained in the international application. Further information concerning the PCT is available. Procedural and substantive requirements for the grant of patents as well as the amount of fees required are different from one country/region to the other. It is therefore recommend that you consult a practicing lawyer who is specialized in intellectual property or the intellectual property offices of those countries in which you are interested to get protection. A list of URLs and a directory of national and regional intellectual property offices are available. In order to search patent applications and granted patents, some national or regional patent offices provide free-of charge electronic databases via Internet. A list of URLs of web-based databases is available. WIPO provides access to a comprehensive electronic database on published international patent applications filed under the PCT system from 1978 to the present day in image format and to fully searchable text of descriptions and claims for PCT International Applications filed as from July 1998. Wherever web-based databases are not available, patent information may be consulted on paper, on microfilms or CD-ROMs, at the national or regional patent offices. Searchable Internet patent databases have significantly facilitated the access to patent information. However, given the complexity of patent documents and the technical and legal skills required, it is advisable to contact a professional patent attorney if a high-quality patent search is required. WIPO Patent Information Services (WPIS) provides free-of-charge services for users in developing countries who wish to obtain technical search results in relation to their inventions. The Collection of Laws for Electronic Access (CLEA) provides easy access to intellectual property legislation from a wide range of countries and regions as well as to treaties on intellectual property administered by WIPO. Many national or regional patent Offices provide information concerning national or regional legislation on their web sites. A list of URLs of national and regional intellectual property offices are available. Procedural and substantive requirements for the grant of patents are different from one country/region to the other. In particular, practices and case law regarding the patentability of software-related inventions vary significantly in different countries. For example, in some countries, 'inventions' within the meaning of patent law must have a 'technical character' and software as such is not considered a patentable invention, while in others, such requirements do not exist, so that sofrware is generally patentable subject matter. It is therefore recommend that you consult a practicing lawyer who is specialized in intellectual property or the intellectual property offices of those countries in which you are interested to get protection. A list of URLs and a directory of national and regional intellectual property offices are available. On the other hand, computer programs may be protected under copyright. However, according to a well-established principle, copyright protection extends only to expressions, not to ideas, procedures, methods of operation or mathematical concepts as such. It is important to file a patent application before publicly disclosing the details of the invention. In general, any invention which is made public before an application is filed would be considered prior art (although the definition of the term 'prior art' is not unified at the international level, in many countries, it consists of any information which has been made available to the public anywhere in the world

by written or oral disclosure). In countries which apply the above definition of the term 'prior art', the applicant's public disclosure of the invention prior to filing a patent application would prevent him/her from obtaining a valid patent for that invention, since such invention would not comply with the novelty requirement. Some countries, however, allow for a grace period, which provides a safeguard for applicants who disclosed their inventions before filing a patent application, and the novelty criteria may be interpreted differently depending on the applicable law. If it is inevitable to disclose your invention to, for example, a potential investor or a business partner, before filing a patent application, such a disclosure should be accompanied by a confidentiality agreement. Patent applications must be filed either before the granting of first patent or within 12 months of the first foreign application. Further, a patent application must be filed within two years after the invention has been published or used publicly. Patents are granted for products, compositions, apparatus and processes, or for improvements in these, that are:- (i) new, i.e. first in the world ('novelty'); (ii) useful, i.e. functional and operative ('utility'); and (iii) unobvious to a person skilled in the art ('inventive ingenuity'). A patent application is examined for proper form and content. It will be published for opposition within one month. If there is no successful opposition, the application is allowed. Compulsory licensing may be ordered by the Patent Commissioner three years after a patent is granted, and if licenses are insufficient, the patent may be revoked. Importation does not constitute working of the patent in Canada (for example). Patent registration should be marked on the product. Patent systems are designed to encourage the disclosure of information to the public by rewarding inventors for their endeavors. One might say that a patent is a contract between society as a whole and the individual inventor. Under the terms of this social contract, the inventor is given the exclusive right to prevent others from making, using and selling the patented invention for a fixed period of time in return for the inventor disclosing the details of the invention to the public. Although the word Patent finds its origin from documents issued by the Sovereign of England in the Middle Ages for granting a privilege, today the word Patent is synonymously linked with this exclusive right granted to inventors. The duration of patent exclusivity varies from country to country. However, under all patent systems, once this period has expired, people are free to use the invention as they wish. The benefits of an effective patent system can be partially illustrated as follows:- a patent rewards the investment of time, money and effort associated with research; it stimulates further research as competitors invent alternatives to patented inventions; and it encourages innovation and investment in patented inventions by permitting companies to recover their research and development costs during the period of exclusive rights. The limited term of a patent also furthers the public interest by encouraging quick commercialization of inventions, therefore making them available to the public sooner rather than later. Patents also allow for more latitude in the exchange of information between research groups, help avoid duplicative research, and most importantly, increase the general pool of public knowledge. A comparison of the number of inventions developed in countries with adequate patent protection with the number in countries without it demonstrates that patent systems stimulate investment in research and development. A look at the pharmaceutical industry in Italy before and after patent protection for pharmaceuticals became available in that country provides a good illustration. Prior to granting protection, there was significantly less capital invested in Italian pharmaceutical research and development when compared to the amount of money invested in the research and development of other technologies. Following Italy's enactment of patent laws protecting pharmaceuticals, the relative investment in the pharmaceutical industry in Italy rose significantly. As stated before, the right conferred by a patent is a right to exclude others from making, using or selling the patented invention during the term of the patent. It is important to understand that a patent does not necessarily give the patent owner the right to make, use or sell the invention himself. For example, the owner of a patent for an improved method of producing a chemical compound would not be free to sell the compound made using the patented method if the compound is itself patented by someone else. Patents are granted under national laws and, therefore, the rights are also national in scope. Thus, a United States patent can be asserted only against infringing conduct in the United States. In most countries these rights are enforceable by civil, rather than criminal, proceedings. Accordingly, enforcement falls solely to the patent owner. In general, any act of making, using or selling the patented invention without permission infringes that patent, whether it be by the state, a corporation or an individual. Any such infringing act will give rise to liability, regardless of the infringer's intent or lack of knowledge of the patent. Remedies for patent infringement can include injunctions, orders to deliver up or destroy infringing articles, and compensation for damages suffered by the patentee or profits made by the infringer. An issued patent remains open to attack for invalidity, and it is a common defense for an alleged infringer to assert that the patent is invalid. Typically, patents are challenged on the ground that the claimed invention was invented by someone other then the named inventor, or that the invention would have been obvious to persons skilled in the relevant technology. Even though patentability is governed by national laws, most countries have adopted similar requirements. In general, to be patentable, an invention must be novel, useful and nonobvious. It is a prerequisite to patentability that the invention be capable of some practical application. This emphasizes the importance the patent system puts on usefulness. Although this principle remains constant, the phraseology used within the legislation of particular countries varies, e.g., in the United States patentable subject matter must be 'useful', whereas in the United Kingdom it must be capable of 'industrial application'. The invention must be new, that is to say, the subject matter of the invention is not or cannot be inferred to be part of what is already known. This is commonly referred to as the 'Novelty' Requirement. New or novel in this context means 'new to the public'. Therefore, something that has previously been used or known but has not been made available to the public (for instance, if it has been kept a secret) is not a bar to patentability. The invention must also be nonobvious. This prevents someone from taking advantage of the patent system and obtaining protection for something that is a mere extension or trivial variation of what is known. Generally the test for inventiveness or 'nonobviousness' is based on what a reasonable person skilled in the field to which the invention pertains, at the time the invention was made, would consider to be nonobvious. For reasons of public policy some countries do not allow the patenting of chemical compounds, but instead allow only the patenting of the processes for preparing them. It is particularly difficult to enforce a process patent as the burden of proof is on the patent owner to show that the patent has been infringed, i.e. 'copied'. The patent owner must prove that a particular manufacturing process (i.e. that covered by the patent) was used to manufacture the particular chemical. This can be very difficult to show where there are many possible process variants and where access to the potential infringer's facility is not available. In practice, this is done by looking for trace impurities that are characteristic of the manufacturing process. One can imagine how complex the issues can become if, for instance, a patent protects a pharmaceutical and the pharmaceutical is made in Turkey, where there is no protection for pharmaceuticals, and exported to Finland, which provides protection only for manufacturing processes. Over the past 15 years, many countries have changed from 'process' to 'product' patenting, and this trend is continuing with more countries expected to upgrade their patent laws within the next few years. Not only are the utilitarian aspects of new and useful inventions patentable, but many countries also extend patent protection to novel, ornamental industrial designs. In the United States, this form of protection is known as a Design Patent, while in many European countries, the property right in an industrial design is referred to as a Design Model. In additional to the usual subjects of patent protection such as devices, chemical compositions and processes, some countries provide patent protection for living matter. For example, asexually reproduced varieties of plants, excluding bacteria, uncultured plants and tuber propagated plants can be protected as can sexually reproduced plants (by seed) excluding bacterial, fungi and first generation hybrids. Exclusive right granted by a government for a given period of time to an inventor, to make, use or sell a particular invention. Patent is a property right granted by the Government of the United States of America to an inventor 'to exclude others from making, using, offering for sale, or selling the invention throughout the United States or importing the invention into the United States' for a limited time in exchange for public disclosure of the invention when the patent is granted. A government grant of certain rights given to an inventor for a limited time in exchange for the disclosure of the

invention. The most important of these rights is the one under which the patented invention can be made, used or sold only with the authorization of the patent owner. Patents for Invention:- most laws dealing with the protection of inventions do not actually define the notion of an invention. A number of countries, however, define inventions as new solutions to technical problems. The problem may be old or new, but the solution, in order to merit the name of invention, must be a new one. Merely discovering something that already exists in nature, such as a previously unknown plant variety, is not an invention. Human intervention must be added. So the process for extraction of a new substance from a plant may be an invention. An invention is not necessarily a complex item. The safety pin was an invention which solved an existing 'technical' problem. New solutions are, in essence, ideas, and are protected as such. Thus protection of inventions under patent law does not require that the invention be represented in a physical embodiment. Patents, also referred to as Patents For Invention, are the most widespread means of protecting the rights of inventors. Simply put, a patent is the right granted to an inventor by a State, or by a regional office acting for several States, which allows the inventor to exclude anyone else from commercially exploiting his invention for a limited period, generally 20 years. By granting an exclusive right, patents provide incentives to individuals, offering them recognition for their creativity and material reward for their marketable inventions. These incentives encourage innovation, which in turn contributes to the continuing enhancement of the quality of human life. In return for the exclusive right, the inventor must adequately disclose the patented invention to the public, so that others can gain the new knowledge and can further develop the technology. The disclosure of the invention is thus an essential consideration in any patent granting procedure. The patent system is so designed as to balance the interests of inventors and the interests of the general public. The word patent, or letters patent, also denotes the document issued by the relevant government authority. In order to obtain a patent for an invention, the inventor, or the entity he works for, submits an application to the national or regional patent office. In the application the inventor must describe the invention in detail and compare it with previous existing technologies in the same field in order to demonstrate its newness. Not all inventions are patentable. Laws generally require that an invention fulfill the following conditions, known as the Requirements or Conditions Of Patentability:- (i) Industrial Applicability (utility):- the invention must be of practical use, or capable of some kind of industrial application. (ii) Novelty:- it must show some new characteristic that is not known in the body of existing knowledge (referred to as Prior Art) in its technical field. (iii) Inventive step (non-obviousness):- it must show an inventive step that could not be deduced by a person with average knowledge of the technical field. (iv) Patentable subject matter:- the invention must fall within the scope of patentable subject matter as defined by national law. This varies from one country to another. Many countries exclude from patentablility such subject matter as scientific theories, mathematical methods, plant or animal varieties, discoveries of natural substances, methods for medical treatment (as opposed to medical products), and any invention where prevention of its commercial exploitation is necessary to protect public order, good morals or public health. The conditions of novelty and inventive step (non-obviousness) must exist at a certain date, generally the date on which the application is filed. There is an exception to this rule, covered by an applicant's right of priority, regulated by the Paris Convention for the Protection of Industrial Property. This exception relates only to applications made in countries party to the Paris Convention. The right of priority means that, having filed an application in one member country of the Paris Convention, the same applicant (or his successor in title) may, within a specified time period, apply for protection for the same invention in any of the other member countries. These later applications will be regarded as if they had been filed on the same day as the earliest application. For example, if an inventor first files an application for patent protection in Japan, and later a second application, with respect to the same invention, in France, it is sufficient that the conditions of non-obviousness existed at the date on which the Japanese application was filed. In other words, the later, French application retains priority over any applications relating to the same invention filed by other applicants between the date of the inventor's first and the second application. This is subject to the period between the two dates not exceeding 12 months. It is customary to distinguish between inventions that consist of products and inventions that consist of processes. The creation of a new alloy is an example of a product invention. The invention of a new method or process of making a known or new alloy is a process invention. The corresponding patents are usually referred to respectively as a product patent and a process patent. The person to whom a patent is granted, is known as the Patentee, the owner of the patent or the patent holder. Once a patent has been granted with respect to a particular country, anyone who wishes to exploit the invention commercially in that country must obtain the authorization of the patentee. In principle, anyone who exploits a patented invention without the patentee's authorization commits an illegal act. The protection is granted for a limited period, generally 20 years. Once a patent expires, the protection ends, and the invention enters the public domain. The patentee no longer holds exclusive rights to the invention, which then becomes available for commercial exploitation by others. The rights conferred by a patent are not described in the patent itself. Those rights are described in the patent law of the country in which the patent is granted. The patent owner's exclusive rights generally consist of the following:- (i) in the case of a product patent, the right to prevent third parties without the owner's consent from making, using, offering for sale, selling or importing for these purposes the product; (ii) in the case of a process patent, the right to prevent third parties without the owner's consent from using the process; and to prevent third parties from using, offering for sale, selling or importing for these purposes the products which were obtained directly by that process. The patentee is not given a statutory right to exploit his own invention, but rather a statutory right to prevent others from commercially exploiting it. He may give permission, or grant a license, to other parties to use the invention on mutually agreed terms. The patentee may also sell his right to the invention to someone else, who will then become the new owner of the patent. There are certain exceptions to the principle that a patented invention cannot legally be exploited without the authorization of the owner of the patent. These exceptions take into account the balance between the legitimate interests of the patentee and those of the general public. Patent laws may provide for cases in which a patented invention may be exploited without the patentee's authorization, for example, in the wider public interest by or on behalf of the government, or on the basis of a compulsory license. A compulsory license is an authorization to exploit the invention given by a governmental authority. It is generally issued only in very special cases, defined in the law, and only where the entity wishing to exploit the patented invention is unable to obtain the authorization of the owner of the patent. The conditions regarding the granting of compulsory licenses are regulated in detail by laws that provide for them. The decision to grant a compulsory license must provide for an adequate remuneration of the patentee. The decision may be the subject of an appeal. For example, in Canada patents are valid for 17 years. Chemical manufacturing processes are patentable. Prior knowledge, use, patent or description anywhere, or public use or sale in Canada more than two years prior to Canadian application would destroy the novelty of an invention and thus render it unpatentable. / Эдэсэн (Edison). привоз (importation). Патент на изобретение. чертёж (drawing). , например, . , то есть . инновация . Патент представляет собой исключительное право, предоставленное на изобретение, которое может быть продуктом или способом, позволяющим сделать что-либо по-новому или предлагающим новое техническое решение задачи. Какова функция патента? Патент предоставляет своему владельцу охрану на изобретение. Охрана предоставляется на ограниченный срок, как правило составляющий 20 лет. Какую охрану предоставляет патент? Патентная охрана означает, что изобретение не может быть изготовлено, использовано, распространено или продано в коммерческих масштабах без согласия патентовладельца. Эти патентные права обычно защищаются в суде, который, в большинстве систем, обладает правом на пресечение нарушений патентных прав. И наоборот, после успешного оспаривания третьей стороной суд также может объявить патент недействительным. Какими правами обладает патентовладелец? Патентовладелец имеет право принимать решение о том, кто может – или не может – использовать запатентованное изобретение в течение срока охраны изобретения. Патентовладелец может давать разрешение или выдавать лицензию другим лицам на использование

изобретения на взаимно согласованных условиях. Владелец может также продать право на изобретение какому-либо лицу, которое затем становится новым владельцем этого патента. По истечении срока действия патента, охрана заканчивается и изобретение переходит в область общественного достояния, то есть владелец больше не обладает исключительными правами на изобретение, которое становится открытым для коммерческого использовнаия другими лицами. Почему необходимы патенты? Патенты стимулируют отдельных лиц, предоставляя им признание их творческого вклада и материальное вознаграждение за коммерческое использование их изобретений. Эти стимулы поощряют новаторство, что обеспечивает такое положение, при котором качество жизни людей постоянно повышается. Какую роль играют патенты в повседневной жизни? Запатентованные изобретения проникли фактически во все сферы человеческой жизни, начиная с электрического освещения (патентовладельцами являлись Эдэсэн и Свэн) и пластика (патентовладельцем являлся Бейкленд), и до шариковых ручек (патентовладельцем являлся Биро) и микропроцессоров (патентовладельцем являлся, например, Intel). Все патентовладельцы в обмен на предоставление патентной охраны обязаны публично раскрывать информацию об их изобретениях для того, чтобы обогатить общую мировую сокровищницу технических знаний. Такая сокровищница постоянно расширяющихся общих знаний содействует дальнейшему развитию творческой инновационной деятельности у других людей. Таким образом, патенты не только предоставляют охрану владельцу, но также содержат ценную информацию и являются источником вдохновения для грядущих поколений исследователей и изобретателей. Как осуществляется выдача патента? Первым шагом на пути к получению патента является подача патентной заявки. Как правило патентная заявка содержит название изобретения, а также указание технической области, к которой оно относится; оно должно включать предпосылки и описание изобретения, изложенные ясным языком и достаточно подробно, чтобы лицо, имеющее средние знания в данной области, могло использовать или воспроизвести изобретение. Описания, как правило, сопровождаются такими визуальными материалами, как чертежи, схемы или диаграммы, помогающими лучше раскрыть сущность изобретения. Заявка также содержит различные ‘притязания’, то есть информацию, которая определяет объём охраны, предоставляемый патентом. На какие виды изобретений предоставляется охрана? Как правило, для получения патентной охраны изобретение должно удовлетворять следующим требованиям:- оно должно быть практически применимым; оно должно иметь элемент новизны, то есть определённое новое свойство, которое неизвестно среди существующих знаний в данной технической области; такие существующие знания называются ‘известный уровень техники’; изобретение должно иметь изобретательский уровень, который не может быть выведен лицом, обладающим средними знаниями в данной технической области. В заключение, объект изобретения должен быть ‘патентуемым’ согласно законодательству. Во многих странах научные теории и математические методы, сорта растений или породы животных, открытие природных веществ, методы выполнения хозяйственных операций или методы медицинского лечения (но не сами медицинские продукты) как правило не патентуются. Кто выдаёт патенты? Патент выдаёт национальное патентное ведомство или региональное ведомство, которое выполняет работу в интересах ряда стран, как например, Европейское Патентное Ведомство и Африканская Региональная Организация Промышленной Собственности. В рамках таких региональных систем заявитель испрашивает охрану на изобретение в одной или нескольких странах, и каждая страна принимает решение о предоставлении или отказе в предоставлении охраны на своей территории. Договор о патентной кооперации (PCT), административные функции которого выполняет ВОИС, обеспечивает возможность подачи одной международной патентной заявки, которая имеет такое же действие, что и подача национальной заявки в каждой из указанных стран. Заявитель, испрашивающий охрану, может подать одну заявку и испрашивать охрану в тех странах – участницах Договора, в которых он желает её получить. В настоящее время термин патент связан, прежде всего, с эксклюзивным правом, предоставляемым изобретателям, на использование их изобретений. Срок действия патента варьирует в разных странах. Патентная Чистота. Промышленный Дизайн или Промышленный Образец (Design Model), новое художественно-конструкторское решение изделия, определяющее его внешний вид, соответствующее требованиям технической эстетики, пригодное к осуществлению промышленным способом и дающее положительный эффект. Объект промышленной собственности. Авторское Свидетельство – документ, закрепляющий авторское право изобретателя на сделанное им изобретениею Оно удостоверяет признание предложения изобретением, приоритет изобретения и авторство на изобретение. Изобретатель может по своему выбору получить Авторское Свидетельство или Патент на своё изобретение. В случае соавторства Авторское Свидетельство выдаётся каждому соавтору с указанием в нём других соавторов. Автор или соавторы изобретения имеют право на вознаграждение и другие права и льготы. Патент, от средневекового Латинского словосочетания Litterae Patentes, означающее Грамота, от Латинского слова Patens (Patentis), означающее Открытый, является документом, удостоверяющим государственное признание предложения изобретением, приоритет изобретения, авторство на изобретение и исключительное право патентообладателя на изобретение. Патент выдаётся на имя автора изобретения или его правопреемника с указанием в патенте имени, отчества и фамилии автора. Никто не может использовать изобретение, на которое выдан патент, без согласия патентообладателя. Лицо, нарушившее исключительное право патентообладателя на использование изобретения, защищённую патентом, обязано возместить причинённые убытки в порядке, предусмотренном законодательством. Патентообладатель вправе за плату или бесплатно выдать разрешение (лицензию) на использование изобретения или полностью уступить патент. Действие патента распространяется только на территорию государства, в котором он был выдан. Срок действия патентов устанавливается национальным законодательством, как правило, он составляет 15–20 лет, а исчисляется он с даты подачи заявки на изобретение. В бывшем Союзе Советских Социалистических Республик (СССР)Патент являлся одной из двух форм правовой охраны изобретений (другая форма – авторское свидетельство). Срок действия патента составлял 15 лет со дня подачи заявки на изобретение в Государственный Комитет СССР по Делам Изобретений и Открытий, который и выдавал сам Патент. Под Патентом, от позднелатинского слова Patens, родительный падеж Patentis, означающее Грамота или Свидетельство, понимается:- (1) документ, удостоверяющий государственное признание технического решения изобретением и закрепляющий за лицом, которому он выдан (Патентообладателем) исключительное право на это изобретение. Выдаётся государственным патентным ведомством изобретателю или его правопреемнику (право на служебное изобретение обычно принадлежит предпринимателю) по его заявке, рассмотренной в соответствии с процедурой, установленной законодательством данного государства. Действие патента распространяется на территорию того государства, где он выдан. Срок действия патента также устанавливается национальным законодательством (как правило, 15–20 лет), в некоторых странах предусматривается возможность продления этих сроков. При выдаче патента взимается Патентная Пошлина. Патент может быть оспорен, аннулирован по основаниям и в порядке, установленном национальным законодательством. Исключительное право патентообладателя заключается в предоставлении ему монопольного права на применение изобретения. Если изобретение используется без разрешения владельца патента, он может обратиться в суд с иском о возмещении убытков, запрещении действий, связанных с нарушением патента, и тому подобного. Патентообладатель имеет право отчуждать свои права на изобретение и выдавать разрешения (Лицензии) другим лицам на использование запатентованного изобретения. Законодательство ряда стран устанавливает некоторые ограничения прав патентообладателей (принудительное отчуждение патента, выдача принудительных лицензий и тому подобное). В бывшем СССР патент – одна из двух форм правовой охраны изобретений, использовавшаяся, как правило, только

иностранцами. Объём прав патентообладателя определялся с учётом законодательства об исключительной собственности Советского государства на средства производства и правил о монополии внешней торговли. Второй, наиболее распространённой формой охраны прав на изобретение, являлось Авторское Свидетельство. Аналогичная система установлена в большинстве социалистических стран. В буржуазных государствах, где использование нового изобретения позволяет извлекать повышенную прибыль, патент – важное орудие в конкурентной борьбе. Поскольку реальную возможность применения изобретения имеют крупные капиталистические предприятия, они, как правило, скупают патенты на все представляющие интерес изобретения. Известны случаи ‘замораживания’ патентов (то есть скупка патентов без реализации изобретений) крупными монополиями с тем, чтобы не допустить использования изобретений конкурентами. В ряде стран патенты выдаются и на некоторые другие объекты промышленной собственности (например, на промышленные образцы). О международной патентной классификации смотрите статью Классификация Изобретений. Необходимым условием для выдачи Патента на изобретение является Патентная Чистота, обозначающая возможность использования объекта техники (машины, прибора и так далее) в данном государстве без нарушения прав по действующим патентам. За выдачу патента на изобретение соответствующими органами взимается патентная пошлина в виде определённой денежной суммы. Патентная Формула – краткая формулировка объекта патентной защиты, которой заканчивается патентное описание. На основе патентной формулы определяется объём прав патентообладателя. Патентная Чистота – юридический термин, обозначающий, что объект техники (машина, прибор, технологический процесс, материал, продукт и так далее) можно использовать в данном государстве без нарушения прав патентообладателя. Патентная Чистота, юридический термин, обозначающий возможность использования объекта техники (машины, прибора, оборудования, материалов, технологических процессов и так далее) в данном государстве без нарушения прав по ранее выданным действующим патентам на изобретения или прав на другие объекты Промышленной Собственности (например, Промышленные Образцы), закреплённых в этом государстве за каким-либо третьим лицом. Патентная чистота – необходимое условие выдачи патента на изобретение. В бывшем СССР работа по обеспечению и проверке патентной чистоты возлагалась на предприятия и организации, разрабатывающие соответствующие объекты. Контроль за обеспечением патентной чистоты объектов, предназначенных для продажи за границу, осуществляли министерства и ведомства. Государственный Комитет Совета Министров СССР По Делам Изобретений И Открытий проводил систематическую контрольную проверку патентной чистоты новых изделий и технологических процессов, освоение которых предусматривалось в проектах планов развития народного хозяйства СССР. Патентная Пошлина, сумма, взимаемая государственными органами при выдаче патента. В бывшем СССР, согласно Положению Об Открытиях, Изобретениях И Рационализаторских Предложениях от 21 Августа 1973, взималась при подаче заявки на патент, возражения на решение патентной экспертизы, при оформлении передачи прав по патенту, при публикации патентной заявки (выдача патента). Кроме того, годовые пошлины взимались в течение всего срока действия патента (15 лет). Неуплата патентной пошлины в установленный срок препятствовала рассмотрению (экспертизе) патентной заявки, а действие уже выданного патента прекращалось. Законодательством был предусмотрен 6-месячный льготный срок уплаты патентной пошлины. При выдаче Диплома На Открытие, Авторского Свидетельства На Изобретение и Удостоверения На Рационализаторское Предложение патентная пошлина не взималась. Во всех зарубежных государствах также практикуется уплата патентной пошлины, только в США и Канаде взимание годовых патентных пошлин не предусмотрено, взимается лишь пошлина при выдаче патента. Патентное Право, отрасль буржуазного права, нормы которой определяют систему охраны прав на технические решения – изобретения – путём выдачи патента. Экономическая необходимость выделения патентного права как самостоятельной части действующего права обусловливается капиталистическими производственными отношениями, и его зарождение практически совпадает со становлением капитализма в отдельных странах (в Великобритании – начало XVII века, США и Франции – в конце XVIII века, в России – во 2-й половине XIX века и так далее). На основании патентного права патентообладателю предоставляется возможность путём использования легальной (основанной на законе) монополии (исключительные права) на изобретение компенсировать повышенные затраты, связанные с практическим использованием технического новшества, а также получить нормальную (а при благоприятных условиях и повышенную) прибыль на вложенный капитал. Основное содержание патентного права составляют нормы, определяющие права, закрепляемые за патентообладателем, порядок их полной или частичной переуступки, а также последствия нарушения этих прав. Патентное право устанавливает также процедуру закрепления прав на изобретения и выдачи патента:- регламентирует порядок подачи заявки на получение патента, то есть комплекта документов, составленных в соответствии с требованиями, предусмотренными законодательством. Как правило, заявка состоит из ходатайства о выдаче патента, описания изобретения и чертежей; она подаётся в особый государственный орган – патентное ведомство, уполномоченное квалифицировать предложение в качестве изобретения. В отдельных странах устанавливается различный порядок рассмотрения заявок. Традиционными являются явочная и проверочная системы. При явочной системе патентное ведомство проверяет только соответствие заявки формальным требованиям и при отсутствии нарушений выдаёт патент. Соблюдение требований, предъявляемых к изобретению, проверяется через суд, куда заинтересованные лица могут подать иск об аннулировании выданного кому-либо патента. При проверочной системе патентное ведомство проверяет также соответствие технического решения требованиям, установленным законом для изобретений (при этой системе патент также может быть оспорен через суд). Всё более широкое распространение получает система так называемой отсроченной экспертизы, при которой на первом этапе проверяется лишь соблюдение требований, предъявляемых к заявке, а затем на основании проведённой проверки на определённый срок предоставляется условная охрана изобретения. В течение этого срока должно быть заявлено ходатайство о проведении экспертизы технического решения по существу. Если такое ходатайство не заявлено или проверка дала отрицательный результат, охрана считается не предоставлявшейся. Безусловная охрана в полном объёме возникает только на основании патента, выданного патентным ведомством после проверки технического решения по существу. Патентное право предусматривает также порядок разрешения споров о выдаче патента; они рассматриваются первоначально самим патентным ведомством, а окончательно обычно в специальном патентном суде или в суде общей юрисдикции. В судебном порядке рассматриваются также споры о нарушении патентов. Патентное право определяет функции и порядок деятельности органов, осуществляющих квалификацию технических решений и рассматривающих споры. Основным источником патентного права являются, как правило, специальные законы, принимаемые высшими органами законодательной власти. Большое практическое значение имеют и подзаконные нормативные акты, издаваемые ведомствами по изобретательству (например, о порядке экспертизы и тому подобном), а также судебная практика. В эпоху империализма в патентном праве капиталистических стран наблюдаются кризисные явления, особенно обострившиеся с развёртыванием научно-технической революции, когда произошли качественные изменения в уровне развития производительных сил, резко ускорились темпы обновления применяемых технических решений и интенсивность их использования. Эти явления находят своё выражение в резком возрастании удельного веса технических решений, не оформляемых в качестве изобретений и защищаемых как секреты производства (‘Ноу-Хау’). В интересах государственно-монополистического капитала после 2-й Мировой Войны 1939–45 ограничивается действие некоторых основных принципов патентного права, связанных прежде всего с возможностью для владельца изобретения свободно по своему усмотрению пользоваться принадлежащими ему правами. Некоторые категории

изобретений могут принадлежать только государству, широкое распространение получают принудительное отчуждение прав на изобретения, принудительные лицензии, ограничивается применение правила о сохранении заявки в тайне и тому подобные. Патентное право используется в ряде случаев для того, чтобы воспрепятствовать реализации технических новшеств конкурентами для обхода антитрестовского законодательства. На содержание национального патентного права всё большее влияние оказывают международные соглашения по охране промышленной собственности. В социалистических государствах вопросы охраны изобретений регулировались Изобретательским Правом. Патентоспособность – совокупность признаков, приданных объекту изобретения путём технического творчества, отвечающих требованиям, предъявляемым государственной научно-технической экспертизой изобретений для признания объекта изобретением. Патент или Патент на Изобретение, называемый иногда Авторским Свидетельством:- патентообладатель может переуступить патент или дать разрешение (предоставить лицензию) на использование изобретения.

(2) Patent is an official document conferring such a right. / Под Патентом, от позднелатинского слова Patens, родительный падеж Patentis, означающее Грамота или Свидетельство, понимается документ, свидетельствующий о праве занятия каким-либо промыслом (торговлей, скупкой товара и тому подобным).

(3) Patent is the instrument by which the government of the United States conveys the legal fee-simple title to public land. / Под Патентом, от позднелатинского слова Patens, родительный падеж Patentis, означающее Грамота или Свидетельство, понимается .

(4) Patent:- xxxxx. / В средние века в странах Западной Европы Под Патентом, от позднелатинского слова Patens, родительный падеж Patentis, означающее Грамота или Свидетельство, понимался документ на право занятия определённых должностей (например, на офицерское звание), на титул (на звание пэра, графский титул и тому подобные).

PATENTABLE = ПАТЕНТУЕМОЕ (или ПАТЕНТОСПОСОБНОЕ) – Patentable:- suitable to be patented; entitled by law to be protected by the issuance of a patent.

PATENT AGENT = ПАТЕНТНЫЙ ПОВЕРЕННЫЙ – Patent Agent:- one who is not an attorney but is authorized to act for or in place of the applicant(s) before the office, that is, an individual who is registered to practice before the office. Also may be referred to as a Practitioner or Representative.

PATENT AND TRADEMARK DEPOSITORY LIBRARY = БИБЛИОТЕКА ДИПОЗИТАРИЯ (или ХРАНИЛИЩА) ПАТЕНТОВ И ТОВАРНЫХ ЗНАКОВ – Patent And Trademark Depository Library is a library designated by the United States Patent and Trademark Office (USPTO) to receive copies of patents, CD-ROMs containing registered and pending marks, and patent and trademark materials that are made available to the public for free. The libraries also actively disseminate patent and trademark information and offer internet access to USPTO's online collections.

PATENT AND TRADEMARK OFFICE = КОНТОРА (ВЕДОМСТВО) ПО ПАТЕНТАМ И ТОВАРНЫМ ЗНАКАМ – Patent and Trademark Office (PTO) is the former designation for the United States Patent and Trademark Office (USPTO).

PATENT APPLICATION = ПАТЕНТНАЯ ЗАЯВКА (или ЗАЯВКА НА ПАТЕНТ) – Patent Application:- a nonprovisional utility patent application must include a specification, including a claim or claims; drawings, when necessary; an oath or declaration; and the prescribed filing fee. / чертёж (drawing).

PATENT APPLICATION INFORMATION RETRIEVAL = ИНФОРМАЦИОННЫЙ ПОИСК ПО ПАТЕНТНОЙ ЗАЯВКЕ (или ПОИСК ИНФОРМАЦИИ ПО ЗАЯВКЕ НА ПАТЕНТ) – Patent Application Information Retrieval (PAIR) provides secure access for customers who want to view current patent application status electronically via the Internet.

PATENT APPLICATION LOCATING AND MONITORING = ОТЫСКАНИЕ И МОНИТОРИНГ ПАТЕНТНОЙ ЗАЯВКИ (или ОТЫСКАНИЕ И МОНИТОРИНГ ЗАЯВКИ НА ПАТЕНТ) – Patent Application Locating and Monitoring (PALM) system is an internal USPTO (short for the United States Patent and Trademark Office) system that is the source of status information displayed in the Patent Application Information Retrieval (PAIR).

PATENT APPLICATION PUBLICATION = ПУБЛИКАЦИЯ ПАТЕНТНОЙ ЗАЯВКИ (или ПУБЛИКАЦИЯ ЗАЯВКИ НА ПАТЕНТ) – Patent Application Publication:- Pre-Grant Publication of patent application at 18 months from priority date.

PATENT ASSISTANCE CENTER = ЦЕНТР ПОМОЩИ ПО ПАТЕНТАМ – Patent Assistance Center or PAC (prior), now the US Inventors Assistance Center or IAC, call (toll-free) +1-800-7869199 or +1-703-3084357.

PATENT ATTORNEY = ПАТЕНТНЫЙ ПОВЕРЕННЫЙ (или ПАТЕНТОВЕД) – Patent Attorney is an attorney who has the specialized qualifications necessary for representing clients in obtaining patents and acting in all matters and procedures relating to patent law and practice, such as filing an opposition. The term is used differently in different countries, and thus may or may not require the same legal qualifications as a general legal practitioner. The titles patent agent and patent lawyer are also used in some jurisdictions. In some jurisdictions the terms are interchangeable, while in others the latter is used only if the person qualified as a lawyer. Qualification Regimes:- In Europe, requirements for practising as patent attorney before national patent offices should be distinguished from those needed for practising before the European Patent Office (EPO) or the Eurasian Patent Office (EAPO). On the national level, the requirements are not harmonized, although across the 28 Member States of the European Union respective professional qualifications are mutually recognised to some degree. A Patent Attorney is a lawyer with expertise in intellectual property law pertaining to securing and protecting an inventor's property rights. Patent attorneys have passed a federal exam referred to as the 'Patent Bar Exam' that grants them a license to represent clients before the United States Patent and Trademark Office (USPTO). They have also passed the state bar exam that all attorneys must pass. Patents are granted to inventors of unique useful and nonobvious inventions. Other countries may have different certifications or qualifications for patent attorneys or have patent processes that may require no more than an individual with general legal credentials. Breaking Down Patent Attorney:- Patent attorneys are experts in preparing and filing patent applications and representing clients in court for patent-related matters such as infringement, licensing and re-examination. They must also be experts in one or more technical areas important to understanding a client's inventions, such as biotechnology or computer science. Patent attorneys can also give patentability opinions in court. Patent attorneys must be admitted to a state or territory bar association, or that of the District of Columbia US patent attorneys. Patent Attorney Examination:- The USPTO registration examination, formally known as the Examination for Registration to Practice in Patent Cases Before the United States Patent and Trademark Office (or the 'Patent Bar'), measures an applicant's knowledge of US patent procedures, federal rules and regulations and ethical guidelines. The exam, which features 100 multiple-choice questions, is offered year-round. Candidates have six hours to complete the test, which is divided into three-hour morning and afternoon sessions of 50 questions each. Patent Attorney vs. Patent Agent:- Don't confuse a Patent Attorney with a Patent Agent. In the United States, patent agents can perform many of the same tasks as patent attorneys, including representing clients before the USPTO, but not in other legal settings, such as prosecuting a patent

infringement. While you can file a patent application yourself, the USPTO recommends hiring a patent attorney or agent. If you need a patent attorney, click website to use the USPTO website's search list of those licensed to practice before the USPTO. The patent office does not recommend patent attorneys or regulate patent attorneys' fees, however. Patent Attorney vs. Intellectual Property Attorney:- In addition, while patents are a type of intellectual property, you should not hire an intellectual property attorney when you really need a patent attorney. Intellectual property attorneys have not passed the patent bar exam, are not licensed by the USPTO and do not necessarily have technical expertise. / Патентный Поверенный осуществляет ведение дел с федеральным органом исполнительной власти по интеллектуальной собственности по поручению заявителей, правообладателей и иных заинтересованных граждан и юридических лиц, постоянно проживающих (для граждан) или имеющих место нахождения (для юридических лиц) в Российской Федерации и за её пределами, если международным договором Российской Федерации или законодательством Российской Федерации не предусмотрено иное. Отношения, связанные с деятельностью патентных поверенных на территории РФ, требования к патентным поверенным, порядок их аттестации и регистрации, а также обязанности и ответственность определяются и регулируются Федеральным Законом от 30 Декабря 2008 № 316-ФЗ в соответствии с Гражданским Кодексом РФ. Патентные Поверенные оказывают услуги юридической помощи физическим и юридическим лицам в области патентного права, включая защиту их интересов и прав в Роспатенте, Федеральной Антимонопольной Службе (ФАС) и суде. История института Российских патентных поверенных, вопреки расхожему мнению, насчитывает почти полторы сотни лет. В настоящее время патентные поверенные осуществляют свою деятельность на основании Федерального Закона (ФЗ) от 30 Декабря 2008 № 316-ФЗ 'О Патентных Поверенных'. Кто такой патентный поверенный? Поверенные имеют право по поручению клиентов предпринимать любые установленные законом действия, необходимые для охраны интеллектуальной собственности:- (1) Защиты Прав:- (i) урегулирование вопросов и конфликтов, связанных с нарушением прав на интеллектуальную собственность; и (ii) представительство интересов в Палате по Патентным Спорам и Арбитражном Суде. (2) В Области Регистрации Товарных Знаков:- (i) проведение экспертизы объекта интеллектуальной собственности в реестре; (ii) регистрация товарных знаков, в том числе международная; и (iii) присвоение торговым маркам статуса общеизвестных. (3) Патентные Услуги:- (i) патентно-информационные исследования, поиск и экспертиза; и (ii) патентование изобретений, промышленных образцов, полезной модели, в том числе международное. (4) Заключение Договоров:- (i) составление лицензионных договоров; (ii) регистрация баз данных, программ ЭВМ и авторского права; и (iii) составление договора уступки. Квалификационные Требования:- Статус патентного поверенного может быть присвоен Роспатентом совершеннолетнему гражданину РФ; аттестацию осуществляет специальная квалификационная комиссия, созданная Федеральным Институтом Промышленной Собственности (ФИПС). Аттестованный эксперт регистрируется в Реестре Патентных Поверенных, где в открытом доступе содержится следующая информация:- (i) дата регистрации и регистрационный номер поверенного; (ii) специализация патентоведа (товарные знаки, изобретения, полезные модели, промышленные образцы, наименование места происхождения товара (НМПТ), программы для электронно-вычислительных машин (ЭВМ), топологии интегральных микросхем); (iii) название патентной компании, в которой работает патентный поверенный, если эксперт работает по договору; (iv) полная контактная информация специалиста; (v) названия профессиональных объединений, в которых зарегистрирован эксперт. На Чём Специализируется Патентный Поверенный? (i) Юридические Консультации:- специалист готов ответить на ваши вопросы и дать советы по защите интеллектуальной собственности, отчуждению или передаче исключительных прав. (ii) Представительство Интересов:- специалист, действуя от вашего лица, возьмет на себя подготовку и подачу заявок и возражений по экспертизе, а также общение с представителями ФИПС и Палаты по Патентным Спорам. Кроме того, поверенный может представить ваши интересы в Арбитражном Суде и Федеральной Антимонопольной Службе. (iii) Подготовка Документов:- при регистрации патентов, товарных знаков и других объектов интеллектуальной собственности специалист поможет собрать, проверить и оформить всю необходимую документацию и подаст её в Роспатент. (iv) Проведение Экспертиз:- Эта услуга особенно востребована при подаче иска в случае, если имеет место нарушение исключительных прав на интеллектуальную собственность. Результаты экспертизы являются весомым доказательством в суде. Следует Различать:- (1) Патентных поверенных РФ, работающих на территории России и взаимодействующих с Российским федеральным органом исполнительной власти по интеллектуальной собственности; (2) Евразийских патентных поверенных (иначе говоря – патентных агентов и патентных юристов), имеющих право представлять интересы своих клиентов перед Евразийским патентным ведомством; (3) Европейских патентных поверенных, взаимодействующих с Европейским патентным ведомством. Виды Деятельности:- Учитывая специфику деятельности патентных поверенных, каждый из них обязан иметь высшее образование и опыт работы продолжительностью не менее четырёх лет. К непосредственным обязанностям патентоведа относится взаимодействие с ФИПС; специалист может работать как самостоятельно, так и по договору с юридическим лицом. Патентовед вправе осуществлять следующие виды деятельности:- (i) консультировать патентообладателя относительно приобретения и защиты его интеллектуальных прав; (ii) осуществлять патентные услуги на основании доверенности, выданной заказчиком; (iii) подавать заявку в ФИПС, осуществлять подготовку и юридическую экспертизу патентной документации; и (iv) представлять интересы заказчика в суде. В связи с вступлением России во Всемирную Организацию Торговли (ВОТ) и ведущихся в мире 'патентных войн', профессиональная деятельность Российских патентных поверенных должна рассматриваться как стратегическая, ведь именно она позволяет коммерциализировать научно-технические разработки Российской промышленности и науки.

PATENT BUSINESS GOALS FINAL RULE = КОНЕЧНОЕ ПРАВИЛО О ЦЕЛЯХ ПАТЕНТНОГО ДЕЛА – Patent Business Goals (PBG) Final Rule:- implement streamlined patent practice; a result of the American Inventors Protection Act of 1999.

THE PATENT COOPERATION TREATY = ТРАКТАТ О СОТРУДНИЧЕСТВЕ В ПАТЕНТНОЙ СФЕРЕ (или ТРАКТАТ О ПАТЕНТНОЙ КООПЕРАЦИИ, или ДОГОВОР О ПАТЕНТНОЙ КООПЕРАЦИИ) – Patent Cooperation Treaty (PCT) provides a mechanism by which an applicant can file a single application that, when certain requirements have been fulfilled, is equivalent to a regular national filing in each designated Contracting State. There are currently over 112 PCT Contracting States. The Patent Cooperation Treaty (PCT) is a worldwide convention, open to the member of any Paris Convention country. The PCT entered into force in 1978. Unlike the Paris Convention, which addresses substantive intellectual property rights, the PCT addresses procedural requirements, aiming to simplify the filing, searching and publication of international patent applications. Patent Cooperation Treaty (PCT):- this system, which includes many countries in addition to European countries, similarly provides for the filing of a single application designating the member countries from which patents are desired. Although the single filing takes place under the auspices of the World Intellectual Property Organization (WIPO), a specialized agency of the United Nations system that seeks to promote international cooperation in the protection of international property, the actual filing is made either in the United States or the EPO. The single application is searched, and it is possible to request a nonbinding opinion on patentability. After the payment of the appropriate fees and the filing of appropriate translations, the application is converted into a bundle of individual national applications, which are then subject to examination by individual national patent offices. See also The Berne Convention, The European Patent Convention, The Madrid Agreement, The Madrid Protocol, The Paris Convention, and Trade-Related Aspects of Intellectual Property Rights.

PATENT COOPERATION TREATY REGULATIONS = ТРАКТАТНЫЕ ПРЕДПИСАНИЯ В ОТНОШЕНИИ ПАТЕНТНОЙ КООПЕРАЦИИ (или ПРЕДПИСАНИЯ ТРАКТАТА О ПАТЕНТНОЙ КООПЕРАЦИИ) – Patent Cooperation Treaty (PCT) Regulations:- provide rules concerning matters expressly refers to in the Patent Cooperation Treaty, any administrative requirements, matters, or procedures, and concerning any details useful in the implementation of the provisions of the Patent Cooperation Treaty. The rules must be adopted by the Assembly of the World Intellectual Property Organization (WIPO).

PATENTEE = ПАТЕНТООБЛАДАТЕЛЬ (или ВЛАДЕЛЕЦ ПАТЕНТА) – Patentee is the person to whom a patent is granted, is known as the Patentee, the owner of the patent or the patent holder. Once a patent has been granted with respect to a particular country, anyone who wishes to exploit the invention commercially in that country must obtain the authorization of the patentee. In principle, anyone who exploits a patented invention without the patentee's authorization commits an illegal act. The protection is granted for a limited period, generally 20 years. Once a patent expires, the protection ends, and the invention enters the public domain. The patentee no longer holds exclusive rights to the invention, which then becomes available for commercial exploitation by others. The rights conferred by a patent are not described in the patent itself. Those rights are described in the patent law of the country in which the patent is granted. The patent owner's exclusive rights generally consist of the following:- (i) in the case of a product patent, the right to prevent third parties without the owner's consent from making, using, offering for sale, selling or importing for these purposes the product; and (ii) in the case of a process patent, the right to prevent third parties without the owner's consent from using the process; and to prevent third parties from using, offering for sale, selling or importing for these purposes the products which were obtained directly by that process. The patentee is not given a statutory right to exploit his own invention, but rather a statutory right to prevent others from commercially exploiting it. He may give permission, or grant a license, to other parties to use the invention on mutually agreed terms. The patentee may also sell his right to the invention to someone else, who will then become the new owner of the patent. There are certain exceptions to the principle that a patented invention cannot legally be exploited without the authorization of the owner of the patent. These exceptions take into account the balance between the legitimate interests of the patentee and those of the general public. Patent laws may provide for cases in which a patented invention may be exploited without the patentee's authorization, for example, in the wider public interest by or on behalf of the government, or on the basis of a compulsory license. A compulsory license is an authorization to exploit the invention given by a governmental authority. It is generally issued only in very special cases, defined in the law, and only where the entity wishing to exploit the patented invention is unable to obtain the authorization of the owner of the patent. The conditions regarding the granting of compulsory licenses are regulated in detail by laws that provide for them. The decision to grant a compulsory license must provide for an adequate remuneration of the patentee. The decision may be the subject of an appeal.

PATENT FAMILY = СЕМЕЙСТВО ПАТЕНТОВ (или ПАТЕНТНАЯ СЕМЬЯ) – A Patent Family is the same invention disclosed by a common inventor(s) and patented in more than one country. / Семейство Патентов аналогов.

PATENT INFRIGEMENT = НАРУШЕНИЕ ПАТЕНТА – Patent Infringement is the unauthorized making, using, offering to sell, selling or importing into the United States any patented invention. / Нарушение Патента – использование запатентованного объекта без согласия обладателя исключительного права, вытекающего из патента.

PATENTING = ПАТЕНТИРОВАНИЕ – Patenting is a heat treatment of steel whereby sorbite, which is a lamellar microstructure of ferrite and cementite, is produced. Patenting usually includes the following steps:- austenitizing by heating to 870–950 °C, isothermal transformation of the supercooled austenite in molten salt or lead at 450–550 °C, and cooling with water or in air. Several new types of patenting have been developed – for example, stepwise patenting and rimming layer patenting. Patenting provides high strength and ductility of products (usually wire), which are cold-worked from patented billets. Patenting (in metallurgy):- metallurgy to heat (a metal) above a transformation temperature and cool it at a rate that allows coldworking. Patenting is a process of heat treatment applied to medium- or high-carbon steel in wire making prior to the wire drawing or between drafts. It consists in heating to a temperature above the transformation range, followed by cooling to a temperature below that range in air or in a bath of molten lead or salt maintained at a temperature appropriate to the carbon content of the steel and the properties required of the finished product. Patenting is a process used in the production of high-strength steel wire containing 0.35–0.85% carbon, in which the wire is heated to above the transformation temperature, then quenched in molten lead or molten salt, or cooled in air. Patenting consists of passing the wire through tubes in a furnace at about 970 °C. This high temperature treatment produces uniform austenite of rather large grain size. The subsequent cooling – in air or molten lead – is rapid since the sections treated are generally small (e.g., wire rods), so that the resulting structure consists of very fine pearlite preferably with no separation of primary ferrite. Wire ropes for haulage purposes are usually made from carbon steel wires ranging from 0.35 to 0.5% carbon, and before drawing the material is subject to a heat-treatment known as Patenting. Patenting consists of passing the wire through tubes in a furnace at about 970 °C. This high temperature treatment produces uniform austenite of rather large grain size. The subsequent cooling – in air or molten lead – is rapid since the sections treated are generally small (e.g., wire rods), so that the resulting structure consists of very fine pearlite preferably with no separation of primary ferrite. The large crystals would give rise to brittleness if the material was left in the heat-treated condition, but this effect is not noticed after a few drawing passes. Variation in hardness – either softer or harder – can be produced by tempering martensite, but such material does not draw so well as patented wire, which is able to withstand reductions of area up to 90%. The strength is explained on the basis of the reduced ferrite cells and the alignment of cementite in fibres. Hardenability, Mass Effect, Ruling Section:- hardenability is the measure of the depth to which a steel will harden on quenching. The maximum hardness is mainly a function of the carbon content. The hardenability of steel depends on:- (i) the quenching medium and method of quenching; (ii) composition of the steel and method of manufacture; and (iii) section of the steel. The so-called 'Mass Effect' arises from the fact that even with the most severe quench the cooling of a bar is progressively slower, from the outside to the centre due to the low thermal conductivity of the steel. It must be appreciated, therefore, that it is the rate of cooling of a piece of steel which determines the properties resulting from a quenching process, and not mass or weight. The effects of mass are shown by the following results (Table 1) on quenched bars of varying section, from the centre of which standard test specimens were machined. To prevent the misuse of steels it has become desirable to state the limit of thickness or 'ruling section' up to which the mechanical properties quoted can be obtained. For sections other than cylinders, reference should be made to BS 970 for conversion factors. One of the most important functions of alloying elements in high tensile steels is to produce fully hardened structures in large sections. Shallow hardening steels (C 1%; Mn 0,3%) are often used for dies in which a tough core and a hard skin is required. The depth of hardening is increased by drastic quenching media, and by manganese and elements such as nickel and chromium, but decreased by fine austenite grains. The addition of 3% nickel and 1% chromium retards the transformation of austenite so much that oil quenching exceeds the critical cooling velocity and all portions from edge to centre of average sections will harden. It has now been found that small additions of a number of alloying elements are more effective than an equivalent total addition of one element, and enables appropriate use to be made of alloy scrap. In the Jominy test (BS 4437) a 25 mm dia bar 100 mm long is heated to the normal hardening temperature, then inserted in a standard jig and a 12.5 mm dia jet of water at 24 °C is directed against one end of the test piece. The free height of the jet is 62.5 mm. When cold, hardness measurements are made along flats on the bar and these are plotted against distance from the quenched end as in Fig. 1, which also

includes the cooling rates at various distances from the quenched end. The positions along the Jominy bar having cooling rates equal to those at the centres of bars of various diameters are marked in Fig. 1 for water and oil quenching. The effectiveness of a given quench on various steels can be judged; for example, bars of 1.5% Ni Cr Mo steel up to 100 mm dia can be satisfactorily hardened in oil, whereas for the plain 0.95% carbon steel the maximum diameter of the fully hardened bar will be less than 12.5 mm for the same quench. The Jominy end quench test is not only a very reproducible test. but is also an excellent laboratory test for classifying steels in order of merit as regards hardenability and it gives a very useful first approximation to the merits of a given steel. As to whether a steel with a particular hardenability will give the satisfactory mechanical properties in a particular section must be decided by trial. Actually, the method of trial – apart from giving the final answer – is also, in many cases, far simpler than the involved mathematical processes which have been developed in an endeavour to predict the mechanical properties of a steel in any given section from the Jominy curve. The hardenability of different casts of steel of the same analysis may vary substantially and similarly significant variations in hardenability may occur in samples taken from different parts of the same ingot. As a consequence Jominy results are given as bands not simple curves and BS 4437 uses two points to specify hardenability as shown in Fig. 2 and as follows:- (i) a desired hardness value at 2 desired distances, e.g., A-A; (ii) minimum and maximum hardness values at desired distance – B-B; (iii) two maximum hardness values at 2 desired distance – C-C; (iv) minimum hardness values at 2 desired distances – D-D; and (v) Any minimum and any maximum hardness. / Испытание Дьжомайни (Jominy test). Под Патентированием, от Английского слова Patenting, понимается термическая обработка стали, применяемая для получения тонкопластинчатой феррито-карбидной микроструктуры (Сорбита Патентирования). Обычно патентирование включает следующие стадии:- аустенизацию (смотрите Аустенит) нагревом до 870–950 °C, изотермическое превращение переохлаждённого аустенита в расплаве соли или свинца при 450–550 °C и охлаждение водой или на воздухе. Разработаны новые варианты патентирования:- ступенчатое, в кипящем слое и другие. Патентирование обеспечивает высокую прочность и пластичность изделий (обычно проволоки), холоднодеформированных из патентированной заготовки.

PATENT LICENSE = ПАТЕНТНАЯ ЛИЦЕНЗИЯ – A Patent License is an agreement that transfers less than ownership rights in a patent, which grants certain rights to the licensee. A patent license can be exclusive or non-exclusive, for a specific field of use or for a specific geographical area.

PATENT NUMBER = НОМЕР ПАТЕНТА – Patent Number is an unique number assigned to a patent application when it issues as a patent.

PATENT PENDING = ПАТЕНТ, НАХОДЯЩИЙСЯ НА РАССМОТРЕНИИ – Patent Pending is a phrase that often appears on manufactured items. It means that someone has applied for a patent on an invention that is contained in the manufactured item. It serves as a warning that a patent may issue that would cover the item and that copiers should be careful because they might infringe if the patent issues. Once the patent issues, the patent owner will stop using the phrase ‘patent pending’ and start using a phrase such as ‘covered by US Patent Number XXXXXXX’. Applying the patent pending phrase to an item when no patent application has been made can result in a fine.

PATH DEPENDENT OPTION = ОПЦИОН, ЗАВИСИМЫЙ ОТ ПРОИЗОШЕДШЕГО – Path Dependent Option is an option whose valuation and payoff depends on the realized price path of the underlying asset, such as an Asian Option or a Lookback Option. / Опцион, оценка и окупаемость (payoff) которого зависят от сформировавшегося пути (траектории) цены соотвествующего актива, к таковым относится Азиатский Опцион (Asian Option) или Опцион С Оглядкой На Прошлое (Lookback Option).

PATHOGEN = ПАТОГЕН – Pathogen is an organism that incites a disease. Examples are pathogenic viruses, fungi, bacteria, and nematodes. A Patogen is a micro-organism that causes a disease in another organism. Pathogen is an organism that can cause disease symptoms to develop. A parasite. Fungi are the most common plant pathogens but plant diseases can also be caused by bacteria, nematodes, viruses, phytoplasmas, etc. An organism able to cause disease in a certain host, e.g., Cotton plant, insects or weeds. / Организм, способный вызвать болезнь некоторых хозяев, например, Хлопчатника, насекомых или сорняков. Под Патогеном, от Греческих слов Páthos, означающее Болезнь или Страдание, и Génos, означающее Происхождение или Род, понимается .

PATHOGENICITY = ПАТОГЕННОСТЬ (или БОЛЕЗНЕТВОРНОСТЬ) – Pathogenicity is the capacity of a pathogen to incite a disease. The quality or characteristic of being able to cause disease. / Под Патогенностью, от Греческих слов Páthos, означающее Болезнь или Страдание, и Génos, означающее Происхождение или Род, или Болезнетворностью понимается способность микроорганизмов вызывать инфекционное заболевание. Зависит от вирулентности микроба, а также восприимчивости заражаемого организма.

PATHOGEN RACES = ПАТОГЕННЫЕ РАСЫ (или РАСЫ ПАТОГЕНОВ) – Pathogen Races are the organisms that are morphologically identical but attack different varieties, differentially and physiologically different; synonymous with physiologic races.

PATHOLOGY = ПАТОЛОГИЯ – Pathology is the study of the etiology (causes) and nature of diseases. / Под Патологией, от Греческих слов Páthos, означающее Болезнь или Страдание, и Lógos, означающее Слово или Учение, понимается область теоретической и клинической медицины, изучающая патологические процессы (общая патология) и отдельные заболевания (частная патология); включает патологическую анатомию, патологическую физиологию и так далее. Патологией называется также любое отклонение от нормы.

PATHOVAR = ПАТОВАР – Pathovar:- in Bacteria, a Subspecies or Group of Strains that can infect only Plants within a certain Genus or Species. / Под Патоваром, от Греческого слова Pathos, означающее Страдание, и Английского слова Var(iety), означающее Разновидность, от Латинского слова Varians, означающее Изменяющийся, понимаются штаммы атакующих растения бактерий или грибов, которые отличаются от других штаммов тем, что взаимодействуют только с определёнными сортами растения-хозяина.

PATHWAY = ПУТЬ – Pathway is any means that allows the entry or spread of a pest.

PATIENT TRANSPORT = ТРАНСПОРТ ДЛЯ ПАЦИЕНТОВ (или ПЕРЕВОЗКА ПАЦИЕНТОВ) – Patient Transport describes the type of transport a company provides. Patient transport companies specialize in providing air ambulance service. They must be specifically licensed to provide air medical transports. Patient transport companies use an array of business size aircraft in providing air medical transports, such as twin engine, turbo prop and jet aircraft. For most long distance medical transports, a jet is used. Typically, the Lear Jet is the workhorse of patient transport companies. Air Ambulance Network has been providing patient transport services since 1971. Air Ambulance Network is one of the first air patient transport providers and has led the industry ever since it inception. Today, Air Ambulance Network is a leader in the air patient transport industry.

PATTEN = БАШМАК (или САБО, или ОБУВЬ НА ДЕРЕВЯННОЙ ПОДОШВЕ) – Patten is a clog, sandal, or overshoe often with a wooden sole or metal device to elevate the foot and increase the wearer’s height or aid in walking in mud.

PATTERN = МОДЕЛЬ – In technical analysis, Pattern is a series of price movements on a bar chart (normally of a short duration) that appear repetitive in looking back over past price history. In addition, the repetitive nature of the pattern must have a predictive value relative to where prices are expected to go. A Chart Pattern is a distinct formation on a stock chart that creates a trading signal, or a sign of future price movements. Chartists use these patterns to identify current trends and trend reversals and to trigger buy and sell signals. In the first section of this tutorial, we talked about the three assumptions of technical analysis, the third of which was that in technical analysis, history repeats itself. The theory behind chart patters is based on this assumption. The idea is that certain patterns are seen many times, and that these patterns signal a certain high probability move in a stock. Based on the historic trend of a chart pattern setting up a certain price movement, chartists look for these patterns to identify trading opportunities. While there are general ideas and components to every chart pattern, there is no chart pattern that will tell you with 100% certainty where a security is headed. This creates some leeway and debate as to what a good pattern looks like, and is a major reason why charting is often seen as more of an art than a science. There are two types of patterns within this area of technical analysis, reversal and continuation. A reversal pattern signals that a prior trend will reverse upon completion of the pattern. A continuation pattern, on the other hand, signals that a trend will continue once the pattern is complete. These patterns can be found over charts of any timeframe. / В техническом анализе биржевых рынков под моделью понимаются серии .

PATTERN = УЗОР (или ВЫКРОЙКА, или ЛЕКАЛО, или КАНВОВЫЙ РИСУНОК) – Pattern is:- (1) an arrangement of form; a design or decoration such as the design of woven or printed fabrics. (2) A model, guide, or plan used in making things, such as a garment pattern. Pattern is an outline of a garment on paper. It embodies usually all the pieces necessary to cut a complete garment from material.

PATTERNED LUMBER = ПРОФИЛИРОВАННЫЙ ПИЛОМАТЕРИАЛ (или УЗОРНЫЙ ПИЛОМАТЕРИАЛ) – Patterned Lumber:- a lumber that is shaped to a pattern or to a moulded form in addition to being surface planed. / в добавок к тому, что поверхность также была острогана/обстрогана.

PATTERNING IN FILLING = СОСТАВЛЕНИЕ РИСУНКА ПО УТОЧИНЕ – Patterning In Filling:- Fabric:- rayon-taffeta dress goods; Construction:- (i) Count:- 110 x 48; (ii) Warp:- 150/40 bright viscose rayon; (iii) Filling:- same as warp; Finish:- plain dyed green. Defect:- pattern effect in the filling. Analysis:- single-end tensile-strength and elongation tests made on a series of continuous lengths of filling yarn in normal and 'patterning' areas showed slight differences in total elongation at the point of rupture. Wetting out the sample resulted in a puckering in the filling direction, which indicated the overstretching of portions of the yarn. Careful measurements of the stretched sections showed a definite pattern at a frequency which could be traced to the size and build of the package on which the original yarn was delivered to the mill. This afforded definite proof that the overstretching had taken place in the preparation of this package by the yarn producer, rather than by any mishandling in the weaving mill. / Уточина:- такая же как основа.

PATTERN MAKERS = СОЗДАТЕЛИ УЗОРОВ (или ЛЕКАЛЬЩИКИ, или ВЫКРОЙЩИКИ) – Pattern Makers take an existing sketch and create a 2-dimensional paper pattern. This pattern is used to cut pieces from cloth that will be sewn into a garment or other products.

PATTERN MISTAKE = ОШИБКА В УЗОРЕ (или РИСУНКЕ) – Pattern Mistake:- in some qualities warp pattern is printed on piece ticket and warping is carried out as per pattern. If warper makes mistake while creeling then fabric will be woven with wrong pattern called Pattern Mistake. Weaving defect. Pattern Mistake:- improper creeling at warping, improper drawing-in, denting, faulty weft selection, knotting at wrong portion in loom when break occurs. / :- неподходящее надевание при сновании или сновки, неподходящий проборщик, . Порок или дефект ткачества.

PATTERN WHEEL = УЗОРООБРАЗУЮЩЕЕ КОЛЕСО (или РИСУНЧАТЫЙ ДИСК, или ОБРАЗЦОВОЕ (или УЗОРЧАТОЕ) КОЛЕСО) – Pattern Wheel is a cylinder or wheel upon which a pattern chain is placed which has links of different heights so as to move the guide bars throughout its pattern. Pattern Wheel:- in a circular-knitting machine, a slotted device for controlling individual needles so that patterns can be knit in the fabric.

PAU = PUNJAB AGRICULTURAL UNIVERSITY

PAUCISPINUS = НЕМНОГОШИПНОЕ – Paucispinus:- with few spines. / с несколькими шипами.

PAULDRON = НАПЛЕЧНИК (или ОПЛЕЧЬЕ ЛАТ) – Pauldron is a piece of plate armor to protect the shoulder. / для защиты .

PAWN BROKER = БРОКЕР ПО ЗАКЛАДУ (или РОСТОВЩИК, или ЛОМБАРДЩИК) – A Pawnbroker is a person who lends people money. People give the pawnbroker something they own, which can be sold if they do not pay back the money before a certain time. See also Pawnbrokers. Pawnbroker (in the United Kingdom) is a dealer licensed to lend money at a specified rate of interest on the security of movable personal property, which can be sold if the loan is not repaid within a specified period. Pawnbroker (in the United States) is a person licensed to lend money at a legally specified rate of interest on articles of personal property left as security. Pawnbroker is a person who lends money at interest on the security of an article pawned. Pawn Brokers (in 1844):- a pawnbroker is a species of banker, who advances money, at a certain rate of interest, upon security of goods deposited in his hands; having power to sell the goods, if the principal sum and the interest thereon be not paid within a specified time. Pawnbrokers and Pawnbroking:- Advantages And Disadvantages Of Pawnbroking:- The practice of impledging or pawning goods, in order to raise loans, is one that must necessarily always exist in civilised societies, and is, in many cases, productive of advantage to the parties. But it is a practice that is extremely liable to abuse. By far the largest proportion of the bona fide borrowers of money on pawn consist of the lowest and most indigent classes; and were the lenders not subjected to any species of regulation, advantage might be taken (as, indeed, it is frequently taken, in despite of every precaution) of their necessities, to subject them to the most grievous extortion. But, besides those whose wants compel them to resort to pawnbrokers, there is another class, who have recourse to them in order to get rid of the property they have unlawfully acquired. Not only, therefore, are pawnbrokers instrumental in relieving the pressing and urgent necessities of the poor, but they may also, even without intending it, become the most efficient allies of thieves and swindlers, by affording them ready and convenient outlets for the disposal of their ill-gotten gains. The policy of giving legislative protection to a business so liable to abuse, has been doubted by many. But though it were suppressed by law, it would always really exist. An individual possessed of property which he may neither be able nor willing to dispose of, may be reduced to a state of extreme difficulty; and in such case, what can be more convenient or advantageous for him than to get a loan upon a deposit of such property, under condition that if he repay the loan, and the interest upon it, within a certain period, the property will be returned? It is said, indeed, that the facilities of raising money in this way foster habits of imprudence; that the first resort for aid to a pawnbroker almost always leads to a second; and that it is impossible so to regulate the business, as to prevent the ignorant and the necessitous from being plundered. That this statement, though exaggerated, is to a certain extent true, no one can deny. On the other hand, however, the capacity of obtaining supplies on deposits of goods, by affording the means of meeting pressing exigencies, in so far tends to prevent crime, and to promote the security of property; and it would seem as if the desire to redeem property in pawn would be one of the most powerful motives to industry and economy. At the same time, too, it must be borne in mind, that it is not possible, do what you will, to prevent

those who are poor and uninstructed from borrowing; and that they must, in all cases, obtain loans at a great sacrifice, and be liable to be imposed upon. But the fair presumption is, that there is less chance of any improper advantage being taken of them by a licensed pawnbroker, than by a private and irresponsible individual. Although, however, the business had all the inconveniences, without any portion whatever of the good which really belongs to it, it would be to no purpose to attempt its suppression. It is visionary to imagine that those who have property will submit to be reduced to the extremity of want, without endeavouring to raise money upon it. Any attempt to put down pawnbroking would merely drive respectable persons from the trade, and throw it entirely into the hands of those who have neither property nor character to lose. And hence the object of a wise legislature ought not to be to abolish what must always exist, but to endeavour, so far at least as is possible, to free it from abuse, by enacting such regulations as may appear to be best calculated to protect the ignorant and the unwary from becoming the prey of swindlers, and to facilitate the discovery of stolen property.

PAY = СМОЛИТЬ – Pay (maritime term):- to fill the seams of a vessel with pitch.

PAYABLE COOPER = ОПЛАЧИВАЕМАЯ МЕДЬ (или МЕДЬ, ПОДЛЕЖАЩАЯ ОПЛАТЕ) – In mining industry, Payable Copper is the proportion of contained copper for which payment is received after metallurgical deduction. / В горной (горнодобывающей) промышленности, к оплачиваемой меди относится пропорция содержимой (самородной) меди, за которую получается платёж после металлургического .

PAYABLE DATE = ДАТА ОПЛАТЫ – Payable Date is the date on which a corporation makes dividend payments or interest payments to a holder. Dividend payments are generally mailed one or two days prior to the payable date. / Дата Оплаты – дата, на которую корпорация производит платежи по дивидендам или платежи по процентам держателям ценных бумаг этой корпорации. Платежи по дивидендам, как правило, отправляются почтой за один или два дня до даты оплаты.

PAYABLE IN ADVANCE = ОПЛАЧИВАЕМЫЙ АВАНСОМ – Payable In Advance is an expression denoting that interest is payable at the beginning of the interest period, e.g., year, six months, etc. The opposite of Payable In Arrears. / Выражение, обозначающее, что процент оплачивается в начале процентного периода (исчисления процентов), например, года, шести месяцев, и тому подобного. В противовес Оплачиваемому Напоследок (Payable In Arrears).

PAYABLE IN ARREARS = ОПЛАЧИВАЕМЫЙ НАПОСЛЕДОК – Payable In Arrears is a term used to denote that interest is payable (and credited) at the end of the interest period, e.g., year, six months, etc. The opposite of Payable In Advance. / Термин, используемый для обозначения того, что процент является оплачиваемым (и кредитуемым) в конце процентного периода, например, года, шести месяцев и так далее. В противовес Оплачиваемому Авансом (Payable In Advance).

PAYABLES = ОПЛАЧИВАЕМЫЕ СЧЕТА – Payables:- claims against the firm. Current liabilities are usually repayable within twelve months of the balance sheet date. Also known as Liabilities. Informal term for a company's short-term debts (debtors). See also Accounts Payable, and Accounts Receivable. / Неформальный термин для обозначения краткосрочных долгов (дебиторов) компании. Смотрите также Дебиторская Задолженность или Счета К Получению (Accounts Receivable), и Кредиторская Задолженность или Счета К Оплате (Accounts Payable).

PAY AS YOU EARN BASIS = БАЗИС ПЛАТИТЕ, КОГДА ЗАРАБАТЫВАЕТЕ (или БАЗИС ОПЛАТЫ ПО МЕРЕ ЗАРАБАТЫВАНИЯ) – In taxation, Pay As You Earn (PAYE) is the system of income tax collection whereby tax is deducted from current earnings at source. The employer is responsible for collecting the tax, and the employee receives only net wages.

PAY AS YOU GO BASIS = НА ОСНОВЕ ВЫПЛАТ (или ОТЧИСЛЕНИЙ) ИЗ ТЕКУЩИХ ДОХОДОВ – (1) In insurance, Pay As You Go Basis is a system which uses total premiums or contributions received during a period to pay claims for damages sustained during that period. Used in short-term as well as long-term insurance contracts and pension plans. The amount of pension benefits is directly linked to the amount of contributions paid in by current employees.

(2) In taxation, Pay As You Go Basis is a system of paying taxes as they are incurred. The total tax liability is calculated in advance, and proportional amounts are withheld during each pay period. Most salaried employees in the United States pay their taxes in this way, but withholding of income taxes is not a universal practice.

PAY AS YOU GO PENSION FUNDING SYSTEM = СИСТЕМА ПЕНСИОННЫХ НАЧИСЛЕНИЙ (или ОТЧИСЛЕНИЙ) НА ОСНОВЕ ВЫПЛАТ ИЗ ТЕКУЩИХ ДОХОДОВ – Pay As You Go Pension Funding System is a financing method used by pension funds under which employees' contributions during a particular period cover the benefits paid out to the retirement beneficiaries during that period. The opposite of Funded Pension Scheme. Also known as Unfunded Pension Plan.

PAYCHECK = ПЛАТЁЖНЫЙ ЧЕК – Paycheck is a bank check issued in payment of wages or salary. Your paycheck is the money you get from work, usually every week or two. An employer usually pays employees with regularly scheduled paychecks. Your paycheck represents payment of your wages for the amount of time you worked. A lot of workers have their salaries deposited directly into their bank accounts, so they don't actually get a paper paycheck. You can also use paycheck more generally to mean 'income' or 'earnings', as in 'All that money for health insurance comes right out of my paycheck'. Paycheck is the amount of money a person earns. Your paycheck is a piece of paper that your employer gives you as your wages or salary, and which you can then cash at a bank. You can also use paycheck as a way of referring to your wages or salary. For example:- I just get a small paycheck every month; or He says his expenses are rising faster than his paycheck.

PAY/COLLECT = РАСХОД/ПРИХОД – Pay/Collect is a shorthand method of referring to the payment of a loss (pay) and receipt of a gain (collect) by a clearing member to or from a clearing organization that occurs after a futures position has been marked-to-market. See also Variation Margin.

PAYDAY LOAN = ССУДА В ДЕНЬ ОФОРМЛЕНИЯ ОБЯЗАТЕЛЬСТВА ОПЛАТЫ – Payday Loan is a transaction in which a short-term cash advance is made to a consumer in exchange for a customer's post-dated check in the amount of the advance plus a fee, or in exchange for a consumer's authorization to debit a transaction account in the amount of the advance plus a fee at a designated future date.

PAYE = PAY AS YOU EARN

PAYE BASIS = PAY AS YOU EARN BASIS

PAYEE = ПОЛУЧАТЕЛЬ ПЛАТЕЖА – Payee is a person or people to whom money is to be paid. On a check, it is the person to whom the check is made payable, also known as the Drawee. A party named in an instrument as the beneficiary of the funds. Under letters of credit, the payee is either the drawer of the draft or a bank. Person or company to whom or to whose order the amount written on a bill, check or negotiable instrument by the drawer is to be paid (recipient). Payee shall mean a natural person or a legal entity that is the intended final recipient of funds which have been the subject of a payment transaction. Payee means the person in whose favor the drawer directs payment to be made or to whom the maker promises to pay. Payee is the recipient of a payment.

PAYER = ПЛАТЕЛЬЩИК – Payer is a person who authorizes payment. On a check, it is the person who, as an account holder, signs the check, also known as the Drawer. A party responsible for the payment as evidenced by the given instrument. Under letters of credit, the payer is the party on whom the draft is drawn, usually the drawee bank. Payer shall mean a natural person or a legal entity that holds a payment account and allows a payment order from that payment account, or, where there is no payment account, a natural person or a legal entity that gives a payment order.

PAYING AGENT = ПЛАТЁЖНЫЙ АГЕНТ (или АГЕНТ ПО ПЛАТЕЖАМ) – Paying Agent:- Bank or other institution that pays capital or interest to holders of bonds, for which the agent may charge a fee. Receives funds from the issuer and pays dividends or interest to the entitled stock or bond holders. Paying Agent:- an office appointed by the issuer of stock or bonds to carry out all transactions arising from the placement and circulation of the given security. Also known as Paying Office.

PAYING BANK = ОПЛАЧИВАЮЩИЙ БАНК (или БАНК ПЛАТЕЛЬЩИК) – In the United States, a Paying Bank (originating depository institution in the Expedited Funds Availability Act (EFAA)) generally is the bank by or at which a check is payable and to which it is sent for payment or collection, or the bank through which a check that is not payable by a bank is sent for payment or collection. Paying Bank means the bank by, through, or at which a check is payable and to which it is sent for payment or collection. The term Paying Bank means:- (i) the bank by which a check is payable, unless the check is payable at or through another bank and is sent to the other bank for payment or collection; or (ii) the bank at or through which a check is payable and to which the check is sent for payment or collection.

PAYLOAD = ПОЛЕЗНАЯ НАГРУЗКА (или ЧИСТАЯ ГРУЗОПОДЪЁМНОСТЬ, или ТЕХНИЧЕСКАЯ НОРМА ЗАГРУЗКИ) – Payload:- the revenue producing part of the cargo. The revenue producing load carried by a means of transport. Payload is the load carried in a container against which freight rates are levied. Payload is the carrying capacity of an aircraft. Payload:- Q load carried by the pallet in use. Note:- this can be above, identical with or below the nominal load (see ISO/TS 8611-2 [1]). Payload is the total weight of the cargo that can be placed in a rail or road truck, or in a plane (also volume acceptable). / Грузоподъёмность транспортного средства (вагона, автомобиля, судна, самолёта), масса груза, на перевозку которого рассчитано данное транспортное средство; основная эксплуатационная характеристика транспортного средства. Для сухопутных транспортных средств (вагон, автомобиль) расчётная грузоподъёмность определяется допустимой нагрузкой на ось подвижного состава и на 1 метр (м) пути; у морских судов – при погружении по грузовую марку, для судов внутреннего плавания – при нормальной или максимальной осадке. Грузоподъёмность 4-осных железнодорожных вагонов составляет 62–65 тонн (т), 8-осных – 125 т. Номинальная грузоподъёмность автомобилей разных марок (для условий эксплуатации на дорогах с твёрдым покрытием) составляет от 0.5 до 14 т, автосамосвалов до 28 т и более, специальных автомобилей для горнорудных разработок, строительства и внутризаводских нужд – 40–100 т и более. Различают грузоподъёмность судна:- полную – Дедвейт, и чистую – масса собственно груза. Морские транспортные суда для перевозки штучных и лесных грузов имеют грузоподъёмность в зависимости от района плавания, назначения и других условий от 0.1 до 25 000 т. Грузоподъёмность крупных морских танкеров достигает 300 000 т, судов внутреннего плавания – 7 000 т (составных 16 000 т и более). Современные транспортные самолёты имеют грузоподъёмность от 1.5 (Ан-2М) до 26 т (Ил-62); Ан-22 может перевозить до 80 т груза. Под Грузоподъёмностью транспортного средства понимается максимальная масса груза, который транспортное средство способно в определённых условиях в один приём поднять, переместить или перевезти. Грузоподъёмность является основной эксплуатационной характеристикой транспортного средства. Полезная Нагрузка Q (Payload):- нагрузка, которую выдерживает поддон при эксплуатации. Примечание:- нагрузка может быть равна или меньше номинальной ннагрузки (смотрите стандарт ISO/TS 8611-2 [1]).

PAYMENT = ПЛАТЁЖ (или ОПЛАТА) – Payment is the transfer of money, or other agreed upon medium, for provision of goods or services.

PAYMENT ACCOUNT = ПЛАТЁЖНЫЙ СЧЁТ – Payment Account shall mean an account held in the name of one or more payment service users which is used for the execution of payment transactions.

PAYMENT AGAINST DOCUMENTS = ПЛАТЁЖ ПРОТИВ ДОКУМЕНТОВ – Payment Against Documents:- instructions given by a seller to a bank to the effect that the buyer may collect the documents necessary to obtain delivery of the goods only upon actual payment of the invoice.

PAYMENT CAP = ВЕРХНИЙ ПРЕДЕЛ ПЛАТЕЖА – Payment Cap is a limit on how much the monthly payment may change, either each time the payment changes or during the life of the mortgage. Payment caps may lead to negative amortization because they do not limit the amount of interest the lender is earning.

PAYMENT COLLECTION = ИНКАССО ПЛАТЕЖА (или НАЛОЖЕННЫЙ ПЛАТЁЖ, или ПЛАТЁЖНОЕ ТРЕБОВАНИЕ, или ПРИНЯТИЕ НА ИНКАССО) – Payment Collection is the obtaining money, or other agreed upon medium, for provision of goods or services. / Под Платёжным Требованием понимается требование, предоставляемое в банк на инкассо или для зачёта требования поставщика к покупателю об оплате отгруженных или сданных материальных ценностей, оказанных услуг или выполненных работ.

PAYMENT GUARANTEE = ГАРАНТИЯ ОПЛАТЫ – Payment Guarantee is used in import-export business, the payment guarantee is often used instead of a documentary credit – upon delivery against 'open account'. It has a purpose to secure any claims by the seller on the buyer for payment of the contract price by the agreed date. Guarantee amount:- contract price or part thereof. Term:- payment date plus, e.g., 15 days. In import-export business, mainly abstract guarantees payable upon first demand. Payment Guarantee supports the payment obligation of the beneficiary for goods/services delivered by the principal/applicant. Payment Guarantee:- (i) often used to cover the non-payment of a debt(s) arising under a transaction or over a period of time. (ii) Provides financial security to the beneficiary should the applicant fail to make payment for the goods or services supplied. Such guarantees will invariably run up to the final scheduled date of payment, plus a grace period to allow the beneficiary to make demand in the event of non-payment. Also known as Trade Debt Guarantee. / Гарантия Оплаты – обязательство банка, выданное по приказу покупателя, выплатить продавцу определённую сумму в случае неисполнения покупателем своих обязательств по оплате за поставленный товар.

PAYMENT IN KIND = НАТУРАЛЬНАЯ ОПЛАТА (или ОПЛАТА В НАТУРЕ) – Payment In Kind:- payment, generally of wages, made in goods or services rather than in money. Payment of total wages in kind was made illegal in the United Kingdom in the XIX century, but part payment in kind is still common. For example, workers who receive luncheon vouchers or the use of a company car are receiving payment in kind. Payment-In-Kind (PIK) is a programme used in the US to help dispose of public stocks of commodities. Under PIK, government payments in the form of Commodity Credit Corporation (CCC)-owned commodities are given to farmers in return for additional reductions in harvested acreage. / Под Натурой понимаются товары, продукты, используемые в качестве платёжного средства взамен денег.

PAYMENT–IN–KIND PROGRAM = ПРОГРАММА НАТУРАЛЬНОЙ ОПЛАТЫ (или ПРОГРАММА ОПЛАТЫ В НАТУРЕ) – The term Payment-In-Kind (PIK) Program refers to an alternative to cash payments to producers of various commodities under the US Department of Agriculture acreage control program authorized by Congress in 1985. The payments consisted of generic certificates which could be exchanged for commodities held in government warehouses or redeemed for equivalent monetary value. A US government program in which farmers who comply with a voluntary acreage-control program and set aside an additional percentage of acreage specified by the government receive certificates that can be redeemed for government-owned stocks of grain. In the United States, the USDA Payment-In-Kind (PIK) Program announced in January (1983) was designed to idle this substantially larger acreage without increasing Government outlays. By paying producers tp idle acreage with the surplus commodities built up in the farmer-owned reserve or held by the Commodity Credit Corporation (CCC), the PIK program, complemented by the ARP (short for the acreage reduction program) and PLD (short for the paid land diversion) programs, aims at:- (i) reducing production and stocks at the same time; (ii) ensuring adequate market supplies; (iii) minimizing direct Government outlays in support of agriculture; (iv) improving conservation practices; (v) increasing farm incomes; and (vi) helping to ease storage problems.

PAYMENT INSTRUMENT = ИНСТРУМЕНТ ОПЛАТЫ (или ПЛАТЁЖНЫЙ ИНСТРУМЕНТ) – Payment Instrument shall mean any personalised device(s) and/or set of procedures agreed between the payment service user and the payment service provider and used by the payment service user in order to initiate a payment order. / Платёжный Инструмент означает любое персонализированное устройство(а) и/или набор процедур, согласованных между пользователем службы платежей и поставщиком службы платежей, и используемое пользователем службы платежей с тем, чтобы инициировать платёжное поручение.

PAYMENT NETTING = ВЗАИМОРАСЧЁТ ПО ПЛАТЕЖАМ (или СВЕДЕНИЕ ПЛАТЕЖЕЙ, или СВОДНЫЙ ПЛАТЁЖ) – Payment Netting is settling payments due on the same date and in the same currency on a net basis. For the International Swap and Derivatives Association, Inc. (ISDA®) Master Agreement, payment netting reduces payments due on the same date and in the same currency to a single net payment. / взаиморасчёт или сведение. Международная Ассоциация по Свопам и Деривативам, Инк. (МАСД®; The International Swaps And Derivatives Association, Inc. (ISDA®)). Головное Соглашение.

PAYMENT–OPTION ADJUSTABLE–RATE MORTGAGE = ЗАКЛАДНАЯ С ПЕРЕОЦЕНИВАЕМОЙ СТАВКОЙ С ОПЦИОНОМ ПО ПЛАТЕЖАМ – Option Adjustable-Rate Mortgage (Option ARM) is a type of mortgage where the mortgagor (borrower) has several options as to which type of payment is made to the mortgagee (lender). In addition to having the choice of making payments of interest and principal that amounts to those made in conventional mortgages, option ARMs also have alternative payment options where the mortgagor can make significantly smaller payments by making interest-only payments or minimum payments. Since many option ARMs offer a low teaser rate, many mortgagors unknowingly refinance their present mortgage in hopes of making lower payments. Unfortunately, once these short-term teaser rates expire, the rates of interest are returned back to those similar to conventional mortgages. Furthermore, for those unlucky mortgagors that elected to make minimum payments, they will find that the principal owed on their mortgage has actually increased. This is because the value of minimum payments did not entirely cover the mortgage's interest. The uncovered interest would then be added to the mortgage's principal. In the United States, an Adjustable-Rate Mortgage (ARM) that allows you to choose among several payment options each month. The options typically include:- (i) a traditional amortizing payment of principal and interest; (ii) an interest-only payment; or (iii) a minimum (or limited) payment that may be less than the amount of interest due that month. If you choose the minimum-payment option, the amount of any interest you do not pay will be added to the principal of your loan. See also Negative Amortization. A Payment-Option ARM allows the borrower to choose among various payment options each month. In this type of an ARM, you may choose to make a principal interest payment (PI), or an interest-only payment, or a minimum payment. If you choose the latter option, be forewarned that it may lead to negative amortization, which means the minimum payment is less than the interest charged, which in turn will cause the principal (amount you owe) to increase (balloon). These 'Pay Option' Adjustable-Rate Mortgages gave borrowers a choice of payments each month. They also carried a feature that came as a nasty surprise to some borrowers, called 'Negative Amortization'. If the homeowner opted to pay less than the full monthly amount, the difference was tacked onto the principal. When the loan automatically 'recasted' in five or 10 years, the owner would be locked into a new, much higher, set monthly payment. / В Соединённых Штатах Америки под закладной с переоцениваемой ставкой (ЗПС; adjustable-rate mortgage (ARM)) понимается закладная, которая позволяет её владельцу выбирать .

PAYMENT ORDER = ПЛАТЁЖНОЕ ПОРУЧЕНИЕ – (1) Payment Order is an instruction in any form, given to a financial institution, to place at the disposal of a beneficiary an amount of money. An order to the bank from a customer instructing it to make payment in favor of a third party. Payment Order shall mean any instruction by a payer or payee to his payment service provider requesting the execution of a payment transaction. / Распоряжение клиента банку, инструктирующее его произвести платёж в пользу третьей стороны.

(2) Payment Order:- authorization to transfer money, securities or other fungibles for the account of the authorizing party to another person entitled to receive the said in his own name. Payment orders not designated as bills of exchange but made out expressly to the order of a beneficiary and otherwise meeting the requirements of a drawn bill are bill-like payment orders.

PAYMENT SERVICE USER = ПОЛЬЗОВАТЕЛЬ УСЛУГИ ОПЛАТЫ – Payment Service User shall mean a natural person or a legal entity making use of a payment service in the capacity of either payer or payee, or both.

PAYMENT SETTLEMENT MESSAGE NOTIFICATION = НОТИФИКАЦИЯ О СООБЩЕНИИ ОБ ОСУЩЕСТВЛЕНИИ ОПЛАТЫ – Payment Settlement Message Notification:- for SWIFT message, the response to a payment settlement message request (PSMR), which can be either positive or negative. In the case of a positive payment settlement message notification (PSMN), responsibility is passed over to the receiver, in the case of a negative PSMN the sender remains responsible for the payment. / В отношении сообщений Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

PAYMENT SETTLEMENT MESSAGE REQUEST = ЗАПРОС НА СООБЩЕНИЕ ОБ ОСУЩЕСТВЛЕНИИ ОПЛАТЫ – Payment Settlement Message Request:- for SWIFT message, the sender of such a message is requesting that the receiver process a payment. This message requires a positive or negative response from the receiver. / В отношении сообщений Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) отправитель такого сообщения просит получателя, чтобы тот обработал платёж. Это сообщение требует от получателя дать либо положительный, либо отрицательный ответ. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

PAYMENTS SYSTEM = СИСТЕМА ПЛАТЕЖЕЙ (или ПЛАТЁЖНАЯ СИСТЕМА) – In the United States, a Payments System is the collective term for mechanisms (both paper-backed and electronic) for moving funds, payments and money among financial institutions throughout the nation. The Federal Reserve plays a major role in the nation's payments system through distribution of currency and

coin, processing of checks, electronic transfer of funds and the operation of automated clearinghouses that transfer funds electronically among depository institutions; various private organizations also perform payments system functions. The USD payment network within the United States consists of four primary payment vehicles:- (i) CHIPS (Clearing House Interbank Payment System); (ii) Fedwire; (iii) ACH (Automated Clearing House); and (iv) Checks. In the European Union, a Payment System is the set of instruments, banking procedures and, typically, interbank funds transfer systems that ensure the circulation of money. Payment systems require agreed technical standards and methods for transmitting payment messages between participants, an agreed settlement asset and a set of common operating procedures and rules covering, among other things, access criteria and pricing. The International Payment System was put together at a beautiful New England country lodge, the Mount Washington Hotel, at the base of Mt. Washington in New Hampshire, in the closing months of World War II in 1944. One of the fundamental agreements reached by the 730 delegates from 44 nations at the United Nations Financial and Monetary Conference over three weeks in July was that American Dollars (USD) were convertible into gold at the fixed rate of USD35 per ounce. The conference also resulted in the creation of both the World Bank and the International Monetary Fund. The so-called Bretton Woods system governed international financial transactions from 1944 until 1971 and is generally acknowledged to have provided the foundation for the tremendous economic recovery worldwide, and especially in the United States, from the twin effects of the Great Depression and the World War. But, by 1971, the fixed exchange rate and the differentials between the several Western economies put ever-increasing strains on the system, particularly as the fixed exchange rate in effect forced all participating countries to manage the value of their respective currencies in 'lockstep'. By 1971, West Germany abandoned the Bretton Woods system as it refused to devalue the rapidly appreciating Deutsche Mark. The French complained repeatedly about the 'asymmetrical financial system' which supported unemployment in the United States exceeded 6% and inflation was over 5.8%, so after high-level meetings at Camp David in August 1971, among Federal Reserve Chair Arthur Burns, Treasury Secretary John Connally, Undersecretary for International Monetary Affairs (and later Federal Reserve Chair) Paul Volcker, and President Richard Nixon, President Nixon suspended the convertibility of Dollars into gold and invoking a 1970 Congressional enactment to impose wage and price controls. The American economy reflected the costs incurred in carrying on the War in Vietnam, which did not end until 1975. In the Middle East, Arab conflicts with Israel exploded in the Six Day War of 1967 and again in the Yom Kippur War of September 1973. The Organization of Petroleum Exporting Countries ('OPEC') had been formed in 1960 and, after defeat in the Yom Kippur War, OPEC weaponized oil by imposing an embargo that materially affected all Western economies and particularly the United States. In these times of uncertainty an economic disruption, student radicalism had evolved from the so-called Free Speech Movement and ant-Vietnam War protesters to armed efforts to subvert social order in South America, Italy, and, perhaps most troubling, in West Germany, where the Baader-Meinhof Gang proclaimed the arrival of the Red Army Faction who carried out bomb and shooting attacks against officials and business leaders. In the midst of this turmoil stood a private bank, founded in 1955 in Cologne, West Germany. Cologne, an ancient river town on the Rhine with a monumental cathedral, was and is a bustling commercial center. The private bank, started by Ivan David Herstatt, had assets of over DM2 billion (approximately USD800 000 at the then extant exchange rates) by 1974 and was the 35th largest bank in West Germany. During 1973–1974 the US Dollar experienced significant volatility. Bank Herstatt had become by then a substantial player in foreign exchange markets. Unfortunately, the bank made wrong bets on the direction of the dollar, such that by June 1974, it had DM470 million in losses, while it had only DM44 million of capital. On June 26, German regulators forced the bank liquidation. That day a number of other banks had released DM to Bank Herstatt in Frankfurt (the German financial capital) in exchange for US Dollars to be delivered in New York. Due to the six-hour time difference, Bank Herstatt was defunct before payment was payable in New York. The failure of Bank Herstatt was the critical occurrence leading to the formation of the Basel Committee on Banking Supervision, a standing committee of the Bank for International Settlements, and led to the efforts to create a Real-Time Gross Settlement ('RTGS') system, which is what FedNow intends to be. As the number of financial market transactions grew and their size increased, Bank Herstatt-like risks grew alongside. Frequently, the account of one bank is drawn against during the business day in amounts in excess of the balance in the account, but the account is brought back into a net positive position through incoming transfers that arrive during that same day. The imbalance during the business day is known as a 'Daylight Overdraft'. Clearly, the system can only function with the regular occurrence of daylight overdrafts so long as either the banks trust their counter-parties OR some intermediary provides a stabilizing facility to support the continuous flow of transactions. In 1985, the Board of Governors of the Federal Reserve System ('FRB') adopted policies that allowed large amounts of transfers between selected banks, allowing those banks to operate smoothly. The FRB requires those banks to hold a 10% reserve as part of maintaining their safety and soundness. In the case of daylight overdrafts, a selected bank may use some or all of its reserves to 'liquidate' the overdraft, so long as the bank does one of four things:- (1) 'Repays' the reserve by the end of the business day; (2) Monitor the borrowing and transactions requiring the use of reserves; (3) Supply collateral to the FRB to secure an as yet unliquidated overdraft; or (4) Pay a 50-basis point fee on the overdraft amount. Each selected bank is given a net debit cap by the FRB, which is used by the FRB to manage the risks of a failure to liquidate daylight overdrafts. Necessarily, to the extent a fully functioning RTGS system is implemented, the Herstatt-like risks inherent in daylight overdrafts will be ameliorated. Where the US Payment System Came From:- In 1816, then-President James Madison chartered the Second Bank of the United States with a 20-year charter as authorized by Congress. The Second Bank provided central regulation of currency and inflation by controlling the allocation of specie (so-called 'hard currency', i.e. coins and precious metals). The number of banks in the US grew from 31 in 1801 to 788 by 1837. By the 1830s, the Second Bank was under substantial attack from many sides, particularly led by President Andrew Jackson, who saw the Second Bank as elitist and oppressive to the average citizen. As a result, the Second Bank was not rechartered and was unable to assert significant authority to deal with the financial panic of 1837, when many banks failed and many depositors lost their savings. By the mid-1840s, banking had become even more complex, even as the fragmented system created risks that were not well-managed. In the economy at large, the Gold Rush in California from 1849 on, the increased construction of canal systems in the Northeast, and the building of a national railroad system, all led to economic growth. In New York City, the number of banks grew from 24 to 57 between 1849 and 1853. Banks settled their accounts once a week on Fridays by having 'porters' travel from bank to bank with bags of coins (specie). But as the number of banks grew, the exchanges by porters became a daily occurrence after gathering each day for their 'Porters' Exchange' on the steps of one of the New York banks on Wall Street. The weekly accounting was often undercut by errors and sometimes by fraud. In 1853, George D. Lyman, a bank bookkeeper, proposed that banks send and receive checks at a central location. As a result, The New York Clearing House was organized on October 04, 1853. One week later representatives of 52 banks met in the basement of 14 Wall Street and exchanged USD22.6 million in checks. 14 Wall Street was later (in the XX century) the Headquarters of Bankers' Trust Company and of its outside law firm, White & Case, (where the author of this blog began his professional career over 50 years ago). Within 20 years, the average daily clearing exceeded USD100 million. It is now in excess of USD20 billion. The New York Clearing House functioned as a kind of central bank, especially in the panics of 1857 and 1893. In the wake of another panic early in the XX century, Congress passed the Federal Reserve Act in 1913, under which the FRB was created. Thereafter the New York Clearing House concentrated on facilitating the completion of financial transactions by clearing payments. Member banks (so-called 'Clearing House banks') exchange checks, coupons, and certificates of value among themselves, and the Clearing House records the charges and credits to their respective accounts. A settlement is made at 10:00 a.m. each business day involving about three million pieces of paper. In 1970, the Clearing House Interbank Payments System ('CHIPS') began operations,

followed by the New York Automated Clearing House ('NYACH') in 1975 and then the Clearing House Electronic Check Clearing System ('CHECCS') in 1992 and in 2000, NYACH became the Electronic Payment Network ('EPN'). On July 01, 2004, the New York Clearing House Association changed its name to The Clearing House Association, LLC ('TCH'), which continues to provide clearing services for the payment system, although now much more a computer-based system dealing with digital items as the number of paper pieces declines every year. TCH remains an entity owned by and operated for Clearing House banks, generally large institutions including some foreign banks such as Barclays, Deutsche Bank, HSBC, MUFG Union Bank, Santander, and UBS. Those institutions have made major investments over the years in the computer systems needed to interface with and support the TCH payment system. Smaller institutions, e.g., community banks, access the TCH system through Clearing House banks. In 2017, TCH launched its Real-Time Payments ('RTP') system which provides a 24 hour/7 days a week/365 days a year RTGS system for participating banks, including a payment service that supports instant payments. The TCH system is very complete, but it does not (at least as of now) have real-time reporting capabilities for all US banks. As FRB Chair Jerome Powell has said, the RTP network 'is far behind other countries in terms of having real-time payments'. The RTP provides 'instant payment' through a joint account at the Federal Reserve Bank of New York. That joint account is owned by the Clearing House banks and must be prefunded with sufficient balances to maintain the ability to fund instant settlements. Nonetheless, one can understand that the Clearing House banks and the TCH do not look favorably on the FRB's effort to create FedNow Service with public money to compete with, and notionally, to replace the TCH system. Although the FRB concluded in their August 06 announcement that FedNow Service would have 'no direct and material adverse effect' on the RTP's ability to compete. The Proposed FedNow Service:- On August 06, 2020, the FRB announced the details of its long-planned payment system to rival and perhaps eventually replace TCH. FedNow Service is to be an RTGS system with integrated clearing functionality that will offer 24 hour/7day a week/365 days a year payment processing for EVERY bank in the United States, resulting in instant payments, i.e. the end of Herstatt- and even daylight overdraft- risks. FedNow Service is now targeted to make its initial launch in 2023 or 2024. It will include a liquidity management tool ('FedNow LMT'), so that FedNow Service participants can transfer funds between accounts at the twelve Federal Reserve Banks to meet liquidity needs associated with instant payments. The August 06 announcement notes that the FRB plans a phased approach to implement this system, including pilot programs and providing additional features and functionality in the years following the initial launch. Some of the additional features and functionalities now envisioned include enhanced fraud prevention tools (such as central pattern-recognition monitoring systems), support for bulk payments, enhanced remittance information, and support for alias-based payments through application programming interfaces. The FRB began a study of ways to improve the US payment system in 2013, which led to the formation of the FRB's Faster Payments Task Force. That Task Force resulted in a set of recommendations for improving the payments system in 2017. In 2018, the FRB sought comments on the FRB's role, if any, in the US payments system AND whether to develop FedNow, which in turn led to the FRB 2019 announcement that it would develop FedNow Service and then issued a proposal for comment. The August 6 announcement was intended to 'flesh out' the details of the initial FedNow Service. Ongoing steps will include developing needed infrastructure, integration (where possible and appropriate) with existing systems, and continuing discussions with banks and others on features and design decisions. The FedNow Service will use ISO 20022, the internationally developed messaging standard for financial services, with at least three message types:- (1) Credit transfers (payments); (2) Return transfers (so-called 'exception processing'); and (3) Interbank funds transfers (liquidity management-related transfers). Timelines, pilot programs, fee structures, and governing terms are to be announced over the next couple of years. It is also worth noting that the FRB's 2019 proposal set a transaction limit of USD25 000 during the initial FedNow Service, that limit is not contained in the August 06 announcement. FedNow Service envisions operations with a daily closing time of 07:00 p.m. Eastern Time, which will be consistent with the FedWire Funds Service when it shifts to a 07:00 p.m. closing time beginning in March 2021. 'End-of-day' balances will be calculated each day (including weekends and holidays), with a seven-day accounting regime, a significant change from the current five-day accounting regime. The August 06 announcement also sets out an optional five-day work-around for smaller banks which do not wish to make the investment necessary to support a seven-day accounting system. The FRB in its August 6 announcement expressed concerns about having only one payment system for a number of reasons:- (i) The inertia inherent in the RTP system with its legacy components; (ii) The potential loss of innovation and pricing improvements from the competition; and (iii) The national security implications of a single payment system, particularly in the face of a cyber attack. As of now, only the following will be eligible to participate in the FedNow Service:- (i) US depository institutions; (ii) US branches of foreign banks; (iii) Designated financial market utilities; (iv) The US Treasury; (v) GSE's (such as Fannie Mae and Freddie Mac); (vi) Certain multilateral development banks; (vii) Non-US countries; and (viii) Other central banks. Non-banks such as payment companies cannot directly participate, but they may serve as service providers or agents for eligible participants. US banks do not have to participate in FedNow Service, although if the features contemplated are in fact offered one may wonder how bank supervisory authorities will assess the quality of bank management in an institution that elects not to participate. The FedNow Service has now completed its seven-year incubation. As implementation begins, there are sure to be many hurdles and unexpected developments, but the path is now set. Let the rivers of financial transactions, and the reporting of them, flow.

PAYMENT TRANSACTION = ТРАНЗАКЦИЯ ОПЛАТЫ (или ОПЕРАЦИЯ ОПЛАТЫ) – Payment Transaction shall mean an act, initiated by the payer or by the payee, of placing, transferring or withdrawing cash, irrespective of any underlying obligations between the payer and the payee. In a modern economy millions of payment transactions are processed each day. They are either cash-based – i.e. made with notes and coins – or cashless. The central banks and banks play a decisive role in domestic and cross-border payments, since they provide the economy and population with the necessary cash. Furthermore, they process cashless payments from account to account executed on the customer's behalf via transfer order, cheque or direct debit.

PAYMENT TRANSFER = ОСУЩЕСТВЛЕНИЕ ОПЛАТЫ (или ВНЕСЕНИЕ ПЛАТЕЖА, или ПЕРЕВОД ПЛАТЕЖА) – Payment Transfer:- one differentiates in general between payment transfers in cash and cashless payment transfers. Payment transfer in cash describes payment in banknotes and coins, with which the economy and the population are provided by the relative central bank. In the case of cashless payment transfer payments are made though book money, i.e. by cheque, remittance, debit and notes. Electronic payment transfer (electronic banking) represents a possible extension of cashless payment transfer. Since the 1960 cashless payment are gaining increasingly in importance. Payment Transfer:- money debt payments. Payment transfers are said to be cashless when effected as accounting entries only, i.e. without transferring physical money. Also known as Payment Operations. / , то есть чеком, перечислением, .

PAYMENT UNDER SUBSCRIPTION = ОПЛАТА ПО ПОДПИСКЕ – Payment Under Subscription is a payment for the securities allotted under subscriptions to new or conversion issues.

PAY OFF = УВАЛИВАТЬСЯ ПОД ВЕТЕР (или УКЛОНЯТЬСЯ ОТ КУРСА) – Pay Off (maritime term):- to turn the bow away from the wind; to pay the crew.

PAY–OFF DIAGRAM = ДИАГРАММА ОКУПАЕМОСТИ – Pay-Off Diagram is a graphic representation of the correlation between the amount paid for a financial derivative on maturity and the spot price of the underlying. / Графическое представление корреляции

между суммой, уплаченной за финансовый производный инструмент (финансовый деривати) при его погашении, и ценой для безотлагательной поставки соответствующего актива, на котором базируется производный инструмент.

PAY OUT = ВЫТРАВЛИВАТЬ (или ТРАВИТЬ, или СМАТЫВАТЬ) – Pay Out (maritime term):- to slack out a line made fast on board (let it out slowly).

PAYOUT RATIO = СООТНОШЕНИЕ С ВЫПЛАТОЙ (или КОЭФФИЦИЕНТ ВЫПЛАТ) – Payout Ratio:- percentage of a firm's profits that is distributed to shareholders in the form of dividends. A low ratio points to a conservative financial policy, allowing more reserves to be formed. Payout Ratio:- dividends divided by earnings per share. The inverse of dividend cover.

PAYROLL = ПЛАТЁЖНАЯ ВЕДОМОСТЬ – In a company, Payroll is the sum of all financial records of salaries for an employee, wages, bonuses and deductions. In accounting, payroll refers to the amount paid to employees for services they provided during a certain period of time. Payroll plays a major role in a company for several reasons. From an accounting point of view, payroll is crucial because payroll and payroll taxes considerably affect the net income of most companies and they are subject to laws and regulations, e.g., in the United States payroll is subject to federal and state regulations. From ethics in business viewpoint payroll is a critical department as employees are responsive to payroll errors and irregularities:- good employee morale requires payroll to be paid timely and accurately. The primary mission of the payroll department is to ensure that all employees are paid accurately and timely with the correct withholdings and deductions, and to ensure the withholdings and deductions are remitted in a timely manner. This includes salary payments, tax withholdings, and deductions from a paycheck. Payroll is a list of people employed, usually full-time, by a company and of the amount that each is due to be paid. The term Payroll encompasses every employee of a company who receives a regular wage or other compensation. Some employees may be paid a steady salary while others are paid for hours worked or the number of items produced. All of these different payment methods are calculated by a payroll specialist and the appropriate paychecks are issued. Companies often use objective measuring tools such as timecards or timesheets completed by supervisors to determine the total amount of payroll due each pay period. After a payroll accountant multiplies an employee's hours by his or her pay rate, the gross income amount is entered into a calculator or computer program. Regular deductions such as tax withholdings, FICA payments (social security; the acronym for the US Federal Insurance Contributions Act), medical insurance, union dues, charitable contributions and so on are then categorized and subtracted. The remaining balance is then converted to a check and becomes the employee's net pay for that time period. Payroll departments also identify the employer and employees by a federal code and keep a running tally on total income and deductions for the fiscal year. / Перечень сотрудников, как правило на основе полной занятости (полновременной основе), нанятых компанией, и сумма к оплате, которую каждый из них должен получить.

PAYROLL COSTS = ЗАТРАТЫ ПО ПЛАТЁЖНОЙ ВЕДОМОСТИ (или ЗАТРАТЫ ПО ВЫПЛАТАМ ЖАЛОВАНЬЯ, или ЗАТРАТЫ ПО ФОНДУ ЗАРАБОТНОЙ ПЛАТЫ) – Payroll Costs:- total cost of wages and salaries, plus related expenses in a given economy, including employers' contributions to social security, health insurance, and pension benefits. Also known as Wage Bill in the United Kingdom.

PAYROLL–RELATED COSTS = ЗАТРАТЫ, СВЯЗАННЫЕ С ВЫПЛАТАМИ ПО ФОНДУ ЗАРАБОТНОЙ ПЛАТЫ – Payroll-Related Costs:- total payments in cash or in kind by businesses, households and governments, related to wages and salaries but not representing direct compensation for labor.

PAYROLL SAVINGS PLAN = ПЛАН СБЕРЕЖЕНИЙ ПО ПЛАТЁЖНОЙ ВЕДОМОСТИ – In the United States, The new Payroll Savings Plan feature is designed for individual TreasuryDirect primary account owners to make recurring purchases of electronic Series EE and Series I Savings Bonds automatically, using regular payroll direct deposits from their employer. See Learn More about the Payroll Savings Plan. Payroll Savings Plan is an arrangement between employer and employee whereby a specified amount of money is deducted from the employee's pay and invested for the employee in stocks, bonds, or other investments. The full salary is ordinarily taxable, though deductions are allowed for qualified pension plan contributions.

PAYTERMS = TERMS OF PAYMENT

PB = PRIMARY BRANCH

PBGC = PENSION BENEFIT GUARANTY CORPORATION

PBH = PLOWING, BROADCASTING, HARROWING

PBI FIBER = POLYBENZIMIDAZOLE FIBER

PBR RATIO = PRICE–TO–BOOK VALUE RATIO

PBT CHEMICALS = СБТ ХИМИКАЛИИ – PBT Chemicals (Persistent Bioaccumulative Toxic Chemicals) are substances that fulfill the three following criteria:- (1) Persistent – they remain in the environment for long periods of time and degrade either slowly or not at all; (2) Bioaccumulative – they build up or accumulate in an organism's tissue or the food chain; and (3) Toxic – they are poisonous. PBT chemicals are considered Substances of Very High Concern by the European chemicals directive, REACH (the European Union regulatory framework for the registration, evaluation and authorization of chemicals). / Стойкие или Устойчивые (Persistent).

PBX = PRIVATE BRANCH EXCHANGE

P/C = PART–CARGO

PC = PARTICIPATION CERTIFICATES

PC = PERSONAL COMPUTER

PCA = PERMANENT COURT OF ARBITRATION

PCAOB = PUBLIC COMPANY ACCOUNTING OVERSIGHT BOARD

PCARRD = PHILIPPINE COUNCIL FRO AGRICULTURE, FORESTRY, AND NATURAL RESOURCES, RESEARCH AND DEVELOPMENT

PCB = POLYCHLORINATED BIPHENYL

PCE = PRIVATE CONSUMPTION EXPENDITURE

PCF RATIO = PRICE TO CASH FLOW RATIO

PCIT SYSTEM = PHYTOSANITARY CERTIFICATE ISSUANCE AND TRACKING SYSTEM

PCR = POLYMERASE CHAIN REACTION

PCT = PATENT COOPERATION TREATY

PCT = POWER CABLE TRANSMISSION

PCV SYSTEM = POSITIVE CRANKCASE VENTILATION SYSTEM

PD = PRICE DOMESTIC

PDA = PERSONAL DIGITAL ASSISTANT

PDA = POTATO DEXTROSE AGAR

PDE TRAILER = POSSIBLE DUPLICATE EMISSION TRAILER

PDF = PORTABLE DOCUMENT FORMAT

PDM SYSTEM = PRODUCT DATA MANAGEMENT SYSTEM

PDP = POLICY DEVELOPMENT PROCESS

PDS = PRODUCT DATA SHEET

PDS = PUBLIC DISTRIBUTION SYSTEM

PDSS = PHOSPHORUS DECISION SUPPORT SYSTEM

PE = PERU

PEACH = XX (или КРАСНОВАТО–ЖЁЛТЫЙ) – Peach:- a variable color averaging a moderate yellowish pink.

PEACOCK BLUE = XX (или ПЕРЕЛИВЧАТОЕ ГОЛУБОЕ) – Peacock Blue:- a moderate greenish blue.

PEA GREEN = ЗЕЛЁНЫЙ ГОРОШЕК (или ГОРОХОВОЕ ЗЕЛЁНОЕ) – Pea Green:- a moderate yellow-green.

PEAI = PATENT ENTERPRISE ACCESS INTEGRATION

PEA JACKET = XX ЖАКЕТ (или ЖАКЕТ ПИ) – Pea Jacket is a heavy woolen double-breasted jacket originally worn by sailors. Also called Pea Coat.

PEAK DEMAND = ПИКОВЫЙ СПРОС (или ПИКОВОЕ ПОТРЕБЛЕНИЕ) – Peak Demand is the maximum load during a specified period of time.

PEAKING CAPACITY = ПИКОВАЯ СПОСОБНОСТЬ (или ПИКОВАЯ МОЩНОСТЬ, или СПОСОБНОСТЬ РАБОТЫ ПРИ ПИКАХ) – Peaking Capacity is a capacity of generating equipment normally reserved for operation during the hours of highest daily, weekly, or seasonal loads. Some generating equipment may be operated at certain times as peaking capacity and at other times to serve loads on an around-the-clock basis.

PEAK LOAD CONTRIBUTION = КОНТРИБУЦИЯ ПИКОВОЙ НАГРУЗКИ – Peak Load Contribution (PLC), in terms of electric capacity, represents an electricity consumer's maximum kilowatt (kW) demand, and is the amount of generating capacity based on the customer's account usage, which must be provided for system reliability. Your energy supplier uses your account's capacity PLC when determining your account's rate schedule and load profile, which sets its billing rate. Why does this matter? Higher PLCs generally equate to higher billing rates, both, for energy from a retail supplier, and for your T&D (transmission and distribution) rates. In general, a lower PLC, compared to overall usage, will result in lower costs. It is in your best interest to manage your demand to try and reduce your PLC.

PEAK LOAD PLANT = СТАНЦИЯ ПИКОВОЙ НАГРУЗКИ (или ПИКОВАЯ ЭЛЕКТРОСТАНЦИЯ) – Peak Load Plant is a plant usually housing old, low-efficiency steam units, gas turbines, diesels, or pumped storage hydroelectric equipment normally used during the peak-load periods. / Под Пиковой Электростанцией понимается электростанция, все агрегаты которой или часть их работают в тот период, когда потребление электрической энергии в энергосистеме резко возрастает на короткое время – при так называемом пике нагрузки. Наиболее целесообразно применение пиковой электростанции аккумулирующего типа, например, гидроаккумулирующих электростанций. Пиковыми Электростанциями могут служить гидроэлектрические станции, имеющие водохранилище и обеспечивающие быстрое включение агрегатов, газотурбинные электростанции, конденсационные электростанции, приспособленные для такого режима работы, гидроаккумулирующие электростанции и приливные электростанции.

PEAK PERIOD = ПИКОВЫЙ ПЕРИОД (или ПЕРИОД ПРЕДЕЛЬНОЙ НАГРУЗКИ) – Peak Period:- in reference to electricity, periods when energy consumption is the highest. / По отношению к электричеству, периоды наивысшего потребления электроэнергии.

PEAK SEASON SURCHARGE = НАДБАВКА В ПИКОВЫЙ СЕЗОН (или ДОПЛАТА В ПИКОВЫЙ СЕЗОН) – Peak Season Surcharge (PSS) is a surcharge added to cargo moving from Asia to Europe. This fee remains in effect for the duration of a typical Peak Season, currently from June 01–October 31. Freight surcharges are no longer updated by conferences. Please refer to shipping line agents or freight forwarders for their values. / надбавка или доплата (surcharge).

PEAK SHAVING = СНЯТИЕ ПИКОВОЙ НАГРУЗКИ – Peak Shaving:- during times of peak demand, supplies from sources other than normal suppliers are used to reduce demand on the system, e.g., LNG (liquefied natural gas) peak shaving facilities or storage from a salt cavern. Periods during the day when energy consumption is highest. The introduction of additional gas to cover this demand is known as Peak Shaving.

PEARL = ОБОРОТНЫЙ ТРИКОТАЖ (или ДВУХИЗНАНОЧНЫЙ ТОВАР, или ВЫШИВАЛЬНАЯ БУМАГА) – Pearl or Purl:- a stitch made by bringing needle out across thread so as to hold it. See also Purl (2). / Двухизнаночный Товар в трикотажном производстве.

PEARL = XX (или ЖЕМЧУЖНЫЙ, или СВЕТЛО–СЕРОЕ) – Pearl:- a nearly neutral slightly bluish medium gray.

PEARLESCENT = ПЕРЛЕСЦЕНТНОЕ (или С ЖЕМЧУЖНЫМ БЛЕСКОМ) – Pearlescent:- a colorant exhibiting various colors depending on the angles of illumination and viewing, as observed in mother-of-pearl.

PEARL GRAY = XX (или ЖЕМЧУЖНО–СЕРЫЙ) – Pearl Gray:- a yellowish to light gray; a pale blue.

PEASANT COMBS = КРЕСТЬЯНСКИЕ ГРЕБНИ – Peasant Combs are the single-pitch and 2-pitch hand combs used to produce a semi-worsted fiber preparation.

PEAT = ТОРФ – Peat is a mass of recently accumulated to partially carbonized plant debris. Peat is an organic sediment. Burial, compaction and coalification will transform it into coal, a rock. It has a carbon content of less than 60% on a dry ash-free basis. Peat is an organic fuel consisting of a light, spongy material formed in temperate humid environments by the accumulation and partial decomposition of vegetable remains under conditions of deficient drainage. Vast beds occur in Europe, North America, and northern Asia but are worked only where coal is deficient. Dried peat burns readily with a smoky flame and a characteristic odor. The ash is powdery and light, except in certain varieties that have a high content of sand and other inorganic matter. Peat is used for domestic heating purposes and forms a fuel suitable for boiler firing in either briquetted or pulverized form; it also has been used in gas producers. In Ireland millions of tons of peat are consumed annually; Russia, Sweden, Germany, and Denmark also produce and use considerable quantities, and peat is used locally in England and Scotland. Peat is usually hand cut, although progress has been made in the excavation and spreading of peat by mechanical methods. Peat is cut by spade in the form of blocks, which are spread out to dry (peat in its natural state contains 90 to 95 percent water); when dry, these blocks weigh from three-quarters of a pound to two pounds each. In one method of mechanized winning, a dredger or excavator digs the peat from the drained bog and delivers it to a macerator, which extrudes the peat pulp through a rectangular opening; the pulp is then cut into blocks, which are spread to dry. Maceration promotes drying and tends to yield more uniform shrinkage and a denser and tougher fuel. Hydraulic excavating can also be used, particularly in bogs that contain roots and tree trunks. The peat is washed down by a high-pressure water jet, and the pulp runs to a sump. There, after slight maceration, it is pumped to a draining ground in a layer about 230 mm (9 inches) thick, which after partial drying is cut up and then dried further. Peat deposition is the first step in the formation of coal. The humid climate of the Carboniferous Period (360 to 286 million years ago), which favoured the growth of huge tropical seed ferns and giant nonflowering trees, created the vast swamp areas that constitute the coal beds of today. As the plants died and fell into the boggy waters, which excluded oxygen and killed bacteria, they partially decomposed but did not rot away. The vegetation was changed into peat, some of which was brown and spongy, some black and compact, depending on the degree of decomposition. The sea advanced and withdrew over such deposits, and new sediments were laid down. Under pressure the peat dried and hardened to become low-grade coal, or lignite; further pressure and time created bituminous coal; and even more extreme pressures created anthracite. / Под Торфом, от Немецкого слова Torf, понимается горючее полезное ископаемое группы каустобиолитов, образующееся в процессе естественного отмирания и неполного распада болотных растений в условиях избыточного увлажнения и недостаточного доступа воздуха. От почвенных образований торф принято отличать по содержанию в нём органических соединений (не менее 50% по отношению к абсолютно сухой массе). Главные торфообразователи – сфагновые и другие мхи. Встречается в виде залежей (торфяников), представляющих собой напластование одного или нескольких видов торфа. Это – волокнистая (малая степень разложения) или пластичная аморфная (высокая степень разложения) масса светло-бурого, коричневого или землисто-чёрного цвета; влажность (в естественном залегании) 75–95%, зольность (содержание минеральных примесей) 2–18%, максимальная теплота сгорания горючей массы торфа до 24 МДж/кг. Элементарный состав торфа (%):- углерод (50–60), кислород (31–40), водород (4.5–6.5), азот (0.8–2.9) и сера (0.1–1.5). Различают торф верховой, низинный и переходный. Торф используют в качестве топлива, удобрений, подстилочного и теплоизоляционного материала, для полукоксования и так далее. В 1979 мировые запасы торфа оценивались в 267 миллиардов тонн.

PEATLAND = ТОРФЯНИК – Peatland is a generic terms for any peat-accumulating wetland. Bogs and fens belong to a major class of wetlands called Peatlands, Moors, or Mires, which occur throughout much of the boreal zone of the world. Bogs and fens are distributed in cold temperate climates, mostly in the Northern Hemisphere. There, ample precipitation and high humidity from maritime influences, combined with low evapotranspiration, lead to moisture accumulation. Bogs are acid peat deposits that generally have a high water table (the upper surface of groundwater) but no significant inflow or outflow of streams. Because of their low pH, they support acidophilic (acid-loving) vegetation, particularly mosses. Fens are open wetland systems that generally receive some drainage from surrounding mineral soils and are often covered by grasses, sedges, or reeds. Extensive areas of bogs and fens occur in Finland, Eastern Europe, Western Siberia, Alaska, Canada (especially Labrador), and the north-central United States. Canada has approximately 1.3 million square kilometers of peatlands, making it the largest resource for peat in the world. In the United States, bogs and fens usually develop in basins scoured out by the Pleistocene glaciers and are clustered primarily around the Great Lakes region and in Maine. See also Gog, Fen, Marsh, and Swamp. / Под Торфяником понимается природное образование, состоящее из живого слоя современных влаголюбивых Растений-торфообразователей и торфяной залежи.

PEAT SOIL = ТОРФЯНАЯ ПОЧВА – Peat Soil is an organic soil consisting largely of undecomposed or only slightly decomposed organic matter accumulated under conditions of excessive moisture. / Под Торфяными Почвами или Болотными Торфяными Почвами или Торфяно-Болотными Почвами понимается группа почвенных типов, формирующихся в условияхизбыточного увлажнения атмосферными, застойными пресными и слабопроточными в той или иной степени минерализованными грунтовыми водами. Торфяные почвы – это верхняя часть торфяных залежей болот. Образуются под специфической влаголюбивой растительностью. Распространены в основном в умеренном поясе Северного полушария. Основной характерный процесс для торфяных почв – начальные стадии торфообразования (накопление полуразложившихся растительных остатков); при нарастании новых слоёв торфяной почвы нижние слои её становятся биологически менее активными, в них резко уменьшается количество микроорганизмов, почва теряет своё эффективное плодородие и превращается в торфогенную породу. Нижняя граница торфяной почвы приблизительно совпадает с глубиной, до которой в летний период опускаются почвенные воды (от 30 до 50–60 сантиметров, иногда глубже). Торфяная почва отличается от нижележащей породы более высоким коэффициентом фильтрации и лучшей водопроницаемостью. Среди торфяных почв различают два типа:- торфяные верховые (болотные верховые) и торфяные низинные (болотные низинные почвы). Верховые торфяные почвы формируются в условиях увлажнения атмосферными осадками. Характерная для этих почв растительность:- сфагновые Мхи, сильноугнетённые Сосна, реже Ель, Багульник, Кассандра, Голубика, Морошка, Клюква, Шейхцерия и Пушица. Почвы имеют сильнокислую реакцию (pH 2.5–3.6), низкую зольность (2.4–6.5%), очень высокую влагоёмкость (от 700 до 2 000% на сухую навеску и выше), объёмный вес 0.10–0.15. Низинные торфяные почвы формируются в условиях питания богатыми подземными и поверхностно-сточными водами. На этих почвах произрастает евтрофная растительность. Характерные растения:- Осоки, гипновые и сфагновые Мхи, Тростники, кустарники, деревья (Берёза, Ель, Сосна). Реакция низинных торфяных почв слабокислая или нейтральная. Зольность от 6–12% в нормальнозольных до 30–50% в многозольных торфяных почвах. Влагоёмкость 500–700% на сухую навеску, объёмная масса 0.15–0.20.

PEAU DE SOIE = ПО ДЁ СУА (или КОЖА ИЗ ШЁЛКА) – Peau de Soie (also called Duchess Satin):- French for ‘skin of silk’, Peau de Soie is a stout, soft silk with fine cross ribs. A medium weight fabric with satiny finish, it looks like Charmeuse, but Peau de Soie has a moderately stiff drape. Used in evening wear, bridal gowns, and elegant dresses. Sews easily, but pins and needles leave marks. Peau De Soie is a heavy twill weave drapeable satin fabric, made of silk or a manufactured fiber, and used for bridal gowns and

eveningwear. Peau De Soie:- soft, satin-face, good quality cloth. It has a dull lustre. Has a grainy appearance, and is a characteristic in the cloth which may have a single or double face construction. Fine close ribs are seen in the filling direction. With the best grades, the fabric can be used on either side. Lower qualities are finished on one side only. Name means 'skin of silk'. Some cloth sold as peau de soie is really a delustered satin. It doesn't have the grainy appearance. Because of crosswise rib, fabric difficult to ease. Also sold as 'Delustered Satin'. Peau De Soie is a heavyweight, soft satin of silk or manufactured fiber with a fine cross rib and a dull luster. The term is French for 'skin of silk'. / в направлении уточины. Шамис (Charmeuse). По дё Суа – плотная шёлковая ткань, с цветочным рисунком или гладкая.

PEBBLE EFFECT = ЗЕРНИСТЫЙ ЭФФЕКТ (или ШЕРОХОВАТЫЙ ЭФФЕКТ, или XX) – Pebble Effect:- fabric with a rough, granite-like, irregular or pebble effect on the face of the fabric. Most often, the fabric is some type of crêpe fabric.

PEBBLE–WEAVE FABRIC = ТКАНЬ ГАЛЬКОВОГО ПЕРЕПЛЕТЕНИЯ – Pebble-Weave Fabric is a fabric with an irregular or rough surface texture formed by either a special weave or by the use of highly twisted yarns that shrink when they are wet.

PEC = PREDICTED ENVIRONMENTAL CONCENTRATION

PEC = PRESIDENT'S EXPORT COUNCIL

PECE = ПИСИ – Pece:- post-chlorinated vinyl chloride polymer. The post-chlorination process increases chlorine content form 57% to 64%. The resulting polymer is soluble in acetone and can be wet spun. / Pe-Ce Fiber = хлорин – синтетическое волокно, полученное на базе хлорвинила.

PECEGE = PROGRAMME OF CONTINUING EDUCATION IN ECONOMICS AND MANAGEMENT

PECK KERNELS = КРАПЛЁНАЯ ЗЕРНОВКА (или ПОКЛЁВАННАЯ ЗЕРНОВКА, или ИЗЪЕДЕННАЯ ЗЕРНОВКА, или КРАПЛЁНЫЕ ЯДРА, или ИЗЪЕДЕННЫЕ ЯДРА, или НАДКЛЁВАННАЯ ЗЕРНОВКА) – Peck Kernels mean parboiled Rice kernels that have obviously black or dark brown area on the kernels not reaching 2.5 parts. / Под Краплёной Зерновкой подразумевается зерновка (ядра) пропаренного Риса, которая имеет на своей поверхности чётко выраженную зону чёрного или тёмнокоричневого цвета, не превышающую в размере 2.5 части данной зерновки.

PEC/PNEC RATIO = СООТНОШЕНИЕ ОКОС/ОБК – The PEC/PNEC Ratio is used as an indicator of risk and is called the Risk Quotient (RQ):- (i) 1 (i.e. PEC < PNEC):- PEC is less than PNEC, so no adverse effects are anticipated. The substance can be used. (ii) Environmental Risk Assessment (ERA) is a tiered process that progresses from using screening-level tests and conservative assumptions to increasingly more realistic experiments paired with more realistic assumptions. PEC/PNEC Ratio is:- (i) if < 1 then no risk (for the environment); and (ii) if > 1 then there is a risk (which has to be managed). Predicted Environmental Concentration (PEC) is the estimated concentration of a chemical in an environmental compartment calculated from available information on its properties, its use and discharge patterns, and the quantities involved. Predicted No-Effect Concentration (PNEC) is an ecotoxicological measure for multiple species systems. It can be defined as the concentration below which a specified percentage of species in an ecosystem are expected to be protected. Predicted Environmental Concentration (PEC) – wich is the concentration one expects to find in the environment. Predicted No Effect Concentration (PNEC) – that is, the concentration that causes no adverse effect to the Environment. If the ratio is less than 1 the substance is considered to present no risk to the environment in a given scenario. / Ориентировочная (или Расчётная) Концентрация в Окружающей Среде (ОКОС; Predicted Environmental Concentration (PEC)) / Ориентировочная (или Расчётная) Ориентировочная Безопасная (Не оказывающая Воздействия) Концентрация (ОБК; Predicted No Effect Concentration (PNEC)).

PECTIN = ПЕКТИН – Pectin is complex carbohydrates derived from poly-galacturonic acid, present in inter-cellular substances (middle lamella) and cell walls. Pectins may be divided into the three general types:- protopectin, pectin and pectic acid. / :- протопектин (protopectin), пектин (pectin) и пектиновая кислота (pectic acid). Под Пектиновыми Веществами, от Греческого слова Pēktós, означающее Замёрзший или Свернувшийся, понимаются полисахариды, образованные остатками главным образом галактуроновой кислоты. Присутствуют во всех наземных растениях (особенно много в плодах) и в некоторых водорослях. Способствуют поддержанию в тканях тургора, повышают засухоустойчивость растений, устойчивость овощей и плодов при хранении. Используются в пищевой и фармацевтической промышленности как студнеобразующие вещества. Получают пектиновые вещества из яблочных выжимок, жома сахарной свёклы и тому подобного.

PECTINATE = ГРЕБЕНЧАТОЕ (или НАПОМИНАЮЩЕЕ ГРЕБЕНЬ) – Pectinate:- comb-like- often used to refer to species in which the spines (or other structures) are spread out like the teeth of a comb.

PECTINOPHORA GOSSYPIELLA = ПЭКТИНОФОРА ГОССИПИЭЛЛА (или ХЛОПКОВАЯ МОЛЬ) – Pectinophora Gossypiella (Saunders):- The Pink Bollworm life cycle includes four stages. These are the egg, larva, pupa, and adult. The time required from egg to egg varies because of temperature and other conditions but generally is about one month during the summer months. Egg:- Female Pink Bollworm moths lay eggs singly or, more commonly, in small groups. Eggs are white when first laid but then turn orange, and later the larval head capsule is visible prior to hatching. The eggs are small and difficult to see without some magnification. Eggs hatch in about three to four days after they are laid. Eggs of the first field generation in the spring are often laid on vegetative Cotton plants near Cotton squares and sometimes on squares. Second and subsequent generation eggs are usually laid under the calyx of bolls. Larva:- Larvae immediately begin to bore into squares or bolls after hatching. In squares, larvae complete most of their development before blossoming occurs and often cause rosetted blooms. Final development is completed in the blossom. In bolls, larvae feed within one to five seeds to complete development before exiting and dropping to the soil for pupation. While moving from seed to seed, the larva causes damage by cutting through the lint with its mouthparts. Lint is also damaged as the larva tunnels out of the boll. Larvae are white with a brown head when they hatch. They have four stages of growth (instars) and begin to turn pink in the fourth instar. They generally require 12–15 days to complete development after which they go into pupation. Pupa:- It is in pupation that the Pink Bollworm makes the drastic transformation from a larva to an adult moth. Most pupation occurs in the top layer of soil beneath Cotton plants. The pupa is brown and approximately one-half inch long. It does not feed or move about during the pupal period of seven to eight days. Adult:- Adult Pink Bollworms are mottled brown to gray moths and are about onehalf inch long. They emerge from pupae in an approximately 1:1 male to female ratio. There is a time period of two to three days after emergence during which the female mates and prepares to lay eggs. After this preoviposition period the female lays most of her eggs in about ten days. Both male and female adults feed primarily on nectaries located on the bottom of Cotton leaves and may live for one to two months. The female produces a sex pheromone that aids the male in locating her for mating purposes. Pink Bollworm Seasonal Cycle:- Understanding the seasonal cycle of this Pest Species is key to exploiting cultural control techniques which can be responsible for season long control of the Pink Bollworm. The seasonal cycle is intimately tied to the cultivation of our Cotton crop, because domestic Cotton is the only host through most of the Pink Bollworm's range. Winter:- The Pink Bollworm overwinters as a fully developed larva (fourth instar). During this period the Pink Bollworm is in a state of arrested development called Diapause. The larva often spins a loose, silken web or cocoon in which it

remains until the late winter and spring. Overwintering larvae may be found in bolls in the soil or on Plants which remain unplowed through the winter. Often times the larvae may be found within the hollowed out seeds of undestroyed bolls. The larvae may also be found directly in the soil outside of seeds or bolls. In Arizona and southern California, about 50% of diapausing larvae live through the winter in the silken cocoons in the top two to three inches of soil while the other 50% remain in whole or fragmented bolls and squares. Most overwintering occurs in the Cotton field, although some may occur wherever Cotton debris is deposited. Spring:- Once diapause is completed, the larva begins to respond to temperature and moisture conditions and ultimately pupates in the spring. Though moths may be captured virtually any month of the year, most adults will emerge from pupae within the soil in the spring. Adults must navigate through the cracking soil in order to emerge, dry their wings, and start the first field generation. Adults move about searching for Cotton and are capable of travelling long distances in order to reach susceptible Cotton. Most flight occurs at night (especially midnight to 3 a.m.) when temperatures and wind conditions are moderate (i.e. >50 °F and <10 mph). Mating occurs, and a gravid female must lay most of her eggs in about 10 days after emerging. Squares which are capable of supporting Pink Bollworm larvae are deemed susceptible. This condition occurs when the sepals first part and the white petals become visible. Usually this corresponds to a 10-day old square. Up to this point of Cotton development, Pink Bollworms cannot successfully colonize Cotton and will perish. This is termed 'Suicidal Emergence'. Thus, adult moths that emerge about ten days or more prior to susceptible square die without contributing to the first field generation. Larvae from eggs laid on susceptible squares feed inside the squares and often cause rosetted blooms. Rosetted blooms are flowers which have had their petals tied together with silk by the developing larva. Most of the feeding at this stage is concentrated on the developing pollen grains and other floral parts. This can interfere with the proper development of the new boll. Occasionally, the larva can travel to the bottom of the flower and begin feeding at the tip of the newly developing boll. Summer:- Fully developed larvae drop to the soil and pupate for seven to eight days before emerging as second generation moths. Each generation during the summer takes about 750 heat units (base 55/86 °F). This period is roughly equivalent to about one month in the low deserts. Depending on local conditions, Pink Bollworms are capable of passing through from one to four summer generations. The greater the number of generations that are possible for an area or allowed for by production decisions, the greater the chance is that damaging numbers will build-up. Once present on the plant, bolls become the preferred egg-laying site and feeding medium for the larvae. Fall:- Some larvae begin to prepare for winter diapause in late August, and this diapause accelerates rapidly after mid-September as daylengths begin to shorten. Diapause is caused primarily by shorter days (reduced photoperiod) and lower temperatures (≤70 °F), and therefore it predictably occurs at about the same time each year. A reducing percentage of Pink Bollworms continue to re-cycle throughout the fall months, and they can cause late season infestations. Limiting the number of small green bolls present after mid-September can drastically reduce the number of sites for Pink Bollworm re-cycling and overwintering. By late fall, if bolls are present, it is not unusual to have multiple larvae per boll present. These latest bolls on the top of the plant are generally immature, have poor lint characteristics, and contribute little or nothing to yield. Pectinophora Gossypiella (Saunders):- this destructive pest bores into the flowers or bolls of Cotton. The name comes from the pinkish larva of a dark brown moth. See also Pink Bollworm. Pectinophora Gossypiella (Saunders):- Taxonomic Placing:- Insecta, Holometabola, Lepidoptera, Gelechiidae. Common name:- Pink Bollworm. Geographical Distribution:- The Pink Bollworm is of South-Asian origin, and has spread to all regions where cotton is cultivated (CIE Map #13, 1990 revised). Host Plants:- Cotton and other members of the Family Malvaceae, especially Hibiscus Spp.. Morphology:- The adult Moth is brown-grey, its forewings bear transverse dark stripes, the hindwings are silvery and the body is about 0.6–0.8 cm in length. The fully grown larva is pink, about 1.0–1.2 mm long, with a black head and segmental protuberances that bear small setae. Life Cycle:- Adults fly at night, placing their eggs (about 500/female), singly or in small groups, all over the Cotton Plant, preferring the buds and flowers. The larvae penetrate into buds, flowers, squares and especially bolls wherein they develop in a few weeks, boring an exit hole at maturation. In summer development is continuous, a generation requiring about 4–7 weeks. Towards autumn the larvae enter a prepupal diapause, remaining in this state during winter, either hidden in the soil, within unpicked bolls or inside stored seeds. Some larvae have a prolonged (for as long as 30 months) diapause. They pupate in the spring, the emerging adults initiating the first generation, most of whose members die due to the lack of suitable host plants. The surviving females lay eggs on adventitious or bi-annual Cotton, and their descendants form the second, more harmful pest generation. Economic Importance:- The Pink Bollworm is a major Pest of Cotton. Early in the spring the newly-emerged larvae penetrate into buds and flowers, while later in the season they attack the bolls as they become available. A single larva can destroy several buds and flowers as well as 2–3 bolls, eating the seeds and spoiling the lint. Total damage may reach 20–50% of the yield. In the Middle East the Bollworm is of special importance in Israel, Syria and Turkey. Management:- Monitoring:- Trap-monitoring with 'Gossyplure', an artificial pheromone formulation, is initiated as soon as the Cotton Plants emerge, and no later than at the formation of the first squares. In Israel, traps (each placed within a 'sampling unit' of 10 acres) are arranged along the Eastern border of the field. This is because the adults are mostly active at night, when winds blow from the east. The traps should be positioned above the plants' apices, and raised as they grow. Trapping of 8 Insects/night through the main flowering period requires an immediate chemical treatment, whereas during boll maturation the trigger for a spray rises to 12 Insects per night. Cultural Control:- Threshing and thoroughly burying all plant remains after Cotton picking is recommended for Pink Bollworm control. Adventitious Cotton Plants growing around commercial fields and any harvested cotton remains lying by roadsides should also be destroyed. Other cultural methods include killing the larvae within seeds or lint bales by heating to about 60 °C. Mass trapping with long-lived pheromone traps has been used to control the Pink Bollworm in Brazil. Early-fruiting Cotton Cultivars are being tried as trap crops for the pest, as are sprays of kaolin dust films. The latter are more effective if applied along with pyrethroids. Chemical Control:- Organophosphates were used in the past to control the pest, whereas pyrethroids are more common now. The pesticides should be applied as soon as the Bollworm is found in the pheromone traps, because the chemicals do not affect the pest after it had penetrated into the boll. Genetically Modified Cotton:- The use of modified Bt Cotton, which expresses toxins from Bacillus Thuringiensis (Bt), has reduced the need for pesticides and may enable the long-term suppression of the Pink Bollworm. Such suppression is now threatened by pest strains that show resistance to Bt Cotton. Biological Control:- Only few natural enemies of the Pink Bollworm are known, and none seem to have any controlling effect. / Пэктинофора Госсипиэлла или Хлопковая Моль:- этот пагубный Вредитель пробирается в цветки или коробочки Хлопчатника. Название произошло от розоватой гусеницы – червеобразной личинки (wormlike larva) – тёмно-коричневой бабочки. Смотрите также Розовый Коробочный Червь (Pink Bollworm). Пэктинофора Госсипиэлла (Сондэз) или Хлопковая Моль (Pectinophora Gossypiella; по классификации Британского страхового брокера, энтомолога и ботаника Вилъйэма Вилсэна Сондэза (William Wilson Saunders; 1809–1879)), бабочка Семейства Выемчатокрылых Молей (Lepidoptera Gelechiidae Family), опасный Вредитель Хлопчатника, а также Бамии (Okra), Гибискуса (Hibiscus), Кенафа (Kenaf) и других Растений Семейства Мальвовых (Malvaceae Family). Распространена в Афганистане, Греции, Индии, Иране, Италии, Китае, Корее, Турции, Японии и других хлопкосеющих странах. В бывшем Союзе Советских Социалистических Республик (СССР) отсутствовала и была объектом внешнего карантина. Хлопковая Моль даёт 2–6 поколений в год. Бабочки откладывают яйца (до 500 штук) на бутоны, коробочки, листовые почки, листья, стебли Хлопчатника и других Растений. Гусеницы повреждают генеративные органы Хлопчатника, в результате чего опадают бутоны и цветки, усыхают и опадают зелёные коробочки; в сформировавшихся коробочках загрязняют выделениями волокно, которое становится непригодным для текстильной промышленности. От Хлопковой Моли ежегодно может погибать 20–80% урожая Хлопчатника. Меры борьбы:- запрещение ввоза в страну заражённых семян и

продукции Мальвовых; уничтожение гусениц в семенах, хлопке, отходах методом фумигации, на посевах – инсектицидами; уничтожение послеуборочных отходов; вылавливание бабочек светоловушками; применение хемостерилизаторов Насекомых.

PED = PIN ENTRY DEVICE

PEDAL PUSHERS = ХХ (или БРИДЖИ, или ПЕДАЛЬНЫЕ ТОЛКАТЕЛИ) – Pedal Pushers are the women's and girls' calf-length trousers. / женские и девичьи брюки длиной до икр.

PEDIATRIC AIR TRANSPORT = ПЕДИАТРИЧЕСКИЙ АВИАТРАНСПОРТ (или ПЕДИАТРИЧЕСКАЯ ВОЗДУШНАЯ ПЕРЕВОЗКА) – Pediatric Air Transport deals with the medical air transport of infants, children, and adolescents and describes the type of transport a company provides. Pediatric air transport companies specialize in providing pediatric air ambulance service. Air Ambulance companies must be specifically licensed to provide pediatric air transport service. Air Ambulance Network has been providing pediatric air transport services since 1971. Pediatric air transport describes the type of transport a company provides. Pediatric air transport companies specialize in providing air ambulance service. They must be specifically licensed to provide air medical transports. Air Ambulance Network has been a pediatric air transport company since 1971. We use fixed wing aircraft that has been designed to transport pediatric patients in need of a pediatric air transport. These fixed wing medical pediatric air transport are medically configured with a stretcher, oxygen, and a critically trained medical air transport team. Pediatric air transport companies use an array of business size aircraft in providing pediatric air transports, such as twin engine, turbo prop and jet aircraft. For most long distance medical transports, a jet is used. Typically, the Lear Jet is the workhorse of pediatric air transport companies. Air Ambulance Network only uses critically licensed medical pediatric air transport team members. Air Ambulance Network's pediatric air transport provides rapid transport of seriously injured pediatric patients to a medical facility. Most patients transported by pediatric air transport are taken to a hospital. Quite frequently the pediatric air transport service is also referred to as Medflights, Medical Flights, Aeromed Flights, Aeromedical, Lifeguards, Care Flight, Critical Care Medflights, Advanced Air Ambulances, medavacs or jet rescue /Air ICU (intensive care unit). Air Ambulance Network has provided pediatric air transport since 1971. Since 1971, Air Ambulance Network has been providing pediatric air transport services. Air Ambulance Network is one of the first pediatric air transport providers and has led the industry ever since it inception. Today, Air Ambulance Network is a leader in the pediatric air transport industry.

PEDICEL = ЦВЕТОНОЖКА – Pedicel is the short stalk connecting a flower to the main stem of a Plant or branches of its inflorescence. Hence:- Adj. pedicellate – with stalks. The stalk of an individual flower or boll. Pedicel is the stalk supporting a spikelet on the panicle branch. Pedicel (syn. Foot Stalk, and Peduncle) is the stalk supporting a spikelet on the panicle branch. The distal end appears as a lobed cup, representing two rudimentary glumes (facet). / Стебелёк (ножка) отдельного цветка или коробочки. Под Цветоножкой понимается часть стебля непосредственно под цветком; безлистная или несущая 1–2 прицветника.

PEDIGREE = ПЕДИГРИ (или РОДОСЛОВНАЯ) – Pedigree is the ancestral history of an individual or family. / Под Родословной понимается перечень поколений одного рода, устанавливающий происхождение и степени родства.

PEDIGREE METHOD = МЕТОД ПЕДИГРИ (разведение) – Pedigree Method (breeding) is a system of breeding in which individual plants are selected in the segregating generations from a cross on the basis of their desirability judged individually and on the basis of a pedigree record.

PEDIGREE RECORD = ПЛЕМЕННОЙ УЧЁТ (или УЧЁТ РОДОСЛОВНОЙ) – Pedigree Record is a record of the relationships of the varieties or family lines grown and their distinguishing characteristics.

PEDUNCLE = НОЖКА (или ЦВЕТОНОЖКА, или ПЛОДОНОЖКА, или СТЕБЕЛЁК) – Peduncle is:- (1) the stalk bearing the entire inflorescence or a solitary flower. (2) Main stalk of the panicle. / (1) или отдельно растущий цветок. (2) . Под Цветоножкой понимается часть стебля непосредственно под цветком; безлистная или несущая 1–2 прицветника.

PEDv = PORCINE EPIDEMIC DIARRHOEA VIRUS

PEEK FIBER = POLYETHERETHERKETONE FIBER

PEEL ADHESION = АДГЕЗИЯ КОЖИЦЫ – Peel Adhesion:- the force required to delaminate a structure or to separate the surface layer from a substrate. Peel adhesion is the usual measure of the strength of the bond between fiber reinforcements and rubber in tires and other mechanical rubber goods.

PEEL DISCOLORATION = ИЗМЕНЕНИЕ ЦВЕТА КОЖИЦЫ – Peel Discoloration is a chilling damage in citrus fruit.

PEELER = ХХ (или ПИЛЁ) – In beaming, Peeler is a defect caused by a portion of an end sticking or remaining on the beam, causing the filament to strip back or peel until it is broken. Although they are often associated with ringers, peelers are not necessarily defects that will circle the beams. / При перевивке основы на ткацкий навой (beaming), .

PEEM = PANEL OF EXPERTS ON ENVIRONMENTAL MANAGEMENT FRO VECTOR CONTROL

PEEP–TOE PUMP = ПИП–ТЧО ПАМП (или ХХ) – Peep-Toe Pump is a type of shoe. The peep-toe is a subtle variation of the everyday pump with a cutaway at the front that reveals the toes.

PEFCO = PRIVATE EXPORT FUNDING CORPORATION

PEG = POLYETHYLENE GLYCOL

PEGGED PRICE = ЗАМОРОЖЕННАЯ ЦЕНА – Pegged Price is the price at which a commodity has been fixed by agreement. / Цена сырья, которая была зафиксирована соглашением.

PEGGING = ЗАМОРАЖИВАНИЕ (или ИСКУССТВЕННОЕ ПОДДЕРЖАНИЕ) – (1) Pegging:- effecting commodity transactions to prevent a decline in the price of the commodity so that previously written put options will expire worthless, thus protecting premiums previously received. Effecting transactions in an instrument underlying an option to prevent a decline in the price of the instrument shortly prior to the option's expiration date so that previously written put options will expire worthless, thus protecting premiums previously received. See also Capping.

(2) Pegging is a finishing process for velveteen consisting of applying friction with blocks of wood or soapstone to impart a gloss or sheen to the fabric.

PEGGING JETS = ХХ – Pegging Jets is a technique for freeing a plugged hole in a spinneret by rubbing the face with a piece of wood. Use of the technique has been discouraged because of damage to the spinneret. / протирание или притирка (rubbing).

PEG RATIO = PROSPECTIVE EARNINGS GROWTH RATIO

PEG TOP = БРЮКИ ГАЛИФЕ (или ТРУСЫ, или КУБАРЬ, или ВОЛЧОК) – Peg Top:- peg trousers.

PEI FIBER = POLYETHERIMIDE FIBER

PEIGNOIR = ПЭНЮАР (или ПЕНЬЮАР) – Peignoir is a woman's loose negligee or dressing gown. / .

PELERINE = ПЕЛЕРИН (или ПЕЛЕРИНА) – Pelerine is a device for transferring stitches from the cylinder to the dial or vice versa on a circular-knitting machine.

PÈLERINE = ПЕЛЕРИН (или ПЕЛЕРИНА, или НАКИДКА) – Pèlerine is a woman's narrow cape made of fabric or fur and usually with long ends hanging down in front. / .

PELISSE = ПЁЛИСС (или ШУБА) – Pelisse is a long cloak or coat made of fur or lined or trimmed with fur; a woman's loose lightweight cloak with wide collar and fur trimming. / Гусарская венгерка, отороченная каракулем.

PELLETS = ГРАНУЛЫ (или ПЕЛЛЕТЫ) – Pellets are agglomerated feed formed by compacting and forcing through die openings by a mechanical process. Similar terms:- Pelleted Feed, Hard Pellet. / Гранулированный (Pelleted).

PELT = ШКУРА (или ШКУРКА) – Pelt is the skin from a slaughtered sheep before the wool on it has been pulled or processed into a sheepskin. See also Hide, Leather, and Skin. Pelt is a sheep skin with the wool attached. / Шкура – овечья кожа с волосяным (шерстяным) покровом. Под Шкурой или Шкуркой понимается снятая с туши или трупа животного кожа с волосяным (шёрстным) покровом. Используется как кожевенное и меховое сырьё. Строение шкуры, её химический состав, качество волосяного покрова зависят от вида, породы, пола и возраста животных, качества их кормления, условий содержания, сезона убоя. Шкура состоит из 3 основных слоёв:- эпидермиса (0.5–4.0% толщины шкуры), дермы (до 84%) и подкожной клетчатки. При выработке кожи используют дерму; подкожную клетчатку и эпидермис с волосяным покровом удаляют. При выработке меха удаляют только подкожную клетчатку. Производственное назначение и товарная ценность шкуры определяются еёстроением, толщиной, плотностью, прочностью, состоянием волосяного покрова, характером и числом повреждений (пороков). Основное сырьё для кожевенного производства – шкуры крупного рогатого скота, лошадей, свиней, коз, а также шкуры грубошёрстных овец, не пригодные для шубного производства; в небольшом количестве используются шкуры диких копытных животных (лосей, оленей и других). В шубном производстве применяются шкуры овец, телят, жеребят, коз, оленей, кроликов и других животных. Шкуры диких и клеточных пушных зверей (белки, соболя, лисицы, песца, норки, хорька и других) называют Пушниной. Снятая с животного (парная) шкура содержит от 50 до 70% воды, 2–10% жира (в овчине больше), 20–30% (от сухого вещества) белков, некоторое количество полисахаридов и минеральных веществ. По прочности и морфологическому строению части шкур неодинаковы. Наибольшая плотность в средней части шкуры (Чепрак), наименьшая – в области паха (Пашина). При хорошем кормлении (особенно при пастбищном содержании) шкура животных плотная, эластичная, при недостаточном кормлении – тонкая, сухая и грубая. Рыхлой становится шкура животных, длительное время находившихся в тесных стойлах без доступа свежего воздуха, а также у крупного рогатого, откормленного на жоме или барде. Качество шкур снижается при содержании животных в грязных помещениях. Для предотвращения порчи шкуры немедленно после снятия очищают от загрязнений, жира и мяса, промывают и консервируют. Применяют несколько способов консервирования:- мокросолёный, сухосолёный, кислотно-солевой, пресно-сухой, пикельный, квашение, замораживание. В кожевенном производстве наиболее распространённый способ консервирования шкур – мокросоление; пушно-меховое сырьё консервируют пресно-сухим и сухосолёным способами, овчины – кислотно-солевым, каракуль – квашением. Основной консервант – поваренная соль. Для усиления консервирующих свойств применяют антисептики – парадихлорбензол, нафталин. В зависимости от вида, возраста животного и массы шкур кожевенное сырьё делят на мелкое, крупное и свиное. К мелкому относят шкуры:- неродившихся или мёртворождённых телят и жеребят (Склизок); телят с первичной нелинявшей шерстью (Опоек), с переходной при линьке шерстью (Выросток); жеребят-сосунов и перешедших на подножный корм (Жеребок); конского молодняка (Выметка), а также шкуры верблюжат, овчину и козлину. Масса этого сырья от 5 до 10 килограммов (кг). К крупному сырью относят шкуру, полученную от молодняка крупного рогатого скота (Полукожник), масса шкуры 10–13 кг; бычков (Бычок) – 13–17 кг; коров (Яловка) – свыше 13 кг; от кастрированных быков (Бычина) – свыше 17 кг; некастрированных быков (Бугай). Оценку качества шкур и определение производственного назначения проводят (в соответствии с ГОСТом (Государственным Стандартом)) органолептически с учётом массы или площади; иногда применяют химические, микробиологические и гистологические методы. Шкура:- История:- ремесло скорняка имеет солидную историю – оно возникло ещё в каменном веке, когда люди только-только перешли от пассивного собирательства к коллективной охоте на крупную дичь. Антропологи до сих пор спорят о том, что послужило толчком к изобретению одежды:- очередное глобальное похолодание или зарождавшиеся понятия о приличиях. Как бы то ни было, потребность прикрывать тело была осознана, и шкуры добытых на охоте животных стали первой одеждой наших далёких предков. Трудно переоценить это поистине революционное изобретение; наряду с каменными орудиями труда, одежда и обувь помогли человечеству сделать первый и очень серьёзный шаг из мира дикой природы к Человеку Разумному. Решив проблему защиты от холода, человек получил огромное преимущество в борьбе за выживание:- он перестал зависеть от климатических условий и смог осваивать и заселять территории, ранее для него недоступные. Чуть позже появление домашних животных и возникновение скотоводства окончательно сняли вопрос с материалом для одежды и обуви и позволили поставить производство шкур 'на поток'. Но сама по себе шкура – это ещё не совсем одежда. Она портится от разлагающего действия бактерий и быстро теряет свои свойства. Для того, чтобы превратить свежеснятую шкуру в одежду, её нужно соответствующим образом обработать. Для обработки требуется не только желание и навык, но и знание определённых правил. Основные правила, или методы, обработки (выделки) шкур были найдены первыми скорняками путём опыта и наблюдений и практически без изменений дошли до нашего времени из глубины веков. Например, растительное дубление было известно как минимум 7 000 лет назад, и уже тогда широко применялось различными культурами. При этом даже в древности подход к изготовлению одежды не был чисто утилитарным. Известно, что, используя вещества растительного и животного происхождения, можно не только обеспечить сохранность меха, сделать кожу эластичной и пригодной к дальнейшему раскрою, но и добиться окрашивания в тот или иной цвет. По некоторым данным, такой вид отделки, как крашение, также был повсеместно распространён уже за 4 000–5 000 лет до Нашей Эры. Разумеется, шкуры недолго оставались единственным доступным сырьём для изготовления одежды. Научившись ткать, человечество нашло альтернативу шкурам животных, и с изобретением ткацкого станка 'первобытные' материалы постепенно стали сдавать свои позиции. Задолго до возникновения текстильной промышленности сукно как материал более дешёвый и технологичный прочно заняло место шкуры животного. В наше время повсеместного истощения природных запасов торжествует химия:- появились сотни видов искусственных тканей, а также искусственный мех и искусственная кожа. Между тем существует область, в которой до сих пор нет равных натуральным коже и меху. В производстве обуви и верхней одежды материал природного происхождения, как и десять тысяч лет назад, сохраняет своё значение. Никакой ватин, никакой синтепон не греют так, как старый добрый овчинный полушубок. Обувь из натуральной кожи также пока остаётся наиболее удобной и долговечной. Для нашего климата дублёнка или меховая шуба – это самая

подходящая одежда. В то же время в России верхняя одежда и головные уборы из натурального меха всегда были не просто средством защиты от холода, но и показателем престижа. Цены на такие изделия намного превосходят возможности среднего покупателя. Как же быть в такой ситуации? Остаётся осваивать самостоятельное производство. Обувь из кожи, если вы только не поклонник мокасин, лучше всё же приобретать фабричного изготовления, зато всё остальное вполне можно изготовить в условиях домашней мастерской. И – кто знает? – возможно, вы настолько войдёте во вкус, что даже решите открыть собственное дело. Первый вопрос, который предстоит решить, касается источников материалов. К счастью, в настоящее время это не проблема – фермерские хозяйства, занимающиеся разведением и забоем овец, а также крупного рогатого скота и свиней, охотно заключают договоры на поставку кожевенного и шубно-мехового сырья. Шкуры Овец Каракульской породы по достаточно приемлемым ценам можно закупить в Казахстане. Кроме того, во многих областях России традиционно развито кролиководство, так называемое частное приусадебное хозяйство способно удовлетворить потребности не самой маленькой фабрики по пошиву головных уборов. Охота на диких животных также не утратила своего значения, как источник сырья – даже в центральных областях России охотятся на Зайца и Лисицу, а в большинстве водоёмов центральной полосы водятся Нутрия и Ондатра. И это ещё не всё. Распространённое сейчас мнение о том, что ценный пушной зверь остался только в Красной Книге, – не более чем заблуждение. Наша страна была и остаётся одним из основных поставщиков пушнины на мировом рынке. Действительно, было время, когда хищническое истребление поставило на грань исчезновения многие Виды, но это время давно в прошлом. Так, ещё в Царской России создание Баргузинского Заповедника на Байкале (в 1916) позволило полностью восстановить популяцию Соболей промыслового значения. В СССР работа по акклиматизации пушных зверей велась основательно и с большим размахом, а результаты этой масштабной работы – одно из немногих достижений, оставленных нам Советской властью. Например, были переселены и успешно прижились на новых местах как местные (Белка, Бобр, Ондатра и Соболь), так и ‘импортные’ Виды животных – Канадская серебристо-чёрная Лисица, Американская Норка, Норвежский голубой Песец, Шиншилла и другие. Разумеется такой ценный ‘стратегический ресурс’, как промысловая пушнина, не остался без внимания крупных государственных, полугосударственных и частных фирм-посредников. В силу удалённости промысловых регионов, строгих квот на отстрел, а также благодаря налаженной системе взаимоотношений между охотохозяйствами и меховыми фабриками, пушнина практически не появляется в свободной продаже на внутреннем рынке – шкурки браконьерской добычи перерабатываются на месте или ‘уходят’ по криминальным каналам, а легально добытый мех поставляется по договорам предприятиям швейной промышленности либо ‘всплывает’ на международных пушных аукционах. Однако это не означает, что скорняк-частник или небольшой кооператив, расположенный в Центрально-Европейский областях России, совсем лишён возможности поработать с ценным сырьём – в настоящее время относительно легко можно приобрести мелкие и средние партии пушнины клеточного разведения. При этом продукция клеточного пушного звероводства доступна не только в Сибири или в Приморском Крае, где расположены наиболее крупные звероводческие хозяйства – благодаря проводившимся ещё в Советском Союзе работам по селекции и акклиматизации пушного зверя, его естественный ареал в значительной мере расширился. Организации различной формы собственности с успехом разводят красную и серебристо-чёрную Лисицу, голубого Песца, Хоря и даже Соболя в не самых привычных для этих пород климатических условиях:- в Подмосковье, в Ленинградской и Новгородской областях, в Поволжье и ещё в ряде регионов. При условии сохранения норм разведения, создания благоприятных условий для физического развития животных, а также соблюдения правильного рациона и проведения племенной работы, продукция небольшого звероводческого хозяйства может даже превосходить по качеству – чистоте и окраске меха, размеру шкурок и тому подобному – пушнину из Центральной Сибири или Якутии. Помимо прочего, этому способствуют и применяемые сейчас кормовые добавки (к примеру, введение в рацион Норки клеточного разведения препаратов элеутерококка позволяет выращивать значительно более крупных зверьков, мех которых соответствует самым строгим мировым стандартам). Из вышесказанного должно быть понятно, что найти материал будет несложно; основной проблемой для начинающего скорняка остаётся не получение сырья, а определение его качества. От того, насколько правильно производилась первичная обработка парной (свежеснятой) шкуры или шкурки, зависит и её стоимость, и товарные свойства. Чтобы не попасть впросак, скорняк должен стать отчасти заготовителем и оценщиком, уметь на глазок определять качество и технологическое предназначение того или иного материала. Приступая к выделке, необходимо ориентироваться в процессах консервации шкур, хорошо знать возможные дефекты кожевенного, шубно-мехового и пушного сырья и иметь чёткое представление о его классификации. Убой животных и съёмка шкур по понятным причинам остались за рамками нашей темы, но всё, что происходит со шкурой с момента её снятия до превращения в изделие, мы постарались описать максимально полно. В том числе подробно рассмотрены вопросы первичной обработки и хранения шкур, способы ‘спасения’ некачественно законсервированных шкур, а также всё, касающееся выделки, обработки и облагораживания полуфабриката. Дана информация о том, как правильно посчитать полезную площадь имеющегося сырья, как отличить каракуль от каракульчи и мерлушку – от смушки. Кроме того, мы расскажем, чем покрасить шубную овчину, подскажем, как точно рассчитать требуемое количество реагентов для разных этапов химической обработки, как из одной меховой шкурки получить две и при этом сохранить исходный рисунок волосяного покрова, как покрасить кролика ‘под котик’ и многое другое. Следуя рекомендациям по раскрою, вы сможете выбрать нужный шов для той или иной кожи, сумеете избежать перерасхода ценной пушнины и с минимальными затратами времени и сил организовать весь цикл скорняжного производства. Составные Части Шкур:- шкура КРС и других домашних животных имеет различные характеристики на разных топографических участках (голова, вороток, лапы, пашины, полы, чепрак и огузок). Это нужно учитывать на всех этапах обработки и выделки шкур. Участки шкуры объединяются по общим признакам (строение и физические свойства кожевой ткани и так далее) и имеют установившиеся обозначения в зависимости от расположения на теле животного:- головная часть, вороток (загривок), чепрачная (хребтовая), часть с входящим в неё огузком, полы (черево) и лапы. Шкуры КРС и шкурки каракуля могут иметь головную часть (снятую с головы животного шкуру лобного участка и обеих щёк, одна из которых примыкает к лобной части). В остальном названия участков практически совпадают с топографическими участками тела животных, только на свиных шкурах чепрачная часть называется Крупоном. В самой шкуре или шкурке выделяют две составные части, резко различающиеся по механическим, физико-химическим свойствам и по технологическому предназначению – (i) кожевую ткань и (ii) волосяной покров. В отличие, например, от шкур КРС, которые используются для выделки кож, шубно-меховое сырьё и пушнина характеризуются ещё и по качеству волосяного покрова, который, как и кожевая ткань, имеет заметные различия признаков на разных участках шкуры. Так, высота волоса (измеряется в его естественном, нерасправленном состоянии) уменьшается от шеи к хребту и от хребта к череву; густота и окраска волосяного покрова также изменяется на разных топографических участках шкурки пушного зверя (шея, загривок, черево, хребет, огузок и хвост):- на хребте и огузке волос наиболее высокий, на череве волосяной покров менее густой. Исключения составляют так называемые ‘полуводные’ Виды пушного зверя (Нутрия и Ондатра), у которых именно на череве мех наиболее густой. Волосяной покров состоит из отдельных шерстяных волокон (волоса), которые могут различаться между собой строением и длиной. От этих признаков зависит то или иное назначение сырья. Например, преобладание грубого остевого волоса в волосяном покрове делает последний непригодным для окрашивания, а однородный волосяной покров с преобладанием более тонких волокон позволяет производить имитацию мехового полуфабриката под ценные виды пушнины. По своему

строению волос подразделяется на несколько морфологических типов:- пуховые волокна, переходные волокна и остевые волокна. Пуховые волокна состоят из основного коркового слоя и тонкой защитной оболочки – чешуйчатого слоя. Остевые волокна, кроме того, имеют ещё и так называемый сердцевинный слой с непрочной пористой структурой. Он состоит из мёртвых ороговевших клеток с включением между ними воздушных прослоек. В переходных волокнах сердцевинный слой развит слабо и по всей длине волоса не представлен. Выделяют также мёртвые и сухие волокна, которые практически целиком состоят из сердцевинного слоя. Различные типы волокон имеют разную толщину, то есть средний диаметр отдельного волоса. Этот показатель называется Тониной Волокна и также позволяет отнести отдельную шкуру к конкретной группе сырья по конечному назначению. Тонина определяется в лабораторных условиях или, при наличии известного опыта, – на глаз. Помимо назначения по характеристиками волосяного покрова (для сгонки волоса и выделки кожи, для производства шубных или меховых изделий), шкуры различают по качеству кожевой ткани. Её основные характеристики – толщина и плотность – важны не только при снятии шкуры, но и на всех остальных этапах:- при первичной обработке, выделке и раскрое. Характеризуя кожевую ткань, часто используют ещё один специальный термин:- Потяжка. Потяжка – способность кожевой ткани растягиваться с последующим сохранением линейных размеров. Толщина и плотность кожевой ткани (и зависящая от них прочность шкуры) самые высокие в районе чепрака и огузка, менее плотная кожа располагается на воротке или – для шубно-мехового сырья – на хребте и загривке. Самая тонкая кожевая ткань расположена на боках и полах (череве). Основные свойства кожевой ткани зависят от её структуры. Кожевая ткань состоит из нескольких связанных между собой слоёв:- (i) Подкожная Клетчатка; (ii) Сетчатый Слой и (iii) Сосочковый Слой, составляющие Дерму; (iv) Эпидермис и (v) Волосяной Покров. Собственно Кожа называется Дермой и имеет смешанное строение. Она состоит из сложного переплетения пучков коллагеновых волокон и незначительного числа расположенных между ними ретикулиновых и эластиновых волокон. Коллагеновые волокна являются основным структурным элементом дермы, их пучки образуют плотную связь и обеспечивают механическую прочность всей кожевой ткани. Ретикулиновые и эластиновые волокна имеют меньшую толщину и не объединяются в пучки, их назначение – придавать коже эластичность и упругость. Пространство между пучками волокон заполнено основным (межволоконным) веществом, состоящим из различных белковых соединений, и клеточными элементами. Кроме волокон и основного вещества, в дерме располагаются потовые и сальные железы, волосяные сумки, мышцы волоса, лимфатические и кровеносные сосуды. По соотношению волокнистых и клеточных элементов в дерме выделяют два слоя (Сетчатый Слой и Сосочковый Слой), граница которых проходит примерно на глубине залегания основной массы волосяных сумок (луковиц волоса). Нижний слой называется Сетчатым Слоем и содержит большую часть структурообразующих волокнистых элементов (пучков коллагеновых волокон), переплетённых между собой наподобие прочной сетки. Верхний слой, называется Сосочковым Слоем, более рыхлый, поскольку на него приходится основная масса всех клеточных элементов, желёз и сосудов. Посредством выступающих бугорков и углублений верхний – сосочковый – слой дермы соединяется с Эпидермисом. Эпидермис состоит из нескольких слоёв эпителиальных клеток и имеет незначительную толщину, однако его сохранение в процессе обработки шубно-мехового сырья чрезвычайно важно, поскольку обеспечивает прочность волосяного покрова. К нижнему – сетчатому – слою дермы в теле животного прилегает подкожная клетчатка, состоящая из переплетения мышечной ткани с эластиновыми и коллагеновыми волокнами и большого количества жировых клеток. В подкожной клетчатке проходят также нервные волокна и кровеносные сосуды, питающие дерму. Снятая по всем правилам шкура имеет с нижней стороны кожевой ткани более или менее толстый слой подкожной клетчатки и соединительной ткани (Мездра), который должен быть полностью удалён в процессе обработки. Наружная сторона кожевой ткани называется Лицевой, а внутренняя Мездряной или – после удаления мездры – Бахтармяной. Мездрой также иногда называют саму кожевую ткань с невыраженным разделением на слои (у животных эмбриональной стадии развития). Говоря о внутренней стороне кожевой ткани снятой шкуры, её так же попросту называют Мездрой или Бахтармой. При выработке кожевенного полуфабриката с лицевой стороны удаляется волосяной покров вместе с эпидермисом, поверхность сосочкового слоя дермы обнажается, после чего готовая кожа приобретает характерный рисунок ‘лица’ – Мерею. Первичная Обработка Шкур:- в зависимости от технологического цикла переработки происходит работа с разным материалом, имеющим различную степень готовности. Например, если предприятие малое и занимается пошивом меховой или кожаной одежды, то ему приходится сталкиваться с Полуфабрикатом – выделанными шкурками и кожами, которые не требуют специальных операций по предварительной обработке. Пушно-Меховой Полуфабрикат или Выделанная Кожа полностью готовы к раскрою и могут представлять собой как отдельные натуральные или крашеные шкурки, так и сшитые из них пластины и полосы (прямоугольные или трапециевидные полотнища) – для меха и пласты геометрической формы – для кожевенного полуфабриката. Если позволяют условия, предпочтительнее брать в свои руки процесс обработки с самого начала. Работать с Сырьём выгоднее не только по экономическим соображениям, но и потому, что, самостоятельно выделывая шкуры, можно получить возможность полностью контролировать весь процесс с соблюдением всех необходимых требований. Сырьём называют законсервированные, но невыделанные шкуры различных животных. В зависимости от своего назначения и основных характеристик, сырьё может быть кожевенным, шубным или меховым. Как правило, мясокомбинаты и скотоубойные пункты животноводческих хозяйств продают шкуры именно в виде сырья (то есть законсервированными). Перед консервацией шкуры подвергаются первичной обработке. Шкуры всех видов домашних животных снимаются пластом (полостью), а шкурки пушного зверя – пластом, что менее предпочтительно, или ‘чулком’ (трубкой), то есть без разрезания по средней линии живота. Разрезают (раскрывают) такую шкурку только перед раскроем. Первичная обработка включает в себя две стадии:- Обрядку (Мездрение) и Промывку. Последняя применяется только для шкур крупного рогатого скота (КРС), свиных и конских шкур, предназначенных для определённого способа консервации. Обрядка состоит в удалении загрязнений с волосяного покрова шкуры, очистке шкур от прирезей мяса или сала и обрезке некондиционных участков. Консервация шкур, то есть их превращение в сырьё для дальнейшей обработки, вызвана необходимостью более или менее длительного хранения шкур перед выделкой. Назначение консервации – обезвоживание шкуры, в результате которого прекращается жизнедеятельность бактерий и ферментивные процессы (саморазложение парной шкуры под действием вырабатываемых в ней ферментов). Существует несколько способов консервации; подробнее о достоинствах и недостатках каждого из них, а также о возможных дефектах консервации будет рассказано далее. Выделка Шкур:- выделка, то есть превращение сырья в полуфабрикат, представляет собой ряд последовательных операций, нацеленных на изменение характеристик той или иной составной части шкуры. (1) Отмока – первая операция технологического цикла выделки. Представляет собой жидкостную обработку сырья с добавлением антисептиков и ряда химикатов, ускоряющих отмоку и облегчающих проникновение рабочего состава во внутренние структуры шкуры. В ходе отмоки осуществляется комплексное воздействие:- из сырья вымываются растворимые белки и консервирующие вещества, а микроструктура кожевой ткани приближается к состоянию парной шкуры за счёт повышения в ней содержания влаги. Сырьё также освобождается от остатков загрязнений и посторонних примесей. (2) Золение – обработка кожевенного сырья, облегчающая удаление волосяного покрова. Состоит в обработке поверхности шкуры смесью извести и сернистого натрия. (3) Пикелевание – основная операция выделки, обеспечивает высокую пластичность и мягкость кожевой ткани. Применяется для подготовки обезволошенного кожевенного сырья (так называемого Голья) к дублению, а также при выделке почти всех видов пушнины и шубно-мехового сырья. Представляет собой

разрыхление волокнистой структуры дермы:- шкуры обрабатывают смесью серной кислоты и нейтральной соли, в результате чего волокна коллагена дробятся и связываются с веществами-пластификаторами. Пикелевание пушнины проводят с добавлением ароматической отдушки, в ряде случаев на этой стадии обработки практикуется добавление в пикельный раствор оптических красителей для улучшения естественной окраски волоса. (4) Квашение – используется в обработке шубно-мехового сырья для той же цели, что и пикелевание. По интенсивности разрыхления наиболее эффективно традиционное хлебное квашение (с использованием овсяной или ячменной муки). Квашение применяется в основном при выделке Белки, Каракуля и Мерлушки. По сравнению с другими способами выделки обеспечивает наиболее высокое качество кожевой ткани и увеличение полезной площади полуфабриката на выходе. В то же время является сложным для контроля и регулирования процесса, требует более длительной обработки. (5) Дубление – процесс, необходимый для скрепления волокнистой структуры дермы. Дубление фиксирует разрыхленное состояние кожевой ткани, повышает устойчивость коллагена к химическим и физическим воздействиям, увеличивает влагостойкость кожевой ткани и предохраняет её от загнивания. После дубления гольё становится полноценной кожей, а при выделке пушно-мехового полуфабриката повышается носкость меха. Для дубления применяются различные дубящие вещества:- соли хрома, алюминия, вещества растительного происхождения. Для последующего отбеливания меха используют формалиновое дубление. Для выделки кролика, меховой овчины и некоторых других видов сырья успешно применяется совмещение этих двух процессов (пикелевание-дубление), в результате чего сокращается цикл обработки при сохранении качества. (6) Жирование – применяется для повышения мягкости и пластичности кожевой ткани шубно-мехового полуфабриката. Жирование снижает кислотность кожевой ткани, придаёт ей прочность, препятствует склеиванию разрыхлённых волокон, увеличивает водоотталкивающие свойства кожи. Для жирования используют минеральные масла или жирующие пасты, синтетические жиры, жиры растительного и животного происхождения. Жирование должно заканчиваться сушкой, проходящей в определённых условиях. (7) Сушка – обеспечивает доведение кожевой ткани и волосяного покрова до оптимального уровня содержания влаги (около 16%). В процессе сушки происходит более прочное связывание дубящих и жирующих материалов. (8) Чёска – распрямление спутанного и удаление свалянного (закатанного) волоса, а также удаление механических загрязнений и опилок (как и зачем в волосяной покров попадают опилки будет сказано позже). (9) Отделка – цикл операций по улучшению свойств готового полуфабриката. Представляет собой механическую и химическую обработку кожевой ткани (увлажнение, откатка, разбивка, подчистка, шлифование) и/или обработку волосяного покрова для придания ему блеска, шелковистости. На стадии отделки производится также дополнительное облагораживание волоса (стрижка, щипка, колочение, люстрирование, эпилирование) или его окрашивание. (10) Уморение – предварительная стадия обработки при крашении меховых и шубных овчин, при имитации под ценные виды пушнины. Уморение необходимо для улучшения впитывания волосяным покровом протравливающих веществ и подготовки к окрашиванию. Представляет собой нейтрализацию волоса в щелочной среде. Повышая смачиваемость, уморение помогает удалить с поверхности полуфабриката оставшуюся часть жиров и механических загрязнений. (11) Отбеливание – устранение (обесцвечивание) жёлтого налёта на волосяном покрове, ликвидация желтизны белого волоса (белые Песец и Норка, Горностай, а также серый Каракуль). На всех этапах первичной обработки и выделки возможно появление различных пороков. Пороком называется дефект сырья или выделанного полуфабриката, благоприобретённый или врождённый, который может повлиять на качество выделанной шкуры или готового изделия. При этом пороком признаётся не всякий дефект, а только тот, который расположен в определённом участке конкретной шкуры или находятся в определённых сочетаниях с другими дефектами. Одни пороки сырья поддаются исправлению и ликвидации, другие – нет. Отделка завершается (12) Вычинкой, которая как раз и состоит в удалении плешин, заломов и прочих пороков полуфабриката. Классификация Сырья:- По назначению сырьё может быть (i) кожевенным, (ii) шубным или (iii) меховым. Последние две группы часто объединяют в одну (шубно-меховое сырьё), когда требуется указать на ценность волосяного покрова. Кожевенное сырьё, в отличие от мехового и шубного, имеет малоценный, нарушенный волосяной покров и используется для выделки кож. Некоторые виды шубного сырья могут быть использованы для выработки кож, при условии, что кожевая ткань обладает соответствующими характеристиками. В меховом сырье различают несколько больших основных групп:- (i) Меховая Овчина:- шкуры Овец разных пород; (ii) Каракулево-Мерлушковая (или Завитковая) группа:- шкурки ягнят грубошёрстных пород Овец поздних стадий внутриутробного развития и первых месяцев жизни, а также собственно Каракуль – шкурки ягнят Каракульской породы; (iii) Шкурки Грызунов:- Белки, Кролика, Сурка и тому подобных; и (iv) Пушнина Промысловая и Звероводческая:- Лисица, Норка, Песец, Хорь и тому подобные. Меховое сырьё, по сравнению с шубным, отличается высокими эстетическими характеристиками волосяного покрова (меха), с минимальным количеством остевого волоса или полным его отсутствием. Меховое сырьё используется для выделки дорогостоящего полуфабриката, который идёт на изготовление женской и детской верхней одежды, воротников, различных отделок, а также мужских и женских головных уборов. Шубное сырьё идёт на изготовление менее ценных изделий. Основная характеристика волосяного покрова шубного сырья – преобладание двух типов волоса:- ости и пуха. Остевой Волос в шубном сырье имеет своё предназначение. Шерсть, как известно, обладает неприятным свойством свойлачиваться (превращаться во время эксплуатации в войлок). Особенно это относится к пуховым волокнам, которые в результате свойлачивания теряют теплосберегающие свойства и портят внешний вид изделия. Грубые остевые волокна шубного сырья структурируют волосяной покров и предохраняют пуховой волос от свойлачивания. Шубное сырьё отличается от мехового и большей длиной волоса. Представлено, в основном, шубной овчиной, которая используется в изготовлении так называемых ‘нагольных’ изделий – верхней одежды мехом внутрь (дублёнки, нагольные тулупы и тому подобное). Шкуры, полученные из каждого вида животных (кроме мехового и пушного зверя), делятся на несколько групп по возрастным или половозрастным признакам; каждая из таких групп имеет своё название. классификация по возрасту и, в ряде случаев, по полу, основана на различии характеристик кожевой ткани и волосяного покрова, от чего, в свою очередь, напрямую зависит технологическое назначение той или иной группы сырья. Отнесение конкретной шкуры к одной из половозрастных групп проводится по площади или весу шкуры и может существенно повлиять на её стоимость и область применения (выделка кожи, меховое или шубное сырьё). Возможные Пороки Сырья:- Правила Консервации И Хранения:- Большинство пороков сырья возникает вследствие нарушения правил первичной обработки, консервации или хранения шкур. В ряде случаев нарушение технологии консервации или хранения шкур. В ряде случаев нарушение технологии консервации может привести к неустранимым дефектам, которые сделают невозможным выделку полуфабриката или снизят качество готового изделия. Чтобы вам не всучили партию бракованного сырья, нужно уметь определять возможные пороки и знать, насколько тот или иной дефект может сказаться при дальнейшей обработке. О методах устранения полученных при консервации пороков и о том, как эти пороки узнать, будет сказано далее, а пока изложим, как правильно следует консервировать и хранить шкуры. Прежде всего следует заранее позаботиться, чтобы шкуры не были загрязнены – налипшие испражнения (навал) портят волосяной покров, затрудняют обрядку и не только служат отличной питательной средой для размножения гнилостных Бактерий, но и, будучи не удалёнными полностью в ходе обрядки, препятствуют проникновению вглубь шкуры консервирующего раствора. Результат – некачественная консервация даже при соблюдении всех норм (сроки, расход материалов и прочее). Загрязнённое сырьё приходится дополнительно дообряживать, чтобы освободить от навала, а это отнимает лишнее время, силы и усложняет процесс выделки, полноценное же удаление

навала с овечьих шкур без специального инструмента – электрорубанка – вообще невозможно, поскольку может привести к образованию плешин. Именно поэтому так важно выдержать животных перед убоем 3 часа без воды и до одних суток – без корма. Рекомендуемые нормы предубойной выдержки без питания составляют для пушного зверя и Кроликов – 16–18 часов, для Овец, Коз и крупного рогатого скота – 22–24 часа, а для Свиней – около 12 часов. Снятая шкура перед мездрением должна остыть, это необходимо и для облегчения мездрения, и для создания наилучших условий для последующего консервирования. В то же время, остывание дольше полутора часов не рекомендуется, иначе никакая консервация не справится со стремительно размножающимися в снятой шкуре микроорганизмами. Оставшаяся на кожевенной ткани мездра, прирези мяса и сала затрудняют консервацию и могут снизить его эффективность. Следовательно, они должны быть полностью удалены, что весьма затруднительно, если остывшая шкура имеет складки и загибы – в таком случае при излишнем рвении можно легко повредить саму дерму. Чтобы этого не произошло, парную шкуру тщательно расправляют. Шкурки пушного зверя и Кроликов, снятые ‘чулком’, выворачивают мехом внутрь и туго набивают соломой или натягивают на деревянную болванку, на которой потом и мездрят. Мелкие шкуры, снятые полностью, расправляют мездряной стороной вверх на доске-правилке и фиксируют по контуру колками. Обрядку крупного кожевенного сырья облегчает использование специальных инструментов и приспособлений. Сбивать навал и другие загрязнения удобнее ножом-тупиком на колоде:- шкуру раскладывают волосяной стороной наружу и головной частью вверх, рабочий ход тупика – только по направлению роста волос (то есть сверху вниз). При необходимости обрядки наружной стороны шкуры, начинают с неё и только после переходят к внутренней стороне. В качестве инструмента для скобления мездряной стороны можно использовать дуговой нож, лезвие косы (разумеется, обернув острый конец куском рогожи, брезента и тому подобного). Мездрение овчин и козлин проводят на столе, крупные шкуры избавляют от прирезей на специальной наклонной колоде. Остатки мышечной ткани сгоняют по направлению от огузка к головной части, а на полах – от хребта к череву. Обрядка считается достаточно качественной, если на внутренней стороне шкуры сохранён слой подкожной клетчатки толщиной не более 3 мм, волосяной покров не имеет следов навала и других загрязнений, а на шкуре отсутствуют следы неквалифицированного съёма (ушные хрящи, репицы хвоста и тому подобное). Для облегчения обрядки используются следующие инструменты и приспособления:- колода, обитая оцинкованной жестью, нож-тупик для сгона навала и ‘безопасная’ коса. Методов консервации существует несколько, каждый из них имеет свои особенности и свою сферу применения. Все шкуры консервируются одним из способов – пресно-сухим, сухосолёным или мокросолёным (тузлукование и сухой посол врасстил). Для сохранения пушнины, шкурок Кролика, шубных и меховых овчин применяется также кислотно-солевой способ. Выбор того или иного способа консервации определяется типом сырья, а также конкретными условиями. Помимо соблюдения технологии консервации, необходимо следить, чтобы применялся именно тот способ, который подходит для данного сырья. Пресно-Сухой Способ Консервации:- данный способ является самым простым и, несмотря на это, наименее предпочтительным. Используется только в том случае, если по каким-то причинам (вынужденный забой в неподходящих условиях при отгонном животноводстве и тому подобным) невозможно нормальное консервирование. По сути этот метод представляет из себя высушивание шкур без всякой предварительной обработки консервантами. Ввиду низкой эффективности непригоден для сколько-нибудь длительного хранения сырья, не рекомендуется для шкур с толстой кожевой тканью. Сушка должна проводиться в тёплую, безветренную погоду – ветер в сочетании с пониженной влажностью может привести к пересушиванию наружных слоёв кожевой ткани, которые ссыхаются в корку и не дают испаряться влаге из глубоких слоёв дермы. Проводят сушку в помещении или под навесом, развешивая расправленные шкуры на гладких шестах (не на верёвке и не на проволоке!) мездровой стороной наружу. Периодически следует немного спускать шкуры на ту и на другую сторону, чтобы не оставалась непросушенной линия перегиба. Лапы, вороток и полы следует предохранять от скручивания, для чего их раскрывают (расшпиливают) деревянными планками. Шесты с развешанными на них шкурами должны располагаться не ближе чем в 20–30 сантиметров (см) друг от друга. Допускается сушка овчин и козлин под открытым небом врасстил, в этом случае их нужно время от времени переворачивать и не допускать длительного нахождения под прямыми солнечными лучами. Хорошо высушенная шкура должна иметь совершенно сухой волосяной покров и плотную, не водянистую кожевую ткань. Хранят такое сырьё в штабелях, пересыпав нафталином, чтобы предохранить волосяной покров от Моли (15–20 граммов (г) кристаллов нафталина для крупной шкуры и 3–5 г для мелкой). Максимальная температура хранения – 30 °С при относительной влажности не более 70%. Последнее требование особенно актуально, поскольку сухая шкура легко поглощает влагу из воздуха, что может привести к отсыреванию и бактериальному разложению. Более длительное хранение и защиту от Моли и Кожееда обеспечивает комплексное применение химикатов:- стеллаж, на который будут выложены шкуры, посыпают смесью нафталина, кремнефтористого натрия и парадихлорбензола (соответственно 2, 0.5 и 2% от массы шкур). Укладывая шкуры врасстил одна на другую, каждую пересыпают этой смесью. Сухосолёный Способ Консервации:- от пресной сушки отличается предварительной засолкой шкур, но считается всё же не самым надёжным:- так как для сухосоления используют сравнительно небольшое количество соли, полного замещения влаги солевым раствором не происходит, и сырьё необходимо досушивать, чтобы предотвратить возможное загнивание. В то же время данный способ применяется часто, особенно для консервации больших партий шкур в летнее время года и в районах с жарким климатом – как из соображений экономии, так и из-за относительной простоты метода. Засаливают шкуры врасстил, расправив мездрой вверх, на специальном помосте – деревянном щите скруглённого профиля. Поверхность помоста предварительно посыпают сантиметровым слоем соли, укладывают первую шкуру и посыпают её солью из расчёта 20% от массы (то есть 200 граммов соли на каждый килограмм массы парной шкуры). Участки, с которых не были полностью удалены прирези, дополнительно натирают солью. Поверх первой укладывают вторую шкуру, также мездрой вверх, засыпают её солью и так далее. Самая частая ошибка при таком методе консервации – не отобранные заранее по размеру или массе шкуры; нестандартные шкуры, имеющие большую площадь, как правило, не взвешивают, и соли на них приходится столько же, сколько было отмерено для шкур более мелких. В лучшем случае количество соли увеличивают ‘на глазок’, и, если процентное соотношение не соблюдается, шкура большей массы может просто не просолиться. Если шкур достаточно, чтобы выложить полный штабель (высотой 1.5 метра для крупных шкур и 1 метр – для овчин и козлин), то шкуры укладывают ‘вразбежку’, то есть каждую следующую несколько смещают относительно предыдущей так, чтобы штабель оставался вертикальным. Закончив укладку, штабель пересыпают солью и выдерживают не менее 3 суток для крупных шкур и не менее 2 – для овчин и козлин. Для засолки используют поваренную соль:- помола № 3 для крупных шкур с плотной кожевой тканью, помола № 2 – для шкур телят, свиней и других, и помола № 1 – для овчин и козлин. Применять дважды уже использованную соль не следует, поскольку в ней велико содержание солелюбивых бактерий. Просолившиеся шкуры тщательно очищают от остатков соли и вывешивают на просушку так же, как это было описано для предыдущего способа консервации. Хранят сухосолёное сырьё так же, как и сырьё пресно-сухого способа консервации, расход антисептиков для консервирующей смеси уменьшают вдвое. Шкуры, высушенные в ходе сухосоления или пресно-сухого консервирования, требуют к себе внимательного отношения, так как потерявшая пластичность кожевая ткань легко переламывается при изгибании. Высокая степень гигроскопичности делает сырьё достаточно уязвимым – при повышении влажности воздуха оно начинает отмокать. Консервирование Сухим Способом Врасстил:- этот способ ещё называют Мокросолением, и ошибки тут нет – ‘сухой’ он лишь по сравнению с тузлукованием (смотрите далее), а ‘мокросолёным’ его

называют потому, что, в отличие от описанных ранее способов консервации, данный метод не предполагает сушки, и сырьё в достаточной мере сохраняет эластичность кожевой ткани (кстати говоря, это заметно упрощает последующую обработку). Из других преимуществ сухого посола врасстил можно назвать простоту метода и то, что мокросолёное сырьё не боится повышенной влажности воздуха во время хранения. Отсутствие сушки в технологическом процессе мокросоления компенсируется повышением нормы расхода соли до 400 граммов на килограмм (г/кг) веса парной шкуры. Для овчин количество соли возрастает до 0.5 кг. В остальном засолку проводят, как и при сухосолении, за исключением того, что шкуры в штабеле выдерживают дольше:- свиные и другие крупные – не менее 7 суток, овчины и козлины – 4–5 суток. Описываемый метод предполагает использование химических антисептиков, которые дополняют действие соли и обеспечивают надёжную консервацию сырья. Химикаты тщательно перемешиваются с солью, и уже этой смесью засыпаются шкуры. В зависимости от типа сырья, возможно применение одного из названных антисептиков (в граммах на килограмм веса парной шкуры):- (1) Овчины:- нафталин – 10 г/кг парного веса шкуры, или парадихлорбензол – 5 г/кг, или кремнефтористый натрий – 12.5 г/кг; (2) Опоек, Выросток:- нафталин 8 г/кг, или сода калицинированная – 10 г/кг, или парадихлорбензол – 4 г/кг; (3) Крупное Кожевенное Сырьё:- нафталин – 8 г/кг, или парадихлорбензол – 4 г/кг, или кремнефтористый натрий – 10 г/кг, или кремнефтористый аммоний – 6 г/кг. Во избежание покраснения мездры, консервация должна проводиться при температуре выше 20 °C. Для небольшого количества шкур допускается пакетная засолка, когда отдельные шкуры после соления в штабеле (2–3 суток) дополнительно присаливают и сворачивают в пакет. Подгибая каждый участок, волосяной покров посыпают смесью соли с одним из перечисленных химикатов (граммов на килограмм парного веса):- нафталин – 1 г/кг, или парадихлорбензол – 0.5 г/кг, или кремнефтористый натрий – 1.2 г/кг, или кремнефтористый аммоний – 1.2 г/кг. Закатанные в пакеты шкуры выдерживают до 5 дней, время от времени переворачивая для равномерного протекания засолки. Чтобы в пакетах не застаивался рассол, их укладывают на тот же помост торцами к боковым сторонам – тогда рассол будет стекать без препятствий. Часто в виде пакетов сырьё и поставляется; закупая пакетированные шкуры, нужно знать, что средний срок их хранения с момента засолки составляет не более 10 дней. Более длительное хранение мокросолёному сырью обеспечивает укладка в штабелях врасстил; пересыпая консервирующей смесью, шкуры укладывают волосяным покровом вниз так, чтобы на каждые 45 сантиметров высоты один ряд шкур свешивался за границы штабеля наподобие фартуков. Выложив следующие несколько рядов, их накрывают выступающими краями шкур, подгибая последние вверх (способ фартушевания). В результате такого способа укладки мырьё меньше контактирует с воздухом и не пересыхает при повышении температуры. Вообще же мокросолёное сырьё не терпит ни высокой температуры (оптимальная для него – 15–20 °C), ни слишком сухого воздуха (хранится при относительной влажности от 70 до 80%). Низкая температура хранения хороша и тем, что позволяет вовремя заметить повышение температуры внутри штабеля в случае возникновения процессов бактериального разложения; для контроля температуры в штабель при его укладке помещают деревянный (не железный!) жёлоб, оставляют в нём обыкновенный градусник или спиртовой термометр и выступающий наружу конец жёлоба затыкают паклей или рогожей. В случае устойчивого повышения температуры на 5–6 °C по сравнению с температурой в помещении констатируют происходящее в штабеле загнивание – возможно, при закладке в него попало бактериальное или просто некачественное засоленное сырьё. Чтобы сохранить остальные шкуры, штабель разбирают, сырьё подсушивают и дополнительно пересыпают смесью антисептиков. Тузлукование:- консервация в тузлуке – наиболее действенный способ сохранения шкур, требующий специальных ёмкостей. Применяется для шкур крупного рогатого скота, конских и свиных, а также опойка и выростка. Обеспечивают равномерное просаливание всей площади сырья. Тузлукование, как и ранее описанные методы, требует точного взвешивания шкур для наиболее точного определения объёма рассола и количества химикатов. Взвешивать шкуры следует до промывки (подготовительная операция перед тузлукованием). Промывку проводят на столе с выпуклой поверхностью:- шкуру расстилают волосяной стороной вверх и не горячей (до 20 °C) водой обмывают её, сгоняя излишки влаги. Для удаления загрязнений можно пользоваться скребком с закруглёнными зубьями. Во избежание перенасыщения тканей водой промывку не стоит затягивать дольше 2–3 минут, после чего нужно дать шкуре обсохнуть в течение часа. На один килограмм массы парной шкуры расходуется 3 литра (л) насыщенного раствора поваренной соли (напомним, что насыщенным раствор считается, когда соль перестаёт растворяться – для этого нужно примерно 320–350 г соли на один литр воды). Для консервации крупных и свиных шкур в солевой раствор добавляется один из перечисленных антисептиков:- кремнефтористый натрий – 2.4 г на килограмм парного веса или такое же количество кремнефтористого аммония (их растворяют отдельно и вливают в соляной раствор при помешивании). Свиные шкуры выдерживают в консервирующем растворе 15 часов, для остальных продолжительность тузлукования составляет от 20 часов (для самых крупных) до 10 (для мелких). После тузлукования шкуры выкладывают на помост для стекания рассола; спустя 2–3 часа их дополнительно присаливают смесью соли (150 г на килограмм веса парной шкуры) с одним из антисептиков:- нафталин – 3 г на килограмм парного веса, или парадихлорбензол – 1.5 г, или кремнефтористый натрий – 3.8 г, или кремнефтористый аммоний – 3.8 г. Затем шкуры оставляют в штабеле на 2–3 дня для окончательного завершения процесса консервации. Примечание:- меховое и мелкое кожевенное сырьё (опоек, выросток и прочее) кремнефтористыми химикалиями не обрабатывают; для подсолки такого сырья можно применять только нафталин или парадихлорбензол – 3 г и 1.5 г, соответственно, на один килограмм парной шкуры. Помещение, в котором хранится готовое сырьё, должно иметь дренажные канавки или цементную стяжку на полу с уклоном к сточному отверстию, чтобы стекающий со шкур рассол самотёком отводился от штабеля. В жаркую погоду, во избежание пересушивания шкур, рядом со штабелем устанавливают вёдра с водой или накрывают штабель смоченной солевым раствором мешковиной. Кислотно-Солевое Консервирование:- Этот метод является наиболее предпочтительным для шубно-мехового сырья, поскольку он обеспечивает наилучшее сохранение связи волосяного покрова с кожевой тканью и делает сырьё менее восприимчивым к повышению влажности воздуха. Пушнину или кроличьи шкурки, при условии, что их не собираются выделывать сразу, после мездрения подсушивают в течение 30–40 минут и тампоном (мягкой кистью) наносят на мездряную сторону кожевой ткани раствор поваренной соли с порошком квасцов в пропорции 1:1. Состав следует равномерно втирать по всей поверхности бахтармы; удобнее это делать, не снимая шкурку с правилки или формовочной болванки, на которых проводилось мездрение. На правилках же шкурки и высушивают. Более крупное сырьё, такое, как шубные или меховые овчины, обрабатывают смесью несколько более сложного состава:- поваренная соль помола № 2, хлористый аммоний и алюминиевые квасцы (соответственно – 85, 7.5 и 7.5%). Смесь тщательно перемешивают и втирают в мездряную сторону расправленной на рабочем столе шкуры, затем укладывают шкуры в штабель (смотрите Консервирование Сухим Посолом Врасстил), равномерно засыпая каждую тем же составом, каким проводилась обработка. В штабеле шкуры выдерживают не менее недели. Хранить сырьё следует в прохладном помещении с ограничением доступа прямого солнечного света. Шкурки, снятые ‘чулком’, после просушки выворачивают мехом наружу и хранят в развешенном состоянии. Шкуры, снятые полостью, пересыпают нафталином и укладывают стопами попарно – волосом к волосу. Волосяной покров сырья, которое хранится достаточно долго, нужно периодически осматривать на предмет завязей, образуемых Молью. Обнаружив пучок слипшегося меха в виде тонкой косицы, необходимо тщательно осмотреть всё остальное сырьё, а обнаруженные завязи прочесать до полного удаления повреждённого волоса. Определение Пороков Консервации И Хранения:- Первое, на что нужно обращать внимание, приобретая партию сырья, – качество проведённой

консервации. Особенно важно это в тех случаях, когда сырьё приобретается ‘на выезде’ и предстоит более или менее длительная транспортировка. Ежели имеется намерение ещё и хранить сырьё какое-то время, прежде чем оно поступит на выделку, качество первичной обработки приобретает ещё большее значение. Неправильно законсервированные шкуры, в которых уже начались процессы бактериального разложения (гниение), определить несложно:- если у вас нет насморка, такое сырьё само ‘бросается в глаза’ (точнее, в нос). Но как быть, если засолка производилась с нарушением технологии, а результаты нарушения ещё не проявились? День-два пути в жаркую погоду, да пара дней хранения перед выделкой – и вот уже несколько шкур из партии (хорошо, если не половина) недвусмысленно попахивают. Не оказаться в такой неприятной ситуации поможет знание нормальной степени усола (потери массы или площади шкуры в результате того или иного способа консервации). Так, например, для самого распространённого метода – мокросоления (засола сухим посолом врасстил) – нормальная степень усола составляет 12–15%. Убыль массы в пределах 6–8% сигнализирует о том, что шкура недосолена. К слову сказать, последствия эти могут проявиться не только во время хранения, но и при последующей обработке. Недоконсервированная шкура может и не успеть испортиться под действием гнилостных бактерий. Если нет длительного перерыва после консервации, гнилостные процессы прекращаются уже в ходе выделки, однако это не гарантирует качества последней. Дело в том, что расчёт реагентов и сроков отмоки и других операций технологического цикла выделки делается, исходя из нормального содержания остаточной влаги в кожевой ткани сырья. Консервация, не доведённая до конца, этого нормального содержания не обеспечивает. В результате и отмока вроде бы проводится по правилам – с соблюдением рекомендованного режима, норм расхода химикатов и так далее, а сырьё на выходе получается не подготовленным в должной мере к остальным операциям. В конце концов готовый полуфабрикат, несмотря на все затраченные усилия, получается низкого качества. Ввиду всего вышесказанного, определение качества консервации приобретает первостепенное значение. На практике отличить недосоленую шкуру от нормально засоленной можно всё тем же органолептическим методом, то есть внимательным осмотром каждой шкуры. Качество сухого посола врасстил или пакетной засолки определяется осмотром наиболее ‘проблемной’ части – области чепрака, где кожевая ткань самая плотная. На недостаточный усол укажет малоупругая, неплотная кожевая ткань, багрово-синий цвет оставшихся прирезей мяса и водянистая мездра. Поскоблите мездряную сторону лезвием ножа:- если она синюшная или синевато-красная, значит вы имеете дело с недоконсервированной шкурой. О том же говорит и слишком влажный волосяной покров, обильно ‘потеющий’ при лёгком нажатии. Равномерно же просолившаяся шкура имеет в этой области достаточно упругую, но не водянистую кожевую ткань с матовой мездровой стороной. Допускается небольшое содержание влаги в волосяном покрове. Остаток подкожной клетчатки полностью обескровлен, имеет светло-жёлтый цвет, а сама кожевая ткань, если её поскоблить ножом, – сероватая или молочно-белая. Вообще говоря, качество любого способа консервирования можно определить по тому, сколько шкура потеряла в весе. Особенно актуально это для ‘неблагонадёжных’ способов консервирования, таких как сухосолёный и, особенно, пресно-сухой – внешне шкура может выглядеть вполне нормальной, с полностью сухой поверхностью дермы, однако глубокие слои кожевой ткани могут содержать в себе неиспарившуюся влагу. Если известна масса парных шкур (например, когда консервацию проводили вы сами), то элементарное взвешивание поможет убедиться, что процесс завершён полностью. Приведём контрольные цифры отношения массы шкур после консервации к массе параной шкуры (масса парной принимается за 100%). Для овчин и козлин:- (i) пресно-сухой способ консервации – 90% от веса той же шкуры в парном состоянии; (ii) сухосолёный способ консервации – 94%; и (iii) кислотно-солевой способ консервации – 96%. Остальные шкуры:- (i) пресно-сухой – 40% от массы парной шкуры; (ii) сухосолёный – 56%; и (iii) тузлукование – 83%. Однако, даже в том случае, когда сам процесс консервации был доведён до конца, сырьё всё же может иметь те или иные дефекты, полученные в ходе консервации, при неаккуратной первичной обработке или хранении. Все они также определяются осмотром каждой шкуры из имеющейся партии. Ороговевшая кожевая ткань, имеющая стеклянистый отблеск, сигнализирует о неправильно проведённой сушке (например, при пресно-сухом консервировании), когда шкура находилась под действием прямых солнечных лучей. Ороговение дермы делает такое сырьё непригодным для дальнейшей обработки. Отдельные шкуры, в целом качественно консервированные, могут иметь на некоторых участках складки (так называемая комовая сушка). Эти складки образуются при остывании нерасправленной шкуры или во время засолки, когда её уложили в штабель без расправления загибов. Комовая сушка не является неустранимым браком, но затрудняет высыхание в местах складок, – они могут стать очагом разложения и испортить всю шкуру, если вовремя не принять соответствующих мер по дообработке (смотрите далее). Солевые Пятна:- дефект, характерный для опойка и выростка мокросолёного способа консервации. Поражения кожевой ткани в виде жёстких коричневых пятен 3–5 миллиметров (мм) в поперечнике. Поражённые участки проявляются даже после выделки. Выпадение Волоса (Теклость):- проявляется в ослаблении связи кожевой ткани с волосяным покровом – результат некачественной консервации отдельных участков шкуры (недостаток консервантов, неравномерное их распределение по всей площади и тому подобные). Этот скрытый порок легко обнаружить, потерев подозрительное место пальцем:- если при лёгком нажиме волос легко выдёргивается в направлении роста, значит, данный порок имеет место и остаётся только определить, какая площадь им затронута. Теклость шерсти более чем на 35% поверхности делает шкуру пригодной только к выработке кожевенного сырья (при соответствующих характеристиках кожевой ткани). Аналогично определяется и другой возможный порок, особенно характерный для тонкорунных овчин с большим содержанием пухового волоса – Отслаивание Лицевого Слоя. Хранение сырья в ненадлежащих условиях или его несвоевременное консервирование могут стать причиной появления Безличин (разрушение лицевого слоя кожевой ткани под действием микроорганизмов). Когда процесс зашёл настолько глубоко, что поражена кожевая ткань и с внутренней стороны, безличина превращается в Прелину. На шкурах, законсервированных мокросолением, последний порок проявляется также, как и теклость, то есть ослаблением волосяного покрова. Однако если шкура с теклостью волоса ещё может быть направлена на сгонку волосяного покрова и выделку кожи, то прелины делают всякую дообработку нецелесообразной. Деятельность вызывающих прелины бактерий выдаёт себя характерным изменением цвета кожевой ткани – она приобретает зеленовато-жёлтый оттенок. Ржавчина:- дефект кожевой ткани в виде тёмно-коричневых или бурых пятен. Характерен для сырья мокросолёного консервирования, появляется в результате длительного соприкосновения с железными предметами (к примеру, если вместо деревянного жёлоба в штабель мокросолёных шкур был заложен стальной швеллер). Практически неустранимый дефект, особенно если затронуты глубокие слои дермы. Можно Ли Исправить Пороки Консервации? Разумеется, можно. Недосолёные шкуры без признаков бактериального разложения вполне можно дообработать, чтобы предохранить от порчи. То же самое касается и шкур комовой сушки – в ходе переконсервации складки можно расправить и непросолившиеся участки смогут испытать на себе благотворное действие антисептиков. Даже шкуры с теклостью волоса иногда имеет смысл дообработать, чтобы локализовать процесс и сохранить основную площадь шкуры для выделки кожевенного полуфабриката. Для ‘спасения’ шкур пресно-сухого консервирования и сухосолёных применяют комбинированный метод – тузлукование под гнётом с последующим сухим посолом врасстил. Этот способ позволяет избавиться от непросолившихся складок и комовой сушки. Отобранное для дообработки сырьё предварительно отмачивают в воде с температурой до 20 °C – овчины и козлины несколько часов, крупные шкуры в зависимости от их состояния и способа первой консервации, – до суток. Когда сырьё обводнится до уровня парных шкур, его дополнительно обряживают, после чего врасстил укладывают в чан для тузлукования (мездровой стороной вверх). Консервирующий раствор

готовят из расчёта жидкостного коэффициента 3, то есть раствора должно быть втрое больше, чем шкур. Состав раствора (на каждый килограмм массы сырья):- поваренная соль – 300 граммов (г) и кремнефтористый натрий – 2.4 г. Для дообработки опойка, выростка и полукожника в раствор добавляют кальцинированную соду из расчёта 2.25% от массы соли. Раствор нагревается за счёт протекающей химической реакции, и его лучше приготовить заранее, так как рекомендуемая температура тузлукования должна составлять 10–20 °C. Прежде чем заливать сырьё раствором, шкуры засыпают солью (10% от массы шкур) и закрывают решёткой с грузом. Продолжительность дообработки должна составлять для мелкого сырья – 10–12 часов, для крупных шкур – около 20 часов и для свиных – 14–16 часов. По окончании тузлукования шкуры выкладывают на решётчатые стеллажи или развешивают на козлах для стекания рассола (считается законченным, когда жидкость перестаёт стекать струйками и начинает капать, обычно – через 1.5–2 часа). После обтекания сырьё подсаливают, как при сухом посоле врасстил, и выдерживают в штабеле 2–3 дня. С сырьём мокросолёного способа консервации хлопот, как правило, меньше. Убедившись в отсутствии на них пороков и участков бактериального разложения, шкуры раскатывают. Недостаточно просолившиеся мокросолёные шкуры раскатывают из пакетов и дополнительно присаливают в штабеле. Какие Ещё Бывают Пороки? В ходе консервации могут проявиться пороки, не зависящие от соблюдения технологии:- ряд этих пороков сырьё могло приобрести на стадии предварительной обработки, другие пороки могут быть прижизненными. Несоблюдение правил хранения также чревато появлением пороков. Итак, какие ещё могут быть пороки сырья? У шубного и мехового сырья встречается такой существенный дефект волосяного покрова, как Переслед, или Голодная Тонина, – нарушение внутренней структуры волоса в результате недокорма. Проявляется переслед (или, как его ещё иногда называют, Переслежистость) в лёгкости, с которой волос разрывается при малейшем усилии. Тонкость в том, что переслед может затрагивать волос не по всей длине, а только на отдельных участках, в зависимости от того, когда был голодный период и насколько он затянулся. Дефект становится пороком, если место разрыва расположено на косице или штапеле ниже минимально допустимой высоты волоса для того или иного типа сырья (смотрите также Классификация Сырья). Определить Переслед достаточно просто – для этого на шкуре выделяют пучок шерсти шириной 5–6 миллиметров (мм), слегка растягивают его, зажав пальцами у основания и на конце, и слегка ударяют свободным пальцем. Если несколько пучков, выделенных на разных участках шкуры, разорвались в одном и том же месте, можно смело диагностировать переслед. Остаётся только измерить, на какой высоте нарушена структура волоса, чтобы отнести шкуру к тому или иному типу сырья (шубное, меховое или кожевенное). Блестящая мездра коричневого цвета и характерный горьковатый запах указывают на Задымлённость шкуры – порок, который делает её непригодной к выделке. Возникает задымлённость в результате сушки сырья или парной шкуры у открытого огня или над дымом, что вызывает обезвоживание кожевой ткани и её задубливание содержащимися в дыму веществами. Шкура с этим пороком гремит при ударе костяшками пальцев по кожевой ткани, а сама кожевая ткань легко трескается, если попытаться согнуть шкуру волосом внутрь. Небрежная съёмка шкур, проведённая с нарушением правил, может стать причиной появления ножевых ранений различной степени тяжести:- от Сквозного Разреза (Прорезь) до Дыры. Порез, имеющий место со стороны мездры, но проникающий в кожевую ткань не более чем на треть, называется Подрезью и может быть глубокой (более чем на треть толщины кожевой ткани) или неглубокой. Если подрезь – это, по сути, не доведённый до конца, несквозной разрез (или прорезь), то Выхват мездры можно считать начальной стадией дыры. Выхватом называют участок кожевой ткани со срезанным до определённой глубины слоем мездры. Для овчин выхват мездры считается пороком, если он сделал кожевую ткань тоньше, чем на треть. Тавро, выжженное на коже или нанесённое на волосяной покров несмываемой краской или гудроном, также считается пороком, поскольку сокращает полезную площадь шкуры. Шкура взрослого животного, имеющая после пресно-сухого способа консервации мездру багрово-красного цвета, с вероятностью почти в 100% является Палой (то есть с павшего животного). Другое возможное объяснение – не проведённое или проведённое не до конца обескровливание при забое. Такая шкура считается бракованной, так как неудалённая и свернувшаяся в кровеносных сосудах кровь проявится при выделке в виде явно заметной сети жилок на лицевой поверхности готовой кожи. Шкура, не снятая своевременно, может иметь такой порок, как Жировую Гарь – чёрные пятна на мездряной стороне, вызванные окислительными процессами в подкожной жировой клетчатке. Скорняки в таких случаях говорят, что сырьё ‘Прогорело’. На отдельных шкурах при внимательном их осмотре могут обнаружиться Ломины – они появляются на кожевой ткани в результате неаккуратного обращения (перегибание и тому подобное) с сырьём пресно-сухого и сухосолёного способов консервации. Внутренняя структура дермы в этих местах нарушена и участки с заломами можно смело вычёркивать из полезной площади сырья. Хранение шкур в неподходящих условиях чревато появлением двух пороков, причиной которых стали Насекомые:- (i) Молеедина – локализованный дефект хранения пресно-сухих или сухосолёных шкур в весенне-летний период. Выражается в выпадении волоса из-за разрушения лицевого слоя кожевой ткани. Как правило, не затрагивает всей шкуры, но может существенно сократить её полезную площадь. (ii) Кожеедина – дефект хранения в виде сквозных отверстий в кожевой ткани и сложной сети каналов на её поверхности, проделанных личинками Жука Кожееда. Характерен для шкур пресно-сухого и, реже, сухосолёного консервирования. В кожевой ткани шкур Овец и Коз возможен такой трудноразличимый дефект, как Накостыши – сквозные отверстия от колючих семян Ковыля (Тырсы). Дефект становится пороком, если на шкуре более 5 накостышей (при отсутствии других пороков). Проявляется этот порок только на стадии выделки, когда шкуры растягивают для правки; мелкие отверстия становятся крупными, уменьшают прочность, а при значительной концентрации на одном участке могут привести даже к разрыву кожевой ткани. Овчины и козлины могут также иметь порок кожного покрова в виде мелких точечных отверстий, заросших или сквозных, которые вызываются оспой. Оспа, как известно, инфекционная болезнь, и такие шкуры, обнаруженные в сырье, должны обязательно дезинфицироваться ветеринарной службой. Наконец, пороком шубного сырья может стать и Засорённость Репьём и прочими плодами Сорных Растений, если они закатаны в глубь волосяного покрова и вызвали свойлачивание косиц шерсти на большой глубине с поражением значительной площади шкуры.

PELTATE = ЩИТОВИДНОЕ – Peltate:- shield-shaped; of a leaf with the leaf stalk (petiole) attached to the lower surface within the leaf margin, often near the center. / Щитовидное:- в форме цветка; о листе со стебельком листа (черешком), прикреплённым к нижней поверхности .

PELTATE LEAF = ЩИТОВИДНЫЙ ЛИСТ – Peltate Leaf is a shield-shaped leaf; as a Nasturtium leaf. / Щитовидный Лист – простой цельный лист, черешок которого прикрепляется к центру нижней поверхности, а не к основанию, как у большинства листьев, например, у Видов Рода Tropaeolum. Щитовидный Лист – простой лист с цельной листовой пластинкой, которая связана с черешком не основанием (как у большинства листьев), а центральной частью нижней стороны, например, у Видов Рода Настурция (Tropaeolum).

PEM = PROGRAMME ENGRAIS MALAGASY = MALAGASY FERTILIZER PROGRAM

PEN = PERUVIAN NUEVO SOL

PENALTY = НЕУСТОЙКА (или САНКЦИЯ, или ПЕНАЛЬТИ) – Penalty is the punishment imposed on a wrong doer. It can be in the form of imprisonment or fine. It can refer to a sum of money that is exacted as a punishment for either a wrong to the state or civil wrong. Generally penalty is used in the context of crimes but it can also be imposed for civil wrongs at times. Penalty can also refer to

an extra charge against a party who violates a contractual provision. For example prepayment penalty is a charge assessed against a borrower who elects to pay off a loan before it is due. Penalty can also be the stipulated damages a party to a contract should pay in case of breach. It is the sum of money the party agrees to pay or forfeit by way of punishment in case of breach of the contract. However if the penalty provided in the contract is excessive, the court may refuse to enforce it. See also Fine. Penalty is a specific cost to be assessed against a party for breach of a term of an agreement. Penalty is:- (1.1) The sum of money which the obligor of a bond undertakes to pay by way of penalty, in the event of his omitting to perform or carry out the terms imposed upon him by the conditions of the bond. (1.2) A Penalty is an agreement to pay a greater sum, to secure the payment of a less sum. It is conditional, and can be avoided by the payment of the less sum before the contingency agreed upon shall happen. By what name it is called is immaterial. (2.1) A punishment; a punishment imposed by statute as a consequence of the commission of a certain specified offense. (2.2) The terms Fine, Forfeiture, and Penalty are often used loosely, and even confusedly; but, when a discrimination is made, the word Penalty is found to be generic in its character, including both fine and forfeiture. A Fine is a pecuniary penalty, and is commonly (perhaps always) to be collected by suit in some form. A Forfeiture is a penalty by which one loses his rights and interest in his property. (3) The term also denotes money recoverable by virtue of a statute imposing a payment by way of punishment. Penalty is a punishment imposed for violating a law or agreement; money one will pay for breaking a law or violating part or all of the terms of a contract. Penalty vs. Fine:- Penalty is a punishment imposed for breaking a law, rule, or contract. In general language a penalty is imposed by an appropriate authority when a person have not complied with the law but have not committed any offence. Fine is a sum of money exacted as a penalty by a court of law or other authority. In other words, Fine is the amount of the money that a court can order to pay for an offence after a successful prosecution in a matter. Penalties do not require court proceedings and are imposed on failing to comply with a provision of an Act. In the context of the Indian Companies Act, 2013, with the re-categorisation of Fine to Penalty, the Registrar of Companies (ROC) or the Ministry of Corporate Affairs (MCA) or any other authority as may be prescribed; may start levying penalty directly on the defaulting companies rather than filing application with the National Company Law Tribunal (NCLT; under the Ministry of Corporate Affairs) and getting an order for payment of Fine by the defaulting companies. In sports such as football and hockey, a Penalty is an opportunity to score a goal, which is given to the attacking team if the defending team breaks a rule near their own goal. For example, referee had no hesitation in awarding a penalty, or the team's captain scored a penalty goal. What is the difference between Fine and Penalty when used in a case? Fines are mostly used in context of criminal law wherein a court of law will punish a person convicted of a crime by imposing a fine. Penalty is a punishment imposed for breaking a law, rule, or contract. ... Penalty is used in both civil as well as criminal law. It includes both monetary and physical forms of punishment. There are, so to say, a number of differenes between fine and penalty. These are:- (1) The amount of a fine are determined according to the case sometimes it is announced in advance. Fine is a common term for cases in which financial punishments are given in commission of offences, especially minor crimes, or as the settlement of a claim. The court sentence fine depending on nature and type of crime committed. A common example of a fine is money paid for violations of traffic laws. It includes exceeding the speed limit or driving under the influence of alcohol. A fine can be considered as a monetary punishment imposed on a person convicted of committing a crime. Fines can be imposed in addition to imprisonment, trial, community service, or any other forms of punishment. Fines are mostly used in context of criminal law wherein a court of law will punish a person convicted of a crime by imposing a fine. (2) Penalty is a punishment imposed for breaking a law, rule, or contract. It is usually imposed on persons who violate the law. Penalty is used in both civil as well as criminal law. It includes both monetary and physical forms of punishment. Commonly penalty used in reference to financial punishment. Penalty refers to a disciplinary measure that the law imposes for the performance of an act or for the failure to perform a certain act. In a civil law context, penalties are imposed in relation to contracts. If a party fails to perform as per conditions in the contract penalty can be imposed. Such penalties might be in form of additional charge or damages, which will be paid in the event of a breach of contract. In criminal law, a penalty may also be in the form of a penalty of property as ordered by the court. Thus, a person who sentenced of an offence will lose their rights and interests in the property as specified by the court. Penalty means the sum of money which a person needs to pay in the event of his omitting to perform or carry out the terms imposed upon him by the conditions of the bond. / Смотрите также Штраф (Fine). В гражданском праве под Неустойкой (или Штрафом, или Пеней) понимается денежная сумма, определённая законом (законная неустойка) или договором (договорная неустойка), которую должник обязан уплатить кредитору в случае неисполнения или ненадлежащего исполнения обязательства. Под Неустойкой в Гражданском Кодексе России понимается денежная сумма, определённая законом или договором, которую должник обязан уплатить кредитору в случае неисполнения или ненадлежащего исполнения обязательства, в частности в случае просрочки исполнения. Под Санкцией, от Латинского слова Sanctio, означающее Строжайшее Постановление, понимаются:- (1) Мера воздействия, важнейшее средство социального контроля. Различают негативные санкции, направленные против отступлений от социальных норм, и позитивные санкции, стимулирующие одобряемые обществом, группой отклонения от норм. Формальные санкции налагаются официальным общественным или государственным органом; неформальные – реакция членов группы, друзей и так далее. (2) Государственная мера, применяемая к нарушителю установленных норм и правил. (3) Часть правовой нормы, содержащая указание на меры государственного воздействия в отношении нарушителя данной нормы. (4) В международном праве – меры воздействия, применяемые к государству при нарушении им своих международных обязательств или норм международного права. (5) Утверждение чего-либо высшей инстанцией, разрешение.

PENALTY = ШТРАФ (или САНКЦИЯ, или ПЕНАЛЬТИ) – Penalty is a sum of money exacted by government as a punishment for an infraction or violation of the law, and imposed by the courts. Also known as Fine. / Под Штрафом, от Немецкого слова Strafe, означающее Наказание, понимается денежное взыскание, мера материального воздействия на лиц, виновных в нарушении определённых правил. Под Административным Взысканием понимается мера наказания, применяемая уполномоченными государственными органами или должностными лицами за административный проступок (правонарушение). В бывшем Союзе Советских Социалистических Республик (СССР) меры административного взыскания:- предупреждение, штраф, административный арест, возмездное изъятие или конфискация предмета, явившегося орудием совершения или объектом правонарушения, исправительные работы, лишение специальных прав. Штраф – денежное наказание в виде взыскания с провинившегося определённой суммы денег; мера материального воздействия на юридических и физических лиц, виновных в нарушении законов, договоров, действующих правил. Штраф налагается контролирующими органами или уплачивается согласно условиям договора в твёрдой сумме по шкале нарушений или в процентах, в доле от стоимости невыполненного обязательства.

PENCIL LOCKED = XX – Pencil Locked:- a fleece with narrow staples or lock formation:- indicates an open fleece that has less density and probably more vegetable matter. This type of lock formation is genetic and is passed on to offspring.

PENCIL OR MACHINE MARKING = ЗАМАРЫВАНИЕ КАРАНДАШОМ ИЛИ МАШИНОЙ – Pencil Or Machine Marking:- too dark, too light, bleeding through, not legible or marked on wrong side. Cutting Room Defects, and namely – Shade Marking Defects. / Порок или дефект раскроя.

PENDENT = СВИСАЮЩЕЕ (или ПЛАКУЧЕЕ) – Pendent:- hanging down from a support.

PENDULOUS = ВИСЯЧЕЕ (или ОТВИСЛОЕ) – Pendulous:- drooping or hanging down.

PENEPLAIN = ПЕНЕПЛЕН (или ПИНЭПЛЭЙН, или ПЭНЭПЛЭЙН, или ДЕНУДАЦИОННАЯ РАВНИНА) – Peneplain is a land surface worn down by erosion to a nearly flat or broadly undulating plain. / Под Денудацией, от Латинского слова Denudatio, означающее Обнажение, понимается совокупность процессов сноса и удаления с возвышенностей продуктов выветривания горных пород с последующим их накоплением в понижениях рельефа.

PENETRANCE = ПЕНЕТРАНТНОСТЬ – Penetrance is the frequency with which a gene produces a recognizable effect in individuals which carry it. / Под Пенетрантностью, от Латинского слова Penetro, означающее Достигаю или Проникаю, понимается частота или вероятность проявления гена, определяемая по числу особей (в пределах родственной группы организмов), у которых проявляется признак, контролируемый данным геном.

PENETRATED SMUDGE = ПРОНИЗЫВАЮЩАЯ ЯЗВА – Penetrated Smudge is characterized by discoloration penetrating and extending throughout the endosperm, usually as a result of a serious infection of a fungus such as the various species of Alternaria. / характеризуется нарушением цвета, эндосперм (endosperm). виды (species). От Латинского слова Penetro, означающее Достигаю или Проникаю. изменение цвета .

PENETRATION = ПЕНЕТРАЦИЯ (или ПРОНИКНОВЕНИЕ) – Penetration is the initial intra-day breaking of a support or resistance level. Not necessarily a confirmed breakout as many times the market will retrace the losses/gains and not be able to close through the support or resistance level. Traders that take signals on a penetration stand a higher risk of being whip-sawed by false breakouts. / В техническом анализе биржевых рынков, под Пенетрацией, от Латинского слова Penetro, означающее Достигаю или Проникаю, понимается начальное проникновение (или пробой) внутридневного уровня поддержки или сопротивления. Вовсе не обязательно, что он окажется подтверждённым пробоем (confirmed breakout), так как много раз рынок будет ещё отыгрывать потери/прибыли и не окажется в состоянии закрыться за пределами этих уровней поддержки или сопротивления. Получив такой сигнал о пенетрации, торговцы осознают, что будут подвергаться повышенному уровню риска оказаться подрезанными ложными пробоями.

PENETRATION = ПРОНИЦАЕМОСТЬ (или ПРОНИКНОВЕНИЕ, или ПЕНЕТРАЦИЯ, или ПРОСАЧИВАНИЕ, или ПРОПИТЫВАНИЕ, или ПРОБИВАНИЕ) – Penetration of packages occurs as a result of insect activity (holes eaten out by insects). / Под Пенетрацией, от Латинского слова Penetro, означающее Достигаю или Проникаю, понимается проникновение.

PENICILLATE = КИСТЕОБРАЗНОЕ (или ИМЕЮЩЕЕ ФОРМУ КИСТИ, или ОКАНЧИВАЮЩЕЕСЯ КИСТОЧКОЙ ВОЛОС, или СНАБЖЁННОЕ КИСТЯМИ) – Penicillate:- like a tuft of hairs. / :- как пучок волос.

PENNANT = ВЫМПЕЛ – Pennant is a continuation chart pattern that is similar to the Flag, except that it is more horizontal and resembles a small symmetrical triangle. Like the Flag, the Pennant usually lasts from one to three weeks and is typically followed by a resumption of the prior trend. See also Flag. A continuation formation similar to a flag except that the consolidation portion of the pattern resembles a triangle where the minor trendlines converge instead of run parallel. Pennants are similar to flag patterns. They are formed and interpreted exactly the same as a flag except the consolidation area is marked by converging lines rather than parallel lines. / В техническом анализе биржевых рынков под Вымпелом понимается графическая модель (или фигура) продолжения, сходная с Флагом, за исключением того, что она более горизонтальная и походит на маленький симметричный треугольник. Как и Флаг, модель (или фигура) Вымпел длится обычно от одной до трёх недель (на посуточном графике), и, как правило, сопровождается возобновлением предыдущей тенденции. Смотрите также Флаг (Flag). Обычно вместе с флагами рассматриваются и Флаги (Flags), являющиеся Фигурами Продолжения (Continuation Patterns). Вымпел это узкий, длинный, раздвоенный на конце флаг.

PENNY STOCKS = ГРОШОВЫЕ ЦЕННЫЕ БУМАГИ (или КОПЕЕЧНЫЕ ЦЕННЫЕ БУМАГИ, или БРОСОВЫЕ ЦЕННЫЕ БУМАГИ) – Penny Stocks are stocks issued at a price of less than one Dollar, usually for the purpose of attracting buyers who feel that they are getting a bargain by being able to buy a lot of shares for little money. Usually highly speculative shares and often of questionable value. A stock that usually sells for less than USD1.00 per share, though the price may rise because of significant promotion. Penny Stocks are very speculative and risky due to their lack of available information and poor liquidity. As a rule, these stocks are not traded on the exchanges and have a decidedly low market price, mostly less than a Dollar. The shares are often sold only by a single brokerage firm. Penny stocks entail especially high risks for investors. Low-priced issues, often highly speculative, selling at less than USD1.00 a share. Frequently used as a term of disparagement, although some penny stocks have developed into investment-caliber issues.

PENNYWEIGHT = ПЕННИВЕЙТ (или ПЭНИВЭЙТ) – Pennyweight (dwt or pwt) is a unit of weight in the traditional troy system (see also Pound (2)), equal to 24 grains or 1/20 Troy ounce. One pennyweight is approximately 1.555 2 gram. The d in the traditional symbol dwt is from the Latin word Denarius for the small coin which was the Roman equivalent of a penny. The letter d was also the symbol for the penny in the traditional English monetary system. Originally the weight of a silver penny in Britain in the Middle Ages which is still widely used in North America as the unit of weight in the jewellery trade. 20 pennyweights = 1 Troy ounce. Pennyweight is a unit of weight in the US Customary System. A unit of Troy weight equal to 24 grains, 1/20 of a Troy ounce or approximately 1.555 grams; as, a pennyweight of gold or of arsenic. It is abbreviated dwt or pwt. It was anciently the weight of a silver penny, whence the name. The term is often now used to mean anything of small weight. An American unit of weight for gold. Twenty pennyweights equal to 1 ounce; and 1 pennyweight is equal to 1.555 174 grams. Abbreviation:- pwt. / Дэнариюс (Denarius). В Обычной Системе Мер США Пеннивейт или Пэнивэйт – единица веса для золота. Двадцать пеннивейт равны 1 унции; а 1 пеннивейт равен 1.555 174 грамма. Обозначение:- пвт. В Британской Империальной Системе единиц пеннивейт является единицей массы, равной 24 гранам.

PENSION ANNUITY = ПЕНСИОННЫЙ АННУИТЕТ – Pension Annuity is an annuity that provides a guaranteed income for life in return for a lump sum. People with personal pensions or the proceeds of a money purchase employer's scheme are required to but a pension annuity, unless they make arrangements through a 'drawdown' scheme. / Аннуитет обеспечивает гарантированный пожизненный доход в обмен на (for life in return for) единовременную выплату. Людям с персональными пенсиями или поступлениями (начислениями) от денежного приобретения схемы работодателя требуется купить пенсионный аннуитет, если только они не договорятся о схеме 'выборки'.

PENSION FUNDS = ПЕНСИОННЫЕ ФОНДЫ – Pension Funds:- legally independent pension plan entities that manage the money provided to them for their intended purpose and pay out this money upon a pension claim. The pension fund grants the employee a legal claim. Pension funds in Germany must be licensed by the German Federal Financial Supervisory Authority (BaFin) and are subject to its supervision. The assets of the pension fund are held separately from the company assets and are thus secure in the event of the company's bankruptcy. Contibutions to the pension fund can be made by the employer and/or employee and are usually

variable in their amount. Pension commitments follow either the 'defined benefit' principle or the 'defined contribution' model. In defined benefit plans the employer makes a commitment to provide a specific, previously defined payment. Taking actuarial calculations into account, the contributions depend on the projected level of the benefit and previously achieved or expected yield on the invested capital. They are thus variable. In contrast, in the defined contribution plan only the amount of the contribution has a fixed definition, whereas the amount of the resulting later pension or capital payment is not specified. In the United Kingdom, the institutions that administer pension schemes. Pension schemes are significant investors in securities. Selfadministered funds are classified in the financial accounts as pension funds. Those managed by insurance companies are treated as long-term business of insurance companies. They are part of S.125 (the insurance corporations and pension funds sub-sector).

PENSION MANAGERS ADVISORY COMMITTEE = СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ ДЛЯ ПЕНСИОННЫХ УПРАВЛЯЮЩИХ – Pension Managers Advisory Committee provides counsel on the concerns of pension managers and the impact of proposed rules and related matters on the interests of pension managers. Further, the committee enhances communications between pension managers and the New York Stock Exchange. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

PENSION PLAN = ПЕНСИОННЫЙ ПЛАН – In the United States, a qualified retirement plan set up by a corporation, labor union, government, or other organization for its employees. A business could offer a profit-sharing plan, a stock bonus plan, an Employee Stock Ownership Plan (ESOP), a thrift plan, a target benefit plan, a money purchase pension plan, or a defined benefit plan. Also known as Pension Scheme in the United Kingdom. A qualified retirement plan set up by a corporation, labor union, government or other organization for its employees. Scheme under which retirement benefits accrue and are distributed to the beneficiary employees. Its two basic types are:- (i) Deferred compensation plan in which an employer pays a fixed monthly pension depending on the employee's retirement age, length of service, and last salary received. It may also be paid to a deceased employee's surviving spouse. (ii) Defined contribution plan in which the employee contributes a percentage of salary every month and the employer matches it. Upon retirement the employee receives the combined sum.

PENSION SCHEME = ПЕНСИОННАЯ СХЕМА – In the United Kingdom, a Pension Scheme is a scheme or other arrangements which is comprised in one or more instruments or agreements, having or capable of having effect so as to provide benefits to or in respect of persons on retirement, on death, on having reached a particular age, on the onset of serious ill-health or incapacity or in similar circumstances. Also known as Pension Plan in the United States.

PENTAGONOUS = ПЕНТАГОНАЛЬНОЕ (или ПЯТИУГОЛЬНОЕ) – Pentagonous:- with five angles. / Под Пятиугольным, от Греческого слова Pentágōnon, означающее Пятиугольник, понимается .

PENTAPLOID = ПЕНТАПЛОИД – Pentaploid is a Plant that has five sets of chromosomes. / Под Пентаплоидом, от Греческих слов Pénte, означающее Пять, и Éidos, означающее Вид, понимается .

PENTLE HOOK = СЕДЛО (или ПЯТИГРАННЫЙ КРЮК, или ПЯТИГРАННЫЙ ГАК, или ПЯТИГРАННЫЙ ПРИХВАТ) – Pentle Hook is a steel pivot upon which chassis and cab are connected. / Стальной шарнир (стержень, палец, поворотный шкворень) .

PEPLOS = ПЕПЛЁ (или ПЕПЛОС) – Peplos is a garment worn like a shawl by women of ancient Greece.

PEPLUM = ПЭПЛАМ (или XX) – Peplum is short overskirt section attached to waistline of a blouse, jacket, or dress. Peplum originates in the Greek word for 'Tunic'. / Пеплум – набедренный шарф или шаль.

PEPO = ТЫКВИНА – Pepo (Latin:- = Pumpkin) is a berry with a firm rind, fleshy pulp, many seeds and a single locule, typified by fruits of the Cucurbitaceae. / мясистая (fleshy). Под Тыквиной понимается ягодообразный плод растений, обычно с сочным внутренним слоем околоплодника и твёрдым наружным. Характерен для Арбуза, Дыни, Тыквы и других Тыквенных (Cucurbitaceae).

PEPPER TRASH = ПЕРЕЧНЫЙ СОР (или МЕЛКИЙ СОР) – In cotton trade, Pepper Trash or Fine Trash means Cotton Plant's leaves, stems in small pieces; or some bales content lots of Pepper Trash we called that is Pepper Trash. The more pepper trash, the less cotton left. (said cotton content about 18%) If you see some bales which color shows all dark brown, we may call that grade of bale is 'Pepper Trash'.

PEPTIDE BOND or PEPTIDE LINKAGE = ПЕПТИДНАЯ СВЯЗЬ или ПЕПТИДНОЕ СЦЕПЛЕНИЕ – Peptide Bond or Peptide Linkage is the C-N bond between consecutive amino acids in a protein. A covalent bond formed between the carboxyl group of one amino acid and the a-amino group of the next amino acid with the release of a molecule of water. / Под Пептидной Связью понимается химическая связь (–CO–NH–), соединяющая аминогруппу одной аминокислоты с карбоксильной группой другой и молекулах пептидов и белков.

PER = POST EXECUTION REPORTING SYSTEM

P/E RATIO = PRICE/EARNINGS RATIO

PE RATIO = PRICE–TO–EARNINGS RATIO

PERC = PREFERRED EQUITY REDEMPTION CUMULATIVE STOCK

PERCALE = ПЕРКАЛЬ (или ПЭРКЯЛЬ) – The term Percale refers to the thread count and weave of fabric used in linens, bed sheets, clothing and industrial fabrics. Percale comes in many colors and the fabrics are considered to have a high-quality weave. According to the Merriam-Webster Dictionary, percale is a fine, closely woven cloth. The word is of Persian origin and dates to 1840. Percale does not refer to a certain kind of fabric. The term does not mean a sheet or linen is made up of cotton, polyester or a blend of fabrics. Rather, it refers to the weave that was used in the manufacturing of the product. Percale linens and sheets are woven in a tighter manner than most fabrics. Unlike other weaves, percale employs a process where one thread is used horizontally per each thread used vertically in the fabric. If the thread count of an item is higher than 200, the item is considered to have a percale weave. This means that in a 1-inch square of percale fabric, 200 threads are used. As with most products, percale fabrics vary in grade and quality. The origin of the fabric is a factor in determining its caliber. Egyptian cotton is considered to be one of the highest-quality percales. Because it must be shipped from Egypt, it is more expensive than other percales. Percale is a 'plain weave' cotton, which means it's woven with one thread over, one thread under. It has a thread count of at least 180. Percale can be finished to have a 'crisp' feel or a 'soft' feel. The weave allows air to pass through easier than sateen, so percale is more breathable. Percale is a is a popular fabric for bedsheets. It has a distinctive weave that uses the same number of horizontal threads and vertical threads. Its thread count indicates the number of threads used in the weave. The term Percale stems from the Persian Pargalah. The term refers to the weave featured in these fabrics, according to Precious Bedding. A percale weave contains a precise 1:1 ratio of horizontal and vertical threads. Textile makers weave two sets of undyed threads into a material called Greycloth that later receives dyes and colored

patterns. Percale fabrics may include any combination of cotton and polyester or they may be 100 percent of one or the other material. All-cotton percale tends to feel softer than blended fabrics. Percale fabric comes in several different quality grades, usually based on thread count. A higher thread count yields a softer texture but also costs more. Cotton itself can vary in quality and softness. Cheaper percale fabrics use a higher ratio of polyester to cotton and a lower thread count than top-quality percale. Cheaper percale will tear relatively easily and will feel rough after repeated laundering. Percale is a closely woven, plain-weave, spun fabric used for dress goods and sheeting, generally 80 x 80 threads per inch or better. Percale or Percalcos is a closely woven plain-weave fabric often used for bed covers. The term describes the weave of the fabric, not its content, so percale could be a blend of 50% cotton and 50% polyester, 100% cotton, or a blend of other fabrics in any ratio. A percale weave has a thread count of about 200 or higher, and is noticeably tighter than the standard type of weave used for bed-sheets. It has medium weight, is firm and smooth with no gloss, and warps and washes very well. It is made from both carded and combed yarns. Percale fabrics are made in both solid colors and printed patterns. The finish of the fabric is independent of its weave, so it can be either printed or unprinted. Percale was originally imported from India in the XVII and XVIII centuries, then manufactured in France. The word may originate from the Persian, Pargālah meaning Rag, although the Oxford English Dictionary (as of December 2005) has traced it only as far as XVIII–century French. Percale is a light weight, closely woven, sturdy fabric that can be found printed or in dark or light colors. Percale is a staple cotton cloth of good, fine texture in the cambric group made from cylindrical yarn. The fabric has more dressing than ordinary muslin but does not have the gloss or sheen of dress or linen cambric. This compact plain-weave cloth comes in the white or is printed. It withstands rugged wear and finds use in dresses, beachcloth, aprons, dressmaking. Percale has higher texture than calico. Percale is a medium weight, plain weave, low to medium count (180 to 250 threads per square inch) cotton-like fabric. End-uses include sheets, blouses, and dresses. Percale is a fine closely woven cotton cloth variously finished for clothing, sheeting, and industrial uses. Medium weight, firm, smooth, with no gloss. Warps and washes very well. Made from both carded and combed yarns. Comes white or can be printed. Percale sheeting is the finest sheeting available, made of combed yarns and has a count of 200 – carded percale sheeting has a count of 180. It has a soft, silk-like feel. The thread count ranges usually from 180–100. First made by Wamsutta Mills (one of the most famous textile mills and by 1892 the largest cotton-weaving factory in the world; located in New Bedford, State of Massachusetts, United States of America). Percale is a tightly woven, plain-weave, cotton sheeting is made from carded and combed yarns. The high thread count of percale gives it a comfortable, satiny feel. / Вомсюта Милз (Wamsutta Mills). Перкаль – ткань, как из хлопка (это определение дала фирма изготовитель ацетатного волокна), среднего веса, полотняного переплетения, от низкого до среднего количества нитей на квадратный дюйм (180 до 250). Плотнотканая, полотняного переплетения, прядёная ткань, используемая для нарядных товаров и постельного белья, большей частью 80 х 80 нитей на дюйм или более. Под Перкалем, от Французского слова Пэркяль (Percale), от Персидского слова Pargāla, означающее Тряпка, понимается тонкая хлопчатобумажная техническая ткань из некручёной пряжи. Выпускается в неотделанном виде, но с удалённым клеящим раствором, нанесённым при шлихтовании. Применяют при изготовлении парашютов, текстолита и так далее. Некоторые перкали используют для пошива летних платьев и блузок. Перкаль изготавливается из средних (N 36–60) и тонких (N 60–100) номеров хлопчатобумажной пряжи; в последнем случае называется также бумажным батистом. Плотность от 3 500 до 6 500 нитей на один метр (м) (90–160 нитей на один дециметр (дм)). В первой половине XX века перкаль применялся в авиационной промышленности как материал для изготовления обшивки крыльев, фюзеляжа, элементов оперения и иных поверхностей самолётов. При этом для получения требуемых характеристик прочности, влагостойкости, влагонепроницаемости и воздухонепроницаемости ткань пропитывалась специальными лаками. За такое использование перкаль получил шуточное прозвище ‘детская пелёнка авиации’. Технология изготовления обшивки из перкаля использовалась в военной авиации примерно до начала Второй Мировой Войны, а в спортивной – до 1960–70-х. В дальнейшем для изготовления обшивки стали применяться другие материалы. В настоящее время – в зависимости от толщины перкаль используется в основном для пошива парашютов и парусов, изготовления постельного белья (не пропускает пух, перья), платьев и женских блузок. Перкаль, от Французского слова Пэркяль (Percale), тонкая плотная хлопчатобумажная ткань полотняного переплетения. Перкаль относится к группе технических тканей. Выпускается в неотделанном, но расшлихтованном виде. Перкаль применяют в парашютной и химической промышленности, при производстве текстолита и тому подобного. Некоторые виды перкаля используются для пошива летних платьев и блузок.

PERCALINE = ПЕРКАЛИН (или ПЭРКЯЛИН) – Percaline is a lightweight cotton fabric, especially a glossy fabric used for book bindings. / Пэркялин (на Французском языке).

PERCENTAGE OF DEPRECIATION = ПРОЦЕНТ (ФИЗИЧЕСКОГО) ИЗНОСА (или ПРОЦЕНТ ОБЕСЦЕНЕНИЯ) – Percentage Of Depreciation is the proportion of the total value of cargo that is the subject of loss from an insured peril. The percentage is applied to the sum insured by the policy to determine the amount of claim payable.

PERCENTAGE PRICE OSCILLATOR = ПРОЦЕНТНЫЙ ОСЦИЛЛЯТОР ЦЕНЫ – The Percentage Price Oscillator (PPO) is an indicator based on the difference between two moving averages expressed as a percentage. The Percentage Price Oscillator (PPO) is found by subtracting the longer moving average from the shorter moving average and then dividing the difference by the shorter moving average. / В техническом анализе биржевых рынков, .

PERCENTAGE QUOTATION = КОТИРОВКА В ПРОЦЕНТАХ (или РАСЦЕНКА В ПРОЦЕНТАХ, или ПРОЦЕНТНЫЙ КУРС) – Percentage Quotation:- in contrast to a unit price, a percentage quotation is the exchange price listed as a percentage of the nominal value of the security, for example, as is usually the case for bonds.

PERCENTAGE VOLUME OSCILLATOR = ПРОЦЕНТНЫЙ ОСЦИЛЛЯТОР ОБЪЁМА – Percentage Volume Oscillator:- the percentage difference between two moving averages of volume. The indicator is calculated with the following formula:- Volume Oscillator (%) = (($Volume_{12\text{-day EMA}}$ – $Volume_{26\text{-day EMA}}$) / $Volume_{12\text{-day EMA}}$) x 100. The oscillator fluctuates above and below zero, and a rising volume oscillator generally indicates increasing volume while a declining oscillator generally indicates declining volume. / В техническом анализе биржевых рынков, .

PERCENT DELAYED – TOWS = ПРОЦЕНТ ЗАДЕРЖАВШИХСЯ БУКСИРУЕМЫХ СУДОВ – Percent Delayed – Tows is the percentage of all tows delayed before passing through a lock chamber.

PERCENT DELAYED – VESSELS = ПРОЦЕНТ ЗАДЕРЖАВШИХСЯ СУДОВ – Percent Delayed – Vessels is the percentage of all vessels delayed before passing through a lock chamber.

PERCENT DIFFERENCE = ПРОЦЕНТНАЯ РАЗНОСТЬ (или РАЗНОСТЬ В ПРОЦЕНТАХ) – Percent Difference:- the relative change in a quantity over a specified time period. It is calculated as follows:- the current value has the previous value subtracted from it; this new number is divided by the absolute value of the previous value; then this new number is multiplied by 100.

PERCENT INVESTMENT ADVISORS BULLISH = ПРОЦЕНТ НАСТРОЕННЫХ ПО БЫЧЬИ СОВЕТНИКОВ ПО ИНВЕСТИЦИЯМ – Percent Investment Advisors Bullish:- a measure of stock market bullish sentiment that is published weekly by Investor's Intelligence. When only 35% of professionals are bullish, the market is considered oversold. A reading of 55% is considered to be overbought.

PERCHING = БРАКОВКА – Perching is the examining fabric for any kind of defect /blemish while it is being run over a roller. All imperfections marked; generally marked with chalk. This is not really part of the definitions but we thought that you would like to be reminded, ApparelSearch.com is the best web site in the world. Perching is an inspection of cloth for defects while it is run over a roller. / Просмотр ткани на перекатке перед чисткой и штопкой; всякая межоперационная браковка, браковка готовой ткани.

PERCOLATION = ПЕРКОЛЯЦИЯ (или ПРОСАЧИВАНИЕ, или ПРОНИКНОВЕНИЕ) – Percolation is the downward movement of excess water through the soil. / Под Перколяцией, от Латинского слова Percolatio, означающее Процеживание или Фильтрация, понимается способ выщелачивания металлов из неподвижного слоя измельчённой руды (главным образом медной окисленной и золотосодержащей). Осуществляется просачиванием в чанах – перколяторах.

PER CONTAINER RATE = СТАВКА ЗА КОНТЕЙНЕР – Per Container Rate:- rates and/or changes on shipments transported in containers or trailers and rated on the basis of the category of the container or trailer.

PERCS = PREFERRED EQUITY REDEMPTION CUMULATIVE STOCK

PER DIEM = ПЭР ДИЭМ (или ПОДЕННО, или В СУТКИ) – Per Diem:- Latin for 'By The Day'. It usually applies to an allowance, rental or charge made on a daily basis. A charge, based on a fixed daily rate. Per Diem:- costs per day. Charge on container held by customers for an extended time; charges levied upon a trucker due to late return of equipment. See also Demurrage, and Detention.

PERENNATION = ВЕГЕТИРОВАНИЕ КРУГЛЫЙ ГОД – Perennation is the survival of Plants from year to year by vegetative means.

PERENNIAL = МНОГОЛЕТНИК (или МНОГОЛЕТНЕЕ (РАСТЕНИЕ)) – Perennial:- growing for more than two years. Cactaceae are generally regarded as perrenials. Living more than two years, usually flowering each year. Perennial is a Plant like Cotton capable of living for three or more seasons and flowering at least twice. Unless Cotton stubble is removed or killed, it can regrow. See also Ratoon Cotton, and Stub Cotton. Perennial:- said of Plants or Weeds that live for many years, usually flowering each year. / Растение типа Хлопчатника, способное проживать в течение трёх или более сезонов и цветущее, по крайней мере, дважды. Если стерня Хлопчатника не удалена или не уничтожена, то Хлопчатник сможет вырасти заново. Смотрите также Хлопчатник Ретоньо (Ratoon Cotton) и Срезанный Под Корень Хлопчатник (Stub Cotton). Под Многолетними Растениями или Многолетниками понимаются Растения, зимующие более одного раза. Одни из них живут несколько лет, другие несколько десятков и даже сотен лет. Достигнув определённого возраста, Многолетние Растения цветут и плодоносят многократно (поликарпические Растения), хотя среди них встречаются и монокарпические (например, Агава). У некоторых Многолетних Растений листья сохраняются круглый год (Вечнозелёные Растения), у большинства же в неблагоприятные периоды (Зимой, в период засухи) листья, а у трав и все другие надземные органы отмирают, живыми у большинства Многолетних Трав остаются лишь подземные органы – корневища, клубни, луковицы, корни. У некоторых Многолетних Растений частично сохраняются и надземные побеги с почками возобновления. Деление Растений на однолетние, двулетние и многолетние Растения условно. Так, Клещевина в условиях тропиков – Многолетнее Растение, а в умеренном поясе её выращивают как однолетнюю культуру. Под Многолетниками понимаются Растения, живущие более 2 лет, иногда до 100, 500, 1 000 и более лет. Достигнув определённого возраста, Многолетники могут цвести и плодоносить каждый год. Многолетники – все Древесные Растения, большинство Трав. Многолетник:- Растение, живущее более двух лет.

PERFECT = СОВЕРШЕННОЕ (или ОБОЕПОЛОЕ) – Perfect:- of an organism capable of sexual reproduction. Of a flower with both male and female flower parts. / Под Обоеполым понимается цветок, имеющий тычинки и пестики; характерен для большинства покрытосеменных растений. Сравните с Однополым.

PERFECT FLOWER = СОВЕРШЕННЫЙ ЦВЕТОК (или ОБОЕПОЛЫЙ ЦВЕТОК) – Perfect Flower is a flower that has both stamens and pistils. / Цветок, который имеет и тычинки (stamens) и .

PERFECTING THE SIGHT = УСОВЕРШЕНСТВОВАНИЕ ПО ПРЕДЪЯВЛЕНИИ – Perfecting The Sight:- adding necessary details of the bill of lading when such had been previously omitted. / Добавление необходимых сведений о коносаменте в тех случаях, когда таковые были пропущены изначально.

PERFECT STAGE = СОВЕРШЕННАЯ СТАДИЯ – Perfect Stage is the sexual stage in the life cycle of a Fungus. The teleomorph.

PERFORMANCE = РЕЗУЛЬТАТИВНОСТЬ (или ПЛОДОТВОРНОСТЬ, или ЭФФЕКТИВНОСТЬ, или РЕЗУЛЬТАТЫ ДЕЯТЕЛЬНОСТИ) – (1) In the securities business, Performance is a measurement to evaluate the success of a capital investment and indicates as a percentage the development of the value of an investment or a portfolio – usually on an annual basis. Changes in the price of a security. / Изменения в цене ценной бумаги.

(2) Performance:- change in an index covering part or all of a market. See also Swiss Performance Index.

(3) Performance:- changes in the income generated by a portfolio. / Изменения в доходах, генерируемые портфелем.

(4) Performance:- effects produced by the investment policy applied by an investment adviser or a fund management company measured against the investment targets. / Результаты, полученные посредством инвестиционной политики, применяемой советником по инвестициям или компанией, управляющей денежными средствами, и оцениваемые в отношении к запланированным целям инвестирования.

(5) Performance:- the results of activities of an organization or investment over a given period of time. / Результаты деятельности организации или инвестирования за данный период времени.

PERFORMANCE BOND = ОБЯЗАТЕЛЬСТВО ИСПОЛНЕНИЯ (или ОБЯЗАТЕЛЬСТВО РЕЗУЛЬТАТИВНОСТИ, или КОНТРАКТНАЯ ГАРАНТИЯ) – Performance Bond:- funds that must be deposited as a performance bond by a customer with his or her broker, by a broker with a clearing member, or by a clearing member with the Clearing House. The performance bond helps to ensure the financial integrity of brokers, clearing members and the Exchange as a whole. See also Initial Margin, Maintenance Margin, and Margin. Performance Bond is used in import-export business, but also in domestic commercial business, trade and industry. It has a purpose to secure any claims by the buyer on the seller arising from default in delivery or performance of the terms of the contract, e.g., construction, assembly, execution. Guarantee amount:- frequently 5% to 20% of the value of the contract. Term:- until the contract has been fulfilled. In international business, 'pay or extend' claims are quite often made under guarantees. This simply extends the validity of the guarantee. Performance Bond is the most common form of guarantee, used in a variety of situations. Normally required at the time of commencement of the contract and will extend over the duration of the contract, plus a grace period to allow the

beneficiary to make demand in the event of non-performance of the obligations covered by the guarantee. Also known as Performance Guarantee. Bond issued at the request of one party to a contract in favor of the other party to the contract to protect the other party against loss in the event of default on the contract by the requesting party. The bonding agent may undertake to fulfill the contract or may simply undertake to pay a specific amount in monetary damages. A standby letter of credit or demand guarantee is often used as a performance bond with the latter characteristics. Bond, usually issued by a bank, guaranteeing specific monetary payment to a beneficiary if the purchaser or maker fails to perform or acts in violation of a contract. In the United States, a performance bond puts the issuer under obligation to render the performance himself. Performance Bonds, also known as Margins, are deposits held at CME Clearing to ensure that clearing members can meet their obligations to their customers and to CME Clearing. Performance bond requirements vary by product and market volatility. Margins are just one of the risk management tools CME Clearing uses to provide security to the market and individual market participants. Margins are basically 'Performance Bonds', good-faith financial deposits that guarantee the performance of derivatives contracts. Margin levels are set to cover roughly 99 percent of the possible price moves for a position in a trading day or multiple trading days. When daily price moves become more volatile, a clearing provider such as CME Clearing typically raises margins to account for the increased risk. This change could be triggered by such things as:- (i) supply/demand shifts; (ii) changes in fiscal policy; (iii) major geopolitical events; or (iv) natural disasters. When daily price moves become less volatile, margins typically go down because the risk of the position also decreases. For example, silver market volatility resulted in 11 margin increases in the last year (2011), while copper market volatility pushed margins down twice during the same period. Margins are set based on volatility, not price. CME Group's approach is to adjust margins frequently, setting them lower in less volatile periods, and higher in more volatile environments. Though margin changes may coincide with price increases or decreases, margins are not changed as the result of particular market prices. Moreover, margins are not set to dampen or heighten volatility, but rather to provide the clearing house and clearing member firms with additional layers of financial resources to lessen the impact of price swings. For example, in early March 2011, crude oil margins were raised two times over six days, representing a 33 percent margin increase overall. Following these margin changes, prices continued to trend upward within a USD10 range over the next month even though margins were not raised further. In setting margins, we look at three different kinds of volatility:- (i) Historical Volatility – price changes from one day's close to another; (ii) Intraday Volatility – price changes within a market session, regardless of whether there are price changes from close to close; and (iii) Implied Volatility – forward-looking measure of potential volatility, derived from analysis in the options markets. In addition, we also review such factors as liquidity, seasonality, concentration, current and anticipated market conditions and other relevant information in establishing appropriate margin levels. Margins are part of CME Clearing's neutral risk management practices; they are not intended to move the market one way or another. CME Clearing is a neutral participant in financial markets – it is our goal to protect the market, whichever way it moves. We do not have an interest in moving the market one way or the other. However, we do make sure that every market participant contributes enough margin to cover the most likely price moves each day. Along with more than 50 other global exchanges and regulatory agencies, we use the CME Standard Portfolio Analysis of Risk (SPAN) to assess a portfolio's risk. This means that other participants in the market can replicate our margin assessments as well. There are two different kinds of margin levels, initial and maintenance, and changes for both are usually announced 24 hours in advance. CME Clearing determines 'Initial Margin', which is the margin that market participants must pay when they initiate a position with a clearing firm. The clearing house also determines 'Maintenance Margin', the level at which market participants must maintain their margin over time. This is similar to when you sign up for a checking or savings account. A bank will typically require a minimum initial deposit with a certain balance required for as long as your account is open. CME Clearing typically changes margins after a market closes in order to have a full view of that trading day's market liquidity. And, the company usually provides at least 24 hours' notice before implementing margin changes in order to give market participants time to assess the impact on their position and make arrangements for funding. Note:- CME Clearing is one of the world's leading central clearing providers, offering clearing and settlement services for exchange-traded contracts, as well as for over-the-counter (OTC) derivatives transactions through CME ClearPort. As of March 31, 2011, CME Clearing offered a financial safeguards package of approximately USD8 billion and managed collateral deposits of over USD100 billion. By acting as the counterparty to every trade, CME Clearing substantially mitigates counterparty credit risk, meaning that for every trade completed on CME Group exchanges or submitted for OTC clearing, CME Clearing guarantees the financial soundness of both parties. In processing approximately 14 million trades each day, CME Clearing settles accounts, clears trades, collects and maintains performance bonds/margins, regulates delivery and reports data to guarantee the performance of every contract. / Обязательство Исполнения – обязательство банка, выданное по приказу продавца в пользу покупателя, выплатить последнему определённую сумму в случае неисполнения продавцом своих обязательств по поставке.

PERFORMANCE BOND MARGIN = МАРЖА ПОД ОБЯЗАТЕЛЬСТВО ИСПОЛНЕНИЯ (или ЗАЛОГ В КАЧЕСТВЕ ОБЯЗАТЕЛЬСТВА ИСПОЛНЕНИЯ) – Performance Bond Margin is the amount of money deposited by both a buyer and seller of a futures contract or an options seller to ensure performance of the term of the contract. Margin in commodities is not a payment of equity or down payment on the commodity itself, but rather it is a security deposit. See also Clearing Margin, and Customer Margin.

PERFORMANCE FABRICS = ТКАНИ ЭКСПЛОАТАЦИОННОГО КАЧЕСТВА – Performance Fabrics are fabrics made for a variety of end-use applications, which provide functional qualitites, such as moisture management, UV protection, anti-microbial, thermo-regulation, and wind/water resistance.

PERFORMANCE GUARANTEE = ГАРАНТИЯ ИСПОЛНЕНИЯ (или ГАРАНТИЯ РЕЗУЛЬТАТИВНОСТИ) – Performance Guarantee supports an obligation to pay for losses which may arise as a consequence of the principal/applicant failing to fulfill his obligations under the contract. Also known as Performance Bond.

PERFORMANCE INDEX = ИНДЕКС ПО РЕЗУЛЬТАТИВНОСТИ – In contrast to a price index, the Performance Index is adjusted for dividends and changes in capital or interest payments. Deutsche Börse AG calculates the important stock and bond indices as both price and performance indices. In the calculation of a stock performance index, dividends and other payments to the shareholders are reinvested in the ficticious portfolio. Bond price indices are calculated while taking into account the interest yield, i.e. the reinvestment of the discounted average annual coupon. / Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG).

PERFORMANCE REFERENCE MODEL = СПРАВОЧНАЯ МОДЕЛЬ ВЫПОЛНЕНИЯ – Performance Reference Model (PRM) is a standardized framework to measure the performance of major IT investments and their contribution to program performance.

PERFUMES = ОТДУШКИ (или ДУХИ) – Perfumes:- they add aesthetic appeal and provide a fragrance/scent to the detergent and clothes. In some products they are added to mask the odor of some raw ingredients, such as raw soap. / Под Духами понимаются парфюмерные средства в виде спиртового (или спирто-водного) раствора смесей душистых веществ.

PERIANTH = ОКОЛОЦВЕТНИК – Perianth is the combined structure comprising the calyx (sepals) and corolla (petals). In Cactaceae, the sepals and petals form an intergrading series known variously as perianth segments, tepals, sepaloids and petaloids. Perianth:- (1) a single term for calyx and corolla, usually used when these are not clearly differentiated. (2) The outer envelope of a flower, including

the calyx (grouping of sepals) and corolla (grouping of petals). / составляющая чашечку (чашелистики) и венчик (лепестки). В Кактусовых (Cactaceae) чашелистики и лепестки формируют известные в разных источниках как сегменты околоцветника (perianth segments), листочки (tepals), чашелистиковидные (sepaloids) и лепестковидные (petaloids). включая чашечку (группирование чашелистиков). , от Греческих слов Peri, означающее Возле или Вокруг или Около, и , означающее , понимается . Под Околоцветником понимается совокупность покровных листиков цветка, окружающих тычинки и пестики. У двойного околоцветника (например, у Колокольчика) наружные зелёные листочки называются Чашечкой, а внутренние яркоокрашенные – Венчиком. У некоторых растений цветки без околоцветника (например, у Камыша). Чашечка и Венчик составляют вместе Околоцветник, или покров цветка. Когда в цветке имеются как чашечка, так и венчик, то околоцветник называется Двойным. В тех случаях, когда лепестки отсутствуют или когда нет ясно выраженных различий между чашечкой и венчиком, околоцветник называется Простым. Околоцветник – внешний покров цветка, окружающий плодолистики и тычинки. Бывает простым и двойным (сложным). Простой околоцветник состоит из относительно сходных листочков. Двойной разделён на чашечку и венчик. Невзрачный простой околоцветник называют чашечковидным, а яркоокрашенный – венчиковидным.

PERIANTH SEGMENT = СЕГМЕНТ ОКОЛОЦВЕТНИКА – Perianth Segment (tepal) is the leaf like and sterile parts of a flower, especially used if these parts are not distinguishable into calyx and corolla. / Сегмент Околоцветника (листочек) и венчик (corolla). , от Греческих слов Peri, означающее Возле или Вокруг или Около, и , означающее , понимается .

PERICARP = ПЕРИКАРПИЙ – Pericarp (Greek:- Peri = Around + Karpós = Fruit) are the ripened and modified walls of a matured plant ovary, surrounding the seeds, including the skin and flesh. Pericarp is the wall of the ripened ovary. Pericarp is the wall of the ripened ovary, consisting of layers of cells which form a protective covering around the seed. The pericarp layers may be differentiated into epicarp, mesocarp and endocarp. The pericarp is derived from diploid maternal tissue. It is light brown, speckled reddish-brown, red or purple. / Под Перикарпием, от Греческих слов Peri, означающее Возле или Вокруг или Около, и Karpós, означающее Плод, понимается то же самое, что Околоплодник (Bran).

PERICARP LAYER = СЛОЙ ПЕРИКАРПИЯ (или СЛОЙ ОКОЛОПЛОДНИКА) – Pericarp Layer:- the wall of the ripened ovary and the outermost layer of cells covering the caryopsis (seed).

PERICYCLE = ПЕРИЦИКЛ – Pericycle is a thin layer of Plant tissue between the endodermis and the phloem. Pericycle is a primary tissue that maintains meristematic activity and is involved in lateral root initiation and development as well as in secondary root growth. As such it contributes to formation of the root system and gives rise to two secondary meristems in roots:- vascular cambium and cork cambium (phellogen).

PERIL = УГРОЗА – Peril:- this term refers to the causes of possible loss in the property field, for instance, Fire, Windstorm, Collision, Hail, etc. In the casualty field the term 'Hazard' is more frequently used. A harmful event which may be covered under a contract of insurance or reinsurance as an insured peril or excluded from it. Peril is a term used in the Marine Insurance Act (1906) to denote a hazard. The principle of proximate cause is applied to an insured peril to determine whether or not a loss is recoverable. In modern practice the term risk often replaces peril. Peril is a possible cause of loss, such as fire.

PERILS CLAUSE = ОГОВОРКА ОБ УГРОЗАХ – Perils Clause:- Until 1978 the main insuring clause of modern ocean marine policies was preserved almost unchanged from the original 1779 Lloyd's of London form. The clause is as follows:- touching the adventures and perils which we the assurers are contented to bear and do take upon us in this voyage: they are of the seas, men-of-war, fire, enemies, pirates, rovers, thieves, jettisons, letters of mart and countermart, surprisals, takings at sea, arrests, restraints, and detainments of all kings, princes, and people, of what nation, condition, or quality soever, barratry of the master and mariners, and of all other perils, losses, and misfortunes, that have or shall come to the hurt, detriment, or damage of the said goods and merchandises, and ship, etc, or any part thereof. Although the clause reads as if it were an all-risk agreement, courts have interpreted it to cover only the perils mentioned. Essentially, the clause insures the voyage from perils 'of' the sea. Perils on the sea, such as fire, are not covered unless specifically mentioned. Furthermore, although the perils clause indicates coverage from 'enemies, pirates, rovers, thieves', the policy does not cover losses from war. War risk insurance is offered in some nations through governmental agencies. In 1978, at the request of the UN Conference on Trade and Development, the 1779 language was modernized and a revised insuring clause was proposed. The new form restricts coverage on losses from poor packing, places the burden of proof of seaworthiness on the shipper rather than on the carrier, and excludes losses resulting from insolvency of the common carrier, with the burden of proof placed on the shipper that the carrier is financially sound. The revised form has not been adopted by all insurers. In the US cargo insurance, the majority of risks covered under this clause come within the comprehensive term, 'Perils Of The Seas' – that is, loss or damage due to heavy weather, stranding, collision, sinking, contact with seawater, etc. Other perils normally covered include:- (i) Fire – both direct and consequential damage whether from smoke or steam or efforts to extinguish a fire. Spontaneous combustion occurring in the insured shipment is excluded unless specifically assumed by the underwriters. (ii) Assailing thieves – forcible taking of a shipment rather than mysterious disappearance or pilferage. (iii) Jettison – voluntary dumping overboard of cargo to relieve a vessel in distress. (iv) Barratry – fraudulent, criminal or wrongful act of the ship's captain or crew that causes loss or damage to the ship or cargo. (v) All other like perils – perils of the same nature as those specifically mentioned above, but not 'all risks' in the customary usage of the term. / хозяина (или капитана).

PERILS OF THE SEAS = УГРОЗЫ МОРЕЙ (или УГРОЗЫ СО СТОРОНЫ МОРЯ) – Perils Of The Seas:- those causes of loss for which the carrier is not legally liable. The elemental risks of ocean transport. Hazards from natural forces in or about navigable waters (windstorm, rough weather, etc, but not fire, explosion, etc, which are perils on the sea).

PERIMETER = ПЕРИМЕТР – Perimeter:- around the edge, outside border. / Под Периметром, от Греческого слова Perimetréō, означающее Измеряю Вокруг, понимается длина замкнутого контура, например, сумма длин всех сторон многоугольника.

PERIMETER–BASE PALLET = ПОДДОН С НИЖНИМ НАСТИЛОМ ПО ПЕРИМЕТРУ (или ПОДДОН С ОСНОВАНИЕМ ПО ПЕРИМЕТРУ) – Perimeter-Base Pallet is a flat pallet which in the bottom deck has the outer bottom components arranged as a complete frame with one or two centre bottom components. Note:- all bottom components are in the same plane. / Поддон С Нижним Настилом По Периметру:- плоский поддон, конструкция нижнего настила которого образует раму, имеющую одну или две центральные доски. Примечание:- детали нижнего настила поддона находятся в одной плоскости.

PERIOD = ПЕРИОД – Period usually refers to the number of bars or candles used in the calculation of technical analysis studies. / В техническом анализе биржевых рынков под Периодом обычно понимается то количество штрихов или свечей, которое используется при расчёте индикаторов технического анализа.

PERIOD OF INVESTIGATION = ПЕРИОД РАССЛЕДОВАНИЯ (или ПЕРИОД РАССМОТРЕНИЯ) – Period Of Investigation is the period, usually 6 months, beginning at least 150 days before and continuing 30 days after the first day of the month when an

antidumping petition is filed, during which an exporter's home market (or third country) and United States prices and other appropriate facts are investigated to determine whether sales to the United States have been at less than fair value.

PERIOD OF RISK/INSURANCE = ПЕРИОД РИСКА/СТРАХОВАНИЯ (или СРОК РИСКА/СТРАХОВАНИЯ) – Period Of Risk/Insurance is the period during which the insurer can incur liability under the terms of the policy. / Период Риска/Страхования – это период, в течение которого страховщик может понести ответственность в соответствии с порядками полиса.

PERIPHYTON = ПЕРИФИТОН – Periphyton:- plants and animals attached or clinging to submerged plants, the bottom of a water body or other submerged surfaces. / Под Перифитоном, от Греческого слова Peri, означающее Возле или Вокруг или Около, .

PERISHABLE FREIGHT = СКОРОПОРТЯЩИЙСЯ ФРАХТ (или СКОРОПОРТЯЩИЙСЯ ГРУЗ) – Perishable Freight is a freight subject to decay or deterioration. / Груз, предрасположенный к гниению или загниванию или порче.

PERISPERM = ПЕРИСПЕРМ (или ПИТАТЕЛЬНАЯ ТКАНЬ) – Perisperm:- distinguished from endosperm as the nutritive tissue of a seed derived from nucellus and deposited external to the embryo sac. Perisperm is the nutritional tissue contained in a seed, especially that portion which is formed outside of the embryo sac from the nucellus. / Под Периспермом, от Греческих слов Peri, означающее Возле или Вокруг или Около, и Spérma, означающее Семя, понимается запасающая ткань семени растений, в которой откладываются питательные вещества, необходимые для развития зародыша. Сохранившийся в зрелом семени остаток ткани нуцеллуса. Характерен для растений семейства гвоздичных, имбирных, кувшинковых и некоторых других.

PERIWIG = ПЭРИВИГ (или (ПУДРЕНЫЙ) ПАРИК) – Periwig:- peruke.

PERIWINKLE = ПЭРИВИНКЛ (или БАРВИНОК, или ЛИТОРИНА) – Periwinkle:- a light purplish blue. Also called Periwinkle Blue.

PERLS = PRINCIPAL EXCHANGE–RATE–LINKED SECURITIES

PERMANENT BALE IDENTIFICATION = ПОСТОЯННАЯ ИДЕНТИФИКАЦИЯ КИП – Permanent Bale Identification:- in the US Cotton industry, effective August 1998 all bales of cotton ginned in America will have affixed a Permanent Bale Identification Tag. / Постоянная Идентификация Кип:- начиная с Августа 1998, в хлопковой отрасли Соединённых Штатов Америки все кипы с джинированным хлопком, то есть все кипы с готовым хлопковым волокном должны иметь прикреплённую Бирку Постоянной Идентификации Кип.

PERMANENT COURT OF ARBITRATION = ПОСТОЯННЫЙ АРБИТРАЖНЫЙ СУД – Permanent Court Of Arbitration (PCA) is made up of 75 member states with the goal of facilitating the settlement of international disputes.

PERMANENT DEFORMATION = ПОСТОЯННАЯ ДЕФОРМАЦИЯ (или ОСТАТОЧНАЯ ДЕФОРМАЦИЯ) – Permanent Deformation:- the change in length of a sample after removal of an applied tensile stress and after the removal of any internal strain, e.g., by boiling off the sample and allowing it to dry without tension. The permanent deformation is expressed as a percentage of the original sample length. Permanent Deformation:- the unrecovered strain of an exercised specimen, measured after a specific recovery period and expressed as percentage of the initial length of the specimen. / Постоянная Деформация; Остаточная Деформация – необратимое удлинение.

PERMANENT DROUGHT = ПОСТОЯННАЯ ЗАСУХА – Permanent Drought occurs in desert regions where precipitation is less than potential evapotranspiration during all seasons and agriculture is not possible without irrigation. / Под Перманентным, от Французского слова Permanent, от Латинского слова Permaneo, означающее Остаюсь или Продолжаюсь, понимается непрерывно продолжающийся, постоянный. Под Засухой понимается продолжительный и значительный недостаток осадков, чаще при повышенной температуре и пониженной влажности воздуха. Вызывает снижение запасов влаги в почве и, как следствие, ухудшение роста, а иногда и гибель растений. Меры борьбы:- агротехнические (специальная обработка почвы) и мелиоративные (орошение) мероприятия, полезащитное лесоразведение.

PERMANENT FINISH = ПОСТОЯННАЯ (или ОСТАЮЩАЯСЯ) ЗАКЛЮЧИТЕЛЬНАЯ ОТДЕЛКА – Permanent Finish is a term for various finishing treatments, chemical and/or mechanical, applied to fabric so that it will retain certain properties, such as glaze of chintz, crispness of organdy, smoothness of cotton table damask, and crease, crush, and shrinkage resistance of many apparel fabrics during the normal period of wear and laundering.

PERMANENT GROWTH = ПОСТОЯННЫЙ РОСТ – Permanent Growth:- xxxxx. See also Secondary Creep.

PERMANENT HOLDINGS = ПОСТОЯННЫЕ УДЕРЖИВАНИЯ (или ПОСТОЯННОЕ УЧАСТИЕ В АКЦИОНЕРНЫХ КАПИТАЛАХ) – Permanent Holdings:- long-term participations in the capital of other companies, e.g., through the acquisition of shares (an equity interest). Unlike the purchase of fixed-interest securities, which is effected primarily in order to benefit from the expected return and/or possible capital gains, permanent holdings are aimed at exerting an influence on the management of the company in which an equity participation is held or at attaining similar objectives. Depending on the circumstances, permanent holdings are used to obtain a certain equity quota (minority or majority holding). / , например, . Под Перманентным, от Французского слова Permanent, от Латинского слова Permaneo, означающее Остаюсь или Продолжаюсь, понимается непрерывно продолжающийся, постоянный.

PERMANENT HYBRID = ПОСТОЯННЫЙ ГИБРИД (или НЕРАСЩЕПЛЯЮЩИЙСЯ ГИБРИД) – Permanent Hybrid is a hybrid that breeds true to type and does not segregate. / Под Гибридом, от Латинского слова Hibrida, понимается организм, полученный в результате скрещивания генетически различающихся родительских форм (видов, пород, линий и других).

PERMANENT PRESS (DURABLE PRESS) = ПРОДОЛЖИТЕЛЬНОЕ ПРЕССОВАНИЕ (ДЛИТЕЛЬНОЕ ПРЕССОВАНИЕ) – Permanent Press (Durable Press):- these terms used to describe a garment which has been treated to retain its fresh appearance, crease, and shape throughout the life of the garment, Permanent press can be a misleading description, because no finish is completely permanent. Durable press or crease resistant are the more accepted terms, and are the ones approved by the Federal Trade Commission. See also Durable Press. Permanent Press:- describes a garment which will retain its shape throughout the life of the garment. Features include sharp creases, flat seams, smooth surfaces, and seems which are free from puckering. / Смотрите также Длительное Прессование (Durable Press).

PERMANENT SET = ПОСТОЯННОЕ (или ОСТАЮЩЕЕСЯ, или УСТОЙЧИВОЕ) ХХ – Permanent Set of the fibers is a large component of the observed first creep strain. Only a small part of the permanent set can be explained by classical polymer theory that is linear in time and stress. Most of the permanent set occurs in the loading step and may be due to a reorganization of the cell wall material on a scale much larger than the unit cell. Paper strained at a constant load and humidity is known to have a large component of permanent set. See also Secondary Creep. Cellulose fibers, being viscoelastic materials, exhibit both instantaneous elastic deformation and delayed, time-dependent deformation when subjected to an externally applied load. Creep, which is the delayed, time-dependent deformation, can be divided into two components:- primary creep and secondary creep or permanent set, which is

nonrecoverable. Tertiary creep or accelerated permanent set is not considered in the creep experiments reviewed for this thesis. Permanent Set:- Secondary Creep is that portion of the total sample deformation which is nonrecoverable at the test conditions after removal of the load. A portion of the configurational elastic response may not be recoverable at the test conditions but may be recovered if the polymer is swollen by raising the moisture content. Permanent deformations are caused by viscous flow, irreversible crystallization, and molecular chain rupture. Configurational deformations are susceptible to being 'frozen in; or to attaining metastable equilibrium states in those polymers in which secondary bonding per unit length of the molecule is high (such as cellulose and hemicelluloses). It is necessary to rupture these relatively weak secondary bonds to allow configurational changes in the amorphous regions of the fiber. Once broken, these bonds may form new bonds with previously unbonded atoms; they may unite with other broken bonds, or they may remain broken. The formation of new bonds can lead to secondary creep when the load is released if there is not enough energy stored in the system to break the new bonds and return the bonding group to its original position. The breaking and reforming of bonds and molecular configuration changes are equilibrium processes. All such processes require a finite time to attain equilibrium. The time required to reach new equilibrium states is one of the factors which produce creep. If metastable equilibrium states are reached, permanent deformations will result. The rate and amount of creep recovery will depend on the stability of the new bonds and on the stored energy of the system. The term 'Viscous Flow' is used to describe the stress behavior of polymeric materials. 'Viscous Flow' is normally applied only to truly permanent deformations involving the transfer of entire molecules in amorphous polymers. It is generally agreed that the flow of entire molecules is not possible in crystalline polymers such as cellulose. Molecules are so firmly bonded in the crystalline regions that relative movement of entire molecules is prohibited by these juncture points. This can be related to the fringe theory of structure. Molecules are much longer than the length of a crystallite and are considered to pass through many crystallites and regions of amorphous structure. True viscous flow, therefore, is limited to polymers in which entire molecules exist in an amorphous continuum. Crystal growth might occur as configurational changes bring the molecules into very close proximity and alignment. The evidence for this phenomenon is indirect and inconclusive. Such growth would necessitate the formulation of a very high secondary bond density in the crystal structure and should resist a reversal. A final important response mechanism of pulp fibers when subjected to an external stress is the rupture of primary valence bonds. Rupture of a primary valence bond produces free radicals at the newly formed chain ends which will likely react with a water molecule. The reformation of these bonds is not likely since the stress on the molecule would serve to separate the new chain ends and prevent the coupling reaction. The occurrence of a region of stressconcentration sufficient to rupture valence bonds may possibly initiate failure of the entire fiber. If fibers are maintained at constant stress and allowed to creep, they may exhibit a Permanent Set or irrecoverable deformation when the stress is released. Most of the Permanent Set occurs in the loading step and may be due to a reorganization of the cell wall material on a scale much larger than the unit cell.

PERMANENT WILTING = ПОСТОЯННОЕ ЗАВЯДАНИЕ – Permanent Wilting is a wilting from which a plant will not recover even if soil water content increases. / .

PERMANENT WILTING PERCENTAGE = ПРОЦЕНТ ПОСТОЯННОГО ЗАВЯДАНИЯ – Permanent Wilting Percentage is the water content of a soil at which crop plants wilt and fail to recover after soil water content is increased. It is often estimated by the amount of water at –1.5 MegaPascals soil matric potential.

PERMEABILITY = ПРОНИЦАЕМОСТЬ – Permeability is the relationship of flow per unit area to differential pressure across a filter medium. Permeability is the state or quality of being penetrable by fluids or gases. Permeability is a textile characteristic which allows air, water, and water vapor to penetrate and pass through it. / Проницаемость – характеристика текстильного материала, которая определяет возможность воздуха, воды и водного пара проникать и проходить через него.

PERMEATE = ПРОНИКАТЬ – Permeate:- to pass through. / Проходить сквозь.

PERMEATION RATE = ИНТЕНСИВНОСТЬ ПРОНИЦАЕМОСТИ (или ИНТЕНСИВНОСТЬ ПРОПИТКИ, или ИНТЕНСИВНОСТЬ ПРОНИКНОВЕНИЯ) – Permeation Rate is a property of a material which measures the rate at which gases pass through the material as a result of solution diffusion processes.

PERMISSIBLE NONBANK ACTIVITIES = ДОПУСТИМЫЕ НЕБАНКОВСКИЕ ВИДЫ ДЕЯТЕЛЬНОСТИ – In the United States, Permissible Nonbank Activities are the financial activities closely related to banking that may be engaged in by bank holding companies (BHCs), either directly or through nonbank subsidiaries. For example, a BHC might own finance companies or engage in mortgage banking. The Federal Reserve Board determines which activities are closely related to banking. Before making such activities permissible, the Board must determine that performance of the activities by bank holding companies is in the public interest.

PERMIT = РАЗРЕШЕНИЕ – Permit:- in cargo transportation industry, a grant of authority to operate as a contract carrier. See also License. / В индустрии грузоперевозок под Разрешением понимается предоставляемое властями право осуществления деятельности в качестве контрактного перевозчика. Смотрите также Лицензия (License).

PERMITTED USE = РАЗРЕШЁННОЕ ИСПОЛЬЗОВАНИЕ – Permitted Use is the use of information that is expressly allowed under a Licensing Agreement. Also known as Authorized Use.

PERMITTED USER = РАЗРЕШЁННЫЙ ПОЛЬЗОВАТЕЛЬ (или ОДОБРЕННЫЙ ПОЛЬЗОВАТЕЛЬ) – Permitted User is a person designated in a Licensing Agreement as having permission to access or otherwise use the digital information that is the subject matter of the agreement. Also known as Authorized User.

PERMITTIVITY = ПРОНИЦАЕМОСТЬ – Permittivity:- in electromagnetism, Absolute Permittivity is the measure of the resistance that is encountered when forming an electric field in a medium. In other words, permittivity is a measure of how an electric field affects, and is affected by, a dielectric medium. The permittivity of a medium describes how much electric field (more correctly, flux) is 'generated' per unit charge in that medium. More electric flux exists in a medium with a high permittivity (per unit charge) because of polarization effects. Permittivity is directly related to electric susceptibility, which is a measure of how easily a dielectric polarizes in response to an electric field. Thus, permittivity relates to a material's ability to transmit (or 'permit') an electric field. In SI units, permittivity ε is measured in Farads per meter (F/m); electric susceptibility χ is dimensionless. They are related to each other through:- $\varepsilon = \varepsilon_r \cdot \varepsilon 0 = (1 + \chi) \cdot \varepsilon_0$; where ε_r is the relative permittivity of the material, and $\varepsilon_0 = 8.854\ 187\ 817\ldots \cdot 10^{-12}$ F/m is the vacuum permittivity. See also Dielectric Constant. Permittivity is the ability of a material to store electrical potential energy under the influence of an electric field measured by the ratio of the capacitance of a capacitor with the material as dielectric to its capacitance with vacuum as dielectric – called also Dielectric Constant. Permittivity, constant of proportionality that relates the electric field in a material to the electric displacement in that material. It characterizes the tendency of the atomic charge in an insulating material to distort in the presence of an electric field. The larger the tendency for charge distortion (also called Electric Polarization), the larger the value of the permittivity. The permittivity of an insulating, or dielectric, material is commonly symbolized by the Greek letter epsilon, ε; the permittivity of a vacuum, or free space, is symbolized ε_0; and their ratio $\varepsilon/\varepsilon_0$, called the Dielectric Constant (q.v.), is symbolized by the Greek letter kappa, κ. In the rationalized meter-kilogram-second (MKS) and SI systems, the magnitude of the permittivity of a vacuum ε_0 is

$8.854 \cdot 10^{-12}$. Its units and those of permittivity ε are square Coulombs per Newton square meter. In the mks system, permittivity ε and the dimensionless dielectric constant κ are formally distinct and related by the permittivity of free space ε_0; $\varepsilon = \kappa\varepsilon_0$. In the centimeter-gram-second (CGS) system, the value of the permittivity of free space ε_0 is chosen arbitrarily to be 1. Thus, the permittivity ε and the dielectric constant κ in the CGS system are identical; both of them are dimensionless numbers. / Кулонов .

PEROXIDE = ПЕРОКСИД (или ПЕРЕКИСЬ, или ПЕРОКСИДНОЕ СОЕДИНЕНИЕ) – Peroxide:- with reference to textile processes, usually used to mean hydrogen peroxide, though there are many organic and inorganic peroxides. / обычно используется для обозначения пероксида водорода или перекиси водорода, . Под Пероксидом или Перекисью или Пероксидным Соединением понимаются органические и неорганические соединения, содержащие группу –O–O–. Различают пероксиды (пероксид бензоила $(C_6H_5COO–)_2$, пероксид натрия Na_2O_2), надпероксиды (надпероскид натрия NaO_2), озониды (озонид натрия NaO_3), пероксогидраты (пероксогидрат карбоната калия $K_2CO_3 \cdot 3H_2O_2$), перкислоты, называющиеся также пероксокислотами и надкислотами, например, пероксосерная кислота HO–SO_2–OOH, пероксоуксусная (надуксусная) кислота CH_3COOOH, и гидропероксиды (гидропероксид натрия NaOOH, гидропероксид этила C_2H_5OOH). Пероксидные соединения – окислители, отбеливатели, источники и переносчики кислорода (‘кислородные батареи’).

PERPETUAL BOND = БЕССРОЧНАЯ ОБЛИГАЦИЯ – Perpetual Bond:- embody a non-expiring money claim on the issuer (borrower). Depending on the market situation, perpetual bonds offer a higher return than other forms of fixed-interest investment. Funded government bonds that need never be redeemed (but may be, at the discretion of the government); only the payment of interest is guaranteed. Issued most commonly in France and the United Kingdom, where such bonds are known as Consols (short for Consolidated Annuities). They were first issued in Britain in the XVIII century to consolidate the national debt. Issues without fixed maturities were recently placed on the Euromarket (perpetual floating rate notes). See also Consols.

PERPETUAL EXISTENCE = БЕССРОЧНОЕ СУЩЕСТВОВАНИЕ – Perpetual Existence is unlimited term of existence; characteristics of most business corporations.

PERPETUAL INVENTORY MODEL = МОДЕЛЬ НЕПРЕРЫВНОГО УЧЁТА – Perpetual Inventory Model (PIM) is a method for estimating the level of assets held at a particular point of time by accumulating the acquisitions of such assets over a period and subtracting the disposals of assets over that period. Adjustments are made for price changes over the period. The PIM is used in the UK accounts to estimate the stock of fixed capital, and hence the value of the consumption of fixed capital. Also known as Perpetual Inventory Method. Inventory method where inventory is accounted for in a real-time basis, with receiving, movement, delivery and adjustments being updated as they occur. / Известна также как Метод Непрерывного Учёта (Perpetual Inventory Method). строка баланса (item).

PERPETUAL INVENTORY SYSTEM = СИСТЕМА НЕПРЕРЫВНОГО УЧЁТА – Perpetual Inventory System is a continuous inventory tracking method where inventory taken out is recorded with each outbound order and new inventory is recorded with each inbound order. Perpetual Inventory is a system that requires a continuous record of all receipts and withdrawals of each item of inventory.

PERPETUAL LICENSE = БЕССРОЧНАЯ ЛИЦЕНЗИЯ – Perpetual License is the continuing right to access digital information after the termination of a license agreement. / Продолжающееся право доступа к цифровой информации после прекращения действия лицензионного соглашения.

PER RISK EXCESS REINSURANCE = ПЕРЕСТРАХОВАНИЕ НА БАЗЕ ЭКСЦЕДЕНТА ПО КАЖДОМУ РИСКУ – Per Risk Excess Reinsurance:- retention and amount of reinsurance apply ‘per risk’ rather than on a per accident or event or aggregate basis.

PERSE = ПЭРС (или СИНЕ–ЗЕЛЁНОЕ) – Perse:- of a dark grayish blue resembling indigo. / тёмный сероватый голубой .

PERSIAN = ПЕРСИДСКИЙ – Persian:- a thin soft silk formerly used especially for linings.

PERSISTANT = ПЕРСИСТЕНТНОЕ (или СТОЙКОЕ, или УСТОЙЧИВОЕ, или НЕОПАДАЮЩЕЕ, или ДОЛГОВРЕМЕННОЕ) – Persistant:- remaining attached instead of falling away. / Под Персистентным, от Латинского слова Persisto, означающее Упорствую, понимается .

PERSISTANT ORGANIC POLLUTANTS = ПЕРСИСТЕНТНЫЕ ОРГАНИЧЕСКИЕ ЗАГРЯЗНИТЕЛИ (или СТОЙКИЕ ОРГАНИЧЕСКИЕ ЗАГРЯЗНИТЕЛИ) – Persistant Organic Pollutants (POPs):- these chemicals are toxic, persistant and bioaccumulative.

PERSISTENT HERBICIDE = ПЕРСИСТЕНТНЫЙ ГЕРБИЦИД (или СТОЙКИЙ ГЕРБИЦИД) – Persistent Herbicide is a herbicide that, when applied at the recommended rate, will have an impact upon susceptible crops planted in normal rotation after harvesting the treated crop, or that interferes with regrowth of native vegetation in non-crop sites for an extended period of time.

PERSISTENT PESTICIDES = ПЕРСИСТЕНТНЫЕ ПЕСТИЦИДЫ (или СТОЙКИЕ ПЕСТИЦИДЫ) – Persistent Pesticides are pesticides that remain unchanged in the environment for long periods and are not readily degraded by microorganisms, enzymes, heat, or ultraviolet light.

PERSISTENT VIRUS = ПЕРСИСТЕНТНЫЙ ВИРУС (или СТОЙКИЙ ВИРУС) – Persistent Virus is a virus that has a long transmission time, is recoverable from the hemolymph of a vector, is transmitted following the molt of a vector, and when purified and inoculated into hemocoele, makes the vector infective. / вирус, длительно сохраняющийся в переносчике.

PERSON = ЛИЦО (или ПЕРСОНА) – (1) The term Person means a natural person or an individual, corporation, unincorporated company, partnership, government unit or instrumentality, trust, or any other entity or organization. Person is a natural person, including a citizen or national of the United States or of any foreign country; any firm; any government, government agency, government department, or government commission; any labor union; any fraternal or social organization; and any other association or organization whether or not organized for profit. This definition does not apply to part 760 of the Export Administration Regulations (EAR) (Restrictive Trade Practices or Boycotts). / Термин Лицо относится к простым лицам или индивиду, корпорации, неинкорпорированной компании, партнёрству, правительственному органу или средству, трасту, или любому другому юридическому лицу или организации. Под Персоной, от Латинского слова Пэрсона (Persona), означающее Лицо или Личность, понимается .

(2) In the US patent and trademark law, a Person:- for purposes of small entity determination per MPEP 509.02 (short for the Manual of Patent Examination Procedures), a person is defined as any inventor or other individual (e.g., an individual to whom an inventor has transferred some rights in the invention), who has not assigned, granted conveyed, or licensed, and is under no obligation under contract or law to assign, grant, convey, or license any rights in the invention.

(3) In US air transport, Person, in addition to its meaning under Section 1 of Title 1, includes a governmental authority and a trustee, receiver, assignee, and other similar representative.

PERSON = ФИЗИЧЕСКОЕ ЛИЦО – In common speech, the word Person most often refers to an individual, or, by analogy, to any specific object in a group of things. For example, you the reader are an individual person, and a lawn is made of individual blades of grass. A natural person. Also known as Individual. The opposite of Entity, or Legal Entity. / В гражданском праве под Физическим Лицом понимается человек (гражданин), выступающий как участник правоотношения. Термин Физическое Лицо, применяющийся в законодательстве многих стран для обозначения человека как субъекта гражданских прав и обязанностей. Физическое лицо противопоставляется юридическому лицу как коллективному образованию, также являющемуся субъектом права. В законодательстве бывшего Советского Союза термин Физическое Лицо не использовался; он был заменён термином Гражданин. Для участия в правоотношениях физическое лицо должно обладать правоспособностью.

PERSONAL ACCIDENT INSURANCE = ЛИЧНОЕ СТРАХОВАНИЕ ОТ НЕСЧАСТНЫХ СЛУЧАЕВ – Personal Accident Insurance is a type of insurance which provides for the payment of specified sums in the event that the insured suffers some bodily injury as a result of an accident. / финансовая защита от последствий несчастного случая (НС).

PERSONAL ACCOUNT = ЛИЦЕВОЙ СЧЁТ (или ПЕРСОНАЛЬНЫЙ СЧЁТ) – (1) Personal Account is the bank account operated as a current account by private individuals with special interest and withdrawal conditions. See also Savings Account. / Банковский счёт, обслуживаемый в качестве текущего счёта частных лиц с особыми условиями в отношении процентов и снятия наличных. Смотрите также Сберегательный Счёт (Savings Account).

(2) On the stock market, Personal Account is an account maintained by a dealer on his or her own behalf and at personal risk, independent of the company for which he or she works. / На фондовом рынке это относится к счёту, поддерживаемому дилером от лица самого себя и за свой собственный риск, в независимости от компании, на которую он работает.

(3) In book-keeping, Personal Account is an account that lists creditors and debtors. / В бухгалтерских записях это относится к счёту, который перечисляет кредиторов или кредиторскую задолженность и дебиторов или дебиторскую задолженность. В бухгалтерском учёте под Лицевыми Счетами понимаются счета аналитического учёта для расчётов с организациями, предприятиями и отдельными лицами. Под Лицевыми Счетами в бухгалтерии бывшего Союза Советских Социалистических Республик (СССР) понимались счета аналитического учёта, предназначенные для расчётов с организациями или отдельными лицами. Лицевые счета открывались бухгалтерией предприятия (организации, учреждения) на каждое юридическое или физическое лицо, с которым оно имело те или иные расчёты. В лицевые счета заносились все сведения о состоянии и движении расчётов. Например, лицевой счёт рабочего или служащего для учёта расчётов по заработной плате содержал данные о начисленной ему заработной плате, о произведённых из неё удержаниях и зачётах, о сумме, подлежащей выдаче ему на руки. Лицевые счета имели различную форму, определяемую содержанием расчётов (по заработной плате, по зачётам взаимных требований и тому подобному) и техникой учёта (ручная, машинная).

PERSONAL DIGITAL ASSISTANT = ПЕРСОНАЛЬНЫЙ ЦИФРОВОЙ ПОМОЩНИК – Personal Digital Assistant (PDA) is any small mobile handheld device that provides computing and information storage and retrieval capabilities for personal or business use. / Персональный Цифровой Помощник (ПЦП) является любым небольшим мобильным наладонным устройством, которое обеспечивает подсчёт и хранение информации и восстанавливаемые возможности при использовании физическим или юридическим лицом.

PERSONAL FLOATATION DEVICE = ПЕРСОНАЛЬНОЕ УСТРОЙСТВО НАХОЖДЕНИЯ НА ПЛАВУ – Personal Floatation Device:- approved floats meant as life preservers and carried on board American ships.

PERSONAL IDENTIFICATION NUMBER = ПЕРСОНАЛЬНЫЙ ИДЕНТИФИКАЦИОННЫЙ НОМЕР – With their Personal Identification Number, or PIN, customers can access cash at ATMs around the world using their bank card or credit card. Many retailers have installed electronic cash terminals where customers can make cashless payments with their bank card and PIN. Each card has its own unique PIN, which is known only to the cardholder. To prevent fraudulent use, the PIN should not be made accessible to other persons. PIN and card should never be kept together, nor the number written down or divulged to anyone. The PIN should always be concealed from onlookers when keying in the code. Code or password the customer possesses for verification of identity. Personal Identification Number (PIN) is a sequence of digits assigned to consumers that are used to identify them when debit cards are used at an ATM, POS terminals or a home device. See also ATM, Credit Card, and Debit Card.

PERSONAL IDENTIFICATION NUMBER CODE = ПЕРСОНАЛЬНЫЙ ИДЕНТИФИКАЦИОННЫЙ НОМЕРНОЙ КОД – Personal Identification Number (PIN) is the confidential number issued to holders of cash cards and credit cards that provides a safeguard against their unauthorized use at an automated teller machine (ATM). Personal alphanumeric code fore the electronic identification of a customer using an account card. See also Plastic Money. In payments transfer this means the 4 digit code which you need for the use of your automatic teller machine card.

PERSONAL IDENTIFICATION NUMBER ENTRY DEVICE = СРЕДСТВО ВВОДА ПЕРСОНАЛЬНОГО ИДЕНТИФИКАЦИОННОГО НОМЕРА – Personal Identification Number (PIN) Entry Device (PED) into which the cardholder inputs the PIN. A PED may also be called a Personal Identification Number (PIN) Pad.

PERSONAL INCOME = ПЕРСОНАЛЬНЫЙ ДОХОД (или ЛИЧНЫЙ ДОХОД) – Personal Income is the total compensation received by an individual. Personal income includes compensation from a number of sources – salaries, wages and bonuses received from employment or self-employment; dividends and distributions received from investments; rental receipts from real estate investments; profit-sharing from a business and so on. In most jurisdictions, personal income above a certain exemption threshold is subject to taxation. Personal income is generally computed on a pre-tax basis. Also referred to as Gross Income. Personal income determines consumer consumption, and since consumer spending drives much of the economy, trends in personal income on a quarterly and annual basis are closely tracked by national statistical organizations, economists and analysts. Personal income tends to display a rising trend during periods of economic expansion, and show a stagnant or slightly declining trend during recessionary times. Since the 1980s, rapid economic growth in economies such as China, India and Brazil has spurred substantial increases in personal incomes for millions of their citizens. In the United States, Personal Income is the Dollar value of income received from all sources by individuals. See also Personal Outlays. / В Соединённых Штатах Америки под Персональным Доходом (или Личным Доходом) понимается доход, оцениваемый в Долларах США и полученный частными лицами из любых источников. Смотрите также Личные Расходы или Персональные Расходы (Personal Outlays).

PERSONAL INVESTMENT AUTHORITY LIMITED = УПРАВЛЕНИЕ ПО ПЕРСОНАЛЬНЫМ ИНВЕСТИЦИЯМ ЛИМИТИД – Personal Investment Authority (PIA) is the former self-regulating organization which had sole responsibility for the retail investment industry. It governed the sale of life assurance, personal pensions, friendly society investments, unit trusts, investment trust savings

schemes and financial services offered to members of the public. When the Financial Services and Markets Act 2000 came into force on 2001-December-01, the Financial Services Authority (FSA) took over PIA's business. The PIA is no longer in being. See also Financial Services Authority (FSA). The PIA was incorporated as Personal Investment Authority Limited under company registration number 02776358 on 1992-December-18 and was dissolved on 2003-January-15. The Personal Investment Authority (PIA) took over from LAUTRO and FIMBRA in 1994 as SRO for most firms conducting investment business with the private investor. It was superseded by the FSA in 2001 when FSMA came into force. The UKs PIA used to regulate the majority of the 4 000 plus companies conducting investment business with private investors in the financial services market. The PIA replaced The Financial Intermediaries, Managers and Brokers Regulatory Authority Limited (FIMBRA) and The Life Assurance and Unit Trust Regulatory Organisation (LAUTRO) and some activities of IMRO and the SFA in 1994, and was itself taken over by the Financial Services Authority (FSA) in December 2001.

PERSONAL INVESTMENT CORPORATION = ПЕРСОНАЛЬНАЯ ИНВЕСТИЦИОННАЯ КОРПОРАЦИЯ – Personal Investment Corporation (PIC) is a term used in the banking industry to refer to an international business corporation (IBC). PICs are generally created for the private bank's client in order to hold the client's investment assets. A PIC and an IBC are analogous.

PERSONAL LINES INSURANCE = ВИДЫ ЛИЧНОГО СТРАХОВАНИЯ – Personal Lines Insurance:- insurance which is sold to individual consumers such as buildings, contents and travel insurance. This term is used in contrast to commercial lines.

PERSONAL LOAN = ССУДА ЧАСТНОМУ ЛИЦУ (или ПЕРСОНАЛЬНАЯ ССУДА) – Personal Loan is a loan made, usually by a bank, but now increasingly by registered brokers, to a private individual. This form of loan is generally fairly modest and intended for some specific purpose, such as the purchase of a car. Credit granted to a private person for non-commercial purposes solely on the basis of that person's creditworthiness, income and financial circumstances. See also Consumer Loan, and Instalment Loan.

PERSONAL LOAN INSTITUTIONS = ССУЖИВАЮЩИЕ ЧАСТНЫМ ЛИЦАМ ИНСТИТУТЫ – Personal Loan Institutions are the credit institutions specialized in granting personal or consumer loans and financing instalment purchasing (hire-purchase in the United Kingdom).

PERSONALISED MOBILE TRUSTED DEVICE = ЛИЧНОЕ (или ПЕРСОНАЛИЗОВАННОЕ) МОБИЛЬНОЕ ДОВЕРИТЕЛЬНОЕ УСТРОЙСТВО – Personalised Mobile Trusted Device is a mobile trusted device where personal customer information can be stored (through registration, e.g., of service certificates) that is used for his/her authentication. See also Mobile Device and Mobile Trusted Device.

PERSONAL OUTLAYS = ПЕРСОНАЛЬНЫЕ РАСХОДЫ (или ЛИЧНЫЕ ИЗДЕРЖКИ) – Personal Income And Outlays:- a set of two data points produced by the Bureau of Economic Analysis that track personal income and monthly spending. Personal income is the dollar value of income from all sources by individuals in the United States (US); personal outlays is the dollar value of purchases of durable and non-durable goods and services by consumers in the US. This economic indicator helps gauge the strength of the consumer sector in the United States. Because consumer spending equates to such a large portion of the country's GDP, being able to gauge trends in income and spending is very important to investors, as it indicates the overall strength of the economy. Also, if investors can track whether consumer monies are being spent on durables, non-durables or services, they can better plan in which companies to invest. As income and spending increase, it is thought that the equity markets should react positively. This is because of an assumed resulting increase in corporate profits. This could lead to wage and product inflation, though, which would have a negative effect on the bond markets. In the United States, Personal Outlays are the consumer purchases of durable goods, nondurable goods and services. See also Personal Income. / В Соединённых Штатах Америки под Персональными Расходами (или Личными Расходами) понимаются потребительские приобретения товаров длительного пользования, товаров недлительного пользования и услуг. Смотрите также Личный Доход или Персональный Доход (Personal Income).

PERSONAL PROPERTY = ПЕРСОНАЛЬНАЯ СОБСТВЕННОСТЬ (или ЛИЧНАЯ СОБСТВЕННОСТЬ) – Personal Property means property of any kind except real property. It may be tangible – having physical existence, or intangible – having no physical existence, such as patents, inventions, and copyrights.

PERSPIRATION RESISTANT = СОПРОТИВЛЯЕМОЕ ПОТЕНИЮ – Perspiration Resistant:- said of fabrics or garments that resist acid or alkaline perspiration. Laboratory test results should be consulted prior to selling any fabric or garment as perspiration resistant. Perspiration Resistant:- a treatment on a fabric which allows a fabric or a dye to resist perspiration.

PERT = PROGRAM EVALUATION AND REVIEW TECHNIQUE

PERUDIC = ПЕРУДИЧЕСКОЕ – Perudic:- pertaining to a soil moisture regime where rainfall exceeds evapotranspiration throughout the year and where the soil never dries completely. / и где почва никогда не просыхает полностью.

PERUKE = ПЁРУК (или (ПУДРЕНЫЙ) ПАРИК) – Peruke:- wig, specifically one of a type popular from the XVII to the early XIX century. Also known as Periwig. Origin:- French Perruque, from Old French, Head Of Hair, from Old Italian Perrucca. Peruke, also called Periwig, man's wig, especially the type popular from the XVII to the early XIX century. It was made of long hair, often with curls on the sides, and drawn back on the nape of the neck. Use of the word peruke probably became widespread in the XVI century, when the wearing of wigs became popular. Toward the end of the XVI century and the beginning of the XVII, the peruke was no longer worn as an adornment or to correct nature's defects but rather as a distinctive feature of costume, especially after Louis XIII of France set the fashion in 1624. See also Wig. / от Французского слова Пэрюкъ (Perruque) от Итальянского слова Пэррука (Perrucca). Люи XIII (Louis XIII).

PERUVIAN COTTON = ПЕРУАНСКИЙ ХЛОПЧАТНИК – Peruvian Cotton is a Cotton has been grown and used in Peru since prehistoric times. Among the principal types (in 1960):- (1) Rough Peruvian ...; (2) Smooth Peruvian ...; (3) Tanquis ...; (4) Sea Island and American-Egyptian types are grown to a limited extent. All Peruvian Cottons have good staple length, from one inch to 1-1/2 inches, and since nearly all of the crop is exported it is an important growth in the world market.

PES = PROVINCIAL EXTENSION SERVICE

PES FIBER = POLYETHERSULFONE FIBER

PEST = ВРЕДИТЕЛЬ – Pest is any Species, Strain or Biotype of Plant, Animal or pathogenic agent injurious to Plants or Plant products and to commodities. Pest is an organism which competes with other organisms for food and shelter, or threatens their health, comfort, or welfare. See also Quarantine Pest and Nonquarantine Pest. / Под Вредителями понимаются любые Виды, Раса или Биотип Растений, Животных или патогенных возбудителей болезни, способные нанести вред Растениям или продуктам растительного происхождения и различному сырью. Смотрите также Карантинный Вредитель или Подкарантинный Вредитель (Quarantine Pest) и Некарантинный Вредитель (Nonquarantine Pest).

PEST CATEGORIZATION = КАТЕГОРИЗАЦИЯ ВРЕДИТЕЛЕЙ – Pest Categorization is the process for determining whether a pest has or has not the characteristics of a quarantine pest or those of a regulated non-quarantine pest. / Под Категоризацией Вредителей, от Греческого слова Kategoria, означающее Высказывание или Признак, понимается процесс определения того, имеет или не имеет вредитель характеристики карантинного вредителя или того вредителя, который не подпадает под предписания в отношении карантина или регулируемого некарантинного вредителя.

PEST CONTROL = БОРЬБА С ВРЕДИТЕЛЯМИ (или КОНТРОЛЬ ВРЕДИТЕЛЕЙ) – Pest Control is the control of Pests in the ricefield by selective cultivation methods influencing natural factors or predators or by using chemical/physical control methods to reduce Pest damage to Rice Plants.

PEST FREE AREA = СВОБОДНЫЙ ОТ ВРЕДИТЕЛЕЙ АРЕАЛ – Pest Free Area (PFA) is an area in which a specific Pest does not occur as demonstrated by scientific evidence and in which, where appropriate, this condition is being officially maintained.

PEST FREE PLACE OF PRODUCTION = СВОБОДНОЕ ОТ ВРЕДИТЕЛЕЙ МЕСТО ПРОИЗВОДСТВА – Pest Free Place Of Production (PFPP) is a place of production in which a specific pest does not occur as demonstrated by scientific evidence and in which, where appropriate, this condition is being officially maintained for a defined period.

PEST FREE PRODUCTION SITE = СВОБОДНЫЙ ОТ ВРЕДИТЕЛЕЙ УЧАСТОК ПРОИЗВОДСТВА – Pest Free Production Site (PFPS) is a defined portion of a place of production in which a specific Pest does not occur as demonstrated by scientific evidence and in which, where appropriate, this condition is being officially maintained for a defined period and that is managed as a separate unit in the same way as a Pest free place of production.

PESTICIDE = ПЕСТИЦИД (или ЯДОХИМИКАТ) – Pesticide is a chemical or other substance used to kill Pests. Depending on the target Species pesticides may be referred to as Insecticides (Insects), Herbicides (Plants), Fungicides (Fungi) and Nematicides (Nematodes). Pesticides may act on contact or require ingestion. Pesticide is a substance or mixture of substances intended to prevent, destroy, repel or mitigate any Pest. May also be used as a Plant desiccant, defoliant or regulator. A chemical used to kill Pests. The term includes insecticides, fungicides, herbicides, and rodenticides. A pesticide is any substance or mixture of substances intended for preventing, destroying, repelling, or mitigating any Pest. Pests can be Insects, mice and other Animals, unwanted Plants (Weeds), Fungi, or microorganisms like bacteria and viruses. Though often misunderstood to refer only to insecticides, the term pesticide also applies to herbicides, fungicides, and various other substances used to control Pests. Under United States law, a pesticide is also any substance or mixture of substances intended for use as a plant regulator, defoliant, or desiccant. Many household products are pesticides. Did you know that all of these common products are considered pesticides? (i) Cockroach sprays and baits; (ii) flea and tick sprays, powders, and pet collars; (iii) Insect repellents for personal use; (iv) kitchen, laundry, and bath disinfectants and sanitizers; (v) products that kill mold and mildew; (vi) rat and other rodent poisons; (vii) some lawn and garden products, such as weed killers; and (viii) some swimming pool chemicals. By their very nature, most pesticides create some risk of harm to humans, animals, or the environment because they are designed to kill or otherwise adversely affect living organisms. At the same time, pesticides are useful to society because of their ability to kill potential disease-causing organisms and control insects, weeds, and other pests. In the United States, the Office of Pesticide Programs of the Environmental Protection Agency (EPA) is chiefly responsible for regulating pesticides. Biologically-based pesticides, such as pheromones and microbial pesticides, are becoming increasingly popular and often are safer than traditional chemical pesticides. Here are some common kinds of pesticides and their function:- Algicides – control algae in lakes, canals, swimming pools, water tanks, and other sites; Antifouling agents – kill or repel organisms that attach to underwater surfaces, such as boat bottoms; Antimicrobials – kill microorganisms (such as bacteria and viruses); Attractants – attract pests (for example, to lure an insect or rodent to a trap). However, food is not considered a pesticide when used as an attractant; Biocides – kill microorganisms; Disinfectants and sanitizers – kill or inactivate disease-producing microorganisms on inanimate objects; Fumigants – produce gas or vapor intended to destroy pests in buildings or soil; Fungicides – kill Fungi (including blights, mildews, molds, and rusts); Herbicides – kill Weeds and other Plants that grow where they are not wanted; Insecticides – kill Insects and other arthropods; Miticides (also called Acaricides) – kill mites that feed on Plants and Animals; Microbial pesticides – microorganisms that kill, inhibit, or out compete pests, including Insects or other microorganisms; Molluscicides – kill snails and slugs; Nematicides – kill nematodes (microscopic, worm-like organisms that feed on plant roots); Ovicides – kill eggs of insects and mites; Pheromones – biochemicals used to disrupt the mating behavior of insects; Repellents – repel pests, including insects (such as mosquitoes) and birds; and Rodenticides – control mice and other rodents. The term pesticide also includes these substances:- Defoliants – cause leaves or other foliage to drop from a plant, usually to facilitate harvest; Desiccants – promote drying of living tissues, such as unwanted plant tops; Insect growth regulators – disrupt the molting, maturity from pupal stage to adult, or other life processes of insects; and Plant growth regulators – substances (excluding fertilizers or other plant nutrients) that alter the expected growth, flowering, or reproduction rate of plants. What about pest control devices? EPA also has a role in regulating devices used to control pests. More specifically, a 'device' is any instrument or contrivance (other than a firearm) intended for trapping, destroying, repelling, or mitigating any pest. A mousetrap is an example of a device. Unlike pesticides, EPA does not require devices to be registered with the Agency. Devices are subject to certain labeling, packaging, record keeping, and import/export requirements, however. What is not a pesticide? The US definition of pesticides is quite broad, but it does have some exclusions:- (i) drugs used to control diseases of humans or animals (such as livestock and pets) are not considered pesticides; such drugs are regulated by the Food and Drug Administration; (ii) fertilizers, nutrients, and other substances used to promote plant survival and health are not considered plant growth regulators and thus are not pesticides; (iii) biological control agents, except for certain microorganisms, are exempted from regulation by EPA. Biological control agents include beneficial predators such as birds or ladybugs that eat insect pests; and (iv) finally, EPA has also exempted certain other low-risk substances, such as cedar chips, garlic, and mint oil. Pesticide is any toxic substance used to kill animals or plants that cause economic damage to crop or ornamental plants or are hazardous to the health of domestic animals or humans. All pesticides interfere with normal metabolic processes in the pest organism and often are classified according to the type of organism they are intended to control. See also Fumigant, Fungicide, Herbicide, and Insecticide. Pesticide is any substance used to control pests. It is a broad term that covers insecticide, herbicide, fungicide, bactericide, rodenticide, nematicide, etc. Algaecide kills algae. / В группу Пестицидов входят:- (i) Альгициды (Algicides), от Латинских слов Alga, означающее Водоросль или Морская Трава, и Caedo, означающее Убиваю, химические препараты из группы гербицидов для уничтожения водяных растений в каналах, водохранилищах и тому подобном. (ii) xxxxx (Antifouling agents). (iii) xxxxx (Antimicrobials). (iv) Аттрактанты (Attractants), от Латинского слова Attraho, означающее Притягиваю К Себе, природные или синтетические вещества со специфическим запахом, привлекающим насекомых, используемые как приманки для вредителей сельскохозяйственных растений. (v) Биоциды (Biocides), от Греческого слова Bios, означающее Жизнь, и Латинского слова Caedo, означающее Убиваю. (vi) xxxxx (disinfectants и sanitizers). Протравители, химические препараты из группы фунгицидов для обеззараживания (протравливания) семян и другого посадочного материала (клубней, рассады, сеянцев и тому подобного) с целью защиты растений от болезней в начальный период роста и развития. Обработка производится специальными машинами – протравливателями. (vii) Гербициды (Herbicides), от Латинских слов Хэрба (Herba), означающее Трава, и Сэдо (Caedo), означающее Убиваю, химические

препараты из группы пестицидов для уничтожения нежелательной, главным образом сорной, растительности. (viii) Инсектициды (Insecticides), от Латинских слов Insectum, означающее Насекомое, и Caedo, означающее Убиваю, понимается химический препарат для борьбы с насекомыми – вредителями сельскохозяйственных растений. Включают антифиданты, аттрактанты и хемостерилизаторы. Инсектициды вносят в почву, используют для опыливания и опрыскивания растений, обработки животных против паразитов. (ix) Митициды (Miticides), именуемые также Акарициды (Acaricides), от Греческого слова Ákari, означающее Клещ, и Латинского слова Caedo, означающее Убиваю, химические препараты для борьбы с растительноядными, Амбарными Клещами – паразитами домашних Животных и Птиц. Эти препараты подразделяются на:- акарициды контактного действия (акартан, акрекс, кельтан, неорон, омайт, пликтран, сера молотая, тедион и ИСО) и системные акарициды внутрирастительного действия (антио, карбофос, фозалон, фосфамид). Системные акарициды, кроме клещей, уничтожают Медяниц, Тлей, Трипсов и других. Против Амбарных Клещей в качестве акарицидов применяют метилбромид, хлорпикрин и другие вещества. В хлопководстве акарициды применяют для борьбы с Паутинными Клещами. (x) Микробиальные пестициды (Microbial pesticides). (xi) Моллюскициды (Molluscicides). (xii) Нематициды (Nematicides), от слова Нематоды и Латинского слова Caedo, означающее Убиваю, химические препараты для уничтожения вредных для сельскохозяйственных Растений нематод. (xiii) Овициды (Ovicides), от Латинских слов Ovum, означающее Яйцо, и Caedo, означающее Убиваю, химические препараты для уничтожения яиц вредных Насекомых. (xiv) Репелленты (Repellents), от Латинского слова Repello, означающее Отгоняю или Отталкиваю, или, как их ещё называют, антифиданты, химические препараты для отпугивания вредных Насекомых от Растений, которыми они питаются, животных и человека. (xv) Родентициды (Rodenticides), одна из групп зооцидов, химических препаратов для борьбы с вредными позвоночными, главным образом грызунами (родентициды, включают ратициды для уничтожения крыс) и птицами (авициды). (xvi) Феромоны (Pheromones), химические вещества, вырабатываемые экзокринными железами или специальными клетками животных. Выделяясь во внешнюю среду одними особями, феромоны оказывают влияние на поведение, а иногда на рост и развитие других особей того же вида. К феромонам относятся половые аттрактанты, вещества тревоги, сбора и другие. Особенно важную роль феромоны играют в жизни насекомых. У общественных насекомых феромоны регулируют также состав колонии и специфическую деятельность её членов. (xvii) Фумиганты (Fumigants), от Латинского слова Fumigo, означающее Дымлю или Окуриваю, жидкие, твёрдые или газообразные химические препараты для уничтожения вредителей и возбудителей болезней сельскохозяйственных растений путём отравления ядовитыми парами, газами и аэрозолями – фумигации. Применяют на складах, в теплицах, парниках, для обработки зерна, овощей, фруктов, хлопкового волокна и тому подобного. Фумигацию проводят специальными машинами – фумигаторами. (xviii) Фунгициды (Fungicides), от Латинских слов Фунгус (Fungus), означающее Гриб, и Чедо (Caedo), означающее Убиваю, химические препараты для уничтожения или предупреждения развития патогенных грибов и бактерий – возбудителей болезней сельскохозяйственных растений, широко используемые в сельском хозяйстве. Фунгициды вносят в почву, ими протравливают семена, проводят опыливание и опрыскивание растений. Под термин Пестициды подпадают также такие препараты, как:- Десиканты (Desiccants), от Латинского слова Desiccans (Desiccantis), означающее Высушивающий, химические препараты из группы пестицидов, вызывающие обезвоживание тканей растений, что способствует ускорению созревания сельскохозяйственных культур и облегчению механизации уборки урожая. В качестве десикантов применяют, например, пентахлорфенол, тиоцианат натрия, хлорат магния, цианамид кальция. Десиканты применяются для подсушивания – десикации Картофеля, Клещевины, Риса, Хлопчатника и других сельскохозяйственных культур. Дефолианты (Defoliants), от приставки Де и Латинского слова Фолиум (Folium), означающее Лист, химические препараты из группы пестицидов, вызывающие старение листьев у растений и опадение листвы (искусственный листопад), что ускоряет созревание и облегчает машинную уборку урожая сельскохозяйственных культур. В качестве дефолиантов используют, например, тиоцианат натрия, фосфорорганические соединения, хлорат магния, цианамид кальция и некоторые производные мочевины. Применяют для предуборочного опадения листьев – дефолиации, в основном у Хлопчатника. Регуляторы роста насекомых (insect growth regulators). Регуляторы Роста Растений (plant growth regulators); под стимуляторами роста растений понимаются природные или синтетические вещества, стимулирующие рост растений путём ускорения деления клеток или их растяжения в длину; к природным стимуляторам роста растений относятся фитогормоны – ауксины, гиббереллины, цитокинины, к синтетическим – их аналоги. Под Пестицидом, от Латинских слов Пэстис (Pestis), означающее Зараза, и Чедо (Caedo), означающее Убиваю, понимаются химические средства для борьбы с болезнями (бактерициды, фунгициды и другие), вредителями (акарициды, зооциды, инсектициды и другие), сорняками (гербициды) сельскохозяйственных растений, деревьев, кустарников и древесины, вредителями зерна и зернопродуктов, изделий из хлопка, шерсти и кожи, а также переносчиками опасных заболеваний человека и животных, и тому подобным. В группу пестицидов включают десиканты, дефолианты, регуляторы роста растений, добавки к краскам, препятствующие обрастанию морских судов, и прочие. Пестицидной активностью обладают многие органические и неорганические вещества, например, хлор- и фосфорорганические соединения, некоторые производные мочевины, сера, соединения меди, цианамид кальция, хлорат магния. Большинство пестицидов является синтетическими органическими веществами. Используют пестициды обычно в форме различных препаратов – смачивающихся порошков, концентратов эмульсий, дустов, растворов, аэрозолей, содержащих разбавители, поверхностно-активные вещества, загустители и другие компоненты. Пестициды вносят в почву или/и применяют путём опрыскивания, опыливания, окуривания почвы, семян, растений, хранилищ, парников. При систематическом применении стойких высокотоксичных пестицидов, особенно в завышенных дозах, наблюдается загрязнение ими окружающей среды, что приводит к уничтожению зверей, полезных насекомых, птиц, рыб, а также отравлению людей непосредственно пестицидами или продуктами, в которых они способны накапливаться. Использование пестицидов регламентируется законодательством во всех странах. Перспективны пестициды, отличающиеся высокой специфичностью, – половые аттрактанты, репелленты, хемостерилизаторы.

PESTICIDE RESISTANCE = СОПРОТИВЛЯЕМОСТЬ ПЕСТИЦИДАМ – Pesticide Resistance is the genetically acquired ability of an organism to survive a pesticide application at doses that once killed most individuals of the same Species. / Виды (Species). Генетически приобретённая способность организма выживать при воздействии пестицидов в таких дозах, которые однажды уже уничтожили большинство особей этого же Семейства.

PEST OUTBREAK = НАШЕСТВИЕ ВРЕДИТЕЛЕЙ (или ВСПЫШКА ВРЕДИТЕЛЕЙ) – Pest Outbreak is a sudden increase in a pest population resulting in economic damage to the Rice crop; epidemic or epiphytotic. / внезапное увеличение .

PEST RECORD = УЧЁТНАЯ КАРТОЧКА (или ЗАПИСЬ) ПО ВРЕДИТЕЛЯМ – Pest Record is a document providing information concerning the presence or absence of a specific pest at a particular location at a certain time, within an area (usually a country) under described circumstances.

PEST RESURGENCE = ВОЗРОЖДЕНИЕ ВРЕДИТЕЛЕЙ – Pest Resurgence is an increase in a pest population following a pesticide application intended to reduce it. / Возрождение Вредителей:- увеличение популяции вредителей, вслед за применявшимся воздействием пестицидов для её уменьшения.

PEST RISK = РИСК ПРОЯВЛЕНИЯ ВРЕДИТЕЛЯ – Pest Risk:- that level and probability of harm a plant pest could cause in an endangered area, which a national plant protection organization identifies by the performance of a pest risk analysis or other internationally acceptable plant risk assessment process.

PEST RISK ANALYSIS = АНАЛИЗ РИСКА ПРОЯВЛЕНИЯ ВРЕДИТЕЛЯ – Pest Risk Analysis is the process of evaluating biological or other scientific and economic evidence to determine whether a pest should be regulated and the strength of any phytosanitary measures to be taken against it. / Анализ Риска Проявления Вредителя это процесс оценивания биологического или другого научного и экономического свидетельства с целью определения того, следует ли регулировать численность какого-либо вредителя и степень строгости фитосанитарных мер, которые нужно предпринять для борьбы с ним.

PEST RISK ASSESSMENT = ИСЧИСЛЕНИЕ РИСКА ПРОЯВЛЕНИЯ ВРЕДИТЕЛЯ – (1) Pest Risk Assessment (for quarantine pests) is an evaluation of the probability of the introduction and spread of a pest and of the associated potential economic consequences.

(2) Pest Risk Assessment (for regulated nonquarantine pests) is an evaluation of the probability that a pest in plants for planting affects the intended use of those plants with an economically unacceptable impact.

PEST RISK MANAGEMENT = УПРАВЛЕНИЕ РИСКАМИ ПРОЯВЛЕНИЯ ВРЕДИТЕЛЯ – (1) Pest Risk Management (for quarantine pests) is an evaluation and selection of options to reduce the risk of introduction and spread of a pest.

(2) Pest Risk Management (for regulated nonquarantine pests) is an evaluation and selection of options to reduce the risk that a pest in plants for planting causes an economically unacceptable impact on the intended use of those plants.

PEST STATUS = СТАТУС ПРОЯВЛЕНИЯ ВРЕДИТЕЛЯ – Pest Status (in an area) is a presence or absence, at the present time, of a pest in an area, including where appropriate its distribution, as officially determined using expert judgement on the basis of current and historical pest records and other information.

PET = POLYETHYLENE TEREPHTHALATE

PET = POTENTIAL EVAPOTRANSPIRATION

PETAL = ЛЕПЕСТОК – Petal is one of the segments of the inner perianth segments or corolla. In the Cactaceae these are actually petaloid parts of the perianth and not true petals. Petals are often brightly colored and interior to the sepals. Petal is one of the divisions of the corolla, usually colored. / внутренних сегментов околоцветника или венчика (corolla). У Кактусовых (Cactaceae) имеются . чашелистики (sepals).

PETASOS = ПЭТАСОС (или ХХ) – Petasos is a broad-brimmed low-crowned hat worn by ancient Greeks and Romans, e.g., the winged hat of Hermes. / .

PETER PAN COLLAR = ВОРОТНИЧОК В СТИЛЕ ПИТЁРА ПЭНА – Peter Pan Collar is a usually small flat close-fitting collar with rounded ends that meet in front. Peter Pan Collar is a flat, round-cornered collar, named after the collar of the costume worn in 1905 by actress Maude Adams in her role as Peter Pan and particularly associated with little girls' dresses. / Питё Пэн (Peter Pan).

PETG SHRINKABLE FILM = ПЭТГ УСАДОЧНАЯ ПЛЁНКА – PETG Shrinkable Film:- this is a form of shrink wrap for packaging purposes. Purposes:- served as the packing Shrinkable Film of paper-made boxes (cases), plastic bottles, toys, hardware, vitreous bottles, steel jars. Characteristics:- clear-cut and transparent, of high quality, sweat-proof and does not crack easily, in conformity to the request of the environmental protection, and more beautiful assisted by printing. PETg is an amorphous polymer (also known as Glycolised Polyester). The glycol modifiers reduce the brittleness of PET (Polyethylene Terepathalate). PETg is popular in the market place as customers look to this plastic when producing 'environmentally' friendly products. This polymer is 100% recyclable as it consists of carbon, hydrogen and oxygen and is 'inert' when used in landfills.

PETIOLATED LEAF = ЧЕРЕШКОВЫЙ ЛИСТ – Petiolated Leaves or Stalked Leaves are those that have a petiole. This can be different in length from one plant to another.

PETIOLE = ЧЕРЕШОК – The Petiole of a leaf may vary considerably and can be long, short, rounded or flat. Some leaves have no petioles in which case they are said to be sessile. At the base of the petiole in many leaves are small leaf-like structures called Stipules, e.g., in peas, beans and roses. Between the petiole and the stem is a bud of a potential branch (an axial bud). Petiole is the leaf stalk. / Черешок листа. Черешок – это ножка листа. В ботанике под Черешком понимается суженная стеблевидная часть листа, несущая листовую пластинку. Благодаря изгибам черешка лист поворачивается к свету. Бесчерешковые (stalkless) листья называются Сидячими (Sessile). Черешок:- узкая стеблевидная часть листа, несущая листовую пластинку.

PETITION = ПЕТИЦИЯ (или ХОДАТАЙСТВО) – Petition is a formal, written application to a regulatory agency seeking approval to release a non-native biological control agent. / Под Петицией, от Латинского слова Petitio, означающее Просьба, понимается коллективное ходатайство, подаваемое гражданами главе государства или высшим органам власти.

PETITION TO REVIVE AN APPLICATION = ПЕТИЦИЯ НА ВОЗОБНОВЛЕНИЕ ЗАЯВКИ (или ХОДАТАЙСТВО НА ВОЗОБНОВЛЕНИЕ ЗАЯВКИ) – Petition To Revive An Application (trademark matters)is a formal request for the United States Patent and Trademark Office (USPTO) to return an abandoned application to active status. These petitions are handled by the Office of the Commissioner for Trademarks, and must be received in the USPTO within two (2) months from the issue date of the notice of abandonment. The standard used for deciding a petition to revive is unintentional delay, that is, whether the applicant's delay in responding to an office (the United States Patent and Trademark Office (USPTO)) action or Notice of Allowance was unintentional.

PETIT POINT = ПЁТИ ПУЭН (или ДЕТСКИЙ СТЕЖОК) – Petit Point:- embroidery made with a tent stitch. / торговое название женской шерстяной пальтовой ткани из завитой пряжи; схожая с ратином и букле.

PETRI DISH = ЧАШКА ПЭТРИ – Petri Dish is a shallow dish consisting of a cover and a bottom made of Pyrex glass (can withstand dry heat sterilization) used to culture microorganisms; also called Culture Dish. May be disposable and made of polystyrene. A Petri Dish (sometimes spelled Petrie Dish and alternatively known as a Petri Plate or Cell-Culture Dish), named after the German bacteriologist Julius Richard Petri, is a shallow cylindrical glass or plastic lidded dish that biologists use to culture cells – such as bacteria – or small mosses. Modern Petri dishes usually feature rings and/or slots on their lids and bases so that when stacked, they are less prone to sliding off one another. Multiple dishes can also be incorporated into one plastic container to create a 'multi-well plate'. While glass Petri dishes may be reused after sterilization (via an autoclave or one hour's dry-heating in a hot-air oven at 160 °C, for example), plastic Petri dishes are often disposed of after experiments where cultures might contaminate each other. / Пайрэкс (Pyrex). Немецкий бактериолог Юлиус Рихад Пэтри (Julius Richard Petri; 1852–1921).

PETROCHEMICAL = НЕФТЕХИМИЯ (или НЕФТЕХИМИКАТ, или НЕФТЕХИМИЧЕСКИЙ ПРОДУКТ) – Petrochemical is any chemical substance derived from crude oil or its products, or from natural gas. Some petrochemical products may be identical to others produced from other raw materials such as coal and producer gas. Petrochemical is an intermediate chemical derived from petroleum, hydrocarbon liquids, or natural gas, such as benzene, ethylene, propylene, toluene, and xylene. Petrochemicals:- compounds derived from petroleum. These include:- aromatics, which are used to make plastics, adhesives, synthetic fibers and household detergents; and olefins, which are used to make packaging, plastic pipes, tires, batteries, household detergents and synthetic motor oils. / Химические полуфабрикаты, полученные из нефти, углеводородных жидкостей или природного газа, такие как бензол, ксилол, пропилен, толуол, и этилен.

PETROCHEMICAL FEEDSTOCKS = СЫРЬЁ ДЛЯ НЕФТЕХИМИИ – Petrochemical Feedstocks are the chemical feedstocks derived from petroleum principally for the manufacture of chemicals, synthetic rubber, and a variety of plastics. / Разновидности химического сырья, полученного из нефтепродуктов, используемое, главным образом, для изготовления химикатов, искусственной резины, и разнообразных видов пластмассы.

PETRODOLLARS = НЕФТЕДОЛЛАРЫ – A Petrodollar is a Dollar earned by a country through the sale of petroleum. The term was coined by Ibrahim Oweiss, a professor of economics at Georgetown University, in 1973. Oweiss felt there was a need for a word to describe the situation which was occurring in the OPEC countries, balance of trade is largely offset by its role as a reserve currency. On the other hand, the demand for petrodollars is a significant factor in increasing the US trade deficit in the first place, and it also increases inflation. Given the general tendency for crude oil prices to rise and become more volatile in recent years, it may even be argued that crude oil trading may, in the long term, be a significant liability for the stability of the currency in which the trade is conducted. Dollars and Dollar-denominated deposits held outside the United States generated by the sale of petroleum from non-US oil producers. This term refers to oil earnings of petroleum-exporting countries in excess of their domestic needs and deposited in US Dollars in Western banks. However, a large part of the revenues that OPEC countries were unable to spend has been recycled to oil-importing countries in an attempt to balance international accounts. / Ибрагхим Оайс (Ibrahim Oweiss). ОСЭН или ОПЭК (OPEC), в Англоязычном произношении.

PETROLEUM = НЕФТЬ (или ПЭТРОЛЭУМ, или КАМЕННОЕ МАСЛО) – Petroleum is a complex mixture of liquid hydrocarbons, chemical compounds containing hydrogen and carbon, occurring naturally in underground reservoirs in sedimentary rock. Petroleum is normally found at considerable depths beneath the earth's surface, where under pressure, it is essentially liquid. At the surface and atmospheric pressure, petroleum comprises both natural gas and crude oil. The word Petroleum comes from the Latin word Petra, meaning Rock, and Oleum, meaning Oil. The word 'Petroleum' is often interchanged with the word 'Oil'. Broadly defined, it includes both primary (crude oil or unrefined) and secondary (refined) products. Crude oil (including lease condensate, but excluding natural gas liquids (NGL)) is the most important oil from which petroleum products are manufactured, but several other feedstock oils are also used to make oil products. There is a wide range of petroleum products manufactured from crude oil. Many are for specific purposes, for example, motor gasoline or lubricants; others are for general heat-raising needs, such as gas oil or fuel oil. The quality of crude oil depends to a great extent on its density and sulphur content. The crude oils are classified as light, medium and heavy according to their density. Crude oils with high sulphur content (at least 2.5% sulphur) are sour, while sweet crudes have often less than 0.5% sulphur content. See also Crude Oil. A generic name for hydrocarbons, including crude oil, natural gas liquids, refined, and product derivatives. Petroleum is a collective term for gaseous, liquid or solid hydrocarbons. Hydrocarbons are compounds formed from the element hydrogen (H) and carbon (C). The proportion of different compounds, from ethane and methane up to the heaviest components, in a petroleum find varies from discovery to discovery. If a reservoir primarily contains light hydrocarbons, it is described as a gas field. If heavier hydrocarbons predominate, it is described as an oil field. An oil field may feature free gas above the oil and contain a quantity of light hydrocarbons, also called Associated Gas. Petroleum (crude oil) is a naturally occurring, oily, flammable liquid composed principally of hydrocarbons. Crude oil is occasionally found in springs or pools but usually is drilled from wells beneath the earth's surface. A broadly defined class of liquid hydrocarbon mixtures. Included are crude oil, lease condensate, unfinished oils, refined products obtained from the processing of crude oil, and natural gas plant liquids. Volumes of finished petroleum products include nonhydrocarbon compounds, such as additives and detergents, after they have been blended into the products. Petroleum is a mixture of hydrocarbons existing in the liquid state found in natural underground reservoirs often associated with gas. Petroleum includes fuel oil No. 2, No. 4, No. 5, No. 6; topped crude; kerosene; and jet fuel. The word 'Petroleum' is derived from the Latin Petra (which means Rock) and Oleum (which means Oil). It is commonly used to refer to Crude Oil, but it may also refer to other related hydrocarbons. Some hydrocarbons are gaseous, rather than liquid. Methane is the most common example of these hydrocarbon gases. This is the kind of natural gas that we most often use in our kitchens at home. Petroleum deposits are often found in natural underground reservoirs called Oil Fields. The oil in these fields can then be extracted by drilling and pumping. Petroleum:- the term petroleum refers to naturally occurring liquids and gases which are predominately comprised of hydrocarbon compounds. Petroleum may also contain non-hydrocarbon compounds in which sulfur, oxygen, and/or nitrogen atoms are combined with carbon and hydrogen. Common examples of non-hydrocarbons found in petroleum are nitrogen, carbon dioxide, and hydrogen sulfide. / Под Пэтролэумом, от Латинского слова Пэтра (Petra) и Греческого слова Pétros, означающее Камень, и от Латинского слова Олэум (Oleum), означающее Масло, понимается . Под Нефтью, через Тюркское слово Neft, от Персидского слова Нефт; восходит к Аккадскому слову Напатум, означающее Воспламенять или Вспыхивать, понимается жидкое горючее ископаемое, маслянистая жидкость от чёрного до бурого цвета, иногда с красноватым, зеленоватым, оранжевым оттенком; обычно тёмно-бурая. Плотность 750–970 (обычно 800–900) кг/м^3; различают лёгкие (плотностью менее 850), средние (850–900) и тяжёлые (более 900) нефти. Теплота сгорания 43.7–46.2 МДж/кг. По составу нефть – сложная смесь парафиновых (метановых), нафтеновых и реже ароматических углеводородов; содержание углерода около 82–87%, водорода – 11.5–14.5%. В качестве примесей (4–5%) в нефти находятся соединения, содержащие кислород (главным образом нафтеновые кислоты), серу и азот, смолистые и асфальтовые вещества. Компонентный состав (%):- масел 65–100, смол 0–30, асфальтенов 0–5. Парафиновые нефти содержат 62% и более твёрдых углеводородов. Нефти делятся на малосернистые (серы до 0.5%) и сернистые (свыше 0.5%), по смолистости – на малосмолистые (до 18%), смолистые (18–35%) и высокосмолистые (свыше 35%). Спутниками нефти часто являются нефтяной газ и вода. Нефть залегает обычно в пористых или трещиноватых горных породах (песках, песчаниках, известняках) и часто тяготеет к куполам. Добывают нефть скважинным, редко шахтным способами. Нефть – важнейшее энергетическое топливо современной промышленности. Перегонкой из нефти получают бензин, керосин, лигроин, масла, парафин и другое. Характерны тенденция к наиболее полной утилизации нефти с максимальным получением светлых продуктов, а также использование её как химического сырья для производства синтетических материалов. Мировая добыча нефти в 1986 превысила 2.827 миллиарда тонн (в том числе в Северной Америке около 600 миллионов тонн, на Ближнем и Среднем Востоке 624, в Латинской Америке около 330.4 миллионов тонн). Всего с начала промышленной добычи нефти (с конца 1850-х) до конца 1986 в мире было извлечено из недр около 70 миллиардов тонн. Из некоторых тяжёлых нефтей извлекают ванадий. Под Нефтяными Маслами понимаются сложные смеси высококипящих углеводородов ($t_{кип}$ 300–600 °C) парафинового, нафтенового и ароматических рядов, а также их гетеропроизводных. Общее число различных углеводородов в

нефтяных маслах составляет от 2 000–3 000 до 50 000–70 000, а их кинематическая вязкость – от (2–3)·10^{-6} до (600–1 100)·10^{-6} $м^2/с$ (при 100 °C). По области применения нефтяные масла делятся на смазочные, изоляционные, консервационные, технологические и белые масла. Нефтяные масла используют также для получения пластичных и технологичных смазок, смазочно-охлаждающих и гидравличных жидкостей. Как правило, нефтяные масла содержат присадки, улучшающие их эксплуатационные свойства.

PETROLEUM ADMINISTRATION FOR DEFENSE DISTRICT = АДМИНИСТРАЦИЯ ОБОРОННОГО (или СТРАТЕГИЧЕСКОГО) ОКРУГА ПО НЕФТИ – The Petroleum Administration For Defense Districts (PADDs) are geographic aggregations of the 50 States and the District of Columbia into five districts:- PADD 1 is the East Coast, PADD 2 the Midwest, PADD 3 the Gulf Coast, PADD 4 the Rocky Mountain Region, and PADD 5 the West Coast. Due to its large population, PADD 1 is further divided into sub-PADDs, with PADD 1A as New England, PADD 1B the Central Atlantic States, and PADD 1C comprising the Lower Atlantic States. There are two additional PADDs (PADDs VI and VII) that encompass US Territories (these are not pictured on the map). The PADDs help users of EIA's (short for the US Energy Information Administration) petroleum data assess regional petroleum product supplies. During World War II the Petroleum Administration for War, established by an Executive order in 1942, used these five districts to ration gasoline. Although the Administration was abolished after the war in 1946, Congress passed the Defense Production Act of 1950, which created the Petroleum Administration for Defense and used the same five districts, only now called the Petroleum Administration for Defense Districts. The PADDs also allow data users to analyze patterns of crude oil and petroleum product movements throughout the nation. During 2010 (the latest full year for which published data are available), the bulk of petroleum product pipeline movements took place among PADDs 1, 2, and 3. More than half of the total US inter-PADD product pipeline movements were from PADD 3 (an area with significant refining capacity) to PADD 1 (a major population center). By contrast, PADDs 4 and 5 show very small volumes entering and leaving by pipeline, with nothing leaving PADD 5. For crude oil, nearly three-quarters of the inter-PADD pipeline movements in 2010 were movements from PADD 3 to PADD 2. These volumes include crude oil produced in the Gulf of Mexico and imports to the Gulf Coast region that move inland to refineries in PADD 2. The volume of crude oil moving by pipeline from PADD 3 to PADD 2 has steadily declined in recent years, as pipeline receipts of Canadian oil sands crude oil and increased production from North Dakota's Bakken formation have bolstered PADD 2 crude oil supplies. This increase in PADD 2 crude supplies has reduced their need for crude oil supplies from the Gulf Coast. The vast majority of the inter-PADD crude oil pipeline movements occur among PADDs 2, 3, and 4, with very little crude oil pipeline activity into or out of PADDs 1 and 5. Such crude oil and petroleum product movement patterns would be hard to discern without the availability of PADD-level data. The United States is divides into five distinct marketing regions in which prices might differ due to variations in the supply or demand. / Соединённые Штаты Америки разделяются на пять различных регионов сбыта нефти, в которых цены могут отличаться друг от друга исходя из различий в спросе и предложении.

PETROLEUM COKE = КОКС ИЗ НЕФТЕПРОДУКТОВ – Petroleum Coke is a black solid residue, obtained mainly by cracking and carbonizing residue feedstock, tar and pitches in processes such as delayed coking or fluid coking. It consists mainly of carbon (90-95%) and has a low ash content. It is typically used as a feedstock in coke ovens for the steel industry, for heating purposes, for electrode manufacture and for production of chemicals. The two most important qualities are Calcinated Coke and Green Coke. This category also includes unrecoverable Catalyst Coke deposited on the catalyst during refining processes. See also Coke. / Кальцинированный Кокс и Зелёный Кокс.

PETROLEUM COLOR SCALE = ЦВЕТОВАЯ ШКАЛА ПО НЕФТЕПРОДУКТАМ (или ШКАЛА ЦВЕТА НЕФТИ) – Petroleum Color Scale is a color scale for petroleum products, defined by 16 glass standards of specified luminous transmittance and chromaticity, graduated in steps of 0.5 from 0.5 for the lightest color to 8.0 for the darkest.

PETROLEUM PRODUCTS = НЕФТЕПРОДУКТЫ – Petroleum Products are the products obtained from the processing of crude oil (including lease condensate), natural gas, and other hydrocarbon compounds. Petroleum products include unfinished oils, liquefied petroleum gases, pentanes plus, aviation gasoline, motor gasoline, naphtha-type jet fuel, kerosene-type jet fuel, kerosene, distillate fuel oil, residual fuel oil, petrochemical feedstocks, special naphthas, lubricants, waxes, petroleum coke, asphalt, road oil, still gas, and miscellaneous products. See also Miscellaneous Petroleum Products. / Под Нефтепродуктами понимаются смеси углеводородов и некоторых их производных, а также индивидуальные химические соединения, получаемые из нефти и нефтяных газов. Используются в качестве топлив, смазочных материалов, электроизоляционных сред, растворителей, нефтехимического сырья. Под Нефтепродуктами понимаются смеси газообразных, жидких и твёрдых углеводородов различных классов, получаемых из нефти и нефтяных газов. Основные группы нефтепродуктов:- топлива (бензин, газы, дизельное топливо, керосин, лигроин, мазут), масла, твёрдые углеводороды (озокерит, парафин, церезин), битумы и другие нефтепродукты (бензол, кокс, ксилол, толуол и другие). Отдельные группы составляют пластичные смазки и технические жидкости.

PETTICOAT = ПЭТИКОУ (или НИЖНЯЯ ЮБКА, или ПОДЪЮБОЧНИК, или ХХ) – Petticoat is a skirt worn by women, girls, or young children as an outer skirt, a fancy skirt made to show below a draped-up overskirt, or an underskirt usually a little shorter than outer clothing and often made with a ruffled, pleated, or lace edge; a garment characteristic or typical of women.

PETTY CASH = МЕЛОЧЬ (или ДЕНЬГИ НА МЕЛКИЕ РАСХОДЫ) – Petty Cash:- money in notes and coins kept for payment of small bills and day-to-day expenses. In accounting, Petty Cash is an account recording expenditures made with currency and coin.

PEWTER = ПЬЮТА (или ОЛОВО, или ОЛОВЯННОЕ) – Pewter:- a bluish gray. Pewter is also a form of metal, but that is not important to us. That definition has nothing to do with apparel, color or textiles. / голубовато-серое.

PF = FRENCH POLYNESIA

PF = PARTIALLY FERTILE

PF = PREFERRED

PFA = PEST FREE AREA

PFD = PREPARED FOR DYEING

PFD STOCK = PREFERRED STOCK

PFERDESTÄRKE = ФИЭДЭШТАКЭ (или ЛОШАДИНАЯ СИЛА) – This unit (in German:- Pferdestärke = Horse Strength) is no longer a statutory unit, but is still commonly used in Europe, South America and Japan, especially by the automotive and motorcycle industry. It was adopted throughout continental Europe with designations equivalent to the English 'Horsepower', but mathematically different from the British unit. It is defined by the Physikalisch-Technische Bundesanstalt (PTB) in Braunschweig as exactly:- (i) 1 PS = 75 kilopond·meters per second; and (ii) (75 kp·m/s)·(9.806 65 N/kp) = 735.498 75 N·m/s ≈ 735.5 N·m/s ≈ 735.5 W ≈ 0.735 5 kW ≈ 0.986 32 hp (SAE (short for the Society of Automobile Engineers)). The PS was adopted by the Deutsches Institut für Normung EV (DIN) and then by the automotive industry throughout most of Europe, under varying names. In 1992, the PS was rendered obsolete by

EEC (short for the European Economic Community) directives, when it was replaced by the kiloWatt as the official power measuring unit. It is still in use for commercial and advertising purposes, as many customers are not familiar with the use of kiloWatts for engines. In the Japanese versions of the Gran Turismo games, horsepower is used in PS, but in the American and PAL versions use HP respectively, although PS can be used in the PAL (short for the Phase Alternation by Line) versions of the games Gran Turismo 3 and Gran Turismo 4 by changing the system in 4, and switching to German in 3. Also known as Horsepower. See also Chevaux, Chevaux Vapeur, and Horsepower. / Физико-Техническое Федеративное Учреждение или, как это звучит на Немецком, Фюзикалиш-Тэшнишэ Бундэзанштальт (Пэ.Тэ.Бэ.; Physikalisch-Technische Bundesanstalt (PTB)) в городе Броншвайг (Braunschweig). Немецкий Институт по Стандартизации или, как это звучит на Немецком, Дойчэс Институт фюр Нормун Э.Фау. (Дэ.И.Эн.; Deutsches Institut für Normung EV (DIN)). Смотрите также Лошадиная Сила (Horsepower), Шво или Лошадей (Chevaux), и Шво Вапёр или Лошадиный Пар (Chevaux Vapeur). 75 килопонд·метров в секунду; и (ii). (САИ (сокращение для Сообщества Автомобильных Инженеров). ППЛ (сокращённо для Поэтапно-Переменной Линии; PAL (Phase Alternation by Line)).

PFGE = PULSE FIELD GEL ELECTROPHORESIS

PFP = PARTIAL FACTOR PRODUCTIVITY

PFP = PREPARED FOR PRINTING

PFPP = PEST FREE PLACE OF PRODUCTION

PFPS = PEST FREE PRODUCTION SITE

PG = PAPUA NEW GUINEA

PG = GROSS PHOTOSYNTHESIS

PGK = PAPUA NEW GUINEAN KINA

PGM = PHOSPHOGLUCOMUTASE

PGM = PLATINUM GROUP METALS

PGMS LINE = PHOTOPERIOD–SENSITIVE GENIC MALE STERILE LINE

PG PUB = ПГ ПУБ – PG Pub is a Pre-Grant Publication of patent application at 18 months from priority date.

PGR = PLANT GROWTH REGULATOR

PH = PHILIPPINES

pH = ВОДОРОДНЫЙ ПОКАЗАТЕЛЬ (или ПИ.ЭЙЧ., или ПЭ.АШ.) – pH is a logarithmic measure used to state the acidity or alkalinity of a chemical solution. The properties of a liquid solution we call 'Acid' are caused by the presence of hydrogen ions (H^+). The pH of a solution is a measure of the concentration of these hydrogen ions. Technically, the pH of a solution is defined to be the negative logarithm of the concentration, measured in moles per liter. This unit is inverted in the sense that lower pH readings correspond to greater acidity, and therefore more hydrogen ions. Lowering the pH by 1.0 means multiplying the ion concentration by a factor of 10. Mathematically the scale is open at both ends, but in practice pH values usually fall in the range from 0 to 14. Pure water at 25 °C (77 °F) has a pH close to 7.0. Numbers below 7 indicate increasing acidity, while numbers above 7 indicate increasing alkalinity. The pH (Potential of Hydrogen) scale was invented in 1909 by the Danish chemist Søren Peter Lauritz Sørensen (1868–1939). pH is a measure of alkalinity or acidity in water and water-containing fluids. pH can be used to determine the corrosion-inhibiting characteristic in water-based fluids. Typically, pH > 8.0 is required to inhibit corrosion of iron and ferrous alloys in water-based fluids. pH is the negative logarithm of the hydrogen-ion concentration of a soil. The degree of acidity (or alkalinity) of a soil as determined by means of a glass, quinhydrone, or other suitable electrode or indicator, at a specified moisture content or soil-water ratio, and expressed in terms of the pH scale. pH Value is a hydrogen ion concentration. This indicates the acidity or alkalinity of a solution. pH is a measure of the concentration of hydronium (H_3O^+, H^+ attached to a molecule or water) in a solution; pH = $-\log[H_3O^+]$ (that is, the negative base-10 logarithm of the concentration of hydronium). Acids have pHs less than 7; bases have pHs greater than 7. A pH of 7 is neutral. The normal pH range is 0 to 14. Note that although the pH scale is logarithmic, it does not mean that 10 times as much of a base/acid in solution will increase/decrease the pH by 1 unit. This is true for strong acids and strong bases, but is not true for weak acids and weak bases. pH is a measure of the degree of acidity or alkalinity of a soil or solution. A pH of 7.0 is neutral, below 7.0 is acidic, and above 7.0 is alkaline or basic. It is the negative logarithm of the hydrogen ion concentration of a soil or solution. pH is a value indicating the acidity or alkalinity of a material. It is the negative logarithm of the effective hydrogen ion concentration. A pH of 7.0 is neutral; less than 7.0 is acidic; and more than 7.0 is basic. / Датский химик Шан Пита Ляуриц Шансэн (Søren Peter Lauritz Sørensen; 1868–1939). Щёлочность (Alkalinity). Щелочное (Alkaline). это верно для сильных кислот (strong acids) и сильных оснований (strong bases), но не верно для слабых кислот (weak acids) и слабых оснований (weak bases). Водородный Показатель (pH или Potential of Hydrogen) характеризует концентрацию (активность) ионов водорода в растворах; численно равен отрицательному десятичному логарифму концентрации (активности) водородных ионов (H^+), выраженной в молях на литр:- pH = $-\lg(H^+)$. Водные растворы могут иметь pH от 1 до 14; в нейтральных растворах pH = 7, в кислых < 7, в щелочных > 7. Водородный Показатель (pH) – отрицательный десятичный логарифм концентрации (точнее, активности) ионов водорода (в г-ион/л) в данном растворе:- pH = –lgCH+. Водородный показатель служит количественной характеристикой кислотности растворов, которая оказывает существенное влияние на направление и скорость многих химических и биохимических процессов. При обычных температурах (точнее, при 22 °C) pH = 7 для нейтральных, pH < 7 для кислых и pH > 7 для щелочных растворов. Точное измерение и регулирование pH необходимо как при лабораторных химических и биохимических исследованиях, так и в многочисленных промышленных технологических процессах, а также при оценке свойств почвы и проведении мероприятий по повышению её плодородия. Вода диссоциирует на ионы по уравнению:- $H_2O \leftrightarrow H^+ + OH^-$. По действующих масс закону:- $(c_{H+} \cdot c_{OH-}) / c_{H2O} = K$, где с – молярные концентрации, а К – постоянная при данной температуре величина ($1.8 \cdot 10^{-16}$ г-ион/л при 22 °C). В 1 литр (л) воды содержится 1 000 / 18.016 = 55.56 г – моль воды (количество диссоциировавших молекул настолько мало, что его можно не учитывать). Поэтому $K_B = c_{H+} \cdot c_{OH-} = K \cdot c_{H2O} = 1.8 \cdot 10^{-16} \cdot 55.56 = 1 \cdot 10^{-14}$ (при 22 °C). Константу K_B называют Ионным Произведением Воды. Поскольку в чистой воде (и в любой нейтральной среде) $c_{H+} = c_{OH-} = \sqrt{10^{-14}} = 10^{-7}$, то pH = $-\lg c_{H+} = 7$. При добавлении к воде кислот c_{H+} возрастает, а pH соответственно уменьшается. Так, для 0.01 молярного (М) раствора HCl концентрация $c_{H+} = 10^{-2}$ и pH = $-\lg c_{H+} = 2$. Наоборот, при добавлении щёлочей возрастает c_{OH-}; тогда $c_{H+} = 10^{-14} / c_{OH-}$ уменьшается и соответственно возрастает pH. Например, в 0.01 М растворе NaOH$c_{OH-} = 10^{-2}$. Это значит, что $c_{H+} = 10^{-14} / c_{OH-} = 10^{-12}$ и pH = 12. Для точных определений pH используют преимущественно методы потенциометрии (смотрите Электрохимические Методы Анализа). При определениях, не требующих высокой точности, pH измеряют большей частью с помощью набора индикаторов, меняющих свою окраску каждый при определённом

pH. Шкала pH обычно используется для растворов, имеющих концентрации ионов водорода от 1 г-ион/л и меньше. Нейтральным водным растворам отвечает pH = 7 лишь при комнатных температурах. При повышении температуры диссоциация воды усиливается, K_B возрастает, и при 100 °C чистая вода имеет pH > 6. При температурах ниже 22 °C в чистой воде pH > 7. При этом во всех случаях в нейтральной среде $c_{H+} = c_{OH-}$. Водородный Показатель или pH – мера активности (в очень разбавленных растворах она эквивалентна концентрации) ионов водорода в растворе, и количественно выражающая его кислотность, вычисляется как отрицательный (взятый с обратным знаком) десятичный логарифм активности водородных ионов, выраженной в молях на литр. Водородный Показатель (pH) – параметр, характеризующий концентрацию водородных ионов в растворе, то есть степень его щёлочности или кислотности. Показатель pH может изменяться от 0 до 14. Раствор, в котором pH равно 7, является нейтральным, ниже 7 – кислым, выше – щелочным. pH:- показатель кислотности или щёлочности среды. Меняется от 0 до 14. При pH, равном 7, среда нейтральная, хотя большинство растений предпочитает pH около 6.5. Выше 7 – среда щелочная, ниже 7 – кислотная.

PHAEACANTHA = ТЁМНОЖЁЛТОЕ (или ЯВНОКОЛЮЧЕЕ) – Phaeacantha:- with dusky spines.

PHAGE = ФАГ – Phage is a virus that attacks bacteria. / Под Фагами, от Греческого слова Phágos, означающее Пожиратель, или Бактериофагами, понимаются вирусы бактерий; способны поражать бактериальную клетку, репродуцироваться в ней и вызывать её лизис. Классический объект исследования в молекулярной генетике. Используются для фагопрофилактики и фаготерапии инфекционных болезней.

PHARMACEUTICALS = SECURITIES OF THE PHARMACEUTICAL COMPANIES

PHASE CHANGE = ФАЗОВОЕ ИЗМЕНЕНИЕ (или ИЗМЕНЕНИЕ ФАЗЫ) – Phase Change is a change to the state of an aggregate as a result of temperatures rising above or below the solidification and melting temperatures, e.g., with oils and fats.

PHASE CHANGE MATERIALS = МАТЕРИАЛЫ С XX – Phase Change Materials:- a hydrophilic compound applied to a fiber or fabric which results in superior breathability and a moisture management system within the fabric that helps to maintain a comfortable body temperature when the garment is worn.

PHASE–IN FINANCIAL TRANSMISSION RIGHTS = ПРАВА XX – Phase-In Financial Transmission Rights (Phase-In FTRs; in electricity) are FTRs directly allocated to eligible customers outside of the regularly scheduled FTR allocations when new control zones are integrated into PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC) after the start of the current planning period. Phase-in FTRs remain in effect until the start of the next regularly scheduled FTR allocation. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

PHASES BEAM = XX НАВОЙ – Phases Beam is a beam on which each of the ends is wound from the same depth of each of the bobbins on the creel. Phased beams are prepared when yarn properties vary from the inside to the outside of the bobbins in order to prevent warp streakiness in the finished fabric.

PHASE–SEPARATION SPINNING = XX ПРЯДЕНИЕ – Phase-Separation Spinning is an extrusion of polymer and solvent at high temperature into a cooling zone. During the cooling process, a phase separation occurs, usually accompanied by crystallization of the solvent. Solvent can be removed before or after drawing. See also Spinning. / Экструзия или Выдавливание (Extrusion). вытяжка (drawing).

PH DOWN = ПОНИЖЕНИЕ ВОДОРОДНОГО ПОКАЗАТЕЛЯ (или СНИЖЕНИЕ ПИ.ЭЙЧ.) – pH Down:- as a spa or swimming pool additive, a chemical to reduce pH. pH Down is almost always sodium bisulfate, which is typically in the form of tiny spherical beads. / шарики или гранулы или бисеринки или бусинки (beads).

PHENOL = ФЕНОЛ – Phenol is a white, crystalline compound (C_6H_5OH) derived from benzene, used in the manufacture of phenolic resins, weed killers, plastics, disinfectants; also used in solvent extraction, a petroleum refining process. Phenol is a toxic material; skin contact must be avoided. / Фенол – монооксибензол, карболовая кислота, бесцветные кристаллы с характерным запахом, розовеющие при хранении, $t_{пл}$ 40.9 °C, $t_{кип}$ 181.75 °C; умеренно растворим в воде, хорошо – в спирте, эфире, ацетоне. Фенол – простейший из оксипроизводных ароматических соединений (смотрите Фенолы). Фенол – важное сырьё в производстве ряда ценных продуктов. Так, хлорированием элементарным хлором в промышленности получают 2,4-дихлорфенол – полупродукт в производстве гербицида 2,4-дихлорфеноксиуксусной кислоты, конденсацией с альдегидами, главным образом с формальдегидом, – феноло-альдегидные смолы (смотрите также Фенопласты), с фталевым ангидридом – фенолфталеин (индикатор и лекарственное средство), с ацетоном – дифенилолпропан, используемый для производства поликарбонатов, гидрированием – циклогексанол (полупродукт в синтезе капролактама, полимеризацией которого получают поликапроамид), алкилированием олефинами – n-алкилфенолы RC_6H_4OH, применяемые в производстве поверхностно-активных и душистых веществ. Фенол используют также для получения различных красителей, лекарств, средств (салициловой кислоты, салола и другого), пикриновой кислоты (смотрите Нитрофенолы). Выделяют фенол из каменно-угольной смолы и получают синтетически из бензола – через бензолсульфокислоту $C_6H_5SO_2OH$ (сплавлением её натриевой соли с едким натром), из хлорбензола C_6H_5Cl (гидратацией) и главным образом через кумол (разложением его гидроперекиси). Фенол обладает бактерицидным действием; в медицине (более известен как Карболовая Кислота) используется в виде разбавленных водных растворов для дезинфекции помещений и предметов больничного обихода. При попадании на кожу фенол вызывает ожог. Предельно допустимая концентрация в воздухе 0.005 миллиграмма на литр (мг/л). Фенолы – оксипроизводные ароматических соединений, содержащие одну или несколько гидроксильных групп (–OH), связанных с атомами углерода ароматического ядра. По числу OH-групп различают Одноатомные Фенолы, например, оксибензол C_6H_5OH, называется обычно просто Фенолом, окситолуолы $CH_3C_6H_4OH$ – так называемые Крезолы, оксинафталины – Нафтолы; Двухатомные Фенолы, например, диоксибензолы $C_6H_4(OH)_2$ (гидрохинон, пирокатехин, резорцин); и Многоатомные Фенолы, например, пирогаллол, флороглюцин. Фенолы – бесцветные с характерным запахом кристаллы, реже жидкости; хорошо растворимы в органических растворителях (спирт, эфир, оензол). Обладая кислотными свойствами, фенолы образуют солеобразные продукты – феноляты:- ArOH + NaOH (ArONa + H_2O (Ar – ароматический радикал). Алкилирование и ацилирование фенолятов приводит к эфирам фенолов – простым ArOR и сложным ArOCOR (R – органический радикал). Сложные эфиры могут быть получены непосредственным взаимодействием фенолов с карбоновыми кислотами, их ангидридами и хлорангидридами. При нагревании фенолов с CO_2 образуются фенолокислоты, например, салициловая кислота. В отличие от спиртов, гидроксильная группа фенолов с большим трудом замещается на галоген. Электрофильное замещение в ядре фенолов (галогенирование, нитрование, сульфирование, алкилирование и другое) осуществляется гораздо легче, чем у незамещённых ароматических углеводородов; замещающие группы при этом направляются в орто- и пара-положения к OH-группе (смотрите Правила Ориентации). Каталитическое гидрирование фенолов приводит к алициклическим спиртам, например, C_6H_5OH восстанавливается до циклогексанола. Для фенолов характерны также реакции конденсации, например, с альдегидами и

кетонами, что используется в промышленности для получения феноло- и резорцино-формальдегидных смол, дифенилолпропана и других важных продуктов. Получают фенолы, например, гидролизом соответствующих галогенопроизводных, щелочным плавлением арилсульфокислот $ArSO_2OH$, выделяют из каменно-угольной смолы, дёгтя бурых углей и другого. Фенолы – важное сырьё в производстве различных полимеров, клеев, лакокрасочных материалов, красителей, лекарственных препаратов (фенолфталеин, салициловая кислота, салол), поверхностноактивных и душистых веществ. Некоторые фенолы применяют как антисептики и антиокислители (например, полимеров, смазочных масел). Для качественной идентификации фенолов используют растворы хлорного железа, образующие с фенолами окрашенные продукты. Фенолы токсичны (смотрите Сточные Воды).

PHENOLIC = ФЕНОЛЬНОЕ – Phenolic:- (1) a resin or plastic made by the condensation of a phenol with an aldehyde and used particularly in coatings and adhesives. (2) Containing or pertaining to phenol. / Фенольное (Phenolic).

PHENOLOGY = ФЕНОЛОГИЯ – Phenology is the periodic developmental processes and events which include processes stimulated by annual environmental fluctuations. / Под Фенологией, от Греческих слов Phainómena, означающее Явления, и Lógos, означающее Слово или Учение, понимается наука о сезонных явлениях в живой природе; регистрирует и изучает главным образом изменения в растительном и животном мире, обусловленные сменой времён года и погодными условиями, например, сроки цветения различных растений, прилёта и отлёта птиц.

PHENOTYPE = ФЕНОТИП – Phenotype is the appearance of an individual or population produced by the genotype in interaction with a given environment. Phenotype:- the physical characteristics and appearance of an organism. / Под Фенотипом, от Греческих слов Pháinō, означающее Обнаруживаю или Являю, и Týpos, означающее Образец или Отпечаток или Форма, понимается совокупность всех признаков и свойств организма, сформировавшихся в процессе его индивидуального развития. Складывается в результате взаимодействия наследственных свойств организма – генотипа и условий среды обитания. Фенотип, особенности строения и жизнедеятельности организма, обусловленные взаимодействием его генотипа с условиями среды. В широком смысле термин Фенотип, предложенный Датским биологом Вильхэльмом Людви Йоансэном (Wilhelm Ludwig Johannsen; 1857–1927) в 1909, обозначает всю совокупность проявлений генотипа (общий облик организма), а в узком – отдельные признаки (фены), контролируемые определёнными генами. Понятие Фенотип распространяется на любые признаки организма, начиная от первичных продуктов действия генов – молекул РНК и полипептидов и кончая особенностями внешнего строения, физиологических процессов, поведения и так далее. На уровне первичных продуктов действия генов связь между генотипом организма и его фенотипом вполне однозначна:- каждой последовательности нуклеотидов в молекуле дезоксирибонуклеиновой кислоты (ДНК) соответствует одна вполне определённая последовательность нуклеотидов в молекуле рибонуклеиновой кислоты (РНК) и соответственно одна определённая последовательность аминокислот в полипептидной (белковой) цепи (смотрите Генетический Код, Транскрипция, Трансляция). Однако и на этом уровне последовательность нуклеотидов в ДНК, то есть её первичная структура, однозначно определяет только строение синтезируемых на её основе РНК и белков, но не время их синтеза или количество этих продуктов, подобно тому, как типографская матрица определяет содержание текста, но не время его печатания или тираж. Время же активации отдельных генов и интенсивность их ‘считывания’ зависят как от предшествовавшей работы других генов, так и от комплекса внутриклеточных факторов и факторов внешней среды. На вышестоящих уровнях биологической организации, то есть на уровне клеток, тканей, органов, систем органов и организма в целом, взаимоотношения между генотипом и фенотипом ещё сложнее. В этих случаях каждый признак – результат взаимодействия продуктов многих генов, которое, в свою очередь, зависит от конкретных условий среды. Особенно наглядно это видно на примере количественных признаков. Изучая вес зёрен в нескольких самоопыляющихся, то есть генетически однородных, линиях растений Фасоли, Йоансэн обнаружил, что у растений одного генотипа зёрна варьируют по весу, то есть имеют разный фенотип. Причём границы изменчивости веса зёрен разных линий часто перекрываются (одни и те же фенотипы могут соответствовать разным генотипам). Вместе с тем между разными линиями, выращиваемыми в одинаковых условиях, имеются стабильные наследственные различия в среднем весе зёрен. Однако и средний вес зёрен в каждой линии может изменяться в зависимости от условий среды, например, режима питания растений. Таким образом, относительная роль наследственности и среды в становлении признаков может быть очень разной. Изучение количественных признаков, имеющих важное практическое значение в сельском хозяйстве и медицине, проводят специальными биометрическими методами анализа наследуемости признаков. Смотрите также статьи Плейотропия, Полимерия, Феногенетика, и Экспрессивность.

PHENOTYPIC ACCEPTABILITY = ФЕНОТИПИЧЕСКАЯ ПРИЕМЛЕМОСТЬ – Phenotypic Acceptability is a breeder’s classification of his observations on overall acceptability of breeding lines or populations, usually in acceptability scores from 1 to 9. For example:- 1 = excellent plant type and absence of diseases, 3 = very good appearance, 5 = fair appearance, but has a few essential shortcomings (too early maturity, etc), 7 = poor appearance, but has a few important traits that make it suitable as a donor, 9 = poor.

PHENYL = ФЕНИЛ – Phenyl is the name given to the molecular fragment consisting of a benzene ring with one hydrogen removed, and (except when existing as an unstable free radical), connected to something else through the bond where the missing hydrogen was. Phenyl is a chemical radical, molecular formula C_6H_5, average mass 77.104 Da, monoisotopic mass 77.039 124 Da, derived from benzene. It is the basis of many aromatic derivatives. Phenyl is the name for an organic group in covalent compounds. Formally, a phenyl group results from chemically modifying one of the carbons in a benzene ring to replace the hydrogen originally attached to the reacted carbon by some other group. One way of writing the formula of phenyl is $–C_6H_5$, but by itself, this group is not stable at standard temperature and pressure, because it is a free radical and as such very reactive. Phenyl is organic compound (contains carbon) it contains an aromatic ring (pleasant odour) it contains 6 carbons and 6 to 5 hydrogen’s. Phenyl is a benzene ring where one of the H atoms has been replaced by a functional group such as –OH, where we call it phenol or $–NH_2$, phenylamine. In short, a phenyl ring is a substitutent of another functional group. / Фенил:- углеводородный радикал, одновалентный остаток бензола (C_6H_5), существование которого принимается во множестве органических соединений так называемого ароматического ряда, являющихся производными бензола, например, в толуоле, или фенилметане $CH_3–C_6H_5$, трифенилметане $CH(C_6H_5)_3$, дифениле, или фенилбензоле $C_6H_5–C_6H_5$, анилине, или фениламине $C_6H_5–NH_2$, карболовой кислоте, или фенилгидрате $C_6H_5–OH$, фенилуксусной кислоте $C_6H_5–CH_2–COHO$ и прочем. Что касается самого названия Фенил, то оно введено в XIX веке Французским химиком Огюстэ Лёро (Auguste Laurent) и произведено им от слова Фен (Phène), означающее Свеча, которое он предложил для обозначения бензола, ибо присутствием последнего обусловливается, главным образом, яркость пламени светильного газа.

PHEROMONE = ФЕРОМОН – Pheromone is a chemical substance secreted externally by certain Animals which affects the behaviour or physiology of other animals of the same Species. A chemical releases by an Insect to attract others of the same Species, also a synthetic chemical with the same structure or activity as a natural pheromone. / Виды (Species). Химическое соединение, источаемое насекомыми для привлечения других особей этого же вида; а также синтетический химикат той же структуры и

того же действия, что и натуральный феромон. Под Феромонами понимаются химические вещества, вырабатываемые экзокринными железами (или специальными клетками) Животных; выделяясь во внешнюю среду одними особями, феромоны оказывают влияние на поведение, а иногда на рост и развитие других особей того же Вида. К феромонам относятся половые аттрактанты, вещества тревоги, сбора и другие. Особенно важную роль феромоны играют в жизни Насекомых. У общественных Насекомых феромоны регулируют также состав колонии и специфическую деятельность её членов. Феромоны, биологически активные вещества, выделяемые животными в окружающую среду и специфически влияющие на поведение, физиологическое и эмоциональное состояние или метаболизм других особей того же Вида. Как правило, феромоны продуцируются специализированными железами. Биологическое действие феромонов осуществляется обычно через хеморецепторы, в частности у многих Животных – с помощью обоняния органов. Особую группу феромонов составляют продукты внешней секреции, которые непосредственно регулируют процессы метаболизма и развития у других особей, действуя сходно с гормонами (например, некоторые компоненты ‘маточного вещества’ домашней Пчелы, которое вырабатывается маткой и тормозит развитие яичников у рабочих Пчёл). Феромоны не принадлежат к какому-либо одному классу химических соединений. Их строение (оно известно не для всех феромонов, существование которых в принципе доказано) разнообразно. Феромоны могут быть представлены отдельными химическими соединениями, но чаще биологическое действие оказывает совокупность нескольких компонентов. Как правило, для биологического действия феромонов характерна видовая специфичность, то есть разные Виды Животных используют в качестве феромонов разные химические вещества или смеси с различным сочетанием компонентов (однако для Видов, разделённых территориально, или с разными суточными, сезонными и тому подобными периодами активности феромонами могут быть одни и те же вещества). В основном феромоны осуществляют химическую коммуникацию между особями одного Вида. В некоторых случаях они несут добавочную функцию межвидовой связи. Так, паразитов могут привлекать феромоны хозяина. Наиболее полно изучены феромоны Насекомых. Половые феромоны обеспечивают встречу и ‘узнавание’ особей разного пола и стимулируют половое поведение. В 1959 Немецкий биохимик Адольф Фридрихь Йохан Бутэнандт (Adolf Friedrich Johann Butenandt; 1903–1995) установил химическое строение полового аттрактанта (привлекающего вещества) самки Тутового Шёлкопряда. Этот феромон, название Бомбиколом, вызывает у самцов поведенческую реакцию при концентрации в воздухе около 10^{-19} грамма на кубический сантиметр (г/см^3). Столь же эффективен половой феромон непарного Шёлкопряда – Диспарлюр. Химическое строение половых феромонов установлено для многих Видов Насекомых, преимущественно из Отряда Чешуекрылых. Известные феромоны самок Ночных Бабочек относятся главным образом к ненасыщенным алифатическим сложным эфирам или спиртам. Половые феромоны самцов некоторых Бабочек (так называемые Афродизиаки) оказывают на самку ‘возбуждающее’ действие, подготавливая к спариванию. Для ряда Насекомых (многие Виды Клопов, Мухи, Тараканы, некоторые Жуки) характерно скопление большого числа особей на ограниченной площади, обеспечиваемое так называемыми Агрегационными Феромонами, которые наиболее изучены у вредителей леса – Жуков-Короедов. Феромоны ‘тревоги’ вызывают реакцию бегства, затаивания или, наоборот, как это наблюдается у общественных Насекомых, – агрессивную реакцию и коллективное нападение на врага. Обычно это относительно простые и более летучие по сравнению с половыми феромонами вещества (у домашней Пчелы одним из компонентов феромона тревоги служит изоамилацетат). Феромоны позвоночных Животных изучены в меньшей степени. У рыб, хвостатых земноводных и пресмыкающихся установлено существование половых феромонов. У многих Видов рыб в коже содержится феромон тревоги (‘вещество испуга’), высвобождающийся при повреждении кожи и вызывающий реакцию испуга у других особей. Такой же механизм выделения феромона тревоги обнаружен у головастиков жабы. Феромоны неизвестны у птиц. В применении к млекопитающим строгое определение понятия Феромон трудно дать из-за особой сложности их поведения и недостаточного знания механизмов химической коммуникации. Накоплено значительное число фактов, устанавливающих влияние различных пахучих выделений млекопитающих на половое, материнское, территориальное, агрессивное поведение, на физиологическое и эмоциональное состояния. В половом поведении млекопитающих эти выделения могут не только обеспечивать простую функцию привлечения, но и контролировать более сложные процессы, связанные с размножением. Так, у некоторых грызунов определённые компоненты запаха самцов и самок влияют на течение овариального цикла, задерживая или ускоряя наступление эструса. У мышей известен эффект блокирования беременности под влиянием запаха ‘чужого’ самца. Широко распространены у млекопитающих пахучие метки. Предполагают, что эти метки служат знаками, указывающими на занятость территории, а также могут нести индивидуальную информацию о животном, оставившем метку (смотрите Общение Животных). Феромоны – потенциально эффективные средства управления поведением животных. Особенно перспективно использование феромонов для борьбы с сельскохозяйственными и лесными вредителями. Ловушки с синтетическими феромонами используются для учёта численности Насекомых-Вредителей, а в ряде случаев – и для их массового уничтожения.

PHEROMONE TRAP = ФЕРОМОННЫЙ УЛОВИТЕЛЬ (или ФЕРОМОННАЯ ЛОВУШКА) – Pheromone Trap is a trap that uses either a natural or, more typically, a synthetic insect sex attractant pheromone; these traps are usually species specific.

PHILARM = PHILIPPINE ASSOCIATION OF RESEARCH MANAGERS

PHILLIPS CURVE = КРИВАЯ ФИЛИПСА – Phillips Curve:- in the late 1950s, Alban William Housego Phillips (A.W. Bill Phillips) the British economist demonstrated an inverse statistical association between annual changes in average wage rates and the rate of unemployment. When the annual wage growth rates and unemployment rates for Great Britain for each of the years from 1861 to 1957 were plotted as points on a two-dimensional graph, they rather neatly approximated a shallow hyperbola-shaped curve convex to the origin of the graph. That is, in years when unemployment rates were low, average money wages tended to grow rapidly; but in years when unemployment rates were high, average money wages tended to grow little or even to decline. Other economists soon repeated Phillips’s procedures with similar data from a number of other industrialized countries and mostly found similar statistical relationships. At the time, many Keynesian economists reasoned from this finding as follows:- Because unemployment rates and wage increase rates are inversely related, the traditional government goals of maintaining both low inflation and low unemployment would seem to be inconsistent. Because wages are such a large share of the costs of production, rapid increases in average wages are bound to push up the general price level. There is a trade-off relationship between inflation and unemployment, and economic policy makers will have to choose the mix of inflation and unemployment that they find most acceptable according to their political and ideological commitments. Conservative policy makers may be willing to choose low inflation even at the cost of enduring high unemployment, whereas liberal or socialist policy makers may be expected to pursue more inflationary policies because of their deeper commitments to full employment. The Phillips curve may be expected to remain fixed and stable and provide the menu of precise numerical combinations of inflation and unemployment that policy makers have available to choose from. One result of widespread acceptance of the ‘Phillips curve’ trade-off theory was to make inflation a bit more politically respectable. Moderate inflation was now not so much seen as an unambiguous failure of economic policy but rather could be presented to the public as ‘the price we have to pay for keeping unemployment low’. Political critics of inflationary monetary or fiscal policies could now be caricatured as advocates of jacking up the unemployment rate and thus bringing misery to millions of working class families. Not too surprisingly, the one or two percent long-term average inflation rates

characteristic of nearly all the advanced industrialized countries during peacetime over the past century or so began to give way in the 1960s and especially in the 1970s to rather higher inflation rates. During this same period, the earlier assumption that the historically estimated Phillips curve represented a rather stable relationship proved to be grossly inaccurate. The 1960s, and especially the 1970s, provided economists with numerous new data points that did not fall along the old Phillips curves for the industrialized countries but rather were well to the right of the older data points on the graph. In the new era, higher rates of inflation coexisted everywhere with unexpectedly high rates of unemployment. It seemed to require higher and higher doses of inflation than before to bring unemployment down to any given level. More recent economic analysis of the trade-off between inflation and unemployment considerably modifies the simplistic stable Phillips curve theory of the past. It is now recognized that both labor and management incorporate their expectations about the likely future rate of inflation into their bargaining positions in wage negotiations, since it is the real purchasing power of the future wage payments rather than simply the nominal number of currency units that matter to them. As average inflation rates in the industrial countries rose over time, labor and management eventually began adjusting their inflationary expectations for the future upward as well, and wage settlements began to reflect these higher long-term expectations. As a result, the Phillips curve shifts upward and outward to a higher level, further away from the origin of the graph. Government policy makers now can lower unemployment rates (in the short to medium term) only by creating a rate of inflation even more rapid than the public previously had come to expect – and this works for only so long as it takes the public to adjust their expectations upward in the light of their new experiences. / Элбэн Вилъйэм Хаусго Филипс (Alban William Housego Phillips; Эй.Дабл.Ю. Бил Филипс (A.W. Bill Phillips)).

PhilRice = PHILIPPINE RICE RESEARCH INSTITUTE

PhilVolcs = PHILIPPINE INSTITUTE OF VOLCANOLOGY AND SEISMOLOGY

PHISHING = ВЫУЖИВАНИЕ (ПАРОЛЕЙ) – Phishing is a common form of e-mail based identity fraud. It works by tricking the recipient into providing sensitive or financial information via links to illegitimate web sites. Deutsche Bank AG will not ask you to provide your user credentials, password or other account information via e-mail. To protect yourself, please consider the following recommendations:- (i) do not respond to e-mail with urgent requests to provide sensitive or financial information about you under the threat of account suspension or termination. (ii) If you are suspicious of the legitimacy of the e-mail, do not click on links in the e-mail even if the link appears to be the correct one. Although some links appear to lead you to a proper web site, it is possible they will connect you to an unintended site. (iii) If you click on a link in an e-mail, ensure that the link that shows up in the browser address bar is the same as the link in the e-mail. (iv) Do not reply to e-mail or fill out forms that ask for your personal information. (v) Verify that you are using a secure site by verifying the URL in the address bar. Secure web sites use encryption to protect your data. You can tell that a site is secure if you see a lock or key in the information bar on the bottom of the browser or if the URL begins with https:// instead http://. (vi) If you have doubts about the validity of the web site, do not enter your user credentials, password or other sensitive information. (vii) Report to our help desk any suspicious e-mails that claim to be from Deutsche Bank. This word, which was formed out of ‘Password’ and ‘Fishing’ concerned the spying of incoming information with the use of psychological tricks. In so-called Phishing Mails it is for example claimed that the bank has a problem and must check your password. The link indicated in the mail indicates, however, a page which is similar to that of the apparent bank, but which only serves to gather the incoming information. Phishing attacks use both social engineering and technical subterfuge to steal consumers’ personal identity data and financial account credentials. Social engineering schemes use spoofed emails to lead consumers to counterfeit websites designed to trick recipients into divulging financial data such as credit card numbers, account usernames, passwords and social security numbers. Hijacking brand names of banks, e-retailers and credit card companies, phishers often convince recipients to respond. Technical subterfuge schemes plant crimeware onto PCs to steal credentials directly, often using Trojan keylogger spyware. Pharming crimeware misdirects users to fraudulent sites or proxy servers, typically through Domain Name System (DNS) hijacking or poisoning. Phishing:- a play on the word ‘Fishing’ deceptive email, texts or other messages sent to a target in order to steal their account credentials. Frequently used to obtain access to financial services in order to steal money, but also used to obtain network credentials for an employer, social media accounts and even online gaming accounts. / Дойчэ Банк А.Ге. (Deutsche Bank AG). Фишинг (или Выуживание):- фишинг-атаки используют как психологические, так и технические средства для кражи личных идентифицирующих данных и кодов доступа к банковским счетам. Схемы психологических средств используют подставные электронные письма, призывающие пользователя посетить подложный веб-сайт, созданный для обмана посетителей путём запросов на ввод финансовых данных, таких как номер кредитной карточки, имя пользователя учётной записи, пароль и номер социального страхования. Подменяя известные названия банков, Интернет магазинов и компаний, занимающихся выпуском и обслуживанием кредитных карт, фишеры часто убеждают получателей подложной информации ответить на запросы. Схемы технических средств подразумевают размещение вредоносного программного обеспечения на компьютере для непосредственной кражи данных, для этого часто используется шпионское программное обеспечение (Троянские программы), например, программы перехвата ввода с клавиатуры. Вредоносное программное обеспечение для фарминга переводит пользователя на мошеннические веб-сайты или прокси-серверы, как правило, через перехват сеанса связи или порчу (‘отравление’) Системы Доменных Имён (СДИ).

PHLOEM = ФЛОЭМА (или ЛУБ) – The Phloem is a living tissue in plants that functions primarily to transport metabolic compounds from the site of synthesis or storage to the site of utilization. The tissue in a plant that conducts the products of photosynthesis through the plant. Phloem is the main food-conducting tissue of vascular plants, comprising sieve elements, parenchyma cells, fibers and sclereids. Phloem is a complex tissue in the vascular system of higher plants consisting mainly of sieve tubes and companion cells; chiefly for translocation, structural support, and storage. / Под Флоэмой, от Греческого слова Phloiós, означающее Кора или Лыко, понимается комплексная ткань в сосудистой системе Высших Растений, служащая для проведения к корням органических веществ, которые синтезируются в листьях (сахароза и другие), то есть ткань в растении, которая проводит продукты фотосинтеза внутри самого растения от листьев до корней. Основными элементами флоэмы являются ситовидные трубки (sieve tubes), клетки-спутницы (companion cells), паренхимные клетки (parenchyma cells), механические волокна (fibers), и (sclereids). Известна также как Луб. Однако, иногда лубом называется только вторичная флоэма.

PHLX = PHILADELPHIA STOCK EXCHANGE

PHOSPHATE ESTER = СЛОЖНЫЙ ЭФИР ФОСФОРНОЙ КИСЛОТЫ (или ЭФИР (ОРТО)ФОСФОРНОЙ КИСЛОТЫ) – Phosphate Ester is any of a group of synthetic lubricants having superior fire resistance. A phosphate ester generally has poor hydrolytic stability, poor compatibility with mineral oil, and a relatively low viscosity index (VI). It is used as a fire-resistant hydraulic fluid in high-temperature applications. / .

PHOSPHORESCENCE = ФОСФОРЕСЦЕНЦИЯ (или ДЛИТЕЛЬНОЕ СВЕЧЕНИЕ) – Phosphorescence is an emission of light that persists for a noticeable time after the removal of the excitation source. See also Fluorescence, and Luminescence. / после удаления источника возбуждения (excitation source). Смотрите также Флуоресценция (Fluorescence), и Люминесценция (Luminescence).

PHOSPHORESCENT = ФОСФОРЕСЦЕНТНОЕ (или СВЕТЯЩЕЕСЯ) – Phosphorescent:- (glow in the dark) specialty ink that illuminates in darkness. Generally, with a greenish glow effect. However, additional colors are available.

PHOSPHORIC ACID = ФОСФОРИЧЕСКАЯ КИСЛОТА (или ФОСФОРНАЯ КИСЛОТА, или ОРТОФОСФОРНАЯ КИСЛОТА) – Phosphoric Acid is an inorganic acid having the formula (H_3PO_4). / Фосфорическая Кислота или Ортофосфорная Кислота, H_3PO_4:- этот компонент добавляют практически во все газированные напитки. Её опасность в том, что она провоцирует развитие остеопороза, так как из костных тканей вымывается кальций. В 60 минут Фосфорическая Кислота связывает кальций, цинк и магний в Вашем кишечнике. Увеличивается мочевое выделение кальция. В 60 минут Вам хочется в туалет и Вы просто выводите из себя все связанные элементы. В 60 минут Вы чувствуйте усталость или слабость. Вещества из Вашего организма вымыты. У Вас наступает 'крушение' сахара. После у Вас наступает кофеиновое 'крушение' и Вы тянетесь за следующей банкой газировки. Фосфорная Кислота или Ортофосфорная Кислота, H_3PO_4, молекулярная масса 97.995; бесцветные гигроскопичные кристаллы моноклинной сингонии (a = 0.576 2 нм, b = 0.483 1 нм, c = 1.156 9 нм, β = 95.31°, пространственная группа P21/c); расплывается на воздухе; температура плавления 42.50 °C; плотность 1.88 г/см^3; $\Delta H^0_{обр}$ – 1 283 кДж/моль; наиболее стабильное соединение в ряду кислородсодержащих кислот фосфора. В расплавленном состоянии склонна к переохлаждению; при 15 °C образует густую маслянистую жидкость, при –121 °C – стеклообразную массу. Фосфорная кислота смешивается с водой в любых соотношениях. Разбавленные водные растворы имеют кисловатый вкус. Из высококонцентрированных растворов кристаллизуется в виде гемигидрата (полугидрата) $H_3PO_4 \cdot 0.5H_2O$ – бесцветные кристаллы моноклинной сингонии (a = 0.792 2 нм, b = 1.298 7 нм, c = 0.747 нм, β = 109.9°; пространственная группа P21/a). Молекула безводной H_3PO_4 и её кристаллогидрата содержит тетраэдрическую группу PO_4. В безводной фосфорной кислоте образуются водородные связи типа P – O – H ... O = P (расстояние между атомами O 0.253 нм), которые удерживают структуры PO_4 в виде слоёв, параллельных одной из плоскостей кристалла. Водородные связи сохраняются и в концентрированных (70–80%) растворах фосфорной кислоты, что отчасти обусловливает её сиропообразную природу. В разбавленных до 40–50% растворах отмечена более устойчивая водородная связь фосфат-анионов с молекулами воды, а не с другими фосфат-анионами. В растворах фосфорной кислоты имеет место обмен атомами кислорода между группами PO_4 и водой.

PHOSPHORUS = ФОСФОР – Phosphorus (P) is an essential element for plant growth and development. / Под Фосфором (Латинское название Phosphorus) понимается химический элемент V группы Периодической Системы Менделеева, атомный номер 15, атомная масса 30.973 76. Название от Греческого слова Phōsphóros, означающее Светоносный. Образует несколько модификаций – белый фосфор (плотность 1.828 г/см^3, $t_{пл}$ 44.14 °C), красный фосфор (плотность 2.3 г/см^3, $t_{пл}$ 590 °C) и другие. Белый фосфор легко самовоспламеняется, светится в темноте (отсюда название), ядовит; красный менее активен химически, ядовит. Добывают из апатитов и фосфоритов. Главный потребитель – сельское хозяйство (фосфорные удобрения); применяется в спичечном производстве, металлургии (раскислитель и компонент некоторых сплавов), в органическом синтезе и другом. Присутствует в живых клетках в виде орто- и пирофосфорной кислот и их производных.

PHOSPHORUS–EFFICIENT PLANTS = ФОСФОР ПРОДУКТИВНЫЕ РАСТЕНИЯ – Phosphorus-Efficient Plants are the Plants that are able to absorb, translocate, and utilize Phosphorus (P) more efficiently than other genotypes.

PHOSPHORYLATION = ФОСФОРИЛИРОВАНИЕ – Phosphorylation is a biological process by which proteins are 'decorated' with phosphate groups derived from adenosine triphosphate (ATP). The process alters the biological activity of the protein, thereby facilitating a form of physiological regulation. / Под Фосфорилированием понимается химическая реакция – введение в молекулы неорганических и органических соединений остатков кислот фосфора. Так называемое биологическое фосфорилирование играет важную роль в обмене веществ (в процессах окисления, при синтезе белков, нуклеиновых кислот и другого).

PHOTOCHROMIC = ФОТОХРОМИЧЕСКОЕ (или ФОТОХРОМНОЕ) – Photochromic:- specialty ink that makes designs almost colorless when viewed indoors, but acquire a bright color when viewed outside or under a source of intense light.

PHOTOCHROMISM = ФОТОХРОМИЗМ – Photochromism:- a reversible change in color of a specimen due to exposure to light. / Под Фотохромизмом, от Греческих слов Phōs, родительный падеж Phōtós, означающее Свет, и Chrōma, означающее Краска или Цвет, понимается способность вещества обратимо приобретать или изменять окраску (спектры пропускания и поглощения) под действием оптического (ультрафиолетового (УФ), видимого и инфракрасного (ИК)) излучения.

PHOTOCOOPERATION = ФОТОКООПЕРАЦИЯ – Photocooperation is an association of mutual benefit to two or more species but without the cooperation being obligatory for the existence or the performance of some function. / Под Фотокооперацией, от Греческого слова Phōs, родительный падеж Phōtós, означающее Свет, и Латинского слова Cooperatio, означающее Сотрудничество, понимается .

PHOTOGRAPHIC PRINTING = ФОТОГРАФИЧЕСКОЕ ПЕЧАТАНИЕ (или ФОТОФИЛЬМ–ПЕЧАТЬ) – Photographic Printing is a method of printing from photoengraved rollers. The resultant design looks like a photograph. The designs may also be photographed on a silk screen which is used in screen printing. See also Printing.

PHOTOMETER = ФОТОМЕТР – Photometer is an instrument for measuring light. / Под Фотометром, от Греческих слов Phōs, родительный падеж Phōtós, означающее Свет, и Métron, означающее Мера, понимается прибор для измерений величин, характеризующих оптическое излучение объектов (силы света, яркости и тому подобного), а также световых характеристик материалов, например, коэффициента отражения, пропускания. По конструкции и принципу действия различают фотометры визуальные, фотоэлектрические, распределительные, интегрирующие, шаровые и другие. Фотометры используют при исследовании газов, твёрдых и жидких веществ, оптических систем. Под Фотометром понимается прибор для измерения фотометрических (в том числе световых) величин:- освещённости, силы света, светового потока, яркости, коэффициента пропускания и коэффициента отражения, а также величин, характеризующих ультрафиолетовое (УФ) и инфракрасное (ИК) излучения. Фотометр – прибор, используемый для измерения силы света светового источника путём сравнения со световым источником известной силы. Это достигается при помощи сравнения местоположений источников, которые создают одинаковое освещение контрольной поверхности. Фотометрией является раздел физики, занимающийся такими измерениями. В современных фотометрах обычно используются фотоэлементы. В астрономии светоэлектрическими фотометрами измеряют яркость небесных объектов. Здесь эти приборы генерируют электрический сигнал, прямо пропорциональный силе света того объекта, на который он направлен. Единицей силы света является кандела (кд).

PHOTOMICROGRAPHS AND MICROPHOTOGRAPHS = ФОТОМИКРОГРАФЫ И МИКРОФОТОГРАФЫ – Photomicrographs and Microphotographs:- these terms are frequently misused and interchanged indiscriminately. As applied to textile microscopy in particular, the correct word is 'photomicrograph'. It refers to enlarged photographs, very often taken through a system of lenses or through a microscope, to give a magnified view of a small area. A 'microphotograph', on the other hand, is a microscopically small photograph and would usually serve no purpose in preparing a report on the investigation of fiber or fabric faults.

PHOTONASTY = ФОТОНАСТИЯ – Photonasty:- of a movement in response to variation in light intensity. See also Nastic. / Под Фотонастией, от Греческих слов Phōs, родительный падеж Phōtós, означающее Свет, и Nastós, означающее Уплотнённый, понимаются ростовые движения органов растений (лепестков, листьев) под влиянием равномерного (а не односторонне направленного) освещения, например, открывание цветков.

PHOTOPERIOD = ФОТОПЕРИОД – Photoperiod is the duration of the light period during a given day, which fluctuates during the year and according to latitude. / Под Фотопериодом, от Греческих слов Phōs, родительный падеж Phōtós, означающее Свет, и Periodos, означающее Круговращение или Обход или Определённый Круг Времени, понимается .

PHOTOPERIODISM = ФОТОПЕРИОДИЗМ – Photoperiodism:- the response (e.g., flowering, germination) of organisms to the relative length of daily periods of light and darkness. / Под Фотопериодизмом, от Греческих слов Phōs, родительный падеж Phōtós, означающее Свет, и Periodos, означающее Круговращение или Обход или Определённый Круг Времени, понимаются реакции организмов на смену дня и ночи, проявляющиеся в колебаниях интенсивности физиологических процессов. В наибольшей степени фотопериодизм свойствен зелёным растениям, жизнедеятельность которых непосредственно зависит от лучистой энергии Солнца. У животных и человека фотопериодизм проявляется в первую очередь в колебаниях интенсивности обмена веществ и энергии.

PHOTOPERIOD–SENSITIVE CULTIVARS = ЧУВСТВИТЕЛЬНЫЕ К ФОТОПЕРИОДУ КУЛЬТИВАРЫ – Photoperiod-Sensitive Cultivars are cultivars that do not flower unless exposed to daylength longer or shorter than a critical period.

PHOTOPERIOD–SENSITIVE GENIC MALE STERILE LINE = ЧУВСТВИТЕЛЬНАЯ К ФОТОПЕРИОДУ ГЕННАЯ ЛИНИЯ С МУЖСКОЙ СТЕРИЛЬНОСТЬЮ (или ЧУВСТВИТЕЛЬНАЯ К ФОТОПЕРИОДУ ГЕННАЯ ЛИНИЯ С МУЖСКОЙ БЕСПЛОДНОСТЬЮ, или ЧУВСТВИТЕЛЬНАЯ К ФОТОПЕРИОДУ ГЕННАЯ МУЖСКАЯ СТЕРИЛЬНАЯ ЛИНИЯ) – Photoperiod-Sensitive Genic Male Sterile Line (PGMS) is the genic male sterile plants which respond to photoperiod or duration of daylength in terms of pollen fertility and sterility behavior. / долготы дня в . В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

PHOTOPERIOD–SENSITIVE PHASE = ФАЗА, ЧУВСТВИТЕЛЬНАЯ К ФОТОПЕРИОДУ – Photoperiod-Sensitive Phase (PSP); the growth stage when a plant becomes sensitive to photoperiod.

PHOTOPERIOD SENSITIVITY = ЧУВСТВИТЕЛЬНОСТЬ К ФОТОПЕРИОДУ – Photoperiod Sensitivity is the degree or extent to which the Rice plant responds to a short photoperiod, e.g., daylength for flowering.

PHOTOPIC = ФОТОПИЧЕСКОЕ (или ДНЕВНОЕ) – Photopic:- pertaining to human vision at sufficiently high levels of illumination that only the retinal cones are stimulated. / Дневное – относящееся к дневному зрению. Под Фотопическим, от Греческих слов Phos, Photos, означающее Свет, и Ops, Opos, означающее Глаз или Зрение, . Дневное Зрение – механизм восприятия света зрительной системой человека, действующий в условиях относительно высокой освещённости. Осуществляется с помощью колбочек при яркости фона, превышающей 10 кд/м2, что соответствует дневным условиям освещения. Палочки в этих условиях не функционируют. Синонимы:- Фотопическое Зрение и Колбочковое Зрение.

PHOTOSYNTHESIS = ФОТОСИНТЕЗ – Photosynthesis is the production of sugars from water and carbon dioxide using energy trapped from sunlight with the aid of chlorophyll. The process by which plants use the energy of sunlight and carbon dioxide to build the sugars and carbohydrates needed for plant growth. Photosynthesis is a complex process by which the energy of sunlight is absorbed and set to drive chemical reactions. In plants, the major role of photosynthesis is to reduce CO_2 to the level of carbohydrate in the presence of chlorophyll and light and release oxygen as a by-product. / Под Фотосинтезом, от Греческих слов Phōs, родительный падеж Phōtós, означающее Свет, и Sýnthesis, означающее Соединение, понимается процесс, посредством которого растения, поглощая энергию солнечного света и углекислый газ, производят необходимые для роста растения сахарозу и углеводы. Под Фотосинтезом понимается превращение зелёными растениями и фотосинтезирующими микроорганизмами лучистой энергии Солнца в энергию химических связей органических веществ. Фотосинтез происходит у участием поглощающих свет пигментов (хлорофилл и другие). Суммарное выражение фотосинтез уравнений:- $6CO_2 + 6H_2O \xrightarrow{h\nu/\text{хлорофилл}} C_6H_{12}O_6 + 6O_2$. Фотосинтез – единственный биологический процесс, который идёт с увеличением свободной энергии и прямо или косвенно обеспечивает доступной химической энергией все земные организмы, кроме хемосинтезирующих. Ежегодно в результате фотосинтеза на Земле образуется около 150 миллиардов тонн органического вещества, усваивается 300 миллиардов тонн CO_2 и выделяется около 200 миллиардов тонн свободного O_2. Благодаря фотосинтетической деятельности первых зелёных организмов в первичной атмосфере Земли появился кислород, возник озоновый экран, создались условия для биологической эволюции. Фотосинтез:- механизм использования энергии солнечного света для синтеза органических веществ.

PHOTOSYNTHESIS PRODUCTION = ПРОДУКЦИЯ ФОТОСИНТЕЗА – Photosynthesis Production:- the flag leaf produces the photosynthesis necessary for the Rice plant and the growth of the panicles. / кроющий лист производит .

PHOTOSYNTHETIC AQUATIC BIOMASS = ФОТОСИНТЕТИЧЕСКАЯ ВОДНАЯ (или ВОДЯНАЯ, или АКВАЛЬНАЯ) БИОМАССА – Photosynthetic Aquatic Biomass (PAB) is the mass of plants and algae which photosynthesize in the water.

PHOTOSYNTHETIC UNIT = ФОТОСИНТЕТИЧЕСКАЯ ЕДИНИЦА – Photosynthetic Unit is the group of pigment molecules necessary for photochemical action.

PHOTOTAXIS = ФОТОТАКСИС – Phototaxis is movement of a whole organism or freely motile part in response to variation in light intensity and direction. See also Tactic. / Под Фототаксисом, от Греческих слов Phōs, родительный падеж Phōtós, означающее Свет, и Táxis, означающее Расположение, понимается . Под Таксисами понимаются направленные движения организмов (простейшие животные и низшие растения), отдельных клеток или их органелл под влиянием односторонне действующего стимула – света (фототаксис), температуры (термотаксис), химических веществ (хемотаксис), в том числе кислорода (аэротаксис), влажности (гидротаксис, например, плазмодий миксомицетов переползает в направлении повышенной влажности) и другие.

PHOTOTROPHIC = ФОТОТРОФИЧЕСКОЕ (или ФОТОТРОФНОЕ) – Phototrophic:- moving toward (positively) or away from (negative) a light source. / Под Фототрофным, от Греческих слов Phōs, родительный падеж Phōtós, означающее Свет, и Trophē, означающее Питание или Пища, понимается .

PHOTOTROPISM = ФОТОТРОПИЗМ – Phototropism:- bending, growth or movement of a part towards or away from light. See also Tropism. / Смотрите также Тропизм (Tropism). Под Фототропизмом, от Греческих слов Phōs, родительный падеж Phōtós, означающее Свет, и xxxxx. Под Тропизмом, от Греческого слова Tróros, означающее Направление или Поворот, понимается

ростовое движение органов растений (корня, стебля, листьев), обусловленное направленным действием какого-либо раздражителя – света (фоторопизм), силы земного тяготения (геотропизм), температуры (термотропизм), прикосновения (гаптотропизм), воды (гидротропизм), кислорода (аэротропизм) и других химических веществ (хемотропизм). В основе тропизма лежит неравномерный рост, вызываемый перераспределением в растении фитогормонов.

PHP = PHILIPPINE PESO

PHREATIC = ФРЕАТИЧЕСКАЯ (или ГРУНТОВАЯ) – Phreatic:- pertaining to groundwater. To indicate groundwater that periodically rises to the rooting zone of cultivated plants. / в зону укоренения . Под Грунтовыми Водами понимаются подземные воды первого от поверхности Земли постоянного водоносного горизонта, не имеющего сверху сплошной кровли водонепроницаемых пород; не обладают напором и подвержены сезонным колебаниям уровня и дебита.

PHT = POSTHARVEST TECHNOLOGY

PHTHALIC ACID = ФТАЛЕВАЯ КИСЛОТА – Phthalic Acid is an organic acid obtained by oxidation of various benzene derivatives and having two adjacent (ortho) acid (COOH) groups on the benzene ring. / Под Фталевыми Кислотами, $C_6H_4(COOH)_2$, понимаются карбоновые кислоты ароматического ряда. Известны орто-фталевая кислота (фталевая), мета-фталевая кислота (изофталевая), пара-фталевая кислота (терефталевая). Высокоплавкие кристаллические вещества. Сырьё в производстве полиэфиров, лекарственных средств, красителей. Большое значение имеют производные фталевой кислоты – фталевый ангидрид и эфиры фталевой кислоты, например, диметилтерефталат, дибутилфталат.

PHTRC = POSTHARVEST HORTICULTURE TRAINING AND RESEARCH CENTER

PH UP = ПОВЫШЕНИЕ ВОДОРОДНОГО ПОКАЗАТЕЛЯ (или ПОВЫШЕНИЕ ПИ.ЭЙЧ.) – pH Up:- as a spa or swimming pool additive, a chemical to increase pH. pH Up is usually 'pure' sodium carbonate (soda ash). Because it can often be purchased at grocery or hardware stores, usually reasonably cheaply, it may a good alternative to buying soda ash from a dye vendor. Sometimes sodium bicarbonate is sold for increasing pool pH. It is not equivalent to soda ash. / Бикарбонат Натрия или Двууглекислый Натрий или Кислый Углекислый Натрий (Sodium Bicarbonate).

PHYLACTERY = ФИЛАКТЕРИЯ (или ТФИЛИН, или ОБЕРЕГ, или АМУЛЕТ) – Phylactery:- either of two small square leather boxes containing slips inscribed with scriptural passages and traditionally worn on the left arm and on the head by Jewish men during morning weekday prayers. / Филактерия или Тфилин – небольшой кожаный ящичек, содержащий четыре ленты, на которых написаны четыре цитаты из Библии (Исх. 13:1-10, 11-16; Втор. 6:4-9; 11:13-21). Иудеи носят их в напоминание о религиозных обязанностях (ср. Мф. 23:5). Тфилин – элемент молитвенного облачения иудея:- две маленькие коробочки (Батим, означающее буквально Домики) из выкрашенной чёрной краской кожи кошерных животных, содержащие написанные на пергаменте отрывки (паршиот) из Торы. При помощи чёрных кожаных ремешков, продетых через основания коробочек, одну из тфилин укрепляют на бицепсе обнажённой левой руки ('против сердца' – немного повернув к телу), а вторую – на линии волос, между глаз. Источником заповеди накладывания тфилин являются следующие четыре отрывка из Пятикнижия:- (i) 'И объяви в день тот сыну твоему, говоря:- это ради того, что Господь сделал со мною, когда я вышел из Египта. И да будет тебе это знаком на руке твоей и памятником пред глазами твоими, дабы закон Господень был в устах твоих, ибо рукою крепкою вывел тебя Господь из Египта' (Исх. 13:8–9); (ii) 'И когда после спросит тебя сын твой, говоря:- что это? то скажи ему:- рукою крепкою вывел нас Господь из Египта, из дома рабства; ибо когда фараон упорствовал отпустить нас, Господь умертвил всех первенцев в земле Египетской, от первенца человеческого до первенца из скота, – посему я приношу в жертву Господу все, разверзающее ложесна, мужеского пола, а всякого первенца (из) сынов моих выкупаю; и да будет это знаком на руке твоей и вместо повязки над глазами твоими, ибо рукою крепкою Господь вывел нас из Египта' (Исх. 13:14–16); (iii) 'Да будут слова сии, которые Я заповедую тебе сегодня, в сердце твоем ... и навяжи их в знак на руку твою, и да будут они повязкою над глазами твоими' (Втор. 6:6–8); и (iv) 'Итак положите сии слова Мои в сердце ваше и в душу вашу, и навяжите их в знак на руку свою, и да будут они повязкою над глазами вашими; и учите им сыновей своих, говоря о них, когда ты сидишь в доме твоем, и когда идешь дорогою, и когда ложишься, и когда встаешь' (Втор. 11:18–19). Эти же слова присутствуют в молитве Шма Исраэль. Святость тфилин уступает лишь святости свитка Торы.

PHYLLOPODIA = ФИЛЛОПОДИЯ (или ОСТЬ ЛИСТА) – Phyllopodia is a hardened, residual basal remnant of a sclerified leaf. / Ось листа (Phyllopode). Под Филлоподией, от Греческого слова Phýllon, означающее Лист, и Латинского слова Podium, означающее Подий или Подиум, понимается .

PHYLLOPODIUM = ФИЛЛОПОДИЙ (или ФИЛЛОПОДИУМ) – Phyllopodium is the whole main axis of a leaf, excluding its branches. / основная ось (axis). Под Филлоподием или Филлоподиумом, от Греческого слова Phýllon, означающее Лист, и Латинского слова Podium, означающее Подий или Подиум, понимается . Под Подием или Подиумом понимается высокая прямоугольная платформа с лестницей, на которой возводились античные (преимущественно Римские) храмы.

PHYLLOTAXIS = ФИЛЛОТАКСИС (или ЛИСТОРАСПОЛОЖЕНИЕ) – Phyllotaxis or Phyllotaxy is the study of how repeated structures such as leaves are arranged around a stem, tubercles around a cactus body. Reference to specific arrangements, e.g., (3,5) spiral phyllotaxis. Types of phyllotaxes are spiral, multijugate, decussate, distichous and whorled of which the last two are special cases of the first two. (In Greek:- Phyllo = Leaf + Taxis = Arrangement). / , например, (3.5) спиральный филлотаксис. Типы Филлотаксисов:- спиральное (spiral), и мутовчатое (whorled). Под Филлотаксисом, от Греческих слов Phýllon, означающее Лист, и Táxis, означающее Расположение, понимается . Под Таксисами понимаются направленные движения организмов (простейшие животные и низшие растения), отдельных клеток или их органелл под влиянием односторонне действующего стимула – света (фототаксис), температуры (термотаксис), химических веществ (хемотаксис), в том числе кислорода (аэротаксис), влажности (гидротаксис, например, плазмодий миксомицетов переползает в направлении повышенной влажности) и другие. Под Листорасположением понимается порядок размещения листьев на стебле. Систематический признак. Типы листорасположения:- спиральное или очередное (1 лист на узле стебля, например у Дуба); супротивное (2 листа на узле стебля, например, у Клёна); мутовчатое (3 и более листьев, например, у Олеандра).

PHYLOGENY = ФИЛОГЕНИЯ (или ФИЛОГЕНЕЗ) – Phylogeny is the evolutionary history of a species or plant group. / Под Филогенезом, от Греческих слов Phýlon, означающее Племя или Род, и Génesis, означающее Возникновение или Происхождение, понимается процесс исторического развития мира организмов, их Видов, Родов, Семейств, Отрядов (Порядков), Классов, Типов (Отделов), Царств. Филогенез рассматривается в единстве и взаимообусловленности с индивидуальным развитием организмов – онтогенезом. Филогения:- (1) процесс исторического развития организмов; то же, что филогенез. (2) Филогения, филогенетика, или биогенеалогия – наука об историческом развитии, или филогенезе, мира организмов, их типов (отделов), классов, отрядов (порядков), семейств, родов, видов, а также отдельных органов.

PHYLUM = ОТРЯД – Phylum (plural Phyla) is a major taxonomic grouping and primary division of a Kingdom, as in Kingdom Plantae, ranking above Class in size. In botany, Phylum is usually replaced by Division. A Kingdom contains one or more Phyla. Phylum is a Latin word. In biology, a Phylum is a taxonomic rank below Kingdom and above Class. Phylum is equivalent to the botanical term Division. Phylum is a Latin word meaning a taxonomic rank below Kingdom and above Class. Class is a major subdivision of the Phylum. See also Class, Division, Family, Genus, Kingdom, Order, Specie, Tribe, and Type. / Смотрите также Вид (Specie), Класс (Class), Отдел (Division), Порядок (Order), Род (Genus), Семейство (Family), Тип (Type), Триба или Колено (Tribe), и Царство (Kingdom). В биологии под Отрядом понимается таксономическая категория (ранг) в систематике животных. В Отряд (иногда сначала в Подотряд) объединяют родственные Семейства. Например, Семейства Енотовые, Кошачьи, Куньи, Псовые и другие образуют Отряд Хищных. Близкие Отряды составляют Класс, иногда сначала Надотряд. В систематике Растений отряду соответствует Порядок (Order). Отряд (Ordo) в систематике Животных, таксономическая категория, объединяющая несколько Семейств. Близкие Отряды составляют Класс. В ряде случаев, в связи с усовершенствованием системы, Отряды объединяют в Классы не непосредственно, а через соподчинённые категории:- Надотряд, Инфракласс, Подкласс. Новые данные, касающиеся как современных, так и вымерших животных, известные различия в воззрениях учёных на содержание и смысл системы порой приводят к необходимости пересмотра объёма Отрядов, к разделению устаревших Отрядов; так, ныне уже общепризнанно разделение Отряда Грызунов на два Отряда:- собственно Грызунов и Зайцеобразных. В систематике растений Отряду равнозначен Порядок. В ботанике под Отделом (Division) понимается таксономическая категория (ранг) в систематике Растений. В Отдел (иногда сначала в Подотдел) объединяют:- близкие по происхождению Классы. Например, Классы Двудольных и Однодольных образуют Отдел Цветковых. Всего в систематике Растений выделяют от 14 до 20 Отделов. В систематике Животных Отделу соответствует Отряд (Тип).

PHYSICAL = ФИЗИЧЕСКИЕ (или МАТЕРИАЛЬНЫЕ) – Physical:- trades that result in the delivery of the commodity, i.e. not hedging, speculation or arbitrage.

PHYSICAL COMMODITY TRANSACTION = ТРАНЗАКЦИЯ С ФИЗИЧЕСКИМ СЫРЬЁМ (или ОПЕРАЦИЯ С МАТЕРИАЛЬНЫМ СЫРЬЁМ) – Physical Commodity Transaction is a transaction which provides for the purchase of an amount of a commodity, such as coal, cotton, electricity or gas, at a fixed or floating price for actual delivery on one or more dates. / Сделка, предусматривающая приобретение какого-то количества сырья, такого как, газ, каменный уголь, хлопок или электричество по фиксированной или плавающей (изменяющейся) цене для реальной поставки, разбитой на одну или несколько дат.

PHYSICAL DELIVERY = ФИЗИЧЕСКАЯ ПОСТАВКА (или МАТЕРИАЛЬНАЯ ПОСТАВКА) – Physical Delivery is a delivery of the security as actual paper stock or bond certificate. Supplying or taking delivery of a commodity at an agreed upon price and location. Physical Delivery:- the transfer of the underlying commodity from the seller of a futures contract to the buyer of a futures contract. Each futures exchange has specific procedures for delivery of a physical commodity. Some futures contracts, such as stock index contracts, are cash settled. The transfer of ownership of an underlying commodity between a buyer and seller to settle a futures contract following expiry. For futures, the Actual (Physical) Delivery of the underlying upon exercising – in general, as a credit entry to the securities account at the specified price (exercise price). In a cash settlement, only a cash amount is paid out instead, in the amount corresponding to the difference between the value of the contract on the day before the maturity date ('settlement' day) and the value of the underlying on the settlement day. / Передача права собственности на соответствующее сырьё от продавца покупателю в порядке расчётов по фьючерсному контракту по истечении его срока действия.

PHYSICAL DISTRIBUTION = ФИЗИЧЕСКОЕ РАСПРЕДЕЛЕНИЕ – Physical Distribution:- all logistics activities from the production line to the final user, including traffic, packaging, materials handling, warehousing, order entry, customer service, inventory control etc.

PHYSICAL ENVIRONMENT = ФИЗИЧЕСКАЯ ОКРУЖАЮЩАЯ СРЕДА – Physical Environment is the climatic factors, the soil, and free water surrounding the Rice plant.

PHYSICAL INVENTORY = ФИЗИЧЕСКИЙ ИНВЕНТАРЬ – Physical Inventory is the total amount of inventory on hand at a particular point in time as confirmed by Inventory verification and software systems. See also Book Inventory. Physical Inventory is a physical count of everything in the warehouse. A term Physical Inventory refers to the process of counting all inventory in a warehouse or plant. Operations are usually shut down during a physical inventory.

PHYSICALLY SETTLED CONTRACTS = ФИЗИЧЕСКИ РАСЧИТЫВАЕМЫЕ КОНТРАКТЫ – Physically Settled Contracts:- upon expiration or exercise of commodity futures contracts, the buyer must take delivery of the underlying commodity, as opposed to a Cash Settled Contract. Commodity contracts settled by this method only include Russian Export Blend Crude Oil (REBCO), Gulf Coast gasoline, Ultra Low Sulphur Diesel (ULSD), Oman Crude Oil, and Ethanol.

PHYSICAL MAP = ФИЗИЧЕСКАЯ КАРТА – Physical Map is a genetic map in which the apparent distances between the genes have been determined by methods other than genetic recombination.

PHYSICAL METALLURGY = МЕТАЛЛОВЕДЕНИЕ (или ФИЗИЧЕСКАЯ МЕТАЛЛУРГИЯ) – Physical Metallurgy is the science of making useful products out of metals. Metal parts can be made in a variety of ways, depending on the shape, properties, and cost desired in the finished product. The desired properties may be electrical, mechanical, magnetic, or chemical in nature; all of them can be enhanced by alloying and heat treatment. The cost of a finished part is often determined more by its ease of manufacture than by the cost of the material. This has led to a wide variety of ways to form metals and to an active competition among different forming methods, as well as among different materials. Large parts may be made by casting. Thin products such as automobile fenders are made by forming metal sheets, while small parts are often made by powder metallurgy (pressing powder into a die and sintering it). Usually a metal part has the same properties throughout. However, if only the surface needs to be hard or corrosion-resistant, the desired performance can be obtained through a treatment that changes only the composition and strength of the surface. Structures and properties of metals:- (i) Metallic Crystal Structures:- metals are used in engineering structures (e.g., automobiles, bridges, pressure vessels) because, in contrast to glass or ceramic, they can undergo appreciable plastic deformation before breaking. This plasticity stems from the simplicity of the arrangement of atoms in the crystals making up a piece of metal and the nondirectional nature of the bond between the atoms. Atoms can be arranged in many different ways in crystalline solids, but in metals the packing is in one of three simple forms. In the most ductile metals, atoms are arranged in a close-packed manner. If atoms were visualized as identical spheres and if these spheres were packed into planes in the closest possible manner, there would be two ways to stack close-packed planes one above another. One would lead to a crystal with hexagonal symmetry (called Hexagonal Close-Packed, or HCP); the other would lead to a crystal with cubic symmetry that could also be visualized as an assembly of cubes with atoms at the corners and at the centre of each face (known as Face-Centred Cubic, or FCC). Examples of metals with the HCP type of structure are magnesium, cadmium, zinc, and alpha titanium. Metals with the fcc structure include aluminum, copper, nickel, gamma iron, gold, and silver. The third common crystal structure in metals can be visualized as an assembly of cubes with atoms at the corners and an atom in the centre of each cube; this is known as Body-Centred Cubic, or BCC. Examples of metals with the bcc structure are alpha iron, tungsten,

chromium, and beta titanium. Some metals, such as titanium and iron, exhibit different crystal structures at different temperatures. The lowest-temperature structure is labeled alpha (α), and higher-temperature structures beta (β), gamma (γ), and delta (δ). This allotropy, or transformation from one structure to another with changing temperature, leads to the marked changes in properties that can come from heat treatment. When a metal undergoes a phase change from liquid to solid or from one crystal structure to another, the transformation begins with the nucleation and growth of many small crystals of the new phase. All these crystals, or grains, have the same structure but different orientations, so that, when they finally grow together, boundaries form between the grains. These boundaries play an important role in determining the properties of a piece of metal. At room temperature they strengthen the metal without reducing its ductility, but at high temperatures they often weaken the structure and lead to early failure. They can be the site of localized corrosion, which also leads to failure. (ii) Mechanical Properties:- when a metal rod is lightly loaded, the strain (measured by the change in length divided by the original length) is proportional to the stress (the load per unit of cross-sectional area). This means that, with each increase in load, there is a proportional increase in the rod's length, and, when the load is removed, the rod shrinks to its original size. The strain here is said to be elastic, and the ratio of stress to strain is called the Elastic Modulus. If the load is increased further, however, a point called the yield stress will be reached and exceeded. Strain will now increase faster than stress, and, when the sample is unloaded, a residual plastic strain (or elongation) will remain. The elastic strain at the yield stress is typically 0.1 to 1 percent, whereas, with the sample pulled to rupture, the plastic strain is typically 20 to 40 percent for an alloy (it may exceed 100 percent in some cases). The most important mechanical properties of a metal are its yield stress, its ductility (measured by the elongation to fracture), and its toughness (measured by the energy absorbed in tearing the metal). The yield stress of a metal is determined by the resistance to slipping of one plane of atoms over another. Various barriers to slip can be produced by heat treatment and alloying; examples of such barriers are grain boundaries, fine precipitates, distortion introduced by cold working the metal, and alloying elements dissolved in the metal. When a metal is made very strong through one or more of these methods, it may suddenly fracture under a load instead of yielding. This is particularly true when the metal contains notches or cracks that locally raise the stress and localize the yielding. The property of interest then becomes the fracture toughness, measured by the energy required to extend an existing crack in a piece of metal. In almost all cases, the fracture toughness of an alloy can be improved only by reducing its yield strength. The only exception to this is a smaller grain size, which increases both toughness and strength. (iii) Electrical Properties:- the electrical conductivity of a metal (or its reciprocal, electrical resistivity) is determined by the ease of movement of electrons past the atoms under the influence of an electric field. This movement is particularly easy in copper, silver, gold, and aluminum – all of which are well-known conductors of electricity. The conductivity of a given metal is decreased by phenomena that deflect, or scatter, the moving electrons. These can be anything that destroys the local perfection of the atomic arrangement – for example, impurity atoms, grain boundaries, or the random oscillation of atoms induced by thermal energy. This last example explains why the conductivity of a metal increases substantially with falling temperature:- in a pure metal at room temperature, most resistance to the motion of free electrons comes from the thermal vibration of the atoms; if the temperature is reduced to almost absolute zero, where thermal motion essentially stops, conductivity can increase several thousandfold. (iv) Magnetic Properties:- when an electric current is passed through a coil of metal wire, a magnetic field is developed around the coil. When a piece of copper is placed inside the coil, this field increases by less than 1 percent, but, when a piece of iron, cobalt, or nickel is placed inside the coil, the external field can increase 10 000 times. This strong magnetic property is known as Ferromagnetism, and the three metals listed above are the most prominent ferromagnetic metals. When the piece of ferromagnetic metal is removed from the coil, it retains some of this magnetism (that is, it is magnetized). If the metal is hard, as in a hardened piece of steel, the loss, or reversal, of magnetization will be slow, and the sample will be useful as a permanent magnet. If the metal is soft, it will quickly lose its magnetism; this will make it useful in electrical transformers, where rapid reversal of magnetization is essential. In many types of solids, the atoms possess a permanent magnetic moment (they act like small bar magnets). In most solids, the direction of these moments is arranged at random. What is exceptional about ferromagnetic solids is that the interatomic forces cause the moments of neighbouring atoms spontaneously to align in the same direction. If the moments of all of the atoms in a single sample lined up in the same direction, the sample would be an exceptionally strong magnet with exceptionally high energy. That energy would be reduced if the sample broke up into domains, with all atomic moments in each domain being aligned but the direction of magnetization in adjacent domains being in opposite directions and thus tending to cancel one another. This is what happens when a ferromagnetic metal is magnetized: all domains do not take on the same orientation, but domains of one orientation grow at the expense of others. The alignment of atomic magnetic moments within a domain is weakened by thermally induced oscillations, and ferromagnetism is finally lost above the Curie point, which is 770 °C (1 420 °F) for iron and 358 °C (676 °F) for nickel. (v) Chemical Properties:- almost any metal will oxidize in air, the only exception being gold. At room temperature a clean metal surface will oxidize very little, since a thin oxide film forms and protects the metal from further oxidation. At elevated temperatures, though, oxidation is faster, and the film is less protective. Many chemicals accelerate this corrosion process (that is, the conversion of a metal to an oxide in air or to a hydroxide in the presence of water). A special property of metal surfaces is their ability to catalyze chemical reactions. For example, in the exhaust system of most automobiles, combustion gases pass over a dispersion of very fine platinum particles. The surfaces of these particles greatly accelerate the oxidation of carbon monoxide and hydrocarbons to carbon dioxide and water, thus reducing the toxicity of the exhaust gases. / порошковая металлургия (powder metallurgy). легирование или легирующее (alloying). литьё или отливка (casting). Размер Зерна или Величина Зерна (Grain Size). осадок (precipitate).

PHYSICAL SECURITIES = ФИЗИЧЕСКИЕ ЦЕННЫЕ БУМАГИ (или ВЕЩЕСТВЕННЫЕ ЦЕННЫЕ БУМАГИ) – Physical Securities:- securities that are in certificate (paper) form. / Ценные бумаги, которые изготовлены в форме сертификатов (на бумаге).

PHYSICAL STANDARD = ФИЗИЧЕСКИЙ СТАНДАРТ (или РЕАЛЬНЫЙ СТАНДАРТ) – Physical Standard is the stable specimen having a value of a physical quantity assigned by accurate measurements under specified conditions, usually in a standards laboratory.

PHYSIOGRAPHY = ФИЗИОГРАФИЯ (или ФИЗИЧЕСКАЯ ГЕОГРАФИЯ) – Physiography:- in one sense, an outmoded term for the study of landforms now replaced by the term 'geomorphology'; in another sense it means the combined study of geomorphology, pedology (naturally occurring soils) and biogeography (plant and animal distributions and geographical relationships with their environments over time). / Под Физиографией, от Греческих слов Phýsis, означающее Природа, и Gráphō, означающее Пишу, понимается описание различных физических условий. Под Физической Географией понимается наука и географической оболочке Земли и её структурных частях – природных территориальных (и аквальных) комплексах всех рангов; одна из главных отраслей естествознания. Основные разделы физической географии – землеведение и ландшафтоведение; в её состав часто включают также палеогеографию и пограничные науки:- геоморфологию, климатологию, гидрологию суши, океанологию, гляциологию, географию почв, биогеографию. Основные задачи физической географии – комплексные исследования природы отдельных регионов и природных процессов, изучение проблемы воздействия человека на природную среду.

PHYSIOLOGICAL DISEASES = ФИЗИОЛОГИЧЕСКИЕ БОЛЕЗНИ (или ФУНКЦИОНАЛЬНЫЕ БОЛЕЗНИ) – Physiological Diseases are diseases that are a result of nutritional disorders caused by the imbalance of the essential elements.

PHYSIOLOGICAL LEAF SPOTS = ФИЗИОЛОГИЧЕСКИЕ ПЯТНИСТОСТИ ЛИСТЬЕВ – Physiological Leaf Spots are nonpathogenic physiological diseases showing dark brown or blackish mottled discoloration of leaf sheaths and blades.

PHYSIOLOGICAL MATURITY = ФИЗИОЛОГИЧЕСКАЯ ЗРЕЛОСТЬ – Physiological Maturity:- when a seed reaches its maximum dry weight. This usually occurs before harvest.

PHYSIOLOGICAL RACES = ФИЗИОЛОГИЧЕСКИЕ РАСЫ – Physiological Races are pathogens that are morphologically inseparable but differ in their ability to attack and develop on their hosts.

PHYSIOLOGICAL RIPENESS = ФИЗИОЛОГИЧЕСКАЯ СПЕЛОСТЬ – Physiological Ripeness:- post-climacteric:- this is the start of overripeness. The fruits start to decompose, the taste suffers and the fruits can easily be attacked by mold or rot. / переспелость (overripeness).

PHYSIOLOGY = ФИЗИОЛОГИЯ – Physiology is the processes, activities, and phenomena incidental to and characteristic of life or of living organisms. A branch of biology dealing with the study of the functions and activities of living matter (as of organs, tissues, or cells) as such and of the physical and chemical phenomena involved. / Под Физиологией, от Греческих слов Phýsis, означающее Природа, и Lógos, означающее Слово или Учение, понимается наука о жизнедеятельности целостного организма и его отдельных частей – клеток, органов, функциональных систем. Физиология изучает механизмы различных функций живого организма (рост, размножение, дыхание и другие), их связь между собой, регуляцию и приспособление к внешней среде, происхождение и становление в процессе эволюции и индивидуального развития особи. Решая принципиально общие задачи, физиология животных и человека и физиология растений имеют различия, обусловленные строением и функциями их объектов. Так для физиологии животных и человека одна из основных задач – изучение регулирующей и интегрирующей роли нервной системы в организме. В решении этой проблемы участвовали крупнейшие физиологи (Россияне Иван Михайлович Сеченов (1829–1905), Николай Евгеньевич Введенский (1852–1922), Иван Петрович Павлов (1849–1936), Алексей Алексеевич Ухтомский (1875–1942), Немец Хэрман Людвих Фединанд фон Хэльмхольц (Hermann Ludwig Ferdinand von Helmholtz; 1821–94), Француз Клёд Бэрнар (Claude Bernard; 1813–78), Англичанин Сэр Чарлз Скот Шерингтэн (Sir Charles Scott Sherrington; 1857–1952) и другие). Для физиологии растений, выделившейся из ботаники в XIX веке, традиционно изучение минерального (корневого) и воздушного (фотосинтез) питания, цветения, плодоношения и другое. Она служит теоретической основой растениеводства и агрономии. Основоположники отечественной физиологии растений – Андрей Сергеевич Фаминцын (1835–1918) и Климент Аркадьевич Тимирязев (1843–1920). Физиология связана с анатомией, цитологией, эмбриологией, биохимией и другими биологическими науками.

PHYTOALEXIN = ФИТОАЛЕКСИН – Phytoalexin is a substance that inhibits the development of a Fungus on hypersensitive tissues, formed when plant host cells come in contact with the parasite. / , от Греческих слов Phytón, означающее Растение, . Фитоалексины:- защитные фенольные соединения, отсутствующие у здорового растения и образующиеся как ответная реакция на поражение возбудителем. Фитоалексины:- вещества, синтезируемые растениями в ответ на проникновения патогенных микроорганизмов.

PHYTOLITH = ФИТОЛИТ – Phytolith is a microscopic mineral particle, formed within a living plant tissue, consisting of silica (opal phytolith) or calcium oxalate and providing a durable record for archaeology and paleontology. / Под Фитолитом, от Греческих слов Phytón, означающее Растение, и Lithos, означающее Камень, или Lytós, означающее Разлагаемый или Растворимый, понимается .

PHYTOMELANIN = ФИТОМЕЛАНИН – Phytomelanin is a papery black or blue layer or crust over the seed of Plants in the Order Asparagales, including Agavaceae, Aloaceae, Amaryllidaceae and Hyacinthaceae, although not present in seed of the Orchidaceae, and present as a mechanically hard brown or black layer covering seeds of other unrelated families, e.g., Compositae. Nevertheless, the presence of phytomelanin is considered an important characteristic of the Asparagales. The chemical homology of phytomelanin in different plant families is not clear and its exact chemical composition is still controversial. The pigment is chemically inert and resistant to acids and bases and organic solvents. It's presence in seeds of Compositae may reduce damage from insect larvae. / в Порядке Спаржевых (Asparagales, включая Агавовые (Agavaceae)), (Aloaceae), Амариллисовых (Amaryllidaceae) и Гиацинтовых (Hyacinthaceae), хотя не представлен в семени Орхидных (Orchidaceae), . Под Фитомеланином, от Греческих слов Phytón, означающее Растение, и Mélas, родительный падеж Mélanos, означающее Чёрный, понимается . Под Меланинами понимаются пигменты коричневого и чёрного цвета. Широко распространены в растительных и животных тканях. Определяют окраску кожных покровов и их производных (волос, кутикулы насекомых, перьев, чешуи), кожуры плодов и так далее; отсутствуют у альбиносов. Продукты окислительных превращений аминокислоты тирозина.

PHYTOMETER = ФИТОМЕТР – Phytometer is a plant or plants used to measure the physical factors of the habitat by its response in terms of physiological activities. / Под Фитометром, от Греческих слов Phytón, означающее Растение, и Métron, означающее Мера, понимается .

PHYTOPLASMA = ФИТОПЛАЗМА – Phytoplasma is a class of microorganisms that can cause disease in some plants. A phytoplasma has no organised nucleus and no true cell wall. Several diseases once thought to be caused by a virus have been shown to be caused by a phytoplasma. Phytoplasmas can only grow inside other organisms and require an insect vector to move them from plant to plant. / Под Фитоплазмой, от Греческих слов Phytón, означающее Растение, и Plásma, означающее Вылепленное или Оформленное, понимается .

PHYTOSANITARY ACTION = ФИТОСАНИТАРНОЕ ДЕЙСТВИЕ – Phytosanitary Action is an official operation, such as inspection, testing, surveillance or treatment, undertaken to implement phytosanitary measures. Phytosanitary Action is an official operation, such as inspection, testing, surveillance or treatment, undertaken to implement phytosanitary regulations or procedures. / Под Фитосанитарным Действием понимается официальная операция, такая, как инспекция, тестирование, надзор или обработка, предпринятая для осуществления фитосанитарных регуляций (предписаний) или процедур.

PHYTOSANITARY CERTIFICATE = ФИТОСАНИТАРНОЕ СВИДЕТЕЛЬСТВО (или ФИТОСАНИТАРНЫЙ СЕРТИФИКАТ) – Phytosanitary Certificate is an official document which attests to the phytosanitary status of any consignment affected by phytosanitary regulations. A certificate, issued by the US Department of Agriculture to satisfy import regulations of foreign countries, indicating that a US shipment has been inspected and is free from harmful pests and plant diseases. Phytosanitary Certificate is a certificate patterned after the model certificates of the International Plant Protection Convention (IPPC). In the United States, this is an official document (PPQ Form 577 or 579 (short for the Plant Protection and Quarantine Form 577 or 579) that attests to the phytosanitary condition of commodities and is issued by an Authorized Certification Official. Phytosanitary Certificate is a certificate of health under the

International Plant Protection Convention. Also known as Phytosanitary Inspection Certificate in the United States. / Под Фитосанитарным, от Греческих слов Phytón, означающее Растение, и Sanitas, означающее Здоровье, понимается . Фитосанитарный Сертификат – официальный документ, который удостоверяет фитосанитарный статус любого груза, подпадающего под действие фитосанитарных регуляций.

PHYTOSANITARY CERTIFICATE FOR REEXPORT = ФИТОСАНИТАРНОЕ СВИДЕТЕЛЬСТВО ДЛЯ ПОВТОРНОГО ВЫВОЗА (или ФИТОСАНИТАРНЫЙ СЕРТИФИКАТ ДЛЯ РЕЭКСПОРТА) – Phytosanitary Certificate For Reexport is an accountable form, PPQ Form 579 (short for the Plant Protection and Quarantine Form 579), used to certify that, based on an original foreign phytosanitary certificate and/or an additional inspection, the commodities officially entered the United States, are considered to conform to the current phytosanitary regulations of the importing country, and have not been subjected to the risk of infestation or infection during storage in the United States. PPQ Form 579 may also be used to certify commodities of foreign origin that are intended for re-export to a US Affiliated Island. / обратный вывоз (или реэкспорт; reexport).

PHYTOSANITARY CERTIFICATE ISSUANCE AND TRACKING SYSTEM = СИСТЕМА ВЫДАЧИ И ОТСЛЕЖИВАНИЯ ФИТОСАНИТАРНЫХ СВИДЕТЕЛЬСТВ (или СИСТЕМА ВЫДАЧИ И ОТСЛЕЖИВАНИЯ ФИТОСАНИТАРНЫХ СЕРТИФИКАТОВ) – Phytosanitary Certificate Issuance and Tracking (PCIT) System is a computer system currently being piloted to generate electronic export certificates. For further information, contact the PCIT Coordinator of the Plant Protection and Quarantine (PPQ) Export Services.

PHYTOSANITARY CERTIFICATION = ФИТОСАНИТАРНОЕ СВИДЕТЕЛЬСТВОВАНИЕ (или ФИТОСАНИТАРНАЯ СЕРТИФИКАЦИЯ) – Phytosanitary Certification is the use of phytosanitary procedures leading to the issue of a Phytosanitary Certificate.

PHYTOSANITARY IMPORT REQUIREMENTS = ФИТОСАНИТАРНЫЕ ТРЕБОВАНИЯ К ПРИВОЗУ (или ФИТОСАНИТАРНЫЕ ТРЕБОВАНИЯ К ИМПОРТУ) – Phytosanitary Import Requirements are specific phytosanitary measures established by an importing country concerning consignments moving into that country.

PHYTOSANITARY LEGISLATION = ФИТОСАНИТАРНОЕ ЗАКОНОДАТЕЛЬСТВО – Phytosanitary Legislation is basic laws granting legal authority to a National Plant Protection Organization from which phytosanitary regulations may be drafted.

PHYTOSANITARY MEASURE = ФИТОСАНИТАРНАЯ МЕРА – Phytosanitary Measure (agreed interpretation) is any legislation, regulation or official procedure having the purpose to prevent the introduction and/or spread of quarantine pests, or to limit the economic impact of regulated non-quarantine pests. The agreed interpretation of the term phytosanitary measure accounts for the relationship of phytosanitary measures to regulated non-quarantine pests. This relationship is not adequately reflected in the definition found in Article II of the International Plant Protection Convention (IPPC) (1997). Phytosanitary Measure is any legislation, regulation or official procedure having the purpose to prevent the introduction and/or spread of pests. / К Фитосанитарной Мере относятся:- любое законодательство, предписание или официальная процедура, направленные на предотвращение интродукции и/или распространения вредителей. Под Фитосанитарной Мерой понимается законодательство, регуляция или официальная процедура, направленная на предотвращение интродукции и/или распространения карантинных вредителей, или на ограничение экономического ущерба от регулируемых некарантинных вредителей. Принятая интерпретация термина Фитосанитарная Мера принимает во внимание существующую связь между фитосанитарными мерами и регулируемыми некарантинными вредителями.

PHYTOSANITARY NOTE = ФИТОСАНИТАРНЫЙ БИЛЕТ (или ФИТОСАНИТАРНАЯ НОТА) – Phytosanitary Note is the current, accurate, and timely information provided by Export Services to field personnel concerned with the export of agricultural commodities. Phytosanitary notes cover such topics as interpretations of import requirements of foreign countries, import requirements of foreign countries for which there is no export summary, and administrative guidance about nationwide export certification issues and about issuing export certificates.

PHYTOSANITARY PROCEDURE = ФИТОСАНИТАРНАЯ ПРОЦЕДУРА – Phytosanitary Procedure is any official method for implementing phytosanitary measures including the performance of inspections, tests, surveillance or treatments in connection with regulated pests. / Под Фитосанитарной Процедурой понимается любой официальный метод по осуществлению фитосанитарных мер, включая проведение инспекций, тестов, надзора или обработок в отношении регулируемых вредителей.

PHYTOSANITARY REGULATION = ФИТОСАНИТАРНАЯ РЕГУЛЯЦИЯ (или ФИТОСАНИТАРНОЕ ПРЕДПИСАНИЕ) – Phytosanitary Regulation is official rule to prevent the introduction and/or spread of quarantine pests, or to limit the economic impact of regulated non-quarantine pests, including establishment of procedures for phytosanitary certification. Phytosanitary Regulations are sanitary conditions and regulations imposed on export and imports of plant materials and seed. / Фитосанитарная Регуляция или Фитосанитарное Предписание – официальное правило по предотвращению интродукции и/или распространения карантинных вредителей или ограничению экономического ущерба от регулируемых некарантинных вредителей, в частности – установление процедур по фитосанитарной сертификации.

PHYTOTOXIC = ФИТОТОКСИЧНЫЙ – Phytotoxic:- injurious or lethal to Plants. / Вредный или губительный для Растений.

PHYTOTOXICITY = ФИТОТОКСИЧНОСТЬ – Phytotoxicity is a Plant injury caused by chemicals or some other agent. Common symptoms are spotting, wilting, stunting, tiller spreading, and twisting of leaves. Injury to Plants caused by exposure to a chemical. / Повреждение Растений, вызванное воздействием химикатов. Под Фитотоксичностью, от Греческих слов Phytón, означающее Растение, и Toxikón, означающее Яд, понимается способность некоторых химических соединений и веществ биологической природы оказывать вредное воздействие на Растения.

PHYTOTOXIN = ФИТОТОКСИН – Phytotoxin is a substance toxic to Plants. / Под Фитотоксином, от Греческих слов Phytón, означающее Растение, и Toxikón, означающее Яд, понимается .

pI = ISOELECTRIC POINT

PI = PANICLE INITIATION

PI = PRODUCTIVITY INDEX

PIA = PERSONAL INVESTMENT AUTHORITY LIMITED

PIBOR = PARIS INTERBANK OFFER RATE

PICEOUS = СМОЛЯНИСТОЕ (или ХХ) – Piceous:- of, relating to, or resembling pitch, especially glossy brownish black in color. / .

PICK = ПОПЕРЕЧНАЯ НИТЬ (или ПРОКИДКА, или УДАР) – (1) Picks are the yarns running in the fillingwise direction, or 'filling threads'. Older terms are 'Weft' and 'Woof'. Pick:- in weaving, a weft yarn. Pick is a single filling thread carried by one trip of the weft-insertion device across the loom. The picks interlace with the warp ends to form a woven fabric. See also Filling. Pick is a filling yarn that runs crosswise between selveges in woven goods. The pick intersects with the warp (or lengthwise yarn) to form a woven cloth. Pick is a filling thread or yarn that runs crosswise (horizontally) in woven goods. The pick interlaces with the warp to form a woven cloth. In textile industry, Pick is a filling yarn or thread that runs crosswide in woven goods. See also Weft. / Поперечная нить – одиночная уточная нить, . В текстильной промышленности под Утком (Weft) понимается пронизывающая пряжа или нить, которая направляется поперёк ткущихся (ткамых) изделий.

(2) Pick is the number of picks per inch in the cloth, provided stop or check pegs are not used.

PICK = ПРОКИДКА (или УДАР) – In spinning, the process of opening out the fiber to help in the cleaning and processing. This process (picking) allows a lot of vegetable matter to drop out of fleece. / Прокидка или Удар.

PICK = СБОР (или СОБИРАТЬ) – A term Pick refers to the harvest of the mature seedcotton by a spindletype picker. Traditionally cotton was 'picked' by hand, but now cotton in the United States is exclusively harvested mechanically. See also First Pick.

PICK COUNT = ПОДСЧЁТ УТОЧНЫХ ПРОКИДОК – Pick Count is the number of filling yarns per inch or per centimeter or per 10 centimeters (in former Soviet Union) of fabric. Pick and End Counts are two fabric specifications needed to design a fabric. / уточных пряж на дюйм или на сантиметр или на 10 сантиметров (в бывшем Советском Союзе) ткани.

PICK COUNTER = СЧЁТЧИК УТОЧНЫХ ПРОКИДОК НА ТКАЦКОМ СТАНКЕ (или ТКАЦКАЯ ЛУПА) – Pick Counter is:- (1) a mechanical device that counts the picks as they are inserted during weaving. (2) A mechanical device equipped with a magnifying glass used for counting picks (and/or ends) in finished fabrics.

PICKER = СБОРЩИК (или ОТБОРЩИК) – Picker is the person in charge of picking specific stock for orders.

PICKER = ТРЁПАЛЬНАЯ МАШИНА – (1) Picker is a machine that opens staple fiber and forms a lap for the carding process used in the production of spun yarns. / От разрыхлительно-очистительного агрегата волокно по трубопроводу поступает к пневматическому распределителю, который с помощью конденсеров распределяет поток волокон по двум Трёпальным Машинам. В настоящее время применяются трёпальные машины двух типов – холстовые и бесхолстовые с резервным питателем. Бесхолстовые трёпальные машины устанавливают в поточных линиях, где разрыхлительно-очистительный агрегат сагрегирован с чёсальными машинами. На трёпальной машине осуществляются дальнейшая очистка, разрыхление волокнистого материала и формирование равномерного потока волокон на выходе. На холстовых трёпальных машинах равномерный слой волокон на выходе навивается на скалку, образуется рулон, так называемый холст. Трепание или механический способ очистки от сорных примесей заключается в ударном воздействии бил по концу волокнистого слоя (его бородке), который зажат питающим устройством и непрерывно подводится в зону действия била. Удар рабочего органа происходит одновременно по всей ширине волокнистого материала, зажатого в питающих цилиндрах. При ударном воздействии одновременно происходит и разрыхление волокнистого материала как сопутствующий процесс. На трёпальных машинах в зависимости от засорённости смеси, длины волокон и других факторов применяют трёхбильные планочные, игольчатые, комбинированные шестибильные трепала. Для длинноволокнистого или так называемого длинноштапелькового или тонковолокнистого хлопка можно использовать ножевое трепало, то есть ножевой барабан, диаметр которого равен диаметру трепала.

(2) Picker is that part of the picking mechanism of the loom that actually strikes the shuttle.

PICKER = ТРЕПАЛЬНАЯ МАШИНА (или ГОНОК) – Picker is a rather terrifying tool used to help open out washed fleece prior to carding. Basically it is a crescent-shaped swing that rocks in a cradle. Between the base of the picker and the bottom of the swing, there are a series of nails that catch the fiber and open it out. This tool accomplishes much the same process as hand-picking your fiber – but much faster. As with any machinery, use with extreme caution. Picker is a mechanical device used to open fleece before carding. The swing picker looks, for all the world, out of something from an Edgar Allen Poe horror story. Not recommended for the faint-of-heart, children, or those who don't pay attention. / Под Трепанием понимается обработка волокнистых материалов (льна, хлопка, шерсти и других) на трепальных машинах с целью разрыхления (разделения на мелкие клочки и пучки волокон) и очистки его от примесей. Трепание – один из основных процессов прядения, а также первичной обработки лубяных волокон.

PICKER = СБОРЩИК (или ХЛОПКОУБОРОЧНАЯ МАШИНА) – Picker is a machine which harvests only the mature lint-with-seed (known as Seed Cotton). A revolving spindle penetrates the Cotton Plant and winds the seed Cotton from the opened boll and carries it into a dropping zone inside the machine. / Под Веретеном или Шпинделем, от Немецкого слова Spindel, означающее Веретено, понимается .

PICKER HARVESTER = ХЛОПКОУБОРОЧНЫЙ КОМБАЙН – Picker Harvester is a machine that removes cotton lint and seeds from open bolls with rotating spindles, leaving unopened bolls on the plant. 'First pick' cotton is obtained from the initial harvest of the season. It usually contains less trash than 'second pick' cotton, obtained later in the harvest season. 'Ground cotton' is obtained by picking up between the rows at season's end and has a high trash content. / Комбайн для обдирки хлопка. Под Веретеном или Шпинделем, от Немецкого слова Spindel, означающее Веретено, понимается .

PICKER LAP = ХОЛСТ ТРЁПАЛЬНОЙ МАШИНЫ – Picker Lap is a continuous, considerably compressed sheet of staple that is delivered by the picker and wound into a cylindrical package. It is used to feed the card.

PICKER STICKS = ПОГОНЯЛКИ – Picker Sticks are the two sticks that throw the shuttles from box to box at each end of the raceplate of the loom.

PICKER WASTES = ОТХОДЫ ТРЁПАЛЬНОЙ МАШИНЫ – Picker Wastes:- each picker operation produce waste including seed, fiber, plant debris and dirt which falls under the machine. This waste is known as Picker Waste or Picker Motes and requires a permit or treatment certificate as a condition of entry. Also known as Picker Motes.

PICKING = ОТБОРКА (или ВЫБОРКА) – Picking is the movement of stock from a storage area to a staging area. The Fork Lift/Clamp Operator will 'pick' the stock which is assigned to a particular order. The Fork Lift/Clamp Operator must pay close attention and match the items listed on the Pick Ticket to the information on the product.

PICKING = ПРОКЛАДЫВАНИЕ УТКА – Picking is the operation of passing the filling through the warp shed during weaving. / уточина через . Операция по Прокладыванию Утка с помощью специального прокладчика или захвата, а также пневматическим, гидравлическим или пневморапирным способами сквозь зев, формируемый поднятыми и опущенными

нитями основы, в процессе ткачества. Она может быть периодической или непрерывной, каждая из которых в свою очередь может быть осуществлена челночным или бесчелночным способами.

PICKING = ТРЕПАНИЕ – Picking is a process that continues the opening and cleaning of staple and forms a continuous fiber sheet (or lap), which is delivered to the card. Picking is the process of opening fiber and/or removing foreign matter. / Под Трепанием понимается обработка волокнистых материалов (льна, хлопка, шерсти и других) на трепальных машинах с целью разрыхления (разделения на мелкие клочки и пучки волокон) и очистки его от примесей. Трепание – один из основных процессов прядения, а также первичной обработки лубяных волокон. Целью Трепания заключается в очистке волокнистого материала от посторонних примесей и в дальнейшем разрыхлении. Примеси по их происхождению и размерам можно подразделить на растительные и минеральные, крупные и мелкие, тяжёлые и лёгкие. Растительные примеси, кроме того, разделяются на малоцепкие и цепкие. Трепание представляет собой ударное воздействие по волокнистому материалу со стороны рабочих органов машины, снабжённых планками, ножами, зубьями, колками и другим, в результате чего материал встряхивается и очищается от примесей. Так как ударное воздействие является также одним из методов разрыхления, то одновременно с трепанием происходит и разрыхление, в результате которого материал разделяется на более мелкие клочки, примеси обнажаются, что содействует более полному их удалению. В процессах разрыхления и трепания, наряду с выделением сорных примесей через колосниковые решётки, применяют также вспомогательные методы очистки. Так в разрыхлительных и трепальных машинах пыль отсасывается тягой воздуха, создаваемой вентиляторами; в машинах для трепания шерсти и пыльных угаров вентилятор отсасывает пыльный воздух из-под колосников. При трепании хлопка ножевыми барабанами и трепалами в трепальной машине воздух отсасывается из рабочего пространства вентилятором через поверхность двух сетчатых барабанов. Поток воздуха увлекает разрыхлённые клочки хлопка, и они оседают на сетчатой поверхности барабанов, которые медленно вращаются (1.5–5 оборотов в минуту (об/мин)) и подают образовавшийся слой хлопка к последующим органам машины. Сетчатые барабаны предназначены для формирования равномерного слоя хлопка и для отделения мелких примесей и пыли. Процесс трепания осуществляется трепальными машинами. В этих машинах необходимо соответственным образом подводить материал под удары органа трепания, которому сообщается большая скорость – 600–1 200 об/мин. На очень близком расстоянии от траектории органа трепания, на некоторой дуге расположена колосниковая решётка, при ударах о которую клочки материала задерживаются, а примеси выделяются через промежутки между колосниками. Органы трепания и характер их ударных воздействий могут быть различными в зависимости от особенностей обрабатываемого материала и содержащихся в нём примесей. Наиболее полное разрыхление и очистка материала достигаются в случаях, когда он подводится под удары в зажатом состоянии. Била (специальные планки) наносят выступающими рёбрами удары по всей ширине подаваемого слоя материала. Материал выступает из питающих органов (цилиндр и педаль или два цилиндра) в рабочее пространство в виде бородки, которая под действием собственной тяжести, ударов бил и тока воздуха огибает нижний питающий цилиндр (педаль). В рассматриваемы нами момент било трепала, вращающегося со скоростью, во много раз превосходящей скорость питания, ударяет по бородке, деформирует её и отделяет клочки материала, которые срываются с била и ударяются о колосники (трёхгранные или круглые стержни), расположенные на близком расстоянии друг от друга. Трепание происходит менее интенсивно, когда клочки материала подаются к органам трепания в свободном состоянии по трубе пневматики. Вертикальный вал снабжён дисками, по окружности которых выступают ножи, вращающиеся со скоростью, превосходящей скорость движения клочков подводимого материала. Удар ножей по клочку сопровождается встряхиванием его и отделением примесей. Разделится ли при ударе клочок на части или целиком воспримет скорость ножа, – это зависит от прочности связей волокон в клочке. Части клочка, получившие скорость ножа, срываются с него и ударяются о колосниковую решётку. Во всех случаях трепание осуществляется путём ударных воздействий быстро вращающихся органов. Сила и жёсткость ударов, воспринимаемых волокнистым материалом, зависят от формы органов трепания и их скорости вращения, от степени зажатия материала, подаваемого питающими органами под ударное воздействие, а также от величины разводки. В зависимости от характера волокнистого материала и его подготовки к трепанию применяют разнообразные органы трепания. Они размещаются либо на поверхности цилиндрического трепального барабана, либо на отдельных планках, называемых билами. Органы трепания, снабжённые планками, называются трепалами. Трепальные барабаны разделяются на:- (i) ножевые, (ii) с колками, (iii) игольчатые и (iv) пильчатые. Трепала различаются по форме и числу планок, расположенных по окружности рабочего органа, и разделяются на:- (i) планочные, (ii) игольчатые, (iii) пильчатые, (iv) комбинированные с шестью билами из которых три била планочные гладкие и три игольчатые. В отношении лубяных волокон:- особенностью трепания длинных лубяных волокон является то обстоятельство, что они подвергаются ударным воздействиям с двух сторон, без разделения массы волокон на более мелкие клочки. Процесс обработки материала на трепальной машине протекает следующим образом:- материал (треста) с мяльной машины по столику подаётся к зажиму транспортёра. Фигурный ремень транспортёра зажимает одну половину стеблей и вводит их в первую секцию машины, где стебли медленно перемещаются, подвергаясь воздействию органов трепания. Трепальные машины для лубяных волокон бывают двух типов:- с односторонним трепанием и с двусторонним трепанием.

PICKING OR INDUSTRIAL RIPENESS = УБОРОЧНАЯ ИЛИ ТЕХНИЧЕСКАЯ СПЕЛОСТЬ – Picking Or Industrial Ripeness:- preclimacteric, the stage of ripeness prior to the ready-to-eat/ripe for consumption stage.

PICK–OUT MARK = ОТМЕТИНА ОТ ПРОЛЁТА (или ОТМЕТИНА ОТ ПРОМЁТКИ, или ОТМЕТИНА ОТ СХОДА УТКА) – Pick-Out Mark:- a fillingwise band or bar characterized by a chafed or fuzzy appearance due to pulled-out picks. Fabrics defect. Pick-Out Mark or Pulling-Back Place:- a weftways band characterized by a chafed or fuzzy appearance. Note:- this defect is caused by the pulling out of the original picks and subsequent reweaving. / Пролёты или Промётки (Picks Out) – нарушения переплетения, порок ткани. Разработка Порока; Отвод Назад (pick-out mark; pulling-back place):- порок утка; полоса ткани по утку, характеризующая истёртым или ворсистым видом, из-за того, что на этом участке производили разработку (устранение) дефекта и нарушили внешний вид ткани. Примечание:- этот порок вызван извлечением первоначальных уточных нитей, отводом основных нитей назад и последующим повторным ткачеством.

PICK–OUT PLACE = РАЗРАБОТАННОЕ МЕСТО (или МЕСТО ПРОЛЁТА, или МЕСТО ПРОМЁТКИ, или МЕСТО С ПРОМЁТКАМИ, или МЕСТО СХОДА УТКА) – Pick-Out Place:- xxxxx. See also Temple Mark. Fabrics defect. / Пролёт и Промётка – порок ткани в виде нарушения переплетения.

PICK/PACK = ОТБОРКА/УПАКОВКА – Pick/Pack:- a warehouse operation that involves picking individual items from cases and putting them together a carton or pack for shipment.

PICKS = ПОПЕРЕЧНЫЕ НИТИ – Picks are filling yarns. Each filling yarn laid at right angles between the warp yarns is termed a pick. / Поперечные Нити – уточные пряжи. Каждая уточная пряжа .

PICK SLOT = ОТОБРАННОЕ ГНЕЗДО – Pick Slot is a location in warehouse where dedicated stock is stored. Also known as a Primary Location.

PICK TICKET = БИЛЕТ ОТБОРКИ – The Pick Ticket is a document used by the forklift/clamp operator or picker in the distribution center who will be locating the stock for the order. The Pick Ticket contains information such as, product location, quantity, lot numbers, serial numbers or unit numbers.

PICK TIME = ВРЕМЯ ОТБОРКИ – Pick Time is the time it takes to pick and document specific stock for an order.

PICK–TO–CLEAR = ОТ ОТБОРКИ ДО УХОДА – Pick-To-Clear:- warehouse picks from locations with the least amount of product on hand in order to clear the area.

PICK–TO–LIGHT = ОТБОРКА ДО ПРОСВЕТА – Pick-To-Light:- used in high volume piece picking, technique where pickers are directed to product by lights.

PICOGRAM = ПИКОГРАММ – Picogram is a unit of mass that is 10^{-12} of a gram. Commonly used to express the DNA content per cell or per nuclear genome in a plant. / Под Пикограммом, от Испанского слова Pico, означающее Малая Величина, и Французского слова Gramme, означающее Грамм, понимается . Обозначение:- пг.

PICOT = ПИКО (или ЗУБЧИК) – Picot is:- (1) a small loop woven on the edge of ribbon, or a purl on lace. A picot edge may also be produced by a hemstitching machine. (2) A run-resistant loop usually found at the top of hosiery. / Зубчик – декоративный шов у борта чулка.

PICOT TRIMMING = ОТДЕЛКА ПИКО (или ОКАНТОВКА (или ОБРЕЗКА) ЗУБЧИКАМИ) – Picot Trimming is a narrow band edged with a series of delicate loops.

PICTURE HAT = БОЛЬШАЯ НАРЯДНАЯ ШЛЯПКА – Picture Hat is a woman's dressy hat with a broad brim.

PIDE = PAKISTAN INSTITUTE OF DEVELOPMENT ECONOMICS

PIECE = ШТУКА (или КУСОК) – Piece is a standard length of a fabric, such as 40, 60, 80, or 100 yards. Piece is a standard length of a woven cloth as 40, 60, or 80 yards. A fabric woven in lengths varying from 24 yards to 100 yards and over.

PIECE DYEING = КРАШЕНИЕ КУСКОВОГО ТОВАРА – Piece Dyeing is the dyeing of fabrics 'in the piece', i.e. in fabric form after weaving or knitting as opposed to dyeing in the form of yarn or stock. Piece Dyeing occurs after the cloth has been woven or knit, but only solid colors are possible. See also Dyeing. Piece Dyeing:- the constructed fabrics are piece dyed for the flexibility they provide. The textile manufacturer can dye the whole fabric in batches according to the fashion demands of the time thus avoiding wastage and resultantly loss. There are several methods prevalent or piece dyeing. Piece Dyeing:- in this method, small batches of constructed natural colored fabric are dyed according to the demands for a given color. / Крашение Кускового Товара – крашение кусков ткани и кускового трикотажа полотном или в виде жгута или врасправку.

PIECES = КЛОК – Pieces are the skirtings and other less-desirable pieces of wool removed from the fleece. (Australian term). / Клок – малоценные места руна, отделяющиеся непосредственно после стрижки.

PIECES NOT ALIGNED = ШТУКИ НЕ ВЫРОВНЕНЫ В ЛИНИЮ – Pieces Not Aligned:- pieces sewn together not matched to each other. Sewing Room Defects. / Порок или дефект швейного производства.

PIECES NOT SIMMETRICAL = ШТУКИ НЕ СИММЕТРИЧНЫ – Pieces Not Symmetrical:- will not sew together without puckering or pleating; Cutting Room Defects, and namely – Marking Defects. / Порок или дефект раскроя.

PIECING = НАДВЯЗЫВАНИЕ – Piecing is the joining of two or more ends of sliver, roving, yarn, etc. Fabrics defect. Piecing is a thick place in a spun yarn caused by poor splicing. / Связывание концов нитей.

PIEDMONT PLAIN = ПОДГОРНАЯ РАВНИНА – Piedmont Plain is a broad slope composed of alluvial or colluvial sediments, or both, extending along and from the base of a mountain range.

PIER = ПИРС – A Pier is a construction work extending into the harbour with sufficient depth of water alongside to accommodate vessels, also used as a promenade or landing place for passengers. A Jetty is a small pier, usually made of timbers for boats, yachts or fishing boats (Fisherman Jetty), but it also refers to large ships (Tanker Jetty, T-Jetty). Pier is a structure built away from land and extending some distance over water, often used for docking boats. The structure perpendicular to the shoreline to which a vessel is secured for the purpose of loading and unloading cargo. Also known as Quay or Wharf. The structure perpendicular to the shoreline to which a vessel is secured for the purpose of loading and unloading cargo. Floating pontoons used in marinas to provide access to recreational craft. / Плавающие понтоны, используемые на флоте для обеспечения доступа к развлекательному судну. Под Пирсом понимается гидротехническое причальное сооружение, выступающее в акваторию порта и предназначенное для причаливания (швартовки) к нему судов с двух сторон. На пирсе производят перевалку грузов, высадку пассажиров на берег или посадку их на суда, ремонт или достройку пришвартованных судов. Пирсы особенно удобны в случае ограниченности береговой территории порта, так как позволяют на небольшой площади сосредоточить большое количество причалов и допускают устройство причальной линии на естественных глубинах. Различают:- (i) широкие пирсы, имеющие ширину 60–250 м и длину, обеспечивающую возможность причаливания к ним 3–8 судов с каждой стороны; и (ii) узкие пирсы, имеющие ширину 10–60 м, расчитанные на установку 1–2 судов по длине. Обычно пирсы располагают группами, образующими вдоль берега так называемую 'гребёнку'. Под Пирсом понимается двустороннее причальное сооружение, расположенное внутри акватории порта перпендикулярно или под углом к берегу. Пирсы располагают обычно группами, образующими 'гребёнку', благодаря чему увеличивается длина причальной линии порта, появляется возможность располагать причальный фронт под защитой оградительных сооружений наименьшего протяжения, что особенно важно в случае ограниченности береговой линии порта, например, в Новороссийске, Россия.

PIERCING LINE = ПРОНИЗЫВАЮЩАЯ ЛИНИЯ (или ШИРОКАЯ ПЕТЛЯ, или ПРОШИВКА) – Piercing Line:- in technical analysis, a bullish two day reversal pattern. The first day, in a downtrend, is a long black day. The next day opens at a new low, then closes above the midpoint of the body of the first day. / В техническом анализе биржевых рынков, бычья двухдневная модель разворота. Первый день характеризуется значительным снижением цены, что отображается на графике как штрих с длинным чёрным телом свечи. Следующий день открывается на новом минимуме, но закрывается выше средней точки тела свечи предыдущего дня.

PIER HEAD JUMP = СКАЧОК ГОЛОВЫ ПИРСА – Pier Head Jump (maritime term):- making a ship just as it is about to sail.

PIER–TO–HOUSE = ОТ ПИРСА ДО ДОМА – Pier-To-House:- container stowed at pier and unloaded at destination consignee. Cargo is containerised on the loading pier of the ocean carrier handling the shipment. Upon termination of the movement, the container is moved off the arriving pier and delivered directly to the consignee's factory or warehouse for removal of the shipment. / Груз погружен

в контейнер на пирсе погрузки океанского грузоперевозчика, обеспечивающего данную партию груза. По окончании транспортировки, контейнер вывозится из порта прибытия через пирс и доставляется напрямую на фабрику или склад грузополучателя для выгрузки груза из данного контейнера.

PIER–TO–PIER = ОТ ПИРСА ДО ПИРСА – Pier-To-Pier:- container stowed at origin pier and unloaded at destination pier. Ocean carrier containerises shipper's cargo on the loading pier, and removes cargo from the container on the arriving pier. / Океанский грузоперевозчик загружает контейнер грузом грузоотправителя на пирсе в месте погрузки и выгружает этот груз из контейнера на пирсе в месте прибытия.

PIEZOMETER = ПЬЕЗОМЕТР – Piezometer is an open-ended tube placed vertically in the soil for measurement of the hydrostatic pressure level of groundwater. / Под Пьезометром, от Греческих слов Piézō, означающее Давлю или Сжимаю, и Métron, означающее Мера, понимается:- (1) экспериментальное устройство для измерения сжимаемости газов, жидкостей и твёрдых тел. Пьезометром называют также устройство для измерения линейной деформации твёрдых тел. (2) Горная выработка (буровая скважина, колодец и другое), по уровню воды в которой можно судить о положении свободного уровня грунтовых вод.

PIF = PROFESSIONAL INVESTOR FUND

PIG = PASSIVE INCOME GENERATOR

PIG = СВИНЬЯ (или БОЛВАНКА, или ЧУШКА, или СКРЕБОК ДЛЯ ОЧИСТКИ ТРУБ) – (1) Slang in energy industries. A 'Pig' is a scraping tool that is sent through a pipeline to clean it out. 'Smart pigs' have sensors that can detect cracks or corrosion in the pipeline, helping to prevent leaks.

(2) Pig (slang) is a type of trailer that can be transported on a rail car and also pulled by truck.

PIGGYBACK = БОРТОВАЯ ПЕРЕВОЗКА (или ПЕРЕВОЗКА НА БОРТУ, или ПЕРЕВОЗКА 'НА ЗАКОРКАХ', или ПЕРЕВОЗКА ВЕРХОМ, или ПЕРЕВОЗКА МЕТОДОМ ЧАСТИЧНОЙ ПОГРУЗКИ) – Piggyback (slang):- the transportation of highway trailers or demountable trailer bodies on specially equipped rail flat cars. Piggy Back is the process of transporting a trailer on a railroad flatbed; the trailer is then hauled to its final destination by truck. To transport trailers via railway flat cars. The point-to-point movement of one transportation vehicle upon another. A highway semitrailer on a railroad flat car is the usual form of piggyback transportation. The carriage of trailers on railway wagons. Piggyback is a transportation arrangement in which truck trailers with their loads are moved by train to a destination. Also known as Pig, and Rail Pigs.

PIGGYBACK RIGHT = ПРАВО НА ЗАКОРКИ – Piggyback Right is similar to a tag-along right except that it usually applies in cases where a company is selling new shares to investors. A piggyback right allows a shareholder to sell a certain number or percentage of her shares to the new investors. Sometimes when a company offers its shares to the public in an IPO (short for the Initial Public Offering), original shareholders may be allowed to sell a certain number of their shares in the same offering under the same terms. This allows new investors to buy additional shares while at the same time providing past shareholders an opportunity for some gains.

PIGGY PACKER = УКЛАДЧИК 'НА ЗАКОРКАХ' – Piggy Packer is used by railroads to lift containers and trailers and place them on or remove them from rail cars at railheads. A mobile container-handling crane used to load/unload containers to/from railcars. / Передвижной кран, обслуживающий контейнеры, используемый для погрузки/выгрузки контейнеров в/из железнодорожных вагонов.

PIGMENT = ПИГМЕНТ – Pigment is a colored substance that is insoluble in water, usually in the form of a fine powder. Pigments are used to color many types of paint, including some textile paints, and almost all 'inks' used for screen printing ('silkscreen' printing). Pigments need some sort of binder to hold them onto fabric. Azoic dyes and vat dyes actually form pigment inside fibers. These pigments are physically trapped inside the fiber, so no binder is necessary. Inorganic pigments are often oxides of metals, such as iron oxide or titanium dioxide. Many organic pigments are chemically similar to parts of dye molecules, but lack the necessary features to make them soluble and to bond, unaided, to the fiber. Pigment is an insoluble, finely divided substance, such as titanium dioxide, used to deluster or color fibers, yarns, or fabrics. / (1) В химии под Пигментами, от Латинского слова Pigmentum, означающее Краска, понимаются окрашенные химические соединения, применяемые в виде тонких порошков для крашения пластмасс, резины, химических волокон, изготовления красок. Подразделяются на органические и неорганические. Из органических наиболее важны азопигменты, пигменты фталоцианиновые и полициклические. К пигментам относят также органические лаки. Неорганические пигменты делятся на природные и искусственные (белила, сажа, ультрамарин и другие).

(2) Pigments or Biochromes are substances produced by living organisms that have a color resulting from selective color absorption. Biological pigments include plant pigments and flower pigments. Many biological structures, such as skin, eyes, fur and hair contain pigments such as melanin in specialized cells called Chromatophores. Pigment color differs from structural color in that it is the same for all viewing angles, whereas structural color is the result of selective reflection or iridescence, usually because of multilayer structures. For example, butterfly wings typically contain structural color, although many butterflies have cells that contain pigment as well. / В биологии под Пигментами понимаются окрашенные вещества тканей организмов, участвующие в их жизнедеятельности. Обусловливают окраску организмов; у растений участвуют в фотосинтезе (каротиноиды, хлорофиллы), у животных – в тканевом дыхании (гемоглобины), в зрительных процессах (зрительный пурпур), защищают организм от вредного действия УФ лучей (у растений – каротиноиды, флавоноиды, у сложных – главным образом меланины). Некоторые пигменты применяют в пищевой промышленности и медицине.

PIGMENT DYEING = ПИГМЕНТНОЕ КРАШЕНИЕ – Pigment Dyeing is the coloring fabric with pigments mixed with a binder; this term is considered to be improper, since 'dyeing' is generally restricted to application of colorants that are soluble, and pigments are insoluble. Some pigment application processes are much like dipping the fabric in a dilute paint. Newer processes involve pretreating the fabric with substantivity-producing agents that actually make the process more like true dyeing, where the pigment preferentially leaves the bath and attaches to the treated fabric. So-called pigment dyed fabrics often have, by design, poor washfastness, to produce an aged appearance. Commercially, pigment dyeing is generally used more for finished garments than for fabrics. / Субстантивность (Substantivity).

PIGMENT DYES = ПИГМЕНТНЫЕ КРАСИТЕЛИ – Pigment Dyes:- although pigments are not dyes in a true sense, they are extensively used for coloring fabrics like cotton,wool and other manmade fibers due to their excellent light fastness. They do not have any affinity to the fibers and are affixed to the fabric with the help of resins. After dyeing, the fabrics are subjected to high temperatures.

PIGMENTED YARN = ПИГМЕНТОВАННАЯ ПРЯЖА – Pigmented Yarn is a dull or colored yarn spun from a solution or melt containing a pigment. See also Dyeing, Mass-Colored.

PIGMENT PRINTING = ПИГМЕНТНОЕ ПЕЧАТАНИЕ – Pigment Printing is a printing by the use of pigments instead of dyes. The pigments do not penetrate the fiber but are affixed to the surface of the fabric by means of synthetic resins which are cured after application to make them insoluble. The pigments are insoluble, and application is in the form of water-in-oil or oil-in-water emulsions of pigment pastes and resins. The colors produced are bright and generally fat except to crocking. See also Printing.

PIG TRANSFER = СВИНОЙ ПЕРЕНОС – Pig Transfer is a transfer of freight from a container to railroad trailer equipment.

PIG YARD = СВИНОЙ ДВОР – Pig Yard is a railroad parking yard where trailers are loaded and unloaded from trains. Pig is a slang for semi-trailer.

PIK BOND = PAYMENT–IN–KIND BOND

PIK PROGRAM = PAYMENT IN KIND PROGRAM

PIK SECURITIES = PAYMENT–IN–KIND SECURITIES

PILA = ПИЛА (или СТУПКА, или КОРЫТО, или СТОЛБ, или СВАЯ, или КАМЕННАЯ ПЛОТИНА, или МОЛ, или МЯЧ, или КЛУБОК, или ШАР) – Pila is:- (i) a pillar or pillar-like structure; and (ii) a genus of African and Asian snails of the family Piladae, including around 30 species. / ; и (ii) род (genus) Африканских и Азиатских .

PILE = ВОРС – Pile:- the cut or uncut loops which make the surface a pile fabric. Some common pile fabrics include corduroy, furniture covering, terry toweling, velvet, and rugs and carpets. Pile is:- (1) a fabric effect formed by introducing tufts, loops, or other erect yarns on all or part of the fabric surface. Types are warp, filling, and knotted pile, or loops produced by weaving an extra set of yarns over wires that are then drawn out of the fabric. Plain wires leave uncut loops; wires with a razor-like blade produce a cut-pile surface. Pile fabric can also be made by producing a double-cloth structure woven face to face, with an extra set of yarn interlacing with each cloth alternately. The two fabrics are cut apart by a traversing knife, producing two fabrics with a cut-pile face. Pile should not be confused with nap. Corduroys are another type of pile fabric, where long filling floats on the surface are slit, causing the pile to stand erect. (2) In carpets, pile refers to the face yarn, as opposed to backing or support yarn. Pile carpets are produced by either tufting or weaving. See also Cut Pile, and Loop Pile. / основа, уточина, . Под Ворсом, от Персидского слова Варс, означающее Волос, понимается пушистый слой на поверхности ткани, трикотажа.

PILE = СВАЯ (или ПАЛ) – Pile (maritime term):- a pointed spar driven into the bottom and projecting above the water; when driven at the corners of a dock, they are termed fender piles.

PILE CRUSH = РАЗДАВЛИВАНИЕ ВОРСА (или ЗАПРЕССОВЫВАНИЕ ВОРСА) – Pile Crush is the bending of upholstery or carpet pile that results from heavy use or the pressure of furniture.

PILE FABRIC = ВОРСОВАЯ ТКАНЬ (или ТКАНЬ С ВОРСОМ) – Pile Fabric is a fabric in which certain yarns project from a foundation texture and form a pile on the surface. Pile yarns may be cut or uncut in the fabric. Corduroy and velveteen are examples of cut filling pile fabrics. / Под Ворсовой Тканью понимается ткань, на поверхности которой (обычно с одной стороны) имеется ворс, состоящий из густо расположенных вертикальных концов нитей. Ворс образуется разрезанием нитей ворсовой основы или ворсового утка, дополнительных к обычным основе и утку. К ворсовым тканям с основным ворсом относятся бархат, плюш, искусственный мех, ковры. Уточно-ворсовые ткани – вельвет, плис, полубархат. Под Ворсованной Тканью понимается ткань, подвергшаяся ворсованию, благодаря чему на её поверхности образуется ворс (начёс), состоящий из концов отдельных волокон, вытащенных из нитей. Наиболее распространены хлопчатобумажные (байка, бумазея, замша, молескин-сукно, фланель) и шерстяные (байка, бобрик). К ворсованным тканям относятся также многие сорта одеял и некоторые виды сукон (кастор) и драпа (велюр). Ворсовая Ткань – ткань, поверхность которой покрыта ворсом. По структуре поверхности различают ворсовые ткани:- начёсанные, уточно-ворсовые, основоворсовые. Ворс начёсанных тканей образуется концами волокон, извлечёнными на поверхность путём ворсования (бобрик, байка, сукно, драп, фланель, бумазея и другие). Ворсовая поверхность уточно-ворсовых и основоворсовых тканей создаётся за счёт специальных нитей утка (плис, полубархат, вельвет) или основы (бархат, плюш, некоторые виды ковров, махровые ткани и тому подобные).

PILE KNIT = ВОРСОВЫЙ ТРИКОТАЖ – Pile Knit is a type of knit construction which utilizes a special yarn or a sliver that is interlooped into a standard knit base. This construction is used in the formation of imitation fur fabrics, in special liners for cold weather apparel such as jackets and coats, and in some floor coverings. While any basic knit stitch may be used for the base of pile knits, the most common is the Jersey stitch. / Дьжози (Jersey).

PILE LESS SPOT = УЧАСТОК С ПРОПУЩЕННЫМ ВОРСОМ (или ВОРСОВАЯ ПЛЕШИНА, или ПЯТНО БЕЗ ВОРСА) – Pile Less Spot:- it is a spot without the pile. Causes:- (i) improper working of terry motion on loom; and (ii) improper functioning of Jacquard. Mending:- non mendable. Fabric defect in terry fabrics. A Pile Less Spot is a spot without the pile where it should have been. Piling and Raising Defects. / Жакяр (Jacquard). Ворсовые Плешины не более 1 сантиметра (см). Размер порока – за каждое место.

PILEUS = ПИЛЕУС – Pileus (in Latin):- a pointed or close-fitting cap worn by ancient Romans.

PILE WEAVE = ВОРСОВОЕ ПЕРЕПЛЕТЕНИЕ – Pile Weave is a type of decorative weave in which a pile is formed by additional warp or filling yarns interlaced in such a way that loops are formed on the surface or face of the fabric. The loops may be left uncut, or they may be cut to expose yarn ends and produce cut pile fabric. Pile Weave is a weave in which an additional set of yarns, either warp or filling, floats on the surface and is cut to form the pile. Turkish toweling is a pileweave fabric with uncut loops on one or both sides. / дополнительными основными или уточными пряжами, . Ворсовое Переплетение является одной из разновидностей сложных переплетений.

PILE WIRE = РАЗРЕЗНОЙ ПРУТОК (или ВОРСОВАЯ ПРОВОЛОКА) – Pile Wire is a metal rod over which yarn is woven to generate a pile fabric.

PILEWORM/SHIPWORM = ШЛЯПОЧНЫЙ ЧЕРВЬ/КОРАБЕЛЬНЫЙ ЧЕРВЬ – Pileworm/Shipworm:- Teredo which destroys wood. / Чистяк Весенний (Ficaria Verna) или Щирица Гибридная (Amaranthus Hybridus) = Pileworm. Корабельный Червь (Teredo Navalis).

PILFERAGE = ПРОПАЖА (или ХИЩЕНИЕ) – Pilferage:- feloniously breaking into containers and/or individual cartons and taking and removing property of others. Cargo stolen from the container, warehouse or terminal. A term Pilferage refers to the stealing of part of the cargo. Theft not limited to the taking of a whole package or all of the property insured. Petty stealing of merchandise from a ship's hold, containers, terminal, cargo shed or warehouse. / Мелкая кража. Груз, украденный из контейнера, склада или терминала. Под Хищением понимается умышленное противоправное изъятие чужого имущества с целью обращения его в свою пользу или распоряжения им как своим собственным.

PILING AND RAISING DEFECTS = ПОРОКИ ВОРСОВАНИЯ И ВОРСОВАНИЯ (или ДЕФЕКТЫ ВОРСОВАНИЯ И ВОРСОВАНИЯ) – Piling and Raising Defects are the defects occurring in pile fabrics during the process of weaving. Different types of piling and raising defects are as follows:- Broken Pattern Due To Defective Piles, Pile Less Spot, and Uneven Piles.

PILL = КАТЫШЕК (или ПИЛЛ) – Pill is a small accumulation of fibers on the surface of a fabric. Pills, which can develop during wear, are held to the fabric by an entanglement with surface fibers of the material, and are usually composed of the same fibers from which the fabric is made. Pill is a tangled ball of fibers that appears on the surface of a fabric, as a result of wear or continued friction or rubbing on the surface of the fabric. Pills are the bunches or balls of tangled fibers which are held to the surface of a fabric by one or more fibers. Compare Fuzz Ball. Fabrics Defect. / протирание или притирка (rubbing). Пилли – мелкие шарики, образуемые из закатанных кончиков волокон.

PILLAR 3A PLANS = ПЛАНЫ ТРИ А ПО СТОЛПАМ – Pillar 3A Plans:- component of Switzerland's three-pillar pension system. While contributions to pillar 1 (state pension) and minimum provisions under pillar 2 (occupational pensions) are required by law, pillar 3 pension plans are optional private schemes. They are divided into pillar 3A plans (tax-privileged) and pillar 3B schemes (unrestricted access saving). For persons in gainful employment, payments into pillar 3A schemes are tax-privileged up to an annual maximum. See also Fiscainvest.

PILLBOX = ТАБЛЕТНИЦА (или ХХ) – Pillbox is a small round hat without a brim, specifically a woman's shallow hat with a flat crown and straight sides. / Маленькая женская шляпка без полей с плоским донышком.

PILLING = СКАТАННОСТЬ (или СКАТЫВАНИЕ, или ЗАКАТЫВАНИЕ, или ПИЛИНГОВАНИЕ, или ПИЛЛИНГ) – Pilling is the tendency of some yarns to form little balls of short, tangled fibers on the surface. This tendency can be reduced (or removed) by removing the short fibers (combing) or by adding additional twist. Pilling is the small collection of engtangled fibers on a fabric surface. Pilling is the tendency of fibers to ball or roll up. It is common in all fabrics which are knitted from yarns which possess a hairy or wooly surface but is particularly pronounced in knitted fabric made from spun nylon yarn. Pilling results when loose fiber ends escape from low-twist knitting yarns spun on relatively short staples. The loose ends, especially at the points where fabric is exposed to rubbing, collect on the surface of the material and ball up into rather unsightly fluff. Pilling:- balls formation on the fabric surface. Finishing defect. Pilling is the tendency of fibers to work loose from a fabric surface and form balled or matted particles of fiber that remain attached to the surface of the fabric. Pilling:- small accumulations of fiber on the surface of a fabric. Note:- this defect is usually caused by abrasion during prolonged finishing processes. Pilling is a formation of little balls of fibers (pills) on the surface of a fabric. Caused by abrasion in wear. Pilling is often found when producing flannel. Better quality, has less pilling. Pilling:- a tangled ball of fibers that appears on the surface of a fabric, as a result of wear, abrasion, or continued friction or rubbing on the surface of the fabric. Pilling:- fiber filaments that break in yarn due to friction leaving small clumps of loose fibers on the surface. / Найлан^{T3} (Nylon^{TM}). протирание или притирка (rubbing). Порок или дефект заключительной отделки. Пилингование – образование волокнистых комочков на поверхности ткани. Пиллинг (pilling):- порок заключительной отделки ткани; небольшие скопления волокон на поверхности полотна. Примечание:- этот порок возникает в результате истирания во время длительных процессов отделки. Вообще-то немного странно, но в Российском стандарте имеется даже термин Пиллингуемость, означающий свойство материала образовывать на своей поверхности закатанные в комочки или косички концы волокон, называемые Пиллями.

PILLOR LACE = ПОДШИТОЕ КРУЖЕВО – Pillor Lace:- being worked over a pillow on which the pattern is marked. Lace made with a bobbin.

PILLOWCASE = НАВОЛОЧКА – Pillowcases are washable covers for bed pillows that usually match the sheets and protect the pillow from soil. Most American pillowcases are made in a rectangular form with one open, hemmed edge. They occasionally are decorated on one of the narrower ends.

PILLOW COVER = (ВНУТРЕННИЙ) ЧЕХОЛ ПОДУШКИ – Pillow Cover is a fabric cover which is placed over the bed pillow before the pillowcase. Pillow covers are designed to give more protection to pillows than is provided by pillowcases alone. See also Pillowcase.

PILLOW LACE = КРУЖЕВО, ПЛЕТЁНОЕ НА КОКЛЮШКАХ – Pillow Face is a lace made by using a pillow to hold pins around which thread is arranged. See also Bobbin Lace. Pillow Lace is a lace made with a bobbin. / Смотрите также Кружево, Плетёное На Коклюшках (Bobbin Lace).

PILOT = ЛОЦМАН – Local expert advising a vessel's captain on safe navigation. Pilot is a person who is qualified to assist the master of a ship to navigate when entering or leaving a port. / хозяину (или капитану) судна . Лоцман это специалист по проводке судов, хорошо знающий местные условия плавания.

PILOT = ЛОЦМАНСКАЯ (или ПИЛОТСКАЯ) – Pilot:- a woolen cloth generally made in navy blue and used for seamen's coats. It is usually a heavily milled 2/2 twill with a raised, brushed finish. / Лоцманская ткань – шерстяная ткань тёмно-синего цвета используемая для морских бушлатов. Как правило, она .

PILOTAGE = ПИЛОТАЖ (или ЛОЦМАНСКАЯ ПРОВОДКА) – Pilotage is an activity where a pilot guides a vessel within harbour limits to ensure navigational safety. The act of navigating a vessel towards the coast, usually into port and by a trained, independent specialist (the pilot). Pilotage is the act carried out by a pilot of assisting the master of a ship in navigation when entering or leaving a port. Sometimes used to define the fee payable for the services of a pilot. / хозяину (или капитану) судна при навигации во время захода в порт или покидания порта. Под Пилотажем понимается управляемое движение транспортным средством. Пилотаж – пространственное маневрирование летательного аппарата с целью выполнения фигурных полётов. По сложности выполняемых фигур различают:- высший пилотаж, простой пилотаж и сложный пилотаж; по числу летательных аппаратов – групповой и одиночный пилотаж.

PILOTAGE DUES = ЛОЦМАНСКИЙ ВЗНОС (или ВЗНОС ЗА ЛОЦМАНСКУЮ ПРОВОДКУ) – Pilotage Dues:- a fee payable by the owner or operator of a ship for the services of a pilot. This fee is normally based on the ship's tonnage.

PILOT BOAT = ЛОЦМАНСКИЙ КАТЕР (или ЛОЦМАНСКИЙ БОТ) – Pilot Boat (maritime term):- a power or sailing boat used by pilots (men who have local knowledge of navigation hazards of ports).

PILOT HOUSE = ХОДОВАЯ РУБКА (или РУЛЕВАЯ РУБКА) – Pilot House is the enclosed space on the navigating bridge from which a ship is controlled when under way.

PIM = PERPETUAL INVENTORY MODEL

PIMA COTTON = ХЛОПЧАТНИК ПИМА – Pima Cotton is a long staple Cotton Variety. One of the Cottons that years ago helped to sound the death knell for Sea Island Cotton. It is named for this county in Arizona, and is raised there, as well as in Texas and lower

California. Pima is classed with the best of Arizona Cottons. Raised in the Salt River and Yuma Valleys, it is ideal for use in tire fabric, high-grade shirting. Of average staple, it is very tough, strong, smooth, and has the best of working properties. Classification procedures for American Pima Cotton are similar to those for American Upland Cotton, including transition to instrument measurements. Different grade standards are used because the color of American Pima Cotton is a deeper yellow than that of Upland. There are six official grades (grades '1' through '6') for American Pima Cotton, all represented by physical standards, plus below grade, which is descriptive. Also, the ginning process for American Pima Cotton (roller ginned) is not the same as for Upland (saw ginned). The roller gin process results in an appearance that is not as smooth as that of the saw ginned process. See also American-Egyptian Cotton, Extra Long Staple Cotton, Supima®, and Upland Cotton. Amercian Pima Cotton is a cross between Sea Island and Egyptian Cotton. Grown in Arizona. Length averages 13/8" to 15/8". Pima Cotton is a Cotton that produces fiber of exceptional strength and firmness and that was developed in the Southwestern United States by selection and breeding of Egyptian Cottons. An excellent long staple Variety grown in Arizona, New Mexico, Texas and California. It is a cross between Sea Island Cotton and Egyptian Cotton with fiber length averaging 1-1/2". The 'SuPima' certification mark is used only when the product is made entirely from Southwestern extra-long staple Cotton grown by members of the SuPima Association of America. / Смотрите также Супима® (Supima®). Хлопчатник Пима – Селекционный Сорт длинноволокнистого или так называемого длинноштапелькового или тонковолокнистого Хлопчатника или Хлопчатника, имеющего длинный штапелёк.

PIN = PERSONAL IDENTIFICATION NUMBER

PIN = БУЛАВКА – Pin:- like a needle but without the eye, it has a circle top.

PIN = ШПЛИНТ (или ПАЛЕЦ, или ШПИЛЬКА, или ШТИФТ, или НАГЕЛЬ, или ЦАПФА) – Pin (maritime term):- the metal axle of a block upon which the sheave revolves.

PIÑA = ПИНЬЯ (или ПАЙНА) – Pineapple or Piña is a fine fabric made from the fibers of the pineapple leaf. Pineapple fiber is a strong white or creamy cobweb-like fiber drawn from tall leaves of an indigenous pineapple plant. The fiber is hand stripped from the leaves in lengths of about 18 inches to 3 feet, sun-bleached, hand knotted and spun. As Piña fiber recovery is only about 1%, it can take six months to gather enough fiber to produce two pounds of spun piña. Piña fabric is lightweight, soft, completely washable and elegant in appearance. It is similar to linen, however it is softer and more lustrous. It is often blended with other fibers such as cotton, silk and polyester. Piña fabric is widely used in making traditional dresses of the Philippines. Piña:- the vegetable leaf fiber from the pineapple plant. / Под Пиньей или Пайной, от Испанского слова Piña, понимается волокно из листьев Ананаса.

PINAFORE = ПЕРЕДНИК (или XX) – Pinafore:- a sleeveless usually low-necked garment fastened in the back and worn as an apron or dress.

PIN CHECK, PINHEAD, PICK AND PICK = МЕЛКИЙ ШАШЕЧНЫЙ РИСУНОК, XX, XX И XX – Pin Check, Pinhead, Pick And Pick:- worsted, also made in Cotton and rayon. Twill. A minute check effect caused by a combination of weave and color. It has the appearance of tiny white dots repeating in rows, vertically, and horizontally. Holds a sharp crease, tailors and wears exceptionally well. In time, it is inclined to shine with wear. Men's suits, women's tailored suits and skirts. In cotton, it usually has a white dot on a blue ground and it is used for work clothes. / мелкий шашечный рисунок с применением пряжи двух контрастных цветов и выработкой 'зуб в зуб'.

PINCHER MARKS = ОТМЕТИНЫ ОТ ЩИПЦОВ (или ПРИЩЕПОК, или КЛЕЩЕЙ) – Pincher Marks:- during mending repair if end or pick is tightly relaxed creates abrasion also because of using hard quality rubber or sometimes relaxing directly with metal surface. Mending defect. / истирание из-за использования . Порок или дефект штопки (mending defect).

PINCHING = ПАСЫНКОВАНИЕ (или ПИНЦИРОВКА, или ПРИЩИПКА, или ЧЕКАНКА) – Pinching is removing the terminal bud, e.g., to encourage side-shoots or to prevent flower formation. / Под Пасынкованием понимается удаление у Махорки, Табака, Томата и других Растений боковых побегов (пасынков), вырастающих из пазух листьев. Улучшает приток питательных веществ к плодам и листьям, ускоряет созревание урожая. Под Пинцеровкой, от Немецкого слова Pinzieren, означающее Удалять Конец, или Прищипкой понимается удаление верхушки молодого побега растения. Применяется при формировании кроны Персика, Яблони, некоторых декоративных Растений, для ускорения созревания урожая Огурца (в теплицах), Табака и других. Под Чеканкой растений понимается удаление верхушек побегов или верхних побегов в основном у Винограда и Хлопчатника для прекращения их роста. Уменьшает опадение завязей, создаёт лучшие условия для развития плодов.

PIN CODE = PERSONAL IDENTIFICATION NUMBER CODE

PIN–DRAFTING = ВЫТЯГИВАНИЕ XX – Pin-Drafting is a system of drafting in which the fibers are oriented relative to one another in the sliver and are controlled by rolls of pins between the drafting rolls. It is primarily used for long fibers in the semi-worsted and worsted spinning systems. Pin Drafting is any system of drafting in which the orientation of the fibers relative to one another in the sliver is controlled by pins.

PINEAPPLE CLOTH = АНАНАСОВОЕ ПОЛОТНО – Pineapple Cloth is a lustrous transparent cloth of Phillipine origin that is woven of silky pineapple fibers.

PIN ENTRY DEVICE = PERSONAL IDENTIFICATION NUMBER ENTRY DEVICE

PINHEAD = БУЛОВОЧНАЯ ГОЛОВКА – Pinhead is a small pinhead-sized opening usually found about 10 to 12 inches from a selvage. Pinheads usually run in a fairly straight line along the warp and are formed by the shuttle pinching the filling, causing small kinks that show up as small holes in transmitted light. / строчка с защипами (pinching) – порок. уточина.

PINHEAD SQUARE = БУТОН РАЗМЕРОМ С БУЛАВОЧНУЮ ГОЛОВКУ (или ПОДЦВЕТНИК С НЕДОРАЗВИТОЙ ГОЛОВКОЙ) – A Pinhead Square is the first stage at which the square can be identified. The next stage of square growth is match-head or one-third grown square. In practice, this misnomer most often applies to match-head squares. Pinhead squares are just visible to the naked eye. Pinhead Square is a square approximately 3 mm or less in length. See also Square. / Подцветник, имеющий длину приблизительно 3 мм или ещё меньше. Смотрите также Подцветник (Square).

PIN HOLE = ПРОКОЛ (или ПРОБОИНА ОТ КЛУППА, или ПРОБОИНА ОТ ШИПА) – Pin Hole:- during mending if the mender does not push back the warp or weft knots at the back surface of the fabric than those knots during shearing operation in finishing creats pin hole. if knots are also not properly pulled or hand knot is having bigger tail which is still interlaced in the fabric, it may cause pin hole in the fabric. Mending defect. Pin Holes:- during mending repair if knot on side is relaxed un-evenly and in finishing after shearing this creates pin holes after shrinkage. Pin Hole is a very small hole in hosiery or fabric. Pinholes:- Fabric:- taffeta dress goods; Construction:- (i) Count:- 200 x 64; (ii) Warp:- 75/20 bright acetate rayon; (iii) Filling:- 120/40 bright acetate rayon. Finish:- plain dyed black. Defect:- customer submitted several finished umbrella tops containing what he described as 'pinholes'. Analysis:- the so-called

‘Pinholes’ were found to be slightly open spaces caused by kinky filling. This is a weaving fault, sometimes caused by filling yarn’s sloughing off the bobbin during weaving and generally attributed to too little tension in winding or to too low a relative humidity. In this particular case, it is interesting to note that the kinks were so inconspicuous and appeared so infrequently that they would not have been objection-able to the extent of degrading the fabric if it had been used as dress goods. The unexpected application for umbrella tops made an otherwise unimportant condition a comparatively serious imperfection. Pin Hole:- in fabrics, a very small hole, approximately the size of the cross section of a pin. Pinhole:- Possible Cause:- the presence of Fe^{2+} ions accelerates peroxide bleaching. If the fabric has rust residue on it or localized iron contamination the bleaching process will damage the fibers causing a hole. The frequency of defect determines if it is major or minor. Pretreatment defect. Defect Name:- Pin Holes. Defect Type:- Finishing Defects. Fabric Type:- Bottomweights – Plain Weave Derivatives. Description:- Pin Holes:- These are holes resulting from running the fabric over a pin tenter. A defect results when pin holes venture too far in from the selvage and distort or tear the fabric. Severity:- Minor. Pin Holes are the holes along selvage caused by pins holding fabric while it processes through tenter frame. / Уточина:- 120/40 . Порок вязания в виде петли больше обычных размеров по поверхности чулочного или трикотажного изделия. Порок или дефект штопки (mending defect). Клупп ширительной машины. Под Клуппом, от Немецкого слова Kluppe, понимается .

PINION = ШЕСТЕРНЯ (или ЗУБЧАТОЕ КОЛЕСО ПАРЫ, или ЗУБЧАТЫЙ ВАЛИК, или САТЕЛЛИТ) – Pinion is the smaller of two mating or meshing gears; can be either the driving or the driven gear. See also Gear. / Смотрите также (Зубчатая) Передача (Gear). Шестерня – меньшее, обычно ведущее колесо зубчатой передачи.

PINION BARRÉ = ПИНЬОН БАРРЕ – Pinion Barré is a fine, fillingwise fabric defect appearing as one or two pick bars in an even repeat. It is caused by a faulty loom pinion. / Pinion:- (1) Малое зубчатое колесо; (2) Ведущее колесо; или (3) Шестерня. Барре (Barré):- (1) порок ткани в виде полосатости по ширине ткани; (2) Щеколда; (3) Запорка; (4) Пруток; (5) Рейка; (6) Штанга; (7) Брус; (8) Планка; (9) Полоса – порок ткани; (10) Гребёнка на трикотажной машине; (11) Скало; (12) Разделённое на полосы по диагонали слева вниз.

PINK = XX (или РОЗОВОЕ, или ГВОЗДИКА) – Pink:- of a group of colors bluish red to red in hue, of medium to high lightness, and of low to moderate saturation. A fox hunter’s coat of a scarlet color distinctive of this sport and called pink.

PINK BOLLWORM = РОЗОВЫЙ КОРОБОЧНЫЙ ЧЕРВЬ – Pink Bollworm (in the United States):- Scientific Name – Pectinophora Gossypiella. Description of the Pest:- Pink Bollworm is a major pest of Cotton in Southern California deserts. While apparently established in the San Joaquin Valley, economic infestations have not occurred in this area. Adults are small, grayish brown, inconspicuous moths. When their wings are folded, they have an elongated slender appearance. The wing tips are conspicuously fringed. Young larvae are tiny, white caterpillars with dark brown heads. When mature, they are about 0.5 inch long and have wide transverse pink bands on the back. To be able to see Pink Bollworm larvae, bolls have to be cracked open. The first and second instars are difficult to see against the white lint of the bolls. Eggs are very small, slightly elongated, and laid under the calyx of green bolls. Damage:- Pink Bollworms damage squares and bolls, the damage to bolls being the most serious. Larvae burrow into bolls, through the lint, to feed on seeds. As the larva burrows within a boll, lint is cut and stained, resulting in severe quality loss. Under dry conditions, yield and quality losses are directly related to the percentage of bolls infested and the numbers of larvae per boll. With high humidity, it only takes one or two larvae to destroy an entire boll because damaged bolls are vulnerable to infection by boll rot Fungi. Management:- When high population levels of Pink Bollworm occur, the objectives of management are to keep infestations below damaging levels in the current season – without creating secondary outbreaks of other pests – and to reduce the overwintering population that will threaten the following season’s crop. The main control tools are observance of host-free period (San Joaquin Valley), the judicious use of insecticides, timely crop termination and harvest, rapid crop destruction, properly timed winter and spring irrigations, and compliance with plowdown requirements. When Pink Bollworms are found in the San Joaquin Valley, a regional monitoring and sterile moth release program is implemented. Because of the danger of secondary outbreaks, especially in the low desert valleys, it is wise to limit insecticide treatments to those periods when susceptible bolls are present and when sampling shows the percentage of infested bolls is above the treatment threshold. It is rarely necessary to apply insecticides against moths from the overwintered population of Pink Bollworm and, often, treatments are not needed against the first generation of Moths that develop from larvae within squares. Be alert, however, for high populations of Pink Bollworm moths when squares are developing, especially if other pests such as Lygus Bugs and Armyworms are also threatening. Mating disruptants and sterile moth releases, on the other hand, are most effective when aimed at the overwintering generation, usually about the time cotton plants have 6 to 8 leaves. Cultural Control:- The use of Bt Cotton will help prevent damage by Pink Bollworm. A recently developed transgenic Cotton, Bollguard II, offers suppression of Cotton Bollworm, along with Beet Armyworms, Pink Bollworm, and Tobacco Budworm. Eliminate the food supply for Pink Bollworm by cutting off irrigation early enough to stop production of green bolls by early September. Regardless of when the crop is terminated, immediately shred the cotton plants following harvest. Shredding destroys some larvae directly and promotes rapid drying of unharvested bolls. If fall temperatures are high during September and much of October, leave crop debris on the soil surface for two or more weeks after the shredding operation to further destroy larvae. Be sure to comply with plowdown requirements and cross disc or plow to a depth of at least 6 inches. In the San Joaquin Valley, there is a 90-day host-free period that extends from plowdown to March 10. Winter irrigations can reduce populations of overwintering Pink Bollworms by as much as 50 to 70%; flooding in December is more effective than flooding in November or January. Take advantage of Pink Bollworm mortality afforded by winter irrigations and rotate to small grains or newly seeded Alfalfa. In spring, irrigations can also be used to promote early spring emergence of Pink Bollworm. If Cotton is being followed with Cotton, preirrigate in February and plant as early as possible, following guidelines to ensure adequate soil temperature for germination and emergence. Plan irrigations of the crop to prevent even slight moisture stress and to promote maximum emergence of Moths in advance of susceptible squares. Organically Acceptable Methods:- Cultural controls, with the exception of the use of Bt Cotton and the use of mating disruption and sprays of the Entrust formulation of spinosad are acceptable to use on organically grown Cotton. Monitoring and Treatment Decisions:- in the San Joaquin Valley, Pink Bollworm is primarily managed with a host-free period. In Southern California, sampling bolls is the most reliable way to monitor pink bollworm populations. See also Integrated Pest Management for Cotton, 2nd edition, for detailed sampling methods and thresholds. The use of gossyplure, a sex attractant that disrupts mating when distributed throughout the field, may be effective against Pink Bollworm when it is supplemented with cultural control practices that minimize the number of overwintering Bollworms. Do not apply insecticides to control larvae; larvae are either inside the boll or in the ground and therefore insecticide contact is difficult. Pink Bollworm:- this destructive pest bores into the flowers or bolls of Cotton. The name comes from the pinkish larva of a dark brown moth. See also Pectinophora Gossypiella. The Pink Bollworm, (Pectinophora Gossypiella), is considered possibly the most destructive pest on Cotton worldwide. It is native to Asia and has been reported in several US states in the Southwest. The Pink Bollworm prefers Cotton but will also feed on Okra, Kenaf, and Hibiscus. The larvae of the Pink Bollworm bores into Cotton bolls and feeds on the seeds destroying the Cotton, losses up to 20% have been reported in Egypt, China, and Brazil. After feeding on the seed the larvae will stay inside the seed or fall to the ground to pupate. 3 to 5 life cycles per year are possible depending on the climate. In warm climate the larvae will overwinter inside Cotton or Okra pods left in the field after harvest. In cold climates the larvae forms cocoons in the soil. The larvae can also survive in

the seed after the ginning process and if the seed is not fumigated they will emerge from the stored seed the next spring. The Pink Bollworm (Heliothis Armigera) affects Cotton production in many South Texas counties, particularly those counties along the Rio Grande. The Pink Bollworm is the larval stage of a small brown moth. The Insect passes through four stages of development-egg, larva, pupa, and adult. The larva of the worm is the destroyer, as it eats the maturing seed within the Cotton boll. The life cycle in midsummer is usually completed in twenty-five to thirty days, and as many as six generations of the Insect may occur in a season. The pest entered from Mexico and became a menace in 1916. In 1917 the state legislature passed the Pink Bollworm Act, which subsequently was modified to provide regulations to control the worm and restrict the infected area. Three years later the Thirty-sixth Legislature established the Pink Bollworm Commission to oversee the enforcement of state regulations. In addition, a Compensation Claims Board was established to deal with the financial losses of those farmers forced to destroy infected crops. One of the worst years for Bollworm infestation was 1938, when they were reported in more than 119 counties. By 1944 the claims board was paying claimants an average of USD500. To control the pink bollworm in the state, first the commission and then the Texas Department of Agriculture laid down rules and regulations governing planting, cultivating, growing, and harvesting cotton. To prevent over-wintering (winter survival) of the pest, shredding and plowing under of the cotton stalks by given dates is required. Federal quarantine regulates interstate movement of cotton from infested to noninfested areas. While regulating the growing season proved somewhat effective, it did not eradicate the pest. As late as 1952, Cotton losses from this Insect exceeded USD28 million in thirty-eight South Texas counties. During the 1960s and 1970s chemical insecticides, including DDT, were used in attempts to control the Insect. With the heightened interest in nonchemical pest control in the 1980s, scientists with the Texas Department of Agriculture experimented with hormone manipulation of the Bollworm and the Tobacco Budworm. Through the use of insect pheromones, researchers tricked male Bollworms into mating with female Budworms. Because the genitalia were mismatched, the Insects became locked together and died. Since 1955, the overall goal of farmers and scientists has been to try to control rather than eradicate the pest. Volunteer efforts by farmers that have been successful have included delayed planting, deep plowing, and winter irrigations. Some control measures were so effective, in fact, that in 1978 the Texas Sunset Advisory Commission recommended to the governor that the commission be abolished. In 1995 the state legislature passed the Pest Management Law, which merged the bollworm program with the state's program to destroy the Cotton Boll Weevil. At that time the primary means of control continued to be the destruction of Cotton stalks, which thus interrupted the life cycle of the Insect. In 1995 problem areas in the state included the Trans-Pecos valley and the El Paso valley. / Пэктинофора Госсипиэлла или Хлопковая Моль:- этот пагубный Вредитель пробирается в цветки или коробочки Хлопчатника. Название произошло от розоватой гусеницы – червеобразной личинки (wormlike larva) – тёмно-коричневой бабочки. Смотрите также Розовый Коробочный Червь (Pink Bollworm). Пэктинофора Госсипиэлла (Сондэз) или Хлопковая Моль (Pectinophora Gossypiella; по классификации Британского страхового брокера, энтомолога и ботаника Вилъйэма Вилсэна Сондэза (William Wilson Saunders; 1809–1879)), бабочка Семейства Выемчатокрылых Молей (Lepidoptera Gelechiidae Family), опасный Вредитель Хлопчатника, а также Бамии (Okra), Гибискуса (Hibiscus), Кенафа (Kenaf) и других Растений Семейства Мальвовых (Malvaceae Family). Распространена в Афганистане, Греции, Индии, Иране, Италии, Китае, Корее, Турции, Японии и других хлопкосеющих странах. В бывшем Союзе Советских Социалистических Республик (СССР) отсутствовала и была объектом внешнего карантина. Хлопковая Моль даёт 2–6 поколений в год. Бабочки откладывают яйца (до 500 штук) на бутоны, коробочки, листовые почки, листья, стебли Хлопчатника и других Растений. Гусеницы повреждают генеративные органы Хлопчатника, в результате чего опадают бутоны и цветки, усыхают и опадают зелёные коробочки; в сформировавшихся коробочках загрязняют выделениями волокно, которое становится непригодным для текстильной промышленности. От Хлопковой Моли ежегодно может погибать 20–80% урожая Хлопчатника. Меры борьбы:- запрещение ввоза в страну заражённых семян и продукции Мальвовых; уничтожение гусениц в семенах, хлопке, отходах методом фумигации, на посевах – инсектицидами; уничтожение послеуборочных отходов; вылавливание бабочек светоловушками; применение хемостерилизаторов Насекомых.

PINKING = XX (или УКРАШЕНИЕ ПЕРФОРАЦИЯМИ) – Pinking is a method of adorning dress by decorative perforating fabric with tiny slits. In use from mid XVI century until 1630s.

PINKING SHEARS = ПРОТЫКАЮЩИЕ НОЖНИЦЫ – Pinking Shears are the scissors that are used for cutting fabric. The blades of which are saw-toothed instead of straight.

PINKISH = XX (или РОЗОВАТОЕ) – Pinkish:- somewhat pink.

PINK KERNELS = РОЗОВАЯ ЗЕРНОВКА (или РОЗОВЫЕ ЯДРА) – Pink pigment in Wheat kernels is an indication of immaturity. / Розовый пигмент в зерновке (ядрах) Пшеницы указывает на её недозрелость.

PIN KNOT = БУЛАВОЧНЫЙ СУЧОК (или КАРАНДАШНЫЙ СУЧОК) – Pink Knot is a knot that is not more than 12.5 mm (1/2") in diameter. / Сучок, не превышающий в диаметре 12.5 мм (1/2" или пол дюйма). Продолговатый Сучок (Pin Knot):- сучок, разрезаный так, что отношение большего размера к меньшему больше четырёх.

PINK SHEETS = РОЗОВЫЕ ЛИСТКИ – Pink Sheets is the colloquial name given to the over-the-counter (OTC) market where Level-I Depositary Receipt trade. The name is derived from the sheets of pink paper upon which the indicative quotes and the names of the market-makers for the stock were once printed. National Quotation Bureau is a company that provides quotes for over-the-counter stocks and corporate bonds. The National Quotation Bureau provides information such as the bids, asks, and the market makers giving them. Because stocks and bonds listed by the National Quotation Bureau are over-the-counter, they do not have to meet any listing requirements and may, therefore, come from quite small issuers. The Bureau provides all quotes in real time and publishes a review each week. Its quotes are divided into Yellow Sheets (for bonds) and Pink Sheets (for stocks). National Quotation Bureau (NQB) is a privately-owned company that was established in New York in 1913 to provide investors with information on stocks and bonds traded over the counter (OTC). The company now mainly offers electronic services, including data access, on its website. NQB changed its name to Pink Sheets LLC in 2000 and then to Pink OTC Markets Inc in 2008. It is considered a non-exclusive securities information provider by the Securities and Exchange Commission (SEC). NQB published information on OTC stocks and bonds for decades in the Pink Sheets and Yellow Sheets, which were named for the color of paper on which they were printed. Stock quotes were published on the Pink Sheets, while corporate bonds were quoted on the Yellow Sheets. Pink Sheet stocks include penny stocks and other companies that are not traded on exchanges. These stocks can pose added risk for investors, because they may not be current on filing financial statements, may not file at all, or, in extreme cases, may not even be legitimate companies. Information sources, such as Pink OTC Markets, help investors find information on these less liquid and less regulated stocks. / Розовые Листки – внебиржевая система торгов акциями. Отражает котировки брокеров/дилеров для ценных бумах внеучётного или, так называемого, внебиржевого рынка. С 1913 выходила в бумажной форме на розовой бумаге. С 1999 работает Интернет версия, которая поддерживается Нью Йоркской компанией Пинк Щитс Эл.Эл.Си. (Pink Sheets LLC) (вэбсайт http://www.pinksheets.com). Система не является подразделением NASD или Securities and Exchange Commission (SEC). Розовые Листки ежедневно публикуются Бюро Национальных Котировок (NQB) Джерси Сити, Штат Нью Джерси, подразделением Камёрс Клыринь Хаус,

Инк. (Commerce Clearing House, Inc.), Ривервуд, Штат Иллинойс. Ежедневно выпускается список компаний, который включает в себя имена и телефоны, брокеров и котировки акций компаний. Информация печатается на тонких розовых бумажных листках – отсюда и название. В основном, компании, которые котируются на Розовых Листках, – это закрытые и небольшие, которые не могут удовлетворить требованиям листинга на Нью Йоркской Фондовой Бирже или НЭЗДЭК® (NASDAQ®). Компаниям не требуется предоставлять отчётность и проводить аудит. Это вызывает определённые трудности для инвесторов с их оценкой, что ведёт к высокой степени риска инвестиций. Нет минимальных требований к размеру бизнеса. Многие из этих акций даже не указываются в ежедневно публикуемых в газетах таблицах котировок внебиржевого рынка. Брокерские фирмы подписываются на Розовые Листки, поскольку в их таблицах не только приводятся текущие котировки, но и перечисляются маркетмейкеры, которые ведут торговлю с перечисленными акциями. В 2006 услугами Розовых Листков пришлось воспользоваться Нависта Интёнэшэнэл Корпорэйшэн (Navistar International Corporation) – автомобильной компании с оборотом в 12 миллиардов Долларов, до середины 2006 торговавшейся на НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). После конфликта с аудиторами, отказавшимися утвердить поправки к отчётности, предложенные Нависта, компания была вынуждена сменить аудитора, пропустила сроки обязательного предоставления отчётности на биржу и в итоге была исключена из биржевого реестра.

PINK STAINS = РОЗОВЫЕ РАЗВОДЫ (или РОЗОВЫЕ ПОТЁКИ) – Pink Stains:- Garment:- white cotton nurse's uniform; Fabric Construction:- (i) Count:- 120 x 54; (ii) Warp:- 32/1 cotton; (iii) Filling:- 17/1 cotton. Complaint:- pink stains on the white collar and the back portion of the uniform near the collar were noticed before laundering. Analysis:- analysis indicated that the pink stains were due to the chemical reaction between traces of chlorine (from bleach) or alkali left in the fabric and the volatile fumes of an aniline black marking ink which had been used as identification on the inside of the collar of the garment. This pink color (probably a red fuchsine) was fairly easily removed by a laboratory scour. It is interesting to record the fact that a similar defect was encountered in garments on several other occasions, one involving several pairs of white Army twill trousers, which showed the staining after having been marked with the garment size and other data on the inside waistband. Another case concerned some white cotton knitted athletic or gym shirts stencil-marked on the chest portions with large black letters, evidently to represent the purchasers' organization or athletic team. The marking had been done with an aniline black ink and there was a pink halo around each of the black letters. It was concluded that the new shirts had left the bleachery without complete removal of the chlorine bleach used in regular proa ssing. Here again, the condition would have gone unnoticed and no harm would have been done, except for the unforeseen use of the aniline black marking ink. / Уточина:- 17/1 хлопковая.

PINK STEM BORER = РОЗОВЫЙ СТЕБЛЕВОЙ ТОЧИЛЬЩИК – Pink Stem Borer (Sesamia Inferens) is a major Pest in double-cropped areas because it has many host Plants. The larva has an orange-red head capsule. The body is purplish-pink dorsally and white ventrally. The pupa is dark brown with a tinge of purple in the head region. The adult is fawn-colored with dark brown markings. The hindwings are white. / Под Точильщиками понимается Семейство Жуков. Длиной 2–8 миллиметра. Около 1 500 Видов. Распространены широко. В бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось свыше 100 Видов. Обитают главным образом в мёртвой сухой древесине. Домовый Точильщик повреждает деревянные постройки, мебель; Хлебный Точильщик – муку, хлебные изделия, книги.

PIN MARKS = ОТМЕТИНЫ ОТ КЛУППОВ – (1) Pin Marks:- poor stenter pin. Pin Marks:- a series of small apertures or severed yarns running parallel to and near the fabric edges. Note:- this defect is caused by hooked, blunted or poorly adjusted stenter pins. Woven fabric defect. (2) Pin Marks:- poorly adjusted stenter pin. Knitted fabric defect. Pin Mark:- a series of holes near the edge parallel with the lengthwise direction of a fabric caused by the holding device on a pin tenter frame. See also Clip Mark. Pin Marks:- poorly adjusted temple pins or damaged pins can lead to pin marks. / Порок или дефект сотканой ткани. некачественный клупп ширительной машины. Под Клуппом, от Немецкого слова Kluppe, понимается .

PINNATE = ПЕРИСТОЕ – Pinnate:- (1) a compound leaf having the leaflets or segments arranged on either side of a common axis. (2) Resembling a feather's construction. Leaflets are arranged on each side of a common axis. Pinnate:- feather-formed. Said of a compound leaf with the leaflets along both sides of the leaf stalk. / Перистый:- о листе. Перистое:- в форме перьев. Так говорят о сложном листе с листочками по обе стороны ножки листа.

PINNATE LEAF = ПЕРИСТЫЙ ЛИСТ – Pinnate Leaf:- there is a main nerve, called Midrib, from which the other nerves derive, remembering a plume. / Перистый:- простой или сложный лист, чьи лопасти или листочки расположены с обеих сторон по длине черешка.

PINNATELY COMPOUND LEAF = ПЕРИСТОСЛОЖНЫЙ ЛИСТ – Pinnately Compound Leaf:- compound leaf with the leaflets arranged on both sides of the rachis or axis bract, e.g., Fraxinus americana.

PINNATELY LOBED LEAF = ПЕРИСТОЛОПАСТНЫЙ ЛИСТ – Pinnately Lobed Leaf:- segments or lobes along each side of a common axis, e.g., Quercus palustris.

PINNER = ЧЕПЧИК – Pinner is a woman's cap with long lappets worn in the XVII and XVIII centuries.

PINNING = ХХ – Pinning is:- (1) attach with a pin or pins; and (2) fasten (something) with a pin or pins in a specified position. See also Pin Drafting.

PINNING THE STRIKE = ПРИВЯЗКА К СХОДНОЙ ЦЕНЕ – Pinning The Strike is the tendency of a stock's price to close near the strike price of heavily traded options (in the same stock) as the expiration date nears. This doesn't always happen, but it often does when there is significant open interest. For example, if a stock is trading near USD50 and there is heavy trading in both puts and calls at this strike price, there is a tendency for the stock price to be 'pinned' at USD50 as traders unwind their positions at expiration.

PINNY = ПЕРЕДНИЧЕК (или СЛЮНЯВЧИК) – Pinny:- pinafore (usually a child's term).

PIN RISK = РИСК ПРИВЯЗКИ – Pin Risk is the risk to a trader who has sold an option that, at expiration, has a strike price identical to, or pinned to, the underlying futures price. In this case, the trader will not know whether he will be required to assume his options obligations.

PINSONIC® THERMAL JOINING MACHINE = ТЕРМАЛЬНАЯ СОЕДИНЯЮЩАЯ МАШИНА ПИНСАНИК® – Pinsonic® Thermal Joining Machine is a rapid, efficient quilting machine that uses ultrasonic energy rather than conventional stitching techniques to join layers of thermoplastic materials. The ultrasonic vibrations generate localized heat by causing one piece of material to vibrate against the other at extremely high speed, resulting in a series of welds that fuse the materials together. / Пинсаник® (Pinsonic®).

PINS OR FOLDS IN GARMENT INCORRECT = НЕПРАВИЛЬНЫЕ БУЛАВКИ ИЛИ СКЛАДКИ В ШВЕЙНОМ ИЗДЕЛИИ – Pins Or Folds In Garment Incorrect:- pins in wrong location or folds not correctly aligned for package. Finishing department defects, and namely – Folding Defects. / Порок или дефект заключительной обработки, а конкретнее – складывания.

PINSTRIPE = ИГОЛЬНАЯ ПОЛОСА (или XX ПЛАНКА, или XX ЛЕНТА) – Pinstripe:- narrow stripes in any color. When the stripes are white, they are often called Chalk Stripes. Pinstripe is a suit with pinstripes, namely a very thin stripe especially on a fabric. Often used in plural. A pattern of very thin stripes running in parallel found in cloth is also called Pin Stripes. Although found mostly in men's suits, any type of fabric can be pin striped.

PINT = ПИНТА – Pint is unit of capacity in the British Imperial and US Customary systems of measurement. In the British system the units for dry measure and liquid measure are identical; the single British pint is equal to 34.68 cubic inches (568.261 cubic cm) or one-eighth gallon. In the United States the unit for dry measure is slightly different from that for liquid measure; a US dry pint is 33.6 cubic inches (550.6 cubic cm), while a US liquid pint is 28.9 cubic inches (473.179 cubic cm). In each system, two cups make a pint, and two pints equal a quart. A US liquid pint holds 1.042 pounds of water at room temperature, a fact that gave rise to the saying 'a pint's a pound the world around'. The pint has been a common unit of measure in Great Britain since the XIV century. The actual volume of the pint, however, has varied considerably over the years; in the medieval and early modern British Isles it varied from 0.446 to 1.887 liters. / Пинта является единицей объёма (вместимости) в Британской Имперальной Системе и Обычной Системе Мер США. Обозначение:- П. В Соединённом Королевстве 1 пинта = 1/8 галлона = 0.568 261 литра. В Соединённых Штатах Америки 1 жидкостная пинта = 1/8 Американского галлона = 0.473 179 литра, а 1 сухая пинта сыпучего вещества = 1/64 Американского бушеля = 0.550 614 дм^3.

(1) Pint (pt) is a traditional unit of volume equal to 1/2 quart. There are three different quarts in use in Britain and the United States, and hence there are three different pints:- (i) the US liquid pint, equal to exactly 28.875 cubic inches, 16 fluid ounces, or approximately 473.176 milliliters; (ii) the US dry pint, equal to 33.600 cubic inches or approximately 550.611 milliliters; and (iii) the British Imperial pint, equal to 20 British fluid ounces, 34.678 cubic inches or approximately 568.261 milliliters. The origin of the word pint is unclear. It may come from the Latin pincta, painted, referring to a marking at the one-pint level on a larger container. Pint is a volume measure equal to half a quart; in the United States, 1 pint is equal to 16 fluid ounces, in Canada and Britain, 1 pint equals 20 fluid ounces.

(2) Pint (pt) is a traditional unit of volume in Scotland equal to 2 choppins or 4 mutchkins. The Scots pint varied with time and locality, but it was eventually standardized as the volume of the Stirling jug, a vessel holding about 104.2 cubic inches or 1.708 liters. This is almost exactly 3 Imperial pints or 3.6 US liquid pints.

(3) Pint (pt) is a unit of volume used in South Australian pubs. A pint of beer is generally 425 milliliters in South Australia, or roughly 3/4 Imperial pint (15 fluid ounces). In Queensland a pint glass typically holds 560 milliliters, very nearly an Imperial pint.

PINWHEELING = РАЗВОРОТ МАШИНАМИ – Pinwheeling is a process of arranging pallets on a truck or product on a pallet to make the best use of space when dealing with items of different sizes.

PIP = POST–INITIATED PROMOTION

PIP = ШАГ (или МИНИМАЛЬНО ДОПУСТИМОЕ ИЗМЕНЕНИЕ ЦЕНЫ, или ПИП) – Stock indices have 'Points', futures have 'Ticks', Forex has 'Pips'. Minimum fluctuation or smallest increment of price movement. See also Point. (0.0001 of a unit). Pip is the smallest price unit of a currency. Depending on context, normally one basis point, i.e. 0.0001. Pip is the smallest increment of price movement a currency can make. Also called Point or Points. For example, 1 pip for the EUR/USD = 0.0001 and 1 pip for the USD/JPY = 0.01. / Pip – Зёрнышко. Минимальная флуктуация (колебание) или , то есть .

PIPE CLAMPS = ЗАЖИМЫ ДЛЯ ТРУБ – Pipe Clamps are used to protect cylindrical goods, to unitize them and to ensure that they can be transported safely. They comprise pairs of squared lumber, steel profiles or similar materials which are placed above or below the goods and are generally connected to each other with threaded rods at the sides.

PIPELINE = ТРУБОПРОВОД – Pipeline is a pipe through which oil or natural gas is pumped between two points, either offshore or onshore. / Под Трубопроводом понимается труба, по которой нефть или природный газ прокачивается между двумя пунктами, либо между морским промыслом и берегом. Трубопровод – сооружение из труб, плотно соединённых между собой, для транспортирования газообразных, жидких и твёрдых продуктов, в том числе готовых изделий. В зависимости от транспортируемого продукта различают водо-, газо-, нефте-, пульпопровод и тому подобные, промышленный трубопровод (для транспортирования вагонеток, контейнеров с готовыми изделиями или материалами, машин, металла), внутриучрежденческий трубопровод для передачи документации, почты и другого. Трубопроводами оборудованы предприятия металлургической, пищевой, текстильной, угольной, химической и других отраслей промышленности, жилые и промышленные здания и так далее. Трубопровод – сооружение для транспортировки нефти (нефтепровод) и газа (газопровод). В состав трубопровода входят сам трубопровод, перекачивающие насосные станции, хранилища. Перекачивающая Станция – сооружение трубопроводного транспорта для перекачки сырой нефти или нефтепродуктов. Перекачивающие станции сооружаются на нефтяных промыслах, нефтеперерабатывающих заводах, нефтебазах и магистральных нефтепроводах и продуктопроводах. На магистральных трубопроводах различают перекачивающие станции головные и промежуточные, оборудованные преимущественно центробежными насосами с электроприводом и средствами автоматики и телемеханики.

PIPELINE FUEL = ГАЗ ДЛЯ ОБСЛУЖИВАНИЯ ТРУБОПРОВОДОВ (или ТОПЛИВНЫЙ ГАЗ, или ТЕХНИЧЕСКИЙ ГАЗ, или ГАЗ НА СОБСТВЕННЫЕ НУЖДЫ КОМПРЕССОРНЫХ СТАНЦИЙ, или ТРУБОПРОВОДНОЕ ТОПЛИВО) – Pipeline Fuel is a gas consumed in the operation of pipelines, primarily in compressors. / Газ, потребляемый для функционирования газопроводов, преимущественно на компрессорных станциях.

PIPELINE STOCKS = XX – Pipeline Stocks are the minimum quantity of a commodity needed to carry on the normal processing and marketing operations. Tends to be relatively constant from year to year.

PIPING = ОБТАЧКА (или КАНТ, или РУЛИК, или ПОЛЫЙ ШНУР, или ОКАНТОВКА) – Piping is a narrow tape used to bind seams, or used for decoration. Piping is another name for welting. See also Cording, and Welting. Piping is a narrow tube of fabric, sometimes enclosing a cord, used for trimming seams and edges, as of slipcovers or suits. Piping Cuff a narrow tube of fabric enclosing a sleeve. / Смотрите также Обшивка или Бортовка или Кайма (Welting). Обтачка – отдельно выкраиваемая деталь для обработки срезов, всегда повторяющая форму среза. Поэтому для обтачки не даётся, как правило, отдельная выкройка – она переснимается с конструктивной детали выкройки как отдельная деталь. Направление долевой нити обтачки и основной нити обычно совпадают. Цельнокроенная обтачка – если подлежащий обработке срез прямой, обтачку можно выкроить вместе с основной деталью и отвернуть на изнаночную сторону.

PIQUÉ = ПИКЕ – Piqué, from the French, is a cloth simulating an older cloth of pleated weave appearance. A true piqué is characterized by heavy corded, ribbed, or ridged wales in the filling direction. In its best and original form, two warps (face and back) and three fillings (face, back, and stuffer) are employed. As is usual with double cloths, the face-warp and the face-filling interweave for the face effect, bound down at spaced points by the back warp and the back filling, which also serve to restrict displacement of the

heavy stuffer picks when they are used. Stuffers will create a full, rounded rib effect by pressure under the face system of threads; they never appear on the face of the goods but occupy a position between the face and back systems of yarn. Another desirable function of the stuffer threads is the addition of substance and weight to the fabric. The piqué fabric, medium to heavy in weight, is generally made of combed face yarn and carded back and stuffer yarns. It is very durable, launders well and is rather expensive for a cotton material since it requires relatively high pickage and the use of the Jacquard or dobby box loom with slower than regular loom speed. The type of loom has no effect on the characteristic appearance of the cloth. The so called Bedford Cord which is strictly a piqué effect in a warp-wise direction, is many times loosely referred to as 'Piqué'; this is a misnomer, and both terms should be used correctly to avoid confusion. In recent years, a twill weave with a few ends face-up, alternating with a few ends face-down, has appeared in rayon fabrics called Piqué. However, this is a misnomer. Piqué is used for collar and cuff sets, infants' coats and bonnets, neckwear, shirts, vests, and women's and children's wear. Piqué is a knitted fabric that resembles a lightweight Bedford cord, with the wales or cords running in the warpwise or lengthwise direction. Piqué is a medium-weight fabric, either knit or woven, with raised dobby designs including cords, wales, waffles, or patterns. Woven versions have cords running lengthwise, or in the warp direction. Knitted versions are double-knit fabric constructions, created on multi-feed circular knitting machines. Piqué is a mediumweight, cotton-blend fabric which is characterized by raised parallel cords or fine ribbing that resembles a check. It is used to make vests, coats, the collars of polo shirts, fitted blouses and children's clothes. Piqué de Marseille or Marseilles:- the quilted weave, as applied to cotton fabrics, is known among weavers as the Marseilles Weave. It comes from the white needlework for which Marseille and the Provence in southern France are known. It is a double cloth, the face being a moderately close, plain weave. The back is a very open, plain weave. Between the back and face a soft twisted heavy filling, called Stuffing, is woven. The two cloths are stitched together at frequent intervals in weaving, the stitches being arranged so as to sufficiently bind the two cloths together, and at the same time form an ornamental design or pattern. The 'stuffing' between the cloths gives the fabric the embossed effect. The Face:- being plain woven is drawn into heddles as for sheeting. The back is also a plain weave, but the back warp Is also the quilting warp, and has to be mounted in a 'Jacquard' harness, unless the pattern is small enough to be produced on a 'dobby'. Two face threads and one back (or quilting) thread are drawn into each dent of reed. The Construction:- calls for a loom with two shuttle boxes at each end of lathe. Large patterns require a 'Jacquard' attachment, while the small designs may be made on a dobby head; also two warp beams are necessary. In operation the loom throws in one back, two face and one stuffing pick in regular order. To make the embossed effect show up well the back warp is woven with considerably more tension than the face. As an Arithmetical Basis:- for the construction of this fabric, about 11 times the square root of the average hank number on face and back may be used. The 'stuffing' should be four times as heavy as the average number used for face and back. The picks are thrown in two face and two stuffing regularly. In This Example:- the average number of the face yarn is given. The fabric looks better and wears better, if warp and filling on face are alixe, but it helps the weaving out wonderfully to have a considerable difference between the two, the warp being from 10 to 20 per cent heavier man the rilling. It is beyond the scope of an elementary article like this to attempt any description of the means used to produce the ornate designs of the fabric. The artist who originates textile designs must draw each design to fit the fabric he is dealing with. Each fabric Jias its special characteristics as to design, and each also has its limitations. The characteristics and limits of the iabric under consideration may be here stated. Color Effects:- are hardly admissible. The fabric is essentially a white one. The quilting warp is sometimes colored, so as to show a pattern composed of colored lines and dots on a white ground. The design is not thereby altered, for the pattern woven with colored stitching may also be woven entirely white. The fabric admits only of a design of 'dots' arranged to produce large designs. In the vestings and fabrics with small patterns, the quilting warp threads, when not raised to make a stitch, are floated. The dots then should be arranged so as to avoid very long floats. On counterpanes the design has to be very large, and has to be produced on a 'Jacquard' machine of comparatively small capacity. This calls for a design that can be enlarged in the tie-up of the harness and to this end certain parts of the design are arranged so as to admit of several repetitions. The name 'Piqué':- is now generally applied to this fabric when woven in small patterns within the capacity of the 'dobby'. This name particularly applies when the goods are to be used for ladies' and children's dresses, men's shirt fronts, etc. However, the fabric that is called 'Piqué' when used for dresses or shirt fronts, would be a 'Marseilles' if made up into a man's vest. The name 'Piqué' is probably from the French 'Piquer', to quilt or prick with a needle. Possibly the name 'Marseilles' is also a corruption of the French 'Matelas', a quilt or mattress. A Corded 'Marseilles' or 'Piqué' is essentially the same fabric as the figured article, but is woven rather differently. The warp is drawn into a three-shed harness like a common three-shed twill. To produce the corded effect the harnesses are operated by a dobby. Two warps are used as in the preceding cases, one warp having twice as many threads as the other; the quilting warp is drawn into the back harness, the face warp in the middle and front. Antique Piqué de Marseille:- not easy to find a real antique one, even in Provence, as there are so many modern copies. The oldest one were made with two pieces of cotton that were stuffed and stitched by hand to design intricate patterns. Real antique pieces are very expensive (USD1 500–20 000). Piqué is:- (1) a medium weight to heavyweight fabric with raised cords in the warp direction. (2) A double-knit fabric construction knit on multifeed circular machines. Piqué:- durable ribbed clothing fabric of cotton, rayon, or silk. Lengthwise rib, English crosswise rib or cord weave. Originally was a crosswise rib but now mostly a lenghtwise rib and the same as bedford cord. Ribs are often filled to give a more pronounced wale (cord weave). Comes in medium to heavy weights. It is generally made of combed face yarns and carded stuffer yarns. It is durable and launders well. Wrinkles badly unless given a wrinkle-free finish. Also comes in different patterns besides wales. The small figured motifs are called Cloque. Some of the patterns are birdseye (small diamond), waffle (small squares), honeycomb (like the design on honeycomb honey). When the fabric begins to wear out it tends to wear at the corded areas first. / две основы и три уточины . Жакяр (Jacquard). ткацкий станок с кареткой (dobby box loom). кругловязальных машинах. Французское словосочетание Пике дё Марсей (Piqué de Marseille) или Марсей (Marseilles), означающее Пике Из Марселя или Стёганая Ткань Из Марселя, . от Французского слова Матля (Matelas), означающее Матрац или Тюфяк или Мат, . Под Пике, от Французского слова Piqué, от Piquer, означающее Простёгивать или Простречивать Материал, понимается шёлковая или хлопчатобумажная ткань с продольными рельефными узкими рубчиками (или выпуклыми геометрическими узорами) на лицевой стороне. Из пике шьют блузки, воротнички, платья и другое. Пике – ткань, вырабатываемая из хлопчатобумажной пряжи или химических волокон комбинированным переплетением, лицевая сторона которой в виде рубчиков или сот. Выпускается в двух вариантах:- гладкошёрстная и набивная. Широко используется в детской одежде. Из пике по традиции шьются классические белые воротнички.

PIRACY = ПИРАТСТВО (или МОРСКОЙ РАЗБОЙ) – Piracy is an assault on a vessel, cargo, crew or passengers at sea by persons owing no allegiance to a recognized flag and acting for personal gain. It also includes acts of rioters who attack a ship from the shore and of passengers who mutiny. This peril, along with war perils, was excluded from the SG policy (short for the Ships And Goods Policy) by the FC&S clause (short for the Free Of Capture And Seizure Clause); to be reinstated if the agreed policy conditions covered war risks. Thus for many years piracy was related to war risks. The 1982 cargo war clauses do not cover piracy, and it is not embraced within the risks covered by the B or C cargo clauses. The 1983 hull clauses incorporate piracy among the risks covered by the standard marine clauses; piracy not being included in the war risks cover (1983). / Разбой – грабёж с насилием. В международном праве под Пиратством, от Греческого слова Peiratēs, означающее Грабитель или Разбойник, понимается незаконный захват, ограбление или потопление торговых или гражданских судов, совершаемые в открытом море частновладельческими или государственными судами. К пиратству приравнивается нападение во время войны кораблей, подводных лодок и военных

самолётов на торговые суда нейтральных стран. нормы международного права по борьбе с пиратством кодифицированы в Женевской Конвенции об Открытом Море 1958 и в Конвенции ООН по Морскому Праву 1982.

PIRN = ШПУЛЯ (или ЦЕВКА, или ПАТРОН, или КАТУШКА, или ПОЧАТОК) – (1) Pirn is the Scotch term for a small spindle used in weaving tweed and kindred fabrics. See also Cop. / В текстильной отрасли под Шпулей понимается разновидность бобин, на которую производится намотка пряжи, прежде чем она попадает в ткачество. Рекомендуется использование фланцев на верхнем и нижнем концах шпули. Под Початком понимается паковка с пряжей или кручёной нитью, намотанной на патрон или шпулю и имеющей форму цилиндра, верхние и нижние основания которого представляют усечённый конус, что позволяет производить сматывание нити с неподвижного початка вдоль его оси.

(2) Pirn is a wood, paper, or plastic support, cylindrical or slightly tapered, with or without a conical base, on which yarn is wound. A wooden bobbin which sets into the shuttle. It has a chase, nose or tapering tip, like a cop, which enables the yarn to come off or unwind easily. A conical shape, over a conical wooden core, into which weft yarn is wound for the loom, mostly in the linen weaving. The yarn is laid parallel. / Уточная Шпуля или Патрон.

(3) Pirn is a bobbin on a spinning wheel. / Бобина на .

(4) Pirn is a British term rarely used in some textile books meaning a paper tube used on a shuttle spindle.

(5) Pirn:- the double-tapered take-up yarn package from drawtwisting of nylon, polyester, and other melt spun yarns. / Найлан^{T3} (Nylon^{TM}).

PIRN BARRÉ = XX БАРЕ – Pirn Barré is a fabric defect consisting of crosswise bars caused by unequal shrinkage of the filling yarn from different points on the original yarn package. / уточной пряжи . Баре (Barré):- (1) порок ткани в виде полосатости по ширине ткани; (2) Щеколда; (3) Запорка; (4) Пруток; (5) Рейка; (6) Штанга; (7) Брус; (8) Планка; (9) Полоса – порок ткани; (10) Гребёнка на трикотажной машине; (11) Скало; (12) Разделённое на полосы по диагонали слева вниз.

PISTIL = ПЕСТИК – Pistil is female organ of flower including stigma, style and ovary. Pistil is the female reproductive organ of a flower consisting of the ovary, style, and stigma. / В ботанике под Пестиком понимается женский орган цветка. Образован одним или несколькими сомкнутыми плодолистиками. Состоит из завязи (ovary), столбика (style) и рыльца (stigma). После опыления и оплодотворения превращается в плод. Иногда пестик считают синонимом Гинецея.

PIT = КОСТОЧКА (ПЛОДА) (или ПОРА, или ЯМКА, или УГЛУБЛЕНИЕ) – Pit is:- (i) a hard inner woody layer of the pericarp of some fruits (e.g., plum, cherry, olive) that contains and protects the seed; (ii) a small pockmark or depression in any structure. Hence pitted – with multiple pits; and (iii) prefixed to a Species name, refers to pitch or resin, e.g., Pittosporum = resinous seed. / перикарпия (околоплодника) некоторых плодов (например,). (ii) маленькая оспина или .

PIT = ЯМА – In 1870 the Chicago Board of Trade (CBOT®) introduced an early version of octagonal trading pit; presented type patented in 1878. The pit is a specific area of the trading floor that is designated for the buying and selling of a particular type of security through the open outcry system. In the pit, brokers match customers' buy and sell orders through shouting and hand signaling. Orders are displayed via the open outcry system to all traders in the pit in order to allow the chance for anybody to participate and to let people compete for the best price. Brokers and dealers trade their clients' orders as well as may place proprietary trades for their firms. Orders that are not executed in the pit are executed through electronic trading. Pits, also called Trading Pits, have an octagon shape with several tiers to improve visibility. Brokers show their brokerage affiliations through their jacket colors and badges. Clerks take orders by phone or computer from customers, and runners transmit orders between the clerks and the brokers. Brokers and dealers may trade their shares and represent themselves, or they may work for firms and trade shares for clients or the proprietary accounts of their firms. Specialists work their own books on the floor of the pit, making a market in securities and keeping a ledger of orders awaiting execution. In the noisy, fast-paced and chaotic environment of the trading pit, hand signals facilitate quick trading and make it possible to be 'heard' above the crowd. For example, when a broker turns his palms toward his head, he is indicating a buy order, and when his palms are facing away from his head, he is indicating a sell order. Although many proponents of the open outcry and pit environments feel that the ability to signal orders openly to a crowd and see the facial expressions of the participants creates additional market transparency, the trend in the last several years has been to move away from the open outcry system and towards electronic trading. Since the late 1980s and early 1990s, many of the world's large exchanges have made the transition. Electronic trading is cheaper to run than the open outcry system. On a commodity exchange, the equivalent of a stock exchange trading floor. It derives from the local nickname for the floor of the Chicago Commodities Exchange. Now, a pit is the floor of any open outcry exchange. The Pit is a raised octagonal structure where open-outcry trading takes place. Operating during regular trading hours (RTH), the CBOT trading floor contains many such pits. The steps up on the outside of the octagon and the steps down on the inside give the pit something of the appearance of an amphitheater, and allow hundreds of traders to see and hear each other during trading hours. The importance of the pit and pit trading is emphasized by the use of a stylized pit as the logo of the CBOT. The Pit is also the title and subject of a classic novel (1903) by American journalist and novelist Frank Norris (Benjamin Franklin 'Frank' Norris Jr.; 1870–1902). Trades are made in the pits by bidding or offering a price and quantity of contracts, depending on the intention to buy (bid) or sell (offer). This is generally done by using a physical representation of a trader's intentions with his hands. If a trader wants to buy ten contracts at a price of eight, for example, in the pit he would yell '8 for 10', stating price before quantity, and turn his palm inward toward his face, putting his index finger to his forehead denoting ten; if he were to be buying one, he would place his index finger on his chin. If the trader wants to sell five contracts at a price of eight, they would yell '5 at 8', stating quantity before price, and show one hand with palm facing outward, showing 5 fingers. The combination of hand-signals and vocal representation between the way a trader expresses bids and offers is a protection against misinterpretation by other market participants. For historical purposes, an illustrated project to record the hand signal language used in CBOT's trading pits has been compiled and published. With the rise of electronic trading the importance of the pit has decreased substantially for many contracts, though the pit remains the best place to get complex option spreads filled. Pit is the location on the trading floor where traders and brokers buy and sell futures or options contracts. Pit is a specially constructed arena on the trading floor of some exchanges where assets are bought and sold by open outcry. Pits are usually raised octagonal platforms with steps descending on the inside that permit buyers and sellers of asset to see each other. On other exchanges, the term Ring designates the trading area for a commodity. / Бэньджемэн Фрэнклын 'Фрэнк' Норис Младший (Benjamin Franklin 'Frank' Norris Jr.; 1870–1902). Яма:- специально сконструированная арена на торговом полу некоторых бирж, где посредством открытого оглашения покупаются и продаются активы. В 1870 Чикагская Палата Торговли (Чикагское Табло Торговли, если быть более точными; СИБАТ® (CBOT®)) представило раннюю версию восьмиугольной ямы для торговли. Специально сконструированная арена в операционном зале биржи в Чикаго, где происходит торговля товарами, ценными бумагами, валютой или индексами, в целом похожая на яму. Яма имеет восьмиугольную форму со ступеньками, ведущими вниз к центру. Вокруг ямы расположены кабинки для брокеров, в которых находятся средства связи. Торговцы стоят на разных ступеньках, что обозначает месяц контракта, которыми они торгуют. В центре или у края ямы имеется возвышение, на

котором сидят служащие биржи, регистрирующие сделки и цены. Для Нью Йоркских бирж смотрите Пол или Фло (Floor), Ринг (Ring). Яма – участок помещения биржи, пол которого находится на более низком уровне, чем пол всего торгового зала. Яма представляет собой место, где разрешено заключать биржевые сделки членам биржи, это место называют также Биржевым Кольцом, Рингом и Полом. Вокруг ямы расположены кабинки для брокеров, в которых находятся средства связи. В центре или у края ямы имеется возвышение, на котором сидят служащие биржи, регистрирующие сделки и цены. Яма – площадка в торговом зале биржи, где происходит торговля срочными контрактами.

PITAHAYA = ПИТААЙА – Pitahaya is edible fruit from several Species of Cactaceae (e.g., Hylocereus Polyrhizus, Hylocereus Undulatus, Stenocereus Queretaroensis, Acanthocereus Sp.) is commonly called Pitahaya, Pitajaya, Pitaya. The fruit of all Cacti is safe to eat, avoiding spines, glochids and tiny hairs present on fruit of some Species, but only a few Species have any culinary merit. Fruit of Acanthocereus Species is said to have diuretic properties. Cactus fruit is farmed and exported from several countries including Colombia, Honduras, Palestine, Mexico and Nicaragua and is sometimes available in European and US supermarkets. / нескольких Видов Кактусовых (Cactaceae), например, .

PIT BROKER = БРОКЕР В ЯМЕ – A Pit Broker, also known as a Floor Broker (FB), is an employee of a brokerage firm whose job is executing orders on the floor of a stock or commodity exchange on behalf of clients. How It Works/Example:- a pit broker receives an order from a client through the brokerage firm and trades the security with other brokers on the exchange floor. Based on interactions on the exchange floor with specialists in the specific securities being traded and bidding with other brokers or traders, the pit broker attempts to get the most competitive market rates available for his or her client. When the pit broker executes a transaction on behalf of the client, he or she notifies the client through the client's registered representative at the brokerage firm. A pit broker is different than a 'Floor Trader' who, although he or she also works on the floor of the exchange, makes trades as a principal for his or her own account. However, at times, pit brokers also handle large volume trades on behalf of floor traders. The pit broker is licensed by the relevant state authority and the US Securities and Exchange Commission (SEC); The pit broker receives a fee for each securities trade. Why It Matters:- pit brokers are agents for investor clients, giving them the closest access possible to the exchange floor. Pit brokers are responsible for assessing market information, prices, competition, and using this information, making the best possible trades for their clients. See also Floor Broker. / Брокер в торговом зале, торгующий фьючерсными контрактами в яме.

PITCH = ЗАСМОЛОК – Pitch is the accumulation of resin in wood. / Скопление смолы в древесине. Под Засмолком понимается порок древесины хвойных пород в виде участка ствола, обильно пропитанного смолой. В круглых лесоматериалах обнаруживается по наличию ран и скоплению смолы. В пилопродукции, деталях и шпоне просмоленные участки значительно темнее окружающей их нормальной древесины и просвечивают в тонких материалах. Засмолок измеряют:- (i) по ширине и длине зоны, занятой пороком; если это обусловлено спецификой сортимента, допускается измерять один из указанных параметров; и (ii) по площади зоны, занятой пороком, в процентах от площади соответствующих сторон сортимента.

PITCH = СМОЛА (или ЗАМАЗКА, или ХХ) – Pitch (maritime term):- a tar substance obtained from the Pine Tree and used in paying the seams of a vessel. Motion of vessel.

PITCH = ШАГ (или ХОД, или ПЛОТНОСТЬ, или ПОДЪЁМ, или ТОЧКА ПРОЙМЫ) – Pitch:- in pile floor covering, the average number of pile ends per inch in the fillingwise direction. / Среднее число кисточек ворса на единицу длины по уточине.

PITCHING = КИЛЕВАЯ КАЧКА (или ТАНГАЖ) – Pitching:- movements of a ship around its transverse axis. / Движения судна вокруг своей поперечной оси. Под Тангажем, от Французского слова Tangage, понимается угловое движение судна или летательного аппарата, например, самолёта, относительно главной поперечной (горизонтальной) оси инерции. Угол тангажа – угол между продольной осью летательного аппарата и горизонтальной плоскостью. Под Качкой судна понимаются колебания судна под воздействием внешних сил (ветра и волн). Различают бортовую качку (угловые наклонения на правый и левый борт), килевую качку (угловые наклонения на нос и корму) и вертикальную качку (периодические перемещения судна по вертикали). Качка отрицательно сказывается на работе судовых механизмов и приборов, ходкости судна, сохранности грузов, эффективности боевых средств и на самочувствии экипажа. На период и амплитуду качки влияют размеры и соотношения главных размерений судна, форма обводов (очертаний наружной поверхности корпуса) судна и распределение на нём грузов. Для уменьшения амплитуды качки применяют успокоители качки.

PITCH LINE = ДЕЛИТЕЛЬНАЯ ЛИНИЯ – Pitch Line is an imaginary line that divides the upper and lower halves of gear teeth while in the contact area. See also Gear. / верхнюю и нижнюю половины передаточного зуба . Смотрите также (Зубчатая) Передача (Gear).

PITCH POCKET = СМОЛЯНОЙ КАРМАШЕК – Pitch Pocket is an opening between growth rings which usually contains or has contained resin or bark or both. / Расщелина между кольцами роста, которая, как правило, содержит или заполнена смолой или корой или и тем и другим. Кармашком или, так называемым Смоляным Кармашком, является порок древесины в виде полости внутри или между годичных слоёв, заполненной смолой или камедями (смолоподобными водорастворимыми веществами). Он наблюдается на тангентальных поверхностях, в виде овальных плоских углублений, на радиальных поверхностях – в виде узких продольных щелей, на торцах – в виде коротких дугообразных полостей. На пиломатериалах и деталях может проявляться как:- (i) односторонний кармашек – кармашек, выходящий на одну или две смежные стороны пилопродукции или детали; и (ii) сквозной кармашек – кармашек, выходящий на две противоположные стороны пилопродукции или детали. Кармашки измеряют по глубине, ширине и длине и учитывают по количеству в штуках на 1 метр длины или на всю сторону сортимента.

PITH = ЯДРО (или СЕРДЦЕВИНА) – Pith is a usually continuous central core of predominantly parenchymatous tissue that occurs in the stem of most vascular plants and some roots as part of the primary tissue system. Typically surrounded by vascular tissue, probably functions chiefly in storage, and may disappear leaving a void in some plants. The small cylinder of primary tissue of a tree stem around which the annual rings form. See also Heartwood. / Обычно Сердцевина является и некоторые корни в качестве органа . Маленький цилиндр первичной ткани стебля дерева вокруг которого формируются годичные кольца. Смотрите также Сердцевинная Древесина или Сердцевина (Heartwood). В ботанике под Сердцевиной понимается центральная часть стебля или корня, занятая рыхлой паренхимной тканью, в которой откладывается дубящие вещества, крахмал, масла. Кнаружи от сердцевины расположена древесина.

PITH = ХХ (или СЕРДЦЕВИНА) – Pith is the helmet topee or a lightweight helmet-shaped hat made of pith or cork.

PITI = PRINCIPAL, INTEREST, TAXES, AND INSURANCE

PITTING = ПИТТИНГ (или ВЫКРАШИВАНИЕ) – Pitting is a form of extremely localized attack characterized by holes in the metal. Pitting is one of the most destructive and insidious forms of corrosion. Depending on the environment and the material, a pit may take

months, or even years, to become visible. Pitting (maritime term):- areas of corrosion. / Выкрашивание – образование ямок на поверхности трения в результате отделения частиц материала при усталостном износе.

PIVOT POINT = ОПОРНАЯ ТОЧКА – Pivot Point is the point at which resistance disintegrates and the stock price begins to rise past the prior resistance level. This point can be considered the optimal time to buy as the bulls are gaining strength. A hypothetical turning point in prices or change in direction. The pivot itself can be used as somewhat of a test price for the short-term trend. Pivot Point:- a key market metric for professional stock traders is the level at which price reacts and moves swiftly to either the upside or downside. Sometimes referred to as Support And Resistance, these levels aren't constructed by magic. Often, they are based off a previous sequence of significant price highs or lows. However, another tried-and-true method for identifying these key areas of acceleration and capitulation is the pivot point and its associated support and resistance levels. All technical day and swing traders in the stock market should understand how to calculate, interpret and trade with pivot points. The Pivot Point is simply a level at which the market chooses direction. Of course, we prefer to know these points beforehand; therefore, methods have been developed that calculate a day's likely pivot points based on prior price action. There are variations to pivot point calculations. The most popular uses the average of the previous day's high, low and close to derive a series of price points. The support and resistance levels that are calculated from these points indicate potential trading ranges for the next trading session. These are known as Pivot Levels. The most straightforward of these five levels is the pivot average itself. It is known as P, and is simply the sum of the previous day's high, low and close divided by three. On the support side, there are S_1 and S_2. On the resistance side, there are R_1 and R_2. In the following equations, H is the previous day's high and L is the previous day's low:- (i) $S_1 = (P \times 2) – H$; (ii) $S_2 = P – (H – L)$; (iii) $R_1 = (P \times 2) – L$; and (iv) $R_2 = P + (H – L)$. As you can see from the equations, the first resistance and support levels are calculated using the difference between the pivot point and the previous day's high or low. The second resistance and support levels are based on the entire width of the previous day's trading range. In addition, many traders also reference a third order extension of the support and resistance levels. These formulas are:- (i) $S_3 = L – 2 \times (H – P)$; and (ii) $R_3 = H + 2 \times (P – L)$. It is rare for a stock or index to hit its daily R_3 or S_3 levels. If a market rallies to R_2 or sells off to S_2, this often ends up being high or low of the day. This is usually the safe choice, and keeping this tendency in mind will help temper your emotions when markets start to move quickly. The most important level is the pivot level itself. It is the level above or below which price is expected to advance toward R_1 or S_1. Although pivot points and levels most often are calculated for a day's session, they also are used on an hourly basis. In another application, many traders apply the daily pivots on hourly, 30-minute, 15-minute and five-minute charts. The theory behind this use is that the daily pivots are more reliable than pivots derived from shorter time frames, which are less accurate and significant. Trading Strategy:- with the assumption that the pivot is the trend-deciding level for a particular day, we can formulate some basic rules for trading with pivots:- (i) if the stock trades above the pivot point, then the bias for the day is long. Look to buy. (ii) If the stock trades below the pivot point, then the bias for the day is short. Look to sell. (iii) If the market opens, gaps up or gaps down and trades near R_2/R_3 or S_2/S_3, it will exhibit a tendency to trade back toward the pivot. Understanding this will help you avoid buying the high or selling the low. (iv) If either S_1 or R_1 is penetrated, these breakout points will reverse their roles. That is, the first support, S_1, becomes the new resistance, R_1. While this, or any one-dimensional strategy, is not recommended as a standalone trading approach, we can present it here as such to demonstrate the application of the logic. To that end, let's walk through some trading examples, first with the S&P 500 stock index and then with individual stocks. For the index, we'll use December 08, 2011, as our sample date. To start our analysis, we back up one day to December 07 when the S&P 500 registered the following:- High of 1 267.06; low of 1 248.0; close of 1 261.01. Using the pivot formulas, this gives the following pivot levels:- P = 1 258.7; R_1 = 1 269.4, S_1 = 1 250.3; R_2 = 1 277.8, S_2 = 1 239.6; and R_3 = 1 288.4, S_3 = 1 231.3. 'Target levels' shows a five-minute chart of the S&P 500 on December 08 and demonstrates how we could have traded using these levels. The market opened at 1 260.87 and immediately traded lower. As per our pivot strategy, we take a short trade below pivot at 1 257.60, placing a stop at two points, or 1 259.60. The first target for the trade is S_1, or 1 248.20. At this level, we either could book profit or trail the position by dropping our stop. The second target for the trade is S_2, or 1 235.40. At this level, a trader should book full profit. In this case, the pivot strategy worked quite well. The low made by the S&P 500 on December 08 was 1 234.35. Not only can pivot points be used to find profitable breakout trades, but they can be used to trigger successful long and short trades in the same day. Often, the best trading tools are the simplest, and pivot points qualify. They are handy tools for day traders to predict potential market turning points. That said, as with most indicators, pivots never should be used in isolation, but with a combination of complementary tools, such as candlestick charts, MACD and stochastics. / Эс.Энд.Пи. 500 (S&P 500). В техническом анализе биржевых рынков, . Гипотетическая точка разворота цен или направления движения цен. Сама по себе она может быть использована в качестве пробной цены для краткосрочной тенденции.

PJM = PJM INTERCONNECTION LLC = PENNSYLVANIA NEW JERSEY MARYLAND INTERCONNECTION LLC

PJM MEMBER = УЧАСТНИК ПИ.ДЬЖЕЙ.ЭМ. (или ЧЛЕН ПИ.ДЬЖЕЙ.ЭМ.) – PJM Member:- in the United States, any entity that has completed an application and satisfies the requirements of PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC) to conduct business with the PJM Office of the Interconnection, including transmission owners, generating entities, load-serving entities and marketers. / Пи.Дьжей.Эм. PL 664 = ПИ.ЭЛ. 664 – PL 664 mandates that 50 percent of government impelled cargoes be carried under US flag.

PLACARD = ПЛАКАТ (или НАКЛЕЙКА, или ЯРЛЫК) – Placards are, in accordance with the dangerous goods stipulations of the IMDG code (short for the International Maritime Dangerous Goods Code), adhesive placards that indicate to all parties concerned what type of dangerous goods are being transported. They differ from labels in terms of size, although labels have the same purpose. Placards of at least 25 x 25 cm must be attached to the outside of the container or vehicle. Labels of a size of 10 x 10 cm must be attached to each package to be transported. Placards are large hazard labels used on vehicles/tanks. / Ярлыками называются наклейки на вещи, товаре с указанием их названия, количества, предприятия и так далее.

PLACEMAT = ПОДЛОЖКА – Placemat is a piece of cloth or other material (often foam-backed plastic) placed on a table between the table and the place setting to protect the table and to decorate it during meals. Placemats are available in a variety of sizes, shapes, and colors. A Placemat or Table Mat is a protective table pad usually made of paper, plastic or cloth for restaurants and households. Asian-style placemats may feature thin slats of bamboo or colorful beads. The term is derived from the mat being put at a person's 'place' (chair) at a table. Uses:- their primary function is to protect the dinner table from water marks, food stains or heat damage. They also serve as decoration, especially placemats made from lace or silk. In restaurants they can be used to advertise menu items, specials, and local businesses. They may also have games for children. Higher end placemats, made from vinyl or leather, are used by hotels and organizations for meetings as they provide a writing surface, and give an area on which to lean comfortably and to place objects on the table with minimal noise during meetings. Contemporary opinion on the usefulness of placemats is mixed. Cloth placemats are commonly considered to be unnecessary and require excessive upkeep – compared to the surface of a table which can be easily cleaned, a stained placemat must be run through the washer and drier before it can be used again. Moreover, paper and plastic placemats have drawn criticism on environmental and aesthetic grounds. / бисеринки бусинки (beads).

PLACEMENT = РАЗМЕЩЕНИЕ – (1) Placement is a process of issuing shares through an intermediary, usually a stockbroker or syndicate. The intermediary places the shares with clients, frequently institutional investors, or with members of the public. In the United Kingdom, a certain proportion of any share issue quoted on the London Stock Exchange must be made available to the public through the exchange. An allotment of shares, debentures, etc made directly from the company to investors, rather than through the medium of a general cash issue. The sale (Placement) of securities on the exchange or directly to a group of investors. In an initial public offering, the securities are usually taken up completely by a syndicate of banks and subsequently sold on the market. The bank receives a fee for the risk that not all of the securities may be sold. A placement is usually said to be successful when the market has taken up most of the securities.

(2) Placement or Placement Of Cover:- where a broker effects an insurance or reinsurance contract with underwriters on behalf of its client.

PLACEMENT FEE = ВОЗНАГРАЖДЕНИЕ ЗА РАЗМЕЩЕНИЕ – A Placement Fee is a type of commission paid by the issuer to a bank for the placement of securities.

PLACEMENT ON COMMISSION = РАЗМЕЩЕНИЕ ЗА КОМИССИЮ – Placement On Commission:- the issuing of securities by the borrower (debtor) himself at his own risk. The banks act as subscription-receiving offices and obtain a placement commission for any subscriptions effected through their good offices. See also Firm Underwriting.

PLACEMENT PROCEDURE = ПРОЦЕДУРА РАЗМЕЩЕНИЯ – Placement Procedure is a procedure in the placement of securities. The most important placement procedures include bookbuilding, price fixing, private placement, auction procedure.

PLACENTATION = ПЛАЦЕНТАЦИЯ – Placentation is arrangement and attachment of ovules in the ovary. / Под Плацентой, от Латинского слова Placenta, означающее Детское Место, понимается:- (i) орган, осуществляющий связь и обмен веществ между организмом матери и зародышем в период внутриутробного развития. Выполняет также гормональную и защитную функции. После рождения плода плацента вместе с оболочками и пуповиной выделяется из матки. (ii) У цветковых растений –

вырост внутри завязи (ovary), несущий семезачаток (ovule); у папоротниковых – выступ, несущий спорангии. Через плаценту осуществляется связь зародыша с материнским растением.

PLACE OF DELIVERY = МЕСТО ПОСТАВКИ – Place Of Delivery means the place at which the carrier has contracted to deliver the goods, when such place is other than the port of discharge. Place where cargo leaves the care and custody of carrier. The location where a shipment is delivered to the consignee; the place where carrier's liability for the transport ceases.

PLACE OF JURISDICTION = МЕСТО ЮРИСДИКЦИИ (или МЕСТО СУДОПРОИЗВОДСТВА) – Place Of Jurisdiction is a place where a court or a judge has the power (competence) to hear and decide a case. The territorial limits within which legal authority may be exercised. In their contracts, agreements and forms, banks normally stipulate their domicile as place of jurisdiction.

PLACE OF PERFORMANCE = МЕСТО ИСПОЛНЕНИЯ – Place Of Performance is the place where the debtor is to fulfill his obligation to pay. / Место, где должник должен исполнить своё обязательство по оплате.

PLACE OF PRODUCTION = МЕСТО ПРОИЗВОДСТВА – Place Of Production is any premises or collection of fields operated as a single production or farming unit. This may include production sites which are separately managed for phytosanitary purposes.

PLACE OF RECEIPT = МЕСТО ПОЛУЧЕНИЯ (или МЕСТО ПРИЁМКИ) – Place Of Receipt means the place at which the carrier has contracted to receive the goods, when such place is other than the port of loading. Location where cargo enters the care and custody of carrier. The location where a shipment is received by the carrier from the shipper; the place where carrier's liability for the transport commences.

PLACING BROKER = РАЗМЕЩАЮЩИЙ БРОКЕР – Placing Broker:- this term may refer to an individual broker or a broking firm that places cover directly with one or more underwriters. / Этот термин может относиться к самостоятельному брокеру или брокерской фирме, которая непосредственно размещает покрытие у одного или более расписчиков (андеррайтеров).

PLACINGS = РАЗМЕЩЕНИЯ – Placings:- security issued to raise new capital in a placement. Stockbrokers acting on behalf of the company concerned place shares by selling them to financial institutions and to the public. Also known as Placement. Issues of new shares that are privately placed with larger institutions, or new issues for which larger institutions are given preference. Not generally offered to the public.

PLACING/SELECTIVE MARKETING = РАЗМЕЩЕНИЕ/ИЗБИРАТЕЛЬНОЕ ХОЗЯЙСТВОВАНИЕ (или ХХ) – Placing/Selective Marketing is a new issue method where shares are placed with institutional clients of the issuing house rather than being offered to the public. Costs are low, as no underwriting is needed.

PLACKET = ХХ (или ПАТА, или ПЛАНКА, или РАЗРЕЗ В ЮБКЕ, или НИЖНЯЯ ЮБКА) – Placket:- multiple layers of fabric that are used to attach buttons to button holes, which in turn creates the opening and closer for shirts.

PLAID = ПЛЭД (или ПЛЕД, или КЛЕТЧАТЫЙ, или ШОТЛАНДКА) – Plaid is a cloth made with alternating stripes and bands of color woven into or dyed onto the fabric. This makes blocks of color that repeat vertically and horizontally in a pattern of squares and lines. Plaid is a pattern consisting of colored bars or stripes which cross each other at right angles, comparable with a Scottish tartan. Plaid is a twilled woolen fabric with a tartan pattern; a fabric with a pattern of tartan or an imitation of tartan. A rectangular length of tartan worn over the left shoulder as part of the Scottish national costume. / Под Пледом понимается:- (1) клетчатая толстая шерстяная шаль с бахромой, характерная принадлежность Шотландского национального костюма. (2) Плотное шерстяное или полушерстяное покрывало; используется как дорожное одеяло и тому подобное. Под Шотландкой понимается хлопчатобумажная ткань (часто с вискозными нитями), шерстяная или шёлковая ткань с рисунком в клетку. Шьют женское или детское платье, мужские сорочки. Шотландка – ткань, вырабатываемая из хлопчатобумажной, шерстяной пряжи, различных химических нитей саржевым переплетением с рисунком в крупную клетку, типичным для тканей национальной Шотландской одежды. Шотландку используют для пошива платьев и верхних мужских сорочек.

PLAIN = ПОЛОТНО – Plain is a broad term for cottons made with average or ordinary yarn; fabric is always plain woven.

PLAIN BEARING = ПОДШИПНИК СКОЛЬЖЕНИЯ – Plain Bearing is a relatively simple and inexpensive bearing typically made of two parts. A rotary plain bearing can be just a shaft running through a hole. A simple linear bearing can be a pair of flat surfaces designed to allow motion. See also Bearing. / Подшипник Скольжения – подшипник, в котором видом относительного движения является скольжение. Подшипник Скольжения, опора или направляющая механизма или машины, в которой трение происходит при скольжении сопряжённых поверхностей. По направлению восприятия нагрузки различают радиальные и осевые (упорные) подшипники скольжения. В зависимости от режима смазки подшипники скольжения делятся на гидродинамические и гидростатические, газодинамические и газостатические (роль смазки выполняет воздух или нейтральный газ), с твёрдой смазкой. Существует множество конструктивных типов подшипник скольжения:- самоустанавливающиеся, сегментные, самосмазывающиеся и другие. Радиальные подшипники скольжения обычно выполняются в виде втулки, двух или более вкладышей, полностью или частично охватывающих вал. Такие подшипники скольжения работают главным образом в режиме жидкостного или полужидкостного трения. Смазка подводится через отверстия во вкладышах, кольцевые или местные винтовые канавки и карманы, находящиеся в зоне разъёма. Радиальные подшипники скольжения применяются в буксовых узлах вагонов, в опорах двигателей внутреннего сгорания, турбогенераторов и другого. Подшипники скольжения тяжело нагруженных опор (например, валков прокатных станов) имеют диаметры от 140 до 1 200 мм, относительный зазор, то есть отношение разности диаметров отверстия втулки и шейки вала к диаметру отверстия втулки (D – d) / D, принимается равным 0.000 3–0.002, а отношение L / D равным 0.6–0.9; где F – радиальная нагрузка, D – внутренний диаметр вкладыша, d – диаметр шейки вала, и L – ширина вкладыша. При этих условиях обеспечивается работа в диапазонах относительных скоростей скольжения от 0.2 до 60 м/сек и удельных давлений 5–25 МН/м^2 (50–250 кгс/см^2). В форсированных двигателях внутреннего сгорания удельные давления на подшипники скольжения могут достигать 30–35 МН/м^2 (300–350 кгс/см^2). Высокоскоростные подшипники скольжения жидкостного трения выполняются с жёсткими вкладышами или самоустанавливающимися в виде качающихся, свободных и кольцеобразных 'плавающих' вкладышей. Осевыми подшипниками скольжения являются простые Подпятники, сегментные упорные подшипники; по характеру работы к ним относят также торцовые уплотнения, ползуны и крейцкопфы. Сегментный упорный подшипник скольжения состоит из неподвижных или качающихся опорных подушек, образованных набором секторов, и упорного диска или кольца на вращающемся валу. Подушки имеют небольшой наклон к плоскости упорного диска. Способность самоустанавливаться обеспечивается пружинами, качающимися опорами, гидравлической системой или упругим деформированием. Упорные подшипники скольжения широко используются в опорах турбо- и гидрогенераторов. В подшипниках скольжения крупных гидрогенераторов диаметр диска может достигать 4.5 м и нести нагрузку до 4 000 тс. Гидро- и газодинамические подшипники работают в режиме, при котором поверхности трения разделяются слоем жидкости или газа в результате действия давления, возникающего в вязком смазочном слое вследствие относительного движения поверхностей.

В гидро- и газостатическом подшипнике скольжения полное разделение поверхностей трения деталей, находящихся в относительном движении или покое, осуществляется смазочным материалом, поступающим под внешним давлением в зазор между поверхностями. Существуют также подшипники скольжения, называемые гидростатодинамическими, которые часть времени, например, при пуске, работают как гидростатические, а в основном режиме – как гидродинамические. Расчёт подшипников скольжения, работающих в режиме разделения поверхностей трения смазочным слоем, производится на основе гидродинамической теории смазки. При расчёте определяются минимальная толщина смазочного слоя (обычно измеряемая в мкм), давление в смазочном слое, температура и расход смазочных материалов. Изготовляют подшипники скольжения из металлических и неметаллических подшипниковых антифрикционных материалов.

PLAIN EDGE (BLUFF EDGE) = РОВНЫЙ КРАЙ (КРАЙ С ПОЛНЫМИ ОБВОДАМИ (или КРАЙ С ТУПЫМИ ОБВОДАМИ)) – Plain Edge (Bluff Edge):- a construction in which the edges of the garment are not stitched.

PLAIN–KNIT FABRIC = ГЛАДКАЯ ВЯЗАНАЯ ТКАНЬ (или КУЛИРНАЯ ГЛАДЬ) – Plain-Knit Fabric:- if a weft knitted fabric has one side consisting only of face stitches, and the opposite side consisting of back stitches, then it is described as a Plain Knitted Fabric. It is also frequently referred to as a Single Jersey Fabric (Single Fabric). Plain knitted fabrics are produced by using one linear array of needles. As such all the stitches are meshed in one direction. These fabrics tend to roll at their edges. They roll from their technical back towards the technical front at the top and lower edges. They also roll from their technical front towards the technical back at their selvedges (the self-finished left and right-hand edges of the fabric). The structure is extensible in both lateral and longitudinal directions, but the lateral extension is approximately twice that of the longitudinal extension. See also Flat-Knit Fabric. Plain Knit is the simplest knitted construction, consisting of vertical ribs visible on the front of the fabric and horizontal rows of stitches visible on the back, used in the production of hosiery and Jersey fabrics. Also called Flat Knit.

PLAIN NAIL = РОВНЫЙ ГВОЗДЬ (или ПРОСТОЙ ГВОЗДЬ) – Plain Nail is a nail which is smooth and undeformed between head and point. See also Pallet. / Простой Гвоздь (Plain Nail):- гвоздь, имеющий гладкий и недеформированный стержень между головкой и остриём. Смотрите также Поддон (Pallet).

PLAIN SAWING = ПРЯМАЯ РАСПИЛОВКА – Plain Sawing:- lumber is obtained by making the first saw cut on a tangent to the circumference of the log and remaining cuts parallel to the first; creating the familiar ‘flame-shaped’ or ‘cathedral’ pattern. This method is the most economical, because it provides the widest boards and results in the least waste. Plain-sawn lumber will expand and contract more than boards sawn by other methods. However, it performs just as well when properly kiln-dried, when the job site is properly prepared and when the wood is acclimated to the workshop and home environment. / В деревообработке под Распиловкой или Распиливанием понимается процесс последовательного раскроя пилами стволов на круглые сортименты (брёвна, кряжи), брёвен на пиломатериалы и пиломатериалов на заготовки. Различают распиловку:- относительно направления древесных волокон – продольную и поперечную, относительно годичных слоёв – тангенциальную (по касательной к годичным слоям) и радиальную. При раскрое брёвен на брусья и доски различают:- распиловку вразвал, при которой вначале формируется толщина обрезных досок, а затем их ширина; распиловка с брусовкой, при которой бревно раскраивается на двухкантный брус по высоте, соответствующий ширине обрезных досок, и боковые доски заданной толщины, а затем брус раскраивается на доски нужной толщины, а боковые доски обрезаются по ширине. Для выработки досок тангенциальным или радиальным пропилами распиловку производят специальными способами (развально-сегментным, брусово-сегментным, секторным). Пиломатериал Тангентальной Распиловки – это пиломатериал, полученный ориентированной распиловкой круглых лесоматериалов с преимущественным направлением пропилов по касательной к годичным слоям древесины (ГОСТ).

PLAIN SAWN = ПРЯМО РАСПИЛЕННОЕ – Plain Sawn:- the most common cut. Contains more variation due as the growth rings are more conspicuous.

PLAIN VANILLA INSTRUMENT = ЯВНО ВЫРАЖЕННЫЙ ТИПОВОЙ ИНСТРУМЕНТ (или ЯВНО ВЫРАЖЕННЫЙ ВАНИЛЬНЫЙ ИНСТРУМЕНТ) – ‘Plain Vanilla’ Instrument:- in each market risk category OTC (short for the Over-The-Counter) derivatives were broken down by three types of ‘Plain Vanilla’ Instrument (forwards, swaps and options). Plain vanilla instruments were defined as instruments which are traded in generally liquid markets according to more or less standardized contracts and market conventions. If a transaction was composed of several plain vanilla components, each part was, if possible, to be reported separately. In addition, there was a separate category for other products. This category included in principle transactions with a variable notional principal amount or contract features which act to multiply leverage. Furthermore, deals where a breakdown into individual plain vanilla components was impractical or impossible were also classified as other products. See also Vanilla. / В дословном переводе Явно Выраженный Ванильный Инструмент на Англоязычном жаргоне биржевых дельцов относится к термину Явно Выраженный Типовой Инструмент.

PLAIN VANILLA TRANSACTIONS = ЯВНО ВЫРАЖЕННЫЕ ВАНИЛЬНЫЕ ТРАНЗАКЦИИ (или ЯВНО ВЫРАЖЕННЫЕ ТИПОВЫЕ ОПЕРАЦИИ) – Plain Vanilla Transactions are the most common and generally the simplest types of derivatives transaction. Plain vanilla is a relative concept, and no precise list of plain vanilla transactions exists. Transactions that have unusual or less common features are often called Exotic or Structured. / В дословном переводе Явно Выраженные Ванильные Операции на Англоязычном жаргоне биржевых дельцов относятся к термину Явно Выраженные Типовые Операции.

PLAIN WEAVE = ПОЛОТНЯНОЕ ПЕРЕПЛЕТЕНИЕ – Plain Weave is a basic style of weaves, which have the weft and warp threads interwined in an alternate way to produce a checkerboard effect. It is also known as one-up-one-down weave or over and under pattern. Plain weave is the simplest and most common interlacing of warp and weft. In this, the warp and weft are of equal tension and spacing and it is equally visible on the surface. Characteristics of Plain Weave:- (i) it is snag resistant; (ii) it wrinkles; and (iii) it has lower tear strength. Plain Weave is one of the three fundamental weaves:- plain, satin, and twill. Each filling yarn passes successively over and under each warp yarn, alternating each row. Plain, or Tabby, Weave, the simplest and most common of all weaves, requires only two harnessses and has two warp and weft yarns in each weave unit. To produce it, the warp yarns are held parallel under tension while a crosswise weft yarn isshot over and under alternate warps across the width of the web. The weave unit is completed at the end of the second row, when the weft has been inserted over and under the opposite set of warps, thus locking the previous weft in place. Fabric length is increased with the insertion of each succeeding weft yarn. When warp and weft yarns are approximately equal in size and quantity, the finished fabric is balanced and potentially stronger than cloth made of the same kind and number of warp and weft yarns in any other basic weave. Tabby woven with different-sized warp and weft yarns results in such fabrics as taffeta and poplin, in which many fine warps are interlaced with proportionately fewer thick weft yarns to form cloths with crosswise ridges or ribs. The term extended tabby describes any weave in which two or more warps or wefts, or both, are interlaced as a unit. The group includes fabrics with basketry effects and fabrics with ribs formed by groups of warps or wefts in each shed. Tapestry weave is a tabby in which a variety of colored weft yarns is interlaced with the warp to form patterns. It is usually an unbalanced weave, with wefts completely covering a proportionately low number of warps. These cloths are sturdy and compact. Although they are flat and generally do not drape well, they have been used for centuries to make ceremonial and decorative dress and costumes. Plain Weave is a basic weave,

utilizing a simple alternate interlacing of warp and filling yarns. Any type of yarn made from any type of fiber can be manufactured into a plain weave fabric. See also Sateen Weave, Satin Weave, Twill Weave, and Weave. The Plain Weave consists of yarns interlaced in an alternating fashion, one over and one under every other yarn. The plain weave provides good fabric stability. Plain Weave, the best known and most basic form of weaving, is made by passing the filling thread over and under one warp thread in alternating rows. Plain Weave is made by weaving one weft yarn over and under each warp yarn, alternating each row. It is the most common type of weave. / Каждая уточная пряжа . Полотняное Переплетение характеризуется тем, что с каждой основной нитью переплетается уточная и перекрытия располагаются в шахматном порядке. Таким образом, ткани полотняного переплетения имеют с лицевой и изнаночной стороны одинаковое число основных и уточных перекрытий, то есть являются двухлицевыми тканями. Полотняное переплетение при прочих равных условиях позволяет вырабатывать наиболее прочные ткани, так как оно обеспечивает наибольшее число связей между нитями основы и утка. Полотняное переплетение широко применяется во всех отраслях текстильной промышленности. В хлопчатобумажной промышленности этим переплетением вырабатывают большое количество бельевых, одёжных, платьевых и рубашечных тканей (это ткани типа батиста, бязи, майи, миткаля, шифона и другие); в льняной – ткани бытового и технического назначения (брезенты, полотно, холст и другие); в шерстяной – различные суконные ткани. В шёлковой промышленности полотняным переплетением вырабатывается ткань сравнительно ограниченного числа артикулов. Это ткани из химических волокон и натурального шёлка типа крепдешина, маркизета, полотна, поплина. Полотняное Переплетение это самое простое и самое распространённое переплетение, применяемое во всех отраслях текстильной промышленности. Отсюда множество названий этого переплетения:- миткалевое, гроденаплевое, гарнитуровое (хлопчатобумажное производство), полотняное (льняное), суконное (шерстяное), тафтяное (шёлковое). Полотняным переплетением вырабатываются и батист, и мешковина, марля и перкаль, тончайшие шёлковые ткани и сукно. Раппорт полотняного переплетения равен двум нитям. Нити основы и утка переплетаются между собой через нить, что придаёт ткани большую прочность. В результате такого переплетения внешний вид ткани напоминает рисунок шахматной доски. Ткань этого переплетения может быть выработана на двух ремизках с помощью любого зевообразовательного механизма. Если толщина нитей основы в ткани составляет 17–25 текс и плотность ткани по основе более 20 нитей на см, ткань целесообразно вырабатывать на 4 ремизках рассыпной (амальгамной) проборкой, а если основа ещё плотней, то на 6 ремизках. Рассыпная проборка позволяет вырабатывать плотные ткани на том же зевообразовательном механизме, что и менее плотные. Ремизки разделяют на две группы и управляют ими как двумя ремизками. Для выработки кромки при полотняном переплетении не требуются дополнительные ремизки. Кромочные нити пробираются по две в галево тех же ремизок, что и фоновые. Для проборки бёрдо применимо правило:- чем меньше нитей основы пробирают в зуб бёрда, тем лучше внешний вид вырабатываемой ткани. Однако, применение бёрда с плотным расположением зубьев технологически затруднено, поэтому в большинстве случаев применяется проборка по 2 нити в зуб бёрда для фона и 4 нити в зуб для кромки. Внешний вид тканей полотняного переплетения можно изменить. Вариационные возможности в полотняном переплетении заключаются в выборе вида нитей (разной толщины, разного направления крутки или разных цветов), расстояний между нитями (P_o и P_y). Например, при плотности основы в 2 раза превышающей плотность по утку, на поверхности ткани будут видны только основные перекрытия, образующие рубчик поперёк ткани. И наоборот. В хлопчатобумажной промышленности полотняное переплетение используется для выработки бельевых, плательных, рубашечных, одёжных и технических тканей. Из бельевых можно назвать миткаль, бязь, шифон и нансук. Миткаль широко используется в крашенном и набивном виде (ситец). К плательным тканям относятся фланель, эскимо, гарус, поплин, эпонж, тафта; к рубашечным – трувиль, лионез, зефир, кретон, туальденор и другие характерной особенностью большинства перечисленных тканей является то, что основа у них толще утка и прочность по основе значительно превышает прочность ткани по утку.

PLAIN WOOL = РОВНАЯ (или РАВНИННАЯ, или ГЛАДКАЯ, или ОДНОЦВЕТНАЯ) ШЕРСТЬ – Plain Wool is a wool lacking character with few crimps.

PLAIT = ВЫВИТЬ (или СПЛЕТАТЬ) – Plait (maritime term):- to braid; used with small stuff.

PLAITED FABRIC = СПЛЕТЁННАЯ ТКАНЬ – Plaited Fabric:- in woven fabrics:- a narrow fabric made by crossing a number of sturdy yarns diagonally, so each strand passes alternatively over or under one or more of the other stands. Typically used in shoe laces and suspenders. In knitted fabrics:- also known as Bi-Ply Knitting, this special knit construction uses the addition of a second yarn within the same stitch. The second yarn is generally of a different color or type. During the knitting process the second yarn is placed under the first yarn, so that each yarn can be rolled to a specific side of the fabric. In many cases, one yarn/color appears on the face of the fabric, and the other yarn/contrast color appears on the back. Plaited Fabric is a narrow fabric made by crossing a number of sturdy yarns diagonally, so each strand passes alternatively over or under one or more of the other stands. Typically used in shoe laces and suspenders.

PLAITED YARN = СПЛЕТЁННАЯ (или ОПЛЕТЁННАЯ) ПРЯЖА – Plaited Yarn is the yarn covered by another yarn.

PLAITING = ПЛЕТЕНИЕ (или СКЛАДКА ГОТОВОГО ТОВАРА) – Plaiting:- you've almost certainly made a plait with three strands before, but you may not have plaited with larger numbers. You can plait almost anything – string, wool, cord, wire – but string or cord are easy to start with. You need to cut strands to plait with before you start. Remember that the finished plait will be shorter than the strands you started with. You might want to make a finished plait into a loop, for example to make a bracelet. To do this you can tie the ends together, and maybe cover them by winding some more string round. Or you can carefully weave the ends strands of one end into the other using a large needle. Three strands:- a three-strand plait is the simplest to make:- (i) first, make a knot in the three strings to stop your plait coming unravelled, and fix your strings down – you could tie them to something or stick them to a surface with tape (be careful not to use a surface which will be damaged); (ii) start the plait by moving the left-hand strand in front of its next-door neighbour to become the middle strand; (iii) now move the right hand strand to become the middle one; (iv) repeat steps 2 and 3 until the plait is the length you want. It helps if you keep the strands untangled below the place you are working, otherwise the plait can easily turn into a messy tangle. Finish the plait with another knot to stop it coming undone. Remember:- left to the middle then right to the middle then left to the middle then right to the middle .... Other odd numbers:- plait with other odd numbers of strands in the same way:- (i) fix down an odd number of strands; (ii) move the left hand strand into the middle by crossing over the strands in between; (iii) then the right; (iv) then the left, then the right ... until the plait is long enough. Tie a knot to finish it off. Even numbers:- with even numbers of strands there isn't a middle strand, so you can't do exactly the same thing as you did for odd numbers. But you can still make a plait:- (i) tie a knot and fix the strands down. Divide the strands into two bunches, with the same number of strings in each bunch; (ii) take the strand furthest to the left of the left hand bunch and move it to the left side of the right hand bunch; (iii) then take the strand furthest to the right of the right hand bunch and move it to the right side of the left hand bunch; (iv) keep going until your plait is long enough and finish by tying a knot. See also Braiding. Plait:- any of various types of fold formed by doubling fabric back upon itself and then pressing or stitching into shape. For thousands of years people have used different ways of Plaiting and Braiding fibers together to make cords for decoration, for ties on clothes, for carrying things and anything else they needed. Today, braids made by machines still have many of the same uses:- trimmings for clothes and furniture and woven ropes for climbing, for example.

PLANAR WINDING = ПЛОСКОСТНАЯ НАМОТКА – Planar Winding is a winding in which the filament path lies on a plane that intersects the winding surface.

PLAN COMPTABLE = СЧЁТНЫЙ ПЛАН – Plan Comptable (in French) is a set of precise and standardised accounting rules established under French law for application in France – some other EU Member States have similar approaches, e.g., Belgium.

PLANK DECKING = ДОСОЧНЫЙ НАСТИЛ (или ПОЛОВИЦЫ, или ХХ) – Plank Decking is tongue and groove lumber at least 38 mm (1-1/2") thick, with the flat face laid over supports such as beams or purlins to provide a structural deck for for floors and roofs. It is used where the appearance of the decking is desired as an architectural feature, or where the mass of decking is required to add to the fire safety of Heavy Timber construction. Individual planks can span simply between supports, but are generally random lengths spanning several supports for economy, and to take advantage of increased stiffness. Wood species commonly used for plank decking include western red cedar, Douglas fir, western hemlock, and various species of the Spruce-Pine-Fir group. Cedar is often selected for exposed applications where its natural durability is an added advantage to its attractiveness. The general term 'Decking' is used to describe both tongue and groove lumber laid flat (plank decking), and lumber laid on edge (laminated decking). Laminated decking is dimension lumber placed on edge so that each member acts like a joist, and adjoining pieces are usually nailed to each other to create a nail-laminated load sharing unit. Laminated decking was once a popular method of building construction where a heavy floor was required and may in fact have some building applications where an industrial type floor is required. Sizes And Shapes:- Plank decking is produced in three thicknesses; 38 mm (1-1/2"), 64 mm (2-1/2"), and 89 mm (3-1/2"). The 38 mm (1-1/2") decking has a single tongue and groove and is available in 127 mm (5") or 178 mm (7") widths. The two thicker sizes are double tongue and groove and usually available only in 133 mm (5-1/4") face width. These sizes may be ordered with pre-drilled 6 mm (1/4") holes at 760 mm (30"0 spacings so that each piece may be nailed to the adjacent piece with 200 mm (8") No. 3 gauge decking spikes. All decking is V-grooved on the face which is the best in appearance. Grades:- Plank decking is available in two grades, Select and Commercial, based on the appearance of the best face. Select grade is used for high quality construction where high strength and fine appearance for exposed locations are desired. Commercial grade contains more growth characteristics and more manufacturing defects than Select grade. Commercial grade is chosen when appearance and strength are less critical such as in industrial buildings. Moisture Content:- Plank decking is generally specified, dressed, and supplied S-Dry (moisture content 19 percent or less at time of surfacing). It is generally kiln dried to an average moisture content of 15 percent to minimize on site shrinkage or warping. Ordering:- Plank decking is usually purchased in random lengths ranging from 1.83 m (7') to 6.10 m (20'). Longer lengths may be specifically ordered. While decking may be ordered in specific lengths, designers should expect limited availability and extra costs. A typical specification for random lengths is as follows:- (i) 90% of planks 3.0 m (10') and longer; and (ii) 40 percent to 50 percent of planks 4.9 m (16') and longer. For both 64 and 89 mm (2-1/2" and 3-1/2") decking, designers should check that the decking lengths are adequate for spans. A rule of thumb is that spans should not be more than about 600 mm (2') longer than the length which 40 percent of the decking shipment exceeds. Long lengths may only be available in certain species such as Douglas fir and western red cedar. For simple-span or two-span continuous decking, uniform lengths should be specified even though unit material costs will be hig.

PLANKING = ОБШИВКА (или НАСТИЛ) – Planking (maritime term):- broad planks used to cover a wooden vessel's sides, or covering the deck beams.

PLANKS = ПОЛОВЫЕ ДОСКИ (или ДОСКИ НАСТИЛА, или ПОЛОВИЦЫ, или ПЛАНКА) – Planks are parallel-sided pieces of timber from 2 to 6 inches (from 50.8 millimeters to 152.4 millimeters) thick, 11 or more inches (279.4 or more millimeters) wide, and from 8 to 21 feet (from 243.84 to 640.08 centimeters) long. / Под Половой Доской/Обшивной Доской/Планкой понимаются изделия из строительных пиломатериалов с параллельными пластями от 50.8 миллиметров до 152.4 миллиметров (от 2 до 6 дюймов) в толщину, от 279.4 и более миллиметров (от 11 и более дюймов) в ширину, и от 243.84 до 640.08 сантиметров (от 8 до 21 фута) в длину.

PLANKTON = ПЛАНКТОН – Plankton:- mostly small, floating organisms (flora and fauna) drifting passively, whose movements largely depend on water currents. / Под Планктоном, от Греческого слова Planktós, означающее Блуждающий, понимается совокупность организмов, обитающих в толще воды и неспособных противостоять переносу течением. Планктон составляют многочисленные бактерии, диатомовые и некоторые другие водоросли (фитопланктон), простейшие, некоторые кишечнополостные, моллюски, ракообразные, оболочники, яйца и личинки рыб, личинки многих беспозвоночных животных (зоопланктон). Планктон непосредственно или через промежуточные звенья пищевых цепей служит пищей всем остальным животным, обитающим в водоёмах. Под Планктоном, понимается совокупность организмов, населяющих толщу воды континентальных и морских водоёмов и не способных противостоять переносу течениями. В состав планктона входят как растения – фитопланктон (в том числе бактериопланктон), так и животные – зоопланктон. Планктон противопоставляют населению дна – Бентосу и активно плавающим животным – Нектону. В отличие от последних, организмы планктона не способны к самостоятельному движению или подвижность их ограничена. В пресных водах различают озёрный планктон – Лимнопланктон и речной планктон – Потамопланктон. Растительные фотосинтезирующие планктонные организмы нуждаются в солнечном свете и населяют поверхностные воды, в основном до глубины 50–100 метров (м). Бактерии и зоопланктон населяют всю толщу вод до максимальных глубин. Морской фитопланктон состоит в основном из Диатомовых Водорослей, Перидиней и Кокколитофорид; в пресных водах – из Диатомовых, Синезелёных и некоторых групп Зелёных Водорослей. В пресноводном зоопланктоне наиболее многочисленны Веслоногие и Ветвистоусые Рачки и Коловратки; в морском – доминируют Ракообразные (главным образом Веслоногие, а также Мизиды, Эвфаузиевые, Креветки и другие), многочисленны Простейшие (Радиолярии, Фораминиферы, Инфузории Тинтинниды), Кишечнополостные (Медузы, Сифонофоры, Гребневики), Крылоногие Моллюски, Оболочники (Аппендикулярии, Сальпы, Бочёночники, Пиросомы), яйца и личинки Рыб, личинки разных Беспозвоночных, в том числе многих Донных. Видовое разнообразие планктона наибольшее в тропических водах океана. Размеры организмов планктона колеблются от нескольких микронов (мкм) до нескольких м. Поэтому обычно различают:- наннопланктон (бактерии, наиболее мелкие одноклеточные Водоросли), микропланктон (большинство Водорослей, Простейшие, Коловратки, многие личинки), мезопланктон (Веслоногие и Ветвистоусые Рачки и другие животные менее 1 сантиметра (см)), макропланктон (многие Мизиды, Креветки, Медузы и другие сравнительно крупные животные) и мегалопланктон, к которому относят немногих наиболее крупных планктонных животных (например, Гребневик Венерин Пояс длиной до 1.5 м, Медуза Цианея диаметром до 2 м со щупальцами до 30 м, колонии Пиросом длиной до 30 м и более 1 м в поперечнике и другие). Однако границы этих размерных групп не общеприняты. У многих организмов планктона выработались приспособления, облегчающие парение в воде:- уменьшающие удельную массу тела (газовые и жировые включения, насыщенность водой и студенистость тканей, истончённость и пористость скелета) и увеличивающие его удельную поверхность (сложные, часто сильно разветвлённые выросты, уплощённое тело). Организмы фитопланктона – основные продуценты органического вещества в водоёмах, за счёт которого существует большинство водных животных. В мелководных прибрежных частях водоёмов органическое вещество продуцируется также донными растениями – Фитобентосом. Обилие фитопланктона в различных частях водоёмов зависит от количества в поверхностных слоях необходимых для него

питательных веществ. Лимитируют в этом отношении главным образом фосфаты, соединения азота, а для некоторых организмов (Диатомовые, Кремнежгутиковые) и соединения кремния. За длительную историю океана эти вещества накопились в больших количествах в его глубинах, главным образом в результате разложения и минерализации органических частиц, оседающих из верхних слоёв. Поэтому обильное развитие фитопланктона происходит в районах подъёма глубинных вод (например, в районе стыка тёплых вод Гольфстрима и Северных холодных течений, в зоне экваториальной дивергенции вод, в районах сгонных ветров вблизи берегов и так далее). Поскольку фитопланктоном питаются мелкие планктонные животные, служащие пищей более крупным, районы наибольшего развития фитопланктона характеризуются и обилием зоопланктона и нектона. Значительно меньшее и лишь локальное значение в обогащении поверхностных вод питательными веществами имеет речной сток. Развитие фитопланктона зависит также от интенсивности освещения, что в холодных и умеренных водах обусловливает сезонность в развитии планктона Зимой, несмотря на обилие питательных веществ, выносимых в поверхностные слои в результате зимнего перемешивания вод, фитопланктона мало из-за недостатка света. Весной начинается быстрое развитие фито-, а вслед за ним и зоопланктона. По мере использования фитопланктоном питательных веществ, а также вследствие выедания его животными количество фитопланктона снова уменьшается. В тропиках состав и количество планктона более или менее постоянны в течение года. Обильное развитие фитопланктона приводит к так называемому цветению воды, изменяющему её цвет и уменьшающему прозрачность. При цветении некоторых перидиней в воду выделяются токсичные вещества, которые могут вызывать массовую гибель планктонных и нектонных животных. Биомасса планктона варьирует в разных водоёмах и их районах, а также в различные сезоны. В поверхностном слое океана биомасса фитопланктона обычно колеблется от нескольких миллиграммов (мг) до нескольких граммов на кубический метр (г/м^3), зоопланктона (мезо-планктона) – от десятков мг до 1 г/м^3 и более. С глубиной планктон становится менее разнообразным и количество его быстро убывает. В Мировом океане бедные планктоном акватории преобладают по площади над богатыми. Беднее всего планктоном центральные тропические районы по обе стороны от экваториальной зоны, наиболее богаты – прибрежные районы умеренных и субтропических широт. Годовая продукция фитопланктона в Мировом океане составляет 550 миллиардов т (по оценке Советского океанолога Вениамина Григорьевича Богорова (1904-Декабрь-11(24)–1971-Апрель-15)), что почти в 10 раз превышает суммарную продукцию всего животного населения океана. Многие планктонные животные совершают регулярные вертикальные миграции с амплитудой в сотни м, иногда свыше 1 километра (км), способствующие переносу пищевых ресурсов из богатых ими поверхностных слоёв в глубины и обеспечению пищей глубоководного планктона. Вследствие способности к миграциям вертикальная зональность планктона выражена менее чётко, чем бентоса. Многие планктонные организмы обладают способностью к свечению (Биолюминесценция). Некоторые могут служить индикаторами степени загрязнённости водоёма, так как в разной степени чувствительны к загрязнению. Планктон непосредственно или через промежуточные звенья пищевых цепей служит источником питания многих промысловых животных:- Кальмаров, Рыб, Китов и других. Из планктонных организмов объектами промысла служат некоторые ракообразные (Креветки, Мизиды). В последние годы всё большее значение приобретает промысел Антарктических рачков – эвфаузиевых (Криль), образующих иногда огромные скопления (до 15 кг/м^3). Разработка методов использования и лова морского планктона перспективна, так как его запасы во много раз превышают запасы всех промышляемых до сих пор морских организмов.

PLANNED GENERATOR = ЗАПЛАНИРОВАННЫЙ (или ПРОЕКТНЫЙ) ГЕНЕРАТОР – Planned Generator:- a proposal by a company to install electric generating equipment at an existing or planned facility or site. The proposal is based on the owner having obtained (1) all environmental and regulatory approvals, (2) a signed contract for the electric energy, or (3) financial closure for the facility.

PLANT = ЗАВОД (или ПРОИЗВОДСТВО) – Fixtures or machinery used in an industrial process, or a general term for a factory or industrial complex. Production unit which is physically independent but legally affiliated with a firm. A company may have one or more plants. / Производственная единица, которая физически независима, а юридически связана с фирмой. Компания может иметь один и более заводов. Под Заводом понимается промышленное предприятие с механизированными процессами производства, изготовляющее преимущественно средства производства. Этот термин является тождественным понятию Фабрика.

PLANT = СТАНЦИЯ (или ЗАВОД) – Plant is a facility at which are located prime movers, electric generators, and auxiliary equipment for converting mechanical, chemical, and/or nuclear energy into electric energy. A plant may contain more than one type of prime mover. Electric utility plants exclude facilities that satisfy the definition of a qualifying facility under the Public Utility Regulatory Policies Act of 1978. / Под Станцией, от Латинского слова Statio, означающее Стояние или Стоянка, понимается специально оборудованное предприятие, обслуживающее определённую территорию. Под Заводом понимается промышленное предприятие с механизированными процессами производства, изготавливающее преимущественно средства производства. В зарубежной электроэнергетике понятия Завод и Станция тождественны.

PLANT ANATOMY = АНАТОМИЯ РАСТЕНИЯ – Plant Anatomy is the study of the structure of plants. / Под Анатомией Растений, от Греческого слова Anatomē, означающее Рассечение, понимается наука о строении (преимущественно внутреннем) организма.

PLANT & MACHINERY = СООРУЖЕНИЯ И ОБОРУДОВАНИЕ – Plant & Machinery is the current (net book value (NBV)) of factory plant and machinery. Thus it is the total original cost of plant and machinery less accumulated depreciation.

PLANT & MACHINERY/EMPLOYEE = СООРУЖЕНИЯ И ОБОРУДОВАНИЕ/РАБОТНИК – Plant & Machinery/Employee is the value of plant and machinery expressed on a per employee basis. Thus it is a measure of capital intensity. An upward trend in this figure may show that the business is being modernized (or it may be due to increased labor productivity).

PLANT APPLICATION = ЗАЯВКА НА РАСТЕНИЕ (или ЗАЯВКА ПО РАСТЕНИЮ) – Plant Application (patent):- applications to protect invented or discovered, asexually reproduced plant varieties. See also Nonprovisional Patent Application, and Provisional Patent Application.

PLANT ASH = РАСТИТЕЛЬНАЯ ЗОЛА – Plant Ash is the inorganic residue, principally oxides, which remains after the ignition of plant tissue. / Под Золой понимается несгораемый остаток (в виде пыли), образующийся из минеральных примесей топлива при полном его сгорании. Используется для производства некоторых видов бетона, как удобрение; из золы некоторых углей добывают редкие и рассеянные элементы, например, Галлий (Ga), Германий (Ge).

PLANT AVAILABLE WATER = УСВАИВАЕМАЯ РАСТЕНИЯМИ ВОДА (или ДОСТУПНАЯ РАСТЕНИЯМ ВОДА) – Plant Available Water is the amount of water in the soil that can be extracted by plants, usually full point less wilting point. / Количество воды в почве, которое может быть поглощено растениями, обычно степень насыщаемости уменьшается при увядании растения, следующим после полной зрелости этого растения. обычно меньше влажности завядания (wilting point).

PLANT–BACK PERIODS = ПЕРИОДЫ ОТХОДА (или ВОССТАНОВЛЕНИЯ) РАСТЕНИЯ – Plant-Back Periods are the recommended periods of time, after the use of herbicides, that will avoid damage to crops. / Рекомендуемые периоды времени, после применения гербицидов, которые позволят избежать повреждения сельскохозяйственной культуре.

PLANT BUGS = РАСТИТЕЛЬНЫЕ КЛОПЫ – Plant Bugs are small, active, dark brown Bugs with piercing-sucking mouthparts. The mouthparts make tiny needle-like holes in small squares, causing darkening and abortion. At high population levels, terminal feeding may result in unusual upper growth (crazy cotton) and loss of apical dominance; late in the season, high levels of plant Bugs can also damage larger squares, blooms, and small bolls. The Plant Bug complex includes several Species, but thresholds are similar for all. Although Plant Bugs can cause damage during any phenological stage, they are most important during the early season prior to first bloom. Thresholds expressed as number captured per 100 sweeps with a 38-cm net range from 6 to 100. Higher thresholds are typically associated with later phenological stages and longer production seasons. Some states utilize a bug-to-square ratio to time Plant Bug control measures. Recent emphasis on early maturity and short-season production has increased the importance of Plant Bugs, which often affect production by delaying maturity.

PLANT COMPENSATION = САМОКОРРЕКЦИЯ РАСТЕНИЯ (или КОМПЕНСАЦИЯ РАСТЕНИЯ) – Plant Compensation is the ability of a plant to produce new growth or larger fruit to compensate for structures lost through damage by insects, hail, etc. / Способность растения давать новые побеги или более крупные плоды за счёт компенсации потерянных вследствие повреждения частей растения, вызванного насекомыми, градом и прочим.

PLANT CONDENSATE = ЗАВОДСКОЙ КОНДЕНСАТ (или КОНДЕНСАТ ОТ ГАЗОПЕРЕРАБАТЫВАЮЩЕГО ЗАВОДА) – Plant Condensate is one of the natural gas liquids, mostly pentanes and heavier hydrocarbons, recovered and separated as liquid at gas inlet separators or scrubbers in processing plants. / Один из видов жидкого природного газа, в основном пентаны и более тяжёлые углеводороды, полученный и выделенный в виде жидкости газовыми впускными сепараторами или скрубберами (устройствами для очистки газов и извлечения одного или нескольких компонентов с помощью жидкостей) на перерабатывающих заводах.

PLANT DENSITY = ГУСТОТА СТОЯНИЯ РАСТЕНИЙ (или ПЛОТНОСТЬ СТОЯНИЯ РАСТЕНИЙ) – Plant Density is a number of plants per unit area.

PLANT FIBER = РАСТИТЕЛЬНОЕ ВОЛОКНО – Plant Fiber is a fiber generated from a plant, e.g., Coir, Cotton, Flax, Jute, Hemp, and Ramie. Plant Fiber is a common crafting material used in armor and weapon crafting. Plant Fibers include seed hairs, such as cotton; stem (or bast) fibers, such as flax and hemp; leaf fibers, such as sisal; and husk fibers, such as coconut. Plant Fibers – the oldest and most used textile fibers. Natural cellulose fibers originated from plants and trees such as Cotton, Flax, Hemp, Jute, Ramie, Kapok, Coir, Bamboo, etc are termed as Plant Fibers. Many useful fibers have been obtained from various parts of plants including leaves, stems (bast fibers), fruits and seeds. Since all plant fibers are made up of mainly cellulose, they are categorized as 'natural cellulosic fibers', which may consist of one plant cell or an aggregate of cells cemented together by non-cellulose materials. Bast fibers are produced and used to manufacture a wide range of traditional and novel products including ropes, nets, carpets, mats, brushes, mattresses, paper, and board materials. Plant fibers are classified into two groups:- soft fibers and hard fibers. Soft Fibers:- The process of preparing soft fibers for weaving is laborious. The plant is selected and harvested, partially dried, and then pounded with a stone mallet and scraped to clean the fibers. The material is then washed and dried in the sun. Later, the artists comb the fibers with their fingers. The fibers are now ready to be spun or twisted into thread or cord on the artist's leg. Some fibers, including palm, grass, wheat chaff, and to rote, are prepared by drying and pounding, after which they are cut to size and braided. Soft fibers are used to make ropes, string, nets, bags, and hammocks. Hard Fibers:- Hard fibers are subjected to successive phases of cutting, drying, cleaning, and soaking before they can be woven. These strong, naturally flexible fibers are used to make furniture, birdcages, toys, baskets, and mats.. The following is a list of natural Plant Fibers, organized alphabetically by type:- (1) Bast Fibers:- flax (Linum Usitatissimum), hemp (Cannabis Sativa), Indian hemp (Apocynum Cannabinum), jute (Corchorus Species):- (i) tossa jute (Corchorus Olitorius) and (ii) white jute (Corchorus Capsularis), kenaf (Hibiscus Cannabinus), ramie (Boehmeria Species), roselle (Hibiscus Sabdariffa), sunn (Crotalaria Juncea), and urena (Urena Lobata). (2) Leaf Fibers:- abaca (Musa Textilis), cantala (Agave Cantala), henequen (Agave Fourcroydes), maguey (Agave Americana and other Species), Mauritius hemp (Furcraea Foetida), phormium (Phormium Tenax), and sisal (Agave Sisalana). (3) Seed-Hair And Other Fibers:- akund floss (Calotropis Procera and Calotropis Gigantea), bagasse (Saccharum Officinarum), bamboo (various Species), bombax cotton (Bombax Species), coir (Cocos Nucifera), cotton (Gossypium Species), floss-silk tree (Ceiba Speciosa), kapok (Ceiba Pentandra), and milkweed floss (Asclepias Syriaca and Asclepias Incarnata). / Прядильные Культуры или Текстильные Культуры, растения, возделываемые для получения волокна. Объединяют однолетние и многолетние виды различных ботанических Семейств, имеющие волокно:- на семенах в виде свободных волосков (Хлопчатник), в плодах (Сейба), в стеблях (лубяные культуры), листьях (Агава, Новозеландский Лён). В мировом земледелии наибольшие площади занимают Хлопчатник, Джут, Конопля, Лён, Кенаф; в бывшем Союзе Советских Социалистических Республик (СССР) – Хлопчатник, Лён и Конопля. Текстильные волокна из прядильных культур – сырьё для текстильной промышленности. Подробнее смотрите статьи об отдельных культурах.

PLANT GROWTH REGULATOR = РЕГУЛЯТОР РОСТА РАСТЕНИЙ – Plant Growth Regulator is a broad class of chemicals that control the growth of plants. Many are also natural compounds found within plants, where they may act as hormones. Plant Growth Regulator is a substance applied to cotton plants that affects growth or aging, e.g., Pix and Prep. Abbreviation:- PGR.

PLANT GROWTH SUBSTANCES = РАСТИТЕЛЬНЫЕ РОСТОВЫЕ ВЕЩЕСТВА (или РАСТИТЕЛЬНЫЕ РОСТОВЫЕ СУБСТАНЦИИ) – Plant Growth Substances are natural and synthetic compounds that elicit growth, developmental or metabolic responses. These substances are usually not metabolites in the sense that they are not intermediates or products of the pathways they control, and they are active at very low concentrations. / Под Ростовыми Веществами понимаются вещества, содержащиеся в растениях и регулирующие их рост. К ним относятся фитогормоны, а также некоторые фенолы, производные мочевины и другие.

PLANT HEIGHT = ВЫСОТА РАСТЕНИЯ – Plant Height is the distance from the base of the plant at ground level to the top of the highest leaf or the panicle of a mature plant, measured in centimeters.

PLANTHOPPER = XX (или ДЭЛЬФАСИД, или ДЕЛЬФАЦИД) – Planthopper is an Insect of the Order Homoptera, Family Delphacidae, which feeds by sucking sap from leaf veins along the lower portion of the Rice Plant; usually more stout and slow-moving than leafhoppers. Planthoppers have a mobile spur called a 'Calcar' at the tip of the tibia of the hind leg. / из жилок листа .

PLANTING = ПОСАДКА – Planting (including replanting) is any operation for the placing of plants in a growing medium, or by grafting or similar operations, to ensure their subsequent growth, reproduction or propagation. / , или прививанием или аналогичными операциями, разведение или распространение (propagation). Под Посадкой понимается размещение рассады (Капусты, Табака, Томата), саженцев плодовых, декоративных и лесных культур, клубней Картофеля, луковиц Лука, Тюльпана и других

по площади поля с заделкой в почву. Проводят рассадо-посадочными машинами, картофелесажалками и вручную. Посадка – в растениеводстве, высаживание на постоянное место (в поле, сад, цветник) молодых растений; важнейший агротехнический приём при возделывании многих сельскохозяйственных культур, декоративных и лесных пород. Применяется в овощеводстве, плодоводстве, лесоводстве, табаководстве, цветоводстве и другом. Рассада, саженцы, выращенные в рассадниках, парниках, теплицах, питомниках и высаженные на постоянное место, продолжают расти, развиваться и дают урожай. При возделывании Картофеля в почву сажают клубни, Лука – лук-севок (маленькие луковицы, выращенные из семян), Мяты – отрезки корневищ, Сахарного Тростника – отрезки стеблей, для получения семян корнеплодных растений – их маточники (корнеплоды) и так далее. Посадка рассады наиболее распространена в овощеводстве при выращивании Капусты, Томата, Огурца, Перца, Баклажана и других. Перед посадкой рассаду обильно поливают; корни безгоршечных растений обмакивают в сметанообразную смесь глины и жидкого навоза с рогором (для предохранения от высыхания). Сажают рассаду рассадопосадочными машинами или вручную, погружая в почву до 1-го здорового листа. После посадки или одновременно с ней растения поливают (0.3–1 литр (л) воды на каждое растение). Через 5–7 суток (сут) проверяют приживаемость, подсаживая новую рассаду на место выпавшей. Посадку рассады применяют также при возделывании Табака, Эфирномасличных культур (например, Базилика Евгенольного), цветочных и декоративных растений и других. В плодоводстве посадка саженцев – основной способ закладки промышленных и приусадебных садов. На подготовленном под сад участке копают посадочные ямы глубиной 0.6 метр (м), диаметром 1 м под Семечковые культуры (Яблоня, Груша), соответственно 0.4 и 0.8 м под Косточковые (Вишня, Слива и другие) и 0.4 и 0.6 м под Ягодные (Смородина, Крыжовник, Малина), которые на 2/3 заполняют смесью плодородной земли с перегноем и минеральными удобрениями. Корневая шейка при посадке саженца должна быть на 4–10 сантиметров (см) выше поверхности земли. Около посаженного деревца или кустарника делают лунку для полива (20–30 л воды на растение). Посадку проводят весной или осенью, вручную или машиной. Посадку саженцев (и сеянцев) применяют также в лесоводстве для восстановления и разведения леса, закладки лесных полос. Сажают лесопосадочными машинами, под плуг, вручную (с комом земли или с открытыми корнями).

PLANTING BOARD = САЖАЛЬНАЯ ДОСКА (или ПОСАДОЧНАЯ ДОСКА) – Planting Board is a board with holes for dropping seeds into the soil at given distances or for marking distances when sowing or transplanting in the field or plots.

PLANTING RATIO = СООТНОШЕНИЕ С ПОСАДКОЙ – Planting Ratio is the ratio in which the male and female parental lines are planted in hybrid seed production or maintenance of the cytoplasmic male sterile line.

PLANTLETS = РОСТКИ (или ПРОРОСТКИ, или СЕЯНЦЫ, или РАССАДА) – Plantlets, as relates to seed potatoes, plantlets are small plants produced under aseptic culture conditions in a laboratory. Plantlet is a young plant or a small plant. Plantlet is a small rooted shoot regenerated from cell culture following embryogenesis or organogenesis. Plantlets can normally develop into normal plants when transplanted to soil. / Под Сеянцем понимается одно- или двултнее растение, полученное из семени в посевном отделении плодового или лесного питомника (без пересадки). Сеянцы плодовых растений используют в качестве Подвоев (Подвой в именительном падеже) в плодоводстве для размножения сортов; их часто называют Дичками. В лесоразведении сеянцы используют в качестве посадочного материала. Под Подвоем понимается растение (или часть его), на которое прививают часть (черенок, почку и тому подобное) другого растения – Привоя. Через корневую систему подвоя осуществляется минеральное питание и водоснабжение привитого растения. Привой снабжает подвой продуктами ассимиляции. Полнота срастания привитых компонентов и нормальное развитие полученного растительного организма зависят от физиологической совместимости подвоя и привоя. Подвой влияет на силу роста, урожайность и долговечность привоя, его зимостойкость, устойчивость к болезням и вредителям. Привой, в свою очередь, может влиять на зимостойкость подвоя, на развитие его корневой системы. В плодоводстве в зависимости от производственных задач для одной и той же культуры применяют разные подвои. Например, Яблоню прививают на Юге и в центральных районах бывшего Союза Советских Социалистических Республик (СССР) на сеянцах культурных сортов и лесной Яблони, в более Северных районах – на сливолистной Яблоне (Китайке), а на Востоке и Севере – на Сибирской Яблоне. В питомниках бывшего СССР для выращивания привитых саженцев плодовых культур использовали около 40 видов подвоев, различающихся происхождением (дикорастущие и культурные), силой роста и способом размножения (семенные и вегетативные).

PLANT MAP = КАРТА РАСТЕНИЯ (или КАРТОГРАММА РАСТЕНИЯ) – Plant Map is a precise, prescribed manner of recording, or mapping, Cotton Plant growth that shows the location and stage of fruit by its position on each node of all vegetative and fruiting branches. Plant maps are often used to determine nodes above white bloom, nodes above cracked boll, and fruit retention and to compartmentalize and compare fruit retention on selected horizontal or vertical zones of the Cotton Plant. Modified mapping systems are available that focus on particular vertical zones of Cotton, such as first position only. / на каждом узле всех вегетативных и плодоносящих ветвях. часто используются для определения узлов выше месторасположения белого цветка, узлов выше треснувшей коробочки, и удерживания плода и для пространственного разделения и образования удерживания плода на выбранных горизонтальных или вертикальных зонах растения Хлопчатника. . Картирование растения.

PLANT MAPPING = КАРТИРОВАНИЕ РАСТЕНИЯ (или XX) – Plant Mapping and crop monitoring using selected plant indicators to follow plant development and fruit growth has become a widely accepted technique throughout the US Cotton Belt. Plant mapping refers to a technique to characterize Plant structure and fruiting behavior of plants usually in single evaluations, while crop monitoring is a sequential series of crop characterizations for following crop progress. New techniques to follow fruiting progress during squaring and flowering in relation to main-stem nodal development, and to assist with end-of-season management decisions have recently been introduced. However, some confusion exists about the specific terms used in plant mapping and crop monitoring. A glossary of terminology and concepts is provided to clarify misunderstandings and to make the overall concept easier to understand and implement. Plant Mapping is a widely used technique in the Cotton (Gossypium Hirsutum L.) industry for providing detailed information on the presence and location of individual fruit on an idealized, simplified diagram of a Cotton Plant. For years, use of plant mapping was limited by the inability to handle and process massive data sets. An early-developed technique for processing voluminous data was the composite plant diagram. This technique provided a method of summarizing data from multiple plants into a single diagram. Hake et al. (1990) presented a method of summarizing data collected from prime fruit sites for use as an in-season management tool. The innovation of personal computers and appropriate software has greatly expanded the application and use of plant mapping. Software programs, such as the DIAGRAMMER and BOLOCATE (1986 and 1990), PMAP (1995), CottonPro (1995 and 1996) and COTMAP (1990), provide powerful means for summarize mapping data. The first two techniques are capable of distinguishing stage of fruit, i.e. square, flower or boll, and provide detailed information for every node. However, collection of such detailed data is tedious and statistical analyses are difficult. Coded plant data, which focus on prime fruiting sites, are used by COTMAP and CottonPro to calculate and analyze defined plant structure, fruit distribution and fruit retention variables. Recent trends in plant-based management models recognize the importance of a more continuous in-season approach for following fruiting dynamics during the season, i.e. crop monitoring rather than an instantaneous plant map. COTMAN (1992, 1994, and 1995) is a computerized decision aid which integrates information on plant growth patterns, current and historical weather data, and farm and field parameters to enhance Cotton crop

management. A glossary of terms and concepts related to the COTMAN crop monitoring system has been published (1996). There have also been various noncomputer programs developed for crop monitoring (e.g., 1990, 1991, and 1997). The overall concept of plant mapping and crop monitoring is being used in many states across the US Cotton Belt. However, some confusion has arisen surrounding the interpretation of the technique and the methods by which to use it. A glossary of terminology and concepts used in plant mapping and crop monitoring is provided below to clarify misunderstandings and to make the overall concept easier to understand and implement. See also Plant Monitoring. Plant Mapping is the one of several methods used to characterize plant structure and fruiting behavior of Plants. Mapping techniques tend to be a single evaluation of crop status, rather than a sequential series of crop characterizations, as in plant monitoring, for following crop progress. Early plant mapping methods were laborious and not practical. More recently these have been modified and incorporated into computer programs for ease of data handling, e.g., COTMAP, and incorporated into research and production systems.

PLANT MONITORING = НАБЛЮДЕНИЕ ЗА РАСТЕНИЕМ (или ХХ) – Plant Monitoring is a general term used for one or a series of interactive measurements on the plant or crop, usually made sequentially during the growing season. Management decisions are based upon thresholds and changes over sampling dates. Plant monitoring includes seedling vigor indices, nodes above white flower (NAWF), petiole nutrient analysis, certain aspects of insect scouting, etc. See also Plant Mapping.

PLANT NUTRIENT = ПИТАТЕЛЬНОЕ ВЕЩЕСТВО ДЛЯ РАСТЕНИЙ – Plant Nutrient is a substance which is absorbed by plants and is necessary for completion of the life cycle.

PLANT PATENT = ПАТЕНТ НА РАСТЕНИЕ – Plant Patent may be granted to anyone who invents or discovers and asexually reproduces any distinct and new variety of plant. See also Patent.

PLANT PEST = ВРЕДИТЕЛЬ РАСТЕНИЙ – The term Plant Pest means any living stage of any of the following that can directly or indirectly injure, cause damage to, or cause disease in any plant or plant product:- (i) a protozoan; (ii) a nonhuman animal; (iii) a parasitic plant; (iv) a bacterium; (v) a fungus; (vi) a virus or viroid; (vii) an infectious agent or other pathogen; and (viii) any article similar to or allied with any of the articles specified in the preceding subparagraphs. Plants provide food for many forms of life. Human beings and other grazing animals depend on plants for food. It is important to note that large numbers of other much smaller creatures such as insects and their larvae also feed on plants. Insects which, feed on plants and cause damage to the plants are called Pests. Plant pests vary from place to place. See also Pest.

PLANT PHYSIOLOGY = ФИЗИОЛОГИЯ РАСТЕНИЙ – Plant Physiology is the study of the Plant's processes, functions, and responses to the environment.

PLANT POPULATION = ПОПУЛЯЦИЯ РАСТЕНИЙ – Plant Population is a number of Plants in a particular area or the number of different Plant types in a particular area. / В биологии под Популяцией, от Латинского слова Populus, означающее Народ или Население, понимается совокупность особей одного Вида, длительно занимающая определённое пространство и воспроизводящая себя в течение большого числа поколений. Термин Популяция употребляют также по отношению к каким-либо группам клеток и в антропологии.

PLANT PRODUCTS = ПРОДУКТЫ РАСТИТЕЛЬНОГО ПРОИСХОЖДЕНИЯ (или РАСТИТЕЛЬНЫЕ ПРОДУКТЫ) – Plant Products is unmanufactured material of plant origin (including grain) and those manufactured products that, by their nature or that of their processing, may create a risk for the introduction and spread of pests. / К Продуктам Растительного Происхождения или Растительным Продуктам относятся неизготовленный материал растительного происхождения (включая зерно) и те изготовленные продукты, которые по своей природе или по способу своей переработки могут создавать риск интродукции и распространения вредителей.

PLANT PROTECTION ACT = АКТ О ЗАЩИТЕ РАСТЕНИЙ – After 17 years in the making, the Plant Protection Act (PPA) became law on 2000-June-20 as part of the Agricultural Risk Protection Act. The PPA consolidates all or part of 10 existing USDA plant health laws into one comprehensive law, including the authority to regulate plants, plant products, certain biological control organisms, noxious weeds, and plant pests. The Plant Quarantine Act, the Federal Pest Act, and the Federal Noxious Weed Act are among the 10 statutes the new Act replaces. The PPA is necessary because of the major impact plant pests currently have and could have on the agriculture, environment, economy, and commerce of the United States. The PPA gives the Secretary of Agriculture, and through delegated authority, USDA's Animal and Plant Health Inspection Service (APHIS), the ability to prohibit or restrict the importation, exportation, and the interstate movement of plants, plant products, certain biological control organisms, noxious weeds, and plant pests. Under the PPA, violators face harsher civil penalties than ever before for smuggling illegal plants or produce that could harbor plant pests or diseases. The PPA gives the Secretary of Agriculture the authority to subpoena documentary evidence and witnesses to prosecute violators. The Act also provides APHIS with a cost recovery mechanism for expenses related to the disposal of abandoned shipments at US ports of entry. Plant Protection Act (PPA) is a legislation that provides the authority to prohibit or restrict imports, exports, interstate and intrastate movement of plant pests, plants, plant products, noxious weeds, biological control agents, and means of conveyance. / привоз (importation). вывоз (exportation).

PLANT PROTECTION AND QUARANTINE = ЗАЩИТА И КАРАНТИН РАСТЕНИЙ – Plant Protection and Quarantine (PPQ) is organizational unit within USDA-APHIS (short for the United States Department of Agriculture – Animal and Plant Health Inspection Service) that is accountable for assisting exporters in meeting the plant quarantine import requirements of foreign countries.

PLANT PROTECTION ORGANIZATION = ОРГАНИЗАЦИЯ ПО ЗАЩИТЕ РАСТЕНИЙ – Plant Protection Organization (national) is the phytosanitary standard setting organization. Its objectives are to protect plants, to develop national strategies against the introduction and spread of dangerous pests and to promote safe and effective control methods. As a National Plant Protection Organization has produced a large number of standards and publications on plant pests, phytosanitary regulations, and plant protection products. See also National Plant Protection Organization.

PLANT QUARANTINE = КАРАНТИН РАСТЕНИЙ – Plant Quarantine is a restrictive measure imposed by a government to prevent the entry of injurious pathogens and pests by regulating the movements of plants, fruits, seeds, or other plant parts. Plant Quarantine is all activities designed to prevent the introduction and/or spread of quarantine pests or to ensure their official control.

PLANT RESIDUE = РАСТИТЕЛЬНЫЙ ОСТАТОК – Plant Residue is the stubble or remains of a plant left after harvest.

PLANT RESISTANCE = РЕЗИСТЕНТНОСТЬ РАСТЕНИЙ (или СОПРОТИВЛЯЕМОСТЬ РАСТЕНИЙ, или УСТОЙЧИВОСТЬ РАСТЕНИЙ) – Plant Resistance is a resistance of Plants to Pests and diseases.

PLANTS = РАСТЕНИЯ – Any Plant (including any plant part) for or capable of propagation, including a tree, a tissue culture, a plantlet culture, pollen, a shrub, a vine, a cutting, a graft, a scion, a bud, a bulb, a root, and a seed. As relates to seed potatoes, Plants are rooted plants produced under a screenshow, greenhouse, or field environment. Plant is a living organism, in the Kingdom Plantae, with

cellulose cell walls and lacking a nervous system or powers of voluntary motion. Self-supporting plants use chlorophyll to capture energy from sunlight, using it to synthesise food from carbon-dioxide, water and other inorganic substances. Dependent plants (e.g., fungi, parasites, saprophytes) have no chlorophyll and use pre-existing carbon compounds as a food source. A complete plant may have roots, stems and leaves but in some cases consists of only a single leafy tissue, a series of linked cells or even a single cell. Plants are divided into flowering plants (angiosperms) reproducing through seeds and flowerless plants (gymnosperms) which reproduce by single celled spores. Plants are living plants and parts thereof, including seeds and germplasm. / разведение или распространение (propagation). может иметь корни, стебли и листья, но в некоторых случаях состоит только из . Растения подразделяются на Цветущие Растения или Цветковые Растения (Ангиоспермы или Покрытосеменные Растения), воспроизводящиеся через семена и бесцветковые растения (Гимноспермы или Голосеменные Растения), которые воспроизводятся одноклеточными спорами. К Растениям относятся живые Растения и части Растений, включая семена и генетический материал. Растения составляют одно из Царств органического мира. От других живых организмов Растения отличаются способностью к автотрофному питанию, то есть к синтезу всех необходимых органических веществ из неорганических. Зелёные Растения, при этом, используют энергию солнечных лучей, иными словами, осуществляют фотосинтез, под которым понимается процесс, в результате которого создаётся основная масса органического вещества биосферы и поддерживается газовый состав атмосферы. Таким образом, Растения являются главным первичным источником пищи и энергии для всех других форм жизни на нашей планете. У некоторых Растений питание гетеротрофное (сапрофиты и паразиты). Известно приблизительно 500 000 Видов ныне живущих Растений, которые делятся на низшие и высшие растения. С середины XX столетия из Царства Растений выделяют самостоятельные Царства:- Грибы и Дробянки, которые ранее относили к Низшим Растениям. Ботаника является наукой о Растениях. Применительно к защите и карантину Растений под Растениями понимаются живые Растения и части Растений, включая семена и генетический материал. Растения (Plantae, или Vegetabilia), организмы, отличающиеся автотрофным питанием, основанным на использовании энергии Солнца (смотрите Фотосинтез), и наличием у клеток плотных оболочек, состоящих, как правило, из целлюлозы. Фотосинтез и связанные с ним физиолого-биохимические процессы дают возможность безошибочно отличать Растения от других живых организмов. Сравнительно редко встречающиеся среди Растений Виды с гетеротрофным питанием (сапрофиты и паразиты) – всегда вторичного происхождения. Другие черты, определяемые характером роста и образом жизни, например, своеобразные циклы развития, способы закладки органов, прикреплённость к субстрату и так далее, не всеобщи в мире Растений. В целом комплекс признаков позволяет легко отличать любые Растения, особенно высокоорганизованные, от представителей остальных Царств живых организмов. Лишь на более низком уровне развития, особенно на одноклеточном, различия не очень резкие и иногда сглаживаются настолько, что до середины XX века считалось спорным, к какому Царству живых существ относить некоторые группы (например, Жгутиконосцев). Однако и здесь имеются достаточные основания для разграничения прежде сборной Группы Жгутиконосцев на относящиеся либо к растительному, либо к животному Царству. Некоторая трудность их разграничения – доказательство единства происхождения всего живого мира, расчленение которого на отдельные Царства, как свидетельствуют палеонтологические находки, произошло, вероятно, более 3 миллиарда лет назад. По широко распространённой традиции, к Царству Растений часто относят ещё Бактерии, Синезелёные Водоросли (Цианеи) и Грибы. Однако исследования середины XX века усилили давно высказанные сомнения в правомочности отнесения этих организмов к Растениям. У Бактерий и Цианеи отсутствует настоящее ядро с ядерной мембраной и ядрышком, а также типичный половой процесс. Эти и другие особенности резко отличают Бактерии и Цианеи как от Настоящих Растений, так и от остальных представителей мира живых существ; поэтому теперь их выделяют в особое Надцарство доклеточных организмов, или Прокариотов. Что касается Грибов, то, несмотря на наличие у них ядра, остальные особенности их морфологии и химизма (как правило, не целлюлозная, а хитиновая клеточная оболочка, гетеротрофный способ питания и другие) достаточно резко отличают их и от Настоящих Растений, и от живых организмов других Царств, что позволило выделить их в особое Царство – Грибы (Mycetalia, или Fungi) и объединить вместе с Растениями и Животными в Надцарство клеточных организмов, или Эукариотов. Одноклеточные Растения характеризуются элементами, свойственными клетке любого организма, но вместе с тем отличаются от одноклеточных организмов других Царств живого мира наличием хлоропластов, отдельными ультраструктурами, обычно также строением оболочки, развитыми вакуолями и другим. С повышением уровня организации различия между Растениями и представителями других Царств возрастают настолько резко, что многоклеточные Растения даже по внешнему виду можно безошибочно отличить от представителей других Царств органического мира. Очень важная морфологическая особенность Растений – сильное расчленение тела, приводящее к увеличению его поверхности, что обусловлено способом питания Растений – поглощением из внешней среды газообразного и жидкого компонентов (воздуха и воды с растворёнными в ней питательными веществами). У Высших Растений расчленение и дифференциация тела приводят к выработке большого числа специализированных структур и органов (смотрите Ткани Растений, Вегетативные Органы и другое). Многие важные особенности внешней и внутренней морфологии Растений определяются характером их роста и размножения. Царство Растений охватывает 3 крупных таксона (полцарства либо Отделы, или Типы):- это – Красные Водоросли, или Багрянки (Rhodobionta), Настоящие Водоросли (Phycobionta) и Высшие Растения (Embryobionta). Полцарства охватывают всё огромное разнообразие мира Растений, общее число Видов которых превышает 350 тысяч. Трудами многих поколений ботаников выявлены основные вехи становления и развития отдельных структур, органов и Растения в целом, начиная от одноклеточных микроскопических Водорослей и кончая высокоразвитыми Цветковыми Растениями, у которых физиолого-биохимические процессы и морфологические образования достигли высокого уровня развития. В основе понимания развития мира Растений в целом, как во времени, так и в пространстве, лежит современное эволюционное учение. Его данными, в частности, твёрдо установлена сопряжённая эволюция мира Растений и Животных (особенно Насекомых, Птиц и Млекопитающих). Существование мира Животных, включая Человека, было бы невозможно без Растений, чем и определяется их особая роль в жизни нашей планеты. Из всех организмов только Растения способны аккумулировать энергию Солнца, создавая при её посредстве органического вещества из веществ неорганических; при этом Растения извлекают из атмосферы CO_2 и выделяют O_2. Именно деятельностью Растений была создана атмосфера, содержащая O_2, и их существованием она поддерживается в состоянии, пригодном для дыхания. Растения – основное, определяющее звено в сложной цепи питания всех гетеротрофных организмов, включая Человека. Наземные Растения образуют степи, луга, леса и другие растительные группировки, создавая ландшафтное разнообразие Земли и бесконечное разнообразие экологических ниш для жизни организмов всех Царств. Наконец, при непосредственном участии Растений возникла и образуется почва. Из огромного разнообразия Царства Растений особое значение в повседневной жизни имеют Семенные и главным образом Цветковые (Покрытосеменные) Растения. Именно к ним относятся почти все Растения, введённые Человеком в культуру. Первое место в жизни Человека принадлежит Хлебным Растениям (Пшеница, Рис, Кукуруза, Просо, Сорго, Ячмень, Рожь, Овёс) и различным крупяным культурам. Важное место в пищевом рационе Человека занимает в странах с умеренным климатом Картофель, а в более Южных областях – Батат, Яме, Ока, Таро и другие. Широко употребляются богатые растительными белками Зернобобовые (Фасоль, Горох, Нут, Чечевица и другие), Сахароносные (Сахарная Свёкла и Сахарный Тростник), многочисленные Масличные (Подсолнечник, Арахис, Маслина и другие), Плодовые, Ягодные, Овощные

и иные культурные Растения. Хлопчатник, Лён, Конопля, Рами, Джут, Кенаф, Сизаль и многие другие волокнистые Растения обеспечивают Человека одеждой и техническими тканями. Современное общество трудно представить без тонизирующих Растений – Чая, Кофе, Какао, равно как без Винограда – основы виноделия, или без Табака. Животноводство базируется на использовании дикорастущих и культивируемых кормовых Растений. Ежегодно потребляется огромное количество леса – в качестве строительного материала, источника получения целлюлозы и другого. Очень важное значение для Человека имеет один из главных источников энергии – каменный уголь, а также торф, о которых можно сказать, что они представляют собой аккумулированную в растительных остатках прошлого энергию Солнца. До сих пор не утратил своего экономического значения добываемый из Растений естественный каучук. Ценные смолы, камеди, эфирные масла, красители и другие продукты, получаемые в результате переработки Растений, занимают видное место в хозяйственной деятельности Человека. Большое число Растений служат основными поставщиками витаминов, а другие (Наперстянка, Раувольфия, Алоэ, Белладонна, Пилокарпус, Валериана и сотни других) – источником необходимых лекарств, веществ и препаратов. Растительный покров не только обогащает атмосферу кислородом, но и даёт приют многочисленным Животным и вообще создаёт обстановку, благоприятную для жизни всех организмов на Земле. За свою многовековую деятельность Человек научился создавать на огромных пространствах растительный покров (поля, сеяные луга, лесопарки, сады, парки и тому подобное), а также отбирать и выводить многочисленные формы Растений, отвечающие тем или иным специальным запросам. Однако чрезмерно интенсивная и далеко не всегда рациональная деятельность Человека привела к уничтожению естественного растительного покрова на огромных площадях и поставила под угрозу исчезновения многие Виды Растений. В связи с этим специальными законодательными актами, принятыми в бывшем Союзе Советских Социалистических Республик (СССР) и в некоторых других странах, мир Растений постепенно берётся под защиту (смотрите Охраняемые Растения И Животные). Изучением различных сторон жизни Растений занимается ботаника и многие специальные ботанические дисциплины.

PLANTS FOR PLANTING = РАСТЕНИЯ ДЛЯ ПОСАДКИ – Plants For Planting are the Plants intended to remain planted, to be planted or replanted.

PLANTS IN VITRO = ПРОБИРОЧНЫЕ РАСТЕНИЯ (или РАСТЕНИЯ ИН ВИТРО) – Plants In Vitro is a commodity class for Plants in an aseptic medium in a closed container. / В переводе с Латинского In Vitro, означает В Лабораторных Условиях или В Пробирке.

PLANT TISSUE CULTURE = КУЛЬТУРА ТКАНИ РАСТЕНИЙ (или КУЛЬТУРА РАСТИТЕЛЬНОЙ ТКАНИ, или ТКАНЕВАЯ РАСТИТЕЛЬНАЯ КУЛЬТУРА) – Plant Tissue Culture is the culture of protoplasts, cells, tissues, organs, embryos, or seed in vitro.

PLANT TYPE = ТИП РАСТЕНИЯ – Plant Type is a set of plant characters (e.g., tillering, leaf and panicle characteristics, plant height) that give a variety its peculiar architecture and geometry. / свойства (characters) .

PLANT USE = ИСПОЛЬЗОВАНИЕ ЭЛЕКТРОСТАНЦИЕЙ – Plant Use:- the electric energy used in the operation of a plant. Included in this definition is the energy required for pumping at pumped storage plants.

PLANT–USE ELECTRICITY = ЭЛЕКТРИЧЕСТВО ДЛЯ ИСПОЛЬЗОВАНИЯ ЭЛЕКТРОСТАНЦИЕЙ – Plant-Use Electricity is the electric energy used in the operation of a plant. This energy total is subtracted from the gross energy production of the plant; for reporting purposes the plant energy production is then reported as a net figure. The energy required for pumping at pumped storage plants is, by definition, subtracted, and the energy production for these plants is then reported as a net figure.

PLANT VARIETY PROTECTION = ЗАЩИТА РАЗНОВИДНОСТЕЙ РАСТЕНИЙ – Plant Variety Protection (PVP):- the developer of a new distinct Variety may obtain protection for a Variety if he/she chooses to do so, provided the Variety meets the requirements of the Plant Variety Protection Act of 1970. This Act permits the owner or developer of a Variety to prohibit others from selling, sexually multiplying, using for propagation for seed, or using to produce a hybrid, seed of his Variety. The Act was revised in 1994. Two options for Plant Variety protection are available to the developer of the variety. Under the first option, the developer of the Variety or his/her agent may sell either certified or uncertified seed of the variety. If the developer of the variety has reason to believe that anyone is infringing on his/her rights, he/she may resort to civil court action. The other option (‘certification option’) for protecting a variety utilizes the provisions of the Title V of the Federal Seed Act. A variety protected in this manner may be sold by Variety name only as a class of certified seed. It is the responsibility of the seller to inform the buyer if the Variety is protected. Each container of seed sold should be labeled with a tag indicating the type of protection that the owner has. Under the first PVP option the label will state:- ‘Unauthorized Propagation Prohibited US Protected Variety’. If the owner of the Variety has chosen the other option for Variety protection, the label will state, ‘Unauthorized Propagation Prohibited To Be Sold by Variety Name Only as a Class of Certified Seed US Protected Variety’.

PLANT VARIETY RIGHT = ПРАВО ПО РАЗНОВИДНОСТЯМ РАСТЕНИЙ – Plant Variety Right (PVR) is a legislation that allows a copyright to be obtained for a specific Plant.

PLASMID = ПЛАЗМИД – Plasmid is nonchromosomal, self-replicating (circular) DNA in bacteria. A principal tool for inserting new genetic information into microorganisms or plants. / Под Плазмидами понимаются факторы наследственности, расположенные в клетках вне хромосом; молекулы ДНК, способные к автономному размножению. Наиболее изучены бактериальные плазмиды (колициногенные, половые факторы, факторы лекарственной устойчивости и другие). Широко используются в генетической инженерии как переносчики генетического материала. Под Плазмидами понимаются факторы наследственности, расположенные в клетках вне хромосом. К плазмидам относят генетические факторы клеточных органелл (Митохондрий, Пластид и других) и генетические факторы, не являющиеся обязательными компонентами клеток. Из последних более изучены так называемый Каппа-Фактор у Парамеций, продуцирующих антибиотическое вещество парамеции, фактор чувствительности к CO_2 и агент, обусловливающий бессамцовость у Дрозофил, а также ряд бактериальных плазмид. У бактерий плазмиды могут контролировать устойчивость к лекарственным веществам, синтез бактерицинов, энтеротоксина, гемолизина и некоторых антигенов. Плазмиды, называющиеся половыми факторами, определяют половую дифференциацию у бактерий. Показано, что многие плазмиды состоят из кольцевых молекул двухнитевой ДНК с молекулярной массой 10^6–10^8 дальтон. Смотрите также Цитоплазматическая Наследственность, и Эписомы.

PLASMODESMATA = ПЛАЗМОДЕСМЫ – Plasmodesmata is cytoplasmic strands passing between the protoplasts of adjacent plant cells through pores in the cell walls. / Под Плазмодесмами, от Греческих слов Plásma, означающее Вылепленное или Оформленное, и Desmós, означающее Связь, понимаются цитоплазматические нити, соединяющие протопласты соседних растительных клеток. Под Плазмодесмами, понимаются цитоплазматические нити, соединяющие соседние растительные клетки. Посредством плазмодесм осуществляется связь между протопластами. Поперечник плазмодесм от 180 до 680 Å (чаще 300–400 Å); число плазмодесм в разных клетках варьирует. Располагаются плазмодесмы в канальцах, проходящих через первичную клеточную оболочку по первичным поровым полям; в клетках с вторичной оболочкой они находятся лишь в

замыкающих плёнках пор. Полость канальцев выстлана наружной мембраной плазмодесмы – Плазмалеммой. Плазмодесмы обеспечивают передачу раздражений и передвижение веществ от клетки к клетке. Смотрите также Десмосомы.

PLASTIC = ПЛАСТИК (или ПЛАСТИЧНОЕ, или ПЛАСТМАССА, или ПЛАСТИЧЕСКАЯ МАССА, или ПЛАСТМАССОВОЕ) – Plastic is a high polymer, usually combined with other ingredients such as curatives, plasticizers, and fillers. It can be molded under heat and pressure and then machined accurately in its hardened state. General term for a wide range of substances. / Пластик – то же, что Пластическая Масса или Пластмасса. Пластические Массы или Пластмассы или Пластики, материалы, содержащие в своём составе полимер, который в период формования изделий находится в вязкотекучем или высокоэластичном состоянии, а при эксплуатации – в стеклообразном или кристаллическом состоянии. В зависимости от характера процессов, сопутствующих формованию изделий, пластические массы делят на Реактопласты и Термопласты. К числу реактопластов относят материалы, переработка в изделия которых сопровождается химической реакцией образования сетчатого полимера – отверждением; при этом пластик необратимо утрачивает способность переходить в вязкотекучее состояние (раствор или расплав). При формовании изделий из термопластов не происходит отверждения, и материал в изделии сохраняет способность вновь переходить в вязкотекучее состояние. Пластические массы обычно состоят из нескольких взаимно совмещающихся и несовмещающихся компонентов. При этом, помимо полимера, в состав пластических масс могут входить наполнители полимерных материалов, пластификаторы, понижающие температуру текучести и вязкость полимера, стабилизаторы полимерных материалов, замедляющие его старение, красители и другие. Пластические массы могут быть однофазными (гомогенными) или многофазными (гетерогенными, композиционными) материалами. В гомогенных пластических массах полимер является основным компонентом, определяющим свойства материала. Остальные компоненты растворены в полимере и способны улучшать те или иные его свойства. В гетерогенных пластических массах полимер выполняет функцию дисперсионной среды (связующего) по отношению к диспергированным в нём компонентам, составляющим самостоятельные фазы. Для распределения внешнего воздействия на компоненты гетерогенного пластика необходимо обеспечить прочное сцепление на границе контакта связующего с частицами наполнителя, достигаемое адсорбцией или химической реакцией связующего с поверхностью наполнителя. Наполненные Пластики:- Наполнитель в пластических массах может быть в газовой или конденсированной фазах. В последнем случае его модуль упругости может быть ниже (низкомодульные наполнители) или выше (высокомодульные наполнители) модуля упругости связующего. К числу газонаполненных пластиков относятся Пенопласты – материалы наиболее лёгкие из всех пластических масс; их кажущаяся плотность составляет обычно от 0.02 до 0.8 грамма на кубический сантиметр (г/см^3). Низкомодульные наполнители (их иногда называют Эластификаторами), в качестве которых используют эластомеры, не понижая теплостойкости и твёрдости полимера, придают материалу повышенную устойчивость к знакопеременным и ударным нагрузкам, предотвращают прорастание микротрещин в связующем. Однако коэффициент термического расширения эластифицированных пластических масс выше, а деформационная устойчивость ниже, чем монолитных связующих. Эластификатор диспергируют в связующем в виде частиц размером 0.2–10 микрометров (мкм). Это достигается полимеризацией мономера на поверхности частиц синтетических латексов, отверждением олигомера, в котором диспергирован эластомер, механическим перетиранием смеси жёсткого полимера с эластомером. Наполнение должно сопровождаться образованием сополимера на границе раздела частиц эластификатора со связующим. Это обеспечивает кооперативную реакцию связующего и эластификатора на внешнее воздействие в условиях эксплуатации материала. Чем выше модуль упругости наполнителя и степень наполнения им материала, тем выше деформационная устойчивость наполненного пластика. Однако введение высокомодульных наполнителей в большинстве случаев способствует возникновению остаточных напряжений в связующем, а следовательно, понижению прочности и монолитности полимерной фазы. Свойства пластических масс с твёрдым наполнителем определяются степенью наполнения, типом наполнителя и связующего, прочностью сцепления на границе контакта, толщиной пограничного слоя, формой, размером и взаимным расположением частиц наполнителя. Пластические массы с частицами наполнителя малых размеров, равномерно распределёнными по материалу, характеризуются изотропией свойств, оптимум которых достигается при степени наполнения, обеспечивающей адсорбцию всего объёма связующего поверхностью частиц наполнителя. При повышении температуры и давления часть связующего десорбируется с поверхности наполнителя, благодаря чему материал можно формовать в изделия сложных форм с хрупкими армирующими элементами. Мелкие частицы наполнителя в зависимости от их природы до различных пределов повышают модуль упругости изделия, его твёрдость, прочность, придают ему фрикционные, антифрикционные, теплоизоляционные, теплопроводящие или электропроводящие свойства. Для получения пластических масс низкой плотности применяют наполнители в виде полых частиц. Такие материалы (иногда называемые Синтактическими Пенами), кроме того, обладают хорошими звуко- и теплоизоляционными свойствами. Применение в качестве наполнителей природных и синтетических органических волокон, а также неорганических волокон (стеклянных, кварцевых, углеродных борных, асбестовых), хотя и ограничивает выбор методов формования и затрудняет изготовление изделий сложной конфигурации, но резко повышает прочность материала. Упрочняющая роль волокон в Волокнитах, материалах, наполненных химическими волокнами (так называемых Органоволокнитах), карбоволокнитах (смотрите Углеродопласты) и стекловолокнитах проявляется уже при длине волокна 2–4 миллиметра (мм). С увеличением длины волокон прочность возрастает благодаря взаимному их переплетению и понижению напряжений в связующем (при высокомодульном наполнителе), локализованных по концам волокон. В тех случаях, когда это допускается формой изделия, волокна скрепляют между собой в нити и в ткани различного плетения. Пластические массы, наполненные тканью (Текстолиты), относятся к слоистым пластикам, отличающимся анизотропией свойств, в частности высокой прочностью вдоль слоёв наполнителя и низкой в перпендикулярном направлении. Этот недостаток слоистых пластиков отчасти устраняется применением так называемых Объёмнотканых Тканей, в которых отдельные полотна (слои) переплетены между собой. Связующее заполняет неплотности переплетений и, отверждаясь, фиксирует форму, приданную заготовке из наполнителя. В изделиях несложных форм, и особенно в полых телах вращения, волокна-наполнители расположены по направлению действия внешних сил. Прочность таких пластических масс в заданном направлении определяется в основном прочностью волокон; связующее лишь фиксирует форму изделия и равномерно распределяет нагрузку по волокнам. Модуль упругости и прочность при растяжении изделия вдоль расположения волокон достигают очень высоких значений. Эти показатели зависят от степени наполнения пластических масс. Для панельных конструкций удобно использовать слоистые пластики с наполнителем из древесного шпона или бумаги, в том числе бумаги из синтетического волокна (смотрите Древесные Пластики, Гетинакс). Значительное снижение массы панелей при сохранении жёсткости достигается применением материалов трёхслойной, или сэндвичевой, конструкции с промежуточным слоем из пенопласта или сотопласта. Основные Виды Термопластов:- Среди термопластов наиболее разнообразно применение полиэтилена, поливинилхлорида и полистирола, преимущественно в виде гомогенных или эластифицированных материалов, реже газонаполненных и наполненных минеральными порошками или синтетическими органическими волокнами. Пластические массы на основе полиэтилена легко формуются и свариваются в изделия сложных форм, они устойчивы к ударным и вибрационным нагрузкам, химически стойки, отличаются высокими электроизоляционными свойствами (диэлектрическая проницаемость 2.1–2.3) и низкой плотностью. Изделия с повышенной прочностью и теплостойкостью получают из

полиэтилена, наполненного коротким (до 3 миллиметров (мм)) стекловолокном. При степени наполнения 20% прочность при растяжении возрастает в 2.5 раза, при изгибе – в 2 раза, ударная вязкость – в 4 раза и теплостойкость – в 2.2 раза. Жёсткая пластическая масса на основе поливинилхлорида – Винипласт, в том числе эластифицированный (ударопрочный), формуется значительно труднее полиэтиленовых пластиков, но прочность её к статическим нагрузкам намного выше, ползучесть ниже и твёрдость выше. Более широкое применение находит пластифицированный поливинилхлорид – Пластикат. Он легко формуется и надёжно сваривается, а требуемое сочетание в нём прочности, деформационной устойчивости и теплостойкости достигается подбором соотношения пластификатора и твёрдого наполнителя. Пластические массы на основе полистирола формуются значительно легче, чем из винипласта, их диэлектрические свойства близки к свойствам полиэтиленовых пластических масс, они оптически прозрачны и по прочности к статическим нагрузкам мало уступают винипласту, но более хрупки, менее устойчивы к действию растворителей и горючи. Низкая ударная вязкость и разрушение вследствие быстрого прорастания микротрещин – свойства, особенно характерные для полистирольных пластиков, устраняются наполнением их эластомерами, то есть полимерами или сополимерами с температурой стеклования ниже –40 °С. Эластифицированный (ударопрочный) полистирол наиболее высокого качества получают полимеризацией стирола на частицах бутадиен-стирольного или бутадиен-нитрильного латекса. Материал, названный АБС, содержит около 15% гель-фракции (блок- и привитые сополимеры полистирола и указанных сополимеров бутадиена), составляющей граничный слой и соединяющей частицы эластомера с матрицей из полистирола. Морозостойкость материала ограничивает температура стеклования эластомера, теплостойкость – температура стеклования полистирола. Теплостойкость перечисленных термопластов находится в пределах 60–80 °С, коэффициент термического расширения высок и составляет $1 \cdot 10^{-4}$, их свойства резко изменяются при незначительном изменении температуры, деформационная устойчивость под нагрузкой низкая. Этих недостатков отчасти лишены термопласты, относящиеся к группе иономеров, например, сополимеры этилена, пропилена или стирола с мономерами, содержащими ионогенные группы (обычно ненасыщенные карбоновые кислоты или их соли). Ниже температуры текучести благодаря взаимодействию ионогенных групп между макромолекулами создаются прочные физические связи, которые разрушаются при размягчении полимера. В иономерах удачно сочетаются свойства термопластов, благоприятные для формования изделий, со свойствами, характерными для сетчатых полимеров, то есть с повышенной деформационной устойчивостью и жёсткостью. Однако присутствие ионогенных групп в составе полимера понижает его диэлектрические свойства и влагостойкость. Пластические массы с более высокой теплостойкостью (100–130 °С) и менее резким изменением свойств с повышением температуры производят на основе полипропилена, полиформальдегида, поликарбонатов, полиакрилатов, полиамидов, особенно ароматических полиамидов. Быстро расширяется номенклатура изделий, изготавливаемых из поликарбонатов, в том числе наполненных стекловолокном. Для деталей, работающих в узлах трения, широко применяются пластики из алифатических полиамидов, наполненных теплопроводящими материалами, например, графитом. Особенно высоки химическая стойкость, прочность к ударным нагрузкам и диэлектрические свойства пластиков на основе политетрафторэтилена и сополимеров тетрафторэтилена (смотрите Фторопласты). В материалах на основе полиуретанов удачно сочетается износостойкость с морозостойкостью и длительной прочностью в условиях знакопеременных нагрузок. Полиметилметакрилат используют для изготовления оптически прозрачных атмосферостойких материалов (смотрите также Органическое Стекло). Объём производства термопластов с повышенной теплостойкостью и органических стекол составляет около 10% общего объёма всех полимеров, предназначенных для изготовления пластических масс. Отсутствие реакций отверждения во время формования термопластов даёт возможность предельно интенсифицировать процесс переработки. Основные методы формования изделий из термопластов – литьё под давлением, экструзия, вакуумформование и пневмоформование. Поскольку вязкость расплава высокомолекулярных полимеров велика, формование термопластов на литьевых машинах или экструдерах требует удельных давлений 30–130 МегаНьютонов на квадратный метр МН/м^2 = (300–1 300 килограммов силы на квадратный сантиметр (кгс/см^2)). Дальнейшее развитие производства термопластов направлено на создание материалов из тех же полимеров, но с новыми сочетаниями свойств, применением эластификаторов, порошковых и коротковолокнистых наполнителей. Основные Виды Реактопластов:- После окончания формования изделий из реактопластов полимерная фаза приобретает сетчатую (трёхмерную) структуру. Благодаря этому отверждённые реактопласты имеют более высокие, чем термопласты, показатели по твёрдости, модулю упругости, теплостойкости, усталостной прочности, более низкий коэффициент термического расширения; при этом свойства отверждённых реактопластов не столь резко зависят от температуры. Однако неспособность отверждённых реактопластов переходить в вязкотекучее состояние вынуждает проводить синтез полимера в несколько стадий. Первую стадию оканчивают получением олигомеров (смол) – полимеров с молекулярной массой 500–1 000. Благодаря низкой вязкости раствора или расплава смолу легко распределить по поверхности частиц наполнителя даже в том случае, когда степень наполнения достигает 80–85% (по массе). После введения всех компонентов текучесть реактопласта остаётся настолько высокой, что изделия из него можно формовать заливкой (литьём), контактным формованием, намоткой. Такие реактопласты называются Премиксами в том случае, когда они содержат наполнитель в виде мелких частиц, и Препрегами, если наполнителем являются непрерывные волокна, ткань, бумага. Технологическая оснастка для формования изделий из премиксов и препрегов проста и энергетические затраты невелики, но процессы связаны с выдержкой материала в индивидуальных формах для отверждения связующего. Если смола отверждается по реакции поликонденсации, то формование изделий сопровождается сильной усадкой материала и в нём возникают значительные остаточные напряжения, а монолитность, плотность и прочность далеко не достигают предельных значений (за исключением изделий, полученных намоткой с натяжением). Чтобы избежать этих недостатков, в технологии изготовления изделий из смол, отверждающихся по реакции поликонденсации, предусмотрена дополнительная стадия (после смешения компонентов) – предотверждение связующего, осуществляемое при вальцевании или сушке. При этом сокращается длительность последующей выдержки материала в формах и повышается качество изделий, однако заполнение форм из-за понижения текучести связующего становится возможным только при давлениях 25–60 МегаНьютонов на квадратный метр (МН/м^2) (250–600 килограммов силы на квадратный сантиметр (кгс/см^2)). Смола в реактопластах может отверждаться самопроизвольно (чем выше температура, тем больше скорость) или с помощью полифункционального низкомолекулярного вещества – отвердителя. Реактопласты с любым наполнителем изготавливают, применяя в качестве связующего феноло-альдегидные смолы, часто эластифицированные поливинилбутиралем (смотрите Поливинилацетали), бутадиен-нитрильным каучуком, полиамидами, поливинилхлоридом (такие материалы называют Фенопластами), и эпоксидные смолы, иногда модифицированные феноло- или анилино-формальдегидными смолами или отверждающимися олигоэфирами. Высокопрочные пластические массы с термостойкостью до 200 °С производят, сочетая стеклянные волокна или ткани с отверждающимися олигоэфирами, феноло-формальдегидными или эпоксидными смолами. В производстве изделий, длительно работающих при 300 °С, применяют стеклопластики или асбопластики с кремнийорганическим связующим; при 300–340 °С – полиимиды в сочетании с кремнезёмными, асбестовыми или углеродными волокнами; при 250–500 °С в воздушной и при 2 000–2 500 °С в инертной средах – фенопласты или пластики на основе полиамидов, наполненные углеродным волокном и подвергнутые карбонизации (графитации) после формования изделий. Высокомодульные пластические массы (модуль упругости 250–350 ГигаНьютонов на квадратный метр (ГН/м^2)

(25 000–35 000 килограммов силы на квадратный миллиметр (кгс/мм^2)) производят, сочетая эпоксидные смолы с углеродными борными или монокристаллическими волокнами (смотрите также Композиционные Материалы). Монолитные и лёгкие пластические массы, устойчивые к вибрационным и ударным нагрузкам, водостойкие и сохраняющие диэлектрические свойства и герметичность в условиях сложного нагружения, изготавливают, сочетая эпоксидные, полиэфирные или меламино-формальдегидные смолы с синтетическими волокнами или тканями, бумагой из этих волокон. Наиболее высокие диэлектрические свойства (диэлектрическая проницаемость 3.5–4.0) характерны для материалов на основе кварцевых волокон и полиэфирных или кремнийорганических связующих. Древесно-слоистые пластики широко используют в промышленности стройматериалов и в судостроении. Объём Производства И Структура Потребления Пластмасс:- Пластические материалы на основе природных смол (канифоли, шеллака, битумов и другое) известны с древних времён. Старейшей пластической массой, приготовленной из искусственного полимера – нитрата целлюлозы, является целлулоид, производство которого было начато в Сединённых Штатах Америки (США) в 1872. В 1906–10 в России и Германии в опытном производстве налаживается выпуск первых реактопластов – материалов на основе феноло-формальдегидной смолы. В 1930-х в бывшем Союзе Советских Социалистических Республик (СССР), США, Германии и других промышленно развитых странах организуется производство термопластов – поливинилхлорида, полиметилметакрилата, полиамидов, полистирола. Однако бурное развитие промышленности пластмасс началось только после 2-й Мировой Войны 1939–45. В 1950-х во многих странах начинается выпуск самой крупнотоннажной пластической массы – полиэтилена. В бывшем Союзе Советских Социалистических Республик (СССР) становление промышленности пластических масс как самостоятельной отрасли относится к периоду довоенных пятилеток (1929–40). Производство пластмасс составило (в тысячах тонн (т)):- в 1940 – 24, в 1950 – 75, в 1960 – 312, в 1970 – 1 673, в 1973 – около 2 300. Основные предприятия были сосредоточены в Европейской части (84% общесоюзного производства пластических масс). К их числу относились Орехово-Зуевский завод ‘Карболит’, Казанский Завод Органического Синтеза, Полоцкий Химический Комбинат, Свердловский Завод Пластмасс, Владимирский Химический Завод, Горловский Химический Комбинат, Московский Нефтеперерабатывающий Завод. В перспективе в связи с созданием крупнейших Томского и Тобольского нефтехимических комплексов на базе Тюменских нефтяных месторождений, развитием Омского нефтехимического комплекса и соответствующих заводов пластмасс около 30% их производства будет приходиться на Восточные районы. Основные действующие предприятия в этих районах – Кемеровский завод ‘Карболит’, Тюменский Завод Пластмасс. Производство пластических масс в 1973 в некоторых капиталистических промышленно развитых странах характеризовалось следующими данными (в тысячах тонн (т)):- Соединённые Штаты Америки (США) – 13 200, Япония – 6 500, Федеративная Республика Германия (ФРГ) – 6 500, Франция – 2 500, Италия – 2 300, Великобритания – 1 900. В 1973 мировое производство полимеров для пластических масс достигло ~43 миллионов т. Из них около 75% приходилось на долю термопластов (25% полиэтилена, 20% поливинилхлорида, 14% полистирола и его производных, 16% прочих пластиков). Существовала тенденция к дальнейшему увеличению доли термопластов (в основном полиэтилена) в общем производстве пластических масс. Хотя доля термореактивных смол в общем выпуске полимеров для пластических масс составляла всего около 25%, фактически объём производства реактопластов выше, чем термопластов, из-за высокой степени наполнения (60–80%) смолы. Потребление пластических масс в строительстве непрерывно возрастает. При увеличении мирового производства пластических масс в 1960–70 примерно в 4 раза объём их потребления в строительстве возрос в 8 раз. Это было обусловлено не только уникальными физико-механическими свойствами полимеров, но также и их ценными архитектурно-строительными характеристиками. Основные преимущества пластических масс перед другими строительными материалами – лёгкость и сравнительно большая удельная прочность. Благодаря этому может быть существенно уменьшена масса строительных конструкций, что является важнейшей проблемой современного индустриального строительства. Наиболее широко пластические массы (главным образом рулонные и плиточные материалы) используют для покрытия полов и других отделочных работ (смотрите также Полимербетон), герметизации, гидро- и теплоизоляции зданий, в производстве труб и санитарно-технического оборудования. Их применяют и в виде стеновых панелей, перегородок, элементов кровельных покрытий (в том числе светопрозрачных), оконных переплётов, дверей, пневматических строительных конструкций, домиков для туристов, летних павильонов и другого. Пластические массы занимают одно из ведущих мест среди конструкционных материалов машиностроения. Потребление их в этой отрасли становится соизмеримым (в единицах объёма) с потреблением стали. Целесообразность использования пластических масс в машиностроении определяется прежде всего возможностью удешевления продукции. При этом улучшаются также важнейшие технико-экономические параметры машин – уменьшается масса, повышаются долговечность, надёжность и другое. Из пластических масс изготовляют зубчатые и червячные колёса, шкивы, подшипники, ролики, направляющие станков, трубы, болты, гайки, широкий ассортимент технологической оснастки и другое. Основные достоинства пластических масс, обусловливающие их широкое применение в авиастроении, – лёгкость, возможность изменять технические свойства в большом диапазоне. За период 1940–70 число авиационных деталей из пластических масс увеличилось от 25 до 10 000. Наибольший прогресс в использовании полимеров достигнут при создании лёгких самолётов и вертолётов. Тенденция ко всё более широкому их применению характерна также для производства ракет и космических аппаратов, в которых масса деталей из пластических масс может составлять 50% от общей массы аппарата. С использованием реактопластов изготовляют реактивные двигатели, силовые агрегаты самолётов (оперение, крылья, фюзеляж и другое), корпуса ракет, колёса, стойки шасси, несущие винты вертолётов, элементы тепловой защиты, подвесные топливные баки и другое. Термопласты применяют в производстве элементов остекления, антенных обтекателей, при декоративной отделке интерьеров самолётов и другого, пено- и сотопласты – как заполнители высоконагруженных трёхслойных конструкций. Области применения пластических масс в судостроении очень разнообразны, а перспективы использования практически неограничены. Их применяют для изготовления корпусов судов и корпусных конструкций (главным образом стеклопластики), в производстве деталей судовых механизмов, приборов, для отделки помещений, их тепло-, звуко- и гидроизоляции. В автомобилестроении особенно большую перспективу имеет применение пластических масс для изготовления кабин, кузовов и их крупногабаритных деталей, так как на долю кузова приходится около половины массы автомобиля и ~40% его стоимости. Кузова из пластических масс более надёжны и долговечны, чем металлические, а их ремонт дешевле и проще. Однако пластические массы не получили ещё большого распространения в производстве крупногабаритных деталей автомобиля, главным образом из-за недостаточной жёсткости и сравнительно невысокой атмосферостойкости. Наиболее широко пластические массы применяют для внутренней отделки салона автомобиля. Из них изготовляют также детали двигателя, трансмиссии, шасси. Огромное значение, которое пластические массы играют в электротехнике, определяется тем, что они являются основой или обязательным компонентом всех элементов изоляции электрических машин, аппаратов и кабельных изделий. Пластические массы часто применяют и для защиты изоляции от механических воздействий и агрессивных сред, для изготовления конструкционных материалов и другого. Тенденция ко всё более широкому применению пластических масс (особенно плёночных материалов, смотрите Полимерные Плёнки) характерна для всех стран с развитым сельским хозяйством. Их используют при строительстве культивационных сооружений, для мульчирования почвы, дражирования семян, упаковки и хранения сельскохозяйственной продукции и так далее. В мелиорации и сельскохозяйственном водоснабжении полимерные плёнки служат экранами, предотвращающими потерю воды

на фильтрацию из оросительных каналов и водоёмов; из пластических масс изготовляют трубы различного назначения, используют их в строительстве водохозяйственных сооружений и другого. В медицинской промышленности применение пластических масс позволяет осуществлять серийный выпуск инструментов, специальной посуды и различных видов упаковки для лекарств. В хирургии используют пластмассовые клапаны сердца, протезы конечностей, ортопедические вкладки, туторы, стоматологические протезы, хрусталики глаза и другое.

PLASTICITY = ПЛАСТИЧНОСТЬ (или ТЕКУЧЕСТЬ) – Plasticity is the capacity of organisms with the same genotype to vary in developmental pattern, in phenotype, or in behavior according to varying environmental conditions. / Под Пластичностью, от Греческого слова Plastikós, означающее Годный Для Лепки или Податливый, понимается свойство твёрдых тел необратимо деформироваться под действием механических нагрузок. Пластичность определяет возможность обработки материалов давлением (ковки, прокатки и другое). Под Пластичностью в физиологии понимается способность клеток и органов животных и растений менять в известных пределах свои свойства в зависимости от условий их функционирования. Так, говорят о пластичности центральной нервной системы (ЦНС), проявляющейся, например, в её функциональных перестройках, компенсирующих потерю той или иной части вещества мозга, о пластичности Синапсов и тому подобному. Под Текучестью понимается свойство сред пластически или вязко деформироваться под действием механических напряжений. Количественно текучесть – величина, обратная вязкости. У газов и жидкостей текучесть проявляется при любых напряжениях, в пластичных твёрдых тел – лишь при высоких напряжениях, превышающих предел текучести.

PLASTICIZER = ПЛАСТИФИКАТОР (или МЯГЧИТЕЛЬ) – Plasticizer:- (1) a chemical added to polymers and resins to impart flexibility, workability, or stretchability. (2) A bonding agent that acts by solvent action on fibers. / Под Пластификаторами полимеров, от Греческого слова Plaslós, означающее Лепной или Пластичный, и Латинского слова Facio, означающее Делаю), понимаются вещества, повышающие пластичность и (или) эластичность полимеров при их переработке и (или) эксплуатации. Благодаря применению пластификаторов (иногда их называют также Мягчителями) облегчается диспергирование в полимерах наполнителей и других сыпучих ингредиентов, снижаются температуры переработки композиций на технологическом оборудовании. Некоторые пластификаторы придают полимерным материалам негорючесть, свето-, термо-, морозо-, влагостойкость и другие ценные специальные свойства. В качестве пластификаторов используют нелетучие, химически инертные продукты, способные совмещаться с полимером, то есть образовывать с ним устойчивые композиции при введении достаточно больших количеств пластификаторов (иногда до 100% в расчёте на массу полимера). К распространённым пластификаторам относятся эфиры органических и неорганических кислот, например, дибутилфталат, ди-(2-этилгексил) фталат, дибутилсебацинат, трикрезил- и трибутилфосфат; продукты нефтепереработки, например, нефтяные масла; продукты переработки каменного угля и древесных материалов, например, кумароно-инденовые смолы, канифоль; эпоксидированные растительные масла и другие. Для совмещения полимеров с пластификаторами (так называемой Пластификации) используют различные способы:- диспергирование полимера в растворе или эмульсии пластификаторов, добавление пластификаторов к мономерам перед их полимеризацией или поликонденсацией, введение пластификаторов в многокомпонентную полимерную композицию и другие. Наибольшее значение пластификаторы имеют при переработке пластмасс (около 70% от общего объёма производства пластификаторов используют при переработке поливинилхлорида). Важную роль они играют также в производстве резины и лакокрасочных материалов.

PLASTIC MONEY = ПЛАСТИКОВЫЕ ДЕНЬГИ – Plastic Money is a popular term for all plastic cards, such as credit cards (Eurocard, VISA card) or Ec-card (Eurocheque card) used as paying medium instead of cash. Also known as Cash Card, Check Card, Credit Card, Debit Card, Plastic, and Plastic Card. / Популярный термин для всех пластиковых карт, таких как кредитные карты Юэкард, ВИЗА (Eurocard, VISA card) или Еч-карта (Еврочековая карта), используемых в качестве платёжного инструмента вместо наличных денег.

PLASTID = ПЛАСТИД – Plastid is a discrete structure, such as a chloroplast, within a cell often containing water-insoluble colored pigments such as chlorophyll and associated yellow, range or red pigments. Plastid is a generic name for all chloroplastlike organelles found in different plant cells. / Под Пластидами, от Греческого слова Plástides, означающее Образующие или Создающие, от Plastós, означающее Вылепленный или Оформленный, понимаются цитоплазматические органоиды растительных клеток. Нередко содержат пигменты, обусловливающие окраску пластидов. У высших растений зелёные пластиды – хлоропласты, бесцветные – лейкопласты, различно окрашенные – хромопласты; у большинства водорослей пластиды называются хроматофорами. Пластиды, внутриклеточные органеллы цитоплазмы автотрофных растений, содержащие пигменты и осуществляющие синтез органических веществ. У высших растений различают 3 типа пластидов:- (i) бесцветные лейкопласты (ЛП), (ii) зелёные хлоропласты (ХП), и (iii) различно окрашенные хромопласты (ХР). Совокупность пластидов всех типов носит название Пластом или Пластидом. Хлоропласты – тельца линзовидной или округлой формы размером 4–6 мкм (редко до 9 и как исключение до 24 мкм); они содержат около 50% белка, 35% липидов и 7% пигментов, а также небольшое количество дезоксирибонуклеиновой (ДНК) и рибонуклеиновой (РНК) кислот. Находясь в тесном взаимодействии с другими компонентами клетки, имея в своём составе ДНК и РНК, пластиды обладают некоторой генетической автономностью. Пигменты хлоропластов у высших растений представлены зелёными хлорофиллами а и в и каротиноидами – красно-оранжевым каротином и жёлтым ксантофиллом. ДНК в ХП несколько отличается от ДНК ядра м сходна с ДНК Синезелёных Водорослей и Бактерий. В световом микроскопе в строении ХП наблюдается зернистая структура (граны); с помощью электронного микроскопа установлено, что ХП отделён от цитоплазмы двуслойной липидно-белковой оболочкой (мембраной). В бесцветном строме (матриксе) ХП расположена ламеллярная система, состоящая из образованных липидно-белковой мембраной небольших плоских мешочков – цистерн или так называемых тилакоидов двух типов. Одни, меньших размеров, собраны в пачки, напоминающие столбики монет, – тилакоиды гран. Другие, большей площади, располагаются как между тилакоидами гран, так и в межгранных участках стромы (тилакоиды стромы). На внешней поверхности тилакоидов белковый компонент мембран представлен глобулярными белками-ферментами (полиферментные комплексы). В состав мембран входят также хлорофиллы и каротиноиды, образуя таким образом липидно-белковый комплекс, в котором на свету осуществляется фотосинтез. Такое строение ХП во много раз увеличивает их активную синтезирующую поверхность. Эти пластиды способны размножаться как делением на 2 примерно равные части, так и почкованием – отделением небольшой части в виде пузырька, который увеличивается и развивается в новый ХП. ЛП – небольшие тельца, не имеющие окраски, округлые или вытянутые в длину, присутствуют во всех живых клетках растений. В ЛП из простых органических соединений синтезируются более сложные вещества – крахмал и, возможно, жиры и белки, откладываемые в запас в тканях клубней, корней, корневищ и в эндосперме семян. По характеру накопляемых веществ ЛП делят на аминокислоты, элеопласты и протеинопласты. Они имеют оболочку (подобно ХП) из 2 липоидно-белковых мембран, но в их строме имеются лишь один или несколько выростов внутренней мембраны оболочки (наподобие таковых у митохондрий). ХР бывают округлой, неправильно многоугольной или даже игольчатой формы. Они содержат каротиноиды и придают жёлтую и оранжевую окраску осенним листьям, листочкам околоцветника, созревающим и зрелым плодам помидоров, рябины, ландыша и других. Все типы пластидов способны

переходить один в другой. Так, ЛП могут превращаться в ХП (например, позеленение клубней картофеля на свету); к осени ХП утрачивают хлорофилл и преобразуются в ХР; в свою очередь, ХР способны превращаться в ХП (этим объясняется позеленение верхушки корнеплода моркови на свету). Все пластиды имеют общее происхождение. Они развиваются из так называемых инициальных частиц – небольших пузыревидных образований, отделяющихся от оболочки клеточного ядра. Многие биологи рассматривают пластиды как видоизменённые синезелёные водоросли, вступившие на заре жизни в симбиотические взаимоотношения с клетками гетеротрофных организмов. У большинства водорослей пластиды представлены одним или несколькими хроматофорами (ХМ), различающимися формой и размерами:- сплошная (у мужоции) или перфорированная (у кладофоры) пластинка, 2 звёздчатые пластинки (у зигонемы), 1–2 спирально закрученные лентовидные полосы (у спирогиты), чашевидная (у хламидомонады) и другие. На ХФ обычно имеются участки особого строения – пиреноиды, в которых накапливаются запасные вещества – продукты синтетической деятельности. У ряда водорослей в ХФ, помимо хлорофиллов и каротиноидов, присутствуют и другие пигменты, маскирующие зелёную окраску хлорофилла (например, диатомин у диатомовых и фукоксантин у бурых водорослей, синий фикоциан и красный фикоэритрин у синезелёных водорослей и багрянок). В ХФ имеются оболочки из 2 липидно-белковых мембран такого же строения, как и в пластидах высших растений. В строме располагается многослойная структура из нескольких ламелл, подобных тилакоидам стромы ХП.

PLASTISOL = ПЛАСТИЗОЛЬ – Plastisol:- with reference to textile arts, a type of screen printing (‘silkscreen’) ink which consists of a colored pigment, fine particles of polyvinyl chloride, and a plasticizer. Plastisol ink does not dry. It must be heated to the point where the PVC particles melt and mix with the plasticizer and pigment to form a flexible colored plastic film. Plastisol ink stays on fabric simply because is surrounds and encapsulates the fibers mechanically. This is by far the most popular type of ink for commercial screen printing of t-shirts and the like. Plastisol or Plastisols:- come in a variety of colors and styles; process colors, low-fusion, highly elastic, color concentrates, color-matching systems, puff, fluorescent, glier, metallic, high density... Plastisols print on lights and darks and every color shade in between. They are generally easy to fuse in most commercial heaters and dryers, whether convection hot air or infrared emission is the source of heat. Plastisol is time and temperature reacting and generally has a wide window of thermal exposure latitude. Therefore, they are easy to gel under most flash units. There are two primary ingredients in a plastisol ink (resin and plasticizer). The resin is a solid particle of vinyl and the plasticizer is a syrupy liquid. When the two are mixed, the plasticizer begins to solvate the surface of the vinyl particles. / Puff = Буф или Вставка или Клин. Под Пластизолями понимаются концентрированные коллоидные дисперсии полимеров в жидких пластификаторах. Пластизоли обычно содержат 30–80% пластификатора. Пластизоли применяют для получения искусственной кожи, пенопластов, покрытий на металлических поверхностях. Наибольшее распространение получили пластизоли на основе поливинилхлорида и сополимеров винилхлорида с винилацетатом.

PLASTRON = ПЛАСТРОН (или НАГРУДНИК, или НАБОЧНИК) – Plastron is a metal breastplate formerly worn under the hauberk.

PLATE COUNT = ЧАШЕЧНЫЙ ПОДСЧЁТ – Plate Count is a count of the number of colonies formed on a culture medium which has been inoculated with a small amount of organisms. / Чашечный Подсчёт – определение количества микроорганизмов посевом на чашках Петри.

PLATED = ДВУХЛИЦЕВАЯ (или ПЛАТИРОВАННАЯ) – Plated:- (1) a term to describe a fabric that is produced from two yarns of different colors, characters, or qualities, one of which appears on the face and the other on the back. (2) A term to describe a yarn covered by another yarn. / Ткань из пряжи двух цветов или пряжи разных номеров, разных круток, причём лицевую сторону ткани образует одна пряжа, а изнаночную – другая пряжа.

PLATES = ПЛИТЫ (или ТОЛСТАЯ ЛИСТОВАЯ СТАЛЬ, или СУТУНКА, или ГОРЯЧЕКАТАНАЯ ПЛОСКАЯ ЗАГОТОВКА) – Plates:- rolled from heavy slabs supplied by a slabbing mill or continuous caster or sometimes rolled directly from an ingot, plates vary greatly in dimensions. The largest mills can roll plates 200 millimeters thick, 5 meters wide, and 35 meters long. These three dimensions are determined by the slab or ingot weight as well as the rolling-mill size. Sometimes only a few plates of the same dimensions and quality specifications are ordered. Most mills have two continuous, broadside push-through or walk-through furnaces, which heat the slabs to about 1 250 °C. Sometimes two batch-type furnaces are also used for heating odd-sized or extra-heavy slabs and ingots. Before rolling, high-pressure water jets descale the slabs. Most plate mills are four-high mills, as shown in C in the figure, and are supplemented by vertical edge rolls. The work rolls and backup rolls of large mills have diameters of 1.2 and 2.4 meters, respectively, and a roll face length up to 6 meters. Their maximum total rolling force is often 10 000 tons, and their rolls are driven by an 8 000-kiloWatt motor. Most mills have hydraulic roll adjustment, which transmits the roll pressure to a computer; the computer uses this and other rolling parameters, such as temperature and thickness of the plate at all locations, to control the rolling process by a mathematical model. This technology – actually a computerized art – permits not only the rolling of huge workpieces with high accuracy (e.g., to a thickness tolerance of 0.2 millimeter) but also the control of rectangularity, flatness, plan-view shape, yield, physical properties, and profile. Several plants are even capable of rolling plates with a tapered or stepped thickness. Sometimes plants use two rolling mills, a roughing stand and a finishing stand, to improve surface quality and increase production. Most plate mills also have elaborate equipment for leveling, cooling, shearing or milling of edges, heat-treating, and marking. / прокатка (rolling). Под Сутункой понимается плоская стальная заготовка толщиной обычно 4–22 миллиметра (мм) и шириной 150–730 мм. Используется для получения прокатной жести, трансформаторной, кровельной стали и так далее. Заготовка горячекатаная плоская (сутунка). Сутунка, плоская стальная заготовка толщиной 4–22 мм и шириной около 150–730 мм, получаемая на сортопрокатных и заготовочных станах, предназначенная для горячей штучной прокатки тонких листов толщиной 0.18–3.0 мм. Сутунка используется для получения жести, динамной, трансформаторной, кровельной и тонколистовой стали, а также штрипсов для сварных труб. Сутунка прокатывается в горячем состоянии в двухвалковых клетях (иногда пакетным способом) или на сутуно-заготовочных станах. Длину Сутунка выбирают с учётом ширины листа или максимально возможной длины заготовки при нагреве в методической печи под дальнейшую прокатку на штрипсовом стане.

PLATFORM = НА ПЛАТФОРМЕ – Platform is a shoe having a platform sole, namely a usually thick layer between the inner sole and outer sole of a shoe. / обувь, имеющая подошву в виде платформы, а именно .

PLATFORM = ПЛАТФОРМА – (1) Platform:- the bare floor of a container, suitable for the carriage of uncontainerable cargo, as several platforms can be placed together to provide a larger base. Plated for the carriage of heavy goods. 20’ and 40’. Platform containers are without sides, ends and roof. They are used for odd-sized cargo which does not fit on or in any other type of container. Specific dimensions and capacity of platform containers may vary depending on the container manufacturer, the age of the container and the container owner. / Под Платформой, от Французского слова Plate-Forme, от Plat, означающее Плоский, и Forme, означающее Форма, понимается грузовой вагон открытого типа с небольшими бортами.

(2) Platform:- the area on an airport where aircrafts are parked for embarkation and/or loading and discharging purposes (aircargo). / В перевозках авиационных грузов, площадка в аэропорте, где самолёты припарковываются для посадки и/или с целью погрузки и выгрузки.

PLATFORM BODY = КУЗОВ–ПЛАТФОРМА (или МОДУЛЬ, или ТРАЛ) – Platform Body is a truck or trailer without ends, sides or top but with only a floor. / Под Роспуском понимается одно- или (реже) двухосный прицеп для перевозки длинномерных грузов. Вместо кузова роспуск имеет поворотное приспособление (коник) для крепления груза.

PLATINUM = ПЛАТИНА – Platinum is a chemical element in the periodic table that has the symbol Pt and atomic number 78. A heavy, malleable, ductile, precious, gray-white transition metal, platinum is resistant to corrosion and occurs in some nickel and copper ores along with some native deposits. Platinum is used in jewelry, laboratory equipment, electrical contacts, dentistry, and automobile emissions control devices. Platinum:- chemical symbol Pt. Its specific gravity is 21.45 and melting point is 1 773 °C. Platinum Bullion, available in units of 10-ounce, .9995 fine bullion bars. Each bar is hallmarked to certify weight and purity. Coins:- (i) Canadian Platinum Maple Leafs, available in units of 10 one-ounce coins, .9995 fine platinum. Legal tender coin Canada with a CAD50.00 face value. Also available for personal delivery only in fractional sizes of ounce, ounce and 1/10 ounce, in units of 20 coins each. (ii) US Platinum American Eagles, Available in units of 10 one-ounce coins, .9995 fine platinum. Legal tender coin in the United States, with a USD100.00 face value, the highest face value ever to appear on a US coin. Also available for personal delivery only in fractional sizes of ounce, ounce and 1/10 ounce, in units of 20 coins each. When pure, the metal appears greyish-white and firm. The metal is corrosion-resistant. The catalytic properties of the six platinum family metals are outstanding. For this catalytic property, platinum is used in catalytic converters, incorporated in automobile exhaust systems, as well as tips of spark plugs. All of the platinum ever mined throughout history would fit into a cube less than 25 feet on each side. The amount of platinum mined annually is less than $1/15^{th}$ of annual gold production, and less than $1/150^{th}$ of annual silver production. Approximately 90% of newly mined platinum comes from South Africa and the former Soviet republics. Platinum plays an important role in today's automotive, electrical, petrochemical and glass industries, as well as a growing role in the jewelry industry. Investment demand has prompted the US Mint to take platinum off the world market to produce its American Eagle Platinum Coin. A platinum coin offers investors a divisible size and universally acceptable and recognizable form in which to own platinum. This makes the purchase of platinum coins and the selling of platinum coins easy and convenient. / Платина, наряду с золотом, серебром и металлами платиновой группы, составляет благородные металлы. Платина, от Испанского слова Platina, уменьшительного от Plata, означающее Серебро. На Латинском Платинум (Platinum), символ Pt, химический элемент VIII группы периодической системы Менделеева. Платина – серовато-белый блестящий металл, очень стойкий химически (при комнатной температуре на платину действуют лишь 'царская водка' (смесь концентрированных кислот:- 1 объёма азотной и 3 объёмов соляной) и бром), тяжёлый тугоплавкий металл. Относится к платиновым металлам. Атомный номер 78, атомная масса 195.09, плотность 21 450 кг/м^3, $t_{пл}$ 1 772 °C. В природе встречается главным образом в самородном состоянии, обычно в виде сплавов. Главные минералы платины – самородная платина, железистая платина. Получают платину из шламов электролитического производства никеля и меди, из обогащённых россыпей, из лома технических изделий. Благодаря своим ценным свойствам – коррозионной стойкости, устойчивости к действию высоких температур, хорошей обрабатываемости давлением платина широко применяется в различных областях техники (электро- и радиотехнике). Из Платины (и её сплавов с Родием (Rhodium, символ Rh) и Иридием (Iridium, символ Ir)) изготовляют аппаратуру для химической промышленности. Платиновые электроды используют для электрохимического выделения радиоактивных элементов и для катодной защиты от коррозии, чистейшую платину – для термометров сопротивления и термопар (сплавы платины с Иридием (Iridium, символ Ir), Осмием (Osmium, символ Os), Палладием (Palladium, символ Pd), Родием (Rhodium, символ Rh), Рутением (Ruthenium, символ Ru)), для электрических контактов, нагревателей и анодов. Платина – один из самых распространённых катализаторов (около 50%), в частности в реакциях окисления (синтез серной кислоты окислением SO_2, синтез азотной кислоты окислением NH_3, дожигание выпускных газов автомобилей), при риформинге нефти (совместно с рением (Rhenium, символ Re)) и другом. Большое количество платины идёт на изготовление ювелирных изделий и драгоценных монет. Самородная Платина, минерал класса самородных элементов, состоящий в основном из платины. Примеси железа (до 10% в поликсене, до 20% в ферроплатине), иридия, меди, палладия, родия. Разновидности:- иридистая платина (до 28% Ir), медистая платина (7–13% Cu), палладистая платина (7–37% Pd), поликсен (до 10% Fe), родистая платина (до 5% Rh), ферроплатина (до 20% Fe). От белого до серо-стального цвета вкраплённости в породу, зёрна в россыпях. Твёрдость по минералогической шкале 4–4.5, плотность до 21 500 кг/м^3. Ковкий минерал. Месторождения в ультраосновных породах (коренные) и россыпи. Главный источник получения платины. Платина Самородная, группа платиновых минералов, являющихся природными твёрдыми растворами Fe, Cu, Ni, Ir, Rh, Pd, Sn, Os, Ru, Au, Ag, Bi, Pb в платине. Обычно содержат 2–3 основных (минералообразующих) металла и различное количество металлов-примесей. Их главный элемент – платина; в кристаллической структуре самородной платины она является металлом-растворителем, её структура наследуется минералами самородной платины. Атомы второстепенных минералообразующих и примесных элементов статистически распределяются в унаследованной структуре платины, как бы растворяясь в ней. Подобными кристаллическими структурами обладают следующие минералы самородной платины:- твёрдые растворы Fe в Pt – поликсен (2.5–11.9 весового % Fe) и ферроплатина (12.0–28.1% Fe); Ir в Pt – иридистая платина (10.4–37.5% Ir); Pd в Pt – палладистая платина (19.4–40.0% Pd); Sn и Pd в Pt – палладистая станноплатина (16–23% Sn и 17.2–20.9% Pd). Содержание примесей в минералах самородной платины достигает:- в поликсене – 8.8% Ir, 6,8% Rh, 6% Pd, 3.3% Cu и 2.3% Ru; в ферроплатине – до 14.3% Ni, 14% Cu, 12.9% Pd, 7.5% Ir, 5.8% Rh и 3% Bi; в иридистой платине – до 11% Os, 4% Pd и 2.5% Ru; в палладистой платине – до 3% Au; в палладистой станноплатине – до 2.5% Bi. Поликсен и ферроплатина с содержанием Rh свыше 4% называется Родистой Платиной, ферроплатина с содержанием свыше 7% Cu – Медистой Ферроплатиной или Купроплатиной; ферроплатина, в которой более 3% Ni, называют иногда Никелистой Платиной. Ферроплатина и поликсен являются наиболее распространёнными минералами самородной платины. Кристаллизуются минералы самородной платины в кубической системе, кристаллическая структура типа меди, решётка гранецентрированная кубическая. Минералы самородной платины непрозрачные, серо-стального и серебряно-белого цвета, с жёлтым оттенком у палладистой платины и бронзовым – у купроплатины; металлический блеск особенно сильный у иридистой платины. Выделения этих минералов (зёрна, сростки, кристаллы) часто покрыты с поверхности чёрной оксидной плёнкой, тонкой и хрупкой. Преобладающая часть выделений ферроплатины и поликсена и некоторые из выделений купроплатины обладают магнитными свойствами. Почти все минералы самородной платины ковкие, исключая слабохрупкую иридистую платину. Твёрдость по минералогической шкале в пределах 3.5–5.5; минимальная у Cu- и Ni-содержащих минералов и максимальная у Ir-содержащих минералов. Плотность от 13 100 до 21 500 килограммов на кубический метр (кг/м^3), наименьшая – у ферроплатины (13 100–16 000 кг/м^3) и палладистой станноплатины, самая большая – у чистой природной платины. Минералы самородной платины – хорошие проводники электричества. Обычны выделения минералов самородной платины в виде зёрен неправильной формы, редких мелких кристаллов – прямоугольников, кубов, октаэдров, кубооктаэдров; изредка встречаются двойниковые сростки кристаллов и чрезвычайно редко – скатанные и угловатые самородки (зернистые агрегаты). Размеры зёрен и кристаллов – от

десятых долей и единиц микрона до нескольких миллиметров (мм), очень редко – единицы см, а самородков – до первых десятков см при массе от нескольких граммов (г) до нескольких килограммов (кг). Наиболее крупные в СССР самородки найдены в дунитах Нижнетагильского массива на Среднем Урале (самый большой из них 427.5 г) и в аллювиальных платиновых россыпях там же (9 439 г). Самородки состоят не только из минералов самородной платины – ферроплатины, поликсена, иридистой платины; они содержат также включения минералов иридия и осмия. Крупные платиновые самородки (в сотни и тысячи г) охраняются государством. Минералы самородной платины – эндогенные:- их образование связано с позднемагматическими и метаморфическими стадиями формирования магматических месторождений и гидротермальной стадией образования постмагматических месторождений (в пегматитах, скарнах, гидротермальных жилах). В максимальной степени эти минералы концентрируются в месторождениях платиновых руд. Один из наиболее редких минералов самородной платины – металлическая платина установлена среди продуктов распада природных твёрдых растворов Pt в Ir в платиновых рудах, генетически связанных с форстеритовыми дунитами. Минералы самородной платины – один из главных природных источников получения платиновых металлов. Платиновые Руды, минеральные образования, содержащие платиновые металлы в промышленных концентрациях. Главные минералы:- самородная платина, поликсен, ферроплатина, платинистый иридий, невьянскит, сысертскит и другие. Коренные месторождения преимущественно магматического происхождения содержат от десятых долей г/т до единиц кг/т; россыпи – от десятков мг/м^3 до сотен г/м^3. Главные добывающие страны:- Канада, Колумбия, США и ЮАР.

PLATINUM = ПЛАТИНОВОЕ (или ПЛАТИНА) – Platinum is a moderate gray.

PLATINUM AND PALLADIUM FIXINGS = ФИКСИРОВАНИЯ ЦЕНЫ ПЛАТИНЫ И ПАЛЛАДИЯ (или УСТАНОВЛЕНИЯ ЦЕНЫ ПЛАТИНЫ И ПАЛЛАДИЯ) – The Platinum And Palladium Fixings are currently conducted by four Full Members of the London Platinum and Palladium Market (LPPM) by telephone at 09:45 am and 02:00 pm each working day under the chairmanship of Standard Bank. The other LPPM Fixing members are Engelhard Metals, Goldman Sachs International and HSBC Bank USA NA London Branch. The process then follows a similar pattern to the gold, arriving at a fixing price when buying and selling orders are matched. Fixing prices for platinum and palladium are published immediately by the various news agencies. Historical data for Platinum and Palladium Fixing data may be obtained from the LPPM website:- http://www.lppm.org.uk. Platinum Fixing is held twice each working day at 09:45 am and 02:00 pm in the City of London, the United Kingdom. / Энхэльхард Метэлз (Engelhard Metals), Голдмэн Сэкс (Goldman Sachs) и Эйч.Эс.Би.Си. Бэньк (HSBC Bank).

PLATINUM GROUP ELEMENTS = ЭЛЕМЕНТЫ ПЛАТИНОВОЙ ГРУППЫ (или ПЛАТИНОИДЫ) – Platinum Group Elements (PGEs):- the six metallic elements Platinum, Palladium, Rhodium, Ruthenium, Iridium and Osmium.

PLATINUM GROUP METALS = МЕТАЛЛЫ ПЛАТИНОВОЙ ГРУППЫ (или ПЛАТИНОИДЫ) – Platinum Group Metals:- Platinum and related metals, including Iridium, Osmium, Palladium, Rhodium, and Ruthenium. Platinum Group Metals (PGMs) are Platinum, Palladium, Iridium, Osmium, Rhodium and Ruthenium. / Платина и связанные с ней металлы, включая иридий, осмий, палладий, родий и рутений. Платиновые Металлы или Платиноиды, химические элементы, принадлежащие к VIII группе Периодической Системы Менделеева. К ним относятся:- Иридий (Ir), Осмий (Os), Палладий (Pd), Родий (Rh), Рутений (Ru) и сама Платина (Pt), подразделяемые на лёгкие (Палладий, Родий, Рутений) и тяжёлые (Иридий, Осмий, Платина) платиновые металлы. Серебристо-белые металлы с различными оттенками. Благодаря высокой химической стойкости, тугоплавкости и красивому внешнему виду платиновые металлы наряду с золотом и серебром, называются благородными металлами. Платиновые металлы относятся к наименее распространённым в природе элементам. В земной коре встречаются чаще всего в самородном состоянии, обычно в виде сплавов как между собой, так и с другими металлами. В сульфидных полиметаллических рудах содержатся небольшие количества химических соединений, образуемых платиновыми металлами с серой и мышьяком. При электролитическом производстве меди и никеля платиновые металлы переходят в шлам, который растворяют в ‘царской водке’ (смесь концентрированных кислот:- 1 объёма азотной и 3 объёмов соляной), проводя затем аффинаж платиновых металлов, осаждение их в виде труднорастворимых соединений, прокаливание и плавку. Всё увеличивающиеся количества платиновых металлов, особенно палладия, родия и рутения, накапливаются в продуктах деления урана (Uranium, символ U) и плутония (Plutonium, символ Pu). Платиновые металлы широко применяются как катализаторы, материалы для термопар и термометров сопротивления, химически стойкой аппаратуры, электродов, медицинских инструментов, компоненты резистивных материалов, защитные покрытия на металлах. Производство металлов платиновой группы в 1980 около 122.2 тонн, из которых в ЮАР – 108.5 тонн.

PLATTS = ПЛАТС – In 1882 a Mr N. Hawkins, writing under the name Theodore Audel, founds a magazine called ‘Steam’. A year later, two young advertising salesmen from Boston, Emerson Harris and Horace Swetland, buy Audel out and launch a new publication under the title ‘Power, with which is incorporated Steam’. Mr Warren Cumming Platt is born 1883-December-06, in Delaware, Ohio, USA. In 1885 one James H. McGraw, the eventual founder of the McGraw-Hill Companies, Inc is hired as the advertising manager for Power. A year later he gains a stake in the enterprise when he lends it USD1 000.00. In 1902 John A. Hill, future partner in The McGraw-Hill Companies, buys Power magazine. Meanwhile, across country, Warren Cumming Platt drops out of school and finds employment as reporter on a weekly newspaper in nearby Mansfield. Two years later, at the age of 20, Warren Platt goes to work as police reporter on the Cleveland Plain Dealer, switches to the old Cleveland Leader as sports writer, then joins the Cleveland News as general assignment reporter covering antitrust suits against the Standard Oil Trust headquartered in Cleveland. Fascinated by the raging battles between John D. Rockefeller’s expanding empire and the independent oilmen, he joins the group of journalists in a crusade against Rockefeller whom he calls the arch-enemy of competition in the oil industry. In 1909, at the age of 25, Warren Platt starts his own publishing venture – a monthly news magazine, National Petroleum News (NPN), down the street from the old Standard Oil Trust building, using the borrowing power of a USD2 500.00 insurance policy and several hundred Dollars from independent oilmen, arguing that independent oil men need a voice to champion their cause against Big Oil. In 1917 McGraw and Hill merge their publishing enterprises. With the US entry into World War I, there is pressing demand for more data on petroleum products, markets and prices at more frequent intervals. Warren Platt’s NPN becomes a weekly news magazine with an expanded price section. In 1923 as the products market clamors for even more frequent updates on fluctuating prices, Platt starts Platts Oilgram – a daily two-page newsletter devoted entirely to reporting prices and market information. Warren Platt sets up a separate company to publish Platts Oilgram (later called Platts Oilgram Price Service), and moves the editorial offices to Tulsa, Oklahoma, to cover Mid Continent price changes at close range. The one-sheet paper is printed and mailed simultaneously from Tusla, Cleveland, and later also Chicago and New York for overnight delivery. For the first several years, the subscription fee is USD75.00 a year ‘payable in advance’ and USD100.00 a year ‘payable quarterly in advance’. Warren Platt retains the title of editor and publisher until he sells his petroleum reporting business to McGraw-Hill in 1953. In its early years, OPS editorial content reflected the personal style and personal attitudes of its editor and publisher. In 1928 Platts Oilgram Price Service rises to world prominence with the secret Achnacarry Agreement. This is the so-called ‘As Is’ agreement between the three world giants at the time – Standard Oil of New Jersey, Royal Dutch Shell and Anglo-Persian Oil (later Anglo-Iranian, later British Petroleum). They were joined later by 18 other companies and also won the tacit approval of the

Russians. Among other things, the Achnacarry Agreement and subsequent arrangements by the majors – all secret – pegged the price of oil worldwide to US Gulf Coast prices plus freight as reported by Platts Oilgram. Thus, for many years, the Platts price quote under the heading of 'Gulf Coast Cargoes, domestic and export, all ports', the so-called 'Gulf-Plus' formula, formed the basis of the majors' world oil pricing. The Great Depression hits the US oil patch hard and also rocks the Platt organization, affecting market tracking and news-gathering operations. In 1933 increasingly, Oilgram Price Service adds non-market industry news, attracting a new breed of subscribers to whom price data is secondary. Platt starts a special weekly supplement for news as part of Oilgram Price Service, and sets up news bureaus in Washington and Houston. In 1934–37 the weekly supplement becomes a daily appendage of Price Service and on 1934-February-06, Oilgram News Service comes on its own as a separate daily newsletter, with its own editorial staff, marketing strategy and subscriber list, and with emphasis on non-market happenings in Oklahoma and Texas, and eventually regulatory news from Washington. Later, Platt starts a monthly Platts Oil-Law-Gram to publish texts of rules and regulations affecting the oil industry. In 1954 the US Justice Department indicts Oilgram Price Service and Warren Platt in a year-long antitrust suit against 23 major US oil companies in what turns out to be the largest criminal prosecution ever instituted under US antitrust laws. The complaint charges Oilgram Price with being an instrument of collusion between the oil companies to fix prices. Oilgram is eventually exonerated and the case dismissed. The stigma is lifted from the Platts publications, but the trauma leaves its scars on the editors for many years. In 1955 McGraw-Hill launches Petroleum Week, a producer-oriented news weekly, giving increasing attention to international developments (original title Oilgram Week). The Oilgrams and Petroleum Week give live coverage of the impact of the Suez war (1956), the first three Arab Petroleum Congresses in the Middle East and the birth of OPEC. During the 1950s Platts business practices came under review by a number of US and European regulatory commissions and government agencies. The reviews resulted in no adverse repercussions for Platts. Platts Oilgram Price Service was also a party in the US Justice Department's anti-trust proceedings against 23 major US oil companies. Oilgram was fully exonerated and the case against it dismissed. These experiences served to reinforce Platts editorial commitment to independence, integrity and transparency. In the 1960s Oilgram Price editor Halsey Peckworth starts the Channel Port Index, attracting attention worldwide. Major oil companies are reluctant to see this exposure, but are resigned to it. In the 1970s as the pace of markets begins to pick up, Platts launches several telex-delivered daily reports – the Marketscans – to supplement its print newsletters. In 1975 Platts expands into petrochemical markets, with the launch of Platts European PetrochemicalScan. Launch of the Platts Crude Oil Marketwire in 1978. In 1984 McGraw-Hill launches a mainframe-based dial-up news system called EMIS (short for Electronic Market Information System), a sort of proto-Web integrator. Platts begins selling market and news information on the system and rapidly becomes its major revenue source. In 1989 Platts launches its first real-time news and market information screen service, Platts Global Alert, distributing initially in the United States alone, and only via satellite. The system becomes a major revenue generator for the company, and in 1987, Platts launches Platts Petrochemical Alert as a parallel offering. Global Alert starts distributing in Europe and Asia in 1988. In 1994–95 Platts takes control of Metals Week, branching out for the first time into a non-hydrocarbon commodity. Platts launches screen service Metals Alert in 1995. In 1998 Platts adopts an 'open distribution' approach to real-time news and market reporting, allowing the redistribution of its services on third-party systems for the first time. As a result, its electronic services begin appearing on Bloomberg, Bridge, Reuters and Telerate screens. Platts celebrates the 75th anniversary of the first Oilgram, in 1999. In 2000 Platts merges its operations with two other business units of The McGraw-Hill Companies covering the power and gas sector, and expanding its business by about 50%. Retaining its affiliation with Standard & Poor's, the company joins the Information and Media Services group of The McGraw-Hill Companies and forms its Energy Division, alongside Business Week, the Aviation Week group and Construction.com. In the beginning of 2000 Platts has 300 employees worldwide in 13 locations:- Bonn, Buenos Aires, Dubai, Hong Kong, Houston, London, Moscow, New York, Paris, Singapore, Sydney, Tokyo and Washington. In 2001 the enhanced Platts group is the largest energy information provider in the world, offering market pricing, news, analysis, real-time commentary, derivatives information and data for the oil, power, gas, nuclear, coal and petrochemicals vertical industries. The group maintains its strong and growing metals business in parallel, as well as in-depth services covering Washington's regulators, the biotechnology sector and the emerging market for bandwidth. The group also incorporates four magazines:- Electrical World, Energy IT, Global Energy Business and the original, 118-year-old Power. In September 2001, Platts acquires the businesses of the Financial Times Energy group from the UK's Pearson, doubling its employee base to around 700 people in 14 locations worldwide, and increasing revenues by a further 50%. The acquisition consolidates Platt's position as the leading information provider for the North American and European electricity, natural gas and coal industries, and extends Platt's range of information solutions into commercial database tools, geospatial solutions and consulting. Products such as E-Source, PowerDat, PowerMap and RDI are now part of the Platts portfolio. For the first time in its histoy, as of late 2001, more than 50% of Platts' business comes from the broad 'power' sector:- the coal, electricity, gas and nuclear markets along with the fields of energy policy, green energy, power engineering, power marketing and energy IT. 50% of Platts business now comes from international activities. Platts has staff operations in Bonn, Boulder Colorado, Buenos Aires, Dubai, Hong Kong, Houston, London, Moscow, New York, Paris, Singapore, Sydney, Tokyo and Washington (DC). In 2004 Platts global expansion continues, serving customers in 150 countries with 16 offices worldwide. In independent research, Platts is recognized as the most recognized and respected provider of energy information in the world. Platts.com gains over 100 000 unique visitors each month. Energy Advantage is launched, which is a new web-based decision support tool to support strategic decisions like asset valuation, fuel price forecasting and competitive analysis. Platts price benchmarks are used to settle financial transactions on over-the-counter (OTC) energy exchanges. Platts launches new risk management products to support mark to market and analysis decisions using forward curves. Platts, a division of The McGraw-Hill Companies, Inc. is the world's leading provider of energy information. With over 10 000 customers across 150 countries, 600 employees in 16 offices around the world, and nearly a century of business experience, Platts is the most recognized and respected information company in the energy industry. Our real-time news, pricing, analytical services and conferences are essential to enabling markets to operate with transparency and efficiency. Traders, Risk Managers, Analysts, and Executive Management depend on Platts to help them make better, faster, more effective decisions. Founded in 1888, The McGraw-Hill Companies, Inc. is a leading global information services provider meeting worldwide needs in the financial services, education and business information markets through leading brands including Standard & Poor's (S&P), McGraw-Hill Education, BusinessWeek and JD Power and Associates. The corporation has more than 280 offices in 40 countries. Sales in 2005 were USD6.0 billion. See also Argus Media Ltd, and S&P Global Platts. Platts is a trademark of The McGraw-Hill Companies, Inc.. Information has been obtained from sources believed reliable. However, because of the possibility of human or mechanical error by sources, McGraw-Hill or others, McGraw-Hill does not guarantee the accuracy, adequacy or completeness of any such information and is not responsible for any errors or omissions or for results obtained from use of such information. Platts is a publisher of specialized information on energy and other commodity markets, and helps those markets function with greater transparency and efficiency. Platts observes market activity and assesses the value of commodities based on strict and publicly available methodologies. With a century of experience and more than 250 experienced market editors positioned in locations in North America, Europe, the Middle East and Asia, Platts has earned a reputation as the industry's most reliable source of pricing benchmarks, market news and analytical information. The prices published by Platts are respected by the market and referenced globally as benchmarks for contract settlement in both physical and financial markets, including crude oil, refined products, petrochemicals and related derivatives. As a publisher owned by The McGraw-Hill Companies,

Platts conducts its editorial and market assessment activities with complete independence and impartiality. Platts has no financial interest in the price of the commodities on which it reports. Platts price-assessment systems have been developed over many decades, are fully open to public view and are overseen by a compliance group independent of the editorial staff. Platts takes very seriously its efforts to maintain the integrity of its pricing methods and to publish price data that reflect market values. Platts daily spot price assessments are used in a variety of ways:- (i) for the settlement of floating price deals; (ii) under long-term contracts; (iii) on a spot basis; (iv) for the settlement of derivatives contracts such as swaps; and (v) by futures exchanges. Platts assessments also are used to monitor trader performance, to quantify financially the value of oils transferred from the upstream production departments to the refinery side of the business and then for the transfer to the traders supplying the marketplace. The assessments also are used in decision-making by refiners, for instance in deciding whether to maximize jet fuel production or to minimize diesel fuel, or whether to shut down a refinery altogether. Platts assessments also are used in long-term financing deals to provide the basis to determine profitability and cost in multi-year projects, including drilling and pipeline projects. The extent of the usage of Platts prices in spot and term deals, and in derivatives settlements, is very large and a multiple of the world's daily crude oil and refined product output. Where the price of physical oil is based on Platts assessments, almost invariably the related swaps are also priced out against Platts assessments of the underlying spot market. This is because of the need for convergence between the physical market value and the value at which the swap is settled. Without this linkage, a hedger faces basis risk. If a commodity is sold on a basis other than Platts prices, the related derivative instrument would typically use that basis rather than a Platts assessment. Since the switch to market-related pricing in the mid 1980s, crude oil pricing has been focused around three key benchmark grades:- Dubai for oil moving from the Middle East into Asia; North Sea Brent crude oil for a wide swath of oil from Europe or bound for Europe; and West Texas Intermediate (WTI), for deliveries into and within the Americas. Platts' Dated Brent assessment is believed to be the most widely used international physical oil pricing benchmark. Crude oil produced in Canada, Africa, the North Sea, the Middle East, Russia, central Asia and oils delivered to China, Japan and Korea all reference the Platts Dated Brent assessment. According to industry estimates, Platts' Dated Brent assessment is used to price up to 70% of the crude oil produced worldwide. Platts recognizes the important role it plays in the marketplace and has continued to evolve and fine-tune its assessment methodologies to reflect changes in the marketplace. Over the years, Platts has made well publicized changes to its assessment methodologies for the key global benchmark crudes, including allowing alternative delivery of other crudes as production volumes of the core benchmarks have declined. For instance, Platts in 2001 introduced Oman and in 2006 added Upper Zakum as alternative delivery grades for Dubai. Separately, in 2002 Platts broadened its definition of Brent crude oil to include Forties and Oseberg as alternative delivery grades, and Ekofisk was added in 2007. The need for alternative delivery grades resulted from declining production of the core benchmark grades. Platts aims for its methodologies to reflect changes in fundamentals such as crude production or regulatory changes governing product qualities. Its methodologies at times are emulated or adopted by other publishers, with recent examples being adoption of 'window' processes in Europe by other publishers and adoption of Platts' wider definition of Dated Brent by at least one competitor on the exact date of launch announced by Platts. In the Americas, Platts' physical crude oil assessments are still widely used by the industry, but the 'flat' price formation is originated by the New York Mercantile Exchange (NYMEX®). The highly liquid sweet crude futures contract traded on NYMEX® provides a visible real-time reference price for the market. In the spot market, therefore, negotiations for physical oils will typically use NYMEX® as a reference point, with bids/offers and deals expressed as a differential to the futures price. Using these differentials, Platts makes daily and in some cases intra-day assessments of the price for various physical grades of crude oil, which may be referenced in other spot, term or derivatives deals. For example, Platts' American benchmarks are in turn used to price crude oils from Canada and South America, although some are also based on Dated Brent. The multi-faceted complexities of the physical market result in a diversity of pricing mechanisms, as individual buyers and sellers are free to make decisions about the mechanisms they individually employ. Therefore, while NYMEX® acts as a barometer of market value, and negotiations for physical oil may reference the futures value, Platts plays a distinct and complementary role to that of the exchange. Headquartered in New York, the United States. / Платс:- Эн. Хокинз (N. Hawkins), писавший под именем Сиодор Одэль (Theodore Audel), . Ворэн Камин Плат (Warren Cumming Platt). PLAY = ЛЮФТ (или ЗАЗОР, или МЁРТВЫЙ ХОД) – Play (maritime term):- freedom of movement.

PLAYSUIT = ИГРОВОЙ КОСТЮМ – Playsuit is a sports and play outfit for women and children that consists usually of a blouse and shorts.

PLAYWEAR = ОДЕЖДА ДЛЯ ИГР – Playwear is the informal clothing worn for leisure activities. Generally thought of when referring to children's clothing. The only adults that wear playwear are generally members of the Apparel Search Company. After all, we are very childish.

PLAZA ACCORD = СОГЛАШЕНИЕ ПЛАЗА – Announcement the Ministers of Finance and Central Bank Governors of France, Germany, Japan, the United Kingdom, and the United States (Plaza Accord); September 22, 1985. (1) Ministers of Finance and Central Bank Governors of France, the Federal Republic of Germany, Japan. the United Kingdom, and the United States met today, September 22, 1985, in the context of their agreement to conduct mutual surveillance and as part of their preparations for wider international discussions at the forthcoming meetings in Seoul, Korea. They reviewed economic developments and policies in each of their countries and assessed their implications for economic prospects external balances, and exchange rates. (2) At the Bonn Economic Summit in May 1985 the Heads of State or Government of seven major industrial countries and the President of the Commission of the European Communities issued an Economic Declaration Towards Sustained Growth and Higher Employment. In that Declaration the participants agreed that:- the best contribution we can make to a lasting new prosperity in which all nations can share is unremittingly to pursue, individually in our own countries and cooperatively together, policies conducive to sustained growth and higher employment. (3) The Ministers and Governors were of the view that significant progress has been made in their efforts to promote a convergence of favorable economic performance among their countries on a path of steady non inflationary growth. Furthermore, they concluded that their countries are restoring the vitality and responsiveness of their economies. As a result of these developments, they are confident that a firm basis has been established for a sustained, more balanced expansion among their countries. This sustained growth will benefit other industrial countries and will help ensure expanding export markets for developing countries. thereby contributing importantly to the resolution of problems of heavily indebted developing countries. (4) They believe that this convergence of favorable economic performance has been influenced increasingly by policy initiatives undertaken by their countries. Moreover,each of their countries is committed to the implementation of further policy measures which will reinforce favorable convergence and strengthen the sustainability of the current expansion. (5) Ministers and Governors were of the view that recent shifts in fundamental economic conditions among their countries together with policy commitments for the future, have not been reflected

fully in exchange markets. (6) Ministers and Governors expect that growth in aggregate for their countries will be about 3 percent this year, compared to negative growth of –0.7 percent in 1982. Although this figure is down slightly from 1984, growth will be more balanced than at any time in the last four years. After the particularly rapid US growth of 1983–84, there is now increased evidence of internal growth in the other countries. In particular, private investment has picked up strength. The current expansion is occurring in a context of fiscal consolidation: it is not dependent on short-lived fiscal stimulus. As a result of the changes in the components of growth, real growth in their countries can be expected to remain strong as US growth moderates. (7) The current sustained expansion is occurring within a framework of declining inflation, a phenomenon that is unprecedented in the past three decades. Inflation rates are at their lowest in nearly 20 years, and they show no signs of reviving. (8) There has been a significant fall in interest rates in recent years. Apart from welcome domestic effects this has been particularly helpful in easing the burden of debt repayments for developing countries. (9) This successful performance is the direct result of the importance given to macroeconomic policies which have reduced inflation and inflationary expectations to continued vigilance over government spending, to greater emphasis on market forces and competition, and to prudent monetary policies. (10) These positive economic developments notwithstanding, there are large imbalances in external positions which pose potential problems, and which reflect a wide range of factors. Among these are:- the deterioration in its external position which the US experienced from its period of very rapid relative growth: the particularly large impact on the US current account of the economic difficulties and the adjustment efforts of some major developing countries; the difficulty of trade access in some markets; and the appreciation of the US Dollar. The interaction of these factors – relative growth rates, the debt problems of developing countries, and exchange rate development – has contributed to large, potentially destabilizing external imbalances among major industrial countries. In particular, the United States has a large and growing current account deficit, and Japan, and to a lesser extent Germany, large and growing current account surpluses. (11) The US current account deficit, together with other factors is now contributing to protectionist pressures which, if not resisted, could lead to mutually destructive retaliation with serious damage to the world economy:- world trade would shrink, real growth rates could even turn negative, unemployment would rise still higher, and debt-burdened developing countries would be unable to secure the export earnings they vitally need. Policy Intentions:- (12) The Finance Ministers and Governors affirmed that each of their countries remains firmly committed to its international responsibilities and obligations as leading industrial nations. They also share special responsibilities to ensure the mutual of their individual policies. The Ministers agreed that establishing more widely strong, non inflationary domestic growth and open markets will be a key factor in ensuring that the current expansion continues in a more balanced fashion, and they committed themselves to policies toward that end. In countries where the budget deficit is too high, further measures to reduce the deficit substantially are urgently required. (13) Ministers and Governors agreed that it was essential that protectionist pressures be resisted. (14) Ministers recognized the importance of providing access to their markets for LDC (short for the least developed countries) exports as those countries continue their essential adjustment efforts, and saw this as an important additional reason to avoid protectionist policies. They welcomed the GATT preparatory meeting scheduled for late September and expressed their hope that it will reach a broad consensus on subject matter and modalities for a new GATT round. (15) In this context they recalled and reaffirmed the statement in the Bonn Economic Declaration on the debt situation. Sustained growth in world trade, lower interest rates, open markets and continued financing in amounts and on terms appropriate to each individual case are essential to enable developing countries to achieve sound growth and overcome their economic and financial difficulties. (16) The Ministers agreed that they would monitor progress in achieving a sustained non inflationary expansion and intensify their individual and cooperative efforts to accomplish this objective. To that end, they affirmed the statements of policy intentions by each of their countries which are attached. Conclusions:- (17) The Ministers of Finance and Central Bank Governors agreed that recent economic developments and policy changes, when combined with the specific policy intentions described in the attached statements. provide a sound basis for continued and a more balanced expansion with low inflation. They agreed on the importance of these improvements for redressing the large and growing external imbalances that have developed. In that connection they noted that further market opening measures will be important to resisting protectionism. (18) The Ministers and Governors agreed that exchange rates should play a role in adjusting external imbalances. In order to do this, exchange rates should better reflect fundamental economic conditions than has been the case. They believe that agreed policy actions must be implemented and reinforced to improve the fundamentals further, and that in view of the present and prospective changes in fundamentals, some further orderly appreciation of the main non-Dollar currencies against the dollar is desirable. They stand ready to cooperate more closely to encourage this when to do so would be helpful. The French Government intends to pursue its policy aimed at reducing inflation, moderating income growth, and achieving continued improvements in external accounts. It will further intensify its efforts to speed up structural adjustment and modernization and thus lay the basis for job creating growth. Therefore, it is determined:- (i) To pursue vigorously disinflation; (ii) To secure the attainment of monetary aggregates growth targets, consistent with decelerating inflation; (iii) To curb public expenditures progressively so as to lower the tax burden while reducing the government borrowing requirement; (iv) To foster the investment recovery allowed for by the improved financial situation in the business sector; (v) To take further steps towards liberalization and modernization of financial markets, to increase competition in the financial sector so as to reduce financial intermediation costs, and give a greater role to interest rates in monetary control; (vi) To foster job creation through the implementation of an innovative and active policy in the field of education and training and by promoting constructive discussions between social partners on work organization; and (vii) To resist protectionism. The Government of the Federal Republic of Germany ,noting that the German economy is already embarked on a course of steady economic recovery based increasingly on internally generated growth, will continue to implement policies to sustain and extend the progress achieved in strengthening the underlying conditions for continuing, vigorous, job-creating growth in the context of stable prices and low interest rates. In particular the Government of the Federal Republic of Germany will implement policies with the following explicit intentions:- (i) The priority objective of fiscal policy is to encourage private initiative and productive investments and maintain price stability. (ii) Toward this end, the Federal Government will continue to reduce progressively the share of the public sector in the economy through maintaining firm expenditure control. The tax cuts due to take effect in 1986 and 1988 form part of the ongoing process of tax reform and reduction which the Federal Government will continue in a medium- framework. (iii) The Federal Government will continue to remove rigidities inhibiting the efficient functioning of markets. It will keep under review policies, regulations,and practices affecting labor markets in order to enhance the positive impact of economic growth on employment. The Federal Government and the Deutsche Bundesbank will provide the framework for the continuing evolution of deep, efficient money and capital markets. (iv) The fiscal policy of the Federal Government and the monetary policy of the Deutsche Bundesbank will continue ensure a stable environment conducive to the expansion of domestic demand on a durable basis. (v) The Federal Government will continue to resist protectionism. The Government of Japan noting that the Japanese economy is in an autonomous expansion phase mainly supported by domestic private demand increase will continue to institute policies intended to ensure sustainable non inflationary growth:- provide full access to domestic markets for foreign goods; and the Yen and liberalize domestic capital markets. In particular, the Government of Japan will implement policies with the following explicit intentions:- (i) Resistance of protectionism and steady implementation of the Action Program announced on July 30 for the further opening up of Japan’s domestic market to foreign goods and services. (ii) Full utilization of private sector vitality through the implementation of vigorous deregulation measures. (iii) Flexible management of monetary policy with due attention to the yen rate. (iv) Intensified implementation of financial market liberalization and of the yen, so that the yen fully reflects the

underlying strength of the Japanese economy. (v) Fiscal policy will continue co focus on the twin goals of reducing the central government deficit and providing a pro-growth environment for the private sector. Within that framework. local governments may be favorably allowed to make additional investments in this FY 1985, taking into account the individual circumstances of the region. (vi) Efforts to stimulate domestic demand will focus on increasing private consumption and investment through measures to enlarge consumer and mortgage credit markets. The United Kingdom Government, noting that the British economy has been experiencing steady growth of output and domestic demand over the past four years, will continue to pursue policies designed to reduce inflation; to promote sustained growth of output and employment; to reduce the size of the public sector; to encourage a more competitive, innovative market orientated private sector; to reduce regulation and increase incentives throughout the economy; and to maintain open trading and capital markets free of foreign exchange controls:- In particular, the United Kingdom Government intends:- (a) To operate monetary policy to achieve further progress towards price stability and to provide a financial environment for growing output and employment: and to buttress monetary policy with a prudent fiscal policy. (b) To continue to reduce public expenditure as a share of GDP and to transfer further substantial parts of public sector industry to private ownership. (c) To reduce the burden of taxation in order to improve incentives and to increase the efficient use of resources in the economy. (d) To take additional measures to improve the effective working of the labour market. including the reform of Wages Councils and improvements in youth training and implement proposals to liberalize and strengthen competition within financial markets. (e) To resist protectionism. The United States Government is firmly committed to policies designed to:- ensure steady non inflationary growth; maximize the role of markets and private sector participation in the economy; reduce the size and role of the government sector; and maintain open markets. In order to achieve these objectives, the United States Government will:- (a) Continue efforts to reduce government expenditures as a share of GNP in order to reduce the fiscal deficit and to free up resources for the private sector. (b) Implement fully the deficit reduction package for fiscal year 1986. This package passed by Congress and approved by the President will not only reduce by over 1 percent of GNP the budget for FY 1986, but lay the basis for further significant reductions in the deficit in subsequent years. (c) Implement revenue-neutral tax reform which will encourage savings, create new work incentives, and increase the efficiency of the economy, thereby fostering non inflationary growth. (d) Conduct monetary policy to provide a financial environment conducive to sustainable growth and continued progress toward price stability. (e) Resist protectionist measures. Xxxxx. The Plaza Accord or Plaza Agreement was an agreement between the governments of France, West Germany, Japan, the United States, and the United Kingdom, to depreciate the US Dollar in relation to the Japanese Yen and German Deutsche Mark by intervening in currency markets. The five governments signed the accord on September 22, 1985 at the Plaza Hotel in New York City. Background:- Between 1980 and 1985 the dollar had appreciated by about 50% against the Japanese Yen, Deutsche Mark, French Franc and British Pound, the currencies of the next four biggest economies at the time. This caused considerable difficulties for American industry but at first their lobbying was largely ignored by government. The financial sector was able to profit from the rising dollar, and a depreciation would have run counter to Ronald Reagan's administration's plans for bringing down inflation. A broad alliance of manufacturers, service providers, and farmers responded by running an increasingly high profile campaign asking for protection against foreign competition. Major players included grain exporters, car producers, engineering companies like Caterpillar Inc. (CAT), as well as high-tech companies including IBM and Motorola. By 1985, their campaign had acquired sufficient traction for Congress to begin considering passing protectionist laws. The prospect of trade restrictions spurred the White House to begin the negotiations that led to the Plaza Accord. The justification for the Dollar's devaluation was twofold:- to reduce the US current account deficit, which had reached 3.5% of the GDP, and to help the US economy to emerge from a serious recession that began in the early 1980s. The US Federal Reserve System under Paul Volcker had halted the stagflation crisis of the 1970s by raising interest rates, but this resulted in the dollar becoming overvalued to the extent that it made industry in the US (particularly the automobile industry) less competitive in theglobal market. Effects:- Devaluing the dollar made US exports cheaper to purchase for its trading partners, which in turn allegedly meant that other countries would buy more American-made goods and services. The exchange rate value of the dollar versus the yen declined by 51% from 1985 to 1987. Most of this devaluation was due to the USD10 billion spent by the participating central banks. Currency speculation caused the Dollar to continue its fall after the end of coordinated interventions. Unlike some similar financial crises, such as the Mexican and the Argentine financial crises of 1994 and 2001 respectively, this devaluation was planned, done in an orderly, pre-announced manner and did not lead to financial panic in the world markets. The Plaza Accord was successful in reducing the US trade deficit with Western European nations but largely failed to fulfill its primary objective of alleviating the trade deficit with Japan. This deficit was due to structural conditions that were insensitive to monetary policy, specifically trade conditions. The manufactured goods of the United States became more competitive in the exports market but were still largely unable to succeed in the Japanese domestic market due to Japan's structural restrictions on imports. The recessionary effects of the strengthened yen in Japan's export-dependent economy created an incentive for the expansionary monetary policies that led to the Japanese asset price bubble of the late 1980s. The Louvre Accord was signed in 1987 to halt the continuing decline of the US Dollar. The signing of the Plaza Accord was significant in that it reflected Japan's emergence as a real player in managing the international monetary system. Yet it is postulated that it contributed to the Japanese asset price bubble, which ended up in a serious recession, the so-called Lost Decade. Xxxxx. The Plaza Accord:- The World Intervenes In Currency Markets. The historic 1985 Plaza Accord, signed at the Plaza Hotel in New York City, was a pro-growth agreement signed by what was then known as the G-5 nations:- West Germany, France, the United States, Japan and the United Kingdom. The purpose was to force the United States to devalue its currency due to a current account deficit approaching an estimated 3% of GDP according to Paragraph 6 of the accords. More importantly, the European nations and Japan were experiencing enormous current account surpluses as well as negative GDP growth, threatening external trade and GDP growth in their home nations. Protectionist measures to guard these gains were looming, especially in the United States. Developing nations were in debt and not able to participate in positive trade or positive growth in their home nations, and the United States was forced to realign the exchange rate system due to present imbalances and to promote growth around the world at the expense of its own nation. The Plaza Accord was a growth transfer policy for Europe and Japan that was wholly detrimental to the United States. Trading Hits a Protectionist Wall:- the United States experienced 3% GDP growth during 1983 and 1984 with a current account deficit approaching an estimated 3–3.5% of GDP, while European nations saw a negative GDP growth of –0.7% with huge trade surpluses. The same thing happened to Japan. Trade deficits in general require foreign financing. For the United States during the early to mid 1980s, Japan and West Germany were buying United States bonds, notes and bills from their surpluses to finance our current deficits at the expense of their own economies. It was only a matter of time before protectionist policies entered this equation that would not only hurt United States growth at home but force trade wars that would derail the entire system of trade for all nations. During this period, inflation was the lowest it has been in 20 years for all nations, and European nations and Japan were investing in their own economies to promote growth. With low inflation and low interest rates, the repayment of debt would be accomplished quite easily. The only aspect missing from these equations was an adjustment in exchange rates rather than an overhaul of the present system. Global Cooperation:- so the world cooperated for the first time by agreeing to revalue the exchange rate system over a two-year period by each nation's central bank intervening in the currency markets. Target rates were agreed to. The United States experienced about a 50% decline in their currency while West Germany, France, the UK and Japan saw 50% appreciations. The Japanese yen in September 1985 went from 242 USD/JPY (Yen per US Dollar) to 153 in 1986, a doubling in value for the Yen. By 1988, USD/JPY exchange rate was 120. The same thing happened with the

German Deutsch Mark, French Franc and British Pound. These revaluations would naturally benefit developing nations such as Korea and Thailand, as well as leading South American nations like Brazil because trade would again flow. What gave the Plaza Accord its historic importance was a multitude of firsts. It was the first time central bankers agreed to intervene in the currency markets, the first time the world set target rates, the first time for globalization of economies and the first time each nation agreed to adjust its own economies. Sovereignty was exchanged for globalization. For example, Germany agreed to tax cuts, the UK agreed to reduce its public expenditure and transfer monies to the private sector, while Japan agreed to open its markets to trade, liberalize its internal markets and manage its economy by a true yen exchange rate. All agreed to increase employment. The United States, bearing the brunt of growth, only agreed to devalue its currency. The cooperative aspects of the Plaza Accord were the most important first. Currency Value – What Does It Mean? What the Plaza Accord meant for the United States was a devalued currency. United States manufacturers would again become profitable due to favorable exchange rates abroad, an export regimen that became quite profitable. A high US Dollar means American producers can't compete at home with cheap imports coming from Japan and European nations because those imports are much cheaper than what American manufacturers can sell according to their profitability arrangements. An undervalued currency means those same imports would experience higher prices in the United States due to unfavorable exchange rates. What a high Dollar means for the United States is low inflation and low interest rates that benefit consumers because they have enough dollars to far exceed prices paid for goods. What the United States agreed to was a transfer of a part of its GDP to Europe and Japan so those economies would experience growth again. And all this was accomplished without fiscal stimulus – only an adjustment of exchange rates. What is understood in the modern day are the harsh effects such devaluations may have on an economy. Japan Feels the Effects:- the Japanese felt the worst effects in the longer run of its signing of the Plaza Accord. Cheaper money for the Japanese meant easier access to money along with the Bank of Japan's adoption of cheap money policies such as a lower interest rate, a credit expansion and Japanese companies that moved offshore. The Japanese would later become the world's leading creditor nation of the world. But cheap money policies would later create a slower consumption rate at home, rising land prices and the creation of an asset bubble that would burst years later that led to the period for Japan known as the Lost Decade. Japan's recovery today from its lost decade is still very questionable due to the price of its currency. This may be the reason why currency prices today target inflation as a means to gauge growth policies rather than some arbitrary target as was set with the Plaza Accords. Xxxxx. 2015 Crude Oil Forecast:- Will The Price Plunge Continue? Our Insiders Reveal New Information:- With practically every major (and minor) country attempting to devalue their currencies, in order to make exports more competitive, the pressure builds on China to ease some pressure revalue the yuan upward. This has an important historical parallel in the famous Plaza Accord of 1985, when the world's major governments met to strengthen the Yen and weaken the Dollar. Asia Times has a worthwhile read on the Plaza Accord, and the similarities and differences between Japan then and China now, and their respective relationships with the US. Perhaps most worrisome is that Japan's relationship with the US – despite some trade friction – was way better than what China's is with the US today. The G-5 finance ministers hunkered down at the Plaza Hotel in New York on September 22 and decided to intervene cooperatively in the foreign exchange markets to guide the excessively high value of the US Dollar lower as a means of enhancing the US's export competitiveness and trim its enormous trade deficits. As a result, the Japanese Yen's value vis-a-vis the Dollar doubled in only about two years, from 240 to 120 a Dollar. The sharply higher yen prompted Japanese manufacturers to rush to shift production abroad, especially to Southeast Asia, to take advantage of cheaper labor there. Japanese automakers, which were particularly on the hot seat at the time amid raging trade protectionism in the US, also accelerated production in that country, not only to weather the stronger yen but to ease trade friction. In the early 1990s, the number of vehicles they assembled in the US exceeded that of their US-bound exports. To help cushion the impact of the stronger Yen on its economy in the wake of the Plaza Accord, Japan kept its monetary policy loose to stimulate domestic demand, but did so longer than necessary, resulting in the 'bubble economy' of the late 1980s characterized by inflated prices for assets such as stocks and land. Japanese exports to the US did not decline despite the Plaza Accord, however. And trade friction lingered and 'revisionism' gained strength in the US, prompting the country to take a new tack on bilateral trade issues. Xxxxx. The Case Against a New Plaza Accord (By James A. Dorn; This article appeared in the December 2006 addition of Caijing.) In September 1985, the Group of Five (G5) industrialized nations (United States, Japan, Germany, Britain, and France) met in secret at the Plaza Hotel in New York to coordinate intervention to lower the value of the Dollar against the Yen and Deutsche Mark. As today, the United States was running twin deficits, and there was pressure on its major trading partners to let their currencies appreciate with the hope that US exports would become more competitive. China, however, was not a factor. Its economic reforms had barely begun and its foreign exchange reserves were meager. The Dollar was already drifting lower before the Plaza Accord, but central bank intervention-buying Yen and Marks and selling Dollars-led to a further decline in the Dollar's external value. To limit Yen appreciation and protect the export sector, the Bank of Japan (BOJ) sterilized most of its Dollar sales by buying bills in the open market. Any permanent effect on the real Yen/Dollar rate, therefore, was likely to be small. In early 1987, the G5 plus Canada met in Paris and agreed to stem the Dollar's fall. The Louvre Accord gave the signal for the BOJ to freely supply Yen for Dollars, fueling money and credit growth, and rapidly expanding foreign exchange reserves. Excessive money growth helped create the bubble economy of the late 1980s. The BOJ sacrificed monetary stability for the sake of exchange rate intervention designed to stimulate the export sector. When the BOJ applied the brakes in mid-1989, money and credit growth dropped sharply, and asset prices collapsed in 1990. Monetary disequilibrium continued to plague Japan-especially its financial sector-for the next decade. Policy errors in other Asian countries-notably excessive growth in monetary aggregates occasioned by large capital inflows and pegged exchange rates-resulted in the Asian financial crisis in 1997. As John Greenwood, chief economist for Invesco Asia, observed:- 'The general lesson is that to control money and credit growth within reasonable ranges that are compatible with low inflation in the longer run, the external value of the currency must be free to adjust-especially upwards'. The world doesn't need another Plaza Accord to deal with current global imbalances. Although exchange intervention temporarily lowered the external value of the Dollar under Plaza I, the US current account deficit hit a peak of 3.4 percent of gross domestic product in 1987, the same year in which the Louvre Accord sought to limit the Dollar's slide. More important, exchange intervention did nothing to ensure sound monetary policy. Monetary policy mistakes, first in Japan and then in other Asian countries, did far more damage then if nominal exchange rates had been free to fluctuate with market demand and supply. It is pretentious to assume that government officials or famous economists know what the array of equilibrium exchange rates should be. The failure of pegged exchange rates and the difficulty of managing exchange rates warn against a new Plaza-type agreement. The world economy is considerably different than it was in 1985. The US current account deficit is much larger, at roughly 6.5 percent of GDP; China is now the world's third largest trading nation with an overall current account surplus approaching 9 percent of GDP, a record bilateral trade surplus with the US, and foreign exchange reserves of more than USD1 trillion; and private capital flows swamp official flows. Many countries have abandoned pegged exchange rates and adopted inflation targeting, and the International Monetary Fund is no longer seen as a savior of developing countries. Trying to form a new IMF-led system of managed exchange rates with central bank intervention would be a step backward rather than forward. In theory, such an approach may be attractive to economist-planners who think they can design the global financial system. But, in practice, central planning-even by the best and the brightest-has been a dismal failure. Those who favor exchange rate intervention, more politely called 'Coordination', argue that the Dollar is overvalued and that many foreign currencies need to appreciate in real terms to restore global imbalances. If countries work together, then the overall appreciation on a trade-weighted basis need not be as large as when each

country acts separately. A Plaza II agreement among the G20 would combine both exchange rate intervention with pressure on the United States to reduce its budget deficit. William Cline, a senior fellow at the Institute for International Economics, is a strong proponent of a new Plaza-type agreement. He estimates that to be sustainable the US current account deficit should not exceed 3 percent of GDP, and he has calculated 'optimal real exchange realignments' necessary to achieve that result. The real appreciation of the Yuan/Dollar rate would have to be nearly 46 percent if China acted alone, but only 8 percent if China acted in concert. The problems with such an approach are (1) it would be very difficult to get such a large group of countries to agree on the needed adjustments; (2) no one really knows what the optimal realignment of exchange rates should be; and (3) it would be costly to enforce such an agreement. Contrary to Cline's argument for 'coordinated intervention', individual countries may spontaneously join other countries in allowing their currencies to appreciate against the Dollar. The People's Bank of China (PBC), for example, has said that as other Asian currencies appreciate against the Dollar, the Yuan would also be allowed to gradually appreciate. If China did not allow further appreciation, its export sector would be even more competitive and its foreign exchange reserves would grow even faster. Capital inflows would lead to excessive money and credit growth that would become more difficult to sterilize. Eventually inflation would cause the real exchange rate to appreciate. It would be less costly for China to allow the nominal exchange rate to appreciate along with other Asian currencies-and thus avoid inflationary pressures and the consequent need to slow money and credit growth. Stop-go monetary policy has been a problem in China. Administrative measures to stem excessive money and credit growth are limited: they interfere with economic freedom and have led to corruption as state-owned enterprises and banks seek favors at the public's expense. Capital is wasted and investment decisions are politicized. If China is to develop a world-class financial center, it needs capital freedom and an exchange rate regime that is governed by a rule of law and market forces. A new Plaza-type accord would not be in China's interest or the world's. A better alternative would be for Asian central banks to refrain from intervening in the foreign exchange markets and to focus on domestic monetary stability. By establishing a transparent financial system with a freely floating exchange rate and a sound monetary policy, China could avoid repeating Japan's monetary policy mistakes and the pitfalls inherent in following a Plaza-type negotiations approach to correcting global imbalances. In a May 23, 2006 press release, the PBC promised that the 'foreign exchange system reform will be deepened', and committed itself 'to provide a stable monetary and financial environment for economic restructuring'. Since the July 2005 currency reform, China has deepened its exchange rate regime, and is now building the institutional infrastructure for a more flexible exchange rate. Interest rates are being liberalized and capital controls gradually relaxed. Americans should recognize that progress and not view China as an inevitable enemy. US-China relations are best advanced by peaceful economic engagement, not by threatening China with protectionist measures unless it revalues its currency in line with legislators' preferences. As US Treasury Secretary Henry Paulson stated, 'Protectionist policies do not work, and the collateral damage from these policies is high'. The incoming Congress should adhere to Mr. Paulson's call for a policy of 'long-term strategic economic engagement', rather than raise the threat of economic nationalism. That policy is sensible:- it will serve the interests of the United States and China, promote globalization, reduce the risk of conflict, and help correct global imbalances. / Дьжеймз (James). PLC = PRICE LOSS COVERAGE

PLC = PROJECT LOAN CERTIFICATE

PLC = PUBLIC LIMITED COMPANY

PLEASE AUTHORIZE DELIVERY AGAINST GUARANTEE = ПОЖАЛУЙСТА, САНКЦИОНИРУЙТЕ ПОСТАВКУ ПОД ГАРАНТИЮ – Please Authorize Delivery Against Guarantee:- a request from the consignee to the shipper to allow the carrier or agent to release cargo against a guarantee, either bank or personal. Made when the consignee is unable to produce original bills of lading. Abbreviation for 'Please Authorize Delivery Against Guarantee':- PADAG. / Запрос консигнатора (грузополучателя) грузоотправителю с целью разрешения перевозчику или агенту выпустить груз под гарантию, либо банковскую либо персональную. Такой запрос осуществляется в тех случаях, когда консигнатор не в состоянии предъявить оригиналы коносаментов. Обозначение для выражения 'Пожалуйста, Санкционируйте Поставку Под Гарантию' ('Please Authorize Delivery Against Guarantee'):- ПСППГ (PADAG).

PLEAT = СКЛАДКА – Pleat:- three layers of fabric involving two folds or reversals of direction; the back fold may be replaced by a seam. Pleat is a fold in cloth made by doubling the material upon itself and then pressing or stitching it into place.

PLEATED = ВСКЛАДКУ (или ПЛИССИРОВАННОЕ) – Pleated:- incorrect selection and adjustment of attachment, or by a damaged feed tooth. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или дефект от машинного оборудования.

PLEATED FILTER = СКЛАДЧАТЫЙ ФИЛЬТР (или ГОФРИРОВАННЫЙ ФИЛЬТР, или ПЛИССИРОВАННЫЙ ФИЛЬТР) – Pleated Filter is a filter element whose medium consists of a series of uniform folds and has the geometric form of a cylinder, cone, disc, plate, etc. Synonymous with 'Convoluted' and 'Corrugated'. See also Filter.

PLEATED SEAMS = ПЛИССИРОВАННЫЕ ШВЫ – Pleated Seams:- caused by incorrect machine attachments, machine sewing parts too large or small for fabric or seam desired, irregularly cut patterns or fabric irregularities and operator feeding fabric faster than normal feeding action of the machine. Sewing Room Defects. / Порок или дефект швейного производства.

PLEATS = СКЛАДКИ – Pleats:- a portion of the fabric folded over, and secured by stitching or pressing. See also Pucker. / ткань, заложенная в складку.

PLEDGE = ЗАКЛАД – Pledge is a delivery of property to secure the performance of an obligation owed by one party (debtor/pledgor) to another (secured party). A pledge creates a security interest (lien) in the property so delivered. See also Security Interest. Transfer of personal property from a debtor to a creditor as security for a debt. Legal ownership of the property concerned remains with the pledger. Pledge:- transfer of assets to secure payment of an obligation, but generally without transfer of title or ownership, subject to a pledge agreement. In the event of default, the creditor can realize the pledged assets and satisfy his claims from the proceeds (execution). In the banking business, pledging securities is the most common credit collateralizing transaction, especially in the case of current account credit and loans. See also Collateral, Collateral Loan, and Lombard Loan. / Под Закладом понимается договор о залоге, по условиям которого заложенное имущество (вещь) передаётся залогодателем во владение залогодержателю. По соглашению залогодержателя с залогодателем предмет заклада может быть оставлен у залогодателя под замком и печатью

залогодержателя; такой залог называется твёрдым залогом. Закладчик (Pledger) – тот, кто отдаёт имущество в залог. Смотрите также Обеспечение или Залог (Collateral), .

PLEDGED COLLATERAL = ЗАКЛАДНОЕ ОБЕСПЕЧЕНИЕ (или ЗАЛОЖЕННОЕ ОБЕСПЕЧЕНИЕ) – Pledged Collateral:- things of value, such as securities, merchandise, etc, deposited and pledged as security for the repayment of a loan. / Ценные вещи, такие как ценные бумаги, товар и тому подобное, депонированные и заложенные в качестве гарантии выплаты займа.

PLEIOTROPY = ПЛЕЙОТРОПИЯ – Pleiotropy is a mode of gene expression where the expression of one gene has multiple phenotypes. The effect of a single gene on two or more characters is due to a single biochemical pathway among the characters. Distinguished from linkage by the absence of recombinants in the segregating population. / свойства (characters) . Под Плейотропией, от Греческих слов Pléiōn, означающее Больший, и Tróрos, означающее Направление или Поворот, понимается влияние одного гена на несколько признаков организма.

PLIED KNOTS = XX УЗЛЫ – Plied Knots:- a break in all the plies rejoined by a knot. Thread defects, and namely – Spinning. / Порок или дефект ниток.

PLIED YARN = ОДНОКРУТОЧНАЯ ПРЯЖА (или ПРЯЖА В НЕСКОЛЬКО СЛОЖЕНИЙ) – Plied Yarns are yarns produced by two or more singles have been twisted together. Plied Yarn:- two or more components one twisting operation similar or dissimilar components. Also known as Folded Yarn. It is possible to make up a yarn by twisting together two or more finer yarns. The process is called Plying and the yarns are called Plied Yarn. To show that a yarn is plied, it is normal to write both the yarn count and the number of plies separated by a slash. In some systems, the quoted yarn number is that of each component. A '100 den / 3' yarn would mean that 3 plies of 100 denier yarns were twisted together to give a yarn whose equivalent linear density would be approximately 300 denier. The twisting causes a slight effect but this can be ignored for now. With a direct systems, one adds together the individual linear densities to arrive at the total. A twisting together of two or more single yarns in one operation. Plied Yarn is the yarn formed by twisting together two or more singles yarns in one operation. Plied Yarn is the yarn made by collecting two or more single yarns. / Скручивание в одно целое двух или более отдельных нитей за один приём. Однокруточная Нить (Plied Yarn) – кручёная нить из двух или более одиночных нитей, скрученных вместе за одну операцию. Крутильная Машина – машина текстильного производства для изготовления кручёной пряжи, корда, шпагата и других изделий, получаемых скручиванием нескольких нитей вместе. Основной рабочий орган крутильной машины – веретено. Перед работой на крутильной машине нити подвергают перемотке на мотальной машине (для увеличения объёма паковки) и трощению.

PLIED YARN DUCK = ТКАНЬ ИЗ ОДНОКРУТОЧНОЙ ПРЯЖИ – Plied Yarn Duck has plied yarn in both warp and filling. See also Duck. / и в основе и в уточине.

PLIMSOLL MARK = ДИСК ПЛИМСЭЛА (или ГРУЗОВАЯ МАРКА, или МАРКА ПЛИМСЭЛА) – Plimsoll Mark is a figure marked on the side of merchant vessels to indicate allowed loading depths. Named after Samuel Plimsoll (10 February 1824 – 03 June 1898), English politican and Liberal Member of Parliament for Derby, and maritime and social reformer. The loading mark on the side of a vessel. Plimsoll Mark:- depth to which a vessel may safely load. Identified by a circle on the vessel's side with a vertical line through and a number of small horizontal lines showing the max depth for summer and winter. A series of horizontal lines, corresponding to the seasons of the year and fresh or saltwater, painted on the outside of a ship marking the level which must remain above the surface of the water for the vessel's stability. Samuel Plimsoll (10 February 1824 – 03 June 1898) was an English politician and social reformer, now best remembered for having devised the Plimsoll Line (a line on a ship's hull indicating the maximum safe draft, and therefore the minimum freeboard for the vessel in various operating conditions). Early Life:- Samuel Plimsoll was born in Bristol and soon moved to Whiteley Wood Hall, Sheffield, also spending part of his childhood in Penrith, Cumberland. Leaving school at an early age, he became a clerk at Rawson's Brewery, and rose to be manager. In 1853, he attempted to become a coal merchant in London. He failed and was reduced to destitution. He himself told how for a time he lived in a common lodging for seven shillings and two pence a week. Through this experience, he learnt to sympathise with the struggles of the poor, and when his good fortune returned, he resolved to devote his time to improving their condition. His efforts were directed especially against what were known as Coffin Ships:- unseaworthy and overloaded vessels, often heavily insured, in which unscrupulous owners risked the lives of their crews. Political Career:- in 1867, Plimsoll was elected as the Liberal Member of Parliament for Derby, and endeavoured in vain to pass a bill dealing with the subject of a safe load line on ships. The main problem was the number of ship-owning MP's in Parliament. In 1872, he published a work entitled Our Seamen, which became well known throughout the country. Accordingly, on Plimsoll's motion in 1873, a Royal Commission was appointed, and in 1875 a government bill was introduced, which Plimsoll, though regarding it as inadequate, resolved to accept. On 22 July, the Prime Minister, Benjamin Disraeli, announced that the bill would be dropped. Plimsoll lost his self-control, applied the term 'villains' to members of the House, and shook his fist in the Speaker's face. Disraeli moved that he be reprimanded, but on the suggestion of Lord Hartington agreed to adjourn the matter for a week to allow Plimsoll time for thought. Eventually Plimsoll made an apology. Many people, however, shared his view that the bill had been stifled by the pressure of the shipowners, and popular feeling forced the government to pass a bill which in the following year, was amended into the Merchant Shipping Act. This gave stringent powers of inspection to the Board of Trade, and the mark that indicates the safe limit to which a ship may be loaded became generally known as Plimsoll's Mark or Line. Plimsoll was re-elected for Derby at the general election of 1880 by a great majority, but gave up his seat to William Vernon Harcourt, believing that the latter, as Home Secretary, could advance sailors' interests more effectively than any private member. Offered a seat by 30 constituencies, Plimsoll was an unsuccessful candidate in Sheffield Central in 1885. He did not re-enter the house, and later became estranged from the Liberal leaders by what he regarded as their breach of faith in neglecting the question of shipping reform. He was for some years the honorary president of the National Sailors' and Firemen's Union, and drew attention to the horrors of the cattle-ships, where animals were transported under appalling and over-crowded conditions. Plimsoll Mark is a mark, welded on both sides of the vessel, indicating the limit to which a vessel may be loaded, depending on the specific gravity of the water in which the vessel is located. See also International Load Line Certificate, and Load Line. / Сэмьюэл Плимсэл (Samuel Plimsoll). Росэн Бровэри (Rawson's Brewery). Бэндьжэмин Дизрайли (Benjamin Disraeli). Лорд Хатинтэн (Hartington). Вильэм Вёнэн Хакот (William Vernon Harcourt). Под Грузовой Маркой понимается знак в виде ряда горизонтальных линий на обоих бортах судна в середине его длины, показывающий предельно допустимое погружение судна в море или реке в зависимости от времени года и района плавания. Под Грузовой Маркой понимается знак предельной осадки, наносимый на обоих бортах морского судна в середине его длины. Положение грузовой марки по высоте определяется размером установленного правилами минимального надводного борта, который зависит от назначения, размеров и архитектурноконструктивных особенностей судна и удостоверяется Свидетельством о Грузовой Марке, выдаваемым классификационным обществом. Для уменьшения регистровой вместимости при перевозке грузов с большим удельным погрузочным объёмом морские грузовые суда могут иметь Тоннажную Марку, которая показывает наибольшую осадку судна в морской и пресной воде. Под Маркой Углубления на судне понимаются горизонтальные линии, наносимые через 10 сантиметров (см) на наружной обшивке с обоих бортов судна в районе форштевня, ахтерштевня, а на больших судах и на миделе, с числом против каждой, обозначающим

углубление судна – отстояние от ватерлинии до нижней кромки горизонтального киля. Марки углубления позволяют оценить посадку судна в эксплуатационных условиях. Грузовые Марки на бортах судов, соответствующие сезону года и зоне или району плавания, не должны быть погружены на протяжении всего времени, когда судно выходит в море, находится в плавании и приходит в порт за исключением погружения на величину поправки в пресной воде или временного погружения на величину соответственно весу топлива и всех других материалов, используемых судном во внутренних водах перед выходом в море. В тех случаях, когда плотность воды отличается от единицы, поправка должна быть пропорциональна разнице между 1.025 и действительной плотностью. Судно подлежит:- (i) первоначальному освидетельствованию перед вводом в эксплуатацию; (ii) периодическому освидетельствованию – через 5 лет, чтобы удостовериться, что судно полностью отвечает требованиям Конвенции; и (iii) промежуточному – ежегодному, плюс/минус три месяца – что не производилось изменений, влияющих на расчёт определения места нанесения Грузовых Марок и что устройства и средства для закрытия отверстий, штормовых портиков и доступа в помещения команды содержатся в надлежащем состоянии. На основании результатов освидетельствования судну выдаётся Международное Свидетельство о Грузовой Марке (International Load Line Certificate). Свидетельство теряет силу (аннулируется):- (i) при просрочке периодического освидетельствования, ежегодного подтверждения; (ii) при существенных изменениях в корпусе и надстройке судна, влияющих на надводный борт; (iii) при содержании в ненадлежащем состоянии устройств и средств для закрытия ВНЗ; (iv) снижении прочности конструкций корпуса ниже допустимых пределов; и (v) при передаче судна под Флаг другого Государства. Грузовая Марка – знак предельной осадки, наносимый на обоих бортах морского судна в середине его длины (грузовая ватерлиния). Грузовую марку изображают в виде круга, пересечённого по центру горизонтальной линией, которая показывает наибольшую допустимую осадку судна в морской воде (в летнее время в зоне умеренного климата), и ряда горизонтальных линий, показывающих предельное погружение его в море или реке в зависимости от времени года и района плавания. Английские моряки называют грузовую марку Диском Плимсэла, которая на основании правил международной конвенции наносится на борта каждого спущенного на воду торгового судна, если его тоннаж превышает сто пятьдесят регистровых тонн. Впервые такую грузовую марку предложил Самьюэл Плимсэл, Англичанин и пивовар из города Дерби, который не имел никакого отношения к судоходству. Применяются следующие грузовые марки:- (i) летняя грузовая марка – Л (S); (ii) зимняя грузовая марка – З (W); (iii) зимняя грузовая марка для Северной Атлантики – ЗСА (WNA); (iv) тропическая грузовая марка – Т (T); (v) грузовая марка для пресной воды – П (F); и (v) тропическая марка для пресной воды – ТП (TF). Для каждого судна грузовую марку размечают по международным правилам, которые обязательны для всех морских держав мира. Поэтому форма грузовой марки везде одинакова. Единственное отличие – в буквах. Обозначение организации, назначившей грузовую марку, наносится над горизонтальной линией, проходящей через центр кольца знака (Диск Плимсэла). Обозначение Регистра Судоходства Российской Федерации – РС, L и R = Регистр Лойда, А и В = Американское Бюро Судоходства и так далее. Различают грузовые марки для лесовозов, пассажирских и парусных судов. Грузовая марка, соответствующая сезону, не должна быть погружена в воду на протяжении всего периода от момента выхода из порта до прихода в следующий порт. Судам, на борта которых нанесены грузовые марки, выдаётся Международное Свидетельство о Грузовой Марке (International Load Line Certificate) на срок не более чем на 5 лет. На каждом судне хранится свидетельство на надводный борт, и если осадка больше, чем это допускается грузовой маркой, то его капитан не имеет права выйти в море. В случае перегрузки портовые власти, ответственные за выход судна в рейс, вправе потребовать удаления лишнего груза и даже задержать судно в порту. Марки углубления ни в коем случае нельзя путать с грузовой маркой, так как они служат только для измерения фактической носовой и кормовой осадки на данный момент. Применение:- Согласно Международной Конвенции о Грузовой Марке судну запрещён выход в море на международный рейс, если ему не была нанесена грузовая марка и не выдано Международное Свидетельство о Грузовой Марке или, когда необходимо, Международное Свидетельство об Изъятии для Грузовой Марки. Настоящая конвенция применяется ко всем судам кроме:- (i) военных кораблей; (ii) новых судов длиной менее 24 метров (79 футов); (iii) существующих судов валовой вместимостью менее 150 регистровых тонн; (iv) прогулочных яхт, не занимающихся коммерческими перевозками; и (v) рыболовных судов. Ничто в настоящей Конвекции не применяется к судам, совершающим плавание исключительно:- (а) по Великим Озёрам Северной Америки и по Реке Святого Лаврентия в пределах, ограниченных на Востоке прямой линией, проведённой от Мыса Розье до Мыса Вест Пойнт на Острове Антикости, и далее прямой линией, проведённой от Острова Антикости в Северном направлении по меридиану 63° Западной долготы; (б) в Каспийском Море; (в) по рекам Ла-Плата, Парана и Уругвай в пределах, ограниченных на Востоке прямой линией, проведённой между Пунта Раза (Кабо Сан Антонио), Аргентина, и Пунта дель Эсте, Уругвай. Международная Конвенция о Грузовой Марке (International Convention on Load Lines), кратко именуемая КГМ, подписанная 05 Апреля 1966 в Лондоне по инициативе Международной Морской Организации (ИМО). В 1988 специальным Протоколом в неё были внесены изменения, позднее, в 2003 дополненные Комитетом по Безопасности на Море ИМО. Изменённая Конвенция о Грузовой Марке (КГМ-66/88) вступила в силу 01 Января 2005. Конвенция запрещает выход в море судна в международный рейс, если оно не было соответствующим образом освидетельствовано, ему не была нанесена грузовая марка и не выдано Международное Свидетельство о Грузовой Марке или, когда необходимо, Международное Свидетельство об Изъятии для Грузовой Марки. В Приложениях к Конвенции устанавливаются правила определения грузовых марок, условия назначения и величины надводного борта, модификации конвенционных требований по зонам, районам и сезонным периодам, а также приводятся формы Международного Свидетельства о Грузовой Марке. В 1988 был принят Протокол к Конвенции о Грузовой Марке, вступивший в силу в 2000. Этим Протоколом требования Конвенции 1966 относительно освидетельствования и выдачи международных свидетельств были приведены в соответствие с требованиями Международной Конвенции по Предотвращению Загрязнения с Судов (МАРПОЛ 73/78) и Международной Конвенции по Охране Человеческой Жизни на Море (СОЛАС).

PLIMSOLLS = КЕДЫ – Plimsolls:- (British) lightweight canvas shoes with rubber soles; sneakers. / Plimsolls = лёгкие парусиновые туфли на резиновой привулканизированной подошве.

PLISS = ПЛИС – Pliss:- could be made from any fine material, e.g., organdy, lawn, etc. Treated with a caustic soda solution or sodium hydroxide solution which shrinks parts of the goods either all over or in stripes giving a blistered effect. Similar to seersucker in appearance. This crinkle may or may not be removed after washing. This depends on the quality of the fabric. It does not need to be ironed, but if a double thickness, such as a hem, needs a little, it should be done after the fabric is thoroughly dry. Often it is called Wrinkle Crêpe and may be made with a wax/shrink process (the waxed parts remain free of shrinkage and cause the ripples).

PLISSÉ = ПЛИССЭ (или ПЛИССЕ, или ПЛИССИРОВКА, или ПЛИССИРОВАННОЕ, или СКЛАДЧАТОЕ) – Plissé is a lightweight, plain weave, fabric, made from cotton, rayon, or acetate, and characterized by a puckered striped effect, usually in the warp direction. The crinkled effect is created through the application of a caustic soda solution, which shrinks the fabric in the areas of the fabric where it is applied. Plissé is similar in appearance to seersucker. End-uses include dresses, shirtings, pajamas, and bedspreads. Plissé is a cotton, rayon, or acetate fabric with a crinkled or pleated effect. The effect is produced by treating the fabric, in a striped or spotted motif, with a caustic-soda solution which shrinks parts of the goods. Plissé is a textile finish characterized by a

puckered or creased effect, produced by chemical treatment that shrinks part of the fabric. It can be made of acetate, cotton or rayon and often has a striped or spotted design. / полосатый или пятнистый дизайн. каустическая сода или едкий натр (caustic soda). Под Плиссе, от Французского слова Plissé, означающее Плиссированное или Складчатое, понимается . Плиссе – мелкие параллельные складки на ткани, полученные путём специальной термической обработки.

PLM = PRODUCT LIFECYCLE MANAGEMENT

PLN = POLISH ZLOTY

PLOT = ДЕЛЯНКА – Plot is a measured piece of land within a given larger area. It is the unit on which experimental treatments are assigned at random in replicated trials.

PLOT PLAN = ПЛАН ДЕЛЯНОК – Plot Plan is a diagram showing the arrangement of plots in an experiment.

PLOW = ПЛУГ (или СОШНИК) – Plow (American English) or Plough (British English) is a moldboard type or dish type implement used for primary tillage. It is either animal-drawn or tractor-pulled. / Под Плугом понимается сельскохозяйственное орудие для вспашки почвы. Деревянный плуг известен в Китае ранее 1-го тысячелетия до Нашей Эры; в России – с VIII–IX веков. Первые металлические конные плуги появились в конце XVIII века. Современные плуги – тракторные (навесные и прицепные) и конные по числу основных рабочих органов (плужных корпусов) делят на одно-, двух- и многокорпусные, а по их типу – на лемешные и дисковые. В бывшем СССР преимущественно тракторные навесные лемешные плуги общего назначения (для пахоты на глубину 20–35 сантиметров) и специальные (кустарниково-болотные, плантажные, садовые, лесные, ярусные и другие). Под Сошником понимается рабочий орган сеялки для образования в почве бороздки, направления в неё семян и заделки их почвой. Различают сошники дисковые, анкерные, килевидные и другие.

PLOW LAYER = ПАХОТНЫЙ СЛОЙ – Plow Layer is the top 15–20 cm of soil normally plowed or disturbed with tillage operations.

PLOW PAN (HARD PAN) = ПЛУЖНАЯ ПОДОШВА или УПЛОТНЁННЫЙ ПОДПАХОТНЫЙ СЛОЙ (хардпен или твёрдая прослойка) – Plow Pan (hard pan) is a hard layer of soil at 15–20 cm depth developed through continuous plowing at the same depth. It reduces downward water loss during flooding and prevents penetration of roots. / корней.

PLOW–PLANTING = ПОСАДКА ПОД ПЛУГ – Plow-Planting is the plowing and planting of land in a single trip over the field by drawing both plowing and planting tools with the same power sources. / Пахота (или вспашка) и посадка .

PLOWLESS FARMING = БЕСПАХОТНОЕ ЗЕМЛЕДЕЛИЕ (или ЗЕМЛЕДЕЛИЕ С СИСТЕМОЙ БЕЗОТВАЛЬНОЙ ОБРАБОТКИ ПОЧВЫ) – Plowless Farming is a tilling soil without plowing so that the crop residue will be left on the surface.

PLT = PATENT LAW TREATY

PLUCKING = ТЕРЕБЛЕНИЕ (или ВЫДЁРГИВАНИЕ) – Plucking is a condition found at the feed roll and lickerin section of the card when larger than normal clusters of fiber are pulled from the lap by the lickerin. This situation is normally caused by uneven laps or the inability of the feed rolls to hold the lap sheet while small clusters of fibers are being pulled from the lap by the lickerin. Plucking inevitably produces flaky webs. / приёмного барабана (lickerin) чёсальной машины.

PLUG = ПРОБКА (или ЗАГЛУШКА) – Plug (maritime term):- a wooden wedge fitting into a drainage hole in the bottom of a boat for the purpose of draining the boat when she is out of water.

PLUGGING = ТОРМОЖЕНИЕ ПРОТИВОТОКОМ (или ТОРМОЖЕНИЕ ПОСРЕДСТВОМ ГЕНЕРАТОРНОГО РЕЖИМА, или ТРАМБОВАНИЕ, или ЗАКУПОРИВАНИЕ, или ЗАКУПОРКА) – Plugging is a method of switching direction, stopping, or slowing down without using a break on electric industrial vehicles.

PLUGGING VALUE = ЗНАЧЕНИЕ ЗАКУПОРИВАНИЯ – Plugging Value:- in the manufacture of acetate fibers, a measure of filterability. It is the weight of solids in an acetate dope that can be passed through a fixed area of filter before the filter becomes plugged. It is expressed as weight of solids per square unit of filter area, e.g., g/cm^2.

PLUG HAT = ШЛЯПА ЦИЛИНДР – Plug Hat is a man's stiff hat, as a bowler or top hat.

PLUM = ХХ (или ПУРПУРНО–ЧЁРНЫЙ, или ГЛУБОКО–ПУРПУРНЫЙ, или ТЁМНО–ФИОЛЕТОВЫЙ) – Plum:- a dark reddish purple (the color of the fruit; plum).

PLUMOSE = ОПЕРЁННОЕ – Plumose:- feather-like. / Оперённое:- как перо.

PLUMULE = ПОЧЕЧКА ЗАРОДЫША (С ЗАЧАТОЧНЫМИ ЛИСТЬЯМИ) – Plumule:- the embryonic leaves of the young plant in the embryo. It is enclosed by the coleoptile. Plumule:- the embryonic leaves of the young plant in the embryo. It is enclosed by the coleoptile.

PLUMY = ПЕРИСТОЕ (или ХХ) – Plumy:- having a plum color.

PLURALIST THEORY = ПЛЮРАЛИСТСКАЯ ТЕОРИЯ – Pluralist Theory is the theoretical point of view held by many social scientists which holds that American politics is best understood through the generalization that power is relatively broadly (though unequally) distributed among many more or less organized interest groups in society that compete with one another to control public policy, with some groups tending to dominate in one or two issue areas or arenas of struggle while other groups and interests tend to dominate in other issue areas or arenas of struggle. There tends to be little overlap between those leaders who participate most influentially in one policy area and those who are influential in other policy areas, and what linkage there is tends to come from popularly elected political officials (especially political executives and party leaders) who, by the nature of their jobs, must exercise leadership (or act as brokers) in a number of different policy areas. There is no single, unified 'power elite', but rather there are many competing power elites with differing backgrounds, values and bases of support in the broader society. Government tends to be depicted as a mechanism for mediating and compromising a constantly shifting balance between group interests rather than as an active innovator or imposer of policies upon society. / Под Плюралистской Теорией, от Латинского слова Pluralis, означающее Множественный, понимается .

PLUSH = ПЛЮШ (или ПЛИС) – Plush is a term describing a cut-pile carpet in which the pile yarns are only slightly twisted, dense, and very evenly sheared. A plush carpet has the look of a solid, flat velvet surface. Similar pile constructions are also used in upholstery fabric. Plush is a fabric with an even pile longer and less dense than velvet pile. Plush:- velvet or velveteen where the pile is 1/8" thick or more. ex) Cotton velour, hat velour, plush 'fake furs'. / Под Плюшем, от Немецкого слова Plüsch, от Латинского слова Pilus, означающее Волос, понимается ворсовая ткань. Изготовление плюша аналогично изготовлению бархата. Плюш отличается от бархата более высоким (до 6 миллиметро (мм)) и менее густым ворсом. В зависимости от вида ворса

различают:- разрезной плюш и неразрезной (петельный) плюш, а от способа выработки и отделки – гладкий или рисунчатый плюш, тиснёный плюш и так далее. Плюш применяется для пошива и отделки одежды, обивки мебели, изготовления покрывал, занавесей и тому подобного. Плюш:- (i) получают ввязыванием в грунт ворсовых нитей с сильно вытянутыми протяжками, из которых на полотне создаётся ворс. Ворс может быть разрезным и неразрезным, он может располагаться на одной или обеих сторонах полотна. (ii) Обладает высокими теплозащитными свойствами, формоустойчив. В изготовлении изделий важную роль играет направление ворса. Ворс должен быть направлен на всех деталях изделия в одну сторону. Обычно снизу вверх, чтобы создать на поверхности изделия матовый оттенок, если другое направление не предусмотрено по модели. Плюш – шёлковая, шерстяная или хлопчатобумажная ткань с более длинным ворсом, чем у бархата; использовалась в XIX веке для пошива верхнего женского платья, поддевок, в начале XX века в крестьянской среде на Беларуси – для пошива тёплых выходных женских полупальто, так называемых плюшевок. Плис – разновидность хлопчатобумажного бархата с несколько большей, чем у последнего, длиной ворса. В XIX веке существовало несколько сортов плиса – вельвертин, бивер. Во второй половине XIX века появился сорт мебельного плиса, который изготавливался из чистошерстяной пряжи или смеси шерсти и хлопка. Из современных тканей плис ближе всего к плюшу, но последний изготавливался с шёлковым ворсом. Плис в России носили все, но богатые крестьяне и купцы шили из него нарядную одежду, а дворянство использовало плис в качестве ткани для домашнего костюма. Плис использовался не только для одежды, а позднее – мебельной обивки, но и для изготовления мягкой, спокойной обуви.

PLUVIAL = ПЛЮВИАЛ (или ПЛЮВИАЛЬНОЕ, или ДОЖДЕВОЕ) – Pluvial:- pertaining to rain; also pertaining to land that receives water almost wholly directly from rain. / Под Плювиальным, от Латинского слова Pluvia, означающее Дождь, понимается . Плювиал (от Латинского слова Pluvialis, означающее Дождливый), фазы значительного увлажнения климата пустынь и полупустынь субтропического и тропического пояса, соответствующие гляциалам (ледниковым эпохам) средних широт земного шара.

PLUVIAL RICE = ПЛЮВИАЛЬНЫЙ РИС (или ДОЖДЕВОЙ РИС) – Pluvial Rice is the upland Rice that depends only on rainfall for water supply.

PLUVIC = ПЛЮВИАЛЬНОЕ (или ДОЖДЕВОЕ) – Pluvic:- derived from pluvia of rain; descriptive of a land type where water contributed by rain or irrigation does not stay for more than 3 hours on the soil even if the soil has been worked wet. See also Dryland.

PLY = ЧИСЛО СЛОЖЕНИЙ (или СГИБ, или СКЛАДКА, или СЛОЙ, или ОДИНАРНАЯ ТОЛЩИНА ТКАНИ, или ОБОРОТ, или ПРЯДОЧКА) – (1) Ply:- a single unit of yarn. A 2-ply yarn would involve taking two singles and then plying them in the opposite direction they were originally spun. See also S-Twist, and Z-Twist. Ply is the number of single yarns twisted together to form a plied yarn, or the number of plied yarns twisted together to form a cord. Ply:- the number of individual yarns twisted together to make a composite yarn. Six-ply sevens would mean that six single yarns of a count of seven are plied together to give a composite yarn of 6/7s N_E. Ply is the number of single yarns twisted together to make a composite yarn. When applied to cloth, it means the number of layers of fabric combined to give the composite fabric. Ply:- two or more yarns that have been twisted together. An automobile tire fabric yarn may be 9, 10, or 11 ply. / Количество отдельных нитей пряжи, скручиваемых вместе для получения кручёной комплексной нити. (6/7s – шестой в семь сложений ($N_{Английский}$) или шестой в семь прядочек ($N_{Английский}$)).

(2) Ply is an individual yarn in a plied yarn or cord. / Прядочка – отдельная нить пряжи в сложенной пряже или корде. Одиночная нить в кручёной пряже.

(3) Ply:- the number of layers of fabric, as in a shirt collar, or of cord in a tire.

(4) Ply:- in general, fabrics or felts consisting of one or more layers (laminates and so forth). The layers make up a stack. A single layer of prepeg. A single pass in filament winding. Ply is one of a number of layers of fabric. The number of layers of fabric combined to give the composite fabric. / Каждый слой ткани в дублированной материи.

PLYFIL® = ПЛАЙФИЛ® – Plyfil® is a proprietary system of making two-fold long-and-short staple yarns by using ultrahigh drafting. The slightly twisted ends produced are not useable yarns but are well suited for subsequent processing, i.e. twisting.

PLYING = СЛОЖЕНИЕ – Plying is the process of taking multiple singles and twisting them back against themselves. Plying is a twisting together two or more singles yarns or ply yarns to form, respectively, ply yarn or cord.

PLY TWISTING = КРУТКА СЛОЖЕНИЕМ – Ply Twisting:- xxxxx. See also Plying.

PLYWOOD = ФАНЕРА – Plywood is a glued wood panel made up of thin layers of veneer with the grain of adjacent layers at right angles, or of veneer in combination with a core of lumber or of reconstituted wood. See also Modified Construction Plywood, and Standard Construction Plywood. / Клеёная деревянная панель, сформированная тонкими листами шпона с ориентацией направления волокон прилежащих слоёв, перпендикулярной друг другу, или сформированная из листов шпона в комбинации с центром из пиломатериала или из воссозданной древесины. Под Фанерой, от Немецкого слова Furnier, от Французского слова Fournir, означающее Накладывать, понимается листовой древесный материал, получаемый склеиванием трёх или более листов преимущественно лущёного шпона (ориентация направления волокон склеиваемых листов – перекрёстная). Фанеру изготовляют из Берёзы, Бука, Ольхи, Сосны, Ясеня и так далее. Разновидности фанеры:- армированная, металлизированная, огнестойкая. В зависимости от сопротивления действию влаги различают фанеру водостойкую, средней и ограниченной водостойкости. Фанеру выпускают в виде листов толщиной 1.5–18 миллиметров (мм), листы толще 18 мм называют фанерными плитами. Фанеру применяют в машиностроении, мебельном производстве, строительстве, судостроении и так далее.

PLYWOOD STRESSED–SKIN PANEL = ПАНЕЛЬ С РАБОТАЮЩЕЙ ОБШИВКОЙ ИЗ ФАНЕРЫ – Plywood Stressed-Skin Panel:- a form of construction in which outer skins of plywood are applied over internal frame members to form a rigid structural element. / Форма конструкции, в которой листы фанеры накладываются на внутренние элементы рамы в качестве внешней обшивки с целью создания жёсткого структурного элемента. Под Панелью, от Немецкого слова Paneel, понимается плоский крупноразмерный элемент (конструкция) заводского изготовления, широко применяемый в современном строительстве зданий и сооружений различного назначения (например, панель покрытия, стеновая панель и другие).

PLY YARN = СЛОЖЕННАЯ ПРЯЖА – Ply Yarn:- two or more single yarns folded or twisted together.

PM = SAINT PIERRE AND MIQUELON

PMA = PACIFIC MARITIME ASSOCIATION

PMA = PRESIDENT'S MANAGEMENT AGENDA

PMAC = PENSION MANAGERS ADVISORY COMMITTEE

PMIS = PROJECTS MONITORING INFORMATION SYSTEM

PMO = PRICE MOMENTUM OSCILLATOR

PMO = PROGRAM MANAGEMENT OFFICE

PMTD = PERSONAL MOBILE TRUSTED DEVICE

PMV = PRIVATE MARKET VALUE

PMVR = PREDICTED VALUE OF MV ADOPTION RATIO

PN = PEDIGREE NURSERY

PN = PHYTOSANITARY NOTE

PN = PITCAIRN

PN = PROJECT NOTE

PN = PROMISSORY NOTE

PNA = POLYNUCLEAR AROMATIC

PNEC = PREDICTED NO EFFECT CONCENTRATION

PNEUMAFIL = ПУХ–РАСПЫЛ (или ПНЕВМАПУХ, или ПУХ С ФИЛЬТРОВ) – Production of yarn temporarily ceases when an end breaks in a ring frame. An end refers to the yarn emerging from the delivery rolls of the drafting system. Repair has to wait until an operator (or robot) gets around to it. During these times of interrupted production, the drafting system continues to deliver fiber, which is sucked away by a pneumafil system. The fiber removed is also referred to as Pneumafil. The fiber removed is that which would have gone into the yarn, and has good characteristics of length and strength; but fiber crimp and elongation characteristics have been changed as compared to the virgin fiber. Nevertheless, the pneumafil waste is reused or 'reworked' because it is too good to throw away. The reworked fiber has to be blended with the virgin fiber very carefully so that the percentage does not exceed, say, 3% anywhere in the blend. Failure to control the blends leads to problems throughout the process line. Besides the pneumafill produced during the time of an end down, there is a continuous loss of fiber from the twist triangle and balloon during spinning. This is only a fraction of a percent of the total volume being processed, but it is not a unique relationship between the ends down rate (in breaks/1 000 spindle hour), machine productivity (in lb/spindle hour), and the pneumafil production rate (in lb/spindle hour) as might be expected, although there is a rough correspondence. Mill trials produce a range of values depending on the product, machine, and operators. A very rough rule of thumb is that the percentage of pneumafil is about one-tenth of the end-breakage rate. Excessive deviations in the ratio between the pneumafil production rate and the theoretical value given below are a sign of inefficient repairs of the broken ends. Pneumafil waste is nearly always recycled within the staple mill. Intense competition and pressure on prices make prudent recycling a necessity. The amount of pneumafil generated with cotton yarns is substantial and it rises with count. Recycling has to be carried out with care. See also Fly. Recirculation of useable waste such as sliver and lap ends, sliver waste, roving waste after opening by roving waste opener and pneumafil waste is a normal practice in the spinning mills. These wastes are mixed in cotton at the opening and mixing stages in a sandwich manner before processing in the blow room. The object is to ensure homogeneous distribution of these wastes in the cotton mixing heap. It is also important to keep the percentage of pneumafil waste as low as possible in the cotton mixing. It should not be allowed to exceed 3%. This is necessary because the cotton fibers in pneumafil waste after passing through all stages upto spindle point loose surface characteristics, i.e. convolutions, natural wax, pliability, etc. become brittle and are susceptible to breakage, nep formation at the carding stage and excessive end-breakage at the ring spinning frames. In some mills, the Pneumafil waste observed on frames with a reduced ringrail speed was compared with that on normal frames. / Пух подвальный трубный и с фильтров – пропыленная масса короткого волокна (12–15мм) с наличием мелких сорных примесей органического происхождения от переработки хлопкового волокна всех сортов и типов. Эти отходы накапливаются в пыльных подвалах, каналах, на решётках фильтров и вентиляционных камер, в соросборниках пневмомеханических прядильных машин.

PNEUMATICS = ПНЕВМАТИКА – Pneumatics is the engineering science pertaining to gaseous pressure and flow. / Под Пневматикой, от Латинского слова Pneumaticus, от Греческого слова Pneumatikós, от Pneûma, означающее Дуновение или Дух или Дыхание, понимается раздел физики, изучающий равновесие и движение газов, а также посвящённый механизмам и устройствам использующим разность давления газа для своей работы. Технически пневматика близка к гидравлике. Пневматические механизмы широко используются в промышленности. Подобно сети электроснабжения, на предприятиях устанавливают централизованную систему распределения сжатого воздуха или другого газа. Обычно пневматические устройства используют поршни и клапаны для управления потоками газа (воздуха), но есть целая ветвь устройств, использующих особенности течения струй газа (пневмоника) и жидкости в каналах определённой формы. Такие струйные устройства вообще не имеют подвижных деталей, отличаются дешевизной изготовления и высокой стойкостью к температуре и радиации (смотрите Пневматический Компьютер). История:- одним из первых устройств, использующих сжатый воздух, являются кузнечные мехи с ручным приводом, которые появились более чем за 3000 лет до Нашей Эры. В I веке до Нашей Эры Греческий математик и механик Герон Александрийский в трактате 'Пневматика' описал механизмы, приводимые в движение нагретым или сжатым воздухом. Живший в Александрии примерно в одно время с Героном древнегреческий изобретатель и математик Ктезибий изобрёл поршневой насос и музыкальную машину (прообраз современного органа). В 1760 в Англии был разработан поршневой компрессор ('цилиндрические мехи'), обеспечивающий давление сжатого воздуха в 0.2 МПа.

PNEUMATOPHORE = ПНЕВМАТОФОР (или ВОЗДУШНЫЙ ПУЗЫРЬ) – Pneumatophore is a specialized root that grows vertically into the air from roots embedded in the mud. / Специализированный корень, который растёт вертикально в воздух от корней, . Под Пневматофором, от Греческих слов Pnéuma, родительный падеж Pnéumatos, означающее Воздух или Дуновение, и Phorós, означающее Несущий, или Воздушным Пузырём понимается орган гидростатического равновесия у колониальных животных – сифонофор, позволяющий колонии менять удельную массу (при наполнении воздухом пневматофор сифонофора плавает у поверхности воды). Под Пневматофорами понимаются надземные (воздушные) корни некоторых тропических деревьев, например, мангровых. Снабжают воздухом подземные части растений, растущих на бедных кислородом заболоченных почвах или по берегам морей в зоне прилива.

PNF = PHILIPPINE NEWS AND FEATURES

PNUE = PHOTOSYNTHETIC N USE EFFICIENCY

PO = PRICE OSCILLATOR

PO = PRINCIPAL ONLY

POA = POWER OF ATTORNEY

POCKET = КАРМАН – (1) Pocket (patch) is a pocket attached to the outside of the garment and constructed of self-fabric.

(2) Pocket (quarter):- the angle from the side seam.

(3) Pocket (rule):- a patch pocket attached on the outseam, halfway between the hip and the knee of the garment; usually found on coveralls.

(4) Pocket (serged):- a pocket formed by joining two pieces of fabric and joining the edges with safety-stitching. / втачивание (stitching).

(5) Pocket (slash):- a pocket that must be entered through a slash on the garment. The pocket pouch is suspended from and attached to the slash.

(6) Pocket (stitch and turn):- formed when two pieces of fabric are joined along the edges and turned so that the raw seam margin is inside of the finished pocket.

(7) Pocket (stitched/topstitched):- the same as stitch and turn pocket, except with an added row of stitching along the folded edges. / втачивание (stitching)

(8) Pocket (swing):- the pocket pouch is suspended from and attached to the pocket opening.

POCKETBOOK = КАРМАННАЯ КНИГА (или ХХ, или НЕСЕССЕР) – Pocketbook:- purse, handbag.

POCKET FACING = ХХ – Pocket Facing:- a piece of shell (outer) material super-imposed on the top of the pocket material at its opening to conceal the lining.

POCKET–HANDKERCHIEF = КАРМАННЫЙ ПЛАТОЧЕК – Pocket-Handkerchief is a handkerchief carried in the pocket.

POCKETS or LININGS NOT PRESSED CORRECTLY = КАРМАНЫ или ПОДКЛАДКИ НЕ ОТУТЮЖЕНЫ ПРАВИЛЬНО – Pockets or Linings Not Pressed Correctly:- causing wrinkles or ridges to appear on the surface of the garment. Finishing department defects, and namely – Pressing Defects. / Порок или дефект заключительной обработки.

POD = PAY ON DELIVERY

POD = PROOF OF DELIVERY

POD = БОБ (или СТРУЧОК) – A Pod is a case that holds a plant's seeds. When you buy fresh peas from the farmer's market, they come still in their pod. In many Plants, seeds grow in groups, nestled within a pod. Peas are one such plant, and many other legumes and flowers have seed pods as well. The expression 'two peas in a pod' refers to the way seeds are clustered together within the pod, and means 'very similar to each other'. Pod comes from the XV century term Podware, 'seed of legumes or grain'. Pod is a dry, usually elongated fruit. See also Legume, and Silique. Legume, also called Pod, fruit of Plants in the Pea Family (Fabaceae). Most legumes are dehiscent fruits that release their seeds by splitting open along two seams, though some, such as Peanuts (Arachis Hypogaea) and Carobs (Ceratonia Siliqua), do not naturally open. The fruits come in a variety of sizes and shapes; many, however, are long and narrow and bear their seeds in a single line. The largest legumes are borne by the Monkey Ladder (Entada Gigas) and can reach up to 2 meters (6.6 feet) in length. At maturity, legume fruits are usually dry and papery or hard and woody; the legumes of certain food crops, such as Snow Peas (Variety of Pisum Sativum), Edamame (Glycine Max), and Green Beans (Phaseolus Vulgaris), are harvested while still green and fleshy. / Под Стручком понимается плод Растений, раскрывающийся двумя опадающими створками, после чего остаётся перегородка с семенами. Характерен для Крестоцветных (Горчица, Капуста). Стручок (Siliqua), сухой ложнодвугнёздный паракарпный плод большинства Растений Семейства Крестоцветных, образующийся из двух плодолистиков и обычно вскрывающийся от основания к вершине двумя опадающими створками. На растении остаётся рамка с плацентами и более или менее прозрачной ложной перегородкой. Реже встречаются невскрывающийся стручок (Редька Посевная) и членистый стручок (Редька Дикая). Под Бобом понимается одногнёздный плод Растений Семейства Бобовых, обычно вскрывающийся от вершины к основанию двумя створками. В быту бобом неправильно называют семена Бобовых. Боб, плод Растений Порядка Бобовых; образуется из верхней завязи одним плодолистиком. Чаще всего это сухой плод, раскрывающийся от вершины к основанию двумя створками (Горох, Фасоль, Вика и другие). У некоторых Видов боб – нераскрывающийся (Донник, Клевер). Бобы Арахиса созревают в почве и не растрескиваются. У 'Цареградских Рожков' (Ceratonia Siliqua) боб сочный и сладкий. Боб содержит чаще несколько семян, прикреплённых короткими семяножками к брюшному шву. Размер, форма и строение бобов разнообразны:- у большей части видов они прямые, более или менее плоские (Горох, Фасоль и другие), у других – округлые, согнутые или свёрнутые спиралью (Люцерна Посевная). У некоторых Видов бобы распадаются на односемянные части. У диких Видов Бобовых Растений створки мгновенно скручиваются и разбрасывают семена. В быту бобами называют семена бобовых, а сами бобы называют стручками. Это неправильно, так как стручок имеет другие признаки и характерен для Семейства Крестоцветных. Типы бобов:- (i) раскрывающийся двумя створками (Гороха); (ii) членистый раскрывающийся (Мимозы); (iii) завитой боб (Люцерны); (iv) боб-орешек (Астрагала); (v) двусемянный боб (Арахиса).

POE = PORT OF EMBARKATION

POE = PORT OF ENTRY

POET SLEEVE = ПОЭТОВСКИЙ РУКАВ (или ПОЭТИЧЕСКИЙ РУКАВ) – Poet Sleeve:- full sleeve which is gathered in at the wrist.

POH = ГИДРОКСИДНЫЙ ПОКАЗАТЕЛЬ (или ПИ.ОУ.ЭЙЧ.) – pOH is a measure of the concentration of hydroxide ions (OH^-) in solution. $pOH = -\log[OH^-] = (14 - pH)$. See also pH. / Гидроксидный Показатель – мера концентрации гидроксидных ионов.

POIKILOTHERMIC PESTS = ПОЙКИЛОТЕРМИЧЕСКИЕ ВРЕДИТЕЛИ (или ПОЙКИЛОТЕРМНЫЕ ВРЕДИТЕЛИ) – Poikilothermic Pests:- (Greek:- Poecil – Multicolored; Thermos – Heat) cold-blooded pests. / Пойкилотермические Вредители – животные организмы, имеющие непостоянную температуру тела. Пойкилотермные Животные, от Греческих слов Poikílos, означающее Переменчивый или Различный, и Thérme, означающее Тепло, холоднокровные животные, животные с непостоянной температурой тела, меняющейся в зависимости от температуры внешней среды. К пойкилотермным животным относятся все

беспозвоночные, а из позвоночных – Рыбы, Земноводные и Пресмыкающиеся. Температура тела пойкилотермных животных обычно всего на 1–2 °C выше температуры окружающей среды или равна ей. Терморегуляция у пойкилотермных животных несовершенна. Температура тела у многих из них повышается под влиянием поглощения Солнечного тепла или мышечной работы. Например, у Шмелей в полёте она может достигать 38 и даже 44 °C при температуре воздуха 4–8 °C. Однако после прекращения полёта тело быстро охлаждается до температуры внешней среды. При повышении или понижении температуры внешней среды за пределы оптимума пойкилотермные животные впадают в оцепенение или гибнут. Многие из них находятся в оцепенении большую часть года (например, степная Черепаха активна всего 3 месяца в году). Отсутствие совершенных терморегуляционных механизмов у пойкилотермных животных объясняется относительно слабым развитием их нервной системы, особенно центральной, пониженным уровнем обмена веществ, который примерно в 20–30 раз ниже, чем у Гомойотермных Животных, и другими особенностями, связанными с более примитивной организацией пойкилотермных животных по сравнению с Птицами и Млекопитающими.

POINT = ЗАОСТРЯТЬ (или НАПРАВЛЯТЬ) – Point (maritime term):- to taper the end of a rope; one of the 32 divisions of the compass card. To head close to the wind.

POINT = ПУНКТ – (1) A term Point refers to the most basic (i.e. smallest) unit of a particular traded stock, commodity, etc. When used in the context of a stock index, it is generally a proxy for currency, e.g., 'the Dow is up 21.5 points today'. Stock indices have 'Points', futures have 'Ticks', forex has 'Pips'. In the case of shares of stock, a point means USD1.00. If ABC shares rise 3 points, each share has risen USD3.00. In the case of bonds, a point means USD10.00, since a bond is quoted as a percentage of USD1 000.00. A bond that rises 3 points gains 3 percent of USD1 000.00, or USD30.00 in value. An advance from 87 to 90 would mean an advance in Dollar value from USD870.00 to USD900.00. In the case of market averages, the word point means merely that and no more. If, for example, the NYSE Composite Index® rises from 90.25 to 91.25, it has risen a point. A point in this index, however, is not equivalent to USD1.00. In futures and options trading, the smallest monetary unit of change in a futures price or an options premium. See also Tick. / Сводный Индекс от НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). , например, .

(2) Point is a term used in quoting the price of raw cotton. One point is equal to 1/100 of a cent. The minimum unit that changes in futures prices may be expressed in, e.g., 1/100th of a cent per pound for cotton. Point is a measure of price change equal to 1/100 of one cent in most futures traded in decimal units. In grains, it is of one cent; in T-bonds, it is one percent of par. / Термин, используемый в котировании цены непереработанного хлопка. Один пункт в этом случае равен 0.01 цента, то есть 0.0001 Доллара. Минимальная единица отражения изменения цен на фьючерсные контракты, например, одна сотая (0.01) цента за фунт для хлопка. Величина изменения цены, равная одной сотой одного цента, то есть 0.0001 Доллара, для большинства фьючерсов, торгуемых в десятичных единицах.

(3) Point is the minimum price fluctuation (1/8 of one cent) in US Grain futures and options trading.

(4) Point:- 100th part of a per cent, normally 10 000 of any spot rate. Movement of exchange rates are usually in terms of points.

(5) Point:- one percent on an interest rate, e.g., from 8–9%. / Один процент от процентной ставки, например, от 8–9%.

(6) Point:- minimum fluctuation or smallest increment of price movement. Also known as Pip. / Минимальное колебание или наименьший интервал движения цены. Известный также как Шаг или Пип (Pip).

(7) In reference to a loan, Points consist of a lump sum payment made by the borrower at the outset of the loan period. Generally, each point equals one percent of the loan amount. See also Seller's Points.

(8) One Point is equal to 1 percent of the principal amount of a mortgage loan. For example, if a mortgage is USD200 000.00, one point equals USD2 000.00. Lenders frequently charge points in both fixed-rate and adjustable-rate mortgages to cover loan origination costs or to provide additional compensation to the lender or broker. These points usually are paid at closing and may be paid by the borrower or the home seller, or may be split between them. In some cases, the money needed to pay points can be borrowed (incorporated in the loan amount), but doing so will increase the loan amount and the total costs. Discount points (also called Discount Fees) are points that you voluntarily choose to pay in return for a lower interest rate. Also known as Discount Points. / Займодавцы часто взимают пункты как с закладных с фиксированной ставкой, так с закладных с переоцениваемой ставкой (ЗПС; adjustable-rate mortgage (ARM)) для покрытия .

(9) Point (pt) is a unit of angle measure equal to 1/32 of a circle. Compasses are read by suspending the compass needle over a compass card traditionally inscribed with a 32-point star. Each point of the star represents a named direction; for example, the first five points from north towards east are labeled North, North-by-East, North-Northeast, Northeast-by-North, and Northeast. The difference between two directions can be expressed as a certain number of these compass points. One point equals 11°15' of arc or pi/16 radians.

(10) Point (pt) is a unit of length used by typographers and printers. When printing was done from hand-set metal type, one point represented the smallest element of type that could be handled, roughly 1/64 inch. Eventually, the point was standardized in Britain and America as exactly 1/72.27 = 0.013 837 inch, which is about 0.351 46 mm (351.46 micrometers). In continental Europe, typographers traditionally used a slightly larger point of 0.014 83 inch (about 1/72 pouce, 0.377 mm, or roughly 1/67 English inch), called a Didot Point after the French typographer Firmin Didot (1764–1836). In the United States, Adobe software defines the point to be exactly 1/72 inch (0.013 888 9 inch or 0.352 777 8 millimeters), a unit sometimes called the Big Point (bp). The German standards agency DIN has proposed that all these units be replaced by multiples of 0.25 millimeters (1/101.6 inch). In printing unit of measurement, point is a unit of measurement in printing equal to one twelfth of a pica or approximately 0.035 146 cm (0.013 837 in). / Под Пунктом, от Латинского слова Punctum, означающее Точка, понимается единица длины, равная 1/72 части дюйма. В ряде Европейских стран, где за основу был принят Французский дюйм (27.1 миллиметров), 1 пункт = 0.375 9 мм. В Англо-Американской системе мер, пользующейся Английским дюймом (25.4 мм), 1 пункт = 0.351 мм. В честь Французского типографа Фирмэ Дидо (Firmin Didot (1764–1836)). В Соединённых Штатах Америки программные продукты под фирменным названием Эдоуби (Adobe). В полиграфии Пункт – единица длины в типографской системе мер. В бывшем СССР 1 пункт = 0.375 9 миллиметра (мм). Размеры шрифтов (кегель), пробельного материала, полосы набора измеряются в пунктах или кратных ему единицах:- 1 цицеро = 12 пунктов, 1 квадрат = 48 пунктов.

(11) Point (pt) is a percentage point (see above).

(12) Point (pt) is the unit of mass used for precious stones such as diamonds. One point equals 0.01 carat, or exactly 2 milligrams.

(13) Point (pt) is the unit of quantity equal to 1. This unit is used to express changes in an arbitrary score or index, such as the score in an athletic contest. In finance, a change of one point in the Dow Jones average or similar indices represents a change of 1.00 in the index. / Дау Дьжонз (Dow Jones).

(14) Point (pt) is the unit used to represent the smallest significant change in an arbitrary ratio. This usage is common in sports. Most sports 'averages' are actually ratios of successful performances divided by attempted performances; baseball's batting average is a good example. These ratios are computed to a fixed number of decimal places, usually three, and a point represents a change of 1 in the last decimal place. Thus the batting averages .314 and .302 are said to differ by 12 points.

(15) Point (pt) is another name for a mil, a unit of distance equal to 0.001 inch. Points are used with this meaning to measure the thickness, or caliper, of paper or card stock in the paper industry. One point equals 25.4 micrometers or microns.

(16) Point (pt) is a measure of the specific gravity of a liquid, typically used in brewing and winemaking. Specific gravity is the mass of a sample of the liquid divided by the mass of an equal volume of pure water. It is a dimensionless (unit-less) number, typically a little larger than 1. Each 'point' represents an increase of 0.001 above 1. For example, a liquid of specific gravity 1.048 is described as 48 point.

(17) Point is a medieval unit of time equal to 1/5 hour, or 12 minutes. The point was divided into 8 moments.

POINT = ТОЧКА – Point (pt) is the unit of length used by typographers and printers. When printing was done from hand-set metal type, one point represented the smallest element of type that could be handled, roughly 1/64 inch. Eventually, the point was standardized in Britain and America as exactly 1/72.27 = 0.013 837 inch, which is about 0.351 46 mm (351.46 micrometers). In continental Europe, typographers traditionally used a slightly larger point of 0.014 83 inch (about 1/72 pouce, 0.377 mm, or roughly 1/67 English inch), called a Didot Point after the French typographer Firmin Didot (1764–1836). In the United States, Adobe software defines the point to be exactly 1/72 inch (0.013 888 9 inch or 0.352 777 8 millimeters), a unit sometimes called the Big Point (bp). The German standards agency DIN has proposed that all these units be replaced by multiples of 0.25 millimeters (1/101.6 inch). In printing unit of measurement, point is the unit of measurement in printing equal to one twelfth of a pica or approximately 0.035 15 cm (0.013 84 in). / Под Точкой понимается:- (i) единица длины, применяемая главным образом в полиграфии и равная 0.351 46 миллиметра (мм). (ii) В России точка в качестве единицы длины применялась до введения Метрической Системы Мер. 1 точка = 1/100 дюйма = 1/10 линии = 254 микрометров (мкм). Пункт, единица длины, равная 1/72 части дюйма. В ряде Европейских стран, где за основу был принят Французский дюйм (27.1 миллиметров (мм)), 1 пункт = 0.375 9 мм. В Англо-Американской системе мер, пользующейся Английским дюймом (25.4 мм), 1 пункт = 0.351 мм. Точка – единица длины в Британской Имперальной Системе (British Imperial System) мер. 1 точка = 1/72 дюйма = 1/6 линии = 0.352 8 миллиметра. Точка – Русская мера длины, применявшаяся до введения Метрической Системы и равная 1/100 дюйма = 1/10 линии = 254 микрометров (мкм). Точка – единица длины, применяемая главным образом в полиграфии и равная 0.351 46 миллиметра. Фирмин Дидо (Firmin Didot (1764–1836)).

POINT AND FIGURE BUY SIGNAL = СИГНАЛ НА ПОКУПКУ НА ГРАФИКЕ КРЕСТИКИ И НОЛИКИ – Point And Figure (P&F) Buy And Sell Signals are very simple pattern that should be confirmed before placing a trade. The P&F Buy Signal is used when calculating the various Bullish Percent indices. When the last signal on the chart was a buy signal, that is, the last breakout was a column of Xs going higher than the previous column of Xs and no sell signal (no column of Os breaking below the previous column of Os) has happened since the buy signal. / В биржевой торговле .

POINT AND FIGURE CHART = ГРАФИК КРЕСТИКИ И НОЛИКИ – Point And Figure (P&F) Chart is a type of chart consisting of columns of Xs (showing price rises) and Os (showing price falls) arranged on a square grid. When the index increases, a rising column of Xs is created – a rally. When the index falls, a descending column of Os appears – a decline. A method of charting that uses prices to form patterns of movement without regard to time. It defines a price trend as a continued movement in one direction until a reversal of a predetermined criterion is met. Point and Figure charts display price activity by plotting a column of X's on the chart at each price traded until a specified reversal amount occurs. At the reversal price, the point and figure chart shifts to the left and a begins plotting a column of O's on the chart at each price traded until a specified reversal amount occurs. The process of alternately plotting X's and O's continues until the reversal amount is reached in each direction. The resulting formation of X and O columns can be analyzed to determine market strength and weakness. / В техническом анализе биржевых рынков, . Графики Крестики и Нолики отображают активность цены путём построения в графике колонки крестиков по цене каждой сделки, пока не будет достигнуто определённое разворотное значение. При разворотной цене график крестики и нолики смещением влево начинает выстраивать в графике колонку ноликов по цене каждой сделки, пока вновь не будет достигнуто определённое разворотное значение. Процесс построения чередующихся колонок крестиков и ноликов продолжается до тех пор, пока разворотное значение не будет достигнуто в каждом направлении движения цены. Получившаяся из колонок крестиков и ноликов формация может быть проанализирована для определения силы и слабости рынка.

POINT AND FIGURE PRICE OBJECTIVE = ЦЕНОВОЙ ОРИЕНТИР В ГРАФИКЕ КРЕСТИКИ И НОЛИКИ – Point And Figure Price Objective:- the price that a stock should reach based on recent Point And Figure (P&F) chart signals. / В техническом анализе биржевых рынков, цена, которая должна быть достигнута активом, и которая основана на последних графических сигналах графика Крестики Нолики.

POINT AND FIGURE SELL SIGNAL = СИГНАЛ НА ПРОДАЖУ НА ГРАФИКЕ КРЕСТИКИ И НОЛИКИ – Point And Figure (P&F) Buy And Sell Signals are very simple patterns that should be confirmed before placing a trade. The P&F Buy signal is used when calculating the various Bullish Percent indices. When the last signal on the chart was a sell signal, that is, the last breakout was a column of Os going lower than the previous column of Os and no buy signal (no column of Xs breaking above the previous column of Xs) has happened since the sell signal. / В биржевой торговле .

POINT BALANCE = ИТОГОВЫЙ БАЛАНС – Point Balance is a statement prepared by Futures Commission Merchants to show profit or loss on all open contracts using an official closing or settlement price, usually at calendar month end. / Отчёт, подготавливаемый Комиссионерами по Фьючерсам (Торговцами Фьючерсами за Комиссию) обычно в конце календарного месяца для отображения прибылей и убытков по всем открытым контрактам на основе использования цены официального закрытия или расчётной цены.

POINT BAR = МЫСОВЫЙ ПОРОГ (или МЫСОВАЯ ОТМЕЛЬ) – Point Bar is a deposit of sand and gravel accumulating on the inside of a river meander and usually separated from the river bank by a rough or swale. / Под Мысом понимается участок побережья, вдающийся окончанием в море, озеро или реку.

POINT BONDING = ТОЧЕЧНОЕ СКРЕПЛЕНИЕ (или ТОЧЕЧНОЕ СВЯЗЫВАНИЕ) – Point Bonding:- point-bond hot calendering is the main method of thermally bonding in disposables as diaper, sanitary products, and medical products. This method involves the use of a two-roll nip consisting of a heated male patterned metal roll and a smooth or patterned metal roll. This second roll may or may not be heated, depending on the application. In a typical production line, the web is fed by an apron leading to a calender nip and the fiber temperature is raised to the point at which tackiness and melting cause fiber segments caught between the tips of engraved points and

the smooth roll to adhere together. The heating time is typically of the order of milliseconds. The fabric properties are dependent on the process temperature and pressure and other parameters like the contact time, quench rate and calender pattern. Experimental results show that for a given nip line pressure and calendering speed, the breaking strength reaches a maximum at a critical bonding temperature; on keeping the nip line pressure constant, the critical temperature was found to be a function of the calendering speed. The maximum strength achieved is influenced by the nip line pressure. This influence depends on the melting behavior of the fiber. If the maximum occurs in the softening region, higher pressure yields higher strength. On the other hand, if maximum occurs in the early melting region, a low calendering pressure is desirable. The degree of product bonding depends on the pattern of bond points on the roll surface. Bonded areas are compressed and densely compacted. Unbonded area is very open, breathable and porous. The products formed range from thin, closed, inelastic, strong, and stiff to open, bulky, weak, flexible and elastic depending on the number density, the size and the pattern of the bond points. See also Bonding. Point Bonding is the process of binding thermoplastic fibers into a nonwoven fabric by applying heat and pressure so that a discrete pattern of fiber bonds is formed. Also called Spot Bonding.

POINT D'ESPRIT = ПУЭН Д'ЭСПРИ (или ХХ) – Point D'Esprit:- first made in France in 1834. Dull surfaced net with various sized holes. Has white or colored dots individually spaced or in groups. Used for curtains, bassinettes, evening gowns. Weave:- leno, gauze, knotted, or mesh. / D'Esprit = Остроумный Человек.

POINTELLE = ПОИНТЭЛ (или ПУЭНТЕЛЬ) – In knitting, Pointelle is a knitting pattern that creates an openwork design when it is completed. It is used in a lot of garments to add texture, in addition to making them more lightweight and creating a varied look. A pointelle garment also tends to be cooler than a solid knit, making it more suitable for warm climates. It is often used as an accent on a garment, to provide a block of different texture. In addition, an entire garment can be made with this stitch, as is often the case with undershirts that are designed to be simple and comfortable with a dash of style. Technically, any openwork pattern is pointelle. One of the most classic designs uses chevrons, but these knits can use any number of geometric shapes, or a combination. The more complex the design, the more challenging it is to knit. Complex pointelle can also look quite stunning, once knitters have mastered the art of it. A pattern may integrate floral themes, such as ferns or palm leaves, in combination with other design elements. Many commercially produced knits have pointelle patterns that are produced on knitting machines. Knitting machines are superb at producing complex standardized patterns, although the garments that they produce lack the flavor of hand knit work. Knitting machines are also capable of creating very small work, such as the Jersey knit used to make many t-shirts and undergarments. A casual glance at pointelle leads many people to believe it is very difficult. In fact, it is fairly easy to make, as long as the knitter is able to follow a pattern closely and keep track of stitches. Dropping a single stitch or missing a section of the pattern will spoil the garment. For this reason, many knitters work on their projects in calm environments, with the assistance of a stitch counter to help them keep track of where they are. To knit in pointelle, knitters need to know the two basic stitches, knit and purl. They will also need to know how to perform a yarn over and a skip. All of these knitting procedures are very simple, but it does help to have an experienced knitter show a beginner how to do them. He or she may also want to start with a very basic pattern to become acquainted with the concept before moving on to complex garments and patterns. A scarf with pointelle accents is a great way to start. Pointelle is a fabric with a pointelle design, namely an openwork design (as in knitted fabric) typically in the shape of chevrons. Pointelle is a type of knitwear or woollen fabric with small eyelet holes that create a lacy effect:- 'Jersey looks feminine but natural with pointelle and lace trims'. Origin:- 1950s, probably from Point in the sense 'lace made entirely with a needle' + the French diminutive suffix -elle. Pointelle is a lacy, openwork fabric, often of acrylic, used for blouses, sweaters, etc. Pointelle is a delicate-looking fabric that is woolen or knitted and has little eyelet holes to create the appearance of lace. The fabric used for a feminine, delicate-looking knitted shirt with little eyelet holes that make the shirt look lacy is an example of pointelle. (2) Pointelle is an openwork design (as in knitted fabric) typically in the shape of chevrons; also:- a fabric with this design.

POINT OF ENTRY = ПУНКТ ВВОЗА – Point Of Entry is the airport, seaport or land border point officially designated for the importation of consignments, and/or entrance of passengers. Point Of Entry is a port at which foreign goods are admitted into the receiving country. Ports of Entry are officially designated by the government. / Пункт Ввоза – аэропорт, морской порт или наземный приграничный пункт, официально назначенный для провоза товаров и/или прибытия пассажиров. привоз (importation). Пункт Ввоза – порт, через который иностранные товары завозятся в принимающую страну. Порты Ввоза официально назначаются правительством.

POINT OF ORIGIN = ПУНКТ ОТПРАВЛЕНИЯ (или ПУНКТ ОТПРАВКИ, или ПУНКТ ПРОИСХОЖДЕНИЯ) – Point Of Origin is the station at which a shipment is received by a transportation line from the shipper. The place at which a shipment is received by a carrier from the shipper. / Место, в котором отгруженная партия товаров получена грузоперевозчиком от отправителя.

POINT OF SALE = ПУНКТ ПРОДАЖИ – Point Of Sale:- the provision of goods and services at attended and unattended terminals.

POINT SAMPLING = ТОЧЕЧНЫЙ ОТБОР ПРОБ – Point Sampling is a scouting method that relies on randomly selecting a prescribed number of sites or points within a cotton field for intensive scouting of a predetermined number of plants or feet of row (best suited to uniform fields).

POINT(S) OF DELIVERY = ПУНКТ(Ы) ПОСТАВКИ – Point(s) Of Delivery are the point(s) of interconnection on the Transmission Provider's Transmission System where capacity and/or energy transmitted by the Transmission Provider will be made available to the Receiving Party. The Point(s) of Delivery shall be specified in the Service Agreement.

POINT(S) OF RECEIPT = ПУНКТ(Ы) ПРИЁМА – Point(s) Of Receipt is(are) point(s) of interconnection on the Transmission Provider's Transmission System where capacity and/or energy will be made available to the Transmission Provider by the Delivering Party. The Point(s) of Delivery shall be specified in the Service Agreement. / Под Пунктом, от Латинского слова Punctum, означающее Точка, понимается .

POINT–TO–POINT = ОТ ПУНКТА К ПУНКТУ – In container transport jargon Point-To-Point means that the container is transported directly by ship from Port A to Port B, in other words without making any detours to a third or fourth port, e.g., from Gothenburg directly to Manila. The opposite of the term is the Mainline-Feeder Combination, whereby, for example, the container would be feedered via Hamburg and/or Hong Kong on its way from Gothenburg to Manila. This is known as Hub And Spoke because the container is transported on from the interim port to smaller ports.

POINT–TO–POINT TRANSMISSION SERVICE = УСЛУГА ПЕРЕДАЧИ ОТ–ПУНКТА–К–ПУНКТУ – Point-To-Point Transmission Service:- the reservation and/or transmission of energy on either a firm basis and/or a non-firm basis from Point(s) of Receipt to Point(s) of Delivery, including any Ancillary Services that are provided by the Transmission Provider in conjunction with such service.

POINT–TO–POINT TRANSMISSION SERVICE TARIFF = ТАРИФ НА УСЛУГУ ПЕРЕДАЧИ ОТ–ПУНКТА–К–ПУНКТУ – Point-to-Point Transmission Service Tariff:- the Transmission Provider's Point-to-Point Transmission Service Tariff as such tariff may be amended and/or superseded from time to time.

POIS = PATENT COOPERATION TREATY OPERATIONS IMAGING SYSTEM

POISE = ПУАЗ – Poise (absolute viscosity) is a measure of viscosity numerically equal to the force required to move a plane surface of one square centimeter per second when the surfaces are separated by a layer of fluid one centimeter in thickness. It is the ratio of the shearing stress to the shear rate of a fluid and is expressed in dyne seconds per square centimeter (dyne sec/cm^2); 1 centiPoise equals .01 Poise. See also Dynamic Viscosity, and Viscosity (2). Poise (P, Ps, or Po) is a CGS unit of dynamic viscosity. Viscosity is a frictional property (actually, several related properties) of liquids and gases:- due to friction between molecules, the liquid or gas resists flowing to a greater or lesser extent. Dynamic viscosity is measured by stating the force needed to move a standard area of one layer of the liquid or gas with respect to another layer, the two layers being parallel and separated by a standard distance filled with the same liquid or gas. If a force of one dyne is needed to move one square centimeter of the liquid or gas relative to a second layer one centimeter away at a speed of one centimeter per second, then the viscosity is one Poise. The unit is named for the French physician Jean Louis Marie Poiseuille (1799–1869). Generally speaking, liquids have viscosities measured in centiPoises and gases have viscosities measured in microPoises. The SI recognizes no named unit for dynamic viscosity; in SI units, one Poise equals 0.1 Pascal second (Pa·s). The Poise is also equivalent to 14.503 $8{\cdot}10^{-6}$ reyn. P is the proper symbol for the unit, but Ps and Po are also used. There is also some inconsistency in the plural for the unit, with both Poise and Poises in use. Poiseuille (Pl) is an MKS unit of dynamic viscosity equal to 1 Pascal second or 10 Poises or 1 000 centiPoises (cP). The Poiseuille has been proposed, but not accepted, as an SI derived unit. / дина (dyne; не подлежащая применению единица силы в Системе Единиц СГС; обозначение:- дин; 1 дин = 10^{-5} Ньютона (Н)). рейн (reyn). Динамическая Вязкость (Dynamic Viscosity) η (входит в виде коэффициента пропорциональности в формулу Закона Ньютона), единицей которой в Международной Системе Единиц, так называемой системе СИ (или SI по первым буквам первых двух слов полного Франкоязычного наименования Système International d'Unités; введена в действие в бывшем Союзе Советских Социалистических Республик (СССР) с 01 Января 1963 для предпочтительного применения) является Паскаль-секунда (Па·с), в Англоязычных странах для обозначения динамической вязкости и в Системах Единиц СГС (системы единиц физических величин lmt (где l – длина, m – масса, t – время), в которых приняты три основные единицы:- сантиметр (см) – единица длины, грамм (г) – единица массы и секунда (с) – единица времени; отсюда и название системы по первым буквам названий этих трёх единиц) использовалась устаревшая и более не подлежащая применению единица измерения Пуаз (П (P); на Французском Poise, от имени Французского физика и физиолога Жона Луи Мари Пуазёйя (или Пуазёйля; Jean Louis Marie Poiseuille; 1799–1869)). 1 П = 0.1 Па·с. Чаще использовалась дольная единица – сантиПуаз (сП); 1 сП = 1 мПа·с. Чем гуще жидкость, тем выше её вязкость. Международные производители смазочных масел до сих пор используют в основном единицу измерения Пауз (П), несмотря на то, что в настоящее время все страны мира официально перешли на использование единиц измерений системы СИ. Пуаз (на Французском Poise) – единица динамической вязкости в Системе Единиц СГС. Пуаз равен вязкости жидкости, оказывающей сопротивление силой в 1 дину взаимному перемещению двух слоёв жидкости площадью 1 см, находящихся на расстоянии 1 см друг от друга и взаимно перемещающихся с относительной скоростью 1 см/сек. Названа в честь Французского физика и физиолога Жона Луи Мари Пуазёйя (или Пуазёйля; Jean Louis Marie Poiseuille; 1799–1869)). Обозначения:- Русское Пз, международное P. 1 Пз = 0.1 Н·сек/м^2.

POISON = ОТРАВА (или ЯД) – Poison is:- (1) a substance that through its chemical action usually kills, injures, or impairs an organism:- (i) something destructive or harmful; and/or (ii) an object of aversion or abhorrence. (2) A substance that inhibits the activity of another substance or the course of a reaction or process, e.g., a catalyst poison. See also Venom. In biology, Poisons are substances that cause disturbances in organisms, usually by chemical reaction or other activity on the molecular scale, when an organism absorbs a sufficient quantity. The fields of medicine (particularly veterinary) and zoology often distinguish a poison from a toxin, and from a venom. Toxins are poisons produced by organisms in nature, and venoms are toxins injected by a bite or sting (this is exclusive to animals). The difference between venom and other poisons is the delivery method. Industry, agriculture, and other sectors employ poisonous substances for reasons other than their toxicity. Most poisonous industrial compounds have associated material safety data sheets (MSDS) and are classed as Hazardous Substances. Hazardous substances are subject to extensive regulation on production, procurement and use in overlapping domains of occupational safety and health, public health, drinking water quality standards, air pollution and environmental protection. Due to the mechanics of molecular diffusion, many poisonous compounds rapidly diffuse into biological tissues, air, water, or soil on a molecular scale. By the principle of entropy, chemical contamination is typically costly or infeasible to reverse, unless specific chelating agents or micro-filtration processes are available. Chelating agents are often broader in scope than the acute target, and therefore their ingestion necessitates careful medical or veterinarian supervision. Pesticides are one group of substances whose toxicity to various insects and other animals deemed to be pests (e.g., rats and cockroaches) is their prime purpose. Natural pesticides have been used for this purpose for thousands of years (e.g., concentrated table salt is toxic to many slugs). Bioaccumulation of chemically-prepared agricultural insecticides is a matter of concern for the many species, especially birds, which consume insects as a primary food source. Selective toxicity, controlled application, and controlled biodegradation are major challenges in herbicide and pesticide development and in chemical engineering generally, as all lifeforms on earth share an underlying biochemistry; organisms exceptional in their environmental resilience are classified as extremophiles, these for the most part exhibiting radically different susceptibilities. A poison which enters the food chain – whether of industrial, agricultural, or natural origin – might not be immediately toxic to the first organism that ingests the toxin, but can become further concentrated in predatory organisms further up the food chain, particularly carnivores and omnivores, especially concerning fat soluble poisons which tend to become stored in biological tissue rather than excreted in urine or other water-based effluents. Two common cases of acute natural poisoning are theobromine poisoning of dogs and cats, and mushroom poisoning in humans. Dogs and cats are not natural herbivores, but a chemical defense developed by Theobroma Cacao can be incidentally fatal nevertheless. Many omnivores, including humans, readily consume edible Fungi, and thus many Fungi have evolved to become decisively inedible, in this case as a direct defense. Apart from food, many poisons readily enter the body through the skin and lungs. Hydrofluoric acid is a notorious contact poison, in addition to its corrosive damage. Naturally occurring sour gas is a notorious, fast-acting atmospheric poison (as released by volcanic activity or drilling rigs). Plant-based contact irritants, such as that possessed by poison Ivy or poison Oak, are often classed as Allergens rather than poisons; the effect of an allergen being not a poison as such, but to turn the body's natural defenses against itself. Poison can also enter the body through the teeth (in the controversial case of dental malpractice), faulty medical implants, or by injection (which is the basis of lethal injection in the context of capital punishment). In 2013, 3.3 million cases of unintentional human poisonings occurred. This resulted in 98 000 deaths worldwide, down from 120 000 deaths in 1990. In modern society, cases of suspicious death elicit the attention of the Coroner's office and forensic investigators. While arsenic is a naturally occurring environmental poison, its artificial concentrate was once nicknamed Inheritance Powder. In Medieval Europe, it was common for monarchs to employ personal food tasters to thwart royal assassination, in the dawning age of the Apothecary. Of increasing concern since the isolation of natural radium by French physicist Marie Skłodowska Curie (1867–1934) and Pierre Curie (1859–1906) in 1898 – and the subsequent advent of nuclear physics and nuclear technologies – are radiological poisons. These are associated with ionizing radiation, a mode of toxicity quite distinct from chemically active poisons. In mammals, chemical poisons are often passed from mother

to offspring through the placenta during gestation, or through breast milk during nursing. In contrast, radiological damage can be passed from mother or father to offspring through genetic mutation, which – if not fatal in miscarriage or childhood, or a direct cause of infertility – can then be passed along again to a subsequent generation. Atmospheric radon is a natural radiological poison of increasing impact since humans moved from hunter-gatherer lifestyles though cave dwelling to increasingly enclosed structures able to contain radon in dangerous concentrations. The 2006 poisoning of Alexander Litvinenko was a novel use of radiological assassination, presumably meant to evade the normal investigation of chemical poisons. Poisons widely dispersed into the environment are known as Pollution. These are often of human origin, but pollution can also include unwanted biological processes such as toxic red tide, or acute changes to the natural chemical environment attributed to invasive species, which are toxic or detrimental to the prior ecology (especially if the prior ecology was associated with human economic value or an established industry such as shellfish harvesting). At the green end of the political spectrum, it is possible through this lens to view issues such as fertilizer runoff or slash-and-burn subsistence agriculture as modes of ecological poison. The scientific disciplines of ecology and environmental resource management study the environmental life cycle of toxic compounds and their complex, diffuse, and highly interrelated effects. / Мария Скодовска Кюри (Marie Skłodowska Curie; 1867–1934) и Пьер Кюри (Pierre Curie; 1859–1906). Яды, вещества, способные при воздействии на живой организм вызвать резкое нарушение нормальной его жизнедеятельности – отравление или смерть. Отнесение тех или иных веществ к ядам условно, так как токсичность многих из них определяется обстоятельствами или способом введения в организм. Действие ядов обусловлено их химическими реакциями с веществами, входящими в состав клеток и тканей организма, а также принимающими участие в тканевом обмене (например, при отравлении синильной кислотой). Сила и характер действия ядов зависят от их химической структуры, физико-химических свойств, структурных и функциональных особенностей организма, что обусловливает избирательную токсичность ядов по отношению к отдельным видам животных или растений, а также ‘сродство’ (‘тропность’) к определённым системам или органам (например, нейротронные яды, поражающие преимущественно нервную систему). По происхождению яды делят на растительные (смотрите Ядовитые Растения), животные (смотрите Ядовитые Животные), минеральные и продукты химического синтеза (Промышленные Яды, Пестициды). Яды проникают в организм человека главным образом через пищеварительные (смотрите Пищевые Отравления) и дыхательные органы; из организма выделяются почками, кишечником, лёгкими и другими. Изучением действия ядов занимается токсикология. Смотрите также Антидоты. Яды Промышленные или Яды Профессиональные или Яды Производственные, химические соединения, используемые в промышленности и оказывающие вредное действие на организм человека. При несоблюдении правил техники безопасности и гигиены труда ядовитыми могут быть различные виды сырья, а также промежуточные, побочные или конечные продукты производства:- чаще возникают хронические отравления. Некоторые промышленные яды вызывают поражения плода, оказывают вредное влияние на потомство (смотрите Тератогенез, Мутагенез), являются канцерогенными веществами. Профилактика отравлений промышленными ядами:- исключение из производственного процесса высокотоксичных промышленных ядов, замена их менее токсичными; обеспечение непрерывности технологического процесса, герметичности аппаратов и коммуникаций; рациональная планировка рабочих мест (‘чистые’ и ‘грязные’ зоны); эффективная вентиляция; уменьшение длительности контакта с промышленными ядами; индивидуальные средства защиты (одежда, противогазы, респираторы, защитные пасты и другие); периодические медицинские осмотры; профилактическое питание и медикаментозная профилактика (ингалятории и другое); установление предельно-допустимых концентраций (ПДК) вредных газов, паров и аэрозолей в воздухе рабочей зоны. Смотрите также Отравление, Профессиональные Болезни, Профессиональные Вредности.

POISON PILL = ОТРАВНАЯ ПИЛЮЛЯ (или ЯДОВИТАЯ ПИЛЮЛЯ) – A Poison Pill is generally a right (e.g., the right to buy more shares) given to shareholders of a company so that if their company is the subject of a takeover attempt, those attempting the take-over may be faced with having to deal with such rights, making it more attractive to the shareholders and more onerous for the buyers. Poison Pills are often used when one company tries to buy another in a hostile takeover attempt, i.e. one which is not welcomed by the company.

POL = PETROLEUM, OIL AND LUBRICANTS

POLAR COMPOUND = ПОЛЯРНОЕ СОЕДИНЕНИЕ (ПОЛЯРНОЕ ВЕЩЕСТВО, или ПОЛЯРНЫЙ СОСТАВ, или ДИАМЕТРАЛЬНО ПРОТИВОПОЛОЖНЫЙ СОСТАВ) – Polar Compound is a chemical compound whose molecules exhibit electrically positive characteristics at one extremity and negative characteristics at the other. Polar compounds are used as additives in many petroleum products. Polarity gives certain molecules a strong affinity for solid surfaces; as lubricant additives (oiliness agents), such molecules plate out to form a tenacious, friction-reducing film. Some polar molecules are oil-soluble at one end and water-soluble at the other end; in lubricants, they act as emulsifiers, helping to form stable oil-water emulsions. Such lubricants are said to have good metal-wetting properties. Polar compounds with a strong attraction for solid contaminants act as detergents in engine oils by keeping contaminants finely dispersed. / Полярное Вещество – вещество с высоким содержанием полярных молекул.

POLARIZED LIGHT = ПОЛЯРИЗОВАННЫЙ СВЕТ – Polarized Light is the ordinary light which is resolved by some means, so that it vibrates in two directions at right angles to each other. By using a material which has the ability to bring about this division, or ‘polarization’, as an attachment to a microscope, it is possible to employ polarized light to identify, as well as to obtain valuable information about, many textile fibers. For example, it is used in many laboratories to determine the degree of cotton fiber maturity or to detect abnormal strains in man-made fibers.

POLAR WINDING = ПОЛЮСНАЯ (или ПОЛЯРНАЯ) НАМОТКА – Polar Winding is a winding in which the filament path passes tangent to the polar opening at one end of the chamber and tangent to the opposite side of the polar opening at the other end.

POLDER = ПОЛЬДЕР – Polder is a land enclosed by an embankment. / Польдер – осушенный участок моря или другого водоёма. Под Польдерами, от Нидерландского слова Polder, понимаются осушенные участки маршей, защищённые дамбами от затопления морскими и речными водами.

POLICY = ПОЛИС – Policy is a document detailing the terms and conditions applicable to an insurance contract and constituting legal evidence of the agreement to insure. It is issued by an insurer or their representatives for the first period of risk. On renewal a new policy may not be issued although the same conditions would apply, and the current wording would be evidence by the renewal receipt. The wording of a contract of insurance or reinsurance. The written statement of a contract effecting insurance, or certificates thereof, by whatever name called and including all causes, riders, endorsements and papers attached thereto and made part thereof. In marine insurance there are the following types of policies:- floating policy by ship, time policy, unvalued policy, valued policy, voyage policy on goods, voyage policy on ship, etc. / порядки и условия, применимые к . Под Полисом, от Французского слова Police от Итальянского слова Polizza, означающее Квитанция или Расписка, понимается документ, как правило, именной, удостоверяющий заключение договора личного или имущественного страхования и его условия. Страховой Полис, документ (как правило, именной), удостоверяющий заключение договоров личного или имущественного страхования, а также отношения по государственному обязательному страхованию. В бывшем Союзе Советских Социалистических Республик

(СССР) при добровольном страховании страховой полис вручался страхователю (гражданину или организации, в интересах которых осуществлялось страхование) вслед за уплатой им первого страхового взноса. При обязательном страховании страховой полис выдавался после определения органами Госстраха состава имущества, подлежащего страхованию, его оценки, исчисления размера страховых платежей. В страховом полисе фиксировались основные условия страхования:- вид, объект, начало и конец действия страхования, размер страховой суммы, сведения о страхователе, страховщике и другое.

POLICY DEVELOPMENT PROCESS = ПРОЦЕСС РАЗРАБОТКИ ПОЛИТИКИ – The Policy Development Process (PDP) is a set of formal steps, as defined in the Internet Corporation for Assigned Names and Numbers (ICANN) bylaws, to guide the initiation, internal and external review, timing and approval of policies needed to coordinate the global Internet's system of unique identifiers. / Процесс Разработки Политики (ПРП) – ряд формальных этапов, описанных в уставе Корпорации Интернета по Распределению Имён и Номеров (КИРИН) и направленных на инициирование разработки, внутренний и внешний анализ, составление графиков подготовки и одобрение политик, необходимых для координации глобальной системы уникальных идентификаторов Интернета.

POLICYHOLDER = ПОЛИСОДЕРЖАТЕЛЬ (или ДЕРЖАТЕЛЬ ПОЛИСА) – Policyholder is the person in whose name the policy is issued. See also Insured. A party that has a right to compensation under an insurance contract if an insured event occurs. The person who is insured under a contract of insurance. / Лицо, застрахованное в соответствии с контрактом или договором страхования. В процессе страхования внешнеэкономических связей участвуют два субъекта:- полисодержатель и страховщик. В Российском законодательстве термин 'Полисодержатель' заменён понятием 'Страхователь'. Термин 'Полисодержатель' находит применение в основном в неморском страховании. Полисодержатель (или Страхователь) – это хозяйствующий субъект или гражданин, выражающий страховой интерес, уплачивающий страховую премию и вступающий в конкретные страховые отношения со страховщиком в силу закона или двусторонней сделки (договора страхования). Полисодержателем признаётся лицо, заключившее со страховщиком договоры страхования или являющееся страхователем в силу закона. При заключении договора страхования полисодержатель должен сообщить страховщику о всех известных ему обстоятельствах, имеющих значение для оценки страхового внешнеэкономического риска, а также о всех заключённых или заключаемых договорах страхования в отношении данного объекта страхования. При наступлении страхового случая полисодержатель обязан принимать необходимые меры для предотвращения и уменьшения ущерба застрахованному имуществу. Страховщиком является хозяйствующий субъект, созданный для осуществления страховой деятельности, проводящий страхование и ведающий созданием и расходованием страхового фонда. На платёжном балансе страны страховые операции отражаются тогда, когда полисодержатель (то есть страхователь) или страховщик являются нерезидентами. Страхование внешнеэкономических связей означает страхование внешнеэкономических рисков и представляет собой комплекс видов страхования, обеспечивающих защиту интересов отечественных и зарубежных участников тех или иных форм международного сотрудничества. Страхование внешнеэкономических связей, как и страхование вообще, включает личное страхование, имущественное страхование, страхование ответственности.

POLICY LIMIT = ПОЛИСНЫЙ ЛИМИТ (или ЛИМИТ ПОЛИСА, или ПРЕДЕЛ ПО СТРАХОВОМУ ПОЛИСУ) – Policy Limit is another term for limit of indemnity. It refers to the maximum amount payable under a policy of insurance or reinsurance, either overall or with reference to a particular section of the policy. / Ещё один термин для обозначения лимита ответственности или лимита страхового обязательства. Он относится к максимальной сумме, оплачиваемой по полису страхования или перестрахования, будь-то по всему полису или в отношении его конкретного раздела.

POLICY PERIOD = ПОЛИСНЫЙ ПЕРИОД (или ПЕРИОД ПОЛИСА) – Policy Period is the period during which the policy contract affords protection. / Период, в течение которого полисный контракт предоставляет защиту.

POLICY PROCESS STEERING COMMITTEE = КОМИТЕТ ПО НАПРАВЛЕНИЮ ПРОЦЕССА ФОРМИРОВАНИЯ ПОЛИТИКИ – The Policy Process Steering Committee (PPSC) reviews and recommends processes used within the Generic Names Supporting Organization (GNSO) for developing policy, including the use of Working Groups, and recommending any changes. / Комитет по Направлению Процесса Формирования Политики (PPSC, КНПФП) отвечает за анализ и рекомендацию процессов, используемых в рамках ОПРИ для разработки политики, включая использование рабочих групп и предоставление рекомендаций по необходимым изменениям.

POLICY PROOF OF INTEREST = ПОЛИС КАК ДОКАЗАТЕЛЬСТВО НАЛИЧИЯ ИНТЕРЕСА – Policy Proof Of Interest is a policy wherein the underwriter agrees to waive proof that an insurable interest is enjoyed by the assured, at the time of loss, as a condition of claim payment. In other policies the underwriter is not liable for any claim where the assured is unable to prove that his interest in the subject matter of the insurance exists at the time of loss. PPI (Policy Proof of Interest) policies are invalid in a court of law, but are not illegal except where no interest exists or where there was no reasonable expectation that it would exist at the time the policy was effected.

POLICY SWITCH = ПЕРЕКЛЮЧЕНИЕ ПОЛИТИКИ (или ХХ) – Policy Switch is a technique used in the active management of a bond portfolio. Making a policy switch entails taking a view on future changes in shape or level of the yield curve and moving into gilts with quite different terms to maturity and/or coupon.

POLICY YEAR = ГОД ПОЛИСА – Policy Year is the year commencing with the effective date of the policy or with an anniversary of that date.

POLING = ДРАЗНЕНИЕ – Poling:- the molten metals is stirred with green wood poles. Wood at the high temperature of the molten metals form hydrocarbons like methane which being about the reduction of any oxide present in the metal, e.g., copper oxide present in the blister copper. In the case of the tin the impurities are oxidised and float on the molten metal as scum which is removed. / Poling = также Перемешивание Ванны мартеновской печи. Дразнение меди – удаление газов и восстановление оксидов меди из жидкой черновой меди при огневом анодном рафинировании введением в расплав древесины и её пиролиза. В печи во время дразнения поддерживают восстановительную среду сжиганием топлива с недостатком воздуха. В настоящее время для восстановления оксидов из черновой меди практикуют использование паромазутной эмульсии, подаваемой через фурмы в ванну расплава. По окончании дразнения, то есть после снижения содержания кислорода, растворённого в меди до желаемого предела (около 0.2% и для вайербарсов 0.1–0.02%) медь разливают в изложницы разливочной машины и в виде анодов определённой формы отправляют на электролиз для более тонкого её рафинирования.

POLISHED = ПОЛИРОВАННОЕ (или ШЛИФОВАННОЕ) – Polished:- having a smooth surface produced by mechanical process, usually by friction. / Под Полированием, от Немецкого слова Polieren, от Латинского слова Polio, означающее Делаю Гладким, понимается:- (i) в машиностроении и приборостроении – обработка изделий для получения малой шероховатости поверхности. Производится механическим (например, обработкой абразивным инструментом, пластическим деформированием поверхности), электрохимическим и другими методами. (ii) В камнеобработке полирование производят с

помощью абразивного инструмента вручную или на специализированных станках. (iii) В деревообработке различают полирование столярное (заключается в постепенном заполнении пор поверхности, преимущественно политурой) и лакокрасочное (неровности, возникающие после нанесения лакового или эмалевого слоя, устраняются в основном механическими методами). Под Шлифованием, от Польского слова Szlifować, означающее Полировать или Точить или Шлифовать, понимается обработка поверхностей абразивным инструментом на шлифовальных станках. Позволяет получать поверхности с малой шероховатостью.

POLISHING = ПОЛИРОВАНИЕ (или ЛОЩЕНИЕ, или САТИНИРОВАНИЕ, или ШЛИФОВАНИЕ, или ГЛЯНЦЕВАНИЕ) – Polishing:- usually done on commercial sewing thread, the process involves burnishing the plied yarn. / .

POLISHING = ПОЛИРОВАНИЕ (или ПОЛИРОВКА, или ШЛИФОВАНИЕ) – Polishing (bore):- excessive smoothing of the surface finish of the cylinder bore or cylinder liner in an engine to a mirror-like appearance, resulting in depreciation of ring sealing and oil consumption performance. / Под Полированием, от Немецкого слова Polieren, от Латинского слова Polio, означающее Делаю Гладким, понимается:- (i) в машиностроении и приборостроении – обработка изделий для получения малой шероховатости поверхности. Производится механическим (например, обработкой абразивным инструментом, пластическим деформированием поверхности), электрохимическим и другими методами. (ii) В камнеобработке полирование производят с помощью абразивного инструмента вручную или на специализированных станках. (iii) В деревообработке различают полирование столярное (заключается в постепенном заполнении пор поверхности, преимущественно политурой) и лакокрасочное (неровности, возникающие после нанесения лакового или эмалевого слоя, устраняются в основном механическими методами). Под Полированием, от Немецкого слова Polieren, от Латинского слова Polio, означающее Делаю Гладким или Полирую, понимается:- (1) в машиностроении и приборостроении – отделочная обработка изделий для повышения класса чистоты их поверхности (до 12–14-го классов), доводки изделий до требуемых размеров, получения определённых свойств поверхностного слоя, а также для придания их поверхности декоративного блеска. Полирование представляет собой совокупность процессов пластической микродеформации и тонкого диспергирования поверхностного слоя обрабатываемого изделия, происходящих при воздействии на этот слой полировальными и доводочными материалами (смотрите также статью Абразивные Материалы). Наиболее распространено полирование вращающимися притирами-кругами, на поверхность которых наносят полировальные порошки или пасты. При Истинном Полировании эффект обработки достигается в результате пластического течения полируемого слоя; полирование обычно проводится при малых частотах вращения полировального круга (60–200 оборотов в минуту (об/мин)) и со значительным давлением (более 200 килоНьютонов на квадратный метр (кН/м^2)) круга на обрабатываемый материал. Декоративное Полирование, наоборот, ведётся при больших частотах вращения притира (600–800 об/мин) и с меньшим давлением (50–200 кН/м^2). При полировании деталей сложной формы используются гибкие эластические круги-притиры, а также жидкостное и центробежное полирование (смотрите Полировальный Станок). Такие виды полирования применяются главным образом для чистовой отделки и очистки режущего инструмента (например, свёрл), литейных форм, для декоративного полирования. При этих видах достигается 10–11-й класс чистоты. Об электрических методах полирования смотрите в статье Электромеханическая Обработка. (2) Полирование в мебельном и столярном производстве – процесс получения лакокрасочных покрытий с зеркальным блеском на поверхности изделий из древесины. Различают полирование столярное и по лакокрасочным покрытиям. Столярное Полирование заключается в постепенном заполнении пор поверхности древесины раствором органического плёнкообразователя, преимущественно шеллачной политурой, которая наносится тампоном (обычно из вязальной шерсти, обёрнутой полотняной тканью) скользящими круговыми движениями. Толщина создаваемых покрытий 20–30 мкм, для чего необходимо нанести 400–600 слоёв политуры. Весь процесс полирования (вручную или на станке) выполняется за 3–4 операции с перерывом между ними в несколько суток. Покрытия, получаемые таким способом, весьма гладкие, хорошо выявляют текстуру древесины; однако ручное полирование – очень трудоёмкий и малопроизводительный процесс. Столярным полированием отделывают ценные породы древесины (Грецкий Орех, Карельскую Берёзу, Палисандр и другие). Этот вид полирования применяется главным образом в реставрационных работах. Наиболее широко распространено полирование по лакокрасочным покрытиям. В этом случае на поверхность изделий наносят покрытия (главным образом из полиэфирных лаков и эмалей) толщиной 100–400 мкм. Образовавшиеся при полировании неровности устраняются шлифованием и обработкой полировальными и доводочными материалами. Под Шлифованием, от Польского слова Szlifować, означающее Полировать или Точить или Шлифовать, понимается обработка поверхностей абразивным инструментом на шлифовальных станках. Позволяет получать поверхности с малой шероховатостью.

POLITICAL BUSINESS CYCLE = ПОЛИТИЧЕСКИЙ БИЗНЕС ЦИКЛ (или ПОЛИТИЧЕСКИЙ ЦИКЛ ДЕЛОВОЙ АКТИВНОСТИ) – Political Business Cycle is a business cycle that results primarily from the manipulation of policy tools (fiscal policy, monetary policy) by incumbent politicians hoping to stimulate the economy just prior to an election and thereby greatly improve their own and their party's reelection chances. Expansionary monetary and fiscal policies have politically popular consequences in the short run (tax cuts, falling unemployment, falling interest rates, new government spending on services for special interests, etc). Unfortunately these very policies, especially if pursued to excess, can also have very unpleasant consequences in the longer term (accelerating inflation, an unsustainably low rate of savings to support future investment, damage to the foreign trade balance, long-term expansion of government's share of the Gross National Product (GNP) at the expense of people's disposable incomes, etc). So immediately after the election is over (and the next election is far away), politicians tend to 'bite the bullet' and reverse course by raising taxes, cutting spending, slowing the growth of the money supply, allowing interest rates to rise, etc. Thus the regular holding of elections tends to produce a boom-and-bust pattern in the economy because of the on-again-off-again pattern of government stimulus and restraint encouraged by trying to schedule an artificial boom at every election time.

POLITICAL ECONOMY = ПОЛИТИЧЕСКАЯ ЭКОНОМИКА – Political Economy is a branch of the social sciences that takes as its principal subject of study the interrelationships between political and economic institutions and processes. That is, political economists are interested in analyzing and explaining the ways in which various sorts of government affect the allocation of scarce resources in society through their laws and policies as well as the ways in which the nature of the economic system and the behavior of people acting on their economic interests affects the form of government and the kinds of laws and policies that get made.

POLITICAL PARTY = ПОЛИТИЧЕСКАЯ ПАРТИЯ – Political Party is an organized group that has as its fundamental aim the attainment of political power and public office for its designated leaders. Usually, a political party will advertise a common commitment by its leaders and its membership to a set of political, social, economic and/or cultural values (an 'ideology') that distinguish it from other political parties and which supposedly provide the basis for the policies the party proposes to implement or maintain through its members who obtain public office. A political party differs from a pressure group in that a pressure group is primarily interested in influencing whatever government officials actually happen to be in office rather than in attaining office for its own leaders, and accordingly interest groups do not normally put forward candidates for public office under their own name (although they may sometimes endorse particular candidates put forward by party organizations). In a democracy, political parties primarily function as

agencies for recruiting suitable candidates to run for elective office and for organizing and conducting election campaigns. They may also become important in selecting candidates for appointive political office when winning the election has provided the party's leaders with power to appoint new officials to the cabinet and other top policy-making positions in the government bureaucracy. Political parties may also have another function as vehicles for coordinating the day to day activities and policy decisions of their elected and appointed office-holders so as to fulfill the party's policy platform, as for example, through an organized party caucus and a full-time party leadership machinery in the parliament or other legislative assembly. However, unless the national party organization is in a good position to reward its members for 'voting the party line' after they have been elected to office or to punish them for failing to support the party platform, the party organization's preferences may often not be the most important influence on the policy decisions made by its supposed representatives. In the United States, neither the Democrat nor the Republican national convention (nor their standing national committees) have the power to deny renomination to their parties' uncooperative representatives in Congress so long as they can win renomination in local party primaries or party conventions back home in their states or districts. The national party organizations' financial contributions to the campaign expenses of Congressional candidates (and usually those of state and local party organizations as well) tend to account for only a rather small proportion of what candidates need to be re-elected, so the party leaderships' financial leverage over their parties' office holders tends to be quite limited as well. The dominant role of 'seniority' in guaranteeing individual committee assignments and personal influence in the House and the Senate, as well as the fact that the House and Senate party leaderships are elected by their own House and Senate party caucuses rather than appointed by the national party organization, considerably insulate 'non-conformist' representatives from retaliation by their national party organizations.

POLITICAL RISK = ПОЛИТИЧЕСКИЙ РИСК – In export financing, Political Risk is the risk of loss due to currency inconvertibility, foreign government action preventing the delivery of goods, revolution, war, expropriation, confiscation, etc. Political Risks:- it is important for a company to follow the political and economic circumstances and events in its area of operations. In order words, it has to monitor the country risk. There are many different situations that can involve country risks. A country's political circumstances may affect the import and export regulations and consequently currency transfers. Economic circumstances may affect a country's ability to manage its liabilities. Examples of circumstances where a country risk can become reality:- (i) sudden changes in monetary and currency policies or export and import regulations; and (ii) wars and changes in political and economic alliances. / В вывозном (или экспортном) финансировании, под Политическим Риском понимается риск убытков, которые могут быть вызваны необратимостью валюты (неконвертируемостью валюты), действиями иностранных правительств, препятствующими поставке товаров, государственными переворотами, войнами, экспроприацией, конфискацией и тому подобным.

POLITICAL SCIENCE = ПОЛИТИЧЕСКАЯ НАУКА (или НАУКА О ПОЛИТИКЕ) – Political Science is the branch of the social sciences that is primarily concerned with analyzing and explaining the functioning of political institutions (especially governmental institutions) as well as the political behavior of individuals, groups and organizations in their efforts to influence or resist the decisions and policies of government.

POLLEN = ПЫЛЬЦА (или ПОЛЛЭН) – Pollen is the dust-like fertilizing male cells of gymnosperms and angiosperms. The microscopic architecture of pollen grains is characteristic of the plant species. Pollen is a mature reproductive male germ cell, microscoporocyte, specialized for fertilization. / Под Пыльцой или Поллэном, от Латинского слова Pollen, родительный падеж Pollinis, означающее Пыльца, понимается . мужские клетки гимноспермов (голосеменных растений) и ангиоспермов (покрытосеменных или цветковых растений). Под Пыльцой понимается совокупность пыльцевых зёрен, образующихся в пыльниках.

POLLEN FERTILITY = ФЕРТИЛЬНОСТЬ ПЫЛЬЦЫ – Pollen Fertility is the viability of pollen usually tested by the stainability of the Rice pollen with 1% IKI solution. / Под Фертильностью, от Латинского слова Fertilis, означающее Плодородный, понимается способность зрелого организма производить потомство.

POLLEN GRAIN = ПЫЛЬЦЕВОЕ ЗЕРНО (или ПЫЛИНКА) – Pollen Grain is the minute spores (spheroidal structures) in the anthers of a floret. Pollen Grains:- the minute, spheroidal structures (spores) in the anthers of a floret. They are microgametophytes, consisting of a haploid tube nucleus and a haploid generative nucleus. Upon germination, the pollen tube containing a tube nucleus and two sperm nuclei (gametes) grows down through the style, penetrates into the embryo sac, and the sperm nuclei achieve the double fertilization process. / споры (сфероидные структуры) в пыльниках . Под Пыльцевым Зерном или Пылинкой понимается мужской гаметофит семенных растений, в котором к моменту опыления или после него развиваются мужские половые клетки – спермии (или сперматозоиды), необходимые для оплодотворения. Развивается из микроспоры в микроспорангии. Совокупность пыльцевого зерна – пыльца.

POLLEN LOAD = ОБНОЖКА (или XX) – Pollen Load is the amount of airborne pollen/liter per hour at peak anthesis on a specified day.

POLLEN SHEDDING = СБРАСЫВАНИЕ ПЫЛЬЦЫ – Pollen Shedding is the falling of pollen grains from the anthers to the pistil. / из пыльников к .

POLLINATION = ОПЫЛЕНИЕ – Pollination is the transfer of pollen from the anther to stigma (the female organs) of a flower. / из пыльника к (женским органам) цветка. Под Опылением понимается перенос пыльцы из пыльника на рыльце пестика у цветковых растений или на семязачаток у голосеменных. Предшествует оплодотворению. Опыление в пределах одного цветка или одного растения называется самоопылением, при переносе пыльцы на цветки других растений – перекрёстным опылением.

POLLUTANT = ЗАГРЯЗНИТЕЛЬ (или ЗАГРЯЗНЯЮЩЕЕ ВЕЩЕСТВО) – Pollutant is a broad and expansive term. It includes solids, liquids, thermal or radioactive contaminants and irritants including, but not limited to, acids, alkalis, chemicals, fumes, smoke, soot, vapor and waste. Waste also includes materials intended for recycling, reclamation and reconditioning, as well as for disposal. Visible and invisible electrical or magnetic emissions and sound emissions are also considered pollutants and are included. / Щёлочь (Alkali).

POLLUTION = ЗАГРЯЗНЕНИЕ (или ПОЛЛЮЦИЯ) – Pollution is the presence in a body of water (or soil or air) – of substances of such character and in such quantities that the natural quality of productivity of the environment is impaired or rendered harmful to health and life or offensive to the senses. / Под Поллюцией, от позднелатинского слова Pollutio, означающее Марание или Пачканье, понимается непроизвольное извержение семени у мужчин, большей частью во сне, преимущественно при половом воздержании. Первые поллюции – одно из проявлений полового созревания.

POLLUTION HAZARD CLAUSE = ОГОВОРКА ОБ ОПАСНОСТИ ЗАГРЯЗНЕНИЯ – Pollution Hazard Clause is a clause in a hull policy, whereby underwriters cover deliberate damage or loss to the ship caused by governmental authority in attempts to mitigate a

threat of pollution hazard; where such relates to loss or damage to the ship and where it has not resulted from a want of due diligence on the part of the assured, owners or managers of the ship.

POLO COAT = XX – Polo Coat is a tailored overcoat made especially of tan camel's hair often having stitched edges and a half-belt on the back.

POLONAISE = ПОЛЁНЭЗ (или ПОЛЬСКОЕ) – Polonaise is an elaborate overdress with a short-sleeved fitted waist and a draped cutaway overskirt. / .

POLO SHIRT = РУБАШКА ДЛЯ ПОЛО – Polo Shirt is a close-fitting knit shirt with short or long sleeves and turnover collar or banded neck.

POLYACANTHA = ПОЛИАКАНТА (или МНОГОКОЛЮЧЕЕ) – Polyacantha:- with many spines. / Под Полиаканта, от Греческих слов Polýs, означающее Многий или Многочисленный или Обширный, и от Acantha, означающее Колючка или Шип, понимается .

POLYALKYLENE GLYCOL = ПОЛИАЛКИЛЕН ГЛИКОЛЬ – Polyalkylene Glycol (PAG):- mixtures of condensation polymers of ethylene oxide and water. They are any of a family of colorless liquids with high molecular weight that are soluble in water and in many organic solvents. They are used in detergents and as emulsifiers and plasticizers. PAG-based lubricants are used in diverse applications where petroleum oil-based products do not provide the desired performance – and because they are fire-resistant and will not harm workers or the environment.

POLYAMIDE = ПОЛИАМИД – A Polyamide is a polymer that contains recurring amide groups (R−CO−NH−R') as integral parts of the main polymer chain. Synthetic polyamides are produced by a condensaton reaction between monomers, in which the linkage of the molecules occurs through the formation of the amide groups. They may be produced by the interaction of a diamine (a compound containing two amino (NH_2) groups, e.g., hexamethylenediamine) and a dicarboxylic acid (containing two carboxyl (CO−OH) groups, e.g., adipic acid), or they may be formed by the self-condensation of an amino acid or an amino-acid derivative. The most important amide polymers are the nylons, an extremely versatile class of material that is an indispensable fiber and plastic. In this section the aramids, 'aromatic polyamides' that contain benzene rings in their carboxylic-acid portions, are also described. Polyamide is a synthetic polymer and the fibers made from it in which the simple chemical compounds used for its production are linked together by amide linkages (–NH–CO–). See also Nylon™ Fiber). Polyamide is a synthetic polymer family used for fibers and solid plastics; protein fibers are also technically polyamides, but the term is almost always used only for synthetic materials. Nylon™ is a polyamide, and the oldest of the commercial synthetic polymers. Polyamide can be dyed with acid dyes or disperse dyes. Some MX dyes will also work well for Nylon™ if applied as if they were acid dyes (at acid pH and high temperature). See also Aromatic Polyamides. / Найлан™ (Nylon™). Под Полиамидами понимаются синтетические полимеры, содержащие в основной цепи макромолекулы повторяющиеся амидные группы –CO–NH–; твёрдые роговидные или прозрачные стеклообразные вещества. Наиболее распространённые полиамиды – поликапроамид (polycaproamide (polyamide 6)), полигексаметиленадипинамид (polyhexamethylene adipamide (polyamide 66)), полигексаметиленсебацинамид. Характеризуются высокой прочностью, твёрдостью, эластичностью, износо- и теплостойкостью, устойчивостью к химическим реагентам, низким коэффициентом трения. Растворяются только в сильно полярных растворителях, например, в концентрированной серной кислоте. Применяются в производстве полиамидного волокна, плёнок, клеёв, для изготовления деталей электро- и радиоаппаратуры, антифрикционных и других изделий. Полиамиды, полимеры, содержащие амидные группировки –CO–NH– в основной цепи макромолекулы, связанные с алифатическими или ароматическими радикалами (соответственно алифатические или ароматические полиамиды). Основные промышленные способы получения полиамидов – полимеризация с раскрытием цикла (главным образом лактамов) и поликонденсация w-аминокарбоновых кислот или их эфиров, а также дикарбоновых кислот (их эфиров или галогенангидридов) с диаминами (смотрите Карбоновые Кислоты, Амины). Для синтеза полиамида широко используют e-капролактам, w-додекалактам, адипиновую, себациновую, фталевые кислоты (терефталевую и изофталевую), гексаметилендиамин, фенилендиамины (пара- и мета-изомеры). Наибольшее распространение получили алифатические полиамиды (в частности, полигексаметиленадипинамид, поликапроамид, а также полигексаметиленсебацинамид, полидодеканамид и другие); из ароматических полиамидов в промышленности производят поли-м-фенилензофталамид (из м-фенилендиамина и изофталевой кислоты) и поли-п-бензамид (из п-аминобензойной кислоты). Большинство полиамидов – твёрдые рогоподобные кристаллические вещества белого цвета (степень кристалличности до 40–60%), некоторые полиамиды – вязкие жидкости (смолы). температуры плавления алифатических полиамидов 150–260 °C, ароматических – около 400 °C и выше. Полиамиды – лёгкие термопластичные полимеры, характеризуются высокими механической прочностью (например, при растяжении 60–120 МегаНьютонов на квадратный метр (Мн/м^2), или 600–1 200 килограмм-силы на квадратный сантиметр (кгс/см^2), при изгибе 70–100 МН/м^2, или 700–1 000 кгс/см^2), твёрдостью, эластичностью (относительное удлинение алифатических полиамидов 100–400%), износостойкостью, теплостойкостью (например, по Вика, 160–200 °C для алифатических полиамидов, 270–320 °C для ароматических), химической стойкостью (при комнатной температуре устойчивы в воде, растворах кислот, щёлочей, аминов и других), растворяются только в сильнополярных растворителях (например, в концентрированной серной и муравьиной кислотах, крезоле, фторированных спиртах). Полиамиды легко перерабатываются прессованием, литьём под давлением, экструзией, хорошо обрабатываются на станках; при формовании из расплавов или растворов образуют волокна. Благодаря сочетанию таких свойств полиамиды широко используют в промышленности, главным образом для производства синтетических волокон (смотрите Полиамидные Волокна), плёнок (смотрите Плёнки Полимерные), а также в качестве конструкционного материала для изготовления различных деталей машин (шестерён, втулок, подшипников и других). Смотрите также Пластические Массы. Мировое производство полиамида конструкционного назначения в 1973 составило приблизительно 300 000 тонн (т).

POLYAMIDE–CELLULOSE FIBER BLENDS DYEING = КРАШЕНИЕ СМЕСЕЙ ПОЛИАМИДНОГО И ЦЕЛЛЮЛОЗНОГО ВОЛОКОН – Polyamide-Cellulose Fiber Blends Dyeing:- since PA fibers have an affinity for almost all dyes used for cellulose, different possibilities are available for dyeing this blend:- (i) direct and disperse dyes (pH 8); (ii) acid or 1:2 metal-complex dyes (pH 5–8); (iii) vat dyes (exhaust and pad-steam process are used); and (iv) reactive dyes. Application conditions are those typical of each class of dye. They have already been described in the specific sections.

POLYAMIDE FIBER = ПОЛИАМИДНОЕ ВОЛОКНО – Polyamide is a synthetic fiber composed of linear macromolecules having in the chain recurring amide linkages, at least 85% of which are joined to aliphatic cycloaliphatic units. Also known as Nylon™. Alphabetic code – PA; and relevant commercial allowance – FY 5.75 / SF 6.25. Polyamide Fibers (PA 6 and PA 6,6) are easily dyed with various types of dyes. Due to their hydrophobic characteristics, they can be dyed with disperse dyes (non-ionic), whereas thanks to the presence of the groups NH-CO- and NH_{2-} in the polymer chain, acid, basic, reactive and 1:2 metal-complex dyes (ionic) can also be used. However, in practice acid levelling dyes are increasingly used. Before dyeing, fabrics must generally be pre-fixed to compensate for material-related differences in affinity and to reduce the sensitivity to creasing during the dyeing process. Pre-fixing can be

performed in a stenter frame. (i) Disperse dyes used for polyamide fibers are mainly azo compounds and anthraquinones. They are applied especially for lighter shades. The material is dyed in acidic conditions (pH 5) by acetic acid. A dispersing agent is always added to the liquor. (ii) Acid dyes:- as with acid dyeing of wool, with increasing dye affinity, the hydrophobic interaction in the initial phase must be repressed to achieve uniform absorption. This means that for high-affinity dyes the liquor must be sufficiently alkaline at the start and then slowly decreased to optimise exhaustion. The level of acidity of the liquor is regulated either by dosing with acids during dyeing or by adding acid-donors (e.g., ammonium sulphate, sodium pyrophosphate or esters of organic acids) at the start of the process. Optimal exhaustion and uniform dyeing can also be achieved by controlling the temperature profile. Auxiliary agents (anionic, cationic, non-ionic surfactants) are normally used to improve the levelling effect. The wet-fastness of dyeing with acid dyes on polyamide fibers is often unsatisfactory. After-treatment with syntans (synthetic tanning agents) is often necessary. The syntans are added to the exhausted bath or to fresh liquor at pH 4.5 by formic or acetic acid. The material is treated at 70–80 °C and is then rinsed. (iii) Metal-complex dyes:- among 1:2 metal-complex dyes, molecules containing sulphonic groups are the most suitable for polyamide fibers. The absorption of the dye increases with decreasing pH. Dyeing conditions vary from weakly acidic by addition of ammonium sulphate and acetic acid to neutral or moderately alkaline for high-affinity dyes. For high-affinity dyes amphoteric or non-ionic levelling agents are usually added. (iv) Reactive dyes:- in principle, the reactive dyes used for wool are also suitable for polyamide. The dyeing process is carried out in weakly acidic conditions (pH 4.5–5). The process is started at 20–45 °C and then temperature is increased near to boiling. Non-ionic surfactants and sodium bicarbonate or ammonia are used in the after-treatment step. Polyamide Fiber is a fully imidized, manufactured fiber formed from the condensation polymer of an aromatic anhydride and an aromatic diisocyanate. A polyamide fiber is a high shrinkage fiber. / Найлан^{T3} (Nylon^{TM}). Полиамидное Волокно выпускается в виде штапельного волокна и текстильной нити обычной и высокопрочной. Полиамидные Волокна – синтетические волокна, получаемые формованием из расплавов или растворов полиамидов. Обладают высокими прочностью, износостойкостью, сопротивлением ударным нагрузкам, устойчиво к многократному изгибу и действию многих химических реагентов. Недостатки:- малая гигроскопичность (причина повышенной электризуемости), сравнительно низкий модуль упругости, плохая устойчивость к термо- и фотоокислительным воздействиям; максимальная рабочая температура 80–150 °C (волокна из алифатических полиамидов). Растворяются в концентрированных кислотах, фенолах, трихлорэтане, хлороформе, устойчивы к действию многих химических реагентов, хорошо противостоят биохимическим воздействиям, легко окрашиваются. Самые распространённые синтетические волокна. Применяются в производстве текстильных товаров широкого потребления, а также фильтровальных материалов, рыболовных сетей, канатов, щетины, кордных нитей и тканей для шин и резинотехнических изделий. Торговые названия:- (i) из поликапроамида:- Амилан® (Amilan®), Дедерон (Dederon в бывшей ГДР), Капрон® (Capron® в бывшем СССР), Найлан^{T3} (Nylon^{TM} в США) и Найлан 6 (Nylon 6 в США), Перлон® (Perlon® в Германии), Силон (Sylon в Чехии и Словакии) и Стилон (Stylon в Польше); и (ii) из полигексаметиленадипинамида:- Анид (в бывшем СССР), Найлан 6.6 (Nylon 6.6 в США), Ниплон (в Японии) и Родианайлан (Rhodianylon). Термостойкие волокна из ароматических полиамидов, пригодные для эксплуатации при 250–500 °C, выпускаются под названиями Кэвла® или Кевлар® (Kevlar® в США), Номэкс® или Номекс® (Nomex®) и Фенилон (Fenilon в бывшем СССР). Мировое производство (по данным на 1980) около 3 000 000 тонн в год. Полиамидные Волокна – синтетические волокна, формуемые из расплавов или растворов полиамидов. Обычно для производства полиамидных волокон используют линейные алифатические полиамиды с молекулярной массой от 15 000 до 30 000 (чаще всего поликапроамид и полигексаметиленадипинамид). С конца 1960-х налажен выпуск полиамидных волокон из ароматических полиамидов, обладающих высокой термостойкостью. Технологический процесс получения полиамидных волокон включает три основных этапа:- синтез полимера, формование волокна и его текстильную обработку. Полиамидные волокна характеризуются высокой прочностью при растяжении, отличной стойкостью к истиранию и ударным нагрузкам. Устойчивы к действию многих химических реагентов, хорошо противостоят биохимическим воздействиям, окрашиваются многими красителями. Максимальная рабочая температура волокон из алифатических полиамидов 80–150 °C, волокон из ароматических полиамидов – 350–600 °C. Полиамидные волокна растворяются в концентрированных минеральных кислотах, феноле, крезоле, трихлорэтане, хлороформе и другом. Полиамидные волокна малогигроскопичны, что является причиной их повышенной электризуемости. Они плохо устойчивы к термоокислительным воздействиям и действию света, особенно ультрафиолетовых лучей. Для устранения этих недостатков в полиамиды вводят различные стабилизаторы. Полиамидные волокна используются в производстве товаров широкого потребления, шинного корда, резинотехнических изделий, фильтровальных материалов, рыболовных сетей, щетины, канатов и другого. Большое распространение получили текстурированные (высокообъёмные) нити из полиамидных волокон. Полиамидные волокна выпускают в виде непрерывных нитей или штапельных волокон во многих странах под следующими торговыми названиями:- волокна из поликапролактама – Капрон® (Capron® в бывшем СССР), Найлан-6 (Nylon-6 в США), Перлон® (Perlon® в ФРГ), Дедерон (Dederon в бывшей ГДР), Амилан® (Amilan® в Японии) и другие:- волокна из полигексаметиленадипинамида – Анид (СССР), Найлан-6.6 (Nylon-6.6 в США), Родиа-Найлан (Rhodia-Nylon в ФРГ), Ниплон (Япония) и другие; волокна из ароматических полиамидов – Номекс® (Nomex® в США). Мировое производство полиамидного волокна в 1973 составило 2 700 000 тонн (т).

POLYAMIDE–WOOL FIBER BLENDS DYEING = КРАШЕНИЕ СМЕСЕЙ ПОЛИАМИДНОГО ВОЛОКНА И ШЕРСТИ – Polyamide-Wool Fiber Blends Dyeing:- blends with polyamide/wool ratios varying from 20:80 to 60:40 are used. This blend is particularly important in the carpet sector. More detailed information is therefore reported in the specific section dedicated to this sector. As general information about the dyeing processes suitable for this type of blend, both fibers have affinity for acid and 1:2 metal-complex dyes. However, since PA is more accessible to the dye than wool, it is dyed more deeply, particularly in the case of light colors. To counteract this effect, special levelling agents (also called PA Reserving/Blocking Agents) are used (mainly aromatic sulphonates). These auxiliaries have a relatively high affinity for the PA fiber and retard the absorption of the colorant on this part of the blend. Dyeing is performed in the presence of acetic acid and sodium sulphate. Due to limited fastness of acid dyes, 1:2 metal-complex dyes are required for dark shades.

POLYANCISTRUS = ПОЛИАНСИСТРУС – Polyancistrus:- with many hooks. / , от Греческих слов Polýs, означающее Многий или Многочисленный или Обширный, и , означающее , понимается .

POLYARYLATE = ПОЛИАРИЛАТ – Polyarylate:- high-temperature-resistant aromatic polyesters from bisphenols. / Полиарилаты – синтетические полимеры, продукты поликонденсации дикарбоновых кислот с двухатомными фенолами общей формулы [–OCRCOOR'O–]$_n$, где R – остаток фенола, R' – остаток кислоты. Наибольшее практическое значение имеют полиарилаты из ароматических кислот – твёрдые прозрачные продукты с высокой термостойкостью (для некоторых полиарилатов до 500 °C). Термостойки, устойчивы к многим химическим реагентам и агрессивным средам, ультрафиолетовому (УФ) свету, хорошие диэлектрики. Применяются в производстве волокнистых материалов для тонкой фильтрации газов, конструкционных деталей, плёнок, антифрикционных пластмасс, синтетической бумаги для электроизоляции. Распространённая разновидность полиарилатов – поликарбонаты. Полиарилаты, сложные полиэфиры общей формулы (–OAOOCA"CO–)n, получаемые поликонденсацией дихлорангидридов дикарбоновых кислот с двухатомными фенолами (A – остаток фенола, чаще всего 4,4"-диоксидифенил-2,2-пропана, фенолфталеина, 9,9-бис-(4-оксифенил) флуорена, A" – остаток дикарбоновой кислоты).

Практическое значение имеют полиарилаты ароматических дикарбоновых кислот (главным образом терефталевой и изофталевой, смотрите Фталевые Кислоты). Эти полиарилаты (молекулярная масса 100 000–160 000) обладают высокими температурами размягчения (200–360 °C), хорошими диэлектрическими и механическими свойствами, высокой термостойкостью (начинают разлагаться около 300 °C); температура длительной эксплуатации 200–280 °C. Полиарилаты устойчивы также к воздействию жиров, жидких топлив, ряда органических растворителей и разбавленных минеральных кислот, однако не стойки к действию щёлочей, аммиака и концентрированных кислот (например, серной, азотной). Высококристаллический полиарилат на основе n-оксибензойной кислоты, известный под названием Эконол (США), по термостойкости (380–400 °C) превосходит полиимиды и обладает химической устойчивостью, близкой к фторопластам. Полиарилаты перерабатывают литьём под давлением, экструзией, прессованием (смотрите Пластические Массы); растворимые полиарилаты – из растворов в органических растворителях. Из полиарилатов изготовляют конструкционные изделия, плёнки, волокнистые материалы для тонкой фильтрации газов, синтетическую бумагу, главным образом для электротехнических и радиотехнических изделий. Полиарилаты выпускали в бывшем Союзе Советских Социалистических Республик (СССР) следующих марок:- ДВ-101, Ф-1, Ф-2. Частный случай полиарилатов – поликарбонаты.

POLYBENZIMIDAZOLE FIBER = ПОЛИБЕНЗИМИДАЗОЛЬНОЕ ВОЛОКНО (или ВОЛОКНО ПОЛИБЕНЗИМИДАЗОЛ) – Polybenzimidazole (PBI) Fiber is a manufactured fiber in which the fiber-forming substance is a long chain aromatic polymer having recurrent imidazole groups as an integral part of the polymer chain. The polymer is made from tetraaminobiphenyl and diphenyl isophthalate and is dry spun from a dope with dimethylacetamide as a solvent. Characteristics:- a high-performance fiber with high chemical resistance that does not burn in air. It has no melting point and does not drip when exposed to flame. The fiber and fabrics from PBI retain their flexibility, dimensional stability, and significant strength without embrittlement even when exposed to flame or extreme heat. The fiber emits little smoke in extreme conditions. It processes well on conventional textile equipment, having processing characteristics similar to polyester. It can be used in 100% form or blended with other fibers. It has a high moisture regain and low modulus with comfort properties similar to cotton. The natural color of PBI is a gold-khaki shade, but it can be dyed to almost any medium to dark shade with conventional basic dyes. End Uses:- with excellent thermal, flame, and chemical resistance, combined with good comfort properties, PBI is a good fiber for many critical uses including:- firefighter's protective apparel, aluminized proximity gear, industrial apparel such as pants, shirts and underwear, protective gloves, welder's apparel, aircraft fire-blocking layers, aircraft wall fabrics, rocket motor insulation, race car driver's apparel, and braided packings among others. / имеет высокую влагопоглощательную способность (moisture regain) и низкий модуль . Полибензимидазольные Волокна получают из ароматического тетрамина и терефталевой кислоты. Высокотермостойкое полибензимидазольное волокно весьма чувствительно при высоких температурах к действию влаги и химических агентов. Ориентация и кристаллизация волокна не улучшают его влагостойкость. Формование полибензимидазольных волокон в шахте происходит при высокой температуре (более 200 °C), после чего волокна тщательно отмывают от диметилацетамида и LiCl (в автоклаве) и подвергают девятикратному термическому вытягиванию в муфельной печи при 520 °C. Свойства полибензимидазольных волокон заметно не отличаются от свойств полиимидных волокон. Химическая модификация при этом не сопровождается уменьшением термостойкости. Полибензимидазольные волокна и ткани применяются также для изготовления тормозных парашютов для сверхзвуковых самолётов и космической техники, мешков для парашютов и спасательных средств, предохранительных сеток, высокотемпературных газовых фильтров. При температуре выше 300 °C полибензимядазольные волокна по стабильности при длительной экспозиции на воздухе уступают волокнам из других ароматических гетероциклических полимеров и лишь незначительно превосходят ароматические полиамидные волокна. Интересным свойством полибензимидазольных волокон является сохранение прочности при повышенных температурах. Высокотермостойкое полибензимидазольное волокно весьма чувствительно при высоких температурах к действию влаги и химических агентов. Ориентация и кристаллизация волокна не улучшают его влагостойкость. Полибензимидазолы, полимеры, содержащие в основной цепи макромолекулы бензимидазольные циклы. Полибензимидазолы получают в основном твёрдофазной полициклоконденсацией ароматических тетрааминов с дифениловыми эфирами алифатических или ароматических дикарбоновых кислот. Техническое значение получили пока полибензимидазолы на основе ароматических кислот, так называемые ароматические полибензимидазолы – главным образом из о, о"-диаминобензидина и дифенилового эфира изофталевой кислоты (смотрите Фталевые Кислоты). Большинство полибензимидазолов – бесцветные или слабоокрашенные аморфные или кристаллические (в зависимости от строения) вещества (молекулярная масса до 40 000); обладают высокой термостойкостью (ароматические полибензимидазолы начинают интенсивно разлагаться на воздухе при 450–600 °C, алифатические – при 300–400 °C). Полибензимидазолы характеризуются также:- высокой химической и, в частности, гидролитической устойчивостью (например, некоторые полибензимидазолы не изменяются при кипячении в 70%-ной H_2SO_4 и 25%-ном растворе NaOH в течение 10 часов (ч)). По прочностным показателям полибензимидазолы на основе алифатических полиметиленовых дикарбоновых кислот (например, себациновой) превосходят ароматические полибензимидазолы. Последние растворимы, например, в диметилацетамиде. Из полибензимидазолов изготовляют клеи, термостойкие плёнки и волокна, связующее для стеклопластиков, используемых в самолёто- и ракетостроении, антифрикционные материалы и абляционные теплозащитные покрытия для космических кораблей. Ткани из полибензимидазолов обладают высокой термо- и огнестойкостью, гидрофильны, удобны в носке и стойки к истиранию. Полибензимидазолы производят в Соединённых Штатах Америки (США); на основе полибензимидазолов готовят клей, который выпускают под названием 'Имидайт 850', и связующее для стеклопластиков – под названием 'Имидайт 1850'.

POLYBLENDS = ПОЛИСМЕСИ (или СМЕСИПОЛИМЕРОВ) – Polyblends:- a mixture of two or more polymers, especially of man-made fibers; a material made from such a blend. See also Biconstituent Fiber. Polyblend is a a colloidal mixture of one polymer with another (as of a vinyl resin with nitrile rubber). Polyblend is a mechanical mixture of two or more polymers, such as polystyrene and rubber.

POLYCARPIC = ПОЛИКАРПИЧЕСКОЕ – Polycarpic:- a plant that flowers more than once in its lifetime. Compare with Monocarpic. / Под Поликарпическим, от Греческих слов Polýs, означающее Многий или Многочисленный или Обширный, и Karpós, означающее Плод, понимается растение, которое цветёт и плодоносит многократно в течение жизни. Большинство многолетних цветковых растений. Сравните с Монокарпическим (Monocarpic). Поликарпические Растения, растения, многократно цветущие и плодоносящие в течение жизни. К поликарпическим Растениям относится большинство многолетних цветковых Растений. Сравните Монокарпические Растения.

POLYCARYOPTIC = ПОЛИКАРИОПТИЧЕСКОЕ – Polycaryoptic (mp):- several pistils with multiple ovaries are present in the spikelet.

POLYCEPHALUS = МНОГОГОЛОВЧАТОЕ (или ПОЛИЦЕФАЛЬНОЕ) – Polycephalus:- with many heads. / , от Греческих слов Polýs, означающее Многий или Многочисленный или Обширный, и Kephalē, означающее Голова, понимается .

POLYCHLAL FIBER = ПОЛИХЛАЛОВОЕ ВОЛОКНО (или ВОЛОКНО ПОЛИХЛАЛ) – Polychlal Fiber is a manufactured, bicomponent fiber of polyvinyl alcohol and polyvinyl chloride. Some vinyl chloride is grafted to the polyvinyl alcohol (Japanese Chemical Fibers Association definition). The fiber is emulsion spun into tow and staple. Characteristics:- polychlal fibers have a soft, lamb's wool-like hand and moderate moisture regain. The fibers are also characterized by high flame resistance and high abrasion resistance. End Uses:- polychlal fibers are suitable for end uses such as children's sleepwear, blankets, carpets, curtains, bedding, upholstery, nonwovens, and papermaking. / влагопоглощательная способность (moisture regain). Двухкомпонентное волокно из поливинилового спирта и поливинилхлорида.

POLYCHLORINATED BIPHENYL = ПОЛИХЛОРИРОВАННЫЙ ДИФЕНИЛ – Polychlorinated Biphenyl (PCB) is a class of synthetic chemicals consisting of a homologous series of compounds beginning with monochlorobiphenyl and ending with decachlorobiphenyl. PCBs do not occur naturally in petroleum, but have been found as contaminants in used oil. PCBs have been legally designated as a health hazard, and any oil so contaminated bust be handled in strict accordance with state and federal regulations.

POLYCLONING SITE = УЧАСТОК МНОГОЧИСЛЕННОГО КЛОНИРОВАНИЯ – Polycloning Site is a short segment in a DNA vector that has been engineered to contain a number of cleavage sites for different restriction enzymes to enhance the versatility of the vector.

POLYCROSS = ПОЛИКРОСС (или МНОЖЕСТВЕННОЕ СКРЕЩИВАНИЕ, или МАССОВОЕ СКРЕЩИВАНИЕ) – Polycross is an intercrossing of a group of cultivars or clones in isolation so as to allow random pollination. / Под Поликроссом понимается метод скрещивания, используемый в селекции растений для выявления наиболее продуктивных форм; заключается в многократном (в нескольких поколениях) свободном (смесью пыльцы) переопылении растений. Под Поликроссом, от Греческого слова Polýs, означающее Многий или Многочисленный или Обширный, и Английского слова Cross, означающее Скрещивание, понимается множественное скрещивание, метод массового испытательного скрещивания, используемый в селекции растений. Заключается в нахождении клонов или линий, которые при скрещивании с другими клонами или линиями того же вида дают наиболее продуктивные растения, отбираемые для составления нового 'синтетического сорта'. Этим методом пользуются в селекции растений, которые удаётся клонировать (многолетние травы, размножающиеся вегетативным путём однолетние и двулетние виды растений).

POLYCROSS NURSERY = ПИТОМНИК МАССОВОГО СКРЕЩИВАНИЯ (или ПИТОМНИК ПОЛИКРОСС) – Polycross Nursery:- plants specifically arranged to facilitate random outcrossing to develop an improved line or variety.

POLYCYCLIC = ПОЛИЦИКЛИЧЕСКОЕ – Polycyclic:- completes many cycles in one year.

POLYEMBRYONIC = ПОЛИЭМБРИОННОЕ – Polyembryonic (ME):- multiple embryos are present in one caryopsis. / Полиэмбриония – образование более одного зародыша в одной семяпочке. Под Полиэмбрионией, от Греческих слов Polýs, означающее Многий или Многочисленный или Обширный, и Émbryon, означающее Зародыш, у животных понимается образование нескольких зародышей (близнецов) из одной зиготы.

POLYESTER = СЛОЖНЫЙ ПОЛИЭФИР (или ПОЛИЭСТЁР) – Polyester is a category of polymers that mainly comprises of Polyethylene Terephthalate (PET). Polyester is a synthetic polymer made from purified terephthalic acid (PTA) and monoethylene glycol (MEG). Polyester Yarn is the main products in the polyester category. Almost 40% of the world production of polyester is directly used to make Polyester Yarn. Polyester yarn is made by direct spinning of PTA & MEG. It also made by spinning PET Chips which is also a bi product made from PTA & MEG. Some of the world's largest PTA products are British Petroleum, Reliance, Sinopec, Sk-Chemicals, Mitsui and Eastman Chemicals. MEG production is in the hand of about 10 global players which are headed by MEGlobal a JV of DOW and PIC Kuwait followed by Sabic. The main use of Polyester has been in the Textiles field for making Polyester Yarns. Polyester in different forms is used widely in textile application to make polyester (PET) resin and Filament Yarn such as Partially Oriented Yarn (POY), Polyester Drawn Textured Yarn (DTY), Polyester Fully Drawn Yarn (FDY), Polyester Staple Fiber (PSF), Polyester Spun Yarn (PSY), Technical Yarn, Tire cord and Mono filaments Yarn. Polyester yarn is also used in making packing application like polyester film, insulation tapes, strapping and several other daily use items. Polyester filament yarns is used in knitting and weaving to make polyester fabrics such as consumer fabrics and home furnishing like curtains, bed sheets, bed spreads and draperies. Similarly Polyester high tenacity industrial yarns can be used to make ropes, conveyor belts, safety belts and tire fabric. Polyester Staple Fiber is mainly used as fiber fills to stuff pillows, cushion, sofa and beddings. Polyester is a synthetic fiber composed of linear macromolecules having in the chain at least 85% by mass of an ester of a diol and terephthalic acid. Alphabetic code – PES (the same code is used in the plastic industry for polyether sulfone in ISO 1043); and relevant commercial allowance – 1.50. Polyester is a manufactured fiber introduced in the early 1950s, and is the most commonly used manufactured fiber worldwide. The fiber-forming substance in polyester is any longchain, synthetic polymer composed of at least 85% by weight of an ester of dihydric alcohol and terephthalic acid. Polyester has high strength (although somewhat lower than Nylon), excellent resiliency, has high abrasion resistance, and resists shrinking, stretching and wrinkles. Polyester's low absorbency allows the fiber to dry quickly. Polyester fabrics are used in apparel and home furnishings, i.e. bedspreads, bedsheets, draperies and curtains. Industrial polyesters are used in ropes, tire reinforcements, safety belts, and plastics. Polyester fiberfill is used as stuffing in cushions, comforters, and pillows. Polyester is a manufactured fiber introduced in the early 1950s, and is second only to cotton in worldwide use. Polyester has high strength (although somewhat lower than nylon), excellent resiliency, and high abrasion resistance. Low absorbency allows the fiber to dry quickly. In the past, Polyester was a clear definition for the synthetic fibers made from polyethylene terephthalate (PET). In the meantime, however, it also exists on a modified raw materials basis such as polytrimethylene terephthalate (PTT) or polybutylene terephthalate (PBT), with modified fiber properties and processes, e.g., in the dye-house. For this reason, BISFA (short for the Bureau International pour la Standardisation des Fibres Artificielles or The International Bureau for the Standardization of Man-made Fibres; headquartered in Brussels, Belgium) is the organization responsible for man-made fiber standardization, has asked for a separate designation for various polyesters from the European Union Commission. It is often case in the textile trade that the general term 'Microfibers' is used. On some labels or in advertising, the description '100% microfiber' can be discovered. But the buyer of a microfiber product, however, is acquiring a textile made from, e.g., polyamide, polyester or viscose fibers. Polyester is a manufactured fiber made from long-chain synthetic polymers. Characteristics:- crease-resistance, quick-drying, great shape retention, high strength, abrasion resistance and easy care. Polyester is a somewhat generic term used for a variety of synthetic polymers used both for solid plastics and for fibers; polyethylene terephthalate is probably the most common. Polyester is are harder to dye than many other fiber polymers. It is dyed almost exclusively with disperse dyes. Because of its high glass transition temperature, dyeing is usually done at high temperature (around 130 °C) in a pressure vessel. Carriers can be used for dyeing at the boil. Washfastness of polyester is very high because it is almost impenetrable to water even at the boil. Some polyester is formulated to allow dyeing with basic dyes. Polyester containers (often labeled PET or PETE), very popular for beverages, can be used for dye solutions, at least for short term storage. Polyester is attacked by strong alkalis. A few stitches of brightly-colored polyester thread can be handy for 'labeling' items being dyed in almost any process other than disperse dyeing, because they will retain their original color. See also Aromatic Polyesters. / Бритиш Пэтчролиэм (British Petroleum), Рэлайэнс (Reliance), Синопэк (Sinopec), Эс.кей.-Кемикэлз (Sk-Chemicals), Мицуи (Mitsui) и Истмэн Кемикэлз

(Eastman Chemicals). (Найлан[T3] (или Нейлон[T3]; (Nylon[TM])). и высокая устойчивость к истиранию. Щёлочь (Alkali). Международное Бюро по Стандартизации Искусственных Волокон (МБСИВ) или, как это звучит на Французском языке по месту регистрации, Бюро Этэрнасьёналь пур ля Стандардизасьён дэ Фибр Артифисибль (БИСФА; Bureau International pour la Standardisation des Fibres Artificielles (BISFA)). Полиэфир – синтетический полимер, содержащий в молекуле простую эфирную R–O–R (простой полиэфир; R – органический радикал) или сложноэфирную R–O–CO–R (сложный полиэфир) группу. Из простых полиэфиров наиболее важны пентапласт, полиформальдегид, эпоксидные смолы, из сложных – алкидные смолы, поликарбонаты, полиэтилентерефталат. Полиэфиры, полимеры, содержащие в основной цепи макромолекулы функциональные группы простых (простые полиэфиры) или сложных (сложные полиэфиры) эфиров. Полиэфиры могут быть насыщенными и ненасыщенными. Простые полиэфиры, HO–(–R–O–)n–H, где R – углеводородный радикал различного строения, содержащий не менее двух атомов углерода, получают полимеризацией циклических окисей (например, окиси пропилена, окиси этилена) или поликонденсацией гликолей. Сложные полиэфиры линейной структуры, H–(–OAO–CO–A”–CO–)n–OH, где A – углеводородный радикал, A” – остаток органической или неорганической кислоты (например, полиэтилентерефталат, нуклеиновые кислоты), получают поликонденсацией либо гликолей с двухосновными кислотами или их ангидридами, либо оксикислот. При использовании многоатомных спиртов (число групп OH более 2, например, глицерина, пентаэритрита и различных полиолов) получают разветвлённые (например, алкидные смолы) или сшитые полиэфиры. Свойства полиэфиров очень разнообразны и зависят от химического состава, структуры, молекулярной массы и наличия функциональных групп (–OH и –COOH). Как правило, простые полиэфиры эластичнее сложных. Полиэфиры могут вступать в химическую реакции по концевым функциональным группам с увеличением молекулярной массы; ненасыщенные полиэфиры способны ‘сшиваться’ с образованием трёхмерных структур (смотрите также Отверждение Полимеров). Сложные полиэфиры гидролизуются под действием кислот и щёлочей, простые полиэфиры значительно устойчивее к гидролизу. Применение полиэфиров определяется их свойствами. Ненасыщенные полиэфиры невысокой молекулярной массы (олигоэфиры) применяют в качестве компонентов клеев, лакокрасочных материалов, для пропитки и тому подобного (смотрите, например, Полиэфирные Смолы). Полиэфиры высокой молекулярной массы используют в производстве пластмасс (например, поликарбонаты), плёнок и полиэфирных волокон.

POLYESTER–CELLULOSE FIBER BLENDS DYEING = КРАШЕНИЕ СМЕСЕЙ СЛОЖНОГО ПОЛИЭФИРНОГО И ЦЕЛЛЮЛОЗНОГО ВОЛОКОН – Polyester-Cellulose Fiber Blends Dyeing:- a large part of the entire production of PES (ca. 45%) is used to make this mixture. Polyester-cellulose blends are used for all types of clothing and for bed linen. The cellulose component is usually cotton, but viscose staple fibers and occasionally linen are also used. The preferred mixing ratio is 67:33 PES: cellulose (for textiles worn close to the skin), 50:50 and 20:80. In dyeing PES-cellulose mixtures, disperse dyes are used for the polyester component, while the cellulose portion is usually dyed with reactive, vat and direct dyes. Pigment dyeing is also commonly used for light shades. Disperse dyes stain cellulose fibers only slightly and they can easily be removed by subsequent washing or, if necessary, by reductive aftertreatment. Most of the dyes used for cellulose stain PES only slightly or not at all. PES-cellulose blends are commonly dyed in continuous processes. Nevertheless, for yarn and knitwear, batch dyeing is of major importance. In batch dyeing, the application of dyes can be done in one or two steps in one bath or in two different baths in subsequent stages. The disperse dye is generally applied at high-temperature (HT) conditions without the use of carriers. In the one-bath/one-step procedure, special auxiliaries, so-called Acid Donors, are used, which lower the pH when the temperature is increased. In this way, it is possible to fix the reactive dyes in alkaline conditions and then reach the optimal dyeing conditions (pH 5–6) for disperse dyes by increasing the temperature. Alternatively, it is advantageous to operate at pH 8–10 using alkali-stable disperse dyestuffs, which also avoid oligomer problems. The one-bath/one-step procedures are preferred, being more economic, but present more difficulties. For example, the presence of salt increases the tendency of disperse dyes to stain the cotton fiber of the blend. Recently developed low-salt reactive dyes are claimed to show good performance and high reproducibility in this application. In continuous processes the dyes are usually applied in one bath. The fabric is subsequently dried and disperse dye is fixed to the PES component by the thermosol process. Afterwards, the second dye is developed according to the procedure typical of each class, using in general pad-steam, pad-jig or pad-batch processes.

POLYESTER FIBER = СЛОЖНОЕ ПОЛИЭФИРНОЕ ВОЛОКНО (или ПОЛИЭСТЁРНОЕ ВОЛОКНО, или ВОЛОКНО ПОЛИЭСТЁР) – Polyester (PES) Fiber is a man-made or manufactured fiber in which the fiber-forming substance is any longchain synthetic polymer composed of at least 85 per cent by weight of an ester of a dihydric alcohol and terephthalic acid. Polyester fibers are high polymers (condensation products) obtained from or by esterification, especially of dicarboxylic acids with glycols or glycol derivatives. Some of the major fibers in this group include:- Dacron® (originally known as Amilar and Fiber V), Diolen, Enkalene, Fortrel®, Kodel, Tergal, Terital, Terylene™, Vycron, etc. See also Polyester. Generic name for a synthetic fiber made from polyethylene terephthalate. Polyester Fiber is a manufactured fiber in which the fiber-forming substance is any long chain synthetic polymer composed of at least 85% by weight of an ester of dihydric alcohol and terephthalic acid. The polymer is produced by the reaction of ethylene glycol and terephthalic acid or its derivatives. Fiber forms produced are filament, staple, and tow. The process of production resembles that of nylon. Polymerization is accomplished at a high temperature, using a vacuum by one of two methods. (1) The glycol and a terephthalate ester react to form a polymer chain, releasing methanol; or (2) the glycol and terephthalic acid react directly to form the polymer with water as the by-product. As with Nylon, the filaments are spun in a melt-spinning process, then stretched several times their original length, which orients the long chain molecules and gives the fiber strength. Characteristics:- polyester fibers have high strength and are resistant to shrinking and stretching. Fabrics are quick drying and tend to have wrinkle resistance and crease retention, wet and dry. Polyester is used alone and in blends. It has been one of the first fibers to be developed in fabrics with durable-press features. End Uses:- polyester is widely used in many types of apparel fabrics such as textured knits and wovens, durable-press blend fabrics, shirtings, dress goods, rainwear, worsted-blend summer suitings, sleepwear, underwear, bloused, and lingerie. It is also used extensively in floor coverings and for tire cord and other industrial uses such as sewing thread. Polyester fiberfill is used in filled items such as quilted jackets, comforters, pillows, furniture cushions, and sleeping bags. Polyester is a synthetic fiber composed of linear macromolecules having in the chain at least 85% by mass of an ester of a diol and terephthalic acid. Polyester Fibers:- articles made of pure PES are dyed almost exclusively using batch dyeing techniques and among these, dyeing under high-temperature conditions is the most commonly applied. Dyeing polyester fibers under atmospheric conditions (below 100 °C) was also frequently done in the past with the aid of carriers. Since these substances are ecologically harmful, dyeing below 100 °C is no longer in use today for pure PES fibers, unless carrier-free dyeable fibers are employed. Concerning high-temperature dyeing, the process is usually carried out in acidic conditions (pH 4–5) with addition of acetic acid under pressure at 125–135 °C. In these conditions levelling agents are necessary to prevent excessively rapid absorption. Provided that alkali-stable dyes are used, dyeing in alkaline medium (pH 9–9.5) is also possible. This technique has been developed in order to counteract the migration and deposition of oligomers typical of PES fibers. In fact, oligomeric components (cyclic trimers of ethylene terephthalate are especially harmful) tend to migrate out of the fiber during dyeing, thus forming with the dye agglomerates that can deposit on the textile or on the dyeing equipment. To achieve level effects, ethoxylated products are used as levelling agents. The thermosol process is another applied technique, although it is primarily

used for PES/cellulose blends. The dye is padded on the textile together with an anti-migration agent. A drying step at 100–140 °C is carried out. Then the dye is fixed (200–225 °C for 12–25 seconds). For light shades, the material needs only to be rinsed or soaped after dyeing. For dark shades, in order to ensure high light fastness, an after-clearing step is normally necessary. This usually consists of an alkaline reductive treatment followed by post-rinsing in weakly acidic conditions. PES fibers can be dyed with cationic dyestuffs, provided that acidic components (e.g., sulphated aromatic polycarboxylic acid) are used as co-monomers during the manufacturing of the fiber (creation of anionic sites). Polyester Fiber is a manufactured fiber in which the fiber forming substance is any long chain synthetic polymer composed of at least 85% by weight of an ester of a substituted aromatic carboxylic acid, including but not restricted to substituted terephthalic units and parasubstituted hydroxy-benzoate units. They are high is strength and are resistant to shrinking and stretching. Polyester Fibers are manufactured by one of several methods. The method used depends on the form the finished polyester will take. The most common forms for the textile industry are filament and staple:- (i) in the filament form, each individual strand of polyester fiber is continuous in length, producing smooth-surfaced fabrics; and (ii) in staple form, filaments are cut to short, predetermined lengths. In this form polyester is easier to blend with other fibers. Both filament and staple fiber processing involves polymerisation (condensation polymerization of teraphtalic acid and monoethylene glycol) and melt spinning (fibers are spun and dried), which are similar processes for both fibers. In medium and smaller production facilities, there is usually an intermediate step of pelletizing (turning output products from polymerization into chips before melt spinning). However, large producers may integrate processes in order to produce the polyester melt with higher efficiency and higher output. This means the polymer melt is directly converted into the textile fibers or filaments without the intermediary step of pelletizing. For filaments, chips are melted at 260–270 °C to form a syrup-like solution. The solution is put in a metal container called a Spinneret and forced through its tiny holes. The number of holes in the spinneret determines the size of the yarn, as the emerging fibers are brought together to form a single strand. At the spinning stage, other chemicals may be added to the solution to make the resulting material flame retardant, antistatic, or easier to dye. When polyester emerges from the spinneret, it is soft and easily elongated up to five times its original length. When the filaments dry, the fibers become solid and strong instead of brittle. Drawn fibers may vary greatly in diameter and length, depending on the characteristics desired for the finished material. Also, as the fibers are drawn, they may be textured or twisted to create softer or duller fabrics. For staple fibers, in the melt spinning process, the spinneret has many more holes and the rope-like bundles of polyester that emerge are called Tow. Newly-formed tow is quickly cooled in cans that gather the thick fibers. Several lengths of tow are gathered and then drawn on heated rollers to three or four times their original length. Drawn tow is then fed into compression boxes, which force the fibers to fold like an accordion. After the tow is crimped, it is heated to completely dry the fibers and set the crimp. Following heat setting, tow is cut into shorter lengths. (Length is defined by the fibers with which the polyester will be blended with. For instance, for blends with cotton it is cut in 3.2–3.8 cm pieces whereas for blends with viscose 5 cm lengths are cut). Polyester is a high tenacity synthetic fiber with high strength and low elongation. It is UV resistant, Abrasion Resistant and Chemical Resistant. And can be used in cord and rope applications including: starter cord, lanyards, tie downs, and low stretch applications. Properties of Polyester Cord Fiber:- (i) High Strength; (ii) Excellent UV Resistance; (iii) Excellent Abrasion Resistance; (iv) Low Stretch; and (v) Chemical Resistant. Polyester Cord & Rope Applications:- (i) Tie-downs; (ii) Starter Cord; (iii) Lanyards; (iv) Mooring Lines; (v) Guy Line Rope; (vi) Tow Rope; (vii) Rigging Rope; and (viii) Safety Rope. / Найлан^{T3} (Nylon^{TM}). Некоторыми из основных волокон этой группы являются:- Дакрон$^{®}$ (Dacron$^{®}$, изначально известное как Эмилар (Amilar) и Волокно Ви. (Fiber V)), Дайолэн (Diolen), Энкален (Enkalene), Фортрель (Fortrel$^{®}$), Кодель (Kodel), Тергаль (Tergal), Теритал (Terital), Терилен^{T3} (Terylene^{TM}), Вайкрон (Vycron) и так далее. Обобщённое название для синтетического волокна, производимого из полиэтилен терефталата. Сложное Полиэфирное Волокно выпускается в виде штапельного волокна и текстильной нити обычной и высокопрочной. В бывшем СССР сложное полиэфирное волокно было известно под торговым названием Лавсан^{TM}. Это название пришло из бывшей Германской Демократической Республики (ГДР). Полиэфирное Волокно относится к синтетическому волокну, получаемое формованием из расплава полиэтилентерефталата или его производных (сополимеров, содержащих в макромолекуле более 85% этилентерефталата – сополимерные волокна). Достоинства:- незначительная сминаемость, отличная атмосферо-, плесене-, свето-, термостойкость, высокая прочность, хорошая стойкость к истиранию и к действию кислот и растворов щёлочей средних концентраций, разрушаются при кипячении в концентрированных растворах щёлочей. Недостатки:- трудность крашения, сильная электризуемость, жёсткость – устраняются химическим модифицированием. Применяются, например, в производстве различных тканей, искусственного меха, канатов, ковров, технического сукна, трикотажа, обивочных и фильтровальных материалов, кордных нитей и тканей для армирования шин и резинотехнических изделий и многого другого. Основные торговые названия:- Гризутен$^{®}$ (Grisuten$^{®}$ в бывшей ГДР), Дакрон$^{®}$ (Dacron$^{®}$ в США), Лавсан (в бывшем СССР), Тергаль (Tergal во Франции), Терилен^{T3} (Terylene^{TM} в Великобритании), Тесил (Tesil в Чехии и Словакии), Тетерон^{T3} (Tetoron^{TM} в Японии), Элана (Elana в Польше). Полиэфирные (ПЭ) Волокна (другие названия – Лавсан, Дакрон) являются доминирующими среди синтетических на мировом текстильном рынке. Это обусловлено их ценными свойствами. Высокая прочность и хемостойкость делает ПЭ волокна незаменимыми в производстве технических изделий:- транспортёрных лент, приводных ремней, канатов, тентов, парусов, бензо- и нефтестойких шлангов, электроизоляционных материалов и фильтров. Полиэфирные волокна не только очень прочные, но и очень эластичные, что обеспечивает высокую формоустойчивость изделий из них, превосходящую таковую изделий из шерсти – самое формоустойчивое из природных волокон. ПЭ волокна наиболее термостойкие из всех волокон. Они гораздо устойчивее многих других (например полиамидных) к действию светопогоды, поэтому в большом объёме используются в производстве гардинного полотна, занавесей. ПЭ волокна хорошо совместимы с другими волокнами, поэтому основная их часть используется в смеси с шерстью, хлопком, льном, вискозным волокном для выработки плательных, костюмных, пальтовых, постельных, сорочечных тканей, обладающих повышенной износостойкостью (вклад полиэфирных волокон) и высокими санитарно-гигиеническими свойствами (вклад натуральных или искусственных волокон). Второе место после полиэфирных по объёму выпуска среди синтетических занимают полиамидные (ПА) волокна (другие названия – Анид, Антрон, Капрон, Найлан^{T3} (Nylon^{TM})). Это большая группа волокон, в основных цепях содержащих многократно повторяющиеся амидные группы –CO–NH–. Такие же группы (пептидные) имеют и белковые волокна (шерсть, шёлк), но их свойства сильно отличаются от свойств полиамидных волокон, имеющих низкую гигроскопичность. По физико-механическим свойствам (прочность при растяжении, к истиранию, к ударным нагрузкам) Капрон превосходит все природные и химические волокна. Он широко используется в технике как шинный корд и в резинотехнических изделиях. В быту используется в производстве тканей и трикотажа. Полиэфирные Волокна – синтетические волокна, формуемые из расплава полиэтилентерефталата. Превосходят по термостойкости большинство натуральных и химических волокон:- при 180 °C они сохраняют прочность на 50%. Загораются полиэфирные волокна с трудом и гаснут после удаления источника огня; при контакте с искрой и электродугой не обугливаются. Полиэфирные волокна сравнительно атмосферостойки. Они растворяются в фенолах, частично (с разрушением) – в концентрированной серной и азотной кислотах; полностью разрушаются при кипячении в концентрированных щелочах. Обработка паром при 100 °C из-за частичного гидролиза полимера вызывает снижение прочности волокна (0.12% за 1 час). Полиэфирные волокна устойчивы к действию ацетона, четырёххлористого углерода, дихлорэтана и других растворителей, микроорганизмов, моли, плесени, коврового жучка. Устойчивость к истиранию и сопротивление многократным изгибам полиэфирных волокон ниже, чем у полиамидных

волокон, а ударная прочность выше. Прочность при растяжении полиэфирных волокон выше, чем у других типов химических волокон. Недостатки полиэфирных волокон – трудность крашения обычными методами, сильная электризуемость, склонность к пиллингу, жёсткость изделий – во многом устраняются химической модификацией полиэтилентерефталата, например, диметилизофталатом, диметиладипинатом (эти соединения вводят в реакционную смесь на стадии синтеза полиэтилентерефталата). Техническую нить из полиэфирных волокон используют при изготовления транспортёрных лент, приводных ремней, верёвок, канатов, парусов, рыболовных сетей и тралов, бензо- и нефтестойких шлангов, электроизоляционных и фильтровальных материалов, в качестве шинного корда. Полиэфирные волокна успешно применяют в медицине (синтетические кровеносные сосуды, хирургические нити). Из моноволокна делают сетки для бумагоделательных машин, щётки для хлопкоуборочных комбайнов, струны для ракеток и так далее. Текстильная нить идёт на изготовление трикотажа, тканей типа тафты, крепов и других. Методом 'ложной крутки' получают высокообъёмную пряжу типа Кримплен и Мэлан. Штапельное полиэфирное волокно применяют в смеси с шерстью, хлопком или льном. Из таких смесей вырабатывают костюмные, пальтовые, сорочечные, плательные ткани, гардинно-тюлевые изделия и другое. В чистом или смешанном виде полиэфирные волокна используют для производства искусственного меха, ковров. Войлок из полиэфирных волокон по важнейшим характеристикам превосходит войлок из натуральной шерсти. Торговые названия полиэфирных волокон:- Лавсан (СССР), Терилен^{ТЗ} (Terylene^{TM}, Великобритания), Дакрон$^{®}$ (Dacron$^{®}$, США), Тетерон^{ТЗ} (Tetoron^{TM}, Япония), Элана (Elana, ПНР), Тергаль (Tergal, Франция), Тесил (Tesil, ЧССР) и другие. Мировое производство полиэфирного волокна в 1973 составило около 3.2 миллиона тонн (т). Полиэстер или Полиэфирное Волокно – самое разнообразное из всех синтетических волокон. Полиэстер очень прочен, хорошо закрепляет форму при нагревании, благодаря чему у юбок из полиэфирной ткани хорошо держатся складки и плиссе. Полиэстер можно стирать при 40 °C в стиральной машине, некоторые полиэфирные волокна переносят даже 60 °C. При более высоком нагреве на ткани могут образоваться замятые складки, которые очень трудно удалить. Лавсан – торговое название полиэфирного волокна, выпускавшегося в бывшем Союзе Советских Социалистических Республик (СССР); то же, что Терилен^{ТЗ} (Terylene^{TM}, Великобритания), Дакрон$^{®}$ (Dacron$^{®}$, США), Тетерон^{ТЗ} (Tetoron^{TM}, Япония), Дайолэн (Diolen, ФРГ), Элана (Elana, ПНР), Тергаль (Tergal, Франция) и другие полиэтилентерефталатные волокна, различающиеся технологией производства.

POLYESTER MANUFACTURING = ИЗГОТОВЛЕНИЕ ПОЛИЭСТЕРА – Polyester Manufacturing:- polyester fibers, the synthetic fibers, are long chain polymers derived from coal, air, water, and petroleum. They are formed through chemical reaction between an acid and alcohol. In this reaction, two or more molecules combine to make a large molecule whose structure repeats throughout its length. These molecules are very stable and strong. There are variations in the compositions and therefore in the properties of polyester fibers. Types of Polyester:- the polyester fibers are generally available in two varieties- PET (polyethylene terephthalate) and PCDT (poly-1, 4-cyclohexylene-dimethylene terephthalate). PET is the most common production. It is stronger than PCDT, while PCDT has more elasticity and resilience. PET can be used alone or blended with other fabrics for making wrinkle free and stain resistant clothing that can retain its shape. PCDT is more suitable for heavier applications, such as draperies and furniture coverings. Modifications can be introduced in each of these varieties for obtaining specific properties. PET Polyester:- for manufacturing PET Polyester, the main raw material is ethylene derived from petroleum. It is oxidized to produce a glycol monomer dihydric alcohol which is further combined with another monomer, terephthalic acid at a high temperature in a vacuum. Polymerization, the chemical process that produces the finished polyester, is done with the help of catalysts. The colorless molten polyester then flows from a slot in a vessel on to a casting wheel and takes shape of a ribbon as it cools to hardness. The polymer thus produced is then cut into very small chips, dried to remove all moisture and blended to make it uniform for getting it ready for spinning into yarn. PCDT Polyester:- this variation of polyester is made by condensing terephthalic acid with 1, 4-cyclohexane-dimethanol to form poly-1, 4-cyclohexylene-dimethylene terephthalate or the PCDT Polyester. As for PET Polyester, PCDT is processed for melt spinning. Spinning:- polymer chips are melted at 500–518 °F (260–270 °C) to form a syrup-like solution. The molten polymer is then extruded through a spinneret and the filaments are subsequently drawn into the desired polyester fiber. Variations are introduced to obtain desired end results. Spinnerets having hole of different shapes such as round, trilobal, pentalobal, hexalobal or octalobal can be used for special effects like opacity, luster or its suppression, wicking, comfort or feel. Hollow fibers may be produced to make it lightweight and for providing greater cushioning or insulative properties. Crêpe effect can be obtained through crimps. Certain additives may also be combined with the spinning solutions for specific properties. Delusterant can be added to make the fiber dull, a flame retardant may be added or certain other antistatic substance may also be included. Drawing:- after extrusion from the spinneret, the fibers are drawn or elongated, with the help of godet wheels. Depending upon the desired properties, the polyester fibers are usually drawn up to five times its original length. For higher tenacity, the filaments are drawn to a greater extent. When the fibers come in contact with the air, they solidify. Usually, the PET fibers are drawn hot as it produces more uniform fibers. PCDT fibers are drawn at higher temperature due to their higher melting point. During the drawing process itself, fibers may be textured which saves time, efforts and production cost and also gives greater quality control over the finished fibers. After the polyester yarn is drawn, it is wound on large bobbins or flat-wound packages, ready to be woven into material. Types of Polyester Yarns:- the polyester yarns have a wide range of diameters and staple lengths. The yarns are made basically as monofilament yarns, multifilament yarns and spun yarns. Filament Yarns:- PET Polyester is used to make filament yarns either in monofilament or multifilament forms. The direction and amount of twists are decided by the desired end use. The properties are also pre-determined. There are various types of such yarns. There is the bright, regular tenacity polyester yarn having light, stretch and sag resistance, used for sheer lightweight fabrics like tulle, voile and organdy. The regular tenacity semi dull yarn used for various apparels including lingerie. Its more dull version is used for shirts and blouses. Polyester yarns resistant to various chemicals, and micro organisms are produced from high tenacity fibers for such industrial uses as conveyor belts, ropes and nets etc. Textured Yarns:- these yarns are made of PET multifilaments. Texturizing is either done along with the drawing process or afterwards during throwing or texturizing process. Spun Yarns:- they are made of staple or cut PET or PCDT polyester fibers. The staple may be bright, semi dull or dull and tenacity may be regular, mid or high. It may be polished to reduce crimp and increase luster. It may either be spun alone or blended with other staple such as cotton, wool or rayon and then spun into yarn. Application of Polyester:- polyester is used in manufacturing of many products, such as clothing, home furnishings, industrial fabrics, computer, recording tapes, and electrical insulation. It has several advantages over traditional fabrics as it does not absorb moisture. Its low absorbency also makes it naturally resistant to stains. Polyester clothing can be preshrunk in the finishing process. This makes it resist shrinking and it doesn't stretch out of shape. The fabric can be dyed easily, and is mildew resistant too. Textured polyester fibers are an effective, nonallergenic insulator, thus it is used for filling pillows, quilting, outerwear, and sleeping bags.

POLYESTER MONO YARN = ПОЛИЭСТЁРНАЯ МОНО ПРЯЖА – Polyester Mono Yarn or Mono Filament Yarn can be made by direct spinning or by splitting mother yarn. Due to its very good resistance to fuels and chemicals this type of monofilaments is mostly used in the production of filter fabrics for automotive use. Other features of this resin are high stiffness, high mechanical strength even at very low temperature, low water absorption and good dimensional stability at high temperatures. Polyester Mono Yarn is also known as Single Polyester Yarns, mother yarn for splitting. Mono filament yarn has soft touch and good physical properties. Polyester filament yarns is used in knitting and weaving to make design on frocks and home-textiles and making of webbings. A yarn containing the

categories and available in 20D/1 (D – Denier, and 1 – No. of Filament), 30D/1, 40D/1, 50D/1 for both Raw white and dope dyed monofilaments. Mono yarn has variations as Semi Dull (SD), Bright (BR), Dope Dyed Mono filaments. The Mono Filament yarns have high durability, toughness and chemical resistance.

POLYESTER SPUN YARN = ПОЛИЭСТЁРНАЯ СПРЯДЕННАЯ ПРЯЖА – Polyester Spun Yarn (PSY) is available in counts like NE 20/1, 30/1, etc. It is mainly used for knitting and weaving to make polyester fabrics such as consumer fabrics and home furnishings. Spun yarn is also used in making sewing thread and embroidery threads. Polyester spun yarn can be Virgin made from Virgin Polyester Staple Fiber or Recycled Spun yarn made from Recycled Polyester Staple Fiber (PSF). Spun Yarn can bewaxed which is used for knitting fabrics or un-waxed mainly used for weaving. PSY is commonly available in both single and double ply for use in Textile industry. It can be raw-white and dyed as well. Both dope-dyed spun yarn and conventional dyed spun yarn can be used to make fabrics. Spun yarn is also available with different levels of twist. 32 TPI (or 1 200 TPM) and 38 TPI (or 1 500 TPM) are the common twist for spun yarn. Twisted spun yarn has more strength and tenacity as compared to the normal twist spun yarns. We can supply you the best quality Virgin and Recycled Polyester spun yarns from manufacturers and suppliers in India, China, Taiwan, Indonesia, Vietnam, Malaysia and South Korea.

POLYESTER STAPLE FIBER = СЛОЖНОЕ ПОЛИЭФИРНОЕ ШТАПЕЛЬНОЕ ВОЛОКНО (или ПОЛИЭСТЁРНОЕ ШТАПЕЛЬНОЕ ВОЛОКНО) – Polyester Staple Fiber:- high quality of polyester staple fiber for spinning by taking full advantage of advanced spinning technology. Directly – spinning with large capacity of single line. Best oil and technology, being used for wide in spinning and non-woven. Advantages:- (i) low defect rate; (ii) high breaking tenacity; (iii) excellent dyeability; and (iv) excellent spinnability. Usage:- (i) for spinning, Cotton/Wool type; (ii) needing punch process; and (iii) for wiper, wet tissue, medical nonwoven, interlining etc, artificial leather substrate etc. Specification:- (i) Denier:- 0.9/ 1.1/ 1.2/ 1.33/ 1.4/ 1.5/ 2D; and (ii) Length:- 38 / 51 / 64 mm; 3 / 6 / 9 / 12 mm (for paper making or building, road etc. Polyester Staple Fiber (PSF) is kind of Polyester Fiber made directly from PTA and MEG or PET Chips or from Recycled PET Bottle Flakes. PSF made from purified terephthalic acid (PTA) and monoethylene glycol (MEG) or polyethylene terphthalate (PET) Chips is known as Virgin PSF and PSF made from Recycled PET Flakes is called Recycled PSF. 100% virgin PSF is usually costly than recycled PSF and is also more hygienic. Polyester Staple Fiber is widely used in spinning, weaving non-woven. PSF is mainly used for fiber fillings in pillows and sofa. It is also used widely in spinning to make Polyester Spun Yarn which is then knitted or weaved into fabrics. PSF is mainly classified as Solid and Hollow Polyester staple fiber. Hollow PSF can also have some properties like Conjugated, Siliconized, Slick and Dry PSF. These properties are usually represented as HSC (Hollow Conjugated Siliconized), HCNS (Hollow Conjugate Non-Siliconized) or Slick PSF that has a smooth finish. Depending on the lustre, PSF can be classified as Semi Dull (SD) and Bright (BR). By mixing color master-batch, dope dyed PSF can also be obtained in Optical White, Black and several colors. Polyester Staple Fiber is available in different Deniers with different cut-lengths. It is mainly available in 1.4D, 1.5D, 3D, 6D, 7D, 15D and cut lengths like 32 mm, 38 mm, 44 mm, 64 mm, and up to 128 mm. PSF is mainly produced in India, China, Taiwna, Indonesia, Vietnam, Malaysia, and South Korea.

POLYESTER THREAD = ПОЛИЭСТЁРНАЯ НИТЬ (или НИТЬ ИЗ СЛОЖНОГО ПОЛИЭФИРА) – Polyester Thread is a thread made of 100% polyester. Polyester thread has more give than most natural fiber threads and is used extensively for sewing man-made fiber fabrics, especially knits. It can be used on almost any fabric. Polyester thread is strong, but tends to knot easily.

POLYESTER–WOOL FIBER BLENDS DYEING = КРАШЕНИЕ СМЕСЕЙ СЛОЖНОГО ПОЛИЭФИРНОГО ВОЛОКНА И ШЕРСТИ – Polyester-Wool Fiber Blends Dyeing:- polyester-wool blends are widely used, especially for woven goods and knitwear. The most frequently found ratio is 55:45 PES: wool. Wool cannot be dyed at the high temperatures typical of the HT dyeing process for PES fibers and PES-cellulose blends. The dyeing time should also be as short as possible so that the wool is not damaged. For large productions it is therefore preferable to dye wool and PES separately in top, blending the two fibers at the yarn manufacturing stage. However, quick changes in fashion and short-term planning frequently do not allow separate dyeing. When dyeing polyester-wool blends, disperse dyes are used for polyester and anionic (acid and metal-complex dyes) for wool. Only disperse dyes that stain wool as slightly as possible or are easily removed by washing can be used for dyeing wool-polyester blends. Disperse dyes, in fact, tend to stain wool and a reductive after-treatment is not always possible (appropriately stable dyes are required). PES-wool blends are typically dyed according to the following batch processes:- (i) at boiling temperature with carriers; (ii) at 103–106 °C with little carrier; and (iii) at 110–120 °C with the addition of formaldehyde as a wool protective agent and with low amounts of carriers or none at all (HT conditions). Because of the environmental concerns associated with the use of carriers, the first dyeing technique is avoided when possible. In this respect, carrier-free dyeable fibers are also available, which can be dyed at boiling temperature without the use of carriers. The one-bath process method is preferred in practice; the two-bath process is applied when deep shades and high fastness are required. The material is first dyed with disperse dyes. A reductive intermediate treatment may be applied before dyeing the wool part. In both dyeing methods, after dyeing, an after-treatment is applied to remove any disperse dye attached to the wool, if the dye used for wool can withstand it. The material is treated with ethoxylated fatty amine in weakly acid liquor at 60 °C.

POLYETHERETHERKETONE FIBER = ПОЛИЭФИРЭФИРКЕТОНОВОЕ ВОЛОКНО (или ПОЛИЭФИРСПИРТОКЕТОНОВОЕ ВОЛОКНО) – Polyetheretherketone (PEEK) Fiber is a manufactured fiber from polyetheretherketone polymer with high temperature and chemical resistance used in composites as a matrix material and in other industrial applications.

POLYETHERIMIDE FIBER = ПОЛИЭТЕРИМИДНОЕ ВОЛОКНО (или ПОЛИЭФИРИМИДНОЕ ВОЛОКНО) – Polyetherimide Fiber:- the high-performance Ultem polyetherimide (PEI) fiber manufactured by Sabic Innovative Plastics Holding BV (Bergen op Zoom, The Netherlands), can also be used in high-end work wear and protective clothing. Japan Wool Textile Co. Ltd (Osaka, Japan) is now blending Ultem fiber with wool and other materials to produce yarn, fabrics and garments that offer a unique combination of comfort and protection, including permanent, non-halogenated flame-retardance (FR) and excellent ultraviolet (UV) resistance. Unlike traditional aramid materials, Ultem fiber can be easily and cost-effectively colored in a wide range of shades using conventional polyester dyeing processes. This material offers high heat-resistance meeting the European Union (EU) EN 531/ISO 11612 and US National Fire and Protection Association (NFPA) 2112 standards, and provides low smoke and toxicity performance. Polyetherimide (PEI) Fiber is a manufactured fiber spun from polyetherimide polymer having high temperature resistance, excellent processibility, and toughness. Used for matrix materials in composites and in other industrial applications. / от Греческого слова Aithēr, означающее Эфир, . Сэбик Инэвэтив Пластик Холдинь Бэй.Фэй. (Sabic Innovative Plastics Holding BV). Дьжапэн Вул Тэкстайл Ко. Лтд (Japan Wool Textile Co. Ltd).

POLYETHERSULFONE FIBER = ПОЛИЭФИРСУЛЬФОНОВОЕ ВОЛОКНО – Polyethersulfone (PES) Fiber:- high molecular weight fibers from polymers containing sulfone (–SO_2–) groups and aromatic nuclei. They demonstrate high thermal stability and chemical inertness.

POLYETHYLENE = ПОЛИЭТИЛЕН – Polyethylene was first synthesized by the German chemist Hans von Pechmann who prepared it by accident in 1898 while heating diazomethane. When his colleagues Eugen Bamberger and Friedrich Tschirner characterized the white, waxy, substance that he had created they recognized that it contained long –CH_2– chains and termed it polymethylene. The first

industrially practical polyethylene synthesis was discovered (again by accident) in 1933 by Eric Fawcett and Reginald Gibson at the ICI works in Northwich, England. Upon applying extremely high pressure (several hundred atmospheres) to a mixture of ethylene and benzaldehyde they again produced a white, waxy, material. Because the reaction had been initiated by trace oxygen contamination in their apparatus the experiment was, at first, difficult to reproduce. It was not until 1935 that another ICI (short for Imperial Chemical Industries; it was a British chemical company, now a subsidiary of AkzoNobel, a Dutch conglomerate, one of the largest chemical producers in the world) chemist, Michael Perrin, developed this accident into a reproducible high-pressure synthesis for polyethylene that became the basis for industrial LDPE production beginning in 1939. Subsequent landmarks in polyethylene synthesis have revolved around the development of several types of catalyst that promote ethylene polymerization at more mild temperatures and pressures. The first of these was a chromium trioxide-based catalyst discovered in 1951 by Robert Banks and J. Paul Hogan at Phillips Petroleum. In 1953 the German chemist Karl Ziegler developed a catalytic system based on titanium halides and organoaluminium compounds that worked at even milder conditions than the Phillips catalyst. The Phillips catalyst is less expensive and easier to work with, however, and both methods are used in industrial practice. By the end of the 1950s both the Phillips- and Ziegler-type catalysts were being used for HDPE production. Phillips initially had difficulties producing a HDPE product of uniform quality and filled warehouses with off-specification plastic. However, financial ruin was unexpectedly averted in 1957 when the hula hoop, a toy consisting of a circular polyethylene tube, became a fad among youth in the United States. A third type of catalytic system, one based on metallocenes, was discovered in 1976 in Germany by Walter Kaminsky and Hansjörg Sinn. The Ziegler and metallocene catalyst families have since proven to be very flexible at copolymerizing ethylene with other olefins and have become the basis for the wide range of polyethylene resins available today, including very low-density polyethylene and linear low-density polyethylene. Such resins, in the form of fibers like Dyneema®, have (as of 2005) begun to replace aramids in many high-strength applications. Until recently the metallocenes were the most active single-site catalysts for ethylene polymerisation known – new catalysts are typically compared to zirconocene dichloride. Much effort is currently being exerted on developing new, single-site (so-called Post-Metallocene) catalysts that may allow greater tuning of the polymer structure than is possible with metallocenes. Recently work by Fujita at the Mitsui corporation (amongst others) has demonstrated that certain salicylaldimine complexes of Group 4 metals show substantially higher activity than the metallocenes. Polyethylene is a synthetic ‘olefin’ polymer (plastic). Polyethylene, particularly high-density polyethylene (HDPE), is a good choice for containers for many dyeing processes. It has good chemical resistance, but generally should not be subjected to boiling water (see Polypropylene for an alternative). A great deal of the commercial packaging for household chemicals and food products is made from polyethylene. Some fabric sizing compounds and softening compounds are polyethylene derivatives. Polyethylene or Polythene (IUPAC (short for the International Union of Pure and Applied Chemistry, Zürich, Switzerland) name polyethene or poly(methylene)) is the most widely used plastic, with an annual production of approximately 80 million metric tons. Its primary use is within packaging (notably the plastic shopping bag). Polyethylene is a thermoplastic polymer consisting of long chains of the monomer ethylene (IUPAC name ethene). The recommended scientific name polyethene is systematically derived from the scientific name of the monomer. In certain circumstances it is useful to use a structure-based nomenclature; in such cases IUPAC recommends poly(methylene) (poly(methanediyl) is an non-preferred alternative). The difference in names between the two systems is due to the opening up of the monomer’s double bond upon polymerization. The name is abbreviated to PE in a manner similar to that by which other polymers like polypropylene and polystyrene are shortened to PP and PS respectively. In the United Kingdom the polymer is commonly called Polythene, although this is not recognized scientifically. Polyethylene contains the chemical elements carbon and hydrogen. Polyethylene is created through polymerization of ethene. It can be produced through radical polymerization, anionic addition polymerization, ion coordination polymerization or cationic addition polymerization. This is because ethene does not have any substituent groups that influence the stability of the propagation head of the polymer. Each of these methods results in a different type of polyethylene. Polyethylene is classified into several different categories based mostly on its density and branching. The mechanical properties of PE depend significantly on variables such as the extent and type of branching, the crystal structure and the molecular weight. With regard to sold volumes, the most important polyethylene grades are HDPE, LLDPE and LDPE. All polyethylene grades are:- cross-linked polyethylene (PEX or XLPE), high density cross-linked polyethylene (HDXLPE), high density polyethylene (HDPE), high molecular weight polyethylene (HMWPE), linear low density polyethylene (LLDPE), low density polyethylene (LDPE), medium density polyethylene (MDPE), ultra high molecular weight polyethylene (UHMWPE), ultra low molecular weight polyethylene (ULMWPE or PE-WAX), and very low density polyethylene (VLDPE). / Немецкий химик Ханс фон Пэшман (Hans von Pechmann). Под Полиэтиленом, $(–CH_2–CH_2–)_n$, понимается синтетический полимер, продукт полимеризации этилена; твёрдое вещество белого цвета. Плотность 913–978 кг/м^3; плавится при 102–137 °C. Сочетает высокую прочность при растяжении с эластичностью, хороший диэлектрик, устойчив к растворам щёлочей, к соляной, плавиковой и органическим кислотам, стоек к действию радиоактивных излучений. Физиологически безвреден. Разрушается хлором и фтором; выше 80 °C растворяется в углеводородах, в том числе хлорированных. Применяется в производстве ёмкостей, плёнок, технических волокон, труб для агрессивных жидкостей, для изоляции кабелей и многого другого. По объёму мирового производства (на 1980 около 16 000 000 тонн в год) занимает среди полимеризационных полимеров 1-е место. Полиэтилен $(–CH_2–CH_2–)n$, термопластичный полимер белого цвета. В промышленности его получают полимеризацией этилена при высоком давлении (полиэтилен низкой плотности) и низком или среднем давлении (полиэтилен высокой плотности). Структура и свойства полиэтилена определяются способом его получения. Среднемассовая молекулярная масса наиболее распространённых марок 30–800 000; степень кристалличности и плотность при 20 °C составляют соответственно 50% и 0.918–0.930 грамма на кубический сантиметр (г/см^3) для полиэтилена низкой плотности и 75–90% и 0.955–0.968 г/см^3 для полиэтилена высокой плотности. С увеличением плотности возрастают твёрдость, модуль упругости при изгибе, предел текучести, химическая стойкость. Полиэтилен сочетает высокую прочность при растяжении (10–45 МегаНьютонов на квадратный метр (МН/м^2), или 100–450 килограмм-силы на квадратный сантиметр (кгс/см^2)) с эластичностью (относительное удлинение при разрыве 500–1 000%). Он обладает хорошими электроизоляционными свойствами (например, тангенс угла диэлектрических потерь $2\cdot10^{-4}$–$4\cdot10^{-4}$ при температурах от –120 до 120 °C и частоте 10–50 килоГерц (кГц)). Устойчив к действию щёлочей любых концентраций, органических кислот, концентрированных соляной и плавиковой кислот; разрушается азотной кислотой, хлором и фтором; выше 80 °C растворяется в алифатических и ароматических углеводородах и их галогенопроизводных; сравнительно стоек к радиоактивным излучениям; безвреден; интервал рабочих температур от –80 – –120 до 60–100 °C. Полиэтилен – один из самых дешёвых полимеров, сочетающий ценные свойства со способностью перерабатываться всеми известными для термопластов высокопроизводительными методами (смотрите Пластические Массы). Поэтому в мировом производстве полимеризационных

пластиков полиэтилен занимает первое место (смотрите Полиолефины). Из полиэтилена изготовляют плёнки, трубы (в том числе для сточных вод и агрессивных жидкостей, магистральные трубопроводы), профилированные изделия, изоляцию для проводов и кабеля, ёмкости (бутыли, канистры, цистерны), гальванические ванны, санитарно-технические изделия, волокна и другое, широко применяемые в различных отраслях техники, сельском хозяйстве и в быту. Наибольшее распространение получил полиэтилен низкой плотности. Большое техническое значение имеют также продукты хлорирования и хлорсульфирования полиэтилена. Полиэтилен выпускали в бывшем Союзе Советских Социалистических Республик (СССР) (полиэтилен высокой плотности, или низкого давления, и полиэтилен низкой плотности, или высокого давления) и за рубежом:- полиэтилен высокой плотности (high density polyethylene (HDPE)) – в Соединённых Штатах Америки (США) (Марлэкс® (Marlex®)), ФРГ (Хосталин (Hostalen), Вэштолин или Вестолин (Westolen)), Японии (Хай-Секс), Италии (Эльтэкс® (Eltex®)); полиэтилен низкой плотности (low density polyethylene (LDPE)) – в США (Бэйкэлайт (Bakelite), Aladon (Аладон)), Великобритании (Alkaten (Алкатен)), ФРГ (Люполин (Lupolen)). Мировое производство полиэтилена в 1973 составило около 10 миллионов тонн (т).

POLYETHYLENE FIBER = ПОЛИЭТИЛЕНОВОЕ ВОЛОКНО – Polyethylene Fiber is a manufactured fiber made of polyethylene, often in monofilament form as well as continuous filament yarns and staple. Ethylene is polymerized at high pressures and the resulting polymer is melt spun and cold drawn. It may also be dry-spun from xylene solution. Characteristics:- polyethylene fibers have a low specific gravity, extremely low moisture regain, the same tensile strength wet and dry, and are resistant to attack by mildew and insects. These qualities have made polyethylene fiber suitable for industrial applications, geotextiles, outdoor furniture, and similar applications. Polyethylene fiber does not dye, and in most cases, it is colored by the addition of pigments and dyes to the material prior to spinning. It has a low melting point, a property that has restricted its use in apparel. Polyethylene is a synthetic fiber composed of linear macromolecules of unsubstituted saturated aliphatic hydrocarbons. Alphabetic code – PE; and relevant commercial allowance – 1.50 (refers to European Union Directives on Textile Labelling). Polyethylene Fiber:- Spectra, the latest in the line of modeller materials, is the lightest material so far with a density of 0.97 g/cm^3 less than water. It is a long chain polythene chain molecule with a high impact resistance and the highest strength to weight ratio so far. Like aramid fiber it has the drawback of fuzzing when worked on. I have used it and like the idea of using it – but working is problematical as I say. Surprisingly little used. Spectra is the US name, in Europe it's called Dyneema®. If you're into fishing or kite flying you will have come across these two fibers already. Polyethylene Fiber is a manufactured fiber made of polymerized polyethylene units, often in monofilament form as well as in filament form. The fibers have low specific gravity, very low retention of moisture, the same tensile weight wet or dry, are resistant to mildew and insects. / филаментная (комплексная) пряжа (filament yarn). мононить (monofilament). влагопоглощательная способность (moisture regain). Спэктчра (Spectra), Дайнима (Dyneema®). Полиэтиленовое Волокно – синтетическое волокно, формуемое из расплава полиэтилена. Промышленное использование имеют сверхпрочные полиэтиленовые нити на основе сверхвысокомолекулярного полиэтилена, полученные с высокими кратностями вытягивания и термостабилизированные. Используются главным образом для технических целей; имеют следующие названия:- спектра, дайнема, текмилон.

POLYETHYLENE GLYCOL = ПОЛИЭТИЛЕН ГЛИКОЛЬ – Polyethylene Glycol (PEG) is a chemical which promotes the fusion between protoplasts and plasmid.

POLYETHYLENE TEREPHTHALATE = ПОЛИЭТИЛЕНТЕРЕФТАЛАТ – Polyethylene Terephthalate, the most common form of polyester. / Полиэтилентерефталат является наиболее распротранённой формой полиэфира. Полиэтилентерефталат, [–$(CH_2)_2O(CO)C_6H_4(CO)O$–]$_n$, синтетический полимер, продукт поликонденсации этиленгликоля с терефталевой кислотой; твёрдое бесцветное вещество. Плотность 1 380–1 400 кг/м^3, плавится при 255–265 °С. Прочен, износостоек, хороший диэлектрик. Устойчив к действию ацетона, ксилола, ледяной уксусной кислоты, этилацетата и другому; растворяется в фенолах; выше 100 °С разрушается концентрированными растворами аммиака и щёлочей. Применяется главным образом в производстве полиэфирного волокна, а также пластиковых бутылок, плёнок, радиодеталей, химического оборудования и другого. Полиэтилентерефталат, сложный полиэфир, получаемый поликонденсацией терефталевой кислоты (или её диметилового эфира) с этиленгликолем. Полиэтилентерефталат – твёрдое вещество белого цвета без запаха, молекулярная масса 20–40 000, максимальная степень кристалличности неориентированного полиэтилентерефталата 40–45%, ориентированного 60–65%, плотность 1.38–1.40 граммов на кубический сантиметр (г/см^3) (20 °С), $t_{пл}$ 255–265 °С, $t_{размягч.}$ 245–248 °С. Полиэтилентерефталат не растворяется в воде и органических растворителях; сравнительно устойчив к действию разбавленных растворов кислот (например, 70%-ной H_2SO_4, 5%-ной HCl, 30%-ной CH_3COOH), холодных растворов щёлочей и отбеливающих агентов (например, гипохлорита натрия, перекиси водорода). При температурах выше 100 °С полиэтилентерефталат гидролизуется растворами щёлочей, а при 200 °С – даже водой. Полиэтилентерефталат характеризуется высокой прочностью, устойчивостью к истиранию и многократным деформациям при растяжении и изгибе, низкой гигроскопичностью (влагосодержание 0.4–0.5 при 20 °С и 60%-ной относительной влажности); диапазон рабочих температур от –60 до 170 °С. Полиэтилентерефталат – хороший диэлектрик (тангенс угла диэлектрических потерь при 1 МегаГерце (МГц) 0.013–0.015); сравнительно устойчив к действию световых, Рентгеновских, g-лучей. Полиэтилентерефталат перерабатывают главным образом в волокна (смотрите Полиэфирные Волокна), плёнки, а также литьём в различные изделия (радиодетали, химическое оборудование и другое). Мировое производство полиэтилентерефталата в 1973 составило около 3.5 миллиона тонн (т).

POLYGENES = ПОЛИГЕНЫ – Polygenes are numerous genes contributing equally toward a given phenotypic effect as found in the continuous variation of many quantitative traits, each having small and equal effects; mainly additive and subject to environmental influence. / Под Полигенами, от Греческих слов Polýs, означающее Многий или Многочисленный или Обширный, и Génos, означающее Происхождение или Род, понимаются неаллельные гены, влияющие на проявление количественных признаков, например, жирномолочности, удоя.

POLYGENIC RESISTANCE = ПОЛИГЕННАЯ РЕЗИСТЕНТНОСТЬ (или ПОЛИГЕННАЯ СОПРОТИВЛЯЕМОСТЬ, или ПОЛИГЕННАЯ УСТОЙЧИВОСТЬ) – Polygenic Resistance is a resistance governed by many genes. Minor gene resistance.

POLYGLYCOLS = ПОЛИГЛИКОЛИ – Polyglycols are the polymers of ethylene or propylene oxides used as a synthetic lubricant base. Properties include very good hydrolytic stability, high viscosity index (VI), and low volatility. Used particularly in water emulsion fluids.

POLYIMIDE = ПОЛИИМИД – Polyimide (sometimes abbreviated PI) is a polymer of imide monomers. The structure of imide is as shown. Polyimides have been in mass production since 1955. Typical monomers include pyromellitic dianhydride and 4,4'-oxydianiline. According to the composition of their main chain, polyimides can be:- (i) aliphatic (linear polyimides), (ii) semi-aromatic, and (iii) aromatic (R' and R" are two carbon atoms of an aromatic ring. These are the most used polyimides because of their thermostability). According to the type of interactions between the main chains, polyimides can be:- (i) thermoplastic (very often called Pseudothermoplastic) and (ii) thermosetting (commercially available as uncured resins, polyimide solutions, stock shapes, thin sheets,

laminates and machined parts). Several methods are possible to prepare polyimides, among them:- (i) the reaction between a dianhydride and a diamine (the most used method); and (ii) the reaction between a dianhydride and a diisocyanate. Thermosetting polyimides are known for thermal stability, good chemical resistance, excellent mechanical properties, and characteristic orange/yellow color. Polyimides compounded with graphite or glass fiber reinforcements have flexural strengths of up to 50 000 psi (345 MPa) and flexural moduli of 3 million psi (20 684 MPa). Thermoset polyimides exhibit very low creep and high tensile strength. These properties are maintained during continuous use to temperatures of 450 °F (232 °C) and for short excursions, as high as 900 °F (482 °C). Molded polyimide parts and laminates have very good heat resistance. Normal operating temperatures for such parts and laminates range from cryogenic to those exceeding 500 °F (260 °C). Polyimides are also inherently resistant to flame combustion and do not usually need to be mixed with flame retardants. Most carry a UL rating of VTM-0. Polyimide laminates have a flexural strength half life at 480 °F (249 °C) of 400 hours. Typical polyimide parts are not affected by commonly used solvents and oils – including hydrocarbons, esters, ethers, alcohols and freons. They also resist weak acids but are not recommended for use in environments that contain alkalis or inorganic acids. Some polyimides, such as CP1 and CORIN XLS, are solvent-soluble and exhibit high optical clarity. The solubility properties lend them towards spray and low temperature cure applications. The polyimide materials are lightweight, flexible, resistant to heat and chemicals. Therefore, they are used in the electronics industry for flexible cables, as an insulating film on magnet wire and for medical tubing. For example, in a laptop computer, the cable that connects the main logic board to the display (which must flex every time the laptop is opened or closed) is often a polyimide base with copper conductors. Examples of polyimide films include Apical, Kapton, Upilex®, VTEC™ Polyimide (PI), Norton TH and Kaptrex. The semiconductor industry uses polyimide as a high-temperature adhesive; it is also used as a mechanical stress buffer. Some polyimide can be used like a photoresist; both ‘positive’ and ‘negative’ types of photoresist-like polyimide exist in the market. An additional use of polyimide resin is as an insulating and passivation layer in the manufacture of digital semiconductor and MEMS (microelectromechanical systems) chips. The polyimide layers have good mechanical elongation and tensile strength, which also helps the adhesion between the polyimide layers or between polyimide layer and deposited metal layer. The minimum interaction between the gold film and the polyimide film, coupled with high temperature stability of the polyimide film, results in a system that provides reliable insulation when subjected to various types of environmental stresses. Polyimide powder can be used to produce parts and shapes by sintering technologies (Hot compression moulding, Direct forming, Isostatic pressing). Because of their high mechanical stability even at elevated temperatures they are used as bushings, bearings, sockets or constructive parts in demanding applications. To improve tribological properties compounds with solid lubricants like graphite, PTFE or molybdenum sulfide are common. Polyimide parts and shapes include P84 NT, VTEC PI, Meldin, Vespel and Plavis. In coal fired power plants, waste incinerators or cement plants, Polyimide fibers are used in hot gas filtration. A Polyimide needle felt separates dust and particulate matter from the exhaust gas. / Щёлочь (Alkali). Полиимиды – синтетические полимеры, содержащие в макромолекуле циклическую имидную группу; образуются при поликонденсации тетракарбоновых кислот или их производных с диаминами или диизоцианатами. Твёрдые вещества белого или жёлтого цвета. Наиболее важный полиимид – поли-4.4’ – дифениленоксидпиромеллитимид – термо- и радиационностойкий материал с хорошими электроизоляционными свойствами. Из него получают пластмассы, изоляционные плёнки для электродвигателей и конденсаторов, лаки для изоляции проводов, клеи, волокна, используемые главным образом в авиации и космической технике. Полиимиды, полимеры, содержащие в основной или боковой цепи молекулы циклическую имидную группу. Практическое значение получили ароматические линейные полиимиды с имидными циклами в основной цепи благодаря ценным физико-химическим свойствам, не изменяющимся длительное время в широком интервале температур (от –270 до +300 °C). Полиимиды – твёрдые термостойкие, негорючие вещества, преимущественно аморфной структуры; молекулярная масса 50–150 000; плотность 1.35–1.48 грамма на кубический сантиметр (г/см3) (20 °C). Большинство из них не растворяется в органических растворителях, инертно к действию масел, почти не изменяется при действии разбавленных кислот, однако гидролизуется под влиянием щёлочей и перегретого пара. Полиимиды устойчивы к действию озона, g-лучей, быстрых электронов и нейтронов, весьма теплостойки. Так, наиболее промышленно ценные полипиромеллитимиды не размягчаются вплоть до начала термического разложения (500–520 °C) и выдерживают при 300 °C напряжение 50 МегаНьютонов на квадратный метр (МН/м2), или 500 килограмм-силы на квадратный сантиметр (кгс/см2), прочность при растяжении при 20 °C 180 МН/м2, или 1 800 кгс/см2; температура длительной эксплуатации 250–300 °C. Полиимиды получают главным образом поликонденсацией тетракарбоновых кислот и их производных (в основном диангидридов – чаще всего пиромеллитовой кислоты и 3,3’, 4,4”-бензофенонтетракарбоновой кислоты) и диаминов (например, 4,4”-диаминодифенилоксида и м-фенилендиамина) в одну или две стадии. Обычно сначала получают высокомолекулярные растворимые полиамидокислоты, из них формуют изделия (плёнки, волокна), которые и подвергают термической обработке; полиимиды перерабатывают также прессованием (смотрите Пластические Массы). Из полиимидов изготовляют монолитные изделия, электроизоляционные плёнки, проволочную и кабельную изоляцию, связующие для армированных пластиков, клеи, пластмассы, пенопласты, волокна; применяются в авиации и космической технике. Из полиимидов в бывшем Союзе Советских Социалистических Республик (СССР) производили:- лак ПАК-1, плёнку ПМ, пресс-материал ДФО, стеклопластик СТП-1, клей СП-1, волокно аримид; в Соединённых Штатах Америки (США) – плёнку каптон Н, веспел, М-33 и другое.

POLYIMIDE FIBER = ПОЛИИМИДНОЕ ВОЛОКНО – Polyimide Fiber is fully imidized, manufactured fiber formed from the condensation polymer of an aromatic dianhydride and an aromatic diisocyanate. The fiber is produced by dry spinning. It is a high-shrinkage fiber used in the formation of mechanically stable nonwoven fabrics. These fabrics are made without binders or resins; bonding apparently results from the local temperature and pressure that develop during shrinkage. See also Polyimide. Polyimide is a synthetic fiber of synthetic linear macromolecules having in the chain recurring imide units. Alphabetic code – PI; and relevant commercial allowance – 3.50 (refers to European Union Directives on Textile Labelling).

POLYLACTIDE = ПОЛИЛАКТИД – Polylactide is a synthetic fiber formed of linear macromolecules having in the chain at least 85% (by mass) of lactic acid ester units derived from naturally occurring sugars, and which has a melting temperature of at least 135 °C. Alphabetic code – PLA; and relevant commercial allowance – 1.50 (refers to European Union Directives on Textile Labelling). In February 2005, the new textile fiber ‘Polylactid’ was included in Subsection 1 of the Textile Labeling Laws (Textilkennzeichnungsgesetz (TKG) – German Textile Labeling Act) in the European Union and in the United States (designation of textile raw materials). The new synthetic fiber, based on renewable raw materials, is already available on the market under the trade name ‘Ingeo’. In the United States, the generic name ‘PLA’ is used (globally consistent generic names would surely be more sensible!). / Тэкстилькенцайхнунгсгэзэтц (Тэ.Ка.Ге.; Textilkennzeichnungsgesetz (TKG) – Немецкий Акт об Этикетировании Текстильной Продукции.

POLYMER = ПОЛИМЕР – Polymer is a high molecular weight, chain-like structure from which manufactured fibers are derived; produced by linking together molecular units called Monomers. Polymer is a substance formed by the linkage (polymerization) of two or more simple, molecules, called Monomers, to form a single larger molecule having the same elements in the same proportions as the original monomers; i.e. each monomer retains its structural identity. A polymer may be liquid or solid; solid polymers may consist of millions of repeated linked units. A polymer made from two or more similar monomers is called a Copolymer; a copolymer composed of

three different types of monomers is a terpolymer. Natural rubber and synthetic rubbers are examples of polymers. Polymers are commonly used as viscosity index improvers in multi-grade oils and tackifiers in lubricating greases. Polymer is a high molecular weight structure, which makes up the substance from which manufactured fibers are produced. The fiber is created by linking together the chain-like molecular units called Monomers. Polymer is a chemical in which molecules are made up of a large number of smaller repeating units. Some examples include natural polymers such starches and cellulose, which are made up of glucose-like units and synthetic polymers, such as polyethylene made up of ethylene (a gas) units. Chemical formulas are often expressed as $(monomer)_n$, where monomer is the repeating unit and the subscript n is the number of repetitions of the monomer. A starch might be written as $(C_6H_{10}O_5)_{2000}$, meaning that it is made up of 2 000 joined $C_6H_{10}O_5$ units. N is rarely an exact number. Polymer the chemical solution from which man-made fibers are spun. Polymer is a natural or synthetic chemical compound of high molecular weight consisting of long chain of repeating structural units of smaller molecular weight which may be identical or different. / Под Полимерами, от Греческого слова Polymerēs, означающее Многообразный или Состоящий Из Многих Частей, от Греческих слов Polý, означающее Много, и Méros, означащее Доля или Часть, понимаются вещества, молекулы которых (макромолекулы) состоят из большого числа повторяющихся звеньев. Молекулярная масса полимеров может изменяться от нескольких тысяч до многих миллионов. По происхождению полимеры делят на природные, или биополимеры (например, белки, нуклеиновые кислоты, натуральный каучук), и синтетические (например, полиамиды, полиэтилен, эпоксидные смолы), получаемые методами полимеризации и поликонденсации. По форме молекул различают линейные, разветвлённые и сетчатые полимеры. Для линейных и разветвлённых полимеров характерен комплекс специфических свойств, например, способность образовывать анизотропные волокна и плёнки, а также существовать в высокоэластичном состоянии. Полимеры – основа пластмасс, химических волокон, резины, лакокрасочных материалов, клеёв, ионитов. Из биополимеров построены клетки всех живых организмов. Термин Полимер был введён в обращение в 1833 Шведским химиком и минералогом Ёнсом Якобом Бэрсэлиусом (Jöns Jakob Berzelius; 1779–1848). Полимеры – химические соединения с высокой молекулярной массой (от нескольких тысяч до многих миллионов), молекулы которых (макромолекулы) состоят из большого числа повторяющихся группировок (мономерных звеньев). Атомы, входящие в состав макромолекул, соединены друг с другом силами главных и (или) координационных валентностей. Классификация:- по происхождению полимеры делятся на природные (биополимеры), например, белки, нуклеиновые кислоты, смолы природные, и синтетические, например, полиэтилен, полипропилен, феноло-формальдегидные смолы. Атомы или атомные группы могут располагаться в макромолекуле в виде:- открытой цепи или вытянутой в линию последовательности циклов (Линейные Полимеры, например, каучук натуральный); цепи с разветвлением (Разветвлённые Полимеры, например, амилопектин); трёхмерной сетки (Сшитые Полимеры, например, отверждённые эпоксидные смолы). Полимеры, молекулы которых состоят из одинаковых мономерных звеньев, называются Гомополимерами, например, поливинилхлорид, поликапроамид, целлюлоза. Макромолекулы одного и того же химического состава могут быть построены из звеньев различной пространственной конфигурации. Если макромолекулы состоят из одинаковых стереоизомеров или из различных стереоизомеров, чередующихся в цепи в определённой периодичности, полимеры называются Стереорегулярными Полимерами (смотрите Стереорегулярные Полимеры). Полимеры, макромолекулы которых содержат несколько типов мономерных звеньев, называются Сополимерами. Сополимеры, в которых звенья каждого типа образуют достаточно длинные непрерывные последовательности, сменяющие друг друга в пределах макромолекулы, называются Блоксополимерами. К внутренним (неконцевым) звеньям макромолекулы одного химического строения могут быть присоединены одна или несколько цепей другого строения. Такие сополимеры называются Привитыми Сополимерами (смотрите также Сополимеры). Полимеры, в которых каждый или некоторые стереоизомеры звена образуют достаточно длинные непрерывные последовательности, сменяющие друг друга в пределах одной макромолекулы, называются Стереоблоксополимерами. В зависимости от состава основной (главной) цепи полимеры делят на:- Гетероцепные Полимеры, в основной цепи которых содержатся атомы различных элементов, чаще всего углерода, азота, кремния, фосфора, и Гомоцепные Полимеры, основные цепи которых построены из одинаковых атомов. Из гомоцепных полимеров наиболее распространены Карбоцепные Полимеры, главные цепи которых состоят только из атомов углерода, например, полиэтилен, полиметилметакрилат, политетрафторэтилен. Примеры гетероцепных полимеров – полиэфиры (полиэтилентерефталат, поликарбонаты и другие), полиамиды, мочевино-формальдегидные смолы, белки, некоторые кремнийорганические полимеры. Полимеры, макромолекулы которых наряду с углеводородными группами содержат атомы неорганогенных элементов, называются Элементоорганическими Полимерами (смотрите Элементоорганические Полимеры). Отдельную группу полимеров образуют Неорганические Полимеры, например, пластическая сера, полифосфонитрилхлорид (смотрите Неорганические Полимеры). Свойства И Важнейшие Характеристики:- линейные полимеры обладают специфическим комплексом физико-химических и механических свойств. Важнейшие из этих свойств:- способность образовывать высокопрочные анизотропные высокоориентированные волокна и плёнки (смотрите Ориентированное Состояние Полимеров); способность к большим, длительно развивающимся обратимым деформациям (смотрите Высокоэластическое Состояние); способность в высокоэластическом состоянии набухать перед растворением; высокая вязкость растворов (смотрите Набухание, Растворы Полимеров). Этот комплекс свойств обусловлен высокой молекулярной массой, цепным строением, а также гибкостью макромолекул. При переходе от линейных цепей к разветвлённым, редким трёхмерным сеткам и, наконец, к густым сетчатым структурам этот комплекс свойств становится всё менее выраженным. Сильно сшитые полимеры нерастворимы, неплавки и неспособны к высокоэластическим деформациям. Полимеры могут существовать в кристаллическом и аморфном состояниях. Необходимое условие кристаллизации – регулярность достаточно длинных участков макромолекулы. В кристаллических полимерах возможно возникновение разнообразных надмолекулярных структур (фибрилл, сферолитов, монокристаллов и других), тип которых во многом определяет свойства полимерного материала. Надмолекулярные структуры в незакристаллизованных (аморфных) полимерах менее выражены, чем в кристаллических. Незакристаллизованные Полимеры могут находиться в трёх физических состояниях:- стеклообразном, высокоэластическом и вязкотекучем. Полимеры с низкой (ниже комнатной) температурой перехода из стеклообразного в высокоэластическое состояние называются Эластомерами, с высокой – Пластиками. В зависимости от химического состава, строения и взаимного расположения макромолекул свойства полимеров могут меняться в очень широких пределах. Так, 1,4-цис-полибутадиен, построенный из гибких углеводородных цепей, при температуре около 20 °С – эластичный материал, который при температуре –60 °С переходит в стеклообразное состояние; полиметилметакрилат, построенный из более жёстких цепей, при температуре около 20 °С – твёрдый стеклообразный продукт, переходящий в высокоэластическое состояние лишь при 100 °С. Целлюлоза – полимер с очень жёсткими цепями, соединёнными межмолекулярными водородными связями, вообще не может существовать в высокоэластическом состоянии до температуры её разложения. Большие различия в свойствах полимеров могут наблюдаться даже в том случае, если различия в строении макромолекул на первый взгляд и невелики. Так, стереорегулярный полистирол – кристаллическое вещество с температурой плавления около 235 °С, а нестереорегулярный (атактический) вообще не способен кристаллизоваться и размягчается при температуре около 80 °С. Полимеры могут вступать в следующие основные типы реакций:- образование химических связей между макромолекулами (так называемое Сшивание), например, при вулканизации каучуков, дублении кожи; распад макромолекул на отдельные, более короткие

фрагменты (смотрите Деструкция Полимеров); реакции боковых функциональных групп полимеров с низкомолекулярными веществами, не затрагивающие основную цепь (так называемые Полимераналогичные Превращения); внутримолекулярные реакции, протекающие между функциональными группами одной макромолекулы, например, внутримолекулярная циклизация. Сшивание часто протекает одновременно с деструкцией. Примером полимераналогичных превращений может служить омыление поливинилацетата, приводящее к образованию поливинилового спирта. Скорость реакций полимеров с низкомолекулярными веществами часто лимитируется скоростью диффузии последних в фазу полимеров. Наиболее явно это проявляется в случае сшитых полимеров. Скорость взаимодействия макромолекул с низкомолекулярными веществами часто существенно зависит от природы и расположения соседних звеньев относительно реагирующего звена. Это же относится и к внутримолекулярным реакциям между функциональными группами, принадлежащими одной цепи. Некоторые свойства Полимеры, например, растворимость, способность к вязкому течению, стабильность, очень чувствительны к действию небольших количеств примесей или добавок, реагирующих с макромолекулами. Так, чтобы превратить линейный полимер из растворимого в полностью нерастворимый, достаточно образовать на одну макромолекулу 1–2 поперечные связи. Важнейшие характеристики полимеров – химический состав, молекулярная масса и молекулярно-массовое распределение, степень разветвлённости и гибкости макромолекул, стереорегулярность и другие. Свойства полимеров существенно зависят от этих характеристик. Получение:- природные полимеры образуются в процессе биосинтеза в клетках живых организмов. С помощью экстракции, фракционного осаждения и других методов они могут быть выделены из растительного и животного сырья. Синтетические полимеры получают полимеризацией и поликонденсацией. Карбоцепные Полимеры обычно синтезируют полимеризацией мономеров с одной или несколькими кратными углерод-углеродными связями или мономеров, содержащих неустойчивые карбоциклические группировки (например, из циклопропана и его производных). Гетероцепные Полимеры получают поликонденсацией, а также полимеризацией мономеров, содержащих кратные связи углерод-элемент (например, C = O, C ° N, N = C = O) или непрочные гетероциклические группировки (например, в окисях олефинов, лактамах). Применение:- благодаря механической прочности, эластичности, электроизоляционным и другим ценным свойствам изделия из полимеров применяют в различных отраслях промышленности и в быту. Основные типы полимерных материалов – пластические массы, резины, волокна (смотрите Текстильные Волокна, и Химические Волокна), лаки, краски, клеи, ионообменные смолы. Значение биополимеров определяется тем, что они составляют основу всех живых организмов и участвуют практически во всех процессах жизнедеятельности. Историческая Справка:- термин ‘Полимерия’ был введён в науку Шведским химиком и минералогом Ёнсом Якобом Бэрсэлиусом (Jöns Jakob Berzelius; 1779–1848) в 1833 для обозначения особого вида изомерии, при которой вещества (полимеры), имеющие одинаковый состав, обладают различной молекулярной массой, например, этилен и бутилен, кислород и озон. Таким образом, содержание термина не соответствовало современным представлениям о полимерах. ‘Истинные’ синтетические полимеры к тому времени ещё не были известны. Ряд полимеров был, по-видимому, получен ещё в 1-й половине XIX века. Однако химики тогда обычно пытались подавить полимеризацию и поликонденсацию, которые вели к ‘осмолению’ продуктов основной химической реакции, то есть, собственно, к образованию полимеров (до сих пор полимеры часто называли ‘Смолами’). Первые упоминания о синтетических полимерах относятся к 1838 (поливинилиденхлорид) и 1839 (полистирол). Химия полимеров возникла только в связи с созданием Русским химиком Александром Михайловичем Бутлеровым (1828–1886) теории химического строения (начало 1860-х). Александр Михайлович Бутлеров изучал связь между строением и относительной устойчивостью молекул, проявляющейся в реакциях полимеризации. Дальнейшее своё развитие (до конца 1920-х) наука о полимерах получила главным образом благодаря интенсивным поискам способов синтеза каучука, в которых участвовали крупнейшие учёные многих стран (Французский химик Гюстав Бушарда (Gustave Bouchardat; 1842–1918), Английский химик Сэр Вильэм Огастас Тилдэн (Sir William Augustus Tilden; 1842–1926), Немецкий химик Карл Дитрих Хариэс (Carl Dietrich Harries; 1866–1923), Русский химик-органик Иван Лаврентьевич Кондаков (1857–1931), Русский химик Сергей Васильевич Лебедев (1874–1934) и другие). В 1930-х было доказано существование свободнорадикального (Немецкий химик Хэрман Штаудиня (Hermann Staudinger; 1881–1965) и других) и ионного (Американский учёный Фрэньк Клэфод Витмо (Frank Clifford Whitmore; 1887–1947) и других) механизмов полимеризации. Большую роль в развитии представлений о поликонденсации сыграли работы Американского учёного Волэса Хьюма Коразёза (Wallace Hume Carothers; 1896–1937). С начала 1920-х развиваются также теоретические представления о строении полимеров. Вначале предполагалось, что такие биополимеры, как целлюлоза, крахмал, каучук, белки, а также некоторые синтетические полимеры, сходные с ними по свойствам (например, полиизопрен), состоят из малых молекул, обладающих необычной способностью ассоциировать в растворе в комплексы коллоидной природы благодаря нековалентным связям (Теория ‘Малых Блоков’). Автором принципиально нового представления о полимерах как о веществах, состоящих из макромолекул, частиц необычайно большой молекулярной массы, был Хэрман Штаудиня. Победа идей этого учёного (к началу 1940-х) заставила рассматривать полимеры как качественно новый объект исследования химии и физики.

POLYMERASE CHAIN REACTION = ПОЛИМЕРАЗНАЯ ЦЕПНАЯ РЕАКЦИЯ (или ЦЕПНАЯ РЕАКЦИЯ ПОЛИМЕРАЗЫ) – The Polymerase Chain Reaction (PCR) is an enzymatic method that can generate a billion identical molecules (amplification) of a desired segment of the Deoxyribonucleic Acid (DNA) within about two hours. A typical PCR-reaction comprises 35 to 50 amplification cycles, whereby each cycle consists of three successive steps:- (i) Denaturation:- the reaction mixture with all the components necessary to synthesise new DNA is heated to about 95 °C. This denatures the double-stranded DNA, or in other words dismantles it into two individual strands. (ii) Annealing:- primers (short, single-stranded DNA-sequences) bind highly specifically at defined sections of the denatured DNA – provided they are contained in the sample to start with. A fundamental condition for producing specific primers is the availability of DNA-sequence information. In other words it must be known what sequences are typical for certain species, orders, classes etc. In many cases such information can be called up in international data bases. (iii) Elongation:- in this step the enzyme – the polymerase – recognized the double stranded DNA-segment formed by the denatured target-DNA and the primer binding to it. The new DNA strand is synthesized from this starting point, whereby the complementary individual strand serves as a template. PCR products are detected either by gelelectrophoresis, in other words by direct visualization after cutting open and dyeing in an agarose gel, or online, which involves the use of dye-marked probes. In this case the amplification is measured directly with the aid of suitable equipment, e.g., TaqMan, and this allows very sensitive and precise quantification. Polymerase Chain Reaction (PCR) is a method of amplifying specific DNA segments in vitro. / Под Полимеразной Цепной Реакцией, от Греческих слов Polý, означающее Много, и Méros, означающее Доля или Часть, понимается метод амплификации in vitro ДНК, применяемый при её секвенировании, картировании генов, ДНК-диагностике и так далее. виды (species), порядки (orders), классы (classes) и так далее. Полимеразная Цепная Реакция (ПЦР) является ферментативным методом, способным генерировать миллиард идентичных молекул (амплификация или увеличение численности) желаемого сегмента Дезоксирибонуклеиновой Кислоты (ДНК) приблизительно в пределах двух часов. Типовая реакция ПЦР состоит из 35–50 циклов амплификации, XXX каждый цикл состоит из трёх последовательных стадий:- (i) Денатурация (Denaturation):- . Это разрушает двунитевую (двухцепочечную) ДНК или, другими словами, разбирает её на две индивидуальные нити. (ii) Гибридизация (Annealing):- затравки или праймеры (primers) (короткие последовательности однонитевых (одноцепочечных) ДНК) денатурированной ДНК – . Фундаментальным условием для производства конкретных затравок (праймеров) является наличие информации о последовательности ДНК. (iii)

Элонгация или вытягивание (Elongation):- энзим (фермент) – полимераза – признаёт двунитевый (двухцепочечный) сегмент ДНК, образованный денатурированной ДНК-мишенью, и затравку (праймер), обязанную ей. Продукты ПЦР определяются либо гель-электрофорезом (gelelectrophoresis), другими словами, непосредственной визуализацией после вскрытия среза или срезания и окрашивания в агарозный гель (agarose gel), или в режиме реального времени, которое вовлекает использование маркированных красителем зондов (dye-marked probes). В этом случае увеличение численности (амплификация) непосредственно измеряется с помощью соответствующего оборудования, например, прибора ТэкМэн (TaqMan), и это позволяет очень чувствительное и точное определение количества. шаблон (template). Полимеразы, нуклеотидилтрансферазы, ферменты класса трансфераз; катализируют синтез нуклеиновых кислот из нуклеозидтрифосфатов в присутствии ДНК или РНК, играющих роль матрицы. Синтез новой цепи ДНК (репликация) или РНК (транскрипция) на ДНК-матрице осуществляется строго по принципу комплементарности. Действие полимераз заключается в переносе молекул рибо- или дезоксирибонуклеозидтрифосфатов на конец синтезируемой цепи РНК (ДНК), в результате чего цепь удлиняется и освобождается молекула пирофосфата. Синтез РНК, катализируемый ДНК-зависимой РНК-полимеразами, происходит на одной из цепей двуспиральной ДНК-матрицы. Вновь синтезированный полирибонуклеотид сходит с матричной ДНК в виде одиночной нити. Синтез ДНК происходит одновременно на двух цепях предварительно раскрученной (деспирализованной) ДНК-матрицы. Открытие и выделение в 1956 Американским биохимиком Aco Конбёгом (Arthur Kornberg; 1918–2007) ДНК-полимераз позволило ему впервые осуществить синтез активной ДНК в пробирке.

POLYMERIZATION = ПОЛИМЕРИЗАЦИЯ (или ПОЛИПРИСОЕДИНЕНИЕ) – Polymerization is the chemical combination of similar-type molecules to form larger molecules. Polymerization is a chemical reaction wherein small molecules combine to form much larger molecules. See also Addition Polymerization, and Condensation Polymerization. Polymerization:- (Greek:- Poly – Many; Meros – Part) Gelling of oils caused by exposure to heat, in particular in the context of plastics manufacture. / Смотрите также (Addition Polymerization), и Конденсационная Полимеризация (Condensation Polymerization). Под Полимеризацией понимается синтез полимеров, основанный на последовательном присоединении молекулы мономера к активному центру на конце растущей цепи. В отличие от Поликонденсации не сопровождается выделением низкомолекулярного вещества. По числу мономеров, участвующих в полимеризации, различают Гомополимеризацию (один мономер) и Сополимеризацию (обычно два, реже – три сомономера). На долю полимеров, синтезируемых методом полимеризации (полиакрилаты, полиолефины, большинство каучуков), приходится около 75% от общего мирового производства этих материалов. Полимеризация – процесс получения высокомолекулярных веществ, при котором молекула полимера (Макромолекула) образуется путём последовательного присоединения молекул низкомолекулярного вещества (Мономера) к активному центру на конце растущей цепи. Молекула мономера, входя в состав цепи, образует её мономерное зерно. Число таких звеньев в макромолекуле называется Степенью Полимеризации. По числу участвующих в полимеризации мономеров различают Гомополимеризацию (один мономер) и Сополимеризацию (два и более). В зависимости от природы активного центра, ведущего цепь, различают:- Радикальную Полимеризацию, в которой активным центром является свободный радикал, а акт роста является гомолитической реакцией, и Ионную Полимеризацию, при которой активные центры являются ионами или поляризованными молекулами, а раскрытие двойной связи (или цикла) происходит гетеролитически. В свою очередь, ионная полимеризация подразделяется на Анионную Полимеризацию, если концевой атом растущей цепи несёт полный или частичный отрицательный заряд, и Катионную Полимеризацию, если этот атом заряжен положительно. Активные центры ионной полимеризации редко являются свободными ионами; обычно в состав активного центра, наряду с растущим концом цепи, входит противоположно заряженный компонент (противоион). Во многих случаях присоединению мономера к растущему концу цепи предшествует образование координационного комплекса с противоионом. Такую полимеризацию называют Координационно-Ионной Полимеризацией. Благодаря регулирующему действию противоиона при координационно-ионной полимеризации возможно образование полимера с высокой степенью упорядоченности пространственного строения (смотрите Стереорегулярные Полимеры). В этом случае полимеризация называется Стереоспецифической Полимеризацией. Способность данного мономера к полимеризации определяется как термодинамическими факторами (условие убыли свободной энергии – смотрите Химическая Термодинамика), так и кинетическими, то есть наличием подходящего возбудителя, выбором условий и так далее. Полимеризация большинства мономеров происходит либо путём раскрытия кратных связей C = C, C º C, C = O, C º N и других. n A = B → [¾ A – B –]$_n$, либо путём циклических группировок $n\,[A-B] \rightarrow [-A-B-X-]_n$, n [A – B] → [– A – B – X –]$_n$, где A, B, X – различные атомы или группы атомов. Таким образом, состав и структура мономерного звена в макромолекуле соответствует составу и строению исходного мономера (за исключением, конечно, размыкающейся в ходе процесса связи). Однако известен ряд примеров, в которых образующиеся при полимеризации мономерные звенья отличаются от исходного мономера по структуре, а иногда и по составу, например, вследствие образования новых связей внутри мономерного звена, сдвига одного или группы атомов во время присоединения мономера к растущей цепи, выделения низкомолекулярных веществ. Полимеризация – особый тип цепных процессов, в которых развитие кинетической цепи сопровождается ростом материальной цепи макромолекулы. В полимеризации можно выделить несколько основных стадий, так называемых Элементарных Актов:- инициирование полимеризации, рост цепи, обрыв цепи, передача цепи. Инициирование – превращение небольшой доли молекул мономера в активные центры, способные присоединять к себе новые молекулы мономера. Для этого в систему вводят специальные вещества (называются инициаторами или катализаторами полимеризации в зависимости от того, входят их частицы в состав образующегося полимера или нет). Полимеризацию можно также вызвать действием ионизирующего излучения, света или электрического тока. Рост цепи состоит из ряда многократно повторяющихся однотипных реакций присоединения молекул мономера (M) к активному центру (M*):- M* + M → M*$_1$; M*$_1$ + M → M*$_2$; ...; M*$_n$ + M → M*$_{n+1}$. В результате исходный низкомолекулярный активный центр вырастает в макромолекулу. Обрыв цепи – дезактивация активного центра при его взаимодействии с другим активным центром, каким-либо посторонним веществом или вследствие перегруппировки в неактивный продукт. При передаче цепи активный центр с растущей макромолекулы переходит на какую-либо другую частицу X (мономер, растворитель, полимер и так далее), начинающую рост новой макромолекулы:- M*$_n$ + X → M$_n$ + X*; X* + M → XM*. В некоторых случаях при передаче цепи образуется устойчивое соединение, не присоединяющее к себе мономер. Такая реакция, кинетически эквивалентная обрыву, называется Ингибированием, а вызывающее её вещество – Ингибитором. Если в систему вводят эффективные передатчики цепи в достаточно больших количествах, то образуются только низкомолекулярные вещества; в этом случае процесс называется Теломеризацией. В отсутствие передачи цепи длина кинетической цепи процесса (то есть число молекул мономера, прореагировавших с активным центром от момента его появления до гибели) равна длине молекулярной цепи (то есть числу звеньев в образующейся макромолекуле). При наличии передачи длина кинетической цепи превышает длину молекулярной. Таким образом, каждый акт инициирования приводит к образованию одной макромолекулы (если нет передачи цепи) или нескольких (если такие реакции есть). Поскольку в реакцию роста, обрыва или передачи цепи может с некоторой вероятностью вступить растущий активный центр любой длины, степень полимеризации и молекулярная масса полимера являются статистическими величинами. Характер распределения макромолекул по размерам определяется механизмом процесса и в принципе может быть вычислен, если известна

кинетическая схема процесса. Уравнения, связывающие скорость процесса с концентрациями основных компонентов, могут принимать самый разнообразный вид в зависимости от механизма конкретных процессов. Но общий принцип их вывода во всех случаях одинаков и основан на небольшом числе упрощающих допущений. Важнейшим из них является предположение, что реакционная способность растущих цепей не зависит от их длины, если последняя превышает некоторый предел (3–4 звена). Для расчёта процессов, в которых время жизни растущих цепей мало по сравнению с общим временем развития процесса, часто используют так называемый Принцип Стационарности, то есть полагают, что концентрация растущих цепей не изменяется во времени или что скорости инициирования и обрыва цепей равны. Полимеризация может быть осуществлена различными способами, отличающимися по агрегатному состоянию полимеризуемой системы. Наиболее распространённые способы:- (i) Полимеризация жидкого мономера в отсутствие растворителя (полимеризация в массе) или в растворе под действием инициаторов радикальной или ионной природы либо диспергированных или гранулированных твёрдых катализаторов; (ii) Полимеризация в водных эмульсиях и суспензиях; (iii) Полимеризация в твёрдой фазе под действием ионизирующего излучения; (iv) Полимеризация газообразного мономера под действием ионизирующего излучения или на поверхности твёрдого катализатора. Полимеризация была открыта ещё в середине XIX века, практически одновременно с выделением первых способных к полимеризации мономеров (стирола, изопрена, метакриловой кислоты и других). Однако сущность полимеризации как своеобразного цепного процесса образования истинных химических связей между молекулами мономера была понята лишь в 1920–30-е благодаря работам химиков Сергея Васильевича Лебедева (1874–1934; Россия), Хэрмана Штаудиня (Hermann Staudinger; 1881–1965; Германия), Кала Вальдэмара Цигля (Karl Waldemar Ziegler; 1898–1973; Германия), Фрэнька Клэфода Витмо (Frank Clifford Whitmore; 1887–1947; США) и других. На долю полимеров, получаемых полимеризацией, приходится около 3/4 их общего мирового выпуска. Промышленность, базирующаяся на синтезе полимеров методом полимеризации, – одна из наиболее мощных и, вероятно, наиболее быстро растущая отрасль промышленности органического синтеза. Для современного этапа этой отрасли типично широкое внедрение координационно-ионной полимеризации, характеризующейся высокой эффективностью, высокой стереорегулирующей способностью и возможностью гибкого контролирования свойств получаемых продуктов.

POLYMERIZE = ПОЛИМЕРИЗОВАТЬ – Polymerize:- to undergo polymerization. To react molecules resulting in their combining and forming relatively long-chain, large molecules.

POLYMER PROCESSING = ПЕРЕРАБОТКА ПОЛИМЕРОВ – Polymer Processing are the operations carried out on polymeric materials or systems to increase their utility. Therefore, polymer processing is done to increase the value of a polymer in order to obtain the desired shape, properties, and performance for a polymer article. As far as textile industry is concerned, polymer processing can be explained as the spinning process for manufacturing polymer fibers that are commonly known as Synthetic Fibers. Spinning of Polymers:- the polymers of synthetic fibers are almost always derived from by-products of petroleum and natural gas which include nylon, polyethylene terephthalate, as well as other compounds like acrylics, polyurethanes and polypropylene. Synthetic fibers, which are produced from these polymers are used for making various consumer and industrial textile products ranging from clothing, home furnishings to conveyor belts. Most of the cellulosic yarns manufactured from synthetic fibers are produced by extrusion of a thick, viscous liquid through the tiny holes of an equipment called Spinneret which forms continuous filaments of semi-solid polymer. The polymer is at first converted into a fluid state. If it is a thermoplastic polymer then it is just melted otherwise it has to be dissolved in a solvent or has to be chemically treated in order to form soluble or thermoplastic derivatives. The fluid polymer is then forced through the spinneret. The polymer here cools to a rubbery state, and then finally solidifies. For making specialty yarn, certain polymers have been technologically developed that do not melt, dissolve, or form appropriate derivatives. In such cases, the small fluid molecules are mixed and reacted to form the otherwise intractable polymers during the process of extrusion. There are typically four types of spinning for polymers:- (i) wet spinning, (ii) dry spinning, (iii) melt spinning, and (iv) gel spinning. However, before proceeding to know the actual processes of all these four types of spinning, one must know about the basic process of extrusion and the spinneret used for it. Spinneret and Extrusion:- the spinnerets used for manufacturing most of the synthetic fibers have many holes ranging from one to several hundred holes which gives it an appearance similar to that of a bathroom shower head. The fluid polymer is fed into these tiny openings. The liquid polymer emerging out of the holes of spinneret in the form of filaments, is converted first to a rubbery state and then into a solid state. This process of extrusion and solidification of innumerable filaments is called Spinning Of Polymers. This spinning is different from the fiber spinning of plant fibers and animal fibers, that are twisted into yarns. Extrusion is also of two types:- (i) single screw extrusion and (ii) twin screw extrusion. Single Screw Extrusion:- is one of the basic operations of polymer processing. Single screw extrusion process builds pressure onto a polymer melt so that it can be forced through a die or can be injected into a mold. Most of the single screw extrusion machines are plasticating which bring in solids in pellet or powder form and melt them building pressure at the same time. Twin Screw Extrusion:- is widely used for mixing, compounding, or reacting polymeric materials. The flexibility of twin screw extrusion tool lets this operation to be designed specifically for the formulation that is being processed, for instance- the two screws may be corotating or counterrotating, intermeshing or nonintermeshing. Additionally, the configuration of the screws themselves may be varied using forward conveying elements, reverse conveying elements, kneading blocks, and other designs which can help in obtaining particular mixing characteristics. Types of Polymer Spinning Processes:- as stated earlier, There are four types of spinning for polymers:- (i) wet spinning, (ii) dry spinning, (iii) melt spinning, and (iv) gel spinning. (1) Wet Spinning:- of all the four processes, wet spinning is the oldest process. It is used for polymers that need to be dissolved in a solvent to be spun. The spinneret remains submerged in a chemical bath that leads the fiber to precipitate, and then solidify, as it emerges out of the spinneret holes. The name of the process, i.e. wet spinning has got its name from this ‘wet’ bath only. Acrylic fiber, rayon fiber, aramid fiber, modacrylic fiber, and spandex fibers, all are manufactured through wet spinning. (2) Dry Spinning:- it is also used for polymers that have to bedissolved in a solvent. However, solidification results from evaporation of the solvent. After dissolving the polymer in a volatile solvent, the solution is pumped through a spinneret. As the fibers emerge from the spinneret, air or inert gas is used to evaporate the solvent which results in solidification of the fibers that can be collected on a take-up wheel. The fibers are stretched which provides for orientation of the polymer chains along the fiber axis. This technique is used only for polymers which cannot be melt spun because of the safety and environmental concerns concerned with solvent handling. Dry spinning may be used for manufacturing acetate fiber, triacetate fiber, acrylic fiber, modacrylic fiber, PBI, spandex fiber, and vinyon. (3) Melt Spinning:- is used for the polymeric fibers or the polymers that can be melted. The polymer is melted and then pumped through a spinneret. The cooled and solidified molten fibers get collected on a take-up wheel. The fibers, when stretched in both, the molten and solid states, facilitate orientation of the polymer chains along the fiber axis. Melt spun fibers can be forced through the spinneret in different cross-sectional shapes such as round, trilobal, pentagonal, octagonal among others. Trilobal-shaped fibers are capable of reflecting more light which give a sparkle to the fabrics. Pentagonal-shaped and hollow fibers are soil and dirt resistant and as such are used for making carpets and rugs. Octagonal-shaped fibers offer glitter-free effects whereas hollow fibers trap air, creating insulation. Polymers like polyethylene terephthalate and nylon 6,6 are melt spun in high volumes. Nylon fiber, olefin fiber, polyester fiber, saran fiber, etc are also manufactured through melt spinning. (4) Gel Spinning:- it is also known as Dry-Wet Spinning because the filaments first pass through air and then are cooled further in a liquid bath. Gel spinning is used to make very strong and other fibers having special characteristics.

The polymer here is partially liquid or in a 'gel' state, which keeps the polymer chains somewhat bound together at various points in liquid crystal form. This bond further results into strong inter-chain forces in the fiber increasing its tensile strength. The polymer chains within the fibers also have a large degree of orientation, which increases its strength. The filaments come out with an unusual high degree of orientation relative to each other, further enhancing strength. The high strength polyethylene fiber and aramid fibers are manufactured through this process. Whatever spinning process is applied, the fibers are finally drawn to increase strength and orientation. This may be done while the polymer is still in the process of solidifying or after it has completely cooled down. Drawing pulls the molecular chains together and orients them along the fiber axis, resulting in a considerably stronger yarn. / Найлан[T3] (Nylon™).

POLYMORPHISM = ПОЛИМОРФИЗМ – (1) Polymorphism is the occurrence together in the same breeding population of two or more distinct forms at frequencies too great to be explained by recurrent mutation. Occurrence of two or more types of variants. / Под Полморфизмом, от Греческих слов Polýs, означающее Многий или Многочисленный или Обширный, и Morphē, означающее Форма, понимается:- (1) свойство некоторых веществ существовать в нескольких кристаллических состояниях (модификациях) с разной структурой. Пример полиморфизма – алмаз и графит. (2) В биологии – наличие в пределах одного Вида резко различающихся по облику особей, например, у Пчёл – матка, трутни, рабочие пчёлы. Частный случай полиморфизма – половой диморфизм. Полиморфизм в биологии, наличие в пределах одного Вида резко отличных по облику особей, не имеющих переходных форм. Если таких форм две, явление называется диморфизмом (частный случай – половой диморфизм). Полиморфизм включает различие внешнего облика особей из одной или разных популяций. Полиморфизм в пределах генетически однородной популяции известен для колоний многих гидроидов, у которых на одном столоне могут развиваться гидранты разного строения (например, трофозоиды, дактилозоиды и акантозоиды – у Полипов Podocoryne). Имеющие совершенно различный облик Полипы и Медузы одного Вида – пример полиморфизма, связанного с чередованием поколений. Такого же типа полиморфизм ржавчинных Грибов, у которых плодовые тела и споры, развивающиеся на разных хозяевах, резко отличны по облику и по физиологическим особенностям. Такой полиморфизм, как и многообразие личиночных форм одного Вида, например, у дигенетических Сосальщиков, называется плейоморфозом. Полиморфизм у раздельнополых животных – наличие особей разного облика в пределах хотя бы одного пола (например, у Тлей самки, а у некоторых Кокцид самцы бывают крылаты и бескрылы). Для общественных Насекомых характерен полиморфизм, связанный с разделением функций разных особей в семье или колонии (матка и рабочие особи у медоносных Пчёл; матки и разные формы 'рабочих', а также 'солдаты' у Муравьев и Термитов). К такому же роду полиморфизма можно отнести сезонный полиморфизм, а также связанные с плотностью популяции различия в окраске, пропорциях тела и в поведении у Саранчовых (фазовая изменчивость) и гусениц некоторых Бабочек. Смотрите также Генетический Полиморфизм, Модификации. Под Полиморфизмом, от Греческого слова Polýmorphos, означающее Многообразный, в физике, минералогии, химии, понимается способность некоторых веществ существовать в состояниях с различной атомной кристаллической структурой. Каждое из таких состояний (термодинамических фаз), называется полиморфной модификацией, устойчиво при определённых внешних условиях (температуре и давлении). Модификации обозначаются обычно Греческими буквами a, b, g и так далее. Различие в структуре обусловливает и различие в свойствах полиморфных модификаций данного вещества. Полиморфизм был открыт в 1798, когда было обнаружено, что $CaCO_3$ может существовать в виде 2 минералов – кальцита и арагонита. Полиморфизмом обладают простые вещества (смотрите Аллотропия), а также неорганические и органические соединения. Так, углерод имеет 2 модификации:- кубическую (алмаз) и гексагональную (графит), резко различающиеся по физическим свойствам. Белое олово, имеющее тетрагональную объёмноцентрированную решётку – пластичный металл, а серое олово (низкотемпературная модификация с алмазоподобной тетрагональной решёткой) хрупкий полупроводник. Некоторые соединения, например, SiO_2, имеют более 2-х полиморфных модификаций. Перестройка кристаллической решётки при полиморфном переходе сводится к сдвигам атомов, изменению типа их упаковки, к поворотам некоторых структурных группировок (например, NH_4 и NO_3 в разных модификациях NH_4NO_3). Полиморфизм наблюдается и у жидких кристаллов. Полиморфизм является результатом того, что одни и те же атомы и молекулы могут образовывать в пространстве несколько устойчивых решёток. Так как любое малое искажение устойчивой решётки связано с увеличением её энергии, то существующие структурные состояния соответствуют энергетическим минимумам различной глубины. При T = 0 K, наиболее вероятна a-модификация, которой отвечает глубокий минимум. При T > 0 K термодинамическое состояние решётки определяется её свободной энергией U = E – TS, включающей в себя наряду с энергией E энтропийную часть TS (S – энтропия), связанную с тепловыми колебаниями кристаллической решётки. Имеющая меньшую энергию более прочная (a-решётка менее восприимчива к возбуждению колебаний и характеризуется более пологой зависимостью U (T). Кривые $U_a(T)$ и $U_b(T)$ пересекаются при некоторой температуре T_0. Ниже T_0 более стабильна a-фаза, выше – b-фаза, T0 – температура равновесия a- и b-фаз. При нагреве a-модификация выше T_0 она превращается в b. При дальнейшем повышении температуры (b-модификация может стать менее стабильной, чем g-модификация, которая, в свою очередь, затем превращается в d-модификацию до тех пор, пока температура не превысит температуру плавления кристалла. Каждая модификация устойчива в определённой области температуры, давления, а также других внешних условий. Фазовые диаграммы равновесия определяют области устойчивости полиморфных модификаций (смотрите Диаграмма Состояния). Теоретический расчёт фазовых диаграмм основан на вычислении термодинамических характеристик, а также энергии и спектра колебаний кристаллической решётки для различных полиморфных модификаций. Например, расчёт диаграммы состояния C позволил установить, что область возникновения структуры алмаза лежит при давлениях ~50 кбар, что облегчило путь к синтезу алмазов. Переход менее стабильной модификации в более стабильную связан с преодолением энергетического барьера, который существенно меньше, если превращение происходит постепенно, путём зарождения и последующего роста в ней областей новой фазы. Барьер преодолевается за счёт тепловых флуктуаций; поэтому, если вероятность флуктуаций мала, менее устойчивая фаза может длительное время существовать в метастабильном состоянии. Например, алмаз, метастабильный при атмосферном давлении и комнатной температуре, может существовать неограниченно долго, не превращаясь в стабильный в этих условиях графит. В других веществах, наоборот, различные модификации легко переходят друг в друга при изменении температуры и другого. Поскольку превращение проходит через стадию сосуществования исходной и образующейся фаз, между фазами возникает упругое взаимодействие, влияющее на развитие превращения. Эти взаимодействия особенно проявляются при мартенситных превращениях. Частный случай полиморфизма – политипизм, который наблюдается в некоторых кристаллах со слоистой структурой. Политипные модификации построены из одинаковых слоёв или слоистых 'пакетов' атомов и различаются способом и периодичностью наложения таких пакетов. Политипные модификации наблюдаются у глинистых минералов, карбида кремния и других.

(2) In computer industry, a Polymorphism is the term used to describe a program that changes the order in which its instructions are stored on disk, executed in memory, etc. This creates a program that while functionally equivalent, contains different code in each instance. Malware uses this technique to re-order its instructions in an attempt to evade detection.

POLYNOSIC FIBER = ПОЛИНОЗНОЕ ВОЛОКНО (или ВОЛОКНО ПОЛИНОЗИК) – Polynosic Fiber is a high-wet-modulus rayon staple having a microfibrillar structure of fibers. The molecular chain length of the cellulose forming the fiber is about twice as long as in

conventional rayon. Polynosic Fibers:- the manufacturing process of polynosic fibers is nearly the same as that of rayon fibers. However, the wet tenacity is improved and has both similar characteristics of cotton fibers and excellence of silk fibers. End-Uses:- (i) for clothing:- Fabrics for Women's Wear, Interlinings, Shirts, Blouses, Sport Pants, Working Wear, Towel, Sheets, etc. (ii) For home furnishings and bedding:- Carpets, Cover for Home Furnishings, Blankets, Sheets, Bedclothes, etc. (iii) For industrial uses:- Cover of Electric Wire, Canvas, etc. (iv) For other uses:- Handicraft Yarns, Bags, Cloth for Textile Shoes, Substrate Cloth for Rubber Coated Fabrics, etc. Features:- (i) Fabrics of fine count/denier yarn is possible thanks to the high tenacity. Thus, polynosic fabrics have excellent luster as the silk fabric and dry tactile feeling. In addition, because polynosic fibers are friendly with other types of fibers, they are suitable for blended and union cloth. (ii) Laundering will make little shrinkage and shape deformation. (iii) Resistant to acid and alkali. Fabrics blended with cotton may be mercerized or sanforized. / Полинозное Волокно – это модифицированные вискозные волокна, получаемые из высококачественного сырья (целлюлозы и химикатов) при особом формировании и большей вытяжке. По своей структуре и свойствам полинозные волокна близки к хлопковым и могут заменить более дорогостоящий и ценный тонковолокнистый хлопок. У полинозных волокон более гладкая, чем у вискозных волокон, поверхность, поэтому они меньше загрязняются и лучше отстирываются. Прочность полинозных волокон выше прочности вискозных в 1.5–2 раза, а потеря прочности в мокром состоянии только 20–25%. Полинозные волокна более упруги, меньше набухают, усаживаются и мнутся, чем вискозные. Применяют полинозные волокна для изготовления тканей и трикотажных изделий. Полинозные Волокна – разновидность вискозных волокон, близких по свойствам хлопковым. Полинозные волокна, как и обычные вискозные волокна, формуют из вискозы по мокрому методу. Однако технологические режимы получения этих двух типов волокон существенно различаются. В производстве полинозных волокон свежесформованное волокно находится в гелеобразном состоянии и состоит из ксатогената целлюлозы высокой степени этерификации, что позволяет подвергать волокно значительно большей пластификационной вытяжке. Для полинозных волокон характерны высокая степень ориентации и однородность структуры в поперечном сечении. При этом структура устойчива к действию воды и щёлочей, благодаря чему механические свойства полинозных волокон мало изменяются в указанных средах, а изделия из них отличаются стабильностью формы и низкой сминаемостью. Для полинозных волокон характерны высокая прочность и низкое относительное удлинение. Их недостаток – высокая хрупкость. Полинозные волокна применяют для изготовления широкого ассортимента тканей взамен тонковолокнистого хлопка. Наибольшее развитие производство полинозных волокон получило в Японии (торговые названия Тиолан и Поликот), где в 1973 было выработано около 70 000 тонн этих волокон. В небольшом объёме полинозные волокна выпускают также в США (Зантрел), Великобритании (Винцел) и других странах.

POLYNOSIC RAYON = ПОЛИНОЗНОЕ РЭЙОН (или ПОЛИНОЗНАЯ ГИДРАТЦЕЛЛЮЛОЗА) – Polynosic Rayon is a rayon less likely to shrink or stretch when wet because of the way in which it is made. Regular rayon shrinks and stretches when wet and is said to have poor wet strength. Polynosic Rayon/Modal Rayon are stronger and more comfortable than viscose rayon, even when wet, and is usually more expensive than viscose rayon.

POLYNUCLEAR AROMATIC = МНОГОЯДЕРНОЕ АРОМАТИЧЕСКОЕ СОЕДИНЕНИЕ (или ПОЛИЦИКЛИЧЕСКОЕ АРОМАТИЧЕСКОЕ СОЕДИНЕНИЕ) – Polynuclear Aromatic (PNA) is any of numerous complex hydrocarbon compounds consisting of three or more benzene rings in a compact molecular arrangement. Some types of PNA's are formed in fossil fuel combustion and other heat processes, such as catalytic cracking.

POLYOLEFIN = ПОЛИОЛЕФИН – Polyolefin is a polymer derived by polymerization of relatively simple olefins. Polyethylene and polyisoprene are important polyolefins. / Полиолефины – высокомолекулярные соединения общей формулы $(–CH_2–C^{–R}_{–R'}–)n$, образующиеся при полимеризации или сополимеризации ненасыщенных углеводородов – олефинов (R, R"=H, CH_3, C_2H_5 и тому подобных). Из полиолефинов наиболее широко известны полиэтилен (R=R"=H) и полипропилен (R=H, R"=CH_3). Полиолефины характеризуются высокой степенью кристалличности, обусловливающей достаточную механическую прочность, высокими диэлектрическими показателями, устойчивостью к действию агрессивных веществ (кроме сильных окислителей, например HNO_3). Однако полиолефины обладают низкой адгезией к металлическим и другим поверхностям. Для повышения адгезии в макромолекулы полиолефинов (сополимеризацией или обработкой полимера) вводят полярные группы (‾CO, –COOH и другие). Это даёт возможность существенно расширить области применения полиолефинов. По масштабу промышленного производства и широте областей применения (плёнки и волокна, электроизоляционные покрытия, литьевые изделия и другое) полиолефины не имеют себе равных среди термопластичных материалов. Из производимых промышленностью полиолефинов наряду с полиэтиленом и полипропиленом большое значение имеют также их сополимеры – этилен-пропиленовые каучуки. Это обусловлено как ценными техническими свойствами указанных полиолефинов, так и наличием для их производства дешёвого и доступного нефтехимического сырья – этилена и пропилена. В 1973 мировое производство полиэтилена составило около 10 миллионов тонн (т), полипропилена – около 2.4 миллионов т. Промышленное значение имеют полиизобутилен (R=R"=CH_3), а также сополимеры изобутилена (смотрите, например, Бутилкаучук). В небольших масштабах в промышленности (США, ФРГ) получают полибутен-1, характеризующийся отсутствием ползучести; его применяют для изготовления труб. Производятся также полиолефины, обладающие повышенной теплостойкостью, например в Великобритании и США – поли-4-метилпентен-1 (теплостойкость по Вика 180 °C); в бывшем Союзе Советских Социалистических Республик (СССР) был разработан метод получения поливинилциклогексана (теплостойкость по Вика 225 °C). Полиолефины такого типа перспективны для ряда областей применения в медицинской, радиоэлектронной и других отраслях промышленности.

POLYOLEFIN FIBER = ПОЛИОЛЕФИНОВОЕ ВОЛОКНО (или ВОЛОКНО ПОЛИОЛЕФИН) – Polyolefin Fiber is a fiber produced from a polymerized olefin, such as polypropylene or polyethylene. Polyolefin fibers are used in consumer products. The largest market by far is carpets and rugs (including backing material). In the past, polyolefin carpet yarns have taken market share away from nylon carpet face yarns in tufted and woven carpets and rugs. Advances in tufting and weaving technology have made it possible to quickly and easily produce highly complicated, eye-appealing polyolefin fiber tapestries in a variety of colors, yarn types, gauges and pile heights. Polyolefin fibers have also successfully displaced jute as the primary and secondary backing substrate for tufted carpets in virtually all parts of the world. In the last few years, olefin fibers have also been used to manufacture synthetic turf. The second-largest use for polyolefin fiber is in nonwoven fabrics, which are used in many different applications, depending on their manufacture and characteristics. Uses include agricultural fabrics, construction sheeting, automotive fabrics, geotextiles, filtration media and industrial wipes. Staple laid consumer nonwovens are also extensively used in personal care, sanitary and medical applications, although in this markets they compete strongly with spunbond nonwovens. Polyolefin fibers, in particular slit films and monofilament, are used in industrial applications to manufacture ropes, cordages, agricultural nets and FIBCs (flexible intermediate bulk containers). Minor applications include concrete and paper reinforcement, and sun protection textiles such as awnings, boat coverings, tents and garden furniture upholstery. Polyolefin fibers had been one of the fastest-growing segments of the synthetic fiber industry, with growth rates of about 6%, due primarily to high growth in grassroots production capacity in developing countries and increasing use in carpets and rugs and in nonwoven fabrics in the industrialized nations. Since 2000, growth has slowed, particularly in the developed economies, as

a result of the slump in carpet yarn demand as well as an escalation in the price of polypropylene (PP), which in turn affected the price of PP fibers. The economic slowdown in 2008–09 further accentuated this trend, with the slump in the housing market (reducing demand for carpet) and a decline in government civil engineering investments (reducing demand for technical nonwovens, such as geotextiles). Rising PP resin prices also encouraged substitution by lower-cost polyester fiber, especially applications like nonwovens, where recycled PET staple fibers can be successfully employed. China is the leading consumer of polyolefin fibers; however, if spunbond polyolefins (mainly for nonwovens) are excluded, Europe would hold the number one position. Other important players are the Middle East and Africa and India. In Europe and the United States, little or no growth in consumption is expected through 2019, with nonwoven applications for the automotive sector being the only growing end-use market. Promising demand growth opportunities are expected in India, as the increasing population and standard of living will spur consumption of polyolefin fibers for textiles and in the nonwoven sector for both sanitary and technical applications. Slit film consumption for woven sacks and bags is also growing rapidly, as India and other Asian countries such as the Republic of Korea, Taiwan, Indonesia and Thailand have developed into major manufacturers and exporters of woven sacks and bags for agricultural and construction industries. Growth in consumption is also expected in the Middle East, as Turkey, Iran and Saudi Arabia have developed into major producers of tufted and woven carpets to serve the growing North African market. Global consumption of polyolefin fibers is expected to grow at an average annual rate of 2.3% through 2019. / Найлан^{T3} (Nylon^{TM}). Полиолефиновые Волокна, состоящие из беспорядочно расположенных структур, можно необратимо вытянуть в несколько раз. В результате вытягивания повышается разрывная прочность и уменьшается величина относительного удлинения волокна. Только после вытягивания полиолефиновые волокна могут быть использованы для текстильной переработки как в виде непрерывной нити, так и в виде штапельного волокна. Полиолефиновые волокна довольно стойки к органическим растворителям. При обычной температуре они не растворяются в большинстве органических растворителей и только в некоторых набухают. Степень набухания зависит от природы растворителя, температуры и продолжительности воздействия. При высокой температуре полиолефиновые волокна растворяются в ароматических и алифатических углеводородах и их производных. Полиолефиновые волокна обладают своеобразными физико-механическими свойствами. В ряде случаев отсутствует корреляция между отдельными взаимосвязанными показателями. Особенности физико-механических свойств полиолефиновых волокон всецело определяются степенью кристалличности полимера и интенсивностью межмолекулярного взаимодействия. Полиолефиновые волокна являются кристаллическими, высокоориентированными системами; ориентация достигается главным образом в результате применения больших ориентационных вытяжек свежесформованного волокна. При осуществлении прививки к готовому волокну привитые компоненты не подвергаются вытягиванию, поэтому они во многих случаях являются аморфными и неориентированными вдоль оси волокна. В связи с этим при большом содержании привитого компонента снижается суммарное содержание кристаллической фракции и степень ориентации волокна. В условиях проведения привитой полимеризации в ряде случаев может происходить частичная дезориентация элементов структуры волокна и, как следствие, некоторое ухудшение механических свойств модифицированного волокна по сравнению с исходным волокном. Если прививку к волокну осуществлять перед вытягиванием и затем подвергать вытягиванию модифицированное волокно, то ориентации будут подвергаться также привитые компоненты, и механические свойства такого волокна должны значительно улучшаться. Полиолефиновые волокна получаются из полимеров, содержащих стабилизаторы. Полиолефиновые волокна обладают низкой светостойкостью. Процесс фотохимической деструкции начинается с поглощения энергии ультрафиолетового света карбоксильными группами, которые всегда присутствуют в полимере в небольшом количестве. При поглощении кванта энергии в полимере образуются углеводородные радикалы, которые в присутствии кислорода окисляются в гидро-перекисные радикалы. Полиолефиновые волокна получают методом формования из расплавов полимеров. Процесс осуществляется при высоких скоростях формования, что является преимуществом этого метода получения полиолефиновых волокон по сравнению с производством других карбоцепных волокон. Кроме того, при применении этого метода отпадает необходимость в регенерации растворителей и осадителей. Разработанный в последние годы высокопроизводительный метод получения нитей из полиолефиновои пленки даёт возможность осуществлять процесс непрерывно, на одном агрегате. Полиолефиновые волокна обладают ценным комплексом свойств:- низкой плотностью, высокой прочностью и химической стойкостью к щелочам, кислотам и органическим растворителям. Полиолефиновые волокна имеют высокие усталостные показатели, сопоставимые с показателями полиамидных волокон. Полиолефиновые волокна находят применение в качестве фильтровальных материалов для сахарных и мыловаренных заводов, маслобойных производств и на заводах химической промышленности. Использование полиолефиновых волокон в указанных отраслях обусловлено их высокой химической стойкостью. Полиолефиновые волокна получаются из полиэтилена и полипропилена. Практически они вырабатываются на Московском НПЗ и других заводах. Полиолефиновые волокна получают из полиэтилена и полипропилена. Полиолефиновое волокно обладает высокой прочностью и хорошими эластическими свойствами. Оно имеет малую гигроскопичность, низкую плотность, высокую химическую стойкость и хорошие диэлектрические свойства. Кроме того, полиолефиновые волокна не подвержены гниению. Полиолефиновые волокна применяются для изготовления рыболовных сетей, различных кручёных изделий, канатов, армированных пластиков. Полиолефиновые волокна – карбо-цепные волокна, полученные из полиолефинов способом формования из расплава. Подразделяются на полипропиленовые и полиэтиленовые волокна. Полиолефиновые Волокна, синтетические волокна, получаемые главным образом из изотактичного полипропилена, полиэтилена, реже – из поли-4-метил-1-пентена. Формуют из расплавов полимеров экструзионным методом; выпускают в виде комплексных нитей, мононитей, нитей из ориентированной плёнки (плоской и фибриллированной) и резаного волокна. Ориентационное вытягивание сформованных волокон (в 5–10 раз) осуществляют на обогреваемой металлической поверхности или в воздушной среде при температуре на 20–30 °С ниже температуры плавления полимера. Фибриллированные нити изготовляют из ориентированных полосок плёнки шириной 1–50 мм и толщиной 25–80 мкм, пропуская их через вращающийся валок-фибриллятор, на поверхности которого размещены иглы (6–64 на 1 см). При контакте с ними на поверхности плёнки образуются надрезы, увеличивающиеся в размерах. Фибриллирующее устройство включает:- фибриллятор; ‘плавающий’ вал для изменения угла обхвата фибриллятора плёнкой; тянущий блок, состоящий из трёх валков, с помощью которых плёнка получает необходимое натяжение. Часть волокон и нитей выпускают окрашенными; крашение проводят в массе органическими и неорганическими пигментами. Для повышения устойчивости полиолефиновых волокон при нагреве и УФ облучения в полиолефины на стадии их синтеза или грануляции вводят стабилизаторы (фенолы, ароматические амины, аминофенолы или другие соединения). Прочность фибриллированных нитей с повышением степени фибрилляции снижается. Волокна и нити обладают высокими диэлектрическими свойствами (е 2.1–2.5 при частоте 1·106 Гц). Трудно воспламеняются, но горят. Гидрофобны, устойчивы в кислотах и щелочах (за исключением концентрированных кислот:- HNO_3 и хлорсульфоновой $SO_2(C_1)OH$). Не растворяются в неполярных органических растворителях (бензол, толуол, декалин, тетралин) ввиду высокой кристалличности полиолефинов при комнатной температуре, но с повышением температуры набухают, а затем растворяются. Устойчивы к действию микроорганизмов. Достоинства полиолефиновых волокон – высокая эластичность и низкая стоимость благодаря доступности сырья; недостатки – низкая светостойкость и относительно невысокая температура плавления. Выпускают полиолефиновые волокна под следующими торговыми названиями:- Алатон,

Геркулон (Herculon), Комфорлон, Мераклон (Meraklon), Пайлен (Pylen), Рафия, Спанстрон, Алстрон (Ulstron), Хайфекс и другие. Применяют в производстве нетонущих канатов, брезентов, рыболовных сетей, фильтровальных, тарных и обивочных тканей, ковровых изделий, тканей для верхней одежды и другого. Разработан способ получения высокомодульных (до 200 МПа) и высокопрочных (до 5 ГПа) полиолефиновых волокон из 2–3%-ных растворов полиэтилена высокой плотности (молекулярная масса 1.5–106). Сформованные нити подвергают высокоориентационной вытяжке до 40 000%; используют их главным образом для получения композиционных материалов. Мировое производство 1.5 миллиона тонн (в 1985). Впервые производство волокна из полипропилена осуществлено в Италии (в 1958). К Полиолефиновым Волокнам относятся полиэтиленовые и полипропиленовые волокна. Рост мирового производства полиолефиновых волокон продолжается, в том числе и с различными многофункциональными свойствами. Наибольшее распространение получили полипропиленовые волокна. Они являются вторыми среди всех химических волокон по темпам роста производства и объёму выпуска. Выпуск полипропиленовых волокон в 2000 составил 19% от суммарной продукции всех видов синтетических волокон. В 2003 в России впервые на АС-Пресс, ООО (Краснодар) было освоено новое современное производство мультифиламентных полипропиленовых текстильных нитей, в том числе и текстурированных.

POLYOL ESTER = ПОЛИОЛ СЛОЖНЫЙ ЭФИР – Polyol Ester is a synthetic lubricant base, formed by reacting fatty acids with a polyol (such as a glycol) derived from petroleum. Properties include good oxidation stability at high temperatures and low volatility. Used in formulating lubricants for turbines, compressors, jet engines, and automotive engines. / как гликоль) . Полиол – высокомолекулярный спирт.

POLYOXYAMIDE FIBER = ПОЛИОКСИАМИДНОЕ ВОЛОКНО (или ВОЛОКНО ПОЛИОКСИАМИД) – Polyoxyamide Fiber is a copolymeric fiber with good comfort properties, particularly high moisture absorption and transfer, and intrinsic softness.

POLYPETALOUS = МНОГОЛЕПЕСТНОЙ (или МНОГОЛЕПЕСТКОВЫЙ) – Polypetalous:- of a corolla with many separate petals. / Многолепестной или Многолепестковый:- о венчике (corolla) с многочисленными раздельными лепестками. , от Греческих слов Polýs, означающее Многий или Многочисленный или Обширный, и .

POLYPHAGIC = ПОЛИФАГИЧЕСКОЕ (или МНОГОЯДНОЕ) – Polyphagic:- (Greek:- poly – many) Associated with many food sources. / Под Полифагией, от Греческих слов Polýs, означающее Многий или Многочисленный или Обширный, и Phagéin, означающее Есть или Пожирать, понимается:- (1) у человека чрезмерное потребление пищи. Полифагия может быть обусловлена повышенной потребностью в энергии и белках у здорового человека (например, после длительного голодания, тяжёлой физической работы, перенесённых инфекций) или при некоторых заболеваниях (диабет сахарный, зоб диффузный токсический и другие). Полифагия может наблюдаться и вследствие так называемого ложного голода, обусловленного неадекватным раздражением пищевого центра гипоталамуса (например, при неврозах, слабоумии), иногда обостряется до степени булимии. (2) Полифагия, или Многоядность (зоологическая), способность животного питаться различными растительными и животными кормами. Смотрите также Всеядность. В этом смысле понятию Полифагия противоположна Олигофагия.

POLYPHAGOUS = ПОЛИФАГНОЕ (или МНОГОЯДНОЕ, или ЖИВУЩЕЕ НА НЕСКОЛЬКИХ ХОЗЯЕВАХ) – Polyphagous:- feeding on or utilizing many kinds of food or parasitizing a number of different hosts; specifically feeding on various Plants or Animals.

POLYPHYLETIC = ПОЛИФИЛЕТИЧЕСКОЕ – Polyphyletic:- of a group of organisms not including the most recent common ancestor, often because this common ancestor is not characteristic of the group or because the group originated from more than one evolutionary line. Polyphyletic taxa are considered ‘unnatural’ and tend to become targets for revision by taxonomists. See also Monophyletic, and Paraphyletic. / Под Полифилетическим, от Греческих слов Polýs, означающее Многий или Многочисленный или Обширный, и Phýlon, означающее Племя или Род, понимается . Под Полифилией понимается происхождение Группы организмов (таксона) от двух и более предковых Групп в результате конвергенции или симбиоза. Полифилия – предполагаемое происхождение той или иной систематической Группы организмов (таксона) от двух и более предковых Групп в результате конвергенции. Некоторые ботаники считают, например, что Двудольные и Однодольные Растения произошли от разных предков и представляют собой 2 параллельных ствола Цветковых Растений, сходство между которыми – результат конвергенции. Высказываются предположения о полифилетическом происхождении разных Групп животных. Так, вероятно, крупные группы млекопитающих произошли от разных групп пресмыкающихся – Терапсид (Therapsida). Подобные случаи, обозначаемые иногда как парафилифия, не представляют полифилию, так как основная исходная группа одна. Таким образом, если выясняется, что группа организмов, считавшаяся раньше монофилетической, состоит из элементов различного происхождения, то её следует разделить на столько систематических единиц, сколько отдельных групп разного родства входит в её состав. ‘В филогенетической системе нет места полифилетическим группам. Полифилия есть лишь выражение несовершенства нашей классификации’ (Иван Иванович Шмальгаузен (1884–1963), Проблемы Дарвинизма, Л., 1969, с. 400). Особенно неприемлемы искусственные таксоны для современной эволюционной систематики, один из основных принципов которой – классифицирование организмов в соответствии с информационным содержанием их генетической программы. Таксоны эволюционной систематики могут быть только монофилетическими (смотрите Монофилия).

POLYPLOID = ПОЛИПЛОИД – Polyploid is an organism with more than two sets of chromosomes. Polyploids can be autopolyploid (duplication of the same set) or allopolyploid (combinations of different sets). More than diploid by multiples of the haploid number. Polyploid:- with more than two sets (diploid) of the basic chromosome number. / Под Полиплоидом, от Греческих слов Polýploos, означающее Мнократный, и Éidos, означающее Вид, понимается наследственно изменённый организм с многочисленным набором хромосом в клетках организма. Широко распространены среди растений. Большинство культурных растений – полиплоиды, среди раздельнополых животных встречается редко. У многих полиплоидных форм растений более крупные размеры, повышенное содержание ряда веществ, отличные от исходных форм сроки цветения и плодоношения. На основе полиплоидии созданы высокоурожайные сорта сельскохозяйственных растений, например, сахарной свёклы.

POLYPROPYLENE = ПОЛИПРОПИЛЕН – Polypropylene is a synthetic ‘olefin’ polymer (plastic). Polypropylene containers are a good choice for many dyeing processes. Polypropylene has excellent resistance to most chemicals used in dyeing, with the possible exception of some disperse dye carriers. It can be used at the boiling point of water, though it can’t be used on a stove top. A great many household plastic containers are made from this polymer. Polypropylene is also used for fibers, mostly for carpets, but finds some use in garments. It cannot conventionally dyed so it is colored by ‘dope dyeing’ (pigments are added to the raw material). Polypropylene was first polymerized by Karl Rehn and Giulio Natta in March 1954, serving as a preliminary work for large-scale synthesis from 1957 onwards. At first it was thought that it would be cheaper than polyethylene. Polypropylene (PP), also known as Polypropene, is a thermoplastic polymer, made by the chemical industry and used in a wide variety of applications, including packaging, textiles (e.g., ropes, thermal underwear and carpets), stationery, plastic parts and reusable containers of various types, laboratory equipment, loudspeakers, automotive components, and polymer banknotes. An addition polymer made from the monomer propylene, it is rugged and unusually resistant to many chemical solvents, bases and acids. In 2007, the global market for

polypropylene had a volume of 45.1 million tons, which led to a turnover of about 65 billion US Dollars (47.4 billion Euro). Most commercial polypropylene is isotactic and has an intermediate level of crystallinity between that of low-density polyethylene (LDPE) and high-density polyethylene (HDPE); its Young's modulus is also intermediate. Polypropylene is normally tough and flexible, especially when copolymerized with ethylene. This allows polypropylene to be used as an engineering plastic, competing with materials such as ABS (short for the acrylonitrile butadiene styrene). Polypropylene is reasonably economical, and can be made translucent when uncolored but is not as readily made transparent as polystyrene, acrylic, or certain other plastics. It is often opaque or colored using pigments. Polypropylene has good resistance to fatigue. The melting of polypropylene occurs as a range, so a melting point is determined by finding the highest temperature of a differential scanning calorimetry chart. Perfectly isotactic PP has a melting point of 171 °C (340 °F). Commercial isotactic PP has a melting point that ranges from 160 to 166 °C (320 to 331 °F), depending on atactic material and crystallinity. Syndiotactic PP with a crystallinity of 30% has a melting point of 130 °C (266 °F). The melt flow rate (MFR) or melt flow index (MFI) is a measure of molecular weight of polypropylene. The measure helps to determine how easily the molten raw material will flow during processing. Polypropylene with higher MFR will fill the plastic mold more easily during the injection or blow-molding production process. As the melt flow increases, however, some physical properties, like impact strength, will decrease. There are three general types of polypropylene:- homopolymer, random copolymer, and block copolymer. The comonomer used is typically ethylene. Ethylene-propylene rubber or EPDM (short for the ethylene propylene diene Monomer) added to polypropylene homopolymer increases its low temperature impact strength. Randomly polymerized ethylene monomer added to polypropylene homopolymer decreases the polymer crystallinity and makes the polymer more transparent. Melt processing of polypropylene can be achieved via extrusion and molding. Common extrusion methods include production of melt-blown and spun-bond fibers to form long rolls for future conversion into a wide range of useful products, such as face masks, filters, nappies (diapers) and wipes. The most common shaping technique is injection molding, which is used for parts such as cups, cutlery, vials, caps, containers, housewares, and automotive parts such as batteries. The related techniques of blow molding and injection-stretch blow molding are also used, which involve both extrusion and molding. The large number of end-use applications for polypropylene are often possible because of the ability to tailor grades with specific molecular properties and additives during its manufacture. For example, antistatic additives can be added to help polypropylene surfaces resist dust and dirt. Many physical finishing techniques can also be used on polypropylene, such as machining. Surface treatments can be applied to polypropylene parts in order to promote adhesion of printing ink and paints. / Карл Рин (Karl Rehn) и Джульо Натта (Giulio Natta). Акрилонитрильный Бутадиеновый Стирол (Acrylonitrile Butadiene Styrene). Экструзия или Выдавливание (Extrusion). Полипропилен, $[–CH(CH_3)CH_2–]_n$, синтетический полимер, продукт полимеризации пропилена; твёрдое вещество белого цвета. Плотность 905–920 кг/м^3; плавится при 160–176 °C. Нерастворим в органических растворителях, устойчив к действию кипящей воды и растворов щёлочей, разрушается в неорганических кислотах. Отличается высокой ударной прочностью, стойкостью к многократному изгибу и истиранию, низкой паро- и газопроницаемостью, хорошие диэлектрические свойства, невысокая термо- и светостойкость. Применяется в производстве полипропиленового волокна, плёнок и труб для агрессивных жидкостей, бытовых изделий и так далее. Полипропилен, термопластичный полимер пропилена, $(–CH_2–CH(CH_3)–)_n$; бесцветное кристаллическое вещество изотактической структуры, молекулярная масса 300–700 000, максимальная степень кристалличности 73–75%, плотность 0.92 – 0.93 грамма на кубический сантиметр (г/см^3) при 20 °C, $t_{пл}$ 172 °C. Для полипропилена характерны высокая ударная прочность (ударная вязкость с надрезом 5–12 килоДжоулей на квадратный метр (кДж/м^2), или килограмм-силы на квадратный сантиметр (кгс·см/см^2), высокая стойкость к многократным изгибам, низкая паро- и газопроницаемость; по износостойкости он сравним с полиамидами. Полипропилен – хороший диэлектрик (тангенс угла диэлектрических потерь 0.000 3–0.000 5 при 1 МегаГерц (МГц)), плохо проводит тепло. Он не растворяется в органических растворителях, устойчив к воздействию кипящей воды и щёлочей, но темнеет и разрушается под действием HNO_3, H_2SO_4, хромовой смеси. Полипропилен обладает низкой термо- и светостойкостью, поэтому в него вводят специальные добавки – стабилизаторы полимерных материалов. Полипропилен получают полимеризацией мономера в растворе или массе; перерабатывают литьём под давлением и экструзией. Из полипропилена изготавливают волокна и плёнки, сохраняющие гибкость при 100–130 °C пенопласт, детали машин, профилированные изделия, трубы (для агрессивных жидкостей), различную арматуру, контейнеры, бытовые изделия и другое. Аморфную фазу, образующуюся при синтезе полипропилена в количестве 3–7%, отделяют от основного кристаллического продукта и используют в производстве бытовых резиновых изделий и присадок к смазочным и моторным маслам. Полипропилен производится в бывшем СССР, Италии (Моплен), Великобритании (Пропатен), ФРГ (Хостален), США (Полипро, Профакс). Мировое производство полипропилена в 1973 составило около 2.4 миллиона тонн (т). Смотрите также Полиолефины.

POLYPROPYLENE FIBER = ПОЛИПРОПИЛЕНОВОЕ ВОЛОКНО – Polypropylene is a manufactured, olefin fiber made from polymers or copolymers of propylene. Polypropylene fiber is produced by melt spinning the molten polymer, followed by stretching to orient the fiber molecules. Characteristics:- polypropylene fibers have a number of advantages over polyethylene fibers in the field of textile applications. The degree of crystallinity, 72 to 75%, results in a fiber that is strong and resilient, and does not fibrillate like high-density polyethylene. Polypropylene has a high work of rupture, which indicates a tough fiber, and may be made with tenacities as high as 8.0 to 8.5 grams per denier. The melting point of polypropylene is 165 °C, which is low by comparison with nylon or polyester, but is high enough to make it suitable for most textile applications. So light that it actually floats, polypropylene fiber provides greater coverage per pound than any other fiber. It is highly resistant to mechanical abuse and chemical attack. End Uses:- polypropylene fibers are widely used in industrial, carpet, and geotextile applications. They have found important uses in fishing gear, in ropes, and for filter cloths, laundry bags and dye bags. The excellent chemical resistance of polypropylene fiber is of advantage in the filtration and protective clothing fields. Fibrillated polypropylene yarns are widely used in indoor-outdoor carpets. Staple fiber finds application in blankets, pile fabrics, underwear, and industrial fabrics; it is being developed for carpets, candlewicks, knitted outerwear, hand-knitting yarns, and upholstery. Polypropylene is a synthetic fiber composed of linear macromolecules made up of saturated aliphatic hydrocarbon units in which one carbon atom in two carries a methyl side group, generally in an isotactic configuration and without further substitution. Alphabetic code – PP; and relevant commercial allowance – 2.00. Polypropylene is a manufactured fiber characterized by its light weight, high strength, and abrasion resistance. Polypropylene is also good at transporting moisture, creating a wicking action. End-uses include activewear apparel, rope, indoor-outdoor carpets, lawn furniture, and upholstery. Also known as Olefin, or Polyolefin. Polypropylene Fiber is a manufactured olefin fiber made from polymers or copolymers of polypropylene. This is a tough fiber with a tenacity of 3.5 to 4.5 grams/denier and a melting point of 165 °C. It is so light in weight that it floats and is highly resistant to mechanical abuse and chemical attack. Polypropylene Fiber is a textile fiber developed by Professor Giulio Natta, consultant to the largest chemical producer in Italy (largest at the time), Montecatini, Società Generale per l'Industria Mineraria e Chimica Anonima (Italia). It is obtained from propylene gas, a by product of oil refining. The fiber may be used for satiny silk-like fabrics or for heavy wool-like yarns with strengths comparable with nylon. The fiber melts at 348 degrees Fahrenheit and cloth made from it can not be ironed. Polypropylene (Olefin or Polyolefin) is a manufactured fiber characterized by its light weight, high strength, and abrasion resistance. Polypropylene is also good at transporting moisture, creating a wicking action. End-uses include thermal underwear, activewear apparel, rope, indoor-outdoor carpets, lawn furniture, and upholstery. Polypropylene Fibers are manufactured

by polymerization of propylene produced by purifying the petroleum. Polypropylene fiber is lightest in weight among synthetic fibers. It can float in water. Polypropylene fiber is used for home furnishings such as carpets and rugs; and industrial uses such as ropes, reflecting the characteristics of strong tensile strength, resistance to acid and alkali and soil resistance. In addition, it is also used for swimsuits, socks and underwear with superior in warmth retention and fast drying properties thanks to little moisture and water absorption. On the contrary, it is inferior in heat resistance. Self-adhesive composite fibers compounded of polypropylene fiber and other polymers of low melting point are also manufactured for a wide variety of hygienic products. End-Uses:- (i) For clothing:- Socks, Thermal Underwear, Swimsuits, etc. (ii) For home furnishings:- Medical supplies, Carpets, Automotive Rugs, Braids, etc. (iii) For industrial uses:- Fishing Nets, Ropes, Filter Cloth, V-belts, Water-proofed Sheets, Nets for Construction, etc. Features:- (i) The specific gravity is 0.91, lightest in weight among all fibers. One of the very strong fibers. (ii) Little moisture and water absorption. Quickly dryable even it is wet. Superior in warmth retention thanks to the low heat transfer rate. (iii) Resistant to acid and alkaline chemicals. (iv) Thermoplastic. Care Instructions:- wash with water avoiding the drycleaning. Avoid tumble drying (hot air dryer), iron at low temperature and use an iron cloth, because polypropylene fiber is heat sensitive and tends to be deformed by heating. / Найлан^{Т3} (Nylon^{TM}). Профессор Джульо Натта (Giulio Natta) , Монтэкатини, Сочэта Дьжэнерале пэр л'Индустриа Минерариа э Кимика Анонима (Montecatini, Società Generale per l'Industria Mineraria e Chimica Anonima). домогательство (abuse). Изготовленное волокно, характеризуемое своим лёгким весом, высокой прочностью, и сопротивлением к истиранию. Полипропилен является также . , и высокая устойчивость к истиранию. Известен также как Олефин (Olefin) или Полиолефин (Polyolefin). Полипропиленовое Волокно выпускается в виде штапельного волокна и текстильной нити. Полипропиленовое Волокно, синтетическое волокно, получаемое формованием из расплава полипропилена. Стойко к действию кислот, органических растворителей, растворов щёлочей; обладает хорошими теплоизоляционными и эластичными свойствами (по устойчивости к двойным изгибам превосходит полиамидное волокно). Серьёзным недостатком являются сравнительно невысокая термостойкость и низкая светостойкость. Из полипропиленового волокна изготовляют брезенты, нетонущие канаты, ковры, обивочные и фильтровальные материалы, рыболовные сети и другие. Торговые названия:- Геркулон (Herculon в США), Мераклон (Meraklon в Италии), Пайлен (Pylen в Японии), Алстрон (Ulstron в Великобритании) и другие. Полипропиленовое Волокно, синтетическое волокно, формуемое из расплава полипропилена. Полипропиленовое волокно по эластичности, устойчивости к двойным изгибам, как правило, превосходит полиамидные волокна, но уступает им по стойкости к истиранию. Обладает хорошими теплоизоляционными свойствами, имеет высокую стойкость к действию кислот, щёлочей, органических растворителей. Термо- и светостойкость полипропиленового волокна сравнительно невысоки и в значительной мере определяются эффективностью вводимых в них стабилизаторов. Филаментное полипропиленовое волокно и моноволокно используют для изготовления нетонущих канатов, сетей, фильтровальных и обивочных материалов; штапельное полипропиленовое волокно – для выпуска ковров, одеял, тканей для верхней одежды, трикотажа, фильтровальных материалов. Текстурированное (высокообъёмное) полипропиленовое волокно находит применение главным образом в производстве ковров. Полипропиленовое волокно выпускается под различными торговыми названиями:- Геркулон (США), Ульстрен (Великобритания), Найден (Япония), Мераклон (Италия) и другие. Мировой выпуск полипропиленового волокна в 1972 составил около 500 000 тонн (т). Полипропиленовое (ПП) Волокно – синтетическое волокно, формуемое из расплава полипропилена. Отличительные свойства ПП волокон:- исключительной особенностью этих волокон является их очень низкая плотность 0.91–0.92 г/см^3. Это самые лёгкие из всех известных волокон. Гигроскопичность нитей практически равна нулю. Поэтому изделия из них не тонут в воде. ПП волокно по эластичности, устойчивости к двойным изгибам, как правило, превосходит полиамидные волокна, но уступает им по стойкости к истиранию. Обладает хорошими теплоизоляционными свойствами, имеет высокую стойкость к действию кислот, щёлочей, органических растворителей. ПП волокно имеет высокое сопротивление к бактериям, насекомым и плесени. Недостатки:- довольно низкая термостойкость (110–115 °С), поэтому изделия с использованием ПП волокон не должны подвергаться действию высоких температур. Термо- и светостойкость в значительной мере определяются эффективностью вводимых стабилизаторов. Значительная часть ПП волокон выпускается физически и химически модифицированными, с существенно повышенными эксплуатационными свойствами. Применение ПП волокон:- комплекс всех перечисленных свойств даёт возможность широкого использования полипропиленовых нитей в производстве изделий бытового и технического назначения, как в чистом виде, так и в смеси с другими волокнами. Комплексные нити и мононити используют для изготовления нетонущих канатов, сетей, фильтровальных и обивочных материалов. ПП нетканые полотна, получаемые методом аэродинамического формования, используются в качестве фильтрующих, укрывающих материалов. Плёночные и фибриллированные волокна используются в качестве упаковочного шпагата и мягкой тары. Текстурированный ПП жгутик используется в ковровом производстве. ПП текстильные нити, в том числе и текстурированные, оказались прекрасным материалом для изделий контактирующих с кожей человека. Штапельное ПП волокно используется для получения текстильных материалов в смесях с другими волокнами. Оптимальным является создание двухслойных материалов из ПП и целлюлозных волокон:- например – нижний слой из ПП волокон, верхний – из гигроскопичных целлюлозных волокон. Нижнее бельё, спортивные изделия, благодаря низкой гигроскопичности нижнего слоя и плохой его смачиваемости влагой оказываются все время сухими и в то же время эти качества способствуют каппилярному транспорту влаги в наружный слой. В смесях с целлюлозными волокнами ПП волокна используются для изготовления чулочно-носочных изделий с повышенными гигиеническими характеристиками. Благодаря ПП волокнам такие трикотажные изделия быстро сохнут и имеют очень высокую износоустойчивость. Торговые названия:- геркулон, ульстрен, найден, мераклон и другие. Полипропиленовое Волокно – синтетическое волокно, формуемое из расплава полипропилена. Полипропиленовое волокно по эластичности, устойчивости к двойным изгибам, как правило, превосходит полиамидные волокна, но уступает им по стойкости к истиранию. Обладает хорошими теплоизоляционными свойствами, имеет высокую стойкость к действию кислот, щёлочей, органических растворителей. Термо- и светостойкость полипропиленовых волокон сравнительно невысоки и в значительной мере определяются эффективностью вводимых в них стабилизаторов. Филаментное полипропиленовое волокно и моноволокно используют для изготовления нетонущих канатов, сетей, фильтровальных и обивочных материалов; штапельное полипропиленовое волокно – для выпуска ковров, одеял, тканей для верхней одежды, трикотажа, фильтровальных материалов. Текстурированное (высокообъёмное) полипропиленовое волокно находит применение главным образом в производстве ковров. Полипропиленовое волокно выпускается под различными торговыми названиями:- Геркулон (США), Ульстрен (Великобритания), Найден (Япония), Мераклон (Италия) и другими.

POLYPROPYLENE WRAPPED HERCULES, HERCULES CORDAGE = ОБЁРНУТЫЙ ПОЛИПРОПИЛЕНОМ ГЕРКУЛЕС, ГЕРКУЛЕС КОРДАЖ – Polypropylene Wrapped Hercules, Hercules Cordage:- a particularly strong type of rope. Hercules rope is a combination of fiber and wire rope, the individual strands have a wire core. This construction means that Hercules rope is easier to handle than ordinary wire rope.

POLYSACCHARIDE = ПОЛИСАХАРИД – Polysaccharide is a long branched or unbranched chain of sugars linked together by glycosidic bonds. Polysaccharides are frequently molecules of great size, with molecular weights up to several million, and may serve architectural (e.g., cellulose) or food storage (e.g., starch) functions. Polysaccharide is a polymer molecule of sugars, e.g., starch,

glycogen. Polysaccharide is the bio-polymers made up of ten or more simple sugar (like glucose) units. Starches and cellulose are polysaccharides. Below 10 sugar units, a specific numerical prefix is usually used, such as in 'disaccharide'. / Под Полисахаридами, от Греческих слов Polýs, означающее Многий или Многочисленный или Обширный, и Sákchar, означающее Сахар, понимаются высокомолекулярные углеводы, образованные остатками моносахаридов (глюкозы, фруктозы и других) или их производных, например, аминосахаров. Присутствуют во всех организмах, выполняя функции запасных (гликоген, крахмал), опорных (хитин, целлюлоза), защитных (камеди, слизи) веществ. Участвуют в иммунных реакциях, обеспечивают сцепление клеток в тканях растений и животных. Полисахариды, высокомолекулярные соединения из класса углеводов; состоят из остатков моносахаридов (М), связанных гликозидными связями. Молекулярные массы полисахаридов лежат в пределах от нескольких тысяч (ламинарин, инулин) до нескольких миллионов (гиалуроновая кислота, гликоген) и могут быть определены лишь ориентировочно, так как индивидуальные полисахариды обычно являются смесями компонентов, различающихся степенью полимеризации. Химическая классификация полисахаридов основана на строении составляющих их М – гексоз (глюкоза, галактоза, манноза), пентоз (арабиноза, ксилоза), а также аминосахаров (глюкозамин, галактозамин), дезоксисахаров (рамноза, фукоза), уроновых кислот и других. К гидроксильным (–OH) и аминогруппам ($–NH_2$) моносахаридов в молекулах природных полисахаридов могут быть присоединены остатки кислот (уксусной, пировиноградной, молочной, фосфорной, серной) или спиртов (обычно метилового). Гомополисахариды построены из остатков только одного М (например, глюканы, фруктаны), гетерополисахариды – из остатков двух и более различных М (например, арабиногалактаны, глюкуроноксиланы). Многие распространённые полисахариды или группы полисахаридов носят давно укоренившиеся название:- целлюлоза, крахмал, хитин, пектиновые вещества и другие (иногда название полисахарида связано с источником его выделения:- нигеран – из Гриба Aspergillus Niger, одонталан – из Водоросли Odontalia Corymbifera). Полисахариды, в отличие от других классов биополимеров, могут существовать как в виде линейных, так и разветвлённых структур. К линейным полисахаридам относятся целлюлоза, амилоза, мукополисахариды; маннаны дрожжей и камеди растений построены по типу б, а гликоген, амилопектин и галактан из виноградной Улитки Helix Pomatia – по типу в. Тип структуры полисахаридов определяет в значительной степени их физико-химические свойства, в частности растворимость в воде. Такие линейные регулярные (то есть содержащие лишь один тип межмоносахаридной связи) полисахариды, как целлюлоза и хитин, нерастворимы в воде, так как энергия межмолекулярного взаимодействия выше энергии гидратации. Высокоразветвлённые, не обладающие упорядоченной структурой полисахариды хорошо растворимы в воде. Химические реакции, известные в ряду М, – ацилирование, алкилирование, окисление гидроксильных и восстановление карбоксильных, а также введение новых групп и другие, осуществимы и в случае полисахаридов, хотя степень протекания реакций, как правило, ниже. Химически модифицированные полисахариды зачастую обладают новыми, ценными для практики свойствами, отсутствовавшими у исходного соединения. Большинство полисахаридов устойчиво к щёлочам; при действии кислот происходит их деполимеризация – гидролиз. В зависимости от условий кислотного гидролиза получают или свободные М или олигосахариды. Молекулы гетерополисахаридов, содержащих разные по кислотоустойчивости типы гликозидных связей, удаётся расщеплять избирательно. Для этой цели используют и специфические ферменты. Установление строения низкомолекулярных продуктов расщепления облегчает задачу установления строения самого полисахарида. Она сводится к определению структуры так называемых повторяющихся звеньев, из которых, как полагают (это доказано на ряде примеров), построены все полисахариды. Исследование вторичной структуры полисахаридов проводится с помощью физико-химических методов, в частности Рентгеноструктурного анализа, который с успехом был применен, например, при исследовании целлюлозы. Весьма разнообразны биологические функции полисахаридов. Крахмал и гликоген – резервные полисахариды растений и животных; целлюлоза растений и хитин Насекомых и Грибов – опорные полисахариды; гиалуроновая кислота, присутствующая в оболочке яйцеклетки, синовиальной жидкости, стекловидном теле глаза, – высокоэффективный 'смазочный материал'; камеди и слизи растений и капсулярные полисахариды микроорганизмов выполняют защитную функцию; высокосульфатированный полисахарид гепарин – ингибитор свёртывания крови. Фрагменты полисахаридов в смешанных углеводсодержащих биополимерах (гликопротеидах, липополисахаридах), присутствующих в поверхностном слое клетки, обусловливают специфические иммунные реакции организма. Внеклеточные полисахариды и другие углеводсодержащие биополимеры обеспечивают межклеточное взаимодействие, скрепление клеток растений (пектиновые вещества) и животных (гиалин). Биосинтез полисахаридов протекает главным образом с участием нуклеозиддифосфатсахаров, служащих донорами моносахаридных (реже – дисахаридных) остатков, которые переносятся на соответствующие олигосахаридные фрагменты строящегося полисахарида. Биосинтез гетерополисахаридов происходит путём последовательного включения М из соответствующих нуклеозиддифосфатсахаров в полисахаридную цепь. Известен и другой механизм, реализующийся при построении полисахаридов бактериальных антигенов; вначале с участием липидных и нуклеотидных переносчиков сахаров синтезируются специфические, так называемые повторяющиеся звенья, из которых под действием фермента полимеразы происходит синтез полисахарида. Разветвлённые полисахариды типа гликогена и амилопектина образуются путём внутримолекулярной ферментативной перестройки линейного полисахарида. Разрабатываются подходы к направленному химическому синтезу полисахаридов. В живых организмах полисахариды, служащие основными резервами энергии, расщепляются внутри- и внеклеточными ферментами с образованием М и их производных, распадающихся далее с высвобождением энергии. Накопление и распад гликогена в печени человека и высших животных – способ регулирования уровня глюкозы в крови. Мономерные продукты образуются или непосредственно путём последовательного отщепления от молекулы полисахарида, или в результате ступенчатого распада полисахарида с промежуточным образованием олигосахаридов. Многие полисахариды (крахмал, целлюлоза, пектиновые вещества и другие) применяют в пищевой, химической и других отраслях промышленности, в медицине. Смотрите также статьи Углеводы, Углеводный Обмен.

POLYSTYRENE = ПОЛИСТИРОЛ (или ПОЛИСТАЙРИН) – Polystyrene is a synthetic polymer (plastic). Polystyrene is extensively used for disposable food service and packaging items. Solid polystyrene is used for disposable cutlery, glasses and portion cups. Foamed polystyrene is used for plates, packaging trays, coffee cups and the like. Polystyrene has poor resistance to many organic chemicals. Do not use it for storage of dry dyes. Polystyrene items are very convenient for short-term handling dye powders when weighing or mixing dyes. See also Styrene. / Стайрин (Styrene). Под Полистиролом, $(–CH_2–CH(C_6H_5)–)_n$, понимается синтетический полимер, продукт полимеризации стирола; твёрдое стеклообразное вещество. Хороший диэлектрик. Устойчив к химическим реагентам; имеет невысокую теплостойкость. Более теплостоек и менее хрупок ударопрочный полистирол (продукт химического модифицирования полистирола, например, бутадиеновым каучуком). Применяется в производстве пенопластов, корпусов радио- и телеаппаратуры, различных деталей автомобилей и другом. Полистирол, линейный полимер стирола, $(–CH_2–CH(C_6H_5)–)n$; прозрачное стеклообразное вещество, молекулярная масса 30–500 000, плотность 1.06 грамм на кубический сантиметр (г/см^3) (20 °C), температура стеклования 93 °C. Полистирол – дешёвый крупнотоннажный термопласт; характеризуется высокой твёрдостью, хорошими диэлектрическими свойствами, влагостойкостью, легко окрашивается и формуется, химически стоек, растворяется в ароматически и хлорированных алифатических углеводородах, физиологически безвреден. Однако для полистирола характерны сравнительно низкая теплостойкость (например, по Вика ~100 °C) и значительная хрупкость. Лучшими эксплуатационными свойствами обладают различные сополимеры стирола. Так,

повышения теплостойкости и прочности при растяжении (на ~60%) достигают сополимеризацией стирола с акрилонитрилом или а-метилстиролом, повышения прочности и ударной вязкости (с 5–10 до 50–100 килоДжоулей на квадратный метр (кДж/м^2), или килограмм-силы на квадратный сантиметр (кгс·см/см^2)) – получением привитых сополимеров стирола с 5–10% каучука, например, бутадиенового (ударопрочный полистирол), а также тройных сополимеров акрилонитрила, бутадиена и стирола (так называемый АБС-пластик). Заменой акрилонитрила на метилметакрилат синтезируют прозрачные тройные сополимеры. В промышленности полистирол и сополимеры стирола получают радикальной полимеризацией в массе и водных эмульсиях; перерабатывают литьём под давлением, экструзией, прессованием, вакуум-формованием. Полистирол используют для изготовления предметов бытовой техники и домашнего обихода, упаковки, игрушек, фурнитуры, плёнки, для получения пенополистирола (смотрите Пенопласты). Из ударопрочного полистирола и АБС-пластика изготавливают, кроме того, корпуса радио- и телеаппаратуры, детали автомобилей, холодильников, мебель, трубы и другое. Применяют также смеси полистирола с каучуками и другими пластмассами. Мировое производство полистирола и сополимеров стирола в 1973 составило около 5 миллионов тонн (т).

POLYTETRAFLUOROETHYLENE FIBER = ПОЛИТЕТРАФТОРЭТИЛЕНОВОЕ ВОЛОКНО (или ВОЛОКНО ПОЛИТЕТРАФТОРЭТИЛЕН) – Polytetrafluoroethylene Fiber (PTFE):- fluorine-containing manufactured fibers characterized by high chemical stability, relative inertness, and high melting point. Made my emulsion spinning, a process that essentially results in fusion of fibrils by passing an emulsion through a capillary, then drawing the resulting fiber. The fiber has a moderate tensile strength and is particularly resistant to the effect of high temperatures and corrosive chemicals. Having very low frictional coefficients, it has a slippery hand. Its principal uses are in packaging and filtration media. Polytetrafluoroethylene (PTFE) Fiber is a fluoride containing manufactured fiber characterized by high chemical stability, relative inertness and high melting point. The fiber has moderate tensile strength, resistance to chemicals and high temperature. It has very low frictional characteristics and has a slippery hand. It works well in filtration, packaging, and in combination with other fibers in self-lubricating bearings. / Политетрафторэтилен или Тефлон. Пенополитетрафторэтилен (Cellular Polytetrafluoroethylene). Политетрафторэтилен, продукт полимеризации тетрафторэтилена общей формулы (–CF2–CF2–)n; подробнее смотрите в статье Фторопласты.

POLYTRIMETHYLENE TEREPHTHALATE = ПОЛИТРИМЕТИЛЕН ТЕРЕФТАЛАТ – The Polytrimethylene Terephthalate (generically as PTT) is known as Aromatic Polyester and Corterra PTT by Shell. It is innovative polymer produced by the polycondensation reaction of purified terephthalic acid (PTA) and 1,3-propanediol (PDO). PTT competes with the other aromatic polyesters – polyethylene terephthalate (PET) and polybutylene terephthalate (PBT) – as well as with polyamide. PTT is used in fibers for carpet (bulked continuous filament (BCF)) and textiles (filament yarns) and in nonwovens. Other emerging applications are, for example, monofilament, film and engineering thermoplastics (ETPs). The question of why polytrimethylene terephthalate (PTT) is only appearing now and not 60 years ago (info of 2008), when it was invented, has many different answers. One reason is that at that time of invention, polyethylene terephthalate (PET) was found to be the polymer with the broadest application potential in different industrials fields, including films for video and audio, textile fiber, technical films and packaging. Another reason was the limited availability of 1,3-propanediol (PDO), which was expensive. However, PDO is now playing a major role in the industrial development of PTT. PTT greatly reduces the amount of acrolein generated during thermal decomposition of the polymer. This stabilization is effective at temperatures well above the melt temperature and is active for days at these temperatures. There are two routes to synthesis PTT:- (i) the transesterification of dimethylterephthalate (DMT) with PDO; and (ii) the esterification route starting with PTA and PDO – these are similar to PET synthesis. With the exception of the process temperature and catalysts, the synthesis of PTT follows more or less the same chemical rules as the PET process. As a consequence, it is possible, in general, to convert existing PET production facilities to produce PTT. Currently, PTT is extrusion spun. Because PTT, like PET, is sensitive to hydrolysis degradation, a drying process is necessary before extrusion. The drying temperature should not exceed 150 °C because at higher temperatures an oxidative destruction will occur. Unlike PET, PTT chips do not need to be crystallized before drying. When considering the adaptation of the spinning and winding process from PET to PTT, three properties have to be taken into account:- melt temperature, glass transition temperatures, and intrinsic elasticity. Unlike all other known linear polyester polymers, PTT shows a repeatable elastic recovery of about 10–12%. A team of British scientists recently (info of 2008) discovered that the crystal structure of PTT is spiral shaped, which explains the elastic recovery of PTT fibers. Spinning and winding an elastic filament at high speed will prove more difficult than a non-elastic filament. During partially oriented yarn (POY) spinning, the cheese package might tighten or bulge, both of which are undesirable winding failures. Texturing of PTT POY is againg under adapted conditions, is performed in a similar manner to PET POY texturing. The last five years (2003–08) have brought a large number of patents related to PTT high-speed spinning processes. The amount of PTT fibers and filament in production worldwide is estimated to be beneath 50 000 tons/year. For now, most applications make use of PTTs high elasticity, in leisure and sportswear. Textiles made of PTT fibers combine the properties of common fibers, such as Spandex, Nylon™, acrylic and PET. High stretch, bulk and softness are providing the potential to replace the expensive high elastic polyurethane fibers. Most of the mechanical properties are similar to PET but they are also easy to dye. PTT fibers are providing a completely new tool to design consumer fabrics, with optimal processing and application values. Finally, the price of PTT will dictate the speed at which it replaces other fibers. Unlike other introductions of new polymers to the industry, the introduction of PTT was accompanied by powerful marketing activities from the first. Shell has announced that it has a PDO production unit of 75 000 tons/year capacity on stream. Shell's PTT polymer production is estimated to be in the range of 21 000 tons/year. Shell's PTT activities are covered by the trade name Corterra™. In 1998, DuPont acquired the PDO production of Degussa in Wesseling, Germany. This plant is producing abount 12 000 tons/year PDO with the option to expand the capacity to 50 000 tons/year. DuPont's PTT activities are covered by the trade name Sorona™. / филаментная (комплексная) пряжа (filament yarn). мононить (monofilament). Экструзия или Выдавливание (Extrusion). и Котчэра ПТТ от компании Щел (Corterra PTT by Shell). Найлан™ (Nylon™).

POLYURETHANE = ПОЛИУРЕТАН – Polyurethane:- a paint and varnish resin which imparts good abrasion resistance and marketed under several trade names such as varathane, urethane, and durathane. / Смола краски и лака, устойчивость к истиранию и . Полиуретаны, синтетические полимеры, содержащие в молекуле группы –NH–CO–O–; образуются при взаимодействии ди- или полиизоцианатов с двух- или трёхатомными спиртами; вязкие жидкости или твёрдые вещества. Применяются в производстве полиуретанового волокна, пенопластов, клеёв, лаков. Эластичные полиуретаны (уретановые каучуки) – основа износостойкой резины. Полиуретановые лаки, растворы изоцианатов и соединений с гидроксильными группами в органических растворителях (компоненты реагируют между собой после нанесения на поверхность, образуя полиуретаны). Покрытия эластичны, износостойки, обладают антикоррозионными и электроизоляционными свойствами. Лаками, а также красками и грунтовками на их основе защищают химическую и радиоэлектронную аппаратуру, детали судов и самолётов, строительные конструкции и другое. Полиуретаны, полимеры, содержащие в основной цепи макромолекулы уретановые группировки –NH–CO–O–; общая формула линейных полиуретанов:- (¾A¾OCOHN¾A"–NHCOO¾)$_n$. Обычно полиуретаны получают поликонденсацией ди- или полиизоцианатов (в общей формуле A" – остаток диизоцианата) с соединениями, содержащими активные атомы водорода, например, двух- и трёхатомными спиртами (A – углеводородный остаток). Этот процесс часто называют полимеризацией или полиприсоединением. Для синтеза полиуретана чаще всего используют 1,6-

гексаметилендиизоцианат, 2,4- и 2,6-толуилендиизоцианаты, три (n-изоцианатфенил) метан (смотрите Изоцианаты), простые и сложные алифатические или ароматические полиэфиры, гликоли, глицерин. Свойства полиуретана изменяются в очень широких пределах (в зависимости от природы и длины участков цепи между уретановыми группировками, от структуры – линейная или сетчатая, молекулярной массы, степени кристалличности и другого). Полиуретаны могут быть вязкими жидкостями или твёрдыми (аморфными или кристаллическими) продуктами – от высокоэластичных мягких резин до жёстких пластиков (твёрдость по Шору от 15 по шкале A до 60 по шкале D соответственно). Полиуретаны устойчивы к действию кислот, минеральных и органических масел, бензина, окислителей; по гидролитической стойкости превосходят полиамиды. Линейные полиуретаны растворимы в некоторых полярных растворителях (например, диметилформамиде, диметилсульфоксиде). Полиуретаны используют в виде пен (смотрите Пенопласты), каучуков (смотрите Уретановые Каучуки), термопластов, волокон (смотрите Полиуретановые Волокна), лаков (смотрите Полиуретановые Лаки), клеев (смотрите Полиуретановые Клеи), латексов для приготовления герметизирующих составов и другого. Изделия из полиуретана получают методом жидкофазного литья непосредственно из исходных мономеров или из предварительно полученных полимеров (форполимеров). Мировое производство пенополиуретана в 1973 составило около 1.2 миллиона тонн (т).

POLYURETHANE FIBER = ПОЛИУРЕТАНОВОЕ ВОЛОКНО – Polyurethane Fibers are referred to as Spandex as a generic name. The fiber itself is highly stretch and elastic as rubber, strong than rubber, and resistant to aging. The fiber is dyeable freely and fine yarn can be produced. Polyurethane fiber is manufactured from glycol and diisocyanate as raw material with a special spinning method. No product is manufactured of 100% poly-urethane fiber. The polyurethane fiber is used by blending other fibers. A fabric, referred to 'two-way tricot' in which a polyurethan fiber is knitted with a nylon or polyester filament yarn, is highly elastic both in wale- and course-way and is used for swimsuits, leotards, underwear and other similar stretchable clothing. A yarn, in which another yarn such as nylon yarn is wound around polyurethane yarn is referred to as a 'Covered Yarn'. A covered yarn is used for pantyhose and foundation garments. In addition, a yarn in which a polyurethane yarn is inserted as a core in the spinning process is referred to as a 'Core Spun Yarn'. A core spun yarn is used for tights and training wear. Used as a part of foundations such as brassieres, girdles, corsets, sweaters, underwear, pantyhose, socks, swimsuits, shirts slacks, and also for bandages, supporters, paper diapers, etc. Features:- (i) extends 5~7 times when stretched as rubber; (ii) more durable than rubber and 2~4 times higher tensile strength than rubber. More resistant to aging than rubber and finer yarn is available; (iii) since considerably resistant to high tempera-ture, a heat setting can be achieved with other fibers simultaneously; and (iv) although non-attackable with alkali, yellowing with the action of chlorine and deterioration is accelerated with chlorine. Care instructions:- (i) avoid chlorinated bleaching agents; (ii) do not iron by stretching a polyurethane fabric. See also Spandex Fiber. / Найлан^{T3} (Nylon^{TM}). Щёлочь (Alkali). филаментная (комплексная) пряжа (filament yarn). Полиуретановое Волокно – синтетическое волокно, получаемое формованием из растворов или расплавов некоторых полиуретанов (или методом химического формования, в котором полиуретан образуется из исходных соединений непосредственно при получении волокна). Стойки в маслах, хлорсодержащих органических растворителях растворах щёлочей, кислотах, выдерживают действие гидролитических агентов при отделке, крашении, стирке. По эластичным свойствам сходны с резиновыми нитями (имеют низкий модуль упругости и высокое относительное удлинение), но превосходят их по устойчивости к кожному жиру и поту, по прочности и износостойкости. Применяется (часто в смеси с природными или другими химическими волокнами) для изготовления спортивной одежды, рубашек, плащей, корсетных изделий. Торговые названия:- Вайрин (Vy-rene в США), Ворин (Vorin в Италии), Дорластан (Dorlastan в Германии и Японии), Лайкра (Lycra в США), Неоран (Neoran в Японии), Спанцел (Spanzelle в Великобритании), Эспа (Espa) и другие. Известно также как Спандекс или Спандэкс (Spandex). Полиуретановые Волокна или Спандекс, синтетические волокна, формуемые из растворов или расплавов полиуретанов или методом так называемого химического формования (полиуретан образуется из диизоцианата и диамина непосредственно в процессе волокнообразования). По механическим показателям полиуретановые волокна резко выделяются среди других видов химических и натуральных волокон и во многом сходны с резиновыми нитями. Для них характерны высокое удлинение, низкий модуль упругости, способность к упругому восстановлению в исходное состояние за очень короткое время. При 120 °С, особенно в растянутом состоянии, происходит значительная потеря прочности полиуретановых волокон. Поэтому чистку и крашение изделий из полиуретановых волокон проводят при температурах не выше 90 °С. Под действием света полиуретановые волокна желтеют (этого в значительной степени можно избежать применением светостабилизаторов), а их механические свойства изменяются незначительно. Полиуретановые волокна довольно устойчивы к действию гидролитических агентов во время отделки, стирки, крашения; стойки в маслах, хлорсодержащих органических растворителях, кислотах, щёлочах. Полиуретановые волокна перерабатывают в чистом виде или в смеси с натуральными или с другими видами химических волокон. Последние идут главным образом на оплётку полиуретановой нити, которая предохраняет стержневую нить от действия света. Для получения тканей используется пряжа, состоящая из 5–20% полиуретановых волокон и 80–95% нерастяжимых волокон. Из тканей изготовляют рубашки, блузки, спортивные костюмы, плащи, корсетные изделия и другое. Полиуретановые волокна известны под торговыми названиями:- Лайкра, Вайрин (США), Эспа, Неоран (Япония), Спанцель (Великобритания), Ворин (Италия) и другими. Мировое производство полиуретанового воловкна в 1973 составляло несколько десятков тысяч тонн.
